‡ The root of *Damasonium* (according to *Dioscorides*) taken in the weight of one or two drams, helpeth such as haue deuoured the *Lepus marinus* or sea Hare, or haue beene bitten by a Toad, or taken too great a quantity of *Opium*. D

It is also profitably drunke, either by it selfe, or with the like quantity of *Daucus* seeds, against gripings in the belly, and the bloudy flux. E

Also it is good against conuulsions and the affects of the wombe. F

The herbe staies the flux of the belly, moues the courses, and applied in forme of a pultis assuageth œdematous tumors. ‡ G

Chap. 256. *Of Mountaine Sanicle.*

¶ *The Kindes.*

There be sundry sorts of herbes contained vnder the name of Sanicle, and yet not one of them agreeing with our common Sanicle, called *Diapensia*, in any one respect, except in the vertues, wherof no doubt they tooke that name; which number doth dayly increase, by reason that the later writers haue put downe more new plants, not written of before by the Antients, which shall be distinguished in this chapter by seuerall titles.

¶ *The Description.*

1 Spotted Sanicle of the mountaine hath small fat & round leaues, bluntly indented about the edges, and fashioned like vnto the leaues of *Saxifragia aurea*, or rather *Cyclamen folio hederæ*, of a darke greene colour, and somewhat hairy vnderneath: amongst which rise vp

1 *Sanicula guttata.*
Spotted Sanicle.

2 *Pinguicula ſiue Sanicula Eboracenſis.*
Butterwort, or Yorkſhire Sanicle.

3 *Sanicula Alpina Cluſij, ſiue Cortuſa Matthioli.*
Beares-eare Sanicle.

vp ſundry ſtalkes, beſet with like leaues, but ſmaller, and of a cubit high, diuiding themſelues into many ſmall armes or branches, bearing diuers little white floures, ſpotted moſt curiouſly with bloudy ſpecks or prickles, inſomuch that if you marke the admirable workemanſhip of the ſame wrought in ſuch glorious manner, it muſt needs put euery creature in minde of his Creator: the floures are in ſmell like the May floures or Hawthorne: the ſeed is ſmall and blacke, contained in ſmall pointals like vnto white Saxifrage: the root is ſcaly and full of ſtrings.

2 The ſecond kind of Sanicle, which *Cluſius* calleth *Pinguicula*, not before his time remembred, hath ſmall thicke leaues, fat and full of juyce, being broad towards the root, and ſharpe towards the point, of a faint greene colour, and bitter in taſte: out of the middeſt whereof ſprouteth or ſhooteth vp a naked ſlender ſtalke, nine inches long, euery ſtalke bearing one floure and no more, ſometimes white but commonly of a blewiſh purple colour, faſhioned like vnto the common *Conſolida regalis*, hauing the like ſpur or Larks heele annexed thereto.

3 The third kinde of mountaine Sanicle

ſome

ſome Herbariſts haue called *Sanicula alpina floro rubro:* the leaues ſhoot forth in the beginning of the Spring, very thicke and fat, and are like a purſe or round lumpe at their firſt comming out of the ground; and when it is ſpread abroad, the vpper part thereof is full of veines or ſinewes, and houen vp or curled like *Ranunculus Luſitanicus*, or like the crumpling of a cabbage leafe; and are not onely indented about the edges, but each leafe is diuided into ſix or more jagges or cuts, deepely hacked, greeniſh aboue, and of an ouerworne greene colour vnderneath, hot in taſte; from the middle whereof ſhooteth forth a bar or naked ſtalke, ſix inches long, ſomewhat purple in colour, bearing at the top a tuft of ſmall hollow floures, looking or hanging downewards like little bells, not vnlike in forme to the common Cowſlips, but of a fine deepe red colour tending to purple, hauing in the middle a certaine ring or circle of white, and alſo certaine pointals or ſtrings, which turne into an head wherein is contained ſeed. The whole plant is couered as it were with a rough woollineſſe: the root is fibrous and threddy.

¶ *The Place.*

Theſe plants are ſtrangers in England; their naturall country is the Alpiſh mountaines of Heluetia: they grow in my Garden, where they flouriſh exceedingly, except Butterwort, which groweth in our Engliſh ſqually wet grounds, and will not yeeld to any culturing or tranſplanting: it groweth eſpecially in a field called Crag-Cloſe, and at Crosby, Rauenſwaith, in Weſtmerland, vpon Ingleborow fels twelue miles from Lancaſter, and in Harwood in the ſame county neere to Blackburne, ten miles from Preſton in Aunderneſſe vpon the bogs, and mariſh grounds, and in the boggie medowes about Biſhops Hatfield; and alſo in the fens in the way to Wittles meare from London, in Huntingdonſhire. ‡ It groweth alſo in Hampſhire, and abundantly in many places of Wales. ‡

¶ *The Time.*

They floure and flouriſh from May to the end of Iuly.

¶ *The Names.*

The firſt is called *Sanicula guttata*, taken from the ſpots wherewith the floures are marked: of *Lobel, Geum Alpinum*, making it a kinde of Auens: in Engliſh, ſpotted Sanicle: of our London dames, Pratling Parnell.

The ſecond is called *Pinguicula*, of the fatneſſe or fulneſſe of the leafe, or of fatning: in Yorkeſhire, where it doth eſpecially grow, and in greateſt abundance, it is called Butterworts, Butter-root, and white root: but the laſt name belongeth more properly to Solomons Seale.

¶ *The Temperature.*

They are hot and dry in the third degree.

¶ *The Vertues.*

The husbandmens wiues of Yorkſhire do vſe to annoint the dugs of their kine with the fat and oilous juyce of the herbe Butterwort, when they are bitten with any venomous worme, or chapped, rifted and hurt by any other meanes. A

They ſay it rots their ſheepe, when for want of other food they eat thereof. B

Chap. 277. *Of Fox-Gloues.*

¶ *The Deſcription.*

1 FOx-gloue with the purple floure is moſt common; the leaues whereof are long, nicked in the edges, of a light greene, in manner like thoſe of Mullein, but leſſer, and not ſo downy: the ſtalke is ſtraight, from the middle whereof to the top ſtand the floures, ſet in a courſe one by another vpon one ſide of the ſtalke, hanging downwards with the bottome vpward, in forme long, like almoſt to finger ſtalkes, whereof it tooke his name *Digitalis*, of a red purple colour, with certaine white ſpots daſht within the floure; after which come vp round heads, in which lies the ſeed ſomewhat browne, and as ſmall as that of Time. The roots are many ſlender ſtrings.

2 The Fox-Gloue with white floures differs not from the precedent but in the colour of the floures; for as the other were purple, theſe contrariwiſe are of a milke-white colour.

3 We haue in our Gardens another ſort hereof, which bringeth forth moſt pleaſant yellow floures, and ſomewhat leſſer than the common kinde, wherein they differ. ‡ This alſo differs from the common kind in that the leaues are much ſmoother, narrower, and greener, hauing the nerues or veines running alongſt it, neither are the nerues ſnipt, nor ſinuated on their edges. ‡

1 *Digitalis purpurea.*
Purple Fox-gloues.

2 *Digatalis alba.*
White Fox-gloues.

‡ 3 *Digitalis lutea.*
Yellow Fox-gloues.

‡ 4 *Digitalis ferruginea.*
Dusky Fox-gloues.

4 We haue also another sort, which we call *Digitalis ferruginea*, whose floures are of the colour of rusty yron; whereof it tooke his name, and likewise maketh the difference. ‡ Of this sort there is a bigger and a lesser; the bigger hath the lower leaues some foot long, of a darke green colour, with veines running along them; the stalks are some yard and halfe high, the floures large and ending in a sharpe turned vp end as you see in the figure, and they are of a rusty colour, mixed of a yellow and red.

5 The lesser duskie Fox-gloue hath much lesse leaues and those narrow, smooth, and exceeding greene: amongst which comes vp a stalke some foot high, hauing small floures of the colour of the last described. This I obserued in the yeare 1632. in floure with M^r. *Iohn Tradescant* in the middle of Iuly. It may fitly be called *Digitalis ferruginea minor*, small duskie Fox-gloues. ‡

¶ *The Place.*

Fox-gloue groweth in barren sandy grounds, and vnder hedges almost euery where.

Those with white floures do grow naturally in Landesdale, and Crauen, in a field called Cragge close, in the North of England: likewise by Colchester in Essex; neere Excester in the West parts, and in some few other places. The other two are strangers in England, neuertheless they doe grow with the other in my Garden.

¶ *The Time.*

They floure and flourish in Iune and Iuly.

¶ *The Names.*

Fox-gloues some call in Greeke, Ψηφαλλις, and make it to be *Verbasci speciem*, or a kinde of Mullein: in Latine, *Digitalis*: in High Dutch, **Fingerhut**, and **Fingher kraut**: in Low Dutch, **Vinger hoet**: in French, *Gantes nostre dame*: in English, Fox-gloues. ‡ *Fabius Columna* thinkes it to be that *Ephemerum* of *Dioscorides* described in his fourth booke, and *cap.* 75. ‡

¶ *The Temperature.*

The Fox-gloues in that they are bitter, are hot and dry, with a certaine kinde of clensing qualitie joyned therewith; yet are they of no vse, neither haue they any place amongst medicines, according to the Antients.

¶ *The Vertues.*

Fox-gloue boiled in water or wine, and drunken, doth cut and consume the thicke toughnesse of A
grosse and slimie flegme and naughty humours; it openeth also the stopping of the liuer, spleene,
and milt, and of other inward parts.

The same taken in like manner, or boiled with honied water or sugar, doth scoure and clense the B
brest, ripeneth and bringeth forth tough and clammie flegme.

They serue for the same purposes whereunto Gentian doth tend, and hath been vsed in stead C
thereof, as *Galen* saith.

‡ Where or by what name *Galen* either mentions, or affirmes this which our Authour cites D
him for, I must confesse I am ignorant. But I probably conjecture that our Authour would haue said *Fuchsius*: for I onely finde him to haue these words set downe by our Author, in the end of his Chapter of *Digitalis*. ‡

Chap. 278. *Of Baccharis out of* Dioscorides.

¶ *The Description.*

1 ABout this plant *Baccharis* there hath beene great contention amongst the new Writers; *Matthiolus* and *Dodonæus* haue mistaken this plant, for *Coniza major*, or *Coniza Helenitis Cordi*; *Virgil* and *Athenæus* haue confounded *Baccharis*, and *Azarum* together: but following the antient Writers, it hath many blackish rough leaues, somwhat bigger than the leaues of Primrose: amongst which riseth vp a stalke two cubits high, bearing at the top little chaffie or scalie floures in small bunches, of a darke yellowish or purple colour, which turne into downe, and are carried away with the winde, like vnto the kindes of Thistles: the root is thicke, grosse, and fat, spreading about in the earth, full of strings: the fragrant smell that the root of this plant yeeldeth, may well be compared vnto the sauour of Cinnamon, *Helenium*, or *Enula Campana*, being a plant knowne vnto very many or most sort of people, I meane in most parts of England.

¶ *The Place.*

Baccharis delighteth to grow in rough and craggy places, and in a leane soile where no moisture is:

Baccharis Monſpelienſium.
Plowmans Spikenard.

it: it groweth very plentifully about Montpellier in France, and diuers places in the Weſt parts of England.

¶ *The Time.*

It ſpringeth vp in April, it floureth in Iune, and perfecteth his ſeed in Auguſt.

¶ *The Names.*

The learned Herbariſts of Montpellier haue called this plant *Baccharis*: the Græcians, βακχάρις: or after others, πάϊχαρις, by reaſon of that ſweet and aromaticall ſauour which his root containeth and yeeldeth: in Engliſh it may be called the Cinamom root, or Plowmans Spiknard; *Virgil* in his ſeuenth Ecloge of his Bucolicks maketh mention of *Baccharis*, and doth not onely ſhew that it is a Garland plant, but alſo ſuch a one as preuaileth againſt inchantments, ſaying,

——— *Bacchare frontem*
Cingite, ne vati noceat mala lingua futuro.

With Plowmans Nard my forehead girt,
Leſt euill tongue thy Poët hurt.

Baccharis is likewiſe an ointment in *Athenæus*, in his 15. booke, which may take his name of the ſweet herbe *Baccharis*: for as *Plinie* writeth, *Ariſtophanes* of old, being an antient comical Poët witneſſeth, that ointments were wont to bee made of the root thereof: to bee briefe, *Cratevas*, his *Aſarum* is the ſame that *Dioſcorides* his *Baccharis* is. ‡ This plant here deſcribed is the *Coniza maior* of *Matthiolus*, *Tragus*, and others. ‡

¶ *The Temperature.*

Baccharis or Plowmans Spiknard is of temperature very aſtringent or binding.

¶ *The Vertues.*

A *Baccharis* or the decoction of the root, as *Paulus Ægineta* briefely ſetteth downe, doth open the pipes and paſſages that are ſtopped, prouoketh vrine, and bringeth downe the deſired ſickneſſe: the leaues thereof for that they are aſtringent or binding, ſtop the courſe of fluxes and rheumes.

B *Baccharis* is a ſingular remedy to heale inflammations and Saint Anthonies fire, called *Ignis ſacer*, and the ſmell thereof prouoketh ſleepe.

C The decoction of the roots of *Baccharis* helpeth ruptures and conuulſions, thoſe alſo that haue falne from an high place, and thoſe that are troubled with the ſhortneſſe of breath.

D It helpeth alſo the old cough, and difficulty to make water.

E When it is boiled in wine, it is giuen with great profit againſt the biting of Scorpions, or any venomous beaſt, being implaiſtered and applied thereto.

F A bath made thereof and put into a cloſe ſtoole, and receiued hot, mightily voideth the birth, and furthereth thoſe that haue extreame labour in their childing, cauſing them to haue eaſie deliuerance.

CHAP. 279. *Of Elecampane.*

¶ *The Deſcription.*

Elecampane bringeth forth preſently from the root great white leaues, ſharpe pointed, almoſt like thoſe of great Comfrey, but ſoft, and couered with a hairy downe, of a whitiſh greene colour,

Helenium.
Elecampane.

lour, and are more white vnderneath, sleightly nicked in the edges: the stalke is a yard and a halfe long, about a finger thicke, not without downe, diuided at the top into diuers branches, vpon the top of euery sprig stand great floures broad and round, of which not only the long smal leaues that compasse round about are yellow, but also the middle ball or circle, which is filled vp with an infinite number of threds, and at length is turned into fine downe; vnder which is slender and long seed: the root is vneuen, thicke, and as much as a man may gripe, not long, oftentimes blackish without, white within, and full of substance, sweet of smell, and bitter of taste.

¶ *The Place.*

It groweth in medowes that are fat and fruitfull: it is also oftentimes found vpon mountains, shadowie places, that be not altogether dry: it groweth plentifully in the fields on the left hand as you go from Dunstable to Puddlehill: also in an orchard as you go from Colbrooke to Ditton ferry, which is the way to Windsor, and in sundry other places, as at Lidde, and Folkestone, neere to Douer by the sea side.

¶ *The Time.*

The floures are in their brauery in Iune and Iuly: the roots be gathered in Autumne, and oftentimes in Aprill and May.

¶ *The Names.*

That which the Græcians name ἑλένιον, the Latines call *Inula* and *Enula*: in shops, *Enula campana*: in high Dutch, **Alantwurtz**: in low Dutch, **Alandt woztele**: in Italian, *Enoa*, and *Enola*: in Spanish, *Raiz del alla*: in French, *Enula Campane*: in English, Elecampane and Scab-woort, and Horse-heale: some report that this plant tooke the name *Helenium* of *Helena* wife to *Menalaus*, who had her hands full of it when *Paris* stole her away into Phrygia.

¶ *The Temperature.*

The root of this Elecampane is maruellous good for many things, being of nature hot and dry in the third degree, especially when it is dry: for being greene and as yet full of juyce, it is full of superfluous moisture, which somewhat abateth the hot and dry quality thereof.

¶ *The Vertues.*

It is good for shortnesse of breath, and an old cough, and for such as cannot breathe vnlesse they hold their neckes vpright. A

It is of great vertue both giuen in a looch, which is a medicine to be licked on, and likewise preserued, as also otherwise giuen to purge and void out thicke, tough, and clammy humours, which sticke in the chest and lungs. B

The root preserued is good and wholesome for the stomacke: being taken after supper it doth not onely helpe digestion, but also keepeth the belly soluble. C

The juyce of the same boyled, driueth forth all kinde of wormes of the belly, as *Pliny* teacheth: who also writeth in his twentieth booke, and fifth chapter, the same being chewed fasting, doth fasten the teeth. D

The root of Elecampane is with good successe mixed with counterpoisons: it is a remedy against the bitings of serpents, it resisteth poison: it is good for them that are burſten and troubled with cramps and conuulsions. E

Some affirme also, that the decoction thereof, and likewise the same beaten into pouder and mixed with hony in manner of an ointment, doth clense and heale vp old vlcers. F

Galen saith, that herewith the parts are to be made red, which be vexed with long and cold griefs: as are diuers passions of the huckle bones, called the Sciatica, and little and continuall bunnies and loosenesse of certaine joynts, by reason of ouermuch moisture. G

The

H The decoction of *Enula* drunken prouoketh vrine, and is good for them that are grieued with inward burſtings, or haue any member out of joynt.

I The root taken with hony or ſugar, made in an electuary, clenſeth the breaſt, ripeneth rough flegme, and maketh it eaſie to be ſpit forth, and preuaileth mightily againſt the cough and ſhortneſſe of breath, comforteth the ſtomacke alſo, and helpeth digeſtion.

K The roots condited after the manner of *Eringos* ſerue for the purpoſes aforeſaid.

L The root of *Enula* boiled very ſoft, and mixed in a morter with freſh butter and the pouder of Ginger, maketh an excellent ointment againſt the itch, ſcabs, mangineſſe, and ſuch like.

M The roots are to be gathered in the end of September, and kept for ſundry vſes, but it is eſpecially preſerued by thoſe that make Succade and ſuch like.

CHAP. 264. *Of Sauce alone, or Iacke by the hedge.*

Alliaria.
Sauce alone.

SAuce alone hath affinity with Garlicke in name, not becauſe it is like it in forme, but in ſmell: for if it be bruiſed or ſtamped it ſmelleth altogether like Garlicke: the leaues hereof are broad, of a light greene colour, nicked round about, and ſharpe pointed: the ſtalke is ſlender, about a cubit high, about the branches whereof grow little white floures; after which come vp ſlender ſmal and long cods, & in theſe black ſeed: the root is long, ſlender, and ſomething hard.

¶ *The Place.*

It groweth of it ſelfe by garden hedges, by old wals, by highway ſides, or oftentimes in the borders of fields.

¶ *The Time.*

It floureth chiefely in Iune and Iuly, the ſeed waxeth ripe in the meane ſeaſon. The leaues are vſed for a ſauce in March or Aprill.

¶ *The Names.*

The later writers call it *Alliaria*, and *Alliaris*: of ſome, *Rima Maria*: it is not *Scordium*, or water Germander, which the apothecaries in times paſt miſtooke for this herbe: neither is it *Scordij ſpecies*, or a kinde of water Germander, whereof we haue written: it is named of ſome, *Pes Aſininus*: it is called in High Dutch, **Knoblauch kraut Leuchel**, and **Sulzkraut**: and in Low Dutch, **Loock ſonder Loock**: you may name it in Latine, *Allium non bulboſum*: in French, *Alliayre*: in Engliſh, Sauce alone, and Iacke by the hedge.

¶ *The Temperature.*

Iacke of the hedge is hot and dry, but much leſſe than Garlicke, that is to ſay, in the end of the ſecond degree, or in the beginning of the third.

¶ *The Vertues.*

A We know not what vſe it hath in medicine: diuers eat the ſtamped leaues hereof with Salt-fiſh for a ſauce, as they do thoſe of Ramſons.

B Some alſo boile the leaues in cliſters which are vſed againſt the paine of the collicke and ſtone, in which not only winde is notably waſted, but the pain alſo of the ſtone mitigated and very much eaſed.

CHAP.

Chap. 281. *Of Dittany.*

¶ *The Description.*

1 Dittanie of Crete now called Candie (as *Dioscorides* saith) is a hot and sharpe hearbe, much like vnto Penni-Royall, sauing that his leaues be greater and somewhat hoary, couered ouer with a soft downe or white woollie cotton: at the top of the branches grow small spikie eares or scaly aglets, hanging by little small stemmes, resembling the spiky tufts of Marjerome, of a white colour: amongst which scales there do come forth small floures like the flouring of Wheat, of a red purple colour; which being past, the knop is found full of small seed, contrary to the saying of *Dioscorides*, who saith, it neither beareth floure nor seed, but my selfe haue seene it beare both in my Garden: the whole plant perished in the next Winter following.

1 *Dictamnum Creticum.*
Dittany of Candy.

2 *Pseudodictamnum.*
Bastard Dittany.

2 The second kind called *Pseudodictamnum*, that is, Bastard Dittany, is much like vnto the first, sauing that it is not sweet of smell, neither doth it bite the tongue, hauing round soft woolly stalkes with knots and joynts, and at euery knot two leaues somewhat round, soft, woolly, and somewhat bitter: the floures be of a light purple colour, compassing the stalks by certain spaces like garlands or whorles, and like floures of Penny-Roiall. The root is of a wooddy substance: the whole plant groweth to the height of a cubit and a halfe, and lasteth long.

¶ *The Place.*

The first Dittany commeth from Crete, an Island which we call Candie, where it growes naturally: I haue seene it in my garden, where it hath floured and borne seed; but it perished by reason of the injury of our extraordinary cold Winter that then happened: neuertheless *Dioscorides* writeth

writeth againſt all truth, that it neither beareth floures nor ſeed: after *Theophraſtus*, *Virgil* witneſſeth that it doth beare floures in the twelfth of his Æneidos.

Dictamnum genetrix Cretæa carpit ab Ida,
Puberibus caulem foliis, & flore comantem
Purpureo. ——

In Engliſh thus:

His mother from the Cretæan Ida crops
Dictamnus hauing ſoft and tender leaues,
And purple floures vpon the bending tops, &c.

¶ *The Time.*

They floure and flouriſh in Summer Moneths, their ſeed is ripe in September.

¶ *The Names.*

It is called in Greeke δίκταμνος: in Latine, *Dictamnus* and *Dictamnum*: of ſome, *Pulegium ſylueſtre*, or wilde Pennie-roiall: the Apothecaries of Germany for *Dictamnum* with *c*, in the firſt ſyllable, doe reade *Diptamnum* with *p*: but (ſaith *Dodonæus*) this errour might haue beene of ſmall importance, if in ſtead of the leaues of Dittanie, they doe not vſe the roots of *Fraxinella* for Dittany, which they falſely call *Dictamnum*: in Engliſh, Dittany, and Dittany of Candie.

The other is called *Pſeudodictamnum*, or baſtard Dittany, of the likeneſſe it hath with Dittany, skilleth not, though the ſhops know it not: the reaſon why let the Reader gueſſe.

¶ *The Nature.*

Theſe plants are hot and dry of Nature.

¶ *The Vertues.*

A Dittany being taken in drinke, or put vp in a peſſary, or vſed in a fume, bringeth away dead children: it procureth the monethly termes, and driueth forth the ſecondine or afterbirth.

B The juyce taken with wine is a remedy againſt the ſtinging of ſerpents.

C The ſame is thought to be of ſo ſtrong an operation, that with the very ſmell alſo it driues away venomous beaſts, and doth aſtoniſh them.

D It is reported likewiſe that the wilde Goats or Deere in Candy when they be wounded with arrowes, do ſhake them out by eating of this plant, and heale their wounds.

E It preuaileth much againſt all wounds, and eſpecially thoſe made with invenomed weapons, arrowes ſhot out of guns, or ſuch like, and is very profitable for Chirurgians that vſe the ſea and land wars, to carry with them and haue in readineſſe: it draweth forth alſo ſplinters of wood, bones, or ſuch like.

F The baſtard Dittany or *Pſeudodictamnum*, is ſomewhat like in vertues to the firſt, but not of ſo great force, yet it ſerueth exceeding well for the purpoſes aforeſaid.

CHAP. 282. *Of Borage.*

¶ *The Deſcription.*

1 BOrage hath broad leaues, rough, lying flat vpon the ground, of a blacke or ſwart green colour: among which riſeth vp a ſtalke two cubits high, diuided into diuers branches, wherupon do grow gallant blew floures, compoſed of fiue leaues apiece; out of the middle of which grow forth blacke threds joined in the top, and pointed like a broch or pyramide: the root is threddy, and cannot away with the cold of Winter.

2 Borage with white floures is like vnto the precedent, but differeth in the floures, for thoſe of this plant are white, and other of a perfect blew colour, wherein is the difference.

† 3 Neuer dying Borage hath many very broad leaues, rough and hairy, of a blacke darke greene colour: among which riſe vp ſtiffe hairy ſtalkes, whereupon doe grow faire blew floures, ſomewhat rounder pointed than the former: the root is blacke and laſting, hauing leaues both Winter and Summer, and hereupon is was called *Semper virens*, and that very properly, to diſtinguiſh it from the reſt of this kinde, which are but annuall. ‡

4 There

1 *Borago hortensis.*
Garden Borage.

2 *Borago flore albo.*
White Houred Borage.

3 *Borago semper virens.*
Neuer-dying Borage.

4 There is a fourth sort of Borage that hath leaues like the precedent, but thinner and lesser, rough and hairy, diuiding it selfe into branches at the bottome of the plant, whereupon are placed faire red floures, wherein is the chiefest difference between this and the last described. ‡ The figure which belonged to this description was put hereafter for *Lycopsis Anglica.* ‡

¶ *The Place.*

These grow in my garden and in others also.

¶ *The Time.*

Borage floures and flourishes most part of all Summer, and till Autumne be far spent.

¶ *The Names.*

Borage is called in shops *Borago*: of the old writers, Βούγλωσσον, which is called in Latine *Lingua bubula*: *Pliny* calleth it *Euphrosinum*, because it makes a man merry and ioyfull: which thing also the old verse concerning Borage doth testifie:

Ego Borago gaudia semper ago.

I Borage bring alwaies courage.

It is called in high-Dutch, **Burretsch**: in Italian, *Boragine*: in Spanish, *Boraces*: in low-Dutch, **Beruagie**: in English, Borage.

¶ *The Temperature.*

It is euidently moist, and not in like sort hot, but seems to be in a mean betwixt hot and cold.

¶ *The Vertues.*

Those of our time do vse the floures in sallads, to exhilerate and make the minde glad. There be also many things made of them, vsed for the comfort of the heart, to driue away sorrow, & increase the ioy of the minde.

B The leaues boiled among other pot-herbs much preuaile in making the belly ſoluble; & being boiled in honied water they are alſo good againſt the roughneſſe and hoarſeneſſe of the throat, as *Galen* teacheth.

C The leaues and floures of Borrage put into wine make men and women glad and merry, driuing away all ſadneſſe, dulneſſe, and melancholy, as *Dioſcorides* and *Pliny* affirme.

D Syrrup made of the floures of Borrage comforteth the heart, purgeth melancholy, and quieteth the phrenticke or lunaticke perſon.

E The floures of Borrage made vp with ſugar, do all the aforeſaid with greater force and effect.

F Syrrup made of the juice of Borrage with ſugar, adding thereto pouder of the bone of a Stags heart, is good againſt ſwouning, the cardiacke paſſion of the heart, againſt melancholy and the falling ſickneſſe.

G The root is not vſed in medicine: the leaues eaten raw ingender good bloud, eſpecially in thoſe that haue bin lately ſicke.

Chap. 283. *Of Bugloſſe.*

¶ *The Kindes.*

Like as there be diuers ſorts of Borage, ſo are there ſundry of the Bugloſſes; yet after *Dioſcorides*, Borage is the true Bugloſſe: many are of opinion, & that rightly, that they may be both referred to one kinde, yet will we diuide them according to the cuſtome of our time, and their vſuall denominations.

1 *Bugloſſa vulgaris.*
Common Bugloſſe, or garden Bugloſſe.

2 *Bugloſſum luteum.*
Lang de beefe.

¶ *The Deſcription.*

1 THat which the Apothecaries call Bugloſſe bringeth forth leaues longer than thoſe of Borage, ſharpe pointed, longer than the leaues of Beets, rough and hairy. The ſtalke groweth vp to the height of two cubits, parted aboue into ſundry branches, whereon are orderly placed blewiſh floures, tending to a purple colour before they be opened, and afterward more blew: the root is long, thicke, groſſe, and of long continuance.

2 Lang

‡ 3 *Bugloſſa ſylueſtris minor.*
Small wilde Bugloſſe.

2 Lang de beef is a kinde hereof, altogether leſſe, but the leaues herof are rougher like the rough tongue of an Oxe or Cowe, whereof it tooke his name. ‡ The leaues of Lang de beef are very rough, the ſtalke ſome cubit and halfe high, commonly red of colour: the tops of the branches carry floures in ſcaly rough heads: theſe floures are compoſed of many ſmall yellow leaues in maner of thoſe of Dandelion, and fly away in down like as they do: the floures are of a very bitter taſt, whence *Lobel* calls it *Bugloſſum echioides luteum Hieracio cognatum. Tabernamontanus* hath fitly called it *Hieracium echioides*.

3 There is another wild Bugloſſe which *Dodonæus* hath by name of *Bugloſſa ſylueſtris*: it hath a ſmall white root, from which ariſes a ſlender ſtalke ſome foot and halfe high, ſet with ſmal rough leaues ſinuated or cut in on the edges: the ſtalkes at the top are diuided into three or foure ſlender branches, bearing little blew floures in rough husks. ‡

¶ *The Place.*

Theſe grow in gardens euery where. ‡ The Lang de beefe growes wilde in many places, as betweene Redriffe and Deptford by the waterie ditch ſides. The little wild Bugloſſe growes vpon the dry ditch banks about Pickadilla, and almoſt euery where. ‡

¶ *The Time.*

They floure from May or Iune, euen to the end of Summer. The leaues periſh in Winter, and new come vp in the Spring.

¶ *The Names.*

Garden Bugloſſe is called of the later Herbariſts, *Bugloſſa*, and *Bugloſſa domeſtica*, or garden Bugloſſe.

Lang de beef is called in Latine, *Lingua bouis*, and *Bugloſſum luteum Hieracio cognatum*, and alſo *Bugloſſa ſylueſtris*, or wilde Bugloſſe.

‡ Small wild Bugloſſe is called *Borago ſylueſtris*, by *Tragus*; *Echium Germanicum ſpinoſum* by *Fuchſius*: and *Bugloſſa ſylueſtris* by *Dodonæus*. ‡

¶ *The Temperature and Vertues.*

The root, ſaith *Dioſcorides*, mixed with oile, cureth green wounds, and adding therto a little barley meale it is a remedie againſt S. *Anthonies* fire. A

It cauſeth ſweat in agues, as *Pliny* ſaith, if the juice be mixed with a little aqua vitæ, and the body rubbed therewith. B

The Phyſitions of later time vſe the leaues, floures, and roots in ſtead of Borage, and put them into all kindes of medicine indifferently, which are of force and vertue to driue away ſorrow & penſiueneſſe of the minde, and to comfort and ſtrengthen the heart. The leaues are of like operation as thoſe of Borage, and are vſed as pot-herbes for the purpoſes aforeſaid, as well Bugloſſe as Lang de beefe, and alſo to keepe the belly ſoluble. C

Chap. 284. *Of Alkanet or wilde Bugloſſe.*

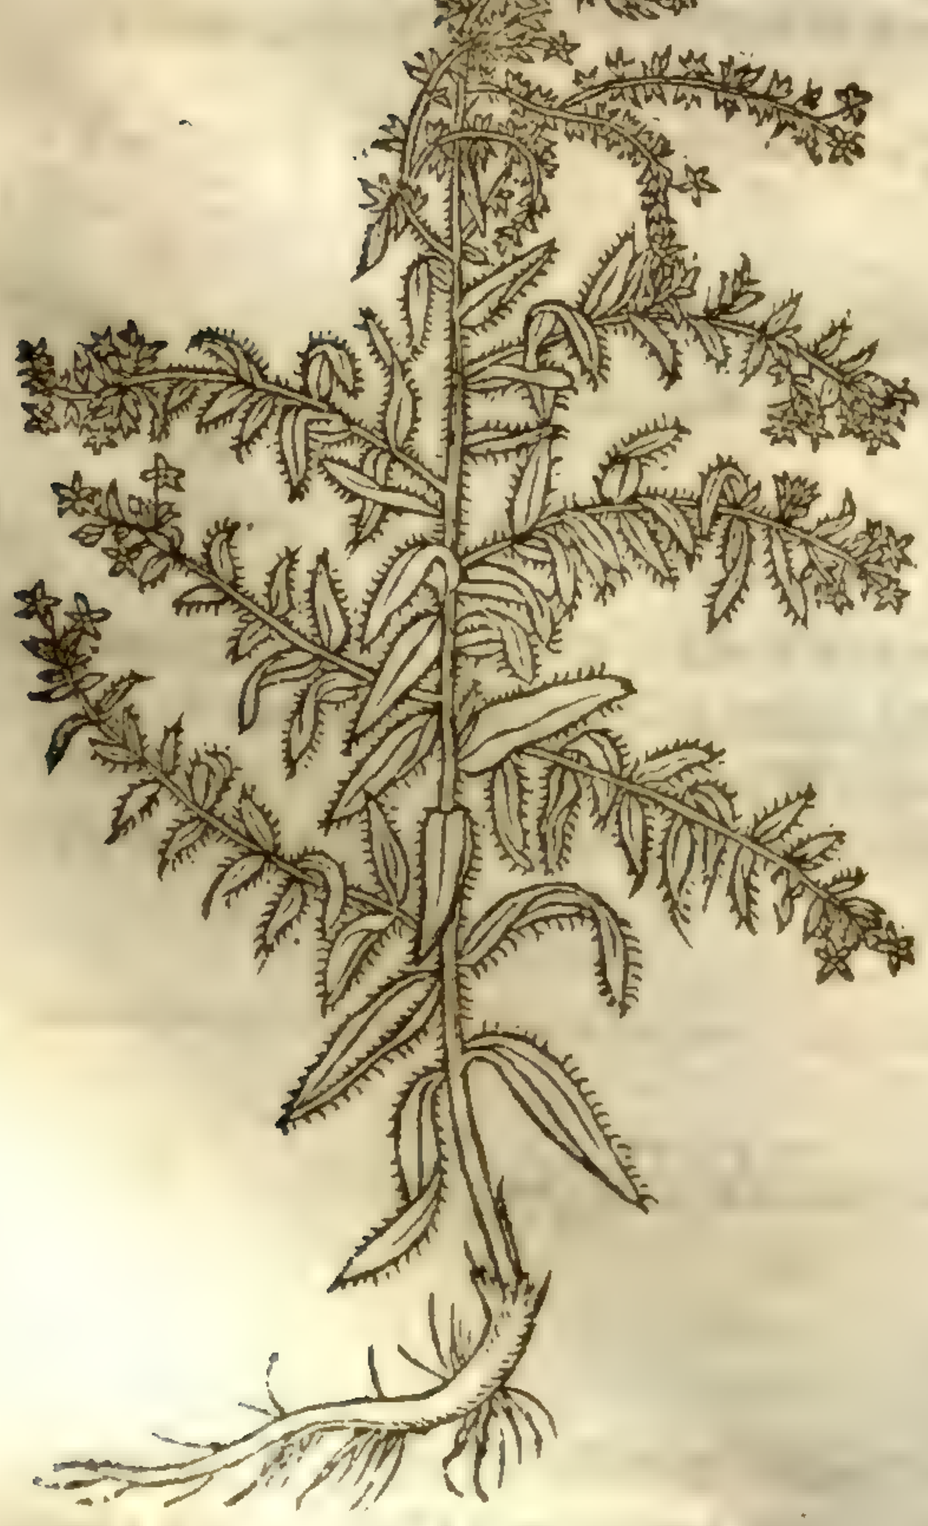
¶ *The Deſcription.*

THeſe herbes compreliended vnder the name of *Anchuſa*, were ſo called of the Greeke word ἀγχύειν; i. *Illinere ſucco, vel pigmentis*, that is, to colour or paint any thing: Whereupon thoſe plants

† 1 *Anchuſa Alcibiadion.*
Red Alkanet.

† 2 *Anchuſa lutea.*
Yellow Alkanet.

† 3 *Anchuſa minor.*
Small Alkanet.



plants were called *Anchuſa*, of that flouriſhing and bright red colour which is in the root, euen as red as pure and cleare bloud; for that is the onely marke or note whereby to diſtinguiſh theſe herbs from thoſe which be called *Echium*, *Lycopſis*, and *Bugloſſa*, wherto they haue a great reſemblance; I haue therefore expreſſed foure differences of this plant *Anchuſa* or Alkanet, from the other kindes, by the leaues, flours, and bigneſſe.

1 The firſt kinde of Alkanet hath many leaues like *Echium* or ſmall Bugloſſe, couered ouer with a pricky hoarineſſe, hauing commonly but one ſtalke, which is round, rough, and a cubit high. The cups of the floures are of a sky colour tending to purple, not vnlike the floures of *Echium*: the ſeed is ſmall, ſomwhat long, and of a pale colour: the root is a finger thicke, the pith or inner part thereof is of a woodie ſubſtance, dying the hands or whatſoeuer toucheth the ſame, of a bloudy colour, or of the colour of Saunders.

2 The ſecond kinde of *Anchuſa* or Alkanet is of greater beauty and eſtimation than the firſt, the branches are leſſe and more buſhy in the top; it hath alſo greater plenty of leaues, and thoſe more woolly or hairy: the ſtalk groweth to the height of two cubits: at the top grow floures of a yellow colour, far different from the other: the root is more ſhining, of an excellent delicat purple colour, and more ful of iuice than the firſt.

3 There

3 There is a ſmall kinde of Alkanet, whoſe root is greater and more ful of juyce and ſubſtance than the roots of the other kindes: in all other reſpects it is leſſe, for the leaues are narrower, ſmaller, tenderer, and in number more, very greene like vnto Borage, yeelding forth many little tender ſtalkes: the floures are leſſe than of the ſmall Bugloſſe, and red of colour: the ſeed is of an aſh colour, ſomewhat long and ſlender, hauing the taſte of Bugloſſe.

4 There is alſo another kinde of Alkanet, which is as the others before mentioned, a kinde of wilde Bugloſſe, notwithſtanding for diſtinctions ſake I haue ſeparated and ſeuered them. This laſt *Anchuſa* hath narrow leaues, much like vnto our common Summer Sauory. The ſtalkes are two handfuls high, bearing very ſmall floures, and of a blewiſh or skie colour: the root is of a dark brownish red colour, dying the hands little or nothing at all, and of a wooddy ſubſtance.

¶ *The Place.*

Theſe plants do grow in the fields of Narbone, and about Montpellier, and many other parts of France: I found theſe plants growing in the Iſle of Thanet neere vnto the ſea, betwixt the houſe ſometime belonging to Sir *Henry Criſpe*, and Margate; where I found ſome in their naturall ripenes, yet ſcarcely any that were come to that beautiful color of Alkanet: but ſuch as is ſold for very good in our Apothecaries ſhops I found there in great plenty,

‡ I doubt whether our Author found any of theſe in the place here ſet down, for I haue ſought it but failed of finding; yet if he found any it was only the firſt deſcribed, for I thinke the other three are ſtrangers. ‡

¶ *The Time.*

The Alkanets floure and flouriſh in the Summer moneths: the roots doe yeeld their bloudy juyce in harueſt time, as *Dioſcorides* writeth.

¶ *The Names.*

Alkanet is called in Greeke ἄγχουσα: in Latine alſo *Anchuſa*: of diuers, *Fucus herba*, and *Onocleia*, *Bugloſſa Hiſpanica*, or Spaniſh Bugloſſe: in Spaniſh, *Soagem*: in French, *Orchanet*: and in Engliſh likewiſe, Orchanet and Alkanet.

¶ *The Temperature.*

The roots of Alkanet are cold and dry, as *Galen* writeth, and binding, and becauſe it is bitter it cleanſeth away cholericke humours: the leaues be not ſo forceable, yet doe they likewiſe binde and drie.

¶ *The Vertues.*

Dioſcorides ſaith, that the root being made vp in a cerote, or ſearecloth with oyle, is very good for A
old vlcers; that with parched barley meale it is good for the leprey, and for tetters and ring-worms.
That being vſed as a peſſarie it bringeth forth the dead birth. B
The decoction being inwardly taken with Mead or honied water, cureth the yellow jaundiſe, C
diſeaſes of the kidnies, the ſpleene and agues.
It is vſed in ointments for womens paintings: and the leaues drunke in wine is good againſt the D
laske.
Diuers of the later Phyſitions do boile with the root of Alkanet and wine, ſweet butter, ſuch as E
hath in it no ſalt at all, vntill ſuch time as it becommeth red, which they call red butter, and giue it not only to thoſe that haue falne from ſome high place, but alſo report it to be good to driue forth the meaſels and ſmall pox, if it be drunke in the beginning with hot beere.
The roots of theſe are vſed to color ſirrups, waters, gellies, & ſuch like infections as Turnſole is. F
Iohn of *Ardern* hath ſet down a compoſition called *Sanguis Veneris*, which is moſt ſingular in deep G
punctures or wounds made with thruſts, as follows: take of oile oliue a pint, the root of Alkanet two ounces, earth worms purged, in number twenty, boile them together & keep it to the vſe aforeſaid.
The Gentlewomen of France do paint their faces with theſe roots, as it is ſaid.

† The two figures that were formerly here were both of the ordinary Bugloſſe, whereof the firſt might well enough ſerue, but the 2. was much different from that it ſhould haue been.

Chap. 285. *Of Wall and Vipers Bugloſſe.*

¶ *The Deſcription.*

1 *Lycopſis Anglica*, or wilde Bugloſſe, ſo called for that it doth not grow ſo commonly elſewhere, hath rough and hairy leaues, ſomewhat leſſer than the garden Bugloſſe: the floures grow for the moſt part vpon the ſide of the ſlender ſtalke, in faſhion hollow like a little bell, whereof ſome be blew, and others of a purple colour.

2 There is another kinde of *Echium* that hath rough and hairy leaues likewiſe, much like vnto the former; the ſtalke is rough, charged full of little branches, which are laden on euery ſide with diuers ſmall narrow leaues, ſharp pointed, and of a brown colour: among which leaues grow floures, each floure being compoſed of one leafe diuided into fiue parts at the top, leſſe, and not ſo wide open as that of *Lycopſis*; yet of a ſad blew or purple colour at the firſt, but when they are open they ſhew to be of an azure colour, long and hollow, hauing certaine ſmal blew threds in the middle: the ſeed is ſmall and black, faſhioned like the head of a ſnake or viper: the root is long, and red without.

† 1 *Lycopſis Anglica.*
Wall Bugloſſe.

‡ 2 *Echium vulgare.*
Vipers Bugloſſe.

‡ 3 *Echium pullo flore.*
Rough Vipers Bugloſſe.

‡ 4 *Echium rubro flore.*
Red floured Vipers Bugloſſe.

‡ 3 This hath a crested very rough and hairy stalke some foot high; the leaues are like those of Vipers Bugloſſe, and couered ouer with a soft downinesse, and grow disorderly vpon the stalke, which toward the top is parted into sundry branches, which are diuided into diuers foot-stalkes carrying small hollow floures diuided by fiue little gashes at their tops; and they are of a darke purple colour, and contained in rough cups lying hid vnder the leaues. The seed, as in other plants of this kinde, resembles a Vipers head: the root is long, as thicke as ones little finger, of a dusky color on the outside, and it liues diuers yeares. This floures in May, and growes in the dry medowes and hilly grounds of Austria. *Clusius* calls it *Echium pullo flore*.

4 This other being also of *Clusius* his description hath long and narrow leaues like those of the common Vipers Bugloſſe, yet a little broader: the stalkes rise vp some cubit high, firme, crested, and hairy; vpon which grow abundance of leaues, shorter and narrower than those below, and amongst these towards the top grow many floures vpon short foot-stalkes, which twine themselues round like a Scorpions taile: these floures are of an elegant red colour, and in shape somewhat like those of the common kinde; and such also is the seed, but somewhat lesse: the root is lasting, long also, hard, wooddy, and blacke on the outside, and it sometimes sends vp many, but most vsually but one stalke. It floures in May, and was found in Hungary by *Clusius*, who first set it forth by the name of *Echium rubro flore*. ‡

¶ *The Place.*

Lycopsis groweth vpon stone walls, and vpon dry barren stony grounds.
Echium groweth where Alkanet doth grow, in great abundance.

¶ *The Time.*

They flourish when the other kindes of Bugloſſes do floure.

¶ *The Names.*

It is called in Greeke, *Echium*, and Αλκιβιάδιον, of *Alcibiades* the finder of the vertues thereof: of some it is thought to be *Anchusæ species*, or a kinde of Alkanet: in high Dutch, wilde **Ochsenzungen**: in Spanish, *Yerua de la Biuora*, or *Chupamel*: in Italian, *Bugloſſa ſaluatica*: in French, *Bugloſſe ſauuage*: in English, Vipers Bugloſſe, Snakes Bugloſſe; and of some, Vipers herbe, and wilde Bugloſſe the lesser.

¶ *The Temperature.*

These herbes are cold and dry of complexion.

¶ *The Vertues.*

The root drunke with wine is good for those that be bitten with Serpents, and it keepeth such from being stung as haue drunk of it before: the leaues and seeds do the same, as *Dioscorides* writes. *Nicander* in his booke of Treacles makes Vipers Bugloſſe to be one of those plants which cure the biting of Serpents, and especially of the Viper, and that driue serpents away. A

If it be drunke in wine or otherwise it causeth plenty of milke in womens brests. B

The herbe chewed, and the juyce swallowed downe, is a most singular remedy against poyson and the biting of any venomous beast; and the root so chewed, and laid vpon the sore, workes the same effect. C

† That figure which formerly stood in the second place, vnder the title of *Onosma*, and whereof there was no more mention made by our Athor, neither in description, name, nor otherwise, I take to be nothing else than the *Lycopsis* which lies with long leaues spred vpon the ground before it comes to send vp the stalke; as you may see it expreſt apart by it selfe in the figure we giue you; which is the true figure of that plant our Author described and meant; for the figure which he gaue was nothing but of the common Borage with narrower leaues, which he described in the fourth place of the chapter of Borage, as I haue formerly noted.

Chap. 286. *Of Hounds-tongue.*

¶ *The Description.*

1 The common Hounds-tongue hath long leaues much like the Garden Bugloſſe, but broader, and not rough at all, yet hauing some fine hoarinesse or softnesse like veluet. These leaues stinke very filthily, much like to the pisse of dogs; wherefore the Dutch men haue called it **Hounds pisse**, and not Hounds-tongue. The stalkes are rough, hard, two cubits high, and of a browne colour, bearing at the top many floures of a darke purple colour: the seed is rough, cleauing to garments like Agrimony seed: the root is blacke and thicke. ‡ These plants for one yeere after they come vp of seed bring forth onely leaues, and those pretty large; and the second yeare they send vp their stalkes, bearing both floures and seed, and then vsually the root perisheth. I haue therefore presented you with the figures of it, both when it floures, and when it sendeth forth onely leaues. ‡

2 We

1 *Cynogloſſum maius vulgare ſine flore.*
Hounds-tongue without the floure.

1 *Cynogloſſum maius cum flore & ſemine.*
Hounds-tongue with the floure and ſeed.

‡ 2 *Cynogloſſum Creticum* 1.
The firſt Candy Dogs-tongue.

‡ 3 *Cynogloſſum Creticum alterum.*
The other Candy Dogs-tongue.

2 We haue receiued another sort hereof from the parts of Italy, hauing leaues like Woade, somewhat rough, and without any manifest smell, wherein it differeth from the common kinde; the seed hereof came vnder the title *Cynoglossum Creticum*, Hounds tongue of Candy. ‡ The flours are lesser, and of a lighter colour than those of the former; the seeds also are rough, and grow foure together, with a point comming out of the middle of them, as in the common kinde, but yet lesse: the root is long and whitish. *Clusius* hath this by the name of *Cynoglossum Creticum* 1.

3 This second *Cynoglossum Creticum* of *Clusius* hath leaues some handfull high, and some inch or better broad: among which the next yeare after the sowing, comes vp a stalke some cubit or more high, crested, stiffe, straight, and somewhat downy, as are also the leaues which grow vpon the same, being somwhat broad at their setting on, and of a yellowish green colour: the top of the stalk is diuided into sundry branches, which twine or turne on their tops like as the scorpion grasse, and carry shorter yet larger floures than the ordinarie kinde, and those of a whitish colour at the first, with many small purplish veins, which after a few daies become blew. The seeds are like the former in their growing, shape, and roughnesse. ‡

4 We haue another sort of Hounds tongue like vnto the common kinde, sauing it is altogether lesse: the leaues are of a shining green colour.

‡ 4 *Cynoglossum minus folio virente.*
Small greene leaued Hounds tongue.

¶ *The Place.*

The great Hounds tongue growes almost euery where by highwayes and vntoiled ground: the small Hounds tongue groweth very plentifully by the wayes side as you ride Colchester highway from Londonward, between Esterford and Wittam in Essex.

¶ *The Time.*

They floure in Iune and Iuly.

¶ *The Names.*

Houndstongue is called in Greek, Κυνόγλωσσον: in Latine, *Lingua canis*: of *Pliny*, *Cynoglossos*: and he sheweth two kinds thereof: in English, Hounds tongue, or Dogges tongue, but rather Hounds pisse, for in the world there is not any thing that smelleth so like Dogs pisse as the leaues of this plant doe.

¶ *The Nature.*

Hounds tongue, but especially his root, is cold and dry.

¶ *The Vertues.*

The roots of Hounds tongue rosted in the embers and laid to the fundament, heal the hemorrhoids, and the disease called *Ignis sacer*, or wilde fire. A

The juice boiled with hony of roses and turpentine to the forme of an vnguent, is most singular in wounds and deep vlcers. B

Dioscorides saith, That the leaues boiled in wine and drunk, doth mollifie the belly; and being stamped with old swines grease, are good against the falling away of the haire, proceeding of hot humors. C

Likewise they are a remedy against scaldings or burnings, and against the biting of dogs, as the same Author addeth. D

Chap. 287.
Of Comfrey or great Consound.

¶ *The Description.*

1 THe stalke of this Comfrey is cornered, thicke, and hollow like that of Sow-thistle. It groweth two cubits or a yard high: the leaues that spring from the root, and those that grow

1 *Conſolida maior flore purpureo.*
Comfrey with purple floures.

‡ 4 *Symphytum parvum Boraginis facie.*
Borage-floured Comfrey.

‡ 3 *Symphytum tuberoſum.*
Comfrey with the knobbed root.

grow vpon the ſtalkes are long, broad, rough, and pricking withall, ſomething hairy, and beeing handled make the hands itch, very like in colour and roughneſſe to thoſe of Borage, but longer, and ſharp pointed as bee the leaues of Elecampane: from out the wings of the ſtalkes appeare the floures orderly placed, long, hollow within, of a light red colour: after them growes the ſeed which is black: the root is long and thick, black without, white within, hauing in it a clammy iuice, in which root conſiſteth the vertue.

2 The great Comfrey hath rough hairy ſtalks and long rough leaues much like the garden Bugloſſe, but greater and blacker: the flours be round and hollow like little bells, of a white colour: the root is black without, white within, and very ſlimy. ‡ This differs no way from the former but only in the colour of the flour, which is yellowiſh or white, whenas the other is reddiſh or purple. ‡

3 There is another kind of Comfrey which hath leaues like the former, ſauing that they bee leſſer: the ſtalks are rough and tender: the flours be like the former, but that they be of an ouerworn yellow colour: the roots are thicke, ſhort, blacke without, and tuberous, ‡ which in the figure are not expreſſed ſo large and knobby as they ought to haue bin. ‡

4 This

This pretty plant hath fibrous and blackiſh roots, from which riſe vp many leaues like thoſe of Borage or Comfrey, but much ſmaller and greener, the ſtalks are ſome eight inches high, and on their tops carry prety floures like thoſe of Borage, not ſo ſharp pointed, but of a more pleaſing blew colour. This flours in the Spring, and is kept in ſome choice gardens: *Lobel* calls it *Symphytum pumilum repens Borraginis facie, ſiue Borrago minima Herbariorum.*

¶ *The Place.*

Comfrey ioyeth in waterie ditches, in fat and fruitfull medowes: they grow all in my garden.

¶ *The Time.*

They flourc in Iune and Iuly.

¶ *The Names.*

It is called in Greeke κύμφυτον: in Latine, *Symphytum*, and *Solidago*: in ſhops, *Conſolida major*, and *Symphytum majus*: of *Scribonius Largus*, *Inula ruſtica*, and *Alus Gallica*: of others, *Oſteocollon*: in high Dutch, **walwurtz**: in low-Dutch, **waelwortele**: in Italian, *Conſolida maggiore*: in Spaniſh, *Suelda majore*, and *Conſuelda maior*: in French, *Conſire*, and *Oreille d'aſne*: in Engliſh, Comfrey, Comfrey Conſound: of ſome, Knit-backe, and Blackwort.

¶ *The Temperature.*

The root of Comfrey hath a cold qualitie, but yet not much: it is alſo of a clammy and gluing moiſture, it cauſeth no itch at all, neither is it of a ſharpe or biting taſte, but vnſauorie or without taſte; ſo farre is the tough and gluing moiſture from the ſharpe clammineſſe of the ſea Onion, as that there is no compariſon betweene them. The leaues may cauſe itching not through heate or ſharpeneſſe, but through their ruggedneſſe, as we haue already written, yet leſſe than thoſe of the Nettle.

¶ *The Vertues.*

The roots of Comfrey ſtamped, and the iuyce drunke with wine, helpeth thoſe that ſpit bloud, A
and healeth all inward wounds and burſtings.

The ſame bruiſed and layd to in manner of a plaiſter, doth heale all freſh and green wounds, and B
are ſoglutinatiue, that it wil ſoder or glew together meat that is chopt in pieces, ſeething in a pot, and make it in one lumpe.

The roots boiled and drunke, do clenſe the breſt from flegme, and cure the griefes of the lungs, C
eſpecially if they be confect with ſugar and ſyrrup: it preuaileth much againſt ruptures or burſtings.

The ſlimy ſubſtance of the root made in a poſſet of ale, and giuen to drinke againſt the paine in D
the backe gotten by any violent motion, as wreſtling, or ouermuch vſe of women, doth in foure or fiue days preſently cure the ſame, although the involuntarie flowing of the ſeed in man be gotten thereby.

The roots of Comfry in number foure, Knot-graſſe and the leaues of Clary of each an hand full, E
ſtamped all together, ſtrained, and a quart of Muſcadel put thereto, the yelks of three eggs, and the pouder of three nutmegs drunke firſt and laſt, is a moſt excellent medicine againſt a Gonorrhæa or running of the reins, and all paines and conſumptions of the backe.

There is likewiſe a ſyrrup made hereof to be vſed in this caſe, which ſtayeth voiding of bloud, F
tempereth the heate of agues, allayeth the ſharpneſſe of flowing humors, healeth vp vlcers of the lungs, and helpeth the cough. The receit whereof is this: Take two ounces of the roots of great Comfrey, one ounce of Liquorice, two handfulls of Folefoot roots and all, one ounce and halfe of Pine-apple kernels, twenty Iuiubes, two drams or a quarter of an ounce of Mallow ſeed, one dram of the heads of Poppy; boile all in a ſufficient quantitie of water till one pint remain, ſtrain it, and adde to the liquor ſix ounces of very white ſugar, and as much of the beſt hony, and make thereof a ſyrrup that muſt be throughly boiled.

The ſame ſyrrup cureth the vlcers of the kidnies, though they haue bin of long continuance, and G
ſtoppeth the bloud that commeth from thence.

Moreouer, it ſtayeth the ouermuch flowing of the monethly ſickneſſe, taken conſtantly for cer- H
tain daies together.

It is highly commended for wounds or hurts of all the intrales and inward parts, and for bur- I
ſtings or ruptures.

The root ſtamped and applied, taketh away the inflammation of the fundament, and ouermuch K
flowing of the hemorrhoids.

CHAP.

Chap. 288. *Of Cowslips of Ierusalem.*

1 *Pulmonaria maculosa.*
Spotted Cowslips of Ierusalem.

2 *Pulmonaria foliis Echij.*
Bugloſſe Cowslips.

3 *Pulmonaria angustifolia 2 Clusij.*
Narrow leafed Cowslips of Ierusalem.

¶ *The Description.*

1 Cowslip of Ierusalem, or the true and right Lung-woort hath rough hairie and large leaues of a brown green color, confusedly spotted with diuers spots or drops of white: among which spring vp certain stalks a spanne long, bearing at the top many fine flours, growing together in bunches like the flours of Cowslips, sauing that they be at the first red or purple, somtimes blew, and oftentimes all these colours at once. The flowres being fallen, there come small buttons ful of seed. The root is black and threddy. ‡ This is somtimes found with white floures. ‡

2 The second kinde of Lungwort is like vnto the former, but greater in each respect; the leaues bigger than the former, resembling wilde Bugloſſe, yet spotted with white spots like the former: the floures are like the other, but of an exceeding shining red color.

3 *Clusius* setteth forth a third kinde of Lungwort, which hath rough & hairy leaues like vnto wild Bugloſſe, but narrower: among which riſes vp a stalke a foot high, bearing at the top a bundle of blew floures, in fashion like vnto those of Bugloſſe or the last described.

¶ *The*

¶ *The Place.*

These plants do grow in moist shadowie woods, and are planted almost euery where in Gardens. ‡ M. *Goodyer* found the *Pulmonaria foliis Echij*, being the second, May 25. *Anno* 1620. flouring in a wood by Holbury house in the New Forrest in Hampshire. ‡

¶ *The Time.*

They floure for the most part in March and April.

¶ *The Names.*

Cowslips of Ierusalem, or Sage of Ierusalem, is called of the Herbarists of our time, *Pulmonaria*, and *Pulmonalis*; of *Cordus*, *Symphytum sylueſtre*, or wilde Comfrey: but seeing the other is also of nature wilde, it may aptly be called *Symphytum maculosum*, or *Maculatum*: in high Dutch, **Lungenkraut**: in low Dutch, **Onser vrouwen melcrutit**: in English, spotted Comfrey, Sage of Ierusalem, Cowslip of Ierusalem, Sage of Bethlem, and of some Lungwort; notwithstanding there is another Lungwort, of which we will intreat among the kindes of Mosses.

¶ *The Temperature.*

Pulmonaria should be of like temperature with the great Comfrey, if the root of this were clammie: but seeing that it is hard and wooddy, it is of a more drying quality and more binding.

¶ *The Vertues.*

The leaues are vsed among pot-herbes. The roots are also thought to be good against the infirmities and vlcers of the lungs, and to be of like force with the great Comfrey.

‡ The figure which formerly was in the fourth place of this chapter, was onely of the first described with white floures. But the Title *Pulmonaria Gallorum*, and the description (though little to the purpose, and therefore omitted) were intended for the *Pulmonaria Gallorum flue aurea*, whereof I haue in the due place largely treated, as ye may see in this booke, *pag.* 304, *chap.* 36.

Chap. 289. *Of Clote Burre, or Burre Docke.*

1 *Bardana major.*
The great Burre-Docke.

2 *Bardana minor.*
The lesser Burre Docke.

¶ *The Description.*

1 CLot-Burre bringeth forth broad leaues and hairy, far bigger than the leaues of Gourds, and of greater compasse, thicker also, and blacker, which on the vpper side are of a darke greene colour, and on the neither side somewhat white: the stalke is cornered, thicke, beset with like leaues, but farre lesse, diuided into very many wings and branches, bringing forth great Burres round like bullets or balls, which are rough all ouer, and full of sharpe crooked prickles, taking hold on mens garments as they passe by; out of the tops whereof groweth a floure thrummed, or all of threds, of colour purple: the seed is perfected within the round ball or bullet, and this seed when the burres open, and the wind bloweth, is carried away with the winde: the root is long, white within, and blacke without.

‡ There is another kinde hereof which hath lesser and softer heads, with weaker prickles; these heads are also hairy or downy, and the leaues and whole plant somewhat lesse, yet otherwise like the fore described; *Lobel* calls this *Arction montanum*, and *Lappa minor Galeni*: it is also the *Lappa minor altera* of *Matthiolus*. *Lobel* found this growing in Somersetshire three miles from Bath, neere the house of one M^r. *Iohn Colt*.‡

2 The lesser Burre hath leaues farre small than the former, of a grayish ouerworne colour like to those of Orach, nicked round about the edges: the stalke is a foot and halfe high, full of little blacke spots, diuiding it selfe into many branches: the flours before the Burres come forth do compasse the small stalkes round about; they are but little, and quickely vade away: then follow the Burres or the fruit out of the bosome of the leaues, in forme long, on the tops of the branches, as big as an Oliue or a Cornell berry, rough like the balls of the Plane tree, and being touched cleaue fast vnto mens garments: they do not open at all, but being kept close shut bring forth long seeds: The root is fastned with very many strings, and groweth not deepe.

¶ *The Place.*

The first groweth euery where: the second I found in the high way leading from Draiton to Iuer, two miles from Colbrooke, since which time I haue found it in the high way between Stanes and Egham. ‡ It also groweth plentifully in Southwicke sheet in Hampshire, as I haue beene enformed by M^r. *Goodyer*. ‡

¶ *The Time.*

Their season is in Iuly and August.

¶ *The Names.*

The great Burre is called in Greeke, ἀρκτίον: in Latine, *Personata*, *personatia*, and *Arcium*: in shops, *Bardana*, and *Lappa maior*: in high Dutch, **Groſskletten**: in low Dutch, **Groot clissen**: in French, *Glouteron*: in English, Great Burre, Burre Docke, or Clot Burre: *Apuleius* besides these doth also set downe certaine other names belonging to Clot Burre, as *Dardana*, *Bacchion*, *Elephantosis*, *Nephelion*, *Manifolium*.

The lesser Burre Docke is called of the Græcians, Ξάνθιον: in Latine, *Xanthium*: in shops, *Lappa minor*, *Lappa inuersa*, and of diuers, *Strumaria*: *Galen* saith it is also called, *Phasganion*, and *Phasganon*, or herbe victory, being but bastard names, and therefore not properly so called: in English, Louse Burre, Ditch Burre, and lesser Burre Docke: it seemeth to be called *Xanthium* of the effect, for the Burre or fruit before it be fully withered, being stamped and put into an earthen vessell, and afterward when need requireth the weight of two ounces thereof and somewhat more, being steeped in warme water and rubbed on, maketh the haires of the head red: yet the head is first to be dressed or rubbed with niter, as *Dioscorides* writeth.

¶ *The Temperature.*

The leaues of Clot Burre are of temperature moderately dry and wasting; the root is something hot.

The seed of the lesser Burre, as *Galen* saith, hath power to digest, therefore it is hot and dry.

¶ *The Vertues.*

A The roots being taken with the kernels of Pine Apples, as *Dioscorides* witnesseth, are good for them that spit bloud and corrupt matter.

B *Apuleius* saith that the same being stamped with a little salt, and applied to the biting of a mad dog, cureth the same, and so speedily setteth free the sicke man.

C He also teacheth that the juyce of the leaues giuen to drinke with hony, procureth vrine, and taketh away the paines of the bladder; and that the same drunke with old wine doth wonderfully helpe against the bitings of serpents.

D *Columella* declareth, that the herbe beaten with salt and laid vpon the scarifying, which is made with the launcet or raser, draweth out the poyson of the viper: and that also the root being stamped is more auaileable against serpents, and that the root in like manner is good against the Kings euill.

The

The ſtalke of Clot-Burre before the burres come forth, the rinde pilled off, being eaten raw with ſalt and pepper, or boyled in the broth of fat meate, is pleaſant to be eaten: being taken in that manner it increaſeth ſeed and ſtirreth vp luſt. E

Alſo it is a good nouriſhment, eſpecially boyled: if the kernell of the Pine Apple be likewiſe added it is the better, and is no leſſe auailable againſt the vlcers of the lungs, and ſpitting of bloud, than the root is. F

The root ſtamped and ſtrained with a good draught of Ale is a moſt approued medicine for a windie or cold ſtomacke. G

Treacle of Andromachus, and the whites of egges, of each a like quantitie, laboured in a leaden mortar, and ſpred vpon the Burre leafe, and ſo applied to the gout, haue beene proued many times moſt miraculouſly to appeaſe the paine thereof. H

Dioſcorides commendeth the decoction of the root of *Arcion*, together with the ſeed, againſt the tooth-ach, if it be holden a while in the mouth: alſo that it is good to foment therewith both burnings and kibed heeles; and affirmeth that it may be drunke in wine againſt the ſtrangury, and paine in the hip. I

Dioſcorides reporteth that the fruit is very good to be laid vnto hard ſwellings. K

The root cleane picked, waſhed, ſtamped, and ſtrained with Malmeſey, helpeth the running of the reines, the whites in women, and ſtrengtheneth the backe, if there be added thereto the yelks of egges, the pouder of acornes and nutmegs brued or mixed together, and drunke firſt and laſt. L

Chap. 290. *Of Colts-foot, or Horſe-foot.*

1 *Tuſſilago florens.*
Colts-foot in floure.

1 *Tuſſilaginis folia.*
The leaues of Colts-foot.

¶ *The Deſcription.*

1 *Tuſſilago* or Fole-foot hath many white and long creeping roots, ſomewhat fat; from which riſe vp naked ſtalkes (in the beginning of March and Aprill) about a ſpanne long, bearing at the top yellow floures, which change into downe and are caried away with the winde: when the ſtalke and ſeed is periſhed, there appeare ſpringing of out the earth many broad

broad leaues, greene aboue, and next the ground of a white hoarie or grayiſh colour, faſhioned like an Horſe foot; for which cauſe it was called Fole-foot, and Horſe-hooſe: ſeldome or neuer ſhall you find leaues and floures at once, but the flours are paſt before the leaues come out of the ground; as may appeare by the firſt picture, which ſetteth forth the naked ſtalkes and floures; and by the ſecond, which pourtraiteth the leaues only.

‡ 2 Beſides the commonly growing and deſcribed Colts-foot, there are other two ſmall mountaine Colts-feet deſcribed by *Cluſius*; the firſt whereof I will here preſent you with, but the ſecond you ſhall finde hereafter in the chapter of *Aſarum*, by the name of *Aſarina Matthioli*. This here delineated hath fiue or ſix leaues not much vnlike thoſe of Alehoofe, of a darke ſhining greene colour aboue, and very white and downy below: the ſtalke is naked, ſome handfull high, hollow and downy, bearing one floure at the top compoſed of purpliſh threds, and flying away in downe: after which the ſtalke falls away, and ſo the leaues onely remaine during the reſt of the yeare: the root is ſmall and creeping. It growes on the tops of the Auſtrian and Stirian mountaines, where it floures in Iune or Auguſt. Brought into Gardens it floures in Aprill. *Cluſius* calls it *Tuſſilago Alpina*, 1. and he hath giuen two figures thereof, both which I here giue you by the ſame titles as he hath them. ‡

‡ 2 *Tuſſilago Alpina flore aperto.*
Mountaine Colts-foot full in floure.

‡ 2 *Tuſſilago Alpina flore evanido.*
Mountaine Colts-foot with the floure fading.

¶ *The Place.*

This groweth of it ſelfe neere vnto Springs, and on the brinkes of brookes and riuers, in wet furrowes, by ditches ſides, and in other moiſt and watery places neere vnto the ſea, almoſt euery where.

¶ *The Time.*

The floures which quickly fade, are to be ſeene in the end of March, and about the Calends of Aprill, which ſpeedily wither together with the ſtems: after them grow forth the leaues, which remaine greene all Summer long: and hereupon it came that Colts-foot was thought to be without floures; which thing alſo *Pliny* hath mentioned in his ſix and twentieth booke, *cap.* 6.

¶ *The Names.*

Fole-foot is called in Greeke, Βήχιον: of the Latines likewiſe *Bechion*, and *Tuſſilago*: in ſhops, *Farfara*, and *Vngula Caballana*: of diuers, *Pata equina*: in Italian, *Vnghia di Cauallo*: in Spaniſh, *Vnha d' aſno*: in French, *Pas d' aſne*: in Engliſh, Folefoot, Colts-foot, Horſe-hooſe, and Bull-foot. The ſame is alſo *Chamaleuce*, which *Pliny* in his twenty eighth booke, and fifteenth chapter reporteth to be likewiſe called *Farfugium*, and *Farranum*, if there be not an errour in the copy: which thing alſo *Aëtius* in his firſt booke affirmeth, pretermitting the name of *Bechium*, and attributing vnto it all the vertues and faculties of *Bechium* or Colts-foot. Whoſe opinion *Orebaſius* ſeemeth to be of, in his fifteenth booke of his medicinable Collections, making mention of *Chamaleuce*, onely *Pliny* alſo

alſo agreeth with them; ſhewing that ſome thinke, that *Bechium* is called by another name *Chamæleuce*, in his twenty ſixth booke, *cap.6.* and it may bee that *Dioſcorides* hath written of one and the ſelfe ſame herbe in ſundry places, and by diuers names. *Bechium* and *Tuſſilago*, which may alſo be Engliſhed Coughwort, ſo called of the effect, and *Farfara*, of the white Poplar tree, to whoſe leaues it is like; which was named of the Antients *Farfarus*, as *Plautus* writeth in his Comedie called *Panulus*:

——*viſcum legioni dedi.*
fundaſque eos proſternebam vt folia Farfari.
To the company I gaue both lime buſh and ſling.
That to the ground as Poplar leaues I might them fling.

‡ *Dodonæus* (from whom our Author tooke this) ſets downe this place in *Plautus* as you finde it here, but not well; for the laſt verſe ſhould be *Fundaſque, eo præſternebant folia Farfari.* Thus it is in moſt editions of *Plautus*, and that rightly, as the enſuing words in that place declare. ‡

The white Poplar tree is called in Greeke, Λευκη, and hereupon *Bechion* or Colts-foot was alſo called *Chamæleuce.*

¶ *The Temperature and Vertues.*

The leaues of Colts foot being freſh and greene are ſomthing cold, and haue withall a drying quality; they are good for vlcers and inflammations: but the dried leaues are hot and dry, and ſomewhat biting. A

A decoction made of the greene leaues and roots, or elſe a ſyrrup thereof, is good for the cough that proceedeth of a thin rheume. B

The green leaues of Fole-foot pound with hony, do cure and heale the hot inflammation called Saint Anthonies fire, and all other inflammations. C

The fume of the dried leaues taken through a funnell or tunnell, burned vpon coles, effectually helpeth thoſe that are troubled with the ſhortneſſe of breath, and fetch their winde thicke and often, and breaketh without perill the impoſtumes of the breſt. D

Being taken in manner as they take Tobaco, it mightily preuaileth againſt the diſeaſes aforeſaid. E

Chap. 291. *Of Butter-Burre.*

¶ *The Deſcription.*

BVtter-Burre doth in like manner bring forth floures before the leaues, as doth Colts-foot, but they are ſmall, moſſie, tending to a purple colour; which being made vp into a big eare as it were, do quickely (together with the ſtem, which is thicke, full of ſubſtance, and brittle) wither and fall away: the leaues are very great like to a round cap or hat, called in Latine *Petaſus*, of ſuch a wideneſſe, as that of it ſelfe it is big and large enough to keepe a mans head from raine, and from the heate of the Sunne: and therefore they be greater than the leaues of the Clot-Burre, of colour ſomewhat white, yet whiter vnderneath: euery ſtem beareth his leafe; the ſtem is oftentimes a cubit long, thicke, full of ſubſtance; vpon which ſtandeth the leafe in the centre or middlemoſt part of the circumference, or very neere, like to one of the greateſt Muſhromes, but that it hath a cleft that ſtandeth about the ſtem, eſpecially when they are in periſhing and withering away: at the firſt the vpper ſuperficiall or outſide of the Muſhromes ſtandeth out, and when they are in withering ſtandeth more in; and euen ſo the leafe of Butter-Bur hath on the outſide a certaine ſhallow hollowneſſe: the root is thicke, long, blacke without, white within, of taſte ſomewhat bitter, and is oftentimes worme-eaten.

¶ *The Place.*

This groweth in moiſt places neere vnto riuers ſides, and vpon the brinks and banks of lakes and ponds, almoſt euery where.

¶ *The Time.*

The eare with the floures flouriſh in Aprill or ſooner: then come vp the leaues, which continue till Winter, with new ones ſtill growing vp.

1 *Petaſites florens.*
Butter-Burre in floure.

2 *Petaſitis folia.*
The leaues of Butter Burre.

¶ *The Names.*

Butter-Bur is called in Greeke, πετασίτης: of the hugeneſſe of the leafe that is like to πέτασος, or a hat: the Latines call it, *Petaſites:* in high Durch, **Peſtilentzwurts:** in low-Dutch, **Dockebladeren:** in Engliſh it is named, Butter-Burre: it is very manifeſt that this is like to Colts-foot, and of the ſame kinde.

¶ *The Temperature.*

Butter Burre is hot and dry in the ſecond degree, and of thinne parts.

¶ *The Vertues.*

A The roots of Butter-Burre ſtamped with ale, and giuen to drinke in peſtilent and burning Feuers, mightily coole and abate the heate thereof.

B The roots dried and beaten to pouder, and drunke in wine, are a ſoueraigne medicine againſt the plague and peſtilent feuers, becauſe they prouoke ſwear, and driue from the heart all venome and ill heate: it killeth wormes, and is of great force againſt the ſuffocation of the mother.

C The ſame cureth all naughty filthy vlcers, if the pouder be ſtrewed therein.

D The ſame kills wormes in the belly: it prouokes vrine, and brings downe the monethly termes.

‡ Chap. 267. *Of Mountaine Horſe-foot.*

¶ *The Deſcription.*

1 THis plant (which the moderne Writers haue referred to the *Cacalia* of the antients, and to the kindes of Colts-foot) I haue thought good to name in Engliſh, Horſe-foot, for that the leaues exceed Colts-foot in bigneſſe, yet are like them in ſhape: and of this plant *Cluſius* (whom I here chiefely follow) hath deſcribed two ſorts: the firſt of theſe haue many leaues almoſt like vnto thoſe of Colts-foot, but larger, very round, and ſnipt about the edges, of a light greene colour aboue, and hoarie vnderneath, hauing alſo many veines or nerues running vp and downe them; and theſe leaues are of an vngratefull taſte, and grow vpon long purpliſh creſted ſtalkes: The ſtemme is ſome two cubits high, creſted likewiſe, and of a purpliſh colour, ſet alſo at certaine ſpaces with leaues very like vnto the other, but leſſer than thoſe next the ground, and more cornered

‡ 1 *Cacalia incano folio.*
Hoarie leaued Horsefoot.

‡ 2 *Cacalia folio glabro.*
Smooth leaued Horse-foot.

cornered and sharper pointed; the tops of the stalkes and branches carry bunches of purple floures, as in an vmbell: and commonly in each bunch there are three little flours consisting of foure leaues a peece, and a forked pestle, and these are of a purple colour, and a weake, but not vnpleasant smell, and they at length turne into downe, amongst which lies hid a longish seed: the root, if old, sends forth diuers heads, as also store of long whitish fibres.

2 The leaues of this are more thin, tough and hard, and of a deeper greene on the vpper sides, neither are they whitish below, nor come so round or close whereas they are fastened to their stalks (which are not crested as those of the other, but round and smooth) they are also full of veines and nickt about the edges, and of somewhat an vngratefull hot and bitter taste. The stalkes are also smoother, and the floure of a lighter colour.

¶ *The Place.*

Both these grow in the Austrian and Stirian Alpes vnder the sides of woods, among bushes and such shadowie places: but not in England, that I haue yet heard of.

¶ *The Time.*

I find it not set downe when these floure and seed, but iudge it about the same time that Coltsfoot doth.

¶ *The Names.*

This by *Clusius*, *Lobel* and others, hath beene called *Cacalia*, and referred to that described by *Dioscorides*, *lib.* 4. *cap.* 123. which is thought to be that set forth by *Galen* by the name of *Cancanus*. In the *Historia Lugd. pag.* 1052. The later of these two here described is figured by the name of *Tussilago Alpina sive montana*, and the former is there, *pag.* 1398. by the name of *Cacalia*, but the floures are not rightly expresst: and if my iudgement faile me not, the figure which is in the seuenteenth page of the *Appendix* of the same Author, by the title of *Aconitum Pardalianches primum*, is of no other than this very plant. But because I haue not as yet seene the plant, I will not positiuely affirme it: but referre this my opinion to those that are iudicious and curious, to know the plant that raised such controuersie between *Matthiolus* and *Gesner*, and whereof neither *Camerarius* nor *Bauhine*, who hath set forth *Matthiolus* his Commentaries, haue giuen vs any certain or probable knowledge.

¶ *The*

¶ *The Temperature and Vertues, out of the Antients.*

The root of *Cacalia* is void of any biting qualitie, and moderately dries, and it is of a groſſe and emplaiſticke ſubſtance; wherefore ſteeped in wine and ſo taken it helpes the cough, the roughneſſe of the Arterie or hoarſnes, like as *Tragacanth*: neither if you chew it and ſwallow downe the juyce doth it leſſe auaile againſt thoſe effects than the juyce of Liquorice. ‡

CHAP. 219. *Of ſmall Celandine or Pilewort.*

¶ *The Kindes.*

THere be two kindes of Celandine, according to the old writers, much differing in forme and figure: the one greater, the other leſſer, which I intend to diuide into two diſtinct chapters, marſhalling them as neere as may be with their like, in forme and figure, and firſt of the ſmall Celandine.

Chelidonium minus.
Pilewort.

¶ *The Deſcription.*

THe leſſer Celandine hath greene round leaues, ſmooth, ſlipperie, and ſhining, leſſe than the leaues of the Iuie: the ſtalks are ſlender, ſhort, and for the moſt part creeping vpon the ground: they bring forth little yellow floures like thoſe of Crowfoot; and after the floures there ſpringeth vp a little fine knop or head full of ſeed: the root conſiſteth of ſlender ſtrings, on which doe hang as it were certain graines, of the bignes of Wheat cornes, or bigger.

¶ *The Place.*

It groweth in medows, by common waies, by ditches and trenches, and it is common euery where, in moiſt and dankiſh places.

¶ *The Time.*

It commeth forth about the Calends of March, and floureth a little after: it beginneth to fade away in Aprill, it is quite gone in May, afterwards it is hard to be found, yea ſcarcely the root.

¶ *The Names.*

Is is called in Greeke, χελιδόνιον: of the Latines *Chelidonium minus*, and *Hirundinaria minor*: of diuers, *Scrophularia minor*, *Ficaria minor*: of *Serapio*, *Memiren*: in Italian, *Fauescello*: in High Dutch, **Feigwurtzenkraut**: in French, *Eſclere*, and *Petit Baſſinet*: in Engliſh, little Celandine, Figwort and Pile-wort.

¶ *The Temperature.*

It is hot and dry, alſo more biting and hotter than the greater: it commeth neereſt in faculty to the Crowfoot.

‡ This which is here, and by moſt Authors ſet forth for *Chelidonium minus*, hath no ſuch great heat and Acrimony as *Dioſcorides* and *Galen* affirme to be in theirs; making it hot in the fourth degree, when as this of ours ſcarce exceeds the firſt, as far as we may conjecture by the taſte. ‡

¶ *The Vertues.*

A It preſently, as *Galen* and *Dioſcorides* affirme, exulcerateth or bliſtereth the skin: it maketh rough and corrupt nailes to fall away.

B The juyce of the roots mixed with hony, and drawne vp into the noſthrils, purgeth the head of foule and filthy humors.

The

The later age vse the roots and graines for the piles, which being often bathed with the jayce mixed with wine, or with the sickmans vrine, are drawne together and dried vp, and the paine quite taken away. C

There be also who thinke, that if the herbe be but carried about one that hath the piles, the paine forthwith ceaseth. D

Chap. 294. *Of Marsh Marigold.*

¶ *The Description.*

1 Marsh Marigold hath great broad leaues somewhat round, smooth, of a gallant greene colour, sleightly indented or purld about the edges: among which rise vp thicke fat stalkes, likewise greene; whereupon doe grow goodly yellow floures, glittering like gold, and like to those of Crow-foot, but greater: the root is small, composed of very many strings.

1 *Caltha palustris maior.*
The great Marsh Marigold.

2 *Caltha palustris minor.*
The small Marsh Marigold.

2 The smaller Marsh Marigold hath many round leaues spred vpon the ground, of a darke greene colour: amongst which rise vp diuers branches, charged with the like leaues: the floures grow at the toppes of the branches, of a most shining yellow colour: the root is also like the former.

3 The great Marsh Marigold with double floures is a stranger in England, his natiue Country should seeme to bee in the furthest part of Germany, by the relation of a man of those Countries that I haue had conference withall; the which he thus described: it hath (saith he) leaues, roots, and stalkes like those of our common sort, and hath double floures like those of the garden Marigold, wherein consisteth the difference.

‡ *Camerarius* writes iust contrary to that which our Author here affirmes: for hee saith, *In Anglia sua sponte non solum plenis, sed oderatis etiam floribus passim sese offert.* But I feare that both our Author

3 *Caltha palustris multiplex.*
Double floured Marsh Marigold.

Author and *Camerarius* were deceiued by trusting the report of some lying, or else ignorant persons, for I could neuer find it growing wilde with double floures here, nor *Camerarius* there: yet I do not deny but by chance some one with double floures may be found both here and there, but this is not euery where. ‡

¶ *The Place.*

They joy in moist and marish grounds, and in watery medowes. ‡ I haue not found the double one wilde, but seene it preserued in diuers Gardens for the beauty of the floure. ‡

¶ *The Time.*

They floure in the Spring when the Crow-foots doe, and oftentimes in Summer: the leaues keepe their greeneneſſe all the Winter long.

¶ *The Names.*

Marsh Marigold is called of *Valerius Cordus*, *Caltha palustris*: of *Tabernamontanus*, *Populago*: but not properly: in English; March Marigolds: in Cheshire and those parts it is called Bootes.

¶ *The Temperature and Vertues.*

Touching the faculties of these plants, wee haue nothing to say, either out of other mens writings, or our owne experience.

Chap. 295. *Of Frogge-bit.*

Morsus Ranæ.
Frogge-bit.

¶ *The Description.*

THere floteth or swimmeth vpon the vpper parts of the water a small plant, which we vsually call Frog-bit, hauing little round leaues, thicke and full of juyce, very like to the leaues of wall Peniwort: the floures grow vpon long stems among the leaues, of a white colour, with a certain yellow thrum in the middle consisting of three leaues: in stead of roots it hath slender strings, which grow out of a short and small head, as it were, from whence the leaues spring, in the bottom of the water: from which head also come forth slopewise certain strings, by which growing forth it multiplieth it selfe.

¶ *The Place.*

It is found swimming or floting almost in euery ditch, pond, poole, or standing water, in all the ditches about Saint George his fields, and in the ditches by the Thames side neere to Lambeth Marsh, where any that is disposed may see it.

¶ *The Time.*

It flourisheth and floureth most part of all the yeare

¶ *The Names.*

It is called of some *Ranæ morsus*, and *Morsus Ranæ*, and *Nymphæa parua*. ¶ *The*

¶ *The Temperature and Vertues.*

It is thought to be a kinde of Pond-weed (or rather of Water Lillie) and to haue the ſame fa- A culties that belong vnto it.

Chap. 296. *Of Water Lillie.*

¶ *The Deſcription.*

1 THe white water Lillie of *Nenuphar* hath great round leaues, in ſhape of a buckler, thick, fat, and full of juyce, ſtanding vpon long round and ſmooth foot-ſtalkes, ful of a ſpungious ſubſtance; which leaues do ſwim or flote vpon the top of the water: vpon the end of each ſtalk groweth one floure only, of colour white, conſiſting of many little long ſharpe pointed leaues in the middeſt whereof be many yellow threds: after the floure it bringeth forth a round head, in which lieth blackiſh glittering ſeed. The roots be thicke, full of knots, blacke without, white and ſpungy within, out of which groweth a multitude of ſtrings, by which it is faſtned in the bottome.

1 *Nymphæa alba.*
White Water Lillie.

2 *Nymphæa lutea.*
Yellow Water Lillie.

2 The leaues of the yellow water Lilly be like to the other, yet are they a little longer. The ſtalkes of the floures and leaues be like: the floures be yellow, conſiſting onely of fiue little ſhort leaues ſomething round; in the middeſt of which groweth a ſmall round head, or button, ſharpe towards the point, compaſſed about with many yellow threds, in which, when it is ripe, lie alſo glittering ſeeds, greater than thoſe of the other, and leſſer than wheat cornes. The roots be thicke, long, ſet with certaine dents, as it were white both within and without, of a ſpungeous ſubſtance.

3 The ſmall white water Lillie floteth likewiſe vpon the water, hauing a ſingle root, with ſome few fibres faſtened thereto: from which riſeth vp many long, round, ſmooth, and ſoft foot-ſtalkes, ſome of which doe bring forth at the end faire broad round buckler leaues like vnto the precedent, but

but leſſer: on the other foot-ſtalks ſtand pretty white floures, conſiſting of fiue ſmall leaues apeece, hauing a little yellow in the middle thereof.

4 The ſmall yellow water Lillie hath a little threddy root, creeping in the bottome of the water and diſperſing it ſelfe far abroad: from which riſe ſmall tender ſtalkes, ſmooth and ſoft, whereon doe grow little buckler leaues like the laſt deſcribed: likewiſe on the other ſmall ſtalke ſtandeth a tuft of many floures likewiſe floting vpon the water as the others do. ‡ This hath the floures larger than thoſe of the next deſcribed, wherefore it may be fitly named *Nymphæa lutea minor flore amplo.* ‡

3 *Nymphæa alba minor.*
The ſmall white Water Lillie.

5 *Nymphæa lutea minima.*
Dwarfe Water Lillie.

5 This dwarfe water Lillie differeth not from the other ſmall yellow water Lillie, ſauing that, that this kinde hath ſharper pointed leaues, and the whole plant is altogether leſſer, wherein lieth the difference. ‡ This hath the floures much leſſe than thoſe of the laſt deſcribed, wherefore it is fitly for diſtinction ſake named *Nymphæa lutea minor flore parno.* ‡

¶ *The Place.*

Theſe herbes do grow in fennes, ſtanding waters, broad ditches, and in brookes that run ſlowly, and ſometimes in great riuers.

¶ *The Time.*

They floure and flouriſh moſt of the Summer moneths.

¶ *The Names.*

Water Lillie is called in Greeke, Νυμφαια: and in Latine alſo *Nymphæa*, ſo named becauſe it loues to grow in watery places, as *Dioſcorides* ſaith: the Apothecaries call it *Nenuphar*: of *Apuleius*, *Water Herculania*, *Alga paluſtris*, *Papauer paluſtre*, *Clauus Veneris*, and *Digitus Veneris*: *Marcellus* a very old writer reporteth, that it is called in Latine, *Claua Herculis*: in french, *Badittin*: in high Dutch, Waſſer Mahem: in low Dutch, Plompen: in Engliſh, Water Lillie, Water Roſe.

¶ *The Temperature.*

Both the root and ſeed of water Lillie haue a drying force without biting.

¶ *The Vertues.*

A Water Lillie with yellow floures ſtoppeth laskes, the ouerflowing of ſeed which commeth away by dreames or otherwiſe, and is good for them that haue the bloudy flix. But

But water Lilly which hath the white flours is of greater force, inſomuch as it ſtaies the whites: B
but both this and the other that hath the blacke root muſt be drunke in red wine: they haue alſo a
ſcouring qualitie, and clenſe away the morphew, being good alſo againſt the pilling away of the
haire of the head: againſt the morphew they are ſteeped in water, and for the pilling away of the
haire in Tarre: but for theſe things that is fitter which hath the blacke root, and for the other, that
which hath the white root.

Theophraſtus ſaith, That being ſtamped and laid vpon the wound it is reported to ſtay the blee- C
ding.

The Phyſitions of our age do commend the floures of white *Nymphæa* againſt the infirmities of D
the head comming of an hot cauſe; and do certainly affirme, that the root of the yellow cures hot
diſeaſes of the kidnies and bladder, and is ſingular good againſt the running of the reines.

The root and ſeed of great water Lilly is very good againſt venerie or fleſhly deſire, if one drink E
the decoction of it, or vſe the ſeed or root in pouder in his meats; for it drieth vp the ſeed of gene-
ration, and ſo cauſeth a man to be chaſte, eſpecially vſed in broth with fleſh.

The conſerue of the floures is good for the diſeaſes aforeſaid, as alſo againſt hot burning feuers. F

The floures made into oile as yee make oile of roſes, coole and refrigerate, cauſing ſweat and G
quiet ſleepe, and put away all venereous dreames: the temples of the head, the palms of the hands
and feet, and the breſt being anointed for the one, the genitoirs vpon and about them for the other.

The green leaues of the great water Lilly either the white or the yellow, laid vpon the region of H
the backe in the ſmall, mightily ceaſe the involuntary flowing of the ſeed called *Gonorrhæa* or run-
ning of the reins, being two or three times a day remoued, and freſh applied thereto.

Chap. 297.

Of Pond-weed, or water Spike.

1 *Potamogeiton latifolium.*
Broad leafed Pond-weed.

2 *Potamogeiton anguſtifolium.*
Narrow leafed Pond-weed.

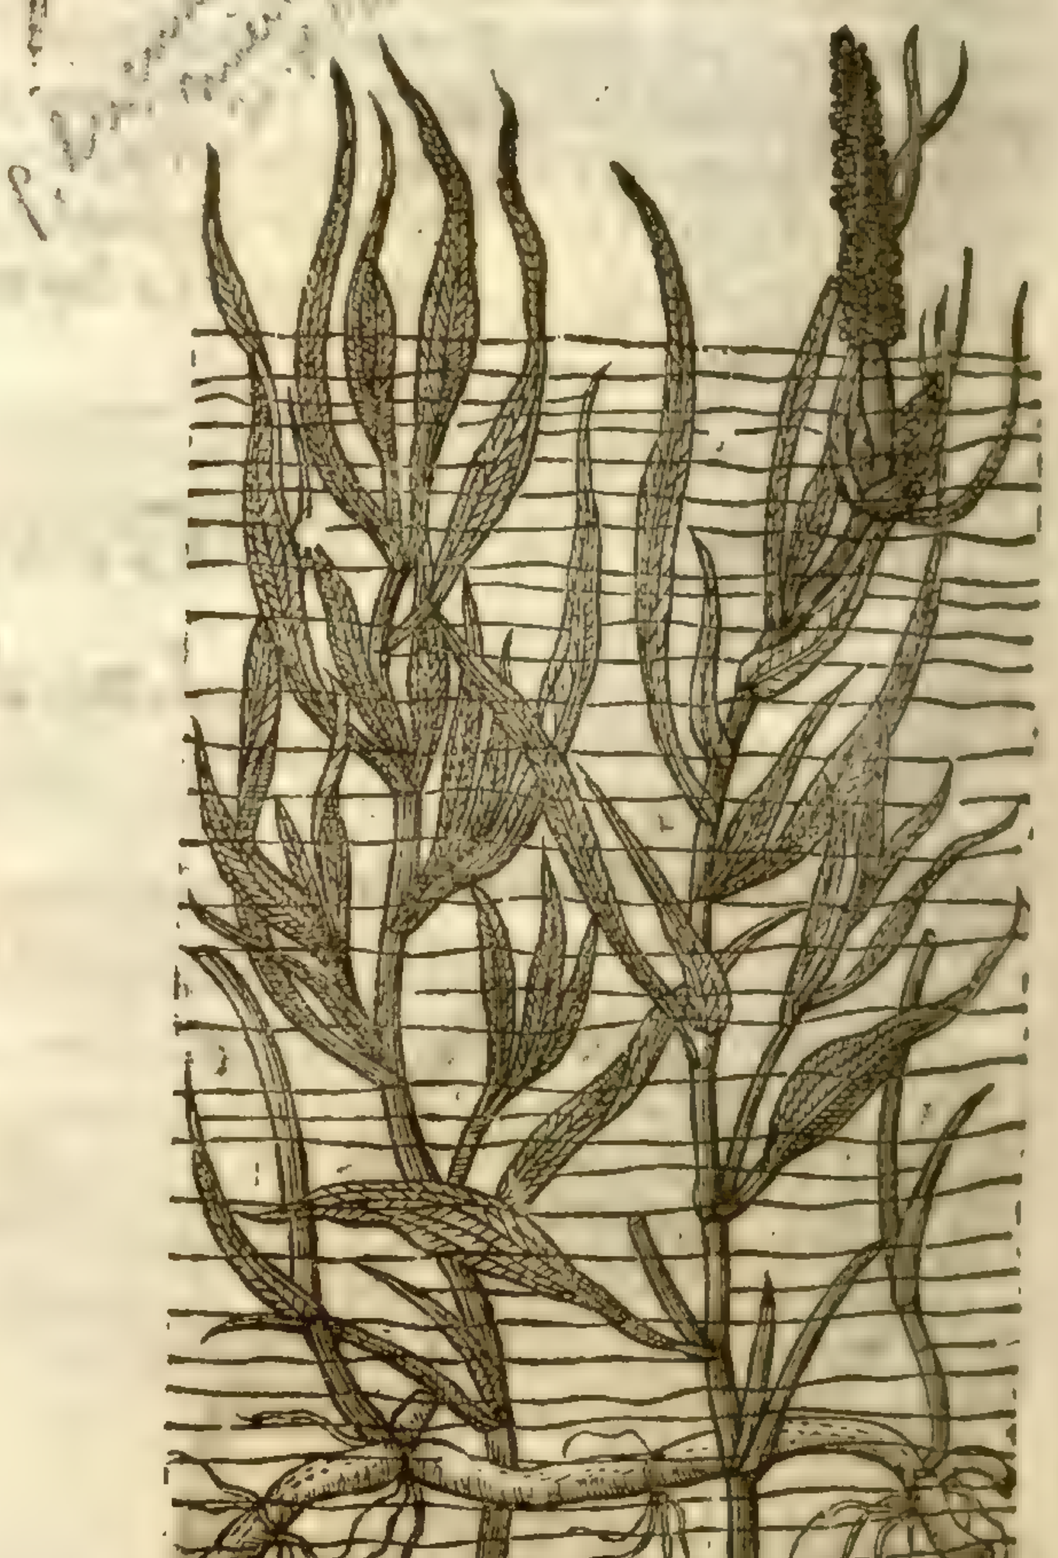
¶ *The Deſcription.*

1 POnd-weed hath little ſtalkes, ſlender, ſpreading like thoſe of the Vine, and jointed: the leaues be long, ſmaller than the leaues of Plantain, and harder, with manifeſt veins running along ſt them as in Plantains, which ſtanding vpon ſlender and long ſtems or foot-ſtalks, ſhew themſelues aboue the water, and lie flat along vpon the ſuperficial or vpper part thereof, as do the leaues of water Lilly: the floures grow in ſhort eares, and are of a light red purple colour like thoſe of Red-thanks or Biſtort: the ſeed is hard.

‡ 2 This (whoſe figure was formerly vnfitly put by our Author to the following deſcription) hath longer, narrower, and ſharper pointed leaues than thoſe of the laſt deſcribed, hauing the veins running from the middle rib to the ſides of the leaues, as in a willow leafe, which they ſomwhat reſemble: at the tops of the ſtalkes grow reddiſh ſpikes or eares like thoſe of the laſt deſcribed: the root is long, jointed, and fibrous. ‡

‡ 3 *Potamogeiton* 3. *Dodonæi.*
Small Pond-weed.

‡ 4 *Potamogeiton longis acutis foliis.*
Long ſharp leaued Pond-weed.



3 There is another Pond-weed deſcribed thus; it ſhooteth forth into many ſlender & round ſtems, which are diſtributed into ſundry branches: his leaues are broad, long, and ſharp pointed, yet much leſſe than the firſt kinde: out of the boſomes of the branches and leaues there ſpring certain little ſtalks which beare ſundry ſmall white moſſie floures, which turn into plaine and round ſeeds like the common Tare or Vetch: the root is fibrous, throughly faſtned in the ground.

‡ 4 There is alſo another Pondweed, which hath whitiſh and jointed roots creeping in the bottom of the water, with ſome fibres, but ſending vp ſlender jointed and long ſtalkes, ſmall below, and bigger aboue, hauing long narrow and very ſtiffe ſharpe pointed leaues. The floures grow in a reddiſh ſpike like thoſe of the firſt deſcribed. This is the *Potamogeiton altera* of *Dodonæus.* ‡

¶ *The Place.*

Theſe herbs grow in ſtanding waters, pooles, ponds, and ditches almoſt euery where.

¶ *The Time.*

They flourc in Iune and Iuly.

¶ *The Names.*

It is called of the Greeks, ποταμογείτων: in Latine, *Fontalis*, and *Spicata*: in high Dutch, Zambraut: in low-Dutch, Fonteyncrupt: in French, *Eſpi d'eaue*: in Engliſh, Pondweed, and water Spike.

¶ *The*

¶ *The Temperature.*

Pondweed, ſaith *Galen*, doth binde and coole, like as doth Knot-graſſe, but his eſſence is thicker than that of Knot-graſſe.

¶ *The Vertues.*

It is good againſt the itch and conſuming and eating vlcers, as *Dioſcorides* writeth. A

Alſo it is good being applied to the inflammation of the leggs, wherein *Ignis ſacer* hath got the ſuperioritie. B

Chap. 298.

Of Water Saligot, water Caltrops, or water Nuts.

¶ *The Deſcription.*

1 WAter Caitrops haue long ſlender ſtalks growing vp and riſing from the bottom of the water, and mounting aboue the ſame: the root is long, hauing here & there vnder the water certaine taſſels full of ſmall ſtrings or threddy baires: the ſtem towards the top of the water is very great in reſpect of that which is lower; the leaues are large and ſomewhat round, not vnlike thoſe of the Poplar or Elme tree leaues, a little creuiſed or notched about the edges: amongſt or vnder the leaues grow the fruit, which is triangled, hard, ſharp pointed and prickly, in ſhape like thoſe hurtfull engins in the wars, caſt in the paſſage of the enemy to annoy the feet of their horſes, called Caltrops, whereof this tooke it's name: within theſe heads or Nuts is contained a white kernell in taſte almoſt like the Cheſnut, which is reported to bee eaten green, and being dried and ground to ſerue in ſtead of bread.

‡ There are two other plants which are found growing in many ponds & ditches of this kingdome both about London and elſewhere, and I will here giue you their figures out of *Lobel* and *Cluſius*, and their deſcriptions as they were ſent me by Mr *Goodyer*, who hath ſaued me the labor of deſcribing them.

Tribulus aquaticus minor quercus floribus, Cluſ. p. 252.
Puſillum fontila pathum, Lobelij.

2 This water herb bringeth forth from the root, thin flat knotty ſtalks of a reddiſh colour, two or three cubits long, or longer, according to the depth of the water (which when they are dry are pliant or bowing) diuided towards the top into many parts or branches, bearing but one leafe at euery joint, ſomtimes two inches long, and halfe an inch broad, thin, and as it were ſhining, ſo wrinkled and crumpled by the ſides that it ſeemeth to be torn, of a reddiſh green colour: the foot ſtalks are ſomwhat long and thicke, and riſe vp from amongſt thoſe leaues, which alwayes grow two one oppoſit againſt another, in a contrary manner to thoſe that grow below on the ſtalk: neere the top of which foot-ſtalke groweth ſmall grape-like husks, out of which ſpring very ſmal reddiſh flours like thoſe of the Oke, euery floure hauing foure very ſmall round topped leaues: after euery floure commeth commonly foure ſharp pointed graines growing together, containing within them a little white kernell. The lower part of the ſtalke hath at euery joint ſmall white threddy roots, ſomwhat long, whereby it taketh hold in the mud, and draweth nouriſhment vnto it. The whole plant is commonly couered ouer with water: it floures in Iune and the beginning of Iuly. I found it in the ſtanding pooles or fiſh-ponds adioyning to a diſſolued Abby called Durford, which ponds diuide Hampſhire and Suſſex, and in other ſtanding waters elſewhere. This deſcription was made vpon ſight of the plant, Iune 2, 1622.

Tribulus aquaticus minor, muſcatellæ floribus.

3 This hath not flat ſtalks like the other, but round, kneed, and alwaies bearing two leaues at euery joint, one oppoſite againſt another, greener, ſhorter, and leſſer than the other, ſharp pointed, not much wrinkled and crumpled by the edges: *Cluſius* ſaith that they are not at all crumpled. I neuer obſerued any without crumples and wrinkles: the floures grow on ſhort ſmall footſtalks of a whitiſh green colour like thoſe of *Muſcatella Cordi*, called by *Gerard*, *Radix cauamini ma viridi flore*: viz. two flours at the top of euery foot-ſtalke, one oppoſit againſt another, euery floure containing foure ſmall leaues: which two floures being paſt, there come vp eight ſmall huskes, making ſix ſeuerall

1 *Tribulus aquaticus.*
Water Caltrops.

‡ 2 *Tribulus aquaticus minor quercus floribus.*
Small water Caltrops, or Frogs Lettuce.

‡ 3 *Tribulus aquaticus minor, Muscatellæ floribus.*
Small Frogs Lettuce.

uerall wayes a square of floures. The roots are like the former. This groweth abundantly in the riuer by Droxford in Hampshire. It floures in Iune and Iuly when the other doth, and continueth couered ouer with water, green both winter & sommer. *Iohn Goodyer.* ‡

¶ *The Place.*

Cordus saith that it groweth in Germanie in myrie lakes, and in city ditches that haue mud in them: in Brabant and other places of the Lowcountries it is found oftentimes in standing waters and springs. *Mathiolus* writeth, that it growes not only in lakes of sweet water, but also in certain ditches by the sea neere vnto Venice.

¶ *The Time.*

It flourisheth in Iune, Iuly, & August.

¶ *The Names.*

The Grecians cal it τριβολος ὑδατιος: the Latines, *Tribulus aquatilis* and *aquaticus*, and *Tribulus lacustris*: the Apothecaries, *Tribulus marinus*: in high Dutch, **Water nusz**: the Brabanders, **Water noten**: and of the likenesse of yron nailes, **Mincknissers**: the

the French men, *Macres*: in Engliſh it is named water Caltrops, Saligot, and water Nuts: moſt do call the fruit of this Caltrops, *Caſtaneæ aquatiles*, or water Cheſnuts.

¶ *The Temperature.*

Water Caltrop is of a cold nature, it conſiſteth of a moiſt eſſence, which in this is more waterie than in the land Caltrops, wherein an earthy cold is predominant, as *Galen* ſaith.

¶ *The Vertues.*

The herb vſed in manner of a pultis, as *Dioſcorides* teacheth, is good againſt all inflammations or hot ſwellings: boiled with hony and water it perfectly cureth cankers of the mouth, ſore gums, and the almonds of the throat. A

The Thracians, ſaith *Pliny*, that dwel in Strymona, fatten their horſes with the leaues of Saligot, and they themſelues feed of the kernels, making very ſweet bread thereof, which bindes the belly. B

The green nuts or fruit of *Tribulus aquaticus*, or Saligot, drunke in wine, are good for them that are troubled with the ſtone and grauell. C

The ſame drunke in like manner, or laid outwardly to the place, helpeth thoſe that are bitten with any venomous beaſt, and reſiſteth all venome and poiſon. D

The leaues of Saligot be giuen againſt all inflammations and vlcers of the mouth, the putrifaction and corruption of the jawes, and againſt the Kings euill. E

A pouder made of the nuts is giuen to ſuch as piſſe bloud and are troubled with grauell: it bindeth the belly very much. F

‡ The two leſſer water Caltrops here deſcribed are in my opinion much agreeable in temper to the great one, and are much fitter *Succidanea* for it than Aron, which ſome in the compoſition of *Vnguentum Agrippæ* haue appointed for it. ‡ G

Chap. 299.

Of Water Sengreen, or Freſh-water Souldier.

Militaris Aizoides.
Freſh-water Souldier.

¶ *The Deſcription.*

Freſh-water Souldier or Water Houſleeke hath leaues like thoſe of the Herb Aloë or *Sempervivum*, but ſhorter and leſſer, ſet round about the edges with certaine ſtiffe and ſhort prickles: amongſt which commeth forth diuers caſes or husks very like to crabs clawes; out of which when they open grow white floures, conſiſting of three leaues altogether like thoſe of Frogs-bit, hauing in the middle little yellowiſh threads: in ſtead of roots there be long ſtrings, round, white, very like to great harp ſtrings or long worms, which falling down from a ſhort head that brought forth the leaues, go to the bottome of the water, and yet be they ſeldome there faſtned: there grow alſo from the ſame other ſtrings aſlope, by which the plant is multiplied after the manner or Frogs-bit.

¶ *The Place.*

‡ I found this growing plentifully in the ditches about Rotſey a ſmall village in Holderneſſe: and my friend Mr *William Broad* obſerued it in the fennes in Lincolnſhire. ‡ The leaues and flours grow vpon the top of the water, and the roots are ſent downe through the water to the mud.

¶ *The Time.*

It floures in Iune, and ſometimes in Auguſt.

¶ *The Names.*

It may be called *Sedum aquatile*, or water Sengreen, that is to ſay, of the likeneſſe of Herb Aloë, which is alſo called in Latine *Sedum*: of ſome, *Cancri chela*, or *Cancri forficula*: in Engliſh, Water Houſleeke, Knights Pondwort, and of ſome, Knights water Sengreen, Freſh-water Soldier, or wading Pondweed: it ſeems to be *Stratiotes aquatilis*, or *Stratiotes potamios*, or Knights water Woundwort, which may alſo be named in Latine, *Militaris aquatica*, and *Militaris Aizoides*, or ſoldiers Yarrow; for it groweth in the water, and floteth vpon it, and if thoſe ſtrings which it ſendeth to the bottom of the water be no roots, it alſo liueth without roots.

¶ *The Temperature.*

This herb is of a cooling nature and temperament.

¶ *The Vertues.*

This Houſleeke ſtaieth the bloud which commeth from the kidnies, it keepeth greene wounds from being inflamed, and is good againſt S. *Anthonies* fire and hot ſwellings, beeing applied vnto them: and is equall in vertues with the former aforeſaid.

Chap. 300. *Of water Yarrow or water Gilloſloure.*

1 *Viola paluſtris.* Water Violet.

‡ 2 *Viola paluſtris tenuifolia.* The ſmaller leaued water Violet.

¶ *The Deſcription.*

1 WAter Violet hath long and great jagged leaues very finely cut or rent like Yarrow, but ſmaller: among which come vp ſmall ſtalks a cubit and a halfe high, bearing at the top ſmall white floures like vnto ſtock Gilloſloures, with ſome yellowneſſe in the middle. The roots are long and ſmall like black threds, and at the end whereby they are faſtned to the ground they are white.

‡ There is another variety of this plant, which differs from it only in that the leaues are much ſmaller, as you may ſee them expreſt in the figure. ‡

2 Water

2 Water Milfoile or water Yarrow hath long and large leaues deepely cut with many diuisions like Fennell, but finelier jagged, swimming vpon the water. The root is single, long, and round, which brings vp a right straight and slender stalke, set in sundry places with the like leaues, but smaller. The leaues grow at the top of the stalk, tuft-fashion, and like vnto the land Yarrow.

3 This water Milfoile differeth from all the kindes aforesaid, hauing a root in the bottom of the water, made of many hairy strings, which yeeldeth vp a naked slender stalke within the water, and the rest of the stalk which floteth vpon the water diuideth it selfe into sundry other branches or wings, which are bedasht with fine small jagged leaues like vnto Cammomill, or rather resembling hairy tassels or fringe, than leaues. From the bosomes whereof come forth small and tender branches, euery branch bearing one floure like vnto water Crow-foot, white of colour, with a little yellow in the midst: the whole plant resembleth water Crow-foot in all things saue in the broad leaues.

† 4 There is another kinde of water Violet very like the former, sauing that his leaues are much longer, somewhat resembling the leaues of fennell, fashioned like vnto wings, and the flours are somewhat smaller, yet white, with some yellownesse in their middles, and shaped like those of the last described: the seed also growes like vnto that of the water *Ranunculus* last described.

5 There is also another kinde of water Milfoile which hath leaues very like vnto water Violet, smaller, and not so many in number: the stalk is small and tender, bearing yellow gaping flours fashioned like a hood or the small Snapdragon; which caused *Pena* to put vnto his name this additament *Galericulatum*, that is, hooded. The roots are small and threddy, with some few knobs hanging thereat like the sounds of fish.

2 *Millefolium aquaticum.*
Water Yarrow.

3 *Millefolium, siue Maratriphyllon, flore & semine Ranunculi aquatice, Hepaticæ facie.*
Crow-foot, or water Milfoile.

‡ 6 To these may we adde a small water Milfoile set forth by *Clusius*: it hath round greene stalks set with many joints, whereout come at their lower ends many hairy fibres whereby it takes hold of the mud: the tops of these stems stand some handfull aboue the water, and at each joint send fiue long finely winged leaues, very greene, and some inch long, which wax lesse and lesse, as they

they ſtand higher or neerer the top of the ſtalke; and at each of theſe leaues about the top of the ſtem growes one ſmall white floure conſiſting of ſix little leaues joined together, and not opening themſelues, which at length turne into little knobs, with foure little pointals ſtanding out of them. *Cluſius* calls this *Myriophyllon aquaticum minus*. ‡

‡ 4 *Millefolium tenuifolium.*
Fennel-leaued water Milfoile.

‡ 5 *Millefolium paluſtre galericulatum.*
Hooded water Milfoile.

¶ *The Place.*

They be found in lakes and ſtanding waters, or in waters that run ſlowly: I haue not found ſuch plenty of it in any one place as in the water ditches adioyning to S. *George* his field neere London.

¶ *The Time.*

They floure for the moſt part in May and Iune.

¶ *The Names.*

The firſt is called in Dutch, **Water Violerian**, that is to ſay, *Viola aquatilis*: in Engliſh, Water Gillofloure, or water Violet: in French, *Gyrofflees d'eaue*. *Matthiolus* makes this to be alſo *Myriophylli ſpecies*, or a kinde of Yarrow, although it doth not agree with the deſcription thereof; for neither hath it one ſtalke only, nor one ſingle root, as *Myriophyllon* or Yarrow is deſcribed to haue; for the roots are full of ſtrings, and it bringeth forth many ſtalks.

The ſecond is called in Greeke, Μυριόφυλλον: in Latine, *Millefolium*, and *Myriophyllon*, and alſo *Supercilium Veneris*: in ſhops it is vnknowne. This Yarrow differs from that of the land: the reſt are ſufficiently ſpoken of in their titles.

¶ *The Temperature and Vertues.*

A Water Yarrow, as *Dioſcorides* ſaith, is of a dry facultie, and by reaſon that it takes away hot inflammations and ſwellings, it ſeemeth to be of a cold nature; for *Dioſcorides* affirmeth, That water Yarrow is a remedie againſt inflammation in green wounds, if with vineger it be applied greene or dry: and it is giuen inwardly with vineger and ſalt to thoſe that haue fallen from an high place.

B Water Gillofloure or water Violet is thought to be cold and dry, yet hath it no vſe in phyſick.

Chap. 301. *Of Ducks meat.*

Lens paluſtris.
Ducks meat.

¶ *The Deſcription.*

Ducks meat is as it were a certain green moſſe, with very little round leaues of the bignes of Lentils: out of the midſt whereof on the nether ſide grow downe very fine threds like haires, which are to them in ſtead of roots: it hath neither ſtalke, floure, nor fruit.

¶ *The Place.*

It is found in ponds, lakes, city ditches, & other ſtanding waters euery where.

¶ *The Time.*

The time of Ducks meat is known to all.

¶ *The Names.*

Duckes meat is called in Latine, *Lens lacuſtris*, *Lens aquatilis*, and *Lens paluſtris*: of the Apothecaries it is named *Aquæ Lenticula*: in high-Dutch, **Meerlinſen**: in low-Dutch, **Waterlinſen**, & more vſually **Enden gruen**, that is to ſay, *Anatum herba*; Ducks herb, becauſe Ducks do feed thereon; whereupon alſo in Engliſh it is called Ducks meat: ſome term it after the Greek, water Lentils; and of others it is named Graines. The Italians call it *Lent di palude*: in French, *Lentille d'eaue*: in Spaniſh, *Lenteias de agua*.

¶ *The Nature.*

Galen ſheweth that it is cold and moiſt after a ſort in the ſecond degree.

¶ *The vertues.*

Dioſcorides ſaith that it is a remedie againſt all A manner of inflammations, S. *Anthonies* fire, and hot Agues, if they be either applied alone, or elſe vſed with parched barly meale. It alſo knitteth ruptures in yong children.

Ducks meat mingled with fine wheaten floure, and applied, preuaileth much againſt hot Swellings, as Phlegmons, Eriſipela's, and paines of the joints. B

The ſame helpeth the fundament fallen downe in yong children. C

Chap. 302. *Of Water Crow-foot.*

1 *Ranunculus aquatilis.*
Water Crow-foot.

¶ *The Deſcription.*

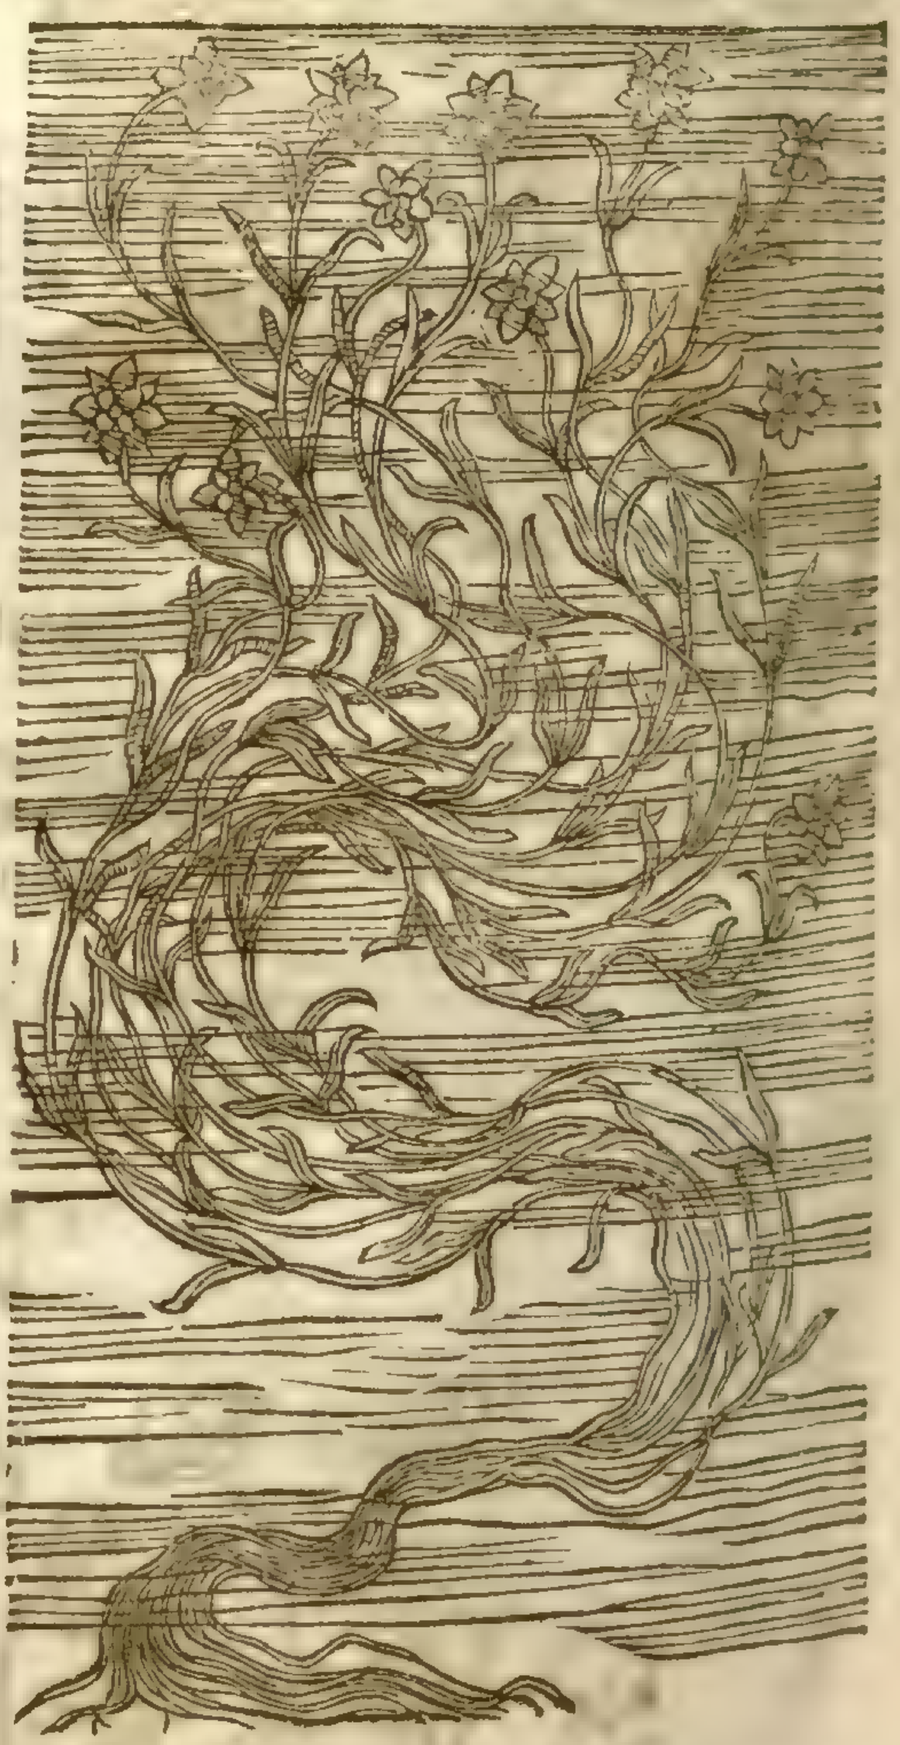
WAter Crow-foot hath ſlender branches trailing far abroad, whereupon grow leaues vnder the water, moſt finely cut and jagged like thoſe of Cammomill: thoſe aboue the water are ſomwhat round, indented about the edges, in forme not vnlike the ſmal tender leaues of the Mallow, but leſſer: among which doe grow the floures, ſmall, and white of colour, made of fine little leaues, with ſome yellowneſſe in the middle like the floures of the Strawberry, and of a ſweet ſmell: after which there come round rough and prickly knaps like thoſe of the field Crow-foot. The roots be very ſmall hairy ſtrings.

‡ There is ſomtimes to be found a varietie of this, with the leaues leſſe, and diuided into three parts after the maner of an Iuy leafe, and the floures alſo are much leſſer, but white of colour, with a yellow bottom. I queſtion whether this be not the *Ranunculus hederaceus Daleſchampij*, *pag.* 1031. of the *Hiſt. Lugd.* ‡

2 There is another plant growing in the water, of ſmal moment, yet not amiſſe to be remembred, called *Hederula aquatica*, or water Iuy; the which is very rare to finde, neuertheleſſe I found it once in a ditch by Bermondſey houſe neere London, and neuer elſewhere: it hath ſmall threddie ſtrings in ſtead of roots and ſtalks, riſing from the bottome of the water to the top, whereunto are faſtned ſmall leaues ſwimming or floting vpon the water, triangled or three cornered like thoſe of barren Iuy, or rather noble Liuerwort, barren of floures and ſeeds.

2 *Hederula aquatica.*
Water Iuy.

‡ 3 *Stellaria aquatica.*
Water Star-wort.



3 There is likewiſe another herb of ſmall reckoning that floteth vpon the water, called *Stellaria aquatica* or water Starwort, which hath many ſmall graſſy ſtems like threds comming from the bottom of the water, vnto the vpper face of the ſame; whereupon grow ſmal double flours of a greeniſh or herby colour. ‡ I take this *Stellaria* to be nothing elſe but a water Chickeweed, growing almoſt in euery ditch, with long narrow leaues at each joint, and halfe a dozen or more lying cloſe together at the top of the water, in faſhion of a ſtar: in which ſhape it may be ſeen in the end of Aprill and beginning of May. I haue not yet obſerued either the floure or ſeed thereof. ‡

¶ *The*

¶ *The Place.*

Water Crowfoot growes by ditches and shallow springs, and in other moist and plashy places.

¶ *The Time.*

It floureth in Aprill and May, and somtimes in Iune.

¶ *The Names.*

Water Crow-foot is called in Latine *Ranunculus aquatilis*, and *Polyanthemum aquatile*: in English, water Crow-foot, and white water Crow-foot. Most Apothecaries and Herbarists doe erroniously name it *Hepatica aquatica*, and *Hepatica alba*; and with greater error they mix it in medicines in stead of *Hepatica alba* or grasse of Parnassus. ‡ I know none that commit this great error here mentioned, neither haue I knowne either the one or the other euer vsed or appointed in medicine with vs in England; though *Dodonæus* (from whom our Author had this and most else) blame his countrymen for this mistake and error.

¶ *The Temperature and Vertues.*

Water Crow-foot is hot, and like to common Crow-foot.

Chap. 303. *Of Dragon.*

1 *Dracontium majus.*
Great Dragons.

† 2 *Dracontium minus.*
Small Dragons.

¶ *The Description.*

1 THe great Dragon riseth vp with a straight stalke a cubit and a halfe high or higher thicke, round, smooth, sprinkled with spots of diuers colours, like those of the adder or snake: the leaues are great and wide, consisting of seuen or more ioyned together in order, euery one of which is long and narrow, much like to the leaues of Dock, smooth and slipperie: out of the top of the stalke groweth a long hose or husk greater than that of the Cuckow pint, of a greenish colour without, and crimson within, with his pestell which is blackish, long, thick, and pointed like a horne; the skinne or filme whereof, when the seed waxeth big, beeing stretched or broken

3 *Dracunculus aquaticus.*
Water Dragons.

broken asunder, there appeareth the fruit, like to a bunch or cluster of grapes; the berries whereof at the first are green, afterwards red and ful of juice; in which is contained seed that is somewhat hard: the root continueth fresh, thicke like to a knob, white, couered with a thinne pilling, oftentimes of the bignesse of a meane apple, full of white little threds appendant thereunto.

2 The lesser Dragon is like Aron or Wake-Robin in leaues, hose or huske, pestle and berries, yet are not the leaues sprinkled with blacke, but with whitish spots, which perish not so soone as those of Wake-Robin, but endure together with the berries euen vntill winter: these berries also be not of a deepe red, but of a colour inclining to saffron. The root is not vnlike to the Cuckow-pintle, hauing the forme of a bulb, full of strings, with diuers rude shapes of new plants, whereby it greatly increaseth.

‡ The figure which our Author here gaue by the title of *Dracuntium minus*, was no other than of Aron which is described in the first place of the next Chapter: neither is the description of any other plant than of that sort thereof which hath leaues spotted either with white or blacke spots, though our Author say only with white. I haue giuen you *Clusius* his figure of *Arum Byzantinum*, in stead of that which our Author gaue. ‡

3 The root of Water Dragon is not round like a bulbe, but very long, creeping, jointed, and of mean bignesse; out of the joints whereof arise the stalks of the leaues, which are round, smooth, and spongie within, certain white and slender strings growing downwards. The fruit springs forth at the top vpon a short stalke, together with one of the leaues, being at the beginning couered with little white threds, which are in stead of the floures: after that it groweth into a bunch or cluster, at the first greene, and when it is ripe red, lesser than that of Cuckow-pint, but not lesse biting: The leaues are broad, greenish, glib, and smooth, in fashion like those of Ivy, yet lesser than those of Cuckow-pint; and that thing whereunto the clustered fruit growes, is also lesser, and in that part which is towards the fruit (that is to say the vpper part) is white.

4 The great Dragon of *Matthiolus* his description is a stranger not onely in England, but elsewhere for any thing that we can learne: my selfe haue diligently enquired of most strangers skilful in plants, that haue resorted vnto me for conference sake, but no man can giue mee any certainetie thereof; and therefore I hold it vnfit to giue you his figure or any description, for that I take it for a feigned picture.

¶ *The Place.*

The greater and lesser Dragons are planted in gardens. The water Dragons grow in watery and marish places, for the most part in fenny and standing waters.

¶ *The Time.*

The berries of these plants are ripe in Autumne.

¶ *The Names.*

The Dragon is called in Greeke Δρακόντιον: in Latine, *Dracunculus*. The greater is named *Serpentaria major*: of some, *Bisaria*, and *Colubrina*: *Cordus* calleth it *Dracunculus Polyphyllos*, and *Luph Cristasmi* in high Dutch, **Schlangenkraut**: in low-Dutch, **Speerwortele**: in French, *Serpentaire*: in Italian, *Dracontea*: in Spanish, *Taragontia*: in English, Dragons, and Dragonwort. *Apuleius* calls Dragon *Dracontea*; and setteth downe many strange names thereof, which whether they agree with the greater or the lesser, or both of them, he doth not expound; as *Pythion*, *Anchomanes*, *Sauchromatin*, *Therion*, *Schœnos*, *Dorcadion*, *Typhonion*, *Theriophonon*, and *Eminion*. *Athenæus* sheweth, That Dragon is called *Aronia*, because it is like to Aron.

¶ *The Temperature.*

Dragon, as *Galen* saith, hath a certaine likenesse with Aron or Wake-Robin, both in leaues and also in root, yet more biting and more bitter than it, and therefore hotter, and of thinner parts: it is also

also something binding, which by reason that it is adjoyned with the two former qualities, that is to say, biting and bitter, it is made in like manner a singular medicine of very great efficacy.

¶ *The Vertues.*

The root of Dragons doth clense and scoure all the entrailes, making thinne, especially thicke A
and tough humours; and it is a singular remedy for vlcers that are hard to be cured, named in Greeke, ἕλκεα.

It scoureth and cleanseth mightily, aswell such things as haue need of scouring, as also white B
and blacke morphew, being tempered with vinegre.

The leaues also by reason that they are of like quality are good for vlcers and greene wounds: C
and the lesse dry they are, the fitter they be to heale; for the dryer ones are of a more sharpe or biting quality than is conuenient for wounds.

The fruit is of greater operation than either the leaues or the root: and therefore it is thought D
to be of force to consume and take away cankers and proud flesh growing in the nosthrils, called in Greeke, *Polypus*: also the juyce doth cleanse away webs and spots in the eies.

Furthermore, *Dioscorides* writeth, that it is reported that they who haue rubbed the leaues or E
root vpon their hands, are not bitten of the viper.

Pliny saith, that serpents will not come neere vnto him that beareth dragons about him, and these F
things are read concerning both the Dragons, in the two chapters of *Dioscorides*.

Galen also hath made mention of Dragon in his booke of the faculties of nourishments; where G
he saith, that the root of Dragon being twice or thrice sod, to the end it may lose all his acrimony or sharpenesse, is somtimes giuen as Aron, or wake-Robin is, when it is needfull to expell the more forceable thicke and clammie humors that are troublesome to the chest and lungs.

And *Dioscorides* writeth, that the root of the lesser Dragon being both sodde and rost with hony, H
or taken of it selfe in meate, causeth the humors which sticke fast in the chest to be easily voided.

The juyce of the Garden Dragons, as saith *Dioscorides*, being dropped into the eies, doth clense I
them, and greatly amend the dimnesse of the sight.

The distilled water hath vertue against the pestilence or any pestilentiall feuer or poyson, being K
drunke bloud warme with the best treacle or mithridate.

The smell of the floures is hurtfull to women newly conceiued with child. L

CHAP. 304. *Of Cuckow pint, or wake-Robin.*

¶ *The Description.*

1 ARum or Cockow pint hath great, large, smooth, shining, sharpe pointed leaues, bespotted here and there with blackish spots, mixed with some blewnesse: among which riseth vp a stalke nine inches long, bespeckled in many places with certaine purple spots. It beareth also a certaine long hose or hood, in proportion like the eare of an hare: in the middle of which hood commeth forth a pestle or clapper of a darke murry or pale purple colour: which being past, there succeedeth in place thereof a bunch or cluster of berries in manner of a bunch of grapes, greene at the first, but after they be ripe of a yellowish red like corall, and full of juyce, wherein lie hid one or two little hard seeds. The root is tuberous, of the bignesse of a large Oliue, white and succulent, with some threddy additaments annexed thereto.

2 There is in Ægypt a kinde of *Arum* which also is to be seene in Africa, and in certaine places, of Lusitania, about riuers and flouds, which differeth from that which groweth in England and other parts of Europe. This plant is large and great, and the leaues thereof are greater than those of the water Lillie: the root is thicke and tuberous, and toward the lower end thicker and broader, and may be eaten. It is reported to be without floure and seed, but the increase that it hath is by the fibres which runne and spread from the roots. ‡ This plant hath also pestels and clusters of berries as the common Aron, but somewhat different, the leaues are not cut into the stalke, but joyned before the setting thereto: the root also is very large. Those that desire to see more of this plant, and the question which some haue mooued, whether this be the *Colocasia*, or *Faba Ægyptia* of the Antients? let them haue recourse to the first chapter of *Fabius Columna*, his *Minus cognitarum stirpium pars altera*, and there they shall finde satisfaction. ‡

1 *Arum vulgare.*
Cockow pint.

‡ 2 *Arum Ægyptiacum.*
Ægyptian Cockow pint.

¶ *The Place.*

Cockow pint groweth in woods neere vnto ditches vnder hedges, euery where in shadowie places.

¶ *The Time.*

The leaues appeare presently after Winter: the pestell sheweth it selfe out of his huske or sheath in Iune, whilest the leaues are in withering: and when they are gone, the bunch or cluster of berries becommeth ripe, which is in Iuly and August.

¶ *The Names.*

There groweth in Ægypt a kinde of Aron or Cuckow pint which is found also in Africa, and likewise in certaine places of Portingale neere vnto riuers and streames, that differeth from those of our countries growing, which the people of Castile call *Manta de naestra senora:* most would haue it to be called *Colocasia*; but *Dioscorides* saith that *Colocasia* is the root of *Faba Ægyptia*, or the Beane of Ægypt. ‡ *Fabius Columna* (in the place formerly alledged) prooues this not to be the true *Colocasia*, and yet *Prosper Alpinus* since in his second booke *de plantis exoticis*, *cap.* 17. and 18. labours to prooue the contrary: let the curious haue recourse to these, for it is to tedious for me in this place to insist vpon it, being so large a point of controuersie, which hath so much troubled all the late Writers. ‡

The common Cuckow pint is called in Latine, *Arum:* in Greeke, ἄρον: in shops *Iarus*, and *Barba Aron:* of others, *Pes vituli:* of the Syrians, *Lupha:* of the men of Cyprus, *Colocasia*, as wee finde among the bastard names. *Pliny* in his 24 booke, 16. chapter, doth witnesse, that there is great difference betweene *Aron* and *Dracontium*, although there hath been some controuersie about the same among the old Writers, affirming them to be all one: in high Dutch it is called, **Paffen pint:** in Italian, *Gigora:* in Spanish, *Yaro:* in low Dutch, **Calfsuoet:** in French, *Pied d'veau:* in English, Cuckow pint, and Cuckow pintle, wake-Robin, Priests pintle, Aron, Calfes foot, and Rampe; and of some Starchwort.

¶ *The Temperature.*

The faculties of Cuckow pint doe differ according to the varietie of countries: for the root hereof, as *Galen* in his booke of the faculties of nourishments doth affirme, is sharper and more biting in some countries than in others, almost as much as Dragons, contrariwise in Cyren a city in Africke, it is generally in all places hot and dry, at the least in the third degree.

¶ The

¶ *The Vertues.*

If any may would haue thicke and tough humours which are gathered in the cheſt and lungs to be cleanſed and voided out by coughing, then that Cuckow-pint is beſt that biteth moſt. A

It is eaten being ſodden in two or three waters, and freſh put to, whereby it may looſe his acrimonie; and being ſo eaten, they cut thicke humours meanely, but Dragons is better for the ſame purpoſe. B

Dioſcorides ſheweth, that the leaues alſo are preſerued to be eaten, and that they muſt be eaten after they be dried and boiled; and writeth alſo, that the root hath a peculiar vertue againſt the gout, being laied on ſtamped with Cowes dung. C

Beares after they haue lien in their dens forty daies without any manner of ſuſtenance, but what they get with licking and ſucking their owne feet, doe as ſoone as they come forth eat the herbe Cuckow-pint, through the windie nature thereof the hungry gut is opened and made fit againe to receiue ſuſtenance: for by abſtaining from food ſo long a time, the gut is ſhrunke or drawne ſo cloſe together, that in a manner it is quite ſhut vp, as *Ariſtole*, *Ælianus*, *Plutarch*, *Pliny*, and others do write. D

The moſt pure and white ſtarch is made of the roots of Cuckow-pint; but moſt hurtfull to the hands of the Laundreſſe that hath the handling of it, for it choppeth, bliſtereth, and maketh the hands rough and rugged, and withall ſmarting. E

Chap. 305. *Of Friers Cowle, or hooded Cuckowpint.*

1 *Ariſarum latifolium.*
Broad leaued Friers Cowle.

2 *Ariſarum anguſtifolium.*
Narrow leafed Friers Cowle.

¶ *The Deſcription.*

1 BRoad leaued Friers hood hath a leafe like Ivie, broad and ſharpe pointed, but far leſſe approching neere to the forme of thoſe of Cuckowpint: the ſtalke thereof is ſmall and ſlender: the huske or hoſe is little; the peſtell ſmall, and of a blacke purpliſh colour; the cluſter when it is ripe is redde; the kernels ſmall; the root white, hauing the forme of Aron or Cuckowpint, but leſſer, whereof doubtleſſe it is a kinde.

The ſecond Friers hood hath many leaues, long and narrow, ſmooth and glittering: The huske or hoſe is narrow and long; the peſtell that commeth forth of it is ſlender, in forme like a great earth worme, of a blackiſh purple colour, as hath alſo the inſide of the hoſe, vpon which, hard to the ground, and ſometimes a little within the ground, groweth a certaine bunch or cluſter of berries, greene at the firſt, and afterwards red: the root is round and white like the others.

¶ *The Place.*

Theſe plants are ſtrangers in England, but common in Italy, and eſpecially in Tuſcane about Rome, and in Dalmatia, as *Aloiſius Anguillara* witneſſeth: notwithſtanding I haue them in my Garden.

¶ *The Time.*

The floures and fruit of theſe come to perfection with thoſe of Cuckowpint and Dragons.

¶ *The Names.*

Friers hood is called *Dioſcorides*, Ἀρισαρον: in Latine, *Ariſarum*: but *Pliny* calleth it Ἄρεως, or *Aris*; for in his twenty fourth booke, *cap.* 16. hee ſaith, That *Aris* which groweth in Ægypt is like Aron or Cuckowpint: it may be called in Engliſh after the Latine name *Ariſarum*; but in my opinion it may be more fitly called Friers hood, or Friers cowle, to which the floures ſeeme to be like; whereupon the Spaniards name it *Frailillos*, as *Daleſcampius* noteth.

¶ *The Temperature.*

Friers-Cowle is like in power and faculty to the Cuckow-pint, yet is it more biting, as *Galen* ſaith.

¶ *The Vertues.*

A There is no great vſe of theſe plants in Phyſicke; but it is reported that they ſtay running or eating ſores or vlcers: and likewiſe that there is made of the roots certaine compoſitions called in Greeke *Collyria*, good againſt fiſtula's: and being put into the ſecret part of any liuing thing, it rotteth the ſame, as *Dioſcorides* writeth.

† That which was formerly figured and deſcribed in the third place, vnder the title of *Ariſarum latifolium Matthioli*, was the ſame with that deſcribed by the name of *Dracontium minus*, in the precedent chapter, and therefore here omitted.

CHAP. 306. *Of Aſarabacca.*

1 *Aſarum.*
Aſarabacca.

2 *Aſarina Matthioli.*
Italian Aſarabacca.

¶ The

¶ *The Description.*

1 THe leaues of Asarabacca are smooth, of a deepe greene colour, rounder, broader, and tenderer than those of Ivie, and not cornered at all, not vnlike to those of Sow-bread: the floures lie close to the roots, hid vnder the leaues, standing vpon slender foot-stalkes, of an ill-fauoured purple colour, like to the floures and huskes of Henbane, but lesse, wherein are contained small seeds, cornered, and somewhat rough: the roots are many, small and slender, growing aslope vnder the vpper crust of the earth, one folded within another, of an vnpleasant taste, but of a most sweet and pleasing smell, hauing withall a kinde of biting quality.

2 This strange kinde of Asarabacca, which *Matthiolus* hath set forth creeping on the ground, in manner of our common Astrabacca, hath leaues somewhat rounder and rougher, sleightly indented about the edges, and set vpon long slender foot-stalkes: the floures grow hard vnto the ground like vnto those of Cammomill, but much lesser, of a mealy or dusty colour, and not without smell. The roots are long and slender, creeping vnder the vpper crust of the earth, of a sharpe taste, and bitter withall. ‡ This *Asarina* of *Matthiolus*, *Clusius* (whose opinion I here follow) hath iudged to be the *Tussilago Alpina* 2. of his description; wherefore I giue you his figure in stead of that of our Author, which had the floures expresst, which this wants. ‡

¶ *The Place.*

It delighteth to grow in shadowie places, and is very common in most Gardens.

¶ *The Time.*

The herbe is alwaies greene; yet doth it in the Spring bring forth new leaues and floures.

¶ *The Names.*

It is called in Greeke Ἄσαρον, *Asarum*: in Latine, *Nardus rustica*: and of diuers, *Perpensa*: *Perpensa* is also *Baccharis* in *Pliny*, *lib.* 21. *cap.* 21. *Macer* saith, That *Asarum* is called *Vulgago*, in these words:

Est Asaron Græcè, Vulgago dicta Latinè.

This herbe, *Asaron* do the Græcians name;
Whereas the Latines *Vulgago* clepe the same.

It is found also amongst the bastard names, that it was called of the great learned Philosophers Ἄρεως ἱμάς: that is, *Martis sanguis*, or the bloud of *Mars*: and of the French men, *Baccar*; and thereupon it seemeth that the word *Asarabacca* came, which the Apothecaries vse, and likewise the common people: but there is another *Baccharis* differing from *Asarum*, yet notwithstanding *Crateuas* doth also call *Baccharis*, *Asarum*.

This confusion of both the names hath been the cause, that most could not sufficiently expound themselues concerning *Asarum* and *Baccharis*; and that many things haue been written amisse in many copies of *Dioscorides*, in the chapter of *Asarum*: for when it is set downe in the Greeke copies a sweet smelling garden herbe, it belongeth not to the description of this *Asarum*, but to that of *Baccharis*: for *Asarum* (as *Pliny* saith) is so called, because it is not put into garlands: and so by that meanes it came to passe, that oftentimes the descriptions of the old Writers were found corrupted and confused: which thing, as it is in this place manifest, so oftentimes it cannot so easily be marked in other places. Furthermore, *Asarum* in called in French *Cabaret*: in high Dutch, Haselwurtz: in low Dutch, Wans oozen: in English, Asarabacca, Fole-foot, and Hazel wort.

¶ *The Temperature.*

The leaues of Asarabacca are hot and dry, with a purging qualitie adjoyned thereunto, yet not without a certaine kinde of astriction or binding. The roots are also hot and dry, yet more than the leaues; they are of thin and subtill parts: they procure vrine, bring downe the desired sicknesse, and are like in faculty, as *Galen* saith, to the roots of *Acorus*, but yet more forceable; and the roots of *Acorus* are also of a thinne essence, heating, attenuating, drying, and prouoking vrine, as he affirmeth: which things are happily performed by taking the roots of Asarabacca, either by themselues are mixed with other things.

¶ *The Vertues.*

The leaues draw forth by vomit, thicke phlegmaticke and cholericke humours, and withall A
moone the belly; and in this they are more forceable and of greater effect than the roots themselues.

They are thought to keepe in hard swelling cankers that they encrease not, or come to exulcera- B
tion, or creeping any farther, if they be outwardly applied vpon the same.

The roots are good against the stoppings of the liuer, gall, and spleene, against wens and hard C
swellings, and agues of long continuance: but being taken in the greater quantitie, they purge flegme and choler not much lesse than the leaues (though *Galen* say no) by vomit especially, and also by siege.

D One dram of the pouder of the roots giuen to drinke in ale or wine, groſſely beaten, prouoketh vomit for the purpoſes aforeſaid; but being beaten into fine pouder, and ſo giuen, it purgeth very little by vomit, but worketh moſt by procuring much vrine; therefore the groſſer the pouder is, ſo much the better.

E But if the roots be infuſed or boiled, then muſt two, three, or foure drams be put to the infuſion; and of the leaues eight or nine be ſufficient: the juyce of which ſtamped with ſome liquid thing, is to be giuen. The roots may be ſteeped in wine, but more effectually in whay or honied water, as *Meſues* teacheth.

F The ſame is good for them that are tormented with the Sciatica or gout in the huckle bones, for thoſe that haue the dropſie, and for ſuch as are vexed with a quartane ague, who are cured and made whole by vomiting.

Chap. 307. *Of Sea Binde-weed.*

1 *Soldanella marina.* Sea Binde-weed.

‡ 2 *Soldanella Alpina major.* Mountaine Binde-weed.

¶ *The Deſcription.*

1 *Soldanella* or Sea Binde-weed, hath many ſmall branches, ſomewhat red, trailing vpon the ground, beſet with ſmall and round leaues, not much vnlike Aſarabacca, or the leaues of Ariſtolochia, but ſmaller; betwixt which leaues and the ſtalkes come forth floures formed like a bell, of a bright red incarnate colour, in euery reſpect anſwering the ſmal Bindeweed, whereof it is a kinde, albeit I haue here placed the ſame, for the reaſons rendred in my Proëme. The ſeed it blacke, and groweth in round huskes: the root is long and ſmall, thruſting it ſelfe far abroad, and into the earth like the other Binde-weeds.

2 *Soldanella* or mountaine Binde-weed hath many round leaues ſpred vpon the ground, not much vnlike the former, but rounder, and more full of veines, greener, of a bitter taſte like ſea Binde-weed: among which commeth forth a ſmall and tender ſtalke a handfull high, bearing at the top little floures like the ſmall Bell-floure, of a sky colour. The root is ſmall and threddy.

‡ 3 There

‡ 3 *Soldanella Alpina minor.*
Small Mountaine Bindweed.

‡ 3 There is of this kinde another hauing all the parts ſmaller, and the leaues redder and rounder: the floures alſo blew, and compoſed of one leafe diuided into fiue parts, and ſucceeded by a longiſh cod, round and ſharp pointed. ‡

¶ *The Place.*

The firſt grows plentifully by the Sea ſhore in moſt places of England, eſpecially neere to Lee in Eſſex, at Merſey in the ſame county, in moſt places of the Iſle of Thanet, and Shepey, and in many places along the Northerne coaſt.

The ſecond groweth vpon the mountaines of Germany, and the Alpes; it groweth vpon the mountaines of Wales, not farre from Cowmers Meare in North-Wales.

¶ *The Time.*

Theſe herbes doe floure in Iune, and are gathered in Auguſt to be kept for medicine.

¶ *The Names.*

The firſt called *Soldanella* is of the Apothecaries and the Antients called *Marina Braſſica*, that is to ſay, Sea Colewoort: but what reaſon hath moued them ſo to do I canot conceiue, vnleſſe it be penury and ſcarſitie of names, and becauſe they know not otherwiſe how to terme it: of this I am ſure, that this plant and *Braſſica* are no more like than things which are moſt vnlike; for *Braſſica Marina* is the Sea Colewort, which doth much reſemble the garden Cabbage or Cole, both in ſhape and in nature, as I haue in his due place expreſſed. A great fault and ouerſight therefore it hath been of the old writers and their ſucceſſors, which haue continued the cuſtome of this error, not taking the paines to diſtinguiſh a Binde-weed from a Cole-wort. But to auoid controuerſies, the truth is, as I haue before ſhewed, that this *Soldanella* is a Binde-weed, and cannot be eſteemed for a *Braſſica*, that is, a Colewort. The later Herbariſts call it *Soldana*, and *Soldanella*: in Dutch, **Zeewind**, that is to ſay, *Convolvulus Marinus*: of *Dioſcorides* κολύμβη θαλασσία, (i) *Braſſica Marina*: in Engliſh, Sea Withwinde, Sea Binde-weed, Sea-Bels, Sea-Coale, of ſome, Sea-Fole-foot, and Scottiſh Scuruie-graſſe.

The ſecond is called *Soldanella Montana*: in Engliſh, Mountaine Bind-weed.

¶ *The Nature.*

Sea Bind-weed is hot and dry in the ſecond degree: the ſecond is bitter and very aſtringent.

¶ *The Vertues.*

Soldanella purgeth downe mightily all kinde of watriſh humours, and openeth the ſtoppings of the liuer, and is giuen with great profit againſt the dropſie: but it muſt be boiled with the broth of ſome fat meat or fleſh, and the broth drunke, or elſe the herbe taken in pouder worketh the like effect. A

Soldanella hurteth the ſtomack, and troubleth the weake and delicate bodies which do receiue it in pouder, wherefore aduice muſt be taken to mix the ſaid pouder with Anniſe ſeeds, Cinnamon, ginger, and ſugar, which ſpices do correct his malignitie. B

Practitioners about Auſpurge and Rauiſpurge (cities of Germany) doe greatly boaſt that they haue done wonders with this herbe *Soldanella Montana*; ſaying, that the leaues taken and emplaiſtred vpon the nauell and ſomewhat lower, draw forth water from their bellies that are hydropicke, that is, troubled with water or the dropſie: this effect it worketh in other parts without heating. C

It doth alſo wonderfully bring fleſh in wounds, and healeth them. D

Dioſcorides witneſſeth, that the whole herbe is an enemy to the ſtomacke, biting and extremely purging (both ſodden, and taken with meat) and bringeth troubleſome gripings thereunto, and doth oftentimes more hurt than good. E

‡ My friend Mr. *Goodyer* hath told me, that in Hampſhire at Chicheſter and thereabout they make vſe of this for Scuruie-graſſe, and that not without great errour, as any that know the qualities may eaſily perceiue. ‡ F

Chap. 308. *Of the Graſſe of Parnaſſus.*

† 1 *Gramen Parnaſſi.*
Graſſe of Parnaſſus.

‡ 2 *Gramen Parnaſſi flore duplici.*
Graſſe of Parnaſſus with double floures.

¶ *The Deſcription.*

1 THe Graſſe of Parnaſſus hath ſmall round leaues, very much differing from any kinde of Graſſe, much reſembling the leaues of Ivie, or Aſarabacca, but ſmaller, and not of ſo darke a colour: among theſe leaues ſpring vp ſmall ſtalkes a foot high, bearing little white floures conſiſting of fiue round pointed leaues; which being falne and paſt, there come vp round knops or heads, wherein is contained a reddiſh ſeed. The root is ſomewhat thicke, with many ſtrings annexed thereto.

2 The ſecond kinde of *Gramen Parnaſſi* doth anſwer the former in each reſpect, ſauing that the leaues are ſomewhat larger, and the floures double, otherwiſe very like.

¶ *The Place.*

The firſt groweth very plentifully in Lanſdall and Crauen, in the North parts of England; at Doncaſter, and in Thornton fields in the ſame country: moreouer, in the Moore neer to Linton, by Cambridge, at Heſſet alſo in Suffolke, at a place named Drinkſtone, in the medow called Butchers mead. ‡ Mr. *Goodyer* found it in the boggy ground below the red well of Wellingborough in Northampton ſhire: and Mr. *William Broad* obſerued it to grow plentifully in the Caſtle fields of Berwicke vpon Tweed. ‡

The ſecond is a ſtranger in England.

¶ *The Time.*

Theſe herbes do floure in the end of Iuly, and their ſeed is ripe in the end of Auguſt.

¶ *The Names.*

Valerius Cordus hath among many that haue written of theſe herbes ſaid ſomething of them to good purpoſe, calling them by the name of *Hepatica alba* (whereof without controuerſie they are kindes) in Engliſh, white Liuerwoort: although there is another plant called *Hepatica alba*, which for

for distinction sake I haue thought good to English, Noble white Liuerwort.
The second may be called Noble white Liuerwort the double floure.

¶ *The Temperature.*

The seed of Parnassus Grasse, or white Liuerwort, is dry, and of subtill parts.

¶ *The Vertues.*

The decoction of the leaues of Parnassus Grasse drunken, doth dry and strengthen the feeble and moist stomacke, stoppeth the belly, and taketh away the desire to vomit. A

The same boiled in wine or water, and drunken, especially the seed thereof, prouoketh vrine, breaketh the stone, and driueth it forth. B

* The figure that was formerly in the first place of this Chapter was of *Parsolium*, described before, *cap.* 60 *pag.* 406. that which was in the second place belonged to the first description.

Chap. 309. *Of white Saxifrage, or Golden Saxifrage.*

¶ *The Description.*

1 THe white Saxifrage hath round leaues spred vpon the ground, and somewhat jagged about the edges, not much vnlike the leaues of ground Ivie, but softer and smaller, and of a more faint yellowish greene: among which riseth vp a round hairie stalke a cubit high, bearing at the top small white floures, almost like Stocke-gillofloures: the root is compact of a number of blacke strings, whereunto are fastened very many small reddish graines or round roots as bigge as pepper cornes, which are vsed in medicine, and are called *Semen Saxifragæ albæ*; that is, the seed of white Saxifrage, or Stone-breake, although (besides these foresaid round knobbes) it hath also small seed contained in little huskes, following his floure as other herbes haue.

1 *Saxifraga alba.*
White Saxifrage.

2 *Saxifraga aurea.*
Golden Saxifrage.

2 Golden

‡ 3 *Saxifraga alba petræa.*
White Rocke Saxifrage.

2 Golden Saxifrage hath round compassed leaues, bluntly indented about the borders like the former, among which rise vp stalkes a handfull high, at the top whereof grow two or three little leaues together: out of the middle of them spring small floures of a golden color; after which come little husks, wherein is contained the red seed, not vnlike the former: the root is tender, creeping in the ground with long threds or haires.

‡ 3 *Pona* hath set forth this plant by the name of *Saxifraga alba petræa*, and therefore I haue placed it here; though I thinke I might more fitly haue ranked him with *Paronychia rutaceo folio* formerly described. It hath a small single root from which arise diuers fat longish leaues, somewhat hairy, and diuided into three parts: amongst those riseth vp a round knotty stalke, roughish, and of a purplish colour, some halfe foot high, diuided into sundry branches which carry white floures, consisting of fiue leaues apiece, with some yellowish threds in their middles: these falling, there remaines a cup containing a very small seed. It floures at the end of Iune in the shadowie places of the Alpes, whereas *Pona* first obserued it. ‡

¶ *The Place.*

The white Saxifrage groweth plentifully in sundry places of England, and especially in a field on the left hand of the high way, as you goe from the place of execution called Saint Thomas Waterings vnto Dedford by London. It groweth also in the great field by Islington called the Mantles: also in the greene places by the sea side at Lee in Essex, among the rushes, and in sundry other places thereabout, and elsewhere. ‡ It also growes in Saint Georges fields behinde Southwarke. ‡

The golden Saxifrage groweth in the moist and marish grounds about Bathe and Wels, also in the Moores by Boston and Wisbich in Lincolneshire: ‡ and M^r. *George Bowles* hath found it growing in diuers woods at Chisselhurst in Kent: M^r. *Goodyer* also hath obserued it abundantly on the shadowie moist rockes by Mapledurham in Hampshire: and I haue found it in the like places in Yorkshire. ‡

¶ *The Time.*

The white Saxifrage floureth in May and Iune: the herbe with his floure are no more seene vntill the next yeare.

The golden Saxifrage floureth in March and Aprill.

¶ *The Names.*

The first is called in Latine *Saxifraga alba:* in English, white Saxifrage, or white Stone-breake.
The second is called Golden Saxifrage, or Golden Stone-breake.

¶ *The Nature.*

The first of these, especially the root and seed thereof, is of a warme or hot complexion.
Golden Saxifrage is of a cold nature, as the taste doth manifestly declare.

¶ *The Vertues.*

A The root of white Saxifrage boiled in wine and drunken, prouoketh vrine, clenseth the kidnies and bladder, breaketh the stone and driueth it forth, and is singular good against the strangury, and all other griefes and imperfections in the reines.

B The vertues of golden Saxifrage are yet vnto vs vnknowne, notwithstanding I am of this minde, that it is a singular wound herbe, equall with Sanicle.

Chap. 310. *Of Sow-bread.*

¶ *The Description.*

1 THe first being the common kinde of Sow-bread, called in shops *Panis porcinus*, and *Arthanita*, hath many greene and round leaues like vnto Asarabacca, saiuing that the vpper part of the leaues are mixed here and there confusedly with white spots, and vnder the leaues next the ground of a purple colour: among which rise vp little stemmes like vnto the stalkes of violets, bearing at the top small purple floures, which turne themselues backward (being full blowne) like a Turks cap, or Tulepan, of a small sent or sauour, or none at all: which being past, there succeed little round knops or heads which containe slender browne seeds: these knops are

1 *Cyclamen orbiculato folio.* Round Sow-bread.

2 *Cyclamen folio Hederæ.* Ivie Sow-bread.

‡ 3 *Cyclamen Vernum.* Spring Sow-bread.

wrapped

wrapped after a few daies in the ſmall ſtalkes, as thred about a bottome, where it remaineth ſo defended from the iniurie of Winter cloſe vpon the ground, couered alſo with the greene leaues aforeſaid, by which meanes it is kept from the froſt, euen from the time of his ſeeding, which is in September, vntill Iune: at which time the leaues doe fade away, the ſtalkes & ſeed remaining bare and naked, whereby it inioyeth the Sun (whereof it was long depriued) the ſooner to bring them vnto maturitie: the root is round like a Turnep, blacke without and white within, with many ſmall ſtrings annexed thereto.

2 The ſecond kinde of Sowbread hath broad leaues ſpred vpon the ground, ſharp pointed ſomwhat indented about the edges, of a darke greene colour, with ſome little lines or ſtrakes of white on the vpper ſide, and of a darke reddiſh colour on that ſide next the ground: among which riſe vp ſlender foot-ſtalkes of two or three inches long: at the tops whereof ſtand ſuch floures as the precedent, but of a ſweeter ſmel, and more pleaſant colour. The ſeed is alſo wrapped vp in the ſtalke, for his further defence againſt the iniurie of winter. The root is ſomewhat greater, and of more vertue, as ſhall be declared.

‡ 4 *Cyclamen Vernum album.*
White floured Sowbread.

‡ 5 *An Cyclaminos altera, hederaceis folijs planta?*

3 There is a third kinde of Sow-bread that hath round leaues without peaked corners, as the laſt before mentioned, yet ſomewhat ſnipt about the edges, and ſpeckled with white about the brims of the leaues, and of a blackiſh colour in the middle; the floures are like to the reſt, but of a deeper purple: the root alſo like, but ſmaller, and this commonly floures in the Spring.

‡ 4 This in leaues and roots is much like the laſt deſcribed; but the flours are ſmaller, ſnow white, and ſweet ſmelling. There are diuers other varieties of theſe plants, which I thinke it not neceſſary for me to inſiſt vpon: wherefore I referre the curious to the Garden of floures ſet forth by Mr *Iohn Parkinſon*, where they ſhall finde ſatisfaction. ‡

5 There is a plant which I haue ſet forth in this place that may very well be called into queſtion, and his place alſo, conſidering that there hath been great contention about the ſame, and not fully determined on either part, which hath moued me to place him with thoſe plants that moſt do reſemble one another, both in ſhape and name: this plant hath greene cornered leaues like to Ivie,

long and small gaping floures like the small Snapdragon: more hath not been said of this plant, either of stalke or root, but is left vnto the consideration of the learned.

‡ The plant which our Author would here acquaint you with, is that which *Lobel* figures with this title which I here giue, and saith it was gathered among other plants on the hils of Italy, but in what part or place, or how growing he knew not; and he only questions whether it may not be the *Cyclaminos altera* of *Dioscorides*, *lib. 2. cap. 195.* ‡

¶ *The Place.*

Sow-bread groweth plentifully about Artoies and Vermandois in France, and in the Forest of Arden, and in Brabant: but the second groweth plentifully in many places of Italie.

It is reported vnto mee by men of good credit, that *Cyclamen* or Sow-bread groweth vpon the mountaines of Wales; on the hils of Lincolnshire, and in Somersetshire by the house of a gentleman called M^r. *Hales*; vpon a Fox-borough also not far from M^r. *Bamfields*, neer to a town called Hardington. The first two kindes grow in my garden, where they prosper well. ‡ I cannot learne that this growes wilde in England. ‡

¶ *The Time.*

Sow-bread floureth in September when the plant is without leafe, which doth afterwards spring vp, continuing green all the Winter, couering and keeping warme the seed vntil Midsommer next, at what time the seed is ripe as aforesaid. The third floureth in the spring, for which cause it was called *Cyclamen vernum*: and so doth also the fourth.

¶ *The Names.*

Sow-bread is called in Greek, κυκλάμινος: in Latine, *Tuber terræ*, and *Terræ rapum*: of *Marcellus*, *Orbicularis*: of *Apuleius*, *Palalia*, *Rapum porcinum*, & *Terræ malum*: in shops, *Cyclamen*, *Panis Porcinus*, and *Arthanita*: in Italian, *Pan Porcino*: in Spanish, *Mazan de Puerco*: in High Dutch, **Schweinbzot**: in Low Dutch, **Uetckins bzoot**: in French, *Pain de Porceau*: in English, Sow-bread. *Pliny* calleth the colour of this floure in Latine, *Colossinus color*: in English, Murrey colour.

¶ *The Nature.*

Sow-bread is hot and drie in the third degree.

¶ *The Vertues.*

The root of Sow-bread dried into pouder and taken inwardly in the quantitie of a dram and a halfe, with mead or honied water, purgeth downeward tough and grosse flegme, and other sharpe humors. A

The same taken in wine as aforesaid, is very profitable against all poison, and the bitings of venomous beasts, and to be outwardly applied to the hurt place. B

The pouder taken as aforesaid, cureth the jaundise and the stoppings of the liuer, taketh away the yellow colour of the bodie, if the patient after the taking hereof be caused to sweat. C

The leaues stamped with honie, and the juice put into the eies, cleareth the sight taketh away all spots and webs, pearle or haw, and all impediments of the sight, and is put into that excellent ointment called *Vnguentum Arthanitæ*. D

The root hanged about women in their extreme trauell with childe, causeth them to be deliuered incontinent, and taketh away much of their paine. E

The leaues put into the place hath the like effect, as my wife hath prooued sundry times vpon diuers women, by my aduise and commandement, with good successe. F

The juice of Sow-bread doth open the Hemorrhoids, and causeth them to flow being applied with wooll or flocks. G

It is mixed with medicines that consume or waste away knots, the Kings euill, and other hard swellings: moreouer it clenseth the head by the nosthrils, it purgeth the belly being anointed therwith, and killeth the childe. It is a strong medicine to destroy the birth, being put vp as a pessary. H

It scoureth the skin, and taketh away the Sun-burning, and all blemishes of the face, pilling off the haire, and marks also that remaine after the small pocks & mesels: and giuen in wine to drink, it maketh a man drunke. I

The decoction thereof serueth as a good and effectuall bath for members out of joint, the gout, and kibed heeles. K

The root being made hollow and filled with oile, closed with a little wax, and rosted in the hot embers, maketh an excellent ointment for the griefes last rehearsed. L

Being beaten and made vp into trochisches, or little flat cakes, it is reported to be a good amorous medicine to make one in loue, if it be inwardly taken. M

¶ *The Daunger.*

It is not good for women with childe to touch or take this herbe, or to come neere vnto it, or to ride ouer the same where it groweth; for the naturall attractiue vertue therein contained is such, that without controuersie they that attempt it in manner abouesaid, shall be deliuered before their

time: which danger and inconuenience to auoid, I haue (about the place where it groweth in my garden) faſtned ſticks in the ground, and ſome other ſtickes I haue faſtned alſo croſſe-waies ouer them, leaſt any woman ſhould by lamentable experiment finde my words to be true, by their ſtepping ouer the ſame.

‡ I iudge our Author ſomthing to womaniſh in this, that is, led more by vaine opinion than by any reaſon or experience, to confirme this his aſſertion, which frequent experience ſhews to be vaine and friuolous, eſpecially for the touching, ſtriding ouer, or comming neere to this herbe. ‡

Chap. 311. *Of Birthwoorts.*

¶ *The Kindes.*

Birthwort, as *Dioſcorides* writeth, is of three ſorts, long, round, and winding: *Pliny* hath added a fourth kinde called *Piſtolochia*, or little Birthwoort. The later writers haue joined vnto them a fifth named Saracens Birthwoort.

1 *Ariſtolochia longa.*
Long Birthwoort.

2 *Ariſtolochia rotunda.*
Round Birthwoort.

¶ *The Deſcription.*

1 Long Birthwoort hath many ſmall long ſlender ſtalkes creeping vpon the ground, tangling one with another very intricately, beſet with round leaues not much vnlike Sowbread or Ivie, but larger, of a light or ouerworne green colour, and of a grieuous or lothſome ſmell and ſauour: among which come forth long hollow floures, not much vnlike the floures of Aron, but without any peſtell or clapper in the ſame; of a darke purple colour: after which follow ſmall fruit like vnto little peares, containing triangled ſeeds of a blackiſh colour. The root is long, thicke, of the colour of box, of a ſtrong ſauour and bitter taſte.

2 The round Birthwoort in ſtalkes aud leaues is like the firſt, but his leaues are rounder: the floures differ onely in this, that they be ſomwhat longer and narrower, and of a faint yellowiſh colour, but the ſmall flap or point of the floure that turneth backe againe, is of a darke or blacke purple

ple colour. The fruit is formed like a peare, ſharp toward the top, more ribbed and fuller than the former: the root is round like vnto Sow-bread, in taſte and ſauor like the former.

3 *Ariſtolochia clematitis.* Climing Birthwort.

‡ 4 *Ariſtolochia Saracenica.*
Saracens Birthwort.

‡ 5 *Piſtolochia.*
Small Birthwort.

3 Climing Birthwort taketh hold of any thing that is next vnto it, with his long and claſping ſtalks, which be oftentimes branched, and windeth it ſelfe like Bindeweed: the ſtalks of the leaues are longer, whoſe leaues be ſmooth, broad, ſharp pointed, as be thoſe of the others; the flours likewiſe hollow, long, yellow, or of a blackiſh purple color: the fruit differs not from that of the other, but the roots be ſlender and very long, ſometimes creeping on the top of the earth, and ſometimes growing deeper, being of like colour with the former ones.

4 There is a fourth kinde of Birthwort reſembling the reſt in leaues and branched ſtalkes, yet higher

higher, and longer than either the long or the round: the leaues thereof be greater than thoſe of *Asarabacca*, the floures hollow, long, and in one ſide hanging ouer, of a yellowiſh colour: the fruit is long and round like a peare, in which the ſeeds lie ſeuered, of forme three ſquare, of an ilfauoured blackiſh colour: the root is ſomwhat long, oftentimes of a mean thickneſſe, yellow like Box, not inferior in bitterneſſe either to the long or round Birthwort: and ſometimes theſe are found to bee ſmall and ſlender, and that is when they were but lately digged vp and gathered: for by the little parcels of the roots which are left, the yong plants bring forth at the beginning tender and branched roots.

5 Small Birthwort is like to the long and round Birthwort both in ſtalkes and leaues, yet is it leſſer and tenderer: the leaues thereof are broad, and like thoſe of Iuy; the floure is long, hollow in the vpper part, and on the outſide blackiſh; the fruit ſomething round like the fruit of round Birthwort: in ſtead of roots there grow forth a multitude of ſlender ſtrings.

‡ 6 *Piſtolochia Cretica, ſiue Virginiana.* Virginian Snake-root.

‡ 6 *Cluſius* figures and deſcribes another ſmal *Piſtolochia*, by the name of *Piſtolochia Cretica*, to which I thought good to adde the Epithit *Virginiana* alſo, for that the much admired Snakeweed of Virginia ſeems no otherwiſe to differ from it than an inhabitant of Candy from one of the Virginians, which none I think wil ſay to differ in *ſpecie*. I wil, firſt giue *Cluſius* his deſcription, and then expreſſe the little varietie that I haue obſerued in the plants that were brought from Virginia, and grew here with vs: It ſends forth many ſlender ſtalks a foot long, more or leſſe, and theſe are cornered or indented, creſted, branched, tough, and bending towards the ground, or ſpred thereon, and of a darke green colour; vpon which without order grow leaues neruous, and like thoſe of the laſt deſcribed, but much ſharper pointed, and after a ſort reſembling the ſhape of thoſe of *Smilax aſpera*; but leſſe; and of a darke and laſting greene colour, faſtned to longiſh ſtalks; out of whoſe boſomes grow long and crooked floures in ſhape like thoſe of the long Birthwort, but of a darker red on the outſide, but ſomewhat yellowiſh within; and theſe are alſo faſtned to pretty long ſtalkes, and are ſucceeded by fruit not vnlike, yet leſſe than that of the long Birthwort. This hath aboundance of roots like as the former, but much ſmaller, and more fibrous, and of a ſtronger ſmel: it flours in Iuly and Auguſt. Thus *Cluſius* deſcribes his: To which that Snake-weed that was brought from *Virginia*, and grew with Mr *Iohn Tradeſcant* at South Lambeth, *An.* 1632, was agreeable in all points, but here and there one of the lower leaues were ſomewhat broader, and rounder pointed than the reſt: the floure was long, red, crooked, and a little hairy, and it did not open the top or ſhew the inner ſide, which I iudge was by reaſon of the coldneſſe and vnſeaſonableneſſe of the later part of the ſomer when it floured: the ſtalks in the figure ſhould haue bin expreſt more crooking or indenting, for they commonly grow ſo. How hard it is to iudge of plants by one particle or faculty may very well appeare by this herb I now treat of: for ſome by the ſimilitude the root had with *Aſarum*, and a vomiting quality which they attributed to it (which certainly is no other than accidental) would forthwith pronounce and maintaine it an *Aſarum*: ſome alſo refer it to other things, as to Primroſes, *Vincitoxicum*, &c. Others more warily name it *Serpentaria Virginiana*, & *Radix Virginiana*, names as it were offering themſelues, and eaſily fitted and impoſed vpon ſundry things, but yet too general, and therfore not fit any more to be vſed, ſeeing the true and ſpecifique denomination is found. ‡

¶ *The Place.*

Pliny ſheweth, That the Birthworts grow in fat and Champian places: The fields of Spaine are full

full of these three long and round Birthworts: they are also found in Italy and Narbone or Languedoc a country of France. *Petrus Bellonius* writeth, That he found branched Birthwortvpon Ida a mountaine in Candy. *Clusius* saith he found this about Hispalis,& in many other places of Granado in Spain among bushes and brambles. They grow all in my garden.

¶ *The Time.*

They floure in May, Iune,and Iuly.

¶ *The Names.*

Birthwort is called in Greeke Ἀριστολόχια: in Latine likewise *Aristolochia*, because it is ἄριστα τοῖς λόχιοις that is to say,good for women newly brought to bed or deliuered with childe: in English, Birthwort, Hartwort, and of some *Aristolochia*.

The first is called *Aristolochia longa*,or long Birthwort, of the forme of his root, and also *Aristolochia mas* or male Birthwort: the second is thought to be *Fœmina*,or female Birthwort, and is called *Rotunda Aristolochia*,or round Birthwort; of diuers also,*Terræ Malum*, the Apple of the earth: yet *Cyclaminus* is also called *Terræ Malum*,or Earth Apple.

¶ *The Temperature.*

All these Birthworts are of temperature hot and dry, euen in the third degree, hauing power to cleanse.

¶ *The Vertues.*

Dioscorides writeth, That a dram weight of long Birthwort drunke with wine and so applied, is A good against serpents and deadly things: and that being drunke with Myrrhe and pepper,it expels whatsoeuer is left in the matrice after the childe is deliuered,the flowrs also and dead childe; and that being put in a pessarie it performeth the same.

Round Birthwort serues for all these things,and for the rest of the other poisons:it preuails also B against the stuffing of the lungs,the hicket, the shakings or shiuerings of agues, hardnesse of the milt or spleen,burstings,cramps,convulsions,and pain of the sides,if it be drunk with water.

It plucketh out thornes,splinters,or shiuers, and being mixed in plaisters or pultesses, it drawes C forth scales or bones,remoueth rottennesse or corruption, mundifieth and scoureth foul and filthy vlcers,and filleth them vp with new flesh,if it be mixed with Ireos and hony.

Galen saith,That branched Birthwort is of a more sweet and pleasant smell,and therefore is vsed D in ointments; but it is weaker in operation than the former.

Birth-wort, as *Pliny* writeth, being drunke in water, is a most excellent remedie for cramps,con- E vulsions,bruises,and for such as haue fallen from high places.

It is good against short windednesse and the Falling sickenesse. F

The round *Aristolochia* doth beautifie,clense,and fasten the teeth,if they be often fretted or rub- G bed with the pouder thereof.

‡ The root of the Virginian *Pistolochia*, which is of a strong and aromatick sent,is a singular and H much vsed antidote against the bite of the Rattle-snake, or rather Adder or Viper, whose bite is very deadly;and therefore by the prouidence of the Creator hee hath vpon his taile a skinny dry substance parted into cels,which contain some loose hard dry bodies that rattle in them(as if one should put little stones or pease into a stiffe and very dry bladder)that so he may by this noise giue warning of his approch,the better to be auoided:but if any be bitten, they know nor stand in need of no better antidote than this root,which they chew and apply to the wound,& also swallow some of it downe,by which means they quickly ouercome the malignitie of this poisonous bite,which otherwise in a very short time would proue deadly. Many also commend the vse of this against the plague,small pox,measels,and such like maligne and contagious diseases. ‡

CHAP. 312. *Of Violets.*

¶ *The Kindes.*

THere might be described many kindes of floures vnder this name of Violets, if their differences should be more curiously looked into than is necessarie: for we might joine hereunto the stock Gillofloures, Wall-floures,Dames Gillofloures,Marian violets,& likewise some of the bulbed floures,because some of them by *Theophrastus* are termed Violets. But this was not our charge, holding it sufficient to distinguish and diuide them as neere as may be in kindred and neighbourhood; addressing my selfe vnto the Violets called the blacke or purple violets, or March Violets of the garden,which haue a great prerogatiue aboue others,not only because the mind conceiueth a certain pleasure and recreation by smelling and handling those most odoriferous floures,but also for that very many by these violets receiue ornament and comely grace; for there be made of them garlands for the head,nosegaies and poesies,which are delightfull to looke on and pleasant to smel to, speaking nothing of their appropriat vertues; yea gardens themselues receiue by these the greatest

teſt ornament of all, chiefeſt beauty, and moſt excellent grace, and the recreation of the minde which is taken hereby cannot be but very good and honeſt; for they admoniſh and ſtirre vp a man to that which is comely and honeſt; for floures through their beauty, variety of colour, and exquiſit forme, do bring to a liberall and gentle manly minde, the remembrance of honeſtie, comlineſſe, and all kindes of vertues: for it would be an vnſeemly and filthy thing (as a certain wiſe man ſaith) for him that doth looke vpon and handle faire and beautiful things, to haue his mind not faire, but filthy and deformed.

¶ *The Deſcription.*

1 THe blacke or purple Violet doth forthwith bring from the root many leaues, broad, ſleightly indented in the edges, rounder than the leaues of Iuy; among the midſt whereof ſpring vp fine ſlender ſtems, and vpon euery one a beautifull flour ſweetly ſmelling, of a blew darkiſh purple, conſiſting of fiue little leaues, the loweſt whereof is the greateſt: after them do appeare little hanging cups or knaps, which when they be ripe do open and diuide themſelues into three parts. The ſeed is ſmal, long, and ſomwhat round withall: the root conſiſteth of many threddy ſtrings.

1 *Viola nigra ſiue purpurea.*
The purple garden Violet.

2 *Viola flore albo.*
The white garden Violet.

2 The white garden Violet hath many milke white floures, in forme and figure like the precedent; the colour of whoſe floures eſpecially ſetteth forth the difference.

3 The double garden Violet hath leaues, creeping branches, and roots like the garden ſingle Violet; differing in that, that this Violet bringeth forth moſt beautifull ſweet double floures, and the other ſingle.

4 The white double Violet likewiſe agrees with the other of his kinde, differing onely in the colour; for as the laſt deſcribed bringeth double blew or purple flours, contrariwiſe this plant beareth double white floures, which maketh the difference.

5 The yellow Violet is by nature one of the wilde Violets, for it groweth ſeldom any where but vpon moſt high and craggy mountaines, from whence it hath been diuers times brought into the garden, but it can hardly be brought to culture or grow in the garden without great induſtrie. And by the relation of a gentleman often remembred, called Maſter *Thomas Hesketh*, who found it growing

3 *Viola martia purpurea multiplex.*
The double garden purple Violet.

† 6 *Viola canina sylueſtris.*
Dogs Violets, or wilde Violets.

5 *Viola martia lutea.*
Yellow Violets.

growing vpon the hils in Lancaſhire, neere vnto a village called Latham; and though he brought them into his garden, they withered and pined. The whole plant is deſcribed to be like vnto the field Violet, and differeth from it, in that this plant brings forth yellow floures, yet like in forme and figure, but without ſmell.

6 The wilde field Violet with round leaues riſeth forth of the ground from a fibrous root, with long ſlender branches, whereupon do grow round ſmooth leaues. The floures grow at the top of the ſtalkes, of a light blew colour: ‡ and this growes commonly in woods and ſuch like places, and floures in Iuly and Auguſt. There is another varietie of this wilde Violet, hauing the leaues longer, narrower, and ſharper pointed: and this was formerly figured & deſcribed in this place by our Author. ‡

7 There is found in Germany about Noremberg and Strasburg, a kind of Violet altogether a ſtranger in theſe parts. It hath (ſaith my Author) a thick tough root of a wooddy ſubſtance, from which riſeth vp a ſtalk diuiding it ſelf into diuers branches of a woody ſubſtance: whereon grow long jagged leaues like thoſe of the paſsy: the flours grow at the top, compact of fiue leaues apiece, of a watchet colour.

¶ The

¶ *The Place.*

The Violet groweth in gardens almoſt euery where: the others which are ſtrangers haue beene touched in their deſcriptions.

¶ *The Time.*

The floures for the moſt part appeare in March, at the fartheſt in Aprill.

¶ *The Names.*

The Violet is called in Greeke, Ἴον: of *Theophraſtus*, both Ἴον μέλαν, and μέλαινον: in Latine, *Nigra viola* or blacke Violet, of the blackiſh purple colour of the floures. The Apothecaries keepe the Latine name *Viola*, but they call it *Herba Violaria*, and *Mater Violarum*: in high-Dutch, **Blau Uſel**: in low Dutch **Violeten**: in French, *Violette de Mars*: in Italian, *Viola mammola*: in Spaniſh, *Violeta*: in Engliſh, Violet. *Nicander* in his Geoponicks beleeueth (as *Hermolaus* ſheweth) that the Grecians did call it Ἴον, becauſe certain Nymphs of Iönia gaue that floure firſt to *Iupiter*. Others ſay it was called Ἴον, becauſe when *Iupiter* had turned the yong damoſell *Iö*, whom he tenderly loued, into a Cow, the earth brought forth this floure for her food; which being made for her ſake, receiued the name from her: and thereupon it is thought that the Latines alſo called it *Viola*, as though they ſhould ſay *Vitula*, by blotting out the letter *t*. *Seruius* reporteth, That for the ſame cauſe the Latines alſo name it *Vaccinium*, alledging the place of *Virgil* in his Bucolicks;

Alba liguſtra cadunt, vaccinia nigra leguntur.

Notwithſtanding *Virgil* in his tenth Eclog ſheweth, that *Vaccinium* and *Viola* do differ:

Et nigræ violæ ſunt, & vaccinia nigra.

† *Vitruvius* alſo, *lib.* 7. of Architecture or Building, doth diſtinguiſh *Viola* from *Vaccinium*: for he ſheweth, that the colour called *Sile Atticum* or the Azure of Athens, is made *ex Viola*; and the gallant purple, *ex Vaccinio*. The Dyers, ſaith he, when they would counterfeit *Sile* or Azure of Athens, put the dried violets into a fat, kettle, or caldron, and boile them with water: afterwards when it is tempered, they poure it into a linnen ſtrainer, and wringing it with their hands, receiue into a mortar the liquor coloured with the Violets; and ſteeping earth of *Erethria* in it, and grinding it, they make the Azure colour of Athens. After the ſame maner they temper *Vaccinium*, and putting milk vnto it do make a gallant purple colour. But what *Vaccinia* are we will elſewhere declare.

¶ *The Temperature.*

The floures and leaues of Violets are cold and moiſt.

¶ *The Vertues.*

A The floures are good for all inflammations, eſpecially of the ſides and lungs; they take away the hoarſeneſſe of the cheſt, the ruggedneſſe of the winde-pipe and jawes, allay the extreme heate of the liuer, kidnies, and bladder, mitigate the fiery heate of burning agues, temper the ſharpneſſe of choler, and take away thirſt.

B There is an oile made of Violets which is likewiſe cold and moiſt. The ſame being anointed vpon the teſticles doth gently prouoke ſleep which is hindred by an hot and dry diſtemper: mixed or labored together in a woodden diſh with the yelke of an egge, it aſſwageth the pain of the fundament and hemorrhoids: it is likewiſe good to be put into cooling cliſters, and into pulteſſes that coole and eaſe paine.

C But let the oile in which the Violets be ſteeped be either of vnripe Oliues, called *Omphacinum*, or of ſweet almonds, as *Meſues* ſaith; and the Violets themſelues muſt be freſh and moiſt, for being dry and hauing loſt their moiſture they do not coole, but ſeem to haue gotten a kinde of heate.

D The later phyſitions thinke it good to mix dry Violets with medicines that are to comfort and ſtrengthen the heart.

E The leaues of Violets inwardly taken do coole, moiſten, and make the belly ſoluble. Being outwardly applied, they mitigate all kinde of hot inflammations, both taken by themſelues, and alſo applied with Barley floure dried at the fire, after it hath lien ſoking in the water. They are likewiſe laid vpon a hot ſtomacke, and on burning eies, as *Galen* witneſſeth. *Dioſcorides* writeth, that they be alſo applied to the fundament that is fallen out.

F They may help the fundament that is fallen out, not as a binder keeping backe the fundament; but as a ſuppler and a mollifier. Beſides, *Pliny* ſaith that Violets are as well vſed in garlands, as for ſmell, and are good againſt ſurfeting, heauineſſe of the head; and being dried in water & drunk, they remoue the Squinancie or inward ſwellings of the throat. They cure the falling ſickeneſſe, eſpecially in yong children, and the ſeed is good againſt the ſtinging of ſcorpions.

G There is a ſyrrup made of Violets and ſugar, whereof three or foure ounces taken at one time, ſoften the belly and purge choler. The manner to make it is as followes:

H Firſt make of clarified ſugar by boiling, a ſimple ſyrrup of good conſiſtence or meane thickeneſſe, whereunto put the floures cleane picked from all manner of filth, as alſo the white ends nipped

nipped away,a quantitie according to the quantity of the ſyrrup, to your owne diſcretion, wherein let them infuſe or ſteep foure and twenty houres,and ſet vpon a few warme embers ; then ſtrain it, and put more violets into the ſame ſyrrup : thus do three or foure times,the oftner the better;then ſet them vpon a gentle fire to ſimper,but not to boile in any wiſe : ſo haue you it ſimply made of a moſt perfect purple colour,and of the ſmell of the floures themſelues. Some do adde therto a little of the juice of the floures in the boiling,which maketh it of better force and vertue. Likewiſe ſome do put a little quantitie of the juice of Lymmons in the boiling,which doth greatly increaſe the beauty thereof,but nothing at all the vertue.

There is likewiſe made of Violets and ſugar certaine plates called Sugar violet, Violet tables, I
or Plate,which is moſt pleaſant and wholeſome, eſpecially it comforteth the heart and the other inward parts.

The decoction of Violets is good againſt hot feuers,and the inflammation of the liuer, and all K
other inward parts : the like propertie hath the juyce, ſyrrup or conſerue of the ſame.

Syrrup of Violetts is good againſt the inflammation of the lungs and breſt, againſt the pluriſie L
and cough,againſt feuers and agues in yong children,eſpecially if you put vnto an ounce of ſyrrup eight or nine drops of oyle of Vitrioll, and mix it together, and giue it to the childe a ſpoonefull at once.

The ſame giuen in manner aforeſaid is of great efficacie in burning feuers and peſtilent diſea- M
ſes,greatly cooling the inward parts : and it may ſeeme ſtrange to ſome that ſo ſharpe a corroſiue as oile of Vitrioll ſhould be giuen into the bodie ; yet being delayed and giuen as aforeſaid, ſucking children may take it without any perill.

The ſame taken as aforeſaid cures all inflammations of the throat, mouth,uvula,ſquinancy,and N
the falling euill in children.

Sugar-Violet hath power to ceaſe inflammations,roughneſſe of the throat,comforts the heart, O
aſſwageth paines of the head,and cauſeth ſleep.

The leaues of Violets are vſed in cooling plaiſters, oiles, and comfortable cataplaſmes or pul- P
teſſes ; and are of greater efficacie among other herbs,as Mercurie, Mallowes, and ſuch like,in cliſters for the purpoſes aforeſaid.

Chap. 313. *Of Hearts-eaſe, or Panſies.*

¶ *The Deſcription.*

1 THe Hearts-eaſe or Panſie hath many round leaues at the firſt comming vp ; afterward they grow ſomewhat longer, ſleightly cut about the edges, trailing or creeping vpon the ground : the ſtalks are weake and tender, whereupon grow floures in form & figure like the Violet,and for the moſt part of the ſame bigneſſe,of three ſundry colours,whereof it tooke the ſyrname *Tricolor*, that is to ſay, purple,yellow,and white or blew ; by reaſon of the beauty and brauerie of which colours they are very pleaſing to the eye,for ſmel they haue little or none at all. The ſeed is contained in little knaps of the bigneſſe of a Tare, which come forth after the floures be fallen,and do open of themſelues when the ſeed is ripe. The root is nothing elſe but as it were a bundle of threddy ſtrings.

2 The vpright Panſie bringeth forth long leaues deeply cut in the edges,ſharpe pointed,of a bleake or pale green colour,ſet vpon ſlender vpright ſtalkes,cornered, jointed, or kneed a foot high or higher ; whereupon grow very faire floures of three colours, *viz.* of purple,blew,and yellow, in ſhape like the common Hearts-eaſe, but greater and fairer ; which colours are ſo excellently and orderly placed,that they bring great delight to the beholders, though they haue little or no ſmell at all: for oftentimes it hapneth that the vppermoſt floures are differing from thoſe that grow vpon the middle of the plant,and thoſe vary from the lowermoſt, as Nature liſt to dally with things of ſuch beauty. The ſeed is like that of the precedent.

3 The wilde Panſie differeth from that of the garden,in leaues,roots,and tender branches:the floures of this wilde one are of a bleak and pale colour,far inferior in beauty to that of the garden, wherein conſiſteth the difference.

4 Stony Hearts-eaſe is a baſe and low plant : the leaues are rounder, not ſo much cut about the edges as the others : the branches are weak and feeble, trailing vpon the ground : the flours are likewiſe of three colours,that is to ſay,white,blew,and yellow,void of ſmell:the root periſheth hauing perfected his ſeed.

5 There is found in ſundry places of England a wilde kinde hereof,hauing floures of a *feint* yellow colour,without mixture of any other colour, yet hauing a deeper yellow ſpot *in the loweſt* leafe,

1 *Viola tricolor.*
Hearts eaſe.

2 *Viola aſſurgens tricolor.*
Vpright Hearts eaſe.

3 *Viola tricolor ſylveſtris.*
Wilde Paunſies.

4 *Viola tricolor petræa.*
Stony Hearts eaſe.

kaſe with foure or fiue blackiſh purple lines, wherein it differeth from the other wilde kinde: and this hath been taken of ſome young Herbariſts to be the yellow Violet.

¶ *The Place.*

The Hearts-eaſe groweth in fields in many places, and in gardens alſo, and that oftentimes of it ſelfe: it is more gallant and beautifull than any of the wilde ones.

Matthiolus reporteth, that the vpright Paunſie is found on mount Baldus in Italy. *Lobel* ſaith that it groweth in Languedocke in France, and on the tops of ſome hills in England; but as yet I haue not ſeene the ſame.

Thoſe with yellow floures haue beene found by a village in Lancaſhire called Latham, foure miles from Kyrcham, by M^r. *Thomas Hesketh* before remembred.

¶ *The Time.*

They floure not onely in the Spring, but for the moſt part all Summer thorow, euen vntill Autumne.

¶ *The Names.*

Hearts eaſe is named in Latine *Viola tricolor*, or the three coloured Violet; and of diuers, *Iacea*; (yet there is another *Iacea* ſyrnamed *Nigra*: in Engliſh, Knap-weed, Bull-weed, and Matfellon) of others, *Herba Trinitatis*, or herbe Trinitie, by reaſon of the triple colour of the floures: of ſome others, *Herba Clauellata*: in French, *Penſees*: by which name they became knowne to the Brabanders and others of the Low-countries that are next adioyning. It ſeemeth to be *Viola flammea*, which *Theophraſtus* calleth φλόξα, which is alſo called φλόξιον: in Engliſh, Hearts-eaſe, Paunſies, Liue in idleneſſe, Cull me to you, and Three faces in a hood.

The vpright Panſie is called not vnproperly *Viola aſſurgens*, or *Surrecta*, and withall *Tricolor*, that is to ſay, ſtraight or vpright Violet three coloured: of ſome, *Viola arboreſcens*, or Tree Violet, for that in the multitude of branches and manner of growing, it reſembles a little Tree.

¶ *The Nature.*

It is of temperature obſcurely cold, but more euidently moiſt, of a tough and ſlimie juice, like that of the Mallow; for which cauſe it moiſtneth and ſuppleth, but not ſo much as the Mallow doth.

¶ *The Vertues.*

It is good, as the later Phyſitians write, for ſuch as are ſicke of an ague, eſpecially children and infants, whoſe conuulſions and fits of the falling ſickneſſe it is thought to cure. A

It is commended againſt inflammations of the lungs and cheſt, and againſt ſcabs and itchings of the whole bodie, and healeth vlcers. B

The diſtilled water of the herbe or floures giuen to drinke for ten or more daies together, three ounces in the morning, and the like quantitie at night, doth wonderfully eaſe the paines of the French diſeaſe, and cureth the ſame, if the patient be cauſed to ſweat ſundry times, as *Coſtæus* reporteth, in his booke *de natura Vniuerſi ſtirp.* C

Chap. 314. *Of Ground-Iuy, or Ale-hooſe.*

¶ *The Deſcription.*

GRound Ivy is a low or baſe herbe; it creepeth and ſpreads vpon the ground hither and thither all about, with many ſtalkes of an vncertaine length, ſlender, and like thoſe of the Vine, ſomething cornered, and ſometimes reddiſh: whereupon grow leaues ſomething broad and round, wrinckled, hairy, nicked in the edges, for the moſt part two out of euerie joint: amongſt which come forth the floures gaping like little hoods, not vnlike to thoſe of Germander, of a purpliſh blew colour: the roots are very threddy: the whole plant is of a ſtrong ſmell and bitter taſte.

‡ 2 Vpon the rockie and mountainous places of Prouince and Daulphine grows this other kinde of Ale-hooſe, which hath leaues, ſtalkes, floures, and roots like in ſhape to thoſe of the former, but the floures and leaues are of a light purple colour, and alſo larger and longer. This by *Lobel* is called *Aſarina, ſive ſaxatilis hedera.* ‡

¶ *The Place.*

It is found as well in tilled as in vntilled places, but moſt commonly in obſcure and darke places, vpon banks vnder hedges, and by the ſides of houſes.

¶ *The Time.*

It remaineth greene not onely in Summer, but alſo in Winter at any time of the yeare: it floureth from Aprill till Summer be far ſpent.

¶ The

1 *Hedera terreſtris.*
Ale-hoofe.

‡ 2 *Hedera ſaxatilis.*
Rocke Ale-hoofe.

¶ *The Names.*

It is commonly called *Hedera terreſtris*: in Greeke, χαμαιπίτυς: alſo *Corona terræ*: in High-Dutch, **Gundelreb**: in Low-Dutch, **Onderhaue**: in French, *Lierre terreſtre*: *Hedera humilis* of ſome, and *Chamæciſſum*: in Engliſh, Ground-Ivy, Ale-hoofe, Gill go by ground, Tune-hoof, and Cats-foot. ‡ Many queſtion whether this be the *Chamæciſſus* of the Antients: which controuerſie *Dodonæus* hath largely handled, *Pempt. 3. lib. 3. cap. 4.* ‡

¶ *The Temperature.*

Ground-Ivie is hot and dry, and becauſe it is bitter it ſcoureth, and remoueth ſtoppings out of the intrals.

¶ *The Vertues.*

A Ground-Ivy is commended againſt the humming noyſe and ringing ſound of the eares, being put into them, and for them that are hard of hearing.

B *Matthiolus* writeth, That the juice being tempered with Verdugreaſe, is good againſt fiſtulaes and hollow vlcers.

C *Dioſcorides* teacheth, That halfe a dram of the leaues being drunk in foure ounces and a halfe of faire water, for fortie or fiftie daies together, is a remedie againſt the Sciatica, or ache in the huckle bone.

D The ſame taken in like ſort ſix or ſeuen daies doth alſo cure the yellow jaundiſe. *Galen* hath attributed (as we haue ſaid) all the vertue vnto the floures: Seeing the floures of Ground-Ivy (ſaith he) are very bitter, they remoue ſtoppings out of the liuer, and are giuen to them that are vexed with the Sciatica.

E Ground-Ivy, Celandine, and Daiſies, of each a like quantitie, ſtamped and ſtrained, and a little ſugar and roſe water put thereto, and dropped with a feather into the eies, taketh away all manner of inflammation, ſpots, webs, itch, ſmarting, or any griefe whatſoeuer in the eyes, yea although the ſight were nigh hand gone: it is proued to be the beſt medicine in the world.

F The herbes ſtamped as aforeſaid, and mixed with a little ale and honey, and ſtrained, take away the pinne and web, or any griefe out of the eyes of horſe or cow, or any other beaſt, being ſquirted into the ſame with a ſyringe, or I might haue ſaid the liquor injected into the eies with a ſyringe. But I liſt not to be ouer eloquent among Gentlewomen, to whom eſpecially my Workes are most neceſſarie.

G The women of our Northerne parts, eſpecially about Wales and Cheſhire, do turne the herbe Ale-hoof into their Ale; but the reaſon thereof I know not: notwithſtanding without all contro-

uerſie

uerſie it is moſt ſingular againſt the griefes aforeſaid; being tunned vp in ale and drunke, it alſo purgeth the head from rheumaticke humors flowing from the braine.

Hedera terreſtris boyled in water ſtaieth the termes; and boyled in mutton broth it helps weake I and aking backes.

They haue vſed to put it into ointments againſt burning with fire, gunpouder, and ſuch like. K

Hedera terreſtris, being bound in a bundle, or chopt as herbes for the pot, and eaten and drunke in L thin broth ſtaieth the flux in women.

Chap. 315. *Of Iuy.*

¶ *The Kindes.*

THere be two kindes of Ivie, as *Theophraſtus* witneſſeth, reckoned among the number of thoſe plants which haue need to be propped vp; for they ſtand not of themſelues, but are faſtned to ſtone walls, trees, and ſuch like, and yet notwithſtanding both of a wooddy ſubſtance, and yet not to be placed among the trees, ſhrubs, or buſhes, becauſe of the affinitie they haue with climbing herbes; as alſo agreeing in forme and figure with many other plants that climbe, and are indeed ſimply to be reckoned among the herbes that clamber vp. But if any will cauill, or charge me with my promiſe made in the beginning of this hiſtory, where we made our diuiſion, namely, to place each plant as neere as may be in kindred and neighbourhood; this promiſe I haue fulfilled, if the curious eie can be content to reade without raſhneſſe thoſe plants following in order, and not only this climbing Ivie that lifteth her ſelfe to the tops of trees, but alſo the other Ivie that creepeth vpon the ground.

Of the greater or the climing Ivie there are alſo many ſorts; but eſpecially three, the white, the blacke, and that which is called *Hedera Helix*, or *Hedera ſterilis*.

1 *Hedera corymboſa.*
Clymbing or berried Ivie.

2 *Hedera Helix.*
Barren or creeping Ivie.

¶ *The Deſcription.*

1 THe greater Ivie climbeth on trees, old buildings, and walls: the ſtalkes thereof are wooddy, and now and then ſo great as it ſeemes to become a tree; from which it ſendeth a multitude of little boughes or branches euery way, whereby as it were with armes

armes it creepeth and wandereth far about: it alſo bringeth forth contiuually fine little roots, by which it faſtneth it ſelfe and cleaueth wonderfull hard vpon trees, and vpon the ſmootheſt ſtone walls: the leaues are ſmooth, ſhining eſpecially on the vpper ſide, cornered with ſharpe pointed corners. The floures are very ſmall and moſſie; after which ſucceed bundles of black berries, euery one hauiug a ſmall ſharpe pointall.

There is another ſort of great Ivie that bringeth forth white fruit, which ſome call *Acharnicam irrignam*: and alſo another leſſer, the which hath blacke berries. This *Pliny* calleth *Selinitium*.

We alſo finde mentioned another ſort hereof ſpred abroad, with a fruit of a yellow Saffron colour, called of diuers, *Dionyſias*, as *Dioſcorides* writeth: others *Bacchica*, of which the Poëts vſed to make garlands, as *Pliny* teſtifieth, *lib.* 16. *cap.* 34.

2 Barren Ivie is not much vnlike vnto the common Ivie aforeſaid, ſauing that his branches are both ſmaller and tenderer, not lifting or bearing it ſelfe vpward, but creeping along by the ground vnder moiſt and ſhadowie ditch bankes. The leaues are moſt commonly three ſquare, cornered, of a blackiſh greene colour, which at the end of Summer become browniſh red vpon the lower ſide. The whole plant beareth neither floures nor fruit, but is altogether barren and fruitleſſe.

‡ 3 There is kept for noueltes ſake in diuers gardens a Virginian, by ſome (though vnfitly) termed a Vine, being indeed an Ivie. The ſtalkes of this grow to a great heighth, if they be planted nigh any thing that may ſuſtaine or beare them vp: and they take firſt hold by certaine ſmall tendrels, vpon what body ſoeuer they grow, whether ſtone, boords, bricke, yea glaſſe, and that ſo firmely, that oftentimes they will bring pieces with them if you plucke them off. The leaues are large, conſiſting of foure, fiue, or more particular leaues, each of them being long, and deepely notched about the edges, ſo that they ſomewhat reſemble the leaues of the Cheſnut tree: the floures grow cluſtering together after the manner of Ivie, but neuer with vs ſhew themſelues open, ſo that we cannot iuſtly ſay any thing of their color, or the fruit that ſucceeds them. It puts forth his leaues in April, and the ſtalkes with the rudiments of the floures are to be ſeene in Auguſt. It may as I ſaid be fitly called *Hedera Virginiana*. ‡

¶ *The Place.*

Ivie groweth commonly about walls and trees; the white Ivie groweth in Greece, and the barren Ivie groweth vpon the ground in ditch bankes and ſhadowie woods.

¶ *The Time.*

Ivie flouriſheth in Autumne: the berries are ripe after the Winter Solſtice.

¶ *The Names.*

Ivie is called in Latine, *Hedera*: in Greeke, κίσσος, and κισσὸς: in high Dutch, **Epheu**: in low Dutch, **Ueyle**: in Spaniſh, *Tedra*: in French, *Liarre*.

The great Ivie is called of *Theophraſtus*, ὑψηλὸς κισσὸς: in Latine, *Hedera attollens*, or *Hedera aſſurgens*: *Gaza* interpreteth it *Hedera excelſa*. The later Herbariſts would haue it to be *Hedera arborea*, or tree Ivie, becauſe it groweth vpon trees, and *Hedera muralis*, which hangeth vpon walls.

Creeping or barren Ivie is called in Greeke, χαμαίκισσος κισσὸς: in Engliſh, Ground-Ivie: yet doth it much differ from *Hedera terreſtris* or Ground-Ivie before deſcribed: of ſome it is called *Clauicula*, *Hedera Helix*, and *Hedera ſterilis*; and is that herbe wherein the Bore delighteth, according to *Iohannes Khuenius*.

¶ *The Temperature.*

Ivie, as *Galen* ſaith, is compounded of contrarie faculties; for it hath a certaine binding earthy and cold ſubſtance, and alſo a ſubſtance ſomewhat biting, which euen the very taſte doth ſhew to be hot. Neither is it without a third faculty, as being of a certaine warme watery ſubſtance, and that is if it be greene: for whileſt it is in drying, this watery ſubſtance being earthy, cold, and binding conſumeth away, and that which is hot and biting remaineth.

¶ *The Vertues.*

A The leaues of Ivie freſh and greene boyled in wine do heale old vlcers, and perfectly cure thoſe that haue a venomous and malitious quality joyned with them; and are a remedy likewiſe againſt burnings and ſcaldings.

B Moreouer, the leaues boiled in vinegre are good for ſuch as haue bad ſpleenes; but the floures or fruit are of more force, being very finely beaten and tempered with vinegre, eſpecially ſo vſed they are commended againſt burnings.

C The juyce drawne or ſnift vp into the noſe doth effectually purge the head, ſtaieth the running of the eares that hath beene of long continuance, and healeth old vlcers both in the eares and alſo in the noſthrils: but if it be too ſharpe, it is to be mixed with oile of Roſes, or ſallad oyle.

D The gum that is found vpon the trunke or body of the old ſtocke of Ivie, killeth nits and lice, and taketh away haire: it is of ſo hot a quality, as that it doth obſcurely burne: it is as it were a certaine

certaine wateriſh liquor congealed of thoſe gummie drops. Thus farre *Galen*.

The very ſame almoſt hath *Dioſcorides*, but yet alſo ſomewhat more: for ouer and beſides he ſaith, E
that fiue of the berries beaten ſmall, and made hot in a Pomegranat rinde, with oyle of roſes, and dropped into the contrary eare, doth eaſe the tooth-ach; and that the berries make the haire blacke.

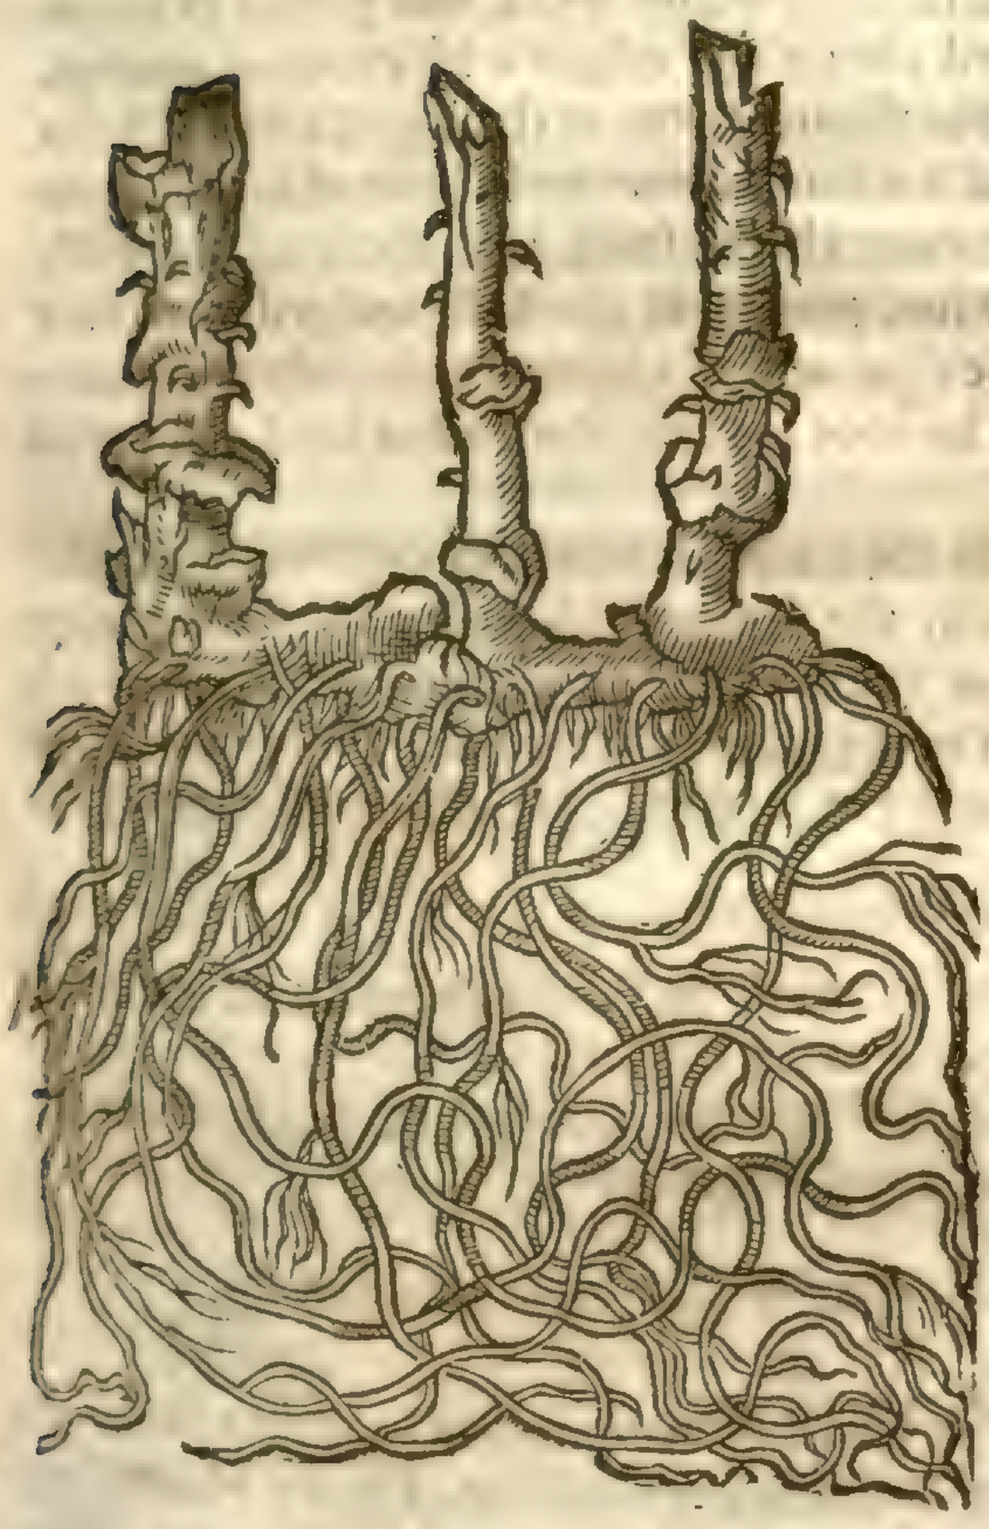
Ivie in our time is very ſeldome vſed, ſaue that the leaues are laid vpon little vlcers made in the F
thighes, legs, or other parts of the body, which are called iſſues; for they draw humors and wateriſh ſubſtance to thoſe parts, and keepe them from hot ſwellings or inflammations, that is to ſay, the leaues newly gathered, and not as yet withered or dried.

Some likewiſe affirme that the berries are effectuall to procure vrine; and are giuen vnto thoſe G
that be troubled with the ſtone and diſeaſes of the kidnies.

The leaues laid in ſteepe in water for a day and a nights ſpace, helpe ſore and ſmarting wateriſh H
eies, if they be bathed and waſhed with the water wherein they haue beene infuſed.

Chap. 316. *Of rough Binde-weed.*

1 *Smilax Peruviana, Salſa parilla.*
Rough Binde-weed of Peru.



2 *Smilax aſpera.*
Common rough Bindeweed.

¶ *The Deſcription.*

1 ALthough we haue great plenty of the roots of this Binde-weed of Peru, which we vſually cally *Zarza*, or *Sarſa parilla*, wherewith diuers griefes and maladies are cured, and that theſe roots are very well knowne to all; yet ſuch hath beene the careleſneſſe and ſmall prouidence of ſuch as haue trauelled into the Indies, that hitherto not any haue giuen vs inſtruction ſufficient, either concerning the leaues, floures, or fruit: onely *Monardus* ſaith, that it hath long roots deepe thruſt into the ground: which is as much as if a great learned man ſhould tell the ſimple, that our common carrion Crow were of a blacke colour. For who is ſo blinde that ſeeth the root it ſelfe, but can eaſily affirme the root to be very long? Notwithſtanding, there is in the reports of ſuch as ſay they haue ſeene the plant it ſelfe growing, ſome contradiction or contrarietie: ſome report that it is a kind of Bindweed, and eſpecially one of theſe rough Bind-weeds: others

3 *Smilax aſpera Luſitanica.*
Rough Bind-weed of Portugall.

tained a blackiſh ſeed in ſhape like that of hempe.

others, as one Mr. *White* an excellent painter, who carried very many people into Virginia (or after ſome Norembega) there to inhabit, at which time he did ſee thereof great plenty, as he himſelfe reported vnto me, with this bare deſcription; It is (ſaith he) the root of a ſmall ſhrubby tree, or hedge tree, ſuch as are thoſe of our country called Haw-thorns, hauing leaues reſembling thoſe of Iuy, but the floures or fruit he remembreth not. ‡ It is moſt certaine, that *Sarſaparilla* is the root of the Americane *Smilax aſpera*, both by conſent of moſt Writers, and by the relation of ſuch as haue ſeene it growing there. ‡

2 The common rough Bind-weed hath many branches ſet full of little ſharpe prickles, with certaine claſping tendrels, wherewith it taketh hold vpon hedges, ſhrubs, and whatſoeuer ſtandeth next vnto it, winding and claſping it ſelfe about from the bottome to the top; whereon are placed at euery joint one leafe like that of Ivie, without corners, ſharpe pointed, leſſer and harder than thoſe of ſmooth Binde-weed, oftentimes marked with little white ſpots, and garded or bordered about the edges with crooked prickles. The floures grow at the top of crooked ſtalks of a white colour, and ſweet of ſmell. After commeth the fruit like thoſe of the wilde Vine, greene at the firſt, and red when they be ripe, and of a biting taſte; wherein is contained a blackiſh ſeed in ſhape like that of hempe. The root is long, ſomewhat hard, and parted into very many branches.

3 This rough Binde-weed, found for the moſt part in the barren mountaines of Portugall, differeth not from the precedent in ſtalkes and floures, but in the leaues and fruit; for the leaues are ſofter, and leſſe prickly, and ſometimes haue no prickles at all, and they are alſo oftentimes much narrower: the fruit or berry is not red but blacke when as it commeth to be ripe. The root hereof is one ſingle root of a wooddy ſubſtance, with ſome fibres annexed thereto, wherein conſiſteth the difference.

¶ *The Place.*

Zarza Parilla, or the prickly Binde-weed of America, groweth in Peru a prouince of America, in Virginia, and in diuers other places both in the Eaſt and Weſt Indies.

The others grow in rough and vntilled places, about the edges and borders of fields, on mountaines and vallies, in Italy, Languedoc in France, Spaine, and Germany.

¶ *The Time.*

They floure and flouriſh in the Spring: their fruit is ripe in Autumne, or a little before.

¶ *The Names.*

It is named in Greeke, Σμίλαξ τραχεῖα. *Gaza* (*Theophraſtus* his tranſlator) names it *Hedera Cilicia*; as likewiſe *Pliny*, who *lib.* 24. *cap.* 10. writeth, that it is alſo ſyrnamed *Nicophoron*. Of the Hetrurians, *Hedera ſpinoſa*, and *Rubus Cervinus*: of the Caſtilians in Spaine, as *Lacuna* ſaith, *Zarza parilla*, as though they ſhould ſay, *Rubus viticula*, or Bramble little Vine. *Sarſa* as *Matthiolus* interpreteth it, doth ſignifie a Vine; and *Parilla*, a ſmall or little Vine.

Diuers affirme that the root (brought out of Peru a Prouince in America) which the later Herbariſts do call *Zarza*, is the root of this Bindeweed. *Garcias Lopius Luſitanus* granteth it to be like thereunto, but yet he doth not affirme that it is the ſame. Plants are oftentimes found to be like one another, which notwithſtanding are proued not to be the ſame by ſome little difference; the diuers conſtitutions of the weather and of the ſoile maketh the difference.

Zarza parilla of Peru is a ſtrange plant, and is brought vnto vs from the Countries of the new world called America; and ſuch things as are brought from thence, although they alſo ſeeme and are like to thoſe that grow in Europe, notwithſtanding they do often differ in vertue and operation: for the diuerſitie of the ſoile and of the weather doth not only breed an alteration in the forme but

but doth most of all preuaile in making the vertues and qualities greater or lesser. Such things as grow in hot places be of more force, and greater smell; and in cold, of lesser. Some things that are deadly and pernitious, being remoued wax milde, and are made wholesome: so in like manner, although *Zarza parilla* of Peru be like to rough Bind-weed, or to Spanish *Zarza parilla*, notwithstanding by reason of the temperature of the weather, and also through the nature of the soile, it is of a great deale more force than that which groweth either in Spaine or in Africke.

The roots of *Zarza parilla* of Peru, which are brought alone without the plant, be long and slender, like to the lesser roots of common liquorice, very many oftentimes hanging from one head, in which roots the middle string is hardest. They haue little taste, and so small a smell that it is not to be perceiued. These are reported to grow in Honduras a prouince of Peru. They had their name of the likenesse of rough Binde-weed, which among the inhabitants it keepeth; signifying in Spanish, a rough or prickly vine, as *Garcias Lopius* witnesseth.

¶ *The Temperature.*

The roots are of temperature hot and dry, and of thinne and subtill parts, insomuch as their decoction doth very easily procure sweat.

¶ *The Vertues.*

The roots are a remedie against long continuall paine of the joynts and head, and against cold diseases. They are good for all manner of infirmities wherein there is hope of cure by sweating, so that there be no ague joyned. A

The cure is perfected in few daies, if the disease be not old or great; but if it be, it requireth a longer time of cure. The roots here meant are as I take it those of *Zarza parilla*, whereof this *Smilax aspera* or rough Binde-weed is holden for a kinde: notwithstanding this of Spaine and the other parts of Europe, though it be counted lesse worth, yet is it commended of *Dioscorides* and *Plinie* against poysons. The leaues hereof, saith *Dioscorides*, are a counterpoyson against deadly medicines, whether they be drunke before or after. B

† The second and fourth were both formerly of one plant, I meane the historie; for the figure in the fourth place should haue beene in the third, and the figure in the third was the same with the second, and should haue beene in the fourth place.

Chap. 317. *Of smooth or gentle Binde-weed.*

1 *Smilax lenis siue læuis major.*
Great smooth Binde-weed.

2 *Smilax lenis minor.*
Small Binde-weed.

¶ *The Deſcription.*

1 IT is a ſtrange thing vnto me, that the name of *Smilax* ſhould be ſo largely extended, as that it ſhould be aſſigned to thoſe plants that come nothing neere the nature, and ſcarſly vnto any part of the forme of *Smilax* indeed. But we will leaue controuerſies to the further conſideration of ſuch as loue to dance in quag-mires, and come to this our common ſmooth *Smilax*, called and knowne by that name among vs, or rather more truly by the name of *Conuolvulus major*, or *Volubilis major*: it beareth the long branches of a Vine, but tenderer, and for the length and great ſpreading thereof it is very fit to make ſhadows in arbors: the leaues are ſmooth like Ivie, but ſomwhat bigger, and being broken are full of milke: amongſt which come forth great white and hollow floures like bells. The ſeed is three cornered, growing in ſmall huskes couered with a thinne skin. The root is ſmall, white, and long, like the great Dogs graſſe.

2 *Smilax lævis minor* is much like vnto the former in ſtalkes, leaues, floures, ſeed, and roots, ſauing that in all reſpects it is much ſmaller, and creepeth vpon the ground. The branches are ſmall and ſmooth: the little leaues tender and ſoft: the floures like vnto little bells, of a purple colour: the ſeed three cornered like vnto the others.

3 *Convolvulus minimus ſpicæ-folius.*
Lauander leafed Binde-weed.

† 4 *Convolvulus argenteus Altheæ folio.*
Siluer leafed Binde-weed.

3 This Bindweed *Pena* ſaith he neuer ſaw but in the brinks of quicke-ſets and Oliuets in Province, Sauoy, and Narbone; notwithſtanding I found it growing in the corne fields about great Dunmow in Eſſex, in ſuch abundance, that it doth much hurt vnto their corne. This kind of Bindweed or *Volubilis* is like vnto the ſmall Bindweed before mentioned, but it hath a finer floure, plaited or folded in the compaſſe of a bell very orderly, eſpecially before the Sun riſe (for after it opens it ſelfe the welts are not ſo much perceiued) and it is of a darke purple colour: the ſeed is not vnlike the reſt, cornered and flat, growing out of ſlender branches which ſtand vpright and thicke together, proceeding out of a wooddy white root. The leaues are long and narrow, reſembling *Linaria* both in colour and hairineſſe, in taſte drying, and ſomewhat heating.

‡ 4 The

5 *Volubilis nigra.*
Blacke Bindweed.

‡ 4 The ſtalkes and branches of this are ſome cubite long, ſlender, weake and hairy, ſo that they lie vpon the ground, if they haue nothing to ſuſtaine them: vpon theſe without any order grow leaues, ſhaped like thoſe of Ivie, or the Marſh Mallow, but leſſe, and couered ouer with a ſiluer-like downe or hairineſſe, and diuided ſomewhat deepe on the edges, ſometimes alſo curled, and otherwhiles onely ſnipt about. The floure growes vpon a long ſtalke like as in other plants of this kinde, and conſiſts of one folding leafe, likeas that of the laſt mentioned, and it is either of a whitiſh purple, or els abſolute purple colour: The root is ſmall and creeping. It growes in many places of Spaine, and there floures in March and Aprill. *Cluſius* calls this *Convolvulus Althæa folio*, and ſaith that the Portugals name it *Verdezilla*, and commend it as a thing moſt effectuall to heale wounds. Our Author gaue the figure hereof (how fitly let the Reader iudge) by the name of *Papauer cornutum luteum minus*, making it a horned Poppy, as you may ſee in the former Edition, *pag.* 294. ‡

† 5 This kind of Bindweed hath a tough root full of threddy ſtrings, from which riſe vp immediatly diuers trailing branches, whereon grow leaues like the common field Bindweed, or like thoſe of Orach, of a black green colour, whereof it tooke his name: the floures are ſmal, and like thoſe of Orach: the ſeed is black, three ſquare, like, but leſſe than that of Buck-wheat. The whole plant is not onely a hurtfull weed, but of an euill ſmell alſo, and too frequently found amongſt corne. *Dodonæus* calls this *Convolvulum nigrum*: and *Helxine Ciſſampelos*: *Tabernamontanus*, *Volubilis nigra*: and *Lobel*, *Helxine Ciſſampelos altera Atriplicis effigie.*

¶ *The Place.*

All theſe kindes of Bindweeds do grow very plentifully in moſt parts of England. ‡ The third and fourth excepted. ‡

¶ *The Time.*

They do floure from May to the end of Auguſt.

¶ *The Names.*

The great Bindweed is called in Greeke, σμίλαξ λεία: in Latine, *Smilax Lævis*: of *Galen* and *Paulus Ægineta*, σμίλαξ λεία: it is ſurnamed *Lævis* or ſmooth, becauſe the ſtalkes and branches thereof haue no prickes at all. *Dolichus* called alſo *Smilax hortenſis*, or Kidney beane, doth differ from this: and likewiſe *Smilax* the tree, which the Latines call *Taxus*: in Engliſh, the Yew tree. The later Herbariſts do call this Bindweed *Volubilis maior*, *Campanella*, *Funis arborum*, *Convolvulus albus*, and *Smilax lævis major*: in like manner *Pliny* in his 21. booke, 5. chap. doth alſo name it *Convolvulus*. It is thought to be *Liguſtrum*, not the ſhrub priuet, but that which *Martial* in his firſt booke of Epigrams ſpeaketh of, writing againſt *Procillus*.

The ſmall Bindweed is called *Convolvulus minor*, and *Smilax lævis minor*, *Volubilis minor*: in high Dutch, **Windkraut**: in low Dutch, **Wrange**: in French, *Liſeron*: in Italian, *Vilucchio*: in Spaniſh, *Campanella Yerua*: in Engliſh, Withwinde, Bindeweed, and Hedge-bels.

¶ *The Temperature.*

Theſe herbes are of a hot and dry temperature.

¶ *The Vertues.*

The leaues of blacke Bindeweed called *Helxine Ciſſampelos*, ſtamped and ſtrained, and the juyce drunken, doth looſe and open the belly exceedingly. A

The leaues pound and laid to the grieued place, diſſolue, waſte, and conſume hard lumps and ſwellings, as *Galen* ſaith. B

The

D The reſt of the Bindweeds are not fit for medicine, but vnprofitable weeds, and hurtfull vnto each thing that groweth next vnto them.

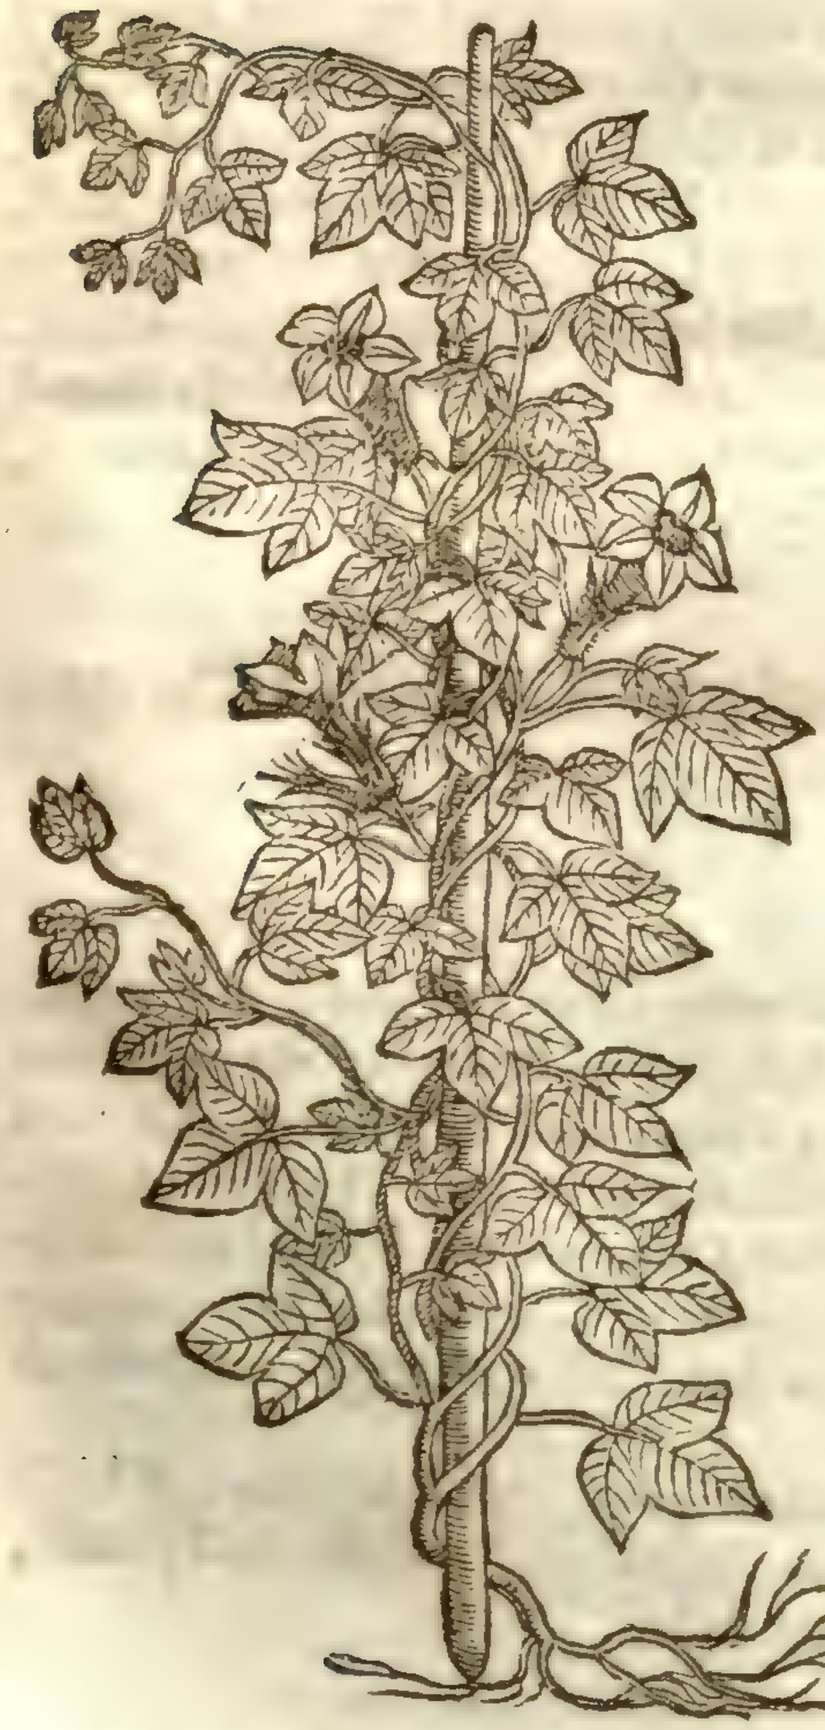
† The deſcription which our Author intended in the firſt place for *Volubilis nigra*, and tooke out of the 274. page of the *Aduerſaria*, but ſo confuſedly and imperfectly, neither agreeing with that he intended, I haue omitted as impertinent, and made his later, though alſo imperfect deſcription, ſomewhat more compleat and agreeable to the plant figured and intended.

Chap. 318. *Of Blew Bindweed.*

¶ *The Deſcription.*

1 BLew Bindweed bringeth forth long, tender, and winding branches, by which it climeth vpon things that ſtand neere vnto it, and foldeth it ſelfe about them with many turnings and windings, wrapping it ſelfe againſt the Sun, contrary to all other things whatſoeuer, that with their claſping tendrels doe embrace things that ſtand neere vnto them; whereupon doe grow broad cornered leaues very like vnto thoſe of Ivie, ſomething rough and hairy, of an ouerworne ruſſet greene colour: among which come forth moſt pleaſant floures bell faſhion, ſomthing cornered as are thoſe of the common Bindweed, of a moſt ſhining azure colour tending to purple: which being paſt, there ſucceed round knobbed ſeed veſſels, wherein is contained long blackiſh ſeed of the bigneſſe of a Tare, and like vnto thoſe of the great hedge Bindweed. The root it thredy, and periſheth at the firſt approach of Winter.

1 *Convolvulus Cæruleus.*
Blew Binde-weed.



‡ 2 *Convolvulus cæruleus folio rotundo.*
Round leaued blew Bindweed.

‡ 2 There are alſo kept in our Gardens two other blew floured Bindweeds. The one a large and great plant, the other a leſſer. The great ſends vp many large and long winding branches, like thoſe of the laſt deſcribed, and a little hairie: the leaues are large and roundiſh, ending in a ſharpe point: the floures are as large as thoſe of the great Bindweed, and in ſhape like them, but blew of colour, with fiue broad purpliſh veines equally diſtant each from other: and theſe floures commonly grow three neere together vpon three ſeuerall ſtalkes ſome inch long, faſtened to another ſtalke

‡ 3 *Convolvulus cærulens minor, folio oblongo.*
Small blew Bind-weed.

stalke some handfull long: the cup which holds the floures, and afterwards becomes the seed vessell, is rough and hairie: the seed is blacke, and of the bignesse of a Tare: the root is stringie, and lasts no longer than to the perfecting of the seed. I haue onely giuen the figure of the leafe and floure largely expresst, because for the root and manner of growing it resembles the last described.

3 This small blew Bind-weed sendeth forth diuers long slender creeping hairie branches, lying flat vpon the ground vnlesse there be something for it to rest vpon: the leaues be longish and hairy, and out of their bosomes (almost from the bottome to the tops of the stalkes) come small foot-stalkes carrying beautifull floures of the bignesse and shape of the common smal Bindweed, but commonly of three colours; that is, white in the very bottome, yellow in the middle, and a perfect azure at the top; and these twine themselues vp, open and shut in fiue plaits like as most other floures of this kinde doe. The seed is contained in round knaps or heads, and is blacke and cornered: the root is small, and perishes euery yeare. *Bauhine* was the first that set this forth, and that by the name of *Convolvulus peregrinus cærulens folio oblongo.* ‡

¶ *The Place.*

The seed of this rare plant was first brought from Syria and other remote places of the world, and is a stranger in these Northerne parts; yet haue I brought vp and nourished it in my Garden vnto flouring, but the whole plant perished before it could perfect his seed.

¶ *The Time.*

The seed must be sowne as Melons and Cucumbers are, and at the same time: it floured with me at the end of August.

¶ *The Names.*

It is called *Campana Lazura*, and *Lazara*: of the later Herbarists *Campana Cærulea*, and also *Convolvulum Caruleum*: it is thought to be the *Liguſtrum nigrum*; of which *Columella* in his tenth booke hath made mention:

Fercalathis violam, & nigro permista liguſtro
Balsama cum Cassia nectens, &c.

In Baskets bring thou Violets, and blew Bindweed withall,
But mixed with pleasant Baulme, and Cassia medicinall.

For if the greater smooth Withwinde, or Bindweed be *Liguſtrum*, then may this be not vnproperly called *Liguſtrum nigrum*: for a blew purple colour is oftentimes called blacke, as hath beene said in the blacke Violet. But there be some that would haue this Bindweed to be *Granum nil Auicennæ*, of which he writes in the 306. chapter; the which differeth from that *Nil* that is described in the 512. chapter. For this is *Isatis Græcorum*, or the Grecian Woad: but that is a strange plant, and is brought from India, as both *Avicen* and *Serapio* do testifie: *Avicen* in this manner: what is *Granum Nil?* It is *Cartamum Indum*: and *Serapio* thus; *Habal Nil*, is *Granum Indicum*, in *cap.* 283. where the same is described in these words: [The plant hereof is like to the plant of *Lchlab*, that is to say of *Convolvulus*, or Bindweed, taking hold of trees with his tender stalke: it hath both green branches and leaues, and there commeth out by euery leafe a purple floure, in fashion of the Bell-floures; and when the floure doth fall away, it yeeldeth a seed in small cods (I read *little heads*) in which

which are three graines, leſſer than the ſeeds of Staueſaker] to which deſcription this blew Bindeweed is anſwerable.

There be alſo other ſorts of Bindweeds, which be referred to *Nil Auicennæ*; which no doubt may be kindes of *Nil*; for nothing gaine-ſaith it why they ſhould not be ſo. Therefore to conclude, this beautifull Bind-weed, which we call *Conuolvulus Cæruleus*, is called of the Arabians *Nil*: of *Serapio*, *Hab ab Nil*: about Alepo and Tripolis in Syria the inhabitants call it *Haſmiſen*: the Italians, *Campana laZurea*: of the beautifull azured floures, and alſo *Fior de notte*, becauſe his beauty appeares moſt in the night.

¶ *The Temperature.*

Convolvulus Caruleus, or *Nil*, as *Auicen* ſaith, is hot and dry in the firſt degree: but *Serapio* maketh it to be hot and dry in the third degree.

¶ *The Vertues.*

A It purgeth and voideth forth raw, thicke, flegmaticke, and melancholy humours: it driues out all kinde of wormes, but it troubleth the belly, and cauſeth a readineſſe to vomit, as *Avicen* ſaith: it worketh ſlowly, as *Serapio* writeth; in whom more hereof may be found, but to little purpoſe, wherefore we thinke good to paſſe it ouer.

Chap. 319. *Of Scammonie, or purging Bindweed.*

1 *Scammonium Syriacum.*
Syrian Scammonie.

† 2 *Scammonea Valentina.*
Scammonie of Valentia.

Conuolvulus Scammonea, &c.

¶ *The Deſcription.*

1 Scammonie of Syria hath many ſtalkes riſing from one root, which are long, ſlender, and like the claſping tendrels of the vine, by which it climeth and taketh hold of ſuch things as are next vnto it. The leaues be broad, ſharpe pointed like thoſe of the ſmooth or hedge Bind-weed: among which come forth very faire white floures tending to a bluſh colour, bell-faſhion. The root is long, thicke, and white within: out of which is gathered a juyce that being hardned

hardned, is greatly vsed in Physicke: for which consideration, there is not any plant growing vpon the earth, the knowledge whereof more concerneth a Physition, both for his shape and properties, than this Scammonie, which *Pena* calleth *Lactaria scansoriaque volvula*, that is, milky and climbing Windweed, whereof it is a kinde; although for distinction sake I haue placed them as two seuerall kinds. And although this herbe be suspected, and halfe condemned of some learned men, yet there is not any other herbe to be found, whereof so small a quantity will do so much good: neither could those which haue carped at it, and reproued this herbe, finde any simple in respect of his vertues to be put in his roome: and hereof ensueth great blame to all practitioners, who haue not endeuoured to be better acquainted with this herbe, chiefely to auoid the deceit of the crafty Drug-seller and Medicine-maker of this confected Scammony, brought vs from farre places, rather to be called I feare infected Scammony, or poysoned Scammony, than confected. But to auoid the inconueniences hereof, by reason of the counterfeiting and ill mixing thereof: I haue therefore thought good to set downe what I haue taken out of the diligent, and no lesse learned obseruations of *Pena*, concerning this plant, *Anno* 1561. or 1562. *Vid. adners. pag.* 272.

‡ 3 *Scammonium Monspelienſe.*
French Scammonie.

Sequinus Martinellus an Apothecary of Venice, being a most diligent searcher of Simples, that he might haue the right Scammony of Antioch, trauelled into Syria, where from the citie of Aleppo he sent an 100. weight of the juyce of Scammony of Antioch, prepared and hardned into a lumpe, at the making whereof he was present himselfe. This man sent also of the seeds thereof, which in all points answered the cornered seed of *Volubilis*; which being sowne in the beginning of the Spring at Padua and Venice, grew vp to the form of a braue & goodly *Convolvulus*, in leaues, floures, and shew so like vnto our *Cissampelos*, that a man would haue taken it for the same without controuersie, sauing that the root was great, and in bignesse equall to the great Brionie, as also in tendernesse. The outward bark of the root was of a dusky colour, and white within: the inner pith beeing taken forth seemeth in all mens iudgements to be the same and the best allowed *Turbith officinarum*: and yet it differeth from Turbith, in that, that it is more brittle, and will more easily bee broken, though the pith in Scammony be no lesse gummie and full of milkie juyce, than Turbith. Further *Pena* reporteth, that afterward he sent of this seed vnto Antwerpe, where it grew very brauely, the climing strings and branches growing vp to the height of fiue or six cubits, not differing from that which was sowne in Italy. Also *William Drixs* of Antwerpe, a most excellent Apothecary, did cut of the branches of his Antwerpian Scammonie from the root, and dried them, planted the seeds in his Garden, and conferred the superfluous branched roots with the Turbith of Alexandria, and could not find them to differ or disagree the one from the other in any point. But he that will know more concerning the making, difference, choise and vse of Scammony, let him read *Pena* in his chapter of Scammonie, in the place formerly cited, where he shall finde many excellent secrets worthy the noting of those which would know how to vse such rare and excellent medicines.

2 Scammony of Valentia (whereof I haue plenty in my Garden) is also a kinde of Bindweed, growing naturally by the sea side vpon the grauelly shore, by the mouth of the riuer Rhodanus, at the waters called *Aquas Marianas*, where the Apothecaries of Montpellier gather of it great plentie, who haue attempted to harden the milkie juyce thereof, to vse it in stead of Scammony of Antioch. This plant bringeth forth many slender branches, which will climbe and very well run vpon a pole; as being supported therewith, and mounteth to the height of fiue or six cubits, climbing and ramping like the first kinde of Scammony. The leaues are greene, smooth, plaine, and sharpe pointed,

pointed, which being broken do yeeld abundance of milke: the floures are white, ſmall, and ſtarre-faſhion: the roots white and many, ſhooting forth ſundry other roots, whereby it mightily increaſeth.

† 3 This ſtrange kinde of Scammony, which *Cluſius* maketh rightly to be *Periplocæ ſpecies*, hath very many long branches ramping and taking hold of ſuch things as do grow neer vnto them, of a darkiſh aſh colour: whereupon do grow leaues ſharp pointed, crooked at the ſetting on of the ſtalke like thoſe of the blacke Bryony, and likewiſe of an aſhe colour, ſet together by couples: from the boſome whereof thruſt forth ſmall tender foot-ſtalkes, whereon are placed ſmall white floures ſtar-faſhion: the ſeeds are contained in long cods, and are wrapped in downe, like as thoſe of Swallow-wort. The root is very long, ſlender, and creeping, like that of the ſmall Bindweed, ſo that if it once take in any ground, it can hardly be deſtroied.

¶ *The Place.*

It doth grow in hot regions, in a fat ſoile, as in Miſia, Syria, and other like countries of Aſia; it is likewiſe found in the Iſland of Candia, as *Bellon.* witneſſeth; from whence I had ſome ſeeds, of which ſeed I receiued two plants that proſpered exceeding well; the one whereof I beſtowed vpon a learned Apothecary of Colcheſter, which continueth to this day, bearing both floures and ripe ſeed. But an ignorant weeder of my garden plucked mine vp, and caſt it away in my abſence, in ſtead of a weed: by which miſchance I am not able to write hereof ſo abſolutely as I determined: it likewiſe groweth neere vnto the ſea ſide about Tripolis in Syria, where the inhabitants doe call it *Meudheudi.*

¶ *The Time.*

It floured in my Garden about S. *Iames* tide, as I remember, for when I went to Briſtow Faire I left it in floure; but at my returne it was deſtroied as aforeſaid.

¶ *The Names.*

The Greekes call it, Σκαμμωνία: the Latines, *Scammonium*, ſo naming not onely the plant it ſelfe, but alſo the hard and condenſed juyce: of the Apothecaries, *Scammonea*; and when it is prepared, *Diagridium*: as though they ſhould ſay, διακρῦδιον: which ſignifieth a little teare: both the herbe and juyce are named *Scamony*: of *Rhaſis*, *Coriziola.*

¶ *The Temperature.*

The juyce doth mightily purge by the ſtoole, and is the ſtrongeſt purge whatſoeuer; for as *Oribaſius* ſaith, it is in no part ouercome by thoſe things which ſtir and moue the body. It worketh the ſame not vehemently by any hot quality, but by ſome other hid and ſecret property of the whole ſubſtance: for there is no extremity of heat perceiued in it by taſte: for with what liquor or thing ſoeuer it is mixed, it giueth vnto it no bitterneſſe, biting, or other vnpleaſant taſte at all, and therefore it is not to be accounted among the extreme hot medicines, but amongſt thoſe that are moderately hot and dry.

¶ *The Vertues.*

A It cleanſeth and draweth forth eſpecially choler: alſo thinne and wateriſh humours, and oftentimes flegme, yet is it as *Paulus* teacheth, more hurtfull to the ſtomacke than any other medicine.

B *Meſues* thinketh that it is not onely troubleſome and hurtfull to the ſtomacke, but alſo that it ſhaueth the guts, gnawing and fretting the intrails; openeth the ends of the veines, and through the eſſence of his whole ſubſtance, it is an enemy to the heart, and to the reſt of the inward parts: if it be vſed immoderately and in time not conuenient, it cauſeth ſwounings, vomitings, and ouerturnings of the ſtomacke, ſcouring, the bloudy flux and vlcers in the lower gut, which bring a continuall deſire to the ſtoole.

C Theſe miſchiefes are preuented if the Scammonie be boiled in a Quince and mixed with the ſlime or mucilage of *Pſillium*, called Fleawoort, the pap or pulp of Prunes, or other things that haue a ſlimie jnyce, with a little maſticke added, or ſome other eaſie binding thing.

D *Pliny* affirmeth that the hurt thereof is taken away if Aloes be tempered with it: [Scammonie (ſaith he) ouerthroweth the ſtomack, purgeth choler, looſeth the belly vnleſſe two drams of Aloes be put vnto one ſcruple of it] which alſo *Oribaſius* alloweth of in the firſt booke of his *Synopſis*, and the ſeuenth booke of his medicinall Collections.

E The old Phyſitions were alſo woont to boile Scammonie in a quince, and to giue the quince to be eaten, hauing caſt away the Scammony: and this quince ſo taken doth moue the belly without any hurt vnto the ſtomacke, as *Galen* in his firſt booke of the Faculties of Nouriſhments doth ſet downe, and likewiſe in his third booke of the Faculties of ſimple Medicines.

F The Apothecaries do vſe Scammonie prepared in a Quince, which as we haue ſaid they name *Diagridium*, and do mix it in diuers compoſitions.

They

They keepe vsually in their shops two compositions, or electuaries, the one of *Psyllium* or Flea- G
wort, set downe by *Mesue*: the other of Prunes, fathered vpon *Nicolaus*, which were deuised for the tempering and correction of Scammony, and be commended for hot burning agues, and tertians, and for what diseases soeuer that proceed of choler.

Galen hath taken Masticke and *Bdellium* out of the pilles called *Cochiæ*, which also containe in H
them a great quantitie of Scammony, as we may read in his first Booke of medicines according to the places affected, which also we meane to touch in the chapter of Coloquintida, where we intend to treate at large concerning mastick, and other binding things, that are accustomed to bee mixed for the correction of strong and violent purgers.

The quantitie of Scammonie or of *Diagridium* it selfe, to be taken at one time, as *Mesue* writeth, I
is from fiue grains to ten or twelue: it may be kept as the same Author sheweth, foure yeres: *Pliny* iudgeth it to be little worth after 2 yeares: it is to be vsed, saith he, when it is two yeres old, and it is not good before, nor after. The mixing or otherwise the vse therof, more than is set down, I think it not expedient to set forth in the Physicall vertues of Scammony, vpon the receipt whereof many times death insueth: my reasons are diuers, for that the same is very daungerous, either if too great a quantitie thereof be taken, or if it be giuen without correction; or taken at the hands of some runnagat physick-monger, quack saluer, old women-leaches, and such like abusers of phisick, and deceiuers of people. The vse of Scammony I commit to the learned, vnto whom it especially and onely belongeth, who can very carefully and curiously vse the same.

† The tales of the second and third were formerly transposed, and both the figures belonged to the second description, which was of the *Scammonium Mesue* of the Arabians, being the same with the *Scammonea Valentina* of *Clusius*.

Chap. 320. *Of Briony, or the white Vine.*

¶ *The Kindes.*

THere be two kinds of Bryony, the one white, the other blacke: of the white Briony as followeth.

Bryonia alba.
White Bryonie.

¶ *The Description.*

WHite Briony brings forth diuers long and slender stalkes with many clasping tendrels like the vine, wherwith it catcheth hold of those things that are next to it. The leaues are broad, fiue cornered, and indented like those of the vine; but rougher, more hairy and whiter of colour: the floures be small and white, growing many together. The fruit consisteth in little clusters, the berries whereof are at the first green, and red when they be ripe. The root is very great, long, and thicke, growing deepe in the earth, of a white yellowish colour, extreame bitter, and altogether of an vnpleasant taste. The Queens chiefe Surgion M^r. *William Godorous*, a very curious & learned gentleman, shewed me a root herof, that waied half an hundred weight, and of the bignes of a child of a yeare old.

¶ *The Place.*

Briony groweth almost euery where among pot-herbes, hedge-bushes, and such like places.

¶ *The Time.*

It floureth in May, and bringeth forth his grapes in Autumne.

¶ *The Names.*

Briony is called in Greek, ἄμπελος λευκή: in Latine,

Vitis alba, or white Vine, and it is named, ἄμπελος, becauſe it is not onely like the vine in leaues, but alſo for that it bringeth forth his fruit made vp after the likeneſſe of a little cluſter, although the berries ſtand not cloſe together: it is called of *Pliny*, *Bryonia*, and *Madon*: of the Arabians *Alſeſera*: of *Matthæus*, *Syluaticus*, *Viticella*: in the poore mans Treaſure, *Roraſtrum*: of *Apuleius*, *Apiaſtellum*, *Vitis Tamnia*, *Vitis alba*, and *Vitalba*: in high Dutch, **Suchwurtz**: in low Dutch, **Brionie**: in Engliſh, Briony, white Briony, and tetter Berrie: in French *Couleuree*: in Italian, *Zucca ſylueſtica*: in Spaniſh, *Nueza blanca*.

¶ *The Temperature.*

White Briony is in all parts hot and dry, exceeding the third degree, eſpecially of heate, with an exceeding great force of clenſing and ſcouring, by reaſon wherof it purgeth and draweth forth, not onely cholericke and flegmaticke humors, but alſo watrie.

¶ *The Vertues.*

A *Dioſcorides* writeth, that the firſt ſprings or ſproutings being boiled and eaten, do purge by ſiege, and vrine. *Galen* ſaith, that all men vſe accuſtomably to eat of it in the ſpring time, and that it is a nouriſhment wholeſome, by reaſon of the binding quality that it hath; which is to be vnderſtood of thoſe of the wild vine, called in Latine, *Tamus*; and not of the ſproutings of this plant; for the ſproutings of the firſt ſprings of white Bryony are nothing binding at all, but do mightily purge the belly, and torment the ſtomacke.

B *Dioſcorides* alſo affirmeth, That the juice of the root being preſſed out in the ſpring, and drunke with meade or honied water, purgeth flegme: and not only the juice, but alſo the decoction of the root draweth forth flegme, choler, and wateriſh humors, and that very ſtrongly; and it is withall oftentimes ſo troubleſome to the ſtomacke, as it procureth vomite.

C This kinde of ſtrong purgation is good for thoſe that haue the dropſie, the falling ſickneſſe, and the dizzineſſe and ſwimming of the braine and head, which hath continued long, and is hardly to be remoued: yet notwithſtanding it is not daily to be giuen (as *Dioſcorides* admoniſheth) to them that haue the falling ſickneſſe, for it will be troubleſome enough to take it now and then: and it is (as we haue ſaid) an exceeding ſtrong medicine, purging with violence, and very forceable for mans nature.

D The root put vp in maner of a peſſary bringeth forth the dead childe and afterbirth: being boiled for a bath to ſit in, it worketh the ſame effect.

E It ſcoureth the skin, and taketh away wrinkles, freckles, ſun burning, blacke markes, ſpots, and ſcars of the face, being tempered with the meale of vetches or Tares, or of Fenugreeke: or boiled in oile till it be conſumed; it taketh away blacke and blew ſpots which come of ſtripes: it is good againſt Whitlowes: being ſtamped with wine and applied it breaketh biles, and ſmall apoſtumes: it draweth forth ſplinters and broken bones, if it be ſtamped and laid thereto.

F The ſame is alſo fitly mixed with eating medicines, as *Dioſcorides* writeth.

G The fruit is good againſt ſcabs and the leprie, if it be applied and anointed on, as the ſame Author affirmeth.

H *Galen* writeth, that it is profitable for Tanners to thicken their leather hides with.

I Furthermore, an electuary made of the roots and hony or ſugar, is ſingular good for them that are ſhort winded, troubled with an old cough, paine in the ſides, and for ſuch as are hurt and burſten inwardly: for it diſſolueth and ſcattereth abroad congealed and clottered bloud.

K The root ſtamped with ſalt is good to be laid vpon filthy vlcers and ſcabbed legges. The fruit is likewiſe good to the ſame intent, if it be applied in manner aforeſaid.

L The root of Briony and of wake-Robin ſtamped with ſome ſulphur or brimſtone, and made vp into a maſſe or lump and wrapped in a linnen clout, taketh away the morphew, freckles, and ſpots of the face, if it be rubbed with the ſame being dipped firſt in vineger.

Chap. 321. *Of blacke Brionie, or the wilde Vine.*

¶ *The Deſcription.*

1 THe black Briony hath long flexible branches of a woody ſubſtance, couered with a gaping or clouen bark growing very far abroad, winding it ſelfe with his ſmall tendrels about trees, hedges, and what elſe is next vnto it, like vnto the branches of the vine: the leaues are like vnto thoſe of Iuie or garden Nightſhade, ſharpe pointed, and of a ſhining greene colour: the floures are white, ſmall, and moſſie; which being paſt, there ſucceed little cluſters of red berries

1 *Bryonia nigra.*
Blacke Bryonie.

berries, somewhat bigger than those of the small Raisins or Ribes, which wee call Currans or small Raisins. The root is very great and thicke, oftentimes as big as a mans leg, blackish without, and very clammy or slimy within; which beeing but scraped with a knife or any other thing fit for that purpose, it seemes to be a matter fit to spred vpon cloath or leather in manner of a plaister of Sear-cloath: which being so spred and vsed, it serueth to lay vpon many infirmities, and vnto verie excellent purposes, as shal be declared in the proper place.

2 The wild black Bryonie resembles the former as well in slender Vine-stalkes, as leaues; but clasping tendrels haue they none, neuertheless by reason of the infiniteness of the branches, and the tenderness of the same, it takes hold of those things that stand next vnto it, although easie to be loosed, contrarie vnto the other of his kinde. The berries hereof are blacke of colour when they be ripe; the root also is blacke without, and within of a pale yellow colour like Box. ‡ This which is here described is the *Bryonia nigra* of *Dodonæus*; but *Bauhine* calleth it *Bryonia alba*, and saith it differeth from the common white Bryonie, onely in that the root is of a yellowish Box colour on the in-side, and the fruit or berries are blacke when as they come to ripenesse.

Bryonia nigra florens non fructum ferens.

3 This is altogether like the first described in roots, branches, and leaues, only the foot-stalks whereon the floures grow are about eight or nine inches long: the floures are something greater, hauing neither before or after their flouring any berries or shew thereof, but the flours & footstalks do soon wither and fall away. This I haue heretofore and now this Summer 1621, diligently obserued, because it hath not bin mentioned or obserued by any that I know. *Iohn Goodyer.* ‡

¶ *The Place.*

The first of these plants groweth in hedges and bushes almost euery where.

The second growes in Hessen, Saxonie, Westphalia, Pomerland, and Misnia, where white Bryonie groweth not, as *Valerius Cordus* hath written; who saith that it growes vnder hasell trees neere a city of Germany called Argentine or Strausborough.

¶ *The Time.*

They spring in March, bring forth the floures in May, and their ripe fruit in September.

¶ *The Names.*

Blacke Bryonie is called in Greeke, Ἄμπελος ἄγρια: in Latine, *Bryonia nigra*, and *Vitis sylvestris*, or wild Vine; notwithstanding it much differs from *Labrusca*, or *Vitis vinifera sylvestris*, that is, the wild Vine, which bringeth forth wine called *Ampelos agria*. Why both these were called by one name *Pliny* was the cause, who could not sufficiently expound them, *Lib.* 23. *cap.* 1. but confounded and made them all one, in which error are also the Arabians.

This wilde Vine is also called in Latine, *Tamus*; and the fruit thereof *Vva Taminia*. *Pliny* nameth it also *Salicastrum*. *Ruellius* saith that in certain shops it is called *Sigillum B. Mariæ*; it is also called *Cyclaminus altera*, but not properly: in English, Blacke Bryonie, wilde Vine, and our Ladies seale.

¶ *The Nature.*

The roots of the wilde Vine are hot and dry in the third degree: the fruit is of like temper, but not so forceable: both of them scoure and waste away.

¶ *The Vertues.*

A *Dioſcorides* ſaith that the roots do purge wateriſh humors,& are good for ſuch as haue the dropſie,if they be boiled in wine,adding vnto the wine a little ſea water,and be drunke in three ounces of faire freſh water: he ſaith furthermore,that the fruit or berries doth take away the Sunne-burne and other blemiſhes of the skin.

B The berries do not only clenſe and remoue ſuch kinde of ſpots, but do alſo very quickely waſte and conſume away blacke and blew marks that come of bruiſes and dry-beatings:which thing alſo the roots performe being laid vpon them.

C The yong and tender ſproutings are kept in pickle,and reſerued to be eaten with meat,as *Dioſcorides* teacheth. *Matthiolus* writeth,that they are ſerued at mens tables in our age alſo in Tuſcanie; others alſo report the like to be done in Andoloſia one of the kingdomes of Granado.

D It is ſaid that ſwine ſeeke after the roots hereof, which they dig vp and eat with no leſſe delight than they do the roots of *Cyclaminus* or *Panis Porcinus*; whereupon it was called *Cyclaminus altera* or Sow-bread. If this reaſon ſtand for good; then may we in like manner joine hereunto many other roots,and likewiſe call them *Cyclaminus altera* or Sow-bread; for ſwine do not ſeeke after the roots of this only,but alſo of diuers other plants,of which none are of the kinds of Sow-bread. It would therefore be a point of raſhneſſe to affirme *Tamus* or our Ladies ſeale to be a kinde of Sow-bread, becauſe the roots hereof are a pleaſant meat to ſwine.

E The root ſpred vpon ſheeps leather in manner of a plaiſter,whileſt it is yet freſh and greene, taketh away blacke and blew marks,all ſcars and deformitie of the skin,breaks hard apoſtems,draws forth ſplinters and broken bones,diſſolueth congealed bloud, and being laid on and vſed vpon the hip or huckle bones,ſhoulders,armes,or any other part where there is great paine and ache,it takes it away in ſhort ſpace,and worketh very effectually.

† The figure that was formerly in the ſecond place of this Chapter did no way agree with the deſcription,for it was of the *Vioma* or Trauellors ioy, hereafter to be mentioned; which *Tabernamontanus* (whoſe figures our Author made vſe of) calls *Vitis nigra ſecunda*.

Chap. 322.

Of Bryonie of Mexico.

¶ *The Deſcription.*

1 THat plant which is now called *Mechoacan* or Bryonie of Mexico commeth very neere the kinds of Bindweeds in leaues and trailing branches, but in roots like the Bryonies: for there ſhooteth from the root thereof many long ſlender tendrels,which do infinitely graſpe or claſpe about ſuch things as grow or ſtand next vnto them; whereupon do grow great broad leaues ſharp poinred,of a darke green colour, in ſhape like thoſe of our Ladies ſeale, ſomewhat rough and hairy,and a little biting the tongue: among the leaues come forth the floures (as *Nicolaus Monardus* writeth) not vnlike thoſe of the Orenge tree, but rather of the golden Apple of Loue,conſiſting of fiue ſmall leaues,out of the midſt whereof comes forth a little clapper or pistil in manner of a round lump as big as an haſell nut; which being diuided with a thin skin or membrane that commeth through it, openeth into two parts, in each whereof are contained two ſeeds as big as Peaſe,in colour blacke and ſhining. The root is thicke and long,very like vnto the root of white Bryonie,whereof we make this a kinde,although in the taſte of the roots there is ſome difference; for the root of white Bryonie hath a bitter taſte,and this hath little or no taſte at all.

2 The Bryonie or *Mechoacan* of Peru groweth vp with many long trailing flexible branches, interlaced with diuers Viny tendrels which take hold of ſuch things are next or neere vnto them, euen in ſuch manner of claſping or climing as doth the blacke Bryonie or wine Vine,whereunto it is very like almoſt in each reſpect,ſauing that his moſſie floures do ſmell very ſweetly. The fruit as yet I haue not obſerued, by reaſon that the plant which growes in my garden did not perfect the ſame,by occaſion of the great raine and intemperat weather that hapned *An.* 1596. but I am in good hope to ſee it in his perfection,and then we ſhall eaſily iudge whether it be that right *Mechoacan* that hath bin brought from Mexico and other places of the Weſt Indies, or no. The root by the figure ſhould ſeeme to anſwer that of the wilde Vine,but as yet thereof I cannot write certainly.

‡ 3 There is brought to vs and into vſe of late time, the root of another plant which ſeemes to

1 *Mechoacan.*
Bryonie of Mexico.

2 *Mechoacan Peruviana.*
Bryonie of Peru.

haue much affinity with *Mechoacan*, and therefore *Bauhine* hath called it *Bryonia Mechoacan nigricans* and thus deliuers the historie thereof: [It is a root like *Mechoacan*, but couered with a blackish barke, and reddish, or rather grayish on the inside, and cut into slices; it was brought some yeares agon out of India, by the name of *Chelapa* or *Gelapa*. It is called by those of Alexandria and Marseilles, *Ialapium*, or *Gelapum*; and of those of Marseilles it is thought the blacke or male *Mechoacan*: the taste is not vngratefull, but gummy, and by reason of the much gumminesse, put to the fire it quickly flames: it in facultie exceeds the common *Mechoacan*, for by reason of the great gumminesse it more powerfully purgeth serous humours with a little griping, also it principally strengthens the liuer and stomacke; wherefore it is safely giuen ʒj. and performs the operation without nauseousnesse. It is vsually giuen in Succorie water or some thin broth, three houres before meat.] Thus much *Bauhine*, who saith it was first brought to these parts eleuen yeres before he set forth his *Prodromus*, which was about 1611. It hath bin little vsed here till within these ten yeares. ‡

¶ *The Place.*

Some write, that *Mechoacan* was first found in the prouince of New Spain, neer the city of Mexico or Mexican, whereof it tooke his name. It groweth likewise in a prouince of the West Indies called Nicaragua and Quito, where the best is thought to grow.

¶ *The Names.*

It beareth his name, as is said, of the prouince wherein it is found. Some take it for a kinde of Bryonie: but seeing the root is nothing bitter, but rather without taste, it agrees little with Bryonie, for the root of Bryonie is very bitter. Diuers name it *Rha album* or white Rubarb, but vnproperly, being nothing like. It comes neere vnto Scammonie, and if I might yeeld my censure, it seems to be *Scammonium quoddam Americanum*, or a certaine Scammonie of America. Scammony ceeseth, as we haue said, like Binde-weed: the root is both white and thicke: the juice hath but little taste, as also hath this of *Mechoacan*. It is called in English, Mechoca, and Mechocan, and may be called Indian Bryonie.

¶ *The Temperature*

The root is of a mean temper between hot and cold, but [illegible] dry.

¶ *The Vertues.*

It purgeth by ſiege eſpecially flegme, and then wateriſh humors. It is giuen from one full dram weight to two, and that with wine, or with ſome diſtilled water (according as the diſeaſe requires) or elſe in fleſh broth.

It is giuen with good effect to all whoſe diſeaſes proceed of flegme and cold humors: it is good againſt head-ache that hath continued long, old coughs, hardneſſe of breathing, the colique, paine of the kidnies and joints, the diſeaſes of the reins and belly.

Chap. 323. *Of the manured Vine.*

¶ *The Kindes.*

THe Vine may be accounted among thoſe plants that haue need of ſtayes and props, and canot ſtand by themſelues; it is held vp with poles and frames of wood, and by that means it ſpreds all about and climbeth aloft: it ioyneth it ſelfe vnto trees or whatſoeuer ſtandeth neere vnto it.

Of Vines that bring forth wine ſome be tame and husbanded, others wild: of tame Vines there are many that be greater, and likewiſe another ſort that are leſſer.

¶ *The Deſcription.*

THe trunke or body of the Vine is great and thicke, very hard, couered with many barks, which are full of cliffes or chinks; from which grow forth branches as it were armes, many wayes ſpreading; out of which come forth jointed ſhoots or ſprings; and from the boſom of thoſe joints, leaues and claſping tendrels, and likewiſe bunches or cluſters full of grapes: the leaues be broad, ſomething round, fiue cornered, and ſomewhat indented about the edges: amongſt which come forth many claſping tendrels, that take hold of ſuch props or ſtaies as ſtand next vnto it. The grapes differ both in colour and greatneſſe, and alſo in many other things, which to diſtinguiſh ſeuerally were impoſſible, conſidering the infinite ſorts or kinds, and alſo thoſe which are tranſp'anted from one region or clymat to another, do likewiſe alter both from the forme and taſte they had before: wherefore it ſhall be ſufficient to ſet forth the figure of the manured grape, and ſpeak ſomwhat of the reſt.

There is found in Grecia and the parts of Morea, as *Pantalarea*, *Zante*, *Cephalonia*, and *Petras* (whereof ſome are Iſlands, and others of the continent) a certain Vine that hath a trunk or body of a woody ſubſtance, with a ſcaly or rugged barke of a graviſh colour, whereupon grow faire broad leaues ſleightly indented about the edges, not vnlike thoſe of the marſh Mallow: from the boſom whereof come forth many ſmall claſping tendrels, and alſo tough and pliant foot-ſtalks, whereon grow very faire bunches of grapes of a Watchet blewiſh colour: from the which fruit commeth forth long tender laces or ſtrings ſuch as is found among Sauorie, whereupon we call that plant which hath laced Sauorie, not vnlike that growing among and vpon flax, which we cal Dodder, or *Podagralini*, whereof is made a blacke wine called Greeke wine, yet of the taſte of Sack. The laced fruit of this Vine may be fitly termed *Vua barbata*, laced or bearded Grapes.

The plant that beareth thoſe ſmall Raiſins which are commonly called Corans or Currans, or rather Raiſins of Corinth, is not that plant which among the vulgar people is taken for Currans, it being a ſhrub or buſh that brings forth ſmall cluſters or berries, differing as much as may be from Corans, hauing no affinitie with the Vine or any kinde thereof. The Vine that beareth ſmall Raiſins hath a body or ſtock as other Vines haue, branches and tendrels likewiſe. The leaues are larger than any of the others, ſnipt about the edges like the teeth of a ſaw: among which come forth cluſters of grapes in forme like the other, but ſmaller, of a blewiſh colour; which beeing ripe are gathered and laid vpon hurdles, carpets, mats, and ſuch like, in the Sun to dry: then are they caried to ſome houſe and laid vpon heaps, as wee lay apples and corne in a garner, vntill the merchants buy them: then do they put them into large buts or other woodden veſſels, and tread them downe with their bare feet, which they call Stiuing, and ſo are they brought into theſe parts for our vſe. ‡ And they are commonly termed in Latine, *Vuæ Corinthiacæ*, and *Paſſulæ minores*.

There is alſo another which beareth exceeding faire Grapes whereof they make Raiſins, whiter coloured, and much exceeding the bigneſſe of the common Raiſin of the Sunne; yet that grape whereof

Vitis Vinifera.
The manured Vine.

wherof the Raisin of the Sun is made is a large one, and thought to bee the *Vva Zibibi* of the Arabians; and it is that which *Tabernamontanus* figured vnder that name, who therin was followed by our Author: but the figures being little to the purpose, I haue thought good to omit them. ‡

There is another kinde of Vine which hath great leaues very broad, of an ouerworne colour; whereupon grow great bunches of grapes of a blewish colour, the pulpe or meat whereof sticketh or cleaueth so hard to the graines or little stones, that the one is not easily diuided from the other, resembling some starued or withered berry that hath been blasted, whereof it was named *Duracina*.

There be some Vines that bring forth grapes of a whitish or reddish yellow colour; others of a deep red, both in the outward skin, juice, and pulpe within.

There be others whose grapes are of a blew colour, or something red, yet is the juice like those of the former. These grapes doe yeeld forth a white wine before they are put into the presse, and a reddish or paller wine when they are trodden with the husks, & so left to macerate or ferment, with which if they remain too long, they yeeld forth a wine of a higher colour.

There be others which make a black and obscure red wine, whereof some bring bigger clusters, and consist of greater grapes, others of lesser; some grow more clustered or closer together, others looser; some haue but one stone, others more; some make a more austere or harsh wine, others a more sweet: of some the old wine is best, of diuers the first yeres wine is most excellent: some bring forth fruit foure square, of which kindes we haue great plenty.

¶ *The Place.*

A fit soile for Vines, saith *Florentinus*, is euery blacke earth, which is not very close nor clammy, hauing some moisture. But *Columella* saith great regard is to be had, what kinde or sort of Vine you would nourish, according to the nature of the country and soile.

A wise husbandman will commit to a fat and fruitfull soile a leane Vine, of his own nature not too fruitfull: to a lean ground a fruitfull Vine: to a close and, compact earth a spreading vine, and that is full of matter to make branches of: to a loose and fruitful soile a Vine of few branches. The same *Columella* saith, that the Vine delighteth not in dung, of what kinde soeuer it be; but fresh mold mixed with some shauings of horne is the best to be disposed about the roots to cause fertilitie.

¶ *The Time.*

Columella saith Vines must be pruned before the yong branches spring forth. *Palladius* writeth, in Februarie: if they be pruned later they lose their nourishment with weeping.

¶ *The Names.*

The Vine is called in Greeke, Ἄμπελος οἰνόφορος: as much to say in Latine, as *Vitis Vinifera*, or the vine which beareth wine; and Ἄμπελος ἥμερος: that is, *Vitis manſuefacta, ſiue cultiva*, Tame or manured Vine. And it is called οἰνόφορος, that it may differ from both the Bryonies, the white and blacke, and from *Tamus* or our Ladies seale, which be likewise named Ἄμπελοι. It is called *Vitis*, because *inuitatur ad uuas pariendas*. It is cherished to the intent to bring forth full clusters, as *Varro* saith.

Pliny, lib. 14. *cap.* 3. maketh *Vva Zibeba*, *Alexandrina vitis*, or Vine of Alexandria; describing the same by those very words that *Theophrastus* doth. *Dioscorides* sets it down to be *altera ſpecies Vitis ſylueſtris*, or a second kinde of wilde Vine; but we had rather retaine it among the tame Vines. We may name it in English, Raisin Vine. The fruits hereof are called in shops, *Paſſularum de Corintho*: in English, Corans, or small Raisins.

Sylueſtris

Syluestris Vitis or wilde Vine is called in Greek, Ἄμπελος ἀγρία: and in Latine *Labruſca*; as in *Virgils* Eclogs.

——— *Adſpice ad antrum*
Syluestris raris ſparſit labruſca racemis.

——— See how the wilde Vine
Bedecks the caue with ſparſed cluſters fine.

To this wilde Vine doth belong thoſe which *Pliny, lib. 16. cap. 27.* reporteth to be called *Triſera* or that bring three ſundry fruits in a yeare, as *Inſanæ* and mad bearing Vines; becauſe in thoſe ſome cluſters are ripe and full growne, ſome in ſwelling, and others but flouring.

The fruit of the Vine is called in Greeke βότρυς, and σταφυλὴ: in Latine, *Racemus*, and *Vua*: in Engliſh a bunch or cluſter of Grapes.

The cluſter of grapes that hath bin withered or dried in the Sun is named in Greeke σταφὶς: in Latine, *Vua Paſſa*: in ſhops, *Paſſula*: in Engliſh, Raiſins of the Sun.

The berry or grape it ſelfe is called in Latine *Acinus*, and alſo *Granum*, as *Democritus* ſaith, ſpeaking of the berry.

The ſeeds or ſtones contained within the berries are called in Latine *Vinacea*, and ſomtimes *Nuclei*: in ſhops, *Arilli*, as though they ſhould ſay *Ariduli*, becauſe they are dry and yeeld no juice: notwithſtanding *Vinacea* are taken in *Columella* for the droſſe or remnant of the grapes after they bee preſſed.

The ſtalke which is in the middle of the cluſters, and vpon which the grapes doe hang, is called of *Galen*, βότρυος: of *Varro*, *Scapus uvaram*.

¶ *The Nature and Vertues.*

A The tender claſping branches of the Vine and the leaues do coole and mightily binde: they ſtay bleeding in any part of the body: they are good againſt the laske, the bloudy flix, the heart-burne, heate of the ſtomacke, or readineſſe to vomit. It ſtayeth the luſting or longing of women with childe, though but outwardly applied, and alſo taken inwardly after any maner: they be moreouer a remedie for the inflammation of the mouth and almonds of the throat, if they be gargled, or the mouth waſhed therewith.

B Of the ſame faculti̇e be alſo the cluſters gathered before they be ripe; and likewiſe the bunches of the wilde Grape, which is accounted to be more effectuall againſt all thoſe infirmities.

C *Dioſcorides* ſaith, That the liquor which falleth from the body and branches beeing cut, and that ſomtimes is turned as it were into a gum (which driueth ſtones out of the kidnies and bladder, if it be drunke in wine) healeth ring-wormes, ſcabs, and lepry, but the place is firſt to be anointed with Nitre. Being often anointed or layd on it taketh away ſuperfluous haires: but yet he ſaith that the ſame is beſt which iſſueth forth of the green and ſmaller ſticks, eſpecially that liquor which falls away whileſt the branches are burning, and it takes away Nits being laid on them.

D The ſtones and other things remaining after the preſſing are good againſt the bloudy flix, the laske of long continuance, and for thoſe that are much ſubiect to vomiting.

E The aſhes made of the ſticks and droſſe that remain after the preſſing, being laid vpon the piles and hard ſwellings about the fundament, cure the ſame: beeing mixed with oile of Rue or Herbe-Grace and Vineger, as the ſame Authour affirmeth, it helpeth to ſtrengthen members out of ioynt, and ſuch as are bitten with any venomous beaſt, and eaſeth the pain of the ſpleen or milt, being applied in manner of a plaiſter.

F The later age do vſe to make a Lye with the aſhes of Vine ſtickes, in compoſition of cauſticke and burning medicines, which ſerue in ſtead of an hot iron: the one wee call a potentiall cauterie, and the other actuall.

¶ *Of Grapes.*

G OF Grapes, thoſe that are eaten raw do trouble the belly, and fil the ſtomacke full of wind, eſpecially ſuch as are of a ſoure and auſtere taſte; ſuch kindes of Grapes do very much hinder the concoction of the ſtomacke; and while they are diſperſed through the liuer and veins they ingender cold and raw juice, which cannot eaſily be changed into good bloud.

H Sweet Grapes and ſuch as are thorow ripe are leſſe hurtfull: the juice is hotter, and eaſilier diſperſed. They alſo ſooner paſſe through the belly, eſpecially being moiſt, and moſt of all if the liquor with the pulp be taken without the ſtones and skin, as *Galen* ſaith.

I The ſubſtance of the ſtones, although it be drier, and of a binding quality, doth deſcend thorow all

all the bowels,and is nothing changed; as also the skins, which are little or nothing at all altered in the body.

Those grapes which haue a strong taste of wine are in a mean between soure and sweet.

Such grapes as haue little juice do nourish more,and those lesse that haue more juice:but these do sooner descend; for the body receiueth more nourishment by the pulp than by the juice;by the juice the belly is made more soluble.

Grapes haue the preheminence among the Autumne fruits,and nourish more than they all, but yet not so much as figges; and they haue in them little ill juice, especially when they bee thorow ripe.

Grapes may be kept the whole yeare,being ordered after the same manner that *Ioachimus Camerarius* reporteth. You shall take, saith hee, the meale of mustard seed,and strew in the bottome of any earthen pot well leaded; whereupon you shall lay the faireſt bunches of the ripeſt grapes, the which you shall couer with more of the foresaid meale,and lay vpon it another sort of Grapes, so doing vntiil the pot be full; then shall you fill vp the pot to the brimme with a kind of sweet wine called Must. The pot being very close couered shall be set into some cellar or other cold place:the grapes you may take forth at your pleasure,washing them with faire water from the pouder.

¶ *Of Raisins.*

OF Raisins most are sweet, some haue an austere or harsh taste: sweet Raisins are hotter, austere colder; both of them do moderatly bind,but the austere somwhat more,which do strengthen the stomacke more. The sweet ones do neither slacken the stomack,nor make the belly soluble,beeing taken with their stones,which are of a binding qualitie: otherwise the stones taken forth,they do make the belly loose and soluble.

Raisins yeeld good nourishment to the body,they haue in them no ill juice at all, but ingender somwhat a thick juice,which notwithstanding nourisheth the more.

There comes of sweet and fat Raisins most plenty of nourishment; of which they are the best that haue a thin skin.

There is in the sweet ones a temperat and smoothing qualitie,with a power to clense moderately: they are good for the cheſt,lungs,winde-pipe, kidnies, bladder, and stomacke; for they make smooth the roughnesse of the winde-pipe, and are good against hoarsenesse, short windednesse, or difficultie of breathing: they serue to concoct the spittle, and cause it to rise more easily in any disease whatsoeuer of the cheſt,sides,or lungs,and do mitigate the pain of the kidnies and bladder which hath joined with it heate and sharpenesse of vrine: they dull and allay the malice of sharpe and biting humors that hurt the mouth of the stomacke.

Moreouer,Raisins are good for the liuer,as *Galen* writeth in his seuenth booke of Medicines according to the places affected; for they be of force to concoct raw humors and restraine their malignitie,and they themselues do hardly putrifie: besides, they are properly and of their owne substance familiar to the intrals,cure any distemper,and nourish much, wherein is their chief vertue; for they strengthen, resist putrifaction, and helpe without hurt any distemperature of moisture or coldnesse,as the said *Galen* affirmeth.

The old Physitions haue taught vs to take out the stones, as we may see in diuers compositions of the antient writers;as namely in that called by *Galen*, *Arteriaca Mithridatis*,which hath the seeds taken out: for seeing that Raisins containe in them a thicke substance, they canot easily passe thorow the veins,but are apt to breed obstructions and stoppings of the intrals; which happeneth the rather by reason of the seeds,for they so much the harder passe through the body,and do quickely and more easily cause obstructions,in that they are more astringent or binding. Wherefore the seeds are to be taken out, for so shall the juice of the Raisins more easily passe, and the sooner bee distributed through the intrals.

Dioscorides reporteth,That Raisins being chewed with pepper draw flegme and water out of the head.

Of Raisins is made a pulteſſe good for the gout,rottings about the joints,gàngrens, and mortified vlcers: beeing stamped with the herb All-heale it quickely takes away the loose nailes in the fingers and toes,being laid thereon.

¶ *Of Must.*

MVst, called in Latine *Mustum*,that is to say,the liquor newly issuing out of the grapes when they be trodden or pressed, doth fill the stomacke and intrals with winde; it is hardly digested, it is of a thicke juice,and if it doe not speedily passe through the body, it becommeth more hurtfull.

hurtfull. It hath only this one good thing in it(as *Galen* ſaith)that it maketh the body ſoluble.

A That which is ſweeteſt and preſſed out of ripe grapes doth ſooneſt paſſe through; but that which is made of ſoure and auſtere grapes is worſt of all; it is more windy,it is hardly concocted, it ingendreth raw humors,and although it doth deſcend with a looſeneſſe of the belly, notwithſtanding it oftentimes bringeth withall the Colique and pain of the ſtone; but if the belly be not moued,all things are the worſe and more troubleſome,and it oft times brings an extreme laske and the bloudy flix.

B The firſt part of the wine that comes forth of it ſelfe before the grapes be preſſed,is anſwerable to the Grape it ſelf,and doth quickly deſcend; but that which iſſues forth afterward,hauing ſome part of the nature of the ſtones,ſtalks,and skins,is far worſe.

¶ *Of Cute.*

C OF Cute that is made of Muſt,which the Latines call *Sapa*, and *Defrutum*, is that liquor called in Engliſh Cute,which is made of the ſweeteſt Muſt, by boiling it to a certaine thickneſſe, or to a third part,as *Columella* writeth.

D *Pliny* affirmeth, That *Sapa* and *Defrutum* differ in the maner of the boiling,and that *Sapa* is made when the new Wine is boiled away till onely a third part remaines; and *Defratum* till halfe bee boiled.

E *Siræum* (ſaith he,*lib*.14.*cap*.17.) which others call ἕψημα, and we *Sapa*, a worke of wit,and not of Nature, is made of new Wine boyled to a third part; which beeing boyled to halfe, wee call *Defrutum*.

F *Palladius* ioyneth to theſe *Carœnum*,which as hee ſaith is made when a third part is boiled away, and two remaine.

G *Leontius* in his Geoponicks ſheweth, That *Hepſema* muſt be made of eight parts of new Wine, and an hundred of wine it ſelfe boiled to a third.

H *Galen* teſtifieth, That *Hepſema* is new wine very much boiled. The later phyſitians call *Hepſema* or *Sapa* boiled wine.

I Cute or boiled wine is hot, yet not ſo hot as wine,but thicker,not ſo eaſily diſtributed or caried through the body,and it ſlowly deſcendeth by vrine,but by the belly oftentimes ſooner, for it moderatly looſens it.

K It nouriſheth more,and filleth the body quickly; yet doth it by reaſon of his thickneſſe ſticke in the ſtomack for a time,and is not ſo fit for the liuer or ſpleen. Cute alſo digeſteth raw humours that ſticke in the cheſt and lungs,and raiſeth them vp ſpeedily;wherfore it is good for the cough and ſhortneſſe of breath.

L The Vintners of the Low-Countries (and perhaps of London) do make of Cute and wine mixt in a certain proportion, a compound and counterfeit wine which they ſell for Candy wine, vſually called Malmſey.

M *Pliny*,*lib*.14.*cap*.9. ſaith,that Cute was firſt deuiſed for a baſtard hony.

¶ *Of Wine.*

N TO ſpeake of wine the juice of Grapes,which being newly preſſed forth is called (as wee haue ſaid) *Muſtum* or new wine;after the dregs and droſſe are ſetled, and it appeareth pure and cleer, it is called in Greek Οἶνος: in Latine,*Vinum*: in Engliſh, Wine,and that not vnproperly. For certain other juices,as of Apples,Pomegranats,Peares,Medlars,Seruices,or ſuch otherwiſe made(for examples ſake)of Barley and Graine,be not at all ſimply called wine,but with the name of the thing added whereof they do conſiſt. Hereupon is the wine which is preſſed forth of the Pomegranate berries named *Rhoites*,or wine of Pomegranats; out of Quinces,*Cydonites*,or wine of Quinces: out of Peares, *Apyites* or Perry; and that which is compounded of Barley is called *Zythum*, or Barley wine: in Engliſh, Ale or Beere.

O And other certain wines haue borrowed ſyrnames of the plants that haue bin infuſed or ſteeped in them; and yet all wines of the Vine,as Wormwood wine,Myrtle wine,and Hyſſop wine,which are all called artificiall wines.

P That is properly and ſimply called wine which is preſſed out of the grapes of the wine, and is without any manner of mixture.

Q The kindes of Wines are not of one nature,nor of one facultie or power, but of many, differing one from another; for there is one difference thereof in taſte, another in colour, the third is referred to the conſiſtence or ſubſtance of the Wine; the fourth conſiſteth in the vertue and ſtrength thereof. *Galen* addeth that which is found in the ſmell, which belongs to the vertue and ſtrength of the Wine.

That

That may also bee joyned vnto them, which respecteth the age: for by age wines become hotter and sharper, and doe withall change oftentimes the colour, the substance, and the smell: for some wines are sweet of taste; others austere or somthing harsh; diuers of a rough taste, or altogether harsh; and most of them sufficient sharp: there be likewise wines of a middle sort, inclining to one or other qualitie. A

Wine is of colour either white or reddish, or of a blackish deep red, which is called blacke, or of some middle colour betweene these. B

Some wine is of substance altogether thin; other some thick and fat; and many also of a middle consistence. C

One wine is of great strength, and another is weake, which is called a waterish wine: a full wine is called in Latine *Vinosum*. There be also among these very many that be of a middle strength. D

There is in all wines, be they neuer so weake, a certaine winie substance thin and hot. There be likewise waterie parts, and also diuers earthy: for wine is not simple, but (as *Galen*, testifieth *lib.* 4. of the faculties of medicines) consisteth of parts that haue diuers faculties. E

Of the sundry mixture and proportion of these substances one with another, there rise diuers and sundry faculties of the wine. F

That is the best and fullest wine in which the hot and winie parts doe most of all abound: and the weakest is that wherein the waterie haue the preheminence. G

The earthy substance abounding in the mixture causeth the wine to be austere or something harsh, as a crude or raw substance doth make it altogether harsh. The earthy substance being severed falleth downe, and in continuance of time sinketh to the bottome, and becomes the dreggs or lees of the wine: yet it is not alwaies wholly seuered, but hath both the tast and other qualities of this substance remaining in the wine. H

All wines haue their heate, partly from the proper nature and inward or originall heate of the vine, and partly from the Sun: for there is a double heate which ripeneth not only the grapes, but also all other fruits, as *Galen* testifieth; the one is proper and naturall to euery thing; the other is borrowed of the Sun; which if it be perceiued in any thing, it is vndoubtedly best and especially in the ripening of grapes. I

For the heate which proceeds from the Sun concocteth the grapes and the juice of the grapes, and doth especially ripen them, stirring vp and increasing the inward and naturall heat of the wine, which otherwise is so ouerwhelmed with abundance of raw and waterish parts, as it seemes to bee dulled and almost without life. K

For vnlesse wine had in it a proper and originall heat, the grapes could not be so concocted by the force of the Sunne, as that the wine should become hot; no lesse than many other things naturally cold, which although they be ripened and made perfect by the heat of the Sun, do not for all that lose their originall nature; as the fruits, iuices, or seeds of Mandrake, Nightshade, Hemlocke, Poppy, and of other such like, which though they be made ripe, and brought to full perfection, yet still retaine their owne cold qualitie. L

Wherefore seeing that wine through the heate of the Sunne is for the most part brought to his proper heate, and that the heate and force is not all alike in all regions and places of the earth; therefore by reason of the diuersitie of regions and places, the wines are made not a little to differ in faculties. M

The stronger and fuller wine groweth in hot countries and places that lie to the Sun; the rawer and weaker in cold regions and prouinces that lie open to the North. N

The hotter the Summer is, the stronger is the wine; the lesse hot or the moister it is, the lesse ripe is the wine. Notwithstanding not only the manner of the weather and of the Sun, maketh the qualities of the wine to differ, but the natiue propertie of the soile also; for both the tast and other qualities of the wine are according to the manner of the Soile. And it is very well knowne, that not only the colour of the wine, but the tast also dependeth vpon the diuersity of the grapes. O

Wine (as *Galen* writeth) is hot in the second degree, and that which is very old, in the third; but new wine is hot in the first degree: which things are especially to bee vnderstood concerning the meane betweene the strongest and the weakest; for the fullest and mightiest (being but *Horna*, that is as I take it, of one yeare old) are for the most part hot in the second degree. The weakest and the most waterish wines, although they be old, do seldome exceed the second degree. P

The drinesse is answerable to the heate in proportion, as *Galen* saith in his book of Simples: but in his books of the gouernment of health he sheweth, that wine doth not only heate, but also moisten our bodies, and that the same doth moisten and nourish such bodies as are extreame dry; and both these opinions be true. Q

For the faculties of wine are of one sort as it is a medicine, and of another as it is a nourishment; which *Galen* in his book of the faculties of nourishments doth plainly shew, affirming that those qualities of the wine which *Hippocrates* writeth of in his booke of the manner of diet, be not R

as

as a nouriſhment, but rather as of a medicine. For wine as it is a medicine doth dry, eſpecially being outwardly applied; in which caſe, for that it doth not nouriſh the body at all, the drines doth more plainely appeare, and is more manifeſtly perceiued.

A Wine is a ſpeciall good medicine for an vlcer, by reaſon of his heate and moderate drying, as *Galen* teacheth in his fourth booke of the method of healing.

B *Hippocrates* writeth, That vlcers, what manner of ones ſoeuer they are, muſt not be moiſtned vnleſſe it be with wine: for that which is dry (as *Galen* addeth) commeth neerer to that which is whole, and the thing that is moiſt, to that which is not whole.

C It is manifeſt, that Wine is in power or facultie dry, and not in act; for Wine actually is moiſt and liquid, and alſo cold: for the ſame cauſe it likewiſe quencheth thirſt, which is an appetite or deſire of cold and moiſt, and by this actuall moiſture (that we may ſo terme it) it is if it be inwardly taken, not a medicine, but a nouriſhment; for it nouriſheth, and through his moiſture maketh plenty of bloud; and by increaſing the nouriſhment it moiſtneth the body, vnleſſe peraduenture it be old and very ſtrong: for it is made ſharpe and biting by long lying, and ſuch kinde of Wine doth not only heate, but alſo conſume and dry the body, for as much as it is not now a nouriſhment, but a medicine.

D That wine which is neither ſharp by long lying, nor made medicinable, doth nouriſh and moiſten, ſeruing as it were to make plenty of nouriſhment and bloud, by reaſon that through his actuall moiſture it more moiſtneth by feeding, nouriſhing, and comforting, than it is able to dry by his power.

E Wine doth refreſh the inward and naturall heate, comforteth the ſtomacke, cauſeth it to haue an appetite to meat, moueth concoction, and conueyeth the nouriſhment through all parts of the body, increaſeth ſtrength, inlargeth the body, maketh flegme thin, bringeth forth by vrine cholericke and waterie humors, procureth ſweating, ingendreth pure bloud, maketh the body well coloured, and turneth an ill colour into a better.

F It is good for ſuch as are in a conſumption, by reaſon of ſome diſeaſe, and that haue need to haue their bodies nouriſhed atd refreſhed (alwaies prouided they haue no feuer,) as *Galen* ſaith in his ſeuenth booke of the Method of curing. It reſtoreth ſtrength moſt of all other things, and that ſpeedily: It maketh a man merry and ioyfull: It putteth away feare, care, troubles of minde, and ſorrow: It moueth pleaſure and luſt of the body, and bringeth ſleepe gently.

G And theſe things proceed of the moderate vſe of wine: for immoderate drinking of wine doth altogether bring the contrarie. They that are drunke are diſtraughted in minde, become fooliſh, and oppreſſed with a drowſie ſleepineſſe, and be afterward taken with the Apoplexy, the gout, or altogether with other moſt grieuous diſeaſes; the braine, liuer, lungs, or ſome other of the intrails being corrupted with too often and ouermuch drinking of wine.

H Moreouer, wine is a remedy againſt taking of Hemlock or green Coriander, the juice of black Poppy, Wolfes bane, and Leopards-bane, Tode-ſtooles, and other cold poiſons, and alſo againſt the biting of Serpents, and ſtings of venomous beaſts, that hurt and kill by cooling.

I Wine alſo is a remedy againſt the ouer-fulneſſe and ſtretching out of the ſides, windy ſwellings, the green ſickneſſe, the dropſie, and generally all cold infirmities of the ſtomack, liuer, milt, and alſo of the matrix.

K But Wine which is of colour and ſubſtance like water, throughſhining bright, pure, of a thinne ſubſtance, which is called white, is of all wines the weakeſt; and if the ſame ſhould bee tempered with water it would beare very little: and hereupon *Hippocrates* calleth it ὀλιγόφορον, that is to ſay, bearing little water to delay it withall.

L This troubleth the head and hurteth the ſinewes leſſe than others do, and is not vnpleaſant to the ſtomacke: it is eaſily and quickely diſperſed thorow all parts of the body: it is giuen with far leſſe danger than any other wine, to thoſe that haue the Ague (except ſome inflammation or hot ſwelling be ſuſpected) and oftentimes with good ſucceſſe to ſuch as haue intermitting feuers; for as *Galen*, *lib.* 8. of his Method ſaith, it helpeth concoction, digeſteth humors that be halfe raw, procureth vrine and ſweat, and is good for thoſe that cannot ſleep, and that be full of care and ſorrow, and for ſuch as are ouerwearied.

M Black wine, that is to ſay, wine of a deep red colour, is thick, and hardly diſperſed, and doth not eaſily paſſe through the bladder: it quickely taketh hold of the braine and makes a man drunk: it is harder of digeſtion: it remaineth longer in the body; it eaſily ſtoppeth the liuer and ſpleen; for the moſt part it bindes, notwithſtanding it nouriſheth more, and is more fit to engender bloud: it filleth the body with fleſh ſooner than others do.

N That which is of a light crimſon red colour is for the moſt part more delightfull to the taſte, fitter for the ſtomacke; it is ſooner and eaſier diſperſed: it troubleth the head leſſe, it remains not ſo long vnder the ſhort ribs, and eaſilier deſcendeth to the bladder than blacke wine doth: it doth alſo

also make the belly costiue, if so be that it be not ripe. For such crude and rough wines do oftentimes molest weake stomackes, and are troublesome to the belly.

A Reddish yellow wine seemeth to be in a meane betweene a thinne and thicke substance: otherwise it is of all vines the hottest; and suffereth most water to be mixed with it, as *Hippocrates* writeth.

B The old vine of this kinde, being of a thin substance and good smell, is a singular medicine for all those that are much subject to swouning, although the cause thereof proceed of choler that hurteth the mouth of the stomacke, as *Galen* testifieth in the 12. booke of his method.

C Sweet wine the lesse hot it is, the lesse doth it trouble the head, and offend the minde; and it better passeth through the belly, making it oftentimes soluble: but it doth not so easily passe or descend by vrine.

D Againe, the thicker it is of substance, the harder and slowlier it passeth through: it is good for the lungs and for those that haue the cough. It ripeneth raw humors that sticke in the chest, and causeth them to be easilier spit vp; but it is not so good for the liuer, whereunto it bringeth no small hurt when either it is inflamed, or schirrous, or when it is stopped. It is also an enemy to the spleene, it sticketh vnder the short ribs, and is hurtfull to those that are full of choler. For this kind of wine, especially the thicker it is, is in them very speedily turned into choler: and in others when it is well concocted, it increaseth plenty of nourishment.

E Austere wine, or that which is somewhat harsh in taste, nourisheth not much; and if so be that it be thin and white, it is apt to prouoke vrine, it lesse troubleth the head, it is not quickly digested, for which cause it is the more to be shunned, as *Galen* saith in 12. booke of his method.

F That wine which is altogether harsh or rough in taste, the lesse ripe it is, the neerer it commeth to the qualities of Verjuyce made of sower grapes, being euidently binding. It strengtheneth a weake stomacke; it is good against the vnkindely lusting or longing of women with childe; it staieth the laske, but it sticketh in the bowels: breedeth stoppings in the liuer and milt; it slowly descendeth by vrine, and something troubleth the head.

G Old wine which is also made sharpe by reason of age, is not only troublesome to the braine, but also hurteth the sinewes: it is an enemy to the entrailes, and maketh the body leane.

H New wine, and wine of the first yeere, doth easily make the body to swell, and ingendreth winde, it causeth troublesome dreames, especially that which is not throughly refined, or thicke, or very sweet: for such do sooner sticke in the entrailes than others do. Other wines that are in a meane in colour, substance, taste or age, as they doe decline in vertues and goodnesse from the extreames; so also they be free from their faults and discommodities. They come neere in faculties to those wines whereunto they be next, either in colour, taste, or substance, or else in smell or in age.

I Wine is fittest for those that be of nature cold and dry; and also for old men, as *Galen* sheweth in his fifth booke of the gouernment of health: for it heateth all the members of their bodies, and purgeth away the watery part of the bloud, if their be any.

K The best wines are those that be of a fat substance: for those both increase bloud, and nourish the body; both which commodities they bring to old men, especially at such time as they haue no ferous humour in their veines, and haue need of much nourishment. It happeneth that oftentimes there doth abound in their bodies a wateriſh excrement, and then stand they in most need of all of such wines as do prouoke vrine.

L As wine is best for old men, so it is worst for children: by reason that being drunke, it both moisteneth and drieth ouermuch, and also filleth the head with vapours, in those who are of a moist and hot complexion, or whose bodies are in a meane betweene the extreames, whom *Galen* in his booke of the gouernment of health doth perswade, that they should not so much as taste of wine for a very long time: for neither is it good for them to haue their heads filled, nor to be made moist and hot, more than is sufficient, because they are already of such a heate and moisture, as if you should but little increase either quality, they would forthwith fall into the extreme.

M And seeing that euery excesse is to be shunned, it is expedient most of all to shun this, by which not only the body, but also the minde receiueth hurt.

N Wherefore we thinke, that wine is not fit for men that be already of full age, vnlesse it be moderately taken, because it carrieth them headlong into fury and lust, and troubleth and dulleth the reasonable part of the minde.

¶ *Of the delaying, or tempering of Wine.*

O IT was an ancient custome, and of long continuance in oldtime, for wines to be mixed with water, as it is plaine and euident not onely by *Hippocrates*, but also by other old mens Writings. Wine first began to be mixed with water for health and wholesomenesse sake: for as *Hippocrates* writeth in his booke of antient Physicke, beeing simply and of it selfe much drunke, it maketh

keth a man in ſome ſort weake and feeble: which thing *Ouid* ſeemeth alſo to allow of, writing thus:

Vt Venus eneruat vires, ſic copia vini
Et tentat greſſas, debilitatque pedes.

As Venery the vigour ſpends, ſo ſtore of Wine
Makes man to ſtagger, makes his ſtrength decline.

A Moreouer, wine is the ſweeter, hauing water poured into it, as *Athenæus* ſaith. *Homer* likewiſe commendeth that wine which is well and fitly allaied. *Philocorus* writeth (as *Athenæus* reporteth) that *Amphictyon* king of Athens was the firſt that allaied wine, as hauing learned the ſame of *Dionyſius*: wherefore he ſaith, that thoſe who in that manner drunke it remained in health, that before had their bodies feeble and ouerweakened with pure and vnmixed wine.

B The manner of mingling or tempering of wine was diuers: for ſometimes to one part of wine, there were added two, and ſometimes three or foure of water; or to two parts of wine three of water: of a leſſe delay was that which conſiſted of equall parts of wine and water.

C The old Comedians did thinke that this leſſer mixture was ſufficient to make men mad, among whom was *Meneſitheus*, whoſe words be extant in *Athenæus*.

D *Hippocrates* in the ſeuenth booke of his Aphoriſmes ſaith, that this manner of tempering of wine and water by equall parts bringeth as it were a light pleaſant drunkenneſſe, and that it is kinde of remedy againſt diſquietneſſe, yawnings, and ſhiuerings; and this mingling belongeth to the ſtrongeſt wines.

E Such kinde of wines they might be which in times paſt the Scythians were reported of the old writers to drinke, who for this cauſe doe call vnmixed wine the Scythians drinke. And they that drinke ſimple wine ſay, that they will *Scithyzare*, or do as the Scythians do, as we may reade in the tenth booke of *Athenæus*.

F The Scythians, as *Hippocrates* and diuers other of the old writers affirme, be people of Germany beyond the floud Danubius, which is alſo called Iſter: Rhene is a riuer of Scythia: and *Cyrus* hauing paſſed ouer Iſter is reported to haue come into the borders of the Scythians.

G And in this our age all the people of Germany do drinke vnmixed wine, which groweth in their owne country, and likewiſe other people of the North parts, who make no ſcruple at all to drinke of the ſtrongeſt wines without any mixture.

¶ *Of the liquor which is diſtilled out of Wine, commonly called,* Aqua vitæ.

H THere is drawne out of Wine a liquor, which in Latine is commonly called *Aqua vitæ*, or water of life, and alſo *Aqua ardens*, or burning water, which as diſtilled waters are drawne out of herbes and other things, is after the ſame manner diſtilled out of ſtrong wine, that is to ſay, by certaine inſtruments made for this purpoſe, which are commonly called Limbeckes.

I This kinde of liquor is in colour and ſubſtance like vnto waters diſtilled out of herbes, and alſo reſembleth cleere ſimple water in colour, but in faculty it farre differeth.

K It beareth the ſyrname of life, becauſe that it ſerueth to preſerue and prolong the life of man.

L It is called *Ardens*, burning, for that it is eaſily turned into a burning flame: for ſeeing it is not any other thing than the thinneſt and ſtrongeſt part of the wine, it being put to the flame of fire, is quickly burned.

M This liquor is very hot, and of moſt ſubtill and thin parts, hot and dry in the later end of the third degree, eſpecially the pureſt ſpirits thereof: for the purer it is, the hotter it is, the dryer, and of thinner parts: which is made more pure by often diſtilling.

N This water diſtilled out of wine is good for all thoſe that are made cold either by a long diſeaſe, or through age, as for old and impotent men: for it cheriſheth and increaſeth naturall heate; vpholdeth ſtrength, repaireth and augmenteth the ſame: it prolongeth life, quickeneth all the ſenſes, and doth not only preſerue the memory, but alſo recouereth it when it is loſt: it ſharpeneth the ſight.

O It is fit for thoſe that are taken with the Catalepſie (which is a diſeaſe in the braine proceeding of drineſſe and cold) and are ſubject to dead ſleepes, if there be no feuer joyned; it ſerueth for the weakeneſſe, trembling, and beating of the heart; it ſtrengtheneth and heateth a feeble ſtomacke; it conſumeth winde both in the ſtomacke, ſides, and bowels; it maketh good concoction of meate, and is a ſingular remedy againſt cold poyſons.

P It hath ſuch force and power, in ſtrengthening of the heart, and ſtirreth vp the inſtruments of the ſenſes

ſenſes, that it is moſt effectuall, not onely inwardly taken to the quantity of a little ſpoonefull, but alſo outwardly applied: that is to ſay, ſet to the noſthrils, or laid vpon the temples of the head, and to the wreſts of the armes; and alſo to foment and bath ſundry hurts and griefes.

Being held in the mouth it helpeth the toothache: it is alſo good againſt cold cramps and convulſions, being chafed and rubbed therewith. A

Some are bold to giue it in quartaines before the fit, eſpecially after the height or prim of the diſeaſe. B

This water is to be giuen in wine with great iudgement and diſcretion; for ſeeing it is extreme hot, and of moſt ſubtill parts, and nothing elſe but the very ſpirit of the wine, it moſt ſpeedily pierceth through, and doth eaſily aſſault and hurt the braine. C

Therefore it may be giuen to ſuch as haue the apoplexie and falling ſickneſſe, the megrim, the headache of long continuance, the Vertigo, or giddineſſe proceeding through a cold cauſe: yet can it not be alwaies ſafely giuen; for vnleſſe the matter the efficient cauſe of the diſeaſe be ſmall, and the ſicke man of temperature very cold, it cannot be miniſtred without danger: for that it ſpredeth and diſperſeth the humours, it filleth or ſtuffeth the head, and maketh the ſicke man worſe: and if the humors be hot, as bloud is, it doth not a little increaſe inflammations alſo. D

This water is hurtfull to all that be of nature and complexion hot, and moſt of all to cholericke men: it is alſo offenſiue to the liuer, and likewiſe vnprofitable for the kidnies, being often and plentifully taken. E

If I ſhould take in hand to write of euery mixture, of each infuſion, of the ſundry colours, and euery other circumſtance that the vulgar people doe giue vnto this water, and their diuers vſe, I ſhould ſpend much time but to ſmall purpoſe.

¶ *Of Argall, Tartar, or wine Lees.*

THe Lees of wine which is become hard like a cruſt, and ſticketh to the ſides of the veſſell and wine casks, being dried, hard, ſound, and well compact, and which may be beaten into pouder, is called in ſhops *Tartarum*: in Engliſh, Argall, and Tartar. F

Theſe Lees are vſed for many things: the ſiluer-Smiths poliſh their ſiluer herewith: the Diers vſe it: and it is profitable in medicine. G

It doth greatly dry and waſte away, as *Paulus Ægineta* ſaith: it hath withall a binding faculty, proceeding from the kinde of wine, of which it commeth. H

The ſame ſerueth for moiſt diſeaſes of the body: it is good for thoſe that haue the greene ſickneſſe and the dropſie, eſpecially that kinde that lieth in the fleſh, called in Latine, *Leucophlagmatica:* being taken euery day faſting halfe a penny weight or a full penny weight (which is a dram and nine graines after the Romanes computation) doth not onely dry vp the wateriſh excrements, and voideth them by vrine, but it preuaileth much to clenſe the belly by ſiege. I

It would worke more effectually, if it were mixed either with hot ſpices, or with other things that breake winde, or elſe with diuretickes, which are medicines that prouoke vrine; likewiſe to be mixed with gentle purgers, as the ſicke mans caſe ſhall require. K

The ſame of it ſelfe, or tempered with oile of Myrtles, is a remedy againſt ſoft ſwellings, as *Dioſcoridees* teacheth: it ſtaieth the laske, and vomiting, being applied outwardly vpon the region of the ſtomacke in a pultis; and if it be laid to the bottome of the belly and ſecret parts, it ſtoppeth the whites, waſteth away hot ſwellings of the kernels in the flankes, and other places, which be not yet exulcerated: it aſſwageth great breſts, and drieth vp the milke, if it be annointed on with vinegre. L

Theſe Lees are oftentimes burnt: if it become all white, it is a ſigne of right and perfect burning, for till then it muſt be burned: being ſo burnt, the Grecians terme it, καυσις, as *Ægineta* ſaith, the Apothecaries call it, *Tartarum uſtum*, and *Tartarum calcinatum*: that is to ſay, burnt or calcined Tartar. M

It hath a very great cauſticke or burning quality: it clenſeth and throughly heateth, bindeth, eateth, and very much drieth, as *Dioſcorides* doth write: being mixed with Roſin, it maketh rough and ill nailes to fall away: *Paulus* ſaith, That it is mixed with cauſtickes or burning medicines to increaſe their burning quality: it muſt be vſed whileſt it is new made, becauſe it quickly vaniſheth, for the Lees of wine burned, doe ſoone relent or wax moiſt, and are ſpeedily reſolued into liquor: therefore he that would vſe it dry, muſt haue it put in a glaſſe, or glaſſed veſſell well ſtopped, and ſet in a hot and dry place. It melteth and is turned into liquor if it be hanged in a linnen bag in ſome place in a celler vnder the ground. N

The Apothecaries call this liquor that droppeth away from it, oile of Tartar. It retaineth a cauſticke and burning quality, and alſo a very dry faculty: it very ſoon taketh away leprie, ſcabs, tetters, and other filth and deformity of the skin and face: with an equall quantity of Roſe water added, O

added,and as much Ceruſe as is ſufficient for a linament,wherewith the blemiſhed or ſpotted parts muſt be annointed ouer night.

¶ *The briefe ſumme of that hath beene ſaid of the Vine.*

A THe juyce of the greene leaues, branches, and tendrels of the Vine drunken, is good for them that vomit and ſpit bloud, for the bloudy flix, and for women with child that vomit ouermuch. The kernell within the grapes boiled in water and drunke hath the ſame effect.

B Wine moderately drunke profiteth much, and maketh good digeſtion, but it hurteth and diſtempereth them that drinke it ſeldome.

C White wine is good to be drunke before meat; it preſerueth the body,and pierceth quickely into the bladder: but vpon a full ſtomacke it rather maketh opilations or ſtoppings, becauſe it doth ſwiftly driue downe meate before Nature hath of her ſelfe digeſted it.

D Claret wine doth greatly nouriſh and warme the body, and is wholeſome with meate, eſpecially vnto phlegmaticke people; but very vnwholeſome for young children, as *Galen* ſaith, becauſe it heateth aboue nature,and hurteth the head.

E Red wine ſtops the belly,corrupteth the bloud,breedeth the ſtone,is hurtfull to old people, and good or profitable to few,ſaue to ſuch as are troubled with the laske,bloudy flix,or any other looſeneſſe of the body.

F Sacke or Spaniſh wine hath been vſed of a long time to be drunke after meat, to cauſe the meat the better to digeſt; but common experience hath found it to be more beneficiall to the ſtomacke to be drunke before meat.

G Likewiſe Malmſey,Muskadell,Baſtard,and ſuch like ſweet wines haue been vſed before meat, to comfort the cold and weake ſtomacke, eſpecially being taken faſting: but experience teacheth, that Sacke drunke in ſtead thereof is much better,and warmeth more effectually.

H Almighty God for the comfort of mankinde ordained Wine; but decreed withall, That it ſhould be moderately taken,for ſo it is wholſome and comfortable:but when meaſure is turned into exceſſe, it becommeth vnwholeſome, and a poyſon moſt venomous, relaxing the ſinewes, bringing with it the palſey and falling ſickneſſe: to thoſe of a middle age it bringeth hot feuers,frenſie, and lecherie; it conſumeth the liuer and other of the inward parts: beſides,how little credence is to be giuen to drunkards it is euident; for though they be mighty men, yet it maketh them monſters,and worſe than brute beaſts. Finally in a word to conclude; this exceſſiue drinking of Wine diſhonoreth Noblemen, beggereth the poore, and more haue beene deſtroied by ſurfeiting therewith,than by the ſword.

CHAP. 324. *Of Hops.*

¶ *The Kindes.*

THere bee two ſorts of Hops: one the manured or the Garden Hop; the other wilde or of the hedge.

¶ *The Deſcription.*

1 THe Hop doth liue and flouriſh by embracing and taking hold of poles, pearches, and other things vpon which it climeth. It bringeth forth very long ſtalkes, rough, and hairie; alſo rugged leaues broad like thoſe of the Vine, or rather of Bryony, but yet blacker, and with fewer dented diuiſions: the floures hang downe by cluſters from the tops of the branches,puffed vp, ſet as it were with ſcales like little canes,or ſcaled Pine apples,of a whitiſh colour tending to yellowneſſe, ſtrong of ſmell: the roots are ſlender, and diuerſly folded one within another.

2 The wilde Hop differeth not from the manured Hop in forme or faſhion, but is altogether leſſer,as well in the cluſters of floures, as alſo in the franke ſhoots, and doth not bring forth ſuch ſtore of floures,wherein eſpecially conſiſteth the difference.

¶ *The Place.*

The Hop joyeth in a fat and fruitfull ground: it proſpereth the better by manuring: alſo it groweth among briers and thornes about the borders of fields,I meane the wilde kinde.

¶ The

1 *Lupus salictarius.*
Hops.

¶ *The Time.*

The floures of hops are gathered in August and September, and reserued to be vsed in beere: in the Spring time come forth new shoots or buds; in the Winter onely the roots remaine aliue.

¶ *The Names.*

It is called in shops and in all other places, *Lupulus*: of some, *Lupus salictarius*, or *Lupulus salictarius*: in high Dutch, **Hopffen**: in low Dutch, **Hoppe**: in Spanish, *Hombrezillos*: in French, *Houblon*: in English, Hops.

Pliny, lib. 21. *cap.* 15. maketh mention of Hops among the prickly plants.

¶ *The Temperature.*

The floures of the hop are hot and dry in the second degree: they fill and stuffe the head, and hurt the same with their strong smell. Of the same temperature also are the leaues themselues, which doe likewise open and clense.

¶ *The Vertues.*

The buds or first sprouts which come forth in A
the Spring are vsed to be eaten in sallads; yet are they, as *Pliny* saith, more toothsome than nourishing, for they yeeld but very small nourishment: notwithstanding they be good for the intrals, both in opening and procuring of vrine, and likewise in keeping the body soluble.

The leaues and little tender stalkes, and also the B
floures themselues remoue stoppings out of the liuer and spleene, purge by vrine, helpe the spleene, clense the bloud, and be profitable against long lingring Agues, scabs, and such like filth of the skin, if they be boyled in whay.

The juyce is of more force, and doth not onely remoue obstructions out of the intrals, but it is C
also thought to auoid choler and flegme by the stoole. It is written, that the same dropped into the eares, taketh away the stench and corruption thereof.

The floures are vsed to season Beere or Ale with, and too many do cause bitternesse thereof, and D
are ill for the head.

The floures make bread light, and the lumpe to be sooner and easilier leauened, if the meale be E
tempered with liquor wherein they haue been boiled.

The decoction of Hops drunke openeth the stoppings of the liuer, the spleene, and kidnies, and F
purgeth the bloud from all corrupt humors, causing the same to come forth with the vrine.

The juyce of Hops openeth the belly, and driueth forth yellow and cholericke humors, and pur- G
geth the bloud from all filthinesse.

The manifold vertues of Hops do manifest argue the wholesomenesse of beere aboue ale; for the H
hops rather make it a physicall drinke to keepe the body in health, than an ordinary drinke for the quenching of our thirst.

CHAP. 325. *Of Trauellers-Ioy.*

¶ *The Description.*

1 THe plant which *Lobel* setteth forth vnder the title of *Viorna*, *Dodonæus* makes *Vitis alba*; but not properly; whose long wooddy and viny branches extend themselues very far, and into infinite numbers, decking with his clasping tendrels and white starre-like floures (being very sweet) all the bushes, hedges, and shrubs that are neere vnto it. It sends forth many branched stalkes, thicke, tough, full of shoots and clasping tendrels, wherewith it foldeth it selfe vpon the hedges, and taketh hold and climeth vpon euery thing that standeth neere vnto it.

The leaues are faſtned for the moſt part by fiues vpon one rib or ſtem, two on either ſide, and one in the midſt or point ſtanding alone; which leaues are broad like thoſe of Iuy, but not cornered at all: among which come forth cluſters of white floures, and after them great tufts of flat ſeeds, each ſeed hauing a fine white plume like a feather faſtned to it, which maketh in the Winter a goodly ſhew, couering the hedges white all ouer with his feather-like tops. The root is long, tough, and thicke, with many ſtrings faſtned thereto.

2 *Cluſius* hath ſet forth a kinde of *Clematis*, calling it *Clematis Bætica*, hauing a maruellous long ſmall branch full of joynts, with many leaues indented about the edges like thoſe of the peare tree, but ſtiffer and ſmaller, comming from euery joynt; from whence alſo at each joynt proceed two ſmall claſping tendrels, as alſo the ſmall foot-ſtalkes whereon the ſeeds do ſtand, growing in great tufted plumes or feathers, like vnto the precedent, whereof it is a kinde. The floures are not expreſſed in the figure, nor ſeene by the Author, and therefore what hath been ſaid ſhall ſuffice.

1 *Viorna.*
The Trauellers-Ioy.

2 *Clematis Bætica.*
The Spaniſh Trauellers-Ioy.

¶ *The Place.*

The Trauellers-Ioy is found in the borders of fields among thornes and briers, almoſt in euery hedge as you go from Grauеſend to Canturbury in Kent; in many places of Eſſex, and in moſt of theſe Southerly parts about London, but not in the North of England that I can heare of.

The ſecond is a ſtranger in theſe parts: yet haue I found it in the Iſle of Wight, and in a wood by Waltham abbey.

¶ *The Time.*

The floures come forth in Iuly: the beautie thereof appeares in November and December.

¶ *The Names.*

The firſt is commonly called *Viorna, quaſi vias ornans*, of decking and adorning waies and hedges, where people trauel; and thereupon I haue named it the Tauellers-Ioy: of *Fuchſius* it is called *Vitis nigra*: of *Dodonæus*, *Vitalba*: of *Matthiolus*, *Clematis altera*: of *Cordus*, *Vitis alba*: of *Dioſcorides*, *Vitis ſylueſtris*: of *Theophraſtus*, *Atragene*: in Dutch, **Linen**: in French, as *Ruellius* writeth, *Viorne*.

¶ *The Temperature and Vertues.*

Theſe plants haue no vſe in phyſicke as yet found out, but are eſteemed onely for pleaſure, by reaſon of the goodly ſhadow which they make with their thicke buſhing and clyming, as alſo for the beauty of the floures, and the pleaſant ſent or ſauour of the ſame.

Chap.

Chap. 326. *Of Ladies Bower, or Virgins Bower.*

¶ *The Description.*

1 That which *Lobel* describeth by the name *Clematis peregrina*, hath very long and slender stalks like the Vine, which are joynted, of a darke colour; it climeth aloft, and taketh hold with his crooked claspers vpon euery thing that standeth nere vnto it: it hath many leaues diuided into diuers parts; among which come the floures that hang vpon slender foot-stalkes, something like to those of Peruinkle, consisting onely of foure leaues, of a blew colour, and sometimes purple, with certaine threds in the middle: the seeds be flat, plaine and sharpe pointed. The roots are slender, and spreading all about.

1 2 *Clematis peregrina Cærulea, sive rubra.*
Blew or red floured Ladies-Bower.

‡ 3 *Clematis Cærulea flore pleno.*
Double floured Virgins-Bower.

2 The second differeth not from the other, in leaues, stalkes, branches nor seed. The only difference consisteth in that, that this plant bringeth forth red floures, and the other blew.

‡ 3 There is preserued also in some Gardens another sort of this *Clematis*, which in roots, leaues, branches, and manner of growing differs not from the former: but the floure is much different, being composed of abundance of longish narrow leaues, growing thicke together, with foure broader or larger leaues lying vnder, or bearing them vp, and these leaues are of a darke blewish purple colour. *Clusius* calls this *Clematis altera flore pleno.* ‡

¶ *The Place.*

These plants delight to grow in Sunnie places: they prosper better in a fruitfull soile than in barren. They grow in my garden, where they flourish exceedingly.

¶ *The Time.*

They floure in Iuly and August, and perfect their seed in September.

¶ *The Names.*

Ladies Bower in called in Greeke, ἀναθρις: in Latine, *Ambuxum*: in English you may call it, Ladies

dies bower, which I take from his aptneſſe in making of Arbors, Bowers, and ſhadie couertures in gardens.

¶ *The Temperature and Vertues.*

The faculties and vſe of theſe in Phyſicke is not yet knowne.

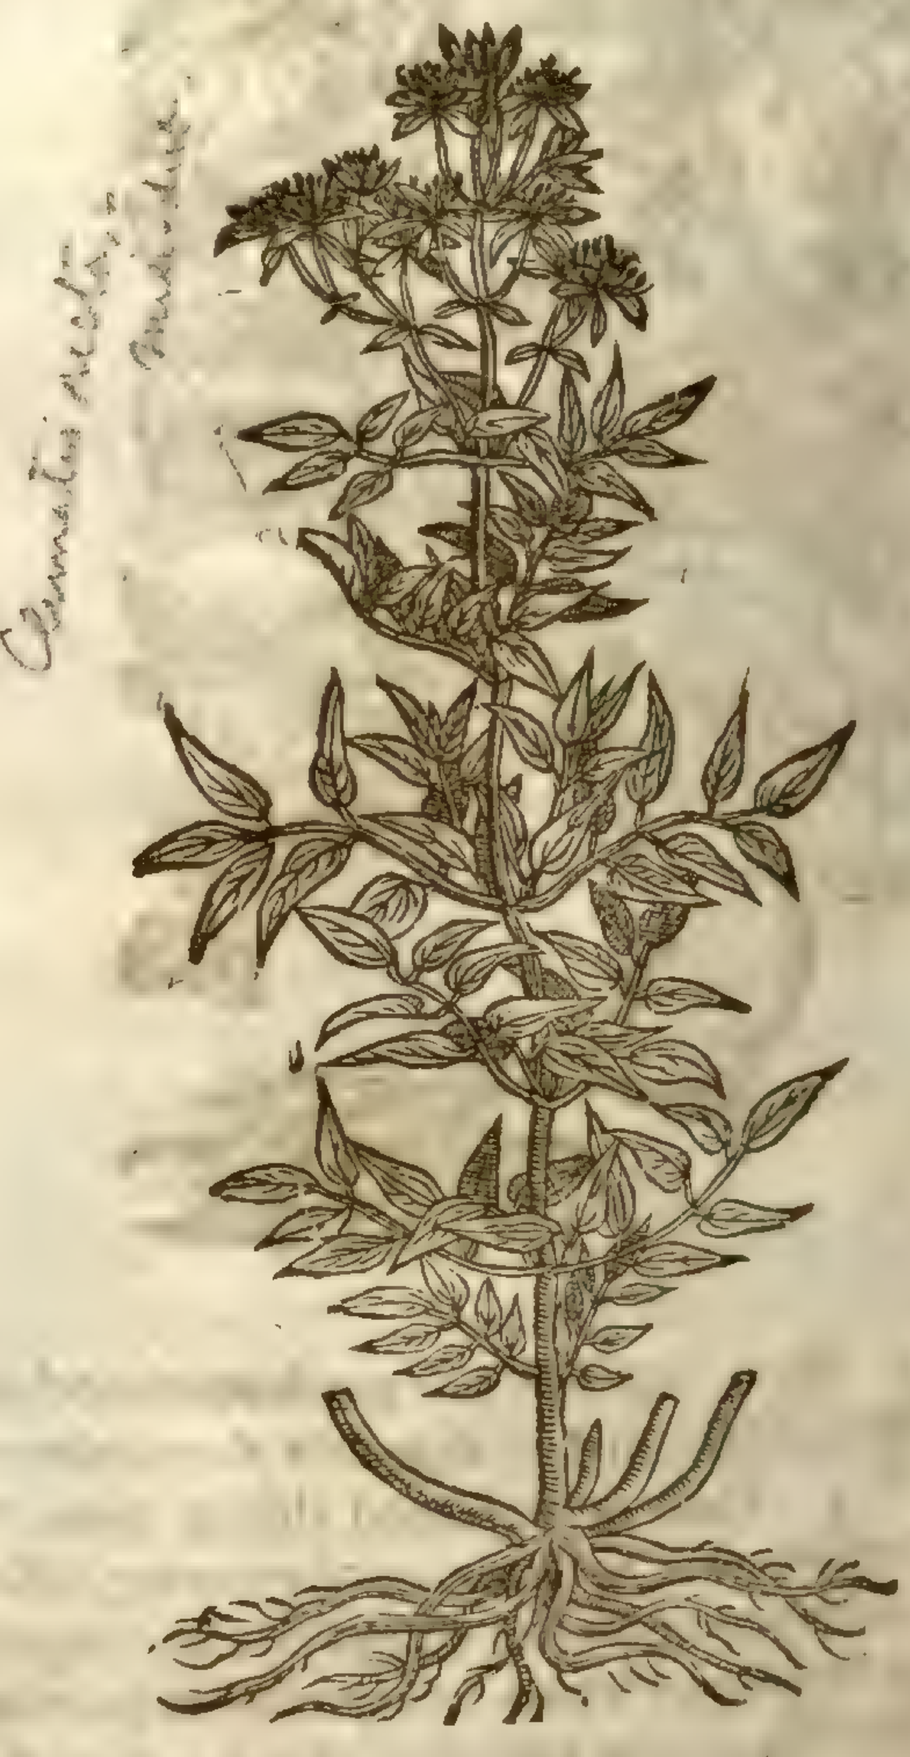
Chap. 327. *Of purging Peruinkle.*

¶ *The Deſcription.*

1 AMong theſe plants which are called *Clematides*, theſe be alſo to be numbred, as hauing certaine affinitie becauſe of the ſpreading, branching, and ſemblance of the Vine; and this is called *Flammula vrens*, by reaſon of his fiery and burning heate, becauſe that being laid vpon the skin, it burneth the place, and maketh an eſchar, euen as our common cauſticke or corroſiue medicines do. The leaues hereof anſwer both in colour and ſmoothneſſe, *Vinca, Peruinca*, or Peruinkle, growing vpon long clambring tender branches, like the other kindes of climbing plants. The flours are very white, ſtar-faſhion, and of an exceeding ſweet ſmell, much like vnto the ſmell of Hawthorne floures, but more pleaſant, and leſſe offenſiue to the head: hauing in the middle of the floures certaine ſmall chiues or threds. The root is tender, and diſperſeth it ſelfe far vnder the ground.

1 *Clematis vrens.*
Virgins Bower.

2 *Flammula Iouis ſurrecta.*
Vpright Virgins Bower.



2 Vpright Clamberer or Virgins Bower is alſo a kinde of *Clematis*, hauing long tough roots not vnlike to thoſe of Licorice; from which riſeth vp a ſtraight vpright ſtalke, of the height of three or foure cubits, ſet about with winged leaues, compoſed of diuers ſmall leaues, ſet vpon a middle rib, as are thoſe of the aſhe tre, or Valerian, but fewer in number: at the top of the ſtalkes come forth ſmall white floures, very like the precedent, but not of ſo pleaſant a ſweet ſmell; after which come the ſeeds, flat and ſharpe pointed.

3 There

3 There is another *Clematis* of the kinde of the white *Clematis* or burning *Clematis*, which I haue recouered from seed, that hath been sent me from a curious and learned citizen of Strawsborough, which is like vnto the other in each respect, sauing that, that the floures hereof are very double, wherein consisteth the especiall difference.

4 Amongst the kindes of climbing or clambering plants, *Carolus Clusius*, and likewise *Lobel* haue numbred these two, which approch neere vnto them in leaues and floures, but are far different in clasping tendrels, or climbing otherwise, being low and base plants in respect of the others of their kinde. The first hath for his roots a bundle of tough tangling threddes, in number infinite, and thicke thrust together; from which rise vp many small stalkes, of a browniſh colour, foure square, and of a wooddy substance: whereupon do grow long leaues, of a biting taste, set together by couples, in shape like those of *Asclepias*, or silken Swallow-wort. The floures grow at the top of the stalkes, of a faire blew or sky colour, consisting of foure parts in manner of a crosse, hauing in the middle a bunched pointell, like vnto the head of field Poppie when it is young, of a whitish yellow colour, hauing little or no smell at all. The floures being past, then commeth the seed, such as is to be seene in the other kindes of *Clematis*. The whole plant dieth at the approch of Winter, and recouereth it selfe againe from the root, which endureth, whereby it greatly increaseth.

