BOTANOLOGIA.

THE ENGLISH HERBAL:

OR,

History of PLANTS.

CONTAINING

I. Their Names, *Greek*, *Latine* and *Engliſh*.
II. Their Species, or various Kinds.
III. Their Deſcriptions.
IV. Their Places of Growth.
V. Their Times of Flowering and Seeding.
VI. Their Qualities or Properties.
VII. Their Specifications.
VIII. Their Preparations, Galenick and Chymick.
IX. Their Virtues and Uſes.
X. A Complete FLORILEGIUM, of all the Choice FLOWERS Cultivated by our FLORISTS, interſperſed through the whole Work, in their proper Places; where you have their *Culture*, *Choice*, *Increaſe*, and *Way of Management*, as well for Profit as Delectation.

Adorned with Exquiſite ICONS *or* FIGURES, *of the moſt conſiderable* Species, *repreſenting to the* LIFE, *the true* Forms *of thoſe ſeveral* PLANTS.

The whole in an Alphabetical Order.

TO THE

QUEEN.

MADAM,

I Account it more a *Duty* than a *Presumption*, to appear to *Your Majesty*, though with such a Trifle as the following Book; and therefore chose to break through that *Difficulty*, rather than to be guilty of such a *Fault*, of letting slip any Opportunity in which I might let *Your Majesty* know, with what a *Profound Respect* I approach *Your Great Presence*.

Our *Great Island*, which ever since the *Memory of Man*, has been divided into two distinct Kingdoms, of different *Names*, *Powers*, *Governments*, *Religions*, *Customs*, *Affections and Interests*, your Majesty has *United* and *Made one*. It was what your Great and Royal Ancestors, with all their Power and Industry, were never able to perform: But it was a Work, the Honour of which, the *Supreme Powers* reserv'd for *You*. This *UNION* of the *British Nations*, was an Undertaking so *Great* in its *Performance*, so *Noble* in its *Kind*, so *Admirable* in its *Effects*, so *Desirable* in its *Good*, so *Singular* in its *Appearances*, and so *Profound* in its *Structure*; that none could have been able to have done it, but a *Greatness of Mind* like *Yours*: One of a *Superlative Prudence* and *Resolution*, of an *Unwearied Industry*, of an *Unmatchable* and *Unshaken Zeal* for the *Publick Good*; of a *Magnanimous Soul*, *Inspir'd* with the *Holy Spirit* of the Immortal GOD.

You have *Madam* by this *UNION*, shut up the *Back-Door*, by which *Great Britain* was always liable to be Assaulted; and thereby have added a *Jewel more to the Imperial Crown*; and Adorn'd it with an *Illustration*, the Greatest and most

desirable

desirable in its Kind, which will be, both to the *British Isles*, and to *Your Majesty* also, not only an *Important Security*, but an *Everlasting Ornament of Glory*.

Surely *Madam*, You who could *Unite Hearts in an Eternal Bond of Friendship*, was the most fit Instrument to *Unite Kingdoms* in one Bond of Interest and Duty. To make those who were so different in *Climate*, *Sovereignty*, *Religion and Manners*, *One People*, in the Bonds of *Nature* and *Affection*: And to make them, *with one Joint Design, Intention and Will*, to become *One United and Faithful People*, to so Desirable and Generous a Mistress. But what might not be expected from such a Lady, *so Great and so Good a Queen?* Whose *Conjugal Friendship* was, and is still the *Wonder of Mankind*, (a Noble Pattern to all the Sex) which exceeded even to *Admiration*, whatever has been yet seen upon Earth: Who is it that has *Sense* and *Gratitude* in his Soul, would not even lay down his Life for such a *Friend?*

When I consider the Admirable Hand of Providence, which has brought Your Majesty to the Throne of the *British Kingdoms*, and has put their Crowns upon *Your Imperial Head*, which has made *Glorious Your Reign*, with a Series of *Wonderful Successes*, and even *Amazing Victories*, over the *Most Formidable Tyrant of the Earth*; rendring his *mighty Attempts* against You, *Vain and Foolish*; notwithstanding his Confederacy with Destruction, his Covenant with Death, and his Agreement with Hell; to the Delivering You and Your People out of *his Snare*, and the Establishing of *Your Just Title*, upon Everlasting Foundations, against all *Pretenders whatsoever*: I humbly prostrate my self to that Tremendous Being.

What can I say, but that *GOD* is with You, and that You are an *Especial Object* of his *Care*, who thus stedfastly holds *You* as in the *Palm of his Hand*: *Your* Sincerity, and Generous Love to Mankind, have prevail'd with that *Almighty Power*, who has given *You a Transcendent Portion of Wisdom*, to Conduct *You* through the *Labyrinths* of *Dominion and Government*; even whilst *You* have been Fighting the Publick Enemy of all *EUROPE*; and putting a *Hook into his Jaws*, by which *You* have already Tamed the *Monster*, fill'd him with Shame and Contempt, and cover'd him with Confusion of Face.

What may I call the *Instruments* of Your Warfare, which have made *You thus to prevail?* Who is it that has set *Your*

Feet

Feet upon the *Necks of Your Enemies*, and given *You Strength* to humble the *Pride of the Lofty*? Who is it that has Eſtabliſhed *Your Strength*, to break in Pieces the *Invincible Powers*, (as they were Fooliſhly called,) by which You have given a Demonſtration to the World, of that *Prophanity* and *Vanity*? Who is it that has thus made *Your Majeſty* to *Triumph*, and adorned you with the *Palms of Victory*?

'Tis the *Great* and the *Holy One*, the *Mighty God of* Jacob, who has done all theſe things for *You*; to whom I make *my Daily Addreſſes*, that he may yet Defend and Support the *Righteous Cauſe* in which *You* are engaged; *Direct Your Counſels* with Wiſdom and Prudence; *Proſper Your Arms* wherever they are engaged; and that the *Angel of his Preſence* may Attend and Conduct *You* in all *Your* Ways: So that making *You* the *Reſtorer of the Breaches*, You may Eſtabliſh ſuch an Univerſal Peace in *Europe*, as may Recognize *Your Happy Reign*, and cauſe it to ſhine with a moſt *Reſplendent* Luſtre, to all Succeeding Ages of Time.

You Contemn *Madam*, the Poor and Little Artifices of *Tyrants*; You have a Soul too Great to think of ſuch *Meanneſs*, and a Spirit too Noble for the bare Thoughts of ſuch *Depraved Vileneſs*: You act with the Magnificence of Grandure, made Illuſtrious with *Piety*, and an *Unbounded Goodneſs*, repleat with all the Ornaments *of Sincerity and Vertue*, by which You will Live in *After-Ages*, and *Your Name* be made *Immortal*. So that inſtead of the *Diadems* being an Honour to *Your Majeſty*, You are become the Exalted Honour of *Royalty*, and the Glory of the *Purple*; which makes *Your Sovereignty* Shine as the moſt Splendid Brightneſs, among the *Heroes* of Time.

G O D has not only made You a *Great Queen*, but even the *Greateſt of Princes*; and *Your* Early Piety, as it has advanced *You* above the beſt of *Women Kind*; ſo it has Exalted *You* above the *Greateſt of Crowned Heads*. Your Vertues merit a perpetual *Encomium*, and *your Excelling Goodneſs to your People*, is that which is never to be forgotten; whom you have been pleas'd to Oblige with *Tranſcendent Acts of Kindneſs*; ſo Extraordinary and Superlative in their kind, as all *Succeeding Generations*, under an *Eternal Senſe of Gratitude*, will be forced for ever to acknowledge.

You carry with *You Madam*, Majeſty and Honour, and *Your Sword* determines the *Succeſſes of War*, making with *Your Thunder*, the World afraid; giving Laws as far as

Your

Your Dreaded Name does reach; which makes the *Tyrants of the Earth*, those *Barbarous Murtherers of Mankind* to tremble, and affrightens the *Obsequious Slaves to Villany*. *Your Triumphs* are not in the Ruin of Nations and Kingdoms, not in Victories of Blood and Cruelty, not for Dominion and Sovereignty; but *to give Freedom and Ease* to Mankind, and set the World at Liberty.

May the High and the Lofty One, the *Almighty GOD*, He by whom *Kings* and *Queens* Reign, *and Princes* decree Justice, give *Your Majesty* a Long and a Happy Life; may He Prolong it to an *Accomplish'd Period*, for the Good of *Your* People, to whom *You* have shewn *Your* Self so exceedingly Kind. May he Bless *You* with *Prosperity*, and give *You* that *inward Consolation and Peace of Mind, which* may as Infinitely exceed all the Enjoyments of this Life, how Great and Magnificent soever, *as the Heavens are high above the Earth*; and make *Your Great and Illustrious Soul*, enjoy the Fullness of Satisfactions, to the *Ultimate* of whatever *You* can desire. So that Crowning *You* with *Glory* and *Honour* here, *You* may very late Ascend, as on Eagles Wings, to those Eternally Serene Habitations of Peace and Tranquility, where *You* may be for ever Transcendently Happy.
So Ardently Prays

Madam,

Your Majesties

Most Humble,

Most Faithful,

AND

Most Obedient

Subject and Servant,

WILLIAM SALMON.

THE

PREFACE:

OR,

INTRODUCTION.

CHAP. I. Of the *WORK* it ſelf.

I. *WE Pretend not here to an univerſal Hiſtory of* Plants, *but chiefly to ſuch as are moſt Known, and Virtuous, moſt Experimented, and Uſeful in* Phyſick. *'Tis a Work highly of Uſe for* Phyſicians, Chyrurgians, *and* Apothecaries, *and for their Sakes, and the Publick Good it was principally Deſigned and Intended.*

II. *As to the Authors made uſe of in this Undertaking, we ſhall not be ſo vain as to enumerate them all, 'twould be to no Purpoſe; and yet it will be Neceſſary for the Credit of the Book, to give you an Account of the Chief of thoſe, in Treating of each Plant, whoſe Leaves we were obliged continually to turn over.*

III. *The Authors we made moſt uſe of in Compoſing this* Herbal, *were theſe following*, viz. Bauhinus, Brunfelſius, Cæſalpinus, Camerarius, Cluſius, Dioſcorides, Dodonæus, Durantes, Fuchſius, Johnſon *on* Gerard, Lobel *and* Pena, Lonicerus, Lugdunenſis, Matthiolus, Parkinſon, Ruellius, Schroder, Tabernæmontanus, Theophraſtus, *and* Tragus. *Theſe, I ſay, were thoſe which were chiefly conſulted, and without whom, we paſſed not off from the Diſcourſe of any Plant: But we cannot ſay theſe were all, for occaſionally as it fell in our way, and where ſome particular Occurrences required it, we had recourſe to many others, more than twice that number beſides; without the Help of which we could not have ſo Compleatly performed what we here Preſent you withall.*

IV. *As to the Hiſtorical Part, we could not much deviate, but were obliged to follow the moſt celebrated Authors of this Subject*, viz. *in their Names, Kinds, Deſcriptions, Places of Growth, and Times of Flowering and Seeding. In their* Names, *we have given you the moſt uſual, and thoſe chiefly by which the Plant (in all Ages) has been moſt known and called, whether* Arabick, Greek, Latine, *or* Engliſh; *in doing of which, we hope we have in ſome meaſure rectified the* Latine Nomenclature, *which, even in all our* Dictionaries, *has hitherto been very Faulty and Imperfect.*

V. *As to the Kinds of any Plant, we own we have not given you all that you will find in* Parkinſon, *and many other Authors, becauſe thoſe which we have Omitted, an* Engliſh *Reader, may not poſſibly come to the Knowledge or Sight of in many Ages, they growing in Foreign and Far-diſtant Countries, as* Turkey, Perſia, East India, *the* Moluccas, China, *&c. Beſides, having no known Virtues or Uſes aſſigned to them, but only their Names and Deſcriptions, we thought they would only take up room, and rather encumber the Book, than add any real Excellency or Advantage to it; conſidering it was chiefly deſign'd for the Benefit and Uſe of the Practical Phyſician.*

VI. *As to the Deſcriptions, we ſay they are the ſame as in other Authors, little or nothing differing from thoſe in* Bauhin, Cluſius, Dodonæus, Fuchſius, Gerard, Johnſon, Lugdunenſis, Matthiolus, Parkinſon, Tabernæmontanus, *and* Tragus: *But we have almoſt every where revers'd the Order of Deſcribing; for whereas they many times begin at the top or upper parts of a Plant, and ſo go downwards to the Root, we on the contrary, generally begin at the Root, firſt Deſcribing it, and ſo aſcend upwards to its Stalks, Leaves, Branches, Flowers and Seed, or Fruit, which we take to be the moſt natural Order or Method.*

VII. *As to the Places of the Growth of Plants, they may be very uncertain, becauſe, where they have been found to Grow in great plenty, in former Ages or Times, the footſteps of the ſame Plant is not to be found now. In ſome places where I have found ſeveral Plants to Grow as Natives of the ſame, when I was a Youth, now in my preſent declining Years, there are no remainders of them to be found.* The Ægyptian Arum, *or* Pſeudocolocaſia, *which we now call the* Carolina Eddo, *(becauſe there every where planted) did formerly Grow plentifully in* Ægypt, *which I ſuppoſe was its Native place of Growth, and was there planted for their uſe in Meats, and for Food: Now our late Travellers ſay, it has not for ſome Ages been known to Grow there at all. But 'tis poſſible that it has been neglected and diſuſed: Yet I am of Opinion, that if it were diligently ſought after, ſome remains of it might be found again. It grows in vaſt plenty*

n Carolina, *where it is a great part of their* Food *and Living; but it prospers only as under the Planters Hands; for should they neglect it, it would quickly be totally lost in that Country too.*

VIII. *We have every where given the various Qualities of each Plant, by which an Estimate may be given in Gross, of their Virtues, and to what Diseases they may be properly applyed, or may be helpful against: The consideration of which alone, is of mighty a Use to the Practical* Physician; *because they indicate to the Mind or Understanding, to what various Purposes and Intents they may be converted, and in what Diseases they may be specifically useful.*

IX. *How these Qualities are to be applyed to Diseases; may be easily exemplified: I know it may be objected by such as are Ignorant of Medical Qualities and Indications, that a great many Virtues are ascribed to most Plants, for the Curing of Diseases, which they can never perform, nor any Author before ever signified: To which I answer; That I do not affirm nor say, that every Herb is a Specifick for the Cure of all Diseases, which in the particular Preparations and Virtues thereof, I may ascribe to it; but he that reads me, ought to read me with a Medical Mind, or Soul, and with a good Understanding; I will exemplify the Matter. Suppose it to be* Rosemary. *As to its first Qualities, it is Hot and Dry in the third Degree; and that it is Cephalick, Neurotick, Stomatick, Alexipharmick: From these Qualities, we conclude that it must be helpful against all cold and moist Diseases, of the Head, Brain, Nerves, Stomach, and Poison; then when we consider what Diseases are apt to afflict those parts, from a hot and dry Cause, we fix the Virtues to be such as may resist those Diseases, not to be an absolute and Specifick Cure for the same, but to be very helpful in those Cases, and so may be drawn into Compositions, with other Ingredients for the same purposes. And thus I desire every Genuine Son of Art to understand me. What I have said in this Paragraph, may be of admirable Use, if it be rightly understood and applyed.*

X. *Thro' the whole Book in every Chapter, we have given you the various Preparations of each Plant, both Galenick and Chymick, which may be made of them, which is a thing never performed by any other Author before me. This being rightly considered, gives you the whole Result of the Plant, and in a few Words teaches you how it is to be used and applyed, in all the Cases, and to all the Distempers to which it may be appropriated: But that this may be more perfectly understood, we particularly Exemplify the whole thereof, in this present* Introduction; *in those several Forms, both Galenick and Chymick, and that to the Capacities of such as are Ignorant of the Medical Arts.*

XI. *Having done all this, when we come to explicate upon the Virtues, we do not give you the Virtues of the Plant in Gross (for that is before done in its Specification) but shew you particularly, how all these several* Preparations *are (in every Disease) to be used and applyed, which as it never was done before me, by any other Author, so I think it is of universal Use in the Art and Practice of* Physick: *It is performed so as to answer every particular and singular Preparation, and in a Stile so full and plain, that the meanest Understanding cannot easily mistake me; by which means it is accommodated to the Use of the Vulgar, tho' they understand little or nothing of the Act of Physick.*

XII. *The last thing which I shall here take notice of, is more matter of Ornament, than any thing of Necessity, which I have done for the sakes of all such as are lovers of Flowers, and of a Flower-Garden: It is a compleat* FLORILEGIUM, *of all or most of the* Choice Flowers, *which are Cultivated in* England *by our* FLORISTS: *This is not done as a particular Work by it self, but is interspersed thro' the whole Book, each* Flower *in its proper place of the* Alphabet; *where you will have their* Culture, Choice, Increase, *and several ways of* Management, *as well for Profit as Delectation; a noble Subject it is, but never brought into any* Herbal *before this.*

CHAP. II.

Of the Greek *Names of* Plants.

AT *First entrance upon this Work, we thought to have given you the known* Greek *Names of all the Herbs and Plants described in this* Herbal, *in the order they were treated of; but finding that it would have been too tedious a Labour, and an Undertaking that would not have answer'd the End, and that withall, besides the taking up of room, it would have mightily encombred the Discourse; we in a manner wholly declined the same: However, for the sakes of all such as are Lovers of the* Greek Tongue, *and desirous to call the Species of each Plant by its proper Appellation in that Language, we have in the body of this Work, given you the known* Greek *Name or Names of each Genus, and the various* Latine Epithites, *by which the differing* Species *of that Plant ought to be distinguished; by which, applying to those several and various* Latine *Epithites, (which are in this place ranked Alphabetically) the* Greek *Words answering to them, you will have the complicated* Greek *Names, as full and compleat, as if we had severally perfected them, in the order of their several* Chapters.

A.

1. Acer, cris, cre.
   Δειμὺς, μεῖα, μὺ.
2. Aculeatus, a, um.

CHAP. III.

Of the First Qualities of *MEDICINES.*

I. THE *Qualities of Medicaments are five-fold, according*, 1. *To their Temperaments.* 2. *As they are Alteratives.* 3. *As they are Appropriate.* 4. *As they Diminish something.* 5. *As they Add or Restore something; all which Qualities we come now to explicate in order.*

II. *The Temperaments of Medicaments are five-fold, considered,* 1. *As they are perfectly Temperate,* viz. *neither Hot nor Cold, Dry nor Moist.* 2. *As they are Hot.* 3. *As they are Cold.* 4. *As they are Dry.* 5. *As they are Moist. In the four last of which, there are said to be* 4 *Degrees, receding from their principal,* ver. gr. *An Herb which is Hot, may be hot in the first, second, third, or fourth Degree of heat. Again, from the four prime Qualities, these also proceed,* viz. *that a Medicament,* 1. *as it is Hot, may be hot and dry, or hot and moist.* 2. *As it is Cold, also cold and dry, or cold and moist; and these likewise in all the four Degrees of Temperature.*

III. *Temperate Medicaments are such which work no change at all, in respect of heat, coldness, dryness, or moisture.*

And these may be Temperate in some respect. 1. *As being neither hot nor cold, and yet may be moist or dry.* 2. *As being neither moist nor dry, and yet may be hot or cold. Their Use is, where there are no apparent Excesses of the four other Qualities; to preserve the Body Temperate, conserve Strength, and restore decayed Nature.*

IV. *Hot Medicaments (and so also Cold) are considered in respect of our Bodies, and not of themselves: For those Simples are called Hot, which heat our Bodies.*

Their Uses are, 1. *To make the offending Humour thin, to be expell'd by Sweat, or thro' the Pores.* 2. *To help Concoction.* 3. *To warm and comfort the* Viscera. 4. *And by outward application, to discuss Tumors.* 5. *Or raise Blisters, make Cauteries,* &c. *according to the degrees of Heat.*

V. *Cold Medicaments are such, as cool our Bodies being over-heat, by any adventitious or accidental Causes.*

Their Uses are, 1. *To cool the Parts or Bowels.* 2. *To condense Vapours.* 3. *To thicken Humours.* 4. *To abate the heat of Fevers.* 5. *To refresh the Spirits almost suffocated.* 6. *Allay Inflammations.* 7. *Repress Sweating.* 8. *Ease violent Pains.*

VI. *Drying Medicaments, are such as make dry the Parts overflowing with moisture.*

They are used, 1. *To stop Fluxes.* 2. *To comfort and strengthen Nature.* 3. *To consume a superfluity of Humours.* 4. *To fortify the Bowels.* 5. *To restore in Consumptions, where great fluxes of the Bowels have been.*

VII. *Moist Medicaments, are such as are opposed to drying, which moisten, loosen, are lenitive, and make slippery.*

They are used, 1. *To moisten an over dry and constipated Habit of Body.* 2. *To ease Coughing.* 3. *To help the roughness of the Wind-pipe.* 4. *To loosen the Belly.* 5. *To relax Parts contracted or hardned.*

VIII. *Things hot in the first Degree, gently warm the Body being over cooled, and outwardly open the Pores. Hot in the second Degree as much exceed the first, as the first exceed Temperature, and these cut tough Humours, open Obstructions, and the Pores also outwardly. Hot in the third Degree, more powerfully heat, and are able (if much used) to inflame the Body, and cause Fevers, provoke Sweat exceedingly, and resist the malignity of the Plague or Pestilence, and more powerfully also cut tough Humours. Hot in the fourth Degree, burn the Body if outwardly applyed, raise Blisters, corrode the Skin.*

IX. *Things cold in the first Degree, qualify the heat of the Stomach, and refresh the Spirit. Cold in the second Degree, are chiefly of use to abate Inflammations. Cold in the third Degree, are Repercussive, and drive back the Matter, repress Sweat, and keep the Spirits from Fainting. Cold in the fourth Degree, stupify the Senses, ease violent Pains, and are used in extream Watchings.*

X. *Things dry in the first Degree, Strengthen. In the second Degree, Bind. In the third Degree, stop Fluxes, and restore in Consumptions. In the fourth Degree, stop Catarrhs, and all Fluxes of Blood and Humours; are highly Stiptick, and dry up a super-abundancy of moisture.*

XI. *Things moist in the first Degree, are opposed to drying in the same Degree: They moisten the Body, and Parts dryed. In the second degree, they Lenify, loosen the Belly, and make slippery. In the third degree, they smooth the roughness of the Wind-pipe. In the fourth degree, they cure a constipation of the Bowels.*

XII. *Thus Medicines alter according to their Temperature: Whose active Qualities are Heat and Cold; and by them Diseases are said to be eradicated. The Passive are dryness and moisture, and they are subservient to Nature.*

CHAP.

CHAP. IV.

Of the Second Qualities.

I. *THE second Qualities of Medicaments are such as are Alterative; which alter the Habit and Constitution of the Body, as it has a respect to the* Blood, Lympha, Serum, *and other Humours of the same; and these Alteratives are considered as they are Medicaments* Internally *used, or* Externally *applyed.*

II. *Of* Internal Alteratives *Authors have made many Titles; but the Whole of the Matter is comprehended under the thirteen following Appellations,* viz. 1. Aperitives. 2. Absterfives. 3. Astringents. 4. Digestives. 5. Incisives. 6. Carminatives. 7. Anodyns. 8. Narcoticks. 9. Bechicks. 10. Solutives. 11. Attenuaters. 12. Coagulatives. 13. Confortatives.

III. *Of* External Alteratives, *we have these following fourteen,* viz. Stypticks, Hemoptoicks, *or* Antihæmorrhagicks. 2. Anodyns. 3. Repercussives. 4. Discussives. 5. Emollients. 6. Attractives. 7. Suppuratives. 8. Corrosives, *or* Pyroticks. 9. Digestives. 10. Absterfives. 11. Incarnatives. 12. Agglutinatives. 13. Cicatrizers. 14. Cosmeticks: *Of all which we shall treat in order.*

I. Of Internal *ALTERATIVES.*

IV. 1. APERITIVES. *These are such Medicaments as* open the Obstructions of the Viscera, *as Stomach, Lungs, Liver, Spleen, Glands, Mesentery, Intestines, Reins, and Womb. They are all hot at least in the second Degree, for the most part in the third, and many times in the fourth degree; of very subtil and thin parts, for without heat there can be no rarefaction, and without rarefaction, no opening of the obstructed Bowels.*

V. 2. ABSTERSIVES. *These are* cleansers, *which after opening Obstructions of the affected Parts, cleanse them, by taking away the Recrements which obstructed them, being the superfluities of the* Blood, Lympha, *and other* Juices, *and without which work be done, all that Aperitives or Openers do, is done in vain. They have a sharpness and tenuity of Substance, and it is not any great matter whether they be Hot or Cold, by reason neither quality (if not excessive) hinder their Action. They also remove glutinous and clammy Humours in the Superficies, or adhering to the Pores of the Skin and Ulcers.*

VI. 3. ASTRINGENTS. *These are Binders, and are generally dry in the second and third Degrees, whether they be hot or cold; they are Stypticks, and in some measure constipate the Bowels in Fluxes, dry up Fluxes of Humours, help Catarrh, and strengthen the Tone of the Stomach and other Bowels, when over Lax, or weakned by long Defluxions, over much moisture, or the vehemency of any inveterate Disease; and are therefore often given in the end of a Cure.*

VII. 4. DIGESTIVES. *These are such as Concoct the Food in the Stomach, and are all naturally hot; for it is Heat which causes Concoction, and excites the natural Fermentation in the Stomach, by which a good* Chylus *is made, in order to Sanguification, and Nourishment of the Body: Yet some things may cause Digestion, which are not naturally hot, but cold, and may excite the natural heat, by way of* Antiperistasis, *whereby the sulphureous Particles in the Stomach are more fermented and heat, or set a boiling.*

VIII. 5. INCISIVES. *They are such things as pierce into and cut tough Matter, which is not easy to be broken, or separated into parts; such are Juice of Limons, Vinegar, and all acid things which by their points enter into and make a division, not a dissolution, whereby tough Flegm, and tartarous or viscous Matter, is prepared for Absterfives, and so made fit either to be expectorated by the Mouth, or expell'd by Urine and Stool. These, whether hot or cold, are of very thin and subtil Parts.*

IX. 6. CARMINATIVES. *These are Medicaments which spread, discuss, or expel Wind, and are generally hot and dry, and of very thin and subtil Parts, proper in Pains of the Stomach and Bowels, the Cholick, and other Indispositions whatever caused of Wind, as Vapours, Hypochondriack Pains, Hysterick Fits,* &c.

X. 7. ANODYNS, *or* PAREGORICKS. *These are easers of Pain; which tho' they do not often Cure Diseases, yet act in order thereto, they regarding the Pain chiefly, while both Cause and Disease are remaining, They are of thin Parts, and are moderately hot, seldom exceeding the first Degree, and rarefacient; and so Digesting, Concocting, Dissipating, Extenuating, and in some measure Evacuating, whatever Humour is sharp, tough, or gross; by it alcalious property absorbing the acritude of the Matter, contain'd in any Cavity, or its Pores.*

XI. 8. NARCOTICKS. *These are stupifying Medicines, and ease Pain, not by mitigating it, but by Stupifaction; not by taking away the Cause, but by Obstruction of the Animal Spirits for the time. Yet* Stupor *is something less than* Insensibility, *or the provocation of Sense: They are also called* Hypnoticks *and* Somnificks, *because they induce Sleep. These being taken too liberally, or to excess, cause Death, as all Opiates, if immoderately dosed. They are to be administred at such times, when the Symptoms are so grievous, as to threaten a greater danger than the Disease.*

XII. 9. BECHICKS. *These are such as abate or ease Coughing. And they are things which incrassate thin Humours, stop Defluxions, and so ease the Cough. Narcoticks of the middle kind, are agreeable to to the Breast and Lungs; which if they are cold, they incrassate thin Humours, and stop Coughing, and especially such as are much Narcotick, or Stupifying: But such things as are hot and of thin parts, and extenuating, which expectorate tough Humours, oft'times ease it.*

XIII. 10. SOLUTIVES. *These are Loosning Medicines, not such as are Purging, but by their hot and moist Qualities, keep the Body soluble; they not only open the Pores of the* Viscera *or Entrails but in some measure removing Obstructions,*

ctions, they open the inferiour Ductus *of the Bowels; as do Nitrous Salts, Soluble Salt of Tartar, Oat-Meal,* &c. *and this they may do, altho' they may have ſome ſmall Aſtriction, and by reaſon of Subſtance, do not differ from thoſe which are Abſterſive, but in degree. For theſe things which cleanſe the* Pores *and inward Paſſages, have a great tenuity of Parts, and are moderately Aſtrictive, which cleanſe, and as it were ſeemingly Purge the greater Paſſages, yet withall ſtrengthen the ſame. Some things are Soluble by lenifying, as Fat things; and ſome by waſhing and abſterſion, as Whey, Solutive Waters, New Beer and Ale,* &c.

XIV. 11. ATTENUATERS. *Theſe are ſuch things as make thin, and are of hot and thin Parts, and ſo extenuate groſs and tough Humours, and are for the moſt part hot and dry in the ſecond and third degrees, as things Sharp,* Picquant, *and Aromatical, generally they are ſtrong provokers of the Terms, becauſe they make the Blood and Lympha, more thin and fluid: They alſo facilitate the Delivery of Women in Labour, bringing forth both Birth and Afterbirth. Hereto belong* Inciders *of Viſcid Humours, which are more ſtrong. And* Diſſolvers *of what is Grumous and Coagulated, as* Sal Volatile Oleoſum, *and all Alcalious and Volatile Salts and Spirits. Alſo* Extenuants, *or waſters of the Fat Subſtance, and Groſs Parts of the Body. And* Laxatives, *which are Solutives, and moderately hot, moiſt, and thin. The uſe of* Attenuating Medicines, *is previouſly in order to open the Obſtructions of the Bowels, Lungs, and Womb.*

XV. 12. COAGULATIVES. *Theſe are ſuch as make thick, being contrary to thoſe things, which make thin or rarefy. They make Rheum and Humours, tough and thick.; and ſo are accounted either cold or temperate. They are given in Colds, Coughs, and vehement Catarrhs and Diſtillations, whereby the Flegm or Rheum being coagulated or thickned, it is made more fit for Expectoration: They alſo take away the ſharpneſs of the Blood and Lympha, and thicken it, whereby they ſtop the overflowing of the Loches and Terms in Women, and perfectly prevail againſt a Diabetes. They alſo ſtop too much Sweating, and the diſpoſition of the Spirits, which often happen to ſuch as are Weak, and in Conſumptions.*

XVI. 13. CONFORTATIVES. *Theſe are* Strengtheners *of the univerſal Man, of the* Spirits *as well as the* Body; *and are generally of hot, dry, aſtringing, and ſubtil Parts, that they may warm thoſe Parts which are cold; dry and confirm thoſe which are weakned by too much moiſture; bind or ſtop the too openeſs of the Pores, by which the Spirits are diſſipated; and of ſubtil and volatile Parts, that they may unite with or join, the Natural, Vital, and Animal Spirits, to revive and exhilerate them. But ſometimes, when the Body is weakned by heat and dryneſs, cold things may become* Confortatives, *by overcoming thoſe Qualities by which the Body is weakned; and ſo we ſee the Spirits and Oils of* Nitre, Salt, Sulphur, *and* Vitriol, Lime Juice, Juice of Limons, *&c.* Confortatives *in the higheſt degree, where the Body has been weakned by Hectic and continual Fevers, and other hot and dry Indiſpoſitions, not eaſily to be expreſſed in few words.*

II. Of External *ALTERATIVES.*

XVII. 1. STYPTICKS, HÆMOPTOICKS, *or* Antihæmorragicks. *Theſe are ſuch things, as ſtop bleeding in what part of the Body ſoever. They are for the moſt part cold, at leaſt temperate, exceeding drying and repulſive: For things which are cold, repel, and many of them coagulate, or thicken; and ſo if they have a craſſitude of Parts, as things acerb and auſtere. And Medicines vehemently drying, which are Aſtringent, repel alſo, becauſe they thicken the Blood and Lympha: Theſe, if they be of thin parts, much conduce to Aſtriction: Some* Stypticks *have a craſſitude of Body, for which reaſon they then cannot eaſily penetrate the more remote Parts, precluding the Paſſages; therefore thoſe which have a thinneſs of Subſtance, are rather to be choſen, unleſs the cauſe lies in the ſuperficies, as in all freſh and bleeding Wounds.* Stypticks *are indeed the higheſt Aſtringents, and Binders, and if joined with Narcoticks, tranſcend in the higheſt degree.*

XVIII. 2. ANODYNS, or PAREGORICKS. *Theſe are eaſers of Pain; and are moderately hot,* viz. *in the firſt degree, not much exceeding temperate, and of thin Parts, and rarefacient: So by opening the Pores, they Evacuate, Rarefy, Extenuate, Digeſt, and Concoct; equally encountring whatever Humour, is either ſharp, cold, groſs, or tough, inhering in the Pores, or near adjacent grieved Parts, which by reaſon of the obſtruction of the Pores, could not find a way out; beſides, they are aqueous or moiſtening, and acreal or of ſubtil Subſtance, not in the leaſt Aſtringent. But there are ſome* Cold Anodyns, *which are ſuch as give eaſe in Tumours, or Pains cauſed from great heat. Again,* Anodyns *are ſaid to be* Proper *or* Improper. Proper, *are ſuch as we have already been ſpeaking of:* Improper, *are ſuch as they call* Narcoticks, *made of Opiates, Henbane, Hemlock, Mandrakes, Nightſhade,* &c.

XIX. 3. REPERCUSSIVES. *Theſe are* Repelling Medicaments, *which drive back the Humour. They are generally cold and drying, and of groſs Parts; for that which is cold, repels, and if it has a craſſitude of Parts alſo, it acts with more force, as that which is* acerb *or* auſtere. *Thoſe things alſo repel which are* Aſtringent, *if they have alſo a tenuity of Parts, for the thinneſs of their Subſtance, does much conduce to* Aſtriction. *And therefore other things which are* Aſtrictive, *by reaſon of the thickneſs of their Subſtance, cannot eaſily penetrate the more remote Parts, precluding the Paſſages. And hereto* Defenſatives, *and* Intercipients *may be reduced, being Cold, Aſtringent, and Repulſive. Theſe, by their* Coldneſs, *repel the Humour; and by their* Aſtringency, *ſtrengthen the Part afflicted.*

XX. 4. DISCUSSIVES. *Theſe are ſuch as reſolve the Matter contained in the Part. They are moderately hot, with a tenuity of Parts, and very little reſiccant or drying: For as Diſcuſſives rarefy and make thin, cauſing the Matter to be diſſipated, ſo exceſſive heat does condenſate and dry; whereas moderate heat opens the Pores, or Paſſages, and deeply-penetrating, by the tenuity of its Subſtance, opens the Pores, attenuates the Matter, and ſo eaſes the Pain. Their uſe therefore is,* 1. *To open the Pores.* 2. *To attenuate the Matter,*

or

or make it thin and fluid. 3. *And to evacuate it for the moſt part by Perſpiration.*

XXI. 5. EMOLLIENTS. *Theſe are ſuch things as mollify or ſoften any hard Tumour or Part. Theſe are generally hot and moiſt; hot in the firſt degree, and moiſt in the firſt or ſecond degree. Their heat is a little beyond the Proportion of Nature, and they are of thin and humid Parts, that they may pierce into the Matter, and mollify or ſoften it. For which reaſon it is of uſe in Strumous or Scirrhus Tumours, Oedema's, and others of like Nature; to ſoften the hardneſs, and reduce it to its priſtine heat: And theſe are either* Common, *or* Proper. 1. *The* Common *are ſuch whoſe general Operation is to ſoften hard Swellings, and ſuch parts and places of the Body, as are hardned by Congelation.* 2. *The* Proper, *are ſuch as are applyed or appropriated to peculiar Humours, which being either hot or cold, the* Emollient *muſt be oppoſite to them, in thoſe active Properties, but retaining its due humidity.*

XXII. 6. ATTRACTIVES. *Theſe are drawing Medicines, which attract or draw the Humours from the Center to the Circumference. They are hot, and of thin Parts: For that which is hot, attracts, and that more ſtrongly, if it has conjoin'd with it a* tenuity *of Parts. Thoſe which are hot and dry in the* ſecond degree, *moderately attract; if in the* third, *more effectually; but moſt thoſe which are hot in the* fourth, *for the attraction is according to the ſtrength or degree of heat: Yet ſome things attract* Specifically, *and not by any manifeſt Quality, as* Emeticks, Catharticks, *&c. Theſe are contrary to* Repercuſſives, *for their Nature is to drive from the Circumference to the Center; but* Attractives *draw from the Center to the Circumference. They are of uſe in Wounds, made by the Bitings of Mad Dogs, Serpents, and other Poiſonous Creatures; in Burnings, Venereal and Peſtilential Tumours,* &c. *where it is abſolutely neceſſary to draw the Poiſon and Malignity outwards, in order to the ſaving of Life.*

XXIII. 7. SUPPURATIVES, *or* Maturatives. *Theſe turn into Matter, contuſed Fleſh, and Humours, as alſo the Subſtance, of which many Tumours or Swellings conſiſt, and bring it to perfect ripeneſs. They are moderately hot, and next to Emollients, yet differing in this, that Suppuratives have an Emplaſtick faculty, where, by obſtructing the Pores, they produce heat, moſt like unto that of the Body, without any* Conſumption *or* Addition *of the Humidity. Theſe are friendly to Nature, and conſpire together with it, to bring the ſuperfluous Matter to form, and to ſuch a form, as that it may be ſeparated and caſt out, and the afflicted Part thereby eaſed.*

XXIV. 8. PYROTICKS, or CORROSIVES. *Theſe are threefold.* 1. Cathereticks. 2. Septicks. 3. Cauſticks, *or* Eſcharoticks. I. Cathereticks, *or Eaters. Theſe are meanly ſtrong; they by their corroſive Properties, conſume Excreſcencies, and eat away proud and dead Fleſh.* II. Septicks. *They are Corroſives, vehemently hot and dry, of thin Parts, and conſiſtence, which by their vehement heat, eliquate the Part, and are called* Putrefactives; *and their uſe is to draw Bliſters; theſe are Veſicatories.* III. Cauſticks, *or* Eſcharoticks. *Theſe are vehemently hot and burning, being the ſtrongeſt of all, ſo that they conſume all they come near. They cauſe* Cruſts *upon the place they are applyed to, and are chiefly of uſe to make Iſſues, or open Apoſtems.*

XXV. 9. DIGESTIVES. *Theſe are a kind of* Maturatives, *which bring laudable or well* digeſted Pus, *or* Matter, *into* Complex *or* confuſed Wounds, *and* ill natured eating Ulcers; *without which the Pain can neither be taken away, nor the Wound or Ulcer healed, or a ſtop put to the eating,* &c. *Of theſe we have largely diſcourſed in our* Ars Chirurgica, *where you may find a plentiful number of Preſcripts in exemplification thereof.*

XXVI. 10. ABSTERSIVES. *Theſe are Cleanſers, which ſeparate and remove the glutinous, clammy, or putrid Matter, adhering to Wounds and Ulcers, which hinders their healing. They have a power to exſiccate with tenuity of Subſtance; and they may be either hot or cold; nor is it of any great moment, which of them, by reaſon neither Quality can hinder their action, except* Exceſſive. *Yet ſome count them chiefly hot and drying, with a certain thickneſs of Parts to compact the Humours: And becauſe they cannot be defined, by either heat or coldneſs, ſince ſome of both ſorts cleanſe, they are to be underſtood to have a terrene Subſtance, which may take away the filth with them; and muſt a certain roughneſs, or nitrous Quality, to carry away the compacted filth.*

XXVII. 11. SARCOTICKS, *or* Incarnatives. *Theſe generate Fleſh in hollow Wounds and Ulcers, and fill up their cavities, as far as Nature will admit. They are hot in the firſt degree, a little* Deterſive, *and that without* Biting *or* Aſtriction. *Alſo moderately drying,* viz. *under the ſecond degree. And ſuch as* Impinguate, *or breed* Fat, *are Heating, Nouriſhing, Impulſive, Attractive, Retentive, or Specifick; as Hemp-Seed, Pouder of Sarcocol, Kernel of the Indian Nut. They dry, and change the Blood that comes to any part into Fleſh. Their degree of dryneſs muſt be according to the Part: If the Ulcer happens in a dry part of the Body, the* Sarcotick *muſt be very dry, and therefore ſome of them are drying, even in the fourth degree. But if the part of the Body is moiſt in which the Ulcer is, the Incarnatives are to be leſs drying: They ought not to exceed the firſt degree, unleſs the Ulcer be very moiſt. They breed not good Blood, nor correct the intemperature of the place affected; they only defend the Blood from ill Symptoms, and the Ulcer from Corruption in breeding Fleſh; for Nature in breeding Fleſh, produces either* ſerous *or* purulent *Recrements, and theſe Medicines which cleanſe and conſume thoſe Excrements, by their drying Quality, are ſaid to breed Fleſh, becauſe by their help, Nature performs that Office.*

XXVIII. 12. AGGLUTINATIVES. *Theſe are ſuch as glew the Lips of Wounds, and ſeparated Parts together. They are alſo called* Symphitica, *which is the reaſon that Comfry is called* Symphitum, *becauſe of its glewing Quality. They are generally drying in the ſecond degree; and are in a mean between* Incarnatives, *and* Cicatrizers. *They are not* Abſterſive, *but* Aſtringent, *and prohibit the Flux of Humours, to the Lips of Wounds, Ulcers, and Fiſtula's. They are temperate, in reſpect of heat, and of a thick Subſtance. By their* dryneſs, *they abſorb that humidity, which intervenes between the Lips of Wounds, that thereby they may be conjoined: And that is the true*

Cure

Cure of an Ulcer, which conjoins the sides of an Ulcer, before brought together. And Ulcers require a greater degree of drying than Wounds, not only to consume what flows out, but also what remains liquid in the Flesh.

XXIX. 13. CICATRIZERS, *or* Epuloticks. *These are such things as skin a Wound, Sore, or Ulcer. They dry and bind without biting; absorbing the humidity of the Flesh, contracting it with a Skin, or a thin* Callus *like unto a Skin, and therefore are more drying than Incarnatives or Glutinatives: For these bind, contract, constipate, and indurate; being cold, and of a thick Substance. There is also a sharp and biting* Epulotick, *which consumes dead Flesh, as Cathereticks; and a third sort, which dries without astriction. The last part of the Cure of a Wound or Ulcer, is to cover it with Skin, and restore the place to its pristine beauty: Now these Medicines meddle with the Flesh, no farther than only to convert it into Skin.*

XXX. 14. COSMETICKS, *or* Beautifyers. *These adorn the Body by adding beauty to it, by absterging or cleansing it from defilements, as Leprosie,* Leuce, *Scabs, Itch, Pimples, Redness, Wrinkles, Freckles, Yellowness, Tanning, Sunburning, and the like. Those which proceed from heat, are to be remedied by cooling things: If the defilement is impacted in the Skin, extenuating Medicines are to be applyed; if Freckles or Worms affect it, the Skin it self is to be absterged by* Emplasters of Soap, *or Oil of Tartar* per deliquium, *diluted with Water; if Leprosie, Scabs, or Pustules, constantly breaking out, the* Cuticula *must be taken off by* Epispasticks, *&c.*

CHAP. V.

Of the Third Qualities.

I. THE third Qualities *of Medicines are such as are* Appropriate, *that is to say, which are appropriated to some principal and noble Parts of the Body, the knowledge of which Physicians have learned and obtained, either, 1. From the signatures of the Medicaments themselves. 2. Or from a long series of Practice and Experience.*

II. *And therefore as Medicines are said to be appropriate, to the most noble and principal Parts of the Human Frame, so from them they take their Denominations or Names, and accordingly are said to be,* 1. Cephalicks. 2. Neuroticks. 3. Stomachicks. 4. Pulmonicks, *or* Pectorals. 5. Pleuriticks. 6. Cardiacks, *or* Cordials. 7. Hepaticks. 8. Spleneticks. 9. Mesentericks, *or* Hypochondriacks. 10. Nephriticks. 11. Hystericks. 12. Arthriticks. *Of which in their respective order.*

III. 1. CEPHALICKS. *These Medicines are said to be appropriated to the Head, and have respect chiefly to the Brain, the* Medulla oblongata, *and the Membranes called* Pia & Dura Mater, *but have very little to do with the* Tongue, *for that is a very unruly Member. The* Brain *is the seat of Apprehension, Judgment, and Memory, and by Nature moderately hot; and so is very easily afflicted by either too much heat or cold, but chiefly by the latter, and for the most part by too much moisture, and therefore the Medicaments appropriated to the Head and Brain, are generally hot and dry, and of very subtil, thin, and volatile Parts, for otherwise they could have no affection upon those Parts. To these some add* Ptarmicks, *and* Sternutatories; *'tis true, these will purge the Brain and Head from a world of pituitous, cold, and moist Recrements, but these are not* proper Cephalicks, *for what they do, is by the Virtue of their violent heat, and strong attractive power. Whether there be any* cooling Cephalicks *is a doubt, if cooling things affect the Head and Brain, they do it simply, either by their cold Quality, or by cooling other Parts over-heated, which by* Sympathy *or* Consent, *affect the Head.*

IV. 2. NEUROTICKS. *These are* Nervous Medicaments, *and are all hot and dry, from the second even to the fourth degree, of a very thin Substance and penetrative Parts, without which they could not pierce and affect the Nerves, to ease their extravagant Pains, as in Cramps and Convulsions, or to warm, comfort, and strengthen them, as in Palsies, &c. they ought to be very subtil and volatile, that they may agree with the Animal Spirits, and as it were recuperate them. Their use is both* Internal, *given in some proper vehicle; and* External, *being applyed to the Parts affected, and all along down the Spine or Back-Bone, from whence all the Nerves of the extream Parts, as well as some others spring. They very much agree in their Qualities with Cephalicks, because the Root or Original of all the Nerves thro' the whole Body, arise from the Brain.*

V. 3. STOMACHICKS, *or* Stomach Medicaments. *These are such as open Obstructions in the Stomach, ease its Pains, and strengthen its Tone. They may be either hot or cold, and so affect the Part, according to the Indisposition which attends it. 1. When it is obstructed, the Appetite is diminished or depraved, with a kind of nauseousness concomitant: And this is remedied chiefly by acid Aperitives. 2. When it is pained, or there is a sickness at Stomach, it is commonly from being either over-heated, and then cooling Stomachicks are to be given; or over-cooled, and then hot Stomachicks are to be exhibited; or from vehemently acid or sharp Humours in it, and then Absorbents, or fixt Alcalies, will be chiefly of use. 3. When its Tone is weakned, or hurt, then the Digestion is bad, the Concoction is weak, and so a bad* Chylus *is generated; whence the* Retentive *Faculty is also many times profligated, and whence proceed sometimes the Scurvy, and Rheumatick Pains, or the Gout; and if it be of long continuance, it induces a Consumption, because the Body will want a suitable Nourishment. And these things are remedied (after due evacuation) by Stomaticks, of a hot and dry Quality, of thin Parts, and Confortative withall, which have power to warm, comfort, and strengthen it, and have likewise an Astringent property, which strengthens the Retentive Faculty.*

VI. 4. PULMONICKS, *or* Pectorals. *These are Medicaments appropriated to the Lungs, and have regard either to the Part afflicted, or to the Matter afflicting.* 1. Those which regard the Part afflicted, *are such as stop bleeding, if any Vessel is broken in the Lungs, and by a kind of Styptick Quality, have power to conglutinate or heal it; or if there be any Ulcer in the Lungs, have the power of cleansing it, and healing it withall, which*

is done by either a Balſamick Property; or by a Specifick, of which Nature is Cinnabar of Antimony, *and all* ſweet Preparations of Mercury, *which entring into the maſs of Blood, and being diſſolved in it, give ſuch a healing property to it, that by its continual paſſage thro' the Lungs, it does at length perfectly heal them.* 2. Thoſe which regard the Matter; *and theſe are ſuch as digeſt and thicken the Rheumatick or pituitous Matter, ſtuffing them (which cauſes Aſthma's, Wheezing, Hoarſneſs, loſs of Voice,* Coughs, &c.) *and cauſe it to be expectorated, and thoſe are they which are moſt uſually called* Pectorals. *Beſides, they many times clear the Stomach of what ſticks to it, cauſing it in ſome meaſure to be ſpit up.*

VII. 5. PLEURITICKS. *Theſe are ſuch things as are appropriated to the* Pleura; *and generally give preſent eaſe to Pains and Swellings in the Sides, Stitches, the* Pleuriſie, &c. *and they are either Anodyns or Narcoticks. The* Anodyns, *are ſuch things as are hot and dry, and abound with an admirable volatile Spirit and Salt, ſuch as Salt of Urine, volatile Sal Armoniack, volatile Salt of Tartar, volatile Salts of Beans, Peaſe, and other Pulſes, as alſo* Sal Volatile Oleoſum. *The* Narcoticks, *are ſuch things as are made of the Wild or Corn Poppy Flowers and Heads, and of Opium; ſo that Opiates, eſpecially ſuch as are repleat with volatile Sal Armoniack, Salt of Hartſhorn, of Tartar,* &c. *all immediately affect the* Pleura, *and give preſent eaſe in the diſaffections thereof.*

VIII. 6. CARDIACKS, *or* Cordials. *Theſe are Medicines appropriated to the Heart; the Fountain of Life, and Seat of the Vital Spirit; the Original of Innate Heat, and of Vigor and Action. And therefore Cordials ought to abound with* Subtilty *and* Volatility, *to revive the Spirits, and with* Heat *to ſtrengthen the Heart, and make it perform its action. Thoſe* Cordials *which* revive and refreſh the Spirits, *muſt be Spirituous, as Wine, and Spirit of Wine: And thoſe which* ſtrengthen the Heart, *are either* Hot, *when its natural heat is decayed or waſted: Or* Cold, *when it is heat above Nature, by either Fevers or any violent Paſſion, or by Poiſon; the firſt of which are* Antifebriticks. *The ſecond,* Confortatives. *The third,* Alexipharmicks, *or* Antidotes *againſt Poiſon.*

IX. 7. HEPATICKS. *Theſe are* Medicaments appropriated to the Liver. *And theſe are conſidered in a three-fold reſpect,* 1. *As they open its Obſtructions.* 2. *As they reſiſt its Diſeaſes.* 3. *As they ſtrengthen it.* As to the firſt, *Hepatick Aperitives are to be choſen, which may open its Veſſels, and keep them free from Obſtruction, without which it is impoſſible that the Perſon ſhould be Well, but muſt at long run fall into a Conſumption: Theſe cut and extenuate without any vehement heat, and yet cleanſe.* As to the ſecond, *Hepaticks oppoſite to the Diſeaſe afflicting the* Liver, *are to be choſen: So if there is an Inflammation, cooling, cleanſing, and extenuating things are to be uſed: If a* Scirrhus, *things ſoftening and diſſolving. With a Decoction of Juniper-berries in Water, drank for a Year together as ordinary Drink, I cured a vaſtly great* Scirrhus *of the Liver, outwardly to be felt, hard, and as large as a great twopenny Loaf.* As to the third. *The* Liver *after all is to be ſtrengthned, and this is done by* Hepaticks, *gently* Aſtringent, *for ſeeing its uſe is to help towards the perfection of the Blood, it needs ſome* adſtriction *to preſerve its heat, and ſtrengthen it. Yet the* Liver *requires not ſo great aſtringents as the* Stomach, *becauſe the paſſages of the* Stomach *are larger, and more open, than thoſe of the* Liver; *ſo that if they be very* Binding, *they may be hurtful to the* Liver, *and cauſe* Obſtructions.

X. 8. SPLENETICKS. *Theſe are* Medicines appropriated to the Spleen. *Spleneticks are conſidered in a threefold reſpect alſo.* 1. To ſuch as open its Obſtructions, *and they are* Aperitives, *which ought to be ſo powerful, as to penetrate into its moſt inward receſſes; for the whole Subſtance of the* Spleen, *is a kind of Animal Honeycomb.* 2. To reſiſt its Diſeaſes; *and theſe in an Inflammation, ought to be cooling and diſcuſſing: In a* Scirrhus, *to be* highly Reſolutive, *not in the leaſt binding; and outwardly Emollients may be applied.* 2. To ſtrengthen it. *And theſe are ſuch as are temperate, in reſpect to heat or drineſs; yet they ought to have ſo much adſtriction, as to confirm its natural and healthful* Tone.

XI. 9. MESENTERICKS, *or* Hypochondriacks. *Theſe are* Medicines dedicated to the Meſentery: *Its grand failure is from* Obſtructions, *which are either from viſcous or clammy Humors, or from Wind, which induce a profound Pining, or univerſal Conſumption of the whole Man; and in the end (if not removed) Death. Upon this* Axle-tree, *the* whole Orb of Life *turns; and when it breaks, the Man ſinks, and the Body returns to its firſt Principles. And therefore the moſt powerful* Deobſtructors *or* Aperients, *are ſpecifick Meſentericks; and theſe in the Mineral Kingdom, are deduced from* Chalybeates: *In the* Animal, *from Volatil Salts, as* Sal Volatile Oleoſum Sylvij: *And in the* Vegetable Kingdom, *ſuch things as have power to diſſolve congelation of the Juices, as Volatil Salts of Beans, and of Tartar; or to cut the viſcid and clammy Matter, as Creſſes, Horſe Radiſh, Muſtard, Rocket, in cold habits of Body; or Juices of Citron, Limons, or Lime Juice, and their Syrups, in hot Conſtitutions joined with other proper Aperients, which may have a power to penetrate into the moſt inward receſſes of this Bowel. Add to theſe* Carminatives, *conjoined with* Sylvius's Spiritus Anticolicus, *where Wind ſeems to have the predominancy.*

XII. 10. NEPHRITICKS. *Theſe are* Medicines appropriated to the Reins and Bladder. *In the* Reins, *a ſeparation is made of the* Serum *from the Blood, without which Man could not live, and the Bladder, of a ſufficient magnitude, is the receptacle to contain it. Therefore it is neceſſary by appropriate Medicaments, to keep thoſe parts clear, and free from Obſtruction, and to retain their ſtrength, that they may the better perform their Offices. The Diſeaſes afflicting the Reins and Bladder, are chiefly,* 1. Obſtructions by a tartarous or viſcid Mucilage. 2. Stones, Gravel, or Sand. 3. Inflammation. 4. Piſſing Blood. 5. Ulcers. The firſt, *is cured by Aperients and Diureticks.* The ſecond, *by Lithontripticks.* The third, *by cooling Diureticks, as* Sal Prunellæ *diſſolved in a Diuretick Wine.* The fourth, *by Stypticks and Narcoticks, as Catechu, and Opiates prepared with Acids.* And the laſt, *by Balſamicks, as Balſams of* Chili, Gilead, Peru, Capivij, Venice, Strasburg, *and* Chio *Turpentines, and* ſweet prepared Mercury, *which tranſcends all other things.*

XIII. 11. HYSTERICKS. *Theſe are* Medicines appropriated to the Womb. *It is a*

Part

Part which one would think had some Sense in it, because it is pleased and delighted with some things, as Aromaticks, Perfumes, and the like; and displeased (so as to fly from them) with stinking and ill-scented things, as Turds, Assa fœtida, and other stinking things of like nature. Therefore since Vapours, Hysterick Fits, and Hysterick Convulsions, proceed from the Womb, those things which alleviate them, suppress the Fumes, and reduce the Womb to its place, ease its Pains, and profligate it. Convulsive Motions are properly called Hysterick, so Musk, Ambergrise, Aromaticks, applied to the Nose, induce Vapours, Fits, Convulsions, &c. Whereas applied to the place of Conception, suppress them all. But Assa fœtida, *and other stinking things applied below, bring those Diseases; whereas held to the Nose, or taken inwardly by the Mouth, they frustrate and Cure them. Medicines which provoke the Terms, or Loches, &c. or which suppress or stop them, are accounted* Hystericks; *but of them we shall treat in the fourth Qualities.*

XIV. 12. ARTHRITICKS. *These are* Medicines appropriated to the Joints. *And seeing that they consist chiefly of tendinous and nervous Parts, therefore they are chiefly composed of Neurotick Medicaments, which have a heating and drying Quality, gently astringent or binding, and withall having a peculiar strengthening Property: But because the Joints are the extream parts of the Body, and more remote from the Vital Center, they require the stronger Medicaments.* Pains *are eased by Anodyn Arthriticks, mixed with Narcoticks, as a mixture of Camphir, and Spirit of Wine, with Opiates.* Inflammations *are abated by Arthritick Baths: And the* Arthritick Tumour *is removed either by* Epispasticks, *or* Burning; *or by the application of* Arthritick Repercussives, *mixed with Camphir, or Opium, or both.*

CHAP. VI.

Of the Fourth Qualities.

I. THE fourth Qualities *of Medicaments are such as are* Abstractive, *to wit, such as by their Power or Operations,* take away some thing *from the Body; or from some of its Bowels or Parts.*

II. *And these receive their Names from the variety of their Operations, which they each perform in the respective parts of the Body, to which they are adapted; which are the Nine following,* viz. 1. Emeticks. 2. Catharticks. 3. Salivaticks. 4. Ptarmicks. 5. Emmenagogicks. 6. Diureticks. 7. Lithontripticks. 8. Sudorificks. 9. Venefick.

III. 1. EMETICKS, *or* Vomitories. *These by giving a reluctance to the nervous Fibres of the Stomach, cause their Relaxation and Stimulation, whereby afterwards as the reluctancy grows more and more, and the nauseousness encreases, those nervous Fibres before relaxed, suffer a kind of Convulsion, or Contraction, and so eject the offending Matter upwards, or by the Mouth, whereby that* Viscus, *by such a discharge, comes to be restored to its pristine Health. Nor is the Stomach otherwise to be cleansed, for ten* Catharticks, *or* Purges, *how strong soever, will not so well cleanse the* Ventricle, *as one proper and well-designed* Emetick. *The* Stomach *therefore is to be cleansed upwards by* Vomiting; *the* Entrails, *or* Intestines, *downwards by* Purging, *which is according to the Law of Nature.*

IV. 2. CATHARTICKS, *or* Purging Medicines. *These peculiarly cleanse the* Entrails, *but withall draw the* Peccant Matter *from all parts of the Body, as has been seen in some who have for many Months lost all the Uses of their extream Parts, or Limbs, by violent and inveterate* Rheumatisms, *and Colicks; who by only Purging with proper* Catharticks, *have been perfectly restored; for which purpose, the* Pulvis Cornachini *has been notoriously known. They remove Obstructions, not only by opening the* Pores *of the Skin, but the interiour* Ductus *of the Bowels, as in those things* Nitrous *and* Bitter, *altho' they have some small* astriction. *They are also* Absterstive *in degree; for these things which open the Pores and cleanse the Passages, must have a power of Attraction, and a great tenuity of Parts, moderately hot, nitrous, and bitter, and so have a power of absterging and purging the greater Passages; but some purge by* lubrifying, *as Fat things. Some by* washing *and* abstersion, *as Whey impregnated with* Sena *and* Beets. *And some by* resolving, penetrating, *and* pricking, *as several Salts.*

V. 3. SALIVATICKS. *These are salivating or spitting Medicines, which resolving all the* Lympha *of the Body, into a pituitous or serous Substance, it is conducted from all parts of the Body to the Head, and passing thro' the salivatick Glands, is spit forth. This is only or chiefly perform'd by* Mercury, *and some of its* Preparations, *which melting the coagulated Juices, and carrying them with it, causes this Operation. The order of it, and how it is to be performed, is not our Business here. They who would know more of this, may see what I have said at large upon this Subject, in the Third Edition of my* Synopsis Medicinæ, *in my* Ars Chirurgica, *and in my* Praxis Medica; *the Second Edition of my Annotations upon Dr.* Sydenhams Processus, lib. 3. cap. 28. sect. 113. ad sect. 155. *to which I refer you.*

VI. 4. PTARMICKS, *or* Errhines. *These are for the most part hot and dry in the third degree, and are endowed with a very piercing Acrimony, by which they extreamly irritate, or shrivel up as it were the Membranes of the Brain, (as Emeticks do the Tunicles of the Stomach;) and by means whereof, the Head and Brain are cleansed or freed from their* Recrements, *and the viscid and pituitous Humour, or Matter, is expelled thro' the Nostrils, in a very extraordinary measure: If these* Nasales, *as some call them, cause Sneezing, they are then called* Sternutatories. *But proper* Errhines, *which only attract the Recrements from the Brain, are of mighty use in curing Apoplexies, Lethargies, Megrims, Vertigo's, Epilepsies, and other Cephalick Diseases of like nature, proceeding from Cold and Moisture.*

VII. 5. EMMENAGOGICKS. *These are such as provoke or draw forth the Terms. They are hot in the third degree, and of thin parts, concoct and digest crude Humours, extenuate and incide the Gross and Tough, and remove Obstructions, by opening and cleansing the Passages. And such are all proper* Diureticks, *for that they pro-*

mote the expurgation of the Menſes; *and if they are bitter as* Aloes, *and fætid as* Aſſa fœtida, ſtinking Arach, *&c. they are ſo much the more effectual*; ſtinking things *depreſſing the Womb, and* bitter things *purging it. There are alſo accidental* Emmenagogicks, *which refrigerate and humect the Body, dried by too much heat: And theſe things, which by their potency expel the* Secundine and dead Child, *as alſo a* Mola, *or* falſe Conception, *which are ſtinking, bitter, with Acrimony, and thineſs of parts, and are to be given often, and in pretty large quantities.*

VIII. 6. DIURETICKS. *Theſe are* Medicaments provoking Urine. *They may be either hot or cold, but moiſt, liquid, thin conſiſtence, and eaſy penetration, that they may encreaſe the quantity of Urine, as it were by Accident.* 2. *But in things cleanſing, attenuating, and aperient, they open the Paſſages; and theſe may be cold, and of thin parts, as* Sal Prunellæ, *which ſometimes expels what ſticks in the Paſſages; or operate after a middle-way, allaying the extream Heat, and cauſing the* Serum *and* Humours, *to be more eaſily attracted by the Reins, and deſcend to the Bladder.* 3. *By things which cleanſe the Paſſages, and open the ſame, having a Quality of extenuating groſs Humours, attenuating or thining the Blood, and ſeparating what is extenuated from the grumous Parts, by which the protruſion of the* Serum *into the Reins, will be made more eaſy, as alſo its paſſage thro' the urinary Parts; which kind of* Diureticks *are hot and dry in the third degree, ſharp, of very thin parts, coactive and ſeparating.* Diureticks *then are of two ſorts.* 1. Such as conduce to the ſeparation of the *Serum* from the Blood; *and they are very hot, ſharp, biting and cutting, whence they penetrate to the Reins, and cut the groſs Humours there.* 2. Such as open the Urinal Paſſages. *And theſe are generally cold things, which provoke Urine, but bite not, yet have a nitrous Quality, by which they open and cleanſe, as Nitre,* Sal Prunellæ, *Winter Cherries.*

IX. 7. LITHONTRIPTICKS. *Theſe are ſuch as break and expel the Stone, Gravel, Sand, or tartarous Mucilage; and they have a power of diſſolving, cleanſing and expelling the ſame: Being Diuretick, hot and dry, and of thin parts, ſharp and cutting, and ſomewhat bitter. Alſo ſome do it by* Inciſion *and* Deterſion, *without heat, as Spirits and Oils of Nitre, Salt, Sulphur and Vitriol, ſome by aſperity, or by ſome occult property.*

X. 8. SUDORIFICKS, *or* Hydroticks. *Theſe are* Medicaments provoking Sweat. *They are generally hot, and of thin parts, yet ſome are ſaid to be aſtringent and cold, working occultly: But the hot being of thin parts, are ſubtil and volatil, thining the Blood and Humours, and giving them a piercing volatility; ſo that being forced by the native heat, excited into action, they penetrate thro' all the coats of the Veſſels and Glands, thro' Fleſh, Fat and Skin, to the ſuperfices or moſt external parts, of the whole Body, from the crown of the Head to the ſoles of the Feet, expelling all noxious Fumes, malign and venene Humours, and peſtilential Miaſmata, from the Center,* viz. *from the Heart and Vital Parts, and ſo defending them from their deleterious aſſaults.*

XI. 9. VENEFICK, *or* Poiſoning. *Theſe are* things which take away Life, *being wholly inimical to Human Nature, and they are in the extremities of heat or cold; now they poiſon not from being in the extreams of intemperature, but from another peculiar property, by which they corrupt the Vital Juices, and by a malign and peſtiferous Gas or Steem, ſmite both the Animal and Vital Spirits; but which Property is excited or ſtirr'd up into action, by thoſe extream degrees of intemperature. Of the* Hot Kind, *are Bears-foot, Hellebor, Leopards-bane, Monks-hood, Woolfs-bane,* &c. *Of the* Cold Kind, *are Hemlock, Hen-bane, Nightſhade,* &c. *There are Poiſons alſo which act by a* Narcotick Property, *as* Poppies, *and* Opium. *Add to theſe Poiſons which do it by a* Congelation of the Blood, *whence proceed a Stagnation, and almoſt immediate Death; as the biting of a* Viper, Rattle-Snake, *&c. There are alſo* burning Mineral Poiſons, *as* Arſenick, *&c. And Poiſons which are only ſo by* Accident, *as* Corroſive Sublimate, Spirits and Oils of Antimony, Nitre, Salt and Sulphur; *which diluted and prudently given, are Salubrious and Healthful.*

CHAP. VII.

Of the Fifth Qualities.

I. THE fifth Qualities of Medicaments *are ſuch as are* Adductive, *to wit, ſuch as by a peculiar Property,* add ſomething *to the Body, or to ſome of its Juices or Parts.*

II. *And theſe are ſuch as reſtore, or daily add to the principal Juices and Parts of the Body, even to the whole Body, without which Human Life, or its Generative Powers, could not be conſerved; and they are,* 1. Chylificks. 2. Analepticks. 3. Galactogeneticks. 4. Spermatogeneticks. 5. Alexipharmicks.

III. 1. CHYLIFICKS, *or* Breeders of the Nutritive Juice. *Theſe are ſuch things as conſerve the natural heat of the Stomach, ſo that it may be able to concoct and digeſt the Food received in, without which a good* Chylus *could not be bred. They are generally hot in the ſecond, third and fourth degrees, ſo that they may not only preſerve but reſtore the Tone of the Stomach if hurt; and theſe are proper Stomachicks, hot, dry, and of thin parts, ſharp and attenuating. But when the Stomach is over-heated, and ſo the* Concoction *is hurt, as alſo the* Appetite *in a great meaſure deſtroyed. Then cold* Chylificks *are to be choſen, which may allay the præternatural heat, and reduce it to its juſt* Temperament; *and theſe are Cowcumers, Lettice, Purſlane, and generally Acids, as all ripe Fruits, Lime Juice, Limon Juice, Vinegar, Spirits of Nitre, Salt, Sulphur and Vitriol; all which not only allay the præternatural heat, but alſo excite the Appetite, and help the Digeſtion.*

IV. 2. ANALEPTICKS, *or* Reſtorers. *Theſe are ſuch things as breed a Reſtorative* Chylus, *which is of abſolute neceſſity in ſuch as are in Conſumptions. The Stomach may breed* Chyle, *and that plentifully, yet it may not be good, or reſtorative; ſuch a nutritious Juice is to be educed from thoſe things, which have naturally in them a reſtoring Virtue; which as they ought to be Stomachicks,*

or

or mixed with Stomachicks, so they ought to warm the Stomach if cold. They are hot in the first and second degrees, and for the most part of a fat or glutinous Substance, yet spirituous withall; of this kind are Meats made of Wheat Flower, as thick Milk, Hasty Pudding, also Parsneps, Turneps, Potatoes, &c. *and a Liquor called* Punch, *thus made.* Take choice Brandy, fair Water, of each a Quart, Lime Juice, a Pint, or three quarters of a Pint, double refined Sugar, a Pound; mix and dissolve: *Of which the Consumptive may drink half a Pint at a time, in the Morning; just before Dinner; at four in the Afternoon; and at Bed-time. To these things you may add Milk-meats, Cheese-cakes, Custards, Oisters,* &c.

V. 3. GALACTOGENETICKS. *These are things which* breed Milk in Nurses. *This is done partly by Meats, and partly by Medicine. For Food it is such as is* Euchymick, *and* Polytrophick, *of good Juice, and of much Nourishment, a little hotter and drier than the Blood, if it is chilly and pituitous; but more moist, and less hot, if affected with Choler. Medicaments breeding Milk, are hot and of thin parts, and of affinity to those things which gently provoke Urine. But such things as are strong, and provoke the Courses, hinder its Generation by too much eliquation of the Humours. Things also* too cold, *thickning, digesting, or drying, do the same.*

VI. 4. SPERMATOGENETICKS. *These are things* generating Sperm or Seed. *They are hot, and not very dry, but flatulent and spirituous, and breed of the purest and most spirituous parts of the Blood; and therefore all such things as encrease a strong and good* Chylus, *and from thence much and good* Blood, *encrease the quantity of Seed. It is also* stimulated *by things hot, volatil, thin of substance, penetrating and sharp; and hindred by things cold, insipid, non-nutritive, and discutient.*

VII. 5. ALEXIPHARMICKS, *or* Antidotes. *These are Medicaments adding Vigour to the Vital and Animal Spirits, to resist and overcome Poison, and are antipathetical to it. They are hot and dry in the second, third and fourth degrees, subtil and volatil, confortative to the Stomach and Heart, and homogene with the Spirits, enlivening the Human Body. They* 1. *Strengthen Nature, that it may be the more able to encounter the Poison.* 2. *They oppose the Poison, just by its opposite Quality.* 3. *By their potency, volatility and expulsive force, they violently expel it. Vomits, Cathartick and Sudorificks, immediately used, and in this order, are good expedients. If in the Stomach, Vomiting. In the Entrails, Purging; but if in the Spirits, (as in the Plague) Sweating.*

CHAP. VIII.

Of Preparations Galenick Internal.

AUthors have made a great number of them, we have reduced them to the following ten Heads.

1. Juices.
2. Infusions.
3. Decoctions.
4. Syrups.
5. Pouders.
6. Electuaries.
7. Lozenges.
8. Pills.
9. Troches.
10. Salts Essential.

I. JUICES. 1. *They are to be pressed out of Herbs, when they are young and tender, or rather, when they are just come to their flowering, because then the Juice is in its greatest Vigour, and gathered withall in a fair and dry Season.* 2. *They are made by beating the Roots, Herbs and Flowers, in a Stone or Iron Mortar, with a Wooden Pestle, and expressing the Juice with a Press.* 3. *They are either Liquid or Inspissate.* 4. *The Liquid are either from hot Herbs, and such as are volatil; or from cold: If from hot Herbs, they are to settle* 6, 8, *or* 10 *Hours, then to be decanted from their settlings, and put into a Glass or Bottle, putting Oil Olive upon them* 2 *or* 3 *Inches thick, to preserve them.* 5. *If cold Herbs, after settling, the clear is to be decanted, and clarified by boiling and scumming, or with Whites of Eggs, and then Bottled, with Oil put over the same.* 6. Inspissate Juices, *are never made from hot, dry, and volatil Plants, but from such as have a more glutinous or clammy Juice, such as* Acatia, Aloes, Cambogium, Catechu, Comfrey, Elaterium, Liquorice, Meconium, Opium, Scammony, Sloes, *&c.*

II. INFUSIONS. 1. *They are made from such Plants, Roots, Barks, Leaves, Flowers, Seeds, which are of hot, dry, and volatil Parts, and of such a Substance, as being rare, easily yield their Tincture.* 2. *They are very rarely or never made of cold Herbs and Plants, such as are of a thick Substance, and it may be Resinous withall.* 3. *If their Substance is thin and rare, a cold Infusion, or Digestion, (if in Summer-time) may do.* 4. *But if of a more compact, solid or tenacious Substance, after being reduced into a gross Pouder, they are to be digested in a warm Oven, or in a Sand heat for some days, shaking the Bottle once or twice a Day; then being settled, the clear is to be decanted, and kept close stopt for use.* 5. *The* Infusion *may be made in* Water, Wine, *or* Vinegar, *according to the Design and Intention of the Physician: If in* Simple Water, *it is then called by the bare Name of an* Infusion: *If in* Wine, *it is called a* Medicated Wine: *If in* Wine Vinegar, *a* Medicated Vinegar.

III. DECOCTIONS. 1. *They are never made of hot, dry, subtil, spirituous and volatil Parts, because, in boiling, all those fine Particles would be lost.* 2. *Or if they are decocted, it ought to be always in an Alembick, with a Receiver luted to it, to receive its spirituous and volatil Parts; that when the Decoction is made and clarified, they may afterwards be mixed therewith.* 3. *The Boiling is half an Hour, an Hour, or two, more or less, according to the crassitude of the Body; as they may be either Herbs, Roots, Barks, Woods,* &c. 4. *It is made either in Water, Broth, Wine, or Vinegar, according to the Intention and Design; but for the most part in Water.* 5. *It is a Medicament for present use, and therefore there needs no Directions for its keeping or preservation.*

IV. SYRUPS and JULEPS. *They are made,* 1. *Of Infusions.* 2. *Of Decoctions.* 3. *Of Juices, of Herbs, Plants, Flowers, Seeds,* &c.

2. *Those*

2. *Thoſe made by Infuſion, are chiefly from* Flowers, *as of Balauſtians, Blewbottle, Clovegilliflowers, Damask Roſes, Peony, Peach Flowers, Poppies Wild, Roſemary, Saffron, Violets,* &c. *by being digeſted one whole Night cloſe covered, either in the heat of a Bath, or Sand heat, often repeating the Infuſion.* 3. *Thoſe made by Decoction, are from ſuch Herbs, Plants, Roots, Barks,* &c. *as will admit of Boiling, as we have declared in the former Section.* 4. *Thoſe by Juices, are made of all your ſucculent Herbs and Plants, freed from their* fæces *or impurities, by ſettling or clarifying with Whites of Eggs.* 5. *The way of making. To every Pint of clear Infuſion, Decoction, or Juice, put two Pounds of Double refined Sugar, which mix together by melting only in* Balneo, *not at all Boiling it.* 6. *All Syrups will keep a Year, if kept cloſe ſtopt in Glaſſes; but ſtop them not with Cork or Bladder, for then they will be apt to break the Glaſs, only bind a piece of thin Leather, or Paper, prickt with a few ſmall holes over the mouth thereof.* 7. Juleps, *are thin, or half Syrups, being made of Infuſions, Decoctions, or Juices, with but half the quantity of Sugar; and theſe will keep but a little while,* viz. 2 *or* 3 *Months, being apt to grow ſour.*

V. POUDERS. 1. *The Ingredients, whether Roots, Barks, Leaves, Flowers, Seeds, Roſins,* &c. *are to be made very dry, either by Sun, a warm Oven, or ſome other Artificial heat.* 2. *By the help of a proper Mill, they are to be ground into Pouder.* 3. *But where a Mill is not to be met with, or it is but a ſmall matter, which is to be reduced; it muſt be done by beating in a Braſs or Iron Mortar, with an Iron Peſtle, and then made to paſs thro' a fine Searce; beating the remainder which will not paſs, and ſearcing it, ſo long till it is all, or very near all paſt thro'.* 4. *Reſinous Bodies, ſuch as Scammony,* &c. *will not eaſily be reduced without the help of a little Oil; anointing the bottom of the Mortar now and then, as alſo the end of the Peſtle with a little Oil Olive, by which means, it will with much more eaſe and ſpeed be reduced.* 5. Camphir, *tho' it may be reduced with a few drops of Oil; yet it is much better done, by adding to it a very ſmall quantity of Brandy, or Spirit of Wine, and then to grind it in a Mortar.* 6. *All Pouders ought to be kept in Glaſs Bottles, cloſe ſtopt with good Corks, but rather with Glaſs Stoppers; otherwiſe they preſently looſe themſelves, and will be good for nothing.*

VI. ELECTUARIES and LOHOCHS. 1. *They are made of ſubtil, or lævigated, or fine ſearced Pouders, mixed with Honey, or a Syrup of double refined Sugar, made into Syrup with Water or Wine, of the thickneſs of Honey.* 2. *The Proportion for a good bodied Electuarie, is* 3 *Ounces of clarified Honey to an Ounce of Pouder, or* 3 *Pounds of clarified Honey, or as much double refined Sugar diſſolved and reduced to the Subſtance of Honey, to one Pound of Pouder, which are to be mixed well together, either by beating in a Mortar, or over a very gentle Heat; then to be put into Gally-Pots, and to be tyed over with White Paper and Leather, and ſo kept for uſe.* 3. *A* Lohoch, *or Licking Medicine, is only a thin kind of Electuary, in which to every Ounce of Pouder, there is to be put* 5 *or* 6 *Ounces of clarified Honey, or Sugar: Theſe are uſed chiefly as Pectorals, in all Diſeaſes of the Breſt and Lungs.* 4. Electuaries, *(if well lookt after) will keep nearly a Year, but* Lohochs *will keep twice that time.*

VII. LOZENGES. 1. *A thick* Mucilage *is to be made of* Gum Tragacanth, *with Water, or rather with equal parts of Water and Spirit of Wine, or Juice of Limons: This is to be thickned with double refined Sugar in very fine Pouder, and beat together in a Mortar, till it comes to a ſtiff Paſte.* 2. *Or fine Sugar may be diſſolved in Brandy to a Candy height, and then mixed with the Mucilage aforegoing.* 3. Lozenges *are made either for* Vomits, *and then you may put to each half Dram* 3 *Grains of Emetick Tartar, which may be made into one Lozenge, and ſo the Patient may take either one, two, or three Lozenges, according to Age and Strength.* 4. *Or the* Lozenges *are* Opiates, *in which one or two Grains of choice Opium in fine Pouder, may be mixed, to make one Lozenge of half a Dram, or a Dram, to be given as a Doſe according to Age, Strength, Neceſſity, and other Circumſtances, in vehement Coughs, Catarrhs,* &c. 5. *Or as* Common Pectorals, *againſt Aſthma's, Wheezings, Hoarſneſs, ſhortneſs of Breath, and then Pouders of Liquorice, of Catechu, Cloves, Ginger, Mace, Nutmegs,* &c. *may be mixed with the Mucilage and Honey, or Sugar, in ſuch proportions, as the Phyſician ſhall think fit.* 6. *Then being well beaten, or wrought together, the Paſte is to be rowled out into thin Plates or Cakes, and ſo with a ſtraight Ruler and a Knife, to be cut out into quadrangular Lozenges, which are to be carefully dried, and kept for uſe.*

VIII. PILLS. 1. *The ingredients are ſeverally to be reduced to a ſubtil Pouder, by firſt beating in a Braſs or Iron Mortar, and then to be paſſed thro' a fine Searce.* 2. *To this Pouder ſo much choice Honey, or ſome proper Syrup is to be added, as may make it (by well beating it in a Mortar) into a Paſte, of ſuch a ſtiffneſs as may be made into* Pills; *which Paſte, is not be ſo hard or ſtiff as to crumble; nor yet ſo ſoft as to fall flat, and not keep up the roundneſs of its form.* 3. *Some Gum-Reſinous Bodies, as Aloes, Cambogia, Scammony,* &c. *being reduced into a fine Pouder, are rather to be made up into* Pills *with fair Water, than with Honey or Syrup; for they will as ſoon diſſolve in the Stomach, and keep a long time without mouldineſs: But then they are immediately to be formed into* Pills, *as ſoon as the Maſs is made; otherwiſe it will grow hard, and not afterwards to be done.*

IX. TROCHES. 1. *Theſe are in form like little Cakes, much about the bigneſs of a Copper Farthing, being only deſigned, that Pouders, which of themſelves are not able to reſiſt the intromiſſion of the Air, might be kept a long time pure, and free from ſpoiling.* 2. *Take half an Ounce of pure white Gum Tragacanth, put to it half a Pint or more of fair Water: Let it ſtand warm for* 24 *Hours, till it becomes a Mucilage, or Gelly,* 3. *Take the Pouders (being made impalpable) and mix with this Mucilage, by beating in a Mortar, ſo much as may make a ſtiff Paſte; which rowl out into thin Plates, and with a round hollow thin edged Braſs, Silver, or Steel Inſtrument, cut it out into little Troches, or Cakes.* 4. *Theſe you are to dry either in the Sun, or a warm Oven, after the Bread is out; and being through dry, put them up into a Gally-Pot, or other proper Veſſel, for uſe,*

tying

tying them over with a Paper and Leather, to keep them from the Air.

X. SALTS ESSENTIAL. 1. *Take a Plant when it is full of Juice,* viz. *in its Flowering time, a sufficient quantity; bruise it in a Wooden Mortar, and add a pretty deal of fair Water: Boil till half be consumed: Strain the Decoction by strongly pressing it out; and then Boil it to the thickness of Honey.* 2. *Take this mucilaginous Magma, put it into a Glass or glazed Vessel, and set it in a cold place for* 8 *or* 10 *Days; so will a Crystal Salt arise like Sal Gem, which gather, and wash it with the distilled Water from the same Plant, which dry and keep it for use.* 3. *Thus is made Salt of Carduus, Mugwort, Wormwood, and other bitter Herbs; but of other Herbs with much difficulty.* 4. *But such as yield a sweet Juice, give a plentiful quantity of Essential Salt, as the Sugar Cane: For* Sugar *is the Essential Salt of that Plant; so also do* Figs, Raisons of the Sun, *and other like sweet things; for* Figs *and* Raisons, *when old and dried, will shew some small quantity of that* Essential Salt *on their outsides, hard, dry, and of a white colour.*

CHAP. IX.

Of Preparations Topical, *or* External.

THO' Authors have multiplied the Titles of these Topical Preparations, yet these following are all that we think necessary for External Uses, or Outward Application.

1. Lotions.
2. Oils.
3. Ointments.
4. Balsams.
5. Pouders.
6. Emplasters.
7. Cataplasms.
8. Clysters.

I. LOTIONS, or WASHES. I. *Washes are made* 1. *Of fair Water.* 2. *Of Infusions, or Decoctions.* 3. *Of Wines.* 4. *Of Vinegars; of which a choice is to be made, according to the Purpose or Design for which it is intended.* II. *The general Intentions of Lotions, or Washes are five-fold,* viz. 1. *To beautify the Skin.* 2. *To ease Pain.* 3. *To discuss Tumours.* 4. *To cleanse old putrid Sores or Ulcers.* 5. *To attract or draw-forth any Poison, Venom, or Malignity, in the Part.* III. *First fair Water is used either simply by it self, as hot as the Patient can bear it, either to bathe with it, or to let the whole Arm, or* Leg, *to lie in it for half an Hour, or* 3 *quarters of an Hour, more or less, which repeat as need may require, twice or thrice a Day: It opens the Pores, abates Inflammations, and abstergs old putrid Sores and Ulcers, making them apt for healing. Or it is used with* Castile *or* Genoua Soap, *a quarter of a Pound dissolved in* 3 *Gallons of it, by a gentle Heat. This opens the Pores, and abstergs more potently.* IV. *Secondly,* Infusions *or* Decoctions. *These are made of such Herbs as are appropriate to the intention, and which the Physician shall advise, in which also* Castile *or* Genoua Soap *may be dissolved, and may serve for easing of Pain, discussing of Tumours,* &c. V. *Thirdly,* Wine *simply of it self, is used to comfort and strengthen weak Parts, discuss Tumours ease Pain,* &c. *by fomenting therewith as hot as the Patient can endure it, once, twice, or thrice a Day: And so it is of use* (viz. Red Wine) *to cure the falling-down of the Fundament. But mixed with* Camphir, *a Dram or Dram and half, dissolved in a little Brandy, to a Quart of Wine, it will be yet more powerful to all those Intentions, as also to prevent a Mortification.* VI. *Fourthly,* Vinegar, *simply of it self, used hot, is excellent to ease Pain, stop Bleeding, and take away Deformities of the Skin; but used with Honey dissolved in it, it abstergs putrid Ulcers, and heals Ulcers of the Mouth and Throat.* If *it is used with* dissolved Camphir, *and* Saccharum Saturni, *it not only cleanses the Skin, but cures most of its Deformities, and also beautifies it. These are some of the things which* Lotions *perform; and in imitation of these Examples, you may make a thousand others, which may have admirable Effects.*

II. OILS. I. *They are made* 1. *by Expression.* 2. *By Insolation.* 3. *By Boiling.* II. *Those which are made by* Expression, *are either Oil Olive, which if it is made out of Ripe Olives, is said to be temperate, in respect of heat, coldness, driness, or moisture; or Oils out of Nuts, as Oil of Almonds, Sweet and Bitter, of Wallnuts, Oil of Ben, which has that Property with it, never to grow Rank; or Oils out of Seeds, as Aniseed, Linseed, Rapeseed,* &c. III. Oils by Insolation. *Take Oil Olive, or rather Oil of Ben, a Gallon; of the Herbs or Flowers, or Seeds you design to make the Oil of,* 24 *Handfuls well bruised; mix them, cover the Pot with a Paper, and set it in the Sun (in the hottest Season) for* 14 *Days or more, stirring it every Day: Then having warm'd it over a gentle Fire, press out the Oil from the Ingredients in a wooden Press. Repeat this Insolation with more bruised Ingredients, three times at least; at last pressing out the Oil as before, let it stand to settle or defecate, and pour off the clear, which keep in Glass Bottles close stopt for use. Where note, that* Oils by Insolation, *ought to be made only of Herbs and Seeds which are hot and dry, of very thin, subtil and volatil parts, as of* Canesbil Musked, Hyssop, Lavender, Marjoram, Mint, Rosemary, Sage, Savory, Southernwood, Thyme, &c. *of* Aniseeds, Carraways, Coriander, Cloves, Fennel, Mace, Nutmegs, Parsly-seed, *&c. IV.* Oils by Boiling. *Take Oil Olive, a Gallon; of the Herbs, Flowers, Seeds,* &c. *bruised,* 20 *or* 24 *Handfuls: Boil all over a gentle Fire to Crispness; and press out the Oil strongly in a wooden Press. Repeat this Coction to Crispness, and expressing at least* 3 *times: Then letting it defecat or settle for a Day or two, decant the clear Oil and keep it for use.*

III. OINTMENTS and LINIMENTS. 1. *Ointments are made three ways,* viz. *first by making the Ingredients into an Oil by the former Section. Secondly, Of the Ingredients themselves by Insolation. Thirdly, Of the Ingredients by Coction or Boiling.* 2. *The first way, by making the Ointment of the Oil. Take a strong Oil made of the designed Herbs,* 2 *Quarts;* Strasburg, Venice, *or* Chio *Turpentine, Bees Wax, of each* 12 *Ounces:*

Ounces: melt and mix them well together, and put the Mass into Gally Pots for use. 3. *The second way by Insolation. Take such Roots, Herbs, Flowers, Seeds,* &c. *which are hot and dry, of very thin, subtil and volatil parts, bruised, eight Handfuls; Hogs Lard, four Pounds: Beat them well together in a Stone Mortar, with a Wooden Pestle; put the Mass into a broad Stone or Earthen Glazed Pot, tye it over with a Paper, and insolate it for* 14 *Days, or for want of a hot Sun, digest it as long in a mild Sand heat, that the Lard may be all that time perfectly melted; and whilst hot, strain out the matter by pressing. Repeat this Insolation or Digestion,* 3 *or* 4 *times, in the same manner; and at length, take the expressed Substance, and add thereto;* Venice *or* Strasburg *Turpentine, Bees Wax, of each* 8 *Ounces: melt and mix them over a gentle Fire without boiling, and keep the Ointment for use.* 4. *The third way, by Coction or Boiling. Take of the bruised Ingredients* 8 *Handfuls; Hogs Lard,* 4 *Pounds, boil over a gentle Fire to Crispness, and strain out by pressing: Repeat this work* 3 *or* 4 *times; and lastly, to the expressed Matter, add Turpentine, Bees Wax, of each* 8 *Ounces; boil and mix, and keep the Ointment for use.* 5. *Sometimes Pouders are added to Ointments for particular Uses, the chief of which, are of Aloes, Birthwort-Roots, Camphir, Coloquintida, Opium, Rosin, Scammony, Staves acre, Tobacco,* &c. *of Minerals, Burnt-Alum, Burnt-Lead, Flowers of Sulphur, Mercurius Dulcis, Saccharum Saturni, Turbith Mineral,* Red *Præcipitate, White Præcipitate, Verdigrise,* &c. 6. Liniments, *They are* Soft Ointments, *and made in all respects as Ointments are, saving, that they are generally made without Wax; or with only the half quantity of Turpentine and Wax.*

IV. BALSAMS. 1. *These are Artificial, and made in Imitation of the Natural, by mixing such Ingredients together as may constitute a body of equal Density or Substance.* 2. *Take Oil of the Ingredient you would add to your Balsam, as strong Oil of Hypericon, or strong Oil of the yellow of Orange Peels by Insolation,* 10 *Pints; Oil of Nutmegs by Expression, Balsam of Peru, choice Chio Turpentine, of each* 4 *Pounds; mix, melt over a gentle Fire, and keep it for use.* 3. *Take Oil of Ben,* 12 *Pounds; Chio Turpentine,* 6 *Pounds; Balsam of Peru,* 5 *Pounds; Oil of Nutmegs,* 4 *Pounds: mix and melt over a gentle Fire, and keep it close stopt for use.*

V. POUDERS. 1. *Those intended in this place, are only such as are for External use, applicable to the Eyes, stopping Blood, Wounds, Ulcers,* &c. 2. *They are made of Ingredients perfectly dried, and then reduced to a subtil kind of Flower, either by grinding in a Mill, or beating in a Mortar, and so passed thro' a fine Search.* 3. *Pouders for the Eyes, as Alabaster calcin'd and levigated, or* Lapis Calaminaris *calcin'd and levigated, or* Flints *calcin'd, beaten and levigated; any of which Pouders being blown into the Eye, consume Pearls, Films,* &c. *so also fine Pouder of Rice, which with ones Finger may be daily and several times a day rubbed upon Films, Pearls,* &c. *which in time wears them off.* 4. *Pouders for stopping Blood, are chiefly Catechu, Vitriol calcin'd with fine Bole and Camphir. Pouder of Puffs or Fus Balls, of Mans Blood, of Alcanet Root,* &c. 5. *Pouders for digesting, cleansing, and healing old Ulcers, as Aloes, of Rosin, of Scammony, of Tobacco,* &c. *which two last things are without comparison.*

VI. EMPLASTERS, *and* CERATS, *or* CERECLOTHS. 1. *Emplasters are made first with Oil Olive. Secondly with Hogs Lard, or some other Fat or Grease, adding the other proper Ingredients.* 2. First with Oil. *Take Oil Olive a Quart, some proper Gum or Gums, from* 10 *to* 16 *Ounces, Bees-Wax* 4 *Ounces, melt, mix, and boil to the Consistence of an Emplaster.* 3. *Where Turpentine, and any proper Pouders of Vegetables are added, Bees-Wax will be needless, and if any proper Juices be added, it is to be boiled to the Consumption of the Juices.* 4. *Some Mineral Pouders, as* Red Lead, White Lead, Litharge, &c. *being added to the Oil with Vinegar, will sufficiently bring the Oil to the Body of an Emplaster, without the addition of Gums or Wax, by a pretty long boiling and constantly stirring, with a wooden Spatula till it is perfected.* 5. *Secondly with Hogs Lard, or some other Fats or Greases. It is made altogether as the former, save in this case it needs much less boiling, and a smaller quantity of Gums or Pouders.* 6. Cerats *or* Cerecloths. *They are soft Emplasters, which will spread without melting in a Pan, or the help of Fire; being for the most part made with Oil Olive, and in a much larger quantity.* 7. *The Emplaster being brought to its due Consistency, it is then made up into Rowls, and so kept for Use.*

VII. CATAPLASMS, *or* PULTICES. *They are made with Oil or Fats, adding the boiled Pulps of Roots, or Figs, and the other proper Ingredients according to the Intention; as baked or boiled white Lilly Roots, Turneps, Onions, Garlick, Leeks, Comfrey Roots,* &c. *and so bringing it to a due Consistency with Flower of Oatmeal, Barley-Flower, Orobus-Meal, Crumbs of White Bread, Milks,* &c. *boiling all to a due softness.* 2. *Some Pultices are made to discuss Tumors which will not probably break; some to ease Pain, some to allay Inflamations, and some to Maturate Tumors which tend to breaking; so that according to the Intention of the Cataplasm, such ought the Ingredients to be, to answer the same.* 3. *It ought to be laid on as hot as the Patient can well endure it; and to be renewed* 2 *or* 3 *times a day, or as often as the Nature of the Malady afflicting requires it.*

VIII. CLYSTERS. 1. *They are Liquids made with Posset drink, or Meat Broths, with the addition of such other Ingredients as are proper to the Intention of Cure.* 2. *The chief Purposes for which they are used are,* First, *to ease Pain in the Bowels from the Colick or sharp Humors. Secondly, for the Cure of Fluxes of the Belly, and Bloody Fluxes. Thirdly, to remedy Costiveness,* Fourthly, *to purge the lower Bowels.* 3. *Clysters* for easing Pain, *are made with Carminative Decoctions adding half,* 3 *quarters, or an Ounce of* Strasburgh *Turpentine, well mixed with* 1 *or* 2 *Yolks of Eggs, and then with the Decoction, and so exhibited something more than Blood warm.* 4. For the Cure of the Bloody Flux, or other Fluxes of the Belly; *to a strengthening Decoction in Whey, a quarter Part of Brandy ought to be added, and the Clyster to be several times repeated: If the Flux is Inveterate, and not easy to be stopt,* 6, 8, *or* 10 *Grains more or less of Laudanum, ought to be dissolved in the Brandy and mixt with the Decoction.* 5. For an extream Costiveness. *The Clyster ought to be made of Lubrificatives, as a Decoction of Althea Roots, in*

which

which a ſmall quantity as 2, *or* 3 *Drams of Caſtile, Genoa, or Venice Soap ought to be diſſolved, or a quarter part of Oil to be mixed therewith, well ſeaſoned with Table Salt.* 6. For purging the Belly and giving Stools. *It may be made of Carminative Decoctions, or Meat Broths, or Poſſet-drink; to a Pint of which, a quarter of a Pound of brown Sugar or Honey, and half an Ounce of Salt are to be added, and diſſolved in the ſame, without the Addition of any Oil; becauſe Oil will Obtund the points of the Salts, and ſo hinder the Operation or Working.* 7. *As to the Quantity to be exhibited at a time, to little Infants, give a quarter of a Pint or* 6 *Ounces; to Children from* 5 *to* 10 *Years Old, half a Pint; to bigger Children from* 10 *to* 16 *Years Old,* 3 *quarters of a Pint; to Men and Women, from a Pint, to a Pint and half.*

CHAP. X.

Of Preparations Chymical.

THE chief Chymical Preparations, as they may have reſpect to this preſent Work, are theſe ten here enumerated, viz.

1. Eſſences.
2. Tinctures.
3. Extracts.
4. Waters.
5. Spirits.
6. Oils.
7. Balſams.
8. Powers.
9. Elixirs.
10. Salts.

I. ESSENCES. 1. *By* Eſſences *here, we do not mean thoſe highly rectified and ſublime ætherial Chymical Oils, which Perfumers and others uſe, and ſo call, but another Preparation which is taken from the whole Subſtance of the Plant.* 2. *Take Angelica, Bawm, Mint, or any other like fitting Herb; beat it in a Marble Mortar with a Wooden Peſtle, to a Pulp or Maſs; put it into a Matraſs or Bolt-head, which Seal up Hermetically, (or otherwiſe ſtop it up with Cork dipt in Wax, then cloſed faſt with Sealing-Wax, and after that luted over) ſet it to digeſt in a Horſe Dunghil, or ſome other analogus Heat, as* Balneo, *Sand,* &c. *for* 40 *or* 50 *Days; ſo will the whole be reduced almoſt to an uniform Subſtance: Afterwards take out the Matter, which is now more liquid than it was before, or reduced into a Liquor; which preſs from the* Fæces. *Digeſt it again in a gentle* Balneo, *that the remaining groſſer parts may ſubſide: decant the clear* Liquor, *or filter it thro' Brown Paper, or Cotton, in a Glaſs Funnel. And from the former* Fæces, *being dried and calcin'd, extract a fixed Salt, which add to the filtrated Liquor. This is* Le Febure's *Eſſence of Plants; and may be given in any proper Vehicle, from one Spoonful to two, or three.* 3. *Some add to this Eſſence, when it is for long keeping, to every Quart, a quarter of a Pint of the beſt Brandy, or Spirit of Wine.* 4. *But if you would exalt this Eſſence to a higher degree of purity and excellency, the ſaid* Le Febure *proceeds thus. Take of the former Eſſence, Water of decripitated common Salt, made* per deliquium, *of each equal parts; put them into a Matraſs or Bolt-head, which Seal up Hermetically, or ſtop up as before: Digeſt in the Sun, or in* Balneo, *or a Sand heat, for* 40 *or* 50 *Days more, ſo will this ſaline Liquor, without any other Operation, ſeparate all the heterogenous and ſlimy Matter, or Subſtance, which hindred its purity and exaltation: And there will ſwim upon the top, the pure exalted Eſſence of the Plant, either green and tranſparent as an Emerald, or of a reddiſh color, according to the nature of the Plant; which ſeparate and keep for uſe. This exalted Eſſence, may be taken from half a Spoonful to a Spoonful, Morning and Night, in a Glaſs of Canary, or other proper Wine.* 5. The Eſſences of Cold Herbs. *Take the whole Plant well beaten in a Mortar, Juice and all; add to it an equal quantity of Spirit of Wine, or Brandy: put them into a very large Bolt-head, which ſtop cloſe as aforeſaid, ſo that nothing may breath forth: ſet it to digeſt in Horſe-dung, or its equal heat in* Balneo, *or Sand, for* 40 *or* 50 *Days, or more; then ſtrain out all the Liquor by hard preſſing; which put into the Bolt-head again: being ſtopt cloſe up as before, digeſt in a gentle Sand heat for* 40 *or* 50 *Days more; ſo will the Eſſence meliorate, ſupernate the* Fæces, *and grow fine; which decant and keep for uſe, adding to it the fixt Salt of the Preſſings. Doſe from one Spoonful to three, in ſome proper Vehicle.*

II. TINCTURES. 1. *There are ſeveral ſorts of* Tinctures, *which are to be drawn out with ſuch Menſtruums, as are moſt proper to the Diſeaſe afflicting; the chief of which are theſe four following. Firſt,* A Spirituous Tincture. *Secondly,* An Acid Tincture. *Thirdly,* An Oily Tincture. *Fourthly,* A Saline Tincture. 2. The Spirituous Tincture. *Take any Root, Bark, Wood, Herb, Flower, or Seed, being dried, and reduced into groſs Pouder in a hot Iron Mortar, with an eighth part of Salt of Tartar or Pot-Aſhes: affuſe thereon, in a large Matraſs, the beſt rectified Spirit of Wine, ſo much as may over-top the Ingredients* 4 *or* 5 *Inches, ſhake them well together, and ſtop the Veſſel very cloſe: digeſt* 20, 30, *or* 40 *Days, (the longer the better) in a place naturally warm, or in a gentle Sand heat, ſhaking the Veſſel once every Day: then decant the clear* Tincture, *and keep it cloſe ſtopt for uſe. Doſe* 1, 2, *or* 3 *Drams, if prepared from Alteratives.* 3. The Acid Tincture. *The Ingredients being prepared as in the former, affuſe thereon the dulcified Spirit, either of Nitre or of Salt, Sulphur or Vitriol, ſo much as to ſupernate* 4 *or* 5 *Inches: digeſt as before, then decant the clear* Tincture, *and keep it in a Glaſs cloſe ſtopt for uſe. Doſe from* 40 *to* 60 *Drops, or ſo much as to give the Vehicle a little acidity.* 4. The Oily Tincture. *Take the Ingredients as before directed to be prepared, which put into a Matraſs, or Bolt-head, and affuſe thereon pure ætherial Oil of Turpentine, ſo much as may over-top it* 4 *or* 5 *Inches; ſtop it cloſe up, and digeſt only in a warm heat for* 14 *or* 21 *Days, ſhaking the Veſſel once every Day: ſtrain out the Tincture by preſſing; let it ſtand till it is fine, and then decant the clear, and keep it for uſe. Doſe from* 6 *to* 12, *or* 18 *Drops; firſt dropt into Sugar, and then mixt with any proper Vehicle, and ſo taken.* 5. The Saline Tincture. *Firſt make the* Spiritus Intimus *thus.* Take Spring Water, 6 Quarts; choice Pot Aſhes, 2 Pounds; Sal Armoniack, one Pound: mix,

digeſt cloſe ſtopt 3 Days, ſtrain, filter, and keep it for uſe. *Then take the Ingredients as before prepared, which put into a Matraſs or Bolt head, and affuſe thereon of the former* Spiritus Intimus, *as much as may over-top the Ingredients 4 or 5 Inches: digeſt cold (being cloſe ſtopt) for 2 or 3 Days, ſhaking the Veſſel twice a Day; let it ſettle for one or two Days; decant the clear from the* Fæces, *which filter thro' Brown filtring Paper, and keep it in a Glaſs cloſe ſtopt for uſe. Doſe from half a Dram, to 1 or 2 Drams, Morning and Night, in a Glaſs of Canary, or ſome other proper Vehicle. Where note, that by this* Menſtruum, *you may extract the* Tincture *from any Root, Bark, Herb, Flower, or Seed, as well green as dry, and that in a manner extemporanee.*

III. EXTRACTS. 1. *Take the Spirituous Tincture of any thing you deſign to have the Extract of; put it into a Bolt-head, with its Alembick and Receiver, and luting the Joints well; by a gentle heat abſtract the Spirit in* Balneo; *the* Magma *at bottom is the Extract.* 2. Extracts *are either ſoft, fit either to be diſſolved in any proper Vehicle, or to be made up with Pouders, if very ſoft, into an Electuary; but if of a more thick body, to be made with Pouders into Pills: Or they are of a ſolid body, ſo that they may be formed into Pills of themſelves, without any addition.* 3. *And therefore according to the conſiſtence you deſign the Extract to be of, to ſuch a degree you muſt abſtract the Spirit.* 4. *The abſtracted Spirit is ſomething more than the ſimple Spirit of Wine, and may very well be called the Spirit of that Ingredient, or Matter, of which the Extract is made, and contains ſome of the moſt volatil Spirits and Particles thereof.*

IV. WATERS. 1. *They are Diſtilled in Common Stills, putting good Store of Aſhes underneath, to avoid an* Empyreuma, *or Smell and Taſte of Burning; or in an Alembick, in* Balneo. 2. *If you Diſtil in an Alembick, it will be good that the Roots, Herbs, Flowers, be bruiſed, and by adding common Salt, or Leven, to be mixed with them to be digeſted; then putting Spring Water to them, to Diſtil them in an Alembick with its Worm or Refrigeratory, till the change of the Taſte ſhews the Virtue to be drawn off, ſeparating the Oil if any be.* 3. *By adding the Salt or Leven, or Yeſt, and digeſting the Herbs therewith, till they have a kind of Winey Smell; by which means the Water is made twice or thrice as ſtrong, and Smells much ſtronger of the Herbs, Flowers,* &c. 4. Waters from dried Herbs. *Let them be cut and infuſed a while in hot Water, and digeſted with Salt, Leven, or Yeſt, and then diſtilled in* Balneo; *and if it be cohobated upon more dried Herbs, it will be ſo much the better and more noble.* 5. *Waters from tender Herbs and Flowers, and from cold Plants, are diſtilled in* Balneo, *with Cohobation upon freſh Herbs.* 6. *Waters from hot Seeds, Spices,* &c. *beat or bruiſe them groſly, infuſe them in a little warm Water, then diſtil them by a Copper* Vefica, *Tin'd within: You may alſo ſteep them in Wine, ſo will the Water be more excellent, with ſome Oil.* 7. *If from green Roots or Barks, bruiſe or ſhave them; but if from dried Roots, Barks, raſp them, or groſly beat them in a Mortar, and infuſe them in a little warm Water,* &c.

V. SPIRITS. 1. Take the Herbs, Flowers, *&c. beat them in a Mortar, and Pickle them with Salt, in an Earthen Veſſel, by mixing the Salt therewith; put all into a well glazed Earthen Jar, preſſing them well down: ſtop the Veſſel very cloſe, and put it into a Cellar for 3 or 4 Months, till they have a ſharp or Wine-like Smell; then diſtil in a* Vefica, *in* Balneo, *or Sand, or Aſhes, to drineſs: cohobate the Spirit and diſtil again, after which rectify it in a Glaſs Matraſs, in a gentle* Balneo, *or Sand-heat.* 2. Spirits from Juices. *Beat the Roots, Herbs, Flowers, Fruits, if Juicy, and preſs forth their Juice: But if they be not Juicy, ſprinkle hot Water on them, and then expreſs the Juice. Steep in this Juice freſh Herbs, and preſs out again, which work repeat till you have Juice enough; this Juice ferment with Sugar, Leven, or Yeſt, diſſolved in a little Water, and then diſtil it as before. Where note, that the Fermentation of the Juice, is beſt done in Wooden Veſſels.* 3. Spirits from Fruits which have a Pulp, as Black Cherries, Elderberries, Goosberries, Mulberries, Raſpberries, Strawberries, *&c. Either make a Wine of them, which let grow a little Acid; and diſtil it as before directed, or as you diſtil Brandy, or Spirit of Wine from Wine: Or elſe take their Pulp, freed from their Stones or Kernels, to which put warm Water, to make it thin; then with Leven, Yeſt, or Sugar, diſſolved alſo in warm Water, cauſe them to ferment; after which diſtil.* 4. Spirits from hot Seeds, Spices, *&c. Bruiſe them well, and macerate the Maſs with Wine, cauſe them to ferment with Leven,* &c. *and then diſtil; ſo will you have a Spirit mixt with a great deal of Water: cohobate and diſtil again, ſo will the Spirit be much better; which after ſeparate from the Water by Diſtillation: reſerve the Spirit by it ſelf, and the Water by it ſelf, as Water of the ſame Seeds, Spices,* &c.

VI. OILS Diſtilled. 1. Oils from green or dry Roots, Herbs, Flowers. *Bruiſe them well in a Stone or Iron Mortar, digeſt them 14 days or more in Water, and let them putrify; then diſtil by a* Vefica *with a great Fire; ſo will you have Water and Oil come over, which you are to ſeparate.* 2. If you diſtil Oils from Angelica, Aniſe, Bawm, Caraway, Dill, Fennel, Lavender, Marjoram, Mint, Origanum, Pennyroyal, Roſemary, Sage, Savory, Southernwood, Thyme, Wormwood, *and the like hot Herbs: It is to be done when in Flower, and you are only to take the upper Branches with the Flowers, for then they yield the greateſt plenty of Oil, and thoſe parts of the Plants the moſt; the Leaves, Stalks,* &c. *little or none at all.* 3. Oils from hot Seeds, as Anniſe, Cardamoms, Cubebs, Caraways, Coriander, Dill, Fennel, Muſtard, Parſly, Rocket, *&c. Bruiſe them groſly, affuſe on them hot Water; add ſome Salt, or Crude Tartar in Pouder, digeſt 10 or 20 Days, then diſtil with a Copper* Vefica, *with its Head and Receiver well luted; ſo will you have Water and Oil together, which you are to ſeparate, keeping the Oil by it ſelf; and the Water for Aniſeed Water, Cardamom, Caraway Water,* &c. 4. Oils from Roots being dried. *Bruiſe them well, or beat them into groſs Pouder, digeſt them with Water and Salt, then diſtil: cohobate the diſtilled Water, digeſt and diſtil again; ſeparate the Oil from the Water: and in that Water, digeſt more freſh Roots, and ſo on continually.* 5. Oils from Citron, Limon, and Orange Peels. *Let them putrify or rot; add Water to them; then diſtil them as the former Roots, ſo will you have Oil and Water, which ſeparate. The Water may be uſed*

in

in like manner to more prepared Peels. 6. Oils from Spices. *Bruiſe them groſly, (for Powders yield leſs Oil;) digeſt them* 8 *or* 10 *Days in the* Menſtruum *you intend, adding Nitre, Salt, or Tartar: then diſtil in a* Veſica; *ſo will you have Water and Oil, which ſeparate: cohobate the Water upon the* Fæces *ſeveral times, ſo will all the volatil Oil aſcend:* The *Water reſerve to make more Oil with, upon freſh Spices. The weighty Oils (as of Cinamon) will ſeparate from the Water, in* 14 *or* 16 *Days, by ſinking to the bottom.* 7. Oils from Aromatick Woods, as Caſſia Lignea, Cedar, Cypreſs, Juniper, Rhodium, Sanders Yellow, Saſſafraſs, Xyloaloes, *&c. Take their raſpings, or let their Chips be exceedingly well bruiſed in an Iron Mortar, which digeſt a good while in Water, then diſtil by a* Veſica: *cohobate, and continue diſtilling for ſome Days; at length the noble odoriferous Oil will come forth very ſubtil and volatil.* 8. Oils from Roſins, Turpentines, *&c. Add to them a good quantity of Water, and diſtil by a* Veſica; *ſo will you have Water, and an Oil ſwimming upon it,* (which Oil is called Spirit;) *continue the diſtillation, and by degrees it will be Yellow; then change the Receiver: Separate this yellow Oil, and keep it by it ſelf, diſtilling till no more appears.* This is called Oil. *The Matter remaining is called* Colophony. 9. The Rectification of Chymical Oils. *They are rectified by diſtilling them by a Cucurbit, or* Veſica, *with much Water; ſo will the pure ætherial Oil aſcend, with ſome Water, which ſeparate. They are alſo rectified in a Bolt-head, with its Receiver, in which the pure ætherial Oil will aſcend, the thicker Subſtance remaining at bottom.*

VII. BALSAMS. 1. *The true difference between Chymical Oils and Chymical Balſams lies chiefly in two things,* viz. *firſt the Oil contains the principal or chief of the ſublime and volatil parts. Secondly, That it is of a thicker Conſiſtence or Subſtance, than the Balſam; which as this latter is leſs ſubtil and thicker, ſo it is more fit for old Sores and Ulcers.* 2. *Hence it appears that as Oils are the more thin, pure, and ætherial parts, ſo they riſe firſt in Diſtillation, from the Matter they are ſeparated from; but the Balſam is that other thicker Oily Matter, which by the force of a ſtronger* Fire, *aſcends next after the former pure, ætherial, volatil Oil is drawn off; which as it is of a thicker body, ſo it is alſo of a deeper color.* 3. Balſams Chymical, *are oftentimes alſo made in Rectification of Chymical Oils; when drawing off the thin, ſubtil, volatil Parts, or Oil, the thick Balſam is left at bottom.* 4. *But they are properly Balſams which (the thin Oil being drawn off in a* Veſica) *are afterwards drawn from the Colophony by a Retort.* 5. *Take the Colophony remaining after the Oil is drawn from Roſins and Turpentine; put it into a Retort, and diſtil with a gradual Fire, firſt ſoft and gentle, then greater, and ſo encreaſing the Heat, till the Colophony has given up all its Oily or Balſamick parts, which will be of a body thick and red. And this is that which is properly called* Balſam; *which if it be rectified again in a Glaſs Retort, in a Sand-heat, will be much more fine and pure.*

VIII. POTESTATES, or POWERS. 1. *Take the rectified Spirit of the Plant, ſuppoſe of Mint, or Pennyroyal, a Pint; Chymical Oil of the ſame Plant, an Ounce, or ſo much as the Spirit will abſorb, or ſwallow up: mix them together, and keep them for uſe.* 2. *But if you take the fixt Salt of the ſame Plant, and grind it with an equal quantity of the volatil Sal Armoniack; ſubliming and re-ſubliming ſo long till the fixt Salt aſcends with the Volatil; and add* 2 *Drams thereof to the former mixture, it will be ſo much the more powerful to all the* Intentions *for which the ſaid Poteſtates are uſed.* 3. *And many times for want of the particular Spirit of the Plant, whoſe Powers you would make, the beſt rectified Spirit of Wine is uſed as a* Succedaneum; *to which may alſo be added, if you pleaſe, the volatiliz'd Salt of the ſame Plant, or a volatil Salt of Tartar.*

IX. ELIXIRS. 1. *An Elixir is the ſulphureous Tincture of any Vegetable, drawn out of the dried Vegetable, (ground groſly with Salt of Tartar in a hot Mortar) with the rectified Spirit of the ſame Vegetable.* 2. *Or thus. Take any dried Herb or Plant, beat it into groſs* Pouder, *which put into a Matraſs or Bolt-head: Take the Powers of the ſame Plant, ſix Pints; rectified Spirit of Nitre,* 12 *Ounces: mix, and digeſt for* 10 *Days; affuſe ſo much of this Mixture upon the former* Pouder, *as may ſupernate* 4 *or* 5 *Inches: digeſt cold for* 20 *Days, ſhaking the Glaſs every Day; then decant the clear* Liquor, *and keep it for uſe.* 3. *But you are not always neceſſitated to uſe* Spirit of Nitre; *but may in place thereof, as the nature of the Diſeaſe may require, take* Oils of Salt, of Sulphur, *or* of Vitriol, *and digeſt with the Powers as above directed.* 4. *Again, by Infuſion of any Vegetable (ſuppoſe* Roſemary) *in Powers of the ſame, acuated with Oil of Salt, and Salt of the ſame, you ſhall have the* Elixir *thereof.*

X. SALTS. 1. *Salts Chymical are either Volatil or Fixed: And tho' all Plants have indeed a volatil Salt, yet the moſt of them having but little, and that little very difficult to be gotten, Authors have taken little or no notice thereof: Thoſe which really abound with it are but few, of which* Beans, Peaſe, *and* Tartar, *are chief. The way of making their Volatil Salts, we ſhall not declare here, having taught it fully and at large in their proper places, in the following Book.* 2. Fixed Salt of Vegetables *is thus made. Firſt burn or calcine the Herb you would make a Salt of, into white Aſhes; yet avoiding a too fierce or haſty Burning, leſt it ſhould vitrify. Boil theſe Aſhes in fair Water, to make a* Lixivium *of them; which filter thro' filtring Brown Paper, by help of a Glaſs Funnel. This filtred Liquor Boil in a Glaſs Veſſel, with a gentle Fire, to the conſumption of all the Water; ſo will the fixt Salt of the Plant be left at bottom.* 3. *If the Salt be not purely White and Fine, you muſt diſſolve it again in more fair Water; filter and coagulate by an abſumption of the Water; which work you are ſo often to repeat, till it is freed from all Impurity, and is very White.* 4. *Theſe alcalious Fixt Salts, are very apt to melt in the Air; but if they be firſt calcined with Sulphur, it much preſerves them from that Accident, and makes them withall ſomewhat more grateful to the Palate.*

CHAP. XI.

Of the Virtues *of* Medicines.

I. THAT *some Plants Heat, some Cool, and some Dry, and some Moisten, is manifest; and this is from their* First Qualities, *which are found out, first by their Taste. Secondly, by their Smell. Thirdly, by their Operations, or Effects. Fourthly, by Experience.*

II. THAT *some Plants open Obstructions, and some stop, as in Catarrhs and Fluxes of Blood; some Bind, and some Relax; some Attract, and some Repercuss; some Maturate, and some Absterge,* &c. *These Virtues, which are* their Second Qualities, *they draw from their* First Qualities, *but are more perfectly known and found out by Experience, and a continued Series of Observations.*

III. THAT *the Appropriation of Medicaments to the several principal Parts of the Body, has been found out partly by their Signatures, and partly by Experience, and sometime by both of them together: And so this Appropriation of them to the Head and Brain, Nerves, Stomach, Lungs,* Pleura, *Heart, Liver, Spleen, Mesentery, Reins, Womb, and Joints, is called* their Third Qualities.

IV. NOW IF *a Plant is hot and dry, it naturally follows, that it must resist and be helpful against Diseases, proceeding from cold and moisture: So also if a Plant is cold and moist, it must resist and be helpful against Diseases proceeding from heat and driness: The same may be said of Plants hot and moist, or cold and dry, which doubtless resist, and are helpful against Diseases proceeding from the* opposite Qualities.

V. THIS *being said, if we consider what Diseases afflict those principal Parts of the Body, and from what Causes they proceed; it follows that those Plants, which are endowed with* those First Qualities, *and withall are in the predicament of* the Third Qualities, *must generally resist and be auxiliaries in the Curing those Distempers, afflicting those particular Parts; and therefore in giving you the Virtues of the Medicament, tho' there are in almost every Plant, and in the Variety of their Preparations, a great number of Diseases enumerated, against which they be Good or Helpful, yet we do not intend thereby, that they are Specificks, and absolute Cures for all the Diseases there named, but chiefly helpful against the same; and in Compositions framed against such Maladies, may as a* Vis duplicata, *add to their Force and Effects.*

VI. AS FOR *Example, take* Angelica, Lavender, *or any other Plants, which are hot and dry in the second, third, or fourth degrees, as to their* First Qualities; *and withall are* appropriated to the Head, Brain, and Nerves: *We say that those Plants, and their Preparations, are good for and helpful against all the Diseases of those Parts, proceeding from* cold and moisture, *and accordingly we enumerate them, as Catarrhs, or Defluxions, Megrims, Vertigo's, Appoplexies, Epilepsies, Lethargies,* Carus, Coma, *Palsies, Cramps, Defluxions into the Eyes and Nose, heaviness of the Head, weakness of the extream Parts, thro' the hurts of the Nerves,* &c. *more especially if the Habit of the Body be cold and moist too. These and other like Diseases of those Parts, proceeding from a cold and moist Cause, we say, these and the like Plants are proper for, and helpful in their Cure, tho' we do not say they will absolutely do the Work: And yet a great deal is to be said, if* Alteratives *be given in a* full Dose, assiduously used, not by fits and girds, and continued for a good length of time; *for so* Nature *acts in conjunction with the Medicine, and the Cure is performed and perfected at length, which otherwise could not be either expected or hoped for.*

VII. *AGAIN, those Plants which are in the* Fourth Qualities of Medicines, *are* Abstractives, *which abstract or take away all superfluous Humours, Recrements, and Excrements out of the Body, its Ventricles, or principal* Viscera, *and Vessels, which are* Emeticks, Catharticks, Salivaticks, Ptarmicks, Emmenagogicks, Diureticks, Lithontripticks, and Sudorificks, *and these are said to be Curative, at least helpful in Curing all Diseases of* Repletion.

VIII. THE KIND *of the* Abstractive *is to be chosen, according to the* site of the Part, or Parts afflicted; and nature of the Diseases afflicting. *So if it be* the Head, *stuft with pituitous, cold and moist Humours,* Ptarmicks *are to be chosen: If* the Stomach, *by Surfeits, Fulness, Obstructions, sharp Humours,* &c. *then* Emeticks. *If* the Entrails, *with sharp Humours, Colicks, Worms,* &c. *then* Catharticks. *If* all the Juices of the Body are contaminated, *as in the* French *Disease, Leprosie,* Leuce, Elephantiasis, *&c. then* Salivaticks. *If* the Womb *be obstructed, or the Courses stopt, then* Emmenagogicks. *If there be a repletion of Urine, thro' an Obstruction of* the Reins, and Urinary Vessels, *then* Diureticks. *If* Gravel, Stones, *&c. in Reins or Bladder, then* Lithontripticks. *If* Universal Obstructions over the whole Body, *with a repletion of Watery Humours, as in Dropsies, then* Catharticks *first, and* Sudorificks *afterwards.*

IX. *AND SO the* Diseases *proceeding from* Repletion, *are enumerated according to the Part or Parts afflicted; and accordingly the proper* Abstractives *are applied, which taking away the superfluous Humours, or Recrements, causing, or some ways contributing to those Diseases; those particular Medicaments according to their Kind, are said to cure, or be helpful, or contributary to the removal, or cure of those Diseases.*

X. THOSE HERBS, *or Plants, which add something to the Body, or its principal Parts, are in* the Fifth Qualities *of Medicines, and are* Adductives, *and said to cure, or be helpful in curing, all Diseases of* Ablation, viz. *such Distempers as are caused from the want of some Nourishment, Juices, or Humours, in order to the conservation of the whole Body, or of some particular and respective Parts: And so they are said to be* Chylificks, Analepticks, Galactogeneticks, Spermatogeneticks, *and* Alexipharmicks; *that is to say, to cure, or to be helpful in curing, all Diseases and Weaknesses, caused by a deficiency of what Nature requires, for preservation of the Body and its Principal.*

XI. AND THEREFORE *the Kind of the* Adductive

is

is to be choſen, according to the nature of the Matter deficient, the Parts affected and the approaching Evils to be feared: So if the Tone of the Stomach is hurt, that it cannot breed good Chylus, *whereby an Atrophy or Pining may be feared,* Chylificks *are to be adminiſtred, which are withall Stomachick, or Stomachicks are to be added to them. If* a grand Waſting of the Fleſh be, *as in a Phthiſis, or deep Conſumption,* Analepticks *are of uſe. If a deficiency of Milk, then* Galactogeneticks. *If a deficiency of Seed, then* Spermatogeneticks. *If Poiſon be taken, then the Vital Powers are to be ſtrengthned and augmented by* Alexipharmicks.

XII. *AND SO the Diſeaſes proceeding from* Ablation, *are enumerated, according as the whole Body, or its Parts may be affected, and accordingly the proper* Adductives *are choſen; which adding to Generating, or encreaſing the Nutriment, or Juices defective, are ſaid either to cure, or ſome ways contribute to the cure, of the prevailing Illneſſes, either preſent, or intruding upon the Patient.*

XIII. *THIS IS the Method, joined with Experience, and a long Series of Obſervations, thro' all preceeding Ages from the firſt beginnings of the Art of Phyſick, by which the Virtues of Medicaments have been inveſtigated and found out; and according to which, the Virtues aſcribed to Herbs and Plants in this our* Herbal, *are rationally to be accounted for.*

CHAP. XII.

Of Doſes, Uſes *and* Application.

I. THE DOSES of Alteratives. 1. Pouders, *if temperate, or hot, or cold in the firſt degree, may be given from one Dram to two Drams; in the ſecond and third degrees, from half a Dram to a Dram, or more: In the fourth degree, from half a Scruple to half a Dram.* 2. Infuſions, Decoctions *and* Waters, *from two Ounces to four, ſix, or eight.* 3. Extracts, *from one Dram to two Drams.* 4. Electuaries, *from one Dram to four, or half an Ounce.* 5. Elixirs *and* Powers, *from* 30 *Drops to* 60, *or* 80 *Drops.* 6. Clyſters, *a Pint at a time to a Man or Woman; but to Infants and Children, from a quarter of a Pint to half a Pint.*

II. DOSES *of* Abſtractives. 1. Emeticks, *if of Antimony, as Tartar Emetick, from three Grains to eight: If Infuſions of* Crocus Metallorum, Vitrum Antimonij, *or* Regulus Antimonij, *from half an Ounce to an Ounce; and if ſtrong, from an Ounce to an Ounce and half, or two Ounces:* Emetick Decoctions *of Herbs, from half a Pint to three quarters of a Pint, or Pint.* 2. Catharticks, *if* Pouders, *from a Scruple, or half a Dram, to a Dram, or Dram and half, according to the ſtrength of the Species, and the Age and Strength of the Patient; the Strongeſt may be given from half a Scruple to half a Dram.* 3. Lenitive Electuaries, *from half an Ounce to two Ounces:* Purging Electuaries, *from half an Ounce to an Ounce.* 4. Purging Infuſions *and* Decoctions, *from an Ounce to ſix Ounces, according to their Strength; the Strong, from an Ounce to four Ounces; the Strongeſt, from an Ounce to two Ounces.* 5. Purging Extracts, *from half a Scruple to two Scruples.* Purging Pills, *from a Scruple to a Dram.* 6. Purging Salts, *from half an Ounce to an Ounce, or Ounce and half.* 7. Salivaticks, *according to the Diſcretion of the Learned Phyſician.* 8. Emmenagogicks, *if* Infuſions *or* Decoctions, *from a quarter of a Pint, to half a Pint, or more. If* Tinctures *or* Elixirs, *from two Drams to three Drams, or half an Ounce.* 9. Diureticks *and* Lithontripticks, *if* Pouders, *from a Dram to two Drams: If* Infuſions *or* Decoctions, *from a quarter of a Pint to half a Pint, or more: If* Salts, *from ten Grains to a Scruple, or half a Dram.* 10. Sudorificks, *if* Infuſions, *from half a Pint to three quarters of a Pint, or more: If* Electuaries, *from a Scruple to a Dram, two Drams, four Drams, or an Ounce. But if an* Opiate, *you muſt be regulated according to the quantity of* Opium *which is in it. If* Salts, *from half a Scruple to half a Dram.*

III. BUT IN ALL *theſe Caſes you are to obſerve, that theſe Rules, nor any other, can be abſolutely General, but that different Accidents which may be, as to the Age, Habit, and Strength of the Patient,* Recency *or Inveteracy of the Diſeaſe, together with the different Strengths or Weakneſſes of the Medicine, may cauſe ſome Exceptions, or particular Cautions and Obſervations neceſſary to be known, and which we could not comprehend in theſe general Directions; ſo that notwithſtanding the Limitations of theſe Doſes in this place, they muſt be proportioned from hence, according as the Accidents may be, in reſpect both to the Patient and the Preparation; giving to Grown Perſons the larger and more compleat Doſes; whilſt to Weak Perſons, Children and Infants, they are to be diminiſhed, according to their Weakneſſes, Diſabilities, and tender Years.*

IV. THE USES of Internal Medicaments. *And they are to be conſidered,* 1. *As to the Time of Giving.* 2. *As to the Way and Manner of Giving,* FIRST, *as to the time of Exhibition,* Alteratives *may be given in the Morning Faſting; but without doubt, all* Aperitives *are beſt given at Night, (but upon an Empty Stomach) becauſe there will be the leſs fear the next Day of taking Cold.* Catharticks *and* Emeticks, *are beſt given in the Morning, becauſe as the Stomach is then moſt Empty, ſo they will the eaſier act upon the Offending Matter, and the ſooner Operate; beſides, the better Attendance may be given, in the time of their Working.*

V. *SECONDLY,* As to the Way and Manner of Giving them. *And this is taken for the moſt part from their Form.* 1. Waters Diſtilled, Syrups *and* Juleps, *are uſed chiefly as Vehicles, to convey other things down the Throat in.* 2. Infuſions, Decoctions *and* Wines, *are generally given by themſelves, dulcified with White Sugar, or ſome proper Syrup.* 3. Eſſences *and* Juices, *are generally mixed with ſome proper Syrup, or with Wine (as the nature of the Diſeaſe may require) ſweetned with White Sugar, Honey, or Syrup.* 4. Tinctures, *if* Spirituous, Acid, *or* Oily, *are almoſt always given in a Glaſs of dulcified Wine.*

But

But Saline Tinctures, *are generally given in ſome Diuretick Decoction, ſweetned with Syrup of Althæa, or of Parſly, Winter Cherries,* &c. 5. Pouders *and* Extracts, *if ſoft, are made into* Bolus's *with Honey, Pulp of a Roſted Apple or Pear, or ſome proper* Loboch. 6. *But* Extracts, *if ſtiff enough to be made into Pills, (while Recent) are ſwallowed as Pills by themſelves: If kept till they are hard, they will ſcarcely diſſolve in the Body, but muſt be reduced to a ſoft Electuary.* 7. Troches, *are to be reduced into a Pouder, and made into a* Bolus *with ſome proper Syrup, or Honey.* 8. Lozenges *are held in the Mouth, and ſwallowed down only as they melt.* 9. Electuaries *are ſwallowed either as a* Bolus, *or diſſolved in ſome proper Infuſion, Decoction, or Wine, ſweetned with ſome Syrup, Honey, or Sugar.* 10. Pills *are ſwallowed by themſelves, waſhing them down with ſome proper diſtilled Water, Infuſion, Decoction, Wine, Julep, Poſſet-drink, or Broth.* 11. Spirits *are dulcified with ſome proper Syrup, or mixt with Wine ſweetned with Syrup, or White Sugar, and ſo taken.* 12. Poteſtates *and* Elixirs, *are always given in a Glaſs of dulcified Wine.* 13. Oils *and* Balſams, *are always dropt into ſoft White Sugar, and ſo well mixt with it, then put into a Glaſs of ſome proper Wine and ſo drank.* 14. Salts Eſſential, Elementary, *or* Fixt, *and* Volatil, *are generally diſſolved in ſome proper diſtill'd Water, Infuſion, Decoction, or Wine, and dulcified with Syrup, Honey, or Sugar, and ſo ſwallowed.*

VI. THE APPLICATION of Topicks or Externals: 1. Lotions *are either for Bathing in, or for Waſhing old Sores and Ulcers; for Gargariſms, for Sore Mouths and Throats; or for Injections into Fiſtula's, the Yard, or Womb, to be uſed with proper Syringes.* 2. Oils, *they are to be anointed upon the Parts affected, rubbing them well in, Morning and Night, or two or three times a Day.* 3. Ointments *and* Balſams; *theſe may be anointed withall; alſo they are ſpread upon Pledgets, and applied to Green Wounds, Old Running Sores and Ulcers.* 4. Pouders; *theſe are either mixed with ſome Ointment or Balſam, and ſo applied; or ſimply ſtrewed upon the Wound, Sore or Ulcer.* 5. Emplaſters *and* Cerates, *are to be ſpread upon ſupple Cloth or Leather, and ſo applied ſimply upon the naked Tumor, Wound, Sore or Ulcer, or laid over Pledgets, dreſt or arm'd with Balſam, to keep them on.* 6. Cataplaſms *are put upon Cloth or Leather, to be applied to Tumors and Apoſtems, to diſcuſs, ſoften or ſuppurate.* 7. Clyſters *are to be uſed either with a Clyſter-Pipe and Bladder, or with a Clyſter-Syring, to force it up the* Inteſtinum rectum, *by the* Anus.

VII. *WHERE NOTE, that* Clyſters *are either* Anodyn, *or* Healing, *or* Purging: *If* Anodyn, *ſome choice* Opiate *is diſſolved in it. If* Healing, *they are mixed either with* Spirit of Wine, *or ſome* Oil, Balſam, *or* Liquid Roſin. *But if* Purging, *they have always a proportional quantity of* Brown Sugar *in them, with ſome* Common Salt; *but no Oil or Oily body by any means, becauſe they always blunt the points of the Saline Particles.*

CHAP. XIII.

Concluſion *of the* Introduction.

I. THUS HAVING *given you a ſhort Explanatory Introduction to our Hiſtory of Plants, without the Knowledge of which, this Work could not well be underſtood, and upon which principles a great part of the Practiſe of Phyſick is founded and built; the Obſervation of which, is truly a practiſing according to Art, and not a going hand over head, and a doing of things at all adventures, as* Empiricks *do, by which the Life of a Patient is not only put into Danger, but by ſuch* Empirical *Practiſes, a thouſand Miſcarriages are daily committed; to the great prejudice of the Sick, and diſreputation of the Medical Arts.*

II. *MANY GREAT things have been performed by ſimple Medicines and Preparations; and by that prime and ſimple Practiſe, the Qualities and Virtues of Simples were firſt inveſtigated or found out. This was the firſt ſtep of Art. Afterwards when the Faculties and Virtues of many things were diſcovered, the ſucceeding Practiſers began to add one thing to another, which they thought to have like Virtues; believing, that two things of equal ſtrength being conjoin'd, the Power and Force of that Medicine muſt be doubled; and indeed it many times ſucceeded according to expectation.*

III. FROM THESE *beginnings, Artiſts began to redouble their Forces, and to multiply Ingredients; making continually* Complex Compoſitions, *and from the belief of a* Vis unita, *to form* Compounds, *which in proceſs of many Ages, became a Magazine or Store-Houſe, as it were, of Remedies for all Diſeaſes; which they formed into a method of Preſcriptions, and under proper Titles, and particular forms of Preparations; they made at length a* Repoſitory *for general Practiſe, conſiſting of a great number of Preſcripts, ſerving for all Indications, and for the Cure of the moſt common and reigning Diſeaſes; which they called by the name of a* Pharmacopœia *or* Diſpenſatory.

IV. THUS THE *Medical Arts, under this natural and primitive Simplicity, continued for many hundred Years; and obtained the name of* Hippocratical *and* Galenical *Phyſick, without any conſiderable or manifeſt advantage, alteration, or advance of Reputation; except in forming a* Farrago *of not only* Compound, *but* decompound *Recipes, which being a* Hodge-Podge *of* Complications, *tended rather to the Detriment and Reproach of our Art, than the adding of any Honour or Glory to it; and thereby reduced the Science from Natural and Simple* Empiriciſm, *into an Artificial and Reputable* Art of Quackery.

V. THE ART THUS *groaning under this Labyrinth of Misfortunes, by the ill Practiſes of ſuppoſed Learned Men; or rather* Empiricks, *began to ſink under the Burthen, and indeed would in a ſhort time have been reduced into the moſt profound Myſtery of* Empiriciſm, *or* Quackery; *had it not pleaſed God, to make the Light of Chymiſtry to Ariſe and Shine upon us, by the Means of*

of that wonderful Spirit, and great Man, Paracelsus: *who not only shew'd the weakness of* Empiricism, *of* Galenick Medicines, *and* Medicasters, *but unvailed and brought the Arts of Medicine out of their Rubbish, and set them in a true light, for the general Good of Mankind.*

VI. IF IT BE OBJECTED, *that Chymistry was in being long before* Paracelsus *was Born. To this we answer, so was the Circulation of the Blood before our* Great Harvey: *But as it was* Harvey, *who first brought the Circulation to Light, for the reforming, and more full elucidating the Art of Physick; so we say, that it was* Paracelsus *who brought the Light of Chymistry to arise and shine in our Horizon; and let us into its Secret Recesses, shewing us all its hidden Treasures, and brought them forth for the Glory of our Art, the Increase of true Medical Knowledge, and an Universal Good.*

VII. YET WE DO NOT SAY, *that the* Old Physick *is wholly to be cast away: There are many (tho' Simple) excellent things in it; which by a Skilful and Prudent* Physician *may be excerpted, and collected together; and which if conjoined with the* Chymical, *open into a great Field of Knowledge, and wonderful Productions, that not only shew us the* Genesis, *but also* Analysis *of all natural things; and with what an amazing Harmony they sympathize with Human Bodies, and how admirably they conspire to Operate in Mankind, to the extirpation of Diseases, and support of Life, against whatever may be opposite to Health, and the well-being of a Living Man.*

VIII. THE NEXT *thing then which the Physician had in his View, was the Composition and Structure of the Human Frame, that thereby he might know how the Body grew, and was nourished, and by what means it might fall to decay, and so fail. And since the Growth and Nourishment was from the Matter received in by the Mouth into the Stomach, they considered that there was an innate Property in that* Viscus, *viz.* Natural Spirits, *to convert the received Food into a kind of nourishing Juice, which the* Greeks *(our first Physicians) were pleased to call* Chylus, *which being more perfected in the Entrails, was thence conducted by proper Vessels, and conveyed to the Heart; where being converted into Blood, it was thence by the* Arteries *distributed over the whole Body, to contribute to its encrease of Magnitude, and nourishment of all its Parts, that it might not fall to decay. The* Meanders, *or Ways, by which this Bloody Juice past and repast, was discovered by* Dissection *of the Human Carcase; how it past from the Heart by the* Arteries, *to almost every individual Part of the Body, for its Nutrition; and how, what was more than was fit for that Purpose, was returned by the* Veins *to the Heart again; which for that reason seems to be the Fountain of the* Vital Spirits, *and so by a perpetual Circulation, conserves the Microcosm in a habitual State of Life and Strength. And by the same Art, they came to a discovery of the* Nervous System, *(whose Original is in the Head) by which the* Animal Spirits, *generated in the Brain, were conveyed thro' the whole Man, giving Sense or Feeling, Life and Motion, to every part of the same.*

IX. HOW THE *Body fell to decay, or failed, was the next Consideration, which was either,* I. *By External Accidents, by Bites, Falls, Cuts, Punctures, Gunshot,* &c. *from whence came Contusions, Wounds, Fluxes of Blood, Ulcers, Fractures, Luxations, Dismembrings, and loss of Substance, which directed them to Topicks, or External Applications, whence from a long Series of Experiences, arose the* Practise *and* Art of Chirurgery. II. *Or Internal, from a defect of* Natural Spirits *in the* Stomach *and* Bowels, *whereby their Tone, or innate concoctive Property being hurt, they either* 1. *generated a bad* Chylus, *which did not Nourish as it ought to do, but either profligated the Blood and* Lympha, *by depauperating them; or otherwise created a tartarous kind of Mucilage, by which not only the Vessels thro' which it was to pass were obstructed, but the* Viscera *also themselves were perturbed in their Operations, by glutinous Slime, Sand, Gravel, Stones,* &c. *Or* 2. *They* generated not Chylus enough *to nourish and sustain the External Man, whereby the Body falls into Lassitudes or Weaknesses, Pinings, and a lingering Consumption; which if not prudently remedied, and that in time, reduces the poor Patient to a meer Skelton, and so making him past hopes of Cure, sends him decently to his Grave. An* indigested Chylus, *or* defective in its quantity, *as it creates a* depauperated Blood and Lympha, *so it makes either* weak Vital Spirits, *or a* deficiency of them, *whence comes Faintness, Languishings, and the like, and an universal decay of the Strength of the whole Man. And according to the poverty of the Blood and* Lympha, *such also are the* Animal Spirits *proceeding from it, from whose weakness or decay, proceed all the Nervous Diseases afflicting the Body, as Tremblings, Numbness, loss of Strength and Motion, Convulsions, Palsies,* &c.

X. THE BODY *being thus afflicted with* Diseases, *it was natural to believe, that they could not be without their* proper Signs, *by which they might be known, as also several* attendent Symptoms; *all which must arise from some certain* Cause, *or* Causes; *the Signs of which Causes, (which they call* Diagnosticks) *they daily learnt from* Observation. *These* Causes, *whether* Original *or* Accidental, *they gradually searched out, that the Sources whence they were derived, might be at length discovered. All which was absolutely necessary towards the investigation of the Cure: For that without the* Cause *was known and removed, the Effects thereof,* viz. *the* Disease, *could not cease, or be taken away. As* Diseases *then appeared in the World, they observed the* Signs *accompanying them, and the* Symptoms *which many times accrued, which they set down in Writing, under the* Names *of those several* Diseases. *And enquiring into the Course of the Patients Life, and what Accidental Matters might also happen, at the* introitum *of the* Disease, *the* antecedent Causes *of the Malady, became in some measure manifest. Whence by a great number of* Remarks, *not only the* Antecedent *and* Remote Causes *came to be discovered, but also the* conjoined *and* near Causes, *were at length brought to Light: From whence the* Diagnostick part *of the Art, received its Illustration. Again, from the* Greatness *or* Lightness *of the* Causes; *from the* impending Symptoms, *as they seem'd more or less dangerous; and from attending to the* end of the Disease, *thro' a long Series of* Observations; *being all rationally considered together, the* Prognostick Precepts *were educed. And if the* Disease *was thought Curable, the* Indi-

Indications of Cure, *voluntarily flowed from the morbifick ſtate of the Sick, which proceeded* 1. *From the* Cauſes *Antecedent and Preſent.* 2. *From the* nature of the Diſeaſe, *whither Similar, Organick, or Common.* 3. *From the* Symptoms, *as being Dangerous or not.* 4. *From the* Vital Powers, *reſpecting the Strength or Weakneſs of the Diſeaſed Body.*

XI. *ART BEING by theſe Advances, and ſo many Degrees, or Steps, brought on towards Perfection; what remains for the Learned Profeſſor to do? Truly to know what Diſeaſe it is which afflicts the Perſon, and by the* Criſis, *and manifeſt Symptoms, to make his Medical Prognoſticks, whether the Patient be Curable or not; that he may do every thing for the Reputation of his Art, and of himſelf. So that if he ſees the Sick paſt hopes of Recovery, he may decline his Attacks, and let the Relatives and Attendents know the Danger impending. But if there be Hopes of Life, (tho' but ſmall) he may make his Artful and Maſterly Preſcriptions, according to the* Indications of Cure, *which with a Rational and Modeſt aſſurance, he may hope and conclude, will not go without their deſired Effects.*

XII. LIKE AS THE *Art of* Rhetorick *was not the foundation of Oratory, or of the firſt Orators,* Demoſthenes, Cicero, *&c. but the Orators the foundation of the Art, out of whoſe unexampled Orations, all its Precepts and Rules were Excerpted, or Gleaned, and by Wiſe Men reduced into the form of an Art, by which all ſucceeding* Rhetoricians *regulated and made their Orations: So the Medical Art, and all its Rules, even the Fabrick of the whole Art, was Reared and Built out of* Empiricism, *or* Quackery; *and its Original or Foundation, was laid by* Empiricks, *or* Quacks, *(as the Learned are pleaſed to phraſe it) and that the firſt Phyſicians were no other than* Empiricks, Quacks, *or* Tryers of Skill; *out of whoſe Tryals, Obſervations and Practiſes, ſome Wiſe Men collected a Set of Precepts and Rules; which being reduced into Method, we now call the Art of Phyſick. But all the to be deplored Misfortunes of the Art is, that it makes not a great many Real Phyſicians, but too many* Ignorant *or Conceited Doctors, and too great a number of Formal and Rattle-headed* Empiricks *or* Quacks.

XIII. *WHAT WE have farther to ſay is, to commend the ſincere Lovers of Art, to the good Providence of God. That in their Search and Enquiries into* Nature, *and unravelling (as it were) the Rules and Precepts of Medicine, they may find the Anſwer of their Expectations; and have their Minds or Souls, enlightned with the Splendor and prevailing Excellencies, of true Wiſdom and Knowledge; ſo as to be able to perform the Great things, wrapt up in the Myſteries of this Science they are Profeſſors of; for the Good of the Sick, their own Benefit, and the Reputation of the ART of PHYSICK.*

W. SALMON.

Black-Friers, London.

ADVERTISEMENT.

I Requeſt all thoſe Gentlemen and others, who ſend Letters to me, about their own Concerns, to be ſo Civil, as to pay Poſtage for them; or elſe they may expect to go without an Anſwer. It is not reaſonable that I ſhould be at Charge for Perſons, I have no Acquaintance withall, and the Buſineſs their own. I ſhould not ſay this, was it but now and than a Letter. But to receive about two thouſand Letters a Year (as I have formerly done) upon other Peoples Affairs, or ſome trifling Matter, and to pay Poſtage for them, makes a conſiderable Sum. And beſides, it is as Burthenſome and Troubleſome to Anſwer them, as it is Chargeable to Receive them.

BOTANOLOGIA:

THE HISTORY OF PLANTS.

Liber Primus.

OF English Herbs and Plants.

CHAP. I.

Of ADDERS-TONGUE.

I. THE *Names.* It is called in *Greek* Ὀφιόγλωσσον; in *Latin*, *Lingua Serpentis*, *Lingua Serpentina*, *Lingua Vulneraria*, *Argentina*, *Lancea Chriſti*, *Herba Lucciola*, *Ophioglosſon:* in *Engliſh*, *Adders Tongue*, and *Serpents Tongue.*

II. *The Kinds.* There is properly but *One Species*, which is ſometimes *miſſhapen*, and therefore are called the *Common* and *miſſhapen*: and differ only in one or two things: the latter has ſometimes two or three ſtalks, and ſometimes but one ſtalk; and ſometimes two or three Crooked Tongues.

III. The Deſcription. *The Root is ſmall and Fibrous, abiding under Ground all Winter, from which riſes up but one leaf, which with the ſtalk, ariſes not above five or ſix Inches from the Ground, being flat or thick, and of a freſh green colour, not much unlike in form to the head of a broad Javelin, or rather the leaves of Water Plantane, but leſſer, without any middle rib in it: from the boſom or bottom of which leaf, on the inſide, riſes up ordinarily one ſmall ſlender ſtalk, about two or three, and ſometimes four Inches long, the upper part of which is ſomewhat bigger, and dented with ſmall round dents, of a yellowiſh green colour, much reſembling an* Adders-Tongue *(whence the name) which never ſhews any other flower, and vaniſhes away without yielding any Seed.*

IV. *The Places.* It grows in *moiſt Meadows* in moſt parts of *England*; in the Meadows by *Colebrook*; in the Fields in *Waltham-Forreſt*; in a Meadow near *Barton*, as you go from *Oxford* to *Stow-Wood:* in a Cloſe near *Botely* on the Weſt-ſide of *Oxford*; and in many Meadows in *Kent*, *Suſſex* and *Surrey*, as alſo near *London*, and ſeveral other parts of this Kingdom.

V. *The Times.* It is in its Prime in *April* and *May*, and flouriſhes ſometimes till the beginning of *June*: but a little heat quickly makes it vaniſh.

VI. *The Qualities.* It is hot in the firſt degree, and dry in the ſecond degree. It is Cleanſing, Aſtringent, Sarcotick, and Traumatick, or Vulnerary; by appropriation, it is Arthritick and Hepatick. It is alſo an Alterative, and Antifebritick.

VII. *The Specification.* It is Vulnerary, good to heal Wounds, broken Bones and Ruptures. *Mr. Ray* ſaith, that *Baptiſta Sardus* affirms that the Pouder of the Herb, being given Inwardly for ſome time, will Cure all Ruptures whatſoever. And *Matthiolus* in his *Epitome* ſays, that the freſh leaves being applied, not only heal Wounds after a wonderful manner, but alſo Cure Ruptures, Burnings and Scaldings.

VIII. *The Preparations.* There are no Preparations of it kept in the Shops: but if you pleaſe you

may make from it, 1. *A Juice.* 2. *A Pouder.* 3. *A Sulphureous Tincture.* 4. *A Saline Tincture.* 5. *An Oily Tincture.* 6. *An Essence.* 7. *An Ointment.* 8. *A Balsam.* 9. *A Cataplasm.*

The Virtues

IX. *The Juice Clarified*, cleanses Ulcers outwardly, and heals Ulcers in the Lungs, which it the sooner performs, if digested with Spirit of Wine: it also stops Vomiting; and a little Nitre being dissolved in it, it is profitable against the Gout; and so drunk inwardly takes away the heat of Fevers.

X. *The Pouder of the leaves*, &c. given from half a Dram to a Dram, stops bleeding inwardly, overflowing of the Terms, as also bleeding at Mouth and Nose, and other fluxes of Blood, being applied: strewed upon Ulcers, it cleanses and drys them, and disposes them to healing.

XI. *The Tincture of the dryed Herb in Spirit of Wine*, heals Wounds admirably, being washed therewith mixed with Wine, and dries up Ulcers: so also being taken inwardly from a Dram to 2 Drams.

XII. *The Saline Tincture*, drawn with *Spiritus Universalis*, allays all Inflammations, and discusses hot Tumors: taken inwardly it is good against burning Fevers, is Traumatick, and heals all inward Wounds and Ulcers, as also bruises of Breast, Stomach, and other *Viscera*.

XIII. *The Oily Tincture*, drawn with Oil of Turpentine, Cures not only all Green Wounds of the Nerves and Tendons, but also a Cold Gout, as also Aches, Pains, and Lameness, from a cold Cause by anointing therewith: it also discusses Tumors and the beginning of Apostems, and puts a stop to the Itch, and spreading Ulcers.

XIV. *The Essence.* It is Vulnerary, good against the bitings of Mad Dogs, Serpents, or any other venomous Creature. It resists Poysons, and all sorts of burning Fevers. Dose from a quarter of an ounce to half an ounce, mixt in any proper Vehicle.

XV. *The Ointment.* It is made by boiling the green leaves shred 2 Pounds, Sheep Suet, Oil Olive, of each half a Pound, till the Herb is crisp, which press out, putting in as much more fresh Herbs, boiling and pressing out as before, then adding to the strained matter 12 Ounces of Turpentine, which mix together. It Cures not only Green Wounds but also cleanses and heals Inveterate and Putrified Ulcers; also Burnings and Scaldings in a very short time.

XVI. *The Balsam*, made of the Juice, and Strasburgh Turpentine, is as good a Vulnerary as can ordinarily be used; for it commonly heals any Simple Wound at first dressing: and applyed with a Truss is good against Ruptures, the Pouder of the Herb being also given inwardly.

XVII. *The Cataplasm*, made of the Green Herb, and pure Yellow Sweet Palm Oil, Cures the Gout, or any Pain in the Joynts, being applyed for some time.

CHAP. II.

of ADONIS-FLOWER.

I. *The Names.* It is called in Greek Ἐρανθεμον; in Latin, *Eranthemum*, *Adonis*, *Flos Adonidis*, & *Flos Adonis:* in English, *Adonis flower*, *Red Camomil*, *Red Maithes*, *Pheasants Eye.*

II. *The Kinds.* It is numbred among those Herbs which are *semine nudo polyspermæ:* and it seems there are two chief Species of it, *viz.* that with Red Flowers, called *Flos Adonis flore Rubro:* the other with yellow flowers called *Adonis flore Luteo.*

III. The Description. *It has a root with very many slender, weak, small and thready strings, perishing every year; from this root rises up several slender weak stalks, trailing or leaning to the Ground, set on every part with fine jagged leaves, very deeply cut, like those of Camomil, or rather those of Mayweed, upon which Stalks, arising a foot higher or better, do grow small red flowers, consisting of 6 or 8 round leaves, almost like Field Crowfoot, having a blackish green head, or pointel in the middle, set round about with many blackish threads, without any smell at all; after the flowers are past, there grows up heads with many roundish white seeds at the tops of them, set close together, very*

like

like unto the heads or ſeeds of the great Ox Eye, or not much unlike to a little Bunch of Grapes: The Plant riſes of its own Seed again, many times before Winter, which will abide till the next year. That with the yellow flower is much like the former, but its ſtalks and leaves are of a more dilute Green.

IV. *The Places.* The Red grows in the *Weſt* part of *England* amongſt Corn, juſt as Mayweed does in other parts, and is likewiſe an enemy to Corn, as Mayweed is: from thence (for the Beauty of the flower ſake) the Seed has been brought into ſome Gardens: The Yellow is a ſtranger in *England*, unleſs Nurſed up in Gardens.

V. *The Times* They flower in the Summer Months, as *May*, *June*, *July* and *Auguſt*, as the Year falls out to be early or late: and the ſeed is ripe ſoon after, and preſently falls away, if not Gathered.

VI. *The Qualities.* They are hot and dry in the firſt degree; but *Bauhine* and *Tabermontanus* ſay they are hot and dry in the ſecond; yet by the taſte we can hardly judge ſo. They are Diſcuſſive, Digeſtive, Aperitive and Carminative: and by appropriation they are Stomatick, Hepatick and Nephritick, and of the kind of Alteratives.

VII. *The Specification.* They are ſaid to be Specificks againſt *Colick*, and *Stone*, which *Parkinſon* ſays has been confirmed by Experience; a dram of the ſeed being given in ſome ſpecifick Vehicle.

VIII. *The Preparations.* The Shops keep nothing of it, but you may make, 1. *A Pouder of the Seed.* 2. *A Sulphureous Tincture.* 3. *A Saline Tincture.* 4. *A Chymical Oil of the Seed.* 5. *An Eſſence of the Herb.* 6. *A Bath of the Herb.*

The Virtues.

IX. *The Pouder of the Seed.* It powerfully expels Wind, is good againſt Griping of the Bowels and Colick, and expels Sand and Gravel from the Reins and Bladder: it alſo ſtrengthens the Stomach, and cauſeth a good Digeſtion.

X. *The Sulphureous Tincture.* It is made of the Seed, and is Stomatick and Carminative, good againſt pains of Head, Stomach and Belly: helps in the Vertigo, and cures a violent Flux. Doſe from one Dram to two Drams in ſome fit Vehicle.

XI. *The Saline Tincture.* It is made both of Seed and Herb, and has all the virtues of the former: beſides which it is an excellent thing againſt moſt Diſeaſes of the lower Ventricle: it powerfully opens all Obſtructions, and expels both Wind and Water out of the Bowels; and has a more ſingular and Specifick force againſt Stone and Gravel, whether in the Reins or Bladder, or any other matter obſtructing thoſe parts. The Doſe is from half a dram to a dram, or dram and half in White Wine.

XII. *The Chymical Oil.* It gives preſent eaſe in the Stone and ſtoppage of Urine, if given from ſix drops to twelve in a Glaſs of White Wine, or Parſley or Arſmart Water. Drop it firſt into Sugar, which mix well together, and then mix it with the Liquor, and ſo let it be taken morning and evening. It provokes Urine powerfully, gives immediate eaſe in the Pain, expels the Gravel, and is an admirable thing againſt the Colick.

XIII. *The Eſſence.* It has the Virtues of the Seed, but not altogether ſo powerful: daily taken, it ſtrengthens the Stomach, and is good againſt the Scurvy in a cold Habit of Body: Doſe one Spoonful or better, in Ale, Beer, Wine, or in ſome proper Water.

XIV. *The Bath.* It is made of the Herb boiled in a ſufficient quantity of Water, in which a little *Caſtile* or *Venice*, or *Genoua* Soap is diſſolved. It opens the Pores, cleanſes the Skin, and is good againſt a Rheumatiſm, and pains of the Bowels and Joints, by ſitting for ſome time in the Bath ſomething more than Blood Warm, and ſeveral times repeating of the ſame.

CHAP. III.

Of AGRIMONY *Common and Baſtard.*

I. THE *Names.* It is called in Arabick *Gnaphat*, *Gnatzfat*: in Greek Εὐπατόριον. (of *Eupator* the firſt Founder of it, as *Pliny* ſaith:) in Latin *Eupatorium*, *Hepatorium* (as being good for the Liver,) *Agrimonia*: and in Engliſh *Agrimony*. The *Baſtard Agrimony* knows no Greek name: and is called in Latin *Agrimonoides.*

II. *The Kinds.* It is accounted amongſt the number of Spiked Plants, and has ſeveral Species, as, 1. *The Common Agrimony.* 2. *The Baſtard.* 3. *The Water Agrimony*, which is both male and female. The Common again is either ſweet ſcented, or not ſweet ſcented.

III. The Deſcription. *Common Agrimony has a root black, long, and ſomewhat Woody, abiding many years, and ſhooting out afreſh every Spring, from which ariſes one ſtalk ſomewhat hoary and whitiſh, hard and round, half a yard high* (plus minus) *from whence comes forth divers long Leaves, ſome greater, ſome leſſer, ſet upon a ſtalk, all of them dented about the edges, ſomewhat greyiſh underneath, and hairy withall: and from the main ſtalk alſo ariſes ſome ſmaller leaves ſet here and there; towards the top whereof grows many ſmall yellow flowers, one above another in long ſpikes, after which comes many rough ſeeds, hanging down like to ſmall Burrs, which when they are ripe, will catch hold and ſtick upon Garments, or any thing which ſhall rub againſt them: the whole Plant is of a pretty pleaſing ſmell.*

IV. *The ſweet ſcented or Aromatick differs little or nothing from the former, except in the ſmell, ſo that he that knew the one may certainly know the other; but the Plant is ſomewhat leſs, with rounder and whiter leaves, and the root of a darkiſh red, but the taſte*

and ſmell of this much ſurpaſſes the common, as being Aromatical and Aſtringent.

V. *The* Agrimonoides, *or* Baſtard Agrimony *has a root ſmall, reddiſh and Woody, abiding all the Winter, from whence ariſes many long, ſoft and hairy Leaves next the Ground, every one upon a long hairy Footſtalk, which are cut and divided into many parts and Leaves, ſeven for the moſt part, three on each ſide, and one at the end, but having ſome ſmaller ones between them, much like to* Common Agrimony, *yet ſomewhat rounder than they, and all of them ſmaller dented, and ſharper pointed, of a dark green Colour on the upper ſide, and Greyiſh underneath. Amidſt theſe Leaves riſes up ſeveral Stalks, not fully ſtanding upright, but leaning downwards, on which are placed very ſparingly ſuch like Leaves as before deſcribed, but ſmaller and rounder, with ſmall pieces at the joynts of every of them. At the Top comes forth three or four hairy green husks like Cups, dented at the Brims, out of which comes forth a ſmall yellow Flower, like to* Common Agrimony, *yet ſometimes ſcarcely appear above the husks, in which, after they are fallen and paſt, ſmall long and round Seeds appear like Grains of Wheat, two ſtanding together, like to ſmall Lumps, which fall out of the husks themſelves when they are ripe, leaving the husk empty and gaping. The Taſte of the Plant is bitter and abſterging, and ſmells like* ſweet Agrimony.

VI. *The Places.* The *Common* grows near the ſides of Hedges in Meadows, and by Borders of Groves and Copſes, in moſt parts of *England* and *Germany*, and in many other Countreys: I have found both the *Common* and *ſweet Scented*, growing Wild in the Plantations of *South Carolina*. The *ſweet Scented* grows with us only in Gardens, but is Natural to *Italy* in many Places.

VII. The *Baſtard* is found in ſome places of this Land by dry Ditch ſides, where the Earth is light, hollow, looſe and ſandy: *Columna* found it in *Naples*: and *Bauhinus* ſays he found it in many Places of *Italy*: It grows generally in Untill'd places, among Briars, Brambles, and ſuch like.

VIII. *The Times.* The *Common* and *Sweet Scented* Flower in *July* and *Auguſt*, and their Seed is ripe in a ſhort time after; but in warmer Climates it comes to its Perfection much ſooner, The *Baſtard* Flowers in *April* and *May*, and comes to Perfection the latter end of *May*, or beginning of *June*, and the Seed is ripe ſoon after.

IX. *The Qualities.* They are all of them hot and dry in the firſt Degree, but the Aromatick ſomething hotter. They are Diſcuſſive, Aperitive, Cleanſing, a little Aſtringent, Traumatick or Vulnerary, and Strengthening: And by appropriation, Stomatick, Hepatick, Splenetick, and Nephritick: and of the ſtock of Alteratives.

X. *The Specification.* They are Specificks in curing old Ulcers, Piſſing Blood, and the Hepatick Flux: and indeed are good againſt moſt Diſeaſes of the Liver, for which reaſon they are accounted Noble Hepaticks: The *Baſtard* is ſaid to be excellent in drying up Catarrhs, its Fume (burnt green) being received into the Mouth and Throat by a Funnel.

XI. *The Preparations.* The Shops keep of the *Common Agrimony*, 1. *The dryed Leaves and Tops.* 2. *A Diſtilled Water of the whole Plant, gathered in* June. 3. *A Syrup of the Juice.* But beſides theſe you may make from all the Plants, the following Preparations. 4. *An Inſpiſſate or Liquid Juice of Leaves and Flowers.* 5. *An Eſſence of the whole green Plant.* 6. *A Pouder.* 7. *A Sulphureous Tincture.* 8. *A Saline Tincture.* 9. *An Oily Tincture.* 10. *A Balſam.* 11. *A Fixed Salt of the whole Plant Calcined.*

The Virtues.

XII. *The dryed Leaves and Tops.* They are Hepatick, and good againſt any inward weakneſs of the Bowels; and are kept moſtly to make Infuſions, Decoctions, Wines of, *&c*

XIII. *The Diſtilled Water*, It is uſed as a Vehicle, to give any other of the Preparations of this Herb in, in any of the following Caſes: Doſe is from ij. ounces to iv. or vj.

XIV. *The Syrup.* It is an excellent Pectoral, good againſt Coughs, Colds, Aſthma's, Wheezings, and moſt other Diſtempers of the Breſt and Lungs; and is commended againſt the Rickets in Children. Doſe from j. ounce to ij. morning, noon, and night.

XV. *The Juice Liquid and Inſpiſſate.* It Powerfully opens Obſtructions of all the *Viſcera*, and has all the Virtues of the Eſſence: The Liquid may be given from ij. ounces to iv. in a Glaſs of Wine: The Inſpiſſate to iij. drams, diſſolved in Wine, and ſo taken faſting.

XVI. *The Eſſences of the whole Plants.* They are approved to be good againſt Putrefaction of the Blood, Obſtructions of the Liver and Spleen, and other *Viſcera*; againſt the yellow, black, and green Jaundice, Dropſies, (by ſtrengthening the Bowels and parts affected, after Purges and Diureticks) inward Wounds and Bruiſes, bitings and ſtingings of Serpents or other Venomous Creatures, the Flux of the Liver, Strangury, Colick, Coughs, Aſthma's, Diſeaſes of the Breſt and Stomach, ſalt and thin Catarrhs, all ſorts of Agues, Palſies, pains of the Spleen and Hypochonders, the Plague or Peſtilence, bitings of mad Dogs, Greenſickneſs, Tertian and Quartan Agues. They contribute much, being taken inwardly, to the healing of old Sores, and long continued Rebellious and running Ulcers. Doſe is from iij. drams to j. ounce, in Wine, Mead, Cyder or Ale: Dropt into foul running Ears it cures them; and dropt into the Eyes it ſtrengthens the Eye-ſight. They ſtop all Fluxes of the Bowels and Fluxes of Blood, open Obſtructions of the Reins, and Urinary Paſſages. Taken Dietetically they are Traumatick or Vulnerary.

XVII. *The Pouder* in made of the dryed Herbs. Being applyed it ſtops Bleeding in Wounds of any Part: If it is thus Compounded it will be better. Take *of the Pouder of the dryed Herbs*, j. *ounce*; *Catechu, Pouder of Toads, Man's Blood dryed and Pouder'd, of each half an ounce; mix them for a Pouder* to ſtop Bleeding internally or externally, which it does incomparably: It drys up Catarrhs, and is good againſt the Dropſy. Doſe from half a dram to a dram, at night.

XVIII. *The Sulphureous Tincture.* It has all the Virtues of the Eſſence, beſides which it is more drying and healing. Doſe from j. dram to ij. drams. It ſtrengthens the Stomach admirably, reſiſts Vomiting, and cauſes a good Digeſtion.

XIX. *The Saline Tincture.* It has alſo all the Virtues of the Eſſence, but is much more powerful againſt all obſtructions of the *Viſcera*, as Liver, Spleen, Womb, Reins, *&c.* It opens the ſtoppages of the Urinary Paſſages, bringing away Sand, Gravel, Filth, Matter and Slime. Doſe from j. dram to ij. drams or more. Outwardly it is good againſt old Sores, running Ulcers, inveterate Scabs, Cankers, and the like in any part of the Body.

XX. *The Oily Tincture.* It cures Palſies, Lameneſs, Numbneſs, and all Pains and Aches, proceeding from a cold Cauſe: it gives eaſe in the Sciatica, and helps the cold Gout; it ſtrengthens the Nerves, Muſcles, Veſſels and Weakned Joynts, after Diſlocations, and ſtops a Flux of Blood in any Part. Inwardly taken it is good againſt the Colick, Gravel, Stone,

Stone, and obſtruction of the Reins, Ureters and Bladder, and may be given from x. drops to xx. in a Glaſs of White Wine.

XXI. *The Balſam.* It cures green Wounds ſometimes at firſt dreſſing, more eſpecially if to ij. ounces hereof, half an ounce of Balſam de Chili is mixed, and ſo applyed to the Part, the Blood and Filth being firſt waſht away with a little Spirit of Wine or Brandy. It cures alſo old Sores, Ulcers, Scurf, Morphew, inveterate Scabs, ſtubborn and rebellious Fiſtula's, and other like affects of the fleſhy parts. It draws forth Nails, Thorns, and Splinters of Wood, or other things gotten into the Fleſh, ſtrengthening much the Nerves, Ligaments and Joynts; it is a ſingular thing to cure wounds of the Head.

XXII. *The Fixed Salt.* It Purifies the Blood and *Viſcera* by Urine, deſtroys the Acidities of the Lungs, and the acritude of the firſt Digeſtions, Fevers, *&c.* Doſe is j. ſcruple or more, in any fit Vehicle.

CHAP. IV.

Of Water AGRIMONY *the Male Kind.*

Water Agrimony male.

I. *THE Names.* It is called in *Greek*, Ευπατόριον ἔνυδρον τὸ ἀρρενικὸν γένος, In *Latin*, *Eupatorium aquaticum mas*, *Eupatorium Cannabinum mas*, *Agrimonia aquatica mas*: In *Engliſh*, *Water Agrimony* Male, alſo *Agrimony Hemp-like*, and by *Gerrard*, *Dutch Agrimony.*

II. *The Kinds.* It is of the third Species of *Agrimony*; and of the *Water Kind* it is the firſt, which is the Male, of which it is the *Genus* to three other Kinds, *viz.* 1. Our *Engliſh* Male *Water Agrimony.* 2. The *New-England*, or *Hemp-like Agrimony.* 2. The *Virginian* Kind.

III. The Deſcription. *The Root is full of thready ſtrings of a mean Bigneſs; from whence ſpring up long round Stalks and ſomewhat reddiſh, about a Yard high or more, which are beſet with long green Leaves, indented about the edges; whereof you ſhall commonly ſee five or ſeven, hanging upon one Stem, like* Hemp *Leaves, but yet ſofter. The Flowers are Little, of a pale reddiſh Colour, conſiſting of Round ſoft Tufts, which ſtand upon the top of the Sprigs, and at length vaniſh away into Down.*

IV. *The* New-England *Kind, is like the former, but has a hairy brittle Stalk, and narrow Leaves, ſome dented, and ſome not, two, three, or four Inches long a Piece, and half an Inch broad, or leſs: the Flowers conſiſt of Moſſie pale Threads on every Branch, out of ſmall green Husks or Heads, which with the Seeds is almoſt inſenſibly carried away with the Wind, ſo that one would think it to have no Seed at all.*

V. *The* Virginian *has a great, hard, ſolid, brown, round Stalk, of three, four, or five Foot high, is wonderfully full of Long Branches, from the bottom, ſet with Joynts, ſpotted red, on the younger green ones, with large green Leaves on them, having below five Leaves on a Stalk, thoſe upwards but three, yet larger than the former; the Flowers and Seed are alſo larger, not rough but ſmooth, blackiſh, and flat, without ſharpneſs of Taſte.*

VI. *The Places.* The *Engliſh* grows about the brinks of Ditches, and in Plaſhes, as alſo on the edges of wet Grounds, and ſtanding and running Waters, almoſt every where.

VII. *The Times.* It Flowers in *July* and *Auguſt*; and in Winter the Stalks and Leaves wither away, but the Root is ſaid to continue.

VIII. *The Qualities.* It is hot and dry in the firſt Degree: Is Aperitive, Abſterſive, and Vulnerary: It is by appropriation *Hepatick* and *Splenetick*; and of the number of *Alteratives.* But the Root as *Geſner* thinks is *Emetick.*

IX. *The Specification.* I am Informed by a Worthy Gentleman, that it particularly cures the *Kings-Evil*, and all ſorts of *Ulcers* and *Fiſtula's*: which peculiar properties he knew it had by Experience.

X. *The Preparations.* The Shops keep nothing hereof; but you may Prepare therefrom, 1. *A Juice.* 2. *A Pouder of the Herb.* 3. *A Decoction.* 4. *A Balſam.* 5. *A Sulphureous Tincture.* 6. *A Saline Tincture.* 7. *An Oily Tincture.* 8. *An Eſſence.* 9. *A Fixed Salt.* 10. *A Wine of the Root.*

The Virtues.

XI. *The Juice.* It attenuates and makes thin groſs Humors, cleanſes and purifies the Blood, is good againſt the Scrophula in Men, and the Rickets in Children. Doſe from j. Ounce to iij. mixt with Ale or Wine, in the Morning Faſting: It is alſo good againſt Tertian Agues.

XII. *The Pouder.* It has the ſame Virtues, and may be given from j. dram to ij. drams, Morning and Evening, in a Glaſs of new Beer or Wine.

XIII. *The Decoction.* It is Traumatick, more eſpecially if to every Pint of it ij. or iij. ounces of ſtrong Cinnamon Water be added; and then be drunk Morning and Evening from iv. ounces to viij. ounces.

XIV. *The Balſam.* The Juice being Inſpiſſate to the thickneſs of new Honey, is mixt with an equal quantity of Turpentine, and Incorporated with a little Oil, over a gentle Fire. It is Vulnerary, and cleanſes and heals Wounds, either inward or outward, admirably.

XV. *The*

XV. *The Sulphureous Tincture.* It is a ſingular Traumatick, and effectual againſt Poyſon and Malignity, Doſe from j. dram to ij. drams.

XVI. *The Saline Tincture.* It is an extraordinary thing againſt the Kings-Evil, and all Scrophulous Symptoms, as alſo againſt the Cachexia, Dropſie, and Rickets in Children, and opens obſtructions of the *Viſcera*, expelling groſs Humors by Urine. Doſe from j. dram to iij. drams, in White Wine.

XVII. *The Oily Tincture.* It cleanſes Wounds, helps Lameneſs, ſtrengthens the Sinews, and is of good uſe againſt Palſies, Numneſs, Pains and Aches from a Cold cauſe, being anointed on the part afflicted, Morning and Night. Inwardly taken from x. drops to xij. or xv. in Wine, or Parſley, or Arſmart Water.

XVIII. *The Eſſence.* It has all the former Virtues, cleanſes the Blood, and is of good uſe to ſuch as have ſcabby and filthy Skins; it takes away hardneſs of Liver and Spleen, and prevails againſt the Jaundice: Doſe from j. ounce to ij. Wounds and Ulcers being waſhed therewith, it heals them.

XIX. *The Fixed Salt.* It opens the obſtructions of the Reins and Urinary Paſſages and cauſes a ſeparation of the Morbifick matter of a Struma, ſending it forth by Urine. Doſe in Arſmart Water or Wine, from viij. grains to xx.

XX. *The Wine.* *Geſner* in his Epiſtles, affirms that a Pugil of the Fibres of the Root, boiled in Wine, and the Wine Drunk, gave him in an hours time one Stool, and afterwards ten Vomits, whereby he caſt out much Flegm; that it works (ſays he) like white Hellebor, but much more eaſily and ſafely, and that it did him much good.

CHAP. V.

Of Water AGRIMONY, *the Female Kind.*

I. THE *Names.* It is called in *Greek*, Ευπατόριον ἔνυδρον τὸ θῆλυ γένος, In *Latin* by Fuſchius, *Eupatorium Adulterinum*; by Geſner, *Eupatorium Aquaticum*; by Matthiolus, *Eupatorium Vulgare*; by Lobel, *Eupatorium Cannabinum Fœmina*; by Bauhinus, *Cannabina aquatica folio tripartito diviſo*, by Tabermontanus, *Eupatorium Cannabinum Chryſanthemum*; by Dodoneus, *Pſeudo-hepatorium Fœmina*; by Sardus, *Terzola*; and by Camerarius, *Eupatorium Avicennæ*; in *Engliſh*, *Female Water Agrimony*, and *Hemp-like Agrimony.*

II. *The Kinds.* This is the ſecond Species of *Water Agrimony*; to wit, the Female Kind, as you may ſee, *chap.* 3. *Sect.* 2. aforegoing.

III. The Deſcription. *The Root conſiſts of many long ſlender Strings, and is of long continuance, from whence Stalks grow up about two Foot high, or higher, and are of a dark purple Color. The Branches are many; growing at diſtances nearly equal one from the other; the one from one ſide of the Stalk, the other from the oppoſite Point. The leaves are winged, and much Indented on the edges. The Flowers grow at the Tops of the Branches, of a brown yellow Color, ſpotted with black ſpots, having a Subſtance within the midſt of them, like that of a Daiſy. If you rub them between your Fingers, they will ſmell like to Gum Elemi, Roſin or Cedar, when they are burnt. The Seeds are long, and eaſily ſtick to any Woollen thing. It plainly differs from our* Common Agrimony, *becauſe it wants the interpoſed little Leaves: and its Flowers are much unlike.*

IV. *The Places.* It grows in cold Grounds, by Ponds and Ditch ſides, as alſo by running Waters; and ſometimes you ſhall find it to grow in the very Water it ſelf.

V. *The Times.* It Flowers in *July* and *Auguſt*; and the Seed is ripe not long after the fading of the Flower.

VI. *The Qualities.* It is hot and dry in the firſt Degree: it is opening, cleanſing, Pectoral, and Traumatick; and by appropriation is Hepatick, and Pulmonick, or Pectoral; it is Sudorifick and Alterative.

VII. *The Specification.* It is ſaid to be a peculiar cleanſer of the Blood; and reſtorer of its Craſis; and has a ſingular Property in curing of old Ulcers and Fiſtula's.

VIII. *The Preparations.* The Shops prepare nothing from it; but there may be made thereof, 1. *A Decoction.* 2. *A Juice.* 3. *A Balſam of the Juice.* 4. *An Eſſence.* 5. *A Spirituous Tincture,* 6. *A Saline Tincture.* 7. *An Oily Tincture.* 8. *Aſhes.*

The Virtues.

IX. *The Decoction in Wine.* It is Traumatick, and a reſtorer of the Blood; attenuates and makes thin, groſs, tough, and viſcous Humors; and is a ſingular thing againſt Scabs, Itch, and other Salt Humors, being given from ij. ounces to vj. morning, noon, and night.

X. *The Juice.* It provokes the Terms in Women; and taken with the Juice of Fumitory, rectifies the ſaltneſs and ſharpneſs of the Blood: it is good againſt Scabs, Itch, ſalt and ſharp Humors, Apoſtems, &c. Doſe from j. ounce to ij. morning, noon, and night.

XI. *The Balſam. Take of the Juice* vj. *ounces, Turpentine* iij. *ounces, Oil* ij. *ounces, Bees Wax* j. *ounce, Roſine half an ounce, mix and make a Balſam, by Evaporating to a Conſiſtence, or till the watry part of the Juice is gone.* It is an excellent thing, for the curing of Wounds, Ulcers, old running Sores and Fiſtula's: Fills Ulcers with Fleſh, and brings them to a ſpeedy healing: Applied alſo in the

the Gout, it abates the Tumor, and gives eaſe in a little time.

XII. *The Spirituous Tincture.* It is ſingular good againſt Agues, taken to the quantity of an ounce: It alſo heals all green Wounds and old Sores, inwardly taken, and outwardly waſht therewith.

XIII. *The Saline Tincture.* Taken inwardly it is good againſt the Stone, opens Obſtructions of the Liver and Spleen, and is good againſt Leproſies, Cachexies, Dropſie and Yellow Jaundice: It removes ſtoppages of the Lungs, provokes Urine, and prevails againſt Gravel and Tartarous Matter, whether in the Reins or Bladder. Doſe from j. dram to ij. or more, in Ale or Wine.

XIV. *The Oily Tincture.* It is good againſt the Stone in the Reins, being taken from iv. drops to xx. in a Glaſs of Ale, Wine, or ſome Nephritick Water, as Parſly, or Arſmart water. Outwardly uſed, it is of Excellent Service againſt a Cold Gout, and all manner of Aches and Pains proceeding from a Cold Cauſe, in what part of the Body ſoever; it warms and Comforts the Part, and prevents a Gangrene and Sphacelus; and is good againſt Scurf, Morphew, Itch and the like, being anointed on the Part.

XV. *The Eſſence.* It is Traumatick, and an excellent thing to open Obſtructions of the *Viſera*, cleanſe the Blood, and heal Ulcers of the Lungs, and has been approved of by ſome to be good againſt the Leproſie, inwardly taken from j. ounce to ij. twice a day in ſome proper Vehicle: things proper being alſo outwardly applyed for the ſame purpoſe.

XVI. *The Fixed Salt.* It Diſſolves Tartar in the Blood, and Urinary Paſſages, abſorbs and evaporates ſharp and malign Humors, which are the cauſe of Scabs, Itch, Leproſy, and other breakings out of the Skin: it alſo cuts and makes thin thoſe Humours which are tough and thick. Doſe j. Scruple in a Glaſs of White Wine.

CHAP. VI.

Of ALEHOOF, *Great, Small, &c.*

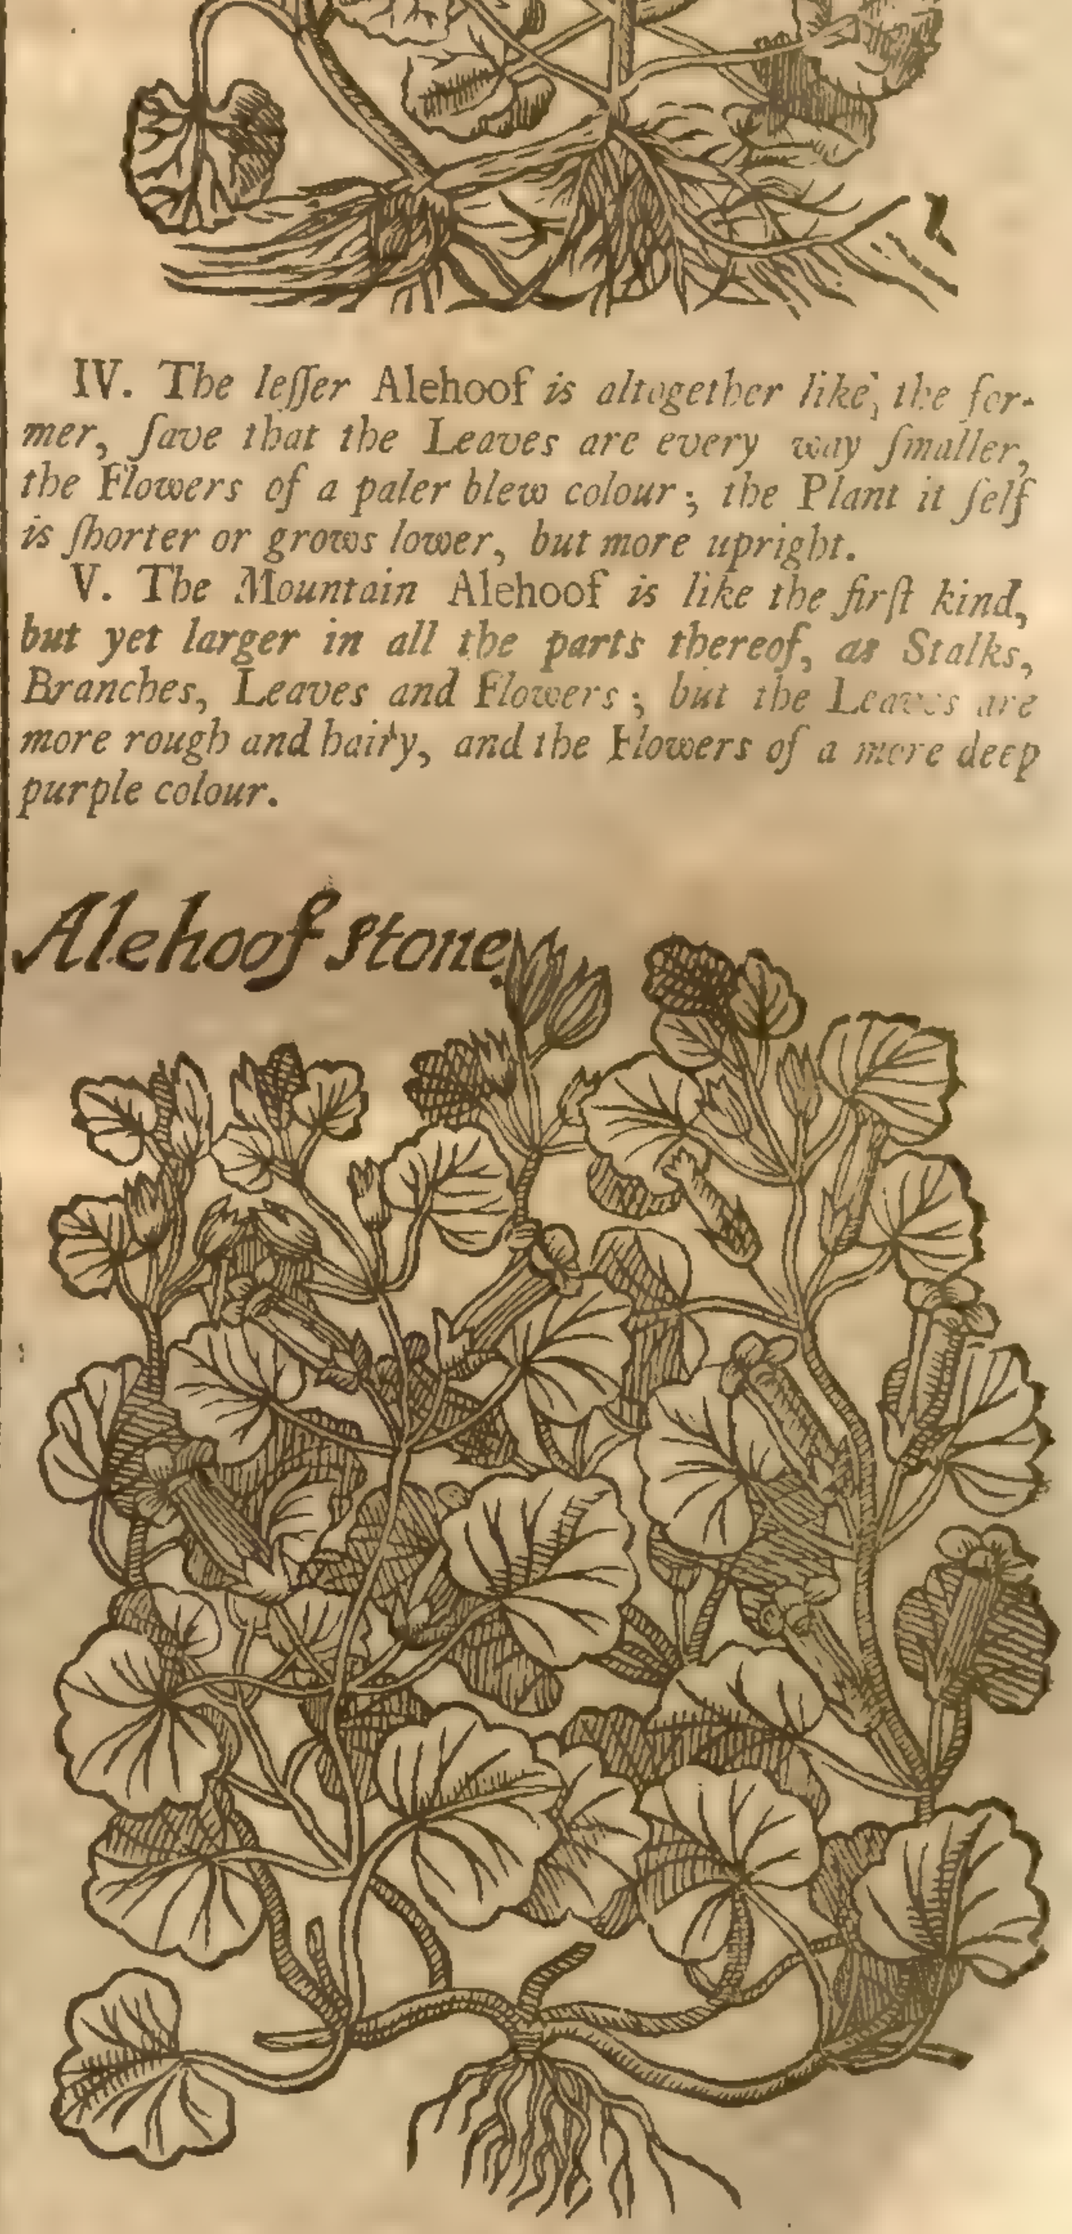
I. THE *Names.* This Plant is called in *Greek*, Χαμαίκισσος, ἢ Κισσὸς χαιώδης, ἢ Κιττὸς χερσαῖος. In *Latin*, Hedera *terreſtris*, *Chamæciſſus*, *Corona Terræ:* and in *Engliſh*, *Ground-Ivy*, *Alehoof*,

II. *The Kinds.* There are four ſorts, 1. The *Common Ground Ivy*, or *Alehoof*, called Χαμαίκισσος μέγας, ἢ τῆς στέφανος. *Hedera terreſtris*, *Corona Terræ*, common or large *Ground Ivy*, or *Alehoof*. 2. Χαμαίκισσος μικρὸς, *Hedera terreſtris Minor*, the leſſer *Ground Ivy*. 3. *Hedera terreſtris montana*, Mountain *Ground Ivy*. 4. *Hedera terreſtris Saxatilis*, *Stone Alehoof*, or *Ground Ivy*.

III. The Deſcription. *The large* Alehoof *has a very large and thready Root, from which riſes many Stalks of an uncertain height, from* 8. *to* 14. *or* 15. *Inches long, it being but a low Herb, creeping and ſpreading upon the Ground, hither and thither, all about: the Stalks are ſlender, ſomething cornered, and green, ſometimes a little reddiſh: from whence grow Leaves ſomewhat broad and round, hairy, and a little nicked in the edges, for the moſt part, two Leaves out of every Joynt. At the Joynts likewiſe with the Leaves, towards the end of the Branches come forth hollow long Flowers, gaping at the ends, of a blewiſh purple colour, not much unlike to thoſe, of Germander, with white ſpots upon the Label or Lips which hang down: the whole Plant is of a ſtrong Smell and bitterish Taſte.*

IV. *The leſſer* Alehoof *is altogether like the former, ſave that the Leaves are every way ſmaller, the Flowers of a paler blew colour; the Plant it ſelf is ſhorter or grows lower, but more upright.*

V. *The Mountain* Alehoof *is like the firſt kind, but yet larger in all the parts thereof, as Stalks, Branches, Leaves and Flowers; but the Leaves are more rough and hairy, and the Flowers of a more deep purple colour.*



VI. *The Stone* Alehoof *creeps and ſpreads all about the Ground, with its ſlender weak Branches, ſet with Leaves like the former by couples, but larger and*

and more unevenly dented, or rather waved at the edges: the Flowers which ſtand at the Joynts with the Leaves, are longer, the hoods larger, and of a paler purplish colour than the former.

VII. *The Places.* The firſt ſort grows under Hedges, and by Ditch ſides, High-ways, and by Houſes, in ſhaddowed Lanes, and the borders of Meadows, and other waſte Grounds in moſt places of the Kingdom. The ſecond kind is found at the feet of old Trees in *England* and *Germany*, and many times in old Orchyards. The Mountain grows upon Hills and Mountains. The laſt kind grows in *Narbone* and *Provence* in *France*; and in ſome places of *Somerſetſhire*, as *Lobel* ſays.

VIII. *The Times.* They all begin to Flower in *April*, and continue flowering for a long time, even till the Summer is far ſpent, and remain green not only in Summer, but alſo in Winter, and abiding the Winter, if it is not too vehement or ſharp.

IX. *The Qualities.* They are all of one nature, hot and dry in the firſt degree: but the two latter are dry in the ſecond degree. They are Aperitive, Abſterſive, Bechicick, Attenuaters and Vulnerary: by Appropriation, they are Pectoral, Nephritick and Arthritick: and operate only as Alteratives.

X. *The Specification.* They are peculiar againſt vehement Coughs and Catarrhs: the Mountain prevails againſt the Gout, and the Saxatile againſt Stone and Gravel.

XI. *The Preparations.* The Shops have only the Herb and Flower; but from them you may prepare, 1. *A Juice.* 2. *An Infuſion.* 3. *A Decoction.* 4. *A Syrup.* 5. *A Mixture.* 6. *A Conſerve.* 7. *A Lobock.* 8. *An Ale.* 9. *A Pouder.* 10. *Troches.* 21. *A Balſam.* 12. *A Cataplaſm.* 13. *An Eſſence.* 24. *A Spirituous Tincture.* 15. *A Saline Tincture.* 16. *An Oily Tincture.* 17. *A Diſtilled Water.* 18. *A Spirit.* 19. *An Extract.* 20. *A Fixed Salt.* 21. *An Ophthalmick.*

The Virtues.