4 *Clematis Pannonica.*
Bush Bower.

5 *Clematis major Pannonica.*
Great Bush Bower.

† 5 The great Bush Bower differeth from the former last described in greatnesse, as also in the shape and colour of the floures, which are lesser, stare fashioned, of a deepe purple colour, and edged with greene. †

‡ 6 Of these there is another, whose bending crested stalkes are some three cubits high, which send forth sundry small branches, set with leaues growing together by threes vpon short foot-stalkes, and they are like myrtle leaues, but bigger, more wrinkled, darke coloured, and snipt about the edges: the floure resembles a crosse, with foure sharpe pointed rough leaues of a whitish blew colour, which containe diuers small loose little leaues in their middles. The roor is long and lasting. It growes vpon the rocky places of mount Baldus in Italy, where *Pona* found it, and he calls it *Clematis cruciata Alpina*. ‡

¶ *The*

‡ *6 Clematis cruciata Alpina.*
Virgins Bower of the Alps.

A

¶ *The Place.*

Theſe plants do not grow wilde in England, that I can as yet learne; notwithſtanding I haue them all in my garden, where they flouriſh exceedingly.

¶ *The Time.*

Theſe plants doe floure from Auguſt to the end of September.

¶ *The Names.*

There is not much more found of their names than is expreſſed in their ſeuerall titles, notwithſtanding there hath beene ſomewhat ſaid, as I thinke, by hearefay, but nothing of certaintie: wherefore let that which is ſet downe ſuffice. We may in Engliſh call the firſt, Biting Clematis, or white Clematis, Biting Peruinkle or purging Peruinkle, Ladies Bower, and Virgins Bower.

¶ *The Temperature.*

The leafe hereof is biting, and doth mightily bliſter, being, as *Galen* ſaith, of a cauſticke or burning quality: it is hot in the beginning of the fourth degree.

¶ *The Vertues.*

Dioſcorides writeth, that the leaues being applied do heale the ſcurfe and lepry, and that the ſeed beaten, and the pouder drunke with faire water or with mead, purgeth flegme and choler by the ſtoole.

Chap. 328. *Of Wood-binde, or Hony-ſuckle.*

¶ *The Kindes.*

There be diuers ſorts of Wood-bindes, ſome of them ſhrubs with winding ſtalkes, that wrap themſelues vnto ſuch things as are neere about them. Likewiſe there be other ſorts or kindes found out by the later Herbariſts, that clime not at all, but ſtand vpright, the which ſhall be ſet forth among the ſhrubby plants. And firſt of the common Wood-binde.

¶ *The Deſcription.*

1 Wood-binde or Hony-ſuckle climeth vp aloft, hauing long ſtender wooddy ſtalkes, parted into diuers branches: about which ſtand by certaine diſtances ſmooth leaues, ſet together by couples one right againſt another; of a light greene colour aboue, vnderneath of a whitiſh greene. The floures ſhew themſeluas in the tops of the branches, many in number, long, white, ſweet of ſmell, hollow within; in one part ſtanding more out, with certaine threddes growing out of the middle. The fruit is like little bunches of grapes, red when they be ripe, wherein is contained ſmall hard ſeed. The root is wooddy, and not without ſtrings.

2 This ſtrange kind of Woodbind hath leaues, ſtalks, and roots like vnto the common Woodbinde or Honiſuckle, ſauing that neere vnto the place where the floures come forth, the ſtalkes do grow through the leaues, like vnto the herbe Thorow-wax, called *Perfoliata*; which leaues do reſemble little ſaucers: out of which broad round leaues proceed faire, beautifull, and well ſmelling floures, ſhining with a whitiſh purple colour, and ſomewhat daſht with yellow, by little and little ſtretched out like the noſe of an Elephant, garniſhed within with ſmall yellow chiues or threddes: and when the floures are in their flouriſhing, the leaues and floures do reſemble ſaucers filled with the

the floures of Woodbinde: many times it falleth out, that there is to be found three or foure saucers one aboue another, filled with floures, as the first, which hath caused it to be called double Hony-suckle, or Woodbinde.

1 *Periclymenum.*
Woodbinde or Honisuckles.

2 *Periclymenum perfoliatum.*
Italian Woodbinde.

¶ *The Place.*

The Woodbinde groweth in woods and hedges, and vpon shrubs and bushes, oftentimes winding it selfe so straight and hard about, that it leaueth his print vpon those things so wrapped.

The double Honisuckle groweth now in my Garden, and many others likewise in great plenty, although not long since, very rare and hard to be found, except in the garden of some diligent Herbarists.

¶ *The Time.*

The leaues come forth betimes in the spring: the floures bud forth in May and Iune: the fruit is ripe in Autumne.

¶ *The Names.*

It is called in Greeke, περικλύμενον: in Latine, *Volucrum majus*: of *Scribonius Largus*, *Syluæ mater*: in shops, *Caprifolium*, and *Matrisylva*: of some, *Lilium inter spinas*: in Italian, *Vinciboſco*: in High Dutch, **Geysbladt**: in Low Dutch, **Gheytenbladt**, and **Hammekens Cruit**: in French, *Cheurefueille*: in Spanish, *Madreselva*: in English, Woodbinde, Honisuckle, and Caprifoly.

¶ *The Temperature.*

There hath an errour in times past growne amongst a few, and now almost past recouery to bee called againe, being growne an errour vniuersall, which errour is, the decoction of the leaues of Honisuckles, or the distilled water of the floures, are rashly giuen for the inflammations of the mouth and throte, as though they were binding and cooling. But contrariwise Honisuckle is neither cold nor binding; but hot, and attenuating or making thinne. For as *Galen* saith, both the fruit of Woodbinde, and also the leaues, do so much attenuate and heate, as if somewhat too much of them be drunke, they will cause the vrine to be as red as bloud, yet do they at the first onely prouoke vrine.

¶ *The*

¶ *The Vertues.*

A *Dioſcorides* writeth, that the ripe ſeed gathered and dried in the ſhadow, and drunke vnto the quantitie of one dram weight, fortie daies together, doth waſte and conſume away the hardneſſe of the ſpleene, remoueth weariſomeneſſe, helpeth the ſhortneſſe and difficulty of breathing, cureth the hicket, procureth bloudy vrine after the ſixth day, and cauſeth women to haue ſpeedy trauell in childe bearing.

B The leaues be of the ſame force: which being drunke thirty daies together, are reported to make men barren, and deſtroy their naturall ſeed.

C The floures ſteeped in oile, and ſet in the Sun, are good to annoint the body that is benummed, and growne very cold.

D The diſtilled water of the floures are giuen to be drunke with good ſucceſſe againſt the piſſing of bloud.

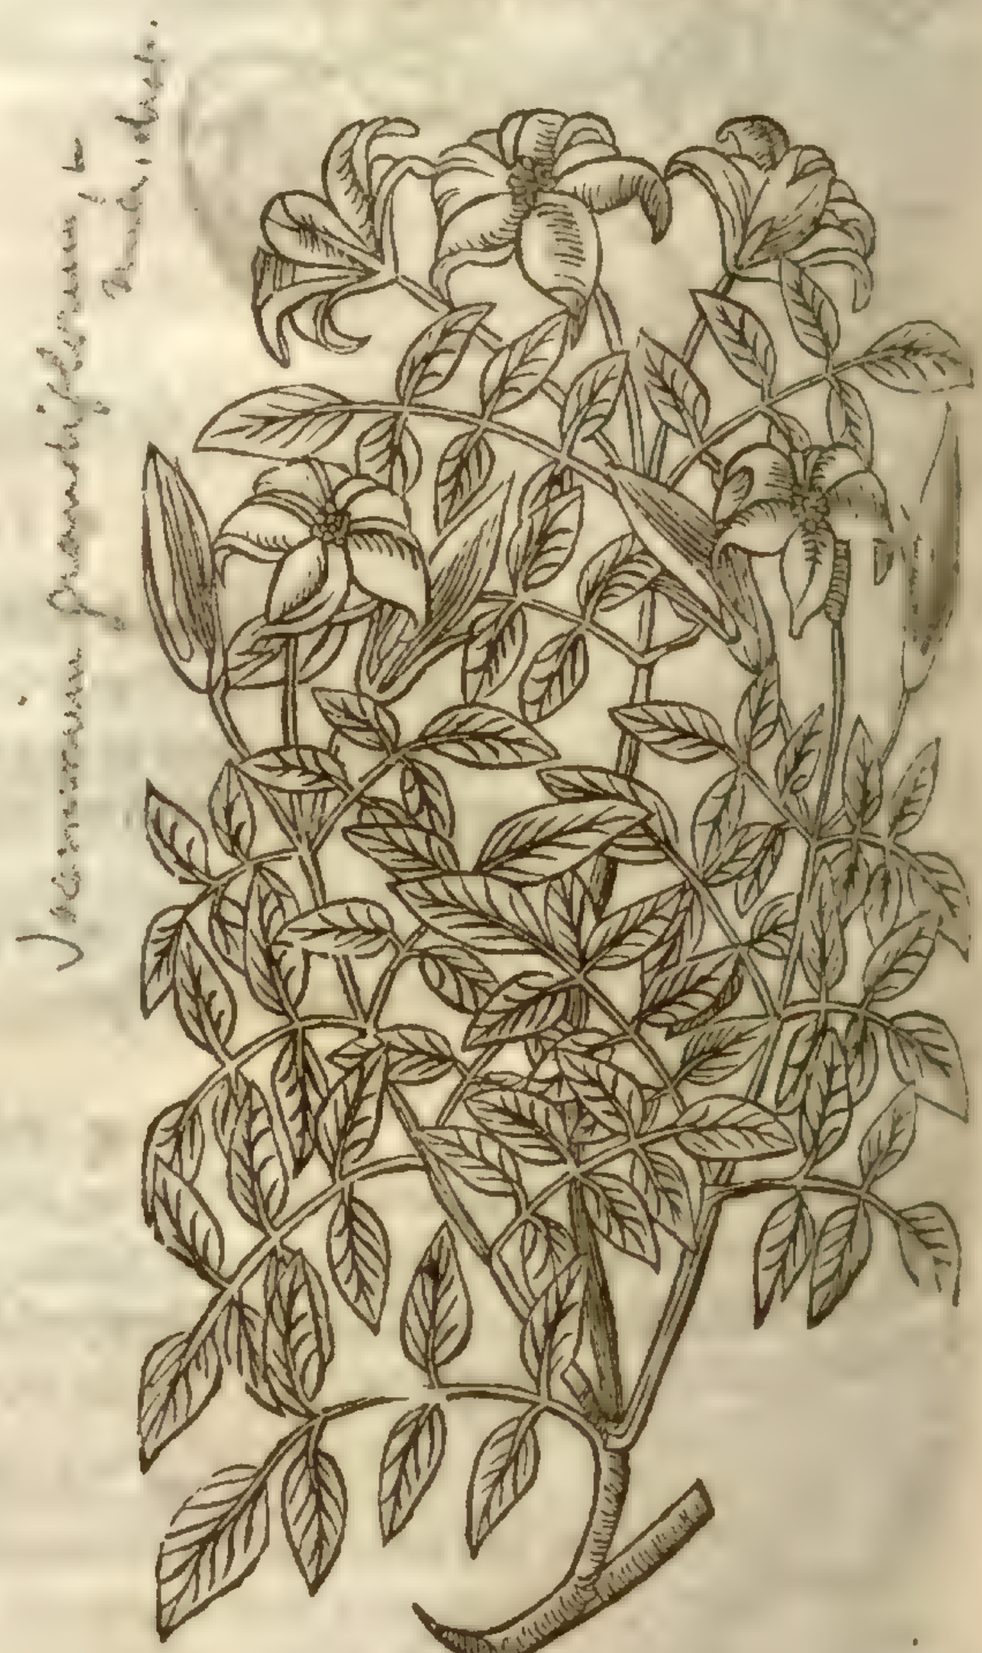
E A ſyrrup made of the floures is good to be drunke againſt the diſeaſes of the lungs and ſpleene that is ſtopped, being drunke with a little wine.

F Notwithſtanding the words of *Galen* (or rather of *Dodonæus*) it is certainly found by experience, that the water of Honiſuckles is good againſt the ſoreneſſe of the throat and uvula: and with the ſame leaues boyled, and the leaues or flours diſtilled, are made diuers good medicines againſt cankers, and ſore mouthes, as well in children as in elder people, and likewiſe for vlcerations and ſcaldings in the priuie parts of man or woman; if there be added to the decoction hereof ſome allome or Verdigreace if the ſore require greater clenſing outwardly, prouided alwaies that there be no Verdigreace put into the water that muſt be injected into the ſecret parts.

Chap. 329. *Of Iaſmine, or Gelſemine.*

1 *Iaſminum album.*
White Geſſemine.

2 *Iaſminum Candiflorum maius.*
Great white Geſſemine.



¶ *The Deſcription.*

1 IAſmine, or Gelſemine, is of the number of thoſe plants which haue need to be ſupported or propped vp, and yet notwithſtanding of it ſelfe claſpeth not or windeth his ſtalkes about

3 *Iasminum luteum.*
Yellow Iasmine.

bout such things as stand neere vnto it, but onely leaneth and lieth vpon those things that are prepared to sustain it about arbors and banqueting houses in gardens, by which it is held vp: the stalkes thereof are long, round, branched, jointed or kneed, and of a green colour, hauing within a white spongeous pith. The leaues stand vpon a middle rib, set together by couples like those of the ash tree, but much smaller, of a deepe greene colour: the floures grow at the vppermost part of the branches, standing in a small tuft far set one from another, sweet in smell, of colour white: the seed is flat and broad like those of Lupines, which seldom come to ripenesse: the root is tough and threddy.

2 *Lobel* reporteth, That hee saw in a garden at Brussels, belonging to a reuerend person called Mr. *Boisot*, a kinde of Gelsemine very much differing from our Iasmine, which he nourished in an earthen pot: it grew not aboue (saith he) the height of a cubit, diuided into diuers branches, wherupon did grow leaues like those of the common white Iasmine, but blacker and rounder. The floures in shew were most beautifull, shaped like those of the common Iasmine, but foure times bigger, gaping wide open, white on the vpper side, and of a bright red on the vnder side.

3 There is a kinde hereof with yellow floures; but some doe describe for the yellow Iasmine, the shrubby Trefoil, called of some, *Trifolium fruticans*; and of others, *Polemonium*: but this yellow Iasmine is one, and that is another plant, differing from the kindes of Iasmine, as shall be declared in his proper place. The yellow Iasmine differs not from the common white Gesmine in leaues, stalks, nor fashion of the flours: the only difference is, that this plant brings forth yellow flours, and the other white.

4 There is likewise another sort that differs not from the former in any respect but in the color of the floure; for this plant hath floures of a blew colour, and the others not so, wherein consisteth the difference.

¶ *The Place.*

Gelsemine is fostred in gardens, and is vsed for arbors, & to couer banqueting houses in gardens: it growes not wild in England, that I can vnderstand of, though Mr *Lyte* be of another opinion: the white Iasmine is common in most places of England: the rest are strangers, and not seene in these parts as yet.

¶ *The Time.*

They bring forth their pleasant floures in Iuly and August.

¶ *The Names.*

Among the Arabians *Serapio* was the first that named Gessemine, *Zambach*: it is called *Iasminum*, *Iesminum*, and also *Gessemium*: in English, Iasmine, Gessemine, and Gesse.

There is in *Dioscorides* a composition of oile of Iasmine, which he saith is made in Persia of the white floures of Violets, which Violets seem to be none other than the floures of this Gessemine; for *Dioscorides* hath often reckoned faire and elegant floures among the Violets; so that it must not seem strange that he calleth the floures of Iessemine Violets, especially seeing the plant it self was vnknown to him, as is euident.

¶ *The Temperature.*

Gessemine, and especially the floures thereof, be hot in the beginning of the second degree, as *Serapio* reporteth out of *Mesue*.

¶ *The Vertues.*

The oile which is made of the flours hereof wasteth away raw humors, and is good against cold rheums; but in those that are of a hot constitution it causeth head-ache, and the ouermuch smell thereof maketh the nose to bleed, as the same Author affirmeth. It is vsed (as *Dioscorides* writeth, and

and after him *Actius*) of the Perſians in their banquets for pleaſures ſake: it is good to be anointed after baths, in thoſe bodies that haue need to be ſuppled and warmed, but for ſmell it is not much vſed.

B The leaues boiled in wine vntill they be ſoft, and made vp to the forme of a pultis, and applied, diſſolue cold ſwellings, wens, hard lumps, and ſuch like out-goings.

Chap. 330. *Of Peruinkle.*

¶ *The Deſcription.*

1 PEruinkle hath ſlender and long branches trailing vpon the ground, taking hold here and there as it runneth, ſmall like ruſhes, with naked or bare ſpaces between joint and joint. The leaues are ſmooth, not vnlike to the Bay leafe, but leſſer: the floures grow hard by the leaues, ſpreading wide open, compoſed of fiue ſmall blew leaues.

We haue in our London gardens a kinde hereof bearing white floures, wherein it differs from the former.

1 *Vinca Peruinca minor.*
Peruinkle.

‡ 2 *Clematis Daphnoides, ſiue Peruinca major.*
Great Peruinkle.

There is another with purple floures, doubling it ſelfe ſomewhat in the middle, with ſmaller leaues, wherein is the difference.

2 There is another ſort greater than any of the reſt, called of ſome, *Clematis Daphnoides*, of the likeneſſe the leaues haue with thoſe of Bay: the leaues and floures are like thoſe of the precedent, but altogether greater, wherein conſiſts the difference.

¶ *The Place.*

They grow in moſt of our London gardens, they loue moiſt and ſhadowie places; the branches remain alwaies green.

¶ *The Time.*

They floure and flouriſh in March, Aprill, and May, and ſometimes later. ¶ *The*

¶ *The Names.*

Peruinkle is called in Greeke, κλιματὶς δαφνοειδὴς, becauſe it bringeth forth ſtalkes which creepe like thoſe of the Vine; and *Daphnoeides*, by reaſon that the leaues are like thoſe of the Bay, as aforeſaid. *Plinie* calls it *Vinca peruinca*, and *Chamædaphne*: notwithſtanding there is another *Chamædaphne*, of which in his place. The ſame Author likewiſe calleth it *Centunculus*: in high-Dutch, **Ingrun**: in low-Dutch, **Vincoorte, maegden cruyt**: in French, *Pucellage*, *Vauche*, and *Peruauche*: in Italian, *Pruenca*: in Spaniſh, *Peruinqua*: in ſhops, *Clematis peruinca*: in Engliſh, Peruinkle, Pervinkle, and Periwinkle.

¶ *The Nature.*

Peruinkle is hot within the ſecond degree, ſomthing dry and aſtringent.

¶ *The Vertues.*

The leaues boiled in wine and drunke ſtop the laske and bloudy flix. A

An handfull of the leaues ſtamped, and the juice giuen to drinke in red wine, ſtoppeth the laske and bloudy flix, ſpitting of bloud, which neuer faileth: it likewiſe ſtops the inordinat courſe of the monethly ſickneſſe. B

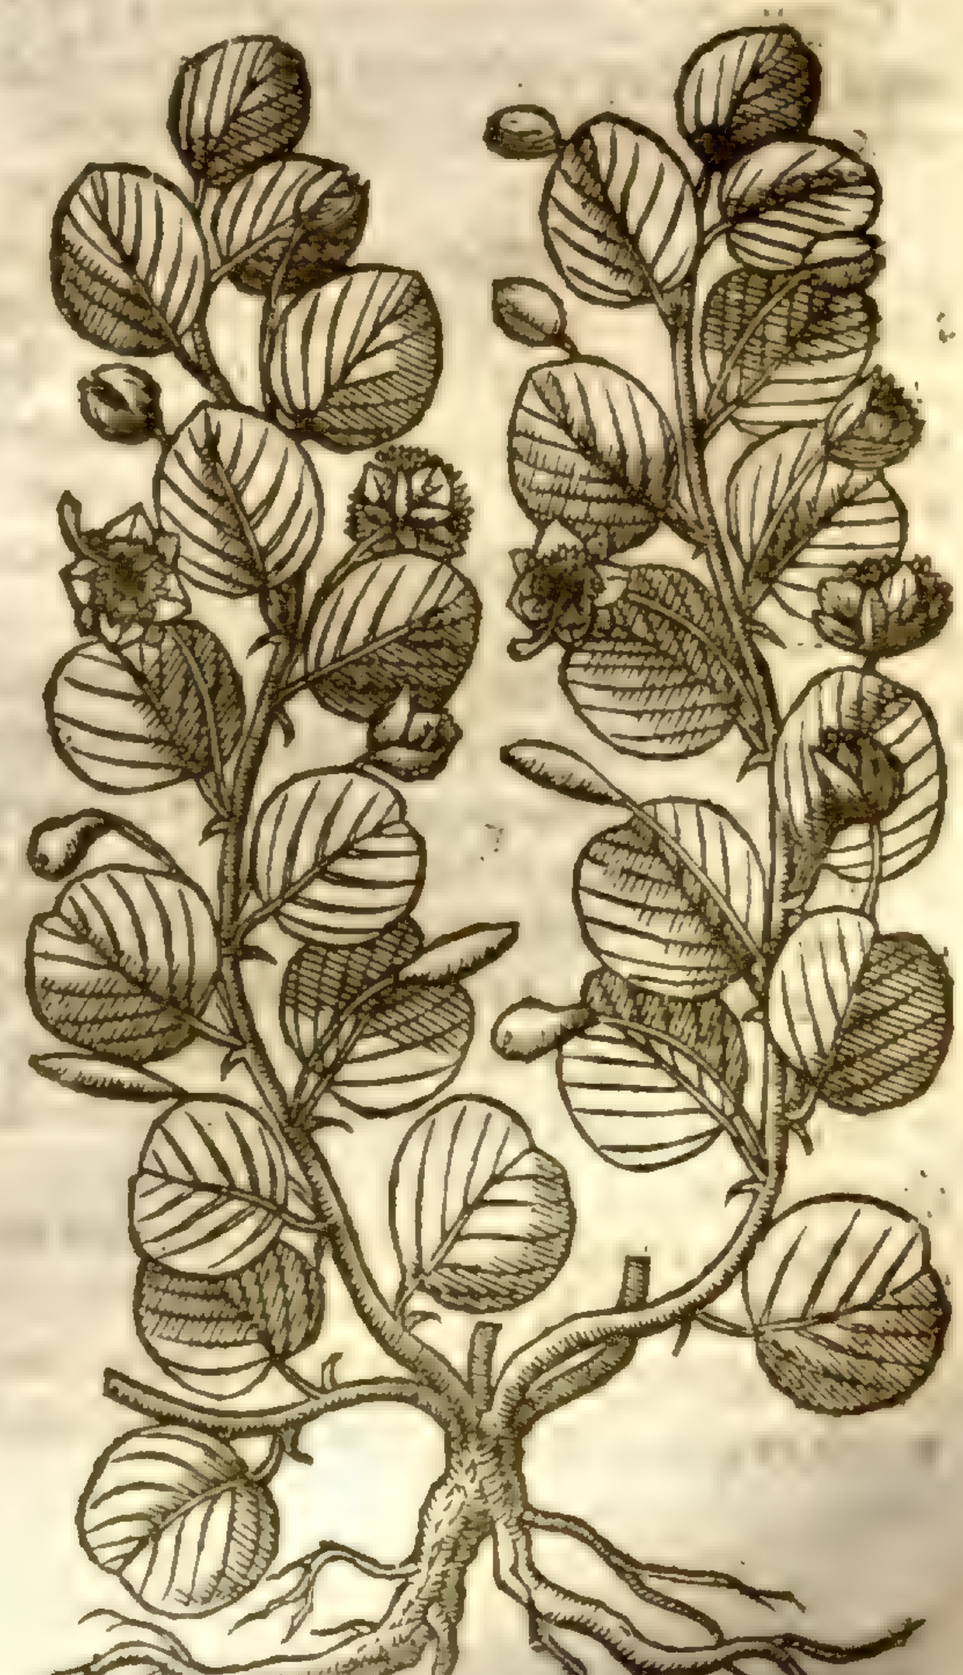
Chap. 331. *Of Capers.*

¶ *The Kindes.*

THere be two ſorts of Capers eſpecially; one with broad leaues ſharp pointed: the other with rounder leaues. The Brabanders haue alſo another ſort called *Capparis fabago*, or Bean Capers:

1 *Capparis folio acuto.*
Sharp leafed Capers.

2 *Capparis rotundiore folio.*
Round leafed Capers.



¶ *The Deſcription.*

1 THe Caper is a prickly ſhrub, the ſhoots or branches whereof be full of ſharpe prickly thornes, trailing vpon the ground, if they be not ſupported or propped vp: whereupon grow leanes like thoſe of the Quince tree, but rounder: among the which come forth long ſlender footſtalks, whereon grow round knops, which open or ſpred abroad into faire floures: after which come in place long fruit like to an Oliue, and of the ſame colour, wherein is contained flat rough ſeeds, of a dusky colour. The root is wooddy, and couered with a thicke barke or rinde, which is much vſed in Phyſicke.

2 The ſecond kinde of Caper is likewiſe a prickly plant much like the bramble buſh, hauing many ſlender branches ſet full of ſharp prickles. The whole plant traileth vpon the place where it groweth, beſet with round blackiſh leaues diſorderly placed, in ſhape like thoſe of Aſtrabacca, but greater, approching to the forme of Fole-foot: among which commeth forth a ſmall and tender naked twig, charged at the end with a ſmall knap or bud, which openeth it ſelfe to a ſmall ſtar-like floure, of a pleaſant ſweet ſmell; in place whereof comes a ſmal fruit long and round like the Cornell berry, of a brown colour. The root is long and wooddy, couered with a thicke barke or rinde, which is likewiſe vſed in medicine.

¶ *The Place.*

The Caper groweth in Italy, Spaine, and other hot regions, without manuring, in a lean ſoile, in rough places amongſt rubbiſh, and vpon old walls, as *Dioſcorides* reporteth.

Theophraſtus writeth, That it is by nature wilde, and refuſeth to be husbanded, yet in theſe our dayes diuers vſe to cheriſh the ſame, and to ſet it in dry and ſtony places. My ſelfe at the impreſſion hereof planted ſome ſeeds in the bricke walls of my garden, which as yet doe ſpring and grow green: the ſucceſſe I expect.

¶ *The Time.*

The Caper floureth in Summer euen vntil Autumne. The knops of the flours before they open are thoſe Capers we eat as ſauce, which are gathered and preſerued in pickle or ſalt.

¶ *The Names.*

It is called in Greeke, κάπαρις: in Latine alſo *Capparis*: of ſome, *Cynoſbatos*, yet *Cynosbates* or *Canirubus* is properly taken for the wild Roſe: it is generally called Cappers in moſt languages: in Engliſh, Cappers, Caper, and Capers.

¶ *The Temperature.*

Capers, or the floures not yet fully growne, be of temperature hot, and of thin parts: if they be eaten green they yeeld very little nouriſhment, and much leſſe if they be ſalted: and therefore are rather a ſauce and medicine, than a meat.

¶ *The Vertues.*

A They ſtir vp an appetite to meat, are good for a moiſt ſtomacke, and ſtay the watering thereof, clenſing away the flegme that cleaueth vnto it. They open the ſtoppings of the liuer and milt: with meat they are good to be taken of thoſe that haue a quartan Ague and ill ſpleens. They are eaten boiled (the ſalt firſt waſhed off) with oile and vineger, as other ſallads be, and ſomtimes are boiled with meat.

B The rinde or bark of the root conſiſteth of diuers faculties, it heateth, clenſeth, purgeth, cutteth and digeſteth.

C This barke is a ſingular remedie for hard ſpleenes, being outwardly applied, or inwardly taken: and the ſame boiled with vineger or Oxymel, or beaten and mixed with other ſimples, expelleth thicke groſſe humors, and conueyeth away the ſame mixed with bloud, by vrine and ſiege, wherby the milt or ſpleen is helpled, and the pain of the huckle bones taken away: moreouer, it bringeth downe the deſired ſickneſſe, purgeth and draweth flegme out of the head, as *Galen* writeth.

D The ſame bark (as *Dioſcorides* teacheth) clenſeth old filthy ſores, and ſcoureth away the thicke lips and cruſts about the edges, and being chewed it takes away the tooth-ache.

E Being ſtamped with vineger it ſcoureth away tettars and ring-wormes, hard ſwellings, and cures the Kings euill.

F The barke of the roots of Capers is good againſt the hardneſſe and ſtopping of the ſpleen, and profiteth much if it be giuen in drink, to ſuch as haue the ſciatica, palſie, or that are burſten or bruſed by falling from ſome high place: it mightily prouokes vrine, inſomuch that if it be vſed ouermuch, or giuen in too great a quantitie, it draweth out bloud with the vrin.

CHAP.

Chap. 332. *Of Beane Capers.*

Capparis Fabago.
Beane Capers.

¶ *The Description.*

THis plant which the Germanes call **Fabago**, and *Dodonæus* sauouring of Dutch, calleth it in his last Edition *Capparis Fabago*, and properly: *Lobel* calleth it *Capparis leguminosa*: between which there is no great difference, who labour to refer this plant vnto the kinds of Capers, which is but a low and base herb, and not a shrubbie bush, as are the true Capers. It bringeth forth smooth stalkes tender and branched, wherupon do grow long thick leaues, lesser than those of the true Capers, & not vnlike to the leaues of Purslane, comming out of the branches by couples, of a light greene colour. The floures before they bee opened are like to those of the precedent, but when they bee come to maturitie and ripenesse they waxe white, with some yellow chiues in the midst: which being past, there appeare long cods, wherein is contained small flat seed. The root is tender, branching hither and thither.

¶ *The Place.*

It groweth of it selfe in corne fields of the low Countries, from whence I haue receiued seeds for my garden, where they flourish.

¶ *The Time.*

It floureth when the Caper doth.

¶ *The Names.*

It is called in Latine of the later Herbarists *Capparis fabago*: of most *Capparis Leguminosa*: it is thought to be that herbe which *Avicen.* describeth in his 28 chapter, by the name of *Ardifrigi*: we may content our selues that *Capparis fabago* retaine that name still, and seek for none other, vnlesse it be for an English name, by which it may be called after the Latine, Beane Caper.

¶ *The Temperature and Vertues.*

Touching the faculties thereof we haue nothing left in writing worth the remembrance.

Chap. 333. *Of Swallow-wort.*

¶ *The Description.*

1 SWallow-wort with white floures hath diuers vpright branches of a browniſh colour, of the height of two cubits, beset with leaues not vnlike to those of *Dulcamara* or wooddy Night-shade, somewhat long, broad, sharpe pointed, of a blackish greene colour, and strong sauor: among which come forth very many small white floures star-fashion, hanging vpon little slender foot-stalkes: after which come in place thereof long sharp pointed cods, stuffed full of a most perfect white cotton resembling silk, as well in shew as handling; (our London Gentlewomen haue named it Silken Cisilie) among which is wrapped soft browniſh seed. The roots are very many, white, threddie, and of a strong sauour.

2 The second kinde is oftentimes found with stalks much longer, climing vpon props or such things as stand neere vnto it, attaining to the height of fiue or six cubites, wrapping it selfe vpon them with many and sundry foldings: the floures hereof are black: the leaues, cods, and roots be like those of the former.

1 *Asclepias flore albo.*
White Swallow-woort.

2 *Asclepias flore nigro.*
Blacke Swallow-woort.

¶ *The Place.*

Both these kindes do grow in my garden, but not wilde in England; yet I haue heard it reported that it groweth in the fields about Northampton, but as yet I am not certaine of it.

¶ *The Time.*

They flourc about Iune, in Autumne the downe hangeth out of the cods, and the seed falleth to the ground.

¶ *The Names.*

It is called of the later Herbarists *Vincetoxicum*: of *Ruellius*, *Hederalis*: in High Dutch, **Swaluwe wortele**, that is to say in Latine, *Hirundinaria*: in English, Swallow-woort: of our Gentlewomen it is called Silken Cistie; *Æsculapius* (who is said to be the first inuentor of physick, whom therefore the Greekes and Gentiles honored as a god) called it after his owne name *Asclepias*, or *Æsculapius* herbe, for that he was the first that wrote thereof, and now it is called in shops *Hirundinaria*.

¶ *The Temperature.*

The roots of Swallow-woort are hot and dry; they are thought to be good against poyson.

¶ *The Vertues.*

A *Dioscorides* writeth, That the roots of *Asclepias* or Swallow-woort boiled in wine, and the decoction drunke, are a remedy against the gripings of the belly, the stingings of Serpents, and against deadly poyson, being one of the especialleſt herbes against the same.

B The leaues boiled and applied in forme of a pultis, cure the cuill sores of the paps or dugs, and matrix, that are hard to be cured.

Chap. 334. *Of Iudian Swallow-woort.*

¶ *The Description.*

THere groweth in that part of Virginia, or Norembega, where our English men dwelled (intending there to erect a certaine Colonie) a kinde of *Asclepias*, or Swallow-woort, which the

the Sauages call *Wisanck*: there riseth vp from a single crooked root, one vpright stalk a foot high, slender, and of a greenish colour: whereupon do grow faire broad leaues sharp pointed, with many ribs or nerues running through the same like those of Ribwort or Plaintaine, set together by couples at certaine distances. The floures come forth at the top of the stalks, which as yet are not obserued, by reason the man that brought the seeds & plants hereof did not regard them: after which, there come in place two cods (seldome more) sharp pointed like those of our Swallow-woort, but greater, stuffed full of a most pure silke of a shining white colour: among which silke appeareth a small long tongue (which is the seed) resembling the tongue of a bird, or that of the herbe called Adders tongue. The cods are not only full of silke, but euery nerue or sinew wherewith the leaues be ribbed are likewise most pure silke; and also the pilling of the stems, euen as flax is torne from his stalks. This considered, behold the iustice of God, that as he hath shut vp those people and nations in infidelity and nakednes, so hath he not as yet giuen them vnderstanding to couer their nakednesse, nor mater wherewith to do the same; notwithstanding the earth is couered ouer with this silke, which daily they tread vnder their feet, which were sufficient to apparell many kingdomes, if they were carefully manured and cherished.

Wisanck, siue Vincetoxicum Indianum.
Indian Swallow-wort.

‡ *Apocynum Syriacum Clusij.*

‡ This plant, which is kept in some gardens by the name of Virginia Silke grasse, I take to be the same, or very like the *Beidelsar* of *Alpinus*; and the *Apocynum Syriacum* of *Clusius*: at Padua they call it *Esula Indica*, by reason of the hot milky juice. *Bauhinus* hath very vnfitly named it *Lapathum Ægyptiacum lactescens siliqua Asclepiadis*. But he is to be pardoned; for *Iohannes Carolus Rosenbergus*, *cap.* 16. *p.* 46. of his *Animad. & Exerc. Medicæ*, or *Rosa nobilis iatrica*, hath taken vpon him the credit and inuention of this absurd denomination: I may call it absurd, for that neither any way in shape or qualitie it resembleth or participateth any thing with a Docke. I haue giuen you the figure of our Author with his title, and that of *Clusius* with his: in the former the cods are onely well expreſt; in the later the leaues and floures reasonably well, but that they are too few in number, and set too far asunder. Vpon the sight of the growing and flouring plant I took this description: The root is long and creeping; the stalks two or three cubits high, square, hollow, a finger thicke, and of a light green colour, sending out towards the top some few branches: vpon this at certaine

certaine ſpaces grow by couples, leaues ſome halfe foot long, and three inches broad, darke greene on their vpper ſides, more whitiſh below, and full of large and eminent veines: at the top of the ſtalke and branches it carries moſt commonly an hundred or more floures, growing vpon foot-ſtalks ſome inch long, all cloſe thruſt together after the manner of the Hyacinth of Peru at the firſt flouring: each floure is thus compoſed; firſt it hath fiue ſmall greene leaues bending backe, that ſerue for the cup: then hath it other fiue leaues foure times larger than the former, which bend back and couer them; and theſe are green on the vnder ſide, and of a pale colour with ſome redneſſe aboue: then are there fiue little graines (as I may ſo terme them) of a pleaſant red colour, and on their outſide like corns of Millet, but hollow on their inſides, with a little thred or chiue comming forth of each of them: theſe fiue ingirt a ſmall head like a button, greeniſh vnderneath, and whitiſh aboue. I haue giuen you the figure of one floure by the ſide of our Authors figure. The leaues and ſtalkes of this plant are very full of a milky juice. ‡

¶ *The Place.*

It groweth, as before is rehearſed, in the countries of Norembega, now called Virginia, by the honourable Knight Sir *Walter Raleigh*, who hath beſtowed great ſums of money in the diſcouerie thereof; where are dwelling at this preſent Engliſh men.

¶ *The Time.*

It ſpringeth vp, floureth, and flouriſheth both Winter and Summer, as do many or moſt of the plants of that countrey. ‡ It dies down with vs euery winter and comes vp in the Spring, and flours in Auguſt, but neuer bringeth forth the cods with vs, by reaſon of the coldnes of our Climate. ‡

¶ *The Names.*

The ſilke is vſed of the people of Pomeioc and other of the prouinces adioyning, being parts of Virginia, to couer the ſecret parts of maidens that neuer taſted man; as in other places they vſe a white kinde of moſſe Wiſanck: we haue thought *Aſclepias Virginiana*, or *Vincetoxicum Indianum* fit and proper names for it: in Engliſh, Virginia Swallow-wort, or the Silke-wort of Norembega.

¶ *The Temperature and Vertues.*

A We finde nothing by report, or otherwiſe of our owne knowledge, of his phyſicall vertues, but only report of the abundance of moſt pure ſilke, wherewith the whole plant is poſſeſſed.

B ‡ The leaues beaten either crude, or boiled in water, and applied as a pulteſſe, are good againſt ſwellings and paines proceeding of a cold cauſe.

C The milkie juice, which is very hot, purges violently; and outwardly applied is good againſt tettars, to fetch haire off skins, if they be ſteeped in it, and the like. *Alpinus*. ‡

Chap. 335.

Of the Bombaſte or Cotton-Plant.

¶ *The Deſcription.*

THe Cotton buſh is a low and baſe Plant, hauing ſmall ſtalkes of a cubit high, and ſometimes higher; diuided from the loweſt part to the top into ſundry ſmall branches, whereupon are ſet confuſedly or without order a few broad leaues, cut for the moſt part into three ſections, and ſometimes more, as Nature liſt to beſtow, ſomwhat indented about the edges, not vnlike to the leafe of the Vine, or rather the Veruaine Mallow, but leſſer, ſofter, and of a grayiſh colour: among which come forth the floures, ſtanding vpon ſlender foot-ſtalks, the brims or edges whereof are of a yellow colour, the middle part purple: after which appeareth the fruit, round, and of the bigneſſe of a Tenniſe ball, wherein is thruſt together a great quantity of fine white Cotton wooll; among which is wrapped vp blacke ſeed of the bigneſſe of peaſen, in ſhape like the trettles or dung of a coney. The fruit being come to maturity or ripeneſſe, the husk or cod opens it ſelfe into foure parts or diuiſions, and caſteth forth his wooll and ſeed vpon the ground, if it bee not gathered in his time and ſeaſon. The root is ſmall and ſingle, with few threds anexed therto, and of a wooddy ſubſtance, as is all the reſt of the plant.

¶ *The Place.*

It groweth in India, in Arabia, Egypt, and in certaine Iſlands of the Mediterranean ſea, as Cyprus, Candy, Malta, Sicilia, and in other prouinces of the continent adiacent. It groweth about Tripolis and Aleppo in Syria, from whence the factor of a worſhipfull merchant in London, Maſter *Nicholas Lete* before remembred, did ſend vnto his ſaid maſter diuers pounds weight of the ſeed; whereof ſome were committed to the earth at the impreſſion hereof, the ſucceſſe we leaue to the

Gossypium, siue Xylon.
The Cotton buth.

the Lord. Notwithstanding my self three yeares past did sow of the seed, which did grow verie frankely, but perished before it came to perfection, by reason of the cold frosts that ouertooke it in the time of flouring.

¶ *The Time.*

Cotton seed is sowne in plowed fields in the spring of the yeare, and reaped and cut downe in harueſt, euen as corne with vs; and the ground must be tilled and sown new again the next yere, and vsed in such sort as we do the tillage for corn and grain; for it is a plant of one yeare, and perisheth when it hath perfected his fruit, as many other plants do.

¶ *The Names.*

Cotton is called in Greeke ξύλον, and ξυλίνη: in Latine, *Xylum*, and *Gossipium*, after the Greeke: in shops, *Lanugo*, *Bombax*, and *Cotum*: in Italian, *Bombagia*: in Spanish, *Algodon*: in high Dutch, **Baumwool**: in English and French, Cotton, Bombast, and Bombace.

Theophrastus, *lib.* 4. *cap.* 9. hath made mention hereof, but without a name; and hee saith it is a tree in Tylus which beares wooll. Neither is it any maruell if he took an vnknown shrub or plant growing in countries far off, for a tree; seeing also in this age (in which very many things come to be better knowne than in times past) the Cotton or wooll hereof is called of the Germanes (as we haue said) **Baum wool**, that is, Wooll of a tree, whereas indeed it is rather an herb or small shrub, and not to be numbred among trees.

Of this *Theophrastus* writeth thus; It is reported that the same Island (*viz.* Tylus) brings forth many trees that beare wooll, which haue leaues like those of the Vine, &c.

Pliny, *lib.* 19. *cap.* 1. writing of the same, saith thus: The vpper part of Ægypt towards Arabia brings forth a shrub called *Gossipion* or *Xylon*, and therefore the linnen that is made thereof is called *Xylina*. It is (saith he) the plant that beareth that wooll wherewith the garments are made which the priests of Egypt do weare.

¶ *The Temperature.*

The seed of Cotton (according to the opinion of *Serapio*) is hot and moist, the wooll it selfe is hot and dry.

¶ *The Vertues.*

The seed of Cotton is good against the cough and short windednesse: it also stirreth vp lust of A
the body by increasing naturall seed; wherein it surpasseth.

The oile pressed out of the seed takes away freckles, spots, and other blemishes of the skin. B

The ashes of the wooll burned stanch the bleeding of wounds, vsed in restrictiue medicines, as C
Bole Armonicke, and is more restrictiue than Bole it selfe.

To speake of the commodities of the wooll of this plant were superfluous, common experience D
and the daily vse and benefit we receiue by it shew them. So that it were impertinent to our historie, to speak of the making of Fustian, Bombasies, and many other things that are made of the wool thereof.

Chap. 336. *Of Dogs-bane.*

¶ *The Kindes.*

THere be two kindes of Dogs-bane: the one a clymbing or clambering plant; the other an vpright shrub.

¶ *The*

¶ *The Deſcription.*

1 DOgs-bane riſeth vp like vnto a ſmall hedge buſh, vpright and ſtraight, vntil it haue attained to a certain height; then doth it claſp and clymbe with his tender branches as do the Bindeweeds, taking hold vpon props or poles, or whatſoeuer ſtands next vnto it: whereupon grow faire broad leaues ſharp pointed like thoſe of the Bay tree, of a deep green colour. The floures come forth at the top of the ſtalks, conſiſting of fiue ſmall white leaues: which beeing paſt, there ſucceed long cods ſet vpon a ſlender foot-ſtalk by couples, ioyning themſelues together at the extreme point, and likewiſe at the ſtalke, making of two pieces knit together one intire cod; which cod is full of ſuch downy matter and ſeed as that of *Aſclepias*, but more in quantitie, by reaſon the cods are greater: which beeing dry and ripe, the ſilken cotton hangeth forth, and by little and little ſheddeth, vntill the whole be fallen vpon the ground. The whole plant yeelds that yellow ſtinking milky juice that the other doth, and ſometimes it is of a white colour, according to the clymat where it groweth; for the more cold the country is, the whiter is the juice; and the hotter, the more yellow. The root is long and ſingle, with ſome threds anexed thereto.

1 *Periploca repens anguſtifolia.*
Climing Dogs-bane.

‡ 2 *Periploca latifolia.*
Broad leafed Dogs-bane.

2 There is another Dogs-bane that hath long ſlender ſtalkes like thoſe of the Vine, but of a browne reddiſh colour, wherewith it windeth it ſelfe about ſuch things as ſtand neere vnto it, in manner of a Bindweed: whereupon are ſet leaues not vnlike thoſe of the Iuy, but not ſo much cornered, of a darke green colour, and of a rank ſmell being bruiſed betwixt the fingers, yeelding forth a ſtinking yellow milky juice when it is ſo broken: amongſt which come forth little white floures ſtanding ſcatteringly vpon little huskes: after the floures come long cods very like *Aſclepias* or Swallow-wort, but greater, ſtuffed with the like ſoft downy ſilke, among which downe is wrapped vp flat blacke ſeed. The roots are many and threddy, creeping all about within the ground, budding forth new ſhoots in ſundry places, whereby it greatly increaſeth.

¶ *The Place.*

They grow naturally in Syria, and alſo in Italy, as *Matthiolus* reporteth. My louing friend *Iohn Robin*, herbariſt in Paris, did ſend me plants of both the kinds for my garden, where they flowre and flouriſh: but whether they grow in France, or that hee procured them from ſome other region, as yet I know not.

The

¶ *The Time.*

They begin to bud forth their leaues in the beginning of May, and shew their floures in September.

¶ *The Names.*

Dogs-bane is called by the learned of our age, *Periploca*: it is euident that they are to be referred to the *Apocynum* of *Dioscorides*. The former of the two hath beene likewise called κυνοκτόνον, and *Brassica canina*, or Dogs-Cole: notwithstanding there is another Dogs Cole which is a kind of wild Mercurie. We may call the first Creeping Dogs bane; and the other, Vpright or Syrian Dogs-bane.

¶ *The Nature.*

These plants are of the nature of that pestilent or poysonous herbe *Thora*, which being eaten of dogs or any other liuing creature doth certainly kill them, vnlesse there be in readines an antidote or preseruatiue against poison, and giuen, which by probability is the herb described in the former chapter, called *Vincetoxicum*; euen as *Anthora* is the antidote and remedy against the poison of *Thora*; and *Herba Paris* against *Pardalianches*.

¶ *The Vertues.*

Dogs-bane is a deadly and dangerous plant, especially to foure footed beasts; for as *Dioscorides* writes, the leaues hereof mixed with bread and giuen, kill dogs, wolues, foxes, and leopards, the vse of their legs and huckle bones being presently taken from them, and death it self following incontinent: wherefore it is not to be vsed in medicine. A

Chap. 337. *Of Solomons Seale.*

1 *Polygonatum.*
Solomons Seale.

2 *Polygonatum minus.*
Small Solomons Seale.

¶ *The Description.*

1 THe first kinde of Solomons Seale hath long round stalks, set for the most part with long leaues somewhat furrowed and ribbed, not much vnlike Plantain, but narrower; which for the most part stand all vpon one side of the stalke, and hath small white floures resembling the

floures

floures of Lilly Conual: on the other ſide when the floures be vaded, there come forth round berries, which at the firſt are green and of a blacke colour tending to blewneſſe, and being ripe, are of the bigneſſe of Iuy berries, of a very ſweet and pleaſant taſte. The root is white and thicke, full of knobs or ioints, in ſome places reſembling the marke of a ſeale, whereof I thinke it tooke the name *Sigillum Solomonis*; it is ſweet at the firſt, but afterward of a bitter taſte with ſome ſharpneſſe.

2 The ſecond kinde of *Polygonatum* doth not much vary from the former, ſauing in the leaues, which be narrower, and grow round about the ſtalke like a ſpur, in faſhion like vnto Woodroofe or red Madder: amongſt the leaues come forth floures like the former, but of a greener white colour; which being paſt, there ſucceed berries like the former, but of a reddiſh colour: the roots are thick and knobby like the former, with ſome fibres anexed thereto.

3 *Polygonatum latifolium 2. Cluſij.*
Sweet ſmelling Solomons ſeale.

4 *Polygonatum ramoſum.*
Branched Solomons ſeale.

3 The third kinde of Solomons Seale, which *Cluſius* found in the wooddy mountains of Leitenberg, aboue Manderſtorf, and in many other mountains beyond the riuer Danubius, eſpecially among the ſtones, he ſent to London to Mr *Garth*, a worſhipful gentleman, and one that greatly delighteth in ſtrange plants, who very louingly imparted the ſame vnto me. This plant hath ſtalkes very like to the common Solomons ſeale, a foot high, beſet with leaues vpon one ſide of the ſtalke like the firſt and common kinde, but larger, and more approching to the bigneſſe of the broad leafed Plantain; the taſt whereof is not very pleaſant: from the boſome of which leaues come forth ſmall well ſmelling greeniſh white flours not much vnlike the firſt: which being paſt, there follow ſeeds or berries that are at the firſt green, but afterwards blacke, containing within the ſame berries a ſmall ſeed as big as a Vetch, and as hard as a ſtone. The roots are like the other of his kinde, yet not ſo thicke as the firſt.

4 The fourth kinde according to my account, but the third of *Cluſius* (which he found alſo in the mountains aforeſaid) groweth a foot high, but ſeldom a cubit, differing from all the others of his kinde; for his ſtalkes diuide themſelues into ſundry other branches, which are garniſhed with goodly leaues, larger and ſharper pointed than any of the reſt, which do embrace the ſtalkes about after the manner of *Perfoliata* or Thorow-wax, yet very like vnto the kindes of Solomons Seale in

ſhew,

shew, saue that they are somwhat hoarie vnderneath the leaues; which at the first are sweet in taste, but somewhat acride or biting towards the later end. From the backe part of the leaues shoot forth small long tender and crooked stems, bearing at the end little gaping white flours not much vnlike *Lilium conuallium*, sauouring like Hawthorne floures, spotted on the inner side with blacke spots: which being past, there come forth three cornered berries like the narrow leafed Solomons seale, greene at the first, and red when they be ripe, containing many white hard graines. The roots differ from all the other kindes, and are like vnto the crambling roots of *Thalictrum*, which the grauer hath omitted in the figure.

5 *Polygonatum angustifolium ramosum.*
Narrow leaued Solomons seale.

5 This rare sort of Solomons Seale rises vp from his tuberous or knobby root, with a straight vpright stalke joynted at certaine distances, leauing betweene each joynt a baie and naked stalke, smooth, and of a greenish colour tending to yellownes; from the which joynts thrust forth diuers smal branches, with foure narrow leaues set about like a star or the herbe Woodroofe: vpon which tender branches are set about the stalkes by certaine spaces long narrow leaues inclosing the same round about: among which leaues come forth small whitish floures of little regard. The fruit is small, and of a red colour, full of pulpe or meate; among which is contained a hard stony seed like that of the first Solomons seale.

‡ 6 There is kept in our gardens, and said to be brought from some part of America another *Polygonatum*, which sends vp a stalk some foot and more high, and it hath leaues long, neruous, and very greene and shining, growing one by another without any order vpon the stalke, which is somewhat crested, crooked, and very greene; bearing at the very top thereof, aboue the highest leafe, vpon little foot-stalks, some eight or nine little white floures, consisting of six leaues apiece, which are succeeded by berries, as in the former. This floures in May, and is vulgarly named *Polygonatum Virginianum*, or Virginians Solomons seale. ‡

¶ *The Place.*

The first sort of Solomons seale growes naturally wilde in Somerset-shire, vpon the North side of a place called Mendip, in the parish of Shepton Mallet: also in Kent by a village called Crayford, vpon Rough or Row hill: also in Odiam parke in Hampshire; in Bradfords wood, neere to a towne in Wiltshire foure miles from bath; in a wood neere to a village called Horsley, fiue miles from Gilford in Surrey, and in diuers other places.

That sort of Solomons seale with broad leaues groweth in certaine woods in Yorkeshire called Clapdale woods, three miles from a village named Settle.

¶ *The Time.*

They spring vp in March, and shew their floures in May: the fruit is ripe in September.

¶ *The Names.*

Solomons seale is called in Greeke, πολυγόνατον: in Latine likewise, *Polygonatum*, of many, Knees, for so the Greeke word doth import: in shops, *Sigillum Salomonis*, and *Scala cœli*: in English likewise, Scala cœly, Solomons seale, and White-woort, or White-root: in high Dutch, Weisswurtz: in French, *Seau de Solomon*: of the Hetrurians, *Frasinella*, and *Fraxinella*.

¶ *The Temperature.*

The roots of Solomons seale, as *Galen* saith, haue both a mixt faculty and quality also: For they haue (saith he) a certaine kinde of astriction or binding, and biting withall, and likewise a certaine loathsome birternesse, as the same Author affirmeth: which is not to be found in those that do grow in our climate.

¶ *The Vertues.*

A *Dioscorides* writeth, That the roots are excellent good for to seale or close vp greene wounds, being stamped and laid thereon; whereupon it was called *Sigillum Salomonis*, of the singular vertue that it hath in sealing or healing vp wounds, broken bones, and such like. Some haue thought it tooke the name *Sigillum* of the markes vpon the roots: but the first reason seemes to be more probable.

B The root of Solomons seale stamped while it is fresh and greene, and applied, taketh away in one night, or two at the most, any bruise, blacke or blew spots gotten by fals or womens wilfulnesse, in stumbling vpon their hasty husbands fists, or such like.

C *Galen* saith, that neither herbe nor root hereof is to be giuen inwardly: but note what experience hath found out, and of late daies, especially among the vulgar sort of people in Hampshire, which *Galen*, *Dioscorides*, or any other that haue written of plants haue not so much as dreamed of; which is, That if any of what sex or age soeuer chance to haue any bones broken, in what part of their bodies soeuer; their refuge is to stampe the roots hereof, and giue it vnto the patient in ale to drinke: which sodoreth and glues together the bones in very short space, and very strangely, yea although the bones be but slenderly and vnhandsomely placed and wrapped vp. Moreouer, the said people do giue it in like manner vnto their cattell, if they chance to haue any bones broken, with good successe; which they do also stampe and apply outwardly in manner of a pulteſſe, as well vnto themselues as their cattell.

D The root stamped and applied in manner of a pulteſſe, and laid vpon members that haue beene out of joynt, and newly restored to their places, driueth away the paine, and knitteth the joynt very firmely, and taketh away the inflammation, if there chance to be any.

E The same stamped, and the juyce giuen to drinke with ale or white wine, as aforesaid, or the decoction thereof made in wine, helps any inward bruise, disperseth the congealed and clotted blood in very short space.

F That which might be wrttten of this herbe as touching the knitting of bones, and that truely, would seeme vnto some incredible; but common experience teacheth, that in the world there is not to be found another herbe comparable to it for the purposes aforesaid: and therefore in briefe, if it be for bruises inward, the roots must be stamped, some ale or wine put thereto, strained, and giuen to drinke.

G It must be giuen in the same manner to knit broken bones, against bruises, blacke or blew marks gotten by stripes, falls, or such like; against inflammation, tumors or swellings that happen vnto members whose bones are broken, or members out of joynt, after restauration: the roots are to be stamped small, and applied pulteſſe or plaisterwise, wherewith many great workes haue beene performed beyond credit.

H *Matthiolus* teacheth, That a water is drawne out of the roots, wherewith the women of Italy vse to scoure their faces from Sunne-burning, freckles, morphew, or any such deformities of the skinne.

† That which our Authour formerly figured and described in the fifth place of this chapter, by the name of *Polygonatum acutum Clusii*, was that described by him in the fourth place; but the figure was not so well expreſt.

Chap. 338. *Of Knee-holme, or Butchers broome.*

¶ *The Description.*

Knee-holme is a low wooddy plant, hauing diuers small branches, or rather stems, rising immediately from the ground, of the height of a foot; whereupon are set many leaues like vnto those of the Box-tree, or rather of the Myrtle, but sharpe and pricking at the point. The fruit groweth vpon the middle rib of the leafe, greene at the first, and red as Corall when it is ripe, like those of *Asparagus*, but bigger. The roots are white, branched, of a meane thickenesse, and full of tough sprouting shoots thrusting forth in other places, whereby it greatly increaseth.

¶ *The Place.*

It groweth plentifully in most places in England in rough and barren grounds, especially vpon Hampsted heath foure miles from London; in diuers places of Kent, Essex, and Barkshire, almost in euery copse and low wood.

¶ *The Time.*

The young and tender sprouts come forth at the first of the Spring, which are eaten in some places

places, as the young tender ſtalkes of Aſparagus and ſuch like herbes. The berries are ripe in Auguſt.

Ruſcus, ſive Bruſcus.
Knee-holme, or Butchers broome.

¶ *The Names.*

It is called in Greeke, ὀξυμυρσίνη, as though they ſhould ſay *Acuta Myrtus*, or pricking Myrtle; and *Myrtus ſylueſtris*, or wild Myrtle, in Latine, *Ruſcum*, or *Ruſcus*: in ſhops, *Bruſcus*, of diuers, *Scopa regia*, as teſtifieth *Marcellus Empericus* an old Writer: in high Durch, **Mieſdoorn**: in low Dutch, **Stekende palm**: in Italian, *Ruſco*, and *Pontogopi*: in Spaniſh *Gilberbaira* in Engliſh, Knee-holme, Knee-huluer, Butchers broome, and Petigree.

There be ſome (ſaith *Pliny*, *lib.* 25. *cap.* 13.) that call it *Oxymyrſine*.

Serapio, *cap.* 288. ſuppoſeth that *Myrtus Agria*, or wilde Myrtle, is the ſame that *Cubebæ* are: he alleageth a reaſon, becauſe *Galen* hath not deſcribed *Myrtus Agria*, or Knee-holme; neither *Dioſcorides Cubebæ*. Which as it is a reaſon of no account, ſo is it alſo without truth: for *Galen* doth no where make mention of *Cubebæ*; and be it that he had, it ſhould not therefore follow that Knee-holme is *Cubebæ*. *Galen* ſpeaketh of *Carpeſium*, which *Auicen* in his 137 chapter makes to be *Cubebæ*: and that *Carpeſium* doth much differ from Kneeholme, thoſe things do euidently declare which *Galen* hath left written hereof in his firſt booke of Counterpoyſons. *Carpeſium* (ſaith he) is an herbe like in kind to that which is called *Phu*, or Setwall, but of greater force, and more aromaticall or ſpicie. This groweth very plentifully in Sida a city of Pamphilia. Alſo he ſaith further, that ſome of the ſtickes of Carpeſium are like to thoſe of Cinnamon: there be two kindes thereof, one which is named *Laërtium*; and another that is called *Ponticum*. They both take their names of the mountaines on which they grow: but *Ponticum* is the better, which is put into medicines in which the herbe *Phu* ought to bee put. For *Carpeſium*, as I haue ſaid, is like vnto *Phu*, or Setwall, yet is it ſtronger, and yeeldeth a certain aromaticall qualitie both in taſte and ſmell. Thus far *Galen*. By which it plainely appeareth, that Knee-holme is not *Carpeſium*, that is to ſay, *Auicennæ* his *Cubebæ*, as ſhall be further declared in the chapter of *Cubebæ*.

Herein *Serapio* was likewiſe deceiued, who ſuſpected it to be ſuch a like thing; ſaying, There be certaine fruits or graines called *Cubebæ*, not ſticks: yet do they neither agree with Knee-holme, neither yet were they knowne vnto *Galen*.

Iſaac in the ſecond booke of his practiſe doth number it among the graines: and likewiſe *Haltebbas* in the ſecond booke of his practiſe alſo, *num.* 162. The later Græcians, among whom is *Nicolaus Myrepſus*, call them *Cubebæ*.

¶ *The Temperature.*

The roots of Knee-holme, which be chiefely vſed, are of temperature hot, and meanely dry, with a thinneſſe of eſſence.

¶ *The Vertues.*

The decoction of the roots of Knee-holme made in wine and drunken, prouoketh vrine, breaketh the ſtone, driueth forth grauell and ſand, and eaſeth thoſe that make their water with great paine. A

Dioſcorides writeth the ſame things of the leaues and berries, which moreouer (ſaith hee) bring downe the deſired ſickeneſſe, helpe the head-ache and the yellow jaundiſe. Ouer and beſides, the roots do ſerue to raiſe vp gently tough and groſſe flegme which ſticketh in the lungs and cheſt, and do concoct the ſame. B

Chap. 339. *Of Horſe-tongue, or Double-tongue.*

¶ *The Deſcription.*

1 HOrſe-tongue ſendeth forth round ſtalkes of a ſpan long; whereupon are ſet long broad and ſharpe pointed leaues, but not pricking as are thoſe of Knee-holme, not vnlike to the leaues of the Bay-tree, but leſſer; greater than thoſe of Knee-holme: out of the middle rib whereof commeth forth another leafe, ſharpe pointed alſo, but ſmall, and of the bigneſſe of the leafe of Knee-holme, reſembling a little tongue. From the boſome of which two leaues commeth forth a berry of the bigneſſe of a peaſe, of colour red when it is ripe, which is ſometimes in a manner all hid vnder the leafe. The root is white, long, and tough, and of a ſweet and pleaſant ſmell.

1 *Hippogloſſum mas.*
The male Horſe-tongue.

2 *Hippogloſſum fœmina.*
The female Horſe-tongue.

2 The female Horſe-tongue differeth not from the precedent but in ſtature and colour of the fruit: it riſeth vp (ſaith my Author) foure or fiue handfulls high: the berries come forth of the middle part of the greater leafe, and the ſetting on of the leſſer, of a feint yellowiſh red colour, wherein conſiſteth the difference. ‡ This is all one with the former. ‡

3 There is likewiſe another ſort of Double-tongue ſet forth by *Matthiolus*, which ſeemes vnto ſome not to differ from the firſt deſcribed or beſt known Horſe-tongue, being in truth the ſelf ſame plant without any difference: notwithſtanding I haue ſet forth the figure, that it may appeare to be the ſame, or very little different, and that not to be diſtinguiſhed: but *Matthiolus* may not eſcape without reprehenſion, who knowing the vntrue tranſlation of *Ruellius*, would ſet forth ſo falſe a figure in his Commentaries.

‡ Our Author here, as in many other places, miſtakes himſelfe; for *Matthiolus* did not ſet forth that figure that our Author giues in this place, for *Hippogloſſum*, but by the title of *Laurus Alexandrina altera:* and it thus differs from the common Horſe-tongue; it hath ſhorter and rounder leaues, yet ſharpe pointed, and the berries are not couered with little leaues as in the other, neither haue they any apparant ſtalkes at all, but grow cloſe to the leaues, as you may ſee them expreſt in the figure. ‡

¶ The

3 *Hippoglossum Matthioli.*
Italian Horse-tongue.

¶ *The Place.*

They are found on the Alps of Liguria, and on the mountaines of Austria. *Belloniꝰ* writeth, that they do grow very plentifully about the hil Athos.

The first of the Horse-tongues growes in my garden very plentifully.

¶ *The Time.*

That which groweth in my Garden floured in the beginning of May: the fruit is ripe in the fall of the leafe.

¶ *The Names.*

Horse-tongue is called in Greeke, ἱππόγλωσσον: of the later Herbarists, *Bonifacia*, *Vvularia*, *Bislingua*, *Lingua Pagana*, and *Victoriola*. The same is also named διφυὴς ἴδαία, of Ida a mountaine of Troy, which is called *Alexanders* Troy: of some, *Laurus Alexandrina*, or the Bay of Alexandria, and *Laurus Idæa*.

This *Hippoglossum*, or *Bonifacia* is called in high Dutch **Zapflinkraut**: in low Dutch, **Tongenbladt**: in Spanish, *Lengua de Cauallo*: in English, Horse-tongue, Tongue-blade, Double-tongue, and Laurel of Alexandria.

¶ *The Temperature.*

Horse-tongue is euidently hot in the second degree, and dry in the first.

¶ *The Vertues.*

The roots of Double-tongue boiled in wine, and the decoction drunke, helpeth the strangury, prouoketh vrine, easeth women that haue hard trauell in childe-bearing. It expelleth the secondine or afterbirth. The root beaten to pouder, whereof six drams giuen in sweet wine, do helpe the diseases aforesaid: it bringeth down the termes, as *Dioscorides* teacheth. The like writeth *Pliny* also: adding further, That it causeth women to haue speedy deliuerance, especially if halfe an ounce of the pouder of the root be giuen to drinke in a draught of sweet wine. A

Baptista Sardus doth notably commend this herbe for the diseases of the mother; by giuing, saith he, a little spoonfull of the pouder either of the herbe, the fruit, or of the root, to her that is troubled with the mother, she is thereby forthwith recouered. He also writeth, that the same is a singular good medicine for those that be burstен, if a spoonefull of the pouder of the root be drunke in the broth of flesh certaine daies together. B

Chap. 340. *Of Cucumbers.*

¶ *The Kindes.*

There be diuers sorts of Cucumbers; some greater, others lesser; some of the garden, some wilde; some of one fashion, and some of another, as shall be declared in the following chapter.

¶ *The Description.*

1 The Cucumber creepes alongst vpon the ground all about, with long rough branches; whereupon doe grow broad rough leaues vneuen about the edges: from the bosome whereof come forth crooked clasping tendrels like those of the Vine. The floures shoot forth betweene the stalkes and the leaues, set vpon tender foot-stalkes composed of fiue small yellow leaues: which being past, the fruit succeedeth, long, cornered, rough, and set with certaine bumpes or risings, greene at the first, and yellow when they be ripe, wherein is contained a firme and sollid pulpe or substance transparent or thorow-shining, which together with the seed is eaten a little before they be fully ripe. The seeds be white, long, and flat.

1 *Cucumis vulgaris.*
Common Cucumber.

2 *Cucumis Anguinus.*
Adders Cucumber.

4 *Cucumis ex Hiſpanico ſemine natus.*
Spaniſh Cucumber.

2 There be alſo certaine long cucumbers, which were firſt made (as is ſaid) by art and manuring, which Nature afterwards did preſerue: for at the firſt, when as the fruit is very little, it is put into ſome hollow cane, or other thing made of purpoſe, in which the cucumber groweth very long, by reaſon of that narrow hollowneſſe, which being filled vp, the cucumber encreaſeth in length. The ſeeds of this kinde of cucumber being ſowne bringeth forth not ſuch as were before, but ſuch as art hath framed; which of their own growth are found long, and oftentimes very crookedly turned: and thereupon they haue beene called *Anguini*, or long Cucumbers.

3 The peare faſhioned Cucumber hath many trailing branches lying flat vpon the ground, rough and prickly; whereon do ſtand at each joynt one rough leafe, ſharpe pointed, and of an ouerworn green colour; among which come forth claſping tendrels, and alſo ſlender foot-ſtalks, whereon do grow yellow ſtarre-like floures. The fruit ſucceeds, ſhaped like a peare, as big as a great Warden. The root is threddy.

4 There hath bin not long ſince ſent out of Spain ſome ſeeds of a rare & beautiful cucumber, into Strausburg a city in Germany, which there brought forth long trailing branches, rough & hairy, ſet with very large rough leaues ſharp pointed, faſhioned like vnto the leaues of the

the great Bur-docke, but more cut in or diuided: amongſt which come forth faire yellow floures growing nakedly vpon their tender foot-ſtalkes: the which being paſt, the fruit commeth in place, of a foot in length, greene on the ſide toward the ground, yellow to the Sun ward, ſtraked with many ſpots and lines of diuers colours. The pulpe or meat is hard and faſt like that of our Pompion.

¶ *The Place.*

Theſe kindes of Cucumbers are planted in gardens in moſt countries of the world.

¶ *The Time.*

According to my promiſe heretofore made, I haue thought it good and conuenient in this place to ſet downe not onely the time of ſowing and ſetting of Cucumbers, Muske-melons, Citruls, Pompions, Gourds, and ſuch like, but alſo how to ſet or ſow all manner and kindes of other colde ſeeds, as alſo whatſoeuer ſtrange ſeeds are brought vnto vs from the Indies, or other hot Regions: *videl.*

Firſt of all in the middeſt of Aprill or ſomewhat ſooner (if the weather be any thing temperate) you ſhall cauſe to be made a bed or banke of hot and new horſedung taken from the ſtable (and not from the dunghill) of an ell in breadth, and the like in depth or thickneſſe, of what length you pleaſe, according to the quantity of your ſeed: the which bank you ſhall couer with hoops or poles, that you may the more conueniently couer the whole bed or banke with Mats, old painted cloth, ſtraw or ſuch like, to keepe it from the injurie of the cold frоſty nights, and not hurt the things planted in the bed: then ſhall you couer the bed all ouer with the moſt fertileſt earth finely ſifted, halfe a foot thicke, wherein you ſhall ſet or ſow your ſeeds: that being done, caſt your ſtraw or other couerture ouer the ſame; and ſo let it reſt without looking vpon it, or taking away of your couering for the ſpace of ſeuen or eight daies at the moſt, for commonly in that ſpace they will thruſt themſelues vp nakedly forth of the ground: then muſt you caſt vpon them in the hotteſt time of the day ſome water that hath ſtood in the houſe or in the Sun a day before, becauſe the water ſo caſt vpon them newly taken forth of a well or pumpe, will ſo chill and coole them being brought and nouriſhed vp in ſuch a hot place, that preſently in one day you haue loſt all your labour; I mean not only your ſeed, but your banke alſo; for in this ſpace the great heate of the dung is loſt and ſpent, keeping in memory that euery night they muſt be couered and opened when the day is warmed with the Sun beames: this muſt be done from time to time vntill that the plants haue foure or ſix leaues a piece, and that the danger of the cold nights is paſt: then muſt they be replanted very curiouſly with the earth ſticking to the plant, as neere as may be vnto the moſt fruitfull place, and where the Sun hath moſt force in the garden; prouided that vpon the remouing of them you muſt couer them with ſome Docke leaues or wiſpes of ſtraw, propped vp with forked ſtickes, as well to keepe them from the cold of the night, as alſo the heat of the Sun: for they cannot whileſt they be young and newly planted, endure neither ouermuch cold nor ouermuch heate, vntill they are well rooted in their new place or dwelling.

Oftentimes it falleth out that ſome ſeeds are more franker and forwarder than the reſt, which commonly do riſe vp very nakedly with long necks not vnlike to the ſtalke of a ſmall muſhrome, of a night old. This naked ſtalke muſt you couer with the like fine earth euen to the greene leaues, hauing regard to place your banke ſo that it may be defended from the North-windes.

Obſerue theſe inſtructions diligently, and then you ſhall not haue cauſe to complaine that your ſeeds were not good, nor of the intemperancie of the climat (by reaſon wherof you can get no fruit) although it were in the furtheſt parts of the North of Scotland.

¶ *The Names.*

The Cucumber is named generally *Cucumis*: in ſhops, *Cucumer*: and is taken for that which the Grecians call σικυος: in Latine, *Cucumis ſatiuus*, or garden Cucumber: in high Dutch, **Cucumen**: in Italian, *Concomero*: in Spaniſh, *Cogombro*: in French, *Concombre*: in low Dutch, **Concommeren**: in Engliſh, Cowcumbers and Cucumbers.

¶ *The Temperature and Vertues.*

All the Cucumbers are of temperature cold and moiſt in the ſecond degree. They putrifie ſoon in the ſtomacke, and yeeld vnto the body a cold and moiſt nouriſhment, and that very little, and the ſame not good. A

Thoſe Cucumbers muſt be choſen which are greene and not yet ripe: for when they are ripe and yellow they be vnfit to be eaten. B

The ſeed is cold, but nothing ſo much as the fruit. It openeth and clenſeth, prouoketh vrine, openeth the ſtoppings of the liuer, helpeth the cheſt and lungs that are inflamed; and being ſtamped and outwardly applied in ſtead of a clenſer, it maketh the skin ſmooth and faire. C

Cucumber (ſaith my Author) taken in meats, is good for the ſtomacke and other parts troubled with heat. It yeeldeth not any nouriſhment that is good, inſomuch as the vnmeaſurable vſe thereof filleth the veines with naughty cold humors. D

The ſeed ſtamped and made into milke like as they do with Almonds, or ſtrained with milke or ſweet E

ſweet wine and drunke, looſeth the belly gently, and is excellent againſt the exulceration of the bladder.

F The fruit cut in pieces or chopped as herbes to the pot, and boiled in a ſmall pipkin with a piece of mutton, being made into potage with Ote-meale, euen as herb potage are made, whereof a meſſe eaten to break-faſt, as much to dinner, and the like to ſupper; taken in this manner for the ſpace of three weekes together without intermiſſion, doth perfectly cure all manner of ſauce flegme and copper aces, red and ſhining fierie noſes (as red as red Roſes) with pimples, pumples, rubies, and ſuch like precious faces.

G Prouided alwaies that during the time of curing you doe vſe to waſh or bathe the face with this li quor following.

H Take a pinte of ſtrong white wine vinegre, pouder of the roots of Ireos or Orrice three dragmes, ſearced or bolted into moſt fine duſt, Brimmeſtone in fine pouder halfe a ounce, Camphire two dragmes, ſtamped with two blanched Almonds, foure Oke apples cut thorow the middle, and the juyce of foure Limons: put them all together in a ſtrong double glaſſe, ſhake them together very ſtrongly, ſetting the ſame in the Sunne for the ſpace of ten daies: with which let the face be waſhed and bathed daily, ſuffering it to drie of it ſelfe without wiping it away. This doth not onely helpe fierie faces, but alſo taketh away lentils, ſpots, morphew, Sun-burne, and all other deformities of the face.

† That which formerly was in the ſecond place by the name of *Cucumis Turcicus*, was the ſame with the fifth of the former Edition (now the fourth) and is therefore omitted.

Chap. 341. *Of Wilde Cucumber.*

Cucumis Aſininus.
Wilde Cucumber.

¶ *The Deſcription.*

THe wilde Cucumber hath many fat hairie branches, very rough and full of juyce, creeping or trailing vpon the ground, whereupon are ſet very rough leaues, hairy, ſharpe pointed, & of an ouerworne grayiſh greene colour: from the boſome of which come forth long tender footſtalkes: on the ends whereof doe grow ſmall floures compoſed of fiue ſmall leaues of a pale yellow colour: after which commeth forth the fruit, of the bignes of the ſmalleſt pullets egge, but ſomewhat longer, very rough and hairy on the outſide, and of the colour and ſubſtance of the ſtalkes, wherein is contained very much water and ſmal hard blackiſh ſeeds alſo, of the bigneſſe of tares; which being come to maturitie and ripeneſſe, it caſteth or ſquirteth forth his water with the ſeeds, either of it owne accord, or being touched with the moſt tender or delicate hand neuer ſo gently, and oftentimes ſtriketh ſo hard againſt thoſe that touch it (eſpecially if it chance to hit againſt the face) that the place ſmarteth long after: whereupon of ſome it hath beene called *Noli me tangere*, Touch me not. The root is thicke, white and long laſting.

¶ *The Place.*

It is found in moſt of the hot countries among rubbiſh, grauell, and other vntilled places: it is planted in gardens in the Low-countries, and being once planted, ſaith *Dodonæus*, it eaſily commeth vp againe many yeares after (which is true:) and yet ſaith he further, that it doth not ſpring againe of the root, but of the ſeeds ſpirted or caſt about: which may likewiſe be true where he hath obſerued it, but in my garden it is otherwiſe, for as I ſaid before, the root is long laſting, and continueth from yeare to yeare.

¶ *The*

¶ *The Time.*

It ſpringeth vp in May, it floureth and is ripe in Autumne, and is to be gathered at the ſame time, to make that excellent compoſition called *Elaterium*.

¶ *The Names.*

It is called in Greeke σίκυος ἄγριος: in Latine, *Agreſtis*, and *Errraticus Cucumis*: in ſhops, *Cucumer aſininus*: in Italian, *Cocomero ſalvatico*: in Spaniſh, *Cogumbrillo amargo*: in Engliſh, wilde Cucumber, ſpirting Cucumbers, and touch me not: in French, *Concombres ſauvages*.

¶ *The Temperature.*

The leaues of wilde Cucumbers, roots and their rindes, as they are bitter in taſte, ſo they be likewiſe hot and clenſing. The juyce is hot in the ſecond degree, as *Galen* witneſſeth, and of thin parts. It clenſeth and waſteth away.

¶ *The Vertues.*

The juyce called *Elaterium* doth purge forth choler, flegme, and watery humours, and that with force, and not onely by ſiege, but ſometimes alſo by vomit. A

The quantity that is to be taken at one time is from fiue graines to ten, according to the ſtrength of the patient. B

The juyce dried or hardened, and the quantity of halfe a ſcruple taken, driueth forth by ſiege groſſe flegme, cholericke humours, and preuaileth mightily againſt the dropſie, and ſhortneſſe of breath. C

The ſame drawne vp into the noſthrils mixed with a little milke, taketh away the redneſſe of the eies. D

The juyce of the root doth alſo purge flegme, cholericke and wateriſh humours, and is good for the dropſie: but not of ſuch force as *Elaterium*, which is made of the juyce of the fruit: the making whereof I commend to the learned and curious Apothecaries: among which number Mr. *William Wright* in Bucklers Burie my louing friend hath taken more paines in curious compoſing of it, and hath more exactly performed the ſame than any other whatſoeuer that I haue had knowledge of. E

Chap. 342. *Of Citrull Cucumbers.*

1 *Citrullus officinarum.*
Citrull Cucumber.

‡ 2 *Citrullus minor.*
Small Citrull.

¶ The

¶ *The Deſcription.*

1 THe Citrull Cucumber hath many long, flexible, and tender ſtalkes trailing vpon the ground, branched like vnto the Vine, ſet with certaine great leaues deeply cut, and very much jagged: among which come forth long claſping tendrels, and alſo tender foot-ſtalkes, on the ends whereof do grow floures of a gold yellow colour: the fruit is ſomewhat round, ſtraked or ribbed with certaine deepe furrowes alongſt the ſame, of a greene colour aboue, and vnderneath on that ſide that lyeth vpon the ground ſomething white: the outward skin whereof is very ſmooth; the meat within is indifferent hard, more like to that of the Pompion than of the Cucumber or Muske-Melon: the pulpe wherein the ſeed lieth, is ſpungie, and of a ſlimie ſubſtance: the ſeed is long, flat, and greater than thoſe of the Cucumbers: the ſhell or outward barke is blackiſh, ſometimes of an ouerworne reddiſh colour. The fruit of the Citrull doth not ſo eaſily rot or putrifie as doth the Melon, which being gathered in a faire dry day may be kept a long time, eſpecially being couered in a heape of Wheat, as *Matthiolus* ſaith; but according to my practiſe you may keepe them much longer and better in a heape of dry ſand.

2 The ſecond kinde of Citrull differeth not from the former, ſauing that it is altogether leſſer, and the leaues are not ſo deeply cut or jagged, wherein conſiſteth the difference.

¶ *The Place and Time.*

The Citrull proſpereth beſt in hot Regions, as in Sicilia, Apulia, Calabria, and Syria, about Aleppo and Tripolis. We haue many times ſowne the ſeeds, and diligently obſerued the order preſcribed in planting of Cucumbers.

¶ *The Names.*

The later Herbariſts do call it *Anguria*: in ſhops, *Citrullus*, and *Cucumus Citrullus*: in Engliſh, Citruls, and Cucumber Citruls, and the ſeed is knowne by the name of *Semen Citrulli*, or Citrull ſeed. But if *Cucumis Citrullus* be ſo called of the yellow colour of the Citron, then is the common Cucumber properly *Cucumis Citrullus*: which is knowne vnto all to be contrary.

¶ *The Temperature and Vertues.*

A The meat or pulpe of Cucumer Citrull which is next vnto the bark is eaten raw, but more commonly boyled: it yeeldeth to the body little nouriſhment, and the ſame cold: it ingendreth a wateriſh bloud, mitigateth the extremity of heat of the inner parts, and tempereth the ſharpneſſe and feruent heat of choler: being raw and held in the mouth, it takes away the roughneſſe of the tongue in Agues, and quencheth thirſt.

B The ſeeds are of the like faculty with thoſe of Cucumbers.

Chap. 343. *Of the wilde Citrull called* Colocynthis.

¶ *The Deſcription.*

1 COloquintida hath beene taken of many to be a kind of the wilde Gourd, it lieth along creeping on the ground as do the Cucumbers and Melons, comming neereſt of all to that which in tho e daies of ſome Herbariſts is called Citrull Cucumber: it bringeth forth vpon his long branches ſmall crooked tendrels like the Vine, and alſo very great broad leaues deeply cut or jagged: among which come forth ſmall floures of a pale yellow colour; then commeth the fruit round as a bowle, couered with a thin rinde, of a yellow colour when it is ripe, which when it is pilled or pared off, the white pulpe or ſpungie ſubſtance appeareth full of ſeeds, of a white or elſe an ouerworne browne colour; the fruit ſo pared or pilled, is dryed for medicine; the which is moſt extreame bitter, and likewiſe the ſeed, and the whole plant it ſelfe in all his parts.

2 The ſecond kinde of Coloquintida hath likewiſe many long branches and claſping tendrels, wherewith it taketh hold of ſuch things as are neere vnto it. It bringeth forth the like leaues, but not ſo much jagged. The floures are ſmall and yellow: the fruit is faſhioned like a peare, and the other ſort round, wherein the eſpeciall difference conſiſteth.

¶ *The Place.*

Coloquintida is ſowne and commeth to perfection in hot regions, but ſeldome or neuer in theſe Northerly and cold countries.

¶ *The*

1 *Colocynthis.*
The wilde Citrull or Coloquintida.

2 *Colocynthis pyriformis.*
Peare fashioned Coloquintida.

¶ *The Time.*

It is sowne in the Spring, and bringrth his fruit to perfection in August.

It hath beene diuers times deliuered vnto me for a truth, that they doe grow in the sands of the Mediterranean sea shore, or very neere vnto it, wilde, for euery man to gather that list, especially on the coast of Barbarie, as also without the mouth of the Streights neer to *Sancta Crux* and other places adjacent; from whence diuers Surgions of London that hath trauelled thither for the curing of sicke and hurt men in the ship haue brought great quantities thereof at their returne.

¶ *The Names.*

It is vulgarly called *Coloquintida:* in Greeke, κολοκύνθις: the Latine translators for *Colocinthis* doe oftentimes set downe *Cucurbita sylvestris:* notwithstanding there is a *Cucurbita sylvestris* that differeth from *Colocinthis*, or Coloquintida: for *Cucurbita sylvestris* is called in Greeke κολοκύνθις ἄγριος: or wilde Coloquintida, whereof shall be set forth a peculiar chapter next after the *Cucurbita* or Gourd: in English it is called Coloquintida, or Apple of Coloquintida.

¶ *The Temperature.*

Coloquintida as it is in his whole nature and in all his parts bitter, so it is likewise hot and drie in the later end of the second degree; and therefore it purgeth, clenseth, openeth and performeth all those things that most bitter things do: but that the strong qualitie which it hath to purge by the stoole, is, as *Galen* saith, of more force than the rest of his operations.

¶ *The Vertues.*

Which operation of purging it worketh so violently, that it doth not onely draw forth flegme A
and choler maruellous speedily, and in very great quantitie: but oftentimes fetcheth forth bloud and bloudy excrements, by shauing the guts, and opening the ends of the meseraicall veines.

So that therefore the same is not to bee vsed either rashly, or without some dangerous and ex- B
treme disease constraine thereunto: neither yet at all, vnlesse some tough and clammie thing bee mixed therewith, whereby the vehemency thereof may be represſed, the hurtfull force dulled, and the same speedily passing through the belly, the guts be not fret or shaued. *Mesues* teacheth to mixe with it either Mastich, or gum Tragacanth.

There be made of it Trochises, or little flat cakes, with Mastich, gum Arabick, Tragacanth and C
Bdellium,

Bdellium, of these, Mastich hath a manifest binding quality: but tough and clammy things are much better, which haue no astriction at all in them, or very little.

D For by such binding or astringent things, violent medicines being restrained and brideled, do afterward work their operation with more violence and trouble: but such as haue not binding things mixed with them do easilier worke, and with lesser paine, as be those pils which *Rhasis* in his ninth booke of *Almanzor* calleth *Illiacæ*: which are compounded of Coloquintida and Scamony, two of the strongest medicines that are; and of a third called gum *Sagapene*, which through his clammines doth as it were daube the intrails and guts, and defend them from the harme that might haue come of either of them.

E The which composition, although it be wonderfull strong, and not to be vsed without very great necessitie vrge thereunto, doth notwithstanding easily purge, aad without any great trouble, and with lesser torment than most of the mildest and gentlest medicines which haue Mastich and other things mixed with them that are astringent.

F And for this cause it is very like that *Galen* in his first booke of Medicines, according to the places affected, would not suffer Mastich aud Bdellium to be in the pilles, which are surnamed *Coliæ*: the which notwithstanding his Schoolemaster *Quintus* was also woont before to adde vnto the same.

G But Coloquintida is not onely good for purgations, in which it is a remedy for the diffinesse or the turning sickenesse, the megrim, continuall head-ache, the Apoplexie, the falling sickenesse, the stuffing of the lungs, the gnawings and gripings of the guts and intrailes, and other most dangerous diseases, but also it doth outwardly worke his operations, which are not altogether to be rejected.

H Common oile wherein the same is boyled, is good against the singing in the eares, and deafenes: the same killeth and driueth forth all manner of wormes of the belly, and doth oftentimes prouoke to the stoole, if the nauell and bottome of the belly be therewith annointed.

I Being boiled in vinegre, and the teeth washed therewith, it is a remedy for the tooth-ache, as *Mesues* teacheth.

K The seed is very profitable to keepe and preserue dead bodies with; especially if Aloes and Myrrhe be mixed with it.

L The white pulpe or spungious pith taken in the weight of a scruple openeth the belly mightily, and purgeth grosse flegme, and cholericke humors.

M It hath the like force if it be boyled and laid to infuse in wine or ale, and giuen to drink.

N Being taken after the same manner it profiteth the diseases before remembred, that is, the Apoplexie, falling sickenesse, giddinesse of the head, the collicke, loosenesse of sinewes, and places out of joynt, and all diseases proceeding of cold.

O For the same purposes it may be vsed in clisters.

P The same boiled in oile, and applied with cotton or wooll, taketh away the paine of the Hemorrhoides.

Q The decoction made in wine, and vsed as a fomentation or bathe, bringeth downe the desired sickenesse.

CHAP. 344. *Of Muske-Melon, or Million.*

¶ *The Kindes.*

THere be diuers sorts of Melons found at this day, differing very notably in shape and proportion, as also in taste, according to the climate and country where they grow: but of the Antients there was onely one and no more, which is that *Melopepo* called of *Galen*, *Cucumis*, or *Galens* Cucumber: notwithstanding some haue comprehended the Muske-Melons vnder the kindes of Citruls, wherein they haue greatly erred: for doubtlesse the Muske-Melon is a kinde of Cucumber, according to the best approued Authors.

¶ *The Description.*

I THat which the later Herbarists do call Muske-Melons is like to the common Cucumber in stalks, lying flat vpon the ground, long, branched, and rough. The leaues be much alike, yet are they lesser, rounder, and not so cornered: the floures in like manner bee yellow: the fruit is bigger, at the first somwhat hairy, somthing long, now and then somwhat round; oftentimes greater, and many times lesser: the barke or rinde is of an ouerworne russet greene colour,

1 *Melo.*
The Muske Melon.

2 *Melo Saccharinus.*
Sugar Melon.

4 *Melo Hispanicus.*
Spanish Melons.

colour, ribbed and furrowed very deepely, hauing often chaps or chinks, and a confused roughnesse: the pulp or inner substance which is to be eaten is of a feint yellow colour; the middle part whereof is full of a slimie moisture: amongst which is contained the seed, like to those of the Cucumber, but lesser, and of a browner colour.

2 The sugar Melon hath long trailing stalks lying vpon the ground, whereon are set small clasping tendrels like those of the Vine, and also leaues like vnto the common Cucumber, but of a greener colour: the fruit commeth forth among those leaues, standing vpon slender foot-stalkes, round as the fruit of Coloquintida, and of the same bignesse, of a most pleasant taste like sugar, whereof it tooke the syrname *Saccharatus*.

3 The peare-fashioned Melon hath many long viny branches, whereupon grow cornered leaues like those of the Vine, and likewise great store of long tendrels, clasping and taking hold of each thing that it toucheth: the fruit groweth vpon sleeder foot-stalks fashioned like a peare, of the bignesse of a great Quince.

4 The Spanish Melon brings forth long trailing branches, wheron are set broad leaues slightly indented about the edges, not diuided at all, as are all the rest of the Melons. The fruit groweth neere vnto the stalke, like vnto the common Pompion, very long, not crested or furrowed at all, but

ſpotted with very many ſuch marks as are on the backe of the Hearts-tongue leafe. The pulpe or meat is not ſo pleaſing in taſte as the other.

¶ *The Place.*

They delight in hot regions, notwithſtanding I haue ſeen at the Queens houſe at S. *Iames* many of the firſt ſort ripe, through the diligent and curious nouriſhing of them by a skilfull gentleman the keeper of the ſaid houſe called Mr *Fowle*: and in other places neere the right honourable Lord of Suſſex his houſe of Bermondſey by London, where yearely there is very great plenty, eſpecially if the weather be any thing temperat.

¶ *The Time.*

They are ſet or ſowne in Aprill, as I haue already ſhewne in the chapter of Cucumbers. Their fruit is ripe in the end of Auguſt, and ſomtimes ſooner.

¶ *The Names.*

The Muske Melon is called in Latine, *Melo*: in Italian, *Mellone*: in Spaniſh, *Melon*: in French, *Melons*: in high-Dutch, **Melaun**: in low-Dutch, **Meloenen**: in Greeke, μῆλον, which ſignifieth an apple; and therefore this kinde of Cucumber is more truly called μηλοπέπων, or *Melopepon*, by reaſon that *Pepo* ſmelleth like an apple, whereto the ſmell of this fruit is like, hauing withall the ſmell as it were of Muske; and for that cauſe are alſo named *Melones Muſchatellini*, or Muske Melons.

¶ *The Nature.*

The meat of the Muske Melon is very cold and moiſt.

¶ *The Vertues.*

A It is harder of digeſtion than is any of the Cucumbers, and if it remaine long in the ſtomack it putrifieth, and is occaſion of peſtilent feuers. Which thing alſo *Aëtius* witneſſeth, in his firſt booke of *Tetrabibles*; writing, That the vſe of *Cucumeres* or Cucumbers breedeth peſtilent feuers: for hee alſo taketh *Cucumis* to be that which is commonly called a Melon; which is vſually eaten of the Italians and Spaniards rather to repreſſe the rage of luſt, than for any other phyſicall vertue.

B The ſeed is of like operation with that of the former Cucumber.

Chap. 345. *Of Melons or Pompions.*

¶ *The Kindes.*

THere be found diuers kindes of Pompions which differ either in bigneſſe or forme; it ſhal be therefore ſufficient to deſcribe ſome one or two of them, and refer the reſt to the view of the figures, which moſt liuely doe expreſſe their differences; eſpecially becauſe this Volume waxeth great, the deſcription of no moment, and I haſten to an end.

¶ *The Deſcription.*

1 THe great Pompion bringeth forth thicke and rough prickely ſtalkes, which with their claſping tendrels take hold vpon ſuch things as are neere vnto them, as poles, arbours, pales, and ledges, which vnleſſe they were neere vnto them would creep along vpon the ground: the leaues be wilde and great, very rough, and cut with certain deep gaſhes, nicked alſo on the edges like a ſaw: the floures be very great like vnto a bell cup, of a yellow colour like gold, hauing fiue corners ſtanding out like teeth: the fruit is great, thicke, round, ſet with thicke ribbs like edges ſticking forth; the pulpe or meat whereof next vnder the rinde is white, and of a mean hardneſſe: the pith or ſubſtance in the middle is ſpongie and ſlimy; the ſeed is great, broad, flat, ſomthing white, much greater than that of the Cucumber, otherwiſe not differing at all in forme. The colour of the barke or rinde is oftentimes of an obſcure green, ſometimes gray. The rinde of the green Pompion is harder, and as it were of a wooddy ſubſtance: the rinde of the gray is ſofter and tenderer.

2 The ſecond kinde of Melons or Pompions is like vnto the former in ſtalkes and leaues, and alſo in claſping tendrels; but the gaſhes of the leaues are not ſo deepe, and the ſtalkes bee tenderer: the floures are in like manner yellow, gaping, cornered at the top, as be thoſe of the former: but the fruit is ſomewhat rounder, ſometimes greater, and many times leſſer; and oftentimes of

of a green colour, with an harder barke, now and then softer and whiter. The meat within is like the former: the seeds haue also the same forme, but are somewhat lesse.

1 *Pepo maximus oblongus.*
The great long Pompion.

2 *Pepo maximus rotundus.*
The great round Pompion.

3 Of this kinde there is also another Pompion like vnto the former in rough stalks, and in gashed and nicked leaues: the floure is also great and yellow like those of the others: the fruit is of a great bigneſſe, whose barke is full of little bunnies or hilly welts, as is the rinde of the Citron, which is in like manner yellow when it is ripe.

4 The fourth Pompion doth very much differ from the others in form: the stalks, leaues, and flours are like those of the rest, but the fruit is not long or round, but altogether broad, and in a maner flat like vnto a shield or buckler, thicker in the middle, thinner in the compasse, and curled or bumped in certain places about the edges, like the rugged or vneuen barke of the Pomecitron, the which rinde is very soft, thin, and white; the meat within is meetly hard and durable: the seed is greater than that of the common Cucumber, in forme and colour all one.

‡ *Macocks Virginiani, sive Pepo Virginianus.*
The Virginian Macock or Pompion.

‡ This hath rough cornered straked trailing branches proceeding from the root, eight or nine foot long or longer, and those again diuided into other branches of a blackish greene colour, trailing, spreading, or running along st the earth, couering a great deale of ground, sending forth broad cornered rough leaues, on great grosse long rough hairy footstalks, like & fully as big as the leaues of the common Pompion, with clasping tendrels and great broad shriueled yellow flours also like those of the common Pompion: the fruit succeedeth growing along st the stalks, commonly not neere the root, but towards the vpper part or tops of the branches, somewhat round, not extending in length, but flat like a bowle, but not so big as an ordinarie bowle, beeing seldome foure inches broad, and three inches long, of a blackish green colour when it is ripe. The substance or eatable part is of a yellowish white colour, containing in the middest a great deale of pulp or soft matter, wherein the seed lieth in certain rowes also, like the common Pompion, but smaller. The root is made of many whitish branches creeping far abroad in the earth, and perish at the first approch of Winter.

3 *Pepo maximus compressus.* The great flat bottomed Pompion.

4 *Pepo maximus clypeatus.* The great Buckler Pompion.

5 *Pepo Indicus minor rotundus.*
The small round Indian Pompion.

6 *Pepo Indicus angulosus.*
The cornered Indian Pompion.

Melones aquatici edules Virginiani.
The Virginian water-Melon.

This Melon or Pompion is like and fully as big as the common Pompion, in spreading running creeping branches, leaues, floures, and clasping tendrels: the fruit is of a very blackish greene colour, and extendeth it selfe in length neere foure inches, and three inches broad, no bigger nor longer than a great apple, and grow alongst the branches forth of the bosomes of the leaues, not farre from the root, euen to the tops of the branches, containing a substance, pulp, and flat seed like the ordinarie Pompion: the root is whitish, and dispersed it selfe very far abroad in the earth, and perisheth about the beginning of Winter. Octob. 10. 1621. *Iohn Goodyer.* ‡

¶ *The Place.*

All these Melons or Pompions be garden plants: they ioy best in a fruitfull soile, and are common in England, except the last described, which is as yet a stranger.

¶ *The Time.*

They are planted in the beginning of Aprill: they floure in August: the fruit is ripe in September.

¶ *The Names.*

The great Melon or Pompion is named in Greek πέπων: in Latine likewise *Pepo*: the fruits of them all when they be ripe are called by a common name in Greeke, πέπονες: in English, Melons, or Pompions. Whereupon certain Physitions (saith *Galen*) haue contended, that this fruit ought to be called σικύωνες, that is to say in Latine, *Pepo Cucumeralis*, or Cucumber. *Pliny, lib. 9. cap. 5.* writes, That *Cucumeres* when they exceed in greatnesse are called *Pepones*: it is called in high-Dutch, Pluker: in low-Dutch, Pepoenen: in French, *Pompons*.

¶ *The Nature and Vertues.*

All the Melons are of a cold nature, with plenty of moisture: they haue a certain clensing qua- A
litie, by means whereof they prouoke vrine, and do more speedily passe through the body than doe either the Gourd, Citron, or Cucumber, as *Galen* hath written.

The pulp of the Pompion is neuer eaten raw, but boiled; for so it doth more easily descend, ma- B
king the belly soluble. The nourishment which comes hereof is little, thin, moist, and cold, bad, as *Galen* saith, and that especially when it is not well digested; by reason wherof it maketh a man apt and ready to fall into the disease called the Cholericke passion, or Felonie.

The seed clenseth more than the meat, it prouoketh vrin, and is good for those that are troubled C
with the stone of the kidnies.

The fruit boiled in milke and buttered, is not only a good and wholsome meat for mans bodie, D
but so prepared, it is also a physical medicine for such as haue an hot stomack, and the inward parts inflamed.

The flesh or pulp of the same sliced and fried in a pan with butter, is also a good and wholsome E
meat: but baked with apples in an ouen, it fills the body with flatuous or windy belchings, and is food vtterly vnwholsome for such as liue idlely; but vnto robustious and rusticke people nothing hurteth that filleth the belly.

Chap. 346. *Of wilde Pompions.*

¶ *The Description.*

1 AS there is a wilde sort of Cucumbers, of Melons, Citrons, and Gourds, so likewise are there certain wilde Pompions that be so of their own nature. These bring forth rough stalks set with sharp thorny prickles: the leaues be likewise rough, the floures yellow, as be those of the garden Melon, but euery part is lesser: the root is thicke, round, and sharpe pointed, hauing a hard green rinde; the pulpe or meat whereof, and the middle pith, with the seed, are like those of the garden Pompion, but very bitter in taste.

2 The second is like vnto the former, but it is altogether lesse, wherein consists the difference.

¶ *The Place.*

These Melons grow wilde in Barbarie, Africa, and most parts of the East and West Indies: they grow not in these parts, except they be sowne.

¶ *The Time.*

Their time of flouring and flourishing answers that of the garden Pompion.

1 *Pepo major ſylueſtris.*
The great wilde Pompion.

2 *Pepo minor ſylueſtris.*
The ſmall wilde Pompion.

¶ *The Names.*

Although the antient phyſitions haue made no mention of this plant, yet the thing it ſelf doth ſhew that there be ſuch, and ought to be called in Greeke πέπονες ἄγριοι: in Latine, *Pepones ſylueſtres*: in Engliſh, wilde Melons or Pompions.

¶ *The Temperature.*

Like as theſe wild Melons be altogether of their owne nature very bitter, ſo be they alſo of temperature hot and dry, and that in the later end of the ſecond degree. They haue likewiſe a clenſing facultie, not inferior to the wilde Cucumbers.

¶ *The Vertues.*

A The wine which when the pith and ſeed is taken forth is poured into the rinde, and hath remained ſo long therein till ſuch time as it becommeth bitter, doth purge the belly, and bringeth forth flegmaticke and cholericke humors. To be briefe, the juice herof is of the ſame operation that the wilde Cucumber is, and being dried it may be vſed in ſtead of *Elaterium*, which is the dried juice of the wilde Cucumber.

CHAP. 347. *Of Gourds.*

¶ *The Kindes.*

THere diuers ſorts of Gourds, ſome wilde, others tame of the garden: ſome bearing fruit like vnto a bottle; others long, bigger at the end, keeping no certain form or faſhion; ſome greater, others leſſe.

‡ I will only figure and deſcribe two or three of the chiefeſt, and ſo paſſe ouer the reſt, becauſe each one vpon the firſt ſight of them knowes to what kinde to refer them. ‡

¶ *The*

¶ *The Description.*

1 THe Gourd bringeth forth very long ſtalks as be thoſe of the Vine, cornered and parted into diuers branches, which with his claſping tendrels taketh hold and clymeth vpon ſuch things as ſtand neere vnto it: the leaues bee very great, broad, and ſharpe pointed, almoſt as great as thoſe of the Clot-burre, but ſofter, and ſomwhat couered as it were with a white freeſe, as be alſo the ſtalkes and branches, like thoſe of the mariſh Mallow: the floures be white, and grow forth from the boſome of the leaues: in their places come vp the fruit, which are not all of one faſhion, for oftentimes they haue the forme of flagons and bottles, with a great large belly and a ſmall necke. The Gourd (ſaith *Pliny, lib. 19. cap. 5.*) groweth into any forme or faſhion that you would haue it; either like vnto a wreathed Dragon, the leg of a man, or any other ſhape, according to the mold wherein it is put while it is yong: being ſuffered to clyme vpon any arbor where the fruit may hang, it hath bin ſeen to be nine foot long, by reaſon of his great weight which hath ſtretched it out in the length: the rinde when it is ripe, is very hard, woody, and of a yellow colour: the meat or inward pulpe is white; the ſeed long, flat, pointed at the top, broad, below, with two peaks ſtanding out like hornes, white within, and ſweet of taſte.

2 The ſecond differs not from the precedent in ſtalks, leaues, or floures: the fruit hereof is for the moſt part faſhioned like a flagon or bottle, wherein eſpecially conſiſteth the difference.

1 *Cucurbita anguina.*
Snakes Gourd.

2 *Cucurbita lagenaria.*
Bottle Gourds.

¶ *The Place.*

Gourds are cheriſhed in the gardens of theſe cold regions rather for pleaſure than profit: in the hot countries where they come to ripenes they are ſomtimes eaten, but with ſmall delight; eſpecially they are kept for the rinds, wherein they put turpentine, oile, hony, and alſo ſerue them as pales to fetch water in, and many other the like vſes.

¶ *The Time.*

They are planted in a bed of horſe-dung in April, like as we haue taught the planting of cucumbers: they flouriſh in Iune and Iuly, the fruit is ripe in the end of Auguſt.

¶ *The Names.*

The Gourd is called in Greeke, κολοκυνθη: in Latine, *Cucurbita edulis, Cucurbita ſatiua*: of *Pliny*, *Cucurbita*

Cucurbita Cameraria, becauſe it climeth vp, and is a couering for arbors, walking places, and banqueting houſes in gardens: he calls the other which climeth not vp, but lieth crawling on the ground, *Cucurbita plebcia*: in Italian, *Zucca*: in Spaniſh, *Calabazza*: in French, *Courge*: in high-Dutch, **Kurbs**: in low-Dutch, **Cauwoozden**: in Engliſh, Gourds.

¶ *The Temperature.*

The meat or inner pulp of the Gourd is of temperature cold and moiſt, euen in the ſecond degree.

¶ *The Vertues.*

A The juice being dropped into the eares with oile of Roſes is good for the paine thereof proceeding of an hot cauſe.

B The pulp or meat thereof mitigateth all hot ſwellings, if it be laid thereon in manner of a pultis, and vſed in like manner it takes away the head-ache and inflammation of the eies.

C The ſame Author affirmeth, that a long Gourd or Cucumber being laid in the cradle or bed by the yong infant whileſt it is aſleep and ſicke of an ague, it ſhall be very quickly made whole.

D The pulp alſo is eaten ſod, but becauſe it hath in it a wateriſh and thinne juice, it yeeldeth ſmall nouriſhment to the body, and the ſame cold and moiſt; but it eaſily paſſeth thorow, eſpecially being ſodden, which by reaſon of the ſlipperineſſe and moiſtneſſe alſo of his ſubſtance, mollifies the belly.

E But being boiled in an ouen or fried in a pan it loſeth moſt part of his naturall moiſture, wherefore it more ſlowly deſcendeth, and doth not mollifie the belly ſo ſoon.

F The ſeed allayes the ſharpneſſe of vrin, and brings down the ſame.

Chap. 348. *Of the wild Gourd.*

1 *Cucurbita lagenaria ſylueſtris.*
Wilde Bottle Gourd.

2 *Cucurbita ſylueſtris fungiformis.*
Muſhrom wilde Gourd.

¶ The

¶ *The Deſcription.*

1 THere is beſides the former ones a certaine wilde Gourd: this is like the garden Gourd in clyming ſtalks, claſping tendrels, and ſoft leaues, and as it were downy; all and euery one of which things being far leſſe: this alſo clymbeth vpon arbours and banqueting houſes: the fruit repreſenteth the great bellied Gourd, and thoſe that be like vnto bottles in form, but in bigneſſe it is very far inferior, for it is ſmall, and ſcarce ſo great as an ordinarie Quince, and may be held within the compaſſe of a mans hand: the outward rinde at the firſt is green, afterward it is as hard as wood, and of the colour thereof: the inner pulp is moiſt and very full of juice, wherin lies the ſeed. The whole is as bitter as Coloquintida, which hath made ſo many errors, one eſpecially, in taking the fruit Coloquintida for the wilde Gourd.

2 The ſecond wilde Gourd hath likewiſe many trailing branches and claſping tendrels, wherwith it taketh hold of ſuch things as be neere vnto it: the leaues be broad, deepely cut into diuers ſections like thoſe of the Vine, ſoft and very downy, whereby it is eſpecially knowne to be one of the Gourds: the flours are very white, as are alſo thoſe of the Gourds: the fruit ſucceeds, growing to a round forme, flat on the top like the head of a Muſhrome, whereof it tooke his ſyr-name.

¶ *The Place.*

They grow of themſelues wilde in hot regions: they neuer come to perfection of ripeneſſe in theſe cold countries.

¶ *The Time.*

The time anſwereth thoſe of the garden.

¶ *The Names.*

The wilde Gourd is called in Greeke, κολοκυνθα ἀγρια: in Latine, *Cucurbita ſylueſtris*, or wilde Gourd. *Pliny, lib.* 20. *cap.* 3. affirmeth, That the wilde Gourd is named of the Grecians, σικυος, which is hollow, an inch thicke, not growing but among ſtones, the juice whereof being taken is very good for the ſtomacke. But the wilde Gourd is not that which is ſo deſcribed, for it is aboue an inch thick, neither is it hollow, but full of juice, and by reaſon of the extreme bitterneſſe offenſiue to the ſtomacke.

Some alſo there be that take this for Coloquintida, but they are far deceiued; for Colocynthis is the wilde Citrull Cucumber, whereof we haue treated in the chapter of Citruls.

¶ *The Temperature.*

The wilde Gourd is as hot and dry as Coloquintida, namely in the ſecond degree.

¶ *The Vertues.*

The wild Gourd is extreme bitter, for which cauſe it opens and ſcoures the ſtopped paſſages of the body: it alſo purgeth downwards as do wilde Melons. A

Moreouer, the Wine which hath continued all night in this Gourd likewiſe purgeth the belly mightily, bringing forth cholericke and flegmaticke humors. B

Chap. 349. *Of Potato's.*

Siſarum Peruvianum, ſiue Batata Hiſpanorum.

Potatus, or Potato's.

¶ *The Description.*

THis Plant (which is called of some, *Sisarum Peruvianum*, or Skyrrets of Peru) is generally of vs called Potatus or Potato's. It hath long rough flexible branches trailing vpon the ground like vnto those of Pompions, whereupon are set greene three cornered leaues very like those of the wilde Cucumber. There is not any that haue written of this plant, haue said any thing of the floures; therefore I refer their description vnto those that shall hereafter haue further knowledge of the same. Yet haue I had in my garden diuers roots that haue flourished vnto the first approch of Winter, and haue growne vnto a great length of branches, but they brought forth no floures at all; whether because the Winter caused them to perish before their time of flouring, or that they be of nature barren of floures, I am not certain. The roots are many, thicke, and knobby, like vnto the roots of Peonies, or rather of the white Asphodill, joined together at the top into one head, in maner of the Skyrret, which being diuided into diuers parts and planted, do make a great increase, especially if the greatest roots be cut into diuers goblets, and planted in good and fertile ground.

¶ *The Place.*

The Potato's grow in India, Barbarie, Spaine, and other hot regions; of which I planted diuers roots (which I bought at the Exchange in London) in my garden, where they flourished vntil winter, at which time they perished and rotted.

¶ *The Time.*

It flourisheth to the end of September: at the first approch of great frosts the leaues together with the roots and stalks do perish.

¶ *The Names.*

Clusius calleth it *Batata*, *Camotes*, *Amotes*, and *Ignames*: in English, Potatoes, Potatus, and Potades.

¶ *The Nature.*

The leaues of Potato's are hot and dry, as may euidently appeare by the taste: the roots are of a temperat qualitie.

¶ *The Vertues.*

A The Potato roots are among the Spaniards, Italians, Indians, and many other nations, ordinarie and common meat; which no doubt are of mighty and nourishing parts, and doe strengthen and comfort nature; whose nutriment is as it were a mean between flesh and fruit, but somewhat windie; yet being rosted in the embers they lose much of their windinesse, especially being eaten sopped in wine.

B Of these roots may be made conserues no lesse toothsome, wholesome, and dainty, than of the flesh of Quinces; and likewise those comfortable and delicate meats called in shops, *Merselli*, *Placentulæ*, and diuers other such like.

C These roots may serue as a ground or foundation whereon the cunning Confectioner or Sugar-Baker may worke and frame many comfortable delicat Conserues and restoratiue sweet-meats.

D They are vsed to be eaten rosted in the ashes. Some when they be so rosted infuse and sop them in wine: and others to giue them the greater grace in eating, do boile them with prunes and so eat them: likewise others dresse them (being first rosted) with oile, vineger, and salt, euery man according to his owne taste and liking. Notwithstanding howsoeuer they be dressed, they comfort, nourish, and strengthen the body, vehemently procuring bodily lust.

Chap. 350. *Of Potato's of Virginia.*

¶ *The Description.*

VIrginian Potato hath many hollow flexible branches trailing vpon the ground, three square, vneuen, knotted or kneed in sundry places at certaine distances: from the which knots commeth forth one great leafe made of diuers leaues, some smaller, and others greater, set together vpon a fat middle rib by couples, of a swart greene colour tending to redneſſe; the whole leafe resembling those of the Winter-Cresses, but much larger; in taste at the first like grasse, but afterward sharp and nipping the tongue. From the bosome of which leaues come forth long round

round slender footstalkes, whereon grow very faire and pleasant floures, made of one entire whole leafe, which is folded or plaited in such strange sort, that it seemes to be a floure made of fiue sundry smal leaues, which canot easily be perceiued, except the same be pulled open. The whole floure is of a light purple colour, striped downe the middle of euery fold or welt with a light shew of yellownesse, as if purple and yellow were mixed together. In the middle of the floure thrusteth forth a thicke flat pointall yellow as gold, with a small sharp green pricke or point in the midst thereof. The fruit succeeds the floures, round as a ball, of the bignesse of a little Bullesse or wilde plumme, green at the first, and blacke when it is ripe, wherein is contained small white seed lesser than those of Mustard: the root is thicke, fat, and tuberous, not much differing either in shape, colour, or taste, from the common Potato's, sauing that the roots hereof are not so great nor long, some of them are as round as a ball, some oual or egge-fashion, some longer, and others shorter; the which knobby roots are fastned vnto the stalks with an infinite number of threddy strings.

Battata Virginiana siue Virginianorum, & Pappus,
Virginian Potatoes.

¶ *The Place.*

It groweth naturally in America, where it was first discouered, as reporteth *Clusius*, since which time I haue receiued roots hereof from Virginia, otherwise called Norembega, which grow & prosper in my garden as in their owne natiue country.

¶ *The Time.*

The leaues thrust forth of the ground in the beginning of May; the flours bud forth in August, the fruit is ripe in September.

¶ *The Names.*

The Indians call this plant *Pappus*, meaning the roots; by which name also the common Potatoes are called in those Indian countries. Wee haue it's proper name mentioned in the title. Because it hath not only the shape and proportion of Potato's, but also the pleasant taste and vertues of the same, we may call it in English, Potatoes of America or Virginia.

‡ *Clusius* questions whether it be not the *Arachidna* of *Theophrastus*. *Bauhine* hath referred it to the Nightshades, and calls it *Solanum tuberosum esculentum*; and largely figures and describes it in his *Prodromus*, *pag.* 89. ‡

The

¶ *The Temperature and Vertues.*

The temperature and vertues be referred to the common Potato's, being likewise a food, as also a meat for pleasure, equall in goodnesse and wholesomnesse to the same, being either rosted in the embers, or boiled and eaten with oile, vineger and pepper, or dressed some other way by the hand of a skilfull Cooke.

‡ *Bauhine* saith, That he heard that the vse of these roots was forbidden in Bourgondy (where they call them Indian Artichokes) for that they were persuaded the too frequent vse of them caused the leprosie. ‡

Chap. 351.

Of the garden Mallow called Hollyhocke.

¶ *The Kindes.*

There be diuers sorts or kindes of Mallowes; some of the garden; some of the marish or sea shore, others of the field, both which are wilde. And first of the garden Mallow or Hollihock.

1 *Malua hortensis.*
Single garden Hollihock.

2 *Malua rosea simplex peregrina.*
Iagged strange Hollihock.

¶ *The Description.*

1 The tame or garden Mallow bringeth forth broad round leaues of a whitish greene colour, rough, and greater than those of the wilde Mallow: the stalke is streight, of the height of foure or six cubits; whereon do grow vpon slender foot-stalks single floures, not much vnlike to the wilde Mallow, but greater, consisting only of fiue leaues, sometimes white or red, now and then of a deep purple colour, varying diuersly as Nature list to play with it: in their places groweth vp a round knop like a little cake, compact or made vp of a multitude of flat seeds like little cheeses. The root is long, white, tough, easily bowed, and groweth deep in the ground.

2 The

3 *Malua purpurea multiplex.*
Double purple Hollihocke.

2 The second being a strange kinde of Hollihocke hath likewise broad leaues, rough and hoarie, or of an ouerworne russet colour, cut into diuers sections euen to the middle ribbe, like those of Palma Christi. The floures are very single, but of a perfect red colour, wherein consisteth the greatest difference. ‡ And this may be called *Malua rosea simplex peregrina folio Ficus*, Iagged strange Hollihocke. ‡

3 The double Hollihocke with purple floures hath great broad leaues, confusedly indented about the edges, and likewise toothed like a saw. The stalke groweth to the height of foure or fiue cubits. The floures are double, and of a bright purple colour.

4 The Garden Hollihocke with double floures of the colour of skarlet, groweth to the height of fiue or six cubits, hauing many broad leaues cut about the edges. The stalke and root is like the precedent. ‡ This may be called *Multea hortensis rubra multiplex*, Double red Hollihockes, or Rose mallow. ‡

5 The tree mallow is likewise one of the Hollihockes; it bringeth forth a great stalke of the height of ten or twelue foot, growing to the forme of a small tree, whereon are placed diuers great broad leaues of a russet greene colour, not vnlike to those of the great Clot Burre Docke, deepely indented about the edges. The floures are very great and double as the greatest Rose, or double Peiony, of a deepe red colour tending to blackenesse. The root is great, thicke, and of a wooddy substance, as is the rest of the plant. ‡ This may be called *Malua hortensis atrorubente multiplici flore.* ‡

¶ *The Place.*

These Hollihockes are sowne in gardens, almost euery where, and are in vaine sought elsewhere.

¶ *The Time.*

The second yeere after they are sowne they bring forth their floures in Iuly and August, when the seed is ripe the stalke withereth, the root remaineth and sendeth forth new stalkes, leaues and floures, many yeares after.

¶ *The Names.*

The Hollihocke is called in Greeke, ἀλθαία: of diuers, *Rosa vltra-marina*, or outlandish Rose, and *Rosa hyemalis*, or Winter Rose. And this is that Rose which *Pliny* in his 21. book, 4. chapter, writes to haue the stalke of a mallow, and the leaues of a pot-herbe, which they cal *Moscouton*: in high Dutch, **Garten pappelen**: in low Dutch, **Winter Roosen**: in French, *Rose d'outremer*: in English, Hollihocke, and Hockes.

¶ *The Temperature.*

The Hollihocke is meetely hot, and also moist, but not so much as the wilde Mallow: it hath likewise a clammy substance, which is more manifest in the seed and root, than in any other part.

¶ *The Vertues.*

The decoction of the floures, especially those of the red, doth stop the ouermuch flowing of the monethly courses, if they be boiled in red wine. A

The roots, leaues, and seeds serue for all those things for which the wilde Mallowes doe, which are more commonly and familiarly vsed. B

Chap. 352. *Of the wilde Mallowes.*

¶ *The Description.*

1 THe Wilde Mallow hath broad leaues somewhat round and cornered, nickt about the edges, smooth, and greene of colour: among which rise vp many slender tough stalkes, clad

clad with the like leaues, but ſmaller. The floures grow vpon little foot-ſtalkes of a reddiſh colour mixed with purple ſtrakes, conſiſting of fiue leaues, faſhioned like a bell: after which commeth vp a knap or round button, like vnto a flat cake, compact of many ſmall ſeeds. The root is white, tough, and full of a ſlimie juyce, as is all the reſt of the plant.

2 The dwarfe wilde Mallow creepeth vpon the ground: the ſtalkes are ſlender and weake, yet tough and flexible. The leaues be rounder, and more hoary than the other. The floures are ſmall, and of a white colour.

3 The criſpe or curled Mallow, called of the vulgar ſort French Mallowes, hath many ſmall vpright ſtalkes, growing to the height of a cubit, and ſometimes higher; whereon doe grow broad leaues ſomewhat round and ſmooth, of a light greene colour; plaited or curled about the brims like a ruffe. The floures be ſmall and white. The root periſheth when it hath perfected his ſeed.

1 *Malva ſylueſtris.*
The field Mallow.

2 *Malva ſylueſtris pumila.*
The wilde dwarfe Mallow.

4 The Veruaine Mallow hath many ſtraight ſtalkes, whereon doe grow diuers leaues deepely cut and jagged euen to the middle ribbe, not vnlike to the leaues of Veruaine, whereof it tooke his name: among which come forth faire and pleaſant floures like vnto thoſe of the common Mallow in forme, but of a more bright red colour, mixed with ſtripes of purple, which ſetteth forth the beautie. The root is thicke, and continueth many yeares. ‡ This is ſometimes though more rarely found with white floures. ‡

‡ 5 This annuall Mallow, called by *Cluſius*, *Malua trimeſtris*, is very like our common Mallow, ſending vp ſlender branched ſtalkes ſome three foot high; the bottome leaues are round, thoſe on the ſtalkes more ſharpe pointed, greene aboue, and whiter vnderneath: the floures conſiſt of fiue leaues of a light carnation colour, the ſeed is like that of the ordinary Mallow, but ſmaller; and ſuch alſo is the root which periſhes euery yeare as ſoone as the ſeed is ripe: it is ſowne in ſome gardens, and growes wilde in Spaine. ‡

¶ *The Place.*

The two firſt Mallowes grow in vntoiled places among pot-herbes, by high waies, and the borders of fields.

The French mallow is an excellent pot-herbe, for the which cauſe it is ſowne in gardens, and is not to be found wilde that I know of.

The

3 *Malua crispa.*
The French curled Mallow.

4 *Malua verbenaca.*
Veruaine Mallow.

‡ 5 *Malua æstiua Hispanica.*
The Spanish Mallow.

‡ The Veruaine Mallow groweth not euerie where: it growes on the ditch sides on the left hand of the place of execution by London, called Tyborn: also in a field neere vnto a village fourteene miles from London called Bushey, on the backe-side of a Gentlemans house named Mr. *Robert Wilbraham*: likewise amongst the bushes and hedges as you go from London to a bathing place called the Old Foord: and in the bushes as you go to Hackny a village by London, in the closes next the town, and in diuers other places, as at Bassingburne in Hartfordshire, three miles from Roiston.

‡ Mr. *Goodyer* found the Veruain Mallow with white floures growing plentifully in a close neere Maple-durham in Hampshire, called Aldercrofts. ‡

¶ *The Time.*

These wilde Mallowes do floure from Iune till Summer be well spent: in the meane time their seed also waxeth ripe.

¶ *The Names.*

The wilde Mallow is called in Latine *Malua syluestris*: in Greeke, Μαλάχη ἀγρία, or χρεμὶς: and ἄνησις, as though they should say a mitigator of paine: of some, *Osiriaca*: in high Dutch, **Pappelin**: in low Dutch, **Walauwe**, and **Beerstens cruit**: in English, Mallow.

The Veuaine Mallow is called of *Dioſcorides*, *Alcea*: in Greeke, ἀλθαία: of ſome, *Herba Hungari*: and *Herba Simeonis*, or Simons Mallow: in Engliſh, Varuaine Mallow, and jagged Mallow.

The name of this herbe *Malua* ſeemeth to come from the Hebrewes, who call it in their tongue מלוח *Malluach*, of the ſaltneſſe, becauſe the Mallow groweth in ſaltiſh and old ruinous places, as in dung-hills and ſuch like, which in moſt abundant manner yeeldeth forth Salt-peter and ſuch like matter: for מלח *Melach* ſignifieth ſalt, as the learned know. I am perſuaded that the Latine word *Malua* commeth from the Chaldee name *Mallucha*, the gutturall letter ח *Ch*, being left out for good ſounds ſake: ſo that it were better in this word *Maliia* to reade *u* as a vowell, that as a conſonant: which words are vttered by the learned Doctor *Rabbi Dauid Kimhi*, and ſeeme to carrie a great ſhew of truth: in Engliſh it is called, Mallow; which name commeth as neere as may be to the Hebrew word.

¶ *The Temperature.*

The wilde Mallowes haue a certaine moderate and middle heate, and moiſtneſſe withall: the juyce thereof is ſlimie, clammie, or gluing, the which are to be preferred before the garden Mallow or Hollihocke, as *Diphilus Siphinus* in *Athenæus* doth rightly thinke; who plainely ſheweth, that the wilde mallow is better than that of the garden: although ſome doe prefer the Hollihocke, whereunto we may not conſent, neither yet yeeld vnto *Galen*, who is partly of that minde, yet ſtanderh he doubtfull: for the wilde Mallow without controuerſie is fitter to be eaten, and more pleaſant than thoſe of the garden, except the French Mallow, which is generally holden the wholſomeſt, and amongſt the pot-herbes not the leaſt commended by *Heſiodo*: whoſe opinion was *Horace*, writing in his ſecond Ode of his *Epodon*,

——— *& graui*
Maluæ ſalubres corpori.

The Mallow (ſaith *Galen*) doth nouriſh moderately, ingendreth groſſe bloud, keepeth the body ſoluble, and looſeth the belly that is bound. It eaſily deſcendeth, not onely becauſe it is moiſt, but alſo by reaſon it is ſlimie.

¶ *The Vertues.*

A The leaues of Mallowes are good againſt the ſtinging of Scorpions, Bees, Waſps, and ſuch like: and if a man be firſt annointed with the leaues ſtamped with a little oile, he ſhal not be ſtung at all, as *Dioſcorides* ſaith.

B The decoction of mallowes with their roots drunken are good againſt all venome and poyſon, if it be incontinently taken after the poyſon, ſo that it be vomited vp againe.

C The leaues of mallowes boiled till they be ſoft and applied, doe mollifie tumors and hard ſwellings of the mother, if they do withall ſit ouer the fume thereof, and bathe themſelues therewith.

D The decoction vſed in cliſters is good againſt the roughneſſe and fretting of the guts, bladder, and fundament.

E The roots of the Veruaine-mallow do heale the bloudy flix and inward burſtings, being drunke with wine and water, as *Dioſcorides* and *Paulus Ægineta* teſtifie.

Chap. 353. *Of Marſh Mallow.*

¶ *The Deſcription.*

1 Marſh-Mallow is alſo a certaine kinde of wilde Mallow: it hath broad leaues, ſmall toward the point, ſoft, white, and freeſed or cottoned, and ſlightly nicked about the edges: the ſtalkes be round and ſtraight, three or foure foot high, of a whitiſh gray colour; whereon do grow floures like vnto thoſe of the wilde Mallowes, yet not red as they are, but commonly white, or of a very light purple colour out of the white: the knop or round button wherein the ſeeds lie is like that of the firſt wilde mallow. The root is thicke, tough, white within, and containeth in it a clammy and ſlimy juyce.

† 2 This ſtrange kinde of Mallow is holden amongſt the beſt writers to be a kinde of Marſh mallow: ſome excellent Herbariſts haue ſet it downe for *Sida Theophraſti*, whereto it doth not fully anſwer: it hath ſtalks two cubits high, whereon are ſet without order many broad leaues hoarie and whitiſh, not vnlike thoſe of the other Marſh mallow: the floures conſiſt of fiue leaues, and are larger than thoſe of the marſh mallow, and of a purple colour tending to redneſſe: after which there come round bladders of a pale colour, in ſhape like the fruit or ſeeds of round *Ariſtochia*, or Birthwort, wherein is contained round blacke ſeed. The root is thicke and tough, much like that of the common mallow.

3 This

1 *Althæa, Ibiscus.*
Marsh Mallow.

2 *Althæa palustris.*
Water Mallow.

3 *Althæa Arborescens.*
Tree-Mallow.

4 *Althæa frutex Clusij.*
Shrubby Mallow.

‡ 5 *Alcea fruticosa cannabina.*
Hempe-leaued Mallow.

or twelue foot: whereupon are set very many leaues deepely cut euen to the middle rib, like vnto the leaues of hempe: the floures and seeds are like vnto the common mallow: the root is exceeding great, thicke, and of a wooddy substance. ‡ *Clusius* calls this *Alcea fruticosa cannabino folio*: and it is with good reason thought to be the *Cannabis sylvestris* described by *Dioscorides, lib. 3. cap. 166.* ‡

3 This wilde Mallow is likewise referred vnto the kindes of marsh mallow, called generally by the name of *Althæa*, which groweth to the form of a smal hedge tree, approching neerer to the substance and nature of wood than any of the other; wherewith the people of Olbia and Narbone in France doe make hedges, to seuer or diuide their gardens and vine-yards (euen as wee doe with quick-sets of prince a thorne) which continueth long: the stalke whereof groweth vpright, very high, comming neere to the Willow in wooddinesse and substance. The floures grow alongst the same, in fashion and colour of the common wilde mallow.

4 The shrubby mallow riseth vp like vnto a hedge bush, and of a wooddy substance, diuiding it selfe into diuers tough and limber branches, couered with a barke of the colour of ashes; whereupon doe grow round pointed leaues, somewhat nickt about the edges, very soft, not vnlike to those of the common marsh mallow, and of an ouerworne hoary colour. The floures grow at the top of the stalkes, of a purple colour, consisting of fiue liues, very like to the common wilde mallow, and the seed of the marsh mallow.

5 We haue another sort of mallow, called of *Pena*, *Alcea fruticosior petaphylla*: it bringeth forth in my Garden many twiggy branches, set vpon stiffe stalkes of the bignesse of a mans thumbe, growing to the height of ten

¶ *The Place.*

The common marsh mallow groweth very plentifully in the marshes both on the Kentish and Essex shore alongst the riuer of Thames, about Woolwych, Erith, Greenhyth, Grauesend, Tilbury, Lee, Colchester, Harwich, and in most salt marshes about London: being planted in Gardens it prospereth well, and continueth long.

The second groweth in the moist and fenny places of Ferraria, betweene Padua in Italy, and the riuer Eridanus.

The others are strangers likewise in England: notwithstanding at the impression hereof I haue sowen some seeds thereof in my garden, expecting the successe.

¶ *The Time.*

They floure and flourish in Iuly and August: the root springeth forth afresh euery yeare in the beginning of March, which are then to be gathered, or in September.

¶ *The Names.*

The common marsh mallow is called in Greeke, Αλθαία, and ἰβίσκος: the Latines retaine the names *Althæa* and *Ibiscus*: in shops, *Bismalua*, and *Maluauiscus*; as though they should say *Malua Ibisci*: in high Dutch, **Ibisch**: in low Dutch, **Witte Maluwe**, and **Witten Hemst**: In Italian and Spanish, *Maluauisco*: in French, *Guimaulue*: in English, marsh mallow, moorish mallow, and white mallow.

The rest of the mallowes retaine the names expressed in their seuerall titles.

¶ *The Temperature.*

Marsh mallow is moderately hot, but drier than the other mallowes: the roots and seeds hereof are more dry, and of thinner parts, as *Galen* writeth; and likewise of a digesting softning or mollifying nature.

¶ *The*

¶ *The Vertues.*

The leaues of Marsh mallow are of the power to digest, mitigate paine, and to concoct. A

They be with good effect mixed with fomentations and pulteſſes against paines of the sides, of the stone, and of the bladder; in a bath also they serue to take away any manner of paine. B

The decoction of the leaues drunke doth the same, which doth not onely asswage paine, which proceedeth of the stone, but also is very good to cause the same to descend more easily, and to passe forth. C

The roots and seeds are profitable for the same purpose: moreouer, the decoction of the roots helpeth the bloudy flix, yet nor by any binding quality, but by mitigating the gripings and frettings thereof: for they doe not binde at all, although *Galen* otherwise thought, but they cure the bloudy flix, by hauing things added vnto them, as the roots of Bistort, Tormentill, the floures and rindes of Pomegranates and such like. D

The mucilage or slimie juyce of the roots, is mixed very effectually with all oiles, ointments, and plaisters that slacken and mitigate paine. E

The roots boyled in wine, and the decoction giuen to drinke, expell the stone and grauell, helpe the bloudy flix, sciatica, crampes and conuulsions. F

The roots of Marsh mallows, the leaues of common Mallowes, and the leaues of Violets, boiled in water vntill they be very soft, and that little water that is left drained away, stamped in a stone morter, adding thereto a certaine quantitie of Fenugreeke, and Linesed in pouder: the root of the black Bryony, and some good quantitie of Barrowes grease, stamped all together to the forme of a pultis, and applied very warme, mollifie and soften Apostumes and hard swellings, swellings in the joynts, and sores of the mother: it consumeth all cold tumors, blastings, and windie outgrowings; it cureth the rifts of the fundament; it comforteth, defendeth, and preserueth dangerous greene wounds from any manner of accidents that may happen thereto, it helpeth digestion in them, and bringeth old vlcers to maturitie. G

The seeds dried and beaten into pouder and giuen to drinke, stop the bloudy flix and laske, and all other issues of bloud. H

Chap. 354. *Of the yellow Mallow.*

Althæa Lutea.
Yellow Mallow.

¶ *The Description.*

The yellow Mallow riseth vp with a round stalke, somthing hard and wooddy, three or foure cubits high, couered with broad leaues something round, but sharpe pointed, white, soft, set with very fine haires like to the leaues of gourds, hanging vpon long tender foot-stalkes: from the bosome of which leaues come forth yellow floures, not vnlike to those of the common Mallow in forme: the knops or seed vessels are blacke, crooked, or wrinkled, made vp of many small cods, in which is black seed: the root is small, and dieth when it hath perfected his seed.

¶ *The Place.*

The seed hereof is brought vnto vs from Spaine and Italy: we doe yearely sow it in our gardens, the which seldome or neuer doth bring his seed to ripenesse: by reason whereof, we are to seeke for seeds against the next yeare.

¶ *The Time.*

It is sowne in the midst of Aprill, it brings forth his floures in September.

¶ *The Names.*

Some thinke this to be *Abutilon*: whereupon that agreeth which *Auicen* writeth, that it is like to the Gourd, that is to say, in leafe, and to be named *Abutilon*, and *Arblutilon*: diuers take

take it to be that *Althæa* or Marſh mallow, vnto which *Theophraſtus* in his ninth booke of the Hiſtorie of Plants doth attribute *Florem μίλινον*, or a yellow floure: for the floure of the common Marſh mallow is not yellow, but white; yet may *Theophraſtus* his copy, which in diuers places is faultie, and hath many emptie and vnwritten places, be alſo faultie in this place; therefore it is hard to ſay, that this is *Theophraſtus* Marſh mallow, eſpecially ſeeing that *Theophraſtus* ſeemeth alſo to attribute vnto the root of Marſh mallow ſo much ſlime, as that water may be thickened therewith, which the roots of common Marſh mallow can very well doe: but the root of *Abutilon* or yellow mallow not at all: it may be called in Engliſh, yellow Mallow, and *Auicen* his Mallow.

¶ *The Temperature.*

The temperature of this Mallow is referred vnto the Tree-mallow.

¶ *The Vertues.*

A *Auicen* ſaith, that *Abutilon* or yellow mallow, is held to be good for greene wounds, and doth preſently glew together and perfectly cure the ſame.

B The ſeed drunke in wine preuaileth mightily againſt the ſtone.

C *Bernardus Paludanus* of Anchuſen reporteth, that the Turks do drinke the ſeed to prouoke ſleep and reſt.

Chap. 355. *Of Venice Mallow, or Good-night at Noone.*

1 *Alcea Peregrina.*
Venice Mallow.

2 *Sabdarifa.*
Thorny Mallow.

¶ *The Deſcription.*

† 1 THe Venice mallow riſeth vp with long, round, feeble ſtalkes, whereon are ſet vpon long ſlender foot-ſtalkes, broad jagged leaues, deepely cut euen to the middle rib: amongſt which come forth very pleaſant and beautifull floures, in ſhape like thoſe of the common mallow, ſomething

‡ 3 *Alcea Ægyptia.*
The Ægyptian Codded Mallow.

fomething white about the edges, but in the middle of a fine purple: in the middeſt of this floure ſtandeth forth a knap or peſtel, as yellow as gold: it openeth it ſelfe about eight of the clocke, and ſhutteth vp againe at noone, about twelue a clock when it hath receiued the beams of the Sun, for two or three houres, whereon it ſhould ſeeme to rejoyce to looke and for whoſe departure, being then vpon the point of declenſion, it ſeemes to grieue. and ſo ſhuts vp the floures that were open, and neuer opens them againe; whereupon it might more properly be called *Malva horaria*, or the Mallow of an houre: and this *Colamella* ſeemeth to call *Molochc*, in this verſe;

—— Et Moloche, Prono ſequitur quæ vertice ſolem.

The ſeed is contained in thicke rough bladders, whereupon *Dodonæus* calleth it *Alcea Veſicaria*: within theſe bladders or ſeed veſſels are contained blacke ſeed, not vnlike to thoſe of *Nigella Romana*. The root is ſmall and tender, and periſheth when the ſeed is ripe, and muſt be increaſed by new and yearely ſowing of the ſeed, carefully reſerued.

2 Thorn Mallow riſeth vp with one vpright ſtalk of two cubits high, diuiding it ſelfe into diuers branches, whereupon are placed leaues deeply cut to the middle rib, and likewiſe ſnipt about the edges like a ſaw: in taſte like Sorrel: the floures for the moſt part thruſt forth of the trunke or body of the ſmall ſtalke, compact of fiue ſmall leaues, of a yellowiſh colour; the middle part whereof is of a purple tending to redneſſe: the huske or cod wherein the floure doth ſtand is ſet or armed with ſharpe thornes: the root is ſmall, ſingle, and moſt impatient of our cold climate, inſomuch that when I had with great induſtry nouriſhed vp ſome plants from the ſeed, and kept them vnto the midſt of May; notwithſtanding one cold night chancing among many, hath deſtroied them all.

‡ 3 This alſo is a ſtranger cut leaued mallow, which *Cluſius* hath ſet forth by the name of *Alcea Ægyptia*. and *Proſper Alpinus* by the title of *Bammia*: the ſtalke is round, ſtraight, green, ſome cubit and halfe high: vpon which without order grow leaues at the bottome of the ſtalke, like thoſe of Mallow, cornered and ſnipt about the edges; but from the middle of the ſtalke to the top they are cut in with fiue deepe gaſhes like as the leaues of the laſt deſcribed: the floures grow forth by the ſides of the ſtalke, in forme and colour like thoſe of the laſt mentioned, to wit, with fiue yellowiſh leaues: after theſe follow long thicke fiue cornered hairy and ſharpe pointed ſeed veſſels, containing a ſeed like *Orobus*, couered with a little downineſſe: this growes in Ægypt, where they eat the fruit thereof as we do Peaſe and Beanes: *Alpinus* attributes diuers vertues to this plant, agreeable to thoſe of the common Marſh-mallow. ‡

¶ *The Place.*

The ſeeds hereof haue been brought out of Spaine and other hot countries. The firſt proſpereth well in my garden from yeare to yeare.

¶ *The Time.*

They are to be ſowne in the moſt fertill ground and ſunnie places of the garden, in the beginning of May, or in the end of Aprill.

¶ *The Names.*

Their names haue beene ſufficiently touched in their ſeuerall deſcriptions. The firſt may be called in Engliſh, Venice-mallow, Good-night at noone, or the Mallow flouring but an houre: of *Matthiolus* it is called *Hypecoon*, or Rue Poppy, but vnproperly.

¶ *The Temperature and Vertues.*

There is a certaine clammie juyce in the leaues of the Venice-mallow, whereupon it is thought A

to

to come neere vnto the temperature of the common Mallow, and to be of a mollifying faculti: but his vse in Physicke is not yet knowne, and therefore can there be no certainty affirmed.

CHAP. 356. *Of Cranes-bill.*

¶ *The Kindes.*

THere be many kindes of Cranes-bil, whereof two were known to *Dioscorides*, one with the knob-by root, the other with the Mallow leafe.

Geranium Columbinum.
Doues foot, or Cranes-bill.

¶ *The Description.*

DOues-foot hath many hairy stalks, trailing or leaning toward the ground, of a brow-nish colour, somewhat kneed or joynted; wherupon do grow rough leaues of an ouerworn green color, round, cut about the edges, and like vnto those of the common Mallow: amongst which come forth the floures of a bright purple colour: after which is the seed, set together like the head and bill of a bird; wherupon it was cal-led Cranes-bill, or Storks-bill, as are also all the other of his kind. The root is slender, with some fibres annexed thereto.

‡ 2 There is another kinde of this with larger stalkes and leaues, also the leaues are more deepely cut in or diuided, and the floures are ei-ther of the same colour as those of the common kinde, or else somewhat more whitish. This may be called *Geranium columbinum majus dissectis foli-is*, Great Doues foot.

3 To this kinde may also fitly be referred the *Geranium Saxatile* of *Thalius*: the root is smal and threddy, the leaues are smoother, redder, more bluntly cut about the edges, and transpa-rent than those of the first described, yet round, and otherwise like them: the floures are small and red, and the bills like those of the former. Mr *Goodyer* found it growing plentifully on the bankes by the high way leading from Gilford towards London, neere vnto the townes end. ‡

¶ *The Place.*

It is found neere to common high waies, desart places, vntilled grounds, and specially vpon mud walls almost euery where.

¶ *The Time.*

It springeth vp in March and Aprill: floureth in May, and bringeth his seed to ripenesse in Iune.

¶ *The Names.*

It is commonly called in Latine, *Pes Columbinus*: in High Dutch, **Scarter kraut**: in Low Dutch, **Duyuen voet**: in French, *Pied de Pigeon*: hereupon it may be called *Geranium Columbinum*: in English, Doues-foot, and Pigeons foot: of *Dioscorides*, *Geranium alterum*: of some *Palmeria*, and *Gruina*.

¶ *The Temperature.*

Doues foot is cold and somewhat drie, with some astriction or binding, hauing power to soder or joyne together.

¶ *The Vertues.*

A It seemeth, saith my Author, to be good for greene and bleeding wounds, and asswageth inflam-mations or hot swellings. The

The herbe and roots dried, beaten into moſt fine pouder, and giuen halfe a ſpoonfull faſting, and the like quantitie to bedwards in red wine, or old claret, for the ſpace of one and twenty daies together, cure miraculouſly ruptures or burſtings, as my ſelfe haue often proued, whereby I haue gotten crownes and credit: if the ruptures be in aged perſons, it ſhall be needfull to adde thereto the pouder of red ſnailes (thoſe without ſhels) dried in an ouen in number nine, which fortifieth the herbes in ſuch ſort, that it neuer faileth, although the rupture be great and of long continuance: it likewiſe profiteth much thoſe that are wounded into the body, and the decoction of the herbe made in wine, preuaileth mightily in healing inward wounds, as my ſelfe haue likewiſe proued. B

Chap. 357. *Of Herbe Robert.*

Geranium Robertianum.
Herbe Robert.

¶ *The Deſcription.*

Herbe Robert bringeth forth ſlender weake and brittle ſtalks, ſomewhat hairie, and of a reddiſh colour, as are oftentimes the leaues alſo, which are jagged and deepely cut, like vnto thoſe of Cheruile, of a moſt loathſome ſtinking ſmell. The flours are of a moſt bright purple colour; which being paſt, there follow certaine ſmal heads, with ſharpe beaks or bils like thoſe of birds: the root is ſmall and threddy.

¶ *The Place.*

Herb Robert groweth vpon old wals, as wel thoſe made of brick and ſtone, as thoſe of mud or earth: it groweth likewiſe among rubbiſh, in the bodies of trees that are cut downe, and in moiſt and ſhadowie ditch banks.

¶ *The Time.*

It floureth from Aprill till Summer be almoſt ſpent: the herbe is green in Winter alſo, and is hardly hurt with cold.

¶ *The Names.*

It is called in high Dutch, **Ruprechts kraut:** in low Dutch, **Robrechts Kruit:** and thereupon it is named in Latine, *Ruberta*, and *Roberti herba: Ruellius* calleth it *Robertiana*; and we *Robertianum*: of *Tabernamontanus*, *Rupertianum*: in Engliſh, Herbe Robert. He that conferreth this Cranes-bill with *Dioſcorides* his third *Sideritis* ſhall plainely perceiue, that they are both one, and that this is moſt apparantly *Sideritis* 3. *Dioſcoridis*; for *Dioſcorides* ſetteth downe three *Sideritides*, one with the leafe of Horehound; the next with the leafe of Fearne; and the third groweth in walls and Vineyards: the natiue ſoile of Herbe Robert agree thereunto, and likewiſe the leaues, being like vnto Cheruile, and not vnlike to thoſe of Corianders, according to *Dioſcorides* deſcription.

¶ *The Temperature.*

Herbe Robert is of temperature ſomewhat cold: and yet both ſcouring and ſomewhat binding, participating of mixt qualities.

¶ *The Vertues.*

It is good for wounds and vlcers of the dugs and ſecret parts; it is thought to ſtanch bloud, which thing *Dioſcorides* doth attribute to his third *Sideritis*: the vertue of this, ſaith he, is applied to heale vp bloudy wounds. A

Chap.

CHAP. 358. *Of knobbed Cranes-bill.*

Geranium tuberoſum.
Knobbie Cranes-bill.

¶ *The Deſcription.*

THis kinde of Cranes-bill hath many flexible branches, weake and tender, fat, and full of moiſture, wheron are placed very great leaues cut into diuers ſmall ſections or diuiſions, reſembling the leaues of the tuberous *Anemone*, or Wind-floure, but ſomewhat greater, of an ouerworn greeniſh colour: among which come forth long foot-ſtalkes, whereon do grow faire flours, of a bright purple color, and like vnto the ſmalleſt brier Roſe in forme: which being paſt, there ſucceed ſuch heads and beaks as the reſt of the Cranes-bill haue: the root is thick, bumped or knobbed, which we call tuberous.

¶ *The Place.*

This kinde of Cranes-bill is a ſtranger in England, notwithſtanding I haue it growing in my Garden.

¶ *The Time.*

The time anſwereth the reſt of the Cranes-bills.

¶ *The Names.*

Cranes-bill is called in Greeke, γεράνιον in Latine, *Gruinalis*, commonly *Roſtrum Gruis*, or *Roſtrum Ciconiæ*, of the likeneſſe of a Cranes bill, or ſtorkes bill: of ſome, *Acus moſcata*: but that name doth rather belong to another of this kind: it is alſo called *Acus Paſtoris*: in Italian, *Roſtro di grua*: in French, *Bec de Grue*: in Spaniſh, *Pico di Ciquena, pico del grou*: in high Dutch, **Storckenſchnable**: in low Dutch, **Oiſcuoers beck**: in Engliſh, Storks-bill, Cranes-bill, Herons-bill, and Pincke-needle: this is alſo called for diſtinctions ſake, *Geranium tuberoſum*, and *Geranium bulboſum*: it is likewiſe *Geranium primum Dioſcoridis*, or *Dioſcorides* his firſt Cranes-bill.

¶ *The Temperature.*

The roots of this Cranes-bill haue a little kinde of heat in them.

¶ *The Vertues.*

A *Dioſcorides* ſaith that the roots may be eaten, and that a dram weight of them drunk in wine doth waſte and conſume away the windineſſe of the Matrix.

B Alſo *Pliny* affirmeth, that the root hereof is ſingular good for ſuch as after weakeneſſe craue to be reſtored to their former ſtrength.

C The ſame Author affirmeth that the weight of a dram of it drunke in wine three times in a day, is excellent good againſt the Ptiſicke, or conſumption of the lungs.

CHAP. 359. *Of Musked Cranes-bill.*

¶ *The Deſcription.*

MVsked Cranes-bill hath many weake and feeble branches trailing vpon the ground, whereon doe grow long leaues, made of many ſmaller leaues, ſet vpon a middle rib, ſnipt or cut about the edges, of a pleaſant ſweet ſmell, not vnlike to that of Muske: among which come forth the floures ſet vpon tender foot-ſtalkes, of a red colour, compact of fiue ſmall leaues apiece: after which appeare ſmall heads and pointed beakes or bills like the other kindes of Cranes-bills: the root is ſmall and threddy.

¶ *The*

swellings and inflammations: and with Beane meale dissolue the Kings euill, wens, and hard lumpes.

The juice of the leaues mixed and laboured in a leaden mortar, with Ceruse, Litharge of siluer, F
vineger, and oile of Roses, cureth S. Anthonies fire, and takes away all inflammations whatsoeuer.

The juice of the greene Coriander leaues, taken in the quantitie of foure dragmes, killeth and G
poisoneth the body.

The seeds of Coriander prepared with sugar, preuaile much against the gout taken in some smal H
quantitie before dinner vpon a fasting stomack, and after dinner the like without drinking immediately after the same, or in three or foure houres. Also if the same be taken after supper, it preuaileth the more, and hath more superiority ouer the disease.

Also if it be taken with meat fasting, it causeth good digestion, and shuts vp the stomacke, kee- I
peth away fumes from rising vp out of the same: it taketh away the sounding in the eares, drieth vp the rheume, and easeth the squinancie.

Chap. 396. *Of Parsley.*

Apium hortense.
Garden Parsley.

¶ *The Description.*

1 THe leaues of garden Parsley are of a beautifull greene, consisting of many little ones fastned together, diuided most commonly into three parts, and also snipt round about the edges: the stalke is aboue one cubit high, slender, somthing chamfered, on the top wherof stand spoked rundles, bringing forth very fine little floures, and afterwards small seeds somwhat of a fiery tast: the root is long & white, & good to be eaten.

2 There is another garden Parsley in tast and vertue like vnto the precedent: the onely difference is, that this plant bringeth forth leaues very admirably crisped or curled like fannes of curled feathers, whence it is called *Apium crispum, siue multifidum*, Curl'd Parsley.

‡ 3 There is also kept in some gardens another Parsley called *Apium siue Petroselinum Virginianũ*, or Virginian parsley; it hath leaues like the ordinary, but rounder, and of a yellowish greene colour, the stalkes are some three foot high, diuided into sundry branches whereon grow vmbells of whitish floures: the seeds are like, but larger than those of the common Parsley, & when they are ripe they commonly sow themselues, and the old roots die, and the young ones beare seed the second yeare after their sowing. ‡

¶ *The Place.*

It is sowne in beds in gardens; it groweth both in hot and cold places, so that the ground be either by nature moist, or bee oftentimes watered: for it prospereth in moist places, and is delighted with water, and therefore it naturally commeth vp neere to fountaines or springs: *Fuchsius* writeth that it is found growing of it selfe in diuers fenny grounds in Germany.

¶ *The Time.*

It may be sown in time but it slowly commeth vp: it may oftentimes be cut and cropped: it bringeth forth his stalks the second yeare: the seeds be ripe in Iuly or August.

¶ *The Names.*

Euery one of the Parsleyes is called in Greeke σέλινον but this is named, σέλινον κηπαῖον, that is to say, *Apium hortense*: the Apothecaries and common Herbarists name it *Petroselinum*: in high Dutch Peterssilgen:

terſilgen: in low Dutch, Trimen Peterſelie: in French, *du Perſil*: in Spaniſh, *Perexil Iuliuer*, and *Salſa*: in Italian, *Petroſello*: in Engliſh, Perſele, Parſely, common Parſley, and garden Parſley. Yet is it not the true and right *Petroſelinum* which groweth vpon rockes and ſtones, whereupon it tooke his name, and whereof the beſt is in Macedonia: therefore they are deceiued who think that garden Parſley doth not differ from ſtone Parſley, and that the only difference is, for that Garden Parſley is of leſſe force than the wild; for wild herbs are more ſtrong in operation than thoſe of the garden.

¶ *The Temperature.*

Garden Parſley is hot and dry, but the ſeed is more hot and dry, which is hot in the ſecond degree, and dry almoſt in the third: the root is alſo of a moderate heate.

¶ *The Vertues.*

A The leaues are pleaſant in ſauces and broth, in which beſides that they giue a pleaſant taſt, they be alſo ſingular good to take away ſtoppings, and to prouoke vrine: which thing the roots likewiſe do notably performe if they be boiled in broth: they be alſo delightfull to the taſte, and agreeable to the ſtomacke.

B The ſeeds are more profitable for medicine; they make thinne, open, prouoke vrine, diſſolue the ſtone, break and waſt away winde, are good for ſuch as haue the dropſie, draw downe menſes, bring away the birth, and after-birth: they be commended alſo againſt the cough, if they bee mixed or boiled with medicines made for that purpoſe: laſtly they reſiſt poiſons, and therefore are mixed with treacles.

C The roots or the ſeeds of any of them boiled in ale and drunken, caſt forth ſtrong venom or poiſon, but the ſeed is the ſtrongeſt part of the herbe.

D They are alſo good to be put into clyſters againſt the ſtone or torments of the guts.

Chap. 397. *Of water Parſley, or Smallage.*

Eleoſelinum, ſiue Paludapium.
Smallage.

¶ *The Deſcription.*

Smallage hath green ſmooth and glittering leaues, cut into very many parcels, yet greater & broader than thoſe of common Parſley: the ſtalkes be chamfered and diuided into branches, on the tops whereof ſtand little white floures; after which do grow ſeeds ſomthing leſſer than thoſe of common Parſley: the root is faſtned with many ſtrings.

¶ *The Place.*

This kind of Parſley delighteth to grow in moiſt places, and is brought from thence into gardens. ‡ It growes wilde abundantly vpon the bankes in the ſalt marſhes of Kent and Eſſex. ‡

¶ *The Time.*

It flouriſhes when the garden Parſley doth, and the ſtalke likewiſe commeth vp the next yeare after it is ſown, and then alſo it bringeth forth ſeeds which are ripe in Iuly & Auguſt.

¶ *The Names.*

It is called in Greeke Ἑλεοσέλινον: of *Gaza*, *Paludapium*: in ſhoppes, *Apium*, abſolutely without any addition: in Latine, *Paluſtre Apium*, and *Apium ruſticum*: in high Dutch, Epfich: in low Dutch, Eppe, & of diuers Jouffrouwmerck: in Spaniſh and Italian, *Apio*: in French *de L'ache*: in Engliſh, Smallage, Marſh Parſley, or water Parſley.

¶ *The Temperature.*

This Parſley is like in temperature and vertues to that of the garden, but it is both hotter and drier

drier, and of more force in most things: this is seldome eaten, neither is it counted good for sauce, but is very vnprofitable in medicine.

¶ *The Vertues.*

The juice thereof is good for many things, it clenseth, openeth, attenuateth, or maketh thin; it re- A
moueth obstructions and prouoketh vrine, and therefore those syrrups which haue this mixt with them, as that which is called *Syrupus Byzantinus*, open the stoppings of the liuer and spleen, and are a remedie for long lasting agues, whether they be tertians or quartans, and all other which proceed both of a cold cause and also of obstructions or stoppings, and are very good against the yellow iaundise.

The same juice doth perfectly cure the malitious and venomous vlcers of the mouth, and of the B
almonds of the throat, with the decoction of Barly and *Mel Rosarum* or hony of Roses added, if the parts be washed therewith: it likewise helpeth all outward vlcers and foule wounds: with hony it is profitable also for cankers exulcerated, for although it cannot cure them yet it keeps them from putrifaction, and preserueth them from stinking: the seed is good for those things for which that of the garden Parsly is: yet is not the vse thereof so safe, for it hurteth those that are troubled with the falling sickneſſe, as by euident proofes it is very well knowne.

Smallage, as *Pliny* writeth, hath a peculiar vertue against the biting of venomous spiders. C

The juice of Smallage mixed with hony and bean floure, doth make an excellent mundificatiue D
for old vlcers and malignant fores, and stayeth also the weeping of the cut or hurt sinues in simple members, which are not very fatty or fleshy, and bringeth the same to perfect digestion.

The leaues boiled in hogs greaſe, and made into the forme of a pultis, take away the pain of fe- E
lons and whitlowes in the fingers, and ripen and heale them.

CHAP. 398. *Of Mountaine Parsley.*

† *Orcoselinum.*
Mountaine Parsley.

¶ *The Description.*

THe stalke of mountaine Parsley, as *Dioscorides* writeth, is a span high, growing from a slender root; vpon which are branches and little heads like those of Hemlocke, yet much slenderer: on which stalks grow the seed, which is long, of a sharp or biting taste, slender, and of a strong smell like vnto Cumin: but we cannot find that this kinde of mountain Parsly is knowne in our age: the leaues of this we here giue are like those of common Parsly, but greater & broader, consisting of many slender foot stalks fastned vnto them: the stalke is short, the floures on the spoked tufts be white, the seed small; the root is white, and of a meane length or bigneſſe, in taste somewhat biting and bitterish, and of a sweet smell.

¶ *The Place.*

† *Dioscorides* writeth, That mountain parsley groweth vpon rocks and mountains. And *Dodonæus* affirmeth that this herb described grows vpon the hills which diuide Silesia from Morauia, called in times past the countrey of the Marcomans: also it is said to be found on other mountains and hils in the North parts of England.

¶ *The Names.*

The Grecians do name it of the mountaines, ὀρεοσέλινον, which the Latines also for that cause do call *Apium montanum*, and *Montapium*: in English, mountaine Parsley: in Latine, *Apium*: but *Dioscorides* maketh *Petroselinum* or stone Parsley to differ from mountaine Parsley; for, saith hee,

we muſt not be deceiued, taking mountaine Parſley to be that which groweth on rocks, for Rock Parſley is another plant: of ſome it is called **Veelgurta**: in Latine, *Multi-bona*: in Engliſh, Much Good, ſo named becauſe it is good and profitable for many things: and this is not altogether vnproperly named *Oreoſelinum*, or mountaine Parſley, for it growes, as we haue ſaid, on mountains, and is not vnlike to ſtone Parſley: the ſeed is not like that of Cumin, for if it were ſo, who would deny it to be *Oreoſelinum*, or *Dioſcorides* his mountaine Parſley.

¶ *The Temperature and Vertues.*

A *Oreoſelinum* or mountaine Parſley is, as *Galen* ſaith, like in facultie to Smallage, but more effectuall: *Dioſcorides* writeth, that the ſeed and root being drunke in wine prouoke vrine, bring downe the Menſes: and that they are mixed with counterpoiſons, diureticke medicines, and medicines that are hot.

B The root of *Veelgutta* or Much-good is alſo hot and dry, euen in the later end of the ſecond degree, it maketh thin, it cutteth, openeth, prouoketh, breaketh the ſtone and expelleth it, openeth the ſtopping of the liuer and ſpleen, and cureth the yellow Iaundice: being chewed it helps the tooth-ache, and brings much water out of the mouth.

† This whole Chapter was wholly taken from *Dodonæus*, *Pempt.* 5. *lib* 4 *cap.* 3. wherefore I haue giuen his figure, which was agreeable to the hiſtorie: the figure our Author here gaue was of the *Selinum montanum pumilum*, far different from this, as I ſhall hereafter ſhew you in the Chap. of *Peucedanum*.

Chap. 399. *Of ſtone Parſley or Macedonie.*

† 1 *Petroſelinum Macedonicum Fuchſij.*
Baſtard ſtone-Parſley.

† 2 *Petroſelinum Macedonicum verum.*
The true Parſley of Macedonia.

¶ *The Deſcription.*

OF ſtone-Parſley there is very little ſpoken by the antient Writers: onely *Dioſcorides* ſaith, That it hath ſeed like to that of Ameos, but of a more pleaſant ſmell, ſharpe, aromaticall, or ſpiced: touching the forme of the leaues, the colour of the floures, and the faſhion of the roots

root he writeth nothing at all: and *Pliny* is more briefe; as for *Theophraſtus* he doth not ſo much as name it, making mention only of Parſley, Alexander, Smallage, and mountaine Parſley.

1 For ſtone Parſley *Leonhartus Fuchſius* hath ſet down a plant, hauing leaues not ſpred and cut after the maner of garden Parſley, but long, and ſnipped round about, made vp and faſtened to a rib or ſtemme in the midſt, ſomthing like, but yet not altogether, to the firſt leaues of the leſſer Saxifrage; the ſtalke is ſlender, and a cubit and a halfe high; the floures on the ſpokie tufts are white: the ſeed ſomthing blacke, like to that of Ameos, and garden Parſley, very ſweet of ſmell, ſomthing ſharp or biting: the root is ſlender and full of ſtrings.

2 *Lobel* alſo in ſtead of the right ſtone Parſley deſcribeth another, which the Venetians call ſtone Parſley of Macedonia: this hath leaues like thoſe of garden parſley, or rather of the Venetian Saxifrage which is the blacke herbe Frankincenſe formerly deſcribed: the ſtalke is a cubit high: the ſpokie tufts ſomthing white: the ſeed ſmall, quickly vading (as he ſaith) inferiour to that of garden Parſley in temperature and vertues: but whether this be the true and right ſtone Parſley, he addeth, he is ignorant.

¶ *The Place.*

It groweth on craggie rockes, and among ſtones: but the beſt in Macedonia, whereupon it beareth the ſyrname *Macedonicum*, of Macedonia.

¶ *The Time.*

It floureth in the ſummer moneths.

¶ *The Names.*

It is called in Greeke, πετροσέλινον, of the ſtony places where it groweth: in Latine, *Petrapium*. and *Petroſelinum Macedonicum*. in Engliſh, ſtone Parſley: the Apothecaries know it not: they are far deceiued that would haue the herbe which *Fuchſius* pictureth to be *Amomum*: for *Amomum* differeth from this, as it is very plaine by the deſcription thereof in *Dioſcorides*: but we hold this for the true ſtone Parſley, till ſuch time as we may learne ſome other more like in leaues to the Parſleyes, and in ſeed, ſuch as that of ſtone Parſley ought to be: and the very ſeed it ſelfe may cauſe vs to hold this opinion, being ſo agreeing to the deſcription as no herbe more; for it is ſharp and biting, and of a ſweeter ſmell than is that of Ameos, and of a more ſpicy ſent; yet doe not the leaues gaine ſay it, which though they haue not the perfect form of other Parſleyes, yet notwithſtanding are not altogether vnlike. ‡ The firſt of theſe is thought by *Anguillara*, *Turner*, *Geſner*, *Cordus*, and others to be the *Siſon* of *Dioſcorides*, & *Tragus* cals it *Amomum Germanicum*, & the ſeeds in ſhops retain the name of *Sem. Amomi*. The ſecond is thought by *Columna* to be the ſecond *Daucus* of *Dioſcorides*. ‡

¶ *The Nature.*

The ſeed of ſtone Parſley, which is moſt commonly vſed, is hot and dry, hauing withall a cutting quality.

¶ *The Vertues.*

It prouoketh vrine, and bringeth down the floures: it is profitable againſt wind in the ſtomack, and collicke gut, and gripings in the belly: for it is, as *Galen* ſaith, ἐφυσον, that is to ſay, a waſter or conſumer of wind: it is a remedy againſt pain in the ſides, kidnies, and bladder, it is alſo mixed in counterpoiſons: *Dioſcorides*.

* The firſt figure that was formerly in this chapter ſhould haue beene in the ſecond place, and that in the ſecond place was of Alexanders, and ſhould haue ſtood in the following chapter.

‡ Chap. 400. *Of Corne Parſley, or Hone-wort.*

¶ *The Deſcription.*

THis Herbe commeth vp at the firſt from ſeed like Parſley, with two ſmall long narrow leaues, the next that ſpring are two ſmall round ſmooth leaues nickt about the edges, and ſo for two or three couples of leaues of the next growth there are ſuch round leaues growing on a middle rib by couples, and one round one, alſo at the top; after as more leaues ſpring vp, ſo the faſhion of them alſo change, that is to ſay, euery leafe hath about eight or nine ſmal ſmooth green leaues, growing on each ſide of a middle rib one oppoſit againſt another, and one growing by it ſelf at the top, and are finely ſnipt or indented about the edges, and in forme reſembling thoſe of *Sium oderatum Tragi*, but not ſo big, long, or at all browniſh; amongſt which riſe vp many ſmall round ſtraked ſtalks or branches, about two foot long, now and then aboue twenty from one root, ſomtimes growing vpright, ſometimes creeping not farre from the ground, joynted or kneed, and diuiding themſelues

‡ *Selinum Sij folijs.*
Hone-wort.

selues into very many branches; at euerie joint groweth one leafe smaller than the former, which together with the lowermost perish, so that seldom one green leaf is to be seen on this herb when the seed is ripe; the floures are white, and grow most commonly at the tops of the branches, somtimes at most of the joints euen from the earth, in vneuen or vnorderly vmbells, euery floure hauing fiue exceeding small leaues, flat, and broad at the top, and in the middle very small cheiues with purple tops; the whole flour not much exceeding the bignesse of a small pins head, which being past there comes vp in the place of euery floure two small gray crooked finaked seeds, like parsley seeds, but bigger, in tast hot and aromaticall. The rot is small and whitish, with many threds not so big as Parsley roots. It begins to floure about the beginning of Iuly, and so continueth flouring a long time; part of the seede is ripe in August, and some scarse in the beginning of October, mean while some falls whereby it renues it selfe, and grows with flourishing greene leaues all the winter.

I took the description of this herb the yere, 1620. but obserued it long afore, not knowing any name for it: first I referred it to *Sium*, calling it, *Sium terrestre*, & *Sium segetum & agrorum*; afterwards vpon sight of *Selinum peregrinum primum Clusij*, which in some respects resembleth this herbe, I named it *Selinum Sij foliis*; yet wanting an English name, at length about the yeare 1625. I saw Mistris *Vrsula Leigh* (then seruant to Mistris *Bilson* of Mapledurham in Hampshire, and now (5. *Martij* 1632. wife to Mr. *William Mooring* Schoolemaster of Petersfield, a town neer the said Mapledurham) gather it in the wheat ershes about Mapledurham aforesaid (where in such like grounds it still groweth, especially in clay grounds) who told mee it was called Hone-wort, and that her Mother mistris *Charitie Leigh* late of Brading in the Island of Wight deceased, taught her to vse it after the manner here expressed, for a swelling which she had in her left cheeke, which for many yeares would once a yeare at the least arise there, and swell with great heate, redness, and itching, vntill by the vse of this herbe it was perfectly cured, and rose no more nor swelled, being now (5. *Martij* 1632) about twenty yeres since, only the scar remaineth to this day. This swelling her mother called by the name of a Hone, but asking whether such tumors were in the said Isle vsually called Hones she could not tell, by reason she was brought from Brading aforesaid young, and not being aboue twelue yeares old when she vsed this medicine.

¶ *The Vertues.*

TAke one handfull of the greene leaues of this Hone-wort, and stamp them, put to it about halfe a pint or more of beer, straine it, and drink it, and so continue to drink the like quantity euery morning fasting, till the swelling doth abate, which with or in her was performed in the space of two weeks at the most. August, 18. 1620. *Iohn Goodyer.* ‡

Chap. 401. *Of Alexander.*

¶ *The Description.*

THe leaues of Alexander are cut into many parcels like those of Smallage, but they be much greater and broader, smooth also, and of a deep greene colour: the stalke is thick, oftentimes a cubit high: the floures be white, and grow vpon spokie tufts: the seed is thicke, long, blacke, somthing

ſomthing bitter,and of an aromaticall or ſpicy ſmell:the root is thicke, blacke without,and white within,and like to a little Radiſh, and is good to be eaten, out of which being broken or cut, there iſſues forth a juice that quickly waxeth thick, hauing in it a ſharp bitterneſſe,like in taſt to Myrrh: which thing alſo *Theophraſtus* hath noted,there iſſueth out of it,ſaith he,a juice like Myrrhe.

† *Hippoſelinum.*
Alexanders.

¶ *The Place.*

Alexanders or great Parſley groweth in moſt places of England.

¶ *The Time.*

The ſeed waxeth ripe the ſecond yeare,in the Moneth of Auguſt.

¶ *The Names.*

It is called in Greeke, of the greatneſſe wherein it excelleth the other Parſleyes ἱππομάρα-θρον or Horſe Parſley;of *Gaza, Equapium*: it is alſo named *Olus atrum*, or the blacke pot-herbe;and of diuers *Sylueſtre Apium*, or wild Parſley;of *Galen* and certain others, σμύρνιον, by reaſon of the juice that iſſueth forth therof, that is, as wee haue ſaid, like vnto Myrrhe, which is called in Greeke σμύρνιον: there is alſo another *Smyrnium* of mount Aman, of which we do write in the 404. chapter: the Apothecaries cal it *Petroſelinum Macedonicum*: others *Petroſelinum Alexandrinum*: the Germaines, **Groß Epffich**: the Low-country-men, **Peterſelie van Macedonien**: in Spaniſh, *Perexil Macedonico*: the French, and Engliſhmen, Alexandre, Alexanders.

¶ *The Temperature.*

The ſeede and root of Alexanders, are no leſſe hot & dry than are thoſe of the garden Parſley, they clenſe and make thinne,being hot and dry in the third degree.

¶ *The Vertues.*

Dioſcorides ſaith,that the leaues and ſtalks are boiled and eaten, and dreſſed alone by themſelues A
or with fiſhes: that they are preſerued raw in pickle:that the root eaten both raw and ſod,is good for the ſtomack:the root hereof is alſo in our age ſerued to the table raw for a ſallad herbe.

The ſeeds bring down the floures,expel the ſecondine,break and conſume wind,prouoke vrine, B
and are good againſt the ſtrangury:the decoction alſo of the root doth the ſame,eſpecially if it be made with wine.

† The figure formerly here was of *Sphondilium*, and that belonging to this place was put in the foregoing chapter.

Chap. 402.

Of wilde Parſley.

¶ *The Deſcription.*

THis is like to the kindes of Parſleyes in the ſundry cuts of the leaues, and alſo in the bignes; for they be broad,and cut into diuers parcels:the ſtalks are round, chamfred ſet with certain joints,hollow within,a cubit high or higher,two or three comming forth together out of one root,and in the nether part many times of a darke reddiſh colour. The floures be white and grow vpon ſpokie tufts:the ſeed is round,flat,like that of Dill:the root is white within,and diuided into many branches and ſtrings. This plant in what part ſoeuer it be cut or broken,yeelds forth a milky juice.

¶ *The*

† *Apium syluestre siue Thisselium.*
Wilde Parsley.

¶ *The Place.*

It is found by ponds sides in moist and dankish places, in ditches also, hauing in them standing waters, and oftentimes by old stocks of Alder trees.

‡ I haue not as yet obserued this plant growing wilde with vs. ‡

¶ *The Time.*

It floureth and bringeth forth seed in Iune and Iuly.

¶ *The Names.*

The shops of the Low countries haue miscalled it in times past by the name of *Meum*, and vsed it for the right Mew, or Spiknel wort. The Germains name it **Olsenich:** *Valerius Cordus*, *Olsenichium*: diuers in the Low countries call it **wilde Eppe:** that is to say, in Latine, *Apium syluestre*, or wild Parsley: and some, **water Eppe:** that is, *Hydroselinon*, or *Apium aquatile*, water Parsley: and oftentimes it is named, as we haue already written, *Eleoselinum*, & *Sium*. It may be more rightly termed in Latine, *Apium syluestre*, and in English, wilde Parsley.

Dioscorides hath made mention of wild Parsley in the chapter of *Daucus* or wilde Carrot: and *Theophrastus*, *lib.* 7. where hee maketh the Parsleyes to differ both in leaues and stalkes, and shews that some haue white stalks, others, purple, or else of sundry colours, and that there is also a certaine wilde Parsley; for he saith that those which haue the purple stalks, and the stalks of diuers colours, come neerest of all to the wilde Parsley. And therefore seeing that *Olsenichium* or wilde Parsley, hath the lower part of the stalke of a purplish colour, and like in leaues to Parsley, which in times past we thought good rather to call *Apium syluestre*, or wild Parsly, than to erre with the Apothecaries, and to take it for Mew. And after when we now know that it was held to bee *Thysselium Plinij*, and that wee could alleadge nothing to the contrary, wee also settled our selues to be of their opinion; and the rather, because the faculties are agreeable. *Thysselium*, saith *Plin. lib.* 25. *cap.* 11. is not vnlike to Parsley: the root hereof purgeth flegme out of the head; which thing also the root of *Olsenichium* doth effectually performe, as we will forthwith declare: the name also is agreeable, for it seemeth to be called Σιλινον, because it extendeth it selfe, in Greek, σιλλει, thorow σελινους, or marish places.

¶ *The Temperature.*

The root hereof is hot and dry in the third degree.

¶ *The Vertues.*

A The root being chewed, bringeth by the mouth flegme out of the head, and is a remedy for the tooth-ach, and there is no doubt but that it also makes thin, cutteth and openeth, prouoketh vrine, and bringeth downe the floures, and doth likewise no lesse but more effectually performe those things that the rest of the Parsleyes do.

† The figure formerly put in this place was of the *Cerefolium syluestre* of *Tabernamontanus*, whose historie I intend hereafter to giue you.

Chap. 403. *Of bastard Parsley.*

¶ *The Description.*

I THe first kind of bastard Parsley is a rough hairy herb, not much vnlike to Carrots: the leaues are like to those of Corianders, but parted into many small jags: at the top of the branches grow shadowie vmbels, or spokie rundles consisting of many small white floures:

1 *Caucalis albis floribus.*
Bastard Parsley with white floures.

‡ 2 *Caucalis Apij foliis flore rubro.*
Bastard Parsley with red floures.

† 3 *Caucalis Peucedani folio.*
Hogs Parsley.

‡ 4 *Caucalis major Clus.*
Great rough Parsley.

floures: the ſeed is long and rough, like the ſeed of Carrots, but greater: the root is ſtraight and ſingle, growing deepe into the ground, of a white colour, and in taſte like the Parſnep.

2 There is another ſort like vnto the former, ſauing that the leaues thereof are broader, and the floures are of a reddiſh colour: there hath great controuerſie riſen about the true determination of *Caucalis*, becauſe the Latine interpretation of *Dioſcorides* is greatly ſuſpected, containing in it ſeeme much ſuperfluous matter, not pertinent to the hiſtory: but wee deeme that this plant is the true *Caucalis*, the notes ſet downe declare it ſo to be: the floures, ſaith he, are reddiſh: the ſeeds couered with a rough huske ſet about with prickles, which cleaue vnto garments that it toucheth, as doe Burs; which roughneſſe being pilled off, the ſeed appeares like vnto hulled Otes, not vnpleaſant in taſte, all which do ſhew it to be the ſame.

3 There is likewiſe another ſort that hath a long ſingle root, thrummed about the vpper end with many thrummie threds of a browne colour: from which riſeth vp diuers ſtalkes full of joynts or knees, couered with a ſheath or skinnie filme, like vnto that of *Meum*: the leaues are finely cut or jagged, reſembling the leaues of our Engliſh Saxifrage: the floures grow at the top of the ſtalks in ſpokie rundles like Fennell: the ſeed is ſmall like that of Parſley.

‡ 5 *Caucalis minor floſculis rubentibus.*
Hedge Parſley.

‡ 6 *Caucalis nodoſa echinato ſemine.*
Knotted Parſley.

‡ 4 *Cluſius* vnder the name of *Caucalis major* hath deſcribed and figured this, which hath many creſted ſtraight ſtalkes ſome two cubits high or more, which are diuided into ſundry branches, and at each joynt ſend forth large and winged leaues ſomwhat like thoſe of Angelica, but rougher, and of a darker green; at the tops of the branches grow vmbels of whitiſh floures, being of ſomewhat a purpliſh or fleſh colour vnderneath; and theſe are ſucceeded by broad ſeed almoſt like thoſe of the Cow-Parſnep, but that they are rougher, and forked at the top, and prickly: the root is white, hard and wooddy. It floures in Iune, ripens the ſeed in Iuly and Auguſt, and then the root dies, and the ſeed muſt be ſowne in September, and ſo it will come vp and continue greene all the Winter.

5 Beſides theſe formerly deſcribed there are two others growing wilde with vs; the firſt of theſe, which I haue thought good to call Hedge, or field Parſley, (becauſe it growes about hedges, and in plowed fields very plentifully euery where) hath creſted hollow ſtalkes growing vp to ſome cubit and halfe high, whereon ſtand winged leaues made of ſundry little longiſh ones, ſet one againſt

against another, snipt about the edges, and ending in a long and sharp pointed leafe: these leaues as also the stalks are somewhat rough and harsh, and of a darke greene colour: the floures are small and reddish, and grow in little vmbels, and are succeeded by longish little rough seed of somewhat a strong and aromaticke taste and smell. It is an annuall plant, and floures commonly in July, and the seeds are ripe in August. *Coradus* and *Thalius* cal it *Daucoides minus*; and *Bauhine*, *Caucalis semine aspero flosculis subrubentibus*. There is a bigger and lesser varietie or sort of this plant, for you shall finde it growing to the height of two cubits, with leaues and all the vpper parts answerable, and you may againe obserue it not to exceed the height of halfe a foot.

6 This other, which *Bauhine* hath first set forth in writing by the name of *Caucalis nodosa echinata semine*, hath a white & long root, from which it sends vp sundry small crested and rough branches which commonly lie along vpon the ground, and are of an vnequal length, some a cubit long, other some scarse two handfulls: the leaues are small, rough, winged, and deeply jagged, and at the setting on of each leafe, close to the stalkes vsually vpon very short foot-stalkes grow small little flours of colour white, or reddish, and made of fiue little leaues apeece: after these follow the seed, round, small, and rough, and they grow close to the stalkes. It floures in Iune and Iuly, and growes wilde in sundry places, as in the fields, and vpon the banks about S. Iames, and Pickadilla. *Fabius Columna* iudges it to be the true *Scandix* of the Antients. ‡

There is likewise one of these found in Spaine, called *Caucalis Hispanica*, like the first: but it is an annuall plant, which perishes at the first approch of winter, the which I haue sowne in my garden, but it perished before the seed was perfected.

¶ *The Place.*

These plants do grow naturally vpon rocks and stony grounds: we haue the first and the third in our pastures in most places of England: that with red floures is a stranger in England.

‡ I haue not heard that the third growes wilde with vs, but the second was found growing in the corne fields on the hils about Bathe, by Mr. *Bowles*. ‡

¶ *The Time.*

They floure and flourish from May to the end of August.

¶ *The Names.*

Bastard Parsley is called in Greeke καυκαλὶς: in Latine also *Caucalis*: of some, *Daucus syluestris*: among the bastard names of *Democritus*, βρίσον: in Latine, *Pes Gallinaceus*, *Pes Pulli*: the Egyptians name it *Seselis*: the countrey-men of Hetruria, *Petrosello saluatico*: in English, bastard Parsley, and Hennes foot.

¶ *The Temperature and Vertues.*

Dioscorides saith, that bastard Parsley is a pot-herbe which is eaten either raw or boiled, and prouoketh vrine. A

Pliny doth reckon it vp also among the pot-herbes: *Galen* addeth, that it is preserued in pickle for sallades in winter. B

The seed of bastard Parsley is euidently hot and dry, and that in the second degree: it prouoketh vrine, and bringeth downe the desired sickenesse: it dissolueth the stone and driueth it forth. C

It taketh away the stoppings of the liuer, spleen, and kidnies: it cutteth and concocteth raw and flegmaticke humors: it comforteth a cold stomacke, dissolueth winde, quickneth the sight, and refresheth the heart, if it be taken fasting. D

Matthiolus in his Commentaries vpon *Dioscorides*, *Lib.* 2. attributeth vnto it many excellent vertues, to prouoke venery and bodily lust, and erection of the parts. E

* The figure which belonged to the third description in this chapter was formerly put for English Saxifrage.

Chap. 404. *Of Candy Alexanders.*

¶ *The Description.*

Dioscorides and *Pliny* haue reckoned *Smyrnium* among the kindes of Parsley, whose iudgement, while this plant is young, and not growne vp to a stalke, may stand with very good reason, for that the young leaues next the ground are like to Parsley, but somwhat thicker and larger: among which riseth vp a stalke a cubit high, and somewhat more, garnished with round leaues, farre different from those next the ground, inclosing the stalke about like Thorow wax, or *Perfoliata*, which leaues are of a yellow colour, and doe rather resemble the leaues of Fole-foot than Parsley: at

Smyrnium Creticum.
Candy Alexander.

at the top of the ſtalkes doe grow round ſpoky tufts of a yellow color, after which comes round and blacke ſeed like Coleworts, of a ſharp & bitter taſt like Myrrh: the root is white and thicke, contrary to the opinion of *Dodonæus*, who ſaith it is blacke without, but I ſpeak that which I haue ſeen and proued.

¶ *The Place.*

Smyrnium groweth naturally vpon the hils and mountaines of Candy, and in my garden alſo in great plenty: alſo vpon the mountain Amanus in Cilicia.

¶ *The Time.*

Smyrnium floureth in Iune, and the ſeed is ripe in Auguſt.

¶ *The Names.*

This plant is called in Latine, *Smyrnium*: in Greek, σμύρνιον: in Cilicia, *Petroſelinũ*, and as *Galen* teſtifies, ſome haue called it, *Hippoſelinum agreſte*: in Engliſh, Candy Alexanders, or Thorow bored Parſley.

¶ *The Temperature.*

Smyrnium is hot and dry in the third degree.

¶ *The Vertues.*

The leaues of *Smyrnium* diſſolue wens and hard ſwellings, dry vp vlcers and excoriations, and glew wounds together.

The ſeeds are good againſt the ſtoppings of the ſpleene, kidnies, and bladder.

Candy Alexander hath force to digeſt and waſt away hard ſwellings, in other things it is like to garden Parſley, and ſtone Parſley, and therefore we vſe the ſeed hereof to prouoke the deſired ſickneſſe, and vrine, and to help thoſe that are ſtuffed in the lungs, as *Galen* writeth,

The root is hot, ſo is the herbe and ſeed, which is good to be drunke againſt the biting of ſerpents: it is a remedy for the cough, and profitable for thoſe that cannot take their breath vnleſſe they do ſit or ſtand vpright: it helpeth thoſe that can hardly make their water: the ſeed is good againſt the infirmities of the ſpleen or milt, the kidnies and bladder: it is likewiſe a good medicine for thoſe that haue the dropſie, as *Dioſcorides* writeth.

CHAP. 405. *Of Parſneps.*

¶ *The Deſcription.*

1 THe leaues of the tame or Garden Parſneps are broad, conſiſting of many ſmall leaues faſtned to one middle rib like thoſe of the aſh tree: the ſtalk is vpright, of the height of a man: the floures ſtand vpon ſpokie tufts, of colour yellow; after which commeth the ſeed flat and round, greater than thoſe of Dil: the root is white, long, ſweet, and good to be eaten.

2 The wild Parſnep is like to that of the Garden, in leaues, ſtalke, tuft, yellow floures, flat and round ſeed, but altogether leſſer: the root is ſmall, hard, wooddy, and not fit to be eaten.

¶ *The Place.*

The garden Parſnep requireth a fat and looſe earth, and that that is digged vp deep.

The wilde Parſnep groweth in vntoiled places, eſpecially in the ſalt marſhes, vpon the bankes and borders of the ſame: the ſeed whereof being gathered and brought into the garden, and ſowed in

1 *Pastinaca latifolia sativa.*
Garden Parsneps.

2 *Pastinaca latifolia sylvestris.*
Wilde Parsneps.

in fertill ground, do proue better roots, sweeter and greater than they that are sowne of seeds gathered from those of the garden.

They floure in Iuly and Auguſt, and seed the second yeare after they be sowne.

¶ *The Names.*

The Herbarists of our time do call the garden Parsneps σταφυλινος, and *Pastinaca*, and therefore wee haue surnamed it *Latifolia*, or broad leafed, that it may differ from the other garden Parsenep with narrow leaues, which is truly and properly called *Stathylinus*, that is, the garden Carrot. Some Physitians doubting, and not knowing to what herbe of the Antients it should be referred, haue fained the wilde kinde hereof to bee *Panacis species*, or a kinde of All-heale: diuers haue named it *Baucia*; others, *Branca Leonina*, but if you diligently marke, and confer it with *Elaphoboscum* of *Dioscorides*, you shall hardly finde any difference at all: but the plant called at Montpellier *Pabulum Ceruinum*: in English, Harts fodder, supposed there to bee the true *Elaphoboscum*, differeth much from the true notes thereof. Now *Baucia*, as *Iacobus Manlius* reporteth in *Luminari maiore*, is *Dioscorides*, and the old Writers *Pastinaca*, that is to say, *Tenuifolia*, or Carrot: but the old Writers, and especially, *Dioscorides* haue called this wilde Parsnep by the name of *Elaphoboscum*: and we do call them Parsneps and Mypes.

¶ *The Temperature.*

The Parsnep root is moderately hot, and more dry than moist.

¶ *The Vertues.*

The Parsneps nourish more than do the Turneps or the Carrots, and the nourishment is somewhat thicker, but not faulty nor bad; notwithstanding they be somewhat windie: they passe through the body neither slowly nor speedily: they neither binde nor loose the belly: they prouoke vrine, and lust of the body: they be good for the stomacke, kidnies, bladder, and lungs. A

There is a good and pleasant food or bread made of the roots of Parsneps, as my friend M^r. *Plat* hath set forth in his booke of expermients, which I haue made no tryall of, nor meane to do. B

The seed is hotter and dryer euen vnto the second degree, it mooueth vrine, and *consumeth* winde. C

D It is reported, ſaith *Dioſcorides*, that Deare are preſerued from bitings of Serpents, by eateing of the herbe *Elaphoboſcum*, or wilde Parſnep, whereupon the ſeed is giuen with wine againſt the bitings and ſtingings of Serpents.

† Both the figures that formerly were in this chapter were of the Garden Parſneps; the firſt being that of *Lobel*, and the ſecond that of *Tabernæmontanus*, that ſhould haue beene in the ſecond place, was formerly put for *Sphondylium*.

CHAP. 406. *Of Skirrets.*

Siſarum. Skirrets.

¶ *The Deſcription.*

THe leaues of the Skirret do likewiſe conſiſt of many ſmall leaues faſtened to one rib, euery particular one whereof is ſomething nicked in the edges, but they are leſſer, greener, & ſmoother than thoſe af the Parſnep. The ſtalkes be ſhort, and ſeldome a cubit high; the floures in the ſpokie tufts are white, the roots bee many in number, growing out of one head an hand breadth long, moſt commonly not a finger thick, they are ſweet, white, good to be eaten, and moſt pleaſant in taſte.

¶ *The Place and Time.*

This skirret is planted in Gardens, and eſpecially by the root, for the greater and thicker ones being taken away, the leſſer are put into the earth againe: which thing is beſt to be done in March or Aprill, before the ſtalkes come vp, and at this time the roots which bee gathered are eaten raw, or boyled.

¶ *The Names.*

This herb is called in Latine, *Siſarum*, and alſo in Greeke, σισαρον; the Latines do likewiſe call it *Siſer*; and diuers of the later Herbariſts *Struthium* or *Cheruillam*, or *Seruilla*, the Germans name it, **Sterlin**: *Tragus*, **Zam garten Rapunkelen**: in the Low-countries, **Suycker wortelen**, that is to ſay, Sugar roots, and oftentimes, **Scrillen**: in Spaniſh, *Cherinia*; in Italian, *Siſaro*: in French, *Cheruy*: in Engliſh, Skirret and Skirwort. And this is that *Siſer* or Skirret which *Tiberius* the Emperour commanded to bee conueied vnto him from Geldubа a caſtle about the riuer of Rhene, as *Pliny* reporteth in *lib.* 16. *cap.* 5. The Skirret is a medicinable herbe, and is the ſame that the foreſaid Emperour did ſo much commend, inſomuch that he deſired the ſame to be brought vnto him euery yeare out of Germany. It is not, as diuers ſuppoſe, *Serapio* his *Secacul*, of which he hath written in his 89. chapter: for *Secacul* is deſcribed by the leafe of *Iulben*, that is to ſay, of the peaſe, as *Matthiolus Syluaticus* expoundeth it: and it bringeth forth a blacke fruit of the bigneſſe of a Ciche-peaſe, full of moiſture, and of a ſweet taſte, which is called *Granum Culcul*: But the Skirret hath not the leafe of the peaſe, neither doth it bring forth fruit like to the Ciché-peaſe; whereupon it is manifeſt, that the Skirret doth very much differ from *Serapio* his *Seracul*: ſo farre is it from beeing the ſame.

¶ *The Temperature and Vertues.*

A The roots of the Skirret be moderately hot and moiſt; they be eaſily concocted; they nourish meanly, and yeeld a reaſonable good juyce: but they are ſomething windie, by reaſon whereof they alſo prouoke luſt.

B They be eaten boiled, with vineger, ſalt, and a little oyle, after the manner of a ſallad, and oftentimes they be fried in oile and butter, and alſo dreſſed after other faſhions, according to the skill of the cooke, and the taſte of the eater.

The

The women in Sueuia, saith *Hieronymus Heroldus*, prepare the roots hereof for their husbands, and know full well wherefore and why, &c. C

The juyce of the roots drunke with goats milke stoppeth the laske. The same drunke with wine putteth away windinesse out of the stomacke, and gripings of the belly, and helpeth the hicket or yeoxing. They stirre vp appetite, and prouoke vrine. D

Chap. 407. *Of Carrots.*

¶ *The Description.*

1 THe leaues of the Garden Carrots are of a deepe greene colour, composed of many fine Fennell-like leaues, very notably cut or jagged; among which riseth vp a stalke straight and round, foure cubits high, somewhat hairie and hollow, hauing at the top round spoled tufts, in which do grow little white floures: in their places commeth the seed, rough and hairie, of a sweet smell when it is rubbed. The root is long, thicke and single, of a faire yellow colour, pleasant to be eaten, and very sweet in taste.

1 *Pastinaca sativa tenuifolia.*
Yellow Carrot.

‡ 2 *Pastinaca sativa atro-rubens.*
Red Carrot.

2 There is another kinde hereof like to the former in all parts, and differeth from it only in the colour of the root, which in this is not yellow, but of a blackish red colour.

¶ *The Place.*

These Carrots are sowne in the fields, and in gardens where other pot-herbes are: they require a loose and well manured soile.

¶ *The Time.*

They are to be sowne in Aprill; they bring forth their floures and seed the yeare after they be sowne.

¶ *The Names.*

The Carrot is properly called in Greeke, καρωτὸν, for that which we haue termed in Latine by the name

name of *Pastinaca latioris folij*, or the Garden Parsenep, is described of the old Writers by another name: this Carrot is called in Latine likewise, *Pastinaca sativa*, but with this addition *tenuifolia*, that it may differ from the garden Parsnep with broad leaues, and white roots. *Theophrastus* in the ninth booke of his History of Plants nameth this *Staphylinus*, or Carrot, *Daucus*, and writeth that it groweth in Arcadia, and saith that the best is found in *Spartensi Achaia*, but doubtlesse hee meant that *Daucus* which we call *Cretensis*, that may be numbred among the Carrots: *Galen* in his booke of the faculties of Simple medicines doth also make it to be *Daucus*, but yet not simply *Daucus*; for he addeth also *Staphilinus* or *Pastinaca*: in high Dutch it is called **Geelruben**: in low Dutch, **Geel Peen Geel Pooten**, and **Geel Wortelen**: in French, *Carrotte*, and *Racine jaulne*: in Italian, *Pastinaca*: in Spanish, *Canahoria*: in English, Yellow Carrots: the other is called red Carrot, and blacke Carrot.

¶ *The Temperature and Vertues.*

A The root of the yellow Carrot is most commonly boyled with fat flesh and eaten: it is temperately hot and something moist. The nourishment which commeth hereof is not much, and not very good: it is something windie, but not so much as be the Turneps, and doth not so soon as they passe through the body.

B The red Carrot is of like facultie with the yellow. The seed of them both is hot and dry, it breaketh and consumeth windinesse, prouoketh vrine, as doth that of the wilde Carrot.

Chap. 408. *Of Wilde Carrot.*

Pastinaca sylvestris tenuifolia.
Wilde Carrot, or Bees-nest.

¶ *The Description.*

THe leaues of the wilde Carrot are cut into diuers slender narrow parcels, very like vnto those of the garden Carrots, but they be somewhat whiter and more hairy: the stalkes be likewise hairie and somewhat rough: the floures are little, and stand vpon broad spoked tufts, of a white color, of which tuft of floures the middlemost part is of a deepe purple: the whole tuft is drawne together when the seed is ripe, resembling a birds nest; whereupon it hath beene named of some, Birds-nest: the root is slender, and of a meane length.

¶ *The Place.*

It groweth of it selfe in vntoyled places, in fields, and in the borders thereof, almost euery where.

¶ *The Time.*

It floures and flourishes in Iune and Iuly, the seed is ripe in August.

¶ *The Names.*

The wilde Carrot is called in Greeke, σταφυλῖνος: in Latine, *Pastinaca sylvestris tenuifolia*: in shops, *Daucus*: and it is vsed in stead of the true *Daucus*, and not amisse nor vnprofitably: for *Galen* also in his time doth testifie that it was taken for *Daucus*, or bastard Parsly, and is without doubt *Dauci sylvestris genus*, or a wilde kinde of bastard parsly, so called of *Theophrastus*: in high Dutch it is named, **Wild Pastenen, Vogel nest**: in low Dutch, **Vogels nest**, and **Wilde Carotten Crookens cruyt**: in French, *Pastena de Sauvage*: in English, wilde Carrot, and after the Dutch, Birds-nest, and in some places Bees-nest.

Athenæus citing *Diphilus* for his Author saith, That the Carrot is called φίλτρον, because it stirreth for loue matters; and *Orpheus*, as *Pliny* writeth, said, that the vse hereof winneth loue: which things be

be written of wilde Carrot, the root whereof is more effectuall than that of the garden, and containeth in it, as *Galen* saith, a certaine force to procure lust.

¶ *The Temperature and Vertues.*

The seed of this wilde Carrot, and likewise the root is hot and dry in the second degree, and doth withall open obstructions. A

The root boiled and eaten, or boiled in wine, and the decoction drunke prouoketh vrine, expelleth the stone, bringeth forth the birth; it also procureth bodily lust. B

The seed drunke bringeth downe the desired sickenesse, it is good for them that can hardly make water, it breaketh and dissolueth winde, it remedieth the dropsie, it cureth the collick and stone, being drunke in wine. C

It is also good for the passions of the mother, and helpeth conception: it is good against the bitings of all manner of venomous beasts: it is reported, saith *Dioscorides*, that such as haue first taken of it are not hurt by them. D

Chap. 409. *Of Candie Carrots.*

Daucus Cretensis verus.
Candie Carrots.

¶ *The Description.*

THis *Daucus Cretensis*, being the true *Daucus* of *Dioscorides*, doth not grow in Candy only, but is found vpon the mountains of Germany, and vpon the hills and rockes of Iura about Geneua, from whence it hath beene sent and conueied by one friendly Herbarist vnto another, into sundry regions: it beareth leaues which are small, and very finely jagged, resembling either Fennel or wild Carrot: among which riseth vp a stalke of a cubit high, hauing at the top white spokie tufts, and the floures of Dill: which being past, there come great plentie of long seed, well swelling, not vnlike the seed of Cumin, saue that it is whitish, with a certaine mossinesse, and a sharpe taste, and is in greater vse than any part of the plant. The root also is right good in medicine, being lesser than the root of a Parsenep, but hotter in taste, and of a fragrant smell.

¶ *The Time.*

This floures in Iune and Iuly, his seed is ripe in August.

¶ *The Names.*

There is sufficient spoken in the description as touching the name.

¶ *The Nature.*

These plants are hot and dry, especially the seed of *Daucus Creticus*, which is hot and dry in the third degree: but the seed of the wilde Carrot is hot and dry in the second degree.

¶ *The Vertues.*

The seed of *Daucus* drunken is good against the stangurie, and painefull making of water, it preuaileth against the grauell and stone, and prouoketh vrine. A

It assuageth the torments and gripings of the belly, dissolueth windinesse, cureth the collick, and ripeneth an old cough. B

The same beeing taken in Wine, is very good against the bitings of beasts, and expelleth poison. C

The seed of *Daucus Creticus* is of great efficacy and vertue being put into Treacle, Mithridate, or any antidotes against poyson or pestilence. D

E The root thereof drunke in wine ſtoppeth the laske, and is alſo a ſoueraigne remedy against ſ-
nome and poyſon.

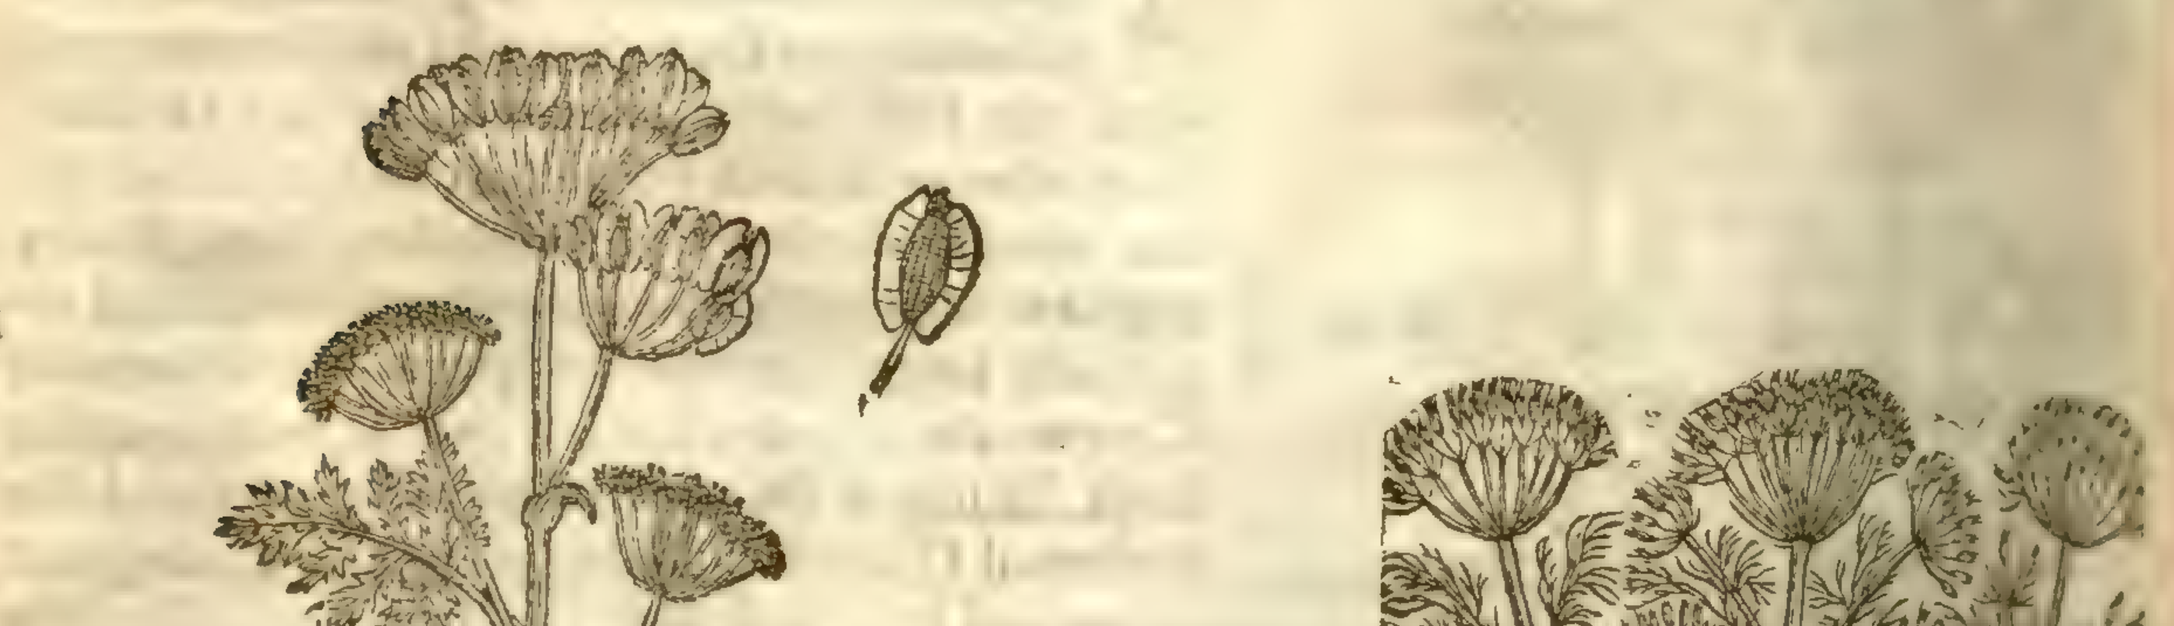
CHAP. 410. *Of ſtinking and deadly Carrots.*

¶ *The Deſcription.*

1 THe great ſtinking Carrot hath very great leaues, ſpred abroad like wings, reſembling thoſe of Fennell gyant (whereof ſome haue taken it to be a kinde, but vnproperly) of a bright greene colour, ſomewhat hairy: among which riſeth vp a ſtalke of the height of two cubits, and of the bigneſſe of a mans finger; hollow and full of a ſpungious pith; whereupon are ſet at certaine joynts, leaues like thoſe next the ground, but ſmaller. The floures are yellow, ſtanding at the top of the ſtalke in ſpokie rundles, like thoſe of Dill: after which commeth the ſeed, flat and broad like thoſe of the Parſnep, but much greater and broader. The root is thicke, garniſhed at the top with certaine capillaments or hairy threds, blacke without, white within, full of milky iuice, of a moſt bitter, ſharpe, and lothſome taſte and ſmell, inſomuch that if a man do ſtand where the wind doth blow trow the plant, the aire doth exulcerate and bliſter the face, and euery other bare or naked place that may be ſubject to his venomous blaſt, and poiſonous quality.

1 *Thapſia latifolia Cluſij.*
Stinking Carrots.

2 *Thapſia tenuifolia.*
Small leafed ſtinking Carrot.



2 This ſmall kind of ſtinking or deadly Carrot is like to the laſt deſcribed in each reſpect, ſauing that the leaues are thinner and more finely minced or jagged, wherein conſiſts the difference.

3 The common deadly Carrot is like vnto the precedent, ſauing that he doth more neerely reſemble the ſtalkes and leaues of the garden carrot, and is not garniſhed with the like buſh of haire about the top of the ſtalkes: otherwiſe in ſeed, root, and euill ſmell, taſte and quality like.

¶ *The Place.*

Theſe pernicious plants delight in ſtony hills and mountaines: they are ſtrangers in England.

¶ *The*

3 *Thapsia vulgaris.*
Deadly Carrots.

¶ *The Time.*

They floure in August or somewhat after.

¶ *The Names.*

The French Physitians haue accepted the root of *Thapsia* for a kinde of Turbith, calling it *Turpetum Cineritium*; notwithstanding vpon better consideration they haue left the vse thereof, especially in purging, for it mightily hurteth the principall parts, and doth often cause cruell gripings in the guts and belly, with convulsions and cramps: neuertheless the venomous quality may be taken away with those correctiues which are vsed in mitigating the extreme heate and virulent quality of *Sarcocolla*, *Hammoniacum*, and *Turpetum*: but where there be so many wholesome Simples, and likewise compounds they are not to be vsed.

Of some it is called *Turpetum Griseum*: it is called *Thapsia*, as some thinke, of the Island Thapsus, where it was first found.

Of the people of Sicilia and Apulia it is called *Ferulacoli*, where it doth grow in great abundance.

¶ *The Temperature and Vertues.*

The temperature and faculties in working haue beene touched in the description, and likewise in the names.

Chap. 411. *Of Fennell.*

¶ *The Description.*

1 THe first kinde of Fennell, called in Latine, *Fœniculum*: in Greeke, Μάραθρον, is so well knowne amongst vs, that it were but lost labour to describe the same.

2 The second kinde of Fennell is likewise well knowne by the name of Sweet Fennell, so called because the seeds therof are in taste sweet like vnto Annile seeds, resembling the common Fennell, sauing that the leaues are larger and fatter, or more oleous: the seed greater and whiter, and the whole plant in each respect greater.

¶ *The*

Fœniculum vulgare.
Common Fennell.

A

¶ *The Place.*

Theſe herbs are ſet and ſowne in gardens; but the ſecond doth not proſper well in this Countrey: for being ſowne of good and perfect ſeed, yet in the ſecond yeare after his ſowing it will degenerate from the right kinde, and become common Fennell.

¶ *The Time.*

They floure in Iune and Iuly, and the ſeed is ripe in the end of Auguſt.

¶ *The Names.*

Fennell is called in Greeke, Μάραθρον: in Latine, *Marathrum*, and *Fœniculum*: in high Dutch, **Fenckell**: in low Dutch, **Uenckell**: in Italian, *Finocchio*: in Spaniſh, *Hinoio*: in French, *Fenoil*: in Engliſh, Fennell, and Fenckell.

¶ *The Temperature.*

The ſeed of Fennel is hot and dry in the third degree.

¶ *The Vertues.*

The pouder of the ſeed of Fennell drunke for certaine daies together faſting preſerueth the eye-ſight: whereof was written this Diſtichon following:

Fœniculum, Roſa, Verbena, Chelidonia, Ruta,
Ex his fit aqua quæ lumina reddit acuta.

Of Fennell, Roſes, Veruain, Rue, and Celandine,
Is made a water good to cleere the ſight of eine.

B The greene leaues of Fennell eaten, or the ſeed drunke made into a Ptiſan, do fill womens breſts with milke.

C The decoction of Fennell drunke eaſeth the paines of the kidnies, cauſeth one to auoid the ſtone, and prouoketh vrine.

D The roots are as effectuall, and not onely good for the intents aforeſaid, but againſt the dropſie alſo, being boiled in wine and drunken.

E Fennell ſeed drunke aſſwageth the paine of the ſtomacke, and wambling of the ſame, or deſire to vomit, and breaketh winde.

F The herbe, ſeed, and root of Fennell are very good for the lungs, the liuer, and the kidnies, for it openeth the obſtructions or ſtoppings of the ſame, and comforteth the inward parts.

G The ſeed and herbe of ſweet Fennell is equall in vertues with Anniſe ſeed.

Chap. 412. *Of Dill.*

¶ *The Deſcription.*

Dill hath a little ſtalke of a cubit high, round and joynted: whereupon doe grow leaues very finely cut, like to thoſe of Fennell, but much ſmaller: the floures be little and yellow, ſtanding in a ſpokie tuft or rundle: the ſeed is round, flat and thin: the whole plant is of a ſtrong ſmell: the root is threddy.

¶ *The Place.*

It is ſowne in gardens, and is alſo ſometimes found wilde.

¶ *The*

Anethum.
Dill.

¶ *The Time.*

It bringeth forth floures and seed in August.

¶ *The Names.*

Dil is called in Greek, Ἄνηθον: in Latine likewise *Anethum*, and *Anetum*: in high Dutch, Dyllen: in low Dutch, Dille: in Italian *Anetho*: in Spanish, *Eneldo*: in French, *Anet*: in English, Dill, and Anet.

¶ *The Temperature.*

Dill, as *Galen* saith, is hot in the end of the second degree, and dry in the beginning of the same, or in the end of the first degree.

¶ *The Vertues.*

The decoction of the tops of dried Dil, and likewise of the seed, being drunke, engendreth milke in the brests of nurses, allaieth gripings and windinesse, prouoketh vrine, increaseth seed, stayeth the yeox, hicket, or hicquet, as *Dioscorides* teacheth. A

The seed likewise if it be smelled vnto stayeth the hicket, especially if it bee boyled in wine, but chiefely if it be boyled in Worme-wood Wine, or Wine and a few branches of Worme-wood, and Rose-leaues, and the stomacke bathed therewith. B

Galen saith, that being burnt and layd vpon moist vlcers, it cureth them, especially those in the secret parts, and likewise those *sub Præputio*, though they be old and of long continuance. C

Common oyle, in which Dill is boyled or sunned, as we do oyle of Roses, doth digest, mitigate paine, procureth sleepe, bringeth raw and vnconcocted humors to perfect digestion, and prouoketh bodily lust. D

Dill is of great force or efficacie against the suffocation or strangling of the mother, if the woman doe receiue the fume thereof being boiled in wine, and put vnder a close stoole or hollow seat fit for the purpose. E

Chap. 413. *Of Caruwaies.*

¶ *The Description.*

Caruwaies haue an hollow stalke foure square, of two cubits high, full of knots or joynts, from which proceed sundry other small branches, set full of leaues very finely cut or jagged, like vnto those of Carrots or Dill: at the top of the stalkes grow spokie white tufts like those of Dill: after which commeth the seed, sharpe in eating, yet of a pleasant taste: the root is like that of Parsley, often white, seldome yellow, and in taste like vnto the Carrot.

¶ *The Place.*

It groweth almost euery where in Germany and in Bohemia, in fat and fruitfull fields, and in medowes that are now and then ouer-run with water: it groweth also in Caria, as *Dioscorides* sheweth, from whence it tooke his name.

¶ *The Time.*

It floureth and seedeth from May to the end of August.

¶ *The*

Carum, sive Careum.
Caruwaie.

¶ *The Names.*

It is called in Greeke, κάρον: in Latine, *Carum* and *Careum*: in shops, *Carui*. *Simeon Zethy* calleth it *Carnabadion*: in high Dutch, **Kym**, and **Kymmel**: in low Dutch, **Carup saet**: in French, *du Caruy*: in Italian, *Caro*: in Spanish, *Carauea*, and an article being joyned vnto it, *Alkarauea*: in English, Caruwaie, and the seed is called Caruwaie seed.

¶ *The Temperature.*

The seed of Caruwaies, as *Galen* saith, is hot and dry in the third degree, and hath a moderate biting qualitie.

¶ *The Vertues.*

It consumeth winde, it is delightfull to the stomacke and taste, it helpeth concoction, prouoketh vrine, and is mixed with counterpoisons: the root may be sodden, and eaten as the Parsenep or Carrot is.

The seeds confected, or made with sugar into Comfits, are very good for the stomacke: they helpe digestion, prouoke vrine, assuage and dissolue all windinesse: to conclude in a word, they are answerable to Anise seed in operation and vertues.

Chap. 414. *Of Annise.*

¶ *The Description.*

1 THe stalke of Annise is round and hollow, diuided into diuers small branches, set with leaues next the ground somewhat broad and round: those that grow higher are more jagged, like those of young Parsley, but whiter: on the top o the stalkes do stand spokie rundles or tufts of white floures, and afterward seed, which hath a pleasant taste as euery one doth know.

‡ 2 This other Annise (whose vmbels *Clusius* had out of England from Master *Morgan* the Queenes Apothecarie, and *Iames Garret*, and which were brought from the Philippines by Mr. *Tho. Candish* in his voyage when he incompassed the world) is thus described by *Clusius*: The vmbels were large, no lesse than those of the Archangelica, made of diuers thicke stiffe foot-stalkes, each whereof carried not double seed as the common Annise, but more, in a round head some inch ouer, made of cods set star fashion, six, eight, or more, of a dusky colour, wrinkled, diuided into two equall parts, and open aboue: most of these huskes were empty, yet some of them contained one smooth shining ash coloured seed, of the bignesse of that of *Orobus*; the taste and smell was the same with our common Anise seed, wherefore they which sent it to *Clusius* called it Annise: yet in the place where it grew it was called *Damor*; for Mr. *Candish* had the name so written in the China characters, after their manner of writing. ‡

¶ *The Place.*

It groweth plentifully in Candy, Syria, Ægypt, and other countries of the East. I haue often sowne it in my garden, where it hath brought forth his ripe seed when the yeare hath fallen out to be temperate.

¶ *The*

1 *Aniſum.*
Aniſe.

‡ 2 *Aniſum Indicum ſtellatum.*
Starry headed Aniſe.

¶ *The Time.*

It is to be ſowne in theſe cold regions in the moneth of May: the ſeed is ripe in Auguſt.

¶ *The Names.*

It is called in Latine, *Aniſum*: in Greeke, Ἄνισον: in high Dutch, Aniſz: in low Dutch, Aniſſaet: in Italian, *Aniſo*: in Spaniſh, *Matahalua*: in French, *Anis*: in Engliſh, Aniſe, and Anniſe ſeed.

¶ *The Temperature.*

Galen writeth, That the ſeed of Aniſe is hot and dry in the third degree: after others, it is hot in the ſecond degree, and much leſſe than dry in the ſecond degree; for it ingendreth milke, which it could not doe if it were very dry, as *Galen* in his chapter of Fennell doth whether hee will or no declare and teſtifie; in that it doth ingender milke, his opinion is that it is not hot aboue the firſt degree: which thing alſo may be in Aniſe ſeed, both by this reaſon, and alſo becauſe it is ſweet. Therefore to conclude, Aniſe ſeed is dry in the firſt degree, and hot in the ſecond.

¶ *The Vertues.*

The ſeed waſteth and conſumeth winde, and is good againſt belchings and vpbraidings of the A
ſtomacke, allaieth gripings of the belly, prouoketh vrine gently, maketh abundance of milke, and ſtirreth vp bodily luſt: it ſtayeth the laske, and alſo the white flux in women.

Being chewed it makes the breath ſweet, and is good for them that are ſhort winded, and quen- B
cheth thirſt, and therefore it is fit for ſuch as haue the dropſie: it helpeth the yeoxing or hicket, both when it is drunken or eaten dry: the ſmell thereof doth alſo preuaile very much.

The ſame being dried by the fire and taken with honey clenſeth the breſt very much from fleg- C
maticke ſuperfluities: and if it be eaten with bitter Almonds it doth helpe the old cough.

It is to be giuen to young children and infants to eat which are like to haue the falling ſickneſs, D
or to ſuch as haue it by patrimony or ſucceſſion.

It taketh away the ſquinancie or Quincie, (that is, a ſwelling in the throat) being gargled with E
hony, vinegre, and a little Hyſſop gently boyled together.

Chap. 415.

Of Biſhops Weed, Herbe-William, or Ameos.

¶ *The Deſcription.*

1 THe common Ameos, eſpecially with vs here in England, hath round greene ſtalks, with diuers boughes and branches, and large long leaues, diuided into diuers other narrow long and ſmall leaues, dented or ſnipt about the edges, hauing at the top of the ſtalke white floures in great ſpoky tufts, which bring forth a little ſharpe and bitter ſeed: the root thereof is white and threddy.

2 This excellent and aromaticall Ameos of Candy hath tufts and leaues like *Daucus Creticus*, and a root like vnto the garden Carrot, of a yellow colour, and hot ſeed like *Origanum*, of an excellent ſpicie ſauour or ſmell, growing in ſpokie tufts or roundles like *Carum*: it hath beene brought from Candy and Syria into Venice, and from Venice into France, Flanders, and England, where we haue often ſowne it; but without doubt we haue beene beguiled therein by the deceitfull drug-maſters, who haue firſt boyled it, or vſed ſome other falſe and deceitfull deuiſe, to bring greater admiration vnto the Venice treacle, for the confection whereof this ſeed is a chiefe and moſt principall ingredient.

1 *Ammi vulgare.*
Common Biſhops-weed.

† 2 *Ammi Creticum.*
Candy Biſhops-weed.

3 There is another kinde of Ameos, which is an herbe very ſmall and tender, hauing ſtalkes a foot and a halfe high, very ſmall and tender, beſet with leaues like vnto Dill, finely jagged, and ſomwhat ſlender; and at the top of the ſtalkes grow little tufts or ſpokie white rundles, which afterwards do turne into ſmall gray ſeed, hot, and ſharpe in taſte. The toot is ſmall and ſlender.

¶ *The Place.*

Theſe plants do all grow in my garden, except *Ammi Creticum*, whereof hath beene ſufficiently ſpoken in the deſcription.

¶ *The*

‡ 3 *Ammi pumilum.*
Small Bishops-weed.

¶ *The Time.*

They floure in Iune and Iuly, and yeeld their seed in the end of August.

¶ *The Names.*

The Græcians call it Ἄμμι: the Latines also *Ammi*: diuers call it *Cuminum Æthiopicum*: others, *Cuminum Regium*, or Comin Ro all: in shops, *Ammios*, or *Ameos* in the Genitiue case: the Germanes, Amey: in English, Ameos, or Ammi: of some, Herbe-William, Bullwort, and Bishops-weed.

¶ *The Temperature.*

The seed of Ameos is hot and dry in the later end of the third degree.

¶ *The Vertues.*

It auaileth against gripings of the belly in making of vrine, against the biting of serpents taken in wine, and also it bringeth downe the floures: beeing applied with honey it taketh away blacke and blew spots which come of stripes: the seed of *Sison* doth also the like, for it is hot and dry, and that in the third degree; likewise of thin parts, prouoking vrine, and bringing downe the desired sickenesse. A

The seed of Ameos is good to bee drunken in wine against the biting of all manner of venomous beasts, and hath power against all maner of poyson & pestilent feuers, or the plague, and is vsed in the correcting of Cantharides, whereby those flies are made medicinable to be applied to the body without danger. B

Ameos brayed and mingled with hony scattereth congealed bloud, and putteth away blacke and blew markes which come by stripes or falls, if it be applied thereto in manner of a plaister. C

‡ The figure which was formerly in the second place was of the *Hippomarathrum album* of *Tabernamontanus*.

Chap. 416. *Of Cheruill.*

¶ *The Description.*

1 THe leaues of Cheruill are slender, and diuersly cut, something hairy, of a whitish greene: the stalkes be short, slender, round, and hollow within, which at the first together with the leaues are of a whitish green, but tending to a red when the seeds are ripe: the floures be white, and grow vpon scattered tufts. The seed is long, narrow, slender, sharpe pointed: the root is full of strings.

‡ 2 There is found in Iune and Iuly, almost in euery hedge, a certaine plant which *Tabernamontanus* and *Bauhine* fitly call *Chærophyllum*, or *Cerefolium syluestre*, and the figure was vnfitly giuen by our Author for *Thysselinum*: It hath a whitish wooddy root, from which arise round red and hairy stalkes some two cubits high, sometimes more, and oft times somewhat big and swolne about the joynts, and they are not hollow but full of pith: toward the top it is diuided into sundry branches which on their tops carry vmbels of small pure white little floures, which are succeded by longish seeds. The leaues are vsually parted into three chiefe parts, and these againe subdiuided into fiue, and they are snipt about the edges, soft and hairy, of a darke greene or else reddish colour. It floureth in Iune and Iuly, and then ripens the seed. ‡

3 Great Cheruill hath large leaues deepely cut or jagged, in shew very like vnto Hemlockes, of a very good and pleasant smell and taste like vnto Cheruill, and something hairy, which hath caused vs to call it sweet Cheruill. Among these leaues riseth vp a stalke somewhat crested or furrowed, of the height of two cubits, at the top whereof grow spokie tufts or rundles with white floures,

floures, which doe turne into long browne crested and shining seed, one seed being as big as some Fennell seeds, which being greene do taste like annise seed. The root is great, thicke, and long as big as *Enula Campana*, exceeding sweet in smell, and tasting like vnto Anise seeds.

1 *Cerefolium vulgare sativum.*
Common Cheruill.

† 2 *Cerefolium sylvestre.*
Hedge Cheruill.

‡ 4 There is found in some part of the Alps, as about Genua and in other places, another *Myrrhis*, which in the leaues and vmbels is like that of the last described, but the whole plant is lesse; the seed is long, small, smooth, and shaped like an Oat, and in taste somewhat like that of the *Daucus Creticus*, *Lobel* hath this by the same name as we here giue it you.

5 About mud walls, high-waies, and such places, here about London, and in diuers other places, is found growing a small plant, which in all things but the smell and height agrees with that referred to this kinde by *Fabius Columna*, and called *Myrrhis Æquicolorum nova*. The root hereof is small and white, perishing euery yeare when it hath perfected his seed: the stalkes are slender, hollow, smooth, and not hairy, seldome exceeding the height of a cubit, or cubit and halfe; it is diuided into sundry branches, vpon the seeds whereof against the setting on of the leaues, or out of their bosomes, grow forth the stalkes, which carry vmbels of small white floures: after which follow the seeds, growing two together, and these longish, rough, round, and hairy, about the bignesse of Anise seeds. The leaues are small, and finely cut or diuided like those of Hemlocke, but of a whitish colour, and hairy: it comes vp in March, floures in May, and ripens his seed in Iune. In Italy they eate the young leaues in sallads, and call it wilde Cheruile: we may in English for distinction take call it small Hemlocke Cheruill.

6 To these we may fitly adde that plant which in the *Hist. Lugd.* is called *Cicutaria alba*, and by *Camerarius*, *Cicutaria palustris*; for it floures at the same time with the last mentioned, and is found in floute and seed in May and Iune very frequently almost in all places; but afterwards his stalkes die downe, yet his roots liue, and the leaues are greene all the yeare. The root of this is very large, and diuided into sundry parts, white also and spungie, of a pleasant strong smell, with a hot and biting taste: the stalkes grow vp in good ground to be some three cubits high, and they are hollow, joynted, pretty thicke, greene, and much crested, sending forth of the bosomes of the leaues many branches, which vpon their tops carry vmbels composed of many white floures, each floure consisting of fiue little leaues, whereof the lowest is twice as big as the rest, the two side-ones lesse, and the vppermost the least of all. The leaues are large like those of *Myrrhis*, but of a dark greene colour, and

and thoſe that grow vpon the tops of the ſtalks are commonly diuided into three parts, and theſe ſubdiuided into ſundry long ſharp pointed and ſnipt leaues like as in *Myrrhis*. The ſeeds grow two together, being longiſh, round, ſharp pointed, blacke, and ſhining. We may fitly terme this plant wilde Cicely, for that it ſo much reſembles the *Myrrhis* or garden Cicely, not only in ſhape, but if I be not deceiued, in vertues alſo.

3 *Ceroſelium magnum, ſiue Myrrhis.*
Great Cheruill or Myrrhe.

‡ 4 *Myrrhis altera parua.*
Small ſweet Cheruill.

¶ *The Place.*

The common Cheruill groweth in gardens with other pot-herbes: it proſpers in a ground that is dunged and ſomewhat moiſt. The great ſweet Cheruill groweth in my garden, and in the gardens of other men who haue bin diligent in theſe matters.

¶ *The Time.*

Theſe herbs floure in May, and their ſeed is ripe in Iuly.

¶ *The Names.*

Cheruill is commonly called in Latine *Ceroſolium*, and as diuers affirme, *Chærofolium*, with o in the ſecond ſyllable. *Columella* nameth it *Chærephyllum*, and it is thought to be ſo called, becauſe it delights to grow with many leaues, or rather in that it cauſeth ioy and gladneſſe: in high-Dutch, **Kotffelkraut**: in low-Dutch, **keruell**: in Italian, *Ceroſoglio*: in French, *Du Cerfueil*: in Engliſh, Cheruell and Cheruill.

Myrrhis is alſo called *Myrrha*, taken from his pleaſant ſauor of Myrrh: of ſome, *Conila*, as it is found noted among the baſtard names. It is alſo by reaſon of the ſimilitude it hath with Hemlocke, called by moſt later writers *Cicutaria*. Of this *Pliny* maketh mention, *lib.* 24. *cap.* 16. where he reporteth that it is called *Smyrrhiza*: in Engliſh it is called Cheruill, ſweete Cheruill, or ſweete Cicely.

¶ *The Nature and Vertues.*

Cheruill is held to be one of the pot-herbs, it is pleaſant to the ſtomack and taſte, it is of a temperat heate and moderat drineſſe, but nothing ſo much as the Parſlies. A

It prouoketh vrine, eſpecially being boiled in Wine, and applied hot to the ſhare or nethermoſt part of the belly, and the wine drunke in which it was boiled. B

It hath in it a certain windineſſe, by means whereof it procureth luſt. C

It is vſed very much among the Dutch people in a kinde of Loblolly or hotchpot which they do eat, called Warmus. D

E The leaues of ſweet Cheruill are exceeding good, wholeſome and pleaſant among other ſallad herbs, giuing the taſte of Aniſe ſeed vnto the reſt.

F The root, ſaith *Galen*, is hot in the ſecond degree, hauing a thinneſſe of ſubſtance ioyned with it.

G *Dioſcorides* teacheth, That the root drunke in wine is a remedie againſt the bitings of the venomous ſpiders called in Latine *Phalangia*; and that it bringeth downe the menſes and ſecondine; and being boiled and drunk it is good for ſuch as haue the Ptyſick and conſumption of the lungs.

H The ſeeds eaten as a ſallad whiles they are yet green, with oile, vineger, and pepper, exceed all other ſallads by many degrees, both in pleaſantneſſe of taſte, ſweetneſſe of ſmell, and wholſomneſſe for the cold and feeble ſtomacke.

I The roots are likewiſe moſt excellent in a ſallad, if they be boiled and afterwards dreſſed as the cunning Cooke knoweth how better than my ſelfe: notwithſtanding I vſe to eat them with oile and vineger, being firſt boiled; which is very good for old people that are dull and without courage: it rejoiceth and comforteth the heart, and increaſeth their luſt and ſtrength.

Chap. 417. *Of Shepheards Needle or wilde Cheruill.*

¶ *The Deſcription.*

1 *Scandix* or *Pecten Veneris* doth not much differ in the quantitie of the ſtalkes, leaues, and floures, from Cheruill; but *Scandix* hath no ſuch pleaſant ſmell as Cheruill hath. The leaues be leſſer, more finely cut, and of a brown green colour: the flours grow at the top of the ſtalks in ſmall white tufts; after which come vp long ſeeds very like vnto pack-needles, orderly ſet one by another like the great teeth of a combe, whereof it tooke the name *Pecten Veneris*, Venus combe, or Venus needle: the root is white, a finger long.

1 *Pecten Veneris, ſiue Scandix.*
Shepheards Needle or Venus Combe.

‡ 2 *Scandix minor, ſiue Anthriſcus.*
Small Shepheards Needle.

‡ 2 This from a ſlender long and whitiſh root ſends vp many ſmal leaues like thoſe of the laſt deſcribed, but of a pleaſing ſmell, and taſte ſomething like that of the common Cheruill amongſt theſe leaues grow vp ſlender ſtalks a little hairy, diuided into ſhort green and ſlender branches carrying little vmbels, conſiſting of fiue, ſix, ſeuen, or eight ſmal white floures, compoſed of fiue leaues apiece,

apiece, with a darke purplish chiue in the middle: the floures are succeeded by, or rather grow vpon long slender cods, which become some inch long, and resemble those of the last described: it flours in Iune, as *Clusius* affirmeth, who giues vs the history of it; and he receiued it from *Honorius Bellus* out of Candy; who writes, that in the Spring time it is much vsed in sallads, and desired, for that it much excites to Venery. He also thinks this plant to be the *Anthriscus* of *Pliny*, and by the same name *Clusius* sets it forth. *Columna* hath called it *Anisо-marathrum*, because the smell and taste is betweene that of Anise and Fennell. ‡

¶ *The Place.*

It groweth in most corne fields in England, especially among wheat and barley.

¶ *The Time.*

It floureth in May: the seed is ripe in August with corne.

¶ *The Names.*

The Latines call it *Scandix*, hauing borrowed that name of the Grecians, who call it Σκάνδιξ: we finde among the bastard words, that the Romans did call it *Scanaria*, and *Acula*, of the seed that is like vnto a needle. *Ruellius* describeth it vnder the name *Pecten Veneris*: of others, *Acus Veneris*, and *Acus pastoris*, or Shepheards Needle, wilde Cheruill, and Ladies combe: in high Dutch, Naelde kamel: This is that herbe (saith *Pliny*, *lib.* 22. *cap.* 22.) which *Aristophanes* obiected in sport to the Poet *Euripides*, that his mother was wont to sell no right pot-herbe but *Scandix*, or Shepheards needle; meaning, as I take it, *Visnaga*, wherwith the Spaniards do picke their teeth when they haue eaten no meat at all except a few oranges or such a like trifle, called also *Scandix*.

¶ *The Temperature.*

Shepheards needle, saith *Galen*, is an herbe somewhat binding, and bitter in taste, insomuch that it is hot and dry either in the later end of the second degree, or in the beginning of the third.

¶ *The Vertues.*

Dioscorides saith it is eaten both raw and boiled, and that it is an vnwholsome pot-herbe among A the Greekes; but in these dayes it is of small estimation or value, and taken but for a wilde Wort, as appeareth by *Aristophanes* taunting of *Euripides*, as aforesaid.

The decoction thereof is good for the bladder, kidneyes, and liuer; but as I deeme hee meant B Cheruill, when he set the same downe to be vsed in physicke.

Chap. 418. *Of Tooth-picke Cheruill.*

¶ *The Description.*

1 THe first of these Tooth-pick Cheruils beareth leaues like wild Turneps, a round stalke furrowed, joynted, blackish, and hairy, diuided into many branches, on the tops wherof grow spokie tufts, beset round about with many small leaues. The floures thereof are whitish: after commeth the seed, which being once ripe doe cluster, and are drawne together, in a round thick tuft like a smal birds nest, as be those of the wild Carrot; whose seeds whoso toucheth, they will cleaue and sticke to his fingers, by reason of the glutinous or slimie matter they are possessed with. The root is small and whitish, bitter in taste, as is all the rest of the plant.

2 The Spanish Tooth-picke hath leaues, floures, and knobby stalkes like vnto wilde carrots, sauing that the leaues are somwhat finer, cut or jagged thicker, and tenderer, but not rough or hairy at all as is the former, of a bitter taste, and a reasonable good smell: among which rise vp bushie rundles or spokie tufts like those of the wilde Carrot or Birds nest, closely drawne together when the seed is ripe; at what time also the sharpe needles are hardned, fit to make Tooth-pickes, and such like, for which purpose they do very fitly serue.

¶ *The Place.*

Both of them grow in Syria, and most commonly in Cilicia: the later likewise is to be found in Spaine almost euery where; and I haue it likewise in my garden in great plentie.

¶ *The Time.*

They floure in my garden about August, and deliuer their seed in October.

¶ *The Names.*

That which the Grecians call τρίχιδιον, the Latines do likewise name *Gingidium*: and it is called in Syria, *Lepidium*: yet is there another *Lepidium*. It is reported among the bastard names to be called by the Romans, *Bisacutum*: of which name some shew remaines among the Syrians, who commonly call the later, *Gingidium*, *Visnaga*: this is named in English, Tooth-picke Cheruill,

1 *Gingidium latifolium.*
Broad Tooth-picke Cheruill.

2 *Gingidium Hiſpanicum.*
Spaniſh Tooth-picke Cheruill.

¶ *The Temperature and Vertues.*

A There is, ſaith *Galen*, great increaſe of *Gingidium* in Syria, and it is eaten no otherwiſe than *Scandix* is with vs at Pergamum: it is, ſaith he, very wholſome for the ſtomack, whether it be eaten raw or boiled; notwithſtanding it is euident that it is a medicine rather than a nouriſhment. As it is bitter and binding, ſo is it likewiſe of a temperate heat and drines. The heat is not very apparant, but it is found to be dry in the later end of the ſecond degree, as alſo the ſaid Author alledgeth in his diſcourſe of the faculties of ſimple medicines.

B *Dioſcorides* doth alſo write the ſame: This pot-herbe (ſaith he) is eaten raw, ſodden, and preſerued with great good to the ſtomack; it prouoketh vrine, and the decoction therof made with wine and drunke, is profitable to ſcoure the bladder, prouoketh vrine, and is good againſt the grauell and ſtone.

C The hard quils whereon the ſeeds do grow are good to clenſe the teeth and gums, and do eaſily take away all filth and baggage ſticking in them, without any hurt vnto the gums, as followeth after many other Tooth-picks, and they leaue a good ſent or ſauor in the mouth.

Chap. 419. *Of Mede-ſweet, or Queene of the Medowes.*

¶ *The Deſcription.*

1 THis herbe hath leaues like Agrimony, conſiſting of diuers leaues ſet vpon a middle rib like thoſe of the aſh tree, euery ſmall leaf ſleightly ſnipt about the edges, white on the inner ſide, and on the vpper ſide crumpled or wrinkled like vnto thoſe of the Elme tree; whereof it tooke the name *Vlmaria*, of the ſimilitude or likeneſſe that the leaues haue with the Elme leaues. The ſtalke is three or foure foot high, rough, and very fragile or eaſie to bee broken, of a reddiſh purple colour: on the top whereof are very many little floures cluſtering and growing together, of a white colour tending to yellowneſſe, and of a pleaſant ſweet ſmell

1 *Regina prati.*
Queene of the Medow.

smell, as are the leaues likewise: after which come the seeds, small, crookedly turning or winding one with another, made into a fine little head: the root hath a sweet smell, spreading far abroad, black without, & of a darkish red color within.

‡ 2 There is also another which by *Fuchsius*, *Tragus Lonicerus*, *Gesner*, and others, is called *Barba Capri*: it hath large wooddy roots, leaues of the bignesse, and growing somwhat after the maner of the wild Angelica: the stalks are crested, and diuided into sundry branches, which cary long bending spikes or eares of white floures and seeds somewhat like those of the common kind: this flours at the same time as the former, & I haue not yet heard of it wild with vs, but only seene it growing with M^r. *Tradescant*. ‡

¶ *The Place.*

It groweth in the brinkes of waterie ditches and riuers sides, and also in medowes: it liketh watery and moist places, and groweth almost euery where.

¶ *The Time.*

It floureth and floureth in Iune, Iuly, and August.

¶ *The Names.*

It is called of the later age *Regina prati*, and *Barba Capri*: of some, *Vlmaria, à foliorum Vlmi similitudine*, for the likenesse it hath with the Elme tree leafe: in high Dutch, **Spitsbart**. It is called *Barba Hirci*, which name belongeth to the plant which the Grecians do cal *Tragopogon*: of *Anguillara*, *Potentilla major*. It hath some likenesse with *Rhodora Plinij*, but yet we cannot affirme it to be the same. It is called in low Dutch, **Betinette**: in French, *Barbe de Cheure*, *Reine des Praiz*: in English, Meadsweet, Medow-sweet, and Queen of the medowes. *Camerarius* of Noremberg saith it is called of the Germanes his countrimen, **wurme kraut**: because the roots, saith he, seeme to be eaten with wormes. I rather suppose they call it so, because the antient hackny men and horseleaches do giue the decoction thereof to their horses and asses, against the bots and worms, for the which it is greatly commended.

¶ *The Nature.*

Mede-sweet is cold and dry, with an euident binding qualitie adioined.

¶ *The Vertues.*

The root boiled, or made into pouder and drunke, helpeth the bloudy flix, staieth the lask, and all other fluxes of bloud in man or woman. A

It is reported, that the floures boiled in wine and drunke, do take away the fits of a quartaine ague, and make the heart merrie. B

The leaues and floures farre excell all other strowing herbes, for to decke vp houses, to straw in chambers, halls, and banqueting houses in the Summer time; for the smell thereof makes the heart merrie, delighteth the senses: neither doth it cause head-ache, or lothsomenesse to meat, as some other sweet smelling herbes do. C

The distilled water of the floures dropped into the eies, taketh away the burning and itching thereof, and cleareth the sight. D

Chap. 420. *Of Burnet Saxifrage.*

¶ *The Description.*

1 THis great kinde of Pimpinell, or rather Saxifrage, hath great and long roots, fashioned like a Parsnep, of an hot and biting taste like Ginger: from which riseth vp an hollow stalke

ſtalke with joints and knees two cubits high, beſet with large leaues, which do more neerely repreſent Smallage than Pimpernell, or rather the garden Parſnep. This plant conſiſteth of many ſmall leaues growing vpon one ſtem, ſnipt or dented about the edges like a ſaw: the floures doe grow at the top of the ſtalkes in white round tufts: the ſeed is like the common Parſley, ſauing that it is hotter and biting vpon the tongue.

‡ There is a bigger and leſſer of this kinde, which differ little, but that the ſtalkes and veins of the leaues of the leſſer are of a purpliſh colour, and the root is hotter. Our Author formerly gaue the figure of the leſſer in the ſecond place, in ſtead of that of *Bipinella*. ‡

1 *Pimpinella Saxifraga.*
Burnet Saxifrage.

† 2 *Bipinella, ſiue Saxifraga minor.*
Small Burnet Saxifrage.

2 *Bipinella* is likewiſe a kind of Burnet or Pimpinell, vpon which *Pena* hath beſtowed this addition *Saxifraga minor*: vnder which name *Saxifraga* are comprehended diuers herbes of diuers kinds, and the one very vnlike to the other: but that kinde of Saxifrage which is called *Hircina*, which is rough or hairy Saxifrage, of others *Bipinella*, is beſt known, and the beſt of all the reſt, like vnto the ſmall Burnet, or common Parſley, ſauing that it is void of haires, as may appeare by the old Latine, verſe,

Pimpinella pilos, Saxifraga non habet vllos.
Pimpinell hath haires ſome, but Saxifrage hath none.

Notwithſtanding, I haue found a kinde hereof growing in our paſtures adioining to London, the leaues whereof if you take and tenderly breake with your hands, you may draw forth ſmall threds, like the web of a ſpider, ſuch as you may draw from the leaues of Scabious. The ſtalke is hollow, diuiding it ſelfe from the joints or knees, into ſundry other ſmall branches, at the top whereof do grow ſmall tufts or ſpokie rundles, of a white colour: after which commeth the ſeed like to *Carui*, or Caruwaies, of a ſharp taſte: the root is alſo ſharp and hot in taſte.

¶ *The Place.*

Theſe plants do grow in dry paſtures and medowes in this countrey very plentifully.

¶ *The Time.*

They floure from Iune to the end of Auguſt.

¶ *The Names.*

That which *Fuchſius* calleth *Pimpinella major*, *Dodonæus* termeth *Saxifragia major*, which kinde of Saxifrage more abſolutely anſwereth the true *Phellandrium* of *Pliny*, than any other plant whatſoeuer:

soeuer: wherein the Physitions of Paris haue bin deceiued, calling or supposing the medow Rue to be the right *Phellandrium*, whereunto it is not like either in shape or faculty: for it is nothing so effectuall in breaking the stone, or prouoking of vrine, as either of these plants, especially *Pimpinella Hircina*, which is not so called because it hath any rammish smell of a Goat, but because practitioners haue vsed to feed goats with it, whose flesh and bloud is singular good against the stone: but we rather take it to be named *Hircina*, of *Hircinea sylua*, where it growes in great aboundance, the saur of the herb not being vnpleasant, somewhat resembling the smell and tast of *Daucus*, *Ligustrum*, and *Pastinaca*: so to conclude, both these are called *Saxifragia*. The smaller is called of some, *Petrapedula*, *Bipinella*, and *Bipennula*: of *Baptista Sardus*, and also of *Leonardus Fuchsius*, *Pimpinella maior*: Diuers call it *Pimpinella saxifraga*; for there is also another *Pimpinella*, called *Pimpinella sanguisorba*: notwithstanding the verse before rehearsed sheweth a difference between *Pimpinella* and *Saxifraga*: in high Dutch it is called **Bibernel**: in low-Dutch, **Bauenaert**: in English the greater may be called great Saxifrage, and the other small Saxifrage.

Bipinella is called *Saxifragia minor*: in English, small Saxifrage, as *Pimpinella* is called great Saxifrage. ‡ *Columna* iudges it to be the *Tragium* of *Dioscorides*. ‡

¶ *The Nature.*

Saxifrage of both kinds, with their seed, leaues, and roots are hot and dry in the third dagree, and of thin and subtill parts.

¶ *The Vertues.*

The seed and root of Saxifrage drunk with wine, or the decoction thereof made with wine, causeth to pisse well, breaketh the stone in the kidnies and bladder, and is singular against the strangurie and stoppings of the kidnies and bladder; whereof it took the name *Saxifragia*, or Break-stone. A

The juice of the leaues of Saxifrage doth clense and take away all spots and freckles of the face and leaueth a good colour. B

The distilled water thereof mingled with some vineger in the distillation, cleareth the sight, and taketh away all obscuritie and darknesse of the same. C

Chap. 421. *Of Burnet.*

1 *Pimpinella hortensis.*
Garden Burnet.

2 *Pimpinella sylvestris.*
Wilde Burnet.

¶ *The Kindes.*

BVrnet of which we will intreat, doth differ from *Pimpinella*, which is also called *Saxifraga*. One of the Burnets is lesser, for the most part growing in gardens, notwithstanding it groweth in barren fields, where it is much smaller: the other greater, is altogether wilde.

¶ *The Description.*

1 GArden Burnet hath long leaues made vp together of a great many vpon one stem, euery one whereof is something round, nicked on the edges, somewhat hairy: among these riseth a stalke that is not altogether without leaues, something chamfered: vpon the tops whereof grow little round heads or knaps, which bring forth small floures of a browne purple colour, and after them cornered seeds, which are thrust vp together. The root is long: the whole plant doth smell something like a Melon, or Cucumber.

2 Wilde Burnet is greater in all parts, it hath wider and bigger leaues than those of the former: the stalke is longer, sometimes two cubits high: the knaps are greater, of a darke purple colour, and the seed is likewise cornered and greater: the root longer, but this Burnet hath no pleasant smell at all.

‡ 3 There is kept in some gardens another of this kinde, with very large leaues, stalkes, and heads, for the heads are some inch and halfe long, yet but slender considering the length, and the floures (as I remember) are of a whitish colour: in other respects it differs not from the precedent: it may fitly be called *Pimpinella sanguisorba hortensis maxima*, Great Garden Burnet. ‡

¶ *The Place.*

The small Pimpinell is commonly planted in Gardens, notwithstanding it doth grow wild vpon many barren heaths and pastures.

The great wilde Burnet groweth (as M^r. *Lyte* saith) in dry medowes about Viluord, and my selfe haue found it growing vpon the side of a causey which crosseth the one halfe of a field, whereof the one part is earable ground, and the other part medow, lying betweene Paddington and Lysson green neere vnto London, vpon the high way.

¶ *The Time.*

They floure from Iune, vnto the end of August.

¶ *The Names.*

The later herbarists doe call Burnet *Pimpinella sanguisorba*, that it may differ from the other, and yet it is called by seuerall names, *Sanguisorba*, and *Sanguinaria*: *Gesner* had rather it should be called *Peponella* of the smell of Melons or Pompions, to which it is like, as we haue said: of others it is named *Pimpinella*, or *Bipennula*: of most men, *Solbastrella*: in high Dutch, **Kolbleskraut**, **der Gots Bartlin**, **Blutkraut**, **megelkraut**: in French, *Pimpennelle*, *Sanguisorbe*: in English, Burnet. It agreeth *cum altera Dioscoridis Sideritide*, that is to say, with *Dioscorides* his second Iron-wort: the leafe (and especially that of the lesser sort) which we haue written to consist of many nicks in the edges of the leaues; and this may be the very same which *Pliny* in his 24 book, chapter 17. reporteth to be named in Persia, *Sissitieptris*, because it made them merry; he also calleth the same *Protomedia*, and *Caligata*, and likewise *Dionysionymphas*, for that it doth maruellously agree with wine; to which also this *Pimpinella* (as we haue said) doth giue a pleasant sent: neither is that repugnant, that *Pliny* in another place hath written, *De Sideritibus*, of the Iron-worts; for it often falleth out that he intreateth of one and the selfe same plant in diuers places, vnder diuers names: which thing then hapneth sooner when the writers themselues do not well know the plant, as that *Pliny* did not well know *Sideritis*, or Iron-wort, it is euen thereby manifest, because hee setteth not downe his owne opinion hereof, but other mens.

¶ *The Temperature.*

Burnet, besides the drying and binding faculty that it hath, doth likewise meanly coole: and the lesser Burnet hath likewise withall a certaine superficiall, sleight, and temperate sent, which when it is put into the wine it doth leaue behind it: this is not in the dry herbe, in the juyce, nor in the decoction.

¶ *The Vertues.*

A Burnet is a singular good herb for wounds (which thing *Dioscorides* doth attribute to his second Iron-wort) and commended of a number: it stancheth bleeding, and therefore it was named *Sanguisorba*, as well inwardly taken, as outwardly applied.

B Either the juyce is giuen, or the decoction of the pouder of the dry leaues of the herbe, beeing bruised, it is outwardly applied, or else put among other externall medicines.

C It staieth the laske and bloudy flix: it is also most effectuall to stop the monethly course.

D The lesser Burnet is pleasant to be eaten in sallads, in which it is thought to make the heart merry and glad, as also being put into wine, to which it yeeldeth a certaine grace in the drinking. The

The decoction of Pimpinell drunken,cureth the bloudy flix, the ſpitting of bloud,and all other fluxes of bloud in man or woman.

The herbe and ſeed made into pouder,and drunke with wine, or water wherein yron hath beene quenched doth the like.

The leaues of Pimpinell are very good to heale wounds,and are receiued in drinks that are made for inward wounds.

The leaues of Burnet ſteeped in wine and drunken,comfort the heart, and make it merry, and are good againſt the trembling and ſhaking thereof.

Chap. 387. *Of Engliſh Saxifrage.*

¶ *The Deſcription.*

1 THis kinde of Saxifrage our Engliſh women Phyſitions haue in great vſe,and is familiarly knowne vnto them,vouchſafing that name vnto it of his vertues againſt the ſtone:it hath the leaues of Fennell, but thicker and broader,very like vnto *Seſeli pratenſe Maſſilienſium* (which addition *Pena* hath beſtowed vpon this our Engliſh Saxifrage) among which riſeth vp a ſtalke, of a cubit high or more, bearing at the top ſpokie rundles beſet with whitiſh yellow floures: the root is thicke,blacke without,and white within,and of a good ſauour.

† 1 *Saxifraga Anglicana facie Seſeli pratenſis.*
Engliſh Saxifrage.

‡ 2 *Saxifraga Pannonica Claſij.*
Auſtrian Saxifrage.

‡ 2 *Cluſius* hath ſet forth another plant not much different from this our common Saxifrage and called it *Saxifraga Pannonica*, which I haue thought fit here to inſert: the leaues, ſaith hee, are much ſhorter than thoſe of Hogs-Fennell,& ſomwhat like to thoſe of Fumitory:the ſtalks are ſome foot high,ſlender,hauing ſome few ſmall leaues,and at the top carrying an vmbell of white floures: the root is not much vnlike that of Hogs-Fennell,but ſhorter and more acride;it is hairy at the top thereof

thereof, whence the ſtalkes and leaues come forth: it growes vpon ſome hills in Hungary and Auſtria, and floures in Iuly. ‡

¶ *The Place.*

Saxifrage groweth in moſt fields and medowes euery where throughout this our Kingdome of England.

¶ *The Time.*

It floureth from the beginning of May to the end of Auguſt.

¶ *The Names.*

Saxifraga Anglicana is called in our mother tongue Stone-breake or Engliſh Saxifrage: *Pena* and *Lobel* call it by this name *Saxifraga Anglicana*: for that it groweth more plentifully in England than in any other countrey.

¶ *The Temperature.*

Stone-breake is hot and dry in the third degree.

¶ *The Vertues.*

A A decoction made with the ſeeds and roots of Saxifrage, breaketh the ſtone in the bladder and kidnies, helpeth the ſtrangury, and cauſeth one to piſſe freely.

B The root of ſtone-breake boiled in wine, and the decoction drunken, bringeth downe womens ſickeneſſe, expelleth the ſecondine and dead childe.

C The root dried and made into pouder, and taken with ſugar, comforteth and warmeth the ſtomacke, cureth the gnawing and gripi' g paines of the belly.

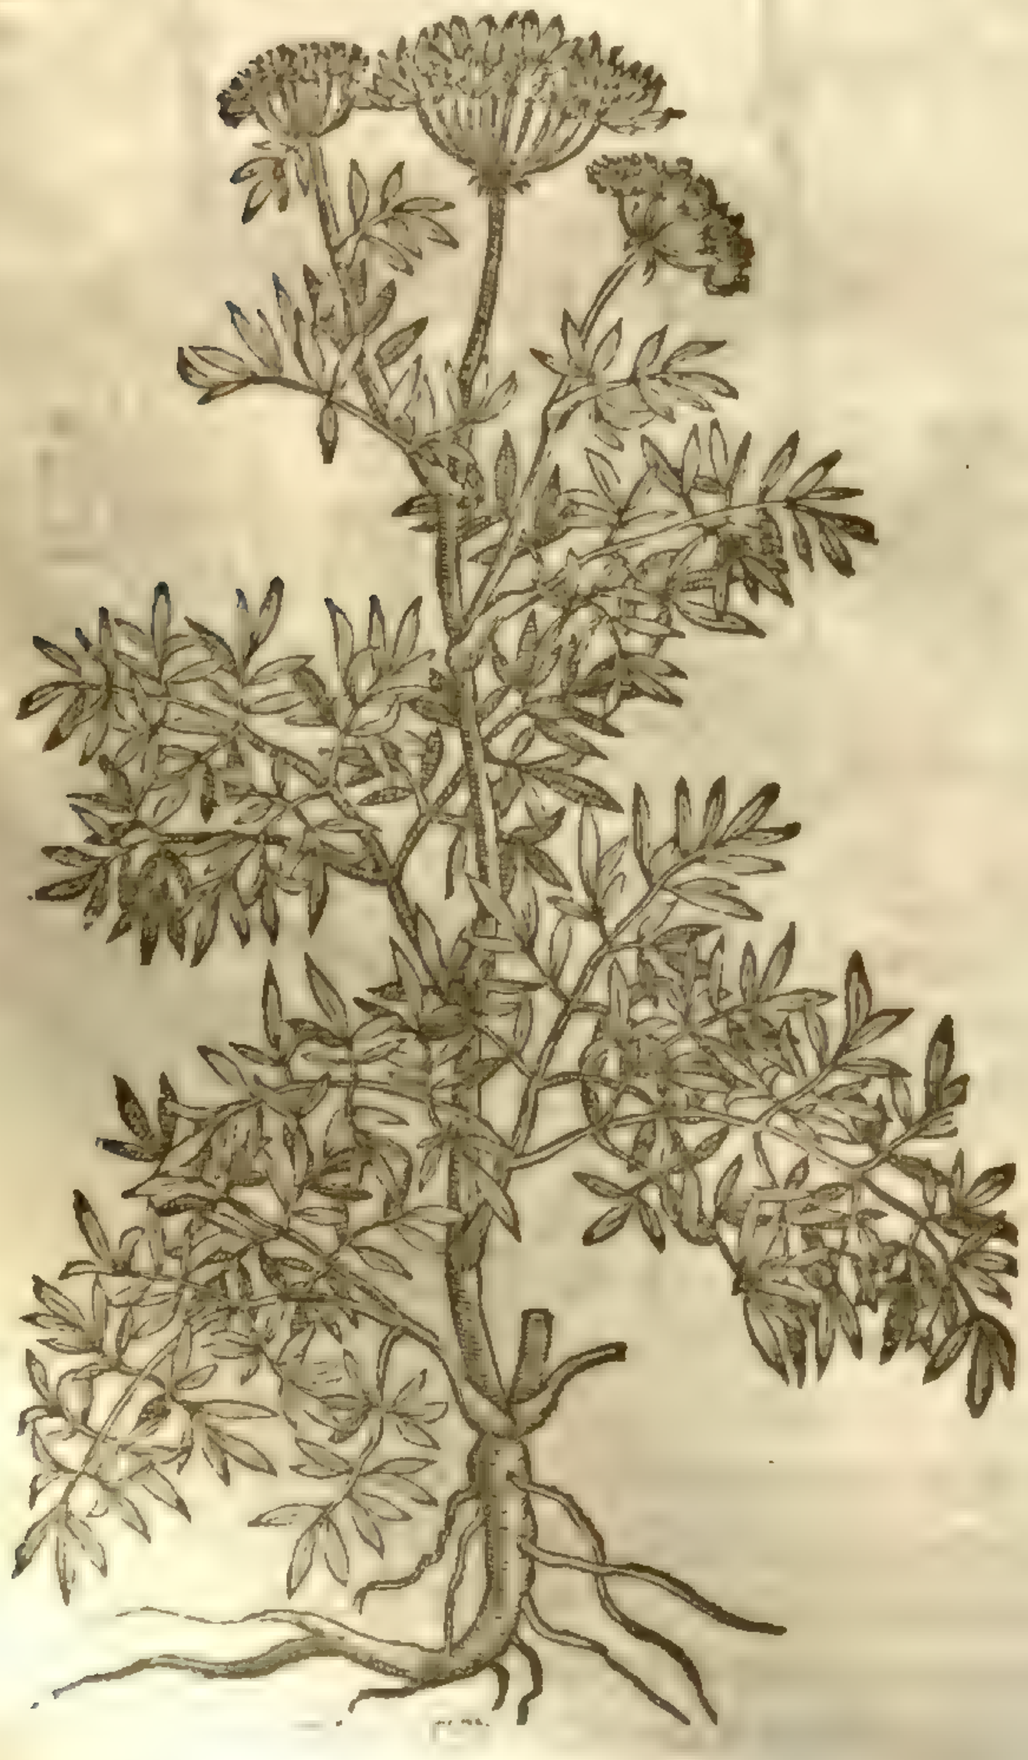
D It helpeth the collicke, and drieth away ventoſities or windineſſe.

E Our Engliſh women v e to put it in their running or rennet for cheeſe, eſpecially in Cheſhire (where I was borne) where the beſt cheeſe of this Land is made.

† I haue formerly Chap. 188 deliuered the hiſtory of the *Saxifraga maior* of *Matthiolus*, and *Saxifraga Antiquorum* of *Lobel*; not thinking that our Author hath inſerted any one amongſt the *Umbelliferæ*, for if I had, I ſhould haue ſpared my labour there beſtowed, and haue giuen the figures here to the deſcription of our Author, which are now omitted. The figure formerly here was of the *Caucalis*, deſcribed in the third place of the 403 chapter.

Chap. 423. *Of Siler Mountaine, or baſtard Louage.*

† 1 *Siler montanum Officinarum.*
Baſtard Louage.



† 2 *Seſeli pratenſe Monſpelienſium.*
Horſe Fennell.

¶ *The Description.*

1 THe naturall plants of *Seseli*, being now better know ne than in times past, especially among our Apothecaries, is called by them *Siler montanum*, and *Seseleos*: this plant they haue retained to very good purpose and consideration; but the errour of the name hath caused diuers of our late writers to erre, and to suppose that *Siler montanum*, called in shops *Seseleos*, was no ther then *Seseli Massilicnsium* of *Dioscorides*. But this plant containeth in his substance much more acrimony, sharpenesse, and efficacy in working, than any of the plants called *Seselios*. It hath stalkes like Ferula, two cubits high. The root smelleth like *Ligusticum*: the leaues are very much cut or diuided, like the leaues of Fennell or *Seseli Massilicnse*, and broader than the leaues of *Peucedanum*. At the top of the stalkes grow spokie tufts like Angelica, which bring forth a long and leafie seed like Cumine, of a pale colour; in taste seeming as though it were condited with sugar, but withall somewhat sharpe, and sharper than *Seseli pratense*.

2 There is a second kinde of *Siler* which *Pena* and *Lobel* set forth vnder the title of *Seseli pratense Massiliensium*, which *Dodonæus* in his last edition calleth *Siler pratense alterum*, that is in shew very like the former. The stalkes thereof grow to the height of two cubits, but his leaues are somewhat broader and blacker; there are not so many leaues growing vpon the stalke, and they are lesse diuided than the former, and are of a little sauour. The seed is smaller than the former, and sauouring very little or nothing. The root is blacke without, and white within, diuiding it selfe into sundry diuisions.

¶ *The Place.*

It groweth of it selfe in Liguria, not far from Genua in the craggy mountaines, and in the gardens of diligent Herbarists.

¶ *The Time.*

These plants do floure from Iune to the end of August.

¶ *The Names.*

It is called commonly *Siler Montanum*: in French and Dutch by a corrupt name *Ser-Montain*: in diuers shops, *Seseleos*, but vntruly: for it is not *Seseli*, nor a kinde thereof: in English, Siler mountaine, after the Latine name, and bastard Louage. ‡ The first is thought to be the *Ligusticum* of the Antients, and it is so called by *Matthiolus* and others. ‡

¶ *The Temperature.*

This plant with his seed is hot and dry in the third degree.

¶ *The Vertues.*

The seeds of *Siler* drunke with Wormewood Wine, or Wine wherein Wormewood hath beene sodden, moueth womens diseases in great abundance: cureth the suffocation and strangling of the matrix, and causeth it to returne vnto the naturall place againe. A

The root stamped with hony, and applied or put into old sores, doth cure them, and couer bare and naked bones with flesh. B

Being drunke it prouoketh vrine, easeth the paines of the guts or entrails proceeding of crudity or rawnesse, it helpeth concoction, consumeth winde, and swelling of the stomacke. C

The root hath the same vertue or operation, but not so effectuall, as not being so hot and dry. D

The figure which formerly was here was of the *Seseli Massiliense* described in the next chapter in the fourth place, and that which belonged to this place was the common Louage. Also that figure which belonged to the second description was formerly vnder the title of *Faniculum dulce*.

Chap. 424. *Of Seselios, or Hart-worts of Candy.*

¶ *The Description.*

1 THis plant beeing the *Seseli* of Candy, and in times past not elsewhere found, tooke his surname of that place where it was first found, but now adaies it is to be seene in the corne fields about Narbone in France, from whence I had seeds, which prosper well in my garden. This is but an annuall plant, and increaseth from yeare to yeare by his owne sowing. The leaues grow at the first euen with the ground, somewhat hairy, of an ouerworne greene colour, in shape much like vnto Cheruill, but thicker: among which riseth vp an hairy rough stalke, of the height of a cubit, bearing at the top spokie tufts with white floures: which being vaded, there followeth round and flat seed, compassed and cunningly wreathed about the edges like a ring.

The ſeed is flat like the other, joyned two together in one, as you may ſee in the ſeed of Ferula or Angelica, in ſhape like a round target, in taſte like *Myrrhis*. *Matthiolus* did greatly miſtake this plant.

2 There is a kinde of *Seſeli Creticum*, called alſo *Tordylion*: and is very like vnto the former, ſauing that his leaues are more like vnto common Parſneps than Cheruil, and the whole plant is bigger than the former.

1 *Seſeli Creticum minus.*
Small Seſeleos of Candie.

‡ 2 *Seſeli Creticum majus.*
Great Seſelios of Candie.

3 There is likewiſe a kinde of *Seſeli* that hath a root as bigge as a mans arme, eſpecially if the plant be old, but the new and young plants beare roots an inch thicke, with ſome knobs and tuberous ſprouts, about the lower part, the root is thicke, rough, and couered ouer with a thicke barke, the ſubſtance whereof is firſt gummie, afterward ſharpe, and as it were full of ſpattle; from the vpper part of the root proceed many knobs or thicke ſwelling roots, out of which there iſſueth great and large wings or branches of leaues, ſome whereof are notched or dented round about, growing vnto one ſide or rib of the leafe, ſtanding alſo one oppoſite vnto another, of a darke and delaid green colour, and ſomwhat ſhining aboue, but vnderneath of a grayiſh or aſh-colour: from amongſt theſe leaues theree ariſeth a ſtraked or guttered ſtalke, a cubit and a halfe high, ſomtimes an inch thick, hauing many joynts or knees, and many branches growing about them, and vpon each joynt leſſer branches of leaues. At the top of the ſtalkes, and vpperends of the branches grow little cups or vmbels of white floures; which being vaded, there commeth in place a ſeed, which is very like *Seſeli montanum*. ‡ I take this here deſcribed to be the *Seſeli montanum* 1. of *Cluſius*, or *Liguſticum alterum Belgarum* of *Lobel*: and therefore I haue giuen you *Cluſius* his figure in this place. ‡

There is alſo a kind of *Seſeli*, which *Pena* ſetteth forth for the firſt kinde of *Daucus*, whereof I take it to be a kinde, growing euery where in the paſtures about London, that hath large leaues, growing for a time euen with the earth, and ſpred thereupon, and diuided into many parts, in manner almoſt like to the former for the moſt part in all things, in the round ſpokie tufts or vmbels, bearing ſtiffe and faire white floures in ſhape like them of Cinkefoile; in ſmell like *Sambucus* or Elder. When the floure is vaded, there commeth in place a yellow guttered ſeed, of a ſpicie and very hot taſte. The root is thicke, and blacke without, which rotteth and periſheth in the ground (as wee may

may see in many gummie or Ferulous plants) after it hath seeded, neither will it floure before the second or third yeare after it is sowne. ‡ I am ignorant what our Author meanes by this description. ‡

‡ 3 *Seseli montanum majus.*
Mountaine Seselios.

† 4 *Seseli Massiliense.*
Seselios of *Marseilles.*

4 There is likewise a kinde of *Seseli* called *Seseli Massiliense*, which hath leaues very much cloaen or cut, and finely jagged, very much like vnto the leaues of sweet Fennell, greater and thicker than the common Fennell. The stalke groweth to the height of three cubits, hauing knotty joynts, as it were knees; bearing at the top thereof tufts like vnto Dill, and seed somewhat long and cornered, of a sharpe and biting taste. The root is long and thicke like vnto great Saxifrage, of a pleasant smell and sharpe in taste.

There is another *Seseli* of Massilia, which hath large and great leaues like vnto Ferula, and not much vnlike *Siler Montanum*: among which rise vp stalkes foure cubits high, bearing at the tops spokie tufts like vnto the last before rehearsed, of a good sauour. The root is like vnto the former in shape, substance, and sauour, but that it is greater.

¶ *The Place.*

These plants are strangers in England, notwithstanding I haue them in my garden.

¶ *The Time.*

They floure and flourish in September.

¶ *The Names.*

Their names haue beene touched in their seuerall descriptions.

¶ *The Temperature and Vertues.*

It prouoketh vrine, and helpeth the strangury, bringeth downe the sickenesse and dead birth: it helpeth the cough and shortnesse of breath, the suffocation of the mother, and helpeth the falling sickenesse. A

The seed drunke with wine concocteth raw humours, taketh away the griping and torments of the belly, and helpeth the ague, as *Dioscorides* saith. B

The juyce of the leaues is giuen to Goats and other cattell to drinke, that they may the sooner be deliuered of their young ones, as the same Author reporteth. C

Chap. 425. *Of Spignell, Spicknell, or Mewe.*

¶ *The Deſcription.*

1 Spignell hath ſtalks riſing vp to the height of a cubit and a halfe, beſet with leaues reſembling Fennell or Dill, but thicker, more buſhie, and more finely jagged; and at the top of the ſtalkes do grow ſpokie tufts like vnto Dil. The roots are thicke, and full of an oleous ſubſtance, ſmelling well, and chafing or heating the tongue, of a reaſonable good ſauour.

1 *Meum.*
Spignell.

‡ 2 *Meum alterum Italicum.*
Italian Spignell.

2 There is a baſtard kinde of Spignell like vnto the former, ſauing that the leaues are not ſo finely cut or jagged: the floures are tufted more thicker than the former: the roots are many, thicke, and full of ſap.

¶ *The Place.*

Mew, or Meon groweth in Weſtmerland, at a place called Round-twhat betwixt Aplebie and Kendall, in the pariſh of Orton.

Baſtard Mewe, or *Menm*, groweth in the waſte mountaines of Italy, and the Alpes, and (as it hath been told me) vpon Saint Vincents rocke by Briſtow, where I ſpent two daies to ſeeke it, but it was not my hap to finde it, therefore I make ſome doubt of the truth thereof.

¶ *The Time.*

Theſe herbes do floure in Iune and Iuly, and yeeld their ſeed in Auguſt.

¶ *The Names.*

It is called of the Græcians, μεῶν: or μῶν: likewiſe of the Latines, *Meum:* of the Italians, *Meo*: in Apulia, as *Matthiolus* declareth, it is called *Imperatrix*: in diuers places of Spaine, *Siſtra*: in others, *Pinello*: in high Dutch, **Beerewurtz**: in French, *Siſtre*: *Ruellius* ſaith that it is named in France *Anethum tortuoſum*, and *ſylueſtre*, or writhed Dill, and wilde Dill: alſo it is called in Engliſh, Spignell, or Spicknell, of ſome Mew, and Bearewort.

The ſecond may be called baſtard Spicknell.

¶ The

¶ *The Temperature.*

Theſe herbes, eſpecially the roots of right Meon, is hot in the third degree, and dry in the ſecond.

¶ *The Vertues.*

The roots of Meon, boyled in water and drunke, mightily open the ſtoppings of the kidnies and A
bladder, prouoke vrine and bodily luſt, eaſe and helpe the ſtrangury, and conſume all windineſſe
and belchings of the ſtomacke.

The ſame taken with hony doth appeaſe the griefe of the belly, and is exceeding good againſt B
all Catarrhes, rheumes, and aches of the joynts, as alſo any phlegme which falls vpon the lungs.

If the ſame be laied plaiſterwiſe vpon the bellies of children, it maketh them to piſſe well. C

They cleanſe the entrals, and deliuer them of obſtructions or ſtoppings: they prouoke vrine, D
driue forth the ſtone, and bring downe the floures: but if they be taken more than is requiſite, they cauſe the head-ache; for ſeeing they haue in them more heat than drineſſe, they carry to the head raw moiſture and windie heat, as *Galen* ſaith.

Chap. 426. *Of Horeſtrange, or Sulpherwort.*

¶ *The Deſcription.*

1 Svlphurwort or Hogs-fennell hath a ſtiffe and hard ſtalke full of knees or knots, beſet with leaues like vnto Fennell, but greater, comming neerer vnto Ferula, or rather like the leaues of wilde Pine-tree, and at the top of the ſtalkes round ſpokie tufts full of little yollow floures, which doe turne into broad browne ſeed. The root is thicke and long: I haue digged vp roots thereof as big as a mans thigh, blacke without, and white within, of a ſtrong and grieuous ſmell, and full of yellow ſap or liquor, which quickely waxeth hard or dry, ſmelling not much vnlike brimſtone, called *Sulphur*; which hath induced ſome to call it Sulphurwort; hauing alſo at the top toward the vpper face of the earth, a certaine buſh of haire, of a browne colour, among which the leaues and ſtalkes do ſpring forth.

2 The ſecond kinde of *Peucedanum* or Hogs-fennell is very like vnto the former, ſauing that the leaues be like Ferula: the roots are nothing ſo great as the former, but all the reſt of the plant doth far exceed the other in greatneſſe.

3 There is another kinde of *Peucedanum* or Hogs-Fennell, which *Pena* found vpon Saint Vincents rock by Briſtow, whoſe picture he hath ſet forth in his *Aduerſaria*, which that famous Engliſh Phyſition of late memory, Dr. *Turner* found there alſo, ſuppoſing it to be the right and true *Peucedanum*, whereof no doubt it is a kinde: it groweth not aboue a foot high, and is in ſhape and leaues like the right *Peucedanum*, but they be ſhorter and leſſer; growing ſomwhat like the writhed Fennell of Maſſilia, but the branches are more largely writhed, and the leaues are of the colour of the branches, which are of a pale greene colour. At the top of the branches grow ſmall white tufts, hauing ſeed like Dill, but ſhorter and ſlenderer, of a good taſte, ſomewhat ſharpe. The root is thicker than the ſmalneſſe of the herbe will well beare. Among the people about Briſtow, and the rocke aforeſaid, this hath beene thought good to eat.

‡ The figure of this our Author formerly gaue (yet vnfitly, it not agreeing with that deſcription) for *Oreoſelinum*: it may be he thought it the ſame with that of *Dodon.* his deſcription, becauſe he found it vnder the ſame title in *Tabernamontanus*. This is the *Selinum montanum pumilum* of *Cluſius*; and the *Peucedani facie puſilla planta* of *Pena* and *Lobel*; wherefore *Bauhine* was miſtaken in his *Pinax*, whereas he refers that of *Lobel* to his third *Peucedanum*: the root of this is blacke without, and white within, but ſhort, yet at the top about the thickeneſſe of ones finger: the leaues are ſmall and greene, commonly diuided into fiue parts; and theſe again ſubdiuided by threes: the ſtalke is ſome ſix inches or halfe a foot high, diuided into ſundry branches, creſted, broad, and at the toppes of the branches, euen when they firſt ſhoot vp, appeare little vmbels of white floures very ſmall, and conſiſting of fiue leaues apiece. The ſeed is blacke, ſhining and round, two being joyned together, as in moſt vmbelliferous plants. It floures in May, and ripens the ſeed in Iuly: I receiued in Iuly 1632, ſome plants of this from Briſtow, by the meanes of my oft mentioned friend Maſter *George Bowles*, who gathered it vpon Saint Vincents Rocke, whereas the Authors of the *Aduerſaria* report it to grow. ‡

1 *Peucedanum.*
Sulphurwort.

2 *Peucedanum majus.*
Great Sulphurwort.

‡ 3 *Peucedanum pumilum.*
Dwarfe Hogs-Fennell.

¶ *The Place.*

The first kinde of *Peucedanum* or Hogs Fennell groweth very plentifully on the South side of a wood belonging to Waltham, at the Nase in Essex by the high-way side; also at Whitstable in Kent, in a medow neere to the sea side, sometime belonging to Sir *Henry Crisse*, and adjoyning to his house there. It groweth also in great plenty at Feuersham in Kent, neere vnto the hauen vpon the bankes thereof, and in the medowes adjoyning.

The second kinde groweth vpon the sea coasts of Montpellier in France, and in the coasts of Italy.

¶ *The Time.*

These plants do floure in Iune, Iuly, and August.

¶ *The Names.*

The Græcians call it, πευκέδανος: the Latines in like manner, *Peucedanes*, or *Peucedanum*, and also *Pinastellum*: most of the shops, and likewise the common people name it *Fœniculum Porcinum*: of divers, *Satania*: of the Prophets, ἀγαθὸς δαίμων: that is to say, a good Angell or Ghost: in high Dutch, **Harstrang, Schweffel wurtzel, Sewfenckel**: in Italian and French, *Peucedano*: in Spanish, *Herbum*: in English, Hore-strange, and Hore-strong, Sow-Fennell, or Hogs Fennell, Sulpher-wort, or Brimstone-wort. It is called *Peucedanum* and *Pinastellum*, of the Greeke and Latine words, πεύκη and *Pinus*.

¶ *The Temperature.*

These herbes, especially the yellow sap of the root, is hot in the second degree, and dry in the beginning of the third.

¶ *The Vertues.*

The yellow sap of the root of Hogs Fennell, or as they call it in some places of England, Hore-strange, taken by it selfe, or with bitter Almonds and Rue, is good against the shortnesse of breath, it assageth the griping paines of the belly, dissolueth and driueth away ventositie or windinesse of the stomacke; it wasteth the swelling of the milt or spleene, looseth the belly gently, and purgeth by siege both flegme and choler. A

The same taken in manner aforesaid prouoketh vrine, easeth the paine of the kidnies and bladder, causeth easie deliuerance of childe, and expelleth the secondine, or after-birth, and the dead childe. B

The sap or juyce of the root mixed with oyle of Roses, or Vineger, and applied, easeth the palsie, crampes, contraction or drawing together of sinewes, and all old cold diseases, especially the Sciatica. C

It is vsed with good successe against the rupture or burstings in young children, and is very good to be applied vnto the nauels of children that stand out ouer much. D

The decoction of the root drunke is of like vertue vnto the juyce, but not altogether so effectuall against the foresaid diseases. E

The root dried and made into pouder doth mundifie and clense old stinking and corrupt sores and vlcers, and healeth them: it also draweth forth the corrupt and rotten bones that hinder the same from healing, and likewise splinters and other things fixed in the flesh. F

The said pouder or juyce of the root mixed with oyle of Roses, causeth one to sweat, if the body be annointed therewith, and therefore good to be put into the vnction or ointment for the French disease. G

The congealed liquor tempered with oile of Roses, and applied to the head after the manner of an ointment, is good for them that haue the Lethergie, that are franticke, that haue dizzinesse in the head, that are troubled with the falling sickenesse, that haue the palsie, that are vexed with convulsions and cramps, and generally it is a remedy for all infirmities of the sinewes, with vineger and oyle as *Dioscorides* teacheth. H

The same being smelt vnto reuiueth and calleth them againe that be strangled with the mother, and that lie in a dead sleepe. I

Being taken in a reare egge it helpeth the cough and difficulty of breathing, gripings and windinesse, which, as *Galen* addeth, proceedeth from the grossenesse and clamminesse of humours. K

It purgeth gently, it diminisheth the spleene, by cutting, digesting and making thin humours that are thicke: it causeth easie trauell, and openeth the matrix. L

A small piece of the root holden in the mouth is a present remedy against the suffocation of the mother. M

Chap. 472.

Of Herbe Ferula, or Fennell Gyant.

¶ *The Kindes.*

Ioſcorides maketh mention of a *Ferula*, out of which is gathered the Gum *Sagapene*; and alſo he declareth, that the Gums *Galbanum* and *Ammoniacum* are liquors of this herb *Ferula*: but what difference there is in the liquors, according to the clymate or countrey where it groweth, he doth not ſet downe; for it may be that out of one kinde of *Ferula* ſundry juyces may be gathered, that is to ſay, according to the diuerſitie of the countries where they grow, as we haue ſaid: for as in Laſer, the juyce of Laſerwort that groweth in Cyrene doth differ from that liquor which groweth in Media and Syria; ſo it is likewiſe that the herbe *Ferula* doth bring forth in Media *Sagapenum*, in Cyrene *Ammoniacum*, and in Syria *Galbanum*. *Theophraſtus* ſaith that the herbe *Ferula* is diuided into two kindes, and he calleth one great, by the name of *Ferula*; and another little, by the name *Ferulago*.

1 *Ferula.*
Fennell-Gyant.

‡ 2 *Ferulago.*
Small Fennell-Gyant.

¶ *The Deſcription.*

1 *Ferula*, or Fennell Gyant, hath very great and large leaues of a deepe greene colour, cut and jagged like thoſe of Fennell, ſpreading themſelues abroad like wings: amongſt which riſeth vp a great hollow ſtalke, ſomewhat reddiſh on that ſide which is next vnto the Sun, diuided into certaine ſpaces, with joynts or knees like thoſe of Hemlocks or Kexes, of the bigneſſe of a mans arme in the wreſt, of the height of foure or fiue cubits where it groweth naturally, as in Italy, Greece, and other hot countries; notwithſtanding it hath attained to the height of foureteene or fifteene foot in my Garden, and likewiſe groweth fairer and greater than from whence it came, as it fareth with other plants that come hither from hot regions: as for example our great Artichoke, which firſt was brought out of Italy into England, is become (by reaſon of the great moiſture which our countrey is ſubject vnto) greater and better than thoſe of Italy; inſomuch

insomuch that diuers Italians haue sent for some plants of our Artichokes, deeming them to be of another kinde; neuertheleſſe in Italy they are small and dry as they were before. Euen so it hapneth to this *Ferula*, as we haue said. This foresaid stalke diuideth it selfe toward the top into diuers other small branches, whereon are set the like leaues that grow next the ground, but much lesser. At the top of the branches at the first budding of the floures appeare certaine bundles inclosed in thin skins, like the yolke of an egge, which diuers call *Corculum Ferulæ*, or the little heart of *Ferula*; which being brought to maturitie, open themselues into a tuft or vmbell like that of Dill, of a yellowish colour: after which come the seed, in colour and fashion like those of the Parsnep, but longer and greater, alwaies growing two together, so closely joyned, that it cannot be discerned to be more than one seed vntill they be diuided: the root is very thicke and great, full of a certaine gummie juyce, that floweth forth, the root being bruised, broken, or cut; which being dried or hardned, is that gum which is called *Sagapenum*, and in some shops *Serapinum*.

2 There is likewise another smaller *Ferula* like vnto the former in each respect, sauing that it is altogether lesse: the root likewise being wounded yeeldeth forth a sap or juyce, which when it is hardened is called *Galbanum*: of the Assyrians, *Metopium*.

I haue likewise another sort sent mee from Paris, with this title *Ferula nigra*; which prospereth exceeding well in my Garden, but difference I cannot finde any from the former, sauing that the leaues are of a more blacke or swart colour.

‡ 3 *Panax Asclepium Ferulæ facie.*
Æsculapius his All-heale.

‡ 3 I know not where more fitly than in this place to giue you the History of that *Ferula* or Ferulaceous plant that *Dodonæus*, *Lobel*, and others haue set downe vnder the name of *Panax Asclepium*. The stalke hereof is slender, a cubit high, crested and joynted, and from these joynts proceed leaues bigger than those of Fennell, and also rougher, and of a strong smell: at the tops of the branches grow vmbels of yellow floures: the seed is flattish, like that of the other *Ferula*: the root long, white, and of a strong smell. This growes naturally in Istria. ‡

¶ *The Place.*

These plants are not growing wilde in England; I haue them all in my garden.

¶ *The Time.*

They floure in Iune and Iuly; they perfect their seed in September; not long after, the stalke with his leaues perish: the root remaineth fresh and greene all Winter.

¶ *The Names.*

The first is called in Greeke, Νάρθηξ: in Latine, *Ferula*: in Italian, *Ferola*: in Spanish, *Cananheia*: in English, Herbe Ferula, and Fennell Gyant.

¶ *The Temperature.*

These plants with their Gums are hot in the third degree, and dry in the second.

¶ *The Vertues.*

The pith or marrow, called *Corculum Ferulæ*, as *Galen* teacheth, is of an astringent or binding qua- A
litie, and therefore good for them that spit bloud, and that are troubled with the flix.

Dioscorides saith, that beeing put into the nosthrils it staieth bleeding, and is giuen in Wine to B
those that are bitten with Vipers.

It is reported to be eaten in Apulia rosted in the embers, first wrapped in leaues or in old clouts, C
with pepper and salt; which, as they say, is a pleasant sweet food, that stirreth vp lust, as they report.

The seed doth heate, and attenuate or make thinne: it is a remedy against cold fits of an Ague, D
by procuring sweat, being mixed with oyle, and the body annointed therewith.

A dram of the juyce of *Ferula* which beareth *Sagapenum*, purgeth by siege tough and slimie hu- E
mors,

mors, and all grosse flegme and choler, and is also good against all old and cold diseases which are hard to be cured; it purgeth the braine, and is very good against all diseases of the head, against the Apoplexie and Epilepsie.

F Being taken in the same manner, it is good against crampes, palsies, shrinkings and paines of the sinewes.

G It is good against the shortnesse of breath, the cold and long cough, the paine in the side and brest, for it mundifieth and cleanseth the brest from all cold flegme and rheumaticke humors.

H *Sagapenum* infused or steeped in vineger all night, and spread vpon leather or cloath, scattereth, dissolueth, and driueth away all hard and cold swellings, tumors, botches, and hard lumps growing about the joynts or elsewhere, and is excellent good to be put into or mingled with all oyntments or emplaisters which are made to mollifie or soften.

I The juyce of *Ferula Galbanifera*, called *Galbanum*, drunke in wine with a little myrrhe, is good against all venome or poyson that hath beene taken inwardly, or shot into the body with venomous darts, quarrels, or arrowes.

K It helps women in painfull trauell, if they do take thereof in a cup of wine the quantitie of a bean.

L The perfume of *Galbanum* helpeth women that are grieued with the rising of the mother, and is good for those that haue the falling sickenesse.

M *Galbanum* softneth, mollifieth, and draweth forth thornes, splinters, or broken bones, and consumeth cold and phlegmaticke humors, seruing in sundry oyntments and emplaisters for the vse of Surgerie, and hath the same physicall vertues that are attributed vnto *Sagapenum*.

Chap. 428. *Of Drop-wort, or Filipendula.*

1 *Filipendula.*
Drop-wort.

2 *Filipendula montana.*
Mountaine Drop-wort.

¶ *The Kindes.*

THere be diuers sorts of Drop-worts, some of the champion or fertill pastures, some of more moist and dankish grounds, and some of the mountaine.

¶ *The*

¶ *The Description.*

1 THe first kinde of Filipendula hath leaues growing and spred abroad like feathers, each leafe consisting of sundry small leaues dented or snipt round about the edges, growing to the stalke by a small and slender stem: these leaues resemble wilde Tansie or Burnet, but that they be longer and thicker, set like feathers, as is aforesaid: among these rise vp stalkes a cubit and a halfe high, at the top whereof grow many faire white floures, each small floure consisting of six slender leaues, like a little star, bushing together in a tuft like the floures of Medesweet, of a soft sweet smell: the seed is small, and groweth together like a button: the roots are small and blacke, whereupon depend many little knops or blacke pellets, much like the roots of the female Peonie, sauing that they be a great deale smaller.

2 The second kinde of Filipendula, called of *Pena* in his Obseruations, *Oenanthe, sive Philipendula altera montana*, is neither at this day very well knowne, neither did the old Writers heretofore once write or speake of it: but *Pena* that painefull Herbarist found it growing naturally in Narbone in France, neere vnto Veganium, on the top of the high hills called *Paradisus Dei*, and neere vnto the mountaine Calcaris: this rare plant hath many knobby long roots, in shape like to *Asphodelus luteus*, or rather like the roots of *Corruda*, or wilde Asparagus; from which riseth vp a stalke a foot high, and more, which is thicke, round, and chanelled, beset full of leaues like those of common Filipendula, but they be not so thicke set or winged, but more like vnto the leaues of a Thistle, consisting of sundry small leaues, in fashion like to *Coronopus Ruellij*, that is, *Ruellius* his Buckes-horne: round about the tops of the stalke there groweth a very faire tuft of white floures, resembling fine small hoods, growing close and thicke together like the floures of *Pedicularis*, that is, Red Rattle, called of *Carolus Clusius*, *Alectorolophos*; whereof he maketh this plant a kinde, but in my judgement and opinion it is rather like *Cynosorchis*, a kinde of Satyrion.

3 *Filipendula angustifolia.*
Narrow leaued Drop-wort.

† 4 *Filipendula Cicutæ facie.*
Hemlocke Drop-wort.

3 There is another kinde of Filipendula set forth vnder the name of *Oenanthe*, that hath many tuberous and thicke roots like those of Drop-wort, but white of colour, and euery one of those knobs hath a certaine string or fibre annexed thereto; from whence ariseth a crested stalke two foot high,

5. *Filipendula aquatica.*
Water Drop-wort.

high, diuiding it ſelfe toward the top into ſundry arms or branches: from the hollow place or boſome of euery joynt (out of which do grow thoſe branches) the leaues doe alſo proceed, very much cut or jagged like Fennell: at the top of thoſe branches come forth ſpokie rundles of white floures faſhioned like ſtars.

† 4 The fourth kinde of Filipendula is as ſtrange a plant as the former, eſpecially with vs here in England, except in the watery places and rills in the North, where *Paludapium* or water Smallage groweth; whereunto in leaues it is not vnlike, but more like *Ruta pratenſis*. it hath many large branches, a naughty ſauour, and in color & ſhape like *Cicuta*, that is, Hemlocke. The ſtalkes are more than two cubits high, comming from a root which exceedingly multiplies it ſelfe into bulbes, like *Aſphodelus albus*. The ſmell of this plant is ſtrong and grieuous; the taſte hot and biting, it being full of a juyce, at firſt milky, but afterward turning yellow. The ſpoky tufts or rundles growing at the top are like *Cicuta*, yea, it much reſembleth Hemlocke in property and qualities, and ſo do they affirme that haue proued and ſeene the experience of it: for being eaten in ſallads it did well nigh poyſon thoſe which ate of it, making them giddie in their heads, waxing very pale, ſtaggering and reeling like drunken men. Beware and take good heed of this and ſuch like Simples; for there is no Phyſitian that wil giue it, becauſe there be many other excellent good Simples which God hath beſtowed vpon vs from the preuenting and curing of diſeaſes. ‡ Pernitious and not excuſable is the ignorance of ſome of our time, that haue bought and (as one may probably conjecture) vſed the roots of this plant in ſtead of thoſe of Peionie; and I know they are dayly by the ignorant women in Cheape-ſide ſold to people more ignorant than themſelues, by the name of water Louage; *Caueat Emptor*. The danger that may enſue by vſing them may be gathered by that which our Author hath here ſet downe, being taken out of the *Aduerſaria, pag. 326.* ‡

5 The fifth and laſt kinde of Filipendula, which is the fourth according to *Matthiolus* his account, hath leaues like water Smallage, which *Pliny* calleth *Sylaus*, the leaues very much reſembling thoſe of *Laser Cratenæ*: among which riſeth vp a ſmall ſtalke deepely furrowed or creſted, bearing at the top whereof ſpokie or buſhie rundles of white floures thicke thruſt together. The roots are compact of very many filaments or threds; among which come forth a few tuberous or knobbie roots like vnto the ſecond.

¶ *The Place and Time.*

The firſt groweth plentifully vpon ſtonie rockes or mountaines, and rough places, and in fertile paſtures. I found great plenty thereof growing in a field adjoyning to Sion houſe, ſomtime a Nunnerie, neere London, on the ſide of a medow called Sion Medow.

The ſecond hath beene ſufficiently ſpoken of in the deſcription. The third groweth neere vnto brookes and riuers ſides. The fourth groweth betweene the plowed lands in the moiſt and wet furrowes of a field belonging to Batterſey by London. ‡ It alſo groweth in great abundance in many places by the Thames ſide; as amongſt the oyſiers againſt Yorke houſe, a little aboue the Horſe-ferrey, againſt Lambeth, &c. ‡ The fifth groweth neere the ſides of riuers and water-ſtreames, eſpecially neere the riuer of Thames or Tems, as in S. Georges fields, and about the Biſhop of Londons houſe at Fulham, and ſuch like places.

They floure from May to the end of Iune.

¶ *The Names.*

They are commonly called *Filipendulæ*. The firſt is called of *Nicolaus Myrepſus*, *Philipendula* of ſome, *Saxifragra rubra*, and *Millefolium ſylueſtre*: of *Pliny*, *Molon*: in Italian and Spaniſh, *Filipendula*: in Engliſh, Filipendula and Drop-wort. Water Filipendula is called *Filipendula aquatica*, *Oenanthe aquatica*, and *Silaus Plinij*.

The

The fourth, whoſe leaues are like to Homlocks, is as ſome thinke called of *Cordus*, *Olſenichium*: in Engliſh, Homlocke Filipendula.

¶ *The Nature.*

Theſe kinds of Filipendula are hot and dry in the third degree, opening and clenſing, yet with a little aſtriction or binding. All the kindes of Onanthes haue the ſame facultie, except the fourth, whoſe pernitiouſneſſe we haue formerly touched.

¶ *The Vertues.*

The root of common Filipendula boiled in wine and drunken, is good againſt all pains of the bladder, cauſeth one to make water, and breaketh the ſtone. The like *Dioſcorides* hath written of Oenanthe: the root, ſaith he, is good for them that piſſe by drops. A

The pouder of the roots of Filipendula often vſed in meat, will preſerue a man from the falling ſickneſſe. B

‡ The figures that were formerly in the fourth and fifth places were both of the plant deſcribed in the fifth place. I haue giuen you in the fourth place the figure which *Lobel* and others haue giuen for the plant there deſcribed; but it is not well expreſſ, for the leaues are large like thoſe of Smallage, the ſtalke, branches, and umbels very large, and like thoſe of Hemlocke, but rather bigger.

Chap. 429. *Of Homlocks or herb Bennet.*

¶ *The Deſcription.*

1 THe firſt kind of Hemlocke hath a long ſtalke fiue or ſix foot high, great and hollow, full of joints like the ſtalks of Fennell, of an herby colour, poudered with ſmall red ſpots almoſt like the ſtems of Dragons: the leaues are great, thick, and ſmal cut or jagged like the leaues of Chervill, but much greater, and of a very ſtrong vnpleaſant ſauor: the flours are white, growing by tufts or ſpoky tops, which do change and turne into a white flat ſeed: the root is ſhort and ſomwhat hollow within.

1 *Cicuta.*
Hemlocks.

2 The Apothecaries in times paſt not knowing the right *Seſeli Peloponnenſe*, haue erroniouſly taken this *Cicuta latifolia* for the ſame: the leaues whereof are broad, thicke, and like vnto *Cicutaria*, but not the ſame. They called it *Seſeli Peloponnenſe cum folio Cicutæ*, the faculties whereof deny and refute that aſſertion and opinion; yea, and the plant it ſelfe, which beeing touched, yeeldeth or breatheth out a moſt virulent or loathſome ſmell. Theſe things ſufficiently argue, that it is not a kinde of *Seſeli*; beſides the reaſons following: *Seſeli* hath a reaſonable good ſauour in the whole plant: the root is bare and ſingle, without fibres, like a Carrot. But *Cicuta* hath not onely a loathſome ſmell, but his roots are great, thicke, and knobbie, like the roots of *Myrrhis*: The whole plant doth in a manner reſemble the leaues, ſtalks, and floures of *Myrrhis odorata*, whoſe ſmall white floures do turn into long and crooked ſeeds, growing at the top of the branches, three cubits high.

‡ 3 This in leaues, ſtalkes, and roots is larger than the laſt deſcribed, the ſtalkes equalling or exceeding the height of a man: the ſmel is ſtrange and grieuous, and in all the parts thereof it is like vnto the other plants of this kinde. *Lobel* figures it by the name of *Cicutaria maxima Brancionis*, and queſtioneth whether it be not the *Thapſia tertia Salamanticenſium* of *Cluſius*: but *Cluſius* denies it ſo to bee ‡

2 *Cicuta latifolia fœtidiſſima.*
Broad leafed ſtinking Hemlocke.

‡ 3 *Cicuta latifolia altera.*
Gyant Hemlocke.

¶ *The Place.*

Common Hemlock growes plentifully about towne walls and villages, in ſhadowie places and fat ſoiles neere ditches.

The ſecond groweth vpon mountains and deſart places, and is a ſtranger in England : yet I haue plants thereof in my garden.

¶ *The Time.*

They flouriſh and ſeed in September.

¶ *The Names.*

Hemlocke is called in Greeke κώνειον: in Latine, *Cicuta:* in high-Dutch, **Schirling:** in Low-Dutch, **Scheerlinck:** in Spaniſh, *Cegutay, Canaheia:* in French, *Cigue:* in Engliſh, Hemlocke, Homlock, Kexe, and herb Bennet.

The ſecond is called *Cicuta latifolia*, and *Cicutaria latifolia*, and *Seſeli Peloponnenſe quorundam:* In Engliſh, great Hemlockes, and garden Hemlocks.

¶ *The Temperature.*

Galen ſaith, that Hemlocke is extreme cold in operation, euen in the fourth degree of coldneſſe.

¶ The

¶ *The Vertues.*

It is therefore a very rash part to lay the leaues of Hemlocke to the stones of yong boyes, or virgins brests, by that meaus to keep those parts from growing great; for it doth not only easily cause those members to pine away, but also hurteth the heart and liuer, being outwardly applied, & must of necessitie hurt more being inwardly taken; for it is one of the deadly poisons which killeth by his cold qualitie, as *Dioscorides* writeth, saying, Hemlocke is a very euill, dangerous, hurtfull, and poysonous herbe, insomuch that whosoeuer taketh of it into his body, dieth remedilesse, except the party drinke some wine, that is naturally hot, before the venom hath taken the heart, as *Pliny* saith: but being drunke with wine, the poison is with greater speed carried to the heart, by reason whereof it killeth presently: therefore not to be applied outwardly, much lesse taken inwardly into the body. A

The great Hemlocke doubtlesse is not possessed with any good faculty, as appeares by his lothsome smell and other apparant signes, and therefore not to be vsed in physicke. B

Chap. 430. *Of wilde and water Hemlocks.*

¶ *The Description.*

† 1 This wilde kinde of Hemlocke hath a small tough white root, from which arise vp diuers stiffe stalks, hollow, somwhat reddish toward the Sunne, jointed or kneed at certain distances: from which joints spring forth long leaues very green, and finely minced or jagged like the common Cheruil or Parsly: the floures stand at the tops of the stalks in small spoky vmbels, with little longish greene leaues about them: the seed followes like those of Hemlocke, or as they grow together on the tops of the stalkes they resemble Coriander seeds, but lesser: the whole plant is of a naughty smell.

† 1 *Cicutaria tenuifolia.*
Then leafed wilde Hemlocke.

2 *Cicutaria palustris.*
Wilde water Hemlocke.

2 Water Hemlock, which *Lobel* calleth *Cicutaria palustris*; *Clusius* and *Dodonæus*, *Phellandrium*, riseth vp with a thicke fat and empty hollow stalke, full of knees or joints, crested, chamfered, or furrowed,

furrowed, of a yellowiſh green colour: the leaues ſhoot forth of the joints and branches, like vnto Hemlocke, but much thicker, fatter, and oilous, very finely cut or jagged almoſt like thoſe of the ſmalleſt *Viſnaga* or Spaniſh Tooth-picks: the floures ſtand at the top of the ſtalkes in ſmall white tufts: the ſeed followes, blackiſh, of the bigneſſe of Aniſe ſeed, & of a ſweet ſauor: the root is thick and long, within the water, very ſoft and tender, with very many ſtrings faſtned thereto.

¶ *The Place.*

1 This groweth amongſt ſtones and rubbiſh by the walls of cities and townes almoſt euerie where.

The other groweth in the middeſt of water ditches and ſtanding pooles and ponds, in moſt places of England: it groweth very plentifully in the ditches by a cauſey as you go from Redriffe to Detford neere London, and in many other places.

¶ *The Time.*

They floure and flouriſh in Iuly and Auguſt.

¶ *The Names.*

‡ 1 This is *Petroſelini vitium* of *Tragus*; and *Dauci inutilis genus* of *Geſner*: *Thalius* calls it *Apium cicutarium*: *Lobel*, *Cicutaria fatua*: *Tabern. Petroſelinum Caninum*; which we may fitly Engliſh, Dogs Parſly.

2 This is *Liguſticum ſyl.* & *Fœminicum ſyl.* of *Tragus*: *Cicutaria paluſtris* of *Lobel* and others. *Dodonæus* thinks it *Plinies Phellandrion*; and *Caſalpinus* iudges it his *Silaus*. ‡

¶ *The Nature and Vertues.*

Their temperature and faculties are anſwerable to the common Hemlocke, and haue no vſe in Phyſicke.

† The figure formerly in the firſt place was of *Myrrhis*; the deſcription I thinke was intended, but not fully agreeing with that I here giue you, wherein I haue a little altered it.

Chap. 431.

Of Earth-Nut, Earth Cheſtnut, or Kippernut.

† 1 *Bulbocaſtanon minus.*
Small Earth-nut.

2 *Bulbocaſtanon majus.*
Great Earth-nut.

¶ *The Description.*

1 EArth-nut or Kipper-nut, called after *Lobelius Nucula terrestris*, hath small euen crested stalks a foot or somewhat more high: whereon grow next the ground, leaues like those of Parsley, and those that do grow higher like vnto those of Dill; the white floures do stand on the top of the stalks in spokie rundles, like the tops of Dill, which turne into small seed, growing together by couples, of a very good smell, not vnlike to those of Fennell, but much smaller: the root is round, knobbed, with certaine eminences or bunchings out; browne without, white within, of a firme and sollid substance, and of a taste like the Chesse-nut, or Chest-nut, whereof it tooke his name.

2 There is also another Earth-nut that hath stalkes a foot high, whereon grow jagged leaues like those of English Saxifrage, of a bright green colour: the floures grow at the top of the branches, in small spokie tufts consisting of little white floures: the root is like the other, bulbous fashion, with some few strings hanging at the bottome, of a good and pleasant taste. ‡ This differs from the former, in that the leaues are larger and greener: the root also is not so far within the ground, and it also sends forth some leaues from the bulb it selfe, whereas our common kind hath onely the end of a small root that carries the stem and leaues vpon it, fastned vnto it as you see it expreſt in the former figure. ‡

¶ *The Place.*

These herbes do grow in pastures and corne fields almost euery where: there is a field adjoining to High-gate, on the right side of the middle of the village, couered ouer with the same; and likewise in the next field to the conduit heads by Maribone, neer the way that leads to Padington by London, and in diuers other places. ‡ I haue not yet obserued the second to grow wild with vs. ‡

¶ *The Time.*

They floure in Iune and Iuly: the seed commeth to perfection afterward.

¶ *The Names.*

Alexander Trallianus hath made mention of Βολβοκάστανον, *Lib.* 7. reckoning it vp among those kindes of meat or sustenances which be good for such as haue rotten lungs: of some it is called *Agriocastanon*.

Guinterius thought the word was corrupted, and that *Balanocastanon* should be read: but this is as strange a word as *Bolbocastanon*, which was deriued of the form of a bulb, and the tast of a Chest-nut: of some, *Nucula terristris*, or the little Earth-nut: it is thought to be *Bunium Dioscoridis* of some; but we think not so: of Dr. *Turner*, *Apios*: yet there is another *Apios*, being a kind of *Tithymale*: of *Matthiolus*, *Oenanthe*, making it a kind of Filipendula: in high-Dutch, **Erdnutz**: in low Dutch, **Eertnoten**: the people of Sauoy cal it *Fauerottes*: in English, Earth-nuts, Kipper-nuts, & Earth chest-nuts.

¶ *The Nature.*

The roots of Earth-nuts are moderately hot and dry, and also binding: but the seed is both hotter and drier.

¶ *The Vertues.*

The seed openeth and prouoketh vrine, and so doth the root likewise. A

The root is good for those that spit and pisse bloud, if the root be eaten raw, or rosted in the embers. B

The Dutch people doe vse to eat them boiled and buttered, as we do Parseneps and Carrots, which so eaten comfort the stomacke, and yeeld nourishment that is good for the bladder and kidneyes. C

There is a plaister made of the seeds hereof, whereof to write in this place were impertinent to our historie. D

Chap. 432. *Of Cumin.*

¶ *The Description.*

THis garden Cumin is a low or base herbe of a foot high: the stalk diuideth it self into diuers small branches, whereon doe grow little jagged leaues very finely cut into small parcels, like those of Fennell, but more finely cut, shorter and lesser, the spoky tufts grow at the top of the branches and stalkes, of a red or purplish colour: after which come the seed, of a strong or rancke smell, and biting taste: the root is slender, which perisheth when it hath ripened his seed.

Cuminum ſatiuum Dioſcoridis.
Garden Cumin.

¶ *The Place*

Cumin is husbanded and ſowne in Italy and Spaine, and is very common in other hot countries, as in Æthiopia, Egypt, Cilicia, and all the leſſer Aſia.

It delights to grow eſpecially in putrified and hot ſoiles: I haue proued the ſeeds in my garden, where they haue brought forth ripe ſeed much fairer and greater than any that comes from beyond the ſeas.

¶ *The Time.*

It is to be ſown in the middle of the ſpring; a ſhowre of rain preſently following much hindereth the growth thereof, as *Ruellius* ſaith.

My ſelf did ſow it in the midſt of May, which ſprung vp in ſix daies after: and the ſeed was ripe in the end of Iuly.

¶ *The Names.*

It is called in Greeke κύμινον ἥμερον, that is, tame or garden Cumin, that it may differ from the wild ones: it is named in Latine *Cuminum*: in ſhops, *Cyminum*: in high-Dutch, Roomiſche kymmel: in Italian, *Comino*: in Spaniſh, *Comachos*: in French, *Comin*: in Engliſh, Cumin.

¶ *The Temperature.*

The ſeed of garden Cumin, as *Galen* ſaith, is hot and dry in the third degree: *Dioſcorides* ſaith that it hath in it alſo a binding quality.

¶ *The Vertues.*

A The ſeed of Cumin ſcattereth and breaketh all the windineſſe of the ſtomacke, belly, guts, and matrix: it is good againſt the griping torments, gnawing or fretting of the belly, not only receiued inwardly by the mouth, but alſo in clyſters, and outwardly applied to the belly with wine and barley meale boiled together to the forme of a pultis.

B Being handled according to art, either in a cataplaſm, pultis, or plaiſter, or boiled in wine and ſo applied, it taketh away blaſtings, ſwellings of the cods or genitors: it conſumeth windie ſwellings in the joints, and ſuch like.

C Being taken in a ſupping broth it is good for the cheſt and cold lungs, and ſuch as are oppreſſed with abundance of raw humors.

D It ſtancheth bleeding at the noſe, being tempered with vineger and ſmelt vnto.

E Being quilted in a little bag with ſome ſmall quantitie of Bay ſalt, and made hot vpon a bed-pan with fire or ſuch like, and ſprinkled with good wine vineger, and applied to the ſide very hot, it taketh away the ſtitch and paines thereof, and eaſeth the pleuriſie very much.

CHAP. 420. *Of wilde Cumin.*

¶ *The Kindes.*

THere be diuers plants differing very notably one from another in ſhape, and yet all comprehended vnder the wilde Cumin.

¶ *The Deſcription.*

1 THe wild Cumin hath ſmall white roots with ſome fibres thereto appendant; from the which ariſe ſundry little jagged leaues, conſiſting of many leſſer leaues, finely dented about the edges, in faſhion like the ſmalleſt leaues of wild parſnep: among which ſpringeth vp a ſlender bending ſtalk a foot high, like vnto *Pecten Veneris*, bearing at the top therof white round

1 *Cuminum syluestre.*
Wilde Cumin.

2 *Cuminum siliquosum.*
Codded wilde Cumin.

3 *Cuminum corniculatum, siue Hypecoum Clusij.*
Horned wild Cumin.

round and hairie buttons or knops, like *Arction*, as *Dioscorides* hath right wel obserued: within which knops is contained a tender downie substance, among which is the seed, like the seed of *Dens Leonis*, but much lesser.

2 The second kinde of Cumin is verie like to the foresaid wilde Cumin, saue that it beareth a number of horned or crooked cods, after the maner of *Scorpioides*, but thicker, and lesse crooked, and the seeds within the cods are seuerally distinct & separated one from another by equall partitions, in small crosses, yellow of color, and somwhat long: the stalkes are little and tender, beset with leaues much like vnto the small leaues of *Carui*, or *Pecten Veneris*: and at the top of the stalks there grow pretty yellow floures, like those of great Celandine or Rocket, sauing that they be somwhat lesser.

† 3 The third kind of Cumin is very like vnto the last before mentioned, but the leaues are much greater, more slender, and more finely cut or jagged, like the leaues of *Seseli* of *Massylia*: among which riseth vp a stalke a cubit high or somewhat more, very smooth & whitish: at the top wherof spring forth fine yellow flours, not like the former, but consisting of six leaues apiece; whereof two are large, and edged with greene on the outside:

outſide: the other foure are ſmall ones, and grow two on a ſide between the two larger leaues: the floures being vaded, there ſucceed crooked cods, greater, and more full of knots or diuiſions than the former, wherein is contained a ſmall and flat yellow ſeed like *Galega*: the root is long, thick, and ſingle.

¶ *The Place.*

Theſe wilde Cumins do grow in Lycia, and Galatia, a prouince of Aſia, and in Carthage a citie of Spaine; ſeldome ſeen in theſe Northerne parts: notwithſtanding at the impreſſion hereof, the laſt did floure and flouriſh in my garden. ‡ Theſe grow in Prouince in France, and in diuers parts of Spaine. ‡

¶ *The Time.*

They floure in Auguſt, and perfect their ſeed in September.

¶ *The Names.*

Their names hath been touched in their titles in as ample manner as hath been ſet down by any Author.

¶ *The Nature and Vertues.*

Their temperature and vertues are referred to the garden Cumin; notwithſtanding I cannot read in any Author of their vſe in Phyſicke.

CHAP. 434. *Of Flixweed.*

1 *Sophia Chirurgorum.*
Flixweed.

¶ *The Deſcription.*

1 FLixweed hath round & hard ſtalks, a cubit and a halfe high, whereon do grow leaues moſt finely cut and diuided into innumerable fine jags, like thoſe of the ſea Wormwood called *Seriphium*, or *Abſinthium tenuifolium*, but much finer and ſmaller, drawing neer vnto the ſmalleſt leaues of Corianders, of an ouerworne green colour: the floures grow alongſt the tops of the ſpriggy branches, of ad ark yellow colour: after which come long cods full of ſmall red ſeeds: the root is long, ſtraight, and of a wooddie ſubſtance.

2 The ſecond ſort differeth not from the precedent, ſauing that the leaues of this plant are broader, wherein eſpecially conſiſteth the difference; notwithſtanding in mine opinion *Tabernamontanus* found this ſecond ſort growing in ſome fertil place, whereby the leaues did grow broader and greater, which moued him to make of this a ſecond ſort, whereas in truth they are both but one and the ſelfe ſame plant.

¶ *The Place.*

This Flixeweede groweth in moſt places of England, almoſt euery where in the ruines of old buildings, by high waies, and in filthie obſcure baſe places.

¶ *The Time.*

It floureth and ſeedeth from Iune to the end of September.

¶ *The Names.*

Flixweed is called *Thalictrum*; and of ſome, *Thalictrum*, but vnproperly; for *Thalictrum* belongs to Engliſh Rubarbe: the Paracelſians doe vaunt and brag very much of an herbe called *Sophia*, adding thereto the ſyrname *Paracelſi*, wherewith they imagine to doe wonders, whether this be the ſame plant it is diſputable, the controuerſie not as yet decided; neuertheleſſe we muſt be content to

to accept of this for the true *Sophia*, vntill some disciple or other of his doe shew or set forth the plant wherewith their Master *Paracelsus* did such great matters: in English we call it Flixweed, of his faculties against the flix.

¶ *The Temperature.*

Sophia drieth without any manifest sharpnesse or heate.

¶ *The Vertues.*

The seed of *Sophia* or Flix-weed drunke with with wine or smiths water, stoppeth the bloudy A flix, the laske, and all other issues of bloud.

The herb bruised or put into vnguents closeth and healeth vlcers, or old sores and wounds, as B *Paracelsus* saith; and that because it drieth without acrimonie or sharpnesse.

Chap. 435. *Of the great Celandine or Swallow-wort.*

¶ *The Description.*

1 The great Celandine hath a tender brittle stalke, round, hairy, and full of branches, each whereof hath diuers knees or knotty joints set with leaues not vnlike to those of Columbine, but tenderer, and deeper cut or jagged, of a grayish green vnder, and greene on the other side tending to blewnesse: the floures grow at the top of the stalks, of a gold yellow colour, in shape like those of the Wal-floure: after which come long cods full of bleak or pale seeds: the whole plant is of a strong vnpleasant smell, and yeeldeth a thicke juice of a milky substance, of the colour of Saffron: the root is thicke and knobby, with some threds anexed thereto, which beeing broken or bruised, yeeldeth a sap or juice of the colour of gold.

1 *Chelidonium majus.*
Great Celandine.

‡ 2 *Chelidonium majus folio magis dissecto.*
Great Celandine with more cut leaues.

‡ 2 This other doth not in forme and magnitude differ from the former, but in the *leaues*, which are finelier cut and jagged, and somewhat in their shape resemble an Oken leafe: the floures

also

alſo are a little jagged or cut about the edges; and in theſe two particulars conſiſts the whole difference. *Cluſius* calls it *Cheledonium majus laciniato flore*: and *Bauhine*, *Cheledonium majus foliis quernis*. ‡

¶ *The Place.*

It groweth in vntilled places by common way ſides, among briers and brambles, about old walls, and in the ſhade rather than in the Sun.

¶ *The Time.*

It is greene all the yeare: it floureth from Aprill to a good part of Summer: the cods are perfected in the mean time.

¶ *The Names.*

It is called in Greeke χελιδόνιον: in Latine, *Chelidonium majus*, and *Hirundinarium major*: amongſt the Apothecaries, *Chelidonia*: diuers miſcall it by the name *Chelidonium*: it is named in Italian, *Celidonia*: in Spaniſh, *Celiduhenha*, *Yerva de las golundrinhas*: in high-Dutch, **Groſz Scholwurtz**: in low-Dutch, **Stinkende Gouwe**: in French, *Eſclere*, or *Eſclayre*, and *Celidoine*: in Engliſh, Celandine, or great Celandine, Swallow-wort, and Tetter-wort.

It is called Celandine not becauſe it firſt ſpringeth at the comming in of Swallowes, or dieth when they go away, (for as we haue ſaid, it may be found all the yere) but becauſe ſome hold opinion, that with this herb the dams reſtore ſight to their yong ones when they cannot ſee. Which things are vain and falſe; for *Cornelius Celſus*, *lib. 6.* witneſſeth, That when the ſight of the eies of diuers yong birds is put forth by ſome outward means, it will after a time be reſtored of it ſelfe, and ſooneſt of all the ſight of the Swallow: whereupon (as the ſame Author ſaith) the tale grew, how thorow an herb the dams reſtore that thing which healeth of it ſelfe. The very ſame doth *Ariſtotle* alledge, *lib. 6. de Animal.* The eies of Swallowes (ſatth he) that are not fledge, if a man do pricke them out, do afterwards grow againe and perfectly recouer their ſight.

¶ *The Nature.*

The great Celandine is manifeſtly hot and dry, and that in the third degree, and withall ſcoures and cleanſeth effectually.

¶ *The Vertues.*

A The juice of the herbe is good to ſharpen the ſight, for it cleanſeth and conſumeth away ſlimie things that cleaue about the ball of the eye, and hinder the ſight, and eſpecially being boiled with hony in a braſen veſſell, as *Dioſcorides* teacheth.

B The root cureth the yellow jaundice which comes of the ſtopping of the gall, eſpecially when there is no ague adjoined with it, for it opens and deliuers the gall and liuer from ſtoppings.

C The root being chewed is reported to be good againſt the tooth-ache.

D The juice muſt be drawn forth in the beginning of Summer, and dried in the ſunne, ſaith *Dioſcorides*.

E The root of Celandine boiled with Aniſe ſeed in white wine, opens the ſtoppings of the liuer, and cureth the jaundice very ſafely, as hath been often proued.

F The root cut into ſmall pieces is good to be giuen vnto Hauks againſt ſundry diſeaſes, whereunto they are ſubiect, as wormes, Cray, and ſuch like.

G ‡ I haue by experience found (ſaith *Cluſius*) that the juice of the great Celandine dropped into ſmall greene wounds of what ſort ſoeuer, wonderfully cures them. ‡

Chap. 436.

Of Cocks-combe or yellow Rattle.

¶ *The Deſcription.*

Chriſta Galli, or *Griſta Gallinacea*, hath a ſtrait vpright ſtalke ſet about with narrow leaues ſnipt round about the edges: the floures grow at the top of the ſtemmes, of a yellow colour; after which come vp little flat pouches or purſes, couered ouer or contained within a little bladder or flat skin, open before like the mouth of a fiſh, wherin is contained flat yellowiſh ſeed, which being ripe and dry will make a noiſe or rattling when it is ſhaken or moued, of which property it tooke the name yellow Rattle.

¶ The

Crista Galli. Yellow rattle or Coxcomb.

¶ *The Place.*

It growes in dry medowes and pastures and is to them a great anoyance.

¶ *The Time.*

It floureth most part of the Summer.

¶ *The Names.*

It is called in low-Dutch, **Ratelen**, and **Geele Ratelen**: commonly in Latine, *Crista Galli*, and *Gallinacea Christi*: In English, Coxcombe, Penny-grasse, yellow or white Rattle: in high-Dutch it is called **geel Rodel**: in French, *Creste de Coc*: diuers take it to be the old writers *Alectorolophes*.

‡ Some thinke it to be the *Mimmulus*: or as others (and that more fitly) reade it, *Nummulus*, mentioned by *Pliny*, *lib.* 18. *cap.* 28. ‡

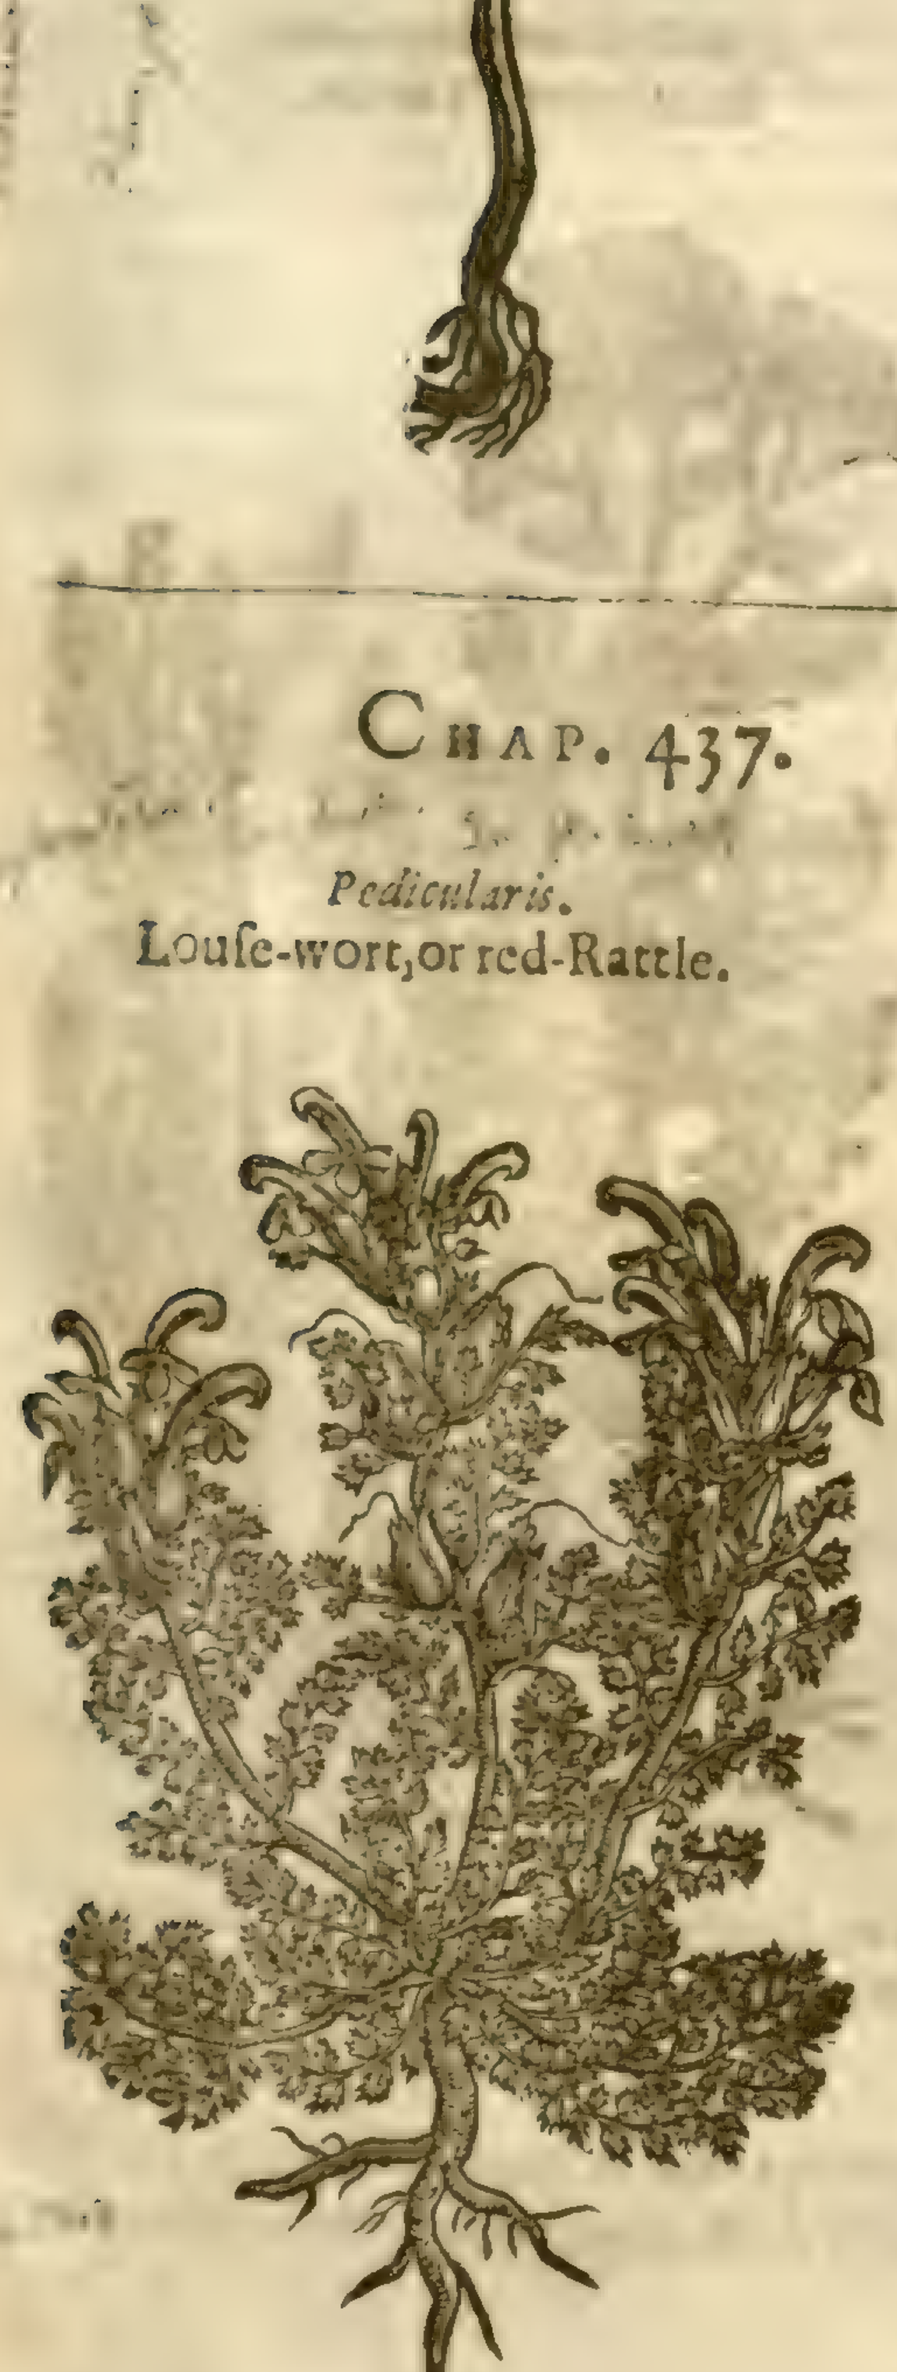
¶ *The Nature and Vertues.*

What temperature or vertue this herb is of, men haue not as yet been carefull to know, seeing it is accounted vnprofitable.

CHAP. 437. *Of Red Rattle or Louse-wort.*

Pedicularis.

Louse-wort, or red-Rattle.



¶ *The Description.*

RED Rattle (of *Dodonæus* called *Fistularia*, and according to the opinion and censure of *Clusius*, *Pena*, and others, the true *Alectorolophos*) hath very small rent or jagged leaues of a brown red colour, and weake small and tender stalks, wherof some lie along trailing vpon the ground: in very mooriſh medows they grow a cubit high and more: but in moist and wet heaths and such like barren grounds not aboue an handfull high: the floures grow round about the stalke, from the midst thereof euen to the top, of a brown colour, in shape like the floures of dead Nettle: which being past, there succeed little flat pouches, wherein is contained flat and blackish seed, in shew very like to the former: the root is small, white, and tender.

¶ *The Place.*

It growes in moist and mooriſh medows: the herb is not only vnprofitable, but also hurtful to medowes

¶ *The Time.*

It is found with the floures and stalks in May and Iune.

¶ *The*

¶ *The Names.*

It is called in Greeke, : in high-Dutch, **Braun Rodel:** in Latine, *Pedicularis*, of the effect, becauſe it filleth ſheep and other cattell that feed in medowes where this groweth, full of lice: diuers of the later herbariſts call it *Piſtularia:* of ſome, *Criſti Galla:* and ſome take it to be *Mimmulus herba:* in Engliſh, Rattle-graſſe, red Rattle-graſſe, and Louſe-wort.

¶ *The Nature.*

It is cold and dry, and aſtringent.

¶ *The Vertues.*

A It is held to be good for fiſtulaes and hollow vlcers, and to ſtay the ouermuch flowing of the menſes or any other flux of bloud, if it be boiled in red wine and drunke.

CHAP. 438. *Of Yarrow or Noſe-bleed.*

¶ *The Deſcription.*

1 COmmon Yarrow hath very many ſtalks comming vp a cubit high, round and ſomwhat hard, about which ſtand long leaues cut in the ſides ſundry wiſe, and as it were made vp of many ſmal jagged leaues, euery one of which ſeem to reſemble the ſlender leaues of Coriander: there ſtand at the top tufts or ſpoked rundles, the floures whereof are either white or purple, which being rubbed do yeeld a ſtrong vnpleaſant ſmel: the root ſends down many ſtrings.

1 *Millefolium terreſtre vulgare.*
Common Yarrow.

2 *Millefolium flore rubro.*
Red floured Yarrow.

2 The ſecond kinde of Milfoile or Yarrow hath ſtalkes, leaues, and roots like the former, ſaue that his ſpoky tufts are of an excellent faire red or crimſon colour, and being a little rubbed in the hand, of a reaſonable good ſauor.

¶ *The Place.*

The firſt groweth euery where in dry paſtures and medowes: red Milfoile growes in a field by Sutton in Kent, called Holy-Deane, from whence I brought thoſe plants that grow in my garden: but it is not common euery where as the other is.

¶ *The Time.*

They floure from May to the end of October.

¶ The

¶ *The Names.*

Yarrow is called of the Latine Herbarists *Millefolium*: it is *Dioscorides* his ἀχίλλειος: in Latine, *Achillea*, and *Achillea sideratis*; which thing he may very plainely see that will compare with that description which *Dioscorides* hath set downe: this was found out, saith *Pliny* in his 25. booke, chap. 5. by *Achilles*, *Chirons* disciple, which for that cause is named *Achilleios*: of others, *Sideritis*: among vs, *Millefolium*: yet be there other *Sideritides*, and also another *Panaces Heraclion*, whereof we haue intreated in another place: *Apuleius* setteth downe diuers names hereof, some of which are also found among the bastard names in *Dioscorides*: in Latine it is called *Militaris*, *Supercilium Veneris*, *Acrum*, or *Acrum sylvaticum*: of the French men, *Millefueille*: in high Dutch, **Garben, scharffgras**: in low Dutch, **Gruwe**: in Italian, *Millefoglio*: in Spanish, *Milhojas yerua*: in English, Yarrow, Nosebleed, common Yarrow, red Yarrow, and Milfoile.

¶ *The Temperature.*

Yarrow as *Galen* saith, is not vnlike in temperature to the *Sideritides*; or Iron worts, that is to say, clensing, and meanely cold, but it most of all bindeth.

¶ *The Vertues.*

The leaues of Yarrow do close vp wounds, and keepe them from inflammation, or fiery swelling: A
it stancheth bloud in any part of the body, and it is likewise put into bathes for women to sit in: it
stoppeth the laske, and being drunke it helpeth the bloudy flix.

Most men say that the leaues chewed, and especially greene are a remedy for the tooth ache. B

The leaues being put into the nose, do cause it to bleed, and ease the paine of the megrim. C

It cureth the inward excorations of the yard of a man, comming by reason of pollutions or ex- D
treme flowing of the seed, although the issue doe cause inflammation and swelling of those secret
parts, and though the spermaticke matter do come downe in great quantity, if the juyce be injected
with a syringe, or the decoction. This hath been proued by a certaine friend of mine, sometimes a
Fellow of Kings Colledge in Cambridge, who lightly bruised the leaues of common Yarrow, with
Hogs-grease, and applied it warme vnto the priuie parts, and thereby did diuers times helpe him-
selfe, and others of his fellowes, when he was a student and a single man liuing in Cambridge.

One dram in pouder of the herbe giuen in wine, presently taketh away the paines of the colicke. E

Chap. 439. *Of yellow Yarrow, or Milfoile.*

1 *Millefolium luteum.*
Yellow Yarrow.

† 2 *Achillea, sive Millefolium nobile.*
Achilles Yarrow.

¶ *The Deſcription.*

1 YEllow Yarrow is a ſmall plant ſeldome aboue a ſpan high: the ſtalkes whereof are couered with long leaues, very finely cut in the edges like feathers in the wings of little birds: the tufts or ſpokie rundles bring forth yellow floures, of the ſame ſhape and forme of the common Yarrow: the root conſiſteth of threddy ſtrings.

2 Achilles Yarrow, or noble Milfoile, hath a thicke and tough root, with ſtrings faſtened thereto: from which immediatly riſe vp diuers ſtalkes, very greene and creſted, whereupon do grow long leaues compoſed of many ſmall jagges, cut euen to the middle rib: the floures ſtand on the top of the ſtalkes with ſpokie vmbels or tufts, of a whitiſh colour, and pleaſant ſmell.

¶ *The Place.*

Theſe kinds of Yarrow are ſeldome found: they grow in a fat and fruitfull ſoile, and ſometimes in medowes, and are ſtrangers in England.

¶ *The Time.*

They floure from May vntill Auguſt.

¶ *The Names.*

Dioſcorides deſcription doth ſufficiently declare, that this herbe is *Stratiotes Millefolium*: in Greeke, στρατιώτης χιλιόφυλλος: the height of the herbe ſheweth it, the forme of the leaues agree; there is ſome ambiguitie or doubt in the colour of the floures, which *Dioſcorides* deſcribeth to be white, as the vulgar copies haue; but *Andreas Lacuna* addeth out of the old booke of a yellow colour: it is named of the later age, *Millefolium minus*, or little Yarrow, and *Millefolium luteum*, yellow Yarrow, or Noſe-bleed: the Apothecaries and common people know it not.

¶ *The Temperature.*

Yarrow is meanely cold and ſomewhat binding.

¶ *The Vertues.*

It is a principall herbe for all kinde of bleedings, and to heale vp new and old vlcers and greene wounds: there be ſome, ſaith *Galen*, that vſe it for fiſtulaes.

This plant *Achillea* is thought to be the very ſame wherewith *Achilles* cured the wounds of his ſouldiers, as before in the former chapter.

† The plant here figured and deſcribed in the ſecond place, was alſo figured and deſcribed formerly in the fifth place of the 209 chapter of this booke, by the title of *Tanacetum minus album*, but the figure of *Lobels* which is put there being ſomewhat imperfect, I thought it not amiſſe here to giue you that of *Dalechamps* which is ſomewhat more exquiſite, otherwiſe both the figure and hiſtory might in this place haue beene omitted.

Chap. 440. *Of Valerian, or Setwall.*

¶ *The Deſcription.*

1 THe tame or garden Valerian hath his firſt leaues long, broad, ſmooth, greene, and vndiuided; and the leaues vpon the ſtalkes greater, longer, and deepely gaſhed on either ſide, like the leaues of the greater Parſenep, but yet leſſer: the ſtalke is aboue a cubit high, ſmooth, and hollow, with certaine joynts farre diſtant one from another: out of which joynts grow forth a couple of leaues, and in the tops of the ſtalkes vpon ſpokie rundles ſtand floures heaped together, which are ſmall, opening themſelues out of a long little narrow necke, of colour whitiſh, and ſometimes withall of a light red: the root is an inch thicke, growing aſlope, faſtned on the vpper part of the earth by a multitude of ſtrings, the moſt part of it ſtanding out of the ground, of a pleaſant ſweet ſmell when it is broken.

2 The greater wilde Valerian hath leaues diuided and jagged as thoſe of the former; thoſe about the ſtalke hereof are alſo ſmooth, hollow, and joynted, and aboue a cubit high: the floures ſtand on ſpokie rundles like to thoſe of the former, but of a light purple colour: the roots are ſlender, and full of ſtrings and ſmall threds, not altogether without ſmell.

3 The other wilde one is much like in forme to the garden Valerian, but farre leſſer: the firſt leaues thereof be vndiuided, the other are parted and cut in ſunder: the ſtalkes a ſpan long: the floures which ſtand on ſpokie rundles are like to thoſe of the others, of a light whitiſh purple colour: the roots be ſlender, growing aſlope, creeping, and full of fine ſmall threds, of little ſmell.

4 There is a ſmall Valerian growing vpon rockes and ſtony places, that is like vnto the laſt deſcribed, ſauing it is altogether leſſe. ‡ The ſtalk is ſome halfe foot high, and ſtrait, diuiding it ſelfe into branches toward the top, and that alwaies by couples: the bottome leaues are whole, the top leaues

1 *Valeriana hortensis.*
Garden Valerian, or Setwall.

2 *Valeriana major sylvestris.*
Great wilde Valerian.

3 *Valeriana minor.*
Small Valerian.

4 *Valeriana Petræa.*
Stone Valerian.

leaues much diuided, the floures are ſmall, of a whitiſh purple colour, parted into fiue, and ſtanding vpon round rough heads, which when the floures are falne, become ſtar-faſhioned, diuided into ſix parts: it floures in Iune, and is an annuall plant. ‡

5 The fifth ſort of Valerian hath diuers ſmall hollow ſtalkes, a foot high and ſomewhat more, garniſhed with leaues like vnto thoſe that do grow on the vpper part of the ſtalks of common Valerian, but ſmaller, cut or jagged almoſt to the middle rib: at the top of the ſtalks do grow the floures cluſtering together, of a blew colour, conſiſting of fiue leaues apiece, hauing in the middle thereof ſmall white threds tipped with yellow: the ſeed is ſmall, growing in little huskes or ſeed veſſels: the root is nothing elſe but as it were all of threds.

5 *Valeriana Græca.*
Greekiſh Valerian.

‡ 6 *Valeriana Mexicana.*
Indian Valerian.

6 I haue another ſort of Valerian (the ſeed whereof was ſent me from that reuerend Phyſition *Bernard Paludane*, vnder the title of *Valeriana Maxicana:*) hauing ſmall tender ſtalkes trailing vpon the ground, very weake and brittle: whereupon doe grow ſmooth greeniſh leaues like thoſe of Corne Sallade (which wee haue ſet forth amongſt the Lettuce, vnder the title *Lactuca Agnina*, or Lambs Lettuce:) among the leaues come forth the floures cluſtering together, like vnto the great Valerian in forme, but of a deepe purple colour: the root is very ſmall and threddy, which periſheth with the reſt of the plant, when it hath brought his ſeed to maturity or ripeneſſe, and muſt bee ſowne anew the next yeare in May, and not before.

7 There is alſo another ſort or kinde of Valerian called by the name *Phyteuma*, of the learned Phyſitions of Montpellier and others (ſet forth vnder the ſtocke or kindred of the Valerians, reſembling the afore-ſaid Corn-ſallad, which is called of ſome *Prolifera*, from the Greeke title *Phyteuma*; as if you ſhould ſay, good to make conception, and to procure loue:) the loweſt leaues are like thoſe of the ſmall Valerian, of a yellowiſh colour: the vpper leaues become more jagged: the ſtalks are an handfull high: on the tops whereof doe ſtand ſmall round ſpokie tufts of white floures; which being paſt, the ſeeds appeare like ſmall round pearles, which being ripe, grow to be ſomewhat flat, hauing in the middle of each ſeed the print of an hole, as it were grauen or bored therein. The root is ſmall and ſingle, with ſome fibres annexed thereto.

‡ 8 This ſends forth from a white and wooddy root many leaues ſpred vpon the ground, green, and

‡ 8 *Valeriana annua, Clus.*
Annuall Valerian.

‡ 9 *Valeriana Alpina latifolia.*
Broad leaued Setwall of the Alps.

‡ 10 *Valeriana Alpina angustifolia.*
Small Alpine Set-wall.

and not vnlike those of the Star-Thistle: among these rise vp some round hollow branched stalks two cubits high: at each joynt grow forth two leaues lesser, yet like the lower: at the tops of the branches grow the floures as it were in little vmbels consisting of fiue leaues apiece; and these of a light red, or flesh colour: and then these as it were vmbels grow into longish branches bearing seed almost like, yet lesse than the red Valerian: it floures in Iuly, and perisheth when it hath ripened the seed. *Clusius* hath set this forth by the name of *Valeriana annua altera* ‡

9 The same Author hath also giuen vs the historie of some other Plants of this kinde; and this he cals *Valeriana syl. Alpina* 1 *latifol.* the stalk hereof is some foot high, round, greene, and crested: vpon which stand leaues longish, sharpe pointed, and cut in with two or three deepe gashes: but the bottome leaues are more round and larger, comming neere to those of *Trachelium*, yet lesser, slenderer, and bitter of taste: the floures which are white of colour, and the seed, are like those of the other Valerians: the root is small, creeping, fibrous, white and aromatick: it growes vpon the Alpes, and floures in Iune and Iuly.

10 This sends forth leaues like those of the mountaine Daisie: out of the midst of which riseth

riseth vp a stalk some foot high, joynted, and at the top diuided into little branches, carrying white floures like the other Valerians: the root is as aromaticke as that of the last mentioned; and growes in the chinkes of the Alpine rockes, where it floures in Iune and Iuly. *Clusius* hath it by the name of *Valeriana sylueſtris Alpin. 2. Saxatilis*, ‡

¶ *The Place.*

The first and likewise the Greeke Valerian are planted in gardens; the wilde ones are found in moist places hard to riuers sides, ditches, and watery pits; yet the greater of these is brought into gardens where it flourisheth, but the lesser hardly prospereth.

¶ *The Time.*

These floure in May, Iune, and Iuly, and most of the Summer moneths.

¶ *The Names.*

Generally the Valerians are called by one name, in Latine, *Valeriana*: in Greeke, ϕῦ: in shoppes also *Phu*, which for the most part is meant by the garden Valerian, that is called of *Dioſc.* νάρδος ἡμερίτις in Latine, *Sylueſtris*, or *Ruſtica Nardus*: of *Pliny*, *Nardus Cretica*: which names are rather referred to those of the next chapter, although these be reckoned as wilde kindes thereof: of certaine in our age, *Marinella*, *Amantilla*, *Valentiana*, *Genicularis*, *Herba Benedicta*, and *Theriacaria*: in most shops, *Valeriana Domeſtica*: of *Theophraſtus Paracelſus*, *Terdina*: in high Dutch, **Gros baldrian**: in low Dutch, **Speercruyt**, **S. Ioris cruyt**, and **Valeriane**: in English, Valerian, Capons taile, and Setwall; but vnproperly, for that name belongeth to *Zedoaria*, which is not Valerian: what hath beene set downe in the titles shall serue for the distinctions of the other kindes.

¶ *The Temperature.*

The garden Valerian is hot, as *Dioſcorides* saith, but not much, neither the green root, but the dried ones; for the greene is easily perceiued to haue very little heate, and the dried to be hotter, which is found by the taste and smell.

¶ *The Vertues.*

A The dry root as *Dioſcorides* teacheth, prouoketh vrine, bringeth downe the desired sickenesse, helpeth the paine in the sides; and is put into counterpoysons and medicines preseruatiue against the pestilence, as are treacles, mithridates, and such like: whereupon it hath been had (and is to this day among the poore people of our Northerne parts) in such veneration amongst them, that no broths, pottage or physicall meats are worth any thing, if Setwall were not at an end: whereupon some woman Poët or other hath made these verses.

They that will haue their heale,
Must put Setwall in their keale.

B It is vsed generally in sleight cuts, wounds, and small hurts.

C The extraction of the roots giuen, is a most singular medicine against the difficulty of making water, and the yellow jaundise.

D Wilde Valerian is thought of the later Herbarists to be good for them that are burſten, for such as be troubled with the crampe and other convulsions, and also for all those that are bruised with falls.

E The leaues of these and also those of the garden, are good against vlcers and soreneſſe of the mouth and gums, if the decoction thereof be gargarized or held in the mouth.

F Some hold opinion that the roots of wilde Valerian dried and poudered, and a dramme weight thereof taken with wine, do purge vpward and downeward.

Chap. 441. *Of Mountaine Setwall, or Nardus.*

¶ *The Description.*

1 THe *Nardus* named *Celtica*, but now by some, *Liguſtica Nardus*, flourisheth in high mountaines. The Valleſians in their mother tongue call it *Selliga*; whence *Geſner* thought it to be *Saliunca*; neither do I doubt, but that it is the same which *Virgil* speaketh of in these verses:

Puniceis humilis quantum Saliunca roſetis,
Iudicio noſtro tantum tibi cedit Amintas.

For it is a very little herbe creeping on the ground, and afterward lifting vp it selfe with a stalke of a handfull high; whereupon from the lower part grow small thin leaues, first greene, but afterwards somewhat yellowish: vpon the roughneſſe of the root there are many scales, platted one vpon another; but vnder the root there are many browne strings and hairy threds, in smell like the roots of *Aſtrabacca*, or rather the wilde mountaine Valerian, whereof it seemes to be a kinde, in taste sharpe and bitter. The floures grow along the vpper branches, white or yellowish, and very small. The

1 *Nardus Celtica.*
Celticke Spikenard.

‡ 4 *Nardus montana germinans.*
Mountaine Nard at the first springing vp.

3 *Hirculus.*
Vrine-wort.

4 *Nardus montana.*
Mountaine Spikenard.

2 The second sort of Spike-nard hath many threddy roots, from the which rise vp many scaly rough and thicke stalkes, hauing at the top certain flat hoary leaues growing vpon small and tender foot-stalks. The whole plant is of a pleasant sweet smell.

3 *Hirculus* is a plant very rare, which as yet I neuer saw, notwithstanding we are greatly beholding to *Carolus Clusius* the father of forreine Simples, who finding this plant among many bunches or handfulls of mountaine Spikenard, hath made it knowne vnto posteritie, as he hath done many other rare plans, in

translating

translating of *Garcias* the Lusitanian Physitian, he setteth it forth with a light description, saying: It is a base and low herbe two handfuls high, bringing forth leaues without any stalks at all, ‡ very hairy about the root, and blackish, hauing no pleasant sent at all. The leaues chewed yeeld no aromaticke taste, but are clammie, or viscide; whereas the leaues of Celticke Narde are hot, with a little astriction, and of a pleasant smell and taste. ‡

4 Mountaine Spikenard hath a great thicke knobbed root, set here and there with some tender fibres, of a pleasant sweet smell; from the which come forth three or foure smooth broad leaues, and likewise jagged leaues deepely cut euen to the middle rib: among which rise vp naked stalkes garnished in the middle with a tuft of jagged leaues. The floures grow at the top of the stalkes, in an vmbel or tuft like those of the wilde Valerian in shape and colour, and such also is the seed. ‡ I haue giuen you the figure of the root and whole leaues as they shew themselues when they first appeare, as it was taken by *Clusius*. ‡

5 The Spikenard of India is a low plant, growing close vnto the ground, composed of many rough browne hairy cloues, of a strong, yet not vnpleasant smell. The root is small and threddie. ‡ It hath certainely stalkes, floures, and seeds; but none of our Indian Writers or Trauellers haue as yet described them. I haue seene little pieces of slender hollow stalkes some two inches long fastned to the roots that are brought to vs. ‡

5 *Nardus Indica.*
Indian Spikenard.

6 *Nardus Narbonensis.*
French Spikenard.

† 6 This French Spikenard, being a bastard kinde, groweth close vpon the ground like the precedent, compact of scaly rough leaues: in the middle whereof commeth forth a great bush of round greene stiffe and rushy leaues: among the which shoot vp diuers round stalkes a cubit high, set from the middle to the top with greenish little cods, standing in chaffie huskes like those of Schœnanth. The root is small and threddy: the whole plant is altogether without smell, which sheweth it to be a bastard kinde of Spikenard.

¶ *The Place.*

These plants [the first foure] are strangers in England, growing in great plenty vpon the mountaines of Iudenberg and Heluetia, on the rockes among the mosse, and in the mountaines of Tirol and Saltsburg.

The first and second, if my memorie faile me not, doe grow in a field in the North part of England

land, called Crag close, and in the foot of the mountaine called Ingleborow Fels. ‡ The fourth may be found in some gardens with vs. The fifth growes in the East Indies, in the Prouinces of Mandou and Chito in the kingdome of Lengala and Decan. The last growes in Prouince in France, neere a little city called Gange. ‡

¶ *The Time.*

The leaues grow to withering in September, at which time they smell more pleasantly than when they flourished and were greene.

¶ *The Names.*

Nardus is called in Pannonia or Hungary, of the countrey people, *Speick*: of some, *Bechi fin*; that is, the herbe of Vienna, because it doth grow there in great abundance, from whence it is brought into other countries: of *Gesner*, *Saliunca*: in English, Celticke Spikenard: of the Valletians, *Selliga*, and *Nardus Celtica*.

¶ *The Temperature and Vertues.*

Celticke Narde mightily prouokes vrine, as recordeth *Rondeletius*; who trauelling through the A
desart countrey, chanced to lodge in a monastery where was a Chanon that could not make his water, but was presently helped by the decoction of this herbe, through the aduice of the said *Rondeletius*.

‡ The true Spikenard or Indian Nard hath a heating and drying facultie, being (according to B
Galen) hot in the first degree [yet the Greeke copy hath the third] and dry in the second. It is composed of a sufficiently astringent substance, and not much acride heate, and a certaine light bitternesse. Consisting of these faculties, according to reason, both inwardly and outwardly vsed it is conuenient for the liuer and stomacke.

It prouoketh vrine, helps the gnawing paines of the stomacke, dries vp the defluxions that trou- C
ble the belly and intrails, as also that molest the head and brest.

It staies the fluxes of the belly, and those of the wombe, being vsed in a pessarie, and in a bath it D
helpes the inflammation thereof.

Drunke in cold water, it helpes the nauseousnesse, gnawings, and windinesse of the stomacke, E
the liuer, and the diseases of the kidnies, and it is much vsed to be put into Antidotes.

It is good to cause haire to grow on the eye-lids of such as want it, and is good to be strewed vp- F
on any part of the body that abounds with superfluous moisture, to dry it vp.

The Celticke-Nard is good for all the forementioned vses, but of lesse efficacie, vnlesse in the G
prouoking of vrine. It is also much vsed in Antidotes.

The mountaine Nard hath also the same faculties, but is much weaker than the former, and not H
in vse at this day that I know of. ‡

Chap. 442. *Of Larks heele or Larks claw.*

¶ *The Description.*

1 THe garden Larks spur hath a round stem ful of branches, set with tender jagged leaues very like vnto the small Sothernwood: the floures grow along st the stalks toward the tops of the branches, of a blew colour, consisting of fiue little leaues which grow together and make one hollow floure, hauing a taile or spur at the end turning in like the spur of Todeflax. After come the seed, very blacke, like those of Leekes: the root perisheth at the first approch of Winter.

2 The second Larks spur is like the precedent, but somewhat smaller in stalkes and leaues: the floures are also like in forme, but of a white colour, wherein especially is the difference. These floures are sometimes of a purple colour, sometimes white, murrey, carnation, and of sundry other colours, varying infinitely, according to the soile or country wherein they liue.

‡ 3 Larks spur with double flours hath leaues, stalkes, roots, and seeds like the other single kinde, but the floures of this are double; and hereof there are as many seuerall varieties as there be of the single kinde, to wit, white, red, blew, purple, blush, &c.

4 There is also another variety of this plant, which hath taller stalkes and larger leaues than the common kinde: the floures also are more double and larger, with a lesser heele: this kinde also yeeldeth vsually lesse seed than the former. The colour of the floure is as various as that of the former, being either blew, purple, white, red, or blush, and sometimes mixed of some of these. ‡

5 The wilde Larks spur hath most fine ijagged leaues, cut and hackt into diuers parts, confusedly set vpon a small middle tendrell: among which grow the floures, in shape like the others, but a great

1 *Conſolida regalis ſatiua.*
Garden Larks heele.

2 *Conſolida ſatiua flore albo vel rubro.*
White or red Larks ſpur.

‡ 3 *Conſolida regalis flore duplici.*
Double Larks ſpur.

‡ 4 *Conſolida reg. elatior flo. pleno.*
Great double Larks ſpur.

a great deale lesser, sometimes purple, otherwhiles white, and often of a mixt colour. The root is small and threddy.

5 *Consolida regalis sylvestris.*
Wilde Larkes heele.

¶ *The Place.*

These plants are set and sowne in gardens: the last groweth wilde in corne fields, and where corn hath grown, ‡ but not with vs, that I haue yet obserued; though it be frequently found in such places in many parts of Germanie. ‡

¶ *The Time.*

They floure for the most part all Summer long, from Iune to the end of August, and oftimes after.

¶ *The Names.*

Larks heele is called *Flos Regius*: of diuers, *Consolida regalis*: who make it one of the Consounds or Comfreyes. It is also thought to be the *Delphinium* which *Dioscorides* describes in his third booke; wherewith it may agree. It is reported by *Gerardus* of Veltwijcke, who remained Lieger with the great Turke from the Emperor *Charles* the fifth, That the said *Gerard* saw at Constantinople a copy which had in the chap. of *Delphinium*, not leaues but floures like Dolphins: for the floures, and especially before they be perfected, haue a certaine shew and likenesse of those Dolphins, which old pictures and armes of certain antient families haue expressed with a crooked and bending figure or shape, by which signe also the heauenly Dolphine is set forth. And it skilleth not, though the chapter of *Delphinium* be thought to be falsified and counterfeited; for although it bee some other mans, and not of *Dioscorides*, it is notwithstanding some one of the old Writers, out of whom it is taken, and foisted into *Dioscorides* his bookes: of some it is called *Bucinus*, or *Bucinum*: in English, Larks spur, Larks heele, Larks toes, and Larks claw: in high Dutch, **Ridder spoozen**, that is, *Equitis Calcar*, Knights spur: in Italian, *Sperone*: in French, *Pied d'alouette*.

¶ *The Temperature.*

These herbes are temperate and warme of nature.

¶ *The Vertues.*

We finde little extant of the vertues of Larks heele, either in the antient or later writers, worth the noting, or to be credited; yet it is set downe, that the seed of Larks spur drunken is good against the stingings of Scorpions; whose vertues are so forceable, that the herbe onely throwne before the Scorpion or any other venomous beast, couseth them to be without force or strength to hurt, insomuch that they cannot moue or stirre vntill the herbe be taken away: with many other such trifling toyes not worth the reading. A

Chap. 443. *Of Gith, or Nigella.*

¶ *The Kindes.*

There be diuers sorts of Gith or Nigella, differing some in the colour of the floures, others in the doublenesse thereof, and in smell of the seed.

¶ *The Description.*

1 The first kind of Nigella hath weake and brittle stalks of the height of a foot, full of branches, beset with leaues very much cut or jagged, resembling the leaues of Fumiterie, but much greener: the floures grow at the top of the branches, of a whittish blew colour, each floure being

1 *Melanthium.*
Garden Nigella.

2 *Melanthium sylvestre.*
Wilde Nigella.

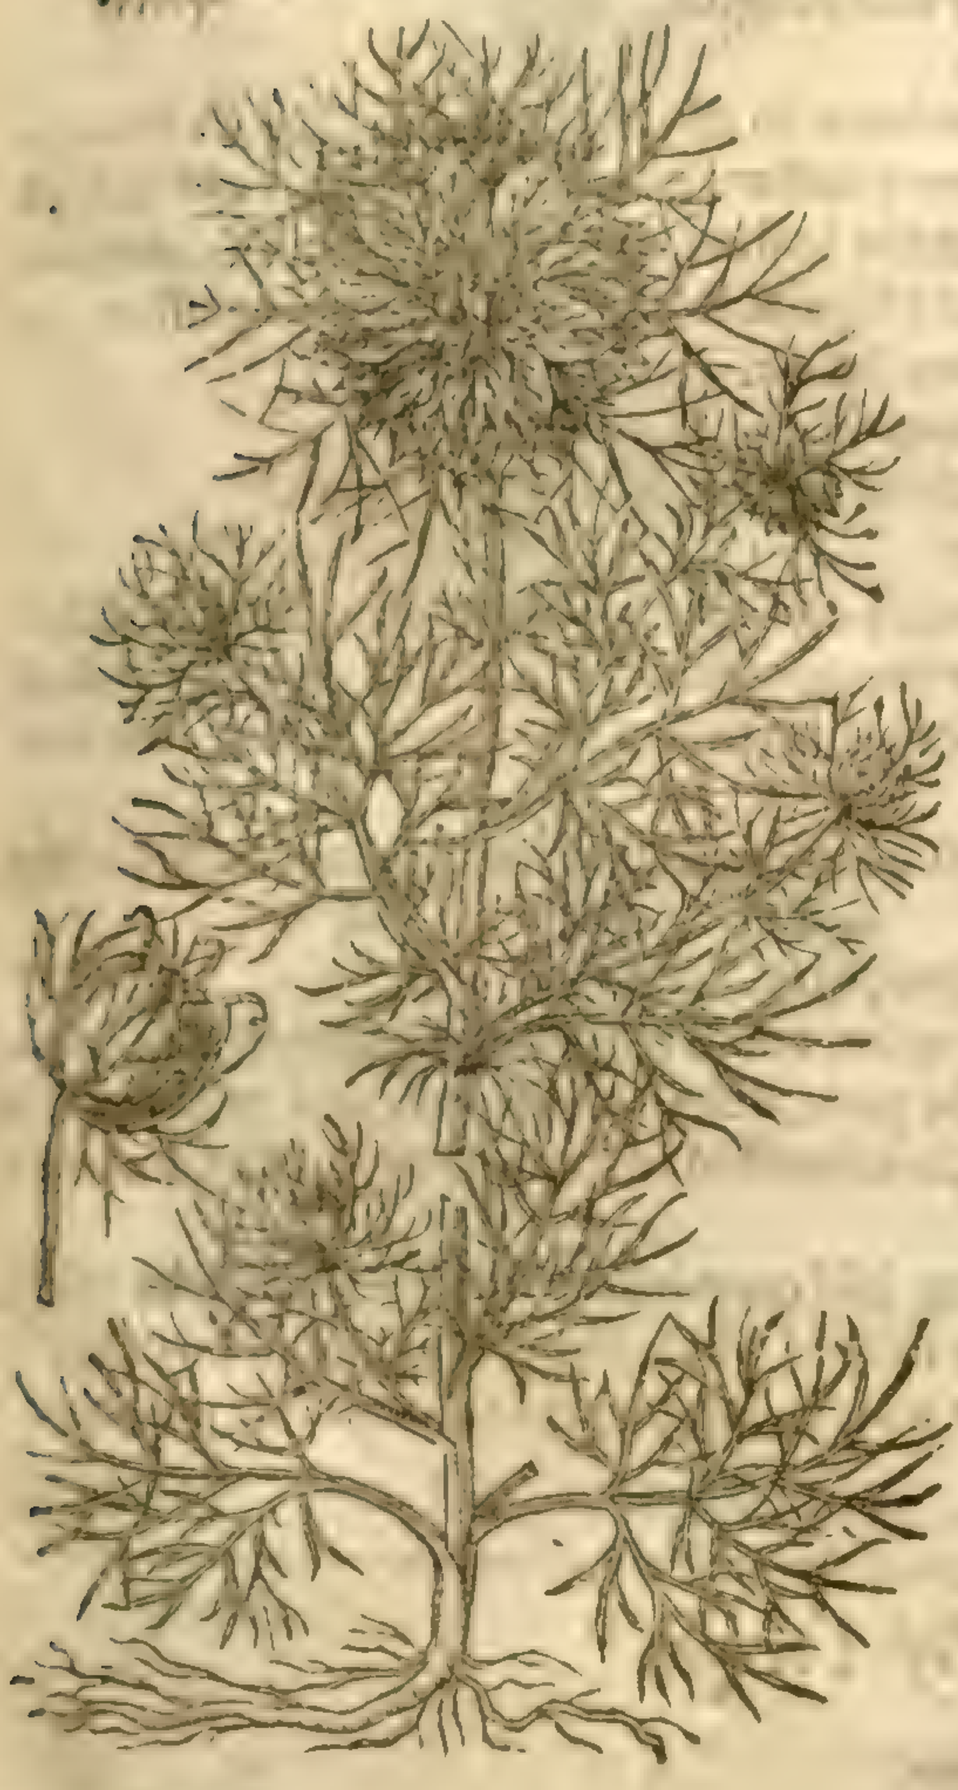
3 *Melanthium Damascenum.*
Damaske Nigella.

‡ 4 *Melanthium Damascenum flo. plen.*
Double floured Damaske Nigella.

being parted into fiue small leaues, starre-fashion: the floures being vaded, there come vp small knobs or heads, hauing at the end thereof fiue or six little sharpe hornes or pointals, and euery knob or head is diuided into sundry small cels or partitions, wherein the seed is contained, which is of a blackish colour, very like vnto Onion seed, in taste sharpe, and of an excellent sweet sauour.

2 The wilde Nigella hath a streaked stalke a foot or more high, beset full of grayish leaues, very finely jagged, almost like the leaues of Dill: the floures are like the former, saue that they are blewer: the cods or knops are like the heads or huskes of Columbines, wherein is conteined the sweet and pleasant seed, like the former.

5 *Nigella flore albo multiplici.*
Damaske Nigella.



‡ 6 *Nigella Hispanica flore amplo.*
Great Spanish Nigella.

3 The third kinde of Nigella, which is both faire and pleasant, called Damaske Nigella, is very like vnto the wilde Nigella in his small cut and jagged leaues, but his stalke is longer: the flours are like the former, but greater, and euery floure hath fiue small greene leaues vnder him, as it were to support and beare him vp: which floures being gone, there succeed and follow knops and seed like the former, but without smell or sauour.

‡ 4 This in the smalnesse, and shape of the leaues and the manner of growing is like to the last described hauing small leaues growing vnder the floure, which is not single, as in the last described, but double, consisting of fiue or more rankes of little blewish leaues, which are succeeded by such cornered heads as those of the former, hauing in them a blacke seed without any manifest smell. ‡

5 The fifth kinde of Nigella hath many small and slender stalkes, set full of slender and thinne leaues deepely cut or jagged, of a faint yellowish greene colour: the floures grow at the top of the stalkes, of a whitish colour, and exceeding double: which being vaded, there succeed bowles or knobs, full of sweet blacke seed like the former: the root is small and tender.

‡ 6 The root of this is slender, and yellowish; the stalke is some cubit high, round, green, crested, and toward the top diuided into sundry branches, the leaues toward the bottome are somewhat small cut, but somewhat larger vpon the stalkes. The floure is much larger *than any of the* former, composed of fiue leaues, of a light blew aboue, and somewhat whitish *vnderneath, with*

large

large veines running about them: in the middle ſtands vp the head, encompaſſed with black threds, and ſome 7. or 8. little gaping bluiſh floures at the bottomes of them; the leaues of the floures decaying the head becomes bigger, hauing at the tops thereof 6. 7. or 8. longiſh twined hornes growing, in a ſtar faſhion; the inſide is parted into cels conteining a yellowiſh green, or blackiſh ſeed. It is ſet forth in the *Hortus Eyſtettenſis* by the name of *Melanthium Hiſpanicum maius*, by Mr. *Parkinſon* it is called *Nigella Hiſpanica flore ſimplici*; and *Bauhine* in his *Prodromus* hath it by the name of *Nigella latifolia flore maiore ſimplici cæruleo*. It is an annuall plant, and floures in Iuly; it is ſometimes to be found in the gardens of our Floriſts.

¶ *The Place.*

The tame are ſowne in gardens: the wilde ones doe grow of themſelues among corne and other graine, in diuers countries beyond the ſeas.

¶ *The Time.*

The ſeed muſt be ſowne in Aprill: it floureth in Iuly and Auguſt.

¶ *The Names.*

Gith is called in Greeke, μελάνθιον: in Latine alſo *Melanthium*: in ſhops, *Nigella*, and *Nigella Romana*: of diuers, *Gith*, and *Saluſandria*, and ſome among the former baſtard names, *Papauer nigrum*: in high Dutch, **Swartzkymmich**: in low Dutch, **Nardus ſaet**: in Italian, *Nigella*: in Spaniſh, *Axenuz*, *Alipiure*: in French, *Nielle odorante*: in Engliſh, Gith, and Nigella Romana, in Cambridgeſhire, Fitches wort: and alſo *Diuæ Catherinæ flos*, Saint Katharines floure.

¶ *The Temperature.*

The ſeed of the garden Nigella is hot and dry in the third degree, and of thin parts.

¶ *The Vertues.*

A The ſeed of *Nigella Romana* drunke with wine, is a remedy againſt the ſhortneſſe of breath, diſſolueth and putteth forth windineſſe, prouoketh vrine, the menſes, increaſeth milke in the breſts of nurſes if it be drunke moderately; otherwiſe it is not onely hurtfull to them, but to any that take thereof too often, or in too great a quantity.

B The ſeed killeth and driueth forth wormes, whether it be taken with wine or water, or laid to the nauell in manner of a plaiſter.

C The oyle that is drawne forth thereof hath the ſame property.

D The ſeed parched or dried at the fire, brought into pouder, and wrapped in a piece of fine lawne or ſarcenet, cureth all murs, catarrhes, rheumes, and the poſe, drieth the braine, and reſtoreth the ſence of ſmelling vnto thoſe which haue loſt it, being often ſmelled vnto from day to day, and made warme at the fire when it is vſed.

E It takes away freckles, ſcurfs, and hard ſwellings, being laid on mixed with vineger. To be briefe, as *Galen* ſaith, it is a moſt excellent remedy where there is need of clenſing, drying, and heating.

F It ſerueth well among other ſweets to put into ſweet waters, bagges, and odoriferous pouders.

† The figures of the third and fourth of the former edition were tranſpoſed.

CHAP. 444. *Of Cockle.*

¶ *The Deſcription.*

COckle is a common and hurtfull weed in our Corne, and very well knowne by the name of Cockle, which *Pena* calleth *Pſeudomelanthium*, and *Nigellaſtrum*, by which name *Dodonæus* and *Fuchſius* do alſo terme it; *Mutonus* calleth it *Lolium*; and *Tragus* calleth it *Lychnoides ſegetum*. This plant hath ſtraight, ſlender and hairy ſtems, garniſhed with long hairy and grayiſh leaues, which grow together by couples, incloſing the ſtalke round about: the floures are of a purple colour, declining to redneſſe, conſiſting of fiue ſmall leaues, in proportion very like to wilde Campions; when the floures be vaded there follow round knobs or heads full of blackiſh ſeed, like vnto the ſeed of *Nigella*, but without any ſmell or ſauour at all.

¶ *The Place and Time.*

The place of his growing and time of his flouring, are better knowne than deſired.

¶ *The Names.*

Cockle is called *Pſeudomelanthium*, and *Nigellaſtrum*, wilde or baſtard Nigella; of *Fuchſius*, *Lolium*: of *Mouton*, *Lychnoides ſegetum*: of *Tragus*, *Githago*: in high Dutch, **Kornegele**: in low Dutch, **Corne rooſen**: in French, *Nielle des Bledz*: in Engliſh, Cockle, field Nigella, or wilde Nigella: in Italian, *Githone*; whereupon moſt Herbariſts being moued with the likeneſſe of the word, haue thought it to be the true Gith or *Melanthium*; but how farre they are deceiued it is better knowne, than needfull to be confuted: for it doth not onely differ in leaues from the true Gith, but alſo in other properties, and yet it is called Gith or *Melanthium*, and that is of the blackeneſſe of the ſeed, yet not properly, but with a certaine addition, that it may differ from the true *Melanthium*: for

Hippocrates

Pseudomelanthium.
Bastard Nigella, or Cockle.

Hippocrates calleth it *Melanthium ex tritico*, of Wheat: *Octavius Horatianus* calleth that Gith which groweth among corne: and for the same cause it is named of the Learned of this our time, *Nigellastrum*, *Gigatho*, and *Pseudomelanthium*. *Ruellius* saith it is called in French *Nicle*, & *Flos Micancalus*.

¶ *The Temperature.*

The seed of Cockle is hot and dry in the later end of the second degree.

¶ *The Vertues.*

The seed made in a pessarie or mother suppositorie, with hony put vp, bringeth down the desired sickenesse, as *Hippocrates* witnesseth in his booke of womens diseases. A

Octavius Horatianus giues the seed parched and beaten to pouder, to be drunk against the yellow Iaundice. B

Some ignorant people haue vsed the seed of this for the seed of Darnel, to the great danger of those who haue receiued the same. What hurt it doth among corne, the spoile of bread, as well in colour, taste, and vnwholesomnesse, is better knowne than desired. C

Chap. 445. *Of Fumitorie.*

¶ *The Kindes.*

There be diuers herbs comprehended vnder the title of Fumitorie; some wilde, and others of the garden; some with bulbous or tuberous roots, and others with fibrous or threddy roots: and first of those whose roots are nothing but strings.

¶ *The Description.*

1 Fvmitorie is a very tender little herbe: the stalkes thereof are slender, hauing as it were little knots or ioints ful of branches, that scarce grow vp from the ground without proppings, but for the most part grow sidelong: the leaues round about are small, cut on the edges as those of Coriander, which as well as the stalks are of a whitish green: the flours be made vp in clusters at the tops of the small branches, of a red purple colour: then rise vp huskes round and little, in which lieth the small seed, the root is slender, and groweth straight downe. ‡ This is also found with floures of a purple violet colour, and also sometimes with them white. ‡

2 The second kinde of Fumitorie hath many small long and tender branches, wherupon grow little leaues vsually set together by threes or fiues, in colour and taste like the former, hauing at the tops of the branches many small clasping tendrels, with which it taketh hold vpon hedges, bushes, and whatsoeuer groweth next to it: the flours are small, and clustering together, of a white colour, with a little spot in their middles; after which succeed cods containing the seed: the root is single, and of a fingers length.

3 The third kinde of Fumitorie hath a very smal root, consisting of diuers little strings, from which arise small and tender branches trailing here and there vpon the ground, beset with many small and tender leaues most finely cut and jagged like the little leaues of Dill, of a deepe greene colour tending to blewnesse, the floures stand at the tops of the branches in bunches or clusters, thicke thrust together, like those of the medow Claver or three leaued grasse, of a most bright red colour, and very beautifull to behold: the root is very small and threddy.

1 *Fumaria purpurea.*
Common or purple Fumitory.

† 2 *Fumaria alba latifolia claviculata.*
White broad leafed Fumitorie.

3 *Fumaria tenuifolia.*
Fine leafed Fumitory.

4 *Fumaria lutea.*
Yellow Fumitorie.

4 The yellow Fumitorie hath many crambling threddy roots, somwhat thicke, grosse, and fat, like those of *Asparagus*: from which rise diuers vpright stalkes a cubit high, diuiding themselues toward the top into other smaller branches, whereon are confusedly placed leaues like those of *Thalictrum*, or English Rubarb, but lesser and thinner: alongst the tops of the branches grow yellow floures, resembling those of Sage: which being past, there followeth small seed like vnto dust.

¶ *The Place.*

The Fumitories grow in corne fields among Barley and other graine; in vineyards, gardens, and such like manured places. I found the second and third growing in a corne field betweene a small village called Charleton and Greenwhich.

¶ *The Time.*

Fumitory is found with his floure in the beginning of May, and so continues to the end of summer. When it is in floure is the best time to gather it to keep dry, or to distill.

¶ *The Names.*

Fumitorie is called in Greeke Καπνὸς, and Κάπνιον, and often Καπνίτις: in Latine, *Fumaria*: of *Pliny*, *Capnos*: in shops, *Fumus terræ*: in high Dutch, **Erdtrauch**: in low Dutch, **Grisseom, Duyuen, Kernel**: in Spanish, *Palomilha*: in French and English, Fumiterre.

¶ *The Temperature.*

Fumitorie is not hot, as some haue thought it to be, but cold and something dry; it openeth and clenseth by vrine.

¶ *The Vertues.*

It is good for all them that haue either scabs or any other filthe growing on the skinne, and for them also that haue the French disease. A

It remoueth stoppings from the liuer and spleene: it putrifieth the bloud, and is oft times good for them that haue a quartane ague. B

The decoction of the herbe is vsed to be giuen, or else the syrrup that is made of the juyce: the distilled water thereof is profitable against the purposes aforesaid. C

It is oftentimes boyled in whay, and in this manner it helpeth in the end of the Spring and in Summer time those that are troubled with scabs. D

Paulus Ægineta saith that it plentifully prouoketh vrine, and taketh away the stoppings of the liuer, and feebleneſſe thereof; that it strengthneth the stomacke, and maketh the belly soluble. E

Dioscorides affirmeth, that the juice of Fumitorie, of that which groweth among Barley, as *Ægineta* addeth, with gum Arabicke, doth take away vnprofitable haires that pricke the eyes, growing vpon the eye lids, the haires that pricke being first plucked away, for it will not suffer others to grow in their places. F

The decoction of Fumitorie drunken driueth forth by vrine and siege all hot chollericke burnt and hurtfull humors, and is a most singular digester of salt and pituitous humors. G

† There were formerly six figures and descriptions in this chapter; whereof the two first figures were of the common Fumitorie, the one with purple, the other with white floures; and the two later were of the *Fumaria latifolia clauiculata*, differing only in the largeneſſe and smalleſſe of the leafe. The description in the second place belonged to the *Fumaria clauiculata*, which also was againe described in the fifth and sixth places, yet not to much purpose; wherefore I haue put the figure to the second, and omitted the other as superfluous.

CHAP. 446. *Of bulbous Fumitorie, or Hollow-root.*

¶ *The Description.*

1 THe leaues of great Hollow-root are jagged and cut in sunder, as be those of Coriander, of a light greenish colour, that is to say, like the gray colour of the leaues of Columbine, whereunto they be also in forme like, but lesser: the stalks be smooth, round, and slender, an handfull long; about which on the vpper part stand little floures orderly placed, long, with a little horne at the end like the floures of Tode-flax, of a light red tending to a purple colour: the seed lieth in flat cods, very soft and greenish when it is ready to yeeld vp his black shining ripe seed: the root is bumped or bulbous, hollow within, and on the vpper part pressed down somewhat flat, couered ouer with a dark yellow skin or barke, with certaine strings fastned thereto, and of a bitter and austere taſt.

2 The second is like vnto the first in each respect, sauing that it bringeth floures of a white colour, and the other not so.

3 The small purple Hollow-root hath roots, leaues, stalkes, floures, and seeds like the precedent, the especiall difference is, that this plant is somwhat lesse.

4 The ſmall white Hollow-root likewiſe agreeth with the former in each reſpect, ſauing that this plant bringeth white floures, and the other not ſo.

1 *Radix caua major purpurea.*
Great purple Hollow-root.

2 *Radix caua major alba.*
Great white Hollow-root.

5 This kinde of Hollow-root is alſo like the laſt deſcribed, ſauing that the floures hereof are mixed with purple and white, which maketh it to differ from the others.

6 There is no difference in this, that can poſſibly be diſtinguiſhed from the laſt deſcribed, ſauing that the floures hereof are of a mixt colour, white and purple, with ſome yellow in the hollowneſſe of the ſame, wherein conſiſteth the difference from the precedent.

7 This thin leafed Hollow-root hath likewiſe an hollow-root, couered ouer with a yellow pilling, of the bigneſſe of a tenniſe ball: from which ſhoot vp leaues ſpred vpon the ground, very like vnto the leaues of Columbines, as well in forme as colour, but much thinner, more jagged, and altogether leſſer: among which riſe vp ſmall tender ſtalkes, weake and feeble, of an handfull high, bearing from the middle thereof to the top very fine floures, faſhioned vnto one peece of the Columbine floure, which reſembleth a little bird of a purple colour.

8 This other thin leafed Hollow-root is like the precedent, ſauing that this plant brings forth white floures tending to yellowneſſe, or as it were of the colour of the field Primroſe.

9 **Bunnykens holwortele**, as the Dutch men do call it, hath many ſmall jagged leaues growing immediately from the ground, among which riſe vp very ſlender ſtalks, whereon do grow ſuch leaues as thoſe next the ground: on the top of the branches ſtand faire purple floures like vnto the others of his kinde, ſauing that the floures hereof are as it were ſmall birds, the bellies or lower parts whereof are of a white colour: wherein it differeth from all the reſt of the Hollow-roots.

10 The laſt and ſmall Hollow-root is like the laſt deſcribed, ſauing that it is altogether leſſe, and the floures hereof are of a green colour, not vnlike in ſhape to the floures of Cinkfoile. ‡ This plant, whoſe figure our Author here gaue with this ſmall deſcription, is that which from the ſmell of muſk is called *Moſchatella*, by *Cordus* and others: it is the *Denticulata* of *Daleſchampius*: the *Fumaria bulboſa tuberoſa minima* of *Tabernamontanus*: and the *Ranunculus minimus ſeptentrionalium herb. muſcoſo flore* of *Lobel*. The root hereof is ſmal and toothed, or made of little bulbs reſembling teeth, and ending in white hairy fibres: it ſends vp diuers little branches ſome two or three inches high: the leaues are ſomwhat like thoſe of the yellow Fumitorie, or *Radix caua*, but much leſſe: the floures grow

grow clustering on the top of the stalke, commonly fiue or seuen together, each of them made of foure yellowish greene leaues with some threds in them; it floures in Aprill, and is to be found in diuers places among bushes at that time, as in Kent about Chislehurst, especially in *Pits* his wood, and at the further end of Cray heath, on the left hand vnder a hedge among bryers and brambles, which is his proper seat. ‡

9 *Radix cava minor.*
Bunnikens Holwoort.

10 *Radix cava minima viridi flore.*
Small Bunnikens Holwoort.

¶ *The Place.*

These plants do grow about hedges, brambles, and in the borders of fields and vineyards, in low and fertile grounds, in Germanie and the Low-countries, neuertheless the two first, and also the two last described do grow in my garden.

¶ *The Time.*

These do floure in March, and their seed is ripe in Aprill: the leaues and stalks are gone in May, and nothing remaining saue only the roots, so little a while do they continue.

¶ *The Names.*

Hollow root is called in high Dutch **Holwurtz**: in low Dutch, **Hoolewoztels**, that is, *Radix cava*: in English, Hollow root, and Holewoort: it is vsed in shops in stead of *Aristolochia*, or round Birthwnort; which errour is better knowne than needfull to be confuted: and likewise their error is apparant, who rashly judge it to be *Pistolochia*, or little Birthwort. It should seem the old Writers knew it not; wherefore some of our later Authors haue made it *Leontopetali species*, or a kind of Lions Turnep: others, *Eriphium*: and othersome, *Thesium*: most men, *Capnos Chelidonia*: it seemeth to agree with *Leontopetalon* in bulbed roots, and somewhat in leaues, but in no other respects, as may be perceiued by *Dioscorides* and *Plinies* description of *Leontopetalon*. And if *Eriphium* haue his name ἀπὸ τοῦ ἦρος, that is to say of the Spring, then this root may be not vnproperly *Eriphium*, and *Veris Planta*: or the plant of the Spring: for it is euident that it appeareth and is green in the Spring onely: some think it hath been called *Eriphium*, *ab Hædo*, or of the Goat: but this *Eriphion* is quite another plant, as both *Apuleius* writeth, and that book also mentioneth which is attributed to *Galen*, and dedicated to *Paternianus*. In the booke which is dedicated to *Paternianus*, there be read these words; [*Eriphion* is an herbe which is found vpon high mountaines, it hath leaues like Smallage, a fine floure like the Violet, and a root as great as an onion: it hath likewise other roots which send forth

roots

roots after roots. Whereby it is euident that this root whereof we intreat is not this kinde of *Eupatorium*. Concerning *Theſium* the old Writers haue written but little: *Theophraſtus* ſaith, that the root thereof is bitter, and being ſtamped purgeth the belly. *Pliny, lib.* 21. *cap.* 17. ſheweth, that the root which is called *Theſium*, is like the bulbed plants, and is rough in taſte: *Athenæus* citing *Timachida* for an Author ſaith, that *Theſium* is called a floure, of which *Ariadnes* garland was made. Theſe things ſeem well to agree with Hollow root, for it is bumped or bulbous, of taſt bitter, and auſtere, or ſomthing rough, which is alſo thought to purge: but what certainty can be affirmed, ſeeing the old Writers are ſo briefe? what manner of herbe *Capnos Chelidonia* is, which groweth by hedges, and hereupon is ſyrnamed φραγμίτης, *Actius* doth not expound, only the name thereof is found in his ſecond Tetrab. the third booke, chap. 110. in *Martianus* his *Collyrium*, and in his Tetrab. *lib.* 2. *cap.* 2. among ſuch things as ſtrengthen the liuer. But if *Capnos Chelidonia* be that which *Pliny* in his 25. booke, chap. 13, doth call *Prima Capnos*, or the firſt *Capnos*, and commendeth it for the dimneſſe of the ſight, it is plaine enough that *Radix cæua*, or the Hollow root, is not *Capnos Chelidonia*: for *Pliny's* firſt *Capnos* is branched, and foldeth it ſelfe vpon hedges: but Hollow root hath no ſuch braunches growing on it, and is a low herbe, and is not held vp with props, nor needeth them. But if *Actius* his *Capnos Chelidonia* be another herb differing from that of *Pliny* (which thing perchance was the cauſe why it ſhould be ſyrnamed *Chelidonia*) there is ſome reaſon why it ſhould be called *Capnos Chelidonia*; for it is ſomwhat like Fumitorie in leaues, though greater, and commeth vp at the firſt Spring, which is about the time when the Swallows do come in; neuertheleſſe it doth not follow, that it is true, and right *Capnos Chelidonia*, for there be alſo other herbes comming vp at the ſame ſeaſon, and periſh in ſhort time after, which notwithſtanding are not called *Chelidonia*.

¶ *The Temperature.*

Hollow root is hot and drie, yet more drie than hot, that is to ſay, dry in the third degree, and hot in the ſecond; it bindeth, clenſeth, and ſomwhat waſteth.

¶ *The Vertues.*

A Hollow root is good againſt old and long laſting ſwellings of the Almonds in the throat, and of the jawes: it likewiſe preuaileth againſt the pains of the hemorrhoides, which are ſwoln and painfull being mixed with the ointment of Poplar buds, called *Vng. Populeon*.

B It is reported that a dram weight hereof being taken inwardly, doth purge by ſiege, and draweth forth flegme.

† I haue reduced the eight figures which were formerly here put to the firſt 8. deſcriptions, beeing all of one and the ſame plant, to two, yet haue I left the deſcriptions, which in my opinion might haue been as well ſpared as the figures, for excepting the various colour of the floures, there are but two diſtinct differences of the *Fumaria bulboſa maior*, the one hauing a hollowneſſe in the bottome of the root, and the other wanting it; and this which hath the ſolid root hath alſo the greene leaues betweene the floures cut in or diuided, the floures alſo are loſſe, more in number, and of an elegant red purple colour; and ſeldome found of any other colour, whereas the other varies much in the colour of the floures.

Chap. 447. *Of Columbine.*

¶ *The Deſcription.*

1 THe blew Columbine hath leaues like the great Celandine, but ſomewhat rounder, indented on the edges, parted into diuers ſections, of a blewiſh green colour, which beeing broken, yeeld forth little juice or none at all: the ſtalke is a cubit and a halfe high, ſlender, reddiſh, and ſleightly haired: the ſlender ſprigs whereof bring forth euerie one one floure with fiue little hollow hornes, as it were hanging forth, with ſmall leaues ſtanding vpright, of the ſhape of little birds: theſe floures are of colour ſomtimes blew, at other times of a red or purple, often white, or of mixt colours, which to diſtinguiſh ſeuerally were to ſmall purpoſe, being things ſo familiarly known to all: after the floures grow vp cods, in which is contained little black and glittering ſeed: the roots are thicke, with ſome ſtrings thereto belonging, which continue many yeres.

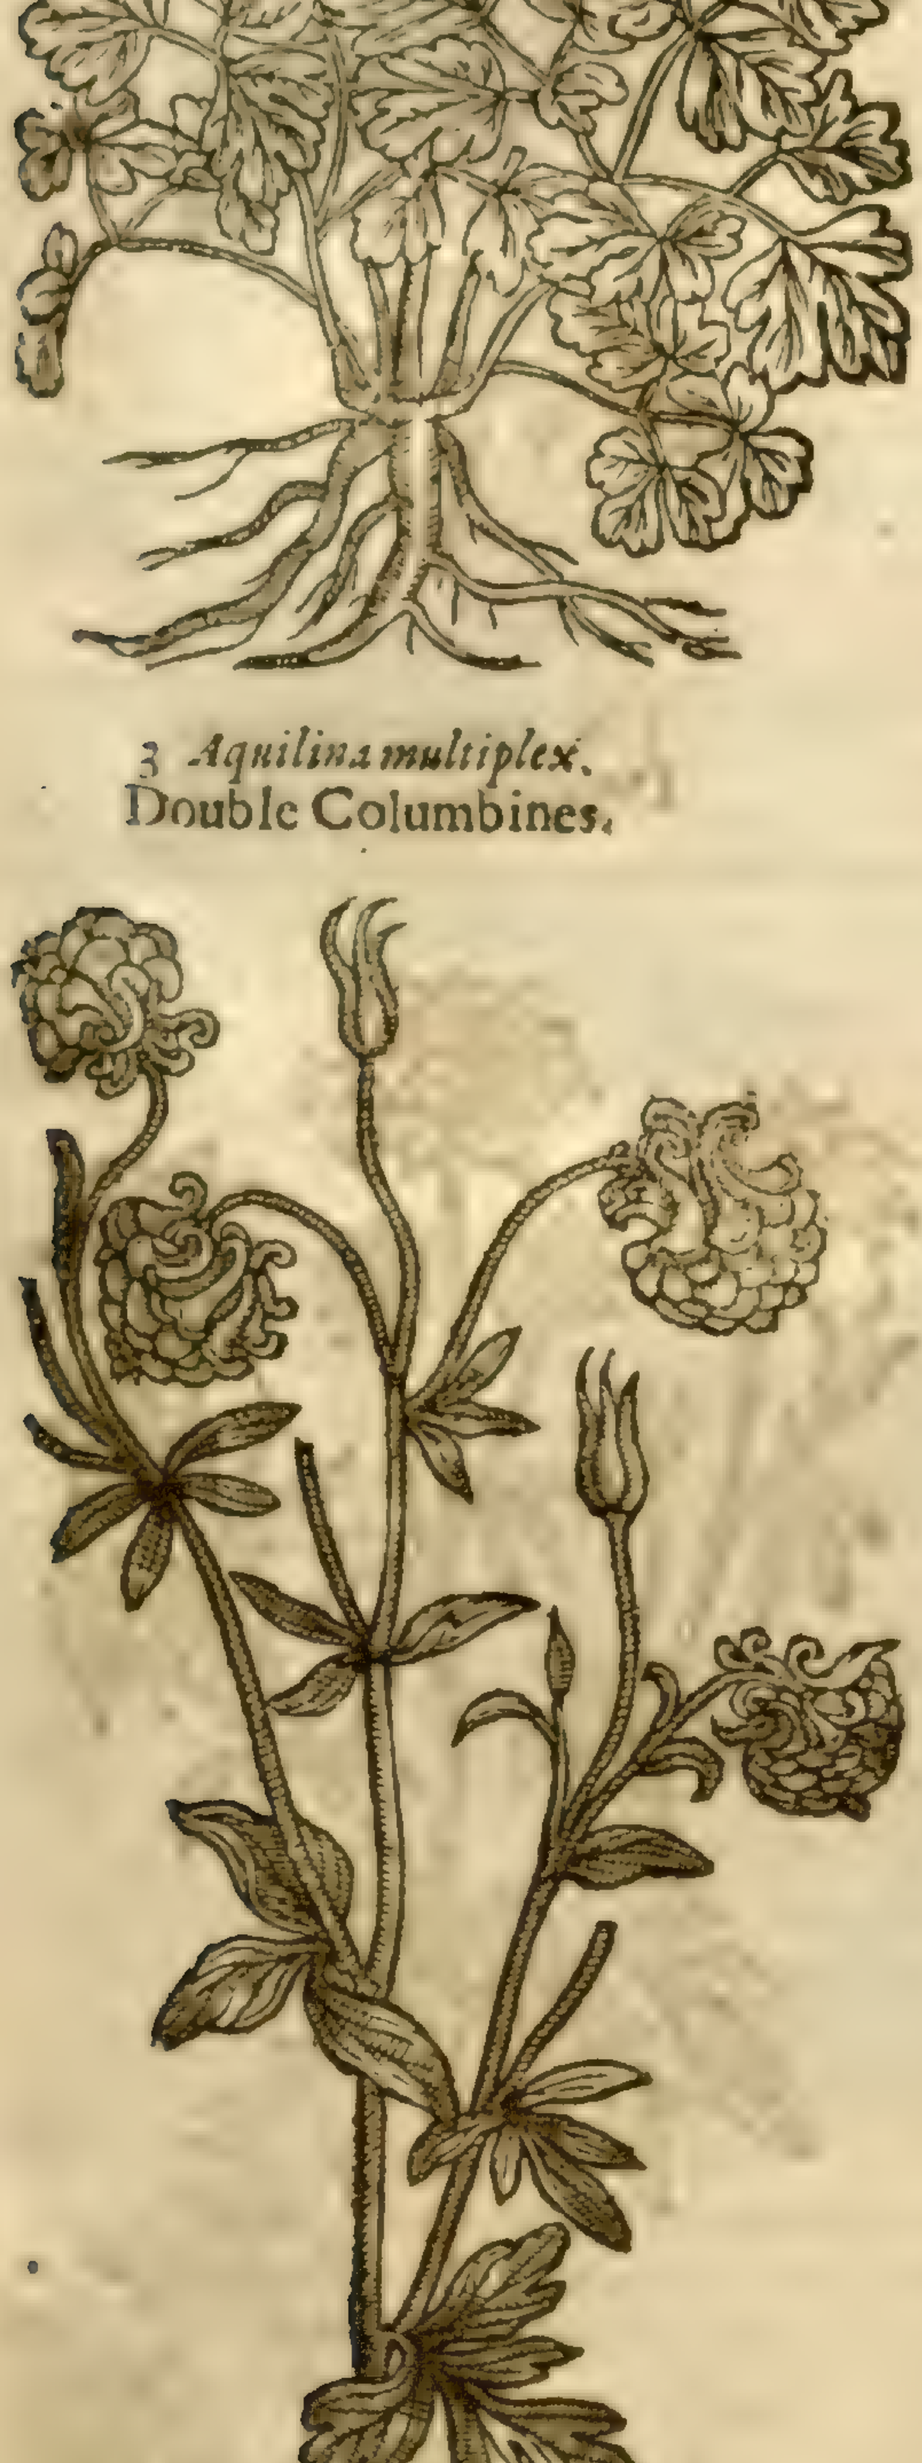
2 The ſecond doth not differ ſauing in the colour of the floures; for like as the others are deſcribed to be blew, ſo thoſe are of a purple red, or horſe-fleſh colour, which maketh the difference.

3 The double Columbine hath ſtalks, leaues, and roots, like the former: the floures hereof are very double, that is to ſay, many of thoſe little floures (hauing the forme of birds) are thruſt one into the belly of another, ſometimes blew, often white, and otherwhiles of mixt colours, as nature liſt to play with her little ones, differing ſo infinitely, that to diſtinguiſh them apart would require more

1 *Aquilegia cærulea.*
Blew Columbines.

2 *Aquileia rubra.*
Red Columbines.

3 *Aquilina multiplex.*
Double Columbines.



‡ 4 *Aquilegia varicgata.*
Variegated Columbine.

‡ 5 *Aquilegia flo. inverſo rubro.*
Columbine with the inverted red floure.

‡ 6 *Aquilegia flo. inverſo albo.*
Inverted Columbine with the white floure.

‡ 7 *Aquilegia flore roſeo.*
Roſe Columbine.

‡ 8 *Aquilegia degener.*
Degenerate Columbine.

more time than were requisite to leese: and therefore it shall suffice what hath beene said for their descriptions.

‡ 4 There are also other varieties of this double kinde, which haue the floures of diuers or partie colours, as blew and white, and white and red variously marked or spotted.

5 This kinde hath the floures with their heeles or spurres turned outward or in the middle of the floure, whence it is called *Aquilina inversa*: the floures of this are commonly reddish, or of a light or darke purple colour, and double.

6 This differs from the last in the colour of the floures which are white, yet double, and inverted as the former.

7 The roots, leaues, and stalks of this are not vnlike that of the precedent, but the floure is much different in shape; for it hath no heels or spurs, but it is made of sundry long leaues lying flat open, being sometimes more single, and otherwhiles more double. The colour of the floure is either red, white, blew, or variously mixt of these as the former.

8 This though it be termed degenerate, is a kinde of it selfe, and it differs from the last described in that the vtmost leaues are the largest, and the colour thereof is commonly greene, or greene somewhat inclining to purple. ‡

¶ *The Place.*

They are set and sowne in gardens for the beautie and variable colour of the floures.

¶ *The Time.*

They floure in May, Iune, and Iuly.

¶ *The Names.*

Columbine is called of the later Herbarists, *Aquileia*, *Aquilina*, and *Aquilegia*: of *Costeus*, *Pothos*: of *Gesner*, *Leontostomum*: of *Daleschampius*, *Iouis flos*: of some, *Herba Leonis*, or the herbe wherein the Lion doth delight: in high Dutch, **Agley**: in low Dutch, **Akeleyen**: in French, *Ancoiles*: in English, Columbine. ‡ *Fabius Columna* iudges it to be the *Isopyrum* described by *Dioscorides*. ‡

¶ *The Temperature.*

Columbines are thought to be temperate betweene heate and moisture.

¶ *The Vertues.*

Notwithstanding what temperature or vertues Columbines haue is not yet sufficiently known; A
for they are vsed especially to decke the gardens of the curious, garlands and houses: neuerthelesse *Tragus* writeth, that a dram weight of the seed, with halfe a scruple or ten graines of Saffron giuen in wine, is a good and effectuall medicine for the stopping of the liuer, and the yellow jaundise; but he saith, that whoso hath taken it must be well couered with cloathes, and then sweat.

Most in these daies following others by tradition, do vse to boyle the leaues in milke against the B
sorenesse of the throat, falling and excoriation of the uvula: but the antient writers haue said nothing hereof: *Ruellius* reporteth, that the floures of Columbines are not vsed in medicine: yet some there be that do affirme they are good against the stopping of the liuer, which effect the leaues doe also performe.

‡ *Clusius* saith, that Dr. *Francis Rapard* a Physition of Bruges in Flanders, told him that the seed C
of this common Columbine very finely beaten to pouder, and giuen in wine, was a singular medicine to be giuen to women to hasten and facilitate their labour, and if the first taking it were not sufficiently effectuall, that then they should repeate it againe. ‡

Chap. 448. *Of Wormewood.*

¶ *The Description.*

1 THe first kind being our common and best knowne Wormwood, hath leaues of a grayish colour, very much cut or jagged, and very bitter: the stalks are of a wooddy substance, two cubits high, and full of branches, alongst which doe grow little yellowish buttons, wherein is found small seed like the seed of Tansey, but smaller: the root is likewise of a wooddy substance, and full of fibres.

2 The second kind of Wormewood bringeth forth slender stalkes about a foot high or somewhat more, garnished with leaues like the former, but whiter, much lesser, and cut or jagged into most fine and small cuts or diuisions: the floures are like the former, hanging vpon small stemmes with their heads downeward: the roots are whitish, small and many, crawling and crambling one ouer another, and thereby infinitely do increase, of sauour lesse pleasant than the common Wormwood.

wood. Some haue termed this plant *Absinthium santonicum*, but they had slender reason so to do: for if it was so called because it was imagined to grow in the Prouince of Saintoinge, it may very well appeare to the contrary; for in the Alpes of Galatia, a countrey in Asia *minor*, it groweth in great plenty, and therefore may rather be called *Galatium Sardonicum*, and not *Santonicum*: but leauing controuersies impertinent to the History, it is the Ponticke Wormwood of *Galens* description, and so holden of the learned *Paludane* (who for his singular knowledge in plants is worthy triple honour) and likewise many others.

1 *Absinthium latifolium sive Ponticum.*
Broad leafed Wormwood.

† 2 *Absinthium tenuifolium Ponticum Galeni.*
Small Ponticke Wormwood.

¶ *The Place.*

This broad leafed Wormewood delighteth to grow on rockes and mountaines, and in vntilled places; it groweth most vpon dry bankes, it is common euery where in all countries: the best, saith *Dioscorides*, is found in Pontus, Cappadocia, and on mount Taurus: *Pliny* writeth, that Ponticke Wormwood is better than that of Italy: *Ovid* in these words doth declare the Ponticke Wormewood to be extreme bitter.

Turpia deformes gignunt Absinthia campi,
Terraque de fructu, quam sit amara docet.

Vntilled barren ground the lothsome Wormwood yeelds,
And knowne it's by the fruit how bitter are the fields.

And *Bellonius* in his first booke of Singularities, chap. 76. doth shew, that there is also a broad leafed Wormwood like vnto ours, growing in the Prouinces of Pontus, and is vsed in Constantinople by the Physitions there, it is likewise found in certaine cold places of Switzerland, which by reason of the chilnesse of the aire riseth not vp, but creepeth vpon the ground, whereupon diuers call it creeping Wormewood.

¶ *The Time.*

The little floures and seeds are perfected in Iuly and August, then may Wormewood be gathered and laied vp for profitable vses.

¶ *The Names.*

It is called in Greeke, ἀψίνθιον: it is named of *Apuleius*, *Absinthium rusticum*, country Wormwood, or

or peſants Wormewood: we haue named it *Abſinthium latifolium*, broad leafed Wormewood, that it may differ from the reſt: the interpreters of the Arabians call the better ſort, which *Dioſcorides* nameth Ponticke Wormewood, *Romanum Abſinthium*, Roman Wormwood: and after theſe, the barbarous Phyſitions of the later age: the Italians name Wormewood, *Aſſenſo*: the Spaniards, *Axenxos*, *Aſenjos*, moſt of them *Donzell*: the Portingales, *Aloſna*: in high Dutch, **Wermmut**, **Wermut**: in French, *Aluyne*: in Engliſh, common Wormewood.

Victor Trincauilla, a ſingular Phyſition, in his practiſe tooke it for *Abſinthium Ponticum*.

2 This is commonly called *Abſinthium Romanum*: and in low Dutch, **Roomſche Alſene**: by which name it is knowne to very many Phyſitons and Apothecaries, who vſe this in ſtead of Ponticke wormwood: furthermore, it hath a leafe and floure far leſſe that the other wormwoods: likewiſe the ſmell of this is not onely pleſant, but it yeeldeth alſo a ſpicie ſent, whereas all the reſt haue a ſtrong and lothſome ſmell: and this Ponticke Wormewood doth differ from that which *Dioſcorides* commendeth: for *Dioſcorides* his Pontick Wormwood is accounted among them of the firſt kind, or of broad leafed wormwood; which thing alſo *Galen* affirmeth in his ſixt booke of the Faculties of medicines in the chapter of Sothernwood. There be three kinds of Wormwood (ſaith he) whereof they vſe to call one by the generall name, and that is eſpecially Pontick: whereby it is manifeſt that *Galen* in this place hath referred Ponticke to no other than to the firſt Wormwood; and therefore many not without cauſe maruell, that *Galen* hath written in his booke of the Method of curing, how Ponticke Wormwood is leſſe in floure and leafe: many excuſe him, and lay the fault vpon the corruption of the booke, and in his 9. booke of Method, the leſſer they would haue the longer: therefore this wormwood with the leſſer leafe is not the right Ponticke Wormwood, neither againe the Arabians Romane wormewood, who haue no other Romane than Ponticke of the Græcians. Alſo many beleeue that this is called *Santonicum*, but this is not to be ſought for in Myſia, Thracia, or other countries Eaſtward, but in France beyoud the Alps, if we may beleeue *Dioſcorides* his copies, there be that would haue it grow not beyond the Alps of Italy, but in Galatia a country in Aſia, & in the region of the Sardines, which is in the leſſer Aſia; whereupon it was called in Greeke ξαρδόνιον, which was changed into the name *Santonicum* through the errour of the tranſlators: *Dioſcorides* his copies keep the word *Sardonium*, & *Galens* copies *Santonicum*, which came to poſterity as it ſeemeth, is called in Engliſh, Romane Wormewood, garden or Cypres Wormewood, and French Wormewood.

¶ *The Temperature.*

Wormewood is of temperature hot and dry, hot in the ſecond degree and dry in the third: it is bitter and clenſing, and likewiſe hath power to binde or ſtrengthen.

¶ *The Vertues.*

It is very profitable to a weake ſtomacke that is troubled with choler, for it clenſeth it through his bitterneſſe, purgeth by ſiege and vrine: by reaſon of the binding quality, it ſtrengthneth and comforteth the ſtomacke, but helpeth nothing at all to remoue flegme contained in the ſtomacke, as *Galen* addeth. A

If it be taken before a ſurfeit it keepeth it off, and remoueth lothſomneſſe, ſaith *Dioſcorides*, and helpeth not only before a ſurfeit, but alſo it quickly refreſheth the ſtomack and belly after large eating and drinking. B

It is oftentimes a good remedy againſt long and lingring agues, eſpecially tertians: for it doth not onely ſtrengthen the ſtomacke and make an appetite to meat, but it yeeldeth ſtrength to the liuer alſo, and riddeth it of obſtructions or ſtoppings, clenſing by vrine naughty humours. C

Furthermore, Wormewood is excellent good for them that vomit bloud from the ſpleene, the which happeneth when the ſpleene being ouercharged and filled vp with groſſe bloud doth vnburden it ſelfe and then great plenty of bloud is oftentimes caſt vp by vomite. It happeneth likewiſe that ſtore of blacke and corrupt bloud mixed with excrements paſſeth downewards by the ſtoole, and it oftentimes happeth that with violent and large vomiting the ſicke man fainteth or ſwouneth, or when he is reuiued doth fall into a difficult and almoſt incurable tympanie, eſpecially when the diſeaſe doth often happen; but from theſe dangers Wormewood can deliuer him, if when he is refreſhed after vomite, and his ſtrength any way recouered, he ſhall a good while vſe it, in what manner ſoeuer he himſelfe ſhall thinke good. D

Againe, Wormewood voideth away the wormes of the guts, not onely taken inwardly, but applied outwardly: it withſtandeth all putrifactions; it is good againſt a ſtinking breath; it keepeth garments alſo from the mothes; it driueth away gnats, the body being annointed with the oyle thereof. E

Likewiſe it is ſingular good in pulteſſes and fomentations to binde and to dry. F

Beſides all this, *Dioſcorides* declareth, that it is good alſo againſt windineſſe and griping pains of the ſtomacke and belly, with Seſeli and French Spikenard: the decoction cureth the *yellow jaundies* or the infuſion, if it be drunke thriſe a day ſome ten or twelue ſpoonfuls at a time. G

H It helpeth them that are ſtrangled with eating of Muſhromes, or toad ſtools, if it be drunke with vinegre.

I And being taken in wine, it is good againſt the poyſon of *Ixia* (being a viſcous matter proceeding from the thiſtle *Chamælion*) and of Hemlocke, and againſt the biting of the ſhrew mouſe, and of the Sea Dragon: it is applied to the ſquincie or inflammations of the throat with honey and water; and with water to night wheales, and with hony to ſwartiſh markes that come vpon bruſes.

K It is applied after the ſame manner to dim eies, and to mattering eares.

L *Ioachimus Camerarius* of Noremberg commendeth it greatly againſt the jaundiſe, giuing of the floures of Wormewood, Roſemarie, Sloes, of each a ſmall quantitie, and a little Saffron, boiled in wine, the body firſt being purged and prepared by the learned Phyſition.

† The figure which formerly was in the ſecond place, was of a ſmall Wormewood not different from the common kinde, but onely in the ſmalneſſe of the leaues, and more aromaticke taſte; it growes on mountainous places, and *Geſner* calls it *Abſinthium commune minus, vel Alpinum*: now our Authors deſcription was intended for the figure we haue giuen you, for it is the *Abſinthium ſantonicum*, of ſome, as *Ruellius* and *Ceſalpinus*; and the *Galatium Sardonium* of *Pena* and *Lobel*.

Chap. 449. *Of Small leafed Worme-wood.*

Abſinthium tenuifolium Auſtriacum.
Auſtrian Wormewood.

¶ *The Deſcription.*

SMall leafed Wormwood bringeth forth very many little branches, ſlender, a ſpan or a foot high, full of leaues, leſſe by a great deale, and tenderer than the former, moſt finely and nicely minced: the floures like thoſe of the former, hang vpon the little branches & ſpikes: the roots are ſmall, creeping ouerthwart, from whence do riſe a great number of yong ſprouts: this Wormwood alſo is ſomewhat white, and no leſſe bitter than the broad leafed one, and hath not ſo ranke, or ſo vnpleaſant a ſmell, but rather delightfull.

¶ *The Place.*

It grows plentifully in Myſia, Thracia, Hungarie, and Auſtria, and in other regions neere adjoyning: it is alſo found in Bohemia, and in many vntilled places of Germany; it is a garden plant in the low Countries, and in England.

¶ *The Time.*

It bringeth forth floures and ſeed in Autumne: a little while after when Winter commeth, the herbe withereth away, but the root remaineth aliue, from which leaues and ſtalkes do come againe in the Spring.

¶ *The Names.*

‡ This *Lobel* calls *Abſinthium Ponticum Tridentinum Herbariorum*: *Cluſius*, *Abſinthium tenuifolium Auſtriacum*: *Tabernamontanus*, *Abſinthium Nabathæum Auicennæ*: wee may call it in Engliſh, ſmall leafed Wormewood. ‡

¶ *The Nature.*

Small leafed Wormewood is of facultie hot and dry, it is as bitter alſo as the broad leafed one, and of like facultie.

¶ *The Vertues.*

The faculties are referred vnto the common Wormewood.

Chap.

Chap. 450. *Of Sea Worme-wood.*

¶ *The Description.*

1 THe white or common Sea Wormwood hath many leaues cut and diuided into infinite fine jags, like those of Sothernwood, of a white hoarie colour and strong smell, but not vnpleasant: among which rise vp tough hoarie stalks set with the like leaues, on the top whereof do grow small yellowish floures: the root is tough, and creepeth far abroad, by means where of it greatly increaseth.

1 *Absinthium marinum album.*
White Sea Wormwood.

2 *Absinthium marinum repens.*
Creeping Sea Wormwood.

2 The broad leafed Sea Wormwood hath very many soft leaues, growing close by the ground, of a darke swart colour, nothing so finely cut or jagged as the other of his kinds: the floures grow vpon the tops of the stalks, of a yellowish colour: the root is tough and creeping. ‡ This hath many weake slender branches commonly two foot long at their ful growth, red of colour and creeping vpon the ground: the leaues are small, narrow, long and jagged, or parted towards their ends into sundry parcels: they are greene aboue, and grayish vnderneath: the toppes of the branches are set with many little stalkes, some inch long: which vpon short foot-stalkes comming out of the bosomes of little longish narrow leaues carry small round knops, like as in other plants of this kinde: the taste is a little bitterish, and the smell not vnpleasant: this growes with M^r. *Parkinson* and others, and (as I remember) it was first sent ouer from the Isle of Rees by M^r. *Iohn Tradescant*. *Lobel* in his Obseruations mentions it by the name of *Absinth. Ponticum supinum Herbariorum*; and *Tabern.* sets it forth by the title of *Absinthium repens*. ‡

¶ *The Place.*

These Wormwoods doe grow vpon the raised grounds in the salt marshes neere vnto the sea, in most places of England; which being brought into gardens doth there flourish as in his naturall place, and retaineth his smell, taste and naturall qualitie, as hath beene often proued. ‡ I haue not heard that the later growes wilde with vs in England. ‡

¶ *The Time.*

Theſe bring forth floures and ſeeds when the other Wormwoods do. ‡ The later ſcarce ſeeds with vs, it floures ſo late in the yeare. ‡

¶ *The Names.*

Sea Wormwood is called in Grkke, ἀψίνθιον θαλάσσιον: in Latine, *Abſinthium marinum*, and like *Scriphium*: in Dutch, **See Alſene**: of diuers, *Santonicum*, as witneſſeth *Dioſcorides*: neuertheleſſe there is another *Santonicum* differing from Sea Wormewood: in Engliſh of ſome Women in the country, Garden Cypreſſe.

¶ *The Temperature.*

Sea Wormwood is of nature hot and dry, but not ſo much as the common.

¶ *The Vertues.*

A *Dioſcorides* affirmeth, that being taken of it ſelfe, or boyled with Rice, and eaten with hony, it killeth the ſmall wormes of the guts, and gently looſeth the belly, the which *Pliny* doth alſo affirme.

B The juyce of ſea Wormwood drunke with wine reſiſteth poiſon, eſpecially the poiſon of Hemlockes.

C The leaues ſtamped with figs, ſalt-peter, and the meale of Darnel, and applied to the belly, ſides, or flankes, helpe the dropſie, and ſuch as are ſplenetick.

D The ſame is ſingular againſt all inflammations, and heat of the ſtomacke and liuer, exceeding all the kindes of Wormwood for the ſame purpoſes that common Wormwood ſerueth.

E It is reported by ſuch as dwell neere the ſea ſide, that the cattell which doe feed where it groweth become fat and luſty very quickly.

F The herbe with his ſtalks laid in cheſts, preſſes, and ward-robes, keepeth clothes from moths and other vermine.

Chap. 451. *Of Holy Wormewood.*

Sementina.
Holy Wormewood.

¶ *The Deſcription.*

THis Wormewood called *Sementina*, and *Semen ſanctum*, which we haue Engliſhed, Holy, is that kinde of Wormwood which beareth that ſeed which we haue in vſe, called Wormeſeed: in ſhops, *Semen Santolinum*: about which there hath been great controuerſies amongſt writers: ſome holding that the ſeed of *Santonicum Gallicum* to be the true Wormeſeed: others deeming it to be that of *Romanum Abſinthium*: it doth much reſemble the firſt of the ſea Wormwoods in ſhape and proportion: it riſeth vp with a wooddy ſtalke, of the height of a cubite, diuided into diuers branches and wings; whereupon are ſet very ſmall leaues: among which are placed cluſters of ſeeds in ſuch abundance, that to the firſt view it ſeemeth to be a plant conſiſting all of ſeed.

¶ *The Place.*

It is a forreine plant: the ſeeds being ſowne in the gardens of hot regions doe proſper well; in theſe cold countries it will not grow at all. Nethertheles there is one or two companions about London, who haue reported vnto me that they had great ſtore of it growing in their Gardens yearely, which they ſold at a great price vnto our London Apothecaries, and gained much money thereby; one of the men dwelling by the Bagge and Bottle neere London, whoſe name is *Cornewall*; into whoſe garden I was brought to ſee the thing that I would not beleeue; for being often told

told that there it did grow, I still persisted it was not true: but when I did behold this great quantitie of Wormewood, it was nothing else but common *Amcos*. How many Apothecaries haue been deceiued, how many they haue robbed of their mony, and how many children haue beene nothing the better for taking it, I refer it to the iudgement of the simplest, considering their owne report, to haue sold many hundreth pounds weight of it; the more to their shame be it spoken, and the lesse wit or skill in the Apothecaries: therefore haue I set downe this as a caueat vnto those that buy of these seeds, first to taste and trie the same before they giue it to their children, or commit it to any other vse. ‡ Certainly our Author was either misinformed, or the people of these times were very simple, for I dare boldly say there is not any Apothecary, or scarce any other so simple as to be thus deceiued now. ‡

¶ *The Time.*

It floureth and bringeth forth his seed in Iuly and August.

¶ *The Names.*

The French men call it *Barbotine*; the Italians, *Semen Zena*: whereupon also the Latine name *Seminina* came: the seed is called euery where *Semen sanctum*: Holy seed; and *Semen contra Lumbricos*: in English, Wormseed; the herbe it selfe is also called Wormseed, or Wormseed-wort: some name it *Semen Zedoariæ*, Zedoarie seed, because it hath a smell somewhat resembling that of Zedoarie.

¶ *The Temperature.*

The seed is very bitter, and for that cause of nature hot and dry.

¶ *The Vertues.*

It is good against wormes of the belly and entrailes, taken any way, and better also if a little Rubarbe be mixed withall, for so the wormes are not onely killed, but likewise they are driuen downe by the siege, which thing must alwaies be regarded. A

The seed mixed with a little *Aloe succotrina*, and brought to the forme of a plaister, and applied to the nauell of a childe doth the like. B

Chap. 452. *Of forreine and Bastard Wormewoods.*

1 *Absinthium album.*
White Wormwood.

2 *Absinthium Ægyptium.*
Wormwood of Ægypt.

¶ *The Deſcription.*

† 1 *Abſinthium album* hath ſtraight and vpright ſtalkes, a foot high, beſet with broad leaues, but very deeply cut or clouen, in ſhew like vnto thoſe of the great Daiſie, but white of colour: at the top of the ſtalkes, out of ſcaly heads, as in an vmbell grow floures, eompact of ſix ſmall white leaues: the root is long, with ſome fibres annexed to it.

2 This kinde of Wormewood *Geſner* and that learned Apothecarie *Valerandus Donraz*, called *Abſinthium Ægyptium*: the leaues of this plant are very like to the leaues of *Trichomanes*, which is our common Maiden haire, of a white colour, euery ſmall leafe ſtanding one oppoſite againſt another, and of a ſtrong ſauour.

3 This Wormewood, which *Dodonæus* calleth *Abſinthium inodorum*, and *Inſipidum*, is very like vnto the Sea Wormewood, in his ſmall and tender leaues: the ſtalke beareth floures alſo like vnto the foreſaid Sea Wormewood, but it is of a ſad or deepe colour, hauing neither bitter taſte, nor any ſauour at all; whereupon it was called, and that very fitly, *Abſinthium inodorum*, or *Abſinthium inſipidum*: in Engliſh, ſooliſh, or vnſauoury Wormwood. ‡ *Dodonæus* ſaith not that his *Abſinthium inſipidum* is like the ſea Wormwood, but that it is very like our common broad leaued Wormwood, and ſo indeed it is, and that ſo like, that it is hard to be diſcerned therefrom, but onely by the want of bitterneſſe and ſmell. ‡

3 *Abſinthium inodorum.*
Vnſauorie Wormewood.

4 *Abſinthium marinum, Abrotani fœmina ſimile.*
Small Lauander Cotton.

4 This kinde of Sea-Wormewood is a ſhrubby and wooddy plant, in face and ſhew like to Lauander Cotton, of a ſtrong ſmell; hauing floures like thoſe of the common Wormwood, at the firſt ſhew like thoſe of Lauander Cotton: the root is tough and wooddy.

¶ *The Place.*

Theſe plants are ſtrangers in England, yet we haue a few of them in Herbariſts gardens.

¶ *The Time.*

The time of their flouring and ſeeding is referred to the other Wormwoods.

¶ *The Names.*

The White Wormewood *Conradus Geſnerus* nameth *Seriphium fœmina*, and ſaith that it is commonly called *Herba alba*, or white herbe: another had rather name it *Santonicum*: for as *Dioſcorides* ſaith, *Santonicum* is found in France beyond the Alpes, and beareth his name of the ſame country

country where it groweth; but that part of Swisserland which belongeth to France is accounted of the Romans to be beyond the Alps; and the Prouince of Santon is far from it: for this is a part of Guines, scituate vpon the coast of the Ocean, beneath the floud Gerond Northward: therefore Santon Wormwood, if it haue his name from the Santons, groweth farre from the Alps: but if it grow neere adjoyning to the Alps, then hath it not his name from the Santons.

¶ *The Temperature and Vertues.*

White Wormewood is hot and somewhat dry.

Vnsauourie Wormewood, as it is without smell and taste, so is it scarse of any hot quality, much lesse hath it any scouring faculty. These are not vsed in Physicke, where the others may be had, being as it were wilde or degenerate kindes of Wormwood; some of them participating both of the forme and smell of other plants. A

‡ The figure which was here formerly in the first place, by the name of *Absinthium arborescens*, is the first of the next chapter: sue one, where you may see more thereof. The white Wormewood mentioned here in the Names, but no where else in the chapter, is either the same with one very like our Sea Wormewood. Let such as are curious looke into *Lonicerus* his *Herb. Med.* in the title of *Absinthium Santonicum*: and in *Dodonæus*, *Pempt.* 1. *lib.* 2. *cap.* 5. where the first description and the Wormewood.

Chap. 453. *Of Mugwort.*

1 *Artemisia, mater Herbarum.*
Common Mugwort.

¶ *The Description.*

1 THe first kinde of Mugwort hath broad leaues, very much cut or clouen like the leaues of common Wormewood, but larger, of a darke greene colour aboue, and hoarie vnderneath: the stalkes are long and straight, and full of branches, whereon do grow small round buttons, which are the floures, smelling like Marjerome when they wax ripe: the root is great, and of a wooddie substance.

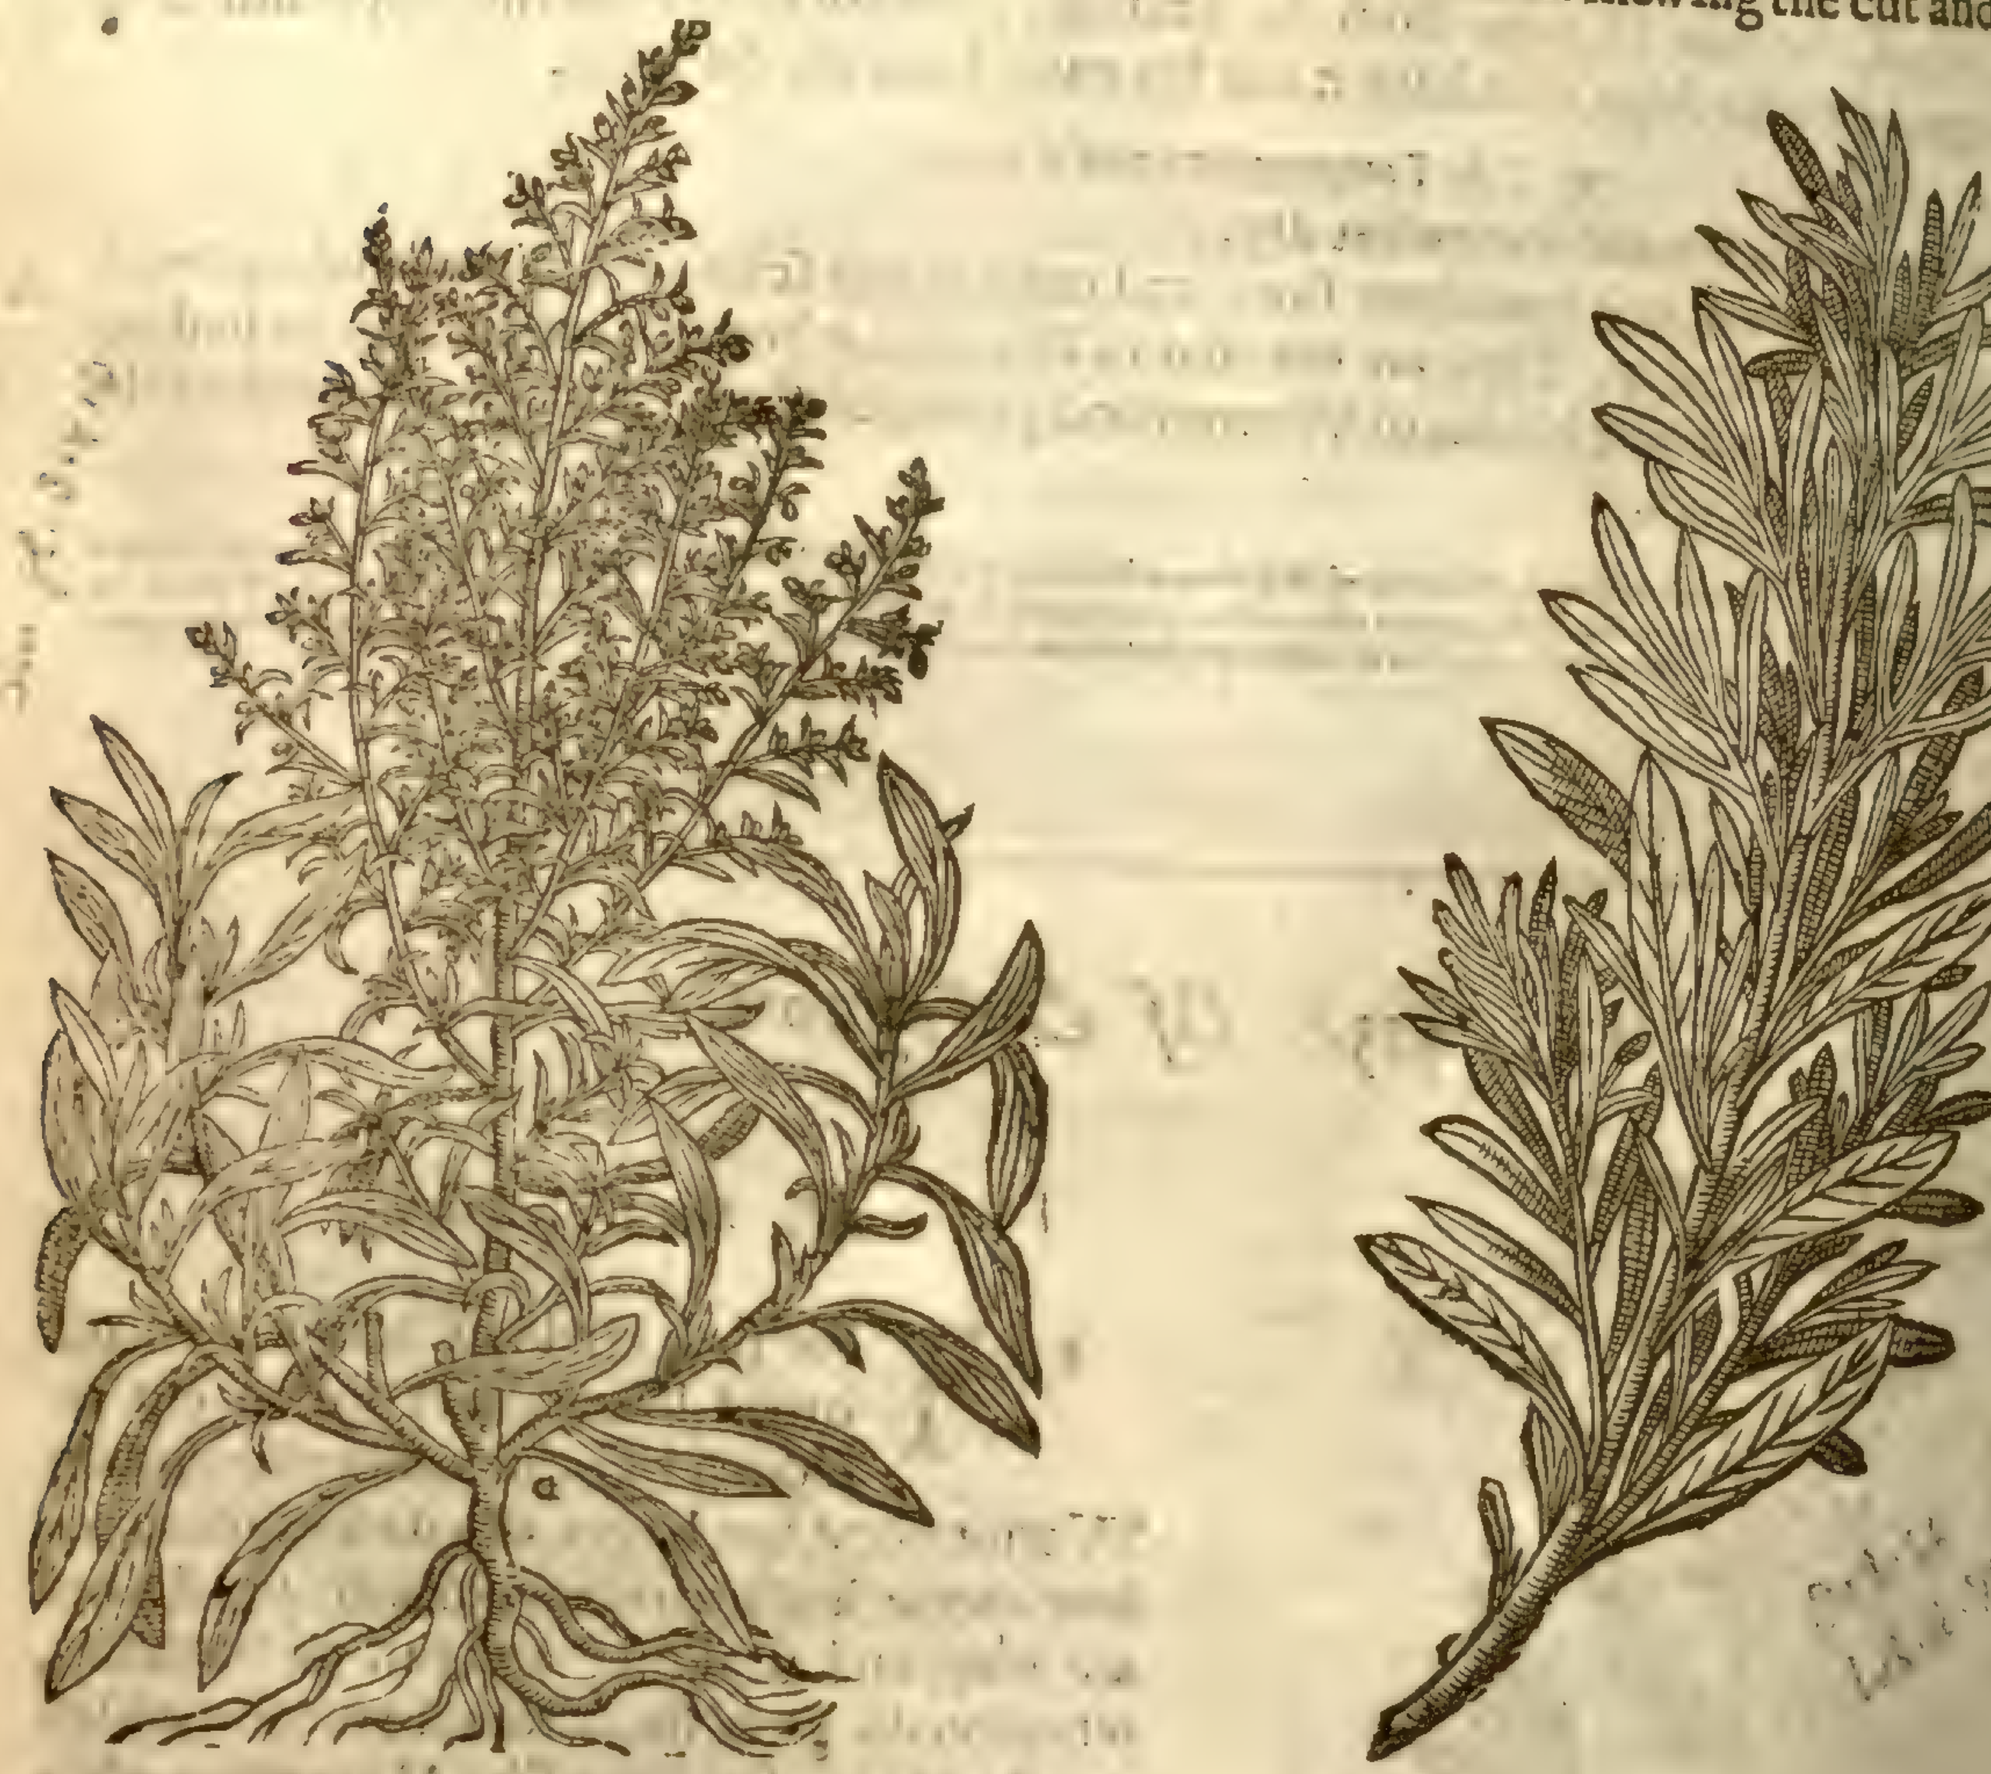
2 The second kinde of Mugwort hath a great thicke and wooddy root, from whence arise sundry branches of a reddish colour, beset full of small and fine jagged leaues, very like vnto sea Sothernwood: the seed groweth alongst the small twiggie branches, like vnto little berries, which fall not from their branches in a long time after they be ripe. ‡ I know not how this differeth from the former, but only in the colour of the stalke and flours, which are red or purplish; whereas the former is more whitish. ‡

3 There is also another Mugwort, which hath many branches rising from a wooddie root, standing vpright in distances one from another, of an ashie colour, beset with leaues not much vnlike sea Purslane; about the lower part of the stalkes, and toward the top of the branches they are narrower and lesser, and cut with great and deep jagges, thicke in substance, and of a whitish colour, as all the rest of the plant is: it yeeldeth a pleasant smell like *Abrotanum marinum*, and in taste is somewhat saltish: the floures are many and yellow: which being vaded, there followeth mossie seed like vnto that of the common Wormwood. ‡ The leaues of this plant are of two sorts; for some of them are long and narrow, like those of Lauander (whence *Clusius* hath called it *Artemisia folio Lauendulæ*) other some are cut in or diuided almost to the middle rib; as you may see it expresst apart in a figure by it selfe, which shewes both the whole, as also the diuided leaues.

¶ *The*

3 *Artemisia marina.*
Sea Mugwort.

‡ *Artemisiæ marinæ ramulus, folia integra & dissecta exprimens.*
A branch shewing the cut and vncut leaues.



¶ *The Place.*

The common Mugwort groweth wilde in sundry places about the borders of fields, about high waies, brooke sides, and such like places.

Sea Mugwort groweth about Rie and Winchelsea castle, and at Portsmouth by the Isle of Wight.

¶ *The Time.*

They floure in Iuly and August.

¶ *The Names.*

Mugwort is called in Greeke, Ἀρτεμισία and also in Latine, *Artemisia*, which name it had of *Artemisia* Queene of Halicarnassus, and wife of noble *Mausolus* King of Caria, who adopted it for her owne herbe: before that it was called Παρθένις, *Parthenis* as *Pliny* writeth. *Apuleius* affirmeth that it was likewise called *Parthenion*: who hath very many names for it, and many of them are placed in *Dioscorides* among the bastard names: most of these agree with the right *Artemisia*, and diuers of them with other herbes, which now and then are numbred among the Mugworts: it is also called *Mater Herbarum*: in high Dutch, **Beifusz**, and **Sant Johanus Gurtell**: in Spanish and Italian, *Artemisia*: in French, *Armoisa*: in low Dutch, **Bijuoet, Sint Jans kruyt**: in English, Mugwort, and common Mugwort.

¶ *The Temperature.*

Mugwort is hot and dry in the second degree, and somewhat astringent.

¶ *The Vertues.*

A *Pliny* saith, That Mugwort doth properly cure womens diseases.

B *Dioscorides* writeth, That it bringeth downe the termes, the birth, and the after-birth.

C And that in like manner it helpeth the mother, and the paine of the matrix, to bee boyled as bathes for women to sit in; and that being put vp with myrrh, it is of like force that the bath is of. And that the tender tops are boyled and drunke for the same infirmities; and that they are applied in manner of a pulteese to the share, to bring downe the monethly course.

D *Pliny* saith, That the traueller or wayfaring man that hath the herbe tied about him feeleth no wearisomnesse at all; and that he who hath it about him can be hurt by no poysonsome medicines, nor by any wilde beast, neither yet by the Sun it selfe; and also that it is drunke against *Opium*, or the

the juyce of blacke Poppy. Many other fantasticall deuices inuented by Poëts are to be seene in the Works of the Antient Writers, tending to witchcraft and sorcerie, and the great dishonour of God; wherefore I do of purpose omit them, as things vnworthy of my recording, to your reuiewing.

Mugwort pound with oyle of sweet almonds, and laid to the stomacke as a plaister, cureth all the paines and griefes of the same. E

It cureth the shakings of the joynts, inclining to the palsie, and helpeth the contraction or drawing together of the nerues and sinewes. F

* There were formerly two descriptions of the *Artemisia vulgaris*; wherefore I omitted the former, being the more vnperfect.

Chap. 454. *Of Sothernwood.*

¶ *The Kindes.*

Dioscorides affirmeth that Sothernwood is of two kindes, the female and the male, which are euery where known by the names of the greater and of the lesser, besides these there is a third kind, which is of a sweeter smell, and lesser than the others, and also others of a bastard kinde.

† 1 *Abrotanum fœmina arborescens.*
Female Sothernwood.

2 *Abrotanum mas,*
Male Sothernwood.

¶ *The Description.*

1 THe greater Sothernwood by carefull manuring doth oftentimes grow vp in manner of a shrub, and commeth to be as high as a man, bringing forth stalkes an inch thicke, or more; out of which spring very many sprigs or branches, set about with leaues diuersly jagged and finely indented, somewhat white, and of a certaine strong smell: in stead of floures, little small clusters of buttons doe hang on the sprigs from the middle to the very top, of colour yellow, and at the length turne into seed. The root hath diuers strings.

2 The

3 *Abrotanum humile.*
Dwarfe Sothernwood.

4 *Abrotanum inodorum.*
Vnſauorie Sothernwood.

5 *Abrotanum campeſtre.*
Wilde Sothernwood.

2 The leſſer Sothernwood groweth low, full of little ſprigs of a wooddy ſubſtance: the leaues are long, and ſmaller than thoſe of the former, not ſo white: it beareth cluſtering buttons vpon the top of the ſtalkes: the root is made of many ſtrings.

3 The third kind is alſo ſhorter: the leaues hereof are jagged and deeply cut after the manner of the greater Sothernwood, but they are not ſo white, yet more ſweet, wherein they are like vnto Lauander cotton. This kinde is very full of ſeed: the buttons ſtand alongſt on the ſprigs, euen to the very top, and be of a glittering yellow. The root is like to the reſt.

4 The vnſauorie Sothernwood groweth flat vpon the ground, with broad leaues deepely cut or jagged in the edges like thoſe of the common Mugwort: among which riſe vp weake and feeble ſtalkes trailing likewiſe vpon the ground, ſet confuſedly here and there with the like leaues that grow next the ground, of a grayiſh or hoary colour, altogether without ſmell. The floures grow alongſt the ſtalkes, of a yellowiſh colour, ſmall and chaffie: the root is tough and wooddy, with ſome ſtrings annexed thereto.

5 This wilde Sothernwood hath a great long thicke root, tough and wooddy, couered

ouer with a scaly barke like the scaly backe of an Adder, and of the same colour: from which rise very many leaues like those of Fennell, of an ouerworne greene colour: among which grow small twigy branches on the tops, and alongst the stalkes doe grow small clustering floures of a yellow colour: the whole plant is of a darke colour, as well leaues as stalkes, and of a strong vnsauourie smell.

¶ *The Place.*

Theophrastus saith that Sothernwood delighteth to grow in places open to the Sun: *Dioscorides* affirmeth that it groweth in Cappadocia, and Galatia a countrey in Asia, and in Hierapolis a city in Syria: it is planted in gardens almost euery where: that of Sicilia and Galatia is most commended of *Pliny*.

¶ *The Time.*

The buttons of Sothernwood doe flourish and be in their prime in August, and now and then in September.

¶ *The Names.*

It is called in Greeke, Ἀβρότονον: the Latines and Apothecaries keepe the same name *Abrotanum*: the Italians and diuers Spaniards call it *Abrotano*: and other Spaniards, *Yerua lombriguera*: in high Dutch, **Stabwurts**: in low Dutch, **Aueroone**, and **Auerruijt**: the French, *Aurone*, and *Auroesne*: the English men, Sothernwood: it hath diuers bastard names in *Dioscorides*; the greater kinde is *Dioscorides* his *Fœmina*, or female Sothernewood; and *Pliny* his *Montanum*, or mountaine Sothernewood: the mountaine Sothernwood we take for the female, and the champion for the male. There be notwithstanding some that take Lauander Cotton to be the female Sothernwood; grounding thereupon, because it bringeth forth yellow floures in the top of the sprigs like cluster buttons: but if they had more diligently pondered *Dioscorides* his words, they would not haue beene of this opinion: the lesser Sothernewood is *Mas*, the male, and is also *Plinies* champion Sothernwood; in Latine, *Campestre*. The third, as we haue said, is likewise the female, and is commonly called sweet Sothernwood, because it is of a sweeter sent than the rest. *Dioscorides* seemeth to call this kinde *Siculum*, Sicilian Sotherwood.

¶ *The Temperature.*

Sothernewood is hot and dry in the end of the third degree: it hath also force to distribute and to rarifie.

¶ *The Vertues.*

The tops, floures, or seed boyled, and stamped raw with water and drunke, helpe them that cannot take their breaths without holding their neckes straight vp, and is a remedie for the cramp and for sineives shrunke and drawne together; for the sciatica also, and for them that can hardly make water; and it is good to bring downe the termes. A

It killeth wormes, and driueth them out: if it be drunke with wine it is a remedy against deadly poysons. B

Also it helpeth against the stinging of Scorpions and field spiders, but it hurts the stomacke. C

Stamped and mixed with oyle it taketh away the shiuering cold that commeth by the ague fits, and it heateth the body if it be annointed therewith before the fits do come. D

If it be pounded with barley meale and laid to pushes it taketh them away. E

It is good for inflammations of the eies, with the pulpe of a rosted Quince, or with crummes of bread, and applied pultis wise. F

The ashes of burnt Sothernwood, with some kinde of oyle that is of thin parts, as of *Palma Christi*, Raddish oyle, oyle of sweet Marjerome, or Organie, cure the pilling of the haire of the head, and make the beard to grow quickely: being strewed about the bed, or a fume made of it vpon hot embers, it driueth away serpents: if but a branch be laid vnder the beds head they say it prouoketh venerie. G

The seed of Sothernwood made into pouder, or boyled in wine and drunke, is good against the difficultie and stopping of vrine; it expelleth, wasteth, consumeth, and digesteth all cold humours, tough slime and flegme, which do vsually stop the spleene, kidnies, and bladder. H

Sothernwood drunke in wine is good against all venome and poison. I

The leaues of Sothernwood boyled in water vntill they be soft, and stamped with barley meale and barrowes grease vnto the forme of a plaister, dissolue and waste all cold tumors and swellings, being applied or laid thereto. K

† The description herein the first place is that of the *Abrotanum fœmina arborescens* of *Dodonæus*, being the very first in his *Pemptades*. The figure which our Author put thereto was of the Lauander Cotton, which should haue beene in the next chapter but one: Now the figure that hee should haue put here was put two chapters before, by the name of *Absinthium arborescens*, by which name *Lobel* also calls it: but I haue thought it fitter to put it here, because here was the better description, and the plant is the better referred to this kinde.

CHAP.

CHAP. 455.

Of Oke of Ieruſalem, and Oke of Cappadocia.

1 *Botrys.*
Oke of Ieruſalem.

2 *Ambroſia.*
Oke of Cappadocia.

¶ *The Deſcription.*

1 OKe of Ieruſalem, or *Botrys*, hath ſundry ſmall ſtems a foot and a halfe high, diuiding themſelues into many ſmall branches, beſet with ſmall leaues deeply cut or jagged, very much reſembling the leafe of an Oke, which hath cauſed our Engliſh women to call it Oke of Ieruſalem; the vpper ſide of the leafe is of a deepe greene, and ſomewhat rough and hairy, but vnderneath it is of a darke reddiſh or purple colour: the ſeedie floures grow cluſtering about the branches, like the yong cluſters or blowings of the Vine: the root is ſmall and threddy: the whole herbe is of a pleaſant ſmell and ſauour, and of a feint yellowiſh colour, and the whole plant dieth when the ſeed is ripe.

2 The fragrant ſmell that this kinde of *Ambroſia* or Oke of Cappadocia yeeldeth, hath mooued the Poëts to ſuppoſe that this herbe was meate and food for the gods: *Dioſcorides* ſaith it groweth three handfuls high: in my garden it groweth to the height of two cubits, yeelding many weake crooked and ſtreaked branches, diuiding themſelues into ſundry other ſmall branches, hauing from the middeſt to the top thereof many moſſie yellowiſh floures not much vnlike common Wormewood, ſtanding one before another in good order; and the whole plant is as it were couered ouer with bran or a mealy duſt: the floures doe change into ſmall prickly cornered buttons, much like vnto *Tribulus terreſtris*; wherein is contained blacke round ſeed, not vnpleaſant in taſte and ſmell: the leaues are in ſhape like the leaues of Mugwort, but thinner and more tender: all the whole plant is hoary, and yeeldeth a pleaſant ſauour: the whole plant periſhed with me at the firſt approch of Winter.

¶ *The Place.*

Theſe plants are brought vnto vs from beyond the ſeas, eſpecially from Spaine and Italy.

¶ *The Time.*

They floure in Auguſt, and the ſeed is ripe in September.

¶ *The*

¶ *The Names.*

Oke of Ierusalem is called in Greeke Βότρυς: in Latine, *Botrys*: in Italian, *Botri*: in Spanish, *Bien Grande*: in high-Dutch, **Traubenkraut**, and **Krottenkraut**: in French and low-Dutch, *Pyment*: in English, Oke of Ierusalem, and of some, Oke of Paradise.

Oke of Cappadocia is called in Greeke Ἀμβροσία: in Latine, *Ambrosia*, neither hath it any other Latine name. *Pliny* saith, *Ambrosia* is a wandering name, and is giuen vnto other herbs: for *Botrys* (Oke of Ierusalem, as we haue written) is of diuers also called *Ambrosia*. In English it is called oke of Cappadocia.

¶ *The Temperature.*

These plants are hot and dry in the second degree, and consist of subtill parts.

¶ *The Vertues.*

These plants be good to be boiled in wine, and ministred to such as haue their brests stopt, and are short winded and cannot easily draw their breath; for they cut and wast grosse humors & tough flegm. The leaues are of the same force, beeing made vp with sugar they commonly call it a Conserue. A

It giueth a pleasant taste to flesh that is sodden with it, and eaten with the broth. B

It is dried and laid among garments, not onely to make them smell sweet, but also to preserue them from moths and other vermin, which thing it doth also performe. C

† There were formerly two more descriptions in this Chapter, both which were made by looking vpon the figures in *Lobels Icons*; the former being of his *Ambrosia Botrys flore luteo*, which is nothing else but the *Coronopus Ruellii* or Swines Cresses. The later was of his *Ambrosia tenuifolia*, which our Author in the last Chapter set forth by the name of *Abrotanum campestre*.

Chap. 456. *Of Lavander Cotton.*

† *Chamæcyparissus.*
Lavander Cotton.

¶ *The Description.*

LAvander Cotton bringeth forth clustred buttons of a golden colour, and of a sweet smel, and is often vsed in garlands and houses. It hath a wooddy stocke, out of which grow forth branches like little boughes, slender, very many, a cubit long, set about with little leaues, long, narrow, purled or crumpled: on the tops of the branches stand vp floures, one alone on euery branch, made vp with short threds thrust close together, like to the flours of Tansie, and to the middle buttons of the floures of Cammomill, but yet something broader, of colour yellow, which be changed into seed of an obscure colour: the root is of a wooddy substance; the shrub it selfe is white both in branches and leaues, and hath a strong sweet smell.

‡ There are some varieties of this plant, which *Matthiolus*, *Lobel*, and others refer to *Abrotanum fœmina*, and so cal it; and by the same name our Author gaue the figure thereof in the last Chapter saue one, though the description did not belong thereto, as I haue formerly noted. Another sort thereof our Author, following *Tabernamontanus* and *Lobel*, set forth a little before by the name of *Absinthium marinum Abrotani fœminæ facie*, which *Dodonæus* calls *Santolina prima*; and this here figured, *Santolina altera*. He also mentions three other differences thereof, which chiefely consist in the leaues; for his third hath very short and small leaues like those of Heath; whence *Bauhine* calls it *Abrotanum fœmina foliis Ericæ*. The fourth hath the leaues lesse toothed; and more like Cypres, whence it is called in the *Aduers. Abrotanum peregrinum cupressi foliis*. The fift hath not the stalkes growing

growing vpright, but creeping; the leaues are toothed, more thicke and hoary than the reſt, in other reſpects alike. *Bauhine* calls it *Abrotanum fœmina repens caneſcens*.

¶ *The Place.*

Lavander Cotton groweth in gardens almoſt euerie where.

¶ *The Time.*

They floure in Iuly and Auguſt.

¶ *The Names.*

They are called by one name *Santolina*, or Lavander Cotton: of moſt, *Chamæcypariſſus*: but *Pliny* concerning *Chamæcypariſſus* is ſo ſhort and brief, that by him their opinions can neither be rejected nor receiued.

They are doubtleſſe much deceiued that would haue Lavander Cotton to be *Abrotanum fœmina*, or the female Sothernwood; and likewiſe they are in the wrong who take it be *Seriphium*, ſea wormwood; and they who firſt ſet it abroch to be a kinde of Sothernwood, we leaue to their errours, because it is not abſolutely to be referred to one, but a plant participating both of Wormwood and Sothernwood.

¶ *The Nature.*

The ſeed of Lavander Cotton hath a bitter taſte, being hot and dry in the third degree.

¶ *The Vertues.*

A *Pliny* ſaith, That the herb *Chamæcypariſſus* being drunke in wine is a good medicine againſt the poiſon of all ſerpents and venomous beaſts.

B It killeth wormes either giuen greene or dry, and the ſeed hath the ſame vertue againſt wormes, but auoideth them with greater force. It is thought to be equall with the vſuall wormſeed.

† The figure which formerly was in this place was a kinde of Moſſe, which *Tragus* ſet forth by the name of *Sabina ſylueſtris*: *Turner* and *Tabernæmontanus* call it *chamæcypariſſus*. See more thereof in the Moſſes.

Chap. 457. *Of Sperage or Aſparagus.*

1 *Aſparagus ſativus.*
Garden Sperage.

2 *Aſparagus petræus.*
Stone or Mountaine Sperage.

¶ *The Description.*

1 THe first being the manured or garden Sperage, hath at his first rising out of the ground thicke tender shoots very soft and brittle, of the thicknesse of the greatest swans quill, in taste like the green bean, hauing at the top a certaine scaly soft bud, which in time groweth to a branch of the height of two cubits, diuided into diuers other smaller branches, whereon are set many little leaues like haires, more fine than the leaues of Dill: amongst which come forth small mossie yellowish floures which yeeld forth the fruit, green at the first, afterward as red as Corall, of the bignesse of a small pease; wherein is contained grosse blackish seed exceeding hard, which is the cause that it lieth so long in the ground after his sowing, before it spring vp: the roots are many thicke soft and spongie strings hanging downe from one head, and spred themselues all about, whereby it greatly increaseth.

2 We haue in our marish and low grounds neere vnto the sea, a Sperage of this kinde which differeth a little from that of the garden, and yet in kinde there is no difference at all, but onely in manuring, by which all things or most things are made more beautifull and larger. This may bee called *Asparagus paluſtris*, marish Sperage.

4 *Asparagus sylvestris aculeatus.*
Wilde prickly Sperage.

5 *Asparagus sylvestris spinosus Clusij.*
Wilde thorny Sperage.

3 Stone or mountain Sperage is one of the wild ones, set forth vnder the title of *Corruda*, which *Lobel* calls *Asparagus petræus*; and *Galen*, *Myacanthinus*, that doth very well resemble those of the garden in stalks, roots, and branches, sauing that those fine hairy leaues which are in the garden Sperage are soft, blunt, and tender; and in this wild Sperage, sharp hard and pricking thornes, though they be small and slender: the root hereof is round, of the bignesse of a pease, and of a black color: the roots are long, thicke, fat, and very many.

4 This fourth kind differeth from the last described, being a wild Sperage of Spain and Hungarie: the plant is altogether set with sharpe thornes, three or foure comming forth together, as are the branches of Whinnes, Goes, and Fursen: the fruit is black when it is ripe, and ful of a greenish pulpe, wherein lie hard and blacke seeds, sometimes one, otherwhiles two in a berry: the roots are like the others, but greater and tougher.

‡ 6 *Drypis.*
Sperage Thiſtle.

5 *Carolus Cluſius* deſcribes alſo a certain wild Sperage with ſharp prickles all alongſt the ſtalks, orderly placed at euery joint one, hard, ſtiffe, and whitiſh, the points of the thornes pointing downward: from the which joints alſo doe grow out a few long greene leaues faſtened together, as alſo a little yellow floure and one berry three cornered, of a blacke colour, wherein is contained one blacke ſeed, ſeldom more: the roots are like the other.

6 *Drypis* beeing likewiſe a kinde hereof, hath long and ſmall roots creeping in the ground like Couch-graſſe; from which ſpring vp branches a cubit high, ful of knotty joints: the leaues are ſmall like Iuniper, not much differing from *Corruda* or *Nepa*: the floures grow at the top of the ſtalke in ſpoky tufts or roundles, of a white colour, cloſely thruſt together: the ſeed before it is taken out of the huske is like vnto Rice; being taken out, like that of Melilot, of a ſaffron colour.

¶ *The Place.*

The firſt being our garden Aſparagus, groweth wilde in Eſſex, in a medow neere to a mill, beyond a village called Thorp; and alſo at Singleton not far from Carby, and in the medowes neere Moulton in Lincolnſhire. Likewiſe it growes in great plenty neere Harwich, at a place called Bandamalading, and at North Moulton in Holland a part of Lincolnſhire.

The wilde Sperages grow in Portugal and Biſcay amongſt ſtones; one of which, *Petrus Bellonius* maketh mention to grow in Candy, *lib.* 1. *cap.* 18. of his Singularities.

¶ *The Time.*

The bare naked tender ſhoots of Sperage ſpring vp in Aprill, at what time they are eaten in ſallads; they floure in Iune and Iuly, the fruit is ripe in September.

¶ *The Names.*

The garden Sperage is called in Greeke Ἀσπάραγος: in Latine likewiſe *Aſparagus*: in ſhops, *Sparagus* and *Speragus*: in high-Dutch, **Spargen**: in low-Dutch, **Aſparges**, and **Cozalcruyt**, that is to ſay, *Herba Coralli*, or Coral-wort, of the red berries, which beare the colour of Corall: in Spaniſh, *Aſparragos*: in Italian, *Aſparago*: in Engliſh, Sperage, and likewiſe Aſparagus after the Latine name: in French, *Aſperges*. It is named Aſparagus, of the excellency, becauſe *aſparagi*, or the ſprings hereof are preferred before thoſe of other plants whatſoeuer: for this Latine word *Aſparagus* doth properly ſignifie the firſt ſpring or ſprout of euery plant, eſpecially when it is tender, and before it do grow into an hard ſtalk, as are the buds, tendrels, or yong ſprings of wild Vine or hops, and ſuch like.

Wild Sperage is properly called in Greeke μύαγρος, which is as much to ſay as Mouſe-prickle; and Ἀσπάραγος πετραῖος, that is to ſay, *Petræus Aſparagus*, or ſtone Sperage: it is alſo named in Latine *Aſparagus ſylueſtris*, or *Corruda*.

¶ *The Temperature.*

The roots of the garden and wilde Sperage do cleanſe without manifeſt heate and drineſſe.

¶ *The Vertues.*

A The firſt ſprouts or naked tender ſhoots hereof be oftentimes ſodden in fleſh broth and eaten, or boiled in faire water, and ſeaſoned with oile, vineger, ſalt, and pepper, then are ſerued vp as a ſallad: they are pleaſant to the taſte, eaſily concocted, and gently looſe the belly.

B They ſomwhat prouoke vrin, are good for the kidnies and bladder, but they yeeld little nourishment to the body, and the ſame moiſt, yet not faulty: they are thought to increaſe ſeed and ſtir vp luſt.

† The *Nepa* formerly mentioned in this Chapter, but now omitted, was againe ſet forth by our Author among the Fardels: where you may find it.

Chap.

Chap. 458. *Of Horſe-taile or Shaue-graſſe.*

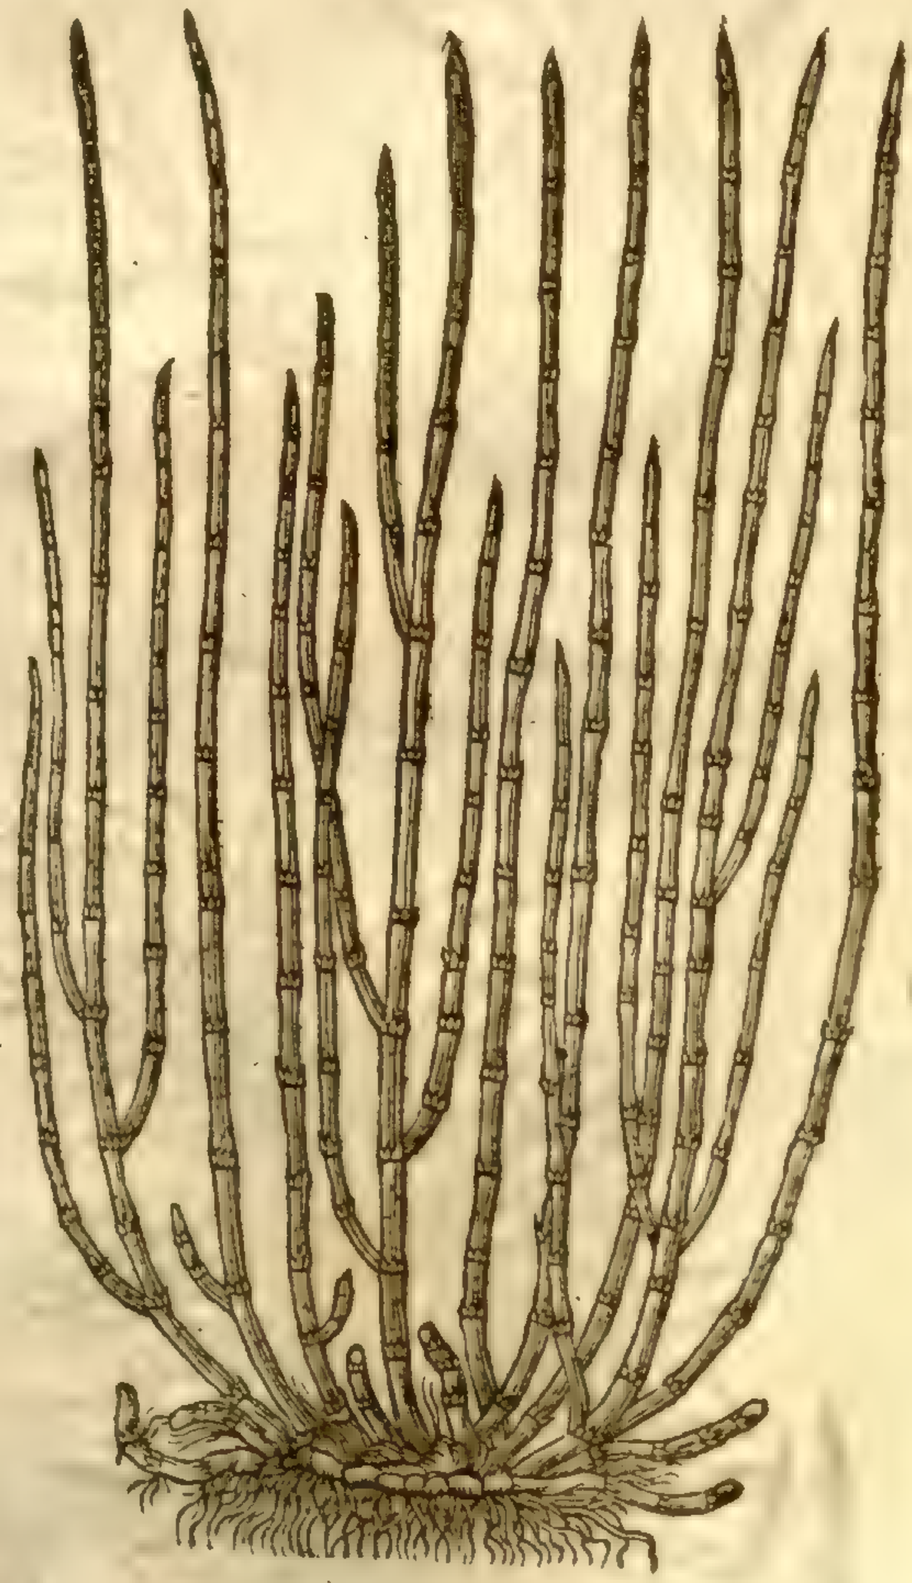
¶ *The Deſcription.*

1 GReat Horſe-taile riſeth vp with a round ſtalke hollow within like a reed, a cubit high, compact as it were of many ſmall pieces one put into the end of another, ſomtimes of a reddiſh colour, very rough, and ſet at euery joint with many ſtiffe Ruſh-like leaues, or rough briſtles, which maketh the whole plant to reſemble the taile of a horſe, whereof it tooke his name: on the top of the ſtalke do ſtand in ſtead of floures cluſtered and thicke catkins, not vnlike to the firſt ſhoots of Sperage, which is called *Myacantha*: the root is jointed, and creepeth in the ground.

2 This ſmall and naked Shaue-graſſe, wherewith Fletchers and Combe-makers doe rub and poliſh their worke, riſeth out of the ground like the firſt ſhoots of Aſparagus, jointed or kneed by certain diſtances like the precedent, but altogether without ſuch briſtly leaues, yet exceeding rough and cutting: the root groweth aſlope in the earth like thoſe of the Couch-graſſe.

1 *Equiſetum majus:*
Great Horſe-taile.

2 *Equiſetum nudum.*
Naked Horſe-taile.



3 Horſe-taile which for the moſt part groweth among corn and where corn hath been, hath a very ſlender root and ſingle; from which riſe vp diuers jointed ſtalks, whereon doe grow very long rough narrow jointed leaues, like vnto the firſt deſcribed, but thicker and rougher, as is the reſt of the plant.

4 Water Horſe-taile, that growes by the brinks of riuers and running ſtreams, and often in the middeſt of the water, hath a very long root according to the depth of the water, groſſe, thicke, and jointed, with ſome threds anexed thereto: from which riſeth vp a great thicke jointed ſtalk whereon grow long rough ruſhy leaues pyramide or ſteeple-faſhion. The whole plant is alſo tough, hard and fit to ſhaue and rub woodden things as the other.

5 This kinde of Horſe-taile that growes in woods and ſhadowie places, hath a ſmall root and ſingle, from which riſeth vp a rough chamfered ſtalke jointed by certaine ſpaces, hauing at each joint two buſhes of rough briſtly leaues, ſet one againſt another like the other of his kinde.

3 *Equiſetum ſegetale.*
Corne Horſe-taile.

4 *Equiſetum paluſtre.*
Water Horſe-taile.

5 *Equiſetum ſylvaticum.*
Wood Horſe-taile.

6 *Cauda equina fœmina.*
Female Horſe-taile.

9 *Iuncaria Salmanticenſis.*
Italian rushy Horſe-taile.

6 The female Horſe-taile groweth for the moſt part in waterish places, and by the brinks of ſmall rills and pirling brooks: it hath a long root like that of Couch-graſſe, from which riſe vp diuers hollow ſtalks, ſet about at certaine diſtances with ſmall leaues in rundles like thoſe of Wood-roofe, altogether barren of ſeed and floure, wherof it was called by *Lobel*, *Polygonon fœmina ſemine Vidua*. ‡ This is ſometimes found with ten or more ſeeds at each joint; whence *Bauhine* hath called it *Equiſetum paluſtre brevioribus foliis polyſpermon*. ‡

‡ 7 In ſome boggy places of this kingdom is found a rare and pretty *Hippuris* or Horſe-taile, which growes vp with many little branches ſome two or three inches high, putting forth at each joint many little leaues, cluſtering cloſe about the ſtalke, and ſet after the maner of other Horſe-tailes: towards the top of the branches the joints are very thicke: the colour of the whole plant is gray, a little inclining to greene, very brittle, and as it were ſtony or grauelly like Coralline, and will craſh vnder your feet as if it were frozen; and if you chew it you ſhall finde it all ſtony and grauelly. My friend Mr *Leonard Buckner* was the firſt that found this plant and brought it to me: hee had it three miles beyond Oxford, a little on this ſide Euenſham ferry, in a bog vpon a common by the Beacon hill neere Cumner wood, in the end of Auguſt, 1632. Mr *Bowles* hath ſince found it growing vpon a bog not far from Chiſelhurſt in Kent. I queſtion whether this be not the *Hippuris lacuſtris quædam foliis manſu arenoſis* of *Geſner*. But if *Geſners* be that which *Bauhine* in his *Prodromus*, pag. 24. ſets forth by the name of *Equiſetum nudum minus variegatum*, then I iudge it not to be this of my deſcription: for *Bauhines* differs from this, in that it is without leaues, and oft times bigger: the ſtalks of his are hollow, theſe not ſo. This may be called *Hippuris Coralloides*, Horſe-taile Coralline.

8 Toward the later end of the yere, in diuers ditches, as in S. *Iames* his Parke, in the ditches on the backe of Southwarke toward S. *Georges* fields, &c. you may finde couered ouer with water a kinde of ſtinking Horſe-taile; it growes ſometimes a yard long, with many joints and branches, and each joint ſet with leaues, as in the other Horſe-tailes, but they are ſomewhat jagged or diuided towards the tops. I take this to be the *Equiſetum fœtidum ſub aqua repens*, deſcribed in the fifth place of *Bauhines Prodromus*. We may call in Engliſh, ſtinking water Horſe-taile. ‡

9 *Cluſius* hath ſet forth a plant that he referreth vnto the ſtocke of Horſe-tailes, which he thus deſcribeth; It hath many twiggy or rushy ſtalks, whereupon it was called *Iuncaria*, and may be Engliſhed, Ruſh weed: the leaues grow vpon the branches like thoſe of flax; on the tops of the ſtalks grow ſmall chaffie floures of a whitiſh colour. The ſeed is ſmall and blacke of colour, the root little and white: the whole plant is ſweetiſh in taſte.

10 *Dodonæus* ſets forth another Horſe-taile, which he called climing Horſe-tail, or Horſe-tail of Olympus. There is (ſaith he) another plant like Horſe-taile, but greater and higher; it riſeth vp oftentimes with a ſtalke as big as a mans arme, diuided into many branches, out of which there grow long ſlender ſprigs very full of joints like to the firſt Horſe-taile: the floures ſtand about the joints, of a moſſie ſubſtance, ſmall as are thoſe of the Cornel tree; in places whereof grow vp red fruit full of ſoure juice, not vnlike to little Mulberries, in which is the ſeed. The root is hard and wooddy. This growes now and then to a great height, and ſometimes lower. *Bellonius* writes in his Singularities, That it hath bin ſeen to be equall in height with the Plane tree: it comes vp lower neere to ſhorter and leſſer trees and ſhrubs, yet doth it not faſten it ſelfe to the trees with any tendrels or claſping aglets, much leſſe doth it winde it ſelfe about them, yet doth it delight to ſtand neere and cloſe vnto them.

¶ The

¶ *The Place.*

The titles and descriptions shew the places of their growing. The last *Bellonius* reports to grow in diuers vallies of the mountaine Olympus, and not far from Raguſa a city in Sclavonia.

¶ *The Time.*

They floure from Aprill to the end of Summer.

¶ *The Names.*

Horſe-taile is called in Greeke Ἵππουρις, *Hippuris*: in Latine, *Equiſetum*, and *Equinalis*: of *Plin. lib.* 15. *cap.* 28. *Equiſetis*, of the likeneſſe of a horſe haire: of ſome, *Salix equina*: in ſhops, *Cauda Equina*: in high-Dutch, **Schaffthew**: in low-Dutch, **Peertſteert**: in Italian, *Coda di Cavallo*: in Spaniſh, *Coda de mula*: in French, *Queve de Cheval*, and *Caqueve*: in Engliſh, Horſe-taile, Shave-graſſe, and in ſome places, Ioynts.

Shaue-graſſe is not without cauſe named *Aſprella*, of his ruggednesſe, which is not vnknowne to women, who ſcoure their pewter and wodden things of the kitchen therewith, which the Germane women call **Zannenkraut**: and therefore ſome of our huſwiues do call it Pewter-wort. Of ſome the tenth is called *Ephedra*, *Anobaſis*, and *Caucon*.

¶ *The Temperature.*

Horſe-taile (as *Galen* ſaith) hath a binding facultie with ſome bitterneſſe, wherefore it mightily drieth, and that without biting.

¶ *The Vertues.*

A *Dioſcorides* ſaith, that Horſe-taile being ſtamped and laid to, doth perfectly cure wounds, yea although the ſinues be cut in ſunder, as *Galen* addeth. It is of ſo great and ſingular vertue in healing wounds, as that it is thought and reported for truth, to cure the wounds of the bladder and other bowels, and helpeth ruptures and burſtings.

B The herb drunke either with water or wine, is an excellent remedy againſt bleeding at the noſe, and other fluxes of bloud: it ſtayeth the ouermuch flowing of womens floures, the bloudy flix, and other fluxes of the belly.

C The juice of the herb taken in the ſame manner doth the like, and more effectually.

D Horſe-taile with his roots boiled in wine is very profitable for the vlcers of the kidnies & bladder, the cough, and difficultie of breathing.

CHAP. 459. *Of Sea Cluſter or Sea Raiſon.*

† 1 *Vua marina minor.*

The ſmall ſea Grape.

¶ *The Deſcription.*

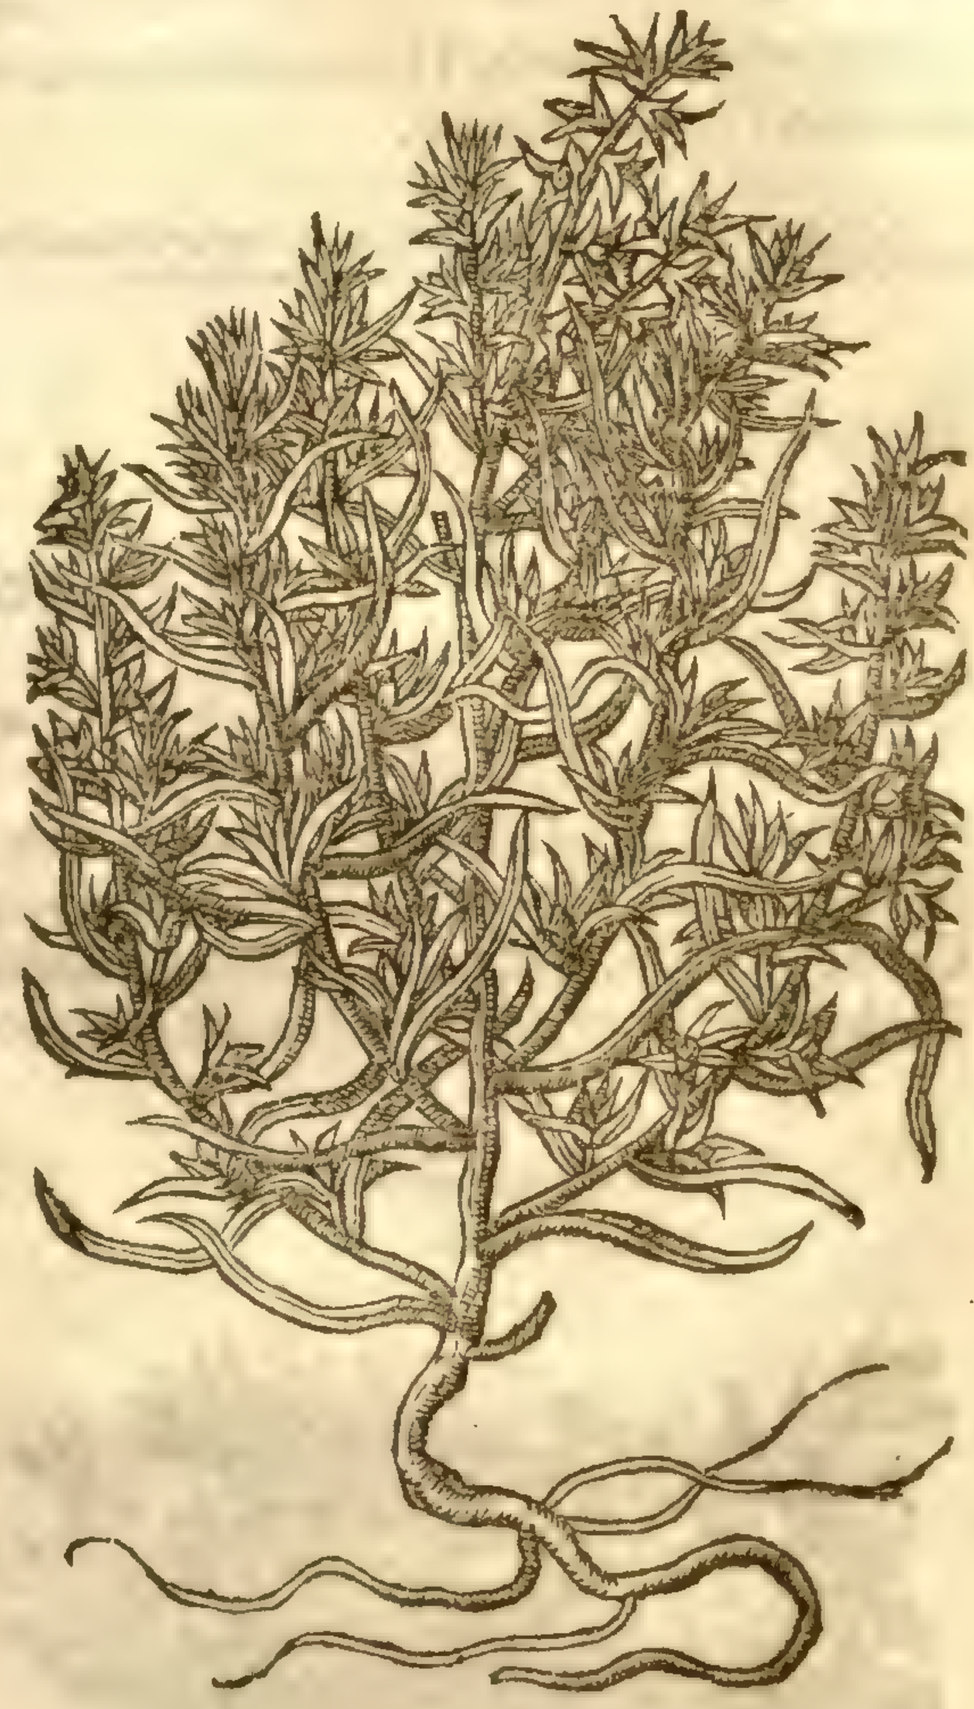
1 SMall ſea Grape is not vnlike to Horſe-taile; it bringeth forth ſlender ſtalks almoſt like Ruſhes, ſet with many little joints, ſuch as thoſe are of the Horſ-taile, and diuided into many wings or branches, the tops whereof are ſharpe pointed, ſomewhat hard and pricking. It is without leaues: the floures grow in cluſters out of the joints, with little ſtemmes, they are ſmall, and of a whitiſh green colour: The fruit conſiſteth of many little pearles, like to the vnripe berries of Raſpis or Hind-berry: when it is ripe it is red, with a ſaffron colour, in taſt ſweet and pleaſant: the ſeed or kernell is hard, three ſquare, ſharp on euery ſide, in taſte binding: the root is jointed, long, and creeps aſlope: the plant it ſelfe alſo doth rather lie on the ground, than ſtand vp. It growes all full of ſmall ſtalks and branches, caſting themſelues all abroad.

2 *Carolus Cluſius* hath ſet forth another ſort of ſea Grape, far different from the precedent. It riſeth vp to the height of a man, hauing many branches of a wooddy ſubſtance, in forme like to Spaniſh Broom, without any leaues at all; whereupon doe grow cluſters of floures vpon ſlender foot-ſtalks of a yellowiſh moſſie or herby colour, like thoſe of the Cornell tree: after which come the fruit like vnto the Mulberry, of a reddiſh colour and ſowre taſte, wherein lieth hid one or two ſeeds

seeds like those of Mullet, blacke without and white within: the root is hard, tough, and wooddy.

2 *Vva marina major.*
Great shrubby sea Grape.

3 *Tragos Matthioli.*
Bastard sea Grape.



3 *Tragon Matthioli*, or rather *Tragos improbus Matthioli*, which hee vnaduisedly called *Tragon*, is without controuersie nothing else but a kinde of *Kali*: this plant riseth vp out of the ground with stalks seldom a cubit high, diuided into sundry other grosse thicke and writhen branches, set or armed with many pricking leaues of the colour and shape of *Aizoon*, and somwhat thick and fleshy: among which come forth such prickly buds as are to be seen in *Tribulus terrestris*, as that it is hard for a man to touch any part thereof without pricking his fingers: the flours are of an herby colour, bringing forth flat seed like vnto *Kali*: the root is slender, and spredeth vnder the turf of the earth: the whole plant is full of clammy juice, not any thing astringent, somwhat saltish, and of no singular vertue as yet knowne: wherefore I may conclude, that this cannot be *Tragos Dioscoridis*, and the rather, for that this *Tragos* of *Matthiolus* is an herb, and not a shrub, as I haue before spoken in *Vva marina*, neither beareth it any berries or grains like wheat, neither is it pleasant in taste or smell, or any thing astringent, all which are to be found in the right *Tragos* before expressed; which (as *Dioscorides* saith) is without leaues, neither is it thorny, as *Tragos improbus Matthioli* is: this plant I haue found growing in the Isle of Shepey, in the tract leading to the house of Sr *Edward Hobby*, called Sherland.

¶ *The Place.*

It loueth to grow vpon dry banks and sandy places neere the sea: it is found in Languedoc not far from Montpelier, and in other places by the sea side, but is a stranger in England.

¶ *The Time.*

When it growes naturally the fruit is ripe in Autumne: the plant it selfe remaines long green, for all the cold in winter.

¶ *The Names.*

It is called of the later herbarists *Vva marina*: in French, *Raisin de mer*, of the pearled fruit, and the likenesse it hath with the Raspisberry, which is as it were a Raisin or Grape, consisting of many little ones: it is named in Greeke τραγος, but is not called *Tragus* or *Tragos* of a Goat, (for so signifieth the Greeke word) or of his ranke and rammish smell, but because it brings forth fruit fit to be eaten;

eaten; of the Verb πωγω, which ſignifies to eat: it may be called Scorpion, becauſe the ſprigs thereof are ſharp pointed like a Scorpions taile.

¶ *The Temperature.*

The berries or Raiſins, and eſpecially the ſeed that is in them, haue a binding qualitie, as we haue ſaid, and are dry in the later end of the ſecond degree.

¶ *The Vertues.*

A *Dioſcorides* writeth, That the Raiſins of ſea grape ſtay the flix, and alſo the Whites in women when they much abound.

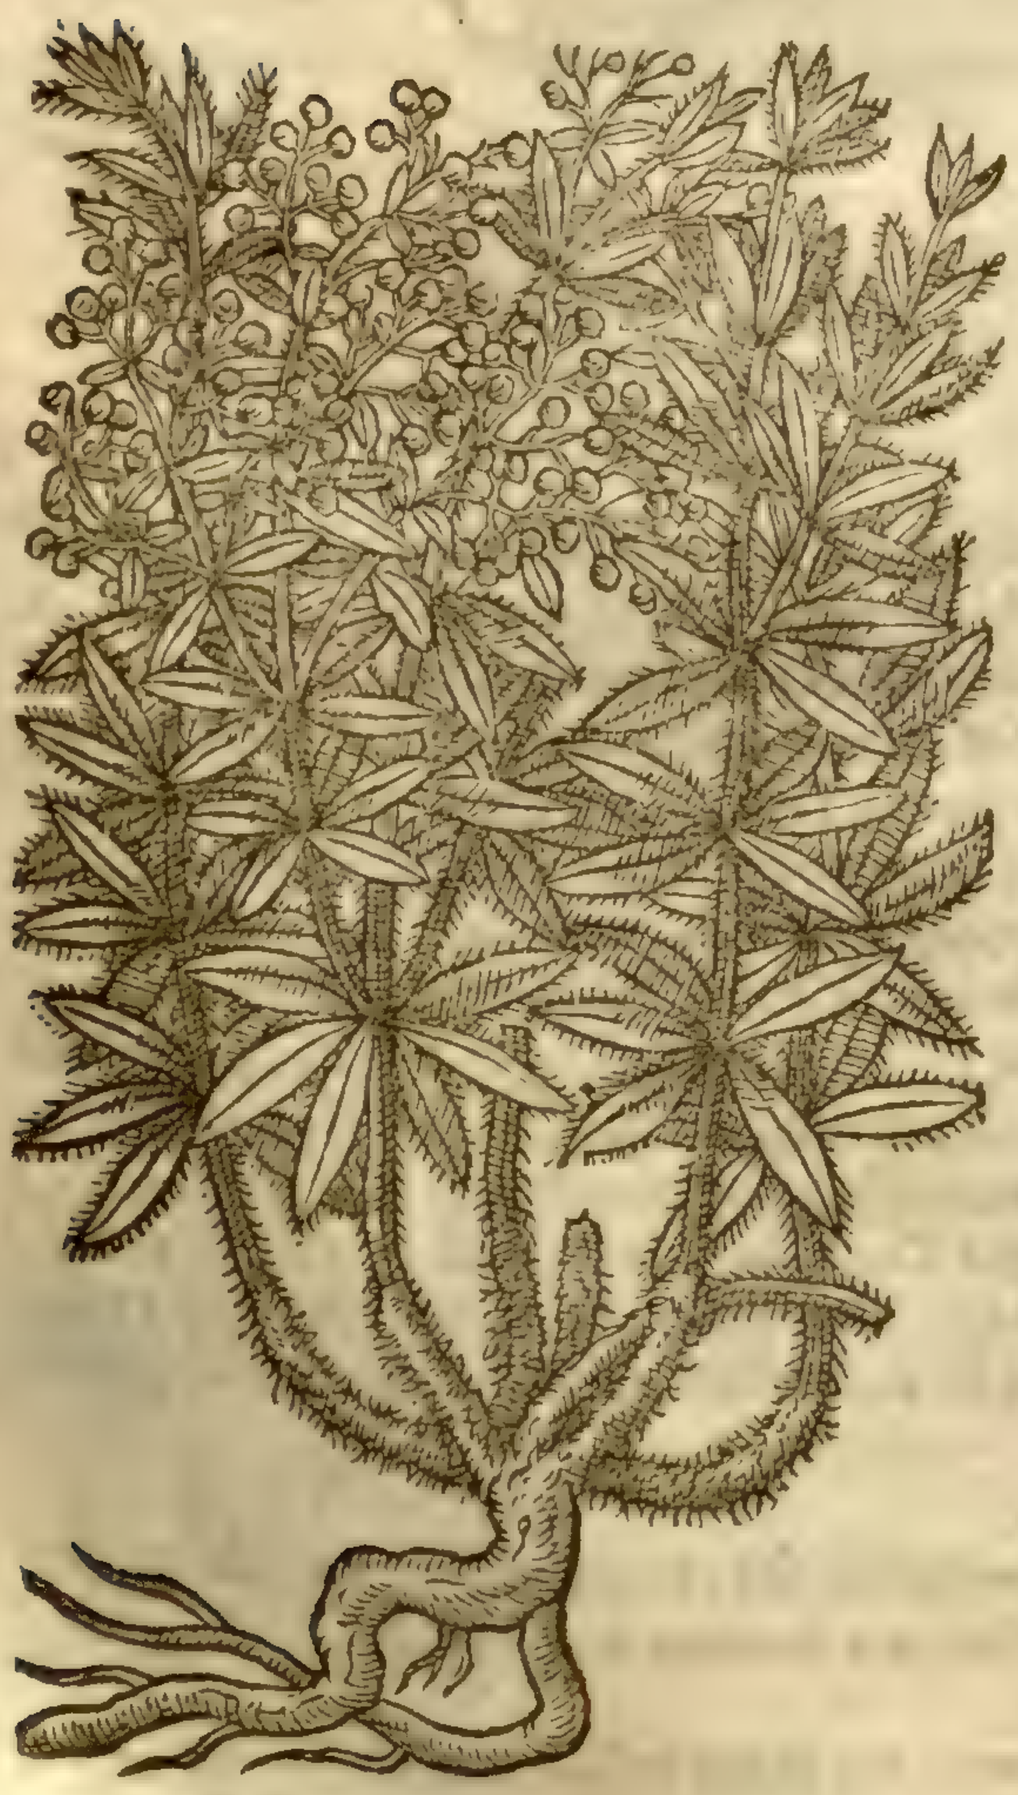
† Our Author, as you ſee, gaue the hiſtorie of the leſſer in the firſt place, but formerly the figure was in the third place, and another figure of the leſſer in the ſecond place, and the figure of the greater was in the firſt place.

CHAP. 460. *Of Madder.*

¶ *The Kindes.*

THere is but one kinde of Madder only which is manured or ſet for vſe, but if all thoſe that are like it in leaues and manner of growing were referred thereto, there ſhould be many ſorts, as Gooſe-graſſe, ſoft Cliuer, our Ladies Bedſtraw, Woodrooſe, and Croſſe-wort; all which are like to Madder in leaues, and therefore thought to be wilde kindes thereof.

1 *Rubia tinctorum.*
Red Madder.



2 *Rubia ſylveſtris.*
Wilde Madder.

¶ *The Deſcription.*

1 THe garden or mannured Madder hath long ſtalkes or trailing branches diſperſed farre abroad vpon the ground, ſquare, rough, and full of joints, at euery joint ſet round with greene rough leaues in manner of a ſtarre, or like thoſe of Woodrooſe: the floures grow at the top of

of the branches, of a feint yellow colour: after which come the seed, round, green at the first, afterward red and lastly of a black colour: the root, long, fat, ful of substance, creepeth far abroad within the vppermost crust of the earth, and is of a reddish colour when it is green and fresh.

2 Wilde Madder is like in forme to that of the garden, but altogether smaller, and the leaues are not so rough, but smooth and shining: the floures are white: the root is very small and tender and oftentimes of a reddish colour.

3 *Rubia marina.*
Sea Madder.

‡ 4 *Rubia spicata Cretica.*
Small Candy Madder.

3 Sea Madder hath a root two foot long, with many dry threds hanging thereat, of a reddish colour like Alkanet, on the out side of the same forme and bigneſſe, but within of the colour of the scrapings of Iuniper or cedar wood, sending forth diuers slender stalks round and ful of joints; from which come forth small thin leaues stiffe and sharp pointed, somewhat hairy, in number commonly foure, standing like a Burgonian Crosse: from the bosome of which come forth certaine tufts of smaller leaues thrust together vpon a heape: the floures grow at the top of the stalkes, of a pale yellowish colour.

‡ *Rubia spicata Cretica Clusij.*

4 This hath proceeding from the root many knotty foure square rough little stalkes, a foot high, diuided immediatly from the root into many branches, hauing but one side branch growing forth of one joint; about which joints grow spred abroad, foure or fiue, somtimes six narrow short sharpe pointed leaues, somewhat rough: the tops of the stalks and branches are nothing but long small foure square spikes or eares, made of three leafed green husks: out of the top of each huske groweth a very small greenish yellow floure, hauing foure exceeding smal leaues scarce to be seen: after which followeth in each huske one small blackish seed, somwhat long, round on the one side, with a dent or hollownesse on the other. The root is smal, hard, wooddy, crooked or scragged, with many little branches or threds, red without, and white within, and perisheth when the seed is ripe. *Iuly* 19. 1621.

Symanchica

Synanchica Lug. p. 1185.

5 The root is crooked, blackiſh without, yellow vnderneath the skinne, white within that are wooddy, about fiue or ſix inches long, with many hairy ſtrings: from the root ariſe many foure ſquare branches trailing vpon the ground, ſometimes reddiſh toward the root. The leaues are ſmall and ſharp pointed like thoſe of *Gallium*, and grow along the ſtalke on certain knees or joints, foure or fiue together, ſometimes fewer: from thoſe joints the ſtalke diuideth it ſelfe towards the top into many parts, wheron grow many floures, each floure hauing foure leaues, ſomtimes white, ſometimes of a fleſh colour, and euerie leafe of theſe fleſh coloured leaues is artificially ſtraked in the middle and neere the ſides with three lines of a deeper red, of no pleaſant ſmel: after which comes the ſeed, ſomething round, growing two together like ſtones: it floureth all the Summer long, and groweth in dry chalky grounds aboundantly. *Auguſt* 13. 1619. *Iohn Goodyer.* ‡

‡ 6 *Rubia minima.*
Dwarfe Madder.

‡ 6 *Lobel* thus deſcribes this dwarf Madder: There is another (ſaith he) which I gathered, growing vpon Saint Vincents rocks, not far from Briſtoll: the leaues are of the bigneſſe of thoſe of Rupture-woort, ſharpe pointed, and growing after the manner of thoſe of Madder, vpon little creeping ſtalkes ſome inch and halfe high, whereon grow yellowiſh ſmall floures. The root is ſmall, and of the colour of Corall. ‡

¶ *The Place.*

Madder is planted in gardens, and is verie common in moſt places of England. Mr *George Bowles* found it growing wilde on Saint Vincents rock, and out of the cliffes of the rocks of Aberdovie in Merioneth ſhire.

The ſecond groweth in moiſt medowes in mooriſh grounds, and vnder buſhes almoſt euerie where.

3 This growes by the ſea ſide in moſt places.

‡ The fourth growes only in ſome few gardens with vs, but the fift may be found wilde in many places. I found it in great plenty on the hil beyond Chattam in the way to Canterbury. ‡

¶ *The Time.*

They flouriſh from May vnto the end of Auguſt: the roots are gathered and dried in Autumne and ſold to the vſe of Diers and medicine.

¶ *The Names.*

Madder is called in Greeke ἐρυθρόδανον, *Erythrodanum*: in Latine, *Rubia*, and *Rubeia*: in ſhops, *Radix tinctorum*: *Paulus Ægineta* ſheweth that it is named *Thapſon* which the Diers vſe, and the Romans call it *Herba rubia*: in Italian, *Rubbia*, and *Robbia*: in Spaniſh, *Ruvia*, *Roya*, and *Granza*: in French, *Garance*: in high-Dutch, **Rotte**: in low-Dutch, **Wee**, and **Wee Crappen**: in Engliſh, Madder and red Madder.

¶ *The Temperature.*

Of the temperature of Madder it hath been diſputed among the Learned, and as yet not confirmed, whether it binde or open: ſome ſay both: diuers diuerſly deem. A great Phyſition (I do not ſay the great learned) called me to account as touching the faculties hereof, although he had no commiſſion ſo to doe: notwithſtanding I was content to be examined vpon the point, what the nature of Madder was, becauſe I haue written that it performeth contrarie effects, as ſhall be ſhewed: the roots of Madder, which both the Phyſitians and Diers do vſe, as they haue an obſcure binding power

power and force; so be they likewise of nature and temperature cold and dry: they are withall of diuers thin parts, by reason whereof their colour doth easily pierce: yet haue they at the first a certaine little sweetnesse, with an harsh binding quality presently following it; which not onely wee our selues haue obserued, but also *Auicen* the prince of physitions, who in his 58. chapter hath written, that the root of Madder hath a rough and harsh taste: now Mr. Doctor, whether it binde or open I haue answered, attending your censure: but if I haue erred, it is not with the multitude, but with those of the best and best learned.

¶ *The Vertues.*

The decoction of the root of Madder is euery where commended for those that are bursten, bruised, wounded, and that are fallen from high places. A

It stencheth bleeding, mitigateth inflammations, and helpeth those parts that bee hurt and bruised. B

For these causes they be mixed with potions, which the later Physitians call wound drinkes: in which there is such force and vertue, as *Matthiolus* also reporteth, that there is likewise great hope of curing of deadly wounds in the chest and intrails. C

Our opinion and iudgement is confirmed by that most expert man, sometimes Physition of Louaine, *Iohannes Spiringius*, who in his *Rapsodes* hath noted, that the decoction of Madder giuen with *Triphera*, that great composition is singular good to stay the reds, the hemorrhoids and bloudy flix, and the same approued by diuers experiments: which confirmeth Madder to be of an astringent and binding qualitie. D

Of the same opinion as it seemeth is also *Eros Iulia* her freed man (commonly called *Trotula*) E who in a composition against vntimely birth doth vse the same: for if he had thought that Madder were of such a quality as *Dioscorides* writeth it to be of, hee would not in any wise haue added it to those medicines which are good against an vntimely birth.

For *Dioscorides* reporteth, that the root of Madder doth plentifully prouoke vrine, and that grosse and thicke, and oftentimes bloud also, and it is so great an opener, that being but onely applied, it bringeth downe the menses, the birth, and after-birth: but the extreme rednesse of the vrine deceiued him, that immediately followeth the taking of Madder, which rednes came as he thought from bloud mixed therewith, which notwithstanding commeth no otherwise than from the colour of the Madder. F

For the root hereof taken any manner of way doth by and by make the vrine extreme red: no otherwise than Rubarb doth make the same yellow, not changing in the meane time the substance thereof, nor making it thicker than it was before, which is to bee vnderstood in those which are in perfect health, which thing doth rather shew that it doth not open, but binde, no otherwise than Rubarbe doth: for by reason of his binding quality the wateriſh humors do for a while keep their colour. For colours mixed with binding things do longer remaine in the things coloured, and do not so soone vade: this thing they will know that gather colours out of the juyces of floures and herbes, for with them they mixe allume, to the end that the colour may be retained and kept the longer, which otherwise would bee quickely lost. By these things it manifestly appeareth that Madder doth nothing vehemently either clense or open, and that *Dioscorides* hath rashly attributed vnto it this kinde of quality, and after him *Galen* and the rest that followed, standing stiffely to his opinion. G

Pliny saith, that the stalkes with the leaues of Madder, are vsed against serpents. H

The root of Madder boyled in Meade or honied water, and drunken, openeth the stopping of the liuer, the milt and kidnies, and is good against the jaundise. I

The same taken in like manner prouoketh vrine vehemently, insomuch that the often vse thereof causeth one to pisse bloud, as some haue dreamed. K

Langius and other excellent Physitions haue experimented the same to amend the lothsome colour of the Kings-euill, and it helpeth the vlcers of the mouth, if vnto the decoction be added a little allume and hony of Roses. L

‡ 5 The fifth being the *Synanchica* of *Daleschampius*, dries without biting, and it is excellent against squinancies, either taken inwardly, or applied outwardly, for which cause they haue called it *Synanchica, Hist. Lugd.* ‡ M

Chap. 461. *Of Goose-grasse, or Cliuers.*

¶ *The Description.*

1 A *Parine*, Cliuers or Goose-grease, hath many small square branches, rough and sharpe, full of joynts, beset at euery joint with small leaues star fashion, and like vnto small Madder:

the floures are very little and white, pearking on the tops of the ſprigs: the ſeeds are ſmall, round a little hollow in the middeſt in manner of a nauell, ſet for the moſt part by couples: the roots ſlender and full of ſtrings: the whole plant is rough, and his ruggedneſſe taketh hold of mens vestures and woollen garments as they paſſe by: being drawne along the tongue it fetcheth bloud: *Dioſcorides* reports, that the ſhepheards in ſtead of a Cullender do vſe it to take haires out of milke, if any remaine therein.

2 The great Gooſe-graſſe of *Pliny* is one of the Moone-worts of *Lobel*, it hath a very round tender ſtalke, whereupon are ſet broad leaues ſomewhat long, like thoſe of Scorpion graſſe, or *Myoſoton Galeni*, *Galens* Moonewort, very rough and hairy, which grow not about the joynts, but three or foure together on one ſide of the ſtalke: the floures grow at the top of the branches, of a blew colour: after which commeth rough cleauing ſeed, that doth ſtick to mens garments which touch it: the root is ſmall and ſingle.

1 *Aparine.*
Gooſe-graſſe, or Cleuers.

2 *Aparine maior Plinij.*
Great Gooſe-graſſe.

¶ *The Place.*

Gooſe-graſſe groweth neer the borders of fields, and oftentimes in the fields themſelues mixed with the corne; alſo by common waies, ditches, hedges, and among thornes: *Theophraſtus* and *Galen* write, that it groweth among Lentles, and with hard embracing it doth choke it, and by that meanes is burdenſome and troubleſome vnto it.

¶ *The Time.*

It is found plentifully euery where in Summer time.

¶ *The Names.*

It is named in Greeke, ἀπαρίνη: *Aparine*: in Latine, *Lappa minor*, but not properly: *Pliny* affirmeth it to be *Lappaginis ſpeciem*: of ſome, *Philanthropos*, as though he ſhould ſay a mans friend, becauſe it taketh hold of mens garments; of diuers alſo for the ſame cauſe, *Philadelphos*: in Italian, *Spermella*: in Spaniſh, *Preſera*, or *amor di Hortalano*: in high Dutch, **Kleeb kraut**: in French, *Roble*, ou *Graceron*: in low Dutch, **Kleefcruyt**: in Engliſh, Gooſe-ſhare, Gooſe-graſſe, Cleuer, or Clauer.

¶ *The Temperature.*

It is, ſaith *Galen*, moderately hot and dry, and ſomewhat of thin parts.

¶ *The*

¶ *The Vertues.*

The juyce which is preſſed out of the ſeeds, ſtalkes, and leaues, as *Dioſcorides* writeth, is a remedie A
for them that are bitten of the poiſonſome ſpiders called in Latine *Phalangia*, and of vipers, if it be drunke with wine.

And the herbe ſtamped with ſwines greaſe waſteth away the kernels by the throte. B

Pliny teacheth that the leaues being applied doe alſo ſtay the abundance of bloud iſſuing out of C
wounds.

Women do vſually make pottage of Cleuers with a little mutton and Otemeale, to cauſe lank- D
neſſe, and keepe them from fatneſſe.

CHAP. 462. *Of Croſſe-wort.*

¶ *The Deſcription.*

1 CRoſſe-wort is a low and baſe herbe, of a pale greene colour, hauing many ſquare feeble rough ſtalks full of joynts or knees, couered ouer with a ſoft downe: the leaues are little, ſhort, & ſmal, alwaies foure growing together, and ſtanding croſſewiſe one right againſt another, making a right Burgunion croſſe: toward the top of the ſtalke, and from the boſome of thoſe leaues come forth very many ſmall yellow floures, of a reaſonable good ſauour, each of which is alſo ſhaped like a Burgunion croſſe: the roots are nothing elſe but a few ſmall threds or fibres.

1 *Cruciata.*
Croſſe-wort.

‡ 2 *Rubia Crutiata lævis.*
Croſſe-wort Madder.

‡ 2 This in mine opinion may be placed here as fitly as any where elſe, for it hath the leaues ſtanding croſſe-waies foure at a joynt, ſomewhat like thoſe of the largeſt Chickeweed: the ſtalkes are betweene a foot and a halfe and two cubits high. The white Starre-faſhioned floures ſtand in roundles about the tops of the ſtalkes. It growes plentifully in Piemont, on the hills not farre from Turine. *Lobel* ſets it forth by the name of *Rubia Lævis Taurinenſium.* ‡

¶ *The Place.*

Cruciata, or Croſſewort, groweth in moiſt and fertile medowes; I found the ſame growing in the Churchyard of Hampſtead neere London, and in a paſture adjoyning thereto, by the mill: alſo it groweth in the Lane or high way beyond Charlton, a ſmall village by Greenewich, and in ſundry other places.

¶ *The Time.*

It floureth for the moſt part all Summer long.

¶ *The Names.*

It is called *Cruciata*, and *Cruciatis*, of the placing of the leaues in manner of a Croſſe: in English, Croſſe-wort, or Golden Mugweet.

¶ *The Temperature.*

Croſſe-wort ſeemeth to be of a binding and dry quality.

¶ *The Vertues.*

A Croſſe-wort hath an excellent property to heale, joyne, and cloſe wounds together, yea it is very fit for them, whether they be inward or outward, if the ſaid herbe be boyled in wine and drunke.

B The decoction thereof is alſo miniſtred with good ſucceſſe to thoſe that are burſten: and ſo is the herbe, being boyled vntill it be ſoft, and laied vpon the burſten place in manner of a pultis.

CHAP. 463. *Of Wodrooffe.*

1 *Aſperula.* Woodrooffe.

‡ 2 *Aſperula flore cæruleo.* Blew Woodrooffe.

¶ *The Deſcription.*

1 WOodrooffe hath many ſquare ſtalkes full of joynts, and at euery knot or joynt ſeuen or eight long narrow leaues, ſet round about like a ſtar, or the rowell of a ſpurre: the floures grow at the top of the ſtems, of a white colour, and of a very ſweet ſmell, as is the reſt of the herbe, which being made vp into garlands or bundles, and hanging vp in houſes in the heat of Summer, doth very well attemper the aire, coole and make freſh the place, to the delight and comfort of ſuch as are therein.

2 There

‡ 3 *Sagina Spergula.*
Spurrey.

2 There is another ſort of Woodrooffe called *Aſperula Cærulea*, or blew Woodrooffe; it is an herbe of a foot high, ſoft, hairy, and ſomething branched, with leaues & ſtalks like thoſe of white Woodrooffe: the floures thereof are blew, ſtanding vpon ſhort ſtems on the tops of the ſtalks: the ſeed is ſmall, round, and placed together by couples: the root is long and of a red colour.

3 There is another herbe called *Saginæ ſpergula*, or Spurry, which is ſown in Brabant, Holland, and Flanders, of purpoſe to fatten cattel, and to cauſe them to giue much milke, and there called Spurrey, and Franke Spurrey: it is a baſe and low herbe, very tender, hauing many jointed ſtalks, whereupon do grow leaues ſet in round circles like thoſe of Woodrooffe, but leſſer and ſmoother, in forme like the rowell of a ſpur: at the top of the ſtalks do grow ſmall white floures; after which come round ſeed like thoſe of Turneps: the root is ſmall and threddie.

‡ 4 There are one or two plants more, which may fitly be here mentioned: the firſt of them is the *Spergula marina* of *Daleſchampius*, which from a pretty large wooddy and roughiſh root ſends vp jointed ſtalks ſome foot long: at each joint come forth two long thick round leaues, and out of their boſomes other leſſer leaues: the top of the ſtalks is diuided into ſundry branches, bearing floures of a faint reddiſh colour, compoſed of fiue little leaues, with yelowiſh threds in the middle: after which follow cups or ſeed veſſels, which open into foure parts, and containe a little flat reddiſh ſeed: it grows in the ſalt marſhes about Dartford, and other ſuch places; floures in Iuly and Auguſt, and in the meane ſpace ripens his ſeed. We may call this in Engliſh, Sea Spurrie.

5 This other hath a large root, conſidering the ſmalneſſe of the plant; from which ariſe many weak ſlender branches ſome three or foure inches long, ſomtimes more, lying commonly flat on the ground, hauing many knots or joints: at each whereof vſually grow a couple of white ſcaly leaues, and out of their boſomes other ſmall ſharpe pointed little greene leaues: at the tops of the branches grow little red floures, ſucceeded by ſuch, yet leſſer heads than thoſe of the former: it floures in Iuly and Auguſt, and growes in ſandy grounds, as in Tuthill-fields nigh Weſtminſter: the figure ſet forth in *Hiſt. Lugd. p.* 2179, by the title of *Chamæpeuce Plinij*; *Camphorata minor Daleſchampij*, ſeems to be of this plant, but without the floure: *Bauhine* in his *Prodromus* deſcribes it by the name of *Alſine Spergulæ facie*. This may be called Chickweed Spurrey, or ſmall red Spurrey. ‡

¶ *The Place.*

White Woodrooffe groweth vnder hedges, and in woods almoſt euery where: the ſecond groweth in many places of Eſſex, and diuers other parts in ſandy grounds. The third in Corne fields.

¶ *The Time.*

They floure in Iune and Iuly.

¶ *The Names.*

Moſt haue taken Woodrooffe to be *Pliny* his *Alyſſos*, which as he ſaith, doth differ from *Erythrodanum*, or Garden Madder, in leaues onely, and leſſer ſtalkes: but ſuch a one is not only this, but alſo that with blew floures: for *Galen* doth attribute to *Alyſſos*, a blew floure: notwithſtanding *Galens* and *Plinies Alyſſos* are thought to differ by *Galens* owne words, writing of *Alyſſos* in his ſecond booke of Counterpoyſons, in *Antonius Cous* his compoſition, in this maner: *Alyſſos* is an herbe very like vnto Horehound, but rougher and fuller of prickles about the circles: it beareth a floure tending to blew.

Woodrooffe is named of diuers in Latine *Aſperula odorata*, and of moſt men *Aſpergula odorata*: of others, *Cordialis*, and *Stellaria*: in high Dutch, **Hertzfreydt**: in low Dutch, **Leuerkraut**: that is to ſay,

say *Iecoraria*, or *Hepatica*, Liuerwort: in French, *Muguet*: in English, Woodrooffe, Woodrowe, and Woodrowell.

¶ *The Temperature.*

Woodrooffe is of temperature somthing like vnto our Ladies Bedstraw, but not so strong being in a meane betweene heate and drinesse.

¶ *The Vertues.*

A It is reported to be put into wine, to make a man merry, and to be good for the heart and liuer: it preuaileth in wounds, as *Cruciata*, and other vulnerary herbes do.

Chap. 464. *Of Ladies Bedstraw.*

¶ *The Kindes.*

THere be diuers of the herbes called Ladies Bedstraw, or Cheese-renning; some greater, others lesse; some with white floures, and some with yellow.

¶ *The Description.*

1 LAdies Bedstraw hath small round euen stalkes, weake and tender, creeping hither and thither vpon the ground: whereupon do grow very fine leaues, cut into small jags, finer than those of Dill, set at certaine spaces, as those of Woodrooffe: among which come forth floures of a yellow colour, in clusters or bunches thicke thrust together, of strong sweet smell but not vnpleasant: the root is small and threddy.

1 *Gallium luteum.*
Yellow Ladies Bedstraw.

2 *Gallium album.*
Ladies Bedstraw with white floures.

2 Ladies Bedstraw with white floures is like vnto Cleauers or Goose-grasse, in leaues, stalkes, and manner of growing, yet nothing at all rough, but smooth and soft: the floures be white, the seed round: the roots slender, creeping within the ground: the whole plant rampeth vpon bushes, shrubs, and all other such things as stand neere vnto it: otherwise it cannot stand, but must reele and fall to the ground.

3 This

3 This small *Gallium*, or Ladies little red Bedstraw, hath beene taken for a kind of wilde Madder; nevertheless it is a kinde of Ladies Bedstraw, or Cheese-renning, as appeareth both by his vertues in turning milke to cheese, as also by his forme, being in each respect like vnto yellow *Gallium*, and differs in the colour of the floures, which are of a dark red colour, with a yellow pointal in the middle, consisting of foure small leaues: the seed hereof was sent me from a Citizen of Strausburg in Germany, and it hath not beene seene in these parts before this time.

4 There is likewise another sort of *Gallium* for distinctions sake called *Mollugo*, which hath stalks that need not to be propped vp, but of it selfe standeth vpright, and is like vnto the common white *Gallium*, but that it hath a smoother leafe. The floures thereof be also white, and very small. The root is blackish.

† 3 *Gallium rubrum.*
Ladies Bedstrow with red floures.

4 *Gallium, sive Mollugo montana.*
Great bastard Madder.

¶ *The Place.*

The first groweth vpon sunnie bankes neere the borders of fields, in fruitfull soiles almost euery where.

The second groweth in marish grounds and other moist places.

The third groweth vpon mountaines and hilly places, and is not yet found in England.

The fourth and last groweth in hedges among bushes in most places.

¶ *The Time.*

They floure most of the Summer moneths.

¶ *The Names.*

The first is called in Greeke, τάλιον: it hath that name of milke, called in Greeke, γάλα, into which it is put as cheese-renning: in Latine likewise *Gallium*: in high Dutch, **Wagerkraut, walstroo**: in low Dutch, **walstroo**: in French, *Petit Muguet*: in Italian, *Galio*: in Spanish, *Coaia leche yerua*: in English, our Ladies Bedstrow, Cheese-renning, Maids haire, and pety Mugwet.

The others are *Species Lappaginis*, or kindes of small Burres, so taken of the Antients: The last, of the softnesse and smoothnesse of the leaues, is commonly called *Mollugo*: diuers take it for a kind of wilde Madder, naming it *Rubia sylvestris*, or wilde Madder.

¶ *The Temperature.*

These herbes, especially that with yellow floures, is dry and something binding, as *Galen* saith.

¶ *The*

¶ *The Vertues.*

A The floures of yellow Maids haire, as *Dioſcorides* writeth, is vſed in ointments againſt burnings, and it ſtancheth bloud: it is put into the Cerote or Cere-cloath of Roſes: it is ſet a ſunning in a glaſſe, with Oyle Oliue, vntill it be white: it is good to annoint the wearied Traueller: the root thereof drunke in wine ſtirreth vp bodily luſt: and the floures ſmelled vnto worke the ſame effect.

B The herbe thereof is vſed for Rennet to make cheeſe, as *Matthiolus* reporteth, ſaying, That the people of Tuſcanie or Hetruria doe vſe to turne their milke, that the Cheeſe which they make of Sheeps and Goats milke might be the ſweeter and more pleaſant in taſte, and alſo more wholſome, eſpecially to breake the ſtone, as it is reported.

C The people in Cheſhire, eſpecially about Namptwich, where the beſt Cheeſe is made, doe vſe it in their Rennet, eſteeming greatly of that Cheeſe aboue other made without it.

D We finde nothing extant in the antient writers, of the vertues and faculties of the white kinde: but are as herbes neuer had in vſe either for Phyſicke or Surgerie.

† The figure that was formerly in the third place was of the *Gallium album minus* of *Tabern.* which commonly hath but two leaues at a ioynt, yet ſometimes ſhooteth with three.

Chap. 465. *Of Ferne.*

¶ *The Kindes.*

There be diuers ſorts of Ferne, differing as well in forme as place of growing; whereof there be two ſorts according to the old writers, the male and the female; and theſe be properly called Ferne: the others haue their proper names, as ſhall be declared.

1 *Filix mas.*
Male Ferne.

2 *Filix fœmina.*
Female Ferne or Brakes.

¶ The

¶ *The Description.*

1 THe female Ferne bringeth forth presently from the root broad leaues and rough, somewhat hard, easie to be broken, of a light greene colour, and strong smell, more than a cubit long, spred abroad like wings, compounded as it were of a great number standing vpon a middle rib, euery one whereof is like a feather, nicked in the edges and on the backeside are sprinkled as it were with a very fine earthy coloured dust or spots, which many rashly haue taken for seed: the root consisteth of a number of tufts or threds, and is thicke and blacke, and is without stalke and seed, and altogether barren.

‡ *Filicis (vulgo) maris varietas & differentiæ.*
Differences of the male Ferne.

I haue obserued foure sorts of Ferne, by most writers esteemed to be the male Ferne of *Dioscorides*: by *Anguillara*, *Gesner*, *Cæsalpinus*, and *Clusius*, accounted to bee the female, and so indeed doe I thinke them to be, though I call them the male with the multitude. If you looke on these Fernes according to their seuerall growths and ages, you may make many more sorts of them than I haue done; which I am afraid hath beene the occasion of describing more sorts than indeed there are in nature. These descriptions I made by them when they were in their perfect growths.

1 *Filix mas ramosa pinnulis dentatis.* Polypodium vulgatius & maius dict.

The roots are nothing but an abundance of small blacke hairy strings, growing from the lower parts of the maine stalkes (for stalkes I will call them) where those stalkes are joyned together. At the beginning of the Spring you may perceiue the leaues to grow forth of their folding clusters, couered with browniſh scales at the superficies of the earth, very closely joyned together: a young plant hath but a few leaues; an old one ten, twelue, or more: each stalke at his lower end neere the joyning to his fellowes, at his first appearing, before he is an inch long hauing some of those blacke fibrous roots for his sustenance. The leaues being at their full growth hath each of them a threefold diuision, as hath the Ferne which is commonly called the female: the maine stalke, the side branches growing from him, and the nerues growing on those side branches bearing the leaues: the maine stalke of that plant I describe was fully foure foot long (but there are vsually from one foot to foure in length) full of those browniſh scales, especially toward the root, firme, one side flat, the rest round, naked fully one and twenty inches, to the first paire of side branches. The side branches, the longest being the third paire from the root, were nine inches long, and shorter and shorter towards the top, in number about twenty paire; for the most part towards the root they grow by couples, almost opposite, the neerer the top the further from opposition: the nerues bearing the leaues, the longest were two inches and a quarter long, and so shorter and shorter toward the tops of the side branches; about twenty in number on each side of the longest side branch. The leaues grow for the most part by couples on the nerue, eight or nine paire on a nerue; each leafe being gashed by the sides, the gashes ending with sharpe points, of a deepe greene on the vpper side, on the vnder side paler, and each leafe hauing two rowes of dusty red scales, of a browne or blackesh colour: toward the top of the maine stalke those side branches change into nerues, bearing onely the leaues. When their leaues are at their full growth, you may see in the middest of them at their roots the said scaly folding cluster; and as the old leaues with their blacke threddy roots wholly perish, they spring vp; most yeares you may finde many of the old leaues greene all the Winter, especially in warme places. This groweth plentifully in the boggie shadowie moores neere Durford Abbey in Sussex, and also on the moist shadowie rockes by Mapledurham in Hampshire, neer Peters-field; and I haue found it often on the dead putrified bodies and stems of old rotten okes, in the said moores; neere the old plants I haue obserued very many small young plants growing, which came by the falling of the seed from those dusty scales: for I beleeue all herbes haue seeds in themselues to produce their kindes, *Gen.* 1. 11. *&* 12.

The three other haue but a twofold diuision, the many stalkes and the nerues bearing the leaues. The roots of them all are blacke fibrous threds like the first, their maine stalkes grow many thicke and close together at the root, as the first doth: the difference is in the fashion of their leaues, and manner of growing, and for distinctions sake I haue thus called them.

2 *Filix mas non ramosa pinnulis latis densis minutim dentatis.*

The leaues are of a yellowish greene colour on both sides, set very thicke and close together on the

the nerue, that you cannot ſee betweene them, with maruellous ſmall nickes by their ſides, and their round tops: each leafe hath alſo two rowes of duſty ſeed ſcales; the figures ſet forth by *Lob.* *Tabern.* and *Gerard*, vnder the title of *Filix mas*, do well reſemble this Ferne. This growes plentifully in moſt places in ſhadowie woods and copſes.

3 *Filix mas non ramoſa pinnulis anguſtis, raris, profunde dentatis.*

The leaues are of a deepe greene, not cloſely ſet together on the nerue, but you may farre eaſily ſee betwixt them, deeply indented by the ſides, ending with a point not altogether ſharpe; each leafe hath alſo two rowes of duſty ſeed ſcales. I haue not ſeene any figure well reſembling this plant. This groweth alſo in many places in the ſhade.

4 *Filix mas non ramoſa pinnulis latis auriculatis ſpinoſis.*

The leaues are of a deeper greene than either of the two laſt deſcribed, placed on the nerue not very cloſe together, but that you may plainely ſee betweene them; each leafe (eſpecially thoſe next the ſtalk) hauing on that ſide fartheſt off the ſtalke a large eare or outgrowing ending, with a ſharpe pricke like a haire; as doth alſo the top of the leafe: ſome of the ſides of the leaues are alſo nicked, ending with the like pricke or haire. Each leafe hath two rowes of duſty ſeed ſcales. This I take to be *Filix mas aculeata major Bauhini*. Neither haue I ſeene any figure reſembling this plant. It groweth abundantly on the ſhadowie moiſt rockes by Maple-durham neere Peters-field in Hampſhire. *John Goodyer.* Iuly 4. 1633. ‡

2 The female Ferne hath neither flouresnor ſeed, but one onely ſtalke, chamfered, ſomething edged, hauing a pith within of diuers colours, the which being cut aſlope, there appeareth a certaine forme of a ſpred-Eagle: about this ſtand very many leaues which are winged, and like to the leaues of the male Ferne, but leſſer: the root is long and blacke, and creepeth in the ground, being now and then an inch thicke, or ſomewhat thinner. This is alſo of a ſtrong ſmell, as is the male.

¶ *The Place.*

Both the Fernes are delighted to grow in barren dry and deſart places: and as *Horace* teſtifieth;

Neglectis vrenda Filix innaſcitur agris.

It comes not vp in manured and dunged places, for if it be dunged (as *Theophraſtus, lib.* 8. *cap.* 8. reporteth) it withereth away.

The male joyeth in open and champion places, on mountaines and ſtony grounds, as *Dioſcorides* ſaith. ‡ It growes commonly in ſhadowie places vnder hedges. ‡

The female is often found about the borders of fields vnder thornes, and in ſhodowie woods.

¶ *The Time.*

Both theſe Fernes wither away in Winter: in the Spring there grow forth new leaues, which continue greene all Summer long.

¶ *The Names.*

The former is called in Greeke, Πτερις: *Nicander* in his diſcourſe of Treacle nameth it Πολυπος: in Latine, *Filix mas*: in Italian, *Felce*: in Spaniſh, *Helecho*, *Falguero*, and *Feyto*: in high Dutch, **Waldt Farne**: in French, *Fougere*, or *Feuchiere maſle*: in low Dutch, **Waren Manneken**: in Engliſh, male Ferne.

The ſecond kinde is called in Greeke, Θηλυπτερις: that is, *Filix fœmina*, or female Ferne: in Latine, *Dioſcorides* noteth among the baſtard names, *Lingua ceruina*: in high Dutch, **Waldt Farn weiblin**, and **Groſz Farnkraut**: in low Dutch, **Waren Wijfken**: in French, *Fougere femelle*: in Engliſh, Brake, common Ferne, and female Ferne.

¶ *The Temperature.*

Both the Fernes are hot, bitter and dry, and ſomething binding.

¶ *The Vertues.*

A The root of the male Ferne being taken to the weight of halfe an ounce, driueth forth long flat wormes out of the belly, as *Dioſcorides* writeth, being drunke in Mede or honied water; and more effectually, if it be giuen with two ſcruples or two third parts of a dram of Scamonie, or of blacke Hellebor: they that will vſe it, ſaith he, muſt firſt eate Garlicke. After the ſame manner, as *Galen* addeth, it killeth the childe in the mothers wombe. The root hereof is reported to be good for them that haue ill ſpleenes: and being ſtamped with ſwines greaſe and applied, it is a remedy againſt the pricking of the reed: for proofe hereof, *Dioſcorides* ſaith the Ferne dieth if the Reed be planted about it; and contrariwiſe, that the Reed dieth if it bee compaſſed with Ferne: which is vaine to thinke, that it hapneth by any antipathy or naturall hatred, and not by reaſon this Ferne proſpereth not in moiſt places, nor the Reed in dry.

B The female Ferne is of like operation with the former, as *Galen* ſaith. *Dioſcorides* reports, That this bringeth barrenneſſe, eſpecially to women; and that it cauſeth women to be deliuered before their time: hee addeth, that the pouder hereof finely beaten is laid vpon old vlcers, and healeth the

the galled neckes of oxen and other cattell: it is alſo reported, that the root of Ferne caſt into an hogſhead of wine keepeth it from ſouring.

The root of the male Ferne ſodden in Wine is good againſt the hardneſſe and ſtopping of the C milt: and being boyled in water, ſtayeth the laske in young children, if they be ſet ouer the decoction thereof to caſe their bodies by a cloſe ſtoole.

Chap. 466. *Of Water-Ferne, or* Oſmund *the water-man.*

¶ *The Deſcription.*

WAter-Ferne hath a great triangle ſtalke two cubits high, beſet vpon each ſide with large leaues ſpred abroad like wings, and dented or cut like Polypody: theſe leaues are like the large leaues of the Aſh-tree; for doubtleſſe when I firſt ſaw them a far off it cauſed me to wonder thereat, thinking that I had ſeene young Aſhes growing vpon a bog, but beholding it a little neerer, I might eaſily diſtinguiſh it from the Aſh, by the browne rough and round graines that grew on the top of the branches, which yet are not the ſeed thereof, but are very like vnto the ſeed. The root is great and thicke, folded and couered ouer with many ſcales and interlacing roots, hauing in the middle of the great and hard wooddy part thereof ſome ſmall whiteneſſe, which hath beene called the heart of *Oſmund* the water-man.

Filix florida, ſive Oſmunda Regalis.
Water-Ferne, or Oſmund Royall.

¶ *The Place.*

It groweth in the midſt of a bog at the further end of Hampſted heath from London, at the bottome of a hill adjoyning to a ſmall cottage, and in diuers other places, as alſo vpon diuers bogges on a heath or a common neere vnto Bruntwood in Eſſex, eſpecially neere vnto a place there that ſome haue digged, to the end to finde a neſt or mine of gold; but the birds were ouer fledge, and flowne away before their wings could be clipped. ‡ It did grow plentifully in both theſe places, but of late it is all deſtroyed in the former. ‡

¶ *The*

¶ *The Time.*

It flouriſheth in Summer, as the former Fernes: the leaues decay in Winter: the root continueth freſh and long laſting; which being brought into the Garden proſpereth as in his natiue ſoile, as my ſelfe haue proued.

¶ *The Names.*

It is called in Latine, *Oſmunda:* it is more truly named *Filix paluſtris,* or *aquatilis:* ſome terme it by the name of *Filicaſtrum:* moſt of the Alchimiſts call it *Lunaria major: Valerius Cordus* nameth it *Filix latifolia:* it is named in high Dutch, **Groſz Farn:** in low Dutch, **Groot Varen, Wilt Varen:** in Engliſh, Water-Ferne, Oſmund the Water-man: of ſome, Saint Chriſtophers herbe, and Oſmund.

¶ *The Temperature.*

The root of this alſo is hot and dry, but leſſer than they of the former ones.

¶ *The Vertues.*

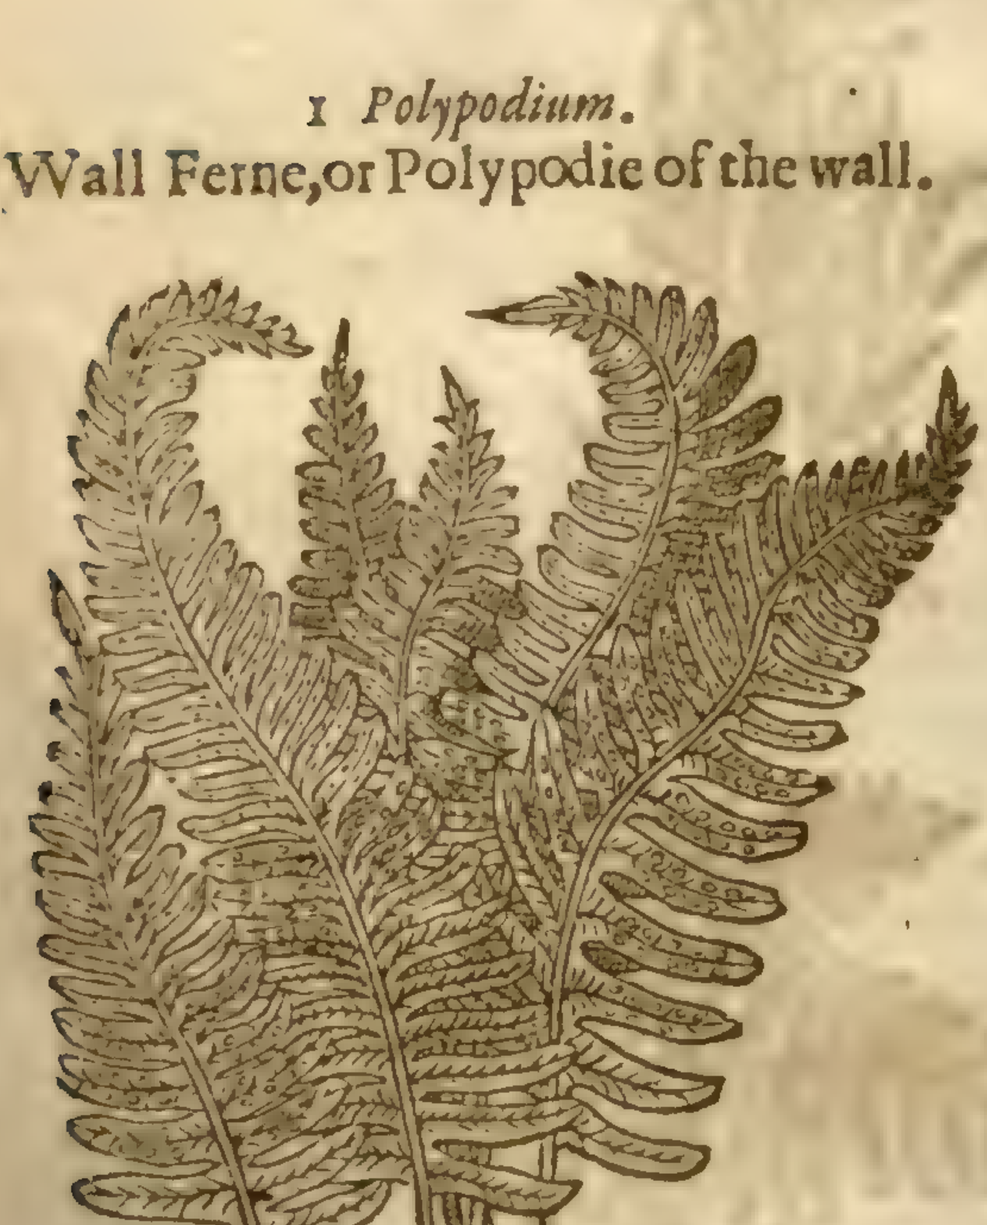
A The root and eſpecially the heart or middle part thereof, boyled or elſe ſtamped, and taken with ſome kinde of liquor, is thought to be good for thoſe that are wounded, dry-beaten and bruiſed; that haue fallen from ſome high place: and for the ſame cauſe the Empericks do put it in decoctions, which the later Phyſitians doe call wound-drinkes: ſome take it to be ſo effectuall, and of ſo great a vertue, as that it can diſſolue cluttered bloud remaining in any inward part of the body, and that it alſo can expell or driue it out by the wound.

B The tender ſprigs thereof at their firſt comming forth are excellent good vnto the purpoſes aforeſaid, and are good to be put into balmes, oyles, and conſolidatiues, or healing plaiſters, and into vnguents appropriate vnto wounds, punctures, and ſuch like.

Chap. 467. *Of Polypodie or Wall-Ferne.*

1 *Polypodium.*
Wall Ferne, or Polypodie of the wall.

2 *Polypodium quercinum.*
Polypody of the Oke.



‡ 2 *Polypodium Indicum.*
Indian Polypodie.

¶ *The Description.*

1 THe leaues of Polypodie might be thought to be like those of male Ferne, but that they are far lesser, and not nicked at all in the edges: these doe presently spring vp from the root, being cut on both the edges with many deepe gashes euen hard to the middle rib: on the vpper side they are smooth, on the nether side they are lightly poudered as it were with dusty marks: the root is long, not a finger thicke, creeping aslope; on which are seen certain little buttons like those pits and dents that appeare in the tailes of cuttle fishes: this hath in it a certaine sweetnesse, with a taste somwhat harsh: this kind of Ferne likewise wanteth not only floures and seed, but stalks also.

2 Polypodie of the oke is much like that of the wall, yet the leaues of it are more finely cut, smooth on the vpper side, of a pale greene colour, together with the stalkes and middle ribs; on the nether side rough like those of Ferne. This Ferne also liueth without a stalke: it groweth without seed: the root hath many strings fastned to it, one folded within another, of a meane bigneſſe, and sweet in taste: it sendeth forth here & there new dodkins or springs whereby it increaseth.

‡ 3 *Clusius* in his *Exoticks, lib.* 4. *cap.* 7. giueth vs the historie of an Indian Fern or Polypodie found amongst the papers of Dr *Nicolas Colie* a Dutch physitian, who died in his return from the East Indies: the root of it was six inches long, and almost one thicke, of the same shape & colour as the ordinarie one is: from this came vp three leaues, of which the third was lesser than the other two: the two larger were eleuen inches long, and their bredth from the middle rib (which was very large) was on each side almost fiue inches; the edges were diuided almost like an oken leafe, from the middle rib came other veins that ran to the ends of the diuisions, and betweene these be smaller veines variously divaricated and netted, which made the leafe shew prettily: the colour of it was like that of a dry oken leafe. Where Dr *Colie* gathered this it was vncertaine, for he had left nothing in writing. ‡

¶ *The Place.*

It growes on the bodies of old rotten trees, and also vpon old walls, and the tops of houses. It is likewise found among rubbish neere the borders of fields, especially vnder trees and thornes, and now and then in woods; in some places it groweth ranke and with a broader leafe, in others not so ranke, and with a narrower leafe.

That which growes on the bodies of old okes is preferred before the rest: in stead of this most do vse that which is found vnder the okes, which for all that is not to be termed *Quircinum*, or Polypodie of the Oke.

¶ *The Time.*

Polypodie is green all the yeare long, and may be gathered at any time: it bringeth forth new leaues in the first Spring.

¶ *The Names.*

The Grecians call it πολυπόδιον, of the holes of the fishes *Polypi* appearing in the roots: it is called in Latine *Polypodium*, after the Greek name, and many times *Filicula*, as though they should say *parua Filix*, or little Ferne: the Italians name it *Polipodio*: the Spaniards, *Filipodio*, and *Polypodio*: in high-Dutch, **Engelsuß, Baumfarn, Dropfoourtz**: in low-Dutch, **Boom varen**: in French, *Polypode*: and we of England, Polypodie; that which groweth vpon the wall wee call Polypodie of the wall; and that on the Oke, Polypodie of the Oke.

¶ *The Temperature.*

Polypodie doth dry, but yet without biting, as *Galen* teacheth.

¶ *The Vertues.*

A *Dioscorides* writeth, That it is of power to purge, and to draw forth choler and flegme. *Ad*[illegible] addeth, That it likewise purgeth Melancholy: others suppose it to be without any purging [illegible] at all, or else very little; of which minde is *Iohannes Monardus*, who thinketh it purgeth very gent[illegible]ly; which thing is confirmed by Experience, the Mistresse of things. For in very deed, Polypo[illegible]dy it selfe doth not purge at all, but only serueth a little to make the belly soluble, being boiled [illegible] the broth of an old cocke, with Beets or Mallowes, or other-like things that move to the stoole [illegible] their slipperinesse. *Iohannes Mesue* reckoneth vp Polypodie among those things that do especia[illegible] dry & make thin: peraduenture he had respect to a certain kind of *Arthritis* or ache in the joints, [illegible] which not one only part of the body, but many together are most commonly touched: for which [illegible] it is very much commended by the Brabanders and other inhabitants about the riuer Rhene and [illegible] the Maze. In this kinde of disease the hands, the feet, and the joints of the knees and elbowes [illegible] swell. There is joined withall a feebleneſſe in mouing, through the extremitie of the pain: [illegible] times the vpper parts are lesse grieued, and the lower more; the humors do also easily run from [illegible] place to another, and then settle. Against this disease the Geldres and Cleuelanders doe vse the [illegible] decoction of Polypodie, whereby they hope the superfluous humors may be wasted and dried [illegible] and that not by and by, but in continuance of time; for they appoint that this decoction should [illegible] taken for certain daies together.

B But this kinde of gout is sooner taken away either by bloud-letting or purgations, or by both [illegible] and afterwards by sweat: neither is it hard to be cured, if these generall remedies be vsed in time; [illegible] for the humors do not remaine fixed in those joints, but are rather gathered together, than setled [illegible] about them.

C Therefore the body must out of hand be purged, and then that which remaines is to be wasted [illegible] and consumed away by such thiugs as procure sweat.

D Furthermore, *Dioscorides* saith that the root of Polypodie is very good for members out of joint, [illegible] and for chaps between the fingers.

E The root of Polypody boiled with a little hony, water, and pepper, and the quantity of an ounce [illegible] giuen, emptieth the belly of cholericke and pituitous humors. Some boile it in water and wine, and [illegible] giue to the quantitie of three ounces for some purposes with good successe.

Chap. 468. *Of Oke-Ferne.*

‡ OVr Author here (as in many other places) knit knots somewhat intricate to loose; for first he confounds in the Names and Nature the Polypodie of the Oke or lesser Polypodie, with the *Dryopteris* or Oke-Ferne; but that I haue now put backe to the former chapter, his fit place. Then in the second place did he giue the Description of the *Dryopteris* of the *Adversar.* taken from thence, *pag.* 363. Then were the Place, Time, Names, &c. taken out of the Chapter of *Dryopteris candida* of *Dodonæus*, being *Pempt.* 3. *lib.* 5. *cap.* 4. but the figure was of the *Filicula fœmina petræa* 4. of *Tabernamontanus*. Now I will in this chapter giue you the *Dryopteris* of the *Adversaria*, then that of *Dodonæus*, and thirdly that of *Tragus*; for I take them to be different, and this last to be that figured by our Author out of *Tabernamontanus*. ‡

¶ *The Description.*

I THis kinde of Ferne, called *Dryopteris* or *Filix querna*, hath leaues like vnto the female Ferne before spoken of, but much lesser, smaller, and more finely cut or jagged, & is not aboue a foot high, being a very slender and delicate tender herb. The leaues are so finely jagged, that in shew they resemble feathers, set round about a small rib or sinue; the backe side being sprinkled not with russet or browne markes or speckes as the other Fernes are, but as it were painted with white spots or marks, not standing out of the leaues in scales, as the spots in the male Ferne, but they are double in each leafe close vnto the middle rib or sinue. The root is long, brown, and somewhat hairy, very like vnto Polypody, but much slenderer, of a sharpe and caustick taste. ‡ *Rondeletius* affirmed that he found the vse of this deadly, being put into medicines in stead of Polypodie, by the ignorance of some Apothecaries in Dauphenie in France. Mr *Goodyer* hath sent me an accurat description, together with a plant of this Ferne, which I haue thought good here also to set forth.

Dryopteris

‡ 1 *Dryopteris Aduerſ.*
True Oke-Ferne.

‡ 2 *Dryopteris alba Dod.*
White Oke-Ferne.

‡ 3 *Dryopteris Tragi.*
Tree Ferne.

Dryopteris Penæ & Lobelij.

The roots creepe in the ground or myre neere the turfe or vpper part thereof, and fold amongſt themſelues as the roots of *Polypodium* do, almoſt as big as a wheat ſtraw, and about fiue, ſix, or ſeuen inches long, cole blacke without, and white within, of a binding taſte inclining to ſweetneſſe, with an innumerable company of ſmall blacke fibres like haires growing thereunto. The ſtalkes ſpring from the roots in ſundry places, in number variable, according to the length and increaſe of the root: I haue ſeen ſmall plants haue but one or two, and ſome bigger plants fourteene or fifteene: they haue but a twofold diuiſion, the ſtalke growing from the root, and the nerue bearing the leaues: the ſtalk is about fiue, ſix, or ſeuen inches long, no bigger than a bennet or ſmal graſſe ſtalk, one ſide flat, as are the male Fernes, the reſt round, ſmooth, and green. The firſt paire of nerues grow about three inches from the root, and ſo do all the reſt grow by couples, almoſt exactly one againſt another, in number about eight, nine, or ten couples, the longeſt ſeldome exceeding an inch in length. The leaues grow on the nerues alſo by couples, eight or nine couples on a nerue, without any nicks or indentures, of a yellowiſh green colour. The Ferne may be ſaid to be like *Polypodium*

in his creeping root, like the male Fern in his ſtalk, and like the female Fern in his nerues & leaues. I could finde no ſeed-ſcales on the back ſides of any of the leaues of this Ferne. Many yeares paſt I found this ſame in a very wet moore or bog, being the land of *Richard Auſten*, called White-row Moore, where Peate is now digged, a mile from Peters-field in Hampſhire: and this ſixth of July, 1633, I digged vp there many plants, and by them made this deſcription. I neuer found it growing in any other place: the leaues periſh at Winter, and grow vp againe very late in the ſpring. *Iohn Goodyer.* Iuly *6.* 1633.

2 *Dodonæus* thus deſcribes his: *Dryopteris* (ſaith he) doth much reſemble the male Fern, but the leaues are much ſmaller and more finely cut, ſmooth on the fore ſide, and of a yellowiſh greene together with the ſtalks and middle nerues: on the backe ſide it is rough like the other Ferues, and alſo liueth without ſtalke or ſeed. The root conſiſts of fibres intricately folded together, of an indifferent thickneſſe, here and there putting vp new buds. This is the *Adianthum* of the *Aduerſ.* who affirme the vſe thereof to be ſafe, and not pernitious and deleterie, as that of *Dryopteris*. It thus differs from the former; the leaues of this are not ſet directly one oppoſit to another, the diuiſions of the leaues are larger and more diuided. The root is more threddy, and creeps not ſo far as that of the former.

3 This (which is *Cluſius* his *Filix pumila ſaxatilis prima*, and which I take to be the *Dryopteris*, or *Filix arborea* of *Tragus*) hath blacke ſlender long creeping roots, with few ſmall hard hairy fibres faſtned to them, of a very aſtringent taſte: from theſe riſe vp ſundry ſtalks a foot high, diuided into certaine branches of winged leaues, like to thoſe of the female Ferne, but much leſſe, tenderer, and finer cut, and hauing many blackiſh ſpots on their lower ſides. This differs from the two former, in that the leaues are branched, which is a chiefe difference; and *Bauhinus* did very well obſerue it, if he had as well followed it, when he diuided *Filix* into *ramoſa* and *non ramoſa*. ‡

¶ *The Place.*

It is oftentimes found in ſunny places, in the vallies of mountaines and little hills, and in the tops of the trunks of trees in thicke woods.

¶ *The Time.*

The leaues hereof periſh in Winter, in the Spring new come forth.

¶ *The Names.*

This is called in Greeke ἀριοπτερὶς: in Latine, *Querna Filix*: *Oribaſius, lib.* 11. of Phyſicall Collections, calls it *Bryopteris*, of the moſſe with which it is found: for as *Dioſcorides* writeth, it groweth in the moſſe of Okes. The Apothecaries in times paſt miſcalled it by the name of *Adiantum*; but they did worſe in putting it in compound medicines in ſtead of *Adiantum*. *Valerius Cordus* calleth it *Pteridion*: in low-Dutch, **Eijcken varen**: the Spaniards, *Helecho de Roble*: it is named in Engliſh, Oke Ferne, Petty Ferne, and it may moſt fitly be called Moſſe-Ferne.

¶ *The Nature and Vertues.*

A Oke Ferne hath many taſtes, it is ſweet, biting, and bitter, it hath in the root a harſh or choking taſte, and a mortifying qualitie, and therefore it taketh away haires. *Dioſcorides* ſaith further, That Oke Ferne ſtamped roots and all is a remedie to root vp haires, if it be applied to the bodie after ſweating, the ſweat being wiped away.

Chap. 469. *Of blacke Oke-Ferne.*

¶ *The Deſcription.*

1 THere is alſo a certaine other kinde of Ferne like to the former Oke-Ferne of *Dodonæus* his deſcription, but the ſtalks and the ribs of the leaues are blackiſh, and the leaues of a deeper green colour: this groweth out alſo immediatly from the root, and is likewiſe diuerſly but not ſo finely indented: the root is made vp of many ſtrings, not vnlike the male Fern, but much leſſer.

2 The female blacke Fern is like to the male, ſauing his leaues are not ſo ſharp at the points, more white and broad than the male, wherein conſiſteth the difference.

¶ *The Place.*

They grow likewiſe vpon trees in ſhadowie woods, and now and then in ſhadowie ſandy bankes and vnder hedges.

¶ *The*

1 *Onopteris mas.*
The male blacke Ferne.

¶ *The Time.*

They remaine greene all the yeare long, otherwise than Polypodie and Maidens haire do; yet do they not cease to bring forth new leaues in Summer: they are destitute of flours and seed, as is the former.

¶ *The Names.*

This is called of diuers of the later herbarists, *Dryopteris nigra*, or blacke Oke-Ferne, of the likenesse it hath with *Dryopteris*; which we haue called in English, Oke-Ferne or Mosse-Ferne: of others, *Adiantum nigrum* or black Maiden-hair, that it may differ from the former, which is falsly called *Adiantum*. There are of the later Herbarists who would haue it to bee *Lonchitis aspera*, or rough Spleen-wort: but what likenesse hath it with the leaues of *Scolopendrium?* none at all: therfore it is not *Lonchitis aspera*, much lesse *Adiantum Plinij*, which differs not from *Adiantum Theophrasti*; for what he hath of *Adiantum* he taketh out of *Theophrastus*: the right *Adiantum* we wil describe hereafter. Notwithstanding blacke Oke-Ferne was vsed of diuers vnlearned Apothecaries of France and Germany for *Adiantum* or Maiden-haire of Lumbardy: but these men did erre in doing so, yet not so much as they who take Polypody of the Oke for the true Maiden-haire.

¶ *The Temperature and Vertues.*

The black Oke-Ferne hath no stipticke qualitie at all, but is like in faculty to *Trichomanes* or English Maiden-haire.

Chap. 470 *Of Harts-Tongue.*

¶ *The Description.*

1 The common kinde of Harts tongue, called *Phyllitis*, that is to say, a plant consisting only of leaues, bearing neither stalk, floure, nor seed, resembling in shew a long tongue, wherefore it hath bin and is called in shops *Lingua Cervina*, that is, Harts tongue: these leaues are a foot long, smooth and plaine vpon one side, but vpon that side next the ground straked ouerthwart with certain long rough marks like small wormes, hanging on the back side thereof. The root is blacke, hairy and twisted, or so growing as though it were wound together,

2 The other kinde of Fern, called *Phyllitis multifida* or *Laciniata*, that is, jagged Harts tongue, is very like the former, sauing that the leaues therof are cut or iagged like a mans hand, or the palme and browantles of a Deare, bearing neither stalke, floure, nor seed.

3 There is another kinde of Harts tongue called *Hemionitis*, which hath bred some controuersie among writers, for some haue taken it for a kind of Harts tongue, as it is indeed: others describe it as a proper plant by it selfe, called *Hemionitis*, of ἡμίονος, that is *Mulus*, a Mule, because Mules do delight to feed thereon. It is barren in seeds, stalks, and floures, and in shape it agreeth very well with our Harts-tongue. The roots are compact of many blackish haires; the leaues are spotted on the back side like the common Harts tongue, and differ in that, that this *Hemionitis* in the base or low-est parts of the leaues is arched after the manner of a new Moon or a forked arrow, the yongest and smallest leaues being like vnto the great Bindweed called *Volubilis*.

4 There is a kinde of Ferne called also *Hemionitis sterilis*, which is a very small and base herbe not aboue a finger high, hauing foure or fiue small leaues of the same substance and colour, spotted on the backe part, and in taste like vnto Harts-tongue; but the leaues beare the shape of them of *Tota-bona*, or good *Henry*, which many of our Apothecaries do abusiuely take for Mercury. The roots are very many, smooth, blacke, and threddy, bearing neither stalke, floure, nor seed. This plant my

1 *Phyllitis.*
Harts-tongue.

2 *Phyllitis multifida.*
Finger Harts-tongue.

‡ 3 *Hemionitis maior.*
Mules Ferne or Moone-Ferne.

‡ 5 *Hemionitis peregrina.*
Handed Moon-Ferne.

my very good friend Mr *Nicolas Belson* found in a grauelly lane in the way leading to Oxey park neer Watford, fifteen miles from London. It groweth likewise on the stone walls of Hampton court, in the garden of Mr *Huggens* keeper of the said house.

5 There is a kinde of Fern called also *Hemionitis*, but with this addition *peregrina*, that is very seldome found, and hath leaues very like vnto Harts-tongue, but that it is palmed or branched in the part next the ground in manner of the second *Phyllitis* at the top of the leaues, otherwise they resemble one another in nature and fome.

¶ *The Place.*

The common Harts-tongue growes by the way sides in great plenty, as you trauell from London to Excester, in shadowie places and moist stony vallies and wells, and is much planted in gardens.

The second I found in the garden of Mr *Cranwich* a surgeon dwelling at Much-Dunmow in Essex, who gaue me a plant for my garden.

‡ Mr *Goodyer* found it wilde in the bankes of a lane neer Swaneling, not many miles from Southhampton. ‡

It groweth vpon Ingleborow hils, and in diuers other mountaines of the North of England.

¶ *The Time.*

It is green all the yeare long, yet lesse green in winter: in summer it now and then brings forth new leaues.

¶ *The Names.*

It is called in Greeke, ἡμίονιτις: in Latine also *Phyllitis*: in shops, *Lingua Cervina*, and falsly *Scolopendria*: for it differs much from the right *Scolopendria* or stone Ferne: it is called in high Dutch, **Hirszong**: in low-Dutch, **Herstonge**: in Spanish, *Lengua cervina*: in French, *Langue de cerf*: in English, Harts tongue; of some, Stone Harts tongue. *Apuleius*, *cap.* 83. nameth it *Radiolus*.

¶ *The Nature.*

It is of a binding and drying facultie.

¶ *The Vertues.*

Common Harts tongue is commended against the laske and bloudy flix: *Dioscorides* teacheth, A That being drunke in wine it is a remedie against the bitings of Serpents.

It opens the hardnesse and stopping of the spleen and liuer, and all other griefes proceeding of B opilations or stoppings whatsoeuer.

Chap. 471.

Of Spleene-woort or Milt-waste.

¶ *The Description.*

1 Spleen-wort, being that kinde of Fern called *Asplenium* or *Ceterach*, and the true *Scolopendria*, hath leaues a span long, jagged or cut vpon both sides, euen hard to the middle rib, euery cut or incisure being as it were cut halfe round (whereby it is knowne from the rough Spleenwort) not one cut right against another, but one besides the other, set in seuerall order, being slipperie and green on the vpper side, soft and downy vnderneath; which when they bee withered are folded vp together like a scrole, and hairy without, much like to the rough Bear-worme wherewith men bait their hooks to catch fish. The root is small, blacke, and rough, much platted or interlaced, hauing neither stalke, floure, nor seeds.

1 *Asplenium*

1 *Aſplenium, ſive Ceterach.*
Spleen-wort or Milt-waſte.

† 3 *Lonchitis aſpera major.*
Great rough Spleen-wort.

2 *Lonchitis aſpera.*
Rough Spleenwort.

† 4 *Lonchitis Maranthæ.*
Baſtard Spleen-wort.

2 Rough Spleenwort is partly like the other Ferns in shew, and beareth neither stalk nor seed, hauing narrow leaues a foot long and somewhat longer, slashed on the edges euen to the middle rib, fourth on the vpper side, and of a swart green colour vnderneath, rough, as is the leaues of Polypodie: the root is blacke, and set with a number of slender strings.

3 This greater Spleenwort hath leaues like Ceterach, of a span long, somwhat resembling those of Polypodie, but that they are more diuided, snipt about the edges, and sharpe pointed: the root is fibrous and stringy. This growes on the rocks and mountainous places of Italy, and is the *Lonchitis aspera maior* of *Matthiolus* and others. ‡

4 This kinde of Spleenwort is not only barren of stalkes and seeds, but also of those spots and warts wherewith the others are spotted: the leaues are few in number, growing pyramide or steeple fashion great and broad below, and sharper toward the top by degrees: the root is thick, black and bushy, as it were a Crowes nest.

¶ *The Place.*

Ceterach groweth vpon old stone walls and rocks in darke and shadowie places throughout the West parts of England, especially vpon the stone walls by Bristow, as you go to S. *Vincents* rocke, also about Bathe, Wells, and Salisbury, where I haue seen great plenty thereof.

The rough Spleenwort groweth vpon barren heaths, dry sandy bankes, and shadowie places in most parts of England, but especially on a heath by Lonon called Hampsted heath, where it grows in great aboundance.

¶ *The Names.*

Spleenwort or Milt-waste is called in Greeke Ἀσπλήνιον: in Latine likewise *Asplenium*, and also *Scolopendria*: of *Gaza*, *Mula herba*: in shops, *Ceterach*: in high-Dutch, **Steynfarne**: in low-Dutch, **Steynwaren**, and **Milterupt**: in English, Spleenwort, Milt-waste, Scale-Fern, and Stone-Fern: it is called *Asplenion*, because it is especiall good against the infirmities of the Spleene or Milt; and *Scolopendria*, of the likenesse it hath with the Beare-worme before remembred.

Rough Milt-waste is called of diuers of the later writers, *Asplenium sylvestre*, or wild Spleenwort: of some, *Asplenium magnum*, or great Spleenwort. *Valerius Cordus* calls it *Strutiopteris*: and *Dioscoride*, *Lonchitis aspera*, or rough Spleenwort: in Latine, according to the same Author, *Longina*, and *Caterach*: in English, rough Spleenwort or Milt-waste.

¶ *The Nature.*

These plants are of thin parts, as *Galen* witnesseth, yet are they not hot, but in a meane.

¶ *The Vertues.*

Dioscorides teacheth, that the leaues boiled in wine and drunke by the space of forty daies, take away infirmities of the spleen, help the strangury and yellow jaundice, cause the stone in the bladder to moulder and passe away; all which are performed by such things as be of thinne or subtile parts. He addeth likewise, that they stay the hicket or yeoxing, and also hinder conception, either inwardly taken, or hanged about the party: and therefore, saith *Pliny*, Spleenwort is not to bee giuen to women, because it bringeth barrennesse. A

There be Empericks or blinde practitioners of this age who teach, that with this herb not onely the hardnesse and swelling of the spleene, but all infirmities of the liuer also may be effectually, and in very short time remoued, insomuch that the sodden liuer of a beast is restored to his former constitution againe, that is, made like vnto a raw liuer, if it be boiled again with this herb. B

But this is to be reckoned among the old Wiues fables, and that also which *Dioscorides* tells of, touching the gathering of Spleene-wort in the night, and other most vain things, which are found here and there scattered in old books: from which most of the later Writers do not abstaine, who many times fill vp their pages with lies and frivolous toyes, and by so doing do not a little deceive young Students. C

‡ Whereas vnder the title of *Lonchitis Matthioli* was put the figure now in the third place, and the figure which should haue bin there was in the third place of the next Chapter, vnder the title of *Filix petræa minor*.

CHAP.

Chap. 472: *Of diuers small Fernes.*

¶ *The Description.*

1 THis small or dwarfe Ferne, which is seldome found except in the banks of stony fountains, wells, and rocks bordering vpon riuers, is very like the common Brakes in leaues, but altogether lesser. The root is composed of a bundle of blacke threddy strings.

2 The female, which is found likewise by running streams, wells, and fountaines vpon rockes and stony places, is like the precedent, but is a great deale smaller, blacker of colour, fewer roots, and shorter.

1 *Filicula fontana mas.*
The male fountaine Ferne.

† 3 *Filicula petræa mas.*
The male dwarfe stone Ferne.

3 The male dwarfe Ferne, that groweth vpon the stony mountaines of the North and West parts of England, especially toward the sea, and also in the joints of stone walls among the rocks, hath small leaues deeply cut on both sides, like vnto *Ceterach* or Spleen-wort, barren both of fruit and stalks, as also of those spots or marks that are to be seen vpon the back part of the other Ferne: the root creepeth along, set with some few hairy strings resembling those of the Oke-Fern called *Dryopteris*.

4 The female stone Ferne hath diuers long leaues rising from a threddy root, contrary to that of the male, composed of many small leaues finely minced or cut like the teeth of a saw, of a whitish green colour, without any spots or marks at all, seeds, or stalks, which groweth vnder high rockes and craggy mountaines in most places. ‡ From a small root composed of many hairy and intricately folding strings, come vp many leaues two or three inches high, slightly darke greene, and shining: in the diuision, growth, position, shape and taste it resembles the Ferne, and hath also rusty spots on the backe: the middle ribbe and stalke is of a shining

Filicula Petræa fœmina, siue Chamæfilix marina Anglica.
The female dwarfe stone Ferne.

nish silken colour: it growes in the chinkes of the Rocks by the Sea side in Cornewall.

¶ *The Place.*

The place is sufficiently touched in the description.

¶ *The Time.*

They flourish both Winter and Summer, for when the leaues wither by reason of age, there arise young to supply the place, so that they are not to be seen without greene and withered leaues both at once.

¶ *The Names.*

It sufficeth what hath bin said of the names in their seuerall titles: notwithstanding the last described wee haue called *Chamæfilix marina Anglica*: which groweth vpon the rockie cliffe neere Harwich, as also at Douer, among the Sampire that there groweth.

¶ *The Temperature and Vertues.*

Their temperature and faculties in working are referred vnto the kinds of black Oke Ferns, called *Dryopteris*, and *Onopteris*.

* I am hard to say what our Author in this chapter meant, by his figures and descriptions, wherefore I haue left his descriptions as I found them: the second figure was very like the first I haue omitted: for the third, which was of the *Lonchitis Maranthæ*, mentioned in the foregoing chapter, I haue put *Clusius* his figure of his *Lonchitis aculeata*, which growes in such places, and reasonable well fits our Authors description: in the fourth place I haue put *Lobels Chamæfilix marina* figure and his description, which our Author as I judge, intended in that place to haue giuen vs.

CHAP. 473. *Of true Maiden-haire.*

¶ *The Kindes.*

Theophrastus and *Pliny* haue set downe two Maiden-haires, the blacke and the white, whereunto may be added another called *Ruta muraria*, or wall Rue, equall to the others in facultie, whereof we will intreat.

1 *Capillus Veneris verus.*
True Maiden-haire.

¶ *The Description.*

1 WHosoeuer will follow the variable opinions of Writers concerning the Fern called *Adianthum verum*, or *Capillus Veneris verus*, must of necessitie be brought into a Labyrinth of doubts, considering the diuers opinions thereof: but this I know that Venus-haire, or Maiden-haire, is a low herb growing an hand high, smooth, of a darke crimson colour, and glittering withall; the leaues be smal, cut in sunder, and nicked in the edges something like those of Coriander, confusedly or without order placed, the middle rib whereof is of a blacke shining colour: the root consisteth of manie small threddy strings.

2 This Assyrian Maiden-haire is likewise a base or low herbe, hauing leaues, flat, smooth, and plaine, set vpon a blackish middle rib, like vnto that of the other Maiden-haire, cut or notched in the edges, naturekeeping no certain forme, but making one leafe of this fashion, and another far different from it: the root is tough and threddie.

3 This plant which we haue inserted among the Adianthes as a kinde thereof, may without error so passe, which is in great request in Flanders and Germanie, where the practitioners in physicke do vse the same in stead of *Capillus Veneris*, and with better successe than any of the Capillare herbes,

herbs, although *Matthiolus* and *Dioscorides* himselfe hath made this wall Rue to be a kind of *Par-*
nychia or Nailewort: notwithstanding the Germans will not leaue the vse thereof, but receiue it as
the true Adianth, esteeming it equall, if not far better, than either *Ceterach*, *Capillus Veneris vera*
Trichomanes, called also *Polytrichon*: it brings forth very many leaues round and slender, cut into two
or three parts, very hard in handling, smooth and green on the out side, and of an ilfauored dead co-
lor vnderneath, set with little fine spots, which euidently sheweth it to be a kind of Fern. The roo
is blacke and full of strings.

2 *Capillus Veneris Syriaca.*
Assyrian Maiden-haire.

3 *Ruta muraria, siue Salvia vita.*
Wall Rue or Rue Maiden-haire.

¶ *The Place.*

The right Maiden-haire groweth vpon walls in stony shadowie and moist places, neere to fou-
taines and where water droppeth: it is a stranger in England; yet I haue heard it reported by some
of good credit, that it growes in diuers places of the West country of England.

The Assyrian Maiden-haire taketh name of his natiue country Assyria, being a stranger in Eu-
rope.

Stone Rue groweth vpon old walls neere vnto waters, Wells, and fountaines: I found it vpon
the wall in the Churchyard of Dartford in Kent, hard by the riuer side where people ride through,
and also vpon the wals of the Churchyard of Sittingburn in the same county, in the middle of the
towne, hard by a great lake of water, and also vpon the Church walls of Railey in Essex, and diuers
other places.

¶ *The Time.*

These plants are green both winter and summer, and yet haue neither floures nor seed.

¶ *The Names.*

Maiden-haire is called in Greeke Ἀδίαντον: *Theophrastus* and *Pliny* name it *Adiantum nigrum*, blac-
Maiden-haire; for they set downe two Maiden-haires, the blacke and the white, making this the
blacke, and the Rue of the wall the white: it is called in Latine, *Polytrichum*, *Callitrichum*, *Cin-*
Terræ Capillus, *Supercilium terræ*: of *Apuleius*, *Capillus Veneris*, *Capillaris*, *Crinita*: and of diuers *Cri-*
andrum putei: the Italians keep the name *Capillus Veneris*: in English, black Maiden-haire and *Ve-*
nus haire, and it may be called our Ladies haire.

It is called *Adianton* because the leafe, as *Theophrastus* saith, is neuer wet, for it casteth off water that falleth thereon, or being drowned or couered in water, it remaineth still as if it were dry, as *Pliny* likewise writeth; and is termed *Callitricon* and *Polytricon*, of the effect it hath in dying haire, and maketh it to grow thicke.

Wall Rue is commonly called in Latine, *Ruta muraria*, or *Ruta muralis*: of some, *Salvia vitæ*, but wherefore I know not, neither themselues, if they were liuing: of the Apothecaries of the Low-Countries *Capillus Veneris*, or Maiden haire, and they haue vsed it a long time for the right Maiden-haire; it is that kind of *Adiantum* which *Theophrastus* termed *Adiantum Candidum*, or white Maiden-haire, for hee maketh two, one blacke, and the other white, as we haue said. *Pliny* doth likewise set downe two kindes, one he calleth *Polytricon*; the other, *Tricomanes*, or English Maiden-haire, whereof we will intreate in the chapter following, which he hath falsely set downe for a kinde of *Adiantum*, for *Tricomanes* doth differ from *Adiantum*.

Some there be that thinke Wall-Rue is *Paronichia Dioscoridis*, or *Dioscorides* his Whitlow-wort, wherein they haue been greatly deceiued: it is called in high Dutch, **Maurranten:** in low Dutch, **Steenruyt:** in French, *Rue de marælle:* in English, Wall-Rue, and white Maiden haire.

¶ *The Temperature and Vertues.*

The true Maiden-haire, as *Galen* testifieth, doth dry, make thin, waste away, and is in a meane betweene heate and coldnesse: *Mesues* sheweth that it consisteth of vnlike or disagreeing parts, and that some are watery and earthy, and the same binding, and another superficially hot and thinne: And that by this it taketh away obstructions or stoppings, maketh things thinne that are thicke, looseneth the belly, especially when it is fresh and greene: for as this part is thin, so is it quickely resolued, and that by reason of his binding and earthy parts: it stoppeth the belly, and staieth the laske and other fluxes. A

Being drunke it breaketh the stone, and expelleth not onely the stones in the kidnies, but also those which sticke in the passages of the vrine. B

It raiseth vp grosse and slimie humors out of the chest and lungs, and also those which sticke in the conduits of the winde pipe, it breaketh and raiseth them out by spitting, if a loch or licking medicine be made thereof. C

Moreouer, it consumeth and wasteth away the Kings-euill, and other hard swellings, as the same Author affirmeth, and it maketh the haire of the head or beard to grow, that is fallen and pilled off. D

Dioscorides reckoneth vp many vertues and operations of this Maiden-haire, which do not onely differ, but are also contrary one to another. Among others he saith, that the same stancheth bloud: and a little before, that it draweth away the secondines, and bringeth downe the desired sickenesse: which words do confound one another with contrarieties; for whatsoeuer things do stanch bloud, the same do also stay the termes. E

He addeth also in the end, that it is sowne about sheepe-folds for the benefit of the sheepe, but what that benefit should be he sheweth not. F

Besides, that it cannot be sowne, by reason it is without seed, it is euident, neither can it fitly bee remoued. Therefore in this place it seemeth that many things are transposed from other places, and falsly added to this chapter: and peraduenture some things are brought hither out of discourse of *Cytisus*, or Milke Trefoile, whereof here to write were to small purpose. G

Wall-Rue is not much vnlike to blacke Maiden-haire in temperature and faculty.

Wall-Rue is good for them that haue a cough, that are short winded, and that be troubled with H
stitches and paine in their sides. I

Being boyled, it causeth concoction of raw humors which sticke in the lungs; it taketh away K
the paine of the kidnies and bladder, it gently prouoketh vrine, and driueth forth stones.

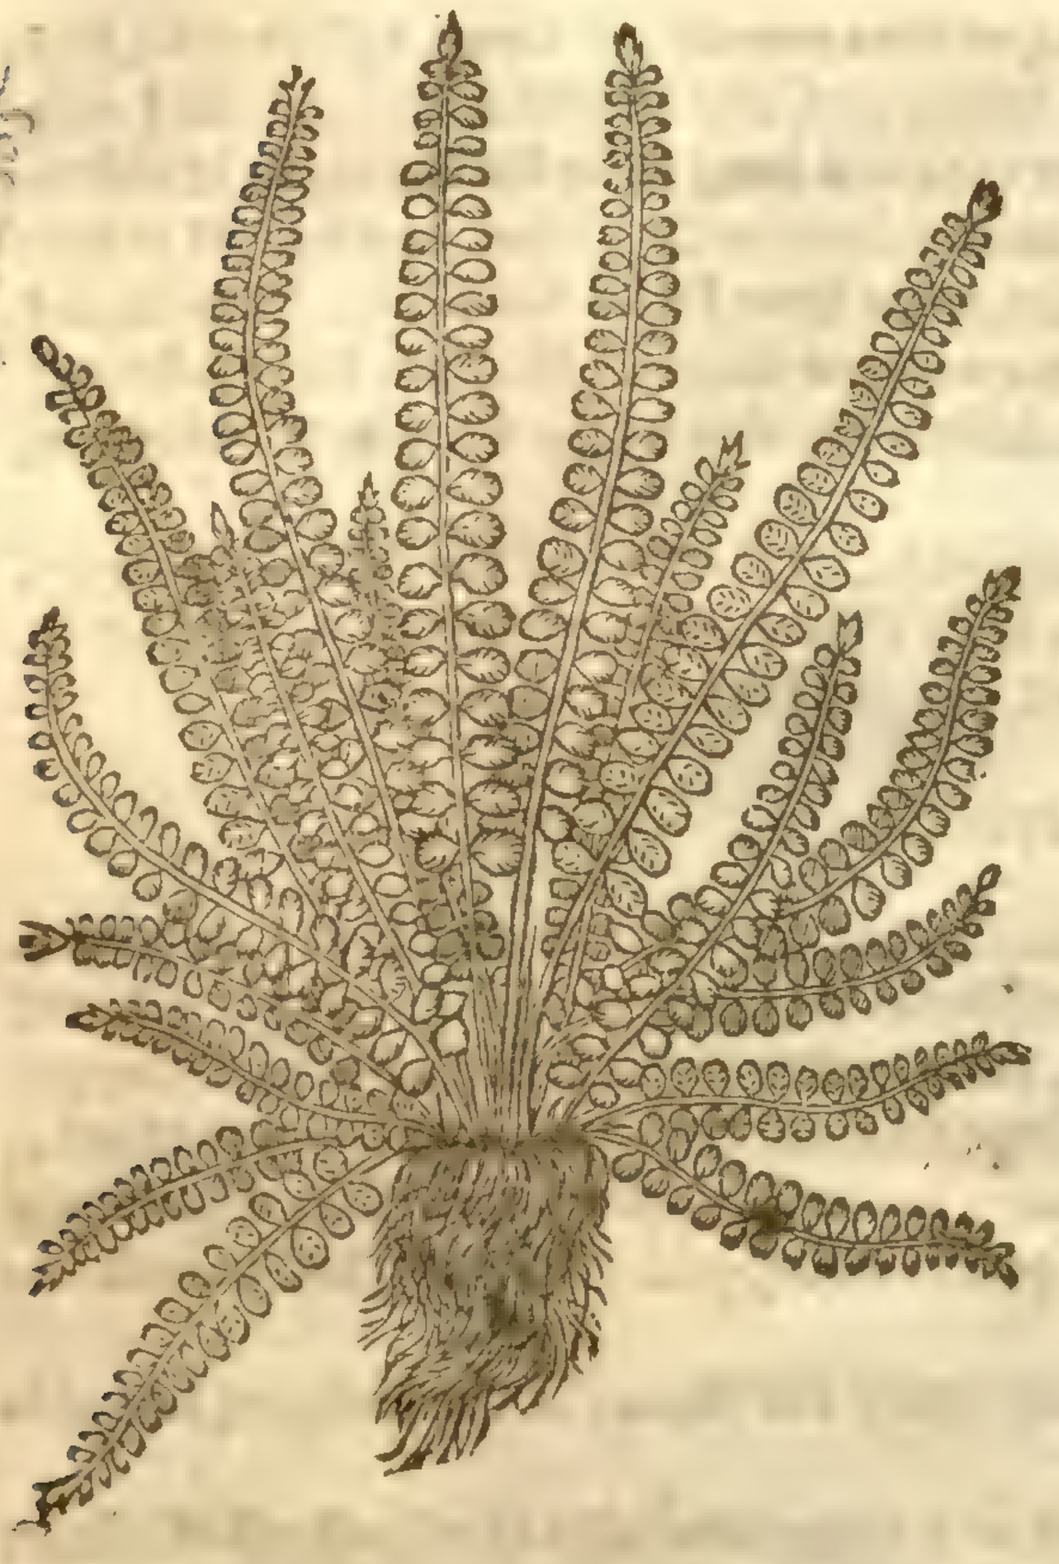
It is commended against ruptures in young children, and some affirme it to be excellent good, L
if the pouder thereof be taken continually for forty daies together.

Chap. 474. *Of English, or common Maiden-haire.*

¶ *The Description.*

1 English Maiden-haire hath long leaues of a darke green colour, consisting of very many small round leaues set vpon a middle rib, of a shining blacke colour, dashed on the nether side with small rough markes or speckes, of an ouerworne colour: the roots are small and threddy.

1 *Trichomanes mas.*
The Male Englisſh Maiden-haire.



2 The female Englisſh Maiden [illegible] like vnto the precedent, ſauing that it is [illegible] and wanteth thoſe ſpots or markes that [illegible] the other, wherein conſiſteth the differ[illegible] ‡ Our Authors figure was of the *Tri[illegible] fœmina* of *Tabernamontanus*, which expr[illegible] variety with branched leaues, and therein [illegible] was the difference. ‡

¶ *The Place.*

It growes for the moſt part neer vnto [illegible] and brookes, and other moiſt places, [illegible] ſtone walls and rocks: I found it growing [illegible] ſhadowie ſandie lane in Betſome, in the [illegible] of Southfleet in Kent, vpon the ground [illegible] as there was no ſtones or ſtony ground [illegible] vnto it, which before that time I did neuer [illegible] it groweth likewiſe vpon ſtone walls at [illegible] Majeſties palace of Richmond, & in moſt [illegible] wals of the Weſt and North parts of Eng[illegible] ‡ Mr. *Goodyer* ſaith, that in Ianuary, 162[illegible] he ſaw enough to lade an horſe growing on [illegible] bancks in a lane, as he rode betweene Rake and Headly in Hampſhire neere Wollmer For[illegible] reſt. ‡

¶ *The Time.*

It continueth a long time, the coldneſſe of Winter doth it no harme, it is barren as the other Fernes are, whereof it is a kinde.

¶ *The Names.*

It is called in Greeke, [illegible]: in Latine, *Filicula*, as though we ſhould ſay, *Parua Filix*, or little Ferne; alſo *Capillaris*: in ſhops, *Capillus Veneris*. *Apuleius* in his 51 chapter maketh it allone with *Callitrichon*: of ſome it is called *Polytrichon*: in Englisſh, common Maiden-haire.

¶ *The Temperature and Vertues.*

A Theſe as *Dioſcorides* and *Galen* do write, haue all the faculties belonging to *Adiantum*, or blacke Maiden-haire.

B The decoction made in wine and drunke, helpeth them that are ſhort winded, it helpeth the cough, ripeneth tough flegme, and auoideth it by ſpitting.

C The lie wherein it hath beene ſodden, or laid to infuſe, is good to waſh the head, cauſing the ſcurfe and ſcales to fall off, and haire to grow in places that are pild and bare.

Chap. 475. *Of Thiſtles.*

¶ *The Kindes.*

THe matter of the Thiſtles is diuers, ſome Thiſtles ſerue for nouriſhment, as the Artichoke without prickles, and the Artichoke with prickles; other for medicine, as the root of Carline which is good for many things; the bleſſed Thiſtle alſo, otherwiſe called *Carduus benedictus*; Sea Huluer, and diuers others: ſome are poiſonſome, as *Chamæleon niger*; one ſmooth, plaine, and without prickles, as the Thiſtle called Beares Breech, or *Acanthus ſatiuus*, whereof there is another with prickles, which we make the wilde, of the which two we intend to write in this chapter.

¶ *The Deſcription.*

1 BEares breech of the garden hath broad leaues, ſmooth, ſomewhat blacke, gaſhed on both the edges, and ſet with many cuts and fine nickes: between which riſeth vp in the middle a big ſtalke brauely deckt with flours, ſet in order from the middle vpward, of colour white, of forme long, which are armed as it were with two catkins, one higher, another lower: after them grow forth the husks, in which is found broad ſeed: the roots be blacke without, and white within.

ig and full of clammie iuyce, and are diuided into many off-springs, which as they creepe far, so do they now and then bud forth and grow afresh: these roots are so full of life, that how little soeuer of them remaine, it oftentimes also bringeth forth the whole plant.

1 *Acanthus sativus.*
Garden Beares-breech.

‡ 2 *Acanthus syl. aculeatus.*
Prickly Beares-breech.

2 Wilde Beares-breech, called *Acanthus sylueſtris, Pena* ſetteth forth for *Chameleonta Monſpelienſium*, and reporteth that he found it growing amongſt the grauelly and moiſt places neere to the walls of Montpellier, and at the gate of Aegidia, betweene the fountane and the brooke neere to the wall: this thiſtle is in ſtalke, floures, colour of leaues and ſeed like the firſt kinde, but ſhorter and lower, hauing large leaues, dented or jagged with many cuts and inciſions, not only in ſome few parts of the leaues, as ſome other thiſtles, but very thickly dented or clouen, and hauing many ſharp, large, white and hard prickles about the ſides of the diuiſions and cuts, not very eaſie to be handled or touched without danger to the hand and fingers.

¶ *The Place.*

Dioſcorides writeth, that garden Branke Vrſine groweth in moiſt and ſtony places, and alſo in gardens: it were vnaduiſedly done to ſeeke it in either of the Germaines any where, but in gardens onely; in my garden it doth grow very plentifully.

The wilde was found in certaine places of Italy neer to the ſea, by that notable learned man *Alo-ſius Pancius*, Phyſition to the Duke of Ferrara, and profeſſor of ſimples and Phyſicke, and is a ſtranger in England. ‡ I haue ſeene it growing in the garden of Mr. *Iohn Parkinſon*. ‡

¶ *The Time.*

Both the Branke Vrſines do floure in the Summer ſeaſon, the ſeed is ripe in Autumne: the root remaineth freſh; yet now and then it periſhes in Winter in both the Germaines, if the weather be too cold: but in England the former ſeldome or neuer dieth.

¶ *The Names.*

It is called in Greeke, ἄκανθος: the Latines keepe the ſame name *Acanthus*: yet doth *Acanthus* ſignifie generally all kinde of Thiſtles, and that is called *Acanthus* by the figure *Antonomaſia*: the Engliſh name is, Branke Vrſine, and Beares-breech.

The tame or garden Branke Vrſine is named in Latine, *Sativus*, or *Hortenſis Acanthus*: in Greeke, ἥμερος: and of *Galen*, *Oribaſius*, and *Pliny*, μελάμφυλλος: *Pliny* alſo calleth this *Acanthus lævis*, or ſmooth

branke Vrſine, and reporteth it to be a city herbe, and to ſerue for arbors: ſome name it *Branca Vrſina* (others vſe to call Cow-Parſnep by the name of *Branca Vrſina*, but with the addition *Germanica*: the Italians call it *Acantho*, and *Branca Orſina*: the Spaniards, *Yerva Giguante*: the Ingrauers of time were wont to carue the leaues of this Branke Vrſine in pillers, and other workes, and alſo vpon the eares of pots; as among others *Virgil* teſtifieth in the third Eclog of his Bucolicks:

Et nobis idem Alcimedon duo pocula fecit,
Et molli circum eſt anſas amplexus Acantha.

‡ I take *Virgils Acanthus* to be that which we now commonly call *Pyracantha*, as I ſhall hereafter ſhew when I come to treat thereof. ‡

The other Branke Vrſine is named in Greeke, ἄγριος ἄκανθος: and in Latine, *Sylueſtris Acanthus*, or wilde Branke Vrſine, and they may be called properly *Acantha*, or *Spina*, a prickle; by which name it is found called of moſt Herbariſts, *Acanthus*: yet there is alſo another *Acanthus* a thorny ſhrub: the liquor which iſſueth forth of it, as *Herodotus* and *Theophraſtus* affirme, is a gumme: for difference whereof peraduenture this kinde of *Acanthus* is named *Herbacantha*: There is likewiſe found among the baſtard names of *Acanthus* the word *Mamolaria*, and alſo *Crepala*, but it is not expreſſed to which of them, whether to the wilde or tame it ought to be referred.

¶ *The Temperature.*

The leaues of the garden Branke Vrſine conſiſt in a meane as it were betweene hot and cold being ſomwhat moiſt, with a mollifying and gentle digeſting faculty, as are thoſe of the Mallow, and therefore they are profitably boyled in clyſters, as well as Mallow leaues. The root, as *Galen* teacheth, is of a more drying quality.

¶ *The Vertues.*

A *Dioſcorides* ſaith, that the roots are a remedy for lims that are burnt with fire, and that haue beene out of joynt, if they be laied thereunto: that being drunke they prouoke vrine, and ſtop the belly: that they helpe thoſe that be broken, and be troubled with the crampe, and be in a conſumption of the lungs.

B They are good for ſuch as haue the ptiſicke and ſpet bloud withall; for thoſe that haue falne from ſome high place, that are bruiſed and dry beaten, and that haue ouerſtrained themſelues, and they are as good as the roots of the greater Comfrey, whereunto they are very like in ſubſtance, tough juyce, and quality.

C Of the ſame root is made an excellent plaiſter againſt the ache and numneſſe of the hands and feet.

D It is put into clyſters with good ſucceſſe againſt ſundry maladies.

CHAP. 476. *Of the Cotton Thiſtle.*

¶ *The Deſcription.*

1 THe common Thiſtle, whereof the greateſt quantity of down is gathered for diuers purpoſes, as well by the poore to ſtop pillowes, cuſhions, and beds for want of feathers, as alſo bought of the rich vpholſters to mix with the feathers and down they do ſell, which deceit would be looked vnto: this Thiſtle hath great leaues, long and broad, gaſhed about the edges, and ſet with ſharpe and ſtiffe prickles all alongſt the edges, couered all ouer with a ſoft cotton or downe: out from the middeſt whereof riſeth vp a long ſtalke about two cubits high, cornered, and ſet with filmes, and alſo full of prickles: the heads are likewiſe cornered with prickles, and bring forth floures conſiſting of many whitiſh threds: the ſeed which ſucceedeth them is wrapped vp in downe; it is long, of a light crimſon colour, and leſſer than the ſeed of baſtard Saffron: the root groweth deep in the ground, being white, hard, wooddy, and not without ſtrings.

2 The Illyrian cotton thiſtle hath a long naked root, beſet about the top with a fringe of many ſmall threds or jags: from which ariſeth a very large and tall ſtalke, higher than any man, rather like a tree than an annuall herbe or plant: this ſtalke is garniſhed with ſcroles of thinne leaues, from the bottome to the top, ſet full of moſt horrible ſharpe prickes, and ſo is the ſtalke and euery part of the plant, ſo that it is impoſſible for man or beaſt to touch the ſame without great hurt or danger: his leaues are very great, far broader and longer than any other Thyſtle whatſoeuer, couered with an hoarie cotton or downe like the former: the floures doe grow at the top of the ſtalkes, which

which is diuided into sundry branches, and are of a purple colour, set or armed round about with the like, or rather sharper thornes than the aforesaid.

1 *Acanthium album.*
The white Cotton Thistle.

2 *Acanthium Illyricum purpureum.*
The purple Cotton Thistle.

¶ *The Place.*

These Thistles grow by high waies sides, and in ditches almost euery where.

¶ *The Time.*

They floure from Iune vntill August, the second yeare after they be sowne: and in the mean time the seed waxeth ripe, which being thorow ripe the herbe perisheth, as doe likewise most of the other Thistles, which liue no longer than till the seed be fully come to maturity.

¶ *The Names.*

This Thistle is taken for that which is called in Greeke, ἀκάνθιον, which *Dioscorides* describeth to haue leaues set with prickles round about the edges, and to be couered with a thin downe like a copweb, that may be gathered and spun to make garments of, like those of silke: in high Dutch it is called, **Weißwege Distill**: in low Dutch, **Witte Wech Distel**: in French, *Chardon argentin*: in English, Cotton-Thistle, white Cotton-Thistle, wilde white Thistle, Argentine or the Siluer Thistle.

¶ *The Temperature and Vertues.*

Dioscorides saith, That the leaues and roots hereof are a remedy for those that haue their bodies drawne backwards; thereby *Galen* supposeth that these are of temperature hot.

A

CHAP. 477. *Of our Ladies-Thistle.*

¶ *The Description.*

THe leaues of our Ladies-Thistle are as bigge as those of white Cotton-Thistle: for the leaues thereof be great, broad, large, gashed in the edges, armed with a multitude of stiffe and sharpe prickles, as are those of Ote-Thistle, but they are without down, altogether slippery, of a light

Carduus Mariæ.
Ladies Thistle.

A

green and speckled, with white and milky spots and lines drawne diuers waies: the stalk is high and as bigge as a mans finger: the floures grow forth of heads full of prickles, being threds of a purple colour: the seed is wrapped in downe like that of Cotton Thistle: the root is long thicke, and white.

¶ *The Place.*

It groweth vpon waste and common places by high waies, and by dung-hils almost euery where.

¶ *The Time.*

It floureth and seedeth when Cotton-Thistle doth.

¶ *The Names.*

It is called in Latine, *Carduus Lacteus*, and *Carduus Mariæ*; in high Dutch, **Onser Vroutwen Distell**: in French, *Chardon de nostre dame*. in English, our Ladies Thistle: it may properly be called *Leucographus*, of the white spots and lines that are on the leaues: *Pliny* in his 27. booke, chap. 11. maketh mention of an herb called *Leucographis*, but what maner of one it is he hath not expressed; therefore it would be hard to affirme this to be the same that his *Leucographis* is; and this is thought to be *Spina alba*, called in Greeke ἄκανθα λευκὴ, or white Thistle, Milke Thistle, and *Carduus Ramptarius*: of the Arabians, *Bedeuar* or *Bedeguar*, as *Matthæus Syluaticus* testifieth.

¶ *The Temperature and Vertues.*

The tender leaues of *Carduus Leucographus*, the prickles taken off, are sometimes vsed to bee eaten with other herbes.

B *Galen* writeth, that the roots of *Spina alba* do dry and moderately binde, that therefore it is good for those that be troubled with the laske and the bloudy flix, that it staieth bleeding, wasteth away cold swellings; easeth the paine of the teeth if they be washed with the decoction thereof.

C The seed thereof is of a thin essence and hot facultie, therefore he saith that it is good for those that be troubled with cramps.

D *Dioscorides* affirmeth that the seeds being drunke are a remedy for infants that haue their sinews drawne together, and for those that be bitten of serpents: and that it is thought to driue away serpents, if it be but hanged about the necke.

Chap. 478. *Of the Globe-Thistle.*

¶ *The Description.*

1 GLobe Thistle hath a very long stalke, and leaues jagged, great, long, and broad, deepely gashed, strong of smell, somewhat greene on the vpper side, and on the nether side white and downy: the floures grow forth of a round head like a globe, which standeth on the tops of the stalkes; they are white and small, with blew threds in the midst: the seed is long with haires of a meane length: the root is thicke and branched.

2 There is another Globe Thistle that hath lesser leaues, but more full of prickles, with round heads also: but there groweth out of them besides the floures, certaine long and stiffe prickles.

3 There is likewise another kinde resembling the first in forme and figure, but much lesser, and the floures thereof tend more to a blew.

4 There is also another Globe Thistle, which is the least, and hath the sharpest prickles of all the rest: the head is small; the floures whereof are white, like to those of the first.

5 There

1 *Carduus globosus.*
The Globe-Thistle.

‡ 2 *Carduus globosus aculeatus.*
Prickly headed Globe-Thistle.

‡ 3 *Carduus globosus minor.*
Small Globe-Thistle.

‡ 5 *Carduus globosus capitulo latiore.*
Flat headed Globe-Thistle.

5 There is a certaine other kinde hereof, yet the head is not so round, that is to say, flatter and broader aboue; out of which spring blew floures: the stalke hereof is slender, and couered with a white thin downe: the leaues are long, gashed likewise on both sides, and armed in euery corner with sharpe prickles.

6 There

6 There is another called the Down-Thistle, which riseth vp with thicke and long stalks. The leaues thereof are jagged, set with prickles, white on the nether side: the heads be round and many in number, and are couered with a soft downe, and sharpe prickles standing forth on euery side, bearing on the vpper part fraught with purple floures all of strings: the seed is long, and shining, as doth the seed of many of the Thistles.

‡ *6 Carduus eriocephalus.*
Woolly headed Thistle.

¶ *The Place.*

These are sown in gardens, and do not grow in these countries that we can finde.

‡ I haue found the sixth by Pocklington and in other places of the Woldes in Yorkeshire. Mr. *Goodyer* also found it in Hampshire. ‡

¶ *The Time.*

They floure and flourish when the other Thistles do.

¶ *The Names.*

Fuchsius did at the first take it to bee *Chamæleon niger*; but afterwards being better aduised, he named it *Spina peregrina*, and *Carduus globosus*. *Valerius Cordus* doth fitly call it *Sphærocephalus*: the same name doth also agree with the rest, for they haue a round head like a ball or globe. Most would haue the first to be that which *Matthiolus* setteth downe for *Spina alba*: this Thistle is called in English, Globe Thistle, and Ball-Thistle.

The downe or woolly headed Thistle is called in Latine, beeing destitute of another name, *Eriocephalus*, of the woolly head: in English, Downe Thistle, or woolly headed Thistle. It is thought of diuers to be that which *Bartholomæus Vrbeveteranus* and *Angelus Palea*, Franciscan Friers, report to be called *Corona Fratrum*, or Friers Crowne: but this Thistle doth far differ from that, as is euident by those things which they haue written concerning *Corona Fratrum*; which is thus: In the borders of the kingdome of Aragon towards the kingdome of Castile we finde another kinde of Thistle, which groweth plentifully there by common wayes, and in wheate fields, &c. *Vide Dod. Pempt. 5. lib. 5. cap. 5.*

¶ *The Temperature and Vertues.*

Concerning the temperature and vertues of these Thistles we can alledge nothing at all.

Chap. 479. *Of the Artichoke.*

¶ *The Kindes.*

There be three sorts of Artichokes, two tame or of the garden; and one wilde, which the Italian esteemeth greatly of, as the best to be eaten raw, which he calleth *Cardune*.

¶ *The Description.*

1 The leaues of the great Artichoke, called in Latine *Cinara*, are broad, great, long, set with deepe gashes in the edges, with a deepe channell or gutter alongst the middle, hauing no prickles at all, or very few, and they bee of a greene ash colour: the stalke is aboue a cubit high, and bringeth forth on the top a fruit like a globe, resembling at the first a cone or Pine apple, that is to say, made vp of many scales; which is when the fruit is great or loosed of a greenish red colour within, and in the lower part full of substance and white; but when it opens it selfe there growes all

1 *Cinara maxima Anglica.*
The great red Artichoke.

2 *Cinara maxima alba.*
The great white Artichoke.

3 *Cinara ſylueſtris.*
Wilde Artichocke.

alſo vpon the cone a floure all of threds, of a gallant purple tending to a blew colour. The ſeed is long, greater and thicker than that of our Ladies thiſtle, lying vnder ſoft and downy haires which are contained within the fruit. The root is thicke, and of a meane length.

2 The ſecond great Artichoke differeth from the former in the colour of the fruit, otherwiſe there is little difference, except the fruit hereof dilateth it ſelfe further abroad, and is not ſo cloſely compact together, which maketh the difference.

3 The prickly Artichoke, called in Latine *Carduus*, or *Spinoſa Cinara*, differeth not from the former, ſaue that all the corners of the leaues hereof, and the ſtalkes of the cone or fruit, are armed with ſtiffe and ſharpe prickles, whereupon it beareth well the name of *Carduus*, or Thiſtle.

¶ *The Place.*

The Artichoke is to be planted in a fat and fruitfull ſoile: they doe loue water and moiſt ground. They commit great error who cut away the ſide or ſuperfluous leaues that grow by the ſides, thinking thereby to increaſe the greatneſſe of the fruit, when as in truth they depriue the roote from much water by that meanes, which would nouriſh it to the feeding of the fruit; for if you marke the trough or hollow channell that is in euery leafe, it ſhall appeare very euidently, that the

Creator

Creator in his ſecret wiſedome did ordaine thoſe furrows, euen from the extreme point of the lea to the ground where it is faſtned to the root, for no other purpoſe but to guide and leade that wate which falls farre off, vnto the root; knowing that without ſuch ſtore of water the whole plant wou wither, and the fruit pine away and come to nothing.

¶ *The Time.*

They are planted for the moſt part about the Kalends of Nouember, or ſomewhat ſooner. Th plant muſt bee ſet and dunged with good ſtore of aſhes, for that kinde of dung is thought beſt planting thereof. Euery yeare the ſlips muſt be torne or ſlipped off from the body of the root, and theſe are to be ſet in April, which will beare fruit about Auguſt following, as *Columella*, *Palladius* and common experience teacheth.

¶ *The Names.*

The Artichoke is called in Latine, *Cinara*, of *Cinis*, Aſhes, wherewith it loueth to be dunged. *Galen* calleth it in Greeke, Κίναρα: but with *k* and *υ* in the firſt ſyllable: of ſome it is called *Cactos*: it is named in Italian, *Carcioffi*, *Archiocchi*: in Spaniſh, *Alcarrofa*: in Engliſh, Artichoke: in French, *Artichaux*: in low Dutch, **Artichoken**: whereupon diuers call it in Latine, *Articocalus*, and *Artinca*: in high Dutch, **Strobildozn.**

The other is named in Latine commonly not onely *Spinoſa cinara*, or prickly Artichoke, but alſo of *Palladius*, *Carduus*: of the Italians, *Cardo*, and *Cardino*: of the Spaniards, *Cardos*: of the Frenchmen, *Chardons*: *Leonhartus Fuchſius* and moſt writers take it to be *Scolymus Dioſcoridis*; but *Scolymus Dioſcoridis* hath the leafe of Chameleon or *Spina alba*, with a ſtalke full of leaues, and a prickly head: but neither is *Cinara* the Artichoke which is without prickles, nor the Artichoke with prickles any ſuch kinde of herbe; for though the head haue prickles, yet the ſtalke is not full of leaues, but is many times without leaues, or elſe hath not paſt a leafe or two. *Cynara* doth better agree with that which *Theophraſtus* and *Pliny* call Κάκτος, *Cactus*, and yet it doth not bring forth ſtalkes from the root creeping alongſt the ground: it hath broad leaues ſet with prickles; the middle ribs of the leaues the skin pilled off, are good to be eaten, and likewiſe the fruit, the ſeed and downe taken away; and that which is vnder is as tender as the braine of the Date tree: which things *Theophraſtus* and *Pliny* report of *Cactus*. That which they write of the ſtalkes, ſent forth immediately from the root vpon the ground, which are good to be eaten, is peraduenture the ribs of the leaues: euery ſide taken away (as they be ſerued vp at the table) may be like a ſtalke, except euen in Sicilia, where they grew only in *Theophraſtus* time. It bringeth forth both certaine ſtalkes that lie on the ground, and another alſo ſtanding ſtraight vp; but afterwards being remoued and brought into Italy or England, it bringeth forth no more but one vpright: for the ſoile and clyme do much preuaile in altering of plants, as not onely *Theophraſtus* teacheth, but alſo euen experience it ſelfe declareth: and of *Cactus*, *Theophraſtus* writeth thus; Κάκτος *(Cactus)* groweth onely in Sicilia: it bringeth forth preſently from the root ſtalkes lying along vpon the ground, with a broad and prickly leafe: the ſtalkes being pilled are fit to be eaten, being ſomewhat bitter, which may be preſerued in brine: it bringeth forth alſo another ſtalke, which is likewiſe good to be eaten.

¶ *The Temperature and Vertues.*

A The nailes, that is, the white and thicke parts which are in the botome of the outward ſcales or flakes of the fruit of the Artichoke, and alſo the middle pulpe whereon the downy ſeed ſtands, are eaten both raw with pepper and ſalt, and commonly boyled with the broth of fat fleſh, with pepper added, and are accounted a dainty diſh, being pleaſant to the taſte, and good to procure bodily luſt: ſo likewiſe the middle ribs of the leaues being made white and tender by good cheriſhing and looking to, are brought to the table as a great ſeruice together with other junkets: they are eaten with pepper and ſalt as be the raw Artichokes: yet both of them are of ill juyce; for the Artichoke containeth plenty of cholericke juyce, and hath an hard ſubſtance, inſomuch as of this is ingendred melancholy juyce, and of that a thin and cholericke bloud, as *Galen* teacheth in his booke of the faculties of nouriſhments. But it is beſt to eate the Artichoke boyled: the ribbes of the leaues are altogether of an hard ſubſtance: they yeeld to the body a raw and melancholy juyce, and contain in them great ſtore of winde.

B It ſtayeth the inuoluntary courſe of the naturall ſeed either in man or woman.

C Some write, that if the buds of yong Artichokes be firſt ſteeped in wine, and eaten, they prouoke vrine, and ſtirre vp the luſt of the body.

D I finde moreouer, That the root is good againſt the ranke ſmell of the arme-holes, if when the pith is taken away the ſame root bee boyled in wine and drunke: for it ſendeth forth plenty of ſtinking vrine, whereby the ranke and rammiſh ſauour of the whole body is much amended.

CHAP.

Chap. 480. *Of Golden Thistle.*

¶ *The Description.*

1 THe stalkes of Golden Thistle rise vp forthwith from the root, being many, round, and branched. The leaues are long, of a beautifull greene, with deepe gashes on the edges, and set with most sharpe prickles: the floures come from the bosome of the leaues, set in a scaly chaffie knap, very like to Succory floures, but of colour as yellow as gold: in their places come vp broad flat and thin seeds, not great, nor wrapped in downe: the root is long, a finger thicke, sweet, soft, and good to be eaten, wherewith swine are much delighted: there issueth forth of this Thistle in what part soeuer it is cut or broken, a juyce as white as milke.

‡ There is some variety of this Thistle; for it is found much larger about Montpelier than it is in Spaine, with longer branches, but fewer floures: the leaues also are spotted or streaked with white like as the milke Thistle: whence *Clusius*, whom I here follow, hath giuen two figures thereof; the former by the name of *Scolymus Theophrasti Hispanicus*; and the other by the title of *Scolymus Theophrasti Narbonensis*. This with white spots I saw growing this yere with M^r. *Tradescant* at South Lambeth. ‡

1 *Cardaus Chrysanthemus Hispanicus.*
The Spanish golden Thistle.

‡ *Cardaus Chrysanthemus Narbonensis.*
The French golden Thistle.

2 The golden Thistle of Peru, called in the West Indies, *Fique del Inferno*, a friend of mine brought it vnto me from an Island there called Saint Iohns Island, among other seeds. What reason the inhabitants there haue to call it so, it is vnto me vnknowne, vnlesse it bee because of his fruit, which doth much resemble a fig in shape and bignesse, but so full of sharpe and venomous prickles, that whosoeuer had one of them in his throat, doubtlesse it would send him packing either to heauen or to hell. This plant hath a single wooddy root as big as a mans thumbe, but somewhat long: from which ariseth a brittle stalke, full of joynts or knees, diuiding it selfe into sundry other small branches, set full of leaues like vnto the milke Thistle, but much smaller, and straked with many white lines or streakes: and at the top of the stalkes come forth faire and goodly yellow floures, very like vnto the sea Poppy, but more elegant, and of greater beauty, hauing in the midst

thereof

thereof a ſmall knop or boll, ſuch as is in the middle of our wilde Poppy, but full of ſharpe thorn and at the end thereof a ſtaine or ſpot of a deepe purple: after the yellow floures be fallen, this ſa ſaid knop groweth by degrees greater and greater, vntill it come to full maturity, which open it ſelfe at the vpper end, ſhewing his ſeed, which is very blacke and round like the ſeed of muſta The whole plant and each part thereof doth yeeld very great abundance of milky juyce, which of a golden colour, falling and iſſuing from any part thereof, if it be cut, or bruiſed: the whole p periſheth at the approch of Winter. The vertues hereof are yet vnknowne vnto me, wherefore purpoſe not to ſet downe any thing thereof by way of conjecture, but ſhall, God willing, be rea to declare that which certaine knowledge and experience either of mine owne or others, ſhall mak manifeſt vnto me.

¶ *The Place.*

The golden Thiſtle is ſowne in gardens of the Low-Countries. *Petrus Bellonius* writes, That it groweth plentifully in Candy, and alſo in moſt places of Italy: *Cluſius* reporteth that he found it in the fields of Spaine, and of the kingdome of Caſtile, and about Montpelier, with fewer branches, and of a higher growth.

The Indian Thiſtle groweth in Saint Iohns Iſland in the Weſt Indies, and proſpereth very well in my garden.

¶ *The Time.*

They floure from Iune to the end of Auguſt: the ſeed of the Indian golden Thiſtle muſt be ſowne when it is ripe, but it doth not grow vp vntill May next after.

¶ *The Names.*

This Thiſtle is called in Latine, *Carduus Chryſanthemus*: in Greeke of *Theophraſtus*, ἀκανθος for thoſe things which he writeth of *Scolymus* in his ſixth and ſeuenth bookes doe wholly agree with this Thiſtle *Chryſanthemus*: which are theſe; *Scolymus*, doth floure in the Summer Solſtice, bravely and a long time together; it hath a root that may be eaten both ſod and raw, and when it is broken it yeeldeth a milky juyce: *Gaza* nameth it *Carduus*. Of this *Pliny* alſo makes mention *lib.21.cap.16.* *Scolymus*, ſaith he, differs from thoſe kindes of Thiſtles, *viz. Acarna*, and *Atractilis*, becauſe the root thereof may bee eaten boyled. Againe, *lib.22.cap.22.* The Eaſt Countries vſe it as a meate: and he calleth it by another name ἀκαρνανικον. Which thing alſo *Theophraſtus* ſeemeth to affirme, in his ſixt booke; for when hee reckoneth vp herbes whoſe leaues are ſet with prickles, he addeth *Scolymus*, or *Limonia*.

Notwithſtanding, *Pliny* maketh mention likewiſe of another *Scolymus*, which he affirmeth to bring forth a purple floure, and betweene the middle of the prickes to wax white quickely, and to fall off with the winde; in his twentieth booke, *cap.23.* Which Thiſtle doubtleſſe doth not agree with *Carduus Chryſanthemus*, that is, with *Theophraſtus* his *Scolymus*, and with that which we mentioned before: ſo that there be in *Pliny* two *Scolymi*; one with a root that may be eaten, and another with a purple floure, turning into downe, and that ſpeedily waxeth white. *Scolymus* is likewiſe deſcribed by *Dioſcorides*; but this differs from *Scolymus Theophraſti*, and it is one of thoſe which *Pliny* reckoneth vp, as we will more at large declare hereafter. But let vs come againe to *Chryſanthemus*: This the inhabitants of Candy, keeping the markes of the old name, do call *Aſcolymbros*: the Italians name it *Anconitani Rinci*: the Romans, *Spina borda*: the Spaniards, *Cardon lechar*, and of diuers it is alſo named *Glycyrrhizon*, that is to ſay, *dulcis Radix*, or ſweet root: it is called in Engliſh, golden Thiſtle: ſome would haue it to be that which *Vegetius* in *Arte Veterinaria* calls *Eryngium*: but they are deceiued; for that *Eryngium* whereof *Vegetius* writeth, is *Eryngium marinum*, or ſea Hulwer, of which we will intreat.

The golden Thiſtle of India may be called *Carduus Chryſanthemus*, of his golden colour, adding thereto his natiue country *Indianus*, or *Peruanus*, or the golden Indian Thiſtle, or the golden Thiſtle of Peru: the ſeed came to my hands by the name *Figue del Inferno*: in Latine, *Ficus infernalis*, the infernall fig, or fig of hell.

¶ *The Temperature and Vertues.*

A The root and tender leaues of this *Scolymus*, which are ſometimes eaten, are good for the ſtomacke, but they containe very little nouriſhment, and the ſame thinne and waterie, as *Galen* teacheth.

B *Pliny* ſaith that the root hereof was commended by *Eratoſthenes*, in the poore mans ſupper, and that it is reported alſo to prouoke vrine eſpecially; to heale tetters and dry ſcurfe, being taken with vinegre; and with wine to ſtir vp fleſhly luſt, as *Heſiod* and *Alcæus* teſtifie; and to take away the ſtench of the arme-holes, if an ounce of the root, the pith picked out, be boyled in three parts of wine, till one part be waſted, and a good draught taken faſting after a bath, and likewiſe after meate

which later words *Dioscorides* likewise hath concerning his *Scolymus*: out of whom *Pliny* is thought to haue borrowed these things,

* The plant our Author here describes in the second place, is that which I described and figured formerly pag. 401. by the name of *Papauer spinosum*. I must confesse I should haue omitted it, because it is here set forth sufficently by our Authour, whereof indeed I had a little remembrance, and therefore at that time sought for it vnder all the names I could remember, but not making it a *Carduus*, I at that time missed thereof; but here finding it, I haue let the history stand as it was, and haue omitted the figure which you may finde before, and something also in the history not here deliuered.

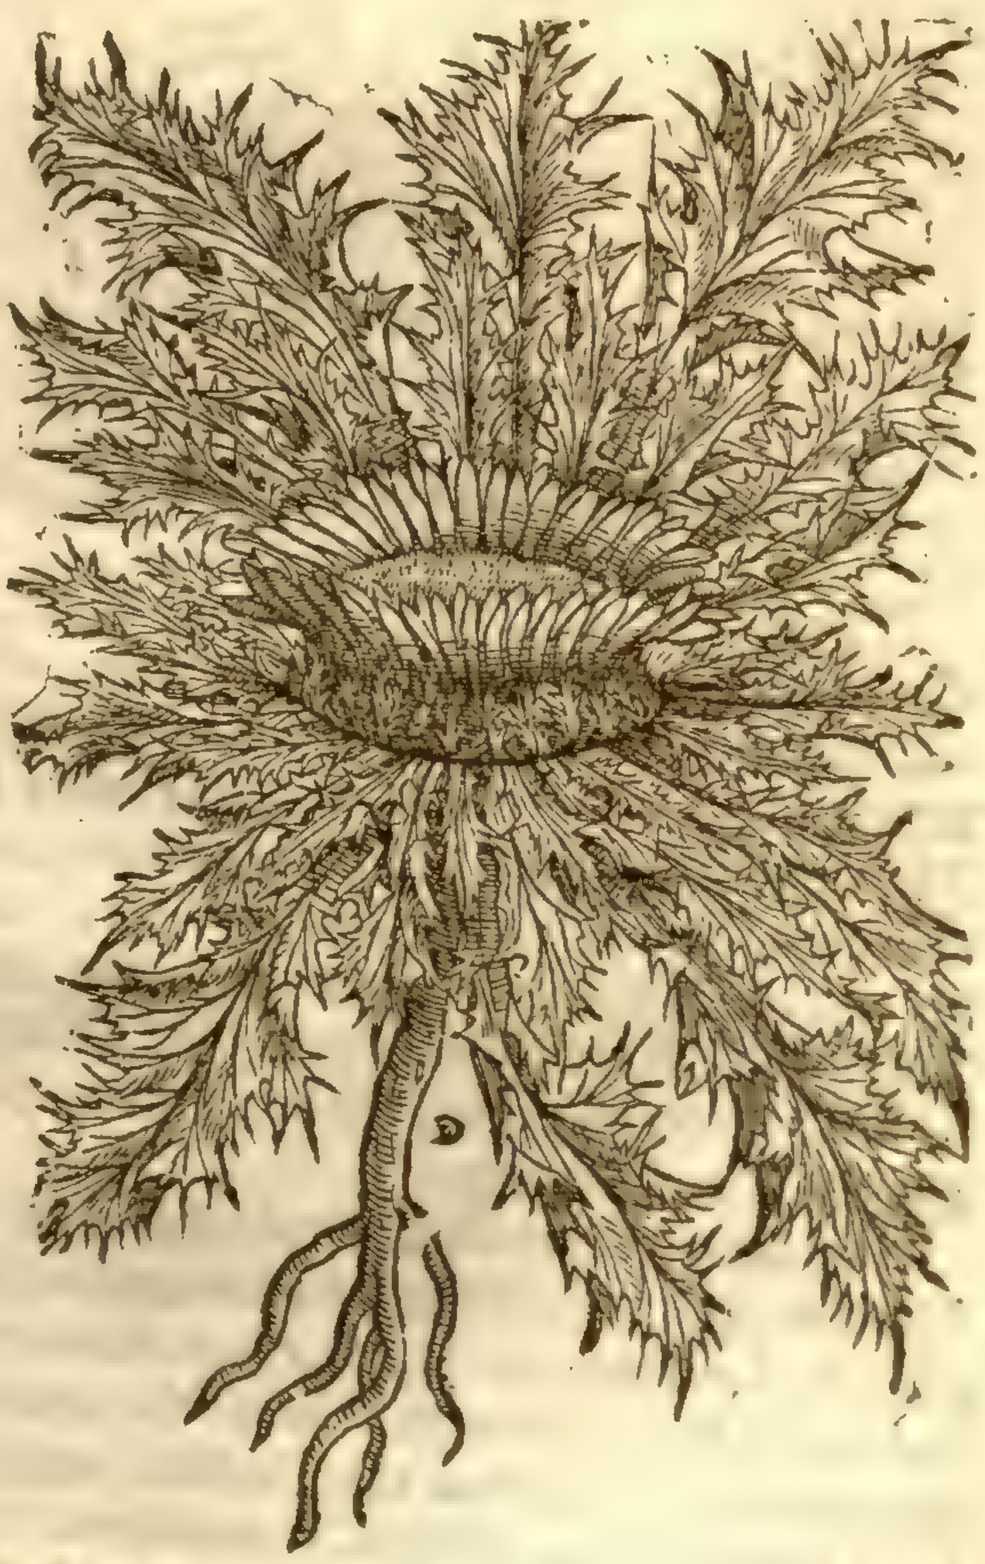
CHAP. 481. *Of white Carline Thistle of* Dioscorides.

¶ *The Description.*

1 THe leaues of Carline are very full of prickles, cut on both edges with a multitude of deepe gashes, and set along the corners with stiffe and very sharpe prickles; the middle ribs whereof are sometimes red: the stalke is a span high or higher, bringing forth for the most part onely one head or knap being full of prickles, on the outward circumference or compasse like the Vrchin huske of a chesnut: and when this openeth at the top, there groweth forth a broad floure, made vp in the middle like a flat ball, of a great number of threds, which is compassed about with little long leaues, oftentimes somewhat white, very seldome red: the seed vnderneath is slender and narrow, the root is long, a finger thicke, something blacke, so chinked as though it were split in sunder, sweet of smell, and in taste somewhat bitter.

‡ 1 *Carlina caulescens magno flore.*
Tall Carline Thistle.

2 *Carlina, seu Chamæleon albus* Dioscoridis.
The white Carline Thistle of *Dioscorides* with the red floure.



2 There is also another hereof without a stalke, with leaues also very full of prickles, like almost to those of the other, lying flat on the ground on euery side: among which there groweth forth in the middle a round head or knap, set with prickles without after the same manner, but greater: the floure whereof in the middle is of strings, and paled round about with red leaues, and sometimes with white, in faire and calme weather the floures both of this and also of the other lay themselues

‡ 3 *Carlina acaulos minor flore purp.*
Dwarfe Carline Thistle.

themselues wide open, and when the weather is foule and misty, are drawne close together: the root hereof is long, and sweet of smell, when it is found, not nicked or splitted as the other.

‡ 3 This small purple Carline Thistle has a pretty large root diuided oft times at the top into diuers branches, from which rise many greenleaues lying spred vpon the ground, deeply cut and set with sharpe prickles; in the middle of these leaues come vp sometimes one, but otherwhiles more scaly heads, which carry a pretty large floure composed of many purple threads like that of the Knapweed, but larger, and of a brighter colour; these heads grow vsually close to the leaues, yet sometimes they stand vpon stalkes three or foure inches high: when the floure is past they turne into down, and are carried away with the winde: the seed is small and grayish. This growes vpon Blacke-Heath, and on the chalky hils about Dartford, and in many such places. It floures in Iuly and August. *Tragus* calls it *Chamæleon albus, vel exiguus*; *Lobel*, *Carduus acaulis, Septentrionalium*, and *Chamæleon albus, Cordi*; *Clusius*, *Carlina minor purpurea flore*, and hee saith, in the opinion of some it seemes not vnlike to the *Chamæleon* whereof *Theophrastus* makes mention, *lib. 6. cap. 3. Hist. plant.* ‡

¶ *The Place.*

They both grow vpon high mountaines or desart places, and oftentimes by highway sides: but that which bringeth forth a stalke groweth euery where in Germany, and is a stranger in England.

¶ *The Time.*

They floure and seed in Iuly and August, and many times later.

¶ *The Names.*

The former is called in Latine, *Carlina*, and *Cardopatium*; and of diuers, *Carolina*, of *Charlemaine*, the first Romane Emperor of that name, whose army (as it is reported) was in times past through the benefit of this root deliuered and preserued from the plague: it is called in high Dutch **Eberwurtz**: in low Dutch, French, and other Languages, as likewise in English, *Carline*, and Carline Thistle: it is *Dioscorides* his *Leucacantha*, the strong and bitter roots shew the same; the Faculties also are answerable, as forthwith we will declare: *Leucacantha* hath also the other names, but they are counterfeit, as among the Romanes *Gniacardus*; and among the Tuscans, *Spina alba*, or White Thistle, yet doth it differ from that Thistle which *Dioscorides* calleth *Spina alba*, of which hee also writeth apart, doth likewise attribute to both of them their owne proper faculties and operations, and the same differing.

The later writers do also call the other *Carlina altera*, and *Carlina humilis*, or *minor*, low or little Carline; but they are much deceiued who goe about to referre them both to the Chamæleons, for in Italy, Germany, or France, *Chamæleones*, the Chamæleons doe neuer grow, as there is one witnesse for many, *Petrus Bellonius*, in his fifth booke of Singularities, who sufficiently declareth what difference there is betweene the Carlines and the Chamæleons; which thing shall be made manifest by the description of the Chamæleons.

¶ *The Temperature and Vertues.*

A The root of Carline, which is chiefely vsed, is hot in the later end of the second degree, and dry in the third, with a thinnesse of parts and substance; it procureth sweat, it driueth forth all kinde of wormes of the belly, it is an enemy to all maner of poysons, it doth not onely driue away infections of the plague; but also cureth the same if it be drunke in time.

B Being chewed it helpeth the tooth-ache; it openeth the stoppings of the liuer and spleene.

C It prouoketh vrine, bringeth downe the menses, and cureth the dropsie.

D And it is giuen to those that haue been dry beaten, and fallen from some high place.

The

The like operations *Dioſcorides* hath concerning *Leucacantha*, ſaying, that it hath a root like Cyperus, bitter and ſtrong, which being chewed eaſeth the pain of the teeth: the decoction of it with a draught of wine is a remedie againſt pains of the ſides, and is good againſt the Sciatica or ache in the huskle bones, as alſo the crampe. E.

The juice alſo being drunke is of like Vertues. F.

Chap. 482. *Of wilde Carline Thiſtle.*

¶ *The Deſcription.*

1 THe great wilde Carline Thiſtle riſeth vp with a ſtalke a cubit high or higher, diuided into certaine branches: the leaues are long, and very full of prickles in the edges like thoſe of Carline: the floures grow alſo vpon a prickely head, being ſet with threds in the midſt, and paled round about with little yellowiſh leaues: the root is ſlender, and hath a twinging taſte.

2 *Cluſius* deſcribeth a certain other alſo of this kinde, with one only ſtalke, ſlender, ſhort, and not aboue an handfull high, with prickly leaues like thoſe of the other, but leſſer, both of them couered with a certain hoary down: the heads or knaps are for the moſt part two, they haue a pale downe in the midſt, and leaues ſtanding round about, being ſomewhat ſtiffe and yellow: the root is ſlender, and of a reddiſh yellow.

1 *Carlina ſylveſtris major.*
The great wilde Carline Thiſtle.

2 *Carlina ſylveſtris minor.*
The little wilde Carline Thiſtle.

¶ *The Place.*

The great Carline is found in vntoiled and deſart places, and oftentimes vpon hils. ‡ It growes vpon Black-heath, and in many other places of Kent. ‡

The leſſer Carline *Claſius* writeth that he found growing in dry ſtony and deſart places, about Salmantica a city of Spain.

¶ *The*

¶ *The Time.*

They floure and flouriſh in Iune and Iuly.

¶ *The Names.*

It is commonly called in Latine, and that not vnfitly, *Carlina ſylveſtris*, for it is like to Carline in floures, and is not very vnlike in leaues. And that this is Ἄκορνα, it is ſo much the harder to affirm, by how much the briefer *Theophraſtus* hath written herof; for he ſaith that this is like baſtard ſaffron of a yellow colour and fat juice: and *Acorna* differs from *Acarna*: for *Acarna*, as *Heſychius* ſaith, is the Bay tree, but *Acorna* is a prickly plant.

¶ *The Nature and Vertues.*

It is hot, eſpecially in the root, the twinging taſte thereof doth declare; but ſeeing it is of no vſe, the other faculties be vnſearched out.

CHAP. 483. *Of Chamæleon Thiſtle.*

¶ *The Kindes.*

THere be two Chamæleons, and both black, the vertue of their roots do differ, and the roots alſo differ in kinde, as *Theophraſtus* declareth.

† 1 *Chamæleon niger.*
The blacke Chamæleon Thiſtle.

2 *Chamæleon niger Salmanticenſis.*
The Spaniſh blacke Chamæleon.

¶ *The Deſcription.*

1 THe leaues of blacke Chamæleon are leſſer and ſlenderer than thoſe of the prickly Artichoke, and ſprinkled with red ſpots: the ſtalke is a cubit high, a finger thicke, and ſomewhat red: it beareth a tufted rundle, in which are ſlender prickly flours of a blew colour like the Hyacinth. The root is thicke, black without, of a cloſe ſubſtance, ſometimes eaten and boyled, which being cut is of a yellowiſh colour within, and being chewed it bites the tongue. 2 The

2 This blacke Chamæleon hath many leaues long and narrow, very full of prickles, of a light green in a manner white: the ſtalk is chamfered, a foot high, and diuided into branches, at the tops whereof ſtand purple floures growing forth of prickly heads: the root is blacke, and ſweet in taſt. This is deſcribed by *Cluſius* in his Spaniſh Obſeruations by the name of *Chamæleon Salmanticenſis*, of the place wherein he found it; for he ſaith that this growes plentifully in the territorie of Salmantica a city of Spain: but it is very manifeſt that this is not blacke Chamæleon, neither doth *Cluſius* affirme it.

¶ *The Place.*

It is very common, ſaith *Bellonius*, in Lemnos, where it beareth a floure of ſo gallant a blew, as it ſeems to contend with the sky in beauty; and that the floure of Blew-bottle being of this colour, ſeemes in compariſon of it to be but pale. It groweth alſo in the fields neere Abydum, and hard by the riuers of Helleſpont; and in Heraclea in Thracia.

Chamæleon Salmanticenſis growes plentifully in the territorie of Salmantica a city in Spain.

¶ *The Time.*

They floure and flouriſh when the other Thiſtles do.

¶ *The Names.*

The blacke Chamæleon is called in Greeke, χαμαιλέων μέλας: in Latine, *Chamæleon niger*: of the Romans, *Carduus niger*, and *Vernilago*: of ſome, *Crocodilion*: in Engliſh, the Chamæleon Thiſtle, or the Thiſtle that changeth it ſelfe into many ſhapes and colours.

¶ *The Temperature and Vertues.*

The root hereof, as *Galen* ſaith, containeth in it a deadly quality: it is alſo by *Nicander* numbred among the poiſonous herbs, in his booke of Treacles; by *Dioſcorides, lib. 6.* and by *Paulus Ægineta*. Wherefore it is vſed only outwardly, as for ſcabs, morphews, tettars, and to be briefe, for all ſuch things as ſtand in need of clenſing: moreouer, it is mixed with ſuch things as do diſſolue and mollifie, as *Galen* ſaith. A

1 The ſtorie which was formerly in the firſt place did not agree with the hiſtorie (which was taken out of *Dodonæus*) though *Tabern.* gaue it for *Chamæleon niger*, ſo in the *Pemptades Creta*, &c. of *Lobel*. You ſhall finde it hereafter with the *Acarna Valesiaca*.

CHAP. 484. *Of Sea Holly.*

¶ *The Kindes.*

Dioſcorides maketh mention only of one ſea Holly. *Pliny, lib. 22. cap. 7.* ſeemes to acknowledge two, one growing in rough places, another by the ſea ſide. The Phyſitions after them haue obſerued more.

¶ *The Deſcription.*

1 SEa Holly hath broad leaues almoſt like to Mallow leaues, but cornered in the edges, and ſet round about with hard prickles, fat, of a blewiſh white, and of an aromatical or ſpicy taſte: the ſtalke is thick, about a cubit high, now and then ſomwhat red below: it breaketh forth in the tops into prickly round heads or knops, of the bigneſſe of a Wall-nut, held in for the moſt part with ſix prickly leaues compaſſing the top of the ſtalke round about; which leaues as well as the heads are of a gliſtering blew: the floures forth of the heads are likewiſe blew, with white threds in the midſt: the root is of the bigneſſe of a mans finger, ſo very long, as that it cannot be all plucked vp but very ſeldome; ſet here and there with knots, and of taſte ſweet and pleaſant.

2 The leaues of the ſecond ſea Holly are diuerſly cut into ſundry parcels, being all ful of prickles alongſt the edges: the ſtalke is diuided into many branches, and brings forth prickely heads, but leſſer than thoſe of the other: from which there alſo grow forth blew floures, ſeldome yellow: there ſtand likewiſe vnder euerie one of theſe, ſix rough and prickly leaues like thoſe of the other, but thinner and ſmaller: the root hereof is alſo long, blacke without, white within, a finger thick, of taſte and ſmell like that of the other, as be alſo the leaues, which are likewiſe of an aromaticall or ſpicy taſte, and being new ſprung vp and as yet tender, be alſo good to be eaten.

1 *Eryngium marinum.*
Sea Holly.

2 *Eryngium Mediterraneum.*
Levant sea Holly.

¶ *The Place.*

Eryngium marinum growes by the sea side vpon the baich and stony ground. I found it growing plentifully at Whitstable in Kent, at Rie and Winchelsea in Sussex, and in Essex at Landmer lading, at Harwich, and vpon Langtree point on the other side of the water, from whence I brought plants for my garden.

Eryngium campestre groweth vpon the shores of the Mediterranean sea, and in my garden also.

¶ *The Time.*

Both of them do floure after the summer Solstice, and in Iuly.

¶ *The Names.*

This Thistle is called in Greeke Ἐρύγγιον: and likewise in Latine *Eryngium*: and of *Pliny* also *Eryngc*: in shops, *Eryngus*: in English, sea Holly, sea Holme, or sea Hulver.

The first is called in Latine, *Eryngium marinum*: in low-Dutch euery where, **Crius distil, Crudeloos, Meerwortele**: in English, sea Holly.

The second is named of *Pliny, lib.* 22. *cap.* 8. *Centum Capita*, or hundred headed Thistle: in high-Dutch, **Wanstrew, Branchen distil, Radendistel**: in Spanish, *Cardo correder*: in Italian, *Eringo* and *Iringo*: it is syrnamed *Campestre*, or champian sea Holly, that it may differ from the other.

¶ *The Temperature.*

The roots of them both are hot, and that in a mean, and a little dry also, with a thinnesse of substance, as *Galen* testifieth.

¶ *The Vertues.*

A The roots of sea Holly boiled in wine and drunke, are good for them that are troubled with the Collicke, it breaketh the stone, expelleth grauel, and helpeth all the infirmities of the kidnies, prouoketh vrine, greatly opening the passages, being drunke fifteen daies together.

B The roots themselues haue the same propertie if they be eaten, and are good for those that are liuer-sicke, and for such as are bitten with any venomous beast: they ease cramps, convulsions, and the falling sickenesse, and bring down the termes.

The

The roots condited or preserued with sugar as hereafter followeth, are exceeding good to be gi- C
uen to old and aged people that are consumed and withered with age, and which want natural moi-
sture: they are also good for other sorts of people that haue no delight or appetite to venery, nou-
rishing and restoring the aged, and amending the defects of nature in the yonger.

¶ *The manner to condite Eringos.*

Refine sugar fit for the purpose, and take a pound of it, the white of an egge, and a pinte of cleer D
water, boile them together and scum it, then let it boile vntil it be come to good strong syrrup, and
when it is boiled, as it cooleth adde thereto a saucer full of rose water, a spoone-full of Cinnamon
water, and a grain of muske, which haue been infused together the night before, and now strained:
into which syrrup being more than halfe cold, put in your roots to soke and infuse vntill the next
day; your roots being ordered in manner hereafter following:

These your roots being washed and picked, must be boiled in faire water by the space of foure
houres, til they be soft: then must they be pilled clean as ye pil parsneps, & the pith must be drawn
out at the end of the root: but if there be any whose pith cannot be drawn out at the end, then you
must slit them and so take it out: these you must also keep from much handling, that they may be
clean: let them remain in the syrrup till the next day, and then set them on the fire in a faire broad
pan vntill they be very hot, but let them not boile at all: let them remain ouer the fire an houre or
more, remooning them easily in the pan from one place to another with a wooden slice. This done,
haue in a readinesse great cap or royall papers, whereupon strow some sugar, vpon which lay your
roots, hauing taken them out of the pan. These papers you must put into a stouve or hot-house to
harden; but if you haue not such a place, lay them before a good fire: in this maner if you condite
your roots, there is not any that can prescribe you a better way. And thus you may condite any
other root whatsoeuer, which will not only be exceeding delicat, but very wholsome, and effectual
against the diseases aboue named.

Actius saith, a certain man affirmed, that by the continual vse of sea Holly he neuer after voided E
any stone, when as before he was very often tormented with that disease.

It is drunke, saith *Dioscorides*, with Carrot seed against very many infirmities, in the weight of a F
dram.

The juice of the leaues pressed forth with wine, is a remedy for those that are troubled with the G
running of the reins.

They report of the herb sea Holly, if one goat take it into her mouth, it causeth her first to stand H
still, and afterwards the whole flocke, vntill such time as the sheepheard take it from her mouth.
Plutarch.

Chap. 485. *Of bastard Sea Hollies.*

¶ *The Description.*

1 THis *Eryngium*, which *Dodonæus* in his last edition calleth *Eryngium planum*; and *Pena* more fitly and truly, *Eryngium Alpinum cæruleum*, hath stalks a cubit and a half high, hauing spaces between euery joint: the lower leaues are greater and broader, and notched about the edges, but those aboue are lesse, compassing or enuironing each joint star-fashion, beset with soft tender pricks not much hurtfull to the hands of such as touch them: the knobs or heads are also prickly, in colour blew. The root is bunchy or knotty like that of Elecampane, black without, white within, like the Eringes in sweetnesse and taste.

2 The second bastard sea Holly, whose picture is set forth in *Dodonæus* his last edition verie gallantly, being also a kinde of Thistle, hath leaues like the former Erynges, but broader next the roots, than those that grow next the stalks, somwhat long, greenish, soft, and not prickly, but lightly crewised or notched about the edges, greater than Quince leaues. The stalks grow more than a cubit high, on the tops whereof there hang downwards fiue or six knobs or heads, in colour and flours like the other; hauing three or foure whitish roots of a foot long.

3 This third kinde of bastard *Eryngium* hath his first leaues (which do grow next the ground) great, broad, and soft, growing as it were in a rundle about the root. The stalke is small and slender, diuided into some branches, which beare many little leaues turning or standing many waies, which be

1 *Eryngium cæruleum.*
Blew ſea Holly.

2 *Eryngium ſpurium primum Dod.*
Baſtard ſea Holly.

3 *Eryngium pumilum Cluſij.*
Dwarfe ſea Holly.

4 *Eryngium Montanum.*
Mountaine ſea Holly.

‡ 5 *Eryngium pusillum planum.*
Small smooth sea Holly.

haue little leaues, and rough green heads with blewish flours in them: the roots creep and are somwhat like those of Asparagus. This neither *Clusius* nor *Lobel* found wilde, but it grew in the garden of *Iohn Mouton* of Tournay, a learned Apothecarie very skilfull in the knowledge of plants: whereupon they both called it *Eryngium pusillum planum Mouteni.* ‡

be also slender, prickly, and set about the stalks starfashion. The knobs or heads growing at the tops of the branches are round and prickely, bearing little blew flours and leaues which compasse them about: the root is slender, and lasts but one yeare.

4 The fourth kinde of bastard sea-Holly, which *Pena* calleth *Eryngium montanum recentiorum*, and is the fourth according to *Dodonæus* his account, is like the Erynges not in shape but in taste: this beareth a very small and slender stalke of a meane height, whereon grow three or foure leaues, and seldom fiue, made of diuers leaues set vpon a middle rib, narrow, long, hard, and of a darke green colour, dented vpon both edges of the leafe like a saw: the stalke is a cubit high, iointed or kneed, and diuiding it selfe into many branches, on the tops whereof are round tufts or vmbels wherein are contained the floures, and after they be vaded, the seeds, which are small, somewhat long, well smelling, and sharp in taste: the root is white and long, not a finger thicke, in taste sweet, but afterwards somewhat sharpe, and in sent and sauor not vnpleasant: when the root is dried it may be crumbled in pieces, and therefore quickly braied

‡ 5 This is a low plant presently from the root diuided into sundry branches, slender, round, & lying on the ground: at each joint grow leaues without any certain order, broad toward their ends, and narrower at their setting on, snipt about their edges. Those next the root were some inch broad, and two or more long, of a yellowish green colour: the stalks are parted into sundry branches, and at each joynt

¶ *The Place.*

These kinds of sea Holly are strangers in England, we haue the first and second in our London gardens.

¶ *The Time.*

They floure and flourish when the Thistles do.

¶ *The Names.*

These plants be *Eryngia spuria*, or bastard sea Hollies, being but lately obserued, & therfore haue no old names.

The first may be called in Latine, *Eryngium Borussicum*, or *Non spinosum*; sea Holly without prickles.

The second is called by *Matthiolus*, *Eryngium planum*, or flat sea Holly: others had rather name it *Alpinum Eryngium*, or sea Holly of the Alps.

The third is rightly called *Eryngium pumilum*, little sea Hulver.

Matthiolus makes the fourth to be *Crithmum quartum*, or the fourth kind of Sampier: others, as *Dodonæus* and *Lobel*, haue made it a kinde of sea Hulver.

¶ *The Nature and Vertues.*

Touching the faculties hereof we haue nothing to set downe, seeing they haue as yet no vse in meat or medicine. But that they be hot the very taste doth declare.

CHAP.

CHAP. 486. *Of Starre Thiſtle.*

¶ *The Deſcription.*

1 THe Star Thiſtle, called *Carduus ſtellatus*, hath many ſoft frizled leaues, deepely cut or gaſht, altogether without prickles: among which riſeth vp a ſtalke, diuiding it ſelf into many other branches, growing two foot high; on the tops whereof are ſmall knops or heads like the other Thiſtles, armed round about with many ſharpe prickles, faſhioned like a blaſing ſtarre, which at the beginning are of a purple colour, but afterwards of a pale bleake or whitiſh colour: the ſeed is ſmall, flat, and round; the root is long and browne without.

1 *Carduus ſtellatus.*
The Srar-Thiſtle.

† 2 *Carduus Solſtitialis.*
S. Barnabies Thiſtle.

2 S. Barnabies Thiſtle is another kinde of Star-Thiſtle, notwithſtanding it hath prickles no where ſaue in the head only, and the prickles ſtand forth of it in manner of a ſtar: the ſtalks are two cubits high, parted into diuers branches ſofter than are thoſe of Star-Thiſtle: which ſtalkes haue velms or thin skins cleauing vnto them all in length, by which they ſeem to be foure ſquare. The leaues are ſomewhat long, ſet with deep gaſhes on the edges: the floures are yellow, and conſiſt of threds, the ſeed is little, the root long and ſlender.

¶ *The Place.*

The two firſt grow vpon barren places neere cities and townes, almoſt euery where.

¶ *The Time.*

They floure and flouriſh eſpecially in Iuly and Auguſt.

¶ *The Names.*

The firſt is called in Latine *Stellaria*, as alſo *Carduus ſtellatus*, and *Carduus Calcitrapa*: but they are deceiued who take it for *Eryngium*, or ſea Holly, or any kinde thereof. *Matthiolus* ſaith it is called in Italian, *Calcatrippa*: in high-Dutch, **Wallen Diſtel**: in low-Dutch, **Sterre Diſtell**: in French, *Chauſſetrappe*: in Engliſh, ſtar Thiſtle.

S. Barnabies Thiſtle is called in Latine, *Solſtitialis ſpina*, becauſe it floureth in the ſummer Solſtice

ſtices, as *Geſner* ſaith, or rather becauſe after the Solſtice the prickles thereof be ſharpeſt: of *Guil. Lu-*
dum, Eryngium, but not properly, and *Stellaria Horatij Augerij*, who with good ſucceſſe gaue it against
the ſtone, dropſies, green ſickneſſe, and quotidian feuers. It is called in Engliſh as aboue ſaid, Saint
Barnabies Thiſtle.

¶ *The Temperature.*

The Star-Thiſtle is of a hot temperature.

¶ *The Vertues.*

The ſeed is commended againſt the ſtrangurie: it is reported to driue forth the ſtone, if it bee A
drunke with wine.

Baptiſta Sardus affirmeth, that the diſtilled water of this Thiſtle is a remedy for thoſe that are in- B
fected with the French Pox, and that the vſe of this is good for the liuer, that it taketh away the
ſtoppings thereof.

That it clenſeth the bloud from corrupt and putrified humours. C

That it is giuen with good ſucceſſe againſt intermitting feuers: whether they be quotidian or D
tertian.

As touching the faculties of Saint Barnabies Thiſtle, which are as yet not found out, we haue E
nothing to write.

† There were formerly three figures and deſcriptions in this chapter, and all of them cūt of the 14. and 15. chapter of the fifth booke, and fifth *Pemptas* of *Do-*
dæus, but the firſt and ſecond figures were both of the firſt deſcribed, the third figure was of the *Acanthium peregrinum* of *Taberna montanus*, which *Bauhine* knowes
not what to make of, but I thinke it was drawne for, and (if the tuberous clogs of the roots were ſomewhat large) might very well ſerue for the *Cirſium maximum*
Lobelij, which figure as I drew it from the plant I will hereafter giue you: the third deſcription was of the *Iacea maior lutea*, deſcribed in the third place of
the 249 Chap. pag. 727.

CHAP. 487. *Of Teaſels.*

¶ *The Kindes.*

OVr age hath ſet downe two kindes of Teaſels: the tame, and the wilde. Theſe differ not ſaue only in the husbanding; for all things that are planted and manured doe more flouriſh, and become for the moſt part fitter for mans vſe.

1 *Dipſacus ſatiuus.*
Garden Teaſell.

2 *Dipſacus ſylueſtris.*
Wilde Teaſell.

‡ 3 *Dipsacus minor, sive Virga pastoris.*
Shepheards rod.

¶ *The Description.*

1 GArden Teasell is also of the nature of the Thistles; it bringeth forth a stalke that is straight, very long, iointed, and ful of prickles: the leaues grow from of the ioynts by couples, not onely opposite set one right against another, but also compassing the stalke about, and fastened together; and so fastened, that they hold dew and raine water in manner of a little bason: these be long, of a light greene colour, and like to those of Lettice, but full of prickles in the edges, and haue on the outside all alongst the ridge stiffer prickles: on the tops of the stalkes stand heads with sharpe prickles like those of the Hedge-hog, and crooking backward at the point like hookes: out of which heads grow little floures: The seed is like Fennell-seed, and in taste bitter: the heads wax white when they grow old, and there are found in the midst of them when they are cut, certaine little magots: the root is white, and of a meane length.

2 The second kinde of Teasell which is also a kinde of Thistle, is very like vnto the former, but his leaues are smaller and narrower: his floures of a purple colour, and the hooks of the Teasell nothing so hard or sharpe as the other, nor good for any vse in dressing of cloath.

3 There is another kinde of Teasell, being a wilde kinde thereof, and accounted among the Thistles, growing higher than the rest of his kindes; but his knobbed heads are no bigger than a Nutmeg, in all other things else they are like to the other wilde kindes. ‡ This hath the lower leaues deeply cut in with one gash on each side at the bottome of the leafe, which little eares are omitted in the figure: the leaues also are lesse than the former, and narrower at the setting on, and hold no water as the two former do: the whole plant is also much lesse. ‡

¶ *The Place.*

The first called the tame Teasell is sowne in this country in gardens, to serue the vse of Fullers and Clothworkers.

The second kinde groweth in moist places by brookes, riuers, and such like places.

The third I found growing in moist places in the high way leading from Braintree to Henningham castle in Essex, and not in any other place except here and there a plant vpon the high way from Much-Dunmow to London. ‡ I found it growing in great plenty at Edgecombe by Croydon, close by the gate of the house of my much honoured friend Sir *Iohn Tunstall*. ‡

¶ *The Time.*

These floure for the most part in Iune and Iuly.

¶ *The Names.*

Teasell is called in Greeke, διψακος, and likewise in Latine, *Dipsacus*, *Labrum Veneris*, and *Cardus Veneris*: it is termed *Labrum Veneris*, and *Lauer Lauacrum*, of the forme of the leaues made vp in fashion of a bason, which is neuer without water: they commonly call it *Virga pastoris minor*, and *Cardus fullonum*: in high Dutch, **Karden Distell**: in low Dutch, **Kaerden**: in Spanish, *Cardencha*: and *Cardo Penteador*: in Italian, *Dissaco*, and *Cardo*: in French, *Chardon de foullon*, *Verge à berger*: in English, Teasell, Carde Teasell, and Venus bason.

The third is thought to be *Galedragon Plinij*: of which he hath written in his 27. booke, the tenth Chapter.

¶ *The Temperature.*

The roots of these plants are dry in the second degree, and haue a certaine clensing faculty.

¶ *The*

¶ *The Vertues.*

There is small vse of Teasell in medicines: the heads (as we haue said) are vsed to dresse wool- A
len cloth with.

Dioscorides writeth, That the root being boyled in wine, and stamped till it is come to the sub- B
stance of a salue, healeth chaps and fistulaes of the fundament, if it be applied thereunto; and that this medicine must bee reserued in a box of copper, and that also it is reported to be good for all kindes of warts.

It is needlesse here to alledge those things that are added touching the little wormes or magots C
found in the heads of the Teasell, and which are to be hanged about the necke, or to mention the like thing that *Pliny* reporteth of Galedragon: for they are nothing else but most vaine and trifling toies, as my selfe haue proued a little before the impression hereof, hauing a most grieuous ague, and of long continuance: notwithstanding Physicke charmes, these worms hanged about my neck, spiders put into a walnut shell, and diuers such foolish toies that I was constrained to take by fantasticke peoples procurement; notwithstanding, I say, my helpe came from God himselfe, for these medicines and all other such things did me no good at all.

† The figure which formerly was put into the second place, was of the *Dipsacus secundus* of *Tabernamontanus*, which differs from our common one, in that the leaues are deeply diuided, or cut in on their edges.

Chap. 488. *Of Bastard Saffron.*

‡ 1 *Carthamus sive Cnicus.*
Bastard Saffron.

† 2 *Cnicus alter cæruleus.*
Blew floured Bastard Saffron.

¶ *The Description.*

Cnicus, called also bastard Saffron, which may very wel be reckoned among the Thistles, riseth vp with a stalke of a cubite and a halfe high, straight, smooth, round, hard, and wooddy, & branched at the top: it is defended with long leaues, somthing broad, sharp pointed,

pointed; and with prickles in the edges; from the tops of the ſtalks ſtand out little heads or knops of the bigneſſe of an Oliue or bigger, ſet with many ſharp pointed and prickly ſcales: out of which come forth floures like threds, cloſely compact, of a deepe yellow ſhining colour, drawing neere the colour of Saffron: vnder them are long ſeeds, ſmooth, white, ſomewhat cornered, bigger than a Barly corne, the huske whereof is ſomething hard, the inner pulpe or ſubſtance is fat, white, ſweet in taſte: the root ſlender and vnprofitable.

2 There is alſo another kinde of Baſtard Saffron, that may very well be numbred among the kindes of Thiſtles, and is very like vnto the former, ſauing that his ſtockie or threddy floures are of a blew colour: the root is thicker, and the whole plant is altogether more ſharpe in prickles: the ſtalkes are alſo more creſted and hairy.

¶ *The Place.*

It is ſowne in diuers places of Italy, Spaine, and France, both in Gardens and in Fields: Pliny *lib.* 25. *cap.* 15. ſaith, that in the raigne of *Veſpaſian* this was not knowne in Italy: being in Egypt onely of good account, and that they vſed to make oyle of it, and not meat.

¶ *The Time.*

The floures are perfected in Iuly and Auguſt: the root after the ſeed is ripe, the ſame yeare it is ſowne withereth away.

¶ *The Names.*

It is called in Greeke, κνικος: in Latine alſo *Cnicus*, or *Cnecus*: in ſhops, *Cartamus*, or *Carthamus*: of diuers, *Crocus hortenſis*, and *Crocus Saracenicus*: in Italian, *Zaffarano Saracineſco*, and *Zaffarano ſaluatico*: in Spaniſh, *Alaſor*, and *Semente de papagaios*: in high Dutch, **Wilden Zaffron**: in French, *Safran Sauuage*: in Engliſh, Baſtard Saffron: of ſome, Mocke Saffron, and Saffron D'orte, as though they ſhould ſay, Saffron *de horto*, or of the garden. *Theophraſtus* and *Pliny* call it *Cnicus vrbana*, and *ſatiua*, or tame and garden baſtard Saffron, that it may differ from *Atractylis*, which they make to be a kinde of *Cnicus ſylueſtris*; or wilde Baſtard Saffron, but rather a *ſpecies* of the Holy Thiſtle.

¶ *The Temperature.*

We vſe, ſaith *Galen*, the ſeed only for purgations: it is hot, and that in the firſt degree, as *Meſue* writeth.

¶ *The Vertues.*

A The juyce of the ſeed of baſtard Saffron bruiſed and ſtrained into honied water or the broth of a chicken, and drunke, prouoketh to the ſtoole, and purgeth by ſiege ſlimy flegme, and ſharp humors: Moreouer it is good againſt the collicke, and difficulty of taking breath, the cough, and ſtopping of the breſt, and is ſingular againſt the dropſie.

B The ſeed vſed as aforeſaid, and ſtrained into milke, cauſeth it to curdle and yeeld much cruds, and maketh it of great force to looſe and open the belly.

C The floures drunke with honied water open the liuer, and are good againſt the jaundiſe: and the floures are good to colour meat in ſtead of Saffron.

D The ſeed is very hurtfull to the ſtomacke, cauſing deſire to vomit, and, is of hard ſlow digeſtion, remaining long in the ſtomacke and entrails.

E Put to the ſame ſeed things comfortable to the ſtomacke, as Anniſe ſeed, Galingale, or Maſtick, Ginger, *Sal gemmæ*, and it ſhall not hurt the ſtomacke at all, and the operation thereof ſhall be the more quicke and ſpeedy.

F Of the inward pulpe or ſubſtance hereof is made a moſt famous and excellent compoſition to purge water with, commonly called *Diacarthamon*, a moſt ſingular and effectuall purgation for thoſe that haue the dropſie.

G The perfect deſcription hereof is extant in *Guido* the Surgion, in his firſt Doctrine, and the firſt Tractat.

H We haue not read, or had in vſe that Baſtard Saffron with the blew floure, and therefore can ſay nothing of his vertues.

† The figure formerly was of the *Cnicus cæruleus*.

Chap. 489. *Of Wilde Baſtard Saffron.*

¶ *The Deſcription.*

1 *Atractylis*, otherwiſe called wilde Baſtard Saffron, bringeth forth a ſtraight and ſtrong ſtalke, very fragile or brittle, diuided at the toppe into certaine branches: it hath long

long jagged leaues set with prickles: the heads on the tops of the branches are very full of sharpe prickles: out of which grow flours all of threds, like those of bastard Saffron, but they are of a light yellow colour, and sometimes purple: the seed is somwhat great, browne, and bitter, otherwise like that of bastard Saffron: the root is of a meane bignesse.

1 *Atractylis.*
Wilde Bastard Thistle.

2 *Carduus Benedictus.*
The Blessed Thistle.

2 The stalkes of *Carduus Benedictus*, or Blessed Thistle, are round, rough and pliable, and being parted into diuers branches, do lie flat on the ground: the leaues are jagged round about, and full of harmlesse prickles in the edges: the heads on the tops of the stalkes are set with prickles, and ironed with sharpe prickling leaues, out of which standeth a yellow floure: the seed is long, and set with haires at the top like a beard: the root is white, and parted into strings: the whole herb, leaues and stalkes, and also the heads, are couered with a soft and thin downe.

¶ *The Place.*

Atractylis groweth in Candie, and in diuers prouinces and Islands of Greece, and also in Languedocke: and is an herbe growing in our English gardens.

Carduus Benedictus is found euery where in Lemnos, an Island of the Midland Sea, in Champion grounds, as *Petrus Bellonius* testifieth: it is diligently cherished in Gardens in these Northerne parts.

¶ *The Time.*

Atractylis is very late before it floureth and seedeth.

Carduus Benedictus floureth in Iuly and August, at which time it is especially to be gathered for Physicke matters.

¶ *The Names.*

Atractylis is called in Greeke, Ἀτρακτυλὶς ἀγρία: of the Latines likewise, *Atractylis*, and *Cnycus syluestris*; and because women in the old time were wont to vse the stiffe stalke therof *pro fuso aut colo*, for a spindle or a distaffe, it is named *Fusus agrestis*, and *Colus Rustica*; which thing *Petrus Bellonius* reporteth the women in Greece do also euen at this day; who call *Atractylis* by a corrupt name *Ardactyla*; diuers of the later herbarists name it *Syluestris Carthamus*: that is to say in low Dutch, **wilden Carthamus**: and in English, wilde Bastard Saffron, or Spindle Thistle.

Blessed Thistle is called in Latine euery where *Carduus Benedictus*, and in shops by a compound

word, *Cardo-benedictus*: it is moſt plaine, that it is *Species Atractylidis*, or a kind of wilde baſtard Saffron: it is called *Atractylis hirſutior*, hairie wilde baſtard Saffron: *Valerius Cordus* nameth it *Carduus ſupinus*: it is called in high Dutch, **Beſeegnete diſtell, Kardo Benedict**: the later name whereof is known to the Low Country-men: in Spaniſh it is called *Cardo Sancto*: in French, *Chardon benoiſt*: in the Iſle Lemnos, *Garderacantha*: in Engliſh, Bleſſed Thiſtle, but more commonly by the Latine name *Carduus Benedictus*.

¶ *The Temperature.*

Wilde baſtard Saffron doth dry and moderately digeſt, as *Galen* witneſſeth.

As *Carduus benedictus* is better, ſo is it alſo hot and dry in the ſecond degree, and withall cleanſing and opening.

¶ *The Vertues.*

A The tops, ſeed, and leaues of *Atractylis*, ſaith *Dioſcorides*, being beaten and drunke with pepper and wine, are a remedy for thoſe that are ſtung of the Scorpion.

B Bleſſed Thiſtle taken in meat or drinke, is good for the ſwimming and giddineſſe of the head: it ſtrengthneth memory, and is a ſingular remedy againſt deafeneſſe.

C The ſame boiled in wine and drunke hot, healeth the griping paines of the belly, killeth and expelleth wormes, cauſeth ſweat, prouoketh vrine, and driueth out grauell; clenſeth the ſtomacke, and is very good againſt the Feuer quartaine.

D The juyce of the ſaid *Cardnus* is ſingular good againſt all poyſon, as *Hierome Bocke* witneſſeth, in what ſort ſoeuer the medicine be taken; and helpeth the inflammation of the liuer, as reporteth *Ioachimus Camerarius* of Noremberg.

E The pouder of the leaues miniſtred in the qnantitie of halfe a dram, is very good againſt the peſtilence, if it be receiued within 24. houres after the taking of the ſickeneſſe, and the party ſweat vpon the ſame: the like vertue hath the wine, wherein the herbe hath beene ſodden.

F The greene herb pounded and laid to, is good againſt all hot ſwellings, as *Eryſipelas*, plague-ſores, and botches, eſpecially thoſe that proceed of the peſtilence, and is alſo good to be laid vpon the bitings of mad dogs, ſerpents, ſpiders, or any venomous beaſts whatſoeuer; and ſo is it likewiſe if it be inwardly taken.

G The diſtilled water thereof is of leſſe vertue.

H It is reported that it likewiſe cureth ſtubborne and rebellious vlcers, if the decoction be taken for certaine daies together; and likewiſe *Arnoldus de Villanoua* reporteth, that if it be ſtamped with Barrows greaſe to the form of an vnguent, adding thereto a little wheat floure, it doth the ſame, being applied twice a day.

I The herbe alſo is good being ſtamped and applied, and ſo is the juyce thereof.

K The extraction of the leaues drawne according to Art, is excellent good againſt the French diſeaſe, and quartaine ague, as reporteth the foreſaid *Camerarius*.

L The ſame Author reporteth, that the diſtilled water taken with the water of Louage, and Dodder, helpeth the ſauce-flegme face, if it be drunke for certaine daies together.

CHAP. 490.

Of Thiſtle vpon Thiſtle, and diuers other Wilde Thiſtles.

¶ *The Deſcription.*

1 AMong all the Thornes and Thiſtles, this is moſt full of prickles; the ſtalks thereof are very long, and ſeeme to be cornered by reaſon of certaine thin skins growing to them, being ſent downe forth of the leaues: the leaues are ſet round about with many deepe gaſhes, being very full of prickles as well as the ſtalks: the heads are very thicke ſet in euery place with ſtiffe prickles, and conſiſt of a multitude of ſcales; out of which grow purple floures, as they do out of other Thiſtles, ſeldome white: the root is almoſt ſtraight, but it groweth not deep.

2 To this alſo may be referred that which *Lobel* writeth to be named of the Italians *Leo*, and *Cardnus ferox*, for it is ſo called of the wonderfull ſharpe and ſtiffe prickles, wherewith the whole plant aboundeth; the ſtalke thereof is ſhort, ſcarce a hand full high; the floure groweth forth of a prickly head, and is of a pale yellow colour, like that of wilde baſtard Saffron, and it is alſo inuironed and ſet round about on euery ſide with long hard thornes and prickles.

3 The third groweth ſeldome aboue a cubit or two foot high: it bringeth forth many round ſtalkes, parted into diuers branches; the leaues are like thoſe of white Cotton Thiſtle, but leſſe, and blacker, and not couered with downe or Cotton: vpon the tops of the ſtalks grow little heads like

† 1 *Polyacanthos.*
Thistle vpon Thistle.

† 3 *Cardnus Asinius sive Onopyxos.*
The Asses Thistle, or Asses box.

2 *Carduus ferox.*
The cruell Thistle.

‡ 4 *Carduus vulgatissimus viarum.*
The Way Thistle.

like Hedge-hogs, out of which ſpring gallant purple floures, that at length are turned into downe, leauing ſeeds behinde them like thoſe of the other Thiſtles: the root conſiſteth of many ſmall ſtrings.

4 The fourth riſeth vp with an higher ſtalke, now and then a yard long, round and not ſo full of branches nor leaues, which are ſharpe and full of prickles, but leſſer and narrower: the heads be alſo leſſer, longer, and not ſo full of ſtiffe prickles: the floures are of a white colour, and vaniſh into downe: the root is blacke, and of a foot long.

5 This wilde Thiſtle which groweth in the fields about Cambridge, hath an vpright ſtalke, whereon do grow broad prickly leaues: the floures grow at the tops of the branches, conſiſting of a flockie downe, of a white colour tending to purple, of a moſt pleaſant ſweet ſmell, ſtriuing with the ſauour of muske: the root is ſmall, and periſheth at the approch of Winter. ‡ I had no figure directly fitting this; wherefore I put that of *Dodonæus* his *Onopordon*, which may well ſerue for it, if the leaues were narrower, and more diuided. ‡

† 5 *Carduus Muſcatus.*
The musked Thiſtle.

6 Carduus lanceatus.
The Speare Thiſtle.

6 The Speare Thiſtle hath an vpright ſtalke, garniſhed with a skinnie membrane, full of moſt ſharpe prickles: whereon do grow very long leaues, diuided into diuers parts with ſharp prickles; the point of the leaues are as the point of a ſpeare, whereof it tooke his name: the floures grow on the tops of the branches, ſet in a ſcaly prickly head, like vnto the heads of Knapweed in forme, conſiſting of many threds of a purple colour: the root conſiſteth of many tough ſtrings.

7 *Theophraſtus* his fiſh Thiſtle called *Acarna*, which was brought from Illyria to Venice, by the learned *Valerandus Dourez*, deſcribed by *Theophraſtus*, hath horrible ſharpe yellow prickles, ſtanding vpon his greene indented leaues, which are cornered on the backe ſide with an hoary downe (as all the reſt of the plant) hauing a ſtalke of a cubit and a halfe high, and at the top certaine ſcaly knops containing yellow thrummie floures, armed or fenced with horrible ſharp prickles: the root is long and threddy.

8 The other kinde of fiſh Thiſtle, being alſo another *Acarna* of *Valerandus* deſcription, hath long and large leaues, ſet full of ſharp prickles, as though it were ſet full of pins: all the whole plant is couered with a certain hoarineſſe, like the former: there ariſeth vp a ſtalke nine inches long, and in ſome fertile grounds a cubit high, bearing the floure of *Carduus benedictus*, ſtanding thicke together, but leſſer.

‡ 9 This

7 *Acarna* Theophrasti.
Theophrastus his fish Thistle.

8 *Acarna Valerandi* Donrez.
Donrez his fish Thistle.

† 9 *Picnomos.*
The thicke or bush headed Thistle.

‡ 9 This Thistle in the opinion of *Bauhine*, whereto I much incline, is the same with the former. The root is small, the leaues long, welting the stalks at their setting on, and armed on the edges with sharpe prickles: the stalkes lie trailing on the ground like those of the star-Thistle, so set with prickles, that one knoweth not where to take hold thereof: it hath many closely compact vmbels, consisting of pale yellowish little floures like those of Groundswell: the seed is like that of *Carthamus*, smal and chaffie. *Pena* and *Lobel* call this *Picnomos Cretæ Salonensis*, of a place in Prouince where they first found it, called the Crau, being not farre from the city Salon. *Tabernamontanus* set it forth for *Chamæleon niger*, and our Author formerly gaue the figure hereof by the same title, though his historie belonged to another, as I haue formerly noted. ‡

¶ *The Place.*

The two first grow on diuers banks not farre from mount Apennine, and sometimes in Italy, but yet seldome.

The way Thistles grow euery where by highwaies sides and common paths in great plenty.

The places of the rest haue beene sufficiently spoken of in their descriptions.

¶ *The*

¶ *The Time.*

These kindes of Thistles do floure from the beginning of Iune vntill the end of September.

¶ *The Names.*

These Thistles comprehended in this present chapter are by one generall name called in Latine *Cardui sylvestres*, or wilde Thistles; and that which is the second in order is named *Scolymus*: but not that *Scolymus* which *Theophrastus* declareth to yeeld a milky juyce (of which we haue written before) but one of those which *Pliny* in his twentieth booke, *cap.* 23. describeth: of some they are taken for kindes of Chamæleon: their seuerall titles doe set forth their seuerall Latine names, and also the English.

‡ There was formerly much confusion in this chapter, both in the figures and history, which I will here endeauour to amend, and giue as much light as I can, to the obscuritie of our Author and some others; to which end I haue made choise of the names as the fittest place.