XII. *The Juice.* It is bitter, cleanſing and opening the Obſtructions of the *Viſcera:* put into the Ears, it helps the Noiſe in them, as alſo their Ringing and Deafneſs, and is profitable againſt the Jaundice, Catarrhs and Rhumatiſms; it has Cured many (ſays *Hollerius*) at point of Death. Doſe from j. ounce to iv. ounces, according to Age and Strength.

XIII. *The Infuſion.* Made in fair Water, or a weak Lime Water, and Drank three or four times a day, from iv. to viij. ounces, it Cures Coughs, Colds, Spittings and Wheezings.

XIV. *The Decoction.* It is a good Vulnerary and Bechicick, more eſpecially if ij. ounces of Spirit of Wine or Brandy be added to every pint thereof: it diſpoſes old Sores, running Ulcers and Fiſtula's to a healing. Doſe from iij. ounces to vj. 3. or 4. times a day. This Decoction mixt with Honey and a little burnt Alum, is good to waſh Sore and Ulcerated Mouths, as alſo Ulcers in the Privy parts of Man or Woman.

XV. *The Syrup.* It is peculiar againſt an old Cough, and other Diſtempers of the Breſt and Lungs, as Catarrhs, Wheazings, Aſthma's, Ulcers of the Lungs, ſpitting of Blood, *&c.* Let it be often taken with a Liquorice Stick: or it may be taken a large ſpoonful at a time, as oft as need requires.

XVI. The Mixture. *Take of the Juice* ij. *ounces, Honey* j. *ounce, burnt Alum* iij. *drams, purified Verdigriſe half a dram, mix them well together:* It Cures Sore Mouths and Throats, Ulcers of the Gums and Tonſils, as alſo other Ulcers and running Sores in other parts of the Body.

XVII. *The Conſerve.* It opens the Breſt and Lungs, and gives relief in Coughs, Colds, ſhortneſs of Breath, Wheezings, and ſoreneſs of Breſt and Stomach.

XVIII. *The Lobock.* It is made of the clarified Juice, mixed with clarified Honey in equal proportions: and is good againſt the moſt vehement and violent Coughs, very powerful againſt Phthiſicks, or Ulcerations of the Lungs, cauſing a ſpeedy healing; let it be taken with a Liquoriſh Stick oftentimes in a day.

XIX. *The Ale.* You may put iij. large handfuls of the green Herb to every Gallon of Ale, whilſt Working: it is ſaid to clarify and make fine the Drink in about 24 hours time, from whence came the name of *Ale-hoof*, or *Tun-hoof*; and in old Time ſupplyed the uſe of Hops: it makes the Drink very opening and Diuretick.

XX. *The Pouder.* It is made of the dryed Leaves; and is given from half a dram to a dram: it may be taken in iv. or v. ounces of its own diſtilled Water; it is ſaid to Cure the Yellow Jaundice in 7. or 8. days, and in 40. or 50. days the Sciatica.

XXI. *The Troches.* They are made of the Pouder aforegoing, with Iſing-glaſs and white Sugar Candy: and are of excellent Uſe againſt Coughs, Colds, Phthiſicks, Conſumptions, Wheezings and ſhortneſs of Breath, being held often in the Mouth, and ſuffered gradually to diſſolve, the Sick alſo drinking Milk every day, in a pretty large quantity.

XXII. *The Balſam.* It is made of the Juice Boiled to the thickneſs of new Honey 4 Ounces, mixed with Turpentine of *Chio*, and Oil of ſweet Almonds, of each ij Ounces. It heals green Wounds, running Sores, old Ulcers, Fiſtula's, *&c.* after an admirable manner, being applied to the Part.

XXIII. The Cataplaſm. *Take Turpentine* ij. *ounces, Yolks of three new-laid Eggs, mix them well together, then add of the green Herb, cut ſmall and beaten in a Mortar,* iij. *large handfuls, mix and apply it;* it gives excellent relief in the Gout, and other Pains of the Joynts; applyed hot to the Region of the Liver or Spleen, it eaſes their Pains: and upon the *Abdomen*, it is ſaid to be a preſent Remedy in the Colick.

XXIV. *The Eſſence.* It is excellent good againſt weak and aching Backs, Coughs, Wheezings, Aſthma's, ſhortneſs of Breath, ſpitting Blood, Ulcers of the Lungs; and is ſingular good for all Wounds, inward or outward, it cleanſes and rarifies, and is good againſt any griping Pains, or windy Cholerick Humors in Stomach, Spleen or Belly: it helps the Yellow Jaundice, by opening the Obſtructions of the *Viſcera*, and is good againſt Poiſon and Plague: it provokes Urine, and the Terms in Women; and being Drunk with Wine for ſome conſiderable time, it is ſaid to Cure the Sciatica, as alſo the Gout in Hands, Knees or Feet, diſſolves and diſperſes the Peccant Humors, and ſo gives eaſe. Doſe from j ounce to ij ounces in Wine, Mead, *&c.*

XXV. *The Spirituous Tincture.* It prevails againſt Catarrhs, coldneſs of the Stomach, ſpitting Blood, Wind, Pains, Gripings, and other like Diſaffections of Stomach, Liver, Spleen and Bowels. Doſe from j dram to ij drams, in its own diſtilled Water, or other fit Vehicle.

XXVI. *The Saline Tincture.* It helps the Yellow Jaundice, opens Obſtructions of the *Viſcera*, provokes Urine and the Courſes, facilitates the Birth, expels Poiſon and the Plague, and has all the Virtues of the Eſſence, but operates more by Urine. Doſe from j dram to ij in any fit Liquor.

XXVII. *The Oily Tincture.* It is good for the Sciatica or Hip Gout, as alſo the Gout in any other Part, proceeding from a cold Cauſe, being anointed very hot upon the part twice a day.

XXVIII. *The*

XXVIII. *The Distilled Water.* It is made from the Green Herb in *April* or *May*, and used chiefly as a Vehicle with most of the former Preparations.

XXIX. *The Spirit.* It is made of the Fermented Juice, and is of singular Use against the Scurvy, whether in a hot or cold Constitution; it strengthens the Stomach, and causes a good Appetite. Dose from half an ounce to j ounce, mixt with Wine, or with the Syrup of the Juice.

XXX. *The Extract.* It Cures Diseases of the Breast and Lungs, and opens Obstructions of the Reins and Womb. Dose j. dram or more, dissolved in Sack. It contributes as a Traumatick to the healing of Wounds and Ulcers.

XXXI. *The Fixed Salt.* It is Diuretick and Nephritick, opens Obstructions of the Reins, Ureters and Bladder, dissolves Tartarous Humors in those parts, or in the other *Viscera*, and is found by Experience to be good against Stones, Sand, Gravel, *&c.* being given from xij. grains to xxiiij. in its own distilled Water, Parsley Water, Arsmart or Onion Water, and repeated twice a day.

XXXII. *The Ophthalmick, or Eye-Wash.* ℞ *Juice of Aleboof* iij. *ounces, Juice of Celandine, Juice of Daisies, Rose Water, Honey, of each* j. *ounce, mix and dissolve, then drop it into the Eyes:* It helps all Inflamations, Spots, Pin and Web, Itch, Smarting, and most other Disaffections of that part; and Cures, tho' almost Blind. Use it 5 or 6 times a day, or oftner.

CHAP. VII.

of ALEXANDERS.

I. THE *Names.* It is called in *Greek* Ἱπποσέλινον, ἢ Σμύρνιον. in Latin *Hipposelinum*, *Smyrnium*, *Equapium*, *Olus atrum* (from making the Pottage black:) in English *Alexanders*, *Alisanders*, and *Horse Parsley.*

II. *The Kinds, or Species.* It seems to be a Species of the *Apii* or *Parsleys*; this being the largest of all, and therefore called *Hipposelinum* or *Horse-Parsley.* This Species is said to be twofold, 1. The *Common* or *English Alexanders.* 2. The *Cretick*, or that which grows in *Candy*, but with us in some Gardens.

III. The Description. *The Root is great, thick and long, blackish on the outside, and white within, of a hot and bitterish Taste, spreading under Ground. From thence rises up a Stalk or Stalks, thick and round, a Yard high, more or less, with sundry Leaves on them, parted into smaller divisions: from the Joynts issue Branches, from whence, upon foot Stalks, proceed Leaves, cut out into many parts, somewhat resembling Smallage, but greater, broader and rounder, and more cut in about the edges, smooth also, and of a deep green colour, having a somewhat hot and spicy Taste, and a little bitter withal. At the extremities of these Branches, grow large tufts or umbles of white Flowers: after which come great blackish Seed, almost round, but a little straked on the back, of a hot Taste, not much unlike that of the Root.*

SMYRNIVM.

IV. *The* Cretick *or* Candy Alexanders *has a Root almost round, yet a little long withal, white on the outside, which afterwards grows thicker and longer, and greatest at top, ending small, and perishing after it has born Seed. From whence rises up* Leaves *like some kind of* Selinum, *the whole Leaf being large, and more divided into smaller parts than the former, as if it were some great* Parsley, *of a dark green shining colour, and dented about the edges, from the midst of which Leaves rises up a Stalk, round and stiff, firm and not hollow, 4 feet high or higher, having commonly at all its Joynts whole and almost round Leaves, yet something longer than round, and here and there cut in on the edges, of a yellowish green colour, which do not so much compass the Stalk, at the bottom of them, as that the Stalk in a manner grows through them: from the Joynts likewise rise sundry Branches, with the like yellowish round Leaves on them, and the Stalks running thro' them to the top, resembling* Through-wax, *or* Through-leaf; *where stand thick*

tufts or umbles of yellowiſh Flowers, which afterwards yield ſmall round blackiſh Seed, about the bigneſs of Radiſh *Seed.*

V. *The Places.* They are commonly Sown in Gardens throughout all *Europe*, but the firſt is alſo found Wild in ſeveral Places in *England*, as at *Preſtholm*, an Iſland on the *North* of *Angleſey*; on the Rocks near the Sea-ſhoars in many places, in ſome places on the Rocks near the *Scotch* Shoars, not far from *Berwick*, and about *Scarborough* Caſtle.

VI. *The Time.* It Flowers in *June* and *July*, and the Seed becomes ripe in *Auguſt*: But *Gerard* will have it, that the Seed is not ripe till the ſecond year, which I confeſs I have not obſerved. Yet being an annual Plant, I ſee not why its Seed ſhould not be annual.

VII. *The Qualities.* It is hot and dry in the third degree: Attenuating, Carminative, Diuretick and Lithontriptick: by Appropriation, it is Stomatick, Hyſterick and Nephritick; and operates as an Alterative.

VIII. *The Specification.* It effectually provokes Urine, helps the Strangury, and prevails againſt Gravel and Tartarous Matter in Reins and Bladder.

IX. *The Preparations.* The Shops keep nothing of this Plant. But you may prepare from it, 1. *A Pouder* from the Seed. 2. *A Decoction* of the Roots and Leaves. 3. *An Expreſſed Juice.* 4. *A Condite* of the Roots. 5. *A Balſam* of the Juice or green Herb. 6. *A Cataplaſm.* 7. *A Diſtilled Water* of the Plant. 8. *An Oil* of the Seed. 9. *A Spirit* from the Seed or Plant. 10. *A Spirituous Tincture.* 12. *An Oily Tincture.* 13. *A Salt* from the whole Plant. 14. *An Eſſence.*

The Virtues.

X. *The Pouder from the Seed.* Being taken from half a dram to j. dram in white *Port* or *Rheniſh* Wine, or diſtilled Water of the Plant, it powerfully provokes the Terms, expels the Birth, moves Urine, helps the Strangury and Cholick, breaks Wind, and is good againſt the bitings of Serpents, Mad Dogs, or other Venomous Creatures.

XI. *The Decoction.* It opens Obſtructions, provokes Urine and cleanſes the Blood admirably: it is good alſo for ſuch as have ſtoppages in their Urine, or are troubled with the Strangury. Doſe from iv. to viij. ounces.

XII. *The Expreſſed Juice.* Given from iij. to vj. ounces mixt with *Rheniſh* Wine, or white *Port*, it is a Specifick againſt Stone and Gravel, eaſes the Strangury, and brings away Urine or Matter obſtructing the Urinary paſſages, when almoſt all other things fail.

XIII. *The Condite, or Pickled Roots.* They are Eaten raw as a Sallet, with Oil, Vinegar and Pepper: they ſtrengthen the Stomach, create a good Appetite, cauſe Digeſtion, reſiſt Crudities, and expel Tartarous and Viſcous Juices from the Stomach.

XIV. *The Balſam.* It is an excellent Vulnerary, curing all ſorts of green Wounds in a ſhort time: it cleanſes running Sores, and old rotten and putrified Ulcers, and cauſes them ſpeedily to heal.

XV. *The Cataplaſm.* It is made of the bruiſed Leaves, and applyed hot to the part afflicted: being made of the Leaves boiled, it drys up old Sores and fætid Ulcers, without any pain, and heals them; and either diſcuſſes or maturates Scrophulous Tumors: if it is made of the raw Herb, beaten in a Mortar with the Yolks of Eggs, and applyed cold, it ſtops bleeding in Wounds new made.

XVI. *The Diſtilled Water.* It may be Diſtilled either from the Seed, or from the whole green Plant: it is a Specifick againſt Gravel and ſtoppage of Urine.

XVII. *The Diſtilled Oil of the Seed.* It is given from iij. drops to x. in any convenient Vehicle, and comforts and warms a cold Stomach, ſtrengthens it, cauſes a good Appetite and Digeſtion, expels Wind, gives eaſe in the Colick, provokes the Terms in Women, and facilitates the Birth; opens Obſtructions of the Breſt, Lungs, Liver, Spleen, Reins and Womb, helps ſhortneſs of Breath, and comforts the Head, Brain and Nerves, being ſingular good againſt Megrims, Vertigo's, Lethargies, Apoplexies, Palſies, Convulſions, and the like; you may give it in Extremity, as alſo morning and evening.

XVIII. *The Spirit.* It is weaker than the Oil, but much pleaſanter, and has all the ſame Virtues, but operates not in ſo powerful a manner. It is Carminative and Cordial, and given againſt fainting Fits. Doſe j. ounce.

XIX. *The Spirituous Tincture.* The Virtues are the ſame with the Oil, but more penetrating; and is indeed much more powerful than the Spirit, for that it abounds much more with the Sulphur of the Vegetable: it may be given in the diſtilled Water, from j. dram to iij. drams, morning and night.

XX. *The Saline Tincture.* It is a Lithontriptick, or Stone-breaker, opens all Obſtructions of the Reins, Ureters and Bladder; attenuates, cleanſes, brings away Sand, Gravel and Tartarous Slime, opens the Womb, provokes the Terms, and ſtrengthens that part, ſo as to cauſe Fruitfulneſs in Women, and brings away both Birth and After-birth: it eaſes the Spleen, and removes its ſtoppages. Doſe from j. dram to iij. drams.

XXI. *The Oily Tincture.* It has the Virtues of the former, but is particularly good againſt the Palſie, being outwardly anointed on the part, and inwardly taken from vj. drops to xx. in a fit Vehicle.

XXII. *The Salt of the whole Plant.* It is Diuretick and Nephritick in a peculiar manner, provokes Urine, brings away Sand and Gravel; and is good againſt Diſeaſes of the Brain and Nerves, by powerfully

fully opening Obſtructions. Doſe from x. grains to j. ſcruple, in its own diſtilled Water.

XXIII. *The Eſſence.* It prevails againſt Phlegm, and a Phlegmatick habit of Body, opens Obſtructions of the *Viſcera*, cleanſes and purifies the Blood, warms a cold Stomach, is Carminative, provokes the Courſes, and brings away both Birth and After-birth. Doſe j. ounce, more or leſs, according to the Neceſſity and Age of the Patient, in a Glaſs of Wine.

CHAP. VIII.

Of ALKANET.

Alkanet.

I. *THE Names.* It is called in *Greek* Ἄγχουσα. in Latin *Anchuſa*, *Onocleia*, *Bugloſſa Hiſpanica*, and in Engliſh *Alkanet*.

II. *The Kinds.* It is ſaid to be a Species of *Bugloſs*; but of this there are ſeveral kinds, as, 1. The great yellow *Alkanet*, called ſimply ἄγχουσα, *Anchuſa*. 2. The leſſer *Alkanet*, with purple Flowers, called ἄγχουσα ἑτέρα, *Anchuſa altera*. 3. The ſmall *Alkanet*, with yellow Flowers, called ἄγχουσα τρίτη, *Anchuſa tertia*. 4. *Anchuſa Lignoſior*, Woody *Alkanet*. 5. *Anchuſa humilis Cretica*, Low *Alkanet* of *Candia*. 6. *Anchuſa arborea*, Great or Tall *Alkanet*. Of theſe, we ſhall only diſcourſe of the three firſt, as being only uſeful for our purpoſe.

III. The Deſcription. *The firſt kind has a great and thick Root, of a dark reddiſh colour, with many Branches from the ſame. The Leaves are long, narrow, hairy and green, like the Leaves of* Bugloſs, *which lye very thick upon the Ground: the Stalks riſe up, and are compaſſed round about thick with Leaves, which are leſſer and narrower than the former; they are tender, and ſlender, not much above a foot and half high, at the tops whereof ſtand ſmall yellow Flowers, with a ſmall Leaf at the foot of every Flower, which are ſomewhat long and hollow, very like to* Comfrey *Flowers, but a little opening themſelves at the brims like unto* Bugloſs *Flowers, with a Pointel in the midſt, after which come in their places, ſmall, long, blackiſh Seed, not unlike to* Bugloſs *and* Comfrey *Seed. The Root is as big as ones Finger or Thumb, and about two Fingers long, whoſe outward Bark is ſomewhat thick, and of an excellent orient red colour, ready to colour ones Hands and Fingers with its red colour, if handled: its inner Pith is white and woody, and the whole Plant is of a Styptick or Aſtringent Taſte.*

IV. *The ſecond kind has a Root pretty large and thick, and of a dusky red colour, with many Branches from the ſame; the Leaves are greater and longer than the next kind, narrow, hairy and green, like* Bugloſs *Leaves, and ſomewhat like to the former, but yet leſſer and narrower, but more plentiful, as well thoſe which lye upon the Ground, as thoſe which riſe up with the Stalks, which are many, ſlender and tender, of about a foot and half high, whoſe Flowers are like the others, ſave that they are of a reddiſh purple colour, and the Seed following mere gray, the whole being of a rough and aſtringent Taſte.*

V. *The ſmall yellow* Alkanet *is like unto the firſt, having a Root great in reſpect to the Plant, red, and tender whilſt it is young, but growing blackiſh and woody when it is old, and lives and abides after Seed time, which ſome others do not; its Leaves alſo are narrower and ſhorter than the firſt, and covered with an Hoaryneſs, as are alſo the Stalks, which in ſome are but a foot, in others a foot and half high, with ſmaller Leaves thereon: the Flowers are hollow and yellow like the firſt, but leſſer, the Seed alſo is like the Seed of the firſt. Theſe Plants are famouſly known throughout all* Europe, *for the beautiful red colour contained in the Roots, which will colour White Wine of the delicate colour of deep Clarret.*

VI. *The Places.* They are nouriſhed up with us, chiefly in Gardens, but the ſecond of them, *Lobel* ſays, grows near *Rocheſter* in *Kent*; as alſo in the *Weſt* of *England*, as in *Devonſhire* and *Cornwall*.

VII. *The Times.* They flower in *July* and *Auguſt*, and the Seed is ripe not long after; and the Roots yield their glorious red or purple Juice or Tincture in Harveſt time, as *Dioſcorides* ſaith.

VIII. *The Qualities.* It is Temperate as to heat and cold, but is dry in the ſecond degree. It is Repercuſſive, Abſterſive, Styptick, Aſtringent, and Traumatick or Vulnerary. And by Appropriation it is Stomatick, Cardiack, Hyſterick and Nephritick: of the Stock of Alteratives.

IX. *The Specification.* It is peculiar in reſiſting of Poyſon, of all kinds, and ſtopping Fluxes.

X. *The Preparations.* The Shops keep nothing hereof, but the Root; but theſe Preparations may be made therefrom, 1. *An Eſſence* of the whole Plant. 2. *A Juice.* 3. *A Decoction.* 4. *A Wine.* 5. *A Vinegar.* 6. *A Spirituous Tincture.* 7. *A Saline Tincture.* 8. *An Oil.* 9. *A Catæplaſm.* 10. *A Cerote.* 11. *A Peſſary.* 12. *Sanguis Veneris.*

The Virtues.

XI. *The Root.* It is uſed to colour Wines with, Syrups, Waters, Gellies, and ſuch like things: and boiled in Wine, and taken with ſweet Butter, it helps Bruiſes by falls, *&c.*

XII. *The Eſſence of the whole Plant.* It is binding and ſtrengthening, and ſtops Fluxes of all kinds, and allays the heat of Choler: and by its Traumatick Property, is good for the healing of Wounds, running Sores and old Ulcers, prevails againſt the Yellow Jaundice, the Spleen, Agues, and Diſeaſes of the Reins and Bladder: it is good againſt all ſorts of Inflamations, burning Heats, Eryſipelas, and the bitings of Venomous Beaſts; it ſtrengthens a weak Back, and is good againſt Fits of the Mother. Doſe j. or ij. ounces.

XIII. *The Juice.* It has the Virtues of the Eſſence, but not ſo pleaſant to be taken, becauſe it is not of ſo fine and pure a body: it may be kept either in a liquid form or inſpiſſated, as is the *Spaniſh* Juice of Liquorice.

XIV. *The Decoction.* It has the Virtues of the Eſſence, but not ſo powerful; it is of good Uſe in the Yellow Jaundice, and ſtopping Fluxes of the Bowels or of the Womb. Doſe iv. vj. or viij. ounces, ſweetned with treble refined Sugar.

XV. *The Wine.* It is made by Infuſion of the Root, either freſh or dry, ſo long or ſo often, till the Tincture is as deep as Blood. It is a Specifick in the Hepatick Flux, and in ſtopping all other kinds of Fluxes whatſoever. It is alſo a moſt ſingular Wound-drink, ſcarcely inferior to any other. It is good againſt the bitings of Mad Dogs, Serpents, and other Venomous Creatures: it ſtrengthens a weak Back, and ſtops the Whites in Women, and helps to bring forth the Meaſles and Small-Pox in Children. Doſe ij. iij. or iv. ounces.

XVI. *The Vinegar.* It has the Virtues of the Wine, but is peculiar againſt Morphew, Scurff, Leproſie, and other Defilements of the Skin; and prevails againſt the bitings of Venomous Creatures, being inwardly taken, and outwardly applyed: Doſe j. or ij. ounces in any fit Vehicle.

XVII. *The Spirituous Tincture.* This is made only of the red part of the Root; and has all the Virtues of the Eſſence and Wine; but is much more fit in cold Conſtitutions, and where the Plague or any other infectious Diſeaſe is feared. Doſe ij. drams, more or leſs in Wine.

XVIII. *The Saline Tincture.* It is made from the whole Plant, and has all the Virtues of the Plant in it; but this is more peculiar in opening ſome Obſtructions, chiefly of the Reins; for it brings away Sand and Gravel, kills Worms, and is good againſt Fits of the Mother. Doſe ij. or iij. drams.

XIX. The Oil. ℞ *Oil Olivæ* j. *pound*, *Oil of Spike* vj. *ounces*, *Oil of Juniper-berries* ij. *ounces*, Alkanet *Roots* vj. *ounces*; *make an Oil by a gentle Digeſtion*, *in a Sand-heat*, *till it is very red.* It is an excellent thing for deep Punctures, Wounds made with pointed Weapons, and Punctures or Wounds of the Nerves.

XX. The Cataplaſm. *Take of the red part of the Root* iv. *ounces: beat it ſoft in a Stone Mortar*; *then add to it Oil of Mace by Expreſſion* iij. *ounces*, *Mithridate* ij. *ounces*, *Oil of Spike half an ounce*; *mix them.* It is an excellent thing againſt deep Punctures, chiefly of the Nerves. A Cataplaſm made of it with Whey or Cream, is good againſt Burnings.

XXI. *The Cerote.* A Cerote being made of the pulp of the Root with a little Oil and Wax, Cures old Ulcers: and made with Barley Meal, it prevails againſt an Eryſipelas, Leproſy, Tettars and Ring-worms.

XXII. *The Peſſary.* A Peſſary being made of the Root, *viz.* Of its pulp, with Wax, Turpentine and Barley-flower, it is ſaid to bring away the Dead Child, and the After-birth.

XXIII. *Sanguis Veneris.* It is thus made: ℞ *Oil Olive* ℔ij. *Alkanet Root* 3. *or* 4. *ounces*, *Earth-Worms cleanſed or purged*, *number* 40. *boil them well together*, *then ſtrain out whilſt hot*, *and keep it cloſe for Uſe.* This was Invented by *John Ardern*, and is a moſt ſingular Vulnerary in deep Wounds and Punctures of the Nerves, made with Thruſts, Stabs or Pricking with any pointed Weapon, *&c.* it eaſes the Pain, and prevents Convulſions.

CHAP. IX.

Of Clowns ALL-HEAL.

I. THE *Names.* It has no known *Greek* Name, but is called in Latin, *Panax Coloni*, *Panax Heracleum Alterum*: and in Engliſh, *Clowns All-heal*, and *Clowns Wound-wort.*

II. *The Kinds.* It is accounted one of the kinds of *Sideritis*, and is, with *Parkinſon*, the fifteenth, called in Latin *Sideritis Anglica Strumoſâ Radice*, or *Engliſh Iron-wort* with a *Tuberous Root.*

III. The Deſcription. *The Root is compoſed of many long Strings*, *with ſome tuberous long knobs commonly growing among them*, *of a pale yellowiſh or whitiſh colour*, *from whence grows up four ſquare*, *green*, *rough Stalks*, *half a yard or two foot high*, *furrowed in*, *a little upon every ſquare*, *the Joynts ſtanding ſomewhat far aſunder*, *with two very long and ſomewhat dark green Leaves*, *bluntly dented about the edges*, *and ſharp pointed at the end: the Flowers ſtand towards the top*, *compaſſing the Stalks at the Joynts*, *as do thoſe of* Horehound, *but end in ſpiked tops*, *which* Horehound *does not*, *having long and much gaping hoods of a purpliſh red colour*, *with whitiſh ſpots in them*, *ſtanding in ſomewhat rough Husks*, *wherein afterwards ſtand blackiſh round Seeds. The whole Plant is of a ſtrong Smell*, *not much unlike to ſtinking* Horehound.

IV. *The Places.* It grows almoſt every where in *England*, by ſeveral Brooks and Ditch ſides, and ſometimes by the Path-ways, and borders of Fields, as in *Middleſex* near *London*, by the Path-ſides, in Fields going to *Chelſea* and *Kenſington*; by *Hackney*, in the Ditch-ſides of a Field called *The Shoulder of Mutton Field*; and in *Surry* in St. *George*'s *Fields*; and in the Meadows by *Lambeth*, and near *Standgate*: in *Kent* by *Southfleet*; and on the back-ſide, of the Church-yard of *Nettleſteed*, and in ſome places near the foot of *Shooters-hill*: in *Eſſex* by the Ditch-ſides, and on the Ditch-ſides on the Left Hand of the Highway beyond *Stratford Bow*; as alſo in *Cambridgſhire*,

bridgeshire, *Huntingtonshire* and *Suffolk*, in all which it grows plentifully.

V. *The Times.* It flowers in *June* and *July*, and sometimes in *August*, and its seed comes to ripeness soon after, *viz.* in *August* or *September*.

VI. *The Qualities.* It is hot in the second degree and dry in the first: It is Agglutinative, Astringent and Vulnerary: and by appropriation, it is Nephritick and Arthritick; and of the kind of Alteratives.

VII. *The Specification.* It is absolute for healing of Wounds whether inward or outward, and that by the first intention.

VIII. *The Preparations.* The Shops keep nothing of it; but you may prepare from it, 1. *A Juice.* 2. *An Essence.* 3. *A Pouder.* 4. *A Diet-drink.* 5. *A Spirituous Tincture.* 6. *A Saline Tincture.* 7. *An Oil.* 8. *A Balsam.* 9. *A Cataplasm.* 10. *An Emplaster.*

The Virtues.

IX. *The Juice.* It is Traumatick and contributes to the Curing Wounds (whether outward or inward) being taken from ij. Ounces to iiij. in a Glass of Alicant: and so also it is good for Ruptures, Bloody-flux, Vomiting, Spitting and Pissing Blood.

X. *The Essence.* It has all the former Virtues, but much more effectual to all those Intentions; and taken inwardly to ij. Ounces, or more, it alters the habit of the Body, makes the blood Balsamick, and destroys the Cancerous humor, when spread over the whole Body.

XI. *The Pouder.* It is given in Ruptures of the *Peritonæum*, as also in spitting and vomiting of blood, for it stops the bleeding and consolidates the broken Veins. Dose from half a dram to j. in any fit Vehicle; and outwardly being strewed upon Wounds it stops their bleeding, and many times heals at the first Intention: It is made of the dryed herb.

XII. *The Diet-drink.* It is made by boiling the Herb in half Wine half Water: or by Tunning it up with new drink, four large handfulls of the herb bruised to every Gallon of new Ale or Beer, put up into a bag with a stone in it to make it sink, and so to work with the Drink; which after 2 or 3 days may be drunk. It is an excellent thing to be taken a good draught of it at a time, morning, noon and night, by wounded people, and such as have inveterate running Sores, old Ulcers and rebellious Fistula's upon them: it alters the whole habit of the Body, and disposes the Wounds, Ulcers, *&c.* to a speedy Healing, and a perfect Cure.

XIII. *The Spirituous Tincture.* It has all the Virtues of the former, but is much better for inward Wounds, broken Veins, and Ruptures, *&c.* because it more easily and speedily enters into the Mass of Blood, and brings it to a Balsamick Crasis. Dose j. dram to iij. drams in Alicant.

XIV. *The Saline Tincture.* This is better for the Cleansing, Healing and Curing of Wounds and Ulcers of the Reins, Ureters and Bladder, because the *Menstruum* more easily and readily conveys the virtue of the Medicine to those parts: It is also Absterstive, and Cleanses those parts of Sand, Gravel, or any Tartarous matter lodged in, or adhering to them. Dose from j. dram to ij. drams in Smallage or Parsley Water.

XV. *The Oil*, made of the Green Herb with Oil Olive and a ninth part of Oil of Turpentine: It is Vulnerary, and heals Wounds of the Nerves with much speed and facility.

XVI. *The Balsam.* It Cures Wounds and Ulcers: the first it does by the first intention: the latter, by Digesting them, Cleansing them, and then Healing them up as a Green Wound.

XVII. *The Cataplasm.* It is made of the Green Herb, by chopping and bruising it in a Stone Morter, and then beating it up with a little Hogs-lard: This applied heals up Wounds by the first intention, closing up the tips of them, without bringing the Wound to matter. With this Cataplasm a Country-man, who had cut his Leg with a Sithe to the Bone, healed it perfectly in seven days.

XVIII. *The Plaister*, made of the Juice inspissate to the thickness of New Honey, the Pouder of the Herb, with Frankincense and a little Oil Olive: It is good against Ruptures of the Bowels, and is profitably applyed to both *Aneurism* and *Varix*, more especially if Comfrey root is also added to it.

CHAP. X.

Of Common ALL-HEAL.

All heal. Panax recentiorum

I. *THE Names.* It is called in *Greek* Πάναξ ἡ πάνακες. in Latin, *Panax*, & *Panaces*, *Panax Heracleum alterum*; *Panaces Peregrinum Dodonæi*, *Panax Syriacum Theophrasti*; and in English *All-heal*, *Common All-heal*, *Hercules* his *Common All-heal.*

II. *The Kinds.* There are several kinds of *All-heals*, or *Wound-worts*, as, 1. *Clowns All-heal.* 2. *Hercules All-heal.* 3. *Æsculapius* his *All-heal.* 4. *Doria's All-heal* or *Wound-wort*. Of the first we have already treated in the former Chapter. Of the third we shall treat in the next Chapter: and of the fourth in Chap. 858 following. The second kind which is the *Hercules All-heal* is manifold, I. The Common which is sixfold, 1. *Panax Heracleum vel Herculeum Alterum*, *Hercules* his common *All-heal.* 2. *Panax Heracleum alterum Americanum.* 3. *Panax Costinum Matthioli*, *Matthiolus* his Costus-like *All-heal.* 4. *Panax Racemosum Americanum*, The *American* cluster-bearing *All-heal.* 5. *Panaces Moschatum Americanum*, The *American* Musked *All-heal.* Of these five we

we treat in this Chapter. 6. *Panaces Hungaricum et Tartarianum*, *Hungarian* and *Tartarian All-heal*, of which we have nothing here to say. II. The true, which is called *Panax Heracleum Verum*, The true *Hercules All-heal* or *Wound-wort*, which see in its proper place, viz. in Chap. 857 following.

III. The Description. *The first Kind*, viz. Panax Herculeum alterum, *or* Hercules *his Common* All-heal, *has a Root somewhat great, growing deep down into the Ground, with 2 or 3 long branches from it, of a whitish yellow on the out side, and more white within, full of a yellow Sap coming from it, if it is cut or broken, of a little strong scent, and hot bitter taste more than either Leaf or Seed: from this root springs many large winged Leaves round about upon the Ground, most of them two feet long, consisting of four, five or six Couples of rough winged Leaves, set against each other on a round great footstalk, furrowed on the upper side, each of them consisting likewise of three or 4 Couples of rough but large, fair, fresh, yellowish green Leaves, and one at the end, broad below, and growing narrower to a point at the other end; the one side of the leaf next its footstalk, being always deeper at the bottom than the other side, and finely dented about the edges, tasting a little hot and biting in the mouth, and yielding forth a yellowish juyce in the Summer, called* Opopanax, *much more Gummy, hot and bitter than the leaves: from amongst these leaves rises up a strong, great, round, green stalk, 4 or 5 feet high or more, with some joynts and leaves thereat, and a few branches towards the top, breaking forth into small yellow umbles of flowers, which afterwards yield whitish, yellow, flat, short Seed.* Note, Lobel *supposes this to be the* Panax Syriacum Theophrasti, *which yields the Gum* Opopanax, *and not without some ground of reason for it, because (says he) a famous Apothecary in* Antwerp *found in a parcel of the Gum* Opopanax *certain Seeds, which being Sowed by him in his Garden produced this very Plant.*

IV. *The second Kind, or* Americanum *has a great and white Root with sundry long strings, and a pith in the middle, not enduring after Seed time, which is sometimes the second year after its springing up, and sometimes the third. From this Root springs up a Plant much like the last, having such like winged leaves, set in the same manner, and the wings with 4, 5 or 6 Couples of Leaves, but differing in Greatness and Colour; for the whole stalk is not above half so long, nor the leaves above half so great in length or breadth, but rather somewhat short, and of a deep green Colour, very much shining on the upper side, but of a paler green underneath, much hotter and sharper in taste than the former, (and not bitter) drawing Water into the mouth. The stalk is seldom above a yard high with joynts, and leaves thereon, and more branches towards the top than the other, and bearing larger umbles of flowers of a yellow Colour, succeeded by flattish, but almost round Seed of a pale brown Color. This is supposed to be the* American Laserpitium, *or Laserwort which yields a kind of* Assa fætida.

V. *The third Kind, or* Costus *like* All-heal, *differs not much in form from the second, but in its greatness, and in the substance of its yellow juyce, which this has not, and therefore is not of that Kind: this has such large winged leaves, set in the same manner together, but lesser, each leaf whereof is larger than a Parsnip leaf, thicker, rougher and more crumpled, also a little dented about the edges. The stalk is small and about a yard high, full of joynts and lesser leaves set at them, branched towards the tops, and bearing round tufts of yellow flowers, after which follows flat and somewhat round Seed: The Root is Sappy, with a thick fleshy Bark, and of a shining Ash Colour, bitter and sharp in taste.*

VI. *The fourth Kind, or Cluster-bearing* All-heal, *has a Root of the thickness of ones Thumb, and very long, from whence rises up a round, pithy, brownish, purple stalk, set at the joynts with large leaves, divided into many parts, usually by three at a place, a little dented about the edges, bearing both at the joynts with the leaves and at the tops on sundry branches, many tufts of flowers, made of small threads, like Vine Blossoms; at the first greenish, but whiter afterwards, which turn into small branches of green Berries, and come afterwards to be of a dark red when they are ripe, full of a pleasant juyce, with many Seeds therein. It looses both Stalks and Leaves every year, and they spring up new again after Winter: the whole Plant, Leaves and Roots are eaten as Pot-herbs and Sallets, by the* Indians, *where it is natural; as also by our* Europeans *which dwell among them, and taste more pleasant than the* Fruit *it self.*

VII. *The fifth Kind, or* Panaces Moschatum Americanum: *The Root is long, white, and a little sharp and bitter, from whence springs up its first leaves, which are large, and about a foot long, only dented about the edges, somewhat like unto* Coltmary *leaves, lying on the Ground, and compassing the long white root at the head; but those which follow are so deeply cut in, that they reach to the middle Rib almost: the stalk rises to be about a yard high, without any leaves thereon, save only about the middle, where it has a Knot and a Leaf which encompasses it, of a differing form from the rest: the top branches are so heavily laden with umbles of white flowers, that before they open, they hang down their heads, which have so admirable, sweet and odoriferous smell, that it is not inferior to Musk, and may be smelt a great way from the place where it grows: the leaves taste sharp and a little bitter; the Seed is like the first Kind, but not so broad.*

VIII. *The Places.* The first grows in *Italy*, and generally in our Gardens in many places; as in the Physick Gardens at *Oxford*, *Westminster* and *Chelsea*: The second was brought from *America*, and is now Nourished in our Gardens also. The third grows on Mount *Garganus* in *Apulia*. The fourth and fifth grow in *America*, as in *New-England*, *Canada*, *New-York*, *Maryland* and *Virginia*.

IX. *The Times.* They all flower in the latter Summer Months, and their Seed is perfected in the end of Summer.

X. *The Qualities.* The herb, as also the Gum *Opopanax*, are hot and dry in the second degree; tho' some Authors will have the Gum to be hot in the 3d. degree, which I do not believe. The Herb, as also the Gum, Attenuate, Rarifie, Discuss, Resolve; are Vulnerary, and very gently attract: and by their appropriation they are Cephalick, Stomatick, Pectoral, Splenetick, Hysterick and Arthritick. And are accounted among the number of Alteratives; yet the Gum has been found sometimes to purge, tho' but very gently; for which reason, it is often mixt with Catharticks.

XI. *The Specification.* Both Herb and Gum are singular Vulnerarys, and are known to Cure Wounds and Ulcers before most other things in the World. The Gum also is specifick in Diseases of the Spleen and Womb, removing Vapors, and helping Fits of the Mother, as also outwardly to discuss or resolve hard Tumors or Swellings, (if resolvable) in what part of the Body soever.

XII. *The Preparations.* The Shops keep nothing of this Herb, but the Gum: from the Herb you may prepare. 1. *A Pouder of the Seed.* 2. *A Juyce.* 3. *An Essence.* 4. *A Syrup.* 5. *A Spirituous Tincture.* 6. *A Saline Tincture.* 7. *An Oily Tincture.* 8. *A Decoction.* 9. *A Wine.* 10. *An Oil.* 11. *A Balsam.* 12. *An Ointment.* 13. *A Cataplasm.* 14. *An Emplaster or Cerote.* From the Gum you have, 15. *The strained or purified Gum.* 16. *Pills of Opopanax.*

nax. 17. *A Volatil Acid Spirit.* 18. *A Diſtilled Oil.* 19. *A Saline Tincture* of the Gum 20. *A Balſam* of the Gum. 21. *A Cerote* of the Gum.

The Virtues.

XIII. *The Powder of the Seed.* This drunk in Wormwood Wine, from half a dram to j. dram, is good againſt Poyſon, and the bitings of all Venomous Creatures,.

XIV. *The Juyce of the Herb.* It is good againſt Pains and Ulcers of the Bladder, and helps againſt the Strangury, or difficulty in making Water: It expels Worms, is good againſt the bitings of mad Dogs, or any other Venomous Creature. Doſe j. ounce.

XV. *The Eſſence.* It is Cephalick, Pectoral, Hyſterick and Vulnerary, curing moſt Diſeaſes of the Head, Breſt, Lungs, and Womb, and is very contributory to the healing of Wounds, or any old Sore, or running Ulcer, helps Pains and Stitches in the ſide, hardneſs in the Spleen, and ſuffocations of the Mother, provokes the Courſes and expels the Birth. Doſe to j. ounce in any proper Vehicle.

XVI. *The Syrup of the Juyce.* It has all the Virtues of the *Juyce* and *Eſſence*, but not altogether ſo powerful and effectual, but ſomething more pleaſant, and may be exhibited to j. ounce more or leſs in Wine, or Arſmart Water.

XVII. *The Spirituous Tincture.* It has all the Virtues of the *Eſſence*, but is much more fit for cold Conſtitutions, it ſtrengthens the Brain, Nerves and Senſitive Parts, warms a cold Stomach, and is good againſt any cold Diſeaſes in thoſe Parts. Doſe from j. dram to iij. in Ale, Mead, or Wine.

XVIII. *The Saline Tincture.* It has all the former Virtues, but is more peculiar againſt all Diſeaſes of the Womb, Reins, Ureters and Bladder, for it diſſolves all Tartarous Slime, Sand, Gravel and the like in thoſe Parts: brings down the Courſes in Women, and forces away both Birth and Afterbirth, and clears the Urinary Paſſages of whatever obſtructs them. Doſe from j. dram to ij. in Wine or Parſley Water.

XIX. *The Oily Tincture.* It is good againſt the Colick, and Windineſs of the Bowels, and is ſaid to expel the dead Child: it heals Wounds by the firſt intention, eſpecially thoſe of the Nerves, and is good againſt the Toothach, (held awhile in the Mouth) old Sores, numneſs of the Limbs, Palſies, *&c.* outwardly applyed, by anointing therewith, and inwardly given, from vj. to xij. or xvj. drops in Ale, Beer, Mead, Wine, or ſome proper Liquor.

XX. *The Decoction of the Herb*, in water or Wine, may be uſed as a Diet-Drink for the curing of Wounds, old Ulcers, running Sores and Fiſtula's, and to heal internal Ulcers in the Lungs: Doſe iv, v, or vj. ounces at a time, two or three times a day; it is ſaid gently to evacuate Choler.

XXI. *The Wine.* It is only an Infuſion of the Herb in Wine, and is ſomething more powerful, at leaſt more proper than the *Decoction*, for all the ſame purpoſes in cold Conſtitutions or habits of Body, to eaſe cold Diſeaſes of the Head and Nerves, and give eaſe in the Cholick: Doſe ij. or iij. ounces or more, two or three times a day.

XXII. *The Oil.* It is Vulnerary, and heals Wounds after an admirable manner: anointed it diſſolves Oedema's, or cold Tumors in any Part, Diſcuſſes hard ſwellings in the Joynts, and gives eaſe in the Gout, Spleen, and other Pains from a cold cauſe, being anointed on the place.

XXIII. *The Balſam.* This is more excellent for curing of Wounds, and commonly performs the Work by the firſt Intention; it cleanſes and heals Ulcers; and is a ſingular thing for the curing of Fiſtula's, being injected ſcalding hot into the ſame. It gives eaſe alſo in the Gout, and in all Aches and Pains from a cold cauſe: And covers naked Bones with Fleſh.

XXIV. *The Ointment.* It ſoftens the hardneſs of the Spleen, and is of good uſe in diſſolving or diſcuſſing hard ſwellings of the Kings Evil.

XXV. *The Cataplaſm.* It is Diſcuſſive, Reſolutive and Anodyn; and an excellent thing to be applyed to Kings evil ſwellings, or any hard Tumor in any part of the Body: The Green Leaves beaten into a *Cataplaſm* with Honey, and applyed, cures Wounds and Ulcers, incarnates, and covers naked Bones with Fleſh.

XXVI. *The Cerot or Emplaſter.* It is Diſcuſſive, Reſolutive and Anodyn: and applyed to any weak Part or Joynt, it ſo ſtrengthens it, as to hinder an afflux of Humors to that Place: it is alſo good againſt Spaſms and Cramps, and numneſs of the Limbs; helps the pain, ſwellings, and hardneſs of the Spleen and Hypochonders, being ſpread upon Leather or new Cloth and applyed.

The Virtues of the Gum Opopanax,

XXVII. *The ſtrained or purified Gum.* It is a Gummy Juyce flowing from the Root of *Panax Herculeum*, being cut or wounded; which is afterwards inſpiſſated or brought to a thickneſs, and is then called in the *Greek*, Ἀποπάναξ, *Apopanax*; and in *Latin*, *Opopanax*: it is a fine fragrant Gum of a reddiſh, or reddiſh yellow color outwardly, but inwardly of a whitiſh yellow: it comes out of the Plant white, and in round looſe drops, and is white within, but being glutinous it ſticks together in Lumps, and by degrees it becomes thick, and of a Gold color on the out ſide, but being diſſolved is almoſt like Milk. It diſcuſſes Wind, purges Flegm which is thick and tough, even from the remote parts of the Body, as from the Head, Brain, Nerves, Joynts, Reins and Womb: it diſſolves Tartarous mucilage in the Breſt, Lungs and Miſentery, digeſts, and ſoftens Tumors, and is a good thing againſt an old Cough, ſharpneſs of Humors, ſhortneſs of Breath, difficulty in breathing, and other obſtructions of the *Viſcera.* It is depurated by diſſolving it in Vinegar, ſtraining and inſpiſſating. It may be given from half a dram to a dram or more, corrected with Ginger, and Nutmeg. Diſſolved in Vinegar and drunk an hour befor the Fit of an Ague, it is ſaid to cure it.

XXVIII. *The Pills* of *Opopanax.* Take *Opopanax* (*made ſoft with Syrupus Catharticus* prepared as in our *Pharmacopœia Chirurgica*) ij. ounces: *Scammony fine Pouder* iv. *ounces*: *Cremor Tartari, a ſufficient quantity*: *Oil of Lemons* ij. *drams*: *mix and make a maſs of Pills.* Doſe from xvi. grains to xxx. grains or half a dram. They purge all Humors, and from all parts of the Body, without making ſick, or griping; diſſolve and expel tartarous and ſharp humors out of the Bowels, which are the original Cauſes of the Gout, Stone, hardneſs of the Spleen, Hypochondriack Melancholy, and fits of the Mother; and have moſt of the Virtues of the Gum at *Sect.* 27. aforegoing: They are an excellent Medicine, not enough to be valued, and may be taken twice or thrice Week, *&c.*

XXIX. *The Volatil Acid Spirit.* It is made of the Gum by Diſtilling it in a Glaſs Retort either in Sand, or *Balneo Mariæ*, as we have taught in Our *Sepaſium*, *lib.* 9. *cap.* 40. *ſect.* 8. It admirably opens the obſtructions of the Lungs, Liver, Spleen, Bowels, Reins, Ureters and Womb; brings down the Courſes, cauſes Urine, and prevails aguinſt Va-

pors

pors, and Fits of the Mother, and moſt Diſeaſes in Women proceeding from a ſtoppage of their Terms: Doſe from xx. to xxx. drops or more, in ſome *Hyſterick Water.*

XXX. *The Diſtilled Oil.* This is made with the Spirit, and comes laſt after the Spirit, as is directed in the place afore quoted of Our *Seplaſium*; it has the Virtues of the Spirit, but is much more nauſeous to be taken, and is chiefly given againſt Fits of the Mother in Women from ij. drops to iv. or vj. in ſome proper Liquor, but is moſtly uſed in ſuch like Caſes to anoint the Noſtrils therewith, or to ſmell to.

XXXI. *The Saline Tincture.* It is a Famous thing, and has all the Virtues of the ſimple Gum, at *ſect.* 27. aforegoing: But this opperates more ſpeedily, and more Powerfully opens all obſtructions of the *Viſcera*, chiefly the Lungs, Spleen, Reins and Womb. Doſe from j. dram to ij. in a Glaſs of White Port Wine, Mead, or other fit Vehicle.

XXXII. The Blſam. *It is made of the Gum, diſſolved in Vinegar* iv. *ounces, mixt with Turpentine, Balſam* Capivij, *of each* iij. *ounces: Gum* Elemi, *Oil Olive, Oil of Ben, of each* ij. *ounces: mix and evaporate to a juſt conſiſtency.* It cures Wounds by the firſt intention, and is excellent in all Wounds of the Head, Brain, Nerves, Joynts, and other parts: it alſo cleanſes running Sores, old Ulcers, malign Fiſtula's, and quickly heals them.

XXXIII. The Cerote. *It is made of the former Balſam, ly adding to every* xvj. *ounces of Balſam,* j. *ounce and half of Oil of* Peter, *and a ſufficient quantity of Wax, to bring it to a due conſiſtency of a ſoft* Cerote: It cures Wounds in any part, and is an excellent thing to ſoften hard Tumors, diſcuſs or reſolve them, as Nature moſt deſigns: It eaſes the Gout, and Pains proceeding from a cold Cauſe. See a Diſcourſe of the Gum more at large, in Our ſaid *Seplaſium*, the place afore quoted.

The Virtues of Panax Coſtinum.

XXXIV. *Its Qualities.* It is compleatly hot and dry in the third Degree. It opens, cleanſes, cuts, and makes thin; and by appropriation it is Cephalick, Pectoral, Hepatick, Splenetick, Hyſterick and Nephritick: performing its operations altogether as an Alterative.

XXXV. *The Specification.* It is prevalent againſt ſhortneſs of Breath, Diſtempers of the Head and Brain, and the Cholick, or Griping of the Guts.

XXXVI. *The Preparations.* You may Prepare from it, 1. *An Eſſence.* 2. *A Sprituous Tincture.* 3. *A Saline Tincture.* 4. *An Oily Tincture.* 5. *A Decoction.* 6. *A Wine.* 7. *A Cataplaſm.*

The Virtues.

XXXVII. *The Eſſence.* It is an Admirable thing againſt cold Diſeaſes of the Head, Brain and Nerves, as Headaches, Vertigo's, Fallingſickneſs, Lethargies, Convulſions and the like: it is good againſt Coughs, Colds, ſhortneſs of Breath, obſtructions of the Lungs, Liver, Spleen and Womb. Doſe ij. or iij. ſpoonfuls in a Glaſs of Wine, Mead, or other proper Liquor.

XXXVIII. *The Sprituous Tincture.* It Warms a cold Stomach, is good for Nerves obſtructed, and chill'd through Cold; and is prevalent againſt the Fallingſickneſs, Spleen and Hypochondriack Melancholy. Doſe from j. to iij. drams.

XXXIX. *The Saline Tincture.* It has all the Virtues of the Eſſence, and Sprituous Tincture, but heats not ſo powerfully; however it better opens obſtructions of the *Viſcera*, provokes the Courſes, repreſſes the Fits of the Mother, cleanſes the Womb, kills Worms, expels the Urine, Birth, Deadbirth, and Afterbirth, and diſſolves Tartarous Concretions, as Stone, Gravel, ſlimy matter, *&c.* Doſe from j. dram to ij. in Parſly Water.

XL. *The Oily Tincture.* It comforts the Nerves, provokes Urine, helps in Diſeaſes of the Reins and Bladder, and prevails againſt Cramps, Convulſions, Gouts, pains and aches proceeding from Cold, Palſies, Rheumatiſms, being outwardly applyed, and inwardly taken from iv. drops to xij. in ſome convenient Vehicle.

XLI. *The Decoction.* It opens Obſtructions, diſſolves the Tartarous Matter which breeds the Gout, and carries of the moſt of the Morbifick cauſe by Urine. Doſe from iv. to viij. ounces.

XLII. *The Wine.* It expels Wind, ſtrengthens the Stomach and Bowels, and is good againſt the Cholick, or Gripings of the Guts. Doſe iij. or iv. ounces, morning and evening, or in Extremity.

XLIII. *The Cataplaſm.* It is made of the Herb beaten in a Morter, and mixt with Hogs-Lard and Turpentine, of each of the two laſt a like quantity. It gives eaſe in the Gout, or any pain in the Joynts proceeding from a cold Cauſe, is good againſt Cramps, and the ſhrinking up of the Sinews, by reaſon of violent Convulſions.

CHAP. XI.

Of ALL-HEAL *of* Æſculapius.

I. *THE Names.* It is called in *Greek* Πάναξες Ἀσκλήπιον: in *Latin*, *Panax & Panaces Aſclepium:* and in *Engliſh*, *Æſculapius* his *All-heal.*

II. *The Kinds.* *Gerard* ſays it is a *Ferulaceous Plant*; of which there are ſaid to be five Kinds. 1. *Panax Aſclepium Lobelij*, Lobel his Eſculapius's All-heal. *Panax Aſclepium Matthioli*, that of Matthiolus. 3. *Panax Aſclepium Columnæ*, That of Columna. 4. *Panax Aſclepium Dalechampij*, That of Delechampius. 5. *Panax Aſclepium Anguilaræ & Camerarij*, That of Anguilara and Camerarius. Theſe differ not much one from another, being all *Ferulaceous Plants*, except that of *Dale-*

Dalechampius; and are much of a Nature, but not eaſily to be gotten except the firſt, aud of that we ſhall only treat in this Chapter.

III. The Deſcription. *The Root is long, white, and of a ſtrong ſmell, not growing deep, nor abiding after its giving Seed; from whence ſprings up a ſlender Stalk, of about a foot and a half high, creſted and Joynted, and from theſe Joynts proceed Leaves, bigger than thoſe of* Fennel, *and alſo rougher, and of a ſtrong ſmell: at the Tops of the Branches grow Umbles of Flowers; which are yellow, after which comes a broad and flattiſh Seed, not ſo ſmall as that of* Fennel, *but more like to that of* Ferula, *and of a quick taſte and ſmell*

IV. *The Places.* It was firſt found growing in *Iſtria*; but now is nouriſhed in our Gardens in *England*, as alſo in Gardens in moſt places of *Europe*.

V. *The Times.* It Flowers in *June*, *July* and *Auguſt*; and the Seed is ripe not long after, or in *September*; after which the Stalk with its Leaves periſh.

VI. *The Qualities.* It is hot and dry in the ſecond Degree. Attenuating, inciding, abſterſive, binding, ſtrengthening, and Vulnerary; and by appropriation is Cephalick, Neurotick, Hyſterick and Arthritick: It is alſo Alexipharmick and Alterative.

VII. *The Spcification.* It reſiſts Poyſon, and is found by long experience to be a famous healer of Wounds.

VIII. *The Preparations.* The Shops keep nothing of it, but you may prepare from it, 1. *A Juice.* 2. *An Eſſence.* 3. *A Saline Tincture.* 4. *An Oily Tincture.* 5. *A Decoction in Wine.* 6. *A Spirituous Tincture from Flowers and Seed.* 7. *An Oil.* 8. *A Balſam.* 9. *A Cataplaſm.* 10. *An Emplaſter or Cerot.*

The Virtues.

IX. *The Juice.* Inwardly taken and outwardly apply'd, it is a good Vulnerary, healing, conglutinating, and drying up Wounds.

X. *The Eſſence.* It not only heals and conglutinates Wounds, but cleanſes old and running Sores, putrid Ulcers, and cacoethick or ill condition'd Fiſtula's. It may be given inwardly from ij. to iij. ounces; and Cloths wet in the ſame may be apply'd to the Sore or Ulcer: if it is a Fiſtula, it is to be injected in, pretty hot, twice a day with a Syring.

XI. *The Saline Tincture.* It cuts, makes thin, cleanſes and carries off by Urine thick and tough humors; cleanſing the Breſt and Lungs from all cold phlegmatick humors. Doſe ij. drams or more.

XII. *The Oily Tincture.* Dropt into Wounds of the Nerves and Tendons, and plegets dipt in the ſame and apply'd upon the part; it heals them commonly at firſt dreſſing.

XIII. *The Decoction in Wine.* It is an Antidote againſt Poyſon, and is profitably drank againſt biting of Serpents, as Vipers, Rattle-Snakes, *&c.* and other Poyſonous Creatures. Doſe vj. or viij. ounces.

XIV. *The Spirituous Tincture from the Flowers and Seed.* It reſtores the Habit of the Body, makes the Blood Balſamick, and gives it its due Craſis, inducing the healing of green Wounds, running Sores, old Ulcers, and other external breakings out in the Skin. Doſe ij. drams, morning and evening in a draught of the Decoction.

XV. *The Oil.* It ſmooths the Skin, takes away Wheals, Puſhes, Scurf, Morphew, and other breakings out, being anointed therewith; heals Wounds, cleanſes Ulcers, and brings them to a ſpeedy cure.

XVI. *The Balſam. It is made of the Juice inſpiſſated to the thickneſs of New Honey,* iv. *ounces, mixed with Gum Elemi, Balſam Capivij, and* Straſburg *Turpentine, Oil of Ben, of each* ij. *ounces.* It heals Wounds of the Head, Joynts, Nerves, Tendons, *&c.* by the firſt Intention, cleanſes Ulcers, Fiſtula's, *&c.* Incarnates, and ſuddenly cures them.

XVII. *The Cataplaſm.* It is made of the green Herb bruiſed and beaten up with a little Honey. It cleanſes Ulcers powerfully, and is good againſt fretting and running Sores, Cankers in the Mouth, Puſhes, *&c.* being apply'd.

XVIII. *The Cerote* or *Emplaſter.* It is made of the Balſam, by adding to every vj. ounces, Frankincenſe and Bee's Wax, of each ij. ounces, mixing them over a gentle fire. It heals green Wounds and incarnates Ulcers and heals them after cleanſing.

CHAT. XII.

Of ALL-SEED.

I. *THE Names.* It is called in the *Greek*, Πολύσπερμον; In *Latin*, *Polyſpermon*, and *Polyſpermon Caſſani Baſſi*; *Atriplex Sylveſtris*: And in *Engliſh*, *All-ſeed*, or *Wild Arrach*.

II. *The Kinds.* It is of the Kind of *Blites*, and of the Wild ſort, of which it is ſingular: But ſome Authors account it among the number of *Araches*, and therefore call it *Atriplex Sylveſtris*, but it is none of thoſe Plants.

III. The Deſcription. *The Root is white, ſlender and long, with ſome ſtrings; and the Plant is ſomething like to the Blite, being one of the Wild Kind as aforeſaid, but leſſer than the Garden Blite; the Leaves are uneven on their edges, broad towards the Stalk, and growing narrower till they end almoſt in a point, but yet round pointed: It has ſeveral Stalks which are much Branched, on the upper parts of which is a great abundance of ſmall Flowers, growing on long and ſpikie greeniſh Heads; ſet very thick together, after which follows the Seed, which being ſo very cloſe and thick ſet makes it look as if it was all Seed, whence came the name* Poyſpermon: *which Seeds are black and ſhining.*

IV. *The Places.* It grows Wild, in many places in *England*, and in many *Gardens* as a weed, where it is Weeded out.

V. *The Times.* It Flowers and Seeds from *June* to the end of *Auguſt*, or the beginning of *September*, the Seed being ripe not long after the falling of the Flowers.

VI. *The Qualities.* It is cold and moiſt (according to *Galen*) in the ſecond Degree. It is ſomething opening, abſterſive and emollient: and by appropriation Uterine and Arthritick; being of the Stock of the Alteratives.

VII. *The Specification.* Its chief intention is to cool Inflamations, and ſoften hard Tumors.

VIII. *The Preparations.* The Shops keep nothing of this Plant; but you may prepare therefrom. 1. *An Eſſence.* 2. *A Juice.* 3. *A Decoction.* 4. *An Ointment.* 5. *A Cataplaſm.* 6. *A Pouder of the Seed.*

The Virtues.

IX. *The Eſſence.* It cools inward Inflamations and abates the heat of Fevers, and is good inwardly taken againſt an Eryſipelas, and other like heats: and opens the obſtructions of the Liver. Doſe from j. to ij. ounces ſweetned with Sugar.

X. *The Juice.* It has the Virtues of the Eſſence, but cools more, and is good to Gargle with in a Quinſey; and is profitable againſt heat of the Stomach, and Inflamation of the Lungs. It cleanſes the Womb, and makes the Belly Soluble. Doſe j. or ij. ounces in any fit Vehicle. Outwardly it is good to bathe with in an Eryſipelas.

XI. *The Decoction.* It is good againſt heat in the Reins, and ſcalding of Urine in making Water: and if a little Nitre is diſolved in it, it not only takes off the burning heat in Piſſing, but opening all the Obſtructions of the Urinary paſſages, it cauſes a plentiful making of Urine, and takes off the heat of any Burning Fever tho never ſo great. Doſe vj. or viij. ounces well ſweetned with Sugar, in which half a dram of Nitre, or more may be diſſolved: it may be taken twice a day.

XII. *The Ointment.* It cools Inflamations, eaſes pain of the Gout and other Aches proceeding from a hot cauſe, and is good againſt Scurff, Morphew, Scabs, Pimples, and other breakings out, and defilements of the Skin: and anointed is good to ſoften hard Tumors.

XIII. *The Cataplaſm.* It is made of the Herb beaten in a Stone Morter, to every handful of which ij. drams of *Nitre* in fine Pouder is put, and diſſolved, and brought to a conſiſtency with *Barley* Flower. It gives preſent eaſe in the Gout, and all other pains proceeding from a hot Cauſe. Is good in an *Eryſipelas* being ſpread thin, as alſo Scurff, Morphew, Leproſy, and is to be renewed two or three times in twenty four Hours

XIV. *The Pouder of the Seed.* It is cooling, affects the Stomach, Reins, Bladder and Womb, taking away any preternatural heat in any of thoſe parts: and being taken from half a dram to j. dram, it is ſaid to be an effectual cure for the Yellow Jaundice; and to repreſs the overflowing of Choler.

CHAP. XIII.

Of Garden ANEMONIES.

I. *THE Names.* This Plant is called in *Arabick*, *Jackick*, *Alnahamen*, *Sakaick*, *Mamira:* in *Greek*, Ἀνεμώνη, ἀπὸ τῦ ἄνεμος, *quaſi herba Venti:* in *Latin* alſo, *Anemone*, & *Herba Venti*: and in *Engliſh*, *Anemonie* ane *Wind-Flower.*

II. *The Kinds.* Some Authors will have them of the Stock of *Crowfoot*, by reaſon of the ſhape of the Leaf. But to me it ſeems to be a peculiar Plant of it ſelf: and is divided into three principal Kinds, *viz.* The *Garden*, the *Wild*, and the *Baſtard.* The *Garden Kinds* are almoſt innumerable, at leaſtwiſe not eaſie to be reckoned up; and for my part I believe, it would puzle the moſt experienced *Floriſt*, to give a juſt enumeration of them, and therefore I ſhall not here attempt it, but give you the Deſcription of theſe few following. 1. *The ſingle Anemone*, which is purple, red, blood-Colored, blew, yellow, white. 2. *The Double Anemone*, which is red or ſcarlet, purple, crimſon, blewiſh, orange, tawny, white, *&c.* to which we add the following *Wild Anemonies*, *viz.* 3. *The great Wild or Wood ſingle Anemone* white. 4. *The ſmaller Wild or Wood ſingle Anemone*, purple, yellow, white. 5. *The Wild double Anemone*, purple, red and white. Theſe laſt three we Treat of in the next Chapter. The third Kind are the *Baſtard Anemonies*, which tho' they may be accounted as one of the Kinds of the ſame Tribe; yet by reaſon the *Engliſh Name*, which is *Paſque-Flower*, falls not in the preſent Letter of the Alphabet, we ſhall refer you to its proper Place and Letter, which will be in Chap. 572. following.

ANEMONE

III. The Deſcription. 1. *The ſingle Garden Anemonie. It has a Root which is thick and Tuberous, or knobby; from whence riſes up many Leaves, much cut in or jagged, almoſt like unto* Adonis Flower, *or not much unlike to the more jagged or finely cut* Crowfoot, *among which riſes up a Stalk or Stalks, bare or naked almoſt up to the Top, at which place it is ſet with two or three Leaves: at the top of the Stalk comes forth a fair Flower conſiſting, ſome of them, of ſix, ſome of ſeven, and ſome of* Eight *Leaves, of a Delicate Color, ſome purple, ſome red, ſome Crimſon, ſome blew, ſome yellow, and ſoue white Colored,* &c. *impoſſible to be deſcribed, to their full perfection; with Thrums or Threads in the middle, of a blackiſh purple Color, and ſometimes various Colored, according to the Color of the Flower. But here*

here is to be noted that the yellow Anemone *differs much from all the reſt of the ſingle various Colored* Anemonies, *for its Leaf is much like to a Common* Mallow *Leaf finely dented about the edges, green on the top, and ſomething reddiſh underneath, its Flower is yellow, and the Head or Thrumb in the middle is yellow alſo. In all theſe Colored ſingle* Anemonies, *when the Flowers are blown away, there remains a Head, whereon grows the Seed, which is ſmall and black, or blackiſh, incloſed in a kind of ſoft Wooll or Down.*

IV. *The Double Garden* Anemone. *The Root is thick and Tuberous much like to the Root of the former: and indeed the Roots, Leaves and Stalks much reſemble the former ſingle* Anemones, *but the Leaf is not altogether ſo finely cut and Divided, as the red or Purple-flowerd ſingle are: at the top of the Stalk there ſtands a fair Flower either red or ſcarlet, crimſon, purple, blewiſh, orange, tawney, yellow or white, or mixt with ſome of theſe; Conſiſting of divers broader Leaves, with ſeveral rows of narrower Leaves one within another, which together make a very fair and beautiful Flower, the middle Head being thick cloſed either of a greeniſh, or whitiſh Color, or with red Colored Thrumbs tipt with blew, or various according to the Colors of the Flower. After the Flowers, there follows the Heads which contain the Seeds as the former. Here note, that the double yellow* Anemone *has ſuch broad roundiſh Leaves as the ſingle Kind, but ſomewhat larger or ranker, and the Stalks are beſet with larger Leaves, more deeply cut in on the edges, and the Flowers are of a more pale yellow, with ſome purpliſh Veins on the out ſide; and there is beſides theſe, ſo great a variety of mixt Colors, in this Kind of* Anemone, *with broad Leaves ariſing every year from the ſowing of the Seed of ſome of the Choiceſt, that it is wonderful to obſerve, not only the variety of ſingle Colors, but the mixture of two or three Colors in one Flower, beſides the diverſity of the bottoms of the Flowers, and of the Thrumbs or Threads in the Middle. But in all theſe various Colored double* Anemones, *the greateſt wonder of beauty is in the variety of double Flowers, that ariſe from the other ſingle ones, ſome having two or three rows of Leaves in the Flowers, and ſome ſo thick of Leaves as a double* Marigold, *or double* Crowfoot, *and of the ſame ſeveral Colors that are in the ſingle Flowers, that it is almoſt impoſſible to expreſs them ſeverally; ſome falling out to be more double in one year which are leſs double in another year, yet very many abiding conſtantly double as at firſt. This we thought good to advertiſe in General, that it may be applied to each variety, and every Kind of Flower of each variety in particular, to ſave the farther trouble of endleſs Deſcriptions, and a needleſs multiplication of Words to no purpoſe.*

V. *The Places.* Theſe were moſt of them brought to us from *Conſtantinople*, ſome from *Italy*, and ſome from *Germany*; but now they are Inhabitants, and Natives of *our own Country*, and may be found almoſt every where in *Gardens*, eſpecially in *Phyſick-Gardens*, and the *Gardens* of induſtrious *Floriſts*.

VI. *The Times.* They Flower from the begining of *January* to the end of *April*; and when they begin to fade, the Seed (where there is any) is carried away with the Wind. But if they bear Seed, it muſt be carefully gathered, but yet not before it is throughly ripe, which you may know by the Head, for when the Seed with the Woolineſs begins to riſe a little of it ſelf, at the Lower end, it muſt then be preſently gathered, and laid to dry for a Week or more, which then being gently rubbed with a little dry Sand or Earth, will cauſe the Seed to be ſomewhat better ſeparated, tho' not perfectly from its Down or Woollineſs, that encompaſſes it: within a Month at the moſt after the ſeed is thus gathered and prepared, it is to be Sown, for ſo you will get a Year in its growth, more than you would do, if you ſowed it in the next Spring: if there is any Woollineſs in the Seed, they are to be ſeparated from it as well as may be, and then ſown pretty thin, not too thick, upon a plain ſmooth bed of fine Earth, or rather in Pots or Tubbs; after the Sowing, ſift or gently ſtrew over them ſome fine, good, freſh Mould, about an inch deep at moſt for the firſt time: about a month after their firſt ſpringing up, ſtrew or ſift over them in like manner, another inch thickneſs of fine Earth, and in the mean Seaſon, if the Weather proves dry, you muſt water them gently and often, but not to over-glut them with moiſture: thus doing, they will ſpring up before Winter, and grow ſo ſtrong, as to be able to abide a ſharp Winter, tho' in their Infancy; but you ought to take ſome care in covering them looſely with Straw, Fern-leaves, or ſuch-like, to keep them from the extremity of cold, which yet muſt not be cloſe upon them, nor too far off neither. The next Spring after Sowing, you may, if you ſo pleaſe, remove them; but in my Opinion it will be better to ſtay till the next *Auguſt*, when you may remove and ſet them in order by rows, with a ſufficient diſtance one from another, where you may keep them till you ſee what kind of Flower each Plant will bear, which you may afterwards diſpoſe according to your mind: many of theſe Plants thus ordered (if your Mould is fine, looſe, freſh and black Earth, not Stony, Clayiſh, *&c.*) will bear Flowers the ſecond year after Sowing, and moſt or all of them the third year, if the place you put them in is in a clear Air, free from the Smoak of Chimnies, Fornaces, Brewers or Dyers Fats, Mault Kilns, *&c.* in which they will never thrive. The ordinary time to Plant *Anemones* in is *Auguſt*, and then they will be in flower ſometimes before Winter, but moſt commonly in *February*, *March* and *April*, few of them abiding until *May*; but if you keep ſome Roots out of the Ground unplanted, untill *February*, *March* and *April*, and Plant ſome at one time and ſome at another, you ſhall have them bear Flowers, according to their Planting: thoſe which you Plant in *February* will flower about the middle or end of *May*, and ſo the reſt accordingly, as to the time you Plant them in; and thus you may have the pleaſure and variety of theſe Plants, out of their natural Seaſons, which is ſcarcely to be had in any other Herb; Nature not being ſo apt to be provoked or forced in other things, as ſhe is in this. But in keeping your *Anemone* Roots out of the Ground for this purpoſe, you are to keep them neither too dry nor too moiſt, that they may neither wither, ſprout nor rot; and in Planting them, you muſt not ſet them in too open and ſunny a place, but where they may have ſomething of ſhaddow.

VII. *The Qualities.* They are hot and dry in the third degree. They Attenuate, Incide, and vehemently Attract; and by Appropriation are Cephalick, Uterine and Arthritick: and are only Alteratives in reſpect to Heat or Cold.

VIII. *The Specification.* It is peculiar againſt Apoplexies, Epilepſies, Lethargies, Madneſs, Vertigo's proceeding from a cold and moiſt Humor, or Diſtemper of the Head and Brain.

IX. *The Preparations.* The Shops keep nothing of this Plant in Store, but you may have, 1. *The Roots, Stalks and Leaves.* 2. *The Juice.* 3. *The Eſſence.* 4. *The Decoction.* 5. *A Maſticatory.* 6. *A Gargariſm.* 7. *A Peſſary.* 8. *An Ointment.* 9. *A Cataplaſm.* 10. *A Saline Tincture.* 11. *An Oily Tincture.*

The Virtues.

X. *The Roots, Stalks and Leaves.* Theſe boiled in Water, chiefly the Roots, or Roots and Leaves, till ſuch time as their fiery and biting Taſte is moſtly gone, and being Eaten as a Salet, with a little Butter, Salt and Vinegar, are ſaid to encreaſe Milk in Nurſes.

XI. *The Juice.* Being ſnuffed up the Noſe morning and evening, but chiefly at Bed time, it mightily Purges the Head and Brain, and brings away abundance of cold, moiſt, flegmatick Humors, and thereby frees the Patient from Apoplexies, Epilepſies, Lethargies, and moſt other cold Diſtempers of the Head, Brain and Nerves, cauſed by thoſe Humors lodged in the Head, in the Cavities of the Brain, or between the *Meninges* thereof, *viz.* between the *Pia* and *Dura Mater.*

XII. *The Eſſence.* It has the ſame Virtues, being uſed as an Errhine, but is chiefly given inwardly to provoke the Terms, bring away the Birth, Afterbirth, or Dead Child. Injected into running Sores, old Ulcers and Fiſtula's, it admirably cleanſes them, and diſpoſes them to healing. Doſe from half an ounce to j. ounce, in any proper Vehicle.

XIII. *The Decoction.* If it is made of the Leaves with half Water half Wine, it powerfully provokes the Terms, and brings away the Dead Child; and the Body or Places affected being bathed therewith, it Cures Sun-burnings, Tanning, Scurff, Morphew, Leproſie, Scabs, *&c.* Doſe iv. ounces twice a day.

XIV. *The Maſticatory.* The Root chewed in the Mouth, draws out a Flux of cold Rheum, by which the Tooth-ach, Head-ach, Megrim, Apoplexies, Epilepſies, Carus, Lethargies, and other ſleepy Diſeaſes proceeding from a cold and moiſt cauſe, are Cured.

XV. *The Gargariſm.* It is made of equal parts of the Juice and Decoction mixt together, in which, to every iv. ounces of the Mixture, ij. drams of Nitre are added and diſſolved. It has all the Virtues of the Juice and Maſticatory, and purges and cleanſes the Head and Brain ſo admirably as to Cure all thoſe Diſeaſes afore-named of thoſe parts; and where they are not preſent, but are only feared from a coldneſs of the Head and Parts adjacent, a Sleepineſs, and a being ſtuffed with cold flegmatick Humors; the uſe hereof now and then prevents their coming, and ſecures the Patient for the future.

XVI. *The Peſſary.* It is made either of the Root cut into form, or of the Juice made up with melted Wax and Barley Flower; put up into the Womb or Vagina, it opens the Veins of the Womb, and by its attractive force, provokes and draws down the Terms: but it ought to be ſeveral times renewed, taking proper things alſo by the Mouth.

XVII. *The Ointment.* It is made of the green Herb or Juice. The Eye-lids being anointed therewith, it helps Ophthalmies or Inflamations of the Eyes; and applyed to running Sores, old Ulcers, putrid Fiſtula's, and other malign and corroding Defilements, it perfectly cleanſes them, ſtrenthens the Part Affected, and promotes their healing.

XVIII. *The Cataplaſm.* It is made of the green Herb beaten with Hogs Lard, in which a little Alum and Nitre, in fine Pouder, are mixt and diſſolved: applyed, it eaſes Pain in any Part, and Cures Scurff, Morphew and Leproſie, being uſed for ſome conſiderable time.

XIX. *The Saline Tincture.* The External Parts of the Body being waſhed with it, it removes all ſorts of Defilements, cleanſing the Part, and killing the Humor, by deſtroying the Ferment which breeds it. Mixt with double quantity of Juice, it becomes an excellent Gargariſm or Liquid Errhine, purging the Head and Brain of all cold Humors. Let Phyſicians talk what they pleaſe, all the Cephalick or Head-purging Pills in the World cannot purge the Head and Brain like to powerful Errhines, Gargariſms or Maſticatories.

XX. *The Oily Tincture.* This is indeed truly beneficial for all ſuch as are troubled with Oedema's, cold Tumors, Pains and Aches in any part of the Body from a cold Cauſe, as alſo for ſuch as are afflicted with Spaſms, Cramps, Convulſions, weakneſs of the Nerves, Tremblings, Numedneſs, Palſies, and the like, being anointed effectually twice a day upon the place affected, (and in Palſies, along the Back Bone alſo;) and continuing the Uſe thereof, for ſome conſiderable time.

CHAP. XIV.

Of Wild ANEMONES.

Wild ANEMONE, *great,*

I. *THE Names.* This Plant is called in *Greek,* Ἀνεμώνη ἄγρια. in Latin, *Anemone Sylveſtris, Anemone Nemorum, Herba Venti Sylveſtris*; and in Engliſh, *Wild Anemone.*

II. *The Kinds.* They are twofold, 1. The ſingle *Anemones.* 2. The double *Anemones.* The ſingle *Anemones* Wild are, 1. The Greater or Broad-leaved Wild White *Anemone.* 2. The Common or Smaller-leaved Wild *Anemone,* Purple, Carnation, Yellow, White. 3. The Wild double *Anemone,* Purple, Red, White.

III. The Deſcription. 1. The Greater or Broad-leav'd Wild White *Anemone. The Root conſiſts of a great number of long black Strings, encreaſing very much by running under Ground, and ſhooting up in divers places, from whence ſprings forth divers broad green Leaves, cut into diviſions, and dented about, very like unto a broad Leav'd* Crowfoot, *from among which riſes*

rises up a Stalk, having some such like cut Leaves in the middle thereof, as grow below, but smaller: on the top whereof stands one large white Flower, consisting of five Leaves for the most part, with some yellow Threads in the middle, standing about such a green thing as you see in the Garden Anemones, *which growing greater after the Flower is past, is compased of many small Seeds, wrapped up in a white kind of Down, which as soon as they are ripe, raise themselves up from the bottom of the Head, and fly away with the Wind, as the Garden kinds do.*

IV. 2. The Common or Smaller-leav'd Wild single-flower'd *Anemone. It has a Root long and small, somewhat like unto the Root of* Polypody, *creeping under the upper crust of the Earth, from whence rises up one or two, and sometimes more small, round, naked Stalks, bearing about the middle of them, small, soft and tender jagged Leaves, deeply cut in and indented on the edges about, from above which also does grow the Stalk, bearing small Flowers, Purple, Carnation, Yellow or White, not much unlike to a* Crow-foot, *(standing upon weak foot Stalks) with some Threads in the middle.*

ANEMONE.

V. 3. The Wild double-flower'd *Anemone.. This double kind is very like unto the single white kind before described, both in its long running* Roots, *and its thin jagged* Leaves, *but somewhat larger: the* Flowers *whereof are very thick and double, but small, of a faint sweet Scent, which are of a purple, red, or white colour after they are blown, for five or six days; the purple and red are of a fine light colour towards the tops of the* Leaves, *but the bottoms of the* Leaves *of a very deep colour of the kind: and the White-flowered are very white when full blown, but afterwards they become a little purplish on the inside, but more on the outside, after which comes a small Head like the former kinds, but seldom or never give any Seed, especially the White kind.*

VI. *The Places.* The first broad-leav'd grows Wild in divers places of *Austria* and *Hungary*; but with us, is nourisht up in Gardens: the other single kinds grow wild in most places in *England*, in Woods, Copses, Groves, Orchards, &c. except that with yellow Flowers. The double-flowered are only found in Gardens; but *Clusius* says they are found in the Low Countries, in a Wood near *Louvain.*

VII. *The Times.* They flower from the beginning of *March*, (which is the earliest) and continue flowering till *May*, or the middle of *May*; and the double kinds begin to flower presently after the single kinds are past.

VIII. *The Qualities.* They are hot and dry in the third degree. They cut, incide, attenuate, attract and inflame; are dedicated to the Head, Womb and Joynts, and Alteratives only in their Operation.

IX. *The Specification.* They are peculiar against cold and moist Distempers of the Head, Brain and Womb, and to cleanse old Ulcers.

X. *The Preparations.* Tho' the Shops keep nothing of this Plant, yet you may prepare therefrom, 1. *A Juice.* 2. *An Essence.* 3. *A Decoction.* 4. *A Gargarism.* 5. *A Saline Tincture.* 6. *An Oily Tincture.* 7. *An Ointment.* 8. *A Cataplasm.* 9. *A Masticatory.* 10. *A Pessary.*

The Virtues.

XI. *The Juice.* It is a singular good Errhine, for by snuffing it up the Nostrils morning and evening, it Purges the Head and Brain of cold, thick and tough flegmatick Humors, whereby it prevails against Apoplexies, Epilepsies, Carus, Lethargies, Vertigo's, Megrims and cold Head-aches, proceeding from a cold Cause.

XII. *The Essence.* It has the same Virtues used as an Errhine; but is most commonly given inwardly, from ij. drams to half an ounce, mixed with a draught of Mead, Wine, or some proper Water, to open Obstructions of the Womb, and to bring down effectually the Terms in Women, as also to hasten the Birth, and bring away the After-birth.

XIII. *The Decoction.* It is not so hot as the former, and therefore not so strong, but yet is effectual for the same things the Essence is, but may be given in a larger Dose, as from ij. ounces to iij. sweetned with white Sugar.

XIV. *The Gargarism.* It is made of the Juice or Essence, mixt with an equal quantity of the Decoction, to 8. ounces of which you may add iij. drams of pure Nitre, dissolving it therein. Used as a Gargle, it powerfully attracts cold and moist Humors out of the Head and Brain, and Parts adjacent, and so is good in the Cure of those Diseases, the Juice is said to be good against.

XV. *The Saline Tincture.* It more powerfully opens the Womb than the Essence does, and is used in inveterate Obstructions thereof when the Essence is not found powerful enough. It also opens Obstructions of the Reins and Bladder, provokes Urin, and expels Sand and Tartarous Matter. Dose from j. dram to ij. in some fit Vehicle.

XVI. *The Oily Tincture.* Tho' this may be used inwardly, yet its chief Use is for External Applications against Weakness and cold Affections of the Nerves, Tendons, Ligaments and Joynts; against all sorts of Aches and Pains proceeding from Cold, or an Afflux of cold Humors, as also against Numedness, Tremblings, Cramps, Convulsions, Palsies, and the like Disaffections of the Nerves.

XVII. *The Ointment.* It has the Virtues of the Oily Tincture, but not so powerful, but is better for cleansing old running Sores, fætid Ulcers, malign and rebellious Fistula's, and taking away Scabs, Itch, Scurff, Morphew, and other like Defilements of the Skin.

XVIII. *The*

XVIII. *The Cataplasm.* It has the Virtues of the Ointment, opens the Pores of the Skin more, and prevails against Scabs, Scurff, Morphew, Leprosie, *&c.*

XIX. *The Masticatory.* It has all the Virtues of the Gargarism, but is better to be used by such as cannot away with the other. It's made of the Root.

XX. *The Pessary.* It is made either of the Root or Juice, with Wax and Barley-flower, and is put up into the Womb, to bring down the Courses.

CHAP. XV.

Of Garden ANGELICA.

I. *THE Names.* It is called in *Greek*, Ἀγγελικὴ, (and yet some Authors say it was unknown to the *Greeks*, unless by some other Name) in Latin *Angelica*; and so also in *English:* and by this Name it is called in almost all *European* Nations, so far as their Dialect will admit: *Cordus* will have it to be *Panax Heracleum*, but this I much question; yet according to its Virtues, it may very well be accounted among the number of the *All-heals:* but its condensed Juice is no *Opopanax*. Others, as *Dodonæus* and *Lacuna*, will have it to be a kind of *Laserpitium*, or *Laserwort*, but of that see *lib.* 3. *cap.* 115. and 116. of this present Work.

II. *The Kinds.* There are four several kinds of *Angelica*; as, 1. *The Garden Angelica.* 2. *The Wild.* 3. *The Water Angelica.* 4. *The Mountain kind*; of which last we shall say nothing in this Book.

III. The Description. *Our* Garden Angelica *has a Root, which is great and large, something pulpy before flowering; but after flowering it becomes woody, extending it self into many and long Arms or Branches, which perish after Seed-time; but if the Plant, by being often cut down, is kept from seeding, the Root will then endure many years together: this Root, if cut or bruised, smells strong, and discharges out of it self an Oily, or rather Gummy, Liquor, which being inspissated Yields no unpleasant Gum, and not much unlike to* Opopanax, *but yet it is not the same thing. From this Root springs forth divers large and fair spread winged Leaves, half a yard long, and sometimes longer, made of many great and broad ones, set usually one against another on a middle Rib, of a pale, but fresh green colour, and dented about the edges; from among which usually arises one round hollow Stalk, very thick, and four or five feet high, with divers great Joynts, and Leaves set on them, whose foot-stalks do encompass the main Stalk at their bottoms; and from thence also, towards the top, comes forth Branches, with the like, but lesser Leaves at them; and at their tops, there comes forth large round spread Umbles of white Flowers, after which comes the Seed, which is somewhat flat, thick, short, and of a whitish brown colour; two always set together, (as is usual in these Umbelliferous Plants) which is a little crested on the round side.*

IV. *The Places.* It is found in great plenty in *Norway* and *Island*, where it grows very high, and whose Inhabitants it is said do eat it, for want many times of other Food, peeling off the Bark: It is also said to grow upon the Rocks, not far from *Berwick*: But with us, it grows only in Gardens, being first brought hither from beyond Sea.

V. *The Times.* It flowers in *July* and *August*, and the Seed is ripe not long after: if this Seed is suffered to fall of its own accord, it will more certainly grow, than that which is gathered and sown by hand, at any other time.

VI. *The Qualities.* It is hot and dry in the second degree; but *Schroder* saith in the third degree, which I believe not. It opens, incides, attenuates or makes thin, Digests, Discusses, and is Sudorifick. As to its appropriation, it is Cephalick, Neurotick, Cardiack and Hysterick. It is Bezoardick or Alexipharmick, Vulnerary, and the most famous of all Vegetable Alteratives.

VII. *The Specification.* It is a peculiar Antidote against the Plague or Pestilence, and all malign, infectious and pestilential Diseases: it is also an Antidote against the Poyson of Mad Dogs, the biting of Vipers, Rattle-snakes, and other Serpents, or other Venomous Creatures, and, as an *All-heal*, Cures Wounds by the first Intention: and is singular against the Scurvy in a cold Constitution.

VIII. *The Preparations.* The Shops sometimes keep hereof, 1. *The dryed Root.* 2. *The Seed.* 3. *A Distilled Water* from the whole Plant. 4. *A Juice* from the fresh Root and Herb. 5. *An Extract* with Spirit of Wine. 6. *The Root Candy'd.* 7. *A Distilled Oil* which ascends with the Water. 8. *A Balsam* made with the said Oil, and Oil of Nutmegs. 9. *A Common Salt.* Besides all these things, you may make therefrom, 10. *A Syrup.* 11. *A Decoction.* 12. *A Wine.* 13. *A Spirit.* 14. *A Spirituous Tincture.* 15. *A Saline Tincture.* 16. *An Oily Tincture.* 17. *The Powers.* 18. *An Essence.* 19. *A Balsam* for Wounds. 20. *An Ointment.* 21. *A Cataplasm.* 22. *A Cerote* or *Emplaster.* 23. *A Gargarism.* 24. *An Errhine.* The virtues and uses of all which follows.

The Virtues.

IX. *The dryed Root.* Used as a Masticatory, it attracts cold and moist humors out of the Head and Brain, and gives ease in the Tooth-Ach: the Pouder thereof taken to j. dram, is good against the bitings of Mad Dogs, Vipers, and other kinds of venomous Creatures, and also prevails against the Pleurisie, Plague, and all other kinds of infectious Diseases. *Take of this Pouder j. dram, Mithridate a dram and half,*

half, mix for a Dose; to be given in the aforesaid Cases.

X. *The Seed.* The Seed has the same Virtues, but not all out so powerful: the Pouder thereof may be given to j. dram or j. dram and half to Sweat upon: it defends the Heart, Spirits and Blood against Poyson, and is a good preservative against Pestilential Infection.

XI. *The Distilled Water from the whole Plant.* It is Bezoartick and Alexipharmick, good against Sickness at Heart, which it many times eases upon the spot; but is mostly used as a Vehicle to convey other preparations of this Plant, and others of like Virtues in.

XII. *The inspissate juice of the Root, and also of the Herb.* It warms, comforts and restores, incides and attenuates thick humors, resists Poyson, and is good against the Plague, or malignity of any other Epidemick and infectious Disease: It Cures also the bitings of Mad Dogs, Serpents, *&c.* and is Pectoral, good against Wind in the Bowels, Coughs, Hoarsness, Phthisicks, Asthmas, shortness of Breath, Peripneumonies, and indeed all Diseases of the Brest and Lungs: outwardly applied, it warms, discusses, and resolves hard Tumors; and therefore is good in an Oedema and other like swellings of the Joynts. Dose inwardly is, from j. dram to ij. drams or more, dissolved in Wine and drunk.

XIII. *The Extract with Spirit of Wine.* It is made of the *Caput Mort.* of the Herb and Plant after Distillation, *&c.* given from j. dram to ij. drams in Sack, it provokes Sweat powerfully, and is an Antidote against the Plague or Pestilence, Measles, Small-Pox, Spotted-Fever, Poyson inwardly taken, or outwardly given by the biting of any Venomous Creature. It Cures Agues if given to Sweat upon.

XIV. *The Candied Root.* It is a pleasant thing, and being often eaten is good against Coughs, Hoarsness; and strengthens, heals and comforts a cold and weak Stomach.

XV. *The Distilled Oil which ascends with the Water.* It is very powerful against the Pleurisie, Obstructions and Wind in the Bowels, the Colick and Gripings of the Guts, Poyson of all Kinds, and the Infection of the Plague or Pestilence: It is also good against most Diseases of the Brest and Lungs, and has all the Virtues of the Inspissate Juice of the Root, but this is more excellent, subtil, penetrating and effectual: It opens all Obstructions of the Urinary Passages, provokes Urine and the Courses, and expels both Birth and After-birth. Dose from iij. drops to 10, first dropt into Sugar, and mixt well therewith, and then mixt with a Glass of Wine.

XVI. *The Balsam with Oil of Nutmegs. Take Oil of Nutmegs or Mace made by expression j. ounce: Balsam of Peru, ij. drams: Oil of Angelica j. dram and half, mix them.* It eases all pains of the Head, as Head-Achs, Megrims, *&c.* proceeding from a cold cause, being anointed thereon.. Inwardly taken to j. Scruple, in a Bolus of Mithridate, or in any proper liquid Vehicle, it has all the Virtues of the Oil aforegoing: besides which, being put into an hollow Tooth, it eases the pains thereof.

XVII. *The fixed Salt of the whole Plant.* It is a singular thing against the Pleurisie, Peripneumony, Plague, or any Pestilential Disease, the Colick, Strangury, and stoppage of Urine; for it absorbs the acid and acrimonious or malign humors, which is the cause of those disaffections; it loosens the Blood, and causes a present and speedy Circulation, and withall it opens all Obstructions of the Lungs, and causes a free breathing. Dose from j. Scruple to j. Dram, in the Distilled Water, or in Wine, or other proper Vehicle.

XVIII. *The Syrup.* It is Pectoral, good against Coughs, and all sorts of inward Obstructions of the *Viscera*, chiefly of the Lungs, but is used mostly as a Vehicle to convey other Medicines in. Dose from j. Ounce to ij. Ounces.

XIX. *The Decoction.* Taken from iiij. Ounces to viij. Ounces, it is good against inward bruises, and to dissolve congealed Blood; strengthens the Stomach, and is effectual against the Suffocation of the Mother. It makes an excellent Wound-drink, for such as have Gunshot or Contused Wounds, old Sores, running Ulcers, fœtid and callous Fistula's, disposing them to a speedy healing.

XX. *The Wine.* It is to be made of the roots and stalks, (as is also the Decoction) and has all the Virtues of the Decoction, save that this is much more powerful to all the said Intentions. Dose from iij. to vj. Ounces twice or thrice a day.

XXI. *The Spirit.* It is either *Simple* or *Compound*. The *Simple* is a most famous Cordial, scarcely inferior to any other Vegetable Cordial in the World: it removes Sickness at Heart and Stomach, prevails against Fainting, Swoonings and Convulsions, whether in Old or Young, warms and comforts a cold and weak Stomach, and as much as may be, restores old Age. I cannot speak enough in the praise of it! It resists Poyson, whether inward or outward, and the Contagion of a Pestilential Air. Dose from j. dram to half an ounce, well dulcified with trebble refined Sugar, and then it may either be taken alone, or in a Glass of Wine. The *Compound Spirit* you may have its Composition, Preparation and Virtues, in Our *Pharmacopœia Londinensis, Lib.* 4. *Cap.* 1. *Sect.* 3. to which you are referred.

XXII. *The Spirituous Tincture.* It is a great Cordial Restorative, and an excellent thing for such as are wounded, and have old running Sores or Fistula's about them, which have been of long standing, and not easily cured: for it alters and changes the discrasy of the Blood, and makes it more Balsamick, as also the other Juices, and so contributes to healing; besides it has all the Virtues of the Spirit, and indeed much more powerful. It may be taken morning, noon and night, for some considerable time, from ij. drams to half an ounce, in some proper *Vehiculum*.

XXIII. *The Saline Tincture.* It is a good Vulnerary, and carries off much of the Morbifick Faculencies and Defilement by Urine; opens Obstructions of all the *Viscera*, takes away Heat, Burnings, is good against the Strangury, stoppage of Urine, and other Diseases of the Reins and Bladder: It is good against shortness of Breath, and difficulty of Breathing, because it dissolves the Tartarous Mucilage of the Lungs, *&c.* Dose from j. dram to iij. drams in the Distilled Water, or in Mead or White Wine.

XXIV. *The Oily Tincture.* It is good to anoint with in the Gout and Sciatica, and all Pains and Aches of the Nerves, Tendons and Joynts, proceeding from a cold Cause. 'Tis excellent against Convulsions, Cramps, Numedness, Lameness and Palsies, and the Scurvy in a cold Constitution. You may anoint with it outwardly twice a day, and take it inwardly as often, from iv. drops to xvj. or xx. in any proper Liquor.

XXV. *The Potestates or Powers.* They have all the Virtues of the Oil and Spirit, to which you are referred: 'tis true they are not altogether so strong as the Oil, but they are more subtil and penetrating, and more pleasant to be taken. Dose is from j. dram to iij. or iv. in the Distilled Water or Syrup, or in a glass of Wine, thrice a day.

XXVI. *The Essence.* This is the most necessary and useful of all the Preparations made of *Angelica*, and is made of the Juice of the whole Plant. It is good against

againſt the Plague, and all ſorts of malign infections and Peſtilential Fevers: It reſiſts Poyſons of all ſorts, as the bitings of Mad Dogs, Vipers, Rattle Snakes, or any other Venomous Creature. It defends the Vital and Animal Spirits, and is a great preſervative againſt all kinds of Peſtilential Infection. It gives eaſe in all Pains and Torments coming of Cold, and is a moſt admirable thing againſt Peripneumoines or Inflamations of the Lungs and Pleuriſies. It is a great Pectoral, opening all obſtructions of the Breſt and Lungs, and thereby gives relief in vehement and old Coughs, Hoarſneſs, Aſthma's or difficulty of breathing, ſhortneſs of Breath, and Phthiſicks. It gives preſent eaſe in the Colick, Provokes the Terms, haſtens and facilitates the Birth, and brings away the After-birth and dead Child. It opens all obſtructions of the Liver, Spleen, Gall, Bowels, and Meſentery, diſcuſſes inward Tumors, and Cures Agues, if given ſeveral times, ſo as to ſweat well upon it. And as it mightily ſtrengthens and fortifies the Stomach, ſo it is one of the beſt things againſt a Sufeit in the World, a Vomit or *Emetick* being given before hand. Dropt into the Eyes it clears them from Clouds, Films, Specks, Pearls, *&c.* and ſtrengthens the Sight. Dropt into the Ears, it helps their pain and deafneſs, noiſe and ſinging in them. It heals inward Bruiſes, diſſolves congealed Blood, and is one of the beſt remedies againſt a Cold Scurvey. *Laſtly*, It is a moſt ſingular Vulnerary, not inferior to any of the *All-heals*, *Conſounds*, or *Wound Herbs:* and being given inwardly dietetically it is inferior to no kind of Wound-drink whatſoever, for after an admirable manner, it diſpoſes all Wounds, of what kind ſo ever, (if curable,) as alſo running Sores, old Ulcers, and Fiſtula's, to a very ſpeedy healing. Doſe from j. ounce to iij. or iv. ounces, two or three times a day, according as you ſee the occaſion requires.

XXVII. *The Balſam for Wounds. Take of the Juice of the Root and Stalks inſpiſſated to the thickneſs of new Honey* vj. *ounces*, *Gum Elemi* iij. *ounces*, *Balſam Capivij*, *Balſam of* Peru, *of each* ij. *ounces*, Chio *Turpentine* j. *ounce*, *mix and melt together*, *and ſtir them till they are nearly cold. Or take Oil Olive a Pound and a half, of the Roots Stalks and Leaves well Bruiſed together*, iv. *handfuls*, *boil till they are Criſp, and preſs out the Oil; this work repeat three times, with the ſame quantity of Bruiſed Roots*, &c. Laſtly, *Preſs forth the Oil: then to every* vi. *ounces of this Oil*, *add Gum Elemi* iij. *ounces: Balſam Capivij*, *and* Peru, *Erankincenſe*, *of each* ij. *ounces:* Chio *Turpentine* j. *ounce*, *mix them well.* Theſe Balſams whether the firſt, or ſecond, cure all ſimple Wounds by the firſt Intention: Cleanſe running Sores, old Ulcers, and Fiſtula's, of all their filth, then Incarnate, and in a veſhort time heal them, almoſt to a wonder. Apply'd alſo, they give eaſe in the Gout. And in Ulcers, where the Bone is bare, the Pouder ſtrewed on, and the Balſam apply'd over that, covers the Bone with Fleſh, and heals it up.

XXVIII. *The Ointment.* It has the Virtues of the Balſam, but not altogether ſo powerful: yet a ſingular Vulnerary, heals Wounds and Ulcers, and eaſes pains in any part being anointed thereon.

XXIX. *The Cataplaſm.* It is made of the Roots and Stalks ſhred ſmall and beaten to a Pulp, mixt with Hogs Lard, and Crums of Wheaten Bread, till it is of a Conſiſtencie. It is good againſt the Gout, Sciatica, or any External pain from a Cold Cauſe: and is of ſingular uſe being preſently apply'd to the Biting of Mad Dogs, Serpents, *&c.* to draw forth the Poyſon: applyed to the Region of the Spleen, it eaſes the pain thereof.

XXX. *The Cerote or Emplaſter.* The Pouder of the Root is made into a Plaiſter, with the Juyce of the Roots Inſpiſſated to thickneſs of Honey, and Pitch added to it, with ſufficient Quantity of Bees Wax. It draws ſtrongly, and therefore is good to be apply'd to the bitings of Mad Dogs, Vipers, *&c.* as alſo to the Sciatica, and the Gout whether in Hands or Feet.

XXXI. *The Gargariſm.* It is made of the Eſſence and Decoction mixed in equal Quantities, with a third part of Vinegar. It heals Ulcers and Sores in the Mouth, and attracts cold Humors and Rheums, from the Head and Brain; it may be uſed morning and evening.

XXXII. *The Errhine.* It is made of the freſh Juyce drawn out of the Root and Stalks, in vj. ounces of which iij. drams of *Sal Nitre* in fine Pouder is diſſolved. Being drawn up the Noſtrils evening and morning, it admirably purges the Head and Brain of Cold, thick Flegm, and other Humors, which are the foundations and Cauſes of many pernicious Diſeaſes.

CHAP. XVI.

Of Wild ANGELICA.

I. THE *Names.* It is called in the *Greek*, Ἀγγελικὴ ἄγρια: in *Latin*, *Angelica Sylveſtris:* and in *Engliſh*, *Wild Angelica.*

II. *The Kind.* It is the ſecond Species of *Angilica* before enumerated in *chap.* 15. *ſect.* 2. aforegoing: and of this there is a greater and leſſer ſort.

III. The Deſcription. The greater ſort. *The Root of this is nothing ſo great as the former, neither are the ſtrings ſo great or long, but it is of a blacker Color on the out ſide, of a pretty ſtrong ſcent, But nothing near ſo Aromatick, as the Garden kind: From this Root riſes up large ſpread Leaves on the Ground, having ſmaller Stalks, and leſſer Diviſions*

sions by much, of a dark green Color, and not smelling half so strong as the Garden kind, yet smelling so much like Angelica, *that by the smell, one may easily see and know it, to be of the Kinds of* Angelica, *tho' Wild: The Stalks are much slenderer and smaller, yet growing three or four Foot high, with*

smaller Joynts and lesser Leaves thereat; at the tops grow Umbles of Flowers, but lesser also, and white, like the Garden kind, which turn into smaller Seed, and of a darker Color on the out-side.

IV. The smaller sort, *has a great thick* Root, *from whence rises up* Leaves *not much differing from the other, but only in being smaller and not so much divided; from whence arises one ormore Stalks, lower from the former also, at the Joynts of which come forth Leaves not much unlike the Garden* Angelica, *except in the Magnitude, the Stalks also being reddish: at the top of these Stalks grow Umbles of white Flowers, yet lesser than the other, after which comes the Seed, which is thicker than the former, and resembling longer.*

V. *The Places.* These grow Wild in many places of this Kingdom, in *Essex*, *Kent*, and *Middlesex*, particularly at *Kentish-town* near *London*, and in other places.

VI. *The Times.* The Roots are in their Prime in *February*, *March*, and *April*; they Flower in *July* and *August*, and their Seed is ripe soon after.

VII. *The Qualities.* They are hot and dry in the second Degree. Are opening, inciding, attenuating, digestive, discussive and sudorifick, and are appropriated to the Head, Stomach, Heart, Womb and Joynts: they are also Alexipharmick, Alterative and Vulnerary.

VIII. *The Specification.* They are peculiar Antidotes against Plague and Poyson, Specificks against the Gout, and singular *Wound Herbs.*

IX. *The Preparations.* The Shops keep nothing of them; but you may Prepare therefrom. 1. *A liquid Juice.* 2. *An Inspissate Juice from the Root.* 3. *An Essence.* 4. *A Wine.* 5. *A Gargarism.* 6. *An Errhine.* 7. *A Decoction.* 8. *A Spirituous Tincture.* 9. *A Saline Tincture.* 10. *An Oily Tincture.* 11. *A Cataplasm.* 12. *A Balsam.* 13. *An Ointment.* 14. *A Cerote* or *Emplaster.*

The Virtues.

X. As to the Virtues of these *Wild Angelica's*, they are exactly the same with the Garden Kind, which we have largely delivered before, and we were the more willing to be explicite in the Garden kind, there, because we intended to say nothing of the Virtues here: For every Preparation of the Wild kinds has the same Intentions and Uses with those of the Garden, and therefore to them you are referred: Yet here is one thing to be taken notice of, *viz.* That tho the Virtues of both Garden and Wild kinds are one and the same, yet the Garden kind much exceeds the Wild in Strength and Vertue, and therefore is rather to be chosen (where it may be) before them. These are dryer than the Garden kind, and ought to be put into all Diet Drinks for Wounded Persons.

CHAP. XVII.

Of Water ANGELICA.

I. *The Names.* It is called in *Greek*, Ἀγγελικὴ ἔνυδρος: in *Latin*, *Angelica Aquatica*, *Archangelica*: And in *English*, *Water Angelica.*

II. *The Kinds.* It is the third Species of *Angelica* aforementioned, in *chap.* 15. *sect.* 2. above: of which there is known to us, this singular kind only. *And it is by some called* Wild Angelica, *whence the Name upon the Cut, which is the first Cut in the former Chapter, and was placed there by a mistake, and Answers only to the following Description.*

III. The Description. *The Root of this Plant is great according to its kind and magnitude, thick and White, with some strings hanging to it, and endures many years without perishing: from whence arises Leaves like unto the Garden* Angelica, *more in number, and smaller divided, which are set upon a great Stalk gross and thick, which is much taller and*

greater than the Garden kind, and somewhat Rediſh at the Joynts, from whence the Leaves by a large Foot-Stalk riſe, whoſe lower part ſeems to encloſe the whole Joynt, and to be of a rediſh Color alſo; the Leaves are of as deep a green Color as thoſe of the Garden ſort: from this Stalk alſo riſes up ſeveral long Branches, coming forth of an Husk or Caſe, not much unlike the common Garden Parſnip; at the top of which Branches come forth Tufts or Umbles of white Flowers, very like to thoſe of the Garden kind: After the Flowers come the Seed, broader, longer, thicker, and of a much darker Color than the Garden Angelica: *and the ſmell of the Plant is much like the ſame.*

Water Angelica.

IV. *The Places.* It grows naturally in *England*, in moiſt and watery Ditches and Places, from whence it took its Name; and in particular in the Marſh-Ditches by *Redriff.*

V. *The Times.* It Flowers alſo in *July* and *Auguſt*, and its Seed is ripe not long after: but its Root is in its prime in *March* and *April.*

VI. *The Qualities.* It is hot and dry in the ſecond Degree: is Inciding, Attenuating, Aperitive, Digeſtive, Diſcuſſive, Attractive and Abſterſive: it is Cephalick, Stomatick, Cardiack, Uterine and Vulnerary.

VII. *The Specification.* It is a thing peculiar againſt the Scurvy in a cold habit of Body, and one of the greateſt Vulneraries among Vegetables.

VIII. *The Preparations.* The Shops keep nothing hereof, yet you may make therefrom, 1. *An Eſſence.* 2. *A Liquid Juyce.* 3. *A Decoction in Wine and Water.* 4. *A Saline Tincture.* 5. *A Diet Drink.* 6. *A Cataplaſm.* 7. *A Balſam.* 8. *A Cerote or Emplaſter.*

The Virtues.

IX. *The Eſſence.* Setting *Scurvy-Graſs* aſide, I can ſpeak by ſingular Experience, that I know nothing among Vegetables ſo effectual for the curing of the Scurvey in a cold habit of Body: and as a *Vulnerary*, I have uſed it I believe above an Hundred times, with ſuch a ſucceſs as is admirable. Again in Diſeaſes of the Womb, I know this to be more prevalent than the *Garden*, in cleanſing it, in repretling the Vapors, and helping fits of the Mother. I remember I once gave this to a Woman, who had a kind of a ſtoney hardneſs in the Womb, with a Tumor as big as a ſmall *Oſtriches* Egg, which almoſt continually bled, with very great pain, but not continual: This ſome Phyſicians and Chirurgians determined to be a Cancer of the Womb, and ſo uncurable: it was dubious what to ſay, and the Diſeaſe ſeemed difficult to cure, if at all Curable: however I adviſed her to the Plentiful uſe of it for ſome time: She took iv. ounces of it, morning, noon and night, and continued it for ſix Weeks, at the end of which time ſhe became perfectly well, and by the uſe thereof, ſhe voided great quantities of hard clotted Blood

X. *The Liquid Juice.* Either alone, or with a little Nitre diſſolved in it, it is an excellent Errhine, to be ſnufft Blood-warm up the Noſtrills, till it comes out of the Mouth: it purges the Head and Brain of much cold, flegmatick Humors, taking away ſleepineſs and heavineſs of the head.

XI. *The Decoction in Wine and Water.* It is an excellent Hyſterick and Vulnerary, and may be of good uſe to ſuch, who cannot be obliged to take either the Juyce or Eſſence. Doſe viij. ounces twice a day.

XII. *The Saline Tincture.* It is an excellent thing in a Scorbute, where the whole Maſs of Blood is tainted, and the Patient breaks forth into Botches, Boyls, Scabs, Leproſy, *&c.* depurates the Humors, and carries off their Fæculencies effectually by Urine. Doſe from j. dram to ij.

XIII. *The Diet Drink.* Tho this is chiefly intended for Wounded People, and ſuch as have inveterate and running Sores, Ulcers, and Fiſtula's; yet it is of as great ſervice for ſuch as are afflicted with the Scurvy, have an obſtruction, pain or tumor of the Spleen, or any grand diſaffection of the Womb. It is drunk daily Spring and Fall as ordinary Drink: and at any other ſeaſons when neceſſity requires it. It is alſo found by experience to be good againſt Hypochondriack Melancholy.

XIV. *The Cataplaſm.* It is uſed againſt a cold Gout, to diſcuſs tumors, eaſe pains, and abſterge filthy running Sores and Ulcers.

XV. *The Balſam.* It cures ſimple Wounds, (which are without fracture of the Bone or Contuſion) by the firſt intention: It alſo cleanſes foul Ulcers, incarnates and heals them.

XVI. *The Cerote or Emplaſter.* It has an attractive force, incarnates and heals; eaſes pain, and ſtrengthens the part it is applyed to.

CHAP. XVIII.

Of ANISE.

I. *The Names.* It is called in *Greek* Ἄνισον; In *Latin*, *Aniſum*: And in *Engliſh*, *Aniſe.* I am apt to believe it is called Ἄνισον *quia habet folia* ἄνισα, *inæqualia, vel quia eſt ſine æquali*, there being no Plant equal to it in goodneſs. It is alſo called in *Greek*, Ἀνίκητον, *Anicetum*, *quaſi*, *invictum*, becauſe it ſeems to be *invincible*, or *not to be overcome*, which, I ſuppoſe, is in reſpect to its extraordinary Taſte and Smell, which overcomes the Taſte and Smells of all other Vegetables in the World.

II. *The Kinds.* It is two-fold, 1. *The Common*, of which we ſhall Treat in this Chapter. 2. *The Starry*

Starry Headed of Clusius growing in *China*, and other parts of the *East-Indies*, of which we have nothing to say in this Work.

III. The Description. *It has a small long Root, with some few strings, which Perishes every Year, from which rises up a Stalk round and hollow, about two or three feet high, (seldom higher, for it is a slender Plant) which is divided into divers small Branches, set with Leaves next the Ground, somewhat broad and dented in about the edges; but those which grow higher are more jagged, much like to those of young Parsley, but Whiter: the higher Leaves are also lesser than the lower, of a whitish green color, and of a good sweet Taste and Smell: the higher the Stalk the rounder it is; and spreads not into Branches, saving near the top, where it thrusts it self forth into several spokie rundles or tuffts; on the top of which, Umbles of white Flowers do stand, which afterwards do give small roundish long Seed, of a whitish grey colour, and very sweet, and of a quick, yet pleasant Taste and Smell, and more in Quantity than any other Umbelliferous Plant whatsoever.*

IV. *The Places.* It grows plentifully in *Egypt*, *Syria*, *Candia*, and other Eastern Countries: It grows also in *England* in the Gardens of Herbalists, where it has well enough thriven, and brought forth Seed perfectly ripe and good.

V. *The Times.* It is Sown with us in *England* in *May*, and the Seed is Ripe in *August*. But you may Sow *Aniseeds* here, in *England*, in *February*, when the *Moon* is at *Full*, or any time between the *Full* and the *Change*: If by reason of Frost, you cannot take the *Full Moon*, you must take the next opportunity, and cast them into the Ground, raking them well in; after which, strew fresh or new Horse-Dung, thinly upon the Ground, to defend them from the Frost, so will these seed and be ripe about *Bartholomew-tide*: Then Sow again in the *Full Moon* in *May*; these, if the Weather is kind, may be ripe sooner than the former. *Aniseed* will also come well up, if they be Self-sown, only the Ground is to be broken up near to and about them, when they begin to ripen. The time of their Flowering does continue four or five Months, so that, at one time, you may find the Plant in full Flower, and the Seed near to its full Growth, as you often see in *Fennel*, *Dill*, &c. That Ground which you would Sow in *February*, you ought to break up about *Michaelmas*, and to let it lye and Crumble all Winter, and when you intend to Sow it, you must stir it up again, that it may be mellow; for the mellower, the better; and a black, rich, mellow Mould is the best, for they delight in a well dung'd rich Soil.

VI. *The Qualities.* It is Hot in the second Degree, and Dry in the first: The Seeds are Opening, Inciding, Attenuating, Digestive, Discussive, Carminative and Anodine; and by Appropriation, they are Cephalick, Stomatick, Pectoral, Hysterick, Nephritick, and Arthritick: They are also Lactogenetick, Spermatogenetick, and Alterative.

VII. *The Specification.* They have a peculiar property against Coughs, Shortness of Breath, Difficulty of Breathing, and the Colick.

VIII. *The Preparations.* The Shops keep, 1. *The Seed.* 2. *Aniseed Comfits.* 3. *Aniseed Comfits Laxative.* 4. *A Distilled Water.* 5. *Anniseed Water, made with Aqua Vitæ.* 6. *A Chymical Oil.* 7. *A Fixt Salt of the Plant by Incineration.* To the former things you may add these following. 8. *The Green Herb.* 9. *The Essence.* 10. *The Potestates* or *Powers.* 11. *A Spirituous Tincture.* 12. *A Saline Tincture.* 13. *An Oily Tincture.* 14. *A Decoction.* 15. *A Balsam.* 16. *A Cataplasm.* 17. *An Extract.* 18. *A Spirit.*

The Virtues.

IX. *The Seed.* *Schroder* says, it is milder when green, Attenuates, Discusses, provokes Urine, breeds Milk, is Pectoral, and good for the Stomach, and to open Obstructions in the Lungs; it is given in Pouder to such as have their Bellies swoln up with Wind: A scruple given to a Child, Purges and Vomits gently, and carrys off those green Excrements, which in those little ones cause Gripings, vehement Pain, sickness at Stomach, and sometimes Convulsions: It is a Specifick also in curing a stubborn Hiccough.

X. *Aniseed Comfits.* They are good against Coughs, open the Lungs, expel Wind, and give ease in the Colick.

XI. *Aniseed Comfits Lavative.* They are made by a Maceration of the Seed in Water, in which Scammony has been Dissolved; or by mixing the Pouder of Scammony with the first Coverings of Sugar; or by Macerating them in an Infusion of *Vitrum Antimonij*. The former Purge gently, without any Pain, Griping or making Sick; the last both Purge and Vomit; but they all carry off Sharp, Corroding, Slimy, Flegmatick, and Tartarous Humors, help Digestion, empty the Lungs of the matter Obstructing them, and Cure the Colick. Dose from half a dram to ij. drams.

XII. *The Distilled Water of the whole Plant, or of the Seed.* It is a good Vehicle to convey other Medicines in; besides which it expels Wind, is good for Sore Eyes, and encreases Milk in Nurses. Dose from ij. to iiij. Ounces.

XIII. *Aniseed Water Distilled off from Aqua Vitæ,* or *Spirit of Wine.* It comforts the Stomach, opens the Lungs, helps Obstructions of the Liver, expels Wind, causes Digestion, and prevails against the Colick. Dose ij. Drams to half an Ounce, now and then upon occasion.

XIV. *The Chymical Oil.* It is an admirable Pectoral, Curing most Diseases of the Breast and Lungs, as Coughs, Colds, Asthma's, Rawness, Windiness of the Stomach, Phthisick, Colick, and indeed all Diseases proceeding from Cold, and Wind; it

provokes Luſt, and is often given with good Succeſs in Fits of the Mother, in Epilepſies, Apoplexies, Vertigo's, Megrims, Head-aches, Lethargies, Carus, and other Diſeaſes proceeding from Cold Flegmatick Humors. Doſe from iiij. Drops to x. in ſome fit Vehicle or Liquor.

XV. *The Fix'd Salt.* It is an admirable Pectoral and Nephritick; it Diſſolves Tartarous Matter in the Lungs, Reins, Ureters, Bladder, or Womb, opens all Obſtructions of thoſe Parts, provokes Urine, and brings away Sand, Gravel, or whatſoever creates a Stoppage in thoſe Parts. Doſe j. Scruple to half a Dram.

XVI. *The Green Herb.* The Decoction in Water and Wine, being drunk ſeveral times a day increaſes Milk in Nurſes; and Boiled in Oil of Roſes, and dropt into the Ears, takes away their Pains, and removes the noiſe in them. The planting this Herb near Bees, is the beſt means for the keeping of Bees, and multiplying of them, as alſo for their Breeding great ſtore of Honey: For firſt it yields an innumerable company of Flowers, and is continually in flowering for Four and ſometimes Five Months, according as the Year is Seaſonable, and theſe Flowers yield much Sweetneſs and Honey, and carry a Scent ſo pleaſant and grateful with them, that the Bees rather chuſe to feed upon it, than upon any other Plant whatſoever; beſides they contain an excellent Sweetning Ferment, by which the Dew is converted into a more Thick and Sweet Subſtance, by many degrees paſſing ſimple Dew, which contains within it a Saccharine Salt, which the Bees greedily reſort to, and ſuck, and with it Load themſelves: But the main excellency is the long duration of its flowering time, ſo that it will afford them a ſupply, the greateſt part of their gathering-time, whereas the Bloſſoms of Fruit-trees, and Flowers of other Herbs, are only at a peculiar ſeaſon, and of ſmall continuance. The Green Herb being taken, and the inſide of the Hives, as alſo the Orifices thereof being rubbed therewith, will ſo much delight the Bees, that when their Swarming time comes, which will be Three Times a Year, if they feed on this Herb, they will certainly enter into them, and go no where elſe: But in caſe when they Swarm, they ſhould ſettle upon ſome Tree, or other Place, the fault may be helped by rubbing the inſide of the new Hive with Green Aniſe, and holding it on the Top of a Pole to the Bees; for by the ſweet Scent or Smell of the Aniſe, they will be allured, to enter thereinto, of their own accords. It is reported, that a certain Lord of *Auſtria* ſo thrived by this Secret, that he furniſhed many Countries with Honey and Wax, whereby he Accumulated to himſelf vaſt Wealth, and a very great Eſtate.

XVII. *The Eſſence.* Whether it is prepared of the Herb, or Green Seed, or both, has all the Virtues of the Chymical Oil, but not all out ſo powerful, for which reaſon this is to be given in a much larger Doſe, as from j. Ounce to ij. Ounces, or more; it powerfully opens Obſtructions of Liver, Spleen, Lungs, Reins, and Womb, and is ſingular againſt the Falling-ſickneſs, Convulſions, and Colick: It powerfully provokes Luſt, is good for ſuch as are Impotent, and makes others more Vigorous; for it mightily encreaſes Seed in the Seminal Veſſels, as alſo Milk in Nurſes, and prevails againſt Poiſon, and the Bitings of Mad Dogs, or other Venomous Creatures.

XVIII. *The Poteſtates* or *Powers.* This Preparation has all the Virtues both of the Oil and Eſſence, and is much more pleaſant to be taken, and in particular is a ſingular thing againſt Vapors, the riſing of the Mother, Frenſie, Madneſs, and other like Diſtempers of the Brain; you may give from j. Dram to iij. or iiij. Drams, in any convenient Vehicle: It is very good againſt Convulſion Fits, and Cures (outwardly by Bathing the place with it) all kinds of Pains, Aches, and Cramps, proceeding from a cold Cauſe: It is good alſo to Prevent and Cure After-pains of Women in Child-bed, being inwardly taken, and outwardly bathed upon the Region of the Belly, a warm Flannel dipt alſo in the ſame being laid over it.

XIX. *The Spirituous Tincture of the Seed.* It has the Virtues of the Oil and Powers, but ſcarcely ſo ſtrong; and cauſes an Expectoration of Flegm in ſuch as have Coughs, Colds, Shortneſs of Breath, Aſthma's or Difficulty of Breathing, ; and is excellent good againſt the Bitings of Mad Dogs, Vipers, or other Venomous Creatures: It prevails much alſo againſt Hypochondriack Melancholly. Doſe from j. Dram to ij. or iij. Drams, in ſome fit Vehicle.

XX. *The Saline Tincture.* It is a Specifick to diſſipate both the Wind and Water in the Dropſie Tympanites; it increaſes Milk in Nurſes, facilitates the Birth, brings away the After-birth, and diſſolves Tartarous Matter, whether in the Lungs, Womb, Reins or Bladder, and therefore powerfully Provokes Urine, and Expels Sand, Gravel, *&c.* Doſe from j. Dram to ij. Drams, or more, according to the Age and Neceſſity.

XXI. *The Oily Tincture.* Altho' it is good in Diſeaſes of the Reins, Ureters, and Bladder, and may be given inwardly, for many Diſeaſes of the Liver, Spleen, and Lungs; yet its principal uſe is in External Applications; for being Anointed upon the Part, it cures Cramps, Old Aches and Pains, Gouts, Numedneſs, Lameneſs, Tremblings, and Palſies, proceeding from a cold Cauſe, and Viſcous, Tartarous Humors; yet in theſe very caſes it may alſo be taken inwardly from v. or vj. Drops, to x. or xij. in Wine, *&c.*

XXII. *The Decoction of the Seed.* It is peculiar for breeding Milk in Nurſes; and if made in Wine, it opens Obſtructions of the Liver, and is very profitable in curing the Dropſie, Aſcites, or Anaſarca; it ſtops the Hiccough, helps Digeſtion, ſtirs up Luſt, is good againſt the Colick, Poiſon, and Bitings of all Venomous Creatures, helps a Stinking Breath, Provokes Urine, and Expels Wind in any part, whether Head, Stomach, Spleen, Bowels, Meſentery, or Womb. Doſe from iij. to viij. ounces, two or three times a Day.

XXIII. *The Balſam.* It has all the Virtues of the Oily Tincture, being outwardly Applied, and Cures Wounds, though of the Nerves, by the firſt Intention.

XXIV. *The Cataplaſm.* If it is made of the Seed, either Green or Dry, and applied to the Eyes which have any thing fallen into them, it quickly draws it forth; and being applied to any place Bitten with a Mad Dog, Viper, Rattle-Snake, or Venomous Creature, it effectually draws forth the Poiſon.

XXV. *The Extract.* Take the Seed bruiſed, upon which Affuſe Spirit of Wine, which Digeſt three or four Days, then preſs forth the Liquor out of the Seed; put this Liquor into an Alembick or Glaſs Veſica, and Abſtract the Spirit by Diſtillation till what remains is of the thickneſs of Honey. This Spirit is Spirit of Aniſeeds. Doſe from j. Dram to ij. Drams, againſt the Falling-ſickneſs.

XXVI. *The Spirit.* It has all the Virtues of Aniſeed Water, and is not much inferior to the Powers. Doſe from j. to ij. Drams, in Wine.

CHAP.

CHAP. XIX.

Of LOVE APPLES.

I. *THE Names.* It is called in Greek, as *Anguillara* says, Ανκοπερσικὸν, ϗ Ανκοπερσιὸν: in Latin, *Pomum Amoris*, *Pomum Aureum*; *Malum Amoris*, *Malum Aureum*: And in English, *Love Apples.*

II. *The Kinds.* There are but two sorts thereof, *viz.* The Greater kind and the Leſſer kind: and of the Greater, there are alſo two ſorts; but they differ in nothing but in the colour of the Fruit, the one being of a fair Reddiſh colour; the other of a pale Yellow.

III. The Deſcription. *The Root of the Greater Kind, which is Small and Thready, ſhoots forth into many ſmall Strings, and larger Branches, under ground, which periſhes at the firſt approach of our Winter, from whence ſprings forth very long round Stalks or Branches, fat and full of Juice, trailing upon the ground, not able to ſuſtain it ſelf upright, by reaſon of the weakneſs of its Stalks, and alſo of the great weight of its Leaves and Fruit wherewith it is loaded.* The *Leaves are many, long, and winged,* viz. *many Leaves ſet on both ſides a middle Rib, ſome greater, others leſs, deeply jagged or dented about the edges, of a grayiſh, over-grown green Colour, ſomewhat rough and hairy in handling: From among theſe Leaves and Branches come forth long Stalks, with many Yellow Flowers ſet thereon, upon ſeveral ſhort foot Stalks, cluſtering together in Bunches, conſiſting of Six, and ſometimes of Eight ſmall long yellow Leaves, with a kind of Prick in the middle: After the Flowers are fallen, there comes in place the Fruit, which is about the bigneſs of a Golden Pippin, very fair and pleaſant, chamfred, uneven, and bunched out in many places, (there being ſcarcely any which are compleatly round without theſe Bunches) of a fair, or bright ſhining pale reddiſh colour, and ſometimes deeper; and of the yellow kind, not much unlike to a pale Orange colour. The Pulp or Meat is very full of moiſture, ſoft, reddiſh or yellowiſh, of the ſubſtance of a Wheaten Plum, in which the Seed lyes, which is ſmall, white, roundiſh, flat, and ſomewhat rough. The whole Plant is of a rank ſmell.*

IV. *The Leſſer Kind has a Root like the former, which periſhes in like manner every Year, from whence comes long trailing Branches, beſet with ſuch like Leaves as the Greater Kind, but ſmaller in every part; the Flowers alſo ſtand many together on a long Stalk, and yellow as the former, but much ſmaller; the Fruit are alſo ſmall, viz. round, yellowiſh, red Berries, not much bigger than great Grapes; in which are contained white, round, flat Seed, like the former, but ſmaller. If you would have them every Year, you muſt new Sow them every Spring, or elſe let them Sow themſelves, ſo will they riſe without any further trouble.*

V. *The Places.* They grow naturally in hot Countries, as in *Ethiopia*, *Barbary*, *Ægypt*, *Syria*, *Spain*, *Italy*, and other hot Countries: Some report they were firſt brought to us from *Peru*; and I have ſeen them grow in *Carolina*, which is the South-Eaſt part of *Florida*; but with us in *England* they grow only in Gardens, where being nouriſh'd up, they bring forth their Fruit to perfection.

VI. *The Times.* The Seed is ſown in the beginning of *April*, in a Bed of hot Horſe-dung, after the manner of *Musk Melons*, and ſuch like cold Fruits; they Flower in *June*, *July*, and *Auguſt*, and the Fruit is ripe for the moſt part in the middle or end of *September*.

VII. *The Qualities.* The whole Plant and Apples are Cold and Moiſt, almoſt in the fourth Degree; but not ſo cold as Mandrakes. They are Cephalick, Stomatick, Nephritick, and Uterine; of an Attenuating, Cleanſing, Repercuſſive, and Anodine Quality; and operate only as Alteratives.

VIII. *The Specification.* They are peculiar to allay the heat of Inflammations, but more eſpecially of an *Eryſipelas*.

IX. *The Preparations.* The Shops keep nothing of this Plant; but you may have from it, 1. *The Apples themſelves.* 2. *The Juice.* 3. *An Eſſence.* 4. *A Cataplaſm.* 5. *An Oil.* 6. *A Balſam for Wounds.*

The Virtues.

X. *The Apples.* In *Spain*, and thoſe hot Countries, they uſe to eat the Apples prepared and boiled in Vinegar, with Pepper and Salt, and ſerved up with Oil, and Juice of Limons: Likewiſe they eat them raw, with Oil, Vinegar and Pepper, for Sawce to their Meat, as we here do Cucumbers; but they yield not much nouriſhment, but only pleaſe and cool or quench the Heat and Thirſt of hot Stomachs.

XI. *The Juice.* Applied upon Inflammations, but eſpecially bathed upon an *Eryſipelas*, and Linen Cloths wet in the ſame, laid thereon, abate the Inflammation, and take away the preternatural heat.

XII. *The Eſſence.* It repreſſes Vapors in Women, is good againſt Fits of the Mother, opens the Obſtructions of the Urine, taking away the heat and ſcalding thereof; is good againſt Sand, Gravel, and the Stone, and gives eaſe in all Pains proceeding from a hot Cauſe. Doſe from j. to ij. ounces.

XIII. *The Cataplaſm.* It is good againſt the Headach, Megrim, Gout, Sciatica, and all Pains whatſoever proceeding from a hot and dry Cauſe: In outward Applications it ought to be renewed twice a Day.

XIV. *The Oil.* It Cures all manner of Burnings, and Scaldings, whether of Fire, Water, Oil, Lead,

&c. and has the Virtues of the Cataplasm, and may be anointed upon those places where a Cataplasm cannot be applied.

XV. *The Balsam.* It is a singular good thing to cool Inflammations in Wounds and Ulcers, heal all sorts of Burnings and Scaldings, cleanse old Running Sores, and to give ease in the Gout, pain in the Back, or any other part proceeding from vehement hot and fiery humors: It admirably heals Wounds, and, when cleansed, Ulcers also, after the manner of Preparations from *All-heals.*

XVI. *A special Note.* It appears that this Plant abounds with a vast humidity; for in the hottest time in Summer, the superfluous Branches being cut off from the Mother Root, and carelesly cast away in the Allies of the Garden, though at a time when no Rain shall fall, yet will they grow as fresh, as if they had not been cut off; which shews indeed the exceeding moisture of the Herb.

CHAP. XX.

Of MAD APPLES.

I. *THE Names.* This Plant has no known *Greek* name, (except Στρύχνος μανικὸς, may be taken for it, which is more properly the name for *Solanum Lethale*:) but to supply the place, we may call it Μῆλον μανικὸν *Pl.* Μῆλα μανικά; in *Latin*, *Malum insanum*, Pl. *Mala insana*; in *English*, *Mad Apple*, and *Mad Apples.*

II. *The Kinds.* There are three Kinds, 1. *The Syrian.* 2. *The European.* 3. *The Ethiopian*, of which we shall say nothing in this Work.

III. The Description. 1. *Of the* Syrian. *It has a Root composed of many strings, some great, others small, not thrusting down deep into the ground, which continues not all Winter, but perishes with the first Frosts; from this Root rises up a great, hard, round, purplish, or brownish green Stalk, two foot high, divided from the bottom into divers Branches, whereon are set many hairy, broad, rough Leaves, somewhat unevenly cut on the edges, and somewhat like the Thorn Apple Leaves: At the Joints with the Leaves come forth several large Flowers, consisting of six large pointed Leaves; in some Plants white, in others of a pale, but deadish purple Colour, with yellow threads in the middle; which passing away, there comes forth large, somewhat long, and round Fruit, in the warm Countries as large as a Cucumber; but in colder Countries seldom bigger than a large Duck or Goose Egg, set in the same Husk or Cup, which before contained the Flower, whose Colour on the outside is usually according to the Flower it bore, either of a whitish Green, more yellowish, or of a grayish Ash Colour, or of a Pale or Wan purplish Colour, with a very thin Skin or Peel, and full of a whitish Pulp, and Juice, having many small flat whitish Seeds within it, somewhat greater than those of the Love Apple.*

IV. *The* Mala insana Europæa, *have a Root stringy, and not much differing from the former, and perishing every year, after Seeding time; from whence grows an upright round Stalk, about the thickness of a Man's Finger, and about a foot and half high, from whence spring forth at several Joints, sometimes on the one side, and sometimes on the other, divers long, and somewhat broad green Leaves, unevenly cut in on the edges, and ending in a long point, three for the most part coming together, each of them upon a short Foot-stalk; at the tops of the Stalks, come forth the Flowers, consisting of six several Leaves; after which succeeds the Fruit, which are round reddish Berries or Apples, about the bigness of a Plum, and very full of Seed.*

V. *The Places.* The first grows in *Syria*, and *Ægypt*, where it grows plentifully Wild, and in most of those Eastern Countries, where the Fruit grows to the bigness (as *Bellonius* reports) of a great Cucumber: It also grows with us in *our Gardens*, where it bears Flowers, and as *Gerrard* says, in a temperate or warm Year, Fruit also, which he saw of the bigness of a Goose Egg, but came not to ripeness. The *European* grows in shadowy places upon the *Appenine Mountains*, and has been translated also into *our Gardens.*

VI. *The Times.* The Seed must be sown in *April*, in a Bed of hot Horse Dung, as Musk Melons are, and then it will Flower in *August.* The *European* Flowers in *August*, and if the Summer is warm, its Fruit comes to perfection in *September.*

VII. *The Qualities.* They are cold and moist almost in the fourth Degree. They are Cleansing, Repercussive, Anodine, or rather Narcotick, and Vulnerary. And by Appropriation are dedicated to the Head, Stomach, Reins, Womb and Joints; acting only as Alteratives.

VIII. *The Specification.* Their chief use is for cooling an *Erysipelas*, and Inflammations, easing Pains proceeding from vehement hot and sharp Humors, and healing of Wounds; but they cause no Madness, as the name would seem to import.

IX. *The Preparations.* The Shops keep nothing of this Plant; but you may have therefrom, 1. *The Apples themselves.* 2. *A Juice.* 3. *An Essence.* 4. *A Cataplasm.* 5. *An Oil.* 6. *A Balsam.*

The Virtues.

X. *The Apples.* They are boiled in Fat Broth, or rather in Water and Vinegar, and so eaten, being served up with Oil, Vinegar, Pepper, and Salt, and this at *Genoua* is a great Dish. *Fuchsius* says, there is a superabundant coldness and moisture in them, as there is in *Cucumbers* and *Mushrooms*; but the beauty

beauty of the Fruit, and the wonderful delight they give to the Palate, alſo their inciting to Venery, (which moſt Windy things, as theſe are, do) are the great Motives which intice to the eating of them: Wherefore in *Italy*, and other hot Countries, where they come to their full Maturity, and proper Reliſh, they eat them with more Deſire and Reliſh, than we do *Cucumbers*, and therefore Prepare and Dreſs them in divers manners; ſome eat them Raw, as we do *Cucumbers*; ſome Roaſt them under the Embers; ſome firſt Boil them, then Pare and Slice them, and ſo eat them as firſt related; ſome ſtrew Flower over them, and Fry them with Oil or Butter, and ſerve them to the Table with Pepper and Salt; and ſome keep them in Pickle, to ſpend in Winter, and the next Spring. Yet *Avicenna*, *lib.* 2. *cap.* 455. Condemns them as hurtful things: On the contrary, *Averrhoes* Commends them. I believe it is true, that they yield but little Nouriſhment, and breed much Wind, whereby 'tis poſſible they may provoke Bodily Luſt. At *Toledo* in *Spain*, they eat them with great Deſire, being Boiled with Fat Fleſh, then putting thereto ſome ſcraped Cheeſe, then keep them in Honey, or Vinegar and Salt Pickle all Winter, to eat as Viands, when they have a mind to it, to procure Luſt.

XI. *The Juice.* It cools the heat of the Reins, and the ſcalding of the Urine, taken to j. ounce in Arſmart Water: Applied upon Inflammations, and bathed upon an *Eryſipelas*, and Linen Cloaths wet therein being laid thereon, it abates the heat of the Inflammation, and cures the *Eryſipelas*: It is alſo of ſingular uſe againſt Burnings and Scaldings, of what kind ſoever: if the Skin is not broken, diſſolve in it a good quantity of Salt, and bathe therewith.

XII. *The Eſſence.* It is an excellent thing againſt hot vapors of the Womb, and Fits of the Mother; and is good againſt Sand, Gravel, and Tartarous matter obſtructing the Urinary Paſſages. Doſe from j. to ij. ounces.

XIII. *The Cataplaſm.* It is good to be applied upon Burnings and Scaldings from what cauſe ſoever, it takes out the Fire, and allays the Heat and Inflammation: It may be good alſo in an *Eryſipelas*, being often renewed; and is prevalent againſt the Gout in Elbows, Wriſts, Hands, Fingers, Legs, Feet, Toes, or any other Pain or Ach, proceeding from a cold Cauſe; and is good to be applied to a ſlight Contuſion or Blow, being laid on before any Tumor ariſes.

XIV. *The Oil.* It is good againſt all ſorts of Burnings and Scaldings, with Fire, Water, Soap Lees, Oil, Pitch, Tar, Lead, Gunpouder, *&c.* being anointed therewith, and the Cataplaſm aforegoing preſently after applied, and often renewed; and has all the Virtues of the Cataplaſm, except in the caſe of an *Eryſipelas*, where Oily Bodies rather inflame, than do any good: It gives eaſe in the Megrim, and Head-ach, from a hot Cauſe, and takes away the black and blew Marks which ariſe from Blows, Falls, *&c.*

XV. *The Balſam.* It is a ſingular Vulnerary, prevents, and allays Inflammations in Wounds and Ulcers, coming from what accident ſoever: It cleanſes Ulcers and Fiſtula's, and ſpeedily heals them afterwards.

CHAP. XXI.

Of THORNIE APPLES.

I. *The Names.* It is called in *Greek*, Μανικὸν πᾶσαν νάρκην καὶ βαρυκάρηνον (*i. e.* a Nut cauſing Drowſineſs:) In *Latin*, *Stramonium*, *Melleſpinum*, *Malum Spinoſum*, *Pomum Spinoſum*: In *Engliſh*, *Thorny Apple*, and *Thorn Apple*. *Matthiolus* thinks this to be the *Nux Mirabil.* of the *Arabians*.

II. *The Kinds.* It is twofold, 1. *That which generally grows with us in* England. 2. *That of* Peru. And of the firſt Kind there is both ſingle and double, with variety of Colours in the Flowers.

III. The Deſcription. *The Root is ſmall and thready, from whence ſprings up, one great Stalk, four, five, or ſix feet high, ſeldom higher; and two or three Inches, or more, thick in Diameter, and ſometimes four or five Inches thick, upright and ſtraight, having very many Branches, and ſometimes but few, upon jointed Stems; on which do grow Leaves, ſmooth, very broad, and cut in, or jagged about the edges, long and broad almoſt as a Spinage Leaf; and not much differing from the ſhape of Gooſe-foot. The Flowers come forth of long Toothed Cups, great, white, and of the form of a Bell, or like the Flower of the great Bindweed, which ſpreads it ſelf in Hedges, but altogether greater, and wider at Mouth, and ſharp cornered at the brims; of a ſtrong ſmell, ſo that it offends the Senſes: After the Flowers follows the Fruit, ſomething of the faſhion of an Egg, ſet about on every ſide and part with ſharp Prickles, almoſt like Thorns, within which Shell is contained very much Seed, of the bigneſs of a very ſmall Tare, and almoſt of the ſame faſhion, and of a blackiſh brown, or black Colour.*

IV. The Thorn *Apple of* Peru *has a Root thicker than the former, with ſome thick Branches, from whence runs ſeveral ſmall ſtrings, and out of which ſprings one pretty thick upright Stalk, about four or*

or five feet high, ſeldom higher; nearly two Inches thick, having very few Branches, ſometimes none at all; from which Stalk and Branches (where there is any) ſpring forth pretty large Leaves, ſmooth and even, little or nothing indented about the edges, longer and broader than the Leaves of Nightſhade, or Mad Apples: From the Bottoms or Foot-ſtalks of the Leaves ſpring forth long Toothed Cups, out of which come the Flowers, great, white, and of the form of a Bell, or the Flowers of the great Bind-weed, but greater and wider at Mouth, and ſharp cornered at the Brims, like the former; which contain white Chives or Threads in the midſt, of a ſtrong Pontick Savour, offending the Head when it is ſmelled to: When the Flower is gone, the Fruit comes forth, of the bigneſs of a ſmall Walnut with the green on; this fruit is full of Prickles; within the Shell are a great number of Seeds, of the bigneſs of ſmall Tares, or Seeds of Mandrakes, and of the ſame form. The whole Herb is of a ſtrong Savour; and ſmelling to it cauſes Drowſineſs.

V. *The Places.* The Firſt was brought from *Conſtantinople*, and now grows with us plentifully in our *Gardens*; it alſo grows Wild and very plentifully in the *South Carolina.* The latter was found growing in the *Mountains* of *Peru*, from whence the Seed was ſent to *Manardus* in *Spain*: and from thence it was conveyed unto other parts of *Europe*; and now it is nouriſhed up in ſome of our *Gardens* in *England.*

V. *The Times.* The firſt may be ſown in *March* or *April*, and it brings forth ripe Seed in *September*, Flowering in the Summer Months: The latter is ſown in a hot Bed of Horſe Dung, as we do *Cucumbers* and *Musk-Melons.* Authors ſay, of both theſe ſorts, there is a greater and a leſſer Kind, and that the greater Kinds are plentiful enough in our *Gardens*, and will abide and give with us ripe Seed: but the leſſer Kinds are very rare, becauſe they ſeldom come to maturity, and ſo we are every Year to ſeek for new Seed.

VII. *The Qualities.* Theſe Plants are ſaid to be cold and moiſt in the fourth Degree: and to be Repercuſſive, Narcotick, or Stupefactive, and Vulnerary: and are by appropriation, Cephalick, Hyſterick and Arthritick, and operate only as Alteratives by their cold and moiſt property.

VIII. *The Specification.* *Manardus* ſays, that the *Indians* commend theſe Plants for provoking Urine, and expelling Sand and Gravel from the Reins and Bladder: and by *Gerard*'s account, it is a famous Wound Herb outwardly uſed.

IX. *The Preparations.* There are taken from it, 1. *The Seed.* 2. *The Juice.* 3. *An Eſſence* from the ſame. 4. *An Oil.* 5. *An Ointment.* 6. *A Cerote* or *Emplaſter.* 7. *A Cataplaſm.*

The Virtues

X. *The Seed.* It is of great Eſtimation in the *Indies*, both by the *Spaniards* and *Indians* themſelves, in that it provoks Urine, and expels Gravel and the Stone both in the Reins and Bladder, for which it is moſt commended: it is ſaid to break the Stone in the Bladder if it is not too hard and inveterate, or may by any medicine be diſſolved; of which there has been many proofs, as *Manardus* ſays, has been declared to his great admiration: For, as he ſays, he did not think that the Stone in the Bladder could be diſſolved and expelled by any means whatſoever, and that the Cure thereof conſiſted only in Cutting it out by a skillful hand: but it was ſaid of this Seed, that being taken in any Fit and convenient Water for that purpoſe, that it would by little and little diſſolve the Stone into ſmall Gravel; which after it is expell'd, or driven forth, would again ſtick together and Grow into a hard Stone.

XI. *The Juice of the Herb.* It is ſingular good to bath with in all Sorts of hot Inflamations and an *Eryſipilas*, by laying Cloths dipt in the *Juice* upon the ſame, and often repeating the Application.

XII. *The Eſſence of the Juice*, Dropt into the Eye, it allays the Inflamation thereof, and removes hot and ſharp Rheums: Injected up the Womb it is good againſt the continual running of the Whites, ſtrengthens the Part, and cools any Inflamation of the ſame, or of the Secrets: it alſo is good againſt all ſorts of Inflamations in Wounds and Ulcers.

XIII. *The Oil*, made by boiling the bruiſed Herb in it till it is criſp, is good againſt all ſorts of Inflamations, Burnings and Scaldings, and gives eaſe in a hot Gout, and Pains and Aches, in the Head chiefly, proceeding from a hot Cauſe and Humor.

XIV. *The Ointment*, made of the *Juice* or bruiſed Herb, boiled to criſpneſs, and twice or thrice repeated, in Hogs Lard, and then preſſed forth, cures all Inflamations whatſoever, and heals all manner of Burnings and Scaldings, whether of Fire, Water, Oil, melted Lead, Gun-Powder or Lightning, and that in a very ſhort time: This was proved upon a Merchants Wife at *Colcheſter*, who (after the uſe of many other things in vain, and when all hopes were paſt) being grievouſly Burned was herewith perfectly cured.

XV. *The Emplaſter.* It is made of the bruiſed Herb, boiled in Oil *Olive* to criſpneſs, and preſſed forth, and three times repeated, and then brought to a body with Turpentine, Roſin and Wax, of each a ſufficient quantity. It cures malign Ulcers, and Apoſtems, helps a hot Gout, and prevails againſt freſh and Green Wounds, and old Sores and running Ulcers, eſpecially upon the Glandulous parts of the Yard, and other places where they are hard of Cure.

XVI. *The Cataplaſm.* It is good againſt Recent Bruiſes eſpecially upon a bony part, to allay Inflamations, and eaſe the Gout and other Pains proceeding from a hot Cauſe.

CHAP. XXII.

Of Red ARCHANGEL.

I. *THE Names.* It is called in *Greek*, Λαμίον πορφύρεον: In *Latin*, *Lamium purpureum*, *Urtica iners purpurea*, *Urtica mortua rubra*: In *Engliſh*, *Red Archangel*, or *Red Dead Nettle.*

II. *The Kinds.* It is twofold, 1. *The Sweet*, called ſimply *Lamium purpureum.* 2. *Stinking*, Γαλίοψις, Γαλέοψις, Γαλεόβδολον: And in *Latin*, *Lamium fætidum*, *Urtica iners fætida*, *Urtica mortua fætida*, *Urtica Labeo*, *ſtinking Dead Nettle* or *Hedg Nettle.* And of this ſtinking kind there are divers ſorts, as 1. *Galeopſis vera*, The true ſtinking *Dead Nettle*, or *Hedg Netle.* 2. *Galeopſis altera pallida*, pale ſtinking *Dead Nettle.* 3. *Galeopſis altera incana*, Hoary ſtinking *Dead Nettle.* 4. *Galeopſis lutea Dalechampij*, Yellow ſtinking *Dead Nettle.*

III. The Deſcription. 1. The Sweet kind. *It has a Root ſmall and thready, perriſhing every Year, from whence riſes divers hollow ſquare Stalks, ſomewhat Hairy, with Joynts at a good diſtance, one from another, and alſo two ſad green Leaves, dented about the edges, ſet oppoſite one to another, the lowermoſt upon long Foot-Stalks, but without any towards the top,*

top, which are somewhat round. yet a little pointed at the ends, and a little crumpled and Hairy; round about the upper Joynts with the Leaves, grow sundry gaping Flowers of a paleish red Color, not much unlike Betony *Flowers, after which come Seeds, three or four set together in a husk; the whole Plant smells strong, and pleasant enough, not stinking.*

Archangel red flowred.

IV. The Galeopsis Vera, *has a Root composed of many strings, shooting out fresh heads every Year, and thereby increasing very much; from whence comes forth divers square, soft, and hairy Stalks rising up to be two or three feet or more high, according as the Ground is in goodness; at the Joynts whereof grow two Leaves a piece upon Foot Stalks, not much unlike to* Nettle *Leaves, but that they are soft and somewhat hoary, and not at all stinging, of a strong unpleasant sent, especially if growing in shaddowy places, but nothing so strong if growing in the open Fields: at the tops of the Stalks grow the Flowers, set in Rundles, for or five at a space, and many of them one above another in manner of a spiked head, every one standing in a greenish Husk, like unto those of the other more pleasant sented* Dead Nettles, *but not so great, nor of so sad a red or purplish Color, especially the Heads or upper parts; but the lower Labels or Lips have some white spots in them: after the Flowers are fallen, there grows within those Husks, small round, but somewhat rough Seed, four of them for the most part stand together, which are of a black Color when Ripe.*

V. The *Pale stinking* Dead Nettle, *has a pretty thick Root and full of Strings, from whence rises up a long, square, hairy Stalk or Stalks, out of which comes several pale green broad Leaves, set upon long hairy Foot Stalks, and higher up, such like but lesser Leaves thereon, with sundry small pale yellowish Flowers, set together at spaces, which turn into small round pointed Heads, with small blackish Seed in them; the whole Plant is of a strong stinking smell.*

VI. The *Hoary stinking* Dead Nettle, *has a Root much like to the former kinds, from whence comes Stalks square, soft, and hoary, but shorter, very slender and weak, creeping as it were by the Ground, with two Leaves set by the Joynts likewise, soft and and hoary, but more hoary underneath, and not so large as the first kind of* Galeopsis: *the top of the Stalks end in a long spike of purplish Flowers, set in Rundles as in the other, after which comes the Seed, Black also as the former.*

VII. The *yellow stinking* Dead Nettle, *has much such a like Root as the others, whence comes forth square low Stalks, not above a Cubit or a Foot and a half high, with long Leaves set thereon by couples, very like unto* Nettle *Leaves, smaller below next the Ground, than up higher upon the Stalks, being hairy, but not so stinking as the first, yet smelling very strong: the Flowers grow in long spiked Heads in like manner, but are all yellow when fully blown, consisting of two Leaves, the uppermost whereof is not so much hooded as the former, but is as it were a cover to the lower, and turns it self up again, having some yellow threads in the middle; but while it is in the bud, it is somewhat reddish, after which comes forth the Seed in the same Husks.*

VIII. *The Places.* *Red Archangel* grows almost ever where, by Ditch and Hedg sides, throughout the whole Kingdom. The first *Galeopsis* grows very frequently in *England* in divers Counties, as at *Hamstead*, going from the Town to the Church, and many other Places from *Hamsted-Heath* to *London*, as also at *Greenwich* in some places not far from the *Park*. The second Kind, grows also wild by Hedg and Ditch sides, and as a Weed in many *Gardens*. The two last Kinds, are not found to grow wild at all with us, but only nourished up in *Gardens*.

IX. *The Times.* They Flower for the most part all *Summer* long, beginning in *May*, and all *June* and *July*, and the Seed is ripe not long after the Flowers are past.

X. *The Qualities.* *Red Archangel* is hot and dry in the first Degree, but the *Galeopses* are hot in the second Degree, and dry in the third Degree, much of the temperature of *Horehound*. They are all Attenuating, something Repercussive and Astringent: and by Appropriation, they are Cephalick, Splenetick, Hysterick and Arthritick; and operate only as Alteratives.

XI. *The Specification.* They dry up moist Humors in Ulcers and Fistula's, are Vulnerary, and stop the overflowing of the Terms in Women.

XII. *The Preparations.* From *Archangel* there are, 1. *A Pouder of the Seed.* 2. *A Conserve of the Flowers.* 3. *A Juice of the Plant.* 4. *An Essence.* 5. *A Spirituous Tincture.* 6. *A Saline Tincture.* 7. *An Oily Tincture.* 8. *A Distilled Water of the whole Plant,* 9. *A Decoction.* 10. *An Oil.* 11. *An Ointment.* 12. *A Cerote or Emplaster.* 13. *A Catàplasm.* The *Galeopses* are used in 14. *A Decoction.* 15. *A Juice.* 16. *An Essence.* 17. *A Syrup.* 18. *An Ointment.* 19. *A Balsam.*

The Virtues of the Red Archangel.

XIII. *The Pouder of the Seed.* It is dry and binding, and of good use in stopping Fluxes of the Bowels, as the Diarrhæa, Dysenteria, Lienteria, and Hepatick Flux. Dose from half a dram to j. dram in Red Wine.

XIV. *The Conserve of the Flowers.* Eaten morning, noon, and night, the quantity of a large Walnut at a time, it has been found by Experience to be effectual against the overflowing of the Courses, and all Fluxes of Blood whether by the Mouth, Stool, or Urine: but this more especially, if to a

Pound of the *Conserve*, ij. ounces of *Crocus martis Astringens* be added.

XV. *The Juice of the Plant.* It is Antihysterick, represses Vapors in Women and Fits of the Mother, opens obstructions of the Liver and Spleen, and is good for Wounded Persons to Drink. Dose ij. or iij. ounces in Wine.

XVI. *The Essence.* It has all the Virtues of the *Juice*, besides which it is an excceding good thing for such as have old running Sores, Fætid Ulcers, and Malign Fistula's running upon them; it corrects the Malignity of the Humors, drys them up and dispose the Ulcers to healing. Dose from j. to iij. ounces: Outwardly it is good to wash the Ulcerations withal, and to inject into Fistula's.

XVII. *The Spirituous Tincture.* It stops Fluxes of the Belly of what kind soever; and the over-flowing of the Courses in Women, quickens and chears the Spirits, drives away Melancholy, makes the Heart merry. Dose iij. drams.

XVIII. *The Saline Tincture.* It operates by Urine, and carries off much of the Morbifick matter in such as are afflicted with Ulcers, Sores and Fistula's, by the Urinary passages; and is good against inward Bruises, dissolving the congealed Blood. Dose from j. dram to ij. drams, in a Glass of the *Distill'd Water.*

XIX. *The Oily Tincture.* Taken from vj. Drops to xx. or xxx, according to Age and strength, in some proper Vehicle, it has been found to be good against Quartan Agues. Outwardly applied or anointed, it is good against all Pains and Aches, as also the Gout in any part proceeding from a cold Cause: it strengthens the Nerves, and is good against the Palsie.

XX. *The Distilled Water.* It is used chiefly as a Vehicle to convey the other Various preparations of this Herb in. Dose vj. ounces.

XXI. *The Decoction.* Made in Wine, and Drank, to vj. or viij. ounces; it strenghens the Bowels much, it is good to open obstructions, and softens the hardness of the Spleen: Fomenting also hot with the same upon the Region of the Spleen: or applying the hot Herb also thereon, for some time.

XXII. *The Oil*, made by boiling the bruised Herb in Oil *Olive*, *&c.* It is good to discuss or resolve cold and hard Swellings in any part of the Body, Chiefly those in the Neck and Throat proceeding frow the *Kings-Evil.*

XXIII. *The Ointment.* It has the same Virtues, besides which it is very good to discuss Inflamations, and heal all green Wounds by cleansing them, drying, and closing up their Lips.

XXIV. *The Cerote* or *Emplaster.* It heals also green Wonnds, cleanses old Ulcers, and resists their Malignity; puts a stop to their fretting, corroding, and spreading, and brings them to a speedy healing.

XXV. *The Cataplasm*, made with the beaten Herb, and Hogs Lard, Vinegar and Salt, boiled to a softness and consistency, and then apply'd to hard and Scrophulous Tumors whether in the Neck or other parts, it helps to discuss and resolve them; gives ease in the Gout, Sciatica, and other Joynt-Aches, strengthens the Nerves, and eases their Pains, caused by Cramps, Convulsions, *&c.* it is good against Inflamations, and the Malignity of old running Sores. *A Cataplasm of the raw Herb beaten up with Vinegar*, being apply'd to the Nape of the Neck, stops bleeding at the Nose: and helps Whitloes, being apply'd to the roots of the Nails.

The Virtues of the stinking Archangel *or* Dead Nettle.

XXVI. *The Decoction.* It is good to bathe places Swelled with hard Kernels, Wens, Inflamations, or Scrophulous Tumors in the Neck, under the Ears, Jaws, Armholes and Groin; and if the *Decoction* is made in Wine, and drunk to vj. or viij. ounces for a Dose, it is a good Traumatick, and wonderfully helps all inward Wounds, Hurts, Bruises, Falls, or the like, and is singular good for the Spleen and the Diseases thereof.

XXVII. *The Juice.* It has all the aforegoing Virtues; besides which being applyed warm with Vinegar, to the Hemorrhoids or Piles, when they are very painful and much Swelled, it gives ease, and discusses the Tumor. It is good also against Warts, Figgs, Criste, Condylomata, and the like which grow in and about the Fundament. Dose inwardly from j. to iv. ounces.

XXVIII. *The Essence.* It has all the Virtues both of the *Decoction* and *Juice*, and may be used as a Wound Drink, for which purqose it is a most singular thing; and contributes very much to the healing of Ulcers, Fistula's and other inveterate and running Sores, which resist most other Remedies. Dose from ij. ounces to iv. twice a day: Outwardly it is good also to wash Sores, Ulcers and Fistula's with, and cleanses them from their filth.

XXIX. *The Syrup.* It may be a Vehicle to mix with the *Essence* for all the purposes aforesaid, as also against Flushings, Vapors, and fits of the Mother, or Hypochondriack melancholy.

XXX. *The Ointment.* Being anointed upon the Region of the Spleen, it eases the pain, and softens the hardness thereof; and anointed on the Fundament, it is good against Clifts, Warts, Figgs, Piles, and other Swellings thereof. It dissolves or Discusses Wens, Kernels, and hard and Scrophulous Swellings of the Neck and Throat, and other hard and Oedematous Tumors in any other part of the Body.

XXXI. *The Balsam.* It is of singular use, and much Commended against Gangreens, Cancers, Corroding Fistula's, and all manner of other running Sores, inveterate and foridid Ulcers happening in what Place soever.

CHAP. XXIII.

Of the White ARCHANGEL.

I. THE *Names.* It is called in *Greek*, Λαμίον λευκὸν: *Lamium album*, *Urtica iners Alba*, *Urtica mortua alba:* and in *English*, *White Archangel*, or *Dead Nettle.*

II. *The Kinds.* Of *Archangels* there are three special Kinds, *viz.* 1. *The Red.* 2. *The White.* 3. *The Yellow.* This then which we Treat of in this Chapter is the second Species, *to wit*, that of the *White* Kind.

III. The Description. *It has a Root White and Thready, not perishing every year, from whence rises divers four square Stalks somewhat hairy, about a Foot and a half, or two Feet high, and sometimes more, as the ground on which they grow is in fatness and goodness, leaning this way and that way by reason of the Weight of its Head and Leaves, Branches and Flowers: at the Joynts whereof stand two Leaves, larger and more pointed than the Red, almost in shape like*

like Nettles, but not ſtinging, and dented about the edges; greener alſo than the Red, and ſomewhat ſoft, as it were, and hairy and downy. At the Joints with the Leaves ſtand larger and more gaping Flowers than thoſe of the Red, *in Husks, and encompaſſing the Stalks at certain diſtances, like as thoſe of Horehound do (of which* Gerard *will have this to be a Species) but not having ſuch a buſh of Leaves and Flowers, ſo cloſely ſet at the Tops, as they are in the* Red: *Theſe Flowers are white in Colour, and ſhaped like to little gaping Hoods, or Helmets; after the Flowers in the ſame Husks grow ſmall roundiſh Seed, which, when ripe, becomes black, or of a blackiſh Colour. Its Root grows not downward, but ſpreads and encreaſes under the upper Cruſt of the Earth, and abides many Years, ſtill encreaſing: The whole Herb has a ſmell pleaſant enough, and much differing from* Galeopſis, *or the Stinking Kind.*

IV. *The Places.* It grows by old Hedges, and Ditch ſides, and in ſome places by the Highways, and borders of Fields, almoſt every where through the whole Kingdom; and many times in *Gardens* ill Husbanded.

V. *The Times.* It Flowers from the beginning of the *Spring*, almoſt all the *Summer* long; and the Seed ripens thro' all the ſame Seaſons.

VI. *The Qualities.* It is hot and dry in the ſecond Degree: it is Attenuating, Inciding, Diſcuſſive, Reſolutive, Aſtringent, Vulnerary, and Alterative: and is appropriated to the Head, Nerves, Liver, Spleen, Womb, and Joints.

VII. *The Specification.* It cures Wounds and Ulcers, ſtops Fluxes, and in particular the Whites in Women.

VIII. *The Preparations.* The Shops keep, 1. *The Herb.* 2. *A Conſerve of the Flowers.* But you may alſo prepare therefrom, 3. *A Pouder of the Seed.* 4. *A Juice of the Plant.* 5. *An Eſſence.* 6. *A Spirituous Tincture.* 7. *A Saline Tincture.* 8. *An Oily Tincture.* 9. *A Diſtilled Water of the whole Plant.* 10. *A Decoction.* 11. *An Oil.* 12. *An Ointment.* 13. *A Cerote or Emplaſter.* 14. *A Cataplaſm.*

The Virtues.

IX. The Virtues of all theſe Preparations are the ſame with thoſe of the Red, in the Chapter foregoing, from *Sect.* 14. to *Sect.* 26. and may ſerve in all the ſame Caſes, there not being much difference in their ſtrength and goodneſs; but if any ſhould be ſuppoſed, theſe of the White may be ſaid rather to excel in Virtue: but this difference there is between them in the Flower, that as the Red ſeem to be ſpecifick, to ſtop the Reds, or overflowing of the Terms, and Loches in Women; ſo the Flowers of the White are ſaid to be ſpecifick in ſtopping the Whites, or White Flux in the ſame Sex; for which reaſon the Shops in many places keep the Conſerve of the Flowers in a readineſs, upon any occaſion.

X. *The Conſerve of the White Flowers.* It is given for the purpoſes aforeſaid, and to ſtrengthen the Womb, from vj. drams to an ounce and half, Morning, Noon, and Night. And it will be more effectual, if the Pouder of *boiled Turpentine* is added to it, iv. ounces to every pound of the Conſerve: thus Prepared, it is truly an excellent thing for the purpoſe intended.

CHAP. XXIV.

Of Yellow ARCHANGEL.

I. THE *Names.* It is called in *Greek*, Λαμίον Χλωρὸν: In *Latin*, *Lamium Luteum*, *Urtica iners lutea*, *Urtica mortua lutea*: and in *Engliſh*, *Yellow Archangel*, or *Dead Nettle.*

II. *The Kinds.* It is the third and laſt Kind of the *Archangels* or *Dead Nettles.*

III. The Deſcription. *The Roots hereof are much like to thoſe of the White, but are not obſerved to creep ſo much under ground as they: from whence riſes up ſquare hoary Stalks, and large green dented Leaves, very much like the* White Archangel, *but that the Stalks are more ſtraight and upright, not bending downwards; and the Joints, with their Leaves, are further aſunder, and the Leaves are ſomething longer than the former. The Flowers alſo are larger, and more gaping, growing in Rundles about the Stalk, of a fair Yellow or Golden Colour in moſt, and in ſome more faint, exactly of the ſhape of thoſe of the* White Archangel, *but gaping wider. After the Flowers follow the Seed in the ſame Husk, little or nothing differing from that of the White.*

IV. *The Places.* It grows uſually in Woods, and wet Grounds in Woods, and ſometimes in dryer places, in divers Countries of our Land: *Gerard* found it under the Hedge on the Left Hand, as you go from *Hamſtead* near *London*, to the Church, and in *the Wood* thereby, as alſo in many other Copſes about *Lee* in *Eſſex*; near *Watford* and *Buſhy* in *Middleſex*, and in the *Woods* belonging to the then Lord *Cobham* in *Kent.*

V. *The Times.* It Flowers from the beginning of *May*, and all *June* and *July*, and the Seed ripens gradually in the mean ſeaſon.

VI. *The Qualities.* It is hot and dry in the ſecond Degree: Attenuating, or making thin, Diſcuſſive, Reſolutive, Vulnerary, and Alterative: and is appropriate to the Head, Stomach, Liver, Spleen, Womb and Joints.

VII. *The Specification.* It is obſerved to be a more peculiar Vulnerary than any of the other kinds.

VIII. *The Preparations.* You may prepare from it: 1. *A Pouder from the Seed.* 2. *A Conſerve of the Flowers.* 3. *A Diſtilled Water of the whole Plant.* 4. *A Decoction in Wine, or Wine and Water.* 5. *A Juice from the Plant.* 6. *An Eſſence of the whole Plant.* 7. *A Spirituous Tincture.* 8. *A Saline Tincture.* 9. *An Oily Tincture.* 10. *An Oil for External Uſes.* 11. *An Ointment.* 12. *A Cerote or Emplaſter.* 13. *A Cataplaſm.* 14. *A Balſam.*

The Virtues.

IX. *This has all the Virtues both of the Red and White aforegoing*, and much of the ſame ſtrength and goodneſs; and therefore as to the Uſes of the various Preparations thereof, we ſhall wholly refer you to what we have ſaid of the like Preparations of the Red, in *Chap.* 22. *from Sect.* 14. *to Sect.* 26. Yet this we have to ſay in relation to the Flowers, that as they ſtrengthen the Womb very much, ſo they have a peculiar property againſt both Reds, and Whites, which yet may be made more powerful by compounding the Conſerve of it, according to the following Preſcript.

X. *The Conſerve.* ℞ *Take of the ſimple Conſerve* 20 *ounces: Turpentine boiled in Water, till it will Pouder,* v. *ounces: fine Pouder of Catechu* ij. *ounces and half; mix them. Doſe from* iij. *drams to* vj. *drams*, Morning, Noon and Night, for ſome time, taking the Eſſence alſo inwardly: A Spirituous Tincture of the dried Flowers, taken from j. dram to ij. drams, does alſo the ſame thing.

XI. *The Balſam.* It heals green Wounds, cleanſes old Ulcers and Fiſtula's, obtunds their Malignity, and ſtops their fretting, corroding, and ſpreading, eſpecially where they are Inveterate, very Filthy, and Corrupt, and where Fiſtula's are Cavernous, with many crooked Windings in them: Firſt waſh them with the Eſſence, by injecting it in Blood-warm; then inject into the hollowneſs, ſome of this Balſam melted, and lay a Pledgit dipt in the ſame over the Mouth thereof, and over all the Cerote or Emplaſter; letting the Patient alſo, in the mean time, take the ſaid Eſſence inwardly twice or thrice a day, as the manner is in wounded Perſons, ſo you will find a wonderful and ſudden Cure. This for a *Vulnerary* uſe is much more powerful than any of the other *Archangels.*

CHAP. XXV.

Of Garden ARACH.

I. *THE Names.* It is called in *Arabick*, *Cataf*, or *Caraf*: In *Greek*, Ἀτξὰφαξις ϗ Χρυσολάχανον, from its yellow Flowers: In *Latin*, *Atriplex*, and *Olus Aureum*: In *Engliſh*, *Arach*, and *Orach.*

II. *The Kinds.* There are four ſeveral Kinds thereof, 1. *The Garden.* 2. *The Wild.* 3. *Stinking.* 4. *Sea.* Of all which in their ſeveral Chapters. *The White* is that we treat of in this Chapter, and that is threefold: 1. *Atriplex ſativa alba major*, The greater White Garden Arrach. 2. *Alba minor*, The leſſer White. 3. *Atriplex ſativa purpurea*, Purple Garden Arrach.

Arach Garden large.

III. The Deſcription. *The Great White Garden Arach has a Root growing deep into the Ground, with many ſmall Fibres faſtned thereto, which fades away as ſoon as it has born Seed; from whence riſes up a Stalk ſquare or cornered, and of a white mealy Colour; out of which comes ſeveral Branches and Leaves: the Leaves are many, ſtanding upon their Foot-ſtalks, broad at bottom, and ending in two*

Points

Points like an Arrow, with two Feathers at the Head, and ſharp pointed at the end of the Leaf, of a whitiſh yellow green Colour, and as it were ſtrewed over with Flower or Meal, or rather ſmall white Sand, eſpecially whilſt young; the Stalk likewiſe is Mealy, or rather Sandy, bearing many Branches, with ſmall yellow Flowers on them, which turn into ſmall leafie Seed.

IV. *The Leſſer White Kind is altogether like the former, and differs nothing from it, unleſs in the magnitude, and the Sandy Flower, which ſeems to be whiter than the former: but I am apt to believe that theſe two are but one kind, and differ only in reſpect of the Ground they grow on, this growing upon a more ſandy, lean, or poor Soil: the richer the Earth, the greater the Plant; the poorer the Soil the leſſer.*

V. *The Purple Arrach is in its Roots, Stalks, Branches, Leaves, Flowers, and Seed, and manner of growing, and indeed in all things like unto the White, except only in the Colour, the Stalks, Leaves and Seed being of a Mealy, or Sandy Purpliſh Colour.*

VI. *The Places.* They grow chiefly in *Gardens*, as their names do ſpecifie, very rarely Wild.

VII. *The Times.* They Flower and Seed from *June* to the beginning of *September*, their Seed ripening all the time of their Flowering.

VIII. *The Qualities.* They are Cold and Moiſt in the ſecond Degree; but *Schroder* will have it only in the firſt Degree. They are Alterative, Aperient, Abſterſive, Emollient, and Expulſive; and are appropriated to the Lungs, Liver, Womb, and Joints.

IX. *The Specification.* They are peculiar againſt the Jaundice, and Diſeaſes of the Breſt and Lungs.

X. *The Preparations.* You may have therefrom, 1. *A Juice.* 2. *An Eſſence.* 3. *A Decoction.* 4. *A Syrup.* 5. *A Cataplaſm.*

The Virtues.

XI. *The Juice.* It cools Inflamations, and is good to be applied in an *Eryſipelas*, Linen Cloths being dipt therein, and applied thereto; and taken from ij. to iij. or iv. ounces, it looſens the Belly, cleanſes the Bowels, and fortifies the Expulſive Faculty.

XII. *The Eſſence.* It is good againſt the Yellow Jaundice, and cleanſes the Womb of all Impurities; and is an excellent thing to open Obſtructions of the Liver, and help Diſeaſes of the Breſt and Lungs. Doſe iv. ſpoonfuls.

XIII. *The Decoction,* has the ſame Virtue, but is weaker, and, drunk plentifully, is a ſingular good thing againſt the Poiſon of *Cimbarides*, and Strumatick Tumors, or Swellings in the Throat, or other parts, and admirably repreſſes Choler. Doſe from iv. to viij. ounces, twice a day.

XIV. *The Syrup of the Juice* made with Honey. It is an excellent Pectoral, opens ſtoppages in the Breſt and Lungs, and prevails againſt Colds, Coughs, Aſthma's, or ſhortneſs of Breath, and Difficulty of Breathing. Doſe from j. ounce to ij. ounces, Morning and Night.

15. *The Cataplaſm.* The Herb bruiſed and applied as a Cataplaſm, is excellent to eaſe Pains and Aches, from a hot Cauſe, and Acrimonious Humors, and to give eaſe in the Gout. *A Cataplaſm* made of the boiled Herb, is ſaid to be good (being applied) to diſcuſs hard ſwellings in the Throat.

XVI. *Nota.* This Herb is uſed as a Pot-herb, or rather boiled for a Sallet, (as they boil Spinage) and ſo to be eaten with Butter and Vinegar, Pepper and Salt, in which way it proves very grateful to a hot Stomach. And the Seed drunk with Mead to j. Dram, is good againſt the Yellow Jaundice: and *Matthiolus* ſays, it purges both upwards and downwards.

CHAP. XXVI.

Of the Common Greater Wild ARACH.

Arrach wild common.

I. THE *Names.* It is called in *Greek*, Ἀτράφαξις ἄγεια μεγάλη: In *Latin*, *Atriplex ſylveſtris vulgatior*

vulgatior ſinuata major; *Atriplex Sylveſtris major:* and in *Engliſh*, The *Common Greater Wild Arrach.*

II. *The Kinds.* It is the firſt Species of the Wild Kind, which Wild Kind, is, 1. Greater, the Subject of this Chapter. 2. Leſſer. 3. Narrow-leaved, *&c.*

III. The Deſcription. *It has a Root ſomewhat Long, Woody, and Fibrous, periſhing Yearly, from whence ſprings up ſtrong, round hard Stalks and Branches, with large Leaves on them, like thoſe of the Garden, but not ſo broad, or pointed at the Bottoms, yet much waved or cut in on the edges, and of a dirty, mealy, green Colour: the tops of the Branches are repleat with long ſpikes of Chaffy Husks, out of which come ſmall yellowiſh green Flowers, which afterwards give ſmall blackiſh Seed, like unto Purſlane.*

IV. *There is another of this larger Kind, but it is lower, and leſſer in every part; it is alſo narrower, and a little waved on the edges, and periſhing every Year, as the former does.*

V. *The Places.* It is found by Hedge and Ditch ſides, and often times on or near Dunghills in moſt places of this Kingdom.

VI. *The Times.* It Flowers in *June* and *July*, and the Seed Ripens in the mean time: and if the Year is warm, it is ſometimes in Flower in *May.*

VII. *The Qualities.* It is cold and moiſt in the ſecond Degree: Alterative, Attenuating, Digeſtive, Emollient, and Cleanſing: and in its appropriations is Hyſterick, and Arthritick.

VIII. *The Specification.* It is a peculiar remedy againſt an *Eryſipelas*, or *Ignis Sacer*, as they call it; and Fits of the Mother.

IX. *The Preparations.* 1. *The Seed in Pouder.* 2. *A Juice.* 3. *An Eſſence.* 4. *A Syrup.* 5. *A Cataplaſm.* 6. *The Balſam.*

The Virtues.

X. *The Seed.* Given from half a dram, to a dram and half, in Pouder, in Ale, Mead, or Wine, it purges upwards and downwards, troubles the Stomach and Bowels, evacuates Choler, and is helpful in the Yellow Jaundice.

XI. *The Juice.* It is an effectual thing againſt all ſorts of Inflamations in what part of the Body ſoever; and injected up the Womb, with a Womb-Syringe, it is prevalent againſt Fits of the Mother: Bathed on an *Eryſipelas*, and Cloths dipt therein, being alſo laid thereon, it is ſaid to cure that Diſeaſe.

XII. *The Eſſence.* It cleanſes the Womb of its filth, is good againſt Vapors, and Fits of the Mother, and a vehement heat of the Stomach. Doſe from j. ounce to ij. ounces, mixt with White Port Wine.

XIII. *The Syrup.* It opens Obſtructions of the Lungs, and if timely given, helps an *Empyema*, or Inflamation of the Lungs, and Hyſterick Diſeaſes, cooling the heat of Luſt. Doſe from j. to ij. ounces.

XIV. *The Cataplaſm.* It abates Inflamations, and eaſes the Gout, and other Pains proceeding from a hot Cauſe. It gives eaſe alſo in a violent hot Megrim or Head-ach.

XV. *The Balſam.* It removes an Inflammation in Wounds and Ulcers, cools, cleanſes, and diſpoſes them to healing, being a good Vulnerary.

CHAP. XXVII.

Of the Leſſer Wild ARACH.

I. THE *Names.* It is called in *Greek*, Ἀτρᾴφαξις ἄγρια μικρά: in *Latin*, *Atriplex Syveſtris parva:* in *Engliſh*, *Wild Arach, the leſs.*

II. *The Kinds.* The *leſſer Wild Arach* is threefold, 1. *Narrow Leaved.* 2. *Berry-bearing.* 3. *Broad Leaved.* I. The *Narrow Leaved*, is, 1. *Atriplex Sylveſtris anguſtifolia*, Narrow Leaved Wild Arach. 2. *Atriplex Sylveſtris anguſtifolia altera*, Another kind of Narrow Leaved. II. *Atriplex baccifera rubra*, Red Berry-bearing Arach. III. *Atriplex Sylveſtris*

veſtris latifolia minor, five, *Pes Anſerinus*. The leſſer Wild Broad Leaved Arach, or Gooſe Foot; whoſe Deſcription, Virtues, &c. you may ſee in *Chap.* 312. following. This laſt Broad Leaved kind is called *Minor*, in reſpect it is accounted of the leſſer Kind, and is leſſer than the *Great Broad Kind* deſcribed in the former Chapter.

III. The Deſcriptions. *The firſt*, Narrow Leav'd Wild Arach, *has a long ſlender Root, with many ſtrings coming from it, from whence riſes up one pretty large Stalk, with many large Branches on it, all over Mealy or Sandy, with a greeniſh gray or white Sandineſs, as alſo are the Leaves: the Leaves grow ſingle, and are placed irregularly up and down the Branches, they are long and narrow, almoſt like the Leaves of* Hydropiper, *or* Looſtrife, *but that they are ſhorter and narrower, not dented on the edges, ſet at the joints, ſmooth, and pointed at the ends: The Stalks and Branches ſhoot up into long Spiky Heads, of green yellow Flowers, not much unlike to the great broad kind in the former Chapter, and the Seed like the ſame alſo.*

IV. The *other* Narrow Leav'd Arach *of the leſſer kind, is not much unlike to the former, but every way leſſer, and the Leaves narrower, moſtly ſmooth on the edges, and pointed, but ſometime ſome of them are divided or jagged, or a little notched, for which reaſon* Lobel *called it*, Atriplex Sylveſtris polygoni aut Helxines folio. *The Stalks, Flowers and Seed, are alſo like the former.*

V. The Red Berry-bearing Arrach, *is a Wild Arrach alſo. in* Spain; *but with us it's Nurs'd up in Gardens: It is an Elegant Plant, having a Root ſmall and Fibrous, and periſhing after Seed time, whence comes divers ſlender Branches ſomewhat Woody, about a Foot high, more or leſs, (according as the place where it grows, and the goodneſs of the Ground will produce, for all the kinds of* Araches, *both Garden and Wild, delight to grow in a Fat, Rank Soil, as on Dunghills, &c.) from theſe Stalks and Branches come forth ſmall corner'd Leaves, not much unlike to the Broad Leav'd Wild* Arach *in the former Chapters, ſet at the joints one above another: and at every of the ſaid joints with the Leaves, which ſtand upon Foot ſtalks, even from the ſmall Leaves, near the Root, ſtands a ſmall Red Berry, Cluſter faſhion, that is like to a Bramble or Dewe Berry, Clear, and almoſt Tranſparent, with many ſeed grains in it, and full of an admirable Juice, as Red as Blood, or deep Red Wine, which being bruiſed upon the back of the Hand, while it is freſh, will ſeem as if it had drawn Blood out thereof; which Berry being dry grows blackiſh, and contains in it ſmall blackiſh Seed, out of which this very Beautiful Plant will ſpring up every Year of its own accord, if ſuffered to ſeed.*

VI. *The Places.* The two firſt grow by Walls, old Hedges, Ditch ſides, and Dunghills, in almoſt all places throughout the Kingdom: the Berry-bearing is Wild in *Spain*, from whence being brought to us, it is planted and nouriſhed up in *Gardens*.

VII. *The Times.* They all Flower in the Summer Months, as *May*, *June*, *July*, and *Auguſt*, the Seed continually ripening in the mean Seaſon.

VIII. *The Qualities.* Theſe Wild kinds are not ſo Cold and Moiſt as the former, not exceeding the firſt Degree. They are Abſterſive, Attenuating, Emollient, and Alterative; dedicated, as the others, to the Womb and Joints.

IX. *The Specification.* They are proper againſt Wounds and Ulcers, the Gout, Pains and Aches, proceeding from a hot Cauſe.

X. *The Preparations.* There are made thereof, 1. *A Powder of the Seed.* 2. *A Juice.* 3. *An Eſſence.* 4. *A Decoction.* 5. *A Syrup.* 6. *A Cataplaſm.* 7. *A Balſam.* 8. *The Juice of the Berries of the Red Berry-bearing.*

The Virtues.

XI. The Uſes of all theſe Preparations are the ſame with thoſe in the two aforegoing Chapters, and therefore to them we refer you; theſe Herbs having the ſame Virtues and Properties, but not full out ſo Cold and Moiſt.

XII. *The Berries of the Red Berry-bearing Arach.* The Beauty of the Juice is admirable; but what Phyſical Virtues it may have is not ſo fully known: being given inwardly to ʒ. dram, or more, in Red Wine or Alicant, it is good againſt Spitting Blood, Piſſing Blood, or the Bloody Flux: The Juice being inſpiſſated and reduced to a Pouder, is good to ſtop Bleeding outwardly: and inwardly given, it ſtops the overflowing of the Loches, or the Terms in Women, and ſtrengthens the Womb. Doubtleſs out of it there may be made ſeveral glorious *Pigments*, or *Limning Colours*, for the uſes of *Limners*, *Painters*, &c. Doſe of the inſpiſſate Juice is half a dram, or more, in any proper Vehicle.

CHAP. XXVIII.

Of Stinking ARACH.

I. *THE Names.* It is called in *Greek*, Ἀτραφαξὶς δυσώδης: in *Latin*, *Atriplex fœtida*: and by *Cordus*, *Garoſmos* (becauſe it ſmells like Stinking Fiſh) from γάρος, *Piſcis*; whence comes γάρον, *i. e. Liquamen ſeu ſanies Piſcium*: alſo, *Tragium Germanicum*; and by *Pena* and *Lobel*, *Atriplex fœtida garum olens*: It ſmells more ſtinking than the Ram, or Male Goat; and therefore, ſays *Gerard*, ſome have called it by a Figure, *Vulvaria*: in *Engliſh* it is called, *Stinking Arach.*

II. The

II. *The Kinds.* There ſeems to be but one ſingle kind hereof, and by reaſon of its growing Wild, it may be accounted one of the Wild kinds.

III. The Deſcription. *It has a Root conſiſting of ſeveral long Branches, filled with many Thready ſtrings, from whences riſes up one or more feeble Stalks, which lye flat upon the Ground, it being but a ſmall low Plant; and from thoſe Stalks come forth many weak and feeble Branches, upon which grow very ſmall Leaves, almoſt round, yet a little Pointed, without Cut or Dent, in ſhape not much unlike to Baſil, of a Greyiſh Colour, ſprinkled over with a certain kind of Duſty Mealineſs, or like to very ſmall White Sand: among which Leaves, here and there confuſedly, are the Seeds diſperſed, which can be likened to nothing but Duſt and Aſhes. The whole Plant is of a moſt Loathſom Savor or Smell, not much differing from that of old Rotten Fiſh, or ſomething worſe. It periſhes in Winter, and riſes yearly again from its own Sowing.*

IV. *The Places.* It grows naturally upon Dunghills, and other the moſt filthy places that may be: ſometimes it is found in places like Brick-kilns, and old Walls, and near the Emptying places of Ordure or Dung; but the cleanneſs of the Ground may in ſome meaſure alter its Smell, which, as ſome fancy, may be like old Rotten Cheeſe: but that which grows in its natural place, ſmells like abominable Stinking Fiſh, whence came the name *Garoſmos*, as is before declared.

V. *The Times.* It is an Annual ſpringing Plant, Flowers in *June* and *July*, and the Seed is ripe preſently after, at what time it periſhes, and riſes again of its own Seed; ſo that if it is once gotten into a Ground, it is not eaſie to be deſtroyed, or rooted out again.

VI. *The Qualities.* It is Cold and Moiſt in the firſt Degree; is Alterative, Cleanſing and Emollient; and is chiefly Hyſterick, or appropriated to the Womb.

VII. *The Specification.* It is a pure Antihyſterick, curing Vapors, and Fits of the Mother, ariſing from almoſt what Cauſe ſoever.

VIII. *The Preparations.* You may have from it, 1. *A Decoction.* 2. *A Juice.* 3. *An Eſſence.* 4. *A Syrup.* 5. *A Saline Tincture.* 6. *An Injection.* 7. *A Cataplaſm.* 8. *An Ointment, or Balſam.*

The Virtues.

IX. *The Decoction.* If made in Wine, and drunk from three ounces to ſix, it quells hot Vapors ariſing from the Stomach to the Head: if made in Water, it cools the Stomach and Womb, being inwardly taken, and outwardly injected with a *Womb Syringe.*

X. *The Juice.* It may be taken from j. ounce, to ij. ounces, or more: It cleanſes the Womb, if it is foul, and ſtrengthens it exceedingly; it provokes the Terms, repreſſes Vapors admirably, and cures Hyſterick Fits: give it in a Glaſs of White Port; and let the Patient ſmell to it.

XI. *The Eſſence.* It makes Barren Women Fruitful, provokes the Terms, if they be ſtopt; and ſtops them if they flow immoderately; it facilitates the Birth, and brings away the After-birth, or Dead Child: it is commended as an Univerſal Medicine for the Womb, both eaſily, ſafely and ſpeedily curing any Diſeaſe thereof, as Vapors ariſing from the foulneſs of the Womb, or too great abundance of Seed, Fits of the Mother, and the like. Doſe from j. ounce to iij. ounces, in a Glaſs of White Wine, *&c.*

XII. *The Syrup.* It has the Virtues of the Juice, and Eſſence, but not full out ſo powerful as either of them, and therefore is to be given to more queaſie Stomachs. It is alſo uſed as a Vehicle to convey the Juice or Eſſence down in: you may make it with Sugar; but for cleanſing the Womb, it is much better to be made with Honey. Doſe iij. or iv. Spoonfuls.

XIII. *The Saline Tincture.* This is more powerful in cleaning the Womb, and repreſſing Vapors, and Hyſterick Fits, than either the Juice or Eſſence, and may be exhibited from j. dram to ij. drams, either in the Sryup, or White Port Wine. Mixt with equal parts of the Juice, it is good to ſmell to, in Vapors, and Mother Fits, for the ill Scent thereof, cauſes the Womb to fly from it, or precipitates the Vapors downwards: and being thus mixed with the Juice, it is good againſt the falling down of the Womb, being caſt in with a Womb Syringe; it alſo kills Worms which breed in the Sores or Ulcers of Horſes, or other Cattel.

XIV. *The Injection.* It is made of the Juice mixed with equal parts of the Syrup, and Red Wine. It cleanſes Ulcers of the Womb, is good againſt the Whites, ſtrengthens the Matrix, and is helpful againſt its falling down.

XV. *The Cataplaſm.* It is applied to the Share-Bone in Women, in a *Procidentia Uteri*; and gives eaſe in the Gout, or other Pains ariſing from a hot Cauſe: applied to the Stomach, it repreſſes Fits of the Mother.

XVI. *The Balſam.* It cures Ulcers in the Womb, and Privy Parts of Man or Woman, and is a ſingular thing to give eaſe in the Gout, being applied; as alſo to cool and diſſipate Inflamations.

CHAP. XXIX.

Of Sea ARACH.

I. THE *Names.* It is called in *Greek*, Ἀτράφαξις θαλάσσια: in *Latin*, *Atriplex marina*; and by *Lobel*, *Xerampelina*; in *Engliſh*, *Sea Arach*, *Marſh Arach.*

II. *The*

II. *The Kinds.* It is twofold, 1. *Atriplex marina repens lutea*, Yellow Creeping Sea Arach. 2. *Atriplex maritima angustifolia*, Narrow Leav'd Marsh Arach.

III. The Description. *The first of these has a great Root with many strings, which perishes not every Year, and is of a saltish Taste, tho' it is bred up in a Garden; from whence comes forth several Stalks, lying in some measure, and creeping upon the Ground, with many White, Hoary, Mealy or Sandy Branches, and with White, Broad, Mealy or Sandy Leaves, deep cut on the Edges, and Pointed, set on them without any order, cut in on the Edges, near at the Bottom, and pointed at the Ends, somewhat like unto a small Goose-foot Leaf: at the top of the Branches grow divers slender, hoary, yellowish Spikes of Seed, set close together like Clusters: sometimes I have seen it reddish, like the Red Garden* Arach, *and sometimes nothing so Mealy, but rather Green.*

IV. *The other kind has a Woody Root, with many small strings, from whence springs forth a Woolly and Hoary Stalk, about a foot high, spread at the top into many small branches, spotted with black spots, which end in long yellow spikes of Clustering Seed, like the former. The Leaves which grow below are somewhat long and narrow, about two Inches long, of a dark green Colour, with some Corners about the Edges, which yet are smaller and smaller, as they grow higher.*

V. *The Places.* They grow in many parts of *England*, by the Sea shore, and Banks of Salt-water Rivers, and Borders of Salt Marshes, and in Marsh Grounds, particularly at *Queenbrough*, at *Kings-Lyn* in *Norfolk*, at *Margate* in the Isle of *Thanet*, and in many other places by the Sea side. The first grows on the Sea shore near *Little Holland* in *Essex*, and at *Kings-Lyn* in *Norfolk*, by the Banks of the *Creek*, running out of the Haven by the South side of the Town, where some years since I found it in great plenty; as also in the *Isle of Mersey*, not far from *Colchester*. The latter, Mr. *Ray* says, grows plentifully by the River, and on the Banks of the *Marshes* about *Malden* in *Essex*, and doubtless in many other the like places.

VI. *The Times.*. They Flower from the beginning of *June*, all *July* and *August*, even to *September*, and the Seed successively ripens in the mean Season.

VII. *The Qualities.* It is Cold and Moist in the first Degree; but some Authors will have it to be Dry. It is something Cathartick, at leastwise Solutive, Diuretick, Absterstive, Attenuating, Discussive and Emollient; and is appropriated to the Womb, Reins and Joints.

VIII. *The Specification.* It is peculiar against a *Polysarcia*, or a too great Fleshiness and Fatness of the Body, and the Dropsie.

IX. *The Preparations.* You may prepare from it, 1. *A Juice.* 2. *An Essence.* 3. *A Decoction.* 4. *A Syrup.* 5. *A Spirituous Tincture.* 6. *A Saline Tincture.* 7. *An Oily Tincture.* 8. *A Cataplasm.* 9. *An Ointment.* 10. *A Balsam.*

The Virtues.

X. *The Juice.* This by reason of its Saltness does purge the Bowels, and habit of the whole Body, of Cold and Watry Humors, being taken from j. ounce to iij. ounces, in the Broth of Fat Meat.

XI. *The Essence.* It is in property much like to the *Wild Arach*; and being taken Morning and Evening for some time, it has been found prevalent against a *Polysarcia*, or *too great Corpulency*, and Bulk of Body; and preserves the Lungs from putrefaction. Dose from j. ounce to iij. ounces.

XII. *The Decoction in Wine.* It has the Virtues of the Essence and Juice, but not full out so powerful: it provokes Urine, and is good against Gravel and Stone. Dose from iij. to vj. ounces, Morning and Evening.

XIII. *The Syrup of the Juice.* It cleanses the Lungs and Bowels, opens the Body; 'tis said, that there is not many better Medicines against the Dropsie than this, to take it to iv. ounces, or more, Morning and Evening; I have proved it. It also causes Leanness in them who are too Fat, as experience has manifested.

XIV. *The Spirituous Tincture.* It strengthens the Womb, and is good against the Diseases thereof, taken to ij. drams in Wine: mixed, half an ounce of it at a time, with vi. or vij. ounces of the Decoction in Water, it cleanses the Womb of the Whites by injection, and stops them.

XV. *The Saline Tincture.* It is a good Nephritick,

and Diuritick, it opens the obſtructions of the Urinary Paſſages, provokes Urine, and expels Sand, Gravel, and gritty Stones. Doſe from j. dram to ij. drams, in white Wine.

XVI. *The Oily Tincture.* It has the Virtues of the former taken inwardly, from vj. drops to xviij. in white Port Wine; but it is beſt to be given in a cold habit of Body: it opens obſtructions of the Womb, and provokes the Terms.

XVII. *The Cataplaſm.* The Herb Cut, Bruiſed, and Boil'd to a Cataplaſm with Oatmeal, diſcuſſes outward cold Tumors, and gives eaſe in the Gout.

XVIII. *The Ointment.* It is good to cool Inflamations, and eaſe Pains and Aches proceeding from a hot Cauſe: and is good to anoint on the Legs, to diſcuſs Hydropical Tumors.

XIX. *The Balſam.* It is a good Vulnerary, abates Inflamations in Wounds and Ulcers, cleanſes them of their filth, makes them eaſie, and in a little time after heals them.

XX. *The Correction* By reaſon this Herb is ſomthing Flatulent, or apt to ſtir up Wind, it ought to be Corrected in its various preparations, as *Juice Clarified, Eſſence, Decoction, and Syrup, with Aniſeeds, Carraways, Cloves, Fennell Seeds, Ginger, Liquorice, Pepper, Zedoary,* &c.

CHAP. XXX.

Of ARROW-HEAD.

Arrow-head:

I. THE *Names.* It is called in *Greek,* Πισάνα: In *Latin, Sagitta, Sagittaria, Sagittalis*: And in *Engliſh Arrow-head.*

II. *The Kinds.* It is threefold, Πισάνα μίγα: *Magopiſtana, Piſtana Magonis, Barba Sylvana Cæſalpini, Sagittaria major latifolia,* the greater broad Leav'd *Arrow-head.* 2, Πισάνα μικρὰ, *Sagittaria Minor latifolia,* the leſſer broad Leaved *Arrowhead.* 3. *Sagittaria Auguſtifolia,* narrow Leav'd *Arrow-head.*

III. The Deſcription. *The Greater broad Leav'd* Arrow-head, *or* Water Archer, *as ſome call it, has a thick Buſhy Root with many Fibres or Strings, from whence comes forth ſeveral thick ſquare and juicy Stalks, with great broad green Leaves on the tops of them, divided at the bottoms into two long and pointed parts, ſo that the whole form or ſhape of the Leaf, is not much unlike the forked Head of a Broad Arrow, or one of the points of an Anchor, ſave that the two points at the bottom are longer; which parts Grow but a little above the Waters wherein they Grow, whether deeper or ſhallower: From among theſe former Stalks, riſe up other thick, round, ſpungy Stalks two or three Feet long, and higher than the Leaves, bearing divers rows of Flowers at the Joynts, one above another, and for the moſt part three in a row, each of which is compoſed of three large white Leaves with ſeveral reddiſh Threads in the midſt, after which come in, their places, round rough Burrs, which are green when they are ripe, much like to thoſe of* Sparganium, *or the Burr Reed; in which Burrs are contained the Seed.*

IV. *The leſſer Broad Leav'd ſort has alſo a thick and buſhy or ſtringy Root like the former, with broad Leaves ſtanding upon large Foot Stalks near two Feet or more high, in ſhape like the former, but every way leſſer; among which riſes up a fat and thick Stalk, ſomething higher than the Leaves, having at the top many pretty white Flowers, declining to a light Carnation, but yet leſs than the former, made alſo of three ſmall Leaves, and in the middle of which are ſeveral Reddiſh Threads; which being paſt, there comes ſeveral Knobs or Burrs greater than the former, in which in like manner are contained the Seed.*

V. *The Narrow Leav'd* Arrow-head *has a ſmall and thready Root, from whence riſes up a tender Foot Stalk about Eighteen Inches high, at the top of which are Leaves ſhaped like the former, except in their length and narrowneſs, not being above half the breadth of the others, yet of their full length; and the two lower forked ones, are almoſt as long as the fore right Leaf; the Flowers and Ears are alſo leſſer.*

VI. *The Places.* They grow ſometimes altogether, ſometimes apart in Watery Ditches, and ſtanding Waters, in moſt places throughout this Kingdom, particularly in the Ditches near the Walls of *Oxford*; by *Chelmsford* in *Eſſex*; in the Ditch near St. *Thomas*'s *Waterings* not far from *London*; and in ſome Ditches in St. *George*'s-*Fields*, and not far from *Lambeth*: The Narrow Leaved grows on the Thames Shore by *Lambeth Bridge*, over againſt the *Archbiſhop* of *Canterbury*'s Palace; plentifully before the *Earl* of *Peterborough*'s houſe, above the Horſe-Ferry on *Weſtminſter* ſide, &c.

VII. *The Times.* They Flower generally in *May* and *June*; and the Burrs or Seed are ripe in the begining or middle of *Auguſt.*

VIII. *The Qualities.* They are Cold in the firſt Degree, and Temperate in reſpect to dryneſs or moiſture. They are alſo Alteratives, Aſtringents, Abſterſives, Incarnatives, Glutinatives, and Traumaticks or Vulneraries; and appropriated to the Spleen, Reins and Joynts.

IX. *The Specification.* I have had great Experience of the Virtues and Uſe of this Herb, and have found it to be a peculiar Wound Herb, whether inwardly taken or outwardly apply'd; beſides its ſignature beſpeaks the very ſame thing.

X. *The Preparations.* I have uſed it in its, 1. *Decoction.* 2. *Juice.* 3. *Eſſence.* 4. *A Spirituous Tincture.* 5. *A Saline Tincture.* 6. *An Oily Tincture.* 7. *An Ointment.* 8. *A Balſam.* 9. *A Cerote or Emplaſter.* 10. *A Cataplaſm.* 11. *A Powder of the Seed.*

The

The Virtues.

XI. *The Decoction* made in Wine, or half Wine, half Water. It is a good Gargle for Sore Mouths, and if a little *Alum* and Honey is diſſolved in it, is a ſingular Medicine, for a Thruſh in Children, and to Gargle with for ſore Throats in Elder Perſons: and uſed as an Injection into the Womb, it is of excellent uſe to cleanſe the Womb, and ſtop the Flux of the Whites: Inwardly taken from iij. to vj. ounces, it is good to ſtop Fluxes of the Bowels and Fluxes of Blood, whether by the Mouth, Urine or Stool: and uſed as a Diet Drink, it is good for Wounded Perſons, and ſuch as have running Ulcers, and Fiſtula's about them.

XII. *The Juice.* It ſtops ſpitting of Blood, and is good againſt the Bloody Flux taken from ij. Spoonfuls to vj. in a Glaſs of Red Wine or Claret twice or thrice a day: it contributes alſo to the healing of all ſorts of Wounds, whether inward or outward: and bathed upon an *Eryſipelas* abates its heat.

XIII. *The Eſſence.* It is a ſingular Traumatick taken from j. ounce to iij. ounces twice a day, in the Decoction, or a Glaſs of Wine: It not only cauſes Wounds ſuddenly to heal, but wonderfully promotes the healing of all running Sores, Cacoethick Ulcers and Fiſtula's where or whatſoever. It is drying, binding, and Aſtringent, ſtops Fluxes, abates Inflamations, ſtops Fluxes of Blood, piſſing Blood, Catarrhs, and Conſumptions.

XIV. *The Spirituous Tincture.* It has the Virtues of the former, but is beſt to be exhibited in a cold habit of Body fro j. to iij. drams, *&c.*

XV. *The Saline Tincture.* It powerfully opens Obſtructions of the Spleen, Reins, Womb, and Urinary Paſſages, carries off the Fæculencies in Cacochymick habits of Body, and which ſupply old running Sores, putrid Ulcers, and Cacoethick Fiſtula's, with the evil and malign Matter which keeps them from Healing: it diſſolves Gravel, and expels Sand and Tartarous Slime out of the Reins and Bladder. Doſe from j. dram to ij. drams.

XVI. *The Oily Tincture.* It eaſes the Spleen, expels Wind, provokes Urine, and is good againſt Wounds or Ulcers of the Reins or Bladder: Outwardly poured upon Wounds of the Nerves it heals them. Doſe from vj. drops to xvj. drops.

XVII. *The Ointment.* It allays Inflamations chiefly in Wounds, heals Green Wounds; and has an abſterſive faculty in cleanſing old Sores and fætid Ulcers.

XVIII. *The Balſam.* It cures Wounds by the firſt Intention, where they are ſimple. But where they are Contuſed, or Complex, it brings them to digeſtion, and afterwards by its abſterſive property cleanſes the Ulcer, then incarnates, and heals after an admirable manner: it alſo diſcuſſes Inflamations in the beginning, and in time reſolves them.

XIX. *The Cataplaſm.* It is good to allay Pains proceeding from a hot Cauſe in what part of the Body ſoever; and I have often found it to give eaſe in the hot Gout, and other Joynt-Aches. It is ſomthing repercuſſive, more eſpecially if it is apply'd cold, which is beſt to be done, when it is uſed to a Contuſion or Blow upon a Bone, as the Forehead; it hinders the riſing of the Tumor, repercuſſes the Juices which would flow thither, and prevents its blackneſs.

XX. *The Cerote or Emplaſter.* It Cures Green Wounds, cleanſes, and heals old Sores and Ulcers, and fills up Wounds and Ulcers with Fleſh. It is drying, aſtringent and ſtrengthning, good to be apply'd to weak Backs, or feeble Joynts, and places Afflicted with Pains and Aches, from a Flux of Humors, or over-ſtraining of the Part through any Violence or Force put upon it.

XXI. *The Pouder of the Seed.* Being drunk in White Wine from j. dram to a dram and a half, it is ſaid to cure the Falling-ſickneſs, and help other Diſeaſes of the Head and Brain: it is prevalent alſo againſt the Dropſie, carrying off the Morbifick Matter by Urine; and is found by experience to be good againſt Sand, Gravel and Tartarous Slime in the Reins, and Urinary Paſſages. Being ſtrowed over Wounds, Sores or Ulcers Inflamed, it takes away the Inflamation, and ſo does the Pouder of the Leaves: and kills Worms in Children.

CHAP. XXXI.

Of Mild *or* Spotted ARSMART.

I. *THE Names.* It may be called in the *Greek*, Περσικάρια ἀπὸ περσίας from the *Peach Tree*, its Leaf being like to a *Peach* Leaf: In *Latin*, *Perſicaria*, and by ſome *Plumbago*: In *Engliſh*, *Mild* or *Spotted Arſmart*, and *Peach-Wort*.

II. *The Kinds.* There are two Principal Kinds. 1. *Perſicaria maculoſa Anglica*, in *Engliſh*, *Spotted Arſmart*, leſſer and greater. 2. *Perſicaria maculoſa Virginiana*, The *Virginian Spotted Arſmart*, which is alſo twofold, with White Colored and Fleſh-Colored Flowers.

III. The Deſcriptions. *The firſt of theſe has a long Root, with many threads and ſtrings thereat, from whence riſes up ſeveral Jointed Stalks, ſmooth round and hard, of a light green or reddiſh Color, eſpecially at the Joynts, which are manifold: from whence ſprings ſeveral ſmooth long Leaves, almoſt Peach faſhioned (whence came the name* Peach-wort*) broad towards the Foot Stalk, after declining Pyramidally to a Point, being even on the edges without any cut or dent, and having thereon (for the moſt part) a leaden Colored or dark Spot, in form of an*

half Moon, or Semicircular. The Flowers grow in long ſpiked Cluſters upon long Stems, either blewiſh or whitiſh, or whitiſh red; after which, comes a ſmall, blackiſh, browniſh, or rediſh Colored flat Seed: the whole Plant has no hot, ſharp, or biting Taſte with it, as has the Hidropiper, *or the biting* Arſmart, *in the next Chapter; but rather almoſt ſowreiſh like* Sorrel, *cooling and drying, or elſe almoſt without Taſte. The Greater is like the former in all reſpects, but the Stalks, Leaves, Spikes, and Seed are every way much larger.*

IV. *The firſt ſort of the white Flowered* Virginian Arſmart, *has a woody Root conſiſting of a great buſh of long black ſtrings or threads, wich Periſh not Yearly, but abide, tho the Stalks with the Leaves may die away, and Spring again the next Year: from this Root riſes up ſeveral hard round green Stalks with many great Joynts on them as the other has; and fair, large, broad, dark, blewiſh, green, ſmooth Edged, and long pointed Leaves, ſpotted oftentimes like our* Engliſh *or Common ſort before deſcribed, and ſometimes without ſpots, many of them ſix Inches long and better, and three Inches and a half broad, with ſeveral Compoſing Veins riſing from the middle Rib, and others leſs and tranſverſe; at the tops of the Stalks, and from the Joynts with the Leaves, Spring Branches of ſpiked white Flowers, like cloſe Grains as in the other, but greater, and ſucceeded by black and flat ſhining Seed.*

V. *The ſecond ſort of bluſh or fleſh Colored* Virginian Arſmart, *has alſo a like woody Root, thick, with many Fibres at it, but greater and more Woody than the former, from whence Springs up ſtraight round Stalks, much higher than the laſt, with much larger and narrower Leaves, marked alſo oftentimes with Spots in the like manner, and often alſo without thoſe Spots: this alſo has many more Branches of Flowers, which are much ſhorter Spikes, or bob Spikes, and very much thicker ſet with fine bluſh Colored, or fleſh-Colored Flowers, much larger than the former, which gives alſo much the like Seed, but in greater plenty.*

VI. *The Places.* The Leſſer and Greater *Engliſh* ſorts grow by the ſides of Rivers and Ditches; the Leſſer almoſt every where both in ſtanding and running Waters, and in ſuch places as are many times wet in Winter, and dry in Summer, and in other moiſt Grounds in moſt parts of this Kingdom, where it may many times be gotten almoſt in Cart Loads. The Larger ſort has been found in great plenty, in the Lands and Furrows of *Hedington* Field above St. *Bartholomew*'s Hoſpital, half a Mile from *Oxford.* The *Virginian* Kinds are only to be had with us in our *Gardens*, nouriſhed up by ſuch as are Curious.

VII. *The Times.* The *Engliſh Arſmarts* Flower only in *June* and *July*; and their Seed is ripe in *Auguſt*: But the *Virginian* Kinds Flower with us much later, and ſcarcely perfect their Seed here.

VIII. *The Qualities.* They are cold and dry in the firſt Degree: Alteratives, Aſtringents, Incraſſatives, Repercuſſives, Glutinatives, Anodyns, and Traumaticks or Vulneraries: Alſo Hyſtericks and Arthriticks.

IX. *The Specification.* Its peculiar property is in curing of Wounds, and healing old running Sores and Ulcers.

X. *The Preparations.* There are taken from it, 1. *The Green Leaves.* 2. *The Diſtilled Water.* 3. *The Mixture.* 4. *The Juice.* 5. *The Eſſence.* 6. *The Ointment.* 7. *The Balſam.* 8. *The Cataplaſm.*

The Virtues.

XI. *The Green Herb.* Authors ſay, that if a handful of *Arſmart* wet in Water, and apply'd for ſome time to a Wound, or Sore, and afterwards Buried in moiſt Ground, or under a Stone, as the Herb rotts, ſo the Sore will Miraculouſly heal. And being put on Horſes or other Cattels Sores, 'twill drive away Flies in Summer time.

XII. *The Diſtilled Water.* Being mixt with a half part of *Aqua Vitæ*, and bathed on any pained place for a Week, more or leſs; it will perfectly take away the pain.

XIII. *The Mixture.* Take the *Diſtilled Water, Ox Gall, Oil of Spike, of each equal parts, mix them well together by ſhaking them in a Glaſs.* This anointed upon any place troubled with the Gout, and a Flanel dipt in the ſame, being alſo apply'd, takes away the pain thereof.

XIV. *The Juice.* If therewith any old running Sore, or old Ulcer, is conſtantly waſhed, it cleanſes and heals it: it is alſo excellent to be put into Diet Drinks for Wounded Perſons, and ſuch as have old and running Sores upon them: and waſhing the Sores of Beaſts therewith, it keeps Flies from them.

XV. *The Eſſence.* It is more powerful than the *Juice*, and is more uſeful to all Intentions, healing alſo much more outwardly, being apply'd.

XVI. *The Ointment.* It is excellent againſt all hot Swellings and Inflamations in any part of the Body, eſpecially being apply'd in the beginning, being ſomthing Repercuſſive: it alſo allays Inflamations in Wounds and Ulcers, and eaſes pains proceeding from a hot Cauſe.

XVII. *The Balſam.* Being made of the *Bruiſed Herb boiled in Oil Olive, and made into a Balſam with Turpentine and Wax*, It heals all ſorts of green Wounds wonderfully; it cools, drys and heals; and therefore is good for putrified Sores, and running Ulcers, whether in Man or Beaſt, cleanſing purifying, incarnating them, and healing them.

XVIII. *The Cataplaſm.* The Herb beaten with *Rue* and *Wormwood*, and heat very hot in a Frying-Pan, and apply'd to the Bowells, as hot as can beendured, in a Cholick, it gives preſent eaſe to a Wonder.

CHAP. XXXII.

Of Hot or Biting ARSMART.

I. *THE Names.* It is called in the *Greek,* Ὑδροπίπερις: In *Latin, Hydropiper, Piper Aquaticum, Perſicaria non maculata, Perſicaria Urens*, vel, *Mordax: Angulara* calls it *Cratæogonon*; and ſome call it, *Zinziber Caninum:* in *Engliſh, Hot or Biting Arſmart, Water Pepper*, and *Peach-Wort*, or *Lake-Weed.*

II. *The Kinds.* It is the ſecond general Species of *Arſmart* or *Peach-wort*, and is, 1. *Hydropiper*, ſeu *Perſicaria acris vulgaris minor*, the Common Leſſer *Biting Arſmart.* 2. *Perſicaria acris Virginiana*, the *Virginian Biting Arſmart*, or *Hidropiper.*

III. The Deſcription. *The firſt or* Engliſh *ſort, has a Root ſomwhat long, with many Fibres thereat, which as well as the reſt of the Plant, is of a very ſharp and quick Taſte, biting the* Tongue *more than* Pepper, *from whence ſprings forth a Jointed crooked Stalk, not ſo High nor ſo* Great *as the former* Mild Kind, *but with a greater ſtore of Branches and* Leaves

ſome-

ſomewhat like unto Peach Leaves, *but much leſſer and narrower; they are alſo long, but ſomewhat narrower than theſe of the* Mild Arſmart, *and without any ſpots at all, yet ſometimes they have been found with reddiſh Marks upon them. The Stalks are about a Foot and half high, round, ſmooth and Jointed. with a kind of Knee at each Joint: at the greater Joints, as well towards the tops of the Stalks and Brances, as at the tops alſo, come forth ſmall ſpiky heads of bluſh or reddiſh Colored, and ſometimes more red or white Flowers Mixed, cluſtering together, which falling away, there comes little blackiſh Seed, ſomewhat broad or flatiſh and ſometimes of a reddiſh yellow Color; of a hot and biting Taſte, (as is all the reſt of the Plant) almoſt like unto* Pepper, *whence came the name of* Water Pepper; *but the Herb it ſelf is without any ſmell.*

Biting Arſmart Or Hydropiper

IV. *The* Virginian *Kind is in moſt things, as its Roots, Stalks, Branches, Joints, Leaves, and Flowers like unto our* Engliſh *before Deſcribed, and differs only in the form of the Flowers growing, and their Color, theſe growing on more ſlender and long ſpikes, and their Color being white.*

V. *The Places.* *Hydropiper* grows almoſt every where, throughout the Kingdom, in moiſt and watry Places, and near unto Rivers and Ditch-ſides, ſtanding plaſhy Waters, running Brooks and ſuch like. The latter has been brought out of *Virginia*, and is nouriſhed up with us in Gardens.

VI. *The Times.* They Flower in *June* and *July*, to *Auguſt*, and the Seed is Perfected or Ripe not long after; yet it is to be obſerved the *Virginian* Kind Flowers ſomething later here, and therefore its Seed is ſomewhat later Ripe.

VII. *The Qualities.* *Hydropiper* is hot and dry in the fourth Degree. It Incides, Attenuates, opens, and is Diuretick, and Emmenagogick, and by Appropriation is Cephalick, Neurotick, Hyſterick and Nephritick.

VIII. *The Specification.* It is known by manifold and large Experience to be a peculiar Plant againſt Gravel and Stone, whether in Reins or Bladder.

IX. *The Preparations.* The Shops keep only, 1. *The Dryed Herb.* But you may prepare therefrom, 2. *The Diſtilled Water.* 3. *The Juice.* 4. *The Eſſence.* 5. *The Oil.* 6. *The Ointment.* 7. *The Cataplaſm.* 8. *The Root, and Seed.*

The Virtues.

X. *The Herb.* It is hot and dry, uſed chiefly in Wounds, hard Tumors and inveterate Ulcers. Some uſe it in the Tranſplantation of Diſeaſes, and removing of Inchantments. The Green Herb ſtrewed in a Chamber, is ſaid to kill all the Fleas; and a good handful put under a Horſes Saddle, will make him go briskly, altho' half tyred before.

XI. *The Diſtilled Water.* It is a Specifick againſt Stone and Gravel in both Reins and Bladder, and has cured to admiration when all other things in the World has failed; and ſo great things have been ſome hundreds of times experimented of this ſimple *Diſtilled Water*, which ſeem to be even Miraculous, it performing what much reputed greater Medicaments cannot do: I write not this from my own Experience only, which in this caſe is very conſiderable, but we have alſo the Suffrage of very Great and Learned Men, as to the ſame thing. And this thing I would have to be noted, That in any of my Books, whereſoever I have mentioned *Perſicary* or *Arſmart Water*, either ſimply or with other Preparations againſt the Stone, Gravel, *&c.* I always in all thoſe places, intend the Water of this preſent Herb, of which we now ſpeak, *viz. Hydropiper*, or *Biting Arſmart.*

XII. *The Juice.* Given to j. ounce in White Port Wine it provokes the Terms, facilitates the Birth, and brings away the After-Birth; and given in vj. or viij. ounces of the *Diſtilled Water*, it provokes Urine, and opens obſtructions of the Urinary Paſſages.

XIII. *The Eſſence.* It has the Virtues of the *Juice*, comforts the Head, Nerves, Stomach, Lungs, Womb, and Reins, provokes the Terms, and cauſes a good Digeſtion, eaſes pains of the Gout from a cold Cauſe, waſts and conſumes ſuperfluous Humors in any part, and is admirable againſt all cold and moiſt Diſeaſes of the Brain, Nerves and Womb, as Fallingſickneſs, Vertigo, Lethargy, Apoplexy, Palſie, Megrim, Barrenneſs, *&c.* and made into a Syrup with Honey it is a good Pectoral. Doſe ij. drams.

XIV. *The Oil.* It diſſolves and diſcuſſes all cold Swellings, Scrophulous and Scirrhous Tumors, Quinſies, Congealed Blood, Pleuriſies, *&c.*

XV. *The Ointment.* It is good againſt Bruiſes in any part, and prevails againſt Oedema's, and other cold Tumors of the Joints, Kings Evil Swellings, and Kernels in Neck and Throat.

XVI. *The Cataplaſm.* It prevails againſt Contuſions, hindering putrifaction; and applyed to a Fellon or Whitloe, it takes away the Pain almoſt preſently, and in a ſhort time after cures it.

XVII. *The Root and Seed.* Either the *Root* or *Seed* bruiſed and applyed to an Aching Tooth, gives preſent eaſe, and in ſhort time after perfectly cures it: Put into a hollow Tooth, it does alſo the ſame thing.

CHAP. XXXIII.

Of Garden ASARABACCA.

I. *THE Names.* It is called by the *Arabians*, *Aſaron:* in *Greek*, Ἄσαρον, ἢ Νάρδος ἀγρία: in *Latin*, *Aſarum*, *Nardus Sylveſtris*, *Nardus Ruſtica* (becauſe of its Aromatick or Sweet Smell;) by *Macer*, *Vulgago*, as by his Verſe, *Eſt Aſaron Græcè, Vulgago dicta Latine; quod Vulgam vel Bulgam ſeu Ventrem moveat:* and in *Engliſh*, *Aſarabacca.* I ſuppoſe our *Engliſh* Name came by a miſtake, taking this Plant for *Baccharis* or *Plowmans Spicknard*, which it is not; and ſo out of the two names, of *Aſaron* and *Baccharis*, they made the name of *Aſarabacca.* Others thought *Aſarum* and *Baccharis* to be one Plant, and ſo compounded the name out of them both; and called it *Aſarabaccara*, as it is called in *Spain* at this day.

II. *The Kinds.* It is twofold, 1. *Garden.* 2. *Wild.* of which in the next Chapter. The Garden kind is alſo twofold, 1. *Aſarum hortorum Vulgare*, Common Garden Aſarabacca. 2. *Aſarum Virginianum*, Virginian Aſarabacca.

Aſarabacca.

III. The Deſcriptions. *Our Common Garden Aſarabacca has ſmall Roots, and whitiſh, ſpreading many ways in the Ground, and increaſing into divers Heads, but not running or creeping under Ground, as many other creeping Herbs do; they are ſweet in Smell, reſembling Spicknard, but more when they are dry, than when green, and of a ſharp, but not unpleaſant, taſte: from theſe Roots riſe up many Heads, from whence comes many ſmooth Leaves, every one upon his own Foot-ſtalk, which are ſmoother, rounder, and bigger than Violet Leaves, thicker alſo, and of a darker green ſhining colour on the upper ſide, and of a paler yellow green underneath, little or nothing dented about the edges; from among which, riſe up ſmall, round, hollow, browniſh, green Husks, upon Stalks of about an Inch long, divided at the brims with five diviſions, very like the Cups or Heads of the Henbane Seed, but that they are ſmaller: and theſe are all the Flower it has, which being ſmell'd unto, are ſomewhat ſweet; and wherein, when they are ripe, are contained ſmall covered rough Seeds, very like the Kernels or Stones of Grapes or Raiſins.*

IV. *The* Virginian Aſarabacca, *grows very like the former; but its Roots are ſomewhat greater, and fuller of ſubſtance, ſpreading in the ſame manner, and ſomething more fragrant, and a little hot in taſte, biting a little the Tongue: From this Root ſprings up the Leaves as the former, but they are a pretty deal larger, ſtiff alſo, and thick, ſomewhat crumpled about the edges, of a dark green colour, and not ſo much ſhining as the former; nor yet ſo round, but a little pointed at the end, very much reſembling the flat ſhape of an Heart; ſome of which Leaves will be ſpotted or ſtraked. The Flowers have but three diviſions or points, and of a paler green colour.*

V. *The Places.* The firſt grows naturally Wild under the ſhades of Trees, and upon ſhady Hills in *Pontus*, *Phrygia*, and other places of the Eaſt: The other grows Wild in *Virginia*; but they are both of them Nurſt up in Gardens with us; of which the firſt is very common.

VI. *The Times.* They both keep their Leaves green all the *Winter*, but ſhoot forth new in the Spring; and with them come forth thoſe Heads or Flowers, which give ripe Seed about *Midſummer*, or in *July* or *Auguſt*, whoſe Seed is ripe not long after: but their *Roots* and *Leaves* are gathered in the *Spring.*

VII. *The Qualities.* They are hot and dry in the ſecond Degree, or rather in the third. They Open, Incide, Attenuate, and Reſolve, and are Cathartick, Emetick, and Diuretick; and are appropriated to the Head, Stomach, Liver, Spleen, Reins, Womb, and Joints.

VIII. *The Specification.* It is a peculiar remedy for the Dropſie, Jaundice and Gout; as alſo for Agues of all ſorts.

IX. *The Preparations.* In the Shops there are, 1. *The Roots in Pouder.* 2. *The Leaves in Wine.* 3. *An Infuſion.* 4. *A Decoction.* 5. *An Extract.* 6. *An Eſſence*, 7. *Diaſarum Fernelij, an Electuary.* 8. *A Saline Tincture.* 9. *An Oil by Inſolation.* 10. *A Cataplaſm.* 11. *The Juice.* 12. *A Conſerve.*

The Virtues.

X. *The Roots.* They Vomit, working both upwards and downwards, but not ſo ſtrongly as the Leaves: Doſe from half a dram to j. dram in Pouder: Being given in White Wine, a little before the Fit of an *Ague*, it takes away the ſhaking Fit, and thereby cauſes the hot Fit to be more remiſs, and in twice or thrice taking, it is ſaid to cure it, whether it is *Quotidian*, *Tertian* or *Quartan.* *Dioſcorides* ſaith, that vj. drams of the Root in infuſion in honied water, being drunk, powerfully provoke the Terms: I fear the Doſe is very much too large in ſubſtance, iij. or iv. drams may be infuſed in the Mead, and ſo drunk: *Parkinſon* ſays, it will work like *Black Hellebor:* It is good alſo againſt the Bitings of Serpents, and other Venomous Creatures. The Pouder, the finer it is, the more it purges by Vomit and Urine; the coarſer it is, the more it purges by Stool. Doſe j. dram in Pouder, as Authors ſay.

XI. *The Leaves.* Wine being made of the Leaves, by ſteeping them therein, is an Emetick, and provokes Urine, as *Dioſcorides* ſaith, eaſes the Pains of the Stone, and an old Sciatica, and is profitable againſt Dropſies. *Meſue* ſays, it not only Vomits, but works downwards, and by Urine alſo, purging both

both Choler and Flegm, but it purges Flegm more manifeſtly than Choler. It wonderfully helps the Obſtructions of the Liver and Spleen, and therefore is excellent againſt the Dropſie and Yellow Jaundice, and ſtubborn Agues, which come from plenty of Evil Humors. You may ſteep 6, 7, 8, or 9, of the Leaves in Wine for one Doſe, according as the Age and Strength of the Patient may be, and repeat it twice or thrice a Week.

XII. *The Infuſion.* Made of the Leaves in Mead or Whey, with the Addition of ſome Spikenard to Correct it, it performs all that the Wine doth, and is very effectual for thoſe that are afflicted with a Sciatica, and other like Pains of the Joints.

XIII. *The Decoction.* Made in Whey, Mead, or Wine, of the Leaves, adding alſo a little Mace, Cinnamon, or Spikenard, by Boiling, which ought not to be much, becauſe then the Virtue will be loſt; it mightily prevails againſt Quotidian, Tertian and Quartan Agues, and performs all that the Wine, or Infuſion can do: this may be given every other day, anointing alſo the Back Bone and Soles of the Feet with the following Oil. Now here is to be noted, that in making this Decoction, the Liquor in which the Leaves are put, ought firſt to boil, that they may not remain long in the Decoction, becauſe of loſing their Virtue, as aforeſaid.

XIV. *The Extract.* Made of the Roots, being Green, and beaten into a Maſs, and the Juice Extracted with Wine, till the whole Virtue is drawn forth, and then evaporated to the due thickneſs of an Extract. Being thus made, it will keep all the Year, and is more ſafe than the ſimple Pouder of the Root; and may be given from xv. grains to half a dram. But *Schroder* has an *Alcaliſate Extract*, which is called alſo *Coagulum Aſari*, thus made. ℞ *Take Roots and Leaves of Aſarum, extract a ſtrong Tincture with Spirit of Wine rectified, which filter through brown Paper, to which add the fixed Salt of the Aſhes, made by elixiviation, and calcined again, even to melting; digeſt a while, then abſtract the Spirit, till the Extract becomes of the thickneſs of Honey. Doſe from j. ſcruple to iij. ſcruples.* It may be given againſt the Bitings of Serpents, and mad Dogs, King's Evil, Aſthma's, Quartans, Worms in Children, and in any of the Caſes which the Pouder of the Roots, or Wine, Infuſion or Decoction of the Leaves, are intended for.

XV. *The Eſſence.* It is a good Emetick and Cathartick, but works not ſo ſtrongly Upwards as the ſimple Juice, or the former Pouders, Wine, Infuſions, or Decoctions; and after it has done working, it commonly provokes Sweat powerfully, expelling the Relicks of the Diſeaſe that way. Doſe from j. dram to ij. or iij. drams in Wine or Mead, as the Patient is in Age and Strength.

XVI *The Electuary.* You may ſee the Preparation of it in our *London Diſpenſatory, lib.* 4. *cap.* 22. *ſect.* 95. It may be given from ij. drams to iv. to evacuate by Vomit all ſorts of Humors from the Stomach, and Parts adjacent: 'tis ſo gentle that Aged People, and Women with Child may ſafely take it; give it in Mead or Wine.

XVII. *The Saline Tincture.* It is Extracted from the green, or freſh gathered Roots and Herbs. This works more by Urine and Sweat, and is gentler than many of the other Preparations. Doſe from j. dram to ij. drams; it carries off the Morbifick Matter of many inveterate Diſeaſes, as the Dropſie, Jaundice, Gout, Sciatica, King's Evil, Agues, Cachexies, Green-ſickneſs, Apoplexies, Lethargies, Megrims, Surfeits, *&c.* by all the ways, as Vomit, Stool, Urine and Sweat. The Head waſhed or Bathed therewith, comforts the Brain and Nerves, which are diſaffected with taking Cold, and ſtrengthens a weak Memory.

XVIII. *The Oil by Inſolation.* The Herb and Roots well bruiſed, and put into a ſufficient quantity of Oil, with the addition of j. ounce of *Ladanum*, to every pound of Oil; and inſolated for two Months in a hot Sun, then preſſed forth; (for want of a hot Sun, a Sand heat may do better, which will be continually Night and Day the ſame.) This Oil warm, being anointed upon all the Back, from the Neck to the Hips, as alſo upon the Soles of the Feet, in a warm Bed, it provokes Sweating: and being upon the acceſs of an Ague, it prevents the cold and ſhaking Fit, and thereby cures thoſe who have been long afflicted with Quotidians, Tertians or Quartans; it is good alſo againſt Cramps, and other diſaffections of the Sinews, and an old Cough.

XIX. *The Cataplaſm.* The Leaves bruiſed, and applied as a Cataplaſm, to the Forehead and Temples, eaſes the Head-ach, and cauſes Sleep: and applied to the Eyes, it takes away their Inflammation.

XX. *The Juice.* The common uſe of this Herb is, to take the Juice of 5, 6, or 7 Leaves (according to the Age and Strength of the Patient) and to mix it with a ſmall draught of Ale, Mead or Wine, and ſo drink it to cauſe Vomiting. It works very ſtrongly, cures Surfeits, and has all the Virtues of the Pouder of the Root, Wine, Infuſion, Decoction, Extract, or Eſſence. Mixed with a little Tutia prepared, and dropt into the Eyes, it clears the Eye-ſight, and helps the Dimneſs and Miſts, which are often before them.

XXI. *The Conſerve*, Made of the Flowers, with refined Sugar or Honey. This being eaten is found by Experience to ſtrengthen very much the Auditory Nerves, and to help difficulty of Hearing, Deafneſs, and a bad Memory. Doſe from j. dram to iv. drams, in the Morning Faſting.

XXII. *Nota.* That moſt of the Preparations of this Plant are not to be given to Women with Child, for that through their Violence, they cauſe Miſcarriage.

CHAP. XXXIV.

Of Wild ASARABACCA.

I. *THE Names.* It is called in *Greek*, Ἀσαρον ἀγριον: in *Latin*, *Aſarina*, *Aſarum Sylveſtre*: in *Engliſh*, *Baſtard* or *Wild Aſarabacca.*

II. *The Kinds.* It is the ſecond Species mentioned in *Chap.* 33. *Sect.* 2. *aforegoing*; and a ſingular Herb of the ſort.

III. The Deſcription. *It has Roots long and ſlender, creeping under the upper cruſt of the Earth, and not ſhooting deep down, having a ſomewhat ſharp taſte, and a little bitter withal; from whence ſpring forth Leaves, almoſt like to our Garden* Aſarabacca, *but ſomewhat rounder, and rougher than they, ſlightly and unevenly indented about the edges, growing upon long ſlender hairy* Foot-ſtalks, *yet is it but a low* Plant, *and creeping, as it were, upon the* Ground. *The Flowers grow near unto the* Ground, *like unto thoſe of Cammomil, but much leſſer, and wholly Yellow, as well the border of the* Leaves, *as the* Thrum *in the middle; but* Gerard *ſays, they are of a Mealy or Duſty Colour, and not unpleaſant in Smell.* This *Plant* Cluſius *thinks to be his* Tuſſilago Alpina ſecunda; *but* Parkinſon *ſays, that by reaſon of its ſharp Taſte,*

Taſte, and creeping Root, it may more probably be taken to be the Cotyledon paluſtris acris, *vel,* Urens.

IV. *The Places.* It is found, as *Matthiolus* ſays, on the Mountains in *Bohemia:* and our *Lobel* found it in ſeveral places in *Somerſetſhire*; it delights in Woody and Shadowy places.

V. *The Times.* It Flowers in *May* and *June*; and the Seed is brought to its ripeneſs much about *Midſummer.*

VI. *The Qualities.* It is hot and dry in the beginning of the third Degree: it Incides, Attenuates, and is Aperitive, and Cathartick: Appropriated to the Head, Stomach, Liver, Womb, and Joints.

VII. *The Specification.* I cannot yet find either from Authors, or my own Experience, what Diſeaſe it is peculiarly good for; but 'tis certain, 'tis a good *Deoppilative*, or opener of Obſtructions.

VIII. *The Preparations.* You may have from it, 1. *The green Herb it ſelf.* 2. *A Pouder of the ſame.* 3. *The Juice.* 4. *An Eſſence.* 5. *A Saline Tincture.* 6. *A Syrup of the Juice, or Herb.* 7. *A Decoction.*

The Virtues.

IX. *The Green Herb.* A little of it eaten with other Herbs, as a Sallet, opens and looſens the Belly, and purges out Cold, Groſs, Thick, Flegmatick Humors.

X. *The Pouder.* It may be given to j. dram in Mead, Canary, Sherry, Malaga, or White Florence Wine, and ſo it will looſen the Belly, and purge thence Tough Thick Phlegm, and Black or Burnt Humors.

XI. *The Juice.* It has a Cleanſing, Attenuating Quality; makes thin that which is thick, cuts that which is tough, and breaks that which is hard, opens the Bowels which are obſtructed, and purges out the Morbifick Matter of many grievous Diſaffections, and therefore is profitably given to ſuch as are afflicted with the Palſie, Falling-ſickneſs, or Yellow Jaundice: It may be given from ij. drams to iij. or iv. according as the Patient is in Age and Strength, in a Glaſs of Mead or Wine.

XII. *The Eſſence.* It has the Virtues of the Juice, but is more grateful to the Stomach, and may be given to half an ounce, or more, in a Glaſs of Wine: It prevails againſt the Gravel in Reins and Bladder; and gives Eaſe in the Gout, inwardly taken, and outwardly applied; and withal it kills Worms in Children.

XIII. *The Saline Tincture.* It opens Obſtructions of the Womb, Reins and Bladder, provokes Urine, and expels Sand, Gravel, and Tartarous Slime: it kills Worms in old or young, and is profitable againſt the Dropſie. Doſe from j. dram to ij. in a Glaſs of White, or Rheniſh Wine and Sugar.

XIV. *The Syrup of the Juice or Herb.* It has all the Virtues of the Juice, but muſt be given in full the double quantity, and is much better for Queaſy Stomachs, and Children, than either the Juice or Eſſence; but it ought to be made in a Bath, for boiling will cauſe much of its Virtue to be loſt.

XV. *The Decoction.* If it is made in Wine, it is a good Cephalick, and excellent againſt moſt cold Diſeaſes of the Head, Brain and Nerves: Uſed as an *Errhine*, it purges the Head of cold and groſs Humors: and taken inwardly from ij. to iv. ounces, or more, it prevails againſt Epilepſies, Apoplexies, Lethargies, Vertigo, Megrim, Head-ach, Palſies, Convulſions, *&c.*

CHAP. XXXV.

Of Common ASPHODEL.

I. *THE Names.* It is called in *Arabick, Barvacah:* in *Greek,* Ἀσφόδελος: in *Latin, Aſphodelus, Haſtula Regia, Albucus,* and *Albucum:* in *Engliſh, Aſpodel.*

II. *The Kinds.* It is fourfold, 1. The *Common Garden Aſphodel.* 2. The *Onion Aſphodel.* 3. *Marſh,* or *Lancaſhire Aſphodel.* 4. *Kings Spear Aſphodel:* of this laſt ſee Chap. 404. following: The Second and Third we ſhall treat of in the two following Chapters. The *Common Garden Aſphodel* is alſo White or Yellow: and the White is either the Greater Single or Branched, and the Leſſer Hollow, and Leaſt.

III. The Deſcriptions. *The Common ſingle White Aſphodel has a Root compact of many knobby Roots, growing out of one Head, like thoſe of the Peony, full of Juice, with a ſmall bitterneſs, and Aſtringent Taſte; from whence ſprings up many long narrow Leaves, like almoſt to thoſe of Leeks, ſharp pointed: the Stalk is round, ſmooth, naked, and without Leaves, two Cubits high, garniſhed from the middle upwards, with a number of Flowers Star-faſhion, made of ſix Leaves apiece: the colour White, with ſome dark Purple ſtreaks, drawn down the Back ſide; within the Flowers are ſeveral ſmall Chives; which being paſt, there ſprings up little round Heads, wherein are contained hard, black, and three corner'd Seed, like thoſe of Buck-wheat or Staves-acre.*

IV. *The Common Branched White Aſphodel has a Root compoſed of many tuberous long Knobs, which are thickeſt in the middle, and ſmaller at both ends, faſtned together at the head, of a dark grayiſh colour on the out ſide, and yellow within; whence riſes up many long and narrow hollow triangular Leaves, ſharp pointed, and lying upon the ground round about the Root; the Stalk is ſmooth, round and naked without Leaves, which riſes from the midſt of them, divided towards the Top, into divers Branches, (if the Plant has been of any long continuance) or elſe into but two or three ſmall Branches, from the ſides of the main great one, whereon ſtand many large Flowers, Star-faſhion, made of ſix Leaves apiece, on the in ſide whitiſh, and ſtraked with a Purple line down*

the

the backside of every Leaf, *having in the midst of the* Flowers *some small yellow* Threads: *the* Seed *is black, and three square like the former, and greater than the* Seed *of* Buck-Wheat, *contained in roundish Heads which open into three Parts.*

Great White *Asphodil*

whole Plant. 8. *An Oil.* 9. *An Ointment.* 10. *A Balſam.* 11. *A Pouder of the Roots.* 12 *A Cataplaſm.*

The Virtues

XII. *The Juice of the Root.* It cleanſes, and takes away the white Morphew in the Face, or other parts of the Body, the place being firſt chafed well and rubed with a courſe Linnen Cloth. If it is mixed with *Sherry Sack* in which a little *Myrrh* has been diſſolved, and a twelfth part of the *Tincture of Saffron*, it makes an excellent Collyrium for the Eyes to heal Inflamations, take away Miſts, Cloudings, dimneſs of Sight, and other diſaffections, being dropt into them.

XIII. *The Eſſence.* It may be taken from j. to ij. ounces in Mead or Wine againſt the Kings Evil, Coughs, Colds, Aſthma's, ſhortneſs of Breath, or any Vehement obſtructions of the Lungs. If the Stomach is foul, it will Vomit the Patient: it evacuates evil Humors, and is contributary to the Cure of running Sores, old Ulcers, Fiſtula's, and the like, Bathing and Waſhing the Swelling and Sores with it alſo.

XIV. *The Decoction in Wine.* It is Emetick if it meets with a foul Stomach, is opening and cleanſing, good for a Cacoethick habit of Body, and prevails againſt the bitings of any venemous Creatures, Stone and Gravel, or any ſtoppage of the Urinary parts. I know it to be an excellent thing to be conſtantly taken by ſuch as are troubled with the Evil, Oedema, or other like Tumors, for it conſumes the Morbifick Matter which Compoſes them. It may be given to iij. iv. or vi. ounces, or leſs, *&c.*

XV. *The Syrup.* It has the ſame Virtues with the former Preparations, but much weaker, yet pleaſanter to be taken by ſuch as are queaſy Stomached: It is an excellent Pectoral, and cauſes eaſy expectoration in ſtoppages of the Lungs. Doſe ij. ounces morning, noon and night. 'Tis fit for Children.

XVI. *The Saline Tincture.* It works downwards, and carries off the Cauſes of Diſeaſes by Urine: given from j. to ij. drams in White Port Wine, it provokes Urine and the Terms powerfully, is good againſt Plurifies, and an old Cough, Pains and Stitches in the ſide, *&c.*

XVII. *The Oily Tincture.* It is Excellent being Bathed with, againſt Punctures and Wounds of the Nerves, bitings of Mad Dogs, Vipers, and other Venomous Creatures.

XVIII. *The Aſhes of the whole Plant. Galen* ſays, that if they are mixed with Ducks Greaſe, the mixture is good againſt an Alopecia, and brings Hair again where it was fallen off, by means of that Diſeaſe.

XIX. *The Oil.* It is good againſt cold Tumors, and to anoint with in Cramps, and for any Ach or Pain in any part, proceeding from a cold Cauſe; and is good to diſcuſs Tumors and Swellings in Womens Breaſts, Teſticles, and other Glandulous parts,

XX. *The Ointment.* It cleanſes old running Sores, putrid Ulcers, and rebellious Fiſtula's, diſpoſes them to healing, and puts a ſtop to fretting and eating Ulcers: Diſcuſſes Inflamations in Womens Breaſts, and Teſticles, and is good againſt Fellons in the Fingers ends.

XXI. *The Balſam.* It is an Excellent thing indeed, for healing all ſorts of Green Wounds; cleanſes Ulcers to the bottom, incarnates and heals them, and is alſo profitable againſt the Gout from a cold Cauſe.

XXII. *The Pouder of the Roots.* It may be given to j. dram in a Glaſs of White Port Wine, it provokes Urine and the Terms in Women, helps Pains in the Sides, Ruptures, Convulſions, and old Coughs: Uſed as an Errhine, it purges the Head and Brain of cold and moiſt Humors which cauſe Head-Aches, Lethargies, Vertigoe's, Epilepſies, Apoplexies, *&c.* And j. dram taken in Broth provokes Vomit, and helps ſuch as are bitten with Venomous Creatures.

XXIII. *The Cataplaſm.* It is ſingular good to diſcuſs Contuſions, Inflamations and the like, to give eaſe in a cold Gout, or any Ach or Pain from a cold Cauſe, ſtrengthens the Nerves, and cures Cramps, in what part ſoever: and is good to be apply'd in Tumors of the Kings Evil, Kernels and Swellings in the Neck and Throat, *&c.* I have had large Experience of the Virtues of the Root of this Herb; and I write little more of it, than what is true to my own knowledge.

CHAP. XXXVI.

Of Onion ASPHODEL.

I. *The Names.* It is called in *Greek*, Ἀσφόδελος βολβώδης: in *Latin*, *Aſphodelus Bulboſus*, by *Dodonæus*, *Aſphodelus Fœmina*; by *Lobel*, *Aſphodelus Hyacinthinus*, and *Hyacintho Aſphodelus*; and that rightly, becauſe the Root is like the *Hyacinth* or *Jacinth*, and the Flowers like the *Aſphodel*: *Cluſius* calls it *Ornithogalum Majus*, the *Greater Star of Bethlem*, and that fitly enough: in *Engliſh* we call it, *Onion Aſphodel*, and *Bulbous Aſphodel*, from the form of the Root.

II. *The Kind.* It is a ſingular Plant, having no particular Species under it.

III. The

III. The Deſcription. *It has a yellowiſh round Bulbous or Onion like Root, with ſome Fibres hanging thereat, from the which come many whitiſh green Graſſy Leaves, long and narrow, not much unlike in ſhape to* Leeks, *and ſpread upon the Ground; theſe come forth at the beginning of the Year, and abide till* May; *and then they withering, amongſt theſe Leaves, riſes up a naked ſmooth Stalk, repleniſhed towards the top with many Star like Flowers, of a whitiſh, or pale yellow green Color on the inſide, and wholly Green without, conſiſting of ſix little Leaves, ſharp pointed, with certain Chives or Threads in the Middle, and growing on ſhort Foot Stalks, on a reaſonable long Head ſpike faſhon: after the Flowers are paſt, there ſucceeds a ſmall Knop, or Head three ſquare, in which lies the Seed which is roundiſh and black. It differs from* Kings Spear, *which is alſo a kind of* Aſphodel, *in the pods, the which are round, but in this long and three ſquare: from the Marſh or* Lancaſhire Aſphodel, *in the Stalk, which is not wholly Naked: and the Common* Aſphodel *in the Pods and Roots, which in thoſe the Pods are round, and the Root multiform and knobby.*

IV. *The Places.* It grows in the *Corn-fields* in the Upper *Hungary*: but with us, it is only nouriſhed up in Gardens.

V. *The Times.* It Flowers in *May*, *June*, and *July*: and the Seed is ripe in *Auguſt*, or not long after.

VI. *The Qualities.* It is hot and dry in the third Degree, having almoſt the ſame temperature with *Aron.* It is aperitive, inciding, attenuating, abſterſive, diſcuſſive, and ſomething Emetick. And are appropriated to the Stomach, Lungs, Womb, Reins and Joynts.

VII. *The Specification.* The Roots which are only uſed, open obſtructions of the Lungs; and are peculiar againſt Aſthma's, cauſing Expectoration.

VIII. *The Preparations.* You may have from the Root. 1. *A Juice.* 2. *An Eſſence.* 3. *A Loboch.* 4. *A Saline Tincture.* 5. *An Oily Tincture.* 6. *An Ointment.* 7. *A Balſam.* 8. *A Cataplaſm.* 9. *A Syrup.* 10. *Aſhes.*

The Virtues.

IX. *The Juice.* Given from half an ounce more or leſs as the Patient is in age and ſtrength in a Glaſs of White Wine, it opens obſtructions of the *Viſcera*, and is a ſingular good Medicine againſt the Yellow Jaundice.

X. *The Eſſence.* It is good againſt Pains and Aches of the Bowels, Pleuriſies, Stitches, and other Diſeaſes cauſed by Obſtruction, whether in the Lungs or elſewhere: It prevails againſt Coughs, Colds, Aſthma's, ſhortneſs of Breath, and difficulty of Breathing, and diſpoſes wounds and Ulcers to a ſpeedy healing. Doſe from j. ounce to j. ounce and half in Wine or Mead.

XI. *The Loboch.* It is made of the *Juice* Boiled up to a thickneſs with Honey, with a quarter part of the fine Pouder of *Elecampane Root*, it is a famous Pectoral: with this I once cured a ſuppoſed incurable *Phthiſis*, in leſs than two Months time: at firſt it Vomited, and continued to do ſo, more or leſs for 10 or 12 Days, after which time the Patient took it very Pleaſantly; it cleanſed the Lungs, cauſed a great Expectoration, and in ſhort time after healed them and performed the Cure Pleaſantly. It is good for Coughs, Colds, Aſthmas, Wheezings, ſhortneſs of Breath, and other Diſtempers of the Lungs. Doſe j. ounce in the morning Faſting, and as much at four in the afternoon.

XII. *The Saline Tincture.* It provokes Urine and is good againſt Gravel, Stone, and Tartarous Slime in the Reins and Bladder. It repreſſes Vapors and Fits of the Mother, provokes the Terms, and prevails againſt the Gout. Doſe from half a dram to ij. drams morning and evening in a Glaſs of Wine.

XIII. *The Oily Tincture.* It is good againſt an *Oedema* in the Knees, Traumatick Tumors in the Neck and Throat, and any other cold Swelling in any part whatſoever, being anointed thereon. It prevails againſt a cold Gout, and other like Pains and Aches. Inwardly taken from vj. drops to xvj. in a Glaſs of Wine, it Comforts the Head, Brain, Nerves, and Womb.

XIV. *The Ointment.* It is good to anoint Kernells and Scrophulous Tumors in the Throat, cleanſe old Ulcers, and being put Scalding hot into Fiſtula's to remove the Callus and Heal them.

XV. *The Balſam,* It is prevalent againſt Oedematous Tumors, and the Gout, heals Wounds, cleanſes old Sores, running Ulcers and Fiſtula's, makes the Fleſh grow, and heals them. It alſo diſcuſſes hard and ſcirrhous Tumors.

XVI. *The Cataplaſm.* It takes away black and blew marks of the Skin occaſioned by Blows or Bruiſes, diſcuſſes or reſolves Inflamations, and abates pain by its Anodine Property: It is good in Tumors of the Breaſts and Cods.

XVII. *The Syrup.* It is Pectoral, good againſt all diſeaſes of the Breſt, Lungs, and Womb; cauſes Expectoration, and a free Breath, and provokes the Terms. You may give it from j. ounce to ij. ounces, in a Glaſs of white Wine morning and evening.

XVIII. *The Aſhes of the whole Plant. Galen* ſaith, That the Aſhes of the Root mixed with Oil, or Hens Greaſe, cures the falling of the Hair in an Alopecia, and reſtores it where it was loſt; and alſo cures a Scald Head. It is good againſt Scurff, Morphew, and other like vices of the Skin.

CHAP. XXXVII.

Of Marſh or *Wild* ASPHODEL.

I. *The Names.* It is called in *Greek*, Ἀσφόδελος ἑλώδης: in *Latin*, *Aſphodelus Paluſter*, *Pſeudo-aſphodelus Luteus:* in *Engliſh*, *Marſh Aſphodel*, *Wild* or *Baſtard Aſphodel*, and *Baſtard yellow Aſphodel*, and *Lancaſhire Aſphodel.*

II. *The Kinds.* There are two ſpecial Kinds hereof, 1. *Pſeudoaſphodelus major*, *Aſphodelus Lancaſtriæ*, the greater *Marſh*, *Wild*, or *Baſtard Aſphodel*, *Lancaſhire Aſphodel.* 2. *Pſeudoaſphodelus minor*, *Aſphodelus Lancaſtriæ verus*, the leſſer *Marſh*, *Wild* or *Baſtard Aſphodel*, the true *Lancaſhire Aſphodel.*

III. The Deſcriptions. *The firſt of theſe has a Root long and Jointed, creeping as Graſs does, with many Fibres thereat, from whence riſe up ſeveral long and narrow Leaves, like unto* Corn Flag, *but not ſo ſtiff or hard, of a beautiful greeen Color, and ſomwhat Chamfered, furrowed or ſtraked down right, yet compaſſing one another, as the* Corn Flag *and* Flower de luces *do at the bottom, among which riſes up a Stalk about a Foot and a half high, with divers ſhort Leaves encloſing the Stalk, as it were hoſed at their bottoms; and at the tops ſtand ſeveral yellow Flowers, as it were in a ſpiked Head, each of them made of ſix Leaves a piece, as are thoſe of the other* Aſphodels; *in the midſt of which come forth ſeveral ſmall Threads or Chives; which being paſt, there comes*

Seed in ſomwhat long and ſquare pointed Husks or Cods, which Seed is very ſmall and Blackiſh.

Lancashire Asphodil,

IV. The leſſer Kind, *has a Root which conſiſts of of a few whitiſh long* Fibres, *not creeping far, or much, but increaſing into ſundry Heads, from whence ſpring forth many ſmooth green Leaves, narrower, ſhorter, and freſher than the former,* (Gerard *ſays, two Inches and a half or three Inches long, ſomewhat broad at the bottom and ſharper towards their ends) not much unlike to a narrow* Flower de luce, *but neither ſo hard nor ſo thick; from among which Leaves riſes up a Stalk, which ſcarcely attains to be a* Foot *high, having very few ſmall Leaves thereon,* (Gerard *ſays it is ſmooth and without any Leaves thereon;*) *towards the top whereof, in a ſpiked Head comes forth ſmall* Flowers, *of a paler yellow than the former, and of a pretty Star like faſhion, which being gon, there ſucceeds ſmall three ſquare reddiſh Husks, or longiſh little Cods, which,* Gerard *ſays, are ſometimes four or five Square, and in which is contained ſmall reddiſh brown Seed.*

V. *The Places.* They are both found Wild in *England*, as well as in other places beyond Sea, in Marſh and Wet Grounds: the firſt near *Lancaſter*, in the Mooriſh Grounds there, as alſo near unto *Mandſley*, and *Marton*, two Villages not far from thence; as alſo at the Foot of *Bagſhot* Hill in the Weſt of *England*, near to a Village of the ſame Name. The ſecond grows near *Egham*, not far from the River ſide there, and in many other places, in the Weſt of *England.*

VI. *The Times.* They Flower in *May*, *June*, and *July*; and the Seed is ripe, about a Month after the Flowers are gon: moſt of their Leaves remain green in the *Winter Time*, if it is not extream cold and hard weather.

VII. *The Qualities.* They are hot and dry in the ſecond Degree; Inciding, Attenuating, Aperitive, Abſterſive and Diuretick: Dedicated to the Lungs, Reins, Womb, and Joynts.

VIII. *The Specification.* There has been nothing in a conſtant Obſervation, to which they can be ſaid to be peculiar; Authors having as to their Virtues been ſilent.

IX. *The Preparations.* You may make from the Roots, 1. *A Decoction.* 2. *A Juice.* 3. *An Eſſence.* 4. *A Syrup.* 5. *An Ointment.* 6. *A Balſam.* 7. *A Cataplaſm.* 8. *A Saline Tincture.*

The Virtues.

X. Altho' Authors have ſaid nothing of the Vertues of theſe Plants; yet, by their Taſtes, and other Signatures, they ſeem to have the Virtues of the Garden *Aſphodels*, tho poſſibly not ſo Potent and Efficacious: I have made ſeveral tryalls of them, and have found the *Decoction* to open obſtructions of the Lungs and provoke Urine. With the *Juice* given to ij. ounces for ſome days in White Wine, I once provoked the Courſes in a Woman where they were obſtructed: and with the *Syrup* and *Eſſence*, I have cured ſome that have had extream Colds. The *Balſam* I know to be a good Vulnerary, and the *Ointment* is very diſcuſſive and reſolutive, and good againſt the Gout. The *Saline Tincture* provokes Urine, and clears the Reins and Urinary Paſſages of Sand, Gravel, Slime and Tartarous Matter, given to ij. drams in White Wine: the other Preparations I have not much uſed; but this laſt, (as it is the eaſieſt made) I have oftentimes proved, and that with good Succſs.

CHAP. XXXVIII.

Of Garden ASPARAGUS.

I. *The Names.* It is called in *Arabick*, *Halion*, & *Helion*: In *Greek*, Ἀσπάραγος, καὶ Ἀσφάραγος, Ὄρμινον, ἀπὸ τῆς ὀρμᾶν, from provoking Luſt: In *Latin*, *Aſparagus & Corurda:* In *Engliſh*, *Aſparagus*, *Sparagus*, and *Sperage.*

II. *The Kinds.* There are ſeveral Species of this Plant, 1. The *Garden Kind.* 2. The *Wild Kinds*, of which there is, 1. The *Sea* or *Marſh.* 2. The *Rock Kind.* 3. The *Prickly:* of which three laſt, in the two following Chapters. The *Garden Kind* is alſo 1. *Aſparagus Sativus* vel *hortenſis vulgatior*, ſeu *Minor*, The Common *Garden Aſparagus*, or Leſſer Kind. 2. *Aſparagus Sativus*, vel *hortenſis Major*, The Greater *Garden Kind.*

III. The Deſcriptions. *The firſt or Smaller Kind, has very many Roots, diſperſed from a Spongie head, which are long, thick, ſoft and ſpongie ſtrings, hanging down, and ſpreading themſelves all about, whereby it greatly encreaſes: from this Root there riſes out of the Ground, divers whitiſh, green, ſcaly Sprouts, thick, tender, very ſoft and Brittle, of the thickneſs of the greateſt Swans Quill, or ſomewhat thicker, in Taſte not much unlike to Green Beans or Peaſe, having at top a certain ſcaly ſoft Bud, which in time does riſe up into very long and ſlender round green Stalks, bigger or leſſer as the Roots are in Growth, and growing to be three or four Feet high or more (as the Ground is in goodneſs) which Stalks ſend forth divers ſmaller Branches, whereon are ſet many little green Leaves, like* Fennel, *but ſhorter and ſmaller, and growing up to the top, much finer than the Leaves of* Dill: *among which, at the Joynts thereof, come forth, ſmall Moſſie, yellowiſh Flowers, Which yield a Fruit or Berries, green at firſt, afterwards red as* Coral, *of the bigneſs of a White-Pea; wherein is contained groſs blackiſh Seed,*

and

and exceeding hard, which is the cauſe it lies ſo long in the Ground after ſowing, before it Springs up.

ASPARAGVS.

IV. *The other or Greater Kind differs nothing from the former, but in the Colour of the Shoots, their Magnitude, and Taſte, they being much whiter, vaſtly larger, and much more ſweet and pleaſant. It is almoſt beyond belief the relation of the vaſt Magnitude to which this Great Kind will grow: This preſent Year* 1696. *a preſent was made to a Lady of one ſingle Bunch containing but one hundred of Sprouts or Heads, which weighed (as was reported to me) above forty Pounds weight: and the laſt Year I cheapned a Bunch or hundred, of the ſame Kind in* Newgate-Market, *which they would not Sell me under eight Shillings, and warranted to weigh above twenty Pounds Weight. So that it is manifeſt that the larger ſort is either another Kind, or elſe, the former ſort vaſtly improved by Art and Induſtry.*

V. *The Places.* They grow with us only in *Gardens*, where they are nouriſhed up for the daily Service of the Houſe, being an Excellent Boiled Sallet.

VI. *The Times.* The bare tender Shoots, which are Sold in Markets in Bunches or Hundreds, come up commonly in the *Spring*, and may be had all *March*, *April*, and *May*, and ſometimes in *June*; but the *Gardner* has arrived now to ſuch a dexterity in his Art, that if the Winter or Seaſon is Warm, you may have them all *January* and *February*, as was manifeſt this preſent Year, when I could have had what quantity I pleaſed on New-Years Day. They ſpring up after that, to a kind of diminutive Buſh, and Flower in *June* and *July*, and bear their ripe *B*erries in *September*, or late in the Year.

VII. *The Qualities.* They ſeem to be Temperate in reſpect to heat or coldneſs, dryneſs or moiſture. They incide, attenuate, open, cleanſe, and are very Diuretick: and ſeem to be chiefly Cephalick, Hyſterick and Nephritick; and, if Authors ſay true, Spermatogenetick withal.

VIII. *The Specification.* They are peculiar againſt the Strangary, or ſtoppage of Urine, and difficulty of making Water, to provoke Urine, and to expel Sand, Gravel, and ſmall Stones out of the Reins, which even the ſignature of the hardneſs of the Seed, ſeems alſo to intimate.

IX. *The Preparations.* You may have therefrom, 1. *The Roots.* 2. *The Seed.* 3. *The Diſtilled Water of the whole Plant*, diſtilled in *September*, when its Berries are Red; which things the Shops are ſaid to keep: But beſides them, we have, 4. *The tender Shoots or Heads.* 5. *The Decoction.* 6. *The Juice.* 7. *The Eſſence.* 8. *The Saline Tincture.* 9. *A Gargariſm.* 10. *A Bath.*

The Virtues.

X. *The Roots.* Being reduced into Pouder, and given from j. dram to ij. drams in White Wine, or the Diſtilled Water of the Plant, it provokes Urin, and opens the ſtoppages of the Urinary parts.

XI. *The Seed.* It is held to be very effectual for the purpoſes aforeſaid, j. dram of it being given in White Wine; ſo alſo, if it is mixed in equal quantities with the Pouder of the Root, and given in like manner from j. to ij. drams.

XII. *The Diſtilled Water.* It is drawn from the whole Plant, and is to be rectified (as *Schroder* directs) by putting it upon more freſh Herbs. It provokes Urine, and gives eaſe in the Stone, being drunk daily three times a day, from iv. to viij. ounces: It is uſed alſo as a Vehicle for other things.

XIII. *The tender Shoots or Heads.* They are Boiled, and Eaten as a Sallet, with Butter, Vinegar and Pepper, being very Nutritive; and tho' cleanſing, as to the Reins, Bladder, and Urinary Paſſages, yet they comfort the Stomach, are eaſie of Digeſtion, and reſtore in Conſumptions.

XIV. *The Decoction of the Roots in Wine.* It opens Obſtructions of the Bowels, provokes Urine, being ſtopped, and expels that Tartarous Matter in the Reins, Ureters and Bladder, which cauſes the Strangury. Doſe from iv. to viij. ounces.

XV. *The Juice of the Roots and young Sprouts.* It prevails againſt the Strangury, or difficulty in making Water, when it is done by Drops; it expels Gravel and the Stone out of the Reins and Bladder, and helps vehement pains in the Back. Doſe iij. or iv. ounces in Wine, twice a day.

XVI. *The Eſſence made of the Juice, or bruiſed Plant.* It has all the Virtues of the Juice beforegoing; beſides which, it is good againſt the Obſtructions of the Lungs, Pains of the Stomach and Bowels, Falling-ſickneſs, Fits of the Mother, Yellow Jaundice, and dimneſs of ſight: and taken every Morning and Evening, from ij. to iv. ounces in a Glaſs of Generous Wine, it is ſaid to ſtir up Bodily Luſt, Generate Seed, and remove Impotency.

XVII. *The Saline Tincture.* It has all the Virtues of the Decoction, Juice, and Eſſence; but more powerful in provoking Urine, and expelling Sand, Gravel, Stones and Slimy Tartarous Matter: beſides it particularly Stimulates the Generative Faculty by its penetrating and ſubtil Quality, and effectually cures the Yellow Jaundice. Doſe from j. to ij. drams in Wine.

XVIII. *The Gargariſm.* The Roots bruiſed and boiled in White Wine Vinegar, being gargled in the Mouth warm, gives eaſe in the Tooth-ach: and the Root it ſelf is ſaid to be profitable to be applied to an *Aneuriſm.*

XIX. *The Bath.* It is made of a good quantity of the Roots and Seeds bruiſed, and boiled in a great ſtore of Water, which is to be put into a large Veſſel, in which a Man may ſit up to the Breaſts

at

at leaſt: This has been found effectual againſt Fits of the Mother, Cholick, and Pains of the Back and Reins, and generally 'tis good againſt Cramps, Convulſions, Sciatica's and other vehement Pains of the lower Parts of the Body.

CHAP. XXXIX.

Of Sea *or* Marſh ASPARAGUS.

I. *THE Names.* It is called in *Greek*, Ἀσπάραγος ἁλώδης: in *Latin*, by *Anguillara* and *Tabermontanus*, *Aſparagus Paluſtris:* and *Aſparagus marinus*, by *Cluſius* and *Camerarius:* by *Bauhinus*, *Pena*, and *Lobel*, *Aſparagus maritimus:* in *Engliſh*, *Sea*, or *Marſh Aſparagus.*

II. *The Kinds.* This is the firſt ſort of the Wild Kinds; which ſome would have us to believe will, by Tranſplantation, and Manuring in Gardens, become the Garden Kind; at leaſt as good as the Garden Kind.

III. The Deſcription. *This* Wild, *or* Sea, *or* Marſh *kind of* Aſparagus *has a Root with many Strings and Fibres diſperſed from a ſpongy Head like the former, from whence riſes up many, but ſhorter Stalks than the Garden Kinds, ſtronger alſo and thicker, branching forth in the ſame manner, and having ſuch like winged Leaves, but ſhorter, thicker, harder, and of a bluiſh, green Colour. The Flowers are like the other, and ſo are the Berries or Seed which follow, but greater than they, and not of ſo freſh a red colour.*

IV. *The Places.* It is found to grow in the Marſhes of *Tidnam*, near *Chepſtow*, and in *Appleton* Meadow in *Glouceſterſhire*, about two Miles from *Briſtol*, where the Poor People do gather the young Shoots or Heads, and ſell them in the Market at *Briſtol*, much cheaper than our Garden Kind is ſold in *London.* Mr *Ray* ſays he has found it alſo at the *Lizzard Point*; and it is ſaid to be found about *Harwich* in *Eſſex*, and divers other Marſh Grounds and Places, as in a Meadow belonging to a Mill near *Thorp* in *Eſſex*; and at *Singleton* not far from *Corbie*: alſo in the Meadows near *Moulton* in *Lincolnſhire*: At a place called *Badmor-lading*, not far from *Harwich*, and at *Moulton* in *Holland*, which is alſo a part of *Lincolnſhire.*

V. *The Times.* The Tender Shoots ſpring up in *March* and *April*, at what times they are gathered and Eaten; they Flower in *June* and *July*, and the *Berries* are ripe in *September.*

VI. *The Qualities.* It is, as to its firſt Qualities, temperate: Mr. *Ray* ſays, that the Roots are Diuretick, and Lithontriptick, and are one of the five opening Roots: They are appropriated to the Liver, Spleen, Reins, Womb and Joints.

VII. *The Specification.* The Roots are peculiar againſt the Yellow Jaundice, Stone or Gravel in the Reins and Bladder, as alſo the Sciatica and Gout.

VIII. *The Preparations.* You may have therefrom, 1. *The tender Sprouts or Heads.* 2. *A Decoction of the Roots in Wine.* 3. *A Juice from the ſame.* 4. *An Eſſence of the Roots.* 5. *A Syrup of the ſame.* 6. *A Saline Tincture.*

The Virtues.

IX. The Virtues of the Roots and Seed, and even of the whole Plant, are the ſame in all reſpects with thoſe of the Manured or Garden; ſo that we need not here be particular in explicating the Virtues and Uſes of the afore enumerated Preparations, but wholly refer you to that which has already been ſaid in the laſt Chapter.

CHAP. XL.

Of Wild ASPARAGUS.

I. *THE Names.* It is called in *Greek*, Ἀσπάραγος ἄγριος, Μυάκανθα, ἀσπάραγος πετραῖος: in *Latin*, *Aſparagus Sylveſtris:* in *Engliſh*, *Wild Aſparagus*, or *Stone Aſparagus.*

II. *The Kinds.* There are two principal Kinds, 1. *Myacanthinus Galeni*, *Aſparagus Sylveſtris foliis acutis: Geſner*, *Dodonæus*, *Camerarius*, and others, call it ſimply *Aſparagus Sylveſtris*: *Cordus*, *Lobel*, *Lugdunenſis*, and others, *Corruda: Bauhinus* and *Parkinſon*, *Aſparagus foliis acutis*; and is thought to be the *Aſparagus Petræus* of *Galen* and *Dioſcorides.* 2. *Aſparagus Petræus*, or *Corruda aculeata*, *Prickly Rock Aſparagus:* this is called by *Cluſius*, *Corruda altera:* by *Dodoneus*, *Aſparagus Sylveſtris*, (ſo that he makes little difference between this and the former, tho' indeed there is much:) and by *Bauhinus*, *Aſparagus aculeatus alter, tribus aut quatuor ſpinis ad eundem exortum.*

III. The Deſcriptions. *The firſt*, Wild Aſparagus with ſharp Leaves, *has a Head of Roots, having many Strings and Fibres depending from it, thicker and ſhorter than any of the other Kinds; from whence riſes up three or four Stalks, which are ſhorter, ſtronger, and tougher than the others, diverſly ſpread and branched into many Wings, on which are ſet at ſeveral diſtances, many ſmall, ſhort, hard and ſharp pointed Leaves, five or ſix ſtanding at a Joint together: At theſe Joints likewiſe, with the Leaves, come forth the Flowers, many, ſet upon a long Stalk, which are Yellow, and conſiſting of ſix Leaves apiece, ſmelling as ſweet as a* March *Violet; after which come ſmall Berries, green at the firſt, and of a black-*

iſh

iſh Aſh-colour when they are ripe, wherein is contained a hard Black Seed.

IV. *The ſecond* Wild Kind, or Prickly Rock Aſparagus, *which ſome call* Thorny Aſparagus, *has very thick and ſhort Roots, with many thick ſtrings, all meeting together at the head of the Root, from whence riſes up ſeveral branched green Stalks, having three or four ſharp green Thorns (more like indeed to Thorns than Leaves, they are ſo hard, ſmall, long, and ſharp pointed) ſet together all along the Stalks and Branches ; from which come forth ſmall, moſſy, yellowiſh green Flowers ; and after them ſtore of Berries, greater than in the former, and of a blackiſh green colour, when they are ripe, full of a greeniſh Pulp ; wherein uſually lies but one black hard Seed, or at moſt two, having a White Kernel within it.*

V. *The Places.* The firſt Kind grows in Stony and Rocky places, as, near to *Salamanca* in *Spain*, alſo under Hedges, and in the very Fields in *Caſtile* and *Granada* ; about *Narbone* and *Montpelier* in *France* ; as alſo in *Creet* or *Candy*. The ſecond grows in ſtony and ragged or rocky places, as alſo by hedge ſides, not only in *Spain*, but alſo in *Portugal* and *Creet*. But with us, both the Kinds are only found Nurſt up in *Gardens* of the Curious.

VI. *The Times.* They ſend forth their tender Shoots early in the *Spring*, and Flower in *June* and *July*, having ripe fruit in *September* : But with us in *England*, it ſcarcely comes to perfection, unleſs the Seaſon is very warm, and they grow in a warm place, which may defend them from cold Blaſts and nipping Winds.

VII. *The Qualities.* They are Temperate as to the firſt Qualities, but rather more drying than any of the former. They incide, attenuate, and open powerfully, and are ſtrong Diuretick and Lithontripticks : and peculiarly appropriated to the Liver, Spleen, Reins, and Womb.

VIII. *The Specification.* I have been informed by ſome intelligent *Engliſh* Men, who have lived in *Spain* for ſome Years, that the People of the place eſteem them as one of the moſt peculiar Remedies againſt the Stone and Gravel, and much Superiour to the Garden or Marſh Kinds.

IX. *The Preparations.* You may make from the Root, 1. *A Decoction.* 2. *A Juice.* 3. *An Eſſence.* 4. *A Saline Tincture.* 5. *A Diſtilled Water* : and from the Seeds or Berries, 6. *A Powder.*

The Virtues.

X. *The Virtues are the ſame with the Garden and Marſh Kinds* : and therefore the Deſignation and Uſes of each Preparation the ſame, to which you are referred ; ſave, that theſe Wild Kinds are eſteemed to be double in Force and Goodneſs.

CHAP. XLI.

Of Common AVENS.

I. THE *Names.* This Herb, for all that we can learn, was unknown to the *Greeks*, and therefore we *can* furniſh you with no *Greek* name for it : but it is called in *Latin*, *Caryophyllata*, and *Garyophyllata*, (from the ſmell of its Root) alſo *Herba Benedicta*, *Sanamunda* ; and *Tragus* would have it called *Nardus agreſtis*, (not only for the ſweet ſcent of its Roots, but for its excellent Virtues) and is ſuppoſed to be the *Geum Plinij*, in *Hiſt. lib. 26. Sect.* 21. It is called in *Engliſh*, *Avens*, and *Herb Bennet.*

II. *The Kinds.* The General Kinds are two. 1. *Caryophyllata vulgatior*, the common Avens. 2. *Caryophyllata Montana*, the Mountain Avens ; of which in the next Chapter. The *Common Avens* is twofold, 1. That, *Flore minore*, with the ſmaller Flower, (which is the more Common :) 2. That, *Flore majore*,

fore, with the greater Flower, as Mr. *Ray* has noted, *Hiſt. Plant.* pag. 606.

III. The Deſcriptions. *The firſt of the Common Kind with the ſmaller Flower, has a Root conſiſting of many thick Strings, and ſmaller Fibres, ſomewhat of a browniſh yellow without, and reddiſh within, ſmelling ſomewhat like unto Cloves, eſpecially if it grows in the higher, hotter and dryer Ground, and in a freer and clearer Air; but nothing ſo much, or not at all in many other places, eſpecially if they be moiſt: From this Root ſpring forth many long, rough, dark, green winged Leaves, every one made of many Leaves, ſet on each ſide of a middle Rib; the three largeſt whereof grow at the ends, and ſnipt or dented round about the edges; the other being ſmall pieces, ſometimes two, and ſometimes four, ſtanding on each ſide of the ſaid middle Rib, under them: among which do riſe up divers rough or hairy Stalks, about a Foot high, branching forth with Leaves at every Joint, not ſo long as thoſe below, but almoſt as much cut in on the edges, ſome into three parts, and ſome into more: on the tops of the Branches ſtand ſmall, pale, yellow Flowers, conſiſting of five Leaves, like Cinquefoil Flowers, but larger; in the midſt whereof, ſtands a ſmall green head, which, when the Flowers are fallen, grow to be rough and round, being made of many long, greeniſh, purple Seeds, like grains, which will ſtick on your Cloths.*

IV. *The other* Avens *with a large Flower, is a Plant little differing from the former in any particular, except in the Flowers, which are greater than thoſe of the common, and fairer: This I have ſometimes formerly ſeen and gathered in Woods and Copſes in ſome parts of* Cambridge-ſhire, *where the whole Plant grew large and very fragrant; but the Roots not much inferior (in my opinion) in their Scent to Cloves themſelves.*

V. *The Places.* They are found to grow Wild in many places of our Land, under Hedge ſides, and near By-paths in ſome Fields, as alſo in Woods and Copſes, delighting to grow rather in Shadowy than Sunny places. And in many places they are brought into *Gardens*, chiefly about *London*, and in ſome great Towns and Cities, that they may be near at hand upon occaſion. The *Large Flowered Avens* is found in *Tedford Wood*, in the *Woulds* of *Lincolnſhire*.

VI. *The Times.* They Flower in *May* and *June* generally, and their Seed is ripe in *July* at fartheſt.

VII. *The Qualities. Avens* is hot and dry in the firſt Degree; and is Inciding, Attenuating, Opening, Abſterſive, Diſcuſſive, Reſolutive, Carminative, Alexipharmick, Aſtringent, and Vulnerary. *Schroder* ſays, it is Cephalick, and Cardiack; and we know by Experience that it is Stomatick, Hepatick, Hyſterick, and Arthritick.

VIII. *The Specification. Schroder* ſays, its chief uſe is in drying up Catarrhs, and reſolving Coagulated Blood: it is a ſingular cure for Wounds and Ulcers.

IX. *The Preparations.* The Shops keep nothing hereof, but only, 1. *The Root*: but you may prepare therefrom, 2. *A Decoction.* 3. *A Wine.* 4. *A Juice from the Roots and Plant.* 5. *An Eſſence.* 6. *A Spirituous Tincture from the whole Plant.* 7. *A Saline Tincture.* 8. *An Oily Tincture.* 9. *An Ointment.* 10. *A Balſam.* 11. *A Cataplaſm.* 12. *A mixture for Callous Ulcers.*

The Virtues.

X. *The Root.* The Pouder of the dryed Roots given from half a dram to j. dram, ſtrengthens the Stomach, opens Obſtructions, is good againſt Spitting or Piſſing Blood, or the Bloody Flux; and ſtrewed on moiſt or running Sores, or Ulcers, drys them up, and diſpoſes them to healing. The dryed Roots are alſo uſed to be laid among Cloths, to perfume them, and keep away Moths.

XI. *The Decoction*, Made in Mead, or half Wine half Water, it is good for ſtoppages of the Breſt and Stomach, Stitches and Pains of the Sides, opens Obſtructions, and corrects cold and crude humors in the Stomach and Bowels. Doſe vj. ounces.

XII. *The Wine.* It is very Aromatick, and if it is drunk for ſome continuance of time, every Morning faſting, it warms and ſtrengthens a cold Stomach, takes away ſickneſs at Stomach, comforts the Heart, expels Wind, makes a good Digeſtion, opens Obſtructions of the Liver and Spleen, reſiſts Poiſon, and is a ſingular preſervative againſt the Plague, or any Peſtilential Diſeaſe: Doſe, in infectious times, iv. or vj. ounces, Morning, Noon, and Night.

XIII. *The Juice from the Root*, &c. It is Pectoral, Warming, Comforting, and Strengthening a cold Stomach, and is good for Inward bruiſes and hurts, for it diſſolves congealed Blood, happening by falls or bruiſes, as alſo ſpitting of Blood; it opens Obſtructions of the Liver, Spleen, and Womb, provokes the Terms, and is good againit the Colick. Doſe from ij. Spoonfuls to iv. or more, in Wine, Mead, or Ale: Outwardly, it is good to waſh old running Sores, or putrid Ulcers with, in order to their cleanſing and healing.

XIV. *The Eſſence.* It is good for Diſeaſes of the Breſt and Lungs, is Cephalick, Stomatick, Cordial, Hyſterick and Vulnerary, eminent againſt cold and moiſt Diſeaſes of the Head, Brain and Nerves; it ſtrengthens Digeſtion, and cauſes a good Appetite, taking away pains of the Stomach, from the coldneſs thereof; it chears the Heart, and is good againſt Sickneſs and Fainting Fits; prevails againſt Barrenneſs in Women, by rectifying the cold and moiſt Diſtempers of the Womb. It is alſo an excellent Vulnerary, for by taking this Eſſence Daily, from j. to iij. or iv. ounces, Morning, Noon and Night, it cauſes Wounds, Ulcers, and Fiſtula's to heal after an admirable manner.

XV. *The Spirituous Tincture.* It has the Virtues of the Eſſence, but not full out ſo powerful, except in Vulnerary caſes, in which it may do full as well. Doſe from j. dram to ij. drams, or more, in a Glaſs of Wine or Diet Drink.

XVI. *The Saline Tincture.* It opens Obſtructions of the Reins, is good againſt the Plague, and all Peſtilential Diſeaſes, Wounds, Ulcers, Sores, Fiſtula's, and many Diſeaſes of the Head, Brain, Nerves, Lungs, Breſt, Liver, Spleen, Womb, and Reins, carrying off the Morbifick Cauſe by Urine. Doſe from j. to ij. drams in Ale, Mead, Wine, or Diet Drink.

XVII. *The Oily Tincture.* Applied to Wounds and Punctures of the Nerves and Tendons, it cures them: it helps Lameneſs, Numbedneſs, Trembling of the Limbs, and Palſies, being anointed Morning and Evening on the parts affected; as Pains, Aches, and Gouts, proceeding from cold Cauſes, or a defluxion of cold Humors. And inwardly taken, from vj. drops to xvi. or xx. drops, in ſome proper Vehicle, it prevails againſt Lethargies, Vertigoes, Apoplexies, Convulſions, and other cold Diſeaſes of the the Head, Brain, and Nerves: It eaſes the Colick, and is good againſt Sand, Gravel, Stone, &c.

XVIII. *The Ointment.* It eaſes Pains from a cold Cauſe, diſcuſſes Oedema's, Scrophula's, and Phlegmons, or Inflammations, and abates Inflammations in Wounds and Ulcers, by diſcuſſing the Cauſe; and is good againſt the Piles in *Ano.*

XIX. *The Balſam.* It is a true Vulnerary, and cures

cures ſimple Wounds by the firſt intention: It cleanſes running Sores; old fœtid Ulcers; and ſtubborn and rebellious Fiſtula's; waſhing them firſt with the Juice, or Eſſence, and then applying of this Balſam: it cleanſes, incarnates, or breeds Fleſh, and brings to a ſpeedy healing.

XX. *The Cataplaſm.* It diſcuſſes Inflamations in their beginning; is good againſt Contuſions, or Bruiſes, eaſes pains or Aches in any part, and is ſingular good in a cold Gout. I have applied it with great ſucceſs in vehement Head-achs, proceeding from taking cold, or any recent Cauſe.

XXI. *The Mixture. Take Juice of the Roots* iv. *ounces, fine Verdigreeſe* ij. *drams; mix them.* It takes off the Callus in hollow Ulcers, and Fiſtula's, where it muſt be injected with a Syringe. But if the Callofity is in an open Ulcer, the Mixture may be thus made: *Take of the foregoing Ointment* ij. *ounces: Pouder of Tobacco* ij. *drams: Verdigreeſe* j. *dram: mix them.* Or thus: *Take of the former Balſam* ij. *ounces: Pouder of round Birthwort Roots* ij. *drams: fine Verdtgreeſe* j. *dram: mix them.* Any of theſe mixtures take off a Callus from any Ulcer or Fiſtula, cleanſes the ſame, and induces it to a ſpeedy healing; and this it will do, if the affect is in the Joints.

CHAP. XLII.

Of Wild *or* Mountain AVENS.

I. *THE Names.* They are called in *Latin*, *Caryophyllata agreſtis*, *Caryophyllata montana*; and in *Engliſh*, *Wild* or *Mountain Avens.* The Epithet *Wild* is put to theſe, to diſtinguiſh them from the former, which are never called Wild; for tho' they grow Wild in Fields and Woods, yet it is always near home, and beſides, they are many times Nurſed up in Gardens, which theſe are never, except as meer Rarities.

II. *The Kinds.* There are ſeveral Kinds of *Mountain Avens*, but thoſe growing in our Country chiefly, are, 1. *Caryophyllata montana purpurea*, as *Gerard* calls it: Or *Montana paluſtris purpurea*, as *Parkinſon:* Alſo *Aquatica nutante flore*, and *Aquatica flore rubro ſtriato*, by the *Bauhins*; *Purple Mountain Avens*, or *Water Avens.* 2. *Caryophyllata flore amplo purpureo*, *Avens with a large double flower.* 3. *Caryophyllata Chamædryos folio*, as *Moriſon* calls it: *Chamædris ſpuria montana Ciſtiflore*, as *Parkinſon: Alpina Ciſtiflore*, and *Alpina flore fragrariæ albo*, as the *Bauhins: Teucrum Alpinum Ciſtiflore*, as *Gerard*; *Mountain Avens with Germander Leaves.* 4. *Caryophyllata Pentaphyllæa*, as *Bauhin* and *Parkinſon: Alpina Pentaphyllæa*, as *Gerard:* and *Alpina quinquefolia*, as *Caſpar Bauhin*; *Cinquefoil Avens.* To which add, 5. *Caryophyllata montana Virginienſis*, *Virginia Mountain Avens.* 6. *Caryophyllata montana flore magno luteo*, *Mountain Avens with a great yellow flower.*

III. Deſcriptions. 1. Purple, or Water Mountain Avens. *It has a Root about a Fingers thickneſs, with many Strings or Fibres thereat, from whence riſes up many long and hairy Leaves, compoſed of divers little Leaves, with larger at the top, and theſe ſnipt or dented about the edges, like as the Common Avens: among theſe Leaves riſe up ſeveral Stalks, a Foot or more in height, on which grow Flowers, whoſe Heads hang down: the tops of the Stalks, and Cups of the Flowers, are commonly of a purpliſh Yellow, but the Flowers ſcarcely appear above the Husks that contain them: Theſe Flowers themſelves are of a pretty Red Colour, and are of divers ſhapes, and grow divers ways: (which is the reaſon that Cluſius, and ſome others, have judged them to be ſeveral Plants, giving the Flowers here expreſt for a differing kind.) For ſome of theſe Flowers, even the greateſt part of them grow with five Red, round pointed Leaves, which never lye fair open, but only ſtand ſtraight out, the middle part being filled with a hairy matter, and yellowiſh Threads: Some of theſe Flowers conſiſt of Seven, Eight, Nine, or more Leaves, and ſome again lye wholly open, with Green Leaves, growing cloſe under the Cup of the Flower; and ſome few now and then may be found compoſed of a great many little Leaves, thick thruſt together, making a very double Flower: after the Flowers are fallen come ſuch hairy Heads, as you ſee in the Figure, and in other Plants of this Kind, among which lies the Seed.*

IV. 2. Avens with a large double purple Flower. *Tho' ſome make this to be a different Kind from the laſt, yet doubtleſs it is not, but is one of the ſportings of Nature, wherein ſhe acts variouſly in one and the ſame Plant; and therefore the Deſcription of the laſt may fully ſerve for this, there being in truth no variation but in the Flower, as we have in the former, above, already declared.*

V. 3. Mountain Avens with Germander Leaves. *It has a long, thick, hard, woody Root, with many Sprigs or Strings growing from it, and ſpreading under ground, of a brown blackiſh colour; from whence ſpring up ſeveral hard, woody Stalks, eight or nine Inches long, ſpread upon the Earth, of a brown, reddiſh colour, which have Leaves growing upon them without any order, like to Germander Leaves, but leſſer, harder, more wrinkled, and ſaw-like indented on the edges, of a White Hony colour below or underneath, and of a blackiſh Green colour above, having an Aſtringent Taſte. The Flowers are White, and each Flower ſtands upon a ſlender hairy Foot-ſtalk, about three or four Inches long, twice as big as a Strawberry Flower, and conſiſting of ſix Leaves apiece, or more, in the middle of which is a Thrummy Head, of a ſmall hairy ſubſtance, which being fallen, there ſucceeds little Down-*

ny or Feathered Heads, not much unlike to those of the Pasque-flower, with an oblong Seed, of a Sad Red Colour. And the bottoms of the Flowers are sustained, as it were, with narrow oblong hairy Leaves.

VI. 4. Cinquefoil Avens. *It has a Root composed of many tough Strings, of a brownish Colour, and smelling somewhat like to the former Kinds, from whence rises up Leaves divided into five parts like unto Cinquefoil, dented about the edges, and having Stalks about a Foot high, having such like Leaves thereon, at the Joints where it branches forth: at the tops whereof stand Pale Yellow Flowers, like those of the Common Avens, but smaller, with many Yellower Threads, somewhat Downy in the middle.*

VII. 5. Mountain Avens of Virginia. *This is wholly like to the Purple Avens, first described in this Chapter, but it is taller and larger than that, almost in every respect, and scarcely differing in any thing else; and it yields flat, thin, blackish Seed in Husk.*

VIII. 6. Mountain Avens, with great yellow Flowers. *This has a thick, long, browniſh round* Root, *of the bigness of ones* Finger, *creeping under the upper Crust of the Earth, not altogether so stringy as the Common, described in* Chap. 41. Sect. 3. *aforegoing, but having some small Fibres shooting downwards in several places, and Smelling and Tasting like to Cloves, or those of the first Common sort; from whence comes forth divers winged Leaves, made of many small Leaves towards the bottom, standing on both sides of the* Rib, *the end Leaves being largest and whole, not divided, but somewhat deeply dented, or cut in on the edges, of a fresher green colour likewise, softer also and gentler in handling, than those of the Common Kind: from among which rise up slender Stalks, seldom branched, having very few Leaves thereon, at the Tops whereof stands usually one Flower apiece, and sometimes more, made for the most part like those of the Common sort, consisting of five or six Leaves, much larger than those, and of a deeper Yellow Colour, and sometimes with a White Flower, as* Camerarius in horto *says, tending to redness, having many Yellow Threads in the middle, compassing a Green Head, which when the Flower is past, increases to be a round Head, beset with flat Seeds, not so rough, or ready to stick to ones Cloths, but every one of them having a long Feather-like Hair or Thread at the end. The whole Plant, as well Leaves as Flowers and Seed, are covered with a small soft hairy Down, which is not much, or easie to be discerned, unless one takes good notice thereof, or heeds it very well.*

IX. *The Places.* *The first* of these are found by Water Sides in Wet or *Marsh Grounds* on the Mountains; in Northern Mountainous Places in *England*, as about *Settle* and *Ingleton*, &c. also in *Wales*, about *Snowden Hill*, &c. and in divers other places. *The second* has been found near *Strickland magnum* in *Westmorland*. *The third* is found in several of the *Alpine Mountains*; and in *Ireland*, on the Mountains between *Gort* and *Galloway*. *The fourth* was found by *Pena* on the *Rhetian Alps* near *Clatena*, who at first took it to be a kind of *Cinquefoil*, but by the Smell and Taste, found it to be *Avens*: it has been found in the Den of *Bethaick* in *Scotland*. *The fifth* grows in *Virginia*, *Carolina*, and other parts of *Florida*, and is only nourished up with us in *Gardens*. *The sixth* is found upon divers Mountains, as on *Coronos* in *Bohemia*, by the Springs of the *River Albis*, as *Matthiolus* says, and upon *Mount Baldus*, as *Pena* says, and in many other places. *Bauhinus* found it in *Mount Braulium* of the *Rhetians*; and *Clusius* on the Ridges of the *Highest Alps*, not every where, but amongst Grass and Shrubs; but with us it is chiefly nourished up in *Gardens*.

X. *The Times.* They Flower from the beginning of *May*, to the end of *July*; and their Seed is ripe in *August*, or not long after.

XI. *The Qualities.* These are all generally of a Nature, and have the same Qualities and Virtues. They are hot and dry in the second Degree: They incide, attenuate, open, cleanse, discuss, resolve, expel Wind; are Astringent, Vulnerary, and resist Poison: and are appropriated to the Head, Nerves, Heart, Stomach, Liver, Spleen, Womb, and Joints.

XII. *The Specification.* They have a peculiar property in curing Wounds and Ulcers, opening all sorts of Obstructions, drying up Catarrhs, and stopping preternatural Fluxes of the Bowels.

XIII. *The Preparations.* The Shops keep nothing of them; but you may have from their Roots, (which are chiefly in use) 1. *A Pouder of the Root*, 2. *A Decoction.* 3. *A Wine.* 4. *A Juice.* 5. *An Essence.* 6. *A Spirituous Tincture.* 7. *A Saline Tincture.* 8. *An Oily Tincture.* 9. *An Ointment.* 10. *A Balsam.* 11. *A Cataplasm.* 12. *A mixture for callous Ulcers.*

The Virtues.

XIV. *The Virtues* of all these *Mountain Avens*, are the same with those of the *Common Avens*, and are applied to all the same Diseases, and differ in nothing but the degree of their strength, force, or efficacy; for that these *Wild* or *Mountain Avens*, are much stronger than the Common Kinds, and operate more powerfully, speedily and effectually than they can possibly do: and therefore, the Virtues and Uses of the several Preparations aforenamed, are the same with those of the *Common Avens* before declared in *Chap.* 41. *Sect.* 10. to *Sect.* 21. to which you are referred.

CHAP. XLIII.

Of Common BARLEY.

I. *THE Names.* It is called in *Hebrew* שעורה, *Segnorah*, *Job* 31. 4. and *Joel* 1. 11. *&c.* In *Arabick*, *Xabaer*, *Shair*: In *Greek*, Κριθή: in *Latin*, *Hordeum*: and in *English*, *Barley*.

II. *The Kinds.* It is either *Manured* or *Wild*, of which latter in the next Chapter. The Manured is, *Hordeum Distichum*, *Common Barley*. 2. *Hordeum Distichum latius*, *Bear* or *Battledore Barley*. 3. *Hordeum Polystichon*, *Square Barley*, or *Winter Barley*. 4. Γυμνόκριθον, *Galeni*, Ζεόπυρον, *Hordeum nudum*, *Zeopyrum*, *Tritico Speltum*, *Naked Barley*.

III. The Descriptions. *The first has a Grassy Root, with many small Fibres or Strings, from whence rises up several Grassy Leaves and Stalks, sometimes more, sometimes less; which are shorter and softer than those of Wheat, and the Grassy Leaves are also shorter, broader and rougher, and the Stalks rise up to be* 12, 14, 16, *or* 18 *Inches high, according to the goodness of the Ground: at the Tops whereof comes forth Ears, having two rows of Corn, set in good order, each inclosed in a Husk, sticking close to the Grain, and having a long rough Aune or Beard thereat, which is many times greater and longer than Wheat, and whiter also, not very easily falling out of the Ear.* Cordus *says, that this kind makes a recompence for the smallness of the Ear, by the number of the Stalks each Grain or Root produces; for,*

says

says he, I have numbred above sixty Stalks rising from the Root of one Corn, but usually twenty, thirty, and forty.

Common Barley.

IV. *The second Kind is like the other in all respects, excepting in the Ear, which is indeed much broader, (tho' it has but two rows, as the former) for that the Grains lye more straight out, not so much sloping upwards, and withal they are something larger, but the Awnes or Beard, not full out so long.*

Barley Eares

V. *The third Kind. This is also altogether like the other Kinds in the Root, Stalk, Leaf and Green, but differs only in the Ear, this always having four Rows of Grains, whereas the others have but two. Some Authors will have it, that this kind has sometimes six Rows of Grains on the Ear, called,* Hordeum Hexasticum, *or* Cantherinum. *But I am of Opinion it is of a different Kind from the four Rowed, or* Square Barley; *for that this is lesser, and without doubt is that small kind which is brought to us out of* Germany, *and sold in our Grocers Shops, called* Pearl Barley: *There is also a sort of large hul'd Barley, called* French Barley, *which is only our common* English Barley hull'd; *and is called* French, *because it was first of all hull'd in* France.

VI. *The fourth Kind. The Root is Grassy, with many Fibres or Strings at it; whence rises up Stalks, like to the Common Barley, or rather like unto Spelt, save that the Ears are rounder; but it has not so many Stalks rising from the Root, as the Common Barley has; it has many rows of Corns in the Ears, which are inclosed in the Husks, but have not that hard or harsh Skin or Husk upon them, which the Common Barley has, with long, rough Awnes or Beards at their ends; and the Grains or Corns are more lank, small, yellow, and short, and naked, without Husks, growing almost like Wheat, the which in its yellowish Colour it somewhat resembles.*

VII. *The Places.* The first or our Common Barley, is sown in all the Southern parts of the Kingdom: the second is sown in the North parts only: the third is reasonably frequent in our Land. The last is sown in several places of *Germany*, for the same uses as the other *Barley* is; this is rare with us, yet it is sown in our *Gardens*, where it flourishes very well.

VIII. *The Times. Barley* is sown with us in *March*, especially the two first kinds: the Square or Winter Barley, is said to be sown before *Winter*; but all sorts of Barley (even the *Winter Barley*) are sown with us in *England* in *March* or *April*, and are ripe or fit for cutting in *August* following, or beginning of *September* at fartheſt.

IX. *The Qualities.* They are cooling and drying in the first Degree. They are gently Repercussive, Abstersive, Diuretick, and Anodyne, appropriated to the Lungs and Reins; also Antifebritick and Galactogenetick, or breeding Milk.

X. *The Specification.* They are peculiar for allaying the heat of Blood in Fevers, to help Pissing Blood, and sharpness of Urine, being caused thro' the Application of Vesicatories, by an unskilful hand.

XI. *The Preparations.* You may have from the Grain, 1. *Malt.* 2. *Beer.* 3. *Ale.* 4. *A Spirit.* 5. *Polenta.* 6. *Maza.* 7. *Ptisan.* 8. *Yest.* 9. *Fæces* or *Bottoms of Ale or Beer.* 10. *A Balsam.* 11. *The Meal or Flower.* 12. *Bread.* 13. *Cream.* 14. *Barley Water.* 15. *A Cataplasm.* 16. *A Mixture.* 17. *A Julep.* 18. *A Bath.* 19. *An Emplaster.* 20. *A Distilled Water from the green Plant, whilst the Grain is yet green, or not fully ripe.* 21. *Brewers Grains.*

The Virtues.

XII. *The Malt.* This is called in *Greek*, Βύρσα by *Ætius*: in *Latin*, *Byne*, and *Maltum*; which is a made *Latin* Word, from the *German* Word *Maltz*, or our *English* Word *Malt*, which is Barley prepared for Brewing Ale or Beer; the manner of which Preparation is thus: *Take a Quantity of Barley, as much as you please, put it into Cisterns made for that purpose, which you may fill full with the Barley, then affuse so much Water thereon as may cover it, and there let the Grain soak for two or three Days*

and Nights, till it is well ſwoln; then drain the Water from it by a Cock or Pipe below; which done, the ſwelled Barley is to be taken out of the Ciſterns, and ſpread equally, or of an equal thickneſs, upon the Floor of a Malting Houſe, about half a Foot thick, or more, and according as the Air is cold, it is covered with Cloths, or not covered, and is to lye till it begins to ſprout, ready as it were to grow, which will be performed in two or three days, if the Weather is warm, or not very cold; otherwiſe it may lye longer: before it grows hot, which it is apt to do, it is to be turned with Shovels for that purpoſe, two or three times a Day for a Week or ten Days together, to cool it, and dry it: When it is thus dryed, it is put upon a Malt Kiln, and there it is throughly dryed by the help of Fire, made either of Straw, Furzes or Wood, to cauſe it to have the ſweeter Reliſh or Taſte: If it is dryed with Faggots or Wood, the Malt will taſte Bitteriſh from the Smoak, and will eaſily be perceived in the Drink, which will taſte Bitter: If it is dried with Furzes, or other light ſtuff, it will taſte leſs Bitter; but the only choice Malt is that which is dried with Straw, for that is truly Sweet, and makes the only pleaſant Drink. *Malt* being groſly Ground is made into Beer and Ale, as we ſhall in the next place ſhew. Ground Malt Fryed, and applied in a Bag, as hot as can be endured to the Sides or Belly, gives eaſe in Pains proceeding from Stitches, Colick, or Gripings cauſed through Cold or Wind: Made into a Pultiſe, it is good to aſſwage Inflamations, or other like Tumors or Swellings.

XIII. *Beer.* This is called in *Greek*, Ζύθος: in *Latin*, *Zythum*, *Cereviſia Lupulata*; and in *Engliſh*, *Beer. It is made by Infuſion of Ground Malt, and a due Quantity of Hops in a ſufficient Quantity of Boiling Water in a proper Fat or Veſſel, ſo long till the whole Virtue and Goodneſs is Extracted out of both Malt and Hops; then this Liquor is drawn off: Now leſt any goodneſs ſhould yet be left in the remaining Malt, another Quantity of Boiling Liquor is put thereon, and ſo ſtirred well together, and kept in Infuſion till the remaining Sweetneſs is Extracted into the Liquor: Theſe two Liquors (or more, if you think needful to make them) which are called Worts, viz. the Stronger and the Smaller Worts, are put together, and being mixed, are put into Coolers, to bring them to a juſt Heat, or rather Warmth, to make them fit for a ſucceeding* Fermentation: *Being thus only brought to a Warmth, the Liquor is put into the Working* Fat; *and to cauſe or facilitate the* Fermentation *or Working, a proportional Quantity of* Ferment *or Yeſt is added, and mixt with it, and the Working is continued ſo long till both Taſte and Smell give a Demonſtration, that the Nature of the Liquor is changed, and turned from a dull, heavy, ſweet Taſte, to a kind of a Vinous Activity and Flavor.* I know our Common Brewers Boil their Worts, and it is their Opinion, that the Beer or Ale will not keep without ſuch Boiling; but Experience has long ſince refuted the Error or Vanity of ſuch Conceptions: 'tis only the Liquors being ſtrong of the Malt, which makes the Ale or Beer keep; if it is weak in that, boil it as long as you will, it will ſoon grow Small, Hard, and Soure, nor can you prevent it, do what you can: and if it is very ſtrong of the Malt (and not too much fermented) tho' the Worts were never Boiled at all, yet will the Drink keep ſeveral Years Good, and grow neither Soure, nor Hard, as your Drink made of Boiled Worts does; and of this I am a particular and faithful Witneſs: See more Arguments againſt the Boiling of Worts in my *Sepaſium*, or *Druggiſts Shop*, *lib.* 8. *cap.* 7. *ſect.* 26. where you may receive abundant Satisfaction, almoſt next to Demonſtration.

XIV. *Ale.* This was called in *Greek* by *Dioſcorides*, Κῶμι, ϗ Κόμμα: In *Latin*, *Curmi*, (from the *Greek*,) alſo *Cereviſia*, *Cerviſia*, & *Cerviſia non lupulata*, or *Drink not Hopt*, now called *Ale. It is made of Malt exactly as* Beer *is made, without any difference, except in the Hopping, which is here wanting.* But of late, in the *Summer* Time, the Brewers put in a ſmall quanty of *Hops*, to make the *Ale* keep the better, which is the property of the *Hops*, confirmed to us by Experience. *Ale* without doubt is the moſt Ancient Drink of our Land; But it has loſt much of its Reputation ſince *Beer* came into Faſhion or Uſe; becauſe the *Hops* make it more durable without ſowering, and leſs fullſome and more wholſome. However, whether it is *Ale* or *Beer* that is drunk, that is the beſt and more wholſom which is recent or new, than that which is hard or ſtale, the former being cleanſing, and keeping the Body open and more Soluble; whereas the ſtale is Aſtringent, and ſtopping, cauſing heart-burnings in many, and breeding Acid Humors, and laying the Foundation of an Acid Ferment.

XV. The Spirit. *It is drawn from* Beer *or* Ale *grown very hard, prickt, or almoſt ſower. It may be drawn in a Copper Veſica, with its Serpentine or Worm, with a gentle* Fire, *drawing off two thirds of the Liquor: or it may be mixt with double the quantity of fair Water, and one third part or better may be drawn off with a ſtrong* Fire, *ſo will it have leſs of an Empyreuma: this* Spirit *thus drawn off muſt be rectified, by mixing it with an equal quantity of Water, and drawing off the one half: and by repeating this Work ſeveral times, you will ſo purely waſh, and perfectly cleanſe the Spirit, that all its Empyreuma and ill ſcent will be taken totally from it:* This being done, you may either keep it in its preſent condition, of the Strength of Common *Brandy*, for common and ordinary Uſes: or you may Deflegmate it by reiterated Diſtillations *per ſe*, either in a *Copper Veſica* tin'd within with its Worm, drawing off only the fine *Spirit*, leaving the Flegm behind; or you may Diſtill it in a Glaſs Body or Bolt Head in *Balneo Mariæ*, or a very gentle Sand heat, which will cauſe the ſubtil *Spirit* only to Aſcend, leaving the Watry parts below; and this Work is ſo often to be repeated, till the Spirit is become purely fine, and free from Flegm, ſtrong enough to fire *Gunpowder*. This Work will the better be done, if a proportional quantity of Common or Bay Salt, or Pot-Aſhes be caſt into the Spirit: for the Salt diſſolving in the Flegm, will keep it down or make it ſtay behind, and cauſe the Liquor to yield its *Spirit* with much more eaſe and freedom, and more pure from Flegm and Empyreuma. As to its Virtues and Uſes, it has the ſame Nature, Quality, and Uſe with the Spirit of Wine, and performs all the ſame things, in making *Tinctures*, *Cordial Water*, *Elixirs*, *Powers*, *Volatile Spirits*, *Baths*, *&c.* and therefore, to that you are referred.

XVI. *Polenta.* This the Ancients made variouſly: *Pliny lib.* 18. *chap.* 7. ſays that the *Greeks* made it of *Green* Barly *taken out of the Ear before it was fully ripe, ſteeped in Water, then beaten in a Mortar, after waſhed in Baskets, to free it from the Husks, ſo dried in the Sun, and afterwards ſteeped and beaten again, till it was throughly cleanſed, which being dried was ground ſmall: of this they took* xx. *pounds, and added thereto, Lin-ſeed, Coriander-ſeed of each* j. *pound: Salt* ij. *ounces: theſe laſt things well beaten together were mixed with the* Barly, *and and ſo prepared for uſe.* II. Other *Grecians*, ſays *Pliny*, *Made it of* Barly *ſteeped for a Night in Water, and Husked by beating in a Mortar, after dried, and ſo parched or fried it the next day, and then ground it to Meal, to make Bread, Cakes, Puddings*

or

or Broath of. III. The *Italians* Made it *of Parched* Barly, *without any moiſtning, ground ſmall; to* xx. *pounds of which they added* Millet-ſeed *in Powder* iij. *pounds:* Coriander-ſeed, Lin-ſeed, *well beaten of each* j. *pound,* Salt ij. *ounces and a half, and then mixt them all together.* IV. *Galen* Commends it to be Made of *Freſh* Barly *not full out ripe or hardned, and before the Beard was white, or quite dry, and then indifferently parched, and reduced to Flower, adding nothing elſe to it.* Many Nations uſed this *Polenta* inſtead of *Bread*; and the *Cypriots* tho' they had *Wheat* growing with them, yet moſtly eat this. It drys and aſtringes more than *Barly* it ſelf, binding the Belly and ſtopping fluxes, being drunk with *Alicant*, or red Wine: drunk with Water, it quenches thirſt, and allays Inflamations of the Throat or Lungs. It was often eaten mixed with new Wine, or boiled up with Wine, and ſo eaten, as every one liked beſt.

XVII. *Maza.* This is only *Polenta*, or the Flower of Parched *Barly*, moiſtned with ſome kind of Liquor, as every one liked beſt: ſome with *Water*, ſome with *Water* and *Oil Olive*, ſome with ſweet *Wine*, ſome with *Wine* and *Oil*, and ſome mixed it with *Honey*, as *Heſychius*, *Hippocrates* and *Galen* declare: but *Galen* ſays that *Maza*, is hard of Digeſtion, and generates Wind: if it is well moiſtned with *Water*, ſweet *Wine*, or *Oil*, and *Honey* alſo is added to it, it the ſooner paſſes off.

XVIII. *Ptiſana.* The Ancients made it of ſeveveral ſorts of Grain, not of *Barly* only, but of *Wheat*, *Rice*, *Oats*, *Peaſe*, *Lentils.* But *Ptiſan*, ſimply conſidered, is always underſtood to be made of Husked *Barly* only. *Hippocrates* his way of making of it is thus, *Take the beſt* Barly, *ſteep it in Water four Hours or more, then put it into a courſe Bag, and beat it with a Mallet or wooden Peſtle till the Husks come off which take away by waſhing, dry it in the Sun, and keep it for uſe. Take of this hulled* Barly *what you pleaſe, and boile it in a ſufficient quantity of Water till it breaks, and that the liquor is thick like Cream: this liquor is the* Ptiſan, *which ought to be moderately liquid.* This has no Aſtriction, nor troubles the Stomach or Bowels, nor ſwells or fills them with Wind, for the Windy part is vaniſhed by boiling: it clogs not the Breſt or Stomach, but by its Lubricity it eaſily digeſts and paſſes off, and quenches Thirſt by its moiſtning quality; and for theſe properties ſake, it is profitable both for ſick and well: Thus *Hippocrates* and *Galen.* But *Dioſcorides* further adds, That this *Ptiſan* by reaſon of its being boiled, yields more nouriſhment than *Polenta*, is good againſt Exulcerations, and to help the hoarſneſs and Roughneſs of the Throat. This was the *Ptiſan* of the Ancients: but the Phiſicians in our Times make it thus, *Take huled* Barly, *commonly called* French Barly; *boil it in Water till it be ſoft or broken, then beat it in a Mortar, and ſtrain it, to which add blanched* Almonds, Melon *and* Citrul Seeds, *beaten to a Pulp, and then mixt together.* This is their uſual *Ptiſan*, or *Barly Milk. Ptiſan Drink* is thus made, *Take hulled* Barley, *boil it in a firſt Water, and then in a ſecond Water, but ſomething leſs than in the former* Recipe, *ſtrain away the Water from the* Barly, *and to* iij. *quarts of this Water, add* Raiſins of the Sun *ſtoned* iv. *ounces*, Blew Currants ij. *ounces*, Liquorice *bruiſed* j. *ounce*, *ſweet* Fennel *ſeeds* iij. *drams*, Coriander *ſeeds* j. *dram and half*, Maiden Hair *a handful*; *boil again a quarter of an Hour, or better, then ſtrain out for ordinary Drink.* It is good againſt Coughs, Colds, Hoarſneſs, ſhortneſs of Breath, difficulty of Breathing, obſtructions of the Lungs, coſtiveneſs of the Bowells, and alſo for weak and Coſumptive Bodies.

XIX. *The Yeſt.* It is the Superficial Feculency of the Drink, raiſed therefrom in Working; and *Yeſt* begets *Yeſt*, haſtning on and more ſpeedily perfecting the *Fermentation* of the Liquor, which is a ſeparating of the *Flowery* or *Mealy* Particles of the *Malt* from the *Wort*, and the ſtirring up an innate and latent *Acid* into act, to give the Drink a pleaſant ſort of briskneſs or Quickneſs, enlivening it with a Subtil and kind of Vinous Spirit. This *Yeſt* by Diſtillation yields a Vinous Spirit, of equal Virtues with the *Spirit of Wine*: and Bakers uſe *Ale Yeſt* inſteap of *Leaven*, to make their Bread light, which would otherwiſe be ſad: but Phyſically it is chiefly of External uſe. Being immediately apply'd in Burns and Scalds, it preſently takes out the Fire, and eaſes the ſmarting Pain, making the affect more eaſy and yielding to other Medicaments. Apply'd to Phlegmons, and other like Tumors, it helps to diſcuſs and reſolve them, unleſs they be Apoſtemated, and then it haſtens the ſuppuration of the Apoſtem or Tumor, and alleviates the pain. Being boiled to a Salve or Emplaſtick body, and apply'd, it ſtrengthens a weak Back, and weak Joints, eaſes Pain in thoſe or other parts; and is diſcuſſive and reſolutive.

XX. *The Fæces or bottoms of the Barels*, called by ſome, *Emptyings. They yield a Spirit by diſtillation like the* Yeſt, *which may be rectified to the like degree of Subtilty and purity*; and may ſerve for all the ſame intentions the other will ſerve for, whether Chymical or Pharmaceutical: And the *Fæces* or *Bottoms* themſelves are good to be outwardly applyed in all the ſame caſes, and to all the ſame Diſeaſes for which we have preſcribed the *Yeſt* in the former Section to be applyed. But this is not ſo good for the Fermentation of Worts, as *Yeſt* is, becauſe it will ſcarcely work at all and if it does it is ſo meanly and weakly that it makes rather a Flat and Inſipid or dead kind of Liquor, than any thing which has briskneſs and Life: But it may be renewed, *by adding a little ſower Leaven to it, diſſolved in a little of ſtrong or ſweet Wort, mixing them well together, ad digeſting them in a warm place, for ſome little time.*

XXI. The Balſam. *It is made of ſtrong* Ale, *by gently boiling it ſo long till it becomes thick like* Chio *Turpentine, and will ſpread on Leather like a Salve, or ſoft Cerote.* This being apply'd warm to the Neck or Throat troubled with the Kings Evil, or Kernels, or other hard Swellings, gives much eaſe and either diſcuſſes or reſolves them: it is good to reſolve contracted Sinews and Tendons, comfort and ſtrengthen weak Nerves and Joints, and is an excellent thing for weakneſs and pain in the Back, and to apply it to any part or Member which is hurt by ſpraining, falls, blows, or other the like Accidents.

XXII. *The Meal or Flower.* The Ancients of old, made of it *Bread*, 2. *Kings* 4. 42. *John* 6. 9, *and* 13. They made alſo *Cakes* of it, *Judges* 7. 13. *Ezek.* 4. 12. And ſo they have done almoſt in all Nations, and in moſt parts of this Kingdome, within theſe three or fourſcore years laſt paſt; they made alſo of it a kind of *boiled Bread* or *Puddings*; and *fried Bread* or *Pancakes*; but now in our days *Wheat* being ſo plentiful with us, *Barly* is wholly diſuſed, unleſs amongſt the pooreſt of the People. The *Turks* at this day make a kind of *Drink* of the *Meal* or *Flower* which they call *Chauſſet*: Thus, *they take the Meal or Flower which they make into Paſte, and boil it in a great Caldron, after which it is made into ſmall balls: theſe balls being caſt into the Water, it will preſently boile up of it ſelf, and grow hot, without the help of any Fire, and become by working a kind of thick Drink.* It is of a whitiſh Color, thick, of a good nouriſhment,

fumes

fumes into the Head, and cauſes Drunkenneſs if it is too largely taken; and this kind of *Drink*, ſays *Petrus Bellonius*, is uſually ſold in all the Cities of *Aſia*, in the Tap Houſes appointed for it, and generally with them called *Chauſſet*. In the *Levant*, and other the *Eaſtern parts* of the World *Barly* is yet more eaten, and made more into *Bread* than *Wheat*, I ſuppoſe becauſe it is more cooling, and preventive of Fevers; it is alſo cheaper for the poor and ordinary ſort of People: it nouriſhes much leſs than *Wheat*, but the Grain being Maulted, makes a more excellent *Drink*, clearer, thinner, purer, more ſtomatick and Diuretick.

XXIII. The Bread. *It is made of the Flower with a proportional quantity of Water and Salt; to every buſhel of which Flower, a four Leaven, as big as a Mans fiſt doubled, or a Pint of* Ale Yeſt, *is added, being diſſolved in the warm Water, with which the Paſte or Dough is made: this being mixed with one part of the Flower, is covered with the other, and left in digeſtion for an hour or two, that the whole may be Leavened; then the Paſte or Dough is made by mingling all well together, and kneading it with the hands, till it becomes a ſtiff Paſte; which then is ſuffered to ly again about half an hour, and then made up into Loaves, which are after baked in an Oven.* This *Bread* is proper to be eaten whileſt new, agreeing then moſt with the Stomach, and nouriſhing beſt. Apply'd to the place where the Pain is, in a Vehe-Head-ach, as ſoon as it comes out of the Oven, or as hot as the Patient can indure it, it gives preſent eaſe; and in a few times Application, cures it.

XXIV. The Cream. *It is made of hull'd* Barley, *boiled in a firſt Water and caſt away, then boiled in a ſecond Water, till the Grain burſts, and is perfectly ſoft: which is then beaten well in a Mortar, and mixed in the Water in which it is boiled, and ſtrained through a Cheeſe Cloth: then* Melon ſeeds *blanched are beaten to a Pulp, and mixed with Milk, and ſtrained till all the oily and moiſt part of the ſeeds are taken forth: This Milk is ſweetned with double Refined* Sugar, *and mixed with the former ſtranings of the* Barley; *ſo you have* Barley *Cream.* Some at Eating mix with it a little Damask Roſe Water and Juice of Limons. This ordinarily taken is good againſt hot burning Fevers, and ſuch as are weak, faint and feeble, labouring under Hectick, and Conſumptions, for it cools preternatural heats, and reſtores much. Without the Juice of Limons, it is good againſt ſharpneſs of Urine, and ſuch as make a Bloody Water.

XXV. Barley Water. *It is made of hull'd* Barley, *boiled in a firſt Water, and that caſt away, and then boiled in a ſecond Water, half a pound of* Barley *to a Gallon of Water, adding alſo an ounce and half of burnt* Hartſhorn, *boiling them ſo long till the* Barly *is breaking: then the Water is ſtrained from the other things, and made pleaſant with the Juice of Limons, and double Refined Sugar.* This is uſed as ordinary Drink for ſuch as are in Burning or Malign Fevers, Hectick Fevers, Conſumptions, or any other ways diſturbed with heat; it cools, admirably quenches Thirſt, and prevails againſt Diſeaſes of the Lungs.

XXVI. The Cataplaſm. 1. *Take* Barley *Flower* xij. *ounces, Meal of* Fleawort *ſeeds* iij. *ounces, Honey, Oil of* Lillies, *of each* ij. *ounces, Water a ſufficient quantity, mix and boil it to the conſiſtence of a Pultiſe.* This apply'd warm cures Tumors under the Ears, in the Neck and Throat, and other the like places. 2. *Take* Barley *Meal or Flower*, xvj. *ounces, Powders of* Fænugreek *ſeed*, Lin *ſeed and* Rue, *of each* iij. *ounces, Flowers of* Melilot *and* Camomile *chopt ſmall of each* ij. *ounces, boile all in ſweet Wine to a thickneſs.* This apply'd warm, diſcuſſes Inflamations, expels Wind out of the Bowels, and eaſes Pains of the ſides, Stomach, and Spleen. 3. *Take* Barly *Flower* xij. *ounces, Pouder of* Pomgranat *peels and* Myrtle *Berries, of each* iij. *ounces, Red Wine, a ſufficient quantity, mix, and boile to a Conſiſtency:* apply'd to the Belly, it is ſaid to ſtop the Looſneſs, or other Fluxes of the Belly. 4. *Take* Barley *Flower* xvj. *ounces, ſharp Wine Vinegar, a ſufficient quantity, mix and boile to the thickneſs of a Cataplaſm.* It is good againſt Scurff, Dandriff, or Morphew in the Head or any other part, being laid on hot, and as Authors ſay helps the Leproſy. 5. *Take* Barley *Flower* xvj. *ounces, white Salt and Honey, of each* iij. *ounces, white Wine Vinegar a ſufficient quantity, mix and make a Cataplaſm.* Apply'd it is ſaid certainly to cure the Itch.

XXVII. The Mixture. *Take* Barley *Water* xij. *ounces, Sirup of* Corn Poppies iij. *ounces, Tincture of the ſame Flowers made with Spirit of Wine* ij. *ounces, mix them.* Doſe iij ounces twice or thrice a day; with this I have cured ſeveral Plurifies. But *Tho. Bartholinus, Germ. Ephem. An.* 2. *obs.* 2. Profeſſes to cure Vehement Plurifies with *Barley* Water alone.

XXVIII. The Julep. *Take hulled* Barley iij. *ounces, boil it in a firſt Water, which caſt away; boil it again in* iij. *quarts more of Water*, Liquorice *bruiſed*, Strawberry *Leaves*, Violet *Leaves, of each* ij. *handfulls, boile till a quart or three pints is conſumed, then ſtrain out, and dulcifie it with* iv. *ounces of Sirup of* Violets: It provokes Urine, and is very good in Cholerick Fevers. 2. *Take hulled* Barley viij. *ounces, boil it in Water, which caſt away; and boile it again in* iij. *quarts more of Watter, adding* Fennel *ſeeds bruiſed, (towards the end of the boiling)* iij. *ounces, boil till the* Barley *breaks, then ſtrain out, and ſweeten with white Sugar Candy.* It breeds Milk in Nurſes plentifully, cools the heat and ſharpneſs of Urine, and helps Piſſing Blood, eſpecially if it is cauſed by the Application of Veſicatories, or Bliſtering Plaiſters. It is good againſt Coughs, Colds, Wheezings, Hoarſneſs Aſthma's, *&c.*

XXIX. The Bath. *Take Leaves of* Mallows, Violets, Beets, Fumitory, Black Hellebor, *of each* iij. *handfulls*, Barley iv. *pound, boil them in a ſufficient quantity of Water for a Bath, till the* Barley *breaks; the Grain is to be boiled a conſiderable time firſt, and then the Herbs to be put in towards the end of the boiling.* It is a very effectual thing againſt Scurff, Morphew, Leproſie, Scabs, Itch, and other breakings out, being often uſed.

XXX. *The Emplaſter. Take* Barley *Flower* ij. *pounds*, Tar j. *pound, Wax half a pound, Oil Olive a ſufficient quantity, mix and boil to the conſiſtence of a* Cerote, *or ſoft* Emplaſter. It is ſaid to cure hard Swellings of the Throat and other places called the Kings Evil. Apply'd alſo, it is an admirable thing to cure the Gout.

XXXI. *The Diſtilled Water from the green* Barly, *and the whole Plant.* It is Diſtilled in the end of *May*, and is good to cool Inflamed Eyes, and for ſuch as have Defluxions upon them, to ſtay the Humors, and to eaſe the Pain, being often dropped into them; white Bread being alſo dipt therein, and apply'd upon them, does the ſame.

XXXII. *The Grains, which are left after Brewing.* Tho they are generally uſed as Food or Meat for Horſes, Cows, Sheep, Hogs, and Fowls; yet they have ſome Phyſical Virtues alſo: for they are beneficial in curing Lameneſs in the Hands, Arms, Legs or Feet, cauſed through Cold, or evil Humors, being fallen into them, as alſo ſhrinkings of the Sinews, Cramps, and pains in the Nerves or Joynts, if a Bathing-Tub or Barrel be filled with them whileſt

whileſt they are hot, or if cold, heated again as hot as may poſſibly be ſuffered; and the Patient ſit therein, ſo as to cover thoſe parts, that they may gently ſweat, as long as he can well endure it without Fainting: this I ſay, if it is done three or four times, or more if need requires it, will both abate the Swelling and eaſe the Pain; alſo reſtore the Nerves, Joints, and Limbs, to their priſtin health and ſtrength.

CHAP. XLIV.
Of Wild BARLEY.

I. THE *Names.* It is called in *Greek*, Κριθὴ ἀγρία: In *Latin*, *Hordeum agreſte*: In *Engliſh*, *Wild Barley.*

II. *The Kinds.* There are ſeveral Kinds thereof, 1. Ζέα καὶ Ζειὰ Μονόκοκκος, and by *Lobel*, *Bryza Monococcus*; *Wild* or *Brant Barley*, *Peters Corn.* 2. Αιγίλωψ, *Ægilops*, *Feſtuca*; *Degenerate Barley*, or *Havergraſs.* 3. Κριθὴ νόθη Ὁλκὰς, (ἀπὸ τῦ ἕλκειν, *à trahendo, quòd ariſtas è corpore trahat*): *Hordeum ſpurium*, *murinum*, vel *ſpontaneum*, *Riſtida*; *Way Barley*, *Wall Barley*, which laſt is alſo ſaid to be *greater* and *leſſer.*

III. The Deſcriptions. Zea, *or* Bryza, *has a ſmall Fibrous or Stringy* Root, *from whence riſes up ſlender and ſhort Stalks, but firm, bearing a ſmall, thin Spiked Ear, ſet with Grains or Corn in two rows, one Corn on each ſide oppoſite to the other, from the bottom of the Ear to the top, whereby the Ear is flat, like unto* Barley, *with rough Awnes or a Beard, as* Barley *alſo has; every Grain is contained ſingly in a husk, wich ſticks to it, ſo as not eaſily to be gotten off; the Ear much reſembles* Barley, *and the Colour of the Grain, is a dark Red: it makes blackiſh or dark brown Bread, and not altogether ſo pleaſant as our Common* Barley.

IV. Ægilops, (*which in my opinion ought rather to be called* Monoccocus) *has a Root which from a ſmall Head ſends forth many Fibres or Strings, from whence ſprings forth Stalks 2. or 3. handfuls high, reſembling* Wheat *or* Barley, *jointed in three or four places, from whence comes forth divers Graſs Leaves, of a pale green colour, and at the top of the Stalk two or three Heads, ſet one above another, which are round and ſomewhat long, hard and ſtriped, having alſo many* Beards *at the end of each, wherein, when they are ripe and look whitiſh, lye 2. or 3. ſmall Grains or Seeds a little ſmaller (ſays* Gerard*) than* Barley: *theſe Seeds are wrapped or infolded in a Crefted Film or Skin, out of which the Awnes come forth*; Matthiolus *ſays, that as* Lolium, *or Common* Darnel *is known to be a Seed degenerate from* Wheat, *being found for the moſt part among* Wheat: *So by his own experimental knowledg, he had found that this* Ægilops *or* Feſtuca, *was a Seed or Grain, degenerating from* Barley, *and is found among* Barley, *or where* Barley *has grown.*

V. The greater Way Barley, *or* Wall Barley, *has a Fibrous or Thready Root, continuing many Years, from whence ſprings up many Graſſy Leaves, and among them ſeveral Benty Stalks about* 16. *or* 18. *Inches high, at the top of which grows ſeveral whitiſh yellowiſh Ears, with ſomewhat rough Beards, but much ſhorter than thoſe of* Barley, *and ſome have ſcarcely any Beards at all. The Ear is much more like that of* Rye *than* Barley, *and the Corn, or Grains which come out of it are brown Coloured, lank and ſmall, in Color and ſhape reſembling* Rye, *ſo that it might more properly be called* Wild-Rye, Way-Rye, *or* Rye-Graſs, *rather than by any Appellation of* Barley, *to which in my opinion it has no reſemblance.*

VI. The leſſer Way or Wall Barley, *is like the other in its Roots, Leaves, Stalks, Ears and Grains, ſo that many have taken it to be the ſame with the former, but in this it differs, that it is much lower, ſo that it ſcarcely attains to be a Foot high; and indeed it comes ſo near to the former* Barley, *or rather* Rye-Graſs, *that many have taken it to be one and the ſame, as even I my ſelf alſo do.*

VII. *The Places.* The firſt was anciently ſown in *Greece*, and the Eaſtern Countries; now it is Sown in ſome parts of *Germany* and *France*, but with us it

it is chiefly found in *Gardens*, tho it grows well and naturally enough here as other Grains do. *Gerard* says, that he had often times found many Ears of it among our ordinary *Barley*, when he lived in the farther side of *Lincoln-shire*, and they there called it *Brant Barley*. The second is Sown in many places of *Italy* and *France*, as in *Provence* and *Narbone*, among their Corn, and grows well in a moist Ground, but prospers most in a more Fruitful dry Soil: *Gerard* says, it grows commonly among their *Barley* in *Italy*, and other hot Countries; but only with us in Gardens. The third and fourth, by the High-ways, and Path-sides, as also on Mud Walls, and at the Foot of other Walls, and Way-sides in Fields, almost every where through the whole Kingdom.

VIII. *The Times.* the first is a *Summer* Corn, and Sown in *March* and *April*, and is ripe in the beginning or middle of *August*. The second also is a *Summer* Grain, aud is ripe towards the latter end of *July*, or the beginning of *August*. The two last are found coming to ripeness all the *Summer* Months.

IX. *The Qualities.* They are all of them temperate in respect to heat or coldness; and dry in the first Degree. The first and second Attenuate, digest and cleanse: and the two last are aperitive, absterssive, and Vulnerary; and are all appropriated to Diseases of the Joynts.

X. *The Specification.* They have a peculiar property to cleanse and dry up Ulcers, and resolve Tumors in the Joynts. The *Ægilops* is said to be a Specifick against the *Ægilops* or *Fistula* in the Corner of the Eye.

XI. *The Preparations.* The first Kind has much the Nature and Virtues of *Common Barley*, and therefore may have most of those *Preparations*, so that we shall say no more of them here. From the *Ægilops* or *Festuca*, you may have, 1. *An Infusion of the Seed in Drink or Wine.* 2. *A Decoction in Wine.* 3. *A Syrup of the whole Plant.* 4. *A Pouder of the Seed or Grain.* 5. *A Juice.* 6. *Ashes of the Stalks.* And from the *Way Barley* or Rye-Grass you have, 7. *A Cataplasm.*

The Virtues.

XII. *The Infusion in Ale, Beer, or Wine.* The Seed Infused, or Drunk in Pouder in any of these Liquors, affects the Head and Brain much, and causes Drunkenness.

XIII. *The Decoction in Wine.* If it is made with the Addition of dryed *Damask Roses*, and drunk from ij. to iv. ounces; as also the Mouth and Throat, Gargled therewith; it is good against a stinking Breath, I suppose caused by some filthy Ulcer or Ulcers in those parts, for that it has a property to heal Ulcers.

XIV. *The Syrup.* If the whole Herb, Roots, and Seed be bruised, boiled in Water, strained, and made into *Syrup* with Honey, to viij. ounces, of which if j. of *Aloes Succotrina* in fine Pouder be added, you have an excellent Medicine against foul Ulcers of the Nostrils, by wetting Tents therein, and putting them up the same, holding them a pretty while therein, and often repeating it.

XV. *The Pouder.* Mixed with Watter in which a little *Roch Alum*, or *Saccharum Saturni* has been dissolved, and laid upon the *Ægilops* or *Fistula* in the Corner of the Eye; it cures it; it also cleanses, drys up and heals Ulcers in other parts of the body, being so used, or strewed on dry.

XVI. *The Juice.* It is mixed with *Barley* Meal and so dried: and then upon occasion moistned with *Rose Water*, and apply'd Plaister wise, it heals (as *Gerard* says) the *Ægilops*, or *Fistula* in the Eyes: it also softens and asswages hard Tumors, and swellings in the Joints. *Lobel* says, this has been often tried to be effectual against the *Ægilops*, for that it has a drying quality without sharpness.

XVII. *The Ashes of the Stalks or Straw.* Made into a *Lixivium* with Water, it is good against the Gout from a flegmatick cause, by often bathing there with, and to dissolve hard Tumors or Swellings in the Flesh, and discuss Tumors of the Joints.

XVIII. *The Cataplasm of Way Barley or Rye Grass.* Being made of the Green Ears and Grass by beating it in a Morter, and then apply'd to places bald, or where the Hair is wanting; *Gerard* says, it causes it to come forth and grow again.

CHAP. XLV.

Of BARREN-WORT.

I. *THE Names.* It is called in the *Greek*, Ἐπιμήδιον: In *Latin*, *Epimedium*; *Epipetron*, *Epimenidium*: In *English*, *Barren-wort*.

II. *The Kinds.* It seems to be a singular Plant of the Kind, without any Species, tho *Parkinson* talks of an *Alterum fruticosum*, &c.

III. The Description. *It has a Root small and reddish, spreading much under ground, in shaddowy rather than Sunny places; from whence springs up several hard round Stalks, twenty or twenty four Inches high, each Stalk divided for the most part into three Branches, and each of them bearing three Leaves apiece, which are several, somwhat broad and round, yet pointed at the ends, hard or dry in feeling, and a little sharply dented about the edges, of a light green Colour on the upper side, and whiter underneath: from the middle of some of the Stalks of Leaves, shoots forth with them, from the first rising up of them, a small long Foot Stalk of Flowers, not much higher than the Stalks of Leaves, divided into Branches, containing on each of them, three Flowers apiece,*

apiece, ſeparated into four parts, as if the Flower conſiſted but of four Leaves, when as each part has two leaves, one lying cloſe upon another, the inner being yellow, and ſmaller than the lower which are red, ſo that the red edge appears round about the yellow, making it ſeem a yellow Flower of four Leaves with red edges, having alſo a few yellow Threads in the middle, ſet with green, the under ſide of the Flowers being of a yellowiſh red Colour, ſtriped with white lines. Gerard *ſays, the Flower is but ſmall conſiſting of four Leaves, whoſe outſides are purple, the edges of the inner ſide red, the bottom yellow, the middle part of a bright red Colour, and the whole Flower ſomewhat hollow. The Flower being paſt, ſmall long Pods or Cods appear much like to* Saracens Conſound, *but ſhorter, in which is contained flattiſh red ſeed. It is a pretty ſhrubby Plant, and its ſmell is rather ſtrong than pleaſant.*

Barren Wort.

IV. *The Places.* It grows on the Mountains of *Liguria*, and in moſt Meadows in *Italy*, about *Bononia* and *Vicentia*; alſo in *Romania*, and on the *Euganian Hills*. It grows with us in Gardens only, in moiſt and ſhadowy places, where it brings forth its Seed to perfection, tho' *Dioſcorides* and *Pliny* ſay, that it is without either Flower or Seed.

V. *The Times.* It Flowers at its firſt coming forth, or firſt Year of its growth from *June* till the middle of *Auguſt*: but after it has taken faſt hold, and well Rooted it ſelf in the Earth, a Year before, it then Flowers in *April* and *May*.

VI. *The Qualities.* *Galen* affirms it to be moderately cold and moiſt: I judge it to be cold and moiſt in the firſt Degree: it is Repercuſſive and Diſcutient, and appropriated to the Joints.

VII. *The Specification.* *Parkinſon* ſays, it is without any ſpecial property, more than to keep Womens Breaſts from growing over great.

VIII. *The Preparations.* By reaſon much of the Virtues of this Plant is not known, there are not many *Preparations* from the ſame: the chief being, 1. *A Juice.* 2. *A Pouder of the Roots and Leaves.* 3. *A Cataplaſm.*

The Virtues.

IX. *The Juice.* Whether it is taken out of the Roots or Leaves, it is good to cool Inflamations, and is profitable to bath with in an *Eryſipelas*.

X. *The Pouder.* It may be made of the Roots or Leaves, for of either the Virtue is the ſame, tho if made of the Root it is thought to be ſtronger; *Parkinſon* ſays it is reported, that being taken inwardly for ſome time, it makes Women Barren: from whence poſſibly the Name might come.

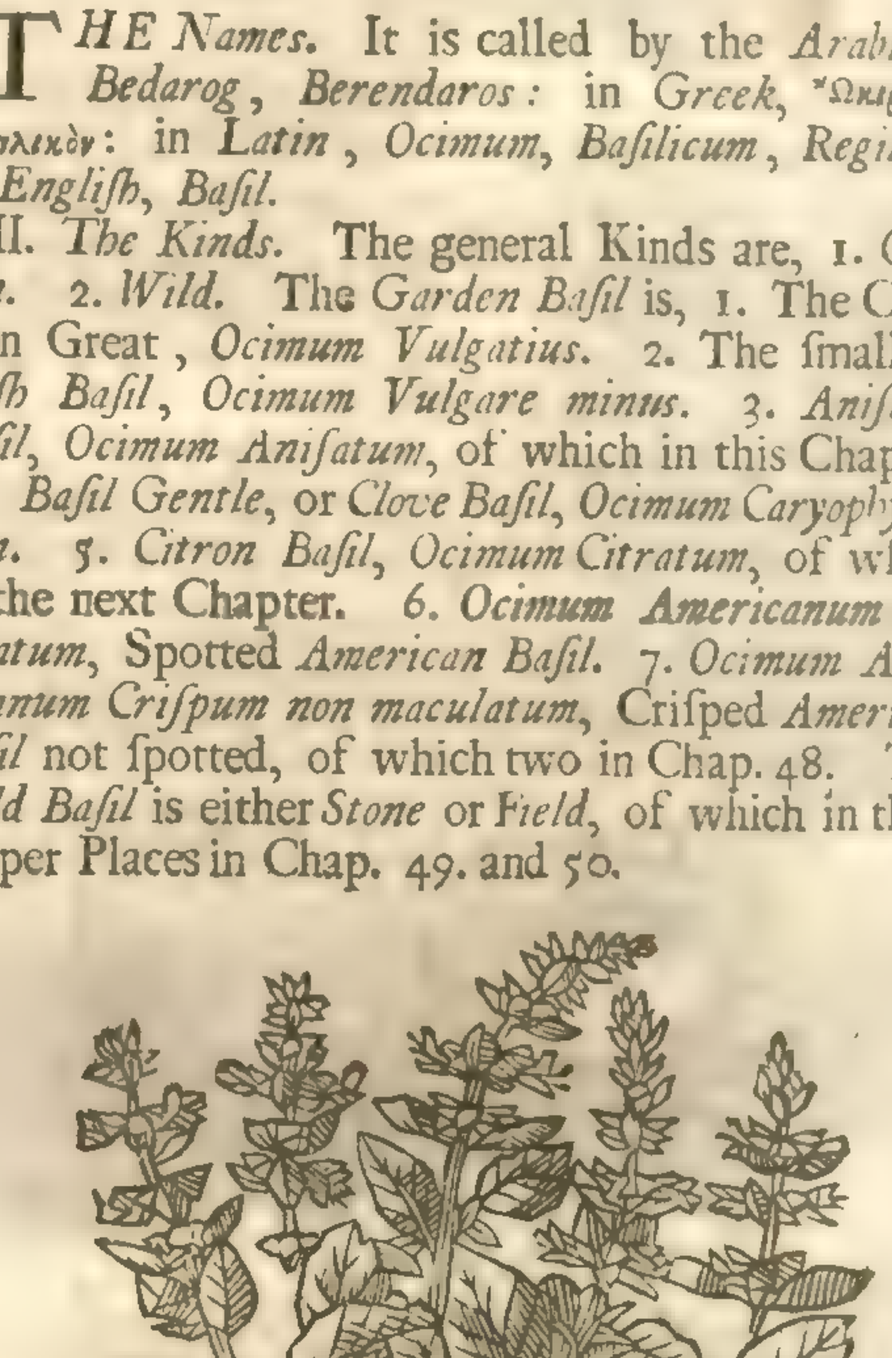
XI. *The Cataplaſm.* The Leaves made into a Pultiſe, by beating them up with Oil, and applyed to Womens Breaſts, keeps them from growing great; and is good to Diſcuſs a ſlight Contuſion.

CHAP. XLVI.

Of Common BASIL.

I. *THE Names.* It is called by the *Arabians*, *Bedarog*, *Berendaros*: in *Greek*, Ὠκιμον ἢ Βασιλικὸν: in *Latin*, *Ocimum*, *Baſilicum*, *Regium*: in *Engliſh*, *Baſil.*

II. *The Kinds.* The general Kinds are, 1. *Garden.* 2. *Wild.* The *Garden Baſil* is, 1. The Common Great, *Ocimum Vulgatius.* 2. The ſmall or *Ruſh Baſil*, *Ocimum Vulgare minus.* 3. *Aniſated Baſil*, *Ocimum Aniſatum*, of which in this Chapter. 4. *Baſil Gentle*, or *Clove Baſil*, *Ocimum Caryophyllatum.* 5. *Citron Baſil*, *Ocimum Citratum*, of which in the next Chapter. 6. *Ocimum Americanum maculatum*, Spotted *American Baſil.* 7. *Ocimum Americanum Criſpum non maculatum*, Criſped *American Baſil* not ſpotted, of which two in Chap. 48. The *Wild Baſil* is either *Stone* or *Field*, of which in their proper Places in Chap. 49. and 50.



III. The Deſcriptions. *The* Common Great Baſil, *has a Threaddy and Fibrous Root which periſhes*

at the firſt approach of Winter, *and therefore is to be ſown a new every Year if you will have it; from whence riſes up uſually but one upright Stalk nearly a foot high, variouſly branching forth it ſelf on all ſides, whereon, at every Joint, are ſet two Leaves, broad, thick, and fat, a little pointed, of a pleaſant ſweet ſmell, of a freſh green Colour, and a little ſnipt about the edges; of which ſome one here and there, are of a black reddiſh hue: towards the upper part of the Stalk and Branches come forth a number of ſmall whitiſh Flowers, which many times tend to a dark purple, with two ſmall Leaves at the Joint, in ſome places green, in others brown; after the Flowers come ſmall black Seed.*

IV. *The* Small Buſh Baſil, *has a Fibrous periſhing Root much like the former, from whence riſes up ſmall tender Stalks, which grow not ſo high as the former, but is thicker ſpread with Branches, and ſmaller Leaves thereon, and ſet cloſer together; theſe Leaves are little, leſs than thoſe of* Pennyroyal, *and the whole Plant is low, and fine or ſmall, growing into a kind of diminutive* Buſh, *whence the Name of* Buſh Baſil; *and is of a more pleaſing ſweet ſent than the former by much: the Flowers are ſmall and white, and the Seed black like the other, when it yields Seed with us, which is more ſeldom, it not often yielding ripe Seed here, becauſe it neither Springs, Flowers, nor Seeds ſo early as the others.* Parkinſon *adds another middle Kind ſomething larger than this both in the height of the* Buſh, *and magnitude of the Leaves, but not otherwiſe differing; which to me ſeems to be one and the ſame Herb, but differing according to the goodneſs of the Soil,*

V. The Aniſated Baſil, *Is truely of the ſelf ſame Kind with our ordinary* Garden Baſil *but of a middle ſize between the* Common Great *and* Buſh Baſil, *and differs nothing in its Roots, Stalks, Leaves, Flowers, nor Seed, but a little in the magnitude, and ſomething in the ſmell, which is like the ſmell of* Aniſeeds.

Common-Baſil *Aniſated.*

VI. *The Places.* Whence theſe Herbs firſt came, is unknown to us, but in *Italy*, *France*, *Spain* and *England*, they are only nouriſhed up in Gardens.

VII. *The Times.* They Flower in the heat of *Summer* as in *June* and *July*, by little and little, whereby they are long a Flowering, beginning at the top firſt, and ſo Flowering as 'twere downwards.

VIII. *The Qualities.* They are hot and moiſt in the ſecond Degree: They incide, attenuate, open, diſcuſs, reſolve, concoct, digeſt, and are carminative and anodyn; being Cephalick, Neurotick, Stomatick, Pectoral, Cardiack, Nephritick, and Uterine: alſo Emmenagogick, and Alexipharmick.

IX. *The Specification. Schroder* ſays, it is a peculiar thing to cleanſe the Lungs, and provoke the Courſes in Women.

X. *The Prepartions.* The Shops make uſe of, 1. *The Leaves.* 2. *The Seed.* 3. *And Diſtil therefrom a Water.* But you may farther prepare, 4. *A Juice.* 5. *An Eſſence.* 6. *A Spirituous Tincture.* 7. *A Saline Tincture.* 8. *An Oily Tincture.* 9. *A Decoction in Wine.* 10. *A Syrup.* 11. *An Oil.* 13. *A Cataplaſm.*

The Virtues.

XI. *The Leaves.* Their ſmell comforts the Brain (whatever ſome Authors ſay to the contrary) and were eaten in *Galen*'s time (I ſuppoſe as a Sallet,) being corected with Oil and Vinegar. Some Authors will have it that they dry up Milk in Womens Breaſts, which in my opinion is againſt their proper Nature, being hot and moiſt, and therefore more apt to breed Milk.

XII. *The Seed.* Being made into a fine Pouder, it may be given from half a dram to j. dram, in Wine, againſt the Palpitation or Trembling of the Heart, to cheer and comfort the ſame, and expel Melancholly, or ſadneſs of Mind: It is good alſo againſt Poyſon and the Stinging of Scorpions.

XIII. *The Diſtilled Water from the whole Plant.* It is good to clear the Eye-ſight, and to be uſed as a Vehicle for the other Preparations.

XIV. *The Juice.* If it is put into the Eyes, it takes away their Dimneſs, and drys up Humors which fall into them; ſnuft up the Noſtrills it cauſeth Sneezing, and ſo Purges the Brain: given to j. ounce in a Glaſs of Generous Canary morning and evening, it provokes Venery, or Luſt, and is good for ſuch as are troubled with Heart Qualms, or Swooning Fits, or ſtoppage of their Terms.

XV. *The Eſſence.* It much exceeds the *Juice* for Inward uſes, being cotrected, and made more Pure or fine, as being freed from its groſs and fæculent parts. It has the Virtues of the *Juice*, beſides which it is an excellent Stomatick, Cardiack, and Pectoral, freeing the Lungs from the Tartarous Matter which obſtructs them, and cauſing thereby a free reſpiration, and therefore is profitable againſt Coughs, Colds, Aſthma's, and other like Diſtempers of the Lungs. Doſe from j. ounce to ij. ounces in Wine, or *Syrup*, or ſome other Pectoral Vehicle, morning and evening.

XVI. *The Spirituous Tincture.* It is Stomatick and Cardiack, reſiſts Poiſon, and is good againſt the ſtinging of Scorpions, or bitings of other Venomous beaſts: prevails againſt Fainting and Swooning Fits, Sickneſs at Heart, and is good for ſuch as are troubled with Lethargies, Carus and Apoplexies, and other Cold Diſeaſes of the Head, Brain and Nerves. Doſe ij drams or more, in the *Diſtilled Water.*

XVII. *The Saline Tincture.* It is powerful againſt Diſeaſes of the Reins, opening their obſtructions, and removing the Tartarous and Viſcous Matter which affects them. It provokes Urine, expels Sand, Gravel, Slime and Stones out of the Reins and Urinary Paſſages. It provokes the Terms in Women, and facilitates

cilitates the Delivery of such as are in Labor, bringing away both Birth and After-birth. Dose from j. to iij. drams in a Glass of White Wine. It is good against the Stinging of Scorpions, and Hornets, biting of mad Dogs and other Venomous Creatures, as also against the Jaundice and Dropsie, carrying off the Morbifick Cause by Urine.

XVIII. *The Only Tincture.* It is singular against the Stone, Sand, Gravel, obstructions of Urine, as also the Yellow Jaundice, Coughs, Colds, Hoarsness, and the like, being taken in the *Syrup* of the same Herb, from iv. to xij. or xvj. drops: it prevails also against Palsies, Convulsions, Lethargies, Apoplexies, *&c.* and outwardly anointed it is good against the bitings of mad Dogs, and Pricks, Punctures, or Wounds of the Nerves.

XIX. *The Decoction in Wine.* Given from iv. to viij. ounces, it is good against Poyson, the stinging and biting of Venomous Creatures, Faintings, Swoonings, fits of the Mother; provokes the Terms, expels both Birth, and After-birth, as also Sand and Gravel from the Reins and Bladder, and is good against all cold Diseases of the Head, Brain, Nerves, Womb, and Bowels.

XX. *The Syrup of the Juice.* It is an admirable Pectoral, good against Coughs, Colds, Asthma's, shortness of Breath, Hoarsness, *&c.* causing expectoration, and making the Brest and Lungs easy. Dose ij. ounces either alone, or mixt with *Alicant*, *Tent*, or *Malaga*.

XXI. *The Oil.* It is made by *Boiling the Juice or Bruised Herb with Oil of Mirtles or Roses and Vinegar.* Being anointed with, it prevails against Pains of the Head and Nerves, Lethargies, Palsies and other cold Diseases of those Parts; and eases pains of the ears being dropt into them.

XXII. *The Cataplasm.* It is Discussive and Resolutive, good against the beginnings of Phlegmons, or Inflamations in any part of the Body: it is also good to take away black and blew spots of the Skin, discuss Contusions, and ease pain proceeding from any cold Cause.

CHAP. XLVII.

Of Citron *and* Clove BASIL.

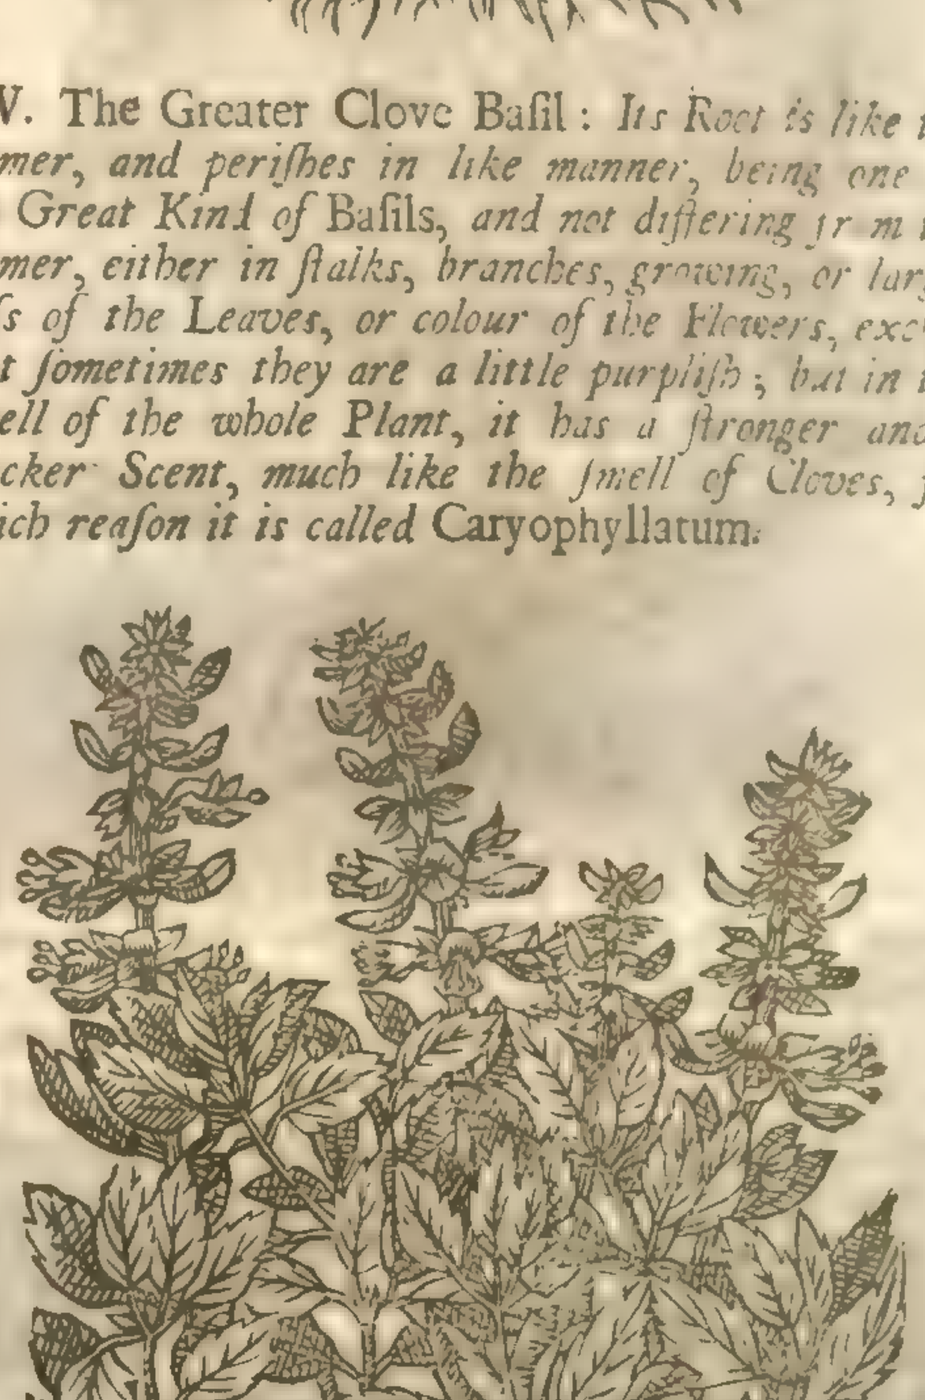
I. THE *Names.* The first of these is called in *Greek*, Ὤκιμον ἕτερον: in *Latin*, *Ocimum*, vel *Basilicum alterum*, *Ocimum Citratum*: in *English*, *Citron Basil.*

II. The second of these is called, Ὤκιμον ἢ Βασιλικὸν μικρότατον: in *Latin*, *Ocimum vel Basilicum Caryophyllatum*: and in *English*, *Clove Basil*, or *Basil Gentle.*

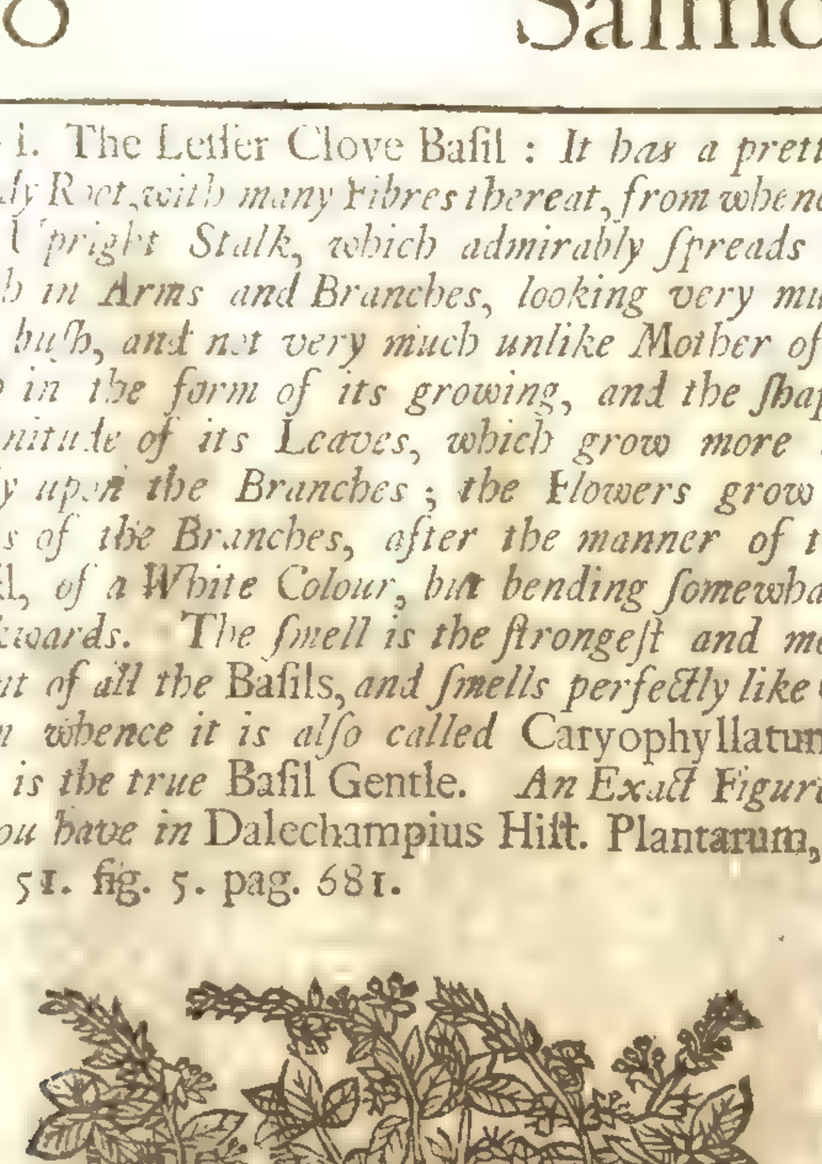
III. *The Kinds.* The first or *Citron Basil*, is the *Greatest Basil*, and is singular. The *Clove Basil* is, 1. *Ocimum Caryophyllatum majus*, the Greater Clove Basil. 2. *Ocimum vel Basilicum caryophyllatum minus*, the Lesser Clove Basil.

IV. The Descriptions. Citron Basil: *It has a pretty thick Root, with many Strings, which perishes after Seeding time, or upon the approach of Winter; from whence grows up one upright Stalk, spreading it self into many Branches, not much unlike to the Common Garden Kind, with Leaves set by couples at the Joints, but much larger, and of a reddish Colour in the hotter Countries, but not so in our colder, a little dented about the edges, of a very pleasing Smell, much resembling that of a Citron Peel, and therefore called* Citratum; *the Flowers are White, like those of the ordinary Common Basil, and the Seed Black alye, like those of the former.*

V. The Greater Clove Basil: *Its Root is like the former, and perishes in like manner, being one of the Great Kind of* Basils, *and not differing from the former, either in stalks, branches, growing, or largeness of the Leaves, or colour of the Flowers, except that sometimes they are a little purplish; but in the Smell of the whole Plant, it has a stronger and a quicker Scent, much like the smell of Cloves, for which reason it is called* Caryophyllatum.



VI. The Leſſer Clove Baſil: *It has a pretty long, woody Root, with many Fibres thereat, from whence riſes one Upright Stalk, which admirably ſpreads it ſelf forth in Arms and Branches, looking very much like to a buſh, and not very much unlike Mother of Time, both in the form of its growing, and the ſhape and magnitude of its Leaves, which grow more diſperſedly upon the Branches; the Flowers grow at the Tops of the Branches, after the manner of thoſe of* Baſil, *of a White Colour, but bending ſomewhat more backwards. The ſmell is the ſtrongeſt and moſt fragrant of all the* Baſils, *and ſmells perfectly like Cloves, from whence it is alſo called* Caryophyllatum, *and this is the true* Baſil Gentle. *An Exact Figure hereof you have in* Dalechampius Hiſt. Plantarum, lib. 5. cap. 51. fig. 5. pag. 681.



VII. *The Places.* They grow in the Eaſtern Regions, and hot Countries, where they are more odoriferous, than in our Northern Climes: but now they grow in all the Northern Nations in *Gardens*, where they flouriſh well, and yield their Seed in perfection, but their fragrant Scent is not altogether ſo ſtrong.

VIII. *The Times* They Flower gradually during the hotteſt Summer Months, as all *June*, *July*, and ſome part of *Auguſt*, Flowering at the Top firſt; and then is gradually Ripe not long after.

IX. *The Qualities.* Theſe are hot in the ſecond Degree, and moiſt in the firſt Degree: Inciding, Attenuating, Opening, Digeſtive, Reſolutive; Carminative and Anodyn. And appropriated to the Head, Nerves, Stomach, Breſt, Lungs, Heart, Reins and Womb: they are alſo Emmenagogick, and reſiſt Poiſon.

X. *The Specification.* They comfort the Nerves, prevail againſt Palſies, cleanſe the Lungs of Tartarous Matter, and provoke the Terms.

XI. *The Preparations.* You may prepare therefrom, 1. *A Pouder from the Seed.* 2. *A Diſtilled Water from the whole Plant.* 3. *A Juice.* 4. *An Eſſence.* 5. *A Spirituous Tincture.* 6. *A Saline Tincture.* 7. *An Oily Tincture.* 8. *A Decoction in Wine.* 9. *A Syrup.* 10. *An Oil.* 11. *A Cataplaſm.*

The Virtues.

XII. All theſe Plants have the ſame Virtues with thoſe in the former Chapter, and therefore the Preparations have the ſame, for which, and their particular Uſes we ſhall refer you thither.

CHAP. XLVIII.

Of American BASIL.

I. *THE Names.* This was wholly unknown to the *Greeks*, and therefore can have no Original *Greek* Name, but conſidering it is an *Indian* Plant, may well enough be called, Ὠκιμον ἢ Βασιλικὸν ἰνδικὸν: in *Latin*, *Ocimum Americanum vel Indicum*: and by *Camerarius*, *Baſilicum Hiſpanicum*: in *Engliſh*, *American Baſil.*

II. *The Kinds.* It is twofold, 1. *Ocimum Americanum maculatum lævе*, ſmooth, ſpotted American Baſil. 2. *Ocimum Americanum criſpum non maculatum*, criſped American Baſil, not ſpotted.

III. The Deſcriptions. *The* ſmooth ſpotted American Baſil, *has a Root like thoſe in the former Chapters, which periſhes after Seeding time, from whence riſes up a four ſquare reddiſh green Stalk, a Foot high, or better, from the Joints whereof ſpread out many Branches, with broad fat Leaves ſet thereon, two always at a Joint, one againſt another, as the* Baſils *have, but ſomewhat deeply cut in on the edges, and ſometimes a little crumpled, ſtanding upon long reddiſh Foot-ſtalks, of a dark purple colour, ſpotted with deeper purple ſpots, in ſome greater, in others leſs; the Flowers ſtand at the Top of the Stalks, Spike-faſhion, of a White Colour, with Reddiſh Stripes and Veins running through them; ſet or placed in*

dark

dark purple coloured Husks: The Seed is greater and rounder than any of the former Kinds, and somewhat long withal: the whole Plant smells strong like to the common or ordinary Basil and Camphire put together.

IV. *The* Crisped or Curled American Basil, not spotted: *It has a Root like the foregoing, being a degenerate of the other kind, risen (as* Parkinson *supposes) from the Seed of the former Plant, gathered in these colder Countries; and is indeed of the Kind of the* American spotted Basil, *having like Stalks, and such like large Leaves, cut somewhat deeply in on the edges, and curled or crumpled, as they also sometimes are, together with swelling bunches like Bladders in them, but wholly of a green colour, and without any spots, or spot upon them: the Flowers hereof are all white, and without any spots as the other has: the smell hereof is very strong, and perfectly resembling the former.*

V. *The Places.* They Originally grew in *America*, from whence they were brought into *Spain*, and from thence to us, being nourished up in our *Gardens*; the latter of which seems now to be a Native of our own Country.

VI. *The Times.* They Flower gradually in *June* and *July*, as the others do; and their Seed is ripe in *August*.

VII. *The Qualities.* They are hot in the second Degree, and moist in the first; highly Cephalick, Neurotick, Cardiack and Hysterick; they Attenuate, Open, Resolve, Discuss; are Carminative, Anodine, Alexipharmick, and Emmenagogick.

VIII. *The Specification.* I have found them peculiar against Palsies, and Pains and Aches proceeding from a cold Cause.

IX. *The Preparations.* You have, 1. *A Pouder from the Seed.* 2. *A Distilled Water.* 3. *A Juice.* 4. *An Essence.* 5. *A Spirituous Tincture.* 6. *A Saline Tincture.* 7. *An Oily Tincture.* 8. *A Decoction.* 9. *A Syrup.* 10. *An Oil.* 11. *A Cataplasm:* the Virtues and Uses of which, are the same with the same Preparations in *Chap.* 46. *Sect.* 12. to *Sect.* 22. aforegoing. 12. *A Distilled Oil.* 13. *The Powers.*

The Virtues.

X. *The Distilled Oil.* It cures Head-aches, Megrims, Lethargies, Apoplexies, Epilepsies, Palsies, Convulsions, Tremblings, and weakness of the Nerves, Obstructions of the Womb, Reins and Bladder, Punctures and Wounds of the Nerves, and all sorts of Pains, Aches, Sciatica, and Lameness from a cold Cause, being taken inwardly from iv. drops to xij. in some proper Vehicle; and outwardly anointing the part affected therewith. It expels Wind, and cures the Colick.

XI. *The Potestates* or *Powers.* They have all the former Virtues, but penetrate more, as being more Subtil or Volatile: They provoke the Terms in Women, ease Pains and Stitches in the Side, are good against Fits of the Mother, and Vapors, chear the Heart, revive the Spirits, resist Poison, and remove Melancholly, strengthening the Stomach, and all the *Viscera*. Dose from j. dram to ij. drams, in a Glass of Wine, or some other proper Vehicle.

CHAP. XLIX.

Of Stone BASIL.

I. *THE Names.* It is called in *Greek*, Ἀκινὸς ἢ Ἄκορος: in *Latin*, *Acinus* and *Acinos* by *Lobel* and *Dalechampius*: *Clinopodium Vulgare*, by *Matthiolus*: *Clinopodium majus*, by *Camerarius*: *Betanica Pauli*, by *Gualandinus*: *Pulegium montanum*, by *Lonicerus*; *Polycnemon*, by *Gesner*; and *Clinopodium Origano simile*, by *Bauhin*: in *English*, *Stone Basil*, and *Great Wild Basil.*

II. *The Kinds.* This is properly the first and chiefest of the *Wild Basils*; and is twofold. 1. *Acinus major*, the greater Stone Basil. 2. *Acinus minor*, the lesser Stone Basil.

Stone Basil Greater.

III. The Descriptions. *The* Greater Stone Basil *has a bushy Root, of many Strings set together at, and depending from one Head, which shoot forth Sockets round about: from this Root springs forth several hard, four square, hairy or hoary Stalks, a foot, or foot and half high, or more, set with two hairy green Leaves at each Joint, being covered also as the Stalks are with a hairy Down, somewhat larger than any of the other* Wild Basils, *coming near unto the bigness and fashion of the Leaves of* Origanum: *the Flowers grow in Rundles, or round the Stalk, in greater plenty than in the* Wild Basils *of the following Chapter, and of a purplish colour, but sometimes white, the Husks of which are somewhat larger and rougher.*

IV. *The* Lesser Stone Basil, *has like Roots, Stalks, Leaves, Flowers and Husks, and differs not any thing from the former, save that the Stalks are lower, the Leaves lesser, and the Husks of the Flowers smaller; in a word, it is of the same Kind, but the whole Plant is every way less.*

V. The

V. *The Places.* *Gerard* says they grow plentifully in *Autumn*, almost by every Hedge: *Parkinson* says, they are found sometimes in Corn Fields in *England*, but more often in open Woods and Copses which have been filled, and that almost through all our Countrey; more especially if they are stony places.

VI. *The Times.* They Flower in the latter end of *May*, all *June* and *July*, and the Seed is gradually ripe in *July* and *August*.

VII. *The Qualities.* They are hot and dry in the first Degree: Discussive, Astringent, and Vulnerary; and dedicated to the Womb.

VIII. *The Specification.* They are peculiar for stopping Fluxes, and the Terms in Women; more especially for Fluxes of Blood.

IX. *The Preparations.* You have from them, 1. *A Juice.* 2. *An Essence.* 3. *A Spirituous Tincture.* 4. *An Oily Tincture.* 5. *A Decoction.* 6. *A Balsam.* 7. *A Cataplasm.*

The Virtues.

X. *The Juice.* Given from j. ounce to ij. ounces, it strengthens the Stomach and Bowels; and bathed upon an Inflamation it asswages it.

XI. *The Essence.* This is more Stomatick than the former, and given inwardly, stops all sorts of Fluxes, whether of Humors or Blood, as also the Terms in Women. Dose from j. to iij. ounces, in some proper Vehicle.

XII. *The Spirituous Tincture.* This has all the Virtues of the former, and is good to take inwardly, to heal Wounds and Ulcers, from j. dram to half an ounce, in a Decoction of the same Herb; 'tis an excellent Vulnerary.

XIII. *The Oily Tincture.* It is good against Pains and Aches from a cold and moist Cause, gives ease in the Gout, and heals Wounds, Punctures, or other hurts of the Nerves, by anointing therewith Morning and Evening.

XIV. *The Decoction in Wine.* By fomenting therewith, it Discusses hot Tumors and Inflamations; used as an Injection into foul, fœtid, and hollow Ulcers, it cleanses them: and daily drunk from iv. to viij. ounces, it stops the overflowing of the Terms in Women, the Bloody Flux, and other Fluxes of the Belly.

XV. *The Balsam.* It is an excellent Vulnerary, cures Wounds by the first intention; and digests and cleanses, old, foul, rotten, and filthy Ulcers with great facility, after which it incarnates, or fills the Ulcer with Fleth, and presently heals it up.

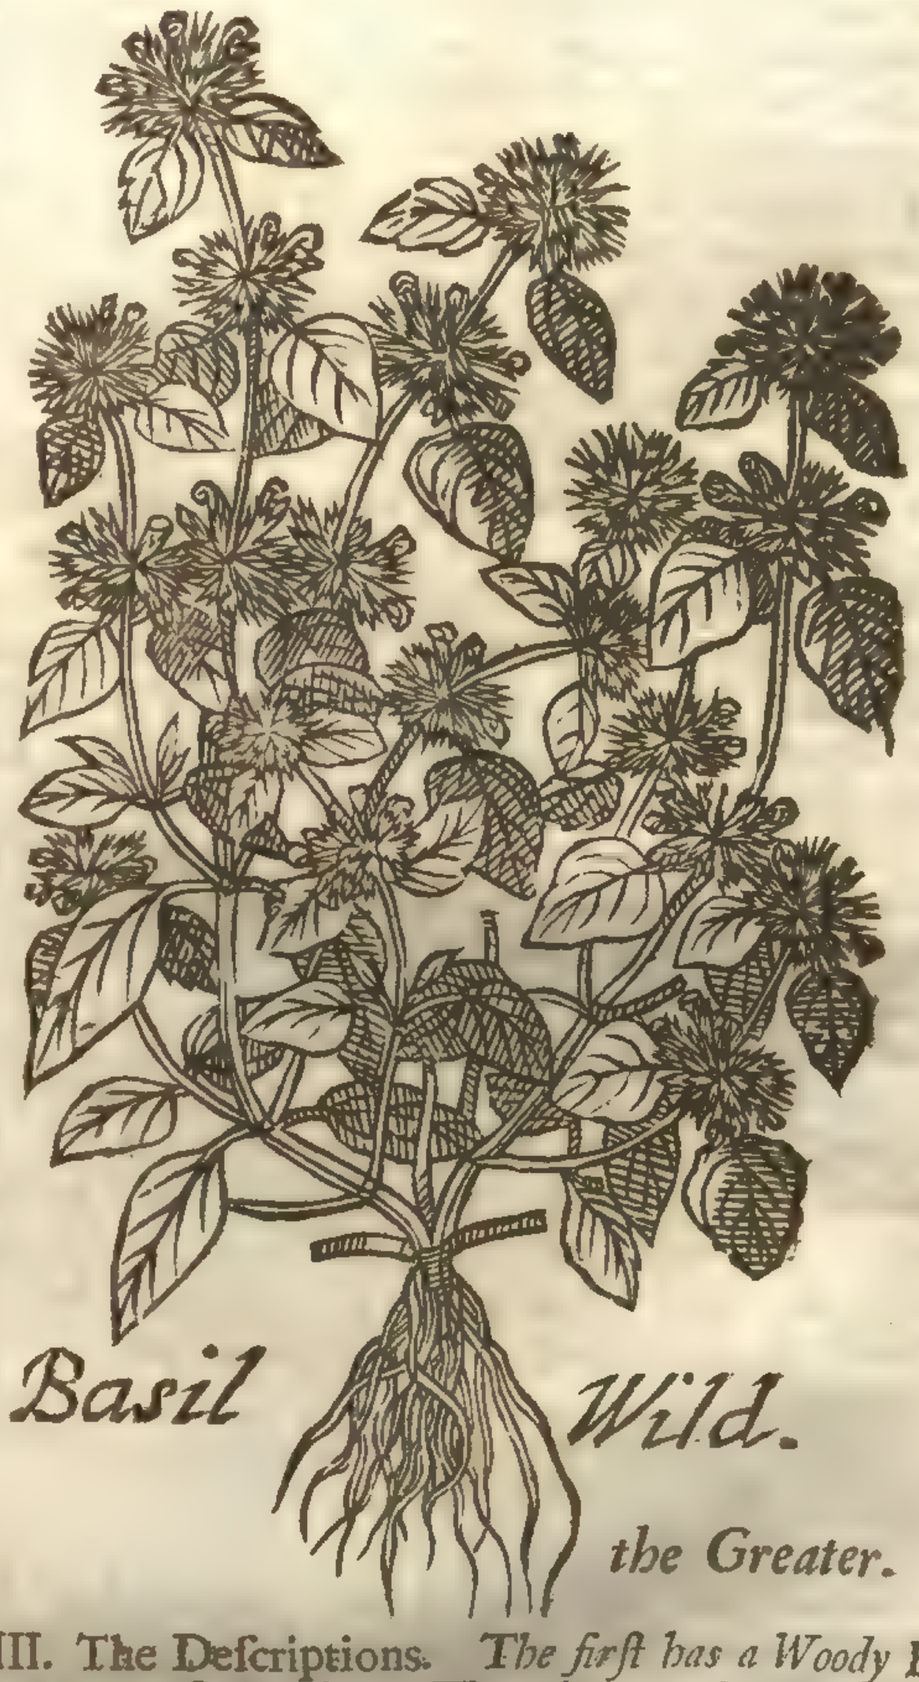
XVI. *The Cataplasm.* It is made of the Herb chopt small, beaten in a Mortar, and boiled in Milk, and brought to the thickness of a Pultise, with Yolks of Eggs, and Crumbs of Bread. It is Discussive, Resolutive, and Anodine, and of singular good use to be applied to a recent Contusion, or a Gout from a cold Cause.

CHAP. L.

Of Wild BASIL.

I. *THE Names.* It is called in *Greek*, Κλινοπόδιον (*quasi* Lectipes, *Bedsfoot Flower*, because they resemble the Beds feet:) in *Latin*, *Ocimum Sylvestre*, *Basilicon Agreste*, *Clinopodium*: and in *English*, *Wild*, or *Field Basil*, *Beds-foot Flower.*

II. *The Kinds.* There are three several Kinds hereof, 1. *Clinopodium Vulgare*, *Clinopodium minus*, (because less than the Stone Basil.) *Ocimum Sylvestre*, by *Lobel* and *Clusius*; *Acinos* and *Ocimastrum*, by *Fuchsius* and *Dodonæus*; *Clinopodium*, by *Anguillara* and *Turner*; *Clinopodium majus*, by *Camerarius*; *Pulegium Petræum*, by *Gesner*; *Clinopodium Alterum*, and *Pseudo-Clinopodium*, by *Matthiolus*; *Clinopodium Arvense Ocimi facie*, by *Bauhinus*; and *Basilicum Tertium*, by *Tragus*; in *English*, *Field Basil*; but the People call this as well as the next following, where they grow, *Horse Time*, and *Poley-mountain.* 2. *Acinos Anglica Clusij*, (which is thought to be, by *Clusius*, the true *Acinos* of *Dioscorides*;) *Clinopodium Ocimi facie alterum* of *Bauhinus*; our *English* Wild Basil the lesser. 3. *Acinos odoratissimum*, *Latifolia Columnæ*, Broad Leav'd sweet Scented Wild Basil.



Basil Wild. the Greater.

III. The Descriptions. *The first has a Woody Fibrous Root, full of hairy Threads, creeping along the Ground, and springing up Yearly of it self without Sowing; from whence rises up several square Stalks, about six or eight Inches high, with two small Leaves set at every Joint, being somewhat like Wild Marjoram, or the fine bush Basil, a little dented about the edges, but not much, and some Leaves not at all dented; and in some Plants and Places a little rough and hairy, and in others, less, or not at all: the Flowers grow at spaces with the Leaves, like as Horehound does, standing in green rough Cups, which are of a purplish Colour, and parted, as it were, into four equal short pieces at the end, like to the four square foot of a Bed-stead, and open with several Leaves like other hooded Flowers; the Cups of the Flowers have not every one of them a single Foot-stalk, but many stand together upon the same Pedicle or Stem; after which comes small round reddish Seed, growing three or four together in small swollen Husks. The whole Plant, has some small heat, but more dryness in the Taste thereof, and sweet or odoriferous in Smell between* Basil *and* Calamint.

IV. *The second Kind has also a Bushy, Fibrous Root, which perishes every Year, from whence rises up several slender four square Branches or Stalks, seven or eight Inches high, lying on the Ground, on which*

which grow divers small grayish green Leaves, two always set together at a Joint, resembling much the former, or those of the Stone Basil, *but smaller, shorter, and fuller of Juice, not dented about the edges at all, and almost like to Mother of Time, or the smaller* Garden Basil, *called* Basil Gentle, *having an excellent sweet Scent, but not Heady: from the middle of the Branches up to the Tops, grow the Flowers in Rundles or Spaces about the Stalks, being very like to the former just now described, but of a more blewish purple colour, with a White Eye, or Circle in every Flower, which being past, there comes three or four small Seeds, like the first in the Husks where the Flowers stood, which fall and rise again every Year of their own Sowing.*

V. *The third Kind has a bushy Root with many Fibrous Strings like the former, from whence rises up four, five, or more, four square hard Woody Stalks, divided into many Branches, covered with a soft white hairyness, two foot long, or longer, not growing upright, but trailing in some measure upon the Ground: the Leaves grow upon short Foot-stalks, by couples, of a light green colour, somewhat like the Leaves of* Basil, *or rather* Bawm, *about three quarters of an Inch broad, and not fully an Inch long, a little sharp pointed, and lightly notched about the edges, covered also with a light soft hoariness, of a very sweet smell, not much inferiour to* Garden Marjoram, *of a hot biting Taste: out of their Bosoms grow other smaller Leaves, or else Branches: the Flowers also grow out of the Bosoms of the Leaves, towards the Tops of the Stalks and Branches, not in Whorls or Rounds, like* Acinos, *or* Stone Basil, *but having one little short Foot-stalk, on which is placed three, four, or more, small Flowars, gaping open, and divided into four unequal parts at the top, like the* Flowers *of* Basil, *and very near of the likeness and bigness of the Flowers of* Garden Marjoram, *but of a pale blewish colour, tending towards a purple, after which come the Seed Vessels, which contain small roundish blackish Seed.*

VI. *The Places.* The first grows commonly in the borders of Fields, and among Corn it self, as at *Sutton* in *Kent*, not far from *Dartmouth*; at *Thetford* in *Norfolk*, and in divers other Dry, Sandy, and Untilled Grounds. The second grows Wild in *Kent* in divers places, where *Clusius* says he found it, also in several other parts of *England*; *Gerard* says he found it a little on this side *Pomfrait* in *Yorkshire*, and since by *Dartford* in *Kent*, and in the Isle of *Thanet*: he says it is brought to our *London* Markets, and is called by the Herb Women *Polymountain.* The third grows Wild in hot Countreys, but with us in *Gardens*, and is often found amongst *Sweet Marjoram.*

VII. *The Times.* The two first Flower in *June* and *July* gradually, and their Seed is ripe in *July* and *August*: The third Flowers in *July* and *August*, and its seed is ripe in *August* and *September.*

VIII. *The Qualities.* They are all of a nature, hot and dry in the end of the second, or beginning of the third Degree: they are also, Attenuating, Inciding, Opening, Carminative, Discussive, Resolutive, Vulnerary and Anodine; Cephalick, Neurotick, Stomatick, Cardiack, Hysterick, and Arthritick; and powerful Alexipharmicks and Emmenagogicks.

IX. *The Specification.* The Field Basil has been experimented against Convulsions, Cramps, and Neurotick Distempers. *Acinos* or *English* Wild Basil is approved for Stopping Fluxes: and the Broad Leav'd sweet Scented Wild Basil is good to facilitate the delivery.

X. *The Preparations.* The Shops keep nothing of them; but you may prepare, 1. *An Inspissate Juice of the Acinos.* 2. *A Spirit from the first and third.* 3. *A Spirituous Tincture.* 4. *An Oily Tincture.* 5. *A Saline Tincture.* 6. *A Balsam or Oil of the first.*

The Virtues.

XI. *An Inspissate Juice of the Acinos.* Being given to a dram in Red Wine, it stops all sorts of Fluxes of the Belly, and Fluxes of the Terms; and dissolved,

diſſolved, and mixed with Lard into an Ointment it diſcuſſes hot Tumors.

XII. *The Spirit from the firſt and third.* It is ſingular good againſt Convulſion-fits, Megrim, Vertigo, Lethargy, and other cold and moiſt Diſeaſes of the Head, Brain, Nerves, and Womb: outwardly bathed upon places troubled with the Cramp, it cures them. Doſe from j. dram to ij. in Wine or Ale.

XIII. *The Spirituous Tincture.* If made of the firſt or third, it warms, comforts, and ſtrengthens the Stomach, cauſes a good Appetite, and is good againſt the ſickneſs thereof. Doſe ij. drams, more or leſs in Wine, Ale, or Poſſet-Drink.

XIV. *The Oily Tincture* Taken to half a dram in any fit Vehicle, it prevails againſt the Stone and Stoppage of Urine: outwardly anointed upon places pained from any Cold Cauſe, it eaſes the Pain, warms and comforts the Part, and reſtores it to its due ſtrength.

XV. *The Saline Tincture.* It opens Obſtructions of the *Viſcera*, and being made of the third Kind, it provokes the Terms, and expels the Dead Child, and After birth. Doſe from j. dram to ij. drams in Wine.

XVI. *The Balſam* or *Oil of the firſt.* It is good againſt Convulſions, Cramps, Ruptures, Strangury, Stinging and Bitings of Venomous Beaſts, and other Diſeaſes of like kind, being anointed upon the Part afflicted, Morning and Evening.

CHAP. LI.

BALSAM-APPLE Male.

I. *THE Names.* It was unknown to the *Greeks*: The *Latins* call it *Balſamina*, which name it took from its ſanative or healing properties. Some call it *Viticella*, from its Vine-like appearance: *Cordus* calls it *Cucumis puniceus*: *Geſner*, *Balſamina pomifera*: *Lobel*, *Balſamina Cucumerina punicea*: Some, *Pomum Hieroſolymitanum*: and we in *Engliſh*, the *Male Balſam Apple*. It is thought by ſome to be that which *Pliny* ſpeaks of, *lib.* 20. *cap.* 3. which the *Greeks* call *Cucurbita Somphos*; but this is diſputable.

II. *The Kinds.* Of the *Balſamina* there are three principal kinds. 1. *Balſamina Mas*, which is that we treat of in this Chapter, and is called by all the names aforegoing: as alſo *Balſamina* by *Matthiolus*: *Balſamina prima* by *Fuchſius* and *Anguila*: *Charantia* by *Dodonæus* and *Lonicerus*: *Balſamina Mas* by *Gerard* and *Parkinſon*: *Momordica* by *Caſtor*: *Momordica fructu luteo rubeſcente*, in *Horto Eyſt.* 2. *Balſamina fœmina*, of which in the next Chapter. 3. *Balſamina lutea, ſive noli me Tangere*, which is called *Herba Impatiens*; in *Engliſh*, *Codded Arſmart.*

III. The Deſcription. *It has a Root which is ſmall and ſtringy, creeping a good way within the Earth: it ſprings up with divers ſlender reddiſh Stalks and Branches, ſhooting forth many claſping tendrels, much like to a Vine, by which it takes hold of any Pole, Twig, or other thing which ſtands near it; but without any ſuch Supporters, it lies upon the ground, not being able to ſupport it ſelf, for which reaſon it is reckoned among the number of the Climers, or a kind of Cucumer, in reſpect to the Flowers and Fruit. The Leaves grow from the Stalks, and ſtand upon Foot-ſtalks, being cut in on the edges, into ſeveral diviſions, like to a Vine leaf, or thoſe of white Briony, but much ſmaller, tenderer, and more divided. The flowers are yellowiſh, like to thoſe of the Cucumer, coming forth in the ſame manner at the Joints with the Leaves: after which comes the Fruit, which is ſomewhat long and round, pointed at both ends, and bunched on the out ſide in rows, the skin it ſelf being ſmooth and very red, almoſt black when the Fruit is ripe, which has a reddiſh Pulp within: The Seed is manifold, rough, hard, flat, and reddiſh; but when dry, of a grayiſh black colour, ſomething like unto Citrul, or Water Melon Seeds, both for the form and largeneſs.*

IV. *The Places.* It is nurſed up with us in *Gardens*, but the Seed came originally to us from *Italy*, and we yet generally make uſe of the *Italian* Seed.

V. *The Time.* It flowers late with us, and the whole Herb withers before the Fruit comes to ripeneſs; it being a tender Plant, and ſo not able to endure our early cold Nights, for which reaſon we have no ripe Seed here.

VI. *The Qualities.* It is almoſt cold in the firſt Degree, and dry in the ſecond: It is Pectoral, Pulmonick, and Vulnerary, and purely an alterative.

VII. *The Specification.* It is a peculiar Specifick for the Curing of Wounds and Ulcers.

VIII. *The Preparations.* 1. *A Pouder of the Leaves.* 2. *A Decoction of the Plant.* 3. *The Inſpiſſate Juice.* 4. *A Spirituous Tincture.* 5. *An Oleaginous Tincture.* 6. *An Oil by Infuſion in Oil Olive.* 7. *The Balſam.*

The Virtues.

IX. *The Pouder of the Leaves.* Given to j. dram Morning and Evening in Red Port Wine, it is ſaid to be good againſt Ruptures or Burſtenneſs; and applied, it heals Wounds.

X. *The Decoction in Wine, or Wine and Water.* Being drunk to five or ſix ounces, it gives eaſe in the Colick, helps the Gripings of the Bowels, and ſtops inward fluxes of the Blood, whether from the Stomach or Bowels; repreſſes Vapors in Women, and what ſome call the Riſing of the Lights.

XI. *The*

XI. *The Inſpiſſate Juice.* Diſſolved in a mixture of Red Wine and Water, it is a ſingular thing to heal internal wounds, and ſtop inward bleedings, and to repreſs the Fits of the Mother. Injected up the Womb two or three times a day, it ſtops the overflowing of the Terms, and the Whites in Women. If it be reduced to pouder, and drank to one dram in *Red Port Wine* it heals inward Wounds, and outwardly being ſtrewed upon any freſh green Wound, it heals it.

XII. *The Spiritous Tincture.* It heals inward Wounds, and gives eaſe in the Colick; and is found to be of excellent uſe in fainting and ſwooning Fits. Doſe from j. dram to ij. drams in any proper Vehicle.

XIII. *The Oleaginous Tincture.* Given to j. dram, it opens obſtructions of the Womb, and is good againſt Fits of the Mother. It alſo eaſes vehement pains in the Back and Reins, being given in a proper Vehicle twice a day.

XIV. *The Oil by Infuſion in Oil Olive.* It is a moſt ſingular Vulnerary, not only for all ſorts of external Wounds, but for inward Wounds alſo, being drunk (in ſome proper Vehicle) from ij. drams to four, twice or thrice a day. And as for all ſorts of outward Wounds which are green or freſh, it drys them, conſolidates their Lips, and heals them. It alſo drys up the moiſture of inveterate or old Ulcers, which hinders them from healing, and diſpoſes them to a ſpeedy cure. Being applied with Lint, it is good againſt the Piles or Hemorrhoids; and being applied hot, it is effectual againſt Punctures of the Nerves. Some Authors ſay, that anointed on the Bellies of Women which are Barren, it cauſes them to be fruitful. It alſo cures burnings with Fire, or ſcaldings with Water, and eaſes the ſtinging of Bees, Waſps, Hornets, *&c.* and being anointed on the Marks, Scars, or blemiſhes of Wounds; it takes them away, or much abates them.

XV. *The Balſam.* If it is made of the former Oil, by addition of *Venice* Turpentine, or *Balſam Capivi*, and Bees Wax; it becomes a moſt ſingular Vulnerary, and in many reſpects more excellent than the ſimple Oil, and indeed is much more profitable for the healing of rotten running Sores, and old putrid Ulcers; applied to Cramps or Convulſions for ſome time, it helps the ſame, and is a ſingular thing to cleanſe and heal Ulcers in Womens Breaſts, and ſuch as happen in the Secret Parts of Man or Woman.