1 This description was taken out of *Dodonæus*, and the title also of *Onopordon* which was formerly put ouer the figure, and they belong to the Thistle our Author before described by the name of *Acanthium, purp. Illyricum, cap.* 476. I haue therefore changed the title, yet let the description stand, for it reasonable well agrees with the figure which is of the *Carduus spinosissimus vulgaris* of *Lobel*, and *Polyacantha Theophrasti* of *Tabern.* of this Thistle I obserue three kindes: the first is a Thistle some two cubits and a halfe high, with many slender stalkes and branches exceeding prickly, hauing commonly fiue prickly welts running alongst the stalkes: the leaues on the vpper sides as also the stalkes are of a reasonable fresh greene colour, but the vnderside of the leafe is somewhat whitish: the heads consist of sundry hairy greene threds which looke like prickles; but they are weake, and not prickly: the floure is of the bignesse, and of the like colour and shape as the common Knapweed, yet somewhat brighter: it growes on ditch sides, and floures in Iuly. This I take to be the *Aculeosa Gasæ* of the *Aduers. pag.* 374. but not that which *Lobel* figures for it in his *Icon.* This is that which *Tabernamontanus* figures for *Polyacantha*, and our Authour gaue his figure in this place. The second of these I take to be that which *Lobel* hath figured for *Polyacantha*, and *Dod.* for *Carduus syl.* 3. (which figure we here giue you) and in the *Hist. Lugd. pag.* 1473. it is both figured and described by the name of *Polyacanthos Theophrasti*. In the figure there is little difference: in the things themselues this; the stalkes of this are as high as those of the last, but slenderer, with fewer and straighter branches, and commonly edged with foure large welts, which haue fewer, yet longer prickles than those of the former: the leaues and stalkes of this are of a grayish or whitish colour: the heads are longish, but much smaller than those of the former, and they seldome open or spread abroad their floures, but only shew the tops of diuers reddish threds of a feint colour. This growes as frequently as the former, and commonly in the same places. The third, which I thinke may fitly be referred vnto these, growes on wet heaths and such like places, hauing a stalke sometimes foure or fiue cubits high, growing straight vp, with few branches, and those short ones: the floures are of an indifferent bignesse, and commonly purple, yet sometimes white. I thinke this may be the *Onopyxos alter Lugdunens.* or the *Carduus palustris* described in *Bauhinus* his *Prodromus. pag.* 156.

2 The second which is a stranger with vs, is the *Phœnix*, *Leo & Carduus ferox* of *Lob.* and *Dod.* *Bauhine* hath refer'd it to *Acarna*, calling it *Acarna minor caule non folioso.*

3 The third description was also out of *Dodonæus*, being of his *Carduus sylvestris primus*, or the *Onopyxos Dodonæi* of the *Hist. Lugd.* The figures formerly both in the third and fourth place of this Chapter were of the *Acanthium Illyricum* of *Lobel*; or the *Onopordon* of *Dodonæus*, formerly mentioned.

4 This description also was out of *Dodonæus*, being of his *Carduus sylvestris alter*, agreeing in all things but the colour of the floures, which should be purple. *Lobel* in his Obseruations describeth the same Thistle by the name of *Carduus vulgatissimus viarum*: but both he and *Dodonæus*, giue the figure of *Carlina sylvestris* for it: but neither the floures nor the heads of that agree with that description. I iudge this to be the Thistle that *Fabius Columna* hath set forth for the *Cnicus* of *Theophrastus*; and *Tabern.* for *Carduus arvensis*: and our Author, though vnfitly, gaue it in the next place for *Carduus muscatus.*

5 The Muske-Thistle I haue seene growing about Deptford, and (as far as my memory serues me) it is very like to the third here described: it growes better than a cubit high, with reasonable large leaues, and also heads which are a little soft or downy, large, with purple floures: the heads before the floures open smell strong of muske. I haue found no mention of this but only in *Cæsalp. de Collectione in parte*, where hee hath these words; *Carduus arvensis major purpureo flore (qui flore maturo Moschum olebat) floret Iulio.* Our Author formerly gaue an vnfit figure for this, as I formerly noted.

There is sufficient of the rest in their titles and descriptions. ‡

¶ To

¶ *The Temperature and Vertues.*

These wild Thistles (according to *Galen*) are hot and dry in the second degree, and that through the propertie of their essence they driue forth stinking vrine, if the roots be boyled in Wine and drunke; and that they take away the ranke smell of the body and arme-holes. A

Dioscorides saith, that the root of the common Thistle applied plaisterwise correcteth the filthy smell of the arme-holes and whole body. B

And that it workes the same effect if it be boyled in wine and drunke, and that it expelleth plenty of stinking vrine. C

The same Author affirmeth also, that the herbe being as yet greene and tender is vsed to be eaten among other herbes after the manner of Asparagus. D

This being stamped before the floure appeareth, saith *Pliny*, and the juyce presséd forth, causeth haire to grow where it is pilled off, if the place be bathed with the juyce. E

The root of any of the wilde Thistles being boyled in water and drunke, is reported to make them dry that drinke it. F

It strengtheneth the stomacke, and it is reported (if we beleeue it) that the same is also good for the matrix, that boyes may be engendred: for so *Chereas* of Athens hath writien, and *Glaucias*, who is thought to write most diligently of Thistles. G

This Thistle being chewed is good against a stinking breath. Thus farre *Pliny*, in his twentieth booke, *cap.* 23. H

Chap. 491. *Of the Melon or Hedge-hog Thistle.*

Melocardus Echinatus Pena & Lob.
The Hedge-hog Thistle.

¶ *The Description.*

WHo can but maruel at the rare and singular workemanship which the Lord God almighty hath shewed in this Thistle, called by the name *Echino-Melocactos*, or *Melo-cardus Echinatus?* This knobby or bunchy masse or lump is strangely compact and context together, containing in it sundry shapes, and formes, participating of a Pepon or Melon, and a Thistle, both being incorporate in one body; which is made after the forme of a cock of hay, broad and flat below, but sharp toward the top, as bigge as a mans body from the belly vpward: on the outside hereof are fourteene hard ribbes, descending from the crowne to the lowest part, like the bunchy or out swelling rib of a Melon standing out, and chanelled betweene: at the top or crowne of the plant issueth forth a fine silken cotton, wherewith it is full fraught: within which cotton or flockes lie hid certain smal sheaths or cods, sharpe at the point, and of a deep sanguine colour, answering the cods of *Capsicum* or Indian pepper, not in shew only, but in colour, but the cods are somewhat smaller. The furrowed or chanelled ribs on the outside are garnished or rather armed with many prickly starres, standing in a compasse like sharp crooked hornes or hookes, each star consisting of ten or twelue prickes, wherewith the outward barke or pilling is garded, so that without hart to the fingers it cannot be touched: this rinde is hard, thicke and like vnto Aloes, of the colour of the Cucumber: the flesh or inner pulpe is white, fat, watersh, of taste sourc, vnsauory and cooling, much like vnto the meat of a raw Melon or Pompion. This plant groweth without leafe or stalke, as our Northerne Thistle doth, called *Cardvus Acaulos*, and is bigger than the largest Pompion:

Pompion: the roots ars ſmall, ſpreading farre abroad in the ground, and conſiſting of blacke and tough twigs, which cannot endure the injury of our cold clymate.

¶ *The Place.*

This admirable Thiſtle groweth vpon the cliffes and grauelly grounds neere vnto the ſea ſide, in the Iſlands of the Weſt-Indies, called S. *Margarets* and S. *Iohns* Iſle, neere vnto *Puerto rico*, or *Porto rico*, and other places in thoſe countries, by the relation of diuers trauellers that haue journied into thoſe parts, who haue brought me the plant it ſelfe with his ſeed; the which would not grow in my garden by reaſon of the coldneſſe of the clymate.

¶ *The Time.*

It groweth, floureth, and flouriſheth all the yeare long, as doe many other plants of thoſe Countries.

¶ *The Names.*

It is called, *Carduus Echinatus*, *Melocarduus Echinatus*, and *Echino Melocactos*: in Engliſh, the Hedge-hog Thiſtle, or prickly Melon Thiſtle. ‡ Such as are curious may ſee more hereof in *Clusius* his *Exoticks*, *lib.* 4. *cap.* 24. ‡

¶ *The Temperature and Vertues.*

There is not any thing extant ſet forth of the antient or of the later Writers, neither by any that haue trauelled from the Indies themſelues: therefore we leaue it to a further conſideration.

Chap. 492. *Of the gummie Thiſtle, called Euphorbium.*

1 *Euphorbium.*
The poyſonous gum Thiſtle.

2 *Anteuphorbium.*
The Antidote againſt the poyſonous Thiſtle.

¶ *The Deſcription.*

1 *Euphorbium* (whereout that liquor or gum called in ſhops *Euphorbium* is extracted) hath very great thicke groſſe and ſpreading roots, diſperſed far abroad in the ground: from which ariſe long and round leaues, almoſt like the fruit of a great Cucumber, a foot and a halfe long, ribbed, walled, and furrowed like vnto the Melon: theſe branched ribs are ſet armed

armed for the most part with certaine prickles standing by couples, the point or sharpe end of one standing one way, and the point of another looking directly a cleane contrary way: these prickes are often found in the gumme it selfe, which is brought unto vs from Libya and other parts: the leaues hereof being planted in the ground will take root well, and bring forth great increase, which thing I haue proued true in my garden: it hath perished againe at the first approch of Winter. The sap or liquor that is extracted out of this plant is of the colour and substance of the Creame of Milke; it burneth the mouth extremely, and the dust or pouder doth very much annoy the head and the parts thereabout, causing great and vehement sneesing.

1 This rare plant called *Antiquorbium* hath a very thicke grosse and farre spreading root, very like vnto *Euphorbium*; from which riseth vp many round greene and fleshie stalkes, whereupon doe grow thicke leaues like Purslane, but longer, thicker, and fatter: the whole plant is full of cold and clammie moisture, which represseth the scortching force of *Euphorbium*; and it wholly seemes at the first view to be a branch of greene Corall.

3 *Cereus Peruvianus spinosus Lobelij.*
The Torch-Thistle or thorny Euphorbium.

4 *Calamus Peruvianus spinosus Lobelij.*
The thorny reed of Peru.

3 There is not among the strange and admirable plants of the world any one that giues more cause of maruell, or more moueth the minde to honor and laud the Creator, than this plant, which is called of the Indians in their mother tongue *Vragua*, which is as much to say, a torch, taper, or wax candle; whereupon it hath been called in Latine by those that vnderstood the Indian tongue, *Cereus*, or a Torch. This admirable plant riseth vp to the height of a speare of twenty foot long, although the figure expresse not the same; the reason is, the plant when the figure was drawne came to our view broken: it hath diuers bunches and vallies, euen as is to be seene in the sides of the Cucumber, that is, furrowed, guttered, or chamfered alongst the same, and as it were laid by a direct line, with a welt from one end vnto the other: vpon which welt or line doe stand small star-like Thistles, sharpe as needles, and of the colour of those of the Melon Thistle, that is to say, of a browne colour: the trunke or body is of the bignesse of a mans arme, or a cable rope; from the middle whereof thrust forth diuers knobby elbowes of the same substance, and armed with the like prickles that the body of the trunke is set withall: the whole plant is thicke, fat, and full of a flashie substance, hauing much juyce like that of Aloes, when it is hardned, and of a bitter taste: the

floures

floures grow at the top or extreme point of the plant: after which follow fruit in shape like a [illegible] full of a red juyce, which being touched staineth the hands of the colour of red leade: the ta[illegible] not vnpleasant.

4 There hath been brought from the Indies a prickly reed of the bignesse of a good big [illegible] of the length of six or eight foot, chamfered and furrowed, hauing vpon two sides growing [illegible] an vneuen membrane or skinny substance, as it were a jag or welt set vpon the wing of a [illegible] and vpon the very point of euery cut or jagge armed with most sharpe prickles: the whole [illegible] is filled full of a spongeous substance, such as is in the hollownes of the brier or bramble; [illegible] the which is to be seene as it were the pillings of Onions, wherin are often found liuing [illegible] at the first seeme to be dead. The plant is strange, and brought dry from the Indies, [illegible] cannot write so absolutely hereof as we desire; referring what more might be said to a further consideration or second edition.

¶ *The Place.*

These plants grow vpon Mount Atlas, in Lybia, in most of the Ilands of the Mediterranean [illegible] in all the coast of Barbary, especially in S. Crux neere vnto the sea side, in a barren place there called by the English-men Halfe Hanneken; which place is appointed for Merchants to confer of their businesse, euen as the Exchange in London is: from which place my friend M^r. *William* [illegible] a right expert Surgeon, did procure me the plants of them for my garden, by his seruant that he sent thither as a Surgeon of a ship. Since which time I haue receiued plants of diuers others that haue trauelled into other of those parts and coasts: notwithstanding they haue not endured the cold of our extreme Winter.

¶ *The Time.*

They put forth their leaues in the Spring time, and wither away at the approch of Winter.

¶ *The Names.*

It is called both in Greeke and Latine, Εὐφόρβιον, *Euphorbium*: *Pliny* in one place putteth the name in the feminine gender, naming it *Euphorbia*: the juyce is called also *Euphorbion*, and so it is likewise in shops: we are faine in English to vse the Latine word, and to call both the herbe and juyce by the name of Euphorbium, for other name we haue none: it may be called in English, the gum Thistle.

¶ *The Temperature.*

Euphorbium (that is to say, the congealed juyce which we vse) is of a very hot, and, as Galen testifieth, causticke or burning faculty, and of thinne parts: it is also hot and dry in the fourth degree.

¶ *The Vertues.*

A An emplaister made with the gumme Euphorbium, and twelue times so much oyle, and a little wax, is very singular against all aches of the joynts, lameneſſe, palsies, crampes, and shrinking of sinewes, as *Galen, lib.* 4. *de medicamentis secundum genera*, declareth at large, which to recite at this present would but trouble you ouermuch.

B Euphorbium mingled with oyle of Bay and Beares grease cureth the scurfe and scalds of the head, and pildnesse, causing the haire to grow againe, and other bare places, being annointed therewith.

C The same mingled with oyle, and applied to the temples of such as are very sleepy, and troubled with the lethargie, doth waken and quicken their spirits againe.

D If it be applied to the nuque or nape of the necke, it bringeth their speech againe that haue lost it by reason of the Apoplexie.

E Euphorbium mingled with vinegre and applied taketh away all foule and ill-fauoured spots, in what part of the body soeuer they be.

F Being mixed with oyle of Wall-floures, as *Mesues* saith, and with any other oyle or oyntment, it quickely heateth such parts as are ouer cold.

G It is likewise a remedy against old paines in the huckle bones, called the Sciatica.

I *Ætius*, *Paulus*, *Actuarius*, and *Mesue* doe report, That if it bee inwardly taken it purgeth by siege water and flegme; but withall it fetteth on fire, scorcheth and fretteth, not onely the throat and mouth, but also the stomacke, liuer, and the rest of the entrals, and inflames the whole body.

For that cause it must not be beaten small, and it is to be tempered with such things as allay the heate and sharpeneſſe thereof, and that make glib and slippery; of which things there must vse such a quantitie, as that it may bee sufficient to couer all ouer the superficiall or outward part thereof.

K But it is a hard thing so to couer and fold it vp, or to mix it, as that it will not burne or scorch. For though it be tempered with neuer so much oyle, if it be outwardly applied it raiseth blisters, especially in them that haue soft and tender flesh, and therefore it is better not to take it inwardly.

it is troublesome to beat it, vnlesse the nosthrils be carefully stopt and defended; for if it hap- L
pen that the hot sharpnesse thereof do enter into the nose, it causeth itching, and moueth neesing,
and after that by reason of the extremitie of the heate, it drawes out aboundance of flegme and
filth, and last of all blood, not without great quantitie of teares.

But against the hot sharpnesse of Euphorbium, it is reported that the inhabitants are remedied M
by a certaine herb, which of the effect and contrarie faculties is named *Anteuphorbium*. This plant
also is full of juice, nothing at all hot and sharpe, but coole and slimy, allaying the heat and sharp-
nesse of *Euphorbium*. We haue not yet learned That the old Writers haue set downe any thing as
touching this herb: notwithstanding it seems to be a kinde of Orpine, which is the antidote or
counterpoison against the venomous poison of *Euphorbium*.

‡ Chap. 493. *Of soft Thistles and Thistle gentle.*

‡ There are certain other plants by most writers referred to the Thistles: which beeing o-
mitted by our Author, I haue thought fit here to giue you.

‡ 1 *Cirsium maximum Asphodeli radice.*
Great soft bulbed Thistle.

2 *Cirsium majus alterum.*
Great soft Thistle.

¶ *The Description.*

1 THe first and largest of these hath leaues consisting of great longish bulbs like those of the Asphodil; from whence arise many large stalks three or foure cubits high, crested and downy: the leaues are very long and large, juicy, greenish, cut about the edges, and set with soft prickles. At the tops of the stalks and branches grow heads round and large, out of which come flours consisting of aboundance of threds of a purple color, which fly away in down. This growes wilde in the mountainous medowes and in some wet places of Austria. I haue seen it growing in the garden of Mr *Iohn Parkinson*, and with Mr *Tuggye*. It floures in Iuly. *Clusius* hath called it *Cirsium maximum mont. incano folio bulbosa radice*. But hee gaue no figure thereof, nor any else, vnlesse the *Acanthium peregrinum* in *Tabernam*. (which our Author formerly, as I before noted,

gaue by the name of *Solstitialis lutea peregrina)* were intended for this plant, as I verily thinke it was I haue giuen you a figure which I drew some yeares ago by the plant it selfe.

2 The root of this is long, yet sending forth of the sides creeping fibres, but not bulbous: the leaues are like those of the last mentioned, but lesse, & set with sharp prickles of a greenish colour with the middle rib white: the heads sometimes stand vpright, and otherwhiles hang down; they are very prickely, and send forth floures consisting of many elegant purple threds. The stalkes are thicke, crested and welted with the setting on of the leaues. This growes wilde vpon the sea coasts of Zeeland, Flanders, and Holland: it flonres in Iune and Iuly. It is the *Cirsium tertium* of *Dodonæus* and *Cirsium majus* of *Lobel*.

3 This, whose root is fibrous and liuing, sendeth forth lesser, narrower, and softer leaues than those of the former, not jagged or cut about their edges, nor hoary, yet set about with prickles, the stalks are crested: the heads are smaller, and grow three or foure together, carrying such purple floures as the former. This is that which *Matthiolus*, *Gesner*, and others haue set forth for *Cirsium* *Dodonæus* for *Cirsium* 2. and *Clusius* hath it for his *Cirsium quartum*, or *Montanum secundum*.

‡ 3 *Cirsium foliis non hirsutis.*
Soft smooth leaued Thistle.

‡ 4 *Cirsium montanum capitulis parvis.*
Small Burre Thistle.

4 The leaues of this are somewhat like those of the last described, but larger, and welting the stalks further at their setting on: they are also set with prickles about the edges: the stalkes are some two cubits high, diuided into sundry long slender branches, on whose tops grow little rough prickly heads, which after the floures come to perfection, do hang downewards, and at length turne into down; amongst which lies hid a smooth shining seed. This growes wilde in diuers woodie places of Hungarie and Austria. It is the *Cirsium* of *Dodonæus*: the *Cirsium* 2. or *Montanum* 1. of *Clusius*: and *Cirsium alterum* of *Lobel*. It floures in Iune: the root is about the thickenesse of ones little finger, fibrous also and liuing.

5 This sends vp long narrow leaues, hairy, and set about the edges with slender prickles: out of the middest of these leaues groweth vp a stalke, somtimes a foot, otherwhiles a cubit high, slender, stiffe, and downy: vpon which grow leaues somwhat broad at their setting on, and there also a little nicked or cut in. This stalke sometimes hath no branches, otherwhiles to or three long slender ones, ot the tops whereof grow out of scaly heads such floures as the common Knap-weed, which

† 5 *Cirsium montanum Anglicum.*
Single headed Thistle.

‡ *Cirsij Anglici Icon* Lobelij.
Lobels figure of the same.

‡ 6 *Carduus mollis foliis dissectis.*
Iagged leaued Thistle gentle.

which at length turne into down: among which lies hid a small shining seed like the other plants of this kinde. The root is made of diuers thicke fibres, which run in the ground, and here and there put vp new heads. This plant wants no setting forth; for *Clusius* giues vs the figure and historie of it, first by the name of *Cirsium Pannonicum* 1. *paterse*; then he giues another historie thereof, with a worser figure (which he receiued of Dr *Thomas Penny* of London) by the name of *Cirsium Anglicum* 2. *Lobel* also described it, and set it forth with a figure expressing the floure already faded, by the name of *Cirsium Anglicum*. *Bauhine* in his *Pinax*, deceiued by these seuerall expressions, hath made three seuerall plants of this one; a fault frequent in many writers of plants. *Clusius* found it growing in the mountainous medowes alongst the side of the Danow in Austria. *Penny*, in the medowes at the foot of Ingleborow hil in Yorkshire: *Lobel*, in the medowes at a place called Acton in Glocester-shire. I found this only once, and that was in a medow on this side High-gate, hauing been abroad with the Company of Apothecaries, and returning homeward that way in the company of Mr *Iames Walsall*, *William Broad*, and some others. I haue giuen you both the figures of *Clusius*, because owne in the first place, and that of Dr *Penny* in the second, but the former is the better. I haue also giuen you that of *Lobel*.

‡ 7 *Carduus mollis foliis Lapathi.*
Docke leaued Thistle gentle.

6 These also *Clusius* (whom I herein follow) addeth to the kindes of This jagged leafed one, which hee calleth *Carduus mollior primus*, hath many leaues at the root, both spreading vpon the ground, and also standing vpright; and they are couered with a white soft downinesse, yet green on the vpper side: they are also much diuided or cut in euen to the middle rib, like to the smaller tenderer leaues of the Star Thistle: they haue no prickles at all vpon them: out of the middle of these leaues grow vp one or two stalkes, round, crested, purplish, hoary, and some cubit or better high. The leaues that grow vpon the lower part of the stalke are diuided, those aboue not so: the tops of the stalks somtimes, yet very seldome are parted into branches, which carry scaly heads containing elegant floures made of many purple strings. The floure decaying, there succeedeth a cornered seed. The root sometimes equalls the the thickenesse of ones finger, brownish, long and somewhat fibrous. It floures in May, and growes vpon the hilly places of Hungary.

7 The stalke of this is some foot or better high, thick, crested, and somwhat hairy: the leaues about the root are somewhat large, and in shape like those of *Bonus Henricus* (abusiuely called in English, Mercury) somewhat sinuated about the edges, and set with harmlesse prickles, greene aboue, and very hoary vnderneath, like the leaues of the white Poplar: those that grow vpon the stalke are lesser and narrower, out of whose bosomes toward the tops of the stalke grow out little branches, which carry three, foure, or more little scaly heads like those of the blew Bottle or Knapweed: whereout grow threddy blewish purple floures: the seed is wrapped in downe, and not vnlike that of Blew-Bottle: the root is blacke, hard, and liuing, sending forth shoots on the sides. It growes vpon the highest Austrian Alps, and floures in Iuly. *Clusius* calls this *Carduus mollior Lapathi folio*.

¶ *The Temperature and Vertues.*

These plants seem by their taste to be of a moderately heating and drying facultie, but none of them are vsed in medicine, nor haue their vertues set down by any Author. ‡

CHAP.

Chap. 494. *Of three leafed Grasse or Medow Trefoile.*

¶ *The Kindes.*

THere be diuers sorts of three leafed Grasses, some greater, others lesser; some beare floures of one colour, some of another: some of the water, and others of the land: some of a sweet smel, others stinking: and first of the common medow Trefoiles, called in Irish *Shamrocks*.

1 *Trifolium pratense.*
Medow Trefoile.

‡ 3 *Trifolium majus flore albo.*
Great white Trefoile.

¶ *The Description.*

MEdow Trefoile bringeth forth stalkes a cubit long, round and something hairy, the greater part of which creepeth vpon the ground: whereon grow leaues consisting of three ioined together, one standing a little from another, of which those that are next ground and roots are rounder, and they that grow on the vpper part longer, hauing for the most part in the midst a white spot like a halfe moone. The floures grow at the tops of the stalks in a thick or small Fox-taile eare, of a purple colour, and sweet of taste. The seed growes in little husks, round and blackish: the root is long, wooddy, and groweth deep.

2. There is another of the field Trefoiles, differing from the precedent especially in the color of the floures; for as those are of a bright purple, contrariwise these are very white, which maketh the difference. The leaues, floures, and all the whole plant is lesse than the former.

4. There is also a Trefoile of this kinde which is sowne in fields of the low-Countries, in Italy and diuers other places beyond the seas, that comes vp ranker and higher than that which groweth in medowes, and is an excellent food for Cattell, both to fatten them and cause them to giue good store of milke.

‡ Of this there is one more with white floures which hath stalkes some foot high, and narrow hairy leaues, with a root of the thickenesse of ones little finger. This is *Clusius* his *Trifolium majus primum*,

CHAP.

Chap. 494. *Of three leafed Grasse or Medow Trefoile.*

¶ *The Kindes.*

There be diuers sorts of three leafed Grasses, some greater, others lesser; some beare floures of one colour, some of another: some of the water, and others of the land: some of a sweet smel, others stinking: and first of the common medow Trefoiles, called in Irish *Shamrocks*.

1 *Trifolium pratense.*
Medow Trefoile.

‡ 3 *Trifolium majus flore albo.*
Great white Trefoile.

¶ *The Description.*

1 Medow Trefoile bringeth forth stalkes a cubit long, round and something hairy, the greater part of which creepeth vpon the ground: whereon grow leaues consisting of three ioined together, one standing a little from another, of which those that are next the ground and roots are rounder, and they that grow on the vpper part longer, hauing for the most part in the midst a white spot like a halfe moone. The floures grow at the tops of the stalks in a tuft or small Fox-taile eare, of a purple colour, and sweet of taste. The seed growes in little husks, round and blackish: the root is long, wooddy, and groweth deep.

2 There is another of the field Trefoiles, differing from the precedent especially in the color of the floures; for as those are of a bright purple, contrariwise these are very white, which maketh the difference. The leaues, floures, and all the whole plant is lesse than the former.

3 4. There is also a Trefoile of this kinde which is sowne in fields of the low-Countries, in Italy and diuers other places beyond the seas, that comes vp ranker and higher than that which groweth in medowes, and is an excellent food for Cattell, both to fatten them and cause them to giue good store of milke.

‡ Of this there is one more with white floures which hath stalkes some foot high, and narrow hairy leaues, with a root of the thickenesse of ones little finger. This is *Clusius* his *Trifolium majus primum*,

‡ 4 *Trifolium majus flo. purpureo.*
Great purple Trefoile.

‡ 5 *Trifolium luteum Lupinum.*
Hop Trefoile.

‡ 6 *Trifolium luteum minimum.*
Little yellow Trefoile.

primum. The other hath ſtalks ſome cubit high, with larger joints and leaues: the floure or head of floures is alſo larger, of an elegant red colour. This *Cluſius* calls *Trifolium majus tertium*. ‡

5. 6 Likewiſe we haue in our fields a ſmaller Trefoile that brings forth yellow flours a greater and a leſſer, & diuers others alſo, differing from theſe in diuers notable points, the which to diſtinguiſh apart would greatly inlarge our volume, and yet to ſmall purpoſe: therefore we leaue them to be diſtinguiſhed by the Curious, who may at the firſt view eaſily perceiue the difference, and alſo that they be of one ſtocke or kindred.

‡ The greater of theſe yellow Trefoiles hath prety large yellow heads, which afterward become of a browniſh colour, and ſomewhat reſemble an hop; whence *Thalius* called it *Lupulus ſyl[illegible]*, or *Trifolium luteum alterum lupulinum*: *Dodonæus* cals it *Trifolium agrarium*. The leaues are ſmall, and lightly nickt about the edges: the leſſer hath ſmaller and far leſſer yellow heads, which are ſucceeded by many little crooked cluſtring ſeeds. The leaues of this are ſmall, and alſo ſnipt about the edges. Both this and the other hath two little leaues cloſe by the faſtning of the foot-ſtalkes of the leaues to the main ſtalks: wherefore I refer them to the Medickes, and vſually call this latter *Medica ſem. racemoſo*. It is the *Trifol. luteum minus* of *Pena* and *Lobel*; and *Trifol. arvenſe* of *Tabern.* ‡

¶ The

¶ *The Place.*

Common medow Trefoile grows in medowes, fertile pastures, and waterish grounds: the others loue the like soile.

¶ *The Time.*

They floure from May to the end of Summer.

¶ *The Names.*

Medow Trefoile is called in Latine *Trifolium pratense*: in high-Dutch, **Waisenklee**: in low-Dutch, **Clauren**: in French, *Treffle*, and *Trainiere*, and *Visumarus*, as *Marcellus* an old writer testifies: in English, Common Trefoile, Three leafed grasse: of some, Suckles, Hony-suckles, and Cocks-heads: in Irish, *Shamrocks*.

¶ *The Temperature.*

The leaues and floures of medow Trefoiles are cold and dry.

¶ *The Vertues.*

The decoction of three leafed grasse made with hony and vsed as a clister, is good against fret- A
tings and paines of the guts, and driueth forth tough and slimy humors that cleaue vnto the guts.

The leaues boiled with a little barrows grease, and vsed as a pultis, take away hot swellings and B
inflammations.

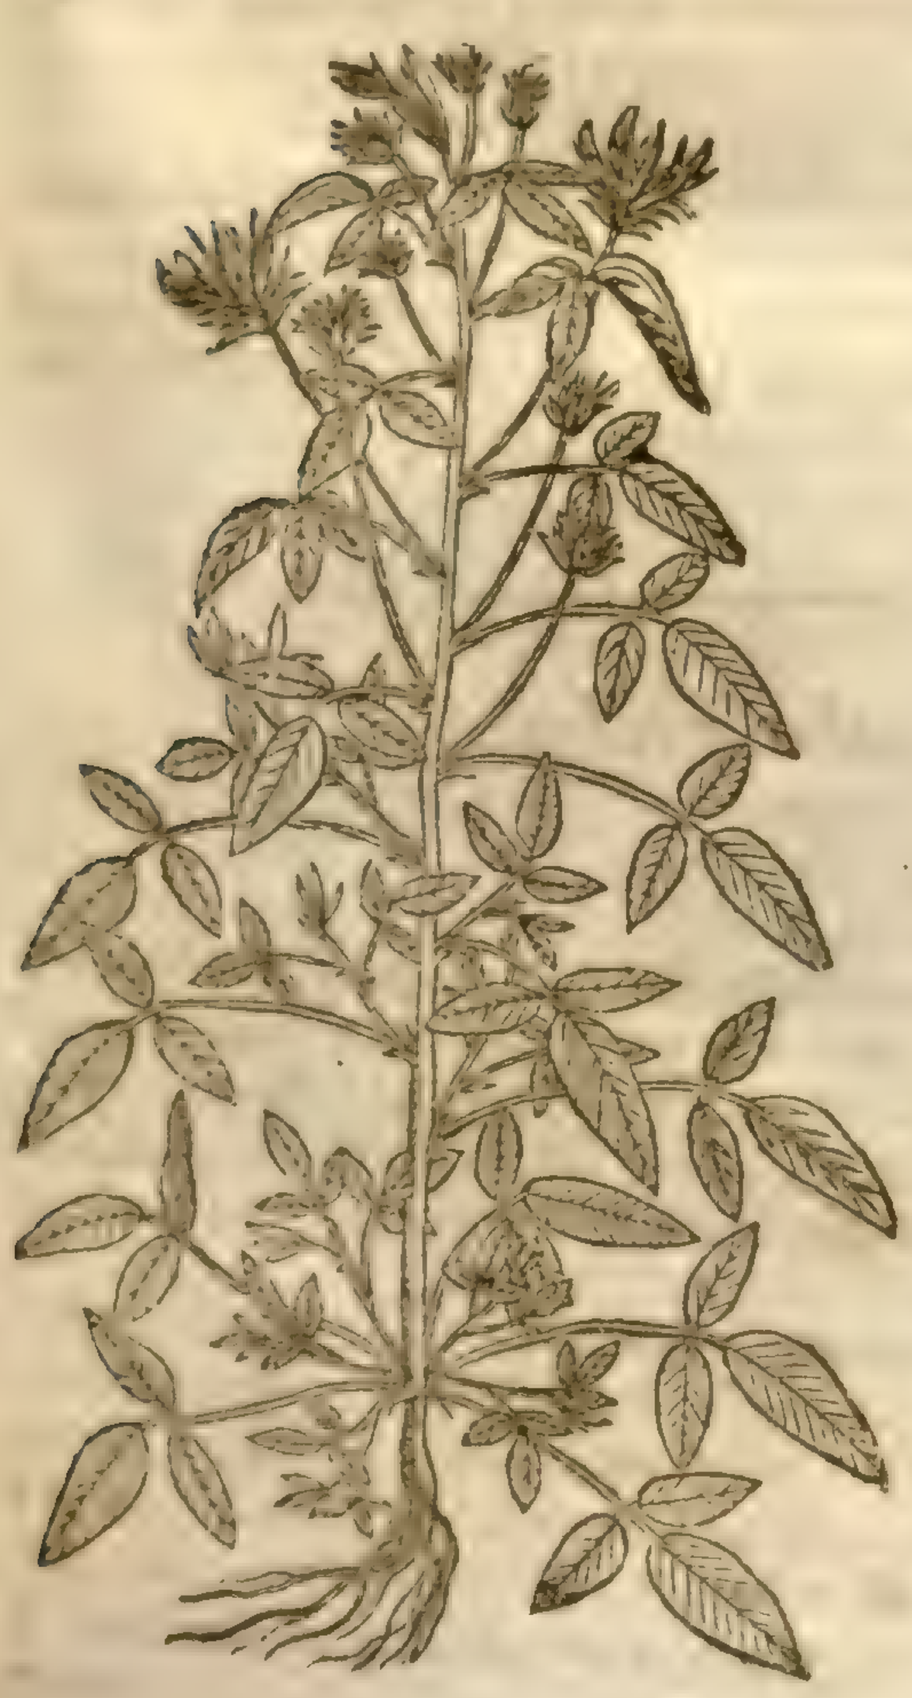
Oxen and other cattell do feed on the herb, as also calves and yong lambs. The flours are accep- C
table to Bees.

Pliny writeth and setteth it downe for certaine, that the leaues hereof do tremble and stand right D
vp against the comming of a storme or tempest.

The medow Trefoile (especially that with the blacke halfe-moon vpon the leafe) stamped with E
a little hony, takes away the pin and web in the eies, ceasing the pain and inflammation thereof, if it be strained and dropped therein.

Chap. 495. *Of stinking Trefoile or Treacle Claver.*

Trifolium bituminosum.
Treacle Claver.



¶ *The Description.*

TReacle Claver growes vpright like a shrubbie plant, with stalkes of a cubit and a halfe high; whereupon grow next the ground broad leaues three joined together: those vpon the stalks are longer and narrower. The stalks are couered ouer with a rough euill coloured hairinesse: the leaues are of a darke blacke green colour, and of a loathsome smell, like the pitch called *Bitumen Iudaicum*, whereof it took the name. The flours grow at the top of the stalks, of a dark purplish colour tending to blewnesse, in shape like those of Scabious. The seed is broad, rough, long, and sharp pointed: the root is smal & tender, and canot endure the coldnesse of our Winter, but perisheth at the first approch thereof.

¶ *The Place.*

It groweth naturally, saith *Hippocrates*, *Hippiatros*, not *Cous*, in rough places, as *Ruellius* translateth it: in Germany, France, and England it neuer commeth vp of it selfe, but must be sown in gardens, as my selfe haue proued diuers times, and was constrained to sow it yerely, or else it would not come vp, either of his owne sowing or otherwise

¶ *The Time.*

It floured not in my garden vntill the end of August.

¶ *The*

¶ *The Names.*

Nicander calls this Trefoile τριφυλλον: in Latine, *Trifolium acutum*, or ſharpe pointed Trefoile: of *Pliny*, *Trifolium odoratum*, but not properly: of others, *Trifolium Aſphaltæum, ſive Bituminoſum*, or ſtone Pitch Trefoile.

Auicen calleth it *Tarſilon*, and not *Handacocha*: *Auicen* doth comprehend *Dioſcorides* his *Lotus*, that is to ſay, *Lotus vrbana ſylveſtris*, and *Ægyptia*; which *Dioſcorides* confoundeth one with another in one Chapter. In Engliſh it is called Clauer gentle, Pitch Trefoile, ſtinking Trefoile, and Treacle Clauer.

¶ *The Temperature.*

This Trefoile, called *Aſphaltæum*, as *Galen* ſaith, is hot and dry in the third degree, as *Bitumen* is.

¶ *The Vertues.*

A Being drunke, it taketh away the pain of the ſides which commeth by obſtruction or ſtoppings, prouoketh vrine, and bringeth downe the deſired ſickneſſe.

B *Hippocrates* writeth, that it doth not only bring them downe, but likewiſe the birth, not onely inwardly taken, but alſo outwardly applied: if a woman, ſaith he, be not well clenſed after her childbearing, giue her this Trefoile to drinke in white wine.

C *Dioſcorides* ſaith, that the ſeeds and leaues being drunke in water are a remedie for the pleuriſie, difficultie of making water, the falling ſickeneſſe, the dropſie when it firſt beginneth, and for thoſe that be troubled with the Mother: the quantity to be taken at once is three drams of the ſeeds, and foure of the leaues.

D The leaues drunke in Oxymel or a ſyrrup of vineger made with hony, is good for thoſe that are bitten with ſerpents.

E Some affirm, that the decoction of the whole plant, root and leaues, taketh away pain comming of the ſting of ſerpents, if the part be waſhed therewith: but if any other man hauing an vlcer, be waſhed with that water wherewith he was bathed that was bitten of the ſerpent, they ſay that he ſhall be troubled in the ſame manner that the ſtinged party was.

F Some alſo giue with wine three leaues, or a ſmall quantitie of the ſeeds in tertian agues, and in Quartane foure, as a ſure remedie againſt the fits.

G The root alſo is put into antidotes or counterpoiſons, ſaith *Dioſcorides*: but other antient Phyſitions do not only mix the root with them, but alſo the ſeed, as we may ſee in *Galen*, *lib.* 2. of his antidots, in many compoſitions; that is to ſay, in the Treacles of *Ælius Gallus*, *Zeno Laudicen*, *Claudius Apollonius*, *Eudemus*, *Heraclides*, *Dorotheus*, and *Heras*.

H The herbe ſtamped and applied vpon any invenomed wound or made with poiſoned weapon, drawes the poiſon from the depth moſt apparantly: but if it be applied vpon a wound where there is no venomous matter to work vpon, it doth no leſſe infect that part, than if it had bin bitten with ſome ſerpent or venomous beaſt: which wonderful effect it doth not performe in reſpect of any vitious qualitie that it hath in it ſelfe, but becauſe it doth not finde that venomous matter to worke vpon, which it naturally draweth (as the Load-ſtone doth iron) wherupon it is conſtrained through his attractiue qualitie, to draw and gather together humors from farre vnto the place, whereby the paine is greatly increaſed.

CHAP. 496. *Of diuers other Trefoiles.*

¶ *The Deſcription.*

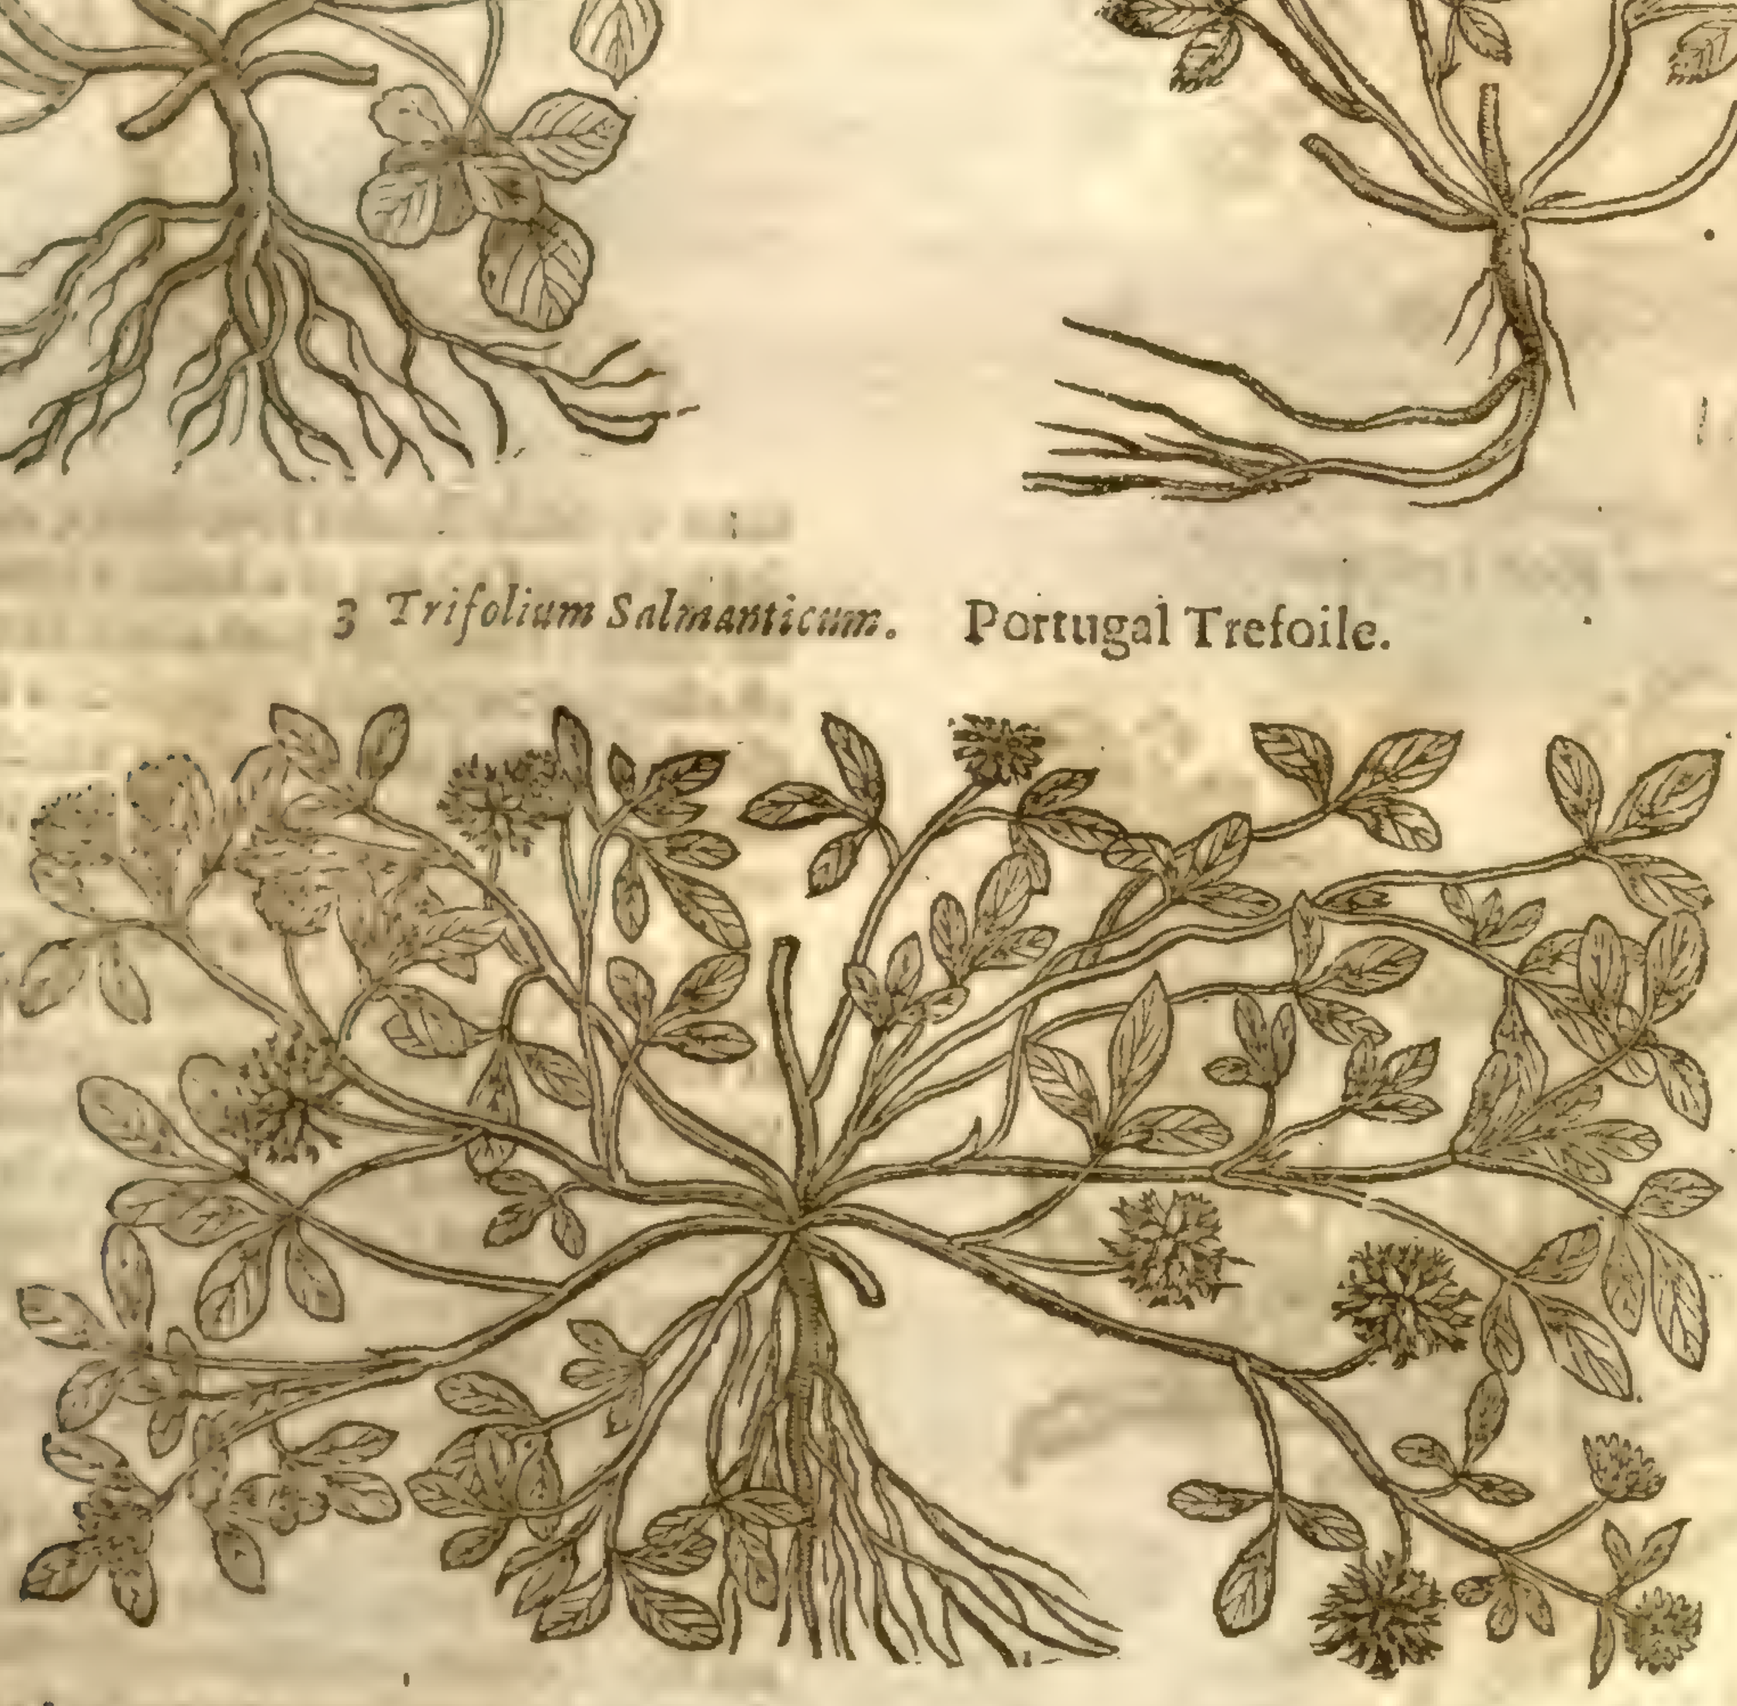
1 TRee leaued Graſſe of America hath diuers crooked round ſtalks leaning this way and that way, and diuided into diuers branches, whereon grow leaues like thoſe of the meadow Trefoile, of a blacke greene colour, and of the ſmell of pitch Trefoile or Treacle Clauer: the floures grow at the top of the branches, made vp in a long ſpiked chaffie eare, white of colour: after which comes the ſeed, ſomwhat flat, almoſt like to thoſe of Tares: the roots are long ſtrings of a wooddy ſubſtance.

2 This three leafed Graſſe (which *Dodonæus* in his laſt edition calleth *Trifolium cochleatum primum*; and *Lobel*, *Fœnum Burgundiacum*) hath diuers round vpright ſtalkes of a wooddy rough ſubſtance, yet not able of it ſelfe to ſtand without a prop or ſtay: which ſtalkes are diuided into diuers ſmall branches, whereupon doe grow leaues joined three together like the other Trefoiles, but of a darke ſwart greene colour: the floures grow at the tops of the ſtalks, in ſhape like thoſe of the couched Trefoile, but of a darke purple colour: the ſeed followeth, contained in ſmall wrinckled huſkes

1 *Trifolium Americum.*
Trefoile of America.

† 2 *Trifolium Burgundiacum.*
Burgondy Trefoile.

3 *Trifolium Salmanticum.* Portugal Trefoile.



links turned round, after the maner of a water snaile. The root is thick, composed of diuers tough threddy strings, and lasteth long in my garden with great increase.

3 This three leaued Grasse of Salmanca, a city as I take it in Portugal, differs not much from our field Trefoile: it hath many branches weak and tender, trailing vpon the ground, of two cubits and a halfe high: whereupon grow leaues set together by three vpon a stemme; from the bosome whereof thrust forth tender foot-stalkes, whereon stand most fine floures of a bright red tending to purple: after which come the seeds wrapped in small skins, of a red colour

4 The Hart Trefoile hath very many flexible branches, set vpon a slender stalke, of the length of two or three foot, trailing hither and thither: whereupon doe grow leaues joined together by

three

4 *Trifolium Cordatum.*
Heart Trefoile.

5 *Trifolium siliquosum minus.*
Small codded Trefoile.

‡ 6 *Coronopus ex codice Cæsareo.*
Crow-foot Trefoile.

three on little slender foot-stalks, euery little leafe of the fashion of a heart, whereof it took his name: amongst which come forth scaly or chaffie yellow floures: the root is thicke and threddy. ‡ I take the plant which our Authour heere figured and intended to describe vnto vs, to be of that *Medica* which *Cæsalpinus* calls *Arabica*, which growes wild in many places with vs, hauing the leaues a little dented in at the ends, so that they resemble the vulgar figure of an heart; and each leaf is marked with a blackish or red spot: the flours be small and yellow; the seed is contained in rough burres wound vp like the other snaile Trefoils, whereof it is a kinde. I haue giuen you the figure a little more exquisite, by the addition of the spots and cods. ‡

5 This kinde of three leaued Grasse is a low herb creeping vpon the ground: the leaues are like those of the common Trefoile, but lesser, and of a grayish greene colour: the flowres are faire and yellow, fashioned like those of Broome, but lesser: after come three or foure cods, wherein is contained round seed: the root is long and reddish. ‡ This is the *Trifolium Corniculatum*, or *Melilotus coronata* of *Lobel*. ‡ *tus pentaphyllos* of *Gesner*. ‡

This codded Trefoile is like vnto the last described in euery respect, sauing that this plant is altogether ‡ larger, hauing stalks a cu-

but and a halfe high: the leaues are also foure times as large, two roundish leaues growing by the stalke, and three longish ones growing vpon a short foot-stalk comming forth betweene the two roundish leaues: both the stalke and leaues haue a little soft downinesse or hairinesse on them: the floures grow clustering together on the tops of the stalks, in shape, bignesse, and colour like that of the last described, but commonly more in number: they are also succeeded by such cods as those of the former.

6 The figure which *Dodonæus* hath set forth out of an old Manuscript in the Emperors Library, being there figured for *Coronopus*, seems to be of the last described, or some plant very like thereto; though the fiue leaues at each joint be not put in such order as they should be, yet all the parts are well expresst, according to the drawing of those times: for you shall finde few antient expressions come so neere as this doth. ‡

7 There is a kind of Clauer growing about Narbon in France, that hath many twiggy tough branches comming from a wooddy root; whereon are set leaues three together, after the maner of the other Trefoiles, somewhat long, hairy, and of an hoary or ouerworn green colour: the floures are yellow, and grow at the tops of the branches like those of Broome.

7 *Lotus incana, sive Oxytriphyllon Scribonij largi.*
Hoary Claver.

‡ 8 *Trifolium luteum siliqua cornuta.*
Yellow horned Trefoile.

‡ This sends vp many branches from one root, some cubit or more long, commonly lying along vpon the ground, round, flexible, and diuided into sundry branches: the leaues stand together by threes, and are like those of the true *Medica* or Burgondy Trefoile, but much lesse: the floures grow clustering together at the tops of the branches, like in shape to those of the former, of a yellow colour, and not without smell: they are succeeded by such, yet narrower crooked coddes, as the Burgondy Trefoile hath (but the Painter hath not well expressed them:) in these cods are contained seeds like those also of that Trefoile, and such also is the root, which liues long, and much increases. It growes in Hungary, Austria, and Moravia. It floures in Iune and Iuly. *Clusius* calls it *Medica flore flavo. Tabernamontanus, Lens maior repens*: and *Tragus, Melilоti majoris species tertia. Bauhine* saith, That about Nimes in Narbone it is found with floures either yellow, white, green, blew, purple, blacke, or mixt of blew and green; and he calleth it *Trifolium sylvestre luteum siliqua cornuta*; or *Medica frutescens.* ‡

¶ The

¶ *The Place.*

The ſeuerall titles of moſt of theſe plants ſet forth their naturall place of growing: the reſt grow in moſt fertile fields of England.

¶ *The Time.*

They floure and flouriſh moſt of the ſummer moneths.

¶ *The Names.*

There is not much to be ſaid as touching their Names, more than hath bin ſet downe.

¶ *The Temperature and Vertues.*

The temperature and faculties of theſe Trefoiles are referred to the common medow Trefoils.

† The figure formerly put in the ſecond place was of the leſſer Trefoile deſcribed in the laſt chapter ſaue one.

Chap. 497.

Of the great Trefoiles or winged Clavers.

¶ *The Deſcription.*

† 1 THe great Hares-foot being a kinde of Trefoile, hath a hard and wooddy root, full of black threddy ſtrings: from whence ariſe diuers tough and feeble branches, whereupon grow leaues ſet together by threes, making the whole plant to reſemble thoſe of the Medow Trefoile: the floures grow at the top of the ſtalks, compoſed of a bunch of gray haires: among the which ſoft matter commeth forth ſmall floures of a moſt bright purple colour, ſomewhat reſembling the floures of the common medow Trefoile, but far greater. *Lobel* calls this *Lagopus minimus folio, & facie Trifolij pratenſis: Dodonæus, Lagopus maior folio Trifolij.*

‡ 1 *Lagopus maximus.*
The great Hares-foot Trefoile.

‡ 2 *Lagopus major ſpica longiore.*
Great large headed Hares-foot.

‡ 2 This

‡ 2 This elegant plant (which *Tragus* hath set forth for *Cytisus*, *Lobel* by the name of *Lagopus altera folio prinnato*, and *Clusius* for his *Trifolij majoris* 3. *altera species*) hath stalkes some foot and better high, whereon grow leaues set together by threes, long, hoary, and lightly snipt about the edges, with elegant nerues or veines, running from the middle ribbe to the sides of the leaues, which are most conspicuous in hot Countries, and chiefly then when the leafe begins to decay. At the tops of the branches, in long and large heads grow the floures, of an elegant sanguine colour. This floures in May and Iune, and growes wilde vpon some mountaines of Hungary and Austria; I haue seene them, both this and the former, growing in the gardens of some of our Florists.

3 This other great kinde of Hares-foot sends forth one slender, yet stiffe stalke, whereon grow leaues whose foot-stalkes are large at the setting on, encompassing the stalkes: the leaues themselues grow by threes, long, narrow, and sharpe pointed, of a grayish colour like those of the common Hares-foot; the spike at the tuft is soft ond downy, with little reddish floures amongst the whitish hairinesse. This growes wild in Spaine: *Clusius* cals it *Lagopus angustifolius Hispanicus major*.

There is another sort of this described by *Lobel* and *Pena* in the *Aduers.* whose leaues are longer and narrower than this, the whole plant also is oft times lesser: they call it *Lagopus altera angustifolia*. ‡

‡ 3 *Lagopus angustifolius Hispanicus.*
Narrow leafed Spanish Hare-foot.

3 *Lagopodium, Pes leporis.*
Little Hares-foot Trefoile.

4 The small Hares-foot hath a round rough and hairy stalke, diuiding it selfe into diuers other branches; whereupon do grow small leaues, three joyned together, like those of the small yellow Trefoile: the floures grow at the very point of the stalkes, consisting of a rough knap or bush of haires or downe, like that of *Alopecuros*, or Fox-taile, of a whitish colour tending to a light blush, with little white floures amongst the downinesse: the root is small and hard.

¶ *The Place.*

The first groweth in the fields of France and Spaine, and is a stranger in England; yet it groweth in my garden.

The small Hare-foot groweth among corne, especially among Barly, and likewise in barren pastures almost euery where.

¶ *The Time.*

They floure and flourish in Iune, Iuly, and August.

¶ *The Names.*

The great Hare-foot Trefoile is called of *Tragus*, *Cytiſus*: of *Cordus*, *Trifolium magnum*: of *Lobelius*, *Lagopum maximum*, and *Lagopodium*: in Greeke, λαγώπους: in Engliſh, the great Hares-foot.

The laſt, being the ſmalleſt of theſe kinds of Trefoiles, is called *Lagopus*, and *Pes Leporis*: in Dutch, **Haſen Pootkens**: in high Dutch, **Haſen fuſz**: in French, *Pied de lieure*: in Engliſh Hare-foot.

¶ *The Temperature and Vertues.*

A The temperature and faculties are referred vnto the other Trefoiles, whereof theſe are kindes: notwithſtanding *Dioſcorides* ſaith, that the ſmall Hares-foot doth binde and dry. It ſtoppeth, ſaith he, the laske, if it be drunke with red wine. But it muſt be giuen to ſuch as are feueriſh with water.

† Our Author in the firſt place formerly gaue the figure of *Tabern* his *Lagopodium flore albo*, being only a variety of that plant you ſhall hereafter finde described by the name of *Anthyllis leguminoſa*; now he made the deſcription ſomewhat in the leaues to agree with the figure, though nothing almoſt with the truth of that he intended to deſcribe, for (as it is euident by the names) he intended to deſcribe both the firſt and ſecond (which are here now deſcribed) in the firſt place, ſo, being confounded them both together in the names.

Chap. 498. *Of Water Trefoile, or Bucks Beanes.*

Trifolium paludoſum.
Marſh Trefoile.

¶ *The Deſcripton.*

1 THe great Marſh Trefoile hath thicke fat ſtalkes, weake and tender, full of a ſpungious pith, very ſmooth, and of a cubit long: wheron do grow leaues like to thoſe of the garden Beane, ſet vpon the ſtalkes three joyned together like the other Trefoiles, ſmooth, ſhining, and of a deepe greene colour: among which toward the top of the ſtalkes ſtandeth a buſh of feather-like floures of a white colour, daſht ouer ſlightly with a waſh of light carnation: after which the ſeed followeth, contained in ſmall buttons, or knobby husks, of a browne yellowiſh colour like vnto Millet, and of a bitter taſte: the roots creepe diuers waies in the mirie mariſh ground, being full of joynts, white within, and full of pores, and ſpungy, bringing forth diuers by-ſhoots, ſtalkes, and leaues, by which meanes it is eaſily increaſed, and largely multiplied.

2 The ſecond differeth not from the precedent, ſauing it is altogether leſſer, wherein conſiſteth the difference, if there be any: for doubtleſſe I think it is the ſelfe ſame in each reſpect, and is made greater and leſſer, according to his place of growing, clymate and countrey.

¶ *The Place.*

Theſe grow in Mariſh and Fenny places, and vpon boggie grounds almoſt euery where.

¶ *The Time.*

They floure and flouriſh from Iune to the end of Auguſt.

¶ *The Names.*

Mariſh Trefoile is called in high Dutch, **Biberklee**, that is to ſay *Caſtoris Trifolium*, or *Trifolium fibrinum*: in low Dutch, of the likeneſſe that the leaues haue with the garden Beanes, **Boczboonen**, that is to ſay, *Faſelus Hircinus*, or *Boona Hircina*: the later Herbariſts call it *Trifolium paluſtre*, and *Paludoſum*: of ſome, *Iſopyrum*: in Engliſh, marſh-Clauer, marſh-Trefoile, and Buckes-Beanes.

¶ *The Temperature and Vertues.*

A The ſeed of *Iſopyram*, ſaith *Dioſcorides*, if it be taken with meade or honied water, is good againſt the cough and paine in the cheſt.

B It is alſo a remedy for thoſe that haue weake liuers and ſpet bloud, for as *Galen* ſaith it cleanſeth and cutteth tough humors, hauing alſo adjoined with it an aſtringent or binding qualitie.

Chap.

Chap. 499. *Of sweet Trefoile, or garden Clauer.*

Trifolium odoratum.
Sweet Trefoile.

¶ *The Description.*

SWeet Trefoile hath an vpright stalk, hollow, and of the height of two cubits, diuiding it selfe into diuers branches: whereon do grow leaues by three and three like to the other Trefoiles, sleightly and superficiously nicked in the edges: from the bosom whereof come the floures, euery one standing on his owne single foot-stalk; consisting of little chaffie husks, of a light or pale blewish colour: after which come vp little heads or knops, in which lieth the seed, of a whitish yellow colour, and lesser than that of Fenugreeke: the root hath diuers strings: the whole plant is not onely of a whitish greene colour, but also of a sweet smell, and of a strong aromaticall or spicie sent, and more sweet when it is dried: which smel in the gathered and dried plant doth likewise continue long: and in moist and rainy weather, it smelleth more than in hot and dry weather: and also when it is yet fresh and greene it loseth and recouereth again his smell seuen times a day; whereupon the old wines in Germany do call it **Sieuen gezeiten kraut**, that is, the herbe that changeth seuen times a day.

¶ *The Place.*

It is sowne in Gardens not onely beyond the seas, but in diuers gardens in England.

¶ *The Time.*

It is sowne in May, it floureth in Iune and Iuly, and perfecteth his seed in the end of August, the same yeare it is sowne.

¶ *The Names.*

It is called commonly in Latine *Trifolium odoratum*: in high Dutch as we haue said **Sieuen gezeiten**: in low Dutch, **Seuenghetijcruijt**, that is to say, an herbe of seuen times: it is called in Spanish, *Trebol real*: in French, *Treffle oderiferant*: in English, Sweet Trefoile, and garden Clauer: it seemeth to be *Lotus Vrbana*, or *satiua*, of which *Dioscorides* writeth in his fourth book: nevertheless diuers Authors set downe Melilot, for *Lotus vrbana*, and *Trifolium odoratum*, but not properly. ‡ The Gardiners and herbewomen in Cheapside commonly call it, and know it by the name of Balsam, or garden Balsam. ‡

¶ *The Temperature.*

Galen saith, that sweet Trefoile doth in a meane concoct and dry, and is in a meane temperate facultie betweene hot and cold: the which faculties vndoubtedly are plainely perceiued in this sweet Trefoile.

¶ *The Vertues.*

The juyce pressed forth, saith *Dioscorides*, with hony added thereto, clenseth the vlcers of the eies, called in Latine *Argema*, and taketh away spots in the same, called *Albugines*; and remoueth such things as do hinder the sight. A

The oile wherein the floures are infused or steeped, doth perfectly cure greene wounds in very short space; it appeaseth the paine of the gout, and all other aches, and is highly commended against ruptures, and burstings in young children. B

The juyce giuen in white Wine cureth those that haue fallen from some high place, auoideth congealed and clotted bloud, and also helpeth those that do pisse bloud, by meanes of some great bruise, as was prooued lately vpon a boy in Fanchurch street, whom a cart went ouer, whereupon C

upon he did not onely piſſe bloud, but alſo it moſt wonderfully guſhed forth, both at his noſe and mouth.

D The dried herbe laid among garments keepeth them from Mothes and other vermine.

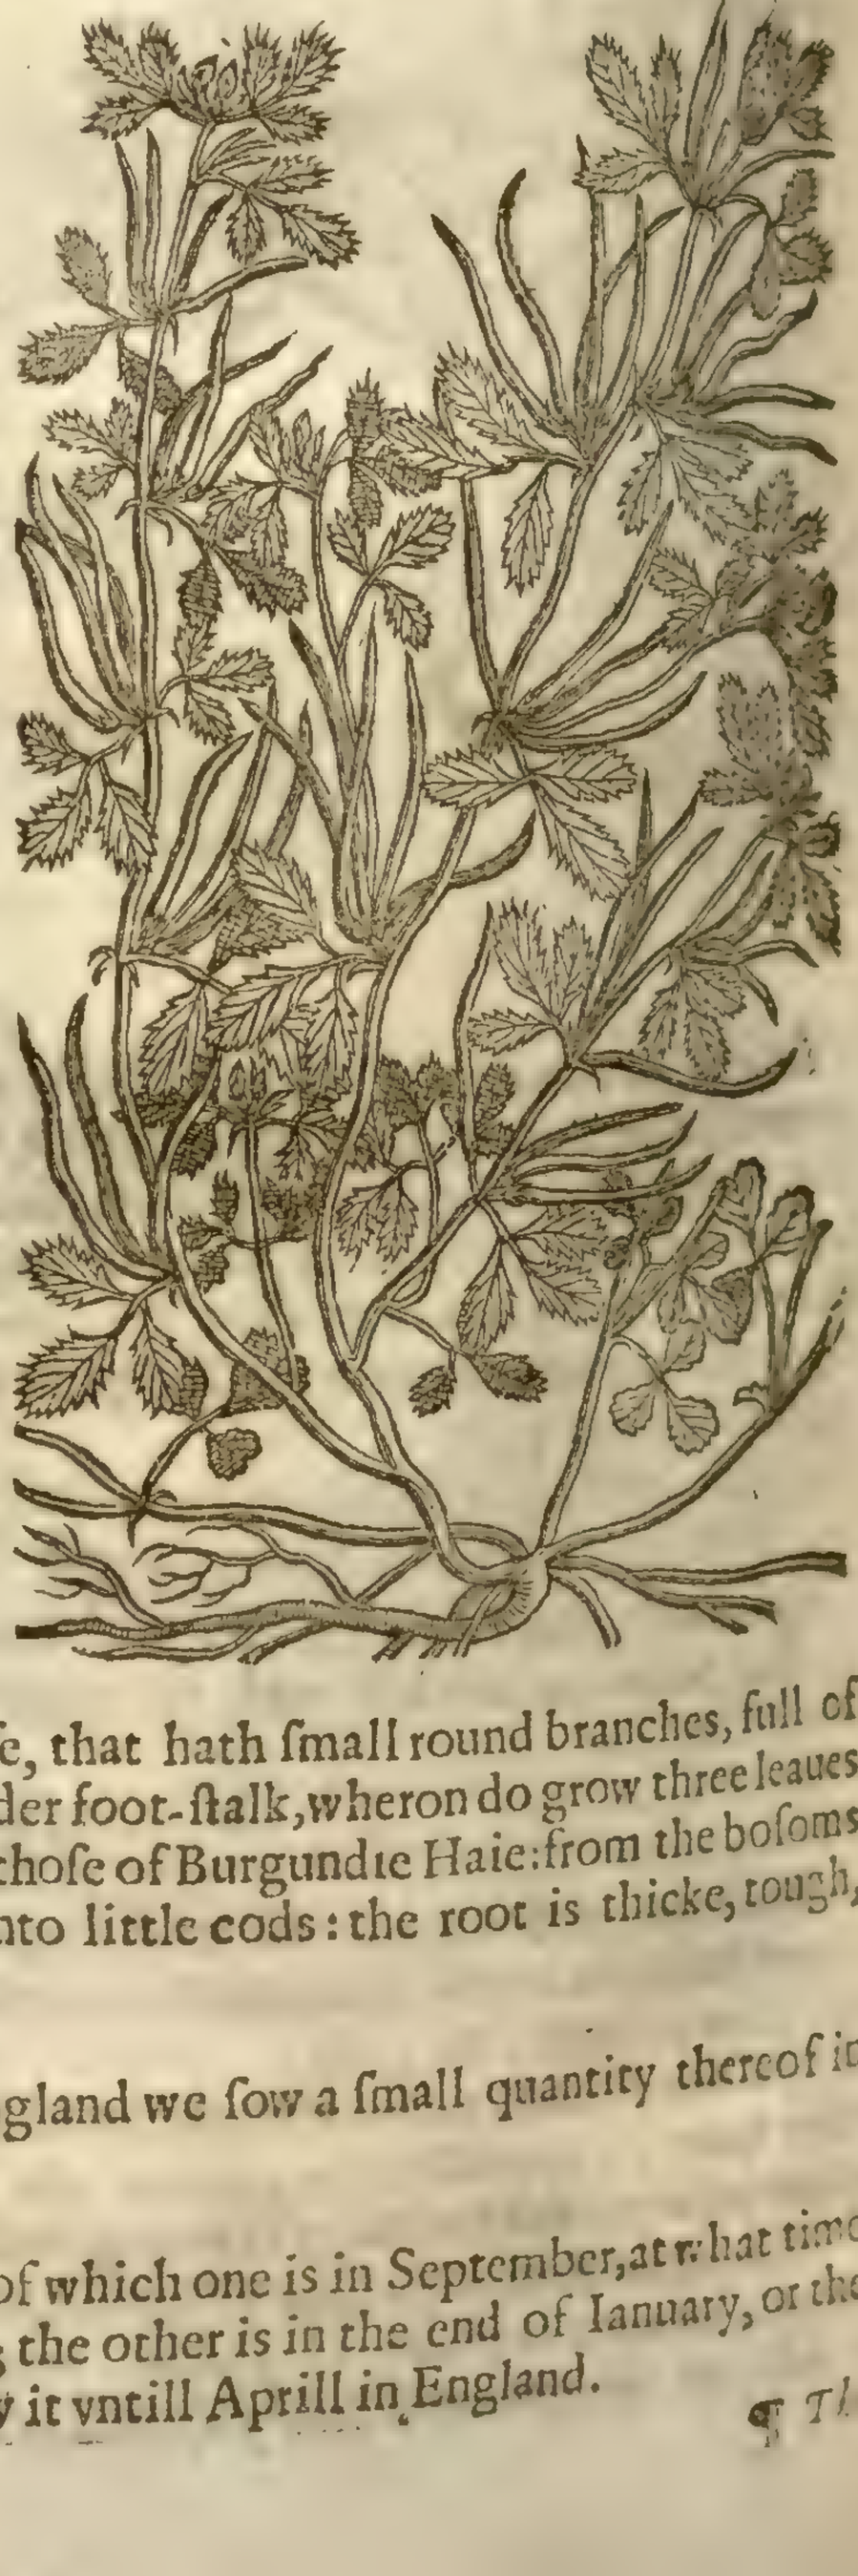
CHAP. 500. *Of Fenugreeke.*

¶ *The Deſcription.*

1 FEnugreeke hath a long ſlender trailing ſtalke, greene, hollow within, and diuided into diuers ſmall branches: whereon doe grow leaues like thoſe of the medow Trefoile, but rounder and leſſer, greene on the vpper ſide, on the lower ſide tending to an aſh colour: among which come ſmall white floures, after them likewiſe long ſlender narrow cods, in which do lie ſmall vneuen ſeeds, of a yellowiſh colour: which being dryed, haue a ſtrong ſmell, yet not vnpleaſant: the root is ſmall, and periſheth when it hath perfected his ſeed.

1 *Fœnumgræcum.*
Fenugreeke.

‡ 2 *Fœnumgræcum ſylueſtre.*
Wilde Fenugreeke.



2 There is a wilde kinde hereof ſeruing for little vſe, that hath ſmall round branches, full of knees or joynts: from each joynt proceedeth a ſmall tender foot-ſtalk, wheron do grow three leaues and no more, ſomewhat ſnipt about the edges, like vnto thoſe of Burgundie Haie: from the boſoms whereof come forth ſmall yellow floures, which turne into little cods: the root is thicke, tough, and pliant.

¶ *The Place.*

Fenugreeke is ſowne in fields beyond the ſeas: in England we ſow a ſmall quantity thereof in our gardens.

¶ *The Time.*

It hath two ſeaſons of ſowing, according to *Columella*, of which one is in September, at what time it is ſowne that it may ſerue for fodder againſt Winter; the other is in the end of Ianuary, or the beginning of February, notwithſtanding we may not ſow it vntill Aprill in England.

¶ *The*

¶ *The Names.*

It is called in Greeke, τῆλις, or as it is found in *Pliny* his copies *Carphos*: in Latine, *Fœnum Græcum*: *Columella* saith that it is called *Siliqua*: in *Pliny* we reade *Silicia*: in *Varro*, *Silicula*: in high Dutch, Bockshorne: in Italian, *Fiengreco*: in Spanish, *Alfornas*: in French, *Fenegrec*: and in English, Fenegreeke.

¶ *The Temperature and Vertues.*

It is thought according to *Galen* in his booke of the Faculties of nourishments, that it is one of A
those simples which do manifestly heat, and that men do vse it for food, as they do Lupines; for it is
taken with pickle to keep the body soluble; and for this purpose it is more agreeable than Lupines,
seeing it hath nothing in his owne proper substance, that may hinder the working.

The juyce of boyled Fenegreeke taken with hony is good to purge by the stoole all manner of B
corrupt humors that remaine in the guts, making soluble through his slimenesse, and mitigating
paine through his warmenesse.

and because it hath in it a clensing or scouring faculty, it raiseth humors out of the chest: but C
there must be added vnto it no great quantity of honie, least the biting quality should abound.

In old diseases of the chest without a feuer, fat dates are to be boyled with it, but when you haue D
mixed the same juyce pressed out with a great quantity of hony, and haue againe boiled it on a soft
fire to a meane thickenesse, then must you vse it long before meat.

In his booke of the Faculties of simple medicines, he saith, that Fenegreeke is hot in the second E
degree and dry in the first: therefore it doth kindle and make worse hot inflammations, but such as
are lesse hot and more hard are thereby cured by being wasted and consumed away.

The meale of Fenegreeke, as *Dioscorides* saith, is of force to mollifie and waste away: being boiled F
with mead and applied it taketh away inflammations, as well inward as outward.

The same being tempered or kneaded with niter and vineger, doth soften and waste away the G
hardnesse of the milt.

It is good for women that haue either imposthume, vlcer, or stopping of the matrix, to bathe and H
sit in the decoction thereof.

The juyce of the decoction pressed forth doth clense the haire, taketh away dandraffe, scoureth I
running sores of the head, called of the Græcians ἐχῶρες: being mingled with goose grease, and put vp
in manner of a pessary, or mother suppository, it doth open and mollifie all the parts about the
mother.

Greene Fenegreeke bruised and pounded with vineger, is a remedy for weake and feeble parts, K
and that are without skin, vlcerated and raw.

The decoction thereof is good against vlcers in the low gut, and foule stinking excrements of L
those that haue the bloudy flix.

The oile which is pressed out thereof scoureth haires and scars in the priuie parts. M

The decoction of Fenegreeke seed, made in wine, and drunke with a litttle vineger, expelleth all N
cuill humors in the stomacke and guts.

The seed boiled in wine with dates and hony, vnto the form of a syrrup, doth mundifie and clense O
the brest, and easeth the paines thereof.

The meale of Fenegreeke boiled in meade or honied water, consumeth and dissolueth all cold P
hard imposthumes and swellings, and being mixed with the roots of Marsh Mallowes and Linseed
effecteth the same.

It is very good for women that haue any griefe or swelling in the matrix, or other lower parts, if Q
they bathe those parts with the decoction thereof made in wine, or sit ouer it and sweat.

It is good to wash the head with the decoction of the seed, for it taketh away the scurfe, scales, R
nits, and all other such like imperfections.

Chap. 501. *Of Horned Clauer, and blacke Clauer.*

¶ *The Description.*

1 THe horned Clauer, or codded Trefoile, groweth vp with many weake and slender stalkes lying vpon the ground: about which are set white leaues, somewhat long, lesser and narrower than any of the other Trefoiles: the floures grow at the tops, of the fashion of those of Peason, of a shining yellow colour: after which come certaine straight cods, bigger than those of Fenegreeke, but blunter at their ends, in which are contained little round seed; the root is hard and wooddy and sendeth forth young springs euery yeare.

1 *Lotus trifolia corniculata.*
Horned or codden Caler.

2 *Lotus quadrifolia.*
Foure leafed graſſe.

2 This kinde of three leafed graſſe, or rather foure leafed Trefoile, hath leaues like vnto the common Trefoile, ſauing that they bee leſſer, and of a browne purpliſh colour, known by the name of Purple-wort, or Purple-graſſe; whoſe floures are in ſhape like the medow Trefoile, but of a duſty ouerworne colour tending to whiteneſſe; the which doth oftentimes degenerate, ſometime into three leaues, ſometimes in fiue, and alſo into ſeuen, and yet the plant of his nature hath but foure leaues & no more. ‡ I do not thinke this to be the purple leaued Trefoile with the white floure, which is commonly called Purple-graſſe, for I could neuer obſerue it to haue more leaues than three vpon a ſtalke. ‡

‡ 3 The root of this is ſmall and white, from which ariſe many weake hairy branches ſome cubit long: wheron grow ſoft hairy leaues three on one foot-ſtalke, with two little leaues at the root therof, & out of the boſoms of theſe vpon like foot-ſtalkes grow three leſſer leaues, as alſo floures of the bigues and ſhape of thoſe of a Vetch, but of a braue deep crimſon veluet colour: after theſe are paſt come cods ſet with foure thinne welts or skins which make them ſeem foure ſquare; whence *Camerarius* called it *Lotus pulcherrima tetragonolobus*: the ſeed is of an aſh colour, ſomewhat leſſe then a peaſe. It floures moſt of the Summer moneths, and is for the prettineſſe of the floure preſerued in many Gardens by yearely ſowing the ſeed, for it is an annuall plant. *Cluſius* hath it by the name of *Lotus ſiliquoſus rubello flore*: and hee ſaith the ſeeds were diuers times ſent out of Italy by the name of *Sandalida*. It is alſo commonly called in Latine *Piſum quadratum*. ‡

¶ *The Place.*

The firſt groweth wilde in barren ditch bankes, paſtures, and dry Mountaines.

‡ 3 *Lotus ſiliqua quadrata.* Square crimſon veluet peaſe.

The

The second groweth likewise in pastures and fields, but not so common as the other; and it is planted in gardens.

¶ *The Time.*

They floure in July and August.

¶ *The Names.*

The second is called *Lotus Trifolia*: in English, horned Clauer, or codded Trefoile.
The other is called *Lotus quadrifolia*, or foure leafed Grasse, or Purple-wort: of *Pena* and *Lobel*, *Quadrifolium phæum fuscum horterum.*

¶ *The Temperature and Vertues.*

Their faculties in working are referred vnto the medow Trefoiles: notwithstanding it is reported, that the leaues of Purple-wort stamped, and the juyce giuen to drinke, cureth young children of the disease called in English the Purples. A

Chap. 502. *Of Medicke Fodder, or Snaile Clauer.*

¶ *The Description.*

1 THis kinde of Trefoile, called *Medica*, hath many small and slender ramping branches, crawling and creeping along vpon the ground, set full of broad leaues slightly indented about the edges: the flours are very small, and of a pale yellow colour, which turne into round wrinkled knobs, like the water Snaile, or the fish called Periwinckle: wherein is contained flat seed fashioned like a little kidney, in colour yellow, in taste like a Vetch or pease: the root is small, and dieth when the seed is ripe: it growes in my garden, and is good to feed cattell fat.

1 *Trefolium Cochleatum.*
Medicke Fodder.

‡ 2 *Medica fructu cochleato spinoso.*
Prickly Snaile Trefoile.

‡ There are many varieties of these plants, and they chiefely consist in the fruit; for some are smooth and flat, as this first described: other some are rough and prickly, some with lesser, and other-

otherſome with bigger prickles; as alſo with them ſtanding diuers waies, ſome are onely rough, and of thoſe, ſome are as big as a ſmall nut, otherſome no bigger then a peaſe. I giue you here the deſcriptions of three rough ones (as I receiued them from Mr. *Goodyer*) whereof the laſt is of the ſea, which, as you may ſee, our Author did but ſuperficially deſcribe.

2 *Medicæ majoris Bæticæ ſpecies prima, ſpinulis intortis.*

This hath foure ſquare reddiſh ſtreaked hairy trailing branches, like the ſmall Engliſh *Medica*, greater and longer, foure or fiue foot long: the leaues are alſo ſmooth, growing three together, neither ſharpe pointed, nor yet ſo broad at the top as the ſaid Engliſh Medica, but blunt topped, with a ſmall blacke ſpot in the midſt, not crooked: the floures are alſo yellow, three, foure, or fiue on a foot-ſtalke: after commeth a round writhed fruit fully as big as a haſell nut, with ſmall prickles not ſtanding fore-right, but lying flat on the fruit, finely wrapped, plaited, folded, or interlaced together, wherein lieth wrapped the ſeed in faſhion of a kidney, very like a kidney beane, but foure times ſmaller, and flatter, of a ſhining blacke colour without, like poliſhed leat; containing a white kernell within: the root is like the former, and periſheth alſo at Winter.

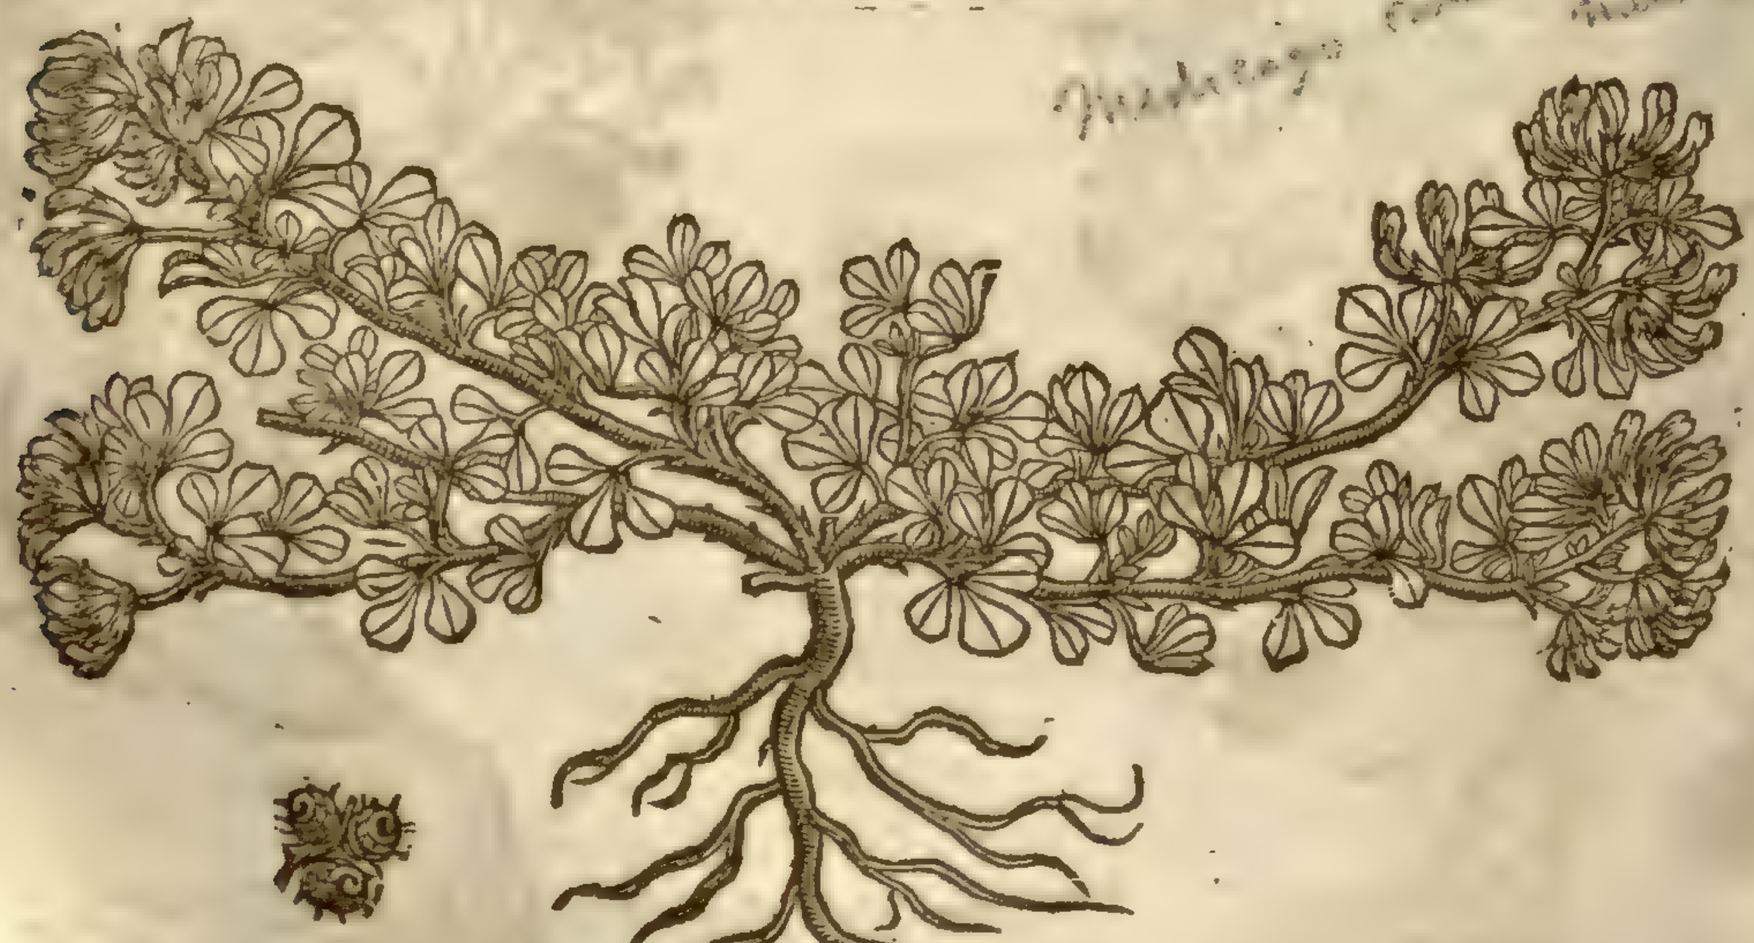
Medicæ majoris Bæticæ ſpinoſæ ſpecies altera.

The branches alſo creepe on the ground, and are ſtraked, ſmooth, foure-ſquare, reddiſh here and there, three or foure foot long: the leaues are ſmooth, finely notched about the edges, ſharpe pointed, without blacke ſpots, very like *Medica pericarpio plana:* the floures are ſmall and yellow like the other: the fruit is round, writhed or twined in alſo, fully as big as a haſell nut, ſomewhat cottonie or woolly, with ſhort ſharpe prickles: wherein lyeth alſo wrapped a ſhining blacke kidney-like ſeed, ſo like the laſt deſcribed, that they are not to be diſcerned apart: the root is alſo alike, and periſheth at Winter.

Medicæ marinæ ſpinoſæ ſpecies.

The branches of this are the leaſt and ſhorteſt of all the reſt, little exceeding a foot or two in length, and are foure ſquare, greene, ſomewhat hairy, and trailing on the ground: the leaues are like to thoſe of *Medica pericarpio plano*, not fully ſo ſharpe pointed, without blacke ſpots, ſoft, hairy, three on a foot-ſtalke: the floures grow along ſt the branches, on very ſmall foot-ſtalkes, forth of the boſomes of the leaues, (not altogether on or neere the tops of the branches) and are very ſmall and yellow, but one on a foot-ſtalke: after commeth ſmall round writhed fruit, no bigger than a peaſe, with very ſhort ſharpe prickles, wherein is contained yellowiſh ſeed of the faſhion of a kidney like the former, and is the hardeſt to be plucked forth of any of the reſt: the root is alſo whitiſh like the roots of the other, and alſo periſheth at Winter. Aug. 2. 1621. *Iohn Goodyer.* ‡

3 *Trifolium Cochleatum marinum.*
Medick Fodder of the ſea.



3 This kinde alſo of Trefoile, (call *Medica marina:* in Engliſh, ſea Trefoile, growing naturally by the ſea ſide about Weſtcheſter, and vpon the Mediterranean ſea coaſt, and about Venice) hath leaues very like vnto the common medow Trefoile, but thicker, and couered ouer with a flockie

flockie hoarinesse like *Gnaphalium*, after the manner of most of the sea herbes: the flowres are yellow: the seeds wrinkled like the former, but in quantitie they be lesser.

¶ *The Place.*

The first is sowne in the fields of Germany, Italy, and other countries, to feed their cattell, as we in England doe Bucke-wheat: wee haue a small quantity thereof in our Gardens, for pleasures sake.

The third groweth neere vnto the sea side in diuers places.

¶ *The Time.*

Medica must be sowne in Aprill; it floureth in Iune and Iuly: the fruit is ripe in the end of August.

¶ *The Names.*

Medick fodder is called of some *Trifolium Cochleatum*, and *Medica*: in French, *L'herbe à Limasson*: in Greeke, Μηδικὴ: in Spanish, *Mielgnas*: of the Valentians and Catalons, *Alfafa*, by a word either barbarous or Arabicke: for the chiefe of the Arabian writers, *Auicen*, doth call *Medica*, *Cot*, *Alascleti*, and *Alfasfasa*.

The other is called Sea Clauer, and Medick fodder of the sea.

¶ *The Temperature and Vertues.*

Medick Fodder is of temperature cold, for which cause it is applied greene to such inflammations and infirmities as haue need of cooling. A

Chap. 503. *Of Wood Sorrell, or Stubwort.*

1 *Oxys alba.*
White Wood Sorrell.

¶ *The Description.*

1 *Oxys Plinians*, or *Trifolium acetosum*, being a kinde of three leafed grasse, is a low and base herbe without stalke; the leaues immediately rising from the root vpon short stemmes at their first comming forth folded together, but afterward they do spred abroad, and are of a faire light greene colour, in number three, like the rest of the Tresoiles; but that each leafe, hath a deep cleft or rift in the middle: among these leaues come vp small and weake tender stems, such as the leaues do grow vpon, which beare small starre-like floures of a white colour, with some brightnes of carnation dasht ouer the same: the floure consisteth of fiue small leaues; after which come little round knaps or huskes full of yellowish seed: the root is very threddy, and of a reddish colour: the whole herbe is in taste like Sorrell, but much sharper and quicker, and maketh better greene sauce than any other herbe or Sorrell whatsoeuer.

‡ My oftmentioned friend Mr. *George Bowles* sent me some plants of this with very faire redde floures, which hee gathered in Aprill last, in a wood of Sir *Thomas Walsingham* at Chisselhurst in Kent, called Stockwell wood, and in a little round wood thereto adjoyning. ‡

The second kinde of *Oxys* or Wood Sorrell is very like the former, sauing that the floures are of

2 *Oxys lutea.*
Yellow Wood Sollell.

of a yellow colour, and yeeld for their ſeed veſſels ſmall and long horned cods; in other reſpects alike.

¶ *The Place.*

Theſe plants grow in woods and vnder buſhes, in ſandie and ſhadowie places in euery countrey.
‡ I haue not as yet found any of the yellow growing with vs. ‡

¶ *The Time.*

They floure from the beginning of Aprill vnto the end of May and midſt of Iune.

¶ *The Names.*

Wood Sorrell or Cuckow Sorrell is called in Latine *Trifolium acetoſum:* the Apothecaries and Herbariſts call it *Alleluya*, and *Panis Cuculi*, or Cuckowes meate, becauſe either the Cuckow feedeth thereon or by reaſon when it ſpringeth forth and floureth the Cuckow ſingeth moſt, at which time alſo *Alleluya* was wont to be ſung in Churches. *Hieronymus Fracaſtorius* nameth it *Lujula. Alexander Benedictus* ſaith that it is called *Alimonia:* in high Dutch, **Saurelklee:** in low Dutch, **Coockoocxbzoot:** in French, *Pain de Coeu:* in Engliſh, wood Sorrell, wood Sower, Sower Trefoile, Stubwort, Alleluia, and Sorrell du Bois.

It is thought to be that which *Pliny, lib.* 27. *cap.* 12. calleth *Oxys*; writing thus: *Oxys* is three leafed, it is good for a feeble ſtomack, and is alſo eaten of thoſe that are burſten. But *Galen* in his fourth booke of Simples ſaith, that *Oxys* is the ſame which *Oxalis* or Sorrell is: and *Oxys* is found in *Pliny* to be alſo *Iunci ſpecies*, or a kinde of Ruſh.

¶ *The Temperature.*

Theſe herbes are cold and dry like Sorrell.

¶ *The Vertues.*

A Sorrell du Bois or Wood Sorrell ſtamped and vſed for greene ſauce, is good for them that haue ſicke and feeble ſtomackes; for it ſtrengthneth the ſtomacke, procureth appetite, and of all Sorrell ſauces is the beſt, not onely in vertue, but alſo in the pleaſantneſſe of his taſte.

B It is a remedy againſt putrified and ſtinking vlcers of the mouth, it quencheth thirſt, and coocleth mightily any hot peſtilentiall feuer, eſpecially being made with a ſyrrup of ſugar.

Chap. 504. *Of noble Liuer-wort, or golden Trefoile.*

¶ *The Deſcription.*

1 Noble Liuerwort hath many leaues ſpred vpon the ground, three cornered, reſembling the three leafed graſſe, of a perfect graſſe greene colour on the vpper ſide, but grayiſh vnderneath: among which riſe vp diuers ſmall tenderfoot-ſtalks of three inches long, on the ends whereof ſtands one ſmall ſingle blew floure, conſiſting of ſix little leaues, hauing in the middle a few white chiues: the ſeed is incloſed in little round knaps, of a whitiſh colour; which being ripe do ſtart forth of themſelues: the root is ſlender, compoſed of an infinite number of blacke ſtrings.

2 The ſecond is like vnto the precedent in leaues, roots, and ſeeds: the floures hereof are of a ſhining red colour, wherein conſiſteth the difference.

3 This

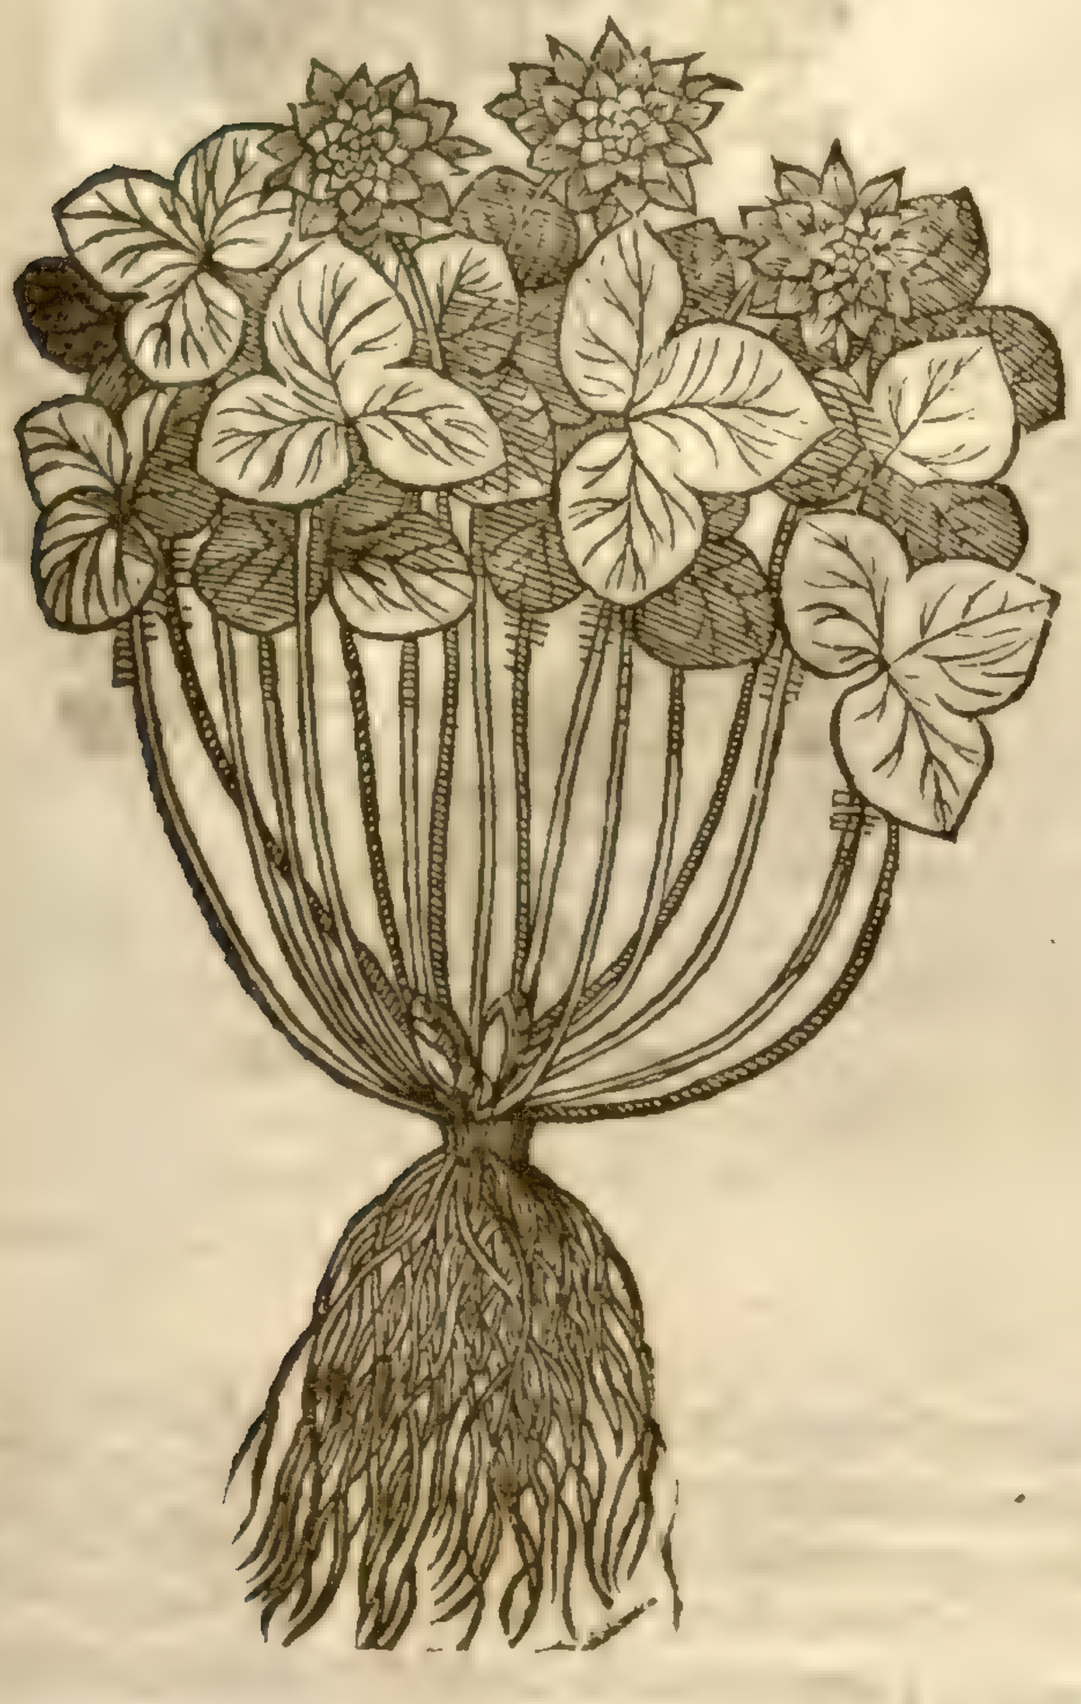
This strange three leaued Liuerwort differeth not from the former, sauing that this brings forth double blew floures tending to purple, and the other not so.

There is another in my garden with white floures, which in stalkes and euery other respect is like the others.

1 *Hepaticum trifolium.*
Noble Liuerwort.

2 *Hepatica trifolia rubra.*
Noble red Liuerwort.

3 *Hepatica multiflora Lobelij.*
Noble Liuerwort with double floures.



¶ *The Place.*

These pretty floures are found in most places of Germanic in shadowie woods among shrubs, and also by high-waies sides: in Italy likewise, and that not only with the blew floures, but the same with double floures also, by the report of *Alfonsus Pancius* Dr. of Physick in the Vniuersity of Ferrara, a man excellently well seen in the knowledge of Simples. They do all grow likewise in my garden, except that with double floures, which is as yet a stranger in England: ‡ It is now plentifull in many gardens. ‡

¶ *The Time.*

They floure in March and April, and perfect their seed in May.

¶ *The Names.*

Noble Liuerwort is called *Hepatica trifolia, Hepatica aurea, Trifolium aureum:* of *Baptista Sardus, Herba Trinitatis:* in high Dutch, **Edel Leber kraut:** in low Dutch, **Edel leuer cruijt:** in French, *Hepatique:* in English, Golden Trefoile, three leaued Liuerwort, noble Liuerwort, and herbe Trinitie.

¶ *The Temperature.*

These herbes are cold and dry, with an astringent or binding quality.

¶ *The*

¶ *The Time.*

Theſe herbes do floure in Iuly and Auguſt.

¶ *The Names.*

Plaiſter Clauer is called by the generall name, *Melilotus*, of ſome, *Trifolium odoratum*; yet there is another ſweet Treſoile, as hath beene declared. Some call it *Trifolium Equinum*, and *Caballinum*, or Horſe-Treſoile, by reaſon it is good fodder for horſes, who do greedily feed thereon: likewiſe *Trifolium Vrſinum*, or Beares Treſoile: of *Fuchſius*, *Saxifraga lutea*, and *Sertula Campana*: of *Cato*, *Serta Campana*, which moſt doe name *Corona Regia*: in high Dutch **Groote Steenclaueren**: of the Romanes and Hetrurians, *Tribolo*, as *Matthiolus* writeth: in Engliſh, Melilot, and Plaiſter-Clauer: in Yorkeſhire, Harts-Clauer.

¶ *The Temperature.*

Melilote, ſaith *Galen*, hath more plenty of hot ſubſtance then cold (that is to ſay, hot and dry in the firſt degree) it hath alſo a certaine binding quality, beſides a waſting and ripening faculty. *Dioſcorides* ſheweth, that Melilot is of a binding and mollifying quality, but the mollifying quality is not proper vnto it, but in as much as it waſteth away, and digeſteth humors gathered in hot ſwellings, or otherwiſe: for ſo far doth it mollifie or ſupple that thing which is hard, which is not properly called mollifying, but digeſting and waſting away by vapors: which kind of quality the Grecians call διαφορητικὴ.

¶ *The Vertues.*

A Melilote boiled in ſweet wine vntill it be ſoft, if you adde thereto the yolke of a roſted egge, the meale of Fenugreeke and Lineſeed, the roots of Marſh Mallows and hogs greaſe ſtamped together, and vſed as a pultis or cataplaſme, plaiſterwiſe, doth aſſwage and ſoften all manner of ſwellings, eſpecially about the matrix, fundament and genetoires, being applied vnto thoſe places hot.

B With the juyce hereof, oile, wax, roſin and turpentine, is made a moſt ſoueraigne healing and drawing emplaiſter, called Melilote plaiſter, retaining both the colour and ſauour of the herbe, being artificially made by a skilfull Surgion.

C The herbe boyled in wine and drunke prouoketh vrine, breaketh the ſtone, and aſſwageth the paine of the kidnies, bladder and belly, and ripeneth flegme, and cauſeth it to be eaſily caſt forth.

D The juyce thereof dropped into the eies cleereth the ſight, conſumeth, diſſolueth, and cleane taketh away the web, pearle, and ſpot in the eies.

E Melilote alone with water healeth *Recentes melicerides*, a kinde of wens or rather apoſtems containing matter like hony; and alſo the running vlcers of the head, if it be laied to with chalke, wine and galls.

F It likewiſe mitigateth the paine of the eares, if the juyce be dropped therein mixed with a little wine, and taketh away the paine of the head, which the Greekes call κεφαλαλγίαν, eſpecially if the head be bathed therewith, and a little vineger and oyle of Roſes mixed amongſt it.

‡ Chap. 506. *Of certaine other Trefoiles.*

‡ THoſe Trefoiles being omitted by our Author, I haue thought good to put into a chapter by themſelues, though they haue little affinity one with another, the two laſt excepted.

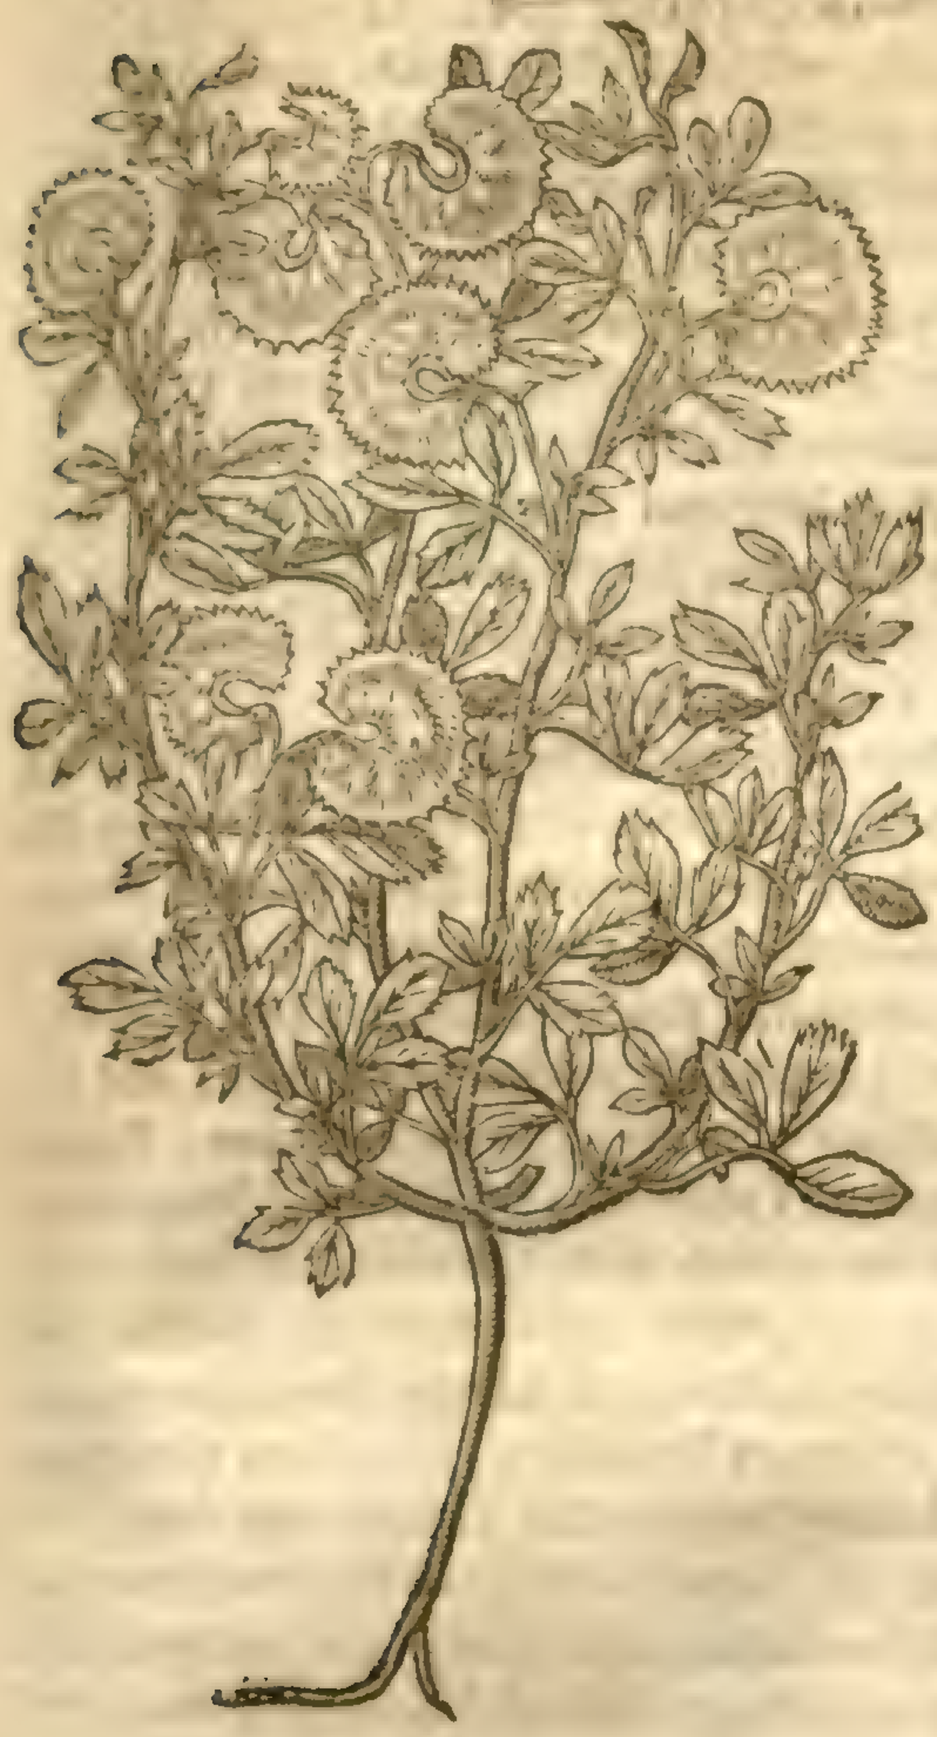
¶ *The Deſcription.*

1 THe firſt of thoſe in roots, ſtalkes, and manner of growing is like the Medicke or ſnaile Trefoiles formerly deſcribed: the leaues are hairy: the floures yellow and ſmall: after which follow crooked flat cods, of an indifferent bredth, wherein is contained ſeeds made after the faſhion of little Kidneyes; this the Italians, according to *Lobel*, call *Lunaria radiata*; in the *Hiſt. Lugd.* it is called *Medica ſyl. altera lunata.*

2 The root of this is long and thicke, couered with a yellowiſh rinde, and hauing a white ſweet pith in the inſide, couered with a hairineſſe on the top, and ſending forth ſundry fibres: from this riſe vp many weake long foot-ſtalkes, whereon grow leaues ſet together by threes, long, narrow, ſmooth, lightly nickt on the edges: amongſt theſe riſeth vp commonly one ſtalke (yet ſometimes two) ſmooth and naked, three or foure inches long; on the top thereof grow ſpike faſhion, eight or ten pretty large light purple floures, each of them being ſet in a cup diuided into fiue parts. This growes vpon diuers parts of the Alps: and *Pona* in his *Mons Baldus* ſet it forth by the name of *Trifolium angaſtifolium Alpinum*. *Bauhinus* ſaith, the root hereof taſts like liquorice, wherefore it may be called *Glycyrrhiza Aſtragaloides*, or *Aſtragalus dulcis*: and he receiued it out of Spaine by the name of *Glycyrrhiza*. He calls it in his *Prodromus*, *Trifolium Alpinum flore magno radice dulci.*

The

‡ 1 *Trifolium siliqua lunata.*
Moone Trefoile.



‡ 2 *Trifol. angustifol. Alpinum.*
Liquorice Trefoile.

‡ 3 *Trifolium spinosum Creticum.*
Prickly Trefoile.

3 This thorny Trefoile hath a long threddy root, from which arise many short branched stalks some two handfuls high, cornered, and spred vpon the ground: the joints which are many, are commonly red, & armed with foure sharp prickles, and out of each of them vpon short foot-stalks grow two trifoile leaues, green, longish, and ending in a little prickle: out of these joints also grow little foot-stalks which carry single floures made of fiue little leaues of the shape and colour of the little Blew-bell floure, with ten chives in the middle tipt with yellow: after these follow fiue cornered sharp pointed heads, containing a single flat red seed in each corner. *Clusius* set forth this by the name of *Trifolium spinosum Creticum*: the seed was sent out of Candy by the name of ὀνοσμος: He questions whether it may not be the true *Tribulus terrestris* of *Dioscorides*.

4 The roots, stalkes, and leaues of this pretty Trefoile doe not much differ from the common white

‡ 4 *Trifolium fragiferum.*
Straw-berry Trefoile.

white Trefoil,but there is ſome difference in the floures and ſeed; for the floures of this are ſmal, grow thicke together,and are of a whitiſh bluſh colour: after which follow heads made of little bladders or thin skins,after ſuch a maner as they reſemble a Straw-berry or Raſpas,and they are of a grayiſh colour here and there marked with red: the ſtalks ſeldom grow aboue three inches high. It growes in moſt ſalt mariſhes, as in Dartford ſalt mariſh: in thoſe below Purfleet,and the like. It floures in Iuly and Auguſt. *Cluſius* hath ſet it forth by the name of *Trifolium fragiferum Friſcum*: ſome had rather cal it *Trifolium veſicarium*, Bladder Trefoile.

5 There are two other Trefoiles with which I thinke good to acquaint you, and thoſe by the ſimilitude of the cups which contain the floures, and become the ſeed-veſſels, may be fitly called *Stellata*; and thus *Bauhine* calls the firſt *Trifolium ſtellatum*: whereto for diſtinctions ſake I add *hirſutum*, calling it *Trifol. ſtellatum hirſutum*, Rough ſtarry headed Trefoile: it hath a ſmal long white root, from which ariſe ſtalkes ſome foot high, round, ſlender, hairy, and reddiſh, hauing few leaues or branches: the leaues ſtand three on a ſtalke, as in other Trefoiles, ſmooth on the vpper ſide,and hairy below: the floures are ſmall and red, like in ſhape to thoſe of the common red Trefoile,but leſſer; and they ſtand each of them in a cup,reddiſh,and rough below,and on the vpper part cut into fiue long ſharp leaues ſtanding open as they commonly figure a ſtar: the floures fallen, theſe cups dilate themſelues, and haue in the middle a longiſh tranſverſe whitiſh ſpot. I ſaw this flouring in May in the garden of Mr *Tradeſcant*, who firſt brought plants hereof from Fermentera a ſmall Iſland in the Mediterranean ſea.

6 This other (which for any thing that I know is not figured nor deſcribed by any) hath ſtalks ſometimes a foot,otherwhiles little aboue an inch high,hairy,and diuided but into few branches: the leaues,which ſtand by threes,are faſtned to long foot-ſtalks,and they themſelues are ſomewhat longiſh,hauing no little ſharpe pointed leaues growing at the ſetting on of the foot-ſtalks to the ſtalks: they are green of colour,and not ſnipt about the edges: the heads that grow on the tops of the ſtalks are round,ſhort,and green,with ſmall purple or elſe whitiſh flours like thoſe of the common Trefoile,but leſſer,ſtanding in cups diuided into fiue parts, which when the flours are fallen, become ſomewhat bigger,harſher,and more prickly,but open not themſelues ſo much as thoſe of the former: the ſeed is like that of Millet,but ſomewhat rounder: this flours in Iune,and the ſeed is ripe in Iuly. I firſt obſerued it in Dartford ſalt mariſh, the tenth of Iune, 1633. I haue named this *Trifolium ſtellatum glabrum*, Smooth ſtarry headed Trefoile.

T. maritimum Sp. Holt. Sm. fl. 3. 303

¶ *The Temperature and Vertues.*

Theſe, eſpecially the three laſt, ſeeme to be of the ſame temper and vertue as the common Medow Trefoiles,but none of them are at this day vſed in phyſicke,or known, vnleſſe to ſome few. ‡

Chap. 507. *Of Pulſe.*

¶ *The Kindes.*

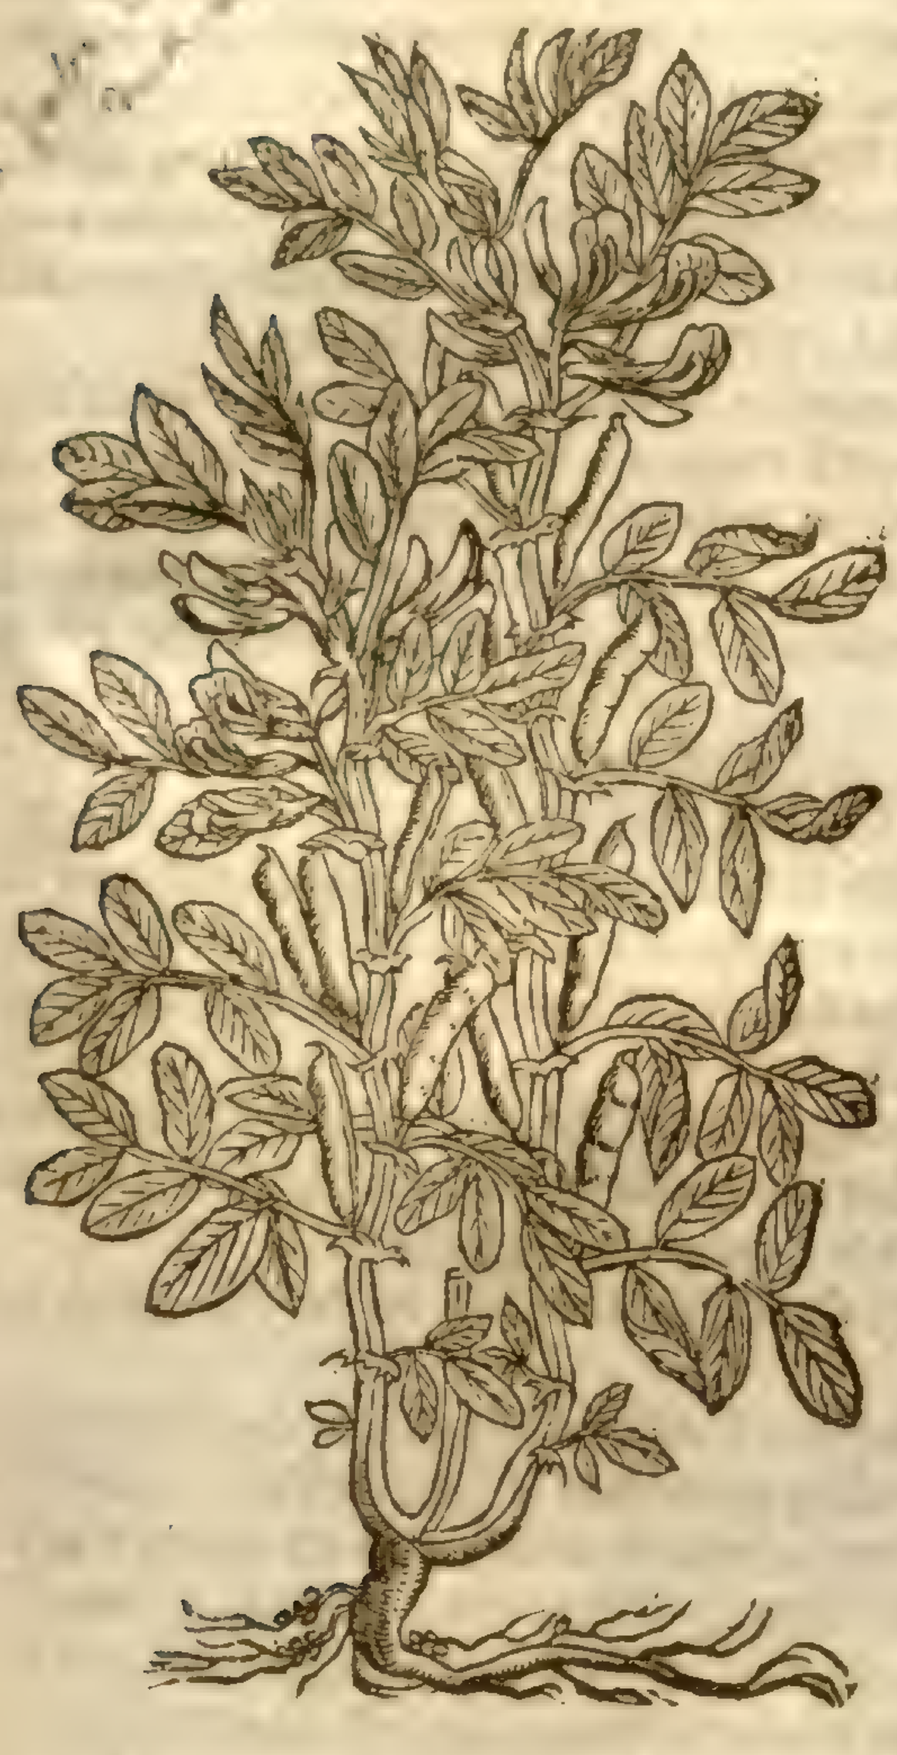
THere be diuers ſorts of Pulſe,as Beans,Peaſon,Tares, Chiches, and ſuch like, comprehended vnder this title Pulſe: and firſt of the great Bean or garden Bean.

¶ *The*

¶ *The Deſcription.*

1 THe great Beane riſeth vp with a foure ſquare ſtalke, ſmooth, hollow, without joynts, long and vpright, which when it is thicke ſowne hath no need of propping, but when it is ſowne alone by it ſelfe it ſoone falleth down to the ground: it bringeth forth long leaues one ſtanding from another, conſiſting of many growing vpon one rib or ſtem, euery one whereof is ſomewhat fat, ſet with veines, ſlippery more long than round. The floures are eared, in forme long, in colour either white with blacke ſpots, or of a blackiſh purple: after them come vp long cods, thicke, full of ſubſtance, ſlenderer below, frized on the inſide with a certaine white wooll as it were, or ſoft flockes; which before they be ripe are green, and afterwards being dry they are black and ſomewhat hard, as be alſo the cods of broome, yet they be longer than thoſe, and greater: in which are contained three, foure, or fiue Beans, ſeldome more, long, broad, flat, like almoſt to a mans naile, great, and oftentimes to the weight of halfe a dram; for the moſt part white, now and then of a red purpliſh colour; which in their vpper part haue a long blacke nauell as it were, which is couered with a naile, the colour whereof is a light greene: the skin of the fruit or beane is cloſely compacted, the inner part being dry is hard and ſound, and eaſily cleft in ſunder; and it hath on the one ſide an euident beginning of ſprouting, as haue alſo the little peaſe, great Peaſe, Ciches, and many other Pulſes. The roots hereof are long, and faſtned with many ſtrings.

1 *Faba major hortenſis.*
The great garden Beane.



2 *Faba ſylueſtris.*
The wilde Beane.

2 The ſecond kinde of Beane (which *Pena* ſetteth forth vnder the title of *Sylueſtris Græcorum Faba*, and *Dodonæus*, *Bona ſylueſtris*; which may be called in Engliſh, Greeke Beanes) hath ſquare hollow ſtalkes like the garden Beanes, but ſmaller. The leaues be alſo like the common Beane, ſauing that the ends of the rib whereon thoſe leaues doe grow haue at the very end ſmall tendrels or claſpers, ſuch as the Peaſe leaues haue. The floures are in faſhion like the former, but of a darke red colour: which being vaded, there ſucceed long cods which are blacke when they be ripe, within which is incloſed blacke ſeed as big as a Peaſe, of an vnpleaſant taſte and ſauour.

‡ 3 The common Beane in ſtalkes, leaues, floures, and cods is like the former great garden Beane, but leſſer in them all; yet the leaues are more, and grow thicker, and out of the boſomes of the leaues vpon little foot-ſtalks grow the floures, commonly ſix in number, vpon one ſtalke, which are ſucceeded by ſo many cods, leſſer and rounder than thoſe of the former: the Beanes themſelues are alſo leſſe, and not ſo flat, but rounder, and ſomewhat longiſh: their colour are either whitiſh, yellowiſh or elſe blacke. This is ſowne in moſt places of this kingdome, in corne fields, and knowne both to man and beaſt. I much wonder our Author forgot to mention ſo common and vulgarly knowne a Pulſe. It is the *Bona* or *Faſelus minor* of *Dodonæus*; and the *Faba minor* of *Pena* and *Lobel*. ‡

¶ *The Place.*

The firſt Beane is ſowne in fields and gardens euery where about London.

This blacke Beane is ſowne in a few mens Gardens who bee delighted in variety and ſtudy of herbes, whereof I haue great plenty in my garden.

¶ *The Time.*

They floure in Aprill and May, and that by parcels, and they be long in flouring: the fruit is ripe in Iuly and Auguſt.

¶ *The Names.*

The garden Beane is called in Latine *Faba*: in Engliſh, the garden Beane: the field Beane is of the ſame kinde and name, although the fertilitie of the ſoile hath amended and altered the fruit into a greater forme. ‡ The difference between the garden and the field Beane is a ſpecificke difference, and not an accidental one cauſed by the ſoile, as euery one that knoweth them may well perceiue. ‡

The blacke Beane, whoſe figure we haue ſet forth in the ſecond place, is called *Faba ſylueſtris*, of ſome thought to be the true Phyſicke Beane of the Antients; whereupon they haue named it *Faba Veterum*, and alſo *Faba Græcorum*, or the Greeke Beane. Some would haue the garden Beane to be the true *Phaſeolus*, or Kidney Beane; of which number *Dodonæus* is chiefe, who hath ſo wrangled and ruffled among his relatiues, that all his antecedents muſt be caſt out of dores: for his long and tedious tale of a tub wee haue thought meet to commit to obliuion. It is called in Greeke πύσος, whereupon the Athenians feaſt daies dedicated to *Apollo* were named πυανέψια, in which Beanes and Pulſes were ſodden: in Latine it is called *Faba freſa* or *fracta*, broken or bruiſed Beanes.

‡ *Dodonæus* knew well what he did, as any that are either iudicious or learned may ſee, if they looke into the firſt chapter of the ſecond booke of his fourth *Pemptas*. But our Authors words are too iniurious, eſpecially being without cauſe, and againſt him, from whom he borrowed all that was good in this his booke, except the figures of *Tabernamontanus*. It may be Dr. *Prieſt* did not fit his tranſlation in this place to our Authors capacitie; for *Dodonæus* did not affirme it to be the *Phaſeolus*, but *Phaſelus*, diſtinguiſhing betweene them. ‡

¶ *The Temperature and Vertues.*

A The Beane before it be ripe is cold and moiſt: being dry it hath power to bind and reſtraine, according to ſome Authors: further of the temperature and vertues of *Galen*.

B The Beane (as *Galen* ſaith in his booke of the Faculties of Nouriſhments) is windie meate, although it be neuer ſo much ſodden and dreſſed any way.

C Beanes haue not a cloſe and heauy ſubſtance, but a ſpongie and light, and this ſubſtance hath a ſcouring and clenſing faculty; for it is plainely ſeene, that the meale of Beanes clenſeth away the filth of the skin; by reaſon of which qualirie it paſſeth not ſlowly through the belly.

D And ſeeing the meale of Beanes is windie, the Beanes themſelues if they be boyled whole and eaten are yet much more windie.

E If they be parched they loſe their windineſſe, but they are harder of digeſtion, and doe ſlowly deſcend, and yeeld vnto the body thicke or groſſe nouriſhing juyce; but if they be eaten greene before they be ripe and dried, the ſame thing hapneth to them which is incident to all fruits that are eaten before they be fully ripe; that is to ſay, they giue vnto the body a moiſt kinde of nouriſhment, and therefore a nouriſhment more full of excrements, not onely in the inward parts, but alſo in the outward, and whole body through: therefore thoſe kindes of Beans do leſſe nouriſh, but they do more ſpeedily paſſe thorow the belly, as the ſaid Author in his booke of the Faculties of ſimple medicines ſaith, that the Beane is moderately cold and dry.

F The pulpe or meate thereof doth ſomewhat clenſe, the skin doth a little binde.

G Therefore diuers Phyſitians hath giuen the whole Beane boyled with vineger and ſalt to thoſe that were troubled with the bloudy flix, with laskes and vomitings.

H It raiſeth flegme out of the cheſt and lungs: being outwardly applied it dryeth without hurt the watery humors of the gout. We haue oftentimes vſed the ſame being boiled in water, and ſo mixed with ſwines greaſe.

We

We haue laid the meale thereof with Oxymel, or syrrup of vineger, both vpon bruised and wounded sinewes, and vpon the wounded parts of such as haue been bitten or stung, to take away the fiery heat. I

It also maketh a great plaister and pultis for mens stones and womens paps: for these parts when they are inflamed, haue need of moderate cooling, especially when the paps are inflamed through the cluttered and congealed milke contained in them. K

Also milke is dried vp with that pultis. L

The meale thereof (as *Dioscorides* further addeth) being tempered with the meale of Fenugreeke and hony, doth take away blacke and blew spots, which come by dry beatings, and wasteth away kernels vnder the eares. M

With Rose leaues, Frankincense, and the white of an egge, it keepeth backe the watering of the eies; the pin and the web, and hard swellings. N

Being tempered with wine it healeth suffusions, and stripes of the eies. O

The Beane being chewed without the skin, is applied to the forehead against rheumes and falling downe of humours. P

Being boyled in wine it taketh away the inflammation of the stones. Q

The skins of Beans applied to the place where the hairs were first plucked vp, wil not suffer them to grow big, but rather consumeth their nourishment. R

Being applied with Barly meale parched, and old oyle, they waste away the Kings euill. S

The decoction of them serueth to die woollen cloth withall. T

This Beane being diuided into two parts (the skin taken off) by which it was naturally joyned together, and applied, stancheth the bloud which doth too much issue forth after the biting of the horseleach, if the one halfe be laied vpon the place. V

The blacke Beane is not vsed with vs at all, seeing, as we haue said, it is rare, and sowne onely in a few mens gardens, who be delighted in variety and study of herbes. X

Chap. 508. *Of Kidney Beane.*

¶ *The Kindes.*

THe flocke or kindred of the Kidney Bean are wonderfully many; the difference especially consisteth in the colour of the fruit: there be other differences, wherof to write perticularly would greatly stuffe our Volume with superfluous matter, considering that the simplest is able to distinguish apart the white Kidney Beane from the blacke, the red from the purple, and likewise those of mixt colours from those that are only of one colour: as also great ones from the little ones. Wherefore it may please you to be content with the description of some few, and the figures of the rest, with their seuerall titles in Latine and English, referring their descriptions vnto a further consideration, which otherwise would be an endlesse labour, or at the least needlesse.

¶ *The Description.*

THe first kinde of *Phascolus* or garden Smilax hath long and small branches growing very high, taking hold with his clasping tendrels vpon poles and stickes, and whatsoeuer standeth neere vnto him, as doth the Hop or Vine, which are so weake and tender that without such props or supporters they are not able to sustaine themselues, but will run ramping on the ground fruitlesse: vpon the branches do grow broad leaues almost like Iuie, growing together by three, as in the common Trefoile or three leaued Grasse: among which come the floures, that do vary and differ in their colours, according to the soile where they grow, sometimes white, somtimes red, and oftentimes of a pale color: afterwards there come out long cods, whereof some are crooked, and some are straight, and in those the fruit is contained, smaller than the common Beane, somwhat flat, and fashioned like a Kidney, which are of diuers colours, like vnto the floures: whereto for the most part these are like.

2 There is also another *Dolichus* or Kidney Beane, lesser, shorter, and with small cods, whose floures and fruit are like in forme to the former Kidney Beanes, but much lesser, and of a blacke colour.

3 There is likewise another strange Kidney Beane, which doth also winde it selfe about poles and props neere adjoyning, that hath likewise three leaues hanging vpon one stem, as haue the other Kidney Beans, but euery one is much narrower and also blacker: the cods be shorter, plainer, and flatter, and containe fewer seeds.

1 *Phaſeolus albus.*
White Kidney Beane.

2. *Phaſeolus niger.*
Blacke Kidney Beane.

3 *Smilax hortenſis rubra.*
Red Kidney Beane.

4 *Smilex hortenſis flaua.*
Pale yellow kidney Beane.

‡ 5 *Phaseolus peregrinus fructu minore albo.*
Indian Kidney bean with a small white fruit.

‡ 6 *Phaseolus peregrinus fructu minore fruteſcens.*
Indian Kidney bean with a small red fruit.

‡ 7 *Phaseolus peregrinus angustifolius.*
Narrow leafed Kidney bean.

4 This Kidney bean differeth not from the others but only in the colour of the fruit, which are of a pale yellow colour, wherein consisteth the difference.

‡ Besides the varieties of these Kidny beans mentioned by our Author, there are diuers other reckoned vp by *Clusius*, which haue bin brought from the East and West Indies, and from some parts of Africa. I will only giue you the figures of two or three of them out of *Clusius*, with the colour of their floures and fruit.

5 The stalk of this is low and stif: the flours of a whitish yellow on the out side, and of a Violet colour within: the fruit is snow white, with a blacke spot in the eye. This is *Phaseolus peregrinus* 4 of *Clusius*.

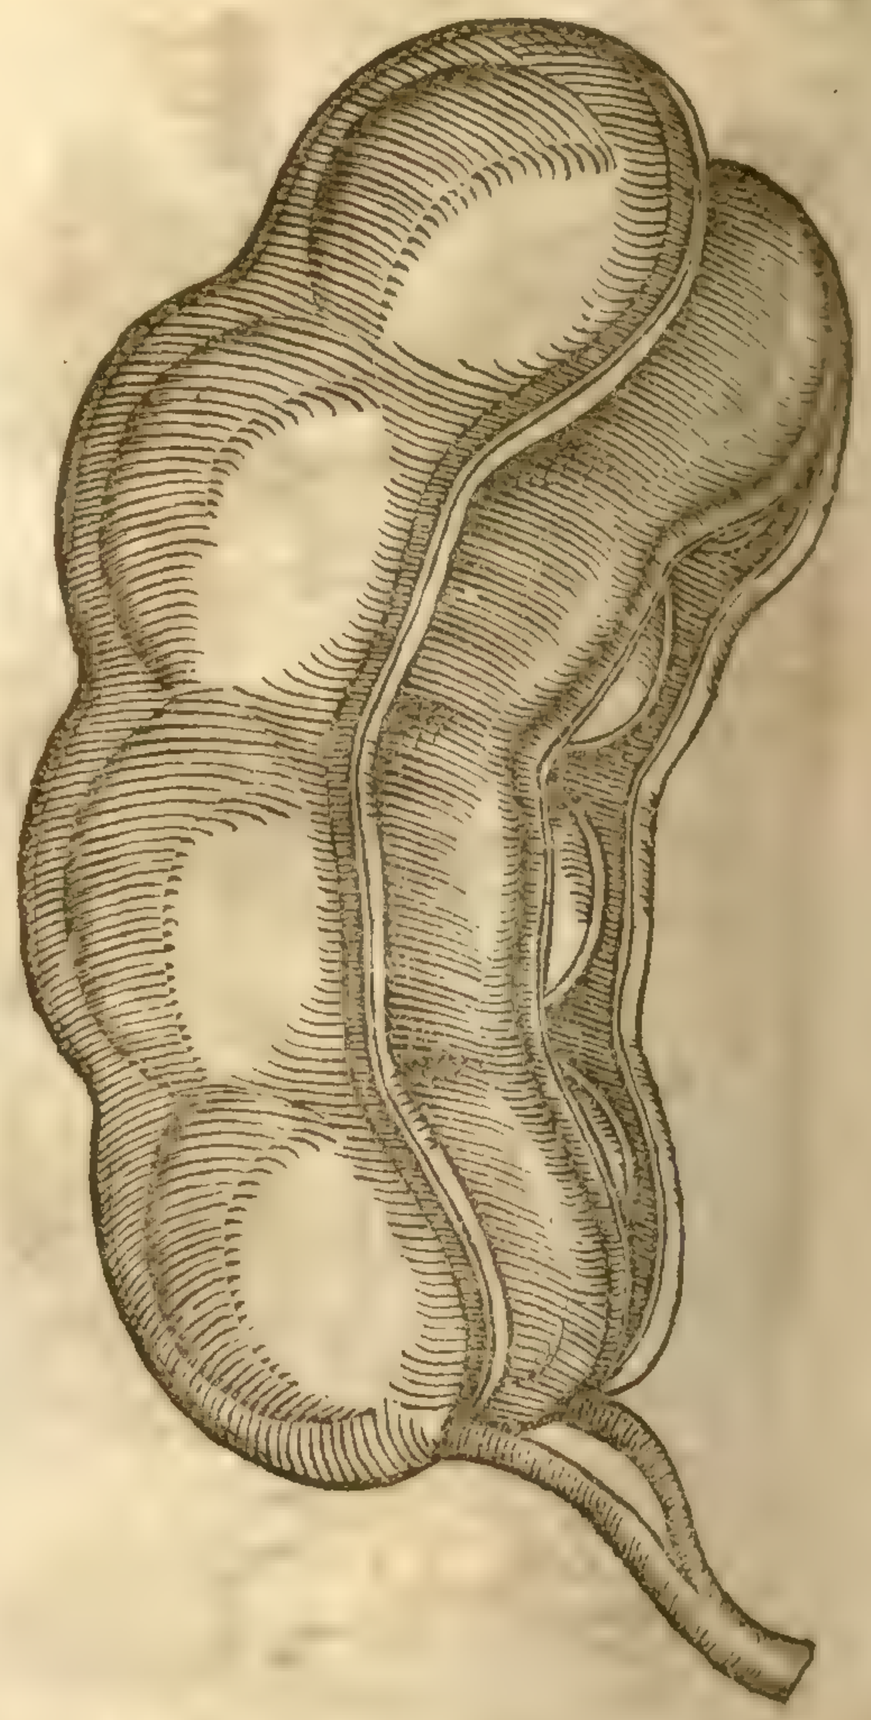
6 This hath leaues like the marsh Trefoile, flours growing many together, in shape & magnitude like those of common Pease: the coddes were narrow, and contained three or foure seeds which were smal, no bigger than the seeds of *Laburnum*; the painter expressed two of them in the leafe next vnder the vppermost tuft of flours: this is *Clusius* his *Phaseolus peregrinus* 5.

7 This groweth high, winding about poles or other supporters: the leaues are narrower than the former: the fruit lesser and flatter, of a reddish colour. This is the *Phaseolus peregrinus* 6 of *Clusius*.

8 This windes about poles, and growes to a great

8 *Phaseolus Brasilianus.*
Kidney Beane of Brasile.

8 *Phaseoli Brasiliani ad vivum.*
The Brasile Kidney Bean in his full bignes.



9 *Phaseolus Ægyptiacus.* The party coloured Beane of Egypt.

10 *Phaseoli Americi purgantes.*
Purging Kidney Beane of America.

Phaseoli magni lati albi.

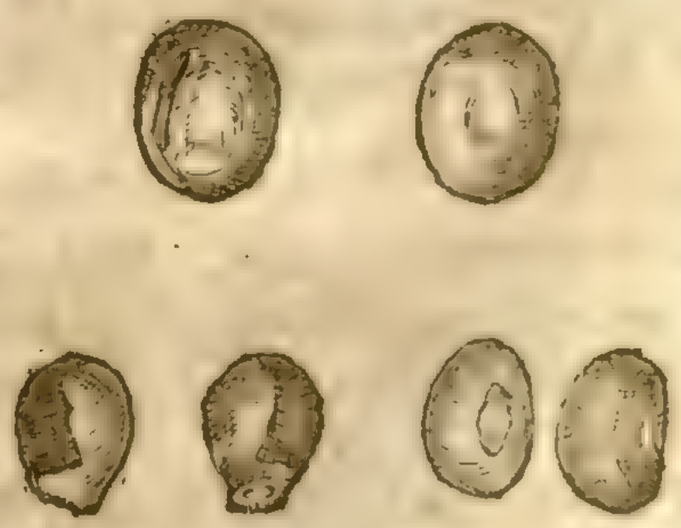
Phaseoli Brasiliani.

Phaseoli parui cx America delati.

Phaseoli parui pallido albi ex America delati.

Phaseoli rubri.

Phaseoli rubri Indiani durissimi.



great height, with soft hairy leaues and large cods, wherein are contained seeds of diuers colours; sometimes they are red, otherwhiles of a whitish ash colour, sometimes wholly blacke, and otherwhiles spotted.

9 The Egyptian Beane is somewhat like the other Kidney beanes in his growing: his fruit is of the bignesse of a small Hasell nut, blacke on one side, and of a golden yellow or Orenge colour on the other.

Besides these you finde here figured, and diuers others described by *Clusius*, I think it not amisse to mention two more. The first of these, which was procured by M^r. *Tradescant*, and growes in our Gardens, is a large plant, not differing in maner of growth from the former Indian Kidney Beanes, but his floures are large, many, and of an elegant Scarlet colour: whence it is vulgarly termed by our Florists, the Scarlet Beane. The other I haue seene grow to a little height, but it would not indure; but the cods of it which were brought to vs were some three inches long, and couered with a hairy downe of a reddish colour, which put vpon the hands or skin in any part of the body would sting like a Nettle, and this was called the Stinging Beane: I thinke it came from some part of the East-Indies.

¶ The

¶ *The Place.*

Kidney Beanes doe eaſily and ſoone ſpring vp, and grow into a very great length, being ſowne neere to long poles faſtned hard by them, or hard by arbors or banqueting places, otherwiſe they lie flat on the ground, ſlowly come vp, hardly bring forth fruit, and become faulty and ſmitted, as *Theophraſtus* writeth.

¶ *The Time.*

It is ſowne in the Spring, eſpecially in the midſt of April, but not before: the fruit is ripe about the end of Summer.

¶ *The Names.*

Hippocrates, *Diocles*, *Theophraſtus*, and moſt of the other old Writers do call it λόμχοι: diuers of the bigneſſe of the ſeed do name it λόβον and λόβιον: in Latine, *Siliqua*: *Dioſcorides* calleth it *Smilax*, becauſe it climeth vp as *Smilax* doth, and taketh hold of props, ſtaies, and ſhrubbes ſtanding neere vnto it: others name it φασίολον, a Diminitiue deriued from φάσηλος: for φάσηλος and φασίολος are not one and the ſelfe ſame pulſe called by diuers names, as ſome ſuppoſe, but ſundry fruits one differing from the other, as *Galen* in his firſt booke of the Faculties of Nouriſhments doth ſufficiently declare, where he intreateth of them both. For firſt he diſputeth of *Phaſeli* and *Ochri*, Beanes and Peaſe; then afterward others comming betweene, he writeth of *Dolichus*, which alſo is named *Phaſeolus*: and though hee may be thought to doubt what manner of pulſe that is which *Theophraſtus* calleth *Dolichus*: notwithſtanding he gathereth and concludeth that it is a fruit of a garden plant in Italy, and in Caria, growing in the fields, which is in forme longer than the Cichlings, and was commonly called in his time *Faſeolus*. Of his opinion is *Paulus Ægineta*, writing of *Phaſeolus*, which he nameth *Dolychus*, in the 79. chap. of his firſt booke. Moreouer, *Faſelus* was in times paſt a common pulſe in Italy and Rome, and *Dolichus* a ſtrange pulſe; for *Columella* and *Palladius*, writers of husbandry, haue made mention of the ſowing of *Phaſelus*: and *Virgil* calleth it *Vilis* in the firſt of his Georgicks: but concerning the ſowing of *Dolichus* or Kidney Beane, none of the Latines haue written, by reaſon that the ſame was rare in Italy, and ſowne onely in gardens, as *Galen* hath affirmed, naming it oftentimes a garden plant, and ſhewing that the ſame, as we haue ſaid, is ſowne in Caria; and likewiſe *Dioſcorides* nameth it φακὸς κηπαῖος, that is to ſay, *Smilax hortenſis*, or garden Smilax, becauſe it groweth in gardens: who alſo writing of this in another ſeuerall chapter, ſheweth plainely, that *Smilax hortenſis*, or *Doli-* which he nameth *Phaſeoluschus*, is another plant differing from *Faſelus*.

For which cauſes it is not to be doubted, but that *Phaſelus* with three ſyllables, differeth from *Faſeolus* with foure ſyllables, no otherwiſe than *Cicer*, *Cicercula*, and *Cicera* differ, which notwithſtanding be neere one to another in names: and it is not to be doubted but that they are deceiued, who thinke it to be one and the ſelfe ſame Pulſe called by ſundry names.

This plant is named in Engliſh, Kidney Beane, Sperage Beanes: of ſome, Faſelles, or long Peaſon, French Beanes, Garden Smilax, and Romane Beanes: in French, *Feues de Romme*: in Dutch, **Turcksboonen.**

¶ *The Temperature.*

Kidney Beans, as *Dioſcorides* teacheth, do more looſe the belly than Peaſon; they are leſſe windy, and nouriſh well, and no leſſe than Peaſon, as *Diocles* ſaith: they be alſo without ingendring windineſſe at all: the Arabian Phyſitions ſay that they are hot and moiſt of nature.

¶ *The Vertues.*

A The fruit and cods of Kidney Beanes boyled together before they be ripe, and buttered, and ſo eaten with their cods, are exceeding delicate meat, and doe not ingender winde as the other Pulſes doe.

B They doe alſo gently looſe the belly, prouoke vrine, and ingender good bloud reaſonable well, but if you eat them when they be ripe, they are neither toothſome nor wholeſome. Therefore they are to be taken whileſt they are yet greene and tender, which are firſt boyled vntill they be tender; then is the rib or ſinew that doth run alongſt the cod to be taken away; then muſt they be put into a ſtone pipkin, or ſome other veſſell with butter, and ſet to the fire againe to ſtew, or boyle gently: which meat is very wholeſome, nouriſhing, and of a pleaſant taſte.

Chap. 509. *Of the flat Beane called Lupine.*

¶ *The Deſcription.*

1 THe tame or Garden Lupine hath round hard ſtems, which of themſelues doe ſtand vpright without any ſuccour, help or ſtay: the leaues conſiſt of fiue, ſix, or ſeuen joyned together,

1 *Lupinus ſatiuus.*
Garden Lupines.

2 *Lupinus flore luteo.*
Yellow Lupines.

3 *Lupinus flore cæruleo.*
Blew Lupine.

‡ 4 *Lupinus major flo. cæruleo.*
The great blew Lupine.

gether, like those of the Chast tree, greene on the vpper side, and on the nether side white and downy; and in the euening about the setting of the Sun they hang flagging downwards as though they were withered: among these there commeth vp a tuft of flours of a pale or light blush colour, which turne into great rough cods, wherein is the fruit, which is flat and round like a cake, of a white colour, and bitter in taste: and where they cleaue vnto the cod, in that part they haue a certaine dent like a little nauell. This Lupine hath but one root, which is slender and wooddy, hauing hanging on it a few small threds like haires.

2 The yellow Lupine is like to the garden one in stalke and leaues, yet both of these lesser and shorter. It hath beautifull floures of an exceeding faire gold yellow colour, sweet of smell, made vp into an eare, of the colour of the yellow Violet, and somewhat of the smell: the cods are small, hard, somewhat hairy: the seeds be little, flat, round, in taste extreme bitter, of sundry colours, ill-fauoured, far lesser than the tame one.

3 The blew Lupines are longer than the yellow, and diuided into more wings or branches: the leaues be lesser and thinner: the floures small: and lesser than the yellow, of a blew colour: the seeds be also of diuers colours, bitter, and lesser than any of them all.

‡ 4 There is also another blew Lupine, whose leaues, stalks, floures, and cods are like: but larger then those of the first described: the floures are of colour blew, with some whitenesse here and there intermixt. ‡

¶ *The Place.*

They require (saith *Theophrastus*) a sandy and bad soile: they hardly come vp in tilled places, being of their owne nature wilde: they grow in my garden, and in other mens gardens about London.

¶ *The Time.*

They are planted in Aprill, and bring forth their fruit at two or three sundry times, as though it did floure often, and bring forth many crops: the first in May, the second in Iuly, the last in September, but it seldome commeth to ripenesse.

¶ *The Names.*

This pulse is named in Greeke, θέρμος ἥμερος: in Latine: *Lupinus*, and *Lupinus sativus*: in high Dutch, **Feigbonen**: in Italian, *Lupino domestico*: in Spanish, *Eniramocos*: in the Brabanders language, **Wijth boonen**, and **Lupinen**: in French, *Lupins*: in English, Garden Lupine, tame Lupine, and of some after the German name Fig-beane.

¶ *The Temperature and Vertues.*

A The seed of the garden Lupines is πολυάχρηστον, that is to say, much and often vsed, as *Galen* saith in his bookes of the Faculties of Nourishments: for the same being boyled and afterwards steeped in faire water, vntill such time as it doth altogether lose his naturall bitternesse, and lastly being seasoned with a reasonable quantity of salt, it is eaten with pickle. The Lupine is of an hard and earthy substance, wherfore it is necessarily of hard digestion, and containeth in it a thicke juyce; of which being not perfectly concocted in the veines, is engendred a bloud or juyce which is properly called crude, or raw: but when it hath lost all his bitternesse by preparing or dressing of it (as aforesaid) it is like τοῖς χυμοῖς, that is to say, to such things as are without relish, which is perceiued by the taste; and being so prepared, it is, as *Galen* writeth in his bookes of the Faculties of simple medicines, one of the emplaistickes or clammers.

B But whilest the naturall bitternesse doth as yet remaine, it hath power to clense and to consume or waste away; it killeth wormes in the belly, being both applied in manner of an ointment and giuen with hony to licke on, and also drunke with water and vineger.

C Moreouer, the decoction thereof inwardly taken, voideth the wormes; and likewise if it be sundry times outwardly vsed as a bath, it is a remedy against the morphew, sore heads, the small Pox, wilde scabs, gangrenes, venomous vlcers, partly by clensing, aud partly by consuming and drying without biting; being taken with Rue and Pepper, that it may be the pleasanter, it scoureth the liuer and milt.

D It bringeth downe the menses, and expelleth the dead childe if it be laied to with myrrhe and hony.

E Moreouer, the meale of Lupines doth waste or consume away without any biting quality, for it doth not onely take away blacke and blew spots that come of dry beatings, but also it cureth *Chiradas*, and *Phymata*: but then it is to be boyled either in vineger or oxymell, or else in water and vineger, and that according to the temperature of the grieued parties, and the diuersities of the diseases, *Quod ex vsu est eligendo*: and it also taketh away blew marks, and what thing soeuer else we haue said the decoction could do, all the same doth meale likewise performe.

F These Lupines, as *Dioscorides* doth furthermore write, being boyled in raine water till they yeeld a certaine creame, are good to clense and beautifie the face.

G They cure the scabs in sheepe with the root of blacke Chameleon Thistle, if they be washed with the warme decoction.

The

The root boyled with water and drunke, prouoketh vrine. H
The Lupines being made sweet and pleasant, mixed with vineger and drunke, take away the loth- I
somnesse of the stomacke, and cause a good appetite to meat.
Lupines boyled in that strong leigh which Barbards do vse, and some Wormwood, Centorie and K
bay salt added thereto, stay the running and spreading of a *Gangræna*, and those parts that are de-
priued of their nourishment and begin to mortifie, and staieth the ambulatiue nature of running
and spreading vlcers, being applied thereto very hot, with stuphes of cloth or tow.

Chap. 510. *Of Peason.*

¶ *The Kindes.*

There be diuers sorts of Peason, differing very notably in many respects; some of the garden, and others of the field, and yet both counted tame: some with tough skinnes or membranes in the cods, and others haue none at all, whose cods are to be eaten with the Pease when they be young, as those of the young Kidney Beane: others carrying their fruit in the tops of the branches, are esteemed and taken for Scottish Peason, which is not very common, There be diuers sorts growing wild, as shall be declared.

1 *Pisum majus.*
Rownciuall Pease.

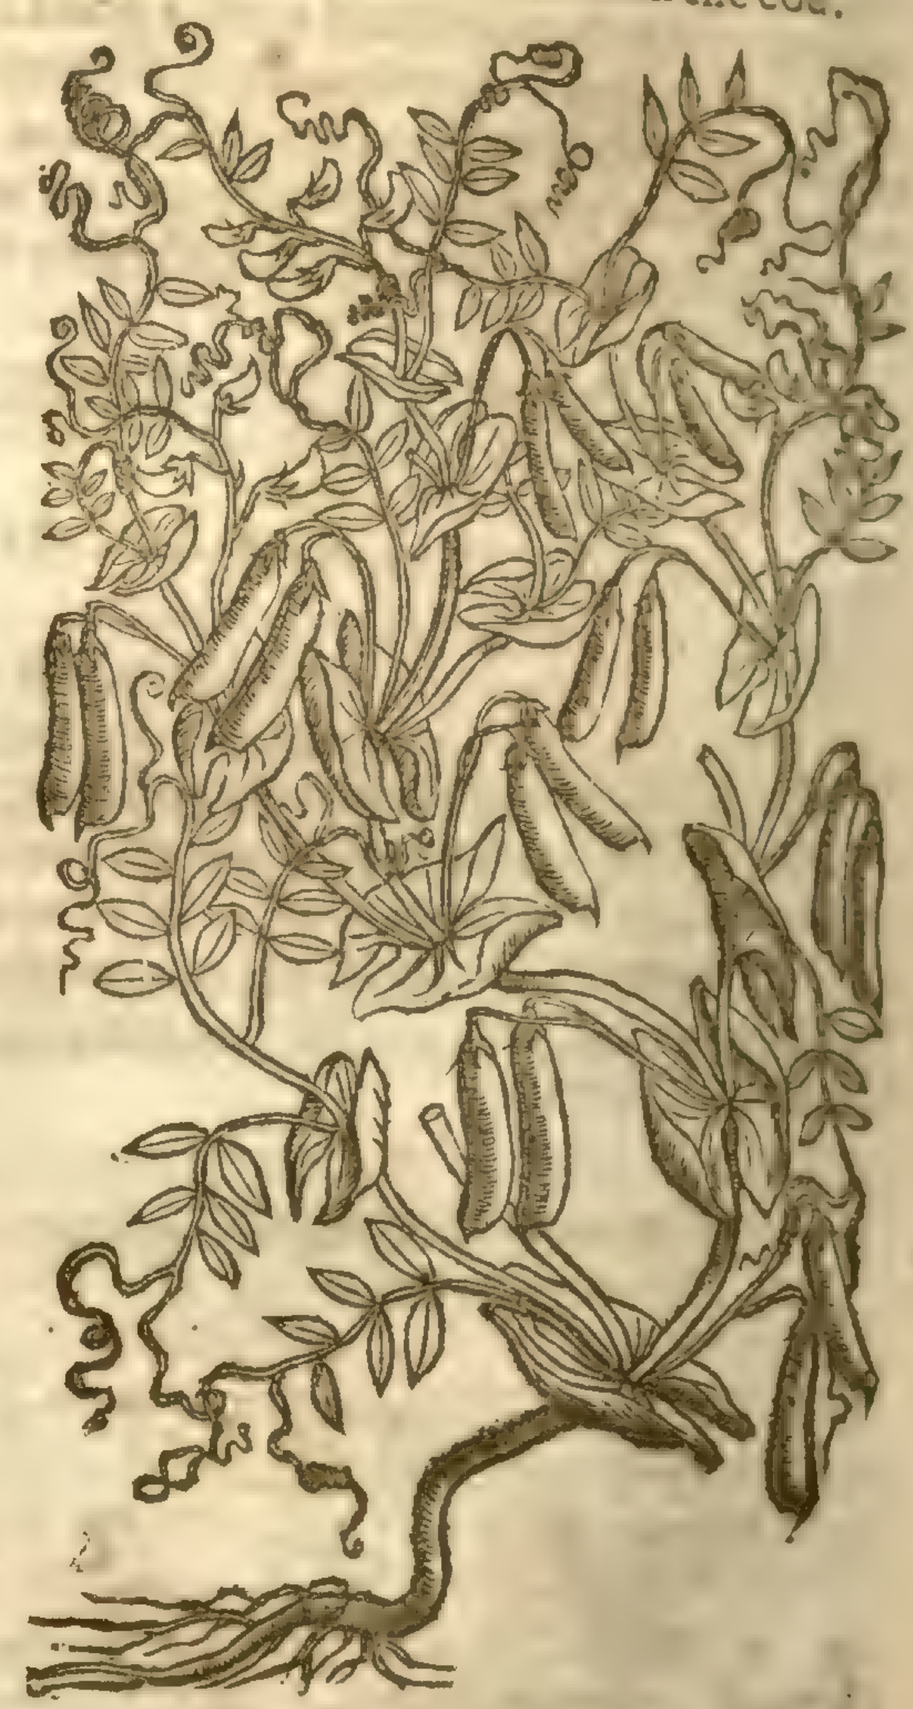
2 *Pisum minus.*
Garden and field Pease.

¶ *The Description.*

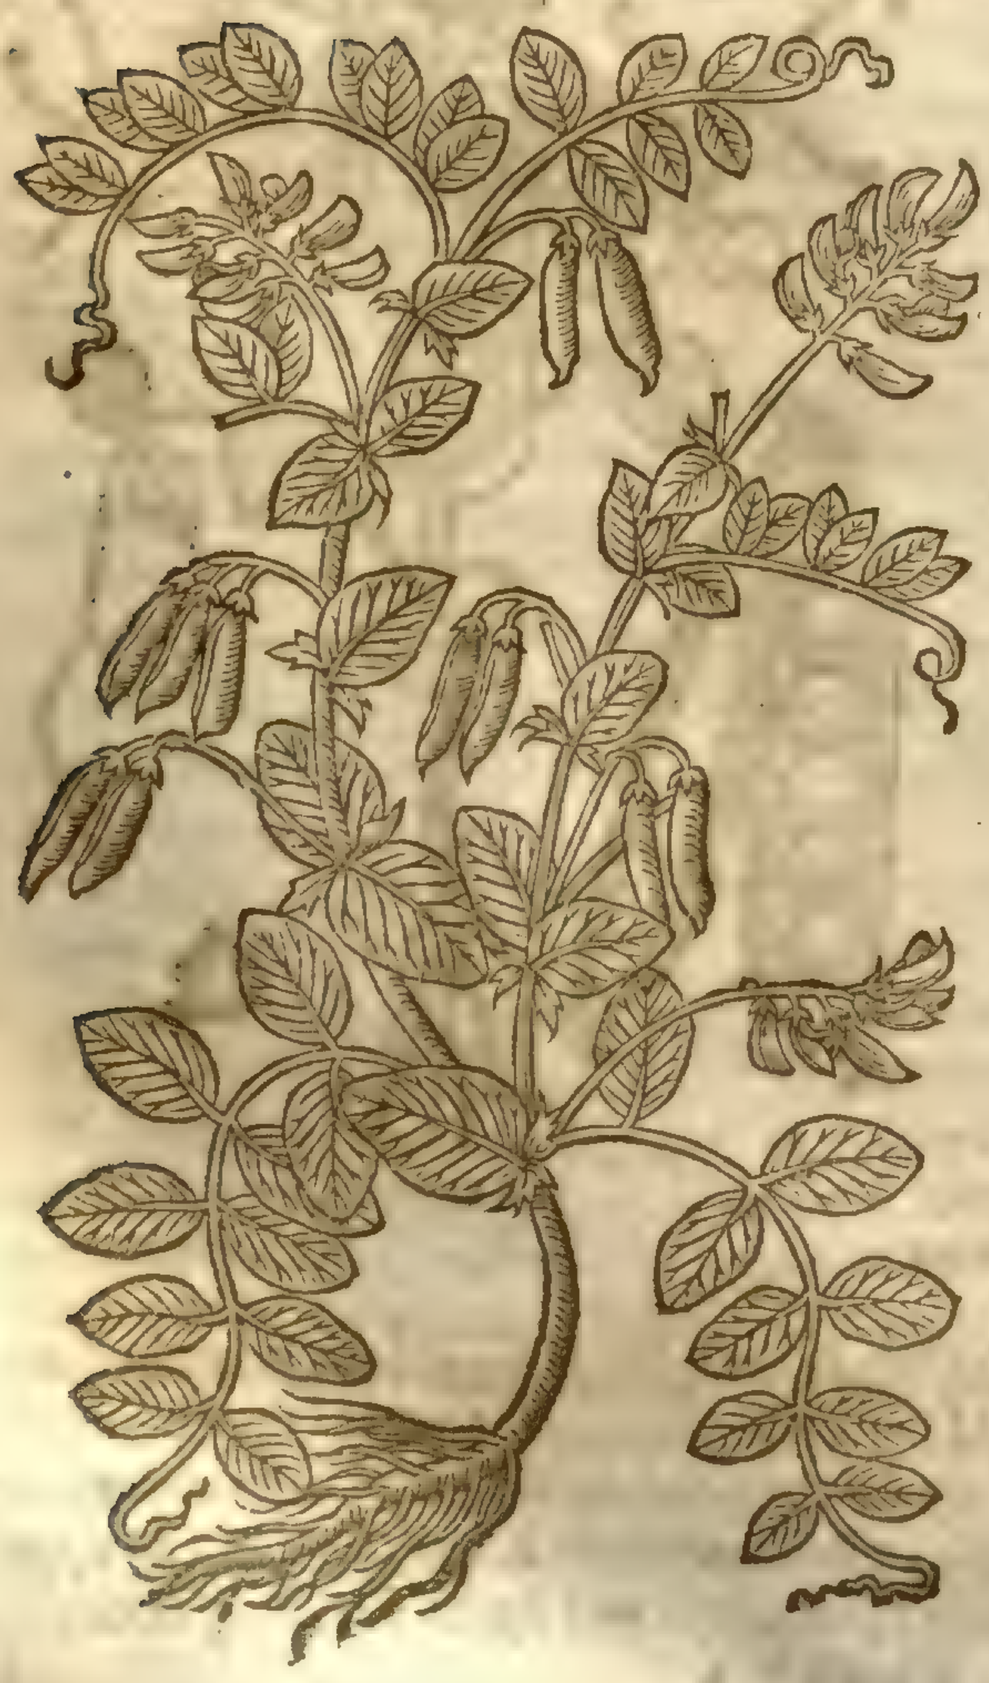
1 The great Pease hath long stalks, hollow, brickle, of a whitish green colour, branched, and spred vpon the ground, vnlesse they be held vp with proppes set neere vnto them: the leafe thereof is wide and long, made vp of many little leaues which be *smooth, white,* growing vpon one little stalke or stem, and set one right against another: it hath also in the vpper part long clasping tendrels, wherewith it foldeth it selfe vpon props and staies *standing* next vnto it:

3 *Pisum umbellatum.*
Tufted or Scottish Peaſe.

4 *Pisum excorticatum.*
Peaſe without skins in the cod.



5 *Pisum syluestre.*
Wilde Peaſe.



6 *Pisum perenne syluestre.*
Euerlasting wilde Peaſe.

it: the flowre is white and hath about the middle of it a purple ſpot: the cods be long, round *Cylindriforma*: in which are contained ſeeds greater than *Ochri*, or little Peaſon; which being dry are cornered, and that vnequall, of cólour ſometimes white and ſometimes gray: the roots are ſmall.

2 The field Peaſe is ſo very well knowne to all, that it were a needleſſe labour to ſpend time about the deſcription.

3 Tufted Peaſe are like vnto thoſe of the field, or of the garden in each reſpect; the difference conſiſteth onely in that, that this plant carreth his floures and fruit in the tops of the branches in a round tuft or vmbel, contrary to all other of his kinde, which bring forth their fruit in the midſt, and alongſt the ſtalkes: the root is thicke and fibrous.

4 Peaſe without skins, in the cods differ not from the precedent, ſauing that the cods hereof want that tough skinnie membrane in the ſame, which the hogs cannot eat by reaſon of the toughneſſe; whereas the other may be eaten cods and all the reſt, euen as Kidney beanes are: which being ſo dreſſed are exceeding delicate meat.

5 The wild Peaſe differeth not from the common field Peaſe in ſtalke and leaues, ſauing that this wilde kinde is ſomewhat leſſer: the floures are of a yellow colour, and the fruit is much leſſer.

6 The Peaſe whoſe root neuer dies differeth not from the wilde Peaſe, onely his continuing without ſowing, being once ſowne or planted, ſetteth forth the difference.

¶ *The Place.*

Peaſe are ſet and ſowne in gardens, as alſo in the fields in all places of England. The tufted Peaſe are in reaſonable plenty in the Weſt part of Kent, about Sennocke or Seuenock; in other places not ſo common.

The wilde Peaſe do grow in paſtures and earable fields in diuers places, ſpecially about the field belonging vnto Biſhops Hatfield in Hartfordſhire.

¶ *The Time.*

They be ſowne in the Spring time, like as be alſo other pulſes, which are ripe in Summer: they proſper beſt in warme weather, and eaſily take harme by cold, eſpecially when they floure.

¶ *The Names.*

The great Peaſe is called in Latine, *Piſum Romanum*, or *Piſum majus*: in Engliſh, Romane Peaſe, or the greater Peaſe, alſo garden Peaſe: of ſome, Branch Peaſe, French Peaſe, and Rounſiuals. *Theophraſtus* and other old Writers do call it in Greeke, πίσον: in Latine, alſo *Piſum*: in low Dutch, **Roomſche erwiten**: in French, *des Pois*. The little Peaſe is called of the Apothecaries euery where *Piſum*, and *Piſum minus*: it is called in Engliſh, little Peaſe, or the common Peaſe.

¶ *The Temperature and Vertues.*

The Peaſe, as *Hippocrates* ſaith, is leſſe windie than Beans, but it paſſeth ſooner through the belly. A
Galen writeth, that Peaſon are in their whole ſubſtance like vnto Beanes, and be eaten after the ſame manner that Beanes are, notwithſtanding they differ from them in theſe two things both becauſe they are not ſo windie as be the Beans, and alſo for that they haue not a clenſing faculty and therfore they do more ſlowly deſcend through the belly. They haue noeffectuall quality manifeſt, and are in a meane between thoſe things which are of good and bad juyce, that nouriſh much and little, that be windy and without winde, as *Galen* in his booke of the Faculties of Nouriſhments hath written of theſe and of Beanes.

Chap. 511. *Of the tame or Garden Ciche.*

¶ *The Deſcription.*

Garden Ciche bringeth forth round ſtalkes, branched and ſomewhat hairy, leaning on the one ſide, the leaues are made of many little ones growing vpon one ſtem or rib, and ſet one right againſt another: of which euery one is ſmall, broad and nicked on the edges, leſſer than the leaues of wilde Germander: the floures be ſmall, of colour either white, or of a reddiſh purple: after which come vp little ſhort cods, puffed vp as it were with winde like little bladders, in which doe lie two or at the moſt three ſeeds cornered, ſmall towards the end, with one ſharpe cörner, not much vnlike to a rams head, of colour either white, or of a reddiſh blacke purple; in which is plainly ſeene the place where they begin firſt to ſprout. The root ir ſlender, white and long: for as *Theophraſtus* ſaith, the Ciche taketh deepeſt root of all the Pulſes.

¶ *The Place.*

It is ſowne in Italy, Spaine, and France, euery where in the fields. It is ſowen in our London gardens, but not common.

Cicer ſatiuum.
Garden Ciche.

¶ *The Time.*

It is ſowne in April, being firſt ſteeped in water a day before: the fruit is ripe in Auguſt.

¶ *The Names.*

It is called in Greeke, ἐρέβινθος ἀρίετις: in Latine, *Cicer arietinum*, or Rams Ciches, & of the blackiſh purple colour, *Cicer nigrum, vel rubrum*: blacke or red Ciche: and the other is named *Candidum vel album Cicer*: or white Ciche: in Engliſh, Common Cich, or Ciches, red Cich, of ſome, Sheepes Ciche Peaſe, or Sheepes Ciche Peaſon.

¶ *The Temperature and Vertues.*

The Ciche, as *Galen* writeth in his booke of the Faculties of nouriſhments, is no leſſe windie than the true Peane, but it yeeldeth a ſtronger nouriſhment than that doth: it prouoketh luſt, and it is thought to engender ſeed.

Some giue the ſame to ſtalion horſes. Moreouer, Ciches do ſcoure more than doe the true Beanes: inſomuch as certaine of them doe manifeſtly diminiſh or waſte away the ſtones in the Kidneyes: thoſe be the blacke and little Ciches called *Arietina*, or Rams Ciches, but it is better to drinke the broth of them ſodden in water.

Both the Rams Ciches, as *Dioſcorides* ſaith, the white and the blacke prouoke vrine, if the decoction therof be made with Roſemary, and giuen vnto thoſe that haue either the Dropſie or yellow jaundiſe; but they are hurtfull vnto the Bladder and Kidneies that haue vlcers in them.

CHAP. 512. *Of wilde Ciches.*

¶ *The Kindes.*

THe wilde Ciche is like to the tame (ſaith *Dioſcorides*) but it differeth in ſeed: the later writers haue ſet downe two kindes thereof, as ſhall be declared.

¶ *The Deſcription.*

1 THe firſt wilde Cich bringeth forth a great number of ſtalkes branched, lying flat on the ground: about which be the leaues, conſiſting of many vpon one rib as do thoſe of the garden Cich, but not nicked in the edges, more like to the leaues of Axcich: the flours come forth faſtned on ſmall ſtems, which grow cloſe to the ſtalkes, of a pale yellow colour, and like vnto eares: in their places come vp little cods, in forme and bigneſſe of the fruit of garden Ciches, blacke and ſomething hairy, in which lieth the ſeed, that is ſmall, hard, flat, and glittering, in taſte like that of Kidney Beane: the root groweth deepe, faſtened with many ſtrings.

2 There is another kinde of wild Cich that hath alſo a great number of ſtalkes lying vpon the ground, about which ſtand ſoft leaues, ſomething hairy and white, conſiſting of three broad leaues ſtanding vpon a middle rib, the leaſt of which ſtand neereſt to the ſtem, and the greateſt at the very top: the floures come forth at the bottome of the leaues many together, of colour yellow: after which grow ſmall long huskes, ſoft and hairy, in euery one whereof is a little cod, in which lie two ſeeds like little Cichlings.

¶ The

1 *Cicer syluestre.*
The wilde Cich.

2 *Cicer syluestre latifolium.*
Broad leafed wilde Cich.

¶ *The Place.*

These plants are sowne in the parts beyond the seas for to feed their cattell with in Winter, as we do Tares, Vetches, and such other base pulse.

¶ *The Time.*

The time answereth the Vetch or Tare.

¶ *The Names.*

The wild Cich hath no other name in Latine but *Cicer syluestre*: the later writers haue not found any name at all.

¶ *The Temperature and Vertues.*

Their temperature and vertues are referred to the garden Cich, as *Theophrastus* affirmes; and *Galen* saith that the wilde Cich is in all things like vnto that of the garden, but in Physicks vse more effectually, by reason it is more hotter and drier, and also more biting and bitter.

CHAP. 513. *Of Lentils.*

¶ *The Description.*

1 THe first Lentil growes vp with slender stalks, and leaues which be somewhat hard, growing aslope from both sides of the rib or middle stalke, narrow and many in number like those of Tares, but narrower and lesser: the floures be small, tending somewhat towards a purple: the cods are little and broad: the seeds in these are in number three or foure, little, round, plaine, and flat: the roots are small and threddy.

2 The second kinde of Lentill hath small tender and pliant branches a cubit high; whereon do grow leaues diuided or consisting of sundry other small leaues, like the wilde Vetch, ending at the middle rib with some clasping tendrels, wherewith it taketh hold of such things as are neere vnto it: among these come forth little browniſh floures mixed with white, which turne into small flat cods, containing little browne flat seed, and sometimes white.

¶ The

1 *Lens major.*
Great Lentils.

2 *Lens minor.*
Little Lentils.

¶ *The Place.*

Theſe Pulſes do grow in my garden; and it is reported vnto me by thoſe of good credit, that about Watford in Middleſex and other places of England the husbandmen doe ſow them for their cattell, euen as others do Tares.

¶ *The Time.*

They both floure and wax ripe in Iuly and Auguſt.

¶ *The Names.*

They are called in Greeke, φακός, or φακή: in Latine, *Lens*, and *Lenticula*: in high Dutch, Linſen: in French, *Lentille*: in Italian, *Lentichia*: in Spaniſh, *Lenteia*: in Engliſh, Lentils.

¶ *The Temperature and Vertues.*

A Lentils as *Galen* ſaith, are in a meane betweene hot and cold, yet are they dry in the ſecond degree: their skin is aſtringent or binding, and the meate or ſubſtance within is of a thicke and earthy juyce, hauing a quality that is a little auſtere or ſomething harſh, much more the skin thereof: but the juyce of them is quite contrary to the binding quality; wherefore if a man ſhall boile them in faire water, and afterwards ſeaſon the water with ſalt and pickle, *aut cum ipſis oleo condiens*, and then take it, the ſame drunke doth looſe the belly.

B The firſt decoction of Lentils doth looſe the belly; but if they bee boyled againe, and the firſt decoction caſt away, then doe they binde, and are good againſt the bloudy flix or dangerous laskes.

C They do their operation more effectually in ſtopping or binding, if all or any of theſe following be boyled therewith, that is to ſay, red Beets, Myrtles, pils of Pomegranats, dried Roſes, Medlars, Seruice berries, vnripe Peares, Quinces, Plantaine leaues, Galls, or the berries of Sumach.

D The meale of Lentils mixed with hony doth mundifie and clenſe corrupt vlcers and rotten ſores, filling them with fleſh againe; and is moſt ſingular to be put into the common digeſtiues vſed among our London Surgeons for greene wounds.

E The Lentil hauing the skin or coat taken off, as it loſeth that ſtrong binding quality, and thoſe accidents that depend on the ſame, ſo doth it more nouriſh than if it had the skin on.

F It ingendreth thicke and naughty juyce, and ſlowly paſſeth through the belly, yet doth it not ſtay the looſeneſſe as that doth which hath his coat on; and therefore they that vſe to eat too much thereof

thereof doe necessarily become Lepers, and are much subject to cankers, for thicke and dry nourishments are apt to breed melancholy.

Therefore the Lentill is good food for them that through waterish humours be apt to fall into the dropsie, and it is a most dangerous food for dry and withered bodies; for which cause it bringeth dimnesse of sight, though the sight be perfect, through his excessiue drynesse, whereby the spirits if the sight be wasted; but it is good for them that are of a quite contrary constitution. G

It is not good for those that want their termes; for it breedeth thicke bloud, and such as slowly passeth through the veines. H

But it is singular good to stay the menses, as *Galen* in his booke of the faculties of nourishments affirmeth. I

It causeth troublesome dreams (as *Dioscorides* doth moreouer write) it hurteth the head, sinewes and lungs. K

It is good to swallow downe thirty graines of Lentils shelled or taken from their husks, against the ouercasting of the stomacke. L

Being boyled with parched barly meale and laid to, it assuageth the paine and ach of the gout. M

With hony it filleth vp hollow sores, it breaketh aschares, clenseth vlcers: being boyled in wine it wasteth away wens and hard swellings of the throat. N

With a quince, and Melilot, and oyle of Roses, it helpeth the inflammation of the eies and fundament; but in greater inflammations of the fundament, and great deep vlcers, it is boyled with the ride of a pomegranate, dry Rose leaues, and hony. O

And after the same maner against eating sores that are mortified, if sea water be added; it is also a remedy against pushes, the shingles, and the hot inflammation called S. Anthonies fire, and for kibes, in such manner as we haue written; being boyled in sea water and applied, it helps women's brests in which the milke is cluttered, and cannot suffer too great abundance of milke. P

Chap. 514. *Of Cich or true Orobus.*

Orobus reptus Herbariorum.
The true Orobus.

¶ *The Description.*

THis Pulse, which of most Herbarists is taken for the true Orobus, and called of some, bitter Fitch, is one of the Pulses whose tender branches traile vpon the ground, as *Theophrastus* saith, and whose long tender branches spred far abroad, whereon doe grow leaues like those of the field Vetch: among which grow white floures; after which come long cods, that appeare bunched on the outside against the place where the seeds do lie, which are small, round, russet of colour, and of a bitter taste: the root is small and single.

¶ *The Place.*

It prospereth best in a leane soile, according to *Columella:* it groweth in woods and copses in sundry places of Spaine and Italy, but here only in gardens.

¶ *The Time.*

This is sowne early and late, but if it be sowne in the Spring it easily commeth vp, and is pleasant; and vnpleasant if it be sowne in the fall of the leafe.

¶ *The Names.*

This is called in Greeke, ὄροβος: the shops of Germany haue kept the name *Orobus:* the Italians cal it *Macho:* the Spaniards, *Yeruo*, and *Yeruos:* in English it is called bitter Vetch, or bitter Fitch, and Orobus, after the Latine name. Of some Ers; after the French name.

¶ *The*

¶ *The Temperature and Vertues.*

A *Galen* in his first booke of the Faculties of nourishments saith, That men do altogether abstaine from the bitter Vetch, for it hath a very vnpleasant taste, and naughty juyce; but Kine in Asia and in most other countries doe eat thereof, being made sweet by steeping in water; notwithstanding men being compelled through necessity of great famine, as *Hippocrates* also hath written, doe oftentimes feed thereof; and we also dressing them after the manner of Lupines, vse the bitter Vetches with hony, as a medicine that purgeth thicke and grosse humors out of the chest and lungs.

B Moreouer, among the bitter Vetches the white are not so medicinable, but those which are neere to a yellow, or to the colour of Okar; and those that haue been twice boyled, or sundry times soked in warer, lose their bitter and vnpleasant taste, and withall their clensing and cutting quality, so that there is onely left in them an earthy substance, which serues for nourishment, that dryeth without any manifest bitternesse.

C And in his booke of the Faculties of simple medicines he saith, That bitter Vetch is dry in the later end of the second degree, and hot in the first: moreouer, by how much it is bitter, by so much it clenseth, cutteth, and remooueth stoppings: but if it be ouermuch vsed it bringeth forth bloud by vrine.

D *Dioscorides* writeth, that bitter Vetch causeth head-ache and heauy dulnesse, that it troubles the belly, and driueth forth bloud by vrine; notwithstanding being boyled it serues to fatten Kine.

E There is made of the seed a meale fit to be vsed in medicine, after this maner: the full and white graines are chosen out, and being mixed together they are steeped in water, and suffered to lie till they be plumpe, and afterwards are parched till the skinne be broken; then are they ground, and searsed or shaken through a meale sieue, and the meale reserued.

F This looseth the belly, prouoketh vrine, maketh one well coloured: being ouermuch eaten or drunke it draweth bloud by the stoole, with gripings, and also by vrine.

G With hony it clenseth vlcers, taketh away freckles, sun-burnes, blacke spots in the skinne, and maketh the whole body faire and cleane.

H It staieth running vlcers or hard swellings, and gangrens or mortified sores; it softeneth the hardnesse of womens breasts, it taketh away and breaketh eating vlcers, carbuncles, and sores of the head: being tempered with wine and applied it healeth the bitings of dogs, and also of venomous beasts.

I With vineger it is good against the strangury, and mitigateth paine that commeth thereof.

K It is good for them that are not nourished after their meat, being parched and taken with honey in the quantitie of a nut.

L The decoction of the same helpeth the itch in the whole body, and taketh away kibes, if they be washed or bathed therewith.

M *Cicer* boyled in fountaine water with some *Orobus* doth asswage the swelling of the yard and priuie parts of man or woman, if they be washed or bathed in the decoction thereof; and the substance hereof may also be applied plaisterwise.

N It is also vsed for bathing and washing of vlcers and running sores, and is applied vnto the scurfe or the head with great profit.

Chap. 515. *Of the Vetch or Fetch.*

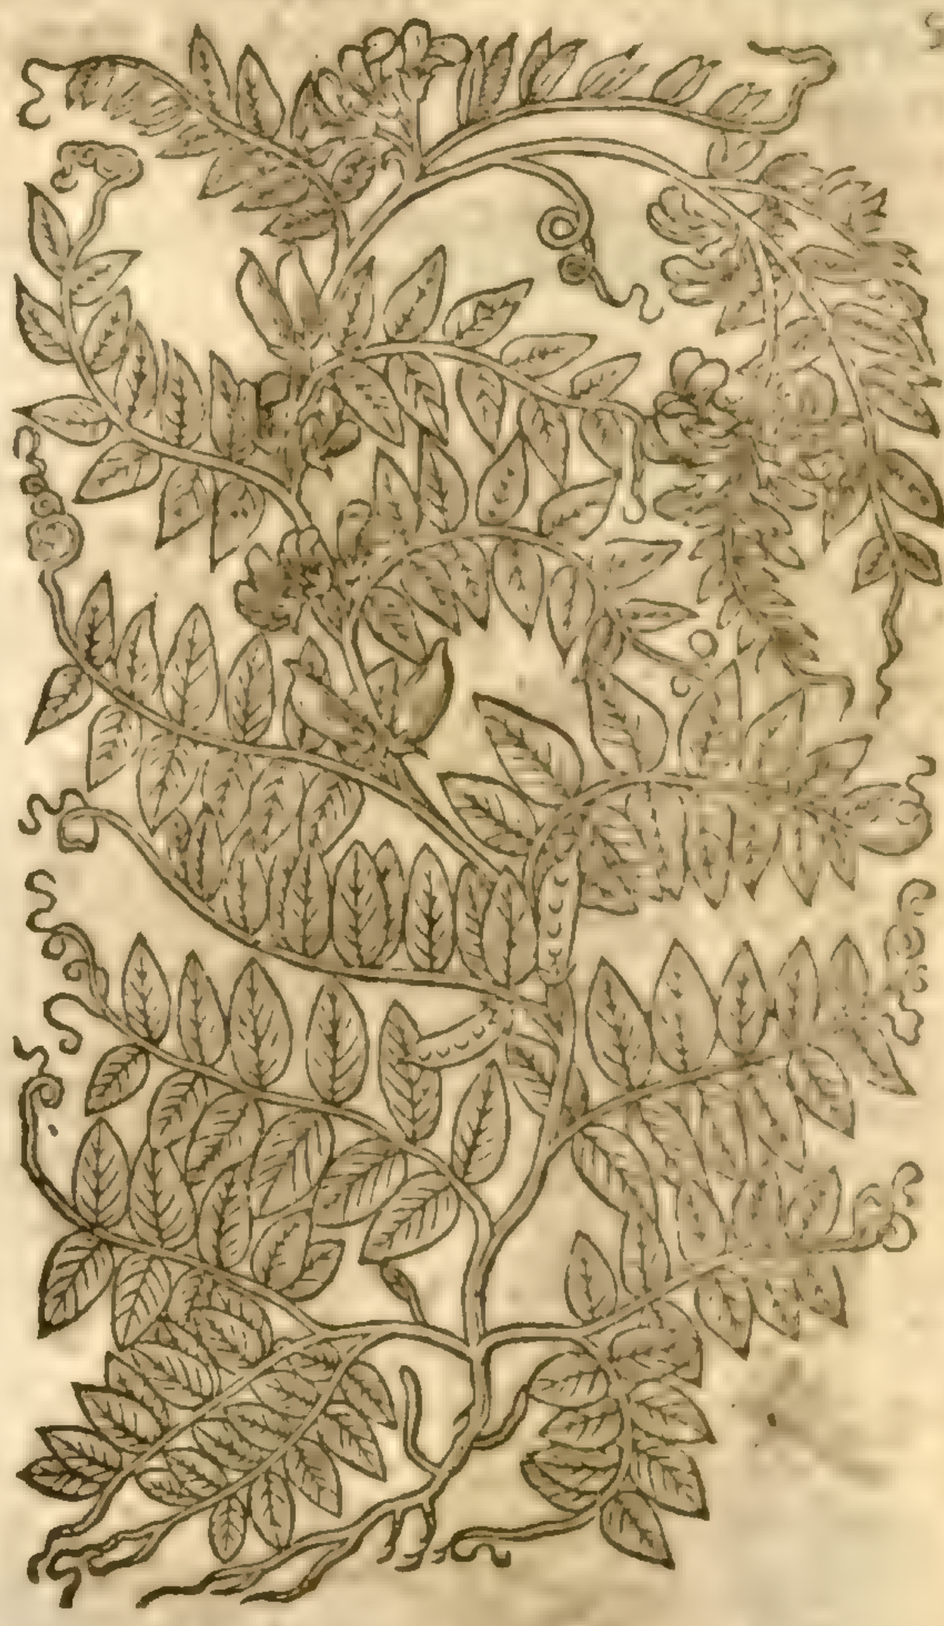
¶ *The Description.*

1 THe Vetch hath slender and foure squared stalkes almost three foot long: the leaues be long, with clasping tendrels at the end made vp of many little leaues growing vpon one rib or middle stem; euery one whereof is greater, broader, and thicker than that of the Lentill: the floures are like to the floures of the garden Beane, but of a blacke purple colour: the cods be broad, small, and in euery one are contained fiue or six graines, not round, but flat like those of the Lentill, of colour blacke, and of an vnpleasant taste.

‡ 2 There is another of this kinde which hath a creeping and liuing root, from which it sendeth forth crested stalkes some cubit and halfe high: the leaues are winged, commonly a dozen growing vpon one rib, which ends in a winding tendrel: each peculiar leaues broader toward the bottome, and sharper towards the top, which ends not flat, but somewhat round. Out of the bosomes of the leaues towards the tops of the stalkes, on short foot-stalkes grow two, three, or more pretty large Pease-fashioned blewish purple floures, which are succeeded by such cods as the former, but somewhat lesser; which when they grow ripe become blacke, and fly open of themselues, and

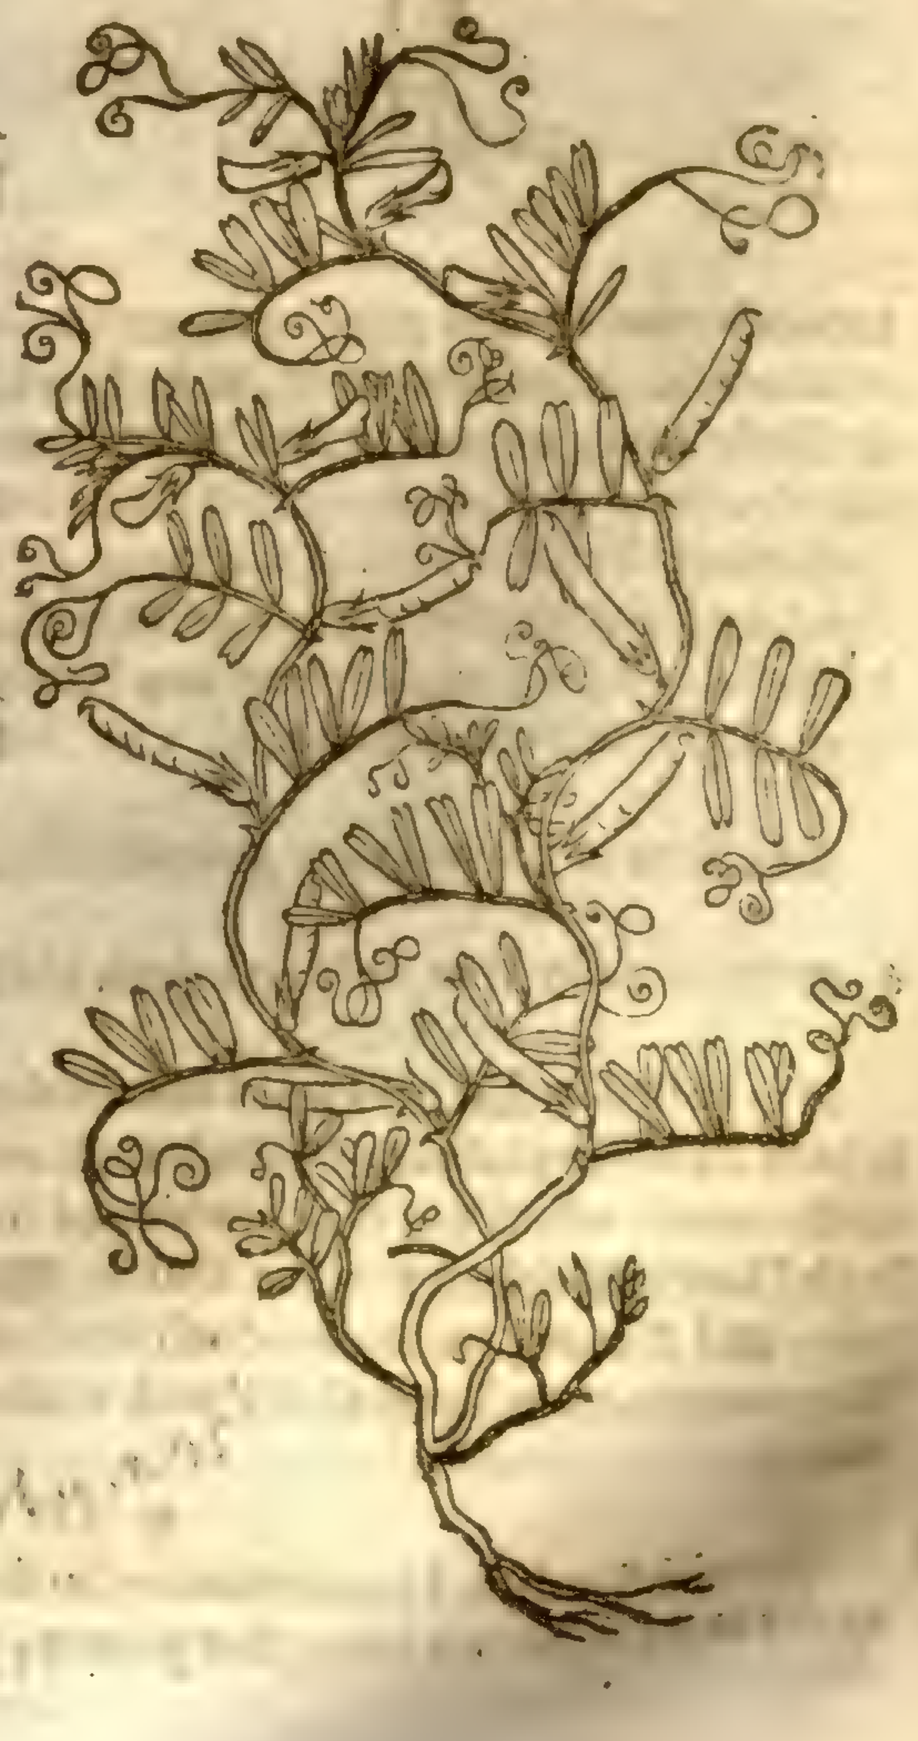
‡ 1 *Vicia.*
Tare, Vetch, or Fetch.

† 2 *Vicia maxima dumetorum.*
Bush Vetch.



‡ 3 *Vicia syl. flo. albo.*
White floured Vetch.

4 *Vicia sylvestris, sive Cracca major.*
Strangle Tare, Tine, or wild Fetch.



and so scatter their seed. This growes in many places wilde among bushes, both here and in Germany, as appeares by that name, *Bauhine* thence giues it, calling it *Vicia maxima dumetorum*. *Tragus* makes it his *Vicia syl. altera*; and iudges it to be the *Aphace* of *Dioscorides*; and he saith the Latines call it *Os mundi*: the high Dutch, **S. Cristoffels kraut**, and **Schwarts Linsen**. *Tabern.* calls it *Cracca maior*.

‡ 5 *Vicia syl. sive Cracca minima.*
Small wilde Tare.

3 This also hath a lasting root, which sendeth vp round crested branches, a foot and sometimes a cubit high, whereon grow such leaues as those of the former, but more white and downie: the floures which grow on short foot-stalkes, out of the bosomes of the leaues, towards the top of the stalks, are of a whitish colour, with veines of a duskie colour, diuaricated ouer the vpper leafe: the cods are like those of the common Fetch. *Clusius* found this in some wilde places of Hungarie; it floured in May: he calls it *Vicia sylvestris albo flore*. ‡

4 Strangle Tare, called in some countries Tine, and of others wilde Vetch, is a ramping herbe like vnto the common Tare, ramping and clymbing among corne where it chanceth, that it plucketh it downe to the ground, and ouergroweth the same in such sort, that it spoileth and killeth not only wheat, but all other graine whatsoeuer: the herbe is better known than desired, therefore these few lines shall suffice for the description. ‡ This groweth pretty long, with many slender weake branches: the leaues are much smaller than the former, and end in clasping tendrels: the floures are of a purple colour, and commonly grow but one at a joynt, and they are succeeded by flat sharpe pointed cods which containe some nine or ten seeds apiece.

5 This also growes a good height, with slenderer stalkes than the former, which is diuided into sundry branches: the leaues grow foure or six vpon foot-stalkes, ending also in clasping tendrels: the floures grow vpon pretty long but very slender foot-stalkes, sometimes two or three, otherwhiles more, very small, and of a whitish colour inclining to blewnesse: which are succeeded by little short flat cods, containig commonly foure or fiue little seeds of a blackish colour: this is the *Arachus, sive Cracca minima* of *Lobel*; but I question whether it be that which *Bauhine* in his *Pinax* hath made the same with it, calling it *Vicia segetum cum siliquis plurimis hirsutis*: for that which I haue described, and which exactly agrees with this figure of *Lobel* and that description in the *Aduersaria* hath cods very smooth without any hairinesse at all. This floures most part of Summer, and growes in most places both in corne fields and medowes. ‡

¶ *The Place.*

The Tare is sowne in any ground or soile whatsoeuer.

¶ *The Time.*

It floureth in May, and perfecteth his seed toward September.

¶ *The Names.*

It is called in Latine *Vicia à vinciendo*, of binding or wrapping, as *Varro* noteth, because, saith he, it hath likewise clasping tendrels such as the Vine hath, by which it crawles vpward vpon the stalks of the weeds which are next vnto it: of some, *Cracca*, and *Arachus*, and also *Aphaca*: it is called in high Dutch, **Wicken**: in low Dutch, **Witsen**: in French, *Vesce*: in most shops it is falsely termed *Ocyus*: and *Eruum*; for *Eruum* doth much differ from *Vicia*: it is called in English, Vetch, or Fetch. The country-men lay vp this Vetch with the seeds and whole plant, that it may be sodder for their cattell.

¶ *The Temperature and Vertues.*

A Notwithstanding I haue knowne, saith *Galen*, some, who in time of famine haue fed hereof, especially in the Spring, it being but greene; yet is it hard of digestion, and bindeth the belly. Therefore

Therefore seeing it is of this kind of nature, it is manifest that the nourishment that commeth therof hath in it no good juice at all, but ingendreth a thick bloud, and apt to become melancholy.

† The figure of the common Fetch was formerly wanting, and in stead thereof was put that of the other described here in the second place.

Chap. 516. *Of Chichlings, Pease, and Tare euerlasting.*

¶ *The Description.*

1 THere is a Pulse growing in our high and thicke woods, hauing a very thick tough and wooddy root, from which rise vp diuers long weake and feeble branches, consisting of a rough middle rib edged on both sides with a thin skinny membrane, smooth, and of a grasse green colour; whereon grow at certaine distances small flat stemmes, vpon which stand two broad leaues joining together at the bottome: from betwixt those leaues come forth tough clasping tendrels which take hold of such things as grow next vnto them: from the bosom of the stem whereon the leaues do grow, shooteth forth a naked smooth foot-stalke, on which grow most beautifull floures like those of the Pease, the middle part whereof is of a light red tending to a red purple in grain: the outward leaues are somewhat lighter, inclining to a blush colour: which beeing past, there succeed long round cods, wherein is contained seed of the bignesse of a Tare, but rounder, blackish without, yellowish within, and of a bitter taste.

‡ 1 *Lathyrus major latifolius.*
Pease euerlasting.

‡ 2 *Lathyrus angustifolius flore albo.*
White floured Chichlings.

† 2 Of this kinde there is likewise another like vnto the precedent in each respect, saue that the leaues thereof are narrower and longer, and therfore called of most which set forth the description, *Lathyrus angustifolia:* the floures of this are white, and such also is the colour of the fruit: the root is small, and not lasting like that of the former.

‡ 3 The stalks, leaues, and floures of this are like those of the precedent, but the floures are of a reddish purple colour: the cods are lesser than those of the former, and in them are contained lesser

leſſer,harder,and rounder ſeeds of a darke or blackiſh colour. This growes not wilde with vs, but is ſometimes ſowne in gardens,where it floures in Iune and Iuly.

4 This Egyptian differs not in ſhape from the reſt of his kinde, but the floures are of an elegant blew on the in ſide, but of an aſh colour inclining to purple on the out ſide: the cods grow vpon long foot-ſtalks,and are a little welted or winged,and containe but two or three little cornered ſeeds ſpotted with blacke ſpots. This floures in Iune and Iuly,and the ſeed thereof was ſent to *Cluſius* from Conſtantinople,hauing been brought thither out of Egypt.

‡ 3 *Lathyrus anguſtifol. flo. purp.*
Purple floured Chichlings.

‡ 4 *Lathyrus Ægyptiacus.*
Egyptian Chichlings.

5 The ſtalks of this are ſome two or three foot long,winged,weake,and lying on the ground, vnleſſe they haue ſomewhat to ſupport them. Vpon theſe at certain diſtances grow winged leaues with two little eares at their ſetting on to the ſtalke: theſe leaues conſiſt of ſixe long and narrow green leaues like thoſe of the other plants of this kinde; and theſe ſix leaues commonly ſtand vpright by couples one againſt another; otherwhiles alternatly: the foot-ſtalke whereon theſe ſtand ends in claſping tendrels: the floures are in ſhape like the former, but the outer leafe is of a faire red or crimſon colour,and the inner leafe white: after the floures come the cods,containing ſome foure or fiue pretty large flat ſeeds,which ſwel out of the cods where they lie,and in the ſpaces between each ſeed are depreſt, like that of *Orobus*. This is only a garden plant with vs,and floures in Iune and Iuly,the ſeed is ripe in Auguſt. I haue for this giuen you *Lobels* figure of his *Lathyris anguſtiore gramineo folio*, which may ſerue, if you but make the leaues and cods to agree with this deſcription. ‡

6 The yellow wilde Tare or Fetch hath diuers very ſmall ramping ſtalkes, tough, and leaning this way and that way,not able to ſtand of it ſelfe without the help of props or things that ſtand by it: the leaues are very thin and ſharp pointed: the floures grow alongſt the leaues, in ſhape of the peaſe floures,of a bright yellow colour: the roots are very ſmall,long,tough,and in number infinit, inſomuch that it is impoſſible to root it forth,being once gotten into the ground,vnleſſe the earth be digged vp with the roots,and both caſt into the riuer or burned. Doubtleſſe it is the moſt pernitious and hurtfull weed of all others,vnto all maner of green wholſome herbs or any wood whatſoeuer.

¶ *The*

‡ 5 *Lathyrus annuus siliquis Orobi.*
Party coloured Chichling.

‡ 6 *Lathyrus sylvestris flo. luteo.*
Tare euerlasting.

¶ *The Place.*

The first growes in shadowie woods and amongst bushes: there groweth great store thereof in Swainscombe wood, a mile and a halfe from Greenhithe in Kent, as you go to a village therby called Betsome, and in diuers other places.

The sixt groweth in most grassie pastures, borders of fields, and among grain almost euery where

¶ *The Time.*

The time answereth the other pulses.

¶ *The Names.*

The first is called *Lathyrus*, to make a difference betwixt it and *Lathyris* or Spurge: of *Matthiolus, Clymenum*: of *Cordus, Ervum sativum*: of *Tragus, Pisum Græcorum*: in English, Pease euerlasting, great wilde Tare, and Cichling.

‡ The second is the *Ervum album sativum* of *Fuchsius*: *Lathyrus* or *Cicercula* of *Dodonæus*: *Lathyrus angustiore gramineo folio* of *Lobel*.

The third is the *Aracus sive Cicera* of *Dodonæus*: the *Lathyrus flore purpureo* of *Camerarius*.

The fourth by *Clusius* is called *Cicercula Ægyptiaca*: by *Camerarius, Aracus Hispanicus, sive Lathyrus Ægyptiacus*.

The fift is not mentioned by any that I remember, but Mr *Parkinson*, in his Garden of flours, and that by the name I giue it you.

The sixt is the *Lathyrus sylvestris flo. luteis* of *Thalius*: *Legumen terræ glandibus simile* of *Dodonæus*: *Vicia* of *Tabern.* and it may be the *Aracus flo. luteo* of the *Advers.* Howeuer, I haue put *Lobels* figure of the *Aracus* for it, which well enough agrees with it. I vse for some resemblance it hath to *Aphaca*, to call it *Aphacoides*. ‡

¶ *The Nature and Vertues.*

The temperature and vertues are referred to the manured Tare or Vetch, notwithstanding they are not vsed for meat or medicine.

CHAP. 517. *Of the oily Pulſe called* Seſamum.

Seſamum, ſive Siſamum.
The oily Graine.

¶ *The Deſcription.*

† *Seſamum* hath a thicke and fat vpright ſtalk a cubit and a half high, garniſhed with leaues much like the Peach or almond, but rougher, and cut in with ſomwhat deep gaſhes on their ſides: amongſt theſe leaues come forth large white or elſe red floures, ſomwhat ſhaped like thoſe of Fox-gloues, which turne into round long creſted cods containing white flat oilous ſeed. *Theophraſtus* affirmeth that there is a kind therof which is white, bearing only one root. No beaſt will eat this plant while it is greene, becauſe of his bitterneſſe: but beeing withered and dried the ſeed thereof becommeth ſweet, and Cattell will feed on the whole plant.

¶ *The Place.*

It groweth both in Egypt and India. *Seſama*, ſaith *Pliny*, came from the Indies: they make an oile of it. It is a ſtranger in England.

¶ *The Time.*

It is one of the Summer grains, and is ſown before the riſing of the ſeuen ſtars, as *Pliny* writeth: yet *Columella* ſaith that *Seſamum* muſt be ſowne after the Autumne Æquinoctial, againſt the Ides of October: they require for the moſt part a rotten ſoile, which the husbandmen of Campania do cal a blacke mold.

¶ *The Names.*

The Grecians call this Grain Σήσαμον: the Latines alſo *Seſamum* and *Siſamum*, and often in the feminine gender *Seſama*: we are conſtrained for want of an Engliſh name to vſe the Latine: it is vnknowne to the Apothecaries, eſpecially the plant it ſelfe; but the ſeed and oile thereof is to bee found among them in other countries: we may call it Turky Millet.

¶ *The Nature and Vertues.*

A According to ſome it is hot and dry in the firſt degree: the ſeed thereof, as *Galen* ſaith, is fat, and therefore being laid vp it commeth to be oily very quickly: wherefore it ſpeedily fills and ſtuffeth vp thoſe that feed thereof, and ouerthroweth the ſtomack, being ſlow of digeſtion, and yeelding to the body a fat nouriſhment: therefore it is manifeſt that it cannot ſtrengthen the ſtomake or any part thereof, as alſo no other kind of fat thing; and the juice that comes thereof is thick, and therefore cannot eaſily paſſe thorow the veines. Men doe not greedily feed of it alone, but make cakes thereof with hony, which they call Σησαμίδας: it is alſo mixed with bread, and is of an hot temper, for which cauſe it procureth thirſt. And in his booke of the faculties of ſimple medicines he ſaith that *Seſamum* is not a little clammy and fat, and therefore it is an emplaſtick and a ſoftner, and is moderatly hot: the oile which comes thereof is of like temperature, and ſo is the decoction of the herb alſo.

B *Dioſcorides* writeth, That *Seſamum* is an enemy to the ſtomacke, cauſing a ſtinking breath if it remain ſticking betweene the teeth after it is chewed.

C It waſteth away groſneſſe of the ſinues: it is a remedie againſt bruiſes of the eares, inflammations, burnings, and ſcaldings, pains of the joints, and biting of the poiſon ſom horned ſerpent called *Ceraſtes*. Being mixt with oile of roſes it takes away the head-ache comming of heate.

D Of the ſame force is the herb boiled in wine, but it is eſpecially good for the heat and paine of the eies.

E Of the herb is made an oile vſed of the Egyptians, which, as *Pliny* ſaith, is good for the eares.

F It is a remedie againſt the ſounding and ringing of the eares.

CHAP.

Chap. 518. *Of Hatchet Vetch.*

¶ *The Description.*

1 THe first kinde of Hatchet Fetch hath many small branches trailing here and there vpon the ground: vpon which grow small leaves spred abroad like the leaues of the wild Vetch: among which come forth clusters of smal yellow floures, which fade away, and turne into little flat thin and brown cods, wherein is contained small reddish seed of a bitter taste.

2 The second kinde of Hatchet Vetch hath many round tough and flexible branches, trailing vpon the ground: whereupon do grow leaves like the former, but more like the leaves of Liquorice, and hath the taste of the Liquorice root; which caused some to deeme it a kinde of Liquorice: among these leaues come forth pale yellow floures: after which there succeed smal crooked cods turning their points inwardly, one answering another like little hornes, containing small flat seeds foure cornered, and fashioned like a little wedge: the root is tough, of a woody substance, and doth continue fruitfull a very long time.

† 1 *Hedysarum majus.*
Hatchet Fetch.

‡ 2 *Hedysarum Glycyrrhizatum.*
Liquorice Hatchet Fetch.

3 There is another kind of *Securidaca* or hatchet Fetch, which hath branches, leaues and roots like the last before remembred, and differeth in that, that the floures of this plant are mixed and do vary into sundry colours, being on the vpper part of a flesh colour, and on the lower of a white or snowy colour, with a purple storks bill in the middle: the leaues are in taste bitter: the cods are small like those of Birds foot, and not much vnlike the cods of *Orobus*.

4 There is likewise another kinde of *Securidaca* or hatchet Fetch, which is dedicated to *Clusius* by the afore named Dr *Penny*, who found it in the North parts of England, hauing leaues, roots, and branches likevnto the former: but the floures of this are white, and mixed with some purple, and bitter also in taste: the cods are like the claw of a Crab, or (as *Clusius* saith) like the knife which shoo-makers do vse in Flanders; in which cods are contained smal redish seed: this root is also of long continuance. ‡ *Clusius* doth not say that Dr *Penny* found this in the North of England, but in the territorie of Geneva not far from Pontetremile, among the bushes, and no where else.

‡ 3 *Hedyſarum majus ſiliquis articulatis.*
Hatchet Fetch with jointed cods.

‡ 4 *Securidaca minor pallide cærulea.*
Small blew floured Hatchet Fetch.

‡ 5 *Securidaca minor lutea.*
Small yellow Hatchet Vetch.

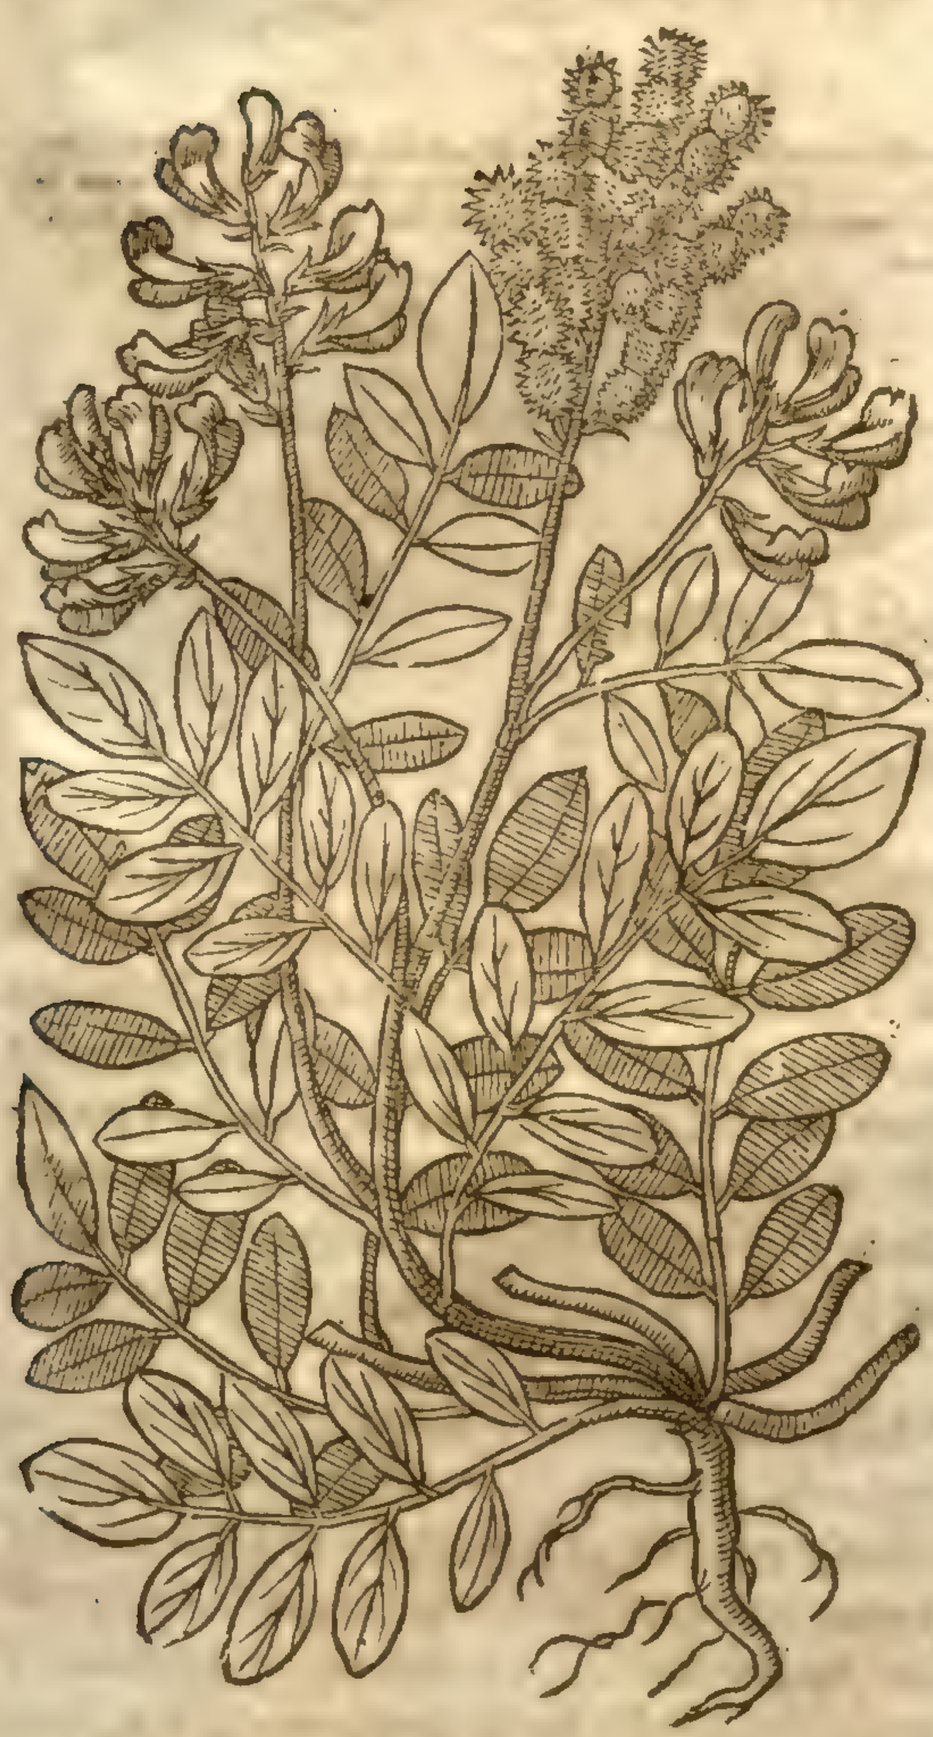
‡ 6 *Securidaca ſiliquis planis dentatis.*
Indented Hatchet Fetch.

‡ 5 This in the ſtalkes, leaues, colour, and ſhape of the floures is like, yet leſſe than the firſt deſcribed; the cods are alſo ſmaller, leſſer, and more crooked, and herein onely conſiſts the chiefe difference: it is an annual plant, and growes only in ſome gardens. *Matthiolus*, *Lobel*, *Dodonæus*, and others make this their *Hedyſarum*, or *Securidaca minor*.

6 This hath many creſted branches, whereon great winged leaues, that is ſome twenty or more are faſtned to one rib: the floures are like thoſe of the other plants of this kind, but the cods are an inch long, flat, indented or toothed on the ſides: but of what colour the floures and ſeeds are it is not expreſt by *Cluſius*, who only ſet this forth by a picture, and ſome pieces of a dried plant thereof, which he receiued from *Cortuſus*, by the name of *Scolopendria leguminoſa*, or *Hedyſarum peregrinum*. *Cortuſus* had it from *Honorius Bellus*, who obſerued it growing vpon the rockes at Seberico a citie of Illyria. ‡

7 There is alſo another ſort of Hatchet Fetch, which hath very long and tough branches trailing vpon the ground, beſet with leaues like the former, but much greater: the floures grow at the top of the branches, of a pale colour, and turne into rough round and flat cods, faſhioned like little bucklers: the root of this (as of the firſt) dieth at the firſt approch of Winter, as ſoon as the ſeed is ripe. ‡ The ſtalks of this are ſtiffe and creſted, growing to the height of two cubits, with leaues as large as thoſe of Liquorice: the floures are of a faire bright red colour, the cods are made as it were of many rough buckler-like ſeeds, or rather ſeed-veſſels, wherein are contained ſmall browne ſeeds. ‡

‡ 7 *Hedyſarum clypeatum.*
French Honyſuckle.



8 *Ferrum Equinum.*
Horſe-ſhoo.

8 Horſe-ſhoo hath many ſtalks tender and lying vpon the ground: the leaues be thin, and leſſer than thoſe of Axſeed: the floures along the ſtalks are little, after which come vp long cods ſomething broad, a little bowing, which haue vpon the one ſide deep round and indented cuts, like after a ſort to a horſe-ſhoo: the root is ſomewhat long.

¶ *The Place.*

Theſe plants grow in my garden. The ſecond kinde I found growing in Suffolke in the high-way on the right hand as you go from Sudbury to Corner Church, about an hundred paces from the end of the towne, as alſo in ſundry other places of the ſame countrey; and in Eſſex about Dunmow,

mow,and in the townes called Clare and Henningham. ‡ Alſo it growes by Purfleet, about the foot of the hill whereon the winde-mill ſtands,and in diuers parts of Kent. ‡

Horſe-ſhoo commeth vp in certain vntilled and ſunny places of Italy and Languedoc:it groweth alſo in my garden.

¶ *The Time.*

Theſe plants floure in Iune,and their ſeed is ripe in Auguſt.

¶ *The Names.*

The Grecians name this,whether it be a Pulſe,or an infirmitie among corn, θέρμος: the Latines, of the forme of the ſeed,*Securidaca*,and *Hedyſarum*: in Engliſh,Axſeed,Axwort,Ax-fitch,and hatchet Fitch: it is vnknowne to the Apothecaries.

‡ The ſecond is the *Fœnugræcum ſylveſtre* of *Tragus* and *Dodonæus*; the *Glycyrrhiza ſylveſtris* of *Geſner*; and the *Glaux vulgaris* of *Lobel* ‡

Horſe-ſhoo is commonly called in Italian,*Sferro de cavallo*: you may name it in Latine,*Ferrum equinum*: in Engliſh,Horſe ſhoo.

¶ *The Nature.*

The ſeeds of theſe plants are hot and dry of complexion.

¶ *The Vertues.*

A Being drunke it is acceptable to the ſtomacke, and remoueth ſtoppings out of the intrals; and of like vertue be the new leaues and tender crops of the whole plant.

B *Dioſcorides* ſheweth that it is alſo good for the ſtomack being taken in drinke, and is mixed with counterpoiſons.

C And it is thought to hinder conception,if it be applied with hony before the act.

D The ſeed of Ax-wort openeth the ſtoppings of the liuer,the obſtruction of the ſpleen and of all the inward parts.

E Horſe-ſhoo is bitter, and like in nature to Axſeed.

† The figure which formerly was in the firſt place agreed with the third deſcription: that which was in the ſecond place was of the *Hedyſarum minus* of *Tabern.* being a kinde of *Ferrum equinum*, which carries the cods many together on the tops of the branches, and growes in Germany: whence *Bauhine* calls it *Ferrum Equinum Germanicum ſiliquis in ſummitate.* This growes about Bath, and in diuers places of the Weſt countrey, bearing yellow floures like *Trifolium Corniculatum*, about the middle of Iune. The floures of the indented hatchet Fitch are of a whitiſh blew colour.

CHAP. 519. *Of Peaſe Earth-nut.*

¶ *The Deſcription.*

1 THe Peaſe Earth-nut comes vp with ſlender weake ſtalkes: the leaues be thin and little, growing on ſlender ſtems, with claſping tendrels at the ends, with which it imbraceth and taketh hold of ſuch things as ſtand neere it: the flours on the tops of the ſtalks are like thoſe of Peaſe,but leſſe,of a red purple colour,in ſmel not vnpleaſant: in their places come vp long cods in which are three or foure round ſeeds: the roots be thick, long, like after a ſort to Acorns,but much greater,black without,gray within,in taſte like the Cheſnut;out of which beneath doth hang a long ſlender ſtring: there grow out of the ſame alſo other ſtrings hard to the ſetting on of the ſtalke,vnto which creeping aſlope do grow other kernelled roots, whileſt the plant doth thus multiply it ſelfe.

‡ 2 This,which *Thalius* in his *Sylva harcynia* ſets forth by the name of *Aſtragalus ſylvaticus*,was by our Author taken for and confounded with the *Terræ glandes*, and therefore I haue put it with it that the difference may the better appeare,which is not a little to ſuch as heedfully obſerue it. But our Author in this is to be pardoned, ſeeing Dr *Turner*, a man more exquiſite in the knowledge of plants,and who had ſeen the true *Terræglandes* in Germany,miſtooke this for it,as may appeare by that little Tract of his of the names of plants in Latine and Engliſh,ſet forth *Anno* 1548. for there he ſaith, [I haue ſeen this herb of late in Come parke more aſtringent than it of Germany.] And indeed this growes there,and is much more aſtringent and woody than that of Germany,and in no wiſe fit to be eaten. The root conſiſts of many blacke tuberous particles, here and there ſending forth fibers:from hence ariſe cornered ſtalks ſome foot high, ſmall below, and ſomewhat larger aboue:the leaues grow forth of the ſtalks,conſiſting ſometimes of two,otherwhiles of 4 longiſh narrow leaues faſtned to one foot-ſtalke,which at the ſetting on hath two little leaues or eares:out of the boſoms of theſe leaues grow ſtalks ſome two inches long,each of which vſually carry a couple of peaſe-faſhioned flours of a purple colour,which fading,vſually become blew: after theſe follow cods ſtraight,round and blacke, and in each of them are commonly contained nine or tenne white round

1 *Terra glandes.*
Peaſe Earth-nut.

‡ 2 *Aſtragalus ſylvaticus.*
Wood Peaſe or heath Peaſe.

round ſeeds: it floures in ſummer, and perfects the ſeed in Iuly and Auguſt.

¶ *The Place.*

† 1 This groweth in corne fields, both with the corne it ſelfe, and alſo about the borders of fields among briers and brambles: it is found in diuers places of Germany, but not with vs, that I can yet learne.

2 This is found in the woods and paſtures of England, eſpecially in Hampſtead Wood neere London: it groweth in Richmond heath, and in Come parke likewiſe.

¶ *The Time.*

It floureth in Iune and Iuly; the nuts after harueſt be digged vp and gathered.

¶ *The Names.*

It is called in high-Dutch, **Erdnuſſen**: in low-Dutch, **Eerdnoten**, **Eerdeeckelen**, and **Muyſen metſteerten**, that is to ſay, tailed Mice, of the ſimilitude or likeneſſe of domeſtick Mice, which the black round and long nuts, with a piece of the ſlender ſtring hanging out behinde do repreſent. The later writers call it in Latine *Terræ glandes*, or *Terreſtres glandes*: in Greeke, χαμαιβαλανοι, *Chamabalani*. in Engliſh, Peaſe Earth-nut.

¶ *The Temperature and Vertues.*

The nuts of theſe Peaſe being boiled and eaten are hardlier digeſted than be either Turneps or Parſneps, yet do they nouriſh no leſſe than the Parſnep: they are not ſo windy as they, but do more ſlowly paſſe through the belly by reaſon of their binding qualitie; and beeing eaten raw they bee yet harder of digeſtion, and do ſlowlier deſcend. A

They be of temperature meanly hot and ſomwhat dry, being withal not a little binding: where- upon alſo they do not only ſtay the fluxes of the belly, but alſo all iſſues of bloud, eſpecially from the mother or bladder. B

The root of Peaſe Earth-nut ſtoppeth the belly, and the inordinat courſe of womens ſickneſſe. C

CHAP.

Chap. 520. *Of Milke-Vetch.*

¶ *The Kindes.*

THere be diuers ſorts of herbs contained vnder the title of *Aſtragalus*; whether I may without breach of promiſe made in the beginning, inſert them amongſt the *Legamina*, Pulſes, or herby plants, it is doubtfull: but ſeeing the matter is diſputable, I thinke it not amiſſe to ſuffer them to paſſe thus, vntill ſome other ſhall finde a place more conuenient and agreeing vnto them in neighborhood.

1 *Aſtragalus Luſitanicus Cluſij.*
Portugal milke-Vetch.

2 *Aſtragalus Syriacus.*
Aſſyrian milke Vetch.

¶ *The Deſcription.*

1 THe firſt kinde of *Aſtragalus* hath reddiſh ſtalks a cubit high, a finger thicke, ſomwhat creſted or furrowed, and couered ouer with an hairy moſſineſſe; which diuide themſelues into ſundry ſmall branches, beſet with leaues conſiſting of ſundry little leaues ſet vpon a middle rib like the wilde Vetch, placed on the ſmal pliant branches like feathers, which are likewiſe couered ouer with a woolly hoarineſſe; in taſte aſtringent at the firſt, but afterwards burning hot: among theſe leaues come forth many ſmall white floures in faſhion like the floures of Lupins, which before their opening ſeem to be ſomewhat yellow: the root is maruellous great and large, conſidering the ſmalneſſe of the plant; for ſometimes it groweth to the bigneſſe of a mans arme, keeping the ſame bigneſſe for the ſpace of a ſpan in length, and after diuideth it ſelfe into two or more forks or branches, blacke without, and wrinkled; white within, hard, and woody, and in taſte vnpleaſant: which being dried becommeth harder than an horne.

2 The ſecond kinde of *Aſtragalus* is a rare and gallant plant, and may well be termed *Planta leguminoſa*, by reaſon that it is counted for a kinde of *Aſtragalus*, reſembling the ſame in the ſimilitude of his ſtalks and leaues, as alſo in the thickeneſſe of his rootes, and the creeping and folding thereof

thereof, and is garnished with a most thicke and pleasant comelinesse of his delectable red floures, growing vp together in great tufts, which are very seemly to behold.

3 There hath been some controuersie about this third kinde, which I am not willing to prosecute or enter into: it may very well be *Astragalus* of *Matthiolus* his description, or else his *Polygala*, which doth exceeding well resemble the true *Astragalus*: his small stalkes grow a foot high, beset with leaues like *Cicer* or *Galega*, but that they are somewhat lesser: among which come forth small pease like flours, of an Orenge colour, very pleasant in sight: the root is tough and flexible, of a finger thicke.

‡ 3 *Astragalus* Matthioli.
Matthiolus his milke Vetch.

‡ 4 *Astragaloides*.
Bastard milke Vetch.

4 The fourth is called of *Mutonus* and other learned Herbarists, *Astragaloides*, for that it resembleth the true *Astragalus*, which groweth a cubit high, and in shew resembleth liquorice: the flours grow at the top of the stalks, in shape like the pease bloome, of a faire purple colour, which turn into small blacke cods when they be ripe: the root is tough and very long, creeping vpon the vpper part of the earth, and of a wooddy substance.

¶ *The Place.*

They grow amongst stones in open places, as *Oribasius* writeth, in places subiect to windes, and couered with snow: *Dioscorides* copies do adde, in shadowie places: it groweth plentifully in Phenea a city in Arcadia, as *Galen* and *Pliny* report: in *Dioscorides* his copies is read, in Memphis a city in Arcadia; but Memphis is a city in Egypt, and in Arcadia there is none of that name. Some of them grow in my garden, and in sundry places of England wilde: they grow in the medowes neere Cambridge, where the Schollers vse to sport themselues; and in sundry places of Essex, as about Dunmow and Clare, and many other places of that country.

‡ I should be glad to know which or how many of these our Author here affirms to grow wild in England; for as yet I haue not heard of nor seen any of them wilde, nor in gardens with vs, except the last described, which growes in some few gardens. ‡

¶ *The Time.*

They floure in Iune and Iuly, and their seed is ripe in September.

¶ *The*

¶ *The Names.*

Milke Vetch is called of *Matthiolus*, *Polygala*, but not properly: of moſt it is called *Aſtragalus*: in Spaniſh, *Garavancillos*: in the Portugals tongue, *Alphabeca*: in Dutch, **Cleyne Cicceren.**

¶ *The Nature and Vertues.*

A *Aſtragalus*, as *Galen* ſaith, hath aſtringent or binding roots, and therefore it is of the number of thoſe Simples that are not a little drying; for it glueth and healeth vp old vlcers, and ſtayeth the flux of the belly, if they be boiled in wine and drunke. The ſame things alſo touching the vertues of *Aſtragalus*, *Dioſcorides* hath mentioned: The root, ſaith he, drunke in wine, ſtayeth the laske, and prouoketh vrine, being dried and caſt vpon old vlcers it cureth them: it likewiſe procureth great ſtore of milke in cattell that do eat thereof; whence it tooke his name.

B It ſtoppeth bleeding, but it is with much ado beaten, by reaſon of his hardneſſe.

Chap. 521. *Of Kidney Vetch.*

1 *Anthyllis leguminoſa.*
Kidney Vetch.

2 *Stella leguminoſa.*
Starry Kidney Vetch.

¶ *The Deſcription.*

1 KIdney Vetch hath a ſtalke of the height of a cubit, diuiding it ſelfe into other branches, whereon grow long leaues made of diuers leaues like thoſe of the Lentil, couered as it were with a ſoft white downineſſe: the floures on the top of the ſtalks are of a yellow colour, very many joined together as it were in a ſpoky rundle: after which grow vp little cods in which is contained ſmall ſeed: the root is ſlender, and of a wooddy ſubſtance. ‡ This is ſometimes found with white floures: whereupon *Tabern.* gaue two figures, calling the one *Lagopodium flore luteo*, and the other *Lagopodium flo. albo.* Our Author vnfitly gaue this later mentioned figure in the chapter of *Lagopus*, by the name of *Lagopum maximum.* ‡

2 The ſtarry Kidney Vetch, called *Stella Leguminoſa*, or according to *Cortuſus*, *Arcturo*, hath many

many small flexible tough branches, full of small knots or knees, from each of which springeth forth one long small winged leafe, like birds foot, but bigger: from the bofome of thofe leaues come forth little tender ftems, on the ends whereof doe grow fmall whitifh yellow floures, which are very ſlender, and ſoone vaded, like vnto them of Birds-foot: theſe floures turne into ſmall ſharp pointed cods, ſtanding one diſtant from another, like the diuiſions of a ſtar, or as though it conſiſted of little hornes; wherein is contained ſmall yellowiſh ſeeds: the root is tough, and deepely growing in the ground.

3 There is another ſort of Kidney Vetch called Birds-foot, or *Ornithopodium*, which hath very many ſmall and tender branches, trailing here and there cloſe vpon the ground, ſet full of ſmall and ſoft leaues, of a whitiſh greene, in ſhape like the leaues of the wilde Vetch, but a great deale leſſer, and finer, almoſt like ſmall feathers: amongſt which the floures do grow, that are very ſmall, yellowiſh, and ſometimes whitiſh; which being vaded there come in place thereof little crooked cods, fiue or ſix growing together, which in ſhew and ſhape are like vnto a ſmall Birds-foot, and each and euery cod reſembling a claw: in which are incloſed ſmall ſeed like that of Turneps.

‡ 3 *Ornithopodium majus.*
The great Birds-foot.

‡ 4 *Ornithopodium minus.*
Small Birds-foot.

‡ 5 *Scorpoides Leguminoſa.*
Small horned pulſe.

4 There is alſo another kinde of *Ornithopodium*, or Birds-foot, called ſmall Birds-foot, which is very like vnto the firſt, but that it is much ſmaller: the branches or ſprigs grow not aboue a hand or halfe an hand in length, ſpreading themſelues vpon the ground with his ſmall leaues and branches, in manner of the leſſer *Arachus*: the floures are like vnto thoſe of the former, but very ſmall, and of a red colour.

‡ 5 This ſmall horned pulſe may fitly here take place: The root thereof conſiſts of many little fibres, from which ariſe two or three little ſlender ſtraight ſtalkes ſome handfull and halfe or foot high: at the tops of theſe grow little ſharpe pointed crooked hornes, rounder and ſlenderer than thoſe of Fenugreeke, turning their ends inwards like the tailes of Scorpions and ſo joynted; the floures are ſmall and yellow; the leaues little, and winged like thoſe of Birds-foot. *Pena* and *Lobel* found this amongſt the corne in the fields in Narbon in France, and they ſet it forth by the name as I haue here giuen you it. ‡

¶ *The Place.*

1. 3. 4. Theſe plants I found growing vpon Hampſtead Heath neere London, right againſt

the Beacon, vpon the right hand as you goe from London, neere vnto a grauell pit: they grow alſo vpon blacke Heath, in the high way leading from Greenwich to Charleton, within halfe a mile of the towne.

¶ *The Time.*

They floure from Iune to the middle of September.

¶ *The Names.*

‡ 1 This *Geſner* calls *Vulneraria ruſtica: Dodonæus, Lobel*, and *Cluſius* call it *Anthyllis*, and *Anthyllis legumnoſa*. ‡

3. 4. I cannot finde any other name for theſe plants, but *Ornithopodium*: the firſt is called in Engliſh, great Birds-foot; the ſecond ſmall Birds-foot.

¶ *The Temperature and Vertues.*

Theſe herbes are not vſed either in meate or medicine, that I know of as yet; but they are very good food for cattell, and procure good ſtore of milke, whereupon ſome haue taken them for kinds of *Polygala*.

Chap. 522. *Of Blacke milke Tare.*

Glaux Dioſcoridis.
Dioſcorides his milke Tare.

¶ *The Deſcription.*

THe true *Glaux* of *Dioſcorides* hath very many tough and wooddy branches trailing vpon the ground, ſet full of ſmall winged leaues, in ſhape like the common *Glaux*, but a great deale ſmaller, reſembling the leaues of Tares, but rather like Birds-foot, of a very gray colour: amongſt which come forth knobby & ſcaly or chaffie heads, very like the Medow Trefoile, of a fare purple colour: the root is exceeding long and wooddy, which the figure doth not expreſſe and ſet forth.

¶ *The Place.*

The true *Glaux* groweth vpon Barton hill, foure miles from Lewton in Bedfordſhire, vpon both the ſides of the declination of the hill.

¶ *The Time.*

Theſe plants do floure and flouriſh about Midſummer.

¶ *The Names.*

Theſe plant haue in times paſt beene called *Glaux*, *i. folia habens glauca, ſiue pallentia*; that is, hauing skie coloured, or pale leaues.

Sithens that in times paſt, ſome haue counted *Glaux* among the kindes of *Polygala*, or Milke-worts, we may therefore call this kinde of *Glaux*, blacke Milke-wort.

¶ *The Temperature.*

Theſe herbes are dry in the ſecond degree.

¶ *The Vertues.*

The ſeeds of the common *Glaux* are in vertue like the Lentils, but not ſo much aſtringent: they A ſtop the flux of the belly, dry vp the moiſture of the ſtomacke, and ingender ſtore of milke.

† Our Author either not knowing, or forgetting what he had done, againe in this chapter, deſcribed the *Glaux Vulgaris*, whoſe hiſtory he gaue vs but foure chapters before, by the name of *Hedyſarum glycyrhizatum*; wherefore I haue omitted it here as not neceſſary.

Chap.

Chap. 523. *Of red Fitchling, Medick Fitch, or Cockes-head.*

¶ *The Description.*

1 THe first kinde of *Onobrychis* hath many small aud twiggie pliant branches, ramping and creeping through and about bushes, or whatsoeuer it groweth neere vnto: the leaues and all the rest of the pulse or plant is very like to the wilde Vetch or Tare: the floures grow at the top of small naked stalkes, in shape like the pease bloome, but of a purple colour laied ouer with blew, which turne into small round prickly husks, that are nothing else but the seed.

1 *Onobrychis, siue Caput Gallinaceum.*
Medick Fitchling, or Cockes-head.

2 *Onobrychis flore purpureo.*
Purple Cockes-head.

2 The second kind of Fitchling or Coks-head, of *Clusius* his description, hath very many stalks, especially when it is growne to an old plant, round, hard, and leaning to the ground like the other pulses, and leaues very like *Galega*, or the wilde Vetch, of a biter taste and lothsome sauour: among which come forth small ronnd stems, at the ends whereof do grow floures, spike fashion, three inches long, in shape like those of the great *Lagopus*, or medow Trefoile, but longer, of an excellent shining purple colour, but without smell: after which there follow small cods, containing little hard and blacke seed, in taste like the Vetch. The root is great and long, hard, and of a wooddy substance, spreading it selfe farre abroad, and growing very deepe into the ground.

3 The third kinde of Fitchling or Cocks-head hath from a tough small and wooddy root, many twiggy branches growing a cubit high, full of knots, ramping and creeping on the ground. The leaues are like the former, but smaller and shorter: among which come forth small tender stemmes, whereupon do grow little floures like those of the Tare, but of a blew colour tending to purple: the floures being vaded, there come the small cods, which containe little blacke seed like a Kidney, of a blacke colour.

4 The fourth kinde of Fetchling hath firme greene hard stalks a cubit and a halfe high, whereupon grow leaues like to the wilde Tare or *Galega*, but smaller and somewhat hairy, bitter and vnpleasant in taste, and in the end somewhat sharpe. At the top of the stalkes come forth long spiked floures,

3 *Onobrychis 2. Cluſij.*
Blew Medicke Fitch.

4 *Onobrychis 3. Cluſij flore pallido.*
Pale coloured Medicke Fitch.

5 *Onobrychis montana 4. Cluſij.*
Mountaine Medicke Fitch.

floures of a pale colour, and in ſhape like thoſe of the ſecond kinde; which being vaded, there follow ſmall bottle cods, wherein is contained little blacke ſeed like the ſeed of Fenugreek, but ſmaller. The root is thicke and hard, and of a wooddy ſubſtance, and laſting very long.

5 The fifth kinde of *Onobrychis* hath many groſſe and wooddy ſtalkes, proceeding immediately from a thick, fat, and fleſhie tough root: the vpper part of which are ſmall, round, and pliant, gamiſhed with little leaues like thoſe of Lentils, or rather *Tragacantha*, ſomewhat ſoft, and couered ouer with a woolly hairineſſe: amongſt which come forth litrle long and naked ſtems, eight or nine inches long, whereon do grow many ſmall floures of the faſhion of the Vetch or Lentill, but of a blew colour tending to purple; and after them come ſmall cods, wherin the ſeed is contained.

¶ *The Place.*

The firſt and ſecond grow vpon Barton hill, foure miles from Lewton in Bedfordſhire, vpon both the ſides of the hill: and likewiſe vpon the graſſie balks between the lands of corn two miles from Cambridge, neere to a water mill towards London; and diuers other places by the way from London to Cambridge: the reſt are ſtrangers in England.

¶ *The Time.*

Theſe plants do floure in Iuly, and their ſeed is ripe ſhortly after.

¶ *The*

¶ *The Names.*

It is ἀνώνυμος, or without a name among the later writers: the old and antient Phyſitions doe call it ὀνοβρυχὶς: for all thoſe things that are found written in *Dioſcorides* or *Pliny* concerning *Onobrychis*, doe eſpecially agree hereunto. *Dioſcorides* writeth thus; *Onobrychis* hath leaues like a Lentill, but longer; a ſtalk a ſpan high; a crimſon floure; a little root: it groweth in moiſt and vntilled places: and *Pliny* in like manner; *Onobrychis* hath the leaues of a Lentill, ſomewhat longer, a red floure, a ſmall and ſlender root: it groweth about ſprings or fountaines of waters.

All which things and euery particular are in this ἀνώνυμος, or nameleſſe herbe, as it is manifeſt: and therefore it is not to be doubted at all, but that the ſame is the *Onobrychis* of the old Writers: it may be called in Engliſh, red Fetchling, or as ſome ſuppoſe, Medick Fetch, or Cockes-head.

¶ *The Temperature.*

Theſe herbes as *Galen* hath written in his books of the Faculties of ſimple Medicines, doe rarifie or make thinne and waſt away.

¶ *The Vertues.*

Therefore the leaues thereof when it is greene, being yet laied vpon hard ſwellings, or waxen kernels, in manner of a ſalue, do waſt and conſume them away, but being dryed and drunke in wine they cure the ſtrangurie; and laied on with oile it procureth ſweat. A

Which things alſo concerning *Onobrychis*, *Dioſcorides* hath in theſe words ſet downe: the herbe ſtamped and applied waſteth away hard ſwellings of the kernels; but being drunke with wine it helpeth the ſtangury, and rubbed on with oile it cauſeth ſweatings. B

Chap. 524. *Of Baſtard Dittanie.*

Fraxinella.
Baſtard Dittanie.

¶ *The Deſcripton.*

BAſtard Dittanie is a very rare and gallant plant, hauing many browne ſtalks, ſomwhat rough, diuided into ſundry ſmall branches, garniſhed with leaues like Liquorice, or rather like the leaues of the Aſh tree, but blacker, thicker, and more ful of juice, of an vnpleaſant ſauor: among which grow floures, conſiſting of fiue whitiſh leaues ſtripped with redde, whereof one which groweth vndermoſt hangeth downe low; but the foure which grow vppermoſt grow more ſtiffe and vpright: out of the midſt of this floure commeth forth a taſſell, which is like a beard, hanging alſo downwards, and ſomewhat turning vp at the lower end: which beeing vaded, there come in place foure huskes joyned together, much like the husks or coddes of Columbines, ſomewhat rough without, ſlimie to handle, and of a lothſome ſauour, almoſt like the ſmell of a goat; whereupon ſome Herbariſts haue called it *Tragium*: in the cods are contained ſmall blacke ſhining ſeeds like Peonie ſeeds in colour: the roots are white, a finger thicke, one twiſting or knotting within another, in taſt ſomwhat bitter.

There is another kinde hereof growing in my garden, not very much differing: the leaues of the one are greater, greener, harder, and ſharper pointed: of the other blacker, not ſo hard, nor ſo ſharpe pointed: the floures alſo hereof be ſomthing more bright coloured, and of the other a little redder.

¶ *The Place.*

Baſtard Dittany groweth wilde in the mountaines of Italy and Germany, and I haue it growing in my garden.

¶ *The Time.*

It floureth in Iune and Iuly: the ſeed is ripe in the end of Auguſt.

¶ *The Names.*

The later Herbariſts name it *Fraxinella:* moſt, χαμαιμηλιον, as though they ſhould ſay *Humilis Fraxinus* or a low aſh: in Engliſh, baſtard, or falſe Dittanie: the ſhops call it *Dictamnum*, and *Diptamum*, but not truly, and vſe oftentimes the roots hereof in ſtead of the right Dittany. That it is not the right Dittany it is better knowne than needfull at all to be confuted; and it is euident that the ſame is not *Dioſcorides* his *Pſeudodictamnum*, or baſtard Dittanie: but it is plaine to be a kinde of *Tragium* of the old Writers wherewith it ſeemeth to agree in ſhew, but not in ſubſtance.

‡ The root of this is onely vſed in ſhops, and there knowne by the name of *Radix Diptamni*, or *Dictamni*. ‡

¶ *The Temperature.*

The root of Baſtard Dittany is hot and dry in the ſecond degree, it is of a waſting, attenuating, and opening faculty.

¶ *The Vertues.*

A It bringeth downe the menſes, it alſo bringeth away the birth and after birth, it helpeth cold diſeaſes of the matrix: and it is reported to be good for thoſe that haue ill ſtomackes and are ſhort
B winded.

They alſo ſay, that it is profitable againſt the ſtingings and bitings of venomous ſerpents; againſt deadly poiſons, againſt contagious and peſtilent diſeaſes, and that it is with good ſucceſſe mixed
C with counterpoiſons.

The ſeed of Baſtard Dittanie taken in the quantity of a dram is good againſt the ſtrangury, pro-
D uoketh vrine, breaketh the ſtone in the bladder, and driueth it forth.

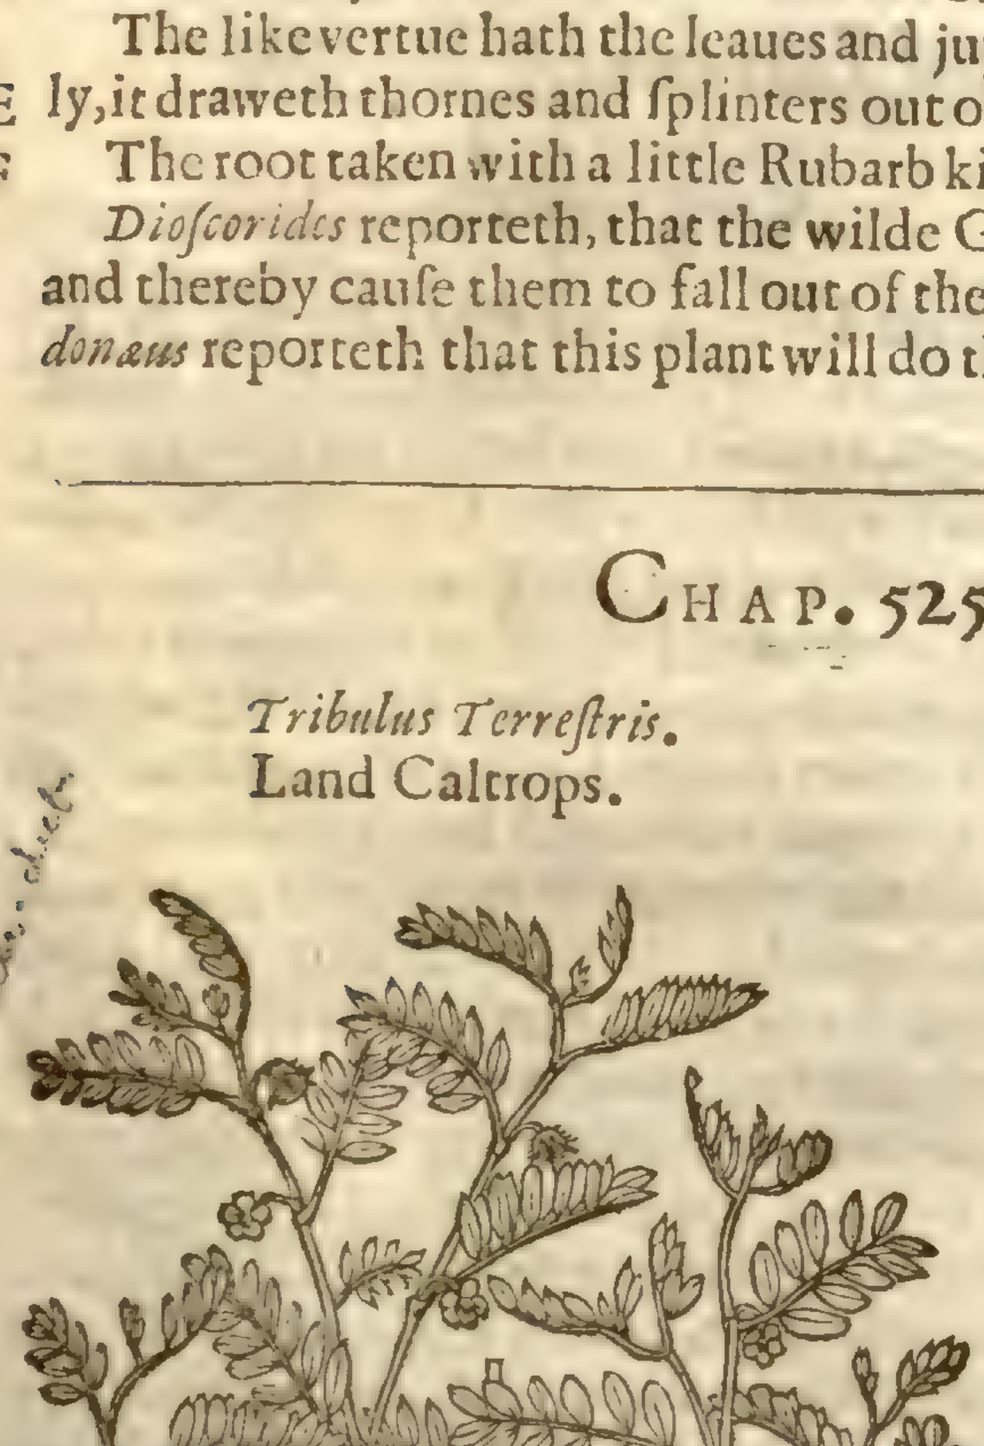
The like vertue hath the leaues and juyce taken after the ſame ſort; and being applied outward-
E ly, it draweth thornes and ſplinters out of the fleſh.

F The root taken with a little Rubarb killeth and driueth forth wormes.

Dioſcorides reporteth, that the wilde Goats being ſtriken with darts or arrowes, will eat *Dictam*, and thereby cauſe them to fall out of their bodies; which is meant of the right *Dictam*, though *Dodonæus* reporteth that this plant will do the like (which I do not beleeue) ‡ nor *Dodonæus* affirme. ‡

Chap. 525. *Of Land Caltrops.*

Tribulus Terreſtris.
Land Caltrops.



¶ *The Deſcription.*

LAnd Caltrops hath long branches full of joynts, ſpred abroad vpon the ground, garniſhed with many leaues ſet vpon a middle rib, after the manner of Fetches; amongſt which grow little yellow branches, conſiſting of fiue ſmall leaues, like vnto the floures of Tormentill: I neuer ſaw the plant beare yellow, but white floures, agreeing with the deſcription of *Dodonæus* in each reſpect, ſaue in the colour of the floures, which doe turne into ſmall ſquare fruit, rough, and full of prickles, wherein is a ſmall kernell or ſeed: the root is white, and full of ſtrings.

¶ *The Place.*

It groweth plentifully in Spain in the fields: it is hurtfull to corne, but yet as *Pliny* ſaith, it is rather to bee accounted among the diſeaſes of corne, than among the plagues of the earth: it is alſo found in moſt places of Italy and France; I found it growing in a moiſt medow adjoyning to the wood or Parke of Sir *Francis Carew*, neere Croidon, not farre from London, and not elſewhere; from whence I brought plants for my garden.

¶ *The*

¶ *The Time.*

It floureth in Iune and Iuly: the fruit is ripe in Auguſt.

¶ *The Names.*

It is called in Greeke, τριβολος: and in Latine, *Tribulus*: and that it may differ from the other which groweth in the water, it is named τριβολος χερσαιος, or *Tribulus terreſtris*: it may be called in Engliſh, land Caltrops, of the likeneſſe which the fruit hath with Caltrops, that are inſtruments of Warre caſt in the way to anoy the feet of the enemies horſes, as is before remembred in the Water Saligot.

¶ *The Temperature and Vertues.*

In this land Caltrop there is an earthy and cold quality abounding, which is alſo binding, as *Galen* ſaith. A

The fruit thereof being drunke waſteth away ſtones in the kidneyes, by reaſon that it is of thinne parts. B

Land Caltrops, ſaith *Dioſcorides*, being drunke to the quantity of a French crowne weight, and ſo applied, cureth the bitings of the Viper. C

And if it be drunke in wine it is a remedy againſt poyſons: the decoction thereof ſprinckled about killeth fleas. D

‡ Chap. 526. *Of Spring or mountaine Peaſe or Vetches.*

‡ 1 *Orobus Venetus.*
Venice Peaſe.

‡ 2 *Orobus ſylvaticus vernus.*
Spring Peaſe.

¶ *The Deſcription.*

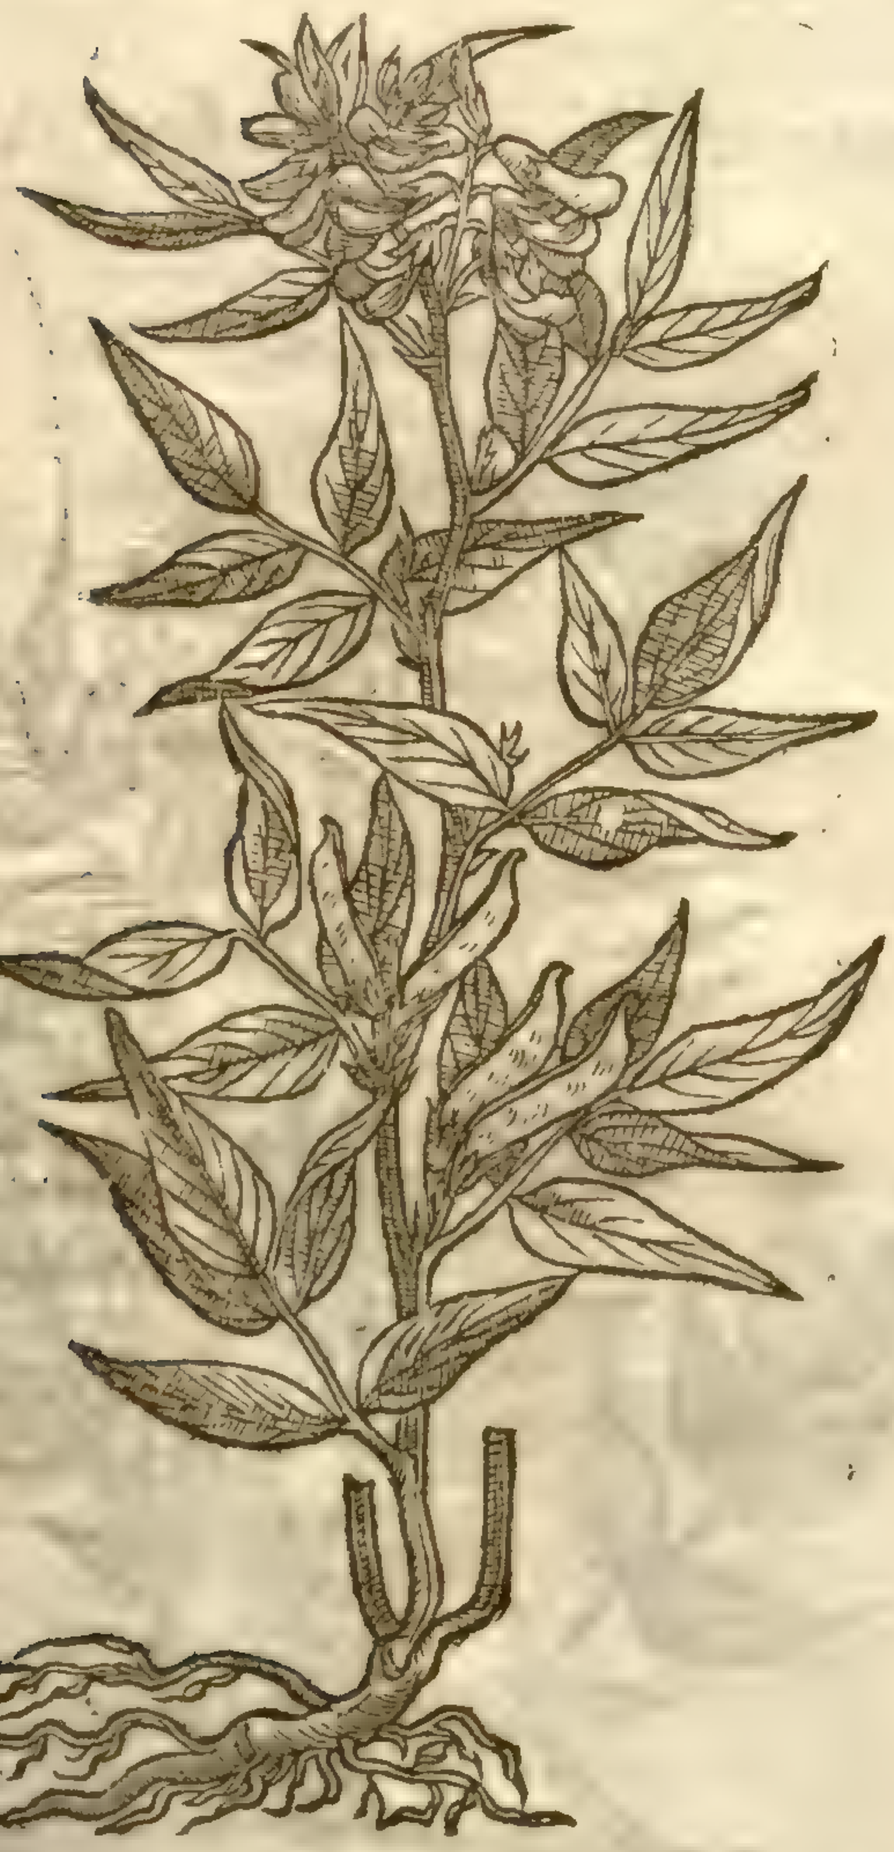
‡ 1 THis, which *Cluſius* calls *Orobus Venetus*, hath many cornered ſtalkes ſome foot long, whereon grow winged leaves, foure or ſix faſtned to one rib, ſtanding by couples one againſt another, without any odde leafe at the end: theſe leaues are of an indifferent largeneſſe, and

and of a light greene colour: the flours grow vpon long foot-ſtalks comming forth of the boſoms of the leaues, many together, hanging downe, ſmall, yet ſhaped like thoſe of other Pulſes, and of a purple colour: after theſe follow cods almoſt like thoſe of Fetches, but rounder, red when they be ripe, and containing in them a longiſh white ſeed: the root is hard and wooddy, running diuers waies with many fibres, and liuing ſundry yeares: this varies ſometimes with yellower green leaues and white floures. It floures in May, and growes only in ſome few gardens with vs.

2 The ſtalkes of this alſo are a foot or more high, ſtiffe, cornered, and greene; on theſe do grow winged leaues ſix or eight on a rib, after the manner of thoſe of the laſt deſcribed: each of theſe leaues hath three veines running alongſt it: the floures in ſhape and manner of growing are like thoſe of the former, but of a moſt elegant purple colour: which fading they become blew. The floures are ſucceeded by ſuch cods as the former, wherein are contained longiſh ſmall variegated ſeed, which ripe, the cods fly open, and twine themſelues round, as in moſt plants of this kinde: the root is blacke, hard, tuberous and wooddy, ſending forth each yeare new ſhoots. This floures in Aprill and May, and ripeneth the ſeed in Iune. This was found by *Cluſius* in diuers mountainous wooddie places of Hungary: he calls it *Orobus Pannonicus* 1.

‡ 3 *Orobus montanus flo. albo.*
White mountaine Peaſe.

‡ 4 *Orobus montanus anguſtifolius.*
Narrow leafed mountaine Peaſe.



3 This hath ſtalkes ſome cubit high, ſtiffe, ſtraight, and creſted; whereon by turnes are faſtned winged leaues, conſiſting of foure ſufficiently large and ſharpe pointed leaues, whereto ſometimes at the very end growes a fifth: the veines in theſe run from the middle rib towards their edges: their taſte is firſt ſomewhat ſouriſh, afterwards bitteriſh. The floures grow vpon ſhort ſtalkes comming forth of the boſomes of the leaues, fiue or ſix together, like thoſe of the Fetch, but of colour white, with ſome little yellowneſſe on the two little leaues that turne vpwards. The cods are like thoſe of the laſt deſcribed, and containe in them a browniſh ſeed, larger than any of the other kindes. This is an annuall plant, and periſheth as ſoone as it hath perfected the ſeed. *Cluſius* giues vs this by the name of *Orobus Pannonicus* 4. *Dodonæus* giues the ſame figure for his *Arachus latifolius*: and *Bauhine* affirmes this to be the *Galega montana*, in the *Hiſt. Lugd. pag.* 1139. But theſe ſeeme to be of two ſeuerall plants; for *Dodonæus* affirmes his to haue a liuing root, and ſuch ſeemes alſo that in the *Hiſt. Lugd.* to be: yet *Cluſius* ſaith expreſſely that his is an annuall, and floureth in Aprill

Aprill and May, and groweth in some wooddy mountainous places of the Kingdome of Hungarie.

4 This fourth hath straight firme cornered stalkes some foot or more high, whereupon grow leaues vsually foure on a foot-stalke, standing two against two, vpright, beeing commonly almost three inches long, at first of a sourish taste, but afterwards bitter: it hath no clauicles, because the stalkes need no supporters: the floures grow vpon long foot-stalkes, spike-fashion like those of Pease, but lesse, and white of colour: after these follow long blackish cods, full of a blacke or else spotted seed: the roots are about the length of ones little finger, fashioned like those of the Asphodill or lesser female Peionie, but lesser, blacke without, and white within. *Clusius* found this on the mountainous places nigh the baths of Baden, and in the like places in Hungary: he calls it *Orobus Pannonicus* 3.

¶ *The Temperature and Vertues.*

These are not knowne nor vsed in Physicke; yet if the third be the *Galega montana* of the *Hispanis Lugd.* then it is there said to be effectuall against poyson, the wormes, the falling sickenesse and the Plague. ‡

‡ Chap. 527. *Of some other Pulses.*

‡ 1 *Ochrus, siue Ervilia.*
Birds Pease.

‡ 2 *Ervum sylvestre.*
Crimson grasse Fetch.

¶ *The Description.*

‡ 1 The first of these hath cornered broad stalks like those of euerlasting Pease, and they are weake, and commonly lie vpon the ground, vnlesse they haue something to support them: the lower leaues are broad, and commonly welt the stalke at their setting on, and at the end of the first leafe do vsually grow out after an vnusuall manner, two, three, or more other pretty large leaues more long than broad, and the middle rib of the first leafe runnes out beyond the setting on of the highest of the out-growing leaues, and then it ends in two or three clasping tendrels. Those leaues that grow the lowest vpon the stalkes haue commonly the fewest comming out of them.

them. The floures are like thoſe of other pulſes, of colour white: the cods are ſome inch and halfe long, containing ſome halfe dozen darke yellow or blackiſh ſmall Peaſe: theſe cods grow one at a joynt, on ſhort foot-ſtalkes comming forth of the boſomes of the leaues, and are welted on their broader ſide, which ſtands towards the maine ſtalke. This growes with vs only in gardens. *Dodonæus*, *Pena*, and *Lobel* call it *Ochrus ſylueſtris, ſiue Ervilia.*

2 The ſtalkes of this grow vp ſometimes a cubit high, being very ſlender, diuided into branches, and ſet vnorderly with many graſſe-like long narrow leaues: on the tops of the ſtalkes and branches, vpon pretty long foot-ſtalkes grow pretty peaſe-faſhioned floures of a faire and pleaſant crimſon colour: which fallen, there follow cods, long, ſmall, and round, wherein are nine, ten, or more round hard blacke ſhining graines: the root is ſmall, with diuers fibres, but whether it die when the ſeed is perfected, or no as yet I haue not obſerued. This growes wilde in many places with vs, as in the paſture and medow grounds about Pancridge Church. *Lobel* and *Dodon.* call this *Ervum ſylueſtre*; and they both partly iudge it to be the firſt *Catanance* of *Dioſcorides*, and by that name it is vſually called. It floures in Iune and Iuly, and the ſeed is ripe in Auguſt.

3 This alſo, though it be not frequently found, is no ſtranger with vs; for I haue found it in the corne fields about Dartford in Kent and ſome other places. It hath long ſlender joynted creeping ſtalkes, diuided into ſundry branches, whereon ſtand pretty greene three cornered leaues two at a joynt, in ſhape and bigneſſe like thoſe of the leſſer Binde-weed. Out of the boſomes of theſe leaues at each joynt comes a claſping tendrel, and commonly together with it a foot-ſtalke ſome inch or more long, bearing a pretty little peaſe-faſhioned yellow flour, which is ſucceeded by a ſhort flattiſh cod containing ſix or ſeuen little ſeeds. This floures in Iune, Iuly, and Auguſt, and ſo ripens the ſeed. It is by *Lobel* and others thought to be the *Aphace* of *Dioſcorides*, *Galen*, and *Pliny*: and the *Pitine* of *Theophraſtus*, by *Anguillara.*

‡ 3 *Aphaca.*
Small yellow Fetch.

I finde mention in *Stowes* Chronicle, in *Anno* 1555, of a certaine Pulſe or Peaſe, as they term it, wherewith the poore people at that time there being a great dearth, were miraculouſly helped: he thus mentions it; In the moneth of Auguſt (ſaith he) in Suffolk at a place by the ſea ſide all of hard ſtone and pibble, called in thoſe parts a ſhelfe, lying betweene the townes of Orford and Aldborough, where nether grew graſſe, nor any earth was euer ſeene; it chanced in this barren place ſuddnely to ſpring vp without any tillage or ſowing, great abundance of Peaſon, whereof the poore gathered (as men iudged) aboue an hundred quarters, yet remained ſome ripe and ſome bloſſoming, as many as euer there were before: to the which place rode the Biſhop of Norwich and the Lord *Willoughby*, with others in great number, who found nothing but hard rockie ſtone the ſpace of three yards vnder the roots of theſe Peaſon: which roots were great and long, and very ſweet.

Geſner alſo, *de Aquatilibus*, *lib.* 4. *pag.* 256. making mention, out of Dr *Cajus* his letters, of the ſpotted Engliſh Whale, taken about that time at Lin in Northfolke, alſo thus mentions thoſe Peaſe: *Piſa* (ſaith he) *in littore noſtro Britannico quod Orientem ſpectat, certo quodam in loco Suffolciæ, inter Alburnum & Ortfordium oppida, ſaxis inſidentia (mirabile dictu) nulla terra circumfuſa, autumnali tempore Anno* 1555, *ſponte nata ſunt, adeo magna copia, vt ſufficerent vel millibus hominum.* Theſe Peaſe, which by their great encreaſe did ſuch good to the poore that yeare, without doubt grew there for many yeares before, but were not obſerued till [*Magiſter artis, ingenijque largitor Venter*] hunger made them take notice of them, aud quickned their inuention, which commonly in our people is very dull, eſpecially in finding out food of this nature.

My

My Worshipfull friend Dr. *Argent* hath told me, that many yeares agoe he was in this place, and caused his man to pull away the beach with his hands, and follow the roots so long, vntill he got some equall in length vnto his height, yet could come to no ends of them: he brought these vp with him to London, and gaue them to Dr. *Lobel*, who was then liuing; and he caused them to be drawne, purposing to set them forth in that Worke which he intended to haue published, if God had spared him longer life. Now whether these Pease be truly so called, and be the same with the *Pisum syluestre Perenne*, or different; or whether they be rather of the stocke of the *Lathyrus major*, or of some other Pulse here formerly described, I can affirme nothing of certainety, because I haue seene no part of them, nor could gather by any that had, any certainty of their shape or figure: yet would I not passe them ouer in silence, for that I hope this may come to be read by some who liue thereabout, that may by sending me the things themselues, giue me certaine knowledge of them; that so I may be made able, as I am alwaies willing, to impart it to others.

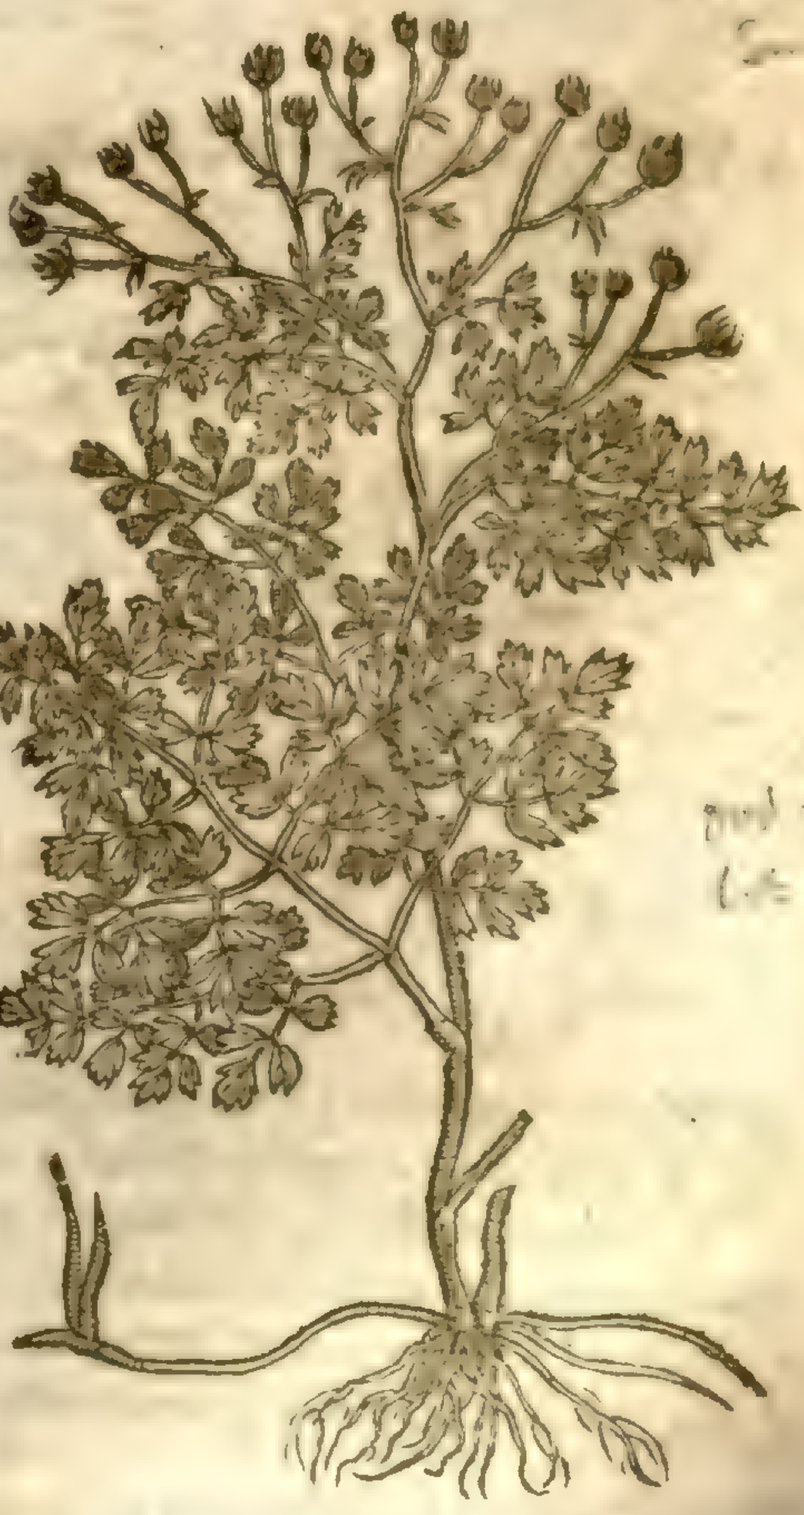
¶ *The Temperature and Vertues.*

I haue not found any thing written of the faculties of the two first; but of *Aphace*, *Galen* saith it hath an astringent faculty like as the Lentill, and also is vsed to be eaten like as it, yet it is harder of concoction, but it dries more powerfully, and heates moderately. The seeds (saith he) haue an astringent faculty; wherefore parched, broken, and boyled, they stay fluxes of the belly. We know (saith *Dodonæus*) by certaine experience, that the *Aphace* here described hath this astringent force and faculty. ‡ A.

Chap. 528. *Of bastard Rubarb.*

1 *Thalictrum, siue Thalictrum majus.*
Great bastard Rubarb.

2 *Thalictrum minus.*
Small bastard Rubarb.



¶ *The Description.*

1 THe great *Thalictrum* or bastard Rubarb hath large leaues parted or diuided into diuers other small leaues, somewhat snipt about the edges, of a blacke or darke greene colour: the

the ſtalkes are creſted or ſtreaked, of a purple colour, growing to the height of two cubits: at the top whereof grow many ſmall and hairy white floures, and after them come ſmall narrow huskes like little cods, foure or fiue growing together: the root is yellow, long, round, and knotty, diſperſing it ſelfe far abroad on the vpper cruſt of the earth.

2 The ſmall baſtard Rubarb is very like vnto the precedent, but that it is altogether leſſer: his ſtalkes are a ſpan or a foot long: his leaues be thin and tender; the root fine and ſlender: the little floures grow together in ſmall bundles or tufts, of a light yellow colour, almoſt white, and are of a grieuous ſauour.

‡ 3 There is kept in ſome gardens a plant of this kinde growing vp with large ſtalkes to the height of three cubits: the leaues are very like thoſe of Columbines: the floures are made of many white threds: it floures in Iune, and is called *Thalictrum majus Hiſpanicum*, Great Spaniſh Baſtard Rubarb. ‡

¶ *The Place.*

Theſe plants doe grow alongſt the Ditch ſides leading from Kentiſh ſtreet vnto Saint Thomas a-Waterings (the place of Execution) on the right hand. They grow alſo vpon the bankes of the Thames, leading from Blacke-wall to Woolwich, neere London, and in ſundry other places alſo.

¶ *The Time.*

They floure for the moſt part in Iuly and Auguſt.

¶ *The Names.*

Diuers of the later Herbariſts do call it *Pigamum*, as though it were πήγανον, that is, Rue; whereupon moſt call it *Ruta paluſtris*, or Fen Rue: others, *Pſeudo-Rhabarbarum*, and *Rhabarbarum Monacherum*, by reaſon of the yellow colour of the root. But nether of their iudgements is greatly to be eſteemed of: they iudge better that would haue it to be *Thalictrum*, which *Dioſcorides* deſcribeth to haue leaues ſomething flatter than thoſe of Coriander; and the ſtalke like that of Rue: vpon which the leaues do grow. *Pena* calleth it *Thalictrum*, *Thalictrum*, and *Ruta pratenſis*: in Engliſh, Baſtard Rubarb, or Engliſh Rubarb: which names are taken of the colour, and taſte of the roots.

¶ *The Temperature.*

Theſe herbes are hot and dry of complexion.

¶ *The Vertues.*

A The leaues of Baſtard Rubarb with other pot-herbes do ſomewhat moue the belly.

B The decoction of the root doth more effectually.

C *Dioſcorides* ſaith, That the leaues being ſtamped do perfectly cure old vlcers. *Galen* addeth, that they dry without biting.

Chap. 529. *Of Goats Rue.*

¶ *The Deſcription.*

Galega or Goats Rue hath round hard ſtalkes two cubits or more high, ſet full of leaues diſplayed or winged abroad; euery leafe conſiſting of ſundry ſmall leaues ſet vpon a ſlender rib, reſembling the leaues of the field Vetch or Tare, but greater and longer. The floures grow at the top of the ſtalke, cluſtering together after the manner of the wilde Vetch, of a light skie colour, which turne into long cods ſmall and round, wherein the ſeed is contained. The root is great, thicke, and of a white colour.

¶ *The Place.*

It groweth plentifully in Italy euery where in fat grounds and by riuers ſides: it groweth likewiſe in my garden.

¶ *The Time.*

It floureth in Iuly and Auguſt.

¶ *The Names.*

The Italians call it *Galega*, and *Ruta Capraria*: diuers name it corruptly *Gralega*: *Hieronymus Fracaſterius*

Galegâ.
Goats Rue.

Fracastorius calleth it *Herba Galleca*: the Hetruscians, *Lauanese*; and it is also called by diuers other names in sundry places of Italy, as *Gesner* saith, as are *Castracane*, *Lauanna*, *Thorina*, or *Taurina*, *Martanica*, *Sarracena*, *Capragina*, *Herbanesa*, *Fœnum græcum syluestre*, and as *Brasauolus* witnesseth, *Giarga*. It is named in English, Italian Fitch, and Goats Rue.

Some iudge that the old Physitions were wont to call it *Onobrychis*: others, *Glauce*: diuers would haue it to bee *Polemonium*, but not so much *Petr. And. Matthiolus* in his commentaries, as euery one of the descriptions mentioned by *Dioscorides* doe gainesay them; as also those, who thinke that *Galega*, is *Polygalon*, and that the name of *Galega* came of *Polygalon*, the very description also of *Polygalon* is against them: for *Galega* is higher and greater than that it may be called a little shrub onely of an hand breadth high.

¶ *The Temperature.*

This plant is in a meane temperature betweene hot and cold.

¶ *The Vertues.*

Goats Rue is a singular herbe against all A venome and poison, and against wormes, to kill and driue them forth, if the juyce be giuen to little children to drinke.

It is of like vertue if it bee fryed with B Linseed oyle, and bound vpon the childes nauell.

It is ministred vnto children which are possessed with a falling euill, a spoonfull euery morning C in milke.

Being boiled in vineger, and drunke with a little Treacle, it is very good against the infection of D the plague, especially if the medicine be taken within twelue houres.

The herbe it selfe is eaten, being boyled with flesh, as we vse to eat Cabbage and other worts, E and likewise in sallades, with oyle, vineger and pepper, as we doe eat boyled Spinage, and such like; Which is most excellent being so eaten, against all poison and pestilence, or any venomous infirmitie whatsoeuer, and procureth sweat.

It also helpeth the bitings and stingings of venomous beasts, if either the juyce or the herbe F stamped be laid vpon the wound.

Halfe an ounce of the juyce inwardly taken is reported to helpe those that are troubled with G convulsions, crampes, and all other the diseases aforesaid.

The seeds do feed pullen exceedingly, and cause them to yeeld greater store of egges than or- H dinary.

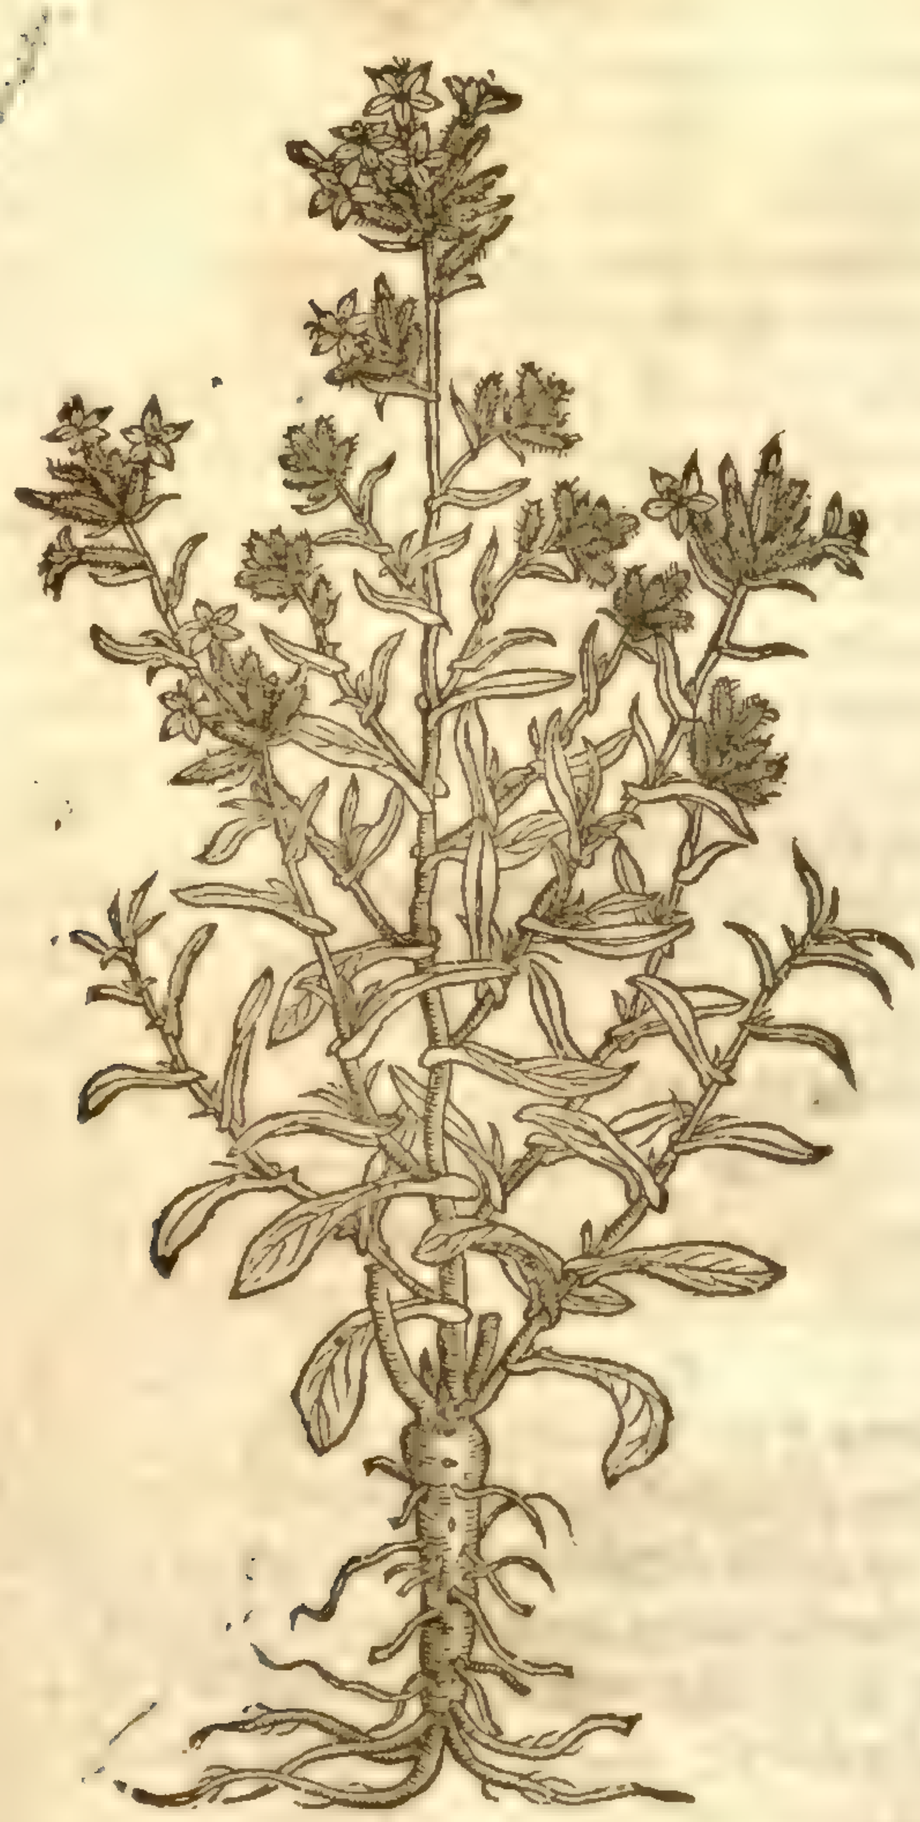
‡ The juyce of the leaues, or the leaues themselues bruised and applied to any part swollen I by the sting of a Bee or waspe, mitigate the paine, and are a present remedy, as Mr. *Cannon* a louer of Plants, and friend of mine, hath assured me he hath seene by frequent experience. ‡

Chap. 530. *Of* Pliny *his Leadwort.*

¶ *The Description.*

Entaria or *Dentillaria* hath offended in the superlatiue degree, in that he hath hid himselfe like a runnagate souldier, when the assault should haue beene giuen to the plant *Lepidium*, whereof doubtlesse it is a kinde. But if the fault be mine, as without question it is, I craue pardon for the ouersight, and doe intreate the gentle Reader to censure me with fauour, whereby I may be more bold to insert it in this place, rather than to leaue it vntouched. The learned of Narbone (especially *Rondeletius*) haue not without good cause accounted this goodly plant for a kinde thereof,

Plumbago Plinij.
Leadwort.



Dentillaria is of a cauſticke quality.

¶ *The Vertues.*

A It helpeth the tooth-ache, and that as ſome ſay if it be holden in the hand ſome ſmall while.

thereof, becauſe the whole plant is of a biting taſte, and a burning faculty, and that in ſuch extremity, that it will raiſe bliſters vpon a mans hand: for which cauſe ſome of the learned ſort haue accounted it *Plinies Molybdæna*, or *Ægineta* his *Lepidium*: but the new Herbarists call it *Dentaria*, or *Dentillaria Rondeletij*, who made the like vſe hereof, as he did of *Pyrethrum*, and ſuch burning plants, to appeaſe the immoderate paine of the tooth-ache and ſuch like. This plant hath great thicke tough roots, of a wooddy ſubſtance, from whence ſpring vp long and tough ſtalks two cubits high, confuſedly garniſhed & beſet with long leaues, in color like Woad, of a ſharpe and biting taſte. The floures grow at the top of the ſtalkes of a purple colour; which being paſt there ſucceed cloſe glittering and hairy huskes, wherein is contained ſmall blackiſh ſeed.

¶ *The Place.*

Pena reporteth that *Dentillaria* groweth about Rome, nigh the hedges and corne fields: it likewiſe groweth in my Garden in great plenty.

¶ *The Time.*

It floureth in Iuly and Auguſt.

¶ *The Names.*

Leadwort is called *Molybdæna, Plumbago Plinij, & Dentillaria Rondeletij*: in Italian, *Crepanella*: the Romanes, *Herba S. Antonij*: in Illyria, *Cucurida*: in Engliſh Leadwort.

¶ *The Temperature.*

Chap. 531. *Of Rue, or herbe Grace.*

¶ *The Deſcription.*

1 GArden Rue or planted Rue, is a ſhrub full of branches, now and then a yard high, or higher: the ſtalkes whereof are couered with a whitiſh barke, the branches are more green: the leaues hereof conſiſt of diuers parts, and be diuided into wings, about which are certaine little ones, of an odde number, ſomething broad, more long than round, ſmooth and ſomewhat fat, of a gray colour or greeniſh blew: the floures in the top of the branches are of a pale yellow conſiſting of foure little leaues, ſomething hollow: in the middle of which ſtandeth vp a little head or button foure ſquare, ſeldome fiue ſquare, containing as many little coffers as it hath corners, being compaſſed about with diuers little yellow threds: out of which hang pretty fine tips of one colour; the ſeed groweth in the little coffers: the root is wooddy, and faſtned with many ſtrings: this Rue hath a very ſtrong and ranke ſmell, and a biting taſte.

2 the ſecond being the wild or mountaine Rue, called *Ruta ſylueſtris*, is very like to garden Rue, in ſtalkes, leaues, floures, ſeed, colour, taſte, and ſauour, ſauing that euery little leafe hath ſmaller cuts, and is much narrower: the whole plant dieth at the approch of Winter, being an anuall plant, and muſt either ſtand till it doe ſow himſelfe, or elſe muſt be ſowne of others. ‡ This ſecond is a variety of the garden Rue differing from the former onely in ſmallneſſe. ‡

3 This plant is likewiſe a wilde kinde of Rue, and of all the reſt the ſmalleſt, and yet more virulent, biting, and ſtinking than any of the reſt: the whole plant is of a whitiſh pale greene, agreeing with the laſt before mentioned in each reſpect, ſaue in greatneſſe, and in that the venomous fumes or vapors that come from this ſmall wild Rue are more noiſome & hurtfull than the former.

‡ The leaues lie ſpred vpon the ground, and are very finely cut and diuided: the whole plant is of ſuch

Ruta hortensis.
Garden Rue.

3 *Ruta sylvestris minima.*
The smalleſt wilde Rue.

4 *Ruta montana.*
Mountaine Rue.

5 *Harmala.*
Wilde Rue with white ſloures.

‡ 6 *Ruta Canina.*
Dogs Rue.

such acrimonie, that *Clusius* saith he hath oftener than once obserued it to pierce through three pair of gloues to the hand of the gatherer; and if any one rub his face with his hand that hath newly gathered it, forthwith it will mightily inflame it. He tells a historie of a Dutch Student of Montpelier that went with him a simpling, who putting some of it between his hat and his head to keep him the cooler, had by that means all his face presently inflamed and blistered whersoeuer the sweat ranne downe. ‡

4 There is another wilde Rue growing on the mountaines of Savoy and other places adioying, hauing a great thicke root, from which arise great shoots or stalkes, whereon grow leaues very thicke and fat, parted into diuers longish sections, otherwise resembling the leaues of the first described, of a strong and stinking smell: the flours grow on the tops of the stalks, consisting of foure small yellow leaues: the seeds are like the other.

5 *Harmel* is one of the wilde Rues, it bringeth forth immediatly from the root diuers little stalks of a cubit high; whereupon grow green leaues diuersly cut into long pieces, longer and narrower than those of the wilde strong smelling Rue. The flours be white, composed of fiue white leaues: the fruit is three square, bigger than that of the planted Rue, in which the seed lies: the root is thicke, long, and blackish. This Rue in hot countries hath a maruellous strong smell: in cold countries not so.

‡ 6 This, which *Matthiolus* gaue for *Si dritis* 3. and *Lobel*, *Clusius*, and others, for *Ruta Canina*, hath many twiggy branches some cubit and half high, whereon grow leaues resembling those of the *Papaver Rhœas* or *Argemone*, lesser, thicker, and of a blackish green: the floures are of a whitish purple colour, fashioned somewhat like those of *Antirrhinum*: the seed is small, and contained in such vessels as those of Rue, or rather those of *Blattaria*: the whole plant is of a strong and ingratefull smel: it grows in the hot and dry places about Narbon in France, Ravenna, and Rome in Italy. ‡

¶ *The Place.*

Garden Rue ioyeth in sunny and open places: it prospereth in rough and bricky ground and among ashes: it can in no wise away with dung.

The wild are found on mountains in hot countries, as in Cappadocia, Galatia, and in diuers prouinces of Italy and Spain, and on the hills of Lancashire and Yorke.

Pliny saith that there is such friendship between it and the fig-tree, that it prospers no where so well as vnder the fig tree. The best for physicks vse is that which groweth vnder the fig tree, as *Dioscorides* saith: the cause is alledged by *Plutarch*, *lib.* 1. of his *Sympoziacks* or Feasts, for he saith it becomes more sweet and milde in taste, by reason it taketh as it were some part of the sweetnesse of the fig tree, whereby the ouer-ranke qualitie of the Rue is allayed; vnlesse it be that the figge tree whilest it drawes nourishment to it selfe, draweth also the rankenesse away from the Rue.

¶ *The Time.*

They floure in these cold countries in Iuly and August: in other countries sooner.

¶ *The Names.*

The first is *Hortensis Ruta* or garden Rue: in high-Dutch, **Rauten**: in low-Dutch, **Ruijte**: The Italians and Apothecaries keep the Latine name: in Spanish, *Aruda*: in French, *Rue de Iarden*; in English, Rue, and Herb-Grace.

Wilde Rue is called in Greeke, Πήγανον. *Peganon*: in Latine, *Ruta syluestris*, or wilde Rue: in Galatia and Cappadocia, Μηλον: of diuers, *Harmala*: of the Arabians, *Harmel*: of the Syrians, *Besara*:

¶ *The Temperature.*

Rue is hot and dry in the later end of the third degree, and wilde Rue in the fourth: it is of thin and

and subtill parts: it wasts and consumes winde, it cutteth and digesteth grosse and tough humors.

¶ *The Vertues.*

Rue or Herb-grace prouokes vrine, brings downe the sickenesse, expels the dead childe and after- A
birth, being inwardly taken, or the decoction drunk; and is good for the mother if but smelled to. *Plinie, lib. 20. cap. 13.* saith it opens the matrix and brings it into the right place, if the belly all ouer and the share (the brest say the old false copies) be anointed therewith: mixt with honey it is a remedie against the inflammation and swelling of the stones, proceeding of long abstinence from venerie, called of our English Mountebanks the Colts euill, if it be boiled with Barrows grease, Bay leaues, and the pouders of Fenugreeke and Lineseed be added thereto, and applied pultis-wise.

It takes away crudity and rawnesse of humors, and also windinesse and old pains of the stomack. B

Boiled with vineger it easeth paines, is good against the stitch of the side and chest, and shortnes C
of breath vpon a cold cause, and also against the pain in the joints and huckle bones.

The oile of it serues for the purposes last recited: it takes away the colick and pains of the guts, D
not only in a clister, but also anointed vpon the places affected. But if this oile be made of the oile pressed out of Lineseed it will bee so much the better, and of singular force to take away hard swellings of the spleen or milt.

It is vsed with good successe against the dropsie called in Greeke ὑδρωψ, beeing applied to the E
belly in manner of a pultis.

The herb a little boiled or skalded, and kept in pickle as Sampier, and eaten, quickens the sight. F

The same applied with hony and the juice of Fennell, is a remedie against dim eies. G

The juice of Rue made hot in the rinde of a pomegranat and dropped into the eares, takes away H
the pain of thereof.

S. Anthonies fire is quenched therewith: it killeth the shingles, and running vlcers and sores in I
the heads of yong children, if it be tempered with Ceruse, white lead, vineger, and oile of roses, and made into the form of *Nutritum* or *Triapharmacon.*

Dioscorides saith, That Rue put vp in the nosthrils stayeth bleeding. K

So saith *Pliny* also: when notwithstanding it is of power rather to procure bleeding, through L
its sharpe and biting quality.

The leaues of Rue beaten and drunke with wine are an antidote against poisons, as *Pliny* saith. M

Dioscorides writeth, That a twelue penny weight of the seed drunke in wine is a counterpoison a- N
gainst deadly medicines or the poison of Wolfes-bane, *Ixia*, Mushroms or Toad-stooles, the biting of Serpents, the stinging of Scorpions, Bees, hornets, and wasps; and is reported, That if a man bee anointed with the juice of Rue, these will not hurt him; and that the serpent is driuen away at the smell thereof when it is burned: insomuch that when the Weesell is to fight with the serpent, shee armeth her selfe by eating Rue, against the might of the Serpent.

The leaues of Rue eaten with the kernels of Walnuts or figs stamped together and made into a O
masse or paste, is good against all euill aires, the pestilence or plague, resists poison and all venome.

Rue boiled with Dil, Fennel seed, and some sugar, in a sufficient quantitie of wine, swageth the P
torments and griping pains in the belly, the pain in the sides and brest, the difficulty of breathing, the cough, and stopping of the lungs, and helpeth such as are declining to a dropsie.

The juice taken with Dill as aforesaid, helpeth the cold fits of Agues, and alters their course: it Q
helpeth the inflammation of the fundament, and paines of the gut called *Rectum intestinum*.

The juice of Rue drunk with wine purgeth women after their deliuerance, driuing forth the dead R
childe, the secondine, and the vnnatural birth.

Rue vsed very often either in meat or drinke, quencheth and drieth vp the naturall seed of gene- S
ration, and the milke of those that giue sucke.

The oile wherein Rue hath bin boiled and infused many daies together in the Sun, warmeth and T
chafeth all cold members if they be anointed therewith: also it prouoketh vrine, if the region of the bladder be anointed with it.

If it be ministred in clisters it expels windinesse, and the torsion or gnawing paines of the guts. V

The leaues of garden Rue boiled in water and drunke causeth one to make water, prouoketh the X
terms, and stoppeth the laske.

Ruta sylvestris or wild Rue is more vehement both in smel and operation, and therefore the more Y
virulent or pernitious; for sometimes it fumeth out a vapor or aire so hurtfull that it scorches the face of him that looketh vpon it, raising vp blisters, wheals, and other accidents: it venometh their hands that touch it, and will infect the face also if it be touched before they be clean washed: wherfore it is not to be admitted to meat or medicine.

The end of the second Booke.

THE THIRD BOOKE OF THE HISTORY OF PLANTS.

Containing the Description, Place, Time, Names, Nature, and Vertues, of Trees, Shrubs, Bushes, Fruit-bearing Plants, Rosins, Gums, Roses, Heath, Mosses, some Indian Plants, and other rare Plants not remembred in the Proeme to the first Booke. Also Mushroms, Corall, and their seuerall Kindes, &c.

The Proeme.

HAuing finished the treatise of Herbs and Plants in general, vsed for meat, medicine, or sweet smelling vse, only some few omitted for want of perfect instruction; and also being hindered by the slackness of the Cutters or grauers of the Figures: these wants we intend to supply in this third and last part. The Tables as well general as particular shall be set forth in the end of this present Volume.

Chap. 1. *Of Roses.*

¶ *The Kindes.*

THe Plant of Roses, though it be a shrub full of prickles, yet it had bin more fit and conuenient to haue placed it with the most glorious floures of the world, than to insert the same here among base and thorny shrubs: for the Rose doth deserue the chief and prime place among all floures whatsoeuer; beeing not onely esteemed for his beauty, vertues, and his fragrant and odoriferous smell; but also because it is the honor and ornament of our English Scepter, as by the conjunction appeareth, in the vniting of those two most Royall Houses of Lancaster and Yorke. Which pleasant floures deserue the chiefest place in crownes and garlands, as *Anacreon Thius* a most antient Greeke Poet (whom *Henricus Stephanus* hath translated in a gallant Latine Verse) affirmes in those Verses of a Rose, beginning thus;

Τὸ ῥόδον τὸ Πιερικὸν, &c.

Rosa honos, decusq; florum,
Rosa, cura, amorq; Veris.
Rosa, cælitum voluptas,
Roseis puer Cytheres.
Caput implicat Corollis,
Charitum Choros frequentans.

The

The Roſe is the honour and beauty of floures,
The Roſe in the care and loue of the Spring:
The Roſe is the pleaſure of th' heavenly Pow'rs.
The Boy of faire *Venus*, *Cythera's* Darling,
Doth wrap his head round with garlands of Roſe,
When to the dances of the Graces he goes.

Augerius Busbequius ſpeaking of the eſtimation and honor of the Roſe, reporteth, That the Turks can by no means endure to ſee the leaues of Roſes fall to the ground, becauſe ſome of them haue dreamed, that the firſt or moſt antient Roſe did ſpring out of the bloud of *Venus*: and others of the Mahumetans ſay that it ſprang of the ſweat of *Mahumet*.

But there are many kindes of Roſes, differing either in the bigneſſe of the floures, or the plant it ſelfe, roughneſſe or ſmoothneſſe, or in the multitude or fewneſſe of the flours, or elſe in colour and ſmell; for diuers of them are high and tall, others ſhort and low, ſome haue fiue leaues, others very many. *Theophraſtus* tells of a certain Roſe growing about Philippi, with an hundred leaues, which the Inhabitants brought forth of Pangæum, and planted in Campania, as *Pliny* ſaith. Which wee hold to be the Holland Roſe, that diuers call the Prouince Roſe, but not properly.

Moreouer, ſome be red, others white, and moſt of them or all ſweetly ſmelling, eſpecially thoſe of the garden.

1 *Roſa alba.*
The white Roſe.

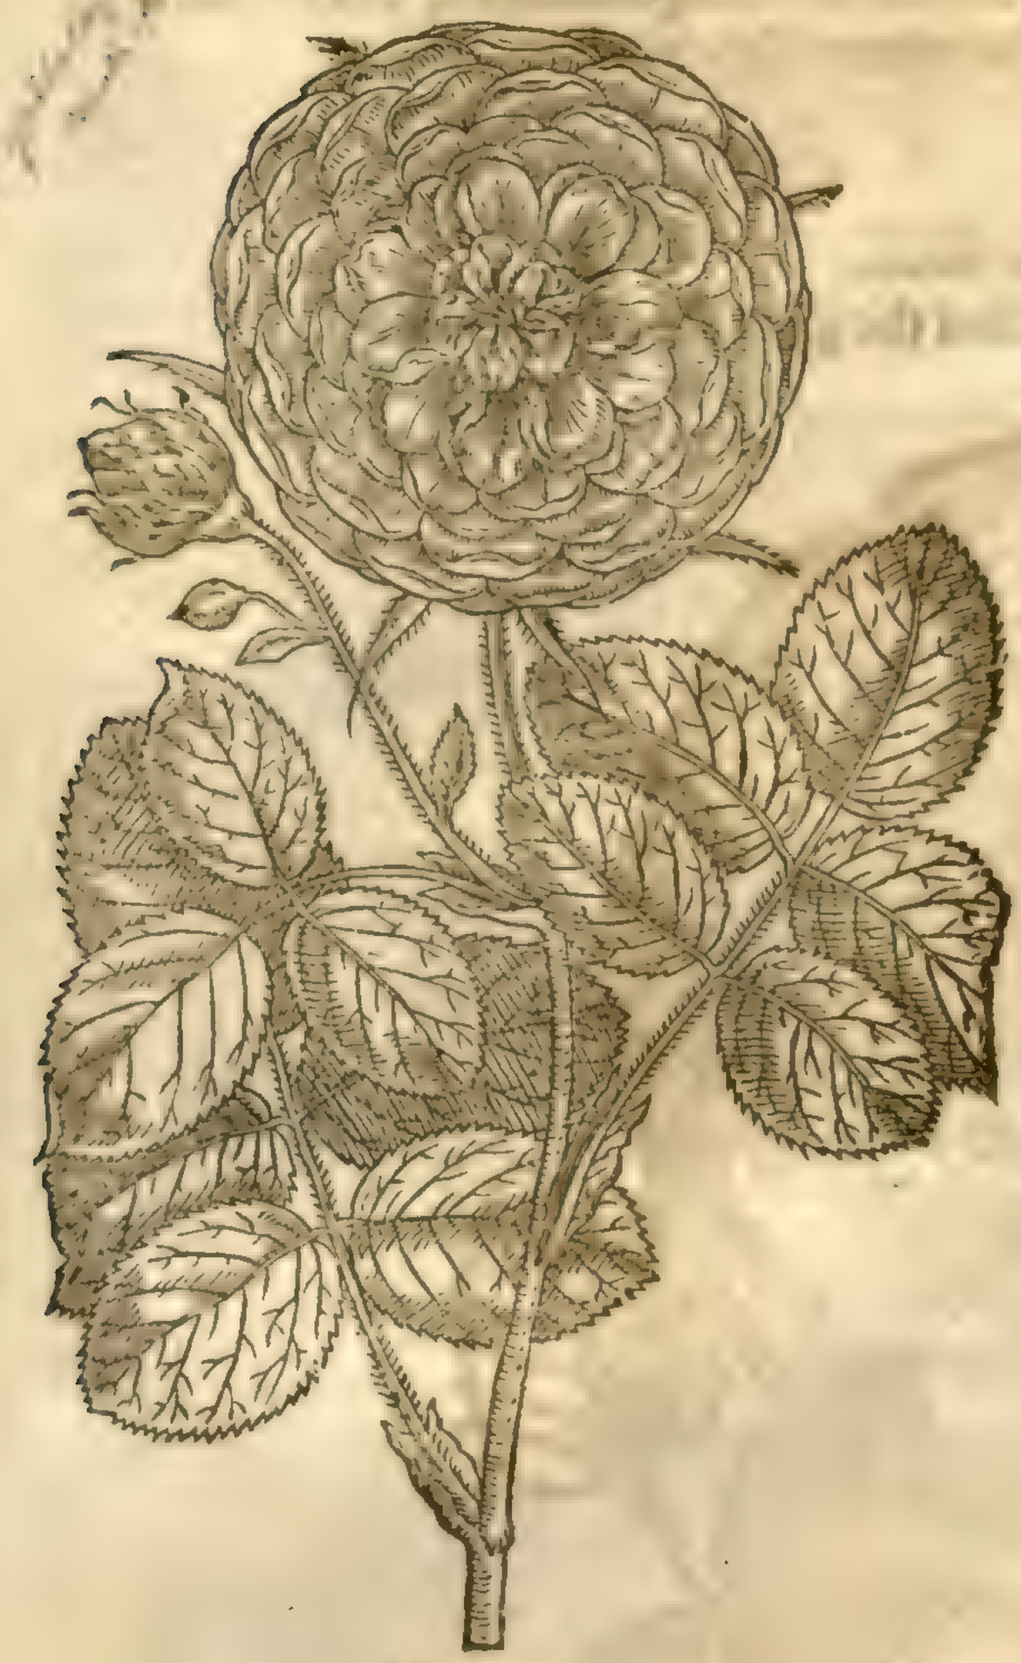
¶ *The Deſcription.*

IF the Curious could ſo be content, one generall deſcription might ſerue to diſtinguiſh the whole ſtock or kindred of the Roſes, being things ſo wel knowne: notwithſtanding I thinke it not amiſſe to ſay ſomthing of them ſeuerally, in hope to ſatisfie all. The white Roſe hath very long ſtalkes of a wooddy ſubſtance, ſet or armed with diuers ſharpe prickles: the branches wherof are likewiſe full of prickles, whereon grow leaues conſiſting of fiue leaues for the moſt part, ſet vpon a middle rib by couples, the old leaf ſtanding at the point of the ſame, and euery one of thoſe ſmall leaues ſomwhat ſnipt about the edges, ſomewhat rough, and of an ouerworne greene colour: from the boſome whereof ſhoot forth long foot-ſtalks, whereon grow very faire double flours of a white colour, and very ſweet ſmell, hauing in the middle a few yellow threds or chiues; which being paſt, there ſucceedeth a long fruit, greene at the firſt, but red when it is ripe, and ſtuffed with a downy choking matter, wherein is contained ſeed as hard as ſtones. The root is long, tough, and of a wooddy ſubſtance.

2 The red Roſe groweth very low in reſpect of the former: the ſtalks are ſhorter, ſmoother, and browner of colour: The leaues are like, yet of a worſe duſty colour: The floures grow on the tops of the branches, conſiſting of many leaues of a perfect red colour: the fruit is likewiſe red when it is ripe: the root is wooddy.

3 The common Damaske Roſe in ſtature, prickely branches, and in other reſpects is like the white

2 *Roſa rubra.*
The red Roſe.



3 *Roſa Provincialis, ſive Damaſcena.*
The Province or Damaske Roſe.

5 *Roſa ſine ſpinis.*
The Roſe without prickles.

white Roſe; the eſpeciall difference conſiſts in the colour and ſmell of the flours: for theſe are of a pale red colour, of a more pleaſant ſmel, and fitter for meat and medicine.

4 The *Roſa Provincialis minor* or leſſer Province Roſe differeth not from the former, but is altogether leſſer: the floures and fruit are like: the vſe in phyſicke alſo agreeth with the precedent.

5 The Roſe without prickles hath many young ſhoots comming from the root, diuiding themſelues into diuers branches, tough, and of a wooddy ſubſtance as are all the reſt of the Roſes, of the height of two or three cubits, ſmooth and plain without any roughneſſe or prickles at all: whereon grow leaues like thoſe of the Holland Roſe, of a ſhining deep green colour on the vpper ſide, vnderneath ſomewhat hoary and hairy. The flours grow at the tops of the branches, conſiſting of an infinite number of leaues, greater than thoſe of the Damaske Roſe, more double, and of a colour between the red and damask Roſes, of a moſt ſweet ſmell. The fruit is round, red when it is ripe, and ſtuffed with the like flocks and ſeeds of thoſe of the damaske Roſe. The root is great, wooddy, and far ſpreading.

6 The Holland or Province Roſe hath diuers ſhoots proceeding from a wooddy root ful of ſharpe prickles, diuiding it ſelfe into diuers branches, wheron grow leaues conſiſting of fiue

leaues

leaues ſet on a rough middle rib,& thoſe ſnipt about the edges: the flours grow on the tops of the branches,in ſhape and colour like the damaske Roſe, but greater and more double, inſomuch that the yellow chiues in the middle are hard to be ſeene; of a reaſonable good ſmell, but not fully ſo ſweet as the common damaske Roſe: the fruit is like the other of his kinde.

6 Roſa Hollandica ſive Batava.

The great Holland Roſe,commonly called the great Prouince Roſe.

We haue in our London gardens one of the red Roſes, whoſe flours are in quantitie and beautie equall with the former,but of greater eſtimation,of a perfect red colour,wherin it eſpecially differeth from the Prouince Roſe; in ſtalks,ſtature,and manner of growing it agrees with our common red Roſe.

¶ *The Place.*

All theſe ſorts of Roſes we haue in our London gardens,except that Roſe without pricks, which as yet is a ſtranger in England. The double white Roſe groweth wilde in many hedges of Lancaſhire in great aboundance, euen as Briers do with vs in theſe Southerly parts, eſpecially in a place of the country called Leyland,and at Roughford not far from Latham. Moreouer,in the ſaid Leyland fields doth grow our garden Roſe wilde,in the plowed fields among the corne,in ſuch aboundance,that there may be gathered daily during the time,many buſhels of roſes,equal with the beſt garden Roſe in each reſpect: the thing that giueth great cauſe of wonder,is, That in a field in the place aforeſaid,called Glovers field,euery yeare that the field is plowed for corne,that yeare it wil be ſpred ouer with Roſes,and when it lieth ley,or not plowed,then is there but few Roſes to be gathered; by the relation of a curious gentleman there dwelling,ſo often remembred in our hiſtory.

‡ I haue heard that the Roſes which grow in ſuch plenty in Glovers field euery yere the field is plowed,are no other than Corn Roſe,that is,red Poppies,howeuer our Author was informed. ‡

¶ *The Time.*

Theſe floure from the end of May to the end of Auguſt,and diuers times after,by reaſon the tops and ſuperfluous branches are cut away in the end of their flouring: and then doe they ſomtimes floure euen vntill October and after.

¶ *The*

¶ *The Names.*

The Rose is called in Latine *Rosa*: in Greeke ῥόδον: and the plant it selfe ῥόδινος: (which in Latine keepeth the same name that the floure hath) and it is called *Rodon* (as *Plutarch* saith) because it sendeth forth plenty of smell.

The middle part of the Roses, that is, the yellow chiues, or seeds and tips, is called *Anthos*, and *Flos Rosæ*, the floure of the Rose: in shops, *Anthera*, or the blowing of the Rose.

The white parts of the leaues of the floure it selfe, by which they are fastened to the cups, be named *Vngues* or nails. That is called *Calix*, or the cup, which containeth and holdeth in together the yellow part and leaues of the floure.

Alabastri are those parts of the cup which are deeply cut, and that compasse the floure close about before it be opened, which be in number fiue, two haue beards and two haue none, and the fifth hath but halfe one: most do call them *Cortises Rosarum*, or the husks of the Roses: the shoots of the plant of Roses, *Strabo Gallus* in his little garden doth call *Viburna*.

The white Rose is called *Rosa alba*: in English, the white Rose: in high Dutch, **Weiß Roosen**: in low Dutch, **Witte Roosen**: in French, *Rose Blanche*: of *Pliny*, *Spinola Rosa*, or *Rosa Campana*.

The red Rose is called in Latine, *Rosa rubra*: the French-men, *Rose Franche*, *Rose de Pronins*, a towne in Campaigne: of *Pliny*, *Trachinia*, or *Præneſtina*.

The Damaske Rose is called of the Italians *Rosa incarnata*: in high Dutch, **Leibfarbige Roosen**: in low Duth, **Prouincie Roose**: of some, *Rosa Prouincialis*, or Rose of Prouince: in French of some, *Melesia*: the Rose of Melaxo, a city in Asia, from whence some haue thought it was first brought into those parts of Europe.

The great Rose, which is generally called the great Prouince Rose, which the Dutchmen cannot endure; for say they, it came first out of Holland, and therefore to be called the Holland Rose: but by all likelihood it came from the Damaske Rose, as a kind thereof, made better and fairer by art, which seemeth to agree with truth.

The Rose without prickles is called in Latine, *Rosa sine spinis*, and may be called in English, the Rose without thornes, or the Rose of Austrich, because it was first brought from Vienna, the Metropolitan citie of Austrich, and giuen to that famous Herbarist *Carolus Clusius*.

¶ *The Temperature.*

The leaues of the floures of Roses, because they doe consist of diuers parts haue also diuers and sundry faculties: for there be in them certaine that are earthy and binding, others moist and watery, and sundry that are spirituall and airie parts, which notwithstanding are not all after one sort, for in one kinde these excell, in another those, all of them haue a predominant or ouer-ruling cold temperature, which is neerest to a meane, that is to say, of such as are cold in the first degree, moist, airie, and spirituall parts are predominant in the White roses, Damaske and Muske,

¶ *The Vertues.*

The distilled water of Roses is good for the strengthning of the heart, and refreshing of the spirits, and likewise for all things that require a gentle cooling. A

The same being put in junketting dishes, cakes, sauces, and many other pleasant things, giueth a fine and delectable taste. B

It mitigateth the paine of the eies proceeding of a hot cause, bringeth sleep, which also the fresh roses themselues prouoke through their sweet and pleasant smell. C

The juyce of these Roses, especially of Damask, doth moue to the stoole, and maketh the belly soluble: but most effectuall that of the Musk Roses: next to them is the juyce of the Damask, which is more commonly vsed. D

The infusion of them doth the same, and also the Syrrup made thereof, called in Latine *Drosatum*, or *Serapium*: the Apothecaries call it Syrrup of roses solutiue, which must be made of the infusion in which a great number of the leaues of these fresh Roses are diuers and sundry times steeped. E

It is profitable to make the belly loose and soluble, when as either there is no need of other stronger purgation, or that it is not fit and expedient to vse it: for besides those excrements which stick to the bowels, or that in the first and neerest veines remaine raw, flegmaticke, and now and then cholericke, it purgeth no other excrements, vnlesse it be mixed with certaine other stronger medicines. F

This Syrrup doth moisten and coole, and therefore it allayeth the extremity of heat in hot burning feuers, mitigateth the inflammations of the intrails, and quencheth thirst: it is scarce good for a weake and moist stomacke, for it leaueth it more slacke and weake. G

Of like vertue also are the leaues of these preserued in Sugar, especially if they be onely bruised with the hands, and diligently rempered with Sugar, and so heat at the fire rather than boyled. H

¶ *The Temperature of Red Roses.*

There is in the red Roses, which are common euery where, and in the other that be of a deep purple, called Prouince Roses, a more earthy substance, also a drying and binding quality, yet not without our I

out certain moisture joyned, being in them when they are as yet fresh, which they lose when they be dried: for this cause their juyce and infusion doth also make the body soluble, yet not so much as of the others aforesaid. These Roses being dried, and their moisture gone, do bind and dry; and likewise coole, but lesser than when they are fresh.

¶ *The Vertues.*

I They strengthen the heart, and helpe the trembling and beating thereof.

K They giue strength to the liuer, kidnies, and other weake intrails; they dry and comfort a weake stomacke that is flashie and moist; stay the whites and reds, stanch bleeding in any part of the body, stay sweatings, binde and loose, and moisten the body.

L And they are put into all manner of counterpoysons and other like medicines, whether they be to be outwardly applied or to be inwardly taken, to which they giue an effectuall binding, and certaine strengthning quality.

M Hony of Roses, or *Mel Rosarum*, called in Greeke ῥοδόμελι, which is made of them, is most excellent good for wounds, vlcers, issues, and generally for such things as haue need to be clensed and dried.

N The oyle doth mitigate all kindes of heat, and will not suffer inflammations or hot swellings to rise, and being risen it doth at the first asswage them.

¶ *The Temperature and Vertues of the parts.*

O The flours or bloomings of Roses, that is to say, the yellow haires and tips, do in like manner dry and binde, and that more effectually than of the leaues of the roses themselues: the same temperature the cups and beards be of; but seeing none of these haue any sweet smell, they are not so profitable, nor so familiar or beneficiall to mans nature: notwithstanding in fluxes at the sea, it shall auaile the Surgion greatly, to carry store thereof with him, which doth there preuaile much more than at the land.

P The same yellow called *Anthera*, stayeth not only those lasks and bloudy fluxes which do happen at the Sea, but those at the land also, and likewise the white flux and red in women, if they bee dried, beaten to pouder, and two scruples thereof giuen in red wine, with a little pouder of Ginger added thereto: and being at the Sea, for want of red Wine you may vse such liquor as you can get in such extremity.

Q The little heads or buttons of the Roses, as *Pliny* writeth, doe also stanch bleeding and stop the laske.

R The nailes or white ends of the leaues of the floures are good for watering eies.

S The juice, infusion, or decoction of Roses, are to be reckoned among those medicines which are soft, gentle, loosing, opening and purging gently the belly, which may be taken at all times and in all places, of euery kinde or sex of people, both old and young, without danger or perill.

T The Syrrup made of the infusion of Roses, is a most singular and gentle loosing medicine, carrying downewards cholericke humors, opening the stoppings of the liuer, helping greatly the yellow jaundise, the trembliug of the heart, and taking away the extreme heat in agues and burning feuers; which is thus made:

V Take two pound of Roses, the white ends cut away, put them to steepe or infuse in six pintes of warme water in an open vessell for the space of twelue houres: then straine them out, and put thereto the like quantitie of Roses, and warme the water again, so let it stand the like time: do thus foure or fiue times; in the end adde vnto that liquor or infusion, foure pound of fine Sugar in pouder; then boyle it vnto the forme of a syrrup, vpon a gentle fire, continually stirring it vntill it be cold; then straine it, and keepe it for your vse, whereof may be taken in white wine, or other liquor, from one ounce vnto two.

X Syrrup of the juyce of Roses is very profitable for the griefes aforesaid, made in this manner:

Y Take Roses, the white nailes cut away, what quantitie you please, stampe them, and straine out the juyce, the which you shall put to the fire, adding thereto Sugar, according to the quantity of the juyce: boyling them on a gentle fire vnto a good consistence.

Z Vnto these syrrups you may adde a few drops of oyle of Vitriol, which giueth it a most beautifull colour, and also helpeth the force in cooling hot and burning feuers and agues: you likewise may adde thereto a small quantity of the juyce of Limons, which doth the like.

A The conserue of Roses, as well that which is crude and raw, as that which is made by ebullition or boiling, taken in the morning fasting, and last at night, strengthneth the heart, and taketh away the shaking and trembling thereof, strengthneth the liuer, kidneies, and other weake intrals, comforteth a weake stomacke that is moist and raw; staieth the whites and reds in women, and in a word is the most familiar thing to be vsed for the purposes aforesaid, and is thus made:

B Take the leaues of Roses, the nails cut off, one pound, put them into a cleane pan; then put thereto a pinte and a halfe of scalding water, stirring them together with a woodden slice, so let them stand to

to macerate, close couered some two or three houres; then set them to the fire slowly to boyle, adding thereto three pounds of sugar in powder, letting them to simper together according to discretion, some houre or more; then keepe it for your vse.

The same made another way, but better by many degrees: take Roses at your pleasure, put them C
to boyle in faire water, hauing regard to the quantity; for if you haue many Roses you may take more water; if fewer, the lesse water will serue: the which you shall boyle at the least three or foure houres, euen as you would boile a piece of meate, vntill in the eating they be very tender, at which time the Roses will lose their colour, that you would thinke your labour lost, and the thing spoiled. But proceed, for though the Roses haue lost their colour, the water hath gotten the tincture thereof; then shall you adde vnto one pound of Roses, foure pound of fine sugar in pure pouder, and so according to the rest of the Roses. Thus shall you let them boyle gently after the sugar is put therto, continually stirring it with a woodden Spatula vntill it be cold, whereof one pound weight is worth six pound of the crude or raw conserue, as well for the vertues and goodnesse in taste, as also for the beautifull colour.

The making of the crude or raw conserue is very well knowne, as also Sugar roset, and diuers D
other pretty things made of Roses and Sugar, which are impertent vnto our history, because I intend nether to make thereof an Apothecaries shop, nor a Sugar-Bakers storehouse, leauing the rest for our cunning confectioners.

Chap. 2. *Of the Muske Roses.*

¶ *The Kindes.*

THere be diuers sorts of Roses planted in gardens, besides those written of in the former chapter, which are of most writers reckoned among the wilde Roses, notwithstanding we thinke it conuenient to put them into a chapter betweene those of the garden and the brier Roses, as indifferent whether to make them of the wilde Roses, or of the tame, seeing we haue made them denizons in our gardens for diuers respects, and that worthily.

1 *Rosa Moschata simplici flore.*
The single Muske Rose.

2 *Rosa Móscata multiplex.*
The double Muske Rose.

¶ *The Deſcription.*

1 THe ſingle Muske Roſe hath diuers long ſhoots of a greeniſh colour and wooddy ſubſtance, armed with very ſharpe prickles, diuiding it ſelfe into diuers branches: whereon doe grow long leaues, ſmooth and ſhining, made of diuers leaues ſet vpon a middle rib, like the other Roſes: the floures grow on the tops of the branches, of a white colour, and pleaſant ſweet ſmell, like that of Muske, wherof it tooke his name; hauing certaine yellow ſeeds in the middle, as the reſt of the Roſes haue: the fruit is red when it is ripe, and filled with ſuch chaffie flockes and ſeeds as thoſe of the other Roſes: the root is tough and wooddy.

2 The double Muske Roſe differeth not from the precedent in leaues, ſtalkes, and roots, nor in the colour of the floures, or ſweetneſſe thereof, but onely in the doubleneſſe of the floures, wherein conſiſteth the difference.

3 Of theſe roſes we haue another in our London gardens, which of moſt is called the bluſh roſe, it floureth when the Damaske Roſe doth: the floures hereof are very ſingle, greater than the other Muske Roſes, and of a white colour, daſht ouer with a light waſh of carnation, which maketh that colour which wee call a bluſh colour: the proportion of the whole plant, as alſo the ſmell of the floures, are like the precedent.

3 *Roſæ Moſchatæ ſpeciis major.*
The great Muske Roſe.

4 *Roſa Holoſericea.*
The Veluet Roſe.