CHAP. LII.

BALSAM-APPLE Female *and* Yellow.

I. *THE Names.* It is alſo unknown to the *Greeks*: but is called in *Latin* by *Matthiolus*, *Anguilla*, *Fuchſius*, *Geſner* and *Tragus*, *Balſamina altera*: by *Dodoneus*, *Balſaminum*: by *Lugdunenſis*, *Balſamina*: by *Cordus*, *Balſamella*: by *Geſner ad Cordum*, *Balſamina amigdoloides*: by *Camerarius*, *Tabermontanus*, and *Gerard*, *Balſamina Fœmina*: by *Lobel*, *Balſamina fœmina perſicifolia*; and by *Ceſalpina*, *Catanance*: and in *Engliſh Balm Apple female.*

II. *The Kinds.* It is the ſecond kind of the *Balm Apple*, *viz.* the *Female*; differing very much from the former, both in the form and manner of growing. The *Yellow Balſamine* is the third kind, and by *Lobel*, *Camerarius*, *Gerard*, and others, is called *Perſicaria Siliquoſa*, in *Engliſh*, *Codded Arſmart*; by *J. Baubin*, *Noli me tangere*: by *Tragus*, *Mercurialis ſylveſtris altera*: by *Dodoneus*, *Impatiens Herba*; and by *Columna*, *Balſamita altera.*

III. The Deſcription. *The* Female Balm Apple *does much differ from the former: It has a Root diſperſed into manifold Arms, from whence proceeds many ſmall ſtrings ſpreading under the Earth: The Stalks ariſe from the main ſtock of the Root, which are thick, fat, full of Juice, in ſubſtance like the ſtalks of Purſlane, of a reddiſh colour, and ſomewhat ſhining. The Leaves are long and narrow, much like thoſe of the Willow or Peach tree, a little toothed about the edges: among which come forth the Flowers, of an incarnate colour, tending to blewneſs, with a little tail or ſpur annexed thereto, like to Larks heels, of a faint, light crimſon colour. Theſe being gone, there comes up in their places the Fruit, or Apples, rough and hairy, round, and ſharp at the point, and leſſer than thoſe of the Male, at firſt green, but afterwards yellowiſh when ripe, the which open of themſelves when full ripe, and caſt abroad their Seed, much like unto a* Fetch, *ſays* Dodoneus; *or like to Lentils, as other Authors ſay. But that which* Gerard *had in his Garden caſt forth the Seed like Cole-flower, or Muſtard-ſeed, which made him to think that either the Clime had altered its ſhape, or that there was two kinds thereof.*

IV. *The* yellow Balſamint *(which* Getard *places with the Arſmarts, and* Parkinſon *with the Mercuries) has a black and thready Root, which periſhes every year, from which ſpring forth Stalks about two foot high, tender, green, and ſomewhat purpliſh, hollow, ſmooth, juicy and tranſparent, with large and eminent Joints: From whence proceed Leaves like thoſe of* French *Mercury, a little larger and broader towards their Stalks, and thereabouts alſo cut in with deeper Teeth or Notches. From the boſoms of each of theſe Leaves, come forth long Stalks hanging downwards, which are divided into three or four branches, upon which hang yellow flowers, much gaping, with crooked Spurs or Heels, and ſpotted alſo with red or crimſon ſpots. The Flowers being gone, there ſucceeds Cods containing the Seed, which are about two Inches long, ſlender, knotted, and of a whi-*

tiſh green, creſted with greeniſh lines; which as ſoon as they begin to be ripe, are ſo impatient, that they will by no means be touched, but preſently the Seed will fly out of them into your face) from whence came the name herba impatiens) *and for which reaſon* Lobel, *and others have called it,* Noli me tangere)

V. *The Places.* The firſt of theſe is only Nurs'd up with us in *Gardens.* The latter grows in ſhady Woods in *France, Germany* and *Italy.* It has alſo been found in ſhady Woods ſide, and ſhady ſides of Mountains, and their Vallies in *Wales*; in *Shropſhire* at *Marington*; on the Banks of the River *Kemlet*, and at *Guerudee* in the Pariſh of *Cherſtock*, half a mile from the ſaid River, in the Highway among great Alder-trees: but it will grow and abide in our *Gardens* very well, and every year ſow it ſelf, being ſet in a ſhady place.

VI. *The Times.* The firſt of theſe (as alſo the former Male kind) muſt be ſown in the beginning of *April*, and in a hot bed of Horſe-dung, as you do *Musk-Melons, Cucumbers*, and ſuch like cold Fruits: then they muſt be replanted abroad from the ſaid beds, into a hot, moiſt, and fertile place, at ſuch time as they have gotten three Leaves a piece. They flower in *July* and *Auguſt*, and their fruit comes to the greateſt perfection our Country will give it in *September* following. The *Noli me tangere* flowers in its natural place, about the middle or end of *Auguſt*, and preſently after Seeds: but that which grows with us in *Gardens* flowers in *June* or *July*.

VII. *The Qualities.* The firſt of theſe is cold in 1° and dry in 2°; Cephalick, Neurotick, Vulnerary, and Alterative. The *Noli me tangere*, is hot and dry in the third degree; Nephretick, Diuretick and Emetick.

VIII. *The Specification.* The latter Specifically provokes Urine, even unto a wonder, as *Geſner* teſtifies.

IX. *The Preparations.* They may be the ſame with thoſe of the Male kind, as, 1. *Pouder.* 2. *Decoction.* 3. *Inſpiſſate Juice.* 4. *Spiritous Tincture.* 5. *Oleaginous Tincture.* 6. *Oil by Infuſion.* 7. *A Balſam.* From the *Noli me tangere*, there is, 1. *A Pouder of the Herb.* 2. *An Inſpiſſate Juice.* 3. *A Diſtilled Water.*

The Virtues.

X. *The Pouder.* It dries up green Wounds, conſolidates, and heals them.

XI. *The Decoction.* It cleanſes old Ulcers, and rotten Sores, and diſpoſes Fiſtula's (being injected into them) to a healing.

XII. *The Inſpiſſate Juice.* Being reduced into a pouder, and ſtrewed upon a green wound, it preſently conglutinates it, and heals it.

XIII. *The Spiritous Tincture.* It is helpful to a Gangrene in beginning, and by its gentle ſtyptick quality, reſtores and conſerves the heat of the Part.

XIV. *The Oleaginous Tincture.* It has the ſame Virtues with the Spiritous Tincture, but much more powerful; bathed upon the Nerves, it comforts and ſtrengthens them, helps Cramps, and eaſes Aches and Pains, and is good againſt punctures of the Sinews.

XV. *The Oil by Infuſion*, heals Wounds, abates Inflamations, and cures fiery Puſtules of the skin.

XVI. *The Balſam.* It cleanſes and heals Ulcers, and gives eaſe in Punctures of the Nerves: being applied, it cures old rotten Ulcers, running Sores, and kibed Heels.

XVII. *The Pouder of Noli me tangere.* It is Emetick, and ſometimes Cathartick, working (as ſome Authors ſay) ſtrongly; for which reaſon *Dodoneus* ſays, it has a pernicious faculty, and is deleterious: yet it may be given from a ſcruple to half a dram in ſome convenient Vehicle, in ſtrong Bodies.

XVIII. *The Inſpiſſate Juice.* It is Emetick like Cambogia, and ſometimes it works downwards like Scammony, but its operations are not altogether ſo certain. It may be given from ten grains to a ſcruple, made up into a Bolus, and ſo ſwallowed.

XIX. *The Diſtilled Water.* It is of mighty power to provoke Urine; and if largely drunk, it is ſaid to induce a Diabetes; and ſome magnifie it, as to expel the Stone in the Reins: but without doubt it powerfully cleanſes the Reins and Urinary paſſages, expelling Sand, Gravel, Slime, and other things which obſtruct the Paſſages of the Urine.

CHAP. LIII.

BAWM Garden *and* Baſtard.

I. THE *Names.* It is called in *Arabick, Bederengie, Bedarungi, Cederenzegum, Turungen, Marmaçor:* in *Greek,* Μελισσόφυλλον, μελίφυλλον, μελίτταινα, *id eſt, Apiaſtrum, &* ἀιμέλιττα, *Apes delectentur, Dioſcor. lib.* 3. *cap.* 18. *Pliny lib.* 21. *cap.* 20. *Melyſophyllon & Melittis:* in *Latin, Meliſſa. ab Apibus quæ etiam* μέλισσαι *dicuntur*: and in *Engliſh, Bawm.*

Bawm.

II. *The Kinds.* There are Six ſeveral kinds of *Bawm*, of which Authors treat: *viz. Meliſſa hortenſis*, the *Garden Bawm*, called by *Anguillara, Brunsfelſius, Ceſalpinus* and *Gerard, Meliſſa:* by *Tragus, Meliſſa domeſtica*; by *Geſner in hort. Caſtellus, Lugdunenſis* and *Tabernmontanus, Meliſſophyllum:* by *Fuchſius, Melyſſophyllum vulgare:* by *Matthiolus, Cordus, Lacuna, Lobel, Apiaſtrum:* by *Parkinſon, Meliſſa vulgaris odore Citri:* and by *Geſner, Citrago.* 2. *Meliſſa*

lissa notha, Baſtard Bawm, called by *Fuchſius*, *Melyſſophyllum*; by *Cluſius*, *Lamium Pannonicum*: theſe we treat of in this Chapter. 2. *Melissa Turcica*, Turkey Bawm. 4. *Melissa Moluccana odorata*, of which we treat in the next Chapter. 5. *Melissa Peregrina*, called by *Matthiolus* and *Lugdunenſis*, *Melissa Moldavica*. 6. *Melissa Moluccana fœtida*, of which we ſay nothing in this Work.

III. The Deſcription. *The common Garden Bawm has a Root of a Woody ſubſtance, and full of ſtrings, which endure long, and faſten themſelves ſtrongly in the ground, the Leaves and Stalks only dying every Year: from this Root ſprings up divers ſquare green Stalks, with round hard dark green Leaves (and ſometimes of a lighter green, according to the place it grows in) a little dented about the edges, ſet by couples at the Joynts, and almoſt of a Citron or Limon ſmell: the Flowers are ſmall and gapeing, growing at Tops of the Stalks, of a pale Carnation colour, and almoſt white.*

IV. Fuchſius *his* Baſtard Bawm *has a hard woody, ſtringy Root like the former, from whence ſprings ſquare Stalks half a yard high, with Leaves like unto common Bawm, but larger and darker coloured, and not of ſo pleaſant a ſcent*; *the Flowers are white, and ſometimes of a pale purple colour, but much larger than thoſe of the former, almoſt like to the yellow* Lamium, *or Dead Nettles, or to thoſe of the Mountain Calamint.* Parkinſon *ſays the flowers are of a pale purpliſh colour on the lower parts, and whitiſh above, not being ſo pleaſantly ſcented as the common* Garden Bawm.

V. *The Places.* The firſt grows with us only in *Gardens*, and is profitably planted there, as *Pliny lib.* 21. *cap.* 12. ſays, for the delight of Bees, for which cauſe it is called *Apiaſtrum*, and by ſome *Apium folium*, *Bees leaf.* The other is a Native of *Hungaria*, but is nouriſhed up by curious Herboriſts in their *Gardens*. I have ſometimes found it growing in *England*, on the Sunny ſide of Ditch and Bank ſides, where the ground has been pretty dry.

VI. *The Time.* They flower in *June*, *July* and *Auguſt*, and wither or dye away towards *Winter*, ſpringing forth a freſh from the old Roots.

VII. *The Qualities.* They are both hot and dry in the ſecond degree: they are Cephalick, Neurotick, Cardiack, and ſomething Hyſterick: famouſly Cordial (chiefly the Garden) and Vulnerary, Alexipharmick, and Alterative.

VIII. *The Specification.* It is approved againſt fainting and ſwooning Fits, Poiſons, Sickneſs at Heart, and Hypochondriack Melancholy.

IX. *The Preparations.* You may prepare from it, 1. *A cold Diſtilled Water.* 2. *A Spirituous Water.* 3. *A Spirit.* 4. *A Spiritous Tincture.* 5. *An Oily Tincture.* 6. *A Saline Tincture.* 7. *An Eſſence.* 8. *A Syrup.* 9. *A fixed Salt.* 10. *A Balſam or Oil.* 11. *A Cataplaſm.* 12. *An expreſſed Juice.*

The Virtues.

X. *The cold Diſtilled Water.* It is a Cordial Water, and only uſed as a Vehicle to convey Cordial Medicaments in.

XI. *The Spiritous Water.* If it is a little dulcified with Syrup of Bawm, it is an excellent Cordial, and good againſt Fainting and Swooning Fits, Convulſions, and the like, and this chiefly in Children: It eaſes gripings in the Bowels, and comforts Univerſal Nature. Doſe from half an ounce to two ounces, according to the Age of the Patient.

XII. *The Spirit.* This is much more excellent than the former water, and has a mighty power to repreſs Hypochondriack Melancholy: it revives the Spirits, and makes the Heart merry and chearful, eaſing the Paſſions thereof after a wonderful manner. Doſe from j. dram to ij. drams in any proper Vehicle.

XIII. *The Spiritous Tincture.* It has the former Virtues, and more powerful to all the ſaid intentions, but not ſo pleaſant: It is indeed a declared thing againſt all Paſſions of the Heart, the Colick, and Griping Pains of the Bowels. Doſe j. or ij. drams, ſweetned with the Syrup of the ſame.

XIV. *The Oily Tincture.* Outwardly bathed upon any place pained from a cold and moiſt cauſe, it gives eaſe and relief: and taken inwardly from xij. to xxx. drops in ſome fit Vehicle, it gives eaſe in pains of the Spleen, Sides and Stomach, eſpecially if they proceed from a cold cauſe: it alſo eaſes pains in the Back and Reins proceeding from weakneſs and obſtructions: and being taken in a right time, it has been found to provoke the Courſes in ſuch as have them preternaturally ſtopt.

XV. *The Saline Tincture.* Being given from one dram to two, or more, in ſome proper Liquor, it is good againſt Poiſon, and the bitings of Mad-Dogs, eaſes the pains of the Stomach, and the gripings of the Bowels, proceeding from ſharp humors: it opens the obſtructions of the Lungs, and cauſes ſuch to breath freely, who before could ſcarcely take their breath: It may be made pleaſant with the Syrup, of which we ſhall ſpeak anon.

XVI. *The Eſſence.* It cauſes ſpeedy and eaſie delivery to Women in Travel; and in a more eſpecial manner is recommended againſt Hypochondriack Melancholy, being aſſiduouſly taken for ſome time. It has all the Virtues of the Spirit and Tincture, but muſt be given in a larger Doſe, by reaſon of the groſs Particles which are mixt with it: mixed and made pleaſant with Roſe-water and Sugar, or its own Syrup, it may be profitably given to Women in Child-bed, to bring away the After-birth, or cauſe a perfect cleanſing. *Galen lib. de Simpl.* ſays, that Bawm is like unto Horehound in Qualities, but much weaker. I will not gainſay *Galen* totally; but that it may be ſo in ſome Caſes; as in Hyſterick Diſeaſes: but where a Cordial is intended, I am ſure Bawm is much the ſuperiour, and is much better for Women in their Lying in, when they are fainting, from their ſore Travel or hard labour. Doſe from half an ounce to two ounces. It is good againſt Poiſon, and the bitings of Venemous Beaſts, and ſuch as have been long troubled with the Bloody Flux.

XVII. *The Syrup.* It is Cordial, but is chiefly uſed as a Vehicle to other Cordial Medicines, and to make them palatable: however it is of it ſelf a ſingular pectoral, and good againſt Coughs, Colds, Aſthma's, Spitting of Blood, Obſtructions of the Lungs, and other like Diſeaſes of the Breaſt, and parts adjacent.

XVIII. *The fixed Salt.* It ſtrengthens the Stomach and Spleen, reſiſts Vomiting, and carries off much of the Morbifick Cauſe by Urine. To ſtop Vomiting you may give it thus: *Take of this Salt a ſcruple*; *Spirit of Sulphur* viij. *or* x. *drops: mix them till the effervеſcence is over: then diſſolve it in a Glaſs of Canary, or ſome other Stomatick Vehicle*; and ſo give it the Patient to drink.

XIX. *The Balſam* or *Oil.* They are moſt ſingular Vulneraries, and many times cure Wounds at one Dreſſing: and it is my opinion (grounded upon the experience I have had of the Plant, in Chirurgery) that it is not interiour for curing Wounds and Ulcers, to any of the Allheals: and from its vulnerary and healing Properties it was, that our Anceſtors called it *Balm*, as being of the nature of *Balſam*. Outwardly applied it is good againſt the ſtinging or ſtri-

king of *Scorpions*, and the Poyſonous Bite of the *Phalangium*

XX. *The Cataplaſm.* Being applyed it eaſes Pains coming from a cold Cauſe, and Diſcuſſes Flatulent Tumors: and being mixt with a little *Niter*, or the *Amalgamation of Mercury with Lead*, it prevails againſt Wens, Kernels and hard Swellings in the Neck and Throat or other parts, and is good alſo to give eaſe in the Gout, and ripen Biles and break them.

XXI. *The Expreſſed Juice.* It ſtrengthens the Vital Spirits; and being given to iij. iv. or vj. Spoonfuls in a Glaſs of *White Port Wine*, it cauſes ſpeedy Delivery to Women in Travel, and brings forth both *B*irth and After-birth. It is an Antiſcorbutick, and helps the *B*loody Flux, by reaſon of its *B*alſamick and healing Virtues. Put into the Eyes, it is a ſingular remedy for dimneſs of Sight, and being mixed with Honey it takes off Films which obfuſcate and hinder the Sight.

XXII. *The Baſtard Bawm.* You may make the ſame Preparations of this, as of the former, and they have in General the ſame Virtues, but as to the Vital Indications, they are not ſo powerful. However in all *Hyſterick Diſeaſes* they very much exceed, as being more effectual in opening Obſtructions of the Womb, and reſiſting Fits of the Mother.

CHAP. LIV.

BAWM, Turkey *and* Syrian.

I. THE *Names.* The firſt is called in *Latin*, *Meliſſa Turcica*, or *Meliſſophillum*, or *Meliphyllum Turcicum:* by *Geſner* in *Hort. Cedromella*, and *Citrago Turcica*, and in *Engliſh*, *Turkey Bawm.*

II. The other is called in *Latin*; *Meliſſa Syriaca*, and by ſome *Meliſſa Moluccana:* by *Matthiolus*, *Meliſſa Conſtantinopolitana:* and by *Tabernmontanus*, *Cardiaca Syriaca:* by *Lobel*, *Maſeluc Turcorum.*

III. *The Kinds.* The *Turkey Bawm*, is the Third Species, in our order: The *Syrian*, or *Moluccan* conſtitutes the Fourth Species, which are all that are neceſſary for us to conſider in this Work. This *Syrian Bawm*, Authors will have to be twofold, *viz. Lævis* and *Aſpera*, or *Aſperior:* or *Odorata*, and *Inodorata.*

IV. The Deſcription. *The* Turkey Bawm *has a Root ſmall and thready, which periſhes every Year at the firſt approach of Winter, and therefore muſt be Sown freſh again, every Spring. From this Rooot riſes up one ſquare browniſh green Stalk, two Feet high and ſometimes more, if it grows in good Ground, ſpreading it ſelf with two Branches from every Joint, where the Leaves are ſet; and this courſe is continued up almoſt to the Top. The Leaves are narrower and longer than thoſe of* Common Garden Bawm, *and more dented in about the edges, of a ſweet* Limmon *ſcent, rather exceeding that of* Common Bawm: *they are rough alſo, and of a like Green Colour. The Flowers are gaping or hooded, growing at the Tops of the Branches at certain Diſtances, ſtanding in ſharp, rough, pointed Husks; and they are of a blew or purpliſh blew Colour; but in ſome the Colour is perfectly white, whence ſeveral Authors would make ſeveral Kinds thereof, tho at the ſame time they differ in nothing but the Colour of the Flowers; but ſome ſay the Leaves are of a freſher green Colour, which I have not yet obſerved. After the Flowers are paſt, then comes the Seed, which is black and roundiſh, with a white Spot in each Seed, whilſt it is freſh, which afterwards in a manner Vaniſhes, not being ſo diſcernable when dry.*

V. *The* Syrian Bawm, *has a Woody thick Root, and full of ſtrings, which periſhes every Year. From whence riſes up, a round hollow Stalk, thick, and of a reddiſh Colour, about* Two Feet *high, branching forth variouſly on all ſides up to the Top, on which are ſet ſhorter and rounder Leaves, at the end of longer Foot Stalks. The other Leaves ſtand alſo upon Foot Stalks, and much reſemble thoſe of the* Common Bawm *(for which reaſon, ſome Authors have taken this to be one of the Kinds thereof) ſomewhat leſs dented about the edges, than the* Garden Kind. *At the Joints of the Stalk, from the middle upwards, come forth round about it, certain hard, whitiſh Skins, ſmall and round at the bottom, and wide open at the brims, a little prickly at the corners, and much like unto a Bell, being for the moſt part five Cornered. From the bottom of each of theſe, comes forth one Flower, ſomewhat ſmall, and like to thoſe of the* Common Bawm, *almoſt white in Colour, or with a ſmall bluſh of Red therein. After they are paſt, in the bottom of the ſame skinny Bell, the Seed grows (but it very rarely comes to be Ripe with us) which is whitiſh and Cornered. The Plant has nothing of the ſmell of* Bawm *in it; but it is ſtrong, and the Taſte is bitter.*

VI. *The other* Syrian Kind, *which is called* Aſperior, *differs not much from the former, as to its Form, yet it riſes a litter higher, and grows ſomewhat greater, but after the ſame Faſhion: the Stalk of this is Four Square, and lightly hollowed or furrowed. The Leaves are ſomewhat longer and ſharper on the edges. The Cups or Bells in which the Flowers grow, are more prickly than the former, and much ſharper at the corners of them, longer, more in number, and of a paler white Colour. The Tunnels of the Flowers are browniſh, and not ſo white as the other; and the Seed is three cornered, and ſharp upwards like a Wedge.*

VII. *The*

VII. *The Places.* The *Turkey Bawm* grows naturally in *Moldavia* and several parts of *Turky*, from whence it is brought to us, and Nouriſh'd up in *Gardens.* The *Syrian Bawm*, called alſo *Moluccan*, was thought by *Matthiolus* to grow in the *Molucca Iſlands* (whence that Name.) But *Parkinſon* ſays he was miſtaken: and that *Sequinus* an *Italian* ſent them from *Syria* to *Verona*, from whence they were brought to us, and nouriſh'd up in *Gardens* only.

VIII. *The Times.* The *Turkey Bawm* Flowers the latter end of *June*, or in *July*: but the *Syrian Kinds*, ſeldom Flower before the middle of *Auguſt*, for which reaſon, they ſeldom give any good Seed, which the *Turkey Bawm* fails not to do.

IX. *The Qualities.* The *Turkey Bawm* agrees herein wholly with our *Common Garden Bawm.* The *Syrian Bawm* is hot in one Degree and dry in two, Hyſterick, Vulnerary, and Alterative.

X. *The Specification.* The *Turkey Bawm* is peculiar againſt Vertigo's, Faintings, and Sickneſs at Heart. The *Syrian* reſiſts fits of the Mother, and Vapors from the Womb.

XI. *The Preparations.* The Shops keep nothing of them, but you may Prepare therefrom. 1. *A Powder from the Leaves and Flowers.* 2. *A Decoction in Wine.* 3. *An Expreſſed Juice,* 4. *A Spirituous Tincture.* 5. *An Oily Tincture.* 6. *A Saline Tincture.* 7. *An Eſſence.* 8. *A Syrup.* 9. *A Fixed Salt.* 10. *A Balſam or Oil.* 11. *A Cataplaſm.*

The Virtues.

XII. All theſe ſeveral Preparations of the *Turkey Bawm*, have the ſame Virtues, Uſes and Doſes, with thoſe of our *Common Garden Bawm*; ſo that no more need be ſaid of them in this place, and therefore we refer you to their reſpective Titles in the Chapter aforegoing.

XIII. *The Pouder of the* Syrian Bawm, heats, rarifies, and cleanſes.

XIV. *The Decoction of it in Wine*, Kills Worms, and is good againſt the pains of the Mother, Vapors, and the like. Doſe iv. ounces.

XV. *The Expreſſed Juice of it*, Kills Worms, and gives relief in Hifterick Fits, pains of the Spleen, and the like. Doſe j. ounce or more.

XVI. *The Spirituous Tincture of it*, Expels Poyſon or Venom, and is good againſt the Plague or Peſtilence, and all ſorts of Malign fevers. Doſe half an ounce.

XVII. *The Oily Tincture of it*, Gives eaſe in the Colick, given to one Dram in Ale or Wine: and outwardly applyed helps Palſies, and eaſes Pains from a cold Cauſe, in any part of the Body.

XVIII. *The Saline Tincture of it*, Is a Specifick for killing Worms in the Body, whether of old or young. Doſe j. or ij. Drams in Wine or Ale.

XIX. *The Eſſence of it*, Kills Worms, and cures Fits of the Mother, Convulſions of the Bowels, *&c.* Doſe from ij. Drams to vj. in Ale or Wine.

XX. *The Syrup of it*, has the Virtues of the Eſſence, but is much weaker, and is moſtly uſed as a Vehicle to convey the other Preparations in.

XXI. *The Fixed Salt of it*, removes Obſtructions of the Spleen and Womb. Doſe to xx grains of it, in a *Decoction* of the Herb, ſweetned with the *Syrup* thereof.

XXII. *The Balſam or Oil of it*, is Vulnerary, and eaſes Pains of the Spleen and Joints.

XXIII. *The Cataplaſm of it*, Diſcuſſes Tumors ariſing from Cold and Wind, and gives eaſe in the Spleen being applied to the Region thereof.

CHAP. LV.

BEANS Garden *and* Baſtard.

I. THE *Names.* The *Bean* is called in *Arabick*, *Bachale*, *Bachele*, *Bakilla*, and *Hachille* in *Greek*, Κύαμος: and in *Latin*, *Faba.* The Cod is called in *Greek* by *Ariſtotle* θήκη: by *Nicander*, λέπος, λέμμα, πίσος: by *Heſichius* λόβος, λέβηες: and by *Apollonius* Κέλυφος: and in *Latin*, *Theca.*

II. *The Kinds.* There are many Kinds of *Beans*, but thoſe which we ſhall chiefly take notice of, are 1. *The Garden.* 2. *Kidney* or *French.* 3. *The Field* or *Horſe Bean.* Of the *Garden Kind* there are ſaid to be two ſorts, 1. *The True.* 2. *The Baſtard.*

III. The Deſcription. *The True, Large, Sweet* Garden Bean, *has a Root thick, with many Fibres or Strings annexed to it; from which riſes up One, Two, or Three Stalks (according to the goodneſs of the Ground) ſmooth and ſquare, and ſometimes Four or Five Feet high or more. Upon theſe Stalks are ſet the Leaves at certain diſtances upon a ſmall Foot-Stalk, from the very bottom almoſt to the top, by Two and Two, which are fleſhy, thick, of a light green, and long, a little pointed at the ends. Between theſe Leaves and Stalk come forth divers Flowers, all of them looking one way for the moſt part, which are cloſe, a little turn'd up at the brims, White, and ſpotted with a blackiſh Spot in the middle, and ſomewhat purpliſh at the foot or bottom; of the Form almoſt of* Broom, *or* Peaſe *Flowers, many of which, that grow upwards towards the top, do ſeldom bear Seed, and therefore are gathered by many to be Diſtilled; and the tops alſo being cut off, it makes the reſt of the Plant to thrive the better. The Flowers being gone, there grows forth long, great, ſmooth, green Cods, greater than in the other Kinds of* Beans, *which*

grow

grow black when they are ripe, and contain within them, Two, Three, or Four, flat and somewhat roundish long Beans, *either white or reddish, which latter when ripe grow many times black withall.*

IV. *The* Baſtard Bean, *Differs little or nothing in the Form and Shape of the Plant, or in the manner of its growing, from the former, ſave that it ſeldom grows full out ſo large as the True* Garden *one doth, nor are the* Beans *themſelves altogether ſo large: but that which is the principal note of diſtinction, between this and the True Kind, is their want of that ſweetneſs, pleaſantneſs, and excellent Taſte which the Right* Garden *ſort has: and therefore by reaſon of the ſmall difference which is between them in reſpect to their Form and growing, they are generally Sold in the Market the one for the other: tho at the ſame time the* Gardener *can diſtinguiſh between them.*

V. *The Places.* Theſe are both Sown in *Gardens* with us, but the latter are for the moſt part Sown abroad in large Fields, and Sold in Markets for the former.

VI. *The Times.* They Flower in *April* and *May*, and that gradually, ſo that they are long in Flowering: and the Beans themſelves are Ripe in *July* and *Auguſt.*

VII. *The Qualities.* They are Temperate as to heat or cold, and moiſt in the firſt Degree; Nephritick, Lithontriptick, Spermatogenetick, Suppurative, and Alterative.

VIII. *The Specification.* They are peculiar againſt Gravel in Reins or Bladder, reſtore in Conſumpions, for they nouriſh much, and being much Eaten cure a *Diarrhœa.*

IX. *The Preparations.* The Shops keep, 1. *A Water from the Flowers or the whole Plant.* 2. *A Meal or Flower from the* Beans. But you may make therefrom alſo, 3. *A Decoction of the* Beans *in Water or Wine.* 4. *An Eſſence of the Leaves and Cods.* 5. *A Cataplaſm of the* Beans. 6. *A Volatile Salt, Spirit and Oil from the* Beans. 7. *The Aſhes of the Cods and Stalks.* 8. *A ſtrong Broth.*

The Virtues.

X. *The Diſtilled Water from the Flowers,* or *whole Plant when in Flower.* They are chiefly uſed as Coſmeticks, to ſoften, whiten, cool, and beautify the Skin, it being often waſhed therewith, and ſuffered to dry on: but before it is applyed, the Face and Hands ought to be made purely clean with warm Water in which *Wheat Bran* or *Bean Meal* has been boiled: ſome Ladies have affirmed to me, that by a continued and long uſing this Waſh, or Water Diſtilled from the Flowers, they have had Lentils, Freckles, and other Deformities of the Skin perfectly removed. This I believe, that if it is acuated with ſome ſmall quantity of the Volatile Salt, and then uſed, it may do much in that Kind.

XI. *The Meal or Flower.* Being uſed with warm Water to waſh the Face and Skin with, it cleanſes it admirably, and is ſaid to take away Deformities thereof, as Scurff, Spots, Wrinkles, Tanning, Sunburning, and the like.

XII. *The Decoction in Wine or Water.* It is very good againſt the Stone and Gravel whether in the Reins or Bladder, and provokes Urine; ſo alſo a Decoction of the Green Cods, or a Water Diſtilled from the ſame.

XIII. *The Eſſence from the Leaves and green Cods.* It is Diuretick and Lithontriptick, removing the Matter cauſing the Strangury, whether it be Gravel, Sand, Slime, or other Glutinous Matter. Mixed with Honey and taken, it prevails againſt Coughs, Colds, Rheums, Catarrhs, and other Diſtempers of the Lungs.

XIV. *The Cataplaſm of* Bean *Flower or Meal.* If *it is made with Vinegar and Oil,* and applied to Womens Breaſts, ſwelled with abundance of Milk, ſo that they can ſcarcely hold, it will not only repreſs the Milk, but alſo diſcuſs the Tumor or Swelling occaſioned by Curdling thereof. If *the Cataplaſm be made with Fœnugreek and Honey,* and applied to Felons, Biles, Bruiſes, Apoſtems, as alſo Kernels about the Ears, and Kings-Evil Swellings, it helps them all. *If the Cataplaſm is made with Wine,* and applied to Watering Eyes, or Eyes having a Contuſion by blows, it gives eaſe and does them good. *If made with Whites of Eggs, Roſe Leaves and Frankincenſe,* and applied, it helps Eyes which Swell or grow out. *If it is made with White Wine, and with Vinegar and Oil,* and applied to the Cods, it takes away their Pain and Swelling. *If it is made with Wine only, and a little Oil,* and Eaten, it is good againſt Impotency, and ſtirs up Luſt in ſuch as cannot uſe the Act of Generation, by reaſon of the coldneſs, ſluggiſhneſs, and weakneſs of their Members. *If Fried in Oil with Garlick to the thickneſs of a Haſty Pudding,* and Eaten as daily Food, it helps inveterate Coughs, almoſt paſt cure, and the hoarſeneſs of the Voice: and being for ſome time Eaten, it breaks Apoſtems of the Breaſt and Lungs.

XV. *The Aſhes from the Cods and Stalks,* Being Infuſed in Ale or Wine, and the Liquor Drunk, they are very Diuretick, and open all Obſtuctions of the Reins and Bladder, and therefore are very good againſt Sand, Gravel, Stone, Dropſy, Jaundice and Gout. *The Aſhes made into a Cataplaſm with Hogs Lard,* and applied, are good againſt old Pains, Contuſions, Wounds of the Nerves, Defluxions upon the Joynts, the Sciatica, and Gout, whether in Hands, Arms, Knees or Feet.

XVI. *The Volatil Salt, Spirit and Oil of the Beans. Beans* and *Peaſe* yield a vaſt Quantity of *Volatil Salt,* and in much larger Proportion than any other Vegetable Production. It is thus made. ℞ Beans ℔ *x. whole and dry, put them into a large Earthen Retort, or into a large Glaſs one well Luted; ſo large as that about a third part may remain Empty: put it into a cloſe Furnace of Reverberation, luting to it a large Receiver or great Glaſs Ball: ſtop the Regiſters of the Cover of the Furnace, and make a ſmall Fire in the Cinder or Aſhes place, at firſt, only to warm the Retort, and heat the Matter within, which keep ſo for an Hour; then kindle a Fire in the Grate Place, gentle at firſt for an Hour more; after which increaſe it gradually from Hour to Hour, but not to an Exceſs: in the mean ſeaſon, the Aqueous parts will come over in large quantity, then give a little Air to the Regiſter of the Cover of the Furnace on the Receivers ſide, continually encreaſing the Fire, till you ſee the Receiver to be filled with white Clouds, which will by degrees condenſe into Liquor; the Oleaginous and Salt parts ſinking to the bottom of the Veſſel; keep now an equal Fire, for about two Hours, giving a little Air to the Regiſter, after which open it for altogether, giving a more violent heat, and at length a flaming Fire, which continue till the Vapors ceaſe, and the Receiver is clear: let then the Fire go out, and the Veſſels cool. In the Receiver you will have much Flegm mixt with Oil, and Spirit, and Volatile Salt, ſo penetrating that you will not be able to hold your Noſe and Eyes over the Mouths of the Veſſels. Put all theſe Subſtances immediately into a a Bolt Head with a long Neck, covered, with its Head well Luted, and fitted with a Beak and Receiver: place it in a Sand heat, in a cool Airy place, ſo may you ſee the Volatile Salt aſcend by little and little, and coagulate it ſelf in the Head (which you muſt often cool by double Cloths dipt in cold Water, to hinder the Diſſolution of the Salt): This Salt with what ſpeed*

may

move the Head out of the Head, and keep it in a Glass Bottle close stopped and in a cool place, for it turns into Liquor or Spirit with the least heat, and sooner than any other Volatile Salt: but you must have another Head ready to put on in the place of the former, whose juncture being well Luted, continue the rectification, so will you have in the Recipient, the rest of the Volatile Salt Dissolved in a little of the Flegm (which is the Spirit) and the Volatile Oil, which you may separate and keep apart; the useless Flegm, and stinking part of the Oil remaining at bottom of the Matrass.

XVII. This *Volatile Salt of Beans*, is a strong Sudorifick, and one of the most Subtil and Volatile Salts that is, being of the same use with all other Volatile Salts. It is good against Palsies, Cramps, Withered Limbs, Epilepsies, Apoplexies, Gouts, Rheumatisms, Colicks, and other diseases of the Head, Brain, Womb, Nerves, and Joints. It kills Worms, and is admirably good in Fits of the Mother. The *Spirit* is also of the same Virtue. The *Oil*, is stronger, and therefore in outward applications, it may be mixt with Oil of Bitter Almonds, or Oil of Ben, and the Stomach and Navel anointed with it, for Fits of the Mother. In Diseases of the Brain, also of the Womb, you may put it up the Nostrils. Dose of the Salt, a gr. vj. ad xij. of the Spirit, from xv drops to xxx. or xl. and of the Oil a gut. ij. ad vj. all which are to be given in some proper Vehicle.

XVIII. *The strong Broth of the Beans.* It is Nutritive in the highest Sense so far as a Vegetable can be Nutritive; It also stirs up Lust, and is of good use where there is an Impotency in the Male Kind, who have not the power to use the Act of Generation, by reason of a weakness in the Instruments of Generation, or defect of Seed, as it has respect either to Quantity or Quality. And by reason the *Bean*, (especially the Field Kind) has the Signature of the *Glans* of the *Penis*, *Pythagoras* and his Followers judged then to provoke Lust, which afterwards by multitudes of Experiments and Observations, has been confirm'd to us, even from that time to this day. This Broth strengthens the Bowels and restores Nature, stopping all sorts of Lasks and Fluxes of the Belly, inveterate Coughs and other Distempers of the Lungs: It is Nephritick and Diuretick, much provoking Urine, and therefore is good against all Obstructions of the Reins and Bladder. If this Broth is made for Nutriment sake, it will be necessary to boil the *Beans* till they are Broken, and the Flowery part of them mixed and as it were dissolved in the Liquor, which afterwards may be made savory with a little Salt, Juice of an Orange, and a bit of sweet Butter. *Beans* are indeed Flatulent (by which property they are said to stir up Lust,) yet accounted good Food. *Nos Trago Subscribimus recentes innoxias esse in Cibo, & bonum succum gignere.* Ray, *Hist. Plant. lib.* 18. *cap.* 2.

CHAP. LVI.

BEANS Kidney *and* Scarlet.

I. THE *Names.* This Plant is called by *Hippocrates*, *Theophrastus*, and most of the Ancient Writers Δόλιχον: some from the Seed call it Λόβον, & Λόβιον: others name it Φασέολον a diminitive from Φάσηλος *Discorides* calleth it Σμίλαξ κηπαία, ὁ καρπός, Λόβια: in *Latin*, *Smilax Hortensis*, *Siliqua*, *Phaseolus*: in *Arabick*, *Lubia*: in *English*, *Kidney Bean*, and *Garden Kidney Bean.*

II. The other is called in *Greek* Κύαμος κόκκινος, & φασὶ λος κόκκινος: in *Latin*, *Faba Coccinus*, & *Phaseolus Coccinus*: and in *English*, the *Scarlet Bean.*

III. *The Kinds.* The Species of the *Kidney Bean* are very many: whose chief differences consist most in the Colour of the Beans, which every Child is able to distinguish at Sight, as the *White*, the *Black*, the *Red*, the *Purple*, the *various Coloured*, the *Great*, the *Small*, &c. as for other Differences, as they would be superfluous and needless, so they would be almost endless.

IV. The *Scarlet Bean* is said to be of two Kinds: 1. That which Grows and is Common with us in *England.* 2. The *Indian Downy or Hairy Bean*, which is called *Cow Itch*, which see in the *Exoticks*, *lib.* 3. *chap.* 73. following.

Kidney Beans

V. The Description. *It has a long Root with many Fibres springing from it, which perishes every Year, from which rises up at first but one Stalk, which afterwards divides it self into many Arms or Branches, every one of them being so weak, that they cannot sustain themselves, but are upheld by Sticks or Poles, or other adjacent things, taking hold with its clasping tendrels thereupon, in like manner as does* Bryony, Hops, *and the* Vine, *otherwise they would lye Fruitless upon the Ground. From these Branches grow forth at several places long Foot Stalks, every one of which has three broad, round, pointed Leaves, of a green Colour, growing together by three's as in the* Common Trefoil: *Towards the Tops of the Branches come forth divers Flowers in form like to* Pease Blossoms, *which varie and differ in their Colours according to the Soil in which they Grow, sometimes White, Black, Red, Yellow, Purple, Pale and Various Coloured, for the most part of the same Colour the* Beans *will be of. After which come forth long and slender, flat, lightish green Cods, mostly crooked a little, and some strait, in which are contained the* Beans, *made almost in form of a Kidney, flat and much about the Magnitude of* Horse Beans.

VI. The Scarlet Bean *is a large Plant, but differs not much in its manner of growing from the former.*

Kidney

Kidney Bean: *but the Flowers are large and many, and of an Elegant Scarlet Colour; for which reaſon it is commonly called by our Floriſts, The* Scarlet Bean.

VII. *The Places.* They Grow both of them, not only in *England*, but alſo in moſt parts of *Europe*, and with us they are nouriſh'd up in *Gardens*. The firſt or *Common Garden Kidney Bean* (which ſome call the *French Bean*) extend their Branches to a very great length, having Poles or other like things to ſupport and faſten themſelves upon. The *Scarlet Bean* was firſt Brought to us by *John Tradeſcant*, and made to Grow in our *Gardens*, where it now very naturally flouriſhes.

VIII. *The Times.* They are ſown in the *Spring*, chiefly about the middle of *April*, and not before, and the *Beans* themſelves are ripe, about the latter end of the Year.

IX. *The Qualities.* The former are Hot and Moiſt in the firſt Degree: (as for the latter they are more for the Show and Beauty of the Flowers, than for any Phyſical uſe:) They are alſo Suppurative, Aſtringent as to the Bowels, Nephritick, Spermatogenetick, and Alterative.

X. *The Specification.* There is nothing Obſervable in this, ſaving that they have been found to provoke Urine.

XI. *The Preparations.* The Shops keep nothing of them; but you may make therefrom, 1. *A Diſtilled Water from the green Cods, and whole Plant.* 2. *A Decoction of the green Cods, or whole Plant in Water or Wine.* 3. *An Eſſence of the Leaves and Cods.* 4. *A Volatile Spirit, Oil and Salt, from the dry'd* Beans. 5. *The Aſhes of the Straw and Cods.* 6. *The green Cods to be eaten as a Sallet.*

The Virtues.

XII. *The Diſtilled Water*, May be uſed as a Vehicle to convey Nephritick, Diuretick, and Lythontriptick Medicaments in.

XIII. *The Decoction in Wine or Water* is very Diuretick; and as its Signature ſhews, powerfully opens Obſtructions of the Reins, Ureters and Bladder: It may be Drank a Pint at a time morning, noon, and night a little ſweetned with Hony, and be continued for ſome days.

XIV. *The Eſſence.* It has the Virtues of the *Decoction*, but much more Powerful, and is a ſingular ſweetner of the Blood.

XV. *The Volatile Spirit, Oil, and Salt.* They are made from the dry'd *Beans*, exactly as we have Taught in the former Chapter, *Sect.* 16. and their ſeveral Virtues, Uſes, and Doſes are the ſame, ſo that we need ſay no more of them in this place.

XVI. *The Aſhes of the Straw and Cods*, being Infuſed a Night or two in a Bottle of Ale or Wine cloſe ſtopt up; and that Liquor Drank Morning, Noon and Night, half a Pint at a time, or more, it powerfully provokes Urine, opens obſtructions of the Reins and Ureters, and plentifully brings away Sand, Gravel, Slime, or other Tartarous Matter offending thoſe Parts. You may put xvj, ounces of the *Aſhes* to a Gallon of Ale or Wine.

XVII. *The Green Cods.* They have the Virtues of the other *Beans*, provoke Luſt and breed Seed: boiled and eaten with ſweet Butter and a little Salt, and Juice of Oranges, they looſen the Belly, provoke Urine, ſtrengthen and pleaſe the Stomach, and make good Blood; but they ought to be eaten whileſt they are green and tender (otherwiſe they will not be ſo Toothſom) and the Rib or String which runs along the Cod, being taken away, then to be boiled cloſe Covered, till they are ſoftiſh, and ſo dreſt up with Salt, melted freſh Butter and Juice of *Sevil* Oranges, as aforeſaid; in which manner they are very wholſom, nouriſhing, reſtorative, and of a pleaſant and grateful Taſte, and not in the leaſt inferior to the other large *Garden Beans.*

CHAP. LVII.

BEANS Field *or* Horſe.

I. *THE Names.* It is called in *Greek*, Κύαμος ἄγριος: in *Latin*, *Faba Equina*, *Faba Minor*: and by *Dodonæus*, *Phaſelus Minor*, *Faba agria*, vel *Ruſtica*: and in *Engliſh*, *Field Bean*, and *Horſe Bean.* Κύαμοι *Græcis dicti creduntur quia ſunt εἰς τὸ κύειν δεινοὶ καὶ ἄπιοι τῇ κύσει.* Ray.

II. *The Kinds.* We ſhall take notice but of three ſorts of theſe *Beans.* The *Firſt Kind*, is our *Common Field Bean*, which is uſually ſown with us for *Horſes* and *Hogs*; and is Named as afore declared. *The Second Kind*, is that which the *Greeks* call Πύανος, and by ſome Κύαμος ἄγριος: in *Latin*, *Faba Sylveſtris*, *Faba Græca*; and in *Engliſh*, The *Wild Bean.* *The Third Kind*, is the *Old Greek Bean*, called Κύαμος ἑλληνικὸς: in *Latin*, *Faba Veterum Græcorum*, *Faba Sylveſtris Græcorum antiquorum*: in *Engliſh*, The *Greek Bean of the Ancients.*

III. The Deſcription. *The* Field *or* Horſe Bean *has a ſhort Root, going down right, with many ſmall ſtrings ſpringing from it, which periſhes every Year; from whence ſprings forth one, two, or more Stalks, which grow upright like the* Garden Bean, *not leaning down; the Leaves are like unto the* Garden Bean, *without any dents on the edges, but they are ſmaller, more at a Joint, and growing cloſer: the Flowers ſtand alſo more at a Joint, leſſer, and of a more Purpliſh Colour: the Cods ſucceeding them*

them are long and round, ſmaller than the Garden Kind, *and ſtanding upright: with in which are ſmall length round* Beans, *which when they are Ripe, are ſome blackiſh, ſome browniſh, and ſome of a dirty* yellow.

Common Field Horse Bean. or. Bean.

IV. The Wild Bean *differs in its deſcription not much from the former, ſave that it is ſomething leſs in the Magnitude of the Plant, and the* Beans *themſelves are black and round.*

V. The Greek Bean *has a Root which goes not deep nor far into the Ground, but ſends forth many long Fibres or ſtrings, dying every Year; from whence ſprings forth two or three long flat Stalks, with two edges, lying or running upon the ground, if it has nothing to riſe or claſp upon. The Stalks branch out on every ſide into ſtalks of Leaves, four commonly ſet thereon, by two and two, with a diſtance between them, like unto the* Garden Bean, *and each Branch bending in a long Claſper. The Flowers grow ſingly at the Joynts of the Branches, under the Leaves, and are of a kind of dead, dull, purple Colour, with ſome paleneſs at bottom of them: after which ſucceed long and ſomewhat flat Cods, with two ſharp edges, dented about, and a little hooked or bowing, green at firſt, but afterwards black and hard when they are Ripe. In theſe Cods are contained four or five, or more round* Beans, *very black, and as large as* Peaſe.

VI. *The Places.* The Firſt grows with us every where, in *Fields*, and are chiefly Sown for the Food of Hoggs and Horſes, whence their Name: The Second and Third ſorts grow with us only in *Gardens*; but are Natives of *Spain* and *Greece*, where they are plentifully to be found.

VII. *The Times.* They all Flower in *April*, and *May*, and *June*, and that gradually, for they are long in Flowering; and the Seed is Ripe ſometimes in *July*; but moſtly in *Auguſt* and *September.*

VIII. *The Qualities.* Our *Field Beans* are hot and moiſt in the firſt Degree, ſuppurative, ſtrengthening and ſpermatogenetick: nephritick, diuretick, and alterative: and uſed externally, as in Waſhings, they are of an abſterſive faculty. The *Wild Bean*, and *Faba Veterum*, or *Greek Bean*, which *Dioſcorides*, *Galen*, and other *Greek* Authors intend, when they give us their Virtues, are uſed to all the ſame purpoſes and intentions aſcribed to theſe *Our Field Beans.*

IX. *The Specification.* They have a peculiar Faculty to remove Obſtructions of Urine; and to make a clear paſſage for the Water.

X. *The Preparations.* They are exactly the ſame with the former, as 1. *A Diſtilled Water from the Flowers and green Cods.* 2. *A Decoction of the ſame.* 3. *An Eſſence.* 4. *A Volatile Spirit, Oil, and Salt.* 5. *The Aſhes and Fixed Salt.* 6. *A Broth of the* Beans. 7. *A Cataplaſm of the Meal.*

The Virtues.

XI. *The Diſtilled Water.* It is uſed as a Vehicle for other Preparations, and as a coſmetick for the Face and Skin, to take away Scurf, Morphew, Tannings, Sunburnings and other like Deformities, by often waſhing therewith, and letting it dry on.

XII. *The Decoction of Cods and Plant*, opens Obſtructions of the *Viſcera*, but chiefly of the Reins, Ureters and Bladder, and provokes Urine.

XIII. *The Eſſence*, Is ſaid to diſſolve the Stone in Reins or Bladder, but then I conceive it muſt be a ſoft and gritty Stone, not of a Flint like Subſtance: it increaſes Seed, and provokes Luſt.

XIV. *The Volatile Spirit, Oil, and Salt of the dry'd Beans*, They are made as thoſe of *Garden Beans chap.* 55. *Sect.* 16. and have all the ſame Virtues, Uſes and Doſes.

XV. *The Aſhes and Fix'd Salt.* They are Diuretick, and powerfully provoke Urine, and therefore are ſingularly good againſt the Dropſy Sarſites, Gout, Stone, Gravel, and Jaundice. Doſe a ſcruple in White Wine, morning and night.

XVI. *The Broth of the Beans.* It has the ſame Virtues, but not all out ſo Powerful.

XVII. *The Cataplaſm. Made with Wine*, it is good againſt ſuffuſions and Blows of the Eyes, and is profitably applyed to eaſe the Pains of the Gout. *Made with Wine Vinegar*, and applyed, it takes away the Inflammation of the Teſticles, and Womens Breaſts, and apply'd where Hairs are firſt and immediately plucked forth, it conſumes their Nutriment, and in ſome meaſure hinders their growing again. And *if beaten up with Whites of Eggs*, it is good againſt the Pin and Web, and helps the Watering of the Eyes. *If made with Vinegar and equal parts of Barley Meal*, it is ſaid to waſt away the Swellings of the *Kings Evil. If made up with equal parts of Meal of Fanugrerk*, it takes black and blew ſpots, occaſioned through Blows, and Diſcuſſes hard Swellings under the Ears. *If the Cataplaſm is made with Oxymel*, it is good againſt the Stinging of *Scorpions*, and Bitings of Venomous Beaſts, Diſcuſſes Tumors cauſed by Blows and Bruiſes, abates the Milk in Womens Breaſts, and eaſes Wounded Nerves, if apply'd upon the Wound.

CHAP. LVIII.

BEARS BREECH.

I. *THE Names.* It is called in *Greek*, Ἄκανθος ἡ Ἄκανθα : in *Latin*, *Acanthus*, *Acantha*, *Branca Urſina :* and in *Engliſh*, *Brank Urſine*, or *Bears-breech.*

II. *The Kinds.* It is twofold ; 1. *The Garden kind*, called in *Greek* ἄκανθος ἥμερος, πάτιος, μελάμφυλλος, Ἑρπάκανθα : in *Latin*, *Acanthos Sativus*, *Acantha Hortenſis*, *Pæderos*, *Melamphyllos*, and *Herpacantha*, *Acanthus verus & lævis*, *Branca Urſina lævis :* and in *Engliſh*, *Garden Brank Urſine*, or *Bears Breech.* 2. *The Wild Kind*, is called in *Greek*, ἄκανθος ἄγριος, in *Latin*, *Acanthus Sylveſtris*, and *Aculeatus*, *Acantha Spinoſa & aculeata*, *Herbacantha :* in *Engliſh*, the *Wild* or *Prickly Bears-breech.* *Acanthos* is the common name for all Thiſtles, but here it is uſed by the figure, *Antonomaſia, qua loco proprij nominis ponitur Appellativum, ut Civitas pro* Londino.

III. The Deſcription. *Garden* Bears Breech *has a Root thick and long, with many long ſtrings ſpreading far and deep in the ground, of a blackiſh or dark colour on the outſide, and white within, full of a very clammy Juice, more mucilaginous than the* Leaves, *ſo full of life, that if a ſmall piece be but left in the ground, it will ſpring up again, and bring forth the whole* Plant, *but requires a ſhelter or defence from the extremity of the Winter. From this Root there ſhoots forth many large, thick, ſmooth, ſad green* Leaves *upon the ground, with a thick middle rib, divided into many parts, with great and deep gaſhes on the edges, from among which (after it has ſtood long in a convenient place) riſes up a reaſonable great Stalk, three or four foot high, without either joint or branch thereon, ſet with ſome* Leaves ; *and from the middle upwards, ſet with a ſpike, as it were, of white hooded or gaping* Flowers, *ſtanding in browniſh Husks, ſomewhat ſharp at the points, and a ſmall long undivided* Leaf *under each* Flower : *after which come (in more hot Countries, but not in ours that I know of) broad, flat, round, thick, brownish yellow Seed.* Dodoneus *ſays, that the Leaves are great, large, of a ſad green colour, thick, groſs, ſmooth, and deeply cut in by the ſides, like the leaves of* Rocket.

IV. *Wild* Bears Breech *has a Root not ſpreading ſo deep, or ſo far as the former, nor ſo great in magnitude, but more tender, as leſs able to endure the Winters cold. From this Root riſes up ſeveral long Leaves lying upon the ground, but much narrower, and more divided on the edges into ſmaller parts, and each part with ſmall inciſions, ſet with very ſharp white prickles ; from among which a leſſer and lower Stalk ariſes, with the like ſpiked heads of Flowers, and a few prickly Leaves thereon, in their way coming up, ſtanding in more ſharp and prickly husks than the former ; after which comes Seed, ſmall as a little Pea, hard, black, and round.* Gerard *ſaith, that this Thiſtle is in Stalk, colour of Leaves, Flowers and Seed much like the firſt kind, but the Plant is ſhorter and lower, and the Leaves pretty large, dented or jagged with many cuts and inciſions, not only in ſome few parts of the Leaves, as ſome other Thiſtles, but very thickly dented or cloven, and having many ſharp, large, white and hard prickles, about the ſides of the diviſions and cuts, not very eaſie to be handled or touched, without danger to the hands and fingers.*

V. *The Places.* They naturally grow in *Greece*, *Italy*, *Spain*, and *France* ; but with us, and in *Holland*, *Germany*, and other cold Countries, it is only to be found nouriſhed up in *Gardens*. *Dioſcorides* ſays it grows only in moiſt and ſtony places. The *Wild* grows in many places of *Italy* near the Sea, and *Pena* ſays, he found it in moiſt and gravelly places near to the Walls of *Mompelier* ; but with us it is only in *Gardens*.

VI. *The Times.* The Root keeps alive in Winter in hot Countries, and ſo with us, but ſometimes it dies, if the weather is too cold : but in *England* that is rare in the Garden kind. The former flowers in *June* and ſometimes in *July* ; but yields no perfect Seed with us : the latter flowers later ; ſeldom or never giving with us any ripe Seed : but in thoſe Countries where the Seed comes to perfection, it is always in *Autumn*, or latter end of *Summer*.

VII. *The Qualities.* They ſeem to be Temperate in reſpect of heat, and drying in the firſt degree. They are Arthritick, and whilſt green, Digeſtive, afterwards Aſtringent, Drying, Reſtorative and Alterative.

VIII. *The Specification.* They are peculiar againſt Conſumptions and Spitting of Blood.

IX. *The Preparations.* The Shops keep nothing of it : but you may make thereof, 1. *An Inſpiſſate Juice, or Liquid.* 2. *An Eſſence.* 3. *A Decoction in Wine.* 4. *A Syrup.* 5. *A Clyſter.* 6. *A Cataplaſm.* 7. *A Saline Tincture.*

The Vertues.

X. *The Liquid* or *Inſpiſſate Juice*, prevails againſt ſpitting of Blood, piſſing of Blood, and the Phthiſick, being ſaid to cure Conſumptions, meaning thoſe of the Lungs. Doſe of the *Liquid*, one or two ſpoonfuls ; of the *Inſpiſſate* one or two drams, diſſolved in Red Wine, or Tent, and ſo either of them to be taken.

XI. *The Eſſence.* It has the Virtues of the former, beſides which it ſtops Fluxes, and the Courſes in Women, and is prevalent againſt Ruptures in Children, and vehement Coughs. Doſe one ſpoonful in Red Wine or Tent, Morning and Evening. Applied it is good againſt burnings.

XII. *The*

XII. *The Decoction in White Wine.* It provokes Urine, and binds the Belly.

XIII. *The Syrup.* It is good againſt Coughs, Colds, Aſthma's, Phthiſicks, ſpitting and piſſing of Blood, Bloody Fluxes, *&c.* Doſe two ſpoonfuls in Wine.

XIV. *The Clyſter.* By reaſon the whole Plant is of a Glutinous, Clammy, and Slimy Mucilaginous Nature; it is given Clyſter-wiſe to procure Stools, and heal the Excoriations of the Bowels.

XV. *The Cataplaſm.* From its Glutinous and Mucilaginous property, it is (like Comfrey) applyed to weak parts to ſtrengthen them: and applyed to the Gout in the Joints, it eaſes the Pain, diſcuſſes the Humor, and cures the Diſeaſe: It alſo is profitable againſt Cramps in any part, and Ruptures in Children, being timely applied to the Part: made into form of an Emplaſter, and applied to the Back, it eaſes Pains there, and ſtrengthens a weak Back.

XVI. *The Saline Tincture.* It opens obſtructions of the Urinary Paſſages, and powerfully provokes Urine. Doſe, one or two drams in a draught of White Wine: and Cloths dipt in it, and applied to parts burned (where the skin is not broken) it preſently draws forth the fire.

XVII. *The* Wild Bears Breech *has the ſame Preparations, Virtues and Uſes.*

CHAP. LIX.

BEARS-EARS.

I. *The Names.* They know no *Greek* Name, but have obtained ſeveral *Latin* ones, according to the variety of Authors, who have treated of them: but they may well enough be called in *Greek*, Λοβὸι τῶν ἀρκτων: They are called variouſly by ſeveral Authors, as *Lunaria Arthritica*, alſo *Lunaria Paralytica Alpina*, ; and *Sanicula Alpina*, by *Geſner*: *Primula veris Pachyphyllos*, by *Lugdun*: *Auricula Urſi*, by *Matthiolus*, *Bauhinus*, and others: and at this day they are ſo generally called by Mr. *Ray*, and other Authors. Some Authors, as *Fabius Columna*, will have them to be the *Aliſma*, or *Damaſonium* of *Dioſcorides*, but are, in my opinion, miſtaken, becauſe the form of the Flowers plainly demonſtrate the contrary: in *Engliſh* they are generally called *Bears-Ears*, and *Auricula*'s by the Floriſts. They are certainly of the Family of the *Cowſlips*, and therefore are alſo called *Alpine Cowſlips*, and *Mountain Cowſlips*, from the places whence they firſt came: *Sanicula Alpina*, *Alpine* or *Mountain Sanicle*, *à ſanandis vulneribus*: and *Auricula*'s from the form of the Leaf.

II. *The Kinds.* There are three principal Kinds, as 1. That with long dented Leaves. 2. That with long Leaves not dented. 3. That with round Leaves; and of each of theſe there are many varieties: as, the *Yellow*: the *Purple*: the *Red*: the *Scarlet*: the *Bright Red*: the *Bluſh-coloured*: the *Various-coloured*: the *Blew*: the *White*: the *Hair-coloured*: the *Straw-coloured*: and the *Variable Green.*

III. The Deſcription. *Thoſe with long dented Leaves (of which the Yellow kind is principal) which is a beautiful fine Plant, has a thready Root, very like to the Oxlip; which ſends forth green, thick, and fat Leaves, ſomewhat finely ſnipt about the Edges, much like to thoſe of Cowſlips, but greener, ſmoother, and nothing ſo crumpled: among which ariſes up a ſlender, round Stem, an handful high, bearing a Tuft of Flowers at the Top, from ſix to twelve in number; ſometimes of a Yellow, ſometimes of a Purple, or Red, and ſometimes of a White colour, or various coloured, not much unlike to the Flowers of Ox-lips, but more open, and conſiſting of one only Leaf like* Cotledon, *or* Pennywort: *after which come ſmall heads with a pointel at Top of them, not riſing to the height of the Cups, containing ſmall blackiſh Seed.*

Bear's. Eares.

IV. *Thoſe with long Leaves not dented, have a Root greater and thicker than the former, with long ſtrings or fibres like unto the other ſorts, but greater; from whence ſprings up many fair, large, thick Leaves, ſomewhat mealy or hoary upon the greenneſs, ſmooth about the Edges, and without any indenting at all. The Stalk is great, round, and not higher than in the former, but bearing many more flowers thereon, more in number than any other kind, amounting ſometimes to twenty or more, yea ſometimes to thirty, ſtanding ſo round and cloſe together, that they ſeem to be a Noſe-gay alone: their form is like ſome others, but that the Leaves are ſhorter and rounder, yet with a notch in the middle, like the reſt, of a fair Yellow, &c. colour, neither very pale nor deep, with a White Eye or Circle in the bottom, about the middle of every Flower, giving them an extraordinary grace; after which comes round heads greater than the former, with a ſmall pointel ſtriking in the middle, in which is contained Seed of a blackiſh brown colour.*

V. *The round Leav'd, which* Tabermontanus, *and* Gerard, *call* Sanicula alpina; *and* Matthiolus, Cortuſa, *and we* Bears-Ear ſanicle; *has a Root conſiſting of a thick Tuft of ſmall whitiſh Threads, rather than Roots, much interlaced one among another: from whence ſpring up Leaves; firſt, ſuch as are much crumpled, and as it were folded together, which afterwards open themſelves into fair, broad and roundiſh Leaves, ſomewhat rough, or hairy, not only cut into five diviſions, but ſomewhat notched alſo about the edges, of a dark green colour on the upper ſide, and more whitiſh green underneath. The Leaves of this Plant die down every Year, and riſe up anew every Spring, whereas all other Bears-Ears keep their Leaves green all the Winter, eſpecially the middlemoſt, which ſtand like a cloſe head, the outwardmoſt for the moſt part periſhing after Seed-*

Lime. From among theſe Leaves riſes up one or two naked round Stalks, five or ſix Inches high, bearing at the Tops ſeveral ſmall Flowers, ſomewhat ſweet, and like unto the purple Bears Ear, *hanging down their Heads, conſiſting of five ſmall pointed Leaves apiece, of a dark, reddiſh, purple Colour, with a white Circle or bottom in the middle, and ſome ſmall threads therein: the Flowers being paſt, there appears ſmall round Heads, ſomewhat longer than any of the former kinds of* Bears Ears, *ſtanding upright upon their ſmall foot Stalks, in which is contained ſmall, round, and blackiſh Seed.*

VI. *The Places.* The native places of theſe Plants are on the *Alpine Mountains*, and other like places, as the *Pyrenæan*: thoſe with the *blew Flower* and *Borrage Leaf*, grow on the *Mountains* in *Spain*, and on that ſide the *Pyrenæans* next to *Spain*, from whence they have been Tranſplanted to us, and are only nouriſh'd up with us in *Gardens*.

VII. *The Times.* They all Flower in *April* and *May*; and their Seed is ripe in the end of *June*, or beginning of *July*: and ſometimes they will Flower again in the end of *Summer*, or in *Autumn*, if the Seaſon proves moiſt, rainy, and temperate. As for the great variety of theſe Flowers, *Parkinſon* is of opinion, that they have riſen from the Seed, according the to differing Climes and Soil in which it has been Sowed.

VIII. *The Qualities.* They are Temperate in reſpect of heat or cold; and dry in the firſt Degree. They are Cephalick, Neurotick and Arthritick, Vulnerary, Aſtringent, and Alterative.

IX. *The Specification.* It is a moſt admirable Vulnerary, as well for Internal as External Wounds.

X. *The Preparations.* The Shops keep nothing of it Prepared, but you may make therefrom, 1. *An expreſſed Liquid Juice.* 2. *An Inſpiſſate Juice.* 3. *An Eſſence.* 4. *A Decoction in Wine.* 5. *An Oil.* 6. *An Ointment or Balſam.* 7. *A Spirituous Tincture.*

The Virtues.

XI. *The Expreſſed Liquid Juice.* Taken inwardly one or two ſpoonfuls at a time in a Glaſs of Tent or Red Wine, it ſtops inward Bleedings, and heals Wounds in the Stomach and Lungs: being ſnuff'd up the Noſtrils it purges the Head and Brain of Phlegmatick and Serous Humors, and therefore is good againſt Epilepſies, Apoplexies, Vertigo's, Megrims and other Head Diſeaſes.

XII. *The Inſpiſſate Juice.* Diſſolved in Red Wine, and uſed as the former, it is prevalent to all the ſame Intentions, and againſt all the ſame Diſeaſes: beſides it ſtrengthens the Stomach to a Miracle,

XIII. *The Eſſence.* It has all the Virtues of the *Expreſſed Liquid* and *Inſpiſſate Juices*: beſides which taken every day from j. to iij. ſpoonfuls in any proper Wine or other fit Vehicle, it prevails as a Vulnerary potion for the Curing of all ſorts of new Wounds and old Ulcers, and is found to be a ſingular thing againſt the Palſie, dimneſs of Sight, and many other Diſeaſes of the Head, Brain, and Nerves.

XIV. *The Decoction in Wine.* It is Vulnerary taken Inwardly, opens Obſtructions of the Lungs, and cauſes free breathing, gives eaſe in Gripings of the Belly, and the Bloody Flux; for which Diſeaſe, alſo in a Diarrhæa, and Lienteria, the *Liquid*, *Inſpiſſate Jucies* and *Eſſence* are all profitable.

XV. *The Oil.* It is made with Sallet Oil by boiling. It cures External Wounds, as *Camerarius* in his *Hortus Medicus* ſaith, tho' of the Nerves to a Miracle; diſcuſſes Swellings, eaſes pain, and is found to be profitable in the Gout whether ariſing from a hot or cold Cauſe.

XVI. *The Balſam.* It has the Virtues of the *Oil*; but more excellent for the Cure of Wounds than it, eſpecially of the Nerves; is good againſt the bitings of the Sea Hare, and of the Toad; and reſolves *Oedema's.*

XVII. *The Spirituous Tincture.* It cures Gripings of the Belly, the Dyſentery, Convulſions, Fits of the Mother, and other Diſtempers of the Womb. Doſe j. ſpoonful Morning and Evening.

XVIII. *Parkinſon* ſays the Leaves of *Cortuſa* taſt a little hot, and if one of them be laid whole, without bruiſing, on the Cheeks of any tender Skinn'd Woman, it will raiſe an Orient Red Colour as if ſome *Fucus* had been laid on, which will paſs away without any manner of hurt, or mark where it lay.

CHAP. LX.

BEETS Common *and* White.

I. THE *Names.* This Plant is called by the *Arabians*, *Decka*, and *Calab*: by the *Grecians*, Τύτλον, ᾧ Σεύτλον, *ab impulſu quod facile excreſcat*, becauſe it comes up in few days after the Sowing, and then grows very faſt till it comes to its bigneſs. In *Latin*, *Beta*, *quoniam figuram literæ B dum ſemine turget referre videtur*, becauſe the figure of it being in Seed, is ſomwhat like to the *Greek* Letter *Beta*, as *Columella* obſerves. And in *Engliſh*, it is called, *Beet*,

II. *The Kinds.* *Dioſcorides* makes a White and a Black: So alſo *Theophraſtus Hiſt. Plant. lib.* 7. *chap.* 4. who ſays, *Candida ſapore nigrâ præſtantior:* So *Pliny*, *lib.* 19. *chap.* 8. *Beta à colore duo genera Græci faciunt*, *nigrum & Candidum.* *Parkinſon* is almoſt

almoſt of the opinion that the *Black Beet* of the *Ancients* was that we now call Our *Red Beets*: but Modern Authors have found out ſeveral other Kinds. As, 1. *Beta viridis Communis*, The Common Green Beet. 2. *Beta alba*, called alſo *Candida & Palleſcens*, The White Beet. 3. *Beta rubra noſtra*, called alſo *nigra*, *& rubra vulgatior*, The Red Beet. 4. *Beta rubra*, called alſo, *Beta Romana*, *Beta rubra Rapæ radice*, *Rapum Rubrum*, *Rapum ſativum Rubrum*, *Beta nigra Romana*, *Beta erythrorrhizos*, by *Lugdunenſis*, The Roman Red Beet. 5. *Beta Cretica ſpinoſa*, Prickly Beets of *Candia*. 6. *Beta Sylveſtris maritima*, Sea Beets. 7. *Beta Lucia Syriaca*, Yellow Beets. 8. *Beta platicaulos*, *Beta Coſta lata*, *alba Lutea*, *aurea*, *ruberrima*, *Italica*, *ſicula*, The yellow or flat Stalk'd Beet. Of all which Kinds we ſhall only Treat of the firſt Four in this Book, as being only proper for this purpoſe. And of them, we ſhall Diſcourſe of the two firſt Kinds in this Chapter.

III. The Deſcription. *Our* Common Green Beet *is almoſt like unto the* White Beet, *having a great long hard Root, of no uſe after Seed time, from whence ſprings up many large Leaves lying upon the Ground of a green Colour, amidſt which riſes up a large green Stalk creſted, with ſome Branches and many Leaves thereon, almoſt up to the Top. The Flowers grow in long Tufts or Spikes, ſmall at the ends and turning down their Heads, and yielding cornered Seed.*

IV. *Our* Common White Beet *has a long thick, great Root, and hard after bearing Seed, which endures all the Winter, and with its Leaves upon it, but periſhing commonly the ſecond Winter. From whence comes forth great broad Leaves, ſmooth and Plain, lying next the Ground; theſe ſays* Parkinſon, *grow in hot Countries to be three Foot long and very broad, and in our Country they are very large but nothing near that Proportion, and they are of a whitiſh green Colour. From this Root riſes up a Stalk great, ſtrong, and Ribbed or Creſted, bearing great ſtore of Leaves upon it, almoſt up to the very top: the Flowers grow along the Stalks in long tuffted Spikes ſmall at their extremities. and bending down their Heads, and they cluſter together in ſhape like little Stars; which being paſt, there are ſmall pale greenish yellow Burrs, yielding cornered, and uneven prickly Seed.*

V. *The Places.* The *Green Beet Parkinſon* ſays has been found near the Salt Marſhes by *Rochefter*, in the Foot way going from the then Lady *Leveſons* Houſe thither. The *White Beet* is ſaid to grow Wild upon the Sea Coaſt of *Tenet*, and divers other places by the Sea. They delight to grow in fat and moiſt Ground, but are chiefly nouriſhed up with us in *Gardens*.

VI. *The Times.* They ought to be ſown in the *Spring*: they flouriſh and are green all the *Summer* long, as alſo in *Winter*; and they Flower in the beginning of *July*, and the Seed is ripe in *Auguſt*.

VII. *The Qualities.* They are Temperate in reſpect to heat and moiſture; and of a Nitrous Quality, Abſterſive, a little Diuretick, Opening, Cephalick, and Hepatick, Ptarmick, Alterative, and Alexipharmick.

VIII. *The Specification.* They are found to be Specifick againſt Diſeaſes of the Head and Brain.

IX. *The Preparations.* The Shops keep nothing thereof, but you may prepare therefrom, 1. *A Liquid Juice.* 2. *An Inſpiſſate Juice.* 3. *An Eſſence.* 4. *A Decoction.* 5. *An Errhine.* 6. *A Cataplaſm.*

The Virtues.

X. *The Liquid Juice.* It is Nitrous and cleanſing: being taken vj. or viij. Spoonfuls at a time, at going to Bed for ſome Nights, it opens the Obſtructions of the Liver and Spleen, and is good againſt the Head Ach.

XI. *The Inſpiſſate Juice*, made with Vinegar into the thickneſs of a Balſam, and apply'd to the Temples, prevails againſt the Inflammations of the Eyes, and mixed with Oil Olive, is good againſt Burnings and Scaldings.

XII. *The Eſſence,* It is good againſt the Yellow Jaundice, opens Obſtructions both of Liver and Spleen, is good againſt the Vertigo, and the Bitings of any Venomous Creature. It is good againſt the Itch, the parts affected being bathed there with, and cleanſes the Head of Dandriff, dry Scurff, Scabs, and heals fretting and running Sores, Ulcers and Herpes in the Head, Legs, or other Parts: it is alſo ſaid to cure Baldneſs, and hinder the falling of the Hair. Doſe 3. or 4. Spoonfuls or more.

XIII. *The Decoction.* If it is made with Equal parts of Water and Vinegar, it has all the Virtues of the *Eſſence*; beſides it prevails againſt St. *Anthonies Fire*, and all other Inflammations in any Part.

XIV. *The Errhine.* It *is made of the Liquid Juice* iv. *ounces*, *Niter half an ounce mixed and diſſolved.* Being ſnuft up the Noſtrils it powerfully empties and cleanſes the Head and Brain of ſuperfluous Humors which cauſe the Apoplexy, Epilepſy, Vertigo, Megrim, Cephalalgia, Cephalæa, Lethargy, Carus, and other like Diſtempers of thoſe Parts; it alſo eaſes the Tooth Ach, and pains in the Ears, and being outwardly apply'd, has all the Virtues of the Eſſence and Decoction.

XV. *The Cataplaſm.* Made of the boiled Herbs with or without the Addition of a little Niter and Alum, and apply'd, it is good againſt all ſorts of Wheals, Puſhes, Boils, Blains, and other eruptions of the Skin, as alſo for Chilblains or Kibes whether on Hands or Feet, ſpeeedily Curing them.

CHAP.

CHAP. LXI.

BEETS Red.

I. *THE Names.* This Plant is called by the *Greeks*, Τεῦτλον ἑεῦθεδ᾽ν: by the *Latines*, *Beta rubra*, and *Beta nigra:* and by us in *Engliſh*, The *Red Beet.*

II. *The Kinds.* It is the third Species of the Generick Kind, as is before declared.

III. The Deſcription. *This Kind differs nothing from the former* White Beet, *but only that it is not ſo great, and that both the Roots and Leaves are ſomewhat red: the Root is red, ſpongy, and not uſed to be eaten. The Leaves are in ſome more red than in others, which have but red Veins or Streaks in them; in ſome of a freſh red, in others of a very dark red, ſtreaked here and there confuſedly. The Flowers and Seed differ little or nothing from the former.*

IV. *The Places.* It grows where the former grows, and with us are only brought up in *Gardens.*

V. *The Times.* They are Sowed in the *Spring*: endure all *Summer*, and ſometimes all *Winter*, Flower in *July*, and the Seed is Ripe in *Auguſt.*

VI. *The Qualities.* It is temperate as to heat and cold; and dry in the firſt, ſome think in the ſecond Degree. It is Abſterſive, Aſtringent, and Vulnerary: Cephalick, Splenetick, Nephritick, Hyſterick and Arthritick, Alterative, and Analeptick.

VII. *The Specification.* It is a peculiar thing for ſtopping the Blood in any kind of Hemorrhage.

VIII. *The Preparations.* They are the ſame with the former, as, 1. *A Liquid Juice.* 2. *An Inſpiſſate Juice.* 3. *An Eſſence.* 4. *A Decoction.* 5. *An Errhine.* 6. *A Cataplaſm.*

The Virtues.

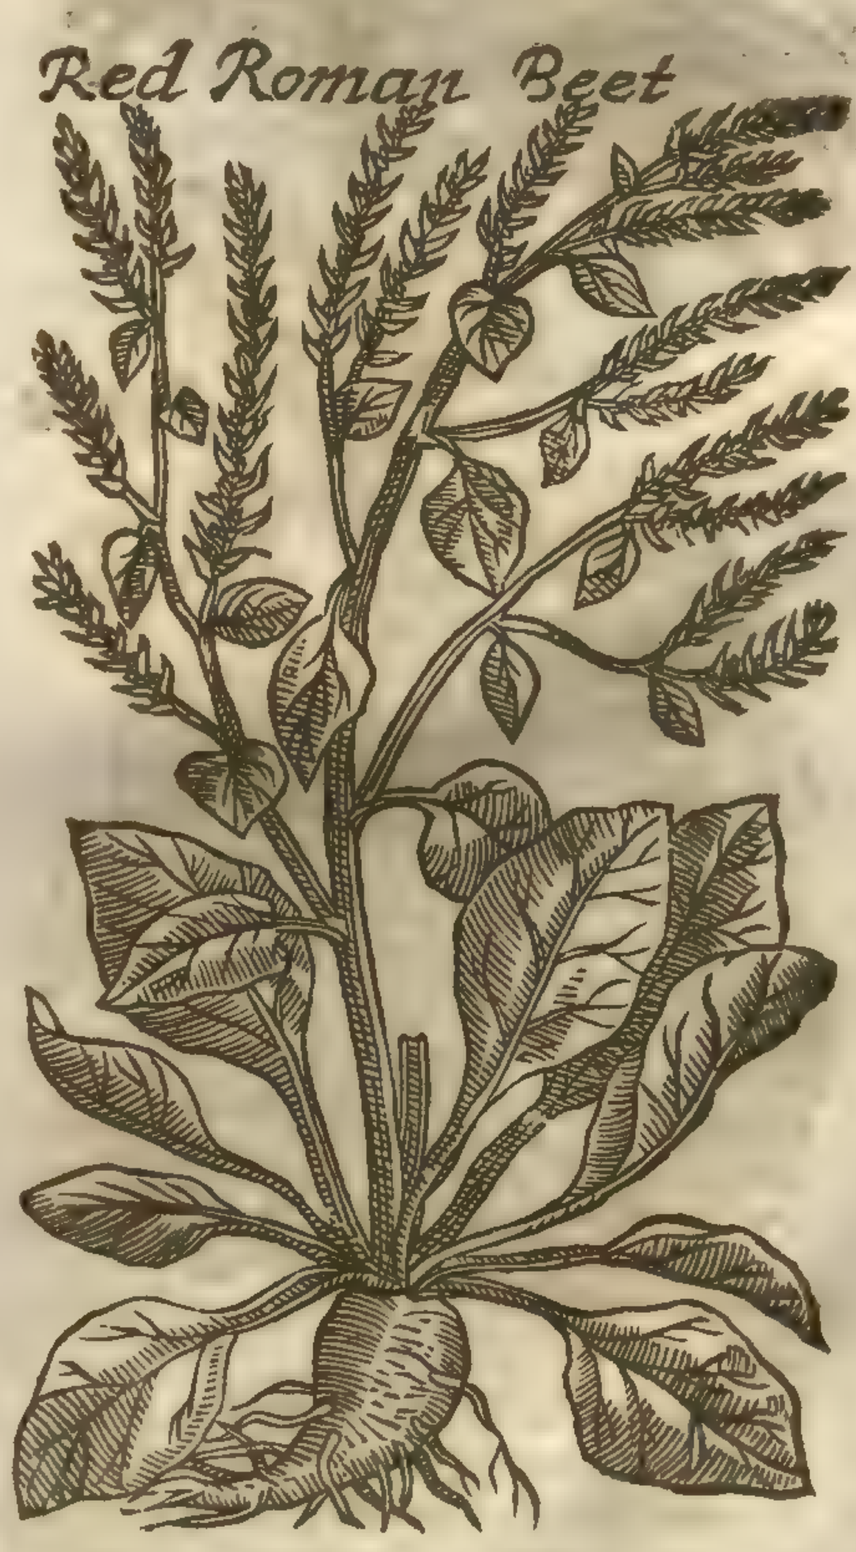
IX. *All theſe Preparations have the ſame Virtues with the former, and may be given in the ſame manner and Doſe.* But this difference is obſerved, that theſe are more Aſtringent or Binding; and therefore, both the *Liquid and Solid Juices, the Eſſence and Decoction*, all very effectually ſtop the overflowing of the Terms in Women, and ſtop other Fluxes of Blood: and are more effectual for curing any Ulcer, or running Sore, and to dry up and remove moiſt and running Scabs, and other like defœdations of the Skin. They are good againſt the Bloody Flux, and other Fluxes of the Bowels, ſtop the Whites in Women, and help the Yellow Jaundice, and this more eſpecially if daily given for ſome time mixed with a ſmall quantity of the Tincture of *Mars.*

CHAP. LXII.

BEETS Roman.

I. *THE Names.* This Plant is called in *Greek*, τεῦτλον ῥωμαϊκον: In *Latin*, *Beta Romana*, *Romana rubra*, *Rapoſa*, *Beta rubra radice Rapæ*, *radice rubra craſſa*; and in *Engliſh*, *Roman Beet*, *Red Beet*, and *Carrot Beet.*

II. *The Kind.* It is our Fourth Species of *Beets*, and a ſingular Kind.



III. The Deſcriptions. *It has a Root red as Blood, and as long and as big as the greateſt* Carrot, *very red both within and without, very ſweet and good, and fit to be eaten (which none of the former are) and ſometimes the Root is ſhort like a* Turnep, *whence it took the Name* Rapa *and* Rapoſa: *From this Root ſprings up a Stalk, higher than our* Common Red Beet, *which in its make and form of the Leaves, and proportion, differs little or nothing from the former, but only are*

are of a better taste, and of a red Colour like the former Beet. Gerard *says, they are of a very red Colour, and that they, as well as the Root, Stalk, and Flowers, are repleat with a perfect purple Juice, tending to Redness: the middle Rib of the Leaves is for the the most part very broad and thick, like the middle part of the Cabbage Leaf, which is equal in goodness with Cabbage being boiled: the Flowers (excepting the height of the Colour) and the Seed are all one with the former* Common Red Kind. Gerard *says that in 1596. it grew with him to the height of* viij. Cubits, *which is* xij. Feet, *and did bring forth its rough and unpleasing Seed very plentifully. With this Plant* (says he) *Nature seems to Play and Sport her self: for the Seeds taken from that Plant, which was altogether of one Colour, being Sown, do bring forth Plants of many and variable Colours, very beautiful. Now if I may be admitted to render a Reason of this Variety, I am of opinion it is from the differing Soils in which they are Sown, which thing I have observed in several other Plants, even to admiration.*

IV. *The Places.* It is Originally a *Foreign Plant*, and brought to us out of *Italy*, but now is become a free Denizon, or rather a Native of our Country, in which it thrives as well as in any place of the World. It is nourish'd with us only in *Gardens* where it prospers very well.

V. *The Times.* It Flowers in the latter end of *June* if the Season is warm, or beginning of *July*; and yields its ripe Seed in *August*.

VI. *The Qualities.* It is temperate as to heat and cold, and dry in the end of the first Degree, Traumatick, very Astringent, and something Styptick withall, Splenetick, and Hysterick, Alterative, and Analeptick.

VII. *The Specification.* It is a peculiar thing for stopping *Hæmorrhages*.

VIII. *The Preparations.* You may Prepare from it 1. *A Liquid Juice. An Inspissate Juice.* 3. *An Essence.* 4. *A Decoction.* 5. *A Cataplasm.* 6. *A Saline Tincture.*

The Virtues.

IX. *The Liquid Juice.* Given to ij. or iv. ounces in White Wine, it is good against the Yellow Jaundice: it also stops all Fluxes of Blood in the internal parts causing Spittings, Vomiting, or pissing of Blood; besides which it is admirable for the cure of a Dysentery, and other Fluxes of the Bowels, very much strengthening them.

X. *The Inspissate Juice.* Being reduced to Pouder, and strewed upon any bleeding Wound, it presently stops the bleeding. So also being dissolved, in Vinegar or Oxycrate, and then Stuphes to be dipt in and apply'd. This Juice dissolved in Syrup of Limons, and made into a Lohoch, is excellent to strengthen a Weak Stomach, being sometimes taken with a Liquorice Stick.

XI. *The Essence.* Being taken daily with *Tinctura Martis*, it powerfully opens Obstructions of the Spleen: And being taken with *Crocus Martis Astringens*, it powerfully stops the overflowing of the Courses.

XII. *The Decoction.* It has the Virtues of the Juices and Essence, but is somewhat weaker, and therefore ought to be taken longer. It will be better if it be made with Red Stiptick Wine, or with the Rougheſt Red *Florence*.

XIII. *The Cataplasm.* If it is made of the raw Leaves and apply'd, it removes Dandriff or the white Scurff, the place being first well rubbed with *Sal Nitre*; it also stops the spreading of running Sores, and helps Scald-Heads, (if mixed with a little *Nitre*) as also the Tinea, Alopecia, and other ill-natured breakings out of those parts, which cause the Hair to fall. If it is made of the boiled Leaves, it is good against Burnings and Scaldings, Inflammations, and other hot Tumors, Tubercles, Wheals and such like, proceeding from Inflamed Blood and Choler.

XIV. *The Saline Tincture.* It is good against Scabs, Itch, Scurff, Dandriff, Scales, Scurvey, Spots, Lice, Nits, &c. Chilblains, Kibed Heels, the parts affected being often washed, and sometimes well soaked in the same,

XV. *It is used (I mean the Root) as a Sallet, and to adorn and furnish out Dishes of Meat withall,* being as sweet and good as any Carrot: and if boil'd as Carrots, and eaten with Butter, Vinegar, Salt and Pepper, it makes a most admirable Dish, and very agreeable with the Stomach.

CHAP. LXIII.

BELL-FLOWER *Small.*

I. *THE Names.* Some Authors will allow this Plant no *Greek* Name; but others suppose it to be the same with *Dioscorides* his Φύτευμα: It is called in *Latin*, *Campanula*: and in *English*, *Bell Flower.*

Bell-flower-round-leaved

II. *The Kinds.* Authors make almost an Infinite number of Kinds, amongst which are the *Throat Worts*, *Campions*, *Rampions*, and several other Nominals, so that they run into so great Confusion about them that it is not easy to be set right. To avoid therefore all this clutter and trouble, we shall Treat of those otherwise Denominated under their proper Titles and Names they are best known by; and in this and the succeeding Chapter, discourse only of the Chief of those which are peculiarly called *Bell-Flower.*

Flowers. Of the *Bell-Flowers* of which we ſhall take notice, there are two Principal Kinds, *viz.* 1. *The Small Bell-Flower*, of which we Treat in this Chapter. 2. *The Great Bell-Flower*; of which in the next Chapter.

III. Of the *Small Bell-flower*, we take notice of three kinds: 1. *Campanula Cerulea vel Rotundifolia*, *Blew* or *Round-leav'd Bell-flower.* 2. *Campanula alba*, *White Bell-flower.* 3. *Campanula lutea*, *Yellow Bell-flower.*

IV. The Deſcription. *The* Blew *or* Round-leav'd *has a ſmall thready Root, from whence riſes up Leaves which lye upon the ground, round and ſmall, almoſt like unto a Violet-leaf, but rounder, and ſnipped or dented, from whence riſe up divers weak, ſlender Stalks about two foot high, ſet from the bottoms to the tops, with many very ſmall, long, narrow leaves, where the flowers ſtand upon ſmall long ſtalks, very like in faſhion and bigneſs unto the ſmall Garden Rampions, but of a perfect blew colour, moſt commonly turning towards Purple, and ſometimes White, tho' ſeldom: after which follows ſmall Seeds, in ſmall Heads, like thoſe of Rampions.*

V. *The* White Bell-flower *(which ſome account a kind of Wild Rampion) is a ſmall Plant with a ſlender Root, of the bigneſs of a ſmall ſtraw, with ſome ſtrings ſpringing from it. The leaves are ſomewhat long, ſmooth, and of a perfect green colour, lying flat upon the ground. From thence riſe ſmall tender ſtalks ſet here and there with a few leaves; and the flowers grow at the tops of them of a Milk-white colour.*

VI. *The* Yellow Bell-flower *is a very beautiful Plant of an handful high: It has roots like to the Blew or Round-leav'd; and the leaves are almoſt like to the ſame, ſave that thoſe which lie next the ground are not ſo round as the former, a little larger, and longiſh, and ſome of them a little dented about the edges; the flowers in their way and manner of growing, are like the former, but differ only in the colour, theſe being of a pale yellow.*

VII. *The Places.* They grow wild in moſt places in *England*, eſpecially upon barren ſandy Heaths, and ſuch other like places.

VIII. *The Times.* They flower all the *Summer* long, ſome continuing till the cold of *Autumn* makes them decay.

IX. *The Qualities.* They are cold and dry in the firſt degree, of the nature of Rampions: Aſtringent, Stomatick, and Alterative.

X. *Preparations.* You may make therefrom, 1. *A diſtilled Water of the whole Plant.* 2. *A Cataplaſm of the Root.*

The Virtues.

XI. *The Diſtilled Water.* It is good againſt diſcolourings and deformities of the skin, cleanſing it, and making the face very clear and fair.

XII. *The Cataplaſm.* The roots beaten into a Maſs, and made into a Cataplaſm, with Meal of *Lupins* and Vinegar, is reſtrictive, abates the Milk in Womens Breaſts, takes away ſpots and marks of the skin, and removes many other of its deformities.

CHAP. LXIV.

BELL-FLOWER Great.

I. *THE Names.* It has no known *Greek* Name: the *Latins* call it *Campanula*, and *Campanula magna*: in *Engliſh*, *Great Bell-flower.*

II. *The Kinds.* This is the ſecond Species of our Generick Kinds, and is three-fold. 1. *Campanula perſicifolia*, the *Peach-leav'd Bell-flower.* 2. *Campanula lacteſcens pyramidalis*, *Campanula major*; the *Pyramidal milky Bell-flower.* 3. *Viola Mariana*, *Coventry Bells.*

III. The Deſcription. *The* Peach-leav'd Bell flower *has a Root very ſmall, white, and thready, creeping under the upper cruſt of the ground, ſo that oft times the heat and drought of the Summer does parch it, and cauſe it to wither away: from whence ſprings many Tufts or Branches of Leaves lying upon the ground, which are long and narrow, much like to an Almond or Peach leaf, being finely nick'd about the edges, and of a ſad green colour. From among theſe riſe up divers Stalks two foot high, or more, ſet with Leaves to the middle; and from thence upwards, with many flowers ſtanding on ſmall Foot-ſtalks, one above another, with a ſmall Leaf at the foot of every one. The flowers ſtand in ſmall green husks, ſmall and round at bottom, but wider open at the brim, and ending in five corners, with a three forked Clapper in the middle, ſet about with ſome ſmall threads tipt with Yellow, which flowers in ſome Plants are pure White, but in others of a pale Blew, or Watchet colour, having little or no ſcent at all: the Seed is ſmall, and contained in round flat Heads, or Seed-Veſſels.*

IV. *The* Lacteſcens Pyramidalis *is a great* Bell-flower, *whoſe Root is thick and whitiſh, yielding more ſtore of Milk, being broken, (as the Leaves and Stalks alſo do) than any other of the* Bell-flowers, *every one of which do yield Milk, ſome more, ſome leſs: From this Root riſes divers Stalks, a yard high, or better, on which grow divers ſmooth, dark, green Leaves, broad at the bottom, and ſmall at the point, ſomewhat unevenly notch'd about the edges; and ſtanding upon longer Foot-ſtalks below, than thoſe above. The Flowers are Blew, and in ſome White, not ſo great or large as the former, but near of the ſame faſhion, growing thicker, and more plentifully together,*

ther, with smaller Leaves among them, hairy thick below, and rising smaller and thinner up to the Top like a Pyramis, or Spire Steeple.

V. Coventry Bells *is a Plant which has a White Root, which being young as in the first year Sowing, is tender, and often eaten as other Rampions are; but the next year when it runs up to Seed, it grows hard and perishes. From hence spring up Leaves of a pale or fresh green colour, long and narrow next to the bottom, and broader from the middle to the end, somewhat round pointed, a little hairy all over, and dented about the edges. The next year after the Sowing, rise up Stalks, something hairy also, and branching forth from the Root into divers Arms, upon which grow several Leaves, smaller than the former, and of a darker green color. At the end of every Branch stand the Flowers in green husks, from whence come large, round, hollow Bells, swelling out in the middle, and rising somewhat above it, like the neck of a Pot, and then ending in five Corners, which are either of a fair or faint White, or of a pale blew Purplish colour, and sometimes of a deeper Purple or Violet. The Flowers being past, there grows up great, square, or corner'd Seed-vessels, in which are contained in five several Cells, or Divisions, small, hard, brown, shining flat Seed.*

VI. *The Places.* All these grow with us in *Gardens*, where they are brought up for the beauty of their Flowers. The *Coventry Bells*, *Ray* says, grow in Woody and Mountainous places; and *Gerard* says, in dark Valleys, under Hedges, among Bushes, more especially about *Coventry*, whence the name, and where they grow very plentifully abroad in the fields, but are also with them Nursed up in *Gardens*, as they are with us in *London*, which pleasant *Bell-flower*, is kept chiefly for its beauty sake, though its Root is also eaten as *Rampions* are. The first of them also requires to be planted in shady places.

VII. *The Times.* These plants are to be continued by sowing them every other year. They flower generally all the *Summer* Months: but the *Peach-leav'd* flower for the most part earlier than the others: The *Coventry Bells* flower in *June*, *July*, and *August*, and the Seed ripens in the mean Season, in regard they bring not forth their flowers all at once, but as some flower, others seed.

VIII. *The Qualities.* They are cold and dry in the first degree, Astringent, Traumatick, Vulnerary, Stomatick, and Alterative.

IX. *The Preparations.* You may make thereof, 1. *An expressed Juice of the whole Plant.* 2. *A Decoction thereof in Wine.* 3. *A Cataplasm.*

The Virtues.

X. *The Expressed liquid Juice.* Being bathed upon any Inflamed Part, it abates the Inflammation, and stops the fluxion. And if a little Alum and Honey is dissolved therein, it makes a good Lotion for old Sores, running Ulcers, and a virulent Gonorrhæa in Man or Woman.

XI. *The Decoction in Wine.* It makes an extraordinary Gargle for a sore Mouth and Throat, inflammation of the Uvula and Almonds, more especially if a little Alum and Honey be also dissolved therein.

XII. *The Cataplasm.* It allays Inflammations, eases Pain, and represses the Flux of Humors.

CHAP. LXV.

BETONY Wood.

I. *THE Names.* It is called by the *Arabians*, *Chastra*: by the *Greeks*, Βίσση, ἡ Ψυχότριφον: by the *Latins*, *Betonica*: and by us *English*, *Betony*.

II. *The Kinds.* There are two principal kinds thereof, 1. Wood, *Betonica*, *Betony*; which is that of the Wood: it is twofold, *viz.* either with *Purple Flowers*, which is moſt common; or with *White*: which two kinds differ nothing one from another, but only in the colour of the Flowers. 2. *Betonica Aquatica*, *Water Betony*, of which in the next Chapter.

III. The Deſcription. Wood Betony *has a Root conſiſting of many white, thready ſtrings like unto thoſe of* Plantane, *which generally endures all the Winter; from whence riſes many Leaves, the lowermoſt whereof are ſomewhat broad, and roundiſh at the ends, ſlightly indented about the edges, and ſtand upon pretty long Footſtalks: but thoſe which grow by two and two at the Joints upon ſmall ſlender four ſquare and ſomewhat hairy Stalks, are much leſſer. The Stalk is for the moſt part near a Foot high, and ſometimes higher, and periſhes every year, upon which grow ſome Leaves, and whereon are ſet ſeveral ſpiked heads of Flowers, of a Rediſh or Purple colour, ſpotted with white ſpots all over. The Seeds are longiſh and uneven, and of a blackiſh colour.*

IV. *That with* White Flowers *is wholly like to the former, ſave that the ſpiked heads of Flowers are ſomewhat ſmaller, the Flowers without any ſpots in them, and the Leaves ſomething greener. There is alſo a* Mountain Betony, *which differs nothing from the firſt, but that the Leaves, Stalks and Flowers are ſmaller. There is a* Broad Leav'd Betony, *which differs not from the firſt, but in the Leaves, being two or three times as big, a larger and higher Stalk, and the Flowers being larger; this is called* Betonica Danica. *Alſo* Betonica Alopecuros, Fox-tail Betony, *ſo called from the form of the ſpiked head of flowers, but is every way leſs, as alſo are the Stalks and Leaves.*

V. *The Places.* The common ſort is uſually found in *Woods* and *Copſes*, and other ſhady places throughout the Kingdom, and is many times nurſed up in Gardens: but that with the *White Flower* is more uſually found in ſtiff Clay Grounds, and in the Woods by *Bromly* in *Kent*. The firſt I have ſeveral times found in, and by the Borders of *Hornſey Wood*, not far off the *New River*. That with the other are alſo nouriſhed up in Gardens.

VI. *The Times.* They flower for the moſt part in the Months of *June* and *July*, and the Seed is ripe not long after.

VII. *The Qualities.* They are hot and dry in the ſecond degree; Abſterſive, Digeſtive, Diſcuſſive, Incarnative, and Vulnerary; Cephalick, Neurotick, Stomatick, Cardiack, Hyſterick, Arthritick, Alterative, and Analeptick.

VIII. *The Specification.* They are peculiar againſt Diſeaſes of the Head and Nerves, as Falling-ſickneſs, Apoplexies, Palſies, Gouts, Madneſs, *&c.*

IX. *The Preparations.* You may make therefrom, 1. *A liquid Juice by Expreſſion.* 2. *A Decoction.* 3. *A Wine.* 4. *A Vinegar.* 5. *A Syrup.* 6. *A Spiritous Tincture.* 7. *An Oily Tincture.* 8. *A Saline Tincture.* 9. *An Acid Tincture.* 10. *An Eſſence.* 11. *A fixed Salt.* 12. *An Ointment.* 13. *A Balſam.* 14. *A Cataplaſm.*

The Virtues.

X. *The liquid Juice by Expreſſion*, being drunk to ſix or eight ſpoonfuls it is good againſt Fits, chiefly the Falling-ſickneſs, Convulſions, and the like; and being mixed with a little pouder of Sena, it prevails againſt Madneſs: being ſnuffed up the Noſtrils, it purges the Head of Flegm, and Cold Humors, and gives relief in the Apoplexy, Palſie, Lethargy, and other like Diſeaſes.

XI. *The Decoction.* If made with Wine, it is Stomatick and Cephalick, comforts the Nerves and Brain, refreſhes the Spirits, opens Obſtructions of Liver and Spleen, and is ſaid to kill Worms, eaſe the Gripings of the Bowels, and the Colick. Doſe half a pint.

XII. *The Vinegar.* It is Stomatick, and being drunk to half a pint, or three quarters of a pint, it is ſaid to cure Quartan Agues, and abate the Humors which fall into the Eyes, and cauſe Blindneſs.

XIII. *The Syrup.* It is Pectoral, and cauſes an Expectoration of Flegm, and other tough Viſcous Humors out of the Lappets of the Lungs, and other places adjacent. It may be taken with a Liquorice ſtick.

XIV. *The Spirituous Tincture.* It is a notable Medicine againſt all cold and moiſt Diſeaſes, of the Head, Brain, Nerves and Joints; is good againſt Epilepſies, Apoplexies, Convulſions, Palſies, Pains and Aches of thoſe parts; Gouts, and Weakneſs of the Joints, *&c.* Doſe from half an ounce to ſix drams, in ſome fit Vehicle.

XV. *The Oily Tincture.* This is of chief uſe for external Applications, and is profitable to be anointed upon any pained place, proceeding from Cold, Blows, Bruiſes, or other weakneſſes of the Limbs and Joints: being bathed upon the Head, it eaſes the Head-ach, Megrim, and other like Diſeaſes.

XVI. *The Saline Tincture.* Outwardly bathed upon the Joints, it prevails againſt the Gout, and other pains of the Limbs, Palſies, Convulſions, or ſhrinking of the Sinews: drunk in White Wine from one dram to two drams, it is good againſt the Jaundice and Dropſie, and opens Obſtructions of the Reins: and given to Children from a ſcruple to a dram, it kills Worms, and is good againſt the Rickets, and expels Sand and Gravel in Reins, Ureters, and Bladder.

XVII. *The Acid Tincture.* This poſſibly is one of the greateſt Stomaticks in the World, and is an excellent thing to ſtrengthen the Head, Stomach, and Womb, to help Digeſtion, cauſe a good Appetite,

tite, open Obſtructions of the *Viſcera*, and to cure Coughs, Colds, Wheezings, Shortneſs of Breath, ſtop inward Bleedings, and to remove Catarrhs, which fall upon the Lungs. Doſe, a quarter of a Spoonful, more or leſs, in a Glaſs of Generous Wine.

XVIII. *The Eſſence.* Taken inwardly two or three or more Spoonfuls at a time, Morning and Evening, it is good againſt the Jaundice, Falling-ſickneſs, Convulſions, Megrim, Vertigo, Stuffings of the Lungs, Griping pains of the Bowels, and Wind Colick; it opens the Womb, and provokes the Terms in Women when ſtopt. It is a famous Traumatick, or Vulnerary, cauſing a ſpeedy healing to old Sores, Running Ulcers, and the like; and given to Women in Travel, it cauſes ſpeedy Delivery, and gives eaſe in the After pains, which many times come through taking cold.

XIX. *The fixed Salt.* Given to one ſcruple with a little Juice of Limons and Canary, it ſtops Vomiting; and mixt with Eſſence of Winter Cherries, it provokes Urine, removes ſtoppages of the Urinary Parts, and expels Sand, Gravel, and other Tartarous and Viſcous Matter.

XX. *The Ointment.* It eaſes Pains and Aches, diſcuſſes Tumors, relaxes ſhrunk Sinews; diſſolves Congelations, and is good againſt Indurations of what kind ſoever, except they be Cancerous.

XXI. *The Balſam.* It is an excellent thing for the curing of Green Wounds, in any part of the Body, but chiefly of the Nervous Parts. It Digeſts, Cleanſes, Incarnates, Cicatrizes, and heals Wounds of all ſorts after an admirable manner; and in many caſes performs the Cure in a few days time; dreſſing the Wound with it twice a day.

XXII. *The Cataplaſm.* Made of the green Herb, and applied to the Head, it eaſes the Head-ach and Megrim in an hours time: applied to hard Tumors, it ſoftens them, and diſcuſſes the Humors gathered together in Contuſions, where no Bones nor Veſſels are broken. Applied to inveterate Scabs, it removes them, qualifies the ſharp Humors, and in a ſhort time after cures them.

CHAP. LXVI.

Water BETONY.

I. *THE Names.* It knows no *Greek* Name: but it is called in *Latin* by *Dodoneus*, *Gerard*, *Lobel*, *Lugdunenſis*, *Parkinſon*, *Tabernmontanus*, and *Turner*, *Betonica Aquatica*, and *Aquatilis*. *Tragus* makes it his greater *Ocimaſtrum*: *Thalius* calls it *Scrophularia major aquatica*: ſo alſo *Bauhinus*: We in *Engliſh* call it *Water Betony*, and ſome *Brown-wort*; but this Name is more proper for the *Scrophularia major*.

II. *The Kinds.* It is the ſecond Species of the Generick; and is alſo either the Greater, or the Leſſer: the *Greater* is called in *Latin* and *Engliſh*, as aforeſaid; the *Leſſer* is called by *Lobel*, *Betonica aquatica minor*: *Camerarius*, in his Epitome of *Matthiolus*, calls it *Scrophularia fœmina*: and in *Engliſh*, *Water Betony the leſſer*, *Brook-Betony*, and *Biſhops-leaves*.

III. The Deſcription. *The* Greater *has a Root conſiſting of a thick buſh of ſtrings and threads proceeding from a head; or of a great number of Fibrous ſtrings, which being faſtned to the bottom of the Stalk, feeds it with nouriſhment in Summer, at the end of which time it periſhes. From this Root the Stalks riſe up ſomewhat like Fig-wort, but generally higher, ſquare, hard, and green, ſometimes brown, ſet with dark, broad, green Leaves, ſo very like unto thoſe of Fig-wort, that they have been often miſtaken one for another, being alſo dented about the edges, but with rounder Notches; by the careful obſerving whereof, they may be diſtinguiſhed; and in that reſpect ſomething reſembling* Wood Betony Leaves, *but of a larger ſize, and two for the moſt part ſet at a joint. At the tops of the Branches, as alſo at the Joints, where the Leaves come out from the middle of the Stalk upwards, come forth many round bellied Flowers, which being perfectly blown, are open at the brims, but divided into two parts, the uppermoſt like a hood; the lowermoſt like a lip hanging down, of a dark red color: which being paſt away, there comes round heads with ſmall points in the ends, containing ſmall and browniſh Seed.*

IV. The Leſſer kind *has thready Roots almoſt like the former, differing only in ſmalneſs: the Stalks are ſquare and green; the Leaves round almoſt, but yet pointed, and of the ſame dark green colour, and the Flowers are of a ſad red or purple. In a word, this is in all things like the former, ſave only in the magnitude; this being lower and leſſer by three parts in four.*

V. *The Places.* The firſt grows in *England* as frequently as any Herb whatever, by Brooks, Banks of Rivers, and other Water-courſes; but is ſeldom found far from the Water-ſide, unleſs it has been planted in a *Garden*. The other is found in like places in *Germany* near *Baſil*, and grows alſo with us, if planted in *Gardens*.

VI. *The Times.* They flower in *July* and *Auguſt*, and their Seed is ripe in a little time after.

VII. *The Qualities.* They are hot and dry in the end of the firſt degree, or beginning of the ſecond: they are Aſtringent, Abſterſive, Digeſtive, Traumatick, and Vulnerary: Pectoral, Hepatick, Splenetick, Hyſterick, and Arthritick; Alterative, and Analeptick.

VIII. *The Specification.* They are peculiar, the *Greater* especially, for the curing of the Kings-Evil, and other malign and inveterate Sores and Ulcers.

IX. *The Preparations.* There may be made from it: 1. *A liquid Juice by Expression.* 2. *A Pouder.* 3. *An Essence.* 4. *A Decoction.* 5. *A Wine.* 6. *A Spiritous Tincture.* 7. *An Oily Tincture.* 8. *A Saline Tincture.* 9. *An Acid Tincture.* 10. *A Spirit.* 11. *A Salt.* 12. *A Wash.* 13. *An Oil.* 14. *A Balsam.* 15. *A Cataplasm.* 16. *A Distilled Water.* 17. *A Syrup.*

The Virtues.

X. *The liquid Juice of the whole Plant.* Mixed with Vinegar, and applied Morning and Night, it wasts and dissolves any hardness or swelling: The Juice drank five or six spoonfuls at a time, cures the spitting of Blood, bleeding at Nose, bloody Flux, overflowing of the Terms, and represses the afflux of Blood to the Tumor in the Throat, called a *Quinsey.*

XI. *The Pouder of the whole Plant.* Being drunk Morning and Evening to one dram, in any convenient Vehicle, it is much commended against the Piles or Hemorrhoids.

XII. *The Essence.* It has all the Virtues of the Juice, besides which, being taken inwardly every day for some time, Morning, Noon and Night, to three or four ounces, it wonderfully prevails against the Kings-Evil, and induces Running Sores, Old Ulcers, and Fistula's in what part of the Body soever to a speedy healing: It is also good against Scabs, Itch, Boils, Wheals, Pushes, Leprosie, being daily drunk, as aforesaid, and outwardly bathed, and applied upon the Parts affected.

XIII. *The Decoction in Water.* It allays the heat of Fevers, quenches Thirst, and is good to Bath with in Leprosies, Scabs, Breakings out, or any other defilements of the Skin: It also gently discusses Inflamations, and other hot Tumors.

XIV. *The Wine.* Drunk daily as a Diet Drink, wonderfully prevails against the *Scrophula*, or Kings Evil, and strikes at the Root of the Disease, whether in Old or Young: resists Vapors in Women, and helps Fits of the Mother.

XV. *The Spirituous Tincture.* Being taken for some time, it warms and deficcates a cold and moist habit of Body, comforts a cold and moist Brain, gives relief to the Nerves, strengthens the Liver and Spleen; and, as I have been told by a very understanding Midwife, it so corroborates and warms the Womb, as to cure Barrenness in Women, the which it has done in several. Dose, half a Spoonful Morning and Evening, in a Glass of Generous Wine.

XVI. *The Oily Tincture.* It cures wounds of the Nerves, takes away Pains and Aches of the Joints, proceeding from a cold Cause, gives relief in Rheumatisms; and softens cold indurated Tumors. Taken daily inwardly from ten drops to twenty, in any proper Vehicle, Morning and Night, it cleanses the Reins and Womb of cold slimy Humors, and other Tartarous Mucilage.

XVII. *The Saline Tincture.* It is a famous thing to clear the Skin of Tanning, Sun-burning, Freckles, Lentils, Scabs, Itch, Scurf, Dandriff, Boils, Wheals, Scabs, Leprosie, and other like Defædations, being bathed therewith Morning and Evening for 3 or 4 days, more or less, as occasion requires: 'tis possible it may take off the old Skin, under which a new one will come beforehand. It ought to be used simple of it self at first; afterwards it is to be weakened, and so used, mixed with Rose-water.

XVIII. *The Acid Tincture.* Being taken for some considerable time Morning, Noon and Night, from thirty to sixty drops in any convenient Vehicle, it cures the Scurvy radically with all its Symptoms, and destroys that humor which is the cause of the Kings-Evil; it also kills Worms in Children, and by correcting the matter which breeds them, prevents their future increase.

XIX. *The Spirit.* It is Cordial, Hysterick, Arthritick, and Antiscorbutick, and has the Virtues of the Spiritous Tincture. Dose one or two spoonfuls.

XX. *The Salt.* It opens obstructions of the Womb, Reins, Ureters, and Bladder, carries off Watry and Hydropick Humors; is good against the Rickets in Children, and the Cachexia in Virgins, and other young Women: and dissolved in Water, is good to wash the face withal, to clear it of Sun-burnings, Tanning, Roughness, and other like deformities of the Skin.

XXI. *The Wash.* It is made of the clarified Juice mixed with the fixed Salt: to a quart of the Juice, one ounce of Salt. It is an admirable thing indeed for the Face and Skin, clearing it, as it were, of all deformities: and if to the former composition, an ounce of pure Nitre is added, it abates all manner of heats, redness of the Skin, Inflamations, and other like disaffections. If also yet you add thereto *Lac Sulphuris*, or if but flowers of Sulphur, you will find it effectual against the Itch, Pimples, Scabs, Scurfs, Dandriff, Leprosie, and all other Breakings out of the Skin whatsoever.

XXII. *The Oil by Infusion or Insolation.* It eases Pains, discusses Tumors, and is good against Contusions or Bruises in what part of the Body soever.

XXIII. *The Balsam.* It has all the Virtues of the Saline Tincture; and, being applied, is a singular thing against Wounds new or old, running Sores, old Ulcers, malign Fistula's, and it cures Scrofula's, or Kings-Evil Sores almost to a miracle, for which reason it is called by some Authors *Scrophularia*; it being also applied to the Gout, and other Aches and Pains of the Limbs, it gives ease to them, by attracting the Humor through the Pores of the Skin.

XXIV. *The Cataplasm.* It is Discussive, wasts and dissolves Swellings, and is profitable, being applied in Strumatick, or Kings-Evil Tumors. If the Cataplasm is only made of the green leaves beaten, and mixed with a little Vinegar, and applied Morning, Noon and Night, it does not only dissolve hard Tumors, but heals old, rotten, corrupted, spreading and fretting Sores and Ulcers, corrects the virulence of Pockey Sores, and stops the malignity of Cancers; and this more especially, if a proportional quantity of *Litharge*, or *Saccharum Saturni* be added thereto.

XXV. *The Distilled Water* It is Cosmetick, and is of the nature of the Saline Tincture, and the Wash, having the same Virtues; but it is nothing near so powerful. However, where water is necessary to be mixed with them, this, as being more homogene, may be used in its place.

XXVI. *The Syrup; if it is made with Honey and Juice of Limons, or pure Wine Vinegar.* It is an excellent thing to open Obstructions of the Breast and Lungs, help shortness of Breath, cause Expectoration, and to expel those gross and obnoxious Humors which cause the Scurvy, Gout, Rheumatism, Kings-Evil, and are the Ground and Foundation of all sorts of Fevers happening to the Bodies of Human Kind.

CHAP.

CHAP. LXVII.

BIFOIL, *or* TWA-BLADE.

I. *THE Names.* It was not known to the *Greeks*, unleſs the Ὄφρυς of *Pliny* be it, which ſome Herboriſts believe, and therefore call this Plant by that name: in *Latin* it is alſo called *Ophris* and *Bifolium:* and in *Engliſh*, *Bifoil* or *Twablade.*

II. *The Kinds.* There are two Kinds thereof, *viz.* 1. *Ophris ſeu Bifolium, ſylveſtre vulgare, Common Wood Bifoil or Twablade.* 2. *Bifolium Paluſtre, Marſh Bifoil.*

III. The Deſcription. *It has a Root ſomewhat ſweet, with a head or top ſomewhat thick (which ſome call a Bulbe) ſhooting many long Fibres downwards, from which Root riſes up a round green Stalk, bare or naked next to the ground, for an Inch, two, or three, to the middle thereof, as the Plant is in age and growth, as alſo from the middle upwards unto the Flowers, having only two broad and ſhort ribb'd pale green or hoary Leaves, very like unto Plantane leaves, but whiter, and ſet at the middle of the Stalk, one on each ſide, and encompaſſing it at bottom: ſometimes it will have three leaves, but is more rare; and this ſome account to be a different ſort, but is rather to be looked upon to be* luſus Naturæ, *in ground which abounds with too much nouriſhment, the which happens alſo to many other Plants; (as in* Herb Paris, *which has ſometimes five, ſix or ſeven leaves, and ſometimes it wants a leaf of its ordinary number being but four, and in common Trefoil, which uſually has but three leaves, yet oftentimes four are found upon ſeveral Stalks,* &c.) *the Flowers at top of the Stalks, are in a ſpiked head, and they are many, ſmall, long, whitiſh green, and almoſt ſhapeleſs bodies, ſomewhat like unto ſome of the Orchides or Vulgar Satyrions: theſe paſſing away, there remains ſmall heads, with a kind of duſt in them, which is accounted to be the Seed.*

IV. *The* Marſh Bifoil *has a Root which runs or creeps in the Earth, and the whole plant is ſo little differing from the former, that the differences have ſcarcely been obſerved, whereby ſeveral have been deceived in their judgments; but in theſe following particulars it is diſtinguiſhed,* 1. *In its Site, or place of growing.* 2. *In the ſmallneſs of the Plant, this being much leſſer, and having ſometimes three leaves alſo.* 3. *In the Greenneſs, the other being of a mere hoary White.* 4. *In the ſpike of Flowers, which although of the ſame faſhion or colour, or very near, yet are leſs by far.*

V. *The Places.* The firſt uſually grows in *Woods* or *Copſes*, and ſuch like ſhady places, as between *Highgate* and *Hamſtead*, alſo at *Southfleet* in *Kent*; in a Wood by *Longfield Downs*: in the Woods by *Ovenden* near to *Clare* in *Eſſex*; as alſo in the Woods by *Dunmow* in *Eſſex*. The other grows not only in the low wet grounds between *Hatfield* and St. *Albans*, but alſo in divers places in *Rumney Marſh*.

VI. *The Times.* They flower for the moſt part in *May*, and ſo continue to the middle or end of *June*, and then wholly wither away, and are gone in *July*.

VII. *The Qualities.* They are Temperate in their firſt qualities, Glutinative and Vulnerary; Neurotick, Arthritick, and Alterative.

VIII. *The Specification.* They are Adapted for the Cure of Green Wounds.

IX. *The Preparations.* Theſe may be made from it: 1. *A liquid Juice.* 2. *An Eſſence.* 3. *A Decoction in Wine.* 4. *A Pouder.* 5. *An Ointment.* 6. *A Balſam.* 7. *A Cataplaſm.*

The Virtues.

X. *The liquid Juice.* If mixt with Nitre, it allays Inflamations; and gives eaſe in the Gout; ſo alſo if mixed with Vinegar.

XI. *The Eſſence.* It is Glutinous, and heals Wounds (if ſimple) by waſhing them therewith; more eſpecially if at time of uſing, it is mixed with a third part of Wine, or Spirit of Wine: it prevails alſo againſt Ruptures.

XII. *The Decoction.* It is of admirable uſe in dilacerated Contuſions, for it draws forth the ſcattered and bruiſed Blood, cleanſes the Wound, and diſpoſes it to healing.

XIII. *The pouder of the Leaves.* It diſpoſes green wounds to healing, drys and heals.

XIV. *The Ointment.* It ſoftens, gives eaſe in pain, and cleanſes Wounds without any ſharpneſs, whether new or old: and is of good uſe in Ruptures.

XV. *The Balſam.* It cures all ſimple wounds commonly at one dreſſing, and if they be contuſed and dilacerated, it digeſts them, cleanſes them, and after an admirable manner ſpeedily heals them.

XVI. *The Cataplaſm.* It diſcuſſes ſoft Tumors, and Contuſions, where the skin is not broken: and applied upon an old open Ulcer, cauſes a ſeparation of the Stuff from the quick fleſh, and diſpoſes it for healing, to be accompliſhed by other proper Medicines.

CHAP. LXVIII.

BIND-WEED Common.

I. *THE Names.* It is called in *Greek*, by *Galen*, and *Paulus Ægineta*, σμίλαξ λεία: in *Latin*, *Smilax lævis:* it is called *Lævis* or *Smooth*, becauſe the Stalks and Branches have no prickles at all. *Pliny lib.* 21. *cap.* 5. calls it *Convolvulus*, and

Campa-

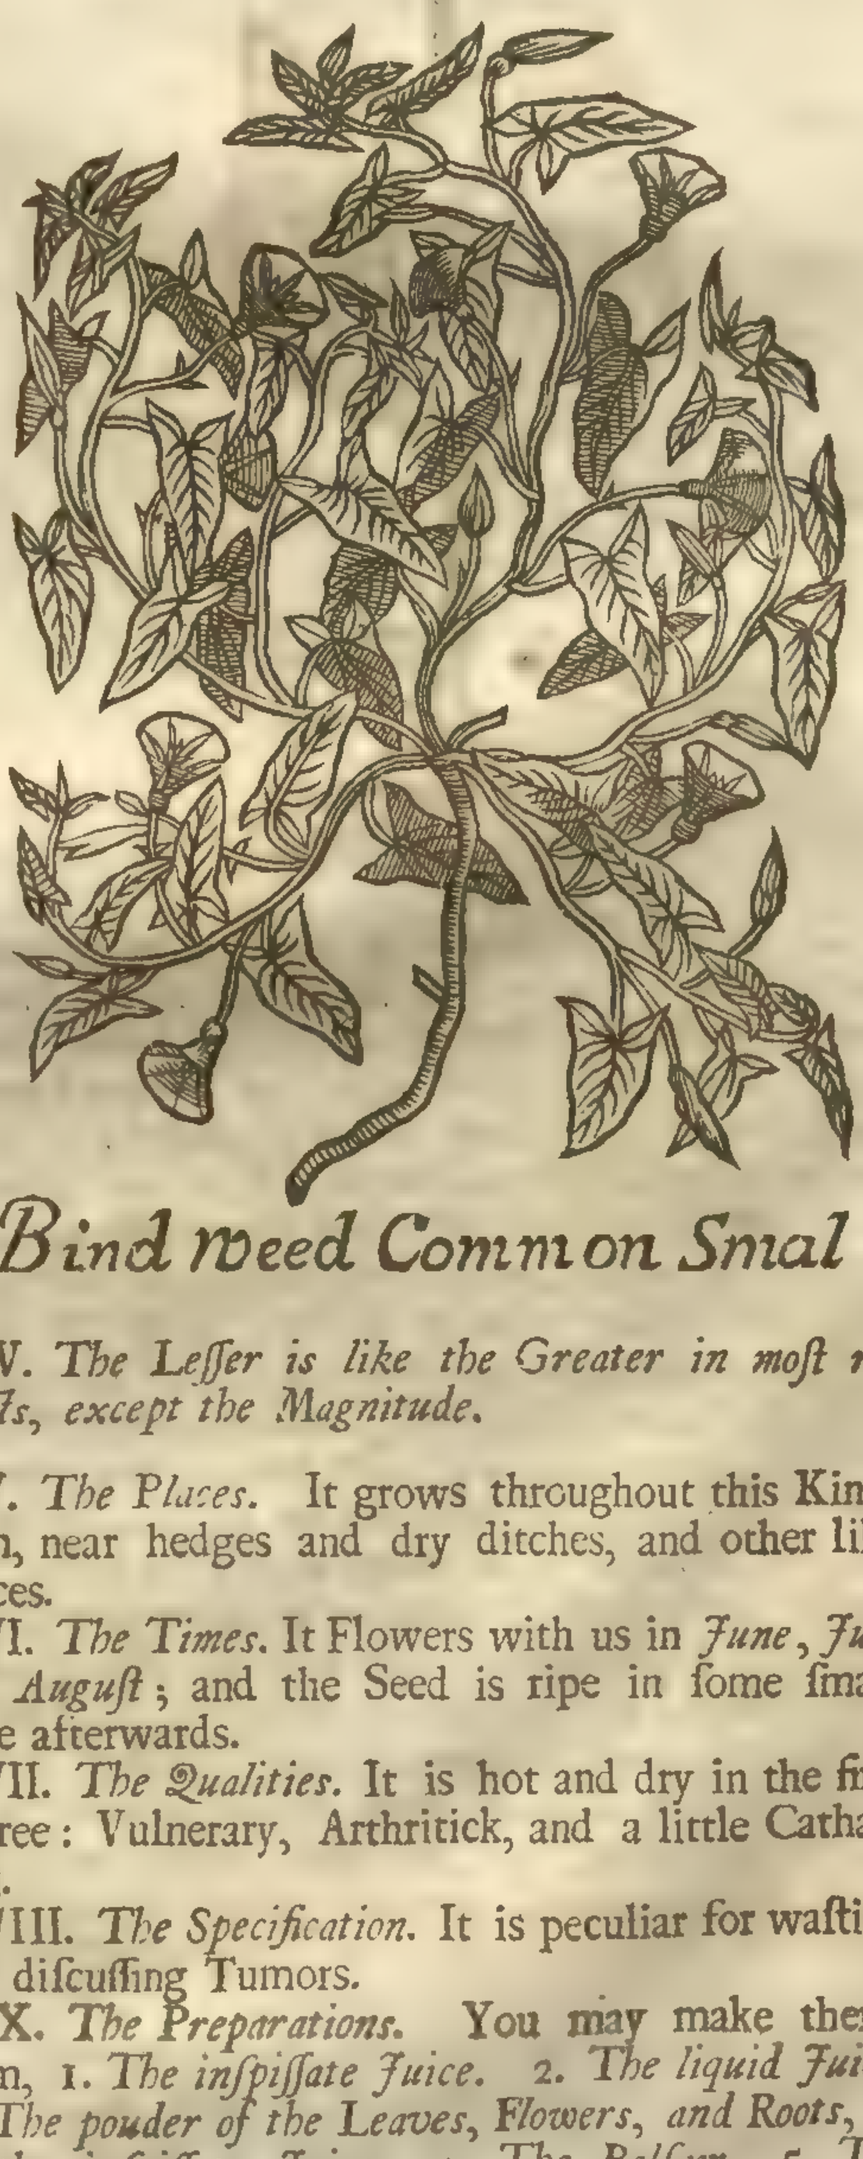
Campanella, *Convolvulus albus*, alſo *Funis Arborum*: others call it *Volubilis*, alſo *Volubilis communis*: and in *Engliſh*, *Bindweed*, *White Bindweed*, and the *Greater Bindweed*.

Gr. *Bind weed common.*

II. *The Kinds.* Of the *Bind-weeds* we have to treat of in this Work, there are chiefly three, 1. *The Common great Bindweed*, as alſo the *Leſs* aforenamed, of which in this Chap. 2. *The leſſer Blew Bind-weed.* 3. *The Black Bind-weed.* Of which in the two next.

Great Bindweed

III. The Deſcription. *The Root is whitiſh and ſmall, of the largeneſs of Quitch-graſs, or ſomething bigger, running much under ground, and ſhooting forth again in ſeveral places: it lives under ground all Winter, and ſhoots forth a freſh every Spring, and yelds Milk, being broken.* From this Root *ſprings up ſlender winding Salks, which run up, and wind themſelves upon hedges, buſhes, or what is next it to catch hold of; and if there is nothing for it to climb upon, it runs it ſelf along upon the ground, eſpecially on the banks of dry ditches.* The Leaves *are divers and large, growing ſeverally on the Stalks, ſomewhat long, and pointed at the further end, and parted into two parts or points at the broad part next to the Stalk, making it ſeem almoſt three ſquare, being ſmooth, and of a pale green colour, yielding a milk, being broken, but not ſo plentifully as Scammony. At the Joints with the* Leaves *towards the tops of the Branches come forth large White* Flowers, *in faſhion of a Bell, without any cut or diviſion in them; which being paſſed off, there comes forth round skinny Husks, or* Heads, *containing within them many ſmall blackiſh Seeds, and almoſt three cornered.* This Great Bind-weed *is ſo like unto* Scammony, *that excepting the largeneſs of the* Roots, *and the greater force in purging, which may both of them proceed in part from the Climate, one would think it to be one of the kinds of* Scammony, *whoſe many ſlender winding Stalks run up, and wind themſelves upon whatever ſtands next, or near to them.*



Bind weed Common Smal

IV. *The Leſſer is like the Greater in moſt reſpects, except the Magnitude.*

V. *The Places.* It grows throughout this Kingdom, near hedges and dry ditches, and other like places.

VI. *The Times.* It Flowers with us in *June*, *July* and *Auguſt*; and the Seed is ripe in ſome ſmall time afterwards.

VII. *The Qualities.* It is hot and dry in the firſt degree: Vulnerary, Arthritick, and a little Cathartick.

VIII. *The Specification.* It is peculiar for waſting and diſcuſſing Tumors.

IX. *The Preparations.* You may make therefrom, 1. *The inſpiſſate Juice.* 2. *The liquid Juice.* 3. *The pouder of the Leaves, Flowers, and Roots,* or *of the inſpiſſate Juice.* 4. *The Balſam.* 5. *The Cataplaſm.* 6. *The Diſtilled Water.*

The

The Virtues.

X. *The inſpiſſate Juice.* Being diſſolved in Wine, it makes an excellent Waſh to cleanſe old Sores, filthy, putrid, and running Ulcers, and hollow Fiſtula's, inducing them to a ſpeedy cure.

XI. *The liquid Juice.* Mixt with Red Wine, it is a very good thing for a ſore Mouth, and is of uſe to heal Cankers in the Mouths of little Children: and if Childrens Feet, who are uſually troubled with Chilblains or Kibes, be waſhed often herewith, it perfectly cures.

XII. *The Pouder of the Roots, Leaves, Flowers,* or *inſpiſſate Juice.* It admirably cleanſes and heals old, rotten, and ſtinking Ulcers: and where the Bone has been putrified, it has perfectly cleanſed the Ulcer, dried the Bone, and in a little time ſcaled it; and afterwards by the continual application, it has covered it with Fleſh, incarnated the Ulcer, and in a little time healed it: I ſpeak this by great experience: One time it happened, that a Youth who had Kibes in his Feet, and ſo much corrupted, that the Bone it ſelf was putrified; by the ſole application of this pouder, dry, upon the Ulcer, I cleanſed it, ſcaled the Bone which was black, and afterwards incarned and healed the Ulcer, beyond the expectation of any one that then ſaw it.

XIII. *The Balſam.* It is ſingular good for the curing of Wounds, but chiefly of old and putrid Ulcers, and eſpecially of thoſe Ulcers which ariſe from Kibes in Childrens Feet, or from Tumors in the Kings-Evil.

XIV. *The Cataplaſm.* Being made of the green Herb, and applied to the grieved place, it waſtes, diſſolves, or diſcuſſes Tumors or Swellings, as *Galen* ſaith: I know it to be excellent to diſcuſs Chilblains in Childrens Feet.

XV. *The Diſtilled Water.* It is a good Coſmetick, and as ſome ſay, good againſt Freckles, Pimples, Scurf, and other defilements of the Skin: it takes away Tanning, Sunburning, and redneſs of the Face and Hands: and this it does more eſpecially, if it is mixt with a ſmall quantity (ſome ſay, equal parts) of Vinegar, or Juice of Limons.

CHAP. LXIX.

The Leſſer BLEW BINDWEED.

I. *THE Names.* It is called in *Latin, Convolvulus minor*, and *Volubilis minor*, to which they add *Purpureus*, becauſe of the Purple color of the Flower. And in *Engliſh, Bindweed the leſſer*, and *Blew* or *Purple Bindweed.*

II. *The Kinds.* There are ſeveral Species of it, as, 1. *Convolvulus minor vulgaris, The Common Small Bindweed.* 2. *Althæa foliis, Mallow leav'd.* 3. *Purpureus, Purple Bindweed.* 4. *Cæruleus Hiſpanicus, Blew Spaniſh Bindweed.* 5. *Convolvulus Spicæ foliis, Lavender leav'd Bindweed*: of all which in order.

III. The Deſcription. *It has a Root ſmall and ſlender, running both very deep into the ground, and ſpreading alſo far about, eſpecially where the ground is looſe and mellow: From this Root comes Stalks, which riſe up and wind themſelves upon any thing which is near it, but otherwiſe uſually ſpreads every way on the Earth, with long trailing and winding Branches, one within another, having Leaves thereon, ſomewhat like unto the* greater White Bindweed, *but much leſſer: The Flower is for form, like the former* White Bell-flower, *and is ſometimes wholly White, or has Plaits parpleh, but leſs, made of one leaf plaited as it were into five folds, and opening wide at the Brims: after which come ſmall blackiſh Seed, contained in ſmall, long and round heads.*

Small Bindweed Blew.

IV. *The* Mallow leav'd *has a ſmall and browniſh Root, creeping under ground, and ſhooting up branches in diſtant places: From this Root ſprings branches, which grow not high, nor climb much upon any thing, but for the moſt part lyes with its ſmall, ſlender, hairy twigs upon the Earth, having divers leaves very*

very thinly, or poreing'ly ſet on them, ſomething broad and long, like unto the leaves of Marſh-mallows, but ſmaller, crumpled, and cut in on both ſides, at the lower ends, dented about the edges, and of a hoary or duſty grayiſh green Color, which when they are cleared, are clammy, or ſticking like Gum to the Teeth, ſharp, and ſomewhat bitter in taſte. The Flowers come forth one by one at the Joints with the Leaves, all along the Stalk, up to the top, every one upon a long Stalk, which are very like the former, juſt before deſcribed; they conſiſt of one whole leaf, yet plaited as it were before the opening into five plaits, and being open, have five corners, as if it had five leaves, broad like a Cup or Bell at the brims, and ſmall at the bottom, of a fine pale Purple color, and ſometimes deeper, after which come forth heads of ſmall Seed.

V. *The* Small Purple Bindweed, *is in all things like unto the firſt of theſe deſcribed in this Chapter, ſaving that the Flowers are of a pale purpliſh, or blewiſh color, the folds being White, or of a deeper Purple without, and White within, the bottom being alſo agreeable therewith, which is of much beauty.*

VI. The *Spaniſh* Blew Bindweed, *has a ſmall thready Root, which dies every Year, from which ſhoots forth ſeveral ſmall Branches a yard long, or more, having ſeveral Leaves ſtanding ſingly thereon, ſmall and long at the bottom, and broader, and almoſt round at the end, a little hairy as it were, all over. At every leaf for the moſt part, from the middle of the Stalks upwards, comes forth a Flower, like unto the common ſort, folded into five plaits, which open into ſo many corners, of a moſt admirable Sky colored Blew (ſo pleaſant to behold, that it amazes the ſpectators) with White bottoms, pointed upwards, and Yellow in the middle, which paſſing away, there comes ſmall, round white heads, containing within them, ſmall blackiſh cornered Seed, which is to be new ſown every Year.*

VII. The Lavender leav'd, *This is like the firſt in all things, except the Leaves, which are long and narrow, reſembling thoſe of Lavender, or Linaria: But it has a finer Flower, plaited or folded in the compaſs of its Bell very orderly, eſpecially before the Sun riſe, for afterwards, when it opens its ſelf, the folds are not ſo much perceived; and it is of a deep Purple color: the Seed is not unlike the reſt, corner'd and flat, growing out of ſlender Branches, which ſtand upright and thick together, proceeding from a White woody Root.*

VIII. *The Places.* The *Firſt* of theſe is common, and grows almoſt every where in Fields, By-ways, dry Ditches, Ditch banks, and Hedge ſides, through *England.* The *Second* and *Fourth* grow in *Spain*, and are nouriſhed up with us in Gardens. The *Third* and *Fifth* are common with us in *England*: This Fifth or laſt, *Gerard* ſays he found it growing in the Corn Fields about *Great Dunmow* in *Eſſex*, in ſuch abundance, that it does much hurt to the Corn, and *Parkinſon* ſays, it is as great a plague to the Fields where it grows, as the firſt is.

IX. *The Times.* They all flower from *May* to the end of *Auguſt*, and the Seed ripens gradually in the mean Seaſon.

X. *The Qualities.* They are all much of a Nature, being hot and dry in the firſt Degree, a little Aſtringent, Vulnerary, Arthritick, and Alterative.

XI. *The Preparations.* You may have, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *A Pouder.* 4. *A Balſam.* 5. *A Cataplaſm.* 6. *A Diſtilled Water.*

The Virtues.

XII. *The liquid Juice.* Being often ſnuffed up the Noſtrils till it comes out again at the Mouth, it cleanſes and heals Running Sores or Ulcers in thoſe parts: And if a little Nitre is diſſolved in it, it purges the Head and Brain.

XIII. *The Eſſence.* It has the ſame Virtues, but is more Diſcuſſive, and prevalent for the cleanſing of Ulcers, and healing of Wounds.

XIV. *The Pouder.* Strewed upon a foul Ulcer, it cleanſes it (if alſo waſhed with the Eſſence) and afterwards it incarnates and heals.

XV. *The Balſam.* It is an excellent Vulnerary, and cures ſimple Wounds many times at once dreſſing.

XVI. *The Cataplaſm.* Made of the Green Herb, it diſcuſſes Tumors, and applied upon Contuſions diſperſes the Humors gathered together.

XVII. *The Diſtilled Water.* If you diſſolve a little *Sal Prunella*, or Nitre in it, it is good againſt Heats and Breakings out in the Face, Tannings, Sun-burnings, Pimples, Scurf, and other like Deformities.

CHAP. LXX.

BINDWEED Black.

I. *THE Names.* It is ſuppoſed to be called in *Greek* Ἑλξίνη μισσάμπελος: In *Latin*, *Helxine Ciſſampelos*, *Convolvulus minor niger*; *Lobel* calls it *Ciſſampelos altera atriplicis effigie*: *Dodonæus* calls it, *Convolvulus niger*: *Thales* calls it, *Volubilis media ſive nigra*: *Columna* calls it, *Polygonum Hederaceum*: *Cordus* on *Dioſcorides* takes it to be *Elatine*: And *Angulara* will have it to be *Centunculus Plinij*: in *Engliſh*, *Black Bindweed.*

II. *The Kinds.* There is, 1. The *Common Black Bindweed*, which though it is one of the ſmall *Bindweeds*, yet is the greater of the Black. 2. *Ciſſampelos altera Anglica minima*, The ſmalleſt *Black Bindweed*, of *Engliſh* Growth.

III. The

III. The Deſcription. *It has a Root ſmall and ſlender, periſhing every Year, and riſing again from the Seed every Spring, unleſs it be weeded out of the Garden. From this Root riſes up Branches, which if they meet not with upright tall Herbs, or other things whereon it may climb, it riſes up but a little height, and leans down again to the ground; but otherwiſe if it meets with fit things, on which it may cling, it will wind it ſelf with its long, ſlender, reddiſh, thready Branches about them, to the height of three or four* Feet, *or more, ſhooting forth its Leaves ſingly at the Joints as the others do, either ſomewhat like to an* Arrach *leaf, or almoſt like the firſt ſmall field* Bindweed, *or like the leaf of* Black Briony, *for of thoſe kinds there are, but much ſmaller. The Flowers,* Gerard *ſays, are ſmall, like thoſe of the* Arrach; *and* Parkinſon *ſays, they are very ſmall, and many, ſtanding together upon a ſmall long Stalk, which comes from the Joint where the leaf ſtands, and are of a reddiſh green color, but ſo ſmall, that they are oftentimes not taken notice of, and they ſo quickly fade, that they are ſcarcely regarded: The Flowers being gone, then comes the Seed, which is ſmall, blackiſh, and three cornered, like, but leſs than that of* Buck Wheat.

IV. The ſmalleſt kind of Black Bindweed, *differs from the former only in the Magnitude, this riſing not above a hand breadth high.*

V. *The Places.* They grow in many places of this Kingdom, both in Fields and Gardens, where they grow as a Weed. The *larger* of them is not only a hurtful Weed, but of an ill ſmell, and too often found amongſt Corn.

VI. *The Times.* They flower in *May*, *June*, *July* and *Auguſt*, and the Seed ripens in the mean Seaſon, in a little time after the Flower is gone.

VII. *The Qualities.* They are hot and dry in the firſt Degree, Diſcuſſive, Vulnerary, Arthritick and Solutive.

VIII. *The Preparations.* You may make thereof, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *A Balſam.* 4. *A Cataplaſm.* 5. *A Diſtilled Water.*

The Vertues.

IX. *The liquid Juice.* It is made of the Leaves only, and if it is taken inwardly 3 or 4 ounces at a time, it looſens and opens the Belly very much.

X. *The Eſſence.* It has the ſame Virtues to looſen the Belly; beſides I have heard it confirmed from Experience, that it is prevalent againſt the King's Evil.

XI. *The Balſam.* It is very good for healing green Wounds, and to cleanſe Old Ulcers, and Running Sores, and to cure Kibes in Childrens heels.

XII. *The Cataplaſm*, made of the Green Leaves. It diſſolves and diſcuſſes Tumors or Swellings, and hard Lumps in the Fleſh, as *Galen* ſays: and if mixed with a little Nitre, it allays Inflammations.

XIII. *The Diſtilled Water.* It is good againſt Pimples, Scurf, Freckles, Tannings, Sun-burnings, and other deformities of the Skin; more eſpecially if a little Vinegar, or Juice of Limons is mixed with it.

CHAP. LXXI.

BINDWEED Sea.

I. *THE Names.* I cannot find that the *Greeks* knew any thing of it: The *Latins* call it *Soldanella*, and *Soldana*, *Convolvulus Marinus*, and *Tuſſilago Marina* (from the reſemblance of the Leaves:) And we in *Engliſh* only *Sea Bindweed*, and *Sea Bells*, or *Bell-flower.* I know that *Matthiolus*, *Cordus*, *Geſner*, *Camerarius*, *Dodonæus*, and others, call it *Braſica Marina*, but it is no ſuch thing, for that is clearly another Plant.

II *The Kinds.* There are three Kinds thereof, 1. *Soldanella*, *Sea Bindweed*, properly ſo called. 2. *Soldanella Maritima major*, the *Greater Sea Bindweed.* 3. *Soldanella Alpina*, *Mountain Soldanella.*

III. The Deſcription. *The firſt of theſe has a Root ſmall and long, ſpreading a little in the ground, and ſhooting up divers heads in ſeveral places; and if any part of it is broken, there comes forth from it (as alſo from the Leaves) a whitiſh water, which is bitter, ſalt, and unpleaſant. From this Root riſes many weak, ſlender, browniſh green branches, trailing or lying upon the ground, rather than raiſing it ſelf up, or climbing upon other things. Upon theſe Stalks are ſet divers* Leaves, *not always two together at a Joint, nor yet always ſingle, one at a Joint, which are always round like the* Leaves *of* Aſarabacca, *but a little unevenly dented about the edges, and thicker, every one ſtanding on a long footſtalk, and of a grayiſh green color: among which come forth the Flowers towards the ends, each Flower by it ſelf, ſpringing forth at the Joints, much like in ſhape or form to the* Common Small Bindweed, *which grows upon the ground by way ſides almoſt every where; but they are a little larger, and of a reddiſh purple color. Theſe being paſt away, there comes round heads, containing within them 2 or 3 round black Seeds.*

IV. The greater Sea Bindweed, *has a Root a little creeping in the Earth, from whence ſhoots up ſeveral long ſlender Branches, on which are ſet larger Leaves than on the former, many of them having a diviſion on both ſides the Leaf next to the bottom, and many of them but on one ſide; and ſeveral of them which are ſmaller, having none at all; yet all of them for the moſt part a little ſinuated on the edges towards the ends, which are round, or with a dent in the middle, making the point ſeem double forked, with many Veins running therein. The Flowers are of a red purple color, and are not Bell or Cup faſhion like*

the former, but consist of five somewhat large and long Leaves. *The Heads and Seeds are like the other, and Spring up by being scattered after Seed time.*

V. Soldanella Alpina major, The greater Mountain Soldanella *(for there is a lesser, of which we shall take no notice here) has a long round Head or Root shooting forth many Fibres, or small Strings. From whence rises many hard round Leaves, standing upon long Foot-stalks, something unevenly cut about the edges; green on the upper side, and of a grayish green underneath, and a little reddish like the leaves of* Sowbread, *and much resembling the* Sea Soldanella *(this* Mountain Soldanella *being so called from the likeness of the Leaves to the former:) The Stalks are slender, small, round, and reddish, about a span high, having upon them four or five Flowers at Top, every one hanging down their heads like unto a* Bell-flower, *consisting but of one leaf, plaited into five folds, each of them ending in a long point, which makes the Flower seem to have five leaves, having a round green head in the middle, with a prick or point at the end thereof. The Flower is of a fair blew color, some deeper, some paler, and some almost white, as nature pleases, but without any smell at all. The middle head, after the flower is fallen, grows to be a long, round Pod, bearing the pointel it had at the end thereof, in which is contained small greenish Seed.*

VI. *The Places.* The two first Kinds grow on our own Sea Coast in great plenty, in many places, as near *Lee* in *Essex*, at *Mersey* in *Essex*, and in most places in the Isles of *Thanet* or *Shepey*, as also along the Northern Coast: The last grows on the *Alps*, and *Mountains* of *Germany*: It also grows on the Mountains of *Wales*, not far from *Cowmers Meer* in *North Wales*.

VII. *The Times.* The two former flower, *Gerard* says, in *June*, but *Parkinson*, about the end of *Summer*, and their Seed is ripe in *August*. The third flowers on the *Alps*, &c. not till *July* or *August*, as the Snow melts sooner or later; but in Gardens it flowers in *April*.

VIII. *The Qualities. Soldanella* is hot and dry in the second Degree, Astringent, Hepatick, Cathartick and Emetick; but is said to be a great Enemy to the Stomach.

IX. *The Specification.* It is said to be a peculiar thing for curing the Dropsie.

X. *The Preparations.* 1. *The Decoction.* 2. *The Juice.* 3. *The Inspissate Juice.* 4. *The Essence.* 5. *The Pouder.* 6. *The Cataplasm.* 7. *The Balsam of the* Mountain Soldanella.

The Virtues.

XI. *The Decoction.* It ought to be made in Fat Mutton or Beef Broth, (because of its strength, and aptness to trouble the Stomach) opens the Belly powerfully, and purges violently in Dropsies, and Timpanies, and therefore is not to be given, but to such as are of a strong Constitution; it opens Obstructions of the Liver, and strengthens the same.

XII. *The liquid Juice.* It is both Emetick and Cathartick, and makes Sick; but in such Bodies as can bear its violence, it effectually carries off Watry Humors. An ounce mixt with a good Glass of White Wine will purge some People very well: others may take two ounces or more; whereas half an ounce will powerfully purge others.

XIII. *The Inspissate Juice.* This is not to be press'd out, but suffered to issue out of its own Accord when the Herb or Stalk is broken; this being dried, and afterwards softned with the Essence, or Wine, or other like Liquid, so as to be used Plaster-wise, being applied to the bottom of the Belly, admirably draws forth the Watry Humor in Dropsies.

XIV. *The Essence.* It has the Virtues of the liquid Juice, but more correct and free from Crudities, and therefore more gentle in its Operation: Being given in Wine from half an ounce, to an ounce, it kills Worms both in Children, and Elder People.

XV. *The Pouder.* It is made of the Leaves dried, and ought to be corrected with Anniseeds, Carraways, Cinnamon, Cubebs, Ginger, Zedoary and Sugar: So prepared and given, it kills Worms in Children, and purges the Belly: The simple pouder is good also to cleanse Sores and Ulcers, to incarnate or breed Flesh in deep and hollow Ulcers, and also to heal them.

XVI. *The Cataplasm.* Made of the Green Leaves, and applied to the Belly, it is said to purge the Bowels by Stool, and drive forth the Watry Humor which causes the Dropsie: but it must be often applied, and renewed with fresh Herbs; and so it is profitable against the Sciatica and Gout.

XVII. *The Balsam of the* Mountain Soldanella. It is an admirable Vulnerary, curing not only green Wounds with much ease and speed; but it also cleanses old and rotten Ulcers, and putrid Sores, destroying the Putridity. It wonderfully incarnates or breeds Flesh in Wounds, and heals them.

XVIII. *Gerard* says, That the *German* Physicians do much boast of the Wonders they have done with *Soldanella Montana*: That the Leaves applied as a *Cataplasm* to the Navel, and somewhat lower, draws forth Water from the Bellies of such as are Hydropick: and this effect (says he) it works in other parts without heating.

CHAP. LXXII.

BIRDS-EYE.

I. *THE Names.* I find no *Greek* Name that this Plant has: but it is called in *Latin*, *Paralytica Alpina*, *Primula veris minor*; by some *Sanicula angustifolia*: in *English*, *Birds-Eye*, and *Birds-eine*, and *Birds-eyne*.

II. *The*

II. *The Kinds.* This Plant doubtleſs belongs to the tribe of the *Cowſlips*, of which it is a ſpecial Kind, as being a *leſſer ſort*. There are alſo two Species of *Birds-Eye*, viz. 1. *Paralyſis minor flore rubro, the leſſer Cowſlip*, which is alſo the leſſer *Birds-Eye* with Red Flowers. 2. *Paralyſis minor flore albo, the leſſer Cowſlip*, which is the greater *Birds-Eye* with White Flowers.

III. The Deſcription. Red Birds-Eye, *which is the ſmaller Plant, has Roots ſmall, white and thready, from which ariſes up a head of Leaves ſo cloſed together, that it ſeems a ſmall white head: this afterwards opening it ſelf ſpreads round upon the ground, and has ſmall long and narrow Leaves, ſnipt about the edges, of a pale green colour, on the upper ſide, but very white or mealy underneath: among theſe Leaves riſe up one or two Stalks, ſmall and hoary, half a foot high, bearing at top a buſh or tuft of much ſmaller flowers, ſtanding upon ſhort Foot-ſtalks, ſomething like to* Cowſlips, *but more like unto* Bears-Ears, *of a fine reddiſh purple colour, in ſome deeper, in others paler, with a yellowiſh Circle in the bottoms of the Flowers, like unto many of the* Bears-Ears, *of a faint, but little ſcent; after which comes a Seed, ſmaller than that of* Cowſlips.

IV. White Birds-Eye, *which is the greater of the two, differs little from the former, ſave that it is a little larger both in its Leaf and Flower, and that the Flowers hereof are wholly white, without any great appearance of a Circle in the bottom of them, unleſs it is well obſerved, at leaſt it is not ſo conſpicuous as the former: both theſe Kinds of* Cowſlips *have ſometimes, though but ſeldom, from the midſt of the Flower on the Stalk, ſent forth another ſmall Stalk, bearing Flowers thereon likewiſe.*

V. *The Places.* They have been found growing wild in *Cloſes* and *Paſture Grounds* in many places of *England*, from whence they have been tranſplanted into *Gardens* for the pleaſantneſs of their Flowers.

VI. *The Times.* The Red *Birds-Eye*, for all the care and induſtry we can uſe to keep it, will ſcarcely endure in our *Gardens*, but all the Winter long, till the Spring begins, its Leaves are ſo cloſed together, that it ſeems a white head of Leaves. They both flower in the *Spring* of the Year, ſome earlier, and ſome later, according to the mildneſs of the Seaſon.

VII. *The Qualities, Specification, Preparations and Virtues* are the ſame with thoſe of *Cowſlips*, and therefore referring you thither, we ſhall ſay no more concerning the ſame in this place.

CHAP. LXXIII.

BIRDS-NEST.

I. *THE Names.* It is called in *Greek* by *Dodonæus*, Νεοττια: and in *Latin*, *Neottia*, *Nidus Avis*: by *Geſner*, it is called, *Orobanche*: by *Lobel*, *Satyrium abortivum*, and *Orchis abortiva*: but we in *Engliſh* call it *Birds-Neſt*, or *Gooſe-Neſt*, from the Platting of the Roots, like the ſticks and ſtraws of a *Crows* or *Birds-Neſt*.

II. *The Kinds.* Authors make two ſorts thereof, the one not much differing from another, ſave in the color: the firſt and longeſt known is of a *yellowiſh colour*: the other of a *purpliſh Violet*, and is called by *Cluſius*, *Limodoron*, and *Pſeudolimodoron*.

IV. The Deſcription. Yellow Birds-Neſt *has a great number of Fibres or thready Roots croſſing one over another, and as it were platted, or intricately entangled together like a Crows Neſt: from which riſes up a thick, ſoft, groſs, brown Stalk, ſet with ſmall ſhort Leaves, of the color of a dry Oaken leaf, which has laid under the Tree all Winter.* Parkinſon *ſays, the Stalks are upright, weak, and ſappy, and that the Leaves are only a ſhew, being rather very*

very ſhort thin skins than leaves, of a browniſh dead yellow color. The Flowers alſo are of a dead yellowiſh color, and ſtand upon a ſpiked head, like unto that of the Orchis, *and of the ſame faſhion; after which follows Husks of duſty Seed.*

IV. *The* Purple Birds-Neſt *has a Root exactly like the former, from whence riſe up a Stalk or Stalks about eight or nine inches high, the lower part of which within the ground is not round like the former, but ſlender, and of a yellowiſh white color: the Stalks are ſet with a few ſmall, narrow, ſhort, skinny, ſharp pointed Leaves, ſet without any order, very little, or almoſt nothing at all wrapping or encloſing the Stalk, which has a ſpike of Flowers very like the former, without Tails or Leaves growing amongſt them. The whole Plant, as it appears above ground, Stalks, Leaves and Flowers, is of a Violet, or deep Purple color: after the Flowers are fallen, there ſucceed Veſſels full of ſmall Seed, like the former.*

V. *The Places.* They are both found in many places of *England*, in Woods, and low Copſes: but they are not ſo much found in the Southern Parts of the Kingdom, as in the Northern: It is ſaid, that they grow near to a Village called *Knaesbrough* in *Yorkſhire*. *Gerard* found it growing in the middle of a Wood in *Kent*, two Miles from *Graveſend*, near to the then Mr. *William Swans* houſe of *Howch-Green*; the Wood then belonging to one Mr. *John Sidley*; the ground in the ſame place (ſays he) is covered all over with the Herb *Sanicle*, and with that kind of *Orchis*, called *Hermaphroditica*, or *Butterfly Satyrion*.

VI. *The Times.* It flouriſhes and flowers in *June*, *July* and *Auguſt*; and its Seed (if it may be called Seed) which is mealy or duſty, falls in the end of *Auguſt*: But *Gerard* will not allow it to be any Seed at all.

VII. *The Virtues.* No Authors that have ever wrote of it, have aſſigned it any Virtues: however it is certain, that it is of the Nature of the *Orchis*, and poſſibly may have their Qualities, Properties, and Effects, being in like manner applied.

CHAP. LXXIV.

BISHOPS-WEED Common.

I. *THE Names.* It is called in *Greek* Ἄμμι, and Ἄμμιον, (from the ſmallneſs of the Seed which reſembles Sand:) In *Latin*, *Ammi*, and *Ameos* (the Genitive Caſe:) Some call it *Cuminum Æthiopicum* (from the likeneſs to that of *Cumin*,) alſo *Cuminum Regium*, *Royal Cumin* (from its excellent properties:) In *Arabick* it is called *Hanochach*, *Anazave*, *Nacachau*, *Nacachave*: And in *Engliſh* it is called, *Biſhops-Weed*, *Herb-William*, and by ſome, *Bullwort*.

II. *The Kinds.* They are of two principal Kinds, 1. *Domeſtick*, called in *Latin*, *Ammi Vulgare*, and *Vulgatius*: It is called by *Tabermontanus*, *Ammio ſelinum*, which is our *Engliſh Biſhops-Weed*. 2. *Forcign*, and is twofold, 1. *Ammi Creticum*, as *Camerarius* calls it, *Ammi Creticum Aromaticum*, as *Lobel* calls it, *Biſhops-weed of Candy*. 2. *Ammi parvum ſoliis fœniculi*, *Ammi alterum parvum*, by *Dodonæus*; *Ammi verum* by *Geſner*, (but *Parkinſon* ſays, the true *Ammi* of *Dioſcorides* is not known) 'Tis true, *Dioſcorides* does not deſcribe it; but from ſome remarks taken from him, from *Pliny*, and from *Galen*, it is almoſt plainly deciphered, eſpecially the Seed, as being much ſmaller and whiter than *Cumin Seed*, and ſmelling like *Origanum*: Now none of the Seeds which the Apothecaries uſe, or have been ſhew'd for *Ammi*, can be compared with *Cumin*, nor have they the ſmell of *Origanum*: in *Engliſh*, *Small Biſhops-weed*: Of theſe two laſt we ſhall treat in the next Chapter.

III. The Deſcription. *Our* Common Biſhops-weed *has a Root White and Fibrous, periſhing every Year, after it has Seeded, and commonly riſing again of its own ſowing: From this Root riſes up a round ſtreight Stalk, ſometimes as tall as a Man, but commonly 3 or 4 feet high, ſet with ſeveral ſmall, long, and ſomewhat broad Leaves, cut in, in ſome places, and ſnipt or dented about the edges, growing on both ſides of a long Footſtalk one againſt another, of a dark green color, ſomewhat like unto Skirret Leaves, having ſeveral Branches on them; and at the tops ſmall Umbles of white Flowers, which turn into ſmall, round, and brown Seed, little bigger than Parſley Seed, and not ſo large as Anniſe Seed, of a brisk quick ſmell, and hot taſte.*

IV. *The Places.* It is found growing Wild in many places of *England* and *Wales*; by a hedge ſide next field beyond *Green Hithe*, on the way as you go to *Graveſend*; and with us it is alſo nouriſhed up in *Gardens*.

V. *The Times.* It flowers in *June* and *July*, and the Seed is ripe towards the latter end of *Auguſt*.

VI. *The Qualities.* It is hot and dry in the third Degree, the Seed more eſpecially. It is attenuating, Diſcuſſive, Diuretick, Nephritick, Hyſterick, and Arthritick; Alterative, and Alexipharmick. It is bitter in taſte, of thin parts, and ſharp withal.

VII. *The Specification.* It is approved againſt the Cholick, and mightily provokes Luſt; which I believe is from its Spermatogenetick faculty.

VIII. *The Preparations.* You may make therefrom, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *A Diſtilled Water.* 4. *A Pouder from the Seed.* 5. *A Spirituous Tincture of the ſame.* 6. *An Oily Tincture.* 7. *A Saline Tincture.* 8. *A Spirit.* 9. *A Chymical Oil of the Seed.* 10. *A Fixed Salt.* 11. *Poteſtates* or *Powers.* 12. *A Balſam.* 13. *A Cataplaſm of the green Herb.*

The

The Virtues.

IX. *The liquid Juice.* It is very thin and subtil, digests Humors, expels Wind, and gives ease in the Gripings of the Guts. Dose from iv. to viij. spoonfuls in a glass of Canary, Sherry, or other generous Wine, two or three times a day.

X. *The Essence.* It has the Virtues of the Juice, but more powerful to the purposes intended, it provokes Urine, and the Courses in Women when stopt, helps the Cholick, and is very powerful against the biting of Mad Dogs, Serpents, as the Viper, Rattle-snake, Slow-worm, or the biting or stinging of any other Venemous Creature whatsoever, being given Morning, Noon and Night, from iij. ounces to vi. in a glass of any generous Wine.

XI. *The Distilled Water.* It is stomatick, and has the Virtues of the Essence, but very much Weaker, and therefore may serve as a Vehicle, to convey any Medicine in, good against those kinds of Diseases.

XII. *The Pouder of the Seed.* It expels Wind, comforts the Stomach, and other *Viscera*, gives ease in the Cholick, and has been found, by experience, to be profitable against the Stone, Sand, Gravel, or any Tartarous or Slimy Matter in the Reins, Ureters and Bladder. It may be given (mixed with Sugar) in a glass of White or Rhenish Wine.

XIII. *The Spiritous Tincture from the Seed.* It is Cordial and Stomatick, good against Vapors, Wind, Fainting and Swooning Fits, *Cardialgia*, Palpitation of the Heart, Poyson of Vipers, Rattle-snakes, Mad-Dogs, and the biting or stinging of any other venomous Creature. Dose from one Dram to two, in a glass of excellent Wine.

XIV. *The Oily Tincture.* It is good against Palsies, Convulsions, Rheumatisms, Pains, Aches, Weaknesses, and Punctures of the Nerves in any part of the Body: It eases the pain of the Gout, proceeding from a cold cause, softens, discusses, and wasts cold Tumors, and is of admirable use, being taken inwardly, for the most inveterate Pains of the Back, or any Obstruction of the Reins, Ureters or Bladder. Dose from half a dram to one or two drams Morning and Evening in a glass of White Wine.

XV. *The Saline Tincture.* This may be made either of the Seed, or of the whole green Plant. It is good to take away Black and Blew Marks, Spots, Tanning, Sun-burning, and other deformities of the Skin, it being often washed therewith, it also is said to abate an high color, and a Spong being dipt therein, and applied upon the biting of any Venemous Beast, especially that of a Mad Dog, it effectually attracts and draws out the Poyson: It also discusses the afflux of humors in Contusions; and being drank to one dram in White Wine, it is prevalent against Fits of the Mother in Women, and is good against the evil Effects of *Cantharides*, if timely taken in some proper Emulsion.

XVI. *The Spirit.* It is an excellent Cordial, good against Fainting and Swooning Fits, eases the Passions of the Heart, cheers the Spirits, comforts Nature, provokes Lust, strengthens the Womb, and all the Instruments of Generation in both Sexes; and has indeed all the Virtues of the Spiritous Tincture, but not altogether so powerful. Dose from two drams to four, alone by it self, if dulcified, otherwise to be taken in a small glass of Wine.

XVII. *The Chymical Oil of the Seed.* It is said to correct the Virulency of *Cantharides*, that if they be digested in it for some time, they may be given inwardly without any danger; this may be true, but the true Corrective of *Spanish Flies* is Spirit of *Nitre*, as we shew in its proper place. This *Chymical Oil* is an admirable Carminative, and gives present ease in the Cholick, by giving it inwardly by the Mouth, if the Disease lies in the *Stomach*, *Duodenum*, and upper Bowels; or giving it Clyster-wise, if it lies in the *Colon*, or other lower parts. It also provokes Urine, and the Terms, is good against Poyson, and the bitings or stingings of Venomous Creatures. It opens Obstructions of the Spleen, and has been found very helpful against Hypochondriack Melancholly. Dose from six drops to twenty in a glass of Wine, or Wine and Water; drop the Oil into Sugar, and mix them well together, then mix it with the Wine, and so drink it up.

XVIII. *The Fixed Salt of the whole Plant.* It is a powerful Diuretick, and being taken in all the Liquor the Patient drinks, as Ale, Beer, Wine, it has been found profitable against the Dropsie and Jaundice: It also cleanses the Womb, Reins and Bladder, of any Tartarous Matter obstructing them. I once knew a Gouty Person, by the constant use of this Salt, and drinking Milk and Water, to become perfectly freed from his Gout, and had not so much as one Fit of it in above 18 Years time, which was confess'd to me at the writing hereof. Dose from xv. grains to xxx. in Water, or Whey, or Milk and Water, if for the Gout; but in Ale, Beer, Cider Mead, or Wine, if against the Dropsie, or other Diseases.

XIX. *Potestates* or *Powers.* They have all the Virtues of the Essence, Spirit, Spirituous Tincture, Chymical Oil and Salt, and may be given from one dram to two, Morning, Noon, and Night, in Wine, Mead, Hypocras or any other fit Vehicle.

XX. *The Balsam.* If it is made of the Chymical Oil, with Turpentine and Wax, it is of excellent use in all Wounds and Punctures of the Nerves; and applied, gives ease in the Gout, proceeding from a cold Cause, as also in the Sciatica, and other Pains and Aches of the Nerves and Joints. If it is made of the green Herb, it is good against Pains and Aches also, but is a peculiar Vulnerary, for healing wounds made in Scorbutick, Cold, Moist, and ill habited Bodies, and in depending places, because besides its admirable healing property, it dries powerfully, and strengthens the part affected.

XXI. *The Cataplasm.* It is excellent to be applied to Contusions, for it prevents the further afflux of Humors, and discusses those which are present, dissolves and scatters congealed Blood, and this more especially if it is mixed with Honey: it also takes away Black and Blew marks, which come by blows or falls, or other discolorings of the Skin.

XXII. *The Seed.* It is one of the four lesser hot Seeds, always commended as a Carminative: and it is said the *Egyptians* make use of the Seed, to provoke Lust or Venery, for which it is very powerful.

CHAP. LXXV.

BISHOPS-WEED Forein.

I. *THE Names.* It is called in *Greek* also Ἄμμι, which is the Name given by *Dioscorides*: and in *Latin*, *Ammi*, *Cuminum Regium*, and *Æthiopicum*; and in *English*, Forein or *Outlandish Bishops-weed.*

II. *The Kinds.* It is twofold, 1. *Cretick*, or that of *Candy*, called *Ammi Creticum*, and by *Lobel*, *Ammi Creticum Aromaticum*, *Bishops-weed* of *Candy*. 2. *Ægyptian*, called by *Gesner*, *Ammi verum*: by *Dodonæus*, *Ammi alterum parvum*: *Ammi perpusillum*,

lum, by *Lobel* and *Gerard*: *Ammium primum Alexandrinum*, by *Tabermontanus*: *Ammi parvum folii fœniculi*, by *C. Bauhin* and *Parkinson*: and *Ammi tenuissimo & Odoratissimo*, by *J. Bauhin*: *Alexandrian Bishops-weed.*

Aromatick Bishopsweed of Candia:

Candia Bishops weed.

III. The Description. Bishops-weed of *Candy has a Root like unto the Garden Carrot, and of a yellowish color, and brown on the outside, as* Parkinson *says, with some fibres or Strings thereon: from this Root comes forth several slender Stalks of fine cut Leaves, somewhat like unto those of Wild Carrots, or* Daucus Creticus, *smelling something quick, and of an excellent Aromatick or Spicy flavor, not much unlike* Origanum; *from which rise up slender Stalks, with some Joints, with like Leaves as the former set thereon, and at the Tops, Umbles of white Flowers, in Tufts or Roundles like Carum, which turn into small Seed like Smallage, of a sweet sharp scent, and quick hot taste.*

IV. The *Alexandrian* Bishops-weed *has a small white Root, perishing after Seed-time; from which small Root rise two or three slender Stalks, about a Foot, or Foot and half high, arched towards the tops, and set with several very fine small Leaves, like unto Dill, and finer than Fennel; at the Extremities whereof grow small Umbles of white Flowers, after which come very small blackish Seed, much like to Parsley Seed, pleasant in smell, and sharp or quick in taste.*

V. *The Places.* The *first* of these came to us from *Candy*; as also from *Syria* to *Venice*, and from thence to *France*, the *Low Countries* and *England*; which Seed has been often sown, but without effect; The *second* grows in *Arabia*, and at *Alexandria* in *Egypt*; from whence it has been brought to us.

VI. *The Times.* They do all Flower and Seed reasonably well with us (says *Parkinson*) if the Year proves kindly, otherwise not: if they flower, it is in *June* and *July*, and the Seed is ripe in *August.*

VII. *The Qualities, Specification, Preparations, Virtues and Uses* are the same with that in the former Chapter in all respects; so that no more need be said of them in this place. *Note*, It is supposed, That the true *Ammi* is wholly lost to us; but *Parkinson* is of Opinion, that *Cuminum Sylvestrum* may be the true *Ammi* of *Dioscorides.*

CHAP. LXXVI.

BISTORT *English.*

I. *THE Names:* This is a Plant that I cannot perceive the *Greeks* knew any thing of, no *Greek* name being yet assigned it: it is called in *Latin*, *Bistorta*, (by most Authors) *à convolutis & intortis radicibus* (says *Ray:*) by *Tragus*, *Lonicerus*, and others, *Colubrina*, and the Root *Radix Colubrina*; *Fracastorius*, *Bulapathum*, as well as *Bistorta:* and we in *English* call it *Bistort* and *Snake-weed.* Some will have it to be *Behen Rubrum*; others *Molybdæna Plinij*; others again *Dracunculus Plinij*: Some again, as *Gesner*, *Limonium*: *Lobel* and *Clusius* say, that it is the *Brittanica* of *Dioscorides* and *Pliny*; but in all these they are mistaken, as those who please to Examine those several Plants in their proper Chapters, and compare them with the Descriptions here, may easily perceive.

II. *The Kinds.* What we shall discourse of here, are principally two, 1. *Bistorta major*, as *Gerard*, and the *Bauhins* call it: *major vulgaris*, as *Parkinson*: *Radice minus intorta*, as the *Bauhins*; *major rugosioribus foliis*, as *J. Bauhin*: and we, *The greater Bistort*, or *Snake-root.* 2. *Bistorta minor*, as *Gerard*; *minor nostras*, as *Parkinson*; *Colubrina minor*, as *Tragus*; *Alpina media*, as *C. Bauhin:* and we, *The lesser Bistort*, or *Snake-weed:* But besides these, Authors make mention of four Kinds more, as, 3. *Bistorta Latifolia*, *Broad leav'd Bistort.* 4. *Bistorta Alpina major*, and *Alpina maxima*, *The Greater* or *Greatest Mountain Bistort.* 5. *Bistorta*

Alpina

Alpina media, & Alpina minor, The *leſſer Alpine Biſtort*. 6. *Biſtorta Alpina pumila foliis variis*, Low *Variable leav'd Biſtort*; of all which we ſhall ſay nothing in this Work.

III. The Deſcription. The Greater Common Biſtort *has a thick, ſhort, Tuberous or knobbed Root, blackiſh without, and ſomething reddiſh within, a little crooked or writhed together, and of an harſh or aſtringent Taſte, with divers blackiſh Fibres or Threads growing thereat: From whence ſpring up every Year, ſeveral Leaves ſtanding upon long Foot-ſtalks, being ſomewhat long and broad, not much unlike to a Dock Leaf, and a little pointed at the ends, but that it is crumpled, of a blewiſh green color on the upper ſide, and of an Aſh colored grey, and a little purpliſh underneath, having ſeveral veins running therein: from among which, riſe ſeveral ſmall and ſlender Stalks about half a Yard high, almoſt naked, and without Leaves, or with very few narrow ones, bearing a ſpiky buſh of pale, freſh colored Flowers; which being paſt, there is found a ſmall, brown, cornered Seed, not much unlike to Sorrel Seed, but greater.*

Small Biſtort or *Snake-weed*

IV. The Leſſer *Engliſh* Biſtort *has a Tuberous Root, ſmall in proportion, but ſomething crooked or turned like the former, being of a blackiſh color without, and ſomewhat whitiſh within, of the ſame auſtere, ſtyptick, or binding taſte, with the former: This Root ſends forth 3 or 4 ſmall narrow Leaves, ſcarcely an Inch broad, and near four Inches long, green above, and grey underneath: The Stalks are ſlender, and with but one or two Leaves ſet thereon; at the tops whereof ſtand long, round, ſpiky heads of white Flowers, with ſeveral ſmall green Leaves among them; after which comes a reddiſh Seed, almoſt round, which being dry, becomes blackiſh, and is bigger than that of the former, about the bigneſs (ſays* Gerard) *of a Tare.*

V. *The Places.* The firſt grows at the Foot of Hills, and in ſhadowy moiſt Woods near to them, in many places of *Germany*; and in *England* in like places, but is chiefly with us nouriſhed up in *Gardens*. The other grows in the *North* of *England*, as in *Lancaſhire*, *Yorkſhire*, and *Cumberland*, in ſeveral places; alſo in *Weſtmorland*, at *Crosby*, *Ravenſwaith*, at the *head of a Park* formerly belonging to one Mr. *Pickering*, from whence it has been brought, and diſperſed into *Gardens*. The *Firſt* is alſo ſaid to grow in a Meadow, about a Stones caſt above the *Abby Mill* at St. *Albans*, about an Acres breadth or more from the River ſide, where it is ſaid to grow in great plenty.

VI. *The Times.* They both flower about the end of *May*, and the Seed is ripe about the beginning of *July*.

VII. *The Qualities.* They are cold and dry in the third Degree; Aſtringent, Styptick, and Vulnerary; Cordial, Hyſterick, Alterative, and Alexipharmick.

VIII. *The*

VIII. *The Specification.* It is famous for the reſiſting and expelling Poyſon, as alſo to ſtop the Flux of Blood in Wounds, or any other bleeding, whether inwards or outwards.

IX. *The Preparations.* 1. *A liquid Juice of the whole Plant.* 2. *A diſtilled Water of the Roots and Leaves.* 3. *A Pouder of the Leaves.* 4. *A Pouder of the Root.* 5. *A Pouder of the Root compound.* 6. *A Decoction of the Root in Wine or Water.* 7. *A Decoction compound of the Root.* 8. *The Diet Drink made of the Roots, Leaves, and Seeds.* 9. *The Spirituous Tincture.* 10. *The Acid Tincture.* 11. *The Oily Tincture.* 12. *The Saline Tincture.* 13. *The Fixed Salt.* 14. *The Eſſence.*

The Virtues.

X. *The liquid Juice.* Taken inwardly 3, 4, or 6 Spoonfuls at a time in a Glaſs of Red Florence, or other Styptick Wine, it preſently ſtops any internal Flux of Blood, reſiſts the Poiſon of Vipers, or any other Serpent, and the bitings of any other Beaſt whatſoever; and is very powerful againſt the Plague, and all other Malign and Peſtilential Fevers.

XI. *The Diſtilled Water.* It is a ſingular remedy to waſh any place bitten or ſtung by any Poiſonous Creatures, as Spiders, Toads, Serpents, Vipers, Rattleſnakes, or the like, and has the Virtues of the Juice, but not with equal power or force. It is good alſo to waſh Sores or Cankers which happen in the Noſe, or any other part; more eſpecially if the pouder of the Root be applied thereto afterwards.

XII. *The Pouder of the Leaves.* Taken to a dram, it is good to kill Worms in Children: prevails againſt a *Diabetes*, and helps ſuch as cannot keep their Water, but are apt to piſs a Bed, and this more eſpecially if given with Juice of Plantane.

XIII. *The Pouder of the Root.* Being given to a dram, more or leſs, in Wine, or other fit Vehicle, it prevails againſt the Malignity of the Purples, Meaſles, and Small Pox, and expels the Poiſon of the Plague or Peſtilence, or of any other infectious Diſeaſe, driving it forth by Sweating. It ſtops alſo all manner of inward Bleeding, as Dyſentery, Spitting, Vomiting, or piſſing Blood, and is profitable againſt Ruptures in Children, or Elder Perſons; it is good alſo for any Contuſion, or Bruiſe cauſed by Blows or Falls, diſſolving the congealed Blood, diſcuſſing the aggregated Humors, and eaſing the Pain. Given to one dram in the Diſtilled Water, in which ſome red hot Iron has been quenched, it is ſaid to help or cure a Gonorrhœa, or Running of the Reins, Univerſals being firſt premiſed. And being ſtrewed upon any Cut, or Wound of a Vein, *&c.* where there is a great Flux of Blood, it preſently ſtops it.

XIV. *The Pouder of the Root compound.* It is made of *equal quantities of Biſtort Root, Root of Pellitory of* Spain, *and of Burnt Allum.* This Pouder being made into a Paſte with a little Honey, and ſome of it put into an hollow Tooth, or held between the Teeth, if there is no hollowneſs in them, eaſes their Pain, and ſtops the defluxion of Rheum upon the Part, cleanſes the Head and Brain, and cauſes an evacuation of abundance of Rheumatick Matter.

XV. *The Decoction of the Root.* If it is made with Water, with the addition of ſome Pomegranate Peels and Flowers, it makes a moſt admirable Injection for the Womb, cleanſes it of any filth lodged there, ſtops the overflowing of the Terms in Women, and cures a long continued Flux of the Whites, drys up Ulcers in that part, and ſtrengthens the Ligaments of the Womb, being relaxed, whereby the Womb ſeems to preſs or fall down. If the Decoction is made with Wine, it ſtops all manner of Inward Bleeding, as Spitting of Blood, Vomiting Blood, and all Fluxes of the Bowels, whether in Man or Woman, is available againſt Ruptures in Old or Young, diſſolves congealed Blood, and diſcuſſes Contuſions to admiration. It is ſaid to cure the Jaundice, and being inwardly given, and outwardly applied, it is eminently good againſt the biting of Vipers, or any other poiſonous Serpent, and the bitings and ſtinging of any Venomous Creature whatſoever. Given to Women with Child, it prevents Abortion, or Miſcarriage, and helps ſuch as cannot hold their Water; and uſed as a Gargariſm in the Mouth, it allays Inflammations, heals Ulcers, and faſtens looſe Teeth.

XVI. *The Decoction of the Root compound.* ℞ *Biſtort Roots ſix ounces: Angelica Roots, Zedoary, of each four ounces: Virginea Snake-root three ounces: Clove-bark an ounce and half: Winters Cinnamon one ounce: all being bruiſed, infuſe in Red Port Wine, or Canary, five quarts, for ſix hours: Then giving it two or three boils, take it from the Fire, and ſtrain out the Wine from the Ingredients; which let ſettle: then decant the Clear from the Fœces, and ſweeten it with Syrup of Limons, or Syrup of Vinegar.* It is a noble Medicament againſt the Meaſles, Small Pox, Purples, Calenture, Spotted Fever, and even the Plague it ſelf, being given either preventionally, as two or three Spoonfuls of it Morning, Noon, and Night: or Curatively, in which four or ſix ounces of it may be given to ſweet upon, and to be repeated as need requires. It is an excellent thing againſt the biting of Mad Dogs, Vipers, Rattle-Snakes, or the bitings or ſtingings of any other Venomous Creatures. It alſo prevails againſt any Vegetable Poiſon, which is taken inwardly, if timely given.

XVII. *The Diet Drink.* It is made of the Roots, Leaves, and Seeds, boiled in half Wine, half Water. It is an excellent Traumatick, cures all curable Inward Wounds, and Ulcers, and Fluxes of Blood, of what kind ſoever, and alſo being regularly drank, contributes very much to the cure of Wounds, and old Ulcers in the External parts.

XVIII. *The Spirituous Tincture.* It defends the Heart againſt Poiſon, whether Inward or Outward, whether a Vegetable or Animal Poiſon, or the Malignity of the Plague, or of any other infectious Diſeaſe. Doſe, one or two drams at a time, two or three times a day, in a glaſs of Wine, or other Vehicle.

XIX. *The Acid Tincture.* This is more peculiar againſt the Plague, and other Malign Fevers, and infectious Diſtempers than the former. It allays the Inflammation of the Jaws, Almonds of the Ears, and Throat, being often taken inwardly, and alſo uſed as a Gargle, by mixing it with the Decoction in Water or Wine aforegoing. It alſo heals Cankers and Sores of the Mouth and Throat, if often waſh'd therewith; and being ſwallowed, cuts tough Flegm, and clears the Throat.

XX. *The Oily Tincture.* It is good againſt Punctures, and Wounds of the Nerves, eaſes their Pain and cures them, being bathed thereon, and applied thereto; and repreſſes the Flux of Humors attending them.

XXI. *The Saline Tincture.* Outwardly uſed, it penetrates, and contributes to the curing of Ruptures. Old Ulcers being waſhed therewith, it cleanſes them, and diſpoſes them to healing: and Phlegmons or Inflammations being bathed therewith, it abates the heat. Inwardly given, it cleanſes the Reins, Ureters and Bladder, after the uſe of it, for ſome time; if there be any Ulcers in thoſe parts, they are cured by giving Inwardly the Decoction in Wine,

Wine, Juice, or Essence, and continuing it for some time. This Saline Tincture is also prevalent against the Jaundice. Dose from half a dram to a dram and half, in any convenient Vehicle.

XXII. *The Fixed Salt.* It is good against Poison, and all malignity of the Plague, opens Obstructions, resists Putrefaction, and defends the Vitals against any kind of Infection, or the malignity of Evil Airs. It provokes Urine, and cleanses the Urinary Passages, carrying off the Recrements of the Humors by those Passages, by which it has been found good against the Jaundice and Dropsie. Dose from ten grains to a scruple in Ale, Beer, Cider, Mead, or Wine.

XXIII. *The Essence.* It resists Poison, Plague, or Pestilence, and all sorts of malign Fevers, stops all Fluxes of the Belly, as Diarrhæa, Dysenteria, Lienteria, and the Hepatick Flux, as also all Hemorrhagies whatsoever, whether inward or outward, the overflowing of the Terms in Women, and the præternatural flux of the Whites: but in these last Cases, Universals ought to be premised. In a word, the Essence has all the Virtues of the Liquid Juice, the Pouder of the Root, and the Decoction in Wine at Sect. 10, 13 and 15, aforegoing. But it peculiarly stops the afflux of Humors to any part, being applied to the same outwardly, and also taken inwardly. Dose is from two to six ounces in Wine, or any other Vehicle, proper against the Disease for which it is given. *Note*, The Root of this Plant is that which is chiefly used, as having most Virtue in it.

CHAP. LXXVII.

BITTER-SWEET.

I. THE *Names.* It is called in *Greek* γλυκιπίκρον, *Glycypicron*, i. e. *Amara dulcis*, and στρυχνοδένδρον, *Strychnodendron*, i. e. *Solanum Arborescens*: but no *Greek* Author, that I know of, has said any thing of it; but some of the Moderns have imposed these *Greek* names upon it. The *Latins* call it, *Solanum Lignosum*, and *Solanum Arborescens*, and yet in Truth, it is not properly any Night-shade, but only so called for the conformity of its Leaves. Also *Amara dulcis*, and *Dulcamara*: Some will have it to be *Melortum Plinii*, others *Vitis Sylvestris Theophrasti*, as *Camerarius* in his Epitome: (but *Vitis Sylvestris* is truly *Black Bryony*, as *Matthiolus* has it:) In *English*, it is called *Bitter-sweet*, or *Woody Night-shade*, and *Felon-wort*.

II. *The Kinds.* It is twofold, 1. *Purple-flowered*, called, as aforesaid. 2. *White-flowered*, which *Dodonæus* thinks to be *Cyclaminus altera Dioscoridis*: *Guillandinus* took it to be *Salicastrum Plinij*, but very erroniously: *Bauhinus* calls it *Solanum Scandens seu Dulcamara, flore Albo*, *Bitter-sweet, with the White flower.*

III. The Description. *It has a Root which spreads it self with many strings under the Earth, not growing into any great or thick Body: from whence comes up many slender, winding, brittle, woody Stalks, five or six Foot high, without any Claspers, or Tendrills, but folding it self about Hedges, or any other thing which stands near unto it: these stalks are covered with a whitish rough Bark, which being chewed in the Mouth, tastes bitter at first, but sweetish afterwards: and in the middle they have a Pith, and shoot out into many Branches on both sides, which are Green whilst young: whereon grow many Leaves without order, somewhat like unto those of* Night-shade, *but that they are something broad, long, and pointed at the ends, with two small Leaves, or rather pieces of Leaves at the bottom of most of them, something like the Sage with Ears; and many of them likewise, with but one piece on one side; sometimes also those pieces are close to the Leaves, making them seem as if they were jagged, or cut in on the edges into so many parts, and sometimes separate therefrom, making the Leaves seem winged, or composed of many Leaves, which are of a pale green color. At the tops and sides of the Branches come forth many Flowers, (standing in fashion of a long Umble) upon short Foot-stalks one above another, which consist of five narrow and long violet purple colored Leaves, not spread like a Star, or very seldom, but mostly turning themselves backwards to the Stalks again on which they stand, with a long golden yellow Pointel in the midst, sticking forth, which afterwards turns into round, and somewhat long Berries, green at first, and very red, soft, and full of Juice when ripe, which are sweet at first tasting, but afterwards of an unpleasing bitter taste; in which Berry is contained many flat white Seeds.*

IV. Dulcamara flore Albo, Bitter-sweet, *with white flowers, differs in nothing from the former, but in the flowers, whose outward Leaves are white, and its Pointel yellow.*

V. *The Places.* The first grows usually by Ditch-sides and hedges, where it may climb up, almost every where: The second is more rare, and seldom to be met with, but grows by or near St. *Margarets* Church near *Romney* Marsh.

VI. *The Times.* The Root is Perennial; and the Branches, tho' they are dispoiled of their Leaves all the Winter, yet they perish not, but shoot forth new Leaves in the Spring: they flower in *July*, and the Berries are ripe in *August*.

VII. *The Qualities.* The Leaves and Berries are hot and dry in the first Degree; Astringent and Cleansing; Cephalick, Hepatick, Splenetick, Hysterick and Cathartick.

VIII. *The Specification.* It is a peculiar thing for the Cure of Jaundice and Dropsie.

IX. *The Preparations.* You may make therefrom, 1. *The Liquid Juice.* 2. *The Essence.* 3. *The* Deco-

Decoction. 4. *The Spirituous Tincture.* 5. *The Acid Tincture.* 6. *The Saline Tincture.* 7. *The Cataplasm.*

The Virtues.

X. *The Liquid Juice.* Being given to two or three ounces, it purges well, and powerfully opens Obstructions of the Liver and Spleen, and helps such as are Asthmatick, or are troubled with difficulty of breathing, being taken every Morning fasting for some time.

XI. *The Essence.* It has all the Virtues of the Juice aforegoing, besides which it is a powerful Medicament against a Phthisick, and for the Cure of the Yellow and Black Jaundice, as also the Dropsie: It brings away the After-birth, and effectually cleanses Women newly brought to Bed: you may give it from two ounces to four in a glass of White Port Wine every Morning fasting: It is also good for Inward bruises caused by any fall or blow, dissolving the congealed Blood in what part of the Body so ever. It purges well, and not churlishly.

XII. *The Decoction.* You may make it thus: ℞ *Of the young tender twigs or woody substance, and of the Leaves,* ℔ j. *bruise them well, and put them into a Glass Vesica, or Bolt-head; affuse thereon White Port Wine* ℔ iij ſs. *cover it with a blind head, and infuse in a Sand heat for twelve hours; and then make the heat so great as it may boil gently; which done, decant, and strain out for use.* It has the Virtues of the Essence, is a Specifick for cure of the Jaundice and Dropsie, according to *Tragus* and *Dodonæus*, is good against the Vertigo and Megrim, and other Head Diseases, cleanses Women in Childbed, and represses Hysterick Vapors. Dose four ounces every Morning: it purges the Body very gently.

XIII. *The Spirituous Tincture.* It purges not, but very much strengthens the *Viscera*, chiefly the Liver and Spleen, and represses Vapors ascending from the Stomach, and other parts, to the Head and Brain, causing Vertigo's, Megrims, and other Distempers of that Ventricle. Dose two drams, or more, every Morning fasting, and Evening at Bed time in a Glass of generous Wine.

XIV. *The Acid Tincture.* Let it be made with Spirit of Wine acuated with Spirit of Salt. It powerfully provokes Urine, cleanses the Reins, Ureters, and Bladder, and cures the Dropsie to a miracle; but it ought to be taken a considerable time, and always in the Decoction of the same Plant, or in a Decoction of Centory, Gentian, and Roman Wormwood. Dose from half an ounce to an ounce, more or less, so as to give a pleasant Acidity, Morning and Evening: and it is to be put into all the Ale, Beer, or Wine the Patient drinks.

XV. *The Saline Tincture.* Bathed with, it takes away Scurf, Morphew, and salt, and sharp breakings out of the Skin: inwardly taken to one dram, it provokes Urine, and cleanses the Urinary passages of Slimy, Viscous, or Tartarous Matter, which is commonly the matter that breeds the Stone and Strangury.

XVI. *The Cataplasm.* It is to be made of the bruised Berries, and Rosin in fine Pouder. This applied to Felons, which commonly come on the Fingers ends, cures them in a very short time.

CHAP. LXXVIII.

BLEW-BOTTLE.

I. *The Names.* It is called in *Greek*, Κύανος, *à floris Cyaneo, vel Cæruleo colore*: In *Latin*, *Cyanus*: and in *English*, *Blew-bottle*, or *Corn-flower.*

II. *The Kinds.* It is twofold: 1. *Single-flowred*, of which in this Chapter. 2. *Double-flowred*, of which in the next. The single flowred is also 1. *Cyanus magnus, vel Cyanus major vulgaris, Cyanus hortensis, The greater Common Blew-bottle*, or *Garden Blew-bottle.* This some call *Cyanus montanus*; *Hermolaus* takes it to be the *Leucoium Dioscoridis*; *Cæsalpinus* to be a kind of *Struthium Theophrasti*: *Fabius Columna*, thinks it to be *Papaver Heracleum Theophrasti*; and *Lobel* questions whether it be not a Species of *Chondrilla.* 2. *Cyanus minor vulgaris, Cyanus segetum, The lesser Common Blew, or Field Blew-bottle:* It is called by some *flos Frumenti, Corn-flower: Battisecula* (as *Ray* has it) and *Baptisecula*, or *Blaptisecula*, from its turning the Edges of Sickles in cutting down Corn; *Secula*, i. e. Falx, *à secundo dicta*, being taken for a Sickle in Ancient times.

III. The Description. *The* Greater or Garden Blew-bottle *has a Root which creeps under ground, spreading it self divers ways, so that its heads with green Leaves will abide all the Winter, (which in the other sorts do not so, but perish wholly after Seed time, rising again of their own Sowing before Winter) and grows Yearly into new shoots and springs, by which it very much increases: from this Root rises up a crested or rather winged Stalk, of a whitish green color, about two or three Feet high, on which are set divers Leaves, something long and broad, without any division, or denting in about the edges; green on the upper side, and grayish underneath, each of*

of them encompaſſing the Stalk about, at the lower ends, which is divided at the top into a few Branches, bearing ſomewhat large, ſcaly, green heads, with white or Silver-like edges; from the midſt of which comes forth a larger Flower than in the ſmaller Kind, thinly ſet, and of a deeper Violet-blew color: in which Heads, after the Flowers are paſt, there is found a Down, containing ſome few white Seeds, like thoſe of the leſſer Kind, but a little larger, and flatter.