4 The Veluet Roſe groweth alwaies very low, like vnto the red Roſe, hauing his branches couered with a certaine hairy or prickly matter, as fine as haires, yet not ſo ſharpe or ſtiffe that it will harme the moſt tender skin that is: the leaues are like the leaues of the white Roſe: the flours grow at the top of the ſtalkes, doubled with ſome yellow thrums in the midſt, of a deepe and blacke red colour, reſembling red crimſon Veluet, whereupon ſome haue called it the Veluet Roſe: when the floures be vaded, there follow red berries full of hard ſeeds, wrapped in a downe or woollineſſe like the others.

5 The yellow Roſe which (as diuers do report) was by Art ſo coloured, and altered from his firſt eſtate, by grafting a wilde Roſe vpon a Broome-ſtalke; whereby (ſay they) it doth not onely change his colour, but his ſmell and force. But for my part I hauing found the contrary by mine owne experience, cannot be induced to beleeue the report: for the roots and off-ſprings of this Roſe haue brought

brought forth yellow roses, such as the maine stocke or mother bringeth out, which euent is not to be seen in all other plants that haue been graffed. Moreouer, the seeds of yellow roses haue brought forth yellow Roses, such as the floure was from whence they were taken; which they should not do by any conjecturall reason, if that of themselues they were not a naturall kinde of Rose. Lastly it were contrary to that true principle,

Naturæ sequitur semina quodque suæ: that is to say.

Euery seed and plant bringeth forth fruit like vnto it selfe, both in shape and nature: but leauing that errour, I will proceed to the description: the yellow rose hath browne and prickly stalks or shoots, fiue or six cubits high, garnished with many leaues, like vnto the Muske rose, of an excellent sweet smell, and more pleasant than the leaues of the Eglantine: the floures come forth among the leaues, and at the top of the branches of a faire gold yellow colour: the thrums in the middle, are also yellow: which being gone, there follow such knops or heads as the other Roses do beare.

5 *Rosa lutea.*
The yellow Rose.

‡ 6 *Rosa lutea multiplex.*
The double yellow Rose.

‡ 6 Of this kinde there is another more rare and set by, which in stalks, leaues, and other parts is not much different from the last described, onely the floure is very double, and it seldome fairely shewes it selfe about London, where it is kept in our chiefe gardens as a prime rariety. ‡

7 The Canell or Cinnamon Rose, or the Rose smelling like Cinnamon, hath shots of a brown colour, foure cubits high, beset with thorny prickles, and leaues like vnto those of Eglantine, but smaller and greener, of the sauour or smell of Cinnamon, whereof it tooke his name, and not of the smell of his floures (as some haue deemed) which haue little or no sauour at all: the floures be exceeding double, and yellow in the middle, of a pale red colour, and sometimes of a carnation: the root is of a wooddy substance.

8 We haue in our London gardens another Cinnamon or Canell Rose, not differing from the last described in any respect, but onely in the floures; for as the other hath very double floures, contrariwise these of this plant are very single, wherein is the difference.

7 *Rosa Cinnamomea pleno flore.*
The double Cinnamon Rose.

‡ 8 *Rosa Cinnamomea flore simplici.*
The single Cinnamon Rose.

¶ *The Place.*

These Roses are planted in our London Gardens, and else-where, but not found wilde in England.

¶ *The Time.*

The Muske Rose floureth in Autumne, or the fall of the leafe: the rest floure when the Damask and red Rose do.

¶ *The Names.*

The first is called *Rosa Moschata*, of the smell of Muske, as we haue said: in Italian, *Rosa Meschetta*: in French, *Roses Musquees*, or *Muscadelles*: in low Dutch, **Musket roosen**: in English Musk Rose: the Latine and English titles may serue for the rest.

¶ *The Temperature.*

The Muske Rose is cold in the first degree, wherin airy and spirituall parts are prodominant: the rest are referred to the Brier Rose and Eglantine.

¶ *The Vertues.*

A Conserue or syrrup made of the Muske Rose, in manner as before told in the Damaske and Red Roses, doth purge very mightily watterish humors, yet safely, and without all danger, taken in the quantity of an ounce in weight.

B The leaues of the floures eaten in the morning, in manner of a sallad, with oyle, vineger and pepper, or any other way according to the appetite and pleasure of them that shall eate it, purge very notably the belly of watterish and cholericke humors, and that mightily, yet without all perill or paine at all, insomuch as the simplest may vse the quantity, according to their owne fancie: for if they do desire many stooles, or sieges, they are to eat the greater quantity of the leaues; if fewer, the lesse quantity; as for example: the leaues of twelue or fourteene floures giue six or eight stooles, and so increasing or diminishing the quantity, more or fewer, as my selfe haue often proued.

C The white leaues stamped in a wooden dish with a piece of Allum and the juyce strained forth into some glased vessell, dried in the shadow, and kept, is the most fine and pleasant yellow colour that may be diuised, not onely to limne or wash pictures and Imagerie in books, but also to colour meats and sauces, which notwithstanding the Allum is very wholesome.

There

There is not any thing extant of the others, but are thought to be equall with the white Muske Rose, whereof they are taken and holden to be kindes.

Chap. 3. *Of the wilde Roses.*

¶ *The Description.*

1 THe sweet Brier doth oftentimes grow higher than all the kindes of Roses; the shoots of it are hard, thicke, and wooddy; the leaues are glittering, and of a beautifull greene colour, of smell most pleasant: the Roses are little, fiue leaued, most commonly whitish, seldom tending to purple, of little or no smell at all: the fruit is long, of colour somewhat red, like a little olive stone, & like the little heads or berries of the others, but lesser than those of the garden: in which is contained rough cotton, or hairy downe and seed, folded and wrapped vp in the same; which is small and hard: there be likewise found about the slender shoots hereof, round, soft, and hairy spunges, which we call Brier Balls, such as grow about the prickles of the Dog-Rose.

1 *Rosa sylvestris odora.* The Eglantine, or sweet Brier.

2 We haue in our London gardens another sweet Brier, hauing greater leaues, and much sweeter: the floures likewise are greater, and somewhat doubled, exceeding sweet of smell, wherein it differeth from the former.

3 The Brier Bush or Hep tree, is also called *Rosa canina*, which is a plant so common and well knowne, that it were to small purpose to vse many words in the description thereof: for euen children with great deligh eat the berries thereof when they be ripe, make chaines and other prettie gewgawes of the fruit: cookes and gentlewomen make Tarts and such like dishes for pleasure thereof, and therefore this shall suffice for the description.

4 The Pimpinell Rose is likewise one of the wilde ones, whose stalks shoot forth of the ground in many places, of the height of one or two cubits, of a browne colour, and armed with sharpe prickles,

♄ 2 *Rosa syl. odora flore duplici.*
The double Eglantine.

3 *Rosa Canina inodora.*
The Brier Rose or Hep-tree.

4 *Rosa Pimpinellæ folio.*
The Pimpinell Rose.

kles, which diuide themselues toward the tops into diuers branches, whereon doe grow leaues consisting of diuers small ones, set vpon a middle rib like those of Burnet, which is called in Latine *Pimpinella*, whereupon it was called *Rosa Pimpinella*, the Burnet Rose. The floures grow at the tops of the branches, of a white colour, very single, and like vnto those of the Brier or Hep tree: after which come the fruit, blacke, contrary to all the rest of the roses, round as an apple; whereupon some haue called it *Rosa Pomifera*, or the Rose bearing apples: wherein is contained seed, wrapped in chaffie or flockie matter, like that of the Brier: the root is tough and wooody.

¶ *The Place.*

These wilde Roses do grow in the borders of fields and woods, in most parts of England. The last growes very plentifully in a field as you go from a village in Essex, called Graies (vpon the brinke of the riuer Thames) vnto Horndon on the hill, insomuch that the field is full fraught therewith all ouer.

It groweth likewise in a pasture as you goe from a village hard by London called Knights brige vnto Fulham, a Village thereby, and in many other places.

We haue them all except the Brier Bush in our London gardens, which we think vnworthy the place.

¶ The

¶ *The Time.*

They floure and flouriſh with the other Roſes.

¶ *The Names.*

The Eglantine Roſe, which is *Cynorrhodi*, or *Caninæ Roſæ ſpecies*, a kinde of Dogs Roſe: and *Roſa ſylueſtris*, the wilde Roſe: in low Dutch, **Eglantier:** in French, *Eſglentine*; and as *Ruellius* teſtifies, *Eglenterium*: who alſo ſuſpects it to be *Cynosbaton*, or *Canirubus*: of which *Dioſcorides* hath written in theſe words; *Cynosbatus*, or *Canirubus*, which ſome call *Oxycantha*, is a ſhrub growing like a tree, full of prickles, with a white floure, long fruit like an oliue ſtone, red when it is ripe, and downie within: in Engliſh we call it Eglantine or ſweet Brier.

The ſpongie balls which are found vpon the branches are moſt aptly and properly called *Spongiola ſylueſtris Roſæ*, the little ſponges of the wilde Roſe. The ſhops miſtake it by the name of *Bedeguar*; for *Bedeguar* among the Arabians is a kinde of Thiſtle, which is called in Greeke [illegible] that is to ſay, *Spina alba* the white Thiſtle, not the white Thorne, though the word doe import ſo much.

The Brier or Hep tree is called *Sylueſtris Roſa*, the wilde Roſe: in high Dutch, **Wilden Roſen:** in French, *Roſes ſauuages*: *Pliny*, *lib.* 8. *cap.* 25. ſaith that it is *Roſa Canina*, Dogs Roſe: of diuers *Caninaſentis*, or Dogs Thorne: in Engliſh, Brier Buſh, and Hep tree: the laſt hath beene touched in the deſcription.

¶ *The Temperature and Vertues.*

The faculties of theſe wilde Roſes are referred to the manured Roſe, but not vſed in Phyſicke where the other may be had: notwithſtanding *Pliny* affirmeth, that the root of the Brier Buſh is a ſingular remedy found out by Oracle, againſt the biting of a mad dog, which hee ſets downe in his eight booke, Chap. 41. A

The ſame Author *lib.* 25. *cap.* 2. affirmeth, that the little ſpongie Brier Ball ſtamped with honey and aſhes cauſeth haires to grow which are fallen through the diſeaſe called *Alopecia*, or the Foxes euill. B

Fuchſius affirmes that the ſpongie excreſcence or ball growing vpon the Brier are good againſt the ſtone and ſtraungurie, if they be beaten to pouder and inwardly taken. C

They are good not as they be diureticks or prouokers of vrine, or as they are wearers away of the ſtone, but as certaine other binding medicines that ſtrengthen the weake and feeble kidnies; which do no more good to thoſe that be ſubject to the ſtone, than many of the diuretickes, eſpecially of the ſtronger ſort; for by two much vſing of diuretickes or piſſing medicines, it hapneth that the kidnies are ouerweakened, and oftentimes too much heated, by which meanes not onely the ſtones are not diminiſhed, worne away, or driuen forth, but oftentimes are alſo increaſed and made more hard: for they ſeperate and take away that which in the bloud is thin, waterie, and as it were wheyiſh; and the thicker part, the ſtronger ſorts of diuretickes do draw together and make hard: and in like manner alſo others that are not ſo ſtrong, by the ouermuch vſing of them, as *Galen lib.* 5. of the faculties of ſimple medicines reporteth. D

The fruit when it is ripe maketh moſt pleaſant meats and banqueting diſhes, as tarts and ſuch like; the making whereof I commit to the cunning cooke, and teeth to eate them in the rich mans mouth. E

Chap. 4. *Of the Bramble or blacke-berry buſh.*

¶ *The Deſcription.*

1 THe common Bramble bringeth forth ſlender branches, long, tough, eaſily bowed, ramping among hedges and whatſoeuer ſtands neere vnto it; armed with hard and ſharpe prickles, whereon doe grow leaues conſiſting of many ſet vpon a rough middle ribbe, greene on the vpper ſide, and vnderneath ſomewhat white: on the tops of the ſtalkes ſtand certaine floures, in ſhape like thoſe of the Brier Roſe, but leſſer, of colour white, and ſometimes waſht ouer with a little purple: the fruit or berry is like that of the Mulberry, firſt red, blacke when it is ripe, in taſte betweene ſweet and ſoure, very ſoft, and full of grains: the root creepeth, and ſendeth forth here and there young ſprings.

‡ *Rubus repens fructu cæſio.*

‡ 2 This hath a round ſtalke ſet full of ſmall crooked and very ſharpe pricking thornes, and creepeth on hedges and low buſhes of a great length, on the vpper ſide of a light red colour, and vnderneath greene, and taketh root with the tops of the trailing branches, whereby it doth mightily encreaſe:

encreaſe: the leaues grow without order, compoſed of three leaues, and ſometimes of fiue, or elſe the two lower leaues are diuided into two parts, as hop leaues are now and then, of a light greene colour both aboue and vnderneath. The floures grow on the tops of the branches, *racematim*, many together, ſometimes white, ſometimes of a very light purple colour, euery floure containing fiue leaues, which are crompled or wrinkled, and do not grow plaine: the fruit followes, firſt greene, and afterwards blew, euery berry compoſed of one or two graines, ſeldome aboue foure or fiue growing together, about the bigneſſe of corans; wherein is contained a ſtony hard kernell or ſeed, and a juice of the colour of Claret wine, contrary to the common *Rubus* or Bramble, whoſe leaues are white vnderneath: the berries being ripe are of a ſhining blacke colour, and euery berry containes vſually aboue forty graines cloſely compacted and thruſt together. The root is wooddy and laſting This growes common enough in moſt places, and too common in ploughed fields. Sept. 6. 1619. *Iohn Goodyer.* ‡

3 The Raſpis or Framboiſe buſh hath leaues and branches not much vnlike the common Bramble, but not ſo rough nor prickly, and ſometimes without any prickles at all, hauing onely a rough hairineſſe about the ſtalkes: the fruit in ſhape and proportion is like thoſe of the Bramble, red when they be ripe, and couered ouer with a little downineſſe; in taſte not very pleaſant. The root creepeth far abroad, whereby it greatly encreaſeth. ‡ This growes either with prickles vpon the ſtalks, or elſe without them: the fruit is vſually red, but ſometimes white of colour. ‡

1 *Rubus.*
The Bramble Buſh.

2 *Rubus Idæus.*
The Raſpis Buſh or Hinde-berry.

4 Stone Bramble ſeldome groweth aboue a foot high, hauing many ſmall flexible branches without prickles, trailing vpon the ground, couered with a reddiſh barke, and ſomewhat hairy: the leaues grow three together, ſet vpon tender naked foot-ſtalkes ſomewhat ſnipt about the edges: the floures grow at the end of the branches, conſiſting of foure ſmall white leaues like thoſe of the Cherry-tree: after which come ſmall Grape-like fruit, conſiſting of one, two, or three large transparent berries, ſet together as thoſe of the common Bramble, of a red colour when they be ripe, and of a pleaſant taſte, but ſomwhat aſtringent. The roots creepe along in the ground very farre abroad, whereby it greatly increaſeth.

4 *Chamæmorus* (called in the North part of England, where they eſpecially doe grow, Knotberries, and Knought-berries) is likewiſe one of the Brambles, though without prickles: it brings forth

forth small weake branches or tender stems of a foot high; whereon do grow at certaine distances rough leaues in shape like those of the Mallow, not vnlike to the leaues of the Gooseberry bush: on the top of each branch standeth one floure and no more, consisting of fiue small leaues of a dark purple colour: which being fallen, the fruit succeedeth, like vnto that of the Mulberry, whereof it was called *Chamæmorus*, dwarfe Mulberry; at the first white and bitter, after red and somewhat pleasant: the root is long, something knotty; from which knots or joynts thrust forth a few threddie strings. ‡ I take that plant to which our Author hereafter hath allotted a whole chapter, and called *Vaccinia nubis*, or Cloud-berries, to be the same with this, as I shall shew you more largely in that place. ‡

4 *Rubus Saxatilis.*
Stone blacke-Berry bush.

4 *Chamæmorus.*
Knot berry bush.

¶ *The Place.*

The Bramble groweth for the most part in euery hedge and bush.

The Raspis is planted in gardens: it groweth not wilde that I know of, except in the field by a village in Lancashire called Harwood, not far from Blackeburne.

I found it among the bushes of a causey, neere vnto a village called Wisterson, where I went to schoole, two miles from the Nantwich in Cheshire.

The stone bramble I haue found in diuers fields in the Isle of Thanet, hard by a village called Birchinton, neere Queakes house, somtimes Sir *Henry Crispes* dwelling place. ‡ I feare our Author mistooke that which was here added in the second place, for that which he figured and described in the third (now the fourth) which I know not yet to grow wilde with vs. ‡

Knot-berries do loue open snowie hills and mountaines; they grow plentifully vpon Ingleborow hils among the heath and ling, twelue miles from Lancashire, being thought to be the highest hill in England.

They grow vpon Stane-more betweene Yorkeshire and Westmerland, and vpon other wet *Fells* and mountaines.

¶ *The Time.*

These floure in May and Iune with the Roses: their fruit is ripe in the end of August and September.

¶ *The*

¶ *The Names.*

The Bramble is called in Greeke, Βάτος: in French, *Rouges, Loi Duyts Brelmers*: in Latine, *Rubus*, and *Sentis*, and *Vepres*, as *Ouid* writeth in the firſt booke of Metamorphoſis:

Aut Lepori, qui vepre latens hoſtilia cernit
Ora canum. ——

Or to the Hare, that vnder Bramble cloſely lying, ſpies
The hoſtile mouth of Dogs. ——

Of diuers it is called *Cynosbatus*, but not properly; for *Cynosbatus* is the wilde Roſe, as we haue written: in high Dutch, **Brzemen**: in low Dutch, **Brzemen**: in French, *Rouce*: in Italian, *Garza*: in Engliſh, Bramble buſh, and Blacke-berry buſh.

The fruit is named in Latine *Morum rubi*; and as *Fuchſius* thinketh, *Vaccinium*, but not properly: in ſhops, *Mora Bati*: and in ſuch ſhops as are more barbarous, *Mora Baſſi*: in Engliſh, Blacke-berries.

The Raſpis is called in Greeke, Βάτος ἰδαία: in Latine, *Rubus Idæa*, of the mountaine Ida on which it groweth: in Engliſh, Raſpis, Framboiſe, and Hinde-berry.

¶ *The Temperature and Vertues.*

A The yong buds or tender tops of the Bramble buſh, the floures, the leaues, and the vnripe fruit, do very much dry and binde withall: being chewed they take away the heate and inflammation of the mouth, and almonds of the throat: they ſtay the bloudy flix, and other fluxes, and all manner of bleedings: of the ſame force is their decoction, with a little hony added.

B They heale the eies that hang out, hard knots in the fundament, and ſtay the hemorrhoides, if the leaues be laid thereunto.

C The juyce which is preſſed out of the ſtalks, leaues, and vnripe berries, and made hard in the Sun, is more effectuall for all thoſe things.

D The ripe fruit is ſweet, and containeth in it much juyce of a temperate heate, therefore it is not vnpleaſant to be eaten.

E It hath alſo a certaine kinde of aſtriction or binding quality.

F It is likewiſe for that cauſe wholeſome for the ſtomacke, and if a man eat too largely therof, ſaith *Galen*, hee ſhall haue the head-ache: but being dried whileſt it is yet vnripe it bindeth and drieth more than the ripe fruit.

G The root beſides that it is binding containeth in it much thinne ſubſtance, by reaſon whereof it waſteth away the ſtone in the kidnies, ſaith *Galen*.

H *Pliny* writeth, that the berries and floures do prouoke vrine, and that the decoction of them in wine is a preſent remedy againſt the ſtone.

I The leaues of the Bramble boyled in water, with honey, allum, and a little white wine added thereto, make a moſt excellent lotion or waſhing water to heale the ſores in the mouth, the priuie parts of man or woman, and the ſame decoction faſtneth the teeth.

K The Raſpis is thought to be like the Bramble in temperature and vertues, but not ſo much binding or drying. The Raſpis, ſaith *Dioſcorides*, performeth thoſe things which the Bramble doth. The fruit is good to be giuen to thoſe that haue weake and queaſie ſtomackes.

Chap. 5. *Of Holly Roſes, or* Ciſtus.

¶ *The Deſcription.*

Ciſtus hath beene taken of diuers to be a kinde of Roſe: the old Writers haue made two ſorts thereof, male and female; and likewiſe a third ſort, which is called *Ledum*: the later Herbariſts haue diſcouered diuers more, as ſhall be declared.

¶ *A generall Deſcription, wherein all the ſorts of Ciſtus are compriſed.*

Ciſtus and his kindes are wooddy ſhrubs full of branches, of the height of two or three cubits: ſome haue broad leaues, others rough, vneuen, wrinkled, ſomewhat downy, and moſt like the leaues of Sage; although ſome haue the leaues of Roſemary, others the forme of thoſe of the Poplar tree: the floures grow on the tops of the branches, like vnto the wild Roſe, yet ſuch as very quickely vade, periſh, and fall away: thoſe of the male are moſt of a reddiſh blew or purple colour; and of the female white: in their places come vp little heads or knops ſomewhat round, in which is contained ſmall ſeed: the roots of them all are wooddy.

There

There groweth vp sometimes vnder the shrub hard to the roots, a certaine excrescence or hypocist, which is thicke, fat, grosse, full of juyce, without leaues, wholly consisting of many little cases or boxes, as do those of Henbane or of the Pomegranate tree; of a yellowish red colour in one kind, and in another white, and in certaine other greene or grassie, as *Dioscorides* saith.

¶ *The Description.*

1 THe first kinde of *Cistus* groweth vp like a small bush or shrub, of a wooddy substance, three or foure cubits high, garnished with many small and brittle branches, set full of crumpled or rugged leaues very like vnto Sage leaues: at the top of the branches come floures of a purple colour, in shape like vnto a single Brier Rose, hauing leaues somewhat wrinkled like a cloth new dried before it be smoothed, and in the midst a few yellow chiues or thrums: the floures for the most part do perish and fall away before noone, and neuer cease flouring in such maner from the moneth of May vnto the beginning of September, at which time the seed is ripe, being of a reddish colour, and is contained in an hard hairy huske not much vnlike the huske of Henbane.

1 *Cistus mas angustifolius.*
The male Holly Rose.

2 *Cistus mas cum Hypocistide.*
The male Holly Rose with his excrescence.

2 The second sort of *Cistus*, being another kinde of the male *Cistus*, which *Pena* calls *Cistus mas cum Hypocistide*, is like vnto the former, but that from the root of this kinde there commeth a certaine excrescence or out-growing, which is sometimes yellow, sometimes greene, and sometimes white; from which is drawne by an artificiall extraction a certaine juyce called in shops *Hypocistis*.

3 This kinde of *Cistus* hath many wooddy stalkes diuided into diuers brittle branches of a russet colour: whereon doe grow rough leaues somewhat cut or toothed on the edges, and of an ouerworne colour: the floures grow on the tops of the branches, in forme of a Muske Rose, but of an excellent bright purple colour: after which come round knops, wherein is contained small reddish seed: the root is tough and wooddy.

4 This fourth sort of *Cistus* hath diuers wooddy branches, whereon are set, thicke thrust together, diuers small leaues narrow like those of Winter Sauorie, but of an ouerworne russet colour: the root and floures are like the precedent,

3 *Cistus*

3 *Ciſtus mas dentatus.*
Toothed or ſnipt male Ciſtus.

4 *Ciſtus mas tenuifolius.*
Thin leafed Ciſtus.

5 *Ciſtus fœmina.*
The female Ciſtus.

7 *Ciſtus folio Halimi.*
Ciſtus with leaues like Sea Purſlane.

5 The first of the females is like vnto the male Cistus in each respect, sauing that the floures hereof are of a white colour, with diuers yellow thrums in the middle, and the others purple, wherin consisteth the difference.

6 The second female of *Matthiolus* description hath many hard and wooddy stalks branched with diuers armes or wings; whereon are set by couples rough hoary and hairy leaues of a dark russet colour, among which come forth small white floures like vnto those of the Iasmin: the root is tough and wooddy. ‡ This I iudge all one with the former, and therefore haue omitted the figure as impertinent, although our Aurhour followed it, making the floure so little in his Description. ‡

† 7 The seuenth sort of Cistus growes vp to the height of a small hedge bush, hauing diuers brittle branches full of pith: whereon are set leaues by couples like those of sea Purslane, that is to say, soft, hoary, and as it were couered ouer with a kinde of mealinesse: the floures are yellow, and lesse than those of the former.

8 *Cistus folio Lauandulæ.*
Lauander leaued Cistus.

9 *Cistus folio Thymi.*
Cistus with the leaues of Tyme.

8 The eighth Cistus hath likewise shrubby stalks in manner of a hedge tree, whereon grow at certain distances diuers leaues close joined together at the stalke like those of the former, but somwhat lower and narrower: the floures we haue not expreſt in the figure, for that we haue no certain knowledge of them.

9 This ninth Cistus is likewise a wooddy shrub some foot high: the stalks are very brittle, as are all the rest of his kinde, whereon grow very small leaues like those of Tyme: the floures are white, which maketh it one of the females.

10 The low or base Cistus with broad leaues growes like a smal shrub, of a woody substance; the leaues are many, of a darke green colour: the floures are in forme like the other, but of a yellow colour: the roots are likewise wooddy.

11 This narrow leafed low Cistus hath diuers tough branches, leaning to the ground, whereon do grow without order many small narrow leaues somwhat long, of a gummy taste at the first, afterwards bitter: the floures grow on the tops of the branches, of a yellow colour, consisting of fiue leaues, with certaine chiues in the middle: after which follow three square cods or seed-vessels: the root is tough and wooddy.

10 *Cistus humilis latifolius.*
Low Cistus with broad leaues.

11 *Cistus humilis angustifolius.*
Low Cistus with narrow leaues.

12 *Cistus humilis Austriaca Clusij.*
Low Cistus of Austria.

13 *Cistus humilis Serpilli folio.*
Low Cistus with leaues like wilde Tyme.

12 The low or base Cistus of Austria groweth likewise leaning to the ground, hauing many wooddy branches very firme and tough, couered with a blackish barke; whereon grow very many rough and hairy leaues in shape like those of the small Myrtle, of a shining green on the vpper side and of an astringent taste: on euery branch standeth one floure, seldom two, in form like the other, but consisting of one leafe deeply diuided into fiue parts, of a fleshy white colour.

13 This low sort of Cistus hath many tough branches trailing vpon the ground, of a reddish colour, whereon grow small leaues like those of wilde Tyme, of a dark green colour, very thick and fat, and somewhat hairy: the floures grow at the top of the branches, of a gold yellow colour, consisting of fiue small leaues of a very sweet smell: the root is thicke, hard, and wooddy.

14 This strange and rare plant of *Lobels* obseruation I haue thought meet to insert among the kindes of Cistus, as a friend of theirs, if not one of the kinde: it hath leaues like the male Cistus, (the first in this chapter described) but more hairy, bearing at the top of his branches a small knop in shape like a rotten Strawbery, but not of the same substance, for it is compact of a scaly or chaffie matter, such as is in the midst of the Camomill floures, and of a russet colour.

14 *Cistus exoticus Lobelij.*
Lobels strange Cistus.

16 *Myrtocistus Th. Pennei Angli.*
Dr *Penny* his Cistus.

15 The adulterine or counterfeit Cistus growes to the height of a hedge bush: the branches are long and brittle, whereon grow leaues like those of the willow, of an ouerworn russet colour: the floures are small, consisting of fiue little yellow leaues: the whole plant being well viewed seemes to be a willow, but at the first sight one of the Cistus, so that it is a plant participating of both: the toot is wooddy. ‡ *Bauhine* iudges this (which our Author out of *Tabern.* figured and named *Cistus adulterinus*) to be the Cistus set forth in the eight place of the next chapter saue one: but I rather iudge it to be the *Ledum Silesiacum* set forth in the eleuenth place of that chapter, and again in the twelfth, where you may finde more thereof. ‡

16 This kinde of Cistus, which Dr *Penny* a famous Physition of London deceased did gather vpon the Island of Majorca, and called by the name μυρτοκίστη, in Latin, *Myrtocistus Balearica*, is a shrub growing to the height of three cubits, hauing a very rough bark, beset round about with rough and scabbed warts, which barke wil of it selfe easily fall away from the old branches or boughes of the tree.

tree. The leaues of this tree are almoſt like them of *Myrtus*, very rough vnderneath like the branches aforeſaid; but the leaues that grow higher, and towards the top of the branches, are ſmooth, growing about the branches very thicke together, as in the other kinds of Ciſtus. The floures are yellow, growing on the top of the twigs, conſiſting of fiue long leaues ful of many very long chiues within. When the floures be vaded, there followeth a very long and fiue ſquare head or husk ful of ſeed. The whole tree is very ſweet, out of which iſſueth a gum or roſin, or rather a thicke clammie and fat juice, ſuch as commeth forth of the kindes of *Ledum*.

17 This annuall Ciſtus groweth vp from ſeed with one vpright ſtalk to the height of a cubit, oft times diuided into other ſmal branches: whereon grow rough leaues ſomewhat long, of a dark green colour: the floures grow at the top of the ſtalks, conſiſting of fiue ſmall yellow leaues: which being paſt, there followes a three ſquare ſeed veſſel full of ſmall reddiſh ſeed. The root is ſmal and wooddy, and periſheth when the ſeed is perfected.

17 *Ciſtus annuus.*
Ciſtus laſting one yeare.

18 *Ciſtus annuus longifolius Lobelij.*
Long leafed yearely Ciſtus.

18 This other Ciſtus which laſteth but a yeare, hath long ſtalks diuided into other branches of the height of two cubits; whereon grow long rough leaues ſet three together at certain diſtances, the middlemoſt whereof is longer than the other two: the flours grow on the ſides of the branches like the female Ciſtus, of a white colour: the root is of a wooddy ſubſtance, as are all the reſt of his kinde.

‡ 19 This growes ſome foot high, with a ſquare rough greeniſh ſtalke, whereon by couples at certain ſpaces ſtand little longiſh rough leaues, yet toward the top of the ſtalke they ſtand ſometimes three together: vpon the top of the little branches grow floures like thoſe of the other Ciſtus, of colour yellow, with a fine ſanguine ſpot vpon each leafe of the floure. It groweth in ſome parts of France, as alſo on the Alps in Italy. *Cluſius* deſcribes it by the name of *Ciſtus annuus 2. Pona* in his *Mons Baldus* calls it *Ciſtus annuus flore guttato.*

20 This hath many ſlender branches whereon grow ſmall roundiſh leaues, hoary, and ſomewhat like thoſe of Marjerome, ſomewhat leſſe, with the middle rib ſtanding out. The floures grow vpon the tops of the branches, and conſiſt of fiue white leaues, with a darke purple ſpot in the middle of each leafe: the threads in the middle of the floure are of a yellow colour: the ſeed-veſſels are

are of the bigneſſe of thoſe of flax, but three ſquare, containing a ſeed of the bigneſſe of that of Henbane. *Cluſius* found this in diuers parts of Spaine, and ſets it forth by the name of *Ciſtus folio Sampſuchi*. ‡

‡ 19 *Ciſtus annuus flore maculato.*
Spotted annuall Ciſtus.

‡ 20 *Ciſtus folio Sampſuchi.*
Marjerome leafed Ciſtus.

¶ *The Place.*

Holly Roſes grow in Italy, Spain, and Languedoc, and in the countries bordering vpon the riuer Padus, in all Hetruria and Maſſiles, and in many other of the hotter prouinces of Europe, in dry and ſtony places, varying infinitely according to the diuerſitie of the regions where they grow. Of which I haue two ſorts in my garden, the firſt, and the *Ciſtus annuus*.

¶ *The Time.*

They ſloure from May to September.

¶ *The Names.*

The Holly Roſe is called in Greeke, κίστος, and κίσθος: in Latine alſo *Ciſtus*, and *Roſa ſylvatica*: of diuers, *Roſa Canina*, as *Scribonius Largus* writes, but not properly: in Spaniſh, *Eſtepa*: of the Portugals *Roſella*: in Engliſh, Holly Roſe, and Ciſtus after the Greek name. The fungous excreſcence growing at the root of Ciſtus, is called in Greeke κιστοκόμιον, becauſe it growes vnder the ſhrub Ciſtus: it is alſo called *Limodoron*: ſome call it κύτινος, among which is *Paulus Ægineta*, who alſo doth not call that *Hypociſtis* which groweth vnder the ſhrub Ciſtus, but the iuice hereof: wherupon might grow the word *Hypociſtis*, by which name the Apothecaries call this iuice when it is hardned: of ſome it is called *Erithanon*, *Citinus*, and *Hypoquiſtidos*.

¶ *The Nature.*

Ciſtus, as *Galen* ſaith, doth greatly dry, almoſt in the ſecond degree, and it is of that coldnes, that it hath withall a temperat heate: the leaues and the firſt buds being beaten do only dry and bind, in ſuch ſort as they may cloſe vp vlcers, and ioine together green wounds.

¶ *The Vertues.*

The floures are of moſt force, which being drunke with wine are good againſt the bloudy flixe, A
weakneſſe of the ſtomacke, fluxes, and ouerflowing of moiſt humors.

They cure putrified vlcers, being applied in manner of a pultis. *Dioſcorides* teacheth, That they B
are a remedie for eating vlcers, called in Greeke νόμαι, being anointed therewith; and that they cure burnings, ſcaldings, and old vlcers.

C *Hypociſtis* is much more binding: it is a ſure remedie for all infirmities that come of fluxes, as voiding of bloud, the whites, the laske, and the bloudy flix: but if it be requiſit to ſtrengthen that part which is ouerweakned with a ſuperfluous moiſture, it doth notably comfort and ſtrengthen the ſame.

D It is excellent to be mixed with fomentations that ſerue for the ſtomack and liuer.

E It is put into the Treacle of Vipers, to the end it ſhould comfort and ſtrengthen weake bodies, as *Galen* writeth.

Chap. 6.
Of other Plants reckoned for dwarfe kindes of Ciſtus.

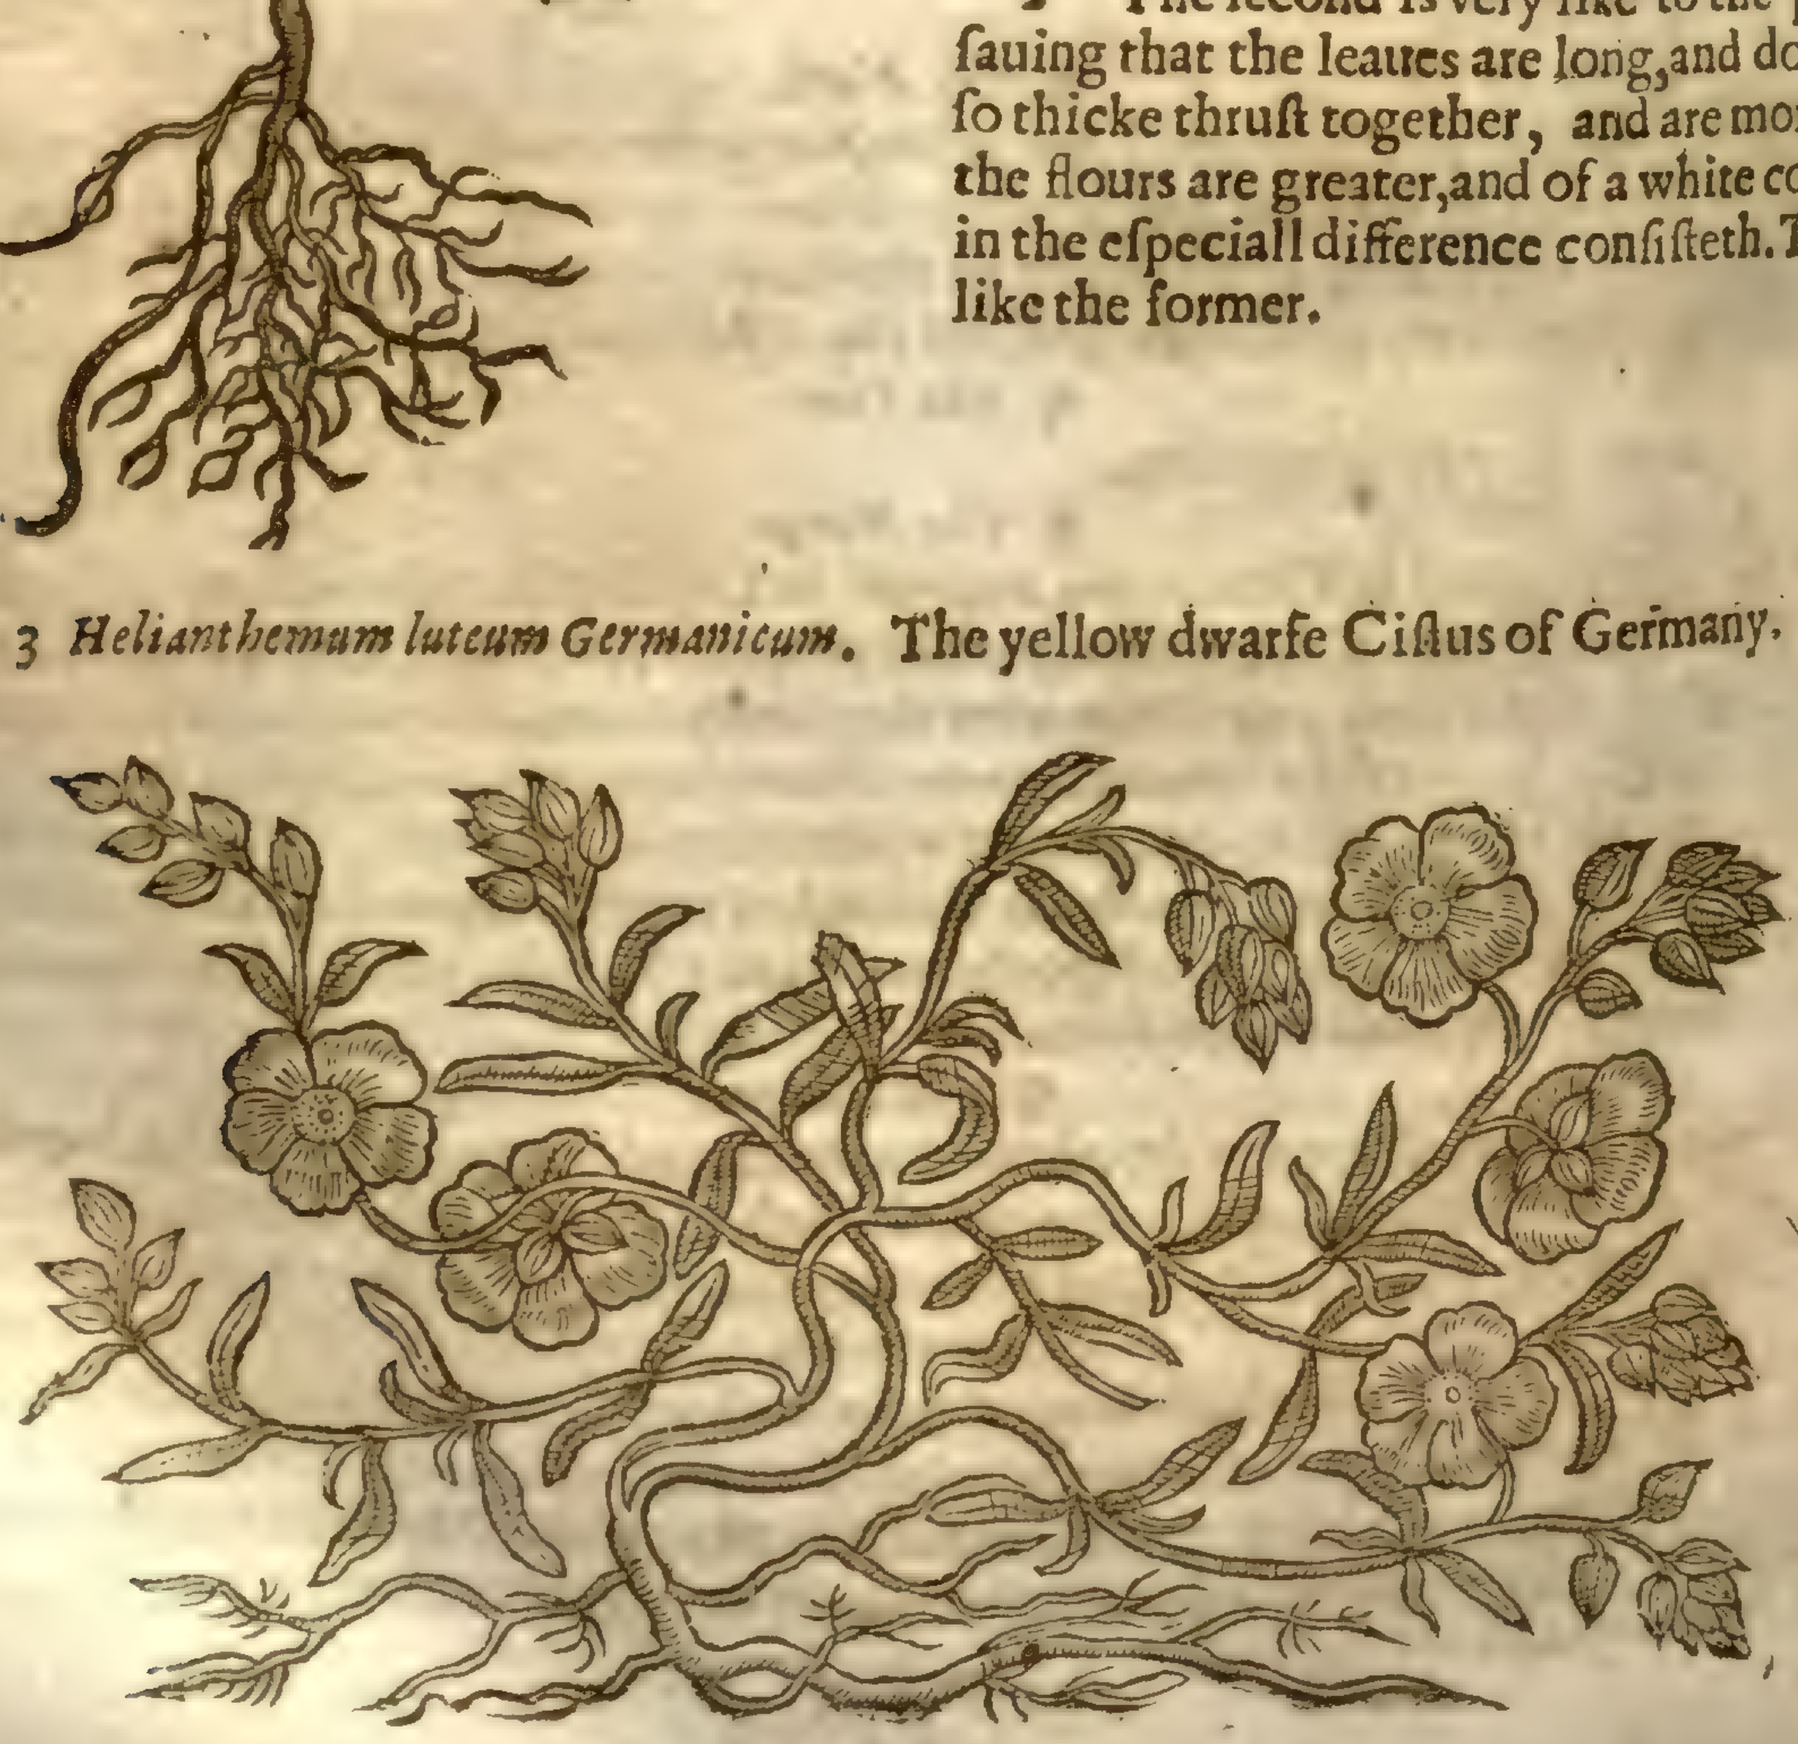
1. 2. *Helianthemum Anglicum luteum vel album.* Engliſh yellow or white dwarfe Ciſtus.

¶ *The Deſcription.*

1 THe Engliſh dwarfe Ciſtus, called of *Lobel, Panax Chironium* (but there is another *Panax* of *Chirons* deſcription which I hold to be the true and right *Panax*, notwithſtanding hee hath inſerted it amongſt the kindes of Ciſtus, as being indifferent to joyne with vs and others for the inſertion) is a low and baſe plant creeping vpon the ground, hauing many ſmall tough branches of a browne colour; wherupon grow little leaues ſet together by couples, thicke, fat, and ful of ſubſtance, and couered ouer with a ſoft downe; from the boſome whereof come forth other leſſer leaues: the floures before they be open are ſmall knops or buttons, of a browne colour mixed with yellow, and beeing open and ſpred abroad are like thoſe of the wilde Tanſie, & of a yellow colour, with ſome yellower chiues in the middle: the root is thicke, and of a wooddy ſubſtance.

2 The ſecond is very like to the precedent, ſauing that the leaues are long, and do not grow ſo thicke thruſt together, and are more woolly. the flours are greater, and of a white color, wherein the eſpeciall difference conſiſteth. The root is like the former.

3 *Helianthemum luteum Germanicum.* The yellow dwarfe Ciſtus of Germany.



3 There is found in Germanie a certaine plant like to Ciſtus and *Ledon*, but much leſſer, creeping vpon the ground vnleſſe it be propped vp, hauing a multitude of twiggy branches ſlender and fine, whereupon grow leaues leſſer than thoſe of Ledon or Ciſtus, very like to that of our Engliſh white dwarfe Ciſtus, of a full ſubſtance, ſlightly haired, wherein is contained a tough juice. The floures are ſmall like little Roſes or the wilde Tanſie, of a yellow colour: the roots be ſlender, woody, and ſomething red.

4 *Helianthemum album Germanicum.* The white dwarfe Ciſtus of Germanie.

5 *Helianthemum Sabaudicum.*
The dwarfe Ciſtus of Savoy.

6 *Helianthemum anguſtifolium.*
Narrow leafed dwarfe Ciſtus.

4 This differeth not from the laſt deſcribed, ſauing that the floures hereof are very white, and the others yellow, wherein they eſpecially differ.

5 The

5 The dwarf Cistus of Savoy hath diuers tough branches of a reddish colour, very tough and woody, diuided into diuers other branches; whereon are set smal leaues foure together, by certain spaces: the floures grow at the top of the branches like those of our yellow dwarfe Cistus, of a yellow colour: the root is very wooddy.

6 This dwarfe Cistus with narrow leaues hath very many small flexible branches, of a brown colour, very smooth, and ramping vpon the ground; whereon grow small long narrow leaues like those of Tyme of Candy; from the bosome whereof come forth diuers other smaller leaues: the floures grow on the tops of the branches, of a bleake yellow colour: the root is likewise woody.

‡ 7 To these I may fitly adde two more: the first hath creeping stalks some foot or two long, blackish, and diuided into sundry smaller branches: the leaues grow thicke and many together, set by couples, though the figure do not well expresse so much: these leaues are small, of the bignesse of those of Tyme, thicke, green aboue, whitish vnderneath, and of a bitter taste: at the ends of the branches grow two or foure floures neere together, very small, composed of fiue little leaues of a kinde of flesh colour: to these succeed heads opening themselues when they come to ripenesse into fiue parts, and containing a very smal seed: the root is hard and wooddy, sending out certaine fibres; also the branches here and there put forth some fibres. This plant dried hath a pretty pleasant smell. It growes vpon the highest Austrian and Styrian Alps, and is set forth by *Clusius* by the name of *Chamæcistus septimus*.

‡ 7 *Chamæcistus serpillifolius.*
Tyme leafed dwarfe Cistus.

‡ 8 *Chamæcistus Frisicus.*
Frisian dwarfe Cistus.

8 The same Author also in his *Curæ Posteriores* giues vs the historie of this, which he receiued with some other rare plants from *Iohn Dortman* a famous and learned Apothecary of Groeningen. This little plant is in leafe and root almost like and neere of the same bignesse with the Celticke Nard, yet the stalkes are vnlike, which are small, set with a few longish leaues, and at the tops they carry fiue or six pretty floures like those of Crow-feet, consisting of six leaues apiece, of a yellow colour, yet with some few spots of another colour, and these set in a double ring about the middle: after these follow heads or seed-vessels with forked tops, filled with a chaffie seed: the whole plant smels somewhat strong. It growes together with *Gramen Parnassi* in rotten moorish places about a village in the country of Drent. *Dortman* called this, *Hirculus Frisicus*: *Clusius* addes, *qui Chamæcisti genus*. ‡

¶ *The*

¶ *The Place.*

Their seueral titles haue touched their natiue countries; they grow in rough dry and sunny places in plain fields and vpon mountains.

Those of our English growing I haue found in very many places, especially in Kent vpon the chalky banks about Grauesend, Southfleet, and for the most part all the way from thence to Canturbury and Douer.

¶ *The Time.*

They floure from Iuly to the end of August.

¶ *The Names.*

Tragus calls dwarfe Cistus in the high-Dutch tongue Heyden Pfope: in Latine, *Gratia Dei*: but there is another herb called also of the later herbarists *Gratia Dei*, which is *Gratiola*: *Valerius Cordus* nameth it *Helianthemum*, and *Solis flos* or Sun floure: of *Clusius*, *Chamæcistus*, or dwarfe Cistus.

Pliny writeth, that *Helianthemum* growes in the champian country Temiscyra in Pontus, and in the mountains of Cilicia neere the sea: saying further, that the wise men of those couutries & the Kings of Persia do anoint their bodies herewith, boiled with Lions fat, a little Saffron, and Wine of Dates, that they may seem faire and beautifull; and therefore haue they called it *Heliocaliden*, or the beauty of the Sun. *Matthiolus* saith, that *Helianthemum* is taken of some to be *Panaces Chironium* or *Chirons* All-heale: but it is nothing likely, as we haue said.

¶ *The Nature and Vertues.*

The faculties and temperature are referred to the kindes of Cistus, for it healeth wounds, stancheth bloud, and stoppeth the spitting of bloud, the bloudy flix, and all other issues of bloud. A

The same boiled in wine healeth vlcers in the mouth and priuy parts, if they be washed therewith: to be briefe, it joineth and strengthneth: which things do plainly and euidently shew, That it is not only like to Cistus and Ledon in forme, but in vertues and faculties also, and therefore it is manifest that it is a certain wilde kinde of Cistus and Ledon. B

Chap. 7. *Of Cistus Ledon and Ladanum.*

¶ *The Kindes.*

THere be diuers sorts of Cistus, whereof that gummy matter is gathered called in shops *Ladanum*, and *Labdanum*, but vnproperly.

¶ *The Description.*

1 CIstus Ledon is a shrub growing to the height of a man, and sometimes higher, hauing many hard wooddy branches, couered with a blackish barke; whereupon grow leaues set together by couples, one right against another like vnto wings, of an inch broad, of a black swart green on the vpper sides, and whitish vnderneath: whereon is gathered a certain clammie transparent or through-shining liquor, of a very hot sweet smel, which being gathered & hardned is that which in shops is called *Labdanum*: the floures grow at the ends of the branches like little roses, consisting of fiue white leaues, euery one decked or beautified toward the bottome with pretty darke purplish spots tending to blackenesse, hauing in the middle very many yellow chiues such as are in the middle of the Rose; after come the knaps or seed-vessels full of most small reddish seed: the whole plant being dried groweth somewhat whitish, and of a pleasant smell, which it retaineth many yeares.

2 The second groweth likewise to the height of an hedge bush, the branches are long, and very fragil or easie to breake, whereon grow leaues greener than any other of his kind, yet vnderneath of a hoary colour, growing toward winter to be somewhat reddish, of a soure and binding taste. The flours are like the precedent, the forme whereof the Grauer hath omitted, in other respects like the former.

3 The third sort of Cistus Ledon groweth vp to the height of a small hedge bush, hauing many twiggy branches, whereon grow leaues like those of the Poplar tree, sharp at the point, couered ouer with that clammy dew that the others are: the floures grow at the tops of the branches, of a white colour like the precedent.

4 The

1 *Cistus Ledon* 1 *Clusij.*
The first Cistus bringing *Ladanum.*

2 *Cistus Ledon* 2 *Clusij.*
The second gum Cistus.

3 *Cistus Ledon populea fronde.*
Cistus Ledon with leaues like Poplar.

4 *Sistus Ledon* 4 *Clusij.*
Cistus Ledon 4 of *Clusius.*

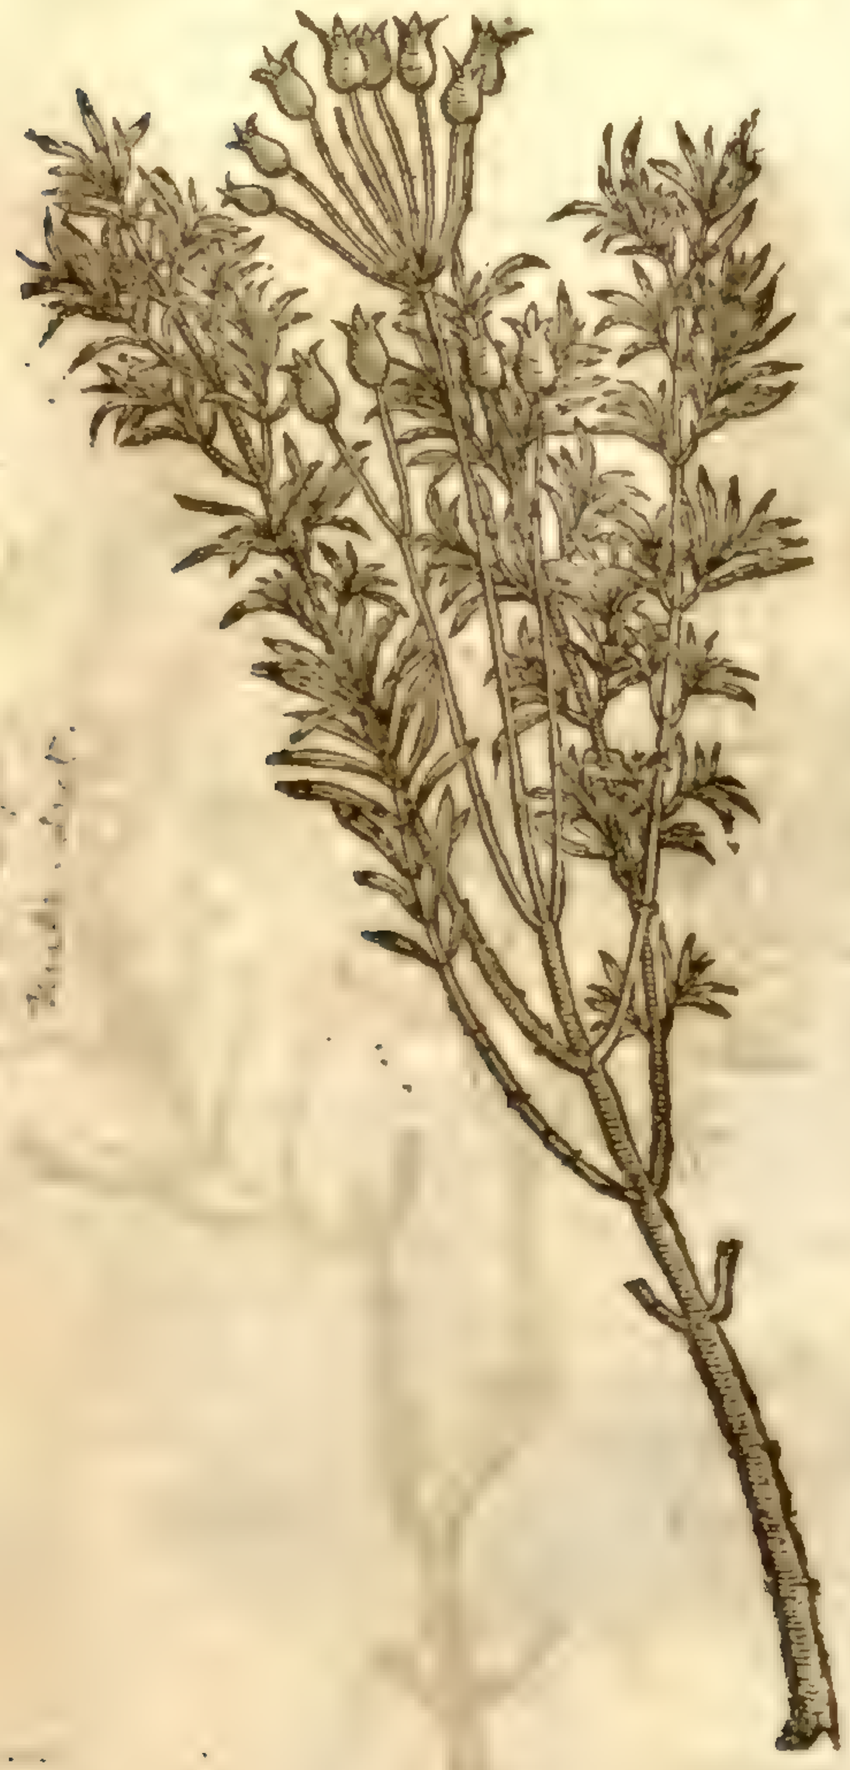
5 *Cistus Ledon 5. Clusij.*
The fift Cistus Ledon.

6 *Cistus Ledon 6. Clusij.*
The sixth Cistus Ledon.

7 *Cistus Ledon 7. Clusij.*
The 7. Cistus Ledon.

8 *Cistus Ledon cum Hypocistide Lobelij.*
The 8. Cistus Ledon, with his excrescense:

9 *Cistus Ledon* 10 *Clusij.*
The tenth Cistus Ledon.



11 *Cistus Ledum Silesiacum.*
The Polonian Cistus Ledon.

10 *Cistus Ledon Myrtifolium.*
Cistus Ledon with leaues like Myrtle.

4 This fourth of *Clusius* descripition groweth likewise to the height of a shrubby bush, hauing many branches flexible, hoary, and hairy: the leaues are like the rest of his kind, but softer, more hairy, of a swart green colour, dasht ouer with that dewy fatnesse not onely in the Spring time, but in the heate of Summer also: the floures are white with yellow thrums in the middle: the rest answereth the last described.

5 The fifth growes vp like a hedge bush with many tough branches, whereon are set long rough leaues hoary vnderneath, somewhat dashed ouer with that fatty dew or humor that the rest are possessed of: the floures are likewise of a white colour, with certaine yellow chiues in the middle. The root is wooddy.

† 6 The sixt hath diuers smal branches couered with a blackish barke: the floures are set together at the toppes of the branches by certaine spaces: they are yellow, and like the former in each respect.

7 This is a low shrub growing to the height of two cubits, hauing many branches couered with a bark of the colour of ashes, whereon are confusedly set diuers leaues at certain distances, small, narrow, like those of Winter Sauorie, of an ouerworne russet colour, verie thicke, fat, and glutinous: the flours are white, and differ not, nor the seed from the rest.

8 The

8 The eighth groweth vp like a little hedge bush, hauing leaues like the common female Cistus, sauing that those of this plant are sprinkled ouer with that clammy moisture, and the other not so: the floures and seed are also like. From the root of this plant commeth such like excrescence called *Limodoron, Orobanche*, or *Hypocistis*, as there doth from the first male Cistus, wherein it differeth from all the rest vnder the name Ledon.

9 The ninth hath diuers brittle stalkes of an ash colour tending to a russet; whereon are set very may leaues like those of Thyme, of an ouerworne colour: the floures are white, with certaine yellow chiues in the middle, which the grauer hath omitted in the figure.

10 The tenth groweth vp like a small shrub, hauing brittle stalkes, couered with a blackish barke, and diuided into diuers branches; whereon are set vpon short truncheons or fat foot-stalkes, foure or fiue like those of the Myrtle tree, of a strong smell: the floures are likewise of a white colour.

12 *Cistus Ledum Rorismarini folio.*
Cistus Ledon with leaues like Rosemarie.

13 *Cistus Ledum Matthioli.*
Cistus Ledon of *Matthiolus* deseription.

11. 12. The twelfth kinde of Cistus Ledon groweth vpright with a straight body or stocke, bringeth at the top many small twigs or rods of a cubit long, couered with a barke of the colour of ashes, which diuide themselues into other branches, of a purplish colour, beset with long and narrow leaues, not much vnlike to Rosemary, but longer; of a greene colour aboue, but vnderneath hauing as it were a long rib, made or compact of wooll or downe; of a sweet and pleasant smell, and somewhat sharpe in taste: on the tops of the branches grow knops or heads compact as it were of many scales, of an iron or russet colour: out of which commeth and proceedeth a certaine round and long mane, or hairy panickled tuft of floures, with many long, tender, greene, and somewhat woolly stalkes or twigs growing vnto them, of a sweet sent and smell: the floures consist of fiue little white leaues, within which are contained ten white chiues with a long stile or pointal in the midst of the floure: when the floures be vaded, there succeed long knops or heads which are fiue cornered, in shape and bignesse like vnto the fruite and berries of *Cornus*; which being greene, are bespeckled with many siluer spots, but being ripe, are of a red colour; containing within them a long yellow seed, which is so small and slender, that it is like to the dust or pouder that falleth out of worme holes. ‡ This is the *Ledum Silesiacum* of *Clusius*; and the *Ledum Rorismarini folio* of *Tabernamontanus*: it is also the *Rosmarinum syluestre* of *Matthiolus*; and *Chamæpeuce* of *Cordus*: and I am deceiued

deceiued if the figure which *Tabernamontanus* and our Author out of him gaue by the name of *Cistus adulterinus*, were not of this. ‡

15 Among the shrubby bushes comprehended vnder the title of *Cistus Ledum*, *Matthiolus* hath set forth one, whereof to write at large were impossible, considering the Author is so briefe, and of our selues we haue not any acquaintance with the plant it selfe: *Dioscorides* to helpe what may be, saith, that it is a shrub growing like vnto the stocke or kindred of the *Cisti*: from whose leaues is gathered a clammy dew which maketh that gummie matter that is in shops called *Lapdanum*: it groweth, saith he, in hot regions (but not with vs:) the Mauritanians call the juyce or clammy matter, *Leden*, and *Laden*: of some, *Ladano*, and *Odano*: in Spanish, *Xara*: and further saith, it groweth in Arabia, where the bush is called *Chasus*: thus much for the description. ‡ Our Author here seems to make *Dioscorides* to comment vpon *Matthiolus*, which shewes his learning, and how well he was exercised in reading or vnderstanding any thing written of Plants. But of this enough; The Plant here figured which *Matthiolus* iudges to be the true *Ledon*, or *Cistus Ladanifera* of *Dioscorides*, hath large stalkes and branches, whereon grow very thicke leaues, broad also and long, with the nerues running alongst the leaues: the floures of this consist of fiue white leaues, and the seed is contained in a three cornered seed vessell. ‡

14 *Cistus Ledum Alpinum Clusij.*
The Mountaine Cistus.

‡ 15 *Cistus Ledon folijs Rorismarini.*
Rosemary leaued Cistus Ledon.

4 The foureteenth Cistus, being one of those that doe grow vpon the Alpish mountaines, which *Lobel* setteth downe to be *Balsamum alpinum* of *Gesner*: notwithstanding I thinke it not amisse to insert it in this place, hauing for my warrant that famous Herbarist *Carolus Clusius*: this plant is one of the beautifullest, differing in very notable points, yet resembling them in the wooddy branches and leaues: it riseth vp hauing many weake branches leaning to the ground, yet of a wooddie substance, couered ouer with an ash-coloured barke: the leaues are broad, and very tough, of a shining greene colour, and a binding taste: the flowres grow at the tops of the branches like little bels, hanging downe their heads, diuided at the lips or brims into fiue diuisions, of a deep red colour on the out side, and dasht ouer here and there with some siluer spots; on the inside of a bright shining red colour, with certaine chiues in the middle, and of a very sweet smell, as is all the rest of the plant; after which come small heads or knaps, full of seed like dust, of a very strong smell, making the head of them to ake that smel therto: the root is long, hard, and very wooddy: oftentimes there is found

found vpon the trunke or naked part of the stalkes certain excrescences, or out-growings in manner of galls, of a fungous substance, like those of Touchwood, white within, and red without, of an astringent or biting taste.

‡ 15 This growes some cubit or better high, and hath long narrow glutinous leaues like in shape to those of Rosemarie, set by couples but not very thicke: the branches whereon the floures doe grow are slender, and the seed vessels are diuided into fiue parts as in other plants of this kinde. This *Clusius* found in Spaine, and sets forth for his *Ledum nonum*. ‡

¶ *The Place.*

Cistus Ledon groweth in the Island of Candie, as *Bellonius* doth testifie, in vntilled places euery where: it is also found in Cyprus, as *Pliny* sheweth, and likewise in many places of Spaine that lie open to the Sun: moreouer, both the forme and bigneſſe of the leaues, and also of the plants themselues, as well of those that bring forth *Ladanum*, as the other Cistus, do vary in this wonderful maner, according to the diuersitie of the places and countries where they grow: they are strangers in these Northernly parts, being very impatient of our cold clymate.

¶ *The Time.*

They floure for the most part from May to the end of August: the clammy matter which falleth vpon the leaues, which is a liquid kinde of Rosen of a sweet smell, is gathered in the Spring time, as *Dioscorides* saith: but as *Petrus Bellonius* affirmeth (being an eye witnes of the gathering) in the midst of summer, and in the extreme heat of the Dog-daies, the which in our time not without great care and diligence, and as great labour, is gathered from the whole plant (with certain instruments made in manner of tooth-pickes, or care-pickes, which in their tongue they call *Ergastiri*) and not gathered from the beards of Goats, as it is reported in the old fables of the lying Monks themselues, called *Calohieros*, that is to say Greekish Monkes, who of very mockery haue foisted that fable among others extant in their workes.

‡ I thinke it not amisse for the better explanation of the matter here treated of, as also to shew you after what manner our Authour in diuers places gaue the testimony of sundry Writers, and how well hee vnderstood them, here to set downe in English the words of *Bellonius* concerning the gathering of *Ladanum*, which are these. [The Greekes (saith he) for the gathering of *Ladanum*, prouide a peculiar instrument which in their vulgar tongue they terme *Ergastiri*: This is an instrument like to a Rake without teeth, to this are fastened sundry thongs cut out of a raw and vntanned hide, they gently rub these vpon the *Ladanum* bearing shrubs, that so the liquid moisture concrete about the leaues may sticke to them, which afterwards with kniues they shaue off these thongs in the heat of the day. Wherefore the labour of gathering *Ladanum* is exceeding great, yea intollerable, seeing they must of necessitie stay in the mountaines all the day long in the greatest heat of the Dog-daies: neither vsually shall you finde any other who will take the paines to gather it; besides, the *Calohieroi*, that is, the Greeke Monkes. It is gathered no where in the whole Island of Candy in greater plenty, than at the foot of the mountaine Ida at a village called Cogualino, and at Milopotamo. ‡]

¶ *The Names.*

The shrub it selfe is called in Greeke, λήδον, or λάδον: the Latines keepe the name *Ledon* or *Ladon*, and is a kinde of *Cistus* or Holly Roses: the fat or clammie matter which is gathered from the leaues, is named *Ladanon* and *Ledanon*, according to the Greeke: the Apothecaries corruptly call it *Lapdanum*: *Dioscorides* counteth that to be the best which is sweet of smell, and somewhat greene, that easily waxeth soft, is fat, without sand, and is not easily broken, but very full of Rosin or gumme.

¶ *The Temperature.*

Ladanum, saith *Galen*, is hot in the later end of the first degree, hauing also a little astrictiue or binding quality; it is likewise of a thin substance, and therefore it softeneth, and withall doth moderately digest, and also concoct.

¶ *The Vertues.*

Ladanum hath a peculiar property against the infirmities of the mother, it keepeth haires from falling; for it wasteth away any setled or putrified humor that is at their roots. A

Dioscorides saith, That *Ladanum* doth binde, heate, souple, and open, being tempered with wine, Myrrhe, and oyle of Myrtles; it keepeth haires from falling, being annointed therewith; or laied on mixed with wine, it maketh the markes or scars of wounds faire and well coloured. B

It taketh away the paine of the eares if it be poured or dropped therein, mixed with honied water, or with oyle of Roses. C

A fume made thereof draweth forth the after-birth, and taketh away the hardnesse of the matrix. D

E It is with good ſucceſſe mixed with mollifying plaiſters that mitigate paine.
F Being drunke with wine, it ſtoppeth the laske and prouoketh vrine.
G There is made hereof diuers ſorts of Pomanders, chaines, and bracelets, with other ſweets mixed therewith.

CHAP. 8. *Of Roſemary.*

¶ *The Deſcription.*

1 ROſemarie is a wooddy ſhrub, growing oftentimes to the height of three or foure cubits, eſpecially when it is ſet by a wall: it conſiſteth of ſlender brittle branches, whereon do grow very many long leaues, narrow, ſomewhat hard, of a quicke ſpicy taſte, whitiſh vnderneath, and of a full greene colour aboue, or in the vpper ſide, with a pleaſant ſweet ſtrong ſmell; among which come forth little floures of a whitiſh blew colour: the ſeed is blackiſh: the roots are tough and wooddy.

1 *Roſmarinum Coronarium.*
Garden Roſemarie.

2 *Roſmarinum ſylueſtre.*
Wilde Roſemarie.

2 The wilde Roſemary *Cluſius* hath referred vnto the kindes of Ciſtus Ledon; we haue as a poore kinſman thereof inſerted it in the next place, in kindred or neighbourhood at the leaſt. This wilde Roſemary is a ſmall wooddy ſhrub, growing ſeldome aboue a foot high, hauing hard branches of a reddiſh colour, diuiding themſelues into other ſmaller branches of a whitiſh color: whereon are placed without order diuers long leaues greene aboue, and hoarie vnderneath, not vnlike to thoſe of the dwarfe Willow, or the common Roſemary, of a dry and aſtringent taſte, of little ſmell or none at all: the floures ſtand on the tops of the branches, ſet vpon bare and naked foot-ſtalkes, conſiſting of fiue ſmall leaues of a reddiſh colour, ſomewhat ſhining; after which appeare little knaps full of ſmall ſeed: the root is tough and wooddy.

3 This plant grows vp like an hedge ſhrub of a wooddy ſubſtance, to the height of two or three cubits;

3 *Casia Poetica, Lobelij.*
The Poëts Rosemary or Gardrobe.

cubits; hauing many twiggie brnnches of a green colour: wherupon do grow narrow leaues like vnto *Linaria* or Toad-flax, of a bitter taste; among which come forth small mossie floures, of a greenish yellow colour like tho'e of the Cornell tree, and of the smell of Rosemarie: which hath moued me to place it with the Rosemaries as a kind thereof, not finding any other plant so neere vnto it in kinde and neighbourhood: after the floures be past, there succeed fruit like those of the Myrtle tree, greene at the first, and of a shining red colour when they bee ripe, like Corall, or the berries of *Asparagus*, soft and sweet in taste, leauing a certaine acrimony or sharpe taste in the end: the stone within is hard as is the nut, wherein is contained a small white kernel, sweet in tast: the root is of a woodie substance: it floureth in the Summer; the fruit is ripe in the end of October: the people of Granade, Montpelier, and of the kingdom of Valentia, doe vse it in their presses and Wardrobes, whereupon they cal it *Guardadelo*. ‡ This in *Clusius* his time when he liued about Montpelier was called *Osyris*; but afterwards they called it *Casia*, thinking it that mentioned by the Poët *Virgil*, the which it cannot be, for it hath no sweet smell. *Pena* and *Lobel* iudge it to be the *Casia* of *Theophrastus*, wherewith also it doth not well agree. ‡

¶ *The Place.*

Rosemary groweth in France, Spaine, and in other hot countries; in woods, and in vntilled places: there is such plenty thereof in Languedocke, that the inhabitants burne scarce any other fuell: they make hedges of it in the gardens of Italy and England, being a great ornament vnto the same: it groweth neither in the fields nor gardens of the Easterne cold countries; but is carefully and curiously kept in pots, set into the stoves and cellers, against the injuries of their cold Winters.

Wild Rosemary groweth in Lancashire in diuers places, especially in a field called Little Reed, amongst the Hurtle berries, neere vnto a small village called Maudsley; there found by a learned Gentleman often remembred in our History (and that worthily) M^r. *Thomas Hesketh.*

¶ *The Time.*

Rosemary floureth twice a yeare, in the Spring, and after in August.
The wilde Rosemary floureth in Iune and Iuly.

¶ *The Names.*

Rosemary is called in Greeke, λιβανωτὶς σφακὼς μερτικὴ: in Latine, *Rosemarinus Coronaria*: it is surnamed *Coronaria*, for difference sake betweene it and the other *Libanotides*, which are reckoned for kindes of Rosemary, and also because women haue beene accustomed to make crownes and garlands thereof: in Italian, *Rosemarino coronario*: in Spanish, *Romero*: in French and Dutch, *Rosemarin*.

Wilde Rosemary is called *Rosemarinus syluestris*: of *Cordus*, *Chamæpence*.

¶ *The Temperature.*

Rosemary in hot and dry in the second degree, and also of an astringent or binding quality, as being compounded of diuers parts, and taking more of the mixture of the earthy substance.

¶ *The Vertues.*

Rosemary is giuen against all fluxes of bloud; it is also good, especially the floures thereof, for all infirmities of the head and braine, proceeding of a cold and moist cause; for they dry the braine, quicken the sences and memory, and strengthen the sinewie parts. A

Serapio witnesseth, That Rosemary is a remedy against the stuffing of the head, that commeth through coldnesse of the braine, if a garland thereof be put about the head, whereof *Abin Mesuai* giueth testimony. B

Dioscorides teacheth that it cureth him that hath the yellow jaundice, if it be boyled in water and drunke before exercise, and that after the taking thereof the patient must bathe himselfe and drinke wine. C

D The diſtilled water of the floures of Roſemary being drunke at morning and euening firſt and laſt, taketh away the ſtench of the mouth and breath, and maketh it very ſweet, if there be added thereto, to ſteep or infuſe for certaine daies, a few Cloues, Mace, Cinnamon, and a little Anniſe ſeed.

E The Arabians and other Phyſitions ſucceeding, do write, that Roſemary comforteth the braine the memorie, the inward ſenſes, and reſtoreth ſpeech vnto them that are poſſeſſed with the dumbe palſie, eſpecially the conſerue made of the floures and ſugar, or any other way confected with ſugar, being taken euery day faſting.

F The Arabians, as *Scrapio* witneſſeth, giue theſe properties to Roſemarie: it heateth, ſay they, is of ſubtill parts, is good for the cold rheume which falleth from the braine, driueth away windines, prouoketh vrine, and openeth the ſtoppings of the liuer and milt.

G *Tragus* writeth, that Roſemarie is ſpice in the Germane Kitchins, and other cold countries. Further, he ſaith, That the wine boyled with Roſemarie, and taken of women troubled with the mother, or the whites, helpeth them, the rather if they faſt three or foure houres after.

H The floures made vp into plates with Sugar after the manner of Sugar Roſet and eaten, comfort the heart, and make it merry, quicken the ſpirits, and make them more liuely.

I The oile of Roſemary chimically drawne, comforteth the cold, weake and feeble braine in moſt wonderfull manner.

K The people of Thuringia doʋſe the wilde Roſemarie to prouoke the deſired ſickneſſe.

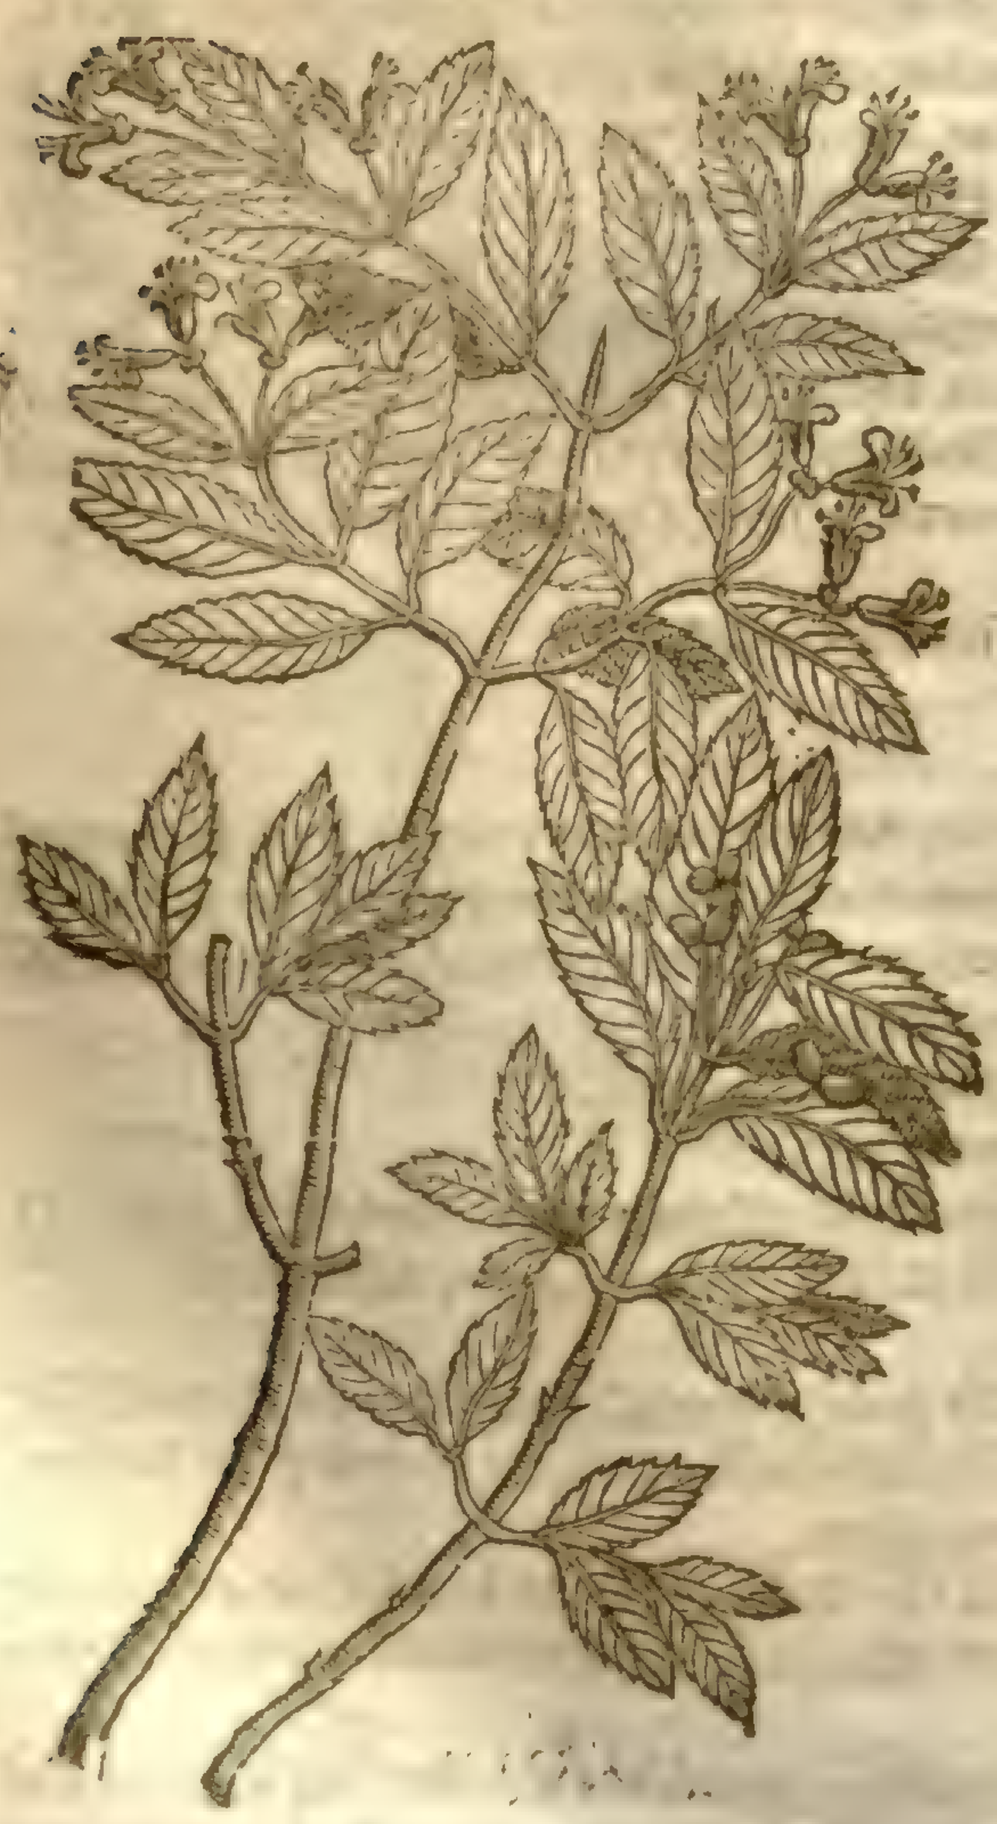
L Thoſe of Marchia vſe to put it into their drinke the ſooner to make their clients drunke, and alſo do put it into cheſts and preſſes among clothes, to preſerue them from moths or other vermine.

† The vertues in the two laſt places properly belong to the *Roſemarinum ſylueſtre* of *Matthiolus*, which is the *Chamæpeuce* of *Cordus*, and is deſcribed in the 11 place of the foregoing chapter, by the name of *Ciſtus Ledum Sileſiacum*.

Chap. 9. *Of Vpright Wood-binde.*

1 *Periclymenum rectum Sabaudicum.*
Sauoy Honiſuckles.

2 *Periclymenum rectum Germanicum.*
Germane Honiſuckles.



¶ The

¶ *The Description.*

1 THis strange kinde of Hony-suckle, found in the woods of Sauoy, represents vnto vs that shrub or hedge-bush called *Cornus fœmina*, the Dog-berry tree, or Pricke-timber tree, hauing leaues and branches like the common Wood-binde, sauing that this doth not clamber or clymbe as the others do, but contrariwise groweth vpright, without leaning to one side or other, like a small tree or hedge-bush: the flours grow vpon the tender sprayes or twiggie branches, by couples, not vnlike in shape and colour to the common Wood-bind, but altogether lesser, and of a white colour, hauing within the same many hairy chiues like the other of his kinde: after which come red berries joyned together by couples: the root is tough and wooddy.

2 The stalkes of the second be oftentimes of a meane thickenesse, the wooddy substance somewhat whitish and soft: the branches be round, and couered with a whitish barke, notwithstanding in the beginning when the sprayes be young they are somewhat reddish. The leaues be long, like those of the common Hony-suckle, soft, and of a white greene: on the lower side they be whiter, and a little hairy: the floures be lesser than any of the Wood-bindes, but yet of the same fashion, and of a whitish colour, joyned together by couples vpon seuerall slender foot-stalkes, like little wilde Cherries, of a red colour, the one lesser oftentimes than the other.

3 *Periclymenum rectum fructu cæruleo.*
Vpright Wood-binde with blew berries.

4 *Periclymenum rectum fructu rubro.*
Cherry Wood-binde.

3 This strange kind of Wood-binde, which *Carolus Clusius* hath set forth in his Pannonicke Obseruations, riseth vp oftentimes to the height of a man, euen as the former doth; which diuides it selfe into many branches, couered with a rough blacke barke, that choppeth and gapeth in sundry clefts as the barke of the Oke. The tender branches are of a whitish greene colour, couered with a woolly hairinesse, or an ouerworne colour whereupon doe grow leaues set by couples one against the other, like vnto the common Woodbinde, of a drying bitter taste: the floures grow by couples likewise, of a whitish colour. The fruit succeedeth, growing like little Cherries each one in his owne foot-stalke, of a bright and shining blew colour; which being bruised, doe die the hands of a reddish colour, and they are of a sharpe winie taste, and containe in them many small flat seeds. The root is wooddy, dispersing it selfe far abroad.

4 This

4 This kind of vpright Wood-bind groweth vp likewiſe to the height of a man, and oftentimes more high, like to the laſt deſcribed but altogether greater. The berries hereof are very blacke, wherein eſpecially is the difference. ‡ The leaues of this are as large as Bay leaues, ſharpe pointed, greene aboue, and whitiſh vnderneath, but not hairy, nor ſnipt about the edges: the floures grow by couples, of a whitiſh purple, or wholly purple: to theſe paires of floures there commonly ſucceeds but oue berry, larger than any of the former, of the bigneſſe of a little cherry, and of the ſame colour, hauing two markes vpon the top thereof, where the floures ſtood. ‡

Periclymeni 3. & 4. *flores.*
The floures of the third and fourth.

5 *Chamæpericlymenum.*
Dwarfe Hony-ſuckle.

5 To the kinds of Wood-bindes this plant may likewiſe be referred, whoſe picture with this deſcription was ſent vnto *Cluſius* long ſince by that learned Doctor in Phyſicke *Thomas Penny* (of our London colledge of famous memory:) it riſeth vp with a ſtalke of a foot high; whereupon are ſet by couples faire broad leaues one right againſt another, ribbed with certain nerues like thoſe of Plantaine, ſharpe pointed, and ſomewhat hollowed in the middle like Spoone-woort: from the boſome of which leaues come forth ſmall floures, not ſeen or deſcribed by the Author: after which commeth forth a cluſter of red berries, thruſt hard together as thoſe of Aaron or Prieſts pint. The root is tough and very ſlender, creeping far abroad vnder the vpper cruſt of the earth, whereby it occupieth much ground.

¶ *The Place.*

Theſe plants are ſtrangers in England: they grow in the woods and mountaines of Switzerland, Germany, Sauoy, and other thoſe parts tending to the Eaſt, Eaſt North-Eaſt, and Eaſt and by South.

I haue a plant of the firſt kinde in my garden: the reſt as yet I haue not ſeene, and therefore cannot write ſo liberally thereof as I could wiſh.

‡ The dwarfe Hony-ſuckle growes in the maritime parts of Norway and Sweden, and the countries thereabout. ‡

¶ *The Time.*

They floure for the moſt part when the others doe, that is to ſay, in May and Iune, and their fruit is ripe in September.

¶ *The*

¶ *The Names.*

Vpright Wood-binde or Hony-suckle is called *Periclymenum stans*, and *Periclymenum rectum*, or vpright Wood-binde: of *Dodonæus*, *Xylosteum*: in high Dutch, **Hondskirsen**, that is to say, *Canum Cerasa*, or Dog Cherries. The English names are expressed in their seuerall titles. It hath beene called *Chamæcerasus*, but not truly.

¶ *The Temperature and Vertues.*

Touching the temperature and vertues of these vpright Wood-bindes we haue no experience at all our selues, neither haue we learned any thing of others.

Chap. 10. *Of Sene.*

Sena foliis obtusis.
Italian Sene.

¶ *The Description.*

Sene bringeth forth stalkes a cubit high, set with diuers branches: the leaues are long, winged, consisting of many small leaues like those of Liquorice, or of bastard Sene: the floures come forth of the bottom of the wings, of colour yellow, standing vpon slender foot-stalkes; from which after the floures be gone hang forked cods, the same bowing inward like a halfe-Moone, plain and flat, in which are contained seeds like to the seeds or kernels of grapes, of a blackish colour. The root is slender, long, and vnprofitable, which perisheth when the leaues are gathered for medicine, and the seeds be ripe and must be sowne againe the next yeare, euen as we do corne.

There is another kinde of Sene growing in Italy, like the other in each respect sauing that it is greater, and hath not that force in purging that the other hath.

¶ *The Place and Time.*

This is planted in Syria and Ægypt, also in Italy, in Prouince, in France, in Languedoc. It hardly groweth in high and low Germany, neither in England: it prospereth in hot Regions, and cannot away with cold; for that cause it is in Italy sowne in May, and continueth no longer than Autumne: the best is brought from Alexandria and Egypt. The Arabians were the first that found it out.

¶ *The Names.*

The Persians call it *Abalzemer*, as *Mesue* his copy teacheth: the Apothecaries *Sena*, by which name it was knowne to *Actuarius* the Grecian, and to the later Latines: it is called in English, Sene.

¶ *The Temperature.*

Sene is of a meane temperature, neither hot nor cold, yet inclining to heate, and dry almost in the third degree: it is of a purging faculty, and that by the stoole, in such sort as it is not much troublesome to mans nature, hauing withall a certaine binding quality, which it leaueth after the purging.

¶ *The Vertues.*

It voideth forth flegmaticke and cholericke humors, also grosse and melancholike, if it be helped with something tending to that end. A

It is a singular purging medicine in many diseases, fit for all ages and kindes. B

It purgeth without violence or hurt, especially if it be tempered with Anise seed or other like sweet smelling things added or with gentle purgers or lenitiue medicines. It may be giuen in pouder, but commonly the infusion thereof is vsed. C

The

D The quantitie of the pouder is a dram weight, and in the infusion, foure, fiue, or more. It may be mixed with any liquor.

E It is in the decoction or in the infusion tempered with cold things in burning agues and other hot diseases: in cold and long infirmities it is boyled with hot opening simples and such like; or else it is steeped in wine, in which manner as familiar to mans nature, it draweth forth gently by the stoole, almost without any kinde of paine, crude and raw humors.

F Most of the Arabians commend the cods, but our Physitions the leaues rather; for vnlesse the cods be full ripe they ingender winde, and cause gripings in the belly. For they are oftentimes gathered before they be ripe, and otherwise easily fall away being shaken downe by the winde, by reason of their weake and slender stalkes.

G Some also thinke that Sene is hurtfull to the stomacke, and weakneth the same, for which cause they say that Ginger or some sweet kinde of spice is to be added, whereby the stomacke may be strengthned. Likewise *Mesue* noteth that it is slow in operation, and therefore Salgem is to bee mixed with it. Moreouer, Sene purgeth not so speedily as stronger medicines do.

H Notwithstanding it may be helped not only by Salgem, but also by other purging things mixed therewith, that is to say, with simple medicines, as Rubarb, Agaricke, and others; and with compounds, as that which is called *Catholicon*, or the Electuary *Diaphœnicon*, or that which is made of the juyce of Roses, or some other, according as the condition or quality of the disease and of the sicke man requireth.

I The leaues of Sene are a familiar purger to all people, but they are windie, and do kinde the bodie afterwards, very much disquieting the stomacke with rumbling and belching: for the auoiding of which inconuenience there must bee added Cinnamon, Ginger, Annise seed, and fennell seed, Raisins of the Sun, and such like that do breake winde, which will the better help his purging qualitie.

K Sene doth better purge when it is infused or steeped, than when it is boyled: for doubtlesse the more it is boyled the lesse it purgeth, and the more windie it becommeth.

L Take Borage, Bugloss, Balme, Fumitory, of each three drams, Sene of Alexandria very well prepared and pouned, two ounces, strow the pouder vpon the herbes and distill them: the water that commeth thereof reserue to your vse to purge those that liue delicately, being ministred in white wine with Sugar, in condited confections, and such dainty waies, wherein delicate and fine people do greatly delight: you may also (as was said before) adde hereunto according to the maladie, diuers purgers, as Agaricke, Mirobalans, &c.

M The pouder of Sene after it is well prepared two ounces, of the pouder of the root of Mechoacan foure drams, pouder of Ginger, Annise seeds, of each a little, a spoonfull of Annise seeds, but a very little Ginger, and a modicum or small quantity of *Sal gemmæ*: this hath beene proued a very fit and familiar medicine for all ages and sexes. The patient may take one spoonefull or two thereof fasting, either in pottage, some supping in drinke, or white wine. This is right profitable to draw both flegme and melancholy from the brest and other parts.

N The leaues of Sene and Cammomill are put in baths to wash the head.

O Sene opens the inward parts of the body which are stopped, and is profitable against all griefes of the principall members of the body.

P Take Sene prepared according to art one ounce, Ginger halfe a quarter of an ounce, twelue cloues, Fennell seed two drams, or in stead thereof Cinnamon and Tartar, of each halfe a dram, pouder all these; which done, take thereof in white wine one dram before supper, which doth maruellously purge the head.

Q Handle Sene in manner aboue specified, then take halfe an ounce thereof, which done adde thereto sixty Raisins of the Sunne with the stones pickt out, one spoonefull of Annise seed braied; boile these in a quart of ale till one halfe be wasted, and while it is boiling put in your Sene: let it stand so till the morning, then straine it and put in a little Ginger: then take the one halfe of this potion and put thereunto two spoonfulls of syrrup of Roses: drinke this together, I meane the one halfe of the medicine at one time, and if the patient cannot abide the next day to receiue the other halfe, then let it be deferred vntill the third day after.

R Sene and Fumitory (as *Rasis* affirmeth, doe purge adust humors, and are excellent good against scabs, itch, and the ill affection of the body.

S If Sene be infused in whey, and then boyled a little, it becommeth good Physicke against melancholy, clenseth the braine and purgeth it, as also the heart, liuer, milt, and lungs, causeth a man to looke young, engendreth mirth, and taketh away sorrow: it cleereth the sight, strengthneth hearing, and is very good against old feuers and diseases arising of melancholy.

† There were formerly two figures in this chapter, which differed onely in that the first, which was the *Sena Orientalis*, had lesser, narrower, and sharper pointed leaues than the *Sena Italica*, which was the second.

CHAP.

Chap. II. *Of Bastard Sene.*

¶ *The Description.*

1 *Colutea* and Sene be so neere the one vnto the other in shape and shew, that the vnskilful Herbarists haue deemed *Colutea* to be the right Sene. This Bastard Sene is a shrubby plant growing to the forme of a hedge bush or shrubby tree: his branches are straight, brittle, and wooddy; which being carelessly broken off, and as negligently prickt or stucke in the ground, will take root and prosper at what time of the yeare soeuer it be done; but slipt or cut, or planted in any curious sort whatsoeuer, among an hundred one will scarcely grow: these boughes or branches are beset with leaues like *Sena* or *Securidaca*, not much vnlike liquorice: among which come forth faire broom-like yellow floures, which turn into small cods like the sownd of a fish or a little bladder, which will make a cracke being broken betweene the fingers: wherein are contained many blacke flat seeds of the bignesse of Tares, growing vpon a small rib or sinew within the cod: the root is hard, and of a wooddy substance.

1 *Colutea.*
Bastard Sene.

2 *Colutea Scorpioides.*
Bastard Sene with Scorpion cods.

2 Bastard Sene with Scorpion cods is a small wooddy shrub or bush, hauing leaues, branches and flours like vnto the former bastard Sene, but lesse in each respect: when his small yellow floures are fallen there succeed little long crooked cods like the long cods or husks of *Matthiolus* his *Scorpioides*, whereof it took his name: the root is like the roor of the Box tree, or rather resembling the roots of *Dulcamara* or Bitter-sweet, growing naturally in the shadowie woods of Valena in Narbone; whereof I haue a small plant in my garden, which may be called Scorpion Sene.

3 The low or dwarfe *Colutea* of *Clusius* description, hath a thicke wooddy root couered with a yellowish barke, with many fibres annexed thereto, which bringeth forth yearely new shoots; whereby it greatly increaseth, of a cubit and a halfe high, smooth, and of a greene colour; whereon doe grow leaues compòsed of six or seuen leaues, and sometimes nine, set vpon a middle rib like those of the common kinde, of a stipticke taste, with some sharpenesse or biting: the floures grow vpon slender

3 *Colutea ſcorpioides humilis.*
Dwarfe Baſtard Sene.

4 *Colutea ſcorpioides montana Cluſij.*
Mountaine Baſtard Sene.

5 *Colutea minima, ſiue Coronilla.*
The ſmalleſt Baſtard Sene.

ſlender foot-ſtalkes, long and naked like thoſe of the Peaſe, and of a yellow colour, of little or no ſmell at all, and yet that little nothing pleaſant: after which come forth long cods, wherein is contained ſmall ſeed like thoſe of the Strangle Tare.

4 This mountaine baſtard Sene hath ſtalks, leaues, and roots like the laſt deſcribed. The floures grow on the tops of the branches in maner of a crowne; whereupon ſome haue called it *Coronilla:* in ſhape like thoſe of the Peaſe, and of a yellow colour: the cods as yet we haue not ſeen, and therefore not expreſſed in the figure.

5 This ſmall Baſtard Sene groweth like a ſmall ſhrub creeping vpon the ground, halfe a cubit high, bringing forth many twiggy branches, in maner of thoſe of the Spaniſh broome; wherupon do grow leaues like thoſe of Lentils or the Strangle Tare, with many ſmal leaues ſet vpon a middle rib, ſomwhat fat or full of juice, of the colour of the leaues of Rue or Herbegrace, of an aſtringent and vnpleaſant taſte: the floures grow at the tops of the branches, of a yellow color, in ſhape like thoſe of the ſmalleſt broome: after which come little crooked cods like the clawes or toes of a bird, wherin is contained ſeed ſomewhat long, blacke, and of an vnſauorie taſte: the root is long, hard, tough, and of a wooddy ſubſtance.

6 There

6 There is also found another sort hereof not much differing from the former, saving that this plant is greater in each respect, wherein especially consisteth the difference.

¶ *The Place.*

Colutea or bastard Sene groweth in diuers gardens, and commeth vp of seed; it quickly comes to perfection, insomuch that if a sticke thereof be broken off and thrust into the ground, it quickly taketh root, yea although it be done in the middle of summer, or at any other time, euen as the sticks of willow or Elder, as I my selfe haue often proued: the which bring forth flours and fruit the next yeare after.

The second with scorpion cods groweth likewise in my garden: the last growes in diuers barren chalky grounds of Kent toward Sittinburne, Canturbury, and about Southfleet; I haue not seene them elsewhere: the rest are strangers in England.

¶ *The Time.*

They floure from May til summer be well spent, in the meane season the cods bring forth ripe seed.

¶ *The Names.*

This shrub is called of *Theophrastus* in Greeke κολουτια, with the dipthong ου in the second syllable: in Latine, as *Gaza* expounds it, *Coloutea*, or *Colutea*: in high-Dutch, **Welsch linsen**: in French, *Eguenaudier*: they are deceiued that thinke it to be *Sena* or any kinde thereof, although wee haue followed others in giuing it to name bastard Sene, which name is very vnproper to it: in low Dutch it is called **Sene boom**: and we may vse the same name Sene tree in English.

This *Colutea* or bastard Sene differs from that plant κολυτια with υ in the second syllable, of which *Colutea Theophrastus* writeth, *lib.* 3. ‡ The fift is the *Polygala Valentina* of *Clusius*. ‡

¶ *The Temperature and Vertues.*

Theophrastus nor any other hath made mention of the temperature or faculties of these plants, A more, than that they are good to fatten cattell, especially sheep.

† There were formerly in the fifth and sixth places here two figures no way different, but that which was in the sixth place was a little larger, and *Lobel*'s title which he puts in his *Icons* ouer this, was diuided between them: For as you see, *Colutea minima, siue Coronilla*, was ouer in the fift; and *Colutea, siue Polygala Valentina Clusij* was ouer the sixt.

Chap. 12. *Of Liquorice.*

¶ *The Description.*

1 THe first kind of Liquorice hath many wooddy branches rising vp to the height of two or three cubits, beset with leaues of an ouerworn green color, consisting of many smal leaues set vpon a middle ribbe like the leaues of *Colutea* or the Mastick tree, somewhat glutinous in handling: among which come small knops growing vpon short stemmes between the leaues and the branches, clustering together, and making a round form or shape: out of which grow small blew flours of the colour of an English Hyacinth: after which succeed round rough prickly heads, consisting of diuers rough and scaly husks closely and thicke compact together, in which is contained a flat seed: the root is straight, yellow within, and browne without, of a sweet and pleasant taste.

2 The common and vsuall Liquorice hath stalkes and leaues very like the former, sauing that his leaues are greener and greater, and the floures of a light shining blew colour: but the floures of this are succeeded by longish cods that grow not so thicke clustering together in round heads as the former, but spike fashion, or rather like the wilde Vetch called *Onebrychis*, or *Galega*: the cods are small and flat like vnto the Tare: the roots are of a browniish colour without, and yellow within like Box, and sweeter in taste than the former.

¶ *The Place.*

These plants grow wilde in sundry places of Germany, France and Spaine, but they ate planted in gardens in England, whereof my garden hath plenty: the poore people of the North parts of England do manure it with great diligence, whereby they obtaine great plenty thereof, replanting the same once in three or foure yeares.

¶ *The Time.*

Liquorice floureth in Iuly, and the seed is ripe in September.

¶ *The*

1 *Glycyrrhiza echinata Dioſcoridis.*
Hedge hog Licorice.

‡ 2 *Glycyrrhiza vulgaris.*
Common Licorice.

¶ *The Names.*

The firſt is called in Greeke, γλυκύῤῥιζα: in Latine, *Dulcis radix*, or ſweet Root: this Licorice is not knowne either to the Apothecaries or vulgar people: we call it in Engliſh, *Dioſcorides* his Licorice.

It is moſt euident, that the other is *Glycyrrhiza* or Licorice: the Apothecaries cal it by a corrupt word, *Liquiritia:* the Italians, *Regalitia:* the Spaniards, *Regeliza*, and *Regalitia:* in high-Dutch, **Sulzhotz, Sulzwurtzel:** in French, *Rigoliſſe, Raigaliſſe*, and *Regliſſe:* in low-Dutch, **Calliſſichout, ſuethout:** in Engliſh, common Licorice: *Pliny* calls it *Scythica herba:* it is named *Scythice*, of the country Scythia where it groweth.

¶ *The Temperature.*

The nature of *Dioſcorides* his Licorice, as *Galen* teſtifieth, is familiar to the temperature of our bodies, and ſeeing it hath a certain binding qualitie adjoined, the temperature thereof, ſo much as is hot and binding, is ſpecially of a warm qualitie, comming neereſt of all to a meane temper: beſides, for that it is alſo ſweet, it is likewiſe meanly moiſt.

Foraſmuch as the root of the common Licorice is ſweet, it is alſo temperately hot and moiſt; notwithſtanding the barke hereof is ſomthing bitter and hot, but this muſt be ſcraped away: The freſh root when it is full of juice doth moiſten more than the dry.

¶ *The Vertues.*

A The root of Licorice is good againſt the rough harſhneſſe of the throat and breſt; it opens the pipes of the lungs when they be ſtuffed or ſtopt, ripeneth the cough, and bringeth forth flegme.

B The juice of Licorice made according to art, and hardned into a lump, which is called *Succus Liquiritiæ*, ſerueth well for the purpoſes aforeſaid, being holden vnder the tongue, and there ſuffered to melt.

C Moreouer, with the juice of Licorice, Ginger, and other ſpices, there is made a certaine bread or cakes called Ginger-bread, which is very good againſt the cough and all infirmities of the lungs and breſt; which is caſt into moulds, ſome of one faſhion, and ſome of another.

D The juice of Licorice is profitable againſt the heate of the ſtomacke and of the mouth:

The

The same is drunk with wine and Raisins against the infirmities of the liuer and chest, scabs or sores of the bladder, and diseases of the kidnies. E

Being melted vnder the tongue it quencheth thirst: it is good for green wounds being laid thereupon, and for the stomacke if it be chewed. F

The decoction of the fresh roots serueth for the same purposes. G

But the dried root most finely poudered is a singular remedie for a pin and a web in the eie, if it be strewed thereupon. H

Dioscorides and *Pliny* also report, that Licorice is good for the stomacke and vlcers of the mouth, being cast vpon them. I

It is good against hoarsnesse, difficultie of breathing, inflammation of the lungs, the pleurisie, spitting of bloud or matter, consumption and rottennesse of the lungs, all infirmities and ruggednesse of the chest. K

It takes away inflammation, mitigateth and tempereth the sharpnesse and saltnesse of humors, concocteth raw humors, and procureth easie spitting. L

The decoction is good for the kidnies and bladder that are exulcerated. M

It cureth the stranguric, and generally all infirmities that proceed of sharpe salt and biting humors. N

These things concerning Licorice hath also *Theophrastus: viz.* That with this and cheese made of mares milke the Scythians were reported to be able to liue eleuen or twelue dayes. O

The Scythian root is good for shortnesse of breath, for a dry cough, and generally for all infirmities of the chest. P

Moreouer, with hony it healeth vlcers, it also quencheth thirst if it be held in the mouth: for which cause they say that the Scythians do liue eleuen or twelue daies with it and *Hippace*, which is cheese made of mares milke, as *Hippocrates* witnesseth. Q

Pliny, lib. 25. *cap.* 8. hath thought otherwise than truth, That *Hippace* is an herb so called. R

‡ Both the figures formerly were of the first described.

Chap. 13. *Of Milke Trefoile or Shrub-Trefoile.*

¶ *The Kindes.*

THere be diuers kindes or sorts of the shrubby Trefoile, the which might very well haue passed among the three leaued Grasses, had it not been for our promise in the proem of our first part, That in the last booke of our historie the shrubby or wooddy plants should be set forth, euery one as neere as might be in kindred and neighborhood.

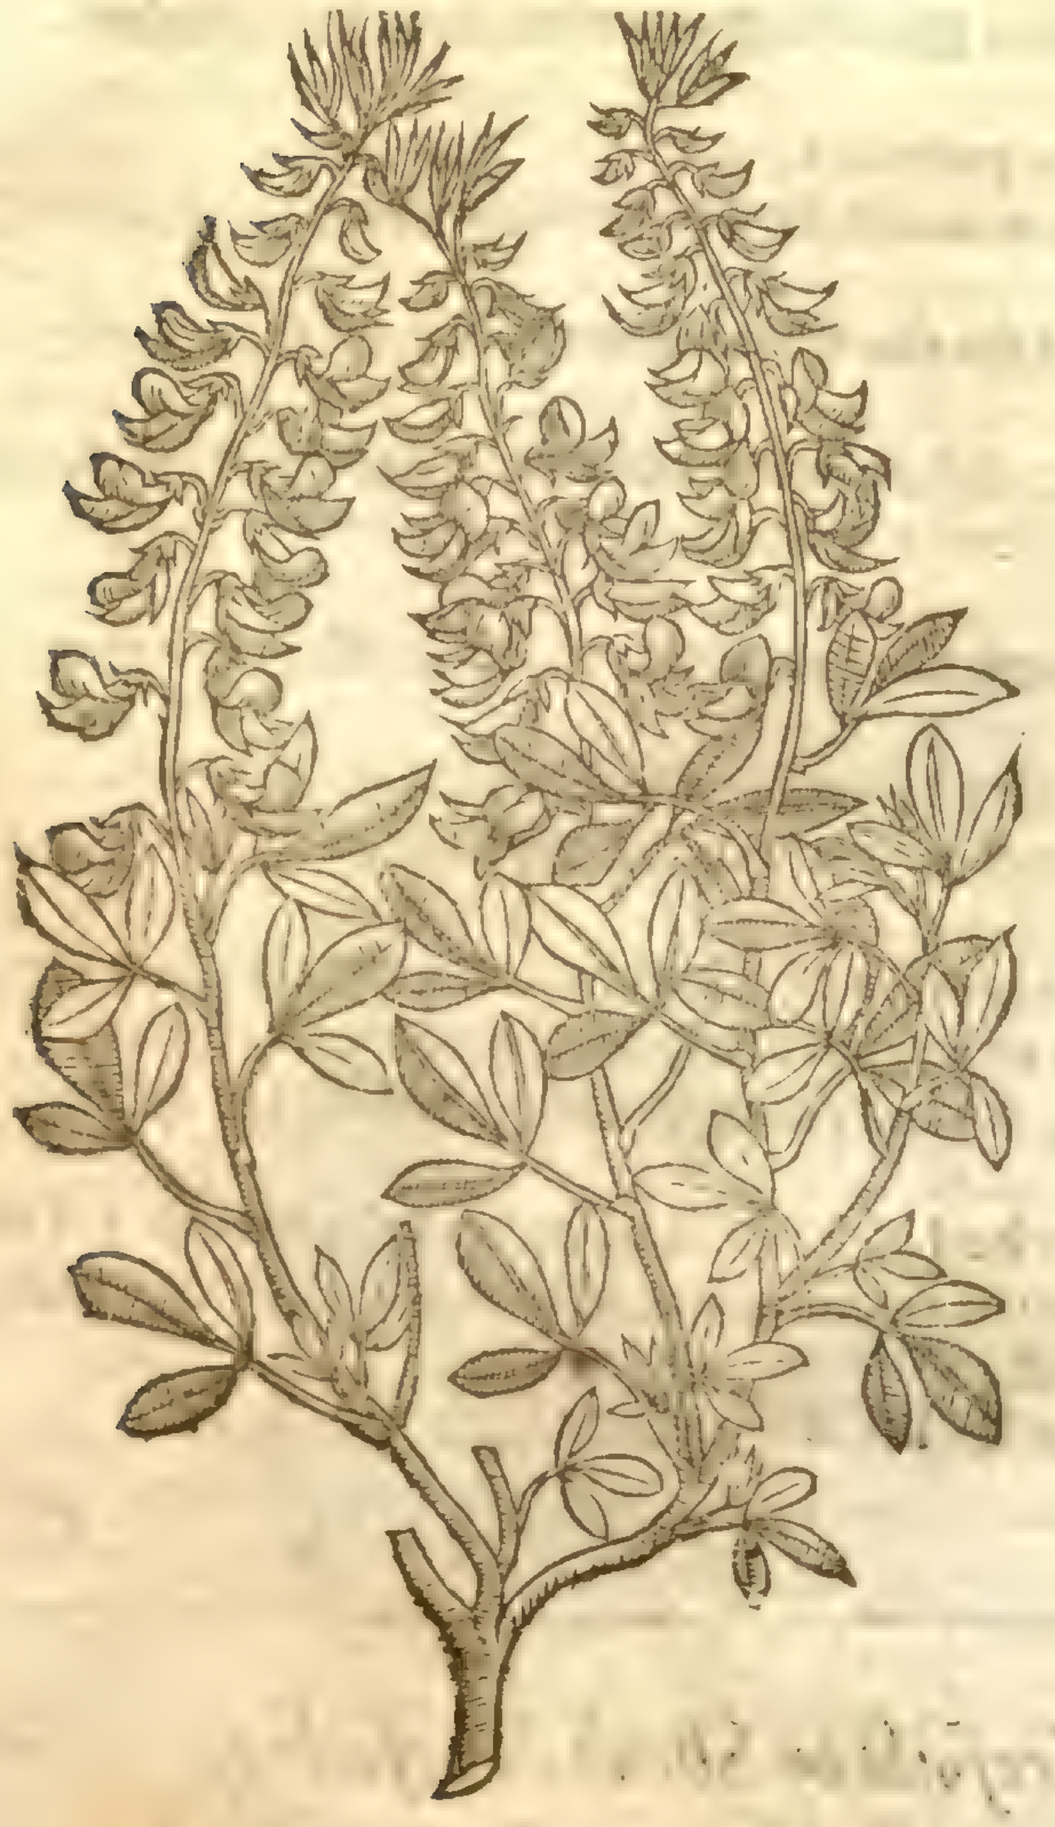
¶ *The Description.*

1 THe first kinde of *Cytisus* or shrubby Trefoile growes to the forme of a small shrub or wooddy bush two or three cubits high, branching into sundry small boughes or armes, set full of leaues like the small Trefoile, darke greene, and not hairy, three growing alwaies together: among these come forth smal yellow flours like them of French broom, which do turn into long and flat cods, containing small seed of a blackish colour.

2 The second kinde of *Cytisus* is likewise a small shrub, in shape after the manner of the former, but that the whole plant is altogether smaller, and the leaues rounder, set together by couples, and the small cods hairy at the ends, which sets forth the difference. ‡ The leaues of this are almost round, and grow three together close to the stalke: they are smooth, of a fresh greene, and the middlemost leafe of the three is the largest, and ends in a sharp point: the flours are of the bignes and colour of the *Trifolium Corniculatum*: it flours in May. ‡

3 The root of this third kinde is single, from whence spring vp many smooth brittle stalks diuided into many wings and branches, wheron grow green leaues smaller than those of medow Trefoile: the flours are yellow, lesser than Broom floures, otherwise very like, growing about the tops of the twiggy branches, diuided into spoky tufts; which being vaded, there follow thin long narrow cods lesser than those of the Broome, wherin is contained small blacke seed. The root is *long*, deeply growing into the ground, and sometimes waxeth crooked in the earth. ‡ This *also hath* smooth green leaues, and differs little (if any thing at all) from the first described, *wherefore* I thought it needlesse to giue a figure. Our Author called it *Cytisus siliquosus*, Codded *shrub* Trefoile, because one of the branches was fairely in the figure expresst with cods; I know *no* other reason, for all the *Cytisi* are codded as well as this. ‡

1 *Cytiſus.*
The firſt ſhrub Trefoile.



2 *Cytiſus.*
The ſecond ſhrub Trefoile.

4 *Cytiſus hirſutus.*
Hairy ſhrub Trefoile.

5 *Cytiſus incanus.*
Hoary ſhrub Trefoile.

4 The fourth kinde of *Cytisus* hath a great number of small branches and stalkes like the former, but it is a low plant and more woolly; whose stalks and branches grow not very high, but yet very plentifully spred about the sides of the plant: the leaues are greater than the former, but lesser than those of medow Trefoile: the floures grow close together, as though they were bound vp or compact into one head or spoky tuft somewhat greater than the former: the cods are also greater, and more hairy: the root groweth very deep into the ground, whereunto are adjoined a few fibres: it falls out to be more hairy or woolly in one place than in another, and the more hairy and woolly that it is, the whiter it waxeth; for the roughnesse bringeth it a certaine whitish colour. ‡ The branches of this oft times lie along vpon the ground: the leaues are smooth, green aboue, and hoary vnderneath: the floures yellow, which fading, somtimes become orange coloured. The cods are round, and seeds browniſh. ‡

5 The fifth kinde of *Cytisus* groweth to the height of a cubit or more, hauing many slender twiggy branches like Broom, streaked, and very hard, whereupon grow leaues very like Fenugreek, yet all hoary, three together; from the bosom of which, or between the leaues and the stalks come forth yellow floures very like Broom, *Spartum*, or Peaſe, but smaller: the cods be like vnto Broome cods, of an ash colour, but slenderer, rougher and flatter; in the seuerall cels or diuisions whereof are contained bright shining seeds like the blacke seeds of Broome: all the whole plant is hoary like *Rhamnus* or *Halymtes*.

6 Cytisus pinnatus.
Winged shrub Trefoile.

7 Cytisus 7. cornutus.
The horned shrub Trefoile.

6 The sixt kind of *Cytisus* or bush Trefoile growes to the height of a tall man, with long stalks couered ouer with a blackish barke, and a few boughes or branches beset or garnished with leaues like the common Trefoile, but smaller, growing also three together, wherof the middlemost of the three leaues is twice as long as the two side leaues; the vpper side whereof is greene, and the lower side somwhat reddish and hairy: the floures grow along the stalks almost from the bottom to the top, of a golden yellow colour, fashioned like the Broom floure, but greater than any of the rest of his kinde, and of a reasonable good sauor: the seed hath the pulsie taste of *Cicer*.

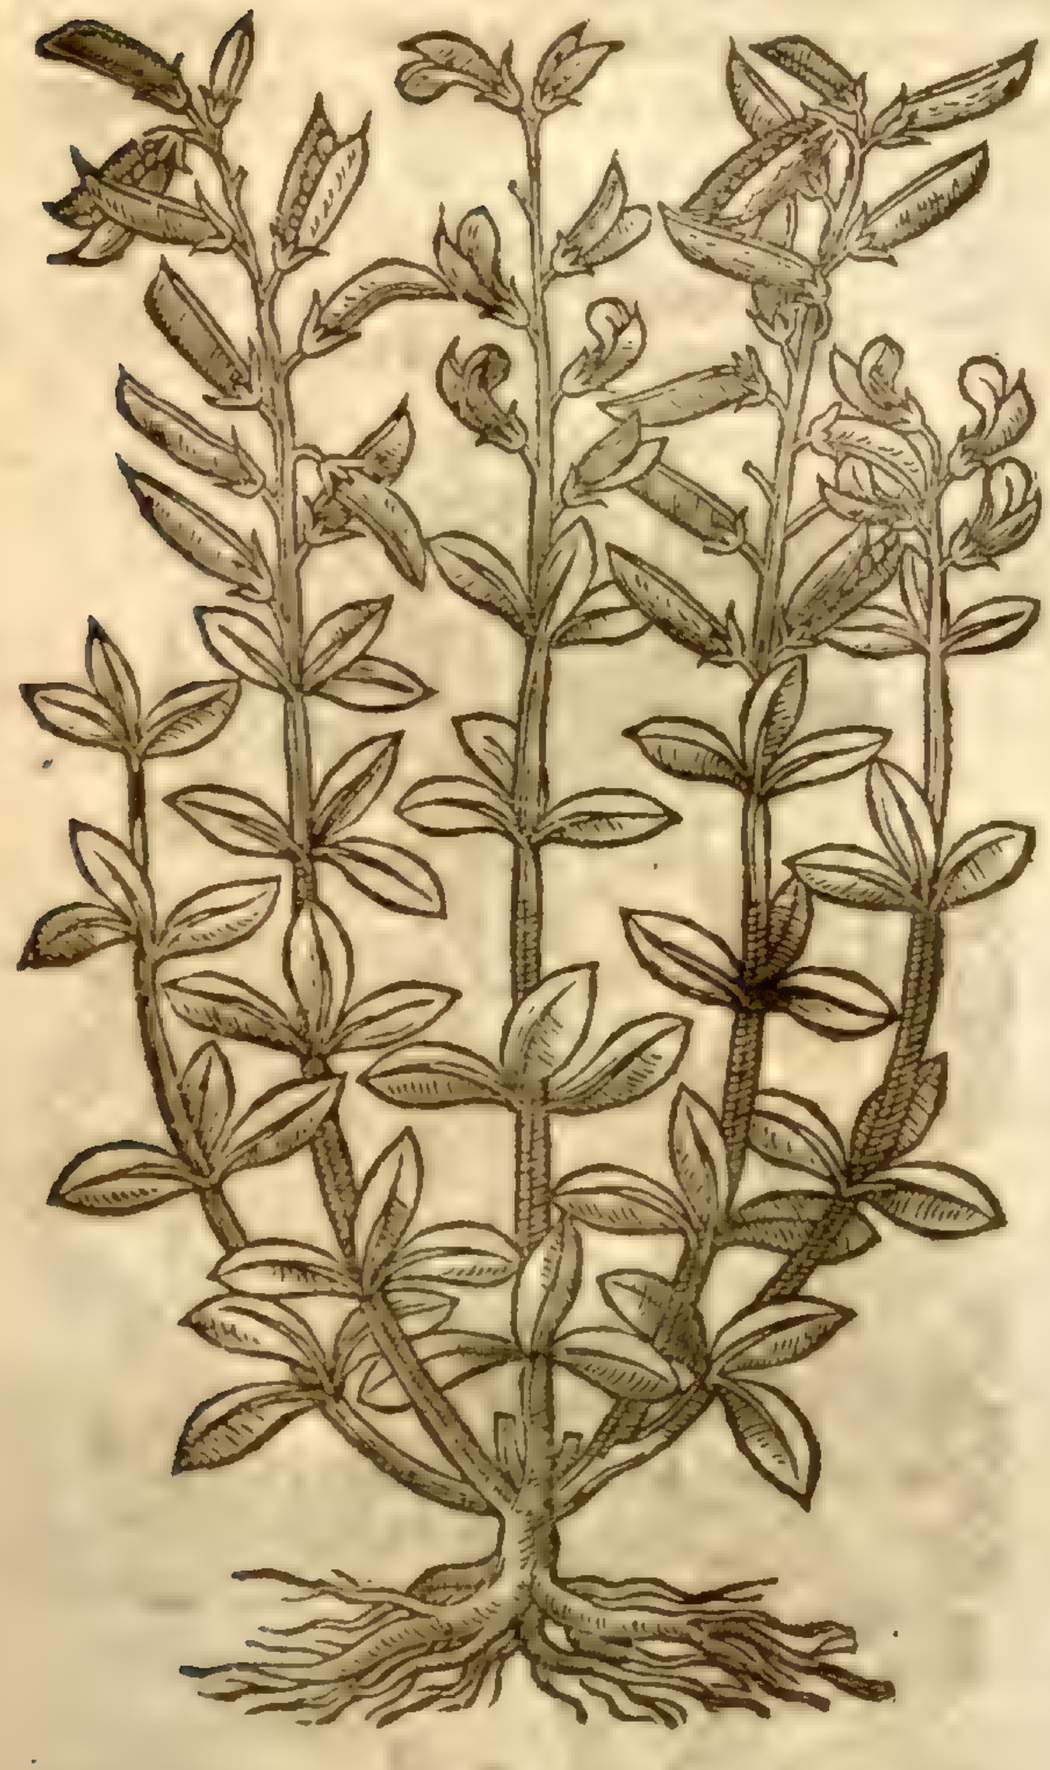
7 The seuenth kinde of *Cytisus* hath many tough and hairy branches rising from a wooddie root foure or fiue cubits high; which are diuided into sundry smaller branches, beset with leaues like the medow Trefoiles; amongst which come forth yellow floures like Broome, that turne into crooked

crooked flat cods like a ſickle, wherein is contained the ſeed taſting like *Cicer* or *Legumen*. The whole plant is hoary like *Rhamnus*, and being broken or bruiſed ſmelleth like Rocket.

8 This eighth kinde of *Cytiſus* which *Pena* ſetteth forth is doubtleſſe another kinde of *Cytiſus*, reſembling the former in leaues, floures, and cods, ſauing that the ſmall leaues (which are alwayes three together) are a little ſnipt about the edges: the whole plant is ſlenderer, ſofter, and greener, rather reſembling an herb than a ſhrub: the root is ſmall and ſingle.

9 This baſtard or miſ-begotten ſhrub Trefoile, or baſtard *Cytiſus* groweth vp like a ſhrub, but not of a wooddy ſubſtance, hauing tender ſtalks ſmooth and plain, whereon grow hairy leaues like the other, diuers ſet vpon one foot-ſtalke, contrarie to all the reſt: the floures grow along the ſtems like thoſe of the ſtock Gillofloures, of a yellow colour: the root is tough and wooddy.

8 *Cytiſus* 8.
The eighth ſhrub Trefoile.



9 *Cytiſus adulterinus, ſive Alyſſon fruticans.*
Baſtard ſhrub Trefoile.

¶ *The Place.*

Theſe plants were firſt brought into Italy and Greece from one of the Iſles of Cyclades, called Cyntho or Cynthuſa, and ſince found in many places of France, as about Montpelier, Veganium, and other places: they are ſtrangers in England, though they grow very plentifully in Scotland, as it is reported; whereof I haue two ſorts in my garden, that is to ſay, *Cytiſus maranthæ*, or the horned *Cytiſus*; and likewiſe one of the ſmalleſt, that is to ſay, the third in number. ‡ The ſecond groweth in the garden of Mr *Iohn Tradeſcant*. ‡

¶ *The Time.*

Theſe plants floure for the moſt part in May, Iune, and Iuly, and ſome after: the ſeed is ripe in September.

¶ *The Names.*

The Grecians and Latines do call this ſhrub κυτισος, of Cynthuſa an Iſland before mentioned, in which place they are in great eſtimation, for that they do ſo wonderfully feed cattell, and encreaſe milke in their dugs, nouriſh ſheep and goats which bring young ones good for ſtore and increaſe. Our Author doth call theſe plants in Greeke κύτισλον, that is to ſay in Latine, *Fœcundum fœnum*, fertil or fruitfull Hay, for that the kindes hereof cauſe milke to encreaſe, maketh good bloud and juice, augmenteth ſtrength, and multiplieth the naturall ſeed of generation: they may be called in Engliſh, milke Trefoile, of the ſtore of milke which they increaſe.

¶ *The*

¶ *The Temperature.*

The leaues of milke Trefoile do coole, as *Dioscorides* writeth: they asswage swellings in the beginning, if they be stamped and laid vnto them with bread: the decoction thereof drunke prouoketh vrine. *Galen* teacheth, That the leaues of milke Trefoile haue a digesting or wasting quality, mixed with a waterie and temperat facultie, as haue those of the Mallow.

¶ *The Vertues.*

Women, saith *Columella*, if they want milke, must steepe dry milke Trefoile in faire water, and when it is throughly soked, they must the next day mix a quart or thereabouts of the same pressed or strained forth with a little Wine, and so let it be giuen vnto them to drinke, and by that meanes they themselues shall receiue strength, and their children comfort by aboundance of milke. A

Hippocrates reckons vp milke Trefoile among those things that encrease milke, in his book of the nature of women and womens diseases. B

Also *Aristomachus* of Athens in *Pliny* commandeth to giue with wine the dry plant, and the same likewise boiled in water, to nurses to drinke when their milke is gon. C

Democritus and *Aristomachus* do promise that you shall want no Bees, if you haue milke Trefoile for them to feed on: for all writers with one consent do conclude (as *Galen* saith) that Bees gather of the floures of Milke Trefoile very great store of hony. D

Columella teacheth, That milk Trefoile is notable good for Hens, Bees, Goats, Kine, and all kind of cattel, which quickly grow fat by eating thereof; and that it yeeldeth very great store of milk. E

The people of Betica and Valentia, where there is great store of *Cytisus*, doe vse it very much for the Silke-wormes to hang their web vpon after they haue been well fed with the leaues of Mulberries. F

Milke Trefoile is likewise a maruellous remedie against the Sciatica and all other kindes of Gouts. G

† The description that formerly was in the first place belonged to that described and figured in the seuenth.

Chap. 14. *Of Bastard milke Trefoiles.*

¶ *The Description.*

1 THis riseth vp with little stalks from the root, brittle, very many in number, parted into wings & branches, about which grow many leaues lesser than those of the medow Trefoile, of colour green: the floures about the tops of the twigs be orderly placed in manner like eares, of colour yellow, lesser than those of Broom, otherwise all alike: in their places grow vp slender cods, long, narrow, and lesser than the cods of Broom, rough also and hairy; in which do lie little blackish seeds: the root is long, and groweth deepe, and oftentimes creepeth aslope.

2 The second kinde of bastard milke Trefoile is like vnto the former in plentifull stalks and twigs, but that it is lower and more downy, neither doe the stalks thereof stand vpright, but rather incline to the one side: the leaues also are somwhat greater, but yet lesser than those of the medow Trefoile, wholly white, and they neuer open themselues out, but keep alwaies folded, with the middle rib standing out: the flours likewise be closelier joined together, and compacted as it were into a little head, and be also something greater: the cods in like manner are a little bigger and hairy, and of a blackish purple or murrey: the root groweth deep in the ground, being diuided into a few sprigs: it oftentimes hapneth to grow in one place more hairy or downy than in another; the more hairy and downy it is, the more white and hoary it is, for the hairinesse doth also bring with it a certain whitish colour.

3 The third kinde of bastard milke Trefoile brings forth a company of yong shoots that are somwhat writhed and crooked, long leaues of a faire green colour: the floures are closed together, long, white, or else galbineous, sweetly smelling, that is to say, hauing the smell of hony: the shrub in selfe is alwaies green both Summer and Winter. ‡ This growes some foot or better high, *with* slender hoary branches, set with leaues three standing together vpon a very short stalk, and *the* middle leafe is as long again as the other two; they are very white and hoary, and the *flours grow out* of the bosoms of the leaues all alongst the stalks. This is that mentioned in the vertues *of the* former chapter at *F*, for the silke wormes to worke vpon. ‡

4 The fourth shrub is likewise one of the wilde kinde, though in face and *stature* like the ma-

nured

1 *Pseudocytisus* 1.
The first bastard shrub Trefoile.

2 *Pseudocytisus* 2.
The second bastard shrub Trefoile.

3 *Cytisus semper-virens.*
The euer-green shrub Trefoile.

4 *Pseudocytisus hirsutus.*
The hairy bastard tree Trefoile.

nured *Cytisus*. It groweth vp like a small shrub or hedge bush, to the height of two or three yards; on whose branches do grow three rough or hairy leaues set vpon a slender foot-stalke, of a grasse-green colour aboue, with a reddish hairinesse below: the floures grow alongst the stalks, from the middle to the top, of a bright shining yellow colour: the root is likewise wooddy.

¶ *The Place.*

These kindes of milke Trefoile are found in Moravia, so called in our age, which in times past was named *Marcomannorum provincia*, and in the vpper Pannonia, otherwise called Austria, neere to highwaies and in the borders of fields, for they seem after a sort to ioy in the shade. ‡ These grow (according to *Clusius*) in sundry parts of Spain. ‡

¶ *The Time.*

They floure especially in Iune and Iuly.

¶ *The Names.*

It is euident enough that they are bastard kindes of milke Trefoiles, and therefore they may be called and plainly termed *Pseudocytisi* or bastard milke Trefoiles, or *Cytisi sylvestres*, that is to say, wilde milke Trefoiles.

¶ *The Nature and Vertues.*

What temperature these shrubs are of, or what vertues they haue we know not, neither haue wee as yet found out any thing by our owne experience, wherefore they may be referred vnto the other milke-Trefoiles.

Chap. 15. *Of the venomous tree Trefoile.*

† 1 *Dorycnium Monspeliensium.*
The venomous Trefoile of Montpelier.

2 *Dorycnium Hispanicum.*
The venomous Trefoile of Spain.

¶ *The Description.*

1 THe venomous Tree Trefoile of Montpellier hath many tough and pliant stalkes two or three cubits high, diuided into sundry small twiggy braunches, beset with leaues three together

together, placed from joint to joint by ſpaces, ſomewhat hoary, very likevnto the leaues of *Cytiſus* or Rue: among which come forth many ſmall moſſie white floures, tuft faſhion, in ſmall bundles like Noſegaies, and very like the floures of the Oliue or Oke tree, which turne into ſmall roundiſh bladders, as it were made of parchment; wherein is contained blacke ſeed like wilde *Lotus*, but in taſte like the wilde Tare: the whole plant is of an vnſauory ſmel; the root is thick, and of a woodie ſubſtance.

2 The Spaniſh venomous Trefoile hath a wooddy ſtalke, rough and hoary, diuided into other ſmall branches, whereon grow leaues like the precedent: the floures grow on the tops of the branches, whereon grow leaues like thoſe of the Peaſe, and of a yellow or rather greeniſh color, wherein it differeth from the precedent.

¶ *The Place.*

Theſe venomous Trefoiles grow in Narbon, on the barren and ſtony craggy mountains, at Frontignana, and about the ſea coaſts, and are ſtrangers in England.

¶ *The Time.*

They flouriſh from May to the end of Iune.

¶ *The Names.*

Dorycnium, or δορύκνιον, is that poiſonous or venomous plant wherewith in times paſt they vſed to poiſon their arrow heads, or weapons, thereby to do the greater hurt vnto thoſe whom they did aſſaile or purſue, whereupon it tooke his name. Great controuerſie hath been amongſt Herbariſts, what manner of plant *Dorycnium* ſhould be; ſome ſaying one thing, and ſome another: which controuerſies and ſundry opinions are very well confuted by the true cenſure of *Rondeletius*, who hath for a definitiue ſentence ſet down the plant deſcribed for the true *Dorycnium*, & none other, which may be called in Engliſh, Venomous tree Trefoile. ‡ Theſe plants do not ſufficiently anſwer to the deſcription of *Dioſcorides*, neither can any one ſay certainly that they are poiſonous. ‡

¶ *The Temperature.*

Dorycnium is very cold without moiſtning.

¶ *The Vertues.*

Venomous Trefoile hath not one good qualitie that I can read of, but it is a peſtilent venomous plant, as hath been ſaid in the deſcription.

† The figures were formerly tranſpoſed.

Chap. 16. *Of Of the ſhrub Trefoile, called alſo Make-bait.*

Polemonium, ſive Trifolium fruticans.

Shrubby Trefole, or yellow Iaſmine.

¶ *The Deſcription.*

THis ſhruby plant called *Polemonium* hath many wooddy twigges growing into the height of four or fiue cubits, hauing ſmal ny twiggy branches of a dark green color, garniſhed with ſmall leaues of a deep green color, alwaies three ioined together vpon little footſtalks, like the *Cytiſus* bnſh or field Trefoile, but ſmaller: the floures be yellow and round, diuided into fiue or ſix parts, not much vnlike the yellow Iaſmine, which hath cauſed many to cal it yellow Iaſmine, euen to this day. When the floures be vaded there ſucceed ſmall round berries as big as a peaſe, of a black purpliſh colour when they be ripe, which being broken wil die or colour the fingers like Elder berries: within theſe berries are contained a ſmall flat ſeed like vnto Lentils: the root is long and ſmall, creeping hither and thither vnder the earth, putting forth new ſprings or ſhoots in ſundry places, whereby it greatly increaſeth.

¶ *The Place.*

It grows plentifully in the country of Montpelier, at New-caſtle, vpon the dry hils, and hot banks of the oliue fields, and in the ſtony fields and Wood of Gramuntium: it groweth in my garden, and in other herbariſts gardens of England.

¶ *The*

¶ *The Time.*

It floureth in Summer: the seed is ripe in Autumne: the shrub it selfe is alwaies green, & hath a lasting root.

¶ *The Names.*

Most do call it *Cytisus*, but we had rather name it *Trifolium fruticans*: for it doth not agree with *Cytisus* or Milk Trefoile, as in the chapter before it is plain enough by his description, vnlesse it be *Cytisus Marcelli*, or *Marcellus* his Milke Trefoile, with which peraduenture it might be thought to haue some likenesse, if the floures which are yellow were white, or *galbineous*, that is to say, blew.

There be diuers also that take this Trefoile to be *Polemonium*, forasmuch as the leaues of it seem to be somewhat like those of common Rue; but *Polemonium* hath not the leafe of common Rue, otherwise called Herb-grace, but of the other, that is to say, of S. *Iohns* Rue: it is called in English, shrubby Trefoile, or Make-bait.

¶ *The Temperature.*

Polemonium is dry in the second degree, with some acrimonie or sharpnesse.

¶ *The Vertues.*

This shrubby plant hath so many singular and excellent vertues contained in it, that some haue A
called it by the name *Chilodunamis*, that is, hauing a thousand properties.

It is very effectual against the stinging of Scorpions; and (as some say) if a man hold it in his B
hand, he cannot be hurt with the biting of any venomous beast.

Being taken with vineger it is very good for those that are splenetick, and whose spleen or milt C
is affected with oppilations or stoppings.

If the root be taken in wine it helpeth against the bloudy flix, it prouoketh vrine being drunke D
with water, scoureth away grauell, and easeth the pain and ache called the Sciatica.

Chap. 17. *Of Broome and Broome-Rape.*

1 *Genista.*
Broome.

2 *Rapum Genistæ, sive Orobanche.*
Broom-Rape, or Orobanch.

¶ The

‡ *Orobanche Monspeliaca flo. oblongis.*
Long floured Broome-Rape.

‡ *Orobanche Ramosa.*
Branched Broom-Rape.

‡ *Orobanche flore majore.*
Great floured Broome Rape.

¶ *The Description.*

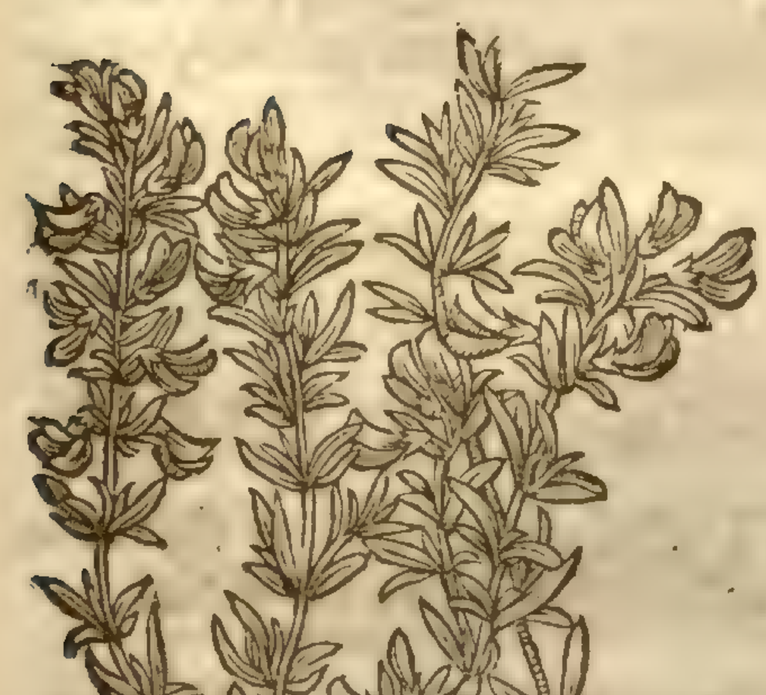
1 BRoom is a bush or shrubby plant, it hath stalks or rather wooddy branches, from which do spring slender twigs, cornered, green, tough, and that be easily bowed, many times diuided into smal branches; about which do grow little leaues of an obscure green colour, & braue yellow floures, and at the length flat cods, which beeing ripe are black, as are those of the common Vetch, in which doe lie flat seeds, hard, something brownish, and lesser than Lentils: the root is hard and wooddy, sending forth diuers times another plant of the colour of an Oken leafe, in shape like vnto the bastard Orchis, called Birds nest, hauing a root like a Turnep or Rape, whereupon it is called *Rapum Genistæ*, or Broom-Rape.

2 This is a certain bulbed plant growing vnto the roots of Broom, big below, and smaller aboue, couered with blackish scales, and of a yellowish pulp within: from which doth rise a stalke a span long, hauing whitish flours about the top, like almost to those of dead Nettle. After which grow forth long thicke and round husks, in which are contained verie many seeds, and good for nothing: the whole plant is of the colour of the Oken leafe.

‡ Of

3 *Geniſta Hiſpanica.*
Spaniſh Broome.

6 Chamægeniſta Pannonica.
Dwarfe Broome of Hungary.



5 *Chamægeniſta Anglica.*
Engliſh Dwarfe Broome.

‡ Of this *Orobanche* or Broome Rape there are ſome varieties obſerued and ſet forth by *Lobel* and *Cluſius*; the firſt of theſe varieties hath longer and ſmaller floures than the ordinarie. The ſecond hath larger floures, and thoſe of a blewiſh colour, and is ſometimes found among corne. The third is parted towards the top into ſundry branches; the floures of this are either blew, purpliſh or elſe white, and it willingly growes among Hempe. ‡

3 The Spaniſh Broome hath likewiſe wooddy ſtems, from whence grow vp ſlender pliant twigs, which be bare and naked without leaues, or at the leaſt hauing but few ſmall leaues, ſet here and there far diſtant one from another, with yellow floures not much vnlike the floures of common Broome, but greater, which turne into ſmall long cods, wherein is contained browne and flat ſeed: the root is tough and wooddy.

4 Small leafed or thin leafed Broome hath many tough pliant ſhoots riſing out of the ground, which grow into hard and tough ſtalks, which are diuided into diuers twiggy branches whereon doe grow very ſmall thin leaues, of a whitiſh colour; whereupon ſome haue called it *Geniſta alba*, white Broome: the floures grow at the top of the ſtalkes, in ſhape like thoſe of the common Broom, but of a white colour, wherein it ſpecially differeth from the other Broomes.

5 Engliſh Dwarfe Broome hath many twiggy branches, very greene, tough, ſomewhat ſtraked or cornered, leaning toward the ground: whereon doe grow leaues ſet without order, ſometimes two together, and often three or foure growing faſt together, like vnto the common Broome, greene on the vpper ſide, hoary vnderneath, and of a bitter taſte: among which leaues come forth yellow floures like thoſe of common Broome, but leſſer, of little or no ſmell at all: after which appeare ſmall cods ſomewhat hairy, wherein is contained ſmall ſeed: the root is tough and wooddy. ‡ *Bauhine* iudges theſe two laſt deſcribed to be onely varieties of the common Broome; to whoſe opinion I do much incline, yet I haue let our Authors deſcription ſtand, together with the figure of this later, which ſeemingly expreſſes the greateſt difference. ‡

6 The Dwarfe Broome of Hungary hath ſtalkes and yellow floures like thoſe of the laſt deſcribed: the leaues hereof are different, they are longer and more in number: the whole plant is altogether greater, wherein eſpecially conſiſteth the difference.

¶ *The Place.*

The common Broome groweth almoſt euery where in dry paſtures and low woods.

The Broome Rape is not to be found but where Broome doth grow; it groweth in a Broome field at the foot of Shooters hill next to London; vpon Hampſtead Heath, and in diuers other places.

Spaniſh Broome groweth in diuers kingdomes of Spaine and Italy; we haue it in our London gardens.

The White Broome groweth likewiſe in Spaine and other hot regions; it is a ſtranger in England; of this *Titus Calphurnius* makes mention in his ſecond Eclog of his Bucolicks, writing thus:

Cernis vt, ecce pater, quas tradidit Ornite vaccæ
Molle ſub hirſuta latus explicuere geniſta.

See Father, how the Kine ſtretch out their tender ſide
Vnder the hairy Broome, that growes in field ſo wide.

¶ *The Time.*

Broome floureth in the end of Aprill or May, and then the young buds of the floures are to bee gathered and laid in pickle or ſalt, which afterwards being waſhed or boyled, are vſed for ſallads, as Capers be, and be eaten with no leſſe delight: the cods and ſeeds be ripe in Auguſt; the Rape appeareth and is ſeene eſpecially in the moneth of Iune.

The Spaniſh Broome doth floure ſooner, and is longer in flouring.

¶ *The Names.*

This ſhrub is called in Latine, *Geniſta*, or as ſome would haue it *Geneſta*: in Italian *Geneſtra*: in Spaniſh likewiſe, *Geneſtra*, or *Gieſtra*: in high Dutch, Pfrimmen: in low Dutch, Brem: in French, *Geneſt*: in Engliſh Broome. ‡ The Spaniſh Broome by moſt Writers is iudged to be the *Spartium* of *Dioſcorides*. ‡

¶ *The Temperature and Vertues.*

A The twigs, floures and ſeeds of Broome are hot and dry in the ſecond degree: they are alſo of a thin eſſence, and are of force to clenſe and open, and eſpecially the ſeed, which is dryer and not ſo full of ſuperfluous moiſture.

B The decoction of the twigs and tops of Broome doth clenſe and open the liuer, milt, and kidnies.

C It driueth away by the ſtoole watery humors, and therefore it is wholeſome for them that haue the dropſie, eſpecially being made with wine; but better for the other infirmities with water.

D The ſeed alſo is commended for the ſame purpoſes.

E There is alſo made of the aſhes of the ſtalkes and branches dryed and burnt, a lie with thin white wine, as Rheniſh wine, which is highly commended of diuers for the greene ſickeneſſe and dropſie, and this doth mightily expell and driue forth thin and watery humors together with the vrine, and that by the bladder; but withall it doth by reaſon of his ſharpe quality many times hurt and fret the intrailes.

F *Meſue* ſaith, That there is in the floures and branches a cutting moiſture, but full of excrements, and therefore it cauſeth vomit: and that the plant doth in all his parts trouble, cut, attenuate, and violently purge by vomit and ſtoole, flegme and raw humors out of the joynts.

G But theſe things are not written of Broome, but of *Spartium*, which purgeth by vomit, after the manner of Hellebor, as both *Dieſcorides* and *Pliny* do teſtifie.

H *Meſue* alſo addeth, That Broome doth breake the ſtone of the kidnies and bladder, and ſuffereth not the matter whereof the ſtone is made to lie long, or to become a ſtone.

I The young buds or little floures preſerued in pickle, and eaten as a ſallad, ſtirre vp an appetite to meate and open the ſtoppings of the liuer and milt.

The

The same being fully blowne, stamped and mixed with swines grease, doe ease the paine of the gout. L

And *Mesue* writeth, That this tempered with hony of Roses, or with an egge, doth consume away the Kings-euill. M

The Rape of the Broome or Broome Rape, being boyled in wine, is commended against the pains of the kidneyes and bladder, prouoketh vrine, breaketh the stone, and expelleth it. N

The juyce pressed forth of Broome rape healeth greene wounds, and cleanseth old and filthy vlcers: the later Physitions do affirme that it is also good for old venomous, and malicious vlcers. O

That worthy Prince of famous memory *Henry* 8. King of England, was wont to drinke the distilled water of Broome floures, against surfets and diseases thereof arising. P

Sir *Thomas Fitzherbert* Knight, was wont to cure the blacke jaundice with this drinke onely. Q

Take as many handfulls (as you thinke good) of the dried leaues of Broome gathered and brayed to pouder in the moneth of May, then take vnto each handfull of the dried leaues, one spoonful and a halfe of the seed of Broome brayed into pouder: mingle these together, and let the sicke drinke thereof each day a quantity, first and last, vntill he finde some ease. The medicine must be continued and so long vsed, vntill it be quite extinguished: for it is a disease not very suddenly cured, but must by little and little be dealt withall. R

Orobanch or Broome rape sliced and put into oyle Oliue, to infuse or macerate in the same as we do Roses for oyle of Roses, scoureth and putteth away all spots, lentils, freckles, pimples, wheals and pushes from the face, or any part of the body, being annointed therewith. S

Dioscorides writeth, That Orobanch may be eaten either raw or boiled, in manner as we vse to eat the sprigs or young shoots of *Asparagus*. T

The floures and seeds of Spanish Broome are good to be drunke with meade or honied water in the quantity of a dram, to cause one to vomit with great force and violence, euen as white Hellebor, or neesing pouder. V

If it be taken alone, it looseneth the belly, driueth forth great quantitie of waterie and filthy humours.

Chap. 18. *Of base Broome or greening weed.*

¶ *The Description.*

1 THis base kinde of Broom called Green weed or Diers weed, hath many tough branches proceeding from a wooddy root: whereon do grow great store of leaues, of a deep green colour, somwhat long like those of Flax: the flours grow at the top of the branches not much vnlike the leaues of Broome, but smaller; of an exceeding faire yellow colour, which turne into small flat cods, wherein is contained a little flat seed.

2 *Carolus Clusius* setteth forth another kinde of Broome, which *Dodonæus* calleth *Genista tinctoria*, being another sort of Diers weed: it groweth like the Spanish Broome: vpon whose branches do grow long and small leaues like Flax, greene on the vpper side, and of an hoary shining colour on the other. The floures grow at the top of the stalkes, spike fashion, in forme and colour like the former: the roots are thicke and wooddy.

3 *Carolus Clusius* setteth forth two kindes of Broome. The first is a low and base plant, creeping and lying flat vpon the ground, whose long branches are nothing else, but as it were stalkes consisting of leaues thicke in the middest, and thinne about the edges, and as it were diuided with small nicks; at which place it beginneth to continue the same leafe to the end, and so from leafe to leafe, vntill it haue increased a great sort, all which doe as it were make one stalke; and hath none other leaues, sauing that in some of the nicks or diuisions there commeth forth a small leafe like a little eare. At the end of those flat and leafed stalks come forth the floures, much like the floures of the common Greening weed, but lesser, and of a yellow colour, which turne into small cods. The roots are very long, tough, and wooddy, full of fibres, closing at the top of the root, from whence they proceed as from one body.

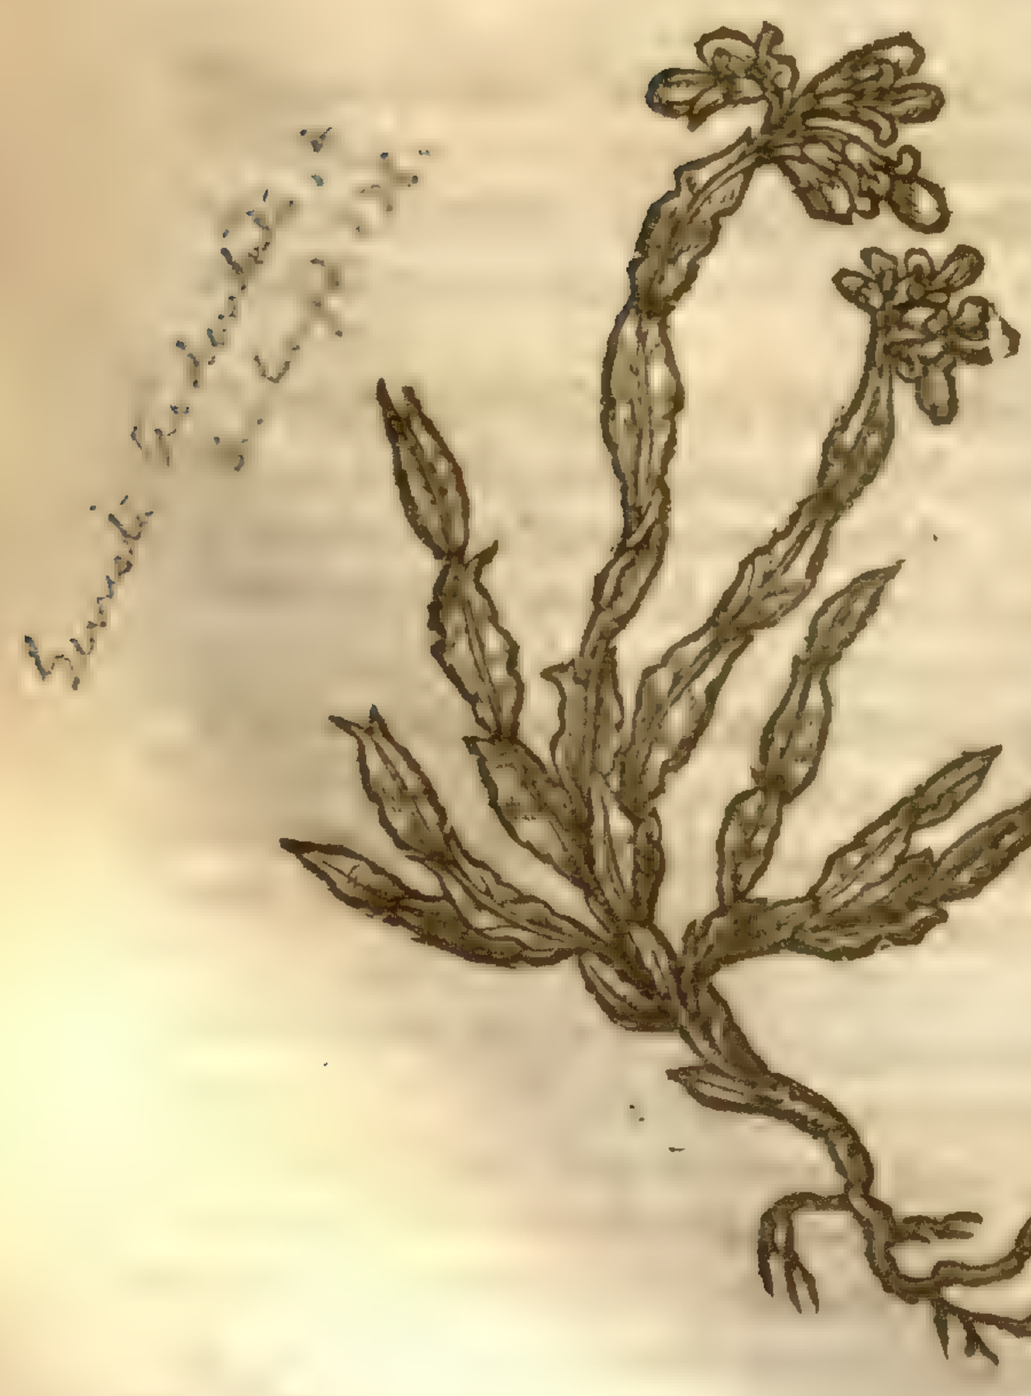
4 This kinde of Greeneweed called of some *Chamæspartium*, hath a thicke wooddy root: from which rise vp diuers long leaues, consisting as it were of many pieces set together like a paire of Beads (as may better be perceiued by the figure, than expressed by words) greene on the vpper side, and whitish vnderneath, very tough, and as it were of a rushie substance: among which rise vp very small naked rushy stalkes; on the top whereof groweth an eare or spike of a chaffie matter, hauing here and there in the said eares diuers yellow floures like Broome, but very small or little.

1 *Geniſtella tinctoria.*
Greeneweed or Diers weed.

2 *Geniſtella infectoria.*
Wooddy Diers-weed.

3 *Geniſtella pinnata.*
Winged Greeneweed.

4 *Geniſtella globulata.*
Globe Greeneweed.



5 The fifth Greenweed hath a wooddy tough root, with certaine strings annexed thereto: from which rise vp diuers long, flat leaues, tough, and very hard, consisting as it were of many little leaues, set one at the end of another, making of many one entire leafe, of a greene colour: amongst which come forth diuers naked hard stalkes, very small and stiffe, on the tops whereof stand spikie eares of yellow floures, like those of Broome, in shape like that great three leafed grasse, called *Lagopus*, or like the Fox-taile grasse: after which come flat cods, wherein is inclosed small seed like to Tares both in taste and forme.

5 *Genistella Lagopoides major.*
Hares foot Greeneweed.

5 *Genistella Lagopoides minor.*
Small Greeneweed with Hares foot floure.

6 This differeth not from the precedent in stalks, roots and leaues: the floures consist of a flockie soft matter, not vnlike to the grassie tuft of Foxtaile, resembling the floure of *Lagopus*, or Haresfoot, but hauing small yellow floures lesser than the former, wherein it chiefely differeth from the other of his kinde.

¶ *The Place.*

The first being our common Diers-weed, groweth in most fertile pastures and fields almost euery where. The rest are strangers in England.

¶ *The Time.*

They floure from the beginning of Iuly to the end of August.

¶ *The Names.*

The first of these Greenweeds is named of most Herbarists *Flos Tinctorius*, but more rightly, *Genista Tinctoria*, of this *Pliny* hath made mention [The Greeneweeds, saith he, do grow to dye clothes with] in his 18. booke, 16. chapter. It is called in high Dutch, **Ferblumen**, and **Ackerbzem**: in Italian, *Cerretta*, and *Cosaria*, as *Matthiolus* writeth in his chapter of *Lysimachia*, or Loose-strife: in English, Diers Greeneweed, base Broome, and Woodwaxen.

The rest we refer to their seuerall titles.

¶ *The Temperature and Vertues.*

These plants are like vnto common Broome in bitternesse, and therefore are hot and dry *in the* A
second degree: they are likewise thought to be in vertues equall; notwithstanding their vse *is not so* well knowne, and therefore not vsed at all where the other may be had: we shall not *need to speake* of that vse that Diers make thereof, being a matter impertinent to our History.

Chap. 19. *Of Spanish base Broomes.*

¶ *The Description.*

‡ 1 THis growes to the height of a cubit, and is couered with a crested and rough barke, and diuided into many longish branches crested and greene, which at their first springing vp haue some leaues vpon them, which fall away as soone as the plant comes to floure: from the sides of the branches come forth long foot-stalkes whereon hang some small yellow flours, which are succeeded by short round yellowish red cods which commonly containe but one seed, seldome two, and these hard and blacke, and like a little Kidney, which when it is ripe will rattle in the cod being shaken. ‡

1 *Pseudospartum Hispanicum Aphyllum.*
Spanish Broome without leaues.

2 *Pseudospartum album Aphyllum.*
The white leafe-lesse Spanish Broome.

2 This naked broome groweth vp to the height of a man: the stalk is rough, and void of leaues, very greene and pliant, which diuideth it selfe into diuers twiggie branches, greene and tough, like rushes: the floures grow all along the stalkes like those of Broome, but of a white colour, wherein it differeth from all the rest of his kinde.

¶ *The Place.*

These grow in the Prouinces of Spaine, and are in one place higher and more bushie, and in another lower.

¶ *The Time.*

‡ The first floures in May, and the second in February. ‡

¶ *The Names.*

These base Spanish broomes may be referred to the true, which is called in Greeke σπάρτος: the Latines vse the same name, calling it sometimes *Spartum*, and *Spartium*: in Spanish, *Retama*: in English, Spanish Broome, and bastard Spanish Broome.

¶ *The Temperature and Vertues.*

Both the seeds and juyce of the branches of these base Broomes, wherewith they in Spaine and other hot regions do tie their vines, do mightily draw, as *Galen* writeth. *Dioscorides*

Dioscorides saith, That the seeds and floures being drunke in the quantity of a dram, with Meede or honied water, doth cause one to vomit strongly, as the Hellebor or neesing pouder doth, but yet without jeopardy or danger of life: the seed purgeth by stoole. B

The juyce which is drawne from out of the branches steeped in water, being first bruised, is a remedy for those that are tormented with the Sciatica, and for those that be troubled with the Squincie, if a draught thereof be drunke in the morning; some vse to steepe the branches in Sea water, and to giue the same in a clister, which purgeth forth bloudy and slimy excrements. C

† In this chapter formerly in the first place was againe figured and described the true *Spartium* or Spanish Broome; which I have now omitted, because it was figured and described in the last chapter save one before. In the second place was described that figured in the third: and in the third place was a description to no purpose, which I therefore omitted, and as you see described anew and put in the first place that which formerly held the second.

Chap. 20.

Of Furze, Gorsse, Whin, or prickley Broome.

¶ *The Kindes.*

THere be diuers sorts of prickely Broome, called in our English tongue by sundry names according to the speech of the countrey people where they doe grow: in some places, Furzes; in others, Whins, Gorsse, and of some, prickly Broome.

† 1 *Genista spinosa vulgaris.*
Great Furze bush.

2 *Genista spinosa minor.*
The small Furze bush.

¶ *The Description.*

1 THe Furze bush is a plant altogether a Thorne, fully armed with most sharpe prickles, without any leaues at all except in the Spring, and those very few and little, and *quickly* falling away: it is a bushy shrub, often rising vp with many wooddy branches to the height of foure or fiue cubits or higher, according to the nature and soile where they grow: the greatest and highest that I did euer see do grow about Excester in the West parts of England, where

where the great ſtalks are dearely bought for the better ſort of people, and the ſmall thorny ſpraies for the poorer ſort. From theſe thorny branches grow little floures like thoſe of Broome, and of a yellow colour, which in hot regions vnder the extreme heate of the Sunne are of a very perfect red colour: in the colder countries of the Eaſt, as Danzicke, Brunſwicke, and Poland, there is not any branch hereof growing, except ſome few plants and ſeeds which my ſelfe haue ſent to Elbing otherwiſe called Meluin, where they are moſt curiouſly kept in their faireſt gardens, as alſo our common Broome, the which I haue ſent thither likewiſe, being firſt deſired by diuers earneſt letters: the cods follow the floures, which the grauer hath omitted, as a German who had neuer ſeene the plant it ſelfe, but framed the figure by heare-ſay: the root is ſtrong, tough, and wooddy.

We haue in our barren grounds of the North part of England another ſort of Furze, bringing forth the like prickly thornes that the other haue: the onely difference conſiſteth in the colour of the floures; for the others bring forth yellow floures, and thoſe of this plant are as white as ſnow.

† 2 To this may be joyned another kinde of Furze which bringeth forth certaine branches that be ſome cubit high, ſtiffe, and ſet round about at the firſt with ſmall winged Lentil-like leaues and little harmeleſſe prickles, which after they haue been a yeare old, and the leaues gone, be armed onely with moſt hard ſharpe prickles, crooking or bending their points downewards. The floures hereof are of a pale yellow colour, leſſer than thoſe of Broome, yet of the ſame forme: the cods are ſmall, in which do lie little round reddiſh ſeeds: the root is tough and wooddy.

† 3 *Geniſta Spinoſa minor ſiliqua rotunda.*
Small round codded Furze.

4 *Geniſta aculeata.*
Needle Furze or petty Whin.

‡ Of this *Cluſius* reckons vp three varieties: the firſt growing ſome cubit high, with deep yellow floures: the ſecond growes higher, and hath paler coloured floures: the third groweth to the height of the firſt, the floures alſo are yellow, the branches more prickly, and the leaues hairy; and the figure I giue you is of this third variety.

3 This ſeldome exceeds a foot in height, and it is on euery ſide armed with ſharpe prickles, which grow not confuſedly, as in the common ſort, but keepe a certaine order, and ſtill grow forth by couples: they are of a lighter greene than thoſe of the common Furze: on the tops of each of the branches grow two or three yellow floures like thoſe of the former; which are ſucceeded by little round rough hairy cods of the bigneſſe of Tares. This floures in March, and groweth in the way betweene Burdeaux and Bayone in France, and vpon the Pyrenean mountaines. *Cluſius* makes it his *Scorpius* 2. or ſecond ſort of Furze: *Lobel* calls it *Geniſta ſpartium ſpinoſum alterum.* ‡

4 This

4 This small kinde of Furze (growing vpon Hampstead heath neere London, and in diuers other barren grounds, where, in manner nothing else will grow) hath many weake and flexible branches of a wooddy substance: whereon doe grow little leaues like those of Tyme: among which are set in number infinite most sharpe prickles, hurting like needles, whereof it tooke his name. The floures grow on the tops of the branches like those of Broome, and of a pale yellow colour. The root is tough and wooddy.

‡ 5 This plant (saith *Clusius*) is wholly new and elegant, some span high, diuided into many branches, some spred vpon the ground, others standing vpright, hauing plentifull store of greene prickles: the floures in shape are like those of Broome, bnt lesse, and of a blewish purple colour, standing in rough hairy whitish cups, two or three floures commonly growing neere together: sometimes whilest it floures it sendeth forth little leaues, but not very often, and they are few, and like those of the second described, and quickely fall away, so that the whole plant seemes nothing but prickles or like a hedge-hog when shee folds vp her selfe: the root is wooddy, and large for the proportion of the plant. It growes in the kingdome of Valentia in Spaine, where the Spaniards call it *Erizo*, that is, the Hedge-hog; and thence *Clusius* also termed it *Erinacea*. It floureth in Aprill. ‡

5 *Genista spinosa humilis.*
Dwarfe or low Furze.

6 *Genista aculeata minor, sive Nepa Theophr.*
Scorpion Furze.

6 The smallest of all the Furze is that of the Antients called *Nepa*, or Scorpion Furze, as the word *Nepa* seemeth to import: it is a stranger in England: it hath beene touched of the Antients in name onely: which fault they haue beene all and euery of them to be complained of, being so briefe that nothing can be gathered from their description: and therefore I refer what might hereof be said to a further consideration. ‡ This hath a thicke wooddy blacke root some halfe foot long, from whence arise many slender branches some foot high, which are set with many stiffe and sharpe prickles, growing somewhat after the manner of the wilde prickly Sperage: the yong plants haue little leaues like those of Tragacanth; the old ones none: the flours are small, and come forth at the bottome of the prickles, and they are succeeded by broad cods wherein the seed is contained. It growes iu diuers places of France and Spaine, and is thought to be the *Scorpius* of *Theophrastus*, which *Gaza* translates *Nepa*. ‡

¶ *The Place.*

The common sort hereof are very well knowne to grow in pastures and fields in most places of England. The rest are likewise well knowne to those that curiously obserue the difference.

¶ *The Time.*

They floure from the beginning of May to the end of September.

¶ *The Names.*

Furze is commonly called *Genista spinosa:* in high Dutch, Gaspeldoren: in English, Furze, Furzen bushes, Whinne, Gorsse, and Thorne-Broome.

This thorny Broome is taken for *Theophrastus* his *Scorpius*, which *Gaza* nameth *Nepa*: the name *Scorpius* in *Pliny* his πολύσημον, that is to say, signifying many things, and common to certaine Plants: for

for beſides this *Scorpius* of which he hath made mention, *lib.*25.*cap.*5. ſetting downe *Theophraſtus* his words, where he maketh *Aconitum Thelyphonon* to be *Scorpius*, *lib.*23.*cap.*10. and likewiſe other plants vnder the ſame title, but vnproperly.

¶ *The Temperature and Vertues.*

A There is nothing written in *Theophraſtus* concerning the faculties of *Scorpius ſpinoſus*, or Furze: *Pliny* ſeemeth to attribute vnto it the ſame vertues that *Scorpioides* hath: notwithſtanding the later Writers do agree that it is hot and dry of complexion: the ſeeds are vſed in medicines againſt the ſtone, and ſtaying of the laske.

† This chapter hath vndergone a great alteration: as thus; the firſt, third, and fourth deſcriptions belonged to the third figure: the ſecond and fifth deſcription, to the fifth figure: and the firſt, ſecond, and fourth figures had no deſcriptions belonging to them. The figure that was in the firſt place is now in the third: the ſecond ſtill holds his place: the third is in the firſt, belonging thereto of right: and for handſomneſſe ſake I haue made the fourth and fifth change place. This figure alſo in the ſixth place was formerly mentioned by our Author (but now omitted) in the chapter of Aſparagus.

Chap. 21.

Of Cammocke, Furze, Reſt-Harrow, or Petty Whinne.

¶ *The Kindes.*

THere be diuers ſorts of Reſt-Harrow, which ſome haue inſerted among the ſmooth Broomes, others, among thoſe with prickles, whereof ſome haue purple floures and likewiſe full of prickles; others white floures, and ſharpe thornes: ſome alſo purple floures, others white, and alſo yellow, and euery of them void of prickles.

1 *Anonis, ſiue Reſta Bouis.*
Cammocke, or Reſt-Harrow.

3 *Anonis non ſpinoſa purpurea.*
Purple Reſt-Harrow without prickles.

¶ *The Deſcription.*

CAmmock or ground Furze riſeth vp with ſtalkes a cubit high, and often higher, ſet with diuers joynted branches, tough, pliable, and full of hard ſharpe thornes: among which do grow leaues in forme like thoſe of S. Iohns-wort, or rather of the Lentill, of a deepe

deepe green colour: from the bosome of which thorns and leaues come forth the floures, like those of Peason, of a purple colour: after which doe come the cods, in which do lie flat seed: the root is long, and runneth far abroad, very tough, and hard to be torne in pieces with the plough, insomuch that the oxen can hardly passe forward, but are constrained to stand still; whereupon it was called Rest-Plough, or Rest-harrow.

4 *Anonis, siue Spina lutea.*
Yellow Rest-Harrow.

2 We haue in our London pastures, and likewise in other places, one of the Rest-Harrowes, not differing from the precedent in stalkes, leaues, or prickles: the onely differnce is, that this plant bringeth forth white flours, and the others not so: whence we may call it *Anonis flore albo*, Cammocke with white floures.

3 Rest-harrow without thornes hath a tough hoary rough stalke, diuided into other rough branches, whereon are set without order, long leaues sharpe pointed, sleightly cut about the edges, of an hoary colour, and somewhat hairie: from the bosome whereof commeth forth purple Pease like floures of a reasonable good smell: the root is very tough, long, and wooddy.

4 The yellow floured Cammock is a stranger in these parts, it is only found in the cold Easterne countries, for ought that I can learne; it differs not from the last described, sauing that the floures hereof are of a darke yellow colour, wherein it differeth from all the other of his kinde.

¶ *The Place.*

These grow in carable grounds in fertile pastures, and in the borders of fields, in a fat, fruitfull, and long lasting soile: it is sooner found than desired of husbandmen, because the tough and wooddie roots are combersome vnto them, for that they stay the plough, and make the oxen stand.

¶ *The Time.*

They send forth new shoots in May: they be full growne in Autumne, and then those that of nature are prickly be fullest of sharpe thornes: they floure in Iuly and Auguſt.

¶ *The Names.*

Cammocke is called in Greeke, Ἄνωνις, or Ὄνωνις: and likewise in Latine *Anonis*, and *Ononis*: Of Herbarists commonly *Arresta Bouis*, and *Remora aratri*, because it maketh the Oxen whilest they be in plowing to rest or stand still: it is also called *Acutella*, of the stiffe and sharpe thorns which pricke those that passe by: in French, *Areste beuf*, and *Boucrande*.

Crateuas nameth it *Ægipyrus*: in high Dutch, **Stalkraut**: in low Dutch, **Dangwortele**: in Italian, *Bonaga*: in Spanish, *Gattilhos*: in French, *Arreste beuf*, *Beuf & Bouerande*: in English, Cammocke, Rest-harrow, Petty Whinne, and ground Furze.

¶ *The Temperature.*

The root of Cammocke is hot in the third degree, as *Galen* saith: it cutteth also and maketh thinne.

¶ *The Vertues.*

The barke of the root drunke with Wine prouoketh vrine, breaketh the stone, and driueth it forth. A

The root boyled in water and vineger allayeth the paine of the teeth, if the mouth be often washed therewith hot. B

Pliny reporteth, That being boyled in Oxymel (or the syrrup made with hony and vineger) till the one halfe be wasted, it is giuen ro those that haue the falling sickenesse. *Matthiolus* reporteth, that he knew a man cured of a ruprure, by taking of the pouder of this root for many moneths together. C

The tender sprigs or crops of this shrub before the thornes come forth, are preserued *in pickle*, and be very pleasant sauce to be eaten with meat as a sallad, as *Dioscorides* teacheth. D

Chap. 22.
Of Gooſe-berrie, or Fea-berry Buſh.

¶ *The Kindes.*

THere be diuers ſorts of the Gooſe-berries; ſome greater, others leſſe: ſome round, others long; and ſome of a red colour: the figure of one ſhall ſerue for the reſt.

‡ I will not much inſiſt vpon diuerſities of fruits, becauſe my kinde friend Mr. *Iohn Parkinſon* hath ſufficiently in his late Worke diſcourſed vpon that ſubject; onely becauſe I iudge many will be deſirous to know their names, and where to get them, I will briefely name the chiefe varieties our Kingdome affords; and ſuch as are deſirous of them may finde them with Mr. *Iohn Millen* liuing in Old-ſtreet.

The ſorts of Gooſe-berries are theſe: the long greene, the great yellowiſh, the blew, the great round red, the long red, and the prickly Gooſe-berry. ‡

Vua Criſpa.
Gooſe-berries.

¶ *The Deſcription.*

THe Gooſe-berry buſh is a ſhrub of three or foure cubits high, ſet thicke with moſt ſharpe prickles: it is likewiſe full of branches, ſlender, wooddy, and prickly: whereon do grow round leaues cut with deepe gaſhes into diuers parts like thoſe of the Vine, of a very greene colour: the floures be very ſmall, of a whitiſh greene, with ſome little purple daſhed here and there: the fruit is round, growing ſcatteringly vpon the branches, greene at the firſt, but waxing a little yellow through maturitie, full of a winie iuyce ſomewhat ſweet in taſte when they be ripe; in which is contained hard ſeed of a whitiſh colour: the root is wooddy, and not without ſtrings annexed thereto.

There is another whoſe fruit is almoſt as big as a ſmall Cherry, and very round in forme: as alſo another of the like bigneſſe, of an inch in length, in taſte and ſubſtance agreeing with the common ſort.

We haue alſo in our London gardens another ſort altogether without prickles: whoſe fruit is very ſmal, leſſer by much than the common kinde, but of a perfect red colour, wherein it differeth from the reſt of his kinde.

¶ *The Place.*

Theſe plants doe grow in our London Gardens and elſe-where in great abundace.

¶ *The Time.*

The leaues come forth in the beginning of Aprill or ſooner: the fruit is ripe in Iune and Iuly.

¶ *The Names.*

This ſhrub hath no name among the old Writers, who as we deeme knew it not, or elſe eſteemed it not: the later Writers call it in Latine, *Groſſularia*: and oftentimes of the berries, *Vua Criſpa*, *Vua ſpina*, *Vua ſpinella*, and *Vua Criſpina*: in high Dutch, **Kruſelbeer**: in low Dutch, **Stekelbeſſen**: in Spaniſh, *Vua Criſpa*, or *Eſpina*: in Italian, *Vua ſpina*: in French, *Groiſelles*: in Engliſh, Gooſe-berry, Gooſe-berry buſh, and Fea-berry buſh in Cheſhire, my natiue country.

¶ *The Temperature.*

The berries of this buſh before they be ripe are cold and dry, and that in the later end of the ſecond degree, and alſo binding.

¶ *The Vertues.*

The fruit is vſed in diuers ſauces for meat, as thoſe that are skilfull in cookerie can better tell than my ſelfe.

They

They are vsed in broths in stead of Verjuice, which maketh the broth not onely pleasant to the taste, but is greatly profitable to such as are troubled with an hot burning ague. B

They are diuersly eaten, but they euery way ingender raw and cold bloud: they nourish nothing or very little: they also stay the belly and stench bleedings. C

They stop the menses or monethly sicknes, except they happen to be taken into a cold stomack, then do they not help, but rather clog or trouble the same by some manner of flix. D

The ripe berries, as they are sweeter, so doe they also little or nothing binde, and are something hot, and yeeld a little more nourishment than those that be not ripe, and the same not crude or raw: but these are seldome eaten or vsed as sauce. E

The juice of the green Gooseberries cureth all inflammations, *Erysipelas*, and S. *Anthonies* fire. F

They prouoke appetite, and cure the vehement heate of the stomacke and liuer. G

The young and tender leaues eaten raw in a sallad prouoke vrine, and driue forth the stone and grauell. H

Chap. 23. *Of Barberries.*

¶ *The Kindes.*

There be diuers sorts of Barberries, some greater, others lesser, and some without stones.

Spina acida, sive Oxyacantha.
The Barberry bush.

¶ *The Discription.*

THe Barberry plant is an high shrub or bush, hauing many yong straight shoots & branches very full of white prickly thorns, the rinde whereof is smooth and thin, the wood it self yellow: the leaues are long, very greene, sleightly nicked about the edges, and of a soure taste: the flours be yellow, standing in clusters vpon long stems: in their places come vp long berries, slender, red when they be ripe, with a little hard kernell or stone within; of a soure and sharp taste: the root is yellow, disperseth it self far abroad, and is of a wooddy substance.

Wee haue in our London gardens another sort, whose fruit is like in forme and substance, but one berry is as big as three of the common kinde, wherein consisteth the difference.

We haue likewise another without any stone, the fruit is like the rest of the Barberries both in substance and taste.

¶ *The Place.*

The Barberry bush growes of it selfe in vntoiled places and desart grounds, in woods and the borders of fields, especially about a gentlemans house called Mr *Monke*, at a village called Iver two miles from Colebrooke, where most of the hedges are nothing else but Barberry bushes.

They are planted in most of our English gardens.

¶ *The Time.*

The leaues spring forth in Aprill, the floures and fruit in September.

¶ *The Names.*

Galen calleth this Thorne in Greeke, ὀξυάκανθα, who maketh it to differ from ὀξυακάνθη, in his booke of the Faculties of simple Medicines; but more plainly in his booke of the Faculties of Nourishments; where he reckoneth vp the tender springs of Barberries amongst the tender shoots that are to

to be eaten, such as *Oxyacanthus* or the Hawthorne bringeth not forth, wherein he plainely made a difference, *Oxyacantha* the Barberry bush, and *Oxyacanthus* the Hawthorne tree.

Dioscorides hath not made mention of this Thorne; for that which he calleth *Oxyacantha*, in the fœminine gender, is *Galens Oxyacanthus* in the masculine gender.

Avicen seemes to containe both these herbes vnder the name of *Amyrberis*, but we know they are neither of affinitie nor neighborhood, although they are both prickly.

The shrub it selfe is called in shops Barberries, of the corrupted name *Amyrberis*: of the later writers *Crespinus*: in Italian, *Crespino*: in Spanish, *Espino de maivelas*: in high-Dutch, Paisselbeer: in low-Dutch, Zuurboom: in French, *Espine vinette*: and thereupon by a Latine name, *Spinine-ta, Spina acida*, and *Oxyacantha Galeni*: ‡ in English, a Barberry bush, or Piprige tree, according to Dr *Turner*. ‡

¶ *The Temperature.*

The leaues and berries of this Thorne are cold and dry in the second degree, and as *Galen* also affirmeth, they are of thin parts, and haue a certain cutting facultie.

¶ *The Vertues.*

A The leaues are vsed of diuers to season meat with, and in stead of a sallad, as be those of Sorrell.

B The decoction thereof is good against hot burnings and cholericke agues: it allayeth the heat of the bloud, and tempereth the ouermuch heate of the liuer.

C The fruit or berries are good for the same things, and be also profitable for hot Laskes, and for the bloudy flix, and they stay all manner of superfluous bleedings.

D The green leaues of the Barberry bush stamped and made into sauce as that made of Sorel, called Green-sauce, doth coole hot stomacks, and those that are vexed with hot burning agues, & procureth appetite.

E A conserue made of the fruit and sugar performeth all those things before remembred, & with better force and successe.

F The roots of the tree steeped for certain daies together in strong lie made with the ashes of the Ash tree, and the haire often moistned therewith, maketh it yellow.

G ‡ The bark of the roots is also vsed in medicins for the jaundice, and that with good successe. ‡

Chap. 24. *Of the white Thorne or Hawthorne tree.*

¶ *The Kindes.*

THere be two sorts of the white Thorn trees described by the later writers, one very common in most parts of England, another very rare, and not found in Europ, except in some few rare gardens of Germay; which differs not from our common Hawthorne, sauing that the fruit thereof is as yellow as Saffron. We haue in the West of England one growing at a place called Glastenbury which brings forth his floures about Christmasse, by the report of diuers of good credit, who haue seen the same: but my selfe haue not seen it, and therefore leaue it to be better examined.

¶ *The Description.*

1 THe white Thorn is a great shrub growing often to the height of a peare tree, the trunk or body is great, the boughes and branches hard and woody, set with long sharp thorns: the leaues be broad, cut with deep gashes into diuers sections, smooth, and of a glistering green colour: the floures grow vpon spoky rundles, of a pleasant sweet smell, somtimes white, and often dasht ouer with a light wash of purple, which hath moued some to thinke a difference in the plants: after which come the fruit, being round berries, green at the first, and red when they be ripe; wherein is found a soft sweet pulpe and certaine whitish seed: the root growes deepe in the ground, of a hard wooddy substance.

2 The second and third haue bin touched in the first title, notwithstanding I haue thought it not vnfit to insert in this place a plant participating with the Hawthorne in floures and fruit, and with the Servis tree in tree in leaues, and not vnlike in fruit also.

Theophrastus hath set forth this Tree vnder the name of *Aria*, which groweth vnto the forme of a small tree, delighting to grow in the shadowie woods of Cumberland and Westmerland, and many other places of the North country, where it is to be found in great quantity: but seldome in Spain,

Spain, Italy, or any hot region. This tree is garnished with many large branches beset with leaues like the Peare tree, or rather like the Aller leaf, of a dark green colour aboue, and white vnderneath: among these leaues come forth tufts of white floures very like vnto Hawthorn floures, but bigger: after which succeed small red berries like the berries of the Hawthorn, in taste like the Neapolitan Medlar; the temperature and faculties whereof are not yet knowne.

1 *Oxyacanthus.*
The Hawthorne tree.

2 *Aria Theophrasti.*
Cumberland Hawthorne.

¶ *The Place.*

The Hawthorn groweth in woods and in hedges neere vnto highwaies almost euery where. The second is a stranger in England. The last groweth at Glastenbury abbey, as it is credibly reported to me. ‡ The *Aria* groweth vpon Hampsted heath, and in many places of the West of England. ‡

¶ *The Time.*

The first and second floure in May, whereupon many do call the tree it selfe the May-bush, as a chiefe token of the comming in of May: the leaues come forth a little sooner: the fruit is ripe in the beginning of September, and is a food for birds in Winter.

¶ *The Names.*

Dioscorides describeth this shrub, and nameth it ὀξυάκανθα, in the feminine gender; and *Galen* in his booke of the Faculties of simple medicines, ὀξυάκανθος, in the masculine gender: *Oxyacanthus*, saith he, is a tree, and is like to the wilde Peare tree in forme, and the vertues not vnlike, &c. Of *Oxyacantha*, *Dioscorides* writeth thus: It is a tree like to the wilde Peare tree, very full of thornes, &c. *Serapio* calleth it *Amyrberis*: and some, saith *Dioscorides*, would haue it called πυρίνα, but the name *Pyrina* seemeth to belong to the yellow Hawthorn: it is called in high-Dutch, **Haagdoren**: in low-Dutch, **Hagedoren**: in Italian, *Bagaia*: in Spanish, *Pirlitero*: in French, *Aubespine*: in English, Whitethorn, Hawthorn tree; and of some Londoners, May-bush. ‡ This is not the *Oxyacantha* of the Greeks, but that which is called *Pyracantha*, as shall be shewed hereafter.

The second is thought to be the *Aria* of *Theophrastus*, and so *Lobel* and *Tabern.* call it. Some, as *Bellonius*, *Gesner*, and *Clusius*, referre it to the *Sorbus*, and that not vnfitly: in some places of this Kingdome they call it a white Beam tree. ‡

¶ *The Temperature.*

The fruit of the Hawthorne tree is very aſtringent.

¶ *The Vertues.*

The Hawes or berries of the Hawthorne tree, as *Dioſcorides* writeth, doe both ſtay the Laske the menſes, and all other fluxes of bloud. Some Authors write, That the ſtones beaten to pouder and giuen to drinke are good againſt the ſtone.

CHAP. 25. *Of Goats-Thorne.*

¶ *The Deſcription.*

1 THe firſt *Tragacantha* or Goats-thorne hath many branchy boughes and twiggs, ſlender and pliant, ſo ſpread abroad vpon euery ſide, that one plant doth ſometimes occupie a great ſpace or room in compaſſe: the leaues are ſmall, and in ſhape like Lentil leaues, whitiſh, and ſomwhat moſſie or hairy, ſet in rowes one oppoſit againſt another: the flour is like the bloſſom of the Lentill, but much leſſer, and of a whitiſh colour, and ſomtimes marked with purple lines or ſtreakes: the ſeed is incloſed in ſmall cods and huskes, almoſt like vnto the wilde *Lotus* or horned Treſoile: the whole plant on euery ſide is ſet full of ſharp prickly thornes, hard, white, and ſtrong: the roots run vnder the ground like Licorice roots, yellow within, and black without, tough limmer, and hard to breake; which being wounded in ſundry places with ſome iron toole, and laid in the Sun at the higheſt and hotteſt time of Summer, iſſueth forth a certaine liquor, which being hardned by the Sun, is that gum called in ſhops *Tragacantha*, and of ſome, though barbarouſly, *Dragagant*.

1 *Tragacantha, ſive Spina Hirci.*
Goats Thorne.

2 *Spina Hirci minor.*
Small Goats Thorne.

2 The ſecond kinde of *Tragacantha* is a low and thicke Shrub, hauing many ſhoots growing from one turfe, of a white or grayiſh colour, about a cubit high, ſtiffe and wooddy: the leaues are like the former, and garded with moſt ſtiffe pricks not very ſafely to be touched: among the thornie leaues come forth many floures in ſmall tufts like *Geniſtella*, but that they are white: the cods are

are many, straight and thorny like *Genistella*, wherin are many small white and three cornered seeds as big as mustard seed. ‡ this differs from the former, in that it is smaller, and loseth the leaues euery winter, when as the former keeps on the leaues vntill new ones come on in the Spring. The middle of the winged leaues ends in a pricke, which by the falling of the leaues becomes a long and naked horne. I haue giuen you a more accurat figure hereof out of *Clusius*, wherein the leaues, flowres, cods, and seeds are all expressed apart. ‡

3 The Grecians haue called this plant Νυκτέλια, because it is good for the sinues: it should seem it tooke the name *Peterion* of *Petrix*, because it loueth a waterie or fenny soile: it hath small branches, and leaues of *Tragacantha*, growing naturally in the tract of Piedmont in Italy: it spreadeth abroad like a shrub: the barke or rinde is blackish, and dry without great moisture, very much writhed or wrinkled in and out as that of *Nepa* or *Corrudæ*: the sharp prickes stand not in order as *Tragacantha*, but confusedly, and are finer and three times lesser than those of *Tragacantha*, growing much after the manner of *Astragalus*; but the particular leaues are green aboue, and white below, shaped somwhat like Burnet: the seed is small and red, like vnto Sumach, but lesser.

‡ *Tragacanthæ minoris icon accuratior.*
A better figure of the Goats-thorne.

† 3 *Peterion Lob. siue Pimpinella spinosa Camer.*
Burnet Goats-thorne.

¶ *The Place.*

Petrus Bellonius, lib. 1. of Singularities reports, that there is great plenty hereof growing in Candy vpon the tops of the mountains. *Theophrastus* saith that it was thought to grow no where but in Candy; but now it is certain that it is found in Achaia, Peloponesus, and in Asia: it growes also in Arcadia, which is thought to be inferior to that of Candy. It is thought by *Lobel* to grow in Languedoc in France, whereof *Theophr. lib.* 9. hath written, that the liquor or gum issues out of it self, and that it is not needfull to haue the root broken or cut. The best is that, saith *Dioscor.* which is through-shining, thin, smooth, vnmixt, and sweet of smell and taste.

¶ *The Time.*

They floure and flourish in the Summer moneths. I haue sown the seed of *Peterion* in April, hauing receiued it from *Ioach. Camer.* of Noremberg: it grew in my garden two yeares together, and afterwards perished by some mischance.

¶ *The Names.*

Goats-thorne is called in Greeke τραγάκανθα: of moſt writers likewiſe *Tragacantha*: we may call it in Latine *Spina hirci*: in French, *Barbe Renard*: and in Engliſh for want of a better name, Goats-thorne: the liquor or gum that iſſueth forth of the root beareth the name alſo of *Tragacantha*: it is called in ſhops *Gumma Tragacanthæ*, and in a barbarous manner, *Gumma Tragacanthi*: in Engliſh, Gum Dragagant.

¶ *The Temperature.*

Each part of this plant is of a drying facultie without biting: it doth conſolidate or glew together ſinues that be cut: but the roots boiled in wine haue that facultie ſpecially, being giuen to thoſe that haue any griefe or hurt in the ſinues.

Gum Dragagant hath an emplaſticke qualitie, by reaſon whereof it dulleth and allayeth the ſharpneſſe of humors, and doth alſo ſomthing dry.

¶ *The Vertues.*

The gum is ſingular good to be licked in with hony againſt the cough, roughneſſe of the throat, hoarſneſſe, and all ſharp and thin rheumes and diſtillations: being laid vnder the tongue it taketh away the roughneſſe thereof.

Being drunke with Cute or the decoction of Licorice it taketh away and allayeth the heate of the vrine: it is alſo vſed in medicines for the eies.

The greateſt part of thoſe artificiall beades, ſweet chaines, bracelets, and ſuch like pretty ſweet things of pleaſure are made hard and fit to be worne, by mixing the gum hereof with other ſweets, being firſt ſteeped in Roſe water vntill it be ſoft.

† The figure which was in the third place was of the plant deſcribed in the ſecond, which *Matthiolus* and *Tabern.* made their *Torrion*, but it agreed not with the deſcription, which was taken out of the *Author*.

CHAP. 26. *Of the Ægyptian Thorne.*

‡ 1 *Acacia Dioſcoridis.*
The Egyptian Thorne.

¶ *The Description.*

1 *Dioscorides* makes mention of *Acacia*, whereof the first is the true and right *Acacia*, which is a shrub or hedge tree, but not growing right or straight vp as other small trees doe: his branches are wooddy, beset with many hard and long thornes; about which grow the leaues, compact of many small leaues clustering about one side, as in the Lentil: the flours are whitish, the huskes or cods be plaine and flat, yea very broad like Lupines, especially on that side where the seed growes, which is contained somtimes in one part, and somtimes in two parts of the husk, growing together in a narrow neck: the seed is smooth and glistering. There is a blacke juyce taken out of these huskes, if they be dried in the shade when they be ripe; but if they are not ripe, then it is somwhat red: some do wring a juice out of the leaues and fruit: there flowes also a gum out of this tree, which is the gum of Arabia, called gum Arabick.

2 *Dioscorides* hauing described *Spina Acacia*, sets downe a second kinde thereof, calling it *Acacia altera*, which hath the three leaues of Rue or *Cytisus*, and coddes like those of *Genistella*, but somewhat more blunt at the end, and thicke at the backe like a Rasor, and still groweth forward narrower and narrower, vntill it come to haue a sharpe edge: in these cods are contained three or foure flat seeds like *Genistella*, which before they wax ripe are yellow, but afterwards blacke: the whole plant growes to the height of *Genista spinosa* or Gorsse, both in shape, height, and resemblance, and not to the height of a tree, as *Matthiolus* would perswade vs, but full of sharp thornes like the former.

¶ *The Place.*

The true Acacia groweth in Egypt, Palestina, Lombardy, and Syria, as *Dioscorides* writes: among the shrubs and trees that remaine alwaies green, Acacia is noted for one, by *Petrus Bellonius, lib.* 1. *cap.* 44. of his Singularities.

The other Acacia growes in Cappadocia and Pontus, as *Dioscorides* writeth: it is also found in Corsica, and in diuers mountaines of Italy, and likewise vpon all the coast of Liguria and Lombardie, and vpon the Narbon coast of the Mediterranean sea.

¶ *The Time.*

These floure in May, and their fruit is ripe in the end of August.

¶ *The Names.*

The tree Acacia is named of the Grecians Ακακία, yea euen in our time, & likewise of the Latines *Acacia*: it is also called *Egyptia spina*: this strange thorne hath no English name that I can learne, and therefore it may still keep the Latine name Acacia; yet I haue named it the Egyptian thorne. The juice also is called Acacia. The Apothecaries of Germanie vse in stead hereof the juice that is pressed out of sloes or snags, which they therefore call *Acacia Germanica*. *Matthiolus* pictureth for *Acacia* the tree which the later Herbarists call *Arbor Iudæ*, to which he hath vntruly added thornes, that he might belie Acacia; and yet he hath not made it agree with *Dioscorides* his description.

They call this Ετερακακία: in Latine, *Acacia altera*, or the other Acacia, and *Pontica Acacia*, or Pontick Acacia.

¶ *The Nature.*

The juice of Acacia, as *Galen* saith, consists not of one onely substance, but is both cold and earthy, to which also is coupled a certain waterie essence, and it likewise hath thinne and hot parts dispersed in it selfe; therefore it is dry in the third degree, and cold in the first, if it be not washed; and in the second if it be washed; for by washing it loseth his sharp and biting quality, and the hot parts.

¶ *The Vertues.*

The juice of Acacia stoppeth the laske, the inordinat course of womens termes, and mans involuntarie issue called *Gonorrhœa*, if it be drunke in red wine. A

It healeth the blastings and inflammations of the eies, and maketh the skin and palmes of the hands smooth, after the healing of the *Scrpigo*: it healeth the blisters & extreme heat in the mouth, and maketh the haires blacke that are washed therewith. B

It is good, saith *Dioscorides*, against S. Anthonies fire, the shingles, Chimetla, Pterygia, & whitloives. C

The gum doth binde and somwhat coole: it hath also joined vnto it an emplasticke qualitie, by which it dulleth or alayeth the sharpnesse of the medicines wherewith it is mixed. Being applied with the white and yolk of an egge it suffers not blisters to rise in burned or scalded parts. *Dioscor.* D

The juice of the other, saith *Dioscorides*, doth also binde, but it is not so effectuall nor so good in eye medicines. E

† Our Author gaue but formerly one figure, which was that in the second place, and he would haue perswaded vs that it was of the right *Acacia*, yet in his description he tells vs otherwise.

CHAP.

Chap. 27.

Of Box Thorne, and the juice thereof called Lycium.

¶ *The Deſcription.*

1 BOx Thorne is a rare plant in ſhape not vnlike the Box tree, whereof it hath bin reckoned for a wilde kinde, hauing many great branches ſet full of round and thicke leaues very like that of the common Box tree: amongſt which grow forth moſt ſharpe pricking thornes: the floures grow among the leaues, which yeeld forth ſmall black berries of a bitter taſte, as big as a pepper corne: the juice whereof is ſomwhat oily, and of a reddiſh colour: which bitter juice being ſet on fire, doth burne with a maruellous cracking and ſparkling: the aſhes thereof are of a reddiſh colour: it hath many wooddy roots growing aſlope.

1 *Lycium, ſive Pyxacantha.*
Box Thorne.

‡ 2 *Lycium Hiſpanicum.*
Spaniſh Box Thorne.

2 The other kinde of *Pyxacantha* or *Lycium* groweth like vnto the common Privet, hauing ſuch like leaues, but ſomewhat narrower: the tops of the ſlender ſprigs are furniſhed with prickles: the root is tough, and of a wooddy ſubſtance.

¶ *The Place.*

They grow in Cappadocia and Lycia, and in many other countries: it proſpers in rough places; it hath likewiſe bin found at Languedoc and Province in France. *Bellonius* writeth that he found it in Paleſtina.

Matthiolus pictureth for Box Thorne a plant with Box leaues, with very many boughes and certaine thornes ſtanding among them: but the notable Herbariſt *Anguillara* and others hold opinion that it is not the right; with whom we alſo agree.

There is drawn out of the leaues and branches of Box Thorn, or as *Pliny* ſaith, out of the boughs and roots being throughly boiled, a juice named *Lycium*.

Dioſcorides ſaith that the leaues and branches muſt be brayed, and the infuſion made many daies in

in the decoction thereof, after which the feces or wooddy stuffe must be cast away, and that which remaineth boiled againe till it become as thicke as hony. *Pliny* saith that the roots and branches are very bitter, and for three daies together they must be boiled in a copper vessell, and the wood and sticks often taken out till the decoction be boiled to the thickenesse of hony.

¶ *The Time.*

They floure in Februarie and March, and their fruit is ripe in September.

¶ *The Names.*

It is named in Greeke πυξάκανθα, which a man may call in Latine *Buxea spina*; and in English, box Thorne: of some, Asses Box tree, and prickly Box: it is also named *Lycium*, of the juice which is boiled out of it: the juice is properly called λύκιον, and retaineth in Latine the same name *Lycium*: it is termed in English, Thorne Box. But it seemeth to me that the originall name *Lycium* is fitter, being a strange thing, and knowne to very few: the Apothecaries know it not, who in stead thereof do vse amisse the juice of the fruit of Woodbinde, and that not without great error, as we haue already written. ‡ It is vnknown in our shops, neither is there any thing vsed for it, it being wholly out of vse: wherefore our Author might here very well haue spared *Dodonæus* his words. ‡

Dioscorides teacheth to make a ῥοῦς or Sumach which is good for those things that *Lycium* is, and is vsed when *Lycium* is not to be had, and it is fit to be put into all medicines in stead thereof.

¶ *The Temperature.*

Lycium, or the juice of Box Thorne is, as *Galen* teacheth, of a drying qualitie, and compounded of diuers kinds of substances, one of thin parts digesting and hot, another earthy and cold, whereby it enioyeth his binding facultie: it is hot in a mean, and therefore it is vsed for seuerall purposes.

¶ *The Vertues.*

Lycium cleareth the sight, saith *Dioscorides*, it healeth the scruuy festred sores of the eye lids, the itch, and old fluxes or distillations of humors: it is a remedie for the running of the eares, for Vlcers in the gums, and almonds of the throat, and against the chaps or gallings of the lips and fundament. A

† The figure which was in the second place was of the *Lycium Italicum* of *Matthiolus* and others; but the description and title better fited this *Lycium Hispanicum* of *Lobel*, which therefore I put thereto. The figure also of the *Lycium Italicum* of *Matthiolus* our Author gaue againe in the next chapter saue two.

Chap. 28. *Of Ram or Harts Thorne.*

¶ *The Kindes.*

After the opinion of *Dioscorides* there bee three sorts of *Rhamnus*; one with long flat and soft leaues, the other with white leaues, and the third with round leaues, which are somewhat blackish. *Theophrastus* and *Pliny* affirme that there are but two, the one white, and the other black, both which do beare Thornes. But by the labor and industrie of the new and late writers there are found sundry sorts moe, all which and euery one of them are plants of a woody substance, hauing also many straight twiggy and pliant branches set with most sharp pricking thornes.

¶ *The Description.*

1 THis is a shrub growing in the hedges, and bringing forth straight branches and hard thornes like those of the Hawthorn, with little long leaues something fat and soft: and this hath that notable learned man *Clusius* more diligently described in these words; The Ram is a shrub fit to make hedges of, with straight branches parting it selfe into many twigs, white, and set with stiffe and strong thornes, hauing leaues which for the most part grow by foures or fiues at the root of euery Thorne, long, something fat, like to those of the Oliue tree, somewhat white, but tender and full of juice; which in Autumne do sometimes fall off, leauing new growing in their places: the floures in Autumne are somthing long, whitish, diuided at the brims into fiue parts: in their places is left a seed in shew as in *Gelsemine*, notwithstanding it was neuer my chance to see the fruit: the root is thicke, and diuersly parted.

‡ I obserued another, saith the same Author, almost like to the former, but lower, and diuided into more branches, with lesser leaues, more thick and salt of taste, and whiter also than the former: the floures are like those of the former in all things but their colour, which in this are purple.

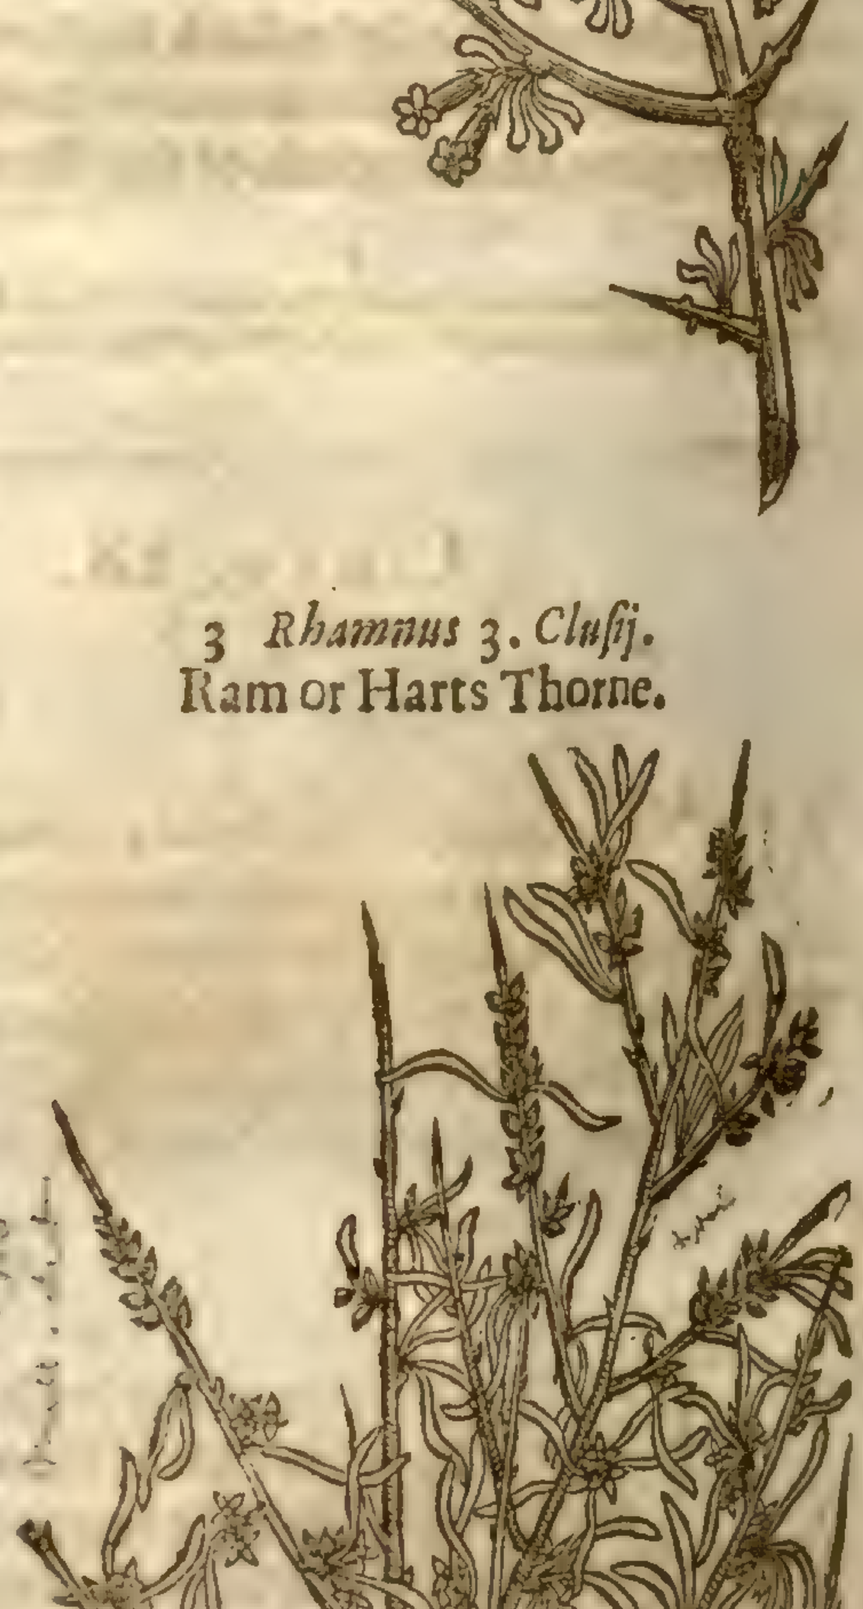
2 This hath more flexible stalks and branches, and these also set with thornes: The leaues are narrow, and not so thicke and fleshy as those of the former, yet remaine alwayes greene like as they do: The floures are small and mossie, of a greenish colour, growing thicke about the branches, and they are succeeded by a round fruit, yellowish when it is ripe, and remaining on the shrubbe all the Winter,

‡ 1 *Rhamnus* 1. *Cluſij flo. albo.*
White floured Ram-thorne.

‡ *Rhamnus alter Cluſ. flore purpureo.*
Purple floured Ram-thorne.

‡ 2 *Rhamnus* 2. *Cluſij.*
Sallow Thorne.

3 *Rhamnus* 3. *Cluſij.*
Ram or Harts Thorne.



Winter. The whole shrub looks as if it were sprinkled ouer with dust.

3 To these may be added another growing with many branches to the height of a Sloe Tree, or blacke Thorne, and these are couered with a blackish barke, and armed with long prickles. The leaues, as in the first, grow forth of certain knots many together, long, narrow, fleshy, green, and continuing all the yeare: their taste is astringent, somwhat like that of Rhabarb: the flours shew themselues at the beginning of the Spring, of a greenish colour, growing thicke together, and neere the setting on of the leaues: in Summer it carries a blacke fruit almost like a Sloe, round, and harsh of taste.

¶ *The Place.*

The first of these growes in sundry places of Spaine, Portugal, and Province: the other varietie thereof *Clusius* saith he found but only in one place, and that was neere the city Horivela, called by the Antients Orcellis, by the riuer Segura, vpon the borders of the kingdom of Valentia. The second growes in many maritime places of Flanders and Holland, and in some vallies by riuers sides. The third growes in the vntilled places of the kingdom of Granado and Murcia. ‡

¶ *The Time.*

This Ram is euer green together with his leaues: the fruit or berries remain on the shrub euen in Winter.

¶ *The Names.*

The Grecians call this Thorne [illegible]: the Latines also *Rhamnus*: diuers name it [illegible], that is, *Spina alba*, or White Thorne; *Spina Cervalis*, or Harts Thorne, as wee finde written amongst the bastard words. *Marcellus* nameth it *Spina salutaris*, and *Herba salutaris*, which hath, saith hee, as it were a grape. It is called in Italian, *Marruco*, and *Rhamno*: in Spanish, *Scambrones*: in English, Ram: or Harts Thorne.

¶ *The Temperature.*

The Ram, saith *Galen*, doth dry and digest in the second degree, it cooleth in the later end of the first, and in the beginning of the second degree.

¶ *The Vertues.*

The leaues, saith *Dioscorides*, are laid pultiswise vpon hot cholericke inflammations and S. *Anthonies* fire, but we must vse them whilest they be yet but tender, as *Galen* addeth. A

‡ The leaues and buds or young shoots of the first are eaten as sallads, with oile, vineger, and salt, at Salamanca and other places of Castile, for they haue a certain acrimonie and acidity which are gratefull to the taste. A decoction of the fruit of the third is good to foment relaxed and weak or paralyticke members, and to ease the paine of the gout, as the inhabitants of Granado told *Clusius*. ‡ B

‡ Our Author in this Chapter gaue only the figure of the third, and the description of the first, and the place of the second, with the names and faculties in generall.

CHAP. 29. *Of Christs Thorne.*

¶ *The Description.*

CHristes Thorne or Ram of Lybia is a very tough and hard shrubby bush, growing vp somtimes to the height of a little tree, hauing very long and sharpe prickely branches; but the Thornes that grow about the leaues are lesser, and not so prickly as the former. The leaues are small, broad, and almost round, somewhat sharp pointed, first of a darke green colour, and then somewhat reddish. The floures grow in clusters at the tops of the stalks, of a yellow colour: the husks wherin the seeds be contained are flat and broad, very like vnto small bucklers, as hard as wood, wherin are contained three or foure thin and flat seeds like the seed of Line or Flax.

¶ *The Place.*

This Thorne groweth in Lybia; it is better esteemed of in the countrey of Cyrene than is their Lote tree, as *Pliny* affirmeth. Of this herb *Diphilus Siphnius* in *Athenæus* his 14 booke makes mention, saying, That he did very often eat of the same in Alexandria, that beautifull city.

Petrus Bellonius, who trauelled ouer the Holy land, saith, That this shrubby Thorne *Paliurus* was the

Paliurus.
Christs Thorne.

the Thorne wherewith they crowned our Saviour Christ: his reason for the proofe hereof is this, That in Iudæa there was not any Thorne so common, so pliant, or so fit for to make a crown or garland of, nor any so full of cruell sharpe prickles. It groweth throughout the whole countrey in such abundance, that it is their common fuell to burn; yea, so common with them there, as our Gorse, Brakes, and Broome is here with vs. *Iosephus, lib.* 1. *cap.* 11. of his Antiquities saith, That this thorne hath the most sharp prickles of any other; wherefore that Christ might bee the more tormented, the Iewes rather tooke this than any other. Of which I haue a small tree growing in my garden, that I haue brought forth by sowing of the seed.

¶ *The Time.*

The leaues fall away and continue not alwayes greene, as doe those of the Rams: it buds forth in the Spring, as *Pliny* testifieth.

¶ *The Names.*

This thorny shrub is called in Greek, παλίουρος: the Latines and Italians retaine the same name *Paliurus*: for want of an English name it may bee termed Ram of Lybia, or Christs thorn. *Pliny* saith the seed is called *Zura*.

¶ *The Temperature.*

The leaues and root of Christs thorne doe euidently binde and cut.

¶ *The Vertues.*

A By vertue of this cutting qualitie the seed doth weare away the stone, and cause tough and slimy humors to remoue out of the chest and lungs, as *Galen* saith.

B The decoction of the leaues and root of Christs Thistle, as *Dioscorides* writes, stoppeth the belly, prouokes vrine, and is a remedie against poisons and the bitings of serpents.

C The root doth waste and consume away *Phymata* and *Oedemata*, if it be stamped and applied.

D The seed is good for the cough, and weares away the stone in the bladder.

Chap. 30. *Of Buck-Thorne, or laxatiue Ram.*

¶ *The Description.*

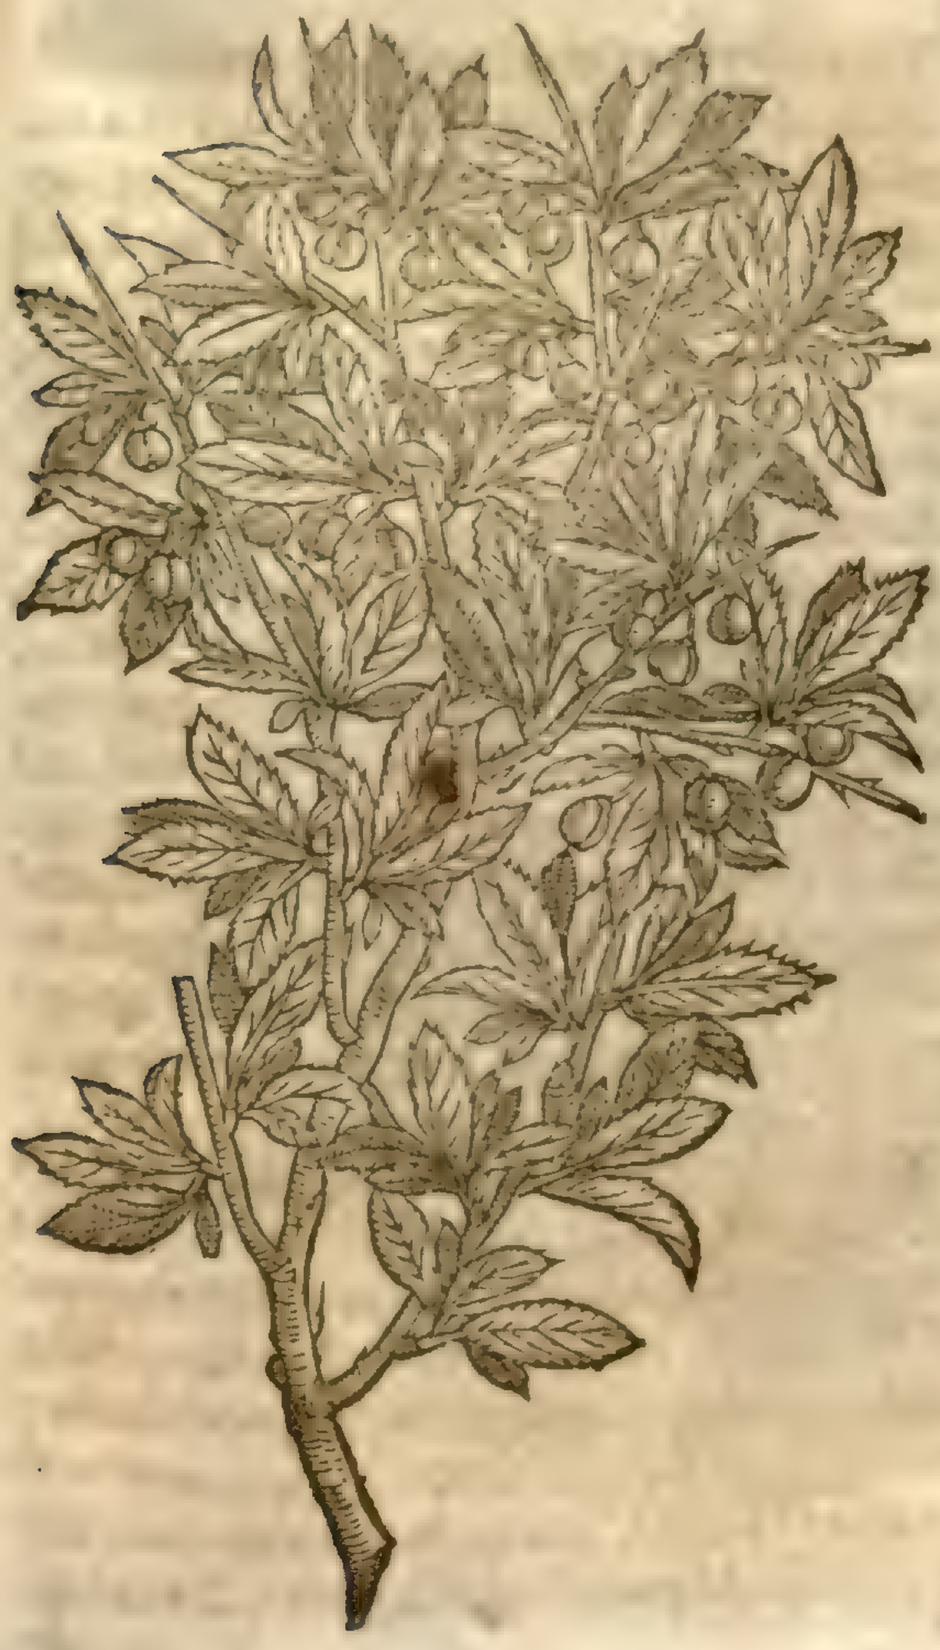
1 BVck-Thorne growes in manner of a shrub or hedge tree; his trunke or body is often as big as a mans thigh; his wood or timber is yellow within, and the barke is of the colour of a Chesnut, almost like the barke of a Cherry tree. The branches are beset with leaues that are somewhat round, and finely snipt about the edges like the leaues of the Crab or Wilding tree: among which come forth thorns which are hard and prickly: the flonres are white and small, which being vaded, there succeed little round berries, green at the first, but afterwards black, whereof that excellent green colour is made which the Painters and limners do call Sap-green: but these berries before they be ripe do make a faire yellow colour, being steeped in vineger.

‡ 2 Besides the common kinde *Clusius* mentions two other: the first of which hath branches some two cubits long, subdiuided into diuers others, couered with a smooth barke like that of the former, which, the vpper rinde being taken off, is of a yellowish greene colour, and bitterish taste: the branches haue some few prickles vpon them, and commonly end in them: the leaues are almost like vnto those of the common kinde, but smaller, narrower, and somwhat resembling those of the blacke Thorne, hauing somewhat a drying taste: the floures consist of foure leaues of a yellowish greene

‡ 1 *Rhamnus solutivus.*
Buck-thorne.

‡ 2 *Rhamnus solutivus minor.*
Middle Buck-thorne.

† 3 *Rhamnus solutivus pumilus.*
Dwarfe Buck-thorne.



greene colour: the root is wooddy as in other shrubs: *Clusius* found this growing in the mountanous places of Austria, and calls it *Spina infectoria pumila*.

3 This other hath branches some cubit long, and of the thickenesse of ones little finger, or lesser, couered with a blacke and shriuelled barke: and towards the top diuided into little boughs, which are couered with a thin & smoother barke, and commonly end in a sharp thorn: the leaues much resemble those of the Slo-tree yet are they shorter and lesser, greene also, and snipt about the edges; first of an astringent, and afterwards of somewhat a bitterish taste; the floures which grow amongst the leaues are of an herby colour, and consist of foure leaues: the fruit is not much vnlike that of the former; but distinguished with two, & somtimes with three crests or dents, first green, and then blacke when it is ripe: the root is thicke, wooddy and hard. *Clusius* found this on the hill aboue the Bathes of Baden, hee calls it *Spina infectoria pumila* 2. This *Matthiolus* and others call *Lycium Italicum*: and our Author formerly gaue the figure of *Matthiolus* and *Tabernamontanus* by the name of *Lycium Hispanicum*, and here againe another for his *Rhamnus solutivus*, which made me to keepe it in this chapter, and omit it in the former, it being described in neither. ‡

¶ *The Place.*

Buck-thorne groweth neere the borders of fields, in hedges, woods, and in other vntoiled places: it delighteth to grow in riuers and in water ditches: it groweth in Kent in ſundry places, as at Farningham vpon the cony burrowes belonging ſometime to Mr *Sibil*, as alſo vpon cony burrowes in South-fleet, eſpecially in a ſmall and narrow lane leading from the houſe of Mr *Willian Swan* vnto Longfield-downes, alſo in the hedge vpon the right hand at Dartford townes end towards London, and in many places more vpon the chalkie bankes and hedges.

¶ *The Time.*

It floureth in May the berries be ripe in the fall of the leafe.

¶ *The Names.*

The later Herbariſts call it in Latine *Rhamnus ſolutivus*, becauſe it is ſet with thornes, like as the Ram, and beareth purging berries. *Matthiolus* nameth it *Spina infectoria*; *Valerius Cordus*, *Spina Cerui*, *Merlo*, *Spino Zertino*, *Spino Ceruino*: in Engliſh, Laxatiue Ram, Way-thorne, and Buck-thorne: in low Dutch they call the fruit or berries **Rhijnbeſſen**, that is, as though you ſhould ſay in Latine, *Bacca Rhenana*: in Engliſh, Rheinberries: in French, *Nerprun*.

¶ *The Temperature.*

The berries of this Thorne, as they be in taſte bitter and binding, ſo be they alſo hot and dry in the ſecond degree.

¶ *The Vertues.*

A The ſame do purge and void by the ſtoole thicke flegme, and alſo cholericke humors: they are giuen being beaten into pouder from one dram to a dram and a halfe: diuers do number the berries, who giue to ſtrong bodies from fifteene to twenty or more; but it is better to breake them and boile them in fat fleſh broth without ſalt, and to giue the broth to drinke: for ſo they purge with leſſer trouble and fewer gripings.

B There is preſſed forth of the ripe berries a juyce, which being boyled with a little Allum is vſed of painters for a deepe greene, which they do call Sap-greene.

C The berries which be as yet vnripe, being dried or infuſed or ſteped in water, do make a faire yellew colour: but if they be ripe they make a greene.

Chap. 31. *Of the Holme, Holly, or Huluer tree.*

Agrifolium.
The Holly tree.

¶ *The Deſcription.*

THe Holly is a ſhrubbie plant, notwithſtanding it oftentimes growes to a tree of a reaſonable bigneſſe: the boughes whereof are tough and flexible, couered with a ſmooth and green barke. The ſubſtance of the wood is hard and ſound, and blackiſh or yellowiſh within, which doth alſo ſinke in the water, as doth the Indian wood which is called *Guaiacum*: the leaues are of a beautifull green colour, ſmooth and glib, like almoſt the bay leaues, but leſſer, and cornered in the edges with ſharp prickles, which notwithſtanding they want or haue few when the tree is old: the floures be white, and ſweet of ſmell: the berries are round, of the bigneſſe of a little Peaſe, or not much greater, of colour red, of taſt vnpleaſant, with a white ſtone in the midſt, which do not eaſily fall away, but hang on the boughes a long time: the root is wooddy.

There is made of the ſmooth barke of this tree or ſhrub, Birdlime, which the birders and country men do vſe to take birds with: they pul off the barke, and make a ditch in the ground, ſpecially in moiſt, boggy, or foggy earth, wherinto they put this bark, couering the ditch with boughes of trees, letting it remaine there til it be rooted and putrified, which will be done in the

the ſpace of twelue daies or thereabout: which done, they take it forth, and beat in morters vntill it be come to the thickeneſſe and clammineſſe of Lime: laſtly, that they may cleare it from pieces of barke and other filthineſſe, they do waſh it very often: after which they adde vnto it a little oyle of nuts, and after that do put it vp in earthen veſſels.

¶ *The Place and Time.*

The Holly tree groweth plentifully in all countries. It groweth green both winter and ſummer; the berries are ripe in September, and they do hang vpon the tree a long time after.

¶ *The Names.*

This tree or ſhrub is called in Latine *Agrifolium*: in Italian, *Agrifoglio*: and *Aguifoglio*: in Spaniſh, *Azebo*: in high Dutch, **Walddiſtell**, and of diuers **Stechpalmen**: in low Dutch, **Hulſt**: in French, *Houx* and *Houſſon*: in Engliſh, Holly, Huluer, and Holme.

¶ *The Temperature.*

The berries of Holly are hot and dry, and of thin parts, and waſte away winde.

¶ *The Vertues.*

They are good againſt the collicke: for ten or twelue being inwardly taken bring away by the ſtoole thicke flagmaticke humors, as we haue learned of them who oftentimes made triall thereof. A

The Birdlime which is made of the barke hereof is no leſſe hurtfull than that of Miſſeltoe, for it is maruellous clammy, it glueth vp all the intrails, it ſhutteth and draweth together the guts and paſſages of the excrements, and by this meanes it bringeth deſtruction to man, not by any quality, but by his gluing ſubſtance. B

Holly beaten to pouder and drunke, is an experimented medicine againſt all the fluxes of the belly, as the dyſentery and ſuch like. C

Chap. 32. *Of the Oke.*

1 *Quercus vulgaris cum glande & muſco ſuo.*
The Oke tree with his Acornes and Moſſe.

¶ *The Deſcription.*

1 THe common Oke groweth to a great tree; the trunke or body whereof is couered ouer with a thicke rough barke full of chops or rifts: the armes or boughes are likewiſe great, diſperſing themſelues farre abroad: the leaues are bluntly indented about the edges, ſmooth, and of a ſhining greene colour, whereon is often found a moſt ſweet dew and ſomewhat clammie, and alſo a fungous excreſcence, which wee call Oke Apples. The fruit is long, couered with a browne, hard, and tough pilling, ſet in a rough ſcaly cup or huſk: there is often found vpon the body of the tree, and alſo vpon the branches, a certaine kind of long white moſſe hanging downe from the ſame: and ſometimes another wooddie plant, which we call Miſſeltoe, being either an excreſcence or outgrowing from the tree it ſelfe, or of the doung (as it is reported) of a bird that hath eaten a certaine berry. ‡ Beſides theſe there are about the roots of old Okes within the earth certaine other excreſcences, which *Bauhine* and others haue called *Vuæ quercinæ*, becauſe they commonly grow in cluſters together, after the manner of Grapes and about their bignes, being ſomtimes round, and otherwhiles cornered, of a wooddy ſubſtance, hollow within; and ſometimes of a purple, otherwhiles of a whitiſh colour on the outſide: their taſte is aſtringent, and vſe ſingular in all Dyſenteries

ries and fluxes of bloud, as *Encelius* affirmes, *cap. 51. de lapid. & gem.* ‡

3 *Carolus Cluſius* reporteth that hee found this baſe or low Oke not farre from Lisbone, of the height of a cubit, which notwithſtanding did alſo beare an Acorne like that of our Oke-tree, ſauing that the cup is ſmoother, and the Acorne much bitterer, wherein it differeth from the reſt of his kinde.

2 *Quercus vulgaris cum excrementis fungoſis.*
The common Oke with his apple or greene Gall.

3 *Quercus humilis.*
The dwarfe Oke.

There is a wilde Oke which riſeth vp oftentimes to a maruellous height, and reacheth very far with his armes and boughes, the body wherof is now and then of a mighty thickeneſſe, in compaſſe two or three fathoms: it ſendeth forth great ſpreading armes, diuided into a multitude of boughs. The leaues are ſmooth, ſomething hard, broad, long, gaſhed in the edges, greene on the vpper ſide: the Acornes are long, but ſhorter than thoſe of the tamer Oke; euery one faſtened in his owne cup, which is rough without: they are couered with a thin rinde or ſhell: the ſubſtance or kernell within is diuided into two parts, as are Beans, Peaſe, and Almonds: the bark of the yong Okes is ſmooth, glib, and good to thicken skins and hides with, but that of the old Okes is rugged, thicke, hard, and full of chops: the inner ſubſtance or heart of the wood is ſomething yellow, hard and ſound, and the older the harder: the white and outward part next to the barke doth eaſily rot, being ſubject to the worme, eſpecially if the tree be not felled in due time: ſome of the roots grow deepe into the earth, and otherſome far abroad, by which it ſtiffely ſtandeth.

¶ *The Place.*

The Oke doth ſcarcely refuſe any ground; for it groweth in a dry and barren ſoile, yet doth it proſper better in a fruitfull ground: it groweth vpon hills and mountaines, and likewiſe in vallies: it commeth vp euery where in all parts of England, but it is not ſo common in other of the South and hot regions.

¶ *The Time.*

The Oke doth caſt his leaues for the moſt part about the end of Autumne: ſome keepe their leaues on, but dry all Winter long, vntill they be thruſt off by the new Spring.

¶ *The Names.*

The Oke is called in Greeke δρῦς: in Latine, *Quercus*: of ſome, *Placida*, as *Gaza* tranſlats it. It may be called *Satiua*, *Vrbana*, or *Culta*; ſome alſo *Emeres mudion*, and *Robur*: the Macedonians ἐμέρες μύδιον, as

as though you should say *Viriquercus*, as *Gaza* expoundeth it, or *Vere Quercus*, the true Oke. We may name it in English, the tamer Oke-tree: in French, *Chesne*: in Dutch, **Eycken boom.**

The fruit is named in Greeke βάλανος: in Latine, *Glans*: in high Dutch, **Eichel**: in low Dutch, **Eickel**: in Spanish, *Bellotas*: in Italian, *Chiande*: in English, Acorne, and Mast.

The cup wherein the Acorne standeth is named in Greeke ὄμφαξ, as *Paulus Ægineta*, in his third booke, 42 chapter testifieth, saying, *Omphacis* is the hollow thing out of which the Acorne groweth: in Latine, *Calix glandis*: in shops, *Capala glandis*: in English, the Acorne cup.

¶ *The Temperature and Vertues.*

The leaues, barke, Acorne cups, and the Acornes themselues, do mightily binde and dry in the A
the third degree, being somewhat cold withall.

The best of them, saith *Galen*, is the thin skin which is vnder the barke of the tree, and that next, B
which lieth neerest to the pulpe, or inner substance of the Acorne; all these stay the whites, the reds, spitting of bloud and laskes: the decoction of these is giuen, or the pouder of them dried, for the purposes aforesaid.

Acornes if they be eaten are hardly concocted, they yeeld no nourishment to mans body, but C
that which is grosse, raw, and cold.

Swine are fatted herewith, and by feeding thereon haue their flesh hard and sound. D

The Acorns prouoke vrine, and are good against all venome and poyson, but they are not of such E
a stopping and binding faculty as the leaues and barke.

The Oke apples are good against all fluxes of bloud and lasks, in what manner soeuer they be ta- F
ken, but the best way is to boile them in red wine, and being so prepared, they are good also against the excessiue moisture and swelling of the jawes and almonds or kernels of the throat.

The decoction of Oke Apples staieth womens diseases, and causeth the mother that is falne G
downe to returne againe to the naturall place, if they do sit ouer the said decoction being very hot.

The same steeped in strong white wine vineger, with a little pouder of Brimstone, and the root of H
Irees mingled together, and set in the Sun by the space of a moneth, maketh the haire blacke, consumeth proud and superfluous flesh, taketh away sun-burning, freckles, spots, the morphew, with all deformities of the face, being washed therewith.

The Oke Apples being broken in sunder about the time of their withering, doe foreshew the se- I
quell of the yeare, as the expert Kentish husbandmen haue obserued by the liuing things found in them: as if they finde an Ant, they foretell plenty of graine to ensue: if a white worme like a Gentill or Magot, then they prognosticate murren of beasts and cattell; if a spider, then (say they) we shall haue a pestilence or some such like sickenesse to follow amongst men: these things the learned also haue obserued and noted; for *Matthiolus* writing vpon *Dioscorides* saith, that before they haue an hole through them, they containe in them either a flie, a spider, or a worme; if a flie then warre insueth, if a creeping worme, then scarcitie of victuals; if a running spider, then followeth great sicknesse or mortalitie.

Chap. 33. *Of the Scarlet Oke.*

¶ *The Kindes.*

Although *Theophrastus* hath made mention but of one of these Holme or Holly Okes onely, yet hath the later age set downe two kinds thereof; one bearing the scarlet grain, and the other only the Acorn: which thing is not contrarie to *Dioscorides* his opinion, for he intreateth of that which beareth the Acorne, in his first booke, among δρύες or the Okes: and the other hee describeth in his fourth booke, vnder the title κόκκος βαφικὸς, or *Coccus Baphicè*.

¶ *The Description.*

The Oke which beareth the Scarlet graine is a small tree, in manner of a hedge tree, of a meane bignesse, hauing many faire branches or boughes spread abroad: whereon are set leaues, greene aboue, white vnderneath, snipt about the edges, and at euery corner one sharpe prickle, in manner of the smoother Holly: among which commeth sometimes, but not often, small Acornes, standing in little cups or husks, armed with prickles as sharpe as thornes, and of a bitter taste. *Besides* the Acornes, there is found cleauing vnto the wooddy branches, a certaine kind of berries, or rather an excrescence, of the substance of the Oke Apple, and of the bignesse of a Pease, at the first white, and of the colour of ashes when they be ripe, in which are ingendred little Maggots, which seeme to

Ilex Coccigera.
The Scarlet Oke.

Of this graine also *Pausanias* hath made mention in his tenth booke, and sheweth, that the tree which bringeth forth this graine is not great, and also groweth in Phocis, which is a countrey in Macedonia neere to the Boetians, not far from the mountaine Parnassus.

Theophrastus writeth, that πρῖνος, or the Scarlet Oke, is a great tree, and riseth vp to the height of the common Oke: amongst which writers there are some contrarietie. *Petrus Bellonius* reporteth it is a little tree, and *Theophrastus* a great one, which may chance accordiug to the soile and clymate; for that vpon the stonie mountains they cannot grow to that greatnesse as those in the fertill grounds.

¶ *The Time.*

The little graines or berries which grow about the boughes begin to appeare especially in the Spring, when the Southwest windes do blow: the floures fall and are ripe in Iune, together with the Maggots growing in them, which receiuing life by the heat of the Sun, doe forthwith flie away (in manner of a Moth or Butterflie) vnlesse by the care and diligence of the keepers, they be killed by much and often shaking them together, as aforesaid.

The tree or shrub hath his leaues alwaies greene: the Acornes be very late before they be ripe, seldome before new come vp in their place.

¶ *The Names.*

The Scarlet Oke is called in Greeke πρῖνος: in Latine, *Ilex*: the later writers, *Ilex Coccigera*, or *Coccifera*; in Spanish, *Coscoia*: for want of a fit English name, wee haue thought good to call it by the name of Scarlet Oke, or Scarlet Holme Oke: for *Ilex* is named of some in English, Holme, which signifyeth Holly or Huluer. But this *Ilex*, as well as those that follow, might be called Holme Oke, Huluer Oke, or Holly Oke, for difference from the shrub or hedge tree *Agrifolium*, which is simply called Holme, Holly, and Huluer.

The graine or berry that serueth to die with is properly called in Greeke κόκκος βαφικὸς: in Latine; *Coccus infectoria*, or *Coccum infectorium*: *Pliny* also nameth it *Cusculium*: or as most men doe reade it, *Quisquilium*: the same Author saith, that it is likewise named *Scarlecion*, or Maggot berry.

The Arabians and the Apothecaries doe know it by the name of *Chesmes*, *Chermes*, and *Kermes*: They are deceiued who thinke that *Chesmes* doth differ from *Infectorium Coccum*: it is called in Italian, *Grano de tintori*: in Spanish, *Grana de tintoreros*: in high Dutch, **Scharlachbeer**: in French, *Vermillen*,

to be without life vntill they feele the heate of the sun, and then they creep, and seeke to flie away. But the people of the countrey (which make a gaine of them) doe watch the time of their flying, euen as wee doe Bees, which they then take and put into a linnen bag, wherein they shake and boult them vp and downe vntil they bee dead, which they make vp into great lumpes oftentimes, and likewise sell them to diers apart, euen as they were taken forth of the bag, whereof is made the most perfect Scarlet.

¶ *The Place.*

This Oke groweth in Languedocke, and in the countries thereabout, and also in Spain: but it beareth not the scarlet grain in all places, but in those especially which lie toward the Midland sea, and which be subject to the scorching heat of the Sun, as *Carolus Clusius* witnesseth; & not there alwaies, for when the tree waxeth old it growes to be barren. Then do the people cut and lop it downe, that after the young shoots haue attained to two or three yeares growth, it may become fruitfull againe.

Petrus Bellonius in his books of Singularities sheweth, That *Coccus Baphicus* or the Scarlet graine doth grow in the Holy land, and neere to the lake which is called the Sea of *Tiberias*, and that vpon little trees, whereby the inhabitants get great store of wealth, who separat the husks from the pulpe or Magots, and sell this being made vp into balls or lumpes, much dearer than the empty shels or husks.

Vermillon, and *Graine d'escarlate*: in English, after the Dutch, Scarlet Berry, or Scarlet graine, and after the Apothecaries word, *Coccus Baphicus*: the Maggot within is that which is named Cutchonele, as most do deeme.

Theophrastus saith, the Acorne or fruit hereof is called of diuers, *Acylum*.

¶ *The Temperature and Vertues.*

This graine is astringent and somwhat bitter, and also dry without sharpenesse and biting, therefore, saith *Galen*, it is good for great wounds and sinewes that bee hurt, if it be layd thereon: some temper it with Vineger; others with Oxymel or syrrup of Vineger. A

It is commended and giuen by the later Physitians to stay the Menses: it is also counted among those Simples which be cordials, and good to strengthen the heart. Of this graine that noble and famous confection *Alkermes*, made by the Arabians, hath taken his name, which many doe highly commend against the infirmities of the heart: notwithstanding it was chiefly deuised in the beginning for purging of melancholy; which thing is plainly perceiued by the great quantitie of *Lapis Lazulus* added thereto: and therefore seeing that this stone hath in it a venomous quality, and likewise a property to purge melancholy, it cannot of it selfe be good for the heart, but the other things be good, which be therefore added, that they might defend the heart from the hurts of this stone, and correct the malice thereof. B

This composition is commended against the trembling and shaking of the heart, and for swounings and melancholy passions, and sorrow proceeding of no euident cause: it is reported to recreate the minde, and to make a man merry and joyfull. C

It is therefore good against melancholy diseases, vaine imaginations, sighings, griefe and sorrow without manifest cause, for that it purgeth away melancholy humors: after this manner it may be comfortable for the heart, and delightfull to the minde, in taking away the materiall cause of sorrow: neither can it otherwise strengthen a weake and feeble heart, vnlesse this stone called *Lapis Cyaneus* be quite left out. D

Therefore he that is purposed to vse this composition against beatings and throbbings of the heart, and swounings, and that not as a purging medicine, shall do wel and wisely by leauing out the stone *Cyaneus*; for this being taken in a little weight or small quantity, cannot purge at all, but may in the meane season trouble and torment the stomacke, and withall thorow his sharpe and venomous quality (if it be oftentimes taken) be very offensiue to the guts and intrails, and by this means bring more harme than good. E

Moreouer, it is not necessary, no nor expedient, that the bristle died with Cochenele, called *Chesmes*, as the Apothecaries terme it, should be added to this composition; for this bristle is not died without *Auripigmentum*, called also Orpiment, and other pernitious things joyned therewith, whose poisonsome qualities are added to the juyces rogether with the colour, if either the bristle or died silke be boyled in them. F

The berries of the Cochenele must be taken by themselues, which alone are sufficient to die the juyces, and to impart vnto them their vertue: neither is it likewise needfull to boile the raw silke together with the graines, as most Physitians thinke: this may be left out, for it maketh nothing at all for the strengthning of the heart. G

Chap. 34. *Of the great Skarlet Oke.*

¶ *The Description.*

THe great Skarlet Oke, or the great Holme Oke, groweth many times to the full height of a tree, sometimes as big as the Peare-tree, with boughes far spreading like the Acorne or common Mast trees: the timber is firme and sound: the leaues are set with prickles round about the edges, like those of the former Skarlet Oke: the leaues when the tree waxeth old haue on them no prickles at all, but are somewhat bluntly cut or indented about the edges, greene on the vpper side, and gray vnderneath: the Acorne standeth in a prickely cup like our common Oke Acorne, which when it is ripe becommeth of a browne colour, with a white kernell within of taste not vnpleasant. There is found vpon the branches of this tree a certaine kinde of long hairy mosse of the colour of ashes, not vnlike to that of our English Oke. ‡ This tree is euer greene, and at the tops of the branches about the end of May, here in England, carrieth diuers long catkins of mossie yellow floures, which fall away and are not succeeded by the Acornes, for they grow out vpon other stalks. *Clusius* in the yeare 1581 obserued two trees; the one in a garden about the Bridge, and the other in the priuat garden at White-Hall, hauing lesser leaues than the former. The later of these is yet standing, and euery yeare beares small Acornes, which I could neuer obserue to come to any maturity. ‡

¶ *The*

Ilex major Glandifera.
The great Skarlet Oke.

‡ *Ilicis ramus floridus.*
The floures of the great Skarlet Oke.

¶ *The Place.*

In diuers places there are great woods of these trees, hills also and vallies are beautified therewith: they grow plentifully in many countries of Spaine, and in Languedocke and Prouince in great plenty. It is likewise found in Italy. It beareth an Acorne greater, and of a larger size than doth the tame Oke: in some countries lesser and shorter: they are strangers in England, notwithstanding there is here and there a tree thereof, that hath been procured from beyond the seas: one groweth in her Majesties priuie Garden at White-Hall, neere to the gate that leadeth into the street, and in some other places here and there one.

¶ *The Time.*

It is greene at all times of the yeare: it is late before the Acornes be ripe. *Clusius* reporteth, that he saw the floures growing in clusters of a yellow colour in May.

¶ *The Names.*

This Oke is named in Greeke πρῖνος: in Latine, *Ilex*: in Spanish, *Enzina*: in Italian, *Elice*: in French, *Chesneuerd*: in English, Barren Skarlet Oke, or Holme Oke, and also of some, French or Spanish Oke.

The Spaniards call the fruit or Acorne *Bellota*, or *Abillota*. *Theophrastus* seemeth to call this tree not *Prinos*, but *Smilax*; for he maketh mention but of one *Ilex* onely, and that is of Scarlet Oke; and he sheweth that the Arcadians do not call the other *Ilex*, but *Smilax*: for the name *Smilax* is of many significations: there is *Smilax* among the Pulses, which is also called *Dolichus*, and *Phaseolus*; and *Smilax aspera*, and *Lævis*, amongst the Binde-weeds: likewise *Smilax* is taken of *Dioscorides* to be *Taxus*, the Yew tree. Of *Smilax*, *Theophrastus* writeth thus in his third booke: the Inhabitants of Arcadia do call a certaine tree *Smilax*, being like vnto the Skarlet Oke: the leaues thereof be not set with such sharpe prickles, but tenderer and softer.

Of this *Smilax Pliny* also writeth, in his sixteenth booke, chap. 6. There be of *Ilex*, saith he, two kindes, *Ex ijs in Italia folio non multum ab oleis distant*, called of certaine Græcians *Smilaces*, in the prouinces *Aquifolia*: in which words, in stead of Oliue trees may perchance bee more truely placed *Suberis*, or the Corke-tree; for this kinde of *Ilex* or *Smilax* is not reported of any of the old Writers to

to haue the leafe of the Oliue tree: but *Suber* in Greeke, called *Phellos*, or the Corke tree, hath a little leafe.

¶ *The Temperature and Vertues.*

The leaues of this Oke hath force to coole and repell and keepe backe, as haue the leaues of the Acornes or Maſt trees: being ſtamped or beaten, and applied, they are good for ſoft ſwllings, and ſtrengthen weake members. A

The barke of the root boyled in water vntill it be diſſolued, and layd on all night, maketh the haire blacke, being firſt ſcoured with *Cimolia*, as *Dioſcorides* ſaith. B

Cluſius reporteth, that the Acorne is eſteemed of, eaten, and brought into the market to be ſold, in the city of Salamanca in Spaine, and in many other places of that country; and of this Acorne *Pliny* alſo hath peraduenture written, *lib.* 16. *cap.* 5. in theſe words: Moreouer, at this day in Spaine the Acorne is ſerued for a ſecond courſe. C

Chap. 35. *Of the great Holme-Oke.*

1 *Cerris majore Glande.*
The Holme-Oke with great Acornes.

2 *Cerris minore Glande.*
The Holme-Oke with leſſer Acornes.

¶ *The Deſcription.*

1 AMong the wilder Okes this is not the leaſt, for his comely proportion, although vnprofitable for timber, to make coles, carts, Wainſcot, houſes, or ſhips of: the fruit is not fit for any man or beaſt to eate, neither any property knowne for the vſe of Phyſicke or Surgerie: it groweth vp to the height of a faire tree, the trunke or body is great, and very faire to looke vpon: the wood or timber ſoft and ſpongie, ſcarce good to be burned: from which ſhooteth forth very comely branches diſperſing themſelues farre abroad; whereon are ſet for the moſt part by couples very faire leaues, greene aboue, and of an ouerworne ruſſet colour vnderneath, cut or ſnipt about the edges very deepe: the Acorne groweth faſt vnto the boughes, without any foot-ſtalke at all, being very like vnto our common Acorne, ſet in a rough and prickly cup like an Hedge-hog or the Cheſnut huske, of a harſh taſte, and hollow within: this tree beareth or bringeth

‡ *Cerri minoris ramulus cum flore.*
A branch of the ſmaller Holme Oke with floures.

bringeth forth oft times a certain ſmooth kind of Gall not altogether vnprofitable. This Oke likewiſe bringeth forth another kind of excreſence, which the Grauer hath omitted in the figure, which is called in Greeke φίκος: *Gaza* nameth it *Penis*. This *Penis* or pricke is hollow, moſſie, hanging downe halfe a yard long, like a long rag of linnen cloath.

2 The ſecond is altogether like the firſt, ſauing that this beareth ſmaller Acornes, and the whole tree is altogether leſſe, wherein conſiſteth the difference.

‡ Both this & the former cary floures cluſtering vpon long ſtalkes, like as in the common Oke; but the fruit doth not ſucceed them, but grow forth in other places. ‡

¶ *The Place.*

This Oke groweth in vntoiled places, it is ſeldome times found, and that but in Woods onely: it is for the moſt part vnknowne in Italy, as *Pliny* reporteth.

¶ *The Time.*

They bring forth their fruit or Acornes in the fall of the leafe.

¶ *The Names.*

This Oke is called in Greeke Κέρρος: in Latine, *Cerrus*: yet doth *Pliny* make mention both of *Ægilops*, and alſo of *Cerrus*: Κέρρος is likewiſe one of the diſeaſes of corne, called in Latine *Feſtuca*: in Engliſh, wilde Otes, and far differing from the tree *Ægilops*.

That which hangeth from the boughes, *Pliny, lib.* 16. *cap.* 8. calleth *Panus* onely: that acorne tree named *Ægilops* bringeth forth *Panos arentes*, withered prickes, couered with white moſſie jags hanging downe, not onely in the barke, but alſo from the boughes, halfe a yard in bigneſſe, bearing a ſweet ſmell, as we haue ſaid among ointments.

¶ *The Temperature and Vertues.*

We finde nothing written of the faculties of this tree among the old Writers, neither of our owne experience.

CHAP. 36. *Of the Corke Oke.*

¶ *The Deſcription.*

1 THe Corke tree is of a middle bigneſſe like vnto *Ilex*, or the barren skarlet Oke, but with a thicker body, and fewer boughes: the leaues be for the moſt part greater, broader, rounder, and more nicked in the edges: the barke of the tree is thicke, very rugged, and full of chinkes or crannies that cleaueth and diuideth it ſelfe into pieces, which vnleſſe they be taken away in due time do giue place to another barke growing vnderneath, which when the old is remoued is maruellous red, as though it were painted with ſome colour: the Acorne ſtandeth in a cup, which is great, briſtled, rough, and full of prickles: this Acorne is alſo aſtringent or binding, more vnpleaſant than the Holme Acorne, greater in one place, and leſſe in another.

2 The Corke tree hath narrow leaues groweth likewiſe to the height and bigneſſe of a great tree; the trunke or body whereof is couered with a rough and ſcabbed barke of an ouerworne blackiſh colour, which likewiſe cleaueth and caſteth his coat when the inner barke groweth ſomewhat thicke: the branches are long, tough, and flexible, eaſie to be blowed any way, like thoſe of the Oziar,

Oziar; whereupon do grow leaues like those of the precedent, but longer, and little or nothing indented about the edges: the fruit groweth in small cups as the Acornes doe: they are lesser than those of the other kinde, as is the rest of the tree, wherein is the chiefest difference. ‡ This varies in the leafe, (as you may see in the figure) which in some is snipt about the edge, in other some not at all. ‡

1. 2. *Suber latifolium & angustifolium.*
The Corke tree with broad and narrow leaues.

¶ *The Place.*

It groweth in the country of Aquitania, neere to the mountaines called Pyrenæi: it also groweth plentifully in the kingdomes of Spaine, differing somewhat from that of Aquitania, as *Clusius* declareth: it is likewise found in Italy, and that in the territory of Pisa, with a longer leafe, and sharper pointed; and about Rome with a broader, and cut in the edges like a saw, and rougher, as *Matthiolus* testifieth.

¶ *The Time.*

The leaues of the first are alwaies greene in Spaine and Italy, about the Pyrenæan mountaines they fall away in Winter.

¶ *The Names.*

This tree is called in Greeke φελλὸς: in Latine, *Suber*: in French, *Liege*: in Italian, *Sugaro*: the same names do also belong to the barke: the Spaniards call the tree *Alcornoque*: the Englishmen, Corke tree; and the barke, *Corcha de Alcornoque*; whereupon the Low-country-men and English-men also do call it Corke; and yet it is called in low Dutch also **Ulothout.**

¶ *The Temperature and Vertues.*

This barke doth most manifestly dry, with a binding faculty. A

Being beaten to pouder and taken in water it stancheth bleeding in any part of the body. The Corke which is taken out of wine vessels, saith *Paulus* being burnt, maketh ashes which doe mightily dry, and are mixed in compositions diuised against the bloudy flix. B

Corke is also profitable for many things: it is vsed (saith *Pliny*) about the anchors of ships, Fishers nets, and to stop vessels with; and in Winter for womens shoos, which vse remaines *with vs* euen to this day: fishermen hang this barke vpon the wings of their nets for feare of sinking: and shoo-makers put it in shooes and pantofles for warmnesse sake. C

Chap. 37. *Of the Gall tree.*

¶ *The Kindes.*

OF trees that bring forth Galls there be diuers sorts, as may appeare by the diuers formes and sorts of Galls set forth in this present chapter, which may serue for their seuerall distinctions, whereof some bring forth Acornes likewise, and some nothing but Galls: the figures of some few of the trees shall giue you sufficient knowledge of the rest: for all the Acorne or Mast trees bring forth Galls, but those trees whose figures we haue set forth doe beare those galls fit for medicine, and to thicken skins with.

Dioscorides and *Galen* make but two sorts of Galls; the one little, yellow, full of holes, and more spongie in the inner part, both of them round, hauing the forme of a little ball, and the other smooth and euen on the out side: since the later writers haue found moe, some hauing certaine little knobs sticking forth, like in forme to the Gall, which doth also cleaue and grow without stalke to the leafe. There is also found a certaine excrescence of a light greene colour, spongie and watery, in the middle whereof now and then is found a little flie or worme: which soft ball in hot countries doth oftentimes become hard, like the little smooth Gall, as *Theophrastus* saith.

1 *Galla, siue Robur majus.*
The great Gall tree.

‡ 2 *Robur, siue Galla major altera.*
Another great Gall tree.

¶ *The Description.*

1 THe Gall tree growes vp to a sufficient height, hauing a very faire trunke or body, whereon are placed long twiggie branches bringing forth very faire leaues, broad, and nicked in the edges like the teeth of a saw: among which come forth acornes, although the figure expresse not the same, like those of the Oke, and likewise a wooddy excrescence, which we name the Gall, hauing certaine small eminences or bunches on the out side, growing for the most part vpon the slender branches without stalks, and sometimes they grow at the ends thereof; which by the heate of the Sun are harder, greater, and more sollid in one country than another, according to the soile and clymat.

‡ 2 This

3 *Galla minor.*
The little Gall tree.

‡ 2 This growes to the height of a tal man, hauing leaues deepely diuided on the edges like the Oke, green aboue, but hairy and hoary below: it carries a great gall of the bigneſſe of a little apple, and that in great plenty, and without any order. This growes in diuers parts of old Caſtile in Spain, and in all the mountainous Woods about Vienna in Auſtria. ‡

3 The leſſer Gal tree differs not from the former, ſauing that it is altogether leſſer: the fruit or gall is likewiſe leſſer, wherin eſpecially conſiſteth the difference.

¶ *The Place.*

The Galls are found in Italy, Spain, and Bohemia, and moſt of the hot regions.

¶ *The Time.*

The Gall, ſaith *Pliny*, appeareth or commeth forth when the Sunne comes out of the ſigne *Gemini*, and that generally in one night.

¶ *The Names.*

The Gall tree is called *Quercus*, *Robur*, and *Galle arbor*: in Greek, [illegible]: the Apothecaries and Italians keepe the name *Galla* for the fruit: in high-Dutch, **Galopffell**: in low-Dutch: **Galnoten**: in Spaniſh, *Agatha*, *Galha*, and *Bugalla*: in French, *Noix de Galle*: in Engliſh, Gaules, and Galls.

¶ *The Temperature and Vertues.*

The Gall called *Omphacitis*, as *Galen* writeth, is dry in the third degree, and cold in the ſecond: it is a very harſh medicine; it faſteneth and draweth together faint and ſlacke parts, as the ouergrowings in the fleſh: it repelleth and keepeth backe rheumes and ſuch like fluxes and doth effectually dry vp the ſame, eſpecially when they haue a deſcent into the gums, almonds of the throat, & other places of the mouth. A

The other Gall doth dry and alſo binde, but ſo much leſſer, by how much the harſh or choking qualitie is diminiſhed: being boiled, beaten, and alſo applied in manner of a plaiſter it is laid with good ſucceſſe vpon the inflammations of the fundament, and falling down thereof. It is boiled in water if there be need of a little aſtriction; and in wine, eſpecially in auſtere wine, if more need require. B

Galls are very profitable againſt the Dyſenterie and the Cœliack paſſion, being drunk in wine, or the pouder thereof ſtrewed vpon meats. C

Galls are vſed in dying and colouring of ſundry things, and in making of inke.

Laſtly, burnt Galls do receiue a further faculty, namely to ſtanch bloud, and are of thinne parts, and of a greater vertue to dry than be thoſe that are not burnt. They muſt be laid vpon hot burning coles vntill they come to be thorow white, and then they are to be quenched in vineger and wine. D E

Moreouer, Galls are good for thoſe that be troubled with the bloudy flixe and common laskes, being taken in wine or water, and alſo applied or vſed in meats: finally, theſe are to be vſed as oft as need requireth to dry and binde. F

Oke apples are much of the nature of Galls, yet are they far inferior to them, and of leſſer force. G

† Our Author out of *Tabern.* gaue the figures of fourteen varieties of Galls; ſome being large, others ſmall; ſome round, others long-iſh, and other ſorts diuerſly formered.

Chap. 38. *Of Misseltoe or Misteltoe.*

1 *Viscum.*
Misseltoe.

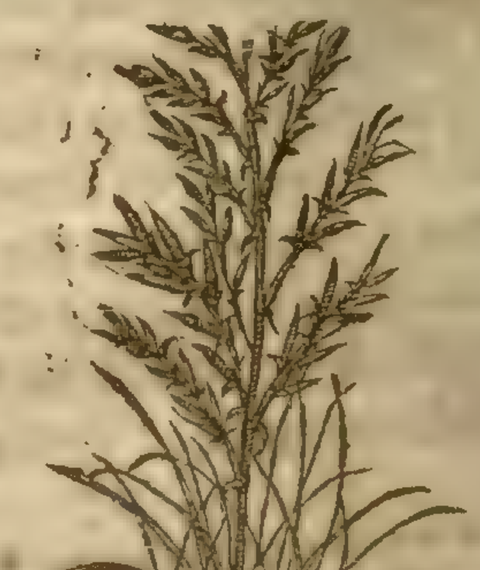
¶ *The Description.*

1 *Viscum* or Misseltoe hath many slender branches spread ouerthwart one another, and wrapped or interlaced one within another, the bark wherof is of a light green or Popinjay colour: the leaues of this branching excrescence be of a brown green colour: the floures be small and yellow: which beeing past, there appeare small clusters of white transluent berries, which are so cleare that a man may see thorow them, and are of a clammy or viscous moisture, whereof the best Bird-lime is made, far exceeding that which is made of the Holm or Holly bark: and within this berry is a small blacke kernel or seed: this excrescence hath not any root, neither doth increase himselfe of his seed, as some haue supposed; but it rather commeth of a certaine moisture and substance gathered together vpon the boughs and joints of the trees, through the barke whereof this vaporous moisture proceeding, brings forth the Misseltoe. Many haue diuersly spoken hereof: Some of the Learned haue set down, that it comes of the dung of the bird called a Thrush, who hauing fed of the seeds thereof, as eating his owne bane, hath voided and left his dung vpon the tree, whereof was ingendred this bery, a most fit matter to make lime of to intrap and catch birds withall.

2 Indian Misseltoe groweth likewise vpon the branches of trees, running alongst the same in maner of Polypodie: the strings of the roots are like those of Couch-grasse, from which rise vp diuers stalks smooth and euen, set with joints and knees at certaine distances: toward the top comes forth one leafe ribbed like the Plantain leafe, wheron are marked certain round eies such as are in the haft of a knife; from the bosome wherof commeth forth a chaffie branch, set with small leaues which continue green Winter and Summer.

2 *Viscum Indicum Lobelij.*
Indian Misseltoe.

3 *Viscum Peruvianum Lobelij.*
Misseltoe of Peru.



3 There is found also another plant growing vpon the boughes or branches of trees, in maner as our Misseltoe doth, and may very well be reckoned as a kind thereof: the plant cleaues vnto the branches, being set thereto as it were with the pillings of the sea Onion, of the bredth of a mans hand toward the bottom, and somewhat hollow: the tops whereof are very small and rushy, hollow likewise, and of a purple colour: among which comes forth a branch like that of *Hastula Regia*, or Kings speare, resembling the bush of Otes, couered with a white silk such as is to be found in *Asclepias*, of a salt and nitrous taste, and very vnpleasant.

¶ *The Place.*

The first kinde of Misseltoe groweth vpon Okes and diuers other trees almost euery where; as for the other two they are strangers in England.

¶ *The Time.*

Misseltoe is alwaies greene as well in winter as summer: the berries are ripe in Autumne, they remain all winter thorow, and are a food for diuers birds, as Thrushes, Black-birds, & Ring-doues.

¶ *The Names.*

Misseltoe is called in Greeke ἱξὸς, and ἱξία: in Latine, *Viscum*: in high-Dutch, **Mistell**: in Low-Dutch, **Marentacken**: in Italian, *Vischio*: in Spanish, *Liga*: in the Portugal tongue, *Visge*: in English, Missel, and Misseltoe.

The glue which is made of the berries of Missel is likewise called *Viscum*, and *Ixia*: in English, Bird-lime. *Ixia* is also called *Chamæleon albus*, by reason of the glue which is oft times found about the root thereof. This word is also ascribed to *Chamæleon niger*, as wee reade amongst the bastard names. *Ixia* is likewise reckoned vp by *Dioscorides*, *lib.* 6. and by *Paulus Agineta*, *lib.* 5. amongst the poisons: but what this poisonsome and venomous *Ixia* is it is hard and doubtfull to declare: many would haue it to be *Chamæleon niger*: others, the glue or clammy substance which is made of the berries of Misseltoe; who do truly thinke that *Ixia* differeth from *Chamæleon niger*: for *Paulus Ægineta*, *lib.* 5. *cap.* 30. in reckoning vp of simple poisons hath first made mention of *Chamæleon niger*; then a little after of *Ixia*: and whilest he doth particularly discourse of euery one, he treateth of *Chamæleon niger*, *cap.* 32. and of *Ixia* which he also nameth *Vlophonon*, *cap.* 47. and telleth of the dangerous and far differing accidents of them both. And *Dioscorides* himselfe, *lib.* 6. where he setteth down his iudgment of simple poisons, intreateth first of *Chamæleon niger*, and then a little after of *Ixia*. These things declare that *Chamæleon niger* differs from *Ixia*, which is reckoned among the poisons. Moreouer, it can no where be read, that *Chamæleon niger* beareth Bird-lime, or hath so glutinous or clammy a substance as that it ought to be called *Ixia*: therfore *Ixia*, as it is one of the poisons, is the glue that is made of the berries of Misseltoe, which because it is sharp and biting, inflameth and setteth the tongue on fire, and with his slimy and clammy substance doth so draw together, shut, and glue vp the guts, as that there is no passage for the excrements, which things are mentioned among the mischiefes that *Ixia* bringeth.

‡ I can by no means approue of, or yeeld to this opinion here deliuered out of *Dodonæus* by our Author; which is, That the Bird-lime made of the berries of Misseltoe is poison; or that *Ixia* set forth by *Dioscorides* and *Nicander* for a poison is meant of this: for this is manifestly treated of in *Dioscorides*, *lib.* 3. *ca.* 103. by the name of ἱξὸς when as the other is mentioned, *lib.* 6. *cap.* 21. by the name of ἰξία. Also daily experience shewes this plant to haue no maligne or poisonous, but rather a contrarie facultie, being frequently vsed in medicines against the Epilepsie. Such as would see more concerning *Ixia* or *Ixias*, let them haue recourse to the first chapter of the first part of *Fabius Columna*, *de Stirpib. min. cognitis & rarioribus*, where they shall finde it largely treated of. ‡

¶ *The Nature and Vertues.*

The leaues and berries of Misselto are hot and dry, and of subtill parts: the Bird-lime is hot and biting, and consists of an airy and watery substance, with some earthy quality; for according to the iudgement of *Galen*, his acrimony ouercommeth his bitternesse; for if it be vsed in outward applications, it draweth humors from the deepest or most secret parts of the body, spreading and dispersing them abroad, and digesting them. A

It ripeneth swellings in the groin, hard swellings behinde the eares, and other impostumes, being tempered with rosin and a little quantitie of wax. B

With Frankincense it mollifieth old vlcers and malitious impostumes, being boiled with vnslaked lime, or with *Gagate lapide* or *Asio*, and applied, it wasteth away the hardnesse of the spleen. C

With Orpment or *Sandaracha* it taketh away foule ilfauored nailes, being mixed with vnslaked lime and wine lees it receiueth greater force. D

It hath been most credibly reported vnto me, That a few of the berries of Misseltoe bruised and strained into oile and drunken, hath presently and forthwith rid a grieuous and sore stitch. E

Chap. 39. *Of the Cedar Tree.*

¶ *The Kindes.*

THere be two Cedars, one great bearing cones, the other ſmall bearing berries like thoſe of Iuniper.

Cedrus Libani.
The great Cedar tree of Libanus.

¶ *The Deſcription.*

THe great cedar is a very big & high tree, not onely exceeding all other reſinous trees and thoſe which beare fruit like vnto it, but in his talneſſe and largeneſſe farre ſurmounting all other trees: the body or trunk thereof is commonly of a mighty bigneſſe, inſomuch as four men are not able to fathom it, as *Theophraſtus* writeth. The bark of the lower part which proceedeth out of the earth, to the firſt young branches or ſhoots, is rough and harſh; the reſt which is among the boughes is ſmooth and glib: the boughes grow forth almoſt from the bottom, and not farre from the ground, euen to the very top, waxing by degrees leſſer & ſhorter ſtil as they grow higher, the tree bearing the forme and ſhape of a Pyramide or ſharpe pointed ſteeple: theſe compaſſe the body round about in maner of a circle, and are ſo orderly placed by degrees, that a man may clymbe vp by them to the very top as by a ladder: the leaues be ſmall and round like thoſe of the Pine tree, but ſhorter, and not ſo ſharp pointed: all the cones or clogs are far ſhorter and thicker than thoſe of the Fir tree, compact of ſoft, not hard ſcales, which hang not downewards, but ſtand vpright vpon the boughes, whereunto alſo they are ſo ſtrongly faſtned, as they can hardly be pluckt off without breaking ſome part of the branches, as *Belonius* writeth. The timber is extreame hard, and rotteth not, nor waxeth old; there is no wormes nor rottenneſſe can hurt or take the hard matter or heart of this wood, which is very odoriferous, and ſomwhat red. *Solomon* King of the Iewes did therefore build Gods Temple in Ieruſalem of Cedar wood. The Gentiles were wont to make their Diuels or Images of this kinde of wood, that they might laſt the longer.

¶ *The Place.*

The Cedar trees grow vpon the ſnowy mountaines, as in Syria vpon mount Libanus, on which there remaine ſome euen to this day, ſaith *Bellonius*, planted as is thought by *Solomon* himſelf: they are likewiſe found on the mountains Taurus and Amanus, in cold and ſtony places. The merchants of the Factorie of Tripolis told me, That the Cedar tree groweth vpon the declining of the mount Libanus, neere to the hermitage by the city Tripolis in Syria: The inhabitants of Syria vſe it to make boats of, for want of the Pine tree.

¶ *The Time.*

The Cedar tree remaines alwaies green, as other trees which beare ſuch maner of fruit: the timber of the Cedar tree, and the images and other works made thereof, ſeem to ſweat and ſend forth moiſture in moiſt and rainy weather, as do likewiſe all that haue an oily juice, as *Theophraſtus* witneſſeth.

¶ *The Names.*

The huge and mighty tree is called in Greeke κέδρος: in Latine likewiſe *Cedrus*: in Engliſh, Cedar, and Cedar tree. *Pliny, lib.* 24. *cap.* 5. nameth it *Cedrelate*, as though he ſhould ſay *Cedrus abies*, or *Cedrus mas abies*, Cedar Firre; both that it may differ from the little Cedar, and alſo becauſe it is very like the Firre tree.

The

The Rosin hath no proper name, but it may be named *Cedrina*, or Cedar Rosin.

The pitch which is drawne out of this is properly called κέδρος; yet *Pliny* writeth, that the liquor of the Torch tree is also named *Cedrium*. The best, saith *Dioscorides*, is fat, thorow shining, and of a strong smell; which being poured out in drops vniteth it selfe together, and doth not remain seuered.

¶ *The Nature and Vertues.*

Cedar is of temperature hot and dry, with such an excellent tenuitie and subtiltie of parts, that it seemeth to be hot and dry in the fourth degree, especially the Rosin thereof. A

There issueth out of this tree a rosin like to that which issueth out of the Fir tree, very sweet in smell, of a clammy or cleauing substance, the which if you chew in your teeth it will hardly be gotten forth again, it cleaueth so fast: at the first it is liquid and white, but being dried in the Sunne it waxeth hard: if it be boiled in the fire an excellent pitch is made thereof called Cedar pitch. B

The Egyptians were wont to coffin and embalme their Dead in Cedar and with Cedar pitch, although they vsed other means, as *Herodotus* recordeth. C

The condited or embalmed body they call in shops *Mumia*, but very vnfitly; for *Mumia* among the Arabians is that which the Grecians call *Pissasphalton*, as appeareth by *Auicen, cap.* 474 and out of *Serapio, cap.* 393. D

He that interpreted and translated *Serapio* was the cause of this error, who rendred *Mumia* after his owne fancy, and not according to the sence and meaning of his author *Serapio*, saying, That this *Mumia* is a composition of Myrrh and Aloes mingled together with the moisture of mans body. E

The gum of Cedar is good to be put into medicines for the eies; for being anointed therewith it cleareth and clenseth the sight from the Haw and from stripes. F

Cedar infused in vineger and put into the eares, killeth the wormes therein; and being mingled with the decoction of Hyssop, appeaseth the sounding, ringing, and hissing of the eares. G

If it be washed or infused in vineger, and applied to the teeth, it easeth the tooth-ache. H

If it be put into the hollownesse of the teeth, it breaketh them, and appeaseth the extreme griefe thereof. I

It preuaileth against *Angina's*, and the inflammation of the tonsils, if a gargarisme be made of it. K

It is good to kill nits and lice and such like vermin: it cureth the biting of the serpent Cerastes being layd on with salt. L

It is a remedie against the poison of the sea Hare, if it be drunke with sweet wine. M

It is good also for Lepers: being put vp vnderneath it killeth all manner of wormes, and draweth forth the birth, as *Dioscorides* writeth. N

Chap. 40. *Of the Pitch tree.*

¶ *The Description.*

† 1 *Picea*, the tree that droppeth pitch, called Pitch tree, groweth vp to be a tall faire and big tree, remaining alwaies green like the Pine tree: the timber of it is redder than that of the Pine or Fir: it is set full of boughes not onely about the top, but much lower, & also beneath the middle part of the body, which many times hang down, bending toward the ground: the leaues be narrow, not like those of the Pine tree, but shorter and narrower, sharpe pointed like them, yet are they blacker, and withall couer the yong and tender twigs in manner of a circle, like those of the Fir tree; but being many, and thick set, grow forth on all sides, and not only one right against another, as in the Yew tree: the fruit is scaly, and like vnto the Pine apple, but smaller: the barke of the tree is somewhat blacke, tough, and flexible, not brittle as is the barke of the Fir tree; vnder which next to the wood is gathered a rosin, which many times issueth forth, and is like to that of the Larch tree.

‡ 2 Of this sort (saith *Clusius*) there is found another that neuer growes high, but remaineth dwarfish, and it caries certain little nugaments or catkins of the bignesse of a small nut, composed of scales lying one vpon another, and ending in a prickly leaf, which in time opening shew certain empty cauities or cels: from the tops of these somtimes grow forth brauches set with many short and pricking little leaues: all the shrub hath shorter and paler coloured leaues than the former. I obserued neither fruit nor floure on this, neither know I whether it carry any. *Dalechampius* seems to haue known this, and to haue called it *Pinus Tubulus* or *Tibulus*. ‡

1 *Picea major.*
The Pitch tree.

‡ 2 *Picea pumila.*
The dwarfe Pitch tree.

¶ *The Place.*

The Pitch tree groweth in Greece, Italy, France, Germany, and all the cold Regions euen vnto Russia.

¶ *The Time.*

The fruit of the Pitch tree is ripe in the end of September.

¶ *The Names.*

The Grecians call this Cone tree πίτυς: the Latines, *Picea*, and not *Pinus*; for *Pinus*, or the Pine tree, is the Grecians πίτυς, as shall be declared: that πίτυς is named in Latine *Picea*, *Scribonius Largus* testifieth in his 201 Composition, writing after this manner: *Resinæ pituinæ, i. ex Picea arbore*, signifying in English, of the rosin of the tree *Pitys*, that is to say, of the Pitch tree. With him doth *Pliny* agree, *lib.* 16. *cap.* 10. where hee translating *Theophrastus* his words concerning *Peuce* and *Pitys*, doth translate *Pitys*, *Picea*, although for *Peuce* he hath written *Larix*, as shall be declared. *Pliny* writeth thus, *Larix vsti s radicibus non repullulat*: and the Larch tree doth not spring vp againe when the roots are burnt: the Pitch tree springeth vp again, as it hapned in Lesbos, when the wood Pythius was set on fire. Moreouer, the wormes *Pityocampæ* are scarce found in any tree but onely in the Pitch tree, as *Bellonius* testifieth. So that they are not rashly called *Pityocampæ*, or the wormes of the Pitch tree; although most of the Translators name them *Pinorum erucæ*, or the Wormes of the Pine trees: and therefore *Pitys* is syrnamed by *Theophrastus*, φθειροφόρος, because Wormes and magots are bred in it. But forasmuch as the name *Pitys* is common both to the tame Pine, and also to the Pitch tree, diuers of the later writers do for this cause suppose that the Pitch tree is named by *Theophrastus*, πίτυς ἄγρια, or the wilde Pine tree. This *Picea* is named in high-Dutch, **Schwartz Tannebaum**, and **Rot Tannebaum**, and oftentimes also **Forenholtz**, which name notwithstanding agreeth also with other plants: in English, Pitch tree: in low-Dutch, **Peck boom.**

¶ *The Temperature and Vertues.*

The leaues, bark, and fruit of the Pitch tree are all of one nature, vertue, and operation, and of the same facultie with the Pines.

Chap.

Chap. 41. *Of the Pine Tree.*

¶ *The Kindes.*

THe Pine tree is of two sorts, according to *Theophrastus*: the one ἥμερος, that is to say, tame, or of the garden; the other ἄγριος, or wild: hee saith that the Macedonians doe adde a third, which is ἄκαρπος, barren or without fruit, which is to vs vnknowne: the later writers haue found more, as shall be declared.

Pinus sativa, sive domestica.
The tame or manured Pine tree.

¶ *The Description.*

THe Pine tree growes high and great in the trunke or body, which below is naked, but aboue is clad with a multitude of boughes which diuide themselues into diuers branches, whereon are set small leaues, very straight, narrow, somwhat hard and sharp pointed: the wood or timber is hard, heauy, about the heart or middle full of an oilous liquor, and of a reddish colour: the fruit or clogs are hard, great, and consist of many sound woody scales, vnder which are included certaine knobs without shape, couered with a woodden shell like small nuts, wherin are white kernels, long, very sweet, and couered with a thin skin or membrane, that easily is rubbed off with the fingers, which kernell is vsed in medicine.

¶ *The Place.*

This tree groweth of it self in many places of Italy, and especially in the territory of Rauenna, and in Languedoc, about Marsiles, in Spaine, and in other hot regions, as in the East countries. It is also cherished in the gardens of pleasure, both in the Low-countries and England.

¶ *The Time.*

The Pine tree groweth greene both Winter and Summer: the fruit is commonly two yeares before it be ripe: wherefore it is not to be found without ripe fruit, and also others as yet very small and not come to ripenesse.

¶ *The Names.*

It is called in Latine, *Pinus*, and *Pinus sativa, Vrbana*, or rather *Mansueta*: in English, tame or garden Pine: of the Macedonians and other Grecians, πίτυς ἥμερος; but the Arcadians name it πίτυς, for that which the Macedonians call πίτυς ἥμερος, the Arcadians name πίτυς, as *Theophrastus* saith: & so doth the tame Pine in Arcadia and about Elia change her name: and by this alteration of them it happens that the fruit or nuts of the Pine tree found in the cones or apples, be named in Greek by *Dioscorides, Galen, Paulus*, and others, πίτυες; as though they should terme it *Pityos fructus*, or the fruit of the Pine tree.

There is also another πίτυς: in Latine, *Picea*, or the Pitch tree, which differeth much from the pine tree: but *Pytis* of Arcadia differeth nothing from the Pine tree, as we haue said.

The fruit or apples of these be called in Greeke, κῶνοι, and in Latine *Coni*: notwithstanding *Conos* is a common name to all the fruits of these kinde of trees: they be also named in Latine, *Nuces pineæ*: by *Mnesitheus* in Greek ἐγκράτιδες, by *Diocles Caristius*, πίτυινα κάρυα, which be notwithstanding the fruit or clogs of the tree that *Theophrastus* nameth πίτυς, or the wilde Pine tree, as *Athenæus* saith. It is thought that the whole fruit is called by *Galen* in his fourth commentary vpon *Hippocrates* books of diet in sharp diseases, *Strobilos*: yet in his second book of the Faculties of nourishments he doth not call *Conos* or the apple by the name of *Strobilos*, but the nuts contained in it. And in like manner in his seuenth booke of the faculties of simple medicines; The Pine apple fruit, saith he, which

they

they call *Coccalus* and *Strobilus*, as we haue ſaid before, that theſe are named in Greeke πίτυλος. This apple is called in high-Dutch, **Zyzbel**: in low-Dutch, **Pijn appel**: in Engliſh, Pine apple, Clog, and Cone.

¶ *The Temperature and Vertues.*

A The kernels of theſe nuts concoct and moderately heate, being in a mean between cold and hot: they make rough parts ſmooth, are a remedy againſt an old cough, and long infirmities of the cheſt, being taken by themſelues or with hony, or elſe with ſome other licking thing.

B It cureth the Ptyſicke, and thoſe that pine and conſume away through the rottenneſſe of their lungs: it recouereth ſtrength, nouriſheth, and is reſtoratiue to the body.

C It yeeldeth a thick and good juice, and nouriſheth much, yet is it not altogether of good digeſtion, and therefore it is mixed with preſerues, and boiled with ſugar.

D The ſame is good againſt the ſtone in the kidnies, and againſt frettings of the bladder, and ſcalding of vrine, for it allayeth the ſharpneſſe, mitigateth pain, and gently prouoketh vrine: moreouer it increaſeth milke and ſeed, and therefore it alſo prouoketh fleſhly luſt.

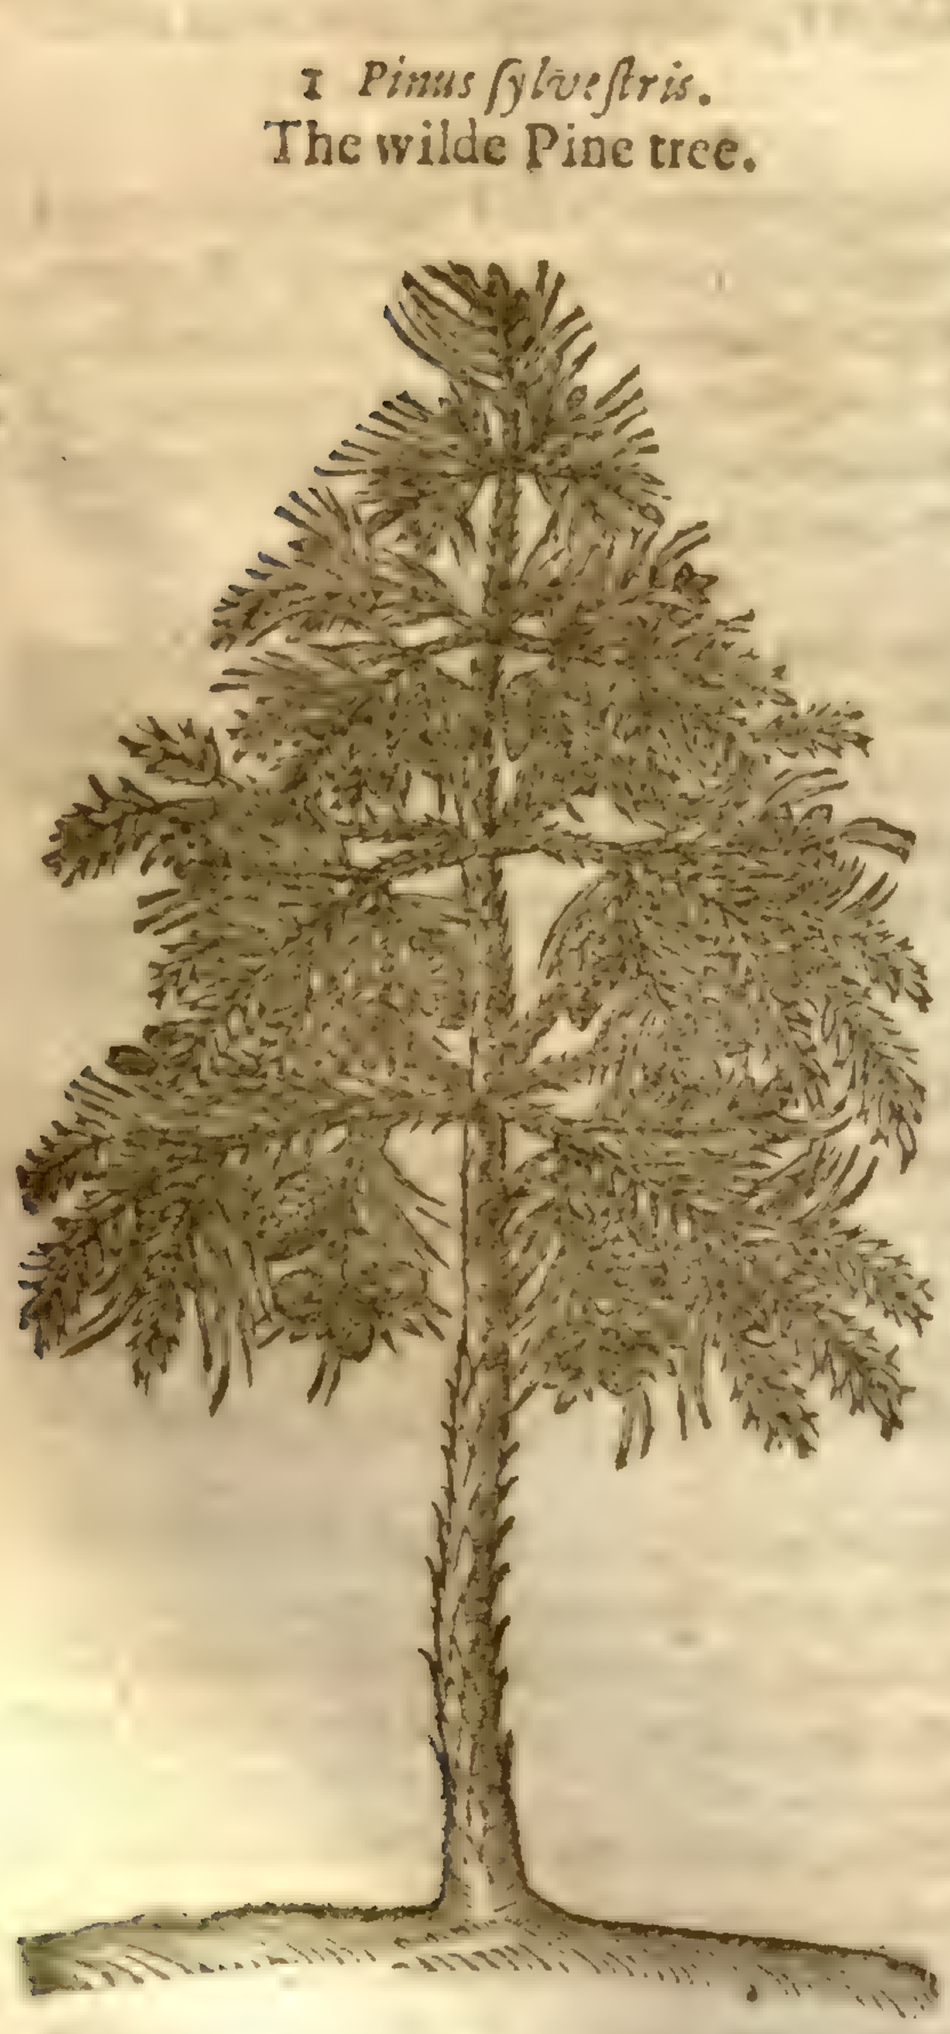
E The whole cone or apple being boiled with freſh Horehound, ſaith *Galen*, and afterwards boiled again with a little hony vntill the decoction be come to the thickneſſe of honey, maketh an excellent medicine for to clenſe the cheſt and lungs.

F The like ſaith *Dioſcor*. The whole cones (ſaith he) newly gathered from the trees, broken and boiled in ſweet wine are good for an old cough, and conſumption of the lungs, if a good draught of the liquor be drunke euery day.

G The ſcales of the Pine apple, with the barke of the tree, ſtop the laske and bloudy flixe, prouoke vrine, and the decoction alſo hath the like propertie.

CHAP. 42. *Of the wilde Pine tree.*

1 *Pinus ſylueſtris.*
The wilde Pine tree.



2 *Pinus ſylueſtris mugo.*
The low wilde Pine tree.

¶ The

¶ *The Description.*

1 THe first kinde of wilde Pine tree groweth very great, but not so high as the former, beeing the tame or manured Pine tree: the barke thereof is glib; the branches are spred abroad, beset with long sharpe pointed leaues: the fruit is somewhat like the tame Pine tree, with some rosin therein, and sweet of smell, which doth easily open it selfe, and quickly falleth from the tree.

2 The second kinde of wilde Pine tree groweth not so high as the former, neither is the stem growing straight vp, but yet it bringeth forth many branches, long, slender, and so easie to bee bent or bowed, that hereof they make hoops for wine hogsheads and tuns: the fruit of this Pine is greater than the fruit of any of the other wilde Pines.

3 The third kinde of wild Pine tree groweth straight vpright, and waxeth great and high, yet not so high as the other wilde kindes: the branches grow like the Pitch tree, the fruit is long and big, almost like the fruit of the said Pitch tree; wherein are contained smal triangled nuts like the nuts of the Pine apple tree, but smaller, and more brittle: in which is contained a kernell of a good tast, like the kernel of the tame Pine apple: the wood is beautiful, and sweet of smell, good to make tables and other works of.

4 There is another wilde Pine of the mountaine, not differing from the precedent but in stature, growing for the most part like an hedge tree, wherein is the difference.

3 *Pinus sylvestris montana.*
The mountain wilde Pine tree.

4 *Pinus montana minor.*
The smaller wilde Pine tree.

5 This kinde of Pine, called the sea Pine tree, groweth not aboue the height of two men, hauing leaues like the tame Pine tree, but shorter: the fruit is of the same form, but longer, somwhat fashioned like a Turnep. This tree yeeldeth very much rosin. ‡ *Bauhine* iudgeth this all one with the third. ‡

6 The sixt kind of wilde Pine, being one of the sea Pines, groweth like an hedge tree or shrub seldome exceeding the height of a man, with little leaues like those of the Larch tree, but alwayes continuing with a very little cone and fine small kernell.

7 The bastard wilde Pine tree groweth vp to a meane height, the trunke or body, as also the branches

5 *Pinus maritima major.*
The great sea Pine tree.

6 *Pinus sylvestris minor.*
The little sea Pine tree.

7 *Teda, sive Pseudopinus.*
The bastard wild Pine.

‡ 8 *Pinaster Austriacus.*
Dwarfe Pine with vpright cones.

‡ 9 *Pinaster maritimus minor.*
Dwarfe sea Pine.

ches and leaues are like vnto those of the manured Pine tree: the onely difference is, That some yeares it resembles the Pine it selfe, and other yeares as a wilde hedge tree, varying often, as Nature listeth to play and sport her self among her delights, with other plants of lesse moment: the timber is soft, and not fit for building, but is of the substance of our Birch tree: the fruit is like those of the other wild Pines, whereof this is a kinde.

‡ 8 This dwarfe Austrian Pine exceeds not the height of a man, but immediatly from the root is diuided and spread abroad into tough bending pretty thick branches, couered ouer with a rough barke: the leaues, as in the former, come two out of one hose, thicker, shorter, blunter pointed, and more greene than the former: the cones or clogs are but small, yet round and compact, and hang not downewards, but stand vpright: the root is tough and woody like other plants of this kind. It growes on the Austrian and Styrian Alps. *Clusius* sets it forth by the name of *Pinaster 4. Austriacus.*

9 The other Dwarfe is of the same height with the former: with such tough and bending branches, which are neither so thicke, nor clad with so rough a barke, nor so much spred. The leaues also are smaller, and not vnlike those of the Larix tree, but not so soft, nor falling euery yeare as they do. The cones are little and slender, the kernels small, blackish, and winged as the rest. *Clusius* found this onely in some few places of the kingdome of Murcia in Spaine; wherefore he calls it *Pinaster 3: Hispanicus. Dodonæus* calls it *Pinus maritima minor.* ‡

¶ *The Place.*

These wilde Pines grow vpon the cold mountaines of Liuonia, Polonia, Norvegia, and Russia, especially vpon the Island called Holland within the Sownd, beyond Denmarke, and in the Woods by Narua vpon the Liefeland shore, and all the tract of the way, being a thousand werstes (each werst containing three quarters of an English mile) from Narua vnto Muscouia, where I haue seen them grow in infinite numbers.

¶ *The Time.*

The fruit of these Pine trees is ripe in the end of September: out of all these issueth forth a white and sweet smelling rosin: they are also changed into *Teda*, and out of these is boiled through the force of the fire a blacke pitch: the Pitch tree and the Larch tree be also sometimes changed into *Teda*, yet very seldome, for *Teda* is a proper and peculiar infirmitie of the wilde Pine tree. A tree is said to be changed into *Teda*, when not only the heart of it, but also the rest of the substance is turned into fatnesse.

¶ *The Names.*

All these are called in Greeke Πίτυς; and in Latine, *Syluestres Pini*: of *Pliny Pinastri*; *Pinaster*, saith he, *lib.* 16. *cap.* 10. is nothing else but *Pinus syluestris*, or the wilde Pine tree, of a lesser height, and full of boughes from the middle, as the tame Pine tree in the top, (most of the couples haue falsly) of a maruellous height: they are farre deceiued who thinke that the Pine tree is called in Greeke Πίτυς, besides the tame Pine, which notwithstanding is not so called of all men, but onely of the Arcadians (as we haue said before) Πίτυς: all men do name the wilde Πεύκη: and therefore *Teda* or the Torch Pine hereof is said to be in Latine, not *Picea*, but *Pinea*, that is, not the Pitch tree, but the Pine tree, as *Ouid* doth plainly testifie in his Heroicall Epistles:

Vt vidi, vt perij, nec notis ignibus arsi,
Ardet vt ad magnos Pinea Teda deos.

Also in *Fast.* 4.

Hic accendit geminas pro lampade Pinus.
Hinc cereris sacris nunc quoque Teda datur.

The same doth also *Virgil* signifie, *Æneid.* 7.

Ipsa inter medias, flagrantem fervida Pinum.
Sustinet. ——

Where in stead of *Flagrantem Pinum*, *Servius* admonisheth vs to vnderstand *Teda Pinea*. *Catullus* also consenteth with them, in the mariage Song of *Iulia* and *Mallius*:

—— *Manu*
Pineam quate tedam.

And *Prudentius*, *in Hymno Cerei Paschalis*,

Seu Pinus piceam fert alimoniam.

Moreouer, the herbe *Peucedanos*, or Horestrong, so named of the likenesse of πεύκη, is called also in Latine *Pinastellum*, of *Pinus*, the Pine tree: all which things do euidently declare, that Πεύκη is called in Latine not *Picea*, but *Pinus*.

The first of these wilde kindes may be *Idæa Theophrasti*, or *Theophrastus* his Pine tree, growing on mount Ida, if the apple which is shorter, were longer: for he nameth two kinds of wilde Pines, one of mount Ida, and the other the sea Pine with the round fruit: but wee hold the contrary; for the fruit or apple of the wild mountain Pine is shorter, and that of the sea Pine longer. This may more truly be *Macedonum mas*, or the Macedonians male Pine: for they make two sorts of wilde Pines, the male and the female, and the male more wrythed and harder to bee wrought vpon, the female more easie; but the wood of this is more wrythed, & not so much in request for works as the other, wherefore it seems to be the male. This wilde Pine tree is called in high-Dutch, **Hartzbaum**, and **Wilder Hartzbaum**: in Gallia Celtica, *Elvo Alezo*: and in Spanish, *Pino Carex*.

The second wilde Pine tree is named commonly of the Italians about Trent and Anagnia, *Cembro*, and *Cirmolo*; it seems to differ nothing at all from the Macedonians wilde female Pine, for the wood is easie to be wrought on, and serueth for diuers and sundry works.

The third they call *Mugo*: this may be named not without cause, χαμαιπίτυς, that is to say, *Humilis Pinus*, or dwarfe Pine: yet doth it differ from *Chamæpeuce*, the herb called in English, ground Pine.

The fourth wild Pine is named in Greeke, Παραλιπίτυς: in Latine, *Maritima*, and *Marina Pinus*: in English, sea Pine.

That which the Latines call *Teda*, is named in Greeke δαὶς, and δᾳδίον: in high-Dutch, **Fyrnholtz**: it may be termed in English, Torch Pine.

Pliny is deceiued, in that he supposeth Torch Pine to be a tree by it selfe, making it the sixt kind of Cone tree: as likewise he erreth in taking *Larix*, the Larch tree, for πίτυν the Pine tree. And as *Dioscorides* maketh so little difference as scarce any, between πίτυν and πίτυος, and supposeth them to bee both of one kinde, so likewise he sets downe faculties common to them both.

¶ *The Nature and Vertues.*

A The barke of them both, saith he, doth binde: being beaten and applied it cureth Merigals, and also shallow vlcers and burnings, if it be laid on with Litharge and fine Frankincense.

B With the Cerot of Myrtles it healeth vlcers in tender bodies: beeing beaten with Copperas it slayeth tettars and creeping vlcers: it drawes away the birth and after-birth, if it be taken vnder in a fume: being drunke it stoppeth the belly, and prouoketh vrine.

C *Galen* hath almost the same things; but he saith that the barke of the Pine tree is more temperat than that of the Pitch tree: the leaues stamped take away hot swellings and the sores that do come thereof.

D Being stamped and boiled in vineger they asswage the pain of the teeth, if they be washed with this decoction hot: the same be also good for those that haue bad liuers, being drunke with water or mede.

E Of the same operation is likewise the barke of the Pine nuts; but *Galen* affirmeth that the Cone or

or apple, although it seeme to be like these is notwithstanding of lesser force, insomuch as it cannot effectually performe any of the aforesaid vertues, but hath in it a certaine biting quality, which hurteth.

The Torch Pine cut into small pieces and boiled in vineger, is a remedy likewise against the tooth-ache if the teeth be washed with the decoction. F

Of this there is made a profitable spather or slice to be vsed in making of compound plaisters and pessaries that ease paine. G

Of the smoke of this is made a blacke which serueth to make inke of, and for eating sores in the corners of eies, and against the falling away of the haire of the eie lids, and for watering and bleere eies, as *Dioscorides* teacheth. H

Of Rosins.

¶ *The Kindes.*

1 OVt of the Pine tres, especially of the wilde kinds, there issueth forth a liquid, whitish, and sweet smelling Rosin, and that many times by it selfe; but more plentifully either out of the cut and broken boughes, or forth of the body when the tree commeth to be a Torch Pine.

2 There issueth also forth of the crackes and chinkes of the barke, or out of the cut boughes, a certaine dry Rosin, and that forth of the Pine tree or Firre Tree.

There is likewise found a certaine congealed Rosin vpon the cones or apples.

It is called in Latine, *Resina*: in Greeke, ῥητίνη in high Dutch, **Hartz**: in low Dutch, **Herst**: in Italian, *Ragia*: in Spanish, *Resina*: in English, Rosin.

The first is named in Latine, *Liquida Resina*: in Greeke, ῥητίνη ὑγρά, and of diuers, ἀπύρηνον, that is to say, issueth out of it selfe: of the Lacedemonians, αὐτόπυρον, or *Primiflua*, the first flowing Rosin: and in Cicilia, πρωτόπιτυν, as *Galen* writeth in his third booke of medicines according to the kindes: in shops, *Resina Pini*, or Rosin of the Pine tree, and common Rosin. It hapneth oftentimes through the negligent and careleſſe gathering thereof, that certaine small pieces of wood, and little stones be found mixed with it: this kinde of Rosin *Galen* surnameth σύμμικτον, as though he should say, confused, which being melted and clensed from the drosse becommeth hard and brittle.

The like hapneth also to another liquid Rosin, which after it is milted, boyled, and cooled againe, is hard and brittle, and may likewise be beaten, ground, and searced; and this Rosin is named in Greeke ψῆκτον: in Latine, *Fricta*, and many times *Colophonia*, in Greeke, κολοφωνία: which name is vsed among the Apothecaries, and may stand for an English name; for *Galen* in his third booke of Medicines according to their kindes saith, that it is called *Fricta*, and of some *Colophonia*: that, saith he, is the drieſt Rosin of all, which some call *Fricta*, others, *Colophonia*: because in times past, as *Dioscorides* writeth, it was fetched from *Colophon*, this being yellow or blacke in comparison of the rest, is white when it is beaten: *Pliny* in his 14 booke, 20. chapter.

The second Rosin is named in Greeke ῥητίνη ξηρά, specially that of the Pitch tree without fatnesse, and that soone waxeth dry, which *Galen* in his 6. booke of Medicines according to their kindes, calleth properly ξηρὰν πιτύινην: that which in Asia is made of the Pitch tree being very white, is called *Spagus*, as *Pliny* testifieth.

The third is called in Greeke ῥητίνη τραγόριζον: the same is also named τραγόριζα τραγήματα: that is vnknowne in shops. Yet there is to be sould a certaine dry Rosin, but the same is compounded of the Rosins of the Pine tree, of the cones or clogs, and of the Firre tree mixed altogether, which they call *Garipot*: this is vsed in perfumes in stead of Frankincense, from which notwithstanding it farre differeth.

¶ *The Temperature and Vertues.*

All the Rosins are hot and dry, but not all after one manner: for there is a difference among them: they which be sharper and more biting, are hotter, as that which commeth of the cones, being of Rosins the hotteſt, because it is also the sharpeſt: the Rosin of the Pitch Tree is not so much biting, and therefore not so hot: the Rosin of the Firre tree is in a meane betweene them both; the liquid Rosin of the Pine is moister, comming neere to the quality and faculty of the Larch-Rosin. A

The Rosins which are burnt or dried, as *Dioscorides* testifieth, are profitable in plaisters, and compositions that ease wearisomeneſſe; for they do not onely supple or mollifie, but also by reason of the thinneſſe of their parts and dryneſſe, they digeſt: therefore they both mollifie and waste away swellings, and through the same faculty they cure wearisomeneſſe: being vsed in compound medicines for that purpose. B

The liquid Rosins are very fitly mixed in ointments, commended for the healing vp of greene wounds, for they both bring to suppuration, and do also glue and vnite them together. C

D Moreouer, there is gathered out from the Rosins as from Frankincense, a congealed smoke, called in Latine *Fuligo*; in Greeke, λιγνὺς: and in English, Blacke, which serueth for medicines that beautifie the eie lids, and cure the fretting sores of the corners of the eies, and also watering eies, for it drieth without biting.

E There is made hereof, saith *Dioscorides*, writing inke, but in our age not that which we write withall, but the same which serueth for Printers to print their bookes with, that is to say, of this blacke, or congealed smoke, and other things added.

Of Pitch and Tar.

The manner of drawing forth of Pitch.

Out of the fattest wood of the Pine tree changed into the Torch Pine, is drawne Pitch by force of fire. A place must be paued with stone, or some other hard matter, a little higher in the middle, about which there must also be made gutters, into which the liquor shall fall; then out from them other gutters are to be drawne, by which it may be receiued; being receiued, it is put into barrels. The place being thus prepared, the clouen wood of the Torch Pine must be set vpright; then must it be couered with a great number of Fir and Pitch boughes, and on euery part all about with much lome and earth: and great heed must be taken, least there be any cleft or chinke remaining, onely a hole left in the top of the furnace, thorow which the fire may be put in, and the flame and smoke may passe ouer: when the fire burneth the Pitch runneth forth, first the thin, and then the thicker.

This liquor is called in Greeke πίσσα: in Latine, *Pix*: in English, Pitch, and the moisture, euen the same that first runneth is named of *Pliny* in his 16. booke, 11. chapter, *Cedria*: There is boyled in Europe, saith he, from the Torch Pine a liquid Pitch vsed about ships, and seruing for many other purposes; the wood being clouen is burned with fire, and set round about the furnaces on euery side, after the manner of making Charcoles: the first liquor runneth through the gutter like water: (this in Syria is called *Cedria*, which is of so great vertue, as in Ægypt the bodies of dead men are preserued being all couered ouer with it) the liquor following being now thicker, is made Pitch. But *Dioscorides* writeth, That *Cedria* is gathered of the great Cedar tree, and nameth the liquor drawne out of the Torch tree by force of fire, πίσσα ὑγρὰ: that is, that which the Latines call *Pix liquida*: the Italians, *Pece liquida*: in high Dutch, **Weich bach**: in low Dutch, **Teer**: in French, *Poix foudire*: in Spanish, *Pex liquida*: certaine Apothecaries, *Kitran*: and we in English Tar.

And of this when it is boyled is made a harder Pitch: this is named in Greeke, ξηρὰ πίσσα: in Latine, *Arida*, or *sicca Pix*: of diuers, πολιμπίσσα as though they should say, *Iterata Pix*, or Pitch iterated: because it is boyled the second time. A certaine kinde hereof being made clammie or glewing is named κολλητὶς: in shops, *Pix naualis*, or Ship Pitch: in high Dutch, **Bach**: in low Dutch, **Steenpech**: in Italian, *Pece secca*: in French, *Poix seche*: in Spanish, *Pez seca*: in English, Stone Pitch.

¶ *The Temperature and Vertues.*

A Pitch is hot and dry, Tarre is hotter, and stone Pitch more drying, as *Galen* writeth. Tar is good against inflammations of the Almonds of the throat, and the uvula, and likewise the Squincie, being outwardly applied.

B It is a remedie for mattering eares with oyle of Roses: it healeth the bitings of Serpents, if it be beaten with salt and applied.

C With an equall portion of wax it taketh away foule ilfauoured nailes, it wasteth away swellings of the kernels, and hard swellings of the mother and fundament.

D With barly meale and a boies vrine it consumeth χοιράδας, or the Kings euill: it staieth eating vlcers, if it be laid vnto them with brimstone, and the barke of the Pitch Tree, or with branne.

E If it be mixed with fine Frankincense, and a cerote made thereof, it healeth chops of the fundament and feet.

F Stone Pitch doth mollifie and soften hard swellings: it ripens and maketh matter, and wasteth away hard swellings and inflammations of kernels: it filleth vp hollow vlcers, and is fitly mixed with wound medicines.

G What vertue Tar hath when it is inwardly taken we may reade in *Dioscorides* and *Galen*, but we set downe nothing thereof, for that no man in our age will easily vouchsafe the taking.

H There is also made of Pitch a congealed smoke or blacke, which serueth for the same purposes as that of the Rosins doth.

Chap. 43. *Of the Firre or Deale Tree.*

¶ *The Description.*

1 THe Firre tree groweth very high and great, hauing his leaues euer greene; his trunke or body smooth, euen, and straight, without joynts or knots, vntill it hath gotten branches; which are many and very faire, beset with leaues, not much vnlike the leaues of the Ewe tree, but smaller: among which come forth floures vpon the taller trees, growing at the bottomes of the leaues like little catkins, as you may see them expresst in a branch apart by themselues. the fruit is like vnto the Pine Apple, but smaller and narrower, hanging downe as the Pine Apple: the timber hereof excelleth all other timber for the masting of ships, posts, rails, deale boords, and sundry other purposes.

1 *Abies.*
The Firre Tree.

‡ 2 *Abies mas.*
The male Firre Tree.

2 There is another kinde of Firre Tree, which is likewise a very high and tall tree, and higher than the Pine: the body of it is straight without knots below, waxing smaller and smaller euen to the very top: about which it sendeth forth boughes, foure together out of one and the selfe same part of the body, placed one against another, in manner of a crosse, growing forth of the foure sides of the body, and obseruing the same order euen to the very top: out of these boughes grow others also, but by two and two, one placed right against another, out of the sides which bend downewards when the other beare vpwards: the leaues compasse the boughs round about, and the branches thereof: they be long, round, and blunt pointed, narrower, and much whiter than those of the Pitch Tree, that is to say, of a light greene, and in a manner of a white colour: the cones or clogs be long, and longer than any others of the cone trees: they consist of a multitude of soft scales, they hang downe from the end of the twigs, and doe not easily fall downe, but remaine on the tree a very long time: the kernels in these are small, not greater than the kernels of the Cherrie stone, with a thinne skin growing on the one side, very like almost to the wings of Bees, or great Flies: the timber or substance of the wood is white, and clad with many coats, like the head of an Onion.

‡ *Abietis ramus cum julis.*
A branch with Catkins or floures.

¶ *The Place.*

The Firre trees grow vpon high mountains, in many woods of Germany and Bohemia, in which it continueth alwaies greene; it is found also on hils in Italy, France, & other countries; it commeth downe oftentimes into the vallies: they are found likewise in Pruse, Pomerania, Liefeland, Russia, and especially in Norway, where I haue seene the goodliest trees in the world of this kinde, growing vpon the rockie and craggie mountaines, almost without any earth about them, or any other thing, sauing a little mosse about the roots, which thrust themselues here and there into the chinkes and cranies of the rockes, and therefore are easily cast downe with any extreme gale of winde. I haue seen these trees growing in Cheshire, Staffordshire, and Lancashire, where they grew in great plenty, as is reported, before *Noahs* flood: but then being ouerturned and ouerwhelmed haue lien since in the mosses and waterie moorish grounds very fresh and sound vntill this day, & so full of a refinous substance, that they burne like a Torch or Linke, and the inhabitants of those countries do call it Fir-wood, and Fire-wood vnto this day: out of this tree issueth the rosin called *Thus*, in English, Frankinsence: but from the young Fir trees proceedeth an excellent cleare and liquid Rosin, in taste like to the peelings or outward rinde of the Pomecitron.

¶ *The Time.*

The time of the Fir tree agreeth with the Pine trees.

¶ *The Names.*

The tree is called in Latine *Abies*: in Greeke, ἐλάτη: amongst the Græcians of our time the same name remaineth whole and vncorrupt: it is called in high Dutch, **Weisz Thannen**, and **Weisz Thannen baum**: in low Dutch, **Witte Dennen Boom**, or **Abel-boom**, and **Mast-boom**: in Italian, *Abete*: in Spanish, *Abeto*: in English, Fir-tree, Mast-tree, and Deale-tree. The first is called in French, *du Sap*, or *Sapin*; the other is *Suiffe*.

The liquid rosin which is taken forth of the barke of the young Firre-trees, is called in Greeke ὁ ἀκρὶς τῆς ἐλάτης: in Latine, *Lachryma abietis*, and *Lachryma abiegna*: in the shops of Germany, as also of England, *Terebinthina Veneta*, or Venice Turpentine: in Italian, *Lagrimo*: diuers doe thinke that *Dioscorides* calleth it ἐλαιώδης ῥητίνη, *Oleasa Resina*, or oile Rosin; but oile Rosin is the same that *Pix liquida*, or Tar is.

Arida Abietum Resina, or dry Rosin of the Firre-trees, is rightly called in Greeke, ξηρὰ ἐλατίνη, and in Latine, *Abiegna Resina*: it hath a sweet smell, and is oftentimes vsed among other perfumes in stead of Frankinscence.

¶ *The Temperature.*

The barke, fruit, and gums of the Fir-tree, are of the nature of the Pitch tree and his gums.

¶ *The Vertues.*

A The liquid Rosin of the Fir tree called Turpentine, looseth the belly, driueth forth hot cholerick humours, clenseth and mundifieth the kidnies, prouoketh vrine, and driueth forth the stone and grauell.

B The same taken with Sugar and the pouder of Nutmegs, cureth the strangurie, staieth the Gonorrhœa or the inuoluntary issue of mans nature, called the running of the rains, and the white flux in women.

C It is very profitable for all green and fresh wounds, especially the wounds of the head: for it healeth and clenseth mightily, especially if it be washed in Plantaine water, and afterward in Rose water, the yolke of an egge put thereto, with the pouders of *Olibanum* and Masticke finely searced, adding thereto a little Saffron.

Chap.

Chap. 44. *Of the Larch Tree.*

¶ *The Description.*

1 THe Larch is a tree of no small height, with a body growing straight vp: the barke whereof in the neither part beneath the boughes is thicke, rugged and full of chinkes; which being cut in sunder is red within, and in the other part aboue smooth, slipperie, something white without: it bringeth forth many boughes diuided into other lesser branches, which be tough and pliable. The leaues are small and cut into many jags, growing in clusters thicke together like taffels, which fall away at the approch of Winter: the floures, or rather the first shewes of the cones or fruit be round, and grow out of the tendereſt boughes, being at the length of a braue red purple colour: the cones be small, and like almost in bigneſſe to those of the Cypresse tree, but longer, and made vp of a multitude of thin scales like leaues: vnder which lie small seeds, hauing a thin velme growing on them very like to the wings of Bees and waſps: the substance of the wood is very hard of colour, especially that in the midst somewhat red, and very profitable for workes of long continuance.

1 *Laricis ramulus.*
A branch of the Larch tree.

2 *Larix cum Agarico suo.*
The Larch tree with his Agarick.

It is not true that the wood of the Larch tree cannot be set on fire, as *Vitruvius* reporteth of the castle made of Larch wood, which *Cæsar* besieged, for it burneth in chimneies, and is turned into coles, which are very profitable for Smithes, as *Matthiolus* writeth.

There is also gathered of the Larch tree a liquid Rosin, very like in colour and substance to the whiter hony, as that of Athens or of Spaine, which notwithstanding issueth not forth of it selfe, but runneth out of the stocke of the tree, when it hath beene bored euen to the heart with a great and long auger and wimble.

Galen writeth, that there be after a sort two kindes hereof, in his fourth book, of Medicines according to the kindes, one like vnto Turpentine, the other more sharper than this, hotter, more liquid

of a ſtronger ſmell,and in taſte bitterer and hotter: but the later is thought not to be the Roſine of the Larch,but of the Fir tree,which *Galen* becauſe it is after a ſort like in ſubſtance, might haue taken for that of the Larch tree.

There groweth alſo vpon the Larch tree a kinde of Muſhrum or excreſcence,not ſuch as is vpon other trees,but whiter,ſofter,more looſe and ſpungie than any other of the Muſhrums,and good for medicine, which beareth the name of *Agaricus*, or Agaricke: I finde that *Pliny* ſuppoſeth all the Maſticke trees,and thoſe that beare Galls,do bring forth this *Agaricum*: wherein he was ſomewhat deceiued,and eſpecially in that he tooke *Glandifera* for *Conifera*,that is,thoſe trees which beare maſt or Acornes,for the Pine apple trees: but among all the trees that beare *Agaricus*, the Larch is the chiefe,and bringeth moſt plenty of Agaricke.

¶ *The Place.*

The Larch tree groweth not in Greece, or in Macedon, but chiefely vpon the Alps of Italy, not far from Trent,hard by the riuers *Benacus* and *Padus*;and alſo in other places of the ſame mountains: it is likewiſe found on hils in Morauia, which in times paſt was called the country of the Marcomans: *Fuchſius* writeth,that it groweth alſo in Sileſia: others,in Luſatia,in the borders of Poland: it alſo groweth plentifully in the woods of Gallia Ceſalpina.

Pliny hath ſaid ſomewhat hereof,contradicting the writings of others,in his 16.booke,8.chapter, where he ſaith,that ſpecially the Acorne trees of France do beare Agaricke,and not only the acorne trees,but the Cone trees alſo,among which,ſaith he,the Larch tree is the chiefe that bringeth forth Agaricke, and that not onely in Gallia, which now is called France, but rather in Lumbardy and Piemont in Italy,where there be whole woods of Larch trees,although they be found in ſome ſmal quantitie in other Countries.

The beſt Agaricke is that which is whiteſt,very looſe and ſpungie,which may eaſily be broken, and is light, and in the firſt taſte ſweet, hard and well compact: that which is heauie, blackiſh, and containing in it little threds as it were of ſinewes, is counted pernicious and deadly.

¶ *The Time.*

Of all the Cone trees onely the Larch tree is found to be without leaues in the Winter: in the Spring grow freſh leaues out of the ſame knobs, from which the former did fall. The cones are to be gathered before Winter,ſo ſoon as the leaues are gone: but after the ſcales are looſed and opened,the ſeeds drop away: the Roſine muſt be gathered in the Summer moneths.

¶ *The Names.*

This tree is called in Greeke,λάριξ: in Latine alſo *Larix*, in Italian and Spaniſh, *Larice*: in high Dutch,**Lerchenbaum**: in low Dutch, **Lorkenboom**: in French, *Meleſe*: in Engliſh, Larch tree, and of ſome Larix tree.

The liquid Roſin is named by *Galen* alſo λάριξ: the Latines call it *Reſina Larigna*, or *Reſina Laricea*, Larch Roſin:the Italians,*Larga*:the Apothecaries,*Terebinthina*,or Turpentine,and it is ſould and alſo mixed in medicines in ſtead thereof: neither is that a thing newly done; for *Galen* likewiſe in his time reporteth,that the Druggers ſold the Larch Roſine in ſtead of Turpentine: and this may bee done without errour; for *Galen* himſelfe in one place vſeth Larch Roſin for Turpentine;and in another,Turpentine for Larch Roſine,in his booke of medicines according to the kindes.

The Agaricke is alſo called in Greeke, ἀγάρικον and ἀγαρικὸς: in Latine, *Agaricum* and *Agaricus*, and ſo likewiſe in ſhops: the Italians, Spaniards, and other nations do imitate the Greeke word; and in Engliſh we call it Agaricke.

¶ *The Temperature and Vertues.*

A The leaues,barke,fruit,and kernell,are of temperature like vnto the Pine, but not ſo ſtrong.

B The Larch Roſin is of a moiſter temperature than all the reſt of the Roſines, and is withall without ſharpeneſſe or biting, much like to the right Turpentine, and is fitly mixed with medicines which perfectly cure vlcers and greene wounds.

C All Roſins,ſaith *Galen*,that haue this kinde of moiſture and clammineſſe joined with them, do as it were binde together and vnite dry medicines,and becauſe they haue no euident biting quality, they do moiſten the vlcers nothing at all: therefore diuers haue very well mixed with ſuch compound medicines either Turpentine Roſin,or Larch Roſin: thus far *Galen*. Moreouer,Larch Roſine performeth all ſuch things that the Turpentine Roſin doth,vnto which,as we haue ſaid,it is much like in temperature,which thing likewiſe *Galen* himſelfe affirmeth.

D Agaricke is hot in the firſt degree and dry in the ſecond,according to the old writers.It cutteth, maketh thin, clenſeth, taketh away obſtructions or ſtoppings of the intrailes, and purgeth alſo by ſtoole.

E Agaricke cureth the yellow jaundiſe proceeding of obſtructions, and is a ſure remedy for cold ſhakings,which are cauſed of thicke and cold humors.

F The ſame being inwardly taken and outwardly applied, is good for thoſe that are bit of venomous beaſts which hurt with their cold poiſon.

It

It prouoketh vrine, and bringeth downe the menſes: it maketh the body well coloured, driueth forth wormes, cureth agues, eſpecially quotidians and wandring feauers, and others that are of long continuance, if it be mixed with fit things that ſerue for the diſeaſe: and theſe things it performes by drawing forth and purging away groſſe, cold, and flegmaticke humours, which cauſe the diſeaſes. G

From a dram weight, or a dram and a halfe, to two, it is giuen at once in ſubſtance or in pouder: the weight of it in an infuſion or decoction is from two drams to fiue. H

But it purgeth ſlowly, and doth ſomewhat trouble the ſtomacke; and therefore it is appointed that Ginger ſhould be mixed with it, or wilde Carrot ſeed, or Louage ſeed, or Sal gem, in Latine, *Sal foſſilis*. I

Galen, as *Meſue* reporteth, gaue it with wine wherein Ginger was infuſed: ſome vſe to giue it with Oxymel, otherwiſe called ſyrrup of vineger, which is the ſafeſt way of all. K

Agaricke is good againſt the paines and ſwimming in the head, or the falling Euill, being taken with ſyrrup of vineger. L

It is good againſt the ſhortneſſe of breath, called *Aſthma*, the inueterate cough of the lungs, the ptyſicke, conſumption, and thoſe that ſpet bloud: it comforteth the weake and feeble ſtomacke, cauſeth good digeſtion, and is good againſt wormes. M

Chap. 45. *Of the Cypreſſe Tree.*

Cupreſſus ſatiua & ſylueſtris.
The Garden and wild Cypreſſe tree.

¶ *The Deſcription.*

THe tame or manured Cypreſſe tree hath a long thicke and ſtraight body; whereupon many ſlender branches do grow, which do not ſpred abroad like the branches of other trees, but grow vp alongſt the body, yet not touching the top: they grow after the faſhion of a ſteeple, broad below, and narrow toward the top: the ſubſtance of the wood is hard, ſound, well compact, ſweet of ſmell, and ſomewhat yellow, almoſt like the yellow Saunders, but not altogether ſo yellow, neither

ther doth it rot nor wax old, nor cleaueth or choppeth it ſelfe. The leaues are long, round like thoſe of Tamariske, but fuller of ſubſtance. The fruit or nuts do hang vpon the boughes, being in manner like to thoſe of the Larch tree, but yet thicker and more cloſely compact: which being ripe do of themſelues part in ſunder, and then falleth the ſeed, which is ſhaken out with the winde: the ſame is ſmall, flat, very thin, of a ſwart ill fauoured colour, which is pleaſant to Ants or Piſmires, and ſerueth them for food.

Of this diuers make two kindes, the female and the male; the female barren, and the male fruitfull. *Theophraſtus* reporteth, that diuers affirme the male to come of the female. The Cypreſſe yeelds forth a certaine liquid Roſin, like in ſubſtance to that of the Larch tree, but in taſte maruelous ſharpe and biting.

The wilde Cypreſſe, as *Theophraſtus* writeth, is an high tree, and alwaies greene, ſo like to the other Cypreſſe, as it ſeemeth to be the ſame both in boughes, body, leaues, and fruit, rather than a certaine wilde Cypreſſe: the matter or ſubſtance of the wood is ſound, of a ſweet ſmell, like that of the Cedar tree, which rotteth not: there is nothing ſo criſped as the root, and therefore they vſe to make precious and coſtly workes thereof.

‡ I know no difference betweene the wilde and tame Cypreſſe of our Author, but in the handſomeneſſe of their growth, which is helped ſomewhat by art. ‡

¶ *The Place.*

The tame and manured Cypreſſe groweth in hot countries, as in Candy, Lycia, Rhodes, and alſo in the territory of Cyrene: it is reported to be likewiſe found on the hils belonging to mount Ida, and on the hills called *Leuci*, that is to ſay, white, the tops whereof be alwaies couered with ſnow. *Bellonius* denieth it to be found vpon the tops of theſe hills, but in the bottoms on the rough parts and ridges of the hills: it groweth likewiſe in diuers places of England where it hath been planted, as at Sion a place neere London, ſometimes a houſe of Nunnes: it groweth alſo at Greenewich, and at other places, and likewiſe at Hampſted in the garden of Mr *Wade*, one of the Clerkes of her Majeſties priuie Councell.

The wilde kinde of Cypreſſe tree groweth hard by *Ammons* Temple, and in other parts of the country of Cyrene vpon the tops of mountaines, and in extreme cold countries. *Bellonius* affirmeth, that there is found a certaine wilde Cypreſſe alſo in Candy, which is not ſo high as other Cypreſſe trees, nor groweth ſharpe toward the top, but is lower, and hath his boughes ſpred flat, round about in compaſſe: he ſaith the body thereof is alſo thicke: but whether this be *Thya*, of which *Theophraſtus* and *Pliny* make mention, we leaue it to conſideration.

¶ *The Time.*

The tame Cypres tree it alwaies greene; the fruit may be gathered thrice a yeare, in Ianuarie, May, and September, and therefore it is ſyrnamed *Trifera*.

The wilde Cypres tree is late, and very long before it buddeth.

¶ *The Names.*

The tame Cypres is called in Greek, Κυπάρισσος, or Κυπάριττος: in Latine, *Cupreſſus*: in ſhops, *Cypreſſus*: in Italian, *Cypreſſo*: in French and Spaniſh, *Cipres*: in high Dutch, **Cipreſſenbaum**: in low Dutch, **Cypreſſeboom**: in Engliſh, Cypres and Cypres tree.

The fruit is named in Greeke, Σφαῖρια τῆς κυπαρίσσου: in Latine, *Pilulæ Cupreſſi*, *Nuces Cupreſſi*, and *Galbuli*: in ſhops, *Nuces Cypreſſi*: in Engliſh, Cypres nuts or clogs. This tree in times paſt was dedicated to *Pluto*, and was ſaid to bee deadly; whereupon it is thought that the ſhadow thereof is vnfortunate.

The wilde Cypres tree is called in Greeke, Θύα or Θυία, and Θύον: from this doth differ Θυΐα, being a name not of a plant, but of a mortar in which dry things are beaten: *Thya* as *Pliny* writeth, *lib.* 13. *cap.* 16. was well knowne to *Homer*: he ſheweth that this is burned among the ſweet ſmells, which *Circe* was much delighted withall, whom hee would haue to be taken for a goddeſſe, to their blame that call ſweet and odoriferous ſmells, euen all of them, by that name; becauſe hee doth eſpecially make mention withall in one verſe, of *Cedrus* and *Thya*: the copies haue falſly *Larix*, or Larch tree, in which it is manifeſt that he ſpake onely of trees: the verſe is extant in the fifth booke of *Odyſſes*, where he mentioneth, that *Mercurie* by *Iupiters* commandement went to *Calypſus* den, and that he did ſmell the burnt trees *Thya* and *Cedrus* a great way off.

Theophraſtus attributeth great honor to this tree, ſhewing that the roofs of old Temples became famous by reaſon of that wood, and that the timber thereof, of which the rafters are made is euerlaſting, and it is not hurt there by rotting, cobweb, nor any other infirmitie or corruption.

¶ *The Temperature.*

The fruit and leaues of the Cypres are dry in the third degree, and aſtringent.

¶ *The Vertues.*

A The Cypres nuts being ſtamped and drunken in wine, as *Dioſcorides* writeth, ſtop the laske and bloudy flix, and are good againſt the ſpitting of bloud and all other iſſues of bloud. They

They glue and heale vp great vlcers in hard bodies: they safely and without harme soke vp and consume the hid and secret moisture lying deepe and in the bottome of weake and moist infirmities. B

The leaues and nuts are good to cure the rupture, to take away the *Polypus*, being an excrescence growing in the nose. C

Some do vse the same against carbuncles and eating sores, mixing them with parched Barley meale. D

The leaues of Cypres boyled in sweet wine or Mede, help the strangury and difficulty of making water. E

It is reported that the smoke of the leaues doth driue away gnats, and that the clogs doe so likewise. F

The shauings of the wood laid among garments preserue them from the moths: the rosin killeth Moths, little wormes, and magots. G

† Our Author in this chapter hath put together two chapters of *Dodonæus*; the one of Cypresse, the other of *Thya*, out of *Theophrastus* and others. *Vid. Pempt. 4. lib. 5. cap. 7. & 8.*

Chap. 46. *Of the tree of Life.*

Arbor Vitæ.
The Tree of Life.

¶ *The Description.*

THe tree of Life growes to the height of a smal tree, the barke being of a dark reddish colour: the timber very hard, the branches spreading themselues abroad, hanging downe toward the ground by reason of the weakenesse of the twiggie branches surcharged with very oileous and ponderous leaues, casting, and spreading themselues like the feathers of a wing, resembling those of the Sauine tree, but thicker, broader, and more ful of gummie or oileous substance: which being rubbed in the hands do yeeld an aromatick, spicie, or gummy sauor, very pleasant and comfortable: amongst the leaues come forth small yellowish flours, which in my garden fall away without any fruit: but as it hath beene reported by those that haue seene the same, there followeth a fruit in hot Regions, much like vnto the fruit of the Cypres tree, but smaller, compact of little and thinne scales closely pact one vpon another, which my selfe haue not yet seene. The branches of this tree laid downe in the earth will very easily take root, euen like the Woodbind or some such plant; which I haue often proued, and thereby haue greatly multiplied these trees.

¶ *The Place.*

This tree groweth not wile in England, but it groweth in my garden very plentifully.