IV. *The* leſſer Common, *or* Field Blew-bottle, *or* Corn-flower, *has Roots ſomewhat long and large, which periſh every Year, but are Annually renewed by its own ſowing; riſing or ſpringing up before Winter, and abiding green all the Winter Seaſon, until the next Spring and Summer, when it Flowers, Seeds, and periſhes again. The Leaves are long and narrower than the former, of a whitiſh green color, deeply cut in on the Edges in ſome places, but ſome more than others, ſomething like unto* Scabious *leaves. The Stalks are two or three Feet high, according to the goodneſs and fertility of the Ground, ſet with ſuch like Leaves, but ſmaller, and little or nothing cut in on the Edges: the tops are ſpread forth into ſeveral Branches, bearing many ſmall green, ſcaly Heads, out of which riſe Flowers, conſiſting of five or ſix, or more, long and hollow Leaves, ſmall at the bottom, and opening wider and larger at the brims, notched, dented or cut in on the Edges, and ſtanding round about many ſmall threads in the middle. The colors of theſe Flowers are manifold, and very variable; for ſome are wholly Blew, or White, or bluſh, or of a ſad or light Purple, or of a light or deep Red, or of an over-worn Purple color, or elſe mixed of theſe colors, in ſome, the edges White, and the reſt Blue or Purple; or the edges Blew or Purple, and the reſt of the Flower White, or Striped, Spotted, or halved, the one part of one color, the other of another, and the Threads alſo in the middle varying in many of them; for in ſome the ſaid middle Thrumb will be of a deeper Purple than the outward Leaves, ſome will have it reddiſh, deeper, or paler, whilſt the Leaves are White, or bluſh. The Flowers being paſt, the heads or bottles contain a Down, in which the Seed is wrapped, which is ſmall, hard, white and ſhining.* Note, *That the Flower of that which grows Wild in the Fields, is for the moſt part only Blew.*

V. *The Places.* The firſt grows Wild in *Germany* upon Sandy Hills, but with us it is nouriſhed up in Gardens: The other with Blew Flowers grows Wild, in many Corn Fields throughout our Kingdom: It is found in Fields of Wheat, Rye and Barley; but is alſo Sown in Gardens, which the skilful Artiſt, by looking after, makes to become of other colors, as in the Deſcription thereof is declared.

VI. *The Times.* They flower from the beginning of *May*, to the end of Harveſt, and their Seed comes to ripeneſs in the mean ſeaſon.

VII. *The Qualities.* They are temperate in reſpect to heat or cold, and dry in the firſt Degree: But *Schroder* ſays, they are cold and dry in the ſecond Degree: They are Aſtringent, Ophthalmick, Cardiack, Alterative, and Alexipharmick.

VIII. *The Specification.* They have a peculiar faculty for the curing of ſore and bleared Eyes, and reſiſting the force of Poiſon.

IX. *The Preparations.* In the Shops are: 1. *The Flowers.* 2. *A Pouder of the dried Leaves.* 3. *An Eſſence of the Juice with Spirit of Wine.* 4. *A Collyrium of the Flowers.* 5. *A Diſtilled Water of the Flowers.* 6. *A Spirituous Tincture of the Flowers.* 7. *A Cataplaſm of the Flowers.* 8. *A Juice.* 9. *A Diſtilled Water of the Herb.*

The Virtues.

X. *The Flowers.* They are cold and dry in 1°: are Styptick, and good to take away Redneſs and Inflammations of the Eyes, and pains thereof: they cool in Fevers, reſiſt Poiſon, and help in Dropſies. You may make an Acid Tincture of them with Spirit of Wine, mixed with a half part of Spirit of Salt, which in Fevers, Plague, *&c.* may be given from 20 to 40 Drops, in any fit Vehicle.

XI. *The Pouder of the dried Leaves.* It is taken in Tent to one dram, for the curing of inward bruiſes, and to heal a Rupture of the Veins, *&c.* whereby they void much Blood at Mouth. Give it in Plantane, Comfrey, or Horſe-tail-water, acuated with a little White Wine Vinegar.

XII. *The Eſſence of the Juice of the Leaves and Flowers.* It has all the former Virtues both of the Acid Tincture and Pouder: It helps in the Dropſie, reſiſts all manner of Venoms and Poiſons, and is peculiar againſt that of the Scorpion, Phalangium, Viper, Mad Dog, and Plague, as alſo all other Peſtilential Fevers, and Infectious Diſeaſes: being dropt into the Eyes, it takes away their heat, inflammation and pain.

XIII. *The Collyrium, or Eye-Water.* ℞ *of the Blew-flowers as many as you pleaſe: put them into Rye Dough or Paſte, bake them in the Oven with Houſhold Bread, then taking it forth, diſtil all,* viz. *Flowers and Rye Paſte, in a Glaſs Body, in* B.M. *and keep the Water for uſe.* With this the Eyes are to be waſht three or four times a day. It is admirable for the cure of moſt Infirmities of the Eyes, eſpecially Heat, Inflammation, Pain, Blood-ſhot, *&c.* It clears, ſtrengthens and preſerves the Eye-ſight, eſpecially of old People, for which reaſon ſome are pleaſed to call it *Break-Spectacle-Water*: for that thoſe that uſe it, need never come to the uſe of Spectacles: If the Diſtemper is inveterate or ſtubborn, uſe it five or ſix times a day.

XIV. *The Diſtilled Water of the Flowers. Aqua florum Cyani,* Blew-bottle-flower-water. ℞ *Flowers*

of blew-bottles, with their Cups, as many as you pleaſe : bruiſe them, and macerate them in a ſufficient quantity of Snow-water, for 24 *Hours, or rather two Days ; then Diſtill in a gentle* B. M. *or Sand heat.* It is ſaid to be a wonderful Water for the Eyes, and their Diſeaſes, as Inflammations, Soreneſs, Dimneſs of Sight, and the like : it has the Virtues of the former, but not altogether ſo powerful. Drop it into the Eyes 3, 4, 5 or 6 times a day.

XV. *The Spirituous Tincture of the Flowers.* Made with Common Brandy, it is a ſecret for curing Sore and Running Eyes, if ſome few times dropt into them. It is Alexipharmick, and has all the Virtues of the Eſſence. Doſe half a Spoonful in any proper Vehicle.

XVI. *The Cataplaſm of the Flowers.* Being applied to Sore and Running Eyes, afflicted with a hot Rheum, it ſtrengthens the Part, cools the Inflammation, repreſſes the flux of Humors, and heals the Eyes.

XVII. *The Liquid Juice.* It is very effectual to heal all Sores and Ulcers of the Mouth ; and put into freſh or green Wounds, it conglutinates their Lips, and quickly heals them : And dropt into the Eyes, it takes away their Heat, Inflammation, and Pain.

XVIII. *The Diſtilled Water of the Herb.* It has the ſame properties with the Juice, and Eſſence, but not altogether ſo powerful.

CHAP. LXXIX.

BLEW-BOTTLE Double-flowred.

I. THE *Names.* They are called in *Latin*, *Cyanus multiflorus* : and in *Engliſh*, *Double-flowred Blew-bottle*, or *Corn-flower.*

II. *The Kinds.* They are of the leſſer Kind of Blew-bottle, and are twofold, 1. *Cyanus cæruleus multiflorus*, Double Blew-flowred Blew-bottle, or Corn-flower. 2. *Cyanus purpureus multiflorus*, Double Corn-flower Purple-flowred. 3. To theſe we add, *Cyanus floridus Turcicus*, *Cyanus floridus odoratus Turcicus*, *Cyanus Orientalis*, which is alſo *Major* and *Minor*. The *Turky* Blew-bottle : The *Turky* Sweet-ſcented Blew-bottle, and the Sultan's Flower, becauſe the *Grand Senior* eſpying it as he was walking abroad, liked it, and wore it himſelf, for which reaſon his Vaſſals held it in great eſteem : of this there is a *Greater* and a *Leſſer.*

III. The Deſcription. *The firſt of theſe differs not at all from the ſmall Field Corn-flower in the former Chapter, neither in the Roots, Stalks, Leaves, nor Seeds, but only in the Flowers, for that the Flowers of this Plant, are of a fair Blew color, and very double, whereas the other are ſingle.*

IV. The Second *of theſe is alſo like unto the former in all reſpects, ſaving in the color of the flower ; for whereas that is double, and of a fair blew ; the flowers of this are alſo double, and of a bright purple color.*

V. The Third *is a Plant or Flower of much beauty : It has a Root like the other Blew-bottles, which periſhes every Year ; the Leaves hereof are not much greener, but larger, and more gaſhed in on the edges ; the Stalks are three feet high at leaſt, and lower than in the other, beſet with the like Leaves, but ſmaller, and branching into ſeveral parts, each of them bearing a larger ſcaly head than the former, and biger in the Greater of this kind, than in the Leſſer, with Blew-bottle like flowers, but larger, and conſiſting of eight or nine hollow Leaves, with wider open brims, and ſmall, pale or almoſt white threads in the middle ; the circling Leaves are of a fine beautiful purple color, very glorious to behold. This Flower is of ſo exceeding a ſweet ſcent, that it ſurpaſſes (ſays* Parkinſon) *the beſt Civet that is. The Seed is blackiſh, and encloſed in a Downy ſubſtance like the former.*

VI. The Places. The two firſt are often found in *Corn*

Corn fields, and are alſo nouriſhed up in *Gardens*. The laſt was brought to us from *Turky*, or *Conſtantinople*, and grows in the *Gardens* of ſome Herboriſts.

VII. *The Times.* They flower for the moſt part thro' all the *Summer*, and their Seed ripens in the mean ſeaſon.

VIII. *The Qualities, Specification, Preparations, Virtues and Uſes*, are all exactly the ſame with thoſe in the former Chapter, ſo that we ſhall ſay no more thereof in this place.

CHAP. LXXX.

BLITES White.

I. *THE Names.* It is called in *Greek* Βλίτον: In *Latin*, *Blitum*: and in *Engliſh*, *Blites*. Yet *Parkinſon* ſays, that none of the Ancients have made any mention of them.

II. *The Kinds.* There are two principal Kinds, *viz.* 1. *Blitum album*, the White Blite; and this is both *Majus* and *Minus*, of which we treat in this Chapter. 2. *Blitum Rubrum*, The Red Blite, which is alſo *Majus* and *Minus*, of which in the next Chapter.

III. The Deſcription. *The* Great White Blite *has a Root very thick, and long, and very full of Threads or Strings; from whence riſes up ſeveral Stalks, making a kind of buſh, till it comes to be three or four Feet high; the Stalks are grayiſh, white, and round: the Leaves are plain and ſmooth almoſt like to thoſe of* Arach, *but not ſo ſoft nor mealy: the Flowers grow thruſt together, like thoſe of* Arach: *after which comes the Seed incloſed in round, flat, husky skins.*

IV. *The* Leſſer White Blite, *which is called the* Wild White Blite *is very like unto the former, except that the Roots, Stalks, Leaves, Branches, and the whole Plant are altogether of a green color, and every way leſs than the former, growing upright and not creeping at all.*

V. *The Places.* The *Firſt* is a *Garden Herb*, and grows chiefly there, but is in ſome places found Wild. The *Second* is as a Weed, growing Wild, tho' alſo in *Gardens*.

VI. *The Times.* They flouriſh and flower all the *Summer* long, their Seed is ripe in *Auguſt* and *September*, ; and grow very green even in the *Winter time*.

VII. *The Qualities.* The *Blite*, ſays *Galen* (*lib. 6. fac. Med. Simp.*) is a Pot Herb, which ſerves for Meat, cold and moiſt (in the ſecond Degree:) Hyſterick, and Solutive. Yet *Parkinſon*, will have them to be Cold, Dry, Aſtringent or Binding.

VIII. *The Specification.* They are peculiar againſt Fluxes and Diſtempers of the Womb.

IX. *The Preparations.* You may have therefrom, 1. *A Liquid Juice.* 2. *An Eſſence.* 3. *A Decoction in Wine.* 4. *A Syrup.*

The Virtues.

X. *The Liquid Juice.* Taken to five or ſix ounces in a Glaſs of Wine, it purges by ſtool, makes the Belly ſoluble, and cools the Bowels: but ſometimes it overturns the Stomach, and cleanſes it by Vomiting.

XI. *The Eſſence.* It does the ſame thing with the Juice, but with leſs detriment to the Stomach; and being taken Morning and Evening from two ounces to three, or four, it ſtops the *Whites* in Women, and a *Gonorrhœa* in Men, Univerſals being premiſed.

XII. *The Decoction in Wine.* This is yet leſs troubleſome to the Stomach, and has the Virtues of the Eſſence; but not altogether ſo powerful; and may be taken without any danger by a Woman with Child.

XIII. *The Syrup.* It is not only Hyſterick, but Pectoral alſo: it cleanſes the Womb, Breaſt, Stomach, and Lungs, of Slime, and Viſcous or Tartarous Matter, eaſes Coughs, and taken for ſome time, helps Aſthma's, and ſhortneſs of Breath.

CHAP.

CHAP. LXXXI.

BLITES Red.

I. THE *Names.* It is called in *Latin*, *Blitum Rubrum*, and in *Engliſh*, the *Red Blite.*

II. *The Kinds.* There are two Species of it 1. *Blitum minus Rubrum*, *Blitum Rubrum Hortenſe*; the greater Red Blite, or Garden Red Blite. 2. *Blitum minus Rubrum*, *Blitum Rubrum Sylveſtre*, the leſſer Red Blite, or Wild Red Blite. 3. Red Blite with much Seed.

III. The Deſcription. *The firſt is almoſt exactly like the* Great White Blite *deſcribed in the former Chapter, except that the Stalks, and* Leaves, *and alſo the reſt of the Plant are reddiſh, and reddiſh mixed with a dark green color, and in all other reſpect they ſeem to be like.*

IV. *The* ſecond, leſſer, *or* Wild Blite, *is almoſt like to the* Wild White Blite, *ſaving that in this, the Stalks and Branches trail upon the ground, and are reddiſh, like the former for their color: the Seed is ſmall and cluſtering together, green of color, and almoſt like unto the Seed of* Coronope Ruellij, *or* Bucks-horn.

V. The third Kind *differs little from the firſt, ſave that the Leaves are longer, and it is much fuller of Seed, and with a multiplicity of ſpiky heads.*

VI. *The Places.* The firſt or Greater is a *Garden* Plant, and a Pot-herb: the other grows *Wild*, but for the moſt part in *Gardens*, and is taken for a Weed: but is ſometimes found Wild in other places.

VII. *The Times.* They Flower all the *Summer* long, and their Seed is ripe in *Auguſt* and *September*; and keep alive in *Winter* alſo.

VIII. *The Qualities.* They are cold and dry in the ſecond Degree, Aſtringent, Hyſterick, and Solutive.

IX. *The Specification.* They are peculiar to ſtop the Terms in Women.

X. *The Preparations.* You may make therefrom, 1. *A Liquid Juice.* 2. *An Eſſence.* 3. *A Decoction.* 4. *A Syrup.*

The Virtues.

XI. They are exactly the ſame with thoſe Preparations in the former Chapter, ſave, that whereas thoſe are peculiar for ſtopping the Whites in Women, and *Gonorrhœa*'s; theſe are peculiar for ſtopping their Courſes when they overflow; and are alſo of great uſe to ſtop other Fluxes of Blood in either Sex.

CHAP.

CHAP. LXXXII.

BLOOD-WORT.

I. *THE Names.* It is called in *Greek* Λάπαθον ἐρυθρὸν: In *Latin*, *Lapathum Sanguineum*, as *Parkinſon*: *Sanguis Draconis Herba*, as *J. Bauhin*: *Lapathum folio acuto rubente*, as *C. Bauhin*: In *Engliſh*, *Blood-wort*.

II. *The Kinds.* It is a Species of the Dock, and differs little but in its color.

Blood wort.

III. The Deſcription. *It has a Root not great, but ſomething long, and very red, abiding many Years, yet ſometimes killed by the extream hardneſs of the Winter: And as it is one of the ſort of Docks, ſo has it long Leaves, like unto the ſmaller yellow Dock, but overſpread with many red Veins, and overſhadowed with red upon the green leaf, that it ſeems ſometimes almoſt wholly red. The Stalk is red or reddiſh, bearing ſuch like Leaves, but ſmaller, up to the Top, where it is divided into divers ſmall Branches, on which grow purpliſh Flowers; after which come three ſquare, dark, red Seed, like unto other Docks.*

IV. *The Places.* It grows chiefly in *Gardens*, as a Pot-herb, almoſt throughout the Kingdom: but *Parkinſon* ſays, it is ſometimes found growing Wild.

V. *The Times.* It riſes up in the *Spring* of the Year; Flowers through all *June* and *July*; and the Seed is ripe in *Auguſt*.

VI. *The Qualities. Blood-wort* in reſpect to heat or cold is temperate, and dry in the ſecond Degree: It is Aſtringent, Digeſtive, Diſcuſſive, and Traumatick; Stomatick, Hepatick, Splenetick, and Alterative.

VII. *The Specification.* It is peculiar for cleanſing the Blood, and ſtrengthening it in its *Criſis*, and therefore powerful againſt the *Scurvy*.

VIII. *The Preparations.* You may make thereof, 1. *A Liquid Juice.* 2. *An Eſſence.* 3. *A Decoction in Red Wine.* 4. *An Acid Tincture.* 5. *A Syrup.* 6. *A Saline Tincture.* 7. *A Balſam.* 8. *A Cataplaſm.* 9. *A Pouder of the Seed.*

The Virtues.

IX. *The Liquid Juice.* Taken from one ounce to four, either alone by it ſelf, or mixed with Wine, it removes the Diſcraſie of the Blood and Humors, cleanſes it, and renews the whole Bloody Maſs, like to the Blood of a young Child: It ought to be given Morning and Night for ſeveral Days.

X. *The Eſſence.* It has the Virtues of the Juice, ſtrengthens the Stomach, Liver, and other Bowels, ſtops Fluxes of the Belly, chiefly the Bloody Flux, helps Spitting of Blood, and the Subverſion or Loathing of the Stomach through Choler: It opens Obſtructions, and is profitable againſt the Jaundice. Doſe four or ſix Spoonfuls, or more.

XI. *The Decoction.* It has the Virtues of the Eſſence, but not full out ſo powerful; and being outwardly uſed it is good againſt Freckles, Tannings, Sun-burnings, Morphew, and other like defilements of the skin. Taken inwardly to ſix ounces, it opens Obſtructions of the Liver and Spleen, ſtrengthens the *Viſcera*, and ſtops all Fluxes of Blood. It may be made both of Roots and Leaves in Red Port Wine.

XII. *The Acid Tincture.* This is more ſtomatick than any of the former, purifies the Blood, rectifies the Humors, and cures the Scurvy whether in Old or Young: The Doſe is from a quarter of a ſpoonful to half, in Wine, or any proper Vehicle. Beſides all this, it kills Worms in Children, and is good againſt the Dropſie; quenches Thirſt, reſtores loſt Appetite, and takes away the Præternatural heat of Fevers: A Julep may be made of it, with the Syrup thereof, to be given in all malign and burning Fevers.

XIII. *The Syrup* It is Pectoral, good againſt Coughs, Colds, Wheezings, and ſhortneſs of Breath.

XIV. *The Saline Tincture.* It purifies the Blood by the Urinary paſſages, allays the heat of Fevers, is prevalent againſt Jaundice and Dropſie, and looſens the Belly: Outwardly uſed, it is good againſt Pimples, Scurf, Morphew, and other breakings out of the Skin.

XV. *The Balſam.* It eaſes Pains, being anointed upon any Part, ſpeedily cures Green Wounds, cleanſes Ulcers, incarnates, and heals them.

XVI. *The Cataplaſm.* It is Diſcuſſive, and ſomewhat Repercuſſive, is profitably applied to Contuſions, and other Tumors, and gives eaſe in the Gout.

XVII. *The Pouder of the Seed.* It is drying and binding, ſtops Fluxes of all ſorts, and bleedings of the *Viſcera*: and taken in Wine to one dram, it is good againſt the wounds of the *Scorpion*, *Mad-Dogs*, and of other Venomous Beaſts.

CHAP. LXXXIII.

BORAGE.

I. *THE Names.* It is called in *Greek*, Εὐφρόσυνη, *Euphroſine*, *ab efficienda Voluptate*: In *Latin*, Borago; *dicta videtur à Corago, ut â lite, â variat â.* *Apuleius* ſaid that it was called, Corago, *quod cordis affectibus medetur*, and from thence it is thought

thought came our name *Borage*, by the alteration of one Letter; but this name is not to be found in any of the Ancient Writers: In *English*, we call it *Borage*.

II. *The Kinds.* There are several Kinds hereof: as, 1. *Borago Vulgaris, Borago Hortensis, Floribus Cæruleis*, Common Garden Borage with Blew Flowers. 2. *Borago flore albo*, Borage with a White Flower. 3. *Borago Semper Vivens*, Everliving *Borage*.

III. The Description. *It has a Root, thicker and shorter than that of* Bugloss, *something blackish without, and whitish within, perishing after Seed time, but rises again of its own Sowing, in the Spring of the Year. The Leaves are broader, shorter, greener, rougher, and more crumpled than are the Leaves of* Bugloss. *The Stalks hereof are not so high, but branched out into many parts, whereon stand larger Flowers, and more pointed at the end than* Bugloss, *and of a paler blew color for the most part, yet sometimes the Flowers are reddish; each Flower consists of five Leaves, standing in a round whitish hairy husk, divided into five parts, or leaves; in the middle of the Flower grew forth a number of fine black Threads, standing out, pointed at the end, and broad at the bottom; which being past away, there succeeds several roundish black Seeds.*

IV. Borago floribus albis, *Borage with white flowers, is a plant like to the other in all respects, except the color of the Flowers, for as they are perfectly blew, these are purely white, and in this particular the difference only consists.*

V. The Everliving Borage, *has Roots black, thicker than either of the former, and more spreading, not dying in the Winter, but yielding green Leaves all the Winter long. It has very many broad Leaves, rough and hairy, more resembling* Comfrey *than* Borage, *yet not so large as either, of a black, dark, green color. Among which rise up stiff hairy Stalks, but not so high as those of our* Common Garden Borage, *upon which do grow many small, fair, blew Flowers, very like to the Flowers of* Bugloss *for the form, and of* Borage *for the color: There are Buds, Flowers, and ripe Seed, all at once, for which reason it is called* Everlasting, *and that very properly, because it not only lasts both Summer and Winter, but is seldom without Buds, Flowers, and Seed, ripe and unripe together, by which it wonderfully increases.*

VI. *The Places.* The first is common in almost all *Gardens*: The second and third are not so common, but they grow with us in *Gardens*, as easily as the former.

VII. *The Times.* They Flower throughout all the *Summer* Months, till the *Autumn* is well spent; and their Seed ripens in the mean season.

VIII. *The Qualities.* They are Temperate in respect of heat or cold, and moist in the first Degree, Absterstive, Aperitive, Emollient, Cordial, Alterative, and Alexipharmick.

IX. *The Specification.* They wonderfully chear the Heart, expelling Sadness and Melancholly, according to the Verse,

Stultis, Leprosis, Tabidis, Timidis, Furiosis,
Dicit Borago, *gaudio semper ago.*

Purificat Sanguinem, & Cor lætificat. It purifies the Blood, and makes the Heart merry.

X. *The Preparations.* You may have therefrom: 1. *A liquid Juice.* 2. *An Essence.* 3. *A Distilled Water of the whole Plant.* 4. *A Syrup.* 5. *An Infusion in Wine.* 6. *A Conserve of the Flowers.* 7. *An Acid Tincture.* 8. *A Balsam.* 9. *Ashes.* 10. *A Spirit.*

The Virtues.

XI. *The liquid Juice.* It effectually purifies the Blood, and is of excellent use in all Putrid, Malign, Spotted and Pestilential Fevers, to defend the Heart from their Poison and Malignity, and to expell the same, as also the Poison of other Creatures. It cools, opens Obstructions, cleanses the Blood and Humors, and is effectual in the cure of the Yellow Jaundice. Dose from three to eight spoonfuls, or more, in Wine, or mixed with the Distilled Water, or in some other fit Vehicle, two or three times a day.

XII. *The Essence.* It has all the Virtues of the former, more exalted, and therefore more powerfully and effectually cheers the Heart, and expells Melancholly. It is an excellent Cordial, revives the Spirits, strengthens Nature, is good against Fainting and Swooning Fits, and other Passions of the Heart, and restores such as have been long wasting in a Consumption. It may be given from two to four or six ounces at a time, and that two or three times a day, in Wine, or some other fit Vehicle, and it may be sweetned, or made pleasant with Syrup of Borage. This *Essence* is Traumatick, and contributes very much towards the curing of Wounds, or old Running Ulcers, and Fistula's, in Bodies of an ill habit.

XIII. *The Distilled Water.* It has the Virtues of the former, but nothing near so powerful; but it may be used as a Vehicle to convey the other things in.

XIV. *The Syrup.* It is of the Nature of the Essence, tho' not so Strong and Effectual; it is Cordial, opens Obstructions of the Breast and Lungs, helps Coughs, Colds, Wheezings, Asthma's, shortness of Breath, and mixt with Juice of Fumitory, it cools and cleanses the Blood, and is profitable against the Yellow Jaundice. Dose two ounces.

XV. *The Infusion of the Herb in Wine.* It very sensibly and admirably recreates the Spirits, and gratifies or pleases the Stomach, is good against the Cardiack Passion, and Melancholly, and is prevalent against the Falling-sickness: If it is a strong Infusion,

it

it is good againſt redneſs and inflammation of the Eyes, they being waſhed therewith.

XVI. *The Conſerve of the Flowers.* They are chiefly uſed as a Cordial Sweet-meat, and to reſtore ſuch as have been long in a Conſumption, being often taken with new Cows Milk, *viz.* ſuch as is warm from the Cow, and in which the heat is preſerved all day, by the help of the heat of a Sand Furnace.

XVII. *The Acid Tincture.* It is an admirable Stomatick and Cordial, refreſhes the languiſhing Stomach, and cauſes a good Appetite: It prevails againſt the Scurvy, Dropſie, Jaundice and Gout; removes Sickneſs at Heart, and ſtops a vehement and preternatural Vomiting. If uſed as a Gargle, by mixing it with ſome of the Diſtilled Water, and Syrup, it cures Cankers, and Ulcers of the Mouth and Throat, and allays Inflammations of the Tonſils. This *Tincture* is a notable thing againſt all burning, malign, putrid, and peſtilential Fevers, and profligates even the Plague it ſelf; for it immediately allays the preternatural heat, quenches the violent thirſt, reſiſts the putridity of the Humors, and profligates the Poiſon of the very Peſtilence it ſelf. It cools, opens Obſtructions, and rectifies the Diſcraſie of the Blood and Humors, beyond many other more Specious, and much Celebrated Medicaments.

XVIII. *The Balſam.* It is an excellent Vulnerary; it cleanſes old Ulcers, and other Putrid and Running Sores; and heals green Wounds to a miracle; I commend it by Experience to my Countrymen.

XIX. *The Aſhes.* If they be boiled in Mead or Honeyed Water, it will be a Gargle for the curing Inflammations of the Throat and Tonſils, Ulcers of the Mouth, *&c.* And if they be boiled in fair water, and that water mixed with Juice of Fumitory, it will make a Lotion againſt Scabs, Itch, Tettars, Ringworms, Scurf, Morphew, and other breakings out, ariſing from ſharp and aduſt Humors.

XX. *The Spirit.* It is made of the Juice of the Plant, fermented with Honey, Sugar, Melloſſus, or Leaven, and then Diſtilled in an Alembick. It is a great Cordial, much exceeding Spirit of Wine in Fainting and Swooning Fits, Sickneſs at Heart, Palpitation, and other Paſſions of the Heart: It chears the Spirits, recreates Nature, and makes Merry, profligating the moſt profound powers of Melancholly. Doſe one Dram, or two, to four Drams, alone, if dulcified, otherwiſe to be mixed with a Glaſs of Wine.

CHAP. LXXXIV.

BROOM Common.

I. THE *Names.* This out Broom was ſcarcely known to the Ancient *Greeks*, though ſome have given it the name of Σπάρτιον *Spartion*: However it is called generally in *Latin*, *Geniſta*; and *Scoparia*, as *Gerard* and *Parkinſon*; ſome ſuppoſe it to be called *Geniſta à genuum flexilitate*, from the flexibleneſs of its Joints; or, *Quia genibus medeatur dolentibus*, becauſe it eaſes the pain of the Knees: or, *quod facile generet, ſpeciemque propaget*, becauſe it eaſily encreaſes, and is not without trouble deſtroyed where it takes Rooting: alſo *Geneſta anguloſa trifolia*, as *J. Bauhin* and Mr. *Ray*: In *Engliſh*, *Broom*, and *Common Broom*.

II. *The Kinds.* There are but two kinds, which we ſhall take notice of in this Book: 1. The *Engliſh*. 2. The *Spaniſh*. The *Engliſh* Broom is twofold, *viz.* 1. *Scoparia*, or *Geniſta vulgaris*, our Common Field or Heath Broom. 2. *Genitella. Dumetella. Chamagenſta* Dwarf Broom. *Gerard* calls it, *Chamagenſta Anglica*.

III. The Deſcription. *Common Broom has a Root which is long and woody, but tough withal, ſpreading ſeveral ways under the Earth, never periſhing, but ſending forth new ſhoots every Year, and more eſpecially, if the old Stalks are cut down, and taken away. From theſe Roots come forth many woody Stems or Stalks, of the bigneſs of a Man's Finger at bottom, ſometimes bigger, ſometimes leſſer, according to its length of time in growing, riſing up to the height of four or five Feet, or more, and ſpreading into ſeveral the like woody Branches, making a kind of Shrub or Buſh, as it were, covered with a hard and thin dark, grayiſh, green Bark, from which ſhoot forth a great number of ſlender, pliant, ſquare or cornered ſmall Twiggs, like Ruſhes, upon which grow ſmall, dark, green Leaves. The Flowers are large, and of a golden yellow ſhining color, growing one above another for a good ſpace, till they come to the Tops of the Branches, which turn into hard, flat, ſmall Cods, almoſt black when they are ripe, and in which are contained ſmall and ſhining, browniſh Seed.*

IV. Geniſtella *or* Dwarf Broom *has a Root long and tough, long laſting, and ſpreading much under ground: This Plant never grows very great or high, neither come its ſlender, pliant, green Branches to be hard or woody, but they always keep low, riſing up but a little more than a foot in height. Upon its green pliant twigs, are ſet ſmall and ſomething long Leaves, of a dark, green color on the upper ſide, and gray underneath, abiding on them all the Summer time: at the tops grow ſmall yellow Flowers, not ſo yellow, nor ſo large as the former, but like unto them for the form; which being paſt, there ſucceeds little long Pods or Cods of Seed, which are like to the firſt, but ſmaller.*

V. *The Places.* The firſt grows very plentifully in many places of *our Land*, as upon *Heaths*, *Barren Places*, and *Uncultivated Grounds*, as well as in *France*, *Germany*, *Italy*, and *Spain*: The other is alſo found in many Parts of *this Kingdom*; and is

alſo found in *Hungary* : about thirty Years ſince as I was a walking, I found it in ſome Waſte and Barren Grounds about *Low-Layton* near *London* : This is ſuppoſed to be *Cluſius* his *Chamægeniſta Pannonica ſeptima.*

VI. *The Times.* They Flower ſometimes earlier, ſometimes later in the *Summer* Months, as in *June* and *July*, to the end of *Auguſt*, and the Seed ripens in the mean ſeaſon

VII. *The Qualities.* They are both hot and dry in the ſecond Degree, and ſaid to be of one and the ſame, and equal Virtues : They are Aperitive, Abſterſive, Diuretick, and Traumatick or Vulnerary : Hepatick, Splenetick, Hyſterick, Nephritick, Arthritick, and Alterative : but the Seed ſome ſay is Cathartick.

VIII. *The Specification.* It is of peculiar uſe againſt the Dropſie, Jaundice, Gout, and Kings-Evil, as alſo Diſtempers of the Reins and Bladder.

IX. *The Preparations.* You may make from theſe Plants : 1. *A Diſtilled Water.* 2. *A Decoction in Wine.* 3. *A Liquid Juice.* 4. *An Inſpiſſate Juice.* 5. *An Eſſence.* 6. *An Oil diſtilled.* 7. *A Spirituous Tincture.* 8. *An Acid Tincture.* 9. *An Oily Tincture.* 10. *A Saline Tincture.* 11. *A Syrup.* 12. *A Fixed Salt of the Aſhes.* 13. *A Pouder of the Leaves and Seeds.* 14. *A Conſerve of the Flowers.* 15. *An Oil.* 16. *An Ointment.* 17. *A Balſam.* 18. *Geniſtæmel.* 19. *A Cataplaſm.* 20. *A Pickle of the Buds.*

The Virtues.

X. *The diſtilled Water.* Whether it is made of the Flowers, or of the green Branches, or both, it is ſaid to be good againſt Surfeits ; and taken with equal quantities of the leſſer Centory Water, and the Patient laid down to Sweat upon it, it is ſaid to alter the Fits of Agues. It is a good Vehicle for ſome of the following Preparations.

XI. *The Decoction in Wine.* It is good againſt the Dropſie, Jaundice and Gout, and to cleanſe the Reins, Ureters, and Bladder, of Sand, Gravel, and other Tartarous matter.

XII. *The liquid Juice, made of the young Branches, and flowery Heads.* It purges downwards Phlegmatick and Watry Humors, and therefore is good for ſuch as have the Dropſie, more eſpecially if it is uſed with White Port, or *Rheniſh* Wine : but poſſibly in ſome other caſes it may be better uſed with Water. It is profitable againſt the Gout and Sciatica, and other pains of the Joints and Limbs. It eaſes pains in the Sides, and is good againſt Tumors of the Spleen. It cleanſes the Reins, Ureters, and Bladder, of Stones, Sand, and Gravel, or any Tartarous Matter Obſtructing them, bringing forth the offending Matter by Urine, which it admirably provokes. Doſe three, four or ſix ounces in Wine, twice or thrice a day, as you ſee need requires.

XIII. *The Inſpiſſate Juice.* The Virtues are the ſame with the former. Doſe from j. to iij. drams : diſſolve it in Wine over a gentle heat, and ſo drink it.

XIV. *The Eſſence.* It has all the Virtues of the Liquid Juice, before enumerated : It opens Obſtructions of the Liver and Spleen, is good againſt Pains and Stitches in the Sides, difficulty of Breathing, and ſhortneſs of Breath ; and as it cleanſes the Reins and Urinary paſſages of Gravel and Stones, it is ſaid ſo perfectly to remove the Cauſe, as to hinder their ever breeding again. Moreover, it prevails againſt the Kings-Evil, and powerfully ſtrikes at the Root of the Cauſe. It opens Obſtructions of the Womb, and provokes the Terms in Women, where they are ſtopt. Doſe five, ſix or eight ſpoonfuls, in White Port or *Rheniſh* Wine.

XV. *The diſtilled Oil.* It is made from the Seed and Roots dried, as Oil of Saſſafras, and other like things is made. Its uſe is External to Anoint with, to take away Spots, Freckles, Pimples, and other deformities of the skin.

XVI. *The Spirituous Tincture.* It is a peculiar thing againſt the Scurvy, and to ſtrengthen the Stomach and Bowels, whilſt the Dropſie is in curing. Doſe two drams.

XVII. *The Acid Tincture.* If it is often and long taken, it deſtroys the Scurvy, Dropſie, and Kings-Evil in their Roots, and deſtroys the præternatural heat in all Burning, Malign, and Peſtilential Fevers. It opens Obſtructions of all the *Viſcera*, and in a word, performs all that the Liquid Juice or Eſſence can do ; and with this advantage, that this may be taken where there is an extreme weakneſs of the Stomach, when thoſe things cannot. It helps ſhortneſs of Breath, and difficulty of Breathing, ſtrengthens a weak Stomach, and cauſes a good Appetite in ſuch as loath their Food, or cannot endure to ſee it in their ſight. Doſe from a quarter to almoſt half a ſpoonful, in Ale, Beer, or Wine, three, four or five times a day.

XVIII. *The Oily Tincture.* It is good againſt external Evils, and deformities of the Skin, as Spots, Freckles, Lentils, Pimples, Wheals, Scurf, Morphew, and ſuch other like Diſeaſes ; eaſes Pains and Aches from a cold cauſe, in what part of the Body ſoever : and being taken inwardly from ten drops to twenty, or more, in any Diuretick Vehicle, it gives preſent eaſe to Pains of the Back, though never ſo extream, provokes Urine, takes away the heat and ſcalding thereof, and expells Sand, Gravel, and Tartarous Matter.

XIX. *The Saline Tincture.* It is good in hot Tumors, and all hot Eruptions, and deformities of the Skin, proceeding from heat, or where they happen in hot Conſtitutions. Inwardly given, it powerfully provokes Urine, and therefore may be of good uſe in the Dropſie *Sarcites*, to drain the water out of the whole Body. It kills ſmall Worms in the Skin, which breed in an extravagant manner in ſome People, chiefly in the Forehead, Noſe and Chin.

XX. *The Syrup.* If it is made of the Juice, it has the Virtues of the Juice, and Eſſence, but not full out ſo powerful ; however it is better for Children, Ladies, and ſuch as are Queaſie Stomached : It purges gently, and carries off the Recrements of Humors. Doſe two ounces to four in a Glaſs of Port Wine : It is a ſingular thing againſt the Dropſie, Jaundice and King's-Evil.

XXI. *The Fixed Salt.* It is made of the Aſhes by Elixiviation in Water, being drank daily in Ale, Beer, or Wine, it is ſaid alone to cure the Dropſy, and to be a Specifick for the ſame. Doſe from a ſcruple to half a dram, in every good draught of Ale, Beer or Wine. And ſo taken in White or *Rheniſh* Wine, it is not only a Specifick againſt the Dropſie, but as Authors ſay, it cures the Greenſickneſs alſo : however it is not to be uſed in too great a quantity, leſt it ſhould by its vehement aperitive and abſterſive Qualities, fret or hurt the Bowels, but it may be given in the Liquid Juice or Eſſence, whereby it exalts their Virtues, and makes them the more powerful to all the intentions they are propoſed for.

XXII. *The Pouder of the Leaves and Seed.* Taken to a dram, or dram and half, in Beer or Wine, it purges downwards Cold, Flegmatick, and Watery Humors, expells the Water in Dropſies, helps the Gout and Sciatica ; and by a conſtant uſe thereof in Wine,

Wine, it cures the Black Jaundice, and preserves from the Gout and Stone.

XXIII. *The Conserve of the Flowers.* Made with Sugar or Honey, and often eaten, it wasts and destroys the Humors which feed the Kings-Evil.

XXIV. *The Oil.* It is made of the young Branches and Flowers, boiled in Oil Olive, till they are Crisp, *&c.* It is a safe and sure Medicament to kill Lice, Nits, and other Vermin, in the Head or Body; and being applied to the Sciatica, it helps it.

XXV. *The Ointment.* It is made of the young Branches bruised, and the Flowers, by boiling them in Oil, adding Sheeps Suet and Wax to bring it to a body, *&c.* This being applied to Sides pained, or where Stitches are, or to the Spleen, eases the pain, and removes it at twice or thrice using.

XXVI. *The Balsam.* It is made of the young Twigs and Flowers, *&c.* being applied to green Wounds, or foul, running, and putrid Ulcers, it cleanses, incarnates, and heals them in a very short time. The same will be done by a Balsam made of the Liquid Juice and Turpentine, boiled to a thickness, adding a little Oil and Wax.

XXVII. *Genistæuel.* It is made *by boiling the liquid Juice and Honey to a thickness.* It cures green Wounds presently. It also cleanses old, running, and putrid Ulcers, fills them with Flesh, and heals them: And apply'd to Kibes in the Feet, with pouder of Scammony, it cures them in a very short time.

XXVIII. *The Cataplasm.* It is to be made of the tender Tops and Flowers, beaten till they become a Mass in a Wooden Mortar. Being applied, it is said to help the bitings of Serpents, and other Venomous Creatures.

XXIX. *The Pickle.* The young Buds of the Flowers are usually Pickled; and they make an excellent Sallet for the Winter time, but it is of use thro' the whole Year; it excites the Appetite, causes a good Digestion, opens Obstructions of the Liver, Spleen and Reins, and provokes Urine.

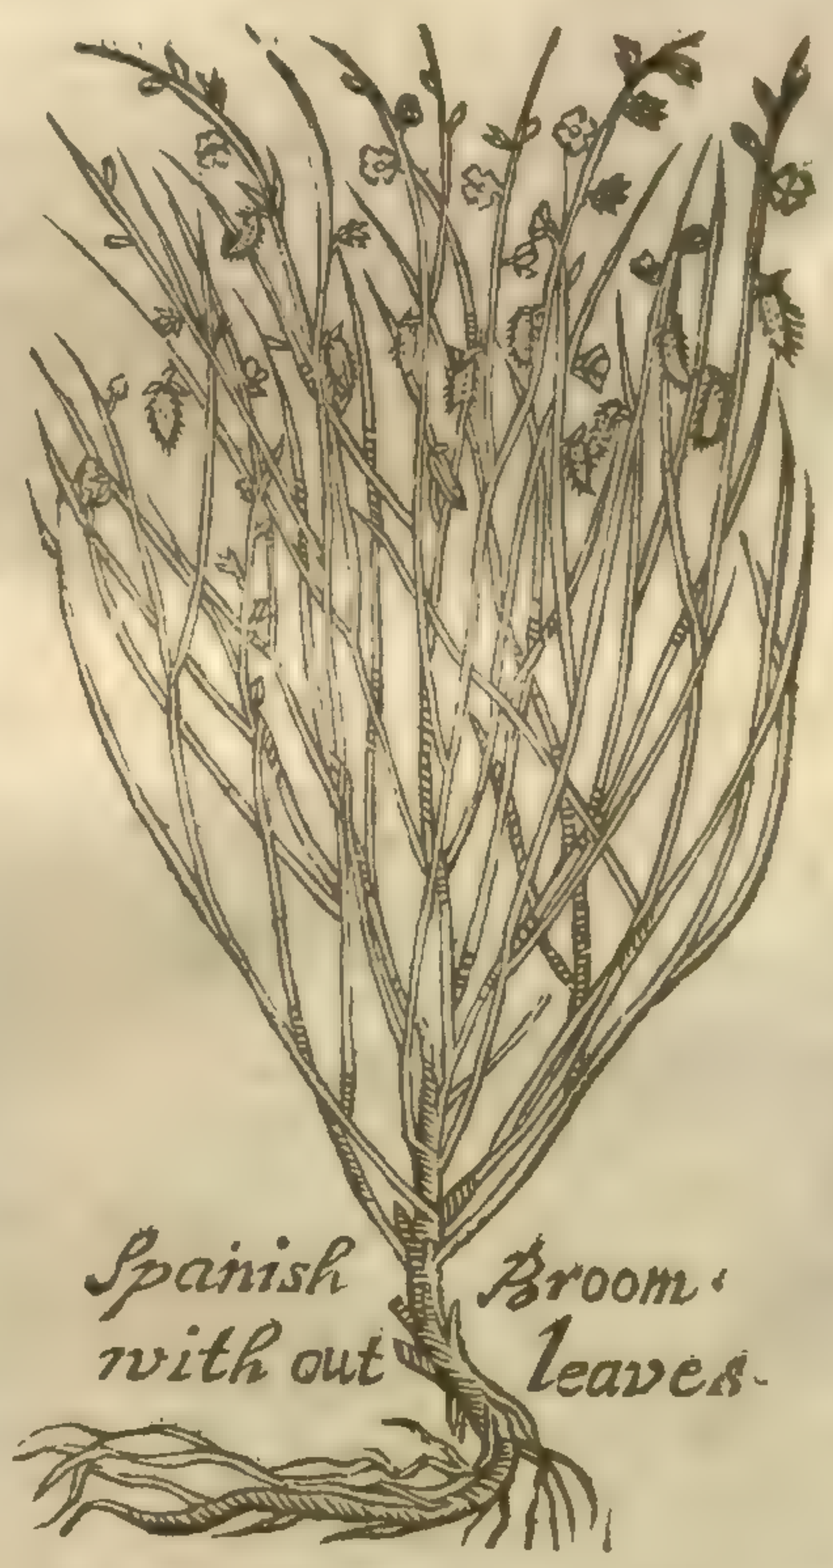
CHAP. LXXXV.

BROOM *Spanish.*

I. *THE Names.* It is called in *Greek* Σπάρτον: in *Latin*, *Spartium*, and *Spartum Hispanicum*: and in *English*, *Spanish Broom.*

II. *The Kinds.* There are, 1. *Spartum Hispanicum*, and *Spartum Hispanicum frutex* (to distinguish it from the *Sedge* or *Rush*, that is so called) *Spartum Græcorum*, *Genista Hispanicum*, and *Spartum Hispanicum vulgare*, Common *Spanish* Broom. 2. *Spartum Hispanicum majus flore albo*, *Pseudospartum Hispanicum Aphyllum*, *Spanish* Broom with a White Flower, Bastard *Spanish* Broom without Leaves. 3. *Spartum Hispanicum flore luteo*, *Pseudospartum luteum Aphyllum*, *Spanish* Broom with a yellow Flower, or the yellow Bastard Broom without Leaves.

III. The Description. *The first of these has a tough, woody Root, spreading it self under the Earth many ways; from whence rises up a Stalk five or six Feet high, with a woody Stock below, covered with a dark Gray, or Ash-coloured Bark, and having above many pliant, long, and slender crested green twigs, whereon, in the beginning of the Year, are set many small, long, green Leaves, which abide not long, but fall away when the Plant comes to flower. Towards the tops of these Branches or Twigs grow the Flowers, fashioned like unto Broom Flowers, but larger as yellow as they, and smelling as well; after which come small, long, round, yellowish red Cods, crested at the back, wherein is contained black flat Seed, fashioned very like unto the* Kidney Bean, *but the Cods (says Gerard) rarely contain more than one Seed, seldom two.*



IV. *Spartum Hispanicum majus flore albo*, The greater White flowred *Spanish* Broom, *has a Root like the former, from whence grows up a Stem much higher than the yellow, even to five or six* Feet *high, whose Branches are more tough, apt to bend, and compliant, than the former, or that following, having*

ſmall Leaves on them like the others, and as ſoon fading: the Flowers alſo ſtand upon long Stalks, and are like the others for form, but larger, and of a White color, and of little or no ſmell; which being paſt away, there comes ſmall round Pods or Cods, like the others, but ſmaller, each one containing, for the moſt part, but one Seed, ſomething leſs than the others alſo.

V. *The third Kind, or* Pſeudoſpartum flore luteo, *is a ſmaller* Spaniſh *Broom, which has alſo a hard, tough, woody Root, from whence grows a Stem or Stalk of the bigneſs of ones* Thumb *at bottom; and grows to be about two Feet high, whoſe bark is rough, and ſtreaked all along, ſending forth many green, ſlender, pliant Branches, which divide themſelves again into many other ſmaller* Twigs, *whereon for a while after they are ſhot forth, abide a few ſmall Leaves, until they begin to ſhoot out Flowers, and then fall away, leaving the Branches naked, and without Leaves all the reſt of the Year after: from the Sides and Joints of the ſmaller* Twigs, *ſhoot forth ſmall long Stalks, bearing many Flowers, ſmaller and yellower than the former* Spartum, *without any Scent for the moſt part: after which come ſmall round skinny Cods, containing for the moſt part but one Seed in them, and faſhioned ſomewhat like unto the* Kidney Bean, *which when they are ripe, will by the ſhaking of the Wind, make a noiſe in their Pods.*

VI. *The Places.* They all grow in *Spain*, *Italy*, *France*, and other Southern Countries; but the firſt of them grows with us in *Gardens*, only as an Ornament, ſays *Parkinſon*, among other delightful Plants, to pleaſe the Senſes of Seeing and Smelling.

VII. *The Times.* The firſt and ſecond Flowers in *April* and *May*, and beginning of *June*; the third Flowers in *February*: and their Seed is ripe before *Winter*: the firſt, which grows in our *Gardens*, its Seed is not ripe till very late in the Year.

VIII. *The Qualities, Specification, Preparations, Virtues and Uſes*, are the ſame in all reſpects with *Engliſh Broom*, excepting, that theſe *Spaniſh Brooms* are ſtronger in operation, and more effectual to the purpoſes intended; inſomuch, that being given inwardly in many of their Preparations as the *Engliſh*, they not only work downwards, but cleanſe the Stomach and Body by Vomiting alſo: this being ſaid, we ſhall ſay no more of them here, but referr you to the former Chapter.

CHAP. LXXXVI.

BROOM Rape.

I. *THE Names.* It is called in *Greek* Ορόβαγχη: in *Latin*, *Orobanche*, *Cauda Leonis*; *Cluſius* calls it *Hæmodoron*, as *Theophraſtus*, *lib.* 8. *cap.* 8. or *Leimodoron*, as others have it: and in *Engliſh*, it is called *Broom-Rape.*

II. *The Kinds.* Of this *Broom-Rape* there are ſeveral Kinds, as, 1. That which proceeds from the Roots of the *Engliſh-Broom.* 2. That which proceeds from the Roots of the *Spaniſh Broom.* 3. That which proceeds from the *Dyers Weed*: all theſe have but one Deſcription, though ariſing from the Roots of thoſe ſeveral Plants. *Lobel* and *Cluſius* make other Varieties, 1. That which has longer and ſmaller Flowers than the other, or common ſort has. 2. That which has larger Flowers, and thoſe of a blewiſh color, and is ſometimes found among Corn. 3. That which is parted towards the Top into ſeveral Branches, whoſe Flowers are either Blew, Purpliſh or White, and is ſometimes found amongſt Hemp.

III. The Deſcription. Broom-Rape *has a bulbous Root, or a Root round and ſcaly, which adheres or grows unto the Roots of* Broom, *big or large below, and ſmaller above, covered with blackiſh Scales, and of a yellowiſh Pulp within: from this Root does riſe up a Stalk of the bigneſs of a Finger or Thumb, and about a ſpan long; ſometimes a Foot, or two Feet high, which has a ſhew of Leaves on it, and many Flowers about the Top of it, ſomewhat whitiſh, almoſt*

most like to those of dead Nettles ; or something resembling the Flowers of Orchis, *but larger, and of a deadish yellow color, as the Stalks and Leaves also are, after which grow forth long, thick and round husks, in which are contained very many Seeds, yet good for nothing ; but* Parkinson *says, it perishes without Seed.*

IV. *The Places.* *Gerard* says, that *Broom-Rape* is not to be found any where but where *Broom* grows. It may be found in a *Broom-field* at the foot of *Shooters-hill* next *London* ; upon *Hampstead-Heath*, and in several other places. But *Parkinson* says, it grows more often where no *Broom* grows, *viz.* by Fields and Hedge sides, and upon Heaths ; and other Authors say, in *Corn-fields* and *Hemp-lands.*

V. *The Times.* It rises up, and appears, and is in its chief perfection in the Month of *June.*

VI. *The Qualities.* It is Temperate in respect to Heat or Cold, Dryness or Moisture, Aperitive, Abstersive, Diuretick, and Vulnerary ; Hepatick, Nephritick, and Alterative.

VII. *The Specification.* Its peculiar property is to provoke Urine, and help the Strangury.

VIII. *The Preparations.* You may make therefrom, 1. *A liquid Juice.* 2. *An Essence.* 3. *A Decoction.* 4. *An Insolated Oil.* 5. *A Balsam.* 6. *A Cataplasm.*

The Virtues.

IX. *The liquid Juice.* It is an extraordinary thing to cure not only green Wounds, but also running Sores, old, filthy, running Ulcers, and malignant breakings out whatsoever.

X. *The Essence.* It is thought to be as effectual in opening Obstructions of the Reins, Ureters and Bladder, provoking Urine, and expelling Sand, Gravel, Stones, or any Viscous, Tartarous or Slimy Matter out of the Urinary passages, as *Broom* it self. Dose three or four ounces at a time, Morning and Evening, in a glass of White Wine.

XI. *The Decoction.* It has the Virtues of the Essence, but not all out so powerful.

XII. *The Insolated Oil.* It ought to be made of four or five repeated Infusions of the top Stalks with the Flowers, strained forth and cleared. It is said to cleanse the Skin of all manner of Spots, Freckles, Lentils, Sun-burning, Tanning, and other like deformities which rise through heat of the Sun, or superabundancy of malign Humors.

XIII. *The Balsam.* It is cleansing, incarnative, and healing, and therefore beneficial against all sorts of old, putrid, malign, and running Sores and Ulcers: It heals Wounds admirably, and conglutinates their Lips in a very short time.

XIV. *The Cataplasm.* It is good against Burnings and Scaldings, eases Pain, discusses Swellings and Contusions, where the Skin is not broken, and softens hard Tumors.

CHAP. LXXXVII.

BRITANNY.

I. *THE Names.* It is called by *Pliny*, *lib.* 20. *cap.* 21. in *Greek* Ὑδρολάπαθον, *Hydrolapathum* : in *Latin*, *Lapathum Sylvestre longifolium nigrum*, *Hydrolapathum*, *Hydrolapathum nigrum*, and *Britannica* : in *English*, the *Wild Black long-leav'd Water-Dock*, or *Black Water-Dock*, and *Britanny*, which last is its most Common Appellation.

II. *The Kinds.* The *Arabian*, *Greek* and *Roman* Authors affirm it to be a Species of *Lapathum*, or *Dock*, which that laborious Botanist *Abraham Munting* in his famous Herbal, published in *Holland*, in Folio, *Anno* 1696. has sufficiently demonstrated. And of this Plant there are two special kinds, 1. The *European*, simply called *Britannica*, and *Britannica Antiquorum vera*, or *Britanny*. 2. The *American*, called by the aforenamed Author, *Britannica Americana* ; and from some of the places where it grows, *Britannica Virginiana*, *American*, or *Virginian Britanny.*

III. This Plant has layen in the Dark for many Ages, ever since the Times of the Ancient *Romans*, to whom it was well known, and by whom it was much used, as *Avicen*, *Dioscorides*, *Pliny*, *Galen*, *Ægineta*, *Ætius*, *Orobasius*, and others, testifie ; whereby it is manifest, that in Ancient times it was famous for its cures, which it performed in the *Roman* Armies, which in *Britanny* and the *Low Countries*, they laboured under, being chiefly the *Scurvy*, or Scorbutick Distempers, as *Diarrhæa's*, or Fluxes of the Bowels, Pains or Aches, Looseness of Teeth, *&c.* for which reason *Claudius Cæsar* carried it along with him to *Rome*, ordering it to be spread upon the Pageants of his Triumph, and to be hung up in the Capitol : And *Nero* himself took care of it afterwards for its Culture, by causing it to be Nurst up in the *Gardens* of *Rome.* But it seems when the *Goths*, and other Barbarous Nations overrun the *Roman Empire*, and the greatest part of Christendom, destroying and rooting up every thing they came near, that this Plant was buried or lost, in that Universal Destruction of almost all things, and

and has lain forgotten for above eight hundred Years, till this our Author discovered it anew.

IV. *The name of this Plant, Britannica*, came not, says *Munting*, from the Island of that Name, but its Etymology (says he) is taken from the *Frisian* Language, *Brit* signifying *Consolidare, vel firmare*, Tan, *Dens*, and *los, loose*, or a thing going forth, which is as much as to say, *to fasten loose Teeth*, the looseness of the Teeth and Gums being one of the Grand Symptoms of the Scurvy. But by that great Man's favour, we can give little credit to that far fetch'd *Etymology*, it being always a thing known, that the pride of the Ancient *Romans* was too great to invent, or investigate any thing whatsoever with a *Latin Name*, whose *Etymology* should arise from the *unpolished Particles* or *Words* of *Barbarous Nations*: Without doubt the *Romans* first finding it in *England* or *Britannia* in great plenty (tho' afterwards they might find it in *Friesland*, and other places of the Low Countries) gave it the Denomination from *the Name of the Country* they first found it in, and so called it ***Britannica, quasi Herba Britannica***, and this is that which I adhere to, and really believe.

V. All the Botanists of the last six or seven hundred Years, knew nothing at all of it: indeed they have named *Britannica*, but they never durst venture to fix it, so as to describe it, or figure it in Sculpture. And according to the several Ages, several kinds of Herbs or Plants, were taken to be this Plants of ours, as, *Bistorta, Betonica, Beccabunga aquatica, Bugla, Cochlearia, Heptaphyllon, Plantago aquatica, Primula veris, Tormentilla, Veronica*, and several others; all which were falsly, in their several Ages, said to be the *Britannica* of the Ancients: and the two famous *Baubins*, who spent their whole lives in the Botanick Study, made so great a mistake, as to take *Colubrina*, or a sort of *Snake-weed* for it: And *Cambden* makes our *English* Herborists to say, that *Scurvy-grass* was the true *Britannica Plinij*; than which nothing is more remote: without doubt this our *Hydrolapathum nigrum*, is the genuine or true *Britannica* of the Ancients, its description agreeing exactly in every particular with their descriptions, and performing every thing, and more than they ascribed to it,

VI. The Description. *The first of these, which is our* European *or* English *kind, has a Tuberous Root, large and roundish, sending forth from it almost round about, several Arms or* **Branches** *of a considerable* ***thickness, all which seem knobbed or gouty,*** *and ill shaped: From this Root rises up several* **Leaves** ***pretty large, not much unlike to those of the*** *largest Dock, but every way broader and longer, growing upright, and sharp pointed, sometimes of a blackish green, sometimes of a purplish green, and sometimes of a yellowish green color, sometimes spotted, and sometimes not. From the midst of these* **Leaves** *rises up, one pretty large Stalk, sometimes three or four* **feet** *high, of the shape and color of an ordinary Dock, except that sometimes it is inclining to a reddish green; it has a kind of Joints, whence spring forth Leaves like the former, but much less; and from the same places it sends forth manifold Branches, not much unlike to the Common Water Dock, but more numerous, larger and higher. The Flowers grow all over these Branches, almost from their very beginning, up even to their several Tops, in a kind of Case or Husk, each set upon a small, slender, short Footstalk, and of a brown color; which being ripe, the Seed is contained in Chaffy husks, not much unlike to other Dock Seed, especially that of the Water Dock.*

VII. The American *or* Virginian Britanny *has a Root consisting of a Head thick and gouty, but not of a round tuberous body like the former, from which Head grows downward into the Earth, several Arms or Branches, which are thick, brownish without, and yellowish within: from this Root rises up one upright Stalk of several feet high, which has also Joints upon it like knees, from whence come forth very long and large* **Leaves**, *strong and hard, not much unlike to Monks* Rhubarb, *but that these are much longer. The Stalk (which is very like that of other Docks) rises up oftentimes to a considerable* ***height, about the middle of which it sends forth a great number of Branches not much unlike the*** European, ***which have some few Leaves, like the others upon them, but much less. The Flowers grow in vast numbers upon all these Branches single, and each upon a small short Footstalk, even from their beginning up to their very tops, set in spaces at certain distances, in a seeming Uniform manner: After the Flowers are past away, the Seed comes, which is contained in a Chaffy Husk like the first, and differs not much from it, neither in shape, nor color, nor magnitude.***

VIII. *The Places.* It commonly grows in *Marshy and Fenny Grounds*, banks of Ditches, and moist Places, and in sides of Ditches, and watry Plashes which are between the Land Ground and Fen Grounds in several parts of this Kingdom: I found some of it in the Borders of the *Fens* in *Cambridgeshire* and *Huntingdonshire*, and in other moist and watry places. It grows plentifully also in *Friesland, Overyssel, Gelderland*, and ***Holland***, and possibly in many other places in the *Low Countries*.

IX. *The Times.* It shoots forth its Leaves in *April*; its Flowers in the latter end of *May*, or beginning of *June*; and its Seed is ripe in *August*. The Root is to be gathered in the beginning of the *Spring*, or in *Autum, viz.* in *March* or *September*; the Leaves and Flowers in *June* and *July*; and the Seed in the latter end of ***August***, or beginning of the next Month.

X. *The Qualities.* It is temperate in respect of heat or cold, but dry in the latter end of the second Degree. It is Astringent, Aperitive, Digestive, and Traumatick; Stomatick, Hepatick, Hysterick, Arthritick and Alterative.

XI. *The Specification.* It is peculiar for the curing the Scurvy, and all sorts of Fluxes of what kind, soever; and *Munting* says, it is a Specifick against Poisons and Convulsions.

XII. *The Preparations.* You may have therefrom, 1. *A liquid Juice.* 2. *An Essence.* 3. *A Decoction.* 4. *A Spirituous Tincture.* 5. *A Spirit by Fermentation.* 6. *A Balsam or Ointment.* 7. *The Fixed Salt.* 8. *The Pouder of the Root.*

The Virtues.

XIII. *The liquid Juice.* Given to five or six spoonfuls, or more, either by it self, or mixt with Red Port Wine, it strengthens and confirms the Stomach and Bowels, and powerfully resists the Scurvy in all its appearances, *viz.* with all its Symptoms, as Ulcers and Cankers in the Mouth, looseness of the Teeth, wandering pains, weakness and sickness at Stomach, *&c.* It is good also against all manner of Fluxes whatsoever, as Diarrhœa's, Dysenteries, Lienteries, Hepatick Fluxes, overflowing of the Terms in Women, *&c.* It is to be taken Morning and Evening for some time.

XIV. *The Essence.* It has all the former Virtues, besides which, it is said to cure Pleurisies, Quinsies, the Hemorrhoids, and all sorts of Inflammations; and is very powerful and successful in the cure of Hydropical Distempers, more especially if it is impregnated with the Fixed Salt of the same Plant. It is also an extraordinary Traumatick, for the curing of Wounds and old Ulcers, being taken Morning,

ing, Noon, and Night for ſome time, two or three ounces for a Doſe in a Glaſs of Wine.

XV. *The Decoction.* It has all the Virtues of the Juice and Eſſence, but not all out ſo powerful; it is an excellent Traumatick, and Antiſcorbutick, and prevails againſt ſpitting and piſſing of Blood, and all other Fluxes of Blood whatſoever.

XVI. *The Spirituous Tincture.* It has all the Virtues of the liquid Juice and Eſſence, a famous thing againſt the Scurvy in a cold and moiſt habit of Body, a very great ſtomatick, ſtrengthening that Viſcus in all its faculties: It is a kind of *Panacæa*, and a Specifick againſt Convulſions, and Poiſons, yea the Plague it ſelf; it ſtops all ſorts of Fluxes, and ſtrengthens the *Viſcera* to a Miracle: but it (as alſo the other Preparations) ought not to be given to Coſtive Bodies, by reaſon of their Aſtringency.

XVII. *The Spirit.* It is made of the Juice by Fermentation: and is uſed (being dulcified) as a Cordial Antiſcorbutick, and to comfort and ſtrengthen the Bowels in Hydropick and Conſumptive Perſons, and ſuch as have been in long Fluxes: being held in the Mouth, it ſtrengthens the Gums, and faſtens looſe Teeth. Doſe from half an ounce to an ounce twice a day, or upon any fainting or illneſs.

XVIII *The Balſam*, or *Ointment.* It cleanſes, incarnates, and heals ſingularly well; it cures Green Wounds at two or three times dreſſing, by reaſon of its Stypticity. Applied to the Hemorrhoids, and the Gout, it eaſes the pains of thoſe Parts.

XIX. *The Fixed Salt.* It is ſingular againſt Quinſies, Pleuriſies, and other Inflammations of the *Viſcera*, opens Obſtructions of the Reins, provokes Urine, and abſorbs the Acid Humor, which is the cauſe of Fluxes of the Bowels; it alſo helps to carry off the Watry Humor in Dropſies. Doſe from fifteen to thirty grains, in any Homogene Liquor, Decoction, *&c.* proper againſt the ſame Diſeaſes, two or three times a day.

XX. *The Pouder of the Root.* It may be given from half a dram to two drams, Morning and Night, in any Flux of the Bowels, whether Simple or Bloody; it is alſo good againſt the Terms in Women, ſpitting and piſſing of Blood, or any weakneſſes of thoſe parts; it ſtrengthens the Stomach and reſiſts Vomiting. It may be given in Port Wine, or other Vehicle proper againſt the Diſtemper. Strewed upon moiſt and running Ulcers, it dries up the Humor, and diſpoſes them to heal.

XXI. *The American* has the ſame Qualities, Specification, Preparations, Virtues and Uſes with the former.

CHAP. LXXXVIII.

BROOKLIME.

I. *THE Names.* It is called in *Greek*, Ἀναγαλλὶς ὑυδέγς: In *Latin*, *Anagallis aquatica*, and *Becabunga* (from the *German* Word:) and in *Engliſh*, *Brooklime*, and *Water Pimpernel*.

II. *The Kinds.* There are ſeveral Kinds of this Plant, as, 1. *Anagallis Aquatica vulgaris*, *Becabunga*, as *Parkinſon* calls it, *Common Brooklime*, which Mr. *Ray* calls *Anagallis rectius Veronica aquatica minor*, *folio ſubrotundo*; *flore cæruleo*, as *J. Bauhin.* 2. *Anagallis rectius Veronica aquatica folio rotundiore major*, five *Becabunga major*, the greater Brooklime, and greater round-leav'd Brooklime. 3. *Anagallis rectius Veronica aquatica major folio oblongo crenato*, great Brooklime, with a long dented Leaf. 4. *Anagallis aquatica rectius Veronica aquatica minor foliis oblongis non crenatis*, The leſſer Brooklime with a long leaf not dented. There are ſeveral other Kinds, as that *foliis Pulegii*, *foliis Alſines*, and *Angaſtifolia*, but not being common with us I forbear them.

III. The Deſcription. *Our* Vulgar Brooklime *has a Root white, low, and creeping, with fine ſtrings ſpringing therefrom at every Joint; from whence riſe up flat, thick Stalks, which are roundiſh, and divided*

divided into ſeveral Branches, having on them thick, ſmooth, and broad deep green Leaves, ſomewhat like to thoſe of Purſlane, but of a deeper green color, and ſet upon the Stalks by couples. The Flowers grow upon ſmall, long, tender Footſtalks, which thruſt themſelves forth from the Boſom of the Leaves, of a perfect blew color, and not much unlike to the Leaves of the Flowers of the Land Pimpernel, conſiſting of five ſmall round pointed Leaves apiece, which being gone, in a ſhort time after comes a ſort of ſmall Seed.

IV. *The* Greater Brooklime; *this differs nothing from the former, but in having larger and rounder Leaves, and a paler blew colored Flower.*

V. *The* Greater long leav'd Brooklime; *this differs little, or almoſt nothing from the former, but in the leaf, which is longer pointed, and dented about the edges; and in the Flowers, which are of a pale whitiſh blew color.*

VI. *The* Leſſer long leav'd Brooklime, *this has a Root conſiſting of a ſmall buſh of White Fibres, but not running far, from whence ſpring many ſmooth, pale, green Leaves, ſmall at the bottoms, but broad and round at the ends, long and not dented, which lying upon the ground, are almoſt like thoſe of the Common Field Daiſy: the Stalk is round, about a Foot, more or leſs, high, with divers ſmaller Leaves thereon, ſet one by one up to the Top, from whence come forth many branched Spikes of white Flowers, conſiſting of one Leaf divided into five parts, growing at firſt as it were in an umble, but afterwards more ſpike faſhion'd.*

VII. *The Places.* They grow by River ſides, ſmall running Brooks, ſtanding Waters, and Ditch ſides. The laſt of them grows in the *Marſhes* of *Dartford* in *Kent*, alſo between *Sandwich* and *Sandown-Caſtle*, and in the Ditches on this ſide *Sandwich*.

VIII. *The Times.* They all flower in *June* and *July*, and yield their Seed in *Auguſt*.

IX. *The Qualities.* They are hot and dry in the ſecond Degree, Digeſtive, Diſcuſſive, Attractive and Diuretick; Stomatick, Hepatick, Nephritick, Hyſterick, Alterative, Spermatogenetick.

X. *The Specification.* It is peculiar againſt the *Scurvey*, to cleanſe the Blood, and open Obſtructions of the Womb.

XI. *The Preparations.* You may make therefrom, 1. *A Diſtilled Water.* 2. *A Spirit.* 3 *A liquid Juice.* 4. *An Eſſence.* 5. *A Spirituous Tincture.* 6. *An Acid Tincture.* 7. *A Saline Tincture.* 8. *An Oily Tincture.* 9. *A Fixed Salt.* 10. *A Cataplaſm.*

The Virtues.

XII. *The Diſtilled Water from the whole Plant.* It is good againſt Stone and Gravel in the Reins, Ureters, and Bladder, opens Obſtructions of the Urinary Paſſages, and is uſed as a Vehicle, to convey the other Preparations of the Herb in. Doſe five or ſix ounces twice or thrice a day.

XIII. *The Spirit.* It is made as Spirit of *Scurvy-graſs.* It is good for a weak Stomach, rectifies Crudities, and removes Nauſeouſneſs and Vomiting, and other Diſtempers of that Bowel, and therefore is a very effectual thing againſt the Scurvy, which the *Greeks* call the Stomach Diſeaſe, as having its Root and Foundation there. Doſe thirty or forty drops in Wine, or ſome other proper Vehicle, Morning and Evening chiefly; but it may be given at other times of the Day upon any occaſion of Stomach ſickneſs. It is an excellent thing in cold Conſtitutions; but ſuch as are of a hot habit of Body are to forbear it.

XIV. *The liquid Juice.* It is ſaid to be effectual to break the Stone in Reins and Bladder (if made of a gritty friable ſubſtance) and to expell it, for it opens all the Urinary paſſages, and powerfully provokes Urine, giving eaſe in the Strangury, Diſury, and other like affections of thoſe parts. Doſe from two ſpoonfuls to ſix, Morning and Evening, in a Glaſs of Ale, Beer, Mead, or Wine.

XV. *The Eſſence.* It has all the Virtues of the Liquid Juice, beſides which it is profitable againſt Ulcers of the Bladder, to provoke the Terms in Women, and expell the Dead Child. It is a ſingular thing againſt the Dropſie *Sarcites*, if its impregnated with the Fixed Salt of the Plant, and be daily given in all the Liquor the Patient drinks. It purifies, or cleanſes the Blood from all ill humors, and perfectly eradicates the Scurvy in a cold habit of Body, Univerſals being alſo premiſed. It is beſt taken in the Spring time, and Fall of the Leaf, becauſe then the Blood and Humors are thin and fluxile, and more apt to paſs a depuration. Doſe from one ounce to three ounces Morning and Evening.

XVI. *The Spirituous Tincture.* It has the Virtues of the Spirit aforementioned, at Sect. XIII. aforegoing, but much more powerful; and may be given from twenty drops to forty in any proper Stomatick Vehicle, or Wine.

XVII. *The Acid Tincture.* It is a potent Antiſcorbutick, and may ſafely be given as well in a hot as a cold Conſtitution. It powerfully opens Obſtructions, provokes Urine, and the Courſes, breaks and diſſolves the Stone, expells Tartarous Matter out of the Body, helps in Rheumatiſms and the Gout, and gives eaſe in wandring pains running over the whole Body. Doſe ſo many drops at a time, as may make a Glaſs of Ale, Beer, Mead, or Wine gratefully ſharp, ſo as if the Juice of an Orange was ſqueezed into it.

XVIII. *The Saline Tincture.* This, tho' given inwardly, powerfully provokes Urine, and opens Obſtructions, yet it is moſtly uſed in outward applications, as to diſcuſs Swellings in the Legs in the Dropſie, by fomenting them therewith; to eaſe pains of the Gout, and to prevent an incipient Gangreene. It clears the skin of Scurf, Morphew, and ſuch other like defilements, if often waſhed therewith.

XIX. *The Oily Tincture.* It is good againſt the Palſie, and Convulſions of the Nerves, being often anointed upon the Parts affected. It eaſes all ſorts of Pains in any Part, proceeding from a cold Cauſe; and being applied to moiſt Wounds, it defends them from Accidents. Being well anointed upon any Tumor or Part inclining to a Mortification, it prevents it, and conduces much to the Cure.

XX. *The Fixed Salt.* It is Deobſtructive and Diuretick, bringing away much Water in Hydropick Perſons, and carrying off much of the Morbifick cauſe of the Scurvy, by Urine, being given in White Port, or *Rheniſh Wine*, or ſome other proper Vehicle, three, four, or five times a day. Doſe from fifteen grains to half a dram.

XXI. *The Cataplaſm.* It is made of the Leaves or Herb, boiled, and beaten in a Stone or Wooden Mortar. Applied to Swollen Legs, or any other part Tumified with the Dropſie, it is ſaid to diſcuſs or abate the Tumor. If it is made into a Cataplaſm, *with the addition of Hogs Lard, the Pulp of Marſh-mallow Roots, and the pouders of Fenugreek ſeed and Linſeed*, and be applied warm, it takes away any Swelling in Arms or Legs; and is alſo powerful in defending Wounds, ſo as to prevent their Apoſtumating, and to prevent any other ill accident which may happen to them. *Farriers* ſometimes uſe it alſo in curing Horſes, to remove Tumors, and heal their Scabs, with other like Diſeaſes incident to them.

CHAP.

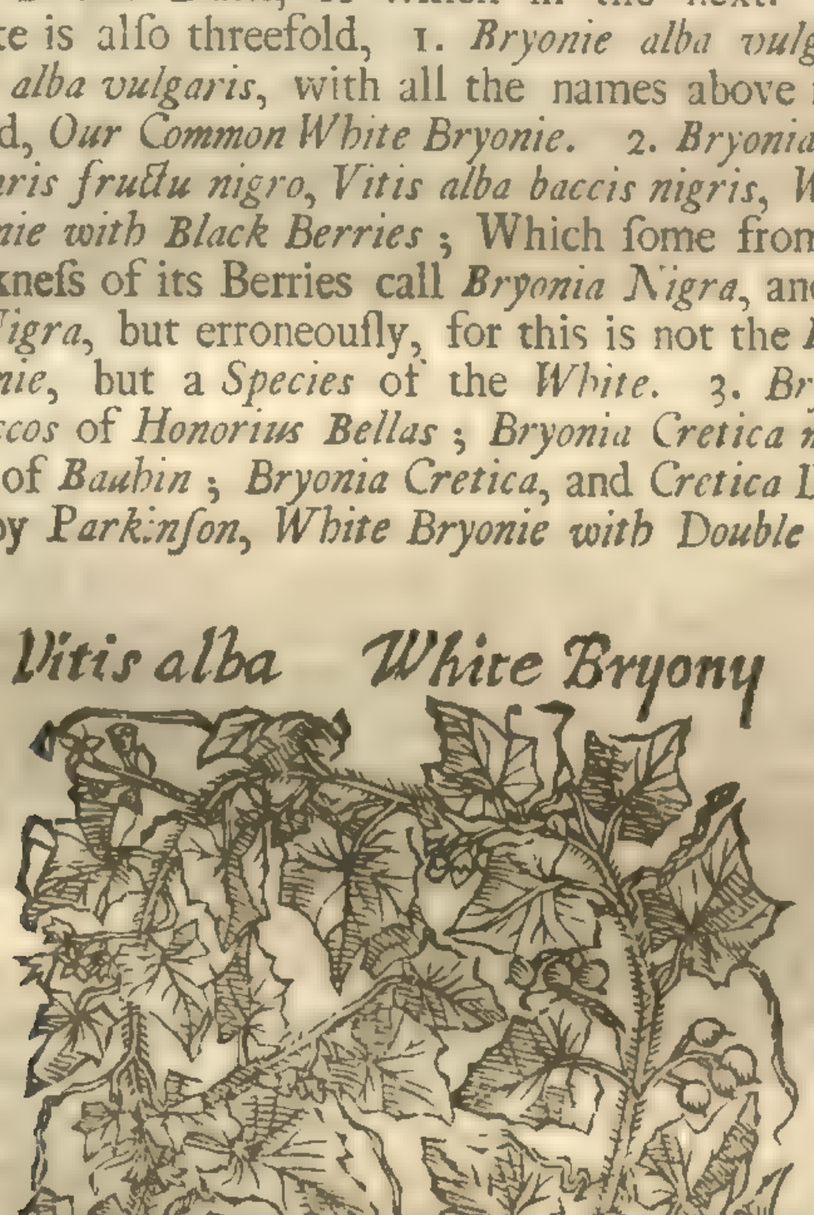
CHAP. LXXXIX.

BRYONIE White.

I. *THE Names.* It is called in *Greek* Ἄμπελος λευκὴ, i. e. *Vitis alba*, not that it is a Vine, but becauſe it is ſomething like one. Alſo Βρυωνία λευκὴ, ἀ Βρύω, i. e. *emano, ſcateo*, from putting forth, becauſe it puts forth many Branches and Tendrells, whereby it climbs up the adjacent Buſhes, Hedges, Trees, or other things adjoining to it. It is alſo called by ſome ψιλοθρον, becauſe the Seeds or Grains of it were formerly uſed to take away Hair. In *Arabick* it is called *Feſire*, *Alfeſire*, *Feſſera*, and *Alfeſſera*, : In *Latin*, *Bryonia*, and *Bryonia alba*, *Vitis alba*, *Vitalba*, *ſic dicta*, *non quod ſit Vitis*, *ſed quod ei ſimilis*, as aforeſaid: alſo *Viticella*, *Roraſtrum*, *Apiaſtellum* : In *Engliſh*, *Bryonie*, *White Bryonie*, and *Wild Vine*. The Uvæ or Berries are many times called in *Engliſh*, *Tettar Berries*, becauſe of their Effects in curing Tettars.

II. *The Kinds.* There are two principal Kinds of *Bryonie*, 1. *The White*, of which in this Chapter. 2. *The Black*, of which in the next. The White is alſo threefold, 1. *Bryonie alba vulgaris*, *Vitis alba vulgaris*, with all the names above mentioned, *Our Common White Bryonie*. 2. *Bryonia alba vulgaris fructu nigro*, *Vitis alba baccis nigris*, *White Bryonie with Black Berries* ; Which ſome from the Blackneſs of its Berries call *Bryonia Nigra*, and *Vitis Nigra*, but erroneouſly, for this is not the *Black Bryonie*, but a *Species* of the *White*. 3. *Bryonia Dicoccos* of *Honorius Bellas* ; *Bryonia Cretica maculata*, of *Bauhin* ; *Bryonia Cretica*, and *Cretica Dicoccos*, by *Parkinſon*, *White Bryonie with Double Berries*.

Vitis alba White Bryony



III. The Deſcription. *The* Common White Bryonie, *has a Root which grows to an exceeding largeneſs, weighing ſometimes half an hundred weight, and of the bigneſs of a Child of a year old, with many* [illegible] *Joints with the Leaves come forth ſmall Tendrells or Claſpers, which twine about whatever ſmall thing is next it : at the ſeveral Joints alſo with the Leaves and Claſpers (eſpecially towards the tops of the Branches) come forth a long Stalk, bearing thereon many whitiſh Flowers in a long Tuft, as it were in a Cluſter, conſiſting of five ſmall Leaves apiece, laid open like a Star, after which come the Berries, ſtanding more open or ſeparate one from another than in a Cluſter of Grapes : they are green at firſt, but very red when they are through ripe, about the bigneſs of Nightſhade berries ; of no good or pleaſant ſmell, and of a loathſom taſte provoking to Vomit, or cauſing a nauſeouſneſs in the Stomach.*

Bryony or Wild Vine

IV. The Common White Bryonie with Black Berries, *ſeems to be abſolutely the ſame with the former, ſave, that the Root of this is of a pale yellow color on the inſide, and ſomewhat browniſh on the outſide ; and the Berries after their greenneſs is paſt, change not into a red color, but into a perfect black, when they are through ripe ; but as to all other parts of the Plant, as in its long, tender, and climbing Branches, form of its Leaves, Tendrels or Claſpers, and Color, Shape, Magnitude and Mode of its Flowers, it is exactly the ſame with the former, ſo that one cannot be known from the other.*

V. *The* Bryonia dicoccos, *has a Root very long, but never growing to be bigger than a Mans Arm, of a browner color on the outſide, and not ſo white within as the common. From this Root ſprings forth many*

many long, rough, trailing Branches, in the ſame manner like the former in all reſpects, from which ſpring claſping Tendrels, *winding it ſelf upon any thing which ſtands next it, as the other does. It has broad Leaves, with ſuch diviſions therein, as the other have, but that they are ſomewhat ſmaller, greener, and ſtriped with white lines through the middle, as likewiſe in the Veins which go to the Corners. The Flowers are ſomewhat greater than the former, of a pale whitiſh color, ſtanding every one upon a little longer Footſtalk, which being paſt, there comes Berries in their places, which are at firſt green, but red when full ripe, and differing in form from the others, for ſtanding Semicircular upon the Stalks they are joined at the bottom, as if it were but one Berry, but are parted at the tops into two parts, wherein are contained two Seeds, from whence aroſe the Sirname of* Dicoccos.

VI. *The Places.* The *firſt* grows on Banks, or under Hedges where are Trees, Shrubs, and Quickſets, in many places throughout the Kingdom. The *ſecond* is found in like places, but where the former with red Berries is not, and is found in ſome places in *Germany*, *Bohemia*, &c. The *laſt* grows plentifully in *Candia*, from whence *Honorius Bellus* ſent the Seed to *Cluſius*, and others.

VII. *The Times.* They all flower in the Month of *July* and *Auguſt*, ſome earlier, ſome later, according to the Clime they grow in, and the warmth or coldneſs of the Seaſons of the Year; and their Fruit or Seed is ripe in ſome little time after.

VIII. *The Qualities.* They are hot and dry in the third Degree, Attractive, Abſterſive, Cephalick, Nephritick, Hyſterick, Arthritick, and Cathartick, purging as well Choler as Phlegm, and Watry Humors.

IX. *The Specification.* It is a peculiar thing againſt the Dropſie, and Kings-Evil.

X. *The Preparations.* You may make therefrom, 1. *A Diſtilled Water of the Root, Berries, and whole Plant.* 2. *A Juice of the Berries.* 3. *A Juice of the Root.* 4. *An Eſſence of the Root.* 5. *A Decoction of the Root.* 6. *A Syrup of the ſame.* 7. *A Pouder of the Root.* 8. *An Electuary of the Root.* 9. *A* Fœcula *thereof.* 10. *A Peſſary of the Root.* 11. *A Saline Tincture thereof.* 12. *A Bathe of the Root, and whole Plant.* 13. *A Cataplaſm of the Root.* 14. *An Oil*, or *Ointment.*

The Virtues.

XI. *The Diſtilled Water of the whole Plant.* It is good againſt Scurf, Morphew, Leproſie, Mangineſs, Spots, Freckles, Tanning, Sun-burning, *&c.* the Face and Skin being often waſhed therewith.

XII. *The Juice of the Berries.* It has all the ſame Virtues, but is much ſtronger, and is ſaid to be a peculiar thing for the cure of Tettars and Ring-worms, Herpes, Scabs, Itch, and other breakings out.

XIII. *The Juice of the Root.* It is thus Made or Extracted. *In* April *take away the Earth, and uncover the Root; which done, make a deep but narrow overthwart cut or gaſh into it; and put in a Gooſe Quill a little under the Slit, letting the Quill lye ſloping or leaning downwards, when thruſt into the Root; but firſt make a hole with your Knife to get in the Quill; then placing a Receiver under the Quill, you will get a great ſtore of the Juice, which will drop thereinto.* A ſpoonful hereof taken by ſuch as are troubled with Fits of the Mother, it helps them; and it is likewiſe profitable againſt the Apoplexy, Epilepſie, Palſie, Vertigo, and other like Diſeaſes of the Head and Brain, which it performs by a Specifick Virtue, which it has in attracting or drawing away Flegm, and Rheumatick Humors which oppreſs and afflict thoſe parts. It may be alſo uſed as an Errhine up the Noſtrils, by which way alſo it purges the Head and Brain admirably, evacuating all ſuch Superfluous Humors, which cauſe Lethargies, Megrims, Head-ach, or any of the aforenamed Diſeaſes afflicting thoſe parts.

XIV. *The Eſſence.* It has all the Virtues of the aforementioned Juice, and may be given from half an ounce to an ounce, more or leſs, according to the age and ſtrength of the Patient. It is a peculiar thing againſt the Dropſie, Kings-Evil, Rheumatiſms, and Gout; but it purges with great Violence, troubling the Stomach, ſo that it works both upwards and downwards, and therefore according to the Opinion of Authors, it ought to be corrected with Ginger, Cinnamon, Winters Cinnamon, Nutmegs, Cloves, Pepper, Juice of Quinces, *&c.* It is very profitable againſt Watry Humors, which it evacuates abundantly, both by Vomit and Stool, and therefore is a peculiar thing againſt the Dropſie, *&c.* It may be mixed with White Port Wine, and ſo drank. It opens Obſtructions of the Urinary parts, provokes Urine, and cleanſes the Reins and Ureters from Sand, Gravel, Slime, and other Viſcous and Tartarous Matters apt to be lodged in thoſe parts. It opens Obſtructions of the Spleen, and takes away the hardneſs and ſwelling thereof. It is good (being outwardly applied) to cleanſe the Skin of Scurf, Morphew, Leproſie, Scabs, Itch, Mangineſs, Herpes, Tettars, Ring-worms, Freckles, Lentils, black and blew Spots, which come from falls, bruiſes, and the like, and diſſolves new Swellings, and expells the dead Child.

XV. *The Decoction of the Root in Wine.* It has all the Virtues of the Eſſence, but not full out ſo powerful, and therefore ought to be given in a larger Doſe, as from one ounce to two, three, or four, according to age and ſtrength. It is an excellent thing againſt Hyſterick Fits, and Vapors in Women, for it opens Obſtructions of the Womb powerfully, and facilitates the birth of Women in Travel, but you ought to be ſure the time is near, leſt it do miſchief; let it be corrected with hot Spices in the making, as before directed, becauſe they alſo promote this end.

XVI. *The Syrup.* It may be made either of the Juice, Eſſence, or Decoction, according to which, it will be of more or leſs ſtrength. It has all the Virtues of thoſe things of which it is made, but not altogether ſo effectual, becauſe of its being clogged with ſuch a quantity of Honey or Sugar, which is neceſſary to bring it into a Syrup. But it is better for Women and Children, and Quæſie Stomachs, becauſe of its pleaſantneſs in taking. It is good againſt Coughs, Colds, ſhortneſs of Breath, Aſthma's, and kills Worms in the Body: Doſe, one, two, or three ounces in a Glaſs of Wine.

XVII. *The Pouder of the Root.* It has the Virtues of the Juice and Eſſence, but is thought to work ſtronger: being taken in White Port Wine, from a a ſcruple to a dram, it is good againſt the bitings of Venomous Creatures, and kills Worms in Children; prevails againſt the Gout, Rheumatiſm, Dropſie, and King's-Evil, and provokes the Terms in Women, but it ought not to be given to Women with Child, becauſe it may induce miſcarriage or Abortion. If it is thus compounded, it becomes a famous Medicament. ℞. *Bryonie Root in fine pouder a pound: Scammony twelve ounces: Cambogium in pouder eight ounces: Liquorice in pouder ſix ounces: Aurum Vitæ four ounces: mix all together.* Doſe from ſixteen Grains to half a Dram. It is a famous thing for the cure of the Gout, Sciatica, Rheumatiſm, Dropſie, Jaundice, and King's-Evil.

Where

Where a Rheumatiſm has been ſo vehement that the Patient has roared out Night and Day with the Vehemency and Extremity of the pain, and has lain Bedrid for two whole Years together, not being able to uſe Hand or Foot, or in the leaſt help themſelves, not ſo much as to put their Hand to their Mouths; this Medicament, or Compoſition, being given but five or ſix times, has perfectly reſtored them, beyond all expectation. I commend it againſt a Rheumatiſm, as a Compoſition which has no equal in the whole Republick of Medicine.

XVIII. *The Electuary.* ℞. *Pouder of Bryonie Roots, four ounces: Scammony in pouder, Liquorice in pouder, of each two ounces: Cloves, Ginger, in pouder, of each one ounce: Nutmegs in pouder, Zedoary, of each half an ounce: Tartar vitriolate two ounces and half: Honey clarified, thirty ſix ounces: mix and make an Electuary.* It cures the Scurvy, Dropſie, and Gout; and is an admirable thing againſt the King's-Evil: It produces the Terms in Women, and expels the Dead Child; and cleanſes the Stomach, and other Bowels, of Cold, Raw, Windy, Slimy, Tartarous and Griping Humors: Doſe, in a Bolus, from one dram to two drams in the Morning faſting.

XIX. *The Fæcula.* It has the Virtues of the Juice and Eſſence, but not altogether ſo violent; it may be given, ſay Authors, from five to ten grains; but in ſtrong Bodies you may give it from ten grains to twenty: mix it with Honey, the Pulp of a Prune or Roaſted Apple, or ſome ſuch like ſubſtance, and ſo let it be taken in the Morning: being mixed with the Diſtilled Water or Eſſence, or any other proper Waſh, it cleanſes the Skin, and takes away Wrinkles, Freckles, Lentils, Spots, black and blew Marks, Tanning, Sun-burning, and the like; let it be laid upon the Skin, and ſuffered to dry on.

XX. *The Peſſary.* It is made of the ſolid ſubſtance of the Root: being put to the Womb, it provokes the Terms in Women, opens Obſtructions of the Womb, and educes both Birth and After-birth, as alſo the Dead Child.

XXI. *The Saline Tincture.* Taken inwardly to a dram, or more, in ſome proper Liquor, it provokes the Terms, and facilitates the Birth: and outwardly applied, it removes all the Vices and Deformities of the Skin, as effectually as either *Eſſence* or *Fæcula*. You muſt waſh therewith, and ſuffer it to dry on, repeating it ſeveral times a day, if the Diſeaſe is inveterate.

XXII. *The Bath of the Root and whole Plant.* It is peculiar againſt all external Defædations of the Skin; as alſo to open Obſtructions of the Womb, and educe the Terms, and to cleanſe it from all other Recrements of Humors, the Patient ſitting for ſome time therein, and repeating it, if need be.

XXIII. *The Cataplaſm of the Root.* Being bruiſed and applied Cataplaſm-wiſe to any place where Bones are broken, it helps to draw them forth: and being mixt with a little Wine, and applied, it breaks Boils, and draws forth Puſhes, and is good againſt Felons and Whitloes, which infeſt the Fingers ends, and Roots of the Nails. It is alſo good to cleanſe the Skin from Morphew, Leproſie, Scabs and Mangineſs.

XXIV. *The Oil* or *Ointment.* It is made by boiling the bruiſed Root in Oil Olive, or Hogs-Lard, or Oil mixt with Beef or Mutton Suet, *&c.* they being anointed with it, diſſolve or diſcuſs recent Tumors, help Contuſions, and take away black and blew Marks which come from blows or falls; and withal remove moſt of the other deformities of the Skin, if applied for ſome reaſonable time.

CHAP. XC.

BRYONIE Black.

I. THE *Names.* It is called in *Greek* Ἄμπελος μελαίνα, ἢ Βρυωνία μελαίνα: In *Latin*, *Vitis nigra*, and *Bryonia nigra*: In *English*, *Black Bryonie*.

II. *The Kinds.* There are three kinds of this: 1. Ἄμπελος ἀγρία, and μελαίνα, *Vitis Sylveſtris*, and *Vitis nigra*, *Bryonia nigra*, *Bryonia nigra Sylveſtris*, *Bryonia nigra communis*. *Sigillum Sanctæ Mariæ*, Common Black Bryonie: but why it ſhould be called *Vitis Sylveſtris*, or *Wild Vine*, I know not, becauſe there is a *Vitis Sylveſtris*, which is *Vinifera*, and differs but little from the true manured Vine, but that it grows Wild, and bears few or no Grapes; but *Pliny* I ſuppoſe was the cauſe of it, who, *lib.* 22. *cap.* 1. being not able to diſtinguiſh them, confounded 'em, and made them all one. 2. *Bryonia nigra Baccifera*, Black Bryonie with [illegible]ed Berries: This *Bauhinus* in his *Prodromus* calls *Bryonia Sylveſtris Baccifera*, and in his *Pinax*, *Bryonia lævis*, five *nigra Baccifera*. 3. *Bryonia nigra Dioſcoridis*, *Vitis nigra*, (*ita dicta ab acinis, radicque nigris, & quod Vitis ſimilitudinem habet:*) *Vitis Chironia*, The true Black Bryonie of *Dioſcorides*.

Vitis Nigra. Black Bryony

III. The Deſcription. *It has a Root which is brownish, or enclining to blackish on the outside, in ſome places by long ſtanding, but white within; it is large if it grows in moiſt grounds: but much ſmaller and whiter, if it grows in dry, barren and ſtony places, as* Dalechampius *ſays, ſomewhat hot, and of a ſharp taſte: from this Root ariſes long trailing Branches, without any cleſping tendrils; but by reaſon of the vaſt number of Branches, and their tenderneſs, it takes hold of, and claws upon thoſe things which ſtand next to it, tho' eaſie to be looſed therefrom, contrary to the other kinds. The*

Leaves are ſomewhat broad, and like unto the Leaves of the rough or prickly Bindweed, *and terminate in a ſharp point. The Flowers come forth at the Joints upon long Stalks, many cluſtering together, in long, thin, or ſparſed Cluſters, each one conſiſting of five ſmall white Leaves, and after they are fallen, there come in their places ſmall Berries, firſt green, and red when they are ripe, and ſometimes changing a little blackiſh as they grow old.*

IV. *The* ſecond Kind, *has a great thick Root, long, and not much unlike the former, having a clammy kind of Juice: from which riſes up many, long, and ſquare Branches, more hard and woody than the other, and without any Claſpers at all. The Leaves are ſomewhat like to thoſe of the* Great White Bindweed, *of a ſhining color, a little unevenly dented about the edges, and ſtanding upon long Footſtalks: towards the tops of the Stalks at the Joints, with the Leaves come forth white Flowers, every one ſtanding on a ſhort Stalk, which afterwards give five ſingle Berries, green at the firſt, and red when they are ripe, not much leſs than Cherries, in which are contained four or five ſomewhat large, round, and black Seed.*

V. *The* third *and* laſt Kind, *has a Root ſomewhat great and blackiſh on the outſide, but of a yellowiſh color within, and full of a clammy moiſt Juice, which will cleave to your Fingers: whence comes forth many long green Branches, on which grow ſeveral broad Leaves, ſomewhat long pointed, and not divided on the edges at all, of a ſad or dark green color, having at the Joints, with the Leaves, claſping tendrels, by which it takes hold, and winds it ſelf about any thing which ſtands next to it. Towards the tops come forth long Bunches of whitiſh Moſſie Flowers, which being paſt, there come Berries, which are green at firſt, and black when they come to ripeneſs.*

VI. *The Places.* The firſt of theſe grow on Bankſides, and under Hedges, and Woody places in many places throughout this Kingdom. The ſecond grows in ſeveral places in *Germany*, as in *Heſſia*, *Saxony*, *Weſtphalia*, *Pomerania*, and other places where the White grows not: the laſt grows in *Græcia*, *Italy*, *Spain*, and ſeveral Southern Countries, and is not with us unleſs nouriſhed up in *Gardens*.

VII. *The Times.* They ſpring in *March*, and flower in *May*, *June* and *July*, and their *Fruit* is ripe in *Auguſt* and *September*.

VIII. *The Qualities.* They are the ſame with the White, but much weaker in their Cathartick Virtue, as in purging Flegm, Choler, and Watry Humors.

IX. *The Specification.* It prevails againſt the Dropſie, King's-Evil, Diſeaſes of the Womb, and Defilements of the Skin, whatſoever.

X. *The Preparations.* 1. *The roaſted Root.* 2. *The Juice.* 3. *The Eſſence.* 4. *The Decoction.* 5. *The Pouder.* 6. *The Cataplaſm.* 7. *The* Fœcula.

The Virtues.

XI. *The roaſted Root.* *Matthiolus* ſays, that the Root of our Common *Black Bryonie* being roaſted in the Embers, and eaten, is a powerful Medicine to increaſe Luſt, provoke Venery, and ſtimulate the Inſtruments of Generation to that act: but *Lobel* ſharply reproves him for it, as not believing it.

XII. *The Juice.* Mixed with Wine and Honey, and drunk, it is good againſt the King's-Evil: and ſimple of it ſelf, it cleanſes the Skin of Spots and Marks, Morphew, Scurf, Leproſie, Tetters, Ring-Worms, *&c.* it eaſes Pain, ſtrengthens the Nerves, diſcuſſes Contuſions, *&c.* Doſe half an ounce, to one ounce, or more.

XIII. *The Eſſence.* It purges Flegm, and Watry Humors, provokes Urine, and is good againſt the Falling-ſickneſs, Palſie, Hyſterick Fits, Vapors from the Spleen and Womb, with other like Diſeaſes of thoſe parts. It is prevalent againſt the King's-Evil, all ſorts of Kernels, Knots, and hard Swellings in the Neck and Throat, or other parts. Doſe, two, three, or four ſpoonfuls in a Glaſs of Wine, according to age and ſtrength.

XIV. *The Decoction in Wine.* It has the Virtues of the Eſſence, but not altogether ſo powerful, and may be taken to ſix or eight ounces: it is prevalent againſt the Dropſie, Jaundice, and King's-Evil, and ſuch other Diſeaſes as proceed from the Plenitude and Corruption of Humors.

XV. *The Pouder.* It is made of the Root, and may be given from a ſcruple to two ſcruples, to purge away Cold, Serous Flegmatick, and Watry Humors, and to remove the Original Cauſe of the King's-Evil: It has the Virtues of the Eſſence.

XVI. *The Cataplaſm.* It is made of the Root beaten to a Pulp in a Mortar, and mixed with a little Honey. This being laid or ſpread upon Sheeps Leather, whilſt it is yet freſh and green, takes away black or blew Marks, and all Scars and Deformities of the Skin, ripens and breaks hard Apoſtems, draws forth Splinters, Thorns, and broken Bones, diſſolves congealed Blood; and being applied to the Hips, and Huckle-bones in the Sciatica, Shoulders, Arms, or other parts, where there is great Pains and Weakneſs, it effectually removes the ſame in a very ſhort time: *Gerard.* And applied to any place out of Joint, it is good to eaſe the Pain, to conſolidate and ſtrengthen the Nerves, that they may not eaſily again be put out of their places. *Parkinſon.*

XVII. *A Cataplaſm of the Leaves.* Being bruiſed and ſprinkled with Wine, and applied to the galled Necks of Oxen, which are hurt with the Yoke, it heals them: I ſuppoſe it will heal Gallings and Sores in Mankind alſo, being applied.

XVIII. *A Cataplaſm of the Berries.* It removes Sun-burnings, Tanning, Spots, and other blemiſhes of the Skin, takes away black and blew Marks, which come from falls, blows, bruiſes, *&c.* being applied to them.

XIX. *The Fœcula.* It has the Virtues of the Pouder and Eſſence, is very powerful to the purpoſes intended; it is prevalent againſt *Pſora*, or Scabs, Mangineſs, Leproſie, King's-Evil, Dropſie, *&c.* Doſe. It may be given in Wine or Broth from ten grains to a ſcruple, *plus minus*, according to the age and ſtrength of the Patient.

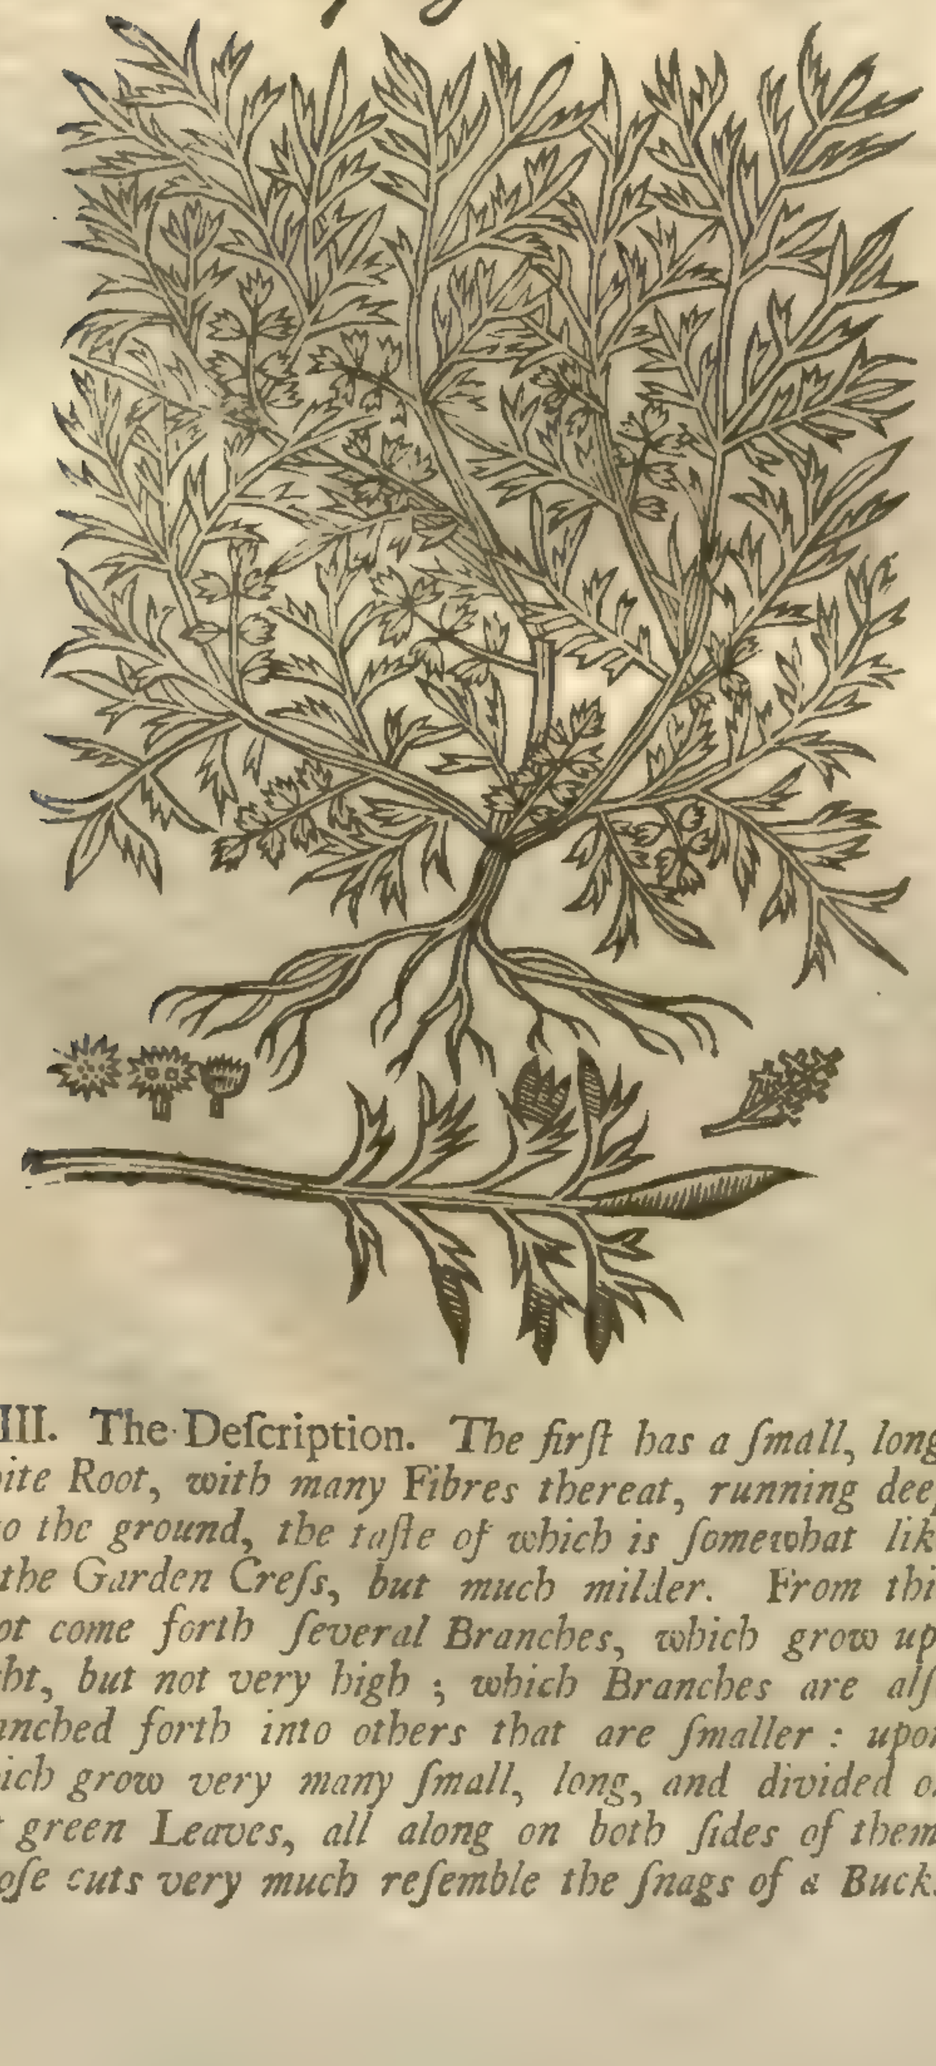
CHAP. XCI.

BUCKS-HORN.

I. *THE Names.* It is called in *Greek* Κορωνόπους, from the ſimilitude it has to a Crows foot: but the true *Greek* name is Ἀμβροσία: the *Latins* call it *Cornu Cervi*, or *Cervinum*, *Coronopus Ruellij*, *Herba Stella*, (both, from the form of the Leaves) *Sanguinaria* and *Sanguinalis* (from its ſtopping of Blood:) *Harenaria*, (from the Sandineſs of the place it grows in:) and *Naſturtium Verrucarium*, (from the likeneſs of its Seeds to Warts:) And we in *Engliſh* call it, *Bucks-horn*, *Swines Creſſes*, and *Wart Creſſes*.

II. *The Kinds.* It is twofold, 1. *Coronopus recta Ruellij*, *Ambroſia Matthioli*, Upright Bucks-horn, or

or Wart Cress. 2. *Coronopus repens Ruelii, Pseudocoronopus Dodonæi, Cornu Cervi alterum Vulgi*: Creeping Bucks horn, or Wart Cress.



III. The Description. *The first has a small, long, white Root, with many Fibres thereat, running deep into the ground, the taste of which is somewhat like to the Garden Cress, but much milder. From this Root come forth several Branches, which grow upright, but not very high; which Branches are also branched forth into others that are smaller: upon which grow very many small, long, and divided or cut green Leaves, all along on both sides of them, whose cuts very much resemble the snags of a Bucks horn, or of some of the Leaves of the Garden Cress. The Flowers grow among the Leaves, coming forth with them at the Joints, they come forth in small rough Clusters, and are small and white, or of an herby greenish color, many of them set upon a small long Footstalk, one above another: which being past, there come in place, small, flatish, rough, round husks, something resembling rough or seeded Warts, which divide themselves into two parts, and contain in each of them a small brownish Seed.*

IV. Ambrosia, or Coronopus repens, *is altogether like the former, saving in the manner of its growing: It is a small low herb, most usually creeping with many long Branches, and spreading a great way, almost round about, upon the ground (yet in some places standing more upright: This Creeping kind never rises above four or five Inches high, but the trailing Branches are furnished with such like Leaves and Flowers as the former, which have a taste a little like Cresses. It is many times used to be eaten as a Sallet Herb, with Salt, Oil, and Vinegar, and that both raw and boiled.*

V. *The Places.* They grow almost every where round about *London*, and in many other parts of the Kingdom in moist Grounds, and at the foot of Banks, where there is any low Trench, or places continually plashed with Water: sometimes by Highway sides, especially in those places where Hogs frequent, from whence, as is supposed, they were called Swines Cresses.

VI. *The Times.* They flower and seed all *May*, *June*, and *July*; and their green Leaves abide fresh in a manner all *Winter*.

VII. *The Qualities.* They are hot and dry in the first Degree; Astringent, Abstersive, Digestive, Carminative and Vulnerary; Cephalick, Stomatick, Pectoral, Hepatick, and Hysterick; Alterative, Alexipharmick, and Spermatogenetick.

VIII. *The Specification.* They are said to be peculiar for taking away Warts, for that the Seed bear the perfect signature of the Warts upon a Man's Hand.

IX. *The Preparations.* You may make therefrom, 1. *A Liquid Juice.* 2. *An Essence.* 3. *A Decoction.* 4. *A Balsam* or *Ointment.* 5. *A Cataplasm.*

The Virtues.

X. *The Liquid Juice* Given to three or four ounces, it is Traumatick, or contributes to the more speedy cure of Wounds and Ulcers, more especially in Scorbutick and Cachectick habits of Body: made thick with fine Bole, and applied, it stops bleeding.

XI. *The Essence.* It strengthens the Head, Stomach, Liver, Womb, and Joints, and is of singular good use against the Scurvy, Cachexia, and disaffections of the Womb. It represses Vapors, and is good against Fits of the Mother. It is also Traumatick, having all the Virtues of the Liquid Juice. Dose from one ounce to three, Morning and Evening, either by it self, or mixt with a Glass of Wine.

XII. *The Decoction.* If made in Wine, it is a good Stomatick, and Hepatick, has the Virtues of the Essence, but not all out so powerful: and externally applied to Wounds, it cleanses, dries, and contributes to their healing, and withal represses the flux of Humors into the part, hindering Pain and Inflammations.

XIII. *The Balsam* or *Ointment.* It is an excellent thing for healing of green Wounds, which it speedily performs: it also cleanses, incarnates, dries and heals old Ulcers, or running Sores, strengthens the parts

parts afflicted, and makes them able to refiſt a flux of Humors falling upon them.

XIV. *The Cataplaſm.* Being applied it has (ſays *Matthiolus*) an adſtringent and repelling power: and therefore muſt neceſſarily repercuſs Humors, abate Inflammations, eaſe Pain, and ſtrengthen the part, eſpecially in the Gout, Sciatica, and other like Diſaffections: Applied upon Warts, it cures them.

CHAP. XCII.

BUGLE.

I. *THE Names.* This is a Plant unknown to the *Greeks* as far as I can find; and therefore has no *Greek* name: It is called in *Latin Bugula*, and *Bugulum*, *Conſolida media*, and *Solidago minor*: *Matthiolus* calls it *Laurentina*, and *Herba Laurentina*: And in *Engliſh*, *Bugle*, *middle Conſound*, and by ſome *Sicklewort*.

II. *The Kinds.* Authors make ſix kinds of this Plant, but all that grow with us, are referred unto two, 1. *Bugla vulgaris*, *Bugla flore Cærulco*, Common Bugle, or Bugle with a Blew Flower; this *Tragus* calls, *Prunella cærulea prima*, vel *major*: but moſt Writers call it, *Conſolida media pratenſis cærulea.* 2. *Bugula flore albo*, Bugle with a White Flower.

III. The Deſcription. *The* firſt *of theſe has a ſtringy Root, ſpreading under the Earth round about, like unto Money-wort, or Penny-royal, from whence ariſes up a hairy ſquare Stalk, about a foot or foot and half high*; *It has Leaves long, fat, and oleous, like thoſe of* Prunella *or* Self-heal, *but larger, and a little longer*; *ſome green on the upper ſide, others more brownish, a little dented about the edges, and ſomewhat hairy. The Stalk is alſo ſet with ſuch like Leaves, which ſtand thereon by Couples, from the middle almoſt whereof upwards, ſtand the Flowers together in roundles, compaſſing the Stalk, of a fair blew color, with Leaves alſo, but ſmaller and browner than thoſe on the Stalk below: theſe Leaves and Flowers are ſet at diſtances, leaving between every roundle bare or void ſpaces. Among the* Flowers *are alſo ſmall ones, as thoſe of* Self-heal, *of a blewiſh, and ſometimes of an Aſh-color, faſhioned like the Flowers of* Ale-hoof *or* Ground-Ivy: *which being paſt, there ſucceeds ſmall, round, blackiſh Seed.*

IV. Bugula flore albo, *Bugle with a white flower differs not in its form or magnitude, either in its Roots, Stalks, Leaves, Flowers or Seeds, from the former, excepting in the color of the Stalks and Leaves, that theſe are always green, and never brown as the former; and in the color of the Flowers, that they are always White.*

V. *The Places.* They grow in *Woods* and wet *Copſes* and *Fields*, generally throughout *England*; but the latter is not ſo common to be met withal: *Gerard* ſays, that he found the firſt of theſe Plants in a moiſt ground upon *Black Heath* near *London*, and near a Village called *Charlton*, but the Leaves were green, and not brown.

VI. *The Times.* They flower from *May* until *July*, perfecting their *Seed* in the mean ſeaſon: But the *Root* and the *Leaves* next unto it, lying as it were upon the Ground, remain all the *Winter* until the next *Spring*.

VII. *The Qualities.* They are Temperate as to heat or cold, and dry in the firſt Degree: Aſtringent, Abſterſive, Incarnative, Traumatick or Vulnerary; Neurotick, Stomatick, Hepatick, and Alterative.

VIII. *The Specification.* They are peculiar for the Cure of Wounds and Ulcers.

IX. *The Preparations.* You may make therefrom, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *A Decoction.* 4. *A Syrup.* 5. *A Diſtilled Water.* 6. *A Spirituous Tincture.* 7. *An Acid Tincture.* 8. *An Oily Tincture.* 9. *A Saline Tincture.* 10. *A Lotion.* 11. *An Ointment.* 12. *A Balſam.* 13. *A Cataplaſm.* 14. *A Fixed Salt.*

The Virtues.

X. *The Liquid Juice.* It is excellent for ſuch as are Livergrown, or troubled with the Rickets: It ſtrengthens the whole Body, and being drunk inwardly to two, three, or four ounces at a time, it contributes to the healing of old Ulcers, running Sores, and Fiſtula's, and to the uniting of broken Bones, and Corroborating any Member out of Joint.

XI. *The Eſſence.* It Dries and Aſtringes moderately, and is of good uſe for ſuch as have got a fall, and are inwardly bruiſed, for that it diſſolves the congealed Blood, and diſperſes it. It has all the Virtues of the Liquid Juice, and is very effectual to ſtrengthen the inward parts, and to cauſe to heal all manner of running Sores, fœtid Ulcers, and Fiſtula's, whether they be old or new. Doſe five or ſix ſpoonfuls in a Glaſs of Red Port Wine.

XII. *The Decoction in Wine.* It has the Virtues of the Juice and Eſſence, but not full out ſo powerful: it is good to cleanſe old running Sores and Ulcers, by waſhing them therewith.

XIII. *The Syrup.* Whether it is made of the Herb, or of its Juice, it is an excellent thing againſt Coughs, Colds, Hoarſneſs, Wheezings, ſhortneſs of Breath, difficulty of breathing, Soreneſs of the Breſt and Stomach, and other Diſtempers of thoſe parts: it ſtops ſpitting of Blood, and cures Ulcers of the Lungs.

XIV. *The Diſtilled Water.* It is a good Vehicle

to convey the other things in: But mixed with half its quantity of the Juice or Essence, it is good to wash a Sore or Ulcerated Mouth, and to cure such Sores or Ulcers which happen in the Secret Parts of Men or Women.

XV. *The Spirituous Tincture.* It heals admirably any Sore or Ulcer, whether inward or outward. In Ulcers of the Lungs it may be mixed with the Syrup aforenamed, thus: ℞ *of the said Syrup, one ounce: of the distilled Water an ounce and half: of the Tincture two drams: mix for a Dose to be given in Ulcers of the Lungs.* Outwardly mixed with the *Juice* or *Essence*, it cleanses old Ulcers, Incarnates and heals, and sometimes heals simple Wounds at once or twice dressing; you may make it thus: ℞ *of the Juice or Essence four ounces: of the Syrup an ounce and half: of this Tincture one ounce: mix them, to wash the Ulcer withal.*

XVI. *The Acid Tincture.* It is an admirable thing against inward Wounds, Thrusts, or Stabs into the Body or Bowels, and is excellent to be mixed with all Wound Drinks, and to be given mixed with the Syrup, against the Rickets in Children: It stops the running of Gangreens, being applied; and opens Obstructions of the Liver, and Gall; and is good to be mixed with Washes for sore Mouths and Throats. Dose inwardly from thirty to forty drops, in any specifick Vehicle.

XVII. *The Oily Tincture.* It cures Wounds at a few times dressing, but chiefly Wounds of the Nerves, for which it is a Sovereign thing: If a Nerve is prickt or wounded, it presently eases the pain, and prevents the return of Convulsions upon that account.

XVIII. *The Saline Tincture.* It is cleansing, and is good to wash and bathe those parts which are apt to break out with Botches, Boils, Scabs, Itch, Scurf, Morphew, and other Defœdations of the Skin.

XIX. *The Lotion.* It is made of the Juice thus: ℞ *Clarified Juice of Bugle a pint: Honey three ounces: Allum six drams: mix and dissolve over a gentle fire.* It is good to wash inveterate and running Sores with, which are very foul, and have been of long continuance; and it is as powerful and effectual to heal all running and stinking Ulcers in the Secret Parts of both Men and Women, and is an excellent Gargle for curing Sores, and Cankers in the Mouth and Throat.

XX. *The Ointment. It is made of the Leaves of Bugle two parts: of Self-heal, Sanicle, and Scabious, of each one part; bruised and boiled in Hogs Lard, or in a mixture of equal parts of Sheeps Suet, and Oil Olive, until the herbs are crisp, and then strained forth, and kept for use.* It is a very good thing for healing any fresh or green Wound, tho' lacerated, torn, or bruised; it brings it to digestion, cleanses, incarnates, and speedily heals it. *Parkinson* says, that he could wish that all the good Women and Ladies, that desire to do good to their own Families, or their poor Neighbours, not to be without this Ointment, always ready prepared, and at hand by them.

XXI. *The Balsam.* It has the Virtues of the Ointment, but more digestive, cleansing, and incarnative, and therefore more fit for complicated Wounds, which are accompanied with Contusions, Dilacerations, and other ill Symptoms.

XXII. *The Cataplasm.* Made of the green Herb, it is good to abate Inflammations, and other hot Swellings in the Neck, Throat, and other Parts. It discusses Contusions, dissolves congealed Blood, and is profitably applied to those Parts which are hurt by any blow or fall: It is also profitable to be applied to all sorts of Ulcers, whether recent or inveterate, washing the same also with the *Lotion* prescribed in Sect. 19. aforegoing, every time you dress them. It is good to be applied to broken Bones, and Dislocations, where the parts have been long out of Joint, and have been often reduced, and fall out again by reason of Weakness: but as these things ought to applied outwardly, so the Essence, or Juice, ought to be used all along inwardly, to corroborate the Tone of the Parts.

XXIII. *The Fixed Salt.* It is opening, cleansing, and diuretick, removes all Tartarous matter out of the Reins, Ureters, and Bladder: and taken to one scruple with the Essence, it is good to heal Wounds, and Ulcers of the Urinary parts.

CHAP. XCIII.

Of BUGLOSS Garden.

I. *THE Names.* It is called in *Greek*, Βύγλωσσον, (but it is rather the name of *Borage*, for so the *Greeks* called that Plant, and this our *Bugloss* was rather the *Lesser Bugloss*; also Λύκοψις, with *Dodonæus*: which *Parkinson* says was unknown to the Ancients. In *Latin*, *Buglossum*: and in *English*, *Bugloss* (after the *Latin* name.)

II. *The Kinds.* There are several sorts of it, as, 1. *The Garden*, which is *Buglossum Hortense*. 2. *Buglossa Sylvestris*, *Wild Bugloss*. 3. *Echium*, *Vipers Bugloss*. 4. *Wall and Stone Bugloss*. 5. *Limonium*, *Marsh Bugloss*: Of these last four we shall treat in the four next Chapters. 6. *Anchusa*, *Alkanet*, of which we have treated in Chap. 8. aforegoing.

BVGLOSSA.

III. *The Garden Kind*, of which we treat in this Chapter, is twofold, *viz.* 1. Λύκοψις, *Lycopsis*, *Buglossum Vulgare*, which is the *Greater Bugloss*. 2. *Buglossum Luteum*, which is the *Lesser Bugloss*, and

and by ſome called *Ox-Tongue*, or *Garden Ox-Tongue*.

IV. The Deſcription. *Our* Common Bugloſs *has a Root which is black without, and whitiſh within, long, thick, and full of a ſlimy Juice (as the Leaves alſo are) which continues and periſhes not every Year, as the Root of* Borage *does; from this Root comes up ſeveral long, narrow, hairy, whitiſh green Leaves, among which riſe up two or three very high Stalks, branched at the top, whereon ſtand many blew Flowers, conſiſting of five ſmall round pointed Leaves, with a ſmall Pointel in the middle, which are very ſmooth, ſhining, and of a reddiſh purple. whilſt they are Buds, and not blown open, which being fallen, there grows in the green Husks, in which the Flowers ſtood, three or four roundiſh black Seeds, having that Thread or Pointel, ſtanding ſtill in the middle of them.*

V. *The Leſſer* Bugloſs, *which ſome will have to be* Ox-tongue, *is much leſſer than the former, the Roots are long and creeping in the ground: and the Leaves are very rough, and rougher indeed than the former, like the rough Tongue of an Ox or Cow, (whence came the name) the Stalk is about two Feet high, more or leſs, and commonly of a reddiſh color: at the top of the Branches grow the Flowers in rough, ſcaly heads, which Flowers are compoſed of many ſmall yellow Leaves, much like thoſe of* Dandelion, *and fly away in Down like as they do, theſe Flowers are bitter of taſte. whence* Lobel *calls it*, Bugloſſum Echioides luteum Hieracio cognatum.

VI. *The Places.* The *firſt* is only nurſed up in *Gardens*, ſo alſo is the *ſecond*: but this latter is found to grow wild in many places, as between *Redriff* and *Deptford*, by watry Ditch ſides, as *Gerard* ſays.

VII. *The Times.* They flower in *May*, *June*, and *July*, to the end of *Summer*, and the Seed ripens in the mean Seaſon.

VIII. As to their *Qualities*, *Specification*, *Preparations*, *Virtues and Uſes*, they are altogether the ſame with thoſe of *Garden Borage*, of which we have treated before in *Chap.* 83. to which you are referred. *But this is to be noted in Bugloſs*, that its Roots are much more Mucilaginous, Viſcous, or Clammy than thoſe of Borage, and therefore are held not to be ſo convenient for opening *Apozems*: but the ſaid *Juice* being made into a *Loboch* or *Licking Electuary*, may be prevalent againſt the Cough, Hoarſneſs, and Colds, and to condenſate thin Diſtillations of Flegm upon the Lungs.

CHAP. XCIV.

Of BUGLOSS Wild, *or* Ox-Tongue.

I. *THE Names.* It is called in *Greek* Βυγλωσσον ἄγριον: in *Latin*, *Bugloſſum Sylveſtre*: and in *Engliſh*, *Wild* or *Field Bugloſs*, or *Ox-Tongue*.

II. *The Kinds.* There are ſeveral Species of the *Wild Bugloſs*, as 1. *Bugloſſum Sylveſtre majus, flore nigro*, The Great Wild Bugloſs. 2. *Bugloſſum Sylveſtre minus*, The Small Wild Bugloſs. 3. *Bugloſſum Sylveſtre minus Aſperum*, Rough Wild Bugloſs. 4. *Bugloſſum dulce, ex Inſulis Lancaſtriæ*, Sweet, or *Lancaſhire* Bugloſs.

III. The Deſcription. *The firſt of theſe differs little from the* Garden Bugloſs, *but in its greatneſs, this being larger in every part: and in the color of the Flowers, which are of ſo deep a purple color, that they are accounted as black.*

IV. *The* ſecond Kind, *has a ſmall long Root: its Leaves are ſomewhat broad, ſhort, and rough, ſmaller than either the former Wild Kind, or the Garden Kind, and ſomething more unevenly dented on the edges: the Flowers grow at the Tops, of a blewiſh purple color, but ſmaller than the former, and the Seeds grow three or four together, and blackiſh alſo, like the other kinds.*

V. *The* Rough Wild Bugloſs, *has a Root like the former, but its Leaves are much rougher than any of the other Kinds, and ſharper or ſmaller towards their ends: the Flowers on the Tops of the Branches, are more like the Flowers of* Galiopſis, *or ſtinking Dead Nettle, than of any of the other ſorts of Bugloſs: in ſome Plants they are of a blewiſh purple color, and in ſome they are white, but both colors are never found in one Plant.*

VI. *The* Lancaſhire Bugloſs, *has a great Root, blackiſh on the out ſide, and divided downwards, in ſeveral large Arms or Branches. From whence ſhoots forth many ſlender Stalks, a Foot and half high, more or leſs. The lower Leaves whereof next the ground, are much leſſer than thoſe of* Borage, *and of a whiter green, and ſomewhat rough; but thoſe which grow on the Stalks are leſſer, having the Flowers ſet at the Joints with them, whoſe Buds before they are blown, are of a reddiſh color, but when they are open, of a blewiſh purple, ſomewhat like thoſe of* Vipers Bugloſs, *or between them and* Borage Flowers, *of a very ſweet, or Honey like Taſte.*

VII. *The Places.* The *firſt*, *ſecond* and *third* grow Wild in ſeveral Countries, and are ſometimes found growing Wild in *England*. The *fourth* was found by Mr. *Hesket* growing in one of the Iſlands about *Lancaſhire*.

VIII. *The Times.* They all flower in *June* and *July*, and their Seed comes to ripeneſs in a ſhort time after, the Seed growing ripe, even in the time of Flowering.

IX. The *Qualities*, *Specification*, *Preparations*, *Virtues and Uſes*, are moſtly the ſame with thoſe of

of *Borage*, but especially with those of *Vipers Bugloss*, of which we treat in Chap. 95. next following.

CHAP. XCV.

Of BUGLOSS Vipers.

I. *The Names.* It is called in *Greek*, Ἔχιον, Ἀλκιβιάδειον, ἢ Ἀλκίβιον; and in *Latin*, *Echium*, *Alcibiadion*, *Alcibion*, & *Alcibiacum*, (from the first finder of it out, who being bitten by a Viper, and gathering this Herb, and chewing it, and swallowing down the Juice, and applying the rest of the Herb to the bitten place, was cured thereby) it is also called *Buglossum Viperinum*, and *Sylvestre Viperinum*, as some say, from the effects of the Roots in curing the bitings of Serpents; but as others say, from the color of the Stalks which are speckled like a Serpents skin: In *English Vipers Bugloss*. *Apuleius* saith, that the *Greeks* called it also Θηριοῤῥίζον, *Theriorrizon*, *Radix Viperea*; and Ἔχιδιον, from the form of the Seed, which, as *Dioscorides* says, is like the Head of a Viper; whence came the name *Echium*.

II. *The Kinds.* Authors make twelve several Kinds of *Vipers Bugloss*, of all which, two only are said to grow with us, *viz.* Ἔχιον κοινὸν, *Echium Vulgare*, Common Vipers Bugloss. 2. Ἔχιον λευκὸν, *Echium Vulgare flore albo*, White flowered Vipers Bugloss.

III. The Description. *The first of these has a Root which is somewhat large and blackish, and grows woody at the approach of Seed time, perishing in the Winter: from whence springs forth many long, rough Leaves, lying on the ground, and from among which rise up several hard round Stalks, which are very rough, as if thick set with prickles or prickly hairs, having many black spots on them, not much unlike to the stem of a Viper, upon which grow such like long, rough, prickly or hairy green Leaves, something narrow, the middle rib being for the most part white. The Flowers stand at the tops of the Stalks, branched forth into many spiked Tufts or Flowers bowing or turning like to the Turnsole, all of them opening generally on the one side, which are long and hollow, turning up the brims a little, of a purplish violet color, where they are fully blown; but more reddish, where they are but yet in the Bud, or not blown open, as also when they are upon their decay and withering: but in some places they are of a paler purple color, with a long Pistil in the middle, feathered, or pointed at the top. The Flowers being fallen, the Seeds grow inclosed in round heads, which growing to be ripe, are blackish, cornered, and pointed something like to a Vipers Head.*

IV. The second Kind *differs not much in any thing from the former, save that in some places it grows larger, the Leaves are of a fresher green color, and the Flowers are wholly of a white color.*

V. *The Places.* The first of these grows wild almost every where, and as *Gerard* says, it is found in great abundance, where *Alkanet* grows. The second grows about the the Castle Walls of *Lewes* in *Sussex*.

VI. *The Times.* They flower in the *Summer Months*, as the other *Bugloss*es do, and their Seed comes to ripeness in the mean season.

VII. *The Qualities.* They are temperate in respect to heat or cold, and dry in the first Degree: Aperitive, Absterfive, and Traumatick, or Vulnerary; Cephalick, Stomatick, Cordial and Neurotick; Alterative and Alexipharmick.

VIII. *The Specification.* The Experiences of many Ages have proved them to be peculiar against the Poison and Malignity of Serpents, Vipers, and other Poisonous and Venomous Creatures.

IX. *The Preparations.* You may make therefrom, 1. *A liquid Juice.* 2. *An Essence.* 3. *A Syrup.* 4. *A distilled Water.* 5. *A Tincture of the Flowers.* 6. *A Pouder of the Seed.* 7. *A Decoction of the Root.* 8. *An Ointment or Balsam.* 9. *A Cataplasm of Roots or Leaves.*

The Virtues.

X. *The liquid Juice.* The Juice of these Plants are wonderfully clammy and slimy, so that it is hard to Express the same; for which reason, after you have well beaten the Herb, you must set it close covered in a cold Cellar, or some other cold and moist place, for two Days and Nights, and then press forth the Juice in a Wooden press: after which you may clarifie it with Whites of Eggs, beaten into Glair, and passed gently thro' a thick Hippocras Bag. It is a famous thing against the biting of the Viper, and of all other Serpents, or any other Venomous Creature, and prevails also against Poison, and the Malignity of Poisonous Herbs. You may give five or six spoonfuls at a time in a Glass of Wine, and repeat it as you see Occasion.

XI. *The Essence.* It has all the Virtues of the Liquid Juice, besides which, it is an excellent thing against the Plague or Pestilence, Spotted Fever, Purple, and all other Burning and Malign Fevers whatsoever. It is a most admirable Traumatick or Vulnerary, so that scarcely any of the Vulneraries or All-heals go beyond it. It comforts the Head, Brain and Nerves, strengthens and fortifies the Stomach, and chears the Heart admirably. Dose, three or four spoonfuls or more, two, three or four times a day, in a glass of the Distilled Water, or in a glass of Wine, or some other proper Vehicle.

XII. *The Syrup. Parkinſon* makes it thus. ℞ *of the Clarified Juice four pounds: fine white Sugar three pounds: Infuſion of the Flowers one pound: mix and boil theſe gently to the conſiſtence of a Syrup, which keep for uſe.* It is (ſays he) very effectual for comforting the Heart, and to expel Sadneſs and Melancholly. Doſe two ſpoonfuls or more.

XIII. *The Diſtilled Water.* It is drawn from the whole Plant, when it is in its chiefeſt ſtrength, which is, when it is in Flower; it is profitable for all the Diſeaſes aforementioned, being inwardly taken, and outwardly applied; and is uſed as a Vehicle to convey the other Preparations in.

XIV. *The Tincture of the Flowers.* It is highly Cordial, and Alexipharmick, and reſiſts Poiſons of all kinds: it defends the Heart from the Malignity of Peſtilential Fevers, and of the Plague it ſelf, and ſuppreſſes Melancholly Vapors: It has the Virtue of the Eſſence, and may be given in the Diſtilled Water to two Drams.

XV. *The Pouder of the Seed.* It is Alexipharmick, comforts the Heart, expels Sadneſs and Melancholly, attemperates the Blood, allays the hot Fits of Agues, encreaſes Milk in Nurſes, and eaſes pains in the Loins, Back and Kidnies. Doſe one dram.

XVI. *The Decoction of the Root.* It prevails againſt Poiſon, and the Plague, and the biting of Vipers, and other Venomous Creatures, and is a ſingular good thing (if made with Wine, or Wine and Water) to be drank as a Diet Drink by wounded Perſons, and ſuch as have inveterate, filthy, and running Ulcers and Fiſtula's, *&c.*

XVII. *The Ointment* or *Balſam.* They are Vulnerary, cure admirably both Wounds and Ulcers; and are of eſpecial uſe to be applied to Wounds made by the bitings of Venomous Creatures, as Vipers, Mad Dogs, *&c.* or made with any Poiſoned Weapon, it extracts the Poiſon or Venom, and induces the healing.

XVIII. *The Cataplaſm.* Applied to the biting of a Viper, Mad Dog, or other Venomous Creature, it extracts or draws forth the Poiſon, and ſo ſecures the life of the Patient; other Alexipharmicks being given in the mean ſeaſon inwardly.

CHAP. XCVI.

Of BUGLOSS, Wall *and* Stone.

I. THE *Names.* The firſt of theſe is called in *Greek*, λυκόψις: In *Latin*, by *Bauhin*, *Lycopſis*; and by *Dodonæus*, *Lycopſis Echij altera Species*: and in *Engliſh*, *Wall Bugloſs.*

II. *The other* is called in *Greek*, ὄνοσμα: by *Galen* ὄσμας φλονίτις, *Oſmas Phlonitis*: In *Latin*, *Onoſma*: and in *Engliſh*, *Stone Buglos.*

III. *The Kinds.* Of the *Wall Bugloſs* there are two Kinds, 1. *Lycopſis Echij folio*, That with a Vipers Bugloſs leaf. 2. *Lycopſis Anglica*, the *Engliſh Wall Bugloſs.* The *Stone Bugloſs*, is a ſingular Plant of its Kind.

IV. The Deſcription. *The firſt kind of* Wall Bugloſs *has a Root which is ſomewhat woody, long, and not much thicker than a Finger, with ſome Fibres thereat; it is of a browniſh red on the outſide, but little or nothing colors the Fingers as the* Anchuſa's *do: yet* Dioſcorides *ſays, it was called by ſeveral* Anchuſa, *and* Galen *ſays, that in his time it was accounted a kind thereof; but it is much like to* Echium, *and other ſorts of Wild Bugloſs. From this Root ariſes Leaves which ſpread upon the Ground, which are many, long, narrow, rough or rugged, hairy, and of a dark green color, ſomewhat like to* Echium, *or ſome other Wild Bugloſs:* These Leaves *abide in this manner, ſome years, without ſending forth of any Stalk, or Flowers at all (which ſome having taken notice of, thought that it never did bear Flower or Seed:) But truly though it bears no Stalk for Flowers or Seed ſome years, yet it has been found to bear them in ſome others, for that divers Plants hereof have been found as well with Stalk and Flowers, as Void, or without: When it bears a Stalk, it riſes up about two Feet high, bearing ſuch like Leaves as grow below, but ſet one diſtant from another, without order, and ſmaller up to the Top, where the Flowers ſtand upon their ſeveral Branches, which are ſpread about, as alſo come forth with the Leaves at the Joints, like unto the hollow Flowers of* Echium, *or* Wild Bugloſs, *with uneven and gaping dented brims or edges, of a pale Purple color, with a long Stile or Pointel in the middle, growing out of the Flower above the length thereof; after which follows the Seed, much like to Bugloſs Seed, but not altogether ſo great or black.*

V. *The* Engliſh Wall Bugloſs *has a Root a little reddiſh like the other, but giving as little color: but as to its Leaves, Stalks, and Flowers, it differs very little from the former: the only difference is, that the Flowers do all grow at the Tops of the Branches, and are of a deeper purple color, with divers threads ſhooting out of them*

VI. Stone Bugloſs *is ſaid by* Dioſcorides *to have a reddiſh Root, but to be without either Stalk, Flower, or Seed, which thing he ſays alſo of* Lycopſis, *and* Cynogloſſum, *both which are known (in divers of their Plants) to have all the three, and therefore it may be as probable in this. This Plant in its form has a great reſemblance or likeneſs to the former* Lycopſis, *as alſo to* Anchuſa *or* Alkanet; *but differ-*

differing from them in its Virtues. It has many long and narrow smooth Leaves lying upon the ground, not above an Inch broad, but about four Inches long, like to those of the lesser Alkanet.

VII. *The Places.* The *first two* grow upon Stone Walls, and upon dry, stony, and barren Grounds: the first has been found about *Frontignan* near *Mompelier* in *France*, as *Pena* and *Lobel* say: The *second Lobel* observed to grow in the *West Countrey*, in the way from *Bristol* and *Bath* to *London*. The *Stone Buglos* grows in *Rocky* and *Stoney* Places.

VIII. *The Times.* The *Wall Buglosses* flower in *July*, and sometimes in *August*; and the Seed is ripe in the following Month. The *Stone Buglos* is green all the Year; but its times of flowering and seeding (if it does so) has not been as yet observed.

IX. *The Qualities. Wall Buglos* is temperate, or rather cold and dry in the first Degree, Astringent, Styptick, Traumatick or Vulnerary, Pectoral, Hepatick and Alterative. *Stone Buglos* is hot and dry in the second Degree, Aperitive, Cleansing, Hysterick, and Alterative.

X. *The Specification.* The *Wall Buglosses* are peculiar Vulneraries for healing Green Wounds. And *Stone Buglos* is a Specifick for the speedy Delivery of Women in Labor.

XI. *The Preparations.* The *Wall Buglosses* have all the Prepartions and Virtues of the *Wild Buglosses*, to which we refer you: But 1. *The Juice.* 2. *The Essence.* 3. *The Oil*, have some peculiar Virtues. Of the *Stone Buglos* you may make also, 1. *A liquid Juice.* 2. *An Essence.* 3. *A Pouder of the Leaves.* 4. *A Decoction.*

The Virtues.

XII. *The liquid Juice of Wall Buglos.* Taken alone, or mixed with Honey, it stops Catarrhs, falling upon the Fauces and Lungs, and resists Fluxes of the Bowels: and being applied upon Inflammations, as a Phlegmon, Erysipelas, *&c.* it cools them: inwardly taken, it is a good Traumatick.

XIII. *The Essence of Wall Buglos.* It is Astringent and Stiptick, stops Catarrhs, and all Fluxes of the Bowels; as also all Fluxes of sharp Humors, to old running Sores and Ulcers, and so renders them easie of cure. Dose one ounce at a time, Morning and Evening, in any specifick Vehicle, as a mixture of Plantane and Poppy Water, an Infusion of Catechu in fair Water, *&c.*

XIV. *The Oil of Wall Buglos.* It is made by boiling the Leaves and Roots in Oil Olive to Crispness, *&c.* It admirably heals Green Wounds, abates Inflammations, and cures Burnings, being anointed upon the Part, and also mixed with Barley Flower, and applied: *Parkinson* says, that this Oil cures *S. Anthonies fire*, but usually Oily and Greasie Bodies do mischief in that case: to bathe with the liquid Juice is much better, and to apply over the Erysipelas, Cloths often wet with the same: or a soft Cataplasm of the Juice mixt with Barley Flower.

Virtues of Stone Buglos.

XV. *The liquid Juice.* It provokes the Terms in Women powerfully, and therefore ought not to be given to Women with Child, left it causes them to miscarry: a spoonful or two of it may be given Morning and Evening in a Glass of White Wine.

XVI. *The Essence.* It has the Virtues of the liquid Juice, and is very effectual to cause speedy Delivery to Women in Labor. It cleanses the Womb of all its fœculencies, resists Vapors, and helps against Fits of the Mother. Dose one or two ounces in a Glass of Wine to Women in Travel.

XVII. *The Pouder of the Leaves.* It is good against Vapors and Fits of the Mother, and taken *ad j. dram* in Wine by Women in Travel, it facilitates and hastens the Delivery, for which it is said to be an excellent thing: it has the Virtues of the Juice and Essence, and therefore ought not to be given to Women with Child.

XVIII. *The Decoction in Wine.* It has the Virtues of the Essence and Pouder, but not altogether so powerful.

CHAP. XCVII.

Of BUGLOSS Marsh.

I. *THE Names.* It is called in *Greek*, Λιμώνιον, ἢ πλατυφύλλος, by *Dioscorides*; so called, because it grows ἐν λειμῶσι, *in pratis riguis vel palustribus*: In *Latin*, *Limonium*: and in *English*, *Marsh* or *Sea Buglos*, and *Sea Lavender.*

II. *The Kinds. Parkinson* makes seven Kinds hereof: Mr. *Ray*, eleven: but we (because here in this Book we treat chiefly of *English* Plants) shall only describe three Kinds, *viz.* 1. *Limonium majus vulgatius*, the Greater Common Marsh or Sea Buglos. 2. *Limonium medium Anglicum*, The *Colchester* Marsh Buglos. 3. *Limonium Virginianum*, which is the *Limonia Conrgner Clusij*, Virginian Marsh Buglos.

III. There has been some controversie among Authors about this Plant *Limonium*, some will have what we here describe to be the true *Limonium*, which it is: others will have some other Plants to be it: *Matthiolus* describes two kinds, but made no sensible distinction between them, nor yet told us which was the *True*, but as ignorant of the matter, speaks not a word of them; but to cease the

contelt, the true *Limonium* is that *which has fair Leaves, like thoſe of the* Limon *or* Orange *tree, of a dark green color, ſomewhat fatter, and a little crumpled.*

IV. *Gerard* calls this Plant in *Engliſh, Sea Lavender*, (and from him Mr. *Ray*) but without any other ground, than that the color of the Flowers is ſomewhat near thoſe of *Lavender*, for which reaſon *Parkinſon* altered the Title, to a more proper name; and call'd it *Sea* or *Marſh Bugloſs*, as being in form and color moſt like to *Bugloſs*.

V. The Deſcription. *The firſt or* Greater Marſh Bugloſs *has a Root ſomewhat thick and long, like unto a ſmall* Red Beet Root, *whence comes ſeveral fair, long, thick, or fat green Leaves, ſomewhat like unto* Small Beet *Leaves, (and that is the reaſon that* Pliny *refers the* Limonium *unto the* Beets, *and calls it a* Wild Beet, *though* Galen *will have it, that there is no Wild ſort of* Beet:) *or Leaves of the* Limon *Tree, from among which ſpring up ſeveral brittle, naked Stalks, without Leaves, near half a yard high, branched at the tops into ſeveral parts, whereon ſtand many ſmall blewiſh purple Flowers, all on one ſide for the moſt part, ſomething like unto* Bugloſs *Flowers, but ſmaller; after which come ſmall reddiſh Seed, incloſed in the husks, which the Flowers ſtood in before.*

VI. Colcheſter Marſh Bugloſs, *is like unto the former almoſt in all reſpects, the Root being reddiſh, but much leſſer, the Leaves alſo leſſer, and the Stalks lower, being but a little more than a foot high; the Flowers alſo of the ſame color with the former, but yet leſſer: ſo that the difference between them ſeems to be only in the magnitude.*

VII. The Virginian Marſh Bugloſs *has a long Root, an Inch thick in Diameter, or more, and going almoſt ſtrait down into the ground, ſending forth from it ſeveral Branches, and ſmall Fibres: It is a very ſtrange Plant, for from this Root ſprings forth very ſtrange Leaves, ſuch as are not to be ſeen in any other Plant that we know of, being nine, or ten, or more, riſing from the head of the Root aforenamed, each by it ſelf, being ſmall below, and growing greater upwards, with a Belly bunching forth, and a bowing back, of a pale whitiſh yellow color, hollow at the upper end, with a Flap, not much unlike the to Flowers of* Ariſtolochia *or* Birthwort, *and round at the Mouth like a half Circle, full of great dark purpliſh Veins on the inſide. The whole Leaf is of a thick ſubſtance, almoſt like unto Leather, and among theſe Leaves ſprings up a Stalk, at the top of which comes forth a Flower with four or five Leaves, in a roundiſh Seed Veſſel, with a Tuberous Thrum in the middle.*

VIII. *The Places.* The two firſt grow in *Marſh* grounds near the *Sea* in many parts of *England.* The *firſt* grows plentifully upon the *Walls* of the *Fort* againſt *Graveſend*, as alſo on the *Banks* of the *River* below the ſame Town, and below the *King's Stone-houſe* at *Chatham*; alſo by the *King's Ferry* going into the Iſle of *Shepey*; and in the Salt Marſhes by *Lee* in *Eſſex*; in the *Marſh* by *Harwich*, and many other places. The ſecond grows in the fields near the Sea, by *Colcheſter*, as *Lobel* ſays; and *Cluſius* ſaith, may be found about *Valentia* in *Spain.* The third has been found growing in *Virginia*; and my ſelf found it in *South Carolina*, in a Marſhy piece of Land at *Canoi* up *Wando* River, about nine Miles from *Charles Town*; it was alſo ſent to *Cluſius* from *Paris*, by one that received it in the ſame manner from *Lisbon* in *Portugal.*

IX. *The Times.* The two firſt flower in *June* and *July*, and their Seed ripens not long after: The laſt I ſaw in Flower in *Carolina*, in the Month of *July*, but ſtayed not in the place, to ſee its Seed.

X. *The Qualities.* They are temperate as to heat or cold, drying in the third Degree, Aſtringent, Styptick, Stomatick and Alterative.

XI. *The Specification.* They are peculiar againſt Catarrhs and Spitting of Blood.

XII. *The Preparations.* You may make therefrom, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *A Pouder of the Seed.* 4. *A Decoction of the Roots.* 5. *An Oil or Balſam of the Leaves.*

The Virtues.

XIII. *The liquid Juice.* It ſtops Catarrhs or Diſtillations of Rheum upon the Breſt and Lungs, and prevails much againſt Fluxes of the Bowels; as alſo all ſorts of Bleedings, whether by the Mouth, as Spitting and Vomiting Blood, Piſſing Blood, the Bloody Flux, or overflowing of the Terms. Doſe three or four Spoonfuls in a Glaſs of *Red Florence*, or *Red Port Wine*, Morning, Noon and Night.

XIV. *The Eſſence.* It has all the Virtues of the Juice, but more Stomatick, and therefore better for ſuch as have weak Stomachs. Doſe two or three ſpoonfuls in Red Wine, as aforeſaid, and at the ſame times.

XV. *The Pouder of the Seed. Gerard* ſays, that being drunk in Wine, it helps the Collick, Strangury, and Dyſentery, or Bloody Flux: Doſe one dram. It alſo ſtops the overflowing of the Courſes in Women, and all other Fluxes of Blood.

XVI. *The Decoction of the Roots.* Being made in Red Wine, it is very Aſtringent and Styptick, good againſt Catarrhs, and Fluxes of Blood, and has all the Virtues of the Juice and Eſſence, but not altogether ſo powerful: It has been found to be a ſpecifick againſt Agues, whether Quotidian, Tertian, or Quartan.

XVII. *The Oil.* It is made by boiling the Leaves in Oil Olive till they are Criſp, *&c.* Applied to Contuſions, weakned Joints, weak Backs, and Burnings, it cures them.

CHAP.

CHAP. XCVIII.

Of BURDOCK Great.

I. *THE Names.* It is called in *Greek*, Ἀρκεῖον, πρόσωπον, ἢ πρόσωπις : In *Latin*, *Arcium*, *Prosopium*, *Prosopis*, *Personata*, *Lappa* and *Bardana*, in Shops : In *English*, *Burdock*, and *Clot Bur*.

II. *The Kinds.* There are several Kinds hereof, as, 1. Ἀρκεῖον μεῖζον, *Lappa major*, *Bardana major vulgaris*, The Common Burdock. 2. *Lappa Virginiana*, The Virginian Burdock. 3. *Lappa seu Bardana languinosis capitulis*, The woolly headed Bur. 4. *Bardana major Rosea*, The Rose Bur : Of all which we shall treat in this Chapter. 6. *Lappa minor sive Xanthium*, The small Burdock. 5. *Petasites*, The Butter Bur, of which two last, in the two following Chapters.

III. The Description. *The* Common Greater Burdock, *has a Root great and thick, black on the outside, and whitish within, sweet and pleasant in taste at first, but something bitter afterwards : from whence spring forth many large, hard, green Leaves, somewhat like to the* Butter-Bur, *or* Wild Dock, *but more crumpled, and of a darker green color on the upper side, but greyish underneath : among which rise up hard and rough green Stalks, two or three feet high, with many Branches from them, having many the like, but lesser Leaves on them, bearing at their Tops several rough heads or burs, with crooked pointed Prickles, apt to stick on Cloths, or other things which they touch ; out of the tops of each of which come forth many hard purplish threads, which are the Flowers ; which being faded and past, turn to Down in the Heads ; and opening themselves, shed their Seed, which is grayish, something like to the Knap-weeds, which together with the Wind, is often carried away, and many times falls down to the ground, in the place where it grows, by which it multiplies it self.*

IV. The Virginian Kind, *is a kind of the former, having like Roots ; but its Leaves are rounder and smaller : the Burrs are also smaller and harder, and furnished with very sharp, crooked points, which stick very fast to every thing they lay hold on.*

V. The woolly headed Bur, *it differs little from the first, but only that the Leaves grow not altogether so great ; and the heads being smaller, are woolly all over, and the prickles not so sharp or sticking.* Gerard *says, that the Leaves and whole Plant are somewhat less than the first or common kind, and that the Heads are hairy or downy, but otherwise like to it.* Lobel *calls this* Arction Montanum, *and* Lappa minor Galeni ; *but it is indeed the* Lappa minor altera Matthioli.

VI. The Rose Bur, *differs little or nothing from the first kind, but in the head, which instead of the prickly Burs, has many small green Leaves, set together like a small Rose Plantane, and not much prickly at their ends.*

VII. *The Places.* The *first* of these grows plentifully with us every where, by *Ditch sides*, *Water sides*, *Wast places*, and *High ways*. The *Virginian* is found in *Virginia*, *Maryland*, *New England*, and in other Provinces upon that Coast. The *third* is not so frequent with us, as is the first, yet I have found it in several places of *England* ; *Lobel* found it growing in *Somerset-shire*, about three Miles from *Bath*, near the then House of Mr. *John Colt* : also in the High way leading from *Draiton* to *Iver*, two Miles from *Colebrook*. The *last* grows not with us, but near *Lipswick* in *Germany*.

VIII. *The Times.* They Head, Flower, and Seed in *June*, *July* and *August* ; the Seed being ripe in a few Weeks after the Flowers are gone.

IX. *The Qualities.* They are all cooling and drying in the first Degree ; yet *Gerard* says, that the *Roots* are moderately hot : They are Astringent, Discussive, Digestive, and Traumatick ; Cephalick, Neurotick, Nephritick, and Hysterick ; Alterative, and Alexipharmick.

X. *The Specification.* The Burdock is peculiar against the Poison of Serpents ; and Obstructions of the Reins, Bladder and Womb.

XI. *The Preparations.* You may have hereof, 1. *The Leaves.* 2. *The Juice.* 3. *The Essence.* 4. *The Saline Tincture.* 5. *The Oily Tincture.* 6. *The Decoction.* 7. *A Pouder of the Root.* 8. *A Pouder of the Seed.* 9. *A Conserve of the Roots.* 10. *A mixture.* 11. *A Cataplasm.* 12. *A Salt.*

The Virtues.

XII. *The Leaves.* Being applied either dry or green, they cool, moderately dry, and discuss withal, as *Galen* says ; whereby they are good to heal old Sores and Ulcers, and help the Cramp, or shrinking of the Sinews.

XIII. *The Juice.* The Juice of the Leaves mixt with Honey, provokes Urine, and takes away the Pains of the Bladder : and mixt with Wine, it is wonderfully good against the bitings of Serpents, Mad Dogs, and other Venomous Beasts. *The Juice of the Root* taken to the quantity of three or four ounces, and drank with a good draught of Ale, is an excellent thing against Wind, and coldness of the Stomach.

XIV. *The Essence.* It has all the Virtues of the Juice, besides which it is excellent against Poison inwardly taken ; and is good, being given Dietetically, against Venereal Diseases, as the Pox, Gonorrhæa,

rhœa, &c. It heals inward Ulcers of the Lungs, and is good to cure ſpitting of Blood. It is good againſt Gravel, Sand, Slime and Tartarous Matter, Obſtructing the Reins, Ureters and Bladder, and prevails againſt Vapors in Women, Obſtructions of the Womb, and Hyſterick Fits. Doſe from one ſpoonful to four, or ſix, mixt with any proper Vehicle.

XV. *The Saline Tincture of Seeds, or Leaves.* It powerfully opens Obſtructions of the Womb, Reins, and Bladder, bringing away the Matter cauſing the Obſtruction: Outwardly, it is good to waſh the part bitten by a Mad Dog, for it draws out the malignity and Poiſon. Doſe inwardly ʒ. or ij drams in *Arſmart* or *Parſly* Water, or any other proper Vehicle.

XVI. *The Oily Tincture.* It is an excellent thing againſt Punctures, and other Wounds of the Nerves, prevails againſt Cramps and Convulſions, inwardly given from twenty to thirty Drops, and outwardly applied.

XVII. *The Decoction of the Root.* Drank liberally for ſome time, it has been found very good to exterminate the Reliques of the *French* Diſeaſe: The Decoction of the Root, as alſo of the Seed, is commended by *Dioſcorides* againſt the Tooth-ach, being held in the Mouth. It is alſo good to foment withal againſt Burnings and Kibed heels: and made with Wine, and drank, it prevails againſt the Strangury.

XVIII. *The Pouder of the Root.* It is good againſt ſpitting Blood, helpful in Conſumptions, and expels Sand, Gravel, and Tartarous Matter out of the Reins, Ureters and Bladder. Doſe one or two drams in White or Red Wine, &c.

XIX. *The Pouder of the Seed.* Taken to one dram, in a proper Vehicle, it is an excellent thing againſt Sand, Gravel, or Tartarous Matter in Reins or Bladder, and gives eaſe in the Strangury, and other like Diſeaſes of thoſe parts: and drank with Wine for forty days together, it wonderfully helps the *Sciatica.*

XX. *The Conſerve of the Roots.* It is helpful in Conſumptions, and good for ſuch as are troubled with the Stone, or any Flux of the Bowels.

XXI. *The Mixture. Take Juice of the Root, which make with Alicant two pounds: Old Tent, a pint and half: mix them.* Four ounces of this being drank Morning, Noon and Night, (after due purging) is good againſt the Running of the Reins in Men, and the Whites in Women. Or thus: *Take Juice of the Root, made as aforeſaid, twelve ounces: old Tent eight ounces: Yolks of new laid Eggs, n° iiij: pouder of Acorns, an ounce and half: Nutmegs in pouder half an ounce: mix them.* It has the Virtues of the former, beſides which, it eaſes pain in the Reins, and wonderfully ſtrengthens a weak Back.

XXII. *The Cataplaſm. Made of the Leaves bruiſed, with the White of an Egg,* and laid on any place burnt with fire, it takes the fire out, gives ſudden eaſe, and afterwards heals it. *The Roots made into a Cataplaſm by being beaten with Salt,* and applied (as *Apuleius* ſays) to the biting of a Mad Dog, cures it, and ſo ſpeedily frees the Patient from all danger. *Columella* ſays, *the Cataplaſm made of the Leaves beaten up with Salt,* being laid upon the biting of a *Viper* (the part being firſt ſcarrified with a Lancet) draws out the Poiſon. The former Cataplaſm of the *Roots with Salt,* is more available than the former againſt the Poiſon of Serpents; and being applied, is alſo good againſt the King's-Evil.

XXIII. *The Salt from the Aſhes.* Taken in White Wine, Arſmart, or Parſley Water, from a ſcruple to half a dram, it is good to provoke Urine, cleanſe the Urinary Paſſages, and to carry off the Watry Humor in Dropſies.

CHAP. XCIX.

Of BURDOCK Small.

I. THE *Names.* It is called in *Greek,* ξάνθιον ἢ φάσγανον: In *Latin, Xanthium:* In the Shops, *Lappa minor, Lappa inverſa,* and by ſome, *Strumaria,* and *Bardana minor:* In *Engliſh,* the *Leſſer* or *Small Burdock.*

II. *The*

II. *The Kinds.* It is the leſſer ſort of the *Burdocks*, and ſingular of the Kind.

III. The Deſcription. *It has a ſmall Root ſomewhat long and fibrous, and periſhing every year: from which Root riſes up a rough creſted Stalk, about two feet high, breaking out into ſeveral Branches, with many blackiſh ſpots upon them, with two much ſmaller and whiter Leaves at every Joint, ſtanding upon long Footſtalks, which Leaves are uſually divided into three parts, ſomething like unto a Marſh Mallow leaf, unevenly notch'd or dented about the edges: at the Joints of the Stalk and Branches with the Leaves, towards the tops of them, come forth ſmall Flowers, which abide not long; and after them, two or three ſmall, cloſe Burs, a little pointed at the top, wherein lye two or three ſmall lank Seeds, ſomewhat like unto an Oat, which fall not out, nor do the heads open.*

IV. *The Places.* It grows in many places of this *Kingdom*, as particularly in two or three places between *Tidenham* and *Chepſtow*, in the foot way; in the Highway between *Stanes* and *Egham*, and between *Drayton* and *Iver*, two Miles from *Colebrook*; and at *Southwick-ſheet* in *Hampſhire*.

V. *The Times.* It Flowers and Seeds when the great *Burdock* does; *viz.* in the Summer Months, *June*, *July* and *Auguſt*.

VI. *The Qualities.* It is temperate as to heat and cold, dryneſs and moiſture, yet *Galen* will have the Seeds to be hot and dry, digeſtive, alſo diſcuſſive, Neurotick, Splenetick, and Hyſterick; Alterative, and Alexipharmick.

VII. *The Specification.* It is ſingular againſt the pain and hardneſs of the Spleen.

VIII. *The Preparations.* You may keep hereof, 1. *The Juice.* 2. *The Eſſence.* 3. *The Saline Tincture.* 4. *The Oily Tincture.* 5. *A Pouder of the Root.* 6. *A Pouder of the Seed.* 7. *A Conſerve of the Roots.* 8. *A Salt.* 9. *A Decoction of the Roots.* 10. *A Lotion, or Waſh.* 11. *A Cataplaſm of the Roots or Seeds.*

The Virtues.

IX. *All theſe Preparations* have the ſame Virtues, Uſes, and Doſes, with thoſe of the ſame name in the Chapter of the *Great Burdock*, to which you are referr'd; but there are ſome peculiar Virtues in this Plant, not obſerv'd to be inherent in the former, for which reaſon we ſhall ſay ſomething more of its *Eſſence*, *Decoction*, *Lotion*, and *Cataplaſm*, in the Sections following.

X. *The Eſſence.* It ſtrikes at the Root of the Leproſie, prevails againſt Faintings and Swoonings, opens Obſtructions of Liver and Spleen, but more eſpecially of the laſt, and gives eaſe in pains of the *Hypochonders* and Bowels. Doſe three or four ſpoonfuls Morning and Evening in a Glaſs of Sherry Wine.

XI. *The Decoction.* It is to be made with Wine: and has the Virtues of the *Eſſence*; it conſumes the hardneſs of the Spleen, being taken inwardly Morning, Noon, and Night, to ſix ounces, and as often bathed warm upon the part affected.

XII. *The Lotion. It is made of the Burs, before they are ripe, being bruiſed and laid to ſteep in Water, or Wine, in which a little Nitre is diſſolved, for twenty four hours.* It diſcuſſes Tumors, and gives eaſe in Pains, being bathed warm upon the parts affected. If the Hair is ſometimes waſhed therewith, it makes it become yellow. It is an excellent Gargle for a ſore Mouth and Throat, taking away the Inflammation, and healing of it in a very ſhort time.

XIII. *The Cataplaſm. It is made of the Roots or Green Burs, being beaten to a Pap in a Mortar, and mixed with a third part of Mithridate.* Being applied upon hard Kernels or Swellings in the Fleſh (as thoſe proceeding from the Kings-Evil) it is ſaid to ſoften and diſſolve them: but more eſpecially, if in the mean ſeaſon, the *Juice*, *Eſſence* or *Decoction in Wine* aforementioned be daily given inwardly two, three or four ounces at a time, and that Morning, Noon, and Night; for theſe Preparations very much ſweeten the Blood and Juices; and correct the *Diſcraſie* of the Humors.

CHAP. C.

Of BUTTER-BUR.

I. *THE Names.* It is called in *Greek* Πετασιτης: In *Latin*, *Petaſites*; (from the largeneſs of the Leaf, it being large like Πέτασος, a Hat:) ſome take it to be Ἴασων *Theophraſti*, and ſome to be *Perſolata Plinij*: In *Engliſh* it is called alſo *Petaſites*, and *Butter-Bur*: The *Germans* call it *Peſtilence-wort*, or *Plague-wort*.

II. *The Kinds.* It is of two ſorts, a *Greater*, and a *Leſſer*, and differing alſo in the Flowers; but ſo very like one another, that one Deſcription will ſerve for both. *Camerarius* calls the more common *Mas*, the other *Fœmina*: but in his *Epitome* of *Matthiolus*, he calls the Greater, *Tuſſilago major*, for that ſome will have it to be a kind of *Coltsfoot*.

Butter Bur without flower

III. The Deſcription. *It has a long Root and thick, ſpreading under ground, blackiſh on the outſide, and whitiſh within, oftentimes Worm eaten, and of a bitter and unpleaſant taſte: It ſprings up very early in the Year, with a thick Stalk about a foot high, on which are ſet a few ſmall Leaves, or*

rather

rather pieces, and at the Tops a long ſpiked head of Flowers, in the one (which is the leſs, and the more rare to find) wholly white, and of a better ſcent than the other (though ſome ſay it has no ſcent) in the Greater, which is the more common with us, of a bluſh, or deep red color, according to the Soil in which it grows; a clay ground bringing forth a paler color, ſomewhat weak; and before the Stalk has ſtood with the Flowers a Month above ground, it will be faded away and gone, and blown away with the Wind: after which the Leaves will begin to ſpring, which when they are full grown, will be very broad and large, big enough to cover the whole Body, at leaſt the Head, like an Umbrella, which hides from Sun and Rain; they are ſomewhat thin, and almoſt round; whoſe thick red Footſtalks, being about a foot or more long, ſtand under, or towards the middle of the Leaves, the lower parts of which, are divided into two round parts, cloſe almoſt one to another, of a pale green color above, and hoary underneath. That which brings white flowers, brings forth alſo ſmaller leaves than the other doth, having divers ribs and veins therein.

Butter Burr.

IV. *Gerard* has another kind of Deſcription, which in ſome meaſure explicates the former, for which reaſon I think it neceſſary to inſert it here: *Butter-Bur* (ſays he) *does in a manner bring forth its Flowers before the Leaves, as Colts-foot does (for which reaſon ſome have thought it to be one of the kinds of* Colts-foot, *and for which reaſon* Matthiolus *and* Camerarius *in their* Epitome, *have called it* Tuſſilago major, *as is before mentioned:) Theſe Flowers,* ſays he, *are Small and Moſſie, tending to a purple color, which are made up into a big Ear, as it were, and quickly after, together with its Stem, (which is thick, full of ſubſtance, and brittle) fade and fall away: then comes up the Leaves, which are very great, like a round Cap or Hat, called in Latin* Petaſites, *of ſuch a wideneſs or largeneſs, as that of it ſelf one leaf is big enough to keep a Man from a ſhower of Rain, or from the heat of the Sun, and therefore are much larger than the Leaves of the great* Burdock; *their color is ſomewhat white, but whiter underneath; every Stem bears his Leaf, which is ſometimes a Cubit long, thick and full of ſubſtance, which ſtands, as it were, under the Leaf in the Center or Middle almoſt of the Circumference, like to one of the greateſt* Muſhrooms, *ſetting aſide the Cleft at the lower part of the Leaf near the Stem, eſpecially when they are periſhing or withering away: at firſt the upper ſuperficial or outſide of the* Muſhroom *ſtands out, and when they are in withering it ſtands more in, and the edges, as it were, turn up; ſo is it in the* Butter Bur Leaf, *which has on the out ſide a certain ſhallow hollowneſs.*

V. *The Places.* They *both* grow in *wet* and *moiſt* Grounds by *Rivers* and *Water ſides*, and upon the *Brinks* and *Banks* of *Lakes* and *Ponds*, almoſt every where.

VI. *The Times.* The Flowers riſe and decay in *February* and *March*, and then fade away; *Gerard* ſays, in *March* or *April*: when they are gone, then come up the Leaves, which remain all *Summer*, even till *Winter*, new ones ſtill growing up, and being added to the former.

VII. *The Qualities.* The Roots, which are moſtly uſed, are hot and dry in the third Degree, Digeſtive, Diſcuſſive, and Sudorifick; Cephalick, Neurotick, Stomatick, Hyſterick, and Cordial; Alterative, and Alexipharmick.

VIII. *The Specification.* It has a peculiar power and force againſt Poiſon of all kinds, and the Infection of the Plague.

IX. *The Preparations.* You may prepare from the Root, 1. *A Pouder.* 2. *A Juice.* 3. *An Eſſence.* 4. *A Spirituous Tincture.* 5. *A Decoction.* 6. *A Mixture.*

The Virtues.

X. *The Pouder.* Being given to one dram, and drunk in Wine, it is a moſt excellent thing againſt the Plague, and all ſorts of Peſtilential Fevers, as Spotted Fever, Purples, Meaſles, Small Pox, *&c.* becauſe it is Sudorifick or provoking Sweat, and drives from the Heart all ſorts of Venom and Poyſon: it kills Worms, and is powerful againſt Hyſterick Fits, or Vapors and Suffocation of the Mother: If it is ſtrewed on old and filthy running Ulcers, it cleanſes, drys, and heals them. It alſo provokes Urine, and the Monthly Terms in Women.

XI. *The Juice.* It is expreſſed out of the Root by being beaten in a Mortar, and ſqueezed out with White Port Wine. It has all the Virtues of the Pouder, and may be given from one ounce, to two or three ounces, Morning and Evening, as a preventive againſt the Plague, and every ſix hours after Infection.

XII. *The Eſſence.* It has all the Virtues of the Pouder and Juice, but more powerful to all the Intentions: It provokes Urine, and the Courſes, and kills the flat, broad Worms in the Belly. Doſe one or two ounces mixed with Wine. It is a powerful thing in the cure of the Yellow Jaundice, and the bitings of Vipers, *&c.*

XIII. *The Spirituous Tincture.* It is good againſt Poiſon, and the Bitings of Mad Dogs, prevails againſt Fainting and Swooning Fits, and is a famous thing to rectifie the Diſtemper of the Stomach. Doſe one or two drams in a Glaſs of Canary.

XIV. *The Decoction.* It is good againſt Coughs, Colds, Aſthma's, Wheezings, difficulty of Breathing, and other Diſtempers of the Lungs, cauſing Expectoration. It kills Worms, provokes the Terms, and has all the other Virtues of the Pouder and Eſſence aforegoing, but not full out ſo powerful: Doſe from two ounces to four or ſix, as hot as it can

can well be taken, Morning and Evening, to prevent the Infection of the Plague; and as much every ſix hours, for thoſe who are already ſeized with it.

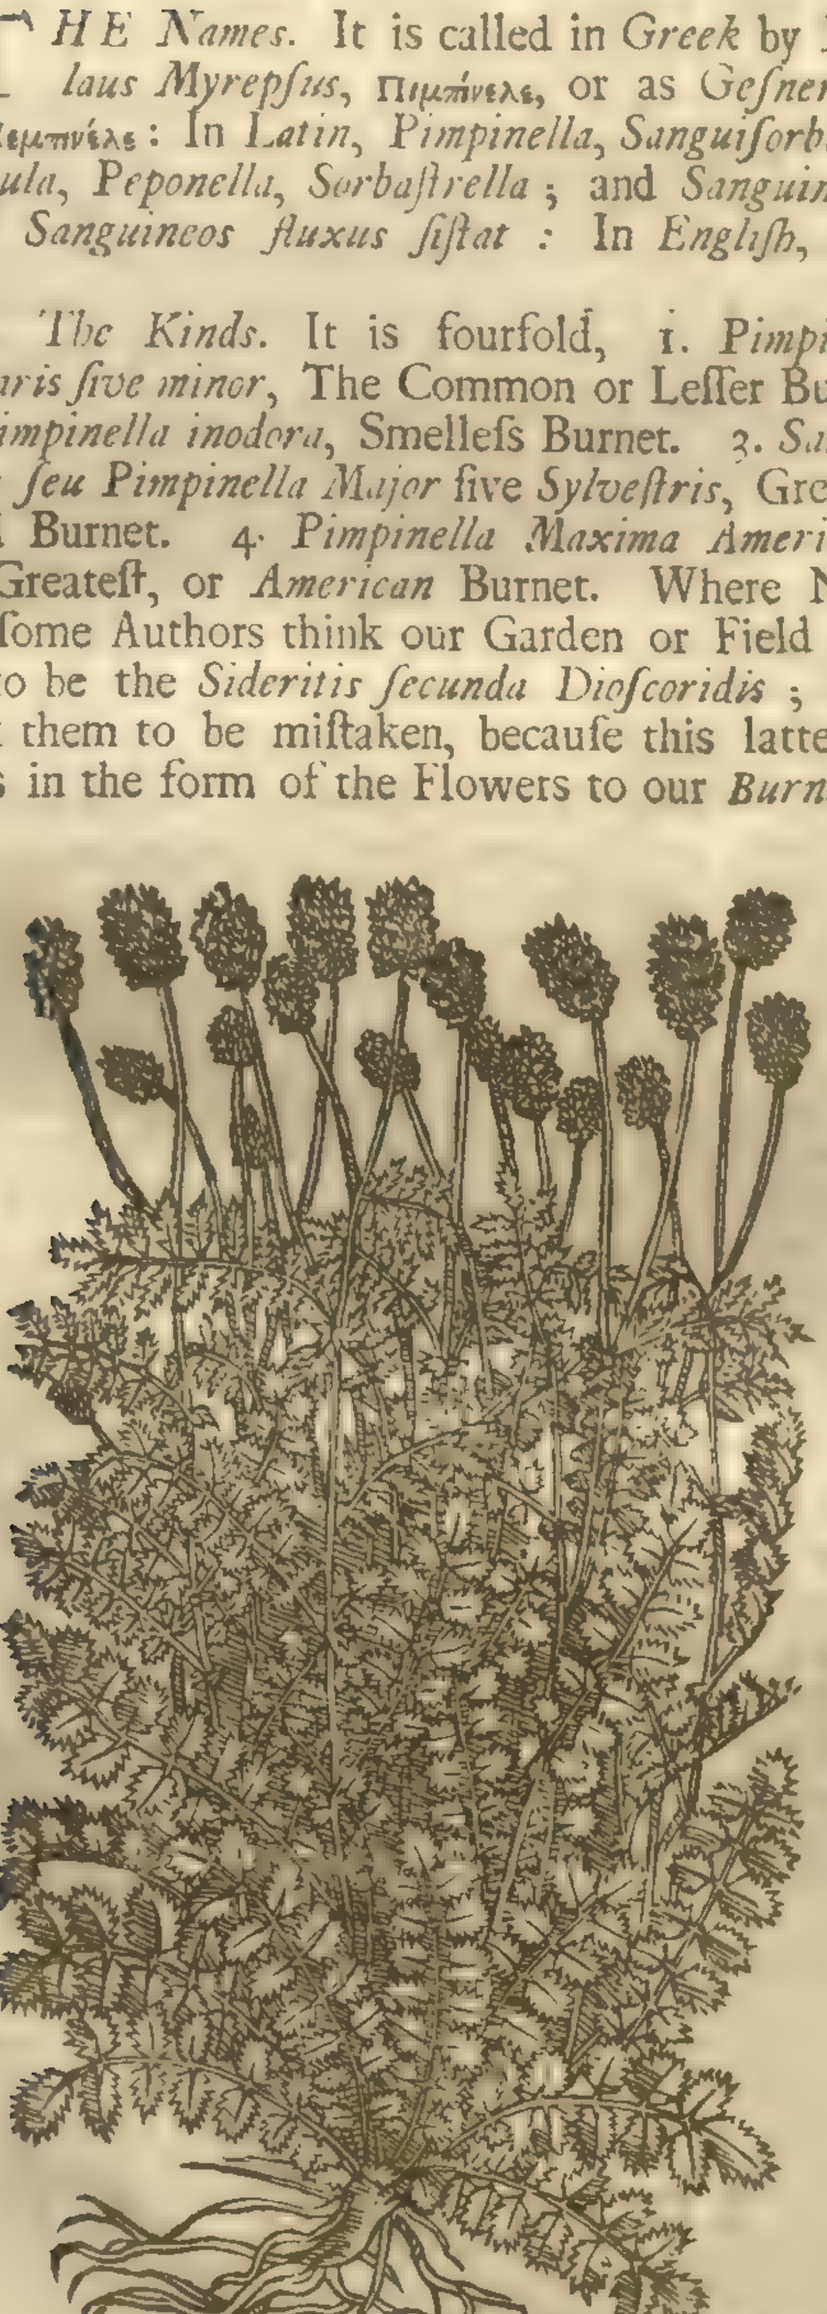
XV. *The Mixture.* It is thus made: *Take of the Juice expreſſed with Vinegar, or the Eſſence, twelve ounces: Juice of Rue four ounces: Venice Treacle, or Mithridate two ounces: mix them well together by ſhaking.* It is an Antidote againſt the Plague or Peſtilence, Spotted Fever, Purples, Small Pox, Meaſles, Poiſon, biting of Vipers, or other Serpents, and the bitings of Mad-Dogs, or of any other Venomous Creature. Doſe two ounces at a time, as often as need requires.

CHAP. CI.

Of BURNET.

I. *THE Names.* It is called in *Greek* by *Nicolaus Myrepſus*, Πιμπινελε, or as *Geſner* has it, Πεμπινέλε: In *Latin*, *Pimpinella*, *Sanguiſorba*, *Bipennula*, *Peponella*, *Sorbaſtrella*; and *Sanguinaria*, *quod Sanguineos fluxus ſiſtat*: In *Engliſh*, *Burnet*.

II. *The Kinds.* It is fourfold, 1. *Pimpinella vulgaris ſive minor*, The Common or Leſſer Burnet. 2. *Pimpinella inodora*, Smelleſs Burnet. 3. *Sanguiſorba ſeu Pimpinella Major* ſive *Sylveſtris*, Great or Wild Burnet. 4. *Pimpinella Maxima Americana*, The Greateſt, or *American* Burnet. Where Note, that ſome Authors think our Garden or Field *Burnet* to be the *Sideritis ſecunda Dioſcoridis*; but I think them to be miſtaken, becauſe this latter anſwers in the form of the Flowers to our *Burnet*.



Small Burnet.

III. The Deſcription. *The firſt of theſe has a Root which is ſmall and long, and of a blackiſh brown on the outſide, growing deep into the Earth, with ſome Fibres thereat; from whence comes forth many long winged Leaves, ſpread upon the Ground, which conſiſt of divers ſmall roundish, or rather oval leaves, green on the upper-ſide, and grayiſh underneath, finely dented about the edges, ſet on each ſide of a middle rib: amongſt which riſe up ſeveral creſted brown Stalks a foot high or better, and in rank ground ſometimes a foot and half high, with ſome ſmaller Leaves ſet in ſome places thereon, divided into ſeveral Branches. At the Tops grow ſmall round looſe heads, upon long Foot-ſtalks of a browniſh color, from whence ſtart forth ſmall purpliſh Flowers, and after them cornered Seed. The whole Plant has a pleaſant quick Smell and Taſte, much like to the ſavor of a* Smelt, *and put into a Glaſs of Wine, gives it a pleaſant Reliſh.*

IV. *The* Inodorous Burnet *in Roots, Stalks, Leaves, and Heads, is altogether like the former, ſave that the Leaves are not ſo round, but ſomething longer, and have no manifeſt Smell or Taſte in them.*

Large Common Burnet.

V. *The* Great *or* Field Burnet, *has a Root black and long like the firſt Kind, but greater, from whence ſprings up ſuch like winged Leaves, but nothing ſo many, and each of thoſe Leaves on the Wings, are twice as large at leaſt as the other, and nicked about the edges in the ſame manner, of a grayiſh color on the under ſide: Stalks are greater, and riſe higher, with many ſuch like Leaves ſet thereon, and greater round heads on the Tops, of a brownish green color, out of which come ſmall dark purple Flowers, very much like the former, but greater: The Plant it ſelf has very little of Smell or Taſte in it, which can be perceived.*

VI. *The* American great Burnet, *has a Root much greater than the former, and woody, longer alſo, and blacker than the laſt; but in all its other parts, it is like our* Field Burnet, *but much greater: often times all its Leaves are of a blewiſh green on the upper ſide, and folded half way together inward, ſo that the under ſides of the Leaves, which are greyiſh, ſhew themſelves upwards; and they are dented ſomewhat deeply about the edges, with greater dents, which makes them ſhew the more comely and pleaſant. The tops of the Stalks bear ſmaller, and much*

longer, whitiſh green ſpiked heads, ſet thick with Knaps, each of which when it flowers (beginning below, and ſo riſing higher) ſhews to be four whitiſh green Leaves, having many ſmall white long threads in the midſt; after which come in their places cornered Seed like the other. The whole plant has not much ſmell, but in its Taſte, is much like the firſt.

VII. *The Places.* The *firſt* grows wild in ſeveral Counties of *our Land*, in *dry ſandy places*, but is uſually kept in *Gardens*. The *ſecond*, *Bauhin* ſaith is found in *Spain*, and I have found it in ſome Meadows in *Norfolk*, not far from *Lyn Regis*. The *third* is found in ſeveral Counties of *England*, in the Meadows in *Norfolk*, *Suffolk*, *Cambridge-ſhire*, *Huntingdon-ſhire*, and *Northampton-ſhire*; as alſo near *London*, by *Paneras* Church, in two or three Fields nigh *Booby's-Barn*, and in the middle of a Field by *Paddington*: I have alſo found it in ſome Fields between *London* and *Newington*, as alſo going towards the *Boarded River*. The *laſt* is found in the *French* Settlements in *Canada*, and in the North parts of *Virginia*, where it is Natural: from whence it has been tranſplanted to us, and is nouriſhed up in *Gardens*.

VIII. *The Times.* They all flower in *June*, and beginning of *July*; and their Seed is ripe in *Auguſt*.

IX. *The Qualities.* They are generally hot and dry; the firſt of them in the Second Degree; the other three in the Firſt Degree: They are Incarnative, Aſtringent, Styptick, Repercuſſive, and Traumatick, or Vulnerary: Cephalick, Neurotick, Stomatick, Cardiack, and Alterative: Alexipharmick, and Analeptick.

X. *The Specification.* *Burnet* is a peculiar Plant for ſtopping all ſorts of Fluxes of Blood; whence came the names *Sanguiſorba*, and *Sanguinaria*.

XI. *The Preparations.* You may prepare therefrom, 1. *A liquid Juice.* 2. *A Decoction.* 3. *A Syrup.* 4. *A Wine.* 5. *A Vinegar.* 6. *A Spirituous Tincture.* 7. *An Acid Tincture.* 8. *A Pouder.* 9. *An Oil.* 10. *An Ointment.* 11. *A Balſam.* 12. *A Spirit.* 13. *The Seed.*

The Virtues.

XII. *The liquid Juice.* Taking it inwardly from three to five ounces, either alone or mixed with Red Wine, it ſtops all manner of Inward bleedings whatſoever, whether ſpitting or vomiting Blood, piſſing Blood, or Bloody-flux: It alſo ſtrengthens the Stomach and Heart: and is ſingular good for all ſorts of Wounds, whether inward or outward.

XIII. *The Decoction.* It has the Virtues of the liquid Juice, but is much weaker, yet very good to repreſs Vapors in Women. Doſe ſix ounces Morning and Evening.

XIV. *The Syrup.* It is excellent againſt ſpitting of Blood, and heals Bloody-fluxes of the Bowels; and it is ſo much the more effectual with Steeled Water or Wine: If it is made of the Juice, it is good for healing all ſorts of Wounds of Head and Body, inward or outward, for all old Ulcers, Ulcerated Cancers, and Running Sores, which are hard to be cured. Doſe two or three ounces at a time.

XV. *The Wine.* It chears the Heart, revives the Spirits; and is good againſt Melancholly, drooping of the Mind, and fainting of the Heart.

XVI. *The Vinegar.* It is a ſpecial thing to preſerve from, and cure the Plague or Peſtilence, the Spotted Fever, or any other malign acute Diſeaſe of that kind; for it in a ſpecial manner defends the Heart from Poiſonous and Noiſom Vapors, and all contagious Diſeaſes, being given mixed with the Juice in equal quantities, and the Patient laid to Sweat thereupon. Doſe three ounces.

XVII. *The Spirituous Tincture.* It comforts and warms the Stomach and Bowels, ſtrengthens Nature, and takes away the weakneſs of the Stomach and Inteſtines, thereby ſtopping Fluxes of the Belly of all kinds: It ſtrengthens the Heart and Liver, and other principal Parts, and therefore is good againſt Faintings and Swoonings. Doſe one ſpoonful at a time in a Glaſs of Wine.

XVIII. *The Acid Tincture.* This has all the Virtues of the Vinegar aforegoing, but is much more powerful than it, to all the purpoſes and intentions there ſpecified: beſides this is an extraordinary Stomatick, and therefore powerful in ſtopping Vomitings, and alſo ſpitting of Blood, being given in a Glaſs of Canary, or Red Port Wine. Doſe thirty or forty drops, to fifty or ſixty, two or three times a day.

XIX. *The Pouder.* Uſed outwardly to old Ulcers, moiſt and running Sores, it drys them up wonderfully, and prepares them for healing. It may be made of the whole Plant.

XX. *The Oil.* It is uſed to abate Inflammations, eaſe Pains, ſtrengthen weak Parts, cure Burnings and Scaldings, and to draw malignity out of Wounds made by the bitings of Venomous Beaſts.

XXI. *The Ointment.* It has the Virtues of the Oil, but penetrates not ſo much, yet is more effectual for the cure of Wounds, Ulcers, and other Running and Malignant Sores.

XXII. *The Balſam.* If it is made of the Juice, or green Herb, it is one of the beſt Vulneraries in the World: it digeſts, cleanſes, drys, ſtrengthens and heals all green Wounds, old Ulcers, running Sores, and other ill natured Diſeaſes of that kind. It is certainly a moſt excellent Wound Balſam. If it is mixed with Pouder of Scammony, it takes away rotten Fleſh, and deſtroys Putridity or Rottenneſs.

XXIII. *The Spirit.* It ſtops inward Bleedings, comforts the Heart and Bowels, and is an excellent thing againſt Fluxes of the Belly of all kinds, more eſpecially the Bloody-flux, and the overflowing of the Terms in Women: and this it does the more powerfully, if a little Catechu be diſſolved in it. It prevails alſo againſt the Contagion of the Plague. Doſe from one dram to half an ounce.

XXIV. *The Seed made into a Pouder.* This, ſays *Parkinſon*, is no leſs effectual, both to ſtop Fluxes, and to dry up moiſt or running Sores, being given inwardly (to one dram) in ſteeled Water or Wine, that is, if Water in which hot Gadds of Steel have been quenched; or if Wine, in which old Nails have been infuſed for two or three Months beforehand: The pouder of the Seed may alſo be mixed with Ointments or Injections.

XXV. *The* American *Burnet* has all the ſame Preparations with our *Engliſh*, and the ſame Virtues, Uſes, and Doſes.

CHAP. CII.

BUTTER-WORT.

I. *THE Names.* It ſeems not to be known to the *Greeks*, and therefore we have no univerſally received *Greek* name for it, only *Geſner* thought it to be *Dodecatheon Plinij*: *Lugdunenſis* thinks it may be *Crias Apulei*, and calls it *Cucullata*: but it is called in *Latin*, *Pinguicula* by *Geſner*, and from him all others call it ſo: others *Lingula Plinij*,

Plinij, *Viola humida*, *Viola Palustris*: *Bauhin* calls it, *Sanicula montana flore calcare donata*: with us it is called, *Sanicula Eboracensis* (because it grows so plentifully in *York-shire*.) In *English* it is called ***Butter-wort***, and *Butter-root*, because of the Unctuosity of the Leaves; or else from *Fattening*, as *Gerard* says, who also saith, they call it *White Rot*, and not *White Root*, because the Countrey people think, that if their Sheep should eat it, that it would give them the Rot; and they give it the Epithite *White*, from the color of the Leaf: as they have another which they call *Red-Rot*, which is *Pedicularis*, Red-Rattle.

II. *The Kinds.* It is a singular Species of the *Sanicles*; being Genus to none else.

Butter wort.

III. The Description. *It has a Root composed of divers white Fibres, or small Strings, which die not in the Winter, but abide all the time with green Leaves upon them: From this Root spring forth divers fat and long Leaves lying upon the ground round about it, broad at the bottom, and pointed at the end, of a pale green color on the upper side, but white underneath, folded together at their first rising, which then are more White. From among these Leaves, rise up two or three, or more, slender naked Stalks, about five or six Inches high, bearing but one only Flower at top of each Stem, set in a small green husk, in form somewhat like a Violet Flower, or those of Larks Heels or Spurs, having a small Heel or Spur behind, in some of a purple, in others of a more blew color, and in some white. When the Flowers are past, there come in their places small pointed round heads, in which is contained small, long, black Seed.*

IV. *The Places.* It is chiefly found in the Common Field, and in several Bogs on the Hills in *Yorkshire*: and in many places also in the *West Country*, and *Wales*: as also in a Common, about a Mile from *Oxford*, near a Village called *Herington*. *Gerard* says, it grows in *England* in squashy wet Grounds, and will not yield to any Transplanting or Cultivating of it; and that it grows especially in a field called *Crag-Close*, and at *Crosby*, and *Ravenswath* in *Westmorland*; upon *Ingleborow Hils*, twelve Miles from *Lancaster*; and in *Harwood* in the same County, near to *Blackburn*; ten Miles from *Preston* in *Aunderness* upon the Bogs, and Marsh Grounds: and in the Boggy Meadows about *Bishops-Hatfield*: also in the *Fenns* in the way from *London* to *Whitlesea Mere* in *Huntington-shire*: It grows also in *Hampshire*, and in great abundance in many places in *Wales*.

V. *The Times.* It Flowers towards the latter end of *May*, and all the Month of *June*, even to *July*, (according as the Weather proves) and the *Seed* is ripe not long after.

VI. *The Qualities.* It is *Temperate* in respect to heat or cold, and *Drying* in the Second Degree. It is Astringent, and Cathartick, like Rhubarb; Consolidative, and Traumatick, or Vulnerary.

VII. *The Specification.* It is dedicated to the curing of Green Wounds, and healing of Recent Ruptures in Children.

VIII. *The Preparations.* You may make therefrom, 1. *A liquid Juice of the Plant.* 2. *A Syrup.* 3. *An Ointment.* 4. *A Balsam.*

The Virtues.

IX. *The liquid Juice.* Country People, who live where it grows do use to wash their Hands with it, when they are Chapt by the Wind or Weather: and in *Yorkshire* they anoint the Dugs of their Kine, with the Fat and Oily Juice, when they are bitten with any Poisonous Worm or Fly, or are Chapt or Rift by Weather, or any other means.

X. *The Syrup.* The Poorer sort of People in *Wales*, make a Syrup thereof, as of Roses, and therewith Purge themselves, and their Children: they mix it with Broth for the same purpose, and so it purges Flegm effectually. Dose from two to four spoonfuls.

XI. *The Ointment.* They also with the Herb make an Ointment, which is held to be singularly good (and that by the Experience of some Physicians) against the Obstructions of the Liver.

XII. *The Balsam.* It is said to cure Ruptures in Children, being applied Plaister-wise: It is a singular Vulnerary, for it digests, cleanses, and heals Green Wounds in any part, being highly Astringent, Drying, and Consolidating, not much inferior to any of the Wound Herbs.

CHAP. CIII.

CABBAGE.

I. THE *Names.* It is called in *Greek*, Κεφάλη κεφαλωτὴ: In *Latin*, *Brassica Capitata*: In *English*, *Cabbage*, or *Headed Colewort*.

II. *The Kinds.* It is twofold, 1. Κεφάλη κεφαλωτὴ λευκὴ, *Brassica Capitata Alba*, White Cabbage. 2. Κεφάλη κεφαλωτὴ ἐρυθρά, *Brassica Capitata Rubra*, Red Cabbage.