¶ *The Time.*

It endureth the cold of our Northerne clymat, yet doth it loose his gallant greenes in the winter moneths: it floureth in my garden about May.

¶ *The Names.*

Theophrastus and *Pliny*, as some thinke, haue called this sweet and aromaticall tree *Thuia*, or *Thya*: some call it *Cedrus Lycia*: the new writers doe terme it *Arbor vitæ*: in English, the Tree of Life, I doe not meane that whereof mention is made, *Gen.* 3. 22.

¶ *The Temperature.*

Both the leaues and boughes be hot and dry.

¶ *The Vertues.*

Among the plants of the New-found Land, this Tree, which *Theophrastus* calls *Thuia*, or *Thua*, is

is the moſt principall, and beſt agreeing vnto the nature of man, as an excellent cordial, and of a very pleaſant ſmell.

Chap. 47. *Of the Yew tree.*

Taxus.
The Yew tree.

¶ *The Deſcription.*

‡ IN ſtead of the deſcription and place mentioned by our Author (which were not amiſſe) giue me leaue to preſent you with one much more accurate, ſent mee by Mr *Iohn Goodyer.*

Taxus glandifera bacciferáque.
The Yew bearing Acornes and Berries.

THe Yew tree that beareth Acornes and berries is a great high tree remaining alwaies greene, and hath vſually an huge trunke or body as big as the Oke, couered ouer with a ſcabbed or ſcaly barke, often pilling or falling off, and a yong ſmooth barke appearing vnderneath; the timber hereof is ſomewhat red, neere as hard as Box, vniuerſally couered next the barke with a thicke white ſap like that of the Oke, and hath many big limmes diuided into many ſmall ſpreading branches: the leaues be about an inch long, narrow like the leaues of Roſemary, but ſmooth and of a darker greene colour, growing all alongſt the little twigs or branches cloſe together, ſeldome one oppoſite againſt another, often hauing at the ends of the twigs little branches compoſed of many leaues like the former, but ſhorter and broader, cloſely compact or joyned together: amongſt the leaues are to be ſeene at all times of the yeare, ſmall ſlender buds ſomewhat long, but neuer any floures; which at the very beginning of the Spring grow bigger and bigger, till they are of the faſhion of little Acornes, with a white kernell within: after they are of this forme, then groweth vp from the bottoms of the Acornes a reddiſh matter, making beautifull reddiſh berries more long than round, ſmooth on the out ſide, very clammie within, and of a ſweet taſte, couering all the Acorne, only leauing a little hole at the top, where the top of the Acorne is to be ſeene: theſe fallen, or deuoured by birds, leaue behinde them a little whitiſh huske made of a few ſcales: appearing like a little floure, which peraduenture may deceiue ſome, taking it to be ſo indeed: it ſeemes this tree, if it were not hindred by cold weather, would alwaies haue Acornes and berries on him, for hee hath alwaies little buds, which ſo ſoone as the Spring yeelds but a reaſonable heate, they grow into the forme of Acornes: about the beginning of Auguſt, ſeldome before, you ſhall finde them turned into ripe berries, and from that time till Chriſtmaſſe, or a little after, you may ſee on him both Acornes and red berries.

Taxus tantum florens.
The Yew which only floures.

The Yew which onely beareth floures and no berries, is like the other in trunke, timber, barke, and leaues; but at the beginning of Nouember, or before, this tree doth begin to be very thicke ſet or fraught on the lower ſide or part of the twigs or little branches, with ſmall round buds, very neere as big, and of the colour of Radiſh ſeed, and doe ſo continue all the Winter, till about the beginning or middle of February, when they open at the top, ſending forth one ſmall ſharpe poin- tall, little longer than the huske, diuided into many parts, or garniſhed towards the top with many ſmall

ſmall duſty things like floures, of the colour of the huskes; and if you ſhall beate or throw ſtones into this tree about the end of February, or a good ſpace after, there will proceed and fly from theſe floures an abundance of duſty ſmoke. Theſe duſty floures continue on the trees till about harueſt, and then ſome and ſome fall away, and ſhortly after the round buds come vp as aforeſaid.

¶ *The Place.*

Theſe trees are both very common in England: in Hampſhire there is good plenty of them growing wilde on the chalkie hills, and in Church-yards where they haue been planted.

¶ *The Time.*

The time is expreſſed in their deſcriptions. Dec. 19. 1621. *John Goodyer.* ‡

¶ *The Names.*

This tree is named by *Dioſcorides*, Σμίλαξ: by *Theophraſtus*, Μιλος: but *Nicander* in his booke of Counterpoyſons, Σμίλος: *Galen* doth alſo call it Κάκτος: it is named in Latine *Taxus*: in high Dutch, **Eybenbaum**: in low Dutch, **Ibenboom**: In Italian, *Taſſo*: in Spaniſh, *Toxo*, and *Taxo*: in French, *Yf*: in Engliſh, Ewe, or Eue tree: in the vnlearned ſhops of Germany, if any of them remaine, it is called *Tamariſcus*; where in times paſt they were wont not without great error, to mix the barke hereof in compound medicines, in ſtead of the Tamariske barke.

¶ *The Temperature.*

The Yew tree, as *Galen* reporteth, is of a venomous quality, and againſt mans nature. *Dioſcorides* writeth, and generally all that heretofore haue dealt in the facultie of Herbes, that the Yew tree is very venomous to be taken inwardly, and that if any doe ſleepe vnder the ſhadow thereof it cauſeth ſickneſſe and oftentimes death. Moreouer, they ſay that the fruit thereof being eaten is not onely dangerous and deadly vnto man, but if birds doe eat thereof it cauſeth them to caſt their feathers, and many times to die. All which I dare boldly affirme is altogether vntrue: for when I was yong and went to ſchoole, diuers of my ſchoole-fellowes and likewiſe my ſelfe did eat our fils of the berries of this tree, and haue not onely ſlept vnder the ſhadow thereof, but among the branches alſo, without any hurt at all, and that not one time, but many times. *Theophraſtus* ſaith, That λέφανα, *animalia*, *Gaza* tranſlates them *Iumenta*, or labouring beaſts die, if they doe eate of the leaues; but ſuch cattell as chew their cud receiue no hurt at all thereby.

Nicander in his booke of counterpoiſons doth reckon the Yew tree among the venomous plants, ſetting downe alſo a remedy, and that in theſe words, as *Gorraus* hath tranſlated them.

Parce Venenatæ Taxo, quæ ſurgit in Oeta
Abietibus ſimilis, lethoque abſumit acerbo
Ni præter morem pleno crater e meraca
Fundere vina pares, cum primum ſentiet æger
Arctari obſtructas fauces animæque canalem.

‡ Shun th'poys'nous Yew, the which on Oeta growes,
Like to the Firre, it cauſes bitter death,
Vnleſſe beſides they vſe pure wine that flowes
From empty'd cups, thou drinke, when as thy breath
Begins to faile, and paſſage of thy life
Growes ſtraight. ——

Pena and *Lobel* alſo obſerued that which our Author here affirmes, and dayly experience ſhewes it to be true, that the Yew tree in England is not poyſonous: yet diuers affirme, that in Prouince in France, and in moſt hot countries, it hath ſuch a maligne quality, that it is not ſafe to ſleepe or long to reſt vnder the ſhadow thereof. ‡

Chap. 48. *Of the Iuniper tree.*

¶ *The Kindes.*

AMong the Iuniper trees one is leſſer, another greater, being a ſtrange and forreine tree: one of theſe bringeth forth a floure and no fruit; the other fruit and no floures.

¶ *The Deſcription.*

THe common Iuniper tree groweth in ſome parts of Kent vnto the ſtature and bignes of a faire great tree, but moſt commonly it growes very low like vnto ground Furres: this tree

1 *Iuniperus.*
The Iuniper tree.

2 *Iuniperus maxima.*
The great Iuniper tree.

‡ 3 *Iuniperus Alpina minor.*
Small Iuniper of the Alps.

tree hath a thin bark or rinde, which in hot regions will chop and rend it ſelf into many cranies or pieces: out of which rifts iſſueth a certaine gum or liquor much like vnto Frankincenſe: the leaues are very ſmall, narrow, and hard, and ſomwhat prickly, growing euer green along the branches, thicke together: amongſt which come forth round and ſmall berries, greene at the firſt, but afterward blacke, declining to blewneſſe, of a good ſauor, and ſweet in taſte, which do wax ſomwhat bitter after they be dry and withered.

2 The great Iuniper tree comes now and then to the height of the Cypres tree, with a greater and harder leafe, and alſo with a fruit as big as Oliue berries, as *Bellonius* writeth, of an exceeding faire blew colour, and of an excellent ſweet ſauour.

‡ 3 This exceeds not the height of a cubit, but growes low, and as it were creeps vpon the ground, and conſiſts of ſundry thicker and ſhorter branches than the common kind, tough alſo, writhen, and hard to breake; three leaues alwaies growing at equall diſtances, as in the common, but yet broader, ſhorter, and thicker, neither leſſe pricking than they, of a whitiſh greene colour on the inſide, and green without incompaſſe the tender branches. *Cluſius*, who giues vs this figure and hiſtory, obſerued not the floure, but the fruit is like that of the ordi-

narie,

nary, but yet somewhat longer: it growes vpon the Austrian Alps, and ripens the fruit in August and September. ‡

¶ *The Place.*

The common Iuniper is found in very many places, especially in the South parts of Eugland. *Bellonius* reporteth, That the greater groweth vpon mount Taurus. *Aloysius Anguillara* writes, that it is found on the shores of the Ligurian and Adriaticke sea, and in Illyrium, bringing forth great berries: and others say it groweth in Provence of France: it comes vp for the most part in rough places and neere to the sea, as *Dioscorides* writeth.

¶ *The Time.*

The Iuniper tree floureth in May; the floure whereof is nothing else but as it were a little yellowish dust or pouder strewed vpon the boughes. The fruit is ripe in September, and is seldome found either winter or summer without ripe and vnripe berries, and all at one time.

¶ *The Names.*

The Iuniper tree is called in Greeke ἄρκευθος: the Apothecaries keepe the Latine name *Iuniperus*: the Arabians call it *Archonas*, and *Archencas*: the Italians, *Ginepro*: in high-Dutch, **Wechholter**: in Spanish, *Enebro*, *Ginebro*, and *Zimbro*: the French men and base Almanes, *Geneue*: in English, Iuniper tree.

The lesser is named in Greeke, ἀρκευθίς: in Latine *Iuniperus*: the great Iuniper tree is called as some thinke in Greeke, κυπάρισσος ἀγρία: in Latine by *Lobel*, *Iuniperus maximus Illyricus cærulea bacca*, by reason of the colour of the berries; and may be called in English, blew Iuniper.

The berries are called *Grana Iuniperi*: in Greeke, ἄρκυθοι, although the tree it selfe is oftentimes called also by the same name ἄρκυθος: it is termed in high-Dutch, **Krametbeer**, **Wechholterbeer**: in low-Dutch, **Genebzebessen**: in Spanish, *Neurinas*: in English, Iuniper berries.

The gum of the Iuniper tree is vsually called of the Apothecaries *Vernix*: in Latine, *Lachryma Iuniperi*. *Serapio* nameth it *Sandarax*, and *Sandaracha*: but there is another *Sandaracha* amongst the Grecians, being a kinde of Orpment, which growes in the same minerals wherein Orpment doth; and this doth far differ from *Vernix* or the Iuniper gum. *Pliny*, *lib.* 11. *cap.* 7. makes mention also of another *Sandaracha*, which is called *Erithrace*, and *Cerinthus*; this is the meat of Bees whilest they be about their worke.

¶ *The Temperature.*

Iuniper is hot and dry in the third degree, as *Galen* teacheth: the berries are also hot, but not altogether so dry: the gum is hot and dry in the first degree, as the Arabians write.

¶ *The Vertues.*

The fruit of the Iuniper tree doth clense the liuer and kidnies, as *Galen* testifieth: it also makes thin clammy and grosse humors. It is vsed in countrepoisons and other wholsome medicines. Being ouer largely taken it causeth gripings and gnawings in the stomack, and maketh the head hot; it neither bindeth nor looseth the belly: it prouoketh vrine. A

Dioscorides reporteth, That this being drunke is a remedie against the infirmities of the chest, coughs, windinesse, gripings, and poisons, and that the same is good for those that be troubled with cramps, burstings, and with the disease called the Mother. B

It is most certain, That the decoction of these berries is singular good against an old cough, and against that with which children are now and then extremely troubled, called the Chin-cough, in which they vse to raise vp raw tough and clammy humors that haue many times bloud mixed with them. C

Diuers in Bohemia do take in stead of other drinke the water wherein those berries haue beene steeped, who liue in wonderfull good health. D

This is also drunke against poisons and pestilent feuers, and it is not vnpleasant in the drinking: when the first water is almost spent, the vessell is again filled vp with fresh. E

The smoke of the leaues and wood driues away serpents and all infection and corruption of the aire, which bring the plague or such like contagious diseases: the juice of the leaues is laid on with wine, and also drunke against the bitings of the viper. F

The ashes of the burned barke being applied with water take away scurfe and filth of the skin. G

The pouder of the wood being inwardly taken is pernitious and deadly, as *Dioscorides* his vulgar copies do affirme; but the true copies do vtterly deny it, neither do any of the old writers affirm it. H

The fume and smoke of the gum doth stay flegmaticke humors that distill out of the head, and stoppeth the rheume: the gum doth stay raw and flegmaticke humors that stick in the stomacke and guts, if it be inwardly taken and also drunke. I

It killeth all manner of wormes in the belly, it stayeth the menses and hemorrhoids: *it is commended* also against spitting of bloud, it drieth hollow vlcers and filleth them with *flesh*, if it be cast thereon: being mixed with oile of Roses it healeth chops in the hands and *feet*. K

L There is made of this and oile of Linefeed mixt together, a liquor called Verniſh, which is vſed to beautifie pictures and painted tables with, and to make iron gliſter, and to defend it from ruſt.

Chap. 49.

Of the prickly Cedar, or Cedar Iuniper.

¶ *The Kindes.*

THe prickely Cedar tree is like to Iuniper, and is called the ſmall or little Cedar, for difference from the great and tall Cedar which bringeth Cones: and of this there are two kinds, as *Theophraſtus* and *Pliny* do teſtifie, that is to ſay, one of Lycia, and another crimſon.

¶ *The Deſcription.*

1 THe crimſon or prickly cedar ſeems to be very like the Iuniper tree in body & boughs, which are writhed, knotty, and parted into very many wings: the ſubſtance of the wood is red, and ſweet of ſmel like that of the Cypreſſe: the tree is couered ouer with a rugged barke; the leaues be narrow and ſharp pointed, harder than thoſe of Iuniper, ſharper and more pricking, and ſtanding thinner vpon the branches: the fruit or berry is ſomtimes as big as a haſell nut, or as *Theophraſtus* ſaith, of the bigneſſe of Myrtle beries, and being ripe it is of a reddiſh yellow or crimſon colour, ſweet of ſmell, and ſo pleaſant in taſte, that the countreymen now and then doe eat of the ſame with bread.

1 *Oxycedrus Phœnicia.*
Crimſon prickly Cedar.

2 *Oxycedrus Lycia.*
Rough Lycian Cedar.

2 The other low Cedar which growes in Lycia is not ſo high as the former, hauing likewiſe a wrythed body as big as a mans arme, full of boughes: the barke is rough, yellowiſh without, and red within: the leaues ſtand thicker, like at the firſt to thoſe of Iuniper, but yet ſomewhat ſhorter, and in the third or fourth yeare thicker, long and round withall, comming neere to the leaues of

‡ 3 *Cedrus Lycia altera.*
The other Lycian Cedar.

of the Cypreſſe tree, or of the ſecond Sauine, that is, blunt and not pricking at all; which being bruiſed betwixt the fingers, doth yeeld a very pleaſant ſmell: ſo doth one and the ſelfe ſame plant bring forth below ſharp & prickly leaues, & aboue thick and blunt ones, as that notable learned Herbariſt *Cluſius* hath moſt diligently obſerued: the fruit or berry is round like that of Iuniper, of color yellow when it is ripe, inclining to a red, in taſt ſomewhat bitter, but ſweet of ſmell.

‡ 3 This alſo hath Cypreſſe-like leaues, not vnlike thoſe of the laſt deſcribed, yet ſomewhat thicker and broader: the fruit is alſo much larger, being as big as Haſell nuts, and of a red or ſcarlet colour; whence *Lobel* calleth it *Cedrus Phœnicia altera.* ‡

¶ *The Place.*

The prickely Cedar with the Crimſon colour comes vp higher and greater in certaine places of Italy, Spain, and Aſia, than in other countries. For that which grows on mount Gargarus in Apulia is much higher and broader than thoſe that grow elſwhere, and bringeth forth greater beries of the bignes of an haſell nut, and ſweeter, as that moſt diligent writer *Bellonius* reporteth. *Cluſius* ſhewes, that the prickely Cedar and the Iuniper tree be of ſo great a growth in diuers places of Spaine, that the body of them is as thicke as a man.

The Lycian Cedar is found in Province of France, not far from Maſſilia, and growes in a great part of Greece, in Illyricum and Epyrum.

¶ *The Time.*

Both of them are alwaies green, and in Winter alſo full of fruit, by reaſon that they continually bring forth berries, as when the old do fall new come in their places: in the ſpring grow vp new buds and beginnings of berries: in Autumne they wax ripe the ſecond yeare, as do the berries of Iuniper.

¶ *The Names.*

They are called in Latine *Minores*, and *Humiles Cedri*, Little and low Cedars, for difference from the tall and great Cedar which beareth Cones.

The former is named in Greeke, Ὀξύκεδρος, and Κέδρος φοινική: in Latine, *Oxycedrus*, and *Cedrus Punica*: in Engliſh, prickly Cedar, and Crimſon Cedar: *Pliny* ſyrnameth it *Phœnicea*, of the crimſon color of the fruit: the Spaniards cal this alſo *Enebro*, as *Cluſius* teſtifies, euen by the ſame name they giue the Iuniper; wherein likewiſe they are thought to imitate diuers of the old writers, who haue not by names diſtinguiſhed the Iuniper from the Cedar, but haue, as *Theophraſtus* noteth, called them *Cedros*, Cedar trees, yet with an addition Ὀξύκεδρος, or prickly Cedars.

The other with the blunt leafe is named of *Theophraſtus*, Λεία Κέδρος: of *Pliny* alſo *Lycia Cedrus*: in Province of France, *Moruein*: diuers name this *Sabina*, and vſe it in ſtead of Savin, which they want: as the apothecaries of Epidaurus, and in diuers cities of Greece, and alſo in Illyricum & Epyrum, as *Bellonius* teſtifieth. Some would haue it to be θύα, *Thya*: but *Thya*, according to *Theophraſtus*, is like not only in body, leaues, and boughes, but in fruit alſo, to the Cypreſſe tree: but the fruit of this is nothing like to the Cypreſſe cones.

The fruit of this Cedar is named by *Theophraſtus*, Κέδρις, *Cedris*: notwithſtanding *Cedrus*, as hee himſelfe doth alſo teſtifie (*Gaza* nameth it *Cedrula*) is a certain little ſhrub which neuer grows to a tree.

The gum or liquor which iſſues from the prickly Cedar is alſo called *Vernix*, and is ſold inſted thereof.

¶ *The Nature and Vertues.*

The little Cedar, as *Galen* writeth, is hot and dry in a manner in the third degree: the matter or A
ſubſtance thereof is ſweet of ſmell like that of Iuniper, and is vſed for perfumes and odoriferous ſmels together with the leaues.

The berries or fruit of the low Cedar haue their faculties not ſo ſtrong, as the ſame Author teſtifieth, inſomuch as that they may alſo be eaten, yet if they bee taken too plentifully they cauſe head-ache, and breed heate and gnawings in the ſtomacke. Yet there is a difference betweene theſe two Cedar berries; for the crimſon ones are not ſo hot and dry, by reaſon they are ſweeter & pleaſanter to the taſte, and therefore they are better to be eaten, and do alſo yeeld vnto the body a kind of nouriſhment: but the berries of that of *Lycia* are biting, hotter and drier alſo than thoſe of Iuniper, from which they differ eſpecially in the biting quality, they bring no nouriſhment at all, and though a man eat neuer ſo few of them, hee ſhall feele gnawings in his ſtomacke, and paine in his head.

The Peaſants doe feed thereon rather to ſatisfie their hunger, than for any delight they haue in the taſte, or the phyſicall vertues thereof; albeit they be good againſt the ſtrangurie, and prouoke vrine.

CHAP. 5. *Of Savin.*

¶ *The Kindes.*

THere be two kinds of Savin, one like in leafe to Tamarisk, the other to the Cypres tree; whereof the one beareth berries, the other is barren.

1 *Sabina ſterilis.*
Barren Savin.

2 *Sabina baccifera.*
Savin bearing berries.

¶ *The Deſcription.*

1 THe firſt Savin, which is the common kind, and beſt of all known in this country, groweth in manner of a low ſhrub or tree, the ſtem or trunke whereof is ſomtimes as big as a mans arm, diuiding it ſelfe into many branches ſet full of ſmall leaues like Cypreſſe or Tamariske, but thicker, and more ſharp and prickly, remaining green winter and ſummer, in ſmell ranke or very ſtrong, barren both of floures and fruit.

2 The

‡ 3 *Sabina baccata altera.*
The lesser berry-bearing Savin.

2 The other Savin is an high tree, as *Bellonius* saith, as tall as the Almond tree, and much like to the tame Cypresse tree: the body is wrythed, thick, and somtimes of so great a compasse as that it cannot be fathomed; the substance of the wood is red within, as is that of Iuniper and of the prickly Cedar: the barke is not very thicke, and it is of a yellowish red: the leaues are of a maruellous gallant greene colour, like to those of the Cypres tree, yet thicker or more in number; in taste bitter, of a spicie smell, and like Rosin: the boughes are broader, and thick set as it were with wings, like those of the Pitch tree and of the Yew tree: on which grow a great number of beries very round like those of the little Cedars, which at the first are green, but when they be ripe they are of a blackish blew. Out of the root hereof issueth oft times a Rosin, which being hard is like to that of the Iuniper tree, and doth also crumble in the chewing.

‡ 3 There is another which differs from the last described, onely in that the leaues are smaller and lesse pricking than those of the former, as also the branches lesser. *Lobel* cals this *Savina baccata altera.* ‡

¶ *The Place.*

Both of them grow vpon hils, in woods & other like vntoiled places, as in Candy, Mysia, and elsewhere. *P. Bellonius* reporteth, that he found them both vpon the tops of the mountains Taurus, Amanus, and Olympus.

The first is planted in our English gardens almost euerie where. The second is planted both by the seed and by the slip: the slips must be set in a ground that is meanly moist and shadowie, till they haue taken root: the shrubs which grow of these decline toward the one side, retaining still the nature of the bough: but that Savin which is planted by the seed groweth more vpright: this in continuance of time bringeth forth seeds, and the other for the most part remaines barren. Both these grow in my garden.

¶ *The Time.*

They both continue alwaies greene: The one is found to be laden with ripe fruit commonly in Winter; but it hath fruit at all times, for before the old berries fall, new are come vp.

¶ *The Names.*

Savin is called in Greeke βράθυ, or βάθυ: in Latine, *Sabina.*

The first is commonly called in the Apothecaries shops by the name *Savina*: of diuers, *Savimera*: the Italians and Spaniards keepe the Latine name: it is called in high-Dutch, **Sibenbaum**: in low-Dutch, **Sauel boom**: in French, *Savenier*: in English, common Savin, or garden Savin.

Some name the other *Cupressus Cretica*, or Cypres of Candy, as *Pliny* saith, *lib.* 12. *cap.* 17. making mention of a tree called *Bruta.* Some there are that take this to be *altera Sabina*, or the second Savin, and to be read *Bruta* for βρᾶθυ, *Brathu*, by altering the vowels: for *Pliny* describes it, *lib.* 12. *cap.* 17. to be like the Cypres tree, in these words; They seeke in the mountain Elimæi the tree *Bruta*, beeing like to the broad Cypres tree, hauing white boughes, yeelding a sweet smell when it is set on fire; whereof mention is made with a miracle, in the stories of *Claudius Cæsar.* It is reported, That the Parthians doe vse the leaues in drinkes; that the smell is very like to that of Cypresse, and that the smoke thereof is a remedie against the smell of other woods. It growes beyond Pisitigris, neere to the towne Sittaca, on mount Zagrus. Thus far *Pliny.*

The mountaines Elimæi are described by *Strabo* in the country of the Assyrians, next after the mountain Sagrus aboue the Babylonians; by *Ptolomæus*, not far from the Persian gulfe: therefore it is hard to say that *Bruta* is *Sabina altera* or the second Savine, seeing that so great a distance of the place may vndoubtedly cause a difference, and that it is not largely, but briefely described. It seemeth that *Thya* mentioned by *Theophrastus* is more like vnto Savin: but yet forasmuch as *Thya* is like in fruit to the Cypres tree, and not to the fruit or berries of the little Cedars, it is also very manifest

manifeſt, that the ſecond Sauin is not *Thya*, neither *Vitæ arbor*, ſo called of the later Herbariſts: it is likewiſe named by *Lobel*, *Sabina genuina baccifera, atro cærulea*, that is, the true Sauine that bears berries of a blackiſh blew colour.

¶ *The Temperature.*

The leaues of Sauine, which are moſt vſed in medicine, are hot and dry in the third degree, and of ſubtill parts, as *Galen* ſaith.

¶ *The Vertues.*

A The leaues of Sauine boyled in Wine and drunke prouoke vrine, bring downe the menſes with force, draw away the after-birth, expell the dead childe, and kill the quicke: it hath the like vertue receiued vnder in a perfume.

B The leaues ſtamped with honey and applied, cure vlcers, ſtay ſpreading and creeping vlcers, ſcoure and take away all ſpots and freckles from the face or body of man or woman.

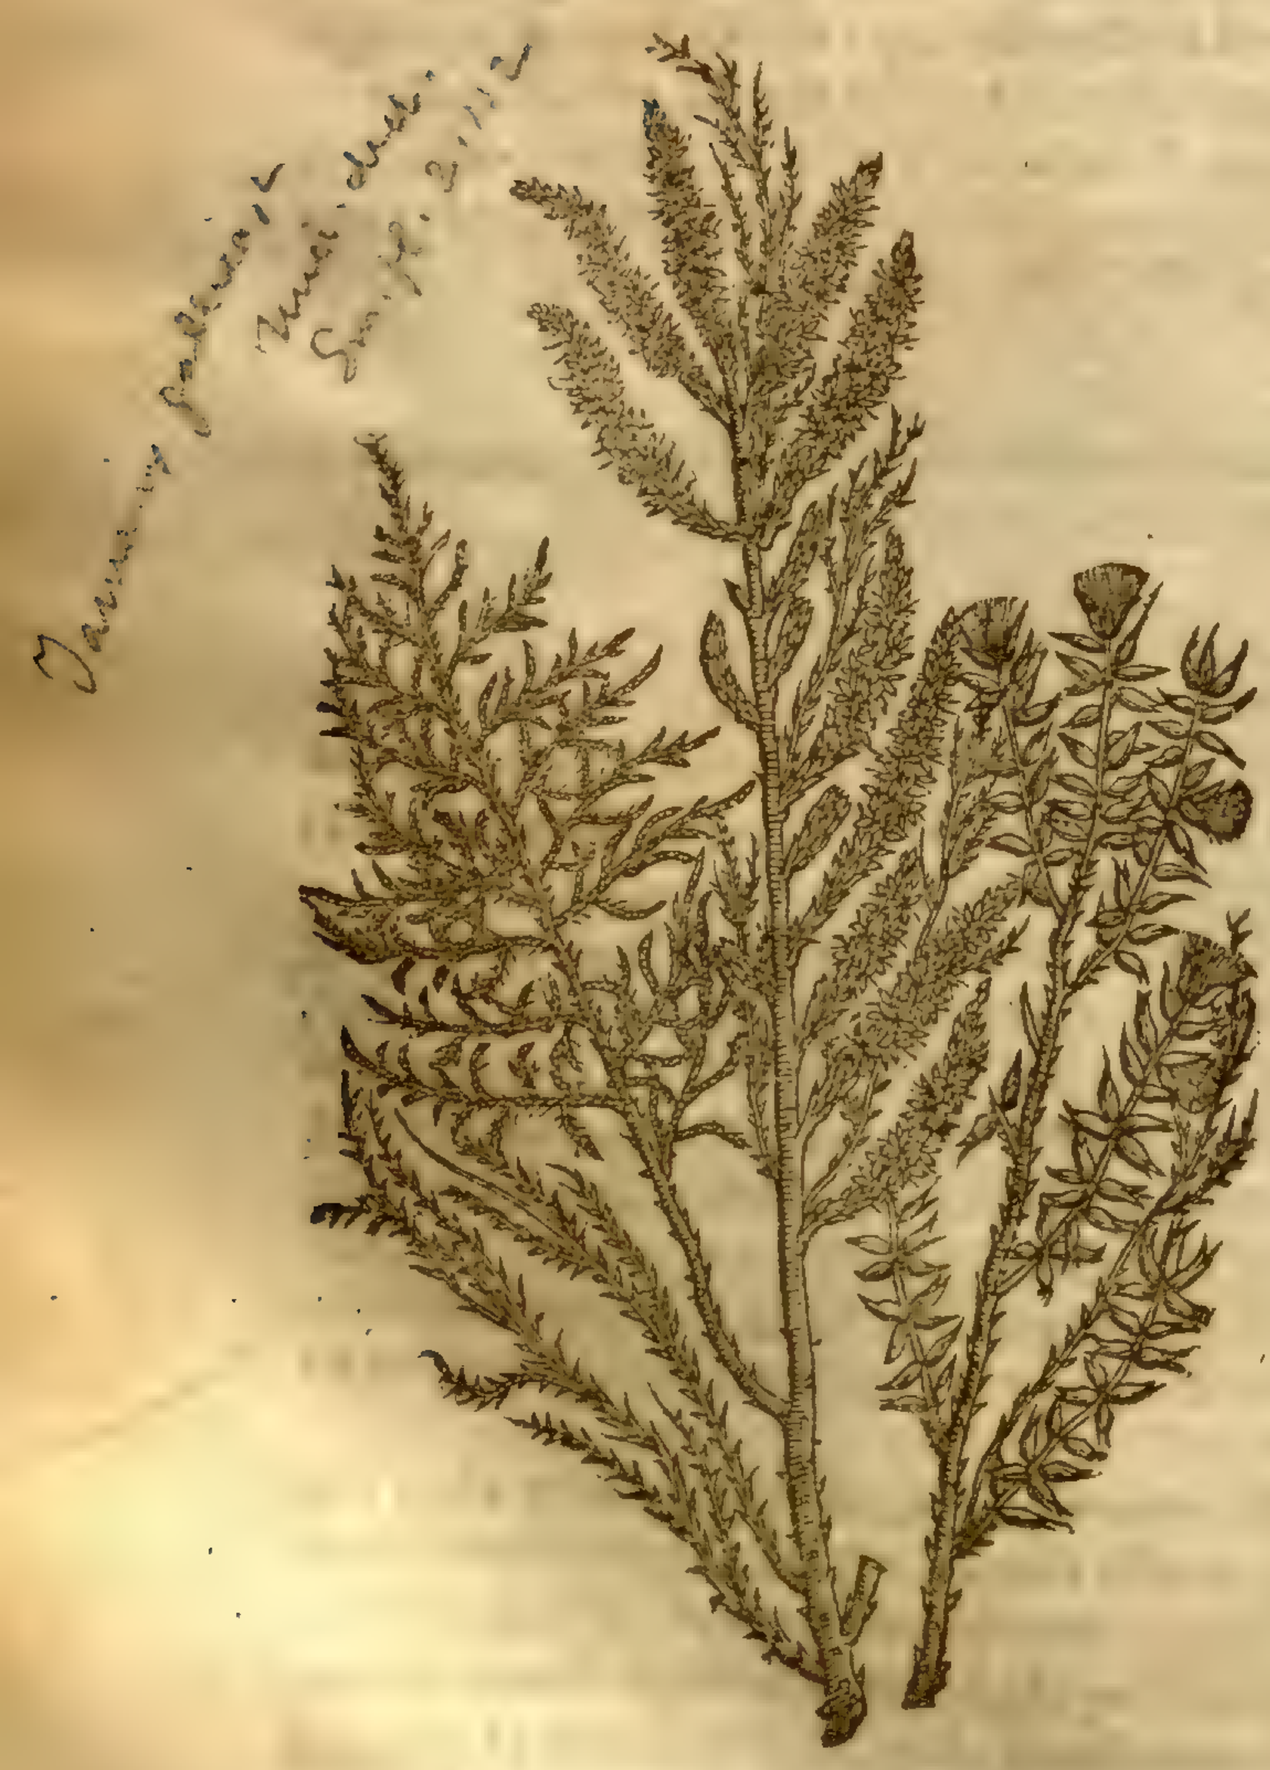
C The leaues boiled in oile Oliue, and kept therein, kill the worms in children, if you anoint their bellies therewith: and the leaues poudered and giuen in milke or Muſcadell doe the ſame.

D The leaues dried and beat into fine pouder, and ſtrewed vpon thoſe kindes of excreſcences *ſub præputio*, called Caroles, and ſuch like, gotten by dealing with vnclean women, take them away perfectly, curing and healing them: but if they be inueterate and old, and haue been much tampered withall, it ſhall be neceſſarie to adde vnto the ſame a ſmall quantity of *Auripigmentum* in fine pouder, and vſe it with diſcretion, becauſe the force of the medicine is greatly increaſed thereby and made more corroſiue.

Chap. 51. *Of Tamariske.*

1 *Tamariſcus Narbonenſis.*
French Tamariske.

2 *Tamariſcus Germanica.*
Germane Tamariske.



¶ The

¶ *The Description.*

1 THe first kinde of Tamariske groweth like a small hedge, couered with a reddish barke, hauing many branches set and bedeckt with leaues much like to Heath: among which come forth small mossie white floures declining to purple, which turn into a pappous or downy seed that flieth away with the winde, as that of Willow doth: the root is woody, as the roots of other shrubs be, and groweth diuers waies.

2 The German Tamariske hath many wooddy branches and shoots rising from the root, with a white barke, hauing his leaues thicker and grosser than the former, and not so finely jagged or cut. The flours are reddish, and larger than the former, growing not vpon footstalks many thick clustering together, as those of the former, but each a pretty distance from another, on the tops of the branches spike-fashion, and begin to flour below: which turn into seed, that is likewise caried away with the winde.

¶ *The Place.*

Tamariske groweth by running streams, and many times by riuers that break forth, and not seldome about fenny grounds, commonly in a grauelly soile, for it best prospereth in moist and stony places: it is found in Germany, Vindelicia, Italy, Spain, and also in Greece.

The Tamarisks do also grow in Egypt and Syria, as *Dioscorides* writeth; and likewise in Tylus an Isle in Arabia, as *Theophr.* noteth, the wood whereof, saith he, is not weake, as with vs in Greece, but strong, like ξύλον or timber, or any other strong thing: this Tamariske *Dioscorides* cals ἥμερος, that is to say, tame or planted; and saith that it bringeth forth fruit very like to Galls, in taste rough and binding.

Petrus Bellonius in his second booke of Singularities reporteth, That he saw in Egypt very high Tamarisks and great like other trees, and that sometimes in moist places by riuers sides, and many times also in dry & grauelly grounds where nó other trees did grow, which now and then did beare hanging on the boughes such a multitude of Galls, that the inhabitants call *Chermasel*, as beeing ouerladen they are ready to breake. Both these grow and prosper well in gardens with vs heere in England.

¶ *The Time.*

These trees or shrubs floure in May, and in the later end of Auguſt: their seed is carried away with the winde.

¶ *The Names.*

They are called in Greeke μυρίκη, and in Latine also *Myrica* and *Tamarix*: in shops, *Tamariscus*: of *Octauius Horatianus*, *Murica*: *Dioscorides* makes that which growes in Italy and Greece to be ἄγριος or wild Tamarisk: it is named in high-Dutch, **Tamarischen holtz**, & **Boxk**: in low-Dutch, **Iben-boom**, **Tamarischboom**: in Italian, *Tamarigio*: in Spanish, *Tamargura*, and *Tamariz*: in French, *Tamaris*: in English, Tamariske.

¶ *The Temperature and Vertues.*

Tamariske hath a clensing and cutting facultie, with a manifest drying: it is also somewhat astringent or binding, and by reason of these qualities it is very good for an hard spleen, being boiled with vineger and wine, either the root, leaues, or tender branches, as *Galen* writeth. A

Moreouer, *Dioscorides* teacheth, That the decoction of the leaues made with wine doth wast the spleen, and that the same is good against the tooth-ache, if the mouth be washed therewith: that it bringeth down the menses, if the patient sit therein; that it killeth lice and nits, if the parts be bathed therewith. B

The ashes of burnt Tamariske haue a drying facultie, and greatly scouring withall, and a little binding. C

The floures and downy seed of the greater Tamariske do greatly binde, insomuch as they come very neere to the Gall named *Galla Omphacitis*, but that the roughnesse of taste is more euident in the gall: the which floures are of an vnequal temper, for there is joined to the nature therof a great thinnesse of parts, and clensing facultie, which the Gall hath not, as *Galen* writeth. D

These floures we fitly vse (saith *Dioscor.*) in stead of Gall, in medicines for the eies and mouth. E

It is good to stanch bloud, and to stay the laske and womens whites, it helpeth the yellow jaundice, and also cureth those that are bit of the venomous spider called *Phalangium*: the bark serueth for the same purposes. F

The leaues and wood of Tamariske haue great power and vertue against the hardnesse and stopping of the spleen, especially the leaues being boiled in water, and the decoction drunke, or else infused in a small vessell of ale or beere, and continually drunke; and if it be drunk forth of a cup or dish made of the wood or timber of Tamariske, is of greater efficacie. G

CHAP.

Chap. 52. *Of Heath, Hather, or Linge.*

¶ *The Kindes.*

THere be diuers ſorts of Heath, ſome greater, ſome leſſer; ſome with broad leaues, and ſome narrower; ſome bringing forth berries, and others nothing but floures.

¶ *The Deſcription.*

1 THe common Heath is a low plant, but yet wooddy and ſhrubby, ſcarce a cubit high: it brings forth many branches, whereupon doe grow ſundry little leaues fomewhat hard and rough, very like to thoſe of Tamariske or the Cypres tree: the floures are orderly placed alongſt the branches, ſmall, ſoft, and of a light red colour tending to purple: the root is alſo wooddy, and creepeth vnder the vpper cruſt of the earth: and this is the Heath which the Antients tooke to be the right and true Heath.

‡ 1 *Erica vulgaris, ſive Pumila.*
Common or dwarfe Heath.

‡ 2 *Erica vulgaris hirſuta.*
Rough leafed Heath.

There is another Heath which differeth not from the precedent, ſauing that this plant bringeth forth floures as white as ſnow, wherein conſiſteth the difference: wherefore we may cal it *Erica pumila alba*, Dwarfe Heath with white floures.

2 The great Heath (which *Cluſius* at his being in England found in the barren grounds about Windſor, which in his Spaniſh trauels he maketh the firſt kinde) groweth to the height of two cubits, ſeldome higher, full of branches, couered with a blackiſh barke: whereon are ſet in very good order by couples ſmall rough ſquare leaues finer than thoſe of Tamarisk or Cypres. The floures incloſe the little twiggy branches round about at certaine diſtances, from the lower part to the top faſhioned like little bottles, conſiſting of foure parts, of a ſhining purple colour, very beautifull to behold, and the rather to be eſteemed becauſe it floureth twice in the yeare. The root is likewiſe wooddy.

‡ 3 This

† 3 *Erica maior flore albo Clusij.*
The great Heath with white floures.

4 *Erica major flore purpureo.*
Great Heath with purple floures.

† 5 *Erica cruciata.*
Crossed Heath.

6 *Erica Pyramidalis.*
Steeple Heath.

‡ 3 This, ſaith *Cluſius*, which is the largeſt that I haue ſeen, ſomtimes exceeds the height of a man, very ſhrubby, hauing a hard and blackiſh red wood: the leaues are ſmall and ſhort, growing about the branches by foures, of a very aſtringent taſte: it hath plentifull ſtore of floures growing all alongſt the branches, ſo that ſometimes the larger branches haue floures for a foot long. This floure is hollow and longiſh, well ſmelling, white and beautifull. It growes betwixt Lisbon and the Vniuerſitie of Conimbrica in Portugal, where it floures in Nouember, December, and Ianuary. ‡

† 4 Of this kind there is another ſort with whitiſh purple floures, more frequently found than the other ſort; which floures are ſomewhat greater than the former, but in forme like, and flouring at the ſame time. ‡ The leaues alſo are hairy, and grow commonly by foures: the hollow floures grow cluſtering together at the very tops of the branches, and are to be found in Iuly and Auguſt. It growes on diuers heathy places of this kingdome. ‡

5 Croſſed Heath growes to the height of a cubit and a halfe, full of branches, commonly lying along vpon the ground, of a dark ſwart colour: whereon grow ſmall leaues ſet at certain ſpaces two vpon one ſide, and two on the other, oppoſite, one anſwering another, euen as do the leaues of Croſſewort. The floures in like manner ſtand along the branches croſſe-faſhion, of a dark ouerworn greeniſh colour. The root is likewiſe wooddy, as is all the reſt of the plant.

6 This ſteeple Heath hath likewiſe many wooddy branches garniſhed with ſmall leaues that eaſily fall off from the dried ſtalks; among which come forth diuers little moſſie greeniſh floures of ſmall moment. The whole buſh for the moſt part groweth round together like a little cock of hay, broad at the lower part and ſharp aboue like a pyramide or ſteeple, whereof it tooke his name.

7 *Erica tenuifolia.*
Small leafed Heath.

8 *Erica tenuifolia caliculata.*
Chalice Heath.

7 This ſmall or thinne leafed Heath is alſo a low and baſe ſhrub, hauing many ſmall and ſlender ſhoots comming from the root, of a reddiſh browne colour; whereupon doe grow very many ſmall leaues not vnlike to them of common Tyme, but much ſmaller and tenderer: the flours grow in tufts at certaine ſpaces, of a purple colour. The root is long, and of a wooddy ſubſtance. ‡ The branches of this are commonly whitiſh, the leaues very green: the flours are ſmalleſt at both ends and biggeſt in the middeſt, hollow, and of a faire purple colour, which doth not eaſily decay. It floures

floures most part of Summer, and growes in many heathy grounds. ‡

8 Chalice heath hath also many wooddy branches growing from the roots, slender, of a reddish brown colour, a foot and half high, garnished with very little leaues lesser than those of Time: the flours grow on the tops and vpper parts of the branches, and be in number fiue, six, or more, hanging downward, in fashion long, hollow within like a little tunnel or open cup or chalice, of a light purplish colour: the root creepeth, and putteth forth in diuers places new springs or shoots.

9 The Heath that bringeth forth berries hath many weake and slender branches of a reddish colour, which trailing vpon the ground do take hold thereof in sundry places, whereby it mightily increaseth: the leaues are somewhat broad, of a thicke and fleshy substance, in taste somthing drying at the first, but afterwards somewhat sharpe and biting the tongue: among which come forth small floures of an herby colour: which being vaded there succeed small round berries that at the first are green, and afterward blacke, being as big as those of Iuniper, wherein is contained purple juice like that of the Mulbery: within those berries are contained also small three cornered grains: the root is hard, and of a woody substance. ‡ I found this growing in great plenty in Yorkshire on the tops of the hills of Gisbrough, betwixt it and Rosemary-topin (a round hill so called) & some of the people thereabouts told me they called the fruit Crake-berries. This is the same that *Matthiolus* calls *Erica baccifera*; and it is the *Erica Coris folio* 11. of *Clusius*. ‡

‡ 9 *Erica baccifera procumbens.*
Heath bearing berries.

10 *Erica baccifera tenuifolia.*
Small leafed Heath with berries.

‡ 10 This which our Authour figured as you see in the tenth place (putting the description of the former thereto) hath brittle branches growing some cubit high, couered with a bark blacker than the rest: the leaues are like those of the former, but blacker and smaller, growing about the stalks by threes, of a hottish taste with some astriction: in September and October it caries a fruit on the tops of the branches different from the rest, for it is very beautiful, white, transparent, resembling dusky and vneuen pearles in forme and colour, succulent also and of an acide tast, commonly containing three little seeds in each berrie: in Nouember this fruit becomes dry, and fals away of it selfe. *Clusius* only obserued this in Portugal, and at the first sight afar off took the white berries to haue been graines of Manna. He calls it *Erica Coris folio* 10.

11 I remember (saith *Dodonæus*) that I obserued another Heath which grew low, yet sent forth many

‡ 11 *Erica pumil. 3. Dod.*
Dodonæus his dwarfe Heath.

‡ 12 *Erica ternis per intervalla ramis.*
Heath with three branches at a joint.

‡ 13 *Erica peregrina Lobelij.*
Lobels ſtrange Heath.

‡ 14 *Erica Coris folio 7. Cluſij.*
Creeping Dutch Heath.

‡ 15 *Erica Coris folio. 9. Clusij.*
Small Austrian Heath.

many wooddy and twiggy branches, hauing vpon them little narrow and longish leaues; on these stalkes spike fashion to the tops of them, yet but on one side, grow elegant redde floures, pointed with blacke. This growes in that tract of Germany which leads from Bohemia to Noremberg on dry and vntilled places, and neere woods. It floures in Aprill.

12 This shrubby Heath is commonly some cubit high, hauing slender branches which come out of the maine stemmes commonly three together; and the leaues also grow in the same order; the tops of the branches are adorned with many floures of a darke purple colour, hollow, round, biggest below, and standing vpon long foorstalks. *Clusius* found this growing in the vntilled places of Portingale aboue Lisbone, where it floured in December; he calls it *Erica Coris folio*, 5.

13 Besides all these (saith *Lobel*, hauing first treated of diuers plants of this kinde) there is a certaine rarer species growing like the rest afrer the manner of a shrub in pots, in the Garden of Mr *Iohn Brancion*: the leafe is long, and the purple floures, which as far as I remember consisted of foure little leaues apiece, grow on the tops of the branches. I know not whence it was brought, and therfore for the rarity I call it *Erica peregrina*, that is, Strange or Forreine Heath.

14 This hath many round blackish purple branches some foot or cubit high, lying oft times along vpon the ground: these are beset with many narrow little leaues, almost like those of the third described, yet somewhat longer, commonly growing foure, yet sometimes fiue together, of an astringent taste; the little floures grow on the top of the branches, longish, hollow, and of a light purple colour, comming out of foure little leaues almost of the same colour; when these are ripe and dried they containe a blackish and small seed; the root is hard, wooddy, and runnes diuers waies; the weake branches also that lie vpon the ground now and then take root againe. *Clusius* found this growing plentifully in diuers mountanous places of Germany, where it floured in Iune and Iuly.

15 The weake stalkes of this are some foot high, which are set with many small greene leaues growing commonly together by threes; the tops of the branches are deckt with little hollow and longish floures diuided at their ends into foure parts, of a flesh colour, together with the foure little leaues out of which they grow, hauing eight blackish little threds in them, with a purplish pointall in the middle. The seed is blacke and small, the root wooddy as in other plants of this kinde. *Clusius* found this in some mountanous woods of Austria, where it floured in Aprill and May. ‡

¶ *The Place.*

Heath groweth vpon dry mountaines which are hungry and barren, as vpon Hampsteed Heath neere London, where all the sorts do grow, except that with the white floures, and that which beareth berries. ‡ There are not aboue three or foure sorts that I could euer obserue to grow there. ‡

Heath with the white floures groweth vpon the downes neere vnto Grauesend.

Heath which beareth berries groweth in the North parts of England, namely, at a place called Crosby Lauenswaith, and in Cragge close also in the same country: from whence I haue receiued the red berries by the gift of a learned Gentleman called Mr *Iames Thwaits*.

¶ *The Time.*

These kindes or sorts of Heath do for the most part floure all the Summer, euen vntill the last of September.

¶ *The Names.*

Heath is called in Greeke, Ἔρικη: in Latine also *Erica*: diuers do falsly name it *Myrica*: in high and low Dutch, Heijden: in Italian, *Erica*: in Spanish, *Breso Quirro*: in French, *Bruyre*: in English, Heath, Hather and Linge.

¶ *The Temperature.*

Heath hath, as *Galen* saith, a digesting faculty, consuming by vapors: the floures and leaues are to be vsed.

¶ *The Vertues.*

A The tender tops and floures, saith *Dioscorides*, are good to be laid vpon the bitings and stingings of any venomous beast: of these floures the Bees do gather bad hony.

B The barke and leaues of Heath may be vsed for, and in the same causes that Tamariske is vsed.

† The figure which our Author gaue in the ninth place by the name of *Erica baccifera latifolia* I take to be the *Vitis Idæa* 2. of *Clusius* (which you shall finde in his due place) and in stead thereof I haue giuen you our ordinary berry-bearing Heath.

Chap. 53. *Of Heath of Iericho.*

1 *Rosa Hiericontea major.*
The Heath Rose of Ierico.

¶ *The Description.*

1 THis kinde of Heath which of the later writers hath beene called by the name *Rosa Hiericontea*; the coiner spoiled the name in the mint, for of all plants that haue bin written of, there is not any more vnlike vnto the Rose, or any kinde thereof than this plant: what moued them thereto I know not: but thus much of my owne knowledge, it hath neither shape, nature, nor facultie agreeing with any Rose; the which doubtlesse is a kind of Heath, as the barren soile, and that among Heath, doth euidently shew, as also the Heathie matter wherewith the whole plant is possessed, agreeing with the kindes of Heath in very notable points. It riseth vp out of the ground, of the height of four inches, or an hand breadth, compact or made of sundry hard sticks, (which are the stalkes) clasping or shutting it selfe together into a round forme, intricately weauing it selfe one stick ouerthwart another, like a little net: vpon which wooddy sticks do grow leaus not vnlike to those of the Oliue tree, which maketh the whole plant of a round forme, and hollow within; among the leaues on the inside grow small mossie floures, of a whitish herby colour, which

2 *Rosa Hiericontea siccata.* The Heath Rose of Ierico dried.

turne

turne into little ſeed, like the ſeed of Rocket, but leſſer: the whole plant is of the ſubſtance of heath, and wooddy.

2 The ſecond figure ſetteth forth the dried plant, as it is brought vnto vs from beyond the ſeas; which being ſet into a diſh of warme water, for halfe an houre, openeth it ſelfe in forme, as when it did grow, and taken forth vntill it be dry, returneth ſhut againe as before.

¶ *The Place.*

It groweth in the barren grounds of France, and other hot regions, among the Heath and ſuch like plants: it is a ſtranger in England, yet dried we haue them in great plenty. ‡ I haue not read nor heard that this growes wilde in France; but *Belonius* ſaith it growes in Arabia *deſerta*: *Bauhine* ſaith it eaſily grew and flouriſhed many yeares in his garden at Baſill. ‡

¶ *The Time.*

The ſeed being ſowne in our cold climate, is ſowne in Aprill; it periſheth when it is ſprung vp, and bringeth neither floures nor ſeed.

¶ *The Names.*

This kind of Heath is called *Roſa Hiericontea*, or *de Hiericho*, the Roſe of Ierico: of ſome, the Roſe of Ieruſalem, and alſo *Roſa Mariæ*: in Engliſh, the Heath Roſe.

¶ *The Temperature and Vertues.*

There is not any of the antient nor later writers that haue ſet downe any certainty of this plant as touching the temperature and faculties, but onely a bare picture with a ſlender deſcription.

Chap. 54. *Of the Chaſte tree.*

1 *Vitex, ſiue Agnus caſtus.*
The Chaſte tree.

‡ 2 *Vitex latiore ſerrato folio.*
Chaſte tree with cut leaues.

¶ *The Deſcription.*

1 *Vitex*, or the Chaſte tree, groweth after the manner of a buſhie ſhrub or hedge tree, hauing many twiggie branches, very pliant and eaſie to be bent without breaking, like to the Willow: the leaues are for the moſt part diuided into fiue or ſeuen ſections or diuiſions, much like the leaues of Hemp, whereof each part is long and narrow, very like vnto the willow leafe, but ſmaller: the floures do grow at the vppermoſt parts of the branches, like vnto ſpikie eares, cluſtering together about the branches, of a light purple or blew colour, and very ſweet ſmell: the fruit is ſmall and round, like vnto the graines or cornes of pepper.

‡ 2 *Lobel* mentions another variety hereof that differs from the former onely in that it hath broader leaues, and theſe alſo ſnipt about the edges. ‡

¶ *The Place.*

Vitex groweth naturally in Italy, and other hot regions, by water courſes and running ſtreames: I haue it growing in my garden.

¶ *The Time.*

Vitex beginneth to recouer his loſt leaues in May, and the floures come forth in Auguſt.

¶ *The Names.*

† The Grecians call this ſhrub ἄγνος, and λύγος: *Agnos* (i.) *Caſtus*, Chaſte: becauſe, ſaith *Pliny* in his 24. booke, 9. chapter, the Athenian Matrons in their feaſt called *Theſmophoria* dedicated to the honour of *Ceres*, deſirous to keepe themſelues chaſte, doe lay the leaues in their beds vnder them: the Latines name it *Vitex*, and of diuers it is termed, as wee finde among the baſtard and counterfeit names, ἄγνος: in Latine, *Salix marina*, or *Salix Amerina*, and *Piper Agreſte*: in high Dutch; **Schaffmulle, Keuſchbaum**: in low Dutch, and alſo of the Apothecaries, *Agnus Caſtus*: the Italians *Vitice*, *Agno caſto*: in Spaniſh, *Gattile caſto*: in Engliſh, Chaſte tree, Hempe tree, and of diuers, *Agnus caſtus*. ‡ The name *Agnus Caſtus* comes by confounding the Greeke name *Agnos* with *Caſtus*, the Latine interpretation thereof. ‡

¶ *The Temperature.*

The leaues and fruit of *Agnus caſtus* are hot and dry in the third degree: they are of very thinne parts, and waſte or conſume winde.

¶ *The Vertues.*

A *Agnus Caſtus* is a ſingular medicine and remedy for ſuch as would willingly liue chaſte, for it withſtandeth all vncleannes, or deſire to the fleſh, conſuming and drying vp the ſeed of generation, in what ſort ſoeuer it bee taken, whether in pouder onely, or the decoction drunke, or whether the leaues be carried about the body; for which cauſe it was called *Caſtus*; that is to ſay, chaſte, cleane, and pure.

B The ſeed of *Agnus Caſtus* drunken, driueth away, and diſſolueth all windineſſe of the ſtomacke, openeth and cureth the ſtoppings of the liuer and ſpleen; and in the beginning of dropſies, it is good to be drunke in wine to the quantity of a dram.

C The leaues ſtamped with butter, diſſolue and aſſwage the ſwelling of the genitories and cods, being applied thereto.

D The decoction of the herbe and ſeed is good againſt paine and inflammation about the matrix, if women be cauſed to ſit and bathe their priuie parts therein: the ſeed being drunke with Pennyroiall bringeth downe the menſes, as it doth alſo both in a fume and in a peſſarie: in a pultis it cureth the head-ache, the Phrenticke, and thoſe that haue the Lethargie are wont to be bathed herewith, oiſe and vineger being added thereto.

E The leaues vſed in a fume, and alſo ſtrowed, driue away ſerpents; and being laid on do cure their bitings.

F The ſeed laied on with water doth heale the clifts or rifts of the fundament; with the leaues, it is a remedy for lims out of joynt, and for wounds.

G It is reported that if ſuch as journey or trauell do carry with them a branch or rod of *Agnus Caſtus* in their hand, it will keepe them from Merry-galls, and wearineſſe: *Dioſcorides*.

Chap. 55. *Of the Willow Tree.*

¶ *The Deſcription.*

1 THe common Willow is an high tree, with a body of a meane thickneſſe, and riſeth vp as high as other trees doe if it be not topped in the beginning, ſoone after it is planted; the barke

barke thereof is smooth, tough, and flexible: the wood is white, tough, and hard to be broken: the leaues are long, lesser and narrower than those of the Peach tree, somewhat greene on the vpper side and slipperie, and on the nether side softer and whiter: the boughes be couered either with a purple, or else with a white barke: the catkins which grow on the toppes of the branches come first of all forth, being long and mossie, and quickly turne into white and soft downe, that is carried away with the winde.

1 *Salix.*
The common Willow.

2 *Salix aquatica.*
The Oziar or water Willow.

2 ☞ The lesser bringeth forth of the head, which standeth somewhat out, slender wands or twigs, with a reddish or greene barke, good to make baskets and such like workes of: it is planted by the twigs or cods being thrust into the earth, the vpper part whereof when they are growne vp, is cut off, so that which is called the head increaseth vnder them, from whence the slender twigs doe grow, which being oftentimes cut, the head waxeth greater: many times also the long rods or wands of the higher Withy trees be lopped off and thrust into the ground for plants, but deeper, and aboue mans height: of which do grow great rods, profitable for many things, and commonly for bands, wherewith tubs and casks are bound.

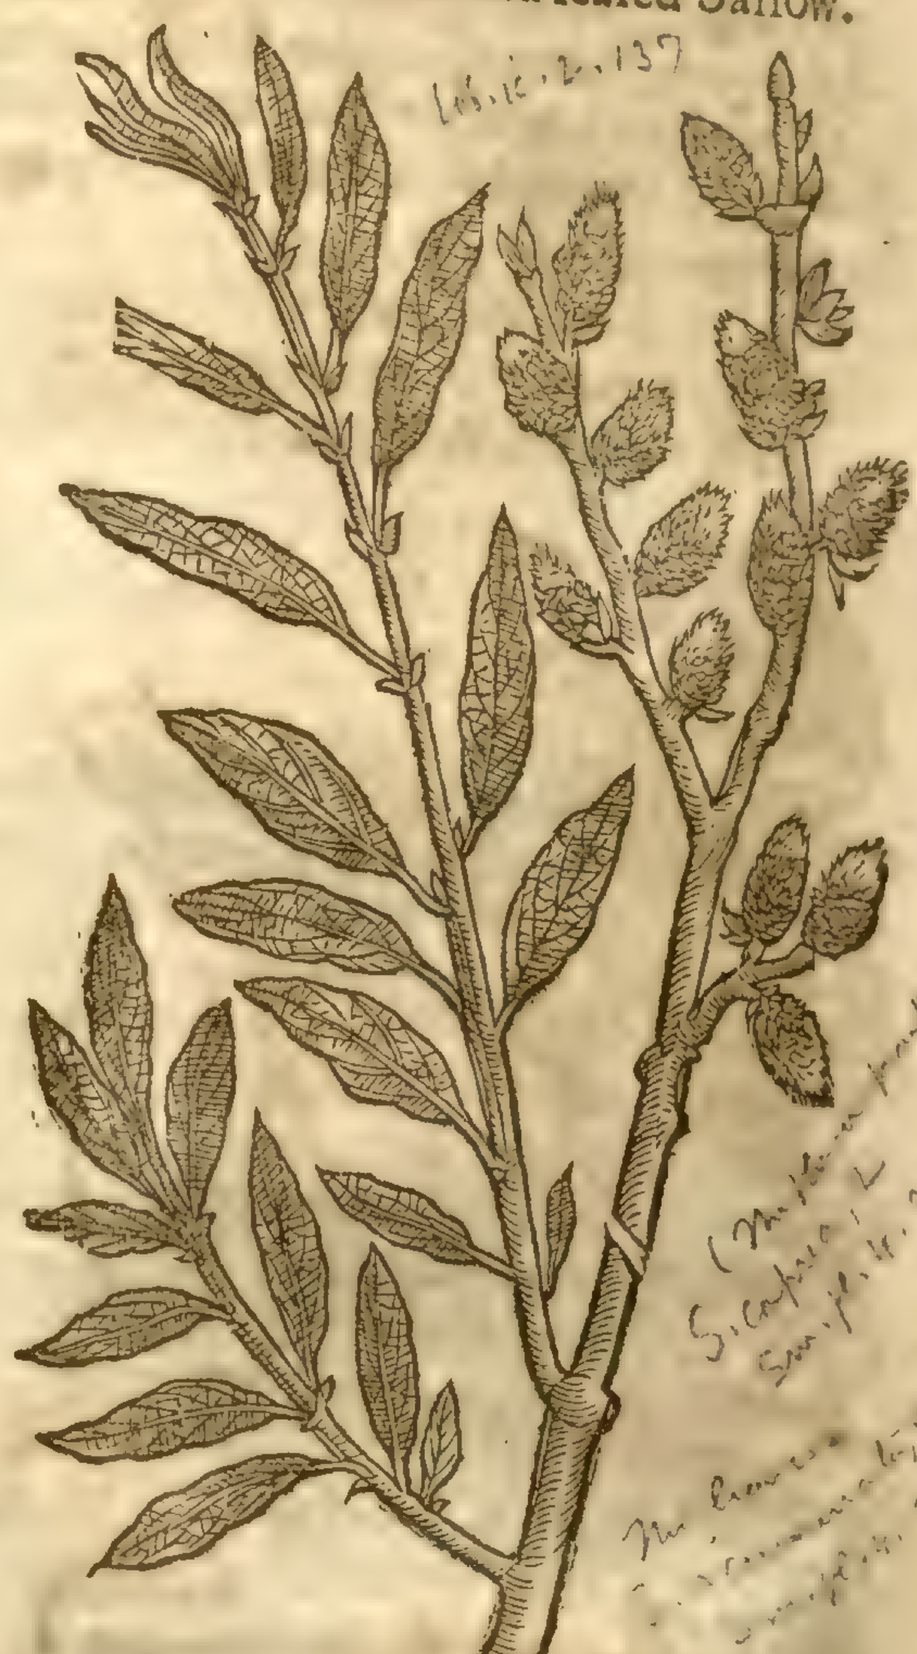
3 The Sallow tree or Goats Willow, groweth to a tree of a meane bigneſſe: the trunke or body is soft and hollow timber, couered with a whitish rough barke: the branches are set with leaues somewhat rough, greene aboue, and hoarie vnderneath: among which come forth round catkins, or aglets that turne into downe, which is carried away with the winde.

4 This other Sallow tree differeth not from the precedent, but in this one point, that is to say, the leaues are greater and longer, and euery part of the tree larger, wherein is the difference. ‡ Both those last described hath little roundish leaues like little eares growing at the bottoms of the foot-stalkes of the bigger leaues, whereby they may bee distinguished from all other Plnats of this kinde. ‡

5 The Rose Willow groweth vp likewise to the height and bigneſſe of a shrubby tree; the body whereof is couered with a scabby rough barke: the branches are many, whereupon do grow very many twigs of a reddish colour, garnished with small long leaues, somewhat whitish: amongst which come forth little floures, or rather a multiplication of leaues, joyned together in forme of a Rose,

3 *Salix Caprea rotundifolia.*
The Goat round leafed Willow.

4 *Salix Caprea latifolia.*
The Goat broad leafed Sallow.



5 *Salix Rosea Anglica.*
The Englisth Rose Willow.

Rose, of a greenish white colour, which doe not only make a gallant shew, but also yeeld a most cooling aire in the heat of Summer, being set vp in houses, for the decking of the same.

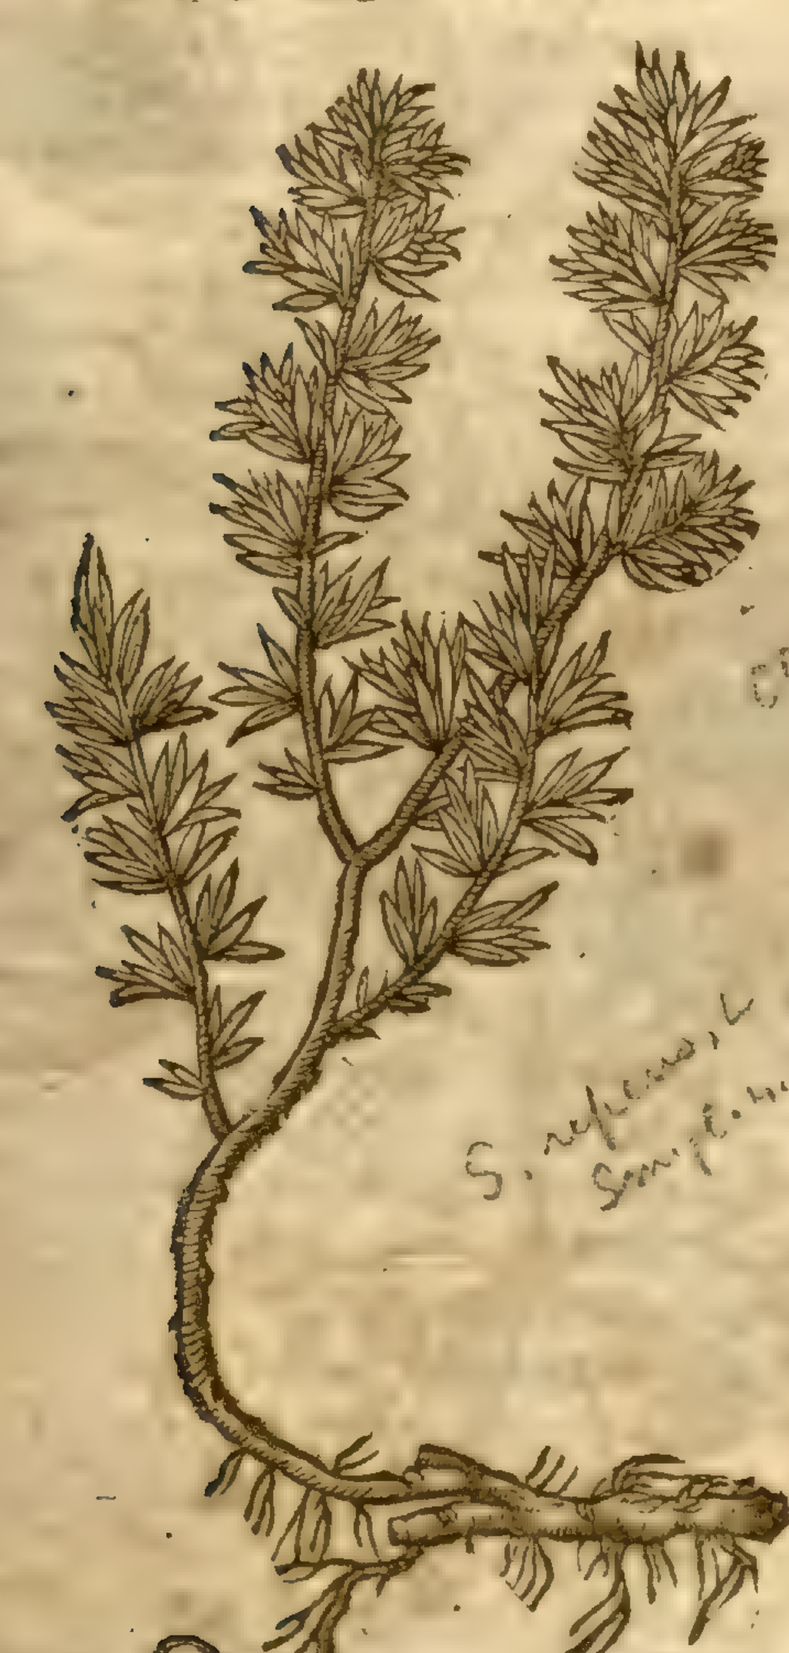
6 The low or base Willow growes but low, and leaneth weakely vpon the ground, hauing many small and narrow leaues, set vpon limber and pliant branches, of a darke or blackish greene colour: amongst which come forth long slender stems full of Mossie floures, which turne into a light downy substance that flieth away with the winde.

7 The dwarfe Willow hath very small and slender branches, seldome times aboue a foot, but neuer a cubit high, couered with a duskie barke, with very little and narrow leaues, of a greene colour aboue, and on the vpper side, but vnderneath of a hory or ouerworne greenish colour, in bigneſſe and fashion of the leaues of garden Flax: among which come forth little duskish floures, which doe turne into downe that is carried away with the winde: the root is small and threddy, of the bigneſſe of a finger, and of a blackish colour.

8 There is anorher kinde of willow like to the former, and differeth from it in that, the leaues of this kinde are smaller and narrower, as big as the leaues of Myrtle, hauing small knobby floures of a duskish colour, which

6 *Salix humilis.*
The low Willow.

‡ 8 *Salix humilis repens.*
Creeping dwarfe Willow.



7 *Chamæitea, siue Salix pumila.*
The dwarfe Willow.

which turne into downe that flyeth away with the winde: the root is small and limber, not growing deepe, but running along vpon the vpper crust of the earth.

¶ *The Place.*

These Willowes grow in diuers places of England: the Rose-Willow groweth plentifully in Cambridge shire, by the riuers and ditches there in Cambridge towne they grow abundantly about the places called Paradise and Hell-mouth, in the way from Cambridge to Grandchester: I found the dwarfe Willowes growing neere to a bog or marish ground at the further end of Hampsted heath vpon the declining of the hill, in the ditch that incloseth a small Cottage there, not halfe a furlong from the said house or cottage.

¶ *The Time.*

The Willowes doe floure at the beginning of the Spring.

¶ *The Names.*

The Willow tree is called in Greeke ἰτέα: in Latine, *Salix*: in high Dutch, **weyden**: in low Dutch, **wilgen**: in Italian, *Salice*; *Salcio*: in French, *Saux*: in Spanish, *Salgueiro*, *Salzer*, and *Sauz*: in English, Sallow, Withie, and Willow.

The

The greater is called in Latine *Salix perticalis*, common Withy, Willow, and Sallow, eſpecially that which being often lopped ſendeth out from one head many boughes: the kinde hereof with the red barke is called of *Theophraſtus*, blacke Withy; and the other white: *Pliny* calleth the blacke *Græca*, or Greeke Withie (the red, being the Greeke Withy) ſaith he, is eaſie to be cleft, and the whiter, *Amerina*.

Theophraſtus writeth, That the Arcadians doe call the leſſer Ἑλικὰς, not Ἰτέας: *Pliny* alſo nameth this *Helice*: both of them doe make this to be *Salicis tertia ſpecies*, the third kinde of Sallow: the ſame is likewiſe called in Latine, *Salix pumila*, *Salix viminalis*, *Gallica Salix*; and by *Columella*, *Sabina*, which he ſaith that many doe terme *Amerina*: in high Dutch, **Kleyn Weyden**: in low Dutch, **Wijmen**: in Engliſh, Oſier, ſmall Withy, Twig Withy: *Petrus Creſcentius* nameth it *Vincus*.

¶ *The Temperature.*

The leaues, floures, ſeed, and barke of Willowes are cold and dry in the ſecond degree, and aſtringent.

¶ *The Vertues.*

A The leaues and barke of Withy or Willowes do ſtay the ſpitting of bloud, and all other fluxes of bloud whatſoeuer in man or woman, if the ſaid leaues and barke be boyled in wine and drunke.

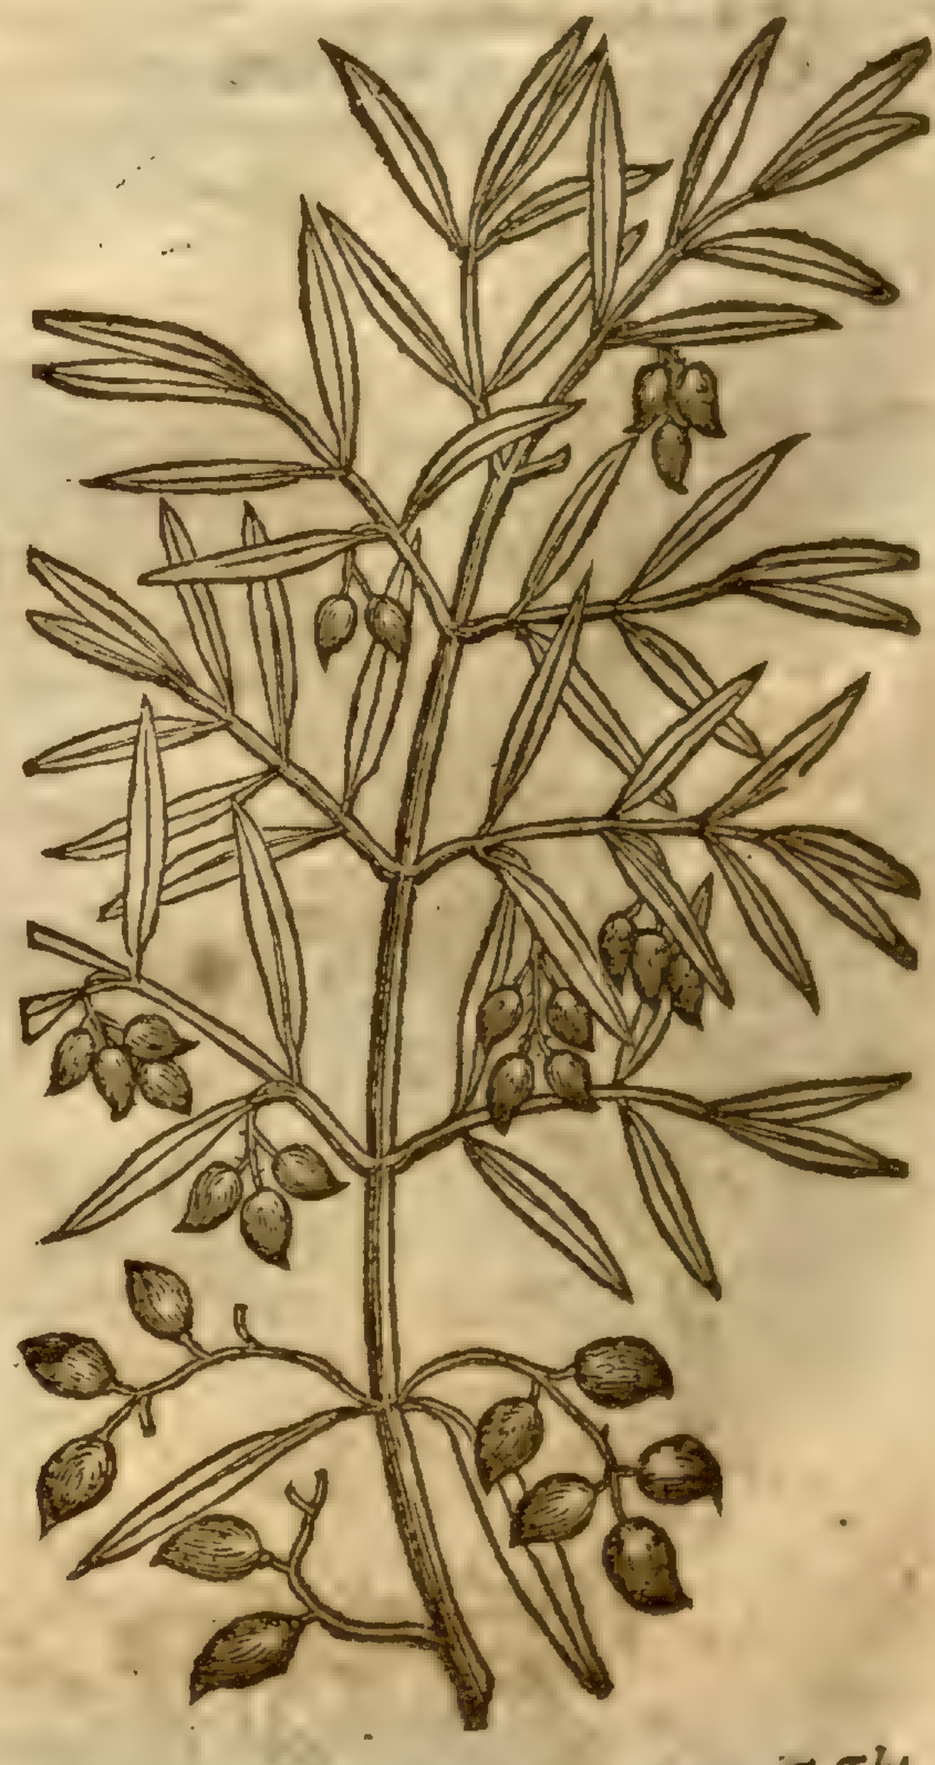
B The greene boughes with the leaues may very well be brought into chambers and ſet about the beds of thoſe that be ſicke of feuers, for they doe mightily coole the heate of the aire, which thing is a wonderfull refreſhing to the ſicke Patients.

C The barke hath like vertues: *Dioſcorides* writeth, That this being burnt to aſhes, and ſteeped in vineger, takes away cornes and other like riſings in the feet and toes: diuers, ſaith *Galen*, doe ſlit the barke whileſt the Withy is in flouring, and gather a certain juyce with which they vſe to take away things that hinder the ſight, and this is when they are conſtrained to vſe a clenſing medicine of thin and ſubtill parts.

Chap. 56. *Of the Oliue tree.*

1 *Olea ſatiua.*
The manured Oliue tree.

2 *Olea ſylueſtris.*
The wilde Oliue tree.



¶ The

¶ *The Description.*

1 THe tame or manured Oliue tree groweth high and great with many branches, full of long narrow leaues not much vnlike the leaues of Willowes, but narrower and smaller: the floures be white and very small, growing vpon clusters or bunches: the fruit is long and round, wherein is an hard stone: from which fruit is pressed that liquor which we call oyle Oliue.

2 The wilde Oliue is like vnto the tame or garden Oliue tree, sauing that the leaues are something smaller: among which sometimes doe grow many prickly thornes: the fruit hereof is lesser than of the former, and moe in number, which do seldome come to maturity or ripenes in so much that the oile which is made of those berries, continueth euer greene, and is called oile Omphacine, or oile of vnripe Oliues.

¶ *The Place.*

Both the tame and the wilde Oliue trees grow in very many places of Italy, France, and Spaine, and also in the Islands adjoyning: they are reported to loue the sea coasts; for most doe thinke, as *Columella* writeth, that aboue sixty miles from the sea they either die, or else bring forth no fruit: but the best, and they that doe yeeld the most pleasant oile are those that grow in the Island called Candy.

¶ *The Time.*

All the Oliue trees floure in the moneth of Iune: the fruit is gathered in Nouember or December: when they be a little dried and begin to wrinkle they are put into the presse, and out of them is squeezed oyle, with water added in the pressing: the Oliues which are to bee preserued in salt and pickle must be gathered before they be ripe, and whilest they are greene.

¶ *The Names.*

The tame or garden Oliue tree is called in Greeke Ἐλαία, and Ἐλαία ἥμερος: in Latine, *Olea satiua*, and *Vrbana*: in high Dutch, **Oelbaum**: in low Dutch, **Olijfboome**: in Italian, *Oliuo domestico*: in French, *Oliuier*: in Spanish, *Oliuo*, and *Oliuera*: in English, Oliue tree.

The berry is called *Oliua*: in Greeke also Ἐλαία: in Spanish, *Aceytuna*: in French, Dutch, and English, Oliue.

Oliues preserued in brine or pickle are called *Colymbades*.

The wilde Oliue tree is named in Greeke, Κότινος: in Latine, *Olea sylueſtris*, *Oleaſter*, *Cotinus*, *Olea Æthiopica*: in Dutch, **Wald Oelbaum**: in Italian, *Oliuo saluatico*: in Spanish, *Acebuche*, *Azambulbeyro*: in French, *Oliuier sauuage*: in English, wilde Oliue tree.

¶ *The Temperature and Vertues.*

The Oliues which be so ripe as that either they fall of themselues, or be ready to fall, which are named in Greeke, Ἀρυπεῖς, be moderately hot and moist, yet being eaten they yeeld to the body little nourishment. A

The vnripe Oliues are dry and binding. B

Those that are preserued in pickle, called *Colymbades*, doe dry vp the ouermuch moisture of the stomacke, they remoue the loathing of meate, stirre vp an appetite; but there is no nourishment at all that is to be looked for in them, much lesse good nourishment. C

The branches, leaues, and tender buds of the Oliue tree doe coole, dry, and binde, and especially of the wild Oliue; for they be of greater force than those of the tame: therefore by reason they be milder they are better for eye medicines, which haue need of binding things to be mixed with them. D

The same do stay S. Anthonies fire, the shingles, epiny & tides, night wheales, carbuncles, and eating vlcers: being laid on with honey they take away eschares, clense foule and filthy vlcers, and quench the heate of hot swellings, and be good for kernels in the flanke: they heale and skin wounds in the head, and being chewed they are a remedy for vlcers in the mouth. E

The juyce and decoction also are of the same effect: moreouer the juyce doth stay all manner of bleedings, and also the whites. F

The juyce is pressed forth of the stamped leaues, with Wine added thereto (which is better) or with water, and being dried in the Sun it is made vp into little cakes like perfumes. G

The sweat or oyle which issueth forth of the wood whilest it is burning healeth tetters, scurfs and scabs, if they be annointed therewith. H

The same which is pressed forth of the vnripe Oliues is as cold as it is binding. I

The old oile which is made of sweet and ripe Oliues, being kept long, doth withall become hotter, and is of greater force to digest or waste away; and that oile which was made of the vnripe Oliue, being old, doth as yet retaine some part of his former astriction, and is of a mixt faculty, that is to say, partly binding, and partly digesting; for it hath got this digesting or consuming faculty by age, and the other property of binding of his owne nature. K

The

L The oile of ripe Oliues mollifieth and aſſwageth paine, diſſolueth tumors or ſwellings, is good for the ſtiffeneſſe of the joynts, and againſt cramps, eſpecially being mingled according to art, with good and wholeſome herbes appropriate vnto thoſe diſeaſes and griefes, as *Hypericon*, Cammomill, Dill, Lillies, Roſes, and many others, which do fortifie and increaſe his verrues.

M The oile of vnripe Oliues, called *Omphacinum Oleum*, doth ſtay, repreſſe, and driue away the beginning of tumors and inflammations, cooling the heate of burning vlcers and exulcerations.

Chap. 57. *Of Priuet or Prim Print.*

Liguſtrum.
Priuet, or Prim Print.

¶ *The Deſcription.*

PRiuet is a ſhrub growing like a hedge tree, the branches and twigs hereof be ſtraight, and couered with ſoft gliſtring leaues of a deepe green colour, like thoſe of Peruincle, but yet longer, greater alſo than the leaues of the Oliue tree: the floures be white, ſweet of ſmell, very little, growing in cluſters; which being vaded there ſucceed cluſters of berries, at the firſt greene, and when they be ripe blacke like a little cluſter of grapes, which yeeld a purple juyce: the root groweth euery way aſlope.

¶ *The Place.*

The common Priuet groweth naturally in euery wood, and in the hedge rowes of our London gardens: it is not found in the countrey of Polonia and other parts adjacent.

¶ *The Time.*

It floureth in the end of May, or in Iune: the berries are ripe in Autumne or about Winter, which now and then continue all the Winter long; but in the meane time the leaues fall away, and in the Spring new come vp in their places.

¶ *The Names.*

It is called in Latine, *Liguſtrum*: in Italian at this day, *Guiſtrico*, by a corrupt word drawne from *Liguſtrum*: it is the Grecians κύπρος, and in no wiſe κυπάρισσος: for Cypres is a ſhrub that groweth naturally in the Eaſt, and Priuet in the Weſt. They be very like one vnto another, as the deſcriptions doe declare; but yet in this they differ, as witneſſeth *Bellonius*, becauſe the leaues of Priuet do fall away in Winter, and the leaues of Cyprus are alwaies greene: Moreouer, the leaues of Cyprus doe make the haire red, as *Dioſcorides* ſaith, and (as *Bellonius* reporteth) doe giue a yellow colour: but the leaues of Priuet haue no vſe at all in dying. And therefore *Pliny*, *lib.* 24. *cap.* 10. was deceiued, in that hee judged Priuet to be the ſelfe ſame tree which Cyprus is in the Eaſt: which thing notwithſtanding he did not write as he himſelfe thought, but as other men ſuppoſe; for *lib.* 12. *cap.* 14. he writeth thus, Some (ſaith he) affirme this, *viz.* Cyprus, to be that tree which is called in Italy, *Liguſtrum*; and that *Liguſtrum* or Priuet is that plant which the Grecians call κύπρος, the deſcription doth declare.

Phylliria, ſaith *Dioſcorides*, is a tree like in bigneſſe to Cyprus, with leaues blacker and broader than thoſe of the Oliue tree: it hath fruit like to that of the Maſtick tree, blacke, ſomething ſweet, ſtanding in cluſters, and ſuch a tree for all the world is Priuet, as we haue before declared.

Serapio the Arabian, *cap.* 44. doth call Priuet *Mahaleb*. There is alſo another *Mahaleb*, which is a graine or ſeed of which *Auicen* maketh mention, *cap.* 478. that it doth by his warme and comfortable heate diſſolue and aſſwage paine. *Serapio* ſeemeth to intreate of them both, and to containe diuers of the *Mahaleb* vnder the title of one chapter: it is named in high Dutch, **Beinholtzleiu, Wundtholtz, Rhein oder Schulweiden:** in low Dutch, **Keelcruyt, Monthout:** in French, *Treſne*: in Engliſh, Priuet, Primprint, and Print.

Some

Some there be that would haue the berries to be called *Vaccinia*, aud *Vaccinium* to be that of which *Vitruvius* hath made mention in his seuenth booke of Architecture or the art of building, chap. 14. of purple colours: after the same manner, saith hee, they temper *Vaccinium*, and putting milke vnto it doe make a gallant purple: in such breuitie of the old Writers what can be certainly determined?

¶ *The Temperature.*

The leaues and fruit of Priuet are cold, dry, and astringent.

¶ *The Vertues.*

The leaues of Priuet doe cure the swellings, apostumations, and vlcers of the mouth or throat, being gargarised with the juyce or decoction thereof, and therefore they be excellent good to be put into lotions, to wash the secret parts, and the scaldings with women, cankers and sores in childrens mouthes. A

Chap. 58. *Of Mocke-Priuet.*

1 *Phillyrea angustifolia.*
Narrow leaued Mocke-Priuet.

2 *Phillyrea latiore folio.*
The broader leaued Mocke-Priuet.

¶ *The Description.*

1 CYprus is a kinde of Priuet, and is called *Phillyrea*, which name all the sorts or kindes thereof doe retaine, though for distinction sake they passe vnder sundry titles. This plant groweth like an hedge tree, sometimes as big as a Pomegranate tree, beset with slender twiggy boughes which are garnished with leaues growing by couples, very like the leaues of the Oliue tree, but broader, softer, and of a green colour: from the bosomes of these leaues come forth great bunches of small white floures, of a pleasant sweet smell: which being vaded, there succeed clusters of blacke berries very like the berries of the Alder tree.

2 The second Cyprus, called also *Phillyrea latifolia*, is very like the former in body, branches, leaues,

3 *Phillyrea serrata 2. Clusij.*
The second toothed Priuet of *Clusius*.

leaues, floures, and fruit; and the difference is this, that the leaues of this plant are broader, but in faculty they are like.

3 This kinde of Priuet riseth vp like an hedge bush, of the height of fiue or six cubits: the branches are long, fragile or brittle, couered with a whitish barke, whereon are set leaues somewhat broad, jagged on the edges like the teeth of a saw, and of a deepe greene colour: among which come forth the flours, which neither my Author nor my selfe haue seene: the berries grow vpon small foot-stalkes, for the most part three together, being round, and of the bignesse of pepper graines, or Myrtle berries, of a blacke colour when they be ripe.

¶ *The Place.*

These plants do grow in Syria neere the city Ascalon, and were found by our industrious *Pena* in the mountaines neere Narbone and Montpelier in France: the which I planted in the garden at Barne-Elmes neere London, belonging to the right Honourable the Earle of Essex: I haue them growing in my garden likewise.

¶ *The Time.*

The leaues shoot forth in the first of the Spring: the floures shew themselues in May and Iune: the fruit is ripe in September.

¶ *The Names.*

This Priuet is called in Greeke, ἀίγειρος, and in Latine also *Cyprus*: they may be named in English, Easterlin Priuet, and Mock-Priuet, for the reason following: they are deceiued who taking *Pliny* for their Author, do thinke that it is *Ligustrum*, or our Westerne Priuet, as we haue shewed in the former chapter, it is the Arabians *Alcanna*, or *Henne*: and it is also called of the Turkes *Henne* euen at this present time.

¶ *The Temperature.*

The leaues of these kindes of Priuet haue a binding quality, as *Dioscorides* writeth.

¶ *The Vertues.*

A Being chewed in the mouth they heale the vlcers thereof, and are a remedy against inflammations or hot swellings.

B The decoction thereof is good against burnings and scaldings.

C The same being stamped and steeped in the juyce of Mullen and laid on, do make the haire red, as *Dioscorides* noteth. *Bellonius* writeth, that not onely the haire, but also the nether parts of mans body and nailes likewise are coloured and died herewith, which is counted an ornament among the Turks.

D The floures being moistned in vineger and applied to the temples asswage head-ache.

E There is also made of these an oile called *Oleum Cyprinum*, sweet of smell, and good to heate and supple the sinewes.

Chap. 59. *Of bastard Priuet.*

¶ *The Description.*

THis shrubby tree, called *Macaleb*, or *Mahaleb*, is also one of the Priuets: it riseth vp like vnto a small hedge tree, not vnlike vnto the Damson or Bullesse tree, hauing many vpright stalkes and spreading branches: whereon do grow leaues not vnlike to those of the *Phillyrea* of *Clusius* description: amongst which come forth mossie floures or a white colour, and of a perfect sweet

sweet smell, growing in clusters, many hanging vpon one stem, which the Grauer hath omitted: after which come the berries, green at the first, and blacke when they be ripe, with a little hard stone within, in which lies a kernell.

2 *Gesner* and *Matthiolus* haue set forth another *Macaleb*, being also another bastard Priuet. It groweth to a small hedge tree, hauing many green branches set with round leaues like those of the Elme tree, somwhat snipt about the edges: the flours are like those of the precedent, the fruit, or rather the kernell thereof, is as hard as a bead of Corall, somwhat round, and of a shining blacke colour; which the cunning French perfumers do bore thorow, making thereof bracelets, chaines, and such like trifling toyes, which they send into England, smeared ouer with some odde sweet Compound or other, and they are here sold vnto our curious ladies and gentlewomen for rare & strange Pomanders, for great summes of mony.

1 *Phillyria arbor, verior Macaleb.*
Bastard Privet.

2 *Macaleb Gesneri.*
Corall Privet.

¶ *The Place.*

These trees grow in diuers places of France, as about Tholouse and sundry other places. They are strangers in England.

¶ *The Time.*

The flowres bud forth in the Spring: the fruit is ripe in Nouember and December.

¶ *The Names.*

This bastard Privet is that tree which diuers suspect to be that *Mahaleb* or *Machaleb* of which *Avicen* writeth, *cap.* 478. and which also *Serapio* speaketh of out of *Mesue*: but it is an hard thing to affirme any certaintie thereby, seeing that *Avicen* hath described it without marks. Notwithstanding this is taken to be the same of most writers, and those of the best. We may call it in English, Bastard Privet, or Corall, or Pomander Privet, being without doubt a kinde thereof.

¶ *The Nature and Vertues.*

Concerning this bastard Privet we haue learned as yet no vse thereof in physicke. The kernels that are found in the stones or fruit, as they be like in taste to those of Cherries, so be they also answerable to them in temperature; for they are of a temperat heate, and gently prouoke vrine, and be therefore good for the stone: more wee haue not to write than hath been spoken in the description. At

Chap. 60. *Of the fruitleſſe Privet.*

¶ *The Deſcription.*

1 THis ſhrubby buſh, called of *Pliny* and *Cluſius*, *Alaternus*, growes vp to a ſmal hedge tree, in forme like vnto a baſtard Privet, but the leaues are more like thoſe of *Ilex* or French Oke, yet ſtiffer and rounder than thoſe of *Macaleb*: among which come forth tufts of greeniſh yellow ſtoures like thoſe of the Lentisk tree: vnder and among the leaues come forth the berries, like thoſe of *Laurus Tinus*, in which are contained two kernels like the acines or ſtones of the Grape.

1 *Alaternus Plinij.*
Fruitleſſe Privet.

2 *Alaternus humilior.*
The lower fruitleſſe Privet.

2 The ſecond kinde of *Alaternus* is likewiſe a fruitleſſe kinde of Privet, hauing narrow leaues ſomwhat ſnipt about the edges; from the boſoms whereof come forth ſmall herby colored ſtours, which being vaded, the fruit ſucceedeth, whereof *Avicen* ſpeaketh, calling it *Fagaras*, being a fruit in bigneſſe & form like thoſe in ſhops called *Cocculus Indi*, and may be the ſame, for any thing that hath bin written to the contrary. This fruit hangs as it were in a darke aſh coloured skin or huske, which incloſeth a ſlender ſtiffe ſhell like the ſhell of a nut, couered with a thin or black filme, whether it be the fruit of this plant it is not cenſured; notwithſtanding you ſhall find the figure hereof among the Indian fruits, by the name *Fagaras*.

‡ This hath ſhorter branches and rounder leaues than the former: the ſtoures are larger, and greener, to which ſucceed fruit cluſtering together, firſt green, then red, and afterwards blacke, and conſiſting of three kernels. It ſtoures in February and the beginning of March, and growes in ſundry places of Spain. The fruit of this is not the *Fagaras*, neither doth the *Fagaras* mentioned by our Author any way agree with the *Cocculus Indi* of the ſhops, as ſhal be ſhewed hereafter in their fit places. ‡

¶ *The Place.*

Theſe Plants grow in the ſhadowy woods of France, and are ſtrangers in England.

¶ *The*

¶ *The Time.*

The Time answereth the rest of the Priuets.

¶ *The Names.*

Alaternus of *Pliny* is the same *Phillyrea* which *Theophrastus* hath written of by the name *Philyca*: and *Bellonius* also, *lib.* 1. *cap.* 42. of his Singularities, and the people of Candy call it *Elaprinon*: the Portugals, *Casca*: in French, *Dalader*, and *Sangin blanc*: in English, barren or fruitlesse Privet: notwithstanding some haue thought it to beare fruit, which at this day is called *Fagaras*: with vs, *Cocculus Indi*, as we haue said. ‡ I can by no meanes approue of the English name here giuen by our Author; but iudge the name of Euer-green Privet (giuen it by Mr *Parkinson*) to be much more fitting to the thing. ‡

¶ *The Temperature and Vertues.*

Whether the plant be vsed in medicine I cannot as yet learn: the fishermen of Portugall vse to seethe the barke thereof in water, with the which decoction they colour their nets of a reddish colour, being very fit for that purpose: the wood also is vsed by Dyers to dye a dark black withall. A

Chap. 61. *Of the white and blew Pipe Priuet.*

1 *Syringa alba.*
White Pipe.

2 *Syringa cærulea.*
Blew Pipe.

¶ *The Description.*

1 THe white Pipe groweth like an hedge tree or bushy shrub; from the root whereof arise many shoots which in short time grow to be equall with the old stocke, whereby in a little time it increaseth to infinit numbers, like the common English Prim or Priuet, whereof doubtlesse it is a kinde, if wee consider euery circumstance. The branches are couered with a rugged gray barke: the timber is white, with some pith or spongie matter in the middest like Elder, but lesse in quantitie. These little branches are garnished with small crumpled leaues of the shape and bignesse of the Peare tree leaues, and very like in form: among which come forth the

‡ 3 *Syringa Arabica.*
Arabian Pipe.

4 *Balanus Myrepsica, sive Glans vnguentaria.*
The oily Acorne.

the flours, growing in tufts, compact of four small leaues of a white colour, and of a pleasant sweet smell; but in my iudgment they are too sweet, troubling and molesting the head in very strange manner. I once gathered the floures and layed them in my chamber window, which smelled more strongly after they had lien together a few houres, with such an vnacquainted sauor that they awaked me out of sleepe, so that I could not rest till I had cast them out of my chamber. The floures being vaded, the fruit follows, which is small, curled, and as it were compact of many little folds, broad towards the vpper part, and narrow toward the stalke, and black when it is ripe, wherein is contained a slender long seed. The root hereof spreadeth it selfe abroad in the ground after the manner of the roots of such shrubby trees.

2 The blew Pipe groweth likewise in manner of a small hedge tree, with many shoots rising from the root like the former, as our common Privet doth, whereof it is a kind. The branches haue a small quantity of pith in the middle of the wood, and are couered with a darke blacke greenish barke or rinde. The leaues are exceeding greene, and crumpled or turned vp like the brimmes of a hat, in shape very like vnto the leaues of the Poplar tree: among which come the flours, of an exceeding faire blew colour, compact of many smal floures in the form of a bunch of grapes: each floure is in shew like those of *Valeriana rubra Dodonæi*, consisting of four parts like a little star, of an exceeding sweet sauour or smell, but not so strong as the former. When these floures be gon there succeed flat cods, and somwhat long, which being ripe are of a light colour, with a thinne membrane or filme in the middest, wherein are seeds almost foure square, narrow, and ruddy.

‡ 3 This (which *Clusius* setteth forth by the name of *Iasminum Arabicum*, or *Syringa Arabica*) groweth some two or three cubits high, diuided into many slender branches, whereon by couples at each joint stand leaues like those of the first described, but thinner, and not snipt about the edges. On the tops of the branches grow the floures, wholly white, consisting of nine, tenne, or twelue leaues set in two ranks: these floures are sweet, hauing a sent as it were compounded of the Spanish Iasmine and Orenge flours. It is a tender plant, and may be grafted on the common Iasmine, whereon it thriues well, and floures most part of the Summer. It groweth plentifully in Egypt; and *Prosper Alpinus* is thought to mention this by the name of *Sambac Arabum, sive Gelseminum Arabicum*. ‡

4 *Glans vnguentaria*, or the oily Acorne, is the fruit of a tree like Tamariske, of the bignesse of an Hasell nut; out of the kernell whereof, no otherwise than out of bitter Almonds, is pressed an oily juyce, which is vsed in pretious Oyntments, as *Dioscorides* affirmeth. Neither is it in our time wholly rejected; for the oile of this Fruit mixed with sweete Odours serueth to perfume gloues

gloues and diuers other things,and is vulgarly known by the name of oile of Ben.

¶ *The Place.*

12 These trees grow not wild in England, but I haue them growing in my garden in very great plenty.

¶ *The Time.*

They floure in Aprill and May,but as yet they haue not borne any fruit in my garden,though in Italy and Spain their fruit is ripe in September.

¶ *The Names.*

The later Physitians call the first *Syringa*,or rather Συριγξ,that is to say,a Pipe,because the stalkes and branches therof when the pith is taken out are hollow like a Pipe: it is also many times syrnamed *Candida* or white,or *Syringa Candida flore*,or Pipe with a white floure, because it should differ from *Lillach*,which is somtimes named *Syringa cærulea*,or blew Pipe: in English,white Pipe.

Blew Pipe the later physitians, as we haue said,do name *Lillach* or *Lilach*: of some,*Syringa cærulea*,or blew Pipe: most do expound the word *Lillach*,and call it *Ben*: *Serapio's* and the Arabians *Ben* is *Glans Vnguentaria*, which the Grecians name Βάλανος Μυρεψικὴ: from which *Lillach* doth very much differ: amongst other differences it is very apparant that *Lillach* bringeth forth no nut, howsoeuer *Matthiolus* doth falsly picture it with one; for it hath only a little cod,the seed whereof hath in it no oile at all. The figure of the *Balanus Myrepsica* we haue thought good to insert in this Chapter,for want of a more conuenient roome.

¶ *The Temperature and Vertues.*

Concerning the vse and faculties of these herbs neither we our selues haue found out any thing, nor learned ought of others.

‡ *Balanus Myrepsica* taken in the quantity of a dram causeth vomit; drunk with *Hydromel* it purgeth by the stoole,and is hurtfull to the stomacke. A

The oile pressed out of this fruit,which is vsually termed oile of Ben,as it hath no good or pleasing smell, so hath it no ill sent,neither doth it become rancide by age, which is the reason that it is much vsed by Perfumers. B

The oile smoothes the skin,softens and dissolues hardnesse,and conduces to the cure of all cold affects of the sinues: and it is good for the pain and noise in the eares,being mixt with goose grease, and so dropped in warme in a small quantitie. ‡ C

Chap. 62. *Of Widow-waile or Spurge Olive.*

¶ *The Description.*

Widow-waile is a small shrub about two cubits high. The stalke is of a woody substance, branched with many small twigs full of little leaues like Privet,but smaller and blacker: on the ends whereof grow small pale yellow floures; which being past, there succedeth a three cornered berry like the Tithymales,for which cause it was called *Tricoccos*, that is, three berried *Chamælea*. These berries are green at the first,red afterward,and brown when they be withered, and contain in them an oily fatnesse like that of the Oliue,being of an hot biting tast,and burning the mouth as do both the leaues and rinde. The root is hard and wooddy.

¶ *The Place.*

It is found in most vntilled grounds in Italy and Languedoc in France, in rough and desart places. I haue it growing in my garden.

¶ *The Time.*

It is alwaies green: the seed is ripe in Autumne.

¶ *The Names.*

The Grecians call it χαμαίδαφνη, as though they should say low or short Oliue tree: the Latines,*Olea*,& *Oleastellus*,and likewise *Citocacium*: it is also named of diuers,*Olivella*,as *Matthiolus Sylvaticus* saith: it is called in English,Widow-waile,*quia facit viduas*.

The fruit is named of diuers, Κόκκος κνίδιος: in Latine,*Coccus cnidius*: but he is deceiued,saith *Dioscorides*,that nameth the fruit of Spurge Olive,*Coccus cnidius*. *Avicen* and *Serapio* call *Chamælea* or Spurge Olive,*Mezereon*; vnder which name notwithstanding they haue also contained both the Chamæleons or Carlines,and so haue they confounded *Chamælea* or Spurge Olive with the Carlines,and likewise *Thymælea* or Spurge flax.

Chamælea Arabum Tricoccos.
Widow-waile.

Chamælea Germanica, ſive Mezereon.
Spurge Flax, or the dwarfe Bay.

¶ *The Temperature.*

Both the leaues and fruit of Spurge olive, as we haue ſaid, are of a burning and extreme hot temperature.

¶ *The Vertues.*

The leaues, ſaith *Dioſcorides*, purge both flegme and choler, eſpecially taken in pils, ſo that two parts of Wormwood be mixed with one of Spurge Olive, and made vp into pills with Mede or honied water: they melt not in the belly, but as many as be taken are voided whole.

Meſue alſo hath a deſcription of pils of the leaues of *Mezereon*, that is, *Chamælea* or ſpurge Olive (yet *Sylvius* expounds it *Thymælea*, or Spurge flax) but in ſtead of wormwood he taketh the outward ſubſtance of the yellow Mirobalans and *Cepula Mirobalans*, and maketh them vp with *Tereniabin*, that is, with Manna and foure Dates, which they call Tamarinds, diſſolued in Endive water; & appointeth the ſame leaues to be firſt tempered with very ſtrong vineger, and to be dried.

Theſe pills are commended againſt the dropſie, for they expell waterie humours, but are violent to nature; therefore wee muſt vſe them as little as may be. Further *Dioſcorides* addeth, that the leaues of Spurge olive beaten with hony do clenſe filthy or cruſted vlcers.

CHAP. 63.

Of Germane Olive Spurge.

¶ *The Deſcription.*

THe dwarfe Bay tree, called of Dutchmen *Mezereon*, is a ſmal ſhrub two cubits high the branches be tough, limber, and eaſie to bend, very ſoft to be cut: whereon grow long leaues like thoſe of Privet, but thicker & fatter: the floures appeare before the leaues, oft times in Ianuarie, cluſtering together about the ſtalks at certain diſtances, of a whitiſh colour tending to purple, and of a fragrant pleaſant ſweet ſmell: after come the ſmall berries, green at the firſt, but beeing ripe of a ſhining red, and after of a darke blacke colour, of a very hot and burning taſt, inflaming the mouth and throat, with danger of choking. The root is wooddy.

¶ *The Place and Time.*

This plant growes naturally in moiſt and ſhadowy woods of moſt of the Eaſt countries eſpecially about Melvin in Poland, from whence I haue had great plenty for my Garden, where they flour in the firſt of the ſpring, and ripen their fruit in Auguſt.

¶ *The Names.*

It is vſually called in high-Dutch, **Zeilant**, **Zeidelbaſt**, **Lenſzkraut**, and **Killerhals**: the Apothe-

Apothecaries of our countrey call it *Mezereon*, but wee had rather name it *Chamælea Germanica*, or Dutch Mezereon, or it may be called Germane Olive Spurge. We haue heard that diuers Italians do name the fruit thereof *Piper montanum*, or Mountain Pepper. Some say that *Laureola* or Spurge Laurell is this plant; but there is another *Laureola*, of which we will hereafter treat: but by what name it is called of the antient writers, & whether they knew it or no, it is hard to tel. It is thought to be *Cneoron album Theophrasti*, but by reason of his breuitie we can affirme no certaintie.

There is, saith he, two kindes of *Cneoron*, the white and the blacke, the white hath a long leaf like in forme to Spurge Olive, the blacke is full of substance like Myrtle; the low one is more white, the same is with smell, and the blacke without smell. The root of both, which groweth deepe, is great: the branches be many, thicke, wooddy, immediatly growing out of the earth, or little aboue the earth, tough; wherefore they vse these to bind with, as with Oziars. They bud and floure when the Autumne Equinoctial is past, and a long time after. Thus much *Theophrastus*.

The Germane Spurge Olive is not much vnlike to the Olive tree in leafe: the floure is sweet of smell, the buds whereof, as we haue written, come forth after Autumne: the branches are wooddy and pliable, the root long, growing deep: all which shew that it hath great likenesse and affinitie with *Cneoron*, if it be not the very same.

¶ *The Temperature.*

This plant is likewise in all parts extreme hot: the fruit, leaues, and rinde are very sharpe and biting; they bite the tongue, and set the throat on fire.

¶ *The Vertues.*

The leaues of Mezereon do purge downeward, flegme, choler, and watery humours, with great violence. A

Also if a drunkard doe eat one graine or berry of this plant, hee cannot be allured to drinke any drinke at that time, such will be the heate in his mouth and choking in the throat. B

This plant is very dangerous to be taken into the body, and in nature like to the sea Tithymale, leauing (if it be chewed) such an heate and burning in the throat, that it is hard to be quenched. C

The shops of Germany and the Low-countries do when need requires vse the leaues hereof in stead of Spurge Olive; which may be done without error, for this Germane Spurge Olive is like in vertue and operation to the other: therefore it may be vsed in stead therof, and prepared after the selfe same manner. D

Chap. 64. *Of Spurge Flax.*

Thymælea.

Spurge Flax, or mountaine Widow-waile.

¶ *The Description.*

SPurge Flax bringeth forth many slender branched sprigs aboue a cubit high, couered round with long and narrow leaues like those of Flax, narrower and lesser than the leaues of Spurge Olive. The flours are white, smal, standing on the vpper parts of the sprigs: the fruit is round, greene at the first, but red when it is ripe, like almost to the round berries of the Hawthorne; in which is a white kernell couered with a blacke skin, very hot, and burning the mouth like Mezereon. The root is hard and wooddy.

¶ *The Place.*

It growes in rough mountaines and vntoiled places in hot regions. It groweth in my garden.

¶ *The Time.*

It is green at any time of the yeare, but the fruit is perfected in Autumne.

¶ *The Names.*

The Grecians cal it Θυμελαια: the Syrians, as *Dioscorides* witnesseth, *Apolinon*: Diuers also *Chamælea*, but vnproperly. *Dioscorides* saith the leafe is properly called *Cneoron*, and the fruit *Coccos Cnidios*: notwithstanding those which *Theophrastus* calls *Cneora* seeme to differ from *Thymælea*, or Spurge flax, vnlesse *Nigrum Cneo-*

ron

ron be *Thymælea*: for *Theophraſtus* ſaith that there be two kindes of *Cneoron*, the one white, the other blacke. This may be called in Engliſh, Spurge flax, or mountain Widow-waile. The ſeed of *Thymælea* is called in ſhops *Granum Cnidium*.

¶ *The Temperature.*

Spurge Flax is naturally both in leaues and fruit extreme hot, biting, and of a burning qualitie.

¶ *The Vertues.*

A The graines or berries, as *Dioſcorides* ſaith, purge by ſiege choler, flegme, and water, if 20 graines of the inner part be drunke; but it burneth the mouth and throat: wherefore it is to be giuen with fine floure of Barly meale, or in Raiſins, or couered with clarified hony, that it may be ſwallowed.

B The ſame being ſtamped with Niter and vineger ſerueth to anoint thoſe with which can hardly ſweat.

C The leaues muſt be gathered about harueſt, and being dried in the ſhade, they are to be layd vp and reſerued.

D They that would giue them muſt beat them and take forth the ſtrings: the quantity of two ounces and two drammes put into Wine tempered with water, purgeth and draweth forth watery humors: but they purge more gently if they be boiled with Lentils, and mixed with pot-herbs chopped.

E The ſame leaues beaten to pouder and made vp into trochiskes or flat cakes with the iuyce of ſoure grapes, are reſerued for vſe.

F The herb is an enemie to the ſtomacke, which alſo deſtroyeth the birth if it be applied.

† Our Author formerly following *Tabern.* gaue two figures and deſcriptions in this Chap. but being both of one thing, I omitted the worſer figure and deſcrip-

CHAP. 65. *Of Spurge Laurel.*

Laureola florens.
Laurel or Spurge Laurell flouring.

Laureola cum fructu.
Laurel with his fruit.

¶ *The Description.*

SPurge Laurell is a shrub of a cubit high, oftentimes also of two, and spreadeth with many little boughes which are tough and lithy, and couered with a thicke rinde: the leaues be long, broad, grosse, smooth, blackish green, shining like the leaues of Laurell, but lesser, thicker, and without smell, very many at the top clustering together. The floures bee long, hollow, of a whitish greene, hanging beneath and among the leaues: the berries when they be ripe are blacke, with a hard kernell within, which is a little longer than the seed of Hemp: the pulpe or inner substance is white: the root wooddy, tough, long, and diuersly parted, growing deep: the leaues, fruit, and bark, as well of the root as of the little boughes, do with their sharpnesse and burning qualitie bite and inflame the tongue and throat.

¶ *The Place.*

It is found on mountaines in vntilled rough shadowy and wooddy places, as by the lake of Lozanna in Geneva, and in many places neere the riuer of Rhene and of the Maze. ‡ It growes abundantly also in the woods in most parts of England. ‡

¶ *The Time.*

The floures bud very soon, a little after the Autumne Æquinoctial: they are full blown in winter or in the first Spring: the fruit is ripe in May and Iune; the plant is alwaies greene, and endureth the cold stormes of winter.

¶ *The Names.*

It is called in Greeke Δαφνοειδὲς, of the likenesse it hath with the leaues of the Laurel or Bay tree: in Latine likewise *Daphnoides*: the later Latines for the same cause name it *Laureola*, as though they should say *Minor Laurus* or little Laurel. It is called χαμαιδάφνη, and πίπλιον: notwithstanding there is another *Chamædaphne* and another *Peplion*. This shrub is commonly called in English, Spurge Laurell; of diuers, Lawrell or Lowry.

Some say that the Italians name the berries thereof *Piper montanum*, or mountain Pepper, as also the berries of Dutch Mezereon: others affirme them to be called in high-Dutch also **Zeilant**.

It may be *Theophrastus* his *Cneoron*; for it is very like the Myrtle in leafe, it is also a branched plant, tough and pliable, hauing a deep root without smell, with a blacke fruit.

¶ *The Temperature.*

It is like in temperature and facultie to the German Spurge Oliue, throughout the whole substance biting and extreme hot.

¶ *The Vertues.*

The dry or green leaues of Spurge Laurel, saith *Dioscorides*, purgeth by siege flegmatick humors; A
it prouoketh vomit and bringeth downe the menses, and being chewed it draweth water out of the head.

It likewise causeth neesing. Moreouer, fifteen grains of the seed thereof drunk are a purgation. B

Chap. 66. *Of Rose-Bay or Oleander.*

¶ *The Description.*

1 ROse bay is a smal shrub of a gallant shew like the Bay tree, bearing leaues thicker, greater, longer, and rougher than the leaues of the Almond tree: the flours be of a fair red colour, diuided into fiue leaues, not much vnlike a little Rose: the cod or fruit is long like *Asclepias* or *Vincetoxicum*, and full of such white down, among which the seed lieth hidden: the root is long, smooth, and wooddy.

2 The second kinde of Rose Bay is like the first, and differs in that, that this plant hath white floures; but in other respects it is very like.

¶ The

1 *Nerium, sive Oleander.*
The Rose Bay.

2 *Nerium flore albo.*
The Rose Bay with white flours.

¶ *The Place.*

These grow in Italy and other hot regions by riuers and the sea side: I haue them growing in my garden.

¶ *The Time.*

In my garden they floure in Iuly and August: the cods be ripe afterwards.

¶ *The Names.*

This plant is named in Greeke Νήριον, by *Nicander*, Νήριος: in Latine likewise *Nerion* and also *Rhododendron*, and *Rhododaphne*, that is to say, *Rosea arbor*, or *Rosea Laurus*: in shops, *Oleander*: in Italian, *Oleandro*: in Spanish, *Adelfa*, *Eloendro*, and *Alendro*: in French, *Rosagine*: in English, Rose tree, Rose-Bay, Rose Bay tree, and Oleander.

¶ *The Temperature and Vertues.*

A This tree being outwardly applied, as *Galen* saith, hath a digesting facultie: but if it be inwardly taken it is deadly and poisonsome, not only to men, but also to most kindes of beasts.

B The flours and leaues kill dogs, asses, mules, and very many other foure footed beasts: but if men drinke them in wine they are a remedy against the bitings of Serpents, and the rather if Rue be added.

C The weaker sort of Cattell, as sheep and goats, if they drinke the water wherein the leaues haue been steeped, are sure to die.

Chap. 67. *Of dwarfe Rose Bay.*

¶ *The Description.*

DWarfe *Nerium* or Rose Bay hath leaues which for the most part are alwaies green, rough, and small, of a pale yellow colour like Box, far lesser than Oleander: the whole plant is of a shrubby stature, leaning this way and that way, as not able to stand vpright without help; his branches are couered and set full of small floures, of a shining skarlet or crimson colour, growing vpon the

Chamærhodendros Alpigena.
Dwarfe Rose Bay.

the hills as you goe from Trent to Verona, which in Iune and Iuly are as it were couered with a scarlet colored carpet, of an odoriferous sauor and delectable aspect; which being fallen, there commeth seed and faire berries like Asparagus.

¶ *The Place.*

The place and time are expressed in the description.

¶ *The Names.*

This may be called in English, dwarf rose Bay of the Alps. I find nothing extant of the vertues, but am constrained to leaue the rest vnto your owne discretion.

† The other plant of our Author, formerly described in this Chapter in the second place, by the name of *Chamærododendros montana*, I haue here omitted, because he set it forth before by the name of *Cistus Ledum Stœchadis folio*, giuing two figures and one description, in the 11 and 12 places of the 8 Chap. of this 3 Booke.

Laurus.
The Bay tree.

ly in Spaine and such hot regions: we plant and set it in gardens, defending it from cold at the beginning of March especially.

I haue not seen any one tree thereof growing in Denmarke, Suevia, Poland, Livonia, or Russia, or in any of those cold countries where I haue trauelled.

¶ *The Place.*

The Bay tree groweth green winter and summer: it floureth in the spring, and the black fruit is ripe in October.

¶ *The Names.*

This tree is called in Greeke δάφνη: in Latine, *Laurus*: in Italian, *Lauro*: in high-Dutch, **Loeerbeerbaum**: in low-Dutch, **Laurus boom**: in French, *Laurier*: in Spanish, *Laurel*, *Lorel*, and *Laurero*: in English, Laurel or Bay tree.

The fruit is named in Greeke δαφνίδες: in Latine, *Lauri baccæ*: in high-Dutch, **Loeerbeeren**: in low-Dutch, **Bakeleer**: in Spanish, *Vayas*: in English, Bay berries.

The Poets feigne that it tooke his name of *Daphne*, *Lado* his daughter, with whom *Apollo* fell in loue.

¶ *The Temperature and Vertues.*

A The berries and leaues of the Bay tree, saith *Galen*, are hot and very dry, and yet the berries more than the leaues.

B The barke is not biting and hot, but more bitter, and it hath also a certain astrictiue or binding qualitie.

C The berries with Hony or Cute are good in a licking medicine, saith *Dioscorides*; against the Ptysicke or consumption of the lungs, difficultie of breathing, and all kindes of fluxes or rheumes about the chest.

D Bay berries taken in wine are good against the bitings and stingings of any venomous beast, and against all venom and poison: they clense away the morphew: the juice pressed out hereof is a remedie for pain in the eares, and deafnesse, if it be dropped in with old wine and oile of Roses. This is also mixed with ointments that are good against wearisomnesse, and that heate and discusse or waste away humors.

E Bay berries are put into Mithridate, Treacle, and such like medicines that are made to refresh such people as are growne sluggish and dull by means of taking opiate medicines, or such as haue any venomous or poisonous qualitie in them.

F They are good also against cramps and drawing together of sinues.

G We in our time do not vse the beries for the infirmities of the lungs or chest, but minister them against the diseases of the stomacke, liuer, spleen, and bladder: they warme a cold stomacke, cause concoction of raw humours, stirre vp a decayed appetite, take away the loathing of meat, open the stopping of the liuer and spleene, prouoke vrin, bring downe the menses, and driue forth the secondine.

H The oile pressed out of these, or drawne forth by decoction, doth in short time take away scabs and such like filth of the skin.

I It cureth them that are beaten blacke and blew, and that be bruised by squats and falls: it remoueth blacke and blew spots and congealed bloud, and digesteth and wasteth away the humours gathered about the grieued part.

K *Dioscorides* saith that the leaues are good for the diseases of the mother and bladder, if a bath be made thereof to bathe and sit in: that the greene leaues doe gently binde, that being applied they are good against the stingings of wasps and Bees: that with barley meale parched and bread they asswage all kinde of inflammations: and that being taken in drinke they mitigate the paine of the stomacke, but procure vomit.

L The berries of the Bay tree stamped with a little Scammonie and saffron, and labored in a mortar with vineger and oile of Roses to the forme of a liniment, and applied to the temples and forepart of the head, do greatly cease the pain of the megrim.

M It is reported that common drunkards were accustomed to eat in the morning fasting two leaues thereof against drunkennesse.

N The later Physitions do often vse to boile the leaues of Laurell with diuers meats, especially fishes, and by so doing there hapneth no desire of vomiting, but the meat seasoned herewith becommeth more sauorie and better for the stomacke.

O The barke of the root of the Bay tree, as *Galen* writeth, drunken in wine prouoketh vrine, breakes the stone and driueth forth grauell: it openeth the stoppings of the liuer, the spleene, and all other stoppings of the inward parts: which thing also *Dioscorides* affirmeth, adding, That it kils the child in the mothers wombe.

It

It helpeth the dropsie and the jaundise, and procureth vnto women their desired sickenesse. P

† Our Author here also gaue the two figures of *Tabernamontanus*; the first by the name of *Laurus mas*, or the male Bay tree, and the other by the name of *Laurus fœmina*, the female Bay: the difference in the figures was little or none, wherefore I haue made one serue.

Chap. 69. *Of the Wilde Bay tree.*

¶ *The Description.*

1 *Laurus Tinus*, or the wilde Bay tree, groweth like a shrub or hedge bush, hauing many tough and pliant branches, set full of leaues very like to the Bay leaues, but smaller and more crumpled, of a deepe and shining greene colour: among which come forth tufts of whitish floures, turning at the edges into a light purple: after which follow small berries of a blew colour, containing a few graines or seeds like the stones or seeds of grapes: the leaues and all the parts of the plant are altogether without smell or sauour.

1 *Laurus Tinus.*
The wilde Bay tree.

2 *Laurus Tinus Lusitanica.*
The Portingale wilde Bay tree.

2 *Tinus Lusitanica* groweth very like to *Cornus Fœmina*, or the Dog-berry tree, but the branches be thicker, and more stiffe, couered with a reddish barke mixed with greene: the leaues are like the former, but larger, hauing many sinewes or veines running through the same like as in the leaues of Sage: the floures hereof grow in tufts like the precedent, but they are of a colour more declining to purple: the small branches are likewise of a purple colour: the leaues haue no smell at all, either good or bad: the berries are smaller than the former, of a blew colour declining to blackenesse.

¶ *The Place.*

The wilde Bay groweth plentifull in euery field of Italy, Spaine, and other regions, which differ according to the nature and scituation of those countries: they grow in my garden and prosper very well.

¶ *The Time.*

The wilde Laurell is euer greene, and may oftentimes be seene most part of the Winter, and the beginning of the Spring, with the floures and ripe berries growing both at one season.

¶ *The Names.*

It is called in Latine *Tinus*, and *Laurus sylvestris*: in Greeke, δάφνη ἀγρία: *Cato* nameth it *Laurus sylvatica*: in Italian, *Lauro sylvatico*: in Spanish, *Vua de perro*, otherwise *Follado*; and of diuers, *Durillo*: in English, wilde Bay.

¶ *The Temperature and Vertues.*

Pliny nor any other of the Antients haue touched the faculties of this wilde Bay, neither haue we any vnderstanding thereof by the later Writers, or by our owne experience.

Chap. 70. *Of the Box Tree.*

Buxus.
The Box tree.

¶ *The Description.*

THe great Box is a faire tree, bearing a great body or trunke: the wood or timber is yellow and very hard, and fit for sundry workes, hauing many boughes and hard branches, beset with sundry small hard greene leaues, both Winter and Summer like the Bay tree: the floures are very little, growing among the leaues, of a greene colour: which being vaded there succeed small blacke shining berries, of bignesse of the seeds of Corianders, which are inclosed in round greenish huskes, hauing three feet or legs like a brasse or boyling pot: the root is likewise yellow, and harder than the timber, but of geeater beauty, and more fit for dagger hafts, boxes, and such like vses, whereto the trunke or body serueth, than to make medicines; though foolish emperickes and Women leaches, doe minister it against the Apoplexie, and such diseases: Turners and Cutlers, if I mistake not the matter, doe call this wood Dudgeon, wherewith they make Dudgeon hafted daggers.

There is also a certaine other kinde hereof, growing low, and not aboue halfe a yard high, but it spreadeth all abroad: the branches hereof are many and very slender: the leaues bee round, and of a light greene.

¶ *The Place.*

Buxus, or the Box tree groweth vpon sundry waste and barren hils in England, and in diuers gardens.

¶ *The Time.*

The Box tree groweth greene Winter and Summer: it floureth in February and March, and the seed is ripe in September.

¶ *The Names.*

The Grecians call it πύξος: in Latine, *Buxus*: in high Dutch, **Buchßbaum**: in low Dutch, **Burboom**: in Italian, *Bosso*: in English, Box tree.

The lesser may be called χαμαιπύξος: and in Latine, *Humi Buxus*, or *Humilis Buxus*: in English, dwarfe Box, or ground Box, and it is commonly called Dutch Box.

¶ *The Temperature and Vertues.*

The leaues of the Box tree aree hot, dry, and astringent, of an euill and lothsome smell, not vsed in medicine, but onely as I said before in the description.

A

Chap.

Chap. 71. *Of the Myrtle tree.*

¶ *The Description.*

1 THe first and greatest *Myrtus* is a small tree, growing to the height of a man, hauing many faire and pliant branches, couered with a browne barke, and set full of leaues much like vnto the Laurell or Bay leafe, but thinner and smaller, somewhat resembling the leaues of Peruincle, which being bruised do yeeld forth a most fragrant smell, not much inferiour vnto the smell of Cloues, as all the rest of the kinds do: among these leaues come forth small white floures, in shape like the flours of the Cherry tree, but much smaller, and of a pleasant sauour, which do turne into small berries, greene at the first, and afterwards blacke.

1 *Myrtus Laurea maxima.*
The Myrtle tree.

‡ 2 *Myrtus Batica latifolia.*
Great Spanish Myrtle.

‖ There is also another kinde of *Myrtus* called *Myrtus Batica latifolia*, according to *Clusius*, *Myrtus Laurea*, that hath leaues also like Bay leaues, growing by couples vpon his pleasant green branches, in a double row on both sides of the stalkes, of a light greene colour, and somewhat thicker than the former, in sent and smell sweet: the floures and fruit are not much differing from the first kinde.

3 There is likewise another kinde of *Myrtus* called *Exotica*, that is strange and not common: it groweth vpright vnto the height of a man like vnto the last before mentioned, but that it is replenished with greater plenty of leaues, which do fold in themselues hollow and almost double, broader pointed, and keeping no order in their growing, but one thrusting within another, and as it were crossing one another confusedly; in all other points agreeing with the precedent.

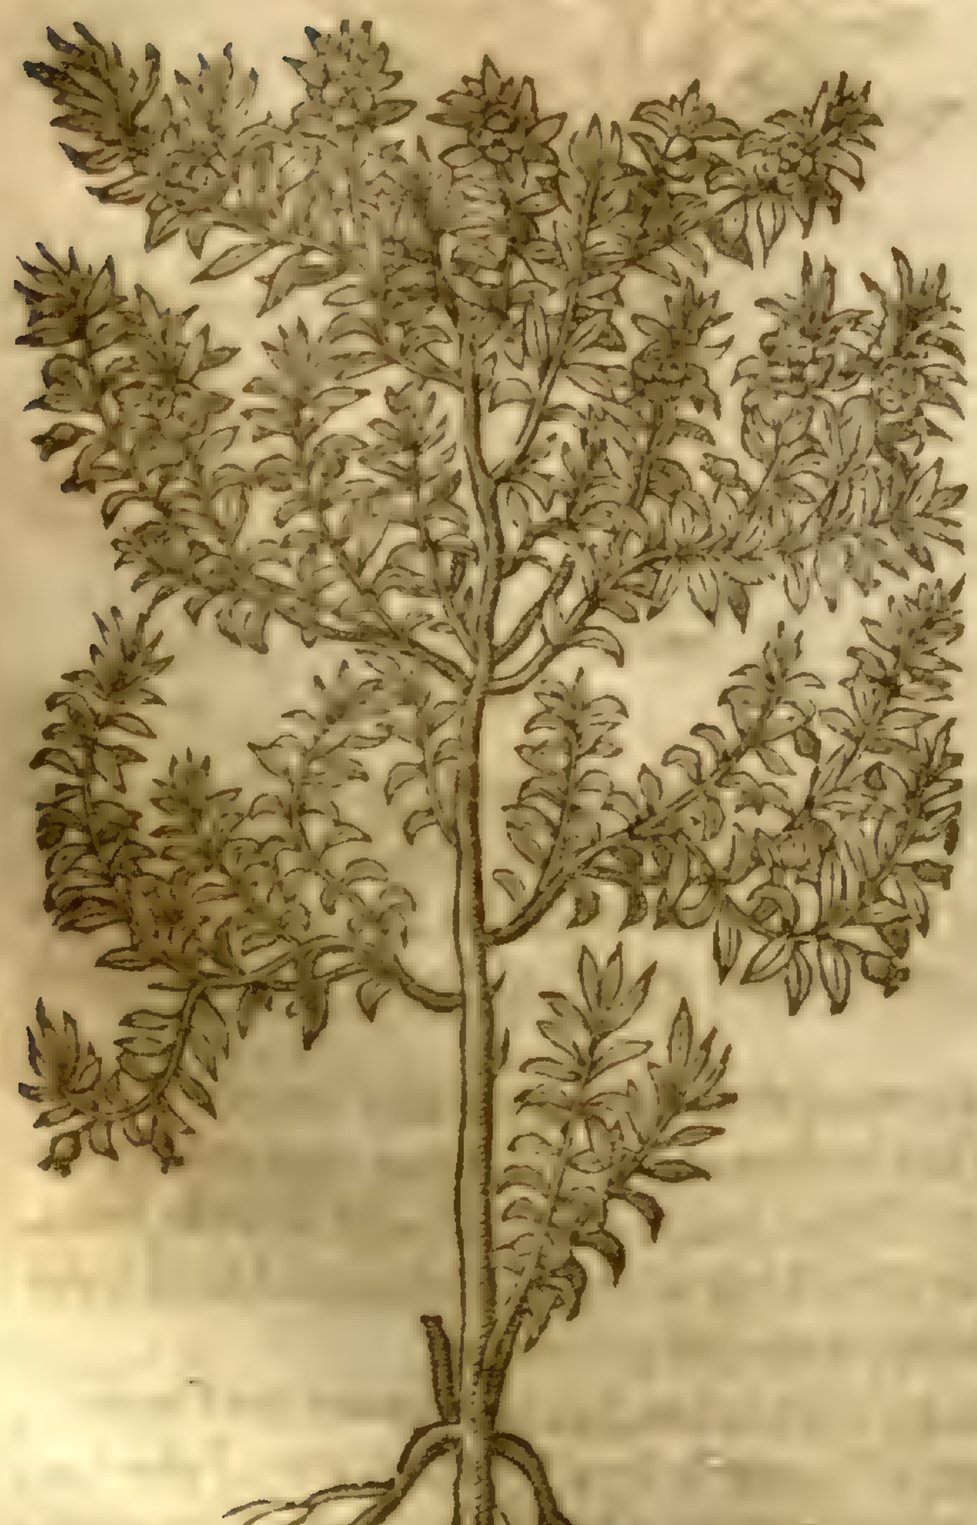
4 There is another sort like vnto the former in floures and branches, but the leaues are *smooth*, flat and plaine, and not crumpled or folded at all, they are also much smaller than any of the former. The fruit is in shape like the other, but that it is of a white colour, wheras the fruit of the other is blacke.

5 There is also another kinde of Myrtle, called *Myrtus minor*, or noble Myrtle, as being the

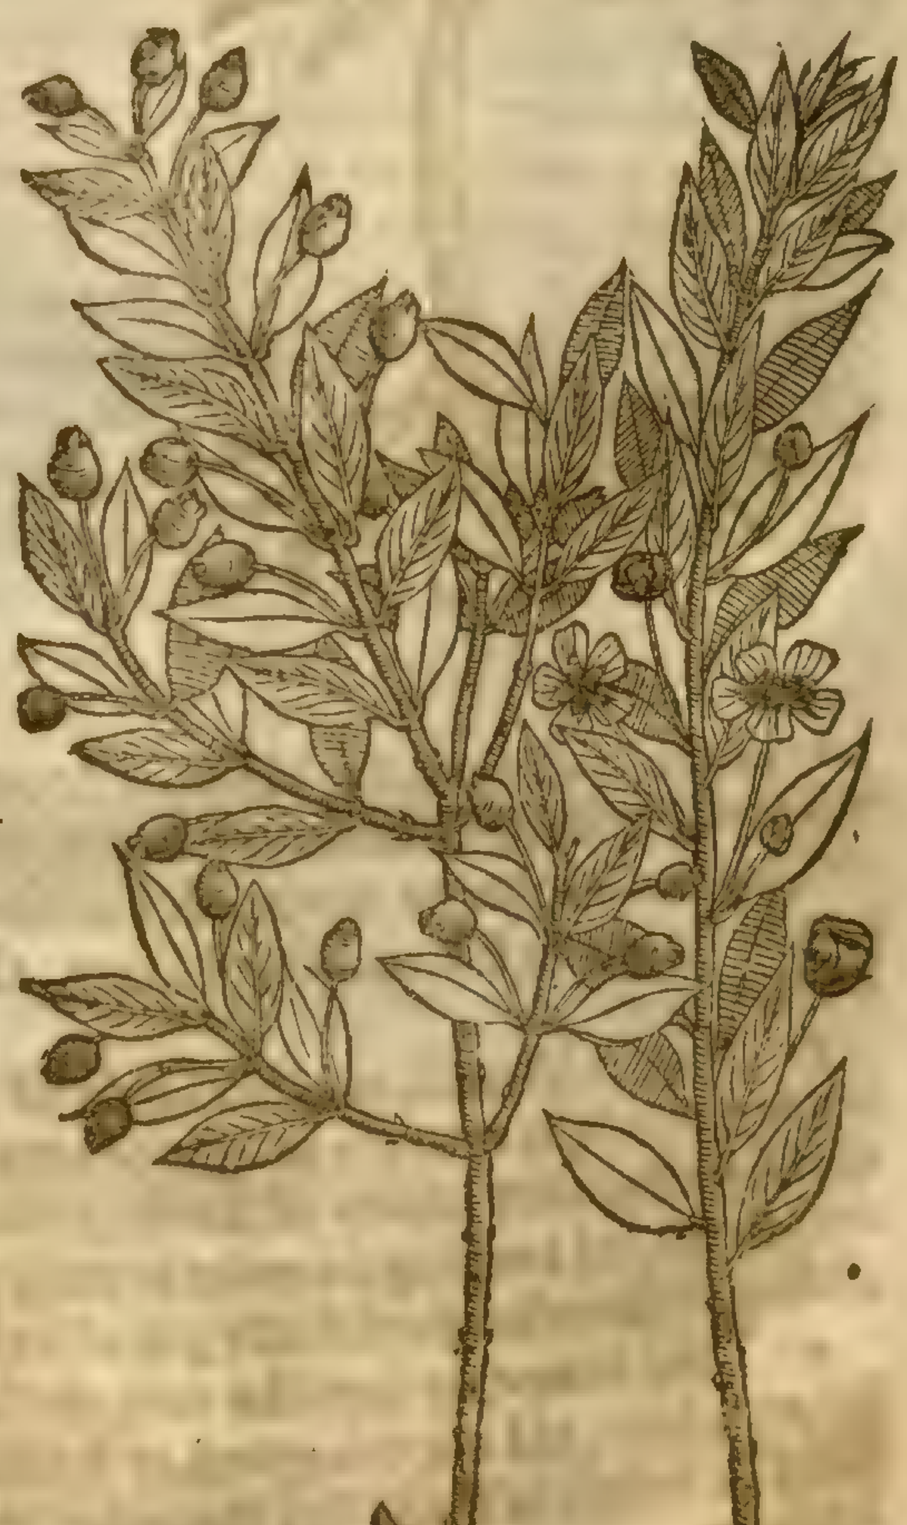
‡ 3 *Myrtus exotica.*
Strange Myrtle.

‡ 4 *Myrtus fructu albo.*
Myrtle with white berries.

‡ 5 *Myrtus minor.*
The little Myrtle.



‡ 6 *Myrtus Batica sylueſtris.*
Wilde Spaniſh Myrtle.



chiefe of all the reſt) although moſt common and beſt knowne) and it groweth like a little ſhrub or hedge buſh, very like vnto the former, but much ſmaller: the leaues are ſmall and narrow, very much in ſhape reſembling the leaues of Maſticke Time called *Marum*, but of a freſher greene colour: the floures be white, nothing differing from the former ſauing in greatneſſe, and that ſometimes they are more double.

‡ 6 This growes not very high, neither is it ſo ſhrubby as the former: the branches are ſmall and brittle: the leaues are of a middle bigneſſe, ſharpe pointed, ſtanding by couples in two rowes, ſeldome in foure as the former, they are blackiſh alſo and well ſmelling, the floure is like that of the reſt: the fruit is round, growing vpon long ſtalkes out of the boſomes of the leaues, firſt greene, then whitiſh, laſtly blacke, of a winy and pleaſant taſte with ſome aſtriction. This growes wilde in diuers places of Portugall, where *Cluſius* found it flouring in October: he calls it *Myrtus Bætica ſylueſtris*. ‡

¶ *The Place.*

Theſe kindes of Myrtles grow naturally vpon the wooddy hills and fertill fields of Italy and Spaine. ‡ The two laſt are nouriſhed in the garden of Miſtriſſe *Tuggie* in Weſtminſter, and in ſome other gardens. ‡

¶ *The Time.*

Where they joy to grow of themſelues they floure when the Roſes doe: the fruit is ripe in Autumne: in England they neuer beare any fruit.

¶ *The Names.*

It is called in Greeke μύρτος: in Latine, *Myrtus*: in the Arabicke tongue, *Alas*: in Italian, *Myrto*: in Spaniſh, *Arrayhan*: in the Portugale language, *Murta*, and *Murtella*: other Nations doe almoſt keepe the Latine name, as in Engliſh it is called Myrtle, or Myrtle tree.

Among the Myrtles that which hath the fine little leafe is ſurnamed of *Pliny*, *Tarentina*; and that which is ſo thicke and full of leaues is *Exotica*, ſtrange or forreine. *Nigra Myrtus* is that which hath the blacke berries: *Candida*, which hath the white berries, and the leaues of this alſo are of a lighter greene: *Satiua*, or the tame planted one is cheriſhed in gardens and orchards: *Sylueſtris*, or the wilde Myrtle is that which groweth of it ſelfe; the berries of this are oftentimes leſſer, and of the other, greater. *Pliny* doth alſo ſet downe other kindes; as *Patritia*, *Plebeia*, and *Conjugalis*: but what manner of ones they are he doth not declare: he alſo placeth among the Myrtles, *Oxymerſine*, or Kneeholm, which notwithſtanding is none of Myrtles, but a thorny ſhrub,

Pliny in his 14. booke, 16. chap. ſaith, that the wine which is made of the wild Myrtle tree is called *Myrtidanum*, if the copy be true. For *Dioſcorides* and likewiſe *Sotion* in his Geoponikes report, that wine is made of Myrtle berries when they be thorow ripe, but this is called *Vinum Murteum*, or *Myrtites*, Myrtle wine.

Moreouer, there is alſo a wine made of the berries and leaues of Myrtle ſtamped and ſteeped in Muſt, or wine new preſſed from the grape, which is called, as *Dioſcorides* ſaith, *Myrſinite vinum*, or wine of Myrtles.

The Myrtle tree was in times paſt conſecrated to *Venus*. *Pliny* in his 15. booke, 29. chapter, ſaith thus, There was an old Alter belonging to *Venus*, which they now call *Murtia*.

¶ *The Temperature and Vertues.*

The Myrtle conſiſteth of contrary ſubſtances, a cold earthineſſe bearing the preheminence; it A
hath alſo a certaine ſubtill heate, therefore, as *Galen* ſaith, it drieth notably.

The leaues, frurt, buds, and juyce do binde, both outwardly applied and inwardly taken: they ſtay B
the ſpitting of bloud, and all other iſſues thereof: they ſtop both the whites and reds in women, if they ſit in a bath made therewith: after which manner and by fomenting alſo they ſtay the ſuperfluous courſe of the hemorrhoides.

They are a remedy for laskes, and for the bloudy flix, they quench the fiery heate of the eies, if C
they be laid on with parched Barly meale.

They be alſo with good ſucceſſe outwardly applied to all inflammations newly beginning, and D
alſo to new paine vpon ſome fall, ſtroke or ſtraine.

They are wholeſome for a moiſt and watery ſtomacke: the fruit and leaues dried prouoke vrine: E
for the greene leaues containe in them a certaine ſuperfluous and hnrtfull moiſture.

It is good with the decoction hereof made with wine, to bathe lims that are out of joint, and bur- F
ſtings that are hard to be cured, and vlcers alſo of the outward parts: it helpeth ſpreading tetters, ſcoureth away the dandriffe and ſores of the head, maketh the haires blacke, and keepeth them from

from ſhedding; withſtanding drunkenneſſe, if it be taken faſting, and preuaileth againſt poiſon, and the bitings of any venomous beaſt.

G There is drawne out of the green berries thereof a juyce, which is dried and reſerued for the foreſaid vſes.

H There is likewiſe preſſed out of the leaues a juyce, by adding vnto them either old wine or raine water, which muſt be vſed when it is new made, for being once dry it putrifieth, and as *Dioſcorides* ſaith, loſeth his vertues.

Chap. 72. *Of ſweet Willow or Gaule.*

Myrtus Brabantica, ſiue Elæagnus Cordi.
Gaule, ſweet willow, or Dutch Myrtle tree.

¶ *The Deſcription.*

GAule is a low and little ſhrub or wooddy plant, hauing many browne & hard branches: whereupon doe grow leaues ſomewhat long, hard, thicke, and oileous, of an hot ſauour or ſmell ſomewhat like *Myrtus*: among the branches come forth other little ones, wherupon do grow many ſpoky eares or tufts, full of ſmall floures, and after them ſucceed great ſtore of ſquare ſeeds cluſtering together, of a ſtrong and bitter taſte. The root is hard, and of a wooddy ſubſtance.

¶ *The Place.*

This Gaule groweth plentifully in ſundry places of England, as in the Ile of Ely, & in the Fenny countries thereabouts, whereof there is ſuch ſtore in that countrey, that they make fagots of it and ſheaues, which they call Gaule ſheaues, to burn and heat their ouens. It groweth alſo by Colebrooke, and in ſundry other places.

¶ *The Time.*

The Gaule floureth in May and Iune, and the ſeed is ripe in Auguſt.

¶ *The Names.*

This tree is called of diuers in Latine, *Myrtus Brabantica*, and *Pſeudomyrſine*; and *Cordus* calleth it *Elæagnus*, *Chamæleagnus*, and *Myrtus Brabantica*. *Elæagnus* is deſcribed by *Theophraſtus* to be a ſhrubby plant like vnto the Chaſte tree, with a ſoft and downy leafe, and with the floure of the Poplar tree; and that which we haue deſcribed is no ſuch plant. It hath no name among the old writers for ought we know, vnleſſe it be *Rhus ſylueſtris Plinij*, or *Pliny* his wilde Sumach, of which he hath written in his 24. booke, 11. chap. [There is, ſaith he, a wilde herbe with ſhort ſtalkes, which is an enemy to poiſon, and a killer of mothes.] it is called in low Dutch, **Gagel**: in Engliſh, Gaule.

¶ *The Temperature.*

Gaule or the wilde Myrtle, eſpecially the ſeed, is hot and dry in the third degree: the leaues be hot and dry, but not ſo much.

¶ *The Vertues.*

A The fruit is troubleſome to the brain; being put into beere or ale whileſt it is in boyling (which many vſe to do) it maketh the ſame heady, fit to make a man quickely drunke.

B The whole ſhrubbe, fruit and all, being laied among clothes, keepeth them from mothes and wormes.

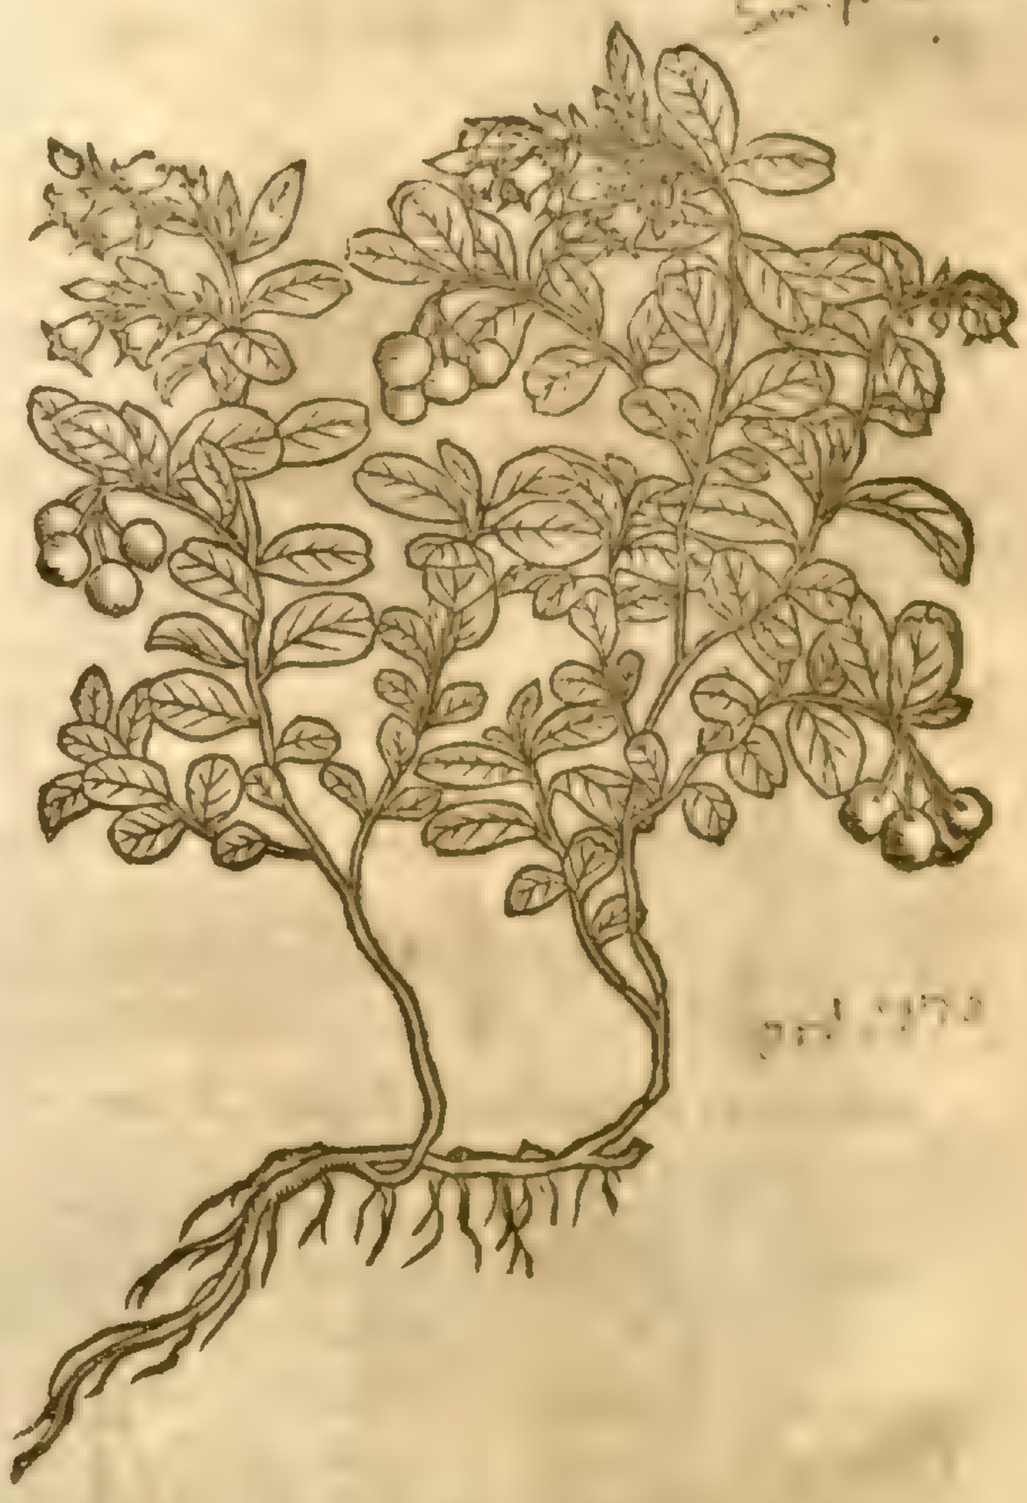
Chap. 73. *Of Worts or Wortle berries.*

¶ *The Kindes.*

Vaccinia, or Worts, of which we treat in this place, differ from Violets, neither are they esteemed for their floures but berries: of these Worts there be diuers sorts found out by the later Writers.

1 *Vaccinia nigra.*
Blacke Worts or Wortle berries.

2 *Vaccinia rubra.*
Red Worts or Wortle berries.



¶ *The Description.*

1 *Vaccinia nigra*, the blacke Wortle or Hurtle, is a base and low shrub or wooddy plant, bringing forth many branches of a cubit high, set full of small leaues of a darke greene colour, not much vnlike the leaues of Box or the Myrtle tree: amongst which come forth little hollow floures turning into small berries, greene at the first, afterward red, and at the last of a blacke colour, and full of a pleasant and sweet juyce: in which doe lie diuers little thinne whitish seeds: these berries do colour the mouth and lips of those that eat them, with a blacke colour: the root is wooddy, slender, and now and then creeping.

2 *Vaccinia rubra*, or red Wortle, is like the former in the manner of growing, but that the leaues are greater and harder, almost like the leaues of the Box tree, abiding greene all the Winter long: among which come forth small carnation floures, long and round, growing in clusters at the top of the branches: after which succeed small berries, in shew and bignesse like the former, but that they are of an excellent red colour and full of juyce, of so orient and beautifull a purple to limme withall, that Indian *Lacca* is not to be compared thereunto, especially when this juyce is prepared and dressed with Allom according to art, as my selfe haue proued by experience: the taste is rough and astringent: the root is of a wooddy substance.

3 *Vaccinia alba*, or the white Wortle, is likevnto the former, both in stalkes and leaues, but the berries are of a white colour, wherein consisteth the difference.

‡ The figure which our Author here giues in the third place hath need of a better description, for

3 *Vaccinia alba.*
The white Worts or Wortle berries.

4 *Vaccinia Pannonica, ſiue Vitis Idæa.*
Hungarie Wortle berries.

5 *Vaccinia Vrſi, ſiue Vua Vrſi apud Claſium.*
Beare Wortle berries.

† 6 *Vitis Idæa folijs ſubrotundis major.*
Great round leaued Wortle berries.

for the difference is not onely in the colour of the berries. This differs from the former in forme and bigneſſe; for it ſends forth many ſtalks from the root, and theſe three, foure, or fiue cubits high, thicke, and diuided into ſundry branches, couered for the moſt part with a blackiſh barke: at the beginning of the Spring from the buds at the ſides of the branches it ſends forth leaues all horie and hairy vnderneath, and greene aboue: from the midſt of theſe vpon little foot-ſtalkes ſtand cluſtering together many little floures, conſiſting of fiue white leaues apiece without ſmell; and then the leaues by little and little vnfold themſelues and caſt off their downineſſe, and become ſnipt about the edges. The fruit that ſucceeds the floures is round, blacke, ſomewhat like, but bigger than a Haw, full of juyce of a very ſweet taſte; wherein lies ten or more longiſh ſmooth blackiſh ſeeds. It growes vpon the Auſtrian and Stirian Alps, where the fruit is ripe in Auguſt. *Cluſius* calls it *Vitis Idæa* 3. *Pena* and *Lobel*, *Amelancher*: *Geſner* by diuers names, as *Myrtomalus*, *Petromelis*, *Pyrus ceruinus*, *&c.* ‡

4 *Carolus Cluſius* in his Pannonicke Obſeruations hath ſet downe another of the Wortle berries, vnder the name of *Vitis Idæa*, which differeth from the other Wortle berries, not onely in ſtature, but in leaues and fruit alſo. ‡ The leaues are long, narrow, ſharpe pointed, full of veines, a little hairy, and lightly ſnipt about the edges, greener aboue than below: the fruit growes from the tops of the branches of the former yeare, hanging vpon long foot-ſtalkes, and being as big as little Cherries, firſt greene, then red, and laſtly blacke, full of juyce, and that of no vnpleaſant taſte, containing no kernels, but flat white ſeeds commonly fiue in number: the ſtalks are weake, and commonly lie vpon the ground: *Cluſius* found it vpon the Auſtrian mountain Snealberg, with the fruit partly ripe, and partly vnripe in Auguſt. It is his *Vitis Idæa* 1. ‡

5 The ſame Author alſo ſetteth forth another of the Wortle berries, vnder the title of *Vua Vrſi*, which is likewiſe a ſhrubby plant, hauing many feeble branches, whereon grow long leaues blunt at the points, and of an ouerworne greene colour: among which, at the tops of the ſtalks come forth cluſters of bottle-like floures of an herby colour: the fruit followeth, growing likewiſe in cluſters, green at the firſt, and blacke when they be ripe: the root is of a wooddy ſubſtance. ‡ This is alwaies greene, and the floures are of a whitiſh purple colour. ‡

‡ 6 This differs from the ſecond, in that the leaues are thinner, more full of veines, and whiter vnderneath: the floure is like the common kind, whitiſh, purple, hollow, and diuided into fiue parts: the fruit alſo is blacke, and like that of the firſt deſcribed. This growes on diuers mountainous places of Germany, where *Cluſius* obſerued it, who made it his *Vitis Idæa* 2. ‡

¶ *The Place.*

Theſe plants proſper beſt in a leane barren ſoile, and in vntoiled wooddy places: they are now and then found on high hills ſubject to the winde, and vpon mountaines: they grow plentifully in both the Germanies, Bohemia, and in diuers places of France and England; namely in Middleſex on Hampſted heath, and in the woods thereto adjoyning, and alſo vpon the hills in Cheſhire called Broxen hills, neere Beeſton caſtle, ſeuen miles from the Nantwich; and in the wood by Highgate called Finchley wood, and in diuers other places.

The red Wortle berry groweth in Weſtmerland at a place called Crosby Rauenſwaith, where alſo doth grow the Wortle with the white berry, and in Lancaſhire alſo vpon Pendle hills.

‡ I haue ſeene none of theſe but onely the firſt deſcribed, growing vpon Hampſted heath. The white formerly mentioned in the third deſcription, and here againe in the place, ſeems only a varietie of the ſecond hauing white berries, as far as I can gather by our Author; for it is moſt certaine, that it is not that which he figured, and I haue deſcribed in the third place. ‡

¶ *The Time.*

The Wortle berries do floure in May, and their fruit is ripe in Iune.

¶ *The Names.*

Wortle berries is called in high Dutch, **Heydelbeeren:** in low Dutch, **Crakebeſſen,** becauſe they make a certaine cracke whileſt they be broken betweene the teeth: of diuers, **Hauerbeſſen:** the French men, *Airelle*, or *Aurelle*, as *Iohannes de Choul* writeth: and we in England, Worts, Whortle berries, Blacke berries, Bill berries, and Bull berries, and in ſome places Win berries.

Moſt of the ſhops of Germany do call them *Myrtilli*, but properly *Myrtilli* are the fruit of the Myrtle tree, as the Apothecaries name them at this day. This plant hath no name for ought wee can learne, either among the Greekes or antient Latines; for whereas moſt doe take it to be *Vitis Idea*, or the Corinth tree, which *Pliny* ſurnameth *Alexandrina*, it is vntrue; for *Vitis Idæa* is not onely like to the common Vine, but is alſo a kinde of Vine: and *Theophraſtus* who hath made mention hereof doth call it, without an Epethete, Ἄμπελος, ſimply, as a little after we will declare; which without doubt he would not haue done if hee had found it to differ from the common Vine: For what things ſoeuer receiue a name of ſome plant, the ſame are expreſſed with ſome Epethit added to be known to differ from others; as *Laurus Alexandrina*, *Vitis alba*, *Vitis nigra*, *Vitis ſylueſtris*, and ſuch like.

Moreouer, thoſe things which haue borrowed a name from ſome plant are like thereunto, if not wholly,

wholly, yet either in leafe or fruit, or in some other thing, *Vitis alba & nigra*, that is, the white and blacke Bryonies, haue leaues and clasping tendrels as hath the common Vine, and clyme also after the same manner: *Vitis sylueſtris*, or the wilde Vine, hath such like stalkes as the Vine hath, and bringeth forth fruit like to the little Grapes. *Laurus Alexandrina*, and *Chamedaphne*, and also *Daphnoides*, are like in leaues to the Laurell tree: *Sycomorus* is like in fruit to the Fig tree, and in leaues to the Mulberry tree: *Chamædrys* hath the leafe of an Oke; *Peucedanus* of the Pine tree: so of others which haue taken their names from some other: but this low shrub is not like the Vine either in any part, or in any other thing.

This *Vitis Idæa* groweth not on the vppermost and snowie parts of Mount Ida (as some would haue it) but about Ida, euen the hill Ida, not of Candy, but of Troas in the lesser Asia, which *Ptolomie* in his fifth booke of Geographie, chap. 3. doth call *Alexandri Troas*, or *Alexander* his Troy: whereupon it is also aduisedly named of *Pliny*, *lib.* 14. *cap.* 3. *Vitis Alexandrina*, no otherwise than *Alexandrina Laurus* is said of *Theophraſtus* to grow there: *Laurus*, syrnamed *Alexandrina*, and *Ficus quædam*, or a certaine Fig tree, and Ἄμπελος, that is to say, the Vine, are reported, saith he, to grow properly about Ida. Like vnto this Vine are those which *Philoſtratus* in the life of *Apollonius* reporteth to grow in Mæonia, and Lydia, scituated not far from Troy, comparing them to those Vines which grow in India beyond Caucasus: The Vines there, saith he, be very small, like as be those that doe grow in Mæonia and Lydia, yet is the wine which is pressed out of them of a maruellous pleasant taste.

This Vine which growes neere to mount Ida is reported to be like a shrub, with little twigs and branches of the length of a cubit, about which are grapes growing aslope, blacke, of the bigneſſe of a beane, sweet, hauing within a certaine winie substance, soft: the leafe of this is round, vncut and little.

This is described by *Pliny*, *lib.* 14. *cap.* 3. almost in the selfe same words: it is called, saith he, *Alexandrina vitis*, and groweth neere vnto Phalacra: it is short with branches a cubit long, with a blacke grape of the bigneſſe of the Latines Beane, with a soft pulpe and very little, with very sweet clusters growing aslope, and a little round leafe without cuts.

And with this description the little shrub which the Apothecaries of Germany do call *Myrtillus* doth nothing at all agree, as it is very manifest; for it is low, scarce a cubit high, with a few short branches not growing to a cubit in length: it doth not bring forth clusters or bunches, nor yet fruit like vnto grapes, but berries like those of the Yew tree, not sweet, but somewhat soure and astringent; in which also there are many little white flat seeds: the leafe is not round, but more long than round, not like to that of the Vine but of the Box tree. Moreouer, it is thought that this is not found in Italy, Greece, or in the lesser Asia, for that *Matthiolus* affirmeth the same to grow no where but in Germany and Bohemia; so far is it from being called or accounted to be *Vitis Idæa* or *Alexandrina*.

The fruit of this may be thought not without cause to be named *Vaccinia*, sith they are berries; for they may be termed of *Baccæ*, berries, *Vaccinia*, as though they should be called *Baccinia*. Yet this letteth not that there may be also other *Vaccinia's*: for *Vaccinia* is πολύσημος *dictio*, or a word of diuers significations. *Virgil* in the first booke of his Bucolicks, *Eclog.* 10. affirmeth that the written Hyacinth is named of the Latines, *Vaccinium*, translating into Latine *Theocritus* his verse which is taken out of his tenth Eidyl.

Καὶ τὸ ἴον μέλαν ἐστὶ καὶ ἀκχαπιδάκινθος·

Virgil:

Et nigræ Violæ, sunt & Vaccinia nigra.

Vitruvius, *lib.* 7. of his Architecture doth also distinguish *Vaccinium* from the Violet, and sheweth, that of it is made a gallant purple; which seeing that the written Hyacinth cannot do, it must needs be that this *Vaccinium* is another thing than the Hyacinth is, because it serues to giue a purple die.

Pliny also, *lib.* 16. *cap.* 18. hath made mention of *Vaccinia*, which are vsed to dye bond-slaues garments with, and to giue them a purple colour.

But whether these be our *Vaccinia* or Whortle berries it is hard to affirme, especially seeing that *Pliny* reckoneth vp *Vaccinia* amongst those plants which grow in watery places; but ours grow on high places vpon mountaines subject to windes, neither is it certainely knowne to grow in Italy. How soeuer it is, these our Whortles may be called *Vaccinia*, and do agree with *Plinies* and *Vitruvius* his *Vaccinia*, because garments and linnen cloath may take from these a purple die.

The red Whortle berries haue their name from the blacke Whortles, to which they be in form very like, and are called in Latine, *Vaccinia rubra*: in High Dutch, **Rooter Heidelbeere**: in Low Dutch, **Roode Crakebessen**: the French-men, *Aurelles Rouges*: they be named in English, Red

Red Worts, or red Wortle berries. *Conradus Gesnerus* hath called this plant *Vitis Idæa rubris acinis*: but the growing of the berries doth show, that this doth farre lesse agree with *Vitis Idæa*, than the blacke; for they do not hang vpon the sides of the branches as do the black (which deceiued them that thought it to be *Vitis Idæa*) but from the tops of the springs in clusters.

As concerning the names of the other they are touched in their seuerall descriptions.

¶ *The Temperature.*

These *Vaccinia* or Wortle berries are cold euen in the later end of the second degree, and dry also, with a manifest astriction or binding quality.

Red Wortle berries are cold and dry, and also binding.

¶ *The Vertues.*

The juyce of the blacke Wortle berries is boyled till it become thicke, and is prepared or kept by adding hony and sugar vnto it: the Apothecaries call it *Rob*, which is preferred in all things before the raw berries themselues; for many times whilest they be eaten or taken raw they are offensiue to a weake and cold stomacke, and so far are they from binding the belly, or staying the laske, as that they also trouble the same through their cold and raw quality, which thing the boyled juyce called *Rob* doth not any whit at all. A

They be good for an hot stomacke, they quench thirst, they mitigate and allay the heate of hot burning agues, they stop the belly, stay vomiting, cure the bloudy flix proceeding of choler, and helpe the felonie, or the purging of choler vpwards and downewards. B

The people of Cheshire do eat the blacke Wortles in creame and milke, as in these South parts we eate Strawberries, which stop and binde the belly, putting away all the desire to vomit. C

The Red Wortle is not of such a pleasant taste as the blacke, and therfore not so much vsed to be eaten; but (as I said before) they make the fairest carnation colour in the World. D

Chap. 74.

Of the Marish Worts, or Fenne-Berries.

Vaccinia palustria.
Marish Worts.

¶ *The Description.*

THe Marish Wortle berries grow vpon the bogs in marish or moorish grounds, creeping thereupon like vnto wilde Time, hauing many small limmer and tender stalkes laid almost flat vpon the ground, beset with smal narrow leaues fashioned almost like the leaues of Thyme, but lesser: among which come forth little berries like vnto the common blacke Wortle berrie in shape, but somewhat longer, sometimes all red, and sometimes spotted or specked with red spots of a deeper colour: in taste, rough and astringent.

¶ *The Place.*

The Marish Wortle growes vpon bogs and such like wateriish and fenny places, especially in Cheshire and Staffordshire, where I haue found it in great plenty.

¶ *The Time.*

The Berries are ripe about the end of Iuly, and in August.

¶ *The Names.*

They are called in high Dutch, **Mosszbeeren, Veenbessen**: that is to say, Fen-Grapes, or Fen-Berries, and Marish-worts, or Marish-Berries. *Valerius Cordus* nameth them *Oxycoccon*: we haue called them *Vaccinia palustria*, or Marish Wortle-berries, of the likenesse they haue to the other berries: some also call them Mosse-Berries, or Moore-berries.

¶ *The Temperature.*

These Wortle berries are cold and dry, hauing withall a certain thinnesse of parts and substance, with a certaine binding quality joyned.

¶ *The*

¶ *The Vertues.*

A They take away the heate of burning agues, and also the drought, they quench the furious heate of choler, they stay vomiting, restore an appetite to meate which was lost by reason of cholericke and corrupt humors, and are good against the pestilent diseases.

B The juyce of these also is boyled till it be thicke, with suger added that it may be kept, which is good for all things that the berries are, yea, and far better.

† I haue brought this chapter and the next following from the place they formerly held, and seated them here amongst the rest of their kindred.

Chap. 75. *Of Cloud-berry.*

Vaccinia Nubis.
Cloud-berries.

¶ *The Description.*

THe Cloud-berry hath many small threddy roots, creeping farre abroad vnder the vpper crust of the earth, and also the mosse, like vnto Couch-grasse, of an ouerworn reddish colour, set here and there with small tufts of hairy strings: from which rise vp two small stalks, hard, rough, and of a wooddy substance (neuer more nor lesse) on which doe stand the leaues like those of the wilde Mallow, and of the same colour, full of small nerues or sinewes running in each part of the same: between the leaues commeth vp a stalke likewise of a wooddy substance, whereon doth grow a small floure consisting of fiue leaues, of an herby or yellowish green colour like those of the wilde Auens. After commeth the fruit, greene at the first, after yellow, and the sides next the Sun red when they be ripe; in forme almost like vnto a little heart, made as it were of two, but is no more but one, open aboue, and closed together in the bottom, of a harsh or sharpe taste, wherein is contontained three or foure little white seeds.

¶ *The Place.*

This plant groweth naturally vpon the tops of two high mountaines (among the mossie places) one in Yorkeshire called Ingleborough the other in Lancashire called Pendle, two of the highest mountaines in all England, where the cloudes are lower than the tops of the same all Winter long, whereupon the people of the countrey haue called them Cloud-berries, found there by a curious gentleman in the knowledge of plants, called Mr *Hesketh*, often remembred.

¶ *The Time.*

The leaues spring vp in May, at which time it floureth: the fruit is ripe in Iuly.

¶ *The Temperature.*

The fruit is cold and dry and very astringent.

¶ *The Vertues.*

A The fruit quencheth thirst, cooleth the stomacke, and allayeth inflammations, being eaten as Worts are, or the decoction made and drunke.

† My friend M. *Pimble* of Maribone receiued a plant hereof out of Lancashire: and by the shape of the leafe I could not iudge it to differ from the *Cham-morus* formerly described, pag. 1273. neither do the descriptions much differ in any materiall point: the figures differ more; but I iudge this a very imperfect one.

Chap. 76. *Of shrub Heart-wort of Æthiopia.*

¶ *The Description.*

THis kind of Sesely, being the Æthiopian Sesely, hath blackish stalkes of a wooddy substance: this plant diuideth it selfe into sundry other armes or branches, which are beset with thicke fat and oileous leaues, fashioned somewhat like the Wood-binde leaues, but thicker, and more

Seseli Æthiopicum frutex.
Shrub Sesely, or Hart-wort of Ethiopia.

more gummy, approching very neere vnto the leaues of Oleander both in shape and substance, being of a deepe or darke greene colour, and of a very good sauor and smell, and continueth green in my garden both winter and summer, like the Bay or Laurell. The floures grow at the tops of the branches, in yellow rundles like the flours of Dill: which being past, there succeedeth a darke or dusky seed resembling the seed of Fennel, and of a bitter taste. The root is thicke, and of a woody substance.

¶ *The Place.*

It is found in stony places and on the sea coast not far from Marsilles, and likewise in other places of Languedoc: it also groweth in Ethyopia in the darke and desart woods. It groweth in my garden.

¶ *The Time.*

It flourisheth, floureth, and seedeth in Iuly and August.

¶ *The Names.*

The Grecians call it Αἰθιοπικὸν σέσελι: the Latines likewise *Æthiopicum Seseli*: the Egyptians, κύνος φρίκη, that is, Dogs Horror: in English, Sesely of Ethiopia, or Ethiopian Hart-wort.

¶ *The Temperature and Vertues.*

Sesely of Ethiopia is thought to haue the same faculties that the Sesely of Marsilles hath, whereunto I refer it.

CHAP. 77. *Of the Elder Tree.*

¶ *The Kindes.*

THere be diuers sorts of Elders, some of the land, and some of the water or marish grounds; some with very jagged leaues, and others with double floures, as shall be declared.

¶ *The Description.*

1 THe common Elder groweth vp now and then to the bignesse of a mean tree, casting his boughes all about, and oftentimes remaineth a shrub: the body is almost all wooddy; hauing very little pith within; but the boughs, and especially the yong ones, which be jointed, are full of pith within, and haue but little wood without: the barke of the body and great armes is rough and full of chinks, and of an ilfauored wan colour like ashes: that of the boughs is not very smooth, but in colour almost like; and that is the outward barke; for there is another vnder it neerer to the wood, of colour green: the substance of the wood is sound, somwhat yellow, and that may be easily cleft: the leaues consist of fiue or six particular ones fastned to one ribbe, like those of the Walnut tree, but euery particular one is lesser, nicked in the edges, and of a ranke and stinking smell. The floures grow on spoky rundles, which be thin and scattered, of a white colour and sweet smell: after them grow vp little berries, green at the first, afterwards blacke, whereout is pressed a purple juice, which being boiled with Allom and such like things, doth serue very well for the Painters vse, as also to colour vineger: the seeds in these are a little flat and somwhat long. There groweth oftentimes vpon the bodies of those old trees or shrubs a certaine excrescence called *Auricula Iudæ* or Iewes eare, which is soft, blackish, couered with a skin, somewhat like now and then to a mans eare, which being plucked off and dried, shrinketh together and becommeth hard. This Elder groweth euery where, and is the common Elder.

1 *Sambucus.*
The common Elder tree.

‡ 2 *Sambucus fructu albo.*
Elder with white berries.

3 *Sambucus laciniatis folijs.*
The jagged Elder tree.

4 *Sambucus racemosa, vel Cervina.*
Harts Elder, or Cluster Elder.

2 There is another also which is rare and strange, for the berries of it are not black, but white: this is like in leaues to the former.

3 The jagged Elder tree growes like the common Elder in body, branches, shoots, pith, flours, fruit, and stinking smell, and differs onely in the fashion of the leaues, which do so much disguise the tree, and put it out of knowledge, that no man would take it for a kinde of Elder, vntill hee hath smelt thereunto, which will quickely shew from whence he is descended; for these strange Elder leaues are very much jagged, rent or cut euen vnto the middle rib. From the trunke of this tree, as from others of the same kinde, proceedeth a certain fleshy excrescence like to the eare of a man, especially from those trees that are very old.

4 This kinde of Elder hath white floures, but red berries, and both are not contained in spoky rundles, but in clusters, and grow after the manner of a cluster of grapes: in leaues and other things it resembleth the common Elder, saue that now and then it groweth higher.

¶ *The Place.*

The common Elder groweth euery where: it is planted about Cony-boroughs for the shadow of the Conies; but that with the white berries is rare: the other kindes grow in like places; but that with the clustered fruit groweth vpon mountains. That with the jagged leaues growes in my garden.

¶ *The Time.*

These kindes of Elders floure in Aprill and May, and their fruit is ripe in September.

¶ *The Names.*

This tree is called in Greeke, Ἀκτή: in Latine and of the Apothecaries, *Sambucus*: of *Gulielmus Salicetus*, *Beza*: in high-Dutch, **Holunder, Holder**: in low-Dutch, **Ulfer**: in Italian, *Sambuco*: in French, *Hus*, and *Suin*: in Spanish, *Sauco*, *Sauch*, *Sambugueyro*: in English, Elder, and Elder tree: that with the white berries diuers would haue to be called *Sambucus sylvestris*, or wild Elder; but *Matthiolus* calls it *Montana*, or mountain Elder.

¶ *The Temperature and Vertues.*

Galen attributeth the like facultie to Elder that he doth to Danewoort, and saith that it is of a drying qualitie, gluing, and moderatly digesting: and it hath not onely these faculties, but others also; for the barke, leaues, first buds, floures, and fruit of Elder, doe not only dry, but also heate, and haue withall a purging qualitie, but not without trouble and hurt to the stomacke. A

The leaues and tender crops of common Elder taken in some broth or pottage open the belly, purging both slimy flegme and cholerick humors: the middle bark is of the same nature, but stronger, and purgeth the said humors more violently. B

The seeds contained within the berries dried are good for such as haue the Dropsie, and such as are too fat and would faine be leaner, if they be taken in a morning to the quantitie of a dram with wine for a certain space. C

The leaues of Elder boiled in water vntill they be very soft, and when they are almost boiled enough a little oile of sweet Almonds added thereto, or a little Linseed oile, then taken forth, and laid vpon a red cloath or a piece of skarlet, and applied to the hemmorrhoids or Piles as hot as can be suffered, and so left remaining vpon the part affected vntill it be somewhat cold, hauing the like in a readinesse, applying one after another vpon the diseased part by the space of an houre or more, and in the end some bound to the place, and the patient put warme a bed; it hath not as yet failed at the first dressing to cure the said disease: but if the Patient be dressed twice it must needs help, if the first faile. D

The green leaues pouned with Deeres suet or Bulls tallow, are good to be laid to hot swellings and tumors, and doe asswage the pain of the gout. E

The inner and green bark doth more forcibly purge; it draweth forth choler and wateriſh humors; for which cause it is good for those that haue the dropsie, beeing stamped, and the liquour pressed out and drunke with wine or whay. F

Of like operation are also the fresh floures mixed with some kind of meat, as fried with egges; they likewise trouble the belly and moue to the stoole: being dried they lose as wel their purging qualitie as their moisture, and retain the digesting and attenuating qualitie. G

The vineger in which the dried floures are steeped is wholesome for the stomacke. Being vsed with meat it stirreth vp an appetite, it cutteth and attenuateth or maketh thin grosse and raw humors. H

The facultie of the seed is somwhat gentler than that of the other parts, it also moues the belly, and I

and draweth forth watery humors, being beaten to pouder, and giuen to a dram weight: being new gathered, ſteeped in vineger, and afterward dried, it is taken and that effectually in the like weight of the dried lees of wine, and with a few Aniſe ſeeds, for ſo it worketh without any maner of trouble, and helpeth thoſe that haue the dropſie: but it muſt be giuen for certain dayes together in a little wine to thoſe that haue need thereof.

K The gelly of the Elder, otherwiſe called Iewes eare, hath a binding and drying qualitie: the infuſion thereof, in which it hath bin ſteeped a few houres, taketh away inflammations of the mouth and almonds of the throat in the beginning, if the mouth and throat be waſhed therewith, and doth in like manner help the uvula.

L *Dioſcorides* ſaith, that the tender green leaues of the Elder tree with parched Barly meale do remoue hot ſwellings, and are good for thoſe that are burnt or ſcalded, and for ſuch as be bitten with a mad dog, and that they glew and heale vp hollow vlcers.

M The pith of the yong boughes is without qualitie: which being dried, and ſomewhat preſſed or quaſhed together, is good to lay open the narrow orifices or holes of fiſtula's and iſſues, if it be put therein.

Chap. 78. *Of Mariſh or Water Elder.*

1 *Sambucus aquatilis, ſive paluſtris.*
Mariſh or water Elder.

2 *Sambucus Roſea.*
The Roſe Elder.

¶ *The Deſcription.*

1 MAriſh Elder is not like to the common Elder in leaues, but in boughes. It groweth after the manner of a little tree; the boughes are couered with a barke of an ill fauoured Aſh colour, as be thoſe of the common Elder: they are ſet with ioynts by certain

certain distances, & haue in them great plenty of white pith, therfore they haue lesse wood, which is white and brittle: the leaues be broad, cornered, like almost to Vine leaues, but lesser and softer: among which come forth spoked rundles which bring forth little floures, the vttermost whereof alongst the borders be greater, of a gallant white colour, euery little one consisting of fiue leaues: the other in the midst and within the borders be smaller, and it floures by degrees, and the whole tuft is of a most sweet smell: after which come the fruit or beries, that are round like those of the common Elder, but greater, and of a shining red colour, and blacke when they be withered.

2 *Sambucus Rosea* or the Elder Rose groweth like an hedge tree, hauing many knotty branches or shoots comming from the root, full of pith like the common Elder: the leaues are like the vine leaues, among which come forth goodly floures of a white colour, sprinkled and dashed heere and there with a light and thin carnation colour, and do grow thicke and closely compact together, in quantitie and bulke of a mans hand, or rather bigger, of great beauty, and sauoring like the floures of the Hawthorne: but in my garden there groweth not any fruit vpon this tree, nor in any other place, for ought that I can vnderstand.

3 This kinde is likewise an hedge tree, very like vnto the former in stalks and branches, which are jointed and knotted by distances, and it is full of white pith: the leaues be likewise cornered. The flours hereof grow not out of spoky rundles, but stand in a round thick and globed tuft, in bignesse also and fashion like to the former, sauing that they tend to a deeper purple colour, wherein only the difference consists.

¶ *The Place.*

Sambucus palustris or water Elder growes by running streames and water courses, and in hedges by moist ditch sides.

The Rose Elder groweth in gardens, and the floures are there doubled by art, as it is supposed.

¶ *The Time.*

These kindes of Elders floure in Aprill and May, and the fruit of the water Elder is ripe in September.

¶ *The Names.*

The water Elder is called in Latine, *Sambucus aquatica*, and *Sambucus palustris*: it is called *Opulus* and *Platanus*, and also *Chamæplatanus* or the dwarfe Plane tree, but vnproperly. *Valerius Cordus* maketh it to be *Lycostaphylos*: the Saxons, saith *Gesner*, doe call it *Vva lupina*; from whence *Cordus* inuented the name Λυκοστάφυλος: it is named in high-Dutch, **Walt holder**, and **Hirsch holder**: in Low-Dutch, **Swelcken**, and **Swelckenhout**: of certaine French men, *Obiere*: in English, Marish Elder, Whitten tree, Oppel tree, and dwarfe Plane tree.

The Rose Elder is called in Latine, *Sambucus Rosea*, and *Sambucus aquatica*, being doubtles a kind of the former water Elder, the floures being doubled by art, as we haue said. It is called in Dutch, **Gheldersche Roose**: in English, Gelders Rose, and Rose Elder.

¶ *The Nature and Vertues.*

Concerning the faculties of these Elders, and the berries of the Water Elder, there is nothing found in any Writer, neither can we set downe any thing hereof of our owne knowledge.

Chap. 79.

Of Dane-wort, Wall-wort, or dwarfe Elder.

¶ *The Description.*

Danewort, as it is not a shrub, neither is it altogether an herby plant, but as it were a plant participating of both, being doubtlesse one of the Elders, as may appeare both by the leaues, floures, and fruit, as also by the smell and taste.

Wall-wort is very like vnto Elder in leaues, spoky tufts, and fruit, but it hath not a woody stalk, it bringeth forth only green stalks, which wither away in winter: these are edged and ful of joints like to the yong branches and shoots of Elder; the leaues grow by couples with distances, wide, and consist of many small leaues which stand vpon a thicke ribbed stalke, of which euery one is long, broad, and cut in the edges like a saw, wider and greater than the leaues of the common Elder tree: at the top of the stalks there grow tufts of white floures tipt with red, with fiue little chiues in them pointed with blacke, which turne into blacke berries like the Elder, in which be little long seed: the root is tough, and of a good and reasonable length, better for physicks vse than the Elder leaves.

Ebulus, ſive Sambucus humilis.
Dane-wort, or dwarfe Elder.

A
B
C
D
E
F
G

¶ *The Place.*

Dane-wort growes in vntoiled places neere to common wayes, and in the borders of fields. It groweth plentifully in the lane at Kilbury Abby by London: alſo in a field by S. *Ioans* neer Dartford in Kent; and in the highway at old Branford townes end next London, and in many other places.

¶ *The Time.*

The flourēs are perfected in Summer, and the berries in Autumne.

¶ *The Names.*

It is called in Greeke χαμαιάκτη, that is, *Humilis Sambucus*, or low Elder: in Latine, *Ebulus*, and *Ebulum*: in high-Dutch, **Attich**: in low-Dutch, **Hadich**: in Italian, *Ebulo*: in French, *Hieble*: in Spaniſh, *Yezgos*: in Engliſh, Wall-wort, Dane-wort, and dwarfe Elder.

¶ *The Temperature.*

Wall-woort is of temperature hot and dry in the third degree, and *Galen* doth attribute a ſingular qualitie vnto it to waſte and conſume. It hath alſo a ſtrange and ſpeciall facultie to purge by the ſtoole: the roots be of greateſt force; the leaues haue chiefeſt ſtrength to digeſt and conſume.

¶ *The Vertues.*

The roots of Wall-woort boiled in wine and drunken are good againſt the dropſie, for they purge downwards watery humors.

The leaues conſume and waſte way hard ſwellings, if they be applied pultiſwiſe, or in a fomentation or bath.

Dioſcorides ſaith, that the roots of Wall-woort doe ſoften and open the matrix, and alſo correct the infirmities thereof, if they be boiled in a bath to ſit in; and diſſolue the ſwellings and pains of the belly.

The iuice of the root of Danewort maketh the haire blacke.

The yong and tender leafe quencheth hot inflammations, applied with Barley meale. It is with good ſucceſſe laid vpon burnings, ſcaldings, and the bitings of mad dogs; and with Buls tallow or Goats ſuet it is a remedie for the gout.

The ſeed of Wall-wort drunke in the quantitie of a dram is the moſt excellent purger of waterie humors in the world, and therefore moſt ſingular againſt the dropſie.

If one ſcruple of the ſeed be bruiſed and taken with ſyrrup of Roſes and a little Secke, it cureth the dropſie and eaſeth the gout, mightily purging downwards watery humors, being taken once a weeke.

Chap. 80. *Of Beane Trefoile.*

¶ *The Deſcription.*

1 THe firſt kinde of *Anagyris* or *Laburnum* groweth like vnto a ſmall tree, garniſhed with many ſmall branches like the ſhoots of Oziars, ſet full of pale greene leaues, alwayes three together, like the *Lotus* or medow Trefoil, or rather like the leaues of *Vitex* or the Cytiſus buſh; among which come forth many tufts of floures of a yellow colour, not much vnlike the flours of Broom: when theſe floures be gon there ſucceed ſmall flat cods, wherein are contained ſeeds like *Galega* or the Cytiſus buſh. The whole plant hath little or no ſauor at all. The root is ſoft and gentle, yet of a wooddy ſubſtance.

2 Stinking

2 Stinking Trefoile is a shrub like to a little tree, rising vp to the height of six or eight cubits or somtimes higher: it sendeth forth of the stalks very many slender branches, the barke whereof is of a deepe greene colour: the leaues stand alwayes three together, like those of *Lotus* or medow Trefoile, yet of a lighter green on the vpper side: the floures be long, as yellow as gold, very like to those of Broom, two or three also joined together: after them come vp the cods, wherein lie hard fruit like Kidny beans, but lesser, at the first white, afterwards tending to a purple, and last of all of a blackish blew. The leaues and floures haue a filthy smell like those of stinking Gladdon, and so rankewithall, as euen the passers by are anoyed therewith.

1 *Anagyris.*
Bean Trefoile.

2 *Anagyris fœtida.*
Stinking Bean Trefoile.

‡ Of *Anagyris* there are foure kinds, two with stinking leaues; the one with longish leaues, the other with rounder.

Two other whose leaues do not stink; the one of these hath somtimes foure or fiue leaues vpon one stalke, and the leaues are long and large. The other hath them lesser and narrower. ‡

¶ *The Place.*

These grow of themselues in most places of Languedoc and Spain, and in other countries also by high-waies, as in the Isle of Candy, as *Bellonius* writeth. The first I haue in my garden; the other is a stranger in England. ‡ Mr *Tradescant* hath two sorts hereof in his garden. ‡

¶ *The Time.*

They floure in Iune, and the seed is ripe in September.

¶ *The Names.*

The Bean Trefoile is called in Greeke Ἀναγύρις, which name remaineth vncorrupt in Candy euen to this day: in Latine also *Anagyris*, and *Laburnum*: of the people of Anagni in Italy, *Eghelo*, which is referred vnto *Laburnum*, wherof *Pliny* writeth, *lib.* 16. *cap.* 18. in English, Bean Trefoile, or the peascod tree.

¶ *The Temperature.*

Bean Trefoile, as *Galen* writeth, hath an hot and digesting facultie;

¶ The

¶ *The Vertues.*

A The tender leaues, ſaith *Dioſcorides*, being ſtamped and laid vpon cold ſwellings, doe waſte away the ſame.

B They are drunke in Cute to the weight of a dram againſt the ſtuffing of the lungs, and do bring downe the menſes, the birth, and the after-birth.

C They cure the head-ache being drunke with wine; the iuice of the root digeſteth and ripeneth; if the ſeed be taken it procureth vomit, which thing, ſaith *Matthiolus*, the ſeed not only of ſtinking Bean Trefoile doth effect, but that alſo of the other.

CHAP. 81. *Of Iudas Tree.*

Arbor Iudæ.
Iudas Tree.

¶ *The Deſcription.*

Iudas Tree is likewiſe one of the hedge-plants; it groweth vp vnto a tree of a reaſonable bigneſſe, couered with a dark coloured barke, whereon grow many tough twiggy branches of a browne colour, garniſhed with round leaues like thoſe of round Birthwort or Sow-bread, but harder, and of a deeper green colour: amongſt which come forth ſmall floures like thoſe of peaſon, of a purple colour mixed with red, which turn into long flat cods preſſed hard together, of a tawny or wan colour, wherein is contained ſmall flat ſeeds like the Lentill, or rather like the ſeed of *Medica*, faſhioned like a little kidney. The root is great and wooddy.

¶ *The Place.*

This ſhrub is found in diuers prouinces of Spain, in hedges, & among briers and brambles; the mountaines of Italy and the fields of Languedoc are not without this ſhrub: it growes in my garden.

¶ *The Time.*

The floures come forth in the Spring, and before the leaues: the fruit or cods be ripe in ſummer.

¶ *The Names.*

It is commonly named in Latine, *Arbor Iudæ*: ſome haue named it *Sycomorus* or Sycomore tree, and that becauſe the flours and cods hang down from the bigger branches; but the right Sycomore tree is like the fig tree in fruit, and in leaues to the Mulberry tree, whereupon it is ſo named. Others take it to be Κέρκις, of which *Theophraſtus* writeth thus; *Cercis* bringeth forth fruit in a cod: Which words are all ſo few, as that of this no certaintie can be gathered, for there be more ſhrubs that bring forth fruit in cods. The French men call it *Guainier*, as though they ſhould ſay, *Vaginula*, or a little ſheath: moſt of the Spaniards name it *Algorovo loco*, that is, *Siliqua ſylveſtris*, or *fatua*, wild or fooliſh Cod: others, *Arbal d' amor*, for the braueneſſe ſake: it may be called in Engliſh, *Iudas* tree, for that it is thought to be that whereon *Iudas* hanged himſelfe, and not vpon the Elder tree, as it is vulgarly ſaid.

¶ *The Temperature and Vertues.*

The temperature and vertues of this ſhrub are vnknowne; for whereas *Matthiolus* makes this to be *Acacia*, by adding falſly thornes vnto it, it is but a furmiſe.

CHAP.

Chap. 82. *Of the Carob tree or S. Iohns Bread.*

¶ *The Description.*

The Carob tree is also one of those that beare cods, it is a tree of a middle bigneſſe, very ful of boughs, the leaues long, and conſiſt of many ſet together vpon one middle rib, like thoſe of the Aſh, but euery particular one of them is broader, harder, and rounder: the fruit or long cods in ſome places are a foot in length, in other places ſhorter by halfe, an inch broad, ſmooth and thicke, in which lie flat and broad ſeeds: the cods themſelues are of a ſweet taſte, and are eaten of diuers, but not before they be gathered and dried; for being green, though ripe, they are vnpleaſant to be eaten, by reaſon of their bad taſte.

Ceratia ſiliqua, ſiue Ceratonia.
The Carob tree.

¶ *The Place.*

This groweth in Apulia a Prouince of the kingdome of Naples, and alſo in diuers vntoiled places in Spain: it is likewiſe found in India & other countries Eaſtward, where the cods are ſo full of ſweet juice as that it is vſed to preſerue Ginger, as *Matthiolus* ſheweth. *Strabo, lib.* 15. ſaith, That *Ariſtobulus* reporteth how there is a tree in India of no great bigneſſe, hauing great cods tenne inches long, full of hony, *Quas qui ederent non facile ſeruare*: which thing peraduenture is only to be vnderſtood of the green cods, and thoſe that are not yet dry. It is very well known in the coaſts of Nicea and Liguria in Italy, as alſo in all the tracts and coaſts of the Weſt Indies and Virginea. It groweth alſo in ſundry places of Paleſtine, where there is ſuch plenty of it, that it is left vnto ſwine and other wilde beaſts to feed vpon, as our Acorns and Beech maſt. Moreouer, both yong and old feed thereon for pleaſure, and ſome haue eaten thereof to ſupply and help the neceſſarie nouriſhment of their bodies. This of ſome is called Saint *Iohns* bread, and thought to be that which is tranſlated Locuſts, whereon S. *Iohn* did feed when he was in the wilderneſſe, beſides the wilde Honey whereof hee did alſo eat: but there is ſmall certainty of this: but it is moſt certain, that the people of that country doe feed on theſe cods, called in Greeke κεράτια; in Latine *Siliquæ*: but Saint *Iohns* food is called in Greek ἀκρίδες, which word is often vſed in the Reuelation written by Saint *Iohn*, and tranſlated Locuſts. Now we muſt alſo remember that this Greek word hath two ſeuerall interpretations or ſignifications; for taken in the good part it ſignifieth a kinde of creeping creature or fly, which hoppeth or skippeth vp and downe as doth the Graſhopper; of which kinde of creatures it was lawfull to eat, *Leuit.* 22. and *Matth.* 3. 4. It ſignifieth alſo thoſe Locuſts which came forth of the Bottomleſſe pit, mentioned, *Apoc.* 9. *v.* 3, 4. &c. which were like vnto horſes prepared for battell. The Hebrew word which the Engliſh Tranſlators haue turned Graſhoppers, *Tremelius* dares not giue the name Locuſt vnto it, but calleth it by the Hebrew name *Arbis*, after the letters and Hebrew name; ſaying thus in the note vpon the 22 verſe of the eleuenth chapter of *Leuit.* Theſe kindes of creeping things neither the Hebrews nor the Hiſtiographers, nor our ſelues do know what they mean; wherefore we ſtill retain the Hebrew words for all the foure kindes thereof. But it is certaine that the Eaſt countrey Graſhoppers and Locuſts were ſometimes vſed in meat; as *Matth.* 3. 4. and *Marc.* 1. 6. *Plin. Lib.* 11. *Natur. Hiſt. ca.* 26. & 29.

Thus

Thus far *Tremelius* and *Iunius*. By that which hath been ſaid it appeareth what S. *Iohn* Baptiſt fed of, vnder the title Locuſts, and that it is nothing like vnto this fruit *Ceratia ſiliqua*. I rather take the husks or ſhels of the fruit of this tree to be the cods or husks whereof the Prodigall childe would haue fed, but none gaue them vnto him, though the ſwine had their fill thereof. Theſe cods being dry are very like Bean cods, as I haue often ſeen. I haue ſowne the ſeeds in my garden, where they haue proſpered exceeding well.

‡ There is no doubt but the κεράτια or *Siliquæ* mentioned in S. *Lukes* Goſpell, *Cap.* 15. *v.* 16. were the cods or fruit of this tree. I cannot beleeue that either the fruit of this or the Locuſts were the ἀκρίδες mentioned by S. *Mathew*, *cap.* 3. *v.* 4. But I am of the opinion of the Greeke Father *Iſodor Peluſiota*, who, *lib.* 1. *Epiſt.* 132. hath theſe words; Αἱ ἀκρίδες, ἃς Ἰωάννης ἔβρωσεν, οὐ ζῷά ἐισιν, ὡς τινες ὄιονται ἀμαθῶς, καὶ ἀκρίδας ἀποκόπτα, μὴ γένοιτο· ἀλλ' ἀκρεμόνες βοτανῶν· ἐπεὶ καὶ πόα τις ὅτι παλιν τὸ μέλι ἄγριον, ἀλλ' ἀμέλι ὄρειον ὑπὸ μελισσῶν ἄγριαι γινόμεν, *&c.* That is; The *Acrides* which *Iohn* fed vpon are not liuing creatures like to Beetles, as ſome vnlearnedly think; but they are the tender buds of herbs and plants or trees. Neither on the other ſide is the *Meli agrion* any herb ſo called, but mountain hony gathered by wilde Bees, &c. ‡

¶ *The Time.*

The Carob tree bringeth forth fruit in the beginning of the Spring, which is not ripe till Autumne.

¶ *The Names.*

The Carob tree is called Κερατία: in Latine likewiſe *Ceratonia*: in Spaniſh, *Garovo*: in Engliſh, Carob tree, and of ſome, Bean tree, and S. *Iohns* Bread. The fruit or cod is named κεράτιον: in Latine, *Siliqua*, or *Siliqua dulcis*: in diuers ſhops, *Xylocaracta*: in other ſhops of Italy, *Carobe*, or *Carobole*: of the Apothecaries of Apulia, *Salequa*: it is called in Spaniſh, *Alfarobas*, or *Algarovas*; and without an article, *Garovas*: in high-Dutch, **S. Johans broot**, that is to ſay, *Sancti Iohan. panis*, or Saint *Iohns* bread; neither is it knowne by any other name in the Low-Countries. Some call it in Engliſh, Carob.

¶ *The Temperature.*

The Carob tree is dry and aſtringent, as is alſo the fruit, and containeth in it a certain ſweetnes, as *Galen* ſaith.

¶ *The Vertues.*

A The fruit of the Carob tree being eat when it is green doth gently looſe the belly; but beeing dry it is hard of digeſtion and ſtoppeth the belly, it prouoketh vrine, is good for the ſtomacke, and nouriſheth well, and much better than when it is green and freſh.

CHAP. 83. *Of* Caſſia fiſtula *or Pudding Pipe.*

¶ *The Deſcription.*

CAſſia *purgatrix* or *Caſſia fiſtula* groweth vp to be a faire tree, with a tough barke like leather, of the colour of Box, whereupon ſome haue ſuppoſed it to take the Greeke name κάσια: in Latine, *Coriacea*: the arms and branches of this are ſmall and limber, beſet with many goodly leaues like thoſe of the Walnut tree: among which come forth ſmall flours of a yellow colour, compact or conſiſting of ſix little leaues like the floures of *Chelidonium minus* or Pilewort. After theſe be vaded, there ſucceed goodly blacke round long cods, whereof ſome are two foot long, and of a woody ſubſtance: in theſe cods are contained a blacke pulp very ſweet and ſoft, of a pleaſant taſte, and ſeruing to many vſes in phyſicke; in which pulp lieth the ſeeds couched in little cels or partitions: the ſeed is flat and browniſh, not vnlike the ſeed of *Ceratia ſiliqua*, and in other reſpects very like vnto it alſo.

¶ *The Place.*

This tree groweth much in Egypt, eſpecially about Memphis and Alexandria, and moſt parts of Barbary, and is a ſtranger in theſe parts of Europe.

¶ *The Time.*

The Caſſia tree groweth greene winter and ſummer, it ſheds his old leaues when new are come, by means whereof it is neuer void of leaues: it floureth early in the ſpring, and the fruit is ripe in Autumne.

¶ *The*

Cassia fistula.
Pudding Pipe tree.

¶ *The Names.*

This tree was vnknown to the old writers, or so little accounted of, as that they haue made no mention of it at all: the Arabians were the first that esteemed of it, by reason they knew the vse of the pulp which is found in the pipes; and after them the later Grecians, as *Actuarius* and others of his time, by whom it was named ξυλοκασια μελαινα, that is to say in Latine, *Cassia nigra*: the fruit thereof, saith *Actuarius, lib.* 5. is like a long pipe, hauing within it a thicke humour or moisture, which is not congealed all alike through the Pipe, but is separated and diuided with many partitions, being thin woody strings. The apothecaries call it *Casta fistula*, and with a double *ff*, *Cassia fistula*. It is called in English after the Apothecaries word, Cassia fistula, and may also be Englished Pudding Pipe, because the cod or pipe is like a pudding. But the old Cassia fistula or σύριγξ in Greeke, is that sweet and odoriferous barke that is rolled together after the manner of a long and round pipe, now named of the Apothecaries *Cassia lignea*, which is a kinde of Cinamon.

¶ *The Temperature.*

The pulp of this Pipe, which is chiefely in request, is moist in the later end of the first degree, and little more than temperatly hot.

¶ *The Vertues.*

The pulp of Cassia fistula extracted with violet water is a most sweet and pleasant medicine, and may be giuen without danger to all weak people, of what age and sex soeuer they be, yea it may be ministred to women with childe, for it gently purgeth cholerick humors and slimy flegme, if it be taken in the weight of an ounce. A

Cassia is good for such as be vexed with hot agues, pleurisies, jaundice, or any other inflammation of the liuer, being taken as afore is shewed. B

Cassia is good for the reins and kidnies, driueth forth grauell and the stone, especially if it bee mingled with the decoction of Parsly and Fennell roots, and drunke. C

It purgeth and purifieth the bloud, making it more clean than before, breaking therewith the acrimonie and sharpnesse of the mixture of bloud and choler together. D

It dissolueth all phlegmons and inflamations of the brest, lungs, and the rough artery called *Trachea arteria*, easing those parts exceeding well. E

Cassia abateth the vehemencie of thirst in agues, or any hot disease whatsoeuer, especially if it be taken with the iuyce of *Intybum*, *Cichoreum*, or *Solanum*, deputed according to Art. It abateth also the intemperat heat of the reins, if it be receiued with diuretick medicines, or with the decoction of Licorice only, and will not suffer the stone to grow in such persons as do receiue and vse this medicine. F

The best Cassia for your vse is to be taken out of the most full, heauy, and fairest cods or canes, and those which shine without, and are full of soft pulpe within: that pulpe which is newly taken forth is better than that which is kept in boxes, by what art soeuer. G

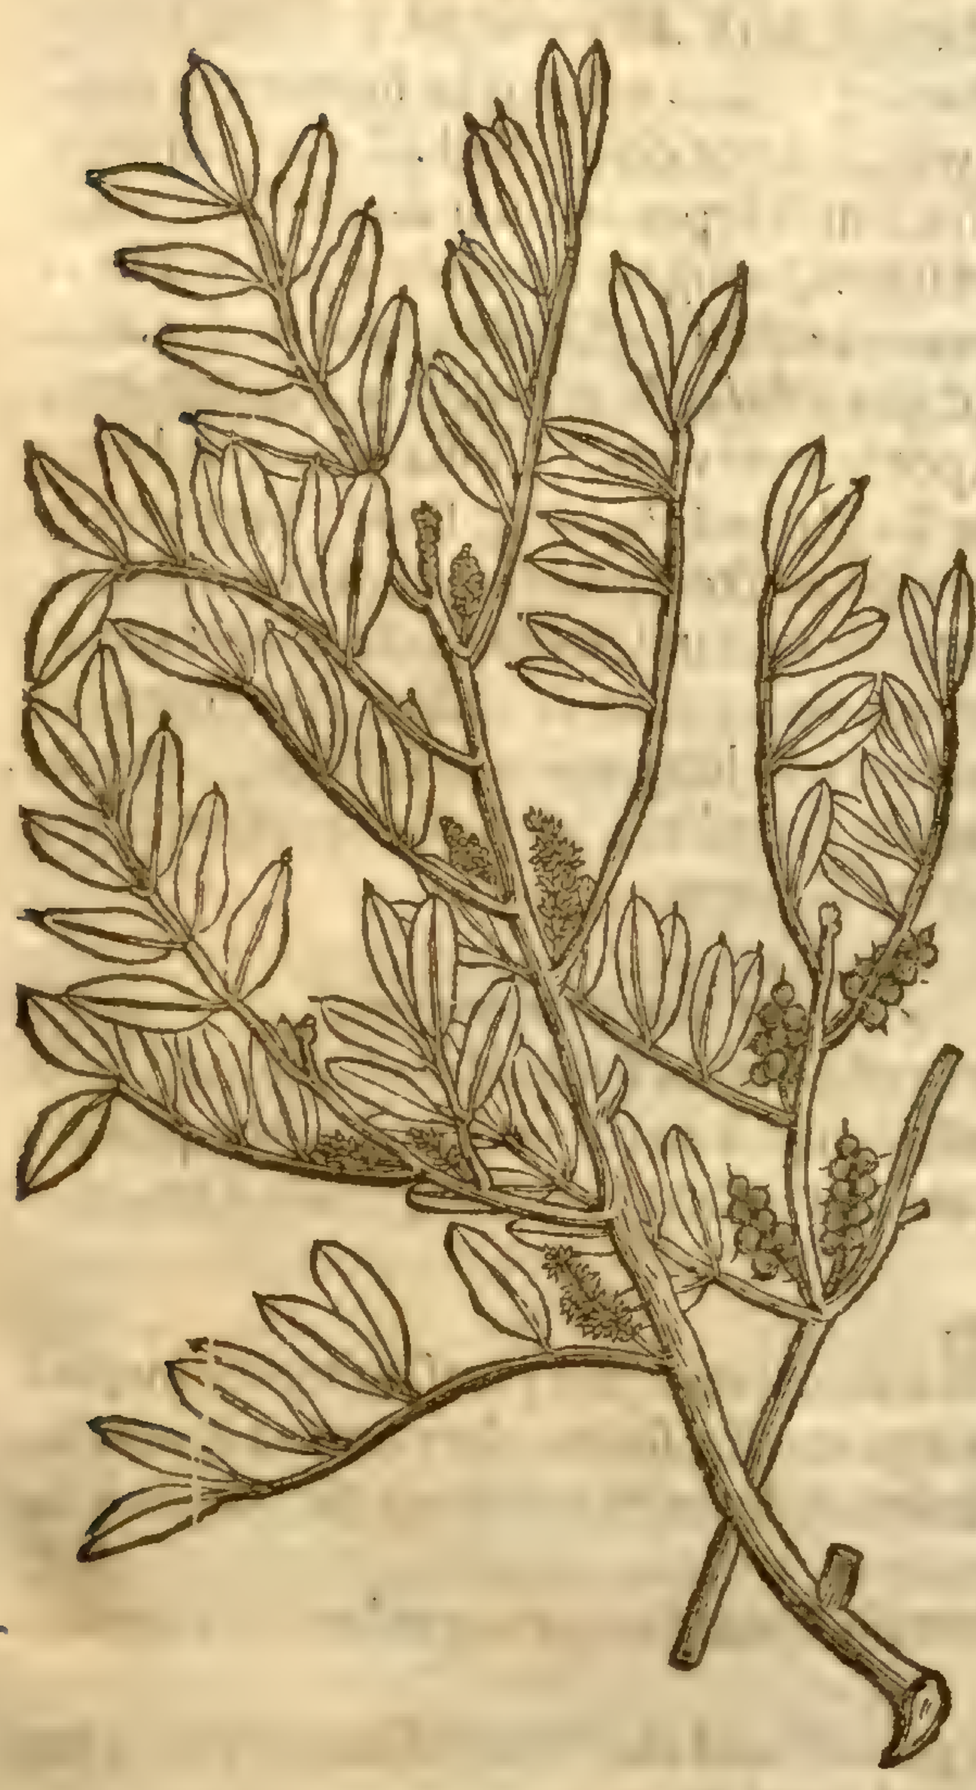
Cassia being outwardly applied taketh away the roughnesse of the skin, and being laid vpon hot swellings it bringeth them to suppuration. H

Many singular compound medicines are made with this Cassia, which here to recite belongs not to my purpose or historie. I

Chap. 84.

Of the Lentiske or Maſticke tree.

Lentiſcus.
The Maſticke tree.



¶ *The Deſcription.*

THe Maſticke tree groweth commonly like a ſhrub, without any great body, riſing vp with many ſprings and ſhoots like the Haſell, and oftentimes it is of the height and bignes of a mean tree: the boughes thereof are tough and flexible: the barke is of a yellowiſh red colour, pliable likewiſe and hard to be broken. There ſtand vpon one rib for the moſt part eight leaues, ſet vpon a middle ribbe, much like to the leaues of Licorice, but harder, of a deep green colour, and oftentimes ſomwhat red in the brims, as alſo hauing diuers veines running along, of a red colour, and ſomwhat ſtrong of ſmel: the floures be moſſie, and grow in cluſters vpon long ſtems: after them come vp the beries, of the bigneſſe of Vetches, green at the firſt, afterward of a purple colour, and laſt of all blacke, fat, & oily, with an hard blacke ſtone within, the kernel whereof is white, of which alſo is made oile, as *Dioſcorides* witneſſeth: it bringeth forth likewiſe cods beſides the fruit (which may be rather termed an excreſcence than a cod) wrythed like an horne; in which lieth at the firſt a liquor, and afterwards when this waxeth ſtale, little liuing things like vnto gnats, as in the Turpentine hornes, and in the folded leaues of the Elme tree. There comes forth of the maſtick tree a roſin, but dry, called Maſticke.

¶ *The Place.*

The Maſtick tree groweth in many regions, as in Syria, Candy, Italy, Languedock, and in moſt Prouinces of Spaine; but the chiefeſt is in Chios an Iſle in Greece, in which it is diligently and ſpecially looked vnto, and that for the Maſtick ſake, which is there gathered euery yeare moſt carefully from the husbanded Maſtick trees, and ſent into all parts of the world.

¶ *The Time.*

The floures be in their pride in the ſpring time, and the berries in Autumne. The Maſtick muſt be gathered about the time that Grapes be.

¶ *The Names.*

This tree is called in Greeke σχῖνος: in Latine, *Lentiſcus*: in Italian, *Lentiſque*: in Spaniſh, *Mata*, and *Arcoyra*: in Engliſh, Maſtick tree, and of ſome, Lentiske tree.

The Roſin is called in Greeke, ῥητίνη σχίνου and Μαστίχη: in Latine, *Lentiſcina Reſina*, and likewiſe *Maſtiche*: in ſhops, *Maſtix*: in Italian, *Maſtice*: in high and low Dutch and French alſo, *Maſtic*: in Spaniſh, *Almaſtiga*, *Maſtech*, and *Almecega*: in Engliſh, Maſtick.

Cluſius writeth, That the Spaniards call the oile that is preſſed out of the beries, *Azeyte de Mata.*

¶ *The Temperature.*

The leaues, barke, and gum of the Maſtick tree are of a meane and temperat heate, dry in the ſecond degree, and ſomwhat ſtringent.

¶ *The Vertues.*

A The leaues and barke of the Maſticke tree ſtop the laske, the bloudy flix, ſpitting of bloud,

bloud, the pissing of bloud, and all other fluxes of bloud: they are also good against the falling sickenesse, the falling downe of the mother, and comming forth of the fundament.

The gum Masticke hath the same vertue, if it be relented in wine and giuen to be drunke. B

Masticke chewed in the mouth is good for the stomacke, staieth vomiting, increaseth appetite, C
comforteth the braines, staieth the falling downe of the rheumes and watery humors, and maketh a sweet breath.

The same infused in Rosewater is excellent to wash the mouth withall, to fasten loose teeth, D
and to comfort the jawes.

The same spred vpon a piece of leather or veluet, and laid plaisterwise vpon the temples, staieth E
the rheume from falling into the jawes and teeth, and easeth the paines thereof.

It preuaileth much against vlcers and wounds, being put into digestiues and healing vnguents. F

It draweth flegme forth of the head gently and without trouble. G

It is also vsed in waters which serue to clense and make faire the face with. H

The decoction of this filleth vp hollow vlcers with flesh if they be bathed therewith. I

It knitteth broken bones, staieth eating vlcers, and prouoketh vrine. K

Chap. 85. *Of the Turpentine Tree.*

1 *Terebinthus.*
The Turpentine tree.

2 *Terebinthus latifolia.*
The broad leafed Turpentine tree.

The Description.

1 THe first Turpentine Tree groweth to the height of a tall and faire tree, hauing many long boughes or branches, dispersed abroad, beset with long leaues, consisting of sundry other small leaues, each whereof resembleth the Bay leafe, growing one against another vpon a little stem or middle rib, like vnto the leaues of the Ash tree: the floures be small and reddish, growing vpon clusters or bunches that turne into round berries, which at their beginning are greene, afterwards reddish; but beeing ripe wax blacke, or of a darke blew colour, clammie, full of fat and

and oilous in substance, and of a pleasant sauour: this plant beareth an empty cod, or crooked horne somewhat reddish, wherein are found small flies, wormes or gnats, bred and ingendred of a certaine humorous matter, which cleaueth to the inner sides of the said cods or hornes, which wormes haue no physicall vse at all. The right Turpentine issueth out of the branches of these trees, if you doe cut or wound them, the which is faire and cleere, and better than that which is gathered from the barke of the Firre tree.

2 The second kinde of Turpentine tree is very like vnto the former, but that it groweth not so great: yet the leaues are greater and broader, and of the same fashion, but very like to the leaues of the Pistacia tree. The berries are first of a scarlet colour, and when they be ripe of a skie colour. The great horned cods are sharpe pointed, and somewhat cornered, consisting as it were of the substance of gristles. And out of those bladders being broken, do creepe and come small flies or gnats, bred of a fuliginous excrement, and ingendred in those bladders. The tree doth also yeeld his Turpentine by dropping like the former.

¶ *The Place.*

These trees grow, as *Dioscorides* saith, in Iurie, Syria, Cyprus, Africke, and in the Islands called *Cyclades*. *Bellonius* reporteth that there are found great store of them in Syria, and Cilicia, and are brought from thence to Damascus to be sould. *Clusius* saith, That it growes of it selfe in Languedocke, and in very many places of Portingale and Spaine, but for the most part like a shrub, and without bearing Turpentine.

Theophrastus writeth, That it groweth about the hill Ida, and in Macedonia, short, in manner of a shrub, and writhed; and in Damascus and Syria great, in manner of a small tree: he also setteth downe a certaine male Turpentine tree, and a female: the male, saith he, is barren, and the female fruitfull. And of these he maketh the one with a berry red at the first, of the bignesse of a Lentill, which cannot come to ripenesse; and the other with the fruit greene at the first, afterwards somewhat of a yellowish red, and in the end blacke, waxing ripe in the Spring, of the bignesse of the Græcians Beane, and rosenny.

He also writeth of a certaine Indian Turpentine tree, that is to say, a tree like in boughes and leaues to the right Turpentine tree, but differing in fruit, which is like vnto Almonds.

¶ *The Time.*

The floures of the Turnentine tree come fotth in the Spring together with the new buds: the berries are ripe in September and October, in the time of Grape gathering. The hornes appeare about the same time.

¶ *The Names.*

This tree is called in Greeke πίστακος, and also many times πιστάκιος: in Latine, *Terebinthus*: in Italian, *Terebintho*: in Spanish, *Cornicabra*: in French, *Terebinte*: in English, Turpentine tree: the Arabians call it *Botin*, and with an article *Albotin*.

The Rosin is surnamed πίσσινος: in Latine, *Terebinthina*: in high Dutch, **Termentijn**: in English, Turpentine, and right Turpentine: in the Arabian language *Albotin*, who name the fruit *Granum viride*, or greene berries.

¶ *The Temperature and Vertues.*

A The barke, leaues, and fruit of the Turpentine tree doe somewhat binde, they are hot in the second degree, and being greene they dry moderately; but when they are dried they dry in the second degree; and the fruit approacheth more neere to those that be dry in the third degree, and also hotter. This is fit to be eaten, as *Dioscorides* saith, but it hurteth the stomacke.

B It prouoketh vrine, helpeth those that haue bad spleenes, and is drunke in wine against the bitings of the poisonsome spiders called *Phalangia*.

C The Rosin of the Turpentine tree excelleth all other Rosins, according to *Dioscorides* his opinion: but *Galen* writeth, That the Rosin of the Masticke tree beareth the preheminence, and then the Turpentine.

D This Rosin hath also an astringent or binding faculty, and yet not so much as Masticke; but it hath withall a certaine bitternesse joyned, by reason whereof it digesteth more than that of the Masticke tree: through the same quality there is likewise in it so great a clensing, as also it healeth scabs, in his eighth booke of the faculties of simple medicines; but in his booke of medicines according to the kindes, he maketh that of the Turpentine tree to be much like the Rosins of the Larch tree, which he affirmeth to be moister than all the rest, and to be without both sharpnesse and biting.

E The fruit of Turpentine prouoketh vrine and stirreth vp fleshly lust.

F The Rosin of this tree, which is the right Turpentine, looseth the belly, openeth the stoppings of the liuer and spleene, prouoketh vrine, and driueth forth grauell, being taken the quantity of two or three Beanes.

The

The like quantity washed in water diuers times vntill it be white, then must be put thereto the like quantity of the yolk of an egge, and laboured together, adding thereto by little and little (continually stirring it) a small draught of possit drinke made of white wine, and giuen to drinke in the morning fasting, it helpeth most speedily the Gonorrhæa, or running of the reines, commonly at the first time, but the medicine neuer faileth at the second time at the taking of it, which giues stooles from foure to eight, according to the age and strength of the patient. G

Chap. 86. *Of the Frankincense Tree.*

¶ *The Description.*

THe tree from which Frankincense floweth is but low, and hath leaues like the Masticke tree; yet some are of opinion that the leafe is like the leafe of a Peare tree, and of a grassie colour: the rinde is like that of the Bay tree, whereof there are two kindes: the one growing in mountains and rockie places, the other in the plaine: but those in the plaines are much worse than those of the mountaines: the gum hereof is also blacker, fitter to mingle with Pitch, and such other stuffe to trim ships, than for other vses.

Arbor Thurifera.
The Frankincense tree.

Thuris Limpidi folium Lobelij.
The supposed leafe of the Frankincense tree.

Theuet in his Cosmographie saith, that the Frankincense tree doth resemble a gummy or rosiny Pine tree, which yeeldeth a juyce that in time groweth hard, and is called *Thus*, Frankincense, in which is found sometimes certaine small graines like vnto grauell, which they call the Manna of Frankincense.

Of this there is in Arabia two other sorts, the one, the gum whereof is gathered in the Dog daies when the Sun is in Leo, which is white, pure, cleare, and shining. *Pena* writeth, That he hath seene the cleare Frankincense called *Limpidum*, and yeelding a very sweet smell when it is burnt, but the leafe hath been seldome seene, which the Physition *Launanus* gaue to *Pena* and *Lobel*, together with some pieces of the Rosine, which he had of certaine mariners, but he could affirme nothing of certainty whether it were the leafe of the Frankincense, or of some other Pine tree, yeelding the like juyce or gum. It is, saith he, (which doth seldom happen in other leaues) from the lower part or foot of the leafe to the vpper end, as it were doubled, consisting of two thin rindes or coats, with a sheath a span and a halfe long, at the top gaping open like a hood or fooles coxcombe, and as it were couered with a helmet, which is a thing seldome seene in a leafe, but is proper to the floures of *Napellus*,

or *Lonchitis*, as writers affirme; the other is gathered in the Spring, which is reddish, worser than the other in price or value, because it is not so well concocted in the heat of the Sunne. The Arabians wound this tree with a knife, that the liquor may flow out more abundantly, whereof some trees yeeld threescore pound of Frankincense.

¶ *The Place.*

Dioscorides saith it groweth in Arabia, and especially in that quarter which is called Thurifera, the best in that country is called *Stagonias*, and is round, and if it be broken is fat within, and when it is burned doth quickly yeeld a smell: next to it in goodnesse is that which groweth in Smilo, lesser than the other, and more yellow.

¶ *The Time.*

The time is already declared in the descriptio.

¶ *The Names.*

It is called in Greeke λίβανος: in Latine, *Thus*: in Italian, *Incenso*: in Dutch, **Wuetrauch**: in Spanish, *Encenso*: in French, *Enceus*: in English, Frankincense, and Incense: in the Arabian tongue, *Louan*, and of some few, *Conder*. ‡ The Rosin carries the same name; but in shops it is called *Olibanum*, of the Greeke name and article put before it. ‡

¶ *The Temperature and Vertues.*

A It hath, as *Dioscorides* saith, a power to heate and binde.

B It driueth away the dimnesse of the eye-sight, filleth vp hollow vlcers, it closeth raw wounds, staieth all corruptions of bloud, although it fall from the head.

C *Galen* writeth thus of it; *Thus* doth heate in the second degree, and dry in the first, and hath some small astriction, but in the white there is a manifest astriction; the rinde doth manifestly binde and dry exceedingly, and that most certainely in the second degree, for it is of more grosser parts than Frankincense, and not so sharpe, by reason whereof it is much vsed in spitting of bloud, swellings, in the mouth, the collicke passion, the flux in the belly rising from the stomacke, and bloudy flixes.

D The fume or smoke of it hath a more drier and hotter quality than the Frankincense it selfe, being dry in the third degree.

E It doth also clense and fill vp the vlcers in the eies, like vnto Myrrhe: thus far *Galen*.

F *Dioscorides* saith, That if it be drunke by a man in health, it driueth him into a frensie: but there are few Greekes of his minde.

G *Auicen* reporteth that it doth helpe and strengthen the wit and vnderstanding, but the often taking of it will breed the head-ache, and if too much of it be drunke with wine it killeth.

Chap. 87. *Of Fisticke Nuts.*

Pistacia. The Fisticke Nut.

¶ *The Description.*

The tree which beareth Fisticke nuts is like to the Turpentine tree: the leaues hereof be greater than those of the Masticke tree, but set after the same maner, & in like order that they are, being of a faint yellow color out of a green; the fruit or Nuts do hang by their stalks in clusters, being greater than the Nuts of Pine Apples, and much lesser than Almonds: the huske without is of a grayish colour, sometimes reddish, the shell brickle and white; the substance of the kernell greene; the taste sweet, pleasant to be eaten, and something sweet of smell.

¶ *The Place.*

Fisticke Nuts grow in Persia, Arabia, Syria, and in India; now they are made free Denizons in Italy, as in Naples and in other Prouinces there.

¶ *The Time.*

This tree doth floure in May, and the fruit is ripe in September.

¶ *The Names.*

This Nut is called in Greeke πιστάκιον in *Athenæus*: *Nicander Colophonius* in his booke of Treacles nameth it φιστάκιον: *Possidonius* nameth it πιστάκιον: others, πιστάκιον: the Latines obseruing the same termes, haue named it *Pistacion*, *Bistacion*, or *Pistacion*:

ſtacion: the Apothecaries, *Fiſtici*: the Spaniards, *Alhocigos*, and *Fiſtices*: in Italian, *Piſtacchi*: in Engliſh, Fiſticke Nut.

¶ *The Temperature and Vertues.*

The kernels of the Fiſticke Nuts are oftentimes eaten as he thoſe of the Pine Apples; they be of temperature hot and moiſt, they are not ſo eaſily concocted, but much eaſier than common nuts: the juyce is good, yet ſomewhat thicke; they yeeld to the body no ſmall nouriſhment, they nouriſh bodies that are conſumed: they recouer ſtrength. A

They are good for thoſe that haue the phthiſicke, or rotting away of the lungs.

They concoct, ripen, and clenſe forth raw humors that cleaue to the lights and cheſt. B

They open the ſtoppings of the liuer, and be good for the infirmities of the kidnies; they alſo remoue out of the kidnies ſand and grauell; and aſſwage their paine: they are alſo good for vlcers. C D

The kernels of Fiſticke nuts condited, or made into comfits, with Sugar, and eaten, doe procure bodily luſt, vnſtop the lungs and the breſt, are good againſt the ſhortneſſe of breath, and are an excellent preſeruatiue medicine being miniſtred in wine againſt the bitings of all manner of wilde beaſts. E

Chap. 88. *Of the Bladder Nut.*

Nux veſicaria.
The Bladder Nut.

¶ *The Deſcription.*

THis is a low tree, hauing diuers young ſprings growing forth of the root: the ſubſtance of the wood is white, very hard & ſound; the barke is of a light greene: the leaues conſiſt of fiue little ones, which be nicked in the edges like thoſe of the Elder, but leſſer, not ſo greene nor ranke of ſmell. It hath the pleaſant whitiſh floures of Bryony or *Labruſca*, both in ſmell and ſhape, which turne into ſmall cornered bladders of Winter Cherries, called Alkakengie, but of an ouerworne greeniſh colour: in theſe bladders are contained two little nuts, and ſometimes no more but one, leſſer than the Haſell nut, but greater than the Ram Cich, with a wooddy ſhell and ſomewhat red: the kernell within is ſomething greene; in taſte at the firſt ſweet, but afterwards lothſome and ready to prouoke vomit.

¶ *The Place.*

It groweth in Italy, Germany and France; it groweth likewiſe at the houſe of Sir *Walter Culpepper* neere Flimmewell in the Weild of Kent, as alſo in the Fryer-yard without Saint Paules gate in Stamford, and about Spalding Abbey, and in the garden of the right Honourable the Lord Treaſurer my very good Lord and Maſter, and by his houſe in the Strand. It groweth alſo in my Garden, and in the Garden hedges of Sir *Francis Carew* neere Croydon, ſeuen miles from London.

¶ *The Time.*

This tree floureth in May, the Nuts be ripe in Auguſt and September.

¶ *The Names.*

It is commonly called in high Dutch, Pimpernuſz: which ſignifieth in low Dutch, Pimpernoten: diuers call it in Latine, *Piſtacium Germanicum*: we thinke it beſt to call it *Nux veſicaria*. *Matthiolus* in his Epiſtles doth judge the Turks *Coulcoul* and *Hebulben*, to agree with this: *Guilelmus Quacelbenus* affirmeth, Coulcoul to be vſed of diuers in Conſtantinople for a daintie, eſpecially when they be new brought out of Egypt. This plant hath no old name, vnleſſe it be *Staphyledendron Plinij*:

for which it is taken of the later writers: and *Pliny* hath written of it in 16. booke, 16. chapter. There is alſo (ſaith he) beyound the Alps a tree, the timber whereof is very like to that of white Maple, and is called *Staphylodendron*, it beareth cods, and in thoſe kernels, hauing the taſt of the Haſel Nut. It is called in Engliſh, S. Anthonies nuts, wild Piſtacia, or Bladder nuts: the Italians call it *Piſtachio Saluaticke*: the French-men call it *Baguenaudes a patre noſtres*, for that the Friers do vſe to make beads of the Nuts.

¶ *The Temperature and Vertues.*

A Theſe nuts are moiſt and full of ſuperfluous raw humors, and therefore they eaſily procure a readineſſe to vomit, and trouble the ſtomacke, by reaſon that withall they be ſomewhat binding, and therefore they be not to be eaten.

B They haue as yet no vſe in Medicine, yet notwithſtanding ſome haue attributed vnto them ſome vertues in prouoking of Venery.

Chap. 89. *Of the Haſell tree.*

¶ *The Deſcription.*

1 THe Haſell tree groweth like a ſhrub or ſmall tree, parted into boughes without joints, tough and pliable: the leaues are broad, greater and fuller of wrinckles than thoſe of the Alder tree, cut in the edges like a ſaw, of colour greene, and on the backſide more white, the barke is thin: the root is thicke, ſtrong, and growing deepe; in ſtead of floures hang downe catkins, aglets, or blowings, ſlender, and well compact: after which come the Nuts ſtanding in a tough cup of a greene colour, and jagged at the vpper end, like almoſt to the beards in Roſes. The ſhell is ſmooth and wooddy: the kernell within conſiſteth of a white, hard, and ſound pulpe, and is couered with a thin skin, oftentimes red, moſt commonly white; this kernell is ſweet and pleaſant vnto the taſte.

1 *Nux Auellana, ſiue Corylus.*
The Filberd Nut.

2 *Corylus ſylueſtris.*
The wilde hedge-Nut.

2 *Corylus sylvestris* is our hedge Nut or Hasell Nut tree, which is very well knowne, and therefore needeth not any description: whereof there are also sundry sorts, some great, some little, some rathe ripe, some later, as also one that is manured in our Gardens, which is very great, bigger than any Filberd, and yet a kinde of Hedge Nut: this then that hath beene said shall suffice for Hedge-Nuts.

‡ 3 The small Turky Nut tree growes but low, and the leaues grow without order, vpon the twigs, they are in shape like those of the former, but somewhat longer: the chiefe difference consists in the fruit, which is small, and like an Hasell Nut, but shorter: the huske, wherein sometimes one, otherwhiles more Nuts are contained, is very large, rough, and hard, diuided both aboue and below into a great many jags, which on euery side couer, and hold in the Nuts, and these cups are very rough without, but smooth on the inside. *Clusius* first set this forth (hauing receiued it from Constantinople) by the name of *Auellana pumila Byzantina*. ‡

3 *Auellana pumila Byzantina cum sue fructu.*
The Filberd Nut of Constantinople.

¶ *The Place.*

The Hasell trees doe commonly grow in Woods and in dankish vntoiled places: they are also set in Orchards, the Nuts whereof are better, and of a sweeter taste, and be most commonly redde within.

¶ *The Time.*

The catkins or Aglets come forth very timely, before winter be fully past, and fall away in March or Aprill, so soone as the leaues come forth: the Nuts be ripe in August.

¶ *The Names.*

This shrub is called in Latine, *Corylus*: in Greeke, κάρυα Ποντικά, that is, *Nux Pontica*, or Ponticke Nut: in high Dutch, **Hasel strauck**: in low Dutch, **Haselaer**: in English, Hasell tree, and Filberd tree; but the Filberd tree is properly that which groweth in gardens and Orchards, and whose fruit is commonly wholly couered ouer with the huske, and the shell is thinner.

The Nut is named in Latine, *Nux Pontica, tenuis Nux, parua Nux*: it is also called *Nux Prænestina, Nux Heracleotica*, and commonly *Nux auellana*, by which name it is vsually knowne to the Apothecaries, in high Dutch, **Hasel Nusz**: in low Dutch, **Hasel Noten**: in Italian, *Nocciuole, Auellane, Nocelle*: in French, *Noisettes, & Noisettes*: in Spanish, *Auellanas*: in English, Hasell Nut, and Filberd.

These

Theſe Nuts that haue their skins red are the garden and planted Nuts, and the right Ponticke Nuts or Filberds: they are called in high Dutch, Rhurnuſz, and Rotnuſz: in low Dutch, Roode Haſel Noten: in Engliſh, Filberds, and red Filberds.

The other Nuts which be white are iudged to be wilde.

¶ *The Temperature and Vertues.*

A Haſell Nuts newly gathered, and not as yet dry, containe in them a certaine ſuperfluous moiſture, by reaſon whereof they are windy: not onely the new gathered Nuts, but the dry alſo, be very hard of digeſtion; for they are of an earthy and cold eſſence, and of an hard and ſound ſubſtance, for which cauſe alſo they very ſlowly paſſe through the belly, therefore they are troubleſome and clogging to the ſtomacke, cauſe head-ache, eſpecially when they be eaten in too great a quantity.

B The kernells of Nuts made into milke like Almonds do mightily binde the belly, and are good for the laske and the bloudy flix.

C The ſame doth coole exceedingly in hot feuers and burning agues.

D The catkins are cold and dry, and likewiſe binding: they alſo ſtay the laske.

E ‡ The kernels of Nuts rather cauſe than cure the bloudy flix and laske, wherefore they are not to be vſed in ſuch diſeaſes. ‡

Chap. 90. *Of the Wall-nut Tree.*

Nux Iuglans.
The Walnut tree.

¶ *The Deſcription.*

THis is a great tree with a thicke and tall body: the barke is ſomewhat greene, and tending to the colour of aſhes, and oftentimes full of cleſts: the boughes ſpread themſelues far abroad: the leaues conſiſt of fiue or ſix faſtned to one rib, like thoſe of the aſh tree, and with one ſtanding on the top, which bee broader and longer than the particular leaues of the Aſh, ſmooth alſo, and of a ſtrong ſmell: the catkins or aglets come forth before the Nuts: theſe Nuts doe grow hard to the ſtalke of the leaues, by couples, or by three & three; which at the firſt when they be yet but tender haue a ſweet ſmel, and be couered with a green huske: vnder that is a wooddy ſhell in which the kernell is contained, being couered with a thin skin, parted almoſt into foure parts with a woody skin as it were: the inner pulpe whereof is white, ſweet and pleaſant to the taſt; and that is when it is new gathered, for after it is dry it becommeth oily and rancke.

¶ *The Place.*

The Walnut tree groweth in fields neere common high-wayes, in a fat and fruitfull ground, and in orchards: it proſpereth on high fruitfull bankes, it loueth not to grow in watery places.

¶ *The Time.*

The leaues together with the catkins come forth in the Spring: the Nuts are gathered in Auguſt.

¶ *The Names.*

The tree is called in Greeke, Κάρυα: in Latine, *Nux*, which name doth ſignifie both the tree and the fruit: in high Dutch, Nuſzbaum: in low Dutch, Noote boome, and Nootelaer: in French, *Neiſier*: in Spaniſh, *Nogueyra*: in Engliſh, Walnut tree, and of ſome, Waliſh nut tree. The Nut is called in Greeke, Κάρυον Βασιλικὸν, that is to ſay, *Nux Regia*, or the Kingly Nut: it it likewiſe named

Nux

Nux Inglans, as though you should say *Iouis glans*, Iupiters Acorne; or *Iuvans glans*, the helping Acorne: and of diuers, *Persica Nux*, or the Persian Nut: in high Dutch, **Welsch Nusz**, and **Baumnusz**: in low Dutch, **Dokernoten, Walsch Noten**: in Italian, *Noci*: in French, *Noix*: in Spanish, *Nueces*, and *Nous*: in English, Walnut; and of some, Walsh nut.

¶ *The Temperature and Vertues.*

The fresh kernels of the nuts newly gathered are pleasant to the taste: they are a little cold, and A
haue no small moisture, which is not perfectly concocted: they be hard of digestion, and nourish
little: they slowly descend.

The dry nuts are hot and dry, and those more which become oily and ranke: these be very hurt- B
full to the stomacke, and besides that they are hardly concocted, they increase choler, cause head-
ache, and be hurtfull for the chest, and for those that be troubled with the cough.

Dry Nuts taken fasting with a fig and a little Rue withstand poyson, preuent and preserue the C
body from the infection of the plague, and being plentifully eaten they driue wormes forth of the
belly.

The greene and tender Nuts boyled in Sugar and eaten as Suckad, are a most pleasant and dele- D
ctable meat, comfort the stomacke, and expell poison.

The oyle of Walnuts made in such manner as oyle of Almonds, maketh smooth the hands and E
face, and taketh away scales or scurfe, blacke and blew marks that come of stripes or bruises.

Milke made of the kernels, as Almond milke is made, cooleth and pleaseth the appetite of the F
languishing sicke body.

With onions, salt, and honey, they are good against the biting of a mad dog or man, if they be G
laid vpon the wound.

Being both eaten, and also applied, they heale in short time, as *Dioscorides* saith, Gangrens, Car- H
buncles, ægilops, and the pilling away of the haire: this also is effectually done by the oyle that is
pressed out of them, which is of thin parts, digesting and heating.

The outward greene huske of the Nuts hath a notable binding faculty. I

Galen deuised and taught to make of the juyce thereof a medicine for the mouth, singular good K
against all inflammations thereof.

The leaues and first buds haue a certaine binding quality, as the same Author sheweth, yet there L
doth abound in them an hot and dry temperature.

Some of the later Physitions vse these for baths and lotions for the body, in which they haue a M
force to digest and also to procure sweat.

Chap. 91. *Of the Chestnut tree.*

¶ *The Description.*

1 THe Chestnut tree is a very great and high tree: it casteth forth very many boughes: the body is thicke, and sometimes of so great a compasse as that two men can hardly fathom it: the timber or substance of the wood is sound and durable: the leaues bee great, rough, wrinkled, nicked in the edges, and greater than the particular leaues of the Walnut tree. The blowings or catkins be slender, long, and greene: the fruit is inclosed in a round rough and prickly huske like to an hedge-hog or Vrchin, which opening it selfe doth let fall the ripe fruit or Nut. This nut is not round, but flat on the one side, smooth, and sharpe pointed: it is couered with a hard shell, which is tough and very smooth, of a darke browne colour: the meate or inner substance of the nut is hard and white, and couered with a thin skin which is vnder the shell.

2 The Horse Chestnut groweth likewise to be a very great tree, spreading his great and large armes or branches far abroad, by which meanes it maketh a very good coole shadow. These branches are garnished with many beautifull leaues, cut or diuided into fiue, six, or seuen sections or diuisions like to the Cinkefoile, or rather like the leaues of *Ricinus*, but bigger. The floures grow at the top of the stalkes, consisting of foure small leaues like the Cherry blossome, which turne into round rough prickly heads like the former, but more sharpe and harder: the Nuts are also rounder. ‡ The floures of this, saith *Clusius*, (whose figure of them I here giue you) come out of the bosome of the leafe which is the vppermost of the branch, and they are many in number growing vpon prettie long foot-stalkes, consisting each of them of foure white leaues of no great bigneſſe; the two vppermost are a little larger than the rest, hauing round purple spots in their middles: out of the middle of the floure come forth many yellowish threds with golden pendants. The fruit is contained in a prickly huske that opens in three parts, and it is rounder and not so sharpe pointed as

the

1 *Caſtanea.*
Cheſtnut tree.

2 *Caſtanea Equina cum flore.*
Horſe Cheſtnut tree in floure.

Caſtaneæ Equinæ fructus.

‡ 3 *Caſtaneæ Peruanæ fructus.*

the ordinary Cheſtnut, neither vnder the vtter coat hath it any peeling within as the other hath, neither is it of ſo good a taſte. ‡

‡ 3 This Americane Cheſtnut is almoſt round, but that it is a little flatted on the ſides, eſpecially whereas it is faſtned to the ſtalke: the vtter coat is ſufficiently thicke, yet brittle, and as it were fungous, of a browniſh yellow colour: vnder this are aboundance of ſmall, yet ſtiffe prickes, faſt ſticking to the ſhell that containes the kernel: the ſhell it ſelfe is browniſh, not thick, but tough and hard to breake, ſmooth and ſhining on the inſide, wherin is contained a kernell of the bigneſſe and color of an hares kidney, white within, and ſweet in taſte, like an almond or the common Cheſtnut. *Cluſius* cals this *Caſtanea Peruana*, or Cheſtnut of Peru; and hee ſaith hee had it from the famous Geographer *Abraham Ortelius*, who had it ſent him by *Benedictus Arcas Montanus*. The figure is expreſt vnder that of the Horſe Cheſtnut. ‡

¶ *The Place.*

The firſt growes on mountaines and ſhadowie places, and many times in the vallies: they loue a ſoft and blackeſoile. There be ſundry woods of Cheſtnuts in England, as a mile

mile and a halfe from Feuersham in Kent, and in sundry other places: in some countries they be greater and pleasanter: in others smaller, and of worse taste.

The Horse Chestnut groweth in Italy, and in sundry places of the East-countries. ‡ It is now growing with Mr *Tradescant* at South Lambeth. ‡

¶ *The Time.*

The blowings or aglets come forth with the leaues in Aprill; but the Nuts later, and be not ripe till Autumne.

¶ *The Names.*

The Chestnut tree beares the name of the Nut both in Greeke and Latine: in high Dutch, **Kestenbaum**, and **Kastanibaum**: in low Dutch, **Castanboom**: in French, *Castaignier*: in English, Chestnut tree.

The Nut is called in Greeke, κάστανον: in Latine, *Castanea, Iouis glans, Sardinia glans*: in high Dutch, **Kesten**: in low Dutch, **Castanien**: in Italian, *Castagne*: in French, *Chastaigne*: in Spanish, *Morones, Castanas*: in English, Chestnut: the greater Nuts be named of the Italians, *Marroni*: of the French men and of diuers base Almanes, *Marons*.

The Horse Chestnut is called in Latine, *Equina Castanea*: in English, Horse Chestnut, for that the people of the East countries do with the fruit thereof cure their horses of the cough, shortnesse of breath, and such like diseases.

¶ *The Temperature and Vertues.*

Our common Chestnuts are very dry and binding, and be neither hot nor cold, but in a mean be- A
tweene both: yet haue they in them a certaine windinesse, and by reason of this, vnlesse the shell be first cut, they skip suddenly with a cracke out of the fire whilest they be rosting.

Of all the Acornes, saith *Galen*, the Chestnuts are the chiefest, and do onely of all the wilde fruits B
yeeld to the body commendable nourishment; but they slowly descend, they be hardly concocted, they make a thicke bloud, and ingender winde: they also stay the belly, especially if they be eaten raw.

Being boiled or rosted they are not of so hard digestion, they more easily descend, and are lesse C
windy, and yet they also make the body costiue.

Some affirme, That of raw Chestnuts dried, and afterwards turned into meale, there is made a D
kinde of bread: yet it must needs be, that this should be dry and brittle, hardly concocted and very slow in passing through the belly; but this bread may be good against the laske and bloudy flix.

An Electuary of the meale of Chestnuts and honey is very good against the cough and spitting E
of bloud.

The barke of the Chestnut tree boyled in wine and drunke, stops the laske, the bloudy flix, and F
all other issues of bloud.

Chap. 92. *Of the Beech tree.*

¶ *The Description.*

The Beech is an high tree, with boughes spreading oftentimes in manner of a circle, and with a thicke body hauing many armes: the barke is smooth: the timber is white, hard, and very profitable: the leaues be smooth, thin, broad, and lesser than those of the blacke Poplar: the catkins or blowings be also lesser and shorter than those of the Birch tree and yellow: the fruit or Mast is contained in a huske or cup that is prickly, and rough bristled, yet not so much as that of the Chestnut: which fruit being taken forth of the shells or vrchin huskes, be couered with a soft and smooth skin like in colour and smoothnesse to the Chestnuts, but they be much lesser, and of another forme, that is to say, triangled or three cornered: the kernell within is sweet, with a certaine astriction or binding qurlitie: the roots be few, and grow not deepe, and little lower than vnder the turfe.

¶ *The Place.*

The Beech tree loueth a plaine and open country, and groweth very plentifully in many Forrests and desart places of Sussex, Kent, and sundry other countries.

¶ *The Time.*

The Beech floureth in Aprill and May, and the fruit is ripe in September, at what time the Deere do eate the same very greedily, as greatly delighting therein; which hath caused forresters and huntsmen to call it Buck-mast.

¶ *The*

Fagus.
The Beech.

¶ *The Names.*

The tree is called in Greeke, φηγὸς: in Latine, *Fagus*: in high Dutch, **Buchbaum**, or **Buch**: in low Dutch, **Bukenboom**: in Italian, *Faggi*: in Spaniſh, *Haia*, *Faia*, and *Fax*: in French, *Fau*, or *Heſtre*: in Engliſh, Beech tree, Beech-maſt, and Buck-maſt.

The fruit is called in Latine, *Nuces Fagi*: in Greeke, βάλανοι τῆς φηγοῦ: in low Dutch, **Bueken noothens**: in French, *Faine*: in Engliſh, Beech-maſt. *Dioſcorides* reckons the Beech among the Acorne trees; and yet is the maſt nothing at all like to an Acorne. Of *Theophraſtus* it is called *Oxya*: of *Gaza*, *Sciſcina*.

Pliny alſo makes mention of this tree, but vnder the name of *Oſtrya* (if ſo be in ſtead of *Oſtrya* we muſt not reade *Oxya*) *lib.* 13. *ca.* 21. It brings forth (ſaith he, meaning Greece) the tree *Oſtrys*, which they likewiſe call *Oſtrya*, growing alone among watery ſtones, like to the Aſh tree in barke and boughes, with leaues like thoſe of the Peare tree, but ſomwhat longer and thicker, and with wrinkled cuts which run quite through, with a ſeed like in colour to a Cheſtnut, and not to barley: the wood is hard and firme, which being brought into the houſe there follows hard trauell of child, and miſerable deaths, as it is reported; and therefore it is to be forborne, and not vſed as fire wood, if *Plinies* copies be not corrupted.

¶ *The Temperature.*

The leaues of Beech do coole: the kernell of the Nut is ſomewhat moiſt.

¶ *The Vertues.*

A The leaues of Beech are very profitably applied vnto hot ſwellings, bliſters, and excoriations; and being chewed they are good for chapped lips, and paine of the gums.

B The kernels or maſt within are reported to eaſe the paine of the kidnies proceeding of the ſtone, if they be eaten, and to cauſe the grauell and ſand the eaſier to come forth. With theſe, mice and Sqirrels are greatly delighted, who do mightily increaſe by feeding thereon: Swine alſo be fatned herewith, and certaine other beaſts: alſo Deere doe feed thereon very greedily: they be likewiſe pleaſant to Thruſhes and Pigeons.

C *Petrus Creſcentius* writeth, That the aſhes of the wood is good to make glaſſe with.

D The water that is found in the hollowneſſe of Beeches cureth the naughty ſcurfe, tetters, and ſcabs of men, horſes, kine, and ſheepe, if they be waſhed therewith.

Chap. 93. *Of the Almond tree.*

¶ *The Deſcription.*

THe Almond tree is like the Peach-tree, yet is it higher, bigger, of longer continuance: the leaues be very long, ſharpe pointed, ſnipt about the edges like thoſe of the Peach tree: the floures be alike: the fruit is alſo like a Peach, hauing on one ſide a cleft, with a ſoft skin without, and couered with a thin cotton; but vnder this there is none, or very little pulpe, which is hard like a griſtle not eaten: the nut or ſtone within is longer than that of the Peach, not ſo rugged, but ſmooth; in which is contained the kernel, in taſte ſweet, and many times bitter: the root of the tree groweth deepe: the gum which ſoketh out hereof is like that of the Peach tree.

‡ There are diuers ſorts of Almonds, differing in largenes and taſte: we commonly haue three or foure ſorts brought to vs, a large ſweet Almond, vulgarly termed a Iordan Almond; and a leſſer, called a Valence Almond: a bitter Almond of the bigneſſe of the Valence Almond, and ſomtimes another bitter one leſſe than it. ‡

¶ *The*

Amygdalus.
The Almond tree.

¶ *The Place.*

The naturall place of the Almond is in the hot regions, yet we haue them in our London gardens and orchards in great plenty.

¶ *The Time.*

The Almond floureth betimes with the Peach: the fruit is ripe in Auguſt.

¶ *The Names.*

The tree is called in Greeke, Ἀμυγδάλη: in Latine, *Amigdalus*: in French, *Amandier*: in Engliſh, Almond tree.

The fruit is called in Greeke, Ἀμυγδάλον: in Latine, *Amygdalum*: in ſhops, *Amygdala*: in high Dutch, **Mandel**: in low Dutch, **Almandelen**: in Italian *Mandole* in Spaniſh, *Almendras*, *Amelles*, and *Amendoas*: in French, *Amandes*: in Engliſh Almond.

¶ *The Temperature and Vertues.*

Sweet Almonds when they be dry be moderately hot; but the bitter ones are hot and dry in the ſecond degree. There is in both of them a certain fat and oily ſubſtance, which is drawne out by preſſing. A

Sweet Almonds beeing new gathered are pleaſant to the taſte, they yeeld ſome kinde of nouriſhment, but the ſame groſſe and earthy, and groſſer than thoſe that be dry, and not as yet withered. Theſe doe likewiſe ſlowly deſcend, eſpecially being eaten without their skins; for euen as the huskes or branny parts of corne doe ſerue to driue downe the groſſe excrements of the belly, ſo doe likewiſe the skins or huskes of the almonds: therefore thoſe that be blanched do ſo ſlowly deſcend, as that they do withall binde the belly; whereupon they are giuen with good ſucceſſe vnto thoſe that haue the laske or the bloudy flix. B

There is drawne out of ſweet Almonds, with liquor added, a white juyce like milke, which ouer and beſides that it nouriſheth, and is good for thoſe that are troubled with the laske and bloudy flix, it is profitable for thoſe that haue the pluriſie and ſpit vp filthy matter, as *Alexander Trallianus* witneſſeth: for there is likewiſe in the Almonds an opening and concocting quality, with a certaine clenſing faculty, by which they are medicinable to the cheſt and lungs, or lights, and ſerue for raiſing vp of flegme and rotten humors. C

Almonds taken before meate do ſtop the belly, and nouriſh but little; notwithſtanding many excellent meates and medicines are therewith made for ſundry griefes, yea very delicat and wholſome meates, as Almond butter, creame of Almonds, marchpane, and ſuch like, which dry and ſtay the belly more than the extracted juyce or milke; and they are alſo as good for the cheſt and lungs. D

They doe ſerue alſo to make the Phyſicall Barley Water, and Barley Creame, which are giuen in hot Feuers, as alſo for other ſicke and feeble perſons, for their further refreſhing and nouriſhments. E

The oyle which is newly preſſed out of the ſweet Almonds is a mitigater of paine and all maner of aches. It is giuen to thoſe that haue the pleuriſie, being firſt let bloud; but eſpecially to thoſe that are troubled with the ſtone in the kidnies: it ſlackens the paſſages of the vrine, and maketh them glib or ſlippery, and more ready to ſuffer the ſtone to haue free paſſage: it maketh the belly ſoluble, and therefore it is likewiſe vſed for the collicke. F

It is good for women that are newly deliuered; for it quickly remoueth the throwes which remaine after their deliuery. G

The oile of Almonds makes ſmooth the hands and face of delicat perſons, and clenſeth the skin from all ſpots, pimples, and lentils. H

Bitter Almonds doe make thin and open, they remoue ſtoppings out of the liuer and ſpleene, therefore they be good againſt paine in the ſides: they make the body ſoluble, prouoke vrine, bring I

downe the menſes, helpe the ſtrangury, aud clenſe forth of the cheſt and lungs clammie humors: if they be mixed with ſome kinde of looch or medicine to licke on: with ſtarch they ſtay the ſpitting of bloud.

L And it is reported that fiue or ſix being taken faſting do keepe a man from being drunke.

M These alſo clenſe and take away ſpots and blemiſhes in the face, and in other parts of the body; they mundifie and make cleane foule eating vlcers.

N With hony they are laid vpon the biting of mad dogs; being applied to the temples with vineger or oile of Roſes, they take away the head-ache, as *Dioſcorides* writeth.

O They are alſo good againſt the cough and ſhortneſſe of winde.

P They are likewiſe good for thoſe that ſpit bloud, if they be taken with the fine floure of *Amylum*.

Q There is alſo preſſed out of theſe an oile which pruoketh vrine, but eſpecially if a few ſcorpions be drowned and ſteeped therein.

R With oile it is ſingular good for thoſe that haue the ſtone, and cannot eaſily make water but with extremitie of paine, if the ſhare and place betweene the cods and fundament be anoynted therewith.

S *Dioſcorides* ſaith, That the gum doth heate and binde, which qualities notwithſtanding are not perceiued in it.

T It helpeth them that ſpit bloud, not by a binding faculty, but through the clammineſſe of his ſubſtance, and that is by cloſing vp of the paſſages and pores, and ſo may it alſo cure old coughes, and mitigate extreme paines that proceed of the ſtone, and eſpecially take away the ſharpeneſſe of vrine, if it be drunke with Baſtard, or with any other ſweet potion, as with the decoction of Licorice, or of Raiſons of the ſunne. The ſame doth likewiſe kill tetters in the outward parts of the body (as *Dioſcorides* addeth) if it be diſſolued in vineger.

Chap. 94. *Of the Peach tree.*

¶ *The Kindes.*

‡ There are diuers ſorts of Peaches beſides the foure here ſet forth by our Author, but the trees do not much differ in ſhape, but the difference chiefely conſiſts in the fruit, whereof I will giue you the names of the choiſe ones, and ſuch as are to be had from my friend Mr *Millen* in Old-ſtreet, which are theſe; two ſorts of Nutmeg Peaches; The Queenes Peach; The Newington Peach; The grand Carnation Peach; The Carnation Peach; The blacke Peach; The Melocotone; The White; The Romane; The Alberza; The Iſland Peach; Peach du Troy. Theſe are all good ones. He hath alſo of that kinde of Peach which ſome call *Nuciperſica* or Nectorins, theſe following kindes; the Roman red, the beſt of fruits; the baſtard Red; the little dainty greene; the Yellow; the White; the Ruſſet, which is not ſo good as the reſt. Thoſe that would ſee any fuller diſcourſe of theſe may haue recourſe to the late worke of Mr *Iohn Parkinſon*, where they may finde more varieties, and more largely handled, and therefore not neceſſary for me in this place to inſiſt vpon them. ‡

¶ *The Deſcription.*

1 The Peach tree is a tree of no great bigneſſe: it ſendeth forth diuers boughes, which be ſo brittle, as oftentimes they are broken with the weight of the fruit or with the winde. The leaues be long, nicked in the edges, like almoſt to thoſe of the Walnut tree, and in taſte bitter: the floures be of a light purple colour. The fruit or Peaches be round, and haue as it were a chinke or cleft on the one ſide; they are couered with a ſoft and thin downe or hairy cotton, being white without, and of a pleaſant taſte; in the middle whereof is a rough or rugged ſtone, wherein is contained a kernell like vnto the Almond; the meate about the ſtone is of a white color. The root is tough and yellowiſh.

2 The red Peach tree is likewiſe a tree of no great bigneſſe: it alſo ſendeth forth diuers boughes or branches which be very brittle. The leaues be long, and nicked in the edges like to the precedent. The floures be alſo like vnto the former; the fruit or Peaches be round, and of a red colour on the outſide; the meate likewiſe about the ſtone is of a gallant red colour. Theſe kindes of Peaches are very like to wine in taſte, and therefore maruellous pleaſant.

3 *Perſica præcocia*, or the d'auant Peach tree is like vnto the former, but his leaues are greater and larger. The fruit or Peaches be of a ruſſet colour on the one ſide, and on the other ſide next vnto the Sun of a red colour, but much greater than the red Peach: the ſtones whereof are like vnto the former: the pulpe or meate within is of a golden yellow colour, and of a pleaſant taſte.

4 *Perſica*

Perſica alba.
The white Peach.

4 *Perſica lutea*, or the yellow Peach tree is like vnto the former in leaues and flours, his fruit is of a yellow color on the out ſide, and likewiſe on the in ſide, harder than the reſt: in the middle of the Peach is a wooddy hard and rough ſtone full of creſts and gutters, in which doth ly a kernel much like to that of the almond, and with ſuch a like skin: the ſubſtance within is white, and of taſte ſomewhat bitter. The fruit hereof is of greateſt pleaſure, and of beſt taſte of all the other of his kinde; although there be found at this day diuers other ſorts that are of very good taſte, not remembred of the antient, or ſet down by the later Writers, whereof to ſpeake particularly would not bee great to our pretended purpoſe, conſidering wee haſten to an end.

‡ 5 There is alſo kept in ſome of our choice gardens a kind of Peach which hath a very double and beautifull floure, but it is ſeldom ſucceeded by any fruit: they call this *Perſica flore pleno*, The double bloſſomed Peach. ‡

¶ *The Place.*

They are ſet and planted in gardens and Vineyards. I haue them all in my garden, with many other ſorts.

¶ *The Time.*

The Peach tree ſoone comes vp, it beares fruit the third or fourth yeare after it is planted, and it ſoon decayeth, being not of long continuance. It flours in Aprill, or a little after the leaues appeare, and ripens his fruit in September.

¶ *The Names.*

The Peach tree is called in Greeke, Μηλέα Περσική: in Latine, *Malus Perſica*, and *Perſica*: in High-Dutch, **Perſichboum**: in low-Dutch, **Perſe boom**: in French, *Perſcher*: in Engliſh, Peach tree.

The fruit, as *Galen* teſtifieth, is named Μῆλα Περσικά, and Περσικά alſo, without any addition: in Latine, *Malum Perſicum*, and *Perſicum*: in high-Dutch, **Pferſing**: in low-Dutch, **Perſen**: in Italy, *Peſche*: in Spaniſh, *Pexegos*: in French, *Piſches*: in Engliſh, Peach.

¶ *The Nature and Vertues.*

Peaches be cold and moiſt, and that in the ſecond degree, they haue a juice and alſo a ſubſtance that doth eaſily putrifie, which yeeldeth no nouriſhment, but bringeth hurt, eſpecially eaten after other meats, for then they cauſe the other meats to putrifie. But they are leſſe hurtfull if they be taken firſt; for by reaſon that they are moiſt and ſlippery, they eaſily and quickly deſcend, and by making the belly ſlippery, they cauſe other meats to ſlip down the ſooner. A

The kernels of the Peaches be hot and dry, they open and clenſe, and are good for the ſtoppings of the liuer and ſpleen. B

Peaches before they be ripe do ſtop the laske, but being ripe they looſe the belly, and ingender naughty humors, for they are ſoon corrupted in the ſtomacke. C

The leaues of the Peach tree do open the ſtoppings of the liuer, and do gently looſen the belly: and being applied plaiſterwiſe vnto the nauel of yong children, they kil the worms, and driue them forth. D

The ſame leaues boiled in milke do kill the wormes in children very ſpeedily. E

The ſame being dried and caſt vpon green wounds cure them. F

The floures of the Peach tree infuſed in warme water for the ſpace of ten or twelue houres, and ſtrained, and more floures put to the ſaid liquor to infuſe after the ſame manner, and ſo iterated ſix or eight times and ſtrained againe, then as much ſugar as it will require added to the ſame liquor, and boiled vnto the conſiſtence or thickneſſe of a ſyrrup, and two ſpoonefulls hereof taken, doth ſo ſingularly well purge the belly, that there is neither Rubarb, Agarick, nor any other purger comparable vnto it; for this purgeth down wateriſh humors mightily, and yet without griefe or trouble, either to the ſtomacke or lower parts of the body. G

H The kernell within the Peach ſtone ſtamped ſmall, and boiled with vineger vntill it be brought to the form of an ointment, is good to reſtore and bring again the haire of ſuch as be troubled with the *Alopecia*.

I There is drawn forth of the kernels of peaches, with Peniroyall water, a juice like to milk, which is good for thoſe that haue the Apoplexy: if the ſame be oftentimes held in the mouth, it draweth forth water and recouereth ſpeech.

K The gum is of a meane temperature, but the ſubſtance thereof is tough and clammy, by reaſon whereof it dulleth the ſharpnes of thin humors: it ſerueth in a looch or licking medicine for thoſe that be troubled with the cough, and haue rotten lungs, and ſtoppeth the ſpitting and raiſing vp of bloud, and alſo ſtayeth other fluxes.

Chap. 95.

Of the Aprecocke or Abrecocke tree.

1 *Armeniaca malus major.*
The greater Aprecocke tree.

2 *Armeniaca malus minor.*
The leſſer Aprecocke tree.

¶ *The Deſcription.*

1 THis tree is greater than the Peach tree, and hath a bigger body, it laſteth longer, eſpecially if it be graffed or inoculated: the leaues hereof are broad and ſharp pointed, like thoſe of blacke Poplar, but leſſer, and comming more neere to the leaues of Birch, nicked in the edges: the floures are ſomewhat white, the fruit round like a Peach, yellow within and without, in which doth lie a browne ſtone nothing rough at all as is that of the Peach, ſhorter alſo and leſſer, in which is included a ſweet kernell.

2 We haue another ſort of Aprecock, whoſe trunke or body is equal with the other in greatneſſe, it is like alſo in leaues and brittle branches: his time of flouring, flouriſhing, and manner of growing accordeth: the only point wherein they differ is, that this tree bringeth forth leſſe fruit, and not ſo good in taſte, in euery other reſpect it is like.

‡ Of this alſo Mr *Parkinſon* hath ſet forth diuers varieties, and my fore mentioned friend Mr *Millen* hath theſe fiue ſorts, the common, the long and great, the Muske, the Barbary, and the early Aprecocke. ‡

¶ *The*

¶ *The Place.*

These trees grow in my garden, and now adaies in many other gentlemens gardens throughout England.

¶ *The Time.*

They floure and flourish in Aprill, and their fruit is ripe in Iuly.

¶ *The Names.*

The tree is called in Greeke, Μῆλον Ἀρμενιακὸν: in Latine, *Malus Armeniaca:* in English, Abrecock tree and Aprecock tree.

The fruit is named Μῆλα Ἀρμενιακὰ, and of diuers, πραικόκκια, or βερικόκκια, which bee words corrupted from the Latine, for *Præcox* in Latine is diuers times called *Præcoquum:* it is named *Malum Armeniacum*, and commonly *Armeniacum*: in high-Dutch, **Wolletten Wollelin, S. Johans Pferſing:** in low-Dutch, **Vroege Perſen, Auant Perſen:** in Italian, *Armeniache, Bacoche, Criſomele, Moniache:* in French, *Abricoz:* in Spaniſh, *Alvarcoques, Alvarchigas*, and *Albercocs:* in Engliſh, Abrecocke, Aprecock, and Aprecox.

Galen ſeems to make a difference between *Præcocia* and *Armeniaca*, in his book of the Faculties of Nouriſhments, preferring *Præcocia* before *Armeniaca:* yet he doth confeſſe that both of them bee called *Armeniaca*. Others pronounce them *Armenia* with foure ſyllables. And in his book of the Faculties of ſimple medicines he affirmeth, that both the fruit and the tree are called πραικόκια: Diuers alſo of the later phyſitians do betwixt theſe make a difference, ſaying, that the greater ones & thoſe that are graffed be *Armeniaca* (which the French men call *Avant Perſes*) and the leſſer *Præcocia:* in French, *Abricoz*.

¶ *The Temperature and Vertues.*

Aprecockes are cold and moiſt in the ſecond degree, but yet not ſo moiſt as Peaches, for which cauſe they do not ſo ſoon putrifie; they are alſo more wholſome to the ſtomack and pleaſant to the taſte, yet doe they likewiſe putrifie and yeeld but little nouriſhment, and the ſame cold, moiſt, and full of excrements. Being taken after meat they corrupt and putrifie in the ſtomack; being firſt eaten before meat they eaſily deſcend, and cauſe other meats to paſſe down the ſooner, like as alſo the Peaches do. A

The kernel within it is ſweet, and nothing at all in faculties like that of the Peach. B

The vertues of the leaues of this tree are not yet found out. C

Chap. 96. *Of the Pomegranat tree.*

¶ *The Kindes.*

AS there be ſundry ſorts of Apples, Peares, Plums, and ſuch like fruits; ſo there are two ſorts of Pomegranats, the garden and the wilde, and a third ſort which is barren and fruitleſſe: the fruit of the garden Pomegranat is of three ſorts; one hauing a ſoure juice or liquor, another a very ſweet and pleaſant liquor, and the third the taſt of wine. Of the wild alſo there be two ſorts, and the difference between them is no more than betwixt crabs and weildings, which are both wilde kindes of apples. Therefore the deſcription of the garden Pomegranat ſhall ſuffice for the reſt.

¶ *The Deſcription.*

1 THe manured Pomegranat tree groweth vp to the height of an hedge tree, beeing ſeuen or eight cubits high, hauing many pliant twiggy branches, very limber, tough, and of a browne colour, whereon are ſet very many leaues in ſhape like thoſe of the Priuet, but more like thoſe of the Myrtle tree, of a bright ſhining green colour tending to yellowneſſe: among which ſtand certain ſharp thorns confuſedly ſet, and likewiſe hollow floures like to the hedge roſe, indented on the edges like a ſtar, of a Carnation colour, and very ſingle: after which commeth the fruit, couered with an hard bark of an ouerworne purpliſh colour, full of grains and kernells, which after they be ripe are of a crimſon colour, and full of juice, which differeth in taſt according to the ſoile, clymat, and country where they grow; ſome be ſweet, others ſoure, and the third are in a middle between them both, hauing the taſte of wine.

† 2 The wild Pomegranat tree is like the other in leaues and twiggy branches, but it is more prickly and horrid. Of this there are two ſorts, the one hauing ſuch floures and fruit as the tame Pomegranat, the other bearing floures very double, as may appeare by the figure, which wither and fall away leauing no fruit behind them, as the double floured Cherry doth, and diuers other herbes

1 *Malus granata ſive Punica.*
The Pomegranat tree.

2 *Malus Punica ſylveſtris.*
The wilde Pomegranat.

Balauſtia, ſive pleni flores Gran ſyl.
The double floures of wild Pomegranat.

and trees alſo, and it is altogether barren of fruit. Of this *Dioſcorides* makes ſundry ſorts, differing in colour, one is white, ſaith hee, another yellowiſh red, and a third ſort of the colour of the Roſe. This with red floures is beſt known to Apothecaries.

¶ *The Place.*

Pomgranats grow in hot countries toward the South, In Italy, Spain, and chiefely in the kingdome of Granado, which is to be ſo named of the great multitude of Pomegranates, which be commonly called *Granata*. They grow in a number of places alſo without manuring, yet being manured they proſper better; for in gardens, vineyards, orchards, & ſuch other husbanded grounds they come vp more chearfully. I haue recouered diuers yong trees hereof by ſowing the ſeed or graines, of three or foure cubits high, attending Gods leiſure for floures and fruit.

¶ *The Time.*

The Pomegranat floureth in the months of May and Iune. The fruit is ripe in the end of Auguſt.

¶ *The Names.*

The Pomegranat tree is called in Latine, *Malus Punica:* in Greeke of the Athenians, Ῥοιὰ and

and Ῥοιὰ, as *Galen* saith; in English, Pomegranat tree.

The Fruit also is named Ῥοιὰ, and Ῥόα, In Latine, *Malum Punicum*: in shops, *Malum*, or *Pomum Granatum*: in high-Dutch, **Granatopffel**: in low-Dutch, **Granappel**: in Italian, *Melagrano*, and *Pomo Granato*: in Spanish, *Granadas*, and *Romanas*: in French, *Pommes Granades*: in English, Pomegranat.

The floure of the fruitfull Pomgranat tree is called of the Grecians κώνος, which is notwithstanding properly the cup of the floure: the Latines name it also *Cytinus*.

The floure of the wild and barren Pomegranat tree is called βαλαύστιον: the Apothecaries likewise term it *Balaustium*.

The pill or rinde of the Pomegranat, so much in vse, is named in Greeke σίδιον: in Latine, *Malicorium*, and *Sidium*: in shops, *Cortex Granatorum*, or Pomegranat pill.

¶ *The Nature and Vertues.*

The juicy grains of the Pomegranat are good to be eaten, hauing in them a meetly good juyce; they are wholsome for the stomack, yet contain but thin and small nourishment or none at all, A

The sweet ones be not so cold as the rest, but they easily cause hot swellings to arise, and are not so much commended for agues. B

The soure ones, especially if they be withall somthing harsh, do euidently coole, dry, and somewhat binde. C

They are good for the heart-burn, they represse and stay the ouermuch vomiting of choler, called the Felony; they help the bloudy flix, aptnesse to vomit, and vomiting. D

There is made of the juice of these soure pomegranates a syrrup seruing for the same purposes, and is also many times very profitable against the longing of women with childe, vnlesse the coldnesse of the stomack hinder it. E

The seeds of the grains, and especially of the soure Pomegranat, being dried, do also coole and binde. F

They stop the flix, stay vomiting and spitting vp of bloud, and strengthen the stomacke. G

Of the same effect be the floures both of the tame and wilde Pomegranat tree, being like to the seeds in temperature and vertues. H

They fasten the teeth and strengthen the gums, if they be washed therewith. I

They are good against Burstings that come by falling down of the guts, if they be vsed in plaisters and applied. K

The rinde or pill is not only like in facultie to the seeds, and both the sorts of floures, but also more auailable; for it cooleth and bindeth more forcibly; it bringeth downe the hot swellings of the almonds in the throat, being vsed in a gargarism or lotion for the throat, and is a singular remedie for all things that need cooling and binding. L

Dioscorides writeth, that there is also gathered a juice out of both these sorts of floures, which is very like in facultie to *Hypocistis*. M

The blossoms of the tame and wild Pomegranats, as also the rind or shel thereof made into pouder, and drunk in red wine, or boiled in red wine, and the decoction drunk, is good against the bloudy flix and all other issues of bloud; yea it is good for women to sit ouer and bathe themselues in the decoction hereof. The blossoms and shels also are good to be put into restraining pouders, to stanch bloud in wounds. N

The seeds or stones of Pomegranats dried in the Sun and beaten to pouder, are of like operation with the floures: they stop the lask and all issues of bloud in man or woman, being taken as aforesaid. O

Chap. 97. *Of the Quince tree.*

¶ *The Kindes.*

Columella maketh three kindes of Quinces, *Struthia*, *Chrysomeliana*, and *Mastela*, but what maner ones they be he doth not declare. Notwithstanding we finde diuers sorts, differing as well in forme, as taste and substance of the fruit, whereof some haue much core and many kernels, and others fewer.

¶ *The*

Malus Cotonea.
The Quince tree.

¶ *The Description.*

THe Quince tree is not great, but growes low, and many times in maner of a shrub: it is couered with a rugged barke, which hath on it now and then certain scales: it spreadeth his boughes in compasse like other trees, about which stand leaues somewhat round like those of the common Apple tree, greene and smooth aboue, and vnderneath soft and white: the flours be of a white purple colour: the fruit is like an Apple, sauing that many times it hath certain embowed & swelling diuisions: it differeth in fashion and bignesse; for some Quinces are lesser and round, trust vp together at the top with wrinckles, others longer and greater: the third sort be of a middle manner betwixt both; they are all of them set with a thinne cotton or freese, and be of the colour of gold, and hurtfull to the head by reason of their strong smell; they all likewise haue a kinde of choking tast: the pulp within is yellow, and the seed blackish, lying in hard skins as do the kernels of other apples.

¶ *The Place.*

The Quince groweth in gardens and orchards, and is planted oftentimes in hedges and Fences belonging to Gardens and Vineyards: it delighteth to grow on plain and euen grounds, and somwhat moist withall.

¶ *The Time.*

These apples be ripe in the fall of the leafe, and chiefly in October.

¶ *The Names.*

The tree is called in Greek Μηλέα κυδωνία: in Latine, *Malus Cotonea*: in English, Quincetree.

The fruit is named Μῆλον κυδώνιον, *Malum Cotoneum*, *Pomum Cydonium*, and many times *Cydonium* without any addition; by which name it is knowne to the Apothecaries: it is called in high-Dutch, **Quitten**, **Quietenopfell**, or **Kuttenopffel**: in low-Dutch, **Queappel**: in Italian, *Mele cotogne*: in Spanish, *Codoyens*, *Membrilhos*, and *Marmellos*: in French, *Pomme de coing*: in English, Quince.

¶ *The Temperature and Vertues.*

A Quinces be cold & dry in the second degree, and also very much binding, especially when they be raw; they haue likewise in them a certain superfluous and excremental moisture, which wil not suffer them to lie long without rotting: they are seldom eaten raw, being rosted or baked they are more pleasant.

B They strengthen the stomack, stay vomiting, stop lasks and also the bloudy flix.

C They are good for those that spit or vomit bloud, and for women also that haue too great plenty of their monethly courses.

D *Simeon Sethi* writeth, that the woman with childe that eateth many Quinces during the time of her breeding, shall bring forth wise children and of good vnderstanding.

E The Marmalad or Cotiniat made of quinces and sugar is good and profitable to strengthen the stomack, that it may retain and keep the meat therein vntill it be perfectly digested; it also staieth all kindes of fluxes both of the belly and other parts, and also of bloud. Which Cotiniat is made in this manner:

F Take faire Quinces, paire them, cut them in pieces, and cast away the core, then put vnto euery pound of Quinces a pound of Sugar, and to euery pound of Sugar a pinte of water: these must be boiled together ouer a stil fire till they be very soft, then let it be strained or rather rubbed through a strainer or an hairy Sive, which is better, and then set it ouer the fire to boile againe, vntill it be stiffe,

ſtiffe,and ſo box it vp,and as it cooleth put thereto a little Roſe water, and a few graines of muske mingled together,which will giue a goodly taſte to the Cotiniat. This is the way to make Marmalad.

Take whole Quinces and boile them in water vntil they be as ſoft as a ſcalded codling or apple, G
then pill off the skin,and cut off the fleſh,and ſtamp it in a ſtone morter,then ſtraine it as you did the Cotiniat; afterward put it in a pan to dry,but not to ſeeth at all, and vnto euery pound of the fleſh of quinces put three quarters of a pound of ſugar,and in the cooling you may put in roſe water and a little muske,as was ſaid before.

There is boiled with Quinces oile,which therefore is called in Greeke *Melinon* or oile of Quin- H
ces,which we vſe,ſaith *Dioſcorides*,ſo oft as we haue need of a binding thing.

The ſeed of Quinces tempered with water doth make a muſcilage, or a thing like jelly, which I
being held in the mouth,is maruellous good to take away the roughneſſe of the tongue in hot burning feuers.

The ſame is good to be laid vpon burnings and ſcaldings,and to be put into cliſters againſt the K
bloudy flix;for it eaſeth the pain of the guts,and allayeth the ſharpneſſe of biting humors.

Many other excellent dainty and wholſome Confections are to be made of Quinces, as jelly of L
Quinces,and ſuch like conceits,which for breuities ſake I do now let paſſe.

Chap. 98. *Of the Medlar tree.*

¶ *The Kindes.*

THere be diuers ſorts of Medlars,ſome greater,others leſſer ; ſome ſweet,and others of a more harſh taſt: ſome with much core and many great ſtony kernels,others fewer ; and likewiſe one of Naples called Aronia.

1 *Meſpilus ſatiua.*
The manured Medlar.

‡ 2 *Meſpilus ſatiua altera.*
The other garden Medlar.

¶ *The Deſcription.*

1 THe manured Medlar tree is not great, the body whereof is wrythed, the boughes hard, not eaſie to be broken: the leaues be longer, yet narrower than thoſe of the Apple tree, darke, green aboue, and ſomwhat whiter and hairy below: the flours are white & great, hauing fiue leaues apiece: the fruit is ſmall, round, and hath a broad compaſſed nauel or crowne at the top: the pulp or meat is at the firſt white, and ſo harſh or choking, that it canot be eaten vntill it become ſoft, in which are contained fiue ſeeds or ſtones, which be flat and hard.

‡ 2 There is another which differs from the laſt deſcribed, in that the leaues are longer and narrower, the ſtocke hath no prickles vpon it, the fruit alſo is larger, and better taſted: in other reſpects it is like to the laſt deſcribed. This is the *Meſpilus fructu præſtantiore* of *Tragus*; and *Meſpilus domeſtica* of *Lobel*. ‡

3 The Neapolitan Medlar tree groweth to the height and greatneſſe of an apple tree, hauing many tough and hard boughes or branches, ſet with ſharp thornes like the white Thorne or Hawthorn: the leaues are very much cut or jagged like the Hawthorn leaues, but greater, and more like Smallage or Parſley: which leaues before they fall from the tree do wax red: amongſt theſe leaues come forth great tufts of flours of a pale herby colour: which being paſt, there ſucceed ſmall long fruit leſſer than the ſmalleſt Medlar, which at the firſt are hard, and green of colour, but when they be ripe they are both ſoft and red, of a ſweet and pleaſant taſte; wherein is contained three ſmall hard ſtones as in the former, which be the kernels or ſeeds thereof.

3 *Meſpilus Aronia.*
The Neapolitan Medlar.

‡ 4 *Chamæmeſpilus.*
Dwarfe Medlar.

4 There is a dwarfe kinde of Medlar growing naturally vpon the Alps and hills of Narbone, and on the rocks of mount Baldus nigh Verona, which hath bin by ſome of the beſt Learned eſteemed for a kinde of Medlar: others, whoſe judgements cannot ſtand with truth or probability, haue ſuppoſed it to be *Euonymus* of the Alpes. This dwarfe Medlar groweth like a ſmall hedge tree, of four or fiue cubits high, bearing many ſmal twiggy wands or crops, beſet with many ſlender leaues greene aboue, and of a skye colour vnderneath, in ſhew like to a dwarfe Apple tree, but the fruit is very

very like the Haw, or fruit of the white Thorne, and of a red colour. ‡ The floures come forth in the Spring three or foure together, hollow, and of an herby colour, it growes in diuers places of the Alpes: it is the *Chamæmespilum* of the *Aduers.* and the *Chamæmespilus Gesneri*, of *Clusius*. ‡

¶ *The Place.*

The Medlar trees do grow in Orchards, and oftentimes in hedges among briers and brambles; being grafted in a White Thorne it prospereth wonderfull well, and bringeth forth fruit twise or thrise bigger than those that are not grafted at all, almost as great as little apples: we haue diuers sorts of them in our Orchards.

¶ *The Time.*

It is very late before Medlars be ripe, which is in the end of October, but the floures come forth timely enough.

¶ *The Names.*

The first is called in Greeke by *Theophrastus* μεσπιλη: in Latine, *Mespilus*: in high Dutch, **Mespelbaum**: in low Dutch, **Mispelboome**: in French, *Nefflier*: in English, Medlar tree.

The Apple or fruit is named in Greeke, μεσπιλον: in Latine likewise, *Mespilum*: in high Dutch, **Mespel**, in low Dutch, **Mispele**: in Italian, *Nespolo*: in French, *Neffle*: in Spanish, *Nesperas*: in English, Medlar.

Dioscorides affirmeth, That this Medlar tree is called ἐπιμηλις, and of diuers, *Sitanion*: *Galen* also in his booke of the faculties of simple medicines nameth this *Epimelis*: which is called, as he saith, by the country-men in Italy, *Vncdo*, and groweth plentifully in Calabria; for vnder the name of *Mespilus*, or Medlar tree, he meaneth no other than *Tricoccus*, which is also named *Aronia*.

The Neapolitane Medlar tree is called in Greeke μεσπιλος, and μεσπιλη: *Galen* calleth it *Epimelis*.

The fruit hereof is called *Tricoccos*, of the three graines or stones that it hath: they of Naples call it *Azarolo*: and we may name it in English, three graine Medlar, or Neapolitane Medlar, or Medlar of Naples.

¶ *The Temperature.*

The Medlars are cold, dry, and astringent, the leaues are of the same nature: the dwarfe Medlar is dry, sharpe, and astringent.

¶ *The Vertues.*

Medlars do stop the belly, especially when they be greene and hard, for after that they haue been kept a while so that they become soft and tender, they doe not binde or stop so much, but are then more fit to be eaten. A

The fruit of the three graine Medlar, is eaten both raw and boyled, and is more wholesom for the stomacke. B

These Medlars be oftentimes preserued with sugar or hony: and being so prepared they are pleasant and delightfull to the taste. C

Moreouer, they are singular good for women with childe: for they strengthen the stomacke, and stay the lothsomenesse thereof. D

The stones or kernels of the Medlars, made into pouder and drunke, doe breake the stone, expell grauell, and procure vrine. E

Chap. 99. *Of the Peare tree.*

¶ *The Kindes.*

TO write of Peares and Apples in particular, would require a particular volume: the stocke or kindred of Peares are not to be numbred: euery country hath his peculiar fruit: my selfe knowes one curious in graffing & planting of fruits, who hath in one piece of ground, at the point of threescore sundry sorts of Peares, and those exceeding good, not doubting but if his minde had beene to seeke after multitudes, he might haue gotten together the like number of those of worse kinds: besides the diuersities of those that be wilde, experience sheweth sundry sorts: and therefore I thinke it not amisse to set downe the figures of some few, with their seuerall titles, as well in Latine as English, and one generall description for that, that might be said of many, which to describe apart, were to send an owle to Athens, or to number those things which are without number.

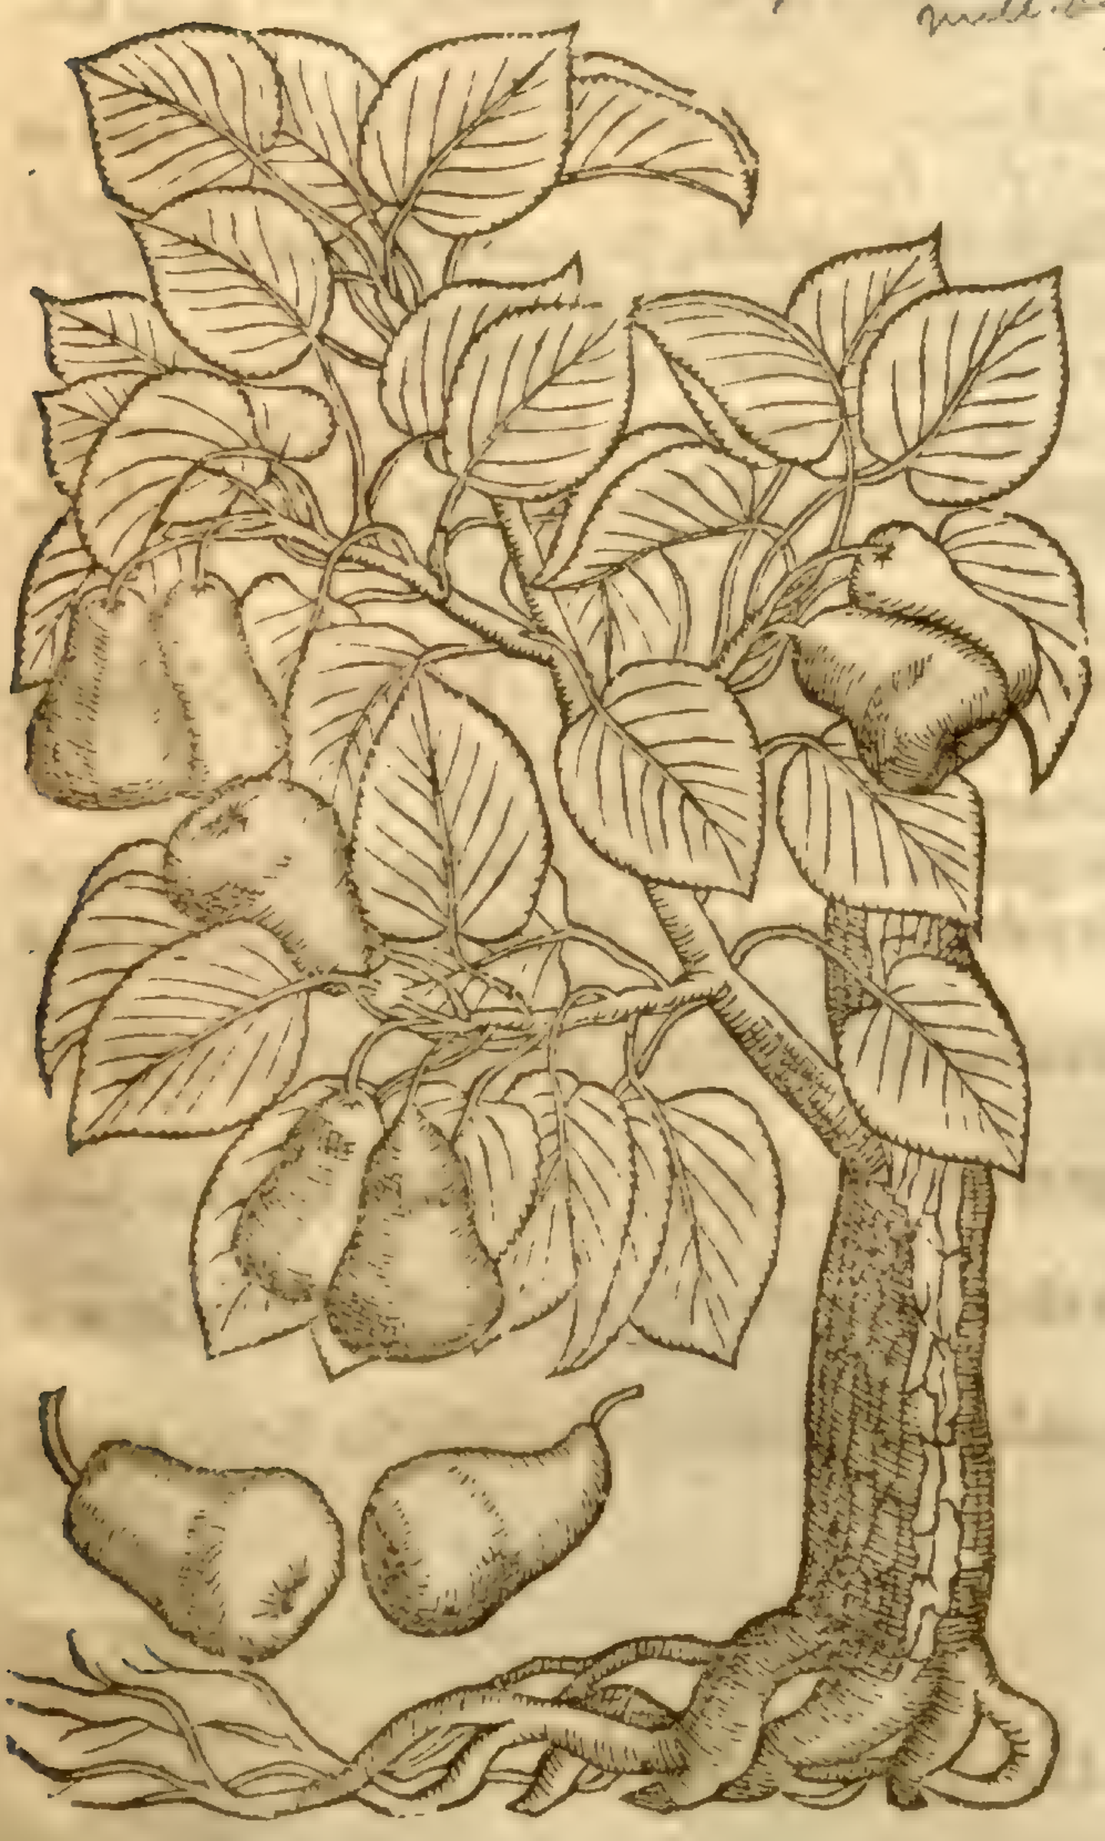
‡ Our Author in this chapter gaue eight figures with seuerall titles to them, so I pluckt a peare from each tree, and put his title to it, but not in the same order that he obserued, for hee made the Katherine peare tree the seuenth, which I haue now made the first, because the figure expresses the whole tree. ‡

¶ The

¶ *The generall Description.*

THe Peare tree is for the most part higher than the Apple tree, hauing boughes not spread abroad, but growing vp in height; the body is many times great: the timber or wood it selfe is very tractable or easie to be wrought vpon, exceeding fit to make moulds or prints to be graued on, of colour tending to yellownesse: the leafe is somewhat broad, finely nicked in the edges, greene aboue, and somewhat whiter vnderneath: the floures are white: the Peares, that is to say, the fruit, are for the most part long, and in forme like a Top; but in greatnesse, colour, forme, and taste very much differing among themselues; they be also couered with skins or coats of sundry colours: the pulpe or meate differeth, as well in colour as taste: there is contained in them kernels, blacke when they be ripe: the root groweth straight downe with some branches running aslope.

Pirus superba, siue Katherina.
The Katherine Peare tree.



1 *Pyra Præcocia.* The Ienneting Peare.
2 *Pyra Iacobæa.* Saint Iames Peare.
3 *Pyrum regale.* The Peare royall.

4 *Pyrum Palatinum.* The Burgomot Peare.
5 *Pyrum Cydonium.* The Quince peare.
6 *Pyrum Episcopatum.* The Bishops Peare.
7 *Pyrum hyemale.* The Winter Peare.

¶ *The Place.*

The tame Peare trees are planted in Orchards, as be the apple trees, and by grafting, though vpon wilde stockes, come much variety of good and pleasant fruits. All these before specified, and many sorts more, and those most rare and good, are growing in the ground of Master *Richard Poynter*, a most cunning and curious graffer and planter of all manner of rare fruits, dwelling in a small village neere London called Twicknam; and also in the ground of an excellent graffer and painfull planter, Mr *Henry Banbury*, of Touthill street neere Westminster, and likewise in the ground of a diligent and most affectionate louer of Plants Mr *Warner* neere Horsey downe by London, and in diuers other grounds about London. ‡ Most of the best peares are at this day to be had with Mr *Iohn Millen* in Old-street, in whose nursery are to be found the choisest fruits this kingdome yeelds. ‡

¶ *The Time.*

The floures doe for the most part come forth in Aprill, the leaues afterwards: all peares are not ripe at one time: some be ripe in Iuly, others in August, and diuers in September and later.

¶ *The Names.*

The tame or Orchard peare tree is called in Greeke ἀπίος, or with a double ππ ἄπιος: in Latine, *Pyrus Vrbana*,

urbana, or *Cultiua*: of *Tarentinus* in his Geoponikes [illegible]: in high Dutch, Birbaum: in low Dutch, Peerboom: in French, *Porrier*.

The Peare or fruit it selfe is called in Greeke [illegible]: in Latine, *Pyrum*: in high Dutch, Birn: in low Dutch, Peere: in Italian, *Pere*: in French, *Poyre*: in Spanish, *Peras*: in English, Peare.

¶ *The Temperature and Vertues.*

Leauing the diuers and sundry surnames of Peares, let vs come to the faculties which the Physi- A
tions ought to know; which also vary according to the differences of their tastes: for some Peares are sweet, diuers fat and vnctious, others soure, and most are harsh, especially the wilde peares, and some consist of diuers mixtures of tasts, and some hauing no taste at all, but as it were a waterish taste.

All Peares are cold, and all haue a binding quality and an earthie substance: but the Choke pears B
and those that are harsh be more earthie and the sweet ones lesse: which substance is so full of superfluous moisture in some, as that they cannot be eaten raw. All manner of Peares do binde and stop the belly, especially the Choke and harth ones, which are good to be eaten of those that haue the laske and the bloudy flix.

The harsh and austere Peares may with good successe be laid vpon hot swellings in the begin- C
ning, as may be the leaues of the tree, which do both binde and coole.

Wine made of the juyce of Peares called in English, Perry, is soluble, purgeth those that are not D
accustomed to drinke thereof, especially when it is new; notwithstanding it is as wholesome a drinke being taken in small quantity as wine; it comforteth and warmeth the stomacke, and causeth good digestion.

Chap. 100. *Of the wilde Peare tree.*

¶ *The Kindes.*

As there be sundry kindes of the manured Peares, so are there sundry wilde; wherof to write apart were to small purpose: therefore one description with their seuerall titles shall be sufficient for their distinctions.

1 *Pyrum strangulatorium majus.*
The great Choke Peare.

¶ *The generall Description.*

THe wilde Peare tree growes likewise great, vpright, full of branches, for the most part Pyramides like, or of the fashion of a steeple, not spred abroad as is the Apple or Crab tree: the timber of the trunke or body of the tree is very firme and sollid, and likewise smooth, a wood very fit to make diuers sorts of instruments of, as also the hafts of sundry tooles to worke withal; and likewise serueth to be cut into many kindes of moulds, not only such prints as these figures are made of, but also many sorts of pretty toies, for coifes, breast-plates, and such like, vsed among our English gentlewomen: the branches are smooth, couered with a blackish barke, very fragile or easie to breake, wheron do grow leaues, in some greater, in other lesser: the floures are like those of the manured Pear-tree, yet some whiter than others; the fruit differ not in shape, yet some greater than others; but in taste they differ among themselues in diuers points, some are sharpe, soure and of an austere taste; some more pleasant, others harsh and bitter, and some of such a choking taste, that they are not to be eaten of hogs & wild beasts, much lesse of men: they also differ in colour, euery circumstance whereof to distinguish apart would greatly enlarge our volume, and bring to the Reader small profit or commodity.

2 *Pyrum ſtrangulatorium minus.*
The ſmall Choke peare.

3 *Pyrus ſylueſtris.*
The wilde hedge Peare tree.

4 *Pyrus ſylueſtris minima.*
The wilde Crab Peare tree.

5 *Pyrus Pedicularia.*
The Lowſie wilde Peare.

6 *Pyrus Cornina.*
The Crow Peare tree.

¶ *The Place.*

The wilde Peares grow of themſelues without manuring in moſt places, as woods, or in the borders of fields, and neere to high waies.

¶ *The Time.*

The Time of wilde Peares anſwereth the tame or manured Peare, notwithſtanding for the moſt part they are not ripe much before Winter.

¶ *The Names.*

The wilde Peare tree is called in Latine, *Pyrus ſylueſtris* and *Pyraſter*: in Greeke, πύρος by which name both the fruit and tree are known. Peares haue diuers ſyrnames among the antient Writers, and eſpecially in *Pliny*, in his 15 booke, 15 chapter, none of which are knowne to the later Writers (or not deſired:) euery city or euery country haue names of themſelues, and Peares haue alſo diuers names according to the places.

¶ *The Temperature.*

All Peares are of a cold temperature, and the moſt part of them of a binding quality and an earthy ſubſtance.

¶ *The Vertues.*

The vertues of the wilde Peares are referred vnto the garden Peares as touching their binding faculty, but are not to be eaten, becauſe their nouriſhment is little and bad.

CHAP. 101. *Of the Apple Tree.*

¶ *The Kindes.*

THe Latine name *Malus* reacheth far among the old Writers, and is common to many trees, but we will briefely firſt intreat of *Mali*, properly called Apple trees, whoſe ſtocke or kindred is ſo infinite, that we haue thought it not amiſſe to vſe the ſame order or method with Apples, that we haue done with Peares; that is, to giue them ſeuerall titles in Latine and Engliſh, and one generall deſcription for the whole.

¶ *The Deſcription.*

THe Apple tree hath a body or trunke commonly of a meane bigneſſe, not very high, hauing long armes or branches, and the ſame diſordered: the barke ſomewhat plaine, and not very rugged: the leaues bee alſo broad, more long than round, and finely nicked in the edges. The floures are whitiſh tending vnto a bluſh colour. The fruit or Apples do differ in greatneſſe, forme, colour, and taſte; ſome couered with a redde skinne, others yellow or greene, varying infinitely

nitely according to the soyle and climate, some very great, some little, and many of a middle sort; some are sweet of taste, or something soure; most be of a middle taste betweene sweet and soure, the which to distinguish I thinke it impossible; notwithstanding I heare of one that intendeth to write a peculiar volume of Apples, and the vse of them; yet when he hath done what he can doe, hee hath done nothing touching their seuerall kindes to distinguish them. This that hath beene said shall suffice for our History.

‡ Our Author gaue foure figures more out of *Tabernamontanus*, with these titles. 3. *Malum reginale*, the Qneening or Queene of Apples. 5 *Platomela siue Pyra æstiua*: The Summer Pearemaine. 6 *Platurchapia siue Pyra hycmalia:* the Winter Pearemaine. ‡

1 *Malus Carbonaria.*
The Pome-Water tree.

2 *Malus Carbonaria longo fructu.*
The Bakers ditch Apple tree.

¶ *The Place.*

The tame and grafted Apple trees are planted and set in gardens and orchards made for that purpose: they delight to grow in good and fertile grounds: Kent doth abound with Apples of most sorts. But I haue seene in the pastures and hedge-rows about the grounds of a worshipfull Gentleman dwelling two miles frow Hereford, called Master *Roger Bodnome*, so many trees of all sorts, that the seruants drinke for the most part no other drinke but that which is made of Apples; The quantity is such, that by the report of the gentleman himselfe, the Parson hath for tithe many hogsheads of Syder. The hogs are fed with the fallings of them, which are so many, that they make choise of those Apples they do eate, who will not taste of any but of the best. An example doubtlesse to be followed of Gentlemen that haue land and liuing: but enuie saith, the poore will breake downe our hedges, and wee shall haue the least part of the fruit; but forward in the name of God, graffe, set, plant and nourish vp trees in euery corner of your ground, the labour is small, the cost is nothing, the commodity is great, your selues shall haue plenty, the poore shall haue somwhat in time of want to relieue their necessitie, and God shall reward your good mindes and diligence.

¶ *The Time.*

They bloome about the end of Aprill, or in the beginning of May. The forward Apples be ripe about the Calends of Iuly, others in September.

¶ *The Names.*

The Apple tree is called in Greeke μηλέα: in Latine, *Malus* and *Pomus*: in high Dutch, **Opffelbaum**: in low Dutch, **Appelboom**: in French, *Pommier*: in Engliſh, Apple-tree.

The Grecians name the fruit μῆλον: the Latines, *Malum* or *Pomum*: in high Dutch, **Opfell**: in low Dutch, **Appel**: in French and Spaniſh, *Manſanas*: in Engliſh, Apple.

¶ *The Temperature.*

All Apples be of temperature cold and moiſt, and haue joyned with them a certaine excrementall or ſuperfluous moiſture: but as they be not all of like coldneſſe, ſo neither haue they like quantitie of ſuperfluous moiſture. They are ſooneſt rotten that haue greateſt ſtore of moiſture, and they may be longer kept in which there is leſſe ſtore: for the abundance of excrementall moiſture is the cauſe why they rot.

Sweet Apples are not ſo cold and moiſt, which being roſted or boyled, or otherwiſe kept, retaine or keepe the ſoundneſſe of their pulpe.

They yeeld more nouriſhment, and not ſo moiſt a nouriſhment as do the other Apples, and doe not ſo eaſily paſſe through the belly.

Soure Apples are colder and alſo moiſter: the ſubſtance or pulpe of theſe when they bee boiled doth run abroad, and retaineth not his ſoundneſſe: they yeeld a leſſer nouriſhment, and the ſame raw and cold.

They do eaſily and ſpeedily paſſe through the belly, and therefore they doe mollifie the belly, eſpecially being taken before meat.

Harſh or Auſtere Apples being vnripe, are cold; they ingender groſſe bloud, and great ſtore of winde, and often bring the Collicke.

Thoſe Apples which be of a middle taſte contain in them oftentimes two or three ſorts of taſts, and yet do they retaine the faculties of the other.

¶ *The Vertues.*

A Roſted Apples are alwaies better than the raw, the harme whereof is both mended by the fire, and may alſo be corrected by adding vnto them ſeeds or ſpices.

B Apples be good for an hot ſtomacke: thoſe that are auſtere or ſomewhat harſh doe ſtrengthen a weake and feeble ſtomacke proceeding of heat.

C Apples are alſo good for all inflammations or hot ſwellings, but eſpecially for ſuch as are in their beginning, if the ſame be outwardly applied.

D The juyce of Apples which be ſweet and of a middle taſte, is mixed in compoſitions of diuers medicines, and alſo for the tempering of melancholy humours, and likewiſe to mend the qualities of medicines that are dry: as are *Serapium ex pomis Regis Saporis*, *Confectio Alkermes*, and ſuch like compoſitions.

E There is likewiſe made an ointment with the pulpe of Apples and Swines greaſe and Roſe water, which is vſed to beautifie the face, and to take away the roughneſſe of the skin, which is called in ſhops *Pomatum*: of the Apples whereof it is made.

F The pulpe of the roſted Apples, in number foure or fiue, according to the greatneſſe of the Apples, eſpecially the Pome-water, mixed in a wine quart of faire water, laboured together vntill it come to be as Apples and Ale, which wee call Lambes Wooll, and the whole quart drunke laſt at night, within the ſpace of an houre, doth in one night cure thoſe that piſſe by droppes with great anguiſh and dolour; the ſtrangury, and all other diſeaſes proceeding of the difficulty of making water; but in twiſe taking, it neuer faileth in any: oftentimes there happeneth with the foreſaid diſeaſes the Gonorrhæa, or running of the Raines, which it likewiſe healeth in thoſe perſons; but not generally in all; which my ſelfe haue often proued, and gained thereby both crownes and credit.

G The leaues of the tree doth coole and binde, and be alſo counted good for inflammations, in the beginning.

H Apples cut in pieces, and diſtilled with a quantitie of Camphire and butter-milke, take away the markes and ſcarres gotten by the ſmall pockes, being waſhed therewith when they grow vnto their ſtate and ripeneſſe: prouided that you giue vnto the patienr a little milke and Saffron, or milke and mithridate to drinke, to expell to the extreme parts that venome which may lie hid, and as yet not ſeene.

Chap. 102. *Of the Wilding or Crab tree.*

¶ *The Kindes.*

Like as there be diuers manured Apples, so are there sundry wilde Apples, or Crabs, whereof to write apart were to small purpose, and therefore one description shall suffice for the rest.

Malus sylueſtris.
The Wilding or Crab tree.

¶ *The generall Description.*

THere be diuers wilde Apple trees not husbanded, that is to say, not grafted; the fruit whereof is harsh and binding: for by grafting both Apples and Peares become more milde and pleasant. The crab or wilding tree growes oftentimes to a reasonable greatnesse, equall with the Apple tree: the wood is hard, firme, and sollid; the barke rough; the branches or boughes many; the floures and fruit like those of the Apple tree, some red, others white, some greater, others lesser: the difference is knowne to all, therefore it shall suffice what hath been said for their seuerall distinctions: we haue in our London gardens a dwarfe kinde of sweet Apple, called *Chamæmalus*, the dwarfe Apple tree, or Paradise Apple, which beareth Apples very timely without grafting.

‡ Our Author here also (out of *Tabernamontanus*) gaue foure figures, whereof I onely retaine the best, with their seuerall titles. 1 *Malus sylueſtris rubens*. The great Wilding or red Crab tree. 2 *Malus sylueſtris alba*. The white Wilding or Crab tree. 3 *Malus sylueſtris minor*. The smaller Crab tree. 4 *Malus duracina sylueſtris*. The choking leane Crab tree. ‡

¶ *The Place.*

The Crab tree groweth wilde in woods and hedge rowes almost euery where.

¶ *The Time.*

The time answereth those of the garden.

¶ *The Names.*

Their titles doth set forth their names in Latine and English.

¶ *The Temperature.*

Of the temperature of wilde Apples hath been sufficiently spoken in the former chapter.

¶ *The Vertues.*

The juyce of wilde Apples or crabs taketh away the heat of burnings, scaldings, and all inflammations: and being laid on in short time after it is scalded, it keepeth it from blistering. A

The juyce of crabs or Verjuice is astringent or binding, and hath withall an absterſiue or clensing qualitie, being mixed with hard yeest of Ale or Beere, and applied in manner of a cold ointment, that is, spread vpon a cloth first wet in the Verjuyce and wrung out, and then laid to, taketh away the heat of S. Anthonies fire, all inflammations whatsoeuer, healeth scab'd legs, burnings and scaldings whereſoeuer it be. B

Chap. 103.

Of the Citron, Limon, Orange, and Assyrian Apple trees.

¶ *The Kindes.*

THe Citron tree is of kindred with the Limon tree, the Orange is of the same house or stocke, and the Assyrian Apple tree claimeth a place as neerest in kindred and neighbourhood: wherefore I intend to comprehend them all in this one chapter.

1 *Malus medica.*
The Pome Citron tree.

2 *Malus Limonia.*
The Limon tree.

¶ *The Description.*

1 THe Citron tree is not very great, hauing many boughes or branches, tough and pliable, couered with a greene barke: whereon do grow greene leaues, long, somewhat broad, very smooth, and sweet of smell like those of the Bay tree: among which come forth here and there certaine prickles, set far in sunder: from the bosome whereof come forth small floures, consisting of fiue little leaues, of a white colour tending to purple, with certaine threds like haires growing in the middle: the fruit is long, greater many times than the Cucumber, often lesser, and not much greater than the Limon: the barke or rinde is of a light golden colour, set with diuers knobs or bumps, and of a very pleasant smell: the pulpe or substance next vnto it is thicke, white, hauing a kinde of aromaticall or spicie smell, almost without any taste at all: the softer pulpe within that, is not so firme or sollid, but more spungie, and full of a sower juyce, in which the seed lieth hid, greater and thicker than a graine of Barley.

2 The Limon tree is like vnto the Pome Citron tree in growth, thorny branches, and leaues of a pleasant sweet smell, like those of the Bay-tree: the floures hereof are whiter than those of the Citron tree, and of a most sweet smell: the fruit is long and thicke, lesser than the Pome Citron: the

the rinde is yellow, somwhat bitter in taste, and sweet of smell: the pulpe is white, more in quantity than that of the Citron, respecting the bignesse; in the middle part whereof is contained more soft spungie pulpe, and fuller of soure juyce: the seeds are like those of the Pome Citron.

3 The Orenge tree groweth vp to the height of a smal Peare tree, hauing many thorny boughes or branches, like those of the Citron tree: the leaues are also like those of the Bay-tree, ‡ but that they differ in this, that at the lower end next the stalke there is a lesser leafe made almost after the vulgar figure of an heart, whereon the bigger leafe doth stand, or is fastned: ‡ and they are of a sweet smell: the floures are white of a most pleasant sweet smell also: the fruit is round like a ball, euery circumstance belonging to the forme is very well knowne to all: the taste is soure, somtimes sweet, and often of a taste betweene both: the seeds are like those of the Limon.

3 *Malus arantia.*
The Orange tree.

4 *Malus Assyria.*
The Assyrian Apple tree.

4 The Assyrian Apple tree is like vnto the Orange tree: the branches are like: the leaues are greater: the floures are like those of the Citron tree: the fruit is round, three times as big as the Orange: the barke or peeling is thicke, rough, and of a pale yellow colour, wherein appeare often as it were small clifts or crackes: the pulpe or inner substance is full of juyce, in taste sharpe, as that of the Limon, but not so pleasant: the seeds are like those of the Citron.

¶ *The Place.*

The Citron, Limon, and Orenge trees doe grow especially on the sea coasts of Italy, and on the Islands of the Adriaticke Tyrrhene, and also Ægæan seas, and likewise on the maine land neer vnto meeres and great lakes: there is also great store of them in Spaine, but in places especially joyning to the sea, or not farre off: they are also found in certaine Prouinces of France which lie vpon the midland sea. They were first brought out of Media, as not onely *Pliny* writeth, but also the Poët *Virgil* affirmeth in the second booke of his Georgickes, writing of the Citron tree after this maner:

Media fert tristes succos, tardumque saporem
Felicis mali, quo non præsentius vllum,
Pocula si quando sæuæ infecere nouercæ,

Miscuerunt que

Miſcueruntque herbas, & non innoxia verba,
Auxilium venit, ac membris agit atra venena.
Ipſa ingens arbos, facieſque ſimillima Lauro;
Et, ſi non alium late jactaret odorem,
Laurus erat; folia haud vllis labentia ventis;
Flos apprime tenax. Animas & olentia Medi
Ora fouent illo, & ſenibus medicantur anhelis.

The Countrey Media beareth juyces ſad,
And dulling taſtes of happy Citron fruit,
Than which, no helpe more preſent can be had,
If any time ſtepmothers worſe than brute
Haue poyſon'd pots, and mingled herbs of ſute
with hurtfull charmes: this Citron fruit doth chaſe
Blacke venome from the body in euery place.
The tree it ſelfe in growth is large and big,
And very like in ſhew to th'Laurell tree;
And would be thought a Laurell, leaſe and twig,
But that the ſmell it caſts doth diſagree:
The floure it holds as faſt as floure may be:
Therewith the Medes a remedy do finde
For ſtinking breaths and mouthes, a cure moſt kinde,
And helpe old men which hardly fetch their winde.

¶ *The Time.*

Theſe trees be alwaies greene, and do, as *Pliny* ſaith, beare fruit at all times of the yeare, ſome falling off, others waxing ripe, and others newly comming forth.

¶ *The Names.*

The firſt is called in Greeke, Μηλία μηδική: in Latine, *Malus Medica*, and *Malus Citria*: in Engliſh, Citron tree, and Pomecitron tree.

The fruit is named in Greeke, Μηλον μηδικόν: in Latine, *Malum Medicum*, and *Malum Citrium*: and *Citromalum*. *Æmilyanus* in *Athenæus* ſheweth, that *Iuba* King of Mauritania hath made mention of the Citron, who ſaith that this Apple is named among them, *Malum Heſpericum*: *Galen* denieth it to be called any longer *Malum Medicum*, but *Citrium*; and ſaith that they who call it *Medicum* doe it to the end that no man ſhould vnderſtand what they ſay: the Apothecaries call theſe Apples *Citrones*: in high Dutch, **Citrin opffell, Citrinaten**: in low Dutch, **Citroenen**: in Italian, *Citroni*, and *Cedri*: in Spaniſh, *Cidras*: in French, *Citrons*: in Engliſh, Citron Apple, and Citron.

The ſecond kinde of Citron is called in Latine, *Limonium Malum*; in ſhops, *Limones*: in French, *Limons*: in low Dutch, **Limonen**: in Engliſh, Limon, and Lemon.

The third is named in Latine, *Malum anarantium* or *Anerantium*: and of ſome, *Aurantium*: of others, *Aurengium*, of the yellow colour of Gold: ſome would haue them called *Arantia*, of *Arantium*, a towne in Achaia or Arania, of a country bearing that name in Perſia: it is termed in Italian, *Arancio*: in high Dutch, **Pomeranken**: in low Dutch, **Araengie Appelen**: in French, *Pommes d' Orenges*: in Spaniſh, *Naranſas*: in Engliſh, Orenges.

The fourth is named of diuers, *Pomum Aſſyrium*, or the Citron of Aſſyria, and may be Engliſhed Adams Apple, after the Italian name; and among the vulgar ſort of Italians, *Lomie*, of whom it is alſo called *Pomum Adami*, or Adams Apple; and that came by the opinion of the common rude people, who thinke it to be the ſame Apple which *Adam* did eate of in Paradiſe, when he tranſgreſſed Gods commandement; whereupon alſo the prints of the biting appeare therein, as they ſay: but others ſay that this is not the Apple, but that which the Arabians do call *Muſa* or *Moſa*, whereof *Auicen*, *cap.* 395. maketh mention: for diuers of the Iewes take this for that, through which by eating, *Adam* offended, as *Andrew Theuet* ſheweth.

¶ *The Temperature and Vertues.*

A All theſe fruits conſiſt of vnlike parts, and much differing in faculty.
B The rindes are ſweet of ſmell, bitter, hot, and dry.
C The white pulpe is cold, and containeth in it a groſſe juyce, eſpecially the Citron.
D The inner ſubſtance or pap is ſoure, as of the Citrons and Limons, cold and dry, with thinneſſe of parts.
E The ſeed becauſe it is bitter is hot and dry.
F The rinde of the Pomecitron is good againſt all poyſons, for which cauſe it is put into treacles and ſuch like confections.

It is

It is good to be eaten against a stinking breath, for it maketh the breath sweet; and being so ta- G
ken it comforteth the cold stomacke exceedingly.

The white, sound, and hard pulpe is now and then eaten, but very hardly concocted, and ingen- H
dreth a grosse, cold, and phlegmaticke juyce, but being condite with sugar, it is both pleasant in taste, and easie to be digested, more nourishing, and lesse apt to obstruction and binding or stopping.

Galen reporteth, That the inner juyce of the Pomecitron was not wont to be eaten, but it is now I
vsed for sauce; and being often vsed, it represseth choler which is in the stomacke, and procures appetite: it is excellent good also to be giuen in vehement and burning feuers, and against all pestilent and venomous or infectious diseases: it comforteth the heart, cooleth the inward parts, cutteth, diuideth, and maketh thin, grosse, tough, and slimy humors.

Of this foresaid sharpe juyce there is a syrrup prepared, which is called in shops, *Syrupus de Ace-* K
tositate Citri, very good against the foresaid infirmities.

Such a syrrup is also prepared of the sharpe juyce of Limons, of the same quality and operation, L
so that in stead of the one, the other will serue very well.

A dozen of Orenges cut in slices and put into a gallon of water, adding thereto an ounce of Mer- M
curie sublimate, and boyled to the consumption of the halfe, cureth the itch and mangineſſe of the body.

Men in old time (as *Theophrastus* writeth in his fourth booke) did not eate Citrons, but were con- N
tented with the smell, and to lay them amongst cloathes, to preserue them from Moths.

As often as need required they vsed them against deadly poysons; for which thing they were es- O
pecially commanded by *Virgils* verses, which we haue before alledged.

Athenæus, lib. 3. hath extant a story of some that for certaine notorious offences were condemned P
to be destroied of Serpents, who were preserued and kept in health and safety by the eating of Citrons.

The distilled water of the whole Limons, rinde and all, drawne out by a glasse Still, takes away Q
tetters and blemishes of the skin, and maketh the face faire and smooth. R

The same being drunke prouoketh vrine, dissolueth the stone, breaketh and expelleth it.

The rinde of Orenges is much like in faculty to that of the Citrons and Limons, yet it is so S
much the more hot as it is more biting and bitter.

The inner substance or soure pap which is full of juyce is of like faculty, or not much inferiour T
to the faculty of the pap of Citrons or Limons; but the sweet pap doth not much coole or drie, but doth temperately heate and moisten, being pleasant to the taste: it also nourisheth more than doth the soure pap, but the same nourishment is thin and little; and that which is of a middle tast, hauing the smacke of wine, is after a middle sort more cold than sweet, and lesser cold than soure: the sweet and odoriferous floures of Orenges be vsed of the perfumers in their sweet smelling ointments.

Two ounces of the juyce of Limons, mixed with the like quantity of the spirit of wine, or the V
best *Aqua vitæ* (but the spirit of wine rectified is much better) and drunk at the first approach of the fit of an ague, taketh away the shaking presently: the medicine seldome faileth at the second time of the taking thereof perfectly to cure the same; but neuer at the third time, prouided that the Patient be couered warme in a bed, and caused to sweat.

There is also distilled out of them in a glasse still, a water of a maruellous sweet smell, which be- X
ing inwardly taken in the weight of an ounce and a halfe, moueth sweat, and healeth the ague.

The seed of all these doth kill wormes in the belly, and driueth them forth: it doth also mighti- Y
ly resist poyson, and is good for the stinging of Scorpions, if it be inwardly taken.

Those which be called Adams Apples are thought to bee like in faculties to the soure juyce, Z
especially of the Limons, but yet they be not so effectuall.

Chap. 104. *Of the Cornell tree.*

¶ *The Description.*

THe tame Cornell tree groweth somtime of the height and bigneſſe of a smal tree, with a great number of springs: it is couered with a rugged barke: the wood or timber is very hard and dry, without any great quantity of sap therein: the leaues are like vnto the Dog-berry leaues, crumpled, rugged, and of an ouerworne colour: the floures grow in small bunches before any leaues do appeare, of colour yellow, and of no great value (they are so small) in shew like the floures of the

Olive

Cornus mas.
The male Cornell tree.

Oliue tree: which being vaded, there come ſmall long berries, which at the firſt bee greene and red when they be ripe; of an auſtere and harſh taſte, with a certaine ſoureneſſe: within this berry is a ſmall ſtone, exceeding hard, white within like that of the Oliue, wherunto it is like both in the faſhion and oftentimes in the bigneſſe of the fruit.

¶ *The Place.*

Tbis groweth in moſt places of Germanie without manuring: it growes not wild in England. But yet there be ſundry trees of them growing in the gardens of ſuch as loue rare and dainty plants, wherof I haue a tree or two in my garden.

¶ *The Time.*

The tame Cornell tree floureth ſometime in February, & commonly in March, and afterwards the leaues come forth as an vntimely birth: the berries or fruit are ripe in Auguſt.

¶ *The Names.*

The Grecians call it Κρανία: the Latines, *Cornus*: in high Dutch, **Cornelbaum**: in low Dutch, **Cornoele boom**: the Italians, *Corniolo*: in French, *Cornillier*: in Spaniſh, *Cornizolos*: in Engliſh, the Cornell tree, and the Cornelia tree; of ſome, long Chertie tree.

The fruit is named in Latine, *Cornum*: in high Dutch, **Cornell**: in low Durch, **Cornoele**: in Italian, *Cornole*: in Engliſh, Cornell berries and Cornelian Cherries.

This is *Cornus mas Theophraſti*, or *Theophraſtus* his ſmall Cornell tree; for he ſetteth downe two ſorts of the Cornell trees, the male, and the female: he maketh the wood of the male to be ſound, as in this Cornell tree; which we both for this cauſe and for others alſo haue made to be the male. The female is that which is commonly called *Virga ſanguinea*, or Dogs berry tree, and *Cornus ſylueſtris*, or the wilde Cornell tree, of which we will treat in the next chapter following.

¶ *The Temperature and Vertues.*

A The fruit of the Cornell tree hath a very harſh or choking taſte: it cooleth, drieth, and bindeth, yet may it alſo be eaten, as it is oftentimes.

B It is a remedy againſt the laske and bloudy flix, it is hurtfull to a cold ſtomacke, and increaſeth the rawneſſe thereof: the leaues and tender crops of the tree are likewiſe of an harſh and choking taſte, and do mightily dry.

C They heale greene wounds that are great and deepe, eſpecially in hard bodies, but they are not ſo good for ſmall wounds and tender bodies, as *Galen* writeth.

CHAP. 105.

Of the female Cornell or Dog-berry tree.

¶ *The Deſcription.*

THat which the Italians call *Virga ſanguinea*, or the bloudy Rod, is like to the Cornell tree, yet it groweth not into a tree, but remaineth a ſhrub: the young branches thereof are jointed, and be of an obſcure red purple: they haue within a white ſpongie pith like that of Elder, but the old ſtalkes are hard and ſtiffe, the ſubſtance of the which is alſo white, and anſwerable to thoſe of the Cornell tree: the leaues are alſo like, the middle rib whereof as alſo the brittle foot-ſtalkes are ſomewhat reddiſh: at the top whereof ſtand white floures in ſpokie rundles, which turne into berries,

Cornus fœmina.
The Dog-berry tree.

greene ar the firſt, and of a ſhining blacke colour when they bee ripe, in taſte vnpleaſant, and not cared for of the birds.

¶ *The Place.*

This ſhrub groweth in hedges and buſhes in euery country of England.

¶ *The Time.*

The floures come forth in the Spring in the moneth of Aprill: the berries are ripe in Autumne.

¶ *The Names.*

The Italians doe commonly call it *Sanguino*, and *Sanguinello*. *Petrus Creſcentius* termes it *Sanguinus*; and *Matthiolus*, *Virga ſanguinea*: *Pliny*, *lib.* 24. *cap.* 10. hath written a little of *Virga Sanguinea*: Neither is *Virga ſanguinea*, ſaith hee, counted more happy; the inner barke whereof doth breake open the ſcarres which they before haue healed. It is an hard thing, or peraduenture a raſh part, to affirme by theſe few words, that *Pliny* his *Virga ſanguinea* is the ſame that the Italian *Sanguino* is. This is called in high Dutch, **Hartriegel:** in low Dutch, **wilde Coznoelle**, that is to ſay, *Cornus ſylueſtris*, or wilde Cornell tree: and in French, *Cornellier ſauuage*: in Engliſh, Hounds tree, Hounds berry, Dogs berry tree, Pricke-Timber: in the North countrey they call it Gaten tree, or Gater tree; the berries whereof ſeeme to be thoſe which *Chaucer* calleth Gater berries: *Valerius Cordus* nameth it ψευδοκρανια, that is to ſay, *Falſa* or *Spuria Cornus*, falſe or baſtard Cornell tree: this ſeemeth alſo to be *Theophraſtus* his σπιραια, or *Cornus fœmina*, female Cornell tree. This hath little branches hauing pith within, neither be they hard nor ſound, like thoſe of the male: the fruit is ἀβεγτος, that is, not fit to be eaten, and a late fruit which is not ripe till after the Autumne Æquinoctiall; and ſuch is the wilde Cornell tree or Gater tree, the young and tender branches whereof be red, and haue (as we haue written) a pith within: the fruit or berries be vnpleaſant, and require a long time before they can be ripe.

¶ *The Temperature.*

The berries hereof are of vnlike parts; for they haue ſome hot, bitter, and clenſing, and very many cold, dry, harſh, and binding, yet they haue no vſe in medicine.

¶ *The Vertues.*

Matthiolus writeth, That out of the berries firſt boyled, and afterwards preſſed, there iſſueth an oyle which the Anagnian country people do vſe in lamps: hut it is not certaine nor very like, that the barke of this wilde Cornell tree hath that operation which *Pliny* reporteth, of *Virga Sanguinea*; for he ſaith, as we haue already ſet downe, that the inner barke thereof doth breake and lay open the ſcars which they before haue healed. A

Chap. 106. *Of Spindle tree or Pricke-wood.*

¶ *The Deſcription.*

1 PRicke-wood is no high ſhrub, of the bigneſſe of the Pomegranat tree: it ſpreadeth farre with his branches: the old ſtalks haue their barke ſomewhat white; the new and thoſe that be lately growne bee greene, and foure ſquare: the ſubſtance of the wood is hard, and mixed with a light yellow: the leaues be long, broad, ſlender, and ſoft: the floures bee white, many ſtanding vpon one foot-ſtalke, like almoſt to a ſpoked rundle: the fruit is foure ſquare, red, and containing foure white ſeeds, euery one whereof is couered with a yellow coat, which being taken off giueth a yellow die.

2 This

1 *Euonymus Theophraſti.*
Engliſh Prick-timber tree.

2 *Euonymus latifolius.*
Broad leafed Spindle tree.

3 *Enonymus Pannonicus.*
Hungary Spindle tree.

2 This other ſort of *Euonymus* groweth to the forme of an hedge tree, of a meane bigneſſe; the trunke or body whereof is of the thickeneſſe of a mans leg, couered with a rough or ſcabbed barke of an ouerworn ruſſet colour. The branches thereof are many, ſlender, and very euen, couered with a greene barke whileſt they be yet young and tender; they are alſo very brittle, with ſome pith in the middle like that of the Elder. The leaues are few in number, full of nerues or ſinewes diſperſed like thoſe of Plantaine, in ſhape like thoſe of the Pomecitron tree, of a lothſome ſmell and bitter taſte: amongſt which come forth ſlender foot-ſtalks very long and naked, whereon do grow ſmall floures conſiſting of foure ſmall leaues like thoſe of the Cherry tree, but leſſer, of a white colour tending to a bluſh, with ſome yellowneſſe in the middle: after commeth the fruit, which is larger than the former, and as it were winged, parted commonly into foure, yet ſomtimes into fiue parts, and opening when it is ripe, it ſheweth the white graines filled with a yellow pulpe. The root is tough and wooddy, diſperſing it ſelfe farre abroad vnder the vpper cruſt of the earth.

3 The

3 The same Author sets forth another sort, which he found in the mountains of Moravia and Hungary, having a trunk or stock of the height of three or foure cubits, covered with a bark green at the first, afterwards sprinkled over with many blacke spots: the boughs are diuided toward the top into diuers small branches, very brittle and easie to breake, whereon are placed leaues by couples also, one opposite to another, somewhat snipt about the edges, in shape like those of the great Myrtle, of an astringent taste at the beginning, after somewhat hot and bitter: among which come forth small floures standing vpon long naked footstalks, consisting of foure little leaues of a bright shining purple colour, having in the middle some few spots of yellow: after comes the fruit, foure cornered, not vnlike to the common kind, of a spongious substance, and a gold yellow color, wherein is contained not red berries like the other, but black, very like to those of *Fraxinella*, of a shining blacke colour like vnto brandished horne; which are deuoured of birds when they be ripe, and the rather because they fall of themselues out of their husks, otherwise the bitternesse of the huskes would take away the delight.