III. The Description. *The Common* White Cabbage *has a Root going right down, but not deep, nor spreading far, and usually dies in Winter: from which Root springs up one thick Stalk, having at top thereof a great thick Head of crumpled Leaves: this Head is closed hard and round, and has at first great large thick Leaves, of a grayish green color, with thick, great, and lying open most part of the Summer, without closing: but towards the end of the Summer, being grown to have many Leaves, it then be-*

gins to grow close and round in the middle, and as it closes, the Leaves grow white inwards; yet there are some kinds, which will never be so close as these, but will remain half open, which are not accounted to be so good as the other. In the middle of this Head, the next Year after the Sowing (in other Countries especially, and sometimes in ours) if the Winter is mild, you may see in divers Gardens a great thick Stalk to shoot forth, which is divided in the top into many Ramifications, *or Branches, bearing thereon divers small Flowers, sometimes white, but most commonly yellow, made of four Leaves, which being past, turn into long, round, and pointed Cods, containing therein small round Seed, like to Turnep Seed. Now here is to be noted, that by reason of the hard Frosts, and Cold of our Countrey, some of our Gardiners, for the preventing the danger of the said Winter Frosts, do use to take up such Cabbages (as they intend to reserve for Seed) with their Roots; and tying a Cloth or some such thing about the Roots, do hang them up in their Houses, that thereby they may be defended against the Cold; and then set them again after the Frosts are past.*

Cabage.

IV. *The* Red Cabbage *is in all things like unto the White, excepting in the color, this being deeply Red; as also in the magnitude, the Red being for the most part less than the White; and though it is many times found large, yet it is scarcely ever found so large as the large ones of the White. In this also the color of the Leaves is very variable, in some it is Green striped with Red; in others it is more Red; and again in some, it is a very deep Red, and sometimes declining to purple.*

V. *The Places.* They are found growing with us only in Gardens, being nourished, and brought to perfection chiefly by the care and industry of Gardiners.

VI. *The Times.* They Flower for the most part in *June* or *July*, and the Seed is ripe in *August*.

VII. *The Qualities.* They are *Temperate* in respect of heat or coldness; and moist in the first Degree: They are also Opening, Absterstive, Diuretick and Emollient: Also Pectoral, Hepatick, Nephritick, and Hysterick; Galactogenetick and Alterative.

VIII. *The Specification.* It is in vain to be particular, for the old *Romans* having expelled Physicians out of their Territories for *Six Hundred Years*, did maintain their Health by using and applying *Cabbages* and *Coleworts* as their only Medicine, or Remedy, in every Disease. And therefore as they thought them to be effectual against all Diseases of the Body, whether inward or outward, so *Chrysipus* wrote a Volume of their Virtues, applying them to every part of the Body.

IX. *The Preparations.* You may make therefrom, 1. *A liquid Juice.* 2. *A Decoction.* 3. *A Syrup.* 4. *An Electuary.* 5. *Ashes.* 6. *The whole Substance.* 7. *A Collyrium.* 8. *The Seed.*

The Virtues.

X. *The liquid Juice.* Drunk in Wine to three or four ounces, it is good against the bitings of Vipers, or other Venomous Creatures: mixed with Honey, and taken, it is good against Hoarseness, or loss of the Voice, and helps to restore such as are in Consumptions: mixed with Wine or Vinegar, and drank, it is good against the Venom of Mushrooms: *Galen* applied it to the Temples of such as had the Head-ach, arising from Drunkenness; it cleanseth so strongly, that it is said to cure the Leprosie.

XI. *The Decoction* The first Decoction is said to open the Body, but the second does Astringe or Bind, for that the Nitrous quality is quite consumed or spent. If it is made in Water, with an old Cock beaten to peices boiled in it, it prevails against Consumptions, and helps such as are troubled with Gripings, and pains in their Stomachs and Bowels, it is also good for such as are troubled with Obstructions of Liver or Spleen, and the Stone or Gravel in Reins or Bladder. It restrains the Vapors arising from Wine, and suddenly makes them sober again. It takes away the Swelling and Pain of Gouty Knees, being bathed warm therewith, dispersing the Humors. It also cleanses and heals old and filthy Ulcers or Sores, and Scabbiness, being often washed therewith, as also Pustules and Wheals which break out in the Skin.

XII. *The Syrup.* Made of the Juice, has the Virtues of the same, but in a more peculiar manner it is good against Coughs, Colds, Wheasings, shortness of Breath, Consumptions, and other Diseases of the Brest and Lungs: dropt into the Eyes, it consumes Films, Clouds, or other things which obfuscate the Sight, and heals Sores and Ulcers in the Eyes.

XIII. *The Electuary.* It is made of the Pulp of the great middle Ribs of the great Leaves, boiled soft in Almond Milk, or Cows Milk, and compleated with Honey. It is profitably used for such as are Hoarse or Wheeze, or are Pursie or Short-winded; being taken three, four or five times a day, as much as a Wallnut.

XIV. *The Ashes.* They are made of the Stalks, and are of such a drying Quality, that as *Parkinson* saith, they become almost Caustick: being mixed with Oil Olive, and Beef Suet, in a small proprotion, they are found to be effectual to anoint the Sides of such as have had vehement and inveterate Pains there; as also it is good for Pains in any other place, caused by the access of Melancholick and Flatulent Humors, helping mightily to discuss and scatter them; and therefore must be very profitable against the Gout.

XV. *The whole Substance.* It is usually boiled in Water, or in Mutton or Beef Broth, till it is soft; and so with Butter, Vinegar, and Pepper, it is eaten as a Sallet, and for Food: and so eaten it nourishes, cleanses the Bowels, creates Seed, also Milk in Nurses,

Nurſes, helps Coughs, and Hoarſneſs, and reſtores in Conſumptions, being very Stomatick; (for Stomaticks are indeed the greateſt reſtauratives.)

XVI. *The Collyrium.* It is made of the Juice mixed with Honey, and boiled to the thickneſs of a thin Syrup. Drop'd into the Eye, it clears the ſight, and clears it of Clouds or Films, or any other matter which hurts it. It prevails againſt an Ophthalmie, and heals Sores or Ulcers of the Eye, removing the weakneſs, and much ſtrengthening the part affected.

XVII. *The Seed.* If it is bruiſed, and mixed with a ſixth part of Muſtard Seed, and ſo drunk with Wine, it kills Worms in the Stomach or Bowels: it alſo expels Wind in the Bowels; and eaſes the pains of the Ventricle cauſed from Acid, or Cold and Moiſt Humors. Doſe one dram, Morning and Evening.

CHAP. CIV.

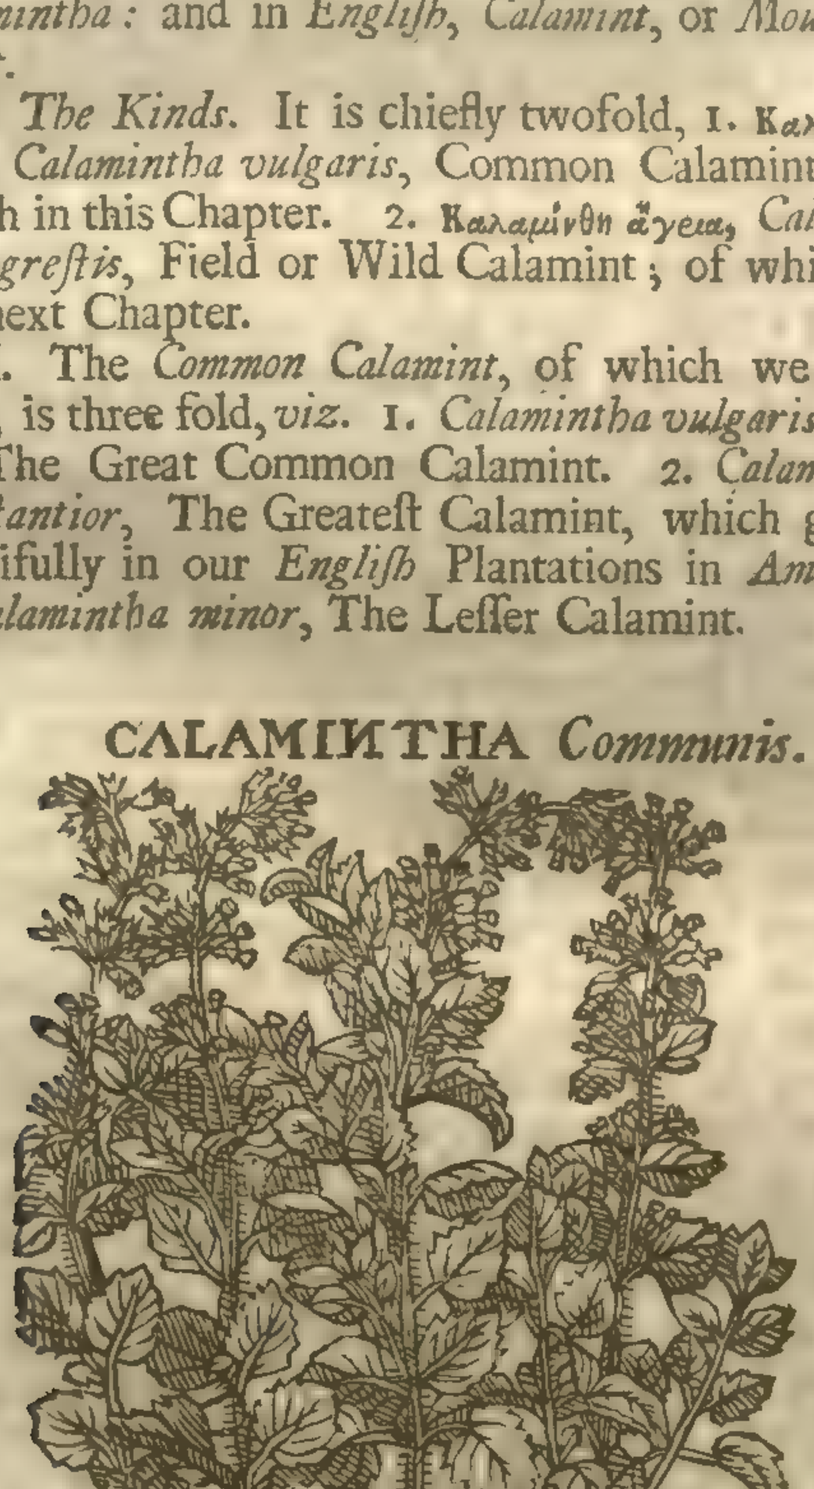
CALAMINT Common *and* Small.

I. *THE Names.* It is called in *Greek*, Καλαμίνθη *(quaſi bona vel utilis Mentha)* in *Latin*, *Calamintha:* and in *Engliſh*, *Calamint*, or *Mountain Mint.*

II. *The Kinds.* It is chiefly twofold, 1. Καλαμίνθη κοινὴ, *Calamintha vulgaris*, Common Calamint; of which in this Chapter. 2. Καλαμίνθη ἄγεια, *Calamintha agreſtis*, Field or Wild Calamint; of which in the next Chapter.

III. The *Common Calamint*, of which we here treat, is three fold, *viz.* 1. *Calamintha vulgaris magna*, The Great Common Calamint. 2. *Calamintha Præſtantior*, The Greateſt Calamint, which grows plentifully in our *Engliſh* Plantations in *America.* 3. *Calamintha minor*, The Leſſer Calamint.

CALAMINTHA *Communis.*



Calaminta Americana.

Calamint Small

IV. The Deſcription. *Our ordinary* Calamint *has a Root ſmall and woody, with divers ſmall twigs, or fibres, ſpreading within the ground, not dying Annually, but abiding many Years; from which Root riſe up ſeveral ſquare hoary and woody Stalks, about a foot high, ſeldom higher: The Stalks and Branches have two hoary Leaves ſet at a Joint, about the bigneſs of Marjoram, or not much bigger, a little dented about the edges, and of a very piercing and quick Scent, as the whole Herb is: The Flowers ſtand at ſeveral*

ſeveral places of the Stalks, from the middle almoſt upwards, which are ſmall and gaping, much like to thoſe of Mint, and of a pale bluſh color. The Flowers being gone, there follows ſmall, round, blackiſh Seed.

V. Calamintha Præſtantior Americana, *has a woody Root, which abideth, and ſends forth new Branches every Year. It is a Sweet Herb, and riſes up to be about a foot and half high, with ſquare, hard, and hoary Stalks, which are many, and more ſlender than thoſe of the Wild Mint; on which are ſet at every Joint, two ſmall, and ſomewhat round Leaves, deeply dented about the edges, yet larger than thoſe of the Wild Kind, being ſomewhat hairy, but not very hoary, rather of a ſad green color, of a very ſweet Scent, and not ſtrong or heady as the other. The Flowers are gaping, and like the former, but larger, and of a purple color; which being gone, then comes the Seed, which is black, ſmall, round, and ſomething like unto Purſlane Seed.*

VI. The Small Calamint, *is another ſort of the firſt, and is like unto it in all thing, except the magnitude, being ſomething leſs, and differing chiefly in the Flowers, which are not ſo large by one half, and therefore denotes it to differ from the ſame.*

VII. *The Places.* The *firſt* grows in many Gardens, and in Dry and Upland Grounds, and on Heaths in many places of *England.* The *ſecond* grows in many places of *Engliſh America*, it having been found in ſeveral old Plantations, after they have been flung up for reſt, as alſo in the Borders of ſeveral Woods. It has alſo been found on the *Euganæan* Hills near *Padua*, on Hills near *Vicenza* in *Italy*; on rocky Cliffs of *Sevena* in *Provence*, as alſo in *Germany*: *Lobel* alſo found it growing in *England.* The *Small Sort* is found for the moſt part in thoſe places where the firſt is alſo found, or not far off from them.

VIII. *The Times.* They all Flower about the latter end of *June*, and in *July*, and their Seed is ripe in ſome ſhort time afterwards.

IX. *The Qualities.* It is hot and dry in the third Degree: Aſtringent, Carminative, Digeſtive, Diſcuſſive and Sudorifick. It is alſo Cephalick, Neurotick, Stomatick, Pectoral, Cordial and Hyſterick: Alexipharmick and Alterative.

X. *The Specification.* It powerfully provokes the Terms in Women, and facilitates the Delivery of Women in Labor.

XI. *The Preparations.* You may make therefrom, 1. *A Pouder of the Leaves.* 2. *A liquid Juice.* 3. *A Decoction.* 4. *A Diſtilled Water from the Herb gathered in* June *or* July. 5. *A ſimple Syrup of the Juice.* 6. *A Spirituous Tincture.* 7. *An Acid Tincture.* 8. *An Oily Tincture.* 9. *A Saline Tincture.* 10. *A Spirit.* 11. *A diſtilled Oil.* 12. *A Balſam.* 13. *An Ointment.* 14. *A Peſſary.* 15. *A Cataplaſm.*

The Virtues.

XII. *The Pouder of the Leaves.* Made into an Electuary with Salt and Honey, it kills Worms in the Body, helps the Leproſie, and ſuch as are troubled with ſhortneſs of Breath.

XIII. *The liquid Juice.* It provokes Urine and the Terms, eaſes ſhortneſs of Breathing, and Cholerick Torments of the Stomach and Bowels: It alſo facilitates the Delivery of Women in Travel, and expels the Dead Child, and therefore Women with Child ought to forbear the uſe of it. Dropped into the Ears, it kills Worms in them; and opens Obſtructions of Lungs, Liver, Spleen and Womb. And the Body being firſt well purged, if it is given from two to four ounces, to ſuch as are troubled with a Tertian Ague, it cures it.

XIV. *A Decoction in Wine.* It has all the Virtues of the Liquid Juice, but not full out ſo powerful; but as it is leſs in power, ſo it is much more pleaſant to be taken, and therefore may be given in the larger Doſe. It brings down Womens Courſes, and provokes Urine, and is good for thoſe who are Burſten, or are troubled with Convulſions, Cramps, or ſhortneſs of Breath. It helps the Yellow Jaundice, and ſtays Vomiting, and is good againſt the bitings of Vipers, or other Venomous Creatures: It provokes Sweat powerfully, and therefore is ſingular good againſt all malign Fevers, as Meaſles, Small Pox, Spotted Fever, and the Plague it ſelf. Doſe from four to ſix or eight ounces.

XV. *The Diſtilled Water.* It has all the Virtues of the Decoction, but much weaker, and therefore is chiefly uſed as a Vehicle to convey any of the other Preparations in.

XVI. *The Syrup of the Juice.* It is highly Pectoral, and therefore a moſt excellent thing to open all Obſtructions of the Lungs, and heal their Diſtempers, prevailing againſt Colds, Coughs, Hoarſneſs, Wheezing, ſhortneſs of Breath, difficulty of Breathing, hardneſs of the Spleen, and other Diſtempers of the Bowels. Doſe two ſpoonfuls Morning and Evening, for ſome conſiderable time.

XVII. *The Spirituous Tincture.* It is a ſingular thing againſt all manner of Malignity, Poiſon, and Infection whatſoever: It powerfully cures Convulſions in the Bowels, Stomach, or in any other part of the Body; it ſtrengthens Nature, chears the Heart, revives the Spirits, and is an excellent thing againſt cold Sweats, Faintings, Swoonings, Fits, and all ſorts of *Deliquiums* of the Spirits or Heart, and other Bowels, proceeding from Cold, or a cold and moiſt Cauſe. Doſe half an ounce in a Glaſs of Wine, Morning faſting, and Evening, or in the time of the Paroxyſm.

XVIII. *The Diſtilled Oil.* It has all the Virtues of the Juice and Decoction, but much more efficacious than either of them: being dropt ten or fifteen drops into Sugar, and ſo drunk in a Glaſs of Wine, it gives immediate relief in the Cholick; and ſo given to a Woman in Labour, it preſently forces away the Child, either alive or dead; outwardly anointed upon parts Paralytick, or affected with the Cramp, it preſently gives relief in the latter, and in ſome few times uſing helps the former.

XIX. *The Acid Tincture.* It is moſt admirable againſt the Plague, Spotted Fever, and all other ſorts of Malignant Fevers; as alſo againſt the Poiſon of Serpents, as Vipers, Rattle Snakes, *&c.* bitings of Mad Dogs, or other Venomous Creatures, the Acid deſtroying all ſorts of malignity and Poiſon whatſoever: It may be given inwardly from half an ounce to two ounces every ſix hours in ſome proper Vehicle; and outwardly bathed upon the Region of the Heart, or upon the place bitten or hurt, and Cloths dipt therein may be laid on, and this three, four, or five times a day.

XX. *The Oily Tincture.* Given inwardly to two drams, it gives eaſe in the Cholick preſently, and opens Obſtructions of the Reins and Womb, provoking Urine, and forcing away Sand, Gravel, and other Tartarous Matter obſtructing thoſe parts: Anointed upon Spaſms, it cures them in a ſhort time: and well rubbed in, Morning and Evening for ſeveral days, upon any part troubled with the Palſie, it reſtores them, comforting the Nerves, and warming and ſtrengthening the Parts afflicted: It is alſo profitable againſt the Piles, proceeding from a cold cauſe, (if not broken) they being anointed therewith two or three times.

XXI. *The*

XXI. *The Saline Tincture.* It is good to wash such parts as break out with any sharp or salt Humor, as the Leprosie of the *Greeks*, Scurf, Morphew, Scald Heads, Dandriff, and the like: bathed upon parts troubled with the Gout or Sciatica, and continued for some time, Morning and Evening, it gives ease of the Pain, does much good, and in time removes the Disease.

XXII. *The Spirit.* It is Cephalick, Neurotick, Stomatick, Cordial, and Alexipharmick: It stops Vomiting, strengthens a weak Stomach, chears the Heart, revives the Spirits, and is good against Fainting and Swooning, Vapors, and Fits of the Mother, and preserves (being taken in a Morning fasting) from the Infection of the Plague, or of the Spotted, or any other Malign Fever. You may take a spoonful or two of it at a time (if Dulcified) and that twice a day, or upon the spot, if any Paroxysm is present: It is also good to bathe with, if any thing like a Gangrene is feared.

XXIII. *The Balsam.* Being applied to a cold Gout, it gives ease to the Pain, and anointed upon the Hemorrhoids, or Piles, it heals and cures them.

XXIV. *The Ointment.* It is good to anoint Womens Breasts, which are swoln and painful, proceeding either from Cold, or Curdled Milk, or some external Violence.

XXV. *The Pessary.* The green Herb made into a Pessary with Wooll, and put up the *Vagina Uteri*, it provokes the Terms, eases the pains of the Mother, resists Vapors and Hysterick Fits, and if it is near the time of Travel, hastens and facilitates the Birth.

XXVI. *The Cataplasm.* It is made of the green Herb, with Lard, Crumbs of Bread, or Pouder of Bay-berries: being applied to any part pained with the Gout, it eases the Pains, abates the Tumor or Swelling, and discusses or draws forth the Humors. It must be continued Morning and Evening for some considerable time, by which means it is said to perfect those Cures. Being applied upon places black and blew, or yellow, or otherwise discolored, it takes away the ill color, and cleanses the skin.

CHAP. CV.

CALAMINT, Wild.

I. THE *Names.* It is called in *Greek*, Καλαμίνθη ἄγρεια: In *Latin*, *Calamintha agrestis*: and in *English*, Wild Calamint.

II. *The Kinds.* We shall treat here of three several Kinds of it: 1. *Calamintha arvensis verticillata, sive Aquatica Lobellij*, Field Calamint with whorled Coronets. 2. *Calamintha altera odore Pulegij, foliis maculosis*; Calamint having the Pennyroyal Smell, and with Spotted Leaves. 3. *Calamintha minor incana*, The lesser hoary Calamint.

III. The Description. *The first of these has a small Root, abiding long, and not perishing after Seed time: From which Root come forth several square hoary Stalks full of Joints; and two small, and almost round hoary Leaves set thereat, up to the tops, something like to Pennyroyal leaves, of a brisk, sharp, and quick Scent, yet Sweet withal, like unto Pennyroyal. Towards the Tops of the Stalks and Branches there stand, with the Leaves, many purplish Flowers. several being set together, in a kind of Whorle or Coronet; after which comes small blackish Seed.*

IV. The second or Spotted Calamint, *differs not much from the Common Calamint in the former Chapter, but that it grows nothing near so great nor high; it has square, hard, hoary Stalks, and hoary Leaves thereon like it; but spotted here and there, of a very strong Scent like unto Pennyroyal. The Flowers grow in the same manner as the Common*

Calamint

Calamint in Cap. 104. Sect. 4. *but ſmaller, and of a pale purpliſh color, having much like ſmall blackiſh Seed.*

Calamint leſſer Hoary.

V. *The* third, *or* Leſſer hoary Calamint, *has a fibrous Root like the others, and not periſhing yearly. From which ſpring up ſmall, low, and ſlender hoary Stalks, not above a Foot high, on which, at every Joint, are ſet two Leaves, as in the other Kinds, but ſmaller, and more hoary, yea ſmaller than the leaſt Buſh Baſil. The Flowers are very ſmall, but like the laſt deſcribed, and of a leſs heady ſmell, with like Seed alſo, but ſomething leſſer.*

VI. *The Places.* The firſt grows in many places of *England*, both in plowed Grounds, and moiſt Meadows. The ſecond, *Pena* ſays he found on certain Hills in *Lombardy*; and in ſeveral places of our own Land, but not always ſpotted: I have found it in ſeveral places of *South Carolina*. The third and laſt is not common with us, but only nouriſhed up in Gardens: It grows in *Candia*, from whence the Seed came firſt to *Camerarius*.

VII. *The Times.* They Flower in *June* and *July*, and their Seed is ripe ſoon after.

VIII. As to their *Qualities, Specification, Preparations, Virtues and Uſes*, they are exactly the ſame with thoſe in the former Chapter, and therefore to thoſe I refer you.

CHAP. CVI.

CALTROPS, Land.

I. *THE Names.* They are called in *Greek* Τειβολος, ἡ Τείβυλος: In *Latin, Tribulus*: In *Engliſh, Calthrops.* The *Arabians* call this Plant *Haſach*, and *Haſerk*; the *Spaniard, Abrolos*, and the *French, Saligot.*

II. *The Kinds.* It is twofold, firſt of the Land, called in *Greek*, Τείβολος χερσαῖος; in *Latin, Tribulus terreſtris*; and in *Engliſh, Land Caltrops*, of which in this Chapter. Secondly, *Water Caltrops*, of which in the next.

Land Caltrope

III. The Deſcription. Land Caltrop *has a Root which is white, grows downwards, and has many Fibres or Strings. From this Root riſe up ſeveral hard, ſmall, long Branches, full of Joints, and ſpread abroad upon the ground; which are furniſhed with many winged Leaves, having a middle Rib, on which ſtand ſeveral ſmall Leaves, on both ſides the ſaid Rib, after the manner of* Orobus *or* Vetches. *At the Joints come forth ſingly, ſmall, pale, whitiſh Flowers, conſiſting of five ſmall Leaves, like the Flowers of Tormentil. Theſe being paſt, there comes forth little, rough, prickly heads, full of Prickles, and having five or ſix Corners, within which prickly Husk lies the Kernel or Seed.*

IV. *The Places.* It is ſaid to grow plentifully in *Spain* in their fields, being ſometimes hurtful to Corn: It is alſo found in moſt places of *Italy* and *France*: And, as *Gerard* ſays, it grows with us in *England*; he found it in a moiſt Meadow adjoining to the then Wood or Park of Sir *Francis Carew*, near *Croydon*, not far from *London*, from whence he brought Plants of it for his Garden. *Parkinſon* ſays it grows amongſt Rubbiſh, and the Ruins of Buildings, and by Walls ſides.

V. *The Times* It Flowers in *June* and *July*; and the fruit or Seed is ripe in *Auguſt.*

VI. *The Qualities.* It is cold in the firſt Degree, and dry in the ſecond. It is Aſtringent and Repercuſſive, it is Alterative and Alexipharmick.

VII. *The Specification.* By reaſon it is of thin Parts, it is ſaid to waſte the Stone, Tartar, or Gravel in the Reins, and parts adjacent.

VIII. *The Preparations.* You may have therefrom, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *A Decoction.* 4. *A Pouder of the Root.* 5. *A Collyrium.* 6. *A Cataplaſm of the Leaves.* 7. *A Lotion.* 8. *The Seed.*

The Virtues.

IX. *The liquid Juice.* Being applied, it abates the Inflammation, and cures an Erylipelas: It hinders the breeding of Inflammations and Apoſtems, and

and ſtops the Flux of Humors; and being drank from two ounces to four, it breaks or waſtes the Stone in the Reins, expelling Sand, Gravel, and Tartarous Humors; and ſtops all ſorts of Fluxes of the Bowels.

X. *The Eſſence.* It has all the ſame Virtues, and the more pleaſant Medicine to take. It cures ſore Eyes, being dropt into them, and abating the Inflammation, takes away the Blood-ſhot. If it is drank to two or three ounces in Wine, it prevails againſt the poiſon of the Viper, and the bitings of other Venomous Beaſts.

XI. *The Decoction.* It has the Virtues of the Juice and Eſſence, but not all out ſo powerful: It may ſerve as a good Vehicle to convey the Pouder of the Root in.

XII. *The Pouder of the Root.* It ſtops Fluxes of the Belly, and binds it: given to two drams, it is good againſt the biting of Vipers; conſumes Nodes and Kernels in the Neck, or other Parts, and in a good meaſure ſtrengthens the Stomach.

XIII. *The Collyrium.* It is made of the Juice or Eſſence made into a thin Syrup with Honey. This put into the Eye three or four times a day, ſtops fluxions of Humors into the Part, cools and takes away the Inflammation, and heals Sores or Ulcers therein.

XIV. *The Cataplaſm of the Leaves.* It is good againſt a hot Gout, repercuſſes the flux of Humors, hinders Apoſtems, and diſcuſſes Swellings in the Legs, or other parts of the Body.

XV. *The Lotion.* It is made of the Decoction in Wine, in a quart of which, Honey three ounces, and Roch Allum half an ounce, is diſſolved. It is made to heal corrupt Sores and Ulcers of the Mouth, Throat, and Gums; and to cleanſe Fiſtula's, as alſo Apoſtems newly broke, or opened, by injecting it with a Syringe.

XVI. *The Seed* or *Fruit.* It is Alexipharmick; *Galen* and *Pliny* ſay, that the *Thracians*, who dwelt near the River *Stirmon*, lived themſelves of the Fruit or Kernels, making them into a ſweet and fine kind of Bread, which ſomething bound up the Belly: And that with the Herb they fed their Horſes. But this making Bread of the Kernels is affirmed by ſome, to be only meant of the Fruit of the *Water Caltrop*, following.

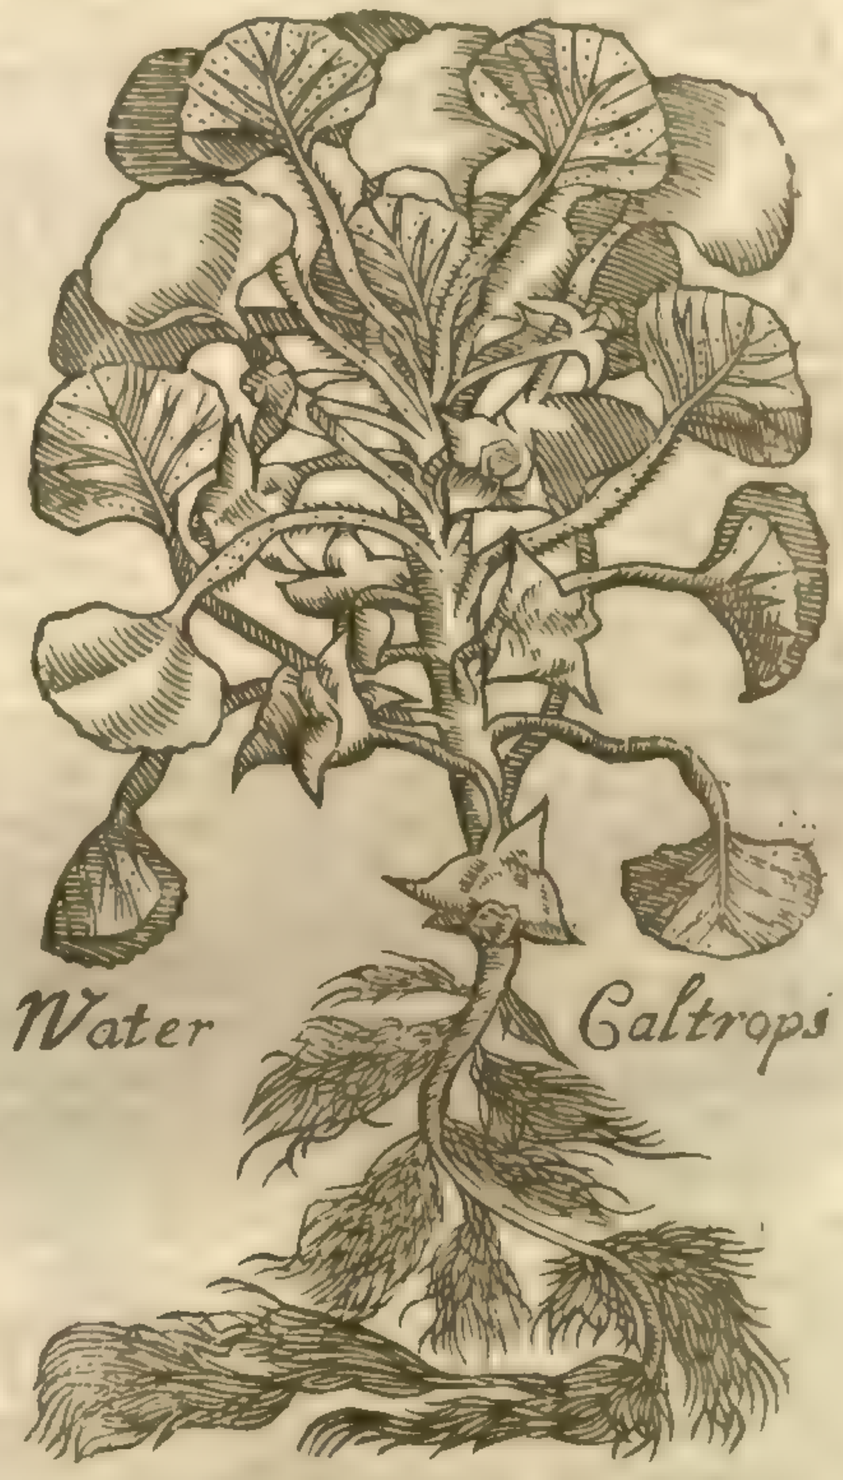
CHAP. CVII.

CALTROP, Water.

I. *THE Names.* It is called in *Greek* Τείβολος ἔνυδρος: in *Latin*, *Tribulus aquaticus*, *Tribulus marinus*, and by *Cordus*, *Lacuſtris*: in *Engliſh*, *Water Caltrop*; *Saligot*, and *Water Nuts.*

II. *The Kinds.* There are two ſorts of *Water Caltrops.* 1. The *Greater Water Caltrops.* 2. The *Leſſer Water Caltrop:* And of the *Leſſer* there are alſo two Kinds, *viz.* The former and the latter. The *Greater Water Caltrop*, is called in *Latin*, *Tribulus Aquaticus major*: *Tribulus Aquatilis*, and *Caſtaneæ aquatiles.* The leſſer ſorts are called by *Cluſius*, *Tribulus aquaticus minor*; and diſtinguiſhed by him, the former of which he calls, *Tribulus aquaticus minor prior*; and the latter, *Tribulus aquaticus minor alter.*

III. The Deſcription. *The* Greater Water Caltrop *has a Root which grows ſomewhat long, and full of Joints, with a Tuft of Hairs or Fibres at each of them. From the head of this Root lying under Water, riſe up ſeveral long ſlender Footſtalks, which riſing from the bottom of the Water, mount above the ſame; at the top of each of which, there are broad, and more than half round Leaves, in ſome places Spotted on the under ſide, and dented about the Edges. The Footſtalks on which theſe Leaves ſtand, are ſmaller at the lower end next the Root, than they are at top of the Water next to the Leaves. Among theſe Leaves riſe up ſappy round Stalks, no higher than the Leaves, bearing whitiſh Flowers at the Tops. After which come thick, hard, and Woody, almoſt round heads, with three or four ſharp pricks or points ſticking out, of the bigneſs of Haſle Nuts, and blackiſh in ſome places: ſome of them are as large as great Walnuts, having a ſweet white Kernel within, which is not much unlike to a Cheſnut. This Fruit, with its outward Husk, or Shell, is hard, triangled, ſharp pointed and prickly, in ſhape almoſt like to thoſe things called* Caltrops, *which in War they caſt in the way of the Enemy, to annoy the feet of their Horſes, and from whence this Plant took its name. The Kernel is taſted almoſt like a Cheſnut, and are uſually eaten green: And being dried, they are ground to pouder, and ſo ſerve to make Bread of.*



IV. *The* former leſſer Caltrop, *the whole Plant, is commonly covered over with Water, having very long, ſlender, creeping Roots, from whoſe ſeveral Parts or Joints come forth divers Tufts of ſmall Fibres or Strings, which take hold of the Mud. From this Root, at the lower Joints thereof come forth thin, flat, knotty Stalks, of a reddiſh color, three, four, or five Feet long, or longer, according to the depth of the Water in which it grows; which being dry, are pliant, and flexible, and fit for many occaſions. They are divided towards the Top, into many Parts or Branches, carrying ſingle Leaves at the lower Joints, on both ſides, being about two Inches long, and half an Inch broad, thin, and almoſt tranſparent, or as it were ſhining: ſo waved, wrinkled, or crumpled on the Edges, that they ſeem to be torn, and for the moſt part of a reddiſh green color. The Footſtalks are ſomewhat long and thick, and riſe up from among thoſe Leaves, which always grow two, one oppoſite againſt another, in a contrary manner to thoſe which grow below on the Stalk. From the Joints*

with the Leaves come forth ſmall Footſtalks, bearing at their ends ſmall, whitiſh, long and thick Flowers. Gerard *ſays, out of theſe Stalks, at the Tops, grows ſmall Grape-like Husks, out of which ſpring ſmall reddiſh Flowers, like thoſe of the Oak, every Flower having four very ſmall round topt Leaves: after every Flower, there comes commonly four ſharp pointed Grains growing together, containing within them a little white Kernel.*

V. *The* latter ſmall Water Caltrop, *has a Root not much unlike to the former, but longer, and fuller of ſingle Fibres or Strings. From whence ſpring up Stalks, not flat, as the former, but round kneed, and always bearing two Leaves at every Joint, one oppoſite againſt the other, greener, ſhorter, and leſſer than the other, ſharp pointed, and not much wrinkled or crumpled on the Edges.* Cluſius *ſays, that they are not at all crumpled. But our* Engliſh *Herboriſts never obſerved any without crumples or wrinkles. The Flowers grow on ſhort ſmall Footſtalks, of a whitiſh green color, like thoſe of* Muſcatella Cordi, *called by* Gerard, Radix cava minima viridi flore, *to wit, two flowers at the top of every Footſtalk, one oppoſite againſt another, every flower containing four ſmall Leaves: which two flowers being paſt, there comes up eight ſmall Husks, making ſix ſeveral ways a ſquare of flowers.*

VI. *The Places.* The greater is found in ſeveral Lakes and moiſt places in *Germany*, as alſo in *Brabant* and *Flanders*, and in many places of *Italy* near the Sea. One *Fincham* a Merchant of *London* found it in the *Eaſt Indies* in the *Mogul*'s Countrey, where it grew like a Weed in moſt Ponds there, the Kernel of which, he ſays, is much eaten by the Natives. See *Purchas his Pilgrims, lib.* 4. *cap.* 4. *ſect.* 5. *pag.* 429. *Cordus* ſays it grows in *Germany* in Muddy Lakes and Places, and in Ditches which have Mud in them, as alſo in Standing Waters, and ſometimes alſo in Running Waters. And *Matthiolus* ſays, it grows not only in Lakes of Sweet Water, but alſo in Ditches by the Sea ſide near to *Venice.* The *ſecond* or *former leſſer* grows in ſtanding Waters, or Pools, Ditches, or Fiſh Ponds: It was found in Ponds adjoining to a diſſolved Abby called *Durford*, which divide *Hampſhire* and *Suſſex*, and in other ſtanding Waters in ſeveral places. The *third* or *latter ſmall* grows plentifully in the River by *Droxford* in *Hampſhire.*

VII. *The Times.* They all Flower in *June* and *July*, and give their Fruit or Seed in *Auguſt.*

VIII. *The Qualities.* They are all cold and moiſt in the firſt Degree, and more Watry than the *Land Caltrop.* They are Emollient, Repercuſſive, Nephritick, Alterative and Alexipharmick.

IX. *The Specification.* They are good againſt the Obſtructions of the Reins, Gravel, Tartar in the Urinary Paſſages, heat of Urine, and piſſing of Blood.

X. *The Preparations.* You may make therefrom, 1. *A liquid Juice.* 2. *A Decoction.* 3. *A diſtilled Water.* 4. *A Lotion.* 5. *A Cataplaſm.* 6. *The Nuts.* 7. *A Pouder of the Nuts.*

The Virtues.

XI. *The liquid Juice.* Being applied, it cures an Eryſipelas; and is good againſt Inflammations in any part of the Body; and cures the King's-Evil, Running Sores, or Ulcers, by waſhing with it.

XII. *The Decoction.* If made in White Wine, or in Wine and Water, it opens the Obſtructions of the Reins and Ureters, expels Tartar, Sand and Gravel, out of the Urinary Parts, and helps ſcalding of the Water.

XIII. *The Diſtilled Water.* If it is drunk with a little Roch Allum diſſolved in it, it ſtops the piſſing of Blood, and is profitable againſt the Diabetes.

XIV. *The Lotion.* It is made of the Decoction in Water with the addition of Honey; *Gerard* ſays, it perfectly cures Cankers of the Mouth, Throat, Almonds, and ſore Gums.

XV. *The Cataplaſm of the Herbs.* *Dioſcorides* ſays, it is good againſt all ſorts of Inflammations, or hot Swellings. It may be profitably applied in a hot Gout, after ſufficient cleanſing of the Body, both with Emeticks and Catharticks.

XVI. *The Nuts.* Eaten raw, they reſiſt Poiſon, and are ſaid to be good againſt the bitings of Venomous Beaſts: Eaten alſo, and drinking White Wine with them, they are ſaid to be good againſt Stone and Gravel. In like manner eaten, and alſo beaten, and applied to the place, they reſiſt the Poiſon of the bitings of Venomous Beaſts.

XVII. *The Pouder of the Nuts.* *Gerard* ſays, it is given to ſuch as piſs Blood, and are troubled with Gravel, and that it binds the Belly. It is doubtleſs a ſingular thing againſt the Bloody Flux, and other Fluxes of the Bowels, if it is given from a dram, to two drams, in a Glaſs of Sherry, or *Madera* Wine: Being dried, and ground to Pouder in Quantities, a pleaſant kind of Bread may be made thereof.

CHAP. CVIII.

CAMOMIL.

I. THE *Names.* It is called in *Greek*, by *Dioſcorides*, Ἀνθεμὶς: by *Theophraſtus* Ἀνθεμὼν: by ſome Λευκάνθεμις (from the whiteneſs of the Flowers:) alſo Χαμαίμηλον, *quod Mali odorem habet*, from having the ſmell of Apples. It is called in *Latin*, *Chamæmelum*, and *Chamomilla*, alſo *Anthemis*, and *Leucanthemum*: In *Engliſh*, *Camomil.*

II. *The*

II. *The Kinds.* There are four ſeveral kinds hereof, *viz.* 1. *The Common Garden kind*, which is called in *Latin*, *Chamomilla hortenſis*, and *Chamæmelum hortenſe*. 2. *The Naked Flowred*, called *Chamæmelum nudum*. 3. *The Double flowred*, called *Chamæmelum flore pleno*, and *Chamæmelum Anglicum flore multiplici*. 4. *The Roman*, called *Chamæmelum Romanum*. As for the Wild Kinds, or *Cotula*, *Parkinſon* thinks them to be not ſo much of the *Camomil* kind, as of the *Parthenium*, or *Featherfew*, of which ſee *May Weed*.

III. The Deſcriptions. The Common Camomil *has a ſmall and fibrous Root, from whence ſpring many weak and feeble Branches, trailing or leaning to the ground, which take hold on the Top of the Earth as it runs, whereby it much encreaſes. The Leaves are very fine, and much jagged, or deeply cut, of a very ſtrong ſweet ſmell. Among which, at tops of the Branches come forth Flowers like unto the Field Daiſie, having a border of ſmall white Leaves, with yellow thrums in the middle, crouded cloſe together, as is that of the* Daiſie, *or* Featherfew, *but larger, and not ſo hard, but more ſoft and gentle in handling; which give a ſmall white Seed, not obſerved by many, but being ſowed, or caſt into the ground, will bring forth Plants as other Seed doth.*

IV. The Naked flowred, *has Roots, Leaves, Stalks and Branches like to the former, and creeping upon the Surface of the Earth as that doth; but its Leaves are finer, and ſhorter, and it bears naked Flowers, which conſiſt only of the middle yellow Thrum, without any pale or border of white Leaves round about it, and ſmelling as ſweet as the former. The whole Plant is of a pleaſing ſmell, for which reaſon ſome have given it the Epithite of* Odoratum, *as* Gerard *ſays.*

V. The Double flowred *has alſo Roots, Leaves, Stalks and Branches like to the firſt, it creeps as was on the ground, and yet ſhoots upright; his Leaves are of a darker green color; and in his Flowers the white Leaves grow round the ſame are mixed, or made double, and the yellow thrumb in the middle is little ſeen, ſo that it ſeems but a little removed from it. This Plant is of a ſweeter Scent than the laſt, and is more tender to be kept in Winter. It has alſo Seed in the middle of the Flowers, which being broken and caſt into the Ground, will produce Double flowred Camomil.*

VI. The *Roman* Camomil, *has a Root ſomewhat thicker than the former, but fibrous withal, from whence riſe up many ſlender Stalks, yet ſtiffer, and ſtronger than any of the others, for which reaſon it ſtands more upright, and does not creep upon the Earth, as the reſt do. The Leaves are fine, but rather ſhorter, and of a more whitiſh color, tending ſomething to the color of* Woad *Leaves: the Flowers are like to the firſt, having a ſingle border of white Leaves, and a cloſe yellow Thrumb in the middle, after which comes ſmall white Seed, like that in the Common Camomil: The whole Plant has a very ſweet Scent.*

VII. *The Places.* The firſt grows in moſt Gardens throughout *England*, beſides it grows Wild (as *Parkinſon* ſays) in many places of this Land: the other three kinds grow with us only in Gardens.

VIII. *The Times.* They Flower for the moſt part through all the Summer Months, and their Seed comes to perfection in the time of flowering.

IX. *The Qualities.* They are all of them hot and dry in three: Aperitive, Anodyne, Digeſtive, Diſcuſſive, Diuretick, Sudorifick, Alterative, and Alexipharmick.

X. *The Specification.* The *Egyptians* dedicated it to the curing of Agues: and experience has confirm'd it an admirable thing againſt Diſeaſes of the *Pleura.*

XI. *The Preparations.* There are, 1. *A Liquid Juice.* 2. *An Eſſence.* 3. *A Syrup.* 4. *An Infuſion.* 5. *A Decoction.* 6. *A Pouder.* 7. *An Oil by Infuſion.* 8. *An Ointment.* 9. *A Balſam.* 10. *A*

Cataplasm. 11. *A Distilled Water.* 12. *A Spirituous Tincture.* 13. *An Acid Tincture.* 14. *A n Oily Tincture.* 15. *A Saline Tincture.* 16. *A Spirit.* 17. *An Oil Distilled.* 18. *Potestates.* 19. *An Elixir.* 20. *A Fixed Salt.*

The Virtues.

XII. *The liquid Juice.* It is Antiscorbutick, resists the Infection of the Plague; and being taken inwardly to four or six ounces, two hours before the coming of the Fit of an Ague, whether Quotidian, Tertian, or Quartan, it commonly cures it at three or four Doses; besides which it cures an exquisite Pleurisie, more expecially if a little Salt of Blood (whether of Man or Beast) is added to it, and this I have had experience of in my own Person, and since that have cured several others by the same Medicament. It provokes the Terms in Women, opens the Urinary passages, and gives ease in the Strangury to a Miracle.

XIII. *The Essence.* It has all the Virtues of the former, besides which it facilitates the Birth, and brings away the Child, whether dead or alive, as also the After-birth: It causes a free Breathing, is good against Colds, Coughs, Asthma's, and other Obstructions of the Lungs, as also Stitches in the Side. Dose four ounces, Morning and Evening.

XIV. *The Syrup.* Made of the Juice of Double-flowred Camomil, saith *Bauhinus*, but of our Common Garden Camomil, say *Pena* and *Lobel*, with the Flowers also, and a little White Wine, being taken three or four spoonfuls at a time, is a remedy against the Jaundice and Dropsie, as also the evil disposition of the Spleen.

XV. *The Infusion.* If it is made in White Port Wine, it provokes Urine, opens Obstructions of the Urinary Parts, expels Sand, Gravel, and Tartar, and helps a stinking Breath. It has the Virtues of the Juice and Essence, but not altogether so powerful.

XVI. *The Decoction.* If made in Wine, or part Wine part Water, and taken inwardly, it has the Virtues of the Juice and Essence, but very much weaker, yet it prevails powerfully against the Cholick: *Parkinson* says, it takes away all Pains and Stitches in the Sides. Tired Limbs being bathed therewith, it takes away their Weariness, and eases Pains to what part of the Body soever it is applied. It comforts the Nerves that are over-strained, mollifies Tumors, and discusses those which are not very hard; and moderately comforts those parts which have need of warmth, or are chill'd by any Cold Paralytick Humor.

XVII. *The Pouder.* Made of the dried Herb, but chiefly of the Flowers, being given from half a dram, to one dram, it helps the Griping of the Guts, Wind, and Pain of the Stomach.

XVIII. *The Oil by Infusion of the Flowers in Oil Olive.* If the Person troubled with an Ague, be anointed with this Oil, before a good fire, from the Crown of the Head to the Soles of the Feet, and after that, be laid to Sweat in a Bed, being so warm covered that they may Sweat well, it cures it, let the Ague be what it will. This is an *Ægyptian* Medicine, and *Galen* seems to confirm it: For he saith, that the *Sophi* of *Ægypt*, Consecrated this Herb to the Sun, for its Virtue in curing all sorts of Agues. But therein, says *Galen*, they were deceived, for it cures only those where the Humors are already digested; but it is very profitable (says he) for all other sorts of Agues, which come either from Flegm or Melancholly, or from an Inflammation of the Bowels; for these (says he) Camomil is a Sovereign Remedy to be applied, the Humors being first Concocted. It is good against cold Gouts, coldness of the Limbs, and Pains and Aches proceeding from Cold and Moisture.

XIX. *The Ointment.* It heals Wounds in a Cold, Scorbutick habit of Body, gives ease in the Gout, and mollifies Tumors proceeding from an afflux of Humors.

XX. *The Balsam.* It is more excellent for healing Wounds than the Ointment, and being mixed with other proper things, it brings Apostems and Tumors to suppuration, and prevails singularly against the Gout, whether it proceeds from a hot or a cold Cause, and it will be so much the more effectual, if *Camphir* be added to it, which contains in it a subtil Fire, which draws forth the Essence of the Gout through the Pores of the Skin.

XXI. *The Cataplasm.* Being applied, it is useful to discuss, or dissolve Tumors, and Wind, in any part of the Body, and to ease Pains and Aches in the Joints. Being applied to the Ribs, and Hypochonders, as hot as it can be endured, it eases the Spleen, expels Wind, and gives immediate relief in the pains of the most exquisite Pleurisie: It also takes away Pains and Stitches in the Sides, removes shortness of Breath, and causes presently an easiness of breathing.

XXII. *The Distilled Water.* It is good against fainting of the Heart and Spirits, is good against Vapors and Fits of the Mother, as also Pains and Distempers of the Spleen; but it is chiefly used as a Vehicle to convey the other Preparations of this Plant into the Body: six ounces of it being drank with a scruple or half a dram of Salt of Camomil dissolved in it, prevails wonderfully against stoppage of Urine, and so is helpful against the Strangury.

XXIII. *The Spirituous Tincture.* Made from the Flowers, or the Herb and Flowers together, it prevails against Fainting and Swooning Fits, coldness of the Stomach, and sickness at Heart. It comforts all parts which have need of warmth; it digests crude Humors, discusses Wind in the Stomach and Bowels, alleviates the Pains and Torments of the Belly, and provokes Urine gently: It induces Sweat, and expells cold Aches and Pains in what part of the Body soever.

XXIV. *The Acid Tincture.* It digests, loosens, eases Pain, is highly Antifebritick, Anticolick, and strongly Diuretick. It powerfully opens Obstructions of the Lungs, and helps such as have a shortness of Breath, difficulty of Breathing, are Hoarse, and Wheeze much, so as in a manner they have lost their Voice. It Attenuates, Cleanses, Purges, Opens, Expectorates tough Flegm, and is profitable for all Diseases of the Brest, caused by the Afflux of moist and flegmatick Humors, whether Thin or Thick, Tough, Rotten, or Corrupted, causing the same to be spit forth. You may make it pleasant and grateful with Syrup of Violets, or Clovegilliflowers, or a pure Tincture of *Spanish* Juice of Liquorice, and so to be taken often in the Day, and that for many Days together.

XXV. *The Oily Tincture.* This being rubbed in daily, Morning and Night, before a good Fire, all along the Back-bone, from the Head to the *Anus*, and also over all the affected Limbs, it cures a Palsie above most other things in the World. It also cures Rheumatick Pains, being well anointed upon the parts affected twice a Day, and continued for some time. It expels Cold, eases Pains, discusses cold and windy Tumors, eases the Pains of the *Pleura*, and After-pains of Women in Child-bed, being anointed a little above the Share Bone, and twenty drops of it given inwardly, in a Glass of Canary. In all outward applications, if you add a little Camphire to it, one ounce of Camphir to a pound of

the

the Tincture, it makes it ſo much the more powerful and effectual.

XXVI. *The Saline Tincture.* It may be given from half a dram to a dram, in White Wine, againſt Stone, Gravel, Sand, and Tartarous Matter in the Reins and Bladder; it opens Obſtructions of the Urinary parts, and of the Womb; is good againſt Vapors, and Fits of the Mothers, and diſſolves Coagulations in the *Pleura.* Outwardly uſed, it is good againſt the Gout, or any other Pains proceeding from a cold Cauſe.

XXVII. *The Spirit.* It is a ſingular Cordial, chears the Heart, revives the Spirits, ſtrengthens Nature, and makes the Body able to withſtand Diſeaſes. It is good againſt Convulſions, and prevails much againſt Wind, Fainting and Swooning Fits, Vapors, and Diſtempers of the Womb, for which it is a Specifick. It comforts the Head, Nerves, and Brain, and is ſo great a Stomatick, that there is but few greater. Doſe two drams, being dulcified.

XXVIII. *The Diſtilled Oil.* It is a famous thing for the Head, Nerves, Womb, and Joints; and therefore is good againſt Vertigo's, Apoplexies, Epilepſies, pain of the Stomach, Convulſions, Fits of the Mother, Palſies, Lameneſs of the Limbs, and all ſorts of Rheumatick pains. In Diſeaſes of the Head and Nerves, as Palſies, it ought to be anointed down the Back-bone, as alſo upon the parts affected; and is alſo to be given inwardly in a Glaſs of Wine from three drops to twelve or ſixteen: drop it firſt into White Sugar, which mix well, then diſſolve it in the Wine, and ſo let the Patient drink it up. In Vertigo's, Apoplexies, Epilepſies, Convulſions, Stomach Pains, and Mother, it needs only to be given inwardly, Morning and Evening, as directed.

XXIX. *The Poteſtates* or *Powers.* They have all the Virtues of the Juice, Eſſence, Tinctures, Spirit and Oil, and indeed more ſubtil and penetrating, piercing like Lightning thro' the Univerſal Frame; and may be given Morning, Noon, and Night, in ſome proper Vehicle, from one dram to two or three drams, according to age and ſtrength.

XXX. *The Elixir.* It has the Virtues of Juice, Eſſence, Tincture, Spirit, Oil and Powers; but much more ſubtil, and effectual to all the purpoſes intended: it is ſingular in the Cure of a Pleuriſie beyond moſt other things. Doſe from one to two drams.

XXXI. *The Fixed Salt.* It is ſingularly Nephritick, and Antipleuretick; eaſes Pains in the Reins, opens Obſtructions of the Urinary parts, diſſolves the Congelation of Blood in the *Pleura*, Womb, and carries off the Seminalities of thoſe Diſeaſes by Urine. Doſe half a dram.

CHAP. CIX.

Of CAMMOCK, *Or* REST HARROW.

I. *THE Names.* It is called in *Greek* by *Dioſcorides* and *Piny*, Ἄνωνις: by *Galen* and *Theophraſtus*, Ὄνωνις: In *Latin*, *Anonis*, and *Ononis*: Alſo *Areſta Bovis*, *Reſta Bovis*, *Remorum Aratri*: becauſe that the Roots of it being very tough, and ſo deeply and ſtrongly faſtned in the Ground, it cauſes the Oxen which draw the Plough to be as it were at a ſtand for the firſt pull, and ſo ſtops the Plough Share, that it cannot ſo readily go on. In *Engliſh* it is called *Cammock*, or *Reſt Harrow.*

II. *The Kinds.* There are many kinds of it; but thoſe which are only Common with us, are theſe following five: 1. *Anonis ſpinoſa flore purpureo*, Common Reſt Harrow, with purplish flowers. 2. *Anonis ſpinoſa flore albo*, Reſt Harrow, with white flowers. 3. *Anonis ſpinoſa lutea minor*, Reſt Harrow, with yellow flowers, the leſſer. 5. *Anonis non ſpinoſa flore purpureo*, Reſt Harrow not thorny, with purple flowers. 5. *Anonis non ſpinoſa lutea major*, Reſt Harrow not thorny, with yellow flowers the greater.

III. The Deſcriptions. *The* firſt *and* Common Reſt Harrow, *which is frequent, as well in Arable as Waſte Grounds, and By-lands, has a Root which*

in

is blackish on the out side, and whitish within, very tough and hard to break, whilst it is fresh and green, and as hard and tough as a horn when it is dried, thrusting it self down very deep into the ground, and spreading it self likewise far about, every little piece, though cut off from the Stock, being apt to grow again, if it be left in the ground. From this Root it rises up, with divers tough woody twigs, two or three feet high, set at the Joints without order, with little roundish Leaves, sometimes more than two or three at a place, of a dark green color, without thorns while they are young, but afterwards armed, or furnished with them in several places, the thorns being short but sharp. The Flowers come forth at the top of the Twigs and Branches, whereof it is full, in fashion much like to Pease or Broom-blossoms, but lesser, flatter, and somewhat closer, of a faint purplish color. They being past away, there succeed small Pods or Cods, containing within them small, flat, and round Seed.

IV. *The* second Rest Harrow *differs not from the former in the Root, Stalks, Branches, Thorns, nor in the Leaves, save that these are of a little fresher green color; but the chief difference is in the Flowers, which are very white in some places more than in others; in all other things they are alike.*

V. *The* third, *which is the* Lesser yellow prickly Rest Harrow *with us (for the greater grows not in* England*) has Thorns or Prickles thereon as the others: But the Plant is lower, and smaller, not rising little above half a foot high, not differing in any other great matter from the last.*

VI. *The* fourth, *which is the* Purplish Rest Harrow without Prickles, *has no other difference in it from the* first *or* Common Cammock, *but in this, that it has no Thorns or Prickles upon the Sprigs or Branches, no not in the Autumn, or declining part of the Year, when the other will be full of them. Of this sort there is one also which beareth white Flowers, which makes all the difference.*

VII. *The* fifth *and last has a Root which is long, tough, rough, and blackish, spreading much about: from this Root spring forth several woody Twigs, very flexible and tough, branching forth on all sides, covered with a browniſh red Bark, set pretty thick with Leaves, which are for the most part three standing together upon a long Footstalk, not much unlike to Trefoil, but somewhat small, long, and narrow, with notches at the ends, much overspread with a strong Scented clamminess, which will stick so fast to the Hands of those which touch them, especially in the heat of the Year, and in hot Countries, that it is difficult to get off again. At Tops of the Branches or Twigs, stand many Pease-blossom-like Flowers, of a fair yellow color, which being past away, there comes forth small and long Cods, with a crooked point at the end of each, in which is contained small flatish Seed: of this there is a lesser sort; also another with a more reddish Flower.*

VIII. *The Places.* The first, second, and fourth grow in many places of *England*, both in Arable Land, and Waste Grounds. The third, *Lobel* saith he found growing both about *London* and *Bristol*; but *Parkinson* says, he never found it growing naturally. The fifth and last I found in several places of *Florida*, as in the Southern Provinces of *Carolina*. It also grows about *Narbone* and *Monpeliere* in *France*; as also in *Spain* and *Portugal*.

IX. *The Times.* They all Flower about the beginning or middle of *July*, and the Seed is ripe in *August*.

X. *The Qualities.* *Galen* says, that the Root of *Rest Harrow* is hot in the third Degree; it is also drying, but seems not to exceed the second Degree: It is Absterſive, Aperitive, Astringent, Diuretick, Traumatick, or Vulnerary; Nephritick, Arthritick, and Alterative.

IX. *The Specification.* It is peculiar to destroy Viscosity or Tartar in the Reins and Urinary parts, to open their Obstructions, and to cleanse them.

XII. *The Preparations.* You may have therefrom, 1. *A Decoction in Wine from the Bark of the Root.* 2. *A Decoction in Vinegar from the same.* 3. *A Pouder of the said Bark.* 4. *A Distilled Water of the Roots.* 5. *A Spirituous Tincture.* 6. *An Acid Tincture.* 7. *An Oily Tincture.* 8. *A Saline Tincture.* The Bark of the Root is that in this Plant, which is chiefly used.

The Virtues.

XIII. *The Decoction in Wine.* Take *Rest Harrow Roots* thin sliced, four pounds: choice Canary a gallon: mix and put it into a Stone Pot, which let be close stopt, and let that Pot be put into a gentle boiling *Balneo* for twenty four hours; so will you have a noble and pleasant Medicine to open Obstructions both of Liver and Spleen, as also of the Urinary parts, provoke Urine, and to break and drive forth the Stone, as also Gravel and Sand out of the Reins, Ureters and Bladder: and also cures the Hemorrhoids or Piles.

XIV. *The Decoction in Vinegar.* Being gargled in the Mouth, it eases the Tooth-ach, more especially when it proceeds from Rheum; it also heals Cankers in Childrens Mouths, and other Running Sores, and Ulcers in the Gums, Mouth, and Throat, if they be three or four times a day gargled, and washt therewith.

XV. *The Pouder of the Bark of the Root.* *Parkinson* says, it is good to provoke Urine when it is stopt, and to break and drive forth the Stone effectually, being taken to one or two drams in generous Wine. *Matthiolus* says, that he knew divers freed from those Diseases, that used the said Pouder in Wine for many Days together. The said Pouder is also good to help the *Hernia Carnosa*, or Fleshy Rupture, which Fleshy Carnosity it consumes by little and little, taking it constantly for some Months together: and this it has done when the Physicians and Chirurgions had given them over as desperate, or no other ways to be cured, but by Cutting, *&c.* being strewed upon the hard, callous brims or edges of Ulcers; or if the said Pouder be mixed with Honey, or with any proper Balsam, and applied, it consumes the hardness, and causes the Ulcer to heal.

XVI. *The Distilled Water of the Roots.* To every pound of the Roots sliced, put a quart of Canary: digest forty eight hours warm, then draw off the Water to dryness in a gentle *Balneo*. It is good for all the purposes aforesaid, and to cleanse the passages of the Urine, not suffering any Tartarous, Viscous or Clammy matter to gather together in those parts, so as to harden, or become a Stone.

XVII. *The Spirituous Tincture.* It is a very good Stomatick, and admirably strengthens the Bowels, stopping Vomiting, and all sorts of Fluxes thereof, as Diarhæa's, Dysenteria's, Lienteria's, and the Hepatick Flux: and although it purges, and cleanses the Urinary parts of any Preternatural Matter lodged in them, yet it stops and cures pissing of Blood, and speedily heals any Wound or Ulcer in those parts.

XVIII. *The Acid Tincture.* It is more Stomatick than the former, and an excellent Styptick; it stops spitting of Blood, and heals Ulcers of the Lungs, if given in a proper Vehicle; and by its Aperitive, Absterſive, and Incisive power, it breaks to pieces,

or

or diſſolves Gritty Stones in the Reins or Bladder. Doſe ſixty or eighty drops, in Ale, Beer, or Wine.

XIX. *The Oily Tincture.* This is more excellent, if there is any Wound or Ulcer in the Reins or Bladder; for many of thoſe parts being Nervous; this Homogene and Oily Body wonderfully comforts the Parts, gently cleanſes them of all Foreign, Tartarous, Viſcous, Clammy or Sharp Humors, palliates the Pain, and in ſome ſhort time heals them. If there be no Wound or Ulcer, but only Obſtructions, or a weakneſs in the Reins and Back, it effectually opens them, ſmoothly cleanſes them, and makes the Patient Piſs free and eaſie, and withal ſo ſtrengthens the Back, and eaſes the Pains thereof, as if there had never been any ſuch Weakneſs, or Diſaffection there. Doſe twenty drops in a Glaſs of Wine.

XX. *The Saline Tincture.* Being bathed upon any parts affected with Pimples, Scurf, Morphew, Dandriff, or other like Preternatural Eruptions of the Skin, it cleanſes it, and takes them away. I was informed by a Gentlewoman who had uſed it for ſome time, that it had taken away Tawnineſs, Sunburnings, and Freckles, and cleared the Skin to admiration. Inwardly it is given to one dram in White Wine againſt Stone, Gravel, Sand, and other Obſtructions of the Reins.

XXI. It is reported, that in former times the young Shoots, and tender Stalks, before they become prickly, were pickled up, to be eaten as a Sawce for Meat: and that they were wonderfully commended againſt a ſtinking Breath, and to take away the ſmell of Wine in ſuch who had drunk too much.

CHAP. CX.

CAMPIONS, Garden.

I. THE *Names.* They are called in *Greek*, by *Dioſcorides* and *Theophraſtus*, λύχνις (from λύχνος, *Lucerna*,) and Ἐλλύχνιον, *quaſi lucernæ funiculum*, for that in former times they uſed the Leaves of *Campions* in their Lamps, to burn inſtead of Weiks: they alſo called it Ἀθάνατος, id eſt, *immortalis, quod diutius Venuſtatem ſuam retinet*: In *Latin*, *Lychnis*, *Lychnis Coronaria*, *Lychnis Sativa & Roſa Græca*: In *Engliſh*, *Campions*, and *Roſe Campions*.

II. *The Kinds.* They are twofold, 1. λύχνις στεφανωματικὴ, *Lychnis Coronaria*, *Lychnis Sativa vel Hortenſis*, Garden Campions, of which in this Chapter. 2. *Lychnis Sylveſtris*, Wild Campions, of which in the next Chapter. The Garden Kind, are, 1. Single. 2. Double. The Single are, *Lychnis coronaria rubra ſimplex*, The ſingle red Roſe Campion. 2. *Lychnis coronaria alba ſimplex*, The ſingle white Roſe Campion. 3. *Lychnis coronaria albeſcens, ſive incarnato maculata, & non maculata ſimplex*, The bluſh Roſe Campion, ſpotted and not ſpotted. The Double, 4. *Lychnis coronaria rubra Multiplex*, The Double red Roſe Campion.

III. The Deſcriptions. *The* Single red Roſe Campion, *has a Root ſmall, long, and woody, with many fibres annexed unto it, and oft times ſhoots forth anew, and ſometimes alſo dies and periſhes. On the Top of this Root, there are divers thick, hoary, or wooly, long, green Leaves, abiding green all the Winter; From among which in the end of the Spring, or beginning of Summer, there ſhoots forth two or three hard, round, woolly Stalks, with ſome Joints thereon, and at every Joint two ſuch like hairy green Leaves, as thoſe below, but ſmaller, diverſly branched at the Top, bearing one Flower upon each ſeveral long Foot-ſtalk, conſiſting of five Leaves, ſomewhat broad and round pointed, of a perfect Red, Crimſon color, ſtanding out of a hard, long, round huſk, ridged and creſted in four or five places: After the Flowers are fallen, there come up round hard heads, in which is contained ſmall blackiſh Seed.*

Garden Campions, red, ſingle flowred.

Campions Garden ſingle flowred White.

V. The

IV. *The ſecond* Single white Campion, *is in all things as Roots, Leaves, Stalks, and Flowers, like to the former, ſaving only the color of the Flowers, that being of a Red Crimſon color, this of a pure White.*

V. *The third ſort of* Single Campions *are like unto the former alſo, theſe other ſorts having no other difference to diſtinguiſh them by, but the colors of the Flowers, which are of a pale or bleak whitiſh bluſh color, chiefly about the brims or edges of the Leaves, or as if a very little Red was mixed with a great deal of White, the middle of the Flower being more White; the one being ſpotted all over the Flower, with ſmall ſpots and ſtreaks, the other not having any ſpot at all.*

Campions Gard double flowred.

VI. *The fourth, or* Double red Roſe Campion, *is in all reſpects like unto the* Single red Roſe Campion, *excepting that this bears Double Flowers, conſiſting of two or three Rows or Courſes of Leaves at moſt, not ſo large as the Single. The whole Plant is more tender, and therefore more apt to die or periſh than the Single is.*

VII. *The Places.* They are only nurs'd up with us in Gardens: both Single and Double are only by Nature not Art: and the Double ones have been found ſo Wild: for I could never obſerve that any Art or Induſtry of Man could ever ſo alter the properties of Nature, tho' by never ſo many repetitions of Tranſplantations, and Obſervation of the Phaſes of the Moon; as to make any Flower Single by Nature, to become Double, tho' many Men have affirmed the ſame; and of this Opinion was *Parkinſon*, who ſays, that whatſoever has been found Wild to be Double, Nature it ſelf, and not Art, ſo produced it, and ſo was brought into Gardens, where they are much encreaſed by ſlipping, and parting the Root, becauſe they give no Seed.

VIII. *The Times.* They do all of them flower in the Summer Months, through *May*, *June* and *July*, to the end of *Auguſt*.

IX. *The Qualities.* The Seed, which is chiefly uſed, is hot and dry in the ſecond Degree. It is Vulnerary, Alterative, and Alexipharmick.

X. *The Specification.* It is peculiar againſt the Poiſon of Scorpions.

XI. *The Preparations.* There are but few Preparations of this Plant; the chief things taken from it are the Leaf, and the Seed: of which there are uſed, 1. *The Green Leaf.* 2. *The Pouder of the Seed.* 3. *The Spirituous Tincture.* 4. *The Acid Tincture.*

The Virtues.

XII. *The Green Leaves.* Being applied whole, or beaten in a Mortar into a Cataplaſm, with a little Hogs Lard and Turpentine, and applied to any old or foul Ulcers in the Legs, Arms, or other parts; it does cleanſe and heal them.

XIII. *The Pouder of the Seed. Galen* affirms it to be hot and dry in the ſecond or third Degree. And *Dioſcorides* ſays, that being drunk in Wine, it helps thoſe who are ſtung by a Scorpion; and ſo it is alſo thought to be good againſt the malignity of the Plague or Peſtilence. Doſe one dram at a time, Morning and Evening.

XIV. *The Spirituous Tincture.* It has the former Virtues, but more powerful againſt the Plague or Peſtilence, the Spotted Fever, bitings of Serpents, Mad Dogs, or other Venomous Creatures. Doſe half a ſpoonful, or a ſpoonful, in a Glaſs of Wine, Morning and Evening.

XV. *The Acid Tincture.* It has the Virtues of the former, is more Stomatick, and more powerfully reſiſts the Malignity or Poiſon of the Plague, it deſtroying that, and the Fever together. Doſe ſixty or eighty drops, or more, in generous Canary.

CHAP. CXI.

Of CAMPIONS Wild.

I. *THE Names.* They are called in *Greek* Λυχνὶς ὄρεια καὶ ἄγρια: In *Latin*, *Lychnis Sylveſtris*: and in *Engliſh*, Wild Campions.

II. *The Kinds.* They are manifold, as, 1. Single. 2. Double. The Single are, 1. *Lychnis Sylveſtris flore albo ſimplex*, Wild Campions with a white Flower. 2. *Lychnis Sylveſtris flore rubro ſimplex*, Wild Campions with a red Flower. 3. *Lychnis Sylveſtris flore rubro minor ſimplex*, The leſſer red Campion with a red Flower. 4. *Lychnis Sylveſtris vel Segetum Vaccaria rubra dicta*, Corn Campion. 5. *Lychnis Marina alba & rubra*, The Sea Campion white and red. 6. *Lychnis arvenſis minor Anglica*, The *Engliſh* ſmall Wild Campion with a white Flower. 7. *Lychnis plumaria Sylveſtris ſimplex*, *Armoraria pratenſis*, The feathered Wild Campion ſimple.

III. The Double Wild Campions, are, 1. *Lychnis plumaria Sylveſtris multiplex*, *Armoraria pratenſis flore pleno*, The feathered Wild Campion Double. 2. *Lychnis agreſtis multiflora*, of *Lobel*; *Ocymoides flore pleno*, of *Camerarius*; *Lychnis Sylveſtris purpurea multiplex*, of *Gerard*: *Flore pleno rubro*, of *Parkinſon*, Red Batchelors Buttons. 3. *Lychnis Sylveſtris multiflora*, by *Pena* and *Lobel*; *Ocymaſtrum*, of *Tabermontanus*; *Lychnis Sylveſtris alba multiplex*, by *Gerard*; *Flore albo pleno*, by *Parkinſon*; White Batchelors Buttons. 4. *Lychnis agreſtis abortivam multiplici flore viridi*, Batchelors Buttons with green Flowers.

IV. The

IV. The Deſcriptions. *The firſt of the* Single Wild Campions *has a Root white and long, ſpreading forth divers Branches in the ground, and periſhing after Seed time: from whence come forth many long and ſomewhat broad, dark, green Leaves, lying upon the ground, with ſeveral Ribs therein, not much unlike to Rib-wort Plantane, but ſomewhat hairy, broader, but not ſo long. The Stalks are hairy, and riſe up in the midſt of them, three or four feet high, and ſometimes more, with ſeveral large white Joints at ſeveral places thereon, and two ſuch like Leaves thereat up to the Top. From theſe hairy Stalks come forth divers Branches alſo at their various Joints, all which bear on various Footſtalks white Flowers at their ſeveral Tops, conſiſting of five broad pointed Leaves, every one cut in on the end unto the middle, making them to look like two apiece: they ſmell ſomething ſweet, and each of them ſtand in a large, green, ſtriped, hairy Husk or Caſe, large and round below next to the Footſtalk. The Seed is ſmall and greyiſh in the hard heads, which come up afterwards.*

Campions Wild Single flow.

V. *The ſecond* Single Wild Campion, *has a Root like the former, which periſhes alſo after Seed-time. This* Red Campion *grows after the ſame manner as the former; but its Leaves are not ſo perfectly ribbed, are ſomething ſhorter, rounder, and more ſoft or wooly in handling. The Flowers are of the ſame form and bigneſs, in ſome of a pale, in others of a bright reddiſh color, cut in at the ends more finely, which makes the cut or jagged Leaves ſeem to be more in number than the other. The Seed is like the former, ſmall and greyiſh.*

VI. *The third* Single Red Wild Campion, *which is the leſſer, has a Root like the former, which periſhes after Seed-time, as they do: This whole Plant is very like the foregoing; but ſmaller and lower; yet very much branched, and repleniſhed with darker green Leaves. The Flowers are reddiſh: but ſmaller, and not ſo much cut or dented in at the ends. The Husks and Seeds are alſo like the former, but every ways leſſer.*

Corn Campions

Engliſh-Sea-Campion

VII. *The fourth, or* Corn Campion *of the Gardens, has a Root, long, white, and woody, with ſeveral Branches ſpringing from it, (and is but an Annual Plant) from which riſes up for the moſt part but one round Stalk, ſpreading it ſelf out every way into ſeveral Branches, having two long Leaves ſet oppoſite at the Joints, being broad at the bottom, and encompaſſing the Stalk and Branches, not much unlike to* Through-wax, *ending in a ſmall point, of a pale green color. At the Tops of the ſeveral Branches, ſtand divers Flowers, conſiſting of four Leaves a*

piece, of a pale red color ; which being paſt away, come forth Skinny Husks, containing ſmall, round, hard, black Seed. This Plant for the beauty of its Flowers, is brought into, and nurſed up in our Gardens.

VIII. *The fifth, or* Sea Campion White. *It has a long ſlender Root, which abides many Years, from whence ſprings up ſeveral weak, flexible Branches, lying all about upon the ground, (which Branches are much divided into many other ſmaller ones) two or three Feet long ; thick ſet with ſmall, long, fat, and whitiſh green Leaves. At the top of every Branch ſtands one ſhort, thick, whitiſh green Husk, parted or cut in at top ; out of which ſprings forth a ſmall long neck'd white Flower, not much unlike to that of the ſpatling Poppy, and as white, compoſed of five ſmall, round pointed Leaves, with ſome blackiſh threads in the middle : which being paſſed away, there comes forth Husks like thoſe of the other* Wild Campions, *containing within them ſmall brown Seed.*

IX. *The* Red flower'd Sea Campion *differs not from the former, neither in its Root, Stalks, Branches, Leaves, Flowers, Husks, nor Seed, nor yet in the manner of growing, excepting only in the color of the Flower, this being of a fine pleaſant Red, whereas the former is White : ſo that ſome have thought it to be one and the ſame Species, Nature only ſporting it ſelf in the variety or color of the Flower : this Plant Herboriſts call in* Latin, Lychnis Marina flore rubello, *Red flower'd Sea Campion.*

X. *The ſixth, or* Engliſh ſmall white Field Campion, *has a Root which is ſmall and white, and periſhes every Year ; from whence ſpring forth Leaves, which are ſmall and hairy, not much unlike to the ſmall Mouſe Ear : and from among which ſprings forth a ſlender ſmall Stalk, ſometimes but one, which is ſingle of it ſelf ; and ſometimes many, not exceeding a Foot high. At every Joint two Leaves are ſet together, ſmaller than thoſe below, and ſpotted with white ſpots ; from the boſom whereof,* viz. *between them and the Stalk, come forth two other Leaves, much ſmaller than they, without any ſenſible Taſte. The Flowers are ſmall and white, like unto the other* Wild Campions. *After which come ſmall, long Heads, with ſmall greyiſh Seed in them.*

XI. *The ſeventh, or* Single Feathered Wild Campion *has a Root very fibrous, or full of ſmall ſtrings, from whence ſprings forth a Stalk ; as alſo Leaves, ſomewhat like the ordinary* White Wild Campion, *but not ſo large, or rather reſembling the Leaves of* Sweet Williams, *but that they grow not ſo cloſe, nor ſo many together. The Stalks have ſmaller Leaves at the Joints, than thoſe below, and branched at the Top ; on which ſeveral Tops grow many pale, but bright red Flowers, jagged or cut in on the edges, like the Feathered Pink, for which thing ſake, ſome have taken it to be a kind, and ſome for a kind of* Wild William ; *but notwithſtand all this, it is but a* Wild Campion, *as may eaſily be obſerved from ſeveral other parts of the Plant. It has a Husk which bears the Flower, like the* Campions, *and alſo round greyiſh Seed.*

Double Wild Campions.

XII. *The firſt of theſe (in our Account) is the* Double Feathered Wild Campion, *which in its Roots, Stalks, Branches, Leaves, Flowers, Husks, and Seed, is like unto the* Single Feathered Wild Campion ; *excepting only in two things,* 1. *That the Flowers are very Double.* 2. *That the whole Plant in its magnitude and manner of growing is ſmaller and lower.*

White Batchelars Buttons.

XIII. *The ſecond, or* Red Batchelors Buttons *has a thick large Root, white and long, with many Branches and Fibres ſpringing from it ; from whence come up many rough broad Leaves, ſomewhat woolly and hoary ; among which riſe up long ſoft and hairy Stalks, branched into many Arms, two or three Feet high, or more, ſet with the like Leaves, but leſs : The Leaves grow at the Joints, two oppoſite one to another, up to the top ; and from theſe Joints other Branches ſpring forth, at top of every one of which Flowers grow compacted of a multitude of Leaves, and of a red color. Theſe Flowers are very double, compoſed of a great many red Leaves, very thickly packt or crouded together, and commonly ſet in a ſhort or broken Husk, whereby the Flowers ſeem to ſtand on one ſide ; but are not jagged, or cut in on the tops, as the Flowers of other Campions are, but altogether ſmooth. It is like in all its parts to the firſt* Single Wild Campion *as to its manner of growing, excepting that it is every ways leſs, and its Flowers are Red, and very Double.*

XIV. *The third, or* White Batchelors Buttons : *As the Leaves of the former* Red Buttons *were like unto the Leaves of the ſecond Single Kind, with Red Flowers ; ſo the Leaves of this are like unto the Leaves of the firſt Single White Knid, and the whole Plant differs nothing from it, but in the Doubleneſs of the Flowers ; nor very little from the* Red Batchelors Buttons, *but in the color of the ſame, theſe being wholly White ; and ſo very Double, that by the multiplicity of Leaves being crouded together, they break the Husk in which the Flowers ſtand, as the other does, ſo that there is not one Flower in a great many which is whole.* Gerard *ſays, That the ſimilitude which theſe Flowers (both of Red and White) have to the jagged Cloth Buttons, formerly worn in this Kingdom, gave occaſion to our Ladies, and other Floriſts of thoſe times, to give them the names which now they bear.*

XV. The

XV. *The fourth, or* Green Batchelors Buttons, *have no difference from the two former in the Roots, Stalks, Branches, Leaves nor Seed, saving only in the Flowers, which in this are of a Greenish color; and sometimes through the midst of them they send up Stalks, bearing also Tufts of the like Double Flowers.*

XVI. *The Places.* Of these, the three first Single sorts grow for the most part in our Countrey Fields, by Hedge and Ditch sides in many parts of *England*. The fourth grows in many Corn Fields in *Germany*, but with us is nourisht up in *Gardens*. The fifth, or *White and Red Sea Campions* grow by *Hurst* Castle near the Isle of *Wight*, and in the said Isle in many places by the Sea side: They grow also by the Sea side in *Lancashire* at a place called *Lytham*, five Miles from *Wigan*, in which place grows that with Red Flowers also. *Johnson* found it also growing in great plenty in the Marsh Grounds in *Thanet*, which lye directly opposite to the Town of *Sandwich*: The Red has been found about a Mile from *Southampton*, and both of them chiefly in the Southern parts of *England*, on the moist Stony Banks by the Sea side. The sixth grows in several grounds by *Colchester*, and in a Field called the *Mill-field*, behind the House of Sir *Thomas Lucy*'s near *Colchester*. The seventh is only nourished up in Gardens.

XVII. Of the *Double Wild Campions*, the first grows here only in Gardens. The second and third grow Wild in several places, but with us are chiefly nursed up in Gardens, for the beauty of their Flowers sake. The fourth also grows in Gardens.

XVIII. *The Times.* They all Flower in the Summer Months of *June*, *July* and *August*, some earlier than others, some later, and their Seed is ripe soon after.

XIX. *The Qualities.* They are all of them hot and dry in the second Degree: Astringent and Alterative; and much of the nature of the Garden Kinds.

XX. *The Specification.* They have been found good to stop the Fluxions of Blood and Humors.

XXI. *The Preparations.* The same Preparations may be made of them which we have said to be made of the Garden Kinds in the former Chapter.

The Virtues.

XXII. Authors have said little of their Virtues, nor have we much to say of them by Experience; the general use is for the beauty of the Garden, the Flowers being very beautiful in their Seasons. *Parkinson* says, that being Drying and Astringent, the several Preparations of them may be profitably applied to stay the Fluxes of Blood and Humors in any part, and thereby also conduce to the healing of old and moist Running Sores and Ulcers.

XXIII. *Gerard* says, the Seed of *Wild Campions* being given to two drams (in pouder) and so drunk, that it purges Choler by Stool, and is good for them that are Bitten or Stung by any Venomous Creature.

CHAP. CXII.

Of CATCH-FLIE.

I. THE *Names.* It is called in *Greek* by *Thalius*, Ἰξοκαῦλον: by others Λύχνις ἄγρια γλοιώδης: In *Latin*, *Lychnis Silvestris Viscosa*, *Muscipula* (*quia muscas capiunt*) *Viscaria*, *Silene* Theophrasti, *Armeria sive Lunaria Dodonæi*, *Ben rubrum Monspeliensium*: In *English*, Catchfly, and Limewort: also by *Gerard*, Red Willows.

II. *The Kinds.* *Parkinson* will have this Plant to be of the Kinds of *Wild Lychnis*, or *Wild Campion*; but *Gerard* says, they are of the Stock of *Wild Pinks* and *Gilliflowers*, and so calls them also with the other names *Wild Willows*. Those which we shall handle in this Work are such as are usual in *England*, *viz.* 1. *Muscipula* Lobelii, *Lychnis Sylvestris prima Clusii*, *sive Ben-rubrum Monspeliensium*, The *French* Catch-flie. 2. *Lychnis Sylvestris latifolia Clusii*, *Muscipula Cretica Auricula Cervi facie*, *Catch-flie* of *Candia*. 3. *Muscipula sive Viscaria* Lobelii, *Viscago Camerarii*, *Lychnis Sylvestris tertia Clusii*, *Gerard*'s first *Catch-flie*, or *Lime-wort*. 4. *Muscipula angustifolia*, *Lychnis Sylvestris quarta Clusii*, Narrow-leav'd, or *German* Catch-flie.

III. The Descriptions. *The first has a small Root, somewhat Fibrous, which perishes after it has given Seed, and afterwards rises again of its own Seed, if it is suffered to shed it self. If it sheds it self, it springs up in the latter end of the Year for the most part, or else in the Spring, with five or six small Leaves, very like unto the Leaves of Pinks, and of the same Willow, or whitish green color, but a little broader and shorter. When it begins to shoot up for Flower, it bears smaller Leaves on the Clammy or Viscous Stalks, which Viscosity is strong enough to hold any small thing or flie which lights on it. These Leaves are broad at bottom, compassing the Stalks and Branches, being set two at a Joint, one against another. The tops of the Stalks are diversly branched into several parts, every Branch having divers small red Flowers, not notched, but smooth, standing out of small, long, round, stript Husks, which after the Flowers are past, contain small, greyish Seed. This* Parkinson *accounts of the Species of* Campions, *being a pretty thing to furnish and deck out a Garden.*

IV. Gerard *will have it to be a kind of* Sweet Williams, *and says, it has many broad* Leaves *like the* Sweet Williams, *but shorter, set upon a stiff and brittle Stalk, from the bosom of which* Leaves *spring forth smaller Branches, clothed with the like* Leaves, *but much less: the Flowers grow at top of the Stalks, many together, Tuft fashion, of a bright red color. The whole Plant is possessed of a Viscousness, or Clammyness, like the other Kinds, but in a less proportion.*

Candia or Clusius } Catch Fly.

V. *The second has a Root small and fibrous, from whence come forth many* Leaves *lying upon the ground, which are thick, fat, and hoary, white, somewhat like to the* Leaves *of the yellow* Auriculi Ursi, Bears Ears, *or* French Cowslips, *smooth on the edges, and a little pointed, which do so abide the first Year of the springing: the Stalk rises up the next Year to the height of three or four Feet, with two* Leaves *at each Joint, and spreading on both sides into Branches from the ground, which are Viscous, Glutinous and Clammy, causing every light or small thing to cleave thereto, as Flies, Pismires, Down, Straws,* &c. *at the tops whereof, and at the Joints next below them come forth many Flowers together, standing in Clusters, but very small, whose small Husks contain every one of them a small greenish yellow Flower, parted in two at the broad end: the Seed is small and blackish in the Husks, and generally Sows it self.*

VI. *The third, which is* Gerard's *first, and by him called* Viscaria *or* Lime-wort, *and which he will have to be of the Stock and Kindred of* Wild Gilliflowers, *(notwithstanding* Clusius *has joined it with the* Wild Campions, *and* Lobel *among the* Sweet Williams) *has a Root which is large, with many Fibres, from whence spring many* Leaves *like those of the* Crow-flower, *or* Wild Sweet William, *among which rise up many reddish Stalks, with Knees or Joints at certain Spaces, set with* Leaves *by couples one against another, at the Top of which come forth fine* Red Flowers. *They being past, there comes in place small blackish Seed. The whole Plant, as well* Leaves *and Stalks as* Flowers, *are in most places overspread with a very thick and viscous or clammy matter, like to Bird-lime, which if you touch or take on your Fingers, the viscousness is such, that your Fingers will stick and cleave together, as if you had touched Bird-lime. If Flies also do light upon it, they will be so intangled therewith, that they cannot flie away, so that in some hot Days you may see many Flies caught thereby, from whence came the names,* Catch-flie *or* Lime-wort.

VII. *The fourth, or* Narrow-leav'd Catch-flie, *has a Root thick and black, with many Fibres, putting up new Shoots and Stalks after the first Year, and not dying every Year, as the two last described: From this comes forth one Stalk a foot, or more, high, of a green, purplish color: But* Parkinson *says, that the* Root *sends forth divers long and narrow dark green* Leaves, *lying upon the ground, pointed at the ends, somewhat rough or rugged, and not fully smooth, as many of the other sorts are; and from among these* Leaves, *there springs up one Stalk, and sometimes two or three, brown of color, and two or three feet high, having two small* Leaves *set at their Joints, but much separate one from another, and which will be clammy like the other in the hot Summer time: From the middle to the top of the Stalk grow little Branches, which upon pretty long Footstalks bear Flowers, every Stalk one Flower by it self, consisting of five little round* Leaves, *yet divided in the middle at the tops. These* Flowers *are of a lively deep red color, almost like the* Single Red Rose Campion, *but with a paler red Circle at bottom, set in green Husks, smaller at bottom and larger at head, in which (after the* Flowers *are past) there grows small Seed, and of a brownish color.*

VIII. *The Places.* These Plants, says *Gerard*, grow wild in the West of *England*, among Corn: But they are also nursed up in *Gardens*, merely for pleasure sake, more than for any Virtues they are hitherto known to possess.

IX. *The Times.* They flourish and flower in the *Summer* Months; and they last not until near the *Winter* Season; and their Seed ripens in the mean while.

X. As to their *Qualities, Specification, Preparations and Virtues*, they may be referr'd, says *Parkinson*, to those of the other *Wild Campions*, whereunto they are likest in face, and outward appearance. But *Gerard* says, the Virtues of these *Wild Williams* are to be referred to the *Wild Pinks* and *Gilliflowers.*

CHAP. CXIII.

Of CATS-TAIL.

I. *THE Names.* It is called in *Greek*, Τύφη: In *Latin*, *Typha*, and by some *Cestrum Morionis*, as *Dodonæus* saith; by some *Typha aquatica*, or *Palustris*, to put a difference between it, and that kind of *Typha* which is among *Corn*, called *Typhe Cerealis:* and in *English* it is called *Cats-tail*, from its soft downiness, and *Reed Mace.*

II. *The Kinds.* Authors say it is a mean between the *Rushes* and the *Reeds*; and is threefold, 1. *Typha maxima*, The greater, or greatest *Cats-tail.* 2. *Typha minor*, The lesser *Cats-tail.* 3. *Typha minima*, The least *Cats-tail.*

III. The Descriptions. *The first of these has a Root which is white, somewhat thick, hard, knobby, jointed, spreading much in the Water, full of many long* Fibres, *and sweet in Taste, if it is chewed; of good use to burn, where there is plenty of it: From this Root shoots forth several very long, soft and narrow* Leaves, *pointed at the Ends, in a manner three square, because the middle on the back side is great, and sticks much out. Among which* Leaves *rise up divers smooth, round, and taper Stalks, stuffed*

jet with a white Pith, and not hollow, near a Man's height, with Joints and Leaves on them, from the lower part upwards a good way, but bare and naked from thence to the top, where they have small, long, and round heads, shewing forth at first some yellowish Flowers, which being past, the Torch-head or Spike grows greater, and consists wholly of a Downy substance, of a blackish brown, and sometimes of a reddish brown color on the outside, and whitish within; somewhat solid or weighty, which yet is in time blown away with the Wind.

IV. *The second differs nothing from the former, but in this, that it grows not so high, nor great, the heads being also less than them of the former.*

V. *The third differs not from the second, but in being smaller than it, in both Leaf and Stalk, which are more hard and rough; and in the head or top, which in some places bears a smaller spike above, the lower being greater, with a small distance between them, and a small Leaf at bottom of it.*

VI. *The Places.* They grow in *Pools* and *standing Waters*, and sometimes in *running Streams*, as also in the middle of *watry Ditches* or *Ponds*, and by their Banks and Sides in many places of this Kingdom. *Gerard* says, he found the smaller sort growing in Ditches and Marshy Grounds in the Isle of *Shepey*, going from *Sherland-House* to *Feversham*. I have also found them growing in many places in the *Fens*, and in Moist and Standing Waters in *Fenny Grounds* in *Cambridge-shire*, and the *Isle of Ely*. And in the South part of *Carolina*, at the head of *Stono* River, in the Marshes near the *New Cut* leading into *Wad-wadmalow River*, which are overflowed with every Tide, I have found them growing plentifully.

VII. *The Times.* They flower in *June* and *July*, and their *Heads*, *Torches* or *Maces*, are ripe in *August*; but the Down hardly flies away till the end of *August*, or Month of *September*.

VIII. *The Qualities.* They are cold and dry in the first Degree: Astringent, and very Styptick, Alterative, and Analeptick.

IX. *The Specification.* The Down is a Specifick to stop the bleeding of External Wounds.

X. *The Preparations.* You may have, 1. *The Down.* 2. *A Pouder of it.* 3. *A Cataplasm.*

The Virtues.

XI. *The Down it self.* Applied dry to bleeding Wounds, it presently stops their bleeding: applied to running ulcerated Kibed Heels, it quickly cures them: so also used to moist Sores, and running Ulcers, it drys almost to a Miracle, incarnates and heals. In the *Fen Countries* it is sometimes used to make Beds of, for poor People to lye on. And mixed with Butter, as a Bait for Rats and Mice, it kills them by choaking them.

XII. *The Pouder of the Down.* *Matthiolus* says, it is good to help the burstenness or Ruptures of Children, wherein the Intestines fall down into the Cods. This others contest against, as being dangerous to be taken inwardly, as being rather fit to strangle than help them, because it choaks Rats and Mice. But this latter opinion I think to be an Error, for as it is used to choak and kill Rats and Mice, it is used Whole, and not in the Pouder, whereas, if it is reduced to a very subtil Pouder, as *Matthiolus* orders it, it can no ways be able to effect any such thing. This Pouder may be given, says *Gerard*, *mixed with Pouder of Betony, Roots of Gladiol, and Leaves of Horsetongue.* This is to be mixed with the Yolk of an Egg, and so eaten; it is (says he) a most perfect Remedy against Ruptures in Children, and must be Administred every Day fasting, for thirty Days together, one dram at a time: it not only helps Children and Striplings, but grown Men also, if in time of their Cure they use convenient Ligatures or Trussings, and fit proper Emplasters upon the grieved place, according to Art; *thus he.* For my part I have had no Experience hereof, and therefore can say but little to it, having, I confess, not much Faith in the Prescription, yet think it not of such a dangerous consequence, as some would have it; nor have I any great opinion of any Internals, given for this kind of Rupture, for that those Medicaments passing through the *Intestines*, can never come actually to the part where the Wound is, and so can do little in order to the Cure.

XIII. *The*

XIII. *The Cataplasm.* Made into a Cataplasm with Hogs Lard, it is said to heal Burnings and Scaldings with Fire or Water.

XIV. The Leaves are usually kept to make a fine sort of Matts of, and other like purposes.

CHAP. CXIV.

Of CARROTS, Garden.

I. *THE Names.* It is called in *Greek*, Σταφυλῖνος, ἡ σταφυλῖνος ἥμερος: In *Latin*, *Staphylinus*, *Staphylinus Hortensis*, and *Pastinaca tenuifolia Hortensis*: In *English*, *Carrot*, and *Garden Carrot.*

II. *The Kinds.* *Carrots* are either *Garden* or *Wild.* The *Garden*, are, 1. *Pastinaca tenuifolia sativa lutea*, Yellow Garden Carrots. 2. *Pastinaca tenuifolia altera sativa atro-rubens*, Red Garden Carrots.

Garden Carrots.

III. The Description. *The* Yellow Carrot *has a large long Root, great or thick, and yellow, big above, and small pointed below, without any Fangs or Twines, of a pleasant sweet Taste, and therefore generally spent for* Food. *From this Root spring forth several long* Leaves, *and well spread, made up of many thin, cut, deep, green* Leaves, *divided into many parts: among which rises up a round Stalk, a yard or more, high, bearing large Tufts of Umbles of white Flowers, which crowd close together, and spread not much, but turn into small whitish rough hairy Seed, sticking one to another.*

IV. *The* Red Carrot, *has a Root round and long, thick above and small below, running to a point as the other, and differs from it only in the color, which is wholly red quite throughout: From this Root rise many winged Leaves, much cut and divided into many other Leaves; and those cut again, and divided into many parts, of a deep green color like the former; some whereof in Autumn will turn to be of a fine Red or Purple; (the beauty of which makes several Persons many times to gather the Leaves, to stick them in their Hats, or Heads, or Bosoms, or pin them on their Sleeves instead of Feathers) from among which Leaves rises up a Stalk, bearing many Leaves likewise upon it, but not so high as the Parsnip, being about a yard high, bearing many Tufts or Umbles of white Flowers, which turn into small rough Seed, seeming as if it were hairy, and smelling gratefully enough, if rubbed between the Fingers. In a word, the whole Plant differs very little from the former, except in the redness of the Root.*

V. *Now here is to be noted*, 1. That the *Yellow Carrot* is of two sorts, *viz. The long and the short. One of the long sorts* is of a pale yellow, and this has the greatest and longest Root, and likewise the greatest head of Green: this for the most part is the worst sort of *Carrot*, not being so sweet and firm as the other. *The other long sort* is of a deep Gold yellow color, having a smaller head of Green Leaves upon it, and this is always the best and sweetest. *Parkinson* says, that yellow Carrots, by sometimes sowing themselves, do oftentimes make their Roots become White. *The short Roots* are also divided into pale and deep yellow, or Golden color. 2. *That the red Carrots*, besides those which are red quite throughout, there is another, whose Root is red without for a pretty way inwards, but the middle is yellow.

VI. *The Places.* They are only Sown in *Gardens*, or other *manured Fields*, chosen and fitted out for that purpose, and delight to grow in a Sandy and light ground, that their Roots may the more easily pierce deep downwards, which in a stiff clay ground they cannot so well do.

VII. *The Times.* They are to be sown in *March* and *April*, the first year they only strike down their Root; and the year following they bring forth their Flower and Seed. In *Carolina* I saw a Carrot above *four years old*, which brought forth its ripe Seed in the *fifth year*: The reason thereof I conceive to be, because the Master of the House cut off every year its green Tops, that it might not Seed, whereby the Root grew very great, as also the green head *the fifth* year, which was four or five times as big as any *ordinary Carrot* head: This head he let stand for Seed, and it produced him an incredible quantity thereof, very fair, and nearly *twice as large as ordinary Carrot Seed.*

IX. *The Qualities.* The Seed is hot and dry in the first Degree, Aperitive, Discussive, Diuretick, Carminative, Stomatick, Nephritick, Hysterick, and Alterative: The Roots are Sweet, Flatulent, Analeptick, and Spermatogenetick.

IX. As to their *Specification*, *Preparations and Virtues*, they are the same with those of the *Wild Carrot*, treated of in the *next Chapter*, to which we refer you; but with this note, that these *Garden Kinds* are nothing near so strong and powerful as those of the *Wild Kinds*, the Seeds of both being chiefly used in *Medicine*: As for the Roots, the *Garden Kind* a thousand fold exceed the *Wild* for Food, not only for the pleasure of Eating them, but also for their Analeptick or Nourishing faculty.

CHAP.

CHAP. CXV.

of CARROTS, Wild.

I. *THE Names.* It is called in *Greek* Σταφυλῖνος ἄγριος: In *Latin*, *Paſtinaca tenuifolia Sylveſtris*, by *Matthiolus*, and others; *Paſtinaca Erratica*, by *Fuchſius*, *Cordus*, and *Tabermontanus*: *Staphylinus Sylveſtris*, by *Tragus* and *Cæſalpinus*: *Daucus agreſtis*, by *Galen*, *in libro de Alimentis*, (and yet truly it is no *Daucus*:) *Daucus Vulgaris & Officinarum*, by *Lobel* and *Cluſius*: and in *Engliſh*, *Wild Carrot*, and *Birds-neſt*.

II. *The Kinds.* We ſhall only deſcribe two Kinds, *viz.* 1. *Paſtinaca tenuifolia Sylveſtris Anglica*, The *Engliſh* Wild Carrot. 2. *Paſtinaca tennifolia Sylveſtris Germanica*, The *German* Wild Carrot.

III. The Deſcriptions. *The firſt of theſe has a Root, ſmall, long, and hard, and therefore unfit for meat, being ſomewhat ſharp and ſtrong: from this Root riſe up* Leaves, *in a manner altogether like the Garden kinds, but that they are ſomewhat whiter and rougher, or more hairy, and ſo are the Stalks likewiſe, which bear large ſpiked tufts of white Flowers, with a deep purple ſpot in the middle, part being hollow and low, the outward Stalks riſing higher, all which are ſo crouded or contracted together, as makes the whole Umble ſhew, when the Seed is ripe, like unto a Birds Neſt, for which reaſon it has been called by ſome* Birds Neſt, *not much unlike to the Flowers of the* Gingidium verum.

IV. *The* German Wild Carrot *has a white Root, which is often a Foot long, ſometimes ſingle, and ſometimes divided into two or three parts, not much unlike in Taſte and Smell to Parſley Roots, but hotter in the Mouth for a long time. From this Root riſes up a Stalk half a yard high, as thick as ones little Finger at the bottom, being ſomething round, but plainly creſted or cornered, very hairy, and full of joints, at which come forth large creſted Branches of winged Leaves, encompaſſing the Stalk at bottom, a foot in length, and divided into ſeveral Leaves, and they again into other ſmaller parts, very rough and hairy alſo, and of a yellowiſh green color, from between which Leaves and Stalks at the Joints, come forth other creſted Stalks, and the like Leaves at their Joints, but leſſer, which do very much reſemble our Garden Carrot Leaves, but that they are larger and ſoft, if one does handle them hard, but rough on the back and edge, being gently touched. From every one almoſt of theſe Joints, both of the Stalk and Branches, ariſes a certain long husk, conſiſting of ſix ſmall long Leaves, cloſe ſet together, which when it opens, ſhews forth a ſmall Tuft, or cloſe Umble of white Flowers, and ſometimes yellowiſh, and a little ſweet; after which follows a roundiſh Seed, two always joined together, and very prickly on the back ſide, the inner ſide being flat, and more yellow than Carrot Seed, otherwiſe much like to it.*

V. *The Places.* The firſt grows plentifully in *England* by the field ſides, and in untilled places, almoſt every where; the other grows in like places in *Germany*, but with us is ſometimes nurſed up in *Gardens*, where it grows very well.

VI. *The Times.* They flouriſh and flower in *June* and *July*, and the Seed is ripe in *Auguſt*.

VII. *The Qualities.* The Seed and Root are hot and dry in the ſecond Degree: Aperitive, Abſterſive, Diſcuſſive, Carminative, Diuretick, Sudorifick, Cephalick, Stomatick, Nephritick, and Hyſterick; Alterative, Alexipharmick, and Spermatogenetick.

VIII. *The Specification.* Both Seed and Root are *Lithontripticks*, and good againſt the bitings of Venomous Beaſts, Wind, and riſing of the Mother.

IX. *The Preparations.* From Seed and Root, ſingly, you may have, 1. *A Pouder.* 2. *A Decoction.* 3. *A Spirituous Tincture.* 4. *An Acid Tincture.* 5. *An Oily Tincture.* 6. *A Saline Tincture.* 7. *A Spirit.* 8. *A Fixed Salt.*

The Virtues.

X. *The Pouder of the Root or Seed.* It expels Wind, and eaſes Stitches in the ſide, provokes Urine and the Terms, and helps to break and expel the Stone. Doſe one dram in White Wine.

XI. *The Decoction of Root or Seed.* If it is made in White Port Wine, it has all the Virtues of the Pouder, and is peculiarly good againſt the Dropſie, and ſuch whoſe Bellies are ſwoln with Wind. Doſe ſix or eight ounces, Morning, Noon and Night, it induces the Terms, provokes Luſt, and facilitates the Delivery of Women in Labour.

XII. *The Spirituous Tincture.* It has the Virtues of both Pouder and Decoction, but is a ſingular thing againſt the Cholick, and good to help Conception. Doſe one ſpoonful, Morning and Night, in a Glaſs of generous Wine.

XIII. *The Acid Tincture.* It is good againſt Stone and Gravel in both Reins and Bladder, and is very powerful to reſiſt Vapors and Hyſterick Fits, as alſo to cure the bitings and ſtingings of Venomous Creatures: and *Dioſcorides* ſaith, it is ſo powerful, that if it is taken beforehand, their bitings ſhall not hurt. Doſe forty or ſixty drops in Wine.

XIV. *The Oily Tincture.* It opens Obſtructions of the Reins and Urinary Parts, eaſes Pains, and cures weakneſſes of the Back and Loins, provokes Urine, and the Courſes. Doſe twenty drops.

XV. *The Saline Tincture.* Outwardly bathed withal, it draws forth the Poiſon and Malignity of Venomous Creatures, takes away Scurf, Morphew, and Sun-burnings, as alſo other deformities of the Skin:

Skin : and being taken inwardly to one dram, it provokes Urine, and prevails againſt the Dropſie.

XVI. *The Spirit.* It comforts the Head, Stomach, Heart and Womb, reſiſts Poiſon, and the Plague, expels Wind, and gives eaſe in Pains and Stitches of the Side. Doſe one ſpoonful.

XVII. *The fixed Salt.* It provokes Urine powerfully, and expels Sand, Gravel, and other Tartarous matter from the Reins, Ureters and Bladder : it powerfully opens and cleanſes, and given from a ſcruple to half a dram, or more, in a ſpoonful of Juice of Limons, it ſtops Vomiting, and admirably ſtrengthens the Stomach.

XVIII. *The green Leaves.* *Dioſcorides* and *Galen* both ſay, that the Leaves being applied with Honey (I ſuppoſe in form of a Cataplaſm) to running Sores or Ulcers, do cleanſe them.

CHAP. CXVI.

Of CARROTS *of* Candy.

I. THE *Names.* It is called in *Greek*, Δαῦκος: In *Arabick*, *Dauco*, and *Giezar :* In *Latin* alſo *Daucus*, *Daucum*, and *Daucium*, and *Daucus Creticus :* In *Engliſh*, *Daucus*, and *Dauke*, and *Candy Carrots.*

II. *The Kinds. Parkinſon* makes ſixteen kinds of *Daucus's*, many of which are nothing to our purpoſe : Thoſe which we are chiefly to treat of in this Chapter, are the *Candy* or *Cretick Kinds*, which *Dioſcorides* makes to be three, *viz.* 1. *Daucus Creticus verus Dioſcoridis*, The true Daucus of *Candy.* 2. *Daucus Selinoides*, The Parſley Leav'd Daucus. 3. *Daucus Coriandri foliis*, *Daucus tertius Dioſcoridis Bellæ*, Coriander Leav'd Daucus, or *Bellus* his third Daucus of *Dioſcorides.* 4. To theſe we think good to add a ſecond kind of the *Daucus Selinoides*, which is *Daucus Selinoides maxima*, The greateſt Parſley Leav'd Daucus.

III. The Deſcriptions. *The* True Daucus *has a Root ſmall, long, and white (leſſer ſays* Gerard, *than the Root of a Parſnip, which is of a fragrant ſmell, and almoſt as quick and ſharp in Taſte as the Seed, but will not abide our Winters here in* England, *with all the skill we can uſe, ſo that we are forc'd to ſow it anew every Year. From this Root riſe up ſeveral Stalks of Winged Leaves, as finely cut as Fennel, but ſhorter, ſet at diſtances one againſt another, of a whitiſh or hoary color, ſmelling a little ſweet. From among which riſe up divers ſlender Branches or Stalks a Foot high, bearing at their Tops ſmall Umbles of white Flowers, and after them ſmall hoary greyiſh Seed, ſomewhat long and round, and of a ſharp or quick Smell and Taſte.*

IV. *The ſecond* Daucus *has a Root ſomewhat great, thick, long and white, with a buſh of hairs at the Head, as many other Umbeliferous Plants have, and of a hot and ſharp taſte, as the Seed alſo is ; from whence riſe up large Stalks of ſomewhat broad pale green Leaves, bigger than Parſley, and with diviſions of the ſame faſhion and manner, next the ground : And alſo large Stalks almoſt two feet high, with the like Leaves at the Joints, but ſhorter ; and at the tops ſpokie rundles of white Flowers, which turn into long creſted Seed, bigger than ordinary Fennel Seed, and of a yellow brown color.*

V. *The third* Daucus *of* Dioſcorides, *according to* Honorius Bellus *his account, has a Root great, thick and ſhort, periſhing yearly. The whole Plant is Aromatical, and both Root and Leaf are eaten by the* Cretians *as a common Sallet Herb. From this Root ſpring ſeveral Stalks of fine cut Leaves, not much unlike to the Leaves of* Coriander, *but leſſer and thicker. The Stalks are near two Feet high, with great and ſwollen Joints, (and therefore called by ſome* Seſeli nodoſom, *knotted Hartwort, but by* Bauhinus, Daucus Criticus nodoſus Umbella lutea) *and ſmaller Leaves at them, at the tops whereof grow yellow Umbles of Flowers (but white with us in* England) *which being paſt away, there comes much Seed, larger than that of* Fennel.

VI. *The fourth* Daucus, *which is the large or largeſt kind of the Parſley Leav'd, has a Root ſometimes as large as ones Arm, or being young, of the bigneſs of ones Thumb, parted into ſeveral Branches at the bottom, and covered with a rugged black Bark, of a Viſcous taſte at the firſt, but ſharp afterwards, ſo as to cauſe ſpitting, having at the top many hairy Heads, from whence come ſeveral very large, and great Winged Leaves, much divided and dented about the edges, muchwhat like the laſt, but bigger, and of a pale or faint green color, a little ſhining on the upper ſide, and of a greyiſh aſh-color underneath. Among theſe Leaves riſes up, a large, great, creſted Stalk, of a Fingers thickneſs, with ſome Joints, and Leaves at the Joints, and with Branches alſo between them : at the tops whereof ſtand ſmall Umbles of whitiſh Flowers, and ſomewhat like Seed to the ſecond kind, but larger.*

VII. *The Places. Candia* is the Natural place of their Growth, but with us in *England* they are only nouriſhed up in *Gardens.* The firſt has been found upon ſeveral Mountains of *Germany* ; and upon the Hills and Rocks of *Jura* near *Geneva*, from whence it has been tranſported into ſeveral of our more Northern Regions.

VIII. *The Times.* They flower in *June* and *July*, ſome earlier, ſome later ; and their Seed is ripe in *Auguſt* ; ſome of it ripening in the time of flowering.

IX. *The Qualities.* The Seed and Roots are hot and dry in the third Degree ; the Herb ſcarcely exceeds the ſecond Degree of heat, and therefore is leſs powerful. They are Aperitive, Attractive, Digeſtive, Carminative, Diuretick, Cephalick, Stomatick, Nephritick, Hyſterick, Lithontriptick, Alterative, Alexipharmick and Spermatogenetick.

X. *The Specification.* It is chiefly dedicated to the Strangury, Stone, and ſtoppage of Urine.

XI. *The Preparations.* You may make hereof,

1. *A liquid Juice of the Herb and Root.* 2. *An Eſſence of the ſame.* 3. *A Pouder of the Seed.* 4. *An Infuſion of the Seed.* 5. *A Decoction of Seed or Root, or both.* 6. *A Cataplaſm of the Herb and Root.* 7. *A Diſtilled Water.* 8. *A Spirituous Tincture.* 9. *An Acid Tincture.* 10. *An Oily Tincture.* 11. *A Saline Tincture.* 12. *A Spirit.* 13. *A diſtilled Oil.* 14. *Poteſtates* or *Powers.* 15. *An Elixir.* 16. *A Salt.*

The Virtues.

XII. *The liquid Juice of the Herb and Root.* It helps the Strangury, provokes Urine, and the Terms, and expels both Birth and After-birth, and is good for thoſe who have been bitten by the *Phalangium*, or any other Venomous Beaſt. Doſe four ſpoonfuls in Wine.

XIII. *The Eſſence.* It has all the Virtues of the liquid Juice, and is ſtronger, finer, and a much more noble Medicine: It prevails againſt Vapors and Hyſterick Fits, as alſo the malignity of the Plague, or Peſtilence. Doſe one or two ounces in generous Wine, Morning and Night, or three or four times a Day, as the neceſſity or extremity may require.

XIV. *The Pouder of the Seed.* This (according to Authors) has that powerful heat in it, that it becomes a principal Medicine to help the Strangury, to eaſe the pain, and remove all ſtoppages of Urine. It provokes the Terms, facilitates the Delivery, and brings away the Dead Child, and Afterbirth, and helps Vapors and Hyſterick Fits. Doſe one dram, to one dram and half, in a Glaſs of White Port Wine, Morning and Night, and in time of a Paroxyſm.

XV. *The Infuſion of the Seed in Wine.* It has all the Virtues of the Pouder, but I fear not full out ſo effectual. Doſe half a Pint, Morning, Noon, and Night.

XVI. *The Decoction of Seed, or Root, or both.* It ought to be made in White Port Wine, and ſo given to drink, two, three or four times a day, half a Pint at a time: It has the Virtues both of the Eſſence, and Pouder of the Seed; and a moſt famous thing againſt the Plague, the Patient being put to Bed, well covered, and ſo made to Sweat upon it.

XVII. *The Cataplaſm.* The Herb, but more eſpecially the Roots made into a Cataplaſm, by beating in a Mortar, and ſo mixed with Hogs Lard, and applied, does eaſe, diſcuſs, or aſſwage Tumors or Swellings in any part. Made into a Mixture or Cataplaſm with Honey, and applied to the Throat, it eaſes an Inveterate Cough.

XVIII. *The Diſtilled Water.* It prevails againſt Stone, Gravel, Sand, Strangury, and all ſtoppages of Urine, but is weak, in reſpect to the Juice, Eſſence, and other more noble Preparations of the Plant, and therefore is only uſed as a Vehicle to convey other Preparations of the ſame in.

XIX. *The Spirituous Tincture.* It is an excellent thing againſt the Plague or Peſtilence, and againſt all other malign Fevers, as Purples, Spotted Fever, Meaſles, Small Pox, and Fevers derived from the bitings of Serpents, as Vipers, Rattle Snakes, and others of like kind: It provokes Sweat gently, and defends the Heart after an admirable manner. Doſe two, three, or four drams in the Diſtilled Water, or Father in Wine, or ſome other fit Vehicle.

XX. *The Acid Tincture.* It has all the Virtues of the Spirituous Tincture, and if the Fever is very high or intenſe, is much the better Medicament; beſides the Acid, deſtroys the Malignity much more powerfully. Doſe to one dram, or more, in the Diſtilled Water.

XXI. *The Oily Tincture.* In an extremity of the Strangury this is the moſt powerful Preparation, being given to thirty drops, or more, in a Glaſs of White Port Wine: It is powerful to defeat Griping Pains, and Torments of the Bowels, to facilitate the Birth, and bring away the Dead Child: It eaſes Convulſions, and heals Wounds in the Body or Bowels.

XXII. *The Saline Tincture.* It cleanſes the Reins and Urinary Paſſages, being taken to one dram, or more, in White Wine; but heals not like the Oily Tincture. It digeſts humors, and provokes Urine, and the Terms in Women.

XXIII. *The Diſtilled Oil of the Seed.* It has all the Virtues of the Juice, Eſſence, Pouder of the Seed, Decoction, Spirituous, Acid, and Oily Tinctures: and therefore may be given from eight drops to ſixteen, being firſt dropt into Sugar, and then mixed with the Diſtilled Water, or ſome other fit Vehicle. It helps the Strangury upon the ſpot, cleanſes the Reins of all Tartarous Matters, and all other of the Urinary Parts, provokes the Terms, reſiſts Vapors, and Hyſterick Fits, eaſes the Cholick, produces the Birth, expels watry Humors in Dropſies, and cures the Poiſon of Mad Dogs, or any other Venomous Creature; and cures intolerable Pains of the Stomach proceeding from Cold, Weakneſs, and other like diſaffections.

XXIV. *The Poteſtates* or *Powers.* They have all the Virtues of the Oil, and are alſo more ſubtil and penetrating, and more pleaſant to be taken, being more eaſily mixed with Wine, or any other potable Liquor. Doſe from two to four drams.

XXV. *The Elixir.* This is yet more excellent and noble than the Powers, being the Tincture of the Seed or Root extracted by the ſublimity of the Poteſtates; by which you have all the noble parts of the Plant concentrated in one Medicament: and ſo has all the Virtues of the Juice, Eſſence, Pouder, Tinctures, Oil, and Poteſtates, in the higheſt exaltation. Doſe one dram to two drams in a Glaſs of Wine, Morning and Evening.

XXVI. *The fixed Salt.* It is ſtrongly Diuretick, ſtrengthens the Stomach, being given in the Acid Tincture, mixed with the Diſtilled Water, or ſome other fit *Vehiculum.* Being taken for ſome time in White Port Wine, it deſtroys all Præternatural Acids, in what part of the Body ſoever, and diſſolves the Stone, if it is of a gritty, friable, or brittle ſubſtance. The Doſe is from a ſcruple to half a dram, or two ſcruples, Morning and Evening.

CHAP. CXVII.

Of CARAWAY.

I. *THE Names.* It is called in *Arabick*, *Karvia*, *Karavia*, and *Carvi*: In *Greek*, Κάρον: In *Latin*, *Carum*; alſo *Carui*, as the Apothecaries call it: *Simon Sethi* calls it *Carnabadion*: It took its name from the Countrey of *Caria*, from whence it came: Some call it *Careum*, ſome *Carvum*, as in the Shops: and in *Engliſh*, *Caraway*.

II. *The Kinds.* We ſhall here enumerate but two Kinds, 1. *Carum Vulgare*, our Ordinary or Common Caraway. 2. *Carum pratenſe*, Meadow Caraway.

III. The Deſcriptions. *The firſt has a Root whitiſh, ſmall, and long, ſomewhat like unto a Parſnep, but with a more wrinkled Bark, and much leſs, having a little hot, and quick taſte, ſtronger than a*

Parſnep, and abiding after Seed time. Gerard *ſays, the Root is like that of Parſley, white, and in taſte like unto a Carrot, and* (ſays he) *may be ſodden, and eaten as the Parſnep or Carrot is. From this Root ſpring up divers Stalks of fine cut Leaves, lying on the Ground, ſomewhat like to the Leaves of Carrots, but not buſhing out ſo thick, of a little quick taſte in them. From among which riſes up a ſquare Stalk, not ſo high as the Carrot, at whoſe Joints are ſet the like Leaves, but ſmaller, and finer cut; and at the tops there are ſmall open Tufts, or Umbles of white Flowers, which turn into ſmall blackiſh brown Seed, ſmaller than the Anniſeed, and of a quicker and hotter Taſte.*

Caravaies.

IV. *The ſecond has a Root ſmall and ſlender, of a Smell not much unlike to* Daucus, *but of a hot and ſharp Taſte, yet not ſo hot and ſharp as the Seed; from this Root grows Leaves like the former, but larger; and from among thoſe Leaves, come forth Stalks greater and higher than the Common Kind. The ſpokie Umbles of white Flowers are in like manner larger, and the Seed like unto* Cummin Seed, *but much bigger.*

V. *The Places.* Caraways grow naturally in *Caria*, as *Dioſcorides* ſaith, whence came the name: now they are found to grow almoſt every where in *Germany*, as *Tragus* ſays, in many places in the Fields, and by the Way ſides; as alſo in Meadows, and in the fat and fruitful Fields of *Bohemia*, and likewiſe in low grounds, which are now and then over run with Water; but with us they are uſually ſown in *Gardens*, where they proſper admirably.

VI. *The Times.* They Flower and Seed from *May*, and continue ſo till the end of *Auguſt*.

VII. *The Qualities.* *Caraways Seeds* are hot and dry, as *Galen* ſays, almoſt in the third Degree. They are Aperitive, Carminative, Digeſtive, Diſcuſſive, Diuretick, Cephalick, Neurotick, Stomatick, Nephritick, Alterative, and Alexipharmick.

VIII. *The Specification.* They powerfully expel Wind, and eaſe Pains of the Cholick.

IX. *The Preparations.* You may have, 1. *The Root.* 2. *The Herb.* 3. *The Seed.* 4. *A Juice of Herb and Root.* 5. *An Eſſence of the ſame.* 6. *A Decoction of the Seed.* 7. *A Pouder of the Seed.* 8. *A Cataplaſm of the Herb.* 9. *A Diſtilled Water of the whole Plant.* 10. *A Spirituous Tincture.* 11. *An Acid Tincture.* 12. *An Oily Tincture.* 13. *A Spirit.* 14. *A Diſtilled Oil.* 15. Poteſtates, or *Powers.* 16. *An Elixir.*

The Virtues.

X. *The Root.* *Parkinſon* ſays, that it is better Food than that of the *Parſnep*, and is pleaſant, and comfortable to the Stomach, helping Digeſtion.

XI. *The Herb.* Being dried, and made into Pouder, and ſtrewed upon moiſt and running Sores and Ulcers, it drys them up, and in ſhort time after heals them; it alſo heals Kibes in Childrens Feet.

XII. *The Seed.* It is uſed whole in Bread, Cakes, Apple Pyes and Paſties, to give a reliſh to them, and to add a ſtomatick and warming Quality, in room of Spice; alſo to be made into Comfits to correct the Wind in the Stomach. Being bruiſed, fryed, and laid hot in a Bag, or double Cloth, to the lower parts of the Belly, it diſperſes the Wind, and eaſes the pains of the Cholick.

XIII. *The Juice of the Herb and Root.* It is prevalent againſt Wind, and all cold Diſeaſes of the Head, Nerves, Stomach, Bowels, Womb and Joints: gives eaſe in the Cholick, and griping of the Guts; repreſſes Vapors, and Hyſterick Fits, and provokes Urine. Doſe two ounces in Wine.

XIV. *The Eſſence.* It has the Virtues of the Juice, but more efficacious in opening Obſtructions of the Reins, Ureters and Bladder, and expelling Tartarous matter from thoſe parts. It prevails againſt the Cholick, and all Diſtempers of the Bowels proceeding from cold and moiſture.

XV. *The Decoction of the Seed.* It has the Virtues of the Juice and Eſſence, and is very good for ſuch as have the yellow Jaundice, and Virgins troubled with the Green-ſickneſs, and ſuch as are daily afflicted with Wind in the Stomach and Bowels. It ought to be made in Wine, and may be taken to half a pint at a time ſweetned with White Sugar.

XVI. *The Pouder of the Seed.* Taken to one dram, daily Morning and Night, mixed with fine Loaf Sugar, it has been found to ſharpen the ſight, to expel Wind, and help a bloody Flux, and other fluxes of the Bowels, though they have been of a long ſtanding. And by the conſtant uſe thereof, a periodical Cholick has been often cured.

XVII. *The Cataplaſm.* Made of the Pouder of the Seed with White Bread and Sherry Wine, it diſcuſſes flatulent Tumors or Swellings, eaſes pains in any part proceeding from Cold, comforts and ſtrengthens weak Limbs, and takes away the black and blew ſpots of Blows, Bruiſes, and the like. The ſame laid as hot on as can be endured to the lower parts of the Belly, gives eaſe in the Cholick.

XVIII. *The Diſtilled Water of the whole Plant.* It is only uſed as a Vehicle to convey Stomatick and Carminative Medicaments in, down into the Body.

XIX. *The Spirituous Tincture.* It is good againſt Lethargies, Carus, Vertigo, Apoplexy, Palſie, Fainting, and illneſs of the Stomach, ſickneſs at Heart, ſwooning Fits, Convulſions, coldneſs and weakneſs of the Nerves, and all thoſe other Diſeaſes for which the Eſſence is proper. The Doſe is half a ſpoonful

in

in a Glaſs of Wine, Morning, Noon and Night, in all cold and moiſt Conſtitutions.

XX. *The Acid Tincture.* It admirably helps Digeſtion, creates a good Stomach, repreſſes Vapors, and is good againſt Fits of the Mother. Doſe thirty or forty drops in any Liquor the Patient drinks, or in a Glaſs of Wine two or three times a day.

XXI. *The Oily Tincture.* It is Diuretick, eaſes pains of the Back and Reins, being taken inwardly to twenty or thirty drops in any proper Vehicle: outwardly bathed upon the part, it gives eaſe in Pains of the Gout, proceeding from a cold Cauſe; and is eminently good againſt Cramps in any part, Convulſions, and the Palſie, if it be well anointed on the Paralitick part before a good fire, and rubbed in for an hour together, and ſo continued daily for twelve, fifteen, or twenty days, till the Patient finds he comes to the feeling ſtrength, and uſe of his Limbs, *&c.*

XXII. *The Spirit drawn from the Seed.* It revives the Spirits, chears the Heart, comforts Nature, repreſſes Melancholly, warms and ſtrengthens a cold Stomach, and is good againſt Fainting and Swooning Fits. Doſe half an ounce, or more, at a time, being dulcified, upon occaſion.

XXIII. *The Diſtilled Oil from the Seed.* It has all the Virtues of the Juice, Eſſence, Decoction, Pouder, Tinctures and Spirit, but much more powerful to all the ſaid purpoſes and intentions. Doſe from eight to ſixteen drops, dropt into Sugar, and then diſſolved in any proper Vehicle the Patient likes beſt, and is alſo agreeable to the Medicament in reſiſting the Diſeaſe.

XXIV. *The Powers.* They have all the Virtues of the Oil, but much more ſubtil and penetrating, and more pleaſant and eaſie to be taken by delicate and weak Stomachs. Doſe two or three drams in a Glaſs of generous Wine, Morning and Night.

XXV. *The Elixir.* It provokes Urine, (having all the Virtues of the Spirit, Tincture, Oil and Powers exalted) and breaks the Stone, if it is ſoft and gritty, expelling Gravel, Sand and Tartarous Matter from all the Urinary Veſſels. It opens Obſtructions of the Liver and Spleen, cleanſes the Blood from corrupted Humors, and is commended againſt the *Cachexia*, or evil diſpoſition of the whole Body, ariſing from a cold, moiſt, and watry habit of the ſame; and therefore, in the going off of a *Dropſie*, when the Bowels are much weakned, and the Tone of them extreamly hurt, it ſo comforts and ſtrengthens them, as to make the Body to withſtand the return of the Diſeaſe, into which if the Patient ſhould Relapſe, it is generally fatal. The Doſe is half a ſpoonful in Sherry, Canary, or *Madera* Wine.

CHAP. CXVIII.

CENTORY the Greater.

I. THE *Names.* It is called in *Greek*, Κεντάυριον τὸ μέγα: In *Latin*, *Centaurium magnum*: of *Theophraſtus* Κεντάυρες: and in *Engliſh*, *Centory* the Greater, or Greater *Centory*.

II. *The Kinds.* There are four Kinds of this Centory, 1. *Centaurium majus vulgare*, *Centaurium magnum*, The Common Great Centory. 2. *Centaurium majus alterum*, The other Great Centory, or Whole leav'd Centory. 3. *Centaurium majus Americanum*, or *Canadanum*, *Centaurium foliis Cynaræ*, *Centaurium Pyrenæum*, The *American* Centory, with Artichoak Leaves. 4. *Centaurium majus luteum*, The great yellow Centory.

III. The Deſcriptions. *The firſt of theſe has a Root which grows to be more than two foot long, and as large as a reaſonable great Parſnep-root, blackiſh on the outſide, and ſomething of a reddiſh yellow within, abiding many years, and ſending forth freſh Leaves every Spring, thoſe dying for the moſt part which were green all the Summer; which Leaves are many, large, long, and ſoft, deeply cut in on the edges, of a pale green color on the upper ſide, and whitiſh underneath, without any thing of the great bitterneſs which is in the leſſer Centory, which is no Species of this Plant. The Stalk is long and round, and three or four feet high, divided at the top into many Branches, on which ſtand large, round, ſcaly-green heads, ſhooting forth at their tops, many ſmall Threads or Thrums, of a pale blewiſh Aſh-color. In which, after they are fallen, do grow, large, whitiſh, ſmooth, ſhining Seeds, not much unlike Thiſtle Seeds, but larger, and lying amongſt a great deal of Downy Matter.*

IV. *The ſecond* Great Centory *has a Root growing to be as great or greater than the former, and black on the out ſide, but yellowiſh within, yielding a yellowiſh red Juice, which is a little bitter, but more Aromatical than the former. From the head of this Root comes forth many Leaves lying almoſt upon the ground, which are long, and as large almoſt as the former, but without any jaggedneſs or diviſion at all in them, yet deeply dented about the edges, and of a deep green color. The Stalk is round and great, but riſes not up ſo high as the other does, nor divides it ſelf at the top, into ſo many Branches, but bearing only two or three heads on a Stalk, which are ſcaly, in the ſame manner, and in it ſuch like Thrums or Thready Flowers, of a pale whitiſh color, which being paſt, there comes ſuch like Seed in the heads, lying in a Flocky or Downy Subſtance, and every one bearded in the ſame manner, but a little blacker.*

V. *The third, which is the* American, *or* Floridian Great Centory, *has a Root great and black on the out ſide, but longer than the firſt, and of the bigneſs of ones Wriſt. It has larger Leaves than the firſt, and more jagged, or cut in deeply on the Edges,*

somewhat resembling an Artichoak Leaf *in the divisions, whence the name* Foliis Cynaris, *green above, and gray, or as it were hoary underneath. The Stalk rises about a yard high, cornered and hoary, having several smaller Leaves, and less jagged, set thereupon, and parted at the top into some Branches, each bearing a few small Leaves, under the Heads, which are much greater, and more scaly, with sharp pricks at their ends, like a little* Wild Artichoak Head. *The tuft of Threads, which are the Flowers, are more purple, than in the first; and the Seeds are white, wrapped up in Down in like manner.*

VI. *The fourth, or* Yellow Great Centory, *has a Root which grows in time to be greater than any of the former, having many Heads which shoot forth new Leaves in the Spring, the old Leaves going away or dying upon the ground every Year, which is wrinkled, and black on the out side, and yellowish within, full of a viscous or slimy moisture, and striking deep into the ground, with some greater Branches, and a few small fibres. The new Leaves which this Root sends forth are both larger and longer from the Root than the others, some of the lowest having fewer divisions in them, than some others of them have; but those which grow upon the Stalk, as well as some of the others below, are very much divided into many parts, making every winged leaf to consist of fourteen or sixteen Leaves, the great rib in the middle between them being whitish, each for the most part set against another, with an odd one at the end, and every of them being narrow and long, without any dents on the edges, and of a whitish green color. The Stalks are manifold, round and strong, a little straked down length ways, each being divided into some other Branches, which bear scaly Heads greater than any of the others, and larger spread thrums in the middle, of a delicate pale, but lively yellow color, which continue in their glory and beauty for a long time, without decaying; but they seldom yield any Seed here with us in* England, *because that the scaly Heads are so full of moisture (as is supposed) which hinders the Seed to grow ripe therein; for if they are but a little pressed between the Fingers, there will issue out on all sides small clear drops of Water, almost of a Honey like Sweetness, and that not only at Noon-time of the* Day, *as* Bauhin *is pleased to say, but also at all other times of the Day, and not for one only time and no more, but often times, and every Day, as long as the Flowers are fresh, and not yet withered: but when it perfects its Seed, it is not much unlike to the Seed of the second kind, but a little lesser, blacker, and more shining.*

VII. *The Places.* The first delights in a fat and fruitful Soil, and in Sunny Banks, full of Grass and Herbs. The first and second grow upon the *Alps*, and Mount *Baldus*: *Dioscorides* saith, they grow plentifully in *Lycia*, *Peloponnesus*, *Arcadia*, &c. The third grows upon the *Pyrænean* Hills, and upon stony Hills near *Lisbon* in *Portugal*, near the River *Tagus*: It has also been found to grow in *America*, upon the *Floridan* Continent, near *Canada*, *New England*, *Virginia*, and parts adjacent to them. The fourth not far from *Lisbon*, near the *Tagus*, and also on Mount *Baldus*, as *Pena* saith: With us, they are only nourished up in Gardens, where they thrive and flourish very well.

VIII. *The Times.* They all Flower about the end of *June*, and in *July*, and the Roots may be gathered in *Autumn*. The *American* seldom Flowers with us, because of the coldness of our Climate, nor does it live, unless with much care.

IX. *The Qualities.* It is hot and dry in the third Degree. It is Aperitive, Absterstive, Astringent, Digestive, Discussive, Incarnative, Anodyn, and Traumatick, or Vulnerary. It is dedicated to the Stomach, Lungs, Liver, Spleen, Reins and Womb: It is Alterative, Alexipharmick, and Hemopock.

X. *The Specification.* It is a noble Wound Herb: *Pliny* and *Theophrastus* set it down among the number of *Panacæa's*, All-heals, or Wound Herbs, this Great Centory, (as also the Lesser, of which in the next Chapter.) *Pliny*, *lib.* 25. *cap.* 4. reciting the words of *Theophrastus*, says, that they were found out by *Chiron* the *Centaure*, and that from thence they were called *Centauria*: and in *cap.* 6. he repeats and affirms again the same thing, and thereupon, he saith, they were both named *Chironia*, though in truth they, *viz.* the Greater and Smaller, are no Kin one to another, not being Species of the same Genus, and so have no relation but only in name. It is reported, that *Chiron* was cured herewith of a Wound in his Foot, which was made with an Arrow, which fell upon it, when he was entertaining *Hercules* in his House, upon which it was called *Chironium*: or else from the curing of the Wounds of his Soldiers, for the which Intention it is most excellent.

XI. *The Preparations.* The Roots and Herb are both used, but the Root chiefly: and from them you may prepare, 1. *A liquid Juice.* 2. *An Essence.* 3. *An Infusion.* 4. *A Decoction.* 5. *A Pouder.* 6. *A Balsam.* 7. *An Ointment.* 8. *A Cataplasm.* 9. *A Spirituous Tincture.* 10. *An Acid Tincture.* 11. *An Oily Tincture*: all made from the Root.

The Virtues.

XII. *The liquid Juice.* Being taken to two or three ounces, or more, Morning and Evening, opens Obstructions of the Liver and Spleen, and prevails against the Dropsie and Yellow Jaundice, stops spitting of Blood, and is prevalent against Ruptures, Cramps, and Pleurisies, and for those who have an old and continued Cough, or are short Winded, and can hardly draw their Breath.

XIII. *The Essence.* It has all the former Virtues, but more powerful to every Intention; besides which, this Preparation is profitable against Agues, eases the Cholick, and all sorts of Griping Pains, both of Belly and Womb. It is also a singular Traumatick, for it heals all inward Wounds and Excoriations of the Bowels, and outwardly applied to Wounds, running Sores and Ulcers, it digests, cleanses, drys, and Disposes the same to a speedy healing. Dose two or three ounces in a Glass of generous Wine.

XIV. *The Infusion.* It is a weak thing compared with the former Preparation; yet being made in Wine, it opens Obstructions of the *Viscera*, and is good against the Jaundice, pains of the *Pleura*, or Stitches in the Side. Dose four or six ounces Morning and Evening.

XV. *The Decoction.* It is something more powerful than the Infusion, and is good for the same Diseases which that and the Essence are good against. Sweetned with Honey, or Sugar Candy, it is good against Wheesings, Hoarseness, Obstructions of the Lungs, shortness of Breath, and an inveterate Cough. It is good against the Strangury, or pissing by drops: and used as a Lotion, it cleanses Wounds, old Sores, and running Ulcers; and as a Gargarism, it cleanses and heals Cankers and Ulcers in the Gums, Mouth and Throat: being drank half a Pint at a time, it expels the malignity of Wounds made by the bitings or stinging of Venomous Creatures. Dropt into the Eyes it clears them, and sharpens the Eyesight.

XVI. *The Pouder.* It has all the Virtues of the Juice, Essence and Decoction, being taken one dram, or dram and half at a time, Morning and Evening,

in

in Wine: beſides which, being ſtrewed upon moiſt, running Sores, it cleanſes, dries, and heals them.

XVII. *The Balſam.* It heals Wounds at once or twice dreſſing: if they be contuſed, it digeſts them, cleanſes and heals. Applied to foul, corrupted, rotten Sores, and old Ulcers, it digeſts them, cleanſes, dries, and heals almoſt to a Miracle. Applied to the Gout, it draws the humor out through the pores of the skin, and ſo cures it.

XVIII. *The Ointment.* It is vulnerary, drying, and healing, good againſt burnings, ſcaldings, and fluxes of ſharp Humors, which it repreſſes by virtue of its Aſtringency, the Sore, Ulcer or Wound, being firſt waſht with the Juice or Eſſence: then the Pouder of the Root being ſtrewed upon it, and afterwards pledgets being dipt in the Ointment, and laid over all, with a *De Minio Emplaſter* upon that to hold it on: by this means deſperate old and running Sores and Ulcers have been ſuddenly and effectually cured.

XIX. *The Cataplaſm.* It is an excellent Anodyn and Diſcuſſive, prevalent againſt flatulent Tumors: If it is made up into a Peſſary with the Pouder of the Root, and put up the Womb, it provokes the Terms in Women, and educeth the Dead Child and After-birth.

XX. *The Spirituous Tincture.* It is good againſt Convulſions, Lethargies, Palſies, Cramps, Pains and Aches in the Limbs, as alſo in the Stomach and Belly, Colick, and all Diſeaſes of thoſe parts proceeding from Wind: Let it be taken inwardly three times a day, from two drams to four in any proper Vehicle: and outwardly, let it be bathed upon the part affected Morning and Evening, till health is recovered.

XXI. *The Acid Tincture.* It is good againſt Malignity, and the Poiſon of Peſtilential Fevers: is good againſt the bitings or ſtingings of Venomous Creatures; opens Obſtructions of the Lungs, helps againſt Coughs, Colds, ſhortneſs of Breath, Wheezing, Hoarſneſs, *&c.* being taken in all that the Patient drinks, whether Ale, Beer, or Wine, ſo many drops at a time as may make the Liquor pleaſingly ſharp.

XXII. *The Oily Tincture.* It opens Obſtructions of the Reins, Ureters and Bladder, is prevalent againſt the Strangury, pains and weakneſs in the Back, being taken from ten to twenty or thirty drops in White Port Wine twice a Day, *viz.* Morning and Night; and withal being bathed well in, upon the *Spina Dorſi*, or Back Bone.

XXIII. *The whole Plant, as well Herb as Root*, is available in all ſorts of Wounds, Sores and Ulcers, to digeſt, cleanſe, dry, conglutinate, and heal them; and therefore are principal ingredients, and ſhould be in all vulnerary Ointments, Balſams, Drinks, Lotions, and Injections, according to ſome of the aforegoing preſcribed Preparations, reſpect being had to the parts afflicted, and the way and Method of Application or Exhibition, whether Inward or Outward.

CHAP. CXIX.

Of CENTORY the Leſſer.

I. *THE Names.* It is called in *Arabick*, *Kantarion Sages*, and *Canturion Sege*, or *Segir*: In *Greek*, Κεντάυειον τὸ μικρὸν: In *Latin*, *Centaurium minus*, *& parvum*: Of ſome, *Centaurea*, *febriſuga*, from its Quality: *De Lyra*, from its [illegible] tremeſs. *Dioſcorides* ſays, it was called *Limnion*, and *Pliny*, *Libadion*, becauſe it loves to grow in moiſt places. It is thought to be that Plant which *Theophraſtus* called *Leptophyllum*: In *English*, *Centory the Leſſer*, and *Leſſer Centory*.

II. *The Kinds.* It is no Species of the *Greater Centory*, nor claims any the leaſt Kindred with it, having no Relation in any kind, but only in the name, and therefore is *Genus* or General it ſelf. It is ſix fold, as growing with us, *viz.* 1. *Centaurium minus vulgare flore rubente*, The Common Red Small Centory. 2. *Centaurium minus flore albo*, White flowered Centory. 3. *Centaurium minus luteum*, Small yellow Centory. 4. *Centaurium minus luteum perfoliatum ramoſum*, Branched through-leav'd Small yellow Centory. 5. *Centaurium minus luteum non ramoſum*, Small yellow Centory, not Branched. 6. *Centaurium minimum luteum*, The very ſmall, or ſmalleſt yellow Centory.

III. The Deſcriptions. *The* firſt *of theſe, which is our* Common ſmall Centory, *has a Root ſmall and hard, periſhing every year, from whence ſprings up for the moſt part, but one round and crefted Stalk, about a foot high, or ſomething more, branching out at the top into many Sprigs or Branches, and ſome alſo from the Joints of the Stalks below. The Leaves are ſmall, and a little roundiſh, very like unto St.* John's *Wort, but without any holes in them, as that has.. The Flowers ſtand at the tops, as it were in a Tuft or Umble, and are of a pale red color, tending to a Carnation. They conſiſt of five, and ſometimes of ſix, ſmall Leaves, very like unto thoſe of* Hypericon, *opening themſelves in the Day time, and cloſing at Night, after which come Seed in little ſhort Husks, and in form like unto* Wheat Corns. *The whole Plant is of an exceeding bitter Taſte.*

IV. *The* ſecond, *with the* White Flower, *differs nothing from the other, as to the form, neither in Root, Stalk, Leaves, Height, Flowers or Seed, ſaving only in the color of the Flowers, which is* White, *as the other is* Red; *and the bitter taſte is the ſame in its full Latitude.*

V. The

V. *The* third, *which is the* Small Yellow Centory, *is a little like to the ſecond, and a little greater than it; the Leaves are alſo larger and broader, and broad at the bottom, but yet not ſo broad as to encompaſs the Stalk, as the next does: the* Flowers *are alſo a little greater, and yellow, which is the principal thing in which it differs from the laſt; and withal the whole Plant is not altogether ſo bitter.*

VI. *The* fourth, *which is the* Through-leav'd Centory, *has a Root ſmall and white, like the former, from whence comes ſome* Leaves *next the ground like unto the former* Centories, *but ſomewhat greater. From this Root comes forth a Stalk, which ſometimes ſpreads it ſelf forth into many long Branches, from every one of the Joints; and ſometimes it ſpreads it ſelf only at top: At the Joints ſtand two ſomewhat broad and long pointed Leaves, ſo encompaſſing the Stalk about the bottom, and making it ſeem as if it run through them, that they will hold the Rain, or any Water which falls upon them: The Flowers which ſtand at the tops of the ſmall Branches are a little larger than thoſe of the* Common Centory, *compoſed of ſix or eight Leaves, of a fine pale yellow color, and ſometimes of a deeper yellow; after which comes larger Heads than thoſe in the firſt, and Seed a little bigger. This Plant is not full out ſo bitter as the firſt.*

VII. *The* fifth, *which is a* Small yellow Centory not Branched, *and differs not in Leaf or Flower from the fourth: The Stalk bears perfoliated Leaves, but ſpread not themſelves forth in Branches, as the former doth: It bears alſo but one only Flower at the top, which thing, together with its not being branched, makes it to be different, and another Species of the perfoliated kind, the whole Plant is leſs bitter than the firſt.*

VIII. *The* fixth, *and ſmalleſt of the* Yellow Centories *differs very little from the fifth, or laſt deſcribed* Through leav'd Centory, *excepting in this, that it is wholly leſs in every part of it, and whereas the former bears but one Flower at the top of it, this bears two or three, and ſometimes more, ſmall Flowers at the top of every of its Branches.*

IX. *The Places.* The firſt grows in great plenty throughout all *England*, in moſt Paſtures and Graſſy Fields, : and indeed they are all of them found in many places of this *Kingdom*, but the firſt or common ſort almoſt every where, in *Fields*, *Paſtures* and *Woods*, but that with the *White Flowers* is more ſparingly to be had than the firſt. The *firſt* I found growing in the South parts of *Carolina*, in many Plantations, but particularly in that, formerly Captain *Abbot*'s, up *Wando* River, about five Miles from *Charles Town*: The *third* of theſe enumerated in this Chapter, grows in many places in *Kent*, as in a Field next unto that which was formerly Sir *Francis Carew*'s Houſe, at *Bedington* near *Croydon*; and in a Field next beyond *Southfleet* Church towards *Graveſend*, and in many other places, where alſo the other kinds are ſometimes found.

X. *The Times.* They all Flower in *July* and *Auguſt*, and their Seed is ripe in about a Month after. They ought to be gathered in their *Flowering time*: but ſome people out of a meer Superſtition, gather them between the two *Lady-days*.

XI. *The Qualities.* They are generally hot and dry in the ſecond Degree: but *Gerard* ſays, that our *third*, which is the *firſt yellow Centory*, is hot and dry in the third Degree, and yet it is not ſo bitter as the firſt. They are all highly Stomatick, Pectoral, Hepatick, Splenetick, and Hyſterick: they are noble Aperitives, and Abſterſives, Vulneraries, Alteratives, and Emmenagogicks.

XII. *The Specification.* It is Antifebritick, and good againſt Diſtempers of the Stomach.

XIII. *The Preparations.* You may have therefrom, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *An Infuſion.* 4. *A Decoction.* 5. *A Pouder.* 6. *An Oil by Inſolation or Boiling.* 7. *An Ointment.* 8. *A Balſam.* 9. *A Cataplaſm.* 10. *A Diſtilled Water.* 11. *A Spirituous Tincture.* 12. *An Acid Tincture.* 13. *An Oily Tincture.* 14. *A Saline Tincture.* 15. *A Spirit.* 16. *A Collyrium.* 17. *A Fixed Salt from the Aſhes.* 18. *An Eſſential Salt.*

The

The Virtues.

XIV. *The liquid Juice.* Being given from four to ſix ounces two hours before the coming of the Fit of an Ague (as alſo given in the ſame quanity Morning and Evening for ſome days) it removes the Fit, and perfectly cures the Ague. It evacuates and carries off Cholerick and Groſs Humors, and prevails againſt the Sciatica: And yet with *Dodonæus*, I do not perceive that it has any ſenſible Purging, or Carthartick quality, though in the mean time, many things which are not purely Catharticks or Purging, are found to be very cleanſing, and in paſſing off themſelves, carry many other Humors along with them.

XV. *The Eſſence.* This has all the Virtues of the Juice; it opens Obſtructions of the Gall, Liver, Spleen, Reins and Womb, prevails againſt Hypochondriack Melancholly, and the Yellow Jaundice: it eaſes Pains in the Sides, and hardneſs of the Spleen, making thin both Blood and Humors. It is of good uſe for thoſe that have the Dropſie, or Green-ſickneſs, becauſe it ſtrengthens the Stomach and all the other *Viſcera*: I know ſome will not allow it to cure the Dropſie; but this I know, that if the Hydropick Humors are carried off by other means, and the parts affected are once emptied of their Water, that if this Eſſence be duly given, it ſo ſtrengthens the Bowels, that that Diſeaſe returns no more. It kills Worms in the Belly, and drys up Rheums.

XVI. *The Infuſion in Wine.* It cleanſes groſs Humors, and eaſes pains in the Hips, the Gout, and other like Diſeaſes proceeding from Tartarous Humors: It is good in Agues, ſtrengthens the Stomach, helps Digeſtion, and cauſes a good Appetite. It alſo prevails againſt Stitches, pains of the Sides, and other diſaffections of the *Pleura*.

XVII. *The Decoction.* It has the Virtues of the Infuſion, is good againſt Agues, Catarrhs, and the vehement pains of the Colick: It provokes the Terms in Women; and brings away the Birth, whether dead or alive, as alſo the After-birth, eaſing the pains of Mother, and cauſing an effectual Cleanſing after Delivery. It is good againſt the Rickets in Children, evacuates Tartar out of the Urinary Paſſages, and brings away Sand and Gravel, ſtopping the paſſage of the Urine.

XVIII. *The Pouder.* Taken to one dram in Wine, it gives eaſe in the Colick, kills Worms in Children, and (as *Parkinſon* ſays) is a wonderful good help againſt the biting and poiſon of a Viper or Adder. Strewed upon moiſt and running Sores and Ulcers, it cleanſes, drys, and heals them.

XIX. *The Oil by Inſolation or Boiling.* It is Anodyn, eaſes the Spleen, and pains of the Mother, and is very effectual in all old pains of the Joints, and Limbs, as Gouts, Sciatica, Convulſions, Cramps, *&c.* proceeding from a Cold Cauſe. It is alſo a very good thing to anoint Womens Breaſts which are ſwoln, hard, or pained, through Cold, or Curdling of the Milk, or any other accident, as of a blow, *&c.*

XX. *The Ointment.* It has the Virtues of the Oil, but is more ſtrengthening and ſanative: It cleanſes, drys, and heals foul Ulcers, and other ſpreading Scabs of the Head; and to anoint the Back-bone and Joints of ſuch Children as have gotten the Rickets: It ſtrengthens and gives eaſe in pains of the Back, by anointing therewith.

XXI. *The Balſam.* It is an incomparable Vulnerary, and cures ſimple Green Wounds at the firſt intention. If they are compoſed by bruiſing, and dilaceration of the fleſh, it firſt digeſts, then cleanſes, drys, and heals them: It alſo cleanſes foul and fœtid Ulcers, fills them up with fleſh, and cicatrizes their Lips. It heals old running Sores, cleanſing, incarnating and drying, and perfectly curing them, tho' Hollow, or Fiſtulous.

XXII. *The Cataplaſm, made of the green Herb.* It has the Virtues of the Balſam, but is an eſpecial thing for cleanſing and healing putrid Ulcers in what part ſoever, if duly applied thrice a day: waſhing the hollowneſs or fiſtulous part alſo with an Expreſſed Juice of the Herb.

XXIII. *The Diſtilled Water.* It has the Virtues of the Infuſion or Decoction, but is pleaſanter, as being leſs bitter; but by ſo much, it is the leſs efficacious: and is many times uſed as a Vehiculum, to convey other Preparations of the Herb in: It is ſaid to take away Tanning of the Skin, Sun-burning, and other the like diſaffections.

XXIV. *The Spirituous Tincture.* It comforts all the *Viſcera* after a ſingular manner; and therefore if it is taken from one dram to four drams, Morning, Noon, and Night, it ſo ſtrengthens the Bowels, as that it prevents the return of a Dropſie in thoſe Perſons where it has been lately cured. It alſo removes the Gout out of the Stomach, (which many times is fatal) is good againſt the Jaundice, and Hypochondriack Melancholly: It is indeed a good remedy againſt the bitings of Vipers, Rattle-Snakes, and other Serpents, as alſo the Poiſon of Mad Dogs.

XXV. *The Acid Tincture.* It is excellent againſt Vapors, Fits of the Mother, and other diſaffections of the Womb. It ſtrengthens a weak Stomach, reſiſts Vomiting, cauſes a good Appetite and Digeſtion, removing faintneſs and ſickneſs at heart. It is good againſt Poiſon, and the Plague, as alſo all Putrid, Malign, and Peſtilential Diſeaſes, being taken in all that the ſick drinks from twenty to forty drops at a time, at leaſt five or ſix times a day; it takes away the malignity of the Diſtemper, and wonderfully abates the putrid heat of the Fever, whether Continent, Continual or Contermitting.

XXVI. *The Oily Tincture.* It carries off the yellow Jaundice, as alſo the Morbifick cauſe of Obſtructions of the Reins and Ureters by Urine: being given from one dram to two drams, in a good draught of *Carduus* Poſſet-drink, it has been known to cure Agues: more eſpecially if the *Spina Dorſi* be effectually anointed therewith, from the *Vertebræ* of the Neck almoſt to the *Anus*. Anointed on the ſides, it eaſes their Pains: and given inwardly, gives eaſe in the Colick. Given to a Woman in Labor from fifteen to thirty or forty drops, in ſome convenient Vehicle, it facilitates the Delivery, whether alive or dead, and effectually brings away the After-birth.

XXVII. *The Saline Tincture.* It is good againſt foul Ulcers, and ſpreading Scabs of the Head, or other parts; takes away Cutaneous Deformities, as Tannings, Sun-burnings, Spots, Marks, Scurf, Dandriff, Morphew, and other like defects of the skin: And being long applied, it is ſaid to remove Freckles, tho' of great continuance.

XXVIII. *The Spirit.* It ſtrengthens the Stomach wonderfully, chears the Heart, revives the Spirits, and fortifies the Univerſal Oeconomy of Nature: it is good againſt Vomiting, and Indigeſtion, and cauſes a good Appetite to Food; makes a freſh and lively Countenance, and reſtores the Priſtine ſtate of the Bowels. It is a very good thing againſt *Diarrheas*, *Dyſenteria's*, *Lienteria's*, and the *Hepatick Flux*, and gives eaſe in an exquiſite Colick, when ſometimes many other things will do nothing. Doſe from one ſpoonful to two, in ſome proper Vehicle.

XXIX. *The*

XXIX. *The Collyrium.* It is made *of the Liquid Juice, or Eſſence, mixt with an equal quantity of clarified Honey.* Being put into the Eyes, four, five or ſix times a day, it clears them from Dimneſs, Miſts or Clouds, or any thing which obſcures or hinders the ſight: and if a little Spirit of Wine (about an eighth part) be added to it, it becomes profitable for ſore, inflamed and running Eyes; it ſtrengthens the weakned part, and powerfully ſtops the Fluxion. It alſo cleanſes Ulcers in the Eyes, drys, and heals them: And I was was informed by a very skilful Chirurgion, that he once cured a *Fiſtula Lachrymalis* therewith, by injecting it in, with a proper Syringe. This I am ſure of, that it ſingularly cleanſes, and drys hollow Ulcers in other parts of the Body, and diſpoſes them to an effectual healing; and drys up moiſt Scabs, and other breakings out like Scurf or Morphew, though of long ſtanding, if it is aſſiduouſly uſed and applied for ſome time. Taken inwardly, from half an ounce to two ounces at a time, it prevails againſt Colds, Coughs, Hoarſneſs, Wheazings, ſhortneſs of Breath, difficulty of Breathing, and other diſaffections of the Lungs. Being thus continued for ſome conſiderable time, I have known it to cure Ulcers of the Lungs; the Patient drinking with it, new Milk warm, ſweetned with double refined Suger, drinking no other Liquor, and wholly forbearing all Wines, and Maulted Drinks.

XXX. *The Fixed Salt.* It is highly Antifebritick and Diuretick. Diſſolved to one dram in the Diſtilled Water, and ſo drank, it carries off the Morbifick cauſe of all Fevers by Urine, and cleanſes all the Urinary parts of Gravel, Sand, and Tartar, lodged in them. It is alſo excellent good againſt the yellow Jaundice, and all Obſtructions of the Liver, Spleen, Reins, and Womb. It diſſolves Choler in the Body, and caſts it out by Urine: Take of this Salt half an ounce: of the diſtilled Water a pint: mix and diſſolve. This cures Cutaneous Diſeaſes, and takes off Freckles from the Face, if conſtantly uſed for ſome time; and alſo removes other deformities of the Skin.

XXXI. *The Eſſential Salt.* It has all the Virtues of the Liquid Juice and Eſſence, and may be given in all thoſe caſes from one dram to two or three drams at a time, in a glaſs of generous Wine, Morning and Evening. It is a great Stomatick, and Sweetner of the Blood; a noble Antifebritick; and kills Worms in Young or Old, being taken for ſome time. It is highly Traumatick, and therefore good to be taken Dietetically, by ſuch as have Wounds and Ulcers about them.

CHAP. CXX.

Of CELANDINE.

I. *THE Names.* It is called in *Greek*, Χελιδόνιον, ἡ Χελιδόνιον τὸ μεγὰ: In *Latin*, *Chelidonium*, and *Chelidonium majus*, *Hirundinaria major*: In *Arabick*, *Kauroch*, ſeu *Memiram*: and in *Engliſh*, *Celandine*, and *Celandine the Greater.* This latter name is given to it, becauſe another Plant leſſer than this, has the name of *Celandine* given to it, and is called the leſſer; and yet it has no Kin or Relation to it: and therefore for diſtinction ſake, this is called *Celandine the Greater.* It is alſo ſometimes called *Swallow-wort*, in anſwer to the latter *Latin* name. The name is ſaid to ariſe from Swallows curing the Eyes of their young ones when they were hurt, therewith; but as it is a thing wholy fabulous, ſo we leave it.

II. *The Kinds.* It is twofold, 1. Χελιδόνιον τὸ μεγὰ κοινὸν, *Chelidonium majus vulgare*, Common Great Celandine. 2. Χελιδόνιον τὸ μεγὰ πολυπώδες, *Chelidonium majus Laciniatum*, Jagged Celandine.

III. The Deſcription. Common Celandine *has a Root ſomewhat great at the Head, ſhooting forth ſeveral other long Roots, with ſmall reddiſh Fibres or Strings ſpringing from them, the inſide being yellow, and full of a yellow Juice: From this Root ſprings up*

up ſeveral tender, round, whitiſh, green Stalks, with larger Joints than are ordinary in other Plants of like magnitude, like as it were knees, very brittle, and eaſie to break, from whence ſpring forth Branches of a dark blewiſh green color on the upper ſide, like unto Columbines, *and of a more pale blewiſh green underneath, full of a yellow Juice or Milk, which iſſues forth, when any part is broken, of a bitter Taſte, and ſtrong Smell. At the tops of the Branches, which are much divided, grow gold yellow Flowers, having four Leaves a piece, after which come ſmall long Cods, with blackiſh Seed therein.*

IV. The Jagged Celandine, *grows in its Roots and Stalks, and almoſt in all things elſe like unto the former, ſave that the Leaves are thinner, and the diviſions ſlenderer, and more cut in on the edges: the Flowers conſiſt alſo of four Leaves a piece, and are of the ſame golden yellow color, but ſomewhat larger than the other, and are each of them cut in on the edges, as the green Leaves are, for which reaſon* Cluſius *calls it,* Chelidonium majus laciniato flore; *this, as the other, by ſhedding its Seed, riſes again before Winter, and ſo continues flowering the next Spring, and ſeeding in Summer.*

V. *The Places.* The firſt is nouriſhed up by many in *Gardens*; but is alſo found growing Wild in many places by old Wall ſides, and by the Hedges and Way ſides in untilled ground in ſeveral parts of this Kingdom, delighting in ſhady places. The ſecond is only found growing in *Gardens.*

VI. *The Times.* They both flower all the Summer long, from the Month of *April*; and in the mean ſeaſon the Cods come to perfection, and yield ripe Seed.

VII. *The Qualities.* They are both hot and dry in the third Degree; and of an Abſterſive or Cleanſing Faculty; Aperitive, Sudorifick, Hepatick, Arthritick, Alterative and Alexipharmick.

VIII. *The Specification.* It is ſaid to be a peculiar thing againſt the yellow Jaundice.

IX. *The Preparations.* You may have therefrom, 1. *The liquid Juice.* 2. *The Eſſence.* 3. *The Decoction in Wine.* 4. *The Pouder of the Root.* 5. *The Inſpiſſate Juice.* 6. *The Diſtilled Water.* 7. *The Spirituous Tincture.* 8. *The Acid Tincture.* 9. *The Saline Tincture.* 10. *A Cataplaſm.* 11. *A Mixture.*

The Virtues.

X. *The liquid Juice.* Being taken faſting from one ounce to two ounces mixed with a dram or two of Mithridate, and a Glaſs of Wine, it is of ſingular good uſe againſt the Plague or Peſtilence, the Patient being laid to Sweat thereupon. The Juice dropped into the Eyes, cleanſes them from Films, and Clouds which hinder the ſight; more eſpecially if mixed with a little of the Diſtilled Water, to allay it. It is alſo to good purpoſe uſed in old running Sores, and filthy and corroding Ulcers whereſoever, to hinder their malignity, and ſtop their running and fretting, and to cauſe them the more ſpeedily to heal. The Juice often applied to Warts, Corns, Tettars, Ring-worms, or ſuch other like ſpreading Sores, deſtroys their Acrid Ferment, and alſo cures them.

XI. *The Eſſence.* It has all the Virtues of the Liquid Juice, but much more powerful to the intentions, and may be given in the ſame Doſe in Wine. It opens Obſtructions of the Gall, Bladder, Liver, and Spleen, and prevails againſt the Dropſie, and yellow Jaundice.

XII. *The Decoction of the Herbs and Roots in Wine.* You may boil with them a few *Ammiſeeds* alſo. It has the Virtues of the Liquid Juice, and Eſſence, but not altogether ſo powerful. It cleanſes much, and ſo is helpful againſt the Yellow Jaundice, and gargled in the Mouth eaſes the Tooth Ach.

XIII. *The Pouder of the Root.* Put upon Aching Gums or Teeth, or upon a looſe or hollow Tooth, it will eaſe the Pain preſently: and as Authors ſay, quickly cauſe them to fall out. *Vix Credo.* The over Credulous may eaſily make a Tryal.

XIV. *The Inſpiſſate Juice.* This is thought to be better for the Eyes than the liquid Juice, becauſe many of the ſharp Particles by the Inſpiſſation are Evaporated. You may diſſolve it with a little Breaſt Milk, or Cows Milk, and ſo drop it into the Eyes, it is good againſt Clouds, Films, Blood-ſhot, Inflammations, Pearls, and other Diſeaſes of the Eyes.

XV. *The Diſtilled Water.* It is ſaid to be a good thing to clear the Eye-ſight; and taken with a little Mithridate or *Venice* Treacle, and Sweating thereon, it is good againſt Malign and Peſtilential Diſeaſes; and may be uſed as a Vehicle for other Preparations.

XVI. *The Spirituous Tincture.* It has the Virtues of the Eſſence; and is a ſingular good thing againſt cold and moiſt Diſtempers of the Head, Nerves, Stomach, Liver and Womb. It prevails againſt Vertigo's, Lethargies, Convulſions, Cramps, Palſies, Lameneſs, Numbneſs, and Contortions of the Bowels. By the conſtant uſe of this Tincture for about ſix or ſeven Months, I knew a Man of about thirty ſix or thirty eight Years of Age, perfectly cured of the Palſie. Doſe one, two or three drams at a time, Morning and Evening (and in very cold habits of Body, Morning, Noon, and Night) in a Glaſs of *Madera*, or other generous Wine. In Cramps and Convulſions it would be good to bathe the parts affected therewith: and in Palſies, to bathe thoſe parts of the Back Bone, whoſe *Vertebræ* ſend Nerves to the places afflicted.

XVII. *The Acid Tincture.* It has all the Virtues of the liquid Juice, and Eſſence, and is indeed a powerful thing againſt all Malign and Peſtilential Fevers, for it actually deſtroys the malignity, and abates the heat of the Fever. Outwardly applied, it is found of ſingular good uſe to take away defœdations, or defilements of the Skin.

XVIII. *The Saline Tincture.* It is good for thoſe who are troubled with the Itch, or have old Sores in their Legs, or other parts of their Bodies: it alſo takes away Tanning, Sun-burning, Scurf, Morphew, black and blew Spots, and other diſcolorings and deformities of the Skin.

XIX. *The Cataplaſm.* The Green Herb, with the Roots, being bruiſed, and made into a Cataplaſm, with a little Oil of Camomil, and pouder of Orrice Roots and Zedoary, and applied hot to the Navel, it eaſes the Griping pains of the Belly and Bowels, as alſo the pains of the Mother. And applied to the Left ſide takes away Stitches, and eaſes the pains of the Spleen. Applied alſo to Womens Breaſts, who have their Courſes in too great a meaſure, it ſtops them, and gives great relief to diſaffections of the Mamillary parts.

XX. *The Mixture.* ℞ *of the liquid Juice four ounces: Oil Olive one ounce: Flowers of Sulphur an ounce and half: mix them.* It cures the Itch, Morphew, Scurf or Dandriff, ſcald Heads, diſcolorings of blows or Wounds, Tettars, Ring-worms, and other like diſcompoſures of the Skin, being anointed therewith, Morning and Evening, for ſome time.

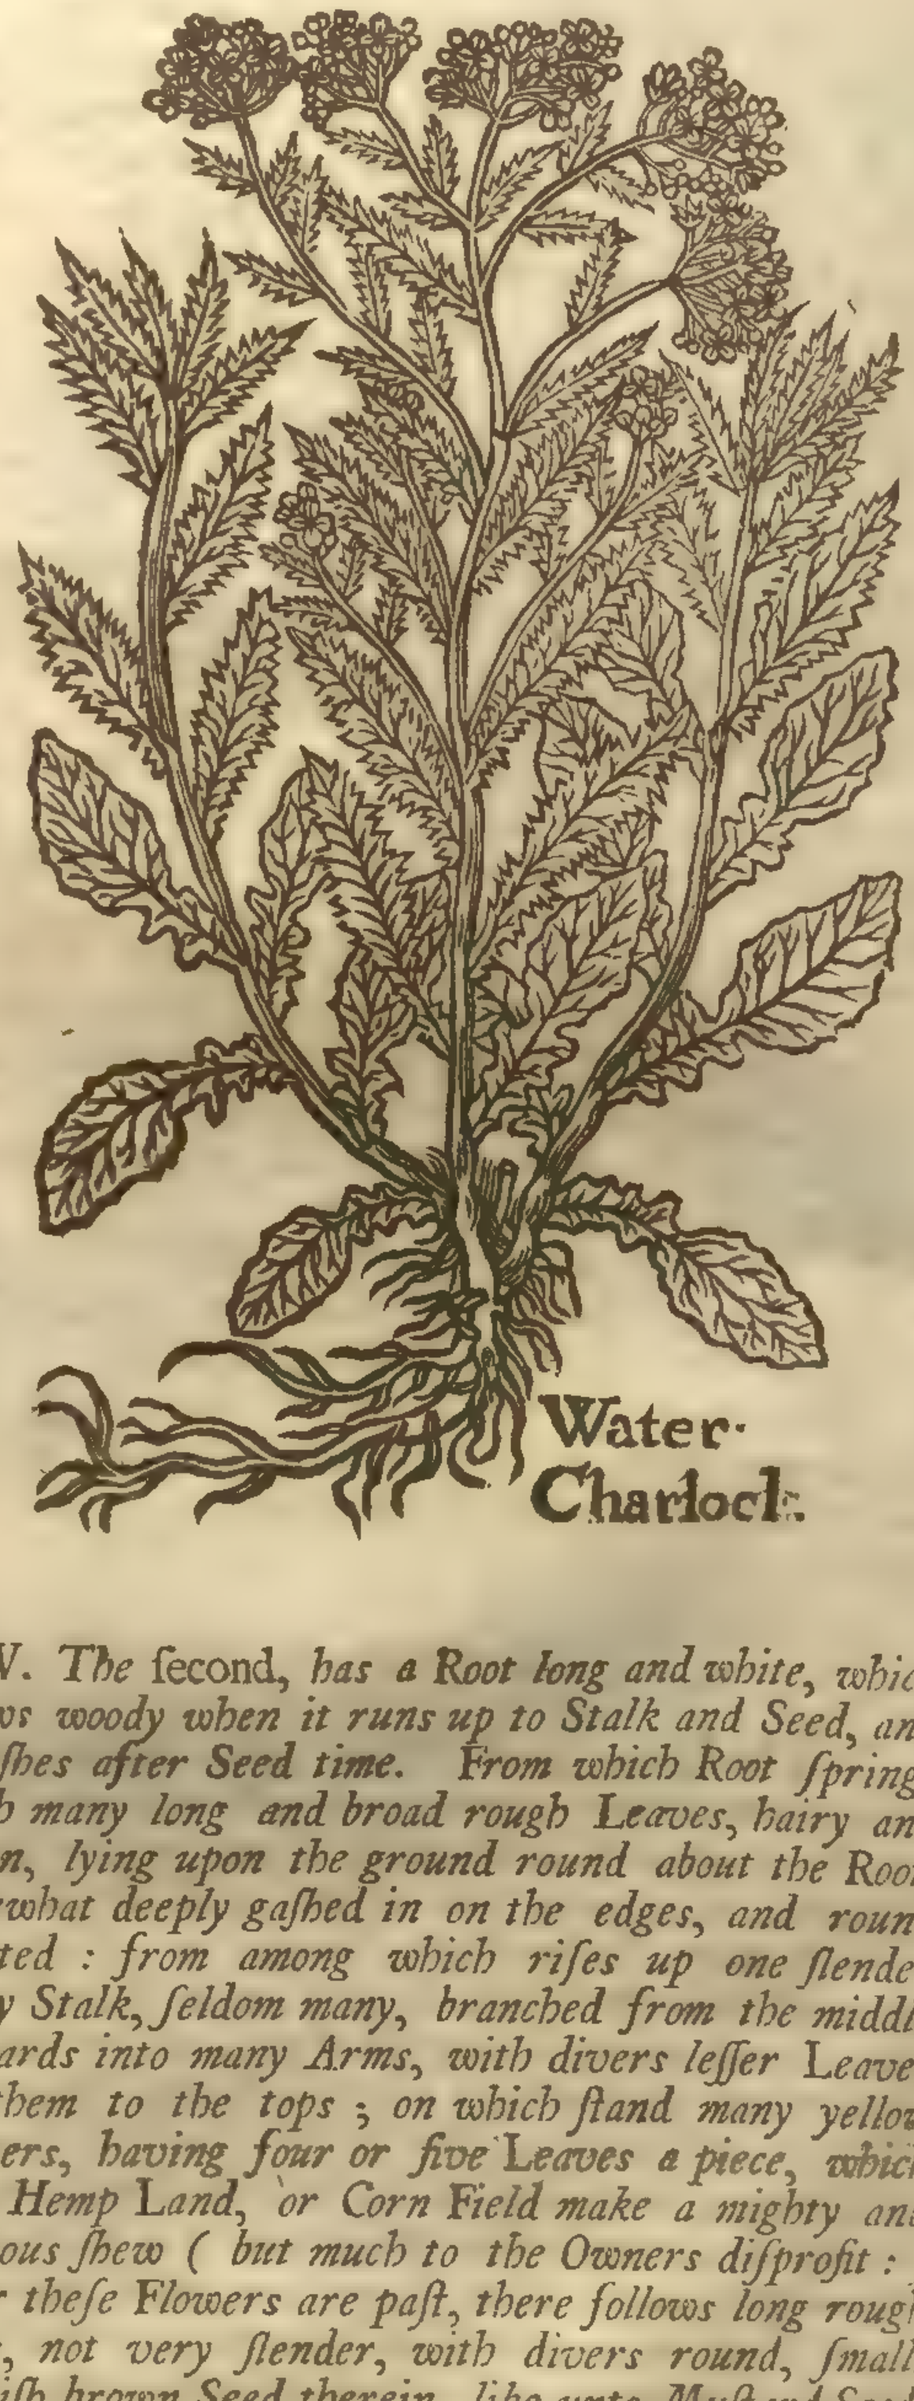
CHAP. CXXI.

Of CHARLOCK.

I. *THE Names.* I do not find that this Plant was known to the *Greeks*, and ſo have no *Greek* name for it. It is called in *Latin*, *Rapiſtrum*: and in *Engliſh*, *Charlock*, *Carlock*, and *Chadlock*.

II. *The Kinds.* Some would have it to be a *Species* of the *Wild Turnep*, others of *Sinapi*; ſome of *Eryſimum*; others refer them to the *Lampſana* of *Dioſcorides*: but it took its name *Rapiſtrum*, *â ſimilitudine Rapiſoliorum*, for which reaſon it was that ſome have called it Wild Turnep. But taking it as *Genus*, There are ſeveral kinds of them to be found in *England*, viz. 1. *Rapiſtrum Commune*, Common Charlock. 2. *Rapiſtrum Sylveſtre, ſive Arvorum*, Wild, or Field Carlock: *Matthiolus* calls it *Lampſana*; ſo alſo *Anguilara*, *Lonicerus*, *Lugdunenſis*, *Gerard* and *Geſner*, *in Hortis*: *Fuchſius* and *Turner* call it *Irion*: *Bauhin*, *Rapiſtrum flore luteo*. 3. *Rapiſtrum alterum Arvorum*, A ſecond Field Charlock; which is alſo called by all the former names. 4. *Rapiſtrum album Articulatum*, White Field Charlock; which is the *Lampſana* of *Turner* and *Cæſalpinus*, who alſo calls it *Radix Sylveſtris*: The third *Sinapi agreſte* of *Tragus*: *Rapiſtrum flore albo Erucæ foliis Lobeli*; *Armoracia Tabermontani*; *Rapiſtrum flore albo ſiliqua articulata Bauhini*. 5. *Rapiſtrum Monoſpermon Bauhini*, One Grained Charlock. 6. *Rapiſtrum Aquaticum*, Water Charlock.

III. The Deſcriptions. *The* firſt *of theſe has ſlender Roots with ſeveral fibres or ſtrings hanging at them, which periſhes when the Seed is ripe; from this Root riſes Leaves almoſt like to the* Rapum Sylveſtre, *but leſſer, and ſmaller at the bottom, not Jagged: among which riſes a rough, ſlender, brittle, and ſomewhat hairy Stalk, a foot and half, or two feet high, having larger Leaves than the former, and ſomewhat Jagged and Waved: The Stalk towards the top is divided into many Arms and Branches, on which do grow little yellowiſh Flowers, which make a great ſhew; but ſometimes they are found to be of a purpliſh color; which being paſt there follows long Pods, ſharp towards the end, containing ſeveral flattiſh Seeds, of a whitiſh yellow color.*



IV. *The* ſecond, *has a Root long and white, which grows woody when it runs up to Stalk and Seed, and periſhes after Seed time. From which Root ſprings forth many long and broad rough Leaves, hairy and green, lying upon the ground round about the* Root, *ſomewhat deeply gaſhed in on the edges, and round pointed: from among which riſes up one ſlender hairy Stalk, ſeldom many, branched from the middle upwards into many Arms, with divers leſſer* Leaves *on them to the tops; on which ſtand many yellow* Flowers, *having four or five* Leaves *a piece, which in a Hemp* Land, *or Corn* Field *make a mighty and glorious ſhew (but much to the Owners diſprofit:) after theſe* Flowers *are paſt, there follows long rough* Pods, *not very ſlender, with divers round, ſmall, reddiſh brown Seed therein, like unto Muſtard Seed, but larger, as quick and ſharp in taſte, but more bitter than it.*

V. *The* third *has a long* Root, *with many* Fibres *at it, like the former, which dies every year, from whence ſpring up many large* Leaves *waved in, a little rough or hairy, but not cut or jagged as the former, the upper* Leaves *being whole and ſmaller. The Stalk riſes up rough and hairy like the others, of about eighteen Inches high, or more, ſpread out into many* Branches; *at the tops of which are a great*

number

number of pale yellow Flowers, which being passed away, long pointed Pods follow, rough like the former, and with a shew of divisions in them, in which are contained little round, and almost Ash-colored, sometimes reddish Seed.

VI. The fourth *has a Root small and long in some Plants, in others thicker and rounder, near to the bigness of a small long rooted Turnep, which is Annual, or perishing every Year: From this Root there comes forth fewer Leaves than in the former, but smaller and rougher, and in some little or nothing jagged, but in others more: the Stalks are rougher and lower than the others, which also spread forth into Branches towards the top: and on the tops of which grow the Flowers, not so many as in the Common, or second kind, nor yet altogether so great or so yellow, but either of a pale yellow, or more white; after which come forth smaller rough Pods, with Joints or Divisions in them; in which are contained smaller browniſh Seed, nothing near so fiery or hot, as in the first or second kind: of this kind also, some have been found with a purplish Flower.*

VII. The fifth *has a Root long and white, and somewhat Fibrous; from whence spring forth its lower Leaves, which are somewhat large, thick, and hairy, of a very fresh green color, torn on both edges at the bottom, but broader at the ends, where they are only waved: The Stalks also are a little rough and hairy, of about twelve or sixteen Inches, or more, high, set with a few such Leaves as the lowest, but smaller; towards the top they branch forth into long spikes of gold yellow Flowers, the length of three, four, or five Inches; which being past, there comes in their places small, round, striped Heads or Husks, with a small point at the end; containing in every one of them but one Seed, from whence came the name.*

VIII. The sixth, *which is the* Water Charlock, *has a Root long, tough, and full of strings, creeping and putting forth many Stalks; from whence comes forth Stalks of a Yard high, and sometimes more, with many Branches, slender and smooth, in respect to any of the rest, which are set with rough ribbed Leaves, deeply indented about the lower parts of the Leaf. The Flowers grow at top of the Branches in Umble or Tuft fashion, sometimes of one color, and sometimes of another: the Seed Vessels are short and small, containing in them small Seed.*

IX. *The Places.* The first has been found growing in divers places of *England*, as going from *Shoreditch* by *Bednal-Green* to *Hackney*: The second, third, and fourth are found growing in Corn Fields, Hemp Lands, in Barren Grounds, and often by the Borders of Fields and Hedges, Bank-sides and Untilled Grounds, and such other like places: The fifth grows in many places of *Germany*, and with us is nourish'd up in Gardens. The sixth grows in moist Meadows, and Marsh Grounds, and in Water Ditches, and other plashy places.

X. *The Times.* They flower all *April*, and continue flowering till the Summer is far spent; and the Seed ripens in the mean time.

XI. *The Qualities.* The Seed is hot and dry in the third Degree; insomuch as some do make use of it instead of Mustard Seed, or mingle it therewith. It is Cephalick, Neurotick, Stomatick, Nephritick and Hysterick; Aperitive, Absterſive, and Diuretick: Alterative, Ptarmick, Masticative, and Alexipharmick.

XII. *The Specification.* It opens the Obstructions of Brain and Nerves, and is good against the Palsie, weakness and trembling of the Nerves.

XIII. *The Preparations.* You may have from the Seed, 1. *An Expressed Oil.* 2. *An Errhine.* 3. *A Sauce imitating Mustard.* 4. *A Spirit, like Spirit of Scurvy-grass.* 5. *A Spirituous Tincture.* 6. *An Oily Tincture.* 7. *A Saline Tincture.* 8. *A Cataplasm.*

The Virtues.

XIV. *The Oil by Expression.* It discusses any cold Tumor, and eases pains proceeding from a cold Cause, being anointed upon the part warm, and well rubbed in. It is of good use to make Soap withal, instead of Oil Olive, and much exceeds Train or Whale Oil for that purpose; and where Butter and other Oil are wanting, it may serve to Fry with.

XV. *The Errhine.* It is made of the Seed by grinding it with fair Water, in a Boul, with a Bullet, then straining the thin or liquid part from the gross: this liquid part being sometimes snuff't up the Nostrils, so as it may come out again at the Mouth, purges the Head and Brain effectually, by the Nostrils, of cold, moist and mucilaginous Humors, and by that means prevails against vehement and inveterate Head-achs, proceeding from a cold cause, Vertigo's, Lethargies, Carus, Apoplexy, Epilepsie, Convulsions, Palsie, and other like Distempers of the Brain and Nerves. And I have known by often using of it, in some who have been Dim sighted, or almost Blind, and in others who have had a constant Flux of Rheum into their Eyes, for some considerable time, that it has cleared the sight, diverted the Rheum, and strengthened the Eyes so admirably, as if they had never ailed any thing at all.

XVI. *The Sawce.* It is made as Mustard, and so to be used: it strengthens the Stomach, sharpens the Appetite, and causes a good Digestion: but it is nothing near so pleasant as Mustard: applied immediately upon a Contusion where the skin is not broken, it discusses the Tumor, and prevents the afflux of Humors to the part.

XVII. *The Spirit.* It is admirable against the Scurvy in a cold habit of Body; it excites the Animal Spirits, and causes liveliness and cheerfulness in such as are Sleepy, Drowsie and Lethargick: and is indeed an excellent thing for such constantly to take of, who are Paralytick, or troubled with numbedness, tremblings, and other weaknesses of the Nerves; more especially, if it is also bathed down along the Back-bone, and parts affected, Morning and Evening, and also taken from one dram to two drams, or more, Morning, Noon, and Night, in some convenient Antiparalytick, and Antiscorbutick Vehicle.

XVIII. *The Spirituous Tincture.* It has the Virtues of the Spirit, and in some cases more effectual, being more Stomatick than that is; and being bathed upon any part afflicted with a cold Tumor or Swelling, or with cold and moist Humors, or with Rheumatick Pains proceeding from cold, it warms and comforts the Part, discusses the Humors, and eases the Pain: mixed with White Wine, and used as an Errhine, it purges the Head and Brain of Cold Phlegmatick Matter which offends it, causing Headachs, Vertigo's, Drowsiness, Lethargies, *&c.*

XIX. *The Oily Tincture.* It is used chiefly outwardly, in Gouts from a cold cause, in which it gives admirable ease. As also in Numbness, Trembling of the Limbs, and Palsies, in all which cases, it ought to be bathed all along upon the Back bone, from the *Vertebræ* of the Neck, almost to the *Anus*, and this to be repeated oftentimes, and well rubbed in both Morning and Evening; the parts at-

fected are likewise to be bathed with the same. Anointed upon a Nerve prickt or hurt, it eases the Pain and Anguish, and abates the Tumor, if any be present.

XX. *The Saline Tincture.* If given inwardly, from half a dram to two drams, it opens Obstructions of the Urinary parts, and of the Womb; but it is of greatest use in outward Applications against Tanning, Sun-burning, Scurf, Morphew, Dandriff, and other like Defœdations of the Skin; for it cleanses after a singular manner, by reason of its Volatile Particles.

XXI. *The Cataplasm.* Made of the Green Herb, but principally of the Seed, with the addition of a quarter part of Mithridate, and so much Orrice pouder as will bring it to a consistence, and applied to cold flatulent Tumors, it discusses them: if Nature designs the Tumor for breaking, it brings it to maturation or ripeness, and that in a little time, because of its heat. If it is applied to the Gout, it eases the Pain, and attracts the Morbifick Humor through the Pores of the Skin, in manner of Sweat.

CHAP. CXXII.

Of CHERRY Winter.

I. THE *Names.* It is called in *Greek*, Στρύχνος, ἢ Στρύχνος ἀλικάκαβος: In *Arabick*, *Kekengi*, & *Alkekengi*: In *Latin*, *Alkakengi*, *Halicacabum*, *Solanum Halicacabum Theophrasti*, *Vesicarium Plinij*, *Saxifraga quarta rubra Brunfelsij*, and *Solanum Vesicarium*: In *English*, *Winter Cherries*.

II. *The Kinds. Parkinson* says, it is one of the kinds of *Solana*, or *Night-shades*, set forth and spoken of by *Dioscorides* and *Galen*, and one of the two of *Theophrastus*. We make two Kinds thereof, 1. *Halicacabum* five *Alkakengi Vulgare*, Our Common *Winter Cherry*. 2. *Halicacabum* five *Alkakengi Virginiense*, The *Virginian* Winter Cherry. There is another Plant, which some Authors have joined with *Winter Cherries*, and called it, *Helicacabum Peregrinum*, *Vesicaria Peregrina*, and *Helicacabum Repens*, Winter Cherries Creeping, as *Tragus*, *Fuchsius*, *Gesner*, *Matthiolus*, *Dodonæus*, and others; but *Cordus* opposes, and makes it another Plant: *Baubinus* puts it among the *Pease*, as a kind thereof, and calls it *Pisum Vesicarium*: *Lobel* thinks it to be the *Isopyum Dioscoridis*, and calls it, *Cor Indum*, *Pisum Indicum*, and *Pisum Cordatum*; for all which Reasons, it being rather a *Grain* than a *Berry*, we have forborn to put it in this place: and so much the more also, because it is no *Native* or *Denison* of our Countrey, nor does it grow naturally, as some think, in any Part of *Europe*.

III. The Description. *Our* Common Winter Cherry *has a running or creeping Root in the Ground, long, and not much unlike to the Roots of Quitch-grass, running very far abroad under the upper crust of the Earth, causing it greatly to encrease; it is sometimes of the thickness of ones little Finger, shooting forth at several Joints, and in several places, by which means it quickly fills a great piece of Ground. From this Root rises up a Stalk two or three Feet high, round, slender, smooth, and somewhat reddish, reeling this way, and that way, by reason of its weakness: upon which come forth many broad and long green Leaves, not much unlike to those of* Common Nightshade, *but larger: at the Joints whereof, and among which Leaves come forth whitish Flowers, consisting of five small Leaves apiece: In the middle of which Flower comes forth a Berry, green at first, and red when it is ripe, like almost in color and bigness to our* Common Red Cherries *(whence the* English *name;) These Berries are enclosed in Skins, or Bladders, of a pale reddish color. In the Berry is contained a reddish Pulp, and the Seed lying in the same, which are many, small, and flat, and of a pale yellow color.*

IV. *The* American *kind, has a small Root spreading under ground, but not so far as the former, and perishes every Year. From this Root comes forth Branches with Leaves on the ground, scarcely rising up so much as the other, seldom above eighteen or twenty Inches high, (which I observed when in its perfection, and growing upon fertil ground) but the Branches are greater, as also are the Leaves, and something more uneven about the edges, of a sad, or deep green, almost of a Sea-green color: at the Joints come forth the Flowers singly, to wit, one at a place, and more towards the bottom than upwards (this I observed not, for I always found each Plant very full of Fruit, almost from the bottom to the very top:) but as they grow to the height of the Branches, both Flowers and Fruit are rather smaller than those which are below: the Flowers are composed of five small whitish Leaves, with a Circle of red, or every Leaf is spotted Circle-wise towards their bottoms: the Flowers being past there follows the Fruit, enclosed in a thin Skin or Bladder, of a whitish, or pale greenish color; and not full out so big as the former. Within this Husk or Bladder is contained the Berry, which never grows full out so large as our* English Winter Cherry, *yet whilst recent, fills almost the Bladder in which it is contained: when the Cherry or Berry comes to its perfection, it is never red, but of a pale whitish green color,*

color, ſometimes of an Amber color, or of a light paliſh yellow; and ſometimes thoſe which the Sun looks full upon, may have ſome ſmall ſtreaks of red, mixed with Amber-colored and pale yelloviſh green colored. The Berry contains a Pulp like the Engliſh, *but whitiſh yellow, or green, in which Pulp is contained the Seed, which is ſmall and flat, like the other, and of a whitiſh color.*

V. *The Places.* The firſt grows by Hedge ſides, and old Walls, and about the Borders of Fields, in moiſt and ſhadowy places (this it may poſſibly do, in ſeveral Southern Regions and Countries beyond Sea) but with us it grows chiefly in *Gardens*. The other grows Wild in *Engliſh* Plantations in *Virginia*. I found it growing in a Plantation up *Wadmalaw* River in *Carolina*, and in ſeveral other Plantations of that Country, where it grew ſpontaneouſly, and that in vaſt plenty. *Parkinſon* makes mention of a third kind of *Weſt India Alkakengi*, which I take to be the ſame with that before deſcribed, and differs from it only in largeneſs, and ſtrength of its Stalks, Branches and Berries, which I believe ariſes only from the differing goodneſs of the Soil, they being in all other reſpects exactly the ſame. I have found them both growing on the ſame ground, but could not poſſibly take them to be two differing *Species* of the ſame *Genus*.

VI. *The Times.* They Flower about the middle or latter end of *July*; and the Fruit is ripe about the latter end of *Auguſt*. In *Carolina* they flower ſomething earlier.

VII. *The Qualities.* The Herb is cold and moiſt in the ſecond Degree, not Aperitive: but the Berries are of the ſame Quality, and Opening; Diuretick, Nephretick, Alterative, and Lithontriptick.

VIII. *The Specification.* They are peculiar againſt Obſtructions of the Reins, Ureters, and Bladder, and to help in the Strangury, Stone, Gravel, Sand, and Tartarous matter, lodged in thoſe Parts.

IX. *The Preparations.* You may have therefrom, 1. *A Diſtilled Water from the Fruit or Leaves.* 2. *A Juice of the Fruit made with White Wine.* 3. *An Infuſion or Decoction of the Berries.* 4. *A Diet Drink.* 5. *A Pouder of the Berries.* 6. *An Oil of the Root.* 7. *A Cataplaſm of the Leaves or Fruit.*

The Virtues.

X. *The Diſtilled Water.* It is Cooling and Diuretick: It may be Diſtilled from the Fruit or Leaves with a little Milk. It may be drank from two ounces to five or ſix, ſweetned with a little Sugar, Morning and Evening, againſt the Strangury, heat of Urine, and all the Diſtempers of the Urinary Parts.

XI. *The Juice of the Fruit.* It may be given from one ounce to two, in a glaſs of White Port Wine, againſt Stone, Gravel, Sand, Tartarous Mucilage, or what ever ſtops the Urine in either Reins, Ureters, or Bladder: but it is not ſo powerful as the pouder.

XII. *The Infuſion or Decoction of the Berries in White Wine, or Water.* It opens the Urinary Parts, and is an excellent thing againſt the Strangury, provoking the Urine plentifully when it is ſtopped, or grows hot, ſharp, or painful in the paſſage. It is good to expel the Stone and Gravel out of the Reins and Bladder, helping (where it is compoſed of a gritty Subſtance) to diſſolve it, and to expel and ſend it forth by Urine in form of Sand or Gravel. It is good to cleanſe inward Apoſtemations, and Ulcers in the Urinary Parts, and to relieve ſuch as make a foul, filthy, or ſtinking Urine, or that piſs Blood. It is profitable alſo againſt the Jaundice, by carrying off the Morbifick Cauſe by Urine. Doſe from four to eight ounces, Morning, Noon, and Night: and to be continued as the Exigency of the Diſeaſe requires.

XIII. *The Diet Drink.* It is made of the Berries put up into new Wine, when it is new made, that working with the Berries therein, their Virtues may be drawn forth into the Wine. Or becauſe our Country affords not new Wine in the *May*, you may put them into new Beer, or Ale, as you ſet them to Work, and alſo Tun them up therewith, that they may fully Work with the ſame. The proportion is two large handfuls, whilſt green, to a Gallon of Wine or Ale: and one large handful well bruiſed when dry. This may be drank as ordinary drink, but at leaſt a Pint of it Morning, Noon and Night. It has all the Virtues of the Infuſion or Decoction.

XIV. *The Pouder.* It is made of the dried Berries, in which the Seeds themſelves are reduced into a Pouder. The Doſe is from fifteen grains to half a dram, Morning and Night, in a Glaſs of White Port Wine. Or you may Infuſe it in the ſame Wine, two ounces of the Pouder to three Quarts of Wine, letting it ſtand in a cold Digeſtion a Month before hand, ſhaking the Bottle every day. When you drink it, ſhake the Bottle, and pour it out thick and thin together, and let the Patient take a quarter of a Pint at a time, Pouder and all, Morning and Evening, and continue this courſe till he has found the deſired relief. This Pouder, and thus taken, is much more efficacious than either the Infuſion, Decoction, or Diet; and ought to be very much valued of ſuch as are troubled or afflicted with the Stone, Strangury, or ſtoppage of Urine.

XV. *The Oil of the Root.* It is good againſt the poiſonous ſtroke of the Scorpion: This Oil being applied, *Parkinſon* ſays, it is powerful againſt their ſtinging. *Pliny* ſays, that the Root hereof is ſo powerful to ſtupifie the Venom of the Scorpion, that if it be put to them, they will utterly looſe their ſtrength.

XVI. *The Cataplaſm.* It is cooling, and profitable to be applied to allay the heat of Inflammations, and to eaſe pains coming from a cold cauſe.

CHAP. CXXIII.

Of CHERVIL Garden.

I. *THE Names.* It is called in *Greek*, Χαιρέφυλλον, and is thought to be ἄνθρισκον *Theophraſti, lib. 7. cap. 7.* tranſlated by *Gaza, Enthuſicum*: In *Latin*, *Cerefolium*, and *Cherifolium*: In *Engliſh*, *Chervil*.

II. *The Kinds.* It is threefold, 1. *Garden.* 2. *Wild.* 3. *Tooth-pick Chervil.* The *Garden Chervil* is threefold, 1. The *Common Garden*, called *Cerefolium Sativum.* 2. The *Great Sweet Chervil, Sweet Ciſley*, called *Cerefolium magnum, ſive Myrrhis.* 3. The *Small Sweet Chervil, Small Sweet Ciſley*, called, *Myrrhis altera parva.* The *Wild* we ſhall treat of in *Cap.* 124. and the *Tooth-pick Chervil* in *Cap.* 125. following.

III. The Deſcription. Garden Chervil *has a ſmall and long Root, which periſhes every Year, and is raiſed up every Year, with Seed ſown in the Spring, as alſo in Autumn for Salleting. It riſes up with Stalks not a foot high, and in its Leaves much reſembles* Parſley, *but after it is grown bigger, the Leaves are very much cut in and jagged, ſomewhat reſem-*

reſembling Hemlock, *being a little hairy, and of a whitiſh green color, but turning reddiſh in Summer, with the Stalks alſo, bearing at the top of its Branches ſpoked Tufts of white Flowers, which being paſt, turn into long and round Seed, pointed at the ends, and blackiſh when they are ripe, of a ſweet taſte, but no ſmell; but the whole Herb it ſelf, has a pretty kind of ſweet Scent.*

Chervil.

Neat Chervil or Sweet Cisley

IV. *The* Great Chervil, *(called alſo* Sweet Ciſley*) has a great Root, blackiſh on the out ſide, and whitiſh within, from which ſprings forth many fibres; it periſhes not, but abides many years, and is of a ſweet, pleaſant, hot, ſpicie Taſte, pleaſing unto many: From this Root comes forth ſeveral Stalks of winged Leaves, conſiſting of many Leaves ſet together, deeply cut in on the edges, and every one alſo dented about, very like, and reſembling the Leaves of* Garden Creſſes, *from which they are not eaſily to be diſtinguiſhed, but by good obſervation of thoſe who know both: Their taſte is not unpleaſant (for which reaſon many put them into Sallets) and is not much differing from the Taſte of* Aniſeeds: *There alſo riſes up a Stalk reaſonable large, and a little creſted, about a yard high, ſpreading it ſelf out into many Branches, at the tops whereof ſtand many ſpoaky Tufts or Umbles of white Flowers, which being paſt away, there follows brown, long, cornered, great Seed, two always joined together.*

V. *The* Small Sweet Chervil, *(or* Small Sweet Ciſley*) has a Root not like the former, but conſiſting of almoſt nothing but fibres, thick and matted together; its Leaves, Stalks, and Umbles of Flowers differ not much from the laſt, ſaving that they are every ways leſs. The Seed is long, ſmooth, ſmall, and ſhaped like to an* Oat, *and in taſte not much unlike to that of* Daucus Creticus.

VI. *The Places.* The two firſt grow in Gardens, and that almoſt throughout this whole Kingdom: The laſt is found in ſome parts of the *Alps*, as about *Genqua*, and other places, but with us only in Gardens of Botaniſts, and ſuch as are curious of Plants.

VII. *The Times.* They Flower and Seed in *May*, and their Seed is ripe in *July*: and therefore are Sown again in the end of Summer.

VIII. *The Qualities.* It is hot and dry in the firſt Degree; *Galen* ſays in the ſecond: Aperitive, Abſterſive, Carminative, Digeſtive, Diuretick and Anodyn. It warms and comforts the Head, Brain, Nerves and Stomach, is Pectoral, Nephritick and Hyſterick.: Alſo Alterative, Alexipharmick and Spermatogenetick.

IX. *The Specification.* It is found by great experience to comfort the Stomach, and provoke Urine, even where it is ſtopt.

X. *The Preparations.* You may have herefrom, 1. *The Green Root.* 2. *The green Herb.* 3. *The green Seed.* 4. *The Diſtilled Water.* 5. *The Liquid Juice.* 6. *The Eſſence.* 7. *The Balſam, or Ointment.* 8. *The Roots Candied.* 9. *The Decoction of the Roots in Wine.*

The Virtues.

XI. *The green Root. Gerard* ſays, they are excellent to be eaten in a Sallet, being firſt boiled, and then dreſt up to the Table, as the Cook can tell beſt, either with Butter and Vinegar, or Oil and Vinegar. They are good (ſays he) for old People which are Dull, and without Courage: they rejoyce and comfort the Heart, ſtrengthen and provoke Luſt much.

XII. *The green Leaves.* They are very good, wholſom and pleaſant, being eaten raw as a Sallet Herb with other Salleting, giving the whole a little reliſh of *Aniſeeds.* Uſed as a Pot-herb, it is pleaſant to the Stomach; and is uſed by the *Dutch* in a kind of Loblolly or Hotchpotch, which they call *Warmus.*

XIII. *The green Seed. Parkinſon* ſays, they are commended, being put into a Sallet of green Herbs, and eaten with Oil and Vinegar, to ſtrengthen the Aged, and comfort a cold Stomach. *Gerard* ſays, that the green Seed eaten as a Sallet, with Oil, Vinegar, and Pepper, exceed all other Sallets by many Degrees, both in pleaſantneſs of Taſte, ſweetneſs of Smell, and wholſomneſs as for Food, being good for a cold and weak Stomach.

XIV. *The*

XIV. *The Diſtilled Water.* Being drank to four or ſix ounces, it is good to diſſolve congealed Blood, and provoke Urine.

XV. *The Liquid Juice.* It diſſolves congealed Blood in the Stomach, Guts, Pleura, Lungs, Womb, or other Bowels: it provokes Urine, and the Terms in Women, and to expel Sand, Gravel, and Stones out of the Reins, Ureters and Bladder: and prevails alſo againſt the Pleuriſie, very much comforting a weak, ſick, and cold Stomach. Doſe four ounces, Morning and Night, in a Glaſs of Wine.

XVI. *The Eſſence.* It has all the Virtues of the liquid Juice, beſides which it facilitates the Birth, and brings away the After-birth, is good againſt Poiſon, and the Venomous biting of the *Phalangium*, as *Dioſcorides* ſaith, is nutritive, and reſtores in Conſumptions: Being often taken it breeds Seed, and very much provokes Luſt, and has reſtored ſome who have been Impotent.

XVII. *The Balſam and Ointment.* They ſoon cure green Wounds, and digeſt them, if Contuſed or Lacerated: Applied to filthy, ſtinking, and fordid Ulcers, they digeſt, cleanſe, dry, conglutinate, and heal admirably: and applied to the Gout, they eaſe the pain thereof, drawing forth the Morbifick matter thro' the Pores of the Skin.

XVIII. *The Candied Roots.* They are very good to warm, comfort and ſtrengthen a cold and weak Stomach, and excite *Venus*: And *Parkinſon* ſays, they are thought to be a good Preſervative in the time of Plague.

XIX. *The Decoction of the Roots in Wine.* It has the Virtues of the Juice and Eſſence, but not all out ſo powerful: It is good againſt the bitings of Vipers, Mad Dogs, and other Venomous Creatures; is profitable againſt the Phthiſick, and ſuch as have an Impotency, or are in a pining Conſumption. Doſe, Morning and Night, from four to eight ounces.

CHAP. CXXIV.

Of CHERVIL Wild.

I. THE *Names.* It is called in *Greek*, Χαιρέφυλλον ἄγριον: In *Latin*, *Cerefolium*, or *Cerefolium Sylveſtre*: and in *Engliſh*, *Wild Chervil.*

II. *The Kinds.* This is the ſecond Species of *Chervils*, and is threefold: 1. *Charophyllum Bauhini*, *Cerefolium Sylveſtre Vulgare*, Common Wild Chervil. 2. *Myrrhis Æquicolorum nova Fabij Columnæ*, Small Hemlock Chervil. 3. *Cicutaria alba Lugdunenſis*, *Cicutaria Paluſtris Camerarij*, Wild Ciſley.

III. The Deſcriptions. Wild Chervil, *has a whitiſh woody Root, from which riſe up round about it, round, red, and hairy Stalks, a yard high, or more, many times large, and ſwoln about the Joints, which Stalks are not hollow, but full of Pith: towards the top they are divided into many Branches, which have on their tops Umbles of ſmall and very fine white little Flowers, which being paſſed away, are ſucceeded by longiſh Seeds. The Leaves are commonly parted into three principal parts; and each part again ſubdivided into five, which are ſnipt about the edges, ſoft, hairy, and of a dark green, or reddiſh color.*

IV. Small Hemlock Chervil, *has a Root ſmall and white, which when it has perfected its Seed, periſhes every Year: from which riſe up Stalks ſlender, hollow, ſmooth, not hairy, and ſeldom exceeding the height of two feet. They are divided into ſeveral Branches, ſpread the Leaves, ſo that they ſeem out of Bigness, as it were, of the Leaves, and carry Umbles of ſmall white Flowers; after which follow the Seeds, rough, hairy, round and sharp, about the bigness of Aniſeeds, and growing two together. The Leaves are ſmall, and finely cut or divided, like thoſe of Hemlock, but of a whitiſh color, and hairy.*

V. Wild Ciſley, *has a Root very large, and divided into ſeveral parts, white, and ſpungy, of a pleaſant ſtrong Smell, and with a hot and biting taſte: This Root, tho' the Stalks fade and periſh, yet lives, and the Leaves are green all the Year. The Stalks (if they grow in good ground) come to be three or four feet high, are hollow, jointed, pretty thick, green, and much Creſted, ſending forth out of the boſoms of the Leaves many Branches, which have on their tops, Umbles of white Flowers, each Flower conſiſting of five little Leaves; of which the loweſt is twice as big as the reſt; the two ſide ones leſs; the uppermoſt the leaſt of all.* The Leaves *are large like thoſe of* Myrrhis, *or* Sweet Ciſley, *but of a dark green color; and thoſe which grow on the Tops of the Stalks, are commonly divided into three parts, and thoſe again ſubdivided into ſeveral long ſharp pointed and ſnipt Leaves, like thoſe in* Sweet Ciſley, *the Seeds are longiſh, round, ſharp pointed, black and ſhining. This Plant may very well be called* Wild Ciſley, *for that it ſo much reſembles the* Garden Sweet Ciſley, *not only in its form, but (as Authors believe) in its Virtues too.*

VI. *The Places. The firſt* grows almoſt in every Hedge, and by every Hedge ſide: *The ſecond*, about Mudd Walls, High Ways, and ſuch like places, about *London*, and many other parts of the Kingdom: it is but a ſmall Plant. *The third* is found very frequently in all places, eſpecially where the ground is moiſt and fat, in Meadows, Orchards, and the like.

VII. *The Times. The firſt* flowers in *June* and *July*, and the Seed ripens in the mean Seaſon, or not

not long after. *The ſecond* comes up in *March*, flowers in *May*, and its Seed ripens in *June*. In *Italy* they eat the young Leaves in Sallets, and call it *Wild Chervil*. *The third* flowers alſo in *May* and *June*, and its Seed ripens in the mean Seaſon, or not long after.

VIII *The Qualities, Specification, Preparations* and *Virtues*, are ſaid to be the ſame with the *Garden Chervils*, to which I refer you. *Parkinſon* ſays, that Wild Chervil will help to diſſolve any Tumor or Swelling, and that in any part of the Body, as alſo to take away the ſpots and marks in the Fleſh and Skin, proceeding from Congealed Blood, by bruiſes or blows, in a ſhort time, by applying it (bruiſed I ſuppoſe) to the place.

IX. *A Cataplaſm of the green Herbs and Roots.* I once knew a Man who had been for a long time, even for many years, affiicted with the Gout; ſo that ſometimes for four, five or ſix Months together he could neither go nor ſtand, which put him ſo much out of heart, as to think himſelf paſt all cure. A Beggar Woman going by, and begging at the Door, at ſuch time as the *Paroxyſm* was upon him, and underſtanding by ſome Diſcourſes the Maſters illneſs, told them ſhe would cure him: ſhe adviſed him to apply a *Pultice of green Wild Chervil* to the parts afflicted, and to renew it as often as he ſaw need: (fetching to him alſo at the ſame time ſome of the Herb, that he might know it:) he did ſo, following exactly the Beggar Womans advice, and he had in a little time eaſe, and in leſs than a Months time a perfect Cure. If at any time afterwards he found any Grumbling Pain, in the ſame parts, or in any other, he had ſtill recourſe to the ſame remedy, and averr'd upon his faithful word, that he never apply'd this Cataplaſm in vain.

CHAP. CXXV.

Of CHERVIL Tooth-pick.

I. THE *Names.* It is called in *Greek*, Τυγγίδιον: In *Latin*, *Gingidium*, and *Biſacuta*: In *Engliſh*, *Tooth-pick Chervil*, and *Strange Chervil*. The *Syrians* call it *Viſnaga*, as *Rauwolfius* ſaith.

II. *The Kinds.* There are three principal kinds, 1. *Gingidium verum*, ſive *Syriacum Dioſcoridis*, *Syrian Tooth-pick Chervil*, called in that Language *Viſnaga*. 2. *Gingidium Hiſpanicum Matthioli*, The *Spaniſh* kind. 3. *Gingidium Chærefolij*, *Foliis Tabernmontani*, *Tooth-pick Chervil*, with *Chervil* Leaves.

III. The Deſcriptions. *The firſt has a Root almoſt like a* Carrot Root, *not great, but long, white and woolly, periſhing every Year after Seed-time, which is the ſame Year it is Sown, or elſe ſpringing up late, and not ſhooting up into Stalks for Seed, it will abide a Winter: from this* Root *it grows up with an upright Stalk, ſomewhat rough, branching forth from the very ground almoſt, on which are ſet Stalks of fine cut* Leaves, *ſmaller than* Fennel, *eſpecially thoſe on the Stalks and Branches, for the loweſt are a little broader. At the tops of the Branches grow broad Umbles of white Flowers, ſomewhat purpliſh in the middle, which Umbles before they flower, hang down their Heads, and after the Flowers are paſt, the Umbles do contract, or draw themſelves rounder, the outward parts being higher than the middle, which then is ſomewhat hollow, that it repreſents a Birds Neſt, ſomething like to the Umbles of the* Wild Carrot: *The Flowers being paſt, there ſucceeds a great plenty of very ſmall Seed. The whole Plant has a kind of Reſinous Taſte and Smell. There is another ſort alſo of* Syrian Chervil, *which has but a few Stalks of winged Leaves, almoſt like to* Parſneps, *but that every divided Leaf is broad and round, but leſſer; the Stalk is ſomewhat hairy, creſted, ſmall, low, and naked of Leaves to the top, whereon grow ſeveral long Stalks with Umbles of white Flowers, and two or three ſmall long leaves with them, whoſe Smell and Taſte is like the former.*

The True Tooth Pick Cheruil

Tooth pick Chervil.

IV. *The* Spaniſh Kind, *has a Root long and white, from whence riſes up a Stalk higher than the firſt* Syrian *kind, and is every ways greater, as to the whole,*

whole, but the Stalk is more ſlender than it, and the Leaves more tender at the Joints, thicker, and more finely cut at the tops, on which ſtand large Umbles of white Flowers, divided into many parts, and ſtanding upon long Stalks, which when the Seed grows ripe and hard, being long and ſlender, will ſerve very well for Tooth-pickers. Gerard *ſays, that in its Leaves, Flowers, and knobby Stalks, it is like unto* Wild Carrots, *ſaving that the Leaves are ſomewhat finer cut, or jagged, and tenderer, but not rough or hairy at all, of a reaſonable good Smell, and a bitter Taſte, among which riſe up buſhy rundles, or ſpoky Tufts, like thoſe of the* Wild Carrot *or* Birds Neſt, *which are cloſely drawn together, when the Seed is ripe, at what time the ſharp Needles are hardned, fit to make Tooth-pickers of, and for which purpoſe they very well ſerve ; and from thence came the* Engliſh *name.*

V. *The third kind has a Root long, white, and bitteriſh, from which ſpring up divers Stalks of winged Leaves, very like unto the Common or Ordinary* Garden Chervil, *but not divided into ſo many parts : the Stalk is round, ſtraked and blackiſh, about a foot and half high, with Joints and Leaves like the others. The Umbles of white Flowers, are encompaſſed about with ſmaller and finer cut Leaves ; when the Flowers are paſt, the Umble is contracted together, which are clammy, and in which lies ſmall Seed.*

VI. *The Places.* They all grow in *Syria* ; The ſecond in *Spain* plentifully : but with us they are only nouriſhed up in *Gardens.*

VII. *The Times.* They flower in *July* and *Auguſt*, and the Seed is ripe in *October* ; but with us they flower late, and therefore the Seed is much later ; ſo that if the Year is not hot and kindly, the Seed will ſcarcely ripen, or come to perfection with us.

VIII. *The Qualities.* They are ſaid to be temperate in reſpect of heat or cold, and dry in the end of the Second Degree : Aſtringent, Stomatick, and Alterative. They are more uſed as Nutriment than Medicine, both in former times and now, for *Dioſcorides* and *Galen* ſay more concerning their Edible Properties, being eaten raw or boiled, or otherways ordered, according to ſeveral Mens liking, for that they are bitteriſh, and a little Styptick, and ſo the more welcome and agreeable to the Stomach : But *Galen* ſays, that they are rather Medicinal than Nutritive, for that though they may have a temperate Quality, as to heat and cold, yet that they have a manifeſt bitterneſs and aſtringency, by both which properties, though they may be very agreeable to the Stomach, yet they are more of the Nature of a Medicine, than of Food ; for that by thoſe Properties, they cleanſe and dry up the moiſt Humors, which by ſuperabounding, may offend the Stomach, and by it the Liver, and other parts.

IX. *The Specification.* Beſides ſtrengthening the Stomach, as aforeſaid, they are proper againſt Diſeaſes of the Reins, Ureters, and Bladder, and to provoke Urine.

X. *The Preparations.* You may have therefrom, 1. *The Juice.* 2. *The Eſſence.* 3. *The Decoction in Wine.* 4. *The Spirituous Tincture.* 5. *The Acid Tincture.* 6. *The Oily Tincture.* 7. *The Quils on which the Seed does grow.*

The Virtues.

XI. *The liquid Juice.* It is good againſt Vomiting, and ſtrengthens the Stomach ; it provokes Urine, and expels Sand and Gravel from the Reins and Bladder. The Doſe is three or four ounces, Morning and Evening, in a Glaſs of White Port Wine.

XII. *The Eſſence.* It has the Virtues of the Juice, but ſtrengthens the Stomach more, and is withal more Diuretick. Doſe three or four ounces in White Port Wine.

XIII. *The Decoction in Wine.* It is an admirable Stomatick ; and being drunk to ſix or eight ounces, Morning, Noon, and Night, it opens Obſtructions, and cleanſes the Reins and Urinary parts of Sand, Gravel, ſmall Stones, and Tartarous Slime lodged in thoſe parts ; but it is not full out ſo powerful as the Eſſence.

XIV. *The Spirituous Tincture.* It ſtrengthens the Stomach, helps Digeſtion, chears the Heart, revives the Spirits, and comforts Univerſal Nature. Doſe a ſpoonful at a time.

XV. *The Acid Tincture.* It ſtops Vomiting, cleanſes the Stomach of Tartar, and Viſcoſity, cauſes a good Appetite, and helps Wheezing, Hoarſneſs, and ſhortneſs of Breath.

XVI. *The Oily Tincture.* It is Nephritick and Diuretick, cleanſes the Reins and Bladder, and ſo is good againſt Stone and Strangury. Doſe twenty or thirty Drops in White Port Wine.

XVII. *The Quils, Needles, or Tooth-pickers.* They ſerve to pick and cleanſe the Teeth and Gums of any thing ſticking in them, which they do without any hurt to them, and leave a good ſcent in the Mouth.

CHAP. CXXVI.

Of CHICHLINGS Annual.

I. *THE Names.* I do not find that it has any *Greek* name : The *Latins* call it *Lathyrus*, which is a kind of Peaſe, (and differs from *Lathyris, Spurge :)* We in *Engliſh* call it *Chichling.*

II. *The Kinds.* It is either *Perennial* or *Annual :* The *Perennial* we ſhall treat of when we come to treat of *Peaſe Everlaſting.* The *Annual* is the ſubject matter of this Chapter : They are 1. *Lathyrus Annuus major Bæticus*, The Great *Spaniſh* Annual Chichling. 2. *Lathyrus Bæticus elegans, ſiliquis Orobi*, *Spaniſh* party-colored Chichling. 3. *Lathyrus major ſiliqua brevi*, The greater ſhort-codded Chichling. 4. *Lathyrus minor ſiliqua brevi*, The leſſer ſhort-codded Chichling. 5. *Lathyrus, ſive Cicercula flore albo, Aracus Dodonæi, Ervum Lacunæ, Piſum Græcorum Tragi, Ervum album ſativum Fuchſij, Ervum anguloſum aliquibus*, White flowred Winged Chichling. 6. *Lathyrus, ſive Cicercula flore purpureo, Aracus ſive Cicera Dodonæi*, Purple flowred Winged Chichling 7. *Lathyrus, ſive Cicercula Bætica flore Cæruleo, Aracus Hiſpanicus Camerarij, Cicercula Ægyptica Cluſij*, Blew flowred Winged Chichling. 8. *Lathyrus, ſive Cicercula flore rubente*, Red flowred Winged Chichling 9. *Lathyrus, ſive Cicercula Bætica Dumetorum*, Wood Chichling.

III. The Deſcriptions. *The firſt of theſe has a Root ſmall, not running deep nor far, but periſhing every Year ; from whence proceeds two or three flat Stalks, three feet or more long, welled as it were with skins or films on both edges, having two ſmall Leaves apiece at each Joint, from whence ſhoot forth the Branches, bearing two pretty long and broad Leaves about the middle thereof, one oppoſite to another, with a twining Claſper or Tendrel running between them. The Flowers ſtand ſingly upon long Footſtalks, of a deeper purple color, but leſſer than the* Perennial *: after which come long pale colored*

Cods, *very like the* Perennial, *as the Peaſe within them alſo are.*

IV. *The ſecond has a ſmall* Root, *from whence ſpring up Branches or Stalks five or ſix* Feet *long, with ſuch like Welts, or skinny Membranes on both edges at every Joint, from whence come forth long* Leaves, *divided at the top into two other ſmaller* Leaves; *and higher upwards ſet with ſix* Leaves *on both ſides: and in the middle between them comes forth a ſmall Claſper or* Tendrel, *by which it catches hold of every thing which ſtands next unto it. At the Joints alſo come forth the* Flowers, *either one or two at the moſt, upon long* Footſtalks, *like unto the other kind, the upper* Leaf *of a fine Crimſon, or Orange color, and the other in the middle of a perfect White. After the* Flowers *are paſt, comes the Peaſe or Seed in long* Cods, *every Seed bunching out, as in the* Cods *of* Orobus, *and as large almoſt as the ſmaller Peaſe.*

Greater short codded Cichling

V. *The third has a ſmall ſlender Root, from whence riſes up ſeveral Stalks, which lye upon the ground, unleſs ſupported by ſomething ſtanding near them: in its manner of growing it differs but little from the former; but its* Leaves *are ſomething longer, turning a little roundiſh, almoſt Cicle faſhion'd. The* Flower *has its inner* Leaves *white, and the outward ſomewhat purpliſh, the* Cods *which follow are thick and ſhort, which contain within them, ſmall, round, blackiſh Peaſe.*

VI. *The fourth differs little from the laſt, but only in the ſmallneſs of the* Plant, *and the* Cods, *having a little roughneſs upon them.*

VII. *The fifth has a ſmall* Fibrous Root, *periſhing every Year, from whence ſprings up weak Winged Stalks lying along on the ground, if not ſupported by ſomething near them, like as all the former, having alſo two ſmall* Leaves *at the Joints, and two others narrower likewiſe on the Branches, which terminate in divided Claſpers or* Tendrels. *The Flowers are white, and ſtand on long Footſtalks; which being paſt away, there comes after them ſhort Cods, ſomewhat flat, with two little narrow films all along the back of them; which contain within them Seed, or Peaſe, flat, white, and cornered, and ſomewhat larger than thoſe of the former ſorts.*

VIII. *The ſixth in its* Roots, *Stalks,* Leaves, *and manner of growing, is like the former: the* Flowers *and Seed chiefly declare the difference; the* Flowers *are of a dark dead purple color, and the Cods which follow, are ſmaller, with films at their backs like the former. The Seed or Peaſe within them, are alſo cornered, but of a dark brown color, ſo that they are almoſt black in appearance.*

IX. *The ſeventh has a ſmall fibrous Root periſhing as the reſt do, every Year; and differs in nothing from the fifth and ſixth, but in the* Leaves, *which are much larger; and the* Flowers, *which are of a pale blew on the outſide, the inner* Leaves *being more blew. The Cods are ſmall, and almoſt round, winged at the back like the former, in which is contained brown cornered Seed.*

X. *The eighth has* Roots, *and Stalks, like the laſt, and reſembles it in its manner of growing; but its green* Leaves *are narrower and longer than thoſe, and its* Flowers *are of a dull dead kind of Orange color, which being paſt away, there follows ſhort Cods, and ſomewhat round, with browniſh cornered Seed.*

XI. *The ninth has a ſmall fibrous Root as the reſt have, from whence there comes forth ſeveral long, weak Stalks with films on the edges; at the Joints are two ſmall* Leaves, *and from between them come forth the Branches, which have ſeveral ſmall dark green* Leaves *on them, ſomewhat round at the ends, and are ſometimes three on a ſide, and ſometimes but two, but not always one againſt another. From the boſom of the Stalk and Branches, come forth commonly two* Flowers *on a long* Footſtalk, *the upper Leaf being reddiſh, and the other purpliſh, after which come forth long ſmooth Cods, without any film at the back, containing within them, round, but ſomewhat flat Seed, or Peaſe, of a browniſh color.*

XII. *The Places.* They all grow in *Spain*, from whence they were firſt brought to us: the firſt four grow Wild: the latter five are Manured there: but with us they all grow only in Gardens.

XIII. *The Times.* They Flower in *July*, and the Seed is ripe in *Auguſt* or *September*.

XIV. *The Qualities, Specification, Preparations, and Virtues*, are the ſame with our Peaſe or Beans, to which we refer you. The five laſt Manured ſorts, *Boel* ſays, are eaten by the poor People of *Spain* inſtead of Bread; for where theſe are eaten for Food, ſeldom any Bread Corn is eaten: They are of a very ſolid Subſtance, and extreamly Nutritive, and therefore nouriſh more than other Grain, but are more hard of Concoction.

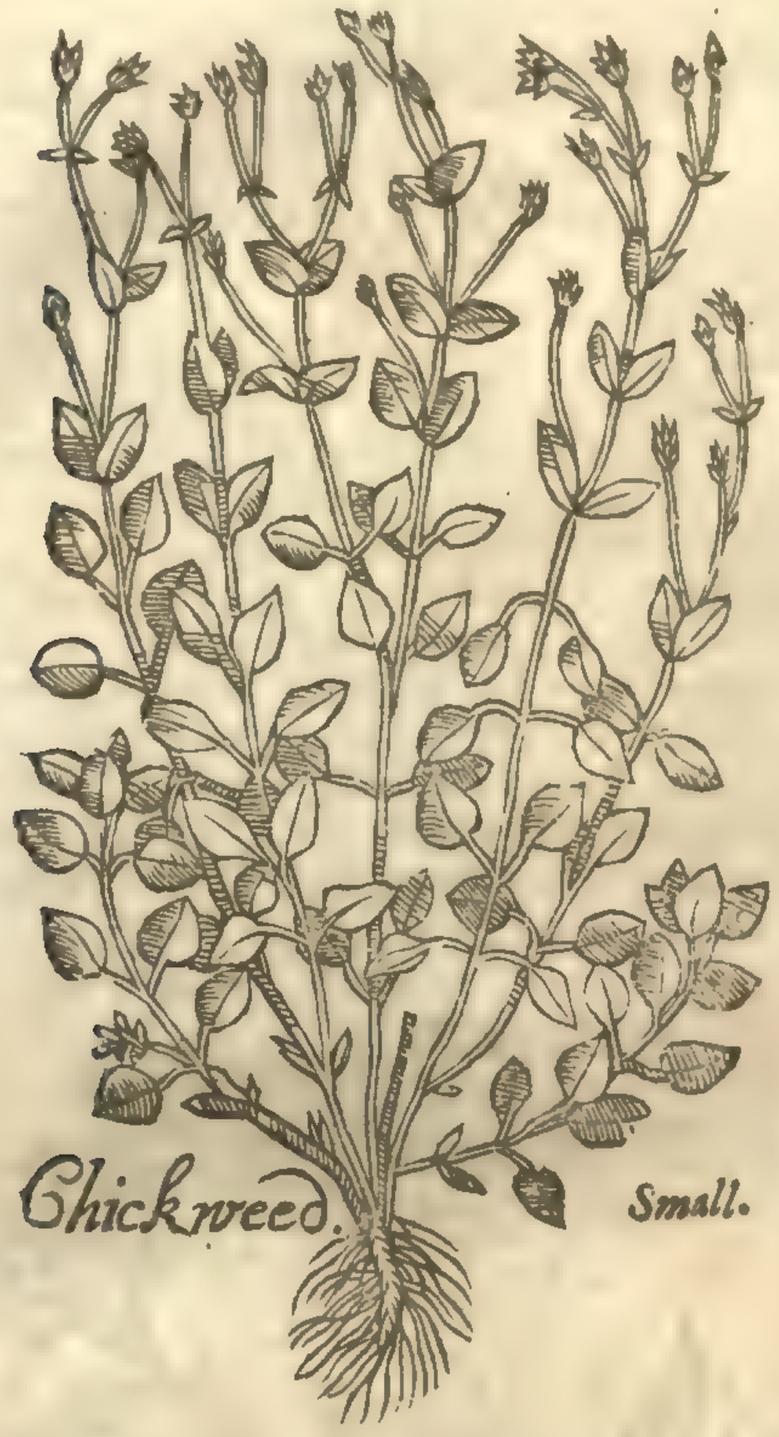
CHAP. CXXVII.

Of CHICKWEED Common.

I. *THE Names.* It is called in *Greek*, Ἄλσινη: In *Latin*, *Alſine*: In *Engliſh*, *Chickweed.*

II. *The Kinds.* There are three principal kinds, 1. Ἄλσινη κοινὴ, *Alſine Communis*, Common Chickweed. 2. Ἄλσινη ὑνυδεσ, *Alſine aquatica*, Water or Marſh Chickweed, of which in the next Chapter. 3. Ἄλσινη νόθη, *Alſine notha*, Baſtard Chickweed, of which we ſhall treat in Chap. 129. Of the *Common kind*, there is, 1. *Alſine maxima, Lugdunenſis*;

dunensis; *Angustifolia Baubini*, Our Greatest Chickweed: *Gerard* calls it, *Alsine major*. 2. *Alsine minor*, Our Common small Chickweed. 3. *Alsine Baccifera*, and *Baccifera repens*, *Cacubalum Plinij*, *Alsine repens Clusij*, Berry-bearing Chick-weed, and Spreading Chickweed.



III. The Descriptions. The first *has a white thready Root, small, and consisting of several little strings like hairs, from whence rise up Stalks a foot or foot and half high, and sometimes higher, a great many from one Root, long, and round, slender, full of Joints, with two Leaves growing out of every Knot or Joint, almost as large, and as long or longer than* Pellitory *Leaves, to which they are very like in shape or form, but smooth, without any hairyness or downiness, and of a light green color. The Stalks are somewhat clear, and as it were perlucid, or transparent; and about the Joints they are often of a very light red color. The Flowers are at the tops of the Branches, being white, and consisting of six Leaves apiece, standing in long green Husks, not much unlike to the Flowers of* Stitchwort, *but lesser. Which being past, in their places succeed long Knops, or Seed Vessels, but not great, containing within them small yellowish Seed.*

IV. The second *has a Root white, and full also of little strings, from whence spring many Stalks or Branches, as in the former, which for the most part lye upon the ground: The Stalks are small, round, long, slender, brittle, or very tender, and jointed: from which slender Branches spring Leaves, resembling the precedent, but much less, as is likewise the whole Plant, which in no respect attains to the greatness of the former,; the Flowers are also in like manner white and small, standing in like fashioned green long husks; which being past, the said Husks or Knops contain small yellowish Seed.*

V. The third *has a Root which is white and long, creeping much under ground, and shooting forth in divers places every year new shoots, the old dying away every Year: from this Root come forth many flexible Branches full of Joints, rising higher than a Man, if it stands by bushes or other things, where it may take hold; otherwise, through weakness, they lye upon the ground, and so seem not so long or tall. At every one of the Joints stand two Leaves, one against another, much like to the* Common Great Chickweed Leaves, *but larger, and coming somewhat near to those of* Pellitory of the Wall, *and of a fresh green color. At the Joints also, on both sides of the Stalks come forth other Branches, jointed and set with the like fashioned Leaves in the same manner, and at the ends of them large, green, round Husks, ending in five points, with white Flowers growing out of them, consisting of five, and sometimes of six white Leaves apiece, cut in at the ends: in which Husks, after the Flowers are past, stand small round Heads, like Berries, green at the first, and blackish when they are ripe, containing within them many flat, blackish, purple Seed. This Plant has only an herby taste, like to the* Common Chickweeds, *and therefore the Learned Botanists refer it to them.*

VI. *The Places.* *The first* grows almost every where throughout *England*, by Highways and Ditch sides, in moist and watry places, especially if the Earth is rich. *The second* is found also in many of the like places, as also in *Gardens*, where many times it is a most pernicious Weed. *The last*, *Clusius* says, grows in several places of *Spain* and *Germany*; as also in *Flanders* and *England*, as *Pena* and *Lobel* say; *Parkinson* says, that he had sometimes found it by Hedge sides in our own Land.

VII. *The Times.* *Chickweed* is mostly green in Winter; they Flower in *Spring* and *Summer*; and their Seed is ripe in *June* and *July*.

VIII. *The Qualities.* They are cold and moist in the second Degree: Emollient, Arthritick, Anodyn, and Alterative: *Galen* and *Oribasius* say, they are without any Astringent Quality.

IX. *The Specification.* Their Juice is peculiar against the Inflammation called St. *Anthonies* fire.

X. *The Preparations.* You may have therefrom, 1. *A Juice.* 2. *An Essence.* 3. *A Distilled Water.* 4. *An Oil.* 5. *A Cataplasm.* 6. *A Compound Oil.*

The Virtues.

XI. *The Juice.* It is very Cooling and Emollient, without any binding property. *Galen* and others say, that it has the Virtues of *Pellitory of the Wall*; but that I doubt; however it is commonly found to be as effectual as *Purslain* to all the purposes whereunto that serves, except for Meat or Salleting only. Applied with Cloths or Spunges dipped therein, to the Region of the Liver, and as they dry, to have fresh applied, does wonderfully attemperate the heat of the Liver. The same also is effectual for all hot Apostems and Tumors wheresoever, and is profitable against *Ignis sacer*, or *Anthonies Fire*, and the like; as also for all redness of the Face, Wheals, Pushes, Itch, Scabs, either simply used, or made into an Ointment with Lard. It is good for all heat and redness of the Eyes, being dropt into them; also put into the Ears warm, it eases their pain proceeding from a hot cause. The Piles bathed, or fomented therewith, it abates their pain, and takes away their heat and sharpness, and eases all other pains of the Body proceeding from heat and sharpness of Humors. It is good against hot and virulent Sores and Ulcers in the Privy Parts, Legs, or elsewhere, they being often washed therewith.

XII. *The Essence.* It cools Inflammations of the Lungs, without any binding property, and takes away the heat of the Stomach and Liver, breaking out into the Lips, causes Appetite, being lost thro' too much heat, is prevalent against Hectick Fevers, as also the heat and pain in the Back, and the sharpness and scalding of Urine. Dose from one to two or three ounces Morning and Night.

XIII. *The Distilled Water.* It has the Virtues of the Juice, but much less effectual; and may be used as a Vehicle to take the Essence in.

XIV. *The Oil.* Made by boiling the Herb in Oil Olive, till it is crisp, and repeating it three or four times with fresh Herbs, it heals sore Legs, Ulcers, Wheals, Pushes, Scabs, and the like: and being anointed upon shrunk up Sinews, it extends them, eases their pains, and makes them pliable again.

XV. *The Cataplasm.* ℞ *of Chickweed four handfuls: Marsh-mallows, two handfuls; mix and boil them to a Pultise, with Fenugreek Seed, Linseed,* ana, *two ounces, bruised.* This applied to Tumors, or Apostems, ripens and breaks them, assuages the Swelling, and eases the Pain.

XVI. *The Compound Oil. Take green Chickweed, fresh Red Rose Leaves, of each two handfuls: Oil of Trotters, two pounds: boil till they are crisp, and strain out: repeat this boiling with fresh Chickweed, and Red Rose Leaves, twice more: strain out, and keep it for use.* Being anointed warm, and well rubbed in upon Sinews which are strained, it is a most excellent thing: Let it be used Morning and Evening, and in a little time the Patient will be cured.

XVII. *The Virtues of the Alsine Baccifera.* Some Authors say, that it is no less fatal to be eaten than the *[illegible] Nightshade*: but others say, of the *Cacubalus Plinij* otherwise: and that if the Leaves thereof be beaten with some Vinegar, and applied to the place stung with Scorpions or Serpents, it helps them. And that the Juice thereof taken, with twice as much honied Wine, it eases the pains of the Back and Loins; also the Head-ach (from a hot cause) if it is applied with Rose Water to the Forehead and Temples: and that being bound to Wens or Kernels, or they bathed often with its Juice, it dissolves them.

CHAP. CXXVIII.

Of CHICKWEED, Water.

I. *THE Names.* It is called in *Greek*, Ἄλσινη ὑγροφίλη: In *Latin*, *Alsine Aquatica*: And in *English*, *Water Chickweed.*

II. *The Kinds.* It is fivefold, 1. *Alsine aquatica major*, The greater Water Chickweed. 2. *Alsine aquatica minor*, The lesser Water Chickweed. 3. *Alsine aquatica minima, & serpillifolia Bauhini*, The smallest Water Chickweed. 4. Ἄλσινη θαλασσία, *Alsine marina*, Sea Chickweed: *Lobel* calls it, *Hippia major*; and *Cæsalpinus*, *Centunculus*. 5. *Alsine recta, flore Cæruleo*, Upright blew Chickweed. There is another which some account a *Sea Chickweed*, viz. *Alsine Palustris minor folio oblongo*, which others more properly call, *Portulaca marina*, *Sea Purslain*, and under that Title you will find it.

III. The Descriptions. *The first of these has a creeping Root, shooting out with divers Fibres, very long, and of the thickness of a Wheat Straw, not much unlike to the Roots of* Quitch-grass, *from whence rise up divers upright Stalks, slender, and jointed from the bottom to the top, set with pretty large sharp pointed Leaves, standing by pairs at certain distances, somewhat like those of* Pellitory of the Wall. *At the tops of the Stalks grow small white Flowers, like to the other* Chickweeds, *or like to* Stitchwort, *but lesser, having many small and pointed Leaves in each Flower, after which come small whitish yellow Seed.*

IV. *The second of these has a bunchy fibrous Root, from whence several weak and tender Stalks rise up, jointed like the former, and with Leaves at the Joints, as in the other, not much unlike in shape and*

and Leaves to the Lesser Chickweed, *in the former Chapter. The Stalks rise up sometimes to be a yard high, full of Branches, and small long Leaves on them, of a pale green Colour. The Flowers are many, which at the tops of the Branches are small and white, consisting of five Leaves apiece; after which follows in Husks small yellowish Seed.*

Smaller Water Chick weed

Smalest water Chick weed.

V. *The third, or smallest kind,* Serpillifoliis, *has a small Root, with many fibres, from whence spring up many weak and tender Stalks, full of joints, with two narrow sharp pointed Leaves at each joint, green above, and of a whitish colour below; at the setting on of these Leaves grow small buds parted as it were into two, with a little crest on each side, in which Capsule are contained very small Seed.*

VI. *The fourth, or* Alsine marina, *has a branchy and threddy Root as some of the former, which sends forth for the most part Branches lying upon the ground, very like unto the lesser sort of* Chickweed *in the former Chapter, but that the Stalks are shorter, and thicker, and closer Jointed, with* Chickweed *like Leaves on them, yet thicker, and whiter: The Flowers also stand at the tops of the Branches, and are composed of many small Leaves in form of a Star; which being past away, the Seed Vessels follow, which are long and round like the others, but flat, and somewhat broad, in which are contained three or four greater Seeds.*

Sea chick weed.

VII. *The fifth has a Root white and long, with some fibres thereat, from whence rise up for the most part several upright Stalks or Branches, jointed in several places, and divers small Leaves growing thereon at the manifold Joints, somewhat divided like unto Leaves of* Rue, *and a little resembling a* Trefoil *Leaf: at the tops of the Joints come forth small blew Flowers, consisting of four Leaves apiece: which being past away, there appears small round* Chickweed *like Heads or Husks, with small Seed therein.*

VIII. *The Places.* The *first three*, and the *fifth*, are found to grow in or near Waters, and Watry places in most Parts of *England*. The *Serpillifolia* may be found in Watry places, between *Clapham Heath* and *Tooting*, and between *Kentish Town* and *Hamstead*. And the *fourth* grows near the Sea shore, and in *Salt Marshy places*, upon several Coasts of this Kingdom.

IX. *The Times.* Their Flowering time is in the heat of *Summer*, and their Seed ripens in the mean Season, and in a little time after.

X. *The Qualities, Specification, Preparations and Virtues*, are the same with those in the former Chapter, to which we refer you.

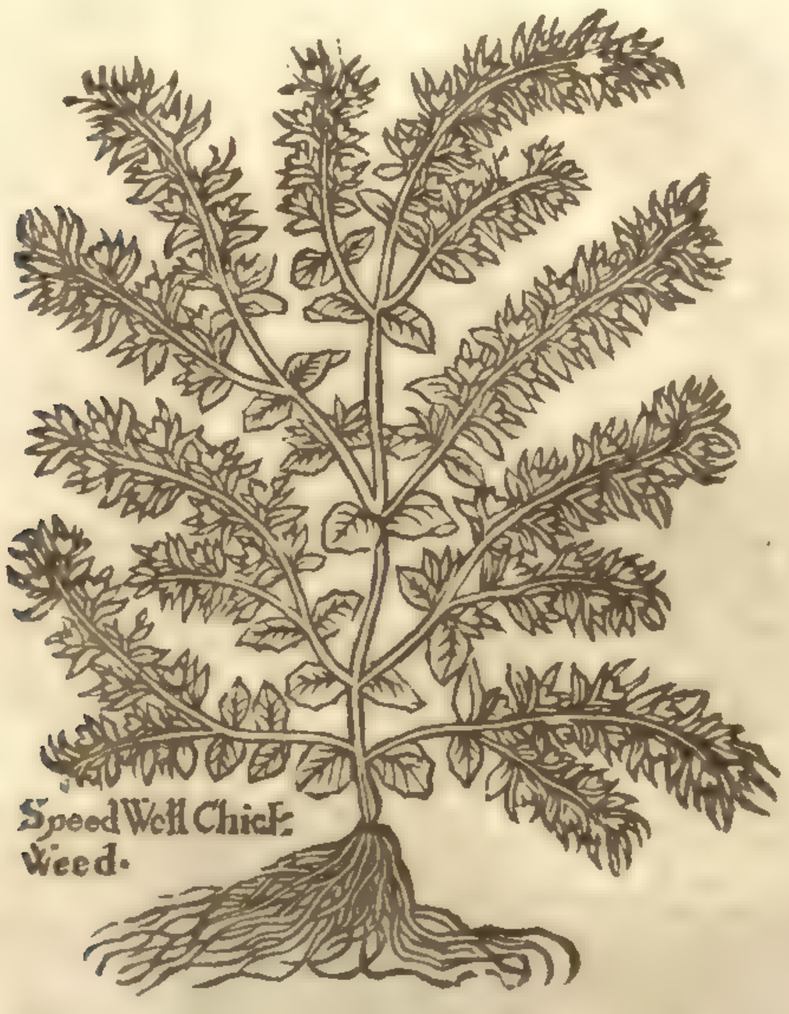
CHAP.

CHAP. CXXIX.

Of CHICKWEED, Baſtard.

I. *THE Names.* It is called in *Greek*, Ἀλσινη νόθη: In *Latin*, *Alſine notha*; and in *Engliſh*, *Baſtard Chickweed.*

II. *The Kinds.* There are many kinds hereof, but theſe following are chief, 1. *Alſine foliis ſubrotundis Veronicæ*, Speedwell Chickweed. 2. *Alſine folio Triſtaginis*, Germander leav'd Chickweed. 3. *Alſine ſparia prior Dodonæi*, *Alſine folio hederulæ minor*, Ivy leav'd Chickweed. 4. *Alſne hirſutia foliis Auriculæ Muris*, Hairy Chickweed, with Mouſe Ear Leaves. 5. *Alſine Viſcoſa*, Clammy Chickweed. 6. *Alſine Petræa*, Stone or Rock Chickweed. 7. *Alſine fluviatilis*, River Chickweed.



III. The Deſcriptions. *The* firſt *of theſe has a ſmall and thready Root, which periſhes not in the Winter; from whence many Branches ſpring up, and ſpread abroad, full of ſmall and almoſt round Leaves, ſet in couples or pairs, very like to thoſe of* Veronica, *or* Pauls Betony, *called* Speedwell, *but not like to* Elatine *or* Fluellin *of any kind. The Flowers grow at the Joints with the Leaves, from the middle of the Branches upwards, being very ſmall, made of five blew Leaves, after which come ſmall flat Seed Veſſels like Pouches, in which is contained ſmall round yellowiſh Seed.*

IV. *The* ſecond *has a ſmall long Root, full of many fibres or threads, which continue all the Winter, from which come forth ſeveral ſmall weak Branches ſpreading upon the ground, three or four Inches long, ſet with ſmall and ſomewhat round Leaves, which are dented about the edges, and pointed at the ends, ſtanding by couples one againſt another: At the joints whereof towards the tops, come forth ſmall blew Flowers, and ſometimes white, conſiſting of five round pointed Leaves; after which ſucceed ſmall round Seed Veſſels, two always joined together, having ſmall round Seed within them.*

V. *The* third *or* Ivy leav'd Chickweed, *has a ſmall and thready Root, from whence riſe up hairy tender Stalks or Branches, many of which ſpread themſelves upon the ground, ſet with two Leaves at a Joint, hairy and Ivy like, but nothing ſo large. The Leaves, ſays* Gerard, *reſemble the Back of a Bee when it flies. The Flowers grow at the tops, and conſiſt of five ſmall blew round pointed Leaves; which being paſt away, round Heads or Husks appear, in which is contained ſmall* Chickweed *like Seed.*

VI. *The* fourth, *or* Hairy leav'd Chickweed, *has a very ſmall Root, with a few Fibres at it, from which ſpring up ſeveral hairy Stalks or Branches, which creep upon the ground; upon which grow in pairs, ſmall, long, whitiſh, hoary Leaves, of a Mouſe Ear like faſhion: the Flowers grow at the ends of the Branches, of a bluſh color, which give long and pointed Seed Veſſels, in which is contained ſmall Seed, like that of the* Common Chickweed.

VII. *The* fifth, *or* Clammy Chickweed, *has a ſmall fibrous Root, from whence come forth Branches, which ſtand more upright than the laſt, with rough, hairy, and clammy Leaves, ſomewhat like the* Common Chickweeds, *but of a more blewiſh green. The Flowers are ſmall and white, and ſcarcely open themſelves but in the hot time of the day, ſtanding at the tops of the Stalks, which from the middle upwards are ſo clammy, that they will ſtick to ones Fingers, if touched, whereby they are apt to catch Flies, and other ſmall things which fall upon them.*

VIII. *The*

VIII. *The* fixth, *or* Stone Chickweed, *has a ſmall and threddy Root, which ſends forth many ſmall and upright Branches, thick ſet; which ſo interfere one with another, that the whole Plant (which is indeed but a ſmall Herb) ſeems like unto a ſmall Buſh. The Leaves are ſmall and pointed; and the Flowers ſmall and white, like the other* Small Chickweeds. *Which being paſt away, round Heads or Husks come forth, like unto thoſe of* Line *or* Flax, *in which the Seed, (which is very ſmall) is contained.*

IX. *The* ſeventh *is a* Baſtard kind of Chickweed, *growing by River ſides; it is a very ſmall Plant, but has an admirable thick matted Root, like a Haſſock, made up of a vaſt number of fibrous or threddy ſtrings, from whence riſe up many ſmall tender Branches, ſtretching or trailing along the Stream, upon which grow long Leaves, having a long middle Rib, upon which grows on each ſide thereof a great number of other ſmaller Leaves, like thoſe of* Lentils, *or the* Wild Vetch. *The Flowers grow at the tops of the Stalks, which are ſmall and white, after which comes in husky Heads a ſmall Seed.*

X. *The Places.* The *ſixth* grows on *Mountains*, and in *Stoney* and *Rocky places*: the *ſeventh* grows in *Rivers*: the *others* grow in *Fields*, as well *Till'd*, as *Untill'd*, and by *Way ſides*, &c.

XI. *The Times.* They do all Flower in Summer, ſome in the latter end of *May*; and ſome in *June* and *July*; ſome earlier, and ſome later than others; and their Seed is ripe quickly after; but the *fourth* or *hairy Chickweed* Flowers not till *Autumn*.

XII. *The Qualities, Specification, Preparations, and Virtues,* Authors aſſent to be the ſame with thoſe of the *Common Chickweed*, to which you are referred; and therefore we ſhall ſay no more of them in this place.

CHAP. CXXX.

of CINKFOIL.

I. *THE Names.* It is called in *Greek*, Πεντάφυλλον: In *Latin*, *Pentaphyllum*, and *Quinquefolium, à numero foliorum*: In *Engliſh*, *Cinkfoil*, and *Five-leav'd Graſs*.

II. *The Kinds.* Authors make at leaſt ſixteen Kinds, or more; many of which grow not in *England*, nor any place belonging to our Territories: The moſt uſual with us are, 1. *Pentaphyllum Vulgatiſſimum*, Our moſt Common Cinkfoil. 2. *Pentaphyllum majus album Vulgare*, The Greater Common white Cinkfoil. 3. *Pentaphyllon magnum flore luteo vel albo.* The Great Common Cinkfoil with a white or yellow Flower. 4. *Pentaphyllum rubrum Paluſtre*, Red Marſh Cinkfoil. 5. *Pentaphyllum ſupinum Potentillæ facie*, Low Silver-weed Cinkfoil. 6. *Pentaphyllum incanum repens majus & minus*, The Greater and Leſs creeping hoary Cinkfoil. 7. *Pentaphyllum rectum majus & minus*, The Greater and Leſſer Upright Cinkfoil. The firſt of theſe is called generally by all, *Pentaphyllum*, or *Quinquefolium vulgare*, and *Quinquefolium majus repens Bauhini*, Common Cinkfoil. The ſecond, *Quinquefolium album*, and *Quinquefolium album majus alterum Bauhini*. The third is called, *Quinquefolium album majus cauleſcens Bauhini*.

III. The Deſcriptions. The firſt *has a Root of a blackiſh brown color, very rarely ſo large as ones little Finger, but growing long, with ſeveral Fibres ſpringing from it; and by which ſmall ſtrings it quickly ſpreads over the place it grows on: From this Root riſes up ſeveral weak Stalks, lying on, ſpreading and creeping on the Earth, with long Greener Branches, or Strings, like to the* Strawberry Plant, *which take Root again, and ſhoot forth many Leaves. Theſe Leaves are five in number, ſometimes ſeven, though but rarely ſo, long, finely dented about the edges, and ending in a pretty ſharp point, ſomewhat hard, and of a lightiſh green color. The Stalks are ſlender, leaning downwards, and bear many ſmall yellow Flowers, with ſome yellow threads in the middle, ſtanding about a ſmooth green Head, which when it is ripe is a little rough, and contains ſmall browniſh Seed.*

Cinkfoil.

White Cinkfoil.

IV. *The*

IV. The second *has a Root thick and long, blackish on the out side, but reddish within, having many fibres appertaining to it. From whence spring forth Stalks with many* Leaves, *also Leaves growing from the Root. The Stalks are small, weak, and a little hoary, and the* Leaves *springing from them are five-fold, or divided into five parts, a little dented and pointed at the ends, green on the upper side, and a kind of hoary white underneath : between these* Leaves *grow weak Branches, leaning down to the ground near a foot long, with many such like Leaves on them, but lesser than those below. The* Flowers *are about the largeness of the former, but not full out so large as the next following, of a white color, consisting of five rounder pointed* Leaves *than the others are, having a nick in the middle, and several small yellow threads in the middle of the* Flower, *set with a woolly Head, having many small Seeds set together like unto a Crowfoot head of Seed. Of this kind there is another whose green* Leaves *are not dented about the edges, little differing in any thing else.*

V. The third *has a Root somewhat thick and long, of a blackish brown color without, and reddish within : From this Root spring forth many* Leaves, *also Stalks or Branches, the* Leaves *stand upon their own Stalks, and are divided into five parts, as if they were five several* Leaves, *dented about the edges, and almost sharp pointed, very like to the* first *or* Common Cinkfoil, *but that these are every ways larger, and a little hairy ; from which rise up strait or upright Stalks for a while, till they are grown up to a considerable length, then they incline, or lean somewhat down towards the ground, as both the former do. These Stalks are a little hairy also, and divided near their tops into two or three Branches, and they again into others smaller ; upon the tops of every one of which grows one* Flower, *of a white color, and larger than in either of the former, consisting of five* Leaves, *as all the other sorts do ; in the middle of which stands a small downy head, encompassed with many reddish yellow threads. This kind, says* Gerard, *is so common, and so universally known, that he thought it needless to give any Description thereof.* Johnson *upon* Gerard *says, it has many long slender Stalks lying spread upon the ground, out of which grow* Leaves, *made of five longish snipt* Leaves, *fastned to one long Foot-stalk ; the* Flowers *also grow upon the like Foot-stalks, and are composed of five yellow* Leaves. *The Root is pretty large, of a reddish color, and round, but dryed, it becomes square.*

VI. The fourth, *or Marsh kind, has a Root of a Woody substance, with some fibres, or thready strings adjoining thereto : From which Root rise up* Leaves *almost like to the former, consisting of five parts, notcht about the edges, and standing close together at their lower ends, upon one long Foot-stalk : the Stalks are about a foot and half high, and of a reddish color ; The* Flowers *grow at the tops of the Stalks, like unto the other* Cinkfoils, *save that they are of a dark red color ; in a word the whole Plant is very like to the other kinds, especially the great Kind last before this described.*

VII. The fifth *or* Silver-weed Cinkfoil, *has a Root small, long, and blackish, like the first* Common Cinkfoil : *from which springs forth long Stalks of* Leaves, *divided into many parts next the ground, set on each side thereof, two at a space, one against another, and an odd one at the end, all of them dented about the edges, very like unto* Wild Tansey Leaves, *but not hoary, or silver like, as they are, but only green. The* Flowers *come forth at the Joints with the* Leaves, *towards the tops of the Stalks, which Stalks creep not, nor stand upright, but being weak lean down towards the ground, having very long Stalks of* Leaves *on them. The* Flowers *which grow on the tops of the Stalks, are lesser, and less divided than those which grow below : they are single, every one by its self, small, of a pale yellow color, and with a head in the middle, which after it is ripe, is like unto the other* Cinkfoil *heads of Seed,* viz. *like to a small, hard, dry* Strawberry.

VIII. The fixth, *or* Hoary Kind, *is all over hoary, whence it took the name of* Incanum : *It has a long slender* Root, *and Woody, from whence rise up several*

veral woody thick Stalks, ſomewhat red, wrinkled alſo, and of a brown color, which grow of unequal lengths from the Root, ſpreading themſelves into many Branches, ſhadowing the place where it grows. The Leaves are thick ſet, and ſnipt on the edges, almoſt like Tormentil, *and are thought by ſome to be of equal force with it againſt Poyſon, and for which reaſon, ſome have thought it to be the* Leucas Dioſcoridis. *The Flowers ſtand alſo upon long Footſtalks, and conſiſt of five yellow Leaves apiece, having a yellow thrummy head in the middle like to the other* Cinkfoils; *This is twofold,* viz. *the Greater and Leſſer, which differ in nothing but in their magnitude.*

IX. *The* ſeventh, *or* Upright Kind, *has a thick black fibrous Root, from which ſpring forth Leaves and Stalks: the Leaves ſtand upon long Footſtalks; the Stalks are ſtrong and upright, not much above half a yard high, ſpreading forth ſeveral ways into divers Branches. The Leaves are ſomewhat longer, larger, and greener than any of the former kinds, ſtand upon long Footſtalks, and are divided into five parts, as the others, and dented about the edges; ſometimes into ſeven, but that more rarely, having three Leaves only at the top. The Flowers grow at the tops of the Stalks, which are large, and of a pale yellow color, and in ſome Plants of a purpliſh color, which turn into Seed, much as the other kinds do: this is the Greater kind. But there is a Leſſer of this* Upright Kind, *which has ſmaller and rounder Leaves, of a ſad green color on the upper ſide, and grey or hoary underneath; the Stalks are tenderer, and lower, the Flowers on the tops ſmaller, and of a more Gold yellow color, in which conſiſts the chief difference.*

X. *The Places.* The *firſt* grows almoſt every where throughout *England*, by Highway ſides, Ditch ſides, and other Untilled places. The *ſecond* is found in ſhady and woody places, under Hedges, and other moiſt places, and by Highway ſides. The *third* is to be found growing almoſt every where upon good Ground, by Highways, and in low and moiſt Meadows. The *fourth* grows in Moiſt and Marſh Grounds, and in Watry places; it grows in a Marſh Ground adjoining to the Land called *Bourn Ponds*, half a Mile from *Colcheſter*, from which place, *Gerard* ſays, he brought ſome Plants for his *Garden*, in which they flouriſhed and proſpered well. The *fifth*, *Gerard* ſays, grew upon Brick and Stone Walls about *London*. The *ſixth*, *Gerard* ſays, is a rare Plant, and that he found it growing on the *Mountains of the Peak*, and dry Gravelly Valleys. The *ſeventh* grows in many places of *France* and *Germany*, where it bears white Flowers; and in *Italy*, where the Flowers are purpliſh; but with us it is only nouriſh'd up in *Gardens*.

XI. *The Times.* They are ſaid to Flower all the Summer Months, as *May*, *June* and *July*; even from the beginning of *May*; and the Seed ripens in the mean Seaſon.

XII. *The Qualities.* The *Cinkfoils* are Temperate in reſpect of heat or coldneſs, but dry in the third Degree. They are Abſterſive, Neurotick, Arthritick, Alterative, Analeptick, and Alexipharmick. Although it is ſuppoſed by Authors, that they have all one and the ſame Virtues, yet it is manifeſt, that ſome of them are ſtronger, and more efficacious than others. Thoſe which are eſtemed the moſt powerful, are the *firſt*, *ſecond*, *third*, and *ſeventh*, theſe are the chieteſt for uſe, and ſtrongeſt in effect, of all the reſt, and are held to be as effectual for all the purpoſes whereunto *Tormentil* is applied, ſo that inſtead thereof, and where that is wanting, *Cinkfoil* ſays *Parkinſon*) may be uſed to as good purpoſe.

XIII. *The Specification.* It is an eſpecial remedy againſt Agues and Fevers, and to ſtop all ſorts of Fluxes, whether of Blood or Humors, in any part of the Body whereſoever.

XIV. *The Preparations.* You may prepare therefrom, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *An Infuſion* or *Decoction.* 4. *A Pouder of the Root.* 5. *A Vinegar.* 6. *A Cataplaſm.* 7. *A diſtilled Water.* 8. *A Spirituous Tincture.* 9. *An Acid Tincture.* 10. *An Oily Tincture.* 11. *A Balſam*, or *Ointment.* 12. *A Collyrium.*

The Virtues.

XV. *The Juice.* It is good againſt all ſorts of Agues and Fevers, whether Continent, Continual or Contermitting: whether they be burning Fevers only, Malign, or Peſtilential. It cools and attemperates the Blood, and Humors, and is an excellent thing for a Lotion, Injection, Gargle, and the like, for ſore Mouths, Ulcers, Cankers, Fiſtula's, and other corrupt, foul, and running Sores. The Juice is given to four ounces at a time, for ſome Days together, two or three Hours before the coming of the Fit of an Ague, whether Quotidian, Tertian, or Quartan, it is ſaid to cure it, but it ought to be drank Morning and Evening in the intermediate Days alſo. And taken in the ſame quantity for the ſame time, *viz.* for thirty Days together, it cures the Falling Sickneſs, as alſo the Quinſey, and Yellow Jaundice, and all Fluxes in Man or Woman, as Whites, Reds, and Bloody Flux, Diarrhæa, *&c.* The Juice mixt with a little Honey, prevails againſt Hoarſneſs, as alſo the Cough of the Lungs.

XVI. *The Eſſence.* It has all the Virtues of the Juice, but more effectual to all the purpoſes aforeſaid; beſides which it is very effectual to cure Conſumptions of all ſorts, and to heal Ulcers of the Lungs: And if the hands be often waſhed therewith, and it is ſuffered every time to dry in of it ſelf, without wiping, it will in a ſhort time help the Palſie, or ſhaking of them.

XVII. *The Infuſion or Decoction in Red Port Wine.* They have the Virtues of the liquid Juice and Eſſence, but not all out ſo effectual: yet however they are very powerful againſt all ſorts of Fluxes of the Bowels: But where there is a ſharpneſs of Humors, the Decoction is beſt made in Milk. The Decoction outwardly applied, and inwardly drank as a Diet drink, very much contributes to the Cure of the Gout and Sciatica; as alſo to conſolidate Ruptures of the Bowels.

XVIII. *The Pouder of the Root.* Taken to a dram Morning and Night, it is good againſt Fluxes of the Belly, ſpitting and piſſing of Blood, Ruptures, and Agues of all ſorts; but it ought alſo to be given over and above on the day the Ague comes, three hours before the Fit, in a Glaſs of Red Port, or Red *Florence* Wine.

XIX. *The Vinegar.* The Roots boiled in Vinegar, and that held in the Mouth, is ſaid to eaſe the pains of the Teeth: it alſo is good againſt all ſorts of Nodes, Kernels, hard Swellings, and Excreſcences growing in the Fleſh, in any part, being applied thereunto. It allays all kinds of Inflammations, and alleviates Anthonies Fire and the Shingles; it prevails againſt Apoſtems, and painful Sores or Ulcers, attended with pain and putrefaction, as alſo all other kinds of running Sores, Ulcers, Foul Scabs, Itch, *&c.* It gives eaſe in pains of the Joints, and the Gout, whether in the Hips, Hands or Feet. It is alſo good againſt bruiſes, or hurts by blows, falls, or the like, and to ſtop the bleeding of Wounds in any part inward or outward.

XX. *The Cataplasm.* Made with Vinegar by boiling, and applied, it softens hard Tumors, is good against Contusions, stops the Flux of Humors to any part, and gives ease in the Gout.

XXI. *The Distilled Water.* It has some small matter of the Virtues of the Juice, Essence and Decoction; but is chiefly used as a Vehicle, to convey other Preparations in.

XXII. *The Spirituous Tincture.* It is a famous thing against all manner of Fluxes of Belly and Womb, but especially those of Blood; it stops spitting, vomiting and pissing of Blood, and wonderfully strengthens the Stomach, Bowels and Womb; and it timely and prudently given, prevails against a *Diabetes*, because by its Spirituous Nature, it so admirably strengthens all the Vessels and Passages. Dose two drams Morning and Night.

XXIII. *The Acid Tincture.* It has all the Virtues of the *Vinegar* at *Sect.* 19. aforgoing, besides which it is an excellent Stomatick, stops Vomiting, strengthens the Stomach, cuts Flegm, causes a good Appetite and Digestion, opens Obstructions, and cleanses the Bowels: mixed in equal quantities with *Tinctura Martis*, and given Daily, Morning, Noon and Night, in some convenient Vehicle to one dram, more or less, it perfectly cures the Greensickness in Virgins, and the Yellow Jaundice in Elder People.

XXIV. *The Oily Tincture.* It prevails against Defædations of the Skin, Scurf, Dandrift, Morphew, and that kind of Disease called Λεύκη, *Leuce*, or the Spotted Leprosie; inwardly taken to half a dram, or one dram in White Wine, it admirably strengthens the Back, and eases the pains thereof; opens Obstructions of the Urinary Parts, and expels small Stones, Gravel, Sand, and other Tartarous matter.

XXV. *The Balsam* or *Ointment.* It digests contused Wounds; cleanses old, putrid, running Sores and Ulcers, drys them, and suddenly heals them. There are but few better Vulneraries than this Balsam and Ointment; and being applied to the Gout, especially the Balsam, it eases the pain, and so effectually draws forth the Morbifick matter, that for the most part the Patient remains perfectly cured.

XXVI. *The Collyrium.* It is made of the Juice mixed with Honey; a quarter of a pound of Honey to a pint of the Juice. Put into the Eyes, it clears the sight, and stops fluxes of Rheum falling down into them: there is nothing better for curing Ulcers in that part, the Eye being washed therewith three or four times a day. It is also an excellent Lotion to heal a sore and ulcerated Mouth, as also Ulcers in the Throat and Gums, the parts affected being often Gargled and Washed therewith: and if the sore or Ulcer seems to be inveterate, or putrid, the *Collyrium* will be so much the more excellent, if to the former quantity two or three ounces of Common Spirit of Wine be added.

CHAP. CXXXI.

of CISTUS Dwarf.

I. THE *Names.* It is called in *Greek*, Ἡλιάνθεμον ἢ Χαμαίκιστος: In *Latin*, *Helianthemum* and *Chamæcistus*: In *English*, *Dwarf Cistus*, and *Small Sun-flower.*

II. *The Kinds.* *Parkinson* makes Nine Kinds of this Plant, but a great part of them are Foreigners to us, and therefore not to be taken notice of: Those which are Natives of our Countrey are chiefly three: 1. *Helianthemum Vulgare*, *Chamæcistus flore luteo*, *Flos Solis quorundam*, Our Common Dwarf Cistus, or small Sun Flower. 2. *Helianthemum flore albo*, White Dwarf Cistus. 3. *Chamæcistus serpilli foliis flore Carneo*, The Great Dwarf Cistus with Wild Time Leaves, and a bluish colored flower.

III. The Descriptions. *The first has a hard and woody Root, of a browniſh color, and growing in time to be ſomewhat great, and very long, and divided into ſmall Branches at the lower end: From this Root come forth ſeveral ſmall and weak, yet hard and almoſt woody Branches, lying for the moſt part round about the Head of the Root upon the Ground, on which grow by pairs, many ſmall and ſomewhat long Leaves, thick, fat, and full of ſubſtance, a little ſoft or hairy, or covered with a ſoft Down, with other ſmall Leaves alſo growing between them: at the tops whereof ſtand three or four ſmall pale yellow, and ſometimes gold yellow colored Flowers, conſiſting of five round pointed Leaves apiece, with ſome yellow threads in the middle, of a pretty ſavor or ſmell in ſome places, but leſs or none in others: which being paſt away, there follow ſmall round Heads, in which are contained ſmall yellow Seed. This Plant dies not, but continues many years, increaſing in its Branches, which yield a Viſcous or Mucilaginous Juice, like unto* Comfrey, *and is of an Auſtere, Aſtringent taſte.*

IV. *The* ſecond *has a Root like the former, and differs not much from it, but that it grows up ſomewhat higher, the Leaves are a little longer, and not ſo thick ſet together, alſo more Woolly and Downey, thereby obtaining a whiter color. The Flower has the ſame number of Leaves, is alſo ſomewhat longer, and white withal; being in ſome places a little ſweet, in others little or nothing at all; and its Taſte is Aſtringent like the former.*

V. *The third has a Root very Fibrous, ſpreading much under Gound: from whence riſe up many red-*

diſh

diſh Branches like unto Wild Time, *with ſuch like ſmall* Leaves *ſet upon them very thick, or as it were in a double row, of a dark green color, and a little hairy or downey withal, but a little longer and whiter next unto the* Flowers, *which ſtand three or four together, every one on a pretty long hairy* Footſtalk, *conſiſting of five ſmall yellow* Leaves, *like unto the other, and ſomewhat ſweet.*

VI. *The Places.* They all grow in divers places of *England*, but the firſt and ſecond more eſpecially in *Kent*, in almoſt all places throughout it, which in ſome places are greater than in others; but that with the *white Flower* is more rare to be met with than the other. The third is that which *Parkinſon* thinks is moſt uſual with us in *England*. *Gerard* ſays, that thoſe of our *Engliſh* growth, he has found in many places, eſpecially upon the Chalky Banks about *Graveſend* and *Southfleet* in *Kent*, and for the moſt part all the way from thence to *Canterbury* and *Dover*, they delighting to grow in rough, dry, and Sunny places in open Fields, and upon Mountains.

VII. *The Times.* They Flower in Summer, *viz.* in *June*, *July* and *Auguſt*; ſome earlier, and ſome later: but their Flowers are ſo ſoon fading, that they ſeldom endure above a day or two; and their Seed is perfected in ſome ſmall time after.

VIII. *The Qualities.* They are temperate in reſpect of heat or coldneſs, and dry in the ſecond Degree: Abſterſive, Aſtringent, Vulnerary, Neurotick, Alterative, and Alexipharmick.

IX. *The Specification.* They are peculiar for ſtanching Blood, and ſtopping all Fluxes of Blood in any part of the Body whatſoever, whether Inward or Outward.

X. *The Preparations.* You may prepare therefrom, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *A Decoction.* 4. *A Pouder.* 5. *A Diſtilled Water.* 6. *A Spirituous Tincture.* 7. *An Acid Tincture.* 8. *A Syrup.* 9. *A Balſam or Ointment.* 10. *A Cataplaſm.*

The Virtues.

XI. *The liquid Juice.* It dries and aſtringes, ſtops bleeding, ſpitting Blood, piſſing Blood, overflowing of the Terms, and all other fluxes of Blood, and heals Wounds, by ſtrengthening the Parts, and conjoining their Lips together: it prevails alſo againſt all manner of fluxes of the Belly, and conſolidates Ruptures. Doſe from one ounce to three in a Glaſs of Red Port Wine.

XII. *The Eſſence.* It has all the Virtues of the Liquid Juice, beſides which it is powerful to Waſh and Gargle ſore Mouths and Throats, and to heal them; as alſo to cure Ulcers in the Privy Parts of Man or Woman, and old running Sores in other parts of the Body, as in the Legs and Feet, which have been of a long ſtanding, and which by reaſon they are depending parts, by a defluxion of moiſt and ſharp Humors, are kept long from healing; It is alſo good againſt Coughs, Colds, and violent Catarrhs, or defluxions of Rheum, which induces, by continuance, a Conſumption. It cleanſes, drys, and heals old Ulcers, and Conglutinates the Lips of Green Wounds, becauſe it is very powerful in conſolidating, binding and ſtrengthening any part; and is as effectual as *Comfrey* for Ruptures, ſtrengthening weak Joints, or any other Glutinating property, to which *Comfrey* is proper.

XIII. *The Decoction in Red Wine.* It has all the Virtues of the Liquid Juice and Eſſence, but not altogether ſo effectual; but drank from four to eight ounces, it ſtops Catarrhs, Coughs, and inward Bleedings, and heals a Rupture of any of the Veſſels.

XIV. *The Pouder of the Leaves.* It is wonderfully aſtringent, drys up moiſture in running Ulcers, cleanſes and heals: it is a peculiar thing againſt ſpitting and piſſing of Blood, and the Diſeaſe called *Diabetes*. Doſe one dram, in ſome proper Vehicle.

XV. *The Diſtilled Water.* It is ſaid to be a good Coſmetick, to beautify or make fair the skin of the Face, Neck, Breaſts, and Hands, or of any other Parts of the Body.

XVI. *The Spirituous Tincture.* It has the Virtues of the Juice, Eſſence, and Decoction, beſides which it is good againſt the ſtinging or biting of any Venomous Creature, ſtopping the farther ſpreading of the Poyſon, and in a ſhort time curing the ſick. Doſe one or two drams in a Glaſs of Canary, Morning, Noon, and Night.

XVII. *The Acid Tincture.* It prevails againſt the Malignity and Venom of Serpents, or the bitings of any other evil Beaſt: it is good againſt malign Fevers, and the Infection of the Plague, and of any other malign or infectious Diſeaſe: it may be inwardly taken, and outwardly applied, in any of the caſes aforeſaid, where outward applications are requiſite. It is good againſt a *Leuce*, or Spotted Leproſie, Scurf, Morphew, and ſuch like, if it is mixed with the Diſtilled Water, and then the parts affected to be Waſhed therewith.

XVIII. *The Syrup.* It is an incomparable thing againſt Coughs, Colds, Catarrhs, or ſharp and Salt diſtillations of Rheum, and ſpitting of Blood, alſo all ſorts of Fluxes of the Bowels. Doſe two ſpoonfuls in ſome proper Vehicle, Morning, Noon, and Night.

XIX. *The Balſam or Ointment.* They are moſt incomparable Vulneraries, ſo that few Medicaments exceed them. They not only ſpeedily cure Green Wounds by conglutination, but alſo digeſt Lacerated Wounds, and cleanſe, incarnate, dry, and heal, old, foul, hollow, running Ulcers.

XX. *The Cataplaſm.* Being applied, it is good againſt the biting or ſtinging of any Venomous Creature, ſtaying the farther ſpreading of the malignity. Applied alſo in the Gout, from what cauſe ſoever, it eaſes the pain, prevents the defluxion, and quickly cures it.

CHAP. CXXXII.

Of CISTUS Male.

I. *THE Names.* It is called in *Greek*, Κίσθος ἄῤῥεν: In *Latin*, *Ciſtus mas*: And in *Engliſh*, *Male Ciſtus*, *Sage Roſe*, and *Holly Roſe*, as *Gerard* calls it.

II. *The Kinds.* It is either *Male*, of which in this Chapter: Or, *Female*, of which in the next. *Parkinſon* makes four ſeveral kinds thereof, of which the firſt of them, *viz. Ciſtus mas*, or *Male Ciſtus*, is the chief which grows with us.

III. The Deſcription. *It has a woody Root, and will abide ſome years with us, if care be taken to keep it from the extremity of our cold Winters, which it will ſcarcely endure. From this Root grows up a ſhrubby Plant, about a yard or more high, having many ſlender, brittle, woody Branches, covered with a whitiſh Bark; on which grow many whitiſh green Leaves, long, and ſomething narrow, crumpled, or wrinkled, as it were, with Veins, and ſomewhat hard in handling, eſpecially the older Leaves, for the young ones are ſofter, ſomething like unto*

our Sage Leaves, *for the form and color, but much ſmaller, two always ſet together at a Joint. The Flowers ſtand at the tops of the Branches, three or four together, upon ſeveral ſlender Footſtalks, conſiſting of five ſmall round Leaves apiece, ſomewhat like unto a ſmall ſingle* Roſe, *or the Roſe of the* Wild Bryar, *of a fine reddiſh purple color, with many yellow threads in the middle, without any Smell at all, and quickly fading or falling away, abiding ſeldom one whole day blown at moſt: when the Flowers are paſt, there come up round hard hairy Heads in their places, containing within them, ſmall browniſh Seed.*

Cistus male ad the Hypocistis

IV. *The Places.* It naturally grows in *Italy*, *Spain*, *Portugal*, and *France*, and other hot and Southern Countries: but with us it is only nouriſhed up in *Gardens.*

V. *The Times.* In its Native places, it Flowers generally in *May:* but with us about the latter end of *June*, alſo in *July* and *Auguſt*; and the Seed is ripe quickly after.

VI. As to its *Qualities*, *Specification*, *Preparations* and *Virtues*, they are the ſame in all reſpect with thoſe of the *Dwarf Ciſtus*, to which I refer you.

CHAP. CXXXIII.

Of CISTUS Female.

I. *THE Names.* It is called in *Greek*, Κίστος ἡ θήλεια ἄνθος: In *Latin*, *Ciſtus fœmina:* and in *Engliſh*, *Female Ciſtus*, or *Sage Roſe.*

II. *The Kinds.* *Parkinſon* makes eight ſeveral kinds of the *Female Ciſtus*: but two of them are chiefly nouriſhed up in our Gardens, *viz. Ciſtus fœmina*, The *Female Ciſtus*, ſpecially ſo called. 2. *Ciſtus Annuus*, The *Annual* or *Yearly Ciſtus.*

III. The Deſcriptions. *The firſt* Female Ciſtus, *has a woody Root like to the former, from whence grows a kind of ſhrub, lower and ſmaller than it, having blackiſh Branches, leſs woody, and not ſo brittle as the Male. The Leaves are ſomewhat rounder and greener, but a little hard and rough withal, growing in the ſame manner upon the Branches, as the other, by Couples. The Flowers grow at the tops of the Branches like to the Male kind, conſiſting of five Leaves, but ſomewhat leſſer, and wholly white, with yellow threads in the middle, as ſoon fading, and of as little Scent as the other, but the Heads and Seed are ſomewhat larger.*

IV. *The ſecond, or* Annual Ciſtus, *has a ſmall woody Root, which periſhes as ſoon as its Seed time is paſt; for the Plant endures but a Year, and therefore requires you to Sow it every Year, if you will have it: From this Root riſe up ſtrait, but ſlender hard Stalks, ſet here and there confuſedly with long and narrow greeniſh Leaves, very like unto the Leaves of the* Gum-Ciſtus, *being a little clammy withal. At the tops of the Stalks, and at the Joints with the Leaves, ſtand two or three pale yellow Flowers, conſiſting of five Leaves apiece, with a reddiſh ſpot, near the bottom of every leaf of the Flowers, which as ſoon fades as any of the former. The Flowers being paſt, ſmall three-ſquare Heads follow after, which contain within them ſmall Seed like to the Female kind, but ſomewhat paler or yellower.*

V. *The Places.* The firſt grows naturally in *hot Countries*, as *Spain*, *Portugal*, *Italy*, *Languedock*; The ſecond in *Colder Countreys*, as *Germany*, *Bohemia*, *Frieſland*; and with us they are both brought up in *Gardens.*

VI. *The Times.* They Flower in the Summer Months, as *June*, *July* and *Auguſt*, and their Seed ripens in the mean Seaſon.

VII. *The Qualities, Specification, Preparations, and Virtues,* are the ſame with the *Dwarf Ciſtus*, ſo that no more need be ſaid of them here.

CHAP. CXXXIV.

Of CIVES, *or* CHIVES.

I. *THE Names.* They are called in *Greek*, Σχοινοπράσσον: In *Latin*, *Schœnopraſum*, as though you ſhould ſay, *Funceum Porrum*, *Ruſh Leek:* In *Engliſh*, *Cives* or *Chives*, which are a kind of *Small Graſs Leeks.*

II. *The Kinds.* They are either *Schœnopraſum ſativum*, Garden Chives: or *Schœnopraſum agreſtis*, Field or Wild Chives.

III. The Deſcriptions. Chives *have many little headed Roots or Bulbs faſtned together, out of which grow down into the Earth, a great number of white little threads, or ſtrings, which have both the Smell and Taſte of* Onions *and* Leeks, *jointly, ſo as if they were participating of both. From theſe Roots ſpring up about a handful high, long, ſlender, round, green Spires, almoſt like to Ruſhes, amongſt which grow up ſmall and tender Stalks, which ſend forth certain knops, or heads, like thoſe of the* Onion, *but much leſs, in which are contained the Seed.*

IV. *The ſecond, or* Wild Kind, *has a ſmall, and ſomewhat Bulbous Root, but nothing near ſo many joined together, from which ſpring downwards a great*

great many white threads or ſtrings. And from the ſame upwards ſpring forth a great number of ſmall blades, almoſt as high again as the former, harder, and of a darker green, and ſometimes not abſolutely round: otherwiſe (excepting their thick growing together) they are much alike, and differ but a very little in their Taſte and Smell.

V. *The Places.* The firſt are nouriſhed up, and grow only in *Gardens*: the other grows Wild in the *Fields*, and by way ſides in uncultivated places in ſeveral Parts of this Kingdom. I have found them by the ſides of the Highway, and in the Field going from *Canbury-Houſe* near *Iſlington*, towards the *Boarded River*, and that in ſeveral places as I walked along.

VI. *The Times.* They flouriſh long, and continue many Years, and well endure the cold of Winter.

VII. *The Qualities.* They are hot and dry in the third Degree; Aperitive, Abſterſive, Digeſtive, Diſcuſſive, Diuretick, and Suppurative; Stomatick, Pectoral, and Nephritick; Alterative, Emmenagogick, Lithontriptick, Alexipharmick, and Spermatogenetick.

VIII. *The Specification.* They are peculiar againſt Diſeaſes of the Reins and Bladder.

IX. *The Preparations.* You may prepare from them, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *A Decoction.* 4. *A Diſtilled Water.* 5. *A Cataplaſm.* 6. *The Seed.*

The Virtues.

X. *The liquid Juice.* It provokes Appetite, cauſes thirſt, heats, warms, and ſtrengthens the Stomach, opens Obſtructions, yet is ſomething flatulent; it looſens the Belly, provokes Urine, and the Courſes, and is good againſt the bitings of Mad Dogs, Serpents, and other Venomous Creatures. Doſe, one ounce or more in White Wine; it eaſes the Strangury, and is good againſt all Obſtructions of the Reins, Ureters, and Bladder, expelling Stones, Sand and Gravel.

XI. *The Eſſence.* It has all the Virtues of the Juice, but is indeed more powerful; the conſtant uſe of this Preparation, or the Juice, admirably encreaſes Seed, and excites Venery. And this, or the former Juice, being ſnuffed up the Noſtrils, it purges the Head and Brain, of cold, moiſt, and flegmatick Humors, and prevails againſt the Lethargy, and other Diſeaſes of the Head and Brain, proceeding from cold and moiſture. Doſe from one to two ounces in any proper Vehicle.

XII. *The Decoction in White Port Wine.* It has the Virtues of the Juice and Eſſence, but not full out ſo powerful, and may be given againſt the Stone and Strangury, from four ounces to eight, once or twice a Day, as alſo in the Paroxyſm.

XIII. *The Diſtilled Water.* Being drank to ſix ounces, or more, either alone, or mixt with White Port Wine, it provokes Urine, and is ſaid by ſome to break the Stone, and drive it forth.

XIV. *The Cataplaſm.* Made by beating the whole Plant with Mithridate, and Pulp of Figs, and applied, is good to ripen and break a Plague Sore, or any other Apoſtem. It is profitably applied to Scaldings or Burnings by Water or Fire, or Gunpowder: As alſo to the Piles when extreamly inflamed and ſwelled.

XV. *The Seed.* Made into Pouder, and given a dram at a time, it encreaſes Seed, and ſtirs up Luſt both in Man and Woman: and given to Children which have Worms, it kills and expels them: It is alſo good againſt the bitings of Venomous Beaſts.

CHAP. CXXXV.

Of CLAVER-GRASS.

I. *THE Names.* It is called of *Dioſcordes*, as it is thought, in *Greek*, Μήδικη: from its being brought from the *Medes* into *Greece*; and ſo the *Medicum malum*, or *Pomecitron*, was ſo called, being brought firſt from *Media*: In *Latin*, *Medica*; and in *Engliſh*, *Claver-graſs*. The *Arabians* call it, *Cot*, *Alaſaleti*, and *Alfoſoſa*: and this is that very Plant which the *French* call *Saint Foin*, which our Moderns have found ſo mightily to improve Land.

II. *The Kinds.* This *Claver-graſs* it ſelf is a Species of the *Trefoils*, but being better known under this name, we thought good to treat of it here. *Claver-graſs* is manifold, 1. *Medica legitima, Fænum Burgundiacum, Trifolium Cochleatum*, Claver, Claver-graſs, Medick Fodder, Snail Claver, Snail Trefoil, and *Saint Foin*. 2. *Medica Racemoſa, Trifolium Cochleatum Polycarpon*, Cluſtering Snail Claver. 3. *Medica Fruteſcens, Medica flore luteo, Trifolium Sylveſtre luteum Siliqua Cornuta, Lens major repens Tabernmontani*, Woody Snail Claver: 4. *Medica Marina, Trifolium Cochleatum Marinum*, Sea Claver. 5. *Medica Cordata, Trifolium Cordatum*, Heart Claver, or Trefoil. 6. *Medica Lunata, Trifolium Lunatum*, Moon Claver. *Parkinſon* has four other kinds, but theſe are the chief which grow in *England*.

III. The Deſcriptions. *The firſt of theſe has a Root which runs deep down into the Earth, ſometimes two feet or more; it is thick, and ſends forth many tough thready ſtrings, and continues long, ſometimes ten, twenty or thirty Years. From this Root riſe up ſeveral weak, green Stalks, with divers ſmall ſad green Trefoil Leaves, ſet thereon without order. The Flowers grow upon long Stalks, coming from the*

Joints

Joints and Tops of the Branches, cluſtering in a thick ſhort Tuft, of a blewiſh purple in thoſe which grow in our parts, but in others of divers and ſeveral colors, as more purple, near a violet, or paler blew, or of a browniſh blew, and yellow colors, parted: In ſome parts of Spain, *and at* Narbon *in* France, *they are of a yellow color alſo. The Flowers being paſt, ſmall, Snail-like, round Cods follow, ſet together, not ſo much twined as many other* Medica's *are, containing within them ſmall pale colored Seed.*

Claver-Graſs, or *Snail Trefoil of* Lobel.

IV. *Obſervations*, 1. The Author of the *Country Farm* gives a mighty commendation of this Plant; and ſays, That there is not any Pulſe, or other Food which is more agreeable, and good for the Feeding of Beaſts, than this *Claver-graſs* or *Snail-Claver*, called by the *French*, *Saint Foin*, not only for the nouriſhing and fattening of Cattle, but alſo to cure Beaſts which are ſick. It is called *Burgundy-Hay*, becauſe the *Burgundians* have always been very careful in Sowing this Herb, and managing Sandy and Barren Land therewith, for that it makes the Worſt and Pooreſt Land very Rich and Fruitful. The benefit of this Herb is ſo great, that every good Husbandman ought to reſerve a good part of his Ground to be ſown therewith.

V. *Obſervat.* 2. In Sowing of this *Saint Foin* Seed, though it grows well in fat Grounds freed from Weeds, yet it grows alſo very well in Poor, Lean, Sandy and Barren Grounds, eſpecially ſuch as are eaſie to be Plowed, and ſuch as have been thrice Sown with Grain, before this is put into it, that it may the eaſier take deep rooting in the Earth, which it naturally does: but in ſowing of this Seed, you muſt not be ſparing of it, for by how much the more Seed you Sow, by ſo much the more will the Herb grow in thickneſs; nor will there grow any other Graſs or Herbs there, by which the profit will be ſo much the greater.

VI. *Obſerv.* 3. As ſoon as it is Sown, it muſt be Harrowed ſeveral ways, as long ways, broad ways, and corner ways; and if it is a dry Seaſon, and a dry Ground, it ought to be gently watered, but not in thoſe Months between the latter end of *September* and beginning of *April*, leſt any hard Froſt ſhould come, which might nip it, and ſo kill it. Authors alſo ſay, it ought to be Mowed, or Cut down, five or ſix times the firſt Year, others ſay three or four times, but your Experience muſt guide you in this; and in after Years two or three times a Year, by which great advantages are made of it; and that Land which has not been worth twelve Pence an Acre *per Annum*, by the Improvements of *Saint Foin*, have in a few Years been made worth forty Shillings, and three Pounds an Acre, and ſometimes more, which is much for the Encouragement of the Husbandman, to proceed in this kind of Husbandry.

VII. *Obſerv.* 4. The fit times for Cutting it down, are in *May*, *June*, *July*, and *Auguſt*, in the New of the Moon, but you muſt not let it lye upon heaps any longer than a Day in the Meadows, for if it ſhould lye any long time, it would endanger the killing the Roots which are under it, and utterly deſtroy it, for which reaſon it is neceſſary to dry it forthwith, and as ſoon as may be, ſtirring and turning it every day from day to day, and then as ſoon as ever it is dry to carry it away.

VIII. *Obſer.* 5. This is alſo to be taken ſpecial notice of, That none of your Cattel ought to feed on the Grounds on which it is ſown, becauſe it is apt to be killed by them, by bruiſing it with their Teeth in biting it off, whereas cutting it with a Sythe hurts it not: nor muſt Cattel be ſuffered to eat it green, becauſe it is apt to make them Sick, by reaſon of its heat and moiſture: for which reaſon it is always cut down, dried, and made into Hay; and then it is to be given to your Beaſts, but in ſmall quantity, becauſe it breeds much Blood, Fleſh and Fat, even to ſuch a Degree, as with Fatneſs to choak them.

IX. *Obſerv.* 6. You muſt always be careful to gather and reſerve Seed of this Graſs, to Sow again, when you ſee you ſhall have occaſion for it: it muſt not be gathered the firſt Year it bears, by reaſon of its weakneſs and poorneſs, but in all the following Years, ſo ſoon as the Husks in which the Seed is contained ſhall appear dry, and the Seed or Grains themſelves are turned yellow, which will be in the Months of *June* and *July*, you may then ſave it.

X. *Obſerv.* 7. That this Graſs being ſowed in barren Land is very profitable there is no doubt; and if it is conſidered that the firſt charge is the principal charge, even for a long time, it is ſo much the more valuable: for Land being once Sowed with this, it not only enriches the ground for the preſent, but for many years after: for this firſt ſowing will be ſufficient for ten or twelve Years, let the ground be what it will; and as the Soil may be, it may laſt twenty or thirty Years, or more, according as it is carefully lookt after, and well managed, which is a matter of ſo great weight, as ought to put every prudent Husbandman into the thoughts and conſideration of it.

XI. *The* Second Kind *has a Root long and running pretty deep into the ground, which endures long, from whence it has Branches lying upon the Earth, a foot in length or more, ſet with ſmall round* Trefoil *Leaves on pretty large Footſtalks: the Flowers of a purple color it ſends forth at the Joints, on long Footſtalks, ſmall and many cluſtering together, after which come forth ſomewhat rough, ſmall, wrinkled Snail-like Shells or Husks, in which are contained the Seed.*

XII. *The* third, *or* Woody Snail Claver *has a long Root, conſiſting of many long ſtrings, and continues many Years, ſhooting forth new Stalks every Year, which are many, hard, round, flexible, and ſo weak as not to be able to ſtand upright, but lying on the*

the Ground, about a foot or more in length, and divided into many Branches, on which grow small, long, and narrow Leaves, by three's on a long Footstalk, with a thick middle Rib, on the back of each: the Flowers are small, and many together, of a yellow color, and somewhat sweet; which being passed away, several small, flat, twined Cods follow, like to those of the first kind, but smaller, which contain within them smaller Seed likewise, flattish, and almost of a Kidney fashion.

XIII. *The* fourth, *or* Sea Claver, *has a Root somewhat thick, and enduring many Years, from whence rise up several hoary trailing Branches, spreading themselves on the ground a foot or two long, with many small and very hoary round* Trefoil *Leaves, on short Footstalks. The Flowers are many, small, and yellow, growing at the end of the Branches; which being past away, many small withered Shells or Husks do follow, much like to the other small* Snail Clavers. *There is also another kind of* Sea Claver, *whose Root perisheth Yearly, but it grows bigger and greener than the other, and the Flowers are small and yellow, coming from the Joints of the Branches, but one at a place, which are followed by small hard and round prickly Heads, and whose windings are difficult to be discerned.*

XIV. *The* fifth, *or* Heart Claver, *has a thick and thready Root, which perishes every Year; from whence spring forth several very slender, small, and weak Branches, full of Joints, and round greenish Trefoil Leaves, standing upon long Footstalks, broad at the ends, and dented in, in their middle, making the fashion of a Heart, with dull, red, or purplish, and sometimes almost blackish spots on them. The Flowers grow two or three together upon Footstalks coming from the Joints; they are small and yellow, which being past away, leave behind them small prickly twining Heads, like unto the other small* Claver-grasses.

XV. *The* sixth, *or* Moon Claver, *has its Roots, Stalks, Leaves, and manner of growing, much like to the other* Snail Trefoils, *or* Clavers, *before described, especially like to the first: the Leaves are hairy, and dented about the edges: the Flowers are small and yellow, which being passed away, crooked, flat Cods, of an indifferent breadth, after the shape or fashion of a Moon three quarters old, follow: in which are contained Seed, in shape or form of small little Kidneys.*

XVI. *The Places.* The first grows naturally in *Italy*, *Spain*, *Portugal*, and *France*, from whence it was brought into *Flanders* and *England*, in both which places it flourishes admirably, and serves them and us for *Hay* for our Cattel, and Horses: in *Spain* they have no other *Hay* with which they feed their Horses, which makes them exceeding Fat: the same they do in the *Low Countries*, whereby their *Cows* yield the greater abundance of Milk. It is sown in the Fields of *Italy*, *Spain*, *France*, the *Low Countries* and *England*, for Food for their Beasts. The second grows oftentimes in *Fields*, *Meadows*, and *Pastures*. The third grows in *Meadows*, by *Hedge and Wood sides*, and places somewhat shaded. The fourth grows near to the Sea in several places, as in our *Marshes* and *Fields* at *Woolwich*, *Deptford*, &c. and by the Sea side about *West Chester*, as also on the *Mediterranean* Sea shore, and about *Venice*. The fifth is often found in *our Fields* and *Meadows*; and though *Camerarius* calls it *Medica Arabica* (I suppose because it grows in that Country:) yet, with *Johnson*, we say, it grows Wild with us in our Meadows in *England*, having seen it, I believe, an hundred times. The sixth grows also plentifully in our *Fields* and *Pasture grounds*.

XVII. *The Times.* The first of these, (the ground being first made fit for its entertainment, by well Ploughing it up, and killing the Weeds thereof) is to be sown in the end of *April*, or something earlier, in the New of the Moon, and towards the latter end of the Day, that it may receive the refreshing Dews of the Night, by which means it will the sooner, and more easily spring out of the Earth, and you may Mow it in *June*, and *July*, and *August*, for Hay, and after the first Year somewhat earlier. The first, and all the rest flower in *June* and *July*, and their Seeds are ripe in the end of *August*, or soon after. But the Seed of the first is not to be gathered in the first Year, by reason of its weakness, as is before observed, but in all the following it may be gathered in *July*, or as soon as it appears ripe.

XVIII. As to the *Qualities*, *Specification*, *Preparations*, *and Virtues*, of the first, or the other five, *Authors* have observed nothing concerning them, but that they (especially the first) are a good nourishing food for Horses, Cows, and other Cattel, and that the first is so powerful to fatten them, that they usually stint them to a quantity, for fear of suffocating them, by reason of their growing too fat.

XIX. *Observation* 1. From this it appears, that it is of a nourishing Virtue, and by reason it encreases Flesh and Fat, I am of the Opinion, that the *Liquid Juice* or *Essence*, or *Syrup* thereof, may be very powerful in restoring such as are in *Consumptions*: it is indeed good against Coughs, Colds, Wheesings, vehement Catarrhs, Obstructions of the Lungs, and other Distempers of those parts.

XX. *Observ.* 2. The *signature* of the Plant, chiefly of the *Cods* and *Seed*, the latter being somewhat like a *Kidney*, made me believe it might be good against the *Stone*, *Gravel*, *and Sand*, *or Tartarous Matter in the Reins*, *Ureters*, *and Bladder*, which occasions *Stranguries*, &c. I made tryal of the *Juice*, *Essence*, *Decoction in White Wine*, *and the Syrup*, and in the first Patient I gave it to, I found it excellently to answer my Expectation: I have since made tryal of it upon several other Patients with very

very good ſucceſs; yet I cannot ſay, but in ſome caſes it has not anſwered the end. *The Decoction of the Seed in White Port Wine*, has the ſame Virtue, but I believe not full out ſo powerful as the *Juice* and *Eſſence* of the Plant; but *the pouder of the Seed* given to one dram is more effectual: So alſo *the Fixed Salt of the whole Plant* made by Incineration.

XXI. *Obſerv.* 3. *Dioſcorides* ſays the *Green Herb* has a cooling property, and for that purpoſe it is chiefly uſed. *Avicen* commends *the Oil* made of it againſt the Trembling of the Heart. *Geſner* ſays that a Liquor may be drawn out of it by fire (*Parkinſon* ſuppoſes he means *an Oil* to be drawn out of the Seed, as out of Sweet Almonds) good againſt the Stone. From this I obſerve, and am apt to believe, that if *an Oily Tincture*, or a *Saline Tincture*, be made of the whole Plant, they may be very effectual for that purpoſe, being duly taken in a proper Vehicle.

CHAP. CXXXVI.

Of CLEVERS, *or* GOOSE-GRASS.

I. *THE Names.* It is called in *Greek*, Ἀπάρινη, as the moſt uſual Name, but it has alſo ſeveral others, φιλίσιον, φιλατίειον, as *Galen* out of *Hippocrates* ſaith; and ὀμφαλόκαρπος, as *Dioſcorides* ſaith (becauſe the Seed is Navel faſhion:) it is alſo called, φιλάνθρωπος, *quaſi hominis amans*, and φιλάλιλος, for the ſame reaſon. In *Latin*, *Aparine*, *Lappa minor Plinij*, *Aſperugo*: In *Engliſh*, *Clevers*, and *Goose-graſs*

II. *The Kinds.* They are chiefly twofold, *viz.*
1. *Aparine Vulgaris*, The common or rough Clevers.
2. *Aparine Lævis*, Smooth Clevers, not mentioned by any Author but *Thalius*, and from him by *Parkinſon*.

III. The Deſcriptions. *The* Common Rough Clever *has a ſmall and very fibrous* Root, *ſpreading much in the Earth, but dying every Year; from whence riſe up divers very rough ſquare Stalks not bigger than the lower part of a naked Wheat Straw, creeping up ſo as to be ſometimes two or three yards high, if it has any tall Buſhes or Trees near it, or any Hedge on which it may Climb, but yet without any Claſpers; otherwiſe they are much lower, or lye upon the ground, being full of Joints; from every one of which ſhoots forth a Branch beſides the Leaves, which are commonly ſix in number, ſet round the Stalk almoſt like a Star, or the Rowel of a Spur. From between the Leaves at the Joints, towards the tops of the Branches come forth very ſmall white Flowers, every one upon a ſmall thready Footſtalk, which after they are fallen, two ſmall round rough brown colored Seeds (but at firſt green) joined together like a pair of Teſticles, do appear. When they are ripe, they grow hard, and of a whitiſh brown color, having a little hole or hollowneſs on the ſide (ſomewhat like unto a Navel) on which the Stalk grows to them. The Stalks, Leaves and Seeds are ſo very rough, that they will cleave almoſt to any thing which ſhall touch them, and ſeem to be a little clammy withal.*

IV. *The* Smooth Kind *has a Root like the foregoing, and grows much like unto it, but it neither grows ſo high, nor are the Leaves ſo great, and not at all rough or ſticking to what it touches, as the former is.* The Leaves *are the ſame in number, and ſtand in the ſame order, and at the Joints alſo: the Flowers are ſmall and white, conſiſting of four very little* Leaves, *like the other, and give ſuch like Seed growing together in* Pairs, *but ſmooth alſo, and not rough as the firſt is. There is another ſort of this* Smooth Kind, *but it little differs from it, excepting in the Seed, which is ſaid to be rough, much like unto a* Coriander *Comfit.*

V. *The Places.* The firſt Kind grows by *Hedge ſides* and *Ditch banks* in moſt places of *England*, and almoſt every where in *Gardens*, it being there nothing but a Weed, and is rooted out with much labor and diligence, for that it will run upon every thing it grows next, and be apt to choak and kill it, if not Weeded up. The ſecond is a Native of *Spain*, but grows in *England* in the *Gardens* of the Curious, where it is apt to be as troubleſome as the other is, if it is ſufferied to Sow its Seed.

VI. *The Times.* They Flower in the end of *May*, and in *June* and *July*; and the Seed is ripe, and falls by the end of *July*, or in *Auguſt*, from which it ſprings afreſh the next Year, and not from the old Roots.

VII. *The Qualities.* It is hot and dry in the beginning of the firſt Degree, according to *Galen*'s Judgment; and are Aperitive, Abſterſive, and Aſtringent, Traumatick, or Vulnerary, Alterative and Alexipharmick.

VIII. *The Specification.* It is peculiar for ſtopping Fluxes, and healing Green Wounds.

IX. *The Preparations.* You may have therefrom, 1. *The Green Herb.* 2. *A liquid Juice.* 3. *An Eſſence.* 4. *A Decoction.* 5. *A Pouder.* 6. *An Ointment.* 7. *A Balſam.* 8. *A Cataplaſm.* 9. *A Diſtilled Water.* 10. *The Oily Tincture.*

The Virtues.

X. *The Green Herb.* *Parkinſon* ſays, that it ſerves the Country People well, inſtead of a ſtrainer, to cleanſe and clear their Milk from Straws, Hairs, or other groſs things which fall into it.

XI. *The Liquid Juice.* Made of the Herb and Seed together, being taken in Wine, is good againſt the

the bitings of Vipers, or the great Spider *Phalangium*, by preserving the Heart from their Poyson, as *Dioscorides* and *Pliny* from him say. *Galen* says, that it cleanses moderately, and drys, and is of subtil parts. It is generally taken in Broth to make such Lank and Lean, as are apt to grow Fat. It is also good to heal Wounds, and stanch Blood, being applied: and *Matthiolus* says, it is commended to conglutinate, or close the Lips of Green Wounds: dropt into the Ears, it eases their pain, though vehement.

XII. *The Essence.* It has all the Virtues of the Juice, but more powerful; besides which, it is very effectual to strengthen the Bowels, and stop all sort of fluxes of the Belly whatsoever: and being taken thrice a day, it helps the yellow Jaundice.

XIII. *The Decoction in Wine.* It is Stomatick, causes Leanness, stops Bleeding, and being drank twice or thrice a day promotes the healing of Wounds, old running Sores and Ulcers.

XIV. *The Pouder.* It is an excellent Vulnerary, and conglutinates the Lips of Green Wounds, being strewed thereon: it also cleanses old running Sores and Ulcers, dries up their moisture, and induces their healing. Taken inwardly to a dram in Red Port Wine, Morning and Evening, it stops spitting, vomiting, and pissing of Blood, and cures the Bloody Flux, as also other Fluxes of the Bowels; and being applied, the bleeding of Wounds.

XV. *The Ointment.* Being made with *Auxungia*, *i. e.* Hogs-Lard, or other proper fat body, and anointed upon the part affected, it helps all sorts of hard Swellings, or Kernels (proceeding from the King's-Evil) in the Neck, Throat, or other Parts.

XVI. *The Balsam.* It is a singular Vulnerary, and cures Green Wounds (not Contused, Lacerated, or otherwise composed) at one, two, or three Dressings. It digests Apostems, as also complicated Wounds, then cleanses them, incarnates, dries, and suddenly heals them. It is indeed a very singular Vulnerary, or Wound Balsam.

XVII. *The Cataplasm.* Being applied to any wound or place which bleeds, it presently stops the Blood; and in a simple Green Wound cures it at the first intention. It is best to be made of the Green Herb, by beating, and made thick by the Pouder of the same.

XVIII. *The Distilled Water.* It has in a weak manner the Virtues of the Juice, Essence, and Decoction; and may be used as a Vehicle for the two first, or the Pouder.

XIX. *The Oily Tincture.* It is an excellent thing to be applied to Wounds of the Nerves and Joints; and taken inwardly, prevails against the Jaundice, and gives present relief in the Colick. Dose thirty or forty drops in a Glass of White Port Wine.

CHAP. CXXXVII.

Of CLARY, Garden.

I. *THE Names.* It is called in *Greek*, Ὀρμίνον ἀπὸ τῆς ὁρμῆν, *ab Impetu quod ad Venerem stimulat*, as *Dioscorides* says: In *Latin*, *Horminum*, *Sclarea*, and *Scarlea*, *Orminum Cordi*, *Gallitricum Tragi*, and so of *Lugdunensis* and *Gerard*: In *English*, Clary, *quasi* Cleer-Eye.

II. *The Kinds.* It is, 1. Ὀρμίνον ἥμερον, *Horminum Hortense*, Garden Clary; of which in this Chapter. 2. Ὀρμίνον ὄρειον, *Horminum Sylvestre*, Wild Clary, of which in the next. The Garden Clary, is, 1. *Horminum sativum*, *Horminum Commune*, Common Clary. 2. *Horminum sativum verum Dioscoridis*, The true Garden Clary of *Dioscorides*. 3. *Calus Jovis*, *Lobelii*, *Clusii*, *Camerarii*, *Lugdunensis*, *Eystettensis*, *Gerard.*; *Orvala Tertia Belonii*; *Horminum Cæsalpini*, *Galeopsis*, *Lutea Dalechampii*, *Horminum Luteum Glutinosum Badarii*, *Horminum Tridentinum*, *Horminum luteum alterum*; *Camphorata & Sphacelus aliis*, Yellow Wild Clary, or *Jupiter's* Distaff. 4. *Horminum humile Germanicum*, *Gallitricum alterum Gerardi*, The Smaller sort of Clary, or *German* Clary.

III. The Descriptions. *The* first, Common Clary *has a Root which is blackish and spreads not far, but perishes after Seed time; from whence proceeds a Stalk a foot and half high, or more, which as it grows up branches it self into others; these Stalks are four square, thick and rough, sending forth broad, rough, wrinkled, whitish, or Hoary green Leaves, somewhat evenly cut in on the edges, and of a strong sweet Scent, some of them growing near the ground, and some by Couples upon the Stalks. The Flowers grow at certain distances, at the Joints, (with two small Leaves under them) somewhat like unto Sage Flowers, but smaller, and of a very whitish pale blew color. The Seed is blackish, or somewhat flat, and not so round as the Wild, and is contained in long toothed Husks, which serve instead of Cods.*

IV. *The* second, *or* True Garden Clary of Dioscorides, *has a Root which is small, and perishing every Year, from whence it rises up but with one square hairy Stalk, about a foot and half high, more or less, as the ground is in goodness: This Stalk spreads it self into several square Branches, on which are set at every Joint two Leaves, one against another, which are something broad and round, a little rugged like unto* Horehound, *but more green than white, and of a reasonable good Smell: at the tops of the Stalks stand divers Leaves, one row under another, of a very fine, deep, purple violet color, the lower being paler than the uppermost, and seem afar off to be Flowers, but approaching nearer to them, are found only to be Leaves, the Flowers coming forth*

under them at ſet Spaces about the Stalks, of a whitiſh purple color, ſmaller than the Flowers *of any other ſort of* Clary, *and ſtanding in browniſh purple Husks, which after the ſaid Flowers are paſt, whilſt the Seed ripens (which is then black) turn themſelves downwards, by reaſon whereof, if it is not gathered in due time, it is loſt.* Gerard *ſays the Leaves are ſomewhat round, and lay'd over with a hoary Cottony ſubſtance, not much unlike* Horehound: *the Stalks are ſquare, ſmall and hairy; and the Flowers coming forth between thoſe beautiful purple Leaves, towards the tops, are ſmall, of a blewiſh or watched color, in faſhion like to* Roſemary-flowers.

V. *The* third, *or* Colus Jovis, *has a knobby Root, which is compoſed of many long ſtrings, by which it takes ſtrong hold in the Earth, and abides many Years: from whence riſe up ſeveral four ſquare rough Stalks, a yard high, or more, which branch forth themſelves into divers four ſquare Stalks or Branches. The Leaves are many, large, hoary, or of a whitiſh green, dented about the edges, and ſtanding upon long* Footſtalks, *riſing ſome from the Root, and ſome from the Joints of the Stalks, which are broader at the bottom, ſmoother alſo, and ſomewhat fat or clammy in handling, and ſomewhat hairy, as the ſquare Stalks alſo are. Theſe Leaves upon the Stalks ſtand by Couples, and are like the Leaves which grow below, but ſomewhat leſſer. At the tops of the Stalks the* Flowers *come forth at ſet Spaces, ſet round about in Coronets or Wharls, which are gaping, and like unto thoſe of* Common Clary, *but of a faint yellow color, after which comes brown blackiſh Seed.* Gerard *ſays, that this kind of* Clary, *called* Colus Jovis, *repreſents in the very top of the Stalk, a Diſtaff, wrapped about with yellow* Flax, *and that from thence it took its name; and that the Leaves are like thoſe of Nettles, rough, ſharp pointed, and of an overworn green color: both Leaves and Flowers have ſomewhat a ſtrong Smell.*

VI. *The* fourth, *or* Small Clary, *has a Root of the thickneſs of a Man's Thumb, black on the outſide, with divers fibres ſpringing therefrom, which periſh not, but abide many years: from this* Root *come forth ſeveral ſquare and ſomewhat hairy Stalks, a foot and half high, on which do grow large* Leaves, *very like unto our common* Garden Clary, *hairy, rough, and rugged, but not all out ſo large, nor of ſo white a color, growing two at a Joint, on the contrary part thereof, one unto another, and ſomewhat cut in on the edges, and deeply dented likewiſe, having alſo a leſs ſtrong ſcent than they.* The *Flowers grow at Spaces about the Stalks, to the tops, bowing their ſpiky Heads, which are of a purple color, not much larger than* Lavender-flowers, *which being paſt away, there comes after them, ſmall blackiſh Seed.*

German Clary

VII. *The Places.* Theſe are all nouriſhed up with us in *Gardens*, the *fourth* of them being brought to us out of *Germany*; and all of them (except the *third*) are ſometimes found to grow Wild in ſeveral places. The *Colus Jovis*, which only grows in *Gardens* here, is found to grow in great plenty throughout all *Hungary* and *Auſtria*, and in many other places.

VIII. *The Times.* The *firſt* is moſt uſually ſown, for the Seed riſes of its own ſhedding: The *ſecond* alſo requires to be new ſown in the Spring, for it ſeldom comes up of the Seed which falls, the Froſts and Winter with us, for the moſt part, killing of it. They all Flower in the Summer Months, as in *June*, *July* and *Auguſt*, ſome a little later than others, and their Seed is ripe in *Auguſt*, or *September*.

IX. *The Qualities. Gerard* ſays, *Clary* is hot and dry in the third Degree: Aperitive, Abſterſive, Aſtringent, Traumatick or Vulnerary; Pectoral, Hyſterick, Alterative, Analeptick, and Spermatogenetick.

X. *The Specification.* It ſtrengthens weak Backs, ſtimulates to Venery, and cauſes fruitfulneſs.

XI. *The Preparations.* You may have therefrom, 1. *The green Leaves.* 2. *A liquid Juice of the Herb.* 3. *An Eſſence.* 4. *A Syrup.* 5. *A Decoction.*

tion. 6. *A Pouder of the Leaves.* 7. *A Balſam.* 8. *A Cataplaſm.* 9. *The whole Seed.* 10. *A Pouder of the Seed.* 11. *A Mucilage of the Seed.* 12. *An Electuary of the Pouder of the Leaves and Seed.*

The Virtues.

XII. *The green Herb.* Becauſe of its properties of Strengthening, and provoking Venery, it is very much uſed by ſome people, eſpecially in Countrey Towns, to be fryed in a Frying Pan, being firſt dipt into a Batter made of Flower, Eggs, and Milk or Cream, and ſo (being ſerved up to the Table) to be eaten.

XIII. *The liquid Juice of the Herb.* Uſed as an Errhine, it cleanſes the Head and Brain of Cold, Flegmatick, and Viſcous Humors, or other matter afflicting thoſe parts: and taken from three ounces to ſix, mixt with a Glaſs of Tent or Alicant, it admirably ſtrengthens the Back, and excites *Venus:* It thickens the Seed, warms and comforts the Womb, and is ſaid to cauſe fruitfulneſs in Women, being taken and uſed Morning and Night for ſome conſiderable time. It alſo cleanſes, and heals green Wounds.

XIV. *The Eſſence.* It has the Virtues of the liquid Juice, beſides which, it provokes the Terms in Women, warms and comforts a cold and moiſt Womb, and takes away the Weakneſs and Slipperineſs thereof: it facilitates the Birth, and expels the Secundine, or Afterbirth. And as it is good to be given to Women which are Barren, through a cold and moiſt diſpoſition of the Womb; ſo is it alſo good to ſtop the Whites, and to comfort a cold and weak Stomach, oppreſt with Viſcous Flegm. Doſe from one ounce to two, three, or four ounces, in a Glaſs of generous Wine.

XV. *The Syrup of the Juice.* It has the Virtues of the two former, but not ſo powerful, becauſe it is ſo much clogg'd with Honey. But in other caſes as a Pectoral, it is much beyond them, for it cauſes better Expectoration, and therefore is good againſt Coughs, Colds, Hoarſneſs, Wheezings, ſhortneſs of Breath, difficulty of Breathing, and other like Diſtempers of the Breſt and Lungs. Doſe two or three ounces, Morning and Night.

XVI. *The Decoction in Wine.* It is weaker than the Juice or Eſſence, but has all the Virtues of the aforegoing Preparations in a lower Degree. It helps to expectorate rotten and purulent matter from the Lungs in a Pleuriſie, as alſo in Coughs, and other Diſtempers of thoſe Parts; and poſſibly may be good for ſuch as are troubled with the Sciatica. Doſe ſix ounces Morning and Night.

XVII. *The Pouder of the Leaves.* Snuffed up the Noſtrils cauſeth ſneezing, and thereby purges the Head and Brain of Rheum, and cold thin Flegm, and Tartarous Matter afflicting thoſe parts, cauſing Head-achs, Vertigo's, Apoplexies, Drowſineſs, Sleepineſs, and Lethargies: and being taken inwardly to one Dram, Morning and Evening, in a little of the Syrup, it ſtrengthens the Back, increaſes the Seed, and excites Venery.

XVIII. *The Balſam.* Whether it is made with the Juice, or with the green Leaves, it is as ſingular a Vulnerary as is to be met withal. It not only cures Green Wounds at once or twice dreſſing them, but alſo digeſts, cleanſes, and heals foul, putrid, or rotten and running Ulcers: and being applied, is an excellent thing to give eaſe in the Sciatica.

XIX. *The Cataplaſm.* Being applied to Contuſions, it diſcuſſes them, if no Veſſels are torn: and applied to Green Wounds, it ſuddenly heals them.

XX. *The whole Seed.* It is uſed to be put into the Eyes to clear them from Films, Clouds, Moats or other like things which offend them. It alſo clears them from Pearls, and white or red Spots, which chance to grow upon them.

XXI. *The Pouder of the Seed.* Put into the Eyes, it clears the ſight; and being taken inwardly from half a dram, to a dram and half, Morning and Night, in Syrup of Clary, it admirably ſtimulates *Venus*, ſtrengthens the Reins, and eaſes Pains of thoſe Parts.

XXII. *The Mucilage of the Seed.* If it is made with Water, and applied to Tumors or Swellings, it diſcuſſes and removes them. It alſo draws forth Splinters, Thorns, or other things gotten into the Fleſh. If made with Vinegar, it is good againſt hot Inflammations, as alſo Biles, Felons, and other hot Excretions in the Fleſh and Skin, more eſpecially if it is applied to them before they are come to too great a head.

XXIII. *The Electuary of the Pouder of the Leaves and Seed.* Put into Sore or Ulcerated Eyes, it heals them; and being uſed Morning, Noon and Night, for ſome conſiderable time, it clears the Eye-ſight of Pearls, Films, Clouds, and other like things, and helps dimneſs of ſight, waſhing the Eyes alſo between whiles four or five times a day, with the Juice or Eſſence of the Herb. This Electuary being alſo taken inwardly from one dram to two drams, Morning and Night, for ſome time, helps Coughs, and Ulcers of the Lungs, reſtores in Conſumptions, ſtrengthens weak Backs, breeds Seed, excites Luſt, and admirably fortifies the whole Man.

XXIV. *Colus Jovis*, yellow Clary, or *Jupiter's Diſtaff*, is hot and dry in the ſecond Degree, and its Juice and Eſſence, are ſingular good to cleanſe and heal old Ulcers, and foul running Sores, being applied to the Parts afflicted, according to Art.

CHAP. CXXXVIII.

Of CLARY, Wild.

I. *THE Names.* It is called in *Greek*, Ὀφθαλμὸς ἄγρειος: In *Latin*, *Horminum Sylveſtre*, *Oculus Chriſti*, and by ſome, *Geminalis*: and in *Engliſh*, *Wild Clary.*

II. *The Kinds.* There are ſeveral *Species* hereof, but the chief, and which we intend to handle in this Work, are theſe following, *viz.* 1. *Horminum Sylveſtre vulgare*, *Oculus Chriſti*, Wild Clary, eſpecially ſo called by *Camerarius*, *Cordus*, *Cluſius*, *Fuchſius*, *Geſner*, *Gerard*, *Lobel*, *Lonicerus*, *Lugdunenſis*, and *Turner*; *Brunfelſius* calls it, *Salvia agreſtis*; and *Beſler* in his *Hortus Eyſtetenſis*, *Salvia agreſtis flore purpureo*: *Geſner* and *Tragus*, *Salvia agreſtis vera*; *Gallitricum verum* (in *Italy*) *Ceſalpini*; *Sclarea Sylveſtris Tabernmontani.* 2. *Horminum Sylveſtre incanum flore albo*, *Horminum Sylveſtre quartum Niveo flore Cluſij*, *Sclarea Sylveſtris flore albo Tabernmontani*, *Salvia agreſtis flore albo horti Eſtetenſis*, Hoary Wild Clary with a White Flower. 3. *Horminum Sylveſtre Lavendule flore Bauhini*, *Sclarea Hiſpanica Tabernmontani*, *Gallitricum alterum Gerardi*, Wild Clary, with Lavender Flowers. 4. *Horminum Sylveſtre ſalvifolium majus & minus Bauhini*, *Horminum Sylveſtre Matthioli*, *Ceſalpini*, *Lugdunenſis*; *Orvula altera Dodonæi*, *Horminum Sylveſtre quintum Cluſij*; *Verbaſcum nigrum ſalvifolium flore purpureo Lobeli*; *Salvia Sylveſtris adulterina Tragi*, Sage Leav'd Wild Clary. Authors make many other kinds, but theſe are all that are found growing with us, either Wild or in Gardens.

III. The Deſcriptions. *The* firſt *kind, or* Oculus Chriſti, *has a Root which is long, tough, and black, attended with many fibres, by which it takes faſt hold of the Earth, from whence riſe up many ſquare Stalks two or three feet high, on which grow broad dark green Leaves, dented about the edges, and ſomewhat rugged and hard in handling; the Flowers grow along towards the tops of the Stalks, like unto the gaping or hooded Flowers of the* Garden Clary, *but ſmaller, and of a pale or whitiſh blew color; which being paſt away, there comes in ſmall husks, round blackiſh or browniſh Seed; the whole Plant has a ſtrong Smell, but it is nothing ſo quick as that of our common* Garden Clary. *There are two other kinds hereof: One, the tops of whoſe Stalks are purpliſh, with Flowers of a deeper purple color, and ſomewhat larger Leaves. Another, differing only in this, that the tops of the Stalks are green, and not purple; the Flowers of a pale blew color, and the Leaves a little torn on the edges.*

Wild Clary

IV. *The* ſecond *kind, or* Hoary Wild Clary, *with white Flowers, has a long tough black Root, not much differing from the former; the Leaves in this being almoſt like thoſe, but more hoary, and a little deeper dented in on the edges, the Stalks are ſquare, and almoſt a yard high, upon which grow the Flowers in the ſame manner, ſaving that theſe are wholly white, which being paſt away, there follows ſmall round browniſh Seed.*

V. *The* third, *or* Lavender flowred Wild Clary, *has a Root not much differing from either of the former* Wild Claries, *from whence come forth ſquare hairy Stalks, two or three feet high, ſet with harder, narrower, and ſmoother Leaves, more deeply indented about the edges, and rounder pointed; the Flowers are much leſs than the former; and neither in bigneſs, nor color, are they greatly differing from the Flowers of* Spike *or* Lavender, *they growing in ſpaces and rundles as the reſt do; the Seed is like to the others, nor does the Smell of the whole Plant differ much from them.*

VI. *The* fourth, *or* Sage Leav'd Wild Clary, *has a long Root, tough and black without, but yellow within, which abides without periſhing for many Years, as the Roots of moſt of the Wild kinds do: from whence riſe up low ſquare Stalks, much about half a yard high, whereon grow hard rugged Leaves, ſet two at a Joint, very like unto* Sage Leaves, *but not hoary at all, of a dark green color, and dented about the edges: the Flowers grow at ſet Spaces round about the Stalks, as in rundles, in ſome Plants of a fair purple, violet color; in others more pale; and in others yet, of almoſt an Aſh-color; which being paſt away, there comes forth (when it is ripe) black ſmall Seed. The Smell of this Plant is more pleaſing and leſs heady than moſt of the former kinds be. There is another Species of this fourth kind, which differs chiefly from it in this, that it grows much higher, has thicker Stalks, larger and thicker Leaves, ſpotted with divers white ſpots and ſtreaks therein; elſe in form and color of Leaves and Flowers, no difference appearing.*

VII. *The Places.* The *firſt* grows Wild in *England*, almoſt every where by the Way ſide, and ſo does the other with the purple Stalks: but that with the green Stalks is not common with us, but grows in many places of *Germany* and *Hungary*: *Gerard* ſays, that the *Oculus Chriſti* grows in Barren places, almoſt in every Countrey, eſpecially in *Holborn-fields*, near unto *Grays-Inn*, in the Highway by the end of a *Brick-Wall* (there it might poſſibly grow formerly, but none can be had there now:) alſo at the hither end of *Chelſey* towards *London*, and in the Highways leading from *Richmond Palace* to the *Water-ſide*, and in divers other places. The *ſecond* grows not Wild here, but only in the Gardens of the Curious. *The third* grew with *Cluſius*, of the Seed which he had out of *Spain*, but he ſaith he found it likewiſe near the *Riding-place of Greenwich*; ſo that it is manifeſt, that it is a natural inhabitant of our Countrey. The *third* grows Wild in *Hungary* almoſt every where, in their *Vineyards*, and by the Way ſides, but with us it is chiefly nouriſhed up in *Gardens*.

VIII. *The Times.* They all Flower in *June* and *July*, as do the Garden Kinds; and their Seeds are ripe in the end of *Auguſt*, or not long after.

IX. *Their Qualities, Specification, Preparations, and Virtues*, are the ſame with thoſe of the *Garden Clary*, ſo that little more need be ſaid thereof here.

X. *Obſervation* 1. *Dioſcorides* ſaith, That the Seed of *Oculus Chriſti*, or *Wild Clary*, drunk with Wine (from one dram to two drams) excites Luſt; and being mixed with Honey, and applied, cleanſes the Eyes from Films, and other imperfections lodged in them: and being put whole into the Eyes, it not only ſimply cleanſes, but alſo purges them very much from Wateriſh Humors, and ſo frees them from Redneſs, Inflammations, and divers other Diſeaſes which happen to them, taking away their Pain and Smarting, one Seed, and no more, being put into the Eye at a time. This, ſays *Gerard*, is a general Medicine in *Cheſhire*, and other Countries thereabout, known of all, and uſed with good ſucceſs.

XI. *Obſerv.* 2. *The Liquid Juice*, or *Eſſence of the Leaves*, given from two ounces to four or ſix, mixed with a Glaſs of Generous Wine, and drank warm, diſſolves congealed Blood in the Stomach, warms and comforts it, and is very good to help againſt dimneſs, and to reſtore the Eyes to their Priſtine State.

CHAP.

CHAP. CXXXIX.

of CLOVE-GILLIFLOWERS.

I. *THE Names.* It was unknown to the *Greeks*, as far as we can learn, but is called of the *Latins*, *Caryophyllus hortenſis*, alſo *Vetonica*, *Vetonica altilis*, *Coronaria*, *Herba Tunica*, *Ocellus Damaſcenus*, and *Barbaricus*, of ſome *Cantabrica Plinij*, *flos Caryophylleus*. Some will have them to be the *Iphium Theophraſti* in *lib.* 6. *cap.* 6 & 7. others to be his *Dios Anthos*, or *Flos Jovis*, but *Ruellius* ſaith that they were unknown to the *Old Writers*; and his judgment ſeems to be good, becauſe the *Gilliflower* is not like to that of *Vetonica*, or *Cantabrica*; and it is a wonder, ſays he, that ſuch a famous Flower, of ſo pleaſant a Form, and ſweet a Smell, ſhould lye hid, and not be known to the Ancients, which may be thought not inferior to the *Roſe*, in its Variety, Smell, and admirable Beauty. The name *Caryophyllus* was given to it, I ſuppoſe, from its Smell, which is very like to that of the *Indian Clove*. We in *Engliſh* call it *Clove-gilliflower*, and *Gilliflowers* (*quaſi July-flowers*, becauſe they begin to flower in the Month of *July*) ſome alſo are called *Carnations*, but that name ariſes chiefly from *the color*.

II. *The Kinds.* They are either *Garden* or *Wild*: of the *Garden Kinds* we ſhall treat in this Chapter. *The Wild* are vulgarly called *Pinks*, of which we ſhall ſay nothing here, but refer you to the Chapter under that Title, where we ſhall fully diſcourſe of them. Of the *Garden Kinds*, or *Gilliflower*, ſome are Single, and ſome Double. The *Single Clovegilliflower* ſome will have to be a *Pink*, but it is no ſuch thing, for it is oftentimes produced by the Seed of moſt of the *Double Clovegilliflowers*, and differs from *Pinks* in its Shape, Magnitude and Smell: That all the Kinds of Double Flowers produce Seed I am apt to believe; though ſome of them, as the *Clovegilliflower* and *Carnation*, not very often; and *Parkinſon* ſays, that they ſeldom give any Seed, as far as he could obſerve, and here in *England*, are uſually increaſed by Slips.

III. As to the *Variety* of *Kinds* of this Flower in reſpect to their various and accidental differences, they are *little* or *few* in their Roots, Leaves, Stalks, and manner of growing, but *manifold* in reſpect to the Flowers; as to their Form, Magnitude, and Color, ſome being of one Color, ſome of another, ſome of many, ſome Striped, ſome Spotted; ſome finely Dented only, ſome Jagged or deeply Cut in, *&c.* I ſay as to theſe, we ſhall take no notice, leaving that work to their conſideration, who make the *Flower Garden* their whole buſineſs. Thoſe which we ſhall treat of here, are only the three following, (which comprehend all the other Kinds, and Varieties under them) *viz.* 1. *Caryophyllus hortenſis pleno rubro*, The Clove-gilliflower of a deep Crimſon Red. 2. *Caryophyllus maximus Anglicus*, The Great *Engliſh* Carnation. 3. *Caryophyllus minor flore pleno*, The leſſer Carnation with a Double Flower. As to the firſt of theſe, *viz.* the *Clove-gilliflower*, there are the *Single Clove*, and the *Double Clove*; only of the Double Clove, there are ſome more Double than others. As to the ſecond, *viz. Caryophillus maximus*, or *Great Carnation*, with that which we deſcribe in *Sect.* V. following. *Parkinſon* in his *Garden of Flowers* makes twenty ſeveral Varieties; to wit, *The Great* Engliſh, *the Grey Hulo*, *the Red Hulo*, *the Black Hulo*, *the Prince*, *the White Carnation*, *the* French *Carnation*, *the Ground Carnation*, *the Cryſtal* or *Cryſtalline*, *the Red Cryſtal*, *the Fragrant*, *the Jagged Savage*, *the Bluſh Savage*, *the Red Savage*, *the* Oxford *Carnation*, *the King's Carnation*, *the Granado*, *the Grand Pere*, *the Camberſine*, *the Great Red Lombard*. As to the *Caryophyllus minor*, or *Leſſer Carnation*, called a *Gilliflower*, we have in *Parkinſon* thirty four Varities, to wit, *The Leſſer Carnation*, *the Gallant* or *Weſtminſter*, *the Briſtol Blew*, *Red Dover*, *Light* or *White Dover*, *Fair Maid*, *Queens Gilliflower*, *the Dainty*, *Braſil Gilliflower*, *Small Granado*, *the Turkie*, *Pool Flower*, *Pale Pageant*, *Dainty Lady*, *beſt White Gilliflower*, *London White*, *Stamell*, *Purple Gilliflower*; *Peach Color*, *blew Gilliflower*, *Bluſh Color*, *Great Tawney*, *Light Tawney*, *Sad Tawney*, *Deep Bluſh*, *Pale Bluſh*, *Infants Bluſh*, *the Great Bluſh*, *Marbled Tawney*, *Princeſs* or *Variable Tawney*, *Flaked Tawney*, *Feathred Tawney*, *Speckled Tawney*, and *Roſe Gilliflower*.

Clove *Gilliſtower.*

IV. The Deſcriptions. *The firſt of thoſe, or deep red* Clove-gilliflower, (*which is that which we only uſe in Phyſick*) *has a pretty long, hard, or woody Root, having ſome ſmall fibres appendent thereto, which endures all the Winter long; from this Root riſes up one or more Stalks, like to thoſe of the* Carnations *following, growing up ſometimes to be a foot and half high, or more, which is round, of an Aſh, or whitiſh color, and pretty hard, not ſo thick ſet with Joints and* Leaves, *as are the* Carnations *following; but the Stalks are more in number, the Leaves are narrower, and whiter for the moſt part, and in ſome do a little turn. The Flowers are much ſmaller than thoſe of the* Carnation, *of a deep red crimſon color, very thick, and double in moſt; the green husks in which they ſtand are alſo ſmaller: the ends of the Leaves in this Flower (as in all the reſt) are dented or jagged, yet in ſome more than in others. Some alſo have two white threads, crooked at the end;*

ends like horns, in the middle of the Flower, whereas ſeveral others have none. Theſe kinds, and eſpecially this that has the Deep Red Crimſon colored Flower, do very well endure the Cold of our Winters, and are with much leſs care preſerved. This Deſcription take as a Preſident for all the kinds of Clove-gilliflowers.

Great Carnation.

V. *The ſecond, or greateſt* Engliſh Carnation, *has a Root which is branched into ſeveral great, long, and woody Arms or Parts, having many ſmall Fibres annexed to them, yet is very difficultly preſerved in Winter, for which reaſon it is not altogether ſo common as the other* Carnations *and* Glove-gilliflowers. *From this Root riſes up a great thick round Stalk, divided into ſeveral Branches, ſomewhat thickly ſet with Joints, and at every Joint two long Leaves, rather green than whitiſh, ſomewhat broader than* Clove-gilliflower *Leaves, turning or winding two or three times round; (yet in ſome other kinds of* Carnations, *they are plain, but bending their points downwards, and in ſome alſo of a dark reddiſh green color, in others not ſo dark, but rather of a whitiſh green color:) The Flowers ſtand at the tops of the Stalks, in long, great, round, green husks, which are divided into five points, out of which riſe many long and broad pointed Leaves, deeply jagged at the ends, ſet in order, round and beautiful, making a noble great double Flower, of a deep* Carnation *color, almoſt red, ſpotted with many bluſh ſpots and ſtrakes, ſome greater, and ſome leſſer, of an excellent, delightful and pleaſant ſweet Smell, not too quick, as many others of this kind are, nor yet too dull, and with two whitiſh crooked threads, like horns in the middle. This kind never bears many Flowers, but as it is ſlow in growing ſo it is alſo in bearing; it is a magnificent Flower, and ſhews a kind of ſtatelineſs, for it will not endure to be often handled. This deſcription may ſerve for all them of this kind.*

VI. *The* third, *or* Leſſer Kind of Carnation, *has a Root much like to the former, but ſomething leſſer, having from it Stalks next the ground, thick ſet, but with ſmaller or narrower Leaves than the* Clove-gilliflower *for the moſt part. The Flowers are like unto the* Clove-gilliflowers, *and about the ſame bigneſs and duplicity, yet in ſome they are much greater than in others, but of a pale yellowiſh* Carnation *color, (tending ſomething to an* Orange) *with two ſmall white threads, and crooked at the ends, in the middle, but ſome have none. The Smell is weaker than that of the* Clove-gilliflower, *yet deleƈtable enough to that Senſe. This kind is more apt to bear Seed than any other, which is ſmall, black, flat, and long, and being Sown, yields wonderful varieties of Flowers, both Single and Double; ſome being of a lighter or deeper color than the Original or Mother Plant; ſome with ſtripes in moſt of the Leaves; others are ſtriped or ſpotted, like one of the great ſpeckled* Carnations *or* Gilliflowers, *in various ſorts or kinds, and that both Single and Double: Some again are wholly of one color, like the Original or Mother Plant, and are either more or leſs Double than it; or elſe are Single, with one row of Leaves, like to a* Pink. *And ſome of theſe are alſo wholly of a crimſon red, or deeper, or lighter, or variably ſpotted, double, or ſingle as a* Pink, *or bluſh, either ſingle or double, yet but very ſeldom white; whilſt all of them in the green Leaves of the Stalks nothing at all perceptably differing.*

VII. *The Places.* Theſe are all nouriſhed in *Gardens* throughout all *England:* of the firſt kind, I have ſeen whole Fields of them planted in *Kent* for the uſe of the *Markets* in *London.* The third was brought out of *Sileſia*, but now is become a free Denizon, and abſolute native of this *Kingdom*, it growing and thriving as well here with us, as any of the former.

VIII. *The Times.* They Flower not until the heat of the Year, which is about the latter end of *June* and in *July*, (unleſs it be an extraordinary hot Seaſon) and they continue flowering, until the Cold of the *Autumn* nip them, or till they have wholly ſpent themſelves out; and are generally, (as was ſaid before) increaſed by Slips. The *Clove-gilliflowers* by reaſon of their hardneſs, being better able to endure the Cold of Winter, are uſually planted

in

in *Gardens*: but the *Carnations* and *Gilliflowers*, by reaſon of their tenderneſs, are uſually Planted in Pots, that they may be houſed, and ſo kept and preſerved from the extream cold of our *Winters*.

IX. *The Qualities.* Theſe Plants as to their Roots, Leaves and Flowers, are temperate in reſpect to heat or cold: Aſtringent, Sudorifick, Traumatick, Cordial, Neurotick, Alterative, and Alexipharmick.

X. *The Specification.* It is peculiar againſt Fainting and Swooning Fits.

XI. *The Preparations.* You may have therefrom, 1. *An Inſpiſſate Juice.* 2. *A Syrup.* 3. *An Eſſence.* 4. *A Conſerve.* 5. *A Diſtilled Water.* 6. *A Spirituous Tincture.* 7. *An Acid Tincture with Vinegar.*

The Virtues.

XII. *The Inſpiſſate Juice.* It is highly Cordial, and may be diſſolved in white Port Wine or Canary, to make a Tincture of at pleaſure, againſt fainting and ſwooning Fits, Sickneſs at Heart, Malignity of the Plague and Poiſon.

XIII. *The Syrup made with Water*, as is taught in our *Pharmacopœia Londinenſis lib.* 4. *cap.* 16. *ſect.* 18. thus: Take Clove-gilliflowers (the Whites being cut off) a pound: infuſe them all night in Spring Water two pounds: being ſtrained, with double-refined white Sugar four pounds, make a Syrup (without boiling) only by melting the Sugar. This Syrup is temperate in Quality, ſtrengthens the Heart, Stomach and Liver; it is Pectoral and Cordial, and may be mixt with other Cordial Liquors, againſt malignant Fevers, and the Plague; as alſo againſt Faintings, Swoonings and the like. It refreſhes the Vital Spirits, chears the Heart, and reſiſts Poiſon.

XIV. *The Syrup made with white Port Wine or Canary.* It is made exactly as the former, and has all the ſame Virtues; only it is a greater and more famous Cordial, more powerful againſt Faintings and Swoonings, to comfort a languiſhing Stomach, as alſo to chear the Heart and revive the Vital Powers.

XV. *The Syrup made with Wine Vinegar.* It is made exactly as that with Water, putting in the ſame quantity of Vinegar inſtead of the Water. It is opening, and reſiſts Vapors which fly into the Brain; it fortifies the Stomach, comforts the Heart, cheats the languiſhing and drooping Spirits; it helps Digeſtion, and prevails againſt all Diſeaſes proceeding from Choler or heat of Blood, as Malign and Peſtilential Fevers, and Fevers not Peſtilential: it cools the Blood, reſiſts Poiſon, quenches Thirſt, and is helpful againſt the Vertigo. Doſe of any of theſe three Syrups, an ounce at a time in any convenient Vehicle.

XVI. *The Eſſence.* It has all the Virtues of the Inſpiſſate Juice and Syrup; it is good againſt Diſeaſes of the Heart, Head and Stomach, very Cordial, ſpecial good againſt Hectick Fevers, to ſtop Fluxes and help ſuch as ſpit Blood: and as it chears the Heart and revives the Spirits, ſo it powerfully reſiſts Melancholy. Doſe from two drams to four.

XVII. *The Conſerve.* It is Cordial, chears the Heart and ſtrengthens the Stomach, and is only eaten as a Sweet-meat. It is good for old People, to eat in a morning faſting.

XVIII. *The diſtilled Water.* It is made by a very gentle heat in *Balneo*, is Cordial, and may be uſed as a Vehicle, to convey other Cordial Medicaments in; beſides which, it is of excellent Uſe to waſh ſore Eyes withal, waſhing them therewith five or ſix times a day.

XIX. *The Spirituous Tincture.* It is a great Preſervative againſt all manner of Malign, Infectious, and Peſtilential Diſeaſes, and ought to be uſed preventively, as firſt in the Morning faſting; ſecondly about four in the Afternoon; thirdly at Bed time. It more powerfully comforts the Stomach, cheats the Heart, and revives the Spirits, than any of the former Preparations. It may be prepared with common Spirit of Wine: and then it may be taken alone of it ſelf, from one ſpoonful to two, according to the Age of the perſon; or otherwiſe mixt with Wine, or ſome other Vehicle.

XX. *The Acid Tincture made with Vinegar.* It comforts the Stomach much, chears the Heart, helps Digeſtion, ſtops Vomiting, is good againſt ſpitting Blood, and ſtrengthens the Retentive Faculty. It cuts tough Flegm, corrects the heat and malignity of Choler, helps Expectoration, and quenches Thirſt in burning Fevers. It is an excellent thing to be given in the Cure of the Plague, and of all manner of Malign and Peſtilential Diſeaſes.

CHAP. CXL.

Of COCKLE.

I. *THE Names.* It is called in *Greek*, Λύχνις ἄγριος: In *Latin*, *Lychnis Segetum*, *Lychnoides Segetum*; by *Tragus*, *Githago*, and makes it *Roſæ marianæ genus ſextum*; *Anthemon folioſum Ruellij*; *Nigellaſtrum & Anthemon Dodonæi*, *Pſeudomelanthium Matthioli*; *Lychnis ſegetum major*, *Bauhini*; (becauſe he makes the *Alſine Corniculata Cluſij*, to be his *Lychnis ſegetum minor*:) In *Engliſh*, *Cockle*, or *Corn Wild Campion.*

II. *The Kinds.* It is a ſingular Plant, and accounted to be one of the *Wild Kinds of Campions.* It is a kind of Wild or Baſtard *Nigella*, as ſome Authors think; for which ſome Herbariſt, from the ſound or likneſs of the word, thought it to be the true *Gith*, or *Melanthium*, but were abſolutely deceived; for it not only differs in Leaves from the true *Gith*, but alſo in other properties: if it has any reſemblance to *Nigella*, it is more in the blackneſs of the Seed, than in the Flower, or in any thing elſe; and therefore *Matthiolus* called it as aforeſaid, *Pſeudomelathium*, as alſo divers others ſince him.

III. The Deſcription. *It has a ſmall and woody Root, which periſhes as ſoon as it has born Seed; from whence ſprings up an upright hairy Stalk, ſhooting forth Branches on all ſides, with two long hairy, or ſoft Woolly Leaves at the Joints.* The *Flowers grow forth at the tops of the Branches, in hairy long Husks, whoſe ends or points are longer than any of the* Campions, *ſtanding upright both before the Flowers open, and after they are paſt, and laying themſelves between the five round pointed Leaves, when they are blown, which are of a bright reddiſh purple or crimſon color: The Seed which follows (which is in hard round heads) is bigger and blacker than in any of the Wild* Lychnides *or* Campions. *Here is to be noted, that ſome have obſerved another Kind of* Cockle, *with white Flowers, but having no other material difference beſides.*

IV. *The Places.* *Cockle* grows too plentifully in moſt of our *Corn-fields*, (chiefly in our *Wheat-fields*) throughout this whole *Kingdom*: for which cauſe *Hippocrates* calls it *Melanthium ex Tritico.*

V. *The Times.* It Flowers in the beginning of *Summer*, and the Seed is ripe in *Harveſt-time.*

VI. *The*

VI. *The Qualities.* It is hot and dry in the end of the ſecond Degree; Aperitive, Cleanſing, Narcotick, and Hyſterick.

VII. *The Specification.* It is peculiar againſt Scabs and running Sores.

VIII. *The Preparations.* You may prepare therefrom, 1. *A Decoction of the Herb in Red Port Wine.* 2. *A liquid Juice.* 3. *A Decoction of the Flowers in Red Port Wine.* 4. *A Pouder of the Flowers.* 5. *A Decoction of the Seed in Wine.* 6. *A Pouder of the Seed.* 7. *A Peſſary of the Seed.* 8. *A Balſam.*

The Virtues.

IX. *The Decoction of the Herb in Red Port Wine.* Being taken inwardly two or three ounces at a time, it is good to ſtop the Terms in Women, as alſo the Whites, and to ſtop any inward Bleeding; it is good alſo to open Obſtructions of the Reins, Ureters and Bladder, and to provoke Urine, and expel Stones, Gravel, Sand, and other Tartarous Matter.

X. *The Liquid Juice.* It has the ſame Virtues, but is ſeldom given inwardly: but outwardly applied, it ſtops all ſorts of External Bleedings of Wounds; cleanſes and heals Scabs and running Sores, Ulcers, Cankers, Fiſtula's, *&c.* by correcting the putrefaction, and drying up the moiſt Humors which offend them.

XI. *The Decoction of the Flowers in Red Port Wine.* It is good againſt all the Diſeaſes againſt which the Decoction of the Herb is good; but is withal a more pleaſant and delicate Medicine, and more powerful to ſtop the Terms in Women, and may be given three, four, or five ounces at a time, Morning and Evening. It is a peculiar opener of Obſtructions in the Reins and Bladder: Uſed as a Gargle in the Mouth, it cleanſes, drys up, and heals Cankers, running Sores, and Ulcers in the Throat, Mouth, and Gums, ſtops the Putridity, cleanſes and heals them. It is good againſt Poiſon, ſtinging of Scorpions, and the bitings of Serpents, or other Venomous Beaſts.

XII. *The Pouder of the Flowers.* It may be given to a dram in Red Port Wine, againſt all ſorts of Fluxes, (and Bloody-fluxes in ſpecial) of the Belly, Reins, and Womb: outwardly applied to Sores and old Ulcers, it cleanſes, drys and heals them. Inwardly given, it is good againſt the Plague, Malign and Peſtilential Diſeaſes, and the bitings of Serpents, or other Venomous Creatures. Outwardly applied to, or ſtrewed upon Ulcerated Kibes, it effectually cleanſes them, drys up the humidities, and heals them, tho' the Ulcer has penetrated to the Bone.

XIII. *The Decoction of the Seed in Wine.* It helps ſuch as are ſtung by Scorpions, being inwardly taken to two or three ounces; and the place outwardly bathed therewith. It has alſo an eſpecial property to cure the Itch, as alſo Scabbineſs, and running Sores; and to correct the putrid Humors flowing to any Wound, Ulcer, or Fiſtula.

XIV. *The Pouder of the Seed.* Being given from a dram to two drams, according to the age of the Perſon, and ſtrength of the Conſtitution, it has been found to purge the Belly of Cholerick Humors, to expel Poiſon, and reſiſt the malign force of the Plague: It is alſo of very good uſe in all ſorts of running Sores, old Ulcers, inveterate Cankers, putrid and malign Fiſtula's, and the like; for it reſiſts the putridity, cleanſes and dries up the Moiſture, and heals beyond all imagination. *Octavius Horatianus* gives the Seed parched, and beaten to pouder, to be drunk againſt the Yellow Jaundice.

XV. *The Peſſary.* Made of the Seed with Honey. Being put up the Womb, it provokes the Terms, as *Hippocrates* teſtifies in his Book of *Womens Diſeaſes.*

XVI. *The Balſam. It is made of the Juice or green Leaves and Flowers, by boiling in Oil Olive to criſpneſs, ſtraining out, and repeating the boiling three times, then mixing with every pound of that Oily Decoction, twelve ounces of Venice Turpentine, and ſix ounces of Wax, boiling to a thickneſs.* It heals Wounds, Ulcers, old running Sores, Fiſtula's, by digeſting, cleanſing, incarnating, drying, *&c.*

CHAP. CXLI.

Of COCKS-HEAD.

I. THE *Names.* It is called in *Greek*, (by the Ancient Herbariſts) Ὀνόβρυχις; and is thought to be the *Onobrychis* of *Dioſcorides*; in *Latin*, *Onobrychis*, and *Caput Gallinaceum*: In *Engliſh*, *Cocks-head*, *Medick Fetch*, and *Red Fetchling.*

II. *The Kinds.* Authors make many varieties hereof; *Parkinſon* makes nine Kinds; but whereas they are not all Natives of our Countrey, we ſhall only deſcribe thoſe which are natural to the place, and to be had with us, which are chiefly three, *viz.* 1. *Onobrychis vulgaris, Caput Gallinaceum*; *Onobrychis Dodonæi, Cluſij, Thalij*; *Glaux ſive Onobrychis Geſneri in hortis*; *Caput Gallinaceum Belgarum Lobeli*; the leſſer ſort of which is called by *Bauhinus, in Prodromo, Caput Gallinaceum minus*; *Cocks-head*, the Common Kind, alſo *Medick Fetchling*; and by the *French*, *Saint Foin*: But this is not the *Saint Foin* ſo much talked of for the Improvement of Land, that we have diſcourſed of before in Chap. 135. where we have ſhewed the excellent uſes thereof in Agriculture. 2. *Onobrychis ſpicata flore*

flore purpurea, Onobrychis Pannonica prima Clusij; *Cicer Astragaloides Ponæ*; spiked *Cocks-head* with purple Flowers. 3. *Onobrychis floribus Cæruleis, Onobrychis Pannonica secunda Clusij*, Bew Flowred *Cocks-head*.

III. The Descriptions. *The first or common kind has a Root which is tough, and somewhat woody; from whence spring forth several weak but rough Stalks, leaning downwards, about a foot and half high, beset with Winged Leaves, each being longer and more pointed, than those of Lentils, and whitish underneath; from the tops of these Stalks rise up other slender Stalks, naked without Leaves, unto the tops, where there grow many small Flowers, in manner of a spike, of a pale reddish color, with some blewness among them: after which rise up in their places, rough, round, and somewhat flat heads. Of this first Species,* Bauhinus *has given us the Description of a lesser, differing in nothing from the former, but only in the magnitude, or rather smallness thereof.*

IV. *The second has a Root great and long, hard, and of a woody substance, spreading it self far abroad, and growing very deep into the ground; from whence rise up many Stalks, especially when it is grown to an old Plant, round, hard, and leaning to the ground like the other Pulses, and has Leaves very like* Galega, *or the* Wild Vetch, *of a bitter Taste, and loathsome Savor: among which come forth small round Stems; at the ends of which do grow Flowers spike fashion, three Inches in length, and in shape like those of the great* Lagopus, *or* Meadow Trefoil, *but longer, of an excellent shining purple color, but without Smell: which Flowers being past away, small cods follow, containing little, hard and black Seed, in taste like to the* Vetch *or* Tare.

V. *The third has also a small, tough, and woody Root, from whence spring up many twiggy Branches, about a foot and half high, full of Knots, ramping and creeping on the ground. The Leaves are like the former, but smaller and shorter: among which come forth small slender Stems, upon which do grow little Flowers, like those of the* Tare, *but of a blew color, tending to purple. The Flowers being fallen, small Cods come forth in their places, which contain little black Seed like a Kidney, and of a black color when it is full ripe.*

VI. *Note.* It is supposed that the first of these is the *Onobrychis* of *Dioscorides*, also of *Pliny*: for *Dioscorides* describes it thus; Onobrychis *has Leaves like a* Lentil, *but longer, a Stalk a Span high, a crimson Flower, and a little Root; and grows in moist and untilled places. Pliny* writes thus; Onobrychis *has the Leaves of a* Lentil, *but somewhat longer, a red Flower, and a small and slender Root; and that it grows about Springs, or Fountains of Waters.*

VII. *The Places.* The first and second grow (says *Gerard*) upon *Barton-hill*, four Miles from *Lewton* in *Bedfordshire*, and likewise upon the *Grassie Balks*, between the *Corn Lands* two Miles from *Cambridge*, near to a Water Mill towards *London*; and in divers other places in the way from *Cambridge* to *London*. The third grows not Wild here, but is only nourished up in *Gardens*.

VIII. *The Times.* They all Flower from the end of *June* to the end of *August*, and the Seed is ripened in the mean Season, and in some little time after.

IX. *The Qualities.* They seem to be temperate in respect of heat or coldness, dryness or moisture: and *Galen* says in his Books of the Faculties of Simple Medicaments, That they rarifie, or make thin, and waste away. This is certain, by Experience from the feeding of Cattel with them, that they are *Galactogenetick*, or breeders of Milk.

X. *The Specification.* They have been found to be singular good for the discussing, consuming, or wasting away of hard Tumors or Swellings.

XI. *The Preparations.* You may have therefrom, 1. *A liquid Juice.* 2. *An Essence.* 3. *A Powder of the Leaves.* 4. *An Oil.* 5. *A Cataplasm.*

The Virtues.

XII. *The liquid Juice.* Taken from two ounces to six, either alone by it self, or mixt with a Glass of White Port Wine, it prevails against the Strangury, and all Obstructions of Urine, caused by Stones, Gravel, Sand, or Tartarous Matter in Reins or Bladder: and taken by Nurses, it causes them to breed abundance of Milk.

XIII. *The Essence.* It has the former Virtues, but opens and cleanses more, being taken in like manner, Morning and Evening: Bathed upon any Tumor or Swelling, not malign nor maturated, it discusses or wastes it away. Dose from two, to three or four ounces.

XIV. *The Powder of the Leaves.* *Dioscorides* says, that if it is drunk with Wine (I suppose from one dram to two drams, Morning and Evening) it cures the Strangury. It has indeed a singular faculty to open Obstructions of the Urinary parts.

XV. *The Oil, made by boiling the Green Herb in Oil Olive to Crispness*, and repeating the Operation three or four times, and so straining it out. This, says *Dioscorides*, being anointed on the Body, it provokes Sweating. Anointed on hard Tumors, it softens them, is discussive, and causes them to waste away.

XVI. *The Cataplasm.* Being bruised green, and laid on (in the form of a Cataplasm,) upon hard Tumors or Swellings, or waxen Kernels in the Neck, or Throat, or in other Parts; it causes them to consume and waste away; and this more especially, if the Juice or Essence, aforesaid, be taken daily, Morning and Evening, in a Glass of White Port Wine, as is directed; and the Patients withal, purge once or twice a Week (according as their Bodies will bear it) with my *Family Pills*.

CHAP. CXLII.

Of COCKS-COMB.

I. *THE Names.* The Ancients we cannot find knew any thing of this Plant, unless it be Ἀλεκτοροφόλος *Plinij*, i. e. *gallinacei Cristam habens.* Our Moderns call it in *Latin Crista Galli*, vel *Gallinacea*, because the Flowers, as some think, stand at the tops of the Stalks, like a Cocks Comb; others think it to be so called from the form of the Leaves, whose dentings on the edges, resemble the Comb, or Crest of a Cock: In *English*, it is called *Cocks Comb*, *Yellow Rattle*, and *Yellow Louse-wort*.

II. *The Kinds.* It is one of the Kinds of *Rattle-Grass*, or *Louse-wort*. Now *Rattle-Grass* is either *Yellow* or *Red*; the *Yellow*, which is called *Cocks-Comb*, we shall treat of in this place; the *Red* we shall treat of under the Title of *Rattle-grass Red*, in some of the Chapters following. Of the *Yellow Kind* there are four Species, of which two of them are only found to grow in *England*, viz. 1. *Crista Galli Lutea, Crista Gallinacea, Crista Galli Bauhini; Pedicularis pratensis lutea Bauhini; Pedicularis Campestris Tragi; Crista Galli vel Gallinacea Dodonæi,*

donæi, Lobelij, Clusij; Cocks Comb, Yellow Rattle, and Yellow Louse-wort. 2. *Crista Galli Lutea Umbellata Baubini*, Yellow Rattle, with Tufted Flowers.

III. The Descriptions. *The* Common Cocks Comb, *or* Yellow Rattle, *has a Root small and slender, which perishes every Year; from which Root seldom grows more than one round green Stalk, which rises up about half a yard, or two feet high, and with but few Branches thereon, having two long, and somewhat broad Leaves set at a Joint, deeply dented, or cut in on the edges, resembling therein the Crest or Comb of a Cock, broadest next to the Stalk, and narrower or smaller towards the end. The Flowers grow at the tops of the Stalks, with some shorter Leaves with them, being hooded as the* Red Rattle-Grasses *are; but of a fair yellow color in most, or else in some paler, and in some more white: The Seed is contained in large Husks, which being ripe will rattle, and make a noise, it lying loose within them.*

IV. *The second has a small slender Root, which sends forth a few narrow* Leaves, *of about an Inch long apiece; and a Stalk from among them but a little more than an hand breadth high, on which grow many yellow Flowers, set together at the top, as it were in an Umble or Tuft, fashioned like the other with hooded and gaping yellow Flowers, but three times longer than those; which being past away, leave great broad husks, containing the Seed.*

V. *The Places.* They grow in our *Meadows* and *Woods* generally through the Land; where they are rather a Plague and Annoyance to it, than of any good use for Cattel. *Gerard* says, that the first grows in dry Meadows and Pastures, and is accounted as an unprofitable thing.

VI. *The Times.* They Flower in *June*, *July*, and *August*, and the Seed ripens in the mean Season.

VII. *The Qualities.* It is held to be cold and dry, of an Alterative property, and Pectoral.

VIII. *The Specification.* It is peculiar against Coughs, and Diseases of the Lungs.

IX. *The Preparations.* You may have therefrom, 1. *A liquid Juice.* 2. *An Essence.* 3. *A Decoction in Wine or Water.* 4. *The whole Seed.*

The Virtues.

X. *The liquid Juice.* If it is mixt with Honey, and put into the Eyes, it takes away Mists, Clouds, Films, and other things which dim the sight: mixt with a little small, or weak Lime Water, it drys up Rheums in the Eyes, and heals any Sore or Ulcer with which they may be affected.

XI. *The Essence.* It has the Virtues of the Juice, besides which, being dulcified with White or Brown Sugar Candy, it is an excellent thing against Coughs, Colds, Hoarseness, Wheezings, and shortness of Breath. Dose a spoonful or two at a time.

XII. *The Decoction in Wine, or in Bean Broth, or Water.* It may be sweetned with Honey, and then clarified with Whites of Eggs. It is a good thing against Coughs and Colds, causes easie Expectoration; and is a good *Collyrium* to wash weak, dim, sore and running Eyes withal, for it admirably clears the sight.

XIII. *The whole Seed.* If it is put into the Eyes, it cures dimness of sight from any pure external Cause, and removes Mists, Cloudiness, Films, Skins, or Pearls, or any other outward matter which obfuscates the sight.

CHAP. CXLIII.

Of COLEWORT Garden.

I. THE *Names.* It is called in *Greek*, Κοράμβη, *Attice*, Κορόμβη, *vel* Κορόμβλη: It is also called Ἀμέθυσος, (not because it drives away drunkenness, but also because it is like in color to the *Amethyst*,) which name is intended of the first sort of the following *Coleworts*: In *Latin*, *Brassica*, and by the

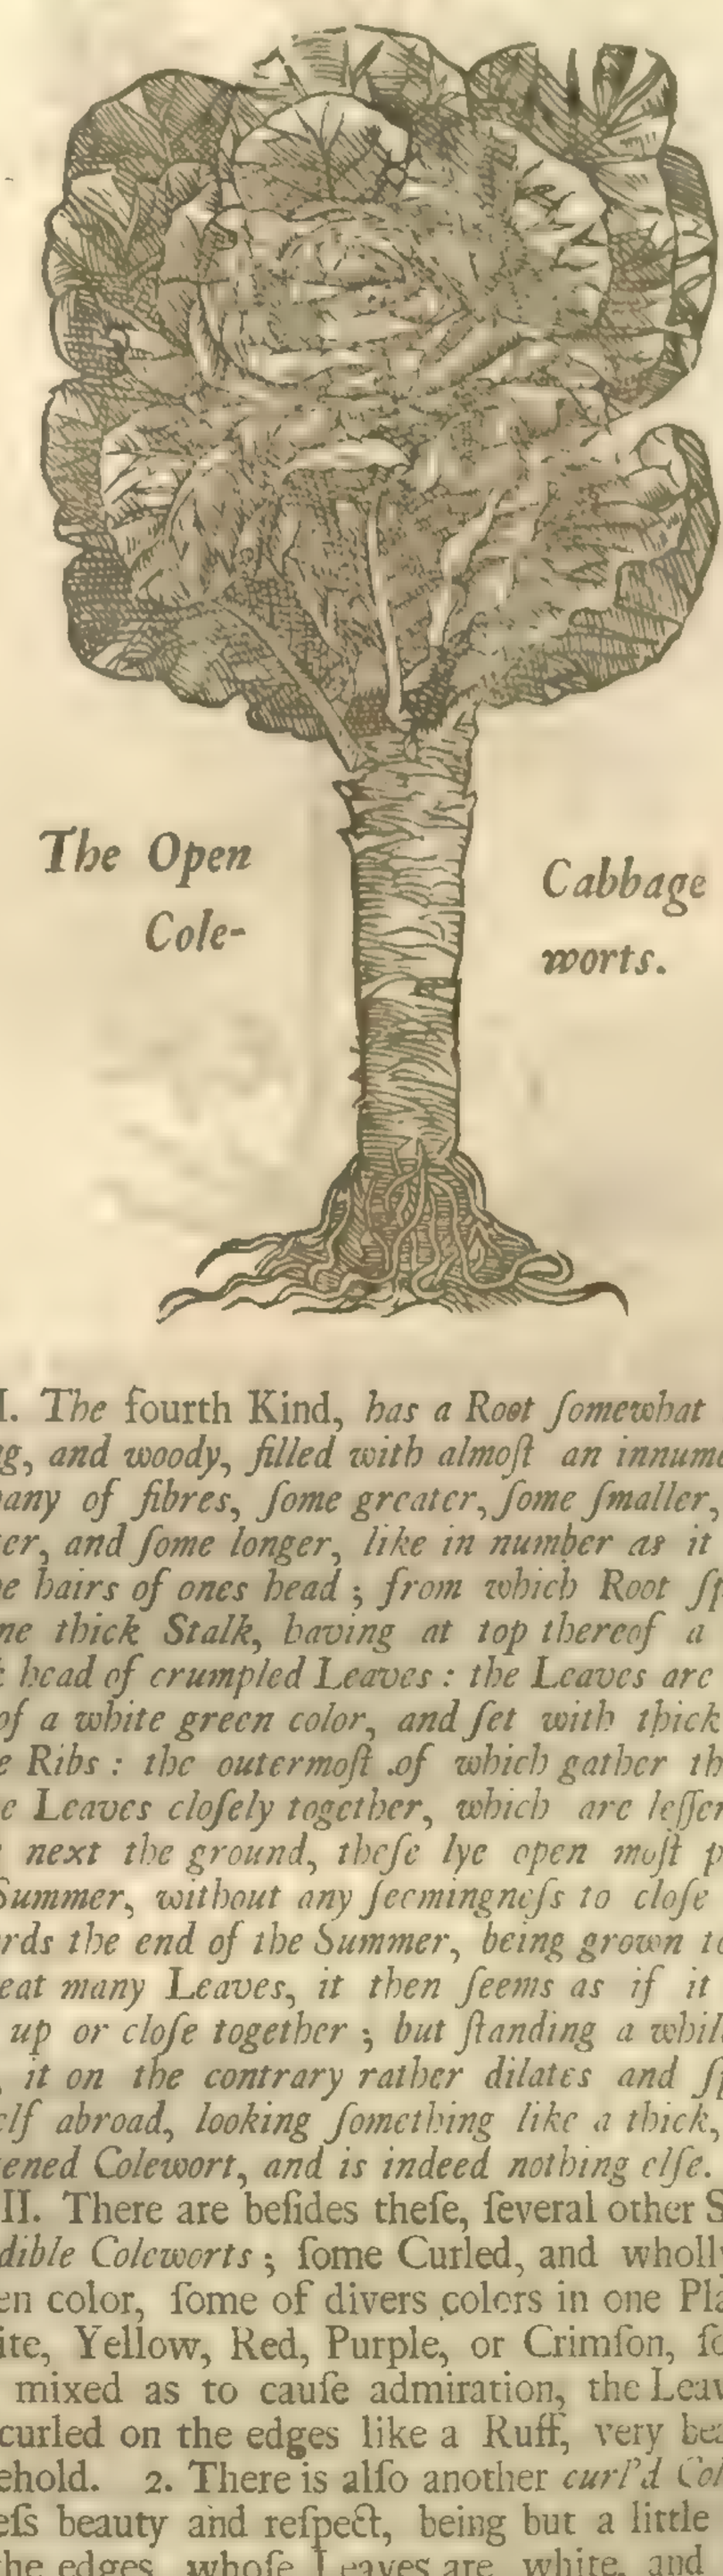
the Apothecaries, *Caulis*: In *English*, *Cole*, and *Colewort*.

II. *The Kinds.* There are two principal Kinds, *viz.* 1. *The Headed Colewort*, which is our Common Cabbage, of which we have at large Treated in *Chap.* 102. aforegoing. 2. *The not headed, or open Colewort*, of which there are several Species, *viz.* 1. *The Garden Kinds*, of which in this Chapter. 2. *The Cole-Flower*, of which in *Cap.* 144. 3. *The Wild Kind*, of which in *Cap.* 145. 4. *The Sea Colewort*, of which in *Cap.* 146. Of the Garden Kind there are many Species, as 1. *Brassica vulgaris sativa*, Our common Garden Colewort. 2. *Brassica sativa Crispa*, Curled Garden Colewort. 3. *Brassica Rubra*, The common Red Colewort. 4. *Brassica Patula*, The open Cabbage Colewort: Of all which in their order.

III. The Descriptions. *The first which is our common* Garden Colewort, *has a woody strong* Root, *with many Fibres or Strings adjoining to it: From which Root rise up many broad, thick, fat* Leaves, *of a deep black green color, through the middle of which Leaves runs in each a great* Rib, *which is thick and high on the backside, with many smaller* Ribs *or Branches rising from that middle* Rib, *of* Reddish, *Whitish, and Ash-colors. The Stalk grows out of the midst from among these Leaves, which spreads it self forth into several Branches, bearing at the top, small yellow Flowers: which* Flowers *being past, long Cods succeed, full of round Seed, like those of the* Turnep, *but smaller.*

IV. *The* second, *or* Crisped Kind, *has a Root, Stalk, Flowers, Cods, and seed not much differing from the former: but the greatest difference lyes in the magnitude, this being something lesser than the former; and in the Leaf, this being divided with many deep Cuts, even to the middle Rib on both sides, by which means it becomes rough every where in its edges, and very much Crisped or Curled.*

V. *The* third Kind, *is so like unto the first in its Roots, Stalk, broad, thick, fat Leaves, Flowers, Cods and Seed, that it would seem to be of the same individual Species, did not the color make the difference, that being of a green color, that of a Red, some of a deep purple, others of a lighter Red, and some of a reddish Green.*



VI. *The* fourth Kind, *has a Root somewhat thick, strong, and woody, filled with almost an innumerable company of fibres, some greater, some smaller, some shorter, and some longer, like in number as it were to the hairs of ones head; from which Root springs up one thick Stalk, having at top thereof a great thick head of crumpled Leaves: the Leaves are large, and of a white green color, and set with thick large white Ribs: the outermost of which gather the rest of the Leaves closely together, which are lesser than those next the ground, these lye open most part of the Summer, without any seemingness to close: but towards the end of the Summer, being grown to have a great many* Leaves, *it then seems as if it would shut up or close together; but standing a while at a stay, it on the contrary rather dilates and spreads it self abroad, looking something like a thick, hard, whitened Colewort, and is indeed nothing else.*

VII. There are besides these, several other Species of *edible Colewort*s; some Curled, and wholly of a Green color, some of divers colors in one Plant, as White, Yellow, Red, Purple, or Crimson, so variably mixed as to cause admiration, the Leaves being curled on the edges like a Ruff, very beautiful to behold. 2. There is also another *curl'd Colewort*, of less beauty and respect, being but a little curl'd on the edges, whose Leaves are white, and edged with green: or green and edg'd with white. 3. *There are two other sorts of Colewort*s, one of a Popinjay green color: the other of a fine deep green, like unto the Savoys. 4. There is the *Cole Rape*, which is also a *Colewort*, which bears a white Head, or headed Stalk above the ground, as large as a reasonable *Turnep*, but longer, and from the top whereof spring out divers great Leaves, like unto other *Colewort*s, among which rise up divers Stalks, which bear yellow Flowers, and Seed in

Pods, almoſt as ſmall as Muſtard Seed, whoſe Root is very long, and very thick or buſhy, with a vaſt number of Fibres.

VIII. *The Places.* They all of them grow every where through *England*, *Scotland* and *Ireland*, in *Gardens*, being chiefly nurs'd up to ſupply the *Markets*, and for the uſe of the *Kitchin*.

IX. *The Times.* They all Flower in *July*, and their Seed is ripe in the end of *Auguſt*.

X. *The Qualities.* They are temperate in reſpect to heat or cold, but are ſaid to be drying in the firſt Degree, and of a binding Faculty: and yet the Broth of the firſt boiling, ſome Authors ſay, looſens the Body; the ſecond Decoction (ſay they) is only Aſtringent. They abound with a certain Nitrous or Salt Quality, whereby they mightily cleanſe the Bowels, whether in their Juice or Broth: but the ſubſtance of the *Colewort* is of a drying and binding Faculty, becauſe in boiling it looſes its Saline Particles, and leaves them in the Decoction or Broth.

XI. *The Specification.* They are peculiar againſt Aſthma's, breathing Obſtructed, and ſhortneſs of Breath; for being of a cleanſing quality, by taking away the ſuperfluity of matter in the Lungs, and other Bowels, they ſo open the Paſſages, as to leave the parts for reſpiration free and clear.

XII. *The Preparations.* You may have therefrom, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *A Syrup made with Honey.* 4. *A Lohoch.* 5. *A Decoction.* 6. *A Collyrium.* 7. *A Cataplaſm.* 8. *Aſhes of the Stalks.* 9. *The Seed.* 10. *A Sallet.*

The Virtues.

XIII. *The liquid Juice.* *Pliny* ſays, that if it is mixed with Wine, and dropt into the Ears, it is beneficial againſt Deafneſs. *Dioſcorides* ſays, that if it is mixed with Juice of *Flowers de luce* and *Nitre*, that it will make the Body ſoluble. The Juice having ſome Nitre diſſolved in it, and uſed as an Errhine, up the Noſtrils, it purges the Head and Brain, of Cold, Moiſt, and Pituitous Humors.

XIV. *The Eſſence.* Being mixed with Wine, and ſo drunk, it helps ſuch as are bitten by Vipers or Adders, or any other Venomous Serpent. It is alſo good for thoſe who have been Poiſoned by eating Venomous Muſhrooms. Doſe three or four onnces twice a day.

XV. *The Syrup made of the Juice with Honey.* It is good againſt Coughs, Colds, Hoarſneſs, ſhortneſs of Breath, and loſs of Voice: and being often uſed, it cauſes eaſie Expectoration; heals the Lungs, and foreneſs of the Stomach, and ſo is good for ſuch as are entring into a Conſumption. Doſe two ounces two or three times a day, in Tent, Mallaga, *&c.*

XVI. *The Lohoch*, or *Electuary.* If it is made of the Pulp of the Stalks with Honey, it is good for ſuch as are ſhort winded, and are purſie, breath difficultly, and have a vehement Cough. You muſt take the middle fleſhy Ribs, boil them in Milk till they are ſoft, then take out their Pulp, and ſo mix it with Honey to a Lohoch or Electuary.

XVII. *The Decoction.* It encreaſes Milk in Nurſes; and being drunk, ſtrengthens the Nerves and Joints. And *Gerard* ſays, that if thoſe ſores in the Eyes called *Carcinomata*, be waſhed therewith, it heals them, though they could be healed by no other means. The firſt Decoction looſens the Belly, but the ſecond binds it: The firſt is ſaid to provoke the Terms, and cauſe Conception, but the ſecond hinders it. If the Decoction is made in Cock Broth, by boiling the Coleworts with the Cock, it will be a ſingular help for ſuch as are troubled with Wind, and Griping Pains in the Stomach and Belly. The ſame Broth, is alſo very good for thoſe who are troubled with Obſtructions of the Liver and Spleen; and for ſuch as have Stones, Gravel, Sand, or other Tartarous Matter in the Reins, Ureters, or Bladder. Taken before meat, it is a very good thing to keep one from Surfeiting, as alſo from Drunkenneſs, though they drink much Wine, by reſtraining and keeping down the Vapors, which otherwiſe would aſcend up, and intoxicate the Brain; and this it will the more effectually do, if it is made pleaſantly or gratefully ſharp with Juice of Limons. Swoln and Gouty Hands, Knees, Legs, and Feet, (into which groſs Humors are protruded or fallen) being bathed with Decoction of Coleworts Warm, eaſes the Pain, diſcuſſes the Humor, and takes away the Swelling. The *Decoction* (as alſo the *Juice* and *Eſſence*) cleanſes, dries, and heals Scabbineſs, old Ulcers, and filthy running Sores, being often waſhed therewith. And *Galen* ſays, it cleanſes ſo ſtrongly, that it will even Cure the Leproſie.

XVIII. *The Collyrium.* It is made of the Juice, Eſſence or Decoction, by diſſolving Honey in the ſame, three ounces of Honey to every Pint. This being often dropt into the Eyes, it clears the ſight by removing any Cloudineſs, Film, or Pearl: it is helpful againſt Inflammations and Blood-ſhot, and alſo cures ſore and running Eyes.

XIX. *The Cataplaſm.* Made of the Juice or Eſſence with Pouder of Fenugreek, and applied, it eaſes the Pains of the Gout, and diſcuſſes the Tumor: it alſo heals filthy running Sores, and old putrid Ulcers. If it is made of the Leaves beaten to a Pultice, it prevails againſt all ſorts of Inflammations, and hot Tumors. If it is made of the Herb or Juice, made into a Body with Barley Meal or Flower, and a little Common Salt, it is ſaid to break Carbuncles, or at leaſt ſome kind of Tumors, which much reſemble them. If it is made up into a Peſſary,

ſtrv. and ſo put up the Womb, it provokes the Terms,

XX. *The Aſhes of the Stalks.* They are wonderfully drying and piercing, ſo that they almoſt become Cauſtick; being mixed with Hogs Lard, the mixture is very effectual to anoint the ſides and Stomach of ſuch, who have of a long time been pained in thoſe parts, or in any other place, where the pain ariſes from the oppreſſion of the Spleen, or excels of the Melancholly Humor, by helping to digeſt it, and diſcuſſing flatulencies.

XXI. *The Seed.* Being bruiſed and drunk, it kills Worms, as *Galen* ſays: it alſo takes away freckles of the Face, and other parts of the Skin, Sunburnings, Tanning, Scurf, Morphew, and other Deformities thereof. *Athenæus* alſo ſays, that it takes away Drunkenneſs.

XXII. *The Sallet.* The fourth ſort eaten raw, being chopt ſmall, and dreſs'd up with Vinegar, Oil, Salt, and Muſtard, ſtrengthen the Stomach, cauſe a good Appetite, preſerve from Drunkenneſs, and cauſe a good Digeſtion. The firſt kind, or any of the reſt, being boiled with Meat till they are ſoft, then chopt ſmall, and dreſs'd up with melted Butter, Vinegar and Salt, become an admirable Sallet for ſuch as have weak Stomachs, or are going into a Conſumption, have dim Eyes, are affected with the Spleen, Flatulencies or Melancholly, or are troubled with Tremblings of the Limbs, or the Palſie. The Ancient *Romans* thought them to be effectual againſt all Diſeaſes of the Body, whether Inward or Outward, for which reaſon *Chryſippus* wrote a whole Volume of their Virtues, applying them to all parts of the Body. And that the Senate of *Rome* having expell'd all the Phyſicians out of their Territories for the ſpace of ſix hundred Years, did for all that length of time, preſerve and maintain their health, againſt the aſſaults of all Diſeaſes, by the only uſe of theſe Plants.

CHAP. CXLIV.

Of COLE-FLOWER.

I. *THE Names.* I cannot find that this Plant was ever known to the *Greeks*; for which reaſon it has no *Greek* name: or yet that the Ancient *Romans* had any knowledge thereof: but our Modern Authors call it in *Latin*, *Braſſica florida*, *Caulis florida*, *Cauli flora*, *Braſſica Cypria*, in *Engliſh*, *Cole Flowers*, and *Colle-Flowers*.

II. *The Kinds* It is a ſingular Plant, but is certainly one of the Kinds of *Coleworts*: and that Species, which *Pliny* lib. 19. cap. 8. calls *Braſſica Pompeiana*.

III. The Deſcription. *It has a Root ſpread out into ſeveral pretty thick Branches, which are full of Fibres or Strings, from which ſpring forth divers large Leaves, which are large, of a whitiſh green color; very like to* Cabbage Leaves, *ſlightly indented about the edges, yet ſmaller, narrower ſomewhat, and ſharper pointed than thoſe of* Cabbage: *In the midſt of which Leaves, ſometimes in the beginning of Autumn, and ſometimes ſooner, there riſes up a great white Head of white hard Flowers cloſely thruſt together, ſometimes they are of a Milk, or Cream, or yellowiſh white color: theſe never open, or ſpread much with us, and are then fitteſt for the Table, the green Leaves being cut away cloſe to the Head: in all the other parts, the Plant is like to the* Cole-worts. *Theſe Flowers have a much pleaſanter taſte than other* Coleworts *or* Cabbages *of any kind, and therefore are the more Valuable as for Food.*

IV. *The Places.* They grow in moſt parts of *Europe*, but very plentifully in *England*, *Scotland* and *Ireland*, and are only nouriſhed up in *Gardens*.

V. *The Times.* The *Colle-Flower* muſt be planted in *April* in a Bed of hot Horſe-dung, and covered with Straw, or the like, to keep it from cold and froſty Mornings; and having gotten about ſix Leaves, then it is to be removed into the place where you deſign it ſhall grow. The *Flowers* are in their Prime in moſt of the Summer Months.

VI. *The Qualities, Specification, Preparations and Virtues*, are the ſame with *Cabbages* and *Coleworts*, of which we have already ſpoken in *Cap.* 103. and 143. aforegoing, to which you are referred: only take this Note, That for the Table and Food, this is much the more excellent and noble Plant. *Note alſo*, That being boiled in Milk, and then eaten with Sweet freſh Butter, and Salt, and Juice of Limons, they have been found to reſtore admirably in Conſumptions.

CHAP. CXLV.

Of COLEWORT Wild.

I. *THE Names.* It is called in *Greek*, Κράμβη ἄγρια: In *Latin*, *Braſſica Sylveſtris*: and in *Engliſh*, *Wild Colewort*.

II. *The Kinds.* It is a ſingular Plant, and the ſecond Species of *Coleworts*, being the Wild Kind.

III. The Deſcription. *It has a Root pretty thick, ſpread into ſome Branches, with ſeveral Fibres adjoining, white, hard, and ſomewhat woody, from whence riſe up ſeveral Leaves, and one principal Stalk. The Leaves are long and broad, not much unlike*

unlike the Common Garden Colewort leaf in ſhape, faſhion and color, but that they are leſs, (as is alſo the whole Plant) being greyiſh, long, roundiſh leaves, much gaſhed or torn on the edges. Among theſe ground Leaves riſes up the ſaid Stalk, bearing ſuch like, but ſmaller Leaves, which is ſpread forth into divers Branches: at the tops of which Branches, grow ſmall yellow Flowers, which being paſt away, they are ſucceeded by ſmall rough Pods, which contain within them ſmall round Seed. This Plant is of its own nature Wild, and therefore not uſed as Food, or ſought after for that purpoſe.

IV. *The Places.* It grows in moſt parts of *England* in open Fields, and new digged Ditch Banks, and ſuch other like Grounds: and is in ſome places Husbanded and Sown for the Seed ſake, which is many times very gainful.

V. *The Times.* It may be Sown in the Spring time, as in *March* and *April*, and ſometimes in *May*. It Flowers in *July*, and the Seed is ripe in *Auguſt* or *September*.

VI. *The Qualities, Specification, Preparations and Virtues*, are the ſame with thoſe of the Garden *Colewort*: (except in the matter of eating them as Food, which is wholly forborn:) and for any Medicinal Uſe, whether internal or external: The Wild is much to be preferred, as being much ſtronger, and ſo more powerful to all the purpoſes and intentions, the *Garden* are ſaid to be good for, or againſt

CHAP. CXLVI.

Of COLEWORT, Sea.

I. THE *Names.* It is called in *Greek*, Κεράμβη ἰαπώδης: In *Latin*, *Braſſica Marina*, *Braſſica Marina multiflora*, *Braſſica Maritima Bauhini*, *Braſſica Marina Monoſpermos*, *Braſſica Marina Anglica Gerardi*: In *Engliſh*, *Sea Colewort*.

II. *The Kinds.* It is the laſt of the principal ſorts of *Coleworts*, and a ſingular Plant of the Kind.

III. The Deſcription. *It has a Root ſomewhat Great, ſhooting forth many Branches under ground, having many Fibres alſo adjoined, and keeping its Leaves green all the Winter. From this Root riſe up ſeveral ſomewhat broad and large, thick wrinkled Leaves, and as it were curled about the edges, growing each upon a ſeveral thick Footſtalk, very eaſie to be broken, and ſo tender, that they can ſcarcely be handled without breaking, of a greyiſh green color; from among which riſes up a ſtrong thick Stalk, two feet or more high; Cubits, ſays* Gerard, *with ſome Leaves thereon, up to the top, where it branches much out; on every Branch ſtands a large Buſh of pale whitiſh Flowers, conſiſting of four Leaves apiece, which being paſt away, ſmall roundiſh, or thick and ſhort Pods come forth, containing each but one roundiſh, greyiſh Seed apiece, of the bigneſs of a Tare, or Vetch, and much greater than* Soldanella, *or* Sea Bindweed, *to which Plant this* Sea Colewort *is not in the leaſt meaſure akin; though ſome Authors have miſtaken the former, viz.* Soldanella, *for this latter.*

IV. *The Places.* It grows in many places upon the Coaſt of *England*, as well on the *Kentiſh* as *Eſſex ſhore*; at *Lidde* in *Kent*, and at *Colcheſter* in *Eſſex*: *Gerard* ſays it grows Naturally upon the Bayche and Shores of the Sea, where there is no Earth to be ſeen but Sand, and Rouling Pebble Stones, which they who grow near the Sea, call, *Bayche*: he found it growing between *Whitſtable*, and the *Iſle of Thanet*, near the Brink of the Sea, and in many places near to *Cocheſter*, and in other places by the Sea ſide.

V. *The Times.* It Flowers in the end of *June*, and all *July*, and the Seed is ripe towards the end of *Auguſt*.

VI. *The Qualities, Specification, Preparations and Virtues*, are the ſame with thoſe of the *Garden Colewort*, (except thoſe various Preparations and Uſes of them for Food) but in all the caſes there mentioned, this is the ſtronger, and more efficacious.

VII. *Note* 1. *The Decoction of the Sea Colewort*, (ſome Authors ſay) doth by its bitter Quality, and ſharp Nitrous Particles, open the Belly, and purge the Body; but as *Galen* thinks, not without ſome hurt or damage thereto, becauſe it differs much from the Temperature of our Bodies, being hotter and drier than the Garden Kinds: For as all other

Wild

Wild Herbs are more potent or ſtronger in their Operations, ſo alſo this; for which reaſon it digeſts and cleanſes more powerfully than the others do.

VIII. *Note* 2. *The young Leaves* boiled in Lye of Pot-Aſhes, (as *Dioſcorides* ſays,) or in Fair Water (as is moſt uſual in our times) are eaten as other Coleworts are, by ſeveral poor People near the Sea, the boiling taking away much of the bitterneſs thereof.

IX. *Note* 3. *The young Leaves, or their Juice,* applied to Sores or Ulcers, cleanſes and heals them, diſſolves Tumors, or Swellings, and takes away Inflammations.

CHAP. CXLVII.

Of COLTS-FOOT.

I. *THE Names.* It is called in *Greek*, Βήχιον, alſo Χαμαιλεύκη: In *Latin*, *Tuſſilago*; but by the Apothecaries, *Farfara*, and *Ungula Caballina*, of ſome *Populago*, (from its likeneſs to the *Popular Leaves*;) *Farranum*, and *Farrugium Plinij*; of divers *Pala Equina*, alſo *Bechium*, *Chamæleuce*, (from the *Poplar Tree*, called in *Greek*, Λεύκη;) In *Engliſh*, *Colts-foot*, *Fole-foot*, and *Horſe hoof*: *Gerard* ſays, it may very well be called *Cough Wort*.

II. *The Kinds. Camerarius* makes three ſorts of *Bechium*, or *Tuſſilago*, *viz.* 1. The *True*, which we intend in this Chapter. 2. The *Petaſites*, of which we have treated before in *Cap.* 100. and the *Caltha Paluſtris*, or *Marſh Marigold*, which he calls *Tuſſilago major*, but is indeed no *Colts-foot*, and of which we ſhall treat in *Cap.* . folowing. The *true Colts-foot* is either *European* or *American*, the Deſcriptions of both which we deſign here. The *American* is called *Calcalia Americana*.

III. The Deſcriptions. *The* Engliſh, *or* European *Kind, has a Root ſmall and white, ſpreading very much in the ground, ſo that where it once takes, the ground is very difficultly cleanſed from it again; for if any little piece or bit of it remains therein, it will from it ſpring forth afreſh. From this Root ſlender naked Stalks ſhoot up very early in the beginning of* March *or* April, *about a ſpan long, bearing at their tops ſmall yellow Flowers, which quickly fade away and after they are paſt, Leaves broad and ſomewhat roundiſh come up, yet ſometimes a little dented about the edges, much leſſer, thicker, and greener than thoſe of* Butter Burr, *with a little downy hoarineſs, over the upper ſide of the green Leaf, which may be rubbed away, and whitiſh or mealy underneath the Leaf.*

IV. *The* American *has a Root which conſiſts of a Buſh of blackiſh Threads or Fibres, (which abide the hardneſs of the Winter, both the Stalks and Leaves periſhing yearly,) but grow browniſh at the end: From this Root riſe up many round Stalks about a foot and half high, and two broad, and ſomewhat round, but pointed Leaves, a little dented about the edges, at each Joint of them; the upper Leaves being ſmaller, and little or nothing dented: at the tops of the Stalks come forth ſeveral Branches with many pure white Flowers, being but ſmall, and made of five Leaves apiece, riſing out of each husk, which being paſt, there ſucceeds ſmall long Seed, ſticking each to a little Downe, which are carried away together with the Wind: The whole Plant has little or no Smell, neither Root, Leaf, nor Flower, whatſoever* Cornutus *ſays to the contrary.*

V. *The Places.* It, *viz.* the firſt, uſually grows in wet grounds, as alſo in dryer places: It is found likewiſe near unto Springs, and on the brinks of Brooks and Rivers, in wet Furrows, by Ditch ſides, and in Ditches, and in other moiſt and watry places near unto the Sea, almoſt every where. The *latter* grows in *America*, in many places of *Canada*, *New Eng-*

England, *New York*, *New Jersey*, *Pensylvania*, *Virginia*, and *Carolina*, in which last place I have found it several times, travelling through moist, wet, and Mooriſh places.

VI. *The Times.* The firſt begins to Flower in the end of *February*, or beginning of *March*, and the Leaves appear about the middle or latter end of *March*, when the Flowers are all gone, and remain green all the Summer long; and for this cauſe it has been thought that *Colts-foot* had never born Flowers, as *Pliny lib.* 26. *cap.* 6. has hinted.

VII. *The Qualities.* They are cold and dry in the firſt Degree; Apperitive, Aſtringent, Traumatick or Vulnerary, Pectoral, and Analeptick.