¶ *The Place.*

The first commeth vp in vntoiled places and amongst shrubs, vpon rough bankes and heapes of earth; it serueth also oftentimes for hedges in fields, growing amongst Brambles and such other thornes.

The other sorts *Clusius* found in a wood in Hungary beyond the riuer Drauus, and also vpon the mountaines of Moravia and other places adiacent.

¶ *The Time.*

The floures appeare in April, the fruit is ripe in the end of August, or in the moneth of September.

¶ *The Names.*

Theophrastus calleth this shrub Κυνόσμος, and describeth it, *lib.* 3. of the Historie of Plants. Diuers also falsly reade it *Anonymos*: *Petrus Crescentius* calleth it *Fusanum*, because spindles be made of the wood hereof; and for that cause it is called in high-Dutch, **Spindelbaum**, yet most of them **Hanhodlin**: in low-Dutch, **Papenhout**: in Italian, *Fusano*: in French, *Fusin*, and *Bonnet de prestre*: in English, Spindle tree, Prickwood, and Prick-timber.

¶ *The Temperature and Vertues.*

This shrub is hurtfull to all things, as *Theophrastus* writeth, and namely to Goats: hee saith the fruit hereof killeth; so doth the leaues and fruit destroy goats especially, vnlesse they scour as wel vpwards as downewards: if three or foure of these fruits be giuen to a man they purge by vomit and stoole. A

Chap. 107. *Of the blacke Aller Tree.*

¶ *The Description.*

The blacke Aller tree bringeth forth from the root straight stalks diuided into diuers branches, the outward barke whereof is blacke, and that next to the wood yellow, and giueth a colour as yellow as Saffron: the substance of the wood is white and brittle, with a reddish pith in the midst: the leaues be like those of the Alder tree, or of the Cherry tree, yet blacker, and a little rounder: the floures be somwhat white; the fruit are round berries, in which appeare a certaine rift or chinke as though two were joined together, at the first green, afterward red, and lastly black; in this there be two little stones: the root runneth along in the earth.

¶ *The Place.*

The Aller tree groweth in moist woods and copses: I found great plenty of it in a wood a mile from Islington, in the way from thence to a small village called Harnsey, lying vpon the right hand of the way; and in the woods at Hampsted neere London, and in most Woods in the parts about London.

¶ *The Time.*

The leaues and floures appeare in the beginning of the spring, and the berries about Autumne.

¶ *The Names.*

This shrub is called *Alnus nigra*, or blacke Alder; and by others *Frangula*: *Petrus Crescentius* nameth it *Auernus*: in low-Dutch, **Sparkenhout**, and oftentimes **Visthout**, because boyes make for themselues arrowes thereof: in high-Dutch, **Faulbaum**: in English, blacke Aller tree, and of diuers, Butchers pricke tree.

Alnus nigra ſive frangula.
The blacke Aller tree.

¶ *The Tmpereature.*

The inner barke of the blacke Aller tree is of a purging and dry qualitie.

¶ *The Vertues.*

The inner barke hereof is vſed of diuers countrymen, who drinke the infuſion therof when they would be purged: it purges thick flegmatick humors and alſo cholerick, not only by the ſtoole, but oft times alſo by vomit, not without great trouble and paine to the ſtomack: it is therfore a medicine more fit for clownes than for ciuil people, and rather for thoſe that feed groſſely, than for dainty people.

Others affirme the dried barke is more gentle, and cauſeth leſſe pain; for the green barke (ſay they) which is not yet dried, contains a ſuperfluous moiſture which cauſeth gripings and vomitings, and troubles the ſtomacke.

The ſame bark boiled in wine or vineger makes a lotion for the tooth-ache, and is commended againſt ſcabs and filthineſſe of the skin.

The leaues are reported to be good fodder for cattell, eſpecially for Kine, cauſing them to yeeld good ſtore of milke.

Chap. 108. *Of the Service Tree.*

¶ *The Deſcription.*

1 THe Servis tree groweth to the height and bigneſſe of a great tree, charged with many great armes or boughs, which are ſet with ſundry ſmall branches, garniſhed with many great leaues ſomwhat long like thoſe of the Aſh: the flours are white, and ſtand in cluſters, which turne into ſmall brown berries ſomewhat long, which are not good to be eaten til they haue lien a while and are ſoft like the Medlar, whereto it is like in taſte and operation.

2 The common Servis tree growes likewiſe to the height of a great tree, with a ſtraight body of a browniſh colour, full of branches, ſet with large diſplaied leaues like the Maple or Whitethorne, ſauing that they are broader and longer: the floures are white, and grow in tufts; which being fallen, there come in place thereof ſmal round berries, brown vpon one ſide, and reddiſh toward the Sun, of an vnpleaſant taſte in reſpect of the former, in which are contained little blackiſh kernels.

¶ *The Place.*

Theſe trees are found in woods and groues in moſt places of England: there be many ſmall trees thereof in a little wood a mile beyond Iſlington by London: in Kent it groweth in great abundance, eſpecially about Southfleet and Grauеſend. ‡ The later of theſe I haue ſeen growing wild in diuers places, but not the former at any time as yet. ‡

¶ *The Time.*

They floure in March, and their fruit is ripe in September.

¶ *The Names.*

The firſt is called in Greeke σορον, and σορα: in Latine, *Sorbus*: in high-Dutch, **Sperwerbaum**: in low-Dutch, **Sorbedboom**: in French, *Cormier*: in Engliſh, Servis tree, and of ſome after the Latin Sorb tree.

The

1 *Sorbus.*
The Servis tree.

2 *Sorbus torminalis.*
Common Servis tree.

The common Servis tree is named of *Pliny*, *Sorbus torminalis*: in high-Dutch, **Arestel, Eschzosel** and **Wilder Sperwerbaum**: in English, Common Servis tree.

The berries or fruit of the Servis tree is callled ὄον, and ὄον: in Latine, *Sorbum*: in high-Dutch, **Speierling, Spozopffel**: in low-Dutch, **Sozben**: in Italian, *Sorbe*, and *Sorbole*: in French, *Corme*: in Spanish, *Servas*, and *Sorbas*: in English, Servis: of some, Sorbe Apple.

¶ *The Temperature and Vertues.*

Servis berries are cold and binding, and much more when they be hard, than when they are mild and soft: in some places they are quickely soft, either hanged in a place which is not altogether cold, or laid in hay or chaffe: these Servises are eaten when the belly is too soluble, for they stay the same; and if they yeeld any nourishment at all, the same is very little, grosse and cold; wherefore it is not good to eat of these or other-like fruits, nor to vse them otherwise than in medicines. A

They stay all maner of fluxes in the belly, the bloudy flix, and vomiting: they stanch bleeding, if they be cut and dried in the sun before they be ripe, and so reserued for vse. These we may vse diuers waies, according to the manner of the griefe and grieued part. B

Chap. 109. *Of the Ash Tree.*

¶ *The Description.*

1 THe Ash is also an high and tall tree, it riseth vp with a straight body, now and then of no small bignesse, now and then of a middle sise, and is couered with a smooth barke; the wood is white, smooth, hard, and somewhat rough grained: the tender branches hereof and such as be new grown vp are set with certaine ioynts, and haue within a white and spongie pith; but the old boughes are wooddy throughout, and be without either ioints or much pith: the leaues are long and winged, consisting of many standing by couples one right against another vpon one rib or stalke, the vppermost of all excepted, which standeth alone; of which euery particular one is long, broad, like to a Bay leafe, but softer, and of a lighter greene, without any sweete smell,

ſmell, and nicked round about the edges; out of the yonger ſort of the boughs, hard to the ſetting on of the leaues, grow forth hanging together, many long narrow and flat cods, as it were like almoſt to diuers birds tongues, where the ſeed is perfected, which is of a bitter taſte: the roots bee many, and grow deep in the ground.

Fraxinus.
The Aſh tree.

A

B

C

D

E

F

G

H

I

K

¶ *The Place.*

The Aſh doth better proſper in moiſt places, as about the borders of medows and riuers ſides, than in dry grounds.

¶ *The Time.*

The leaues and keyes come forth in Aprill and May, yet is not the ſeed ripe before the fall of the leafe.

¶ *The Names.*

This tree is called in Greeke Μελία, and of diuers, Μέλεα: it is named of the Latines, *Fraxinus*: in high-Dutch, **Eſchernbaum**, **Eſchernholtz**, and **Steyneſchern**: in low-Dutch, **Eſſchen**, and **Eſſchenboom**: in Italian, *Fraſſino*: in French, *Freſne*: in Spaniſh, *Freſno*, *Fraxino*, and *Freixo*: in Engliſh, Aſh tree.

The fruit like vnto cods is called of the apothecaries, *Lingua auis*, and *Lingua Paſſerina*: it may bee named in Greeke, Ὀρνιθόγλωσσον: yet ſome would haue it called *Orneogloſſum*: others make *Ornus* or wilde Aſh to be called *Orneogloſſum*: it is termed in Engliſh, Aſh-keyes, and of ſome Kite-keyes.

¶ *The Temperature and Vertues.*

The leaues and barke of the Aſh tree are dry and moderatly hot, the ſeed is hot & dry in the ſecond degree.

The juice of the leaues or the leaues themſelues being applied, or taken with wine, cure the bitings of vipers, as *Dioſcorides* ſaith.

The leaues of this tree are of ſo great vertue againſt ſerpents, that they dare not ſo much as touch the morning and euening ſhadowes of the tree, but ſhun them afar off, as *Pliny* reports, *lib.* 16. *ca.* 13. He alſo affirmeth, that the ſerpent being penned in with boughes laid round about, will ſooner run into the fire, if any be there, than come neere the boughs of the Aſh; and that the Aſh floureth before the ſerpents appeare, and doth not caſt his leaues before they be gon againe.

We write (ſaith he) vpon experience, that if the ſerpent be ſet within a circle of fire & the branches, the ſerpent will ſooner run into the fire than into the boughes. It is a wonderfull courteſie in nature, that the Aſh ſhould floure before the Serpents appeare, and not caſt his leaues before they be gon againe.

Both the leaues and barke are reported to ſtop the belly, and being boiled with vineger & water, do ſtay vomiting, if they be laid vpon the ſtomacke.

The leaues and barke of the Aſh tree boiled in wine and drunke, do open the ſtoppings of the liuer and ſpleen, and do greatly comfort them.

Three or foure leaues of the Aſh tree taken in wine each morning from time to time, doe make thoſe lean that are fat, and keep them from feeding that begin to wax fat.

The ſeed or Aſh keyes prouoke vrine, increaſe naturall ſeed, and ſtirre vp bodily luſt, eſpecially being poudered with nutmegs and drunke.

The wood is profitable for many things, being highly exalted by *Homer*, and by *Achilles* ſpeare, as *Pliny* writeth.

The ſhauings or ſmall pieces being drunke, are ſaid to be pernitious and deadly, as *Dioſcorides* affirmeth.

The Lee which is made of the aſhes of the barke cureth the white ſcurfe, and ſuch other roughneſſe of the skin, as *Pliny* teſtifieth.

Chap. 110.

Of the wilde Ash, otherwise called Quicke-Beam, or Quicken-tree.

Sorbus sylvestris, sive Fraxinus Bubula.

The Quicken-tree, wild Ash, or wild Servis tree.

¶ *The Description.*

THe wilde or Ash Quicken tree *Pena* setteth forth for the wilde Service. This tree groweth seldom or neuer to the stature and height of the Ash tree, notwithstanding it growes to the bignes of a large tree. The leaues be great and long, and scarce be discerned from the leaues of the Service Tree. The floures be white, sweet of smell, and grow in tuft, which do turn into round berries, green at the first, but when they bee ripe of a deepe red colour, and of an vnpleasant taste. The branches are as full of juice as the osier; which is the cause that Boies do make pipes of the barke thereof, as they doe with Willowes.

¶ *The Place.*

The wilde Ash or Quicken tree groweth on high mountains and in thicke Woods in most places of England, especially about Namptwich in Cheshire, in the Weilds of Kent, in Sussex and diuers other places.

¶ *The Time.*

The wild Ash flours in May, and the berries are ripe in September.

¶ *The Names.*

The Latines call this tree *Ornus*, and oftentimes *Sylvestris Fraxinus* or wilde Ash; and it is also *Fraxini species*, or a kind of Ash: for the Grecians (as not onely *Pliny* writeth, but also *Theophrastus*) haue made two kinds of Ash, the one high and tall, the other lower; the high and tall one is *Fraxinus vulgaris*, or the common Ash; and the lower, *Ornus*, which also is named Ὀρεινὴ, or *Montana Fraxinus*, mountain Ash; as the other, πεδία or field Ash, which is also named Βούδια, or as *Gaza* translateth it, *Bubula fraxinus*, but more truly *Magna Fraxinus*, or Great Ash; for the syllable βού is a signe of bignes. This *Ornus* or great Ash is named in high-Dutch, **Malbaum**: in low-Dutch, **Hauereschen**, or **Quereschen**, of diuers, **Qualster**: in French, *Fresne sauvage*: in English, Wilde Ash, Quicken-tree, Quick-beam tree, and Wicken tree. *Matthiolus* makes this to bee *Sorbus sylvestris*, or wilde Service tree.

¶ *The Temperature and Vertues.*

Touching the faculties of the leaues, barke, or berries, as there is nothing found among the old, A
so is there nothiug noted among the later writers: but *Pliny* seems to make this wilde Ash like in faculties to the common Ash; for *lib. 16. cap. 13.* where he writes of both the Ashes, hee saith, that the common Ash is *Crispa*, and the mountain Ash *Spissa*. And forthwith he adds this: The Grecians write that the leaues of them do kill cattel, and yet hurt not those that chew their cud. Which the old Writers haue noted of the Yew tree, and not of the Ash tree. *Pliny* was deceiued by the neerenesse of the words μίλος, and μῖλος: μῖλος is the Yew tree, and μέλια the Ash tree: so that hee hath falsly attributed that deadly facultie to the Ash tree, which belongeth to the Yew tree.

The leaues of the wilde Ash tree boiled in wine are good against the pain in the sides, and stop- B
ping of the liuer, and asswage the bellies of those that haue the tympany and dropsie.

Benedictus Curtius Symphorianus is deceiued in the history of *Ornus*, when he thinks out of *Virgils* C
Georgicks, that *Ornus* hath the floure of the Peare tree; for out of *Virgils* Verses no such thing at all

all can be gathered; for he intreateth not of the formes of trees, but of the graffing of diuers into others, vnlike and differing in nature; as of the graffing of the Nut tree into the Strawbery tree; the Apple into the Plane tree; the Beech into the Cheſtnut tree; the Peare into the wild Aſh or quick-Beam tree, the Oke into the Elm tree: and in this reſpect he writeth, that the Plane tree bringeth forth an apple, the Beech tree a Cheſtnut; the wilde Aſh bringeth forth the white floure of the Peare tree; as is moſt manifeſt out of *Virgils* owne words, after this maner, *lib.* 2. of his *Georgicks*:

Inſeritur vero ex fœtu nucis Arbutus horrida,
Et ſteriles Platani malos geſſere valentes,
Caſtaneæ Fagos: Ornus incanuit albo
Flore Pyri, glandémque ſues fregere ſub Vlmis.

The tree-Strawb'ry on Walnuts ſtock doth grow,
And barren Planes faire Apples oft haue borne;
Cheſtnuts, Beeſt-maſt; the Quicken-tree doth ſhow
The Peares white floure; and Swine oft times th' Acorn
Haue gather'd vnder Elms. ——

Chap. III. *Of Coriars Sumach.*

1 *Rhus Coriaria.*
Coriar Sumach.

2 *Rhus Myrtifolia.*
Wilde or Myrtle Sumach.

¶ *The Deſcription.*

2 COriars Sumach groweth vp vnto the height of an hedge tree, after the manner of the Elder tree, bigger than *Dioſcorides* reporteth it to be, or others, who affirme that *Rhus* groweth two cubits high; whoſe errors are the greater: but this *Rhus* is ſo like to the Service

Service tree in shape and manner of growing, that it is hard to know one from the other, but that the leaues are soft and hairy, hauing a red sinue or rib thorow the midst of the leaf: the flours grow with the leaues vpon long stems clustering together like Cats taile or the catkins of the Nut tree, but greater, and of a whitish green colour; after which come clusters of round berries, growing in bunches like Grapes.

2 The Sumach of *Plinies* description groweth like a small hedge tree, hauing many slender twiggy branches garnished with leaues like *Myrtus*, or rather like the leaues of the Iuiube tree. Among which come forth slender mossie flours, of no great account or value, which bring forth smal seeds, inclosed within a cornered case or huske fashioned like a spoon. The trunk or body of both these kindes of Sumach being wounded with some iron instrument, yeeldeth a gum or liquour.

¶ *The Place.*

Sumach groweth, as *Dioscorides* saith, in stony places: it is found in diuers mountains & woods in Spain, and in many places on the mount Apennine in Italy, and also neere vnto Pontus. *Archigenes* in *Galen, lib.* 8. of Medicines according to the places affected, sheweth, that it groweth in Syria, making choice of that of Syria.

¶ *The Time.*

The floures of Sumach come forth in Iuly: the seed with the berries are ripe in Autumne.

¶ *The Names.*

This is called in Greeke Ῥοῦς: *Rhus*, saith *Pliny*, hath no Latine name, yet *Gaza* after the signification of the Greeke word, feigneth a name, calling it *Fluida*: the Arabians name it *Sumach*: the Italians, *Sumacho*: the Spaniards, *Sumagre*: in low-Dutch, by contracting the word, they cal it **Sumac** or **Sumach** in English, Sumach, Coriars Sumach, and leather Sumach: the leaues of the shrub be called Ῥοὸς Συρικὸς ἀσπάλαθος: in Latine, *Rhus Coriaria*, or *Rhoe*.

The seed is named *Eruthro*, and Ῥοὸς ὁ ἐν τοῖς ἐδέσμασι: in Latine, *Rhus culinaria*, and *Rhus obsoniorum*: in English, Meat Sumach, and Sauce Sumach.

¶ *The Temperature.*

The fruit, leaues, and seed hereof do very much binde: they also coole and dry: dry they are in the third degree, and cold in the second, as *Galen* saith.

¶ *The Vertues.*

The leaues of Sumach boiled in wine and drunken, do stop the lask, the inordinat course of wo- A
mens sicknesses, and all other inordinat issues of bloud.

The seeds of Sumach eaten in Sauces with meat stop all maner of fluxes of the belly, the blou- B
die flix, and all other issues, especially the Whites of women,

The decoction of the leaues maketh haires blacke, and is put into stooles to fume vpward into C
the bodies of such as haue the Dysenterie, and is to be giuen them also in drinke.

The leaues made into an ointment or plaister with hony and vineger, stayes the spreding nature D
of gangrens and *Pterygia*.

The dry leaues sodden in water vntill the decoction be as thicke as honey, yeeld forth a certaine E
oilinesse which performeth all the effects of *Licium*.

The seed is no lesse effectuall to be strewed in pouder vpon their meats that are *Cœliaci* or *Dysen-* F
terici.

The seeds pouned, mixed with hony and the pouder of oke coles, heale the hemorrhoids. G

There issueth out of the shrub a gum, which being put into the hollownesse of the teeth, taketh H
away the pain, as *Dioscorides* saith.

Chap. 112. *Of Red Sumach.*

¶ *The Description.*

1 THese two figures are of one and the selfe same plant; the first sheweth the shrub being in floure, the other when it is ful floured with the fruit grown to ripenesse: notwithstanding some haue deemed them to be of two kinds, wherein they were deceiued.

† This excellent and most beautifull plant *Coggygria* (beeing reputed of the Italians and the Venetians for a kind of *Rhus* or Sumach, because it is vsed for the same purposes whereto *Rhus* serueth,

neth and therein doth farre excell it) is an hedge plant growing not aboue the height of foure or fiue cubits, hauing tough and pliant ſtalkes and twiggy branches like to Oziers, of a brown colour. The leaues be round, thick, and ſtiffe like the leaues of *Capparis*, in colour & ſauor of *Piſtacia* leaues, or *Terebinthus*; among which ariſes a ſmall vpright ſprig, bearing many ſmal cluſtering little greeniſh yellow floures, vpon long and red ſtalks. After which follow ſmall reddiſh Lentill-like ſeeds that carry at the tops a moſt fine woolly or flocky tuft, criſped and curled like a curious wrought ſilken fleece, which curleth and foldeth it ſelfe abroad like a large buſh of haires.

1 *Coggygria Theophraſti.* *vel* *Cotinus Coriarius Plinij.*
Venice Sumach. or Red Sumach.

¶ *The Place.*

Coggygria groweth in Orelans neere Auignion, and in diuers places of Italy, vpon the Alpes of Styria, and many other places. It groweth on moſt of the hils of France, in the high woods of the vpper Pannonia or Auſtria, and alſo of Hungaria and Bohemia.

¶ *The Time.*

They floure and flouriſh for the moſt part in Iuly.

¶ *The Names.*

The firſt is called *Coggygria*, and *Coccygria:* in Engliſh, Venice Sumach, or Silken Sumach; of *Pliny*, *Cotinus*, in his 16. booke, 18. chapter. There is, ſaith he, on mount Apennine a ſhrub which is called *Cotinus ad lineamenta modo Conchylij colore inſignis*, and yet *Cotinus* is *Oleaſter*, or *Olea ſylueſtris*, the wild Oliue tree, from which this ſhrub doth much differ; and therfore it may rightly be called *Cotinus Coriaria*. Diuers would haue named it *Scotinus*, which name is not found in any of the old writers. The Pannonians do cal it *Farblauff:* it is alſo thought that this ſhrub is *Coggygria Plinij*, of which in his 13 book, 22. chapter he writeth in theſe words: *Coggygria* is alſo like to *Vnedo* in leafe, not ſo great; it hath a propertie to looſe the fruit with down, which thing happeneth vnto no other tree.

¶ *The Temperature.*

The leaues and ſlender branches together with the ſeeds are very much binding, cold and dry as the other kindes of Sumach are.

¶ *The Vertues.*

A The leaues of *Coggygria*, or Silken Sumach, are ſold in the markets of Spaine and Italy for great ſummes

ſummes of mony, vnto thoſe that dreſſe Spaniſh ſkins, for which purpoſe they are very excellent.

The root of *Cotinus*, as *Anguillara* noteth, ſerueth to die with, giuing to wooll and cloth a reddiſh colour: which *Pliny* knew, ſhewing that this ſhrub (that is to ſay the root) is *ad lineamenta modo ænchyli colore inſignis*. B

Chap. 113. *Of the Alder Tree.*

¶ *The Deſcription.*

1 THe Alder or Aller tree is a great high tree hauing many brittle branches, the bark is of a brown colour, the wood or timber is not hard, and yet it will laſt and endure very long vnder the water, yea longer than any other timber whatſoeuer; wherefore in fenny and ſoft mariſh grounds they vſe to make piles and poſts thereof, for the ſtrengthening of the walls and ſuch like. This timber doth alſo ſerue very well to make troughs to conuey water in ſtead of pipes of Lead. The leaues of this tree are in ſhape ſomewhat like the Haſell, but they are blacker and more wrinkled, very clammy to handle, as though they were ſprinkled with hony. The bloſſoms or floures are like the aglets of the Birch tree, which beeing vaded, there followeth a ſcaly fruit cloſely growing together, as big as a Pigeons egg; which toward Autumne doth open, and the ſeed falleth out and is loſt.

1 *Alnus.*
The Alder tree.

‡ 2 *Alnus hirſuta.*
Rough leafed Alder.

‡ 2 *Cluſius* and *Bauhine* haue obſerued another kinde of this, which differs from the ordinary, in that it hath larger and more cut leaues, and theſe not ſhining aboue, but hoary vnderneath. The catkins as alſo the rough heads are not ſo large as thoſe of the former; the bark alſo is whiter. *Cluſius* makes it his *Alnus altera*: and *Bauhine*, his *Alnus hirſutus*, or *folio incano*. ‡

¶ *The*

¶ *The Place.*

The Aller or Alder tree delighteth to grow in low and moist wateriſh places.

¶ *The Time.*

The Aller bringeth forth new leaues in Aprill; the fruit whereof is ripe in September.

¶ *The Names.*

The tree is called in Greeke ἀλίσφακος: in Latine *Alnus*: *Petrus Creſcentius* nameth it *Amedanus*: it is called in high-Dutch, **Erlenbaum** and **Ellernbaum**: in low-Dutch, **Elſen**, and **Elſen boom**: in Italian, *Alno*: in French, *Aulne*: in Engliſh, Alder, and Aller.

¶ *The Temperature.*

The leaues and barke of the Alder are cold, dry, and aſtringent.

¶ *The Vertues.*

A The leaues of Alder are much vſed againſt hot ſwellings, vlcers, and all inward inflammations, eſpecially of the almonds and kernels of the throat.

B The bark is much vſed of poore country Diers for the dying of courſe cloath, caps, hoſe, & ſuch like into a blacke colour, whereto it ſerueth very well.

CHAP. 114. *Of the Birch Tree.*

Betula.
The Birch tree.

¶ *The Deſcription.*

THe common Birch tree waxeth likewiſe a great tree, hauing many boughs beſet with many ſmall rods or twigs, very limber and pliant; the barke of the yong twigs and branches is plain, ſmooth, and full of ſap, in colour like the cheſtnut, but the rind of the body or trunk is hard without, white, rough, and vneuen, full of chinks or creviſes: vnder which is found another fine barke, plaine, ſmooth, and as thin as paper, which heretofore was vſed in ſtead of paper to write on, before the making of paper was knowne: in Ruſſia and theſe cold countries it ſerueth in ſtead of tiles and ſlate to couer their houſes withall. This tree beareth for his flours certaine aglets like the Haſel tree, but ſmaller, wherein the ſeed is contained.

¶ *The Place.*

This common Birch tree grows in woods, fenny grounds, and mountains, in moſt places of England.

¶ *The Time.*

The catkins or aglets do firſt appear, and then the leaues, in Aprill or a little later.

¶ *The Names.*

Theophraſtus calleth this tree in Greeke, σμίδα: diuers, σμῖς: others σίμος: it is named in Latine, *Betula*: diuers alſo write it with a double *ll Betulla*, as ſome of *Plinies* Copies haue it: it is called in high-Dutch, **Birkenbaum**: in low-Dutch, **Berckenboom**: in Italian, *Betula*: by them of Trent, *Bedallo*: in French, *Bouleau*: in Engliſh, Birch tree.

¶ *The Nature and Vertues.*

Concerning the medicinable vſe of the Birch tree, or his parts, there is nothing extant either in the old or new writers.

This tree, ſaith *Pliny*, *lib.* 16. *cap.* 18. *Mirabili candore & tenuitate terribilis magiſtratuum virgis*: for in times paſt the magiſtrats rods were made thereof; and in our time alſo Schoolmaſters and Parents do terrifie their children with rods made of Birch.

It ſerueth well to the decking vp of houſes and banqueting rooms, for places of pleaſure, and for beautifying of ſtreets in the Croſſe and Gang weeke, and ſuch like.

CHAP.

Chap. 115.

Of the Horne-beame or hard Beame Tree.

Betulus, sive Carpinus.
The Horn-beam tree.

¶ *The Description.*

Betulus or the Horn-beame tree growes great; and very like vnto the Elme or Wich-Hasell tree, hauing a great body, the wood or timber whereof is better for arrowes and shafts, pulleyes for mils, and such like deuices, than Elm or Wich Hasell; for in time it waxeth so hard, that the toughnesse and hardnes of it may be rather compared to horn than vnto wood, and therfore it was called Horne-beam or Hard-beam: the leaues of it are like the Elme, sauing that they be tenderer; among those hang certaine triangled things, vpon which be found knaps or little heads of the bignesse of Ciches, in which is contained the fruit or seed: the root is strong and thicke.

¶ *The Place.*

Betulus or the Horn-beam tree growes plentifully in Northampton shire, and in Kent by Graues-end, where it is commonly taken for a kinde of Elme.

¶ *The Time.*

This tree springs in Aprill, and the seed is ripe in September.

¶ *The Names.*

The Horn-beame tree is called in Greeke, ζυγία: which is as much to say as *Conjugalis*, or belonging to the yoke, because it serues well to make ζυγὰ of, in Latine *Iuga*, yokes wherwith oxen are yoked together; which are also euen at this time made thereof, as witnesseth *Benedictus Curtius Symphorianus*, and our selues haue sufficient knowledge thereof in our owne country, and therefore it may be Englished, Yoke Elm. It is called of some *Carpinus*, and *Zugia*: it is also called *Betulus*, as if it were a kinde of Birch; but my selfe better like it should be one of the Elmes: in high-Dutch, A Horn: in French *Carne*: in Italian, *Carpino*: in English, Horn-beam, Hard-beam, Yoke-Elme, and in some places Witch Hasell.

¶ *The Temperature and Vertues.*

This tree is not vsed in medicine, the vertues are not expressed of the Antients, neither haue we any certain experiments of our owne knowledge, more than hath been said for the vse of Husbandry.

Chap. 116. *Of the Elme tree.*

‡ OVr Author onely described two Elmes, and those not so accuratly but I think I shall giue the Reader content, in exchanging them for better, receiued from Mr *Goodyer*, the which are these.

Vlmus vulgatimissima folio lato scabro. The common Elme.

¶ THis Elme is a very great high tree, the bark of the yong trees, and boughes, of the elder, which are vsually lopped or shred, is smooth and very tough, and will strip or pill from the wood a great length without breaking: the bark of the body of the old tree as the trees grow in bignesse teares or rents, which makes it very rough. The innermost wood of the tree is of a reddish yellow

yellow or browniſh colour,and curled,and after it is dry,very tough,hard to cleaue or rent,whereof aues of carts are commonly made: the wood next the bark,which is called the ſap,is white. Before the leaues come forth, the floures appeare about the end of March, which grow on the twigges or braunches,cloſely compacted or thruſt together,and are like to the chiues growing in the middle of moſt floures;of a red colour: after which come flat ſeed,more long than broad, not much vnlike the garden Arach ſeed in form and bigneſſe,and do for the moſt part fal away before or ſhortly after the leaues ſpring forth,and ſome hang on a great part of ſummer:the leaues hang on the twigs, of a darke green colour,the middle ſiſe whereof are two inches broad and three inches long; ſome are longer and broader,ſome narrower and ſhorter,rough or harſh in handling on both ſides, nickt or indented about the edges, and many times crumpled, hauing a nerve in the middle, and many ſmaller nerues growing from him: the leafe on one ſide of the nerve is alwaies longer than on the other. On theſe leaues oftentimes grow bliſters or ſmall bladders,in which at the ſpring are little wormes about the bigneſſe of bed-fleas. This Elme is common in all parts of England where I haue trauelled.

1 *Vlmus vulgatiſſ. folio lato ſcabro.*
The common Elme tree.

‡ 2 *Vlmus minor folio anguſto ſcabro.*
The narrow leaued Elme.

Vlmus minor folio anguſto ſcabro.
The narrow leafed Elme.

2 This tree is like the other,but much leſſer and lower; the leaues are vſually about two inches and a halfe long,and an inch or an inch and a quarter broad,nickt or indented about the edges,and hath one ſide longer than the other,as the firſt hath, and are alſo harſh or rough on both ſides, the barke or Rinde will alſo ſtrip as the firſt doth. Hitherto I haue not obſerued either the floures or ſeed, or bliſters on the leaues, nor haue I had any ſight of the Timber, or heard of any vſe thereof. This Kinde I haue ſeene growing but once, and that in the hedges by the high-way, as I rode betweene Chriſt Church and Limmington in the New Forreſt in Hampeſhire, about

about the middle of September 1624. from whence I brought some small plants of it, not a foot in length, which now, 1633. are risen vp ten or twelue foot high, & grow with me by the first kind, but are easily to be discerned apart, by any that will looke on both.

‡ 3 *Vlmus folio latissimo scabro.*
Witch Hasell, or the broadest leaued Elme.

4 *Vlmus folio glabro.*
Witch Elme, or smooth leaued Elme.

Vlmus folio latissimo scabro.
Witch Hasell, or the broadest leaued Elme.

3 This groweth to be a very great tree, and also very high, especially when he groweth in woods amongst other trees: the barke on the outside is blacker than that of the first, and is also very tough, so that when there is plenty of sap it will strip or peele from the wood of the boughes from the one end to the other, a dozen foot in length or more, without breaking, whereof are often made cords or ropes: the timber hereof is in colour neere like the first; it is nothing so firme or strong for naues of Carts as the fruit is, but will more easily cleaue; this timber is also couered with a white sappe next the barke: the branches or young boughes are grosser and bigger, and doe spread themselues broader, and hang more downewards than those of the first; the floures are nothing but chiues, very like those of the first kinde: the seed is also like, but something bigger: the leaues are much broader and longer than any of the kindes of Elme, vsually three or foure inches broad, and fiue or six inches long, also rough or harsh in handling on both sides, snipt or indented about the edges, neere resembling the leaues of the Hasell: the one side of the leaues are also most commonly longer than the other, also on the leaues of this Elme are sometimes blisters or bladders like those of the first kinde. This prospereth and naturally groweth in any soile moist or dry, on high hills, and in low vallies in good plenty in most places in Hampshire, where it is commonly called Witch Hasell. Old men affirme, that when long boughes were in great vse, there were very many made of the wood of this tree, for which purpose it is mentioned in the statutes of England by the name of Witch Hasell, as 8. *El.* 10. This hath little affinitie with *Carpinus*, which in Essex is called Witch Hasell,

Vlmus folio glabro.
Witch Elme, or ſmooth leauen Elme.

4 This kinde is in bigneſſe and height like the firſt, the boughes grow as thoſe of the Witch Haſell do, that is hanged more downewards than thoſe of the common Elme, the barke is blacker, than that of the firſt kinde, it will alſo peele from the boughes: the floures are like the firſt, and ſo are the ſeeds: the leaues in forme are like thoſe of the firſt kind, but are ſmooth in handling on both ſides. My worthy friend and excellent Herbariſt of happy memory Mr *William Coys* of Stubbers in the Pariſh of Northokington in Eſſex told me, that the wood of this kinde was more deſired for naues of Carts than the wood of the firſt. I obſerued it growing very plentifully as I rode between Rumford and the ſaid Stubbers, in the yeare 1620. intermixed with the firſt kinde, but eaſily to be diſcerned apart, and is inthoſe parts vſually called Witch Elme. ‡

¶ *The Place.*

The firſt kinde of Elme groweth plentifully in all places of England. The reſt are ſet forth in their deſcriptions.

¶ *The Time.*

The ſeeds of the Elme ſheweth it ſelfe firſt, and before the leaues; it falleth in the end of Aprill, at what time the leaues begin to ſpring.

¶ *The Names.*

The firſt is called in Greeke, πτελέα: in Latine, *Vlmus*: in high Dutch, **Ruſt holtz, Ruſtbaum, Vlmbaum**: in low Dutch **Olmen**: in French, *Orme*, and *Omeau*: in Italian, *Olmo*: in Spaniſh, *Vlmo*: in Engliſh, Elme tree.

The ſeed is named by *Pliny* and *Columella*, *Samera*. The little wormes which are found with the liquor within the ſmall bladders be named in Greeke, κόνιπες: it Latine *Culices*, and *Muliones*.

The other Elme is called by *Theophraſtus*, ὀρεσίπτελέα; which *Gaza* tranſlateth *Montiulmus* or mountaine Elme. *Columella* nameth it *Vernacula*, or *Noſtras Vlmus*, that is to ſay, *Italica*, or Italian Elme: it is called in low Dutch, **Herſeleer**, and in ſome places, **Heerenteer**.

¶ *The Temperature and Vertues.*

A The leaues and barke of the Elme bee moderately hot, with an euident clenſing faculty; they haue in the chewing a certaine clammy and glewing quality.

B The leaues of Elme glew and heale vp greene wounds, ſo doth the barke wrapped and ſwadled about the wound like a band.

C The leaues being ſtamped with vineger do take away ſcurffe.

D *Dioſcorides* writeth, That one ounce weight of the thicker barke drunke with wine or water purgeth flegme.

E The decoction of Elme leaues, as alſo of the barke or root, healeth broken bones very ſpeedily, if they be fomented or bathed therewith.

F The liquor that is found in the bliſters doth beautifie the face, and ſcoureth away all ſpots, freckles, pimples, ſpreading tetters, and ſuch like, being applied thereto.

G It healeth greene wounds, and cureth ruptures newly made, being laid on with Spleenwoort and the truſſe cloſely ſet vnto it.

Chap. 117. *Of the Line or Linden Tree.*

¶ *The Deſcription.*

1 The female Line or Linden tree waxeth very great and thicke, ſpreading forth his branches wide and farre abroad, being a tree which yeeldeth a moſt pleaſant ſhadow, vnder and within whoſe boughes may be made braue ſummer houſes and banqueting arbors, becauſe the more that it is ſurcharged with weight of timber and ſuch like, the better it doth flouriſh. The barke is browniſh, very ſmooth, and plaine on the outſide, but that which is next to the timber is white, moiſt and tough, ſeruing very well for ropes, traſes, and halters. The timber is whitiſh, plaine and without knots, yea very ſoft and gentle in the cutting or handling. Better gunpouder is made of the coales of this wood than of Willow coales. The leaues are greene, ſmooth,

ſmooth, ſhining, and large, ſomewhat ſnipt or toothed about the edges: the floures are little, whitiſh, of a good ſauour, and very many in number, growing cluſtering together from out of the middle of the leafe: out of which proceedeth a ſmall whitiſh long narrow leafe: after the floures ſucceed cornered ſharpe pointed Nuts, of the bigneſſe of Haſell Nuts. This tree ſeemeth to be a kinde of Elme, and the people of Eſſex about Heningham (wheras great plenty groweth by the way ſides) do call it broad leafed Elme.

1 *Tilia fœmina.*
The female Line tree.

2 *Tilia mas.*
The male Line tree.

2 The male *Tilia* or Line tree groweth alſo very great and thicke, ſpreading it ſelfe far abroad like the other Linden tree: his barke is very tough and pliant, and ſerueth to make cords and halters of. The timber of this tree is much harder, more knotty, and more yellow than the timber of the other, not much differing from the timber of the Elme tree: the leaues hereof are not much vnlike Iuy leaues, not very greene, ſomewhat ſnipt about the edges: from the middle whereof come forth cluſters of litle white flours like the former: which being vaded, there ſucceed ſmall round pellets, growing cluſtering together like Iuy berries, within which is contained a little round blackiſh ſeed, which falleth out when the berry is ripe.

¶ *The Place.*

The female Linden tree groweth in ſome woods in Northampton ſhire; alſo neere Colcheſter, and in many places alongſt the high way leading from London to Henningham, in the county of Eſſex.

The male Linden tree groweth in my Lord Treaſurers garden in the Strand, and in ſundry other places, as at Barn-elmes, and in a garden at Saint Katherines neere London. ‡ The female growes in the places here named, but I haue not yet obſerued the male. ‡

¶ *The Time.*

The trees floure in May, and their fruit is ripe in Auguſt.

¶ *The Names.*

The Linden tree is called in Greeke πτελεα: in Latine, *Tilia*: in high Dutch, **Linden**, and **Lindenbaum**: in low Dutch, **Linde**, and **Lindenboom**: the Italians, *Tilia*: the Spaniard, *Tea*: in French, *Tilet* and *Tilieul*: in Engliſh, Linden tree, and Line tree.

¶ *The Temperature.*

The barke and leaues of the Linden or Line tree, are of a temperate heate, ſomewhat drying and aſtringent.

¶ *The Vertues.*

A The leaues of *Tilia* boyled in Smithes water with a piece of Allum and a little honey, cure the ſores in childrens mouthes.

B The leaues boiled vntill they be tender; and pouned very ſmall with hogs greaſe, and the pouder of Fenugreeke and Lineſeed, take away hot ſwellings and bring impoſtumes to maturation, being applied thereto very hot.

C The floures are commended by diuers againſt paine of the head proceeding of a cold cauſe, againſt diſſineſſe, the Apoplexie, and alſo the falling ſickneſſe, and not onely the floures, but the diſtilled water thereof.

D The leaues of the Linden (ſaith *Theophraſtus*) are very ſweet, and be a fodder for moſt kind of cattle: the fruit can be eaten of none.

Chap. 118. *Of the Maple tree.*

‡ 1 *Acer majus.*
The great Maple.

† 2 *Acer minus.*
The leſſer Maple.

¶ *The Deſcription.*

THe great Maple is a beautifull and high tree, with a barke of a meane ſmoothneſſe: the ſubſtance of the wood is tender and eaſie to worke on; it ſendeth forth on euery ſide very many goodly boughes and branches, which make an excellent ſhadow againſt the heat of the Sun; vpon which

which are great, broad, and cornered leaues, much like to those of the Vine, hanging by long reddish stalkes; the floures hang by clusters, of a whitish greene colour; after them commeth vp long fruit fastened together by couples, one right against another, with kernels bumping out neere to the place in which they are combined: in all the other parts flat and thin like vnto parchment, or resembling the innermost wings of grashoppers: the kernels be white and little.

2 There is a small Maple which doth oftentimes come to the bignesse of a tree, but most commonly it groweth low after the manner of a shrub: the barke of the young shoots hereof is likewise smooth; the substance of the wood is white, and easie to be wrought on: the leaues are cornered like those of the former, slippery, and fastened with a reddish stalke, but much lesser, very like in bignesse and smoothnesse to the leafe of Sanicle, but that the cuts are deeper: the floures be as those of the former, greene, yet not growing in clusters, but vpon spoked rundles: the fruit standeth by two and two vpon a stem or foot-stalke.

¶ *The Place.*

The small or hedge Maple groweth almost euery where in hedges and low woods.

The great Maple is a stranger in England, onely it groweth in the walkes and places of pleasure of noble men, where it especially is planted for the shadow sake, and vnder the name of Sycomore tree.

¶ *The Time.*

These trees floure about the end of March, and their fruit is ripe in September.

¶ *The Names.*

This tree is called in Greeke σφένδαμνος: in Latine, *Acer*: in English, Maple, or Maple tree.

The great Maple is called in high Dutch, **Ahorne**, and **Waldescherne**: the French-men, *Grand Erable*, and *Plasne* abusiuely, and this is thought to be properly called σφένδαμνος: but they are far deceiued that take this for *Platanus*, or the Plane tree, being drawne into this errour by the neerenesse of the French word; for the Plane tree doth much differ from this. ‡ This is now commonly (yet not rightly) called the Sycomore tree. And seeing vse will haue it so, I thinke it were not vnfit to call it the bastard Sycomore. ‡

The other is called in Latine, *Acer minor*: in high Dutch, **Washolder**: in low Dutch, **Boogh out**: in French, *Erable*: in English, small Maple, and common Maple.

¶ *The Temperature and Vertues.*

What vse the Maple hath in medicine we finde nothing written of the Grecians, but *Pliny* in his 14 booke, 8 chapter affirmeth, That the root pouned and applied, is a singular remedy for the paine of the liuer. *Serenus Sammonicus* writeth, that it is drunke with wine against the paines of the side. A

Si latus immeritum morbo tentatur acuto,
Accensum tinges lapidem stridentibus vndis.
Hinc bibis: aut Aceris radicem tundis, & vna
Cum vino capis: hoc præsens medicamen habetur.

Thy harmelesse side if sharpe disease inuade,
In hissing water quench a heated stone:
This drinke. Or Maple root in pouder made,
Take off in wine, a present med'cine knowne.

Chap. 119. *Of the Poplar Tree.*

¶ *The Kindes.*

There be diuers trees vnder the title of Poplar, yet differing very notably, as shall be declared in the descriptions, whereof one is the white, another the blacke, and a third sort set downe by *Pliny*, which is the Aspe, named by him *Lybaca*; and by *Theophrastus*, *Kerkis*: likewise there is another of America, or of the Indies, which is not to be found in these regions of Europe.

¶ *The Description.*

1 THe white Poplar tree commeth soone to perfection, and growes high in short time, full of boughes at the top: the barke of the body is smooth, and that of the boughes is likewise white withall: the wood is white, easie to be cleft: the leaues are broad, deeply gashed, and cornered like almost to those of the Vine, but much lesser, smooth on the vpper side, glib, and somewhat greene; and on the nether side white and woolly: the catkins are long, downy, at the first of a purplish colour: the roots spread many waies, lying vnder the turfe, and not growing deep, and therefore it happeneth that these trees be oftentimes blowne downe with the winde.

1 *Populus alba.*
The white Poplar tree.

2 *Populus nigra.*
The blacke Poplar tree.

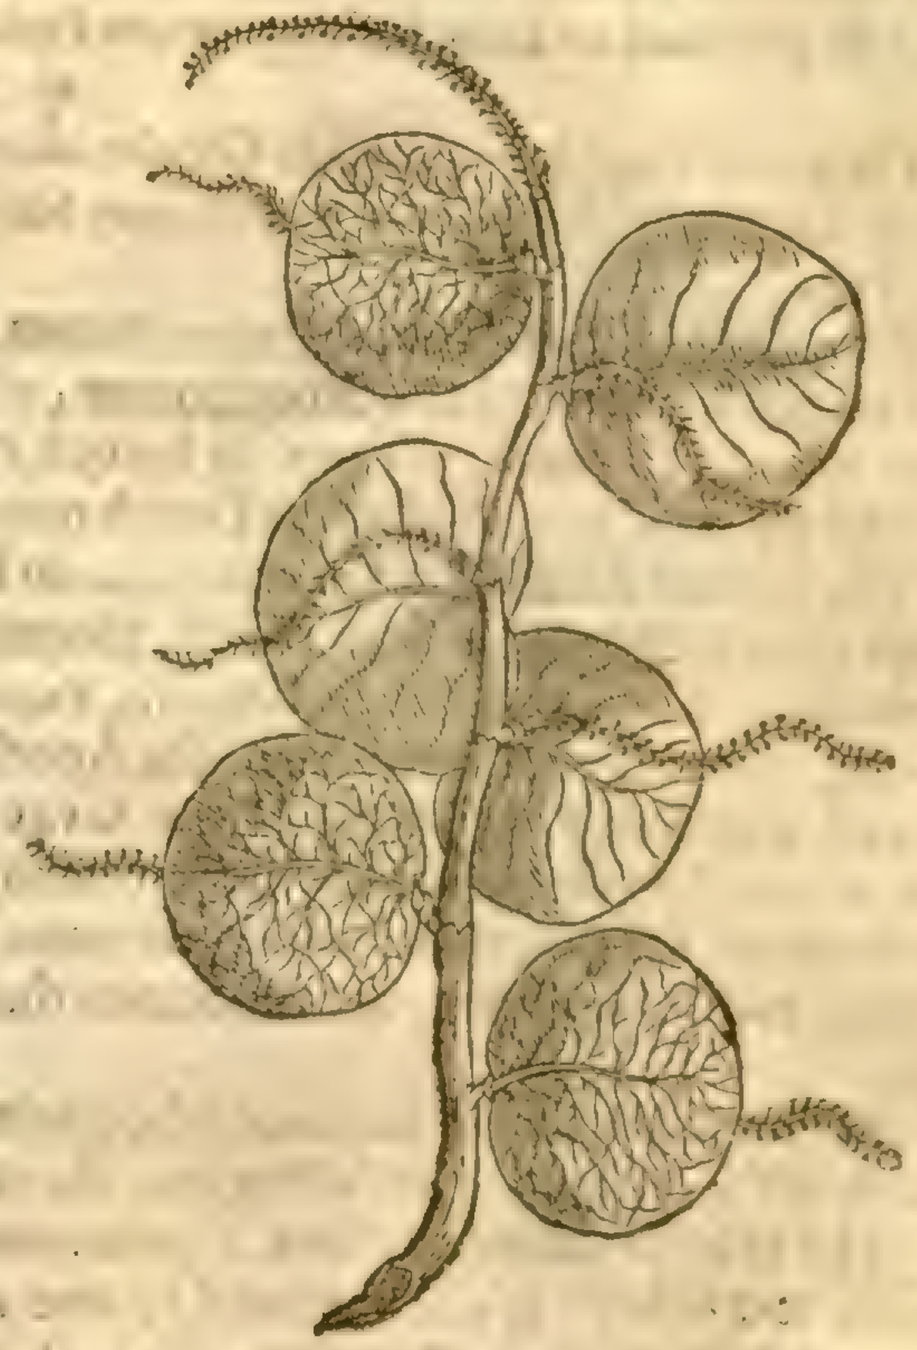
2 The blacke Poplar tree is as high as the white, and now and then higher, oftentimes fuller of boughes, and with a thicker body: the barke thereof is likewise smooth, but the substance of the wood is harder, yellower, and not so white, fuller of veines, and not so easily cleft: the leaues be somwhat long, and broad below toward the stem, sharpe at the point, and a little snipt about the edges, neither white nor woolly, like the leaues of the former, but of a pleasant greene colour: amongst which come forth long aglets or catkins, which do turne into clusters: the buds which shew themselues before the leaues spring out, are of a reasonable good sauour, of the which is made that profitable ointment called *Vnguentum Populeon*.

3 The third kinde of Poplar is also a great tree: the barke and substance of the wood is somewhat like that of the former: this tree is garnished with many brittle and tender branches, set full of leaues, in a manner round, much blacker and harder than the blacke Poplar, hanging vpon long and slender stems, which are for the most part still wauering, and make a great noise by being beaten one to another, yea though the weather be calme, and scarce any winde blowing; and it is known by the name of the Aspen tree: the roots hereof are stronger, and grow deeper into the ground than those of the white Poplar.

4 This strange Poplar, which some do cal *Populus rotundifolia*, in English, the round leafed Poplar of India, waxeth a great tree, bedect with many goodly twiggie branches, tough and limmer like the

3 *Populus Libyca.*
The Aſpen tree.

4 *Populus Americana.*
The Indian Poplar tree.



‡ 5 *Populus alba foliis minoribus.*
The leſſer leaued white Poplar.

the Willow, full of joynts where the leaues doe grow, of a perfect roundneſſe, ſaue where it cleaueth or groweth to the ſtalke: from the boſoms or corners of theſe leaues come forth ſmall aglets, like vnto our Poplar, but ſmaller: the leafe is thicke, and very like the leaues of *Arbor Indæ*, but broader, of an aſtringent taſte, ſomewhat heating the mouth, and ſaltiſh.

5 There is alſo another ſort of Poplar which groweth likewiſe vnto a great tree, the branches whereof are knotty and bunched forth as though it were full of ſcabs or ſores: the leaues come forth in tufts moſt commonly at the end of the boughes, not cut or jagged, but reſembling the leaues of that *Atriplex* called *Pes Anſerinus*; in colour like the former, but the aglets are not ſo cloſely packed together, otherwiſe it is like.

¶ *The Place.*

Theſe trees doe grow in low moiſt places, as in medowes neere vnto ditches, ſtanding waters and riuers.

The firſt kinde of white Poplar groweth not very common in England, but in ſome places here and there a tree: I found many both ſmall & great growing in a low medow turning

turning vp a lane at the farther end of a village called Blacke-wall, from London; and in Eſſex at a place called Ouenden, and in diuers other places.

The Indian Poplar groweth in moſt parts of the Iſlands of the Weſt-Indies.

¶ *The Time.*

Theſe trees do bud forth in the end of March and beginning of Aprill, at which time the buds muſt be gathered to ſerue for *Vnguentum Populeon.*

¶ *The Names.*

The white Poplar is called in Greeke, Λευκὴ: in Latine, *Populus alba*: of diuers, *Farfarus*, as of *Plautus* in his Comedie *Penulus*, as you may ſee by his words ſet downe in the chapter of Colts-foot, *pag.* 813.

It is called in high Dutch, **Poppelbaum, Weiſz Albarbaum**: in low Dutch, **Abeel**, of his horie or aged colour, and alſo **Abeelboome**; which the Grammarians doe falſly interpret *Abies*, the Firre tree: in Italian, *Popolo nero*: in French, *Peuplier blanc*, *Aubel*, *Obel*, or *Aubeau*: in Engliſh, white Poplar tree, and Abeell, after the Dutch name.

The ſecond is called in Greeke, Αἴγειρος: in Latine, *Populus nigra*: by *Petrus Creſcentius*, *Albarus*: in high Dutch, **Aſpen**: in low Dutch, **Populier**: in Italian, *Popolo nero*: in French, *Peuplier noir*: in Spaniſh, *Alamo nigailho*: in Engliſh, Poplar tree, blacke Poplar, and Peplar. The firſt or new ſprung buds whereof are called of the Apothecaries, *Oculi Populi*, Poplar buds: others chuſe rather to call it *Gemma Populi*: ſome of the Græcians name it Στέμφυλα: whereupon they grounded their error, who raſhly ſuppoſed that thoſe roſenny or clammy buds are not to be put or vſed in the compoſition of the ointment bearing the name of the Poplar, and commonly called in Engliſh, Popilion and Pompillion; but the berries that grow in cluſters, in which there is no clammineſſe at all.

They are alſo as farre deceiued, who giuing credit to Poëts fables, doe beleeue that Amber commeth of the clammy roſin falling into the riuer Poo.

The third is called of diues, *Populus tremula*, which word is borrowed of the French-men, who name it *Tremble*: it alſo receiued a name amongſt the low-Country men, from the noiſe and ratling of the leaues, *viz.* **Rateeler**: this is that which is named of *Pliny*, *Libica*: and by *Theophr.* Κυρὶς, which *Gaza* calleth *Populus montana*: in Engliſh, Aſpe, and Aſpen tree, and may alſo be called Tremble, after the French name, conſidering it is the matter whereof womens tongues were made, (as the Poets and ſome others report) which ſeldome ceaſe wagging.

¶ *The Temperature and Vertues.*

A The white Poplar hath a clenſing faculty, ſaith *Galen*, and a mixt temperature, conſiſting of a watery warme eſſence, and alſo a thin earthy ſubſtance.

B The barke as *Dioſcorides* writeth, to the weight of an ounce (or as others ſay, and that more truly, of little more than a dram) is a good remedy for the Sciatica or ache in the huckle bones, and for the ſtrangury.

C That this barke is good for the Sciatica, *Serenus Sammonicus* doth alſo write:

Sæpius occultus victa coxendice morbus
Perfurit, & greſſus diro languore moratur:
Populus alba dabit medicos de cortice potus.

An hidden diſeaſe doth oft rage and raine,
The hip ouercome and vex with the paine,
It makes with vile aking one tread ſlow and ſhrinke;
The barke of white Poplar is helpe had in drinke.

D The ſame barke is alſo reported to make a woman barren, if it be drunke with the kidney of a Mule, which thing the leaues alſo are thought to performe, being taken after the floures or reds be ended.

E The warme juice of the leaues being dropped into the eares doth take away the paine thereof.

F The Roſin or clammy ſubſtance of the blacke Poplar buds is hot and dry, and of thin parts, attenuating and mollifying: it is alſo fitly mixed *acopis & malegmatis*: the leaues haue in a manner the like operation for all theſe things, yet weaker and not ſo effectuall, as *Galen* teacheth.

G The leaues and young buds of blacke Poplar aſſwage the paine of the gout in the hands or feet, being made into an ointment with May butter.

H The ointment made of the buds is good againſt all inflammations, bruſes, ſquats, falls, and ſuch like: this ointment is very well knowne to the Apothecaries.

I *Paulus Ægineta* teacheth to make an oile alſo hereof, called *Ægyrinum*, or oile of blacke Poplar.

Chap. 120. *Of the Plane tree.*

Platanus.
The Plane tree.

¶ *The Description.*

THe Plane is a great tree, hauing very long and farre ſpreading boughes caſting a wonderfull broad ſhadow, by reaſon wherof it was highly commended and eſteemed of among the old Romans: the leaues are cornered like thoſe of *Palma Chriſti*, greater than Vine leaues, and hanging vpon little red foot-ſtalkes: the floures are ſmall and moſſie, and of a pale yellowiſh colour: the fruit is round like a ball, rugged, and ſomewhat hairy; but in Aſia more hairy and greater, almoſt as big as a Walnut: the root is great, diſperſing it ſelfe far abroad.

¶ *The Place.*

The Plane tree delighteth to grow by ſprings or riuers: *Pliny* reports that they were wont to bee cheriſhed with wine: they grew afterward (ſaith he) to bee of ſo great honour (meaning the Plane trees) as that they were cheriſhed and watered with wine: and it is found by experience that the ſame is very comfortable to the roots, and wee haue already taught, that trees deſire to drinke Wine. This tree is ſtrange in Italy, it is no where ſeene in Germany, nor in the low-Countries: in Aſia it groweth plentifully: it is found alſo in Candy, growing in vallies, and neere vnto the hill Athos, as *Petrus Bellonius* in his Singularities doth declare: it groweth in many places of Greece, and is found planted in ſome places of Italy, for pleaſure rather than for profit. My ſeruant *William Marſhall* (whom I ſent into the Mediterranean ſea as Surgeon vnto the Hercules of London) found diuers trees hereof growing in Lepanto, hard by the ſea ſide, at the entrance into the towne, a port of Morea, beeing a part of Greece, and from thence brought one of theſe rough buttons, being the fruit thereof. ‡ There are one or two yong ones at this time growing with Mr *Tradeſcant*. ‡

The Plane trees caſt their leaues in Winter, as *Bellonius* teſtifieth, and therefore it is no maruell that they keepe away the Sun in Summer, and not at all in Winter: there is, ſaith *Pliny*, no greater commendation of the tree, than that it keepeth away the Sunne in Summer, and entertaineth it in Winter.

¶ *The Names.*

This tree is called in Greeke, πλάτανος: and likewiſe in Latine *Platanus*: it beareth his name of the bredth: the French-mens *Plaſne* doth far differ from this, which is a kinde of Maple: this tree is named in Engliſh, Plane tree.

¶ *The Temperature and Vertues.*

The Plane tree is of a cold and moiſt eſſence, as *Galen* ſaith: the greene leaues are good to be laid vpon hot ſwellings and inflammations in the beginning. A

Being boiled in wine they are a remedy for the running and the watering of the eies, if they bee applied. B

The barke and balls do dry: the barke boyled in vineger helpeth the tooth-ache. C

The fruit of the Plane tree drunke with Wine helpeth the biting of mad dogs and ſerpents, and mixed with hogs greaſe it maketh a good oint nent againſt burning and ſcalding. D

The burned barke doth mightily dry, and ſcoureth withall; it remoueth the white ſcurfe, and cureth moiſt vlcers. E

The

The duſt or downe, ſaith *Galen*, that lieth on the leaues of the tree is to be taken heed of, for if it be drawne in with the breath, it is offenſiue to the winde-pipe by his extreme dryneſſe, and making the ſame rough, and hurting the voice, as it doth alſo the ſight and hearing, if it fall into the eyes or eares. *Dioſcorides* doth not attribute this to the duſt or downe of the leaues onely, but alſo to that of the balls.

Chap. 121. *Of the Wayfaring tree.*

Lantana, ſiue Viburnum.
The Wayfaring tree.

¶ *The Deſcription.*

THe Wayfaring mans tree growes vp to the height of an hedge tree, of a meane bignes: the trunke or body thereof is couered with a ruſſet barke: the branches are long, tough, and eaſie to be bowed, and hard to be broken, as are thoſe of the Willow, couered with a ſoft whitiſh barke, whereon are broad leaues thicke and rough, ſleightly indented about the edges, of a white colour, and ſomewhat hairy whileſt they be freſh and green; but when they begin to wither and fall away, they are reddiſh, and ſet together by couples one oppoſit to another. The floures are white, and grow in cluſters: after which come cluſters of fruit of the bigneſſe of a peaſe, ſomewhat flat on both ſides, at the firſt greene, after red, and blacke when they be ripe: the root diſperſeth it ſelfe far abroad vnder the vpper cruſt of the earth.

¶ *The Place.*

This tree groweth in moſt hedges in rough and ſtony places, vpon hils and low woods, ſpecially in the chalky grounds of Kent about Cobham, Southfleet, and Grauеſend, and in all the tract to Canterbury.

¶ *The Time.*

The floures appeare in Summer: the berries are ripe in the end of Autumne, and new leaues come forth in the Spring.

¶ *The Names.*

This hedge tree is called *Viurna* of *Ruellius*: in French, *Viorne*, and *Viorna*: in Italian, *Lantana*: it is reputed for the tree *Viburnum*, of which *Virgill* maketh mention in the firſt Eclog, where hee commendeth the City Rome for the loftineſſe and ſtatelineſſe thereof, aboue other Cities, ſaying, that as the tall Cypres trees do ſhew themſelues aboue the low and ſhrubby Viorne, ſo doth Rome aboue other Cities lift vp her head very high; in theſe verſes:

Verum hæc tam'um alias inter caput extulit vrbes,
Quantum lenta ſolent inter viburna cupreſſi.

But this all other cities ſo excels,
As Cypreſſe, which 'mongſt bending Viornes dwels.

‡ I judge *Viburnum* not to be a name to any particular plant, but a generall name to all low and bending ſhrubs; amongſt which this here deſcribed may take place as one. I enquired of a country man in Eſſex, if he knew any name of this: he anſwered, it was called the Cotton tree, by reaſon of the ſoftneſſe of the leaues. ‡

¶ *The Temperature.*

The leaues and berries of Lantana are cold and dry, and of a binding quality.

¶ *The*

¶ *The Vertues.*

The decoction of the leaues of Lantaua is very good to be gargled in the mouth against all swel- A
lings and inflammations thereof, against the scuruie and other diseases of the gums, and fastneth
loose teeth.

The same boyled in lee doth make the haires blacke if they be bathed or washed therewith, and B
suffered to dry of it selfe.

The berries are of the like faculty, the pouder whereof when they be dried stay the laske, all is- C
sues of bloud, and also the whites.

It is reported that the barke of the root of the tree buried a certaine time in the earth, and after- D
wards boyled and stamped according to Art, maketh good Bird-lime for Fowlers to catch Birds
with.

Chap. 122. *Of the Beade tree.*

1 *Zizypha candida.*
The Beade tree.

‡ 2 *Zizypha Cappadocica.*
The Beade tree of Cappadocia.

¶ *The Description.*

1 THis tree was called *Zizypha candida* by the Herbarists of Montpellier; and by the Venetians and Italians, *Sycomorus*, but vntruly: the Portugals haue termed it *Arbor Paradizo*: all which and each whereof haue erred together, both in respect of the fruit and of the whole tree: some haue called it *Zizypha*, though in faculty it is nothing like; for the taste of this fruit is very vnpleasant, virulent and bitter. But deciding all controuersies, this is the tree which *Auicen* calleth *Azederach*, which is very great, charged with many large armes, that are garnished with twiggie branches, set full of great leaues consisting of sundry small leaues, one growing right opposite to another like the leaues of the ash-tree or Wicken tree, but more deepely cut about the edges like the teeth of a saw: among which come the floures, consisting of fiue small blew leaues layd abroad in manner of a starre: from the middest whereof groweth forth a small hollow cup

resembling

resembling a Chalice: after which succeedeth the fruit, couered with a browniſh yellow ſhell, very like vnto the fruit of Iujubes (whereof *Dodonæus* in his laſt edition maketh it a kinde) of a rancke, bitter, and vnpleaſant taſte, with a ſix cornered ſtone within, which being drawne on a ſtring, ſerueth to make beades of, for want of other things.

2 *Zizyphus Cappadocica* groweth not ſo great as the former, but is of a meane ſtature, and full of boughes: the barke is ſmooth and euen, and that which groweth vpon the trunke and great boughes is of a ſhining ſcarlet colour: out of theſe great armes or boughes grow ſlender twigges, white and ſoft, which are ſet full of whitiſh leaues, but more white on the contrary or backe part, and are like to the leaues of Willow, but narrower, and whiter: amongſt theſe leaues come forth ſmall hollow yellowiſh floures, growing at the joynts of the branches, moſt commonly three together, and of a pleaſant ſauour, with ſome few threds or chiues in the middle thereof. After which ſucceedeth the fruit, of the bigneſſe and faſhion of the ſmalleſt Oliue, white both within and without, wherein is contained a ſmall ſtone which yeeldeth a kernell of a pleaſant taſte and very ſweet.

¶ *The Place.*

Matthiolus writeth, that *Ziziphus candida* is found in the cloiſters of many monaſteries in Italy; *Lobel* ſaith that it groweth in many places in Venice and Narbon; and it is wont now of late to be planted and cheriſhed in the goodlieſt orchards of all the low-Countries.

Zizyphus Cappadocica groweth likewiſe in many places of Italy, and ſpecially in Spaine: it is alſo cheriſhed in gardens both in Germany and in the low-Countries. ‡ It groweth alſo here in the garden of Mr *Iohn Parkinſon*. ‡

¶ *The Time.*

Theſe trees floure in Iune, in Italy and Spaine; their fruit is ripe in September; but in Germany and the low-Countries there doth no fruit follow the floures.

¶ *The Names.*

Zizyphus candida Auicen calleth *AZedcrach*, or as diuers read it, *AZederaeth*: and they name it, ſaith he, in Rechi, *Arbor Mirobalanorum*, or the Mirobalane tree, but not properly, and in Tabraſten, and Kien, and Thihich. The later writers are farre deceiued in taking it to be the Sycomore tree; and they as much, that would haue it to be the Lote or Nettle tree: it may be named in Engliſh, Beade tree, for the cauſe before alledged.

The other is *altera ſpecies Zizyphi*, or the ſecond kinde of Iuiube tree, which *Columella* in his ninth booke and fourth chapter doth call *Zizyphus alba*, or white Iuiube tree, for difference from the other that is ſyrnamed *Rutila*, or glittering redde. *Pliny* calleth this *Zizyphus Cappadocica*, in his 21 booke, ninth chapter, where he entreateth of the honour of Garlands, of which hee ſaith there be two ſorts, whereof ſome be made of floures, and others of leaues: I would call the floures (ſaith he) broomes, for of thoſe is gathered a yellow floure, and *Rhododendron*, alſo *Zizypha*, which is called *Cappadocica*. The floures of theſe are ſweet of ſmell, and like to Oliue floures. Neither doth *Colmmella* or *Pliny* vnaduiſedly take this for *Ziziphus*, for both the leaues and floures grow out of the tender and yong ſprung twigs, as they likewiſe do out of the former: the floures are very ſweet of ſmell, and caſt their ſauor far abroad: the fruit alſo is like that of the former.

¶ *The Temperature.*

Auicen writing and intreating of *AZadaraeth*, ſaith, that the floures thereof be hot in the third degree, and dry in the end of the firſt.

Zizyphus Cappadocica is cold and dry of complexion.

¶ *The Vertues.*

A The floures of *Zyzyphus*, or *AZadaraeth* open the obſtructions of the braine.

B The diſtilled water thereof killeth nits and lice, preſerueth the haire of the head from falling, eſpecially being mixed with whitewine, and the head bathed with it.

C The fruit is very hurtfull to the cheſt, and a troubleſome enemy to the ſtomacke; it is dangerous, and peraduenture deadly.

D Moreouer, it is reported, That the decoction of the barke and of Fumitory, with Mirobalans added, is good for agues proceeding of flegme.

E The juyce of the vppermoſt leaues with hony is a remedy againſt poyſon.

F The like alſo hath *Rhaſis*: the Beade tree, ſaith hee, is hot and dry: it is good for ſtoppings of the head: it maketh the haire long; yet is the fruit thereof very offenſiue to the ſtomacke, and oftentimes found to be pernitious and deadly.

G *Matthiolus* writeth, that the leaues and wood bringeth death euen vnto beaſts, and that the poyſon thereof is reſiſted by the ſame remedies that *Oleander* is.

H *Zizyphus Cappadocica* preuaileth againſt the diſeaſes aforeſaid, but the decoction therof is very good for thoſe whoſe water ſcaldeth them with the continuall iſſuing thereof, as alſo for ſuch as haue the running of the reines and the exulcerations of the bladder and priuy parts.

A looch

A looch or licking medicine made of it or the syrrup is excellent good against the spitting of G bloud proceeding of the distillations of sharp or salt humors.

† The figure that formerly was in the second place was of the narrow leafed kind of *Guaiacum Peruvianum*, which you shall finde in the second place of the next Chapter saue one.

Chap. 123. *Of the Lote or Nettle tree.*

Lotus arbor.
The Nettle tree.

¶ *The Description.*

THis Lote whereof we write is a tree as big as a Pear tree, or bigger & higher: the body and arms are very thick, the bark whereof is smooth, of a gallant greene colour tending to blewnesse, the boughs are long, and spred themselues all abroad: the leaues be like those of the Nettle, sharpe pointed and nickt in the edges like a saw; and dasht here and there with stripes of a yellowish white color: the beries be round and hang vpon long stalks like cherries, of a yellowish white colour at the first, and afterward red, but being ripe they are somwhat black.

¶ *The Place.*

This is a rare and strange tree in both the Germanies; it was brought out of Italy, where there is found store thereof, as *Matthiolus* testifieth. I haue a small tree thereof in my garden. There is also a tree thereof in the garden vnder London wall, somtime belonging to Mr *Gray* an apothecarie of London; and another great tree in a garden neere Colemanstreet in London, belonging to the Queens Apothecarie at the impression hereof, called Mr *Hugh Morgan*, a curious Conseruer of rare Simples. The Lote tree doth also grow in Africke, but it somewhat differs from the Italians Lote in fruit, as *Pliny* in plain words sheweth, *lib.* 13. *cap.* 17. That part of Africk, saith he, that lieth toward vs, brings forth the famous Lote tree which they call *Celtis*, and the same well known in Italy, but altered by the soile: it is as big as the Peare tree, although *Nepos Cornelius* reporteth it to be shorter; the leaues are full of fine cuts, otherwise they be thought to be like those of the Holme tree. There be many differences, but the same are made specially by the fruit, which is as big as a beane, of the colour of Saffron, but before it is thorow ripe it changeth his colour as doth the grape. It growes thick among the boughs after the maner of Myrtle, not as in Italy, after the maner of the Cherry: the fruit of it is there so sweet, as it hath also giuen a name to that Country and land, Too hospitable to strangers, and forgetfull of their own country.

It is reported that they are troubled with no diseases of the belly that eat it. The better is that which hath no kernell, which in the other kind is stony; there is also pressed out of it a Wine like to a sweet wine, which the same *Nepos* denieth to endure aboue ten daies, and the berries stamped with *Alica* are reserued in vessels for food. Moreouer, we haue heard say that armies haue beene fed therewith as they haue passed to and fro thorow Africk. The colour of the wood is black, they vse to make flutes and pipes of it; the root serueth for knife hafts and other short works; this is there the nature of the tree. Thus far *Pliny*. In the same place he saith that this renowned tree groweth about Syrtes and Nasamonæ. And *lib.* 5. *ca.* 7. he sheweth, that there is not far from the lesser Syrtes the Island Menynx, syrnamed Lotophagitis, of the plenty of Lote trees.

Strabo, li. 17. affirmeth, that not only Menynx but also the lesser Syrtis is thought to be *Lotophagitis*: First, saith he, lieth Syrtis, a certain long Island by the name Cercinna, and another lesser, called Cercinnitis; next to this is the lesser Syrtis, which they cal Lotophagitis Syrtis: the compasse of this gulfe is almost 1600 furlongs, the bredth of the mouth 600. By both the capes there be Islands ioined to the main land, that is, Circinna and Menynx, of like bigneſſe: they think that Menynx is the country of the Lotophagi, or those that feed of the Lote trees. Of which country *Homer* maketh mention, and there are certain monuments to be seen, and *Vlysses* altar, and the fruit it selfe, for there be in it great plenty of Lote trees, whose fruit is wonderfull sweet. So saith *Strabo*.

This Lote is also described by *Theophrastus, li.* 4. where he saith there are very many kinds which be seuered by the fruit: the fruit is of the bignes of a bean, which when it waxeth ripe altereth his colour as Grapes do. The fruit of which the Lotophagi eat is sweet, pleasant, harmlesse, and wholsome for the belly, but that is pleasanter which is without kernels, whereof they make their wine.

This Lote tree, as the same author affirmeth, is by nature euerlasting, witnesse those whereof *Pliny* writ, *lib.* 16. *cap.* 44. At Rome (saith he) the Lote tree in *Lucina's* court, how much elder it was than the church of the city (built in the yeare which was without magistrats, 469) is vncertaine. But doubtlesse it was elder, because *Lucina* bare the name of that *Lucus* or groue. This is now about 450 yeares old. That is elder which is syrnamed *Capillata* or hairy, because the haire of the Vestal Virgins was brought vnto it: but the other Lote tree in *Vulcans* church, which *Romulus* built by the victorie of tenths, is taken to be as old as the city, as *Massurius* witnesseth.

¶ *The Time.*

They lose their leaues at the first approch of winter, and recouer them again in Aprill: the fruit is ripe in September.

¶ *The Names.*

The tree is called in Greek, Λωτὸς: in Latine by *Pliny*, *Celtis*: in Italian, *Perlaro*: by those of Trent, *Bagolaro*: in English, Lote tree, and Nettle tree.

¶ *The Temperature and Vertues.*

A The Lote tree is not greatly binding, as *Galen* saith, but of thin parts, and of a drying nature.

B The decoction of the wood beaten small, being either drunke or vsed clister-wise, helpeth the bloudy flix, the whites and reds.

C It stops the lask, and maketh the haire yellow, and as *Galen* saith keepeth haires from falling.

D The shiuers or small pieces thereof, as the same Author saith, are boiled somtimes in water, somtimes in wine, as need shall require.

Chap. 124.

Of Italian Wood of Life, or Pock-wood, vulgarly called Lignum vitæ.

¶ *The Description.*

1 ITalian *Lignum vitæ* or Wood of life grows to a faire and beautifull tree, hauing a straight and vpright body couered ouer with a smooth and dark green barke, yeelding forth many twiggy branches set forth of goodly leaues like those of the Pear tree, but of greater beauty, and somwhat broader; amongst which comes forth the fruit, growing close to the branches, almost without stalks; this fruit is round, at the first green, but black when it is ripe, as big as Cherries, of an excellent sweet taste when it is dried. But this is not the Indian *Lignum sanctum* or *Guaiacum* whereof our bowles and physical drinks be made, but it is a bastard kinde thereof, first planted in the common garden at Padua by the learned *Fallopius*, who supposed it to be the right *Guaiacum*.

‡ 2 The leaues of this are longer and narower than the former, but firm also and neruous like as they are; the fruit is in shape like Sebestens, but much lesse, of a blewish colour when it is ripe, with many little stones within; the taste hereof is not vnpleasant. *Matthiolus* cals this *Pseudolotus*; and *Tabern. Lotus Africana*; whose figure our Author in the last chapter saue one gaue vnfitly for the *Zizyphus Cappadocica*. ‡

¶ *The Place.*

Guaiacum Patavinum groweth plentifully about Lugdunum or Lyons in France. I planted it in the

the garden of Barn-Elmes neere London two trees: besides, there groweth another in the garden of Mr *Gray* an Apothecary of London, and in my garden likewise.

1. *Guaiacum Patavinum latifolium.*
Broad leafed Italian Wood of life.

2 *Guaiacum Patavinum angustifol.*
Narrow leafed Italian Guaiacum.

¶ *The Time.*

It floureth in May, and the fruit is ripe in September.

¶ *The Names.*

Guaiacum Patavinum hath bin reputed for the *Lotus* of *Theophrastus*: in English it is called the bastard Meuynwood.

‡ This hath no affinity with the true Indian Guajacum which is frequently vsed in medicine.

¶ *The Nature and Vertues.*

The fruit of this is thought to be of the same temper and quality with that of the Nettle tree.‡

Chap. 125. *Of the Strawberry tree.*

¶ *The Description.*

The Strawberry tree groweth for the most part low, very like in bigneſſe vnto the Quince tree (whereunto *Dioscorides* compareth it.) The body is couered with a reddish barke both rough and scaly: the boughes stand thicke on the top, somwhat reddish. The leaues be broad, long and smooth like those of Bayes, somwhat nicked in the edges, and of a pale green colour: the flours grow in clusters, being hollow and white, and now and then on the one side somwhat of a purple colour: in their places come forth certain berries hanging down vpon little long stems like to Strawberries, but greater, without, a stone within, but onely with little seeds, at the first greene, and being ripe they are of a gallant red colour, in taste somwhat harsh, and in a manner without any relish; of which Thrushes and Black-birds do feed in winter.

Arbutus.
The Strawberry tree.

¶ *The Place.*

The Strawberry tree groweth in moſt countries of Greece, in Candy, Italy, and Spaine, alſo in the vallies of the mountaine Athos, where being in other places but little, they become huge trees, as *P. Bellonius* writeth. *Iuba* alſo reporteth, that there be in Arabia of them 50 cubits high. They grew only in ſome few gardens with vs.

¶ *The Time.*

The Strawberry tree floureth in Iuly & Auguſt, and the fruit is ripe in September, after it hath remained vpon the tree by the ſpace of an whole yeare.

¶ *The Names.*

This tree is called in Greek, Κόμαρος: in Latine, *Arbutus*: in Engliſh, Strawberry tree, & Arbute tree.

The Fruit is named in Greeke, Μιμαίκυλα, or as others reade it, Μιμαικύλον: in Latine, *Memecylum*, and *Arbutus*. *Pliny* calls it *Vnedo*; ground Strawberries (ſaith he) haue one body, and *Vnedo*, much like vnto them, another body, which only in apple is like to the fruit of the earth. The Italians call this Strawbery *Albatro*: the Spaniards, *Madrono*, *Medronheyro*, and *Medronho*: in French, *Arboutes*, *Arbous*. In Engliſh, Tree Strawberry.

¶ *The Temperature and Vertues.*

The fruit of the Strawberry tree is of a cold temper, hurting the ſtomack and cauſing headache, wherefore no wholſome food, though it be eaten in ſome places by the poorer ſort of people.

Chap. 126. *Of the Plum Tree.*

¶ *The Kindes.*

TO write of Plums particularly would require a peculiar Volume, and yet the end not be attained vnto, nor the ſtock or kindred perfectly known, neither to be diſtinguiſhed apart: the numbers of the ſorts or kinds are not known to any one Country, euery clymat hath his own fruit, farre differing from that of other places: my ſelfe haue ſixty ſorts in my garden, and all ſtrange and rare: there be in other places many more common, and yet yearly commeth to our hands others not before known; therefore a few figures ſhall ſerue for the reſt. ‡ Let ſuch as require a larger hiſtory of theſe varieties haue recourſe to the oft mentioned Work of Mr *Parkinſon*: and ſuch as deſire the things themſelues may find moſt of the beſt with Mr *Iohn Millen* in Old ſtreet. ‡

¶ *The Deſcription.*

1 THe Plum or Damſon tree is of a mean bigneſſe, it is couered with a ſmooth barke: the branches are long, whereon do grow broad leaues more long than round, nicked in the edges: the floures are white; the plums do differ in colour, faſhion, and bigneſſe, they all conſiſt of pulp and skin, and alſo of kernell, which is ſhut vp in a ſhell or ſtone. Some plums are of a blackiſh blew, of which ſome be longer, others rounder, others of the colour of yellow wax, diuers of a crimſon red, greater for the moſt part than the reſt. There be alſo green plums, and withall very long, of a ſweet and pleaſant taſte: moreouer, the pulp or meat of ſome is drier, and eaſilier ſeparated from the ſtone; of other-ſome it is moiſter, and cleaueth faſter. Our common Damſon is known to all, and therefore not to be ſtood vpon.

2 The

1 *Prunus domestica.*
The Damson tree.

2 *Prunus Mirobalana.*
The Mirobalan Plum tree.

3 *Prunus Amygdalina.*
The Almond Plum tree.

5 *Prunus sylvestris.*
The Sloe tree.

2 The Mirobalan Plum tree groweth to the height of a great tree, charged with many great armes or boughes, which diuide themſelues into ſmall twiggy branches, by means whereof it yeelded a goodly and pleaſant ſhadow: the trunke or body is couered with a finer and thinner barke than any of the other Plum trees: the leaues do ſomewhat reſemble thoſe of the Cherrie tree, they are very tender, indented about the edges: the flours be white: the fruit is round, hanging vpon long foot-ſtalks pleaſant to behold, greene in the beginning, red when it is almoſt ripe, and beeing full ripe it gliſtereth like purple mixed with blacke: the fleſh or meat is full of juice, pleaſant in taſt: the ſtone is ſmall, or of a meane bigneſſe: the tree bringeth forth plenty of fruit euery other yeare.

3 The Almond tree groweth vp to the height of a tree of a meane bigneſſe: the branches are long, ſmooth, and euen: the leaues are broad, ſomthing long, and ribbed in diuers places, with ſmal nerues running through the ſame: the flours are white, ſprinkled with a little daſh of purple ſcarcely to be perceiued: the fruit is long, hauing a cleft downe the middle, of a brown red colour, and of a pleaſant taſte.

4 The Damaſcen Plum tree groweth likewiſe to a meane height, the branches very brittle; the leaues of a deep green colour: the fruit is round, of a blewiſh blacke colour: the ſtone is like vnto that of the Cherry, wherein it differeth from all other Plums.

5 The Bulleſſe and the Sloe tree are wilde kindes of Plums, which do vary in their kind, euen as the greater and manured Plums do. Of the Bulleſſe, ſome are greater and of better taſte than others. Sloes are ſome of one taſte, and ſome of others, more ſharp; ſome greater, and others leſſer; the which to diſtinguiſh with long deſcriptions were to ſmall purpoſe, conſidering they be all and euery of them knowne euen vnto the ſimpleſt: therefore this ſhall ſuffice for their ſeuerall deſcriptions.

¶ *The Place.*

The Plum trees grow in all knowne countries of the world: they require a looſe ground, they alſo receiue a difference from the regions where they grow, not only of the forme or faſhion, but eſpecially of the faculties, as we will forthwith declare.

The Plum trees are alſo many times graffed into trees of other kindes, and being ſo ingraffed, they *faciem parentis, ſuccum adoptionis, vt Plinius dicit, exhibent.*

The greateſt variety of theſe rare Plums are to be found in the grounds of Mr *Vincent Pointer* of Twicknam before remembred in the chapter of Apples: although my ſelfe am not without ſome, and thoſe rare and delicate.

The wilde Plums grow in moſt hedges through England.

¶ *The Time.*

The common and garden Plum trees do bloome in April: the leaues come forth preſently with them: the fruit is ripe in Summer, ſome ſooner, ſome later.

¶ *The Names.*

The Plum tree is called in Greek, Κοκκυμηλέα: in Latine, *Prunus*: in high-Dutch, **Pflaumenbaum**: in low-Dutch, **Pruymen**: in Spaniſh, *Ciruelo*: in French, *Prunier*: in Engliſh, Plum tree.

The fruit is called in Greeke, Κοκκυμῆλον: in Latine, *Prunum*: in high-Dutch, **Pflaumen**: in low-Dutch, **Pruymen**: in Italian and French, *Prune*: in Spaniſh, *Prunas*: in Engliſh, Prune, and Plum. Theſe haue alſo names from the regions and countries where they grow.

The old Writers haue called thoſe that grow in Syria neere vnto Damaſcus, *Damaſcena Pruna*: in Engliſh, Damſons, or Damask Prunes: and thoſe that grow in Spain, *Hiſpanica*, Spaniſh Prunes or Plums. So in our age we vſe to call thoſe that grow in Hungarie, *Hungarica*, or *Pannonica*, Plums of Hungarie: ſome, *Gallica Pruna*, or French Prunes, of the country of France. *Clearcus Peripateticus* ſaith, that they of Rhodes and Sicilia do call the Damaske Prunes *Brabula*.

¶ *The Temperature and Vertues.*

A Plummes that be ripe and new gathered from the tree, what ſort ſoeuer they are of, do moiſten and coole, and yeeld vnto the body very little nouriſhment, and the ſame nothing good at all: for as Plummes do very quickly rot, ſo is alſo the juice of them apt to putrifie in the body, and likewiſe to cauſe the meat to putrifie which is taken with them: onely they are good for thoſe that would keep their bodies ſoluble and coole; for by their moiſture and ſlipperineſſe they do mollifie the belly.

B Dried Plums, commonly called Prunes, are wholſomer, and more pleaſant to the ſtomack, they yeeld more nouriſhment and better, and ſuch as cannot eaſily putrifie. It is reported, ſaith *Galen* in his booke of the faculties of Nouriſhments, that the beſt doe grow in Damaſcus a city of Syria; and next to thoſe, they that grow in Spaine: but theſe do nothing at all binde, yet diuers of the Damaske Damſon Prunes very much; for Damaske Damſon Prunes are more aſtringent, but they of Spaine be ſweeter. *Dioſcorides* ſaith, that Damaske Prunes dried do ſtay the belly; but *Galen* affirmeth in his books of the faculties of ſimple medicines, that they do manifeſtly looſe the belly, yet

yet lesser than they that be brought out of Spain, beeing boiled with Mede or honied water which hath a good quantity of hony in it, they loose the belly very much (as the same Author saith) although taken by themselues, much more if the Mede be supped after them. We commend those of Hungary, which be long and sweet, yet more those of Moravia, the chiefe and principall city in times past of the prouince of the Marcomans; for these after they be dried, that the watery humor may be consumed away, be most pleasant to the taste, and do easily without any trouble so mollifie the belly, as that in that respect they go beyond Cassia and Manna, as *Tho. Iordanus* affirmeth.

The leaues of the Plum tree are good against the swelling of the Vvula, the throat, gums, and kernels vnder the throat nnd jawes; they stop the rheum and falling down of humours, if the decoction thereof be made in wine, and gargled in the mouth and throat. C

The gum which comes out of the Plum tree doth glue and fasten together, as *Dioscorides* saith. D

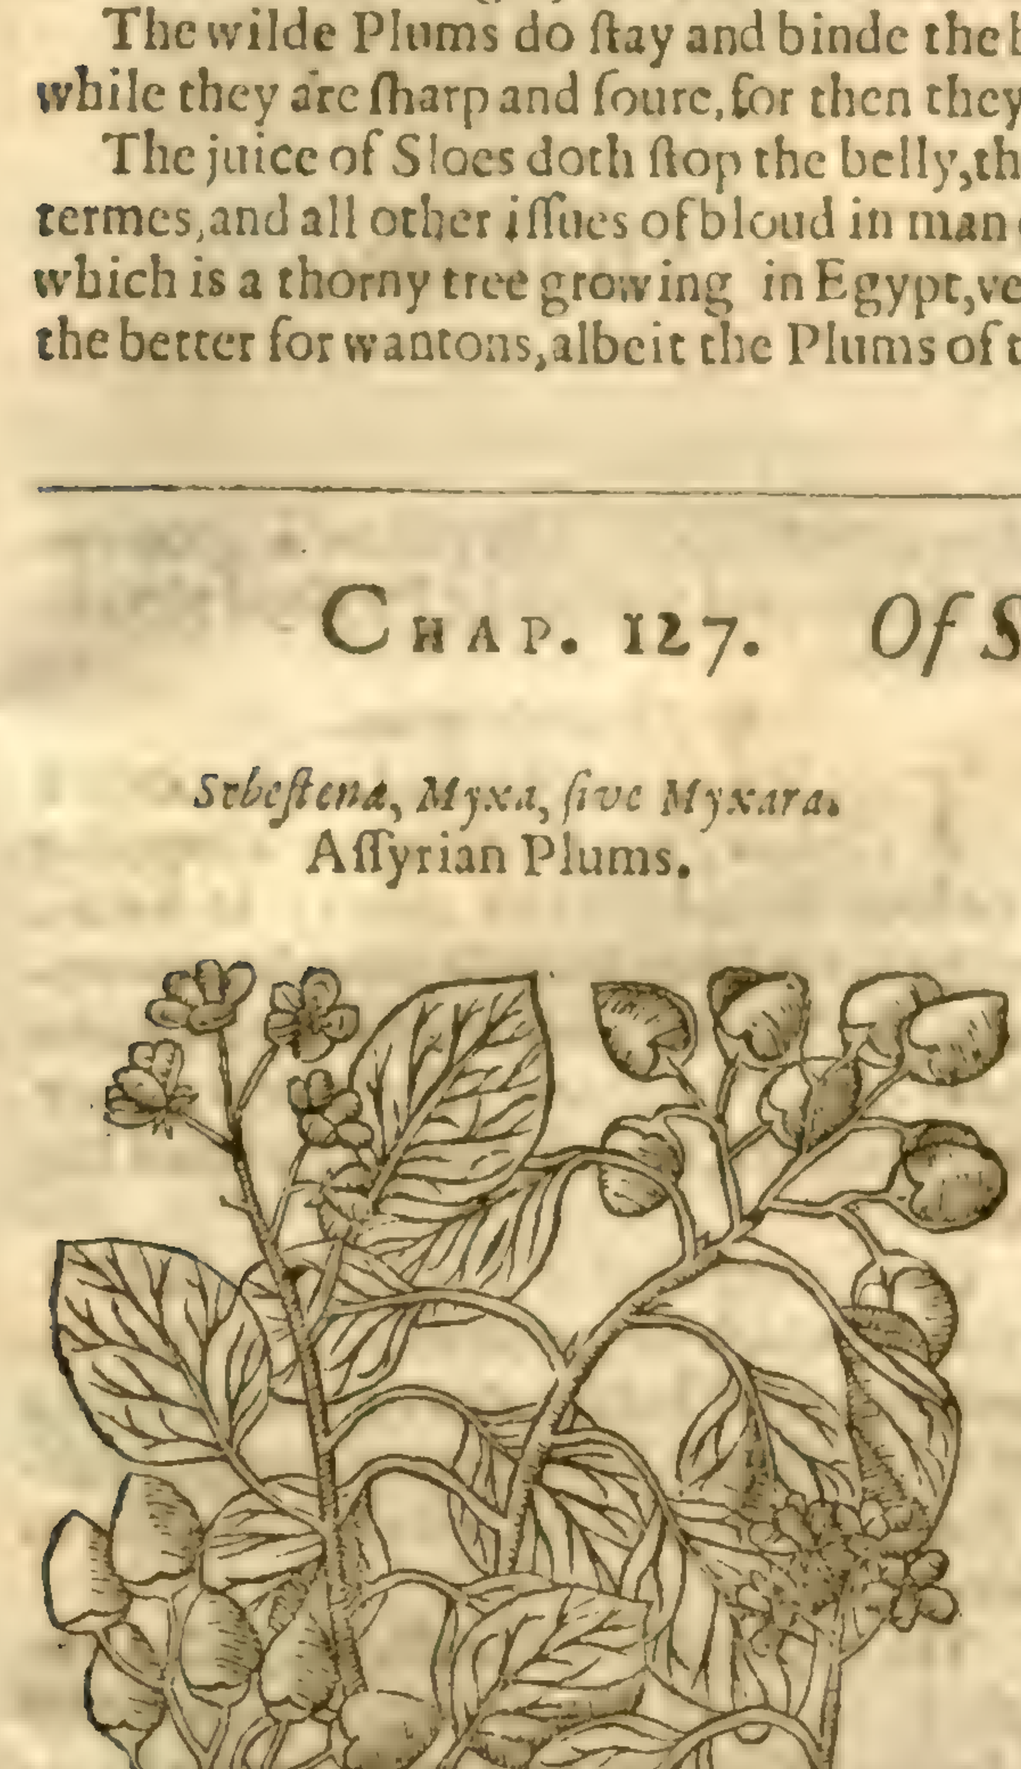
Being drunk in wine it wasteth away the stone and heales Lichens in infants and yong children: E if laid on with vineger, it works the same effects that the gum of the Peach & Cherry tree doth.

The wilde Plums do stay and binde the belly, and so doe the vnripe plums of what sort soeuer, F while they are sharp and soure, for then they are astringent.

The juice of Sloes doth stop the belly, the lask and bloudy flix, the inordinat course of womens G termes, and all other issues of bloud in man or woman, and may very wel be vsed in stead of Acatia, which is a thorny tree growing in Egypt, very hard to be gotten, and of a deare price, and therefore the better for wantons, albeit the Plums of this country are equall vnto it in vertues.

Chap. 127. *Of Sebesten or the Assyrian Plum.*

Sebestena, Myxa, sive Myxara.
Assyrian Plums.



¶ *The Description.*

SEbestens are also a kinde of Plums, the tree whereof is not vnlike to the Plum tree, saving it groweth lower than most of the manured Plumme trees: the leaues be harder and rounder: the floures grow at the tops of the branches, consisting of fiue small white leaues, with pale yellow threds in the middle like to those of the Plumme tree. After followeth the fruit like little Plums, fastned in little skinny cups, which when they be ripe are of a greenish black colour, wherein is contained a smal hard stone. The fruit is sweet in taste, the pulp or meat is very tough and clammy.

¶ *The Place.*

The Sebesten trees grow plentifully in Syria and Egypt; they were in times past forrein and strange in Italy, now they grow almost in euery garden, beeing first brought thither in *Plinies* time: Now do the Sebesten trees, saith hee, *lib.* 15. *cap.* 18. begin to grow in Rome among the Service trees.

¶ *The Time.*

The time doth answer the other common Plums.

¶ *The Names.*

Pliny calleth the tree *Myxa*: it may be suspected that this is the tree which *Matron Paradus* in his Attick banquet in *Athenæus*, calls ἐμπωξις: but we canot certainly affirm it, and especially because diuers haue diuersly deemed thereof. The berry or fruit is named *Myxon*, and *Myxarion*, neither haue the Latines any other name. The Arabians and the Apothecaries doe call it Sebesten, which is

is also made an English name. We may call it the Assyrian Plum.

¶ *The Temperature and Vertues.*

A Sebestens be very temperatly cold and moist, and haue a thick and clammy substance, therefore they nourish more than most fruits do; but withall they easily stop the intrals, and stuf vp the marrow passages, and breed inflammations.

B They take away the ruggednesse of the throat and lungs, and also quench thirst, being taken in a looch or licking medicine, or taken any other way, or by themselues.

C Ten drams or an ounce and halfe of the pap or pulp hereof being inwardly taken doth loose the belly.

D There is also made of this fruit a purging Electuarie, but such an one as quickly mouldeth, and therefore not to be vsed but when it is new made.

Chap. 128. *Of the Indian Plums or Mirobalans,*

¶ *The Kindes.*

THere be diuers kinds of Mirobalans, as *Chebulæ, Bellericæ, Emblicæ, &c.* They likewise grow vpon diuers trees, and in countries far distant one from another; and *Garcias* the Portugal physitian is of opinion that the fiue kindes grow vpon fiue diuers trees.

¶ *The Description.*

1 THe first of the Mirobalan trees, called *Chebulæ*, is a shrubby tree altogether wild (which the Indians call *Aretca)* in stature not vnlike to the Plum tree: the branches are many, and grow thick together, wheron are set leaues like those of the Peach tree. The fruit is greater than any of the rest, somwhat long, fashioned like a Peare.

Myr. flaua.

Myr. indica.

Myr. bellerica.

Myr. chebula.

Myr. emblica.

2 This second kind of Mirobalan, called *Flaua*, or *Citrina*, which some do call *Aritiqui*, but the common people of India, *Arare*, groweth vpon a tree of meane stature, hauing many boughes standing finely in order, and set full of leaues like to the Service tree.

3 The third kinde of Mirobalans, called *Emblicæ*, the Indians call *Amiale*; which grow vpon a tree of mean stature like the former, but the leaues are very much jagged, in shape like the leaues of Fern, but that they be somwhat thicker; the Indians put not the fruit hereof to physicall vses, but occupie it for the thickning and tanning of their leather in stead of *Rhus* or Coriars Sumach, as also to make inke and bletch for other purposes.

4 *Mirobalani Bellericæ*, called of the Sauages, *Gotni* and *Guti*, groweth vp to a mean stature, garnished with leaues like Laurel or the bay tree, but somwhat lesser, thinner, and of a pale green color.

5 The fift kinde of Mirobalans is called *Indicæ*, which the Indians call *Rez annale*: it groweth vpon a tree of mean stature, or rather vpon a shrub or hedge plant, bearing leaues like the Willow, and a fruit eight square. There is a fift kinde, the tree whereof is not mentioned by Authors.

¶ *The Place and Time.*

The last foure kinds of Mirobalans grow in the kingdome of Cambaia: they grow likewise in Goa, Batecala, Malanor, and Dabul: the *Kebula* in Bisnager, Decan, Guzarat, Bengala, and in many other places of the East Indies. The time agrees with other fruits in those countries.

¶ *The Names.*

Those which we haue said to be yellow, the Inhabitants of those countries where they grow, do ca

call them *Arare*: those that be black they call *ReZemule*: the *Bellericæ*, *Gotim*; the *Chebulæ*, *Areum*; the *Emblicæ* are called *Aretiqui*.

¶ *The Temperature and Vertues.*

All the kinds of Mirobalans are in taste astringent and sharpe, like to the vnripe Sorbus or Service berries, and therefore they are of complexion cold and dry.

The Indians vse them rather to bind than purge; but if they vse them for a purge, it is onely the decoction much conserued in sugar, and especially the *Chebulæ*: the yellow and black be good that way likewise. A

The yellow and *Bellericæ* taken before meat stop the laske, and help the weak stomack, as *Garcias* writeth. B

The yellow and blacke, or *Indicæ* and the *Chebulæ*, purge lightly, if two or three drams be taken, and draw superfluous humors from the head. C

The yellow, as some write, purge choler, *Chebulæ* flegme, *Indicæ* melancholy, and strengthen the inward parts; but rosted in the embers, or otherwise wasted, they dry more than they purge. D

There are two sorts especially brought into these parts of the world conserued, the *Chebulæ*, and of them the best are somwhat long like a small Limon, with a hard rind and black pith of the taste of a conserued Walnut; and the *Bellericæ*, which are round and lesser, and tenderer in eating. E

Lobel writeth, that of them the *Emblicæ* do meanely coole, some do dry in the first degree, they purge the stomack of rotten flegme, they comfort the brain, the sinues, the heart, and liuer, procure appetite, stay vomit, and coole the heate of choler, helpe the vnderstanding, quench thirst and heate of the intrals. The greatest and heauiest are the best. F

They purge best and with lesse pain, if they be laid in water in the sun vntill they swell, and sod on a soft fire, & after they haue sod and be cold, preserued in foure times so much white honey, put to them. G

Garcias found the distilled water very helpful against the French disease & such like infections. H

The *Bellericæ* are also of a mild operation, and do comfort: they are cold in the first degree, and dry in the second: the others come neere to the *Emblicæ* in operation. I

† I haue in this Chapter contented my selfe with the expressing of the fruits out of *Clusius* and *Lobel*, and omitted the figures of the three Mirobalan trees, which our Author gaue vs out of *Tabern.* because I iudge them rather drawne by fancy than by the things themselues.

CHAP. 129. *Of the Iujube treé.*

Iujube Arabum, siue Ziziphus Dodonæi.
The Iujube tree.

¶ *The Description.*

THe Iujube tree is not much lesse than *Ziziphus Candida*, hauing a wreathed trunk or body, and a rough barke full of rifts or crannies, and stiffe branches beset with strong and hard prickles, from whence grow out many long twigs or little stalks half a foot or more in length, in shew like Rushes, limmer, and easily bowing themselues, and very slender like the twigs of *Spartum*: about which come forth leaues one aboue another, which are somewhat long, not very great, but hard and tough like to the leaues of *Peruincæ* or Peruincle, & among these leaues come forth pale & mossie little flours: after which succeed long red wel tasted sweet berries as big as Olives (of a mean quantitie) or little Prunes, or small plums, wherein there are hard stones, or in which a small kernell is contained.

¶ *The Place.*

There be now at this day Iujube trees growing in very many places of Italy, which in times past were newly brought thither out of Syria, and that about *Plinies* time, as hee himselfe hath written, *lib.* 17. *cap.* 10.

¶ *The Time.*

It floureth in Aprill, at which time the seeds or stones are to be set or sown for increase.

¶ *The*

¶ *The Names.*

This tree is called in Greeke ζίζυφος and ζιζύφη, with *Iota* in the ſecond ſyllable: in Latine likewiſe *Zizyphus*; and of *Petrus Creſcentius*, *Zezulus*: in Engliſh, Iuiube tree.

The fruit or plums are named in Greeke, ζίζυφα, ζιζύφια: *Galen* calleth them σπίνα, as *Avicen* plainely ſheweth, *cap.* 369. intreating of the Iujube, in which he ſet down thoſe things that are mentioned concerning *Serica* in *Galens* books of the faculties of nouriſhments: in Latine likewiſe *Zizyphæ* and *Sericæ*: in ſhops, *Iujubæ*: in Engliſh, Iujubes.

¶ *The Temperature.*

Iujubes are temperat in heate and moiſture.

¶ *The Vertues.*

A The fruit of the Iujube tree eaten is of hard digeſtion and nouriſheth very little; but being taken in ſyrrups, electuaries, and ſuch like con fections, it appeaſeth and mollifieth the roughneſſe of the throat, the breſt and lungs, and is good againſt the cough, but very good for the reins of the back, the kidnies and bladder.

CHAP. 130. *Of the Cherry tree.*

¶ *The Kindes.*

THe antient Herbariſts haue ſet down four kinds of Cherry trees; the firſt is great and wild, the ſecond tame or of the garden, the third hath four fruit, the fourth is that which is called in Latine *Chamæcraſus*, or the dwarfe Cherry tree. The later writers haue found diuers ſorts more, ſome bringing forth great fruit, others leſſer; ſome with white fruit, ſome with blacke, others of the colour of black bloud, varying infinitely according to the clymat and country where they grow.

1 *Ceraſus vulgaris.*
The common Engliſh Cherry tree.

3 *Ceraſus Hiſpanica.*
The Spaniſh Cherry tree.

¶ *The Description.*

1 THe English Cherry tree groweth to an high and great tree, the body whereof is of a mean bigneſſe, which is parted aboue into very many boughes, with a barke somewhat ſmooth, of a brown crimſon colour, tough and pliable; the ſubſtance or timber is alſo brown in the middle, and the outer part is somwhat white: the leaues be great, broad, long, ſet with veins or nerves, and ſleightly nicked about the edges: the ſloures are white, of a mean bignes, conſiſting of fiue leaues, and hauing certain threds in the middle of the like colour. The Cherries be round, hanging vpon long ſtems or footſtalks, with a ſtone in the middeſt which is couered with a pulp or ſoft meat; the kernell thereof is not vnpleaſant to the taſte, though somwhat bitter.

2 The Flanders Cherry tree differeth not from our Engliſh Cherry tree in ſtature or form of leaues or ſloures, the only difference is, that this tree brings forth his fruit ſooner and greater than the other, wherefore it may be called in Latine, *Ceraſus præcox, ſive Belgica.*

5 *Ceraſus Serotina.*
Late ripe Cherry tree.

6 *Ceraſus vnopediculo plura.*
The Cluſter Cherry tree.

3 The Spaniſh Cherry tree groweth vp to the height of our common Cherry tree, the wood or timber is ſoft and looſe, couered with a whitiſh ſcaly barke, the branches are knotty, greater and fuller of ſubſtance than any other Cherry tree; the leaues are likewiſe greater and longer than any of the reſt, in ſhape like thoſe of the Cheſtnut tree: the ſloures are like the others in form, but whiter of colour; the fruit is greater and longer than any, white for the moſt part all ouer, except thoſe that ſtand in the hotteſt place where the ſun hath ſome reflexion againſt a wall: they are alſo white within, and of a pleaſant taſte.

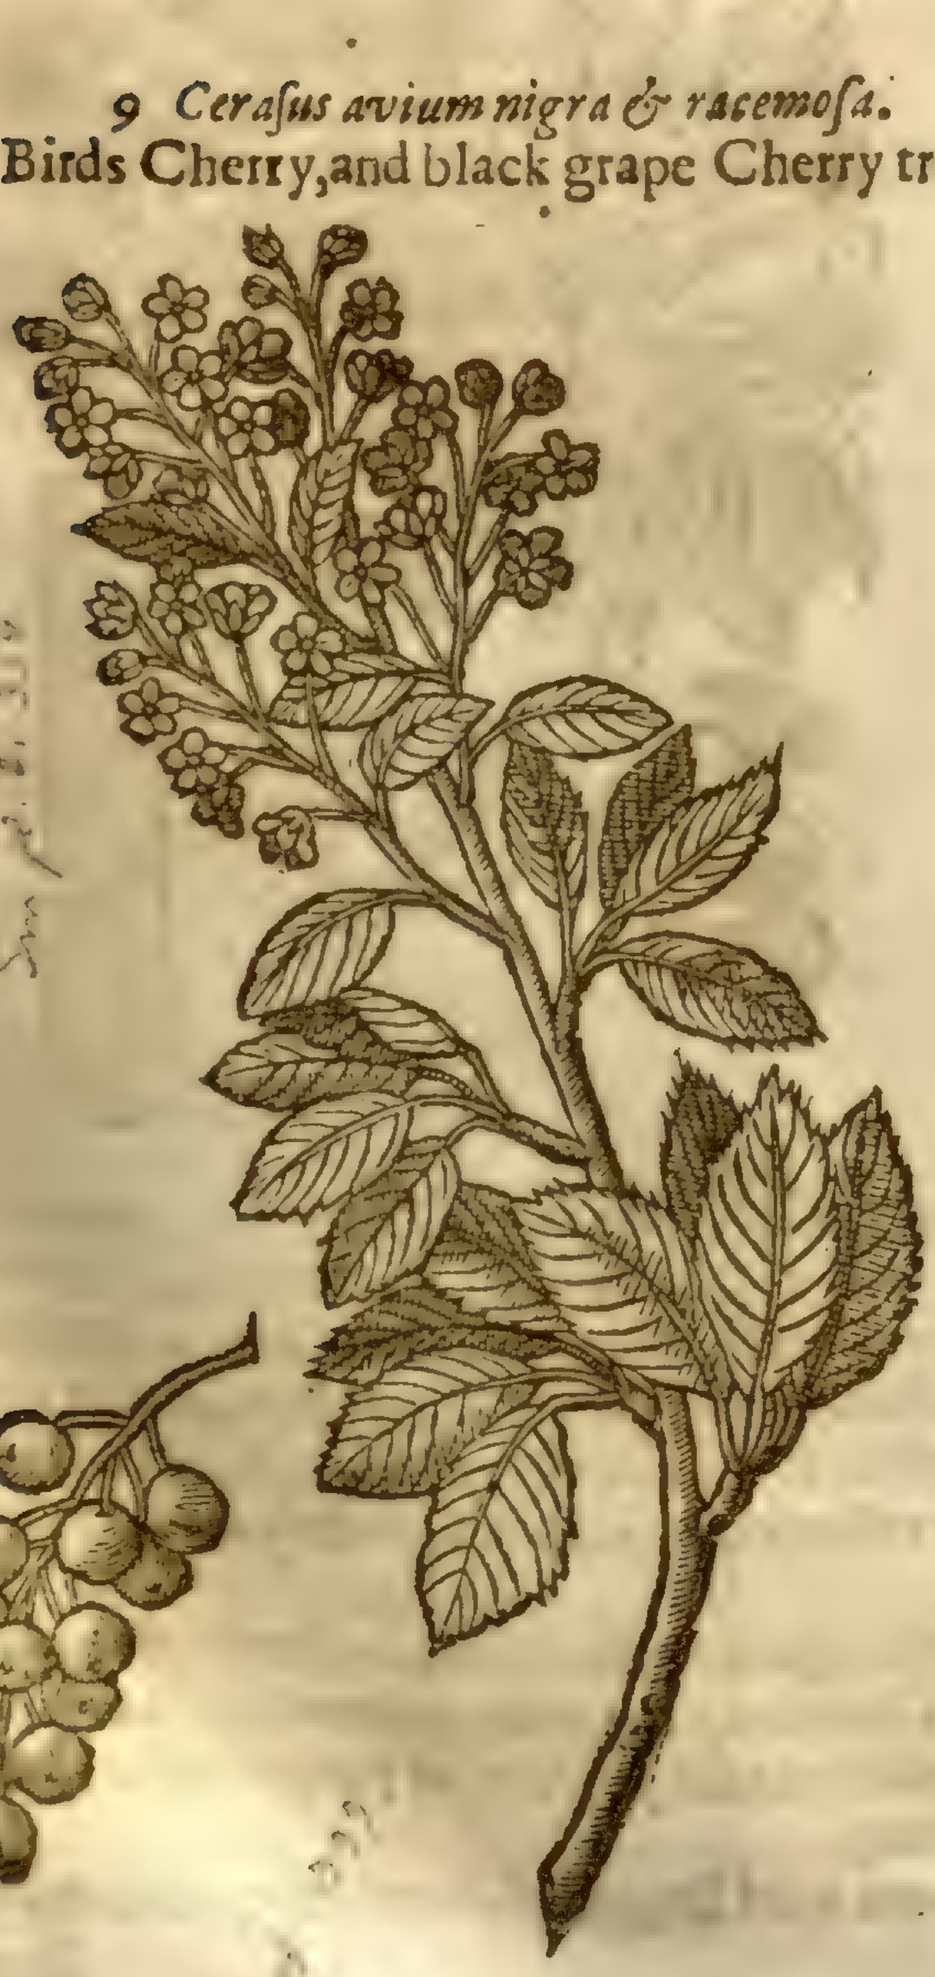
4 The Gaſcoin Cherry tree groweth very like to the Spaniſh cherry tree in ſtature, flours and leaues: it differeth in that it bringeth forth very great Cherries, long, ſharp pointed, with a certain hollowneſſe vpon one ſide, and ſpotted here and there with certain prickles of purple color as ſmal as ſand. The taſte is moſt pleaſant, and excelleth in beauty.

5 The late ripe Cherry tree groweth vp like vnto our wild Engliſh Cherry tree, with the like leaues;

7 *Ceraſus multiflora fructus edens.*
The double floured Cherry tree bearing fruit.

8 *Ceraſus multiflora pauciores fructus edens.*
The double floured barren Cherry tree.

9 *Ceraſus avium nigra & racemoſa.*
Birds Cherry, and black grape Cherry tree.



2 *Ceraſus racemoſa rubra.*
Red Grape Cherry tree.

leaues, branches, and floures, sauing that they are somtimes once doubled: the fruit is small, round, and of a darke bloudy colour when they be ripe, which the French-men gather with their stalkes, and hang them vp in their houses in bunches or handfulls against Winter, which the Physitions do giue vnto their patients in hot and burning feuers, being first steeped in a little warme water, that causeth them to swell and plumpe as full and fresh as when they did grow vpon the tree.

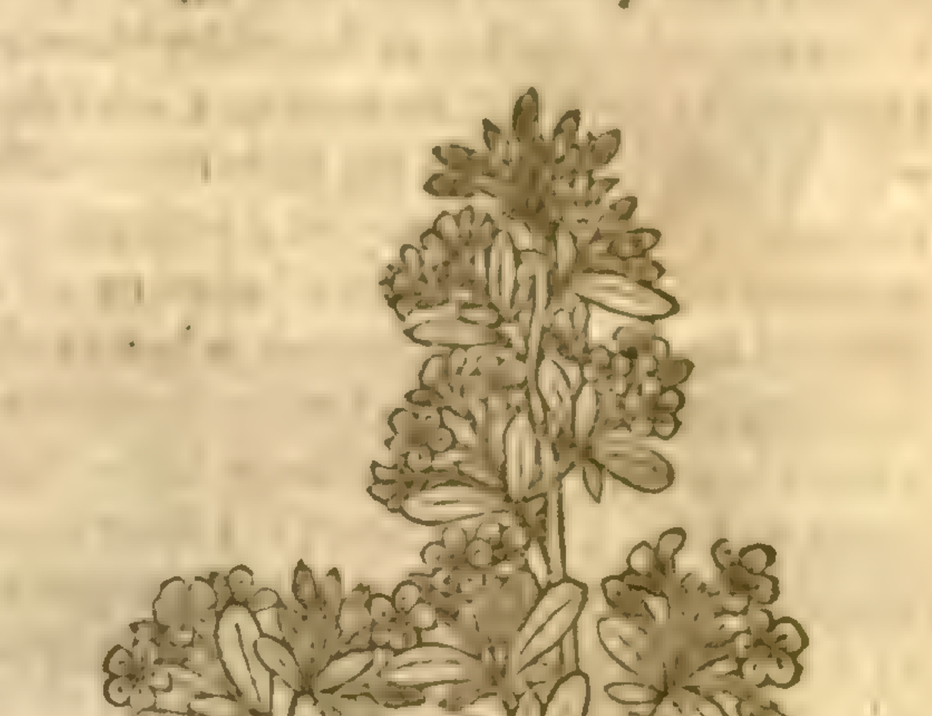
6 The Cluster Cherry tree differeth not from the last described either in leaues, branches, or stature: the floures are also like, but neuer commeth any one of them to be double. The fruit is round, red when they be ripe, and many growing vpon one stem or foot-stalke in clusters, like as the Grapes do. The taste is not vnpleasant although somewhat soure.

7 This Cherrie-tree with double floures growes vp vnto a small tree, not vnlike to the common Cherrie-tree in each respect, sauing that the floures are somewhat double, that is to say, three or foure times double; after which commeth fruit (though in small quantitie) like the other common Cherry.

8 The double floured Cherry-tree growes vp like vnto an hedge bush, but not so great nor high as any of the others; the leaues and branches differ not from the rest of the Cherry-trees. The floures hereof are exceeding double, as are the flours of Marigolds, but of a white colour, and smelling somewhat like the Hawthorne floures; after which come seldome or neuer any fruit, although some Authors haue said that it beareth sometimes fruit, which my selfe haue not at any time seen: notwithstanding the tree hath growne in my Garden many yeeres, and that in an excellent good place by a bricke wall, where it hath the reflection of the South Sunne, fit for a tree that is not willing to beare fruit in our cold climat.

11 *Cerasus nigra.*
The common blacke Cherry-tree.

12 *Chamæcerasus.*
The dwarfe Cherry-tree.



9 The Birds Cherry-tree, or the blacke Cherry-tree, that bringeth forth very much fruit vpon one branch (which better may be vnderstood by sight of the figure, than by words) springeth vp like an Hedge tree of small stature, it groweth in the wilde woods of Kent, and are there vsed for stockes to graft other Cherries vpon, of better taste, and more profit, as especially those called the Flanders Cherries: this wilde tree growes very plentifully in the North of England, especially at a place called Heggdale, neere vnto Rosgill in Westmerland, and in diuers other places about Crosbie Rauenswaith, and there called Hegberrie-tree: it groweth likewise in Martome Parke, foure miles

miles from Blackeburne, and in Harward neere thereunto; in Lancashire almost in euery hedge: the leaues and branches differ not from those of the wilde Cherry-tree: the floures grow alongst the small branches, consisting of fiue small white leaues, with some greenish and yellow thrums in the middle: after which come the fruit, greene at the first, blacke when they be ripe, and of the bigge nesse of Sloes; of an harsh an vnpleasant taste.

10 The other birds Cherry-tree differeth not from the former in any respect, but in the colour of the berries; for as they are blacke; so on the contrary, these are red when they be ripe, wherein they differ.

11 The common blacke Cherry-tree growes vp in some places to a great stature: there is no difference betweene it and our common Cherry tree, sauing that the fruit hereof is very little in respect of other Cherries, and of a blacke colour.

12 The dwarfe Cherry-tree groweth very seldome to the height of three cubits: the trunke or body small, couered with a darke coloured blacke: wherupon do grow very limber and pliant twiggie branches: the leaues are very small, not much vnlike to those of the Priuite bush: the floures are small and white: after which come Cherries of a deepe red colour when they be ripe, of taste somewhat sharpe, but not greatly vnpleasant: the branches laid downe in the earth, quickely take root, whereby it is greatly increased.

My selfe with diuers others haue sundry other sorts in our gardens, one called the Hart Cherry, the greater and the lesser; one of the great bigneſſe, and most pleasant in taste, which we call *Luke Wardes* Cherry, because he was the first that brought the same out of Italy; another we haue called the Naples Cherry, because it was first brought into these parts from Naples: the fruit is very great, sharpe pointed, somewhat like a mans heart in shape, of a pleasant taste, and of a deepe blackish colour when it is ripe, as it were of the colour of dried bloud.

We haue another that bringeth forth Cherries also very great, bigger than any Flanders Cherrie, of the colour of Iet, or burnished horne, and of a most pleasant taste, as witnesseth Mr. *Bull*, the Queenes Majesties Clockemaker, who did taste of the fruit (the tree bearing onely one Cherry, which he did eate; but my selfe neuer tasted of it) at the impression hereof. We haue also another, called the Agriot Cherry, of a reasonable good taste. Another we haue with fruit of a dun colour, tending to a watchet. We haue one of the dwarfe Cherries, that bringeth forth fruit as great as most of our Flanders Cherries, whereas the common sort hath very small Cherries, and those of an harsh taste. These and many sorts more we haue in our London gardens, whereof to write particularly would greatly enlarge our volume, and to small purpose: therefore what hath beene said shall suffice. ‡ I must here (as I haue formerly done, in Peares, Apples, and other such fruites) refer you to my two friends Mr. *Iohn Parkinson*, and Mr. *Iohn Millen*, the one to furnish you with the history, and the other with the things themselues, if you desire them. ‡

¶ *The Time.*

The Cherrie-treee bloome in Aprill; some bring forth their fruit sooner; some later: the red Cherries be alwaies better than the blacke of their owne kinde.

¶ *The Names.*

The Cherry-tree is called in Greeke, κέρασος: and also in Latine, *Cerasus*: in high Dutch, **Kirschenbaum**: in low Dutch, **Kerſenboome** and **Crieckenboom**: in French, *Cerisier*: in English, Cherry-tree.

The fruit or Cherries be called in Greeke, κεράσια, and κράσα: and in Latine likewise, *Cerasa*: in English, Cherries: the Latine and English names in their seuerall titles shall suffice for the rest that might be said.

¶ *The Temperature and Vertues.*

A The best and principall Cherries be those that are somewhat sower: those little sweet ones which be wild and soonest wripe be the worst: they contain bad juyce, they very soone putrifie, and doe ingender ill bloud, by reason whereof they do not onely breed wormes in the belly, but troublesome agues, and often pestilent feuers: and therefore in well gouerned common wealths it is carefully prouided that they should not be sold in the markets in the plague time.

B Spanish Cherries are like to these in faculties, but they doe not so soone putrifie: they be likewise cold, and the juyce they make is not good.

C The Flanders or Kentish Cherries that are through ripe, haue a better juice, but watery, cold and moist: they quench thirst, they are good for an hot stomacke, and profitable for those that haue the ague: they easily descend, and make the body soluble: they nourish nothing at all.

D The late ripe Cherries which the French-men keepe dried against Winter, and are by them called *Morelle*, and wee after the same name call them Morell Cherries, are dry and do somwhat binde, these being dried are pleasant to the taste, and wholesome for the stomacke, like as Prunnes be, and do stop the belly.

Generally

Generally all the kindes of Cherries are cold and moiſt of temperature, although ſome more cold and moiſt than others: which beeing eaten before meate doe ſoften the belly very gently, they are vnwholeſome either vnto moiſt and rheumaticke bodies, or for vnhealthie and cold ſtomackes. E

The common blacke Cherries do ſtrengthen the ſtomacke, and are wholeſomer than the redde Cherries, the which being dried do ſtop the laske. F

The diſtilled water of Cherries is good for thoſe that are troubled with heate and inflammations in their ſtomackes, and preuaileth againſt the falling ſickeneſſe giuen mixed with wine. G

Many excellent Tarts and other pleaſant meats are made with Cherries, ſugar, and other delicat ſpices, whereof to write were to ſmall purpoſe. H

The gum of the Cherry tree taken with wine and water, is reported to helpe the ſtone; it may do good by making the paſſages ſlippery, and by tempering and alaying the ſharpneſſe of the humors; and in this manner it is a remedy alſo for an old cough. *Dioſcorides* addeth, that it maketh one well coloured, cleareth the ſight, and cauſeth a good appetite to meat. I

Chap. 131. *Of the Mulberrie Tree.*

1 *Morus.*
The Mulberrie tree.

2 *Morus alba.*
The white Mulberrie tree.

¶ *The Deſcription.*

1 THe common Mulberrie tree is high, and ful of boughes: the body wherof is many times great, the barke rugged; and that of the root yellow: the leaues are broad and ſharpe pointed, ſomething hard, and nicked on the edges; in ſtead of floures, are blowings or catkins, which are downy: the fruit is long, made vp of a number of little graines, like vnto a blackBerrie, but thicker, longer, and much greater, at the firſt greene, and when it is ripe blacke, yet is the juyce (whereof it is full) red: the root is parted many waies.

2 The white Mulberrie tree groweth vntill it be come vnto a great and goodly ſtature, almoſt as big as the former: the leaues are rounder, not ſo ſharpe pointed, nor ſo deepely ſnipt about the edges, yet ſometimes ſinuated or deeply cut in on the ſides, the fruit is like the former, but that it is white and ſomewhat more taſting like wine.

¶ *The Place.*

The Mulberrie trees grow plentifully in Italy and other hot regions, where they doe maintaine great woods and groues of them, that their Silke wormes may feed thereon. The Mulberry tree is fitly ſet by the ſlip; it may alſo be grafted or inoculated into many trees, being grafted in a white Poplar, it bringeth forth white Mulberries, as *Beritius* in his Geoponickes reporteth. Theſe grow in ſundry gardens in England.

¶ *The Time.*

Of all the trees in the Orchard the Mulberry doth laſt bloome, and not before the cold weather is gone in May (therefore the old Writers were wont to call it the wiſeſt tree) at which time the Silke wormes do ſeeme to reuiue, as hauing then wherewith to feed and nouriſh themſelues, which all the winter before do lie like ſmall graines or ſeeds, or rather like the dunging of a fleſh flie vpon a glaſſe, or ſome ſuch thing, as knowing their proper times both to performe their duties for which they were created, and alſo when they may haue wherewith to maintaine and preſerue their owne bodies, vnto their buſineſſe aforeſaid.

The berries are ripe in Auguſt and September. *Hegeſander* in *Athenæus* affirmeth, that the Mulbery trees in his time did not bring forth fruit in twenty yeares together, and that ſo great a plague of the gout then raigned and raged ſo generally, as not onely men, but boies, wenches, eunuches, and women were troubled with that diſeaſe.

¶ *The Names.*

This tree is named in Greeke μορέα: and συκάμινέα: in Latine, *Morus*: in ſhops, *Morus Celſi*: in high Dutch, **Maulberbaum**: in low Dutch, **Moerbeſie boom**: in French, *Meurier*: in Engliſh, Mulberry tree.

The fruit is called μόρα, and συκάμινον: in Latine, *Morum*: in ſhops, *Morum Celſi*: in high Dutch, **Morbeſie**: in Italian, *Moro*: in French, *Meure*: in Spaniſh, *Moras* and *Mores*: in Engliſh Mulberry.

¶ *The Temperature and Vertues.*

A Mulberries being gathered before they be ripe, are cold and dry almoſt in the third degree, and do mightily bind; being dried they are good for the lask and bloudy flix, the pouder is vſed in meat, and is drunke with wine and water.

B They ſtay bleeding, and alſo the reds; they are good againſt inflammations or hot ſwellings of the mouth and jawes, and for other inflammations newly beginning.

C The ripe and new gathered Mulberries are likewiſe cold and be full of juyce, which hath the taſt of wine, and is ſomething drying, and not without a binding quality: and therefore it is alſo mixed with medicines for the mouth, and ſuch as helpe the hot ſwellings of the mouth, and Almonds of the throat; for which infirmities it is ſingular good.

D Of the juyce of the ripe berries is made a confection with ſugar, called *Diamorum*: that is, after the manner of a ſyrrup, which is exceeding good for the vlcers and hot ſwellings of the tongue, throat, and almonds, or Vvula of the throat, or any other malady ariſing in thoſe parts.

E Theſe Mulberries taken in meat, and alſo before meat, do very ſpeedily paſſe through the belly, by reaſon of their moiſture and ſlipperineſſe of their ſubſtance, and make a paſſage for other meats, as *Galen* ſaith.

F They are good to quench thirſt, they ſtir vp an appetite to meate, they are not hurtfull to the ſtomacke, but they nouriſh the body very little, being taken in the ſecond place, or after meate, for although they be leſſe hurtfull than other like fruits, yet are they corrupted and putrified, vnleſſe they ſpeedily deſcend.

G The barke of the root is bitter, hot, and dry, and hath a ſcouring faculty: the decoction hereof doth open the ſtoppings of the liuer and ſpleene, it purgeth the belly and driueth forth wormes.

H The ſame barke being ſteeped in vineger helpeth the tooth-ache: of the ſame effect is alſo the decoction of the leaues and barke, ſaith *Dioſcorides*, who ſheweth that about harueſt time there iſſueth out of the root a juyce, which the next day after is found to be hard, and that the ſame is very good againſt the tooth-ache; that it waſteth away *Phyma*, and purgeth the belly.

I *Galen* ſaith, that there is in the leaues and firſt buds of this tree a certaine middle faculty, both to binde and ſcoure.

Chap. 132. *Of the Sycomore Tree.*

Sycomorus.
The Sycomore tree.

¶ *The Description.*

THe Sycomore tree is of no small height, being very like to the mulberie tree in bigneſſe & ſhew, as alſo in leafe: the fruit is as great as a Fig, and of the ſame faſhion, very like in juyce and taſte to the wilde Fig, but ſweeter, and without any graines or ſeeds within, which groweth not forth of the tender boughes, but out of the body and great old armes very fruitfully: this tree hath in it plenty of milkie juyce, which ſo ſoone as any part is broken or cut, doth iſſue forth.

¶ *The Place.*

It groweth, as *Dioſcorides* writeth, very plentifully in Caria and Rhodes, and in ſundry places of Ægypt, as at the great Cayre or Alkaire, and in places that doe not bring forth much wheat, in which it is an helpe, and ſufficeth in ſtead of bread & corne where there is ſcarſitie of victuals. *Galen* writeth, that hee ſaw a plant of the Sycomore tree like to the wilde Fig tree, fruit and all.

¶ *The Place.*

It bringeth forth fruit three or foure times in one yeare, and oftner if it be ſcraped with an iron knife, or other like inſtrument.

¶ *The Names.*

This tree is called in Greeke, συκόμορος, of the Fig tree and the Mulbery tree: in Latine, *Sycomorus*: *Cornelius Celſus* nameth it backeward *Moroſycos*: the Egyptians of our time do call it *Ficus Pharaonis*, or *Pharao* his Fig tree, as witneſſeth *Bellonius*: and it is likewiſe termed *Ficus Ægyptia*, Ægyptian Fig tree, and alſo *Morus Ægyptia*, or Ægyptian Mulbery tree. We call it in Engliſh, Sycomore tree after the Greeke and Latine, and alſo Mulberry Fig tree, which is the right Sycomore tree, and not the great Maple, as we haue ſaid in the chapter of Maple.

The fruit is named in Greeke *Sycomoron*, and in Italian, *Sycomoro* and *Fico d'Egitto*.

¶ *The Temperature and Vertues.*

The fruit of the Sycomore tree hath no ſharpneſſe in it at all, as *Galen* ſaith. It is ſomwhat ſweet in taſte, and is of temperature moiſt after a ſort, and cold as be Mulberries. A

It is good, ſaith *Dioſcorides*, for the belly; but it is ἄβρωμα, that is, without any nouriſhment, and troubleſome to the ſtomacke. B

There iſſueth forth of the barke of this tree in the beginning of the Spring, before the fruit appeareth a liquour, which beeing taken vp with a ſponge, or a little wooll, is dried, made vp into fine cakes, and kept in gallie pots: this mollifieth, cloſeth wounds together, and diſſolueth groſſe humours. C

It is both inwardly taken and outwardly applied againſt the biting of ſerpents, hardneſſe of the milt or ſpleene: and paine of the ſtomacke proceeding of a cold cauſe: this liquor doth very quickly putrifie. D

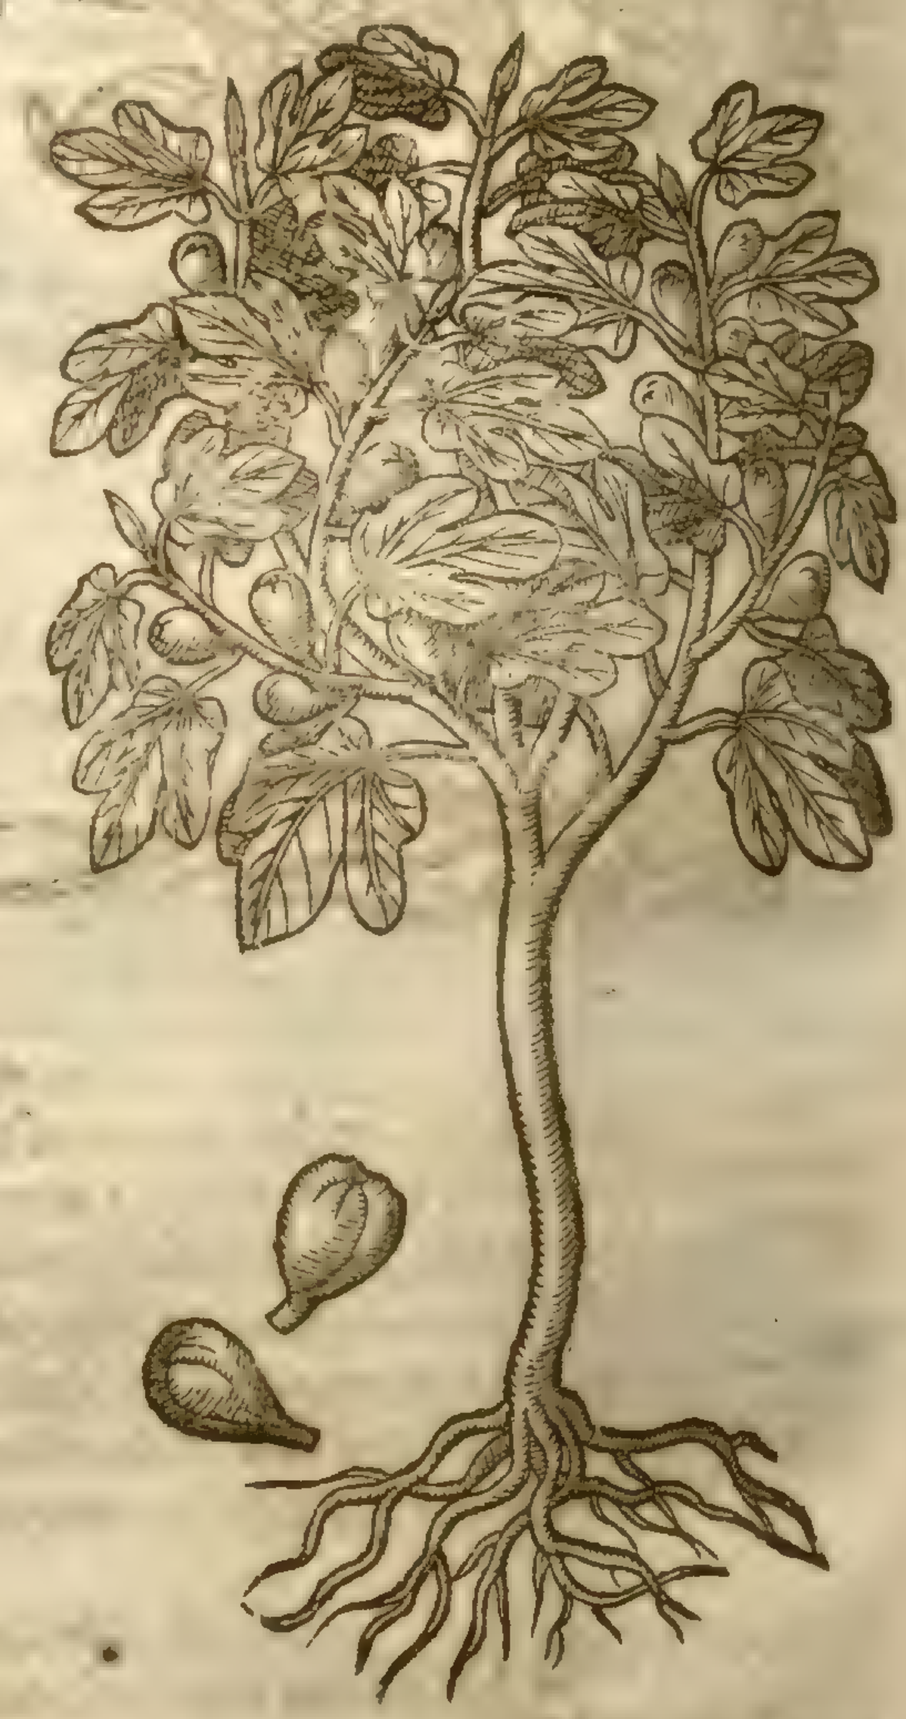
CHAP. 133. *Of the Fig Tree.*

¶ *The Description.*

1 THe garden Figtree becommeth a tree of a meane ſtature, hauing many branches full of white pith within, like Elderne pith, and large leaues of a darke greene colour, diuided into ſundry ſections or diuiſions. The fruit commeth out of the branches without any floure at all that euer I could perceiue, which fruit is in ſhape like vnto Peares, of colour either whitiſh, or ſomewhat red, or of a deepe blew, full of ſmall graines within, of a ſweet and pleaſant taſte; which being broken before it be ripe, doth yeeld moſt white milke, like vnto the kindes of Spurge, and the leaues alſo being broken doe yeeld the like liquor; but when the Figges be ripe, the juyce thereof is like hony.

1 *Ficus.*
The Fig tree.

‡ 2 *Chamæficus.*
The dwarfe Fig tree.



2 The dwarfe Fig tree is like vnto the former in leaues and fruit, but it neuer groweth aboue the height of a man, and hath many ſmall ſhoots comming from the roots, whereby it greatly increaſeth.

There is alſo another wilde kinde, whoſe fruit is neuer ripe; *Theophraſtus* nameth it *Erineos*; *Plinj*, *Caprificus*.

¶ *The Place.*

The Fig trees do grow plentifully in Spaine and Italy, and many other countries, as in England; where they beare fruit, but it neuer commeth to kindely maturity, except the tree be planted vnder an hot wall, whereto neither North, nor North-eaſt windes can come.

¶ *The Time.*

The dwarfe Fig tree groweth in my Garden, and bringeth forth ripe and very great fruit in the moneth of Auguſt, of which Figs ſundry perſons haue eaten at pleaſure.

In England the Fig trees put not forth their leaues vntill the end of May, where oftentimes the fruit commeth before the leaues appeare. ¶ *The*

¶ *The Names.*

The fig tree is called in Greeke, συκὴ, and of diuers, for difference ſake betweene it and the wilde Fig tree, συκῆ ἄγριος: in Latine, *Ficus*, and *Ficus ſatiua*, and *Vrbana*: in high Durch, **Feygenbaum**: in low Dutch, **Wijghcboom**: in French, *Figuier*: in Italian, *Fico*: in Spaniſh, *Higuera*: in Engliſh, Fig tree.

The fruit is named in Greeke, σῦκον: in Latine, *Ficus*: and the vnripe fruit, ὄλυνθος: in Latine, *Groſſus*: that which is dried is called in Greeke, ἰσχάς: in Latine, *Carica*: in high Dutch, **Feygen**: in low Dutch, **Wijghen**: in French, *Figues*: in Italian, *Fichi*: in Spaniſh, *Higos*: in Engliſh Fig: the little ſeeds which are found in them are named by *Galen*, κεγχρίδες, *Cechramides*.

¶ *The Temperature.*

The greene Figs new gathered are ſomewhat warme and moiſt: the dry and ripe Figs are hot almoſt in the third degree, and withall ſharpe and biting.

The leaues alſo haue ſome ſharpeneſſe, with an opening power, but not ſo ſtrong as the juice.

¶ *The Vertues.*

The dry Figs doe nouriſh better than the greene or new Figs; notwithſtanding they ingender A
not very good bloud, for ſuch people as do feed much thereon become lowſie.

Figs be good for the throat and lungs, they mitigate the cough, and are good for them that bee B
ſhort winded: they ripen flegme, cauſing the ſame to be eaſily ſpit out, eſpecially when they bee
ſodden with Hyſſop, and the decoction drunke.

Figges ſtamped with Salt, Rew, and the kernels of Nuts withſtand all poyſon and corruption C
of the aire. The King of Pontus, called *Mithridates*, vſed this preſeruatiue againſt all venom and
poyſon.

Figs ſtamped and made into the forme of a plaiſter with wheate meale, the pouder of Fenugreek, D
and Lineſeed, and the roots of Mariſh Mallowes, applied warme, doe ſoften and ripen impoſtumes,
phlegmons, all hot and angry ſwellings and tumors behind the eares: and if you adde thereto the
roots of Lillies, it ripeneth and breaketh Venerious impoſtumes that come in the flanke, which
impoſtume is called *Bubo*, by reaſon of his lurking in ſuch ſecret places: in plaine Engliſh termes
they are called botches.

Figs boiled in Wormewood wine with ſome Barly meale are very good to be applied as an im- E
plaiſter vpon the bellies of ſuch as haue the dropſie.

Dry Figs haue power to ſoften, conſume and make thinne, and may be vſed both outwardly and F
inwardly, whether it be to ripen or ſoften impoſtumes, or to ſcatter, diſſolue and conſume them.

The leaues of the Fig tree doe waſte and conſume the Kings Euill, or ſwelling kernels in the G
throat, and doe mollifie, waſte, and conſume all other tumors, being finely pouned and laid thereon:
but after my practiſe, being boyled with the roots of Mariſh Mallowes vntill they bee ſoft, and ſo
incorporated together, and applied in forme of a plaiſter.

The milkie juyce either of the Figs or leaues is good againſt all roughneſſe of the skin, lepries, H
ſpreading ſores, tetters, ſmall pockes, meaſels, puſhes, wheales, freckles, lentils, and all other ſpots,
ſcuruineſſe, and deformity of the body and face, beeing mixed with Barley meale and applied: it
doth alſo take away warts and ſuch like excreſcences, if it bee mingled with ſome fatty or greaſie
thing.

The milke doth alſo cure the tooth-ache, if a little lint or cotten be wet therein, and put into the I
hollowneſſe of the tooth.

It openeth the veines of the hemorrhoids, and looſeneth the belly, being applied to the funda- K
ment.

Figs ſtamped with the pouder of Fenugreeke, and vineger, and applied plaiſterwiſe, doe eaſe the L
intollerable paine of the hot gout, eſpecially the gout of the feet.

The milke thereof put into the wound proceeding of the biting of a mad dog, or any other veno- M
mous beaſt, preſerueth the parts adjoyning, taketh away the paine preſently, and cureth the hurt.

The greene and ripe Figs are good for thoſe that be troubled with the ſtone of the kidneies, for N.
they make the conduits ſlippery, and open them, and doe alſo ſomewhat clenſe: whereupon after
the eating of the ſame, it happeneth that much grauell and ſand is conueighed forth.

Dry or barrell Figs, called in Latine *Caricæ*, are a remedy for the belly, the cough, and for old in- O
firmities of the cheſt and lungs: they ſcoure the kidneies, and clenſe forth the ſand, they mitigate
the paine of the bladder, and cauſe women with childe to haue the eaſier deliuerance, if they feed
thereof for certaine daies together before their time.

Dioſcorides ſaith, that the white liquor of the Fig tree, and juyce of the leaues, do curdle milke as P
rennet doth, and diſſolue the milke that is cluttered in the ſtomacke, as doth vineger.

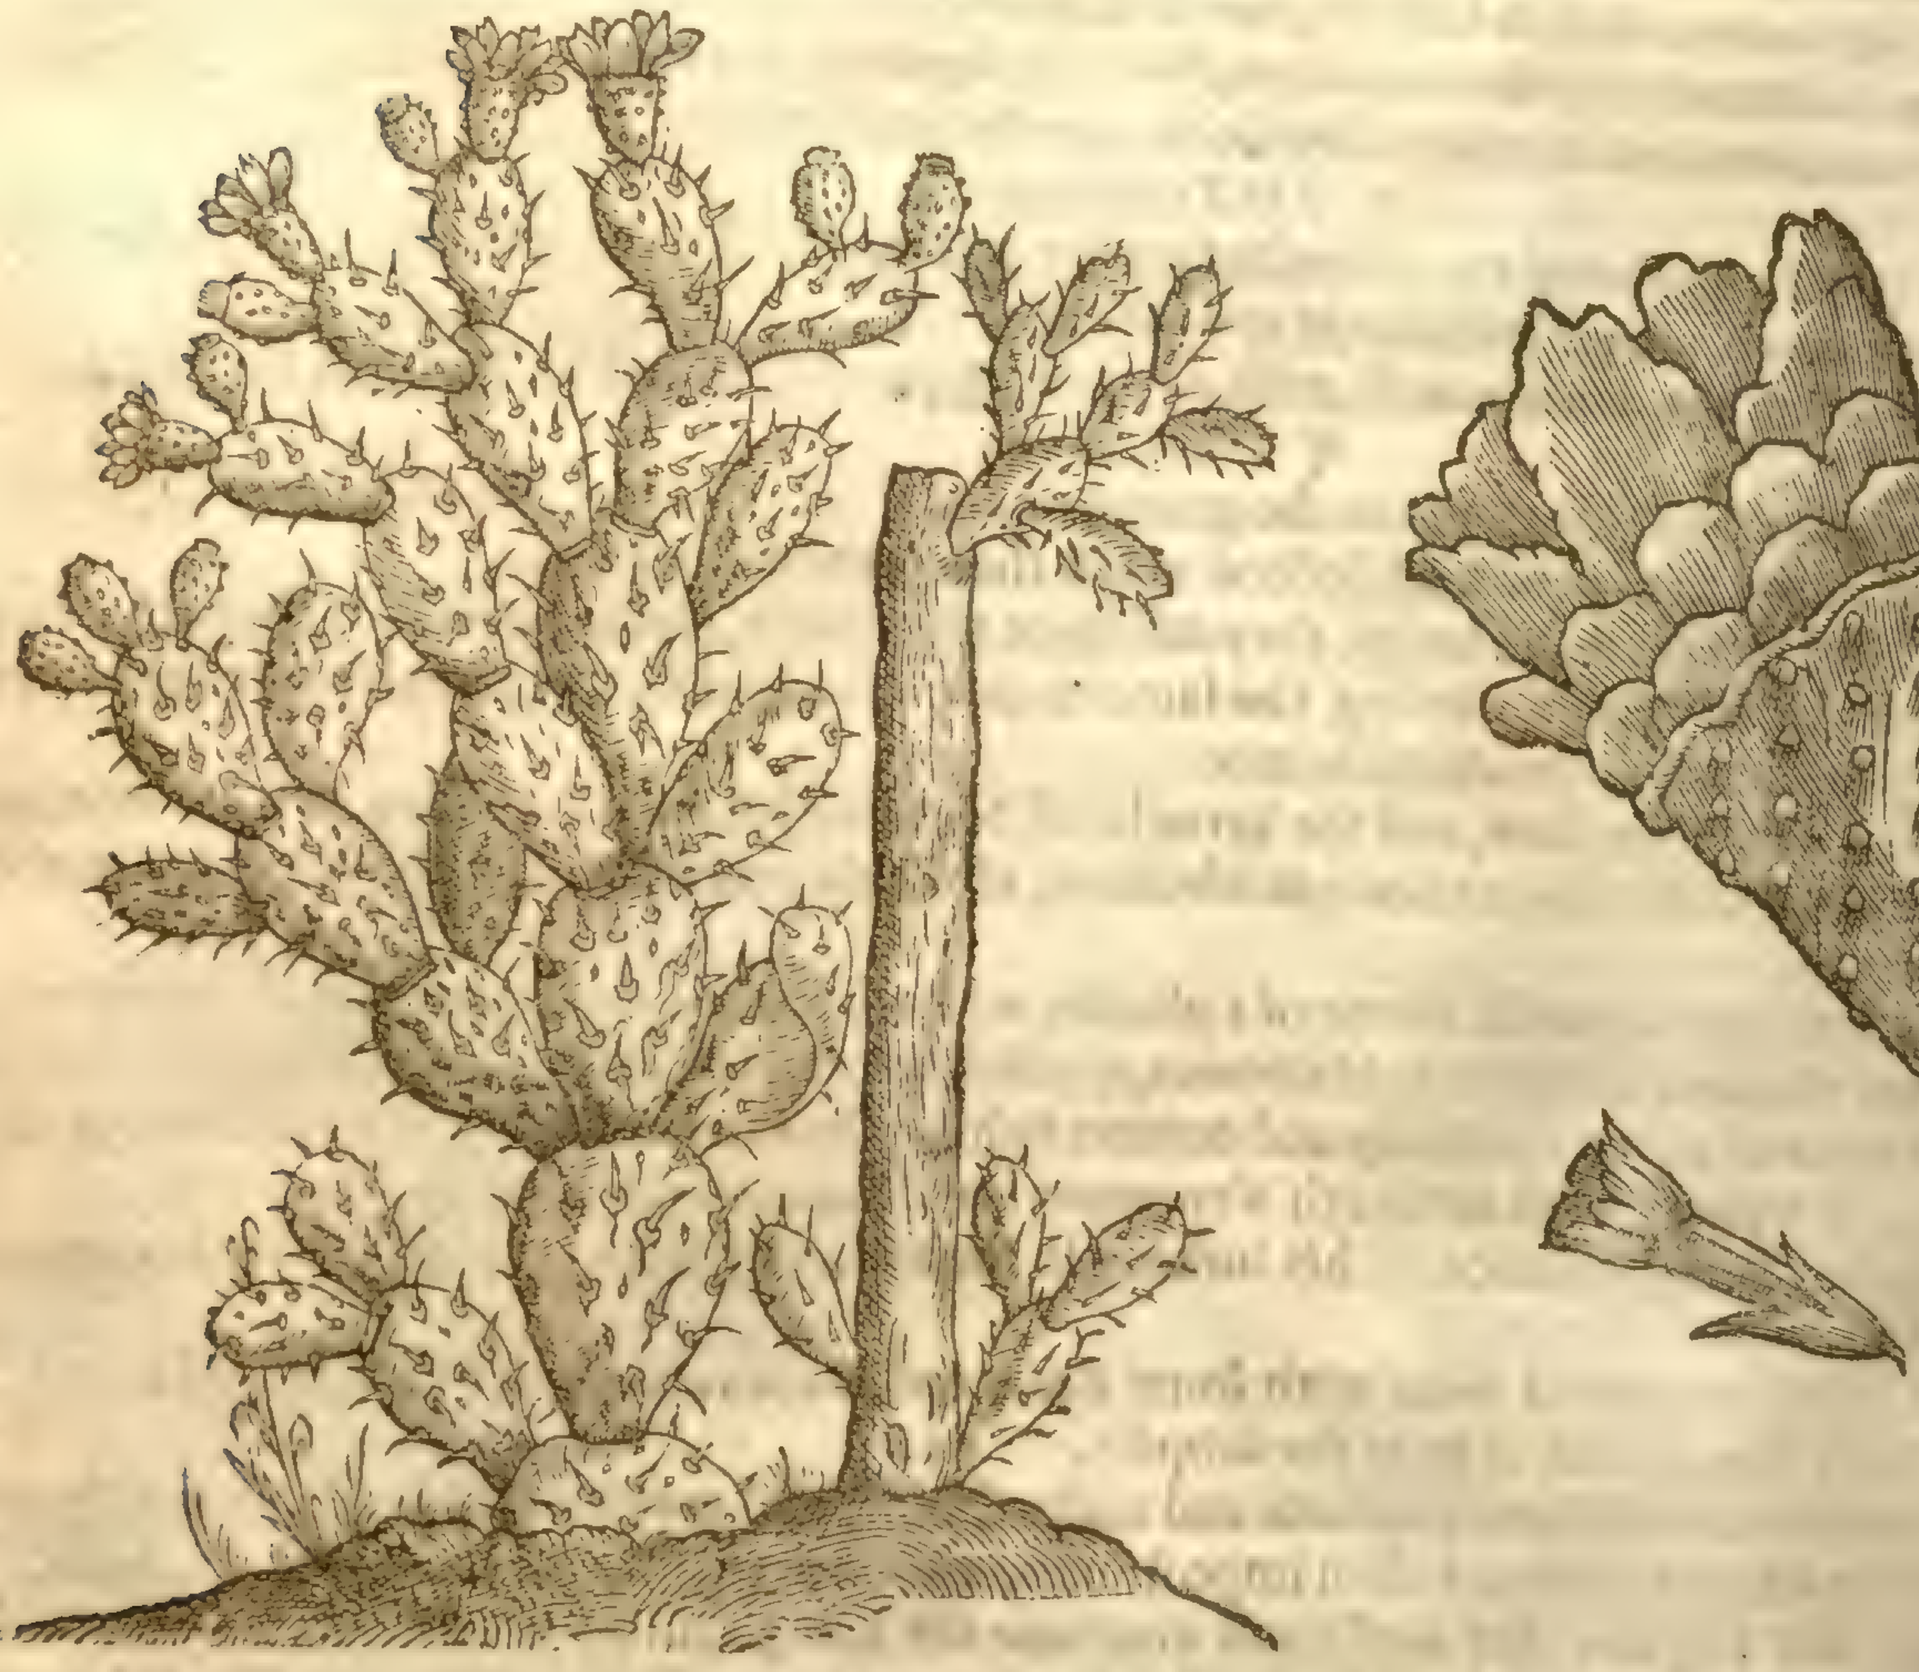
It bringeth downe the menſes, if it be applied with the yolke of an egge, or with yellow wax. Q

CHAP.

Chap. 134. *Of the prickly Indian Fig Tree.*

Ficus Indica.
The Indian Fig tree.

Fructus.
The fruit.



¶ *The Description.*

THis ſtrange and admirable plant called *Ficus Indica*, ſeemes to be no other thing than a multiplication of leaues, that is, a tree made of leaues, without body or boughes; for the leafe ſet in the ground doth in ſhort ſpace take root, and bringeth out of it ſelfe other leaues, from which do grow others one after another, till ſuch time as they come to the height of a tree, hauing alſo in the meane ſeaſon boughes as it were comming from thoſe leaues, ſomtimes more, otherwhiles fewer, as Nature liſt to beſtow, adding leafe vnto leafe, whereby it occupieth a great piece of ground: theſe leaues are long and broad, as thicke as a mans thumbe, of a deepe green colour, ſet full of long, ſlender, ſharpe and whitiſh prickles: on the tops of which leaues come forth long flours not vnlike to thoſe of the manured Pomegranate tree, of a yellow colour: after which commeth the fruit like vnto the common Fig, narrow below, and bigger aboue, of a greene colour, and ſtuffed full of a red pulpe and juyce, ſtaining the hands of them that touch it, as doe the Mulberries, with a bloudy or ſanguine colour: the top of which Figs are inuironed with certain ſcaly leaues like a crowne, wherein are alſo contained ſmall graines that are the ſeeds: the which being ſowne, do bring forth plants round bodied, like vnto the trunke of other trees, with leaues placed thereon like the other; which being ſet in the ground bring forth trees of leaues, as we haue ſhewed.

‡ Vpon this plaut in ſome parts of the VVeſt-Indies grow certaine excreſcences, which in continuance of time turne into inſects; and theſe out-growings are that high prized Cochenele wherewith they die colours in graine. ‡

¶ *The Place.*

This plant groweth in all the tract of the Eaſt and VVeſt-Indies, and alſo in the countrey Norembega, now called Virginia, from whence it hath beene brought into Italy, Spaine, England, and other countries; in Italy it ſometimes beareth fruit, but more often in Spaine, and neuer as yet in England, although I haue beſtowed great paines and coſt in keeping it from the iniury of our cold clymate.

It

It groweth also at S. Crux and other places of Barbary, and also in an Island of the Mediterranean sea, called Zante, about a day and nights sailing with a meane winde from Petrasse a port in Morea, where my seruant *William Marshall* (before remembred) did see not onely great store of those trees made of leaues, but also diuers other round bodied plants of a woody substance: from whence he brought me diuers plants thereof in tubs of earth, very fresh and greene, which flourished in my garden at the impression hereof.

¶ *The Time.*

These plants doe grow greene and fresh both Winter and Summer, by the relation of my foresaid seruant: notwithstanding they must bee very carefully kept in these countries from the extremitie of Winter.

¶ *The Names.*

This is thought to be the plant called of *Pliny*, *Opuntium*; whereof he hath written, *lib.* 21. *ca.* 17. in this manner: About Opuns is the herbe *Opuntia*, to mans taste sweet, and it is to be maruelled, that the root should be made of the leaues, and that it should so grow. Opuns is a City neere vnto Phocis in Greece, as *Pausanias*, *Strabo*, and *Pliny* testifie: but it is commonly called in Latine, *Ficus Indica*. of the Indians, *Tuna*, and *Tunas*, and also *Anapallas*, as testifieth *Bellonius*: in English, Indian Fig tree.

There is a certaine other described for the Indian Fig tree, by *Theophrastus*, *lib.* 4. which *Pliny*, *lib.* 12. *cap.* 5. doth eloquently expresse almost in the same words, but turned into Latine, whereof we intend to speake in the next chapter.

¶ *The Temperature and Vertues.*

We haue no certaine instruction from the Antients, of the temperature or faculty of this plant, or of the fruit thereof: neither haue we any thing whereof to write of our owne knowledge, more than that we haue heard reported of such as haue eaten liberally of the fruit thereof, that it changed their vrine to the colour of bloud; who at the first sight thereof stood in great doubt of their life, thinking it had beene bloud, whereas it proued afterwards by experience to be nothing but the tincture or colour the vrine had taken from the juyce of the fruit, and that without all hurt or griefe at all. A

It is reported of some, that the juyce of the fruit is excellent good against vlcers of long continuance. B

‡ Cochenele is giuen alone, and mixed with other things, in maligne diseases, as pestilent feuers and the like, but with what successe I know not. ‡ C

Chap. 135. *Of the arched Indian Fig tree.*

¶ *The Description.*

THis rare and admirable tree is very great, straight, and couered with a yellow barke tending to tawny: the boughes and branches are many, very long, tough, and flexible, growing very long in short space, as doe the twigs of Oziars, and those so long and weake, that the ends thereof hang downe and touch the ground, where they take root and grow in such sort, that those twigs become great trees: and these being growne vp vnto the like greatnesse, doe cast their branches or twiggy tendrels vnto the earth, where they likewise take hold and root; by meanes whereof it commeth to passe, that of one tree is made a great wood or desart of trees, which the Indians doe vse for couerture against the extreme heat of the Sun, wherewith they are grieuously vexed: some likewise vse them for pleasure, cutting downe by a direct line a long walke, or as it were a vault, through the thickest part, from which also they cut certaine loope-holes or windowes in some places, to the end to receiue thereby the fresh coole aire that entreth thereat, as also for light, that they may see their cattell that feed thereby, to auoid any danger that might happen vnto them either by the enemy or wilde beasts: from which vault or close walke doth rebound such an admirable eccho or answering voice, if one of them speake vnto another aloud, that it doth resound or answer againe foure or fiue times, according to the height of the voice, to which it doth answer, and that so plainely, that it cannot be known from the voice it selfe: the first or mother of this wood or desart of trees is hard to bee knowne from the children, but by the greatnesse of the body, which three men can scarsely fathom about: vpon the branches whereof grow leaues hard and wrinkled, in shape like those of the Quince tree, greene aboue, and of a whitish hoary colour vnderneath, whereupon the Elephants delight to feed: among which leaues come forth the fruit, of the bignesse of a mans thumbe, in shape like a small Fig, but of a sanguine or bloudy colour, and of a sweet taste,

but

but not so pleasant as the Figs of Spaine; notwithstanding they are good to be eaten, and withall very wholesome.

Arbor ex Goa, siue Indica.
The arched Indian Fig tree.

¶ *The Place.*

This wondrous tree groweth in diuers places of the East-Indies, especially neere vnto Goa, and also in Malaca: it is a stranger in most parts of the World.

¶ *The Time.*

This tree keepeth his leaues greene Winter and Summer.

¶ *The Names.*

This tree is called of those that haue trauelled, *Ficus Indica*; the Indian Fig; and *Arbor Goa*, of the place where it groweth in greatest plenty: we may call it in English, the arched Fig tree.

‡ Such as desire to see more of this Fig-tree, may haue recourse to *Clusius* his *Exoticks*, *lib.* 1. *cap.* 1. where he shewes it was mentioned by diuers antient Writers, as *Q. Curtius*, *lib.* 9. *Pliny*, *lib.* 12. *cap.* 5. *Strabo*, *lib.* 5. and *Theophrast. Hist. Plant. lib.* 4. *cap.* 5. by the name of *Ficus Indica*. ‡

¶ *The Temperature and Vertues.*

We haue nothing to write of the temperature or vertues of this tree, of our owne knowledge: neither haue we receiued from others more, than that the fruit hereof is generally eaten, and that without any hurt at all, but rather good, and also nourishing.

Chap. 136.

Of Adams Apple tree, or the West-Indian Plantane.

¶ *The Description.*

Whether this plant may be reckoned for a tree properly, or for an herby Plant, it is disputable, considering the soft and herby substance whereof it is made; that is to say, when it hath attained to the height of six or seuen cubits, and of the bignesse of a mans thigh, notwithstanding it may be cut downe with one stroke of a sword, or two or three cuts with a knife, euen with as much ease as the root of a reddish or Carrot of the like bignesse: from a thicke fat threddy root rise immediately diuers great leaues, of the length of three cubits and a halfe, sometimes more, according to the soile where it groweth, and of a cubit and more broad, of bignesse sufficient to wrap a childe in of two yeares old, in shape like those of Mandrake, of an ouerworne green colour, hauing a broad ribbe running through the middle thereof: which leaues, whether by reason of the extreme hot scorching Sun, or of their owne nature, in September are so drie and withered, that there is nothing thereof left or to bee seene but onely the middle rib. From the middest of these leaues riseth vp a thicke trunke, whereon doth grow the like leaues, which the people do cut off, as also those next the ground, by meanes whereof it riseth vp to the height of a tree, which otherwise would remaine a low and base plant. This manner of cutting they vse from time to time, vntill it came to a certaine height, aboue the reach of the Elephant, which greedily seeketh after the fruit. In the middest of the top among the leaues cómmeth forth a soft and fungous stumpe, whereon do grow diuers apples in forme like a small Cucumber, and of the same bignesse, couered

with

with a thin rinde like that of the Fig, of a yellow colour when they be ripe: the pulpe or substance of the meate is like that of the Pompion, without either seeds, stones or kernels, in taste not greatly perceiued at the first, but presently after it pleaseth, and entiseth a man to eate liberally thereof, by a certaine entising sweetnesse it yeelds: in which fruit, if it be cut according to the length (saith mine Author) oblique, transuerse, or any other way whatsoeuer, may be seene the shape and forme of a crosse, with a man fastned thereto. My selfe haue seene the fruit, and cut it in pieces, which was brought me from Aleppo in pickle; the crosse I might perceiue, as the forme of a spred Egle, in the root of Ferne; but the man I leaue to be sought for by those which haue better eies and judgement than my selfe.

Musa Serapionis.
Adams Apple-tree.

Musæ Fructus.
Adams Apple.

‡ Aprill 10. 1633. my much honoured friend D^r. *Argent* (now President of the Colledge of Physitions of London) gaue me a plant hee receiued from the Bermuda's: the length of the stalke was some two foot; the thickenesse thereof some seuen inches about, being crested, and full of a soft pith, so that one might easily with a knife cut it asunder. It was crooked a little or indented, so that at each two or three inches space it put forth a knot of some halfe inch thickenesse, and some inch in length, which encompassed it more than halfe about, and vpon each of these joints or knots, in two rankes one aboue another, grew the fruit, some twentie, nineteene, eighteene, &c. more or lesse, at each knot: for the branch I had, conteined nine knots or diuisions, and vpon the lowest knot grew twenty, and vpon the vppermost fifteene. The fruit which I receiued was not ripe, but greene, each of them was about the bignesse of a large Beane; the length of them some fiue inches, and the bredth some inch and halfe: they all hang their heads downewards, haue rough or vneuen ends, and are fiue cornered; and if you turne the vpper side downeward, they somewhat resemble a boat, as you may see by one of them expresst by it selfe: the huske is as thicke as a Beane, and will easily shell off it: the pulpe is white and soft: the stalke whereby it is fastned to the knot is very short and almost as thicke as ones little finger. The stalke with the fruit thereon I hanged vp in my shop, where it became ripe about the beginning of May, and lasted vntill Iune: the pulp or meat was very soft and tender, and it did eate somewhat like a Muske-Melon. I haue giuen you the figure of the whole branch, with the fruit thereon, which I drew as soone as I receiued it, and it is marked with this figure 1. The figure 2 sheweth the shape of one particular fruit, with the lower side

ſide vpwards. 3 The ſame cut through the middle long waies. 4 The ſame cut ſide waies, I haue been told (but how certainely it is I know not) that the floures which precede the fruit are bell-fa-ſhioned, and of a blew colour. I could obſerue no ſeed in the fruit; it may be it was becauſe it had beene cut from the ſtocke ſo long before it came to maturity. This plant is found in many places of Aſia, Africke, and America, eſpecially in the hot regions: you may finde frequent mention of it amongſt the ſea voiages to the Eaſt and Weſt Indies, by the name of Plantaines, or *Platanus, Bananas, Bouanas, Dauanas, Poco, &c.* ſome (as our Author hath ſaid) haue judged it the forbidden fruit; otherſome, the Grapes brought to *Moſes* out of the Holy-land. ‡

Muſæ fructus exactior Icon.
An exacter figure of the Plantaine fruit.

¶ *The Place.*

This admirable tree groweth in Ægypt, Cyprus, and Syria, neere vnto a chiefe city there called Alep, which we call Aleppo; and alſo by Tripolis, not far from thence: it groweth alſo in Canara, Decan, Guzarate, and Bengala, places of the Eaſt-Indies.

¶ *The Time.*

From the root of this tree ſhooteth forth young ſprings or ſhoots, which the people take vp and plant for the increaſe of the Spring of the yeare. The leaues wither away in September, as is aboue ſaid.

¶ *The Names.*

It is called *Muſa* by ſuch as trauell to Aleppo: by the Arabians, *Muſa Maum*: in Syria, *Moſe*: The Grecians and Chriſtians which inhabit Syria, and the Iewes alſo, ſuppoſe it to be that tree of whoſe fruit *Adam* did taſte; which others thinke it to be a rediculous fable: of *Pliny, Opuntia.*

It is called in the Eaſt-Indies (as at Malauar where it alſo groweth) *Palan*: in Malayo, *Pican*: and in that part of Africa which we call Ginny, *Bananas*: in Engliſh, Adams Apple tree.

¶ *The Temperature.*

Serapio judges, that it heateth in the end of the firſt degree, and moiſtneth in the end of the ſame.

¶ *The Vertues.*

A The fruit hereof yeeldeth but little nouriſhment: it is good for the heate of the breaſt, lungs, and bladder: it ſtoppeth the liuer, and hurteth the ſtomacke if too much of it be eaten, and pro-cureth

eareth looſneſſe in the belly: whereupon it is requiſit for ſuch as are of a cold conſtitution, in the eating thereof to put vnto it a little Ginger or other ſpice.

It is alſo good for the reins or kidnies, and to prouoke vrine: it nouriſheth the child in the mo- B
thers wombe, and ſtirreth to generation.

Chap. 137. *Of the Date tree.*

Palma.
The Date tree.

Palmarum fructus & flores cum Elate.
The fruit and floures of the Date tree.

¶ *The Deſcription.*

THe Date tree growes very great and high; the body or trunke thereof is thicke, and couered with a ſcaly rugged bark, cauſed by the falling away of the leaues: the boughs grow only on the top, conſiſting of leaues ſet vpon a wooddy middle rib like thoſe of reeds or flags: the inner part of which rib or ſtalk is ſoft, light, hollow, and ſpongie. Among the leaues come forth the floures, included in a long skinny membrane as it were a ſheath or hoſe, like that which couereth the floure de-luce before it be blown; which being opened of it ſelfe, white flours ſtart forth, ſtanding vpon ſhort and ſlender footſtalks, which are faſtned with certain ſmall filaments or threddie ſtrings like vnto little branches: after which ſpring out from the ſame branches the fruit or dates, which be in faſhion long and round, in taſte ſweet, and many times ſomewhat harſh, of a yellowiſh red colour; wherein is contained a long hard ſtone, which is in ſtead of kernel and ſeed; the which I haue planted many times in my garden, and haue grown to the height of three foot: but the firſt froſt hath nipped them in ſuch ſort, that ſoon after they periſhed, notwithſtanding my induſtry by couering them, or what elſe I could do for their ſuccour.

¶ *The Place.*

The Date trees grow plentifully in Affrica and Ægypt; but thoſe which are in Paleſtina and

Syria,

Syria be the best: they grow likewise in most places of the East and West Indies, where there be diuers sorts, as well wild, as tame or manured.

¶ *The Time.*

The Date tree is alwaies greene, and floureth in the spring time: the fruit is ripe in September, and being then gathered they are dried in the Sunne, that they may be the better both transported into other countries far distant, as also preserued from rotting at home.

¶ *The Names.*

The tree is called in Greeke, φοινιξ: in Latine *Palma*: in English, Date tree.

The fruit is named in Greeke, βαλανος φοινικων: that is to say, *Glans Palmarum*, or the fruit of the Date trees: and by one word, φοινικοβαλανος: in Latine *Palmula*: in shops, *Dactylus*: in high-Dutch, **Dattelen**: in low-Dutch, **Dadelen**: in Italian, *Dattoli*: in French, *Dattis*: in Spanish, *Tamaras*, and *Dactiles*: in English, Date.

The cod or sheath wherein the floures and Dates are wrapped, is called ιουλος, and of some, βαλανος.

¶ *The Temperature and Vertues.*

A All manner of Dates whatsoeuer are hard of digestion, and cause head-ache: the worser sort be those that be dry and binding, as the Egyptian Dates; but the soft moist and sweet ones are lesse hurtfull.

B The bloud which is ingendred of Dates in mans body is altogether grosse, and somewhat clammy: by these the liuer is very quickly stopped, especially being inflamed and troubled with some hard swelling: so is the spleen likewise.

C The Dates which grow in colder regions, when they cannot come to perfect ripenesse, if eaten too plentifully, they fill the body full of raw humors, ingender wind, and oftentimes cause the Leprosie.

D The drier sorts of Dates, as *Dioscorides* saith, be good for those that spit bloud, for such as haue bad stomacks, and for those also that be troubled with the bloudy flix.

E The best Dates, called in Latine *Caryotæ*, are good for the roughnesse of the throat and lungs.

F There are made hereof both by the cunning Confectioners & Cooks, diuers excellent, cordial, comfortable and nourishing medicines, that procure lust of the body very mightily.

G They do also refresh and restore such vnto strength as are entring into a consumption, for they strengthen the feebleneſſe of the liuer and spleen, being made into conuenient broths and physical medicines directed by a learned Physition.

H Dry Dates do stop the belly and stay vomiting, and the wambling of womens stomacks that are with childe, if they be either eaten in meats or otherwise, or stamped and applied vnto the stomack as a pectoral plaister.

I The ashes of the Date stones haue a binding qualitie and emplastick facultie, they heal pushes in the eies, *Staphylomata*, and falling away of the haire of the eie-lids, beeing applied together with Spikenard: with wine it keeps proud flesh from growing in wounds.

K The boughs and leaues do euidently bind, but especially the hose or case of the floures: wherefore it is good to vse these so oft as there is need of binding.

L The leaues and branches of the Date tree doe heale green wounds and vlcers, refresh and coole hot inflammations.

M *Galen* in his booke of medicines according to the kinds, mentioneth a composition called *Diapalma*, which is to be stirred with the bough of a date tree in stead of a spature or thing to stir with, for no other cause than that it may receiue thereby some kind of astriction or binding force.

Chap. 138. *Of the wilde Date trees.*

¶ *The Description.*

I *Theophrastus* maketh this plant to be a kinde of Date tree, but low and of small growth, seldome attaining aboue the height of a cubit; on the top whereof shoot forth for the most part long leaues like those of the Date tree, but lesser and shorter: from the sides whereof breake forth a bush of threddy strings, amongst which riseth vp small branches garnished with clusters of white floures, in which before they be opened are to bee seene vnperfect shapes of leaues, closely compassed about with an innumerable sort of thinne skinny huls; which rude shapes with the flours are serued vp and eaten at the second course among other junkets, with a little salt and pepper, being pleasant to the taste. ‡ The stalke is about the thickneſſe of ones little

1 *Palmites, sive Chamæriphes.*
The little wilde Date tree.

2 *Palmapinus, sive Palusa conifera.*
The wilde Date tree bearing cones.

‡ *Fructus Palmapini.*
The fruit of the Cone Date.

little finger, here & there set with a few crooked prickes: the leaues within some handfull or two of the stalke are cut vp and made into little besomes, which are sold in many glasse shops here in London.

2 The wilde Date tree that brings forth cones of key clogs, is of most trauellers into the Indies thought to be barren of Dates, except sometimes it yeeldeth forth some small berries like vnto Dates, but dry, and nothing worth. This groweth vp to the height and bignesse of a low tree, the trunke or body whereof is soft, of a fungous or pithy substance, vnfit for building, as is the mannured Date tree. The branch it selfe was brought vnto vs from the Indies, dry & void of leaues, wherefore we must describe the leaues by report of the bringer. The branches, saith my Authour, are couered ouer with long flaggie leaues, hanging downe of a great length like those of the Date tree: the branches are also couered with a scaly or scabbed barke, very rough, one scale or plate lying ouer another, as tiles vpon a house: the fruit growes at the end of the branches, not vnlike a great Pine Apple cone, couered ouer with a skinne like the Indian Nut, wherein is contained a shell, within which shell lieth hid an acorn or long

kernell of an inch long, and sometimes longer, very hard to be broken, in taste like the Chestnut; which the sauage people do grate and stamp to pouder to make them bread.

¶ *The Place.*

Theophrastus saith, the first growes in Candy, but much more plentifully in Cilicia, and are now found in certaine places of Italy by the sea side, and also in diuers parts of Spaine.

The other hath been found by trauellers into the West-Indies, from whence haue been brought the naked branches with the fruit.

¶ *The Time.*

The time answereth that of the manured Date tree.

¶ *The Names.*

The little Date tree or wilde Date tree is named of *Theophrastus*, χαμαιρωψ: in Naples, *Cephagliene*: in Latine commonly *Palmites*. That which is found in the midst of the yong springs, and is vsed to be eaten in banquets, is called in Greeke, ἐγκεφαλὶς φοινικος: in Latine, *Palmæ cerebrum*, the braine of the Date tree.

¶ *The Temperature and Vertues.*

A *Galen* supposeth that the braine of the Date tree consisteth of sundry parts, that is to say, of a certaine watery and warme substance, and of an earthy and cold; therefore it is moist and cold, with a certaine astriction or binding quality.

B Being taken as a meate it ingendreth raw humors and winde, and therefore it is good to be eaten with pepper and salt.

Chap. 139. *Of the drunken Date tree.*

Areca, siue Faufel.
The drunken Date tree.

¶ *The Description.*

THe drunken Date tree, which *Carolus Clusius* calleth *Faufel*, is an Indian tree of a great bigneſſe, the timber whereof is very soft and spongious, exceeding smooth and plaine vnto a great height,

height, not possible to be climbed vp; and therefore the Indians for their easier ascending vp, at some distances doe tie round about the tree certaine wyths or ropes made of the barkes of trees, as may be perceiued by the figure, wherby very easily they go vp and down to gather the fruit at their pleasure. The top of the tree is diuided into sundry branches, in substance like to the great cane; whereupon do grow faire flaggy leaues like those of the Palme or Date tree, whereof doubtlesse it is a wild kind: from the bottom of which branches comes forth fruit in long branches like traces of Onions, couered with a soft pulp like vnto the walnut, rough, and very ful of haire of a yellowish colour, and like the dried date when it is ripe: within which huske is contained fruit like vnto the Nutmeg, but greater, very hard, and striped ouer with red and white veins or sinues.

¶ *The Place, Time, and Names.*

This Date tree, which the Arabians call *Fausel*, that is by interpretation, *Auellana Indica*, the Indian nut or filberd, *Auicen* and *Serapio* call *Filfel* and *Fufel*. It groweth in the East Indies in diuers and sundry places, as in Malauar, where vulgarly it is called *Pac*: and of the Nobles & gentlemen, *Areca*; which name is vsed among the Portugals that dwell in those Indies: in Guzarat & Decan it is called *Cupare*: in Zeilan, *Poaz*: in Malaca, *Pilan*: in Cochin, *Chacani*: in English, the drunken Date tree, which name we haue coined from his qualitie, because the fruit makes one drunke that eats thereof.

¶ *The Temperature.*

It is cold and dry in the second degree.

¶ *The Vertues.*

The fruit of *Areca* before it be ripe is reckoned among the stupefactiue and astonishing medi- A
cines, for whosoeuer eateth thereof waxeth drunk, because it doth exceedingly amase and astonish the sences.

When the Indians are vexed with some intolerable ache or paine, or must of necessitie endure B
some great torment or torture, they eat of this fruit, wherby the rigor of that pain which otherwise they should feele, is very much mitigated.

The iuice of the fruit of *Areca* strengthens the gums, fastens the teeth, comforts the stomacke, C
stayes vomiting and loosnesse of the belly: it doth also purge the body from congealed or clotted bloud gathered within the same.

CHAP. 140. *Of the Indian Nut tree.*

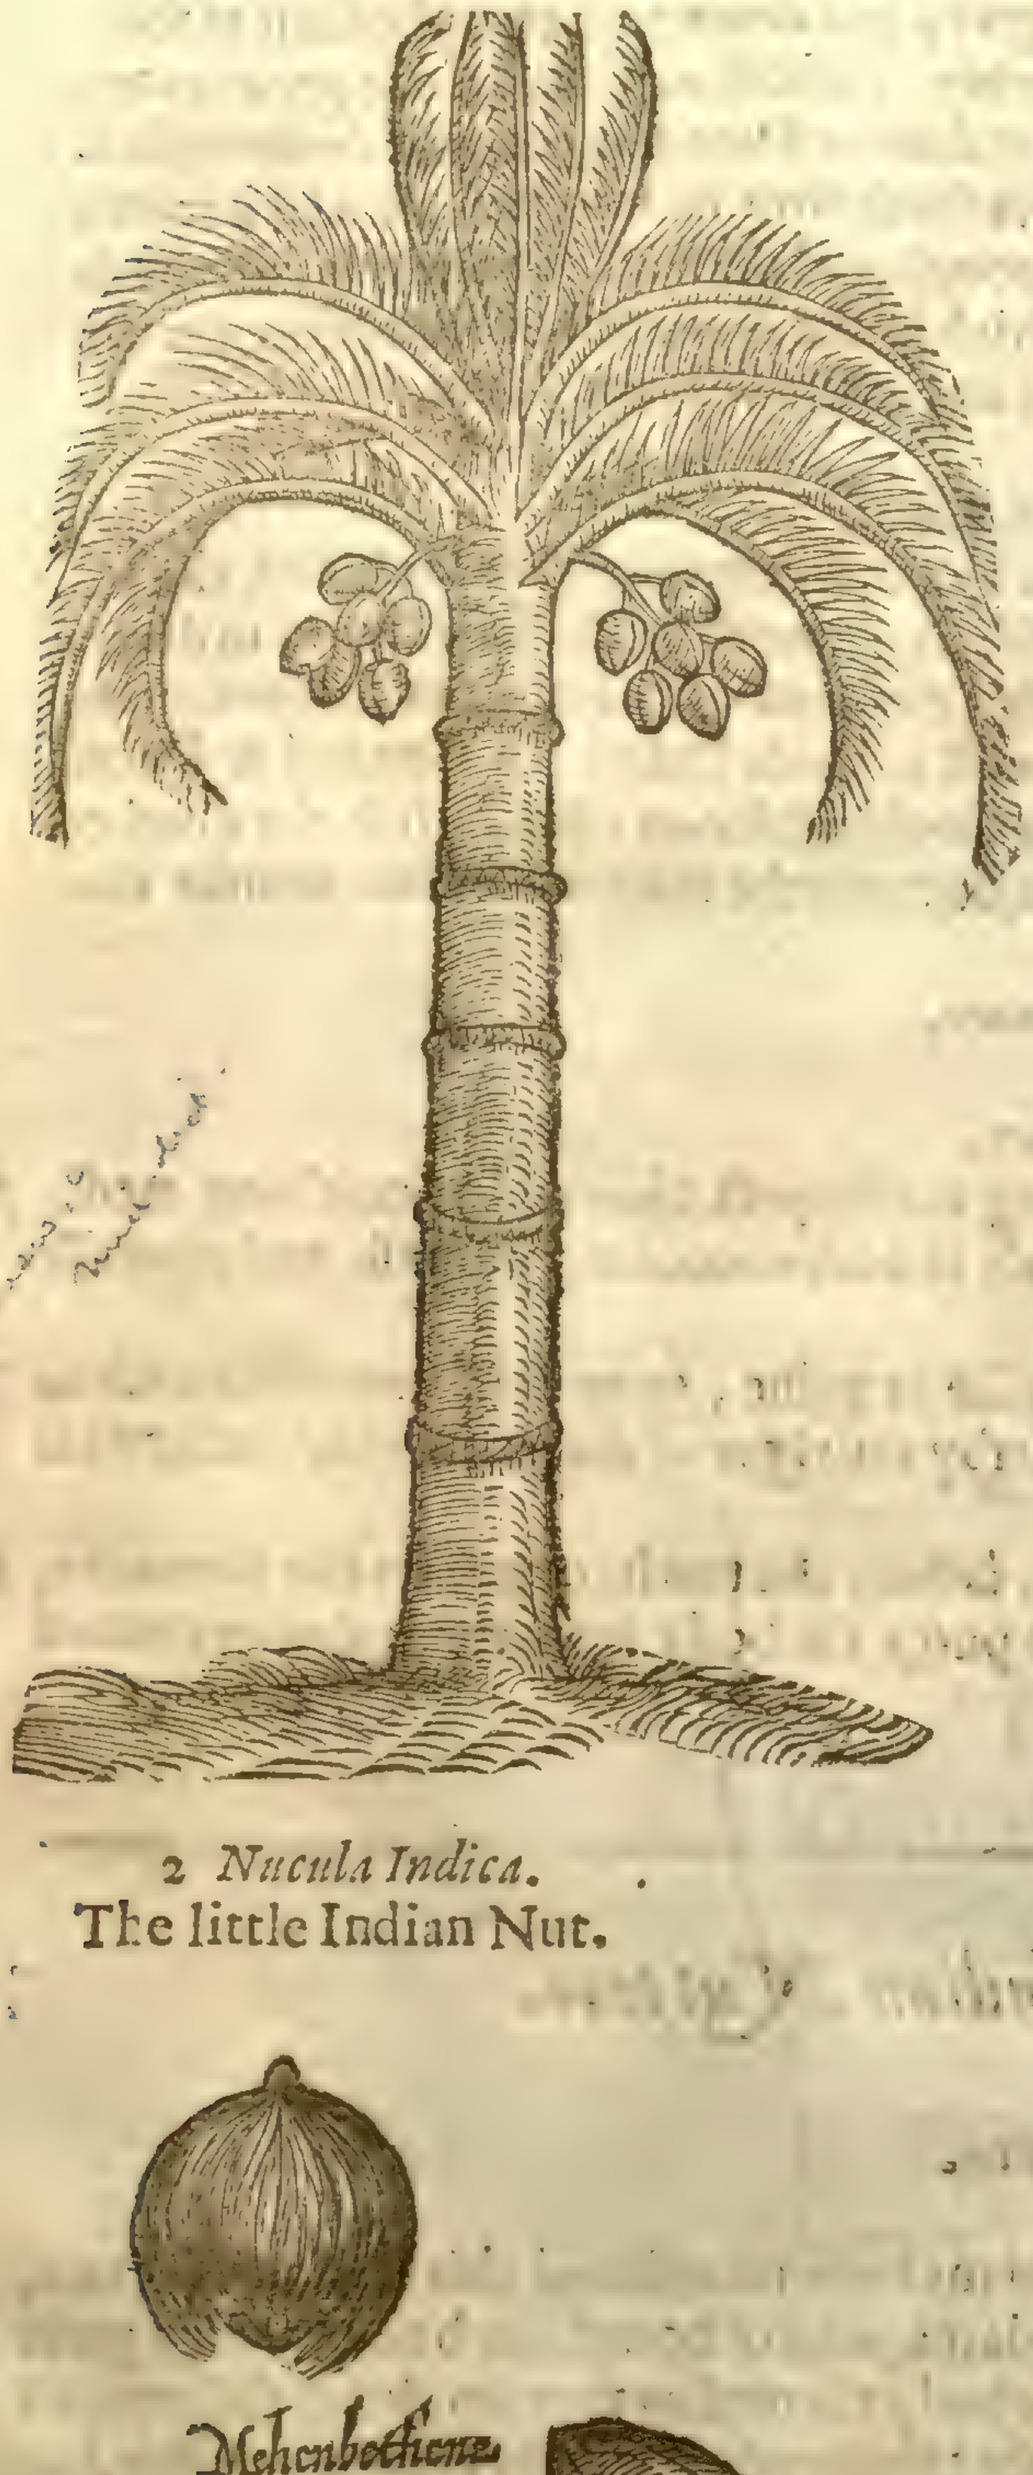
¶ *The Description.*

1 THe Grecians haue not known, but the Arabians haue mentioned this Indian Nut tree, the body wherof is very great, smooth, and plaine, void of boughs or branches of a great height; wherefore the Indians do wrap ropes about the body thereof, as they do about the tree last described, for their more ease in gathering the fruit: the timber wherof is very spongy within, but hard without, a matter fit to make their Canoos & boats of: on the top of the tree grow the leaues like those of the Date tree, but broad, and sharpe at the point as thornes, whereof they vse to make needles, bodkins, and such like instruments, wherewith they sow the sailes of their ships, & do such businesse: among these leaues come forth clusters of floures like those of the Chestnut tree, which turn into great fruit of a round form, and somwhat sharp at one end; in that end next vnto the tree is one hole, somtimes two bored through: this Nut or fruit is wrapped in a couerture consisting of a substance not vnlike to hemp before it be beaten soft; there is also a finer and gentler stuffe next vnto the shell, like vnto Flax before it bee made soft: in the middle whereof is contained a great nut couered with a very hard shel, of a brown colour before it be polished, afterward of a black shining colour like burnished horne. Next vnto the shell vpon the inside there cleaueth a white cornelly substance firm and sollid, of the colour and tast of a blanched almond: within the cauitie or hollownesse thereof is contained a most delectable liquour like vnto milke, and of a most pleasant taste.

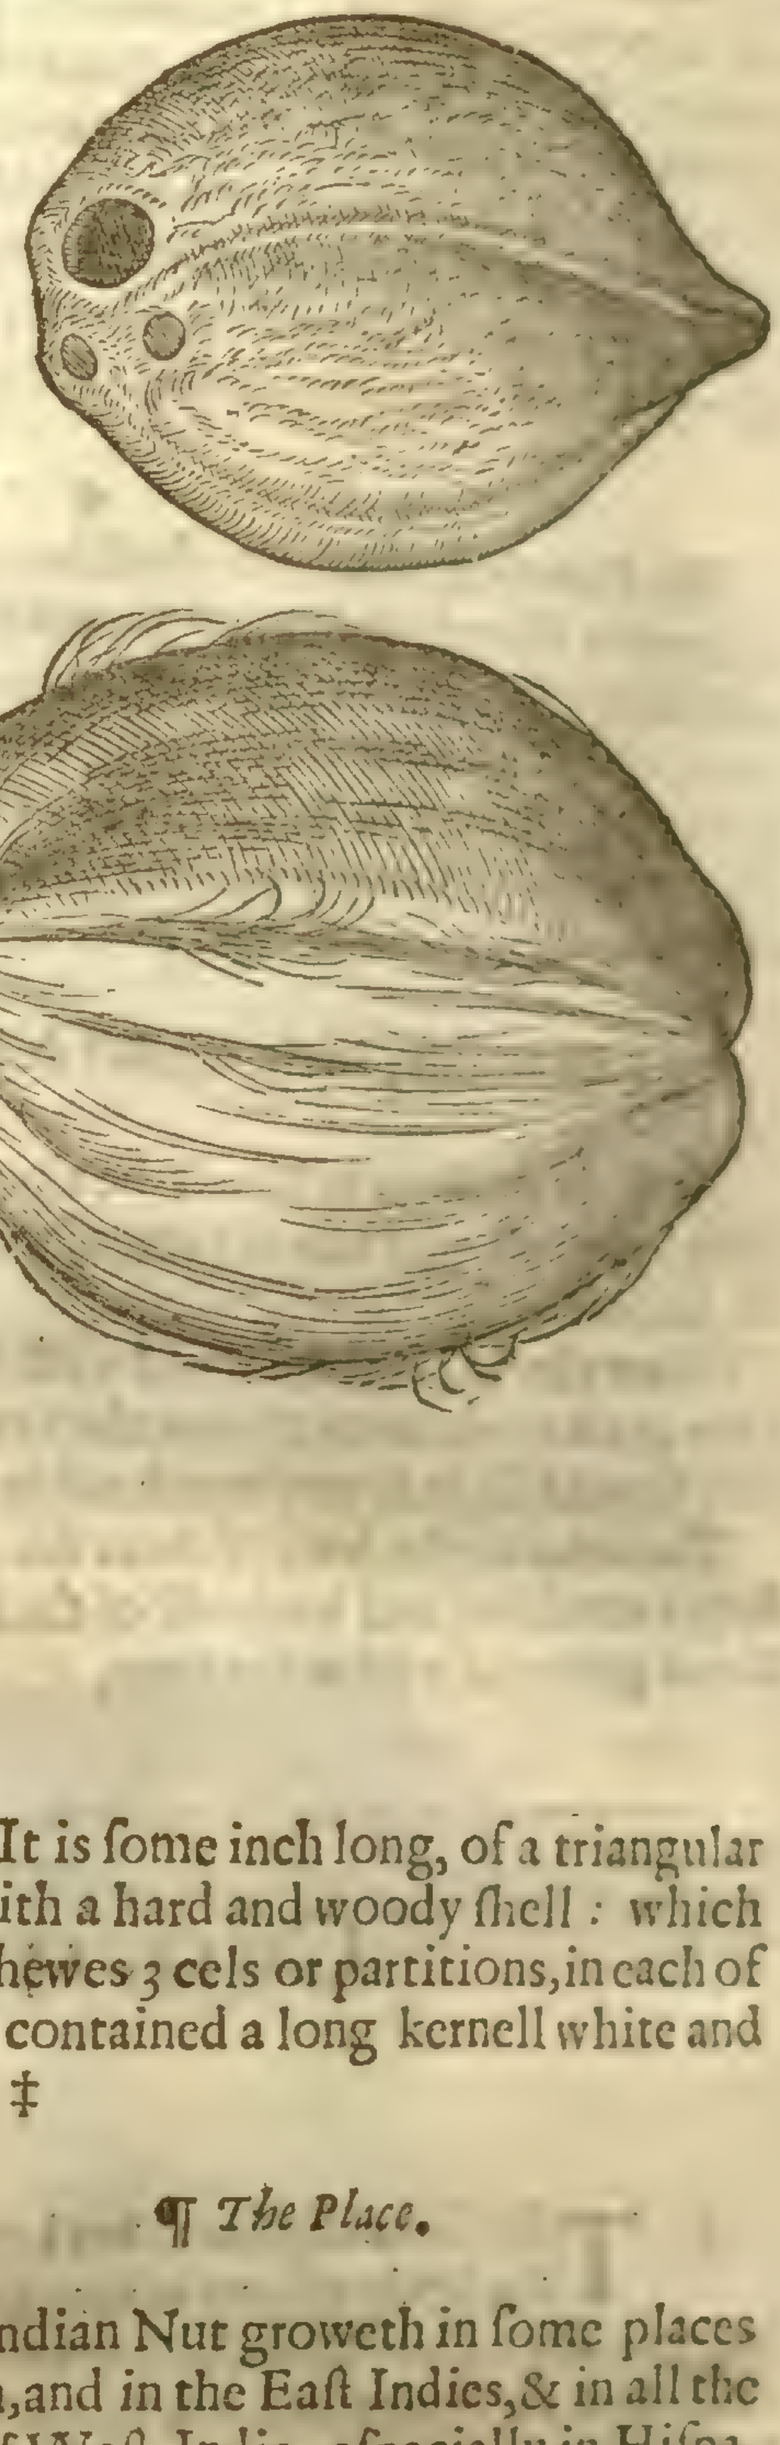
2 We haue no certain knowledge from those that haue trauelled into the Indies, of the tree which beareth this little Indian nut; neither haue we any thing of our own knowledge, more than that we see by experience the fruit hereof is lesser, wherein consisteth the difference.

‡ The other, expressed in the same table with the former, by the name of *Mchenbethenc*, *Clusius* receiued it by the same name from *Cortusus* of Padua; yet it doth not (as hee saith) well agree with the description; and he rather approues of their opinion who refer it to the *Nux vnguentaria*,

1 *Nux Indica arbor.*
The Indian Nut tree.



Nux Indica.
The Indian Nut.



2 *Nucula Indica.*
The little Indian Nut.

or *Ben*. It is ſome inch long, of a triangular figure, with a hard and woody ſhell: which broken ſhewes 3 cels or partitions, in each of which is contained a long kernell white and ſweet. ‡

¶ *The Place.*

This Indian Nut groweth in ſome places of Africa, and in the Eaſt Indies, & in all the Iſlands of Weſt India, eſpecially in Hiſpaniola, Cuba, and S. Iohns Iſland, and alſo vpon the continent by Carthagena, Nombre de dios, and Panama, and in Virginea, otherwiſe called Norembega, part of the ſame Continent, for the moſt part neere vnto the ſea ſide and in moiſt places, but it is ſeldom found in the vplandiſh countries.

¶ *The Time.*

It groweth green Winter and Summer.

¶ *The Names.*

The fruit is called in Latine *Nux Indica*: of the Indians, *Cocus*: of the Portugals that dwel in the Eaſt Indies, *Cocco*, taken from the end, wherein are three holes repreſenting the head of a monkey: *Scrapio* and *Rhaſis* cal this tree, *Iarralnare*, i. *Arborem nuciferam*, the tree bearing nuts: of *Auicen*, *Glaucial hend*: of the vulgar people *Maro*, and the fruit *Narel*; which name *Narel* is common among the Perſians and Arabians. It is called in Malauar, *Tengamaran*: the ripe fruit *Tenga*, and the greene fruit *Eleri*: in Goa it is called *Lanhan*: in Malaio, *Triccan*: and the nut *Nihor*.

The diſtilled liquor is called *Sula*; and the oile that is made thereof, *Copra*,

¶ *The*

¶ *The Temperature.*

It is of a mean temper betwixt hot and cold.

¶ *The Vertues and Vse.*

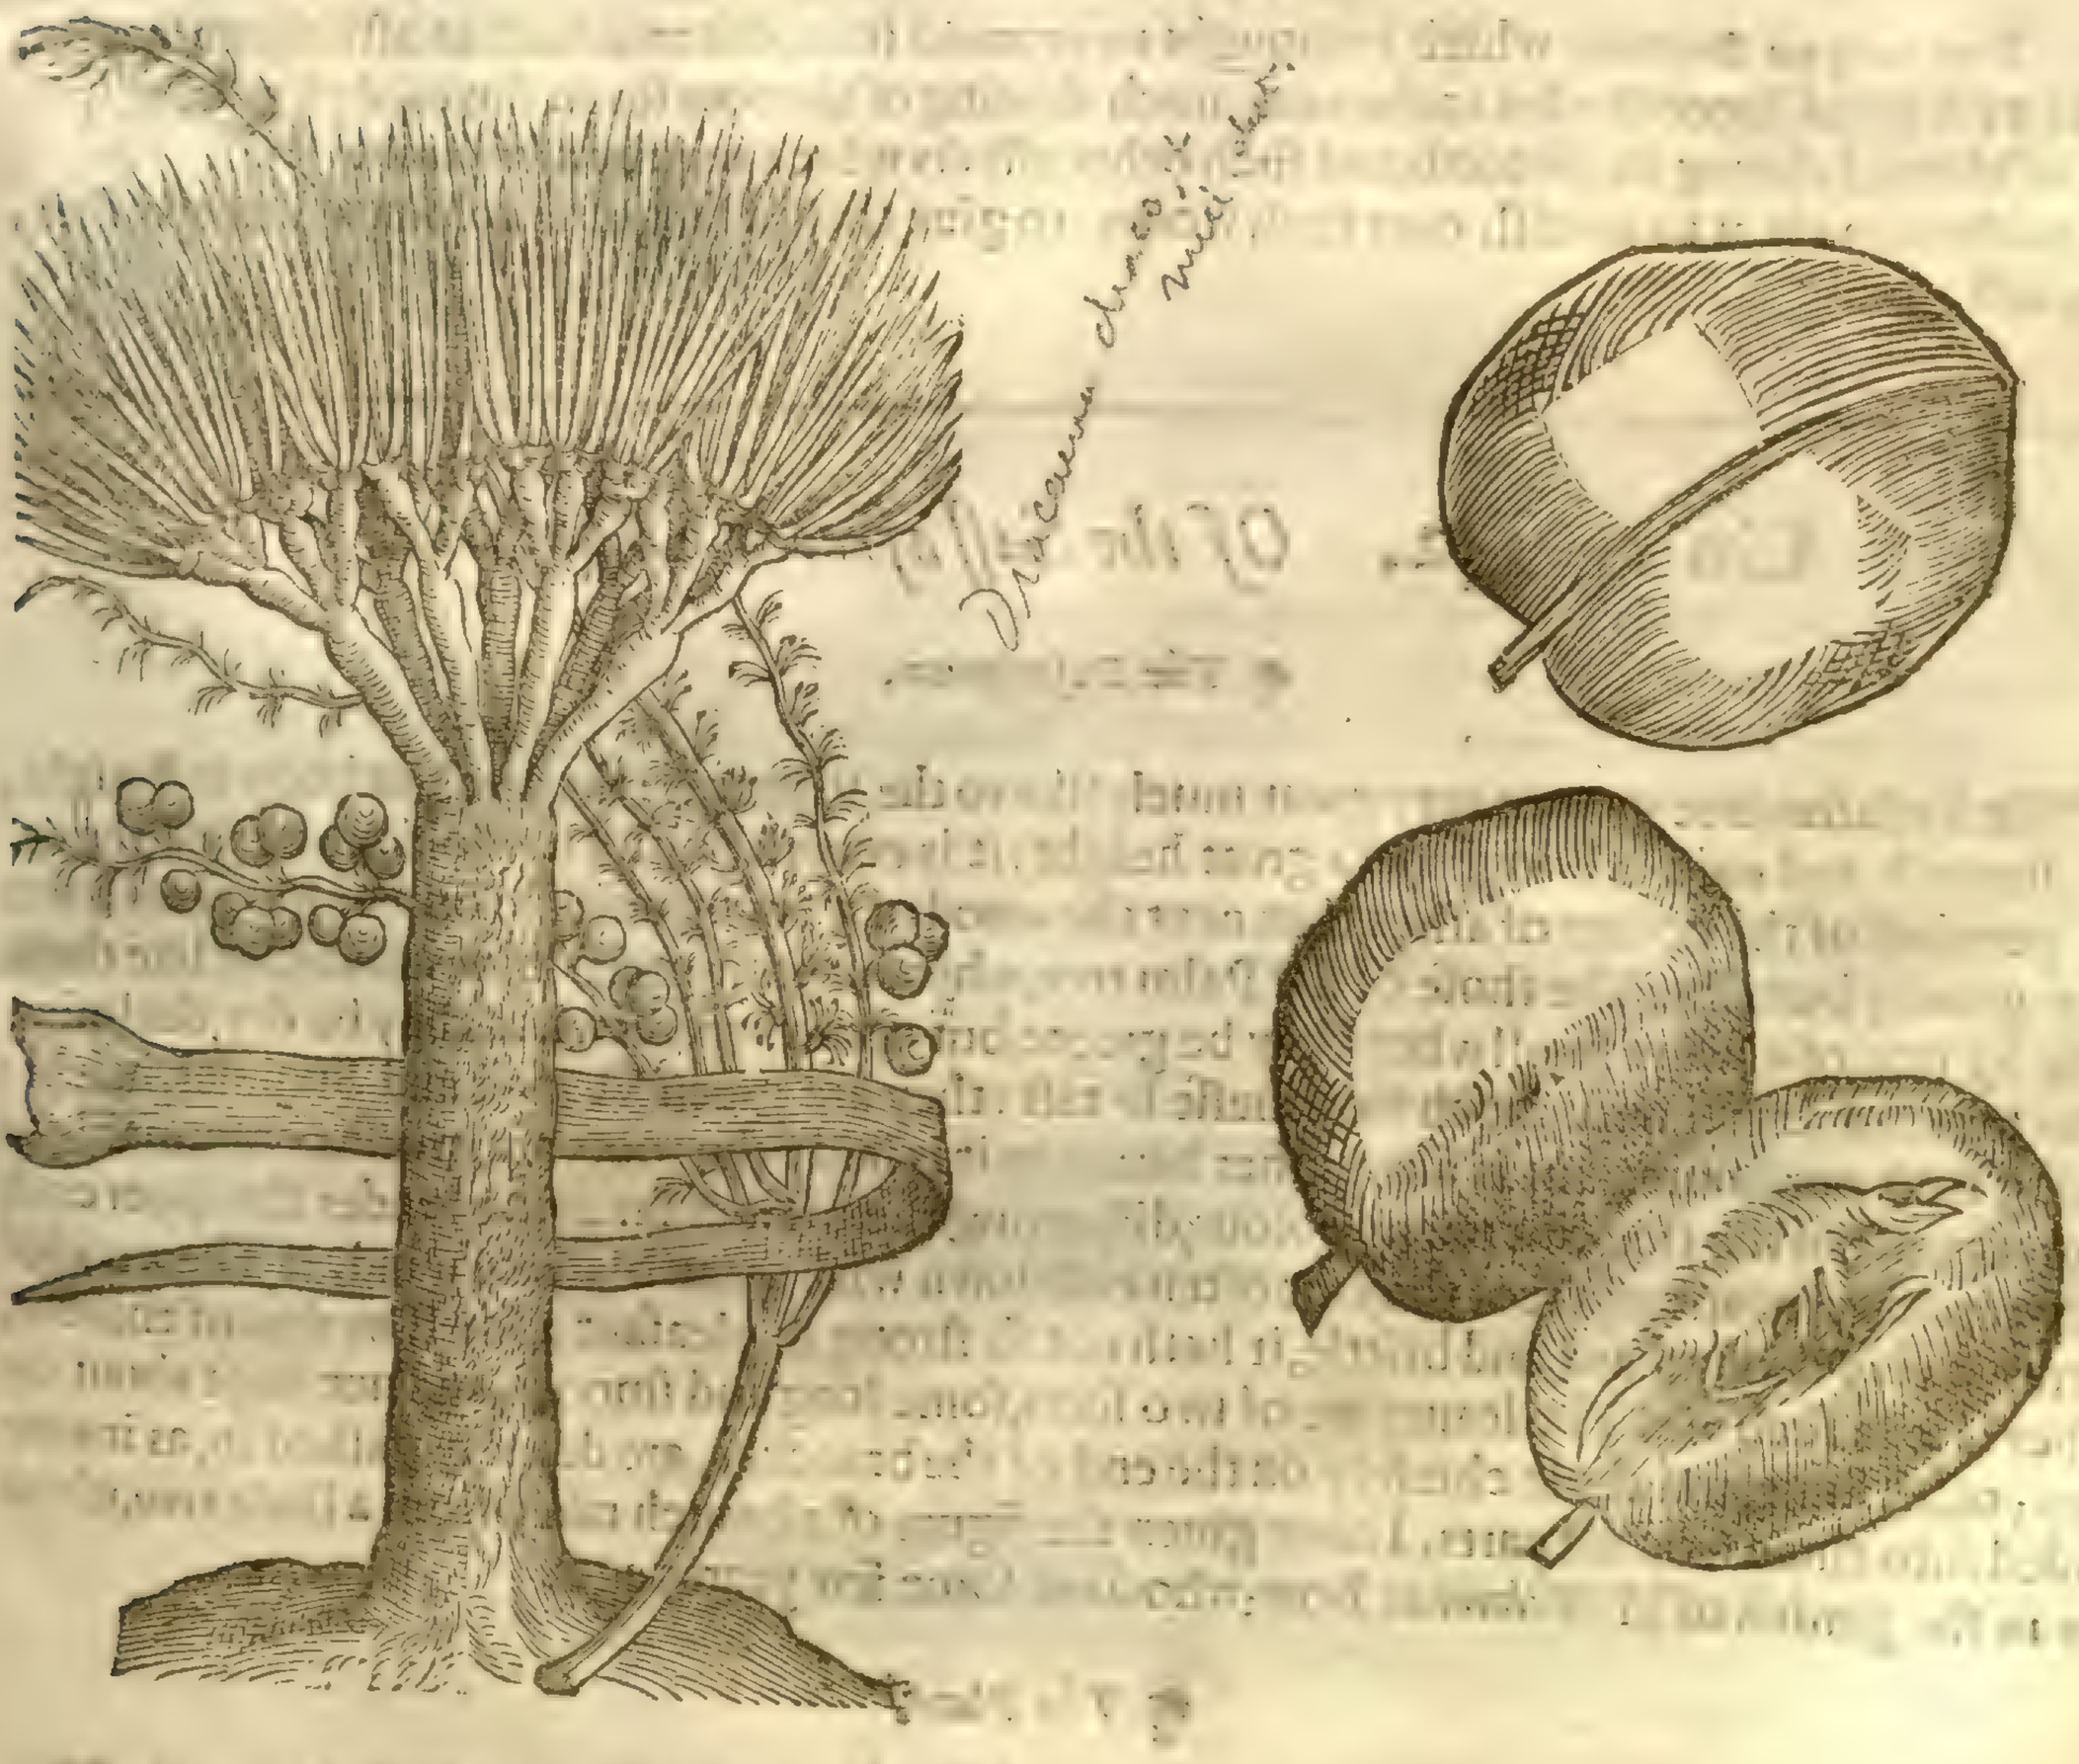
The Indians vse to cut the twigs and tender branches toward the euening, at the ends whereof they haue bottle gourds, hollow canes, and such like things, fit to receiue the water that droppeth from the branches thereof; which pleasant liquor they drinke in stead of wine: from the which is drawn a strong & comfortable Aqua vitæ, which they vse in time of need against all maner of sicknesses. Of the branches and boughs they make their houses, of the trunke or body of the tree ships and boats; of the hemp on the outward part of the fruit they make ropes and cables, and of the finer stuffe sailes for their ships. A

Likewise they make of the shell of the nut cups to drink in, which wee likewise vse in England, garnished with siluer for the same purposes. The kernel serues them for bread and meat: the milky iuice doth serue to coole and refresh their wearied spirits: out of the kernell when it is stamped is pressed a most pretious oile, not only good for meat, but also for medicine, wherewith they annoint their feeble lims after their tedious trauel; by means wherof the ach and pain is mitigated, & other infirmities quite taken away proceeding of other causes. B

Chap. 141. *Of the Dragon Tree.*

1 *Draco arbor.*
The Dragon tree.

Draconis fructus.
The Dragon tree fruit.



¶ *The Description.*

THis strange and admirable tree groweth very great, resembling the Pine tree, by reason it doth alwaies flourish, and hath his boughs or branches of equal length and bignesse, which are bare and naked, of eight or nine cubits long, and of the bignesse of a mans arme: from the ends of which do shoot out leaues of a cubit and a halfe long, and full two inches broad, somewhat thick, & raised vp in the middle, then thinner and thinner like a two edged sword: among which come forth little mossie floures, of small moment, and turn into berries of the bignesse of Cherries, of a yellowish colour;

colour,round,light,and bitter,couered with a threefold skin or film,wherin is to be ſeen,as *Monardus* and diuers others report,the form of a dragon, hauing a long neck and gaping mouth,the ridge or back armed with ſharp prickles like the Porcupine;with a long taile and foure feet very eaſie to be diſcerned: the figure of it we haue ſet forth vnto you according to the greatnes thereof,becauſe our words and meaning may be the better vnderſtood; and alſo the leafe of the tree in his ful bigneſſe,becauſe it is impoſſible to be expreſſed in the figure:the trunk or body of the tree is couered with a tough bark,very thin and eaſie to be opened or wounded with any ſmall toole or inſtrument; which being ſo wounded in the dog days,bruiſed or bored,yeelds forth drops of a thick red liquor, of the name of the tree called Dragons tears,or *Sanguis draconis*,Dragons bloud: diuers haue doubted whether the liquor or bloud were all one with *Cinnabaris* of *Dioſcorides* (not meaning that *Cinnaber* made of Quickſiluer) but the receiued opinion is,they differ not,by reaſon their quality & temperature worke the like effect.

¶ *The Place.*

This tree groweth in an Iſland which the Portugals call Madera,and in one of the Canary Iſles called *Inſula portus ſancti*; and as it ſeemes it was firſt brought out of Africke,though ſome are of a contrarie opinion,and ſay that it was firſt brought from Carthagena in America,by the Biſhop of the ſame prouince.

¶ *The Time.*

The time of his growing we haue touched in the deſcription,where wee ſaid that it flouriſheth and groweth green all the yeare.

¶ *The Names.*

The names haue been ſufficiently ſpoken of in the deſcription,and in their ſeuerall titles.

¶ *The Nature and Vertues.*

A ‡ The *Sanguis Draconis* which is thought to proceed from this tree,hath an aſtringent faculty, and is with good ſucceſſe vſed in the ouermuch flowing of the courſes,in fluxes, dyſenteries, ſpitting of bloud,faſtning looſe teeth,and ſuch other affects which require aſtriction.

B Smiths alſo vſe it to verniſh ouer their works, to giue them a ſanguine colour, and keepe them from ruſt. ‡

Chap. 142. *Of the Saſſafras or Ague tree.*

¶ *The Deſcription.*

THe Saſſafras tree growes very great much like to the Pine tree: the trunk or body is ſtraight, ſmooth,and void of boughs,of a great height: it is couered with a twofold groſſe rind,the vppermoſt of the colour of aſhes,that next the wood of a tawny colour: on the top come forth many goodly branches like thoſe of the Palm tree,whereon grow green leaues ſomwhat like thoſe of the fig tree,of a ſweet ſmell when they be greene,but much ſweeter when they be dry,declining to the ſmell of fennel,with much ſweetneſſe in taſt: they are green Winter and Summer, neither bearing fruit nor floures,but is altogether barren as it is ſaid: the roots are groſſe,conformable to the greatneſſe of the tree,of a tawny colour,diſperſing themſelues far abroad vnder the vpper cruſt of the earth,by means whereof they are often caſt down with mean blaſts of wind. ‡ The wood of the tree is very ſtrong,hard,and brittle,it hath not ſo ſtrong & pleaſant a ſmell as that of the root, neither is it in ſuch vſe. The leaues are of two ſorts,ſome long and ſmooth,and not ſnipt about the edges; otherſome,and thoſe chiefely on the end of the branches, are deepely gaſhed in, as it were diuided into three ſeuerall parts. I haue giuen the figure of a branch taken from a little tree,which grew in the garden of Mr *Wilmot* at Bow;who died ſome few yeares ago.

¶ *The Place.*

This tree groweth in moſt parts of the Weſt Indies, ſpecially about the cape of Florida, Wingandico,and Virginia,otherwiſe named Norembega.

¶ *The Time.*

It flouriſheth and keepeth green Winter and Summer.

¶ The

Sassafras.
The Sassafras tree.

¶ *The Names.*

The Spaniards and French-men haue named this tree, *Sassafras*: the Indians in their tongue, *Pauame*: for want of an English name we are contented to call it the Ague tree, of his vertue in healing the Ague.

¶ *The Tmperature.*

The boughes and branches hereof are hot and dry in the second degree; the rinde is hotter, for that it entreth into the third degree of heate and dryneſſe, as is manifestly perceiued in the decoction.

¶ *The Vertues.*

The best of all the tree is the root, and that worketh the best effect, the which hath the rinde cleauing very fast to the inner part, and is of colour tawny, and much more sweet of smell than all the tree and his branches. A

The rinde tasteth of a more sweet smell than the tree: and the water beeing sod with the root is of greater and better effects than any other part of the tree, and is of a more sweet smell, and therefore the Spaniards vse it, for that it worketh better and greater effects. B

It is a tree that groweth neere vnto the sea, and in temperate places that haue not much drouth, nor moisture. There be mountaines growing full of them, and they cast forth a most sweet smell, so that at the beginning when they saw them first, they thought they had been trees of Cinnamon, and in part they were not deceiued: for that the rinde of this tree hath as sweet a smell as Cinnamon hath, and doth imitate it in colour and sharpneſſe of taste, and pleasantneſſe of smell: and so the water that is made of it is of a most sweet smell and taste, as the Cinamon is, and procureth the same workes and effects as Cinnamon doth. C

The wood hereof cut in small pieces and boyled in water, to the colour of Claret wine, and drunk for certain daies together, helpeth the dropsie, remoueth oppilation or stopping of the liuer, cureth quotidian and tertian agues, and long feuers D

The root of Sassafras hath power to comfort the liuer, and to free from oppilations, to comfort the weake and feeble stomacke, to cause good appetite, to consume windineſſe, the chiefest cause of cruditie and digestion, stay vomiting, and make sweet a stinking breath. E

It prouoketh vrine, remoueth the impediments that doe cause barrenneſſe, and maketh women apt to conceiue. F

Chap. 143. *Of the Storax tree.*

¶ *The Description.*

THe Storax tree groweth to the height and bigneſſe of the Quince tree: the trunke or body is couered with a barke or rinde like vnto the Birch tree: the branches are small and limmer: wheron do grow leaues like those of the Quince tree, greenish aboue, and whitish vnderneath: among which come forth white floures, like those of the Orange tree, of an vnpleasant smell: after commeth the fruit or berries, standing vpon long and slender foot-stalkes, couered ouer with a little woollineſſe, of the bigneſſe of a bladder nut, of of the same colour; wherein is contained small seed,

Styrax arbor.
The Storax tree.

feed, whereto also cleaue certain gummy tears bearing the name of the tree, and which issue from the trunk or body when it is wounded.

¶ *The Place.*

This tree groweth in diuers places of France, Italy, and Spaine, where it bringeth forth little or no gum at all. It groweth in Iudæa, Pamphilia, Siria, Pisidia, Sidon, and many other places of Iury or Palestine, as also in diuers Islands in the Mediterranean sea, namely Cyprus, Candy, Zant, and other places, where it bringeth forth his gummy liquour in full perfection of sweetnesse, and also in great plenty, where it is gathered and put into great Canes or Reeds, whereof as some deem it took the name *Calamita*; others thinke of the leaues of reeds wherein they wrap it. Hereof I haue two smal trees in my garden, the which I raised of seed.

¶ *The Time.*

It flours in May, and the fruit is ripe in September.

¶ *The Names.*

This tree, as may be gathered by some, was called *Styrax*, by reason of the gum or liquor which droppeth out of the same, being like to the hollow pipes of ice that hang at the eaves of houses in winter, called *Styria*, or of the Canes or leaues of Reeds spoken of before: in Latine, *Storax Calamitæ*: in English, Storax, which is kept in canes or the leaues of Reeds. There floweth from some of these trees a certaine gummie liquour, which neuer groweth naturally hard, but remaineth alwayes thinne, the which is called liquid Styrax or Storax.

¶ *The Temperature.*

The gum of this tree is of an heating, mollifying, and concocting qualitie.

¶ *The Vertues.*

A It helpeth the cough, the falling down of rheums and humors into the chest, and hoarsenesse of the voice; it also helpeth the noise and sounding of the ears, preuaileth against *Strumas* or the kings Euill, nodes on the nerues, and hard swellings proceeding of a cold cause, as also against all cold poisons, as Hemlock and the like.

B Of this gum there are made sundry excellent perfumes, pomanders, sweet waters, sweet bags, and sweet washing balls, and diuers other sweet chaines and bracelets, whereof to write were impertinent to this historie.

Chap. 144.

Of the Sorrowfull Tree, or Indian Mourner.

¶ *The Description.*

Arbor Tristis, the Sad or sorrowfull tree, waxeth as big as an Olive tree, garnished with many goodly branches set full of leaues like those of the Plum tree; among which come forth most odoriferous and sweet smelling floures, whose stalkes are of the colour of Saffron, which flourish and shew themselues only in the night time, and in the day time looke withered and with a mourning cheere; the leaues also at that time shrink in themselues together, much like a tender Plant that is frost-bitten, very sadly lumping, lowring, and hanging downe the head, as though it loathed the light, and could not abide the heate of the Sunne. I should but in vain lose labor in repeating a foolish fansie of the poëtical Indians, who would make fooles beleeue that this tree was once a fair daughter of a great Lord or King, and that the Sun was in loue with her; with other toies which I omit.

Arbor triſtis.
The ſorrowfull tree.

omit. ‡ The floures are white, ſomewhat like thoſe of Iaſmine, but more double, and they are of a very ſweet ſmell. There ſucceed them many little cods, containing ſome ſixe ſeeds apiece ſomewhat like thoſe of *Stramonium.* ‡

¶ *The Place, Time, and Names.*

This tree growes in the Eaſt Indies, eſpecially in Goa and Malayo: in Goa it is called *Parizataco:* in Malayo, *Singadi:* in Decan, *Pul:* of the Arabians, *Guart:* of the Perſians and Turks, *Gul:* in Engliſh, the ſad or ſorowfull tree, or the Indian mourner. The time is ſpecified in the deſcription.

¶ *The Nature and Vertues.*

Wee haue no certaine knowledge of the temperature hereof; neuertheleſſe we reade, that the Indians doe colour their broths and meats with the ſtalks of the floures hereof in ſtead of Saffron; or whatſoeuer they deſire to haue of a yellow colour. A

It is reported, That if a linnen cloath bee ſteeped in the diſtilled water of the flours, & the eies bathed and waſhed therwith, it helpeth the itching and pain thereof, and ſtayes the humors that fall down to the ſame. B C

There is made of the ſplinters of the wood certain tooth-picks, and many prety toies for pleaſure.

Chap. 145. *Of the Balſam tree.*

¶ *The Kindes.*

THere be diuers ſorts of trees from which do flow Balſams, very different one from another, not only in form, but alſo in fruit, liquor, and place of growing; the which to diſtinguiſh would require more time and trauell than either our ſmall time will afford, or riches for our maintenance to diſcouer the ſame in their natural countries: which otherwiſe by report to ſet downe certain matter by incertainties, would diſcredit the Author, and no profit thereby ſhall ariſe to the Reader: notwithſtanding we wil ſet down ſo much as we haue found in the works of ſome trauellers, which beſt agree with the truth of the hiſtorie.

¶ *The Deſcription.*

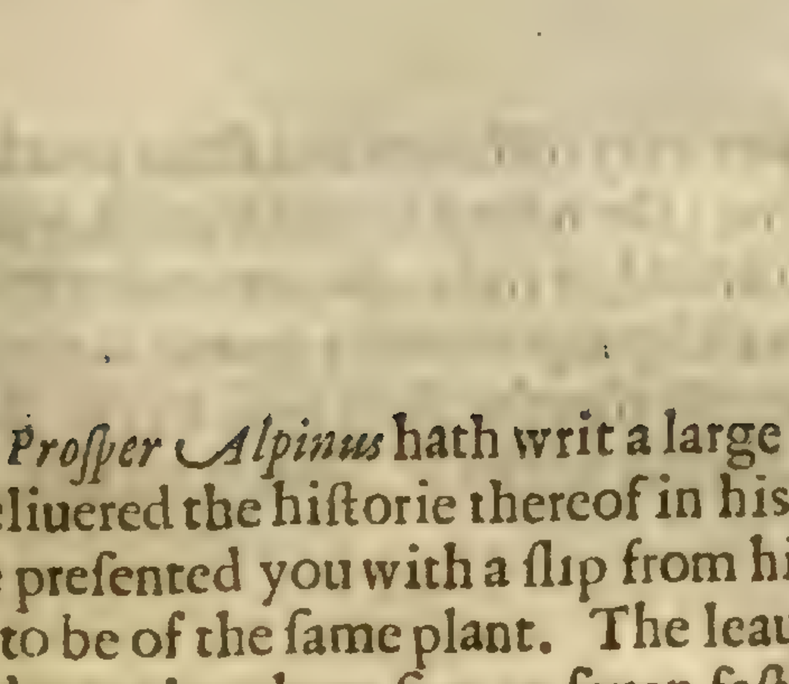
1 THere be diuers trees growing in the Indies, whoſe fruits are called by the name of the fruit of the Balſam tree: among the reſt this whoſe figure wee here ſet forth vnto your view, we our ſelues haue ſeen & handled, and therfore are the better able to deſcribe it. It is a fruit very crooked, & hollowed like the palm of an hand, two inches long, half an inch thick, couered with a thick ſmooth rind, of the colour of a dry oken leafe; wherein is contained a kernell (of the ſame length and thickneſſe, apt to fil the ſaid ſhel or rinde) of the ſubſtance of an almond, of the colour of aſhes, fat and oily, of a good ſmell, but very vnpleaſant in taſt.

2 The wood we haue dry brought vnto vs from the Indies for our vſe in phyſicke (a ſmall deſcription may ſerue for a dry ſticke) neuertheleſſe wee haue other fruits brought from the Indies, whoſe figures are not ſet forth, by reaſon they are not ſo well knowne as deſired; whereof one is of the bigneſſe of a walnut, ſomewhat broad on the vpper ſide, with a rough or rugged ſhell, vneuen, blacke of colour, and full of a white kernell, with much juice in it, of a pleaſant taſt and ſmell, like the oile of Mace: the whole fruit is exceeding light, in reſpect of the quantity or bigneſſe, euen as

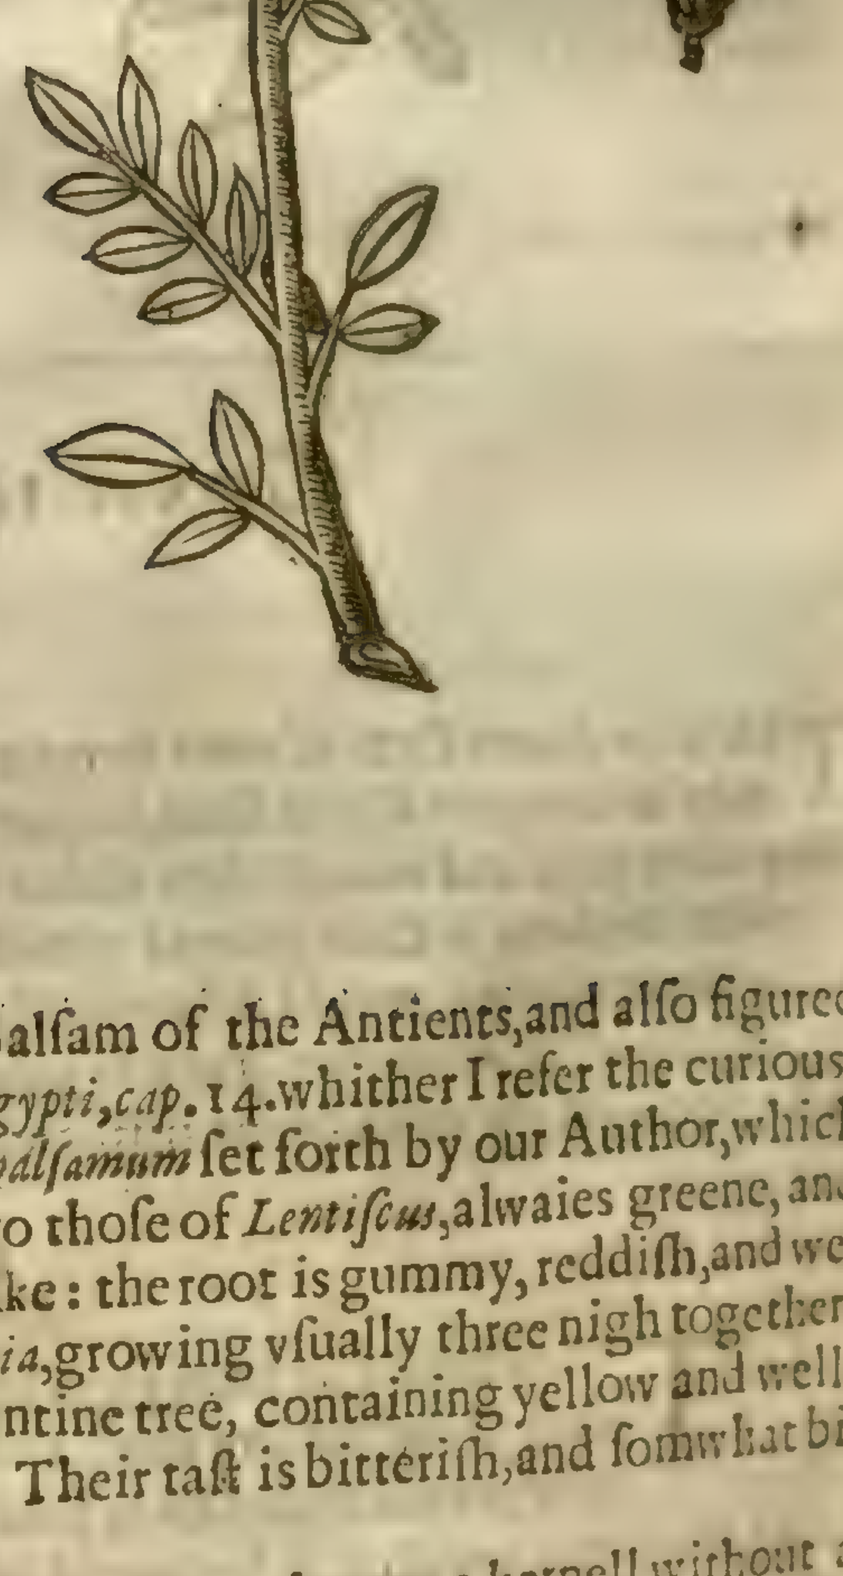
it were a piece of corke, which notwithſtanding ſinketh to the bottom when it fals into the water, like as doth a ſtone.

3 This tree, ſaith *Garcias*, that beareth the fruit *Carpobalſamum*, is alſo one of the Balſam trees: it groweth to the height and bigneſſe of the Pomegranat tree, garniſhed with very many branches, whereon do grow leaues like thoſe of Rue, but of colour whiter, alwaies growing greene: amongſt which come forth floures, whereof wee haue no certaintie: after which commeth forth fruit like that of the Turpentine tree, which in ſhops is called *Carpobalſamum*, of a pleaſant ſweet ſmell; but the liquor which floweth from the wounded tree is much ſweeter, which liquor is called of ſome, *Opobalſamum*.

1 *Balſami fructus.*
The fruit of the Balſam tree.



‡ 3 *Balſamum Alpini cum Carpobalſamo.*
The Balſam tree with the fruit.



‡ *Proſper Alpinus* hath writ a large Dialogue of the Balſam of the Antients, and alſo figured and deliuered the hiſtorie thereof in his book *De Plant. Ægypti, cap.* 14. whither I refer the curious. I haue preſented you with a ſlip from his tree, & the *Carpobalſamum* ſet forth by our Author, which ſeems to be of the ſame plant. The leaues of this are like to thoſe of *Lentiſcus*, alwaies greene, and winged, growing three, fiue, or ſeuen faſtned to one footſtalke: the root is gummy, reddiſh, and well ſmelling: the floures are ſmal and white like thoſe of *Acacia*, growing vſually three nigh together. The fruit is of the ſhape and bigneſſe of that of the Turpentine tree, containing yellow and well-ſmelling ſeeds filled with a yellowiſh moiſture like hony. Their taſt is bitteriſh, and ſomwhat biting the tongue. ‡

Of theſe Balſam trees there is another ſort, the fruit whereof is as it were a kernell without a ſhell, couered with a thin skin ſtraked with many veins, of a brown colour; the meat is firm and ſolid like the kernell of the Indian nut, of a white colour, and without ſmell, but of a gratefull taſte; and it is thought to be hot in the firſt degree, or in the beginning of the ſecond.

There be diuers ſorts more, which might be omitted becauſe of tediouſneſſe, neuertheles I will trouble you with two ſpecial trees worth the noting; There is, ſaith my author, in America a great tree of monſtrous hugeneſſe, beſet with leaues and boughes euen to the ground, the trunk whereof is couered with a twofold bark, the one thicke like vnto Cork, aed another thin next the tree: from betweene which barks doth flow (the vpper barke being wounded) a white Balſam like vnto teares or

or drops, of a moſt ſweet ſauor and ſingular effects, for one drop of this which thus diſtilleth out of the tree, is worth a pound of that which is made by decoction. The fruit hereof is ſmal in reſpect of the others; it ſeldome exceedeth the bigneſſe of a peaſe, of a bitter taſt, incloſed in a narrow huſk of the length of a finger, ſomthing thin, and of a white colour, which the Indians vſe againſt headache: which fruit of moſt is that we haue before deſcribed, called *Carpobalſamum*.

It is alſo written that in the Iſland called Hiſpaniola, there growes a ſmall tree of the height of two men, without the induſtry of man, hauing ſtalks and ſtems of the colour of aſhes; whereon do grow green leaues, ſharp at both ends, but more green on the vpper ſide than on the lower, hauing a middle rib ſomewhat thicke and ſtanding out: the foot ſtalke whereon they grow is ſomwhat reddiſh: among which leaues comes fruit growing by cluſters, as long as a mans hand. The ſtones or graines in the fruit be few, and greene, but growing to redneſſe more and more as the fruit waxeth ripe: from the which is gathered a juice after this manner; they take the yong ſhoots and buds of the tree, and alſo the cluſters of the fruit, which they bruiſe and boile in water to the thickneſſe of hony, which being ſtrained, they keep for their vſes.

They vſe it againſt wounds and vlcers, it ſtops and ſtancheth the bloud, maketh them clean, bringeth vp the fleſh, and healeth them mightily, and with better ſucceſſe than true Balſam. The branches of the tree being cut, do caſt forth by drops a certain cleare water, more worth than *Aqua vitæ*, moſt wholſome againſt wounds and all other diſeaſes proceeding from cold cauſes, being drunke ſome few daies together.

¶ *The Place.*

Theſe trees grow in diuers parts of the world, ſome in Egypt and moſt of thoſe countries adjacent. There groweth of them in the Eaſt and Weſt Indies, as trauellers in thoſe parts report.

¶ *The Time.*

Theſe trees for the moſt part keepe green Winter and Summer.

¶ *The Names.*

Balſam is called in Greek, Βάλσαμον: in Latine alſo *Balſamum*: of the Arabians, *Balſeni*, *Baleſina*, and *Bolſan*: in Italian, *Balſamo*: in French, *Baume*.

The liquor that flowes out of the tree when it is wounded, is called *Opobalſamum*: the wood, *Xylobalſamum*: the fruit, *Carpobalſamum*: and the liquor which naturally flowes from the tree in Egypt, *Balſamum*.

¶ *The Temperature.*

Balſam is hot and dry in the ſecond degree, with aſtriction.

¶ *The Vertues.*

Natural Balſam taken in a morning faſting, with a little Roſe water or Wine, to the quantity of A
fiue or ſix drops, helpeth thoſe that be aſthmatick or ſhort winded: it preuaileth againſt the pains
of the bladder and ſtomack, comforting the ſame mightily: it alſo amendeth a ſtinking breath, and
takes away the ſhaking fits of the quotidian ague, if it be taken two or three times.

It helpeth conſumptions, clenſeth the barren wombe, eſpecially being annointed vpon a peſſary B
or mother ſuppoſitorie, and vſed.

The ſtomack being anointed therewith, digeſtion is helped thereby; it alſo preſerueth the ſto- C
mack from obſtruction and windineſſe; it helps the hardneſſe of the ſpleen, eaſeth the griefs of the
reins and belly, proceeding of cold cauſes.

It alſo takes away all manner of aches occaſioned by cold, if they be annointed therewith; but D
more ſpeedily, if a linnen cloth be wet therein and laid thereon: vſed in the ſame manner it diſſol-
ueth hard tumors called *œdemata*; and ſtrengthneth the weak members.

The ſame refreſheth the brain, and comforteth the parts adioyning; it helpeth the palſie, Con- E
vulſions, and all griefes of the ſinues, being anointed therewith.

The maruellous effects it worketh in new and green wounds, were here too long to ſet down, and F
alſo ſuperfluous, conſidering the skilfull Surgeon, whom it moſt concernes, knoweth the vſe there-
of: and as for the beggerly Quackſaluers, Runnagates, and knauiſh Mountibankes, we are not wil-
ling to inſtruct them in things ſo far aboue their reach, capacitie, and worthineſſe.

Chap. 146. *Of a kinde of Balme or Balſam tree.*

¶ *The Deſcription.*

THis tree which the people of the Indies do call *Molli*, groweth to the bigneſſe of a great tree, hauing a trunke or bodie of a darke greene colour, ſprinkeled ouer with many aſh-coloured

ſpots:

ſpots: the branches are many, and of very great beauty, whereupon grow leaues not vnlike thoſe of the aſh tree, conſiſting of many ſmal leaues ſet vpon a middle ribbe, growing narrower euer toward the point, euery particular one jagged on the ſides like the teeth of a Saw; which beeing plucked from the ſtem, yeelds forth a milky juice tough and clammy, ſauouring like the bruiſed leaues of fenell, and in taſt ſeems ſomewhat aſtringent: the floures grow in cluſters on the twiggy branches, like thoſe of the Vine a little before the grapes are formed: after followes the fruit or berries, ſomwhat greater than pepper corns, of an oily ſubſtance, green at the firſt, and of a dark reddiſh colour when they be ripe. ‡ The firſt of the figures was taken from a tree only of three years growth, but the later from a tree come to his full growth, as it is affirmed by *Cluſius* in his *Cur. Poſt.* It differs only, in that the leaues of the old tree are not at all ſnipt or diuided about the edges. ‡

1 *Molli, ſiue Molly Cluſij & Lobelij.*
The Baſſam tree of *Cluſius* and *Lobels* deſcription.

‡ 2 *Molle arboris adulti ramus.*
A branch of the old tree of Molle.

¶ *The Place.*

This tree, ſaith a learned Phyſition *Ioh. Fragoſus*, growes in the king of Spains garden at Madril, which was the firſt that euer he had ſeen: ſince which time, *Iohn Ferdinando*, Secretarie to the ſaid King, did ſhew vnto the ſaid *Fragoſus* in his own garden a tree ſo large, and of ſuch beauty, that he was neuer ſatisfied with looking on it, and meditating vpon the vertues thereof. Which words I receiued from the hands of a famous learned man called Mr *Lancelot Browne*, D^r in phyſick, and phiſition to the Queenes Maieſtie at the impreſſion hereof; faithfully tranſlated out of the Spaniſh tongue, without adding or taking any thing away.

They grow plentifully in the vales and low grounds of Peru, as all affirm that haue trauelled to the Weſt Indies; as alſo thoſe that haue deſcribed the ſingularities thereof. My ſelfe with diuers others, as namely Mr *Nicholas Lete* a Worſhipfull Merchant of the Citie of London; and alſo a moſt skilful Apothecarie Mr *Iames Garret*, who haue receiued ſeeds hereof from the right honorable the Lord *Hunſdon* Lord high Chamberlaine of England; who is worthy of triple honor, for his care in getting, as alſo for his curious keeping ſuch rare and ſtrange things brought from the fartheſt parts of the world. Which ſeeds we haue ſown in our gardens, where they haue brought forth plants of a foot high, and alſo their beautifull leaues; notwithſtanding our care, diligence, and

and industry, they haue perished at the first approch of winter, as not being able by reason of their tenderneſſe to endure the cold of our winter blasts.

¶ *The Time.*

As touching the time of his flouriſhing and bringing his fruit to maturitie, wee haue as yet no certain knowledge, but is thought to be green both winter and ſummer.

¶ *The Names.*

This moſt notable tree is called by the Indian name *Molle*: of ſome, *Molly* and *Muelle*, taken from his tender ſoftneſſe, as ſome haue deemed: it may be called the Fenel tree, or one of the Balme or Balſam trees.

¶ *The Temperature.*

This tree is thought to be of an aſtringent or binding qualitie, whereby it appeares, beſides the hot temperature it hath, to be compounded of diuers other faculties.

¶ *The Vertues.*

The Indians vſe to ſeeth the fruit or berries hereof in water, and by a ſpeciall skill they haue in the boiling, do make a moſt wholſome wine or drinke, as alſo a kinde of vineger, and ſomtimes hony; which are very ſtrange effects, theſe three things being ſo contrary in taſte. A

The leaues boiled and the decoction drunke, helpeth them of any diſeaſe proceeding of a cold cauſe. B

The gum which iſſueth from the tree, being white like vnto Manna, diſſolued in milke, taketh away the web of the eies, and cleareth the ſight, being wiped ouer with it. C

The barke of this tree boiled, and the legs that be ſwoln and full of paine bathed with the decoction diuers times, taketh away both the infirmities in ſhort ſpace. D

This tree is of ſuch eſtimation among the Indians, that they worſhip it as a god, according to their ſauage rites and ceremonies. Like as *Pliny* reporteth of *Homers Moly*, the moſt renowned of all plants, which they of old time had in ſuch eſtimation and reuerence, that, as it is recorded, the gods gaue it the name of *Moly*, and ſo writeth *Ouid*, E

Pacifer huic dederat florem Cyllenius album,
Moly vocant Superi, nigra radice tenetur.

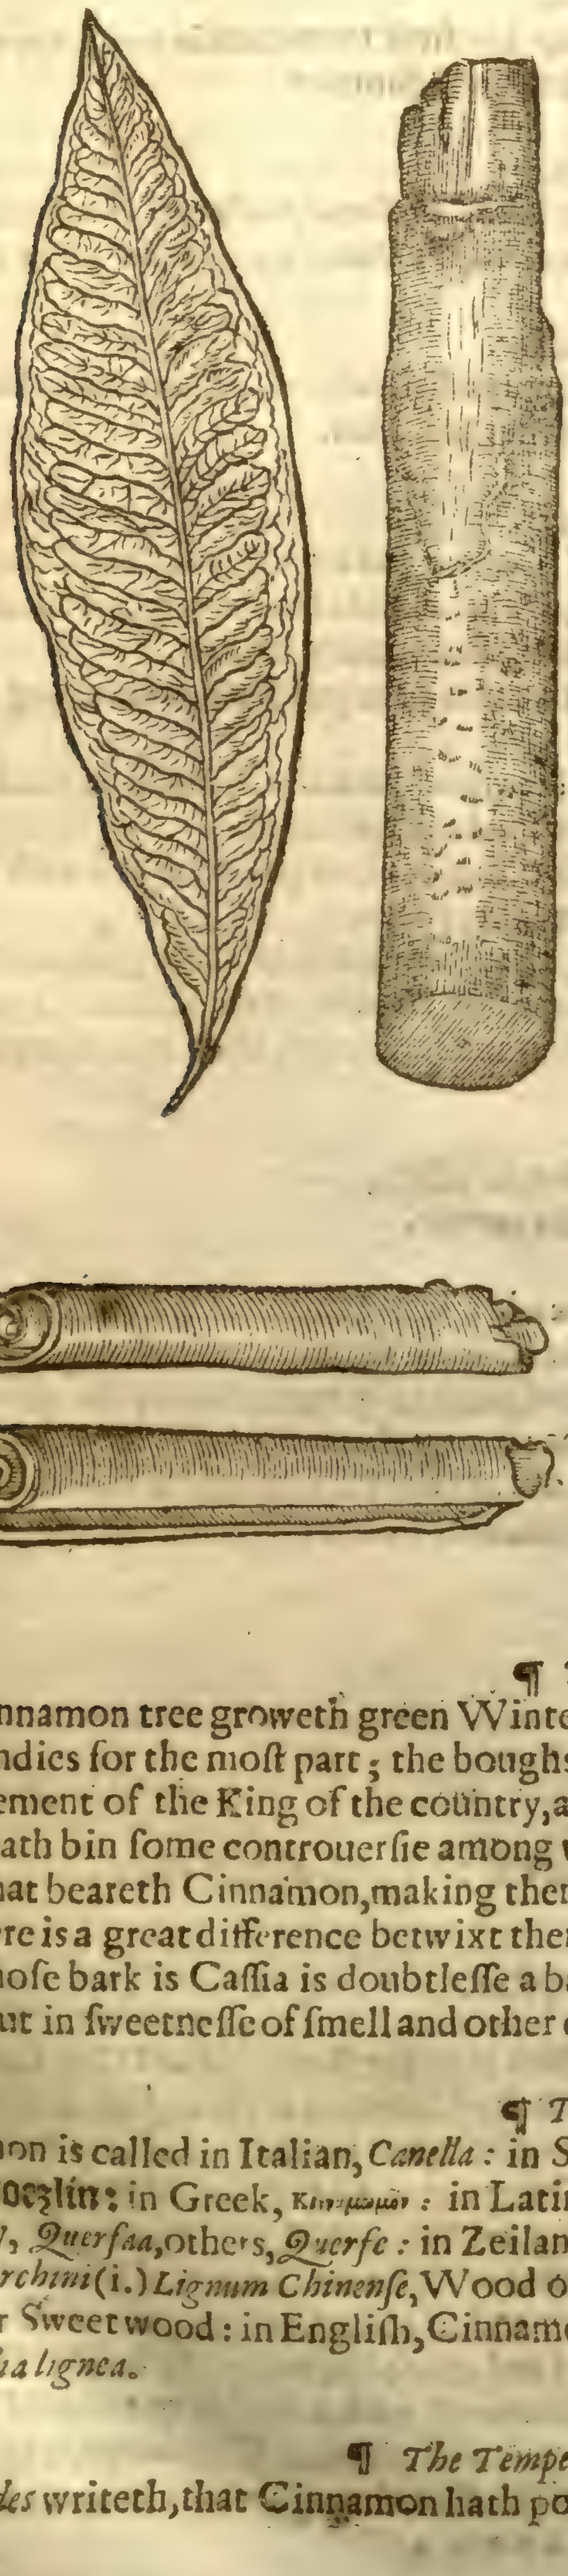
If any be deſirous to ſee more hereof, they may reade a learned diſcourſe of it ſet forth in Latine by the learned *Lobel*, who hath at large written the hiſtorie thereof, dedicated to the right honorable the Lord Chamberlain at the impreſſion hereof, faithfully examined by the aforeſaid learned phyſitian Dr *Browne*, and his cenſure vpon the ſame: ‡ together with *Lobels* Reply, who iudged this plant (and not without good reaſon) to be a kind of the true Balſam of the Antients, and not much differing from that ſet forth by *Proſper Alpinus*, whereof I haue made mention in the foregoing chapter. ‡ F

Chap. 147. *Of the Canell or Cinnamon tree.*

¶ *The Deſcription.*

THe tree which hath the Cinamon for his bark is of the ſtature of an Olive tree, hauing a body as thick as a mans thigh, from whence the Cinamon is taken; but that taken from the ſmaller branches is much better: which branches or boughes are many and very ſtraight, whereon grow beautifull leaues in ſhape like thoſe of the Orenge tree, and of the colour of the Bay leaf, not as it hath been reported, like vnto the leaues of flags or Flour-de-Lys. Among theſe pleaſant leaues and branches come forth many faire white floures, which turn into round black fruit or berries of the bigneſſe of an Haſell nut or the Olive berry, and of a black colour; out of which is preſſed an oile that hath no ſmell at all vntill it be rubbed and chafed between the hands: the trunk or body with the greater arms or boughs of the tree are couered with a double or twofold barke like that of the Corke tree, the innermoſt whereof is the true and pleaſant Cinnamon, which is taken from the tree and caſt vpon the ground in the heate of the Sun, through whoſe heate it turneth and

Canellæ folium Bacillus, & Cortex.
The leafe, barke, and trunke of the Cinamon tree.



foldeth it ſelfe round together, as we daily ſee by viewing the thing it ſelfe. This tree being thus peeled recouereth a new bark in the ſpace of three yeares, and is then readie to be disbarked as afore. That Cinnamon which is of a pale colour hath not bin well dried in the ſun: that of a fair brown color is beſt, and that which is blackeſt hath bin too much dried, and alſo hath taken ſome wet in the time of drying.

‡ 2 Beſides the Cinnamon vulgarly known & vſed, there is another ſort, which alſo is commonly receiued for the *Caſia* of *Dioſcorides* and the Antients. Now this differs from the former, in that it is of a redder colour, of a more hard ſollid and compact ſubſtance, commonly alſo thicker, and if you chew it, more clammy and viſcous. The taſte and ſmell are much like Cinnamon, yet not altogether ſo ſtrong as that of the beſt Cinnamon. There is much controuerſie in late Writers, concerning both the true Cinnamon and Caſſia of the Antients: the which I haue not time nor ſpace here to mention, much leſſe to inſiſt vpon. I haue obſerued, that both the Cinnamon & Caſſia that we haue are couered ouer with a rough grayiſh barke like that of an Oke or other ſuch tree, which is clean ſcraped off and taken away before it be brought vnto vs. ‡

¶ *The Place.*

The chiefeſt places where the trees doe grow that beare Cinnamon, are Zeilan and Malavar; but thoſe of Zeilan are the beſt. They grow in other of the Molucca Iſles, as Iaoa and Iava, the greater and the leſſe, and alſo in Mindanoa, for the moſt part vpon mountaines.

¶ *The Time.*

The Cinnamon tree groweth green Winter and Summer, as do all the others of the Molucca's and Eaſt Indies for the moſt part; the boughs whereof are cut off at ſeaſonable times, by expreſſe commandement of the King of the country, and not before he appoints the time.

There hath bin ſome controuerſie among writers concerning the tree whoſe bark is Caſſia and that tree that beareth Cinnamon, making them both one tree; but that opinion is not to be receiued, for there is a great difference betwixt them, as there is betwixt an Oke and a Cheſtnut tree; for the tree whoſe bark is Caſſia is doubtleſſe a baſtard kinde of Canell or Cinnamon, in ſhew it is very like, but in ſweetneſſe of ſmell and other circumſtances belonging to Cinnamon far inferior.

¶ *The Names.*

Cinnamon is called in Italian, *Canella*: in Spaniſh, *Canela*: in French, *Canelle*: in high-Dutch, **Zimmet coeʒlin**: in Greek, Κινναμωμον: in Latine likewiſe *Cinnamomum*: the Arabians, *Darſeni*, and as ſome ſay, *Querfaa*, others, *Querfe*: in Zeilan, *Cunde*: in the Iſland Iava they name it *Cameia*: in Ormus, *Darchini* (i.) *Lignum Chinenſe*, Wood of China: in Malavar, *Cais ñiains*, which ſignifies *Dulce lignum*, or Sweet wood: in Engliſh, Cinnamome, Cinnamon, and Canel. The other is called *Caſſia*, and *Caſsia lignea*.

¶ *The Temperature and Vertues.*

Dioſcorides writeth, that Cinnamon hath power to warme, and is of thinne parts. It is alſo dry and

and astringent, it prouoketh vrine, cleereth the eies and maketh sweet breath.

The decoction bringeth downe the menses, preuaileth against the bitings of venomous beasts, B
the inflammotions of the intestines and reines.

The distilled water hereof is profitable to many, and for diuers infirmites, it comforteth the C
weake, cold, and feeble stomacke, easeth the paines and frettings of the guts and entrailes proceeding of cold causes, it amendeth the euill colour of the face, maketh sweet breath, and giueth a most pleasant taste vnto diuers sorts of meates, and maketh the same not onely more pleasant, but also more wholesome for any bodies of what constitution soeuer they be, notwithstanding the binding quality.

The oile drawne chimically preuaileth against the paines of the brest, comforteth the stomacke, D
breaketh windinesse, causeth good digestion, and being mixed with some hony, taketh away spots from the face being annointed therewith.

The distilled water of the floures of the tree, as *Garcias* the Lusitanian Physition writeth, excel- E
leth far in sweetnesse all other waters whatsoeuer, which is profitable for such things as the barke it selfe is.

Out of the berries of this tree is drawn by expression, as out of the berries of the Oliue tree, a cer- F
taine oile, or rather a kinde of fat like butter, without any smell at all, except it be made warme, and then it smelleth as the Cinnamon doth, and is much vsed against the coldnesse of the sinewes, all paines of the joynts, and also the paines and distemperature of the stomacke and breast.

To write as the worthinesse of the subject requireth, would aske more time than we haue to be- G
stow vpon any one plant; therefore these few shall suffice, knowing that the thing is of great vse among many, and knowne to most.

‡ *Cassia* vsed in a larger quantity serueth well for the same purposes which Cinnamon H
doth. ‡

Chap. 148. *Of Gum Lacke and his rotten tree.*

Lacca cum suis bacillis.
Gum Lacke with his staffe or sticke.

¶ *The Description.*

THe tree that bringeth forth that excremental substance called *Lacca*, both in the shops of Europ and elsewhere, is called of the Arabians, Persians, and Turkes, *Loc Sumutri*, as who should say, *Lacca* of Sumutra: some which haue so termed it haue thought that the first plenty thereof came from Sumutra, but herein they haue erred, for the abundant store thereof came from Pegu, where the inhabitants therof do cal it *Lac*, & others of the same prouince, *Trec*: the history of which tree, according to that famous Herbarist *Clusius* is as followeth. [There is in the country of Pegu and Malabar, a great tree, whose leaues are like them of the Plum tree, hauing many small twiggy branches; when the trunk or body of the tree waxeth old, it rotteth in sundry places, wherin do breed certain great Ants or Pismires, which continually work and labour in the time of Haruest and Summer, against the penury of Winter: such is the diligence of those Ants, or such is the nature of the tree wherein they harbour, or both, that they prouide for their winter food, a lumpe or masse of substance, which is of a crimson colour, so beautifull and so faire, as in the whole World the like is not seene, which serueth not onely to physicall vses, but is a perfect and costly colour for Painters, called by vs, Indian Lack. The Pismires (as I said) worke out this colour, by sucking the substance or matter of Lacca from the tree, as bees doe make hony and wax, by sucking the matter

thereof from all herbes, trees, and floures, and the inhabitants of that country, do as diligently seeke for this Lacca, as we in England and in other countries seeke in the woods for hony; which Lacca after they haue found, they take from the tree, and dry it into a lumpe; among which sometimes there come ouer some stickes and pieces of the tree with the wings of the Ants, which haue fallen among it, as we daily see.

‡ The Indian Lacke or Lake which is the rich colour vsed by Painters, is none of that which is vsed in shops, nor here figured or described by *Clusius*, wherefore our Author was much mistaken in that hee here confounds together things so different; for this is of a resinous substance, and a faint red colour, and wholly vnfit for painters, but vsed alone and in composition to make the best hard sealing wax. The other seemes to bee an artificiall thing, and is of an exquisite crimson colour, but of what it is, or how made, I haue not as yet found any thing that carries any probabilitie of truth. ‡

¶ *The Place.*

The tree which beareth Lacca groweth in Zeilan and Malauar, and in other parts of the East-Indies.

¶ *The Time.*

Of the time we haue no certaine knowledge.

¶ *The Names.*

Indian Lacke is called in shops *Lacca:* in Italian, *Lachetta:* *Auicen* calleth it *Luch:* *Paulus* and *Dioscorides*, as some haue thought, *Cancamum:* the other names are expressed in the description.

¶ *The Temperature and Vertues.*

A Lacke or Lacca is hot in the second degree, it comforteth the heart and liuer, openeth obstructions, expelleth vrine, and preuaileth against the dropsie.

B There is an artificiall Lacke made of the scrapings of Brasill and Saffron, which is vsed of Painters, and not to be vsed in Physicke as the other naturall Lacca.

Chap. 149. *Of the Indian leafe.*

Tamalapatra.

The Indian leafe.

¶ *The Description.*

Tamalapatra, or the Indian leafe growes vpon a great tree like the Orenge tree, with like leaues also, but broader, a little sharp pointed, of a greene glistering colour, and three small ribs running through each leafe, after the manner of Ribwort, wherby it is easie to be known: it smelleth somewhat like vnto Cloues, but not so strong as Spikenard or Mace (as some haue deemed) nor yet of so subtill and quick a sent as Cinnamon. There was sent or added vnto this figure by *Cortusus* a certaine fruit like vnto a small Acorn, with this inscription, *Fructus Canellæ*, the fruit of the Canell tree, which may be doubted of, considering the description of the forenamed tree holden generally of most to be perfect.

¶ *The Place.*

The Indian leafe groweth not fleeting vpon the water like vnto *Lens Palustris*, as *Dioscorides* and *Pliny* doe set downe, (though learned and painfull writers) but is the leafe of a great tree, a branch whereof we haue set forth vnto your view, which groweth in Arabia and Cambaya, far from the water side.

¶ *The Time.*

Of the time we haue no certain knowledge, but it is supposed to bee greene Winter and Summer.

¶ *The*

¶ *The Names.*

Tamalapatra is called of the Indians in their mother tongue, especially of the Arabians, *Cadegi Indi*, or *Ladegi Indi*, that is, *Folium Indicum*, or *Indum*, the Indian leafe: but the Mauritanians doe call it *Tembul*. The Latines and Græcians following some of the Arabians, haue called it *Malabathrum*.

¶ *The Temperature and Vertues.*

The Indian leafe is hot and dry in the second degree, agreeing with Nardus in temperature, or as A
others report with Mace: it prouoketh vrine mightily, warmeth and comforteth the stomacke, and helpeth digestion.

It preuaileth against the pin and web in the eies, the inflamed and waterie eies, and all other in- B
firmities of the same.

It is laid among cloathes, as well to keepe them from mothes and other vermine, as also to giue C
vnto them a sweet smell.

Chap. 150. *Of the Cloue tree.*

Caryophylli veri Clusij.
The true forme of the Cloue tree.

¶ *The Description.*

THe Cloue tree groweth great in forme like vnto the Bay tree, the trunke or body whereof is couered with a russet barke: the branches are many, long, and very brittle, whereupon doe grow leaues like those of the Bay tree, but somewhat narrower: amongst which come the floures, white at the first, after of a greenish colour, waxing of a darke red colour in the end: which floures are the very cloues when they grow hard: after when they bee dried in the Sunne they become of that dusky black colour which we daily see, wherein they continue. For those that wee haue in estimation are beaten downe to the ground before they be ripe, and are suffered there to lie vpon the ground vntill they bee dried throughly, where there is neither grasse, weeds, nor any other herbes growing to hinder the same, by reason the tree draweth vnto it selfe for his nourishment all the moisture of the earth a great circuit round about, so that nothing can there grow for want of moisture, and therfore the more conuenient for the drying of the Cloues. Contrariwise, that grosse kinde of Cloues which hath beene supposed to be the male, are nothing else than fruit of the same tree tarrying there vntill it fall downe of it selfe vnto the ground, where by reason of his long lying, and meeting with some raine in the meane season, it loseth the quicke taste that the others haue. Some haue called these *Fusti*, whereof we may English them Fusses. Some affirme that the floures hereof surpasse all other floures in sweetnesse when they are greene; and hold the opinion, that the hardned floures are not the Cloues themselues, (as we haue written) but thinke them rather to be the seat or huske wherein the floures doe grow: the greater number hold the former opinion. And further, that the trees are increased without labour, graffing, planting, or other industrie, but by the falling of the fruit, which beare fruit within eight yeares after they be risen vp, and so continue bearing for an hundred yeares together, as the inhabitants of that country do affirme.

¶ *The Place.*

The Cloue tree groweth in some few places of the Molucca Iſlands, as in Zeilan, Iaua the greater and the lesser, and in diuers other places.

¶ *The*

¶ *The Time.*

The Cloues are gathered from the fifteenth of September vnto the end of February, not with hands, as we gather Apples, Cherries, and ſuch like fruit, but by beating the tree, as Wall-nuts are gotten, as we haue written in the deſcription.

¶ *The Names.*

The fruit hereof was vnknowne to the antient Grecians: of the later writers called Καρύοφυλλον: in Latine alſo *Caryophyllus*, and *Clavus*: in French, *Clou de Gyroſle*: the Mauritanians, *Charumfel*: in Italian, *Carofano*: in high Dutch, **Naegel**: in Spaniſh, *Clauo de eſpecia*: of the Indians, *Calafur*: in the Molucca's, *Changue*: of the Pandects, *Arumfel*, and *Charumfel*: in Engliſh, Cloue tree, and Cloues.

¶ *The Temperature.*

Cloues are hot and dry in the third degree.

¶ *The Vertues.*

A Cloues ſtrengthen the ſtomacke, liuer, and heart, helpe digeſtion, and prouoketh vrine.

B The Portugall women that dwell in the Eaſt Indies draw from the Cloues when they bee yet greene, a certaine liquor by diſtillation, of a moſt fragrant ſmell, which comforteth the heart, and is of all Cordials the moſt effectuall.

C Cloues ſtop the belly: the oile or water thereof dropped into the eies, ſharpens the ſight, and clenſeth away the cloud or web in the ſame.

D The weight of foure drams of the pouder of Cloues taken in milke procureth the act of generation.

E There is extracted from the Cloues a certaine oile or rather thicke butter of a yellow colour; which being chafed in the hands ſmelleth like the Cloues themſelues, wherewith the Indians doe cure their wounds and other hurts, as we do with Balſam.

F The vſe of Cloues, not onely in meate and medicine, but alſo in ſweet pouder and ſuch like, is ſufficiently knowne: therefore this ſhall ſuffice.

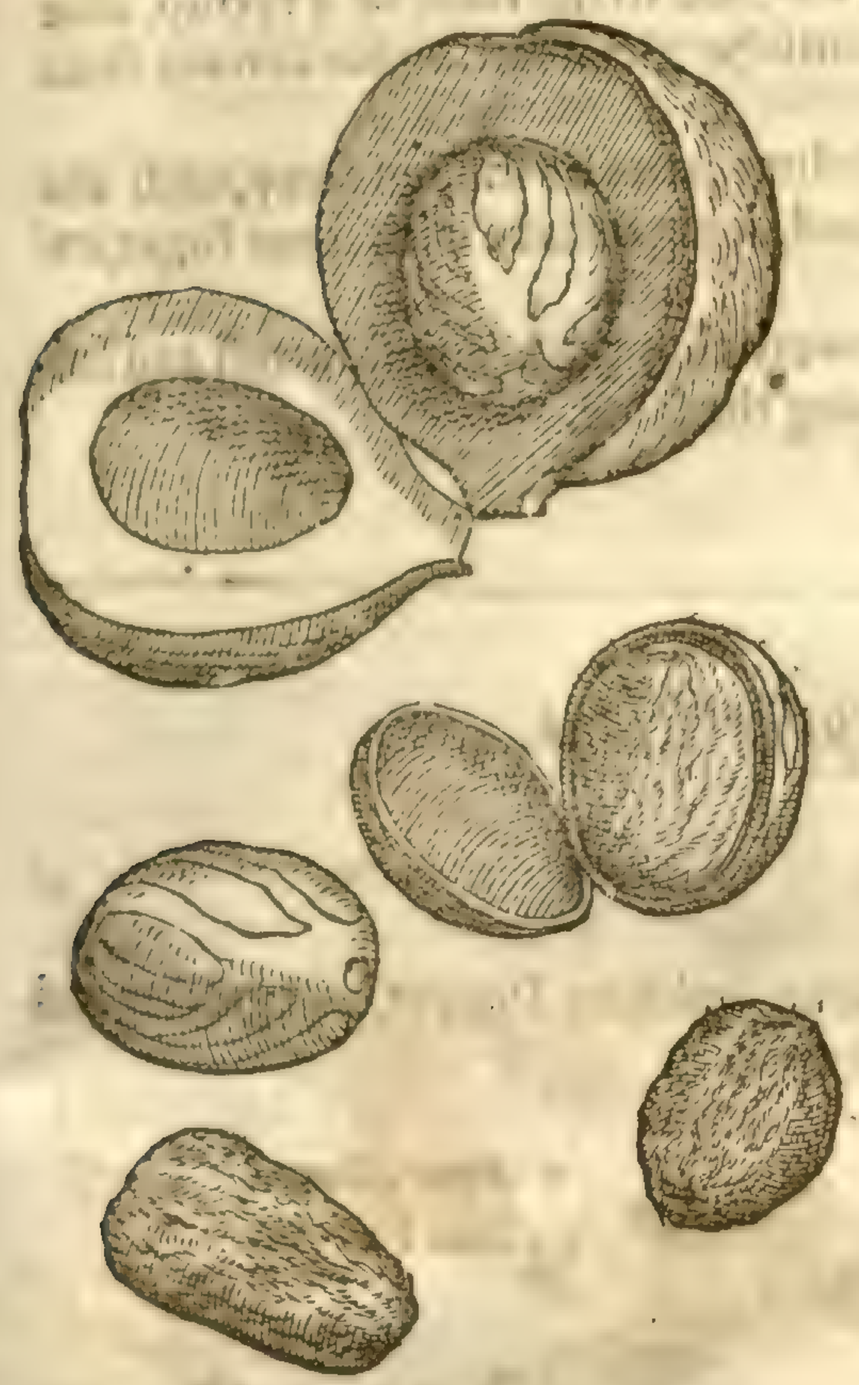
† There were formerly three figures in this chapter: wherefore I omitted two as impertinent.

CHAP. 151. *Of the Nutmeg tree.*

1 *Nux Muſcata rotunda, ſiue fœmina.*
The round or female Nutmeg.

2 *Nux Myriſtica oblonga, ſiue mas.*
The longiſh or male Nutmeg.

Nux Moschata cum sua Maci.
The Nutmeg with his Mace about him.



¶ *The Description.*

1 THe tree that beareth the Nutmeg and the Mace is in form like to the Peare tree, but the leaues of it are like those of the Orenge tree, alwaies green on the vpper side, and more whitish vnderneath; amongst which come forth the Nut and Mace as it were the floures. The Nut appeares first, compassed about with the Mace, as it were in the middle of a single rose, which in proces of time doth wrap and inclose the Nut round on euery side: after commeth the huske like that of the Wallnut, but of an harder substance; which incloseth the Nut with his Mace as the Walll-nut husk doth couer the Nut, which in time of ripenesse cleaueth of it self as the wal-nut huske doth, and sheweth his Mace, which then is of a perfect crimson colour, and makes a most goodly shew, especially when the tree is well laden with fruit: after the Nut becomes dry, the Mace likewise gapeth and forsaketh the nut, euen as the first husk or couerture, and leaueth it bare as we all doe know. At which time it getteth to it selfe a kinde of darke yel-low colour, and loseth that braue crimson dye which it had at the first.

‡ 2 The tree which carrieth the male Nutmeg (according to *Clusius*) thus differs from the last described: the leaues are like those of the former in shape, much bigger, being sometimes a foot long, and three or foure inches broad; their common length is seuen or eight inches, and bredth two and a halfe: they are of a whitish colour vnderneath, and green and shining aboue. The Nuts also grow at the very ends of the branches, somtimes two or three together, and not only one, as in the common kinde. The nut it selfe is also larger and longer: the Mace that incompasseth it is of a more elegant colour, but not so strong as that of the former.

‡ I can scarse beleeue our Authors assertion in the foregoing description, that the Nut appea-reth first, compassed about with the Mace as it were in the midst of a single Rose, &c. But I rather thinke they all come forth together, the Nutmeg, Mace, the green outward husk and all, iust as we see Walnuts do, and only open themselues when they come to full maturitie. In the third figure you may see exprest the whole manner of the growing of the Nutmeg, together with both sorts of Nutmegs taken forth of their shels. ‡

¶ *The Place.*

The Nutmeg tree groweth in the Indies, in an Island especially called Banda, in the Islands of Molucca, and in Zeilan, though not so good as the first.

¶ *The Time.*

The fruit is gathered in September in great aboundance, all things beeing common in those countries.

¶ *The Names.*

The Nutmeg tree is called of the Grecians Κάρυον μοσχάτον: of the Latines, *Nux Moschata*, and *Nux Myristica*: in Italian, *Noce Moscada*: in Spanish, *Nuez de escetie*: in French, *Noix Muscade*: in high-grow, *Palla*; the Maces, *Bunapalla*. In Decan the Nut is called *Iapatri*; and the Maces, *Iaifol*: of *Avi-cen*, *Iausiband* (i.) *Nux Bandensis*. The Mace he calleth *Befbase*. In English, Nutmeg.

¶ *The Temperature.*

The Nutmeg, as the Mauritanians write, is hot and dry in the second degree compleat, and som-what astringent.

¶ *The Vertues.*

Mutmegs cause a sweet-breath, and mend those that stinke, if they be much chewed and holden in the mouth. A

The

B The Nutmeg is good againſt freckles in the face, quickneth the ſight, ſtrengthens the belly and feeble liuer, taketh away the ſwelling in the ſpleen, ſtayeth the laske, breaketh wind, and is good againſt all cold diſeaſes in the body.

C Nutmegs bruiſed and boiled in Aqua vitæ vntill they haue waſted and conſumed the moiſture, adding thereunto hony of Roſes, gently boiling them, being ſtrained to the form of a ſyrrup, cure all pains proceeding of windy and cold cauſes, if three ſpoonfulls be giuen faſting for certain daies together.

D The ſame bruiſed and boiled in ſtrong white Wine vntill three parts be ſodden away, with the roots of Motherwort added thereto in the boiling, and ſtrained, being drunke with ſome ſugar, cureth all gripings in the belly proceeding of windineſſe.

E As touching the choice, there is not any ſo ſimple but knoweth that the heauieſt, fatteſt and fulleſt of juice are beſt, which may eaſily be found out by pricking the ſame.

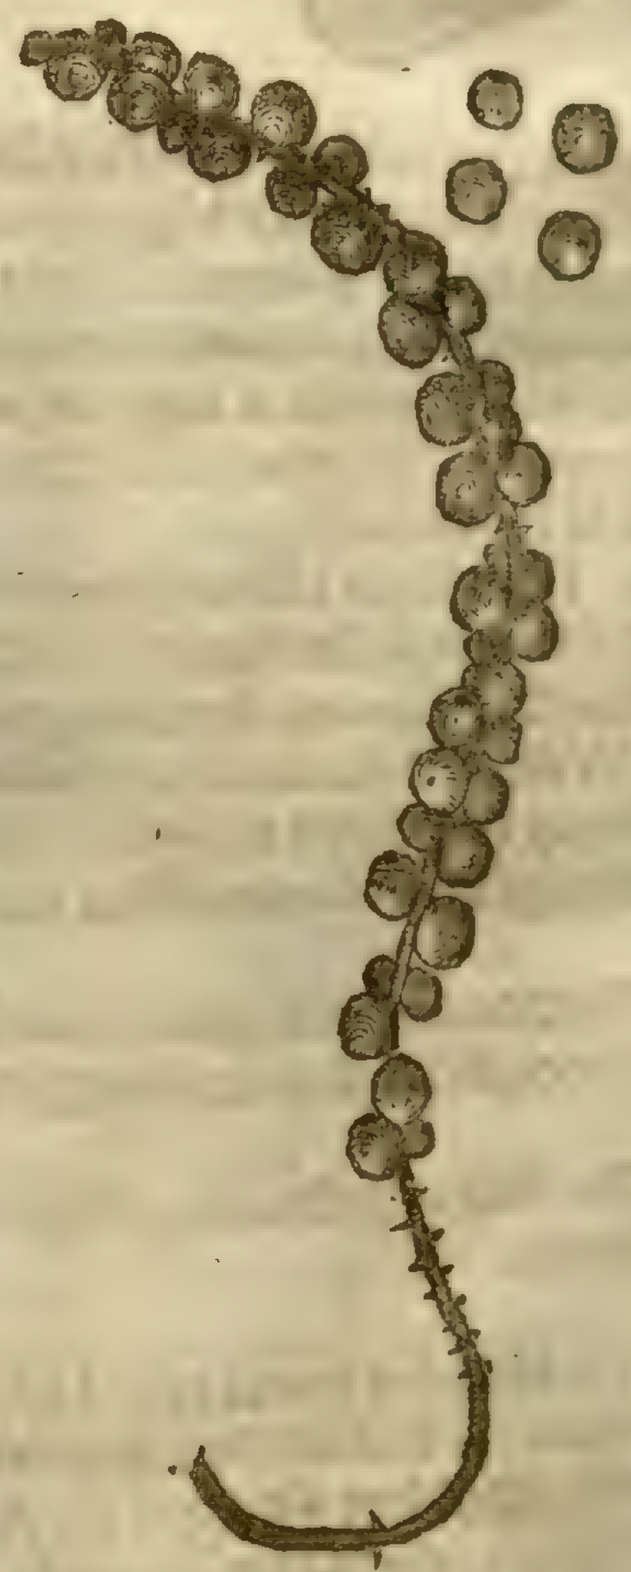
Chap. 152. *Of the Pepper Plant.*

¶ *The Kindes.*

THere be diuers ſorts of Pepper, that is to ſay, white, blacke, and long Pepper, one greater and longer than the other; and alſo a kinde of Ethiopian Pepper.

1 *Piper nigrum.*
Blacke Pepper.

2 *Piper album.*
White Pepper.

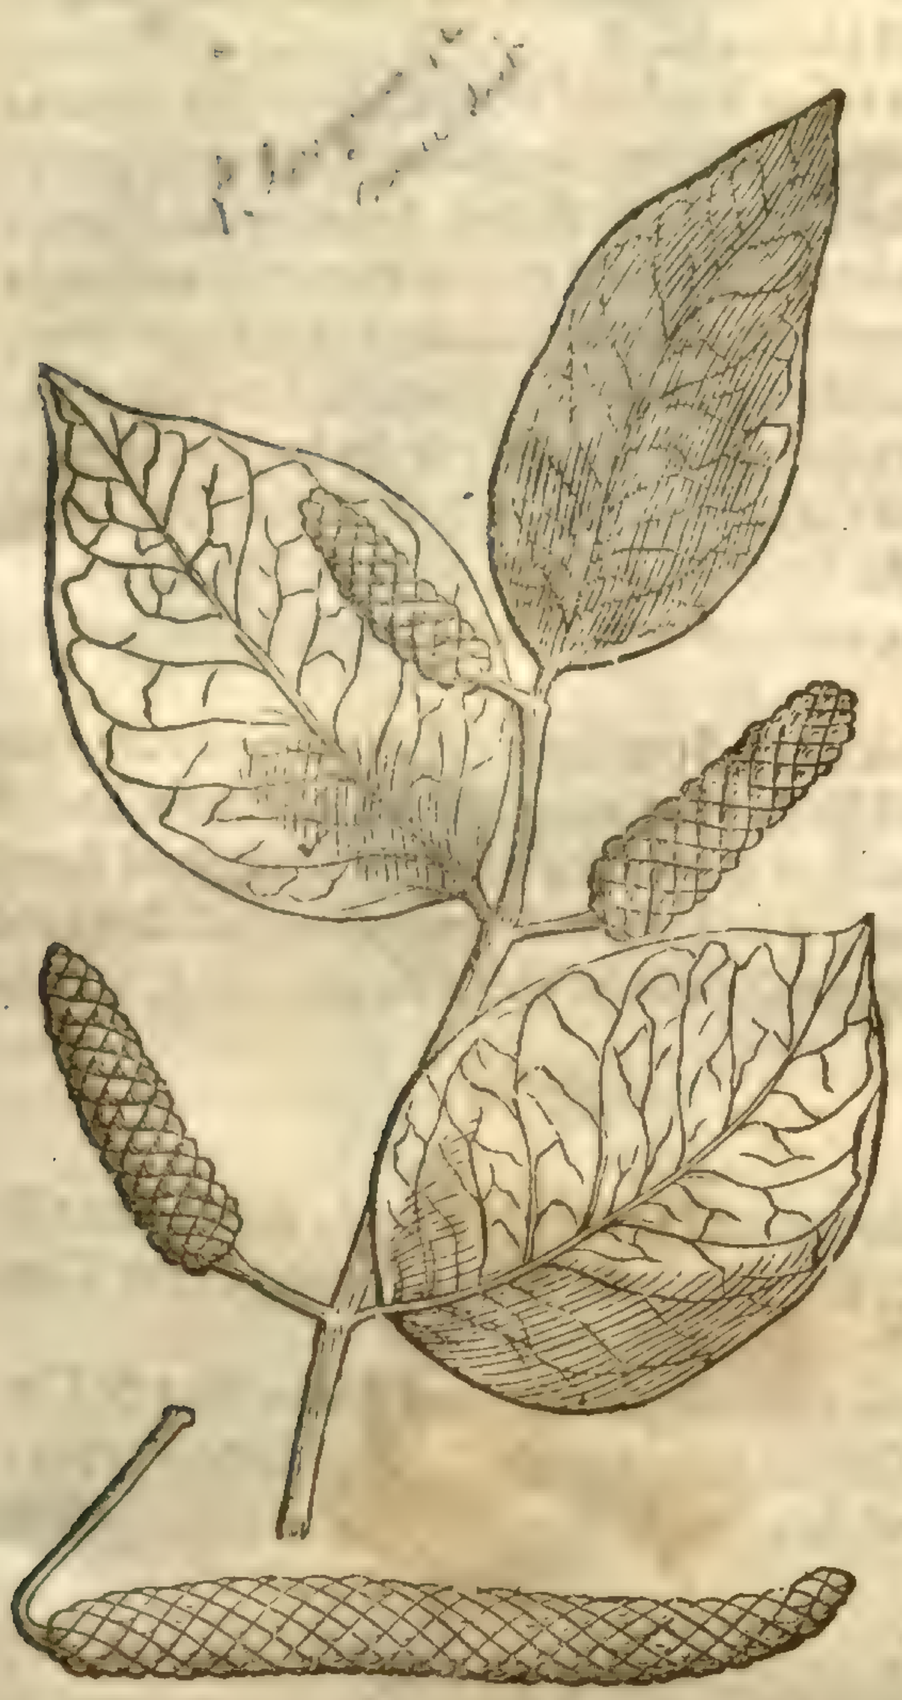


¶ *The Deſcription.*

1 THe Plant that beareth the blacke Pepper groweth vp like a Vine, amongſt buſhes and brambles, where it naturally groweth; but where it is manured it is ſowne at the bottom of the tree *Faufel* and the Date trees, whereon it taketh hold and clymbeth vp euen vnto the top, as doth the Vine, ramping and taking hold with his claſping tendrels of any other thing

thing it meets withall. The leaues are few in number, ‡ growing at each joint one, first on one side of the stalk, then on the other, like in shape to the long vndiuided leaues of Iuy, but thinner, sharp pointed, and sometimes so broad that they are foure inches ouer, but most commonly two inches broad and foure long, hauing alwaies fiue pretty large nerues running along them. The fruit grow clustering together vpon long stalks, which come forth at the joints against the leaues, as you may see in the figure: the root (as one may conjecture) is creeping, for the branches that ly on the ground do at their joints put forth new fibres or roots. Wee are beholden to *Clusius* for this exact figure and description, which hee made by certaine branches brought home by the Hollanders from the East Indies. The Curious may see more hereof in his Exoticks and notes vpon *Garcias*.

† 3 *Piper longum.*
Long Pepper.



4 *Piper Æthiopicum, siue Vita longa.*
Pepper of Æthiopia.

2 The plant that brings white Pepper is not to be distinguished from the other plant, but only by the colour of the fruit, no more than a Vine that beareth blacke grapes, from that which brings white: and of some it is thought, that the selfe same plant doth somtimes change it self from black to white, as diuers other plants doe. ‡ Neither *Clusius*, nor any other else that I haue yet met with, haue deliuered vs any thing of certaine, of the plant whereon white Pepper growes; *Clusius* onely hath giuen vs the maner how it growes vpon the stalks, as you may see it here expreſt. ‡

There is also another kind of Pepper, seldome brought into these parts of Europe, called *Piper Canarium*: it is hollow within, light, and empty, but good to draw flegme from the head, to helpe the tooth-ache and cholericke affects.

3 The tree that beareth long pepper hath no similitude at all with the plant that brings black and white Pepper: some haue deemed them to grow all on one tree; which is not consonant to truth: for they grow in countries far distant one from another, and also that countrey where there is blacke Pepper, hath not any of the long Pepper. And therefore *Galen* following *Dioscorides*, were together both ouerseene in this point. This tree, saith *Monardus*, is not great, yet of a wooddy substance, dispersing here and there his clasping tendrels, wherewith it taketh hold of other trees and such other things as do grow neere vnto it. The branches are many and twiggy; whereon groweth the fruit, consisting of many graines growing vpon a slender foot-stalke, thrust or compact close together,

‡ 5 *Piper Caudatum.*
Tailed Pepper.

together, green at the first, and afterward blackish: in taste sharper and hotter than common blacke pepper, yet sweeter and of better taste. ‡ For this figure also I acknowledge my selfe beholden to the learned and diligent *Clusius*, who caused it to be drawne from a branch of some foot in length, that he receiued from Dr *Lambert Hortensius*, who brought it from the Indies. The order of growing of the leaues and fruit is like that of the black, but the joints stand somewhat thicker together; the leaf also doth little differ from that of the black, only it is thinner, of a lighter green and (as *Clusius* thought) hath a shorter footstalke, the veins or nerues also were lesse eminent, more in number, and run from the middle rib to the sides, rather than alongst the leafe. ‡

4 This other kinde of Pepper, brought vnto vs from Æthiopia, called of the country where it groweth, *Piper Æthiopicum*: in shops, *Amomum*, and *Longa Vita*. It growes vpon a smal tree in maner of an hedge bush, wherupon grow cods in bunches, a finger long, of a brown colour, vneuen, and bunched or puft vp in diuers places, diuided into fiue or six lockers or cels, each wherof containeth a round seed somwhat long, lesse than the seeds of Peony, in taste like common Pepper or *Cardamomum*, whose facultie and temper it is thought to haue, whereof we hold it a kind.

5 Another kind of Pepper is somtimes brought, which the Spaniards cal *Pimenta de rabo*, that is, Pepper with a taile: it is like vnto Cubebes, round, full, somewhat rough, black of colour, and of a sharp quick taste like the common pepper, of a good smell: it growes by clusters vpon smal stems or stalks, which some haue vnaduisedly taken for *Amomum*. The king of Portugal forbad this kind of Pepper to be brought ouer, for feare lest the right Pepper should be the lesse esteemed, and so himselfe hindred in the sale thereof.

¶ *The Place.*

Black and white Pepper grow in the kingdom of Malauar, and that very good; in Malaca also, but not so good; as also in the Ilands Sunde and Cude: there is great store growing in the Kingdome of China, and some in Cananor, but not much.

Pepper of Æthiopia growes also in America, in all the tract of the country where Nat & Carthago are situated. The rest haue bin spoken of in their seueral descriptions. The white Pepper is not so common as the blacke, and is vsed there in stead of salt.

¶ *The Time.*

The plant riseth vp in the first of the spring: the fruit is gathered in August.

¶ *The Names.*

The Grecians who had best knowledge of Pepper, do cal it πίπερι: the Latines, *Piper*: the Arabians, *Fulfel*, and *Fulful*: in Italian, *Pepe*: in Spanish, *Pimenta*: in French, *Poiure*: in high-Dutch, Pfeffer: in English, Pepper.

That of Æthiopia is called *Piper Æthiopicum*, *Amomum*, *Vita longa*, and of some *Cardamomum*. I receiued a branch hereof at the hands of a learned Physition of London, called Mr *Stephen Bredwel*, with his fruit also.

¶ *The Temperature.*

The Arabian and Persian Physitions iudge, that Pepper is hot in the third degree. But the Indian Physitions (which for the most part are Emperickes) hold, that Pepper is cold, as almost all other spice, which are hot indeed: the long Pepper is hot also in the third degree, and as wee haue said, is thought to be the best of all the kinds.

¶ *The Vertues.*

A *Dioscorides* and others agreeing with him affirme, that Pepper resisteth poison, and is good to be put into medicaments for the eies. All

All Pepper heateth, prouoketh vrin, digeſteth, draweth, diſperſeth, and clenſeth the dimneſſe of B the ſight, as *Dioſcorides* noteth.

† I haue omitted in this chapter *Matthiolus* his counterfeit figure which was formerly here.

Chap. 153. *Of baſtard Pepper, called Betle or Betre.*

Betle ſive Betre.
Baſtard Pepper.

¶ *The Deſcription.*

THis plant climeth and rampeth vpon trees, buſhes, or whatſoeuer elſe it meets withall, like to the Vine, or the black Pepper, whereof ſome hold it for a kinde. The leaues are like thoſe of the greater Binde-weed, but ſomewhat longer, of a duſty colour, with diuers veins or ribs running through the ſame. The fruit groweth among the leaues, very crookedly writhed, in ſhape like the taile of a Lizard, of the taſte of Pepper, yet very pleaſant to the palate.

¶ *The Place.*

It groweth among the Date trees, and *Areca*, in moſt of the Molucca Iſlands, eſpecially in the mariſh grounds.

¶ *The Time.*

The time anſwereth that of Pepper.

¶ *The Names.*

It hath been taken for the Indian leafe, but not properly: of moſt it is called *Tembul*, and *Tambul:* in Malavar, *Betre:* in Decan, Guzarat, and Canam it is called *Pam:* in Molaio, *Siri*.

¶ *The Vſe and Temperature.*

The leaues chewed in the mouth are of a bitter taſte; whereupon (ſaith *Garcias*) they put thereto ſome Areca, with the lime made of oiſter ſhells; whereunto they alſo adde ſome Amber greece, *Lignum Aloes*, and ſuch like, which they ſtamp together, making it into a paſte which they rolle vp into round balls, keepe dry for their vſe, and carry the ſame in their mouthes vntill by little and little it is conſumed; as when we carry ſugar-Candy in our mouthes, or the juice of Licorice: which is not only meat to the ſilly Indians, but alſo drink in their tedious trauels, refreſhing their wearied ſpirits, and helping memory; which is eſteemed amongſt the Empericke phyſitians to be hot and dry in the ſecond degree. ‡ *Garcias* doth not affirm that the Indians eat it for meat, or in want of drinke, but that they eat it after meat, and that to giue the breath a pleaſant ſent, which they count a great grace, ſo that if an inferior perſon that hath not chewed Betre or ſome ſuch thing, chance to ſpeak with any great man, he holds his hand before his mouth, leſt his breath ſhould offend him. ‡

Chap. 154. *Of Graines, or Graines of Paradice.*

¶ *The Kindes.*

THere be diuers ſorts of Graines, ſome long, others Peare-faſhioned; ſome greater, and others leſſer.

¶ *The Description.*

† THe figure hereof ſetteth forth to your view the cod wherein the hot ſpice lies, which we cal Graines; in ſhops, *Grana Paradiſi:* it growes, by the report of the Learned, vpon a low herby plant; the leaues are ſome foure inches long, and three broad, with ſomewhat a thicke middle rib, from which run tranſverſe fibres, they much in ſhape reſemble thoſe of Cloues. The fruit is like a great cod or huske, in ſhape like a fig when it groweth vpon the tree, but of colour ruſſet, thruſt full of ſmall ſeeds or grains of a darke reddiſh colour (as the figure ſheweth which is diuided) of an exceeding hot taſte.

Cardamomi genera.
The kindes or ſorts of Graines.

The other ſorts may be diſtinguiſhed by the ſight of the picture, conſidering the only difference conſiſts in forme.

¶ *The Place.*

Graines grow in Ginny, and the Cardamones in all the Eaſt Indies, from the port of Calecute vnto Cananor: it groweth in Malavar, in Ioa, and in diuers other places.

¶ *The Time.*

They ſpring vp in May being ſowne of ſeed, and ripen their fruit in September.

¶ *The Names.*

Graines are called in Greeke Καρδάμωμον: in Latine, *Cardamomum:* of the Arabians, *Corrumeni:* of diuers Gentiles, *Dore:* of *Avicen*, *Saccolaa quebir* (i.) *magnum:* the other, *Saccolaa ceguer* (i.) *minus*. It is called in Malavar *Etremelli:* in Zeilan, *Ençal:* in Bengala, Guzarat, and Decan, *Hil*, and *Eluchi:* The firſt and largeſt ſort are called of ſome *Milegnetta*, and *Milegetta*; in Engliſh, Grains, & Grains of Paradice.

¶ *The Temperature.*

Avicen writeth, that *Saccolaa*, *Cardamomum*, or *Grana Paradiſi*, are hot and dry in the third degree, with aſtriction.

¶ *The Vertues.*

A The Graines chewed in the mouth draw forth from the head and ſtomacke wateriſh and pituitous humors.

E They alſo comfort and warm the weake cold and feeble ſtomack, help the ague, and rid the ſhaking fits, being drunke with Sacke.

CHAP.

Chap. 155. *Of Yucca or Iucca.*

Yucca, sive Iucca Peruana.
The root whereof the bread Casua or Cazava is made.

¶ *The Description.*

THe Plant of whose root the Indian bread called Cazava is made, is a low herbe consisting onely of leaues and roots: it hath neither stalks, flours, nor fruit, that I can vnderstand of others, or by experience of the plant it selfe, which hath grown in my garden four yeres together, and yet doth grow and prosper exceedingly; neuertheless without stalke, fruit, or floures, as aforesaid. It hath a very great root, thick and tuberous, and very knobby, ful of iuice somwhat sweet in taste, but of a pernitious qualitie, as saith my Author. From which root riseth vp immediatly forth of the ground very many leaues ioyned vnto the head of the root in a round circle; the which are long, of the length of a cubit, hollowed like a gutter or trough, very smooth, and of a green colour like that of woad: the edges of the leaues are sharpe like the edge of a knife, and of a brown colour, the point of the leafe is a prick as sharpe as a Needle, which hurteth those that vnaduisedly passe by it. The leafe with aduised eye viewed is like to a little Wherry or such like boat; they are also very tough, hard to break, and not easie to be cut, except the knife be very sharp.

‡ *Lobel* in the second part of his *Aduersaria* largely describes and figures this plant; & there he affirmes hee wrot a Description (which hee there sets down) for our Author, but hee did not follow it, and therefore committed these errors: first, in that he saith it is the root wherof Cazava bread was made; when as *Lobel* in his description said he thought it to be *Alia species à Yucca Indica ex qua panis communis fit*. Secondly, in that he set down the place out of the *Hist. Lugd.* (who tooke it out of *Theuet*) endeauoring by that meanes to confound it with that there mentioned, when as he had his from Mr *Edwards* his man: and thirdly (for which indeed he was most blame-worthy, and wherein he most shewed his weaknesse) for that he doth confound it with the *Manihot* or true *Yuicca*, which all affirme to haue a leaf like that of Hemp, parted into seuen or more diuisions; and also for that he puts it to the *Arachidna* of *Theophrastus*, when as he denies it both floure and fruit; yet within some few yeares after our Authour had set forth this Worke it floured in his garden.

This some yeares puts forth a pretty stiffe round stalke some three cubits high, diuided into diuers vnequall branches carrying many prety large floures, shaped somwhat like those of *Fritillaria*, but that they are narrower at their bottoms: the leaues of the floure are six, the colour on the inside white, but on the out side of an ouerworn reddish colour from the stalke to the middest of the leafe; so that it is a floure of no great beauty, yet to be esteemed for the raritie. I saw it once floure in the garden of Mr *Wilmot* at Bow, but neuer since, though it hath bin kept for sundry yeres in many other gardens, as with Mr *Parkinson* and Mr *Tuggy*. This was first written of by our Author, and since by *Lobel* and Mr *Parkinson*, who keepe the same name, as also *Bauhine*, who to distinguish it from the other calls it *Yucca foliis Aloes*. ‡

¶ *The Place.*

This Plant groweth in all the tract of the Indies, from the Magellane straights vnto the cape of Florida, and in most of the Islands of the Canibals, and others adjoining, from whence I had that plant brought me that groweth in my garden, by a seruant of a learned and skilfull Apothecary of Excester, named Mr *Tho. Edwards*.

¶ *The Time.*

It keepeth green both Winter and ſummer in my garden, without any couerture at all, notwithſtanding the injurie of our cold clymat.

¶ *The Names.*

It is reported vnto me by Trauellers, that the Indians do call it in ſome parts, *Manihot*, but generally *Yucca* and *Iucca*. It is thought to be the plant called of *Theophraſtus*, *Arachidna*: of *Pliny*, *Aracidna*.

¶ *The Temperature.*

This plant is hot and dry in the firſt degree, which is meant by the feces or droſſe, when the poiſonous juice is preſſed or ſtrained forth; and is alſo dry in the middle of the ſecond degree.

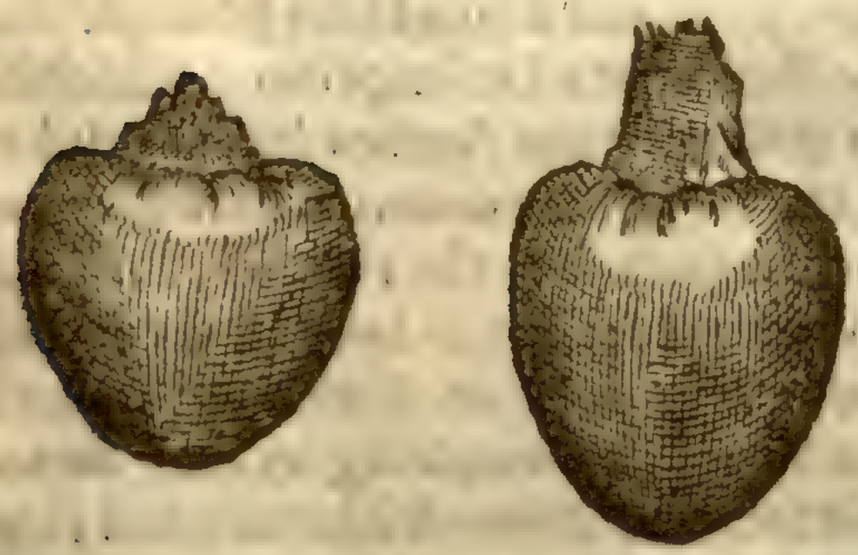
CHAP. 156.

Of the Fruit Anacardium, and Caious or Caiocus.

¶ *The Deſcription.*

THe antient writers haue bin very briefe in the hiſtorie of *Anacardium*: the Grecians haue touched it by the name of Ανακαρδιον, taking the name from the likeneſſe it hath of an heart both in ſhape and colour, called of the Portugals that inhabit the Eaſt Indies, *Fava de Malaqua*, the bean of Malaca; for being green, and as it hangeth on the tree, it reſembleth a Bean, ſauing that it is much bigger: but when they be dry they are of a ſhining blackiſh colour, containing betweene the outward rinde and the kernell, which is like an almond, a certain oile of a ſharp cauſtick or burning facultie, called *Mel Anacardinum*, although the kernell is vſed in meats & ſauces, as we do Oliues and ſuch like, to procure appetite.

Anacardium.
The Bean of Malaca.



Caious.
The kidny Bean of Malaca.

The other fruit groweth vpon a tree of the bigneſſe of a Peare tree: the leaues are much like to thoſe of the Olive tree, but thicker and fatter, of a feint greene colour: the floures are white, conſiſting of many ſmall leaues much like the floures of the Cherry tree, but much doubled, without ſmell: after commeth the fruit, according to *Cluſius*, of the forme and magnitude of a gooſe egge, full of juice, in the end whereof is a nut, in ſhape like an Hares kidny, hauing two rindes, betweene which is contained a moſt hot and ſharp oile like that of *Anacardium*, whereof it is a kinde.

The bean or kernell it ſelfe is no leſſe pleaſant and wholeſome in eating, than the *Piſtacia* or Fiſtick nut, whereof the Indians do eat with great delight, affirming that it prouoketh venery, wherein is their chiefeſt felicitie. The fruit is contained in long cods like thoſe of beanes, but greater; neere vnto which cods commeth forth an excreſcence like vnto an apple, very yellow, of a good ſmell, ſpungeous within, and full of juice, without any ſeeds, ſtones, or grains at all, ſomwhat ſweet in taſte, at the one end narrower than the other, Peare-faſhion, or like a little bottle, which hath bin reputed of ſome for the fruit, but not rightly; for it is rather an excreſcence, as is the Oke apple.

¶ *The Place.*

The firſt growes in moſt parts of the Eaſt Indies, eſpecially in Cananor, Calecute, Cambaya, and Decan. The later in Braſile.

¶ *The*

¶ *The Time.*

These trees floure and flourish Winter and Summer.

¶ *The Names.*

Their names haue bin touched in their descriptions. The first is called *Anacardium*, of the likenesse it hath with an heart: of the Arabians *Balador*: of the Indians *Bibo*.

The second is called *Caiou*; and is written *Caiöüs*; and *Caius*: of some, *Caiocus*.

¶ *The Temperature and Vertues.*

The oile of the fruit is hot and dry in the fourth degree; it hath also a caustick or corrosiue qualitie: it taketh away warts, breaketh impostumes, preuaileth against lepry, *alopecia*, and easeth the pain of the teeth, being put into the hollownesse thereof. A

The people of Malavar do vse the said oile migled with chalke, to marke their cloathes or any other thing they desire to be coloured or marked, as we vse chalke, okar, and red marking stones, but their colour will not be taken forth again by any art whatsoeuer. B

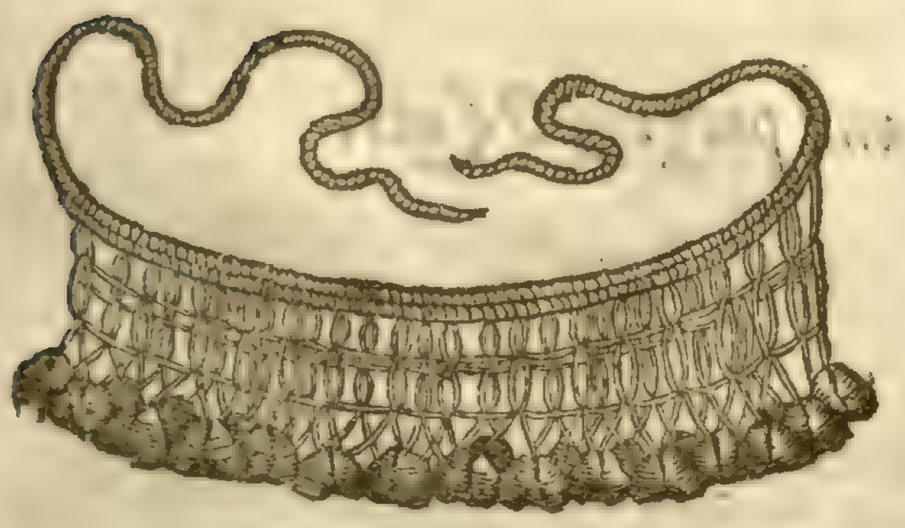
They also giue the kernell steeped in whay to them that be asthmaticke or short winded; and when the same is green they drinke the same so steeped against the wormes. C

The Indians for their pleasure will giue the fruit vpon a thorne or some other sharpe thing, and hold it in the flame of a candle or any other flame, which there will burn with such crackings, lightnings, and withall yeeld so many strange colors, that it is great pleasure to the beholders who haue not seen the like before. D

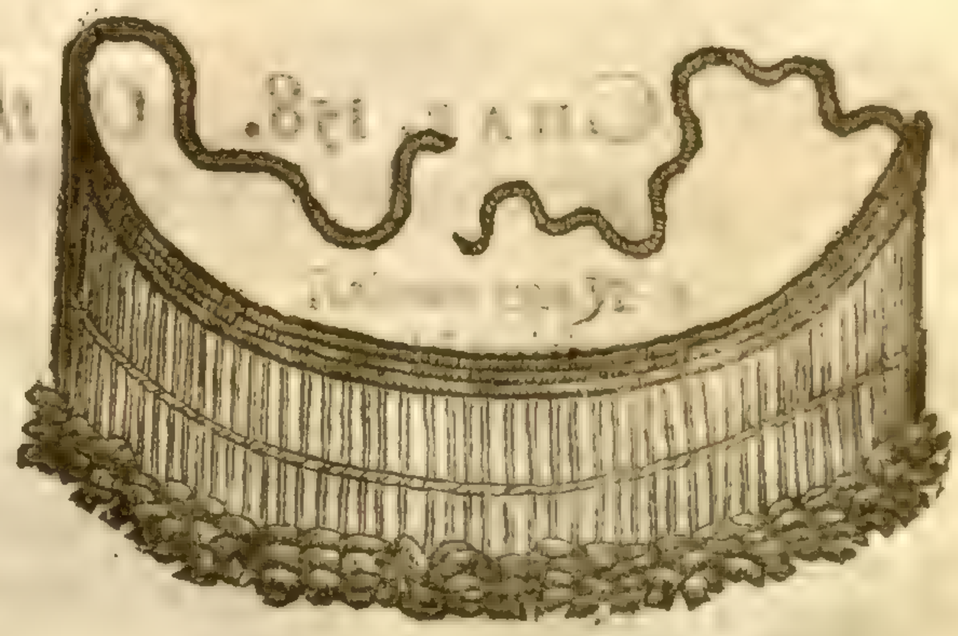
Chap. 157.

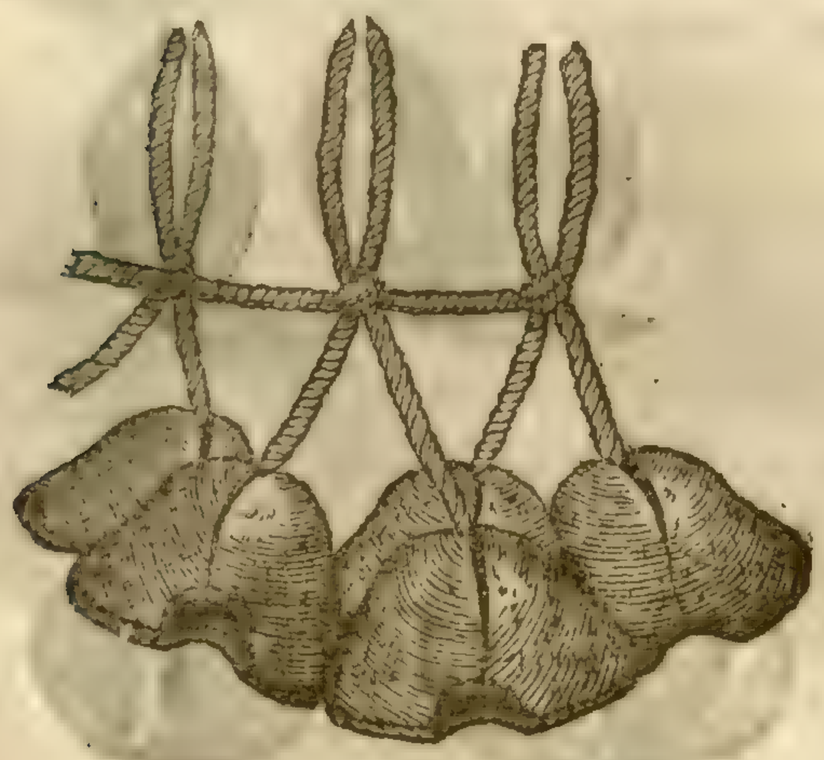
Of Indian Morrice bells, and diuers other Indian Fruits.

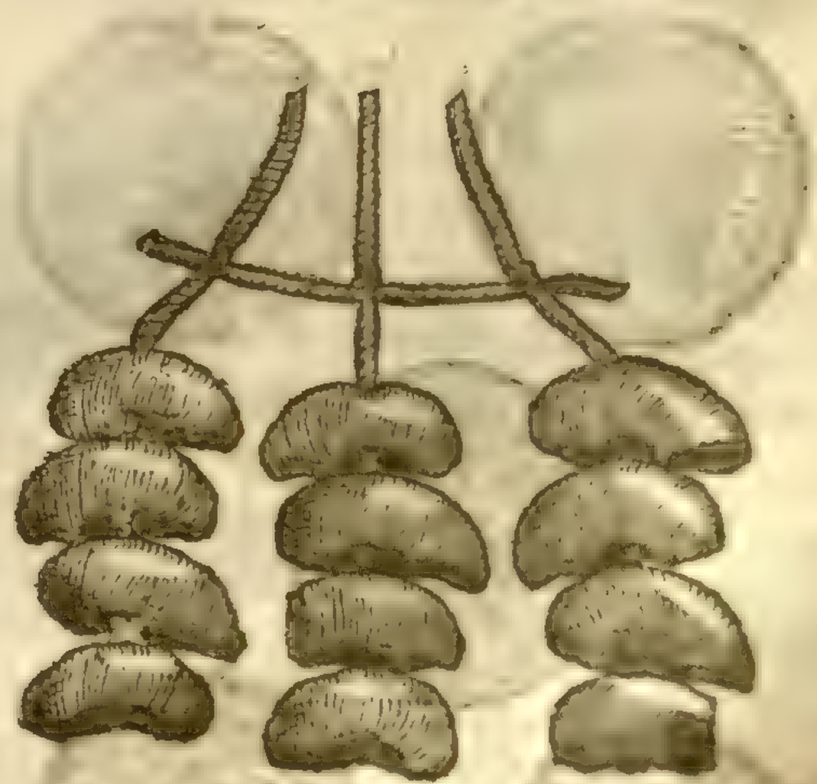
† 1 *Ahouay Theueti.*
Indian Morrice bells.



† 2 *Fructus Higuero.*
Indian Morosco bells.







¶ *The Description.*

THis fruit groweth vpon a great tree of the bignesse of a peare tree, full of branches, garnished with many leaues which are alwayes greene, three or foure fingers long, and in bredth two: when the branches are cut off there issueth a milky iuyce not inferior to the fruit in his venomous

qualitie. The trunk or body is couered with a grayiſh barke: the timber is white and ſoft, not fit to make fire of, much leſſe for any other vſe; for being cut and put to the fire to burne, it yeeldeth forth ſuch a loathſome and horrible ſtinke, that neither man nor beaſt are able to endure it; wherefore the Indians haue no vſe thereof, but only of the fruit, which in ſhape is like the Greeke letter Δ, of the bigneſſe of a Cheſtnut, and couered with a moſt hard ſhell, wherein is contained a kernell of a moſt venomous and poiſonſome qualitie, wherewith the men beeing angry with their wiues doe poiſon them, and likewiſe the women their husbands: they likewiſe vſe to dip or anoint and invenom their arrowes therewith, the more ſpeedily to diſpatch their enemies. Which kernel they take forth with ſome conuenient inſtrument, leauing the ſhel as whole as may be, not touching the kernell with their hands becauſe of its venomous qualitie, which would ſpoile their hands, and ſometimes take away their life alſo. In which ſhells they put ſome little ſtones and tie them on ſtrings, (as you may perceiue by the figure) which they dry in the Sun, and after tie them about their legs as we do bels, to ſet forth their dances and Moroſco Matachina's, wherein they take great pleaſure, by reaſon they think themſelues to excell in thoſe kindes of dances. Which ratling ſound doth much delight them, becauſe it ſetteth forth the diſtinction of ſounds, for they tune and mix them with great ones and little ones, in ſuch ſort as we do chimes or bells.

2 There is alſo another ſort herof, differing only in forme, being of the like venomous quality, and vſed for the ſame perpoſe. ‡ The fruit of *Higuerro* is like that of a Gourd in pulpe, and may be eaten: the ſhape of the fruit is round, whereas the other is three cornered. ‡

¶ *The Place.*

Theſe grow in moſt parts of the Weſt Indies, eſpecially in ſome of the Iſlands of the Canibals, who vſe them in their dances more than any of the other Indians. ‡ You may ſee theſe on ſtrings as they are here figured, among many other rarities, with Mr *Iohn Tradeſcant* at South Lambeth. ‡

¶ *The Time.*

We haue no certain knowledge of the time of flouring or bringing the fruit to maturitie.

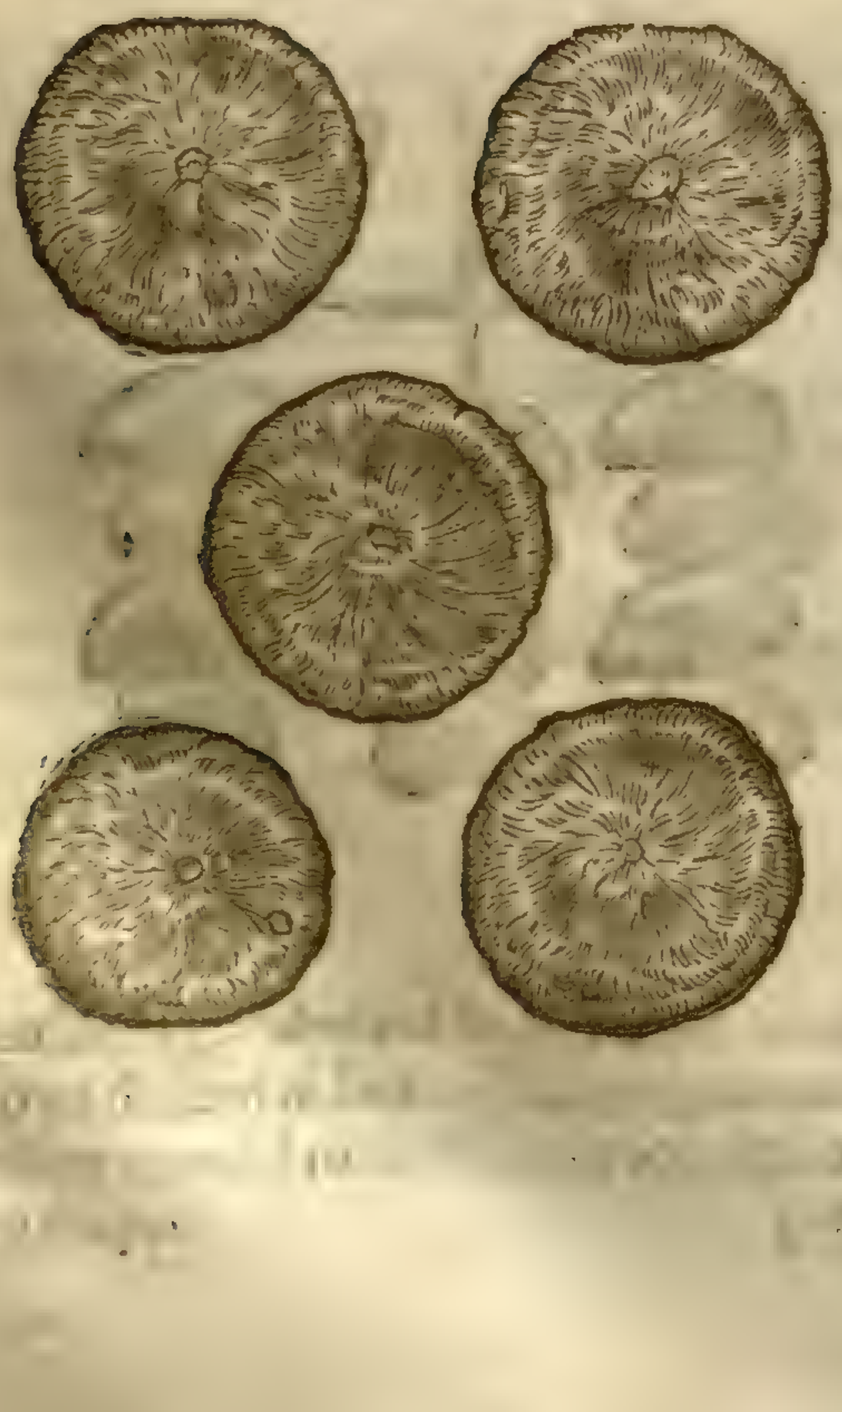
¶ *The Names and Vſe.*

We haue ſufficiently ſpoken of the names and vſe hereof, therefore what hath beene ſayd may ſuffice.

† The figures were tranſpoſed.

Chap. 158. *Of the vomiting and purging Nuts.*

1 *Nuces vomicæ.*
Vomiting Nuts.



2 *Nuces purgantes.*
Purging Nuts.

¶ The

¶ *The Description.*

1 *Avicen* and *Serapio* make *Nux vomica* and *Nux Methel* to be one, whereabout there hath been much cauilling: yet the case is plain, if the text be true, that the Thorn Apple is *Nux Methel*. Of the tree that beareth the fruit called in shops *Nux vomica* and *Nux methel*, we haue no certain knowledge: some are of opinion that the fruit is the root of an herb, & not the nut of a tree: wherefore since the case among the Learned resteth doubtfull, we leaue what els might be said to a further consideration. The fruit is round, flat like a little cake, of a russet ouerworne colour, fat and firme, in taste sweet, and of such an oily substance, that it is not possible to stamp it in a mortar to pouder, but when it is to be vsed it must be grated or scraped with some instrument for that purpose.

2 There be certain nuts brought from the Indies, called Purging nuts, of their quality in purging grosse and filthy humors: for want of good instruction from those that haue trauelled to the Indies, we can write nothing of the tree it selfe: the Nut is somwhat long, oual, or in shape like an Egge, of a browne colour: within the shell is contained a kernell, in taste sweet, and of a purging facultie.

¶ *The Place and Time.*

These Nuts do grow in the desarts of Arabia, and in some places of the East Indies: we haue no certain knowledge of their springing or time of maturitie.

¶ *The Names.*

Avicen affirmeth the Vomiting nut to be of a poisonous qualitie, cold in the fourth degree, hauing a stupifying nature, and bringing deadly sleepe.

¶ *The Vertues.*

Of the physicall vertues of the Vomiting Nuts we thinke it not necessarie to write, because the danger is great, and not to be giuen inwardly, but mixed with other Compositions, and that very curiously by the hands of a faithfull Apothecarie. A

The pouder of the nut mixed with some flesh and cast vnto Crowes and other rauenous Fowles, doth kill, at the least so dull their sences, that you may take them with your hands. B

They make also an excellent sallet, mixed with some meat or butter, and laid in a garden where Cats vse to scrape to bury their excrements, spoiling both herbs and also seeds new sowne. C

CHAP. 159. *Of diuers sorts of Indian Fruits.*

¶ *The Kindes.*

THese fruits are of diuers sorts and kinds, wherof we haue little knowledge, more than the fruits themselues, with the names of some of them: wherefore it shall suffice to set forth vnto your view the form only, leauing vnto Time, and those that shall succeed, to write of them at large, who in time may know that which at this time is vnknowne.

‡ OVr Author formerly in this chapter set forth diuers sorts of Indian fruits, and among the rest, *Beritinus*, *Cacao*, *Cocci Orientales*, *Buna*, *Fagaras*, *Cububæ*, *&c.* but he gaue but only three descriptions, and these either false, or to no purpose; wherefore I haue omitted them, and in this chapter giuen you most of these fruits which were formerly figured therein, together with an addition of sundry other out of *Clusius* his *Exoticks*, whose figures I haue made vse of, and here giuen you al those which came to my hands, though nothing so many as are set forth in his *Exoticks*; neither if I should haue had the figures, would the shortnesse of my time, nor bignesse of the book (being already grown to so large a volume) suffer me to haue inserted them: therefore take in good part those I here giue, together with the briefe histories of them.

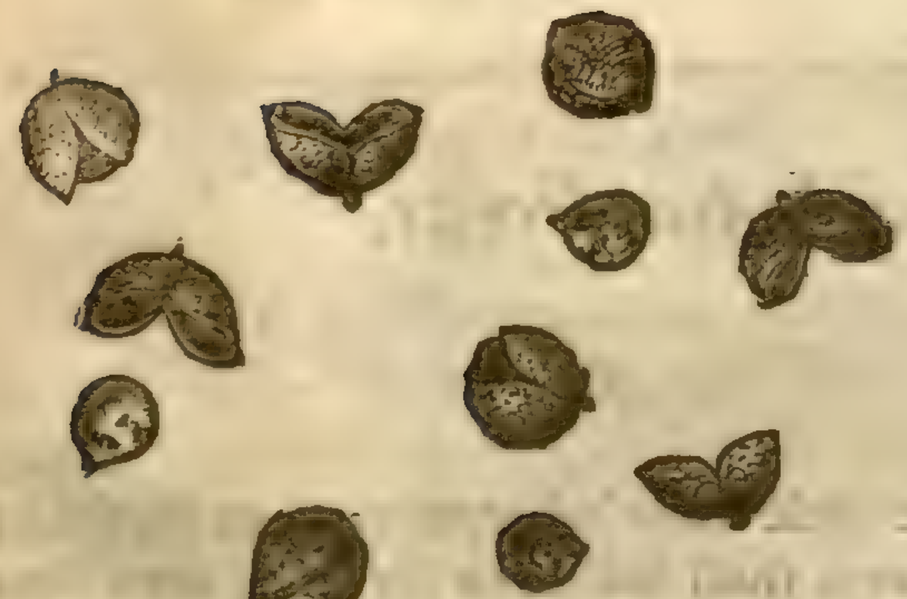
¶ *The Description.*

1 THe first and one of the best knowne of these fruits, are the *Cubibæ*, called of the Arabian Physitions, *Cubibe*, and *Quabeb*; but of the Vulgar, *Quabebochini*; in Iaoa where they plentifully grow, *Cumuc*: the other Indians (the Malayans excepted) call them *Cubas sini*, not because they grow in China, but because the Chinois vse to buy them in Iaoa and Sunda, and so carry them to the other ports of India. The Plant which carrieth this fruit hath leaues

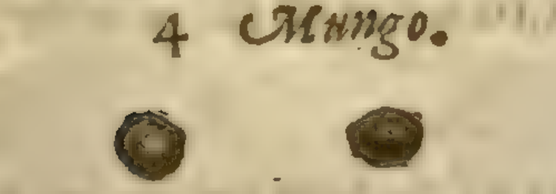
like

Cubibæ. Cubi bs.
2 *Cocci Orientales. Cocculus Indi.*

3 *Fagara.*



4 *Mungo.*



5 *Buna.*

‡ 8 *Amomis.*

9 *Beritinus.*

‡ 10 *Nuces inſanæ.*
Mad Nuts.

like those of Pepper,but narrower,and it also windes about trees like as Ivy or Pepper doth. The fruit hangs in clusters like as those we call red Currans, and not close thrust together in bunches, as Grapes:the fruit or berries are of the bigness of Pepper cornes,wrinkled,and of a browniſh colour;they are of a hot and biting aromaticke taste,and oft times hollow within,but if they be not hollow,then haue they a pretty reddish smooth round seed vnder their rough vtter huske, each of these berries commonly hath a piece of his footstalke adhering to it. It is reported, That the Natiues where it growes first gently boile or scald these berries before they sel them, that so none els may haue them,by sowing the seeds. Some haue thought these to haue been the *Carpesium* of the Antients ; and other-some haue iudged them the seeds of *Agnus Castus*,but both these opinions are erronious.

These are hot and dry in the beginning of the third degree, wherfore they are good against the A cold and moist affects of the stomacke,and flatulencies ; they help to clense the brest of tough and thicke humors,they are good for the spleen,for hoarseness and cold affects of the womb ; chewed with Mastick they draw much flegmatick matter from the head,they heate and comfort the brain. The Indians vse them macerated in wine to excite venery.

2 The plant which caries this fruit is vnknowne,but the berry is well knowne in shops by the name of *Cocculus Indicus* , some call them *Cocci Orientales* ; others,*Cocculæ Orientales* ; others,as *Cordus* for one,thinke them the fruit of *Solanum furiosum* ; others iudge them the fruit of a Tithymale, or of a *Clematis*. These beries are of the bigness of Bay beries,commonly round,and growing but one vpon a stalke; yet somtimes they are a little cornered, and grow two or three clustering together : their outer coat or shel is hard,rough,and of a browniſh dusky colour ; their inner substance is very oily,of a bitter taste.

They are vsed with good successe to kill lice in childrens heads,being made into pouder and so B strowed amongst the haire. They haue also another facultie which our Author formerly set down in the chapter of *Alaternus* (where he confounded these with *Fagaras*) in these words,which I haue there omitted,to insert here:

In England we vse the fruit called *Cocculus Indi* in pouder,mixed with floure,hony,and crums of C bread,to catch fish with,it being a numming, soporiferous, or sleeping medicine, causeth the fish to turn vp their bellies,as being senseless for a time.

3 *Fagara* is a fruit of the bigness of a Cich pease, couered with a thin coat of a blackish Ash colour,vnder which outer coat is a slender shell containing a sollid kernel involved in a thin black filme. The whole fruit both in magnitude,form,and colour,is so like the *Cocculus Indus* last described,that at the first sight one would take it to be the same. *Avicen* mentions this,*cap.*266.after this manner : What is *Fagara ?* It is a fruit like a Chich,hauing the seed of *Mahaleb*,and in the hollowness is a black kernell as in *Schehedenegi*,and it is brought out of Sofale.

He places it amongst those that heate and dry in the third degree, and commends it against the coldness of the stomacke and liuer,it helps concoction,and bindes the belly.

4 This,which *Clusius* thinks to be *Mungo* (which is vsed in the East Indies about Guzarat and Decan for prouender for horses) is a small fruit of the bigness of Pepper,crested,very like Coriander seed,but that it is bigger and blacke,it is of an hot taste.

5 *Buna* is a fruit of the bigness of *Fagara*, or somewhat bigger or longer, of a blackish Ash colour,couered with a thinne skin furrowed on both sides longwise,whereby it is easily diuided into two parts,which contain each a kernell longish and flat vpon one side,of a yellowish colour, and acide taste. They say that in Alexandria they make a certain very cooling drinke hereof. *Rauwolfius* in his Iournall seems to describe this fruit by the name of *Bumu* ; and by the appellation,form,and faculties,he thinks it may be the *Buncho* of *Avicen*,and *Buncha* of *Rhasis*,to *Almansor*. *Clus.*

6 This is a kinde of Cardamome, and by diuers it is thought to be the true *Amomum* of the Antients :and to this purpose *Nicolas Morogna* a physitian of Verona hath written a treatise which is set forth at the later end of *Pona's* description of Mount Baldus, to which I refer the Curious. These cods or berries (whether you please to call them) grow thicke clustering together, they are round,and commonly of the bigness of a cherry;the outer skin is tough,smoother,whiter, & lesse crested than that of the Cardamome:within this filme lie the seeds clustering together,yet with a thin filme parted into three : the particular seeds are cornered, somwhat smoother and larger than those of Cardamomes,but of the same aromatick taste,and of a brown colour. Their temperature and faculties may be referred to those of Cardamones.

7. 8. This with the next insuing are by *Clusius* set forth by the names I here giue you them, though,as he saith,neither of them agree with the *Amomum* of *Dioscorides*, they were only branches set thick with leaues,hauing neither any obseruable smell or tast:they were sent to the learned and diligent Apothecarie *Walarandus Donrez* of Lyons, from Ormuz the famous mart and port towne in the Persian Bay.

9 Those that accompanied the renowned Sir *Francis Drake* in his Voyage about the World,

light

11 *Cacao*. Small Coco's.

12 *Cucciophora*. Quince Dates.

‡ 13 *Baruce. Arara. Orukoria. Cropiot.*

‡ 14 *Guanobanus*. Tree Melon.

‡ 15 *Ananas*. The Pinia or Pine Thistle.

light vpon a certaine desart Island, wherein grew many very tall trees, and looking for something amongst these to refresh themselues, amongst others they obserued some bigger than Okes, hauing leaues like those of the Bay tree, thicke and shining, not snipt about the edges, their fruit was longish like to the small acornes of the Ilex or Holme-Oke, but without any cup, yet couered with a thin shel of an ash colour, and somtimes blacke, hauing within it a longish white kernell wrapped in a thin peeling, being without any manifest tast. They when they found it, though much oppresst with hunger, yet durst not taste thereof, lest it should haue bin poisonous: but afterward comming to the Island Beretina, not far from this, they found it to abound with these trees, and learned that the fruit was not poisonous, but might be eaten: whereupon afterwards they in want of other victuals, boiled some as they doe pease, and ground others into floure, wherewith they made puddings. They found this tree also in the Molucco's.

10 The first expressed in this table is the Mad plum, or as *Clusius* had rather term it, the Mad Nut, for he cals them Κάρυα Μανικά, or *Insanæ Nuces*. The Hollanders finding them in their return from the East Indies, and eating the kernels, were for a time distracted, and that variously, according to the particular temperature of each that ate of them; as you may see in *Clusius Exot. lib. 2. cap. 26.* This was round, little more than two inches about, with a shell not thicke, but sufficiently strong, browniſh on the out side, and not smooth, but on the in side of a yellowish colour, and smooth, containing a membranous stone or kernell couered with a black pulp, in form and bignesse not much vnlike a Bullas or Sloe, hauing a large white spot on the lower part whereas it was fastned to the stalke: vnder the pulp lay the kernell, somwhat hard, and of an Ash colour: the foot stalk was short and commonly caried but one fruit, yet sometimes they obserued two growing together: the tree whereon this fruit grew was of the bignesse of a Cherry tree, hauing long narrow leaues like those of the Peach tree: the other fruit figured in the second place was of a browniſh yellow color, somwhat bigger, but not vnlike a small nut, an inch long, and somewhat more about, smaller below, and bigger aboue, and as it were parted into foure, beeing very hard and sollid. Of this see more in the fourteenth place.

11 The *Cacoa* is a fruit well knowne in diuers parts of America, for they in some places vse it in stead of mony, and to make a drink, of which, though bitter, they highly esteem. The trees which beare them are but small, hauing long narrow leaues, and will onely grow well in places shadowed from the Sun. The fruit is like an Almond taken out of the huske, and it is couered with a thinne black skin, wherein is contained a kernell obliquely diuided into two or three parts, browniſh, and distinguished with ash coloured veines, of an astringent and vngratefull taste.

12 This, which *Clusius* had from *Cortusus* for the fruit of *Bdellium*, is thought to be the *Cuci* of *Pliny*, and is the *Cuciophera* of *Matthiolus*, and by that name our Author had it in this Chapter. The whole fruit is of the bignesse of a Quince, and of the same colour, with a sweet and fibrous flesh; vnder which is a nut of the bignes of a large walnut or somwhat more, almost of a triangular form, bigger below, and smaller aboue, well smelling, of a darke ash colour, with a very hard shell, which broken, there is therein contained an hard kernell of the colour and hardnesse of marble, hauing an hollownesse in the middle, as much as may contain an Hasell nut.

13 In this table are foure seuerall fruits described by *Clusius, Exot. lib. 2. ca. 21.* The first is called *Baruce*, and is said to grow vpon a high tree in Guyana called Hura. It consisted of many Nuts some inch long, strongly fastned or knit together, each hauing a hard wooddy shel, falling into two parts, containing a round and smooth kernell couered with an ash coloured filme.

They say the Natiues there vse this fruit to purge and vomit.

The second called Arara growes in Kaiana, but how it is not knowne: it was some inch long, couered with a skin sufficiently hard and blacke, fastened to a long and rugged stalke that seemed to haue carried more than one fruit: the kernell is black, and of the bignesse of a wilde Olive. A

The Natiues vse the decoction hereof to wash maligne vlcers, and they say the kernel will loose the belly. B

The third named *Orukoria* is the fruit of a tree in Wiapock called *Iuruwa*. They vse this to cure their wounds, dropping the juice of the fruit into them. This fruit is flat, almost an inch broad and two long, writhen like the cod of the true Cytisus, but much bigger, very wrinkled, of an ash color, containing a smooth seed.

The fourth called *Cropiot* is a small and shriveled fruit, not much vnlike the particular joints of the Ethiopian Pepper.

The Savages vse to take it mixt amongst their Tabaco, to assuage head-ache: there were diuers of them put vpon a string (as you may see in the figure) the better to dry them. C

14 This, which by *Clusius* and *Lobel* is thought to be the *Guanabanus* mentioned by *Scaliger, Exerc. 281. part. 6.* is a thick fruit some foot and halfe long, couered with a thick and hard rind, freezed ouer with a soft downinesse like as a Quince is, but of a greenish colour, with some veines, or rather furrowes running alongst it as in Melons: the lower end is somewhat sharpe, at the vpper end it is

fastned

faſtned to the boughes with a firme hard and fibrous ſtalke: this fruit containeth a whitiſh pulpe, which the Ethiopians vſe in burning feuers to quench the thirſt, for it hath a pleaſant tartneſſe: this dried becomes friable, ſo that it may be brought into pouder with ones fingers, yet retains it's aciditie: in this pulp lie ſeeds like little kidnies or the ſeeds of the true *Anagyris*, of a blacke ſhining colour, with ſome fibres comming out of their middles: theſe ſowne brought forth a plant hauing leaues like the Bay tree, but it died at the approch of Winter. *Cluſ.*

15 *Ananas Pinias*, or Pine Thiſtle, is a plant hauing leaues like the *Aizoon aquaticum*, or Water

‡ 18 *Bucnas Noches.*

VII

Sengreene,

Sengreene, ſomewhat ſharpe and prickly about the edges: the ſtalke is round, carrying at the top therof one fruit of a yellowiſh colour when it is ripe, of the bignes of a Melon, couered with a ſcale-like rinde: the ſmell is gratefull, ſomewhat like that of the Malecotone: at the top of the fruit, and ſometimes below it come forth ſuch buds as you ſee here preſented in the figure, which they ſet in the ground and preſerue the kind by in ſtead of ſeed: the meat of this fruit is ſweet & very pleaſant of taſte, & yeelds good nouriſhment; there are certaine ſmall fibres in the meat thereof, which though they do not offend the mouth, yet hurt they the gums of ſuch as too frequently feed thereon.

16 The forme of this is ſomwhat ſtrange, for it is like a large Poppy head cut off nigh the top: the ſubſtance thereof was membranous and wrinckled, of a browniſh colour, very ſmooth: the circumference at the top is about nine inches, and ſo it growes ſmaller and ſmaller euen to the ſtalke, which ſeems to haue carried a floure whereto this fruit ſucceeded: the top of the fruit was euen, and in it were orderly placed 24. concauities, in each whereof was contained a little Nut like an Acorn, almoſt an inch long, and as much thick; the vpper part was of a browniſh colour, and the kernel within was all rank and mouldy. *Cluſius* could learne neither whence this came, nor how it grew, but with a great deale of probability thinks it may be that which the Antients deſcribed by the name of *Faba Ægyptia*.

17 The former of theſe two *Cluſius* receiued by the name of *Coxco Cypote*, that is, the Nut Cypote: It is of a dusky browne colour, ſmooth, and ſhining, but on the lower part of an aſh colour, rough, which the Painter did not well expreſſe in drawing the figure. The 2. he receiued by the name of *Almendras del Peru*, (i.) Almonds of Peru: the ſhell was like in colour and ſubſtance to that of an almond, and the kernell not vnlike neither in ſubſtance nor taſte: yet the forme of the ſhell was different, for it was triangular, with a backe ſtanding vp, and two ſharpe ſides, and theſe very rough.

18 This was the fruit of a large kinde of *Convolvulus* which the Spaniards called *Buenas naches*, or Good-night, becauſe the floures vſe to fade as ſoone as night came. The ſeeds were of a ſooty colour as big as large Peaſe, being three of them contained in a skinny three cornered head. You may ſee more hereof in *Cluſius Exot. lib. 2. cap. 18.*

19 This is the figure of a ſquare fruit which *Cluſius* conjectures to haue been ſome kind of Indian Nut or Coco: it was couered with a ſmooth rinde, was ſeuen inches long, and a foot and halfe about, being foure inches and a halfe from ſquare to ſquare.

20 About Bantam in the Eaſt-Indies growes a tall tree ſending forth many branches, which are ſet thicke with leaues long and narrow, bigger than thoſe of Roſemary: it carries cods ſix inches long, and fiue about, couered with a thin skin, wrinkled and ſharp pointed, which open themſelues from below into fiue parts, and are full of a ſoft woolly or Cottony matter, wherewith they ſtuffe cuſhions, pillowes and the like, and alſo ſpin ſome for certaine vſes: amongſt the downe lie blacke ſeeds like thoſe of Cotton, but leſſe and not faſtned to the downe.

21 This which *Cluſ.* calls *Palma ſaccifera*, or the Bag Date, becauſe it carries the figure of an Hippocras bag, was found in a deſart Iſland in the Antlanticke ocean, by certaine Dutch mariners who obſerued whole woods thereof: theſe bags were ſome of them 22. or more inches long, and ſome ſeuen inches broad in the broadeſt place, ſtrongly woue with threds croſſing one another, of a browniſh yellow colour. Theſe ſachels (as they report who cut them from the tree) were filled with fruit of the bigneſſe of a Walnut, huske and all: within theſe were others, as round as if they had bin turned, and ſo hard that you could ſcarce breake them with a hammer: in the midſt of theſe were white kernels, taſting at the firſt ſomewhat like pulſe, but afterwards bitter like a Lupine.

22 The tree which carries this rough cod is very large, as I haue been told by diuers: ſome who ſaw it in Perſia, and others that obſerued it in Mauritius Iſland. *Cluſius* alſo notes that they haue bin brought from diuers places: the cod is ſome three inches long, and ſome two inches broad, of a duskie red colour, and all rough and prickly: in theſe cods are contained one, two, or more round nuts or ſeeds of a grayiſh aſh-colour, hauing a little ſpot on one ſide, where they are faſtened to the cod they are exceeding hard, and difficult to break, but broken they ſhew a white kernel very bitter and vnpleaſant of taſte. I haue ſeen very many and haue ſome of theſe, and ſome haue offered to ſel them for Eaſt-Indian *Beazor*, whereto they haue ſome ſmall reſemblance, though nothing in faculty like them (if I may credit report, which I had rather doe than make triall) for I haue been told by ſome that they are poyſonous: and by others, that they ſtrongly procure vomit.

23 The long cod expreſſed in this figure is called in the Eaſt-Indies (as *Cluſius* was told) *Kayo baka*, it was round, the thickneſſe of ones little finger, and ſix inches long: the rinde was thick, black, hard and wrinkled, and it contained a hard pulpe of a ſouriſh taſte, which they affirme was eatable. The other was a cod of ſome inch and halfe long, and ſome inch broad, membranous, rough, and of a browniſh colour, ſharp pointed, and opening into two parts, and diſtinguiſhed with a thin filme into foure cels, wherein were contained ſcarlet Peare faſhioned little berries, hauing golden ſpots eſpecially in the middles. This growes in Braſile, and as *Cluſius* was informed was called *Daburi*.

24 In the ſecond place of the tenth figure and deſcription in this chapter you may finde the

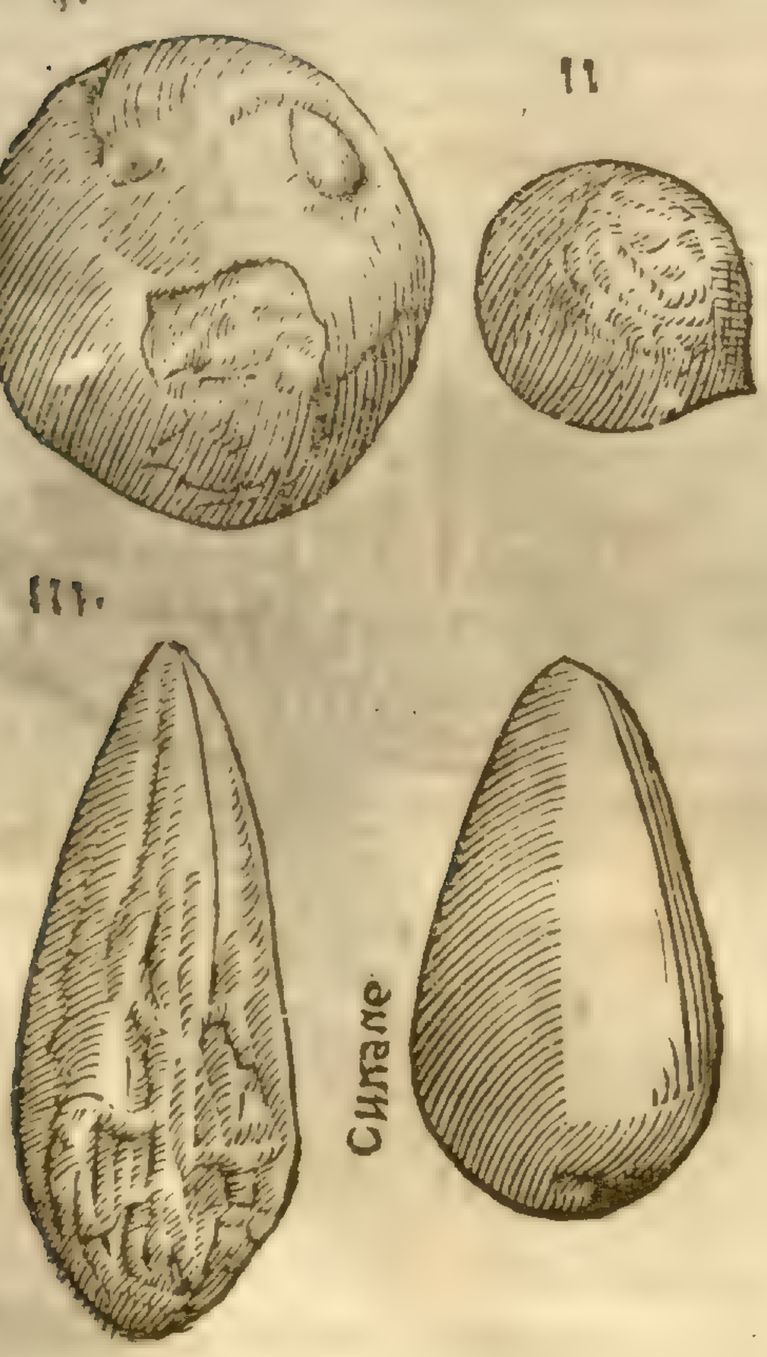
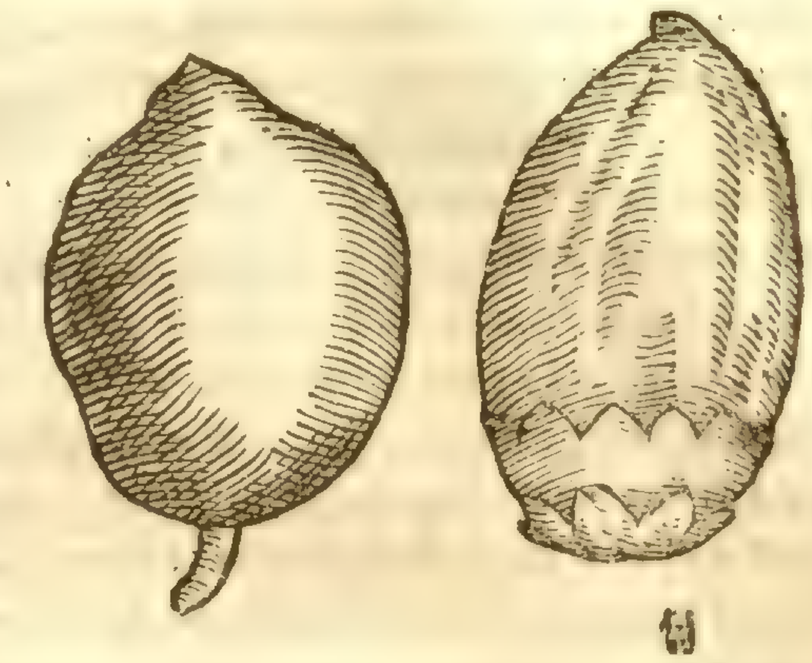
Other ſtrange fruits.



‡ 26 *Fructus alij Exotici.*
Other ſtrange fruits.



ſingle Nut here figured, deſcribed, & ſet forth; but this figure better expreſſes the manner of growing therof: for firſt it preſents to the view the nuts in their outer husks growing cloſe together, then the ſingle nuts in and out of their husks, and laſtly their kernell: the ſhell of this nut containes in it a certaine oilie ſubſtance, ſomwhat reſembling the oile of ſweet almonds: the tree whereof this nut is the fruit growes in Ginny, & is much vſed by the people there, for they preſſe a liquor forth of the leaues, or elſe boile them in water, and this ſerues them in ſtead of wine and beere, or at leaſt for a common drinke, of the fruit they make bread of a ſweet and pleaſant taſte.

25 Theſe ſcaily fruits are ſet forth by *Cluſius, Exot. l. 2. c. 3.* The firſt was three inches long and two inches about, and had it in a longiſh hard ſollid kernell, with many veines diſperſed ouer it, & ſuch kernels are ſomtimes poliſhed, whereby they become white, and then their blacke veines make a fine ſhew, which hath giuen occaſion to ſome impoſters to put them to ſaile for rare and pretious ſtones.

The ſecond was ſmall, round and ſcaily, and the ſcailes turned their points downewards towards the ſtalke.

The third was alſo ſcaily, of the bigneſſe of a Walnut in his huske, with the ſcales very orderly placed, and of browniſh colour: it had a kernel which ratled in it when it was ſhaken.

26 The firſt of the two in the former table was brought from Ginny, it was of the bigneſſe and ſhape of a plum, two inches long, and one and halfe broad, of a thicke fungous ſubſtance, ſomewhat wrinckled, and blackiſh on the outſide, and within containing a certaine whitiſh inſiped friable pulpe, wherein lay a few ſmall ſeeds.

The ſecond was ſome inch and halfe long, an inch thicke, couered with an aſh coloured skin, compoſed within of many fibres almoſt like the huske of the Nut Faufell, at the lower end it ſtood in a double cup, and it was ſharp pointed,

at the vpper end: in this skin was contained a kernell, or rather nut, blacke, hard, and very wrinckled not much vnlike to that of Faufell, whereto I refer it as a kinde thereof. Theſe two are treated of by *Cluſius, Exot. lib. 2. cap. 23.*

The firſt of the ſecond table (wherein are contained foure figures) was of a round forme, yet a little flat on one ſide, diſtinguiſhed vnder the black and ſhining coat wherewith it was couered, with furrowes running euery way, not vnlike to the Nut Faufell taken forth of his couer: the inner pulpe was hard and whitiſh, firſt of a ſalt, and then of an aſtringent taſte.

The ſecond of theſe was an inch long, but rather the kernell of a fruit, than a fruit it ſelfe; it was round except at the one end, and all ouer knobby (though the picture expreſſe not ſo much) there was alſo ſome ſhew of a triangular forme at the each end.

The third was two inches and a halfe long, and in the broadeſt part ſome inch and more broad: it was ſomewhat crooked, the backe high and riſing, the top narrow, and the loweſt part ſharp pointed, of an aſh colour, with thicke and eminent nerues running alongſt the back from the top to the lower part, expreſt with ſuch art, as if they had been done by ſome curious hand: it ſeemeth to haue bin couered ouer with another rinde, but it was worne off by the beating of the waues of the ſea vpon the ſhore.

The fruit *Cunane* figured in the fourth place of this table, was two inches long, and an inch broad at the head, and ſo ſmaller by little and little, with a backe ſtanding out, ſmooth, black, and ſhining, hauing three holes at the top, one aboue, and two below: they ſaid it grew vpon a ſmall tree called Morremor, and was yet vnripe, but when it was ripe it would be as big againe, and that the natiues where it grew (which was as I take it about Wiapock) roſt it vpon the coles, and eate it againſt the head-ache. *Cluſius* ſets forth theſe foure in his *Exot. l. 2. c. 22.* he deſcribes *Cunane cap. 21.* ‡

Chap. 160. *Of Sun-Dew, Youth wort, Ros Solis.*

1 *Ros Solis folio rotundo.*
Sun-Dew with round leaues.

2 *Ros Solis folio oblongo.*
Sun Dew with longiſh leaues.

¶ *The Description.*

1 SVn-Dew is a little herbe,and groweth very low,it hath a few leaues ſtanding vpon ſlender ſtems very ſmall,ſomething round,a little hollow, and like an eare picker, hairy and reddiſh as be alſo the ſtems, hauing dew and moiſture vpon them at the drieſt time of the yeare,and when the Sun ſhineth hotteſt euen at high noone ; and a moneth after there ſpring vp little ſtalks, a hand bredth high, on which ſtand ſmall whitiſh floures : the roots are very ſlender, and like vnto haires.

2 The ſecond kinde is like vnto the former,in ſtalkes and floures, but larger, and the leaues are longer,and not ſo round,wherein conſiſteth the difference,

¶ *The Place.*

They grow in deſart, ſandie, and ſunnie places, but yet wᾶtery, and ſeldome other where than among the white mariſh moſſe which groweth on the ground and alſo vpon bogs.

¶ *The Time.*

Sun-Dew flouriſheth in Summer,it floureth in May and Iune:it is to be gathered when the weather is moſt dry, and calme. The diſtilled water hereof that is drawne forth with a glaſſe ſtill,is of a glittering yellow colour like gold,and coloureth ſiluer put therein like gold.

¶ *The Names.*

It is called in Latine, *Ros Solis :* of diuers, *Rorella:* it is named of others, *Salſi Roſa*,of the dew which hangeth vpon it,when the Sun is at the hotteſt:it is called in high Dutch, **Sondaw**,and **Sundew**: in low Dutch, **Loopichertuit**,which in Engliſh ſignifieth Luſtwoort,becauſe ſheepe and other cattell,if they do but only taſt of it,are prouoked to luſt.It is called in Engliſh, Sun-Dew, Ros Solis, Youth-woort : in the Northerne parts,Red Rot,becauſe it rotteth ſheepe ; and in Yorkſhire,Moore graſſe.

¶ *The Temperature.*

It is a fearing or cauſticke herbe, and very much biting, being hot and dry in the fourth degree.

¶ *The Vertues.*

The leaues being ſtamped with ſalt do exulcerate and raiſe bliſters,to what part of the body ſoeuer they be applied. A

The later Phyſitions haue thought this herbe to be a rare and ſingular remedy for all thoſe that be in a conſumption of the lungs, and eſpecially the diſtilled water thereof : for as the herbe doth keep and hold faſt the moiſture and dew, and ſo faſt, that the extreme drying heate of the Sun cannot conſume and waſte away the ſame : ſo likewiſe men thought that herewith the naturall and radical humidity in mens bodies is preſerued and cheriſhed.But the vſe therof doth otherwiſe teach, and reaſon ſheweth the contrary : for ſeeing it is an extreme biting herbe,and that the diſtilled water is not altogether without this biting quality,it cannot be taken with ſafety:for it hath alſo been obſerued,that they haue ſooner periſhed that vſed the diſtilled water hereof,than thoſe that abſtained from it,and haue followed the right and ordinary courſe of diet. B

Cattell of the female kind are ſtirred vp to luſt by eating euen of a ſmall quantity : which thing hath greatly increaſed their vain opinion,without ſence or reaſon;for it doth not moue nor prouoke cattell to luſt,for that it increaſeth the ſubſtance of the ſeed,but becauſe through his ſharp and biting quality it ſtirreth vp a deſire to luſt,which before was dulled and as it were aſleepe. C

It ſtrengthneth and nouriſheth the body, eſpecially if it be diſtilled with wine, and that liquor made thereof which the common people do call Roſa Solis. D

If any be deſirous to haue the ſaid drinke effectuall for the purpoſes aforeſaid, let them lay the leaues of Roſa Solis in the ſpirit of wine, adding thereto Cinnamon, Cloues, Maces, Ginger, Nutmegs, Sugar, and a few graines of Muske, ſuffering it ſo to ſtand in a glaſſe cloſe ſtopt from the aire, and ſet in the Sun by the ſpace of ten daies,then ſtraine the ſame and keep it for your vſe. E

Chap. 161. *Of the Moſſe of Trees.*

¶ *The Description.*

TRee Moſſe hath certaine things like haires,made vp as it were of a multitude of ſlender leaues, now and then all to be jagged, hackt,and finely carued,twiſted and interlaced one in another, which cleaue faſt to the barkes of trees, hanging downe from the bodies : one of this kinde is more

Muscus quernus.

The Mosse of the Oke and of other trees.

¶ *The Place.*

This Mosse is found on the Oke tree, the white and blacke Poplar tree, the Oliue tree, the Birch tree, the Apple tree, the Peare tree, the Pine tree, the wilde Pine tree, the Pitch tree, the Firre tree, the Cedar tree, the Larch tree, and on a great sort of other trees. The best, as *Dioscorides* saith, is that of the Cedar tree, the next of the Poplar, in which kinde the White and the sweet smelling Mosse is the chiefest; the blackish sort is of no account. *Matthiolus* writeth, that in Italy that Mosse is sweet which groweth on the Pine tree, the Pitch tree, the Fir tree, and the Larch tree, and the sweetest, that of the Larch tree.

¶ *The Time.*

Mosse vpon the trees continueth all the yeare long.

¶ *The Names.*

It is called of the Grecians βρύον: of the Latines, *Muscus*. the Arabians and some Apothecaries in other countries call it *Vsnea*: in high Dutch, Mosz: in low Dutch, Mosch: the French-men, *Le Mousch*: the Italians, *Musgo*: in Spanish, *Musgo de los arbores*: in English, Mosse, tree Mosse, or Mosse of trees.

¶ *The Temperature.*

Mosse is somewhat cold and binding, which notwithstanding is more or lesse according vnto the nature and faculty of that tree on which it groweth, and especially of his barke: for it taketh vnto it selfe and also retaineth a certaine property of that barke, as of his breeder of which hee is ingendred: therefore the Mosse which commeth of the Oke doth coole and very much binde, besides his owne and proper faculty, it receiueth also the extreme binding quality of the Oke barke it selfe.

The Mosse which commeth of the Cedar tree, the Pine tree, the Pitch tree, the Fir tree, the Larch tree, and generally all the Rosine trees are binding, and do moreouer digest and soften.

¶ *The Vertues.*

A *Serapio* saith, that the wine in which Mosse hath been steeped certain daies, bringeth sound sleep, strengthneth the stomacke, staieth vomiting, and stoppeth the belly.

B *Dioscorides* writeth, That the decoction of Mosse is good for women to sit in, that are troubled with the whites; it is mixed with the oile of Ben, and with oiles to thicken them withall.

C It is fit to be vsed in compositions which serue for sweet perfumes, and that take away wearisomnesse; for which things that is best of all which is most sweet of smell.

Chap. 162. *Of ground Mosse.*

¶ *The Kindes.*

THere groweth also on the superficiall or vppermost part of the earth diuers Mosses, as also vpon rocks and stony places, and marish grounds, differing in forme not a little.

¶ *The Description.*

1 THe common Mosse groweth vpon the earth, and the bottome of old and antient trees, but specially vpon such as grow in shadowie woods, and also at the bottom of shadowie hedges,

slender and thinne, another more thicke, another shorter, another longer; all of them for the most being of a whitish colour, yet oftentimes there is a certaine one also which is blacke, but lesser and thinner: the most commendable of them all, as *Pliny* saith, be those that are whitish, then the reddish, and lastly such as be blacke.

1 *Muscus terrestris vulgaris.*
Common ground Mosse.

2 *Muscus terrestris scoparius.*
Beesome ground Mosse.

3. 4. *Muscus capillaris, siue Adianthum aureum majus & minus.*
Goldilockes or golden Maiden-haire the bigger and the lesser.

hedges and ditches, and such like places: it is very well knowne by the softnesse and length thereof, being a mosse most common, and therefore needeth not any further description.

2 Beesome Mosse, which seldome or neuer is found but in bogs and marish places, yet sometimes haue I found it in shadowie dry ditches, where the Sunne neuer sheweth his face: it groweth vp halfe a cubit high, euery particular leafe consisting of an innumerable sort of hairy threds set vpon a middle rib, of a shining blacke colour like that of Maiden-haire, or the Capillare Mosse called *Adianthum aureum*, whereof it is a kinde.

3 This kinde of Mosse, called *Muscus capillaris*, is seldome found but vpon bogs and moorish places, and also in some shadowie dry ditches where the Sun doth not come. I found it in great abundance in a shadowie ditch vpon the left hand neere vnto a gate that leadeth from Ham, the l

heath,

5 *Muscus ramosus floridus.*
Flouring branched Mosse.

heath toward Highgate; which place I haue shewed vnto diuers expert Surgeons of London, in our wandering abroad for our farther knowledge in Simples. This kind of Mosse, the stalkes thereof are not aboue one handfull high, couered with short haires standing very thicke together, of an obscure yellow green colour; out of which stalkes spring vp sometimes very fine naked stems, somewhat blacke, vpon the tops of which hang as it were little graines like wheat cornes. The roots are very slender and maruellous fine.

‡ Of this *Adianthum aureum* there are three kindes, different onely in magnitude, and that the two bigger haue many hairie threds vpon their branches, when as the least hath onely three or foure close to the root; and this is the least of plants that I euer yet saw grow. ‡

4 Of this there is also another kinde altogether lesser and lower. This kind of mosse groweth in moist places also, commonly in old mossie and rotten trees, likewise vpon rocks, and oftentimes in the chinks and crannies of stone walls.

† 5 There is oftentimes found vpon old Okes and Beeches, and such like ouer-growne trees, a kind of Mosse hauing many slender branches, which diuide themselues into other lesser branches; whereon are placed confusedly very many small threds like haires, of a greenish ash-colour: vpon the ends of the tender branches sometimes there commeth forth a floure in shape like vnto a little buckler or hollow Mushrom, of a whitish colour tending to yellownes, and garnished with the like leaues of those vpon the lower branches.

6 *Muscus Pyxidatus.*
Cup or Chalice Mosse.

6 Of this Mosse there is another kinde, which *Lobel* in his Dutch Herbal hath set forth vnder the title of *Muscus Pyxidatus*, which I haue Englished, Cup Mosse or Chalice Mosse: it groweth in the most barren dry and grauelly ditch bankes, creeping flat vpon the ground like vnto Liuerwort, but of a yellowish white colour: among which leaues start vp here and there certaine little things fashioned like a little cup called a Beaker or Chalice, and of the same colour and substance of the lower leaues, which vndoubtedly may be taken for the floures: the pouder of which Mosse giuen to children in any liquor for certaine daies together, is a most certaine remedy against that perilous malady called the Chin cough.

7 There is likewise found in the shadowie places of high mountaines, and at the foot of old and

and rotten trees, a certaine kinde of mosse in face and shew not vnlike to that kinde of Oke Ferne called *Dryopteris*. It creepeth vpon the ground, hauing diuers long branches, consisting of many small leaues, euery particular leafe made vp of sundry little leaues, set vpon a middle rib one opposit to another.

7 *Muscus Filicinus.*
Mosse Ferne.

8 *Muscus corniculatus.*
Horned or knagged Mosse.

9 *Muscus denticulatus.*
Toothed Mosse.

8 There is found vpon the tops of our most barren mountaines, but especially where sea Coles are accustomed to be digged, stone to make iron of, and also where ore is gotten for tinne and lead, a certaine small plant: it riseth forth of the ground with many bare and naked branches, diuiding themselues at the top into sundry knags like the forked hornes of a Deere, euery part whereof is of an ouerworne whitish colour.

‡ Our Author formerly gaue another figure and description of this plant, by the name of *Holosteum petræum*, which I haue omitted, thinking this the better. *Tragus*, *Lonicerus*, and *Bauhine* refer this to the Fernes; and the last of them calleth it *Filex saxatilis cornicnlata*: *Pena* and *Lobel* made it their *Holostium alterum*: *Thalius* calls it *Adianthum acroschiston, seu furcatum*. ‡

9 There is found creeping vpon the ground a certaine kinde of mosse at the bottome of Heath and Ling, and such like bushes growing vpon barren mountaines, consisting as it were of scales made vp into a long rope or cord, dispersing it selfe far abroad into sundry branches, thrusting out

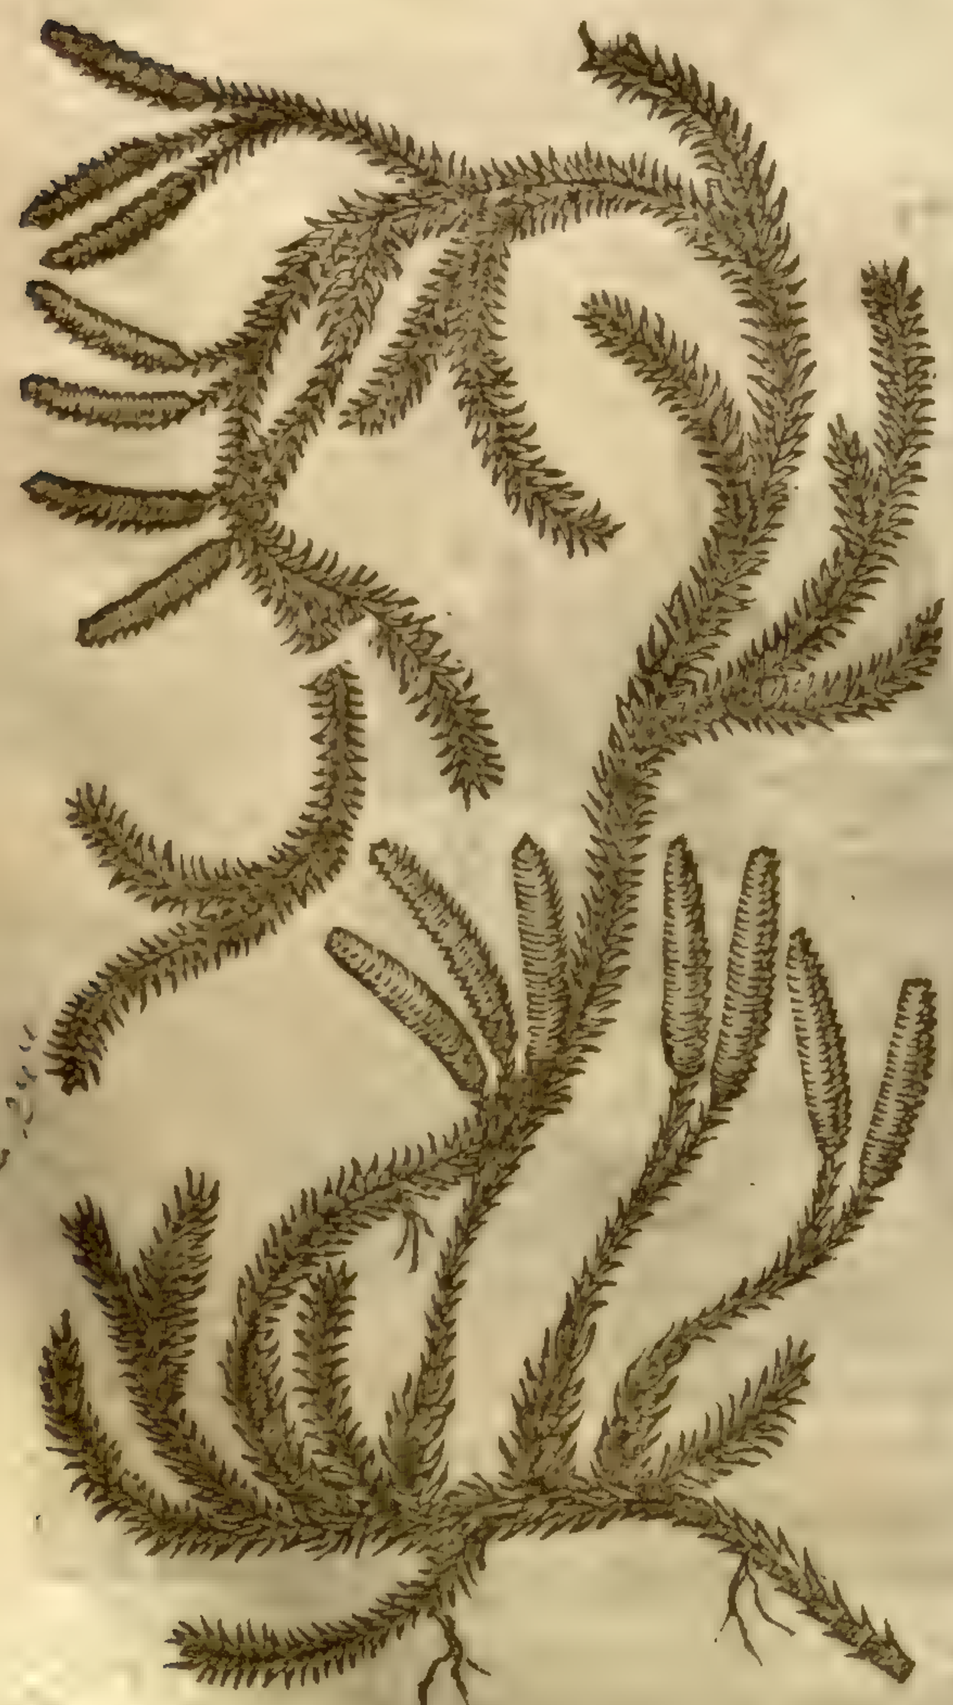
here

here and there certaine roots like threds, which take hold vpon the vpper cruſt of the earth, whereby it is ſent and diſperſed far abroad: the whole plant is of a yellowiſh greene colour.

10 This other kinde of moſſe is found in the like places: it alſo diſperceth it ſelfe far abroad, and is altogether leſſer than the precedent, wherein conſiſts the difference.

10 *Muſcus minor denticulatus.*
Little toothed Moſſe.

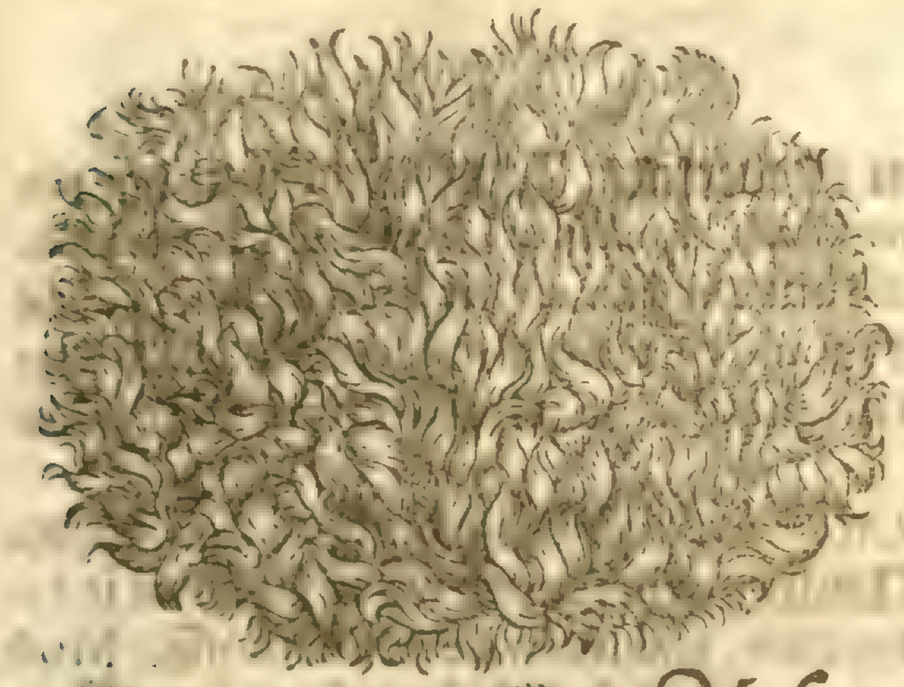
11 *Muſcus clauatus, ſiue Lycopodium.*
Club Moſſe, or Wolfe claw Moſſe.

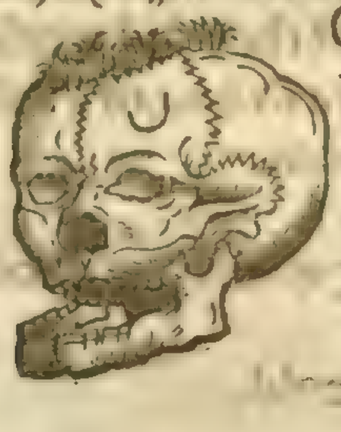


† 12 *Muſcus clauatus foljs Cupreſſi.*
Heath Cypres.

11 There is likewiſe another kinde of Moſſe, which I haue not elſewhere found than vpon Hampſted heath, neere vnto a little cottage, growing cloſe vpon the ground amongſt buſhes and brakes, which I haue ſhewed vnto diuers Surgeons of London, that haue walked thither with mee for their further knowledge in Simples, who haue gathered this kinde of moſſe, whereof ſome haue made

13 *Muscus ex cranio humano.*
Mosse growing vpon the skull of a man.





Muscus ex Cranio Humano

made them hat-bands, girdles, and also bands to tye such things as they had before gathered, for the which purpose it most fitly serued; some pieces whereof are six or eight foot long, consisting as it were of many hairie leaues set vpon a tough string, very close couched and compact together, from which is also sent forth certain other branches like the first: in sundry places there be sent down fine little strings, which serue in stead of roots, wherewith it is fastened to the vpper part of the earth, and taketh hold likewise vpon such things as grow next vnto it. There spring also from the branches bare & naked stalkes, on which grow certaine eares as it were like the catkins or blowings of the Hasell tree, in shape like a little club or the reed Mace, sauing that it is much lesser, and of a yellowish white colour, very wel resembling the claw of a Wolfe, whereof it tooke his name; which knobby catkins are altogether barren, and bring forth neither seed nor floure.

‡ 14 *Muscus paruus stellaris.*
Small Heath Mosse.

‡ 12 This, whose figure in the former edition was by our Author vnfitly put for Lauandet Cotton (hauing more regard to the title of the figure in *Tabernamontanus*, than to see whether it were that which he there described) it is no other than a kind of *Muscus Clauatus*, or Club-Mosse. It is thought to be the *Selago* mentioned by *Pliny, lib.* 25. *cap.* 11. *Tragus* and some others call it *Sauina syluestris*: *Turner* and *Tabernamontanus*, *Chamæcyparissus*: but *Bauhine* the most fitly nameth it *Muscus clauatus folijs Cypressi*: and *Turner* not vnfitly in English, Heath Cypresse. This is a low plant, and keepes greene Winter and Summer: the leaues are like those of Cypresse, bitter in taste, but without smell: it carries such eares or catkins as the former, and those of a yellowish colour: it is found growing in diuers wooddy mountainous places of Germany, where they call it **Wald Seuenbaum**, or wilde Sauine. ‡

13 This kinde of Mosse is found vpon the skulls or bare scalpes of men and women, lying long in charnell houses or other places, where the bones of men and women are kept together: it growes very thicke, green, and like vnto the short mosse vpon the trunkes of old Okes: it is thought to be a singular remedie against the falling Euill and the Chin-cough in children, if it be poudered, and then giuen in sweet wine for certaine daies together.

‡ 14 Vpon diuers heathy places in the moneth of May is to be found growing a little short Mosse not much in shape different from the first described, but much lesse, and parted at the top into star-fashioned heads. *Lobel* calls this, *Muscus in Ericetis prouenies*. ‡

¶ *The*

¶ *The Place.*

Their seuerall descriptions set forth their naturall places of growing.

¶ *The Time.*

They flourish especially in the Summer moneths.

¶ *The Names.*

Goldilocks is called in high Dutch, **Widertodt, golden Wedertodt, Jung Urauwen har:** in low Dutch, **Gulden Wederdoot:** *Fuchsius* nameth it *Polytrichon Apuleij*, or *Apuleius* his Maiden-haire; neuertheleſſe *Apuleius* Maiden-haire is nothing elſe but *Dioscorides* his *Trichomanes*, called Engliſh Maiden-haire; and for that cauſe we had rather it ſhould be termed *Muscus Capillaris*, or hairy Moſſe. This is called in Engliſh, Goldilockes: it might alſo be termed Golden Moſſe, or Hairy Moſſe.

Wolfes claw is called of diuers Herbariſts in our age, *Muscus terrestris*: in high Dutch, **Beerclay, Surtelkraut, Setkraut:** in low Dutch, **Wolfs Clauwen**; whereupon we firſt named it *Lycopodium*, and *Pes Lupi*: in Engliſh, Wolfes foot, or Wolfes claw, and likewiſe Club moſſe. Moſt ſhops of Germany in former times did falſly terme it *Spica celtica*: but they did worſe, and were very much too blame, that vſed it in compound medicines in ſtead of *Spica Celtica*, or French Spikenard: as touching the reſt, they are ſufficiently ſpoken of in their deſcriptions.

¶ *The Temperature.*

The Moſſes of the earth are dry and aſtringent, of a binding quality, without any heate or cold.

Goldilockes and the Wolfes clawes are temperate in heate and cold.

¶ *The Vertues.*

A The Arabian Phyſitians doe put moſſe among their cordiall medicines, as fortifying the ſtomacke, to ſtay vomit, and to ſtop the laske.

B Moſſe boiled in Wine and drunke ſtoppeth the ſpitting of bloud, piſſing of bloud, the termes, and bloudy flix.

C Moſſe made into pouder is good to ſtanch the bleeding of greene and freſh wounds, and is a great helpe vnto the cure of the ſame.

D Wolfes claw prouoketh vrine, and as *Hieronymus Tragus* reporteth, waſteth the ſtone, and driueth it forth.

E Being ſtamped and boiled in wine and applied, it mitigateth the paine of the gout.

F Floting wine, which is now become ſlimie, is reſtored to his former goodneſſe, if it be hanged in the veſſell, as the ſame Author teſtifieth.

† The figure formerly in the firſt place was of the *Muscus Monanus* of *Tabern.* being a ſmall kinde of *Muscus denticulatus*. The fifth and ſixth were both of one; and ſo of the two deſcriptions I haue made one more accurate, and reſerued the better figure.

Chap. 163. *Of Liuerwort.*

¶ *The Deſcription.*

1 Liuerwort is alſo a kinde of Moſſe which ſpreadeth it ſelfe abroad vpon the ground, hauing many vneuen or crumpled leaues lying one ouer another, as the ſcales of Fiſhes do, greene aboue, and browne vnderneath: amongſt theſe grow vp ſmall ſhort ſtalkes, ſpred at the top like a blaſing ſtarre, and certaine fine little threds are ſent downe, by which it cleaueth and ſticketh faſt vpon ſtones, and vpon the ground, by which it liueth and flouriſheth.

2 The ſecond kinde of Liuerwort differeth not but in ſtature, being altogether leſſe, and more ſmooth or euen: the floures on the tops of the ſlender ſtems are not ſo much laid open like a ſtar; but the eſpeciall difference conſiſteth in one chiefe point, that is to ſay, this kinde being planted in a pot, and ſet in a garden aboue the ground, notwithſtanding it ſpitteth or caſteth round about the place great ſtore of the ſame fruit, where neuer any did grow before.

‡ Of this ſort which is ſmall, and oftentimes found growing in moiſt gardens among Beares-eares, and ſuch plants, when they are kept in pots, there are two varieties, one hauing little ſtalkes ſome inch long, with a ſtarre-faſhioned head at the top: the other hath the like tender ſtalke, and a round head at the top thereof. ‡

3 This is found vpon rockes and ſtony places, as well neere vnto the ſea, as further into the land: it groweth flat vpon the ſtones, and creepeth not far abroad as the ground Liuerwort doth, it only reſteth it ſelfe in ſpots and tufts ſet here and there, of a duſty ruſſet colour aboue, and blackiſh vnderneath: among the crumpled leaues riſe vp diuers ſmall ſtems, whereupon do grow little ſtarlike floures of the colour of the leaues: it is often found at the bottom of high trees growing vpon high

1 *Hepatica terrestris.*
Ground Liuer-wort.

2 *Hepatica stellata & vmbellata.*
Small Liuerwort with starry and round heads.

3 *Hepatica petræa.*
Stone Liver-wort.

high mountains, especially in shadowy places.

¶ *The Place.*

This is often found in shadowy and moist places, on rockes and great stones laid by the highway, and in other common paths where the sun beams do seldome come, and where no traueller frequenteth.

¶ *The Time.*

It brings forth his blasing starres and leaues oftentimes in Iune and Iuly.

¶ *The Names.*

It is called of the Grecians, Λειχὴν: of the Latines, *Lichen*: of some, Βρύον, that is to say, *Muscus* or Mosse, as *Dioscorides* witnesseth. It is named in shops *Hepatica*, yet there are also many other herbs named *Hepaticæ*, or Liverworts; for difference whereof this may fitly be called *Hepatica petræa* or stone Liverwort, hauing taken that name from the Germans, who call this Liuer-woort, **Steyn Leberkraut**: and in Low-Dutch, **Steen Leuerkruyt**, In English, Liuerwort.

¶ *The Temperature.*

Stone Liverwort is cold and dry, and somwhat binding.

¶ *The Vertues.*

It is singular good against the inflammations of the liuer, hot and sharp agues, and tertians that proceed of choler.

B *Dioſcorides* teacheth, That Liverwort being applied to the place ſtancheth bleeding, takes away all inflammations, and is good for a tettar or ringworme called in Greek ἁλφος: and that it is a remedie for them that haue the yellow jaundice, euen that which commeth by inflammation of the liuer; and that it alſo quencheth the inflammations of the tongue.

CHAP. 164.

Of Lung-wort or wood Liver-wort, and Oiſter-greene.

1 *Lichen arborum.*
Tree Lung-wort.

2 *Lichen marinus.*
Sea Lung-wort, or Oiſter-greene.

¶ *The Deſcription.*

1 TO Liver-wort there is ioyned Lung-wort, which is alſo another kinde of Moſſe, drier, broader, of a larger ſize, and ſet with skales: the leaues hereof are greater, and diuerſly folded one in another, not ſo ſmooth, but more wrinckled, rough and thicke almoſt like a Fel or hide, and tough withall; on the vpper ſide whitiſh, and on the nether ſide blackiſh or duſty: it ſeems after a ſort to reſemble lungs or lights.

2 This kind of ſea Moſſe is an herby matter much like vnto Liver-wort, altogether without ſtalke or ſtem, bearing many green leaues very vneuen or crumpled, and full of wrinkles, ſomewhat broad, not much differing from leaues of criſpe or curled Lettuce. This growes vpon rocks within the bowels of the ſea, but eſpecially amongſt oiſters, and in great plenty among thoſe oiſters called Wal-fleet oiſters. It is very well known euen to the poore oiſter women which carry oiſters to ſell vp and down, who are greatly deſirous of the ſaid moſſe for the decking and beautifying of their oiſters, to make them ſell the better. This moſſe they call Oiſter-green.

‡ 3 The branches of this elegant plant are ſome handfull or better high, ſpred abroad on euery ſide, and only conſiſting of ſundry ſingle roundiſh leaues, whereto are faſtned ſometimes one, ſometimes

sometimes two or more such leaues, so that the whole plant consists of branches made vp of such round leaues, fastned together by diuers little and very small threds: the lower leaues which sticke fast to the rockes are of a browniſh colour, the other of a whitiſh or light greene colour, smooth and shining. This growes vpon rocks in diuers parts of the Mediterranean. *Clusius* sets it forth by the name of *Lichen marinus*; and he receiued it from *Imperato* by the name of *Sertuloria*: and *Cortusus* had it from Corsica by the title of *Corallina latifolia*; and he called it *Opuntia Marina*, hauing reference to that mentioned by *Theophrast. lib. 1. cap. 12. Hist. plant.* ‡

‡ 3 *Lichen marinus rotundifolius.* Round leaued Oister-weed.

4 *Quercus marina.*
Sea Oke or Wrack.

‡ 4 *Quercus marinæ varietas.*
A varietie of the sea Oke or Wrack.

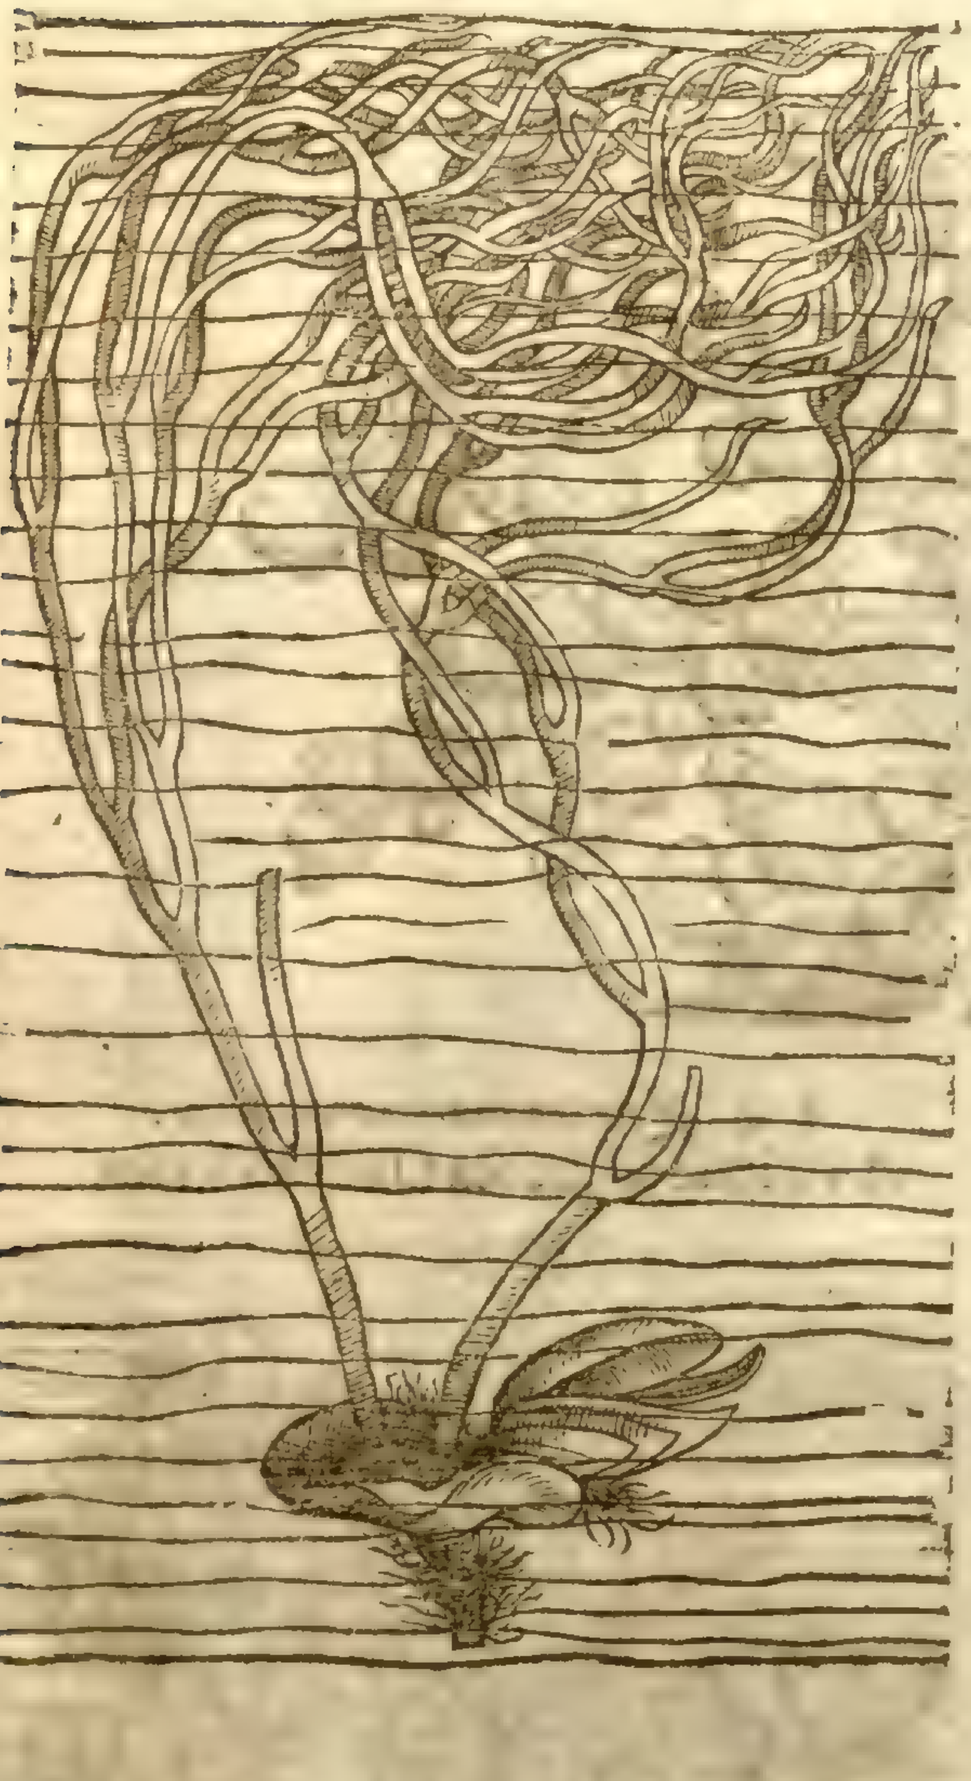
4 There is also another sort of Sea Weed found vpon the drowned rocks which are naked and bare of water at euery tyde. This sea Weed groweth vnto the rocke, fastned vnto the same at one

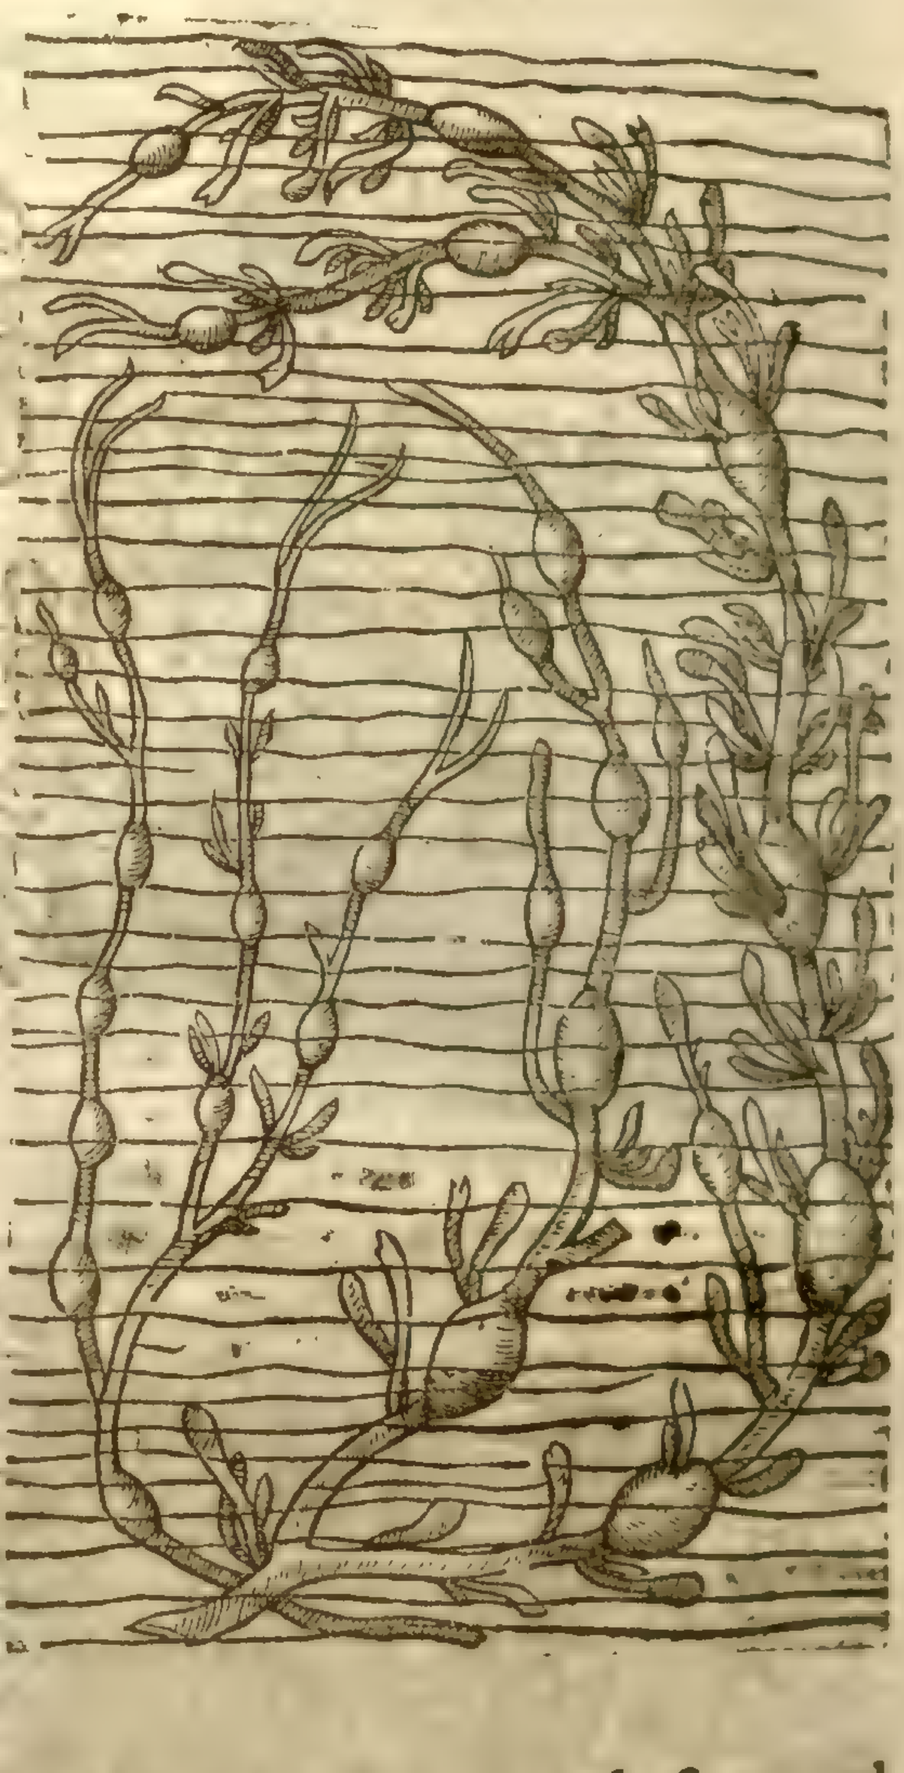
end,

end, being a ſoft herby plant very ſlippery, inſomuch as it is an hard matter to ſtand vpon it without falling; it rampeth far abroad, and here and there is ſet with certaine puft vp tubercles or bladders full of winde, which giue a cracke being broken: the leafe it ſelfe doth ſomwhat reſemble the Oken leafe, whereof it took his name *Quercus marina* or ſea Oke: of ſome, Wrack, and Crow gall. His vſe in phyſick hath not bin ſet forth, and therefore this bare deſcription may ſuffice.

‡ 5 *Quercus marina ſecunda.*
Sea Thongs.

‡ 6 *Quercus marina tertia.*
The third ſea Wrack.





‡ Of this *Quercus marina* or *Fucus* there are diuers ſorts, whereof I will giue you the figures and a briefe hiſtory. The firſt of theſe is onely a varietie of the laſt deſcribed, differing therefrom in the narrowneſſe of the leaues, and largeneſſe of the ſwolne bladders.

5 This growes to the length of fiue or ſix foot, is ſmooth and membranous, being ſome halfe fingers bredth, and variouſly diuided like wet parchment or leather cut into thongs. This hath no ſwoln knots or bladders like as the former; and is the *Fucus marinus ſecundus* of *Dodonæus*.

6 This Wrack or Sea Weed hath long and flat ſtalks like the former, but the ſtalks are thicke ſet with ſwolne knots or bladders, out of which ſomtimes grow little leaues; in other reſpects it is not vnlike the former kindes. *Dodonæus* makes this his *Fucus marinus* 3.

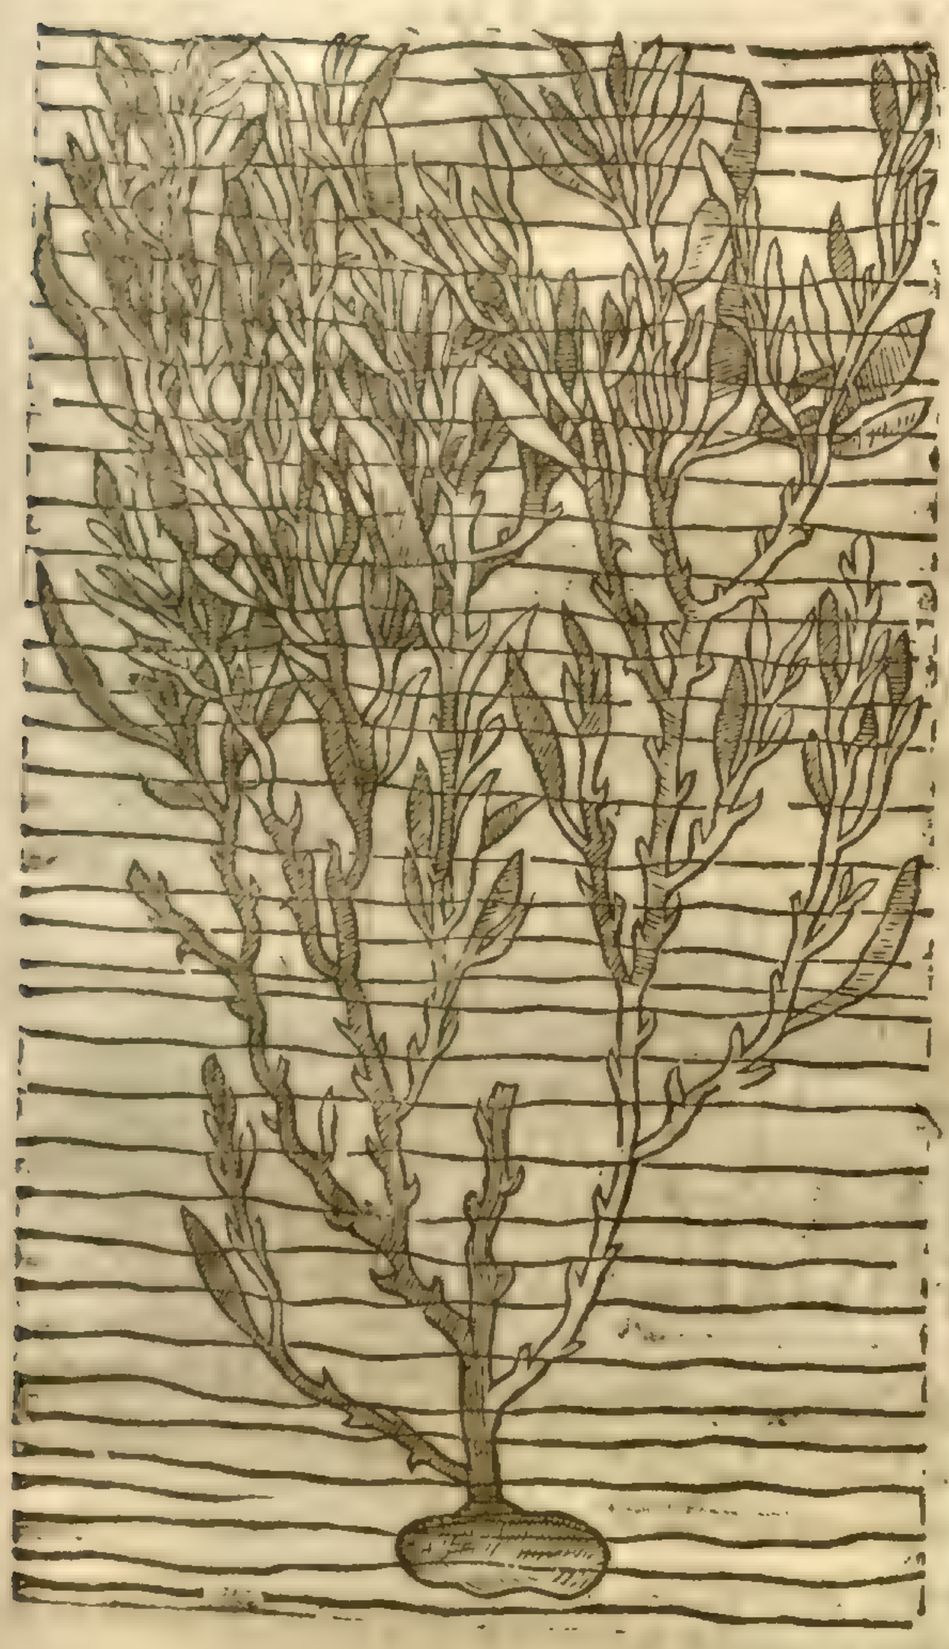
7 The leaues of this other Wracke, which *Dodonæus* makes his *Fucus marinus* 4. are narrower, ſmaller, and much diuided; and this hath either none or very few of thoſe ſwolne bladders which ſome of the former kindes haue.

8 This, which *Lobel* cals *Alga marina*, hath jointed black branched creeping roots of the thickneſſe of ones finger, which end as it were in diuers eares or hairy awnes, compoſed of whitiſh hairy threds ſomwhat reſembling Spikenard; from the tops wherof come forth leaues long, narrow, ſoft, and graſſe-like, firſt greene, but white when they are dry. It growes in the ſea as the former. They vſe it in Italy and other hot countries to pack vp glaſſes with, to keepe them from breaking.

9 Of this Tribe are diuers other plants; but I will onely giue you the hiſtory of two more, which I firſt obſerued the laſt yeare, going in company with diuers London Apothecaries to finde out Simples, as far as Margate in the Iſle of Tenet; and whoſe figures (not before extant that I know of) I firſt gaue in my Iournall or enumeration of ſuch Plants as wee there and in other places found. The firſt of theſe by reaſon of his various growth is by *Bauhine* in his *Prodromus* diſtinguiſhed

guished into two, and described in the second and third places. The third he calls *Fucus longissimo, latissimo, crassoque folio*, and this is marked with the figure 1. The second he calls *Fucus arboreus Polyschides*, and this you may see marked with the figure 2. This Sea weed (as I haue said) hath a various face; for somtimes from a fibrous root, which commonly groweth to a pibble stone, or fastned to a rock, it sends forth a round stalk seldom so thick as ones little finger, and about some half foot in length, at the top whereof grows out a single leafe, somtimes an ell long, and then it is about the bredth of ones hand, ending in a sharpe point, so that it very well resembles a two edged sword. Somtimes from the same root come forth two such fashioned leaues, but then commonly they are lesser. Otherwhiles at the top of the stalke it diuides it selfe into eight, nine, ten, twelue, more or fewer parts, and that iust at the top of the stalk, and these neuer come to that length that the single leaues do. Now this I iudge to be the *Fucus polyschides* of *Bauhine*. That these two are not seueral kinds I am certain; for I haue marked both these varieties from one and the same root, as you may see them here expresst in the figure. At Margate where they grow they cal them sea Girdles: which name well besits the single one; and the diuided one they may call sea Hangers, for if you hang the tops downward they do reasonable wel resemble the old fashioned sword hangers. Thus much for their shape: now for their colour, which is not the same in all; for some are more greene, and these can scarce be dried; others some are whitish, and these do quickly dry, and then both in colour and substance are so like Parchment, that such as know them not would at the first view take them to be nothing els. This is of a glutinous substance and a little saltish tast, and diuers haue told me they are good meat, being boiled tender, and so eaten with butter, vineger and pepper.

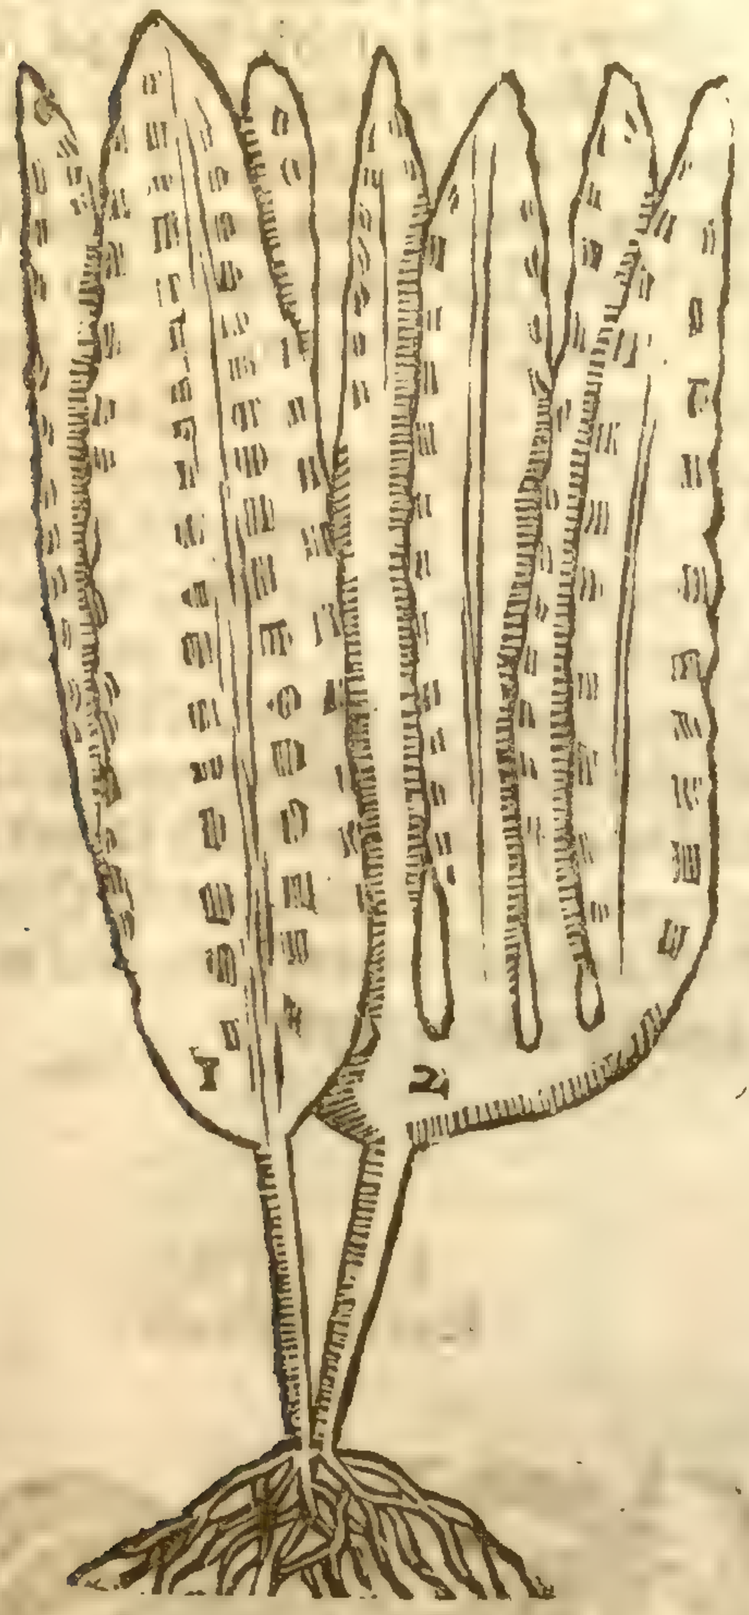
‡ 7 *Quercus marina quarta.*
Iagged sea Wrack.



† 8 *Alga.*
Grasse Wrack.

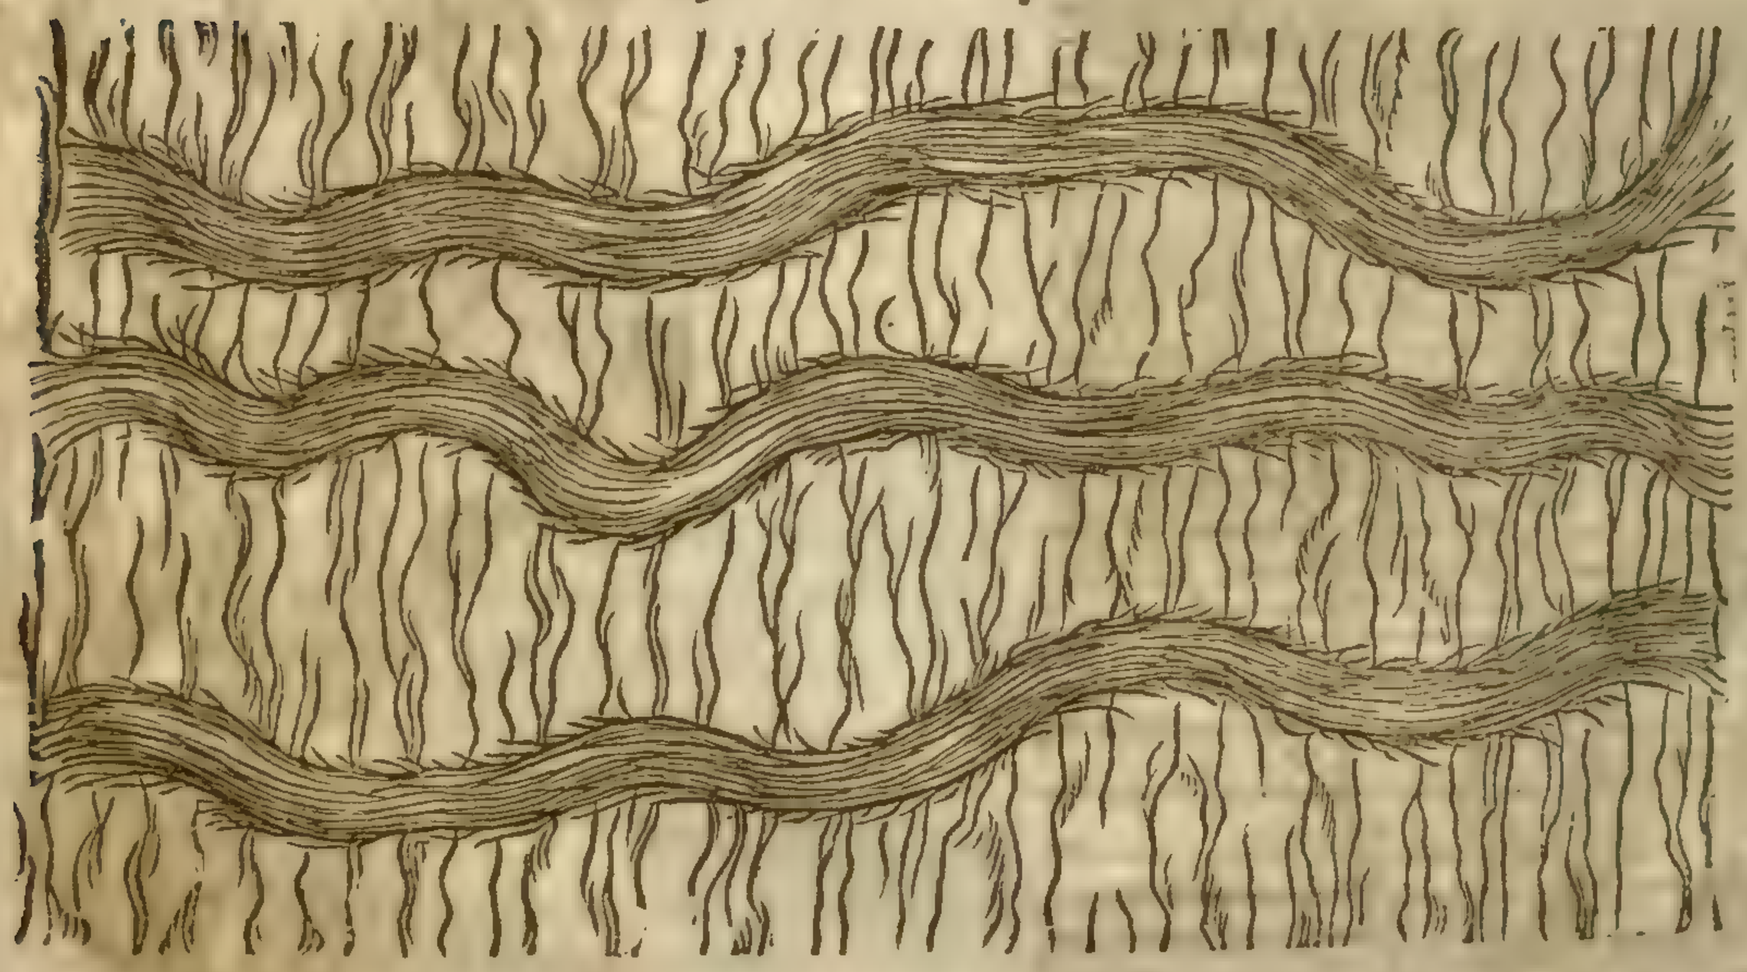
10. This which I giue you in the tenth place is not figured or described by any that as yet I haue met with; wherefore I gaue the Figure and Description in the fore-mentioned journal, which I will here repeat. This is a very succulent and fungous plant, of the thickneſſe of ones thumb; it is of a dark yellowish colour, and buncheth forth on euery side with many vnequall tuberosities or knots: whereupon Mr *Tho. Hicks* being in our company did fitly name it sea Ragged staffe. We did not obserue it growing, but found one or two plants thereof some foot long apiece.

‡ 9 *Fucus phaſganoides & polyſchides.*
Sea Girdle and Hangers.



‡ 10 *Fucus ſpongioſus nodoſus.*
Sea ragged Staffe.

‡ 11 *Conferua.* Hairy Riuer-weed.



11 In ſome ſlow running waters is to be found this long green hairy weed, thought to be the *Conferua* of *Pliny*: it is made vp only of long hairy green threds, thick thrummed together without any particular ſhape or faſhion, but only following the current of the ſtream. ‡

¶ *The Place, Time, and Names.*

It growes vpon the bodies of old Okes, Beech, and other wild trees, in dark and thick woods: it is oftentimes found growing vpon rocks, and alſo in other ſhadowy places,

It flouriſheth eſpecially in the ſummer moneths.

It taketh his name *Pulmonaria* of the likeneſſe it hath with lungs or lights, called in Latine *Pulmones*, of ſome *Lichen*: it is called in high-Dutch, **Lungenkraut**: in low-Dutch, **Longhencruyt**: in French, *Herbe à Poulmon*: in Engliſh, Lungwort, and wood Liverwort.

¶ *The Temperature.*

This ſeemeth to be cold and dry.

¶ *The*

¶ *The Vertues.*

It is reported, That ſhepheards and certain horſeleeches do with good ſucceſſe giue the pouder hereof with ſalt vnto their ſheep and other cattell that be troubled with the cough and be broken winded. A

Lungwort is much commended of the learned Phyſitions of our time, againſt the diſeaſes of the lungs, eſpecially for the inflammations and vlcers of the ſame, being brought into pouder & drunk with water. B

It is likewiſe commended for bloudy and green wounds, and for vlcers in the ſecret parts, and alſo to ſtay the reds. C

Moreouer, it ſtops the bloudy flix and other flixes and ſcourings, either vpwards or downwards eſpecially if they proceed of choler: it ſtayeth vomiting, as ſome ſay, and alſo ſtops the belly. D

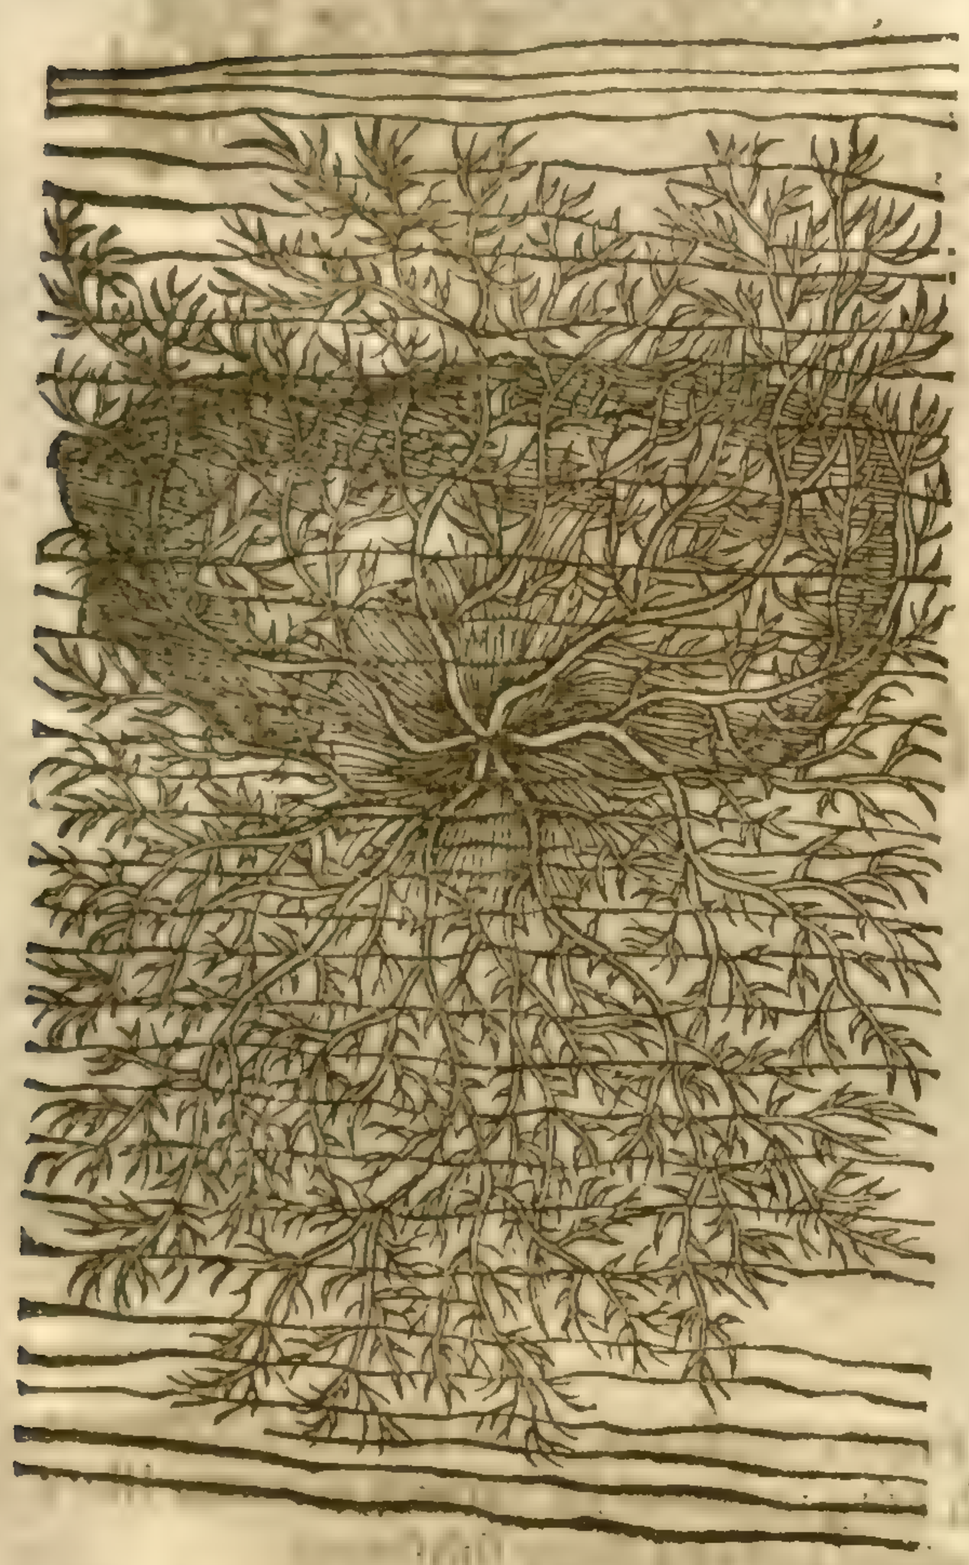
Oiſter-green fried with egges and made into a tanſie and eaten, is a ſingular remedie to ſtrengthen the weakneſſe of the backe. E

Chap. 165. *Of Sea Moſſe or Coralline.*

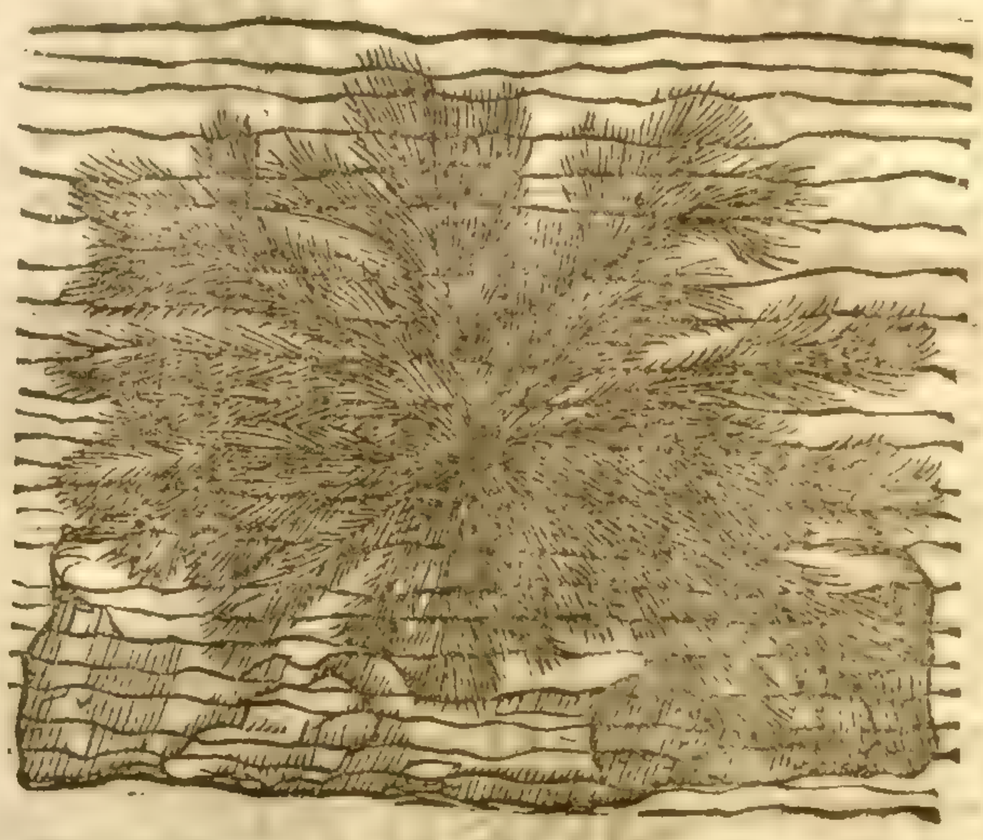
¶ *The Kindes.*

There be diuers ſorts of Moſſe, growing as well within the bowels of the ſea, as vpon the rocks, diſtinguiſhed vnder ſundry titles.

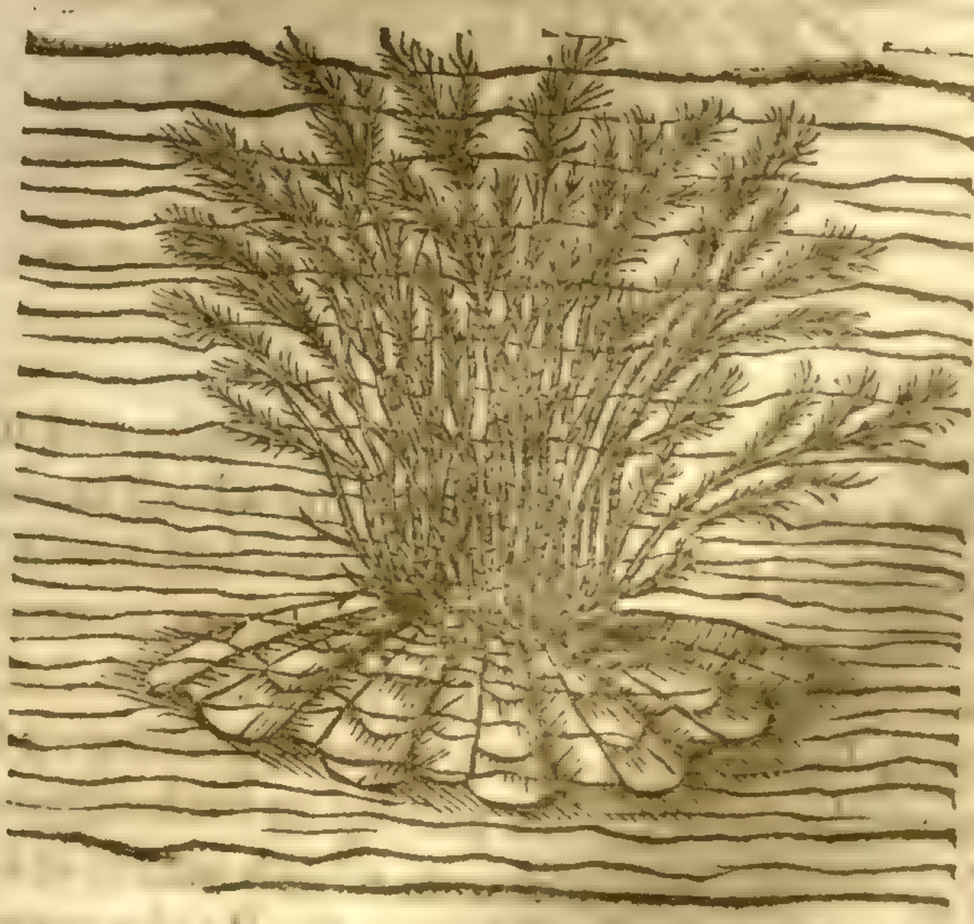
1 *Muſcus marinus, ſiue Corallina alba.*
White Coralline or Sea moſſe.



† 2 *Muſcus marinus albidus.*
White Sea Moſſe.



3 *Corallina Anglica.*
Engliſh Coralline.



¶ The

¶ *The Deſcription.*

1 THis kinde of Sea moſſe hath many ſmall ſtalks finely couered or ſet ouer with ſmall leaues, very much cut or jagged euen like the leaues of Dill, but hard, and of a ſtony ſubſtance.

2 The ſecond is much like the former, yet not ſtony, but more finely cut, and growing more vpright, branching it ſelfe into many diuiſions at the top, growing very thicke together, and in great quantity, out of a piece of ſtone, which is faſhioned like an hat or ſmall ſtony head, whereby it is faſtned vnto the rocks.

3 This third kind of Sea moſſe is very well known in ſhops by the name *Corallina*: it yeeldeth forth a great number of ſhoots in ſhape much like to Corall, being full of ſmall branches diſperſed here and there, diuerſly varying his colour according to the place where it is found, beeing in ſome places red, in others yellow and of an herby colour; in ſome gray or of an aſh colour, in other ſome very white.

4 This Sea moſſe is ſomwhat like the former, but ſmaller, and not ſo plentiful where it groweth, proſpering alwaies vpon ſhels, as of Oiſters, Muſcles, and Scallops, as alſo vpon rolling ſtones in the bottom of the water, which haue tumbled down from the high clifs and rocks, notwithſtanding the old Prouerb, That rolling ſtones neuer gather moſſe.

4 *Corallina minima.*
The ſmalleſt Coralline.

5 *Muſcus Corallinus, ſive Corallina montana.*
Corall moſſe, or mountain Coralline.

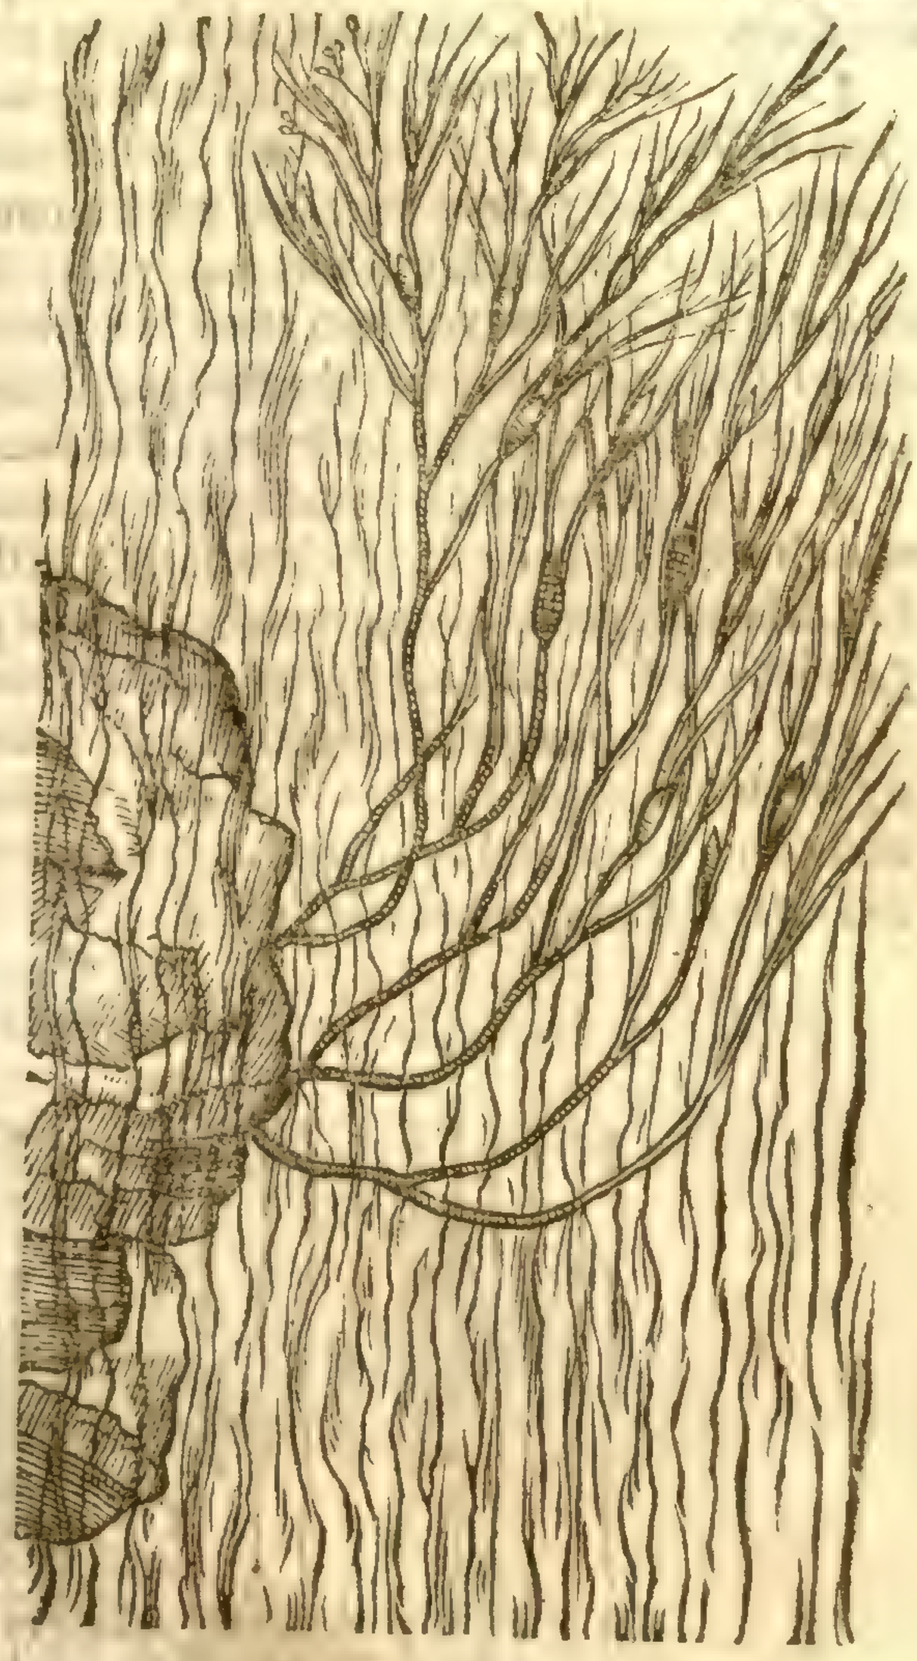
5 There is found vpon the rocks and mountains of France bordering vpon the Meditetranian ſea, a certain kind of Coralline which in theſe parts hath not bin found: it growes in maner like a branch of Corall, but altogether leſſer, of a ſhining red colour, and of a ſtony ſubſtance.

‡ I know not what our Author meant by this deſcription, but the plant which here is figured out of *Tabern.* (and by the ſame title he hath it) is of a moſſe growing vpon Hampſtead heath, and moſt ſuch places of England: it growes vp ſome two or three inches high, and is diuided into very many little branches ending in little threaddy chiues; all the branches are hollow, and of a very light white dry ſubſtance, which makes it ſomwhat reſemble Coralline, yet is it not ſtony at all. ‡

6 There is found vpon the Rocks neere vnto Narbone in France, and not far from the ſea, a kinde

6 *Fucus marinus tenuifolius.*
Fenell Coralline or Fenell Moſſe.

‡ 7 *Fucus ferulaceus.*
Sea Fenell.



‡ 8 *Fucus tenuifolius alter.*
Bulbous ſea Fenell.

‡ 9 *Muſcus marinus Cluſij.*
Branched ſea Moſſe.

kinde of Coralline: it groweth vp to the form of a ſmall ſhrub, branched diuerſly, wheron do grow ſmall graſſe-like leaues very finely cut or jagged like to Fenell, yet are they of a ſtony ſubſtance as are the reſt of the Corallines, of a darke ruſſet colour.

‡ 7 This growes alſo in the like places, hauing many ſmall long Fennel-like diuided leaues vpon ſtalks ſome foot long, with ſome ſwelling eminences here and there ſet in the diuiſions of the leaues. This by *Lobel* is called by the name I here giue you it.

8 This alſo hath fine cut leaues like thoſe of Fenel, but much leſſe and ſhorter, of a faire green colour: theſe grow vp from round tuberous roots, which, together with the fibres they ſend forth, are of a blackiſh colour: the ſtalks alſo are tuberous and ſwoln as in other plants of this kinde. It growes in the ſea with the former. *Dodonæus* calls this *Fucus marinus virens tenuifolius*.

9 This kind of Sea moſſe grows ſome foure or more inches long, diuided into many branches which are ſubdiuided into ſmaller, ſet with leaues finely jagged like thoſe of Camomil; at firſt ſoft flexible and tranſparent, green below, and purpliſh aboue: being dried it becommeth rough & fragile like as Coralline. It growes in the Mediterranian ſea.

10 This Sea moſſe is a low little excreſcence, hauing ſomwhat broad cut leaues growing many from one root: in the whole face it reſembles the moſſe that growes vpon the branches of okes and other trees, and is alſo white and very like it, but much more brittle. This by *Dodonæus* is called *Muſcus marinus tertius*.

‡ 10 *Muſcus marinus 3. Dod.* Broad leafed Sea Moſſe.

‡ 11 *Abies marina Belgica Cluſ.* *Cluſius* his ſea Firre

11 Vpon the rocks and ſhels of ſea fiſhes are to be found diuers ſmall plants reſembling others that grow on the land; and *Cluſius* ſaith, vpon the coaſt of the Low-countries he obſerued one that very much reſembled the Fir tree, hauing branches growing orderly on both ſides, but thoſe very brittle and ſmall, ſeldome exceeding an handfull in height, and couered as it were with many ſmall ſcales. He obſerued others that reſembled Cypreſſe trees, and other branches that reſembled Tamariske or Heath. ‡

¶ *The*

¶ *The Place.*

These Mosses grow in the sea vpon the rocks, and are often found vpon oister shels, muskle shels, and stones. I found great plenty thereof vnder Reculuers and Margate, in the Isle of Tenet, and in other places alongst the sands from thence to Dover.

¶ *The Time.*

The time answereth the other Mosses, and are found at all times of the yeare.

¶ *The Names.*

Sea mosse is called in Greeke, Ἐρυθρὰ θαλασσία; in Latine, *Muscus marinus*: of the Apothecaries, Italians, and French men, *Corallina*: in Spanish, *Malharquiana yerva*: in high-Dutch, Meermosz: in low-Dutch, Zee Mosch: in English, Sea mosse, and of many Corallina, after the Apothecaries word, and it may be called Corall mosse. The titles distinguish the other kindes.

¶ *The Temperature.*

Corallina consisteth, as *Galen* saith, of an earthy and waterish essence, both of them cold: for by his taste he bindeth, and being applied to any hot infirmitie it also euidently cooleth. The earthy essence of this mosse hath in it also a certain saltnesse, by reason wherof it likewise dries mightily.

¶ *The Vertues.*

Dioscorides commendeth it to be good for the gout which hath need of cooling. A

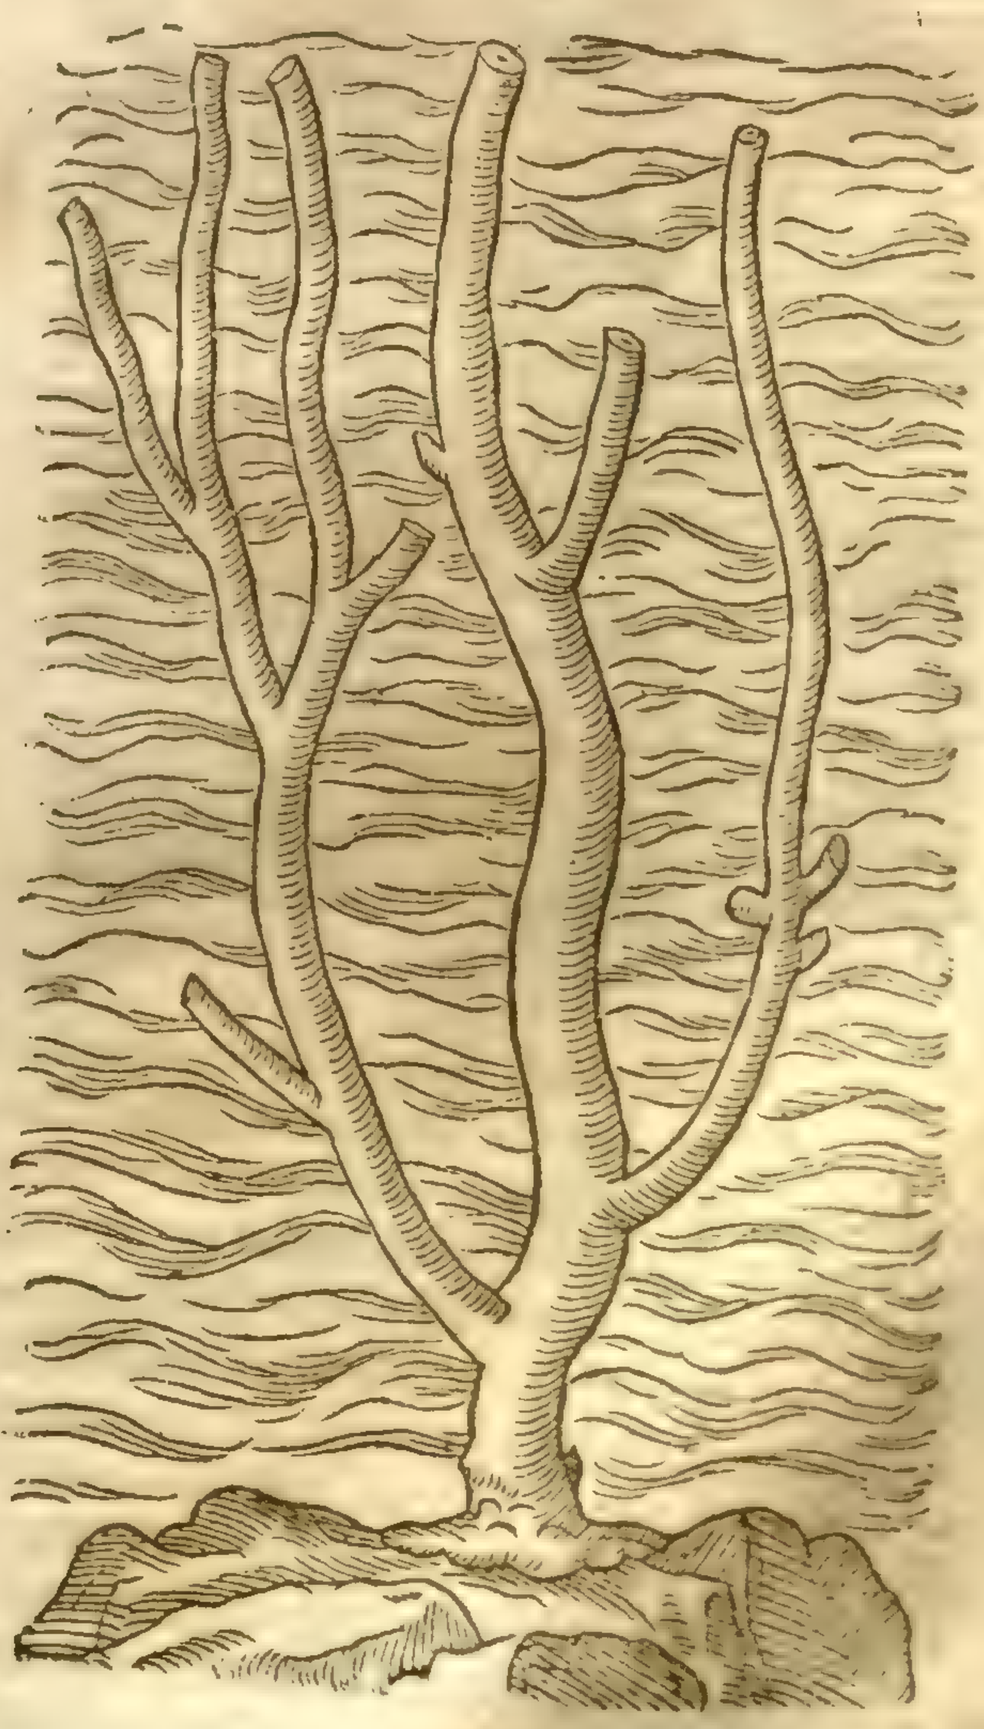
The later physitians haue found by experience that it killeth wormes in the belly. It is giuen to B this purpose to children in the weight of a dram or thereabouts.

That which cleaueth to Corall, and is of a reddish colour, is of some preferred and taken for the C best: they count that which is whitish to be the worser; notwithstanding in the French ocean, the Britain, the Low-country, and the German ocean sea there is scarce found any but the whitish Coralline, which the nations neere adioyning do effectually vse.

Chap. 166. *Of Corall.*

1 *Corallium rubrum.*
Red Corall.

2 *Corallium nigrum, sive Antipathes.*
Blacke Corall.

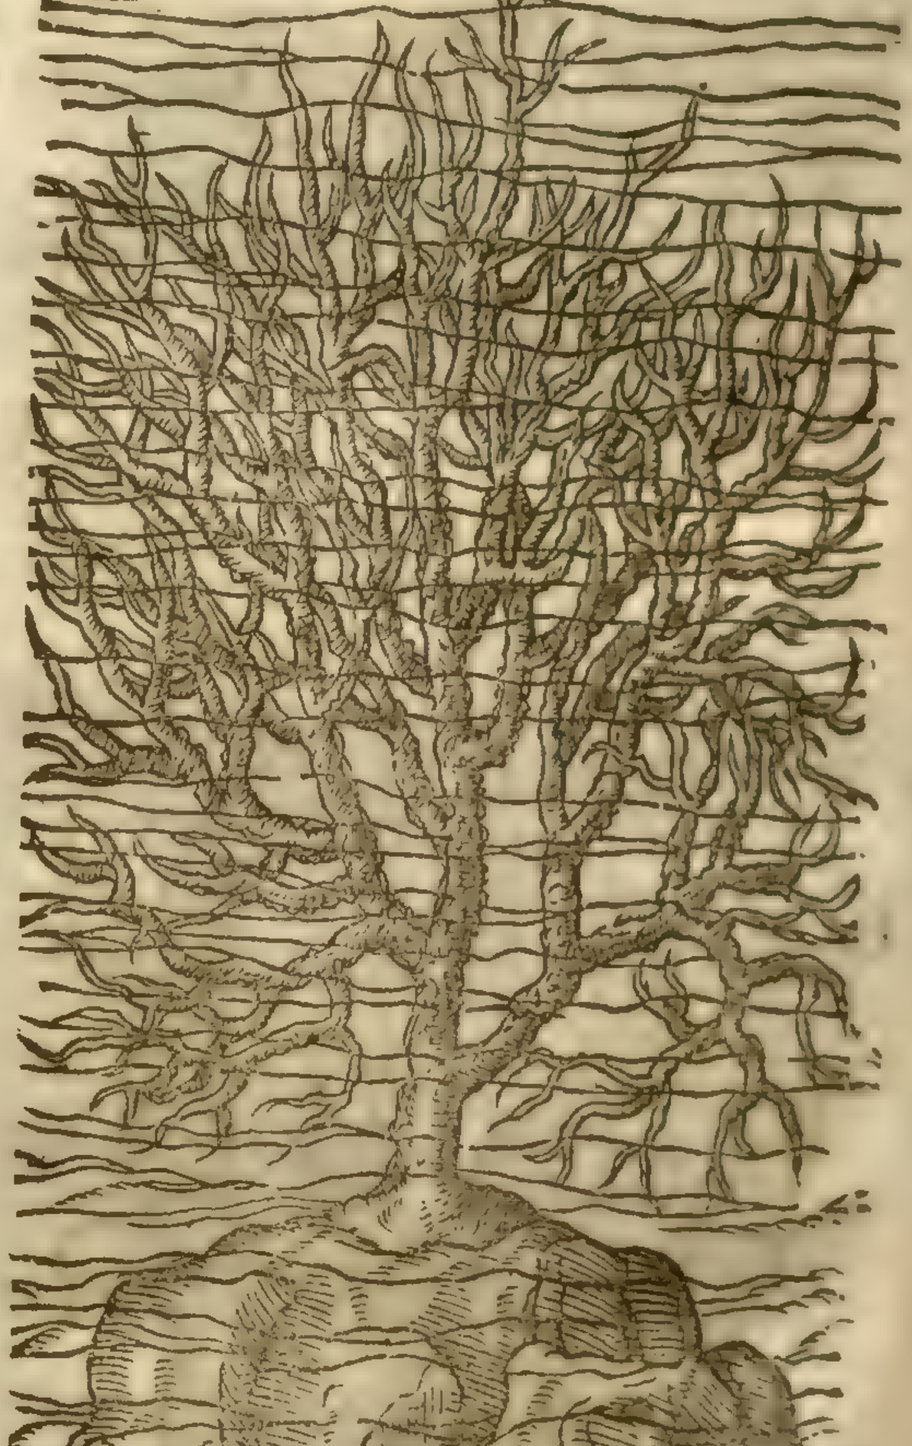


¶ *The*

3 *Corallium album.* White Corall.

4 *Corallium album alterum.*
The other white or yellow Corall.

‡ 5 *Coralloides albicans.*
Baſtard whitiſh Corall.



¶ *The Deſcription.*

1 ALthough Corall be a matter or ſubſtance euen as hard as ſtones; yet I think it not amiſſe to inſert it here next the moſſes; and the rather for that the kinds thereof do ſhew themſelues as well in the maner of their growing, as in their place & form, like to the Moſſes. This later age wherein we liue, hath found more kinds therof than euer were known or mentioned among the old Writers. Some of theſe Corals grow in the likeneſſe of a ſhrub or ſtony matter, others in a ſtraight form with crags and joints, ſuch as we ſee by experience; which being ſo well known, and in ſuch requeſt for phyſick, I will not ſtand to deſcribe; only remember this, That ſome Corall is of a pale colour, others red, and ſome white.

2 The black Corall growes vpon rocks neere the ſea about Maſſilia, in maner of the former, ſauing that this is of a ſhining black colour, very ſmooth, growing vp rather like a tree than a ſhrub.

3 The white Corall is like the former, growing vpon the rocks neere the ſea, and in the Weſt parts of England about S. *Michaels* mount; but the branches hereof are ſmaller and more brittle, finelier diſperſed into a number of branches, of a white colour.

4 The

‡ 6 *Coralloides rubens.*
Reddish bastard Corall.

7 *Spongia marina alba.*
White Spunge.

‡ 8 *Spongia infundibuli forma.*
Funnell fashioned Spunge.

‡ 9 *Spongia ramosa.*
Branched Spunge.

4 The fourth and last groweth also vpon the Westerne rocks of the sea, and in the place aforenamed, and varieth his colour, sometimes waxing white, sometimes yellow, and sometimes red.

‡ 5 This groves vp with many branches some two or three handfulls high: the inner part is a hard wooddy substance, which is couered ouer with a white and hard stony matter, so that it much resembleth White Corall, but that it is neither so thicke, hard, nor smooth, but is rough

and bends eaſily without breaking, which Corall will not do. *Lobel* calls this *Corallina alba*, it growes in the Mediteranian ſea, and vpon the Coaſts of Spaine.

6 This in all reſpects is like the laſt deſcribed, the colour excepted, which is a darke red, and therefore better reſembles the red Corall. *Cluſius* refers both theſe to the *Quercus marina* mentioned by *Theophraſtus*, *Hiſt. plant. 7. cap. 4.* ‡

7 There is found growing vpon the rockes neere vnto the ſea, a certaine matter wrought together, of the forme or froth of the ſea, which we call ſpunges, after the Latine name, which may very fitly be inſerted among the ſea Moſſes, wherof to write at large would greatly increaſe our volume, and little profit the Reader, conſidering we haſten to an end, and alſo that the vſe is ſo well knowne vnto all: therefore theſe few lines may ſerue vntill a further conſideration, or a ſecond Edition. ‡ Spunges are not like the *Alcyonium*, that is, an accidentall matter wrought together of the froth of the ſea, as our Author affirmes, but rather of a nobler nature than plants, for they are ſaid to haue ſence, and to contract themſelues at the approach of ones hand that comes to cut them vp, or for feare of any other harme-threatning obiect, and therefore by moſt Writers they are referred to the ζωόφυτα: which ſome render *Plantanimalia*, that is, ſuch as are neither abſolute plants, nor liuing creatures, but participate of both: they grow of diuers ſhapes and colours vpon the Rockes in the Mediterranean, as alſo in the Archipelago, or Ægean ſea.

8 *Cluſius* obſerued one yet adhering to the ſtone whereon it grew, which in ſhape reſembled a funnell, but in ſubſtance was like another Spunge.

9 There is alſo to be found vpon our Engliſh coaſt a ſmall kinde of ſpunge caſt vp by the ſea, and this is alſo of different ſhapes and colour, for the ſhape it is alwaies diuided into ſundry branches, but that after a different manner; and the colour is oft times browniſh, and otherwhiles gray or white. *Lobel* makes it *Conferuæ marinæ genus*. ‡

¶ *The Place.*

The place of their growing is ſufficiently ſpoken of in their ſeuerall deſcriptions.

¶ *The Time.*

The time anſwereth the other kindes of ſea Moſſes.

¶ *The Names.*

Corallium rubrum is called in Engliſh, red Corrall. *Corallium nigrum*, blacke Corrall. *Corallium album*, white Corrall.

¶ *The Temperature.*

Corrall bindeth, and meanely cooleth: it clenſeth the ſcars and ſpots of the eies, and is very effuall againſt the iſſues of bloud, and eaſeth the difficulty of making water.

¶ *The Vertues.*

A Corrall drunke in wine or water, preſerueth from the ſpleene; and ſome hang it about the neckes of ſuch as haue the falling ſickeneſſe, and it is giuen in drinke for the ſame purpoſe.

B It is a ſoueraigne remedy to drie, to ſtop, and ſtay all iſſues of bloud whatſoeuer in man or woman, and the Dyſentery.

C Burned Corrall drieth more than when it is vnburned, and being giuen to drinke in water, it helpeth the gripings of the belly, and the griefes of the ſtone in the bladder.

D Corrall drunke in wine prouoketh ſleepe: but if the patient haue an ague, then it is with better ſucceſſe miniſtred in water, for the Corrall cooleth, and the water moiſtneth the body, by reaſon whereof it reſtraineth the burning heate in agues, and repreſſeth the vapours that hinder ſleepe.

Chap. 167. *Of Muſhrumes, or Toadſtooles.*

¶ *The Kindes.*

SOme Muſhrumes grow forth of the earth; other vpon the bodies of old trees, which differ altogether in kindes. Many wantons that dwell neere the ſea, and haue fiſh at will, are very deſirous for change of diet to feed vpon the birds of the mountaines; and ſuch as dwell vpon the hills or champion grounds, do long after ſea fiſh; many that haue plenty of both, do hunger after the earthy excreſcences, called Muſhromes: whereof ſome are very venomous and full of poyſon, others not ſo noiſome; and neither of them very wholeſome meate; wherefore for the auoiding of the venomous quality of the one, and that the other which is leſſe venomous may be diſcerned from it, I haue thought good to ſet forth their figures with their names and places of growth. ‡ Becauſe the booke is already growne too voluminous, I will only giue you the figures of ſuch as my Author hath here mentioned, with ſome few others, but not trouble you with any more hiſtory, yet diſtinguiſh betweene ſuch as be eatable, and thoſe that be poiſonous, or at leaſt not to be eaten; for the firſt figured among the poiſonous ones, is that we call Iewes-eare, which hath no poyſonous faculty in it. *Cluſius* (all whoſe figures I could haue here giuen you) hath written a peculiar tract of theſe baſtard plants, or excreſcences, where ſuch as deſire it may finde them ſufficiently diſcourſed of. ‡

¶ *The*

1 *Fungi vulgatissimi esculenti.* Common Mushrums to be eaten.

¶ *The Description.*

1 GRound Mushrums grow vp in one night, standing vpon a thicke and round stalke, like vnto a broad hat or buckler, of a very white colour vntil it begin to wither, at what time it loseth his faire white, declining to yellownesse: the lower side is somewhat hollow, set or decked with fine gutters, drawne along from the middle centre to the circumference or round edge of the brim.

2 All Mushroms are without pith, rib, or veine: they differ not a little in bignesse and colour, some are great, and like a broad brimmed hat; others smaller, about the bignesse of a siluer coine called a doller: most of them are red vnderneath; some more, some lesse; others little or nothing red at all: the vpper side which beareth out, is either pale or whitish, or else of an ill-fauoured colour like ashes (they commonly call it Ash-colour) or else it seemeth to be somewhat yellow.

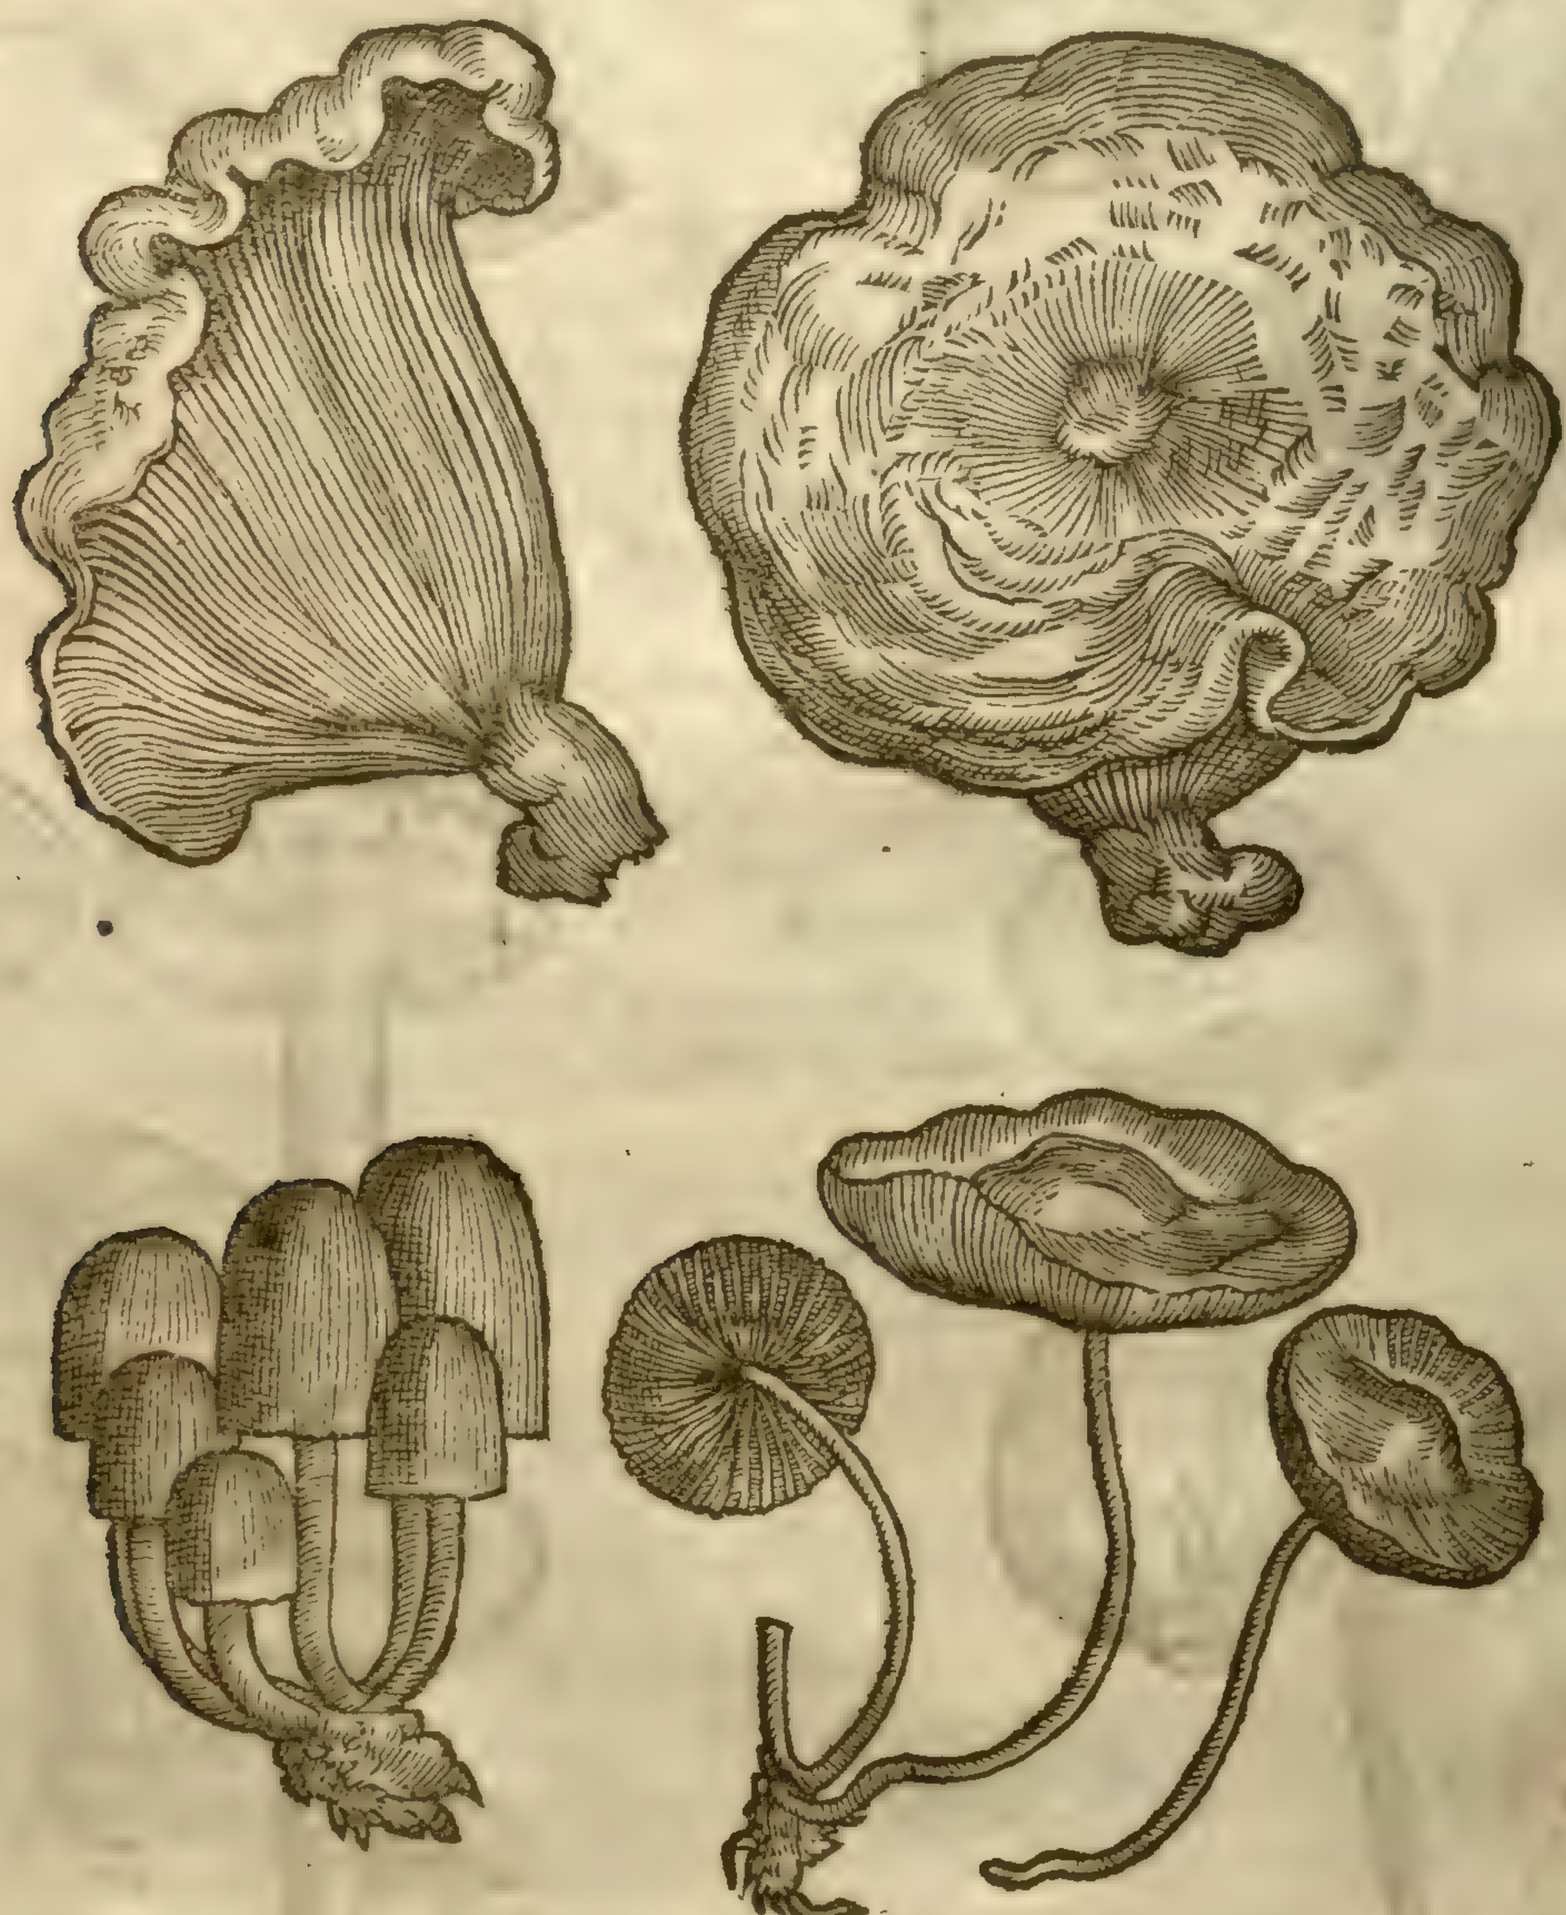
There is another kinde of Mushroms called *Fungi parui lethales galericulati*: in English, deadly Mushrums, which are fashioned like vnto an hood, and are most venomous and full of poyson.

There is a kinde of Mushrom called *Fungus Clypeiformis lethalis*, that is also a deadly Mushrum, fashioned like a little buckler.

There is another kinde of Mushrum, which is also most venomous and full of poyson, bearing also the shape of a buckler, being called *Fungus veneiatus Clypeiformis*: in English, the stinking venomous Mushrum.

2 *Fungi lethales, aut saltem non esculenti.*

Poyson Mushrums, or at the least such as are not vulgarly eaten.



The Mushrums or Toodstooles which grow vpon the trunkes or bodies of old trees, very much resembling *Auricula Iudæ*, that is, Iewes eare, doe in continuance of time grow vnto the substance of wood, which the Fowlers doe call Touchwood, and are for the most halfe circuled or halfe round, whose vpper part is somewhat plaine, and sometimes a little hollow, but the lower part is plaited or pursed together. This kinde of Mushrum the Grecians do call ἀγυρίτης, and is full of venome or poyson as the former, especially those which grow vpon the Ilex, Oliue, and Oke trees.

There is likewise a kinde of Mushrum called *Fungus Fauaginosus*, growing vp in moist and shadowie woods, which is also venomous, hauing a thicke and tuberous stalke, an handfull high, of a duskish colour; the top whereof is compact of many small diuisions, like vnto the hony combe.

There

Fungus sambucinus, siue Auricula Iudæ. Iewes eares.

Fungi lethales, siue non esculenti. Poysonous Mushrums.

There is alſo found enother, ſet forth vnder the title *Fungus virilis penis arecti forma*, which wee Engliſh, Prick Muſhrum, taken from his forme.

3 *Fungus orbicularis*, or *Lupi crepitus*, ſome do call it *Lucernarum fungus*: in Engliſh, Fuſſe balls, Pucke Fuſſe, and Bulfiſts, with which in ſome places of England they vſe to kill or ſmolder their Bees, when they would driue the Hiues, and bereaue the poore Bees of their meat, houſes and liues: theſe are alſo vſed in ſome places where neighbours dwell far aſunder, to carry and reſerue fire from place to place, wherof it tooke the name, *Lucernarum Fungus*: in forme they are very round, ſticking and cleauing vnto the ground, without any ſtalks or ſtems; at the firſt white, but afterwards of a duskiſh colour, hauing no hole or breach in them, whereby a man may ſee into them, which being troden vpon doe breath forth a moſt thin and fine pouder, like vnto ſmoke, very noiſome and hurtfull vnto the eies, cauſing a kinde of blindneſſe, which is called Poor-blinde, or Sandblinde.

Fungi lethales, ſiue non eſculenti. Poiſonous Muſhrums.

There is another kinde of *Fungus*, or Muſhrum, which groweth in moiſt medowes, and by ditch ſides, fiue or ſix inches high, couered ouer with a skin like a piece of ſheepes leather, of a ruſſet colour; which being taken away there appeareth a long and white ſtumpe, in forme not much vnlike to an handle, mentioned in the title, or like vnto the white or tender ſtalke of Aron, but greater: this kinde is alſo full of venome and poiſon.

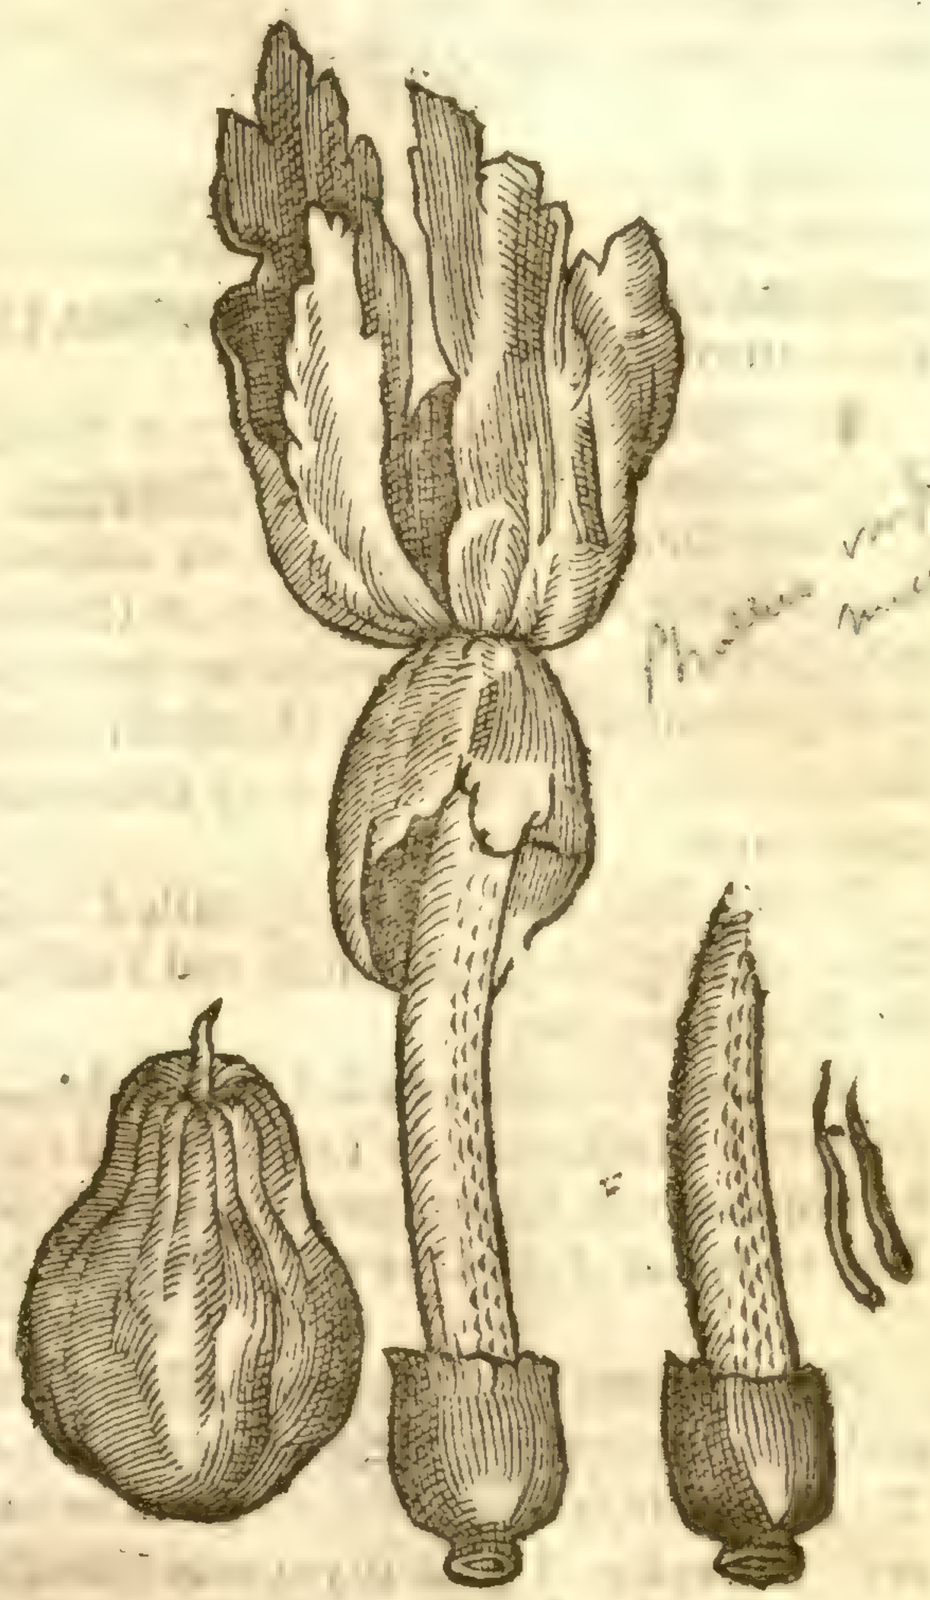
There is likewiſe a kinde of Muſhrum, with a certaine round excreſcence, growing within the earth, vnder the vpper cruſt or face of the ſame, in dry and grauelly grounds in Pannonia and the Prouinces adjoining which do cauſe the ground to ſwel, and be full of hils like Mole-hils. The people where they grow, are conſtrained to dig them vp and caſt them abroad like as we do Mole-hils. ſpoiling their grounds, as Mole-hils are hurtfull vnto our ſoile: theſe haue neither ſtalkes, leaues, fibres nor ſtrings annexed or faſtened vnto them, and for the moſt part are of a reddiſh colour, but within of a whitiſh yellow: the Grecians haue called this tuberous excreſcence, *Idna*, and the Latines *Tubera*: the Spaniards doe call them *Turmas tierra*: in Engliſh wee may call them Spaniſh Fuſſe-bals.

¶ *The Place.*

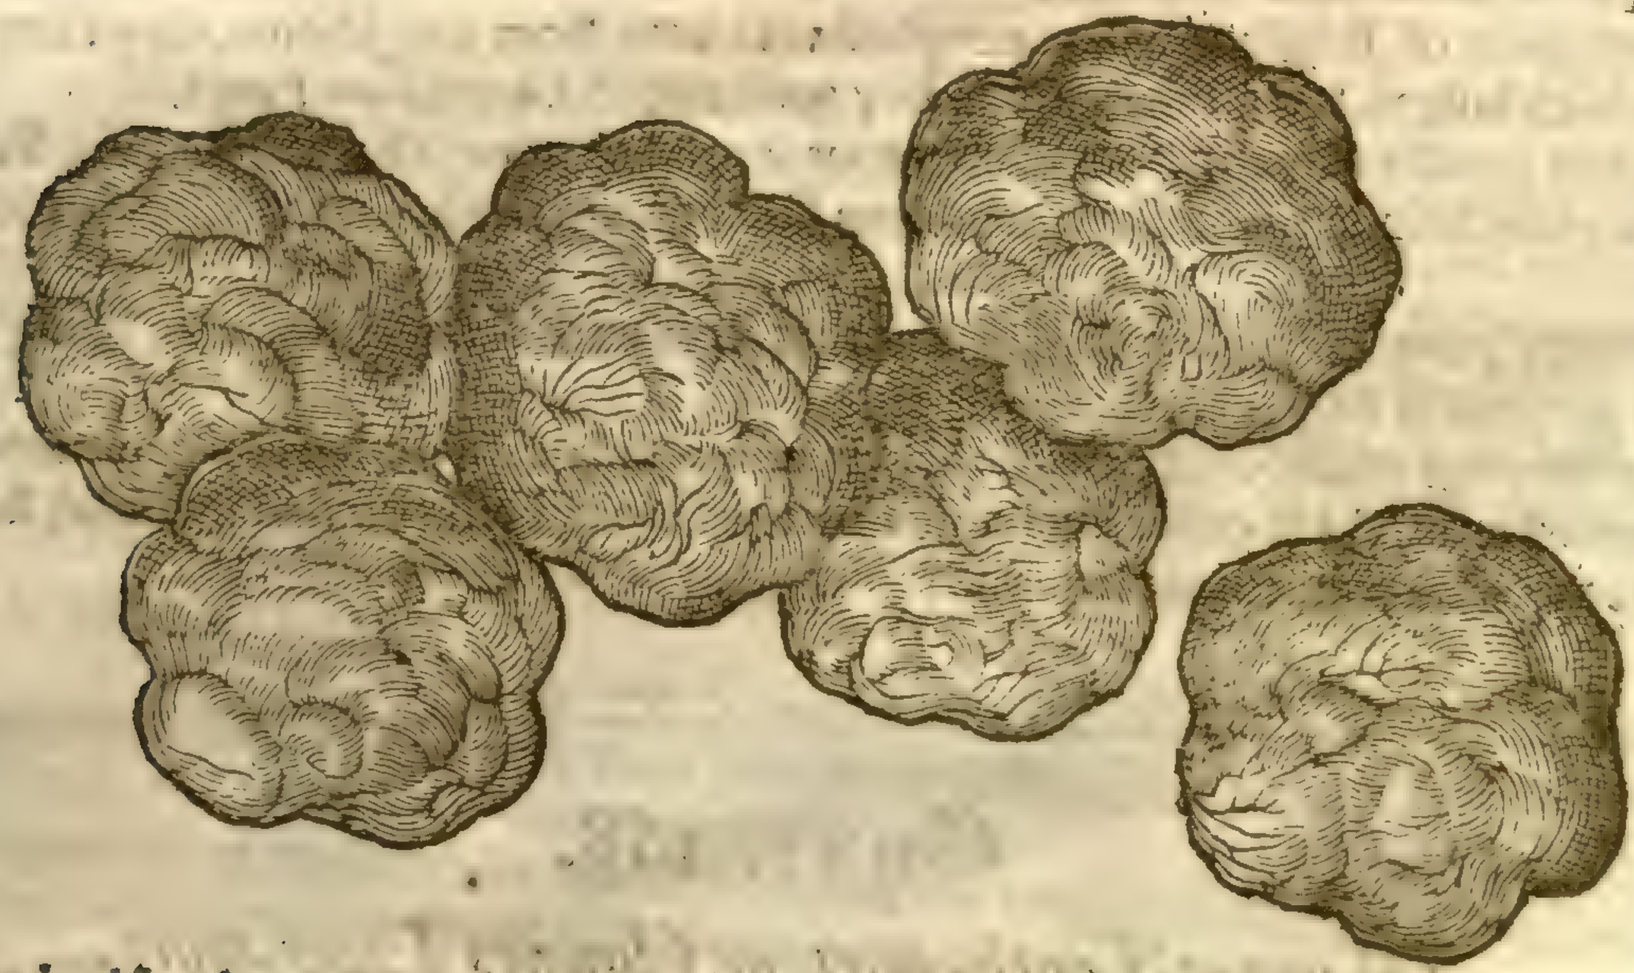
Muſhrums come vp about the roots of trees, in graſſie places of medowes, and Ley Land newly turned

Fungus fauiginosus.
Hony-comb'd Mushrome.

Fungus Virilis Penis effigie.
Pricke Mushrome.



Tuberaterræ.
Fusse-balls, or Puck-fists.



turned; in woods also where the ground is sandy, but yet dankish: they grow likewise out of wood, forth of the rotten bodies of trees, but they are vnprofitable and nothing worth. Poisonsome mushroms, as *Dioscorides* saith, groweth where old rusty iron lieth, or rotten clouts, or neere to serpents dens, or roots of trees that bring forth venomous fruit. Diuers esteeme those for the best which grow in medowes, and vpon mountaines and hilly places, as *Horace* saith, *lib. ser. 2. satyr. 4.*

——— *prætensibus optima fungis.*
Natura est, alijs malè creditur.

The medow Mushroms are in kinde the best,
It is ill trusting any of the rest.

¶ The

¶ *The Time.*

Diuers come vp in Aprill, and last not till May, for they flourish but whilest Aprill continues: others grow later, about August; yet all of them after raine, and therefore they are found one yeare sooner, and another later. Mushroms, saith *Pliny*, grow in shoures of raine: they come of the slime of trees, as the same Author affirmeth.

¶ *The Names.*

They are called in Latine, *Fungi:* in Greeke, μύκητες: in Italian, *Fonghi:* in Spanish, *Hungos*, *Cugumenos:* in French, *Campinion*, which word the Low-Country men also vse, and call them **Campernoellen:** in high Dutch, **Schwemme, Pfifferling:** in English, Mushroms, Toadstooles, and Paddock-stooles.

The mushroms that come vp in Aprill are called in Latine of some, *Spongiolæ:* of the Italians, *Prignoli:* and in high Dutch, **Morchel.**

They that are of a light red are called of some *Boleti*, among the later ones which rise and fall awae in seuen daies. The white, or those which bee somewhat yellow, are called in Latine, *Sulli:* which the later Physitions name *Porcini*, or Swine mushrums. *Suilli*, saith *Pliny*, are dried, being hanged vpon rushes, which are thrust through them. The dry ones are in our age also eaten in Bohemia and Austria: they that grow by the roots of Poplar trees are called of the Latines, *Populnei*, Poplar mushrums.

Puffes-fists are commonly called in Latine, *Lupi crepitus*, or Wolfes fists: in Italian, *Vescie de Lupo:* in English, Puffes-fists, and Fusse-balls in the North. *Pliny* nameth them *Pezicæ*, as though he should say, flat.

Tree mushroms be called in Greeke, μυκήτες: in Latine, *Fungi arborum*, and *Fungi arborei:* in English, tree Mushroms, or Touch-wood: in high Dutch also **Schwemme.** They are all thought to be poisonsome, being inwardly taken. *Nicander* writeth, that the mushroms of the Oliue tree, the Ilex tree, and of the Oke tree bring death.

¶ *The Temperature and Vertues.*

A *Galen* affirmes, that they are all very cold and moist, and therefore to approach vnto a venomous and murthering facultie, and ingender a clammy, pituitous, and cold nutriment if they be eaten. To conclude, few of them are good to be eaten, and most of them do suffocate and strangle the eater. Therefore I giue my aduice vnto those that loue such strange and new fangled meates, to beware of licking honey among thornes, least the sweetnesse of the one do not counteruaile the sharpnesse and pricking of the other.

B Fusse-balls are no way eaten: the pouder of them doth dry without biting: it is fitly applied to merigals, kibed heeles, and such like.

C In diuers parts of England where people dwell farre from neighbours, they carry them kindled with fire, which lasteth long: whereupon they were called *Lucernarum Fungi.*

D The dust or pouder thereof is very dangerous for the eies, for it hath been often seene, that diuers haue beene pore-blinde euer after, when some small quantitie thereof hath beene blowne into their eies.

E The country people do vse to kill or smother Bees with these Fusse-balls, being set on fire, for the which purpose it fitly serueth.

F ‡ The fungous excrescence of the Elder, commonly called a Iewes eare, is much vsed against the inflammations and all other soreneſſes of the throat, being boyled in milke, steeped in beere, vineger, or any other conuenient liquor. ‡

Chap. 168.

Of great Tooth-wort, or Clownes Lung-wort.

¶ *The Description.*

1 THere is often found among the Mushroms a certaine kinde of excrescence consisting of a jelly or soft substance, like that of the Mushroms, and therefore it may the more fitly be here inserted: it riseth forth of the ground in forme like vnto *Orobanche*, or the Broome-Rape, and also in substance, hauing a tender, thicke, tuberous, or mis-shapen body, consisting as it were of scales like teeth (whereof it tooke his name) of a dusty shining colour tending to purple. The stalke riseth vp in the middle, garnished with little gaping hollow floures like those of Satyrion; on the outside of an ouerworne whitish colour: the whole plant resembleth a rude forme of that jelly,

gellie, or slimie matter, found in the fields, which we call the falling of stars: the root is small and tender.

2 There is also another sort hereof found, not differing from the precedent: the chiefe difference consisteth in that, that this plant is altogether lesser; ‡ and hath a root diuersly diuaricated like Corall, white of colour, full of juyce, and without any fibers annexed therto ‡; in other respects like.

1 *Dentaria major Matthioli.*
Great Toothwort, or Lungwort.

2 *Dentaria minor.*
Little Lungwort.

¶ *The Place.*

These plants do grow at the bottom of Elme trees, and such like, in shadowie places: I found it growing in a lane called East lane, on the right hand as ye go from Maidstone in Kent vnto Cockes Heath, halfe a mile from the towne; and in other places thereabout: it doth also grow in the fields about Croidon, especially about a place called Groutes, being the land of a Worshipfull Gentleman called Mr *Garth*, and also in a Wood in Kent neere Crayfoot, called Rowe, or Rough-hill: it groweth likewise neere Harwood in Lancashire, a mile from Whanley, in a wood called Talbot banke.

¶ *The Time.*

They flourish in May and Iune.

¶ *The Names.*

There is not any other name extant, more than is set forth in the description.

¶ *The Temperature and Vertues.*

There is nothing extant of the faculties hereof, either of the antient or later writers: neither haue we any thing of our owne experience; onely our country women do call it Lungwort, and do vse it against the cough, and all imperfections of the lungs: but what benefit they reape thereby I know not; neither can any of judgement giue me further instruction thereof.

Chap. 169. *Of Saunders.*

¶ *The Kindes.*

The antient Greekes haue not knowne the sorts of Saunders: *Garcias* and others describe three; *Album*, *Rubrum*, and *Pallidum*; which in shops is called *Citrinum*.

¶ *The*

¶ *The Description.*

1 THe Saunders tree groweth to the bigneſſe of the Walnut-tree, garniſhed with many goodly branches; whereon are ſet leaues like thoſe of the Lentiske tree, alwaies green; among which come forth very faire floures, of a blew colour tending to blackeneſſe; after commeth the fruit of the bigneſſe of a Cherry, greene at the firſt, and blacke when it is ripe; without taſte, and ready to fall downe with euery little blaſt of winde: the timber or wood is of a white colour, and a very pleaſant ſmell.

2 There is likewiſe another which groweth very great, the floures and fruit agree with the other of his kinde: the wood is of a yellowiſh colour, wherein conſiſteth the difference.

‡ 3 The third ſort which we call Red-Saunders is a very hard and ſollid wood, hauing little or no ſmell, the colour thereof is very red, it groweth not in thoſe places where the other grow, neither is the forme of the tree deſcribed by any that I know of, it is frequently vſed to colour ſauces, and for ſuch like vſes. ‡

¶ *The Place.*

The white and yellow Saunders grow naturally, and that in great abundance, in an Iſland called Timor, and alſo in the Eaſt-Indies beyond the riuer Sanges or rather Ganges, which the Indians call *Hanga*, and alſo about Iaua, where it is of better odour than any that growes elſe-where.

The red Saunders growes within the riuer Ganges, eſpecially about Tanaſarim, and in the marriſh grounds about Charamandell: *Auicen*, *Serapio*, and moſt of the Mauritanians call it by a corrupt name, *Sandal*: in Timor, Malaca, and in places neere adjoyning, *Chandama*: in Decan and Guzarate, *Sercanda*: in Latine, *Sandalum* and *Santalum*, adding thereto for the colour *album*, *flauum*, or *Citrinum*, and *Rubrum*, that is, white, yellow, and red Saunders.

¶ *The Time.*

Theſe trees which are the white and yellow Saunders grow green Winter and Summer, and are not one knowne from another, but by the Indians themſelues, who haue taken very certaine notes and markes of them, becauſe they may the more ſpeedily diſtinguiſh them when the Mart commeth.

¶ *The Names.*

Their names haue been ſufficiently ſpoken of in their deſcriptions.

¶ *The Temperature.*

† Yellow and white Saunders are hot in the third degree, and dry in the ſecond. The red Saunders are not ſo hot.

¶ *The Vertues.*

A The Indians doꝛſe the decoction made in water, againſt hot burning agues, and the ouermuch flowing of the menſes, *Eryſipelas*, the gout, and all inflammations, eſpecially if it be mixed with the juyce of Night-ſhade, Houſleeke, or Purſlane.

B The white Saunders mixed with Roſe-water, and the temples bathed therewith, ceaſeth the pain of the megrim, and keepeth backe the flowing of humors to the eies.

C *Auicen* affirmeth it to be good for all paſſions of the heart, and maketh it glad and merry, and therefore good to be put into colliſes, jellies, and all delicate meates which are made to ſtrengthen and reuiue the ſpirits.

D ‡ Red Saunders haue an aſtrictiue and ſtrenghthning faculty, but are not cordiall as the other two, they are vſed in diuers medicines and meates both for their faculty and pleaſing red colour which they giue to them. ‡

Chap. 170. *Of Stony wood, or wood made Stone.*

¶ *The Deſcription.*

AMong the wonders of England this is one of great admiration, and contrary vnto mans reaſon and capacitie, that there ſhould bee a kinde of Wood alterable into the hardneſſe of a ſtone called Stonie Wood, or rather a kinde of water, which hardneth Wood and other things, into the nature and matter of ſtones. But wee know that the Workes of God are wonderfull,

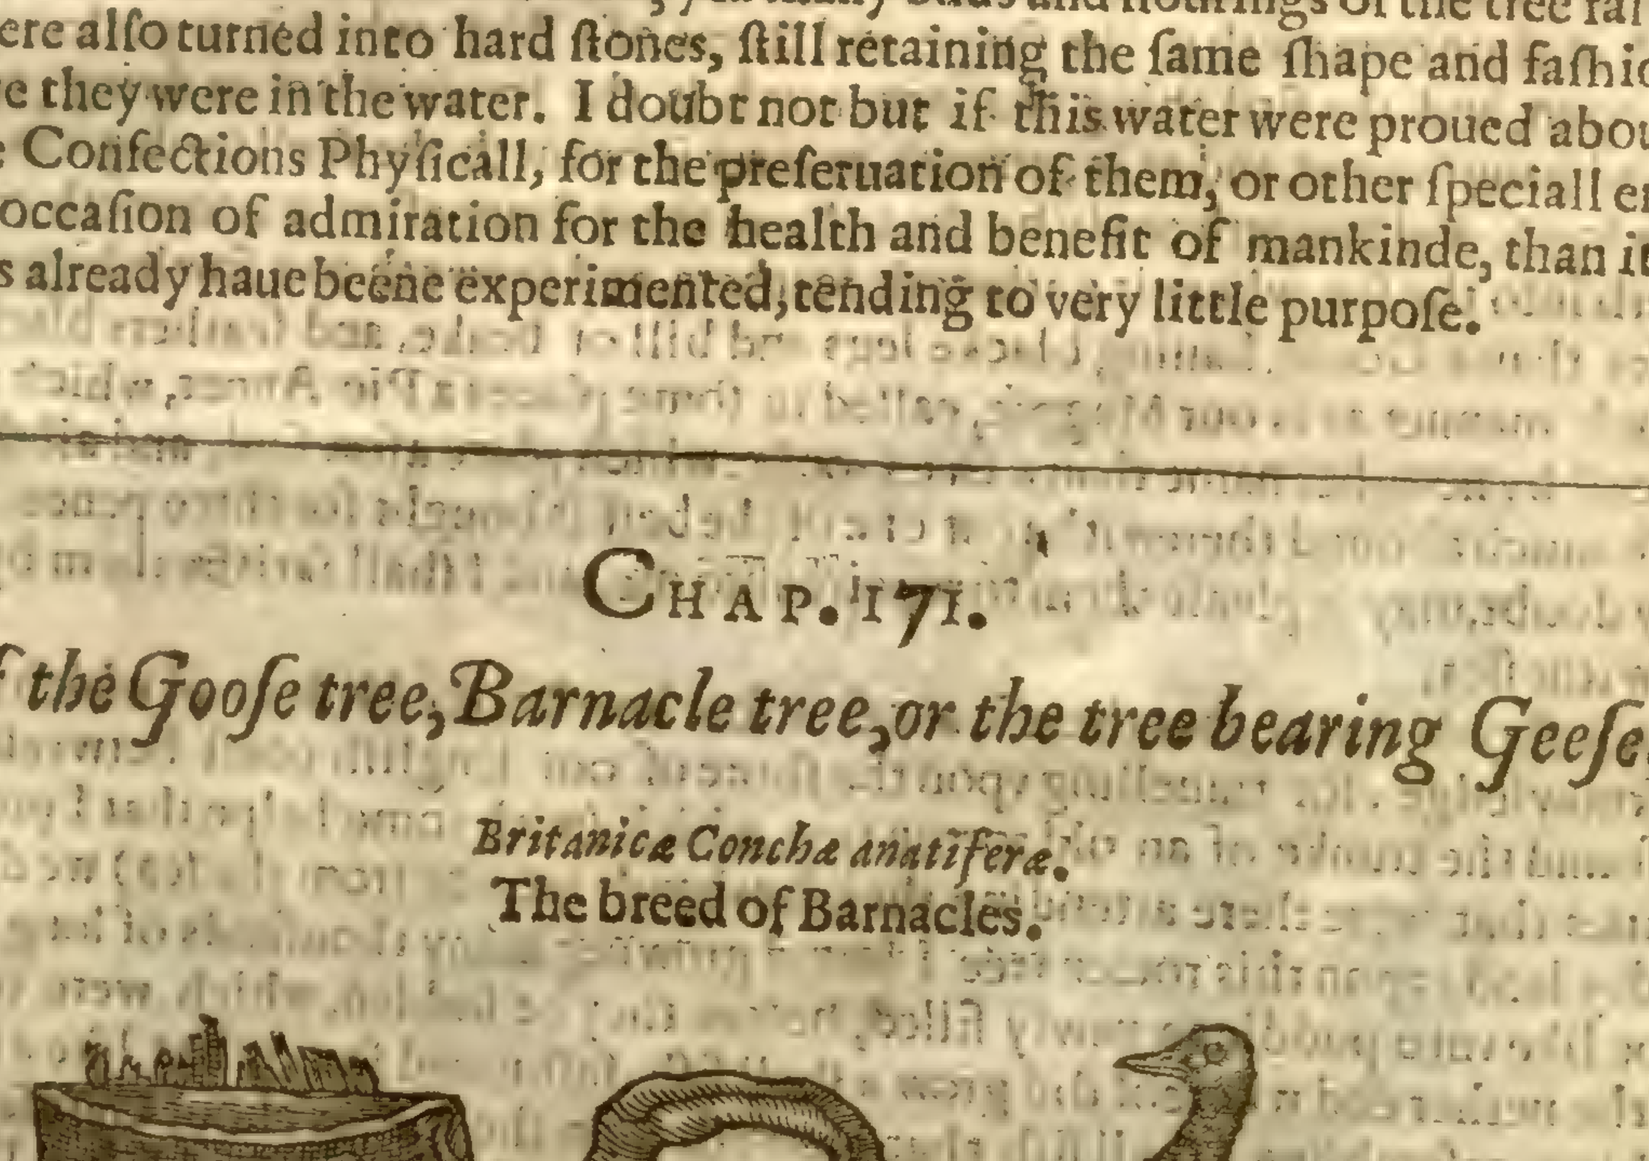
Lignum Lapideum, ſiue in Lapides conuerſum.
Stonie wood, or wood made ſtones.

wonderfull, if we doe but narrowly ſearch the leaſt of them, which wee daily behold; much more if wee turne our eies vpon thoſe that are ſeldome ſeene, and knowne but of a few, and that of ſuch as haue painfully trauelled in the ſecrets of Nature. This ſtrange alteration of Nature is to bee ſeene in ſundry parts of England and Wales, through the qualities of ſome waters and earth, which change ſuch things into ſtones as do fall therein, or which are of purpoſe for triall put into them. In the North part of England there is a Well neere vnto Knaesborough, which will change any thing into ſtone, whether it be wood, timber, leaues of trees, moſſe, leather gloues, or ſuch like. There be diuers places in Bedfordſhire, Warwickſhire, and Walls, where there is ground of that qualitie, that if a ſtake be driuen into it, that part of the ſtake which is within the ground will be a firme and hard ſtone, and all that which is aboue the ground retaineth his former ſubſtance and nature. Alſo my ſelfe being at Rougby (about ſuch time as our fantaſticke people did with great concourſe and multitudes repaire and run headlong vnto the ſacred Wells of *Newnam Regis*, in the edge of Warwickſhire, as vnto the water of life, which could cure all diſeaſes) I went from thence vnto theſe Wells, where I found growing ouer the ſame a faire Aſh-tree, whoſe boughes did hang ouer the ſpring of water, whereof ſome that were ſeare and rotten, and ſome that of purpoſe were broken off, fell into the water and were all turned into ſtones. Of theſe boughes or parts of the tree I brought into London, which when I had broken in pieces, therein might be ſeene, that the pith and all the reſt was turned into ſtones; yea many buds and flourings of the tree falling into the ſaid water, were alſo turned into hard ſtones, ſtill retaining the ſame ſhape and faſhion that they were of before they were in the water. I doubt not but if this water were proued about the hardening of ſome Confections Phyſicall, for the preſeruation of them, or other ſpeciall ends, it would offer greater occaſion of admiration for the health and benefit of mankinde, than it doth about ſuch things as already haue beene experimented, tending to very little purpoſe.

Chap. 171.

Of the Gooſe tree, Barnacle tree, or the tree bearing Geeſe.

Britanicæ Conchæ anatiferæ.
The breed of Barnacles.



¶ The

¶ *The Description.*

HAuing trauelled from the Grasses growing in the bottome of the fenny waters, the Woods, and mountaines, euen vnto Libanus it selfe; and also the sea, and bowels of the same, wee are arriued at the end of our History; thinking it not impertinent to the conclusion of the same, to end with one of the maruels of this land (we may say of the World.) The history whereof to set forth according to the worthinesse and raritie thereof, would not only require a large and peculiar volume, but also a deeper search into the bowels of Nature, than my intended purpose will suffer me to wade into, my sufficiencie also considered; leauing the History thereof rough hewen, vnto some excellent man, learned in the secrets of nature, to be both fined and refined: in the meane space take it as it falleth out, the naked and bare truth, though vnpolished. There are found in the North parts of Scotland and the Islands adiacent, called Orchades, certaine trees whereon do grow certaine shells of a white colour tending to russet, wherein are contained little liuing creatures: which shells in time of maturity doe open, and out of them grow those little liuing things, which falling into the water do become fowles, which we call Barnacles; in the North of England, brant Geese; and in Lancashire, tree Geese: but the other that do fall vpon the land perish and come to nothing. Thus much by the writings of others, and also from the mouthes of people of those parts, which may very well accord with truth.

But what our eies haue seene, and hands haue touched we shall declare. There is a small Island in Lancashire called the Pile of Foulders, wherein are found the broken pieces of old and bruised ships, some whereof haue beene cast thither by shipwracke, and also the trunks and bodies with the branches of old and rotten trees, cast vp there likewise; whereon is found a certaine spume or froth that in time breedeth vnto certaine shells, in shape like those of the Muskle, but sharper pointed, and of a whitish colour; wherein is contained a thing in forme like a lace of silke finely wouen as it were together, of a whitish colour, one end whereof is fastned vnto the inside of the shell, euen as the fish of Oisters and Muskles are: the other end is made fast vnto the belly of a rude masse or lumpe, which in time commeth to the shape and forme of a Bird: when it is perfectly formed the shell gapeth open, and the first thing that appeareth is the foresaid lace or string; next come the legs of the bird hanging out, and as it groweth greater it openeth the shell by degrees, til at length it is all come forth, and hangeth onely by the bill: in short space after it commeth to full maturitie, and falleth into the sea, where it gathereth feathers, and groweth to a fowle bigger than a Mallard, and lesser than a Goose, hauing blacke legs and bill or beake, and feathers blacke and white, spotted in such manner as is our Magpie, called in some places a Pie-Annet, which the people of Lancashire call by no other name than a tree Goose: which place aforesaid, and all those parts adioyning do so much abound therewith, that one of the best is bought for three pence. For the truth hereof, if any doubt, may it please them to repaire vnto me, and I shall satisfie them by the testimonie of good witnesses.

Moreouer, it should seeme that there is another sort hereof; the History of which is true, and of mine owne knowledge: for trauelling vpon the shore of our English coast betweene Douer and Rumney, I found the trunke of an old rotten tree, which (with some helpe that I procured by Fishermens wiues that were there attending their husbands returne from the sea) we drew out of the water vpon dry land: vpon this rotten tree I found growing many thousands of long crimson bladders, in shape like vnto puddings newly filled, before they be sodden, which were very cleere and shining; at the nether end whereof did grow a shell fish, fashioned somewhat like a small Muskle, but much whiter, resembling a shell fish that groweth vpon the rockes about Garnsey and Garsey, called a Lympit: many of these shells I brought with me to London, which after I had opened I found in them liuing things without forme or shape; in others which were neerer come to ripenesse I found liuing things that were very naked, in shape like a Bird: in others, the Birds couered with soft downe, the shell halfe open, and the Bird ready to fall out, which no doubt were the Fowles called Barnacles. I dare not absolutely auouch euery circumstance of the first part of this history, concerning the tree that beareth those buds aforesaid, but will leaue it to a further consideration; howbeit, that which I haue seene with mine eies, and handled with mine hands, I dare confidently auouch, and boldly put downe for verity. Now if any will obiect that this tree which I saw might be one of those before mentioned, which either by the waues of the sea or some violent wind had beene ouerturned as many other trees are; or that any trees falling into those seas about the Orchades, will of themselues beare the like Fowles, by reason of those seas and waters, these being so probable conjectures, and likely to be true, I may not without prejudice gainesay, or indeauour to confute.

‡ The Barnakle whose fabulous breed my Author here sets downe, and diuers others haue also

also deliuered, were found by some Hollanders to haue another originall, and that by egs as other birds haue: for they in their third voiage to find out the North-East passage to China & the Molucco's, about the 80 degree and eleuen minutes of Northerly latitude, found two little Islands, in one of which they found aboundance of these geese sitting vpon their eggs, of which they got one Goose, and tooke away sixty eggs, &c. *Vide Pontani, rerum & vrb. Amstelodam. hist. lib. 2. cap. 22.* Now the shels out of which these birds were thought to fly, are a kind of *Balanus marinus*; and thus *Fabius Columna*, in the end of his *Phytobasanos*, writing *piscium aliquot historia*, iudiciously proueth. To whose opinion I wholly subscribe, and to it I refer the Curious. His asseueration is this; *Conchas vulgò Anatiferas, non esse fructus terrestres, neque ex ijs Anates oriri; sed Balani marinæ speciem.* I could haue said somthing more hereof, but thus much I think may serue, together with that which *Fabius Columna* hath written vpon this point. ‡

¶ *The Place.*

The bordes and rotten plankes whereon are found these shels breeding the Barnakle, are taken vp in a small Island adioyning to Lancashire, halfe a mile from the main land, called the Pile of Foulders.

¶ *The Time.*

They spawn as it were in March and Aprill; the Geese are formed in May and Iune, and come to fulnesse of feathers in the moneth after.

And thus hauing through Gods assistance discoursed somewhat at large of Grasses, Herbes, Shrubs, Trees, and Mosses, and certaine Excrescences of the earth, with other things moe, incident to the historie thereof, we conclude and end our present Volume, with this wonder of England. For the which Gods Name be euer honored and praised.

FINIS.

AN APPENDIX OR ADDITION OF certaine Plants omitted in the former Hiſtory.

The Preface.

HAuing run through the hiſtory of plants gathered by Maſter *Gerard*, and much inlarged the ſame, both by the addition of many figures and hiſtories of plants not formerly contained in it, and by the amending and increaſing the hiſtory of ſundry of thoſe which before were therein treated of; I finde that I haue forgotten diuers which I intended to haue added in their fitting places: the occaſion hereof hath been, my many buſineſſes, the troubleſomneſſe, and aboue all, the great expectation and haſte of the Worke, whereby I was forced to perform this task within the compaſſe of a yeare. Now being conſtant to my firſt reſolution, I here haue, as time would giue me leaue, and my memorie ſerue, made a briefe collection and addition (though without method) of ſuch as offered themſelues to me; and without doubt there are ſundry others which are as fitting to be added as thoſe; and I ſhould not haue bin wanting if time had permitted me to haue entred into further conſideration of them. In the meane time take in good part thoſe that I haue here preſented to your view.

CHAP. 1. *Of the Maracoc or Paſſion Floure.*

¶ *The Deſcription.*

THis Plant, which the Spaniards in the Weſt Indies call *Granadilla*, becauſe the fruit ſomwhat reſembles a Pomgranat, which in their tongue they term *Granadas*, is the ſame which the Virginians cal *Maracoc*. The Spaniſh Friers for ſome imaginarie reſemblances in the floure, firſt called it *Flos Paſſionis*, The Paſſion floure, and in a counterfeit figure, by adding what was wanting, they made it as it were an Epitome of our Sauiors paſſion. Thus ſuperſtitious perſons *ſemper ſibi ſomnia fingunt*. *Bauhine* deſirous to refer it to ſome ſtock or kindred of formerly known plants, giues it the name of *Clematis trifolia*: yet the flours and fruit pronounce it not properly belonging to their tribe; but *Clematis* being a certain genericke name to all wooddy winding plants, this as a ſpecies may come vnder the denomination, though little in other reſpects participating with them. The roots of this are long, ſomwhat like, yet thicker than thoſe of *Sarſa parilla*, running vp and down, and putting vp their heads in ſeueral places; from theſe roots riſe vp many long winding round ſtalks, which grow two, three, foure, or more yards high, according to the heate and ſeaſonableneſſe of the yeare and ſoile whereas they are planted. Vpon theſe ſtalks grow many leaues diuided into three parts, ſharp pointed, and ſnipt about the edges: commonly out of the boſoms of each of the vppermoſt leaues there growes a claſping tendrel and a floure, the floure groweth vpon a little foot-ſtalk ſome two inches long, and is of a longiſh cornered forme, with fiue little crooked hornes at the top, before ſuch time as it opens it ſelfe, but opened, this longiſh head diuides it ſelfe into ten parts, and ſuſtains the leaues of the floure, which are very many, long, ſharp pointed, narrow, and orderly ſpred open one by another, ſome lying ſtraight, others crooked. Theſe leaues are of colour whitiſh, but thick ſpotted with a peach colour, and toward the bottom it hath a ring of a perfect peach colour, and aboue and beneath it a white circle, which giue a great grace to the floure, in the midſt whereof riſeth an vmbone, which parts it ſelfe into foure or fiue crooked ſpotted hornes, with broadiſh heads; from the middeſt of theſe riſes another roundiſh head which carries three nailes or hornes, biggeſt aboue, and ſmalleſt at their lower end. This floure with vs is neuer ſucceeded by any fruit, but in the Weſt Indies, whereas it naturally growes, it beares a fruit,

when it is ripe of the bigneſſe and colour of Pomegranats, but it wants ſuch a ring or crown about the top as they haue; the rinde alſo is much thinner and tenderer, the pulp is whitiſh, and without taſte, but the liquor is ſomwhat tart: they open them as they do egges, and the liquor is ſupped off with great delight both by the Indians and Spaniards (as *Monardus* witneſſeth) neither if they ſup off many of them ſhall they finde their ſtomack oppreſt, but rather their bellies are gently looſened. In this fruit are contained many ſeeds ſomewhat like Peare kernels, but more cornered and rough.

Clematis trifolia, ſive Flos Paſſionis.
The Maracoc or Paſſion-floure.

This growes wilde in moſt of the hot countries of America, from whence it hath been brought into our Engliſh gardens, where it growes very well, but flours onely in ſome few places, and in hot and ſeaſonable yeares. It is in good plenty growing with Miſtreſſe *Tuggy* at Weſtminſter, where I haue ſome yeares ſeen it beare a great many floures.

CHAP. 2. *Of Ribes or red Currans.*

¶ *The Deſcription.*

1 THe plant which carries the fruit which we commonly terme red Currans, is a ſhrubbie buſh of the bigneſſe of a Gooſeberry buſh, but without prickles: the wood is ſoft and white, with a pretty large pith in the middle; it is couered with a double barke, the vndermoſt being the thicker, is greene, and the vppermoſt, which ſometimes chaps and pills off, is of a browniſh colour,

colour, and ſmooth: the barke of the yongeſt ſhoots is whitiſh and rough: the leaues which grow vpon foot-ſtalkes ſome two inches long, are ſomewhat like Vine leaues, but ſmaller by much, and leſſe cornered, being cut into three, and ſometimes, but ſeldome, into fiue parts, ſomewhat thicke, with many veines running ouer them, greener aboue than they are below: out of the branches in Spring time grow ſtalkes hanging downe ſome ſix inches in length, carrying many little greenish floures, which are ſucceeded by little red berries, cleare and ſmooth, of the bigneſſe of the Whortle berries, of a pleaſant tart taſte. Of this kinde there is another, onely differing from this in the fruit, which is twice ſo big as that of the common kinde.

2 The buſh which beares the white Currans is commonly ſtraighter and bigger than the former: the leaues are leſſer, the flours whiter, and ſo alſo is the fruit, being cleare and tranſparent, with a little blackiſh rough end.

1 *Ribes vulgaris fructu rubro.*
Red Currans.

2 *Ribes fructu albo.*
White Currans.

3 Beſides theſe there is another, which differs little from the former in ſhape, yet grows ſomewhat higher, and hath leſſer leaues: the floures are of a purpliſh greene colour, and are ſucceeded by fruit as big againe as the ordinary red, but of a ſtinking and ſomewhat loathing ſauour: the leaues alſo are not without this ſtinking ſmell.

¶ *The Place, Time, and Names.*

None of theſe grow wild with vs, but they are to be found plentifully growing in many gardens, eſpecially the two former, the red and the white.

The leaues and floures come forth in the Spring, and the fruit is ripe about Midſommer.

This plant is thought to haue been vnknowne to the Antient Greekes: ſome thinke it the *Ribes* of the Arabian *Serapio*. *Fuchſius*, *Matthiolus*, and ſome other deny it; notwithſtanding *Dodonæus* affirmes it: neither is the controuerſie eaſie to be decided, becauſe the Author is briefe in the deſcription thereof, neither haue we his words but by the hand of a barbarous Tranſlator. However the ſhops of late time take it (the faculties conſenting thereto) for the true Ribes, and of the fruit hereof prepare their *Rob de Ribes*. *Dodonæus* calls it *Ribeſium*, *groſſularia rubra*, & *Groſſularia tranſmarina*; and they are diſtinguiſhed into three ſorts, *Rubra*, *Alba*, *Nigra Ribeſia*, red, white and blacke Currans: the Germans call them **S. Johans traubell**, or **traublin**, and **S. Johans Beerlen**: the Dutch, **Beſſkins ouer Zee**: the Italians, *Vuetta roſſa*: the French, *Greiſſeles*, *Groſelles d'outre mer*: the Bohemians, **Jahodi S. Jana**: the Engliſh, Red Currans: yet muſt they not be confounded

with those Currans which are brought from Zant, and the continent adjoyning thereto, and which are vulgarly sold by our Grocers; for they are the fruit of a small Vine, and differ much from these.

¶ *The Temperature and Vertues.*

A The berries of red Currans, as also of the white, are cold and dry at the end of the second degree, and haue some astriction, together with tenuity of parts.

B They extinguish and mitigate feuerish heates, represse choler, temper the ouer-hot bloud, resist putrefaction, quench thirst, helpe the dejection of the appetite, stay cholericke vomitings and scourings, and helpe the Dysentery proceeding of an hot cause.

C The juyce of these boyled to the height of hony, either with, or without sugar (which is called *Rob de Ribes*) hath the same qualities, and conduces to the same purposes.

CHAP. 3. *Of Parsley Breake-stone, and bastard Rupture-wort.*

1 *Percipier Anglorum Lob.*
Parsley Breake-stone.

2 *Polygonum Herniariæ facie.*
Bastard rupture-wort.

¶ *The Description.*

1 I Thought that it was not altogether inconuenient to couple these two Plants together in one Chapter; first, because they are of one stature; and secondly, taken out of one, and the same History of Plants, to wit, the *Aduersaria* of *Pena* and *Lobel*.

The first of these, which the Authors of the *Aduersaria* set forth by the name of *Percepier*, (and rather assert, than affirme to be the *Scandix* of the Antients) is by *Tabernamontanus* called *Scandix minor*: and by *Fabius Columna*, *Alchimilla montana minima*: it hath a small wooddy yellowish fibrous root, from which rise vp one, two, or more little stalks, seldome exceeding the height of an handfull, and these are round and hairy, and vpon them grow little roundish leaues, like the tender leaues of Cheruil, but hairy, & of a whitish green color, fastned to the stalks with short foot-stalks, & hauing little eares at their setting on: the floures are small, greene, and fiue cornered, many clustering together at the setting on of the leaues: the seed is small, smooth, and yellowish: the stalks of this grow sometimes vpright, and otherwhiles they leane on the ground: it is to be found vpon dry and barren grounds, as in Hide Parke, Tuthill fields, &c. It floures in May, and ripens the seed in Iune and Iuly. It seemes by the Authors of the *Aduersaria*, that in the West countrey about Bristow they call this Herbe Percepier: but our herbe women in Cheapside know it by the name of Parsley Breakestone.

D This is hot and dry, and of subtill parts: it vehemently and speedily moues vrine, and by some is kept in pickle, and eaten as a sallad.

E The distilled water is also commended to be effectuall to moue vrine, and clense the kidnies of grauell.

2 The history of this, by the forementioned Authors, *Aduers. pag.* 404. is thus set forth vnder this title, *Polygonium Herniariæ foliis & facie, peramplaradice Astragalitidi*: Neither (say they) ought this to be despised by such as are studious of the knowledge of Plants; for it is very little knowne, being a very small herbe lying along vpon the ground, and almost ouerwhelmed or couered with the grasse, hauing little branches very full of joints: the little leaues and seeds are whitish, and very like those of *Herniaria* or Rupture-wort: the whole plant is white, hauing a very small and mossie floure: the root is larger than the smalnesse of the plant seemeth to require, hard, branched, diuersly turning and winding, and therefore hard to be plucked vp: the taste is dry and hottish. It growes vpon a large Plaine in Prouince, betweene the cities Arles and Selon. Thus much *Pena* and *Lobel*. I am deceiued, if some few yeares agone I was not shewed this plant, gathered in some part of this kingdome, but where, I am not able to affirme.

CHAP.

Chap. 4. *Of Heath Spurge and Rocke Rose.*

¶ *The Description.*

1 THese Plants by right should haue followed the history of *Thymelæa*, for in shape and faculties they are not much vnlike it. The first is a low shrub, sending from one root many branches of some cubit long, and these bending, flexible, and couered with an outer blackish barke, which comprehends another within, tough, and which may bee diuided into fine threds: the leaues are like those of *Chamælea*, yet lesser, shorter, and thicker, a little rough also, and growing about the branches in a certaine order: if you chew them they are gummy, bitter at the first, and afterward hot and biting: the floures grow among the leaues, longish, yellowish, and diuided at the end into foure little leaues: the fruit is said to be like that of *Thymælea*, but of a blackish colour, the root is thicke and wooddy. It growes frequently in the kingdome of Granado and Valentia in Spaine, it floures in March and Aprill. The Herbarists there terme it *Sanamunda*, and the common people, *Micrda.craz*, by reason of the purging faculty.

1 *Sanamuuda* 1. *Clus.*
Heath Spurge.

2 *Sanamunda* 2. *Clus.*
The second Heath Spurge.

2 The other is a shrub some cubit high, hauing tough flexible branches couered with a dense and thick barke, which the outward rinde being taken away, ouer all the plant, but chiefely next the root, may be drawne into threds like Flax or Hemp: the vpper branches are set with thick, short, fat, rough sharp pointed leaues, of somewhat a saltish taste at the first, afterwards of a hot and biting taste: the floures are many, little and yellow: the root is thicke and wooddy like as that of the former: this growes vpon the sea coast of Spaine, and on the mountaines nigh Granado, where they call it *Sanamunda*, and the common people about Gibralter call it Burhalaga, and they only vse it to heate their ouens with. It floures in February. *Anguillara* called this, *Empetron: Cæsalpinus*, *Cneoron*, and in the *Historia Lugd.* it is the *Cneoron nigrum Myconi*: *Sesamoides minus*: *Daleschampij*, and *Phacoides, Oribasij quibusdam.*

3 This

3 This is bigger than either of the two former, hauing whiter and more flexible branches, whose barke is vnmeasurably tough and hard to breake: the vpper branches are many, and those very downy, and hanging downe their heads, set thicke with little leaues like Stone crop, and of the like hot or burning faculty: the floures are like those of the former; sometimes greenish, otherwhiles yellow: *Clusius* did not obserue the fruit, but saith, it floured at the same time with the former, and grew in all the sea coast, from the Straits of Gibralter, to the Pyrenæan mountaines. *Alfonsus Pantius* called this *Cneoron*: *Lobel* and *Tabernamontanus* call it *Erica Alexandrina*.

3 *Sanamunda 3. Clus.*
The third Heath Spurge.

4 *Cneoron Matthioli.*
Rocke Rose.

4 This also may not vnfitly bee joyned to the former, for it hath many tender flexible tough branches commonly leaning or lying along vpon the ground, vpon which without order grow leaues greene, skinny, and like those of the true *Thymelæa*; at first of an vngratefull, and afterwards of a bitter taste, yet hauing none or very little acrimony (as far as may be perceiued by their taste:) the floures grow vpon the tops of the branches six, seuen, or more together, consisting of foure little leaues of a reddish purple colour, very beautifull and well smelling, yet offending the head if they be long smelt vnto: these are succeded by small berries, of colour white, containing a round seed, couered with an ash-coloured skin. The root is long, of the thickneſſe of ones little finger, sometimes blackish, yet most commonly yellowish, tough, and smallest at the top where the branches come forth. It floures in Aprill or May, and ripens the fruit in Iune: it floures sometimes thrice in the yeare, and ripens the fruit twise; for *Clusius* affirmes that twice in one yeare he gathered ripe berries from one and the same plant. It growes plentifully vpon the mountainous places of Austria about Vienna; whither the countrey women bring the floures to the market in great plenty to sell them to deck vp houses: it growes also in the dry medowes by Frankford on the Mœne, where there is obserued a variety with white floures. *Matthiolus* would haue this to be the *Cneoron album* of *Theophraſtus*: *Cordus* calls it *Thymelæa minor*: it is the *Cneoron alterum Matthioli*, and *Oleander ſyl. Auicennæ Myconi*, in the *Hiſt. Lugd.* The Germanes call it **Stein Roſelin**: and we may call it Rocke Rose, or dwarfe Oleander.

5 This plant by *Bauhine* is called *Cneorum album folio oleæ argenteo molli*: and by *Daleſchampius*, *Cneorum album*, which hath been the reason I haue put it here, although *Caſalpinus*, *Imperatus*, and *Plateau*,

5 *Cneorum album foliis argenteis.*
White rocke Roſe.

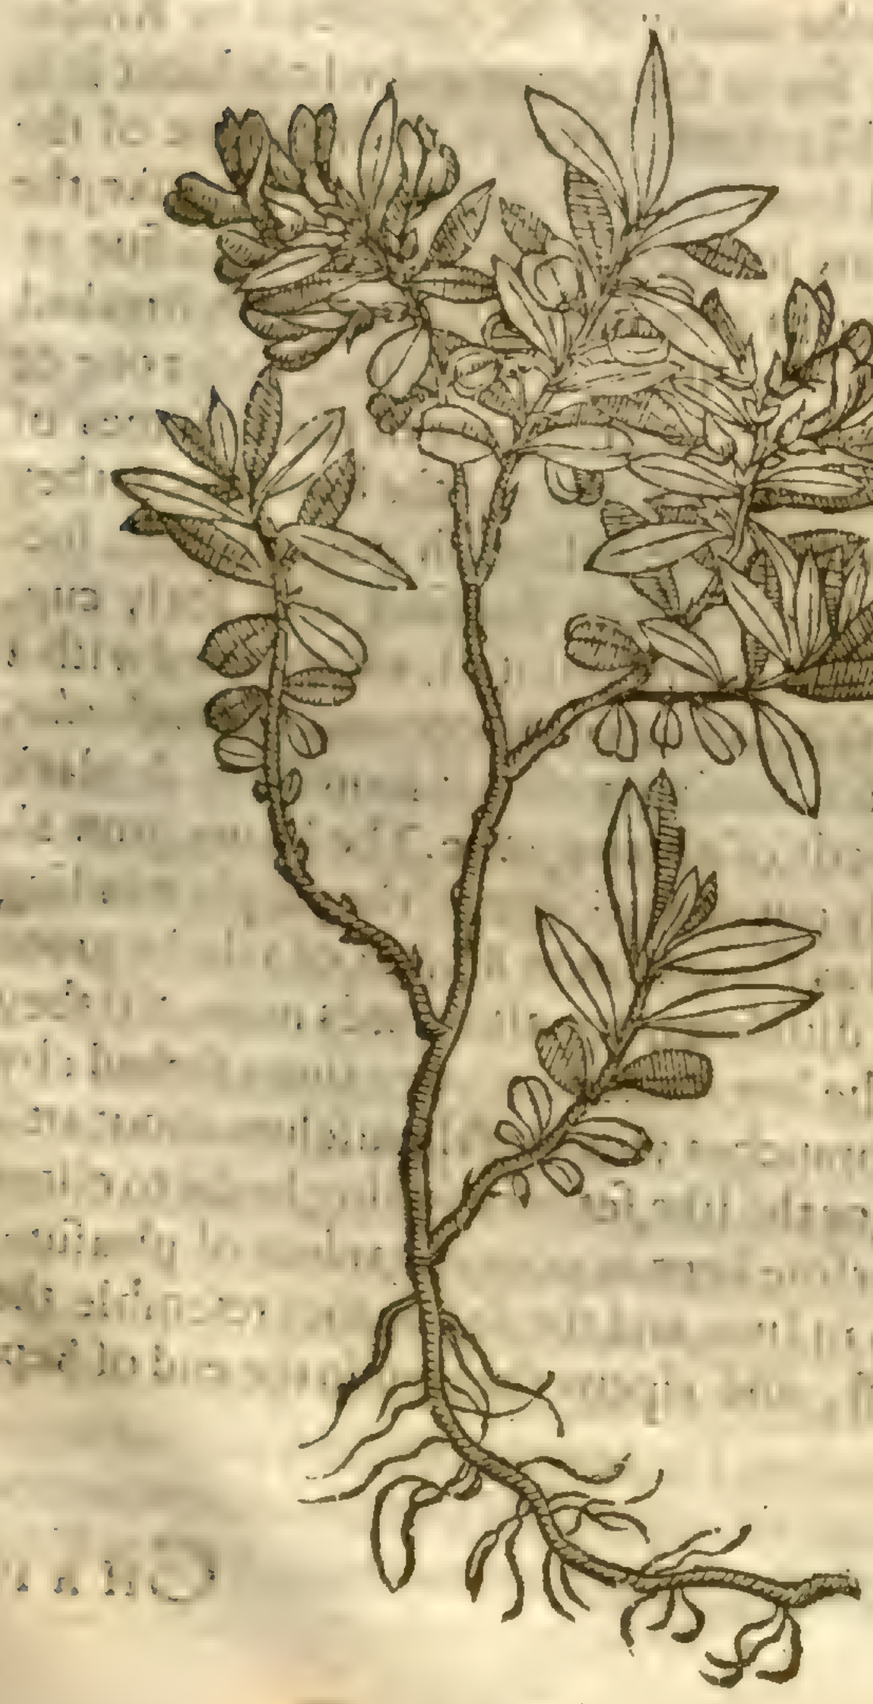
teau who ſent it to *Cluſius*, would haue it to be and call it *Dorycnium*. It is a ſhrubbie herbe, ſending from one root many ſingle ſtalks ſom halfe cubit or better high. The leaues, which grow vpon the ſtalks without order, are like thoſe of the Oliue, but ſomewhat narower, and couered ouer with a ſoft ſiluer-like downineſſe: At the top of the ſtalkes grow many floures cluſtering together, in ſhape like thoſe of the leſſer Bindeweed, but white of colour. This grows wild in ſome parts of Sicily, whence *Cæſalpinus* calls it *Dorycnium ex Sicilia*.

¶ *The Temperature and Vertues.*

The three firſt are very hot, and two firſt haue a ſtrong purging facultie, for taken in the weight of a dram with the decoction of cicers they mightily purge by ſtoole, both flegme, choler, and alſo wateriſh humours, and they are often vſed for this purpoſe by the country people in ſome parts of Spain. A

The faculties of the reſt are not known, nor written of by any as yet.

Chamæbuxus flore Coluteæ.
Baſtard dwarfe Box.



CHAP. 5.
Of baſtard dwarfe Box.

¶ *The Deſcription.*

THis which *Cluſius* for want of a name calls *Anonymos flore Coluteæ*, *Geſner* called *Chamæbuxus*; to which *Bauhine* addeth *flore Coluteæ*; and *Beſler* in his *hortus Eyſtettenſis*, agreeable to the name I haue giuen it in Engliſh, cals it *Pſeudochamæbuxus*. It is a ſmall plant, hauing many creeping woody tough roots, here and there ſending forth ſmall fibres: From theſe ariſe many tough bending branches ſome ſpan long, hauing thicke ſharpe pointed green leaues almoſt like thoſe of Box, and theſe grow vpon the ſtalks without any order, & when you firſt chew them they are of an vngratefull taſte, afterwards bitter and hot. At the tops of the branches do come forth among the leaues three or foure longiſh flours for the moſt part without ſmell, yet in ſome places they ſmell ſweet like as ſome of the Narciſſes: they conſiſt of three leaues apiece, two whereof are white, and ſpred abroad as wings, a whitiſh little hood couering their lower ends; the third is wrapt vp in form of a pipe, with the end hollow and crooked,

crooked,and this is of a yellow colour,which by age often times becomes wholly red: after those floures succeed cods broad and flat,little lesse than those of the broad leafed *Thlaspi*,and greene of colour,rough,and in each of these cods are commonly contained a couple of seeds,of the bignesse of little Chichlings,of a blackish ash colour,rough,and resembling a little dug.

This is sometimes found to vary, hauing the two winged leaues yellow or red, and the middle one yellow.

¶ *The Place.*

It floures in Aprill and May,and ripens the seed in Iune. It growes vpon most of the Austrian and Styrian Alps,and in diuers places of Hungary. It is neither vsed in physicke,nor the faculties thereof in medicine known.

Chap. 6. *Of winged Binde-weed or Quamoclit.*

Quamoclit, sive Convolvulus Pennatus.
Winged Binde-weed.

¶ *The Description.*

THe first that writ of & described this plant was *Cæsalpinus*,and that by the name or *Gelseminum rubrum alterum*. After him *Camerarius* gaue a figure and description thereof in his *hortus Medicus*,by the name of *Quamoclit*. And after him *Fabius Columna* both figured and described it more accuratly,whose description is put to the figure of it we here giue,in *Clus.* his *Curæ Posteriores*. It is so tender a plant that it wil not come to any perfection with vs,vnlesse in extraordinary hot yeres,& by other artificial helps; wherefore I wil borrow the description thereof out of *Fabius Columna*. This exotick plant,saith he,cannot more fitly be referred to any Kinde, than to the family of the *Convolvuli* or Binde-weeds, for in the nature and whole habit it is almost like them, except in the shape of the winged leaues: it is stored with lesse milke;the floures are long,hollow,but parted into fiue at the top, of a pleasing red colour, with streaked lines or folds, standing vpon long stalks one or two together comming out of the bosomes of the leaues at each joint of the branches,& they haue in them fiue yellowish pointals;then succeeds a longish fruit standing in a scaly cup, ending in a sharpe pointall, and couered with a tough skin,as that of the common *Convolvulus*, but lesser, hauing within it foure longish black hard seeds,of a biting taste. The leaues grow alternatly out of the joints of the purple winding branches,being winged and finely diuided,twice as small as the common *Rheseda*, of a darke green colour,but the yong ones are yellowish,first hauing a few diuisions, but afterwards more, till they come to haue thirteen on a side,and one at the top; but the lower ones are often times forked: by reason of the great plenty of leaues and flouring stalks or branches winding themselues about artificial hoops,crossings,or other fashioned works of Reeds,or the like,set for winding herbs to clime vpon,it much delights the eye of the beholder, and is therfore kept in pots in gardens of pleasure. The seed sown in the beginning of the Spring growes vp in Iune,and the first leaues resemble the winged fruit of the Maple: it floures in the end of August, and ripens the seed in the end of September.

Chap.

CHAP. 7. *Of the Senſitiue herbe.*

Herba mimoſa.
The Senſitiue herbe.

¶ *The Deſcription.*

THis which I here call the Senſitiue herbe, is that which *Chriſtopher Acoſta* ſets forth by the name of *Herba mimoſa*, or the Mocking herbe, becauſe when one puts his hand thereto, it forthwith ſeemes to wither and hang downe the leaues; but when you take it away againe, it recouers the priſtine greeneſſe and vigor. I will here giue you that which *Acoſta* writes thereof, and the figure & hiſtorie which *Cluſius* giues in his notes vpon him; and alſo another figure better expreſſing the leaues and manner of growing. There is found, ſaith *Acoſta*, in ſome gardens another plant ſome fiue handfulls long, reſting vpon the neighboring ſhrubs or wals, hauing a ſlender ſtalke of freſh greene colour, not very round, ſet at certaine ſpaces with ſmal & pricking thornes: the leaues are not vnlike the former, [That is, the *Herba viua*, which in condition is little different from this] being ſomwhat leſſer than thoſe of the female Fern. It loues to grow in moiſt and ſtony places, and is called *Herba mimoſa* for the reaſon formerly giuen. The nature hereof is much different from that of *Arbor triſtis*; for euery night at Sunne-ſet it as it were withers and dries, ſo that one would thinke it were dead, but at Sunne-riſe it recouers the former vigor, and by how much the Sun grows hotter, by ſo much it becomes the greener, and all the day it turns the leaues to the Sun.

This plant hath the ſmel and taſte of liquorice, A
and the leaues are commonly eaten by the Indians againſt the cough, to clenſe the cheſt, and clear the voice. It is alſo thought good againſt the paines of the kidnies, and to heale greene wounds. Thus much *Acoſta*.

Now, ſaith *Cluſius*, the leaues of many plants, eſpecially Pulſes, vſe to contract or ſhrink vp their leaues in the night time. Now I receiued a drie plant, which was ſent to mee by the name of *Herba mimoſa*, by *Iames Garret* in the end of October, 1599. which he writ he had from the right honorable the Earle of Cumberland, who returning from Saint *Iohn de puerto rico* in the Weſt Indies, brought it put in a pot with ſome earth, but could not preſerue it aliue. But I cauſed the figure of that dried plant to be expreſſed as well as it might, ſo to fit it to the deſcription following, made alſo by the dried plant. This plant which was wholly dry and without leaues, had a ſingle root, and that not thick, but hard and wooddy, with few fibres, from whence aroſe three or foure ſhort ſtalks, which ſtraight diuided themſelues into ſlender branches which ſpred themſelues round about vpon the ground, at each joint putting forth many long and ſlender fibres, like as in the branches of the common Wood-bind, which lie vpon the ground: theſe branches were a cubit long, and ſomtimes more, round, tough, with ſome prickles, broader at their ſetting on, as you may ſee in the common bramble, yet leſſer, fewer, & leſſe firm; theſe again were diuided into other more ſlender branches ſet with many little prickles, out of whoſe joints betwixt 2 little leaues grew forth foot-ſtalks bedeckt with their little leaues, which were many, ſet in order, with other to anſwer to them on the other ſide, but hauing no ſingle leafe at the end: they were tender & green, not vnlike the little leaues of *Acacia*, & theſe at their firſt comming out couered with a thin whitiſh hairines, as I gathered by a little branch retaining the foot-ſtalk and leaues thereon (which he ſent with the former) and it had alſo ſome fibres comming forth therof. He alſo added to the former two little heads, which growing on the ſame plant, he writ he receiued of the

Eius exactior Icon.
A perfect figure thereof.

forementioned right honourable Earle, with some branches yet retaining the leaues. These little heads consisted of many slender narrow and as it were prickly little leaues; amongst which lay hid round seeds, smooth, black, and somwhat swoln in the middle: the floures I saw not, neither know I whether they were brought with the rest: but whether the leaues of this plant being green, & yet growing on the ground, do wither at the approch of ones hand, as *Christopher Acosta* writes, and for that cause imposes the name thereon, they best know who haue seene the greene and yet growing plant: for the faculties you may haue recourse to that which *A Costa* hath set down. Thus much out of *Clusius*.

Novemb. 7. 1632. I being with Mr *Iob Best* at the Trinity house in Ratcliffe, among other rarities hee shewed me a dry plant hereof, which I heedfully obserued, and carefully opening out some of the broadest leaues, which (as also the whole plant besides) were carelesly dried, I found the leaues grew vsually some dozen or more on a foot-stalke, iust as many on one side as on the other; & they were couered ouer with a little downinesse, which standing out on their edges made them looke as if they had bin snipt about the edges, which they were not: also I found at euery ioint two little hooked prickles, & not two little leaues or appendices at the setting on of the foot-stalks, but 3 or foure little leaues, as the rudiment of a young branch, comming forth at the bosome of each foot-stalke: the longest branch (as far as I remember) was not aboue a span long; I then drew as perfect a figure as I could of the perfectest branch thereof, drawing as neer as I could the leaues to their ful bignesse, the which I here present you withall. There are two figures formerly extant, the one this of *Clusius*, which I here giue you; and the other in the 18 book & 144 chap. of the *hist. Lugd.* which is out of *Acosta*, and this seemes to be so far different from that of *Clusius*, that *Bauhine* in his *Pinax* saith, *Clusius notis suis in Acostam diuersam planè figuram proposuit, herbam mimosam nominans*: but he did not well consider it, for if he had, he might haue found these so much different, thus farre to agree; they both make the branches prickly and weak; the leaues many on one rib, one opposit to another without any odd one at the end: but *Clusius* figures the leaues so close together that they seeme but one leafe, and *Acosta* makes them too far asunder, and both of them make them too sharpe pointed. *Clusius* made his to be taken from a dried plant, and *Acosta* I iudge made his by the Idæa thereof which he had in his memory; and after this maner, if my iudgement faile me not, are most of the figures in him expresst: but of this enough, if not too much.

CHAP. 8. *Of the Staffe-tree, and euer-greene Priuet.*

1 *Celastrus Theophrasti.*
The Staffe-tree.

2 *Phillyrea* 1. *Clus.*
Clusius his first Mock-Priuet.

¶ *The Deſcription.*

1 THe hiſtorie and figure of this tree are ſet forth in *Cluſius* his *Curæ Poſt.* and there it is aſſerted to be πίλυρος or πίλυρεα of *Theophraſtus*; for by diuers places in *Theophraſtus* there collected, it is euident, that his *Celaſtus* was euer greene, grew vpon very high and cold mountains, yet might be tranſplanted into plain and milder places; that it floured exceeding late and could not perfect the fruit by reaſon of the nigh approch of Winter, and that it was fit for no other vſe but to make ſtaues for old men.

Now this tree growes but to a ſmall height, hauing a firme and hard body, diuiding it ſelf at the top into ſundry branches, which being yong are couered with a green bark, but waxing old, with a browniſh one; it hath many leaues growing alwaies one againſt another, and thicke together, of a deep ſhining green aboue, and lighter vnderneath, keeping their verdure both winter and ſummer: they are of the bignes of thoſe of *Alaternus*, not ſnipt about the edges, but only a little nickt, when they are yet yong: at the top of the tendereſt branches among the leaues, vpon foot ſtalkes of ſome inch long, grow fiue or ſix little floures, conſiſting commonly of fiue little leaues of a yellowiſh green colour, and theſe ſhew themſelues in the end of Autumne or the beginning of winter, and alſo in the beginning of the Spring; but if the Summer be cold and moiſt, it ſhewes the buds of the floures in October. The fruit growes on a ſhort ſtalke, and is a berry of the bigneſſe of a myrtle, firſt green, then red of the colour of that of Aſparagus, and laſtly blacke when it is withered: the ſtone within the berry is little and as it were three cornered, containing a kernell couered with a yellow ſilme. Where this growes wild I know not, but it was firſt taken notice of in the publique garden at the Vniuerſitie of Leyden, from whence it was brought into ſome few gardens of this Kingdome.

2 The firſt *Phyllyria* of *Cluſius* may fitly be referred to the reſt of the ſame Tribe and name, deſcribed formerly, *Lib.*3. *Cap.*59. It growes ſomewhat taller than the Skarlet Oke, and hath branches of the thickneſſe of ones thumbe and ſomewhat more, and thoſe couered with a greene barke marked with whitiſh ſpots: the leaues ſomewhat reſemble thoſe of the Skarlet Oke, but greater, greener, thicker, ſomewhat prickly about the edges, of an aſtringent taſt, but not vngratefull. The floure thereof *Cluſius* did not ſee: the fruit is a little blacke berry, hanging downe out from the boſome of the leaues, and containing a kernel or ſtone therein. It growes wild in many places of Portugal, where they call it Azebo.

The temper and vertues are referred to thoſe ſet down in the formerly mentioned chapter.

CHAP. 9. *Of Mock-Willow.*

Speiræi Theophraſti, Cluſ.
Mock-Willow.

¶ *The Deſcription.*

THis Wilow-leaued ſhrub, which *Cluſius* conjectures may be referred to the *Speiræa* mentioned by *Theophraſtus*, *lib.*1. *cap.*23. *hiſt. plant.* I haue named in Engliſh, Mock-willow; how fitly I know not, but if any will impoſe a fitter name, I ſhall be well pleaſed therewith. But to the thing it ſelf. It is a ſhrub (ſaith *Cluſius*) ſome two cubits high, hauing ſlender branches or twigs couered ouer with a reddiſh barke, whereon grow many leaues without order, long, narrow, like thoſe of the Willow, ſnipt about the edges, of a light greene aboue, and of a blewiſh green vnderneath, of a drying taſt conjoined with ſome bitterneſſe. The tops of the branches for ſome fingers length carry thicke ſpikes of ſmall floures cluſtering together, and conſiſting of fiue leaues apiece; out of whoſe middle come forth many little leaues of a whitiſh red or fleſh colour, together with the floure, hauing no peculiar ſmell, but ſuch as is in the floure of the Oliue tree: theſe floures fading, there ſucceed ſmall fiue

cornered heads, which comming to full maturitie contain a small & yellowish dusty seed: it flours in Iuly, and ripens the seed in the end of August. *Clusius* had this plant from *Fredericke Schizius* Physition to the duke of Briga, and that from Briga in Silesia, and hee (as I said) referreth it to the Ἀνδράχνη of *Theophrastus*, which he reckons among the shrubs that carry spike-fashioned floures.

This is not vsed in medicine, nor the temperature and faculties thereof as yet known.

Chap. 10. *Of the Strawberry Bay.*

Adrachne Theophrasti.
The Strawberry Bay.

¶ *The Description.*

THe figure and historie of this was sent by *Honor. Bellus* out of Candy to *Clusius*, from whom I haue it. It is that which *Theophrastus* calleth *Adrachne* or (as most of the printed books haue it) *Andrachne*: but the former seems the righter, and is the better liked by *Pliny*, *Lib.* 13. *cap.* 22. At this day in Candy where it plentifully growes, it is called *Adracla*. It is rather a shrub than a tree, delighting in rocky and mountainous places, and keeping greene Winter and Summer, hauing leaues so like those of Bayes, that they are distinguishable only by the smell, which these are destitute of. The barke of the bole and all the branches is so smooth, red, and shining that they shew like branches of Coral; this barke crackes or breaks off in Summer, and pills off in thin fleakes; at which time it is neither red nor shining, but in a mean betweene yellow and ash-colour. It hath floures twice in the yeare like as the *Arbutus* or Strawberry tree, and that so like it, that you can scarse know the one from the other, yet this differs from it in that it groweth onely in the mountaines, hath not the leaues jagged, neither a rough barke: the wood hereof is very hard, and so brittle that it will not bend, and they vse it to burn and to make whorls for their womens spindles. *Theophrastus* reckons vp this tree amongst those which dye not when their barks are taken off, and are alwaies greene, and retaine their leaues at their tops all Winter long: which to be so *Honorius Bellus* obserued. *Bellonius* also obserued this tree in many places of Syria.

The fruit in temperature, as in shape, is like that of the Strawberry tree.

Chap. 11. *Of the Cherry Bay.*

¶ *The Description.*

THe Chery-bay is one of the euer-greene trees: it rises vp to an indifferent height, & is diuided into sundry branches couered ouer with a swart green bark: that of the yonger shoots is wholly greene.

green, the leaues alternatly ingirt the branches, and they are long, ſmooth, thick, greene & ſhining, ſnipt alſo lightly about the edges: when the tree is grown to ſome height, at the tops of the branches amongſt the leaues of the former years growth, vpon a ſprig of ſome fingers length it putteth forth a great many little white floures conſiſting of fiue leaues a piece, with many little chiues in them. Theſe floures quickly fall away, and the fruit that ſucceeds them is a berry of an oval figure, of the bigneſſe of a large Cherry or Damſon, and of the ſame colour, and of a ſweet and pleaſant

Laurocerаſi flos.
The Cherry-bay in floure.

Laurocerаſi fructus.
The Cherry-bay with the fruit.

taſte, with a ſtone in it like to a Cherry ſtone. This floures in May, and ripens the fruit in Auguſt or September. It was firſt ſent to *Cluſius* from Conſtantinople, and that by the name of *Trabiſon curmaſi* 1. *Trapazuntina dactylus*, the Date of Trapezon; but it hath no affinitie with the Date. *Dalechampius* refers it to the ſecond *Lotus* mentioned by *Theophraſtus*, *Hiſt. plant. lib.* 4. *ca.* 4. but therewith it doth not agree. *Cluſius* and moſt ſince call it fitly *Laurocerаſus*, or *Cerаſus folio Laurino*. It is now got into many of our choice Engliſh gardens, where it is well reſpected for the beauty of the leaues, and their laſting or continuall greenneſſe.

The fruit hereof is good to be eaten, but what phyſicall vertues the tree or leaues thereof haue it is not yet knowne.

CHAP. 12. *Of the euer-greene Thorne.*

THis plant, which *Lobel* and ſome other late Writers haue called by the name of *Pyracantha*, is the *Oxyacantha* mentioned by *Theophraſtus*, *lib.* 1. *cap.* 15. *lib.* 3. *cap.* 4. *hiſt. plant.* amongſt the euer-green trees; and I thinke rather this than our white Thorn to be the *Oxyacantha* of *Dioſcorides*, *lib.* 1. *ca.* 123. And certainly it was no other than this Thorn which *Virgil* mentioneth by name of *Acanthus*, *lib.* 2. *Georg.* in theſe words, *Et bacchas ſemper frondentis Acanthi*: That is, And the berries of the E're-green Thorn.

Oxyacantha Theophrasti.
The euer-green Thorne.

¶ *The Description.*

THis grows vp like a bush, vnles you keep it with pruning, and then it will in time grow to the height of a small tree, as the Hawthorne, whereto it is of affinitie, for the wood is white and hard, like it, and couered ouer with the like barke; but the leaues are somewhat like those of the Damson tree, longish, sharpe pointed, and snipt about the edges: they grow alongst the branches, without any order, yet somtimes they keep this maner of growing, at each knot, where commonly there is a sharp prickle, growes out one of the larger leaues, which may be some inch & half long, & some three quarters of an inch broad: then vpon the prickle & at the comming out thereof are three or foure, more or lesse, much smaller leaues: now these leaues are of a faire & shining green aboue, but paler vnderneath, and they keepe on all the yeare. At the ends and oft times in the middle of the branches come forth clusters of vmbels of little whitish Blush-coloured floures consisting of fiue leaues apiece, with some little chiues in their middls: then follow clusters of beries, in shape tast and bignes like those of Hawthorn, & of the same, but much more orient and pleasing colour, and containing in them the like seed. Now these berries hang long vpon the tree, and make a gallant shew amongst the greene leaues, but chiefely then when as the autumne blasts haue depriued other trees of their wonted verdure. This flours in May and Iune, and ripens the fruit in September and October. It grows wilde in sundry places of Italy and Province in France, but is kept in gardens with vs, where it is held in good esteem for his euer-greenesse and pliablenesse to any work or forme you desire to impose vpon him.

The fruit haue the same faculties that are formerly attributed to Haws, in the third book, *p.* 1328. and therefore I will not here repeat them.

CHAP. 13. *Of the Egyptian Nap, or great Iujube tree.*

¶ *The Description.*

THis tree, which for his leaues and manner of growing I thinke may fitly be referred to the Iujubes tree, is of two sorts, that is, the one prickly, and the other not prickly, in other respects they are both alike, so that one figure and history may serue for them both; which I will giue you out of *Clusius*, who receiued this figure together with a description thereof from *Honorius Bellus*, and also added thereto that which *Prosper Alpinus* hath written of it, *cap.* 5. *de plant. Ægypt.* It grows to the height of an indifferent Pear tree, and the body and branches thereof are couered with a whitish ash coloured barke: the leaues are like those of the Iujubes tree, two inches long, & one broad, with three nerues running along them, of a deepe shining greene aboue, and more whitish vnderneath, and they grow alternately vpon the branches, and at their comming forth grow tufts of little white floures hanging vpon single long foot-stalks: after these followes the fruit, like vnto a small apple, of the bignesse for the most part of a large Cherry, and sometimes as big as a Wallnut, of a sweet tast, containing therein a kernell or stone like that of an Olive. It beares fruit twice a yeare, for it hath ripe fruit both in the Spring and Fall; yet the vernal fruit seldom comes to good, by

Oenopliamen ſpinoſa.
The great Iujubes tree.

by reaſon of the too much moiſture of the ſeaſon, which cauſes it to become worme-eaten. The Thorny kind is deſcribed by *Alpinus*, who rightly iudges it the *Connarus* of *Athenæus*, but the figure he giues is not very accurate. That which wants prickles growes (as well as the prickly one) in Ægypt and Syria, as alſo in the city Rhetimo in Candy, whither it was brought out of Syria.

The hiſtory of both theſe trees is in *Serapio*, by the name of *Sadar*: but he, according to his cuſtome confounds it with the *Lotus* of *Dioſcorides*, from which it very much differs. *Bellonius* in his ſecond booke, and 79. chap. of his Obſeruations, reckons vp *Napeca* amongſt the trees that are alwaies greene: which is true, in thoſe that grow in Egypt and Syria; but falſe in ſuch as grow in Candy. That tree in Ægypt and Syria is called *Nep*, or *Nap*. *Alpinus* calls it *Paliurus Athenæi*, or *Nabca Ægyptiorum*, thinking it (as I formerly ſaid) the *Connarus* mentioned in the 14. booke of *Athenæus*, his Deipnoſophiſts.

¶ *The Vertues out of Alpinus.*

The fruit is of a cold and dry facultie, and A
the vnripe ones are frequently vſed to ſtrengthen the ſtomacke, and ſtop lasks: the juyce of them being for this purpoſe either taken by the mouth, or injected by clyſters: of the ſame fruit dried and macerated in water, is made an infuſion profitable againſt the relaxation and vlceration of the guts.

The decoction or infuſion of the ripe dried B
fruit, is of a very ftequent vſe againſt all peſtilent feuers: for they affirme that this fruit hath a wonderfull efficacie againſt venenate qualities, and putrifaction, and that it powerfully ſtrengthens the heart.

Alſo the juyce of the perfectly ripe fruit is very good to purge choler forth of the ſtomacke and C
firſt veines: and they willingly vſe an infuſion made of them in all putride feuers to mitigate their heate or burning.

CHAP. 14. *Of the Perſian Plum.*

¶ *The Deſcription.*

1 THis tree is thought by *Cluſius* (to whom I am beholden for the hiſtory and figure) to be the *Perſea arbor* mentioned by *Pliny* and *Plutarch*, but he ſomwhat doubts whether it be that which is mentioned by *Theophraſtus*. *Dioſcorides* alſo, *Galen* and *Strabo* make mention of the *Perſea arbor*, and they all make it a tree alwaies greene, hauing a longiſh fruit ſhut vp in the ſhell and coat of an Almond: with which how this agrees you may ſee by this deſcription of *Cluſius*.

This tree (ſaith he) is like to a Peare tree, ſpreading it ſelfe far abroad, and being alwaies greene, hauing branches of a yellowiſh green colour. The leaues are like thoſe of the broadeſt leaued Bay-tree, greene aboue, and of a grayiſh colour vnderneath, firm, hauing ſome nerues running obliquely, of a good taſte and ſmell, yet biting the tongue with a little aſtriction, The floures are like thoſe of the Bay, growing many thicke together, and conſiſt of ſix ſmall whitiſh yellow leaues. The fruit at the firſt is like a Plum, and afterwards it becomes Peare-faſhioned, of a blacke colour, and pleaſant taſte: it hath in it a heart-faſhioned kernell, in taſte not vnlike a Cheſnut, or ſweet Almond. I found it flouring in the Spring, and I vnderſtood the fruit was ripe in Autumne, by the relation of Sig^r.

Perſea arbor.
The Perſian Plum.

Cotonaſter Geſneri.
Geſners wilde Quince.

Iohn Placa, Phyſition and Profeſſor of Valentia, who ſhewed me the tree growing in the Garden of a Monaſterie a mile from Valentia, brought thither, as they ſay, out of America, and he ſaid they called it *Memay*: but the Spaniards who haue deſcribed America giue this name to another tree. But diuers yeares after, I vnderſtood by the moſt learned *Simon de Touar*, a Phyſition of Ciuil, who hath the ſame tree in his Garden, with other exoticke plants, that it is not called *Mamay*, but *Aguacate*. Thus much out of *Cluſius*; where ſuch as are deſirous, may finde more largely handled the queſtion, whether this be the *Perſea* of the Antients or no? *Rariorum plan. Hiſt. l.* 1. *c.* 2.

Chap. 15.
Of Geſners wilde Quince.

¶ *The Deſcription.*

THe ſhrub which I here figure out of *Cluſius*, is thought both by him and others, to be the *Cotanaſtrum* or *Cidonago*, mentioned by *Geſner* in his Epiſtles, *lib.* 3. *pag.* 88. It hath branches ſome cubit long, tough, and bare of leaues in their lower parts, couered with a blacke barke: and towards the tops of the branches grow leaues ſomewhat like thoſe of Quinces: of a darke green aboue, and whitiſh vnderneath, ſnipt about the edges: at the tops of the branches grow vſually many floures, conſiſting of fiue purpliſh coloured leaues apiece, with ſome threds in their middles: theſe decaying, vnder them grow vp red dry berries without any pulpe or juyce, each of them containing foure triangular ſeeds. *Cluſius* found this flouring in Iune vpon the tops of the Auſtrian Alpes, and he queſtions whether it were not this which *Bellonius* found in the mountains of Candy, and called *Agrimalea, lib.* 1. *cap.* 17. This is not vſed in Phyſicke, nor the faculties thereof knowne.

Chap. 16. *Of Tamarindes.*

Tamarindus.
The Tamarinde.

Tamarindi ſiliqua.
The cod of the Tamarinde.

¶ *The Deſcription.*

TAmarinds, which at this day are a medicine frequently vſed, and vulgarly knowne in ſhops, were not knowne to the antient Greekes, but to ſome of the later, as *Actuarius*, and that by the name of *Oxyphœnicæ*, that is, ſoure Dates, drawne as it may ſeeme from the Arabicke appellation, *Tamarindi*, that is, Indian Date: but this name is vnproper, neither tree nor fruit being of any affinitie with the Date, vnleſſe the Arabicke *Tamar* be a word vſed in compoſition for fruits of many kindes, as the Greeke μῆλον, the Latine *Malum*, and Apple with vs in Engliſh; for we call the Cone of the Pine, and excreſcence of the Oke leafe, by the name of Pine Apple, and Oke Apple. But howſoeuer it be, it is no matter for the name, whether it be proper or no, if ſo be that it ſerue to diſtinguiſh the thing from others, and we know what is denoted by it. In Malauer they call it *Puti*: in Guzarat, *Ambili*, by which name it is knowne in moſt parts of the Eaſt-Indies. This tree is thus deſcribed by *Proſper Alpinus*, *de Plant. Ægypti*, *cap.* 10. The Tamarind (ſaith he) is a tree of the bigneſſe of a Plum tree, with many boughes and leaues like thoſe of the Myrtle, many ſtanding vpon one rib [one againſt another, with a ſingle one at the end:] it carrieth white floures very like thoſe of the Orange tree: out of whoſe middle comes forth foure white and very ſlender threds: after theſe come thicke and large cods, at firſt greene, but when they are ripe of an aſh-colour; and within theſe are contained thicke, hard, browniſh, cornered ſeeds, and a blacke acide pulpe. Theſe trees grow in ſome few gardens of Ægypt, whither they haue been brought out of Arabia and Ethiopia. This plant hath this ſtrange quality that the leaues alwaies follow the Sun,, and when it ſets they all contract themſelues, and open out themſelues againe at the riſing thereof; and there is obſerued to be ſuch force in this motion, that they cloſely ſhut vp and hold their cods (if any be on the tree) and then at the riſing of the Sun they forgoe them againe. But I haue obſerued this folding vp of the leaues to be common to diuers other Ægyptian plants, as *Acatia*, *Abrus*, *Abſus*, and *Sesban*. Thus much out of *Alpinus*.

The

The figure I here giue in the first place, out of *Lobel*, is of a plant some six moneths old, arisen of a seed: and such by sowing of seeds I haue seene growing in the garden of my diseased friend Mr. *Tuggy*, but they still died at the first approach of Winter. The other figure expresseth the cods, and some of the seeds apart, taken forth of the cods: now the cods are neuer brought whole to vs, but the vtter rindes are taken off; and the strings or nerues that run along st the cods, the pulpe and seeds in it are close thrust together, and so are brought to vs in pots and such like vessels.

¶ *The Temperature and Vertues.*

A The fruit or pulpe of Tamarindes is cold and dry in the third degree: it is of good vse in cholericke diseases, and burning Feuers, Tertians, and the like: it is a lenitiue and very gently purging medicine and therefore vsed to be put into medicines seruing to that purpose.

B They vse (saith *Alpinus*) the leaues of Tamarindes to kill wormes in young children; and also their infusion or decoction to loosen the belly; the leaues are acide, and not vnpleasant vnto the taste.

C The Arabians preserue the small and yet greene cods of this tree, as also the ripe ones, either with sugar, or the hony boyled out of the fruit of the Carob tree: they also mix the pulpe with sugar, which trauellers carry with them in their journies through the desart places of Africke, wherewith they being dry or ouerheated, may quench their thirst, coole and refresh themselues, and also euacuate many hot humors by stoole.

D In pestilent and all other burning putrid feuers they drinke the water with sugar, wherein a good quantitie of Tamarinds haue beene infused; for it is a drinke very pleasant to such as are thirsty by reason of too much heate, for it powerfully cooles and quencheth thirst.

E They are also vsed in all putrid feuers, caused by cholericke and adust humors, and also against the hot distempers and inflammations of the liuer and reines, and withall against the Gonorrhœa.

F Some also commend them against obstructions, the dropsie, jaundise, and the hot distempers of the spleene: they conduce also to the cure of the itch, scab, leprosie, tetters, and all such vlcerations of the skin which proceed of adust humors.

G They are not good for such as haue cold stomackes, vnlesse their coldnesse be corrected by putting to them Mace, Anise seeds, Squinanth, or such like.

Chap. 17.

Of the Mamoera, the Male and Female.

¶ *The Description.*

THe historie of these two trees, together with the figures I here giue you, are it the *Curæ Posteriores* of *Clusius*, from whence I will take as much as concernes their history, and briefely here giue it you.

That of the Poët (saith he) is most true, *Non omnis fert omnia tellus*: for I thinke there is no Prouince to be found, which produces not some peculiar plant not growing in other regions, as they can testifie who haue trauelled ouer forreine countries, especially if they haue applied themseles to the obseruations of plants. Amongst such I thinke I may reckon that honest and courteous man *Iohn Van vfele*, who returning out of that part of America called Brasile, shewed mee in the yeare 1607. a booke, wherein he in liuely colours had exprest some plants and liuing creatures: for as he told me, when he purposed to trauell he learned to paint, that so he might expresse in colours, for his memorie and delight after he was returned home, such singularities as he should obserue abroad. Now amongst those which he in that booke had expressed, I obserued two very singular, and of a strange nature, whose figures without any difficulty he bestowed vpon me, as also the following history.

These two trees, whose figures you see here expresst, are of the same kinde, and differ only in sex; for the one of them, to wit, the male, is barren, and only carries floures, without any fruit; but the female onely fruit, and that without floure: yet they say they are so louing, and of such a nature, that if they be set far asunder, and the female haue not a male neere her, shee becomes barren and beares no fruit: of which nature they also say the Palme is.

Now the bole or trunke of that tree which beares the fruit is about two foot thicke, and it groweth some nine foot high before it begin to beare fruit; but when it hath acquired a just magnitude, then shall you see the vpper part of the tree laden with fruit, and that it will bee as it were thicke girt

girt about therewith for ſome nine foot high more: the fruit is round and globe-faſhioned, of the ſhape and magnitude of a ſmall gourd, hauing when it is ripe a yellowiſh pulpe, which the Inhabitants vſe to eat to looſen their bellies. This fruit contains many kernels of the bigneſſe of a ſmall peaſe, blacke and ſhining, of no vſe that he could learne, but which were caſt away as vnneceſſary. The leaues come forth amongſt the fruit, growing vpon long footſtalks, and in ſhape much reſemble the Plane tree or great Maple.

Mamocra mas.
The male Dug tree.

Mamoera fœmina.
The female Dug tree.

What name the Braſilians giue it he could not tell, but of the Portugals that dwelt there it was called *Mamocra*, and the fruit *Mamaon*, of the ſimilitude I thinke they haue with dugs, which by the Spaniards are called *Mamas* and *Tetas*.

There is no difference in the forme of the trunke or leaues of the male and female, but the male only carries floures hanging down, cluſtering together vpon long ſtalkes like the floures of Elder, but of a whitiſh yellow colour, and theſe vnprofitable, as they affirme.

Both theſe trees grow in that part of America wherein is ſcituat the famous Bay called by the Portugals, *Baya de todos los ſanctos*, lying about thirteen degrees diſtant from the Equator towards the Antartick Pole.

Chap. 18. *Of the Clove-berry tree.*

¶ *The Deſcription.*

I Muſt alſo abſtract the hiſtorie of this out of the works of the learned and diligent *Cluſius*, who ſet it forth in his *Exot. lib.* 1. *cap.* 17. in the next chapter after Cloves.

I put (ſaith he) the deſcription of this Fruit next after the hiſtorie of Cloves, both for the affinity

Amomum quorundam, fortè Garyophyllon Plinij.

The Clove-berry tree.

affinitie of ſmell it hath with Cloves, as alſo for another cauſe, which I will ſhew hereafter. *Iames Garret* in the yeare 1601, ſent mee from London this round Fruit, commonly bigger than Pepper cornes, yet ſome leſſe, wrinkled, of a browniſh colour, ſufficiently fragil; which opened, I found contained a ſeed, round, blacke, which might be diuided into two parts, of no leſſe aromatick taſte and ſmell than the fruit it ſelfe, and in ſome ſort reſembling that of Cloves. It grows in bunches or cluſters, as I conjectured by many berries which yet kept their ſtalkes, and two or three which ſtuck to one little ſtalke. To theſe were added leaues of one form, but of much different bignes, for ſome of them were 7 inches long and 3 broad; ſome only 5 inches long, and two and a halfe broad; others did not exceed 3 inches in length, and theſe were not two inches broad; and ſome alſo were much leſſe and narrower than theſe, eſpecially thoſe that were found mixed with the berries, differing according to the place, in the boughs or branches which they poſſeſt I obſerued none amongſt them which had ſnipt leaues, but ſmooth, with many ſmall veins running obliquely from the middle rib to the ſides, with their points now narrower, otherwhiles broader and roundiſh; they were of a browniſh aſh colour, of a ſufficient acride taſte: the branches which were added to the reſt were ſlender, quadrangular, couered with a bark of an aſh colour, and thoſe were they of a yeares growth; for thoſe that were of an after-growth were browniſh, and they had yet remaining the prints where the leaues had growne, which for the moſt part were one againſt another, and theſe alſo were of an acride taſte, as well as the leaues, and of no vngratefull ſmell.

I receiued the ſame fruit ſome yeres before, but without the ſtalks, with this queſtion propounded by him which ſent it, *An Amomum?* And certainly the faculties of this fruit are not very much vnlike thoſe which *Dioſcorides* attributes to his *Amomum*; for it hath an heating aſtrictiue and drying facultie, and I think it may perform thoſe things whereto *Dioſcorides*, *lib.*1.*cap.*14. ſaith his is good: yet this wanteth ſome notes which he giues vnto his, as the leaues of Bryonie, &c.

But I more diligently conſidering this Exotick fruit, finde ſome prime notes which doe much moue me (for I will ingeniouſly profeſſe what I thinke) to judge it the *Garyophyllon* of *Pliny*; for he, *Hiſt.Nat.lib.*12.*cap.*7. after he hath treated of Pepper, addes theſe words; [There is beſides in the Indies a thing like to the Pepper corn, which is called *Garyophyllon*, but more great and fragil; they affirm it growes in an Indian groue, it is brought ouer for the ſmells ſake.] Though this deſcription be briefe and ſuccinct, neither containes any faculties of the fruit it ſelfe, yet it hath manifeſt notes, which, compared with thoſe which the fruit I here giue you poſſeſſe, you ſhal find them very like; as comparing them to Pepper corns, yet bigger and more fragil, as for the moſt part theſe berries are: their ſmell is alſo very pleaſing, and commeth very neere to that of Cloves; and for the ſmels ſake only they were brought ouer in *Plinies* time. I found, this fruit being chewed made the breath to ſmell wel; and it is credible, that it would be good for many other purpoſes, if trial were made.

CHAP.

Chap. 19. *Of Guaiacum or Indian Pock-wood.*

Guaiaci arboris ramuli.
A branch of the Guaiacum tree.

¶ *The Deſcription.*

GVaiacum, which ſome call *Lignum Sanctum:* others, *Lignum vitæ*, is a well known wood, though of a tree vnknown, or at leaſt not certainly knowne; for this figure which I here giue you out of *Cluſius*, was gotten, and the hiſtory framed as you ſhall hear by his own words, taken out of his *Scholia* vpon the 21 Chapter of *Monardus*. About the beginning (ſaith he) of the yeare 1601, I receiued from *Peter Garret* a branch of a foot long, which he writ was giuen him by a certain Surgeon lately returned from America, for a branch of the tree *Guaiacum*: which if it be a branch of the true Guaiacum, then hath *Nicolas Monardus* ſleightly enough ſet downe the hiſtory of this tree. I thus deſcribed the branch that was ſent me.

This branch was a foot long, very writhen and diſtinguiſhed with many knots, ſcarſe at the lower end equalling the thickeneſſe of a writing pen or gooſe quil, hauing an hard and yellowiſh wood, and a wrinkeled barke of an aſh colour: at the vpper end it was diuided into ſlender branches, wherof ſome yet retained their leaues, and other ſome the floures and the rudiment of the fruit: the leaues, or more truly the wings or foot-ſtalkes of the leaues grew on ſlender branches one againſt another, each winged leafe hauing foure or ſix little leaues, alwaies growing by couples one againſt another, as in the Maſticke tree; and theſe are thickiſh, round, and diſtinguiſhed with many veins, which by reaſon of their drineſſe (as I obſerued) would eaſily fall off, leauing the foot-ſtalks naked, and only retaining the markes whereas the leaues had bin. In the knots or vpper branches there grew as it were ſwellings, out of which together grew ſix, eight, ten, or more ſlender foot-ſtalks, ſome inch long, each carrying a floure not great, conſiſting of ſix little leaues (but whether white, yellow, or blew, I could not by reaſon of the drineſſe iudge:) out of the middeſt of the floure grew many little threds, and in ſome the rudiment of the fruit began to appeare, hauing two cells, almoſt ſhaped like the ſeed-veſſell of the common Shepheards purſe.

Thus much *Cluſius*; who afterwards receiued the fruit from two or three, but the moſt perfect from the learned Apothecarie *Iohn Pona* of Verona: they are commonly parted into two parts or cels, yet hee obſerued one with three: he found longiſh ſtones in them almoſt like thoſe of *Euonymus*, and they conſiſted of a very hard and hairy ſubſtance like to that of the Date ſtones, containing a ſmooth kernell of a yellowiſh colour.

Now will I giue you the deſcriptions of *Monardus*: then what I haue obſerued my ſelfe of this wood, which I muſt confeſſe is very little, yet which may giue ſome light to the ignorant. Of this wood (ſaith *Monardus*) many haue written many waies, ſaying that it is either Ebonie, or a kinde of Box, or calling it by ſome other names. But as it is a new kind of tree not found in theſe Regions, or any other of the whole world deſcribed by the Antients, but onely thoſe of late diſcouered; ſo this ſhal be a new tree to vs: howeuer it be, it is a large tree of the bigneſſe of Ilex, ful of branches, hauing a great matrix or blackiſh pith, the ſubſtance of the wood being harder than Ebonie: The bark is thick, gummy or fat, and when the wood is dry falls eaſily off: the leaues are ſmal and hard: the floure yellow; the which is followed by a round ſollid fruit, containing in it ſeeds like thoſe of the Medlar.

It growes plentifully in the Iſles of *Sancto Domingo*.

Another

Another kind of this was afterwards found in the Iſland of S. Iohn de Puerto rico, neere to the former: it is alſo like the laſt deſcribed, but altogether leſſe, and almoſt without matrix or pith, ſmelling ſtronger, and being bitterer than the former: which being left, this is now in vſe, and of the wondrous effects it is called *Lignum ſanctum*; neither without deſert, being (experience giuing teſtimonie) it excels the other; yet both their faculties are admirable in curing the French diſeaſe, and therefore the water or decoction of both of them are drunk, either mixed together, or ſeuerally, both for the cure of the forementioned diſeaſe, as alſo againſt diuers other affects. Thus much for *Monardus* his deſcription.

The wood which is now in vſe with vs is of a large tree, whoſe wood is very heauy, ſollid, and fit to turne into bowles or the like, and all that I haue yet ſeen hath beene wholly without matrix or pith, and commonly it is of a dark browniſh colour ſomwhat inclining to yellow, hauing a ring of white ingirting it next to the barke: I haue obſerued a tree whoſe diametre hath bin two foot and a quarter, to haue had as little or leſſe of this white wood, than one whoſe diametre was 13 inches; and this which had thirteen inches had only a white circle about it of one inch in bredth. I thinke the yonger the tree is, the bigger the white circle is: the beſt wood is denſe, heauy, browniſh, leauing a quick and biting taſt in the decoction, as alſo his ſmell and colour. The bark of this wood is alſo denſe and heauy, of a hard ſubſtance and yellowiſh colour within, but rough and greeniſh, or elſe grayiſh without, and of ſomewhat a bitteriſh taſt. Thus much for the deſcription of the wood and his bark. Now let me ſay ſomewhat briefly of the temperature and qualities.

¶ *The Temperature and Vertues.*

A It is iudged to be hot and dry in the ſecond degree: it hath a drying, attenuating, diſſoluing, and clenſiug facultie, as alſo to moue ſweat, and reſiſt contagion and putrefaction.

B The decoction of the bark or wood of Guaiacum, made either alone or with other ingredients, as ſhall be thought moſt fit for the temper and age of the patient, is of ſingular vſe in the cure of the French Poxes, and it is the moſt antient and powerfull antidote that is yet knowne againſt that diſeaſe. I forbeare to ſpecifie any particular medicine made thereof, becauſe they are well enough knowne to all to whom this knowledge belongs, and they are aboundantly ſet downe by all thoſe that haue treated of that diſeaſe.

C It alſo conduceth to the cure of the Dropſie, Aſthma, Epilepſie, the diſeaſe of the bladder and reines, paines of the joints, flatulencies, crudities, and laſtly all Chronicall diſeaſes proceeding from cold and moiſt cauſes: for it oftentimes works ſingular effects whereas other medicines little preuaile.

D It doth alſo open the obſtructions of the liuer and ſpleen, warms and comforts the ſtomack and all the intrals, and helps to free them from any groſſe viſcous matter that may be apt to breed diſeaſes in them.

Chap. 20.

Of Guayaua or Orange-Bay.

¶ *The Deſcription.*

Simon de Touar ſent *Cluſius* a branch of the tree which the Spaniards cal *Guayauas*, from which he drew this figure, thus deſcribing it. This branch, (ſaith *Cluſius*) whoſe vpper part together with the fruit I cauſed to be drawne, was ſome foot long, foure ſquare, alternately ſet with leaues growing by couples, being foure inches long, and one and a halfe or two broad, of the forme of Bay leaues, very firm, hauing a ſwelling rib running alongſt the lower ſide, with veins running obliquely from thence to the ſides, of an aſh or grayiſh colour beneath, but ſmooth aboue, with the veins leſſe appearing: which broken, though old, yet retained the ſmel of Bay leaues, and alſo after ſome ſort the taſte: the fruit was ſmooth, yet ſhriueled, becauſe peraduenture it was vnripe, of the bigneſſe of a ſmall apple, longiſh, blackiſh on the out-ſide like a ripe plumme, but within full of a reddiſh pulpe, of an acide taſt; and in the middle were many whitiſh ſeeds of the bignes of Millet, or thoſe that are in Figs.

Nicolas Monardus (as hee is turned into Latine by *Cluſius*) thus giues vs the hiſtory of *Guayauas*, in his ſixty fourth Chapter. It is a Tree (ſaith he) of an indifferent bigneſſe, and hath ſpreading branches, the leafe of the Bay, and a white floure like that of the Orange, yet ſomewhat bigger, and

Gnaphalium arboris ramus.
The Orange Bay.

and well ſmelling. It eaſily grows whereſoeuer it be ſowne, and ſo ſpreds and creepes that it is accounted as a weed, for it ſpoiles the ground of many paſtures with the too much ſpreding as brambles do. The fruit is like to our apples, of the bigneſſe of thoſe the Spaniards call *Camueſas*, green at the firſt, and of a golden colour when they be ripe, with their inner pulp white, and ſomtimes red; diuided: it hath foure cels, wherein lie the ſeeds, like thoſe of the Medlars very hard, of a browniſh colour, wholly ſtony, without kernell and taſte.

The fruit is vſually eaten, the rind being firſt taken off; it is pleaſing to the palat, wholſome & eaſie of concoction: being green it is good in fluxes of the belly, for it powerfully bindes; and ouer or throughly ripe it looſeth the belly: but between both, that is, neither too green nor ouer-ripe, if roſted it is good both for ſound and ſick; for ſo handled it is wholeſomer, and of a more pleaſing taſte: that alſo is the better which is gathered from domeſticke and huſbanded trees: the Indians profitably bath their ſwolne legs in the decoction of the leaues, and by the ſame they free the ſpleene from obſtruction. The fruit ſeemes to be cold, wherefore they giue it roſted to ſuch as are in Feuers. It growes commonly in all the Weſt Indies. So much *Monardus*. A

CHAP. 21. *Of the Corall tree.*

¶ *The Deſcription.*

THe ſame laſt mentioned, *Simon de Tovar* a learned and prime phyſition of Seuill ſent *Cluſius* three or foure branches of this tree, from whence he framed this hiſtory and figure. He writ (ſaith *Cluſ.*) that this tree grew in his garden, ſprung vp of ſeeds ſent from America, which had the name of Corall impoſed on them, by reaſon the floures were like Corall, but he did not ſet down their ſhape, writing only this in his letter: That hee had two little ſhrubs which had borne floures, and that the greater of them bore alſo cods full of large beans, but in the extreme Winter, which they had the yeare before, he loſt not only that tree and others ſprung vp of Indian ſeed, but alſo many other plants. Now ſeeing that this tree carries cods, I conjecture the floures were in form not vnlike to thoſe of Peaſe, or of the tree called *Arbor Iudæ*, but of another colour, to wit, red like Corall; eſpecially ſeeing that in the Catalogue of his garden which he ſent me the yeare before, he had writ thus: [*Arbor Indica dicta Coral, ob ejus florem ſimilem Corallo, &c.* That is, An Indian tree called Corall, by reaſon of the floure like to Corall, whoſe leaues are very like thoſe of *Arbor Iudæ*, but this hath thorns, which that wants.] And verily the branches which he ſent (for he writ he ſent the branches with the leaues, but the tree brought out ſome twice or thrice as big) had leaues not much vnlike thoſe of *Arbor Iudæ*, but faſtned to a ſhorter foot-ſtalke, and growing one againſt another, with a ſingle one at the end of the branch, which was here and there ſet with ſharp & crooked prickles; but whether theſe branches are onely the ſtalkes of the leaues, or perfect branches, I doubt, becauſe all that he ſent had three leaues apiece: I could eaſily perſuade my ſelfe they were only leaues, ſeeing the vpper part ended in one leafe, and the lower end of one amongſt the reſt, yet ſhewed the place where it ſeemed it grew to the bough. But I affirme nothing, ſeeing there was none whereof I could enquire, by reaſon of his death who ſent them me, which hapned ſhortly after; yet I haue made the form of the leaues, with the maner as I conjectured they grow, to be delineated

Coral arboris ramus.
A branch of the Coral tree.

neated in the figure which I heere giue you. Whether *Matthiolus* in the last edition of his Commentaries vpon *Dioscorides* would haue expreſt this by the *Icon* of his firſt *Acacia*, which is prickly, and hath leaues reſembling thoſe of *Arbor Iudæ*, I know not: but if hee would haue expreſſed this tree, the painter did not well play his part.

After that *Clusius* had ſet forth thus much of this tree, in his *Hiſt. rarior. plant.* the learned Dr. *Caſtaneda* a Phyſitian alſo of Sevill certified me (ſaith he) that the flours of this tree grow thick together at the tops of the branches, ten, twelue, or more hanging vpon ſhort footſtalks, growing out of the ſame place: whoſe figure he alſo ſent, but ſo rudely drawne, that I could not thereby haue come to any knowledge of the floures, but that he therewith ſent me two dried floures, by which I partly gathered their form. Now theſe floures were very narrow, 2 inches long or more, conſiſting of three leaues, the vppermoſt wherof much exceeded the two narrow ones on the ſides both in length and bredth, and it was doubled; but before the flour was opened it better reſembled a horne or cod, than a floure, and the lower end of it ſtood in a ſhort green cup in the midſt of the floure vnder the vpper leafe that was folded, but open at the top; there came forth a ſmooth pointall, diuided at the top into nine parts or threds, whoſe ends of what colour they were, as alſo the threds, I know not, becauſe I could not gather by the dried flour, whoſe colour was quite decayed, and the picture it ſelfe expreſſed no ſeparation of the leaues in the floure, no forme of threds, but only the floures ſhut, and reſembling rather cods than floures, and thoſe of a deep red colour. But if I could haue ſeen them freſher, I ſhould haue been able to haue giuen a more exact deſcription: wherefore let the Reader take in good part that which I haue here performed. Thus much *Clusius*.

CHAP. 22. *Of the Sea Lentill.*

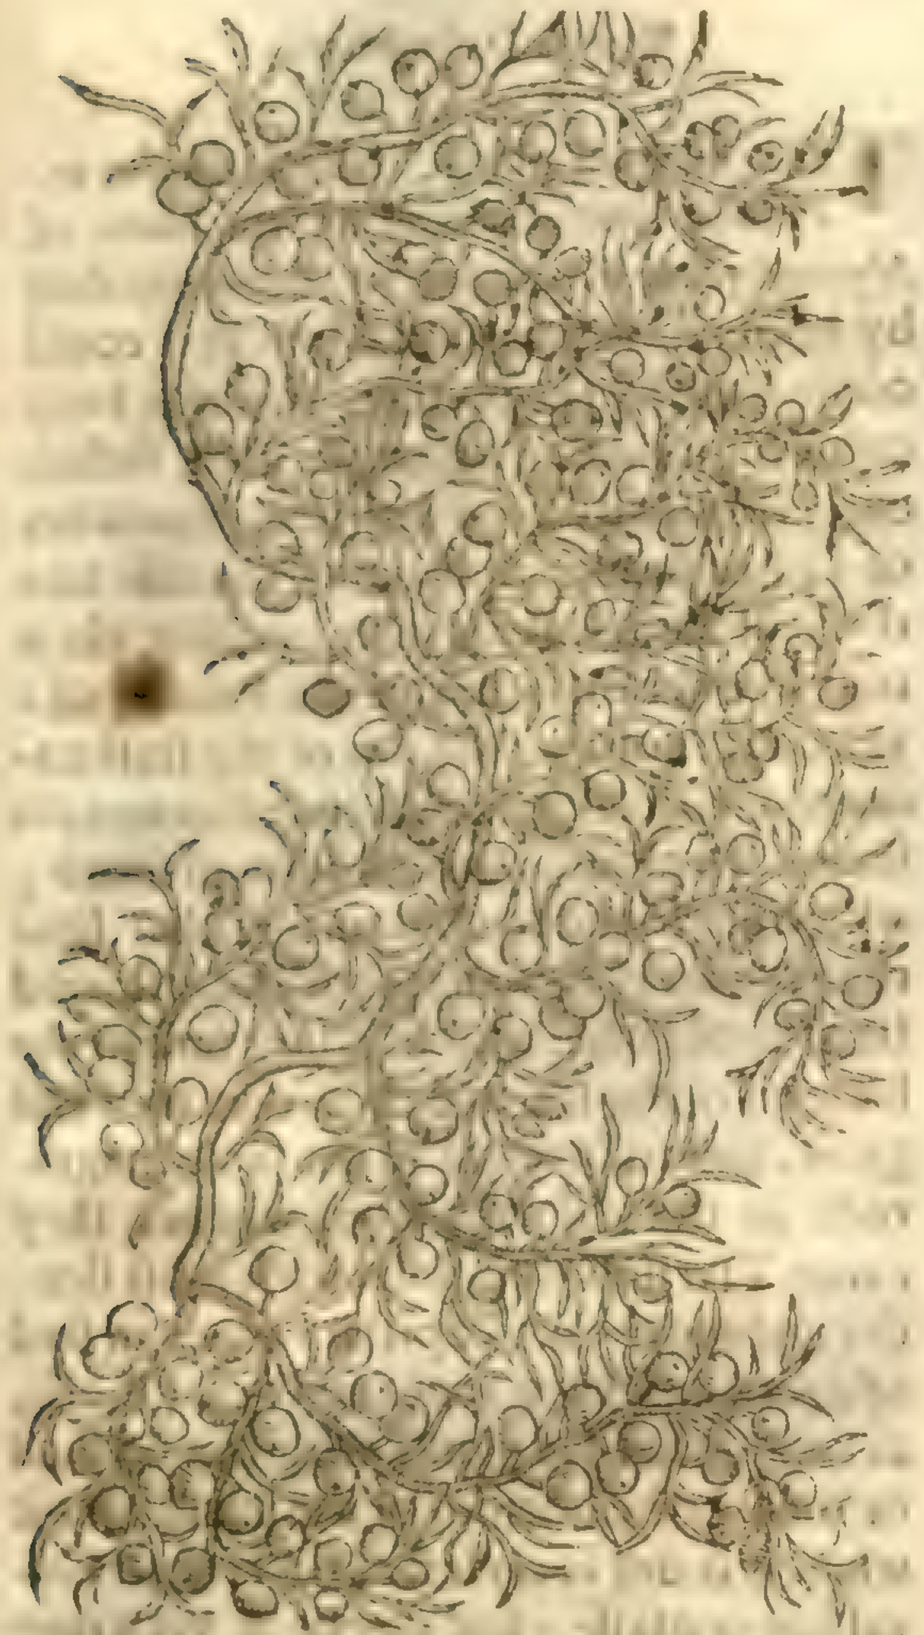
¶ *The Deſcription.*

SOme call this *Vna marina*; and others haue thought it the *Lenticula marina* of *Serapio*, but they are deceiued; for his *Lenticula marina* deſcribed in his 245 chap. is nothing els but the *Muſcus marinus* or *Bryon thalaſſion* deſcribed by *Dioſcorides, lib.* 4. *cap.* 99. as any that compare theſe two places together may plainly ſee.

1 The former of theſe hath many winding ſtalks, whereon grow ſhort branches ſet thick with narrow leaues like thoſe of Beluidere or Beſom flax, and amongſt theſe grow many skinny hollow empty round berries of the bigneſſe and ſhape of Lentils, whence it takes the name. This growes in diuers places of the Mediterranian and Adriatick ſeas.

2 This differs little from the former, but that the leaues are broader, ſhorter, and ſnipt about the edges. But this being in probabilitie the *Sargazo* of *Acoſta*, you ſhall heare what he ſays thereof. In that famous and no leſſe to be feared nauigation del Sergazo (for ſo they which ſaile into the Indies call all that ſpace of the Ocean from the 18 to the 34 degree of Northerly latitude) is ſeen a deepe and ſpatious ſea couered with an herb called Serguazo, being a ſpanne long, wrapped with the tender branches as it were into balls, hauing narrow and tender leaues ſome halfe inch long, much

1 *Lenticula marina angustifolia.*
Narrow leafed sea Lentill.



2 *Lenticula marina serratis foliis.*
Cut leafed sea Lentill.

much snipt about the edges, of colour reddish, of taste insipid, or without any sensible biting, but what is rather drawn from the salt water, than naturally inherent to the plant. At the setting on of each leafe growes a seed round like a pepper corne, of a whitish colour, and somtimes of white and red mixt, very tender when it is first drawn forth of the water, but hard when it is dried, but by reason of the thinnesse very fragil, and full of salt water; there is no root to be obserued in this Plant, but only the marks of the breaking off appears, and it is likely it growes in the deep and sandy bottom of the sea, and hath small roots: yet some are of opinion that this herb is plucked vp and caried away by the rapid course of waters that fall out of many Ilands into the Ocean. Now the Master of the ship wherein I was did stiffely maintain this opinion, and in failing here we were becalmed; but as far as euer we could see we saw the sea wholly couered with this plant; and sending down some yong sailers which should driue the weeds from the ship and clense the water, we plainly saw round heaps thereof rise vp from the bottom of the sea, where by sounding we could find no bottom.

This plant pickled with salt and vineger hath the same tast as Sampier, and may be vsed in stead thereof, and also eaten by such as saile, in stead of Capers. I willed it should be giuen newly taken forth of the sea, to Goats which we caried in the ship, and they fed vpon it greedily. A

I found no faculties thereof; but one of the Sailers troubled with a difficulty of making water, casting out sand & grosse humors, ate thereof by chance both raw and boiled, only for that the tast thereof pleased him; after a few daies he told me that he found great good by the eating thereof, and he tooke some of it with him, that so he might vse it when he came ashore. Hither to *Acosta*. B

Chap. 23. *Of the Sea Feather.*

Myriophyllum marinum.
The Sea Feather.

¶ *The Description.*

THis elegant plant, which *Clusius* receiued from *Cortusus* by the name of *Myriophyllum Pelagicum*, is thus described by him. As much (saith he) as I could conjecture by the picture, this was some cubit high, hauing a straight stalk, sufficiently slender, diuided into many branches or rather branched leaues, almost like those of Fern, but far finer, bending their tops like the branches of the Palme, of a yellowish colour: the top of the stalke adorned with lesser leaues ended in certain scales or cloues framed into an head; which are found to contain no other seed than tender plants already formed, shaped like the old one: which falling sink to the bottom of the sea, and there take root and grow, and so become of the same magnitude as the old one from whence they came. The stalk is fastned with most slender and more than capillary fibres, in sted of a root, not vpon rocks and oister shells, as most other sea plants are, but on sand or mud in the bottom of the sea: this stalk when it is dry is no lesse brittle than Coralline or glasse; but greene & yet growieg it is as tough and flexible as *Spartum*, or Matweed.

¶ *The Place.*

It groweth in the deepest streames of the Illyrian sea, whence the fishermen draw it forth with hooks or other instruments, which they call Spern. The whole plant though dried retains the faculties.

¶ *The Names.*

The Italian fishermen call it *Penachio delle Ninfe*, and *Palma de Nettuno*: some also, *Scettro di Nettuno*.

¶ *The Vertues.*

A They say it is good against the virulent bites of sea Serpents, and the venomous stings or pricks of fishes.

B Applied to small green wounds it cures them in the space of 24 houres.

C *Cortusus* writ, that he had made triall thereof for the killing and voiding of worms, and found it to be of no lesse efficacie than any Coralline, and that giuen in lesse quantitie.

Chap. 24. *Of the Sea Fan.*

¶ *The Description.*

THis elegant shrub groweth vpon the rocks of the sea (where it is sometimes couered with the water) in diuers places; for it hath been brought both from the East and West Indies, and as I haue bin informed it is to be found in great plenty vpon the rocks at the Burmuda Isles. *Clusius* calls

Frutex marinus reticulatus. Sea Fan.

ſuch Curioſities, amongſt which for the rareneſſe of the ſtructure this may hold a prime place.

calls it *Frutex marinus elegantiſſimus*, & thinks it may be referred to the *Palma marina* of *Theophraſtus*. *Bauhine* hath referred it to the *Corallina's*, calling it *Corallina cortice reticulato maculoſo purpuraſcente*. It growes ſometimes to the height of three foot, hauing a ſtalk ſome hand-full or two high before it part into branches; then is it diuided into three, foure, or more branches, which are ſubdiuided into infinite other leſſer ſtrings, which are finely interwouen & ioyned together as if they were netted, yet leauing ſomtimes bigger, otherwhiles leſſer holes; and theſe twiggy branches become ſmaller and ſmaller, the farther they are from the root, and end as it were in ſmall threds. Theſe branches grow not vp on euery ſide, as in other plants, but flat one beſides another, ſo that the whole plant reſembles a fan, or a cabbage leafe eaten full of holes; yet ſometimes vpon the ſides come forth other ſuch fan-like branches, ſome bigger, ſome leſſe, ſometimes one or two, otherwhiles more. The inner ſubſtance of this Sea Fan is a blackiſh tough and hard wood, and it is all couered ouer with a rough Coral-like ſtony matter, of a reddiſh or purpliſh colour, and this you may with your naile or a knife ſcrape off from the ſmooth and black wood.

I know no vſe of this, but it is kept for the beauty and raritie thereof, by many louers of

Chap. 25. *Of China, and baſtard China.*

¶ *The Deſcription.*

THis root which is brought from the remoteſt parts of the world, and is in frequent vſe with vs, hath not bin known in Europe little aboue ninety yeares: for *Garcias ob Orta* the Portugall Phyſitian writes, That he came to the firſt knowledge thereof in the East Indies in the yeare 1535, and that by this means, as he relates it: It hapned (ſaith he) that about this time a merchant in the Iſle Diu told the noble gentleman Sr *Mart. Alfonſo de Souſa* my Patron, by what meanes he was cured of the French Poxes, which was by a certain root brought from China; whoſe faculties he much extolled, becauſe ſuch as vſed it needed not obſerue ſo ſtrict a dyet as was requiſite in the vſe of Guajacum; but ſhould only abſtain from beefe, porke, fiſh, and crude fruits; but in China they do not abſtain from fiſh, for they are there great gluttons. When the report of this root was divulged abroad, euery man wonderfully deſired to ſee and vſe it, becauſe they did not wel like the ſtrict dyet they were forced to obſerue in the vſe of Guajacum. Beſides, the inhabitants of theſe countries by reaſon of their idle life are much giuen to gluttony. About this time the China ſhips arriue at Malaca, bringing a ſmal quantity of this root for their own vſe; but this little was ſought for with ſuch earneſtneſſe that they gaue an exceſſiue rate for it: but afterward the Chinois bringing a greater quantity, the price fell, and it was ſold very cheape. From this time Guajacum began to be out of vſe, and baniſhed the Indies, as a Spaniard that would famiſh the Natiues. Thus much *Garcias*, concerning the firſt vſe thereof in the East Indies.

1 The China now in vſe is a root of the largeneſſe of that of the ordinary Flag, or *Iris paluſtris*, and not much in ſhape vnlike thereto, but that it wants the rings or circles that are imprinted in the other: the outer coat or skinne of this root is thin, ſometimes ſmooth, otherwhile rugged, of a browniſh red colour, and not to be ſeparated from the ſubſtance of the root, which is of an indifferent firmeneſſe, being not ſo hard as wood, but more ſollid than moſt roots which are not of ſhrubs or trees: the colour is ſometimes white, with ſome very ſmall mixture of redneſſe; otherwhiles it hath a greater mixture of red, and ſome are more red than white: it is almoſt without taſte, yet that it hath is dry, without any bitterneſſe or acrimony at all. The beſt is that which is indifferently ponderous, new, firme, not worme-eaten, nor rotten, and which hath a good and freſh colour, and that either white, or much inclining thereto. The plant whoſe root is this (if we may beleeue *Chriſtopher A Coſta*) hath many ſmall prickly and flexible branches, not vnlike the *Smilax aſpera*, or the prickly Binde weed: the biggeſt of theſe exceedeth not the thickeneſſe of ones little finger. The leaues are of the bigneſſe of thoſe of the broad leaued Plantaine: the roots as large as ones hand, ſometimes leſſe, ſollid, heauie, white, and alſo ſometimes redde, and many oft times growing together.

1 *China vulgaris Officinarum.*
True China.

2 *Pſeudo-China.*
Baſtard China.

It groweth abundantly in the territory of China, and is alſo found in Malaber, Cochin, Cranganor, Coulan, Tanor and other places.

The Chinois call it *Lampatan*: in Decan they call it *Lampatos*: in Canarin, *Bouti*: the Arabians, Perſians and Turks terme it *Choph-China*.

2 This other root, whoſe figure you ſee here expreſt, was ſent from London to *Cluſius* in the yeare 1591, by *Iames Garret*, being brought out of Wingandecaow, or Virginia, with this inſcription, *Chinæ ſpecies*, A kind of China. *Cluſius* cauſed this figure thereof to be drawne, and thus deſcribeth it. This root (ſaith he) was very knotty, and formed with out-growings, or bunches ſtanding out, of a reddiſh colour, and it yet retained at the top ſome part of the ſtalke, being ſomewhat like vnto that of *Smilax aſpera*, or common rough Binde-weed, hard, wooddy, and full of veines, as the ſtalkes of *Smilax aſpera*: the ſubſtance of the root was alſo reddiſh, as the root of the common Flag, at the firſt of a ſaltiſh taſte, it being old, (for ſo it was when I receiued it) and then drying. Now I iudge

I iudge this is the ſame that the writer of the Virginian Hiſtory mentions in his chapter of roots, and ſaith, it was brought into England for China, though the Natiues knew no vſe thereof: but they vſe another root very like China, which they call *Tſinaw*, of which being cut, beaten, and preſſed out with water, they draw a juice wherewith they make their bread. Thus much *Cluſius*; to whoſe words I thinke it not amiſſe to adde that which Mr *Thomas Hariot* (who was the Writer of the Virginian hiſtory, here mentioned by *Cluſius*) hath ſet downe concerning this thing.

Tſinaw (ſaith he) is a kinde of root much like vnto that which in England is called the China root, brought from the Eaſt-Indies. And we know not any thing to the contrary but that it may be of the ſame kinde. Theſe roots grow many together in great cluſters, and doe bring forth a Brier ſtalke, but the leafe in ſhape is far vnlike: which being ſupported by the trees it groweth neereſt vnto, will reach or clime to the top of the higheſt. From theſe roots while they be new or freſh, being chopt into ſmall pieces and ſtampt, is ſtrained with water a juyce that maketh bread, and alſo being boiled, a very good ſpoonemeat in manner of a gelly, and is much better in taſte, if it be tempered with oyle. This *Tſinaw* is not of that ſort which by ſome was cauſed to be brought into England for the China root; for it was diſcouered ſince, and is in vſe as is aforeſaid; but that which was brought hither is not yet knowne, neither by vs, nor by the inhabitants, to ſerue for any vſe or purpoſe, although the roots in ſhape are very like. Thus much *Hariot*.

¶ *The Temperature and Vertues.*

China is thought to be moderately hot and dry: the decoction therof made alone or with other things, as the diſeaſe and Symptoms ſhall require, is much commended by *Garcias*, for to cure the French Pox, but chiefely that diſeaſe which is of ſome ſtanding: yet by moſt it is iudged leſſe powerfull than *Guajacum*, or *Sarſaparilla*. A

It attenuates, moues ſweat, and dries, and therefore reſiſts putrifaction: it ſtrengthens the liuer, helpes the dropſie, cures maligne vlceres ſcabbes, and lepry. It is alſo commended in conſumptions. B

The decoction of this root, ſaith *Garcias*, beſides the diſeaſes which haue community with the Pox, conduces to the cure of the Palſie, Gout, Sciatica, ſchirrous and œdematous tumours. It alſo helps the Kings-Euill. It cureth the weakeneſſe of the ſtomacke, the inueterate head-ache, the ſtone and vlceration of the bladder; for many by the vſe of the decoction hereof haue beene cured, which formerly receiued helpe by no medicine. C

Chap. 26. *Of Coſtus.*

¶ *The Deſcription.*

THis ſimple medicine was briefely deſcribed by *Dioſcorides*, who mentions three kindes hereof, but what part of a plant, whether root, wood or fruit, he hath not expreſt: but one may probably conjecture it is a root, for that hee writes toward the end of the Chapter where he treats thereof, *lib.* 1. *cap.* 15. that it is adulterated by mixing therewith the roots of *Helenium commagenum*; now a root cannot well be adulterated but with another. Alſo *Pliny*, *lib.* 12. *cap.* 12. calls it a root; but neither any of the antient or moderne Writers haue delineated the plant, whoſe root ſhould be this *Coſtus*. *Dioſcorides* makes three ſorts, as I haue ſaid: the Arabian being the beſt; which was white, light, ſtrong, and well ſmelling: the Indian, which was large, light, and blacke: the Syrian, which was heauie, of the colour of Box, and ſtrong ſmelling. Now *Pliny* makes two kindes, the blacke, and the white, which he ſaith is the better; ſo I judge his blacke to be the Indian of *Dioſcorides*, and his white, the Arabian. Much agreeable to theſe (but whether the ſame or no, I do not determine) are the two roots whoſe figures I here preſent to your view, and they are called by the names of *Coſtus dulcis* (I thinke they ſhould haue ſaid *odoratus*) and *Coſtus amarus*.

1 The firſt of theſe, which rather from the ſmell than taſte, is called ſweet, is a pretty large root, light, white, and well ſmelling, hauing the ſmell of Orris, or a violet, but ſomewhat more quick and piercing, eſpecially if the root be freſh, and not too old: it is oft times diuided at the top into two, three, or more parts, from whence ſeuerall ſtalkes haue growne, and you ſhall ſomtimes obſerue vpon ſome of them pieces of theſe ſtalkes ſome two or three inches long, of the thickeneſſe of ones little

little finger,creſted and filled with a ſoft pith like the ſtalks of Elder, or more like thoſe of the bur Docke : the taſt of the root is bitter,with ſome acrimony,which alſo *Dioſcorides* requires in his, for he ſaith the taſt ſhould be biting and hot. Thus much for the firſt,being *Coſtus dulcis* of the ſhops.

1 *Coſtus Indicus ſive odoratus.*
Indian or ſweet ſmelling Coſtus.

2 *Coſtus officinarum Lobelij.*
Bitter Coſtus.

2 The ſecond,which is the *Coſtus amarus*, and it may be the Indian of *Dioſcorides*,and *Niger* of *Pliny*,is a root black both within and without,light,yet very denſe. It ſeemeth to be of ſome large root,for that it is brought ouer cut into large pieces,of the bigneſſe of ones finger,ſometimes bigger,ſomtimes leſſer,which it ſeems is for the more conuenient drying thereof,for a large root,vnles it be cut into pieces can ſcarſe be well dried:the taſte of this is bitter,ſomwhat clammy & ingrate: the ſmell is little or none.

There are ſome other roots which haue bin ſet forth by late writers for *Coſtus*, but becauſe they are neither in vſe,known here with vs,nor more agreeable to the deſcription of the antients,I haſtning to an end,am willing to paſſe them ouer in ſilence.

¶ *The Temperature and Vertues.*

A It hath a heating and attenuating faculty, and therefore was vſed in oile to annoint the bodie againſt the cold fits of Agues,the Sciatica,and when it was needful to draw any thing to the ſuperficies of the body

B It is alſo conuenient to moue vrine,to procure the termes,to help ſtrains,convulſions,or cramps and pains in the ſides,and by reaſon of the bitterneſſe it kils wormes.

C It is good to be drunk againſt the bite of the viper,againſt pains of the cheſt, and windineſſe of the ſtomack,taken in wine and wormwood;and it is vſed to be put into ſundry Antidotes.

CHAP. 27. *Of Drakes Root or Contra-yerva.*

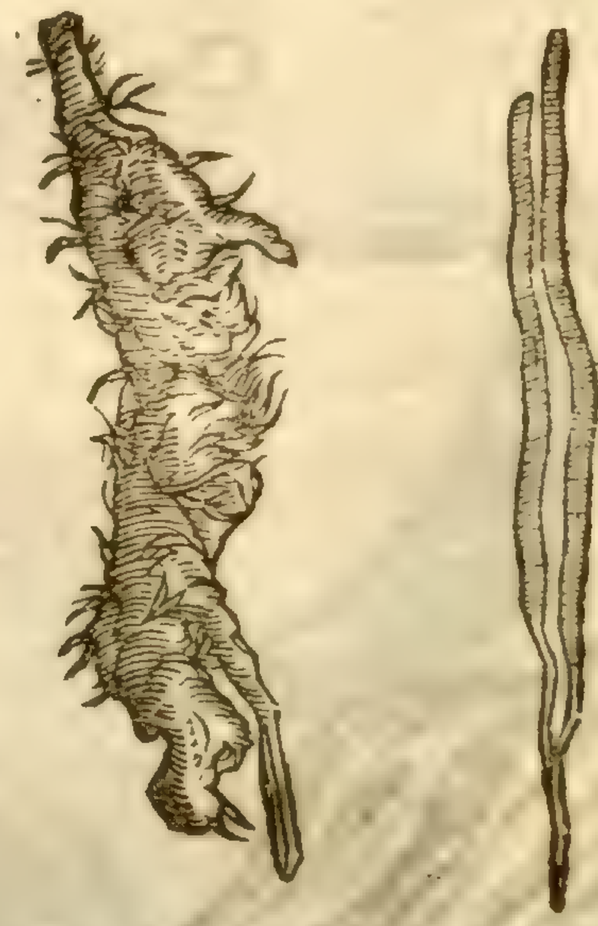
¶ *The Deſcription.*

THat root which of late is known in ſome ſhops by the Spaniſh name *Contra-yerva*, is the ſame which *Cluſius* hath ſet forth by the title of *Drakena radix*: wherfore I will giue you the hiſtorie of *Cluſius*, and thereto adde that which *Monardus* writes of the *Contra-yerva*. For although *Bauhine* and the Author of the *Hiſtoria Lugdunenſis* ſeeme to make theſe different; yet I finde that both *Cluſius* his figure and hiſtorie exactly agree with the roots ſent vs from Spaine by that title. Wherefore I ſhall make them one, till ſome ſhal ſhew me how they differ: and *Cluſius* ſeems to be of this minde alſo, who deſired but the degree of heate which *Monardus* giues theſe, and that is but the ſecond degree: now theſe haue no taſte at the firſt, vntill you haue chewed them a prety while, and then you ſhall finde a manifeſt heate and acrimonie in them, which *Cluſius* did alſo obſerue in his.

In the yeare (ſaith *Cluſius*) 1581, the generous Knight Sr *Francis Drake* gaue me at London certain roots, with three or foure Peruvian Beazor ſtones, which in the Autumne before (hauing finiſhed his voiage, wherein paſſing the ſtraights of Magellan he had incompaſſed the world) hee had brought with him, affirming them to be of high eſteem amongſt the Peruvians. Now for his ſake that beſtowed theſe roots vpon me, I haue giuen them the title of *Drakena radix*, or *Drakes* root, and haue made them to be expreſſed in a table, as you may here ſee them.

1 *Drakena radix.*
Contra-yerva.

2 *Radix Drakena affinis.*
Another ſort of Contra-yerva.



Theſe roots were for the moſt part ſome halfe inch thicke, longiſh, now and then bunching out into knots and vnequall heads, and their tops looked as if they were compoſed of thicke ſcales, almoſt like thoſe of the *Dentaria enneaphyllos*; blackiſh without, wrinckled and hard, becauſe dried: their inner part was white, they had ſlender fibres here and there growing out of them, and ſome more thick and large, hard alſo and tough, at which hung other knots. I obſerued no manifeſt ſmel they had, but found them to haue a taſte ſomwhat aſtringent, and drying the tongue at the firſt; but being long chewed they left a quick and pleaſing acrimony in the mouth.

It ſeemed to haue great affinitie with the *Radix S. Helenæ*, whereof *Nic. Monardus* ſpeakes in his booke of the Simple Medicines brought from the Weſt Indies: but ſeeing *N. Eliot* (who accompa-

nied

nied Sr *Francis Drake* in that voyage, said that the Spaniards in Peru had them in great request, and they could not easily be got of them, and that he had learned by them, that the leaues were present poison, but the root an antidote, and that not only against the same poison, but also against other; and that it strengthned the heart and vitall faculties, if it were beaten to pouder, and taken in the morning in a little wine; and giuen in water it mitigated the heate of Feuers. By reason of these faculties it should much agree with the *Radix Contra-yerva*, whereof *Monardus* writes in the same booke: yet in these I required the aromatick tast and degree of heate which he attributes to these roots. Thus much *Clus.*

A From Charchis a prouince of Peru (saith *Monard.*) are brought certain roots very like the roots of *Iris*, but lesse, and hauing the smell of Fig leaues. The Spaniards that liue in the Indies cal them *Contra-yerva*, as if you should say an antidote against poison; because the pouder of them taken in white wine is a most present remedie against all poison of what kinde soeuer it be (only sublimate excepted, whose malignity is only extinguished by the drinking of milk) it causes them to be cast vp by vomit, or evacuated by sweat. They also say that Philtres or amorous potions are cast forth by drinking this pouder. It also killeth wormes in the belly. The root chewed hath a certain aromatick taste ioyned with acrimony; wherfore it seems hot in the second degree: Thus far *Monardus.*

2 *Clusius, Exot. l.* 4. *c.* 11. being the next after *Drakena radix*, describes this root, whose figure, I giue you in the second place, and that by the same title as it is here set forth. These roots, saith hee, seemed somewhat like the *Drakena radix* which were found in the great ship which brought backe the Viceroy from the East Indies, & was taken by the English: for they were tuberous, & as much as one may gather by their form, crept vpon the surface of the earth, hauing vpon them many hairs and fibres, and being of a sooty colour, yet somwhat inclining to yellow, dying the spittle in chewing them, and being bitter. They as yet retained foot-stalks of the leaues, but of what fashion they were no man can easily guesse. But it is very likely they were of great vse among the Indians, seeing the Viceroy brought them together with other pretious medicines growing in the East Indies. *Iames Garret* sent this to *Clusius*, with the little plant dried, whose figure you see expresst by it.

Chap. 28. *Of* Lignum Aloes.

Lignum Aloes vulgare.

¶ *The Description.*

IT is a Question, whether the *Agallochum* described *ca.* 21. *li.* 1. of *Dioscorides*, be the same which the later Greekes and shops at this time call *Xyloaloe* or *Lignum aloes*. Many make them the same; others, to whose opinion I adhere, make them different: yet haue not the later shewed vs what *Agallochum* should be; which I notwithstanding wil do. And though I do not now giue you my arguments, yet I will point at the things, and shew positiuely my opinions of them.

The first & best of these is that which some cal *Calumbart*: others, *Calumba*, or *Calambec*: This is of high esteem in the Indies, and seldome found but among the Princes and persons of great qualitie; for it is sould oft times for the weight in gold. I haue not seen any thereof but in beads. It seemeth to be a whiter wood than the ordinary, of a finer grain, not so subiect to rot, of a more fragrant smel and but light.

The second sort, which is vsually brought ouer, and called in Shops by the name of *Lignum Aloes*, is also a precious and odoriferous wood, especially burnt: the sticks of this are commonly knotty and vnsightly, some parts of them being white, soft, and doted; other-some dense, blackish,

blackiſh,or rather intermixt with black and white veins,but far more black than white ; which put to the fire will ſweat out an oily moiſture,and burnt yeeld a moſt fragrant odor. This I take for the true *Xyloaloe* of the late Greeks;and the *Agalugen* of *Auicen* ; and that they in the Indies call *Agula*.

The third is a wood of much leſſe price than the former,and I conjecture it may well be ſubſtituted for *Thus* ; which I take to be the *Agallochum* of *Dioſcorides* ; the *Lignum Aloes ſylveſtre* of *Garcias*,and the *Agula brava* of *Linſcoten*. It is a firm ſollid wood ſomwhat like that of Cedar,not ſubject to rot or decay : the colour thereof is blackiſh, eſpecially on the out ſide, but on the inſide it is oft times browniſh and ſpeckled,containing alſo in it an oily ſubſtance,and yeelding a ſweet pleaſing ſmel when it is burnt,but not like that of the two former : the taſte alſo of this is bitterer than that of the former;and the wood (though denſe and ſollid) may be eaſily cleft longways. It is alſo a far handſomer and more ſightly wood than the former,hauing not many knots in it.

Garcias ab Orta thus deſcribes the tree that is the *Lignum Aloes* (I judge it is that I haue ſet forth in the ſecond place) It is, ſaith he, like an olive tree, ſomtimes larger: the fruit or floure I could not yet ſee, by reaſon of the difficulties and dangers which are to be vndergone in the accurat obſeruation of this tree (Tigers frequently there ſeeking their prey.) I had the branches with the leaues brought me from Malaca. They ſay the wood new cut down hath no fragrant odor,nor til it be dried;neither the ſmell to be diffuſed ouer the whole matter of the wood, but in the heart of the tree; for the bark is thick,and the matter of the wood without ſmell. Yet may I not deny,but the barke and wood putrifying that oily fat moiſture,may betake it ſelfe to the heart of the tree and make it the more odoriferous. But there is no need of putrifaction to get a ſmell to the *Lignum Aloes* ; for there are ſundry ſo expert and skilfull in the knowledge thereof,that they will iudge whether that new cut down will be odoriferous or no. For in all ſorts of wood ſome are better than other ſome. Thus far *Garcias* ; where ſuch as are deſirous may ſee more vpon this ſubiect.

¶ *The Nature and Vertues.*

It is moderatly hot and dry,and alſo of ſomwhat ſubtil parts. Chewed it makes the breath ſmel ſweet,and burnt it is a rich perfume. A

Taken inwardly it is good to help the too cold and moiſt ſtomack,as alſo the weak liuer. B

It is commended likewiſe in dyſenteries and pleuriſies ; and put alſo into diuers cordiall medicines and antidotes as a prime ingredient. C

Chap. 29. *Of Gedwar.*

1 *Gedwar, aut Geiduar.*

2 *Zedoaria exactior icon.* A better figure of Zedoary.

¶ *The Deſcription.*

IN the chapter of Zedoary (which I made the 28 of the firſt booke) I might fitly haue giuen you this hiſtory of Gedwar, which is thought to be that deſcribed by *Auicen, li.* 2. *c.* 734. and a kind of Zedoary. *Garcias* ſaith, Gedwar is at a high rate, and not eaſie to be found, vnleſſe with the Indian Mountibanks and juglers, called *Iogues*, which go vp and down the country like rogues, and of theſe the Kings and noblemen buy *Geiduar*. It is good for many things, but chiefly againſt poiſons and the bites and ſtings of venomous creatures. Now *Cluſius* in his *Auctarium*, at the end thereof giues this figure, with the following hiſtory.

1 Becauſe *Garcias* (ſaith he, *cap.* 42. *lib.* 1. *Aromat. hiſt.*) treating of Zedoary, writes that *Auicen* called it Gedwar; and ſaith that it is of the magnitude of an acorn, and almoſt of the ſame ſhape; I in my notes at the end of that Chapter affirmed that it was not knowne in Europe, and hard to be known. But in the yere 1605, *Iohn Pona* ſent me from Verona together with other things, two roots written on by the name of *Gedwar verum*: they were not much vnlike a longiſh acorn, or (that I may more truly compare them) the ſmaller bulbs of an Aſphodil or *Anthora*: the one of them was whole and not periſhed, the other rotten and broken, yet both of them very hard and ſollid, of an Aſh colour without, but yellowiſh within; which taſted, ſeemed to poſſeſſe a heating faculty & acrimony.

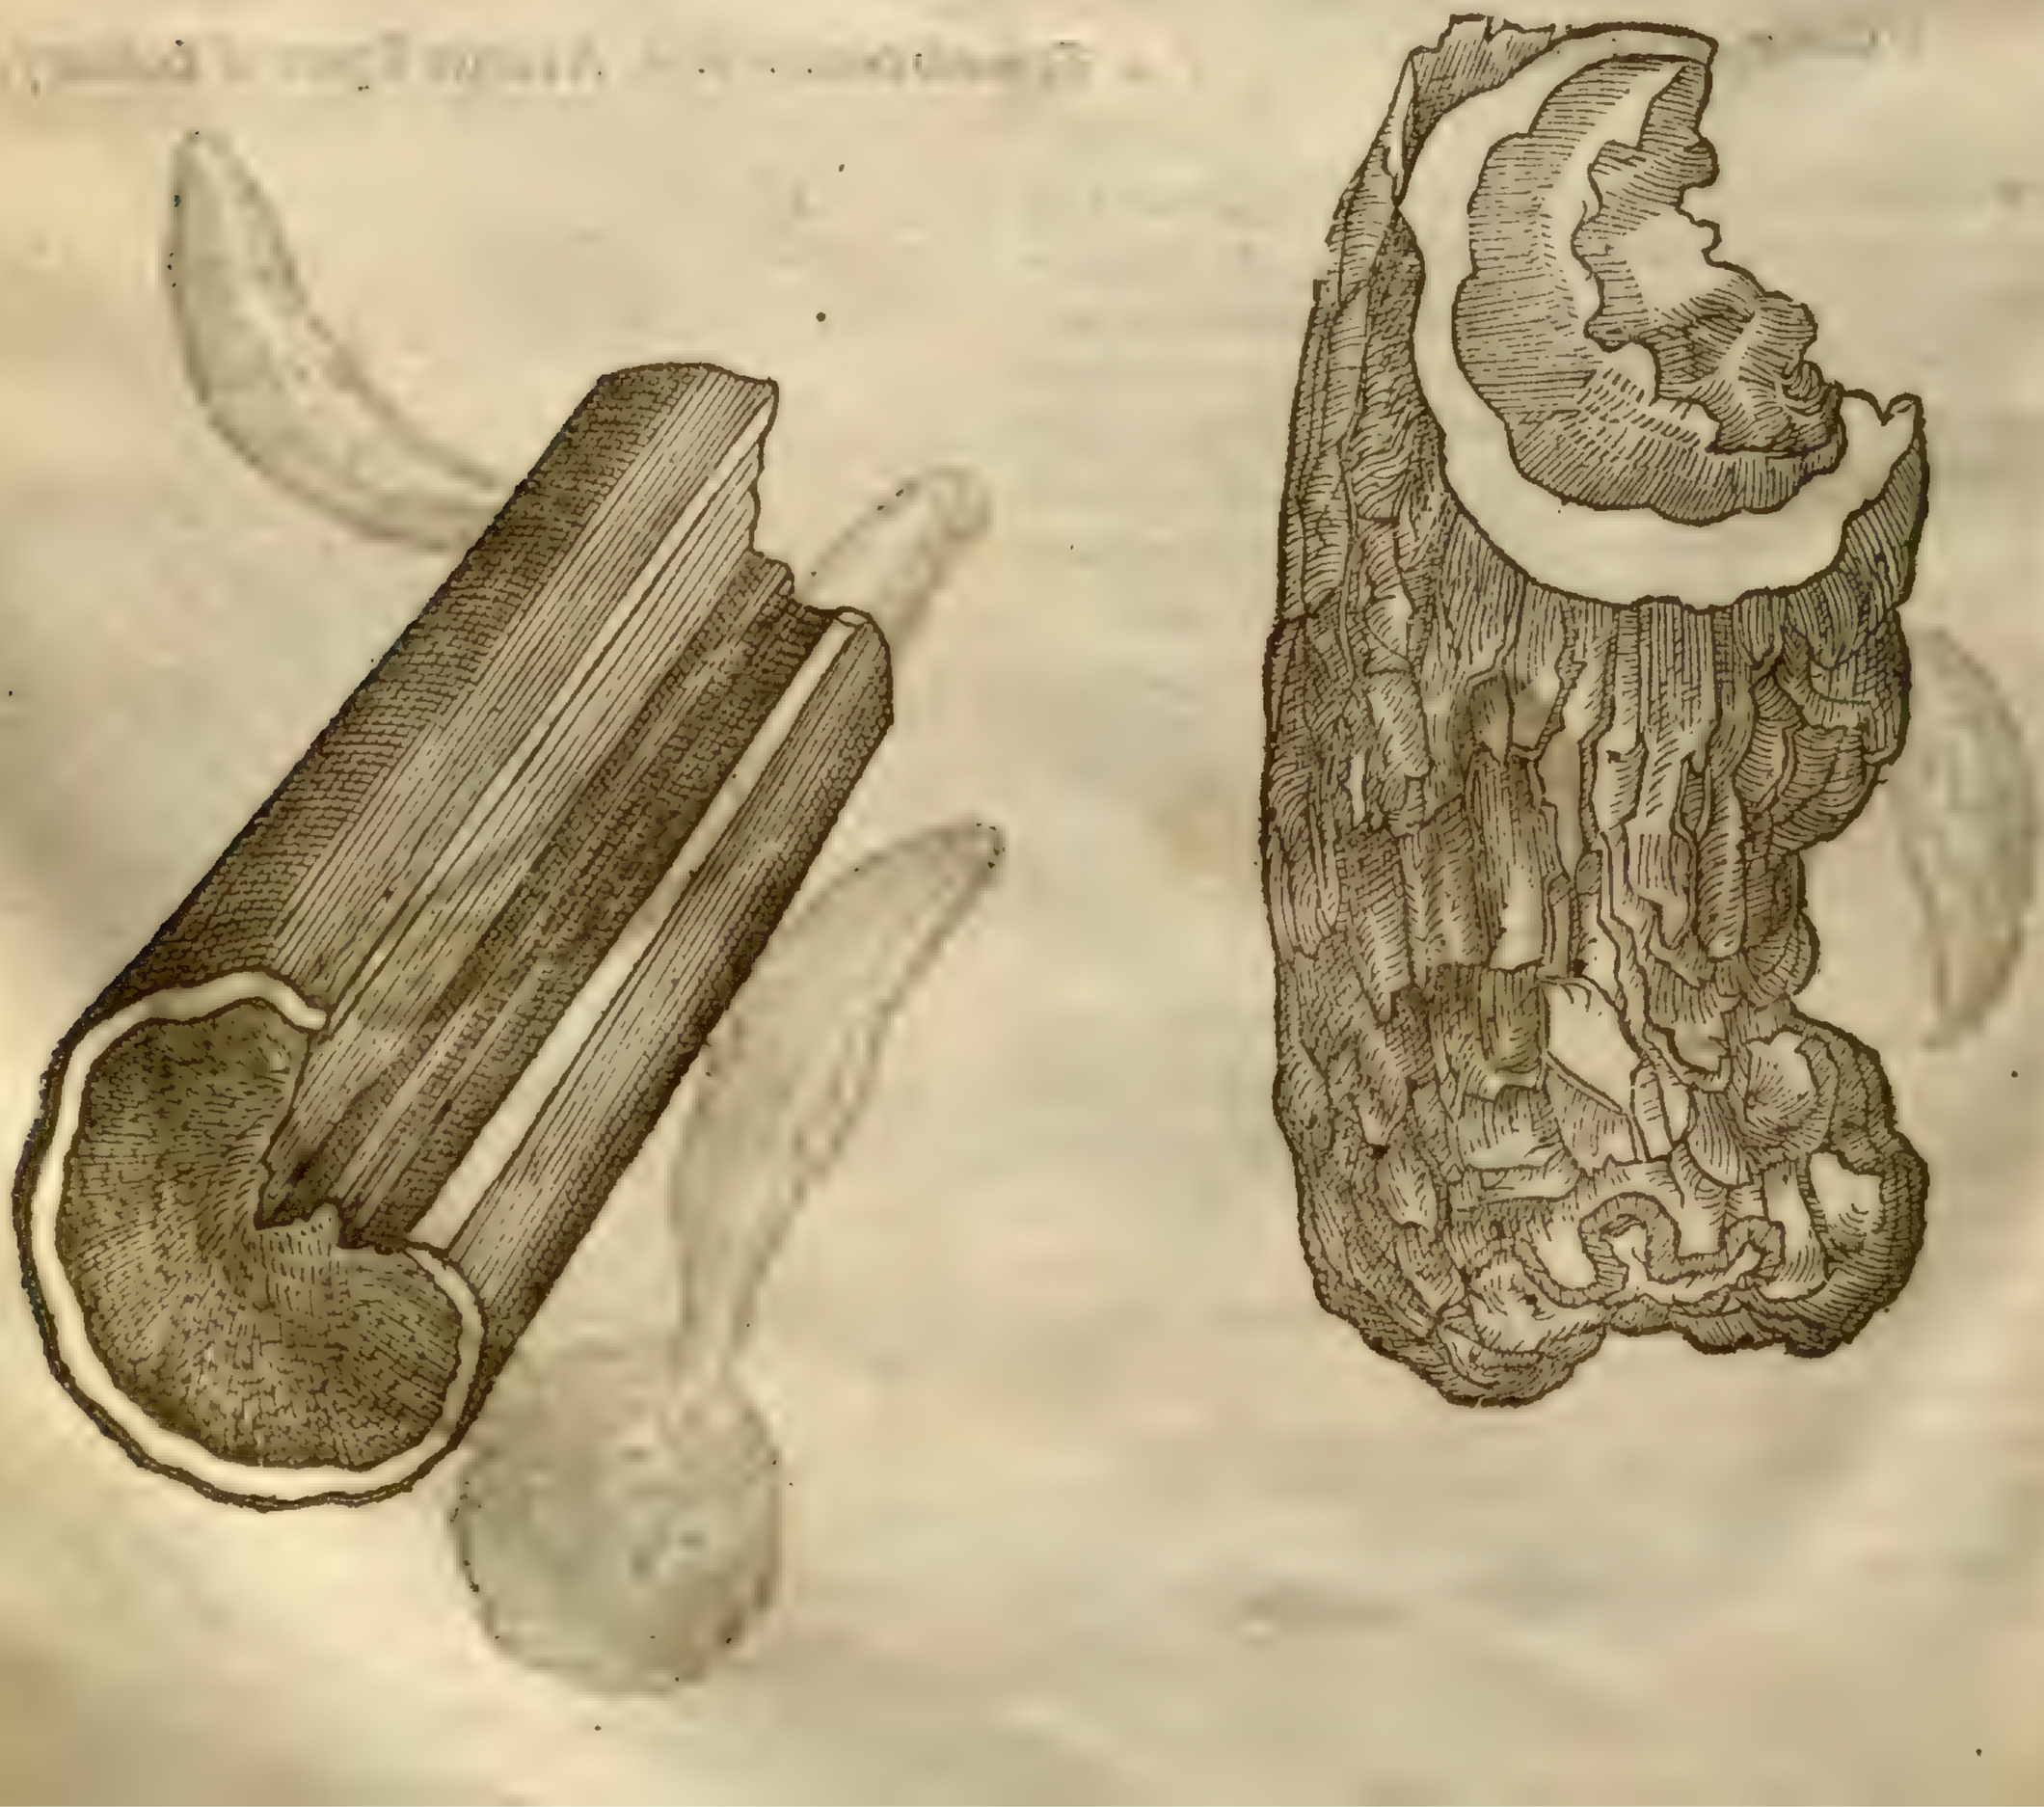
But although I can affirm nothing of certaintie of this root, yet I made the figure of the wholler of them to be expreſt in a table, that ſo the form might be conceiued in ones mind more eaſily, than by a naked deſcription. Let the Studious thank *Pona* for the knowledge hereof. Thus far *Cluſ.*

2 In the 28 chapter of the firſt book I gaue the figure of Zedoary out of *Cluſius*, hauing not at that time this figure of *Lobel*, which preſents to your view both the long and the round, with the manner how they grow together, being not ſeuerall roots, but parts of one and the ſame.

CHAP. 30. *Of Roſe-wood.*

Aſpalathus albicans torulo citreo.
White Roſe-wood.

Aſpalathus rubens.
Reddiſh Roſe wood.



¶ *The Deſcription.*

BOth theſe as alſo ſome other woods are referred to the *Aſpalathus* deſcribed by *Dioſcorides, lib.* 1. *c.* 19. But the later of theſe I take to be the better of the two ſorts there mentioned. The firſt of them is whitiſh without, hauing a yellowiſh or citrine coloured round in the middle: the taſte is hottiſh, and ſmell ſomewhat like that of a white-Roſe.

The other hath alſo a ſmall ring of white, next the thicke and rugged barke, and the inner wood is of a reddiſh colour, very denſe, ſollid and firme, as alſo indifferent heauie: the ſmell of this is alſo like that of a Roſe, whence they vulgarly call it *Lignum Rhodium*, Roſe-wood, rather than from Rhodes the place where the later of them is ſaid to grow.

¶ *The Faculties out of* Dioſcorides.

It hath a heating faculty with aſtriction, whence the decoction thereof made in wine is conue- A
nient to waſh the vlcers of the mouth, and the eating vlcers of the priuities and ſuch vncleane ſores as the *Oζæna* (a ſtinking vlcer in the noſe ſo called.)

Put vp in a peſſary it drawes forth the childe, the decoction thereof ſtaies the looſeneſſe of the B
belly, and drunke it helpes the caſting vp of bloud, the difficulty of making water, and windineſſe.

AT the end of this Appendix I haue thought good to giue you diuers deſcriptions of Plants, which I receiued from my often mentioned friend Mr *Goodyer*, which alſo were omitted in their fitting places, partly through haſte, and partly for that I receiued ſome of them after the printing of thoſe chapters wherein of right they ſhould haue beene inſerted. They are moſt of them of rare and not written of Plants, wherefore more gratefull to the curious.

Hieracium ſtellatum Boelij.

THis plant is in round, hairy, ſtraked, branched ſtalks, and long, rough, blunt indented leaues, like to *Hieracium falcatum*, but ſcarce a foot high: the floures are alſo yellow, three times ſmaller: which paſt, there ſucceed long crooked ſlender ſharpe pointed cods or huskes, neere an inch long, ſpreading abroad, ſtar-faſhion, wherein a long ſeed is contained: this hath no heads or woolly down like any of the reſt, but onely the ſaid crooked coddes which doe at the firſt ſpread abroad. The root is ſmall, threddy, full of milkie juyce, as is alſo the whole plant, and it periſheth when the ſeed is ripe.

Hieracium medio nigrum flore majore Boelij.

This hath at the firſt ſpreading vpon the ground many long, narrow, green, ſmooth leaues, bluntly indented about the edges, like thoſe of *Hieracium falcatum*, but ſmaller: amongſt which riſe vp three, foure, or more, ſmall, ſmooth, ſtraked round ſtalkes, diuided into other branches, which grow longer than the ſtalkes themſelues, leaning or trailing neere the ground: the flours grow on the tops of the ſtalkes, but one together, compoſed of many pale yellow leaues, the middle of each floure being of a blackiſh purple colour.

Hieracium medio nigrum flore minore Boelij.

This is altogether like the laſt before deſcribed in ſtalkes and leaues: the floures are alſo of a blackiſh purple in the middle, but they are three times ſmaller.

Hieracium lanoſum.

There groweth from one root three, foure or more round vpright ſoft cottony ſtalkes, of a reaſonable bigneſſe, two foot high, diuided into many branches, eſpecially neere the top, whereon groweth at each diuiſion one broad ſharpe pointed leafe, diuided into corners, and very much crumpled, and alſo very ſoft cottony and woolly, as is the whole plant: the floures are ſmall, double, of a pale yellow colour, very like thoſe of *Piloſella repens*, growing cluſtering very many together at the tops of the ſtalkes and branches, forth of ſmall round ſoft cottony heads: theſe foure plants grew from

ſeed which I receiued from Mr *Coys*, 1620. and I made theſe deſcriptions by the Plants the 22. of Auguſt, 1621.

Blitum ſpinoſum: eſt Beta Cretica ſemine Bauhini, Matth. pag. 371.

This ſendeth forth from one root many round greene ſtrailing, joynted, ſmall branches, about a foot long: the leaues are of a light greene colour, and grow at euery joynt one, ſomewhat like the leaues of great Sorrell, but they are round topped without barbes or eares below, or any manifeſt taſte or ſmell, very like the leaues of Beets, but much ſmaller: the floures grow cluſtering together about the joynts, and at the tops of the branches ſmall and greeniſh, each floure conteining fiue or ſix very ſmall blunt topped leaues, and a few duſty chiues in the middle: which paſt, there commeth great prickly ſhriuelled ſeed, growing euen cloſe to the root, and vpwards on the joynts, each ſeed hauing three ſharpe prickes at the top growing ſide-waies, which indeed may be more properly called the huske; which huske in the in-ſide is of a darke reddiſh colour, and containeth one ſeed in forme like the ſeed of *Flos Adonis*, round at the lower end, and cornered towards the top, and ſharp pointed, couered ouer with a darke yellowiſh skin; which skin pulled away, the kernell appeareth yellow on the outſide, and exceeding white within, and will with a light touch fall into very ſmall pouder like meale.

Geranij Bætici ſpecies, Boelij.

This hath at the beginning many broad leaues, indented about the edges, ſomwhat diuided, like thoſe of *Geranium Creticum*, but of a lighter greene colour, and ſmaller: amongſt which grow vp many round hairy kneed trailing branches, diuided into many other branches, bearing leaues like the former but ſmaller, and no more diuided. The flours are ſmall like thoſe of *Geranium Moſchatum*, but of a deeper reddiſh colour, each floure hauing fiue ſmall round topped leaues: after followeth ſmall long hairy ſeed, growing at the lower end of a ſharpe pointed beake like that of *Geranium Moſchatum*: the whole plant periſheth when the ſeed is ripe.

Boelius a Low-countrey man gathered the ſeeds hereof in Bætica a part of Spaine, and imparted them to Mr *William Coys*, a man very skilfull in the knowledge of Simples, who hath gotten plants thereof, and of infinite other ſtrange herbes, and friendly gaue me ſeeds thereof, and of many other, *Anno*, 1920.

Antirrhinum minus flore Linariæ, luteum inſcriptum.

This hath at the firſt many very ſmall, round, ſmooth branches from one root, trayling on the ground, about foure or fiue inches long, ſet with many ſmall greene ſhort ſharp pointed leaues, like thoſe of *Serpillum*, but that theſe are longer, ſmooth, and three or foure growing oppoſite one againſt another: amongſt which riſe vp fiue or ſix, ſometimes ten or twelue vpright round ſmooth little ſtalkes a cubit high, diuided into branches bearing ſmall long ſmooth greene leaues, growing without order, as narrow as the vpper leaues of *Oenanthe Anguſtifolia*: at the toppes of the ſtalkes and branches grow cluſtering together fiue ſix or more ſmall yellow floures, flouring vpwards, leauing a long ſpike of very ſmall huskes, each huske hauing a ſmall line or chinke as though two huskes were joyned together, the one ſide of the huske being a little longer than the other, wherein is contained exceeding ſmall blackiſh ſeed. The root is very ſhort, ſmall, and white, with a few threds, and periſheth at Winter.

This plant is not written of that I can finde. I receiued ſeed thereof from Mr *William Coys* often remembred.

Linaria minor æſtiua.

The ſtalkes are round, ſmooth, of a whitiſh greene colour, a foot high, weake, not able to ſtand vpright: whereon grow long narrow ſharpe pointed leaues, moſt commonly bending or turning downewards. The floures grow in ſpikes at the tops of the branches, yet not very neere together, and are very ſmall and yellow, with a ſmall taile: the ſeed of this plant is ſmall, flat, and of a blackiſh gray colour, incloſed in ſmall round huskes, and you ſhall commonly haue at one time floures and ripe ſeed all on a ſtalke. The whole plant is like to the common *Linaria*, but that it is a great deale leſſer, and the floures are ſix times as ſmall, and periſh at Winter. I alſo receiued ſeeds thereof from Mr *William Coys*.

Scor-

Scorpioides multiflorus Boëlij.

This Plant is in creeping branches and leaues like the common *Scorpioides Bupleuri folio*: the floures are alſo alike, but a little bigger, and grow foure or fiue together on one foot-ſtalke: the cods are rougher, and very much turned round, or folded one within another: in all things elſe alike.

Scorpioides ſiliqua craſſa Boëlij.

This is alſo like the other in creeping branches and leaues: the flouree are ſomething bigger than any of the reſt, and grow not aboue one or two together on a foot-ſtalke: the cods are crooked, without any rough haire, yet finely checkquered, and ſeuen times bigger than any of the reſt, fully as big as a great Palmer-worme, wherein is the difference: the ſeed is almoſt round, yet extending ſomewhat in length, almoſt as big as ſmall field Peaſon, of a browne or yellowiſh colour. This alſo periſheth when the ſeed is ripe. *Sept.* 1. 1621.

Silibum minus flore nutante Boëlij.

This Thiſtle is in ſtalkes and leaues much ſmaller than our Ladies Thiſtle, that is to ſay, The ſtalkes are round, ſtraked, ſomewhat woolly, with narrow skinny prickly edges three or foure foot high, diuided into many branches, whereon grow long leaues, deeply diuided, full of white milke-like ſtreakes and ſharpe prickles by the edges: the floures grow on the top of the ſtalkes and branches full of ſmall heads, commonly turning downewards, of the bigneſſe of an Oliue, ſet with very ſmall ſlender ſharpe prickes, containing nothing but ſmall purple chiues, ſpreading abroad like thoſe of *Iacea*, with ſome blewiſh chiues in the middle: the ſeed followeth, incloſed in downe, and is ſmall and grayiſh like the ſeed of other Thiſtles, but it is as clammy as Bird-lime. The whole plant periſheth at Winter, and reneweth it ſelfe by the falling of the ſeed. I finde not this written of. It was firſt gathered by *Boelius* in Spaine, and imparted vnto Mr *William Coys*, who friendly gaue me ſeeds thereof.

Aracus major Bæticus Boelij.

It hath ſmall weake foure ſquare ſtreaked trailing branches, two foot high, leſſer, but like thoſe of Fetches; whereon grow many leaues without order, and euery ſeuerall leafe is compoſed of ſix ſeuen, or more ſmall ſharp pointed leaues, like thoſe of Lentils, ſet on each ſide of a middle rib, which middle rib endeth with claſping tendrels: the floures grow forth of the boſomes of the leaues, but one in a place, almoſt without any foot-ſtalkes at all, like thoſe of Vetches, but of a whitiſh colour, with purple ſtreakes, and of a deeper colour tending to purple towards the nailes of the vpper couering leaues: after which follow the cods, which are little aboue an inch long, not fully ſo big as thoſe of the wilde beane, almoſt round, and very hairy: wherein is contained about foure peaſon, ſeldome round, moſt commonly ſomewhat flat, and ſometimes cornered, of a blackiſh colour, neere as big as field peaſon, and of the taſte of Fetches: the whole herbe periſheth when the ſeed is ripe. This plant *Boelius* ſent to Mr *William Coys*, who hath carefully preſerued the ſame kind euer ſince, and friendly imparted ſeeds to me in *Anno* 1620.

Legumen pallidum Vliſſiponenſe, Nonij Brandonij.

This plant is very like, both in ſtalkes, leaues, and cods, to *Aracus major Bæticus*, but the floures of this are of a pale yellow or Primroſe colour, and the whole herbe ſmaller, and nothing ſo hairy. It periſheth alſo when the ſeed is ripe. I receiued the ſeeds likewiſe from Mr *Coys*.

Vicia Indica fructu albo. Piſum Indicum Gerardo.

This Vetch differeth not in any thing at all, either in ſtalkes, leaues, cods, faſhion of the floures, or colour thereof, from our common manured Vetch, but that it groweth higher, and the fruit is bigger and rounder, and of a very cleare white colour, more like to Peaſon than Vetches. Mr *Gerard* was wont to call this Vetch by the name of *Piſum Indicum*, or Indian Peaſe, gotten by him after the publiſhing of his Herball, as Mr *Coys* reported to me. But the ſaid Mr *Coys* hath in my judgement more properly named it *Vicia fructu albo*: which name I thought moſt fit to call it by, onely adding *Indica* to it, from whence it is reported to haue been gotten. *Iuly*, 30. 1621.

Aſtragalus marinus Luſitanicus Boelij.

This hath fiue, ſix, or more round ſtraked reddiſh hairy ſtalkes or branches, of a reaſonable bigneſſe, proceeding from one root, ſometimes creeping or leaning neere the ground, and ſometimes ſtanding vpright, a cubit high, with many greene leaues, ſet by certaine diſtances, out of order like thoſe of *Glaux vulgaris*, but leſſer, euery leafe being compoſed of fourteene or more round topped

ped leaues, a little hairy by the ed ges, ſet on each ſide of a long middle rib, which is about nine or ten inches in length, without tendrels: the floures grow forth of the boſomes of the leaues, neere the tops of the ſtalkes, on long round ſtreaked hairy foot-ſtalkes, of a very pale yellow colour, like thoſe of *Securidaca minor*, but bigger, growing cloſe together in ſhort ſpikes, which turne into ſpikes of the length of two or three inches, containing many ſmal three cornered cods about an inch long, growing cloſe together like thoſe of *Glaux vulgaris*, each cod containing two rowes of ſmall flat foure cornered ſeeds, three or foure in each row, of a darke yellowiſh or leadiſh colour, like to thoſe of *Securidaca minor*, but three or foure times as big, of little taſte: the root is ſmall, ſlender, white, with a few threds, and groweth downe right, and periſheth when the ſeed is ripe. I firſt gathered ſeeds of this plant in the garden of my good friend Mr *Iohn Parkinſon* an Apothecary of London, *Anno*, 1616.

Faba veterum ſerratis foliis Boelij.

This is like the other wilde Beane in ſtalks, floures, cods, fruit, and claſping tendrels, but it differeth from it in that the leaues hereof (eſpecially thoſe that grow neere the tops of the ſtalkes) are notched and indented about the edges like the teeth of a ſaw. The root alſo periſheth when the ſeed is ripe. The ſeeds of this wilde Beane were gathered by *Boelius* a Low-country man, in Baetica a part of Spaine, and by him ſent to Mr *William Coys*, who carefully preſerued them, and alſo imparted ſeeds thereof to me, in *Anno* 1620. *Iuly* 31. 1621.

Piſum maculatum Boelij.

They are like to the ſmall common field Peaſon in ſtalkes, leaues, and cods; the difference is, the floures are commonly ſmaller, and of a whitiſh green colour: the peaſon are of a darke gray colour, ſpotted with blacke ſpots in ſhew like to blacke Veluet; in taſte they are alſo like, but ſomewhat harſher. Theſe peaſon I gathered in the garden of Mr *Iohn Parkinſon*, a skilfull Apothecary of London; and they were firſt brought out of Spaine by *Boelius* a Low-country man.

Lathyrus æſtivus flore luteo. Iuly, 28. 1621

This is like *Lathyris latiore folio Lobelij*, in ſtalkes, leaues, and branches, but ſmaller: the ſtalks are two or three foot long, made flat with two skins, with two exceeding ſmall leaues growing on the ſtalkes, one oppoſite againſt another: betweene which ſpring vp flat foot-ſtalkes, an inch long, bearing two exceeding narrow ſharpe pointed leaues, three inches long: betweene which grow the tendrels, diuided into many parts at the top, and taking hold therewith: the floures are ſmall, and grow forth of the boſomes of the leaues, on each foot-ſtalke one floure, wholly yellow, with purple ſtrakes. After each floure followeth a ſmooth cod, almoſt round, two inches long, wherein is contained ſeuen round Peaſon, ſomewhat rough, but after a curious manner, of the bigneſſe and taſte of field Peaſon, and of a darke ſand colour.

Lathyrus æſtivus Baticus flore cæruleo Boelij.

This is alſo like *Lathyris latiore folio Lobelij*, but ſmaller, yet greater than that with yellow floures, hauing alſo adjoyning to the flat ſtalkes, two eared ſharpe pointed leaues, and alſo two other ſlender ſharpe pointed leaues, about foure inches long, growing on a flat foot-ſtalke betweene them, an inch and an halfe long, and one tendrel betweene them diuided into two or three parts: the flours are large, and grow on long ſlender foure-ſquare foot-ſtalkes, from the boſomes of the leaues, on each foot-ſtalke one: the vpper great couering leafe being of a light blew, and the lower ſmaller leaues of a deeper blew: which paſt, there come vp ſhort flat cods, with two filmes, edges, or skins on the vpper ſide, like thoſe of *Eruilia Lobelij*, containing within, four or fiue great flat cornered Peaſon, bigger than field Peaſon, of a darke ſand colour.

Lathyrus æſtivus edulis Baticus flore albo Boelij.

This is in flat skinny ſtalkes, leaues, foot-ſtalkes, and cods, with two skins on the vpper ſide, and all things elſe like the ſaid *Lathyrus* with blew floures; only the floures of this are milke white: the fruit is alſo like.

Lrthyrus æſtivus flore miniato.

This is alſo in skinnie flat ſtalkes and leaues like the ſaid *Lathyris latiore folio*, but far ſmaller, not three foot high: it hath alſo ſmall ſharp pointed leaues growing by couples on the ſtalke, betweene which grow two leaues, about three inches long, on a flat foot-ſtalk halfe an inch long: alſo between thoſe leaues grow the tendrels: the floures are coloured like red lead, but not ſo bright, growing on

ſmooth

ſmooth ſhort ſoot-ſtalks one on a ſoot-ſtalke: after which follow cods very like thoſe of the common field peaſon, but leſſer, an inch and a halfe long, containing foure, fiue, or ſix cornered Peaſon, of a ſand colour, or darke obſcure yellow, as big as common field peaſon, and of the ſame taſte.

Lathyrus paluſtris Luſitanicus Boelij

Hath alſo flat skinny ſtalks like the ſaid *Lathyrus latiore folio*, but the paire of leaues which grow on the ſtalke are exceeding ſmall as are thoſe of *Lathyrus flore luteo*, and are indeed ſcarce worthy to be called leaues: the other paire of leaues are about two inches long, aboue halfe an inch broad, and grow from betweene thoſe ſmall leaues, on flat foot-ſtalkes, an inch long: betweene which leaues alſo grow the tendrels: the ſloures grow on foot-ſtalks which are fiue inches long, commonly two on a foot-ſtalke, the great vpper couering leaues being of a bright red colour, and the vnder leaues are ſomewhat paler: after commeth flat cods, containing ſeuen or eight ſmall round peaſon, no bigger than a Pepper corne, gray and blacke, ſpotted before they are ripe, and when they are fully ripe of a blacke colour, in taſte like common Peaſon: the ſtalkes, leaues, foot-ſtalkes and cods are ſomewhat hairy and rough.

Lathyrus æſtivus dumetorum Boeticus Boelij

Hath alſo flat skinny ſtalkes like the ſaid *Lathyrus latiore folio*, but ſmaller, and in the manner of the growing of the leaues altogether contrary. This hath alſo two ſmall ſharp pointed leaues, adjoyning to the ſtalke: betweene which groweth forth a flat middle rib with tendrels at the top hauing on each ſide (not one againſt another) commonly three blunt topped leaues, ſometimes three on the one ſide, and two on the other, and ſometimes but foure in all, about an inch and a halfe long; the ſloures grow on foot-ſtalks, about two or three inches long, each foot-ſtalke vſually bearing two ſloures, the great couering leafe being of a bright red colour; and the two vnder leaues of a blewiſh purple colour: after which follow ſmooth cods, aboue two inches long, containing fiue ſix or ſeuen ſmooth Peaſon, of a browne Cheſtnut colour, not round but ſomewhat flat, more long than broad, eſpecially thoſe next both the ends of the cod, of the bigneſſe and taſt of common field Peaſon.

Iuniperus ſterilis.

This ſhrub is in the manner of growing altogether like the Iuniper tree that beareth berries, only the vpper part of the leaues of the youngeſt and tendereſt bowes and branches are of a more reddiſh greene colour: the flours grow forth of the boſoms of the leaues, of a yellowiſh colour, which neuer exceed three in one row, the number alſo of each row of leaues: each floure is like to a ſmall bud, more long than round, neuer growing to the length of a quarter of an inch, being nothing elſe but very ſmall ſhort crudely chiues, very thicke and cloſe thruſt together, faſtened to a very ſmall middle ſtem, in the end turning into ſmall duſt, which flieth away with the winde, not much vnlike that of *Taxus ſterilis*: on this ſhrub is neuer found any fruit. 15. *Maij*. 1621.

WHen the laſt ſheets of this worke were on the Preſſe, I receiued a letter from Mr *Roger Bradſhaghe*, wherein he ſent me incloſed a note concerning ſome plants mentioned by our Author which I haue thought fitting here to impart to the Reader: he writ not then who it was that writ it, but ſince hath certified me that it was one Mr *Iohn Redman* a skilfull Herbariſt, to whom, though vnknown, I giue thankes, for his deſire to manifeſt the truth and ſatisfie our doubts in theſe particulars.

BEcauſe you write that *Gerards* Herball is vpon a review, I haue thought good to put you in mind what I haue obſerued touching ſome plans which by him are affirmed to grow in our Northern parts: firſt the plant called *Pyrola*, which he ſaith groweth in Lanſdale, I haue made ſearch for it the ſpace of twenty yeares, but no ſuch is to be heard of.

Sea Campion with a red floure was told him groweth in Lancaſhire: no ſuch hath euer beene ſeene by ſuch as dwell neere where they ſhould grow.

White Fox-gloues grow naturally in Lanſdale, ſaith he, it is very rare to ſee one in Lanſdale.

Garden Roſe he writes groweth about Leiland in Glouers field wilde: I haue learned the truth from thoſe to whom this Glouers field did belong, and I finde no ſuch thing, onely aboundance of red wilde poppie, which the people call Corne-Roſe, is there ſeene.

White Whortles, as he ſaith, grow at Crosbie in Weſtmerland, and vpon Wendle hill in Lancaſhire: I haue ſought Crosbie very diligently for this Plant and others, which are ſaid to grow there, but none could I finde, nor can I here of any of the countrey people in theſe parts, who dayly are labouring vpon the mountaines where the Whortle berries abound, that any wihte ones haue

beene

beene seene, sauing that those which *Gerard* calls red Whortles, and they are of a very pale white greene vntill they be full ripe, so as when the ripe ones looke red, the vnripe ones looke white.

Cloud-berry assuredly is no other than Knout-berry.

Heskets Primrose groweth in Clap-dale. If Mr *Hesket* found it there it was some extraordinary luxurious floure, for now I am well assured no such is there to be seene, but it is only cherished in our gardens.

Gerard saith many of these Northerne plants do grow in Crag-close. In the North euery towne and village neere vnto any craggie ground both with vs and in Westmerland haue closes so called, whereby *Gerards* Crag-close is kept close from our knowledge.

Chamæmorus, sex Vaccinia nubis. Knot, or Knout-berry, or Cloud-berry.

THis Knot, Knout, or Cloud-berry (for by all these names it is knowne by vs 'in the North, and taketh these names from the high mountaines whereon it groweth, and is perhaps, as *Gerard* saith, one of the brambles, though without any prickles) hath roots as small as packe-thred, which creepe far abroad vnder the ground, of an ouerworne red colour, here and there thrusting more fastly into the mossie hillockes tufts of small threddy strings, and at certaine joynts putting vp small stalks rather tough than wooddy, halfe a foot high, somthing reddish below, on which do grow two or three leaues of a reasonable sad greene colour, with foot-stalks an inch long, one aboue another without order: the highest is but little, and seldome will spread open; they are something rugged, crispie, full of nerues in euery part, notched about the edges, and with some foure gashes a little deeper than the rest, wherby the whole leafe is lightly diuided into fiue portions. On the top of the stalke commeth one floure consisting of foure, sometimes of fiue leaues apiece, very white and tender, and rather crumpled than plaine, with some few short yellow threds in the midst: it standeth in a little greene huske of fiue leaues, out of which when the floure fades, commeth the fruit, composed of diuers graines like that of the bramble, as of eight, ten, or twelue, sometimes of fewer, and perhaps through some mischance but of three or two, so joyned, as they make some resemblance of a heart, from whence (it may be) hath growne that errour in *Gerard* of diuiding this plant into two kindes: the fruit is first whitish greene, after becommeth yellow, and reddish on that side next the Sun.

It groweth naturally in a blacke moist earth or mosse, whereof the countrey maketh a fewell wee call Turfe, and that vpon the tops of wet fells and mountaines among the Heath, mosse, and brake: as about Ingleborough in the West part of Yorke-shire, on Graygreth a high fell on the edge of Lancashire, on Stainmor such a like place in Westmerland, and other such like high places.

The leaues come forth in May, and in the beginning of Iune the floures: the fruit is not ripe till late in Iuly.

The berries haue a harsh and something vnpleasant taste.

THis Worke was begun to be printed before such time as we receiued all the figures from beyond the Seas, which was the occasion I omitted these following in their fitting places: but thinking it not fit to omit them wholly, hauing them by me, I will giue you them with their titles, and the reference to the places whereto they belong.

* In August last whiles this worke was in the Presse, and drawing to an end, I and Mr *William Broad* were at Chissel-hurst with my oft mentioned friend Mr *George Bowles*, and going ouer the heath there I obserued this small *Spartum* whose figure I here giue, and whereof you shall find mention, in the place noted vnder the title of the figure; but it is not there described, for that I had not seen it, nor could finde the description therof in any Author, but in Dutch, which I neither had, nor vnderstood. Now this little Matweed hath some small creeping stringy roots: on which grow somwhat thicke heads, consisting of three or foure leaues, as it were wrapt together in one skin, biggest below, and so growing smaller vpwards, as in *Schænanth*, vntill they grow vp to the height of halfe an inch, then these rushie greene leaues (whereof the longest scarce exceeds two inches) breake out of these whitish skins wherein they are wrapped, and lie along vpon the ground, and amongst these growes vp a small grassie stalke, some handfull or better high, bending backe the top, which carries two rowes of small chaffie seeds. It is in the perfection about the beginning of August.

Meirw. Iuniper tree.
Meillionen y meirch. Right trefoile.
Mintas. Mints.
Moren. Parſneps.
Moren y maes. Wilde Parſneps.
Mwg y ddayar. Fumetory
Mwſſogl. Moſſe.
Mynawyd y bigail. Storks bill.

N

Nyddoes. Spinage.

O

Onnen. An Aſh tree.

P

Pawen yr Arth. Beares breech.
Padere Mair. Croſſewort.
Perſli y dwr. water Parſley.
Perſli Frengic. Smallage.
Phionſſrwyth, v. Menic y ellyllion.
Pidny y goc. Aron, or Cuckow pint.
Poerlys, v. y laúlys.
Poplys. a Poplar.
Pwrſ. y Bigail. Shepheards purſe.
Pys y Ceirw. Tares.

R

Rhedyn. Ferne.
Rhedegat y derw, v. Gallaer.
Rhúg. Rie.
Rhoſyn. a Roſe.

S

Saeds gwyllt, v. Chwerwlys.
Siwdrmwt. Sothernwood.
Siaceked y melnydd, v. Cynffon llwynoc.
Sirian. Cherries.
Snodan Fair. Engliſh Galengale.
Sowdl y Crydd, v. Blaen yr yiwrch.
Suran y góc. Wood Sorrell.
Suran. Sorrell.
Syſi, v. Mefys.

T

Tafod y ki. Dogs tongue.
Tafod y neidr. Adders tongue.
Tafod yr hydd. Harts tongue.
Tafol. a Docke.
Tafol Mair. Biſtort.
Tagaradr, v. Hwb yr ychen.
Tafod yr edn. Birds tongue.
Tafod yr ych. Bugloſſe.
Telephin. Orpin.
Tormaen. Filipendula.
Tryw, v. Caliwlyn y mêl.
Troed y glomen. Columbine.
Triacl y tylodion. Tormentilla.
Troed y dryw. Parſley Breakſtone, or ſmall Saxifrage.
Triacl y Cymro. Germander.
Troed yr hedydd. Larke heele.

W

Wilffraeu, v. Llyſie yr gwaedlin.
Winniwn. Onions.

Y

Y Bewfelen. Fleabane.
Y Benlas wenn, v. Claſſlys.
Y bengaled. Red Scabious.
Y Benlas. Blewbottle, or Cornefloure.
Y bengoch. Horehound.
Y Claſſlyes. Scabious.
Y Dorfagl. Medow three leafed graſſe.
Y Droedrydd. Herbe Robert.
Y Drywynſawr. Caliwlyn y mêl.
Y Ddwy geonioc. herbe Twopence or Moneywort.
Y Dorlwyd. wild Tanſy or ſiluerweed.
Y dew bannoc, v. Cynffon Llwynoc.
Y Dinboeth. Arſmart.
Y Ddayarlys. Peony.
Y Doddedigc wenn. Pilewort.
Y fendigedi. Tutſan or Parkeleaues.
Y Fabgoll. Poppy.
Y fiolud. Violet.
Y fylfen Y fronwys. ſmall Celandine.
Y feidioc lâs, v. Llyſſie Ivan.
Y fyddarlys. Prickmadam.
Y fyddygyn, v. Craith vn nos.
Y fyw fyth. Llyſſiev pentú.
Y gauri goch, v. Buſtl y Ddayar.
Y gynga, v Llyſie yr bidl.
Y gloria: wilde Roſe or Spargwort.
Y gás wenwyn. Diuels bit.
Y gyſog. a kinde of Spurge.
Y glaiarlys. Y grevlus. Groundſwell.
Y gyſgadur. Nightſhade or Morell.
Y gyngreen. Todeflax.
Y llew gwynn dóf. Garden Orach.
Y llew gwynn gwyllt. wilde Orach.
Y lliwlys, v. Llyſiev lliw.
Y llwynbidydd. Ribwort.
Y llindro. Dodet.
Y llyſiewyn benegidedic. Valerian.
Y lleúadlys. Lunaria.
Y Môr gelyn. Sea Holly.
Y Múrlys. Pellitory of the wall.
Y Papi coch, v. red Poppy, or corne Roſe.
Yr Eſcarlys { *Hîr geon bychan* } Atiſtolochia, or Birthwort, of Hartwort. { long. round. ſmall.
Yr Alaw. Water Lilly.
Yr hên lydan, i. ffordd. Waybread.
Yr rhúd. Rue or herbe Grace.
Yr vchelſa. Miſſeltoe.
Yr yſcallen Fraith. our Ladies thiſtle.
Yr yſcallen Fendigedic. Card. Benedict.
Yr holliach. Clownes wort.
Yſcall drain gwynn. Carline thiſtle.
Yſcall. Wilde thiſtles.
Yſcal y moch. Sow thiſtle.
Yſcolfair. Peters wort or ſquare S. Iohns wort.
Yſcaw. Elder trees.
Yſcaw Mair. Walwort.
Yſpaddaden. Whitethorne.
Yſniab. Muſtard.
Y wermod. Wormwood.
Y wermod wenn. Feuerfew.
Y winwidden wenn. white Brionie.
Y winwydden ddû. blacke Brionie.
Y wilffrae. Llyſie yr gwaedlin.
Y wenunlydd. Great Thickwead.

A TABLE, WHEREIN IS CONTAINED THE NATVRE AND VERTVES OF ALL THE Herbes, Trees, and Plants, described in *this present Herbal.*

A

Causing **Abortment**,60,d.845,m,1130,b.
Against **Abortment**,766,a.
Against **Aches**,71,c.359,l.756,b.1445,f.1529,d.
Against **Aches** in the ioynts and lymbes,132,c.164,b.281 b.1529,d. See **Ioynts.**
To consume and heale the **Achors**,being vlcers in the head,191,a 1197,i 1206,c.
Act of generation,vid. **Bodily** and **Lust.**