VIII. *The Specification.* They are peculiar againſt Coughs, and Diſeaſes of the Lungs.

IX. *The Preparations.* You may have therefrom, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *A Syrup.* 4. *A Decoction.* 5. *A Cataplaſm.* 6. *Dryed Leaves.* 7. *A Diſtilled Water.* 8. *Tinder.*

The Virtues.

X. *The liquid Juice.* Taken alone, or ſweetned with Sugar or Honey, it is prevalent againſt Coughs, Colds, Wheezing, Hoarſneſs, and other Diſtempers of the Lungs. Doſe from one to three ounces, Morning and Night at Bed time; and at other times of the Day, if the Cough is vehement.

XI. *The Eſſence.* It has all the Virtues of the Juice, but more powerful; beſides which, it is ſingularly good to cure Ulcers of the Lungs, and Stomach, as alſo the Bloody Flux, and Ulcers of the Bowels; it ſtops thin Rheums and Diſtillations, or Catarrhs, and helps in Conſumptions. Doſe from one ounce to three, two or three times a day, either alone, or mixed with the Diſtilled Water.

XII. *The Syrup.* It cures Coughs, chiefly dry Coughs; but has an Influence againſt all Diſtempers of the Breaſt and Lungs, being often taken, even by ſpoonfuls, as alſo with a Liquorice ſtick.

XIII. *The Decoction.* If it is made of the green Leaves and Roots, it cures a Cough proceeding from a thin Rheum, and helps Hoarſneſs, you may ſweeten it with Sugar or Honey.

XIV. *The Cataplaſm of the green Leaves.* If it is made alone, or with Honey, it is good to abate hot Inflammations, and Anthonies fire, and to cure other hot excretions of the Skin; and being applied, it is good to heal Ulcers, and other old and running Sores.

XV. *The Dryed Leaves.* Taken as Tobacco, they are good for thin Rheums, Diſtillations and Coughs: ſo alſo the Root taken in like ſort, as *Dioſcorides* and *Galen* ſay: *viz.* the Fumes of it, taken (from burning Coles) into the Mouth thro' a Funnel; as alſo the Fumes of the Leaves ſo taken (for I ſuppoſe the Ancients knew nothing of Tobacco Pipes, that being a Modern invention;) they effectually help ſuch as are troubled with ſhortneſs of Breath, and draw their Breath thick and often. The Fumes alſo ripen and break Apoſtems of the Thorax and Lungs, and that without any danger.

XVI. *The Diſtilled Water.* Uſed ſimply of it ſelf, or mixed with *Elder-flowers* and *Nightſhade*, it is a ſingular remedy againſt all hot Agues, to drink two ounces at a time, and to have Cloths wet therein, and to be applied to the Head and Stomach. The ſame applied to hot Swellings, or any Inflammation, does much good, and prevails againſt Burnings and Scaldings, and Anthonies fire. It is ſingular good alſo to take away red Pimples, Wheals, and other ſmall eruptions of the Skin, which ariſe through heat; and is profitable againſt the inflammation of the Piles, and burning heat of the Privy Parts, cloths being wet therein and applied.

XVII. *The Tinder.* It is made, as *Matthiolus* ſays, of the Cotton or white Wool, which grows in ſome parts of the Root; the ſaid Cotton being cleanſed from the Roots, and bound up hard in Linen Cloths, and boiled in Lye for a while; then adding ſome Salt-petre to it, it is to be dried in the Sun. This, ſays *Parkinſon*, is the beſt Tinder to take Fire that can be, being ſtruck from a Flint. Applied to moiſt Ulcers, it dries up their Humidities.

CHAP. CXLVIII.

Of COLUMBINE.

I. *The Names.* It is ſaid to be called in *Greek*, Πόθος, as *Coſtæus* thinks from *Theophraſtus*, *lib.* 6. *cap.* 7. and yet ſome think the *Greeks* knew nothing at all of it: *Dalechampius* upon *Athenæus*, calls it, Διοσάνθος, *Dioſanthos*, i. e. *Flos Jovis*. *Fabius Columna*, in his *Phytobaſanos*, to whom *Cluſius* gives the greateſt approbation, refers it to the Ἰσόπυρον, *Iſopyrum Dioſcoridis*. In *Latin*, it is called, *Aquileia*, *Aquilina*, *Aquilegia*, *Aquilegia Roſea*, *Aquilegia Stellata*, *Leontoſtomum Geſneri*, *Herba Leonis*: and in *Engliſh*, *Columbine*.

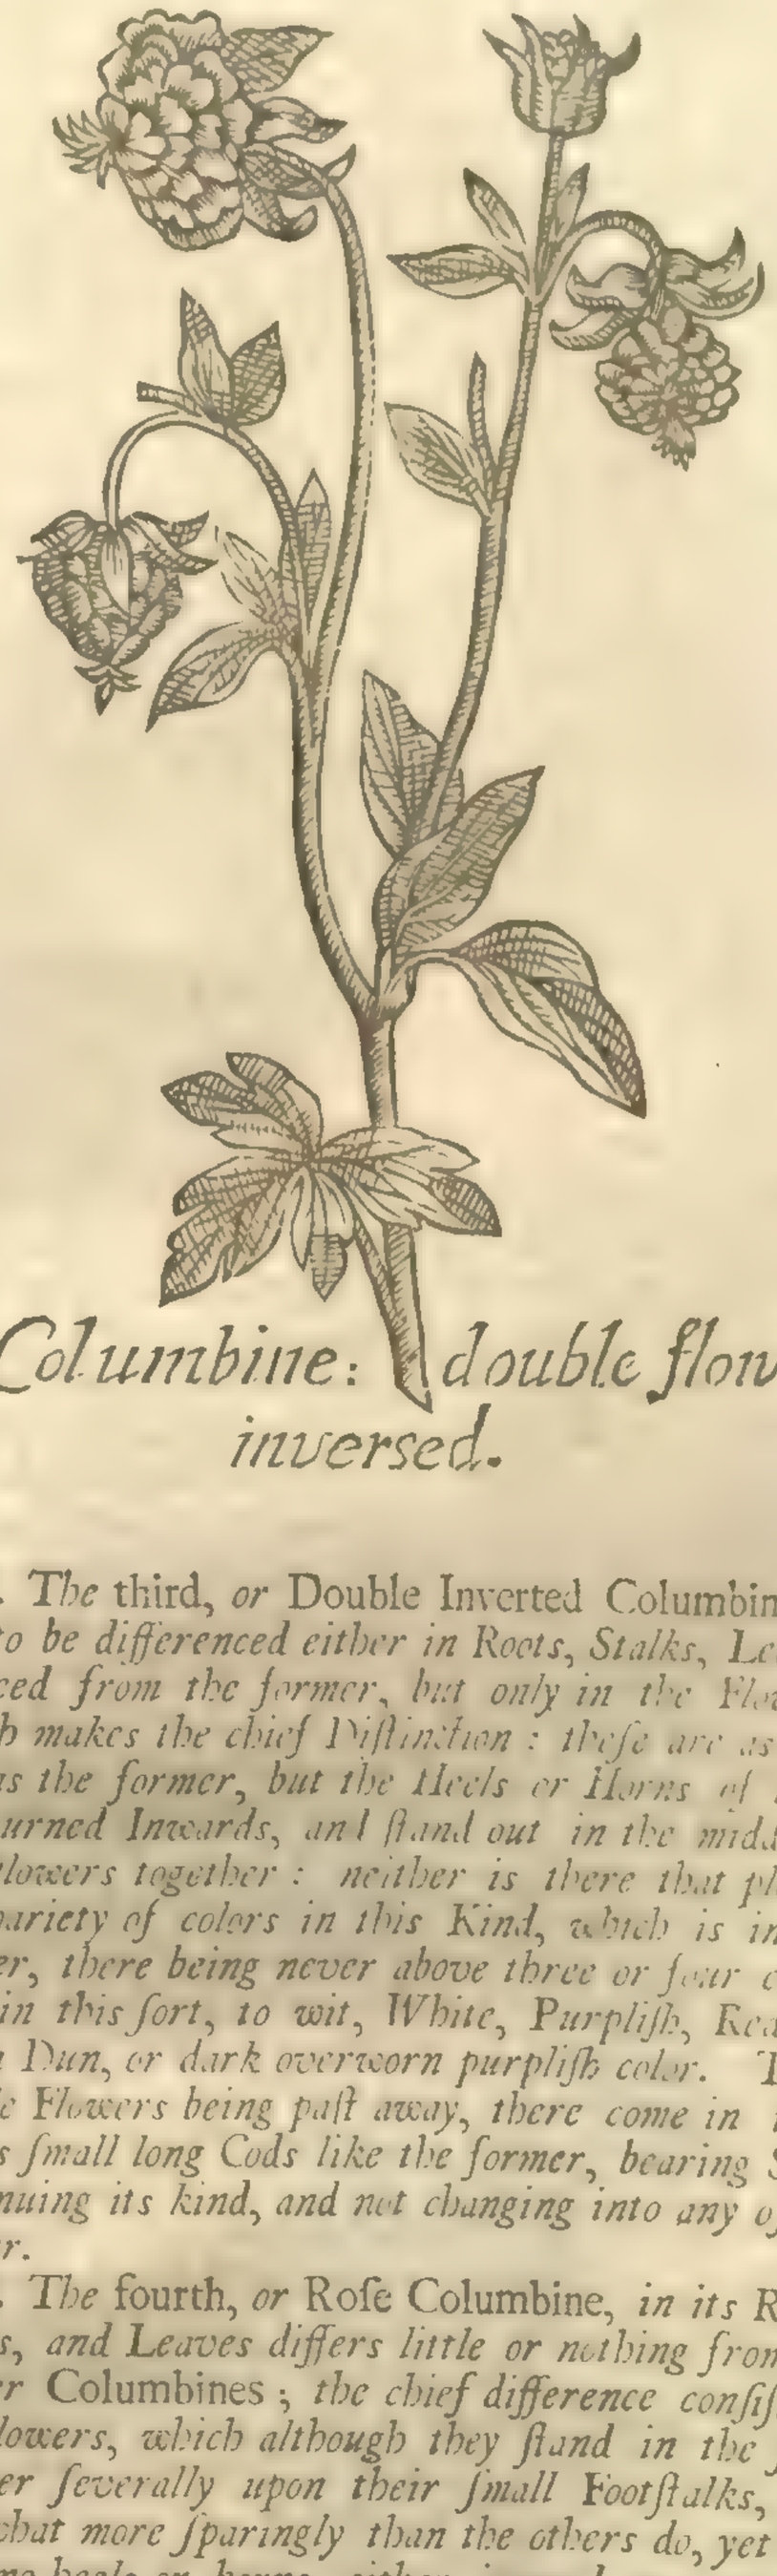
II. *The Kinds.* Authors deſcribe many Kinds hereof, but thoſe which we ſhall treat of, are theſe ſeven following: 1. *Aquilegia Vulgaris flore ſimplici*, The Common Single Columbine. 2. *Aquilegia Vulgaris flore pleno*, Common Double Columbine. 3. *Aquilegia inverſis Corniculis*, Double inverted Columbines. 4. *Aquilegia Roſea*, The Roſe Columbine. 5. *Aquilegia Degener*, The Degenerate Columbine. 6. *Thalictrum* vel *Thalictrum Hiſpanicum album & purpureum*, *Ruta Paluſtris*, *Ruta Pratenſis*, *Pſeudorhabarbarum*, Tufted Columbines, White and Purple. 7. *Aquilegia Virginiana flore rubeſſente præcox*, The early red Columbine of *Virginia*.

III. The Deſcriptions. *The firſt has Roots thick and round, for a little way within the ground, and then it is divided into Branches, furniſhed with many*

ny small Fibres, abiding many Years; and from the round Heads of the Roots which abide all the Winter, shooting forth afresh every Spring, both Leaves and Stalks. The Leaves are divers, and large spread, standing on long Footstalks, every one divided into several parts, and roundly indented about the edges, in color of a blewish green, and not much unlike to the Great Celandine. *The Stalks rise up sometimes two or three feet high, reddish, and slightly haired, which usually spread themselves into many Branches, bearing one long divided Leaf at the lower Joint, above which the Flowers grow, every one standing on a long Footstalk, consisting of five hollow Leaves, crooked or horned at the ends, turning backward, the Flower is open, shewing almost like to little Birds (*says Gerard*) and hollow. The variety of their colors are very much, for some are wholly white, some blew, some of a violet color, others of a blush or flesh color; some of a deep* Red, *some of a pale* Red, *some of a dead* Purple, *or dead* Murry, *and some of mixt colors, as nature is pleased to exert her powers, all which to distinguish severally would be to little purpose, they being so commonly known. The Flowers being past, small long Cods appear, four or five together, in which are contained small black, and glittering or shining Seed.*

Columbine manifold double.

IV. Double Columbine *has a Root like the former, and differs not in Leaf or manner of growing from the* Single; *so that until they come to flower, they cannot be discerned one from another; the only or chief difference is, that this bears very thick and double Flowers, that is, many horned or crooked hollow Leaves set together, which Leaves are not so large as the Leaves of the single Flowers. The variety of colors in this Double Kind is as great or plentiful, or rather more than in the Single, for of those there are party-colored blew, and white, and spotted variably, which are not in the Single Kind, as also a very deep* Red, *very thick and double, but a smaller Flower, and less plentiful in bearing, than many other of the Double sorts. These Double bear as good Seed as the Single Kinds, which thing is not observed in many other Plants.*



Columbine: double flow inversed.

V. The third, *or* Double Inverted Columbine, *is not to be differenced either in Roots, Stalks, Leaves, or Seed from the former, but only in the Flowers, which makes the chief Distinction: these are as double as the former, but the Heels or Horns of these are turned Inwards, and stand out in the middle of the Flowers together: neither is there that plentiful variety of colors in this Kind, which is in the former, there being never above three or four colors seen in this sort, to wit,* White, Purplish, Reddish, *and a* Dun, *or dark overworn purplish color. These double Flowers being past away, there come in their places small long Cods like the former, bearing Seed, continuing its kind, and not changing into any of the former.*

VI. The fourth, *or* Rose Columbine, *in its Roots, Stalks, and Leaves differs little or nothing from the former* Columbines; *the chief difference consists in the Flowers, which although they stand in the same manner severally upon their small Footstalks, but somewhat more sparingly than the others do, yet they have no heels or horns, either inward or outward, or very seldom; but stand sometimes with eight or ten small, smooth, plain Leaves, set in order one by one, as in a Compass, in a double row, and sometimes with four or five rows of them, every one directly before the other, like unto a small thick double Rose laid open, or a spread Marigold: but sometimes it happens, that some of these Flowers will have two or three of the first rows of Leaves, without any heel; and the rest which are inwards, each of them with a piece of a small heel or horn at them, as the former have. The colors of these Flowers are almost as variable, and as variably mixt, as the former double kinds. This also gives its Seed, which for the most part preserves its own kind in perfection.*

VII. *The* fifth *or* Degenerate Columbine *holds the proper form of a* Columbine, *being much like to the Double Roſe kind, but that the outwardmoſt row of Leaves are larger than any of the reſt inwards, and is of a greenish, or of a purpliſh green color, which is not altogether ſo apt to give good Seed like the former. This kind of* Columbine *might ſeem to ſome to be but a caſual Degeneration, and no true natural kind, happening by ſome cauſe of Tranſplanting, or otherwiſe by Art; but finding it to hold and keep its own proper Species, (being raiſed from its own Seed) and not variouſly to change into other forms, I am obliged, I think, to conclude the contrary.*

VIII. *The* fixth, *or* Spaniſh Tufted Columbine, *has a Root made of many long yellow Branches and Strings, which endure many Years, and encreaſe much. Theſe Plants (whether white or purple) have both one form in Roots, Stalks, Leaves, and Flowers, and therefore need but one Deſcription: The Leaves are both for color and form, ſo like unto* Columbine *Leaves (tho' leſſer and darker, yet more ſpread, and on larger Stalks) that they may eaſily deceive one, that does not conſiderately obſerve them. For the Leaves are much more divided, and in ſmaller parts, and not ſo round at the ends. The Stalks are round, ſtrong, and a yard high at leaſt, branching out into two or three parts, with Leaves at their ſeveral Joints; at the tops whereof ſtand many Flowers, which are nothing but a number of Threads, made like unto a ſmall round Tuft, breaking out of a white Skin or Leaf, which incloſes them, and which being unblown, appear like unto little Buttons. The color of theſe Threads or Tufts are whitiſh, with yellow Tips on them, and ſomewhat purpliſh at bottom, having a ſtrong, but no good or pleaſant Smell. They abide in their Beauty (more eſpecially if they grow in the ſhade, and not too hot in the Sun) a great while, and then fall away like ſhort Down, or Threads: The Seed Veſſels are three ſquare, containing ſmall, long, and round Seed. The purple* Tufted Columbine *differs only from the white, in that it is not full ſo high, nor ſo large, and that the color of the Flowers or Tufts, is a blewiſh purple, with yellow Tips, and is much more rare than the white.*

IX. *The* ſeventh, *or* Virginian Columbine, *has a Root long, with many Fibres thereat, but differs little from our common ſingle ſort, except in the following particulars. The Stalk (*Cornutus *makes to be a Dwarf, but) is as tall as our common* Engliſh, *and of a reddiſh color. The Leaves are ſmaller, and ſomewhat like to thoſe of the* Thalictrum *laſt deſcribed, or* Meadow Rue, *but of a paler green color. The Flowers are of a pale reddiſh color, and ſingle from the middle of them to the ends; but yellowiſh from thence to the bottom; the ends of whoſe Leaves are not blunt, as in ours, but ſtiff, rough, and pointed, within which horned Leaves there are five other ſmaller, and of a reddiſh color alſo, their points bending downwards, having many ſmall white Threads in the middle tipt with yellow; after which come five pointed horned Seed Veſſels, containing within them black ſhining Seed.*

X. *The Places.* They all grow with us in our *Gardens* as Garden Flowers: but *Cluſius* ſays, that the ſingle kinds have been often found on ſome of the Woody Mountains in *Germany*. The ſeventh Kind is a Native of *Virginia*, and was brought to us from thence by *John Tradeſcant*.

XI. *The Times.* They moſt of them flower not until *May*, and for the moſt part of *June*, and (as *Gerard* ſays) in *July*, their Seed ripening in the mean time. The *Aquilegia Virginiana*, or *Virginian* Kind, flowers ſomewhat earlier than any of the other Kinds, uſually ſooner by a Month.

XII. *The Qualities.* They are Temperate in reſpect of Heat or Coldneſs, Dryneſs or Moiſture: Aperitive, Abſterſive, and Aſtringent; Hepatick, Nephritick, and Hyſterick, Alterative, Vulnerary, and Lithontriptick.

XIII. *The Specification.* It facilitates the Delivery of Women in Child-bed.

XIV. *The Preparations.* You may have, 1. *A liquid Juice from the Herb and Root.* 2. *An Eſſence from the ſame.* 3. *A Decoction in Wine.* 4. *A Lotion.* 5. *A Pouder of the Seed.* 6. *The Root of the Common Kinds.* 7. *The Root of the Tufted Kind.*

The Virtues.

XV. *The liquid Juice.* Mixed with Milk and Honey, it is good to heal ſore Mouths: and taken four or ſix ſpoonfuls at a time in White Port Wine, Morning and Night, it opens Obſtructions of the Liver, and prevails againſt the Jaundice.

XVI. *The Eſſence.* It has more potently the Virtues of the Liquid Juice, beſides it is of excellent uſe to heal old running Sores, and putrid Ulcers: and being taken for ſome time, it is an admirable thing againſt Obſtructions of the Reins and Bladder.

XVII. *The Decoction of the Herb and Root in Wine.* This being perfumed with ſome Grains of Ambergriſe, is good againſt thoſe Swoonings, which the *Greeks* call ἀδυναμία; as alſo to open the Obſtructions of the Liver, Reins, and Womb.

XVIII. *The Lotion.* It is made of the Leaves boiled in Milk or Poſſet-drink, and ſweetned a little with Honey; it is good againſt the ſoreneſs of the Throat, alſo prevails againſt the Inflammation, Swelling, Falling and Excoriation of the Uvula; Cankers in the Mouth and Gums, and other moiſt and running Sores in thoſe parts; all which it heals by Virtue of its drying and binding Quality.

XIX. *The Pouder of the Seed.* Given to one dram in Wine, with ten grains of Saffron, it opens the Obſtructions of the Liver, and helps againſt the yellow Jaundice, as *Tragus* ſays, but he adviſes that the Patient after taking of it ſhould be laid in a warm Bed, and made to Sweat well thereupon. *Cluſius* ſays, that a Phyſician in *Bruges* gave it to Women in Travel (in a Glaſs of Wine) to cauſe ſpeedy Delivery, repeating it two or three times, as need required.

XX. *The Roots of the Common Kinds.* *Camerarius* ſays, that in *Spain* they eat the Root for many days together, to help ſuch as were troubled with the Stone in the Reins.

XXI. *The Roots of the Tufted Kind.* They are ſaid to have the Virtues of *Rhubarb*, by reaſon that (beſides their being yellow) they have an opening and drying Quality, as *Rhubarb* has. They are good (as *Dioſcorides* ſays) to cleanſe and dry old Ulcers, and to heal them. *Camerarius* ſays, that in *Italy* they are uſed againſt the Plague; and in *Saxony* againſt the Jaundice.

CHAP. CXLIX.

Of COMFREY.

I. *THE Names.* It is called in *Greek*, Σύμφυτον, ἢ Σύμφιτον, *à facultate Glutinandi*: alſo Πηκτὸς, ἢ Πηκτὸν, as *Dioſcorides* ſaith: In *Latin*, *Symphytum*, *Symphitum*, *Conſolida*, *Conſolida major*; and by

by ſome *Solidago*, *Oſteocollon* (a Bone Soderer) and by *Scribonius Largus*, *Inula Ruſtica*: and in *Engliſh*, *Comfrey*.

II. *The Kinds.* Authors make ſeveral ſorts of *Comfrey*; but the three following are only, or chiefly to be had in *England*, *viz.* 1. *Symphitum majus vulgare*, Our Common Great Comfrey. 2. *Symphitum majus flore purpureo*, Our Great Comfrey with purple flowers. 3. *Symphitum Tuberoſum*, Tuberous Comfrey, or Comfrey with knobbed Roots.

Comfrey *with Purple Flowers.*

III. The Deſcriptions. *The firſt of theſe hath Roots which are large and long, great at the head, and ſpreading it ſelf out into great, long, and fleſhy Branches under ground, black on the outſide, and white within, ſhort and eaſie to break, and full of a Viſcuous or Clammy Juice, having little or no taſte in it. From this Root ſprings forth divers very large and hairy dark green Leaves, lying on the ground, ſo hairy or prickly, that if they touch any tender part of the Hand or Face, or other part of the Skin, it will cauſe it to itch or tingle. From among theſe Leaves riſes up a Stalk, two or three feet high, hollow and cornered, which is alſo very hairy, having many ſuch like Leaves on it as grow below, but leſſer and leſſer up to the top, which are long, rough, pretty broad, and ſharp pointed. At the Joints of the Stalks, it is divided into many Branches with ſome Leaves thereon; and at the ends ſtand many Flowers in order, one before, or above another, which are ſomething long and hollow, like the finger of a Glove, of a pale whitiſh color, after which comes ſmall black Seed.*

IV. The ſecond Kind *in its Roots, Leaves, Stalks, Flowers, and manner of growing, is altogether like the former; and differs from it only in this, that, as to the whole body of the Plant, it is ſomewhat leſs: and as to the Flowers, that theſe are of a pale purple color.*

V. The third Kind, *has a large Tuberous or Knobbed Root, which Branches it ſelf out into other Thick and Tuberous parts, more Tuberous or Knobbed towards their ends, with ſeveral Fibres adjoining, black on the outſide, and yellowiſh within, repleniſhed with ſuch Viſcous, Glutinous or Clammy Juice as the others, but not altogether ſo ſlimy: The Roots are alſo as tender and eaſie to be broken, or more eaſie than the others, and ſpread themſelves under ground in like manner. From this Root riſes up a hairy, creſted, or cornered Stalk, not ſo high as the former, with ſmaller Leaves, and more thinly ſet thereon,*

of the ſame form, and greenneſs, that thereby it may at the firſt ſight be known to be a Comfrey, *by any who has well obſerved the Common Kind; but more eſpecially when the top Branches are in Flower; which being placed after the ſame manner, and of the ſame hollow faſhion, but ſmaller, are of a more ſad yellowiſh color; whoſe Seed following is alſo like the Seed of the other Kinds. The Stalks and Leaves Dye away, or periſh every Year, as they do in the others, the Roots abiding and increaſing in the Earth, and ſhooting forth new Stalks and Leaves every Spring. Some make a leſſer Species of this Tuberous Kind, which if there is any ſuch thing, I am apt to believe, ariſes only from the differing goodneſs of the Soil; a fat and rich Soil making or producing a larger Plant than that can do which is poor and lean.*

VI. *The Places.* The two firſt grow by Ditches and Water ſides, and in divers low, fat, and moiſt Fields, Orchards and Grounds; for in ſuch they chiefly delight to grow: The firſt is found generally through all *England*; The ſecond but in ſome particular places: The third grows with us only in *Gardens*, but is found Wild in Woods and moiſt places in *Auſtria*, *Hungary*, and *Germany*.

VII. *The Times.* They flower in *June* and *July*, and perfect their Seed in *Auguſt*. There are ſeveral of the *Conſolida's*, which have their different times of their flowering and ſeeding, as, 1. The *Symphitum*, or *Conſolida Petræa*, of which *Dioſcorides* ſpeaks. 2. *Conſolida Saraſenica*, Saracens Confound. 3. *Conſolida Media*, Bugle, or Middle Confound. 4. *Conſolida minor*, *Prunella*, or Self-heal. 5. *Conſolida Media*, vel *Bellis major Vulgaris*, The Great White Wild Daiſie. 6. *Conſolida minor*, vel *Minima*, *Bellis minor Sylveſtris*, The Common Small Field Daiſie. But as theſe are all of them different Plants, and not a *Species* of one and the ſame *Genus*, nor properly any of the *Comfreys*, ſo we ſhall ſay nothing of them here, but to avoid Confuſion treat of them in their ſeveral and reſpective Chapters; our intention being in this Chapter, to treat of that Plant, which we properly call *Comfrey*, and the *Latins*, *Symphitum majus*, which is of ſeveral ſorts, as are before deſcribed.

VIII. *The Qualities.* It is cold and dry in the firſt Degree: Aſtringent, Anodyn, Repercuſſive and Vulnerary: Neurotick, Pectoral, and Arthritick; Alterative, Antiemmenagogick, and Analeptick.

IX. *The Specification.* It is of a Clammy and Glewing Nature, and is peculiar againſt Fuxes of Blood, of what kind ſoever, whether internal or external.

X. *The Preparations.* You may have therefrom, 1. *A Juice of the Leaves and Roots.* 2. *An Eſſence of the ſame.* 3. *A Syrup of the Juice of the Root.* 4. *A Decoction of the Root.* 5. *A Pouder of the Root.* 6. *A Balſam of the Root.* 7. *A Cataplaſm of the Root.* 8. *A Diſtilled Water.* 9. *An Acid Aqueous Tincture.*

The Virtues.

XI. *The Juice of Leaves or Roots. Camerarius* ſays, that two ounces of it being drank at a time, does much good in the Lethargy, and Dead Sleep: it is drying and binding in a great meaſure, and is good for ſuch as ſpit Blood, bleed at Mouth, or make a bloody Urine: yet it opens Obſtructions of the Lungs, and cauſes eaſie Expectoration.

XII. *The Eſſence.* It has all the former Virtues, but is much more effectual to ſtop any Flux of Blood, in any part whatſoever. It prevails againſt all inward hurts, bruiſes and wounds, cleanſes Ulcers of the Lungs, drys and heals them; and being taken Daily, Morning and Evening, it prevails againſt Catarrhs, and ſtops the defluxion of Rheum from the Head upon the Lungs; fluxes of Blood, or Humors by the Belly, and the immoderate or overflowing of the Courſes in Women: It ſtops alſo the overflowing of the Whites; and (univerſals being premiſed) it cures a Gonorrhæa, or Running of the Reins in Men, coming from what cauſe ſoever. Doſe two or three ounces in Red Port Wine.

XIII. *The Syrup of the Juice of the Root.* It has the Virtues of the Eſſence, but cauſes a better and more eaſie Expectoration out of the Lungs; is good againſt Coughs and Colds, Wheefings, and other like Diſtempers of thoſe Parts. It is ſaid to be good for ſuch as have broken Bones, becauſe it haſtens the breeding of the *Callous*; and for the ſame Reaſon, it is ſaid alſo to be good to cure Ruptures in Children. It is ſo powerful to Conſolidate or Knit together, whatſoever needs knitting, that if the Roots be boiled with fleſh cut into pieces, or very deeply flaſh'd, in a Pot, they will join them together again.

XIV. *The Decoction in Wine or Water.* It is good againſt inward Bruiſes and Wounds, inward Bleeding, Spitting, Vomiting, or Piſſing Blood, as alſo the Bloody or Hepatick Flux; and has indeed all the Virtues of the Juice, Eſſence and Syrup, (but not full out ſo effectual as they are) being drank to ſix or eight ounces, Morning, Noon, and Night. It is alſo good to cleanſe, dry, and heal external Wounds, Ulcers, and Running Sores, they being waſhed therewith once or twice a day.

XV. *The Pouder of the Root.* Being taken inwardly to one dram in a little of the Syrup, it ſtops inward bleeding, heals Wounds in the Stomach and Thorax, as alſo Ulcers in the Lungs. If it is applied to green Wounds, as ſoon as the Wound is made, it conglutinates or joins the Lips thereof together, and cauſes it ſpeedily to be healed: mixed with the Syrup, and applied to the Hemorrhoids or Piles, it cools the Inflammation, and repreſſes their over much bleeding, and allays the heat of the Parts adjacent, taking away, and eaſing all the pain.

XVI. *The Balſam of the Juice of the Root.* It is a ſingular Vulnerary, and cures ſimple green Wounds, generally at one dreſſing. It is digeſtive, and cleanſing, and dries up and heals running Sores, and old Ulcers, in any part of the Body, but chiefly in thoſe parts which are not depending; reſiſting Gangrenes, Mortifications, *&c.*

XVII. *The Cataplaſm of the Root.* If it is made of the ſimple Root, beaten into a Mucilage raw, and then ſpread upon Leather or Linnen Cloth, and applied to parts pained with the Gout; it gives preſent eaſe to the pain, and ſo admirably ſtrengthens the part, as that the Diſeaſe never returns any more from the old Cauſe; and this I have ſeveral times proved. If it is made of the Root boiled till it is ſoft in Water, and then beaten into a Pulp, adding to it the Pouder of the Root, enough to bring it to the Conſiſtence of a Cataplaſm, and it is preſently applied to any ſimple Green Wound, or Cut, it quickly heals it by conſolidating, or conjoining the lips theteof together: Apply'd alſo upon broken Bones, it facilitates and ſpeeds the Cure, by preventing a flux of Humors, inducing the *Callus*, and ſtrengthening the Part; and applied, is alſo profitable againſt Ruptures in Children. It is good alſo to be uſed to Womens Breaſts, which ſwell and grow hard and ſore by the abundance of Milk flowing into them, which it does by a repercuſſive Virtue: It alſo cools the Inflammation, abates the Swelling, and eaſes the Pain of the Piles, as experience has ſufficiently proved. It is alſo very profitable againſt moiſt and running Ulcers,

Gangrenes,

Gangrenes, Sphacelus, and the like, in which caſes it has been experienced, and found often helpful.

XVIII. *The Diſtilled Water from the Leaves, Stalks, and Roots thin ſliced.* It has the Virtues of the *Juice* and *Eſſence*, but very much weaker; yet Authors ſay, it is good for outward Wounds or Sores, whether in the fleſhy or nervous parts of the Body whereſoever; as alſo to take away the Fits of Agues, and allay the ſharpneſs of the Humors: but this it the more effectually does, if it is mixed with equal parts of the Liquid Juice or Eſſence.

XIX. *The Acid Aqueous Tincture. Take Spring Water, a gallon: Oil of Vitriol, or Oil of Sulphur* per Campanum *three ounces, mix them: then put into it of the pouder of the Root, ſix ounces: digeſt in a gentle Sand heat for a Month, ſhaking the glaſs three or four times a day: afterwards being well ſettled, decant the clear Tincture for uſe.* Given inwardly in Wine, or any other proper Vehicle, it ſtops inward bleedings, and ſtrengthens and reſtores the Tone of the Stomach: And mixed with Red Port Wine, it makes a good Lotion to cleanſe, dry, and heal any old Ulcer, or running Sore, and effectually deſtroys the Putridity (if any) therein.

CHAP. CL.

Of CONSOUND Saracens.

I. *THE Names.* It was unknown to the *Greeks*, and therefore among them we have no name for it. The *Latins* call it *Conſolida* (from *Conſolidare*, to Soder, Cloſe, or Glew up:) *Conſolida Saracenica*, (becauſe uſed by the *Turks* and *Saracens* in healing of Wounds:) *Herba fortis*, from its ſtrong Smell and Taſte: Alſo *Solidago*, and *Herba Vulneraria*: In *Engliſh*, it is called *Saracens Conſound*, alſo *Saracens Wound-wort.*

II. *The Kinds.* Authors make four Kinds thereof, *viz.* 1. *Solidago Saracenica vera ſalicis foliis, Conſolida Saracenica vera*, The true Saracens Conſound, or Wound-Wort. 2. *Solidago* vel *Conſolida Saracenica major Lugdunenſis*, The greater Saracens Conſound, or Wound-Wort. 3. *Solidago* vel *Conſolida Saracenica*, vel *Germanica Siliquoſa*, Codded Saracens, or German Conſound, or Wound-Wort. 4. *Solidago* vel *Conſolida Saracenica*, vel *Germanica altera, Conſolida Tertia Tragi, Herba Vulneraria Tragi, Tragus* his third Saracens Conſound, or ſecond German, which he alſo calls Wound Wort: Theſe Plants the *Germans* generally call *Vulneraria Turcica*, Turkiſh Wound Wort.

III. The Deſcriptions. *The firſt (which is the* True Saracens Conſound) *has a Root conſiſting of many Fibres or Strings, ſet together and growing from a Head, which periſh not in Winter, but continue, though the Stalks fade and dye away, without ſo much as a Leaf appearing in that Seaſon*: From *this Root proceed ſeveral long and narrow green Leaves, ſnipt about the edges, like to thoſe of the* Almond *or* Peach Tree, *or* Willow Leaves, *but not of ſuch a whitiſh green color*: From *amidſt theſe Leaves riſes up a Stalk or Stalks, very high, growing ſometimes to a Man's height, which are of a browniſh, or browniſh green color, and hollow, having many long and narrow green Leaves (as before deſcribed) ſet thereon. At the tops of the Stalks grow many pale yellow Star-like Flowers, ſtanding in green Heads; which when they are faden, and the Seed ripe (which is of a ſomewhat long, ſmall, and yelloweth color, and wrapped in Down) is carried away with the Wind. The Root and whole Plant is of a ſtrong and unpleaſant Smell and Taſte.*

IV. *The* ſecond, *or* Greater Saracens Conſound, *has a Root compoſed of a great Buſh of white Fibres or Threads, growing very deep and ſtrongly in the ground, and ſhooting forth ſtrings on all ſides, which produce new Plants, encreaſing in a little time, and over-running a great quantity of ground. From this Root ſprings forth a head of Leaves, which is ſomewhat brown at the firſt ſhooting out of the ground, (and ſo alſo is the head of the Root before the Spring,) which is of a bitter Taſte, and binding withal*: This *Plant differs not much from the former, and therefore from amidſt this head of Leaves, there riſe up upright, hard, round hollow Stalks, as high as the former, with many dark green Leaves at the firſt, ſet (as aforeſaid) at the head of the Root, which afterwards riſe up with the Stalks, and are ſet there without any order, ſomewhat larger than the others, and a little dented about the edges. The Flowers are much greater than thoſe of the firſt Kind, more in number, and with yellower long Leaves, Star faſhion, ſtanding in green heads many together; wherein, after they are paſt, is contained the Seed, which with the Down thereof, flies away with the Wind, in the ſame manner as the former does.*

V. The third, *or* Codded Kind, *has a Root which in time grows to be very great, even to the bigneſs of a Man's Arm, and runs very deep alſo into the ground (as thoſe who are acquainted with the Plant well know:) It is of a ſtrong unpleaſant Smell and Taſte, ſharper than* Creſſes, *and very like unto that of* Flixweed, *abiding many Years, but the Stalks periſh Annually, ſpringing forth afreſh from the ſame Root every Spring. Theſe Stalks thus Annually riſing up, are great, round and woody, and in height equal to any of the former, or rather (when they*

they have attained to their height) higher, but are so weak, by reason of the length and weight of the Leaves thereon, that they cannot stand upright, but fall down upon the ground, bearing many dark green Leaves thereon, long and narrow like to the first, with a white Rib in the middle, and snipt gently, or dented about the edges. At the tops of the Branches or Stalks, come forth many yellowish Flowers, but smaller than those of the other kinds, which being past away, there come forth very small and long round dark Pods or Cods, as small and long as those of Sophia Chirurgorum, *or* Flixweed, *which contain within them small brownish Seed, of a hot and quick, sharp and unpleasant Taste, as the whole Herb it self is, but much more the Root.*

VI. The fourth, *or* Tragus *his* German Confound, *has a Root which creeps in the ground, and shoots up Branches round about it, which are somewhat like both in Stalks and Leaves unto the middle kind of* Nep *or* Catmint, *with long Leaves, and white as they are. The Flowers come forth at the tops of the Stalks, many together, upon small, round, green heads, not unlike to the first sort, being small, and yellow. After that they are past, and the Heads, with the Seed, are ripe, they open themselves, and with the Down in them, the Seed is carried away with the Wind, after the manner of the first.*

VII. *The Places.* These do all grow in moist and wet grounds, by Wood sides, and sometimes in the moist places of shadowy Groves, as also by Water sides. The first of these has been found growing in *Shropshire*, in the Hedge, by the way as one goes from *Dudson* in *Cherberry Parish*, to *Guarthlow*. *Gerard* also says, that it grows by a Wood, as you go from Great *Dunmow* in *Essex*, unto *Clare* in the same County.

VIII. *The Times.* They Flower in *July*, and the Seed of the two first is soon after ripe and carried away with the Wind. The third has not its Pods and Seed ripe until the end of *August*, or beginning of *September*.

IX. *The Qualities. Saracens Consound*, (under which singular name we comprehend all the kinds) is temperate in respect to heat or cold, but dry in the third Degree; Astringent, Anodyn, Incarnative, and Vulnerary: It is Neurotick, Arthritick, Alterative and Analeptick.

X. *The Specification.* It is not inferior to any of the Wound-Herbs whatsoever, being inwardly given, and outwardly applied in suitable Preparations.

XI. *The Preparations.* You may have therefrom, 1. *A liquid Juice.* 2. *An Essence.* 3. *A Decoction in Wine or Water.* 4. *A Gargarism.* 5. *An Oil by insolation or boiling.* 6. *An Ointment.* 7. *A Balsam.* 8. *A Cataplasm.* 9. *A Distilled Water.* 10. *A Spirit.*

The Virtues.

XII. *The liquid Juice.* It cures internal Ulcers of the Lungs: I suppose it was with the Juice thereof, that *Gerard* (as he says) cured one *Cartwright*, a Gentleman of *Grays-Inn*, who was grievously wounded into the Lungs; and that in a short time: In this case, it will be the best way to make it into a Syrup with Honey. It cleanses, drys, and heals old Ulcers, and foul running Sores, and Consolidates Wounds by washing them.

XIII. *The Essence.* It has all the Virtues of the liquid Juice exalted, and is an excellent thing to give inwardly, for the cure of those who have lain long languishing with old, running Fistula's, ill-natured Ulcers, and other stubborn and rebellious putrid Sores; washing them also outwardly therewith, or injecting it with a Syringe. However the application of it to Green Wounds is a matter beyond all Exception. Inwardly taken, it opens Obstructions of both Liver and Spleen, and is profitable for the cure of the Yellow Jaundice.

XIV. *The Decoction of the Leaves in Wine or Water.* It has the Virtues of the former, but in a much lower Degree; and being made in Water, it is said to cure Agues or Fevers, even of a long continuance: Made with Wine, it opens Obstructions of the Gall Bladder, as also of the Liver and Spleen, and therefore is said to be prevalent against the Dropsie in the beginning thereof, and heals all inward Ulcers of the Reins, Ureters, or Bladder, or else where: It cures also inward Wounds and Bruises.

XV. *The Gargarism. Take of the Decoction in Wine a pint: of the Decoction in Water half a pint: Alum in fine Pouder a dram: mix and dissolve: then add choice Honey four ounces: dissolve, and just boil them up together.* It is excellent to heal a sore Mouth or Throat, by gargling therewith; and to wash Sores and Ulcers in the Privy Parts of Man or Woman: and to inject into Fistula's with a proper Syringe.

XVI. *The Oil made with Oil Olive*, &c. It is excellent against burnings and scaldings, and is proper against Pains and Aches in any part of the Body, arising from Cold: as also to anoint Nerves which are strained, or Joints which are weakned, by any extraordinary force, or by being put out of Joint. It is good also against dry Scabs or Scurf, to bring it off, and clear the Skin.

XVII. *The Ointment.* It heals green Wounds admirably; digests, cleanses, incarnates and drys running Sores, and old Ulcers, and is prevalent against fractures of the Bones, inducing the Callus, and strengthning the part affected. It is good (being mixt with a little Red Precipitate) against Venereal Ulcers in the Privy Parts of Man or Woman, cleansing them from their putridity, and quickly afterwards healing them up.

XVIII. *The Balsam.* It cures simple green Wounds at the first Intention. But if they be composed with Contusion, Fractures of the Bone, *&c.* It admirably digests them by a speedy maturation, then cleanses, and incarnates, afterwards dries and heals them: The same thing it does to old running Sores, putrid Ulcers, and Fistula's, (being first laid open) and then duly applied according to Art. I have seen very few things more prevalent against Sores and Ulcers of the King's Evil, which after a singular manner resists the malignity of the Disease, the Patient also taking the Juice or Essence thereof inwardly.

XIX. *The Cataplasm.* It ripens Phlegmons or Inflammations, as also other Tumors which Nature designs to have brought to Maturation, and to break them. Applied, it gives ease to Pains of the Gout, discusses Simple and Recent Contusions, strengthens Weak Parts, and cleanses Ulcers in any Part, be they never so foul or stinking.

XX. *The Distilled Water.* Whether it is Distilled from the green Herb, or the Liquid Juice, or the Essence, it is effectual to heal any green Wound, or old Sore or Ulcer whatsoever, cleansing, drying, and healing them as Nature requires; but yet after all, the Juice or Essence are much more effectual for the same purposes.

XXI. *The Spirit.* It is made by Infusing the Herb forty eight Hours in Wine, and then drawing it off in a gentle Balneo. It is singular good to heal inward Ulcers of the Reins, Ureters, or Bladder, inward Wounds or Bruises, and to rectifie the Discra-

Diſeaſe of the Liver and Spleen: It is good alſo to eaſe gnawings in the Stomach, Pains and Torments in the Bowels, to expel Wind, and eaſe the Pains of the Mother. Doſe one ſpoonful in a glaſs of Wine Morning and Night.

CHAP. CLI.

Of CONSOUND Daiſie.

I. *THE Names.* It was unknown to the *Greeks*: the *Latins* call it, *Conſolida media*, *Oculus Bovis Brunfelſij*, and *Buphthalmus*, *Bellium majus Tabernmontani*: but by all other Authors, *Bellis major*, and *Bellis major Vulgaris*, five *Sylveſtris*: in *Engliſh* it is called *Daiſie* or *Middle Conſound*, *Ox Eye*, the *Great Field White Daiſie*, and *Maudlin-wort*.

II. *The Kinds.* It is a *Species* of the *Daiſie*, being the firſt and great Kind of *White Field Daiſie*; and is twofold, 1. *Conſolida media Anglica*, *Conſolida media Vulnerariorum*, *Bellis major agreſtis Anglica*, The *Engliſh* Middle Confound, or *Engliſh* Great Field Daiſie. 2. *Conſolida media*, vel *Bellis major Americana* vel *Virginiana*, The *American* or *Virginian* Middle Confound, or Great Field Daiſie. 3. *Conſolida media*, or *Bugle*, which ſee in *Cap.* 92. aforegoing.

Conſound-Daiſie.

III. The Deſcriptions. *The firſt or* Engliſh *Kind, has a Root which is only a Buſh of White Strings, which abide many Winters, with the Leaves ſhooting forth every Spring afreſh: From this Root come forth many long, narrow, and round pointed Leaves next the ground, pretty deeply cut in on both ſides, making it look almoſt like the diviſions of ſome ſorts of* Oaken *Leaves, or rather like thoſe of* Groundſel: *From among theſe Leaves come forth the Stalks, which grow to be about a foot and half high, with leaves like Leaves, but ſmaller, and leſs divided than the lower. At the tops of the Stalks and Branches grow large Flowers, each upon ſeveral Footſtalks, conſiſting of many white and narrow Leaves, as a Pale, or Border, about the yellow Thrums in the middle, like thoſe of* Maweed, *having no Smell at all: The Seed is ſmall and long, and is blown away with the Wind. Of this Kind there is one which bears double Flowers, differing from the former in nothing elſe.*

IV. *The ſecond, or* Virginian *Kind, has a Root full of Fibres not much unlike to the former; from which Root riſe up Stalks higher and greater than thoſe before deſcribed: the Leaves alſo are larger, and broadeſt towards the ends, but longer and ſmaller at the bottoms, dented likewiſe about the Edges, ſhooting forth ſeveral Branches, at the tops of all which they bear many white Flowers, as it were in an Umbel, yet not ſo great, nor the white Leaves ſo large as the former, but ſmaller, and more in number, with a greeniſh yellow in the middle; and ſome a little larger than others, and ſucceeded with Seed ſomewhat ſmaller than the former.*

Middle Conſound.

or Bugle.

See Cap. 92.

V. *The Places.* The firſt grows every where by Hedge ſides in Meadows, and in the Borders of Fields, and other waſte Grounds, The ſecond grows in *Virginia*, from whence it was firſt brought to us here.

VI. *The Times.* It Flowers in *May* and *June*, and the Seed is ripe in ſome ſhort time after.

VII. *The Qualities.* This *Conſound*, or *Great Daiſie*, is cold in the end of the firſt Degree, and dry in the ſecond Degree: It is Anodyn, Vulnerary, Neurotick, Arthritick, and Alterative.

VIII. *The Specification.* It is a famous thing for the immediate cure of Wounds in any part.

IX. *The Preparations.* You may have therefrom, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *A Syrup.* 4. *A Decoction in Wine or Water.* 5. *A Lotion or Gargariſm.* 6. *An Ointment or Balſam.* 7. *A Cataplaſm.* 8. *A Diſtilled Water.*

The

The Virtues.

X. *The liquid Juice.* It much attemperates the heat of Choler, refreſhes the Liver, and other Inward Parts, and Conſolidates Wounds, whether Inward or Outward, after an admirable manner. It is good to cure the Wounds of the Thorax or Breſt, being taken two, three, or four ounces at a time, either alone, or mixed with a Glaſs of Wine, Morning and Evening. Outwardly it alſo Conſolidates Wounds, cleanſes old running Sores and Ulcers, and drys and heals them: Dropt into ſore and running Eyes, it cleanſes, ſtrengthens, and heals them.

XI. *The Eſſence.* It has all the Virtues of the Juice, and is indeed more effectual, outwardly applied, it heals Sores in the Privy Parts, gives eaſe in Pains of the Gout, diſcuſſes Tumors, and diſperſes Kernels in the Fleſh; and helps bruiſes and hurts which come by Falls or Blows. Inwardly taken, it induces the cure of Wounds, Ulcers and Fiſtula's, whether inwards or outwards, and haſtens the Callus breeding, in Fractures of the Bones: for which reaſon alſo it is ſaid to be good againſt Ruptures, and other inward Breaches of any Veſſel within the Body. Doſe two or three ounces Morning and Night.

XII. *The Syrup.* It has the Virtues of the Juice and Eſſence; and is better to be given to Children in Ruptures becauſe of its pleaſantneſs. And if it is made with Honey, it is more effectual in Wounds and Ulcers of the Breſt and Lungs, or of any other Bowel: It thickens Rheum, and is good againſt Coughs, Colds, Wheezings, or any Obſtruction of the *Viſcera.*

XIII. *The Decoction in Wine or Water.* It helps to cure Wounds of the *Thorax*, and may be uſed Dietetically in all the Caſes for which the Juice, Eſſence or Syrup are commended. It ſingularly refreſhes the inward Parts, removes the Diſcraſie of the Blood and Humors, and as a moſt admirable Vulnerary induces the healing of Wounds and Ulcers. If there is any Inflammation in or about the part afflicted, or if a Fever is preſent, the Decoction is beſt to be made with Water; but otherwiſe with Wine. It is alſo of good uſe to waſh the Wound, (if made with Wine) or cleanſe foul Ulcers or Fiſtula's, by injecting it with a Syring, or otherwiſe, as often as they are dreſt, by which they are daily cleanſed and kept clean, and if hollow, incarnated; by which means the healing ſpeedily follows. If it is made with Wine, with the Addition of a third part of *Agrimony* and *Angelica*, and the parts afflicted with the Palſie or Sciatica, be daily, Morning and Night, fomented therewith very warm for half an hour, or thereabouts, it gives great eaſe and relief.

XIV. *The Lotion. Take of the Decoction in Wine eight ounces, of the Eſſence four ounces: Alum in fine powder three drams: Honey of Mulberries four ounces: mix and diſſolve.* It heals and cures all Wounds, Ulcers, Sores and Puſtules of the Mouth, Gums or Throat, as alſo of the Secret Parts of Man or Woman, if duly waſh'd therewith. Dropt into the Eyes, it clears the ſight, taking away, Clouds, Films, Inflammations, Flux of Humors, &c.

XV. *The Ointment or Balſam.* They do wonderfully help all Wounds which have an Inflammation about them, or have a Flux of ſharp and moiſt Humors upon them, by which they are kept long from healing. Any ſimple green Wound the Balſam many times cures at the firſt intention: and other deep generated Sores it digeſts, cleanſes, incarnates (if fleſh is wanting) and quickly heals them, and this although in the Joints, whether of the Arms or Legs.

XVI. *The Cataplaſm.* It is excellent to diſcuſs Contuſions or Tumors coming upon ſimple Bruiſes, if applied upon the Spot. Applied to the Teſticles, or to any other part which is Swoln, and Inflamed, it allays the Heat, diſcuſſes the Humors, and reſolves it: Applied alſo immediately to a ſimple green Wound, it prevents Inflammation, conglutinates the Lips, and heals it; and this more eſpecially if it is made of the raw green Herb. And ſo made and applied, it is very effectual to eaſe the pains of the Gout, diſcuſs the Tumor, and ſtrengthen the Part: but whether it is altogether ſo effectual as the Cataplaſm of Comfrey Roots, I will not preſume to ſay.

XVII. *The Diſtilled Water.* It has the Virtues of the Juice and Eſſence, but much leſs effectual. Dropt into the Eyes, it allays an Inflammation there: and if Pouder of White Sugar Candy, or clarified Honey be added, j. ounce, to vj. ounces of the Water, it makes a *Collyrium* which cures dim, cloudy, ſore, and running Eyes, being often dropt into them.

CHAP. CLII.

of CORALWORT.

I. *The Names.* *Dioſcorides* nor *Pliny*, nor any other of the Ancient Writers, knew any thing of this Plant, ſo far as I can learn; but it ſeems to be purely an invention of the Moderns. The *Latins* (from the Form and Color of the Roots) call it *Coraloides*, *Dentaria*, *Dentillaria*, *Dentillaria* or *Dentaria Corolloide Radice*, *Alabaſtrites Lobelij*, *Viola Dentaria Dodonæi*, (from the Roots and Flowers, being like unto Stock-Gilliflowers:) by *Geſner*, *in Hortis*, *Sanicula alba*, *Pulmonaria*, *Saxifraga montana* (from its Virtues;) but *Columna* takes it to be the *Ceratia Plinij*, becauſe it has all the Virtues which *Pliny* aſcribes unto his *Ceratia*, but this is doubtful. *Dalechampius in Lugdunenſis* took it to be an *Aconitum*, but this was wholly Error. In *Engliſh* it is called *Coralwort*, *Toothwort*, and *Toothed Violets.*

II. *The Kinds.* *Matthiolus* places this between *Symphita* and *Conſolida*, it being wholly of their Nature and Qualities. *Parkinſon* makes ſeven Kinds thereof; ſome other Authors more; but we ſhall only diſcourſe of thoſe which are to be had with us, either Wild in our Fields and Woods, or nurſed up in our *Gardens*; and they are, 1. *Dentaria Bulbiferæ*, vel *Bacciferæ*, Bulbed, or Berrybearing Coralwort. 2. *Dentaria minor*, or *minima*, *Alabaſtrites*, Small Coralwort. 3. *Dentaria Pentaphyllos*, Cinkfoil Coralwort. 4. *Dentaria Pentaphyllos alter*, The ſecond Cinkfoil Coralwort. They are generally called *Dentaria*: and moſt of them from the number of their Leaves, as, *Triphyllos*, *Pentaphyllos*, and *Heptaphyllos*; but the *Triphallos* or *Enneaphyllos Lobelij*, and the *Heptaphyllos*, are ſtrangers in our Country.

III. The Deſcriptions. *The firſt of theſe has a Root very white, ſmooth, and ſhining, made of divers ſmall round knobs ſet together, not growing downwards, but lying along, and encreaſing under the upper cruſt of the Earth, having very few fibres thereat; its taſte is ſomewhat bitter, hot and ſharp, like* Radiſh, *as all the reſt of the Kinds are. From this Root ſhoots forth one or two Winged Leaves, upon long brownish Footſtalks, which in their riſing out of the ground, are, as it were, doubled, or folded downwards, and then open themſelves, moſt commonly,* into

into seven Leaves, and sometimes into but five, each of which is something long, dented about the edges, and pointed, of a sad green color, and set on both sides of the middle Rib, one against another. The Stalk, which beareth Flowers, rises up in the same manner with the Leaves, and is bare or naked of Leaves, to the middle thereof, where it shoots forth a Leaf, and so one or two more up higher, each consisting but of five Leaves, and sometimes but of three, having also the uppermost single; at each whereof comes forth a small round Bulb, cloven, or as it were, divided into several parts or cloves, of a sad purplish green color, which being ripe, and put into the ground will grow to be a Root, and bear Leaves, like as the Bulbs of a red Bulbed Lilly; about which, at the very top, stand four or five Flowers in long Husks, upon short Footstalks, opening into four several Leaves, of a purplish color, and very like unto the Flowers of Stock-gilliflowers, *or* Dames Violets. *These being past away, small long horns, or Cods, pointed at the ends come forth; in which Pods or Cods lyes such like Seed as are in the Cods of* Dames Violets; *which as soon as it is ripe, the Cod opens, and the Seed falls out: The Leaves, and indeed the whole Plant, is of a bitterish, hot, sharp, Radish-like Taste.*

IV. *The second, or* Small Coralwort, *has a Root small, and somewhat long, composed as it were, of many small, very shining, white thick scales, growing upwards, and having many white Fibres at the head of them, of a little sweetish bitter, sharp and astringent Taste. From this Root spring forth three or four slender pale green Stalks of Leaves somewhat divided on their edges, not half a foot high, and not of half that height in some places, very like unto those of the hollow Root, but smaller, and of a paler shining green color; from among which rise up one or two small Stalks, with two such like Leaves thereon, but smaller, and a little above them, a small round greenish yellow head, which spreads not into Leaves, but into four or five more heads of Threads, and so abides a while, (having no other Flower) which pass away leaving in their room many small kernelly Seed. The Leaves have a bitter sweet scent, somewhat like unto the* Musked Cranes Bill, *yet more sweet when it grows Wild in its natural places, than when it is transplanted out of them into Gardens. This Plant is referred by many unto the* Ranunculi *or* Crowfeet, *to which it has but a small resemblance, and ought rather to be inserted in this place, for the likeness of its Root sake.*

V. *The third Kind, which is the first* Cinkfoil Coralwort, *has a Root which is greater than the first, and made as it were into Joints, not so white as that is, but with longer Fibres coming from between the Joints. From this Root rises one or two Leaves*

upon long Foot-ſtalks, conſiſting of five Parts, or Leaves, each of them ſomewhat like the firſt, and dented about the edges, but they are longer, rougher and harder in feeling, and more cloſely ſet together, riſing for the moſt part from one Joint, like as the Cinkfoils *do: upon the Stalks alſo are ſome ſuch like Leaves ſet one above another; at the top four or five ſuch like Flowers, but ſomewhat larger, of a purpliſh color, ſomething deeper than the firſt, which turn into ſuch like Pods, with the like Seeds in them, but has no Bulbs on the Stalks.*

VI. *The fourth, or ſecond* Cinkfoil *Kind of* Coralwort, *has a Root very like the firſt, conſiſting of many round clear white Knobs, but more in number, ſet together by pieces, with divers long* Fibres *growing out of it: From this Root ſhoots forth a lower and ſmaller Stalk than the former, being not above a foot high, with ſome Leaves ſet thereon; as alſo there is ſome of theſe very like the laſt, but narrower; more ſmooth and gentle, and alſo of a paler green color: the Flowers ſtand at the top, like unto the other, and are of a purpliſh color, after which come the like Pods with Seed in them, as in the reſt.*

VII. *The Places.* The firſt and ſecond are found Wild in *England*, the firſt at *Mayfield* in *Suſſex*, in a Wood called *Highreed*; and in another Wood there alſo, called *Fox-holes*; as alſo in divers ſhadowy and dark Mountains, or Hills: the two laſt are only nurs'd up with us in Gardens.

VIII. *The Times.* They Flower about the middle of *April*, and beginning or middle of *May*, and the Seed is ripe in *Auguſt*, after which they quickly wither and periſh; the Roots abiding ſafe all the Winter.

IX. *The Qualities.* They ſeem to be Temperate in reſpect of heat or cold, but are drying in the firſt Degree. They cleanſe, aſtringe, dry, bind, and ſtrengthen.

X. *The Specification.* They are dedicated to the curing of Wounds.

XI. *The Preparations.* You may make therefrom, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *A Decoction in Wine.* 4. *A Syrup.* 5. *A Pouder.* 6. *A Balſam.*

The Virtues.

XII. *The liquid Juice.* It ſtrengthens the Bowels, and makes them able to perform their Offices, provokes Urine, and is ſaid to expel the Stone and Gravel, being drunk, Morning and Evening, from three ounces to ſix, in a Glaſs of Port Wine.

XIII. *The Eſſence.* It has the former Virtues, beſides which it is ſaid to cure any inward Wounds, eſpecially thoſe Wounds which have pierced into the hollowneſs of the *Thorax*. It is alſo good to eaſe the Griping Pains of the Bowels, and Sides, being taken to four or ſix ounces in a glaſs of Red Port Wine, or old Malaga.

XIV. *The Decoction in Wine.* It has the former Virtues, but much weaker, and is good againſt Lasks or Fluxes which proceed from hot and cholerick Humors: you may give it to ſix or eight ounces, Morning and Evening, for many Days together.

XV. *The Syrup.* It is made of the Juice or Eſſence, and is proper to be given to Children which have Ruptures, or are troubled with Gripings, Vomitings, or other Diſeaſes of the Bowels.

XVI. *The Pouder of the Root.* It has the Virtues of the Juice and Eſſence; and heals Wounds of the Breſt and Lungs, being given to a dram in Red Wine for ſome conſiderable time. It is alſo profitable againſt Burſtenneſs, being given in the Syrup aforeſaid.

XVII. *The Balſam.* It is good to be applied to green Wounds, for it quickly conſolidates and heals them; it alſo digeſts, cleanſes, incarnates, drys, and heals old, running, filthy and hollow Ulcers; facilitating the cure after an admirable manner.

CHAP. CLIII.

Of CORIANDER.

I. *THE Names.* It is called in *Greek*, Κόριον, and Κορίανον (from Κόρις, *Cimex*, the *Wall-Louſe*, which we call *Buggs*; for that *Coriander* in its ſcent, very much reſembles their ſtinking Smell when they are killed:) In *Latin*, *Corion*, and *Coriannon*, but moſtly in the Shops *Coriandrum*: In *Arabick*, *Casberra*, and *Elcosbur*: In *Engliſh*, *Coriander*.

II. *The Kinds.* There are but two ſorts of it which are found with us, *viz.* 1. *Coriandrum vulgare*, The common Coriander. 2. *Coriander minus odorum*, The leſſer ſweet Coriander. And by the name *Coriander* theſe Plants are known in almoſt all Nations.

Coriander.

III. The Deſcriptions. *The firſt has a ſmall Root, which periſhes every Year after Seed time: from this Roots ſpring up Leaves which are ſomething broad, almoſt like unto* Parſley *or* Chervil; *but after the Stalk or Stalks come forth, which are three or four feet high, being full grown; the Leaves then are ſmaller and finer, every one than other, up to the top, being of a faint green color, and very much cut or jagged in, almoſt like to the Leaves of* Fumitory, *but a great deal ſmaller, tenderer, and more jagged. The Flowers are white, and grow in ſmall looſe Umbles, like unto* Dill; *which being paſſed away, there comes forth round ſtriked hollow Seed, of a whitiſh yellow color when it is ripe. The whole Plant, Seed and all, while it is green and growing,*

has

has a ſtrong and loathſom Smell, ſcarcely to be endured; but when the Seed is full ripe and dry, it is of a very good Scent, and of an agreeable Taſte.

IV. *The ſecond has Roots and Stalks almoſt like the former; but the Leaves, the lower as well as the higher, are all finely cut in, and jagged; the Stalks are much lower, not above half a foot high; (ſays* Parkinſon*) and lying almoſt on the ground: the Flowers on its Tops are white; and the Seed round as the other, but fuller and larger, and two always joined together.*

V. *The Places.* They are only Sown in Gardens now, as in old time. *Pliny* ſays, they are not found Wild; nor are their natural places known.

VI. *The Times.* They Flower in *July*, and their Seed is ripe in *Auguſt*.

VII. *The Qualities.* The green Leaves are ſaid to be Cold and Dry. The dried Seed is Hot and Dry in the end of the ſecond Degree, or beginning of the third. It is Aperitive, Anodyn, Carminative, Diſcuſſive, Stomatick, and Alexipharmick.

VIII. *The Specification.* It ſtays Vomiting, and helps Digeſtion.

IX. *The Preparations.* You may have therefrom, 1. *A Juice from the Green Herb.* 2. *An Eſſence of the ſame.* 3. *An Ointment or Balſam of the ſame.* 4. *A Cataplaſm of the Green Herb.* 5. *Coriander Comfits.* 6. *A Pouder of the Seed.* 7. *A Spirituous Tincture of the Seed.* 8. *An Acid Tincture thereof.* 9. *An Oily Tincture of the ſame.* 10. *A Saline Tincture thereof.* 11. *A Spirit.* 12. *An Oil by Diſtillation.*

The Virtues.

X. *The Juice of the Green Herb.* Authors ſay, it is of a cold Quality, and that being drunk, altho' but to half an ounce, it kills them that take it. But outwardly applied, it diſſolves Knots and Kernels; and diſcuſſes other hard Tumors, being aſſiduouſly uſed.

XI. *The Eſſence of the ſame.* It has the Virtues of the Juice, and being applied by Rags upon the in, it is ſaid to cure [illegible] and cleanſe Tumors.

XII. *The Ointment or Balſam of the ſame.* It is made with Cerate, Lithurge, Vinegar, and Oil of Roſes. It is commended againſt an Eryſipelas, running and fretting Sores, Wheals, Pufhes, Carbuncles, and Botches, riſing in the Skin or Flesh; it cools the Inflammation, and takes away alſo the Swelling of the Cods.

XIII. *The Cataplaſm of the Green Herb made with Barley Meal, or Barley Bread.* It has the Virtues of the Ointment, but is more powerful to allay Inflamnations, and diſcuſs hot Tumors or Swellings. It is alſo good to diſſolve or diſcuſs Wens, fleſhy Tumors, and protuberances of the King's-Evil, being duly applied.

XIV. *The Comfits of the Seed.* Gerard ſays, they prevail much againſt the Gout, being eaten upon a faſting Stomach, before Dinner; and alſo after Dinner without drinking after the ſame for three or four hours time: and they have yet a greater power over that Diſeaſe, if they be eaten in the ſame manner alſo after Supper.

XV. *The Pouder of the Seed.* If it is taken faſting to almoſt a dram in a Glaſs of Generous Wine, it ſtrengthens the Stomach, cauſes an Appetite, and makes a good Digeſtion, depreſſes Fumes and Vapors riſing from the Stomach, Spleen or Womb, and aſcending up into the Head. It ſtops Catarrhs, helps the noiſe in the Ears, and diſcuſſes that Tumor in the Throat, vulgarly called the Quinſey.

XVI. *The Spirituous Tincture of the Seed.* It is a moſt ſingular Stomatick, ſtrengthens the Ventricle, ſtops Vomiting, helps Digeſtion, and eaſes the moſt inveterate Pains of that Bowel: and is indeed a moſt excellent thing againſt the Gripings of the Guts.

XVII. *The Acid Tincture.* This is yet a more excellent Stomatick than the former, where there is a laſſitude or weakneſs of the Stomach, and the Tone thereof ſeems to be depraved or undone, and the Acidities thereof ſo diminiſhed, as that the Patient wants an Appetite, and cannot at all digeſt their Food, but that it comes up again undigeſted, with Vomitings, manifold Reachings, and vehement Sickneſs thereof, being taken in Red or White Port Wine, or in a generous Canary, to a pleaſing Acidity; it reſtores the Tone of the Stomach, and kills Worms in the Body.

XVIII. *The Oily Tincture.* If it is daily taken, *viz.* Morning and Night, in any generous Vehicle, from twenty drops to forty, it cures the Colick, and Griping of the Guts, and mightily ſtirs up Venery. It prevails alſo againſt the bitings of Serpents, eſpecially of that called *Amphisbena*, the place bitten being alſo anointed therewith. And as it is comfortable to the Stomach and Bowels, by its healing and drying property, and prevails againſt a *Paralyſis*, or *Palſie*, ſo alſo it is eminently good againſt that Diſeaſe by anointing the whole length of the Back-bone therewith, as alſo the parts affected, twice a day before a fire, and rubbing it very well in for a long time: And by outward application in like manner, it prevails againſt Cramps, Convulſions, Gouts, and the Sciatica, and all cold and moiſt Diſeaſes happening in what part of the Body ſoever.

XIX. *The Saline Tincture.* It opens Obſtructions of the Reins, Ureters, and Bladder, provokes Urine, and cauſes an Evacuation of Sand, Gravel, and Tartarous Matter out of thoſe parts. Doſe to one dram, or more, in a Glaſs of generous White Port Wine.

XX. *The Spirit.* It is very comfortable to the Stomach, and exceeding Cordial; by heating and refreſhing of it, and taking away the cold and moiſt Temperature thereof, which is the ground and foundation of Catarrhs and Rheumatiſms; it helps Digeſtion, repreſſes the Vapors, which aſcend thence up into the Head, and forcibly reſiſts the Tortures of the Colick, proceeding from Cold, Wind, and the like: and being moderately uſed, it ſtirs up Venery by an encreaſe of Blood and Seed, and by a gentle warming, and, as it were, vivifying the ſame. Doſe one ſpoonful, or more, in the Morning faſting, a little afore Dinner, and at Bed time, either alone, or in a Glaſs of Canary.

XXI. *The Oil by Diſtillation.* Being taken inwardly from ten to fifteen or twenty drops, and in ſome very cold and moiſt Conſtitutions to thirty or forty drops; firſt dropt into, and mixt well with White Sugar, and then mixed well with a glaſs of Wine, and ſo taken, it is a famous thing againſt the Palſie, Cramps and Convulſions, whether in Old or Young, and the Gout in the Stomach; anointing all thoſe parts which are affected with thoſe Diſeaſes, outwardly, Morning and Night, and rubbing or chafing it well in. It effectually opens the Urinary Paſſages, and powerfully ſtirs up to Coition, by encreaſing Seed, making it Spirituous, and ſtrengthening the parts of Generation.

XXII. *An Obſervation.* The *Arabian* Phyſicians, and others of the Ancients, tell us how we ſhould correct *Coriander Seed* before we uſe it, *viz.* by ſteeping it all Night in Vinegar, and then drying it again, thereby to take away (as they think) its Venene Qualities. But this *Lobel* ſeems to deſpiſe, and that truly with very good reaſon, becauſe no ſuch thing can be extracted from it; for after it is ripe, if it is ſuffered to dry of it ſelf, or in the Sun, all thoſe pretended Obnoxious Qualities will vaniſh away of their own accord; nor needs it any other Preparation when it is made into Comfits, and is ſo far from being hurtful to the Stomach, and Bowels (as ſome Authors have affirmed) that on the contrary, it has been found by great Experience to be an excellent Stomatick, exceeding many others: and this even Country People have found by the uſe of it, without any Preparation at all: for being only Dry, it has a warming Faculty, and a Sweet, and no Noiſome Smell or Taſte, that being contained only in its Humidities whilſt it is Green, and not in the Seed when only dried.

CHAP. CLIV.

Of CORN-FLAG.

I. THE *Names.* It is called in *Greek*, Ξιφιον, and φασγανον: In *Latin*, *Gladiolus*, and of ſome *Enſis* (as it were the *Sword Flag:*) of ſome *Gladiolus Segetalis*, *Victorialis fœmina Cordi*, and *Victorialis Rotunda:* In *Engliſh*, *Corn-Flag.*

II. *The Kinds.* There are ſeveral ſorts thereof, as, 1. *Gladiolus Narbonenſis*, The French Corn-Flag. 2. *Gladiolus Italicus binis florum ordinibus*, The Italian Corn-Flag. 3. *Gladiolus Byzantinus*, The Conſtantinopolitan or Turkiſh Corn-Flag. 4. *Gladiolus flore rubente*, Bluſh-colored Corn-Flag. 5. *Gladiolus flore albo*, White-flowred Corn-Flag. 6. *Gladiolus purpureus minor*, The ſmall purple Corn-Flag. 7. *Gladiolus Lacuſtris*, The Water, Corn, or Sword Flag, deſcribed by *Cluſius.*

III The Deſcriptions. *The firſt has a Root which is ſomewhat great, round, flat and hard, looking as if it was netted, having another ſhort ſpongy one under it, which when it has done bearing, and the Stalk dry, that the Root may be taken up, ſticks cloſe to the bottom, but may be eaſily taken away, having commonly a number of ſmall Roots encreaſed about it, the leaſt of which will quickly grow, ſo that if it is ſuffered any long time in a Garden, it will even choak it up. From this Root, three or four broad, long, and ſtiff green Leaves riſe up, one, as it were, riſing*

rising out of the side of another, being joined together at the bottom, somewhat like unto the Leaves of Flower-de-luces, *but stiffer, more full of Ribs, and longer than many of them, and sharper pointed. The Stalk rises up from among the Leaves, bearing them on it as it rises, having at the top divers Husks, out of which come the Flowers, one above another, all of them turning and opening themselves one way, which are long and gaping, like unto the Flowers of* Fox-Glove, *a little Arched or bunching up in the middle, of a fair reddish purple color, having two white spots within the mouth thereof, one on each side, made of a Lozenge fashion, viz. square, and long pointed. After the Flowers are past, round Heads or Seed Vessels come up, in which is contained reddish flat Seed, like unto the Seed of* Fritillaria, *but thicker and fuller.*

IV. *The second, or* Italian Corn-Flag, *is like unto the former* French *kind, in its Root, Leaf, and Flower, without any other difference, than that the Root is smaller, and browner, the Leaf and Stalk of a darker color; and the Flowers (darker also in their color, and a little smaller) standing out on both sides the Stalk.*

V. *The third, or* Turky Corn-Flag, *except that it is larger in its Roots, Leaves, and Flowers, is like in all things to the first* Corn-Flag; *the Flowers on this standing only on one side, of a deeper Red color, and being later in the Year before they appear, viz. after all the rest are past. The Root is netted in this, as plainly as in any of the others; it as plentifully also encreases, but is more tender, and less able to abide our cold Winters.*

VI. *The fourth is like unto the* French Corn-Flag *in all respects, excepting only that the Flowers are of a pale red color, tending to whiteness, commonly called a Blush color.*

VII. *The fifth differs not from the last, excepting that the Roots are whiter on the outside, the Leaves are greener, without any brownness or darkness, as in the former, and the Flowers are of a pure Snow white color.*

VIII. *The sixth differs not from any of the former, but in the smallness of the Leaves, Stalk and Flowers, which stand all on one side, like unto the* French *kind, and of the same color: and the Root of this sort is netted more than any of the others.*

IX. *The seventh, or* Water Gladiol *has a matted bushy fibrous Root; from whence rise up Leaves about a span long, thick and hollow, with a Partition in their middle, like as you see in the Cods of* Stock-gilliflowers, *and the like: their Color is green, and Taste sweet, so that they are an acceptable Food to Wild Ducks, diving to the bottom of the Water; for they sometime lye some Yards under Water; which notwithstanding are over-topt by the Stalk, which springs up from among those Leaves, and bears Flowers of a white color, and larger than those of* Stock-gilliflowers: *but in that hollow part which is next to the Stalk, they are of a blewish color, almost in shape resembling the Flowers of the* Corn-Flag, *but not absolutely like them. They consist of five Leaves, whereof the two uppermost are reflected towards the Stalk; the three other being broader, hang downwards: after the Flowers are past, round pointed Vessels follow, filled with red Seed.*

X. *The Places.* Their Titles, of the chief, generally show from whence they first came: but with us they are only nurs'd up in *Gardens*: they seem to be Natural to *Barbary*, where *John Tradescant* saw many Acres of Ground overspread with them. In those Countries where they grow Wild, as in *Turkey*, *Italy*, *Spain*, and *France*, they grow in Meadows, and in Earable Land among Corn: and we have great plenty of them in our *Gardens* near and about *London*, which serve for their Beauty and Ornament. The *Water Gladiol* is found in some places of *West Friesland*, growing in Waters which have a Gravelly bottom, and which scarcely bring forth any other Plants besides.

XI. *The Times.* They Flower from *May*, to the end of *June*, and sometimes in *July*; but the *Byzantine*, or *Turky*, after all the rest, as is above-said.

XII. *The Qualities.* They are hot and dry, but in what Degree Authors have not said: but *Galen* says, they have a power to Dry, Attract, Waste and Consume; and that they have a subtil and digestive Quality.

XIII. *The Preparations.* You may have therefrom, 1. *A liquid Juice of the upper Root.* 2. *An Essence of the same.* 3. *An Emplaster.* 4. *A Cataplasm.* 5. *A Pouder of the Cods and Seed.*

The Virtues.

XIV. *The liquid Juice.* If it is drunk with Red Port Wine, it is said to cure the Rupture in Children, called *Enterocele*, which is when the Guts fall into the Cods.

XV. *The Essence of the same.* It has the former Virtues, and being drank Morning and Evening for some time, to four or six ounces in a Glass of Sherry Wine, it is said to provoke Lust, and strengthen the *Viscera.*

XVI. *The Emplaster.* It is made of the Root mixed with Frankincense and a little Wine: Being applied, it eases the Pains of the Gout: it also draws forth Thorns, Prickles, Splinters, or broken Bones out of the Flesh; it Digests, Maturates, and Cleanses.

XVII. *The Cataplasm.* It is made of the Root beaten up with Meal of Darnel, and Honey, and a little Lard. It wastes and discusses hard Nodes, lumps of Flesh, and other like hard Tumors. It is also found to be a certain and approved remedy against scrophulous Swellings in the Throat, vulgarly called the King's-Evil.

XVIII. *The Pouder of the Cods and Seed.* If it is drank in Goats, or Asses Milk, to one dram, or more, Morning and Evening, as also in the time of the Paroxysm of the Colick, it eases the pains of the Colick: but if it is drank in Juniper Water, it is much better.

CHAP. CLV.

Of CORN-SALLET, OR, LAMBS-LETTICE.

I. *THE Names.* It may be called in *Greek*, Λευκολάχανον: In *Latin*, *Lactuca Agnina*, and *Olus Album Dodonæi*: In *English*, *Corn-Sallet*, or *Lambs-Lettice.*

II. *The Kinds.* It is not a Kin to the *Lettice*, though called by that name, which I suppose was, because it is eaten for a Sallet, as the *Lettice* is. And is a singular Plant by it self.

III. The Description. *It has a Root consisting of many small and long Fibres; from whence spring up many slender, round, weak Stalks, trailing, as it were, upon the ground, about a foot high, if it grows in good and fertil ground; otherwise but a hand or*

two high, with ſeveral Joints, and two Leaves ſtanding at each Joint, narrow and long. Likewiſe from the ſame Root, at its firſt coming forth out of the ground, many Leaves, *long, narrow, and round pointed, of a whitiſh green color, ſpring forth, which grow cloſe upon the ground, which live all the Winter, and from among which, in the beginning of the Spring, (if it is ſown in Autumn, as is uſual, when it is to ſerve for an early Sallet) ſeveral ſmall, round Stalks riſe up, branching forth at the top, and bearing Tufts of ſmall black blew Flowers, (but* Dodonæus *ſay, they are very ſmall white* Flowers, *cloſely compact together:) Theſe Tufts of white* Flowers *are broad, but the* Flowers *themſelves are very ſmall, ſo that they can ſcarcely be known to be* Flowers, *ſaving that they grow many together, like a Tuft or Umble.*

IV. *The Places.* This Herb grows Wild in Corn-Fields: (whence the Name) but ſince it has grown into uſe amongſt us for Salletting, it is alſo ſown in Gardens for a Sallet Herb.

V. *The Times.* It is found Green all *Winter* and *Summer*: and runs up to Flower and Seed in *March*, *April*, and *May*.

VI. *The Qualities.* It is Temperate in reſpect of heat or cold; and moiſt in the firſt Degree. It is Emollient, Hepatick, Alterative, and Galactogenetick.

VII. As to the *Specification, Preparations, Virtues and Uſes* of this Herb, Authors have been ſilent. It is doubtleſs an innocent Plant, and pleaſant to be eaten: for which reaſon it is uſed as a Winter Sallet, at leaſt wiſe very early in the Spring; for which purpoſe it is dreſs'd up to the Table as Garden Lettices are, with Salt, Vinegar, and Oil, and ſometimes with Sugar alſo, as the Eater beſt likes.

CHAP. CLVI.

Of COSTMARY.

I. THE *Names.* It ſeems not to have any *Greek* Name: but the *Latins* call it *Coſtus hortorum major:* ſome call it *Balſamita major, Mentha Græca, Mentha Romana, Mentha Corymbifera major, Mentha Saracenica*; by *Geſner, in Hortis, Oviaria:* by *Cæſalpinus, Herba Mariæ*; and *Laſſulata* by others: In *Engliſh, Coſtmary*, or *Alecoaſt.*

II. *The Kinds.* Of the *Coſtus hortorum*, there are two Kinds, *viz.* 1. The *Greater*, which is *Coſtmary*, of which in this Chapter. 2. The *Leſſer*, which is *Maudlin*, of which in its place, in ſome one of the following Chapters of this Book: Many Authors join theſe two Plants together in one Chapter, making them as two *Species* under one *Genus*: But in my Opinion, notwithſtanding the Unity or Sameneſs of the *Latin* Name, they are truly two differing Herbs.

III. The Deſcription. Coſtmary *has a Root which is ſomewhat hard, and very full of Strings, which being divided with the Heads of Leaves, may be replanted in the Spring time for encreaſe. From this Root ſpring forth many broad and long pale green Leaves, dented, or cut a little about the Edges, every one ſtanding upon a long Footſtalk; among which riſe up many round green Stalks, with ſuch like Leaves thereon, but leſſer up towards the top, where it ſpreads into three, four, or more Branches, every one bearing an Umble or ſcaly Tuft of gold yellow Flowers; ſomewhat like unto* Tanſie Flowers, *but leſſer; which afterwards are the Heads which contain the Seed, which is ſmall, flat, and long: Theſe Flowers being gathered before they be ripe, keep their color and beauty a pretty while without Withering; and the whole Plant is of a very pleaſant Smell and Taſte, and very agreeable with the Stomach.*

IV. *The Places.* It grows almoſt every where in *Gardens*, and is nurs'd up with us for the ſweet Smelling of its Flowers and Leaves. But in *Italy* it has been found to grow naturally Wild in rough and untilled places, eſpecially in the Duke of *Tuſcany*'s Dominions.

V. *The Times.* It Flowers in *June* and *July*, and the Seed is ripe ſome time after.

VI. *The Qualities.* It is hot and dry in the end of the ſecond Degree. It is Aperitive, Abſterſive, Carminative, Digeſtive, Diſcuſſive, Diuretick, Traumatick or Vulnerary; it is alſo Cephalick, Neurotick, Stomatick, Cordial, Nephritick, and Hyſterick; Alexipharmick, and Analeptick.

VII. *The Specification.* It is ſingular in curing all ſorts of Green Wounds.

VIII. *The Preparations.* You may prepare therefrom, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *An Infuſion or Decoction.* 4. *A Pouder.* 5. *An Oil by Inſolation.* 6. *An Ointment.* 7. *A Balſam.* 8. *A Cataplaſm.* 9. *A Spirituous Tincture.* 10. *An Acid Tincture.* 11. *An Oily Tincture.* 12. *A Saline Tincture.* 13. *A Spirit.* 14. *An Oil Diſtilled.* 15. *Poteſtates or Powers.* 16. *An Elixir.* 17. *A Fixed Salt.*

The Virtues.

IX. *The liquid Juice of the Herb.* It provokes Urine mightily, by opening Obſtructions of the Urinary Parts; and by injection takes away the hardneſs of the Womb, if it be not Cancerous: It gently evacuates Choler and Flegm, attenuates that

that which is thick and grofs, cuts and divides that which is tough and glutinous, cleanfes that which is foul, hinders Corruption or Putrefaction, diffolves without Attraction, opens Obftructions, and removes their evil effects. It ftrengthens the Stomach and Liver, and all the other *Vifcera*; and if it is taken from two ounces to four, or fix, in Clarified Whey, it operates the more effectually to all the aforenamed intentions. Being alfo duly given Morning and Evening, as alfo about two or three hours before the coming of a QuotidianAgue, it is very powerful in repreffing it, and for the moft part Cures it.

X. *The Effence.* It has all the Virtues of the liquid Juice, and indeed more powerful to all the intentions; befides which, it is an excellent thing to be ufed Dietetically by all thofe who have compofed Wounds, running Sores, old and putrid Ulcers, inveterate Fiftula's, or have a Cachexia, or are inclinable to the Green-ficknefs, in which laft cafe, it does as much as moft Vegetables can do. It may be given either alone of it felf, or mixt with a glafs of White Port Wine, from one ounce to fix, every Morning faffting, and laft every Night at Bed time. Thus taken, it is alfo very profitable againft continual Pains of the Head, to ftop, dry up, and confume all thin diftillations, which are apt to fall upon the Lungs, and helps to digeft raw Humors. It is a truly beneficial thing to the Bowels, and kills Worms in Children.

XI. *The Infufion, or Decoction in Wine.* They have the Virtues of the Juice and Effence, but not full out fo powerful, and therefore may be given to half a Pint, Morning, Noon, and Night. It opens Obftructions of the Womb, and if feafonably taken, *viz.* about a Week before the time, it provokes the Terms in Women.

XII. *The Pouder of the Leaves.* It is a good Stomatick, and may be taken from half a dram, to two drams, Morning and Night, in any proper Vehicle. I commend it to fuch as are apt to have the Gout to fly upwards into the Stomach: it is Aftringent, refifts Poifon, and the bitings of Venomous Beafts, and kills Worms in Humane Bodies.

XIII. *The Oil by Infolation*, or *boiling in Oil Olive.* It warms and comforts Parts affected with any Preternatural Coldnefs, and refifts the afflux of cold and moift Humors, it difcuffes Swellings, and gives eafe in the Gout, Sciatica, and other like Pains.

XIV. *The Ointment.* If it is made with the addition of *Adders-tongue*, it is an excellent thing to cure Burnings and Scaldings, whether with Fire, Water, or Oil, and to cleanfe and heal old Ulcers; and particularly to difcufs hard Tumors in Womens Breafts.

XV. *The Balfam.* It not only cures fimple Green Wounds at the firft Intention, but alfo digefts and maturates thofe which are Compofed or Complicate. It digefts putrid and eating Ulcers, and by its Anodyn quality eafes their Pains; it cleanfes them, and if hollow, or wanting in flefh, it incarnates; and by its Aftringent property, it dries up their Humidities, ftrengthens the part, and brings the Sore to a fpeedy healing.

XVI. *The Cataplafm.* Applied, it difcuffes recent Contufions, cleanfes old and running Sores, refifts the putridity of Ulcers, eafes the Gout, ftrengthens weak Limbs and Joints, abates Inflammations, and draws out the fire in Burnings, being applied before they are blifter'd.

XVII. *The Spirituous Tincture.* It warms and drys a cold and moift Stomach, and is an efpecial thing to help an evil, weak, cold, and diftemperature affected Liver. It prevails againft Convulfions, and the diftemperature, or tortions of the Bowels, ftrengthens the Nerves, Head and Brain, and helps all cold and moift diftaffections of thofe parts. By the conftant taking of it, ftops and dries up Catarrhs, and the affluxes of cold Rheums to other parts of the Body; and is very profitable againft an inveterate Head-ach, proceeding from a cold and moift Caufe. Dofe one fpoonful Morning and Night, in a Glafs of Sherry, Canary, White Port, or other Generous Wine.

XVIII. *The Acid Tincture.* It is a moft fingular Stomatick, refifts Crudities and Putrifaction, and therefore is very good againft all Putrid, Malign, and Peftilential Fevers: it quenches Thirft, caufes a good Appetite to Food, and helps digeftion. And being prudently adminiftred, it is a very effectual Medicament to kill Worms in Children. Bathed well in, Morning, Noon, and Night, upon places affected with the Gout, it opens the Pores, attracts and draws forth the malign Humor, eafes the Pain to a Miracle, difcuffes the Tumor, and quickly reftores the Patient to his defired health. When it is taken inwardly, it is to be given in fome proper Vehicle, or Wine, to a grateful Acidity; it repreffes Vapors from the Womb, and is to be taken Morning, Noon, and Night.

XIX. *The Oily Tincture.* It eafes all external Aches or Pains in any part of the Body whatfoever, proceeding from a cold and moift Caufe, it takes away the relaxation of the Nerves, and Mufcles, prevails wonderfully againft the Palfie, and ftrengthens the Mufcles, Nerves, Tendons and Joints, being weakned through Pain, or any afflux of Humors. But in cafe of the Palfie, the Back-bone, from the Neck to the *Anus*, is daily, Morning and Night, to be well anointed therewith, as alfo all the Parts which are affected, rubbing and chafing it in. It cures the Nerves, being Prickt or Wounded, immediately eafing the Pain, and abating the Tumor; and in a fhort time after heals the Wound. If it is taken inwardly from twelve to twenty or thirty drops, in any Homogene Vehicle, it cures cold and moift Diftempers of the Head, Breft and Lungs, and prevails againft the Head-ach, Megrim, Vertigo, Carus, Lethargy, Apoplexy, Falling-ficknefs, Palfie of the Head and Tongue, and other Difeafes of like kind. It alfo opens Obftructions of the Reins and Womb, and is prevalent againft Vapors, and Fits of the Mother.

XX. *The Saline Tincture.* Given to one dram, or more, in a Glafs of White Port Wine, Morning and Evening, it fingularly opens the Urinary Paffages, and powerfully provokes Urine, expelling all præternatural, or Tartarous Matter out of the Reins, Ureters, and Bladder, and is very prevalent againft a *Sarcites*, or *Anafarca*, which is a *Dropfie* in the fleftiy parts of the whole Body.

XXI. *The Spirit.* It is Cordial, and refifts Poifon, and is prevalent againft Fainting and Swooning Fits, Vapors, and Fits of the Mother: it refifts the malignity of the Plague or Peftilence, and the contagion of the Spotted Fever, or other infectious Difeafes; it is good alfo againft the Venom of Serpents, as of the Viper, Rattle Snake, and others of that kind, the poifon of Mad-Dogs, for which there are but few better remedies. It is a fingular thing againft Vomiting, and ficknefs at Heart, by reviving the Spirits, and ftrengthening the Parts.

XXII. *The Diftilled Oil.* Taken inwardly in any proper Vehicle (being firft dropt into White Sugar) it comforts the Head, Brain, and Nerves, dries up cold and moift Humors, and is helpful againft all thofe Difeafes which are caufed by them, in any of the Parts aforenamed. It cures Palfies, inwardly taken and outwardly applied; fo alfo Convulfions, happening in what part of the Body

foever. Taken to a dram at a time, in ſome proper Vehicle, two hours before the coming of the Fit of an Ague, it cures it; more eſpecially if it is taken or repeated two, three, or four times: The beſt thing to take it in (in this caſe) is the ſtrongeſt Wine: in the ſame (and in the ſame Doſe) alſo in a Palſie; but in other Diſtempers it may be taken from ten to twenty or thirty drops: outwardly alſo anointed upon Cramps, and parts Convulſed, it gives relief in a ſhort time.

XXIII. *The Powers.* They have all the ſame Virtues with the Oil, and are much more Subtil and Penetrative, yet may be taken in a much larger Doſe, as from a dram to four drams, in any proper Vehicle. They have alſo all the Virtues of the Spirit, aforementioned, and ſtrengthen the Stomach admirably. Given Morning and Night in White Port Wine, or in ſome other Diuretick Vehicle, as in Parſley, or hot Arſmart Water, Decoction, or Infuſion of Winter Cherries, *&c.* they powerfully open Obſtructions of the Reins, Ureters, and Bladder, provoke Urine, and expel all Tartarous Matter, as Stones, Gravel, Sand, Slime, Matter, *&c.* lodged in thoſe Parts.

XXIV. *The Elixir.* It has all the Virtues of the Spirit, Diſtilled Oil, and Powers, exalted, performing more effectually, and more gratefully to the Stomach, all that it is poſſible for thoſe Preparations to do. It renovates, as it were, the Blood, and all the Juices, ſtrengthens the Heart, and comforts the whole Univerſal Frame, making the Patient pleaſant, lively, chearful, and giving him a healthful habit of Body. Being bathed upon parts affected with the Gout, in a cold habit of Body; it gives relief, and in a ſhort time. Taken inwardly in a Glaſs of Canary, from one dram to three or four, it gives preſent eaſe in the Colick, by diſſipating and expelling the Wind.

XXV. *The Fixed Salt.* It is good againſt Diſeaſes of the Nerves, by carrying off the Matter which obſtructs them, by the Reins; for it diſſolves Viſcous Juices in all parts of the Body, eſpecially in the Blood, and cauſes them to be piſs'd forth; for as it opens Obſtructions of the Urinary Parts, and provokes Urine, by its mixtion with the Blood, ſo it carries off the Morbifick Matter of Palſies, Numbneſs, Rheumatiſms, and Obſtructions (be they where they will) the right way, *viz.* by that way which Nature ſeems moſt inclin'd to promote, which is moſt commonly by Urine. Doſe twenty, thirty, or forty grains Morning and Night, in a large glaſs of White Port Wine.

CHAP. CLVII.

Of COWSLIPS.

I. *THE Names.* Some doubt whether the *Greeks* knew this Plant or no; however later Authors have called it Παρέλυσις, ἢ Βετάνη παραλυτικὴ: In *Latin*, *Paralyſis*, *Herba Paralyſis*, *Herba Paralytica*, *Aliſma Dioſcoridis*, according to *Fabius Columna*, *Aliſma Pratorum*, *Arthritica*, *Herba Arthritica*, *Dodecatheon*, *Primula veris major*: and in *Engliſh*, *Cowſlips*, *Oxlips*, and *Paigles*.

II. *The Kinds* There are ſeveral ſorts hereof, as, 1. *Paralyſis vulgaris pratenſis flore flavo ſimplici odorato*, The Common Field Cowſlip. 2. *Paralyſis altera odorata flore pallido polyanthos*, The Primroſe, or many flowered Cowſlip. 3. *Paralyſis flore Viridante ſimplici*, The ſingle green Cowſlip. 4. *Paralyſis flore & Calice Criſpo*, The curled Cowſlip. 5. *Paralyſis flore geminato odorato*, The double Cowſlip, one within another. 6. *Paralyſis flore Flavo ſimplici inodoro ſine Calicibus*, Single Oxlips. 7. *Paralyſis flore geminato inodora*, Double Oxlips, hoſe in hoſe. 8. *Paralyſis inodora calicibus diſſectis*, Oxlips with Jagged Husks. 9. *Paralyſis flore fatuo*, The fooliſh Cowſlips. 10. *Paralyſis hortenſis flore pleno*, Double Garden Cowſlips. 11. *Paralyſis flore viridante pleno*, Double green Cowſlips. 12. *Paralyſis flore viridante, ſive Calamiſtrato*, The Double green feathered Cowſlip, or green Roſe Cowſlip.

III. There are ſeveral Plants called by the name of *Primula veris*, (from their being the firſt Flowers which appear in the Spring) and to which that name is *Genus*, they being all various *Species* of the ſame, *viz.* 1. *Primula veris major, ſive Paralyſis*, The Cowſlip or Oxlip, of which we have before enumerated twelve ſeveral Kinds, whoſe Deſcriptions we ſhall give in this Chapter. 2. *Primula veris minor*, The Primroſe, Single and Double, of which hereafter. 3. *Primula viris Pachyphyllos, Auricula Urſi*, Bears Ears, three ſeveral Kinds of which we have treated in Chap. 59. paſt. 4. *Primula veris minor flore Rubro & Albo*, The White and Red Birds Eye, of which in Chap. 72. aforegoing: this being ſaid, we come to the matter in hand.

Cowſlip.

IV. The Deſcriptions. *The firſt, or* Common Cowſlip, *has Roots like to the* Primroſe, *with many Fibres annexed to the greater Root; from which ſpring up ſeveral green Leaves, very like unto the* Wild Primroſe, *but ſhorter, rounder, ſtiffer, rougher, more crumpled about the edges, and of a ſadder green color, every one ſtanding upon its Stalk, of an Inch or two long. From among theſe Leaves riſe up divers round naked Stalks of a whitiſh color, a foot, more or leſs, high, bearing at the top many fair ſingle yellow Flowers, growing out of a long Husk, upon a ſhort Footſtalk, with ſpots of a deeper yellow at the bottom of each Leaf, and ſmelling very Sweet.*

V. The

V. *The ſecond, which is the* Primroſe Cowſlip, *or many Flowred, has a Root like the former, from which ſpring forth Leaves, which are larger than the* Common Field Cowſlip, *and of a dark yellowiſh green color; from the midſt of which ſpring up ſeveral Stalks like the other; at the tops of which are the Flowers, which are manifold, and growing together in Husks like the former, ſometimes to the number of thirty in one Head, at the top of one Stalk, and ſometimes more, every one of them having a longer* Footſtalk *than the Common Kind, which is requiſite by reaſon of their great number: they are of a pale yellowiſh color, almoſt like thoſe of the* Field Primroſe, *with yellow ſpots at the bottom of the Leaves, as the Common Kind have, and of a ſweet Smell.*

VI. *The third, or* Single Green Cowſlip, *has a Root like the firſt, with many Fibres annexed, and from which there is but little difference either in its Root, or Leaf; the chief difference in this Kind being, that the Leaves are ſomewhat greater; the Flowers being in all reſpects like in form to the firſt Field Kind, but ſomewhat larger, and of the ſame color with the whitiſh yellowiſh green Husks, or rather a little yellower, and of very little Smell: In any other thing there is no diverſity, but that it is much longer in Flower, before it fades, eſpecially if it grows out of the Sun.*

VII. *The fourth, or* Curled Cowſlip, *differs chiefly in the Flowers, which are folded or crumpled at the edges, the Husks of the Flowers being larger than any of the former, more ſwelling out in the middle, as it were Ribs, and crumpled on the ſides of the Husks.*

VIII. *The fifth, or* Double Cowſlip, *one in another, which ſome call hoſe in hoſe, has each Single Flower growing out of another, which makes the ſame Double; for which reaſon* Pena *calls it* Geminata, *for that the Flowers are brought forth like Twins: The Smell is the ſame with the common* Field Cowſlip, *but ſomething weaker.*

IX. *The ſixth, or* Single Oxſlip, *is a kind of* Cowſlip, *which has Roots, and Leaves, and Stalks like the firſt Kind, but ſomewhat ſmaller: the Flowers are yellow like the firſt* Cowſlip, *and ſmaller alſo, ſtanding many upon a Stalk, but bare or naked, without any Husk to contain them, and having no other thing beſides differing from the Common, or* Field Cowſlip.

X. *The ſeventh, or* Double Oxlip, *called,* Hoſe in Hoſe, *is almoſt like the former* Double Cowſlip, *or* Hoſe in Hoſe, *having its ſingle Flowers one within another, ſaving that this has no Husks to contain them, no more than the former* Oxlips, *but ſtands bare or naked, and of the very ſame bigneſs each of them, and of the ſame deep yellow color with it, and with as little Smell as the Single. There is another of this Species whoſe Leaves are ſomewhat larger, as alſo the Flowers, but of a paler yellow color.*

XI. *The eighth, or* Oxlip with Jagged Leaves, *differs not from the firſt* Single Oxlip *in the ſmallneſs of the green Leaves, but in the Flower, which ſtanding many of them together on a reaſonable high Stalk, are very ſmall and yellow, and ſcarce open, or lay abroad themſelves, but appear only, as having a green Husk under each Flower, which is divided into ſix ſeveral ſmall long pieces.*

XII. *The ninth, or* Fooliſh Cowſlip, *differs not much in Leaves from the former* Cowſlip, *but bears at the top of the Stalk a Tuft or Buſh of ſmall, long, green Leaves, with ſome yellow Leaves, as it were pieces of Flowers broken, and ſtanding among the green Leaves. And ſometimes ſome Stalks among thoſe green Leaves at the Top (which are a little larger than when it has but broken pieces of Flowers) do carry whole Flowers in Husks like the Single Kind.*

XIII. *The tenth, or* Double Garden Cowſlip, *has ſmaller and darker green Leaves, than the firſt Single Field Kind has, and longer Footſtalks alſo, on which the Leaves do ſtand: It bears ſeveral Flowers upon a Stalk, but not ſo many as the Single Kind, every one of which is of a much deeper and fairer yellow color than any of the former, ſtanding not much above the brims of the Husks which hold them, conſiſting each of two or three rows of Leaves, ſet round together, which makes it very thick and double, of a pretty pleaſant ſweet Smell, but not Heady.*

XIV. *The eleventh, or* Double green Cowſlip, *is ſo like to the ſingle green kind, before deſcribed, that until it is near flowering, it can hardly be diſtinguiſhed from the Single Kind: but when it is in flower, it has large Double Flowers, of the ſame yellowiſh green color, with the Single Green, and more laid open or ſpreading than the Flowers of the former* Double Cowſlip.

XV. *The twelfth, or* Double Green Feathered Cowſlip *has but little difference in the Leaves from the Double Green laſt deſcribed, but that they are not of ſo dark a Green. The principal difference conſiſts in the Flowers, which are many, ſtanding together at the tops of the Stalks, but far differing from all others of theſe kinds; for every Flower ſtanding upon its own Stalk, is compoſed of many very ſmall and narrow Leaves, without any Husk to contain them, but ſpreading open like a little Roſe, (whence came the name of* Roſe Cowſlip) *of a pale yellowiſh green color, and without any Smell at all, abiding in Flower (eſpecially if it ſtands in a ſhadowy place out of the Sun) above two Months, almoſt in as perfect beauty, as in the firſt Week.*

XVI. *The Places.* All theſe Kinds have been found growing Wild in *England*, and from their natural places of growth, they have been tranſplanted into our *Gardens*, where they abide; and being in a richer Mould, grow larger and fairer than in their natural places.

XVII. *The Times.* They all Flower in the *Spring* of the Year, ſome earlier, and ſome later, according as they are defended from Cold and Froſt, and as the mildneſs of the Seaſon will permit. They Flower at the latter end of *April* and in *May*, (later than *Primroſes* do) and the Single and Double green *Cowſlips* the lateſt, and continue flowering a pretty while after all the reſt.

XVIII. *The Qualities.* They are all hot and dry in the firſt Degree, They are Aperitive, do Attenuate, are Digeſtive, Diſcuſſive, Incarnative, Traumatick or Vulnerary; Cephalick, Neurotick and Arthritick.

XIX. *The Specification.* They are ſingular for the cure of Palſies and Gouts.

XX. *The Preparations.* You may have therefrom, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *A Wine of the Flowers.* 4. *A Pouder of the Leaves.* 5. *An Ointment of the Flowers.* 6. *A Cataplaſm of the Whole Plant.* 7. *A Diſtilled Water of the Whole.* 8. *A Spirituous Tincture of Leaves and Flowers.* 9. *An Oily Tincture of the ſame.* 10. *A Saline Tincture.* 11. *A Spirit.* 12. *A Fixed Salt.* 13. *A Balſam.*

The Virtues.

XXI. *The liquid Juice.* Snufft up the Noſtrils, it is an excellent *Errhine* to purge the Head and Brain of cold, groſs, viſcous Humors, which obſtruct the Roots of the Nerves, and parts adjacent. Given inwardly from two ounces to four, it eaſes

Pains in the Back and Bladder, and opens the paſſages of the Urine, cauſing a free and eaſie paſſage.

XXII. *The Eſſence.* It has the former Virtues, and as it is an admirable Neurotick, ſo it helps all infirmities of the Head, Brain, and Nerves, coming of Cold, Wind, or moiſt Humors, as the Vertigo, *Ephialtes* or Night-mare, falſe Apparitions or Whimſies, Phrenſies, *Epilepſies*, or Falling-ſickneſs, Palſies, Convulſions, Cramps, and other Pains of the Nerves and Joints. Doſe three ounces or more in a Glaſs of Wine, Morning and Night, bathing alſo twice a Day very well, the parts affected with the ſame.

XXIII. *The Wine of the Flowers.* It is Cordial and Comfortative, refreſhes the Spirits, and is conducive to all the purpoſes aforementioned: The Patient may drink a Glaſs of it half an hour afore Dinner, or any other time of eating.

XXIV. *A Pouder of the Leaves.* It is a ſmall kind of an Errhine, being ſnufft up the Noſtrils, and ſo purges the Head, but yet very gently. Being ſtrewed upon old running Sores or Ulcers, it cleanſes, dries, and heals them, and takes away the ſharpneſs of Humors, Pain, or Inflammation therein, if preſent: it may be ſtrewed on dry, or mixed with *Unguentum Nicotianæ*, and ſo applied.

XXV. *The Ointment.* If it is made of the Flowers, either by Inſolation, or a boiling to Criſpneſs, and a treble repetition of the ſame, it is ſaid by Authors to take away ſpots and wrinkles of the Skin, Sun-burnings, and Freckles, adding Beauty, and heightning the Complexion. If the Ointment is made of the Leaves, it is an excellent thing to heal ſimple Green Wounds, cleanſe old Ulcers, dry up and heal inveterate running Sores, *&c.*

XXVI. *The Cataplaſm.* Applied upon the ſpot, it diſcuſſes ſimple Contuſions, and prevails againſt the Gout in the Hands or Feet, by comforting and ſtrengthening the Nerves, and eaſing their pain, being often repeated as need requires.

XXVII. *The Diſtilled Water of the whole Plant.* It is uſed as a Vehicle for other *Cephalick* and *Neurotick* Preparations: In the mean Seaſon it is ſaid to be *Coſmetick*, and therewith the Face and Skin may be waſhed every Morning after the Ointment is rubbed off.

XXVIII. *The Spirituous Tincture.* It has all the Virtues of the Eſſence; and is much more Cordial, and therefore better againſt Fainting and Swooning Fits, ſickneſs at Heart, and other Diſtempers in which the Vitals are concerned. Doſe half a ſpoonful or more in a Glaſs of Generous Wine.

XXIX. *The Oily Tincture.* It is peculiar againſt the Palſie and Gout, as alſo Convulſions, Cramps, Punctures of the Nerves, *&c.* in all which caſes, it has ſcarcely any equal: In Palſies anoint with it Morning and Evening, all along the Back-bone, from the *Vertebræ* of the Neck, almoſt to the *Anus*, as alſo the Parts affected, rubbing it very well in; in Gouts, (from a cold Cauſe) Convulſions, Cramps, Punctures, *&c.* you may only anoint the parts affected; but in Convulſions, it will be good alſo to take it inwardly (in ſome Neurotick Vehicle) Morning and Night, from fifteen drops to thirty or forty, as the Exigency may require.

XXX. *The Saline Tincture.* If it is daily taken twice a day, from half a dram to one dram, in a good Glaſs of White Port Wine or Canary, it powerfully opens Obſtructions of the Urinary parts, and eaſes pains in the Reins, Ureters and Bladder; and if any Sand, Gravel, Small Stones, or Tartarous Mucilage be lodged in thoſe parts, it cleanſes them thereof, and expells it.

XXXI. *The Fixed Salt.* It is Neurotick and Diuretick, peculiarly dedicated to the Head, Brain, Nerves, Reins and Bladder: It is good againſt the Jaundice, and carries it off, as alſo Febritick Diſtempers by Urine, being given to half a dram in White Port Wine.

XXXII. *The Balſam.* It is an admirable Vulnerary, curing ſimple Green Wounds at the firſt intention: If they be compoſed, it digeſts them, or brings them to maturation, reſiſts putrefaction, cleanſes, incarnates, dries and heals them in a very ſhort time. If it is mixt with equal parts of *Unguentum Nicotianæ*, it performs all theſe things the more admirably, and is a Medicament which every good Country man ought to keep always in his Houſe.

CHAP. CLVIII.

Of COWSLIP Spotted.

I. *The Names.* It does not appear that this Plant was known to the *Greeks*, yet ſome, as accounting it among the Kinds of *Comfrey*, have called it Σύμφυτον ῥυπαρὸν: It is called in *Latin*, *Pulmonaria*, (and yet it is no Species of the *Lungworts*, as we ſhall, God willing, hereafter ſhew:) alſo, *Symphitum maculoſum*: and in *Engliſh*, *Jeruſalem Cowſlip*, and *Spotted Cowſlip*, (and yet it is not of the Species of *Cowſlips*:) alſo *Sage of Jeruſalem*, *Sage of Bethlem*, *Spotted Lungwort*, and *Spotted Comfrey*.

II. *The Kinds.* Authors make three Species or Kinds of this Plant, *viz.* 1. *Pulmonaria maculoſa vulgaris*, Common ſpotted Jeruſalem Cowſlips.

2 *Pulmo-*

2. *Pulmonaria maculosa altera*, (*Parkinson* says, *non maculosa*) *Pulmonaria Echij foliis*, Bugloss Leav'd Jerusalem Cowslip. 3. *Pulmonaria angustifolia* (*secunda Clusij*) Narrow Leav'd Jerusalem Cowslip. All which Plants, *Gerard* says, are the *True Lungworts*.

III. The Descriptions. *The first of these has a Root composed of many long and thick black strings; from whence arise many rough, large, and round Leaves, but pointed at the ends, standing upon long Footstalks, spotted with many round white spots on the upper sides of the Leaves, which are of a sad green or brown color on the tops, but of a grayer green underneath. From among these Leaves spring up several brown Stalks, a foot, more or less, high, bearing many Flowers at the tops, very much resembling those of* Cowslips, *being of a purple or reddish color, while they are Buds, and of a dark blewish color when they are blown, standing in brownish green Husks (sometimes this Plant has been found with white Flowers:) The Flowers being past, small round Heads, like Buttons, come up, in which is contained small black Seed.*

IV. *The second, or* Bugloss Jerusalem Cowslip, *is like unto the former, but greater in each respect: the Roots black like unto the first; the Leaves, says* Gerard, *are bigger than the former, (but* Parkinson *says smaller) being rough like the former, resembling* Wild Bugloss *Leaves, of a fairer color above, and of a whiter underneath, spotted with white spots like the first, says* Gerard *(but without any spots at all, says* Parkinson: *) The Stalks are a little more branched than the other: at the tops of which come forth Flowers like to the first in form, and of an exceeding red shining color.*

V. *The third, or* Narrow Leav'd Jerusalem Cowslip, *or* Lungwort, *which is the second of* Clusius, *has a Root which is black, and stringy, in which last respect it is like unto* Cowslips, *as are both the other. From this Root spring forth Leaves somewhat longer than the last described, and not so broad, which are rough and hairy like unto the Leaves of* Echium *or* Wild Bugloss, *but narrower, and spotted with whitish spots also like the former. The Stalk is about a foot high, or better, set with the like long hairy Leaves, but smaller, bearing at the top a bundle of many Flowers, standing in Husks like the first (in fashion, says* Gerard, *like those of* Bugloss, *or those last described;) being somewhat reddish in the Bud, and of a dark purplish blew color, when they are fully blown, and having Seed also like the others. All these Plants do well resemble* Bugloss *or* Comfrey *in most parts, excepting in their Roots: And these are they which,* Gerard *says, are the true* Lungwort; *(but* Cowslip *is indeed the more usual name.)*

VI. *The Places.* All these grow naturally in the Woods of *Germany* in divers places: *Parkinson* says, that the first Kind is found in *England*. *Johnson* upon *Gerard* says, that the second *Pulmonaria folij Echij* was found by Mr. *John Goodyer* flowering in a Wood by *Holbury House* in the *New Forest* in *Hampshire*. Their natural place is in moist and shadowy Woods, but with us they are for the most part Nurs'd up in *Gardens*.

VII. *The Times.* They flower generally very early in the Year, for the most part in *March*, and in the beginning of *April*.

VIII. *The Qualities, Specification, Virtues and Uses,* are much like those of *Comfrey*, in Chap. 149. foregoing, to which you are referred; but doubtless as these have not such a Viscosity, as our common *Comfrey* has, so in many cases they may not be all out so powerful: but as these are more drying and binding than *Comfrey*, so also in some other cases, they may exceed *Comfrey*. And whereas in *Comfrey* the *Root* is chiefly used; in these Plants, the *Leaves* are the most considerable.

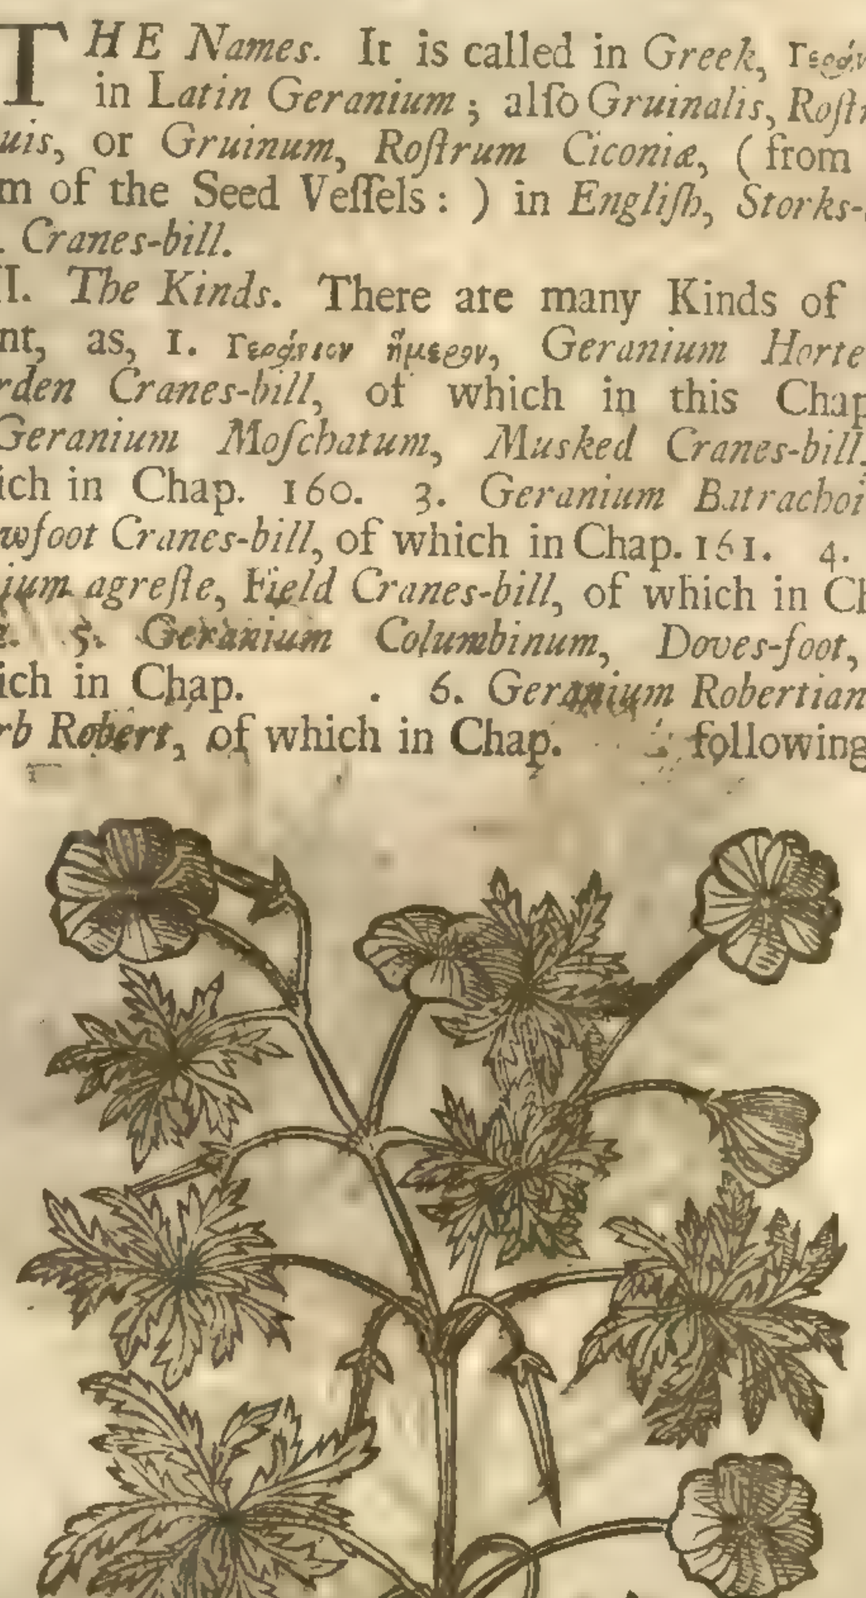
IX. *An Observation. The liquid Juice or Essence of the Leaves, or whole Plant*, have been found by large Experience to be singularly good for the Cure of Ulcerated Lungs, which are full of corrupted and rotten Matter: and it has been found to be a Cure for those who spit Blood. Dose two, three, or four ounces in a Glass of pure Red Port Wine. But the greatest use which our Countrey People make of it, is for a Pot Herb.

CHAP. CLIX.

Of CRANES-BILL Garden.

I. *THE Names.* It is called in *Greek*, Γεράνιον; in *Latin Geranium*; also *Gruinalis, Rostrum Gruis*, or *Gruinum, Rostrum Ciconiæ*, (from the form of the Seed Vessels:) in *English*, *Storks-bill*, and *Cranes-bill*.

II. *The Kinds.* There are many Kinds of this Plant, as, 1. Γεράνιον ἥμερον, *Geranium Hortense*, *Garden Cranes-bill*, of which in this Chapter. 2. *Geranium Moschatum*, *Musked Cranes-bill*, of which in Chap. 160. 3. *Geranium Batrachoides*, *Crowfoot Cranes-bill*, of which in Chap. 161. 4. *Geranium agreste*, *Field Cranes-bill*, of which in Chap. 162. 5. *Geranium Columbinum*, *Doves-foot*, of which in Chap. . 6. *Geranium Robertianum*, *Herb Robert*, of which in Chap. following.

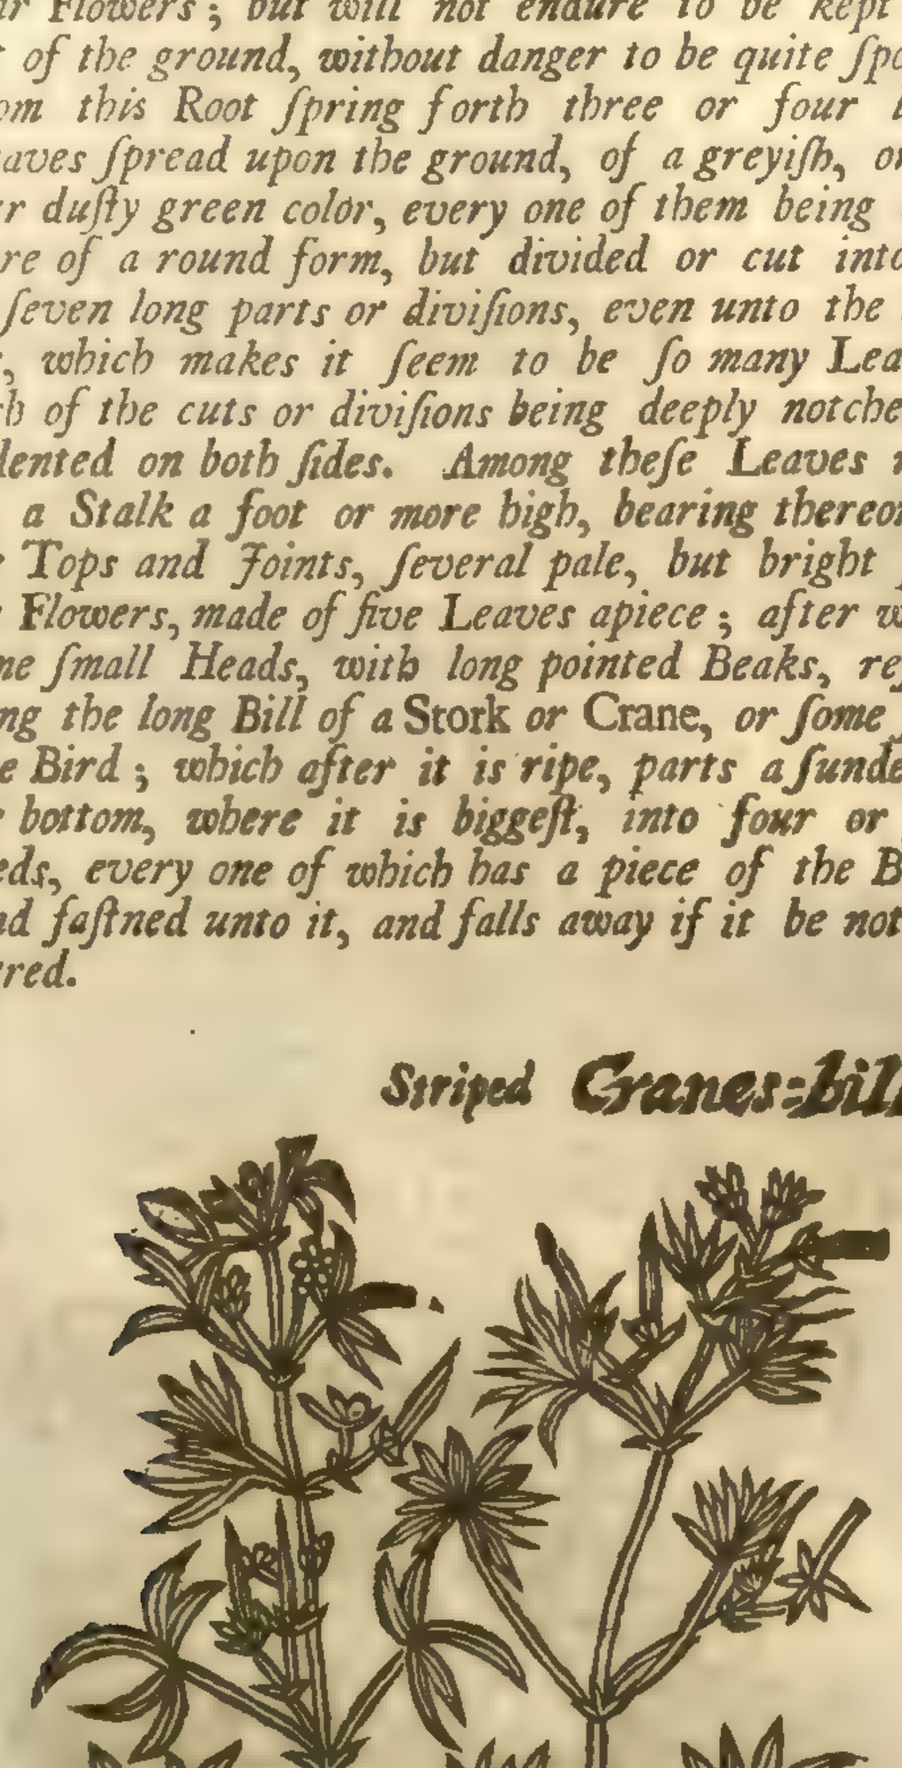


III. *The Garden Kinds*, of which we treat in this Chapter, are manifold, *viz.* 1. *Geranium Tuberosum*, Tuberous or Knobbed Cranes-bill. 2. *Geranium Anglicum Variegatum Besleri*, *Geranium Versicolor, sive striatum*, the Variable, or Strip'd Cranes-bill. 3. *Geranium fuscum sive maculatum*, Brown, or spotted Cranes-bill. 4. *Geranium Hæmatoides*

natoides, vel Sanguineum, Geranium Gruinale hæmatoides Lobellij, Bloody Cranes-bill, or Red Rose Cranes-bill.

IV. The Descriptions. *The first or Tuberous* Cranes-bill *has a Root Tuberous and round, like almost unto the Root of* Cyclamen, *or common* Sow-bread, *but smaller, and of a dark russet color on the outside, but white within, which encreases under Ground by several strings running from the Mother Root, swelling out into small round Tubercles or Knobs, like unto the Roots of Ground Nuts, which will quickly shoot out Leaves, and in a short time bear Flowers; but will not endure to be kept long out of the ground, without danger to be quite spoiled. From this Root spring forth three or four large Leaves spread upon the ground, of a greyish, or rather dusty green color, every one of them being as it were of a round form, but divided or cut into six or seven long parts or divisions, even unto the middle, which makes it seem to be so many Leaves, each of the cuts or divisions being deeply notched or indented on both sides. Among these Leaves rises up a Stalk a foot or more high, bearing thereon at the Tops and Joints, several pale, but bright purple Flowers, made of five Leaves apiece; after which come small Heads, with long pointed Beaks, resembling the long Bill of a* Stork *or* Crane, *or some such like Bird; which after it is ripe, parts asunder at the bottom, where it is biggest, into four or five Seeds, every one of which has a piece of the Beak-head fastned unto it, and falls away if it be not gathered.*

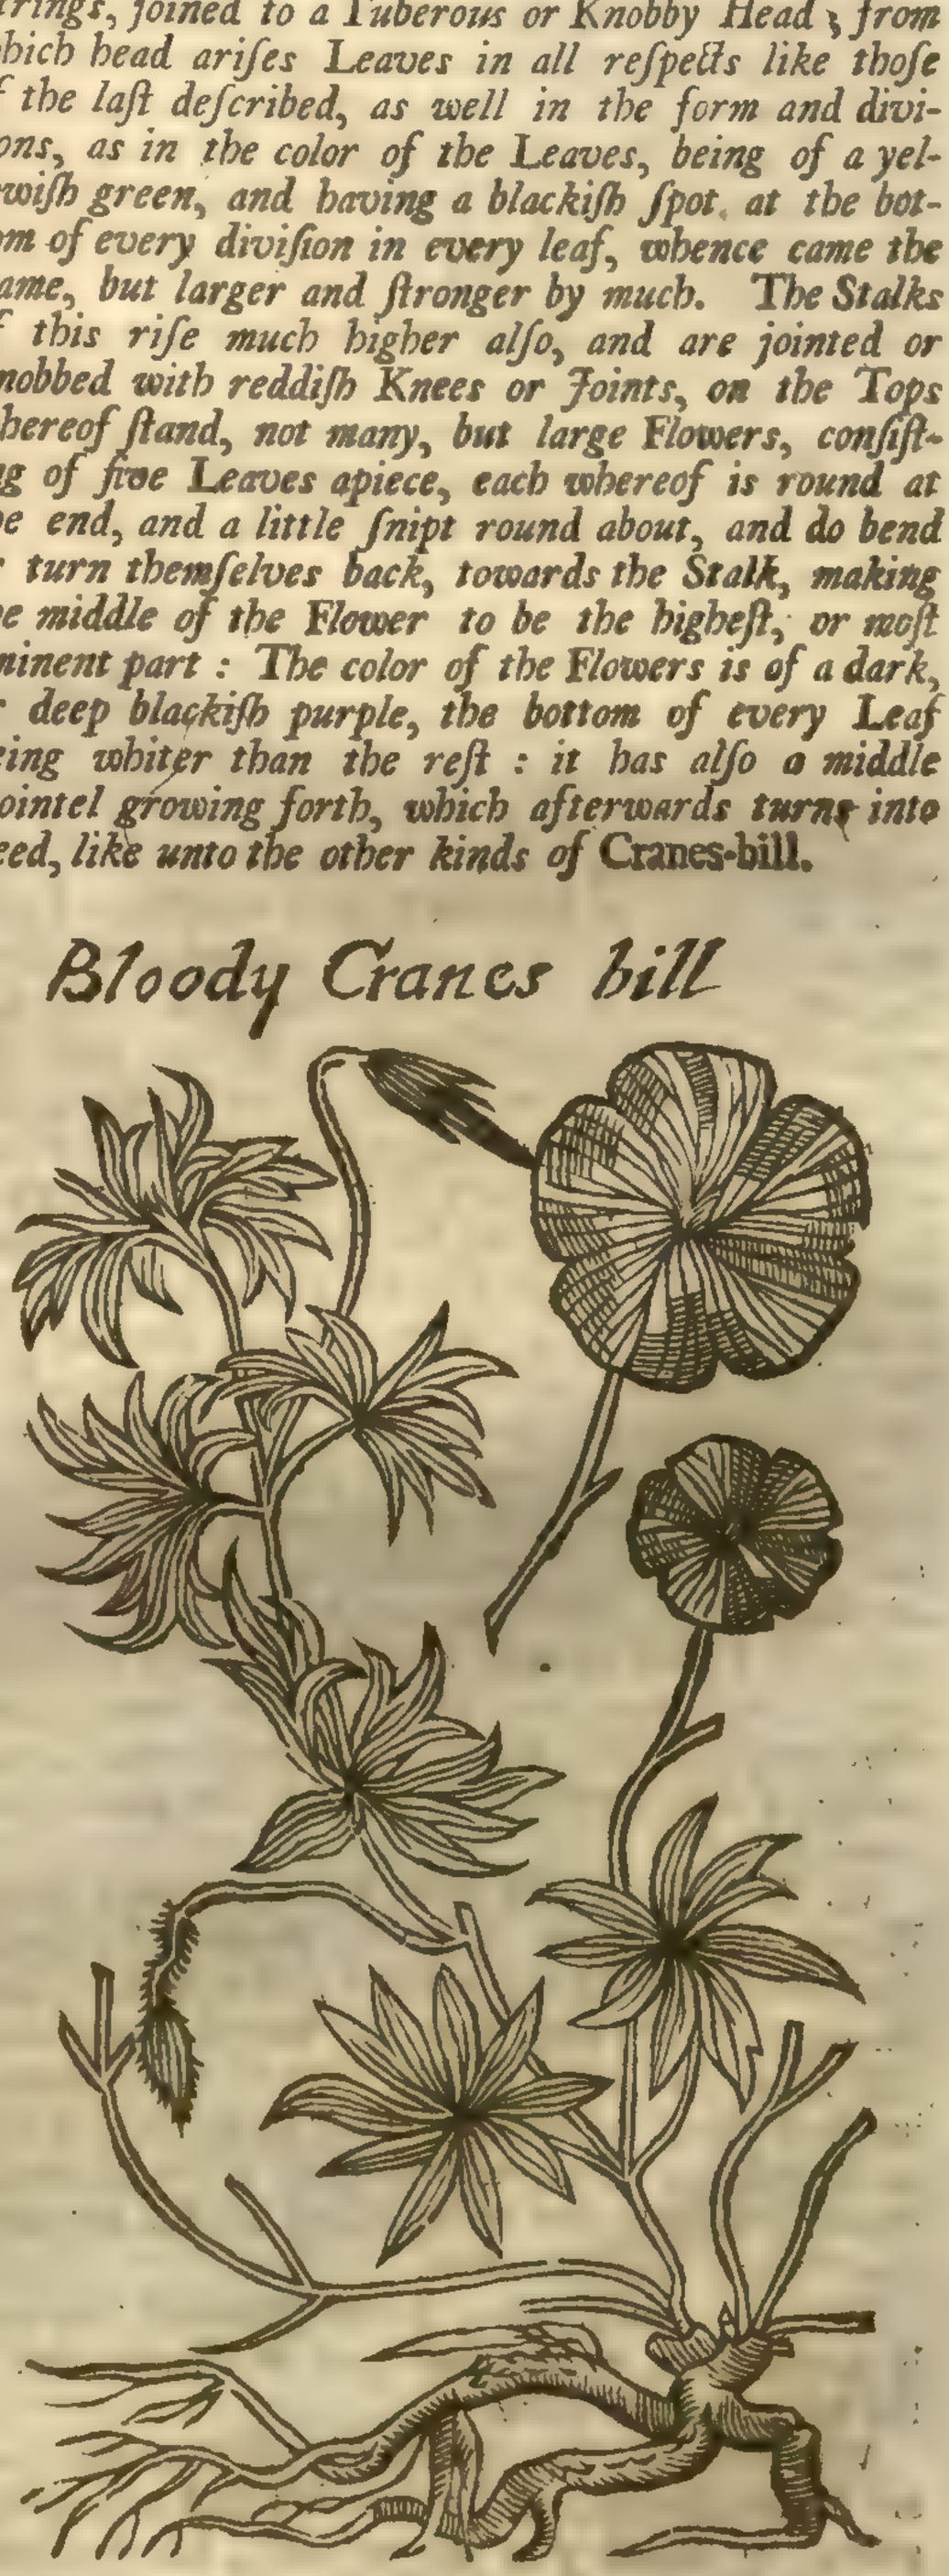
Striped Cranes-bill



V. *The second, or* Striped Cranes-bill, *has a Root made of many small yellow threads or strings; from which rise up many broad yellowish green Leaves, divided into five or six parts, but not unto the middle, as the former is; each of these Leaves has a blackish spot at the bottom corners of the divisions; the whole Leaf, as well in form, as color and spots, is very like unto the Leaf of the* Geranium Fuscum, *or* Spotted Cranes-bill, *next to be described; but that the Leaves of this are not so large as the Leaves of that: From among these Leaves spring up several Stalks a foot or more high, jointed and knobbed here and there, bearing at the Tops two or three white Flowers, consisting of five Leaves a piece, so thickly, and variably striped with fine small reddish Veins, that no green Leaf, which is of that bigness, can shew so many Veins in it, nor so thick running, as every Leaf of the Flower of this beautiful* Cranes-bill *doth. In the middle of the Flower stands a small pointel, which when the Flower is past, does grow to be the Seed-Vessel, on which is set several small Seeds, like unto the small Seeds of the other* Cranes-bills.

VI. *The third, which is the* Brown, *or* Spotted Cranes-bill, *has a Root consisting of divers great Strings, joined to a Tuberous or Knobby Head; from which head arises Leaves in all respects like those of the last described, as well in the form and divisions, as in the color of the Leaves, being of a yellowish green, and having a blackish spot at the bottom of every division in every leaf, whence came the name, but larger and stronger by much. The Stalks of this rise much higher also, and are jointed or knobbed with reddish Knees or Joints, on the Tops whereof stand, not many, but large Flowers, consisting of five Leaves apiece, each whereof is round at the end, and a little snipt round about, and do bend or turn themselves back, towards the Stalk, making the middle of the Flower to be the highest, or most eminent part: The color of the Flowers is of a dark, or deep blackish purple, the bottom of every Leaf being whiter than the rest: it has also a middle Pointel growing forth, which afterwards turns into Seed, like unto the other kinds of* Cranes-bill.

Bloody Cranes bill



VII. *The fourth Kind, or* Bloody Cranes-bill, *has a Root which is hard, long, and thick, with several Branches spreading from it, of a reddish yellow color*

on

on the outside, and whitish within, which abides, and perishes not, but shoots forth some new green Leaves, which abide all the Winter, although those which turn red, do fall away. From this Root divers Leaves *also spring, which spread themselves upon the ground, very much cut in or divided into many parts; and each of them again slit or cut into two or three pieces, growing upon slender long Footstalks, of a fair green color all the Spring, and Summer, but reddish in Autumn.* From among *these* Leaves *spring up several slender and weak Stalks, beset at every Joint (which is something reddish) with two* Leaves *for the most part, like unto the lower.* The Flowers *grow severally on the Tops of the Stalks, but not many together, in Bunches or Branches, as in all the other kinds of* Cranes-bills; *every* Flower *being as large as a* Single Rose Campion *Flower, consisting of five large* Leaves, *of a deeper red color than in any other* Cranes-bill *at the first opening; but changes more blewish afterwards: when the* Flower *is past, there does arise such like Beaks, or Heads of Seed, as are produced in the other kinds; but they seem to be smaller.*

VIII. *The Places.* All these grow Wild in Foreign places, but are only nurs'd up with us in *Gardens. Matthiolus* says, that the first grows very plentifully in *Dalmatia* and *Illyria*: and *Camerarius*, *Clusius*, and others say, that the rest grow in *Germany*, *Bohemia*, *Austria*, &c.

IX. *The Times.* All these *Cranes-bills* do Flower for the most part, in *April*, *May*, and *June*: but the *Variable* or *Strip'd Cranes-bill* Flowers usually later than any of the rest.

X. *The Qualities, Specification, Preparations, Virtues and Uses,* of all the *Cranes-bills*, being one and the same, we shall forbear the declaring thereof in this place, as also in some of the following Chapters; till such time as we have fully described all such kinds as are to be found growing in our Countrey: and therefore I refer you to Chap. 162. where we shall (God willing) discourse the same at large, and to full satisfaction.

CHAP. CLX.

Of CRANES-BILL Musked.

I. *The Names.* It is called in *Greek*, Μοσχων εἰδιον; Βοτάνη ὁ μόσχος, vel τὸ μόσχε: In *Latin*, *Geranium Moschatum*, also *Acus Moschata*, *Rostrum Ciconiæ Moschatum*, *Myrrhida Plinij*, and *Acus Pastoris*: In *English*, *Musked Cranes-bill*, or *Storks-bill*, of the Vulgar, *Musk*, *Muschata*, and *Herb-Musk.*

II. *The Kinds.* We have four several sorts of this Plant, *viz.* 1. *Geranium Moschatum Vulgare vel Hortense*, *Herba Moschus*, the Common, or Garden Musked Cranes-bill, or Herb Musk. 2. *Geranium Moschatum inodorum*, Musked Cranes-bill without smell, being only called Musked from its form. 3. *Geranium Apulum odorum*, *alterum odorum folio Coriandri*, Italian Musked Cranes-bill. 4. *Geranium Creticum*, Candy Cranes-bill.

III. The Descriptions. *The first, or* Musked Cranes-bill, *has a Root somewhat long, with divers Fibres thereat, from whence spring up several long winged Leaves, of a dark green color, (and sometimes of an Ash green color, or somewhat whitish by reason of the hairs which are thereon,) lying upon the ground, and cut or divided into many* Parts or Leaves; *and each of them cut in or snipt on the Edges; among which rise up weak tender Stalks, scarce able to stand upright, about a foot, more or less high, with some such like* Leaves *growing upon them, as you find below, but smaller the higher they grow on the Stalk, and the finer cut in on the edges on the* Tops; *also among the upper* Leaves *sometimes, several very small* Red *or Crimson* Flowers *grow, after which very small and long Beaks or Bills come forth, with Seed at the bottom, as all the rest of the* Cranes-bills *have, which twines it self, as most of them do.* The *whole* Plant, *and every part thereof above ground, has a very fine and pleasing sort of smell, very much resembling that of Musk, whence came the name.*

Musked kind With Out Smell.

IV. *The second kind, or* Inodorous, *in its Roots Leaves, Stalks, Flowers, Magnitude, form and manner of growing, so much resembles the former, that at first sight there seems to be no difference: but that which makes the distinction is, that this whole* Plant

Plant has no Smell at all; or if it has any, it is not of the Musky kind; this has Red Flowers: But there is alſo another Species of this Inodorous kind, nothing differing from the laſt, but in the color of the Flowers, the color of theſe being white.

V. *The third, or* Italian Musked Cranes-bill, *has a Root ſmall and yellow, lifting up its head a little above ground, from whence ſpring up ſeveral long Leaves, ſomewhat hairy, lying upon the ground, and a little ſnipt or cut in on the edges, and divided into parts, even to the middle* Rib, *not much unlike to the* Geranium Moſchatum *firſt deſcribed, which ſtand upon reddiſh Footſtalks, the two loweſt Jaggs being greater than the reſt; but thoſe which riſe up with the Stalk are more cut in, ſomewhat like unto the lower Leaves of* Coriander *or* Fetherfew, *but with rounder dents; the Stalks are Jointed and Kneed, with two ſuch like Leaves at them, but more finely jagged: at the tops of the Stalks and Branches the Flowers grow, of a pale blewiſh purple color, each ſtanding in a green hairy Husk, wherein afterwards ſtand the heads of Seed, very like to the other kinds, great below and ſmall above. The whole Plant above ground is of a Pleaſing Sweet Musky Smell, like the firſt of theſe, and of which it is a Species.*

VI. *The fourth, or* Candy Cranes-bill, *has a Root which is long and white, with ſome Fibres adjoining to it; and periſhes when it has perfected its Seed: from this Root ſpring up ſeveral long and tender Stalks, ſoft and full of Juice, upon which grow ſeveral broad and long winged Leaves, not much unlike to the firſt* Musked Cranes-bill, *cut in, or notched on the edges. Theſe Stalks ſpread themſelves out into many Branches, more eſpecially towards the Top, on the Tops of which grow many Flowers made of five Leaves apiece, of a reaſonable bigneſs, and of a fair Blew, or Watchet color, with a purpliſh Pointel in the middle, which being paſt, beak-like heads follow, as in the other* Cranes-bills, *but greater, and containing larger, greater, and ſharper pointed Seed, able to pierce the skin. This Plant ſprings up many times of its own Sowing, if the Winter is not too ſharp; otherwiſe being Annual, it muſt be Sown in the Spring of the Year.*

VII. *The Places.* The two firſt grow Wild (ſays *Parkinſon*) in many places of this Land, as well in *Meadows* as waſte Grounds. But *the firſt* is now nurſed up in *Gardens* for its pleaſant ſweet Smell. The ſecond is found ſometimes upon *Heaths*, and dry Gravelly places, but much ſmaller than when it grows in better or richer Ground. The third was brought to us out of *Italy*, and the fourth out of *Candia*, and in *England* are only nurs'd up in *Gardens*, where they grow very well.

VIII. *The Times.* They Flower in *June* and *July*, and the Seed ripens not long after: the *Candy Cranes-bill*, *Gerard* ſaith, flowered with him for the moſt part in *May*.

IX. As for the *Qualities, Specification, Preparations and Virtues* (theſe being of the ſame nature with the *Wild Cranes-bills*) ſee them in Chap. 162. following. Theſe here are accounted excellent Wound Herbs, and equal to *Doves-foot*: The *Cretick* or *Candy Cranes-bill* being uſed in Wound Drinks, does far excell (as *Gerard* ſays) any of the *Cranes-bills*, and is equal with any other Wound Herb whatſoever for the ſame purpoſe.

CHAP. CLXI.

Of CRANES-BILL-Crowfoot.

I. *THE Names.* It is called in *Greek*, Γερανιον βατραχοειδες: In *Latin*, *Geranium Batrachioides*, *Gratia Dei Fuchſij*, *Ranunculus cæruleus*: and in *Engliſh*, *Crowfoot Cranes-bill.*

II. *The Kinds.* There are ſix ſeveral kinds hereof, 1. *Geranium Batrachioides flore Cæruleo*, Blew Crowfoot Cranes-bill. 2. *Geranium Batrachioides flore albo*, White Crowfoot Cranes-bill. 3. *Geranium Batrachioides alterum, flore purpureo*, Purple Crowfoot Cranes-bill. 4. *Geranium Batrachioides, pullo flore*, Dark Red Crowfoot Canes-bill. 5. *Geranium Batrachioides flore albo & Cærulco vario*, Party colored Crowfoot Cranes-bill. 6. *Geranium Batrachioides longius radicatum Lobelij*, Long Rooted Crowfoot Cranes-bill.

III. TheDeſcriptions. *The firſt, or* Blew Crowfoot Cranes-bill, *has a Root which is compoſed of many reddiſh ſtrings, ſpreading in the Ground, from a head made of divers red heads, which lye oftentimes above ground, from this Root ſpring forth many large Leaves, cut into five or ſix parts or diviſions, even to the bottom, and jagged alſo on the edges, ſet upon very long ſlender Footſtalks, very like to the Leaves of the* Field Crowfoot: *from among which Leaves divers Stalks ſpring up with great Joints, ſomewhat reddiſh, ſet with Leaves like to the firſt Garden kind: The Stalks towards their Tops ſpread themſelves into many Branches, on which grow ſeveral Flowers, made of five Leaves apiece, as large as any of the* Field Crowfoot, *round pointed, and of a fair Blew, or Watchet color, which being paſt, ſuch like heads and bills do ſucceed, as are found in other* Cranes-bills.

IV. *The ſecond, or* White Flowered Crowfoot Cranes-bill, *is in Leaves, Stalks, Branches, Flowers, Magnitude, Form, and manner of growing, altogether like*

like to the former, excepting in two particulars, viz. 1. *In the Root, which has not ſuch red heads as the former Blew Flowered has.* 2. *In the Flowers, the former being Blew, whereas the Flowers in this are wholly White, and fully as large as the firſt.*

V. *The third, or* Purple Crowfoot Cranes-bill, *has a Root which is compoſed of a great Tuft of ſtrings, faſtned to a Tuberous or Knobby Head, from whence many Leaves ſpring forth, ſet upon long Footſtalks, ſomewhat like unto the other, yet not ſo broad, but more divided or cut,* viz. *into ſeven, or more ſlits, even to the middle, each of which is alſo cut in on the edges, more deeply than the former. The Stalks are a little Knobbed or Gouty at the Joints, ſet with Leaves like unto the lower, and bearing a great Tuft of Buds at the Tops of the Branches, which bud and put out into fair large Flowers, made of five purple Leaves, which do ſomething reſemble the Flower of a* Mallow, *before it be too full blown, each whereof has a reddiſh Pointel in the middle, and many ſmall threads compaſſing of it, (ten in number) as* Gerard *ſays. This Umble or Tuft of Buds, does Flower by Degrees, and not all at once, and every Flower abides open but a little more than one day, and then ſheds its Leaves; ſo that every day yields freſh Flowers, which becauſe they are ſo many, are a long time before they are all blown and ſpent. The Flowers being paſt, ſmall Beak or Bill Heads come forth, like unto the other* Cranes-bills, *with ſmall turning Seed.*

VI. *The fourth, or* Dark Red Crowfoot Cranes-bill, *has a Root with great reddiſh heads above, with many long ſtrings and fibres deſcending from it; from this Root ſpring ſeveral broad ſpread, ſoft, and ſomewhat hairy Leaves, growing upon long Footſtalks, cut into five, ſix, or ſeven deep gaſhes or diviſions, with a blackiſh ſpot at the bottom of every one of them, and dented alſo about their edges. The Stalk riſes up about two Feet high, ſpotted with many bloody ſpots, and is ſtrong, ſomewhat hairy, and ſpread forth into three or four Branches, with ſuch like Leaves on them, but leſſer, and at their Tops, two or three Flowers apiece, each of them conſiſting of five Leaves, cut in on the edges (which is a mode differing from all other* Cranes-bills) *of a deep red color, almoſt blackiſh, and in the middle a long Stile or Pointel, with many withered threads about it. The Flowers being paſt, there follows brown pointed Seed, like to the other* Cranes-bills.

VII. *The fifth, or* Party-colored Crowfoot Cranes-bill, *is in its Roots, Stalks, Leaves, Flowers, Seed, Magnitude, Form, and manner of growing, ſo like to the firſt deſcribed in this Chapter, that until it is perfectly in Flower, this cannot be known from that: but when it is blown out, the Flowers are found to be variably ſtriped and ſpotted, and ſometimes divided, the one half of every Leaf being white, and the other half blew; ſometimes with greater or leſſer ſpots of blew in the white Leaf, very variable, and more in ſome years than in others; ſo that it would be a very difficult matter to expreſs all the varieties which may be obſerved, at the ſame and differing times, in the blown Flowers.*

VIII. *The ſixth, or* Long Rooted Crowfoot Cranes-bill, *has a Root very long and great, with ſmall fibres adjoining thereto, of a reddiſh color without, and abiding all the Winter: from this Root ſpring forth Leaves (upon long Footſtalks) ſomewhat large, but yet leſs than thoſe of the other* Crowfoot Cranes-bills, *otherwiſe very like. From among theſe Leaves riſe up ſeveral Stalks, bearing fair and beautiful red Flowers, of a more excellent red color than thoſe of the* Tuberous Cranes-bill, *and of a lighter red than thoſe of the third kind before deſcribed in this Chapter: they are alſo contained in thicker and ſhorter Cups, and are of a ſweet Musk-like Smell: The Flowers being paſt, the Seed ſucceeds, which is like to that of the other* Cranes-bills, *ſaving that the Bills are a little ſhorter.*

IX. *The Places.* Theſe are all Wild of their own Nature, and grow in Barren Places, and in Vallies, rather than in Mountainous Grounds. Some ſay, that the firſt has been found growing naturally in *England*, but *Parkinſon* ſays, he never could find it: but with us they are for the moſt part Nurs'd up in *Gardens.*

X. *The Times.* They all Flower in *June* and *July*, and their Seed is ripe in a ſhort time afterwards.

XI. *The Qualities, Specification, Preparations and Virtues*, being the ſame with all the aforegoing *Cranes-bills*, as alſo with thoſe in the following Chapter, where we have declared them at large, we ſhall forbear to ſpeak any more in this place, referring you thither.

CHAP. CLXII.

Of CRANES-BILL Field.

I. *THE Names.* It is called in *Greek*, Γεράνιον ἄγριον: In *Latin*, *Geranium agreſte*: and in *Engliſh*, *Field Cranes-bill.*

II. *The Kinds.* The *Field Cranes-bill* is manifold, but thoſe which we deſign under that Name, are, 1. *Geranium agreſte, Geranium Violaceum*, Field, or Violet colored Cranes-bill. 2. *Geranium Cicutæ folio inodorum*, Field Cranes-bill without Smell; of this we have diſcourſed in Chap. 160. Sect. 4. 3. *Geranium Columbinum*, Doves-foot. 4. *Geranium Robertianum*, Herb Robert; of which two laſt we ſhall ſpeak in ſome of the Chapters following.

III. The

III. The Deſcription. *It has a Root which is thick and woody, having ſome few ſtrings adjoining thereto, and is wholly red, both within and without, not ſmelling ſo ſtrong as the Root of* Herb Robert: *from this Root riſe up ſeveral ſlender hairy reddiſh Stalks, about two or three feet high; at the Joints of which grow Leaves, upon ſhorter, yet reddiſh Footſtalks. The Stalks ſpread themſelves out alſo into other ſmall Branches, whereon are ſet confuſedly broad Leaves, made of three, four or five Leaves apiece, and thoſe jagged or cut about the edges.* Parkinſon *ſays, the Leaves are moſt uſually divided into three parts, as large, or rather more than the other, and turning red likewiſe. The Flowers which conſiſt of five* Leaves *apiece grow at the Tops of the Stalks and Branches, and are of a perfect Violet color, (whence came the name) or as* Parkinſon *ſays, of a Purpliſh Red, of the bigneſs of the Flowers of* Herb Robert; *which being paſt away, the Seed comes in ſuch headed Beaks or Bills as the other* Cranes-bills *produce.*

IV. *The Places.* It is often found by Way-ſides, Ditch-banks, Borders of Fields, and other waſte Grounds.

V. *The Times.* It Flowers in *June* and *July*, and the Seed ripens in the mean Seaſon, or not long after.

VI. *The Qualities.* All the *Cranes-bills* ſeem to have one and the ſame Qualities; they are temperate in reſpect of Heat or Cold, and Dry in the firſt Degree. They are Abſterſive, Aſtringent, Diuretick, Traumatick or Vulnerary and Incarnative: Pectoral, Nephritick, Hyſterick, and Anti-emmenagogick, Hemoptoick and Analeptick.

VII. *The Specification.* They heal Wounds ſpeedily, conglutinate their Lips, ſtop Fluxes of Blood, and cure Ruptures.

VIII. *The Preparations.* You may have therefrom, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *A Syrup.* 4. *A Decoction in Red Port Wine.* 5. *A Pouder of the Herb.* 6. *A Balſam.* 7. *A Cataplaſm.*

The Virtues.

IX. *The liquid Juice.* It is ſaid to be good againſt Fluxes of the Bowels, whether Diarrhæa, Dyſenteria, Lienteria, or Hepatick Flux, healing them, and ſo eaſing the Griping Pains, it prevails againſt Hyſterick Fits, and is good againſt Sand, Gravel, and Stone in Reins and Bladder. Doſe four ounces, or more, either alone, or in Wine, Morning and Night.

X. *The Eſſence.* It has all the former Virtues, and more powerful to all the ſame Intentions; beſides which, it is a famous thing to ſtop the overflowing of the Terms in Women, and to conſolidate Ruptures, whether in old or young. It is good againſt Fits, and the extream Tortures of the Colick, as alſo to heal Wounds, whether inward or outward; cures Spitting, Vomiting, or Piſſing Blood, diſſolves coagulated Blood, whether in the Stomach, Bowels, or Reins, and expels it, and is a ſingular thing to be taken as a Wound drink, for them who have any Wounds, running Sores, old Ulcers, or Fiſtula's, to induce them to a ſpeedy healing. Doſe three ounces, Morning, Noon, and Night in a Glaſs of Red Port Wine.

XI. *The Syrup.* It has all the former Virtues (being made either of the Juice or Eſſence) but is ſo much the weaker by the Sugar which is added to it: however it is more fit for Children, and ſqueamiſh Stomachs, and may be given to them againſt Ruptures.

XII. *The Decoction.* It has the Virtues of the Juice and Eſſence, but very much weaker, and may be given to thoſe who cannot be induced to take them. However you make thereof an exceeding good Wound drink, to all the purpoſes aforementioned. Being injected into Fiſtula's, or running Sores, and Ulcers, being waſhed therewith, it perfectly cleanſes and heals them, and alſo conglutinates the Lips of Green Wounds.

XIII. *The Pouder.* It is good againſt Ruptures, or Burſtings, given to one dram, in ſome proper Vehicle: outwardly ſtrewed upon old running Sores or Ulcers, it cleanſes, drys and heals them, and is good to ſtop Bleeding in Wounds, and to conſolidate their Lips.

XIV. *The Balſam.* It is a ſingular Vulnerary, and cures ſimple Wounds at the firſt Intention: it digeſts, cleanſes, incarnates, and dries old running Sores, and rebellious Ulcers, and by ſtrengthening the Part, brings on the healing after an admirable manner: applied in the Gout, it gives eaſe, and by continuing of it, cures it in a ſhort time.

XV. *The Cataplaſm.* Being applied to ſimple Contuſions, it Diſcuſſes, prevents Pain and Inflammation, and ſo cures them: It conglutinates ſimple Green Wounds, and gives eaſe in the Gout, as alſo in all other Pains of the Joints, Nerves, or Tendons, coming from blows, ſtrains, or the like.

CHAP. CLXIII.

Of CRESS Garden.

I. *THE Names.* This Plant is called in *Greek*, Κάρδαμον, ἀπο τῆς καρδίας, *Cardamon quod cordatos faciat, vel quod Cor foveat, quia in ſincope Cardiaca plurimum valet:* And of this Herb, the *Greeks* had this Proverb, Φθεῖε κάρδαμον, *Ede Naſturtium, propterea quod Naſturtio ineſſe Credebant animi vigorem excitandi.* In *Arabick*, *Narf, vel Naf alchaf:* In *Latin*, *Naſturtium, à narium tormento*, as *Pliny* ſaith: And in *Engliſh*, *Creſs.*

II. *The Kinds.* They are manifold, as, 1. *Naſturtium Hortenſe*, Garden Creſs, of which in this Chapter. 2. *Naſturtium Indicum*, Indian Creſs, of which in Chap. 164. 3. *Naſturtium Pratenſe*, Meadow Creſs, of which in Chap. 165. and 166. 4. *Naſturtium agreſte*, Wild Creſs, of which in Chap. 167. 5. *Naſturtium Iſchiadicum, vel Iſchiacum*, Sciatica Creſs, of which in Chap. 168. 6. *Naſturtium Hibernum*, Winter Creſs, of which in Chap. 169. 7. *Naſturtium Aquaticum*, Water Creſs, of which in Chap. 170. following.

III. Of the Garden Kind, Καρδάμου ἥμερον, there are theſe following, *viz.* 1. *Naſturtium Sativum vulgare*, The common Garden Creſs. 2. *Naſturtium Hortenſe Latifolium*, and *Naſturtium Latifolium Hiſpanicum*, Broad Leav'd Garden Creſs. 3. *Naſturtium Hortenſe Criſpum Latifolium*, and *Anguſtifolium*, Curled Creſs, with Broader and Narrower Leaves. 4. *Naſturtium impatiens, Sium minimum, Sium Naſturtij Silveſtris folio, Noli me tangere*, The impatient Creſs, being called a Creſs, more from the form of its Leaf, than any thing elſe.

IV. The Deſcriptions. *The firſt has a long Root with ſome Fibres adjoined to it, which periſhes every Year after the ripening of the Seed, or upon the approach of Winter; from this Root the Stalks grow up half a yard, or two feet high, having many ſmall, tender, whitiſh, broad, indented, or torn Leaves ſet thereon, growing together upon a middle rib next the ground;* but

but those which grow higher upon the Stalks are smaller and longer: The *Leaves in general are so like to those of* Garden Chervil, *or* Sweet Cicely, *that it must be a very observant Eye which can distinguish them, and whilst young are scarcely to be differenced but by the taste. The tops of the Stalks are replenished with white* Flowers, *which turn into flat* Pods *or* Pouches, *not much unlike to* Shepherds Purse; *in which is contained flat reddish Seed; the Smell of both* Leaves *and* Seed *is strong and spicey; and their* Taste *is hot, sharp, and biting, almost like* Pepper, *for which reason some call it,* Pepper-wort.

Garden Cresses

Garden Cress

V. *The second, or* Broad Leav'd Garden Cress *has a Root which is small and long, perishing every year, and therefore must be constantly Sown in the Spring; and for this reason also, because after it is Sown, it springs up quickly, and will not endure the cold of Winter. Its first* Leaves *are small like* Basil, *among which rises up a Stalk about half a yard high, set with larger* Leaves *thereon, without any division, but smally dented about the edges, and pointed at the ends, every one standing upon a long* Footstalk, *branched from the middle to the Top with lesser and narrower* Leaves, *like to the Top* Leaves *of* Garden Cress: *From whence break forth many white* Flowers *set in Spikes, one above another, after which come* Pouches *or* Purses *containing brownish Seed like to the other Cresses, but much more bitter, and yet not all out so fiery or sharp.*

VI. *The third, or* Curled Cress, *has a* Root *like to the former, which goes pretty deep into the Earth, and perishes every year after Seed time, as the other does. It grows like the first, or common* Garden Cress, *and differs therefrom only in the* Leaves, *which are of two sorts: the one with broad* Leaves, *cut, and roundly dented, and curled about the edges, every one by it self, on a long Stalk. The other, consisting of many smaller* Leaves, *set one against another upon a middle rib, each part of which is in the same manner cut in, and curled as are the other. The* Flowers *are white, like the common Garden Kind; and the reddish Seed also like the same in Form and Magnitude.*

VII. *The fourth, or* Impatient Cress, *has a small Root spreading forth it self into many Branches; from whence arise many winged* Leaves, *not much unlike to the smaller* Sium, *which spread themselves at first upon the ground, not much above an Inch or two long, which so abide from Autumn, when it springs up, all the Winter long. In the Spring of the year, they grow somewhat bigger, and the said* Leaves *are a little dented about the edges, the bottom of the Leaf being for the most part the biggest. From among these* Leaves *rises up a slender Stalk, about a foot and half high, which is divided into several Branches, from the middle thereof to the Top. On the extremities or tops of all which Branches grow many very small white* Flowers, *which being past away, as many slender long pointed* Cods *follow, in which is contained small yellowish Seed; when these* Cods *are ripe, they are so impatient of being touched, and the Seed is so hard to be gathered, that the* Pod *breaks it self, even of its own accord, upon the least touch of the hand, or any thing else, and so the Seed flies away, not being then possible to be gathered:* This Seed *has little or no heat in it.*

VIII. *An Observation.* It is indeed the Nature of this *Impatient Cress*, that if you but touch the Cods when the Seed is ripe, though you do it never so gently, yet will the Seed fly all away with a great Violence, not suffering it self to be touched, from whence came the name, *Noli me tangere*, and *Nasturtium Impatiens*; as for the like quality, the *Persicaria Siliquosa* is named. The nature of this Plant is somewhat admirable, for if the Seed is fully ripe, though you put your hand but near the Cods, as profferring to touch them, though you touch them not, yet will the said Cods be apt to open, and the Seed to fly out upon you, when you may expect no such thing. *Prosper Alpinus* is the only Man who formerly wrote hereof, from whom our *Parkinson* and *Johnson* have taken their Discourses.

IX. *The Places.* These Plants are all of them nurs'd up with us in *Gardens.* The first matters not what Soil it grows in, for it likes any ground, especially if it is well watered: The second came

fruit out of *Spain*, but grows well with us in *England*, as does alſo the third. The fourth *Johnſon* found about *Bath*, and other Parts of our Land, which, ſays he, is now kept in divers of our *London Gardens*, in ſome of which I have ſeen it grow.

X. *The Times.* They may be Sown at any time of the Year, unleſs it be in Winter. They quickly ſpring up, after ſown, flower in *April* and *May*, and the Seed is ripe in *June*, or not long after their flowering time; after which they die every Year, and recover themſelves, *i. e.* ſpring up again of the ſhaken or fallen Seed.

XI. *The Qualities.* All *Creſſes* (except the *Noli-me tangere*) are hot and dry in the fourth Degree, but more eſpecially the Seed. They attenuate, incide, attract, digeſt, diſcuſs; are Carminative, Diuretick, and in ſome meaſure Suppurative. They are Cephalick, Stomatick, Pectoral, Nephritick, Hyſterick and Arthritick: Ptarmick, Emmenagogick, Lithontriptick and Alexipharmick.

XII. *The Specification.* They are peculiar againſt Poiſon, the Bitings of Venomous Beaſts, and to purge the Head and Brain of cold and moiſt Humors.

XII. *The Preparations.* You may have therefrom, 1. *The green Herb.* 2. *A liquid Juice.* 3. *An Eſſence.* 4. *A Spirituous Tincture.* 5. *An Acid Tincture.* 6. *An Oily Tincture.* 7. *A Saline Tincture.* 8. *A Spirit.* 9. *A Cataplaſm.* 10. *The Seed.*

The Virtues.

XIV. *The Herb.* Eaten as a Sallet with other Sallet Herbs, as Lettice, *&c.* it warms, comforts and pleaſes the Stomach: bruiſed and applied, it takes away Spots and Marks, eaſes the Pains of the Loins and Sciatica, and draws forth broken Bones, Thorns and Splinters; and puts a ſtop to the Corroding of putrid and creeping Ulcers: held or chewed in the Mouth, it cures the Tooth-ach.

XV. *The Liquid Juice.* Uſed as an Errhine, it purges the Head and Brain of cold and viſcous Humors, thereby eaſing all kinds of Head-aches proceeding therefrom, and for the ſame Reaſon prevails againſt Palſies, Lethargies, Apoplexies, Epilepſies, Vertigo's, Carus, Convulſions, and all other like Diſeaſes afflicting thoſe Parts. Given from half an ounce to two ounces, in a Glaſs of Generous Wine, it powerfully cuts groſs and viſcous Flegm, opens Obſtructions, provokes the Terms in Women, and Urine obſtructed, cleanſing the Reins, Ureters and Bladder from Sand, Gravel, Stones, or any Tartarous Matter lodged in them. It powerfully provokes Venery, but is ſaid to kill the Child in the Womb.

XVI. *The Eſſence.* It has all the former Virtues exalted, beſides which, it cuts and expectorates tough Flegm, out of the Breſt and Lungs, and as Authors ſay, looſens the Belly, and cleanſes it from viſcous Humors, opens Obſtructions of both Liver and Spleen, heals all inward Wounds, and reſiſts Poiſon, whether inwardly taken, or outwardly received from the biting or ſtinging of any venomous Creature. Doſe from one ounce to two ounces in any proper Vehicle, Morning faſting, and at Night going to Bed.

XVII. *The Spirituous Tincture.* It is Cordial, provokes Urine, and expels Wind, and prevails againſt the Obſtruction of the Courſes in Women, being given Morning, Noon and Night, in ſome proper Vehicle, for a Week before the expected time of their coming. Doſe from half a Spoonful to a Spoonful. It expels Wind, and prevails againſt the Cholick, and Griping of the Guts to Admiration.

XVIII. *The Acid Tincture.* It wonderfully ſtrengthens the Stomach, and is an admirable thing, as well to preſerve from the Contagion and Infection of the Plague or Peſtilence, as to cure the ſame, for which it is an approved thing. It cures the Scurvy in a cold Conſtitution or Habit of Body, being aſſiduouſly uſed, and ſo removes all the Symptoms of that troubleſome Diſeaſe. Doſe from 30 to 40, 60, or more Drops in Ale, Wine or other Vehicle, according to the quantity the Patient drinks at a time.

XIX. *The Oily Tincture.* It cures the Palſie, being anointed well Morning and Evening upon the Back-bone, and Parts affected. But that Part of the *Spina Dorſi* is to be chiefly bathed therewith, from whence the Nerves proceed, which repleniſh the Parts afflicted with that Diſeaſe. It is alſo good againſt Cramps, Convulſions and Gouts ariſing from a cold Cauſe; and gives eaſe in the moſt intollerable Pains of the Back, as alſo of the Reins, being outwardly anointed therewith, and inwardly given from 15 to 30 Drops, Morning and Evening in any Nephritick or Opiate Vehicle.

XX. *The Saline Tincture.* It powerfully opens Obſtructions of the Womb, Reins, Ureters and Bladder, promotes the Secretion of Morbifick Humors by Urine; and provoking Urine, it expels Sand, Gravel, Stones, and Tartarous Matter out of the Maſs of Blood, and cleanſes all the Urinary Parts from the ſame. Doſe from 40 to 60 drops in Wine.

XXI. *The Spirit.* How it is to be made, we have ſhewn at large in the *Second Edition* of our *Pharmacopæi Bateana*, *lib.* 1. *cap.* 2. *ſect.* 67. This Spirit thus prepared, is very ſubtil and volatile, an admirable Antiſcorbutick, and powerful againſt all Diſeaſes ariſing from viſcous Flegm, and other Tartarous Humors: it thins and rarifies the Blood, provokes Urine and the Terms, and cleanſes the Womb. And as it is famous againſt the Scurvy, ſo it is excellent againſt the Dropſie, Jaundice, Stone and Gout: it is a good Nephritick, and cures moſt Diſeaſes of the Reins, expels Sand, Gravel and Slime, and prevails againſt the Colick, and Virulent Diſeaſes of the Bowels. It is ſaid to be good alſo againſt the Green-ſickneſs in Virgins, becauſe it powerfully opens Obſtructions, and purifies the Blood, for which Reaſon it is ſingularly good againſt the Kings-Evil: it warms the Inſtruments of Generation, provokes Luſt, and is good againſt Impotency. The Doſe of this Spirit is from 20 drops to a dram, in ſome proper Vehicle. The diſtilled Water of *Creſſes*, which is made after the Diſtillation of the Spirit, by a ſtronger Heat in *B. M.* will be much ſtronger and better than that which is made the vulgar way, it being impregnated with much of the Eſſential Salt, looſened by Fermentation, which yet remains behind, and does impregnate the Water. This Water may be given from one ounce to ſix, its Virtues being the ſame with the Spirit, but much weaker in its Operation.

XXII. *The Cataplaſm.* It is good againſt the Gout and Sciatica, as alſo itching Humors and Eruptions in the Skin. It draws forth Thorns, Splinters and other things gotten into the Fleſh. If it is made with Vinegar, and applied, it is ſaid to be good againſt the Kings-Evil, whether in the Throat or any other Part: If made with Hogs Lard, it cures ſore, running and ſcabby Heads, ripens Plague Sores, and breaks them; is good againſt Whitloes and Fellons on the Fingers ends, and takes away the Deformity of the Nails.

XXIII. *The Seed.* If it is chewed in the Mouth, and held for ſome time, it eaſes the Tooth-ach, (and ſo alſo does the Herb:) it alſo helps the Palſie of the Tongue, provokes Sneezing, and is good againſt

againſt Sleepineſs, Drouſineſs, and ſuch as are troubled with the Lethargy.

CHAP. CLXIV.

Of CRESS Indian.

I. *THE Names.* It is called in *Greek*, Κάρδαμον ἰνδικόν: in *Latin*, *Naſturtium Indicum*, *Flos Sanguineus Monardis*; and in *Engliſh*, *Indian Creſs*, or *Yellow Larks-heels*, from the Form of the Flower.

II. *The Kinds.* It is a ſingular Plant of the kind, and by its Taſte declares it ſelf to be one of the kinds of *Creſſes*. Some do account it among the *Clematides* or *Convolvuli*, the *Clamberers* or *Bindweeds*, but any of theſe it cannot be, becauſe it has no Claſpers, nor does it wind it ſelf about any thing, but by reaſon of the number of its Branches which run one within another, it may ſeem to climb up a Pole, or the like, which yet it does but only cloſe, as having ſomething whereon to reſt or lean its Branches. But *Parkinſon*, from *Lobel*, makes two kinds, *viz.* the *Round Leaved*, (which is the Common) and the *Cornered Leaved.*

III. The Deſcription. *This fair and noble Plant has Roots which are ſmall, and ſpreading under Ground, which periſh with the firſt Froſts, and muſt be ſown afreſh every Year: from this Root ariſe many long trailing Branches, interlaced one within another very confuſedly, (yet it does not wind it ſelf with any Claſpers, about either Pole, or any other Prop, but if you would have it lye cloſe thereto, you muſt tye it, or elſe it will lye upon the Ground) four or five feet in length at the leaſt, for which Reaſon it takes up a great deal of Ground. The Leaves are ſmooth, green, and as round as the* Pennywort *which grows on the Ground, without any Cut or Inciſure in any part, the foot Stalks of which ſtand in the middle of each Leaf, and grow forth at every Joint of the Stalk, where they are a little reddiſh, and knobbed or bunched out: the Flowers are of an excellent Gold-yellow color, and grow all along the Stalks, almoſt at every Joint, with the Leaves, upon pretty long foot Stalks, which are compoſed of five Leaves apiece, not hollow or gaping, but ſtanding open, each Leaf apart by it ſelf; two of them, which are larger and longer than the other, ſtand above, and the other two, which are leſſer, ſtand below, which are a little jagged or bearded on both ſides; and the fifth loweſt. In the midſt of each of the three lower Leaves, (yet ſometimes it is but in two of them) there is a little long Spot or Streak, of an admirable Crimſon color, (whence the Name* Flos Sanguineus: *) and the Flower has a long Heel or Spur behind it, hanging down, (from which and the Color, came the Name of* Yellow Larks-heels: *) the whole Flower has a great Beauty, and Sweetneſs withal, very pleaſing, which being placed in the middle of ſome* Carnations *or* Clove-gilliflowers, *(which are both in flower at the ſame time) make a noble Noſegay, both for Sight and Smell. When the Flowers are paſt, come the Seed, which are rough or uneven, round, greeniſh, yellow Heads, ſometimes but one, and ſometimes two or three ſtanding together upon one Stalk, bare or naked of themſelves, without any Husk, containing a white pulpy Kernel.*

IV. The *ſecond*, or Cornered Leaved *kind, in its Root, Stalks, Branches and Flowers differs little or nothing from the former: the chief Difference is in the Leaves, for as in the former they are round, and are faſtned upon a long foot Stalk underneath, nearly in the Center or Middle of each Leaf, and bunched out; in this, they are broad, and ſeven, eight or nine cornered, of the ſame Smoothneſs and Color, ſharp pointed at their tops, and growing upon a long foot Stalk, which is joined to the Leaf at the lower*

part thereof. The Flowers are Lark-ſpurred, like the other, and in the whole, differs nothing from it in its Manner and Form of growing. Parkinſon *ſeems to ſay it was taken from the Life, which tho' it has not been ſeen here with us in* England *ſince, yet that hinders not (ſays he) the Verity of the thing. When I was in the* Weſt Indies, *in my Travels up and down, I ſaw it ſeveral times.*

V. *The Places.* This goodly and beautiful Plant was firſt found in the *Weſt Indies*, and brought thence into *Spain* by *Monardus*; from whence it was afterwards conveyed into *France*, *Flanders* and *England*. It grows now familiarly in moſt of our Gardens, where it flouriſhes, and is become as it were a natural Inhabitant. It need not be planted or ſown in Beds of Horſe-dung, or the like, for the natural Ground will be ſufficient, ſo that it is but a little defended from thoſe Froſts in the Spring of the Year, which are apt to nip it whilſt but tender, or newly ſprung up.

VI. *The Times.* It may be ſown in *March* or *April*; the which, when it is ſprung up, and having gotten three Leaves, muſt be taken up, and carefully replanted abroad, in the hotteſt place of the Garden, and in the fineſt and fatteſt Mould. It flowers ſometimes in *June*, but uſually in *July*, if it is well defended, and in good Ground; and ſo continues flowering till the cold Froſts and Weather in the latter end of *Octoher*, does check it, and put a ſtop to its Luxuriant Nature; the Seed growing continually ripe in the mean Seaſon, which after it is ripe, ſoon falls down on the Ground, whence for the moſt part the beſt is gathered.

VII. *The Qualities, Specification, Preparations and Virtues*, are exactly the ſame with thoſe of *Garden Creſſes* in the former Chapter, to which I refer you; ſo that no more need be ſpoken of them here, except that the ſame Preparations of this Plant, as they are ſtronger, ſo they are more Efficacious.

CHAP. CLXV.

Of CRESS *Meadow*, OR, CUCKOW-FLOWER, *Single.*

I. *THE Names.* It is called in *Greek*, Κάρδαμον λειμώνιον: in *Latin*, *Flos Cuculi*, *Naſturtium Pratenſe*, *Siſymbrium alterum Dioſcoridis*, and *Cardamine*: and in *Engliſh*, *Meadow Creſs*, or *Cuckow-flower*: in ſome Countries it is called, as *Gerard* ſays, *Ladies Smocks.*

II. *The Kinds.* They are either *Single* or *Double*: the *Single* we ſhall treat of in this Chapter, the *Double* in the next following. *Of the Single*, ſo many as grow with us in *England*, there are three Varieties, *viz.* 1. *Naſturtium pratenſe majus Tragi & Geſneri, Cardamine latifolia, Naſturtium agreſte Fuchſii, & Sylveſtre Loniceri, Lepidium minus Cordi, Flos Cuculi Dodonei & Brunfelſii*, The Great or Broad-leaved Creſs, or Cuckow-flower. 2. *Cardamine altera minor, Siſymbrium Cardamine Lacunæ & Lugdunenſis, Siſymbrium aquaticum alterum Matthioli & Tabernmontani, Hiberis Fuchſii, Iberis Thalii, Cardamine altera Lobelii & Cluſii, Agriocardamum, ſive Cardamantica Naſturtii foliis, Naſturtium pratenſe magno flore Bauhini, Naſturtium aquaticum ſimplici flore Beſleri*, The Small Cuckow-flower. 3. *Cardamine altera parvo flore*, The Small Flowred Cuckow-flower.

III. The Deſcriptions. *The firſt has a Root compoſed of many white Heads or Fibres, from which ſhoot forth ſeveral long Stalks of winged Leaves, that is, many together, ſomewhat broad and round, tender, and dark green Leaves ſet one againſt another upon a middle Rib, the greateſt being at the ends; among theſe winged Leaves riſe up divers tender, weak, round, green Stalks, ſomewhat ſtraked; on which grow much ſmaller and longer Leaves, very like the ſmalleſt divided Leaves of* Garden Creſs, *at the tops whereof ſtand ſeveral Flowers made of four Leaves apiece, ſomewhat large, and almoſt like to* Stock-gilliflowers, *but rounder, and not full out ſo long, whitiſh in Color, or a little daſht over with Bluſh, and many times but at the edges only, each of them growing in a green Husk, which being paſs'd away, ſmall Pouches grow forth, containing reddiſh Seed, ſomething ſharp and biting in Taſte, as is the Herb alſo it ſelf, coming near to the Taſte of* Creſſes.

IV. *The* Small Cuckow-flower with great Flowers, *is in its Roots, Leaves, Stalks, Flowers, Form and Manner of Growing, like to the former but now deſcribed, excepting that it is ſmaller in every part, not buſhing out with ſo many Leaves or Stalks; and that the Pods of Seed are ſomething longer than thoſe of that aforegoing.*

V. *The* Small Cuckow-flower with the ſmall Flower, *is almoſt in all Reſpects like to the* Small Cuckow-flower *beforegoing; ſave, that the* Leaves *of this are ſmaller and longer, and yet round ſometimes alſo, growing in the ſame manner as the former does: the Flowers are alſo like them, but ſmaller, and the Pods of Seed are ſomewhat longer.*

VI. *The Places.* They are all found in ſeveral parts of *England*, in moiſt Meadows, and near unto Brook ſides, and ſmall Rills of Water, paſſing thro' low Grounds. They have been found in the *Caſtle Ditch* at *Clare* in *Eſſex.*

VII. *The*

VII. *The Times.* They flower somewhat early in the *Spring* about *April* and *May*, at fartheſt, and continue with the lower Leaves all the *Winter*.

VIII. *The Qualities, Specification, Preparations and Virtues* are the ſame with *Garden Creſs* in *Chap.* 163. aforegoing, to which you are referred.

CHAP. CLXVI.

Of CRESS *Meadow,* OR, CUCKOW-FLOWER, *Double.*

I. *THE Names.* This is called in *Latin*, *Cardamine flore pleno*, (that it was known to the *Greeks*, I cannot learn) and in *Engliſh*, *Double Meadow Creſs*, and *Double Cuckow-flower*.

II. *The Kinds.* Taken as Garden Flowers, there are two of them, *viz.* 1. *Cardamine flore pleno*, being the double kind of that Plant, which growing Wild abroad, is called, *Cardamine altera*, and *Siſymbrium alterum Dioſcoridis*, alſo *Flos Cuculi*; but this Name is more uſually given to the *Wild feathered Campions*, both ſingle and double: in *Engliſh* we call it *Double-flowred Cuckow-flower*, or *Ladies Smocks*. 2. *Cardamine trifolia*, *Trefoil Meadow Creſs*, or *Cuckow-flower*; this is not truly a double-flowred Plant, but rather a Plant very full of Flowers, which at firſt ſight makes it look as if it was double-flowred. Theſe two being the faireſt of all the *Meadow Creſſes* or *Cuckow-flowers*, and for their Beauty being brought into Gardens, we thought beſt to place them both in one Chapter.

III The Deſcriptions. *The firſt double-flowred has a Root which creeps under Ground, ſending forth many ſmall white Fibres or Strings, and ſhoots up in divers places: from this Root ſpring forth ſeveral winged Leaves, weak and tender, lying on the Ground, very like to the ſingle Meadow kind; from among which riſes up a round green Stalk, ſet here and there with the like Leaves that grow below, the top whereof has a few Branches, on which ſtand ſeveral Flowers, every one of them upon a ſmall ſoot Stalk, conſiſting of many ſmall whitiſh round Leaves, a little daſht over with a blew Bluſh, ſet round together, which make a double Flower.*

IV. *The ſecond, or* Trefoil Cuckow-flower, *has a Root compoſed alſo of ſeveral white Fibres, from the Heads whereof run forth ſmall Strings, of a dark purple color, by which it encreaſes. From this Root ſpring forth ſeveral dark, round, green Leaves, a little uneven about the edges, and always three ſet together on a blackiſh ſmall foot Stalk, among which riſe up ſmall, round, blackiſh Stalks, ſix, ſeven or eight inches high, with three ſmall Leaves at the Joints where they branch forth: at the tops whereof grow many Flowers, conſiſting of four Leaves apiece, of a whitiſh, or very pale bluſh color. The Flowers being paſt, ſmall, thick and long Pods come forth, in which is contained ſmall round Seed.*

V. *The Places.* The firſt generally grows with us in *Gardens*, but is alſo found Wild in divers parts of *England*, as near *Mitcham*, about eight Miles from *London*, alſo in *Lancaſhire*, in ſeveral places: the other was brought to us at firſt from beyond Sea, and is here only nurſt up in Gardens.

VI. *The Times.* They flower uſually in the end of *April* or *May*; but the latter of them commonly flowers before the former.

VII. *The Qualities, Specification, Preparations, Virtues and Uſes*, are the ſame with thoſe of *Garden Creſs* in *Chap.* 163. or with thoſe of *Water Creſſes*, to which you are referred.

CHAP. CLXVII.

Of CRESS *Wild.*

I. *THE Names.* It is called in *Greek*, Κάρδαμον πόντιον ἢ ἄγριον: in *Latin*, *Naſturtium agreſte*, *Naſturtium Sylveſtre*: in *Engliſh*, *Wild Creſs*.

II. *The Kinds.* There are three which go under the Name of *Wild Creſs*, viz. 1. *Naſturtium Sylveſtre Oſyridis foliis*, Narrow-leav'd White Creſſes. 2. *Naſturtium agreſte Carolinianum*, The *Carolinian* Wild Creſs. 3. *Naſturtium Petræum*, The Stone or Rock Creſs.

III. The Deſcriptions. *The firſt of theſe has a woody Root, which periſhes after Seed time, from whence ſpring forth many ſmall, round and hard Stalks, with ſeveral ſmall, round and narrow Leaves growing thereon without Order, branched from the middle upwards into many parts, at the tops of which come forth a great number of ſmall white Flowers, (but ſome have been found with yellow Flowers, tho' not often) one ſtanding above another, Spike faſhion, after which appear Husks, containing ſmall Seed.*

IV. *The ſecond, or* Carolinian Wild Creſs, *has a long and ſlender Root, with many Fibres proceeding from it, which alſo periſhes every Year; from which Root grows up a round, green and hairy Stalk, about a foot high or more, and if it grows in rich or fertil Ground, ſometimes about a foot and half high; ſometimes but one Stalk grows up, and ſometimes more; which Stalk or Stalks ſpread into Branches from the very Ground, at every Joint whereof ſtand long winged Leaves, very much divided, like unto the*

Common

Common Garden Creſs, *but yet more finely cut or divided, and ſharp in Taſte, like* Creſſes. *The Flowers are many, and of a pale whitiſh yellow color, ſtanding in long Spikes at the tops; which being paſs'd away, ſmall, ſhort Pouches appear, divided into two parts, which ſtand not upright, but hang downwards, in which is contained ſmall reddiſh Seed, like unto* Creſs *Seed.*

Stone Creſs.

V. *The third, or* Rock Creſs, *has a ſmall and thready periſhing Root, from whence riſe up ſeveral Leaves upon long* Foot-ſtalks, *which Leaves are jagged and cut about the edges, much like to* Oak Leaves, *or rather the Leaves of* Shepherds-purſe: *from amidſt theſe Leaves riſe up ſeveral Stalks, with ſmall jagged Leaves growing thereon, one only at a place, without any* Foot-ſtalk, *and not being above one, two or three in number, to the top of each Stalk: on which tops ſpiked Heads of Flowers very thick ſet, which are ſmall, and of a white color, like thoſe of the* Garden Creſs. *The Seed is contained in ſmall Pouches or Seed-Veſſels, which are flat, like to* Thlapſi, *or* Treacle-Muſtard.

VI. *The Places.* *The firſt* grows Wild in the Fields, by High-ways, and Hedge-ſides, and among Rubbiſh, and in many other places. *The ſecond* grows plentifully in many places, Wild in the Fields which have been formerly Manured, and afterwards lye as Fallow or Waſte: I found a great quantity of it in Capt. *Abbot*'s *Plantation* up *Wando River*, not above four or five Miles from *Charles Town* in *Carolina.* In grows alſo very plentifully in the Kingdom of *Valentia* in *Spain*, (from whence it was brought to us in *England*) for which Reaſon it is called alſo *Naſturtium Sylveſtre Valentianum.* *The third* has been found growing in *Shropſhire*, in the Fields about *Birch*, in the Pariſh of *Eleſmere*, and in the Grounds formerly belonging to one *Richard Herbert*, and that in great plenty: alſo on the farther ſide of *Black-heath*, by the Highway ſide, leading from *Greenwich* to *Luſam.*

VII. *The Times.* Theſe flower later than ſome of the former *Creſſes*, viz. in *June* and *July*, and the Seed ripens not long after.

VIII. *The Qualities, Specification, Preparations and Virtues*, are the ſame with *Garden Creſſes* in *Chap.* 163. aforegoing, and to them you are referred.

CHAP. CLXVIII.

Of CRESS Sciatica.

I. *THE Names.* It is called in *Greek*, Ἰβηρὶς ἡ καρδαμαντικὴ: in *Arabick*, *Seitaragi*, and *Hauſab*: in *Latin*, *Iberis ſive Cardamantica, (quod Cardamo, id eſt Naſturtio ſimilis eſt:)* and in *Engliſh*, *Sciatica Creſs.*

II. *The Kinds.* It is twofold, *viz.* 1. *Iberis naſturtii foliis, Lepidium Campeſtre Anguilaræ, Iberis ſecunda Tabernmontani, Iberis Cardamantica Gerardi, Iberis Naſturtii folio Bauhini*, Sciatica Creſs. 2. *Iberis Latiore folio Bauhini, Iberis Lugdunenſis Dodonæi, Lacunæ, Geſneri in hortis, & Cæſalpini*, who alſo ſays it is *Lepidium forte Columellæ, Lepidium hortenſe Anguilaræ, Iberis Cardamantica Lobelii, Lepidium Iberias Pauli Æginetæ*, Sciatica Creſs with broader Leaves.

III. The Deſcriptions. *The firſt has a Root which is long, white and woody, from which riſes up a round Stalk about two feet high, which ſpreads it ſelf into divers Branches, whoſe lower Leaves are ſomewhat larger than the upper, yet all of them cut or torn on the edges, ſomewhat like unto* Garden Creſſes, *but ſmaller: the Flowers are ſmall and white, growing at the tops of the Branches, which being paſs'd away, Husks grow forth, like to thoſe of* Creſſes, *with ſmaller browniſh Seed therein than in the other, which is very ſharp and biting in Taſte, more than thoſe of* Creſſes *are.*

IV. *The ſecond, or* Sciatica Creſs with broader Leaves, *has a Root like the former, and ſharp in Taſte as it; from which ſpring up Leaves ſomewhat long and broad, not rent or torn at all, but whole, only a little dented about the edges towards the ends, very like to thoſe of the* Thlaſpi Creticum. *From among theſe Leaves riſes up a Stalk pretty thick and ſtrong, much about the height of the other, which ſuddenly ſpreads it ſelf out into ſeveral Branches, on which grow Leaves, which are leſſer, ſhorter and narrower,*

narrower, as they grow in height, and ſtand on the Stalks without any great Order. The Flowers grow at the tops of the Branches in ſpiked Heads, which with their Seed, are very like the former, the Seed of this taſting as hot, ſharp and biting, as the Seed of the other.

V. *The Places.* They grow by the Way ſides in rough and untill'd places, and by the ſides of old Walls, and ſuch-like: they have been found in Corn-fields about *Southfleet*, near to *Graveſend* in *Kent*.

VI. *The Times.* They flower according as they are early or late ſown in the Fields; but for the moſt part in *June* and *July*, and their Seed is ripe not long after.

VII. *The Qualities, Specification, Preparations, Virtues and Uſes*, are in the main the ſame with thoſe of *Garden Creſs* in *Chap.* 163. aforegoing. But more eſpecially theſe are ſaid to be Specificks in curing the *Sciatica* and *Gout* in any Part.

VIII. *Obſervation.* A *Cataplaſm* made of the green Leaves, but eſpecially of the Roots, either alone or mixed with old Hogs Lard, and applied to the place pained with the Sciatica, letting it to lye on for four hours in Men, and two hours in Women, is ſaid by *Galen* from *Dæmocrates*, to cure the Diſeaſe; and not only this Diſeaſe in the Hips or Huckle-bone, but alſo the Gout, and all other Pains and Aches in the Joints, whether of Hands, Knees or Feet; likewiſe all other inveterate Griefs of the Head, or other Parts of the Body difficult to be cured; as vehement and long continued Catarrhs, univerſal Rheumatiſms, *&c.* he alſo ſays, that *Dæmocrates* cured hereby all thoſe Diſeaſes, to which *Sinapi*, *Thlapſi* and *Thapſia* are applied. *Pliny* recites the ſame method and manner of Application, and ſays farther, that if any part of the Grief remains, that the ſame Medicine after twenty days is to be applied again. And applied to the Skin, it takes away the Blemiſhes thereof, as *Freckles*, *Lentils*, *Scars*, *Scabs*, *Scurf*, *Leproſie*, &c. it is true, that it exulcerates or bliſters the Part, but that is to be healed with a Balſam made of Oil and Wax, with the Addition of a little *Strasburgh* Turpentine. After the Application of the *Cataplaſm* in the *Sciatica*, the Part, ſays *Gerard*, is to be bathed with warm Water; or, as *Parkinſon* ſays, with warm Wine and Oil mixed together; and then wrapped up with Wool or Skins, or a Lamb-skin may be applied whilſt it is yet hot, and but newly taken off from the Creature. *Dioſcorides* and *Pliny* ſay, that if the Root is hung about the Neck, or tyed to the Arm, it will give eaſe in the *Tooth-ach*.

CHAP. CLXIX.

Of CRESS Winter.

I. *THE Names.* It is thought to be that Plant which the *Greeks* (as *Dioſcorides*) call Ψευδοβούνιας, (tho' it is Ψευδοβούνιον in the Text, which I judge is by a miſtake in tranſcribing, Βούνιον *Bunium* being *Earth-nuts*, and Βούνιας *Bunias*, the *Navew* or *Wild Turnep*, to which latter, this our *Winter Creſs* is ſomething a kin:) in *Latin* it is called *Naſturtium Hybernum*, *Pſeudobunias Dodonæi*, *Naſturtium Barbaricum*, *Barbarea*, *Sanctæ Barbaræ Herba*, *Scopa Regia Anguilaræ*, *Sideritis Latiſſima Fuchſii*, *ſinapi quinti generis Tragi*; and in *Engliſh*, *Winter Creſs*.

II. *The Kinds.* They are threefold, 1. *Barbarea ſimplex*, *Barbarea ſive Eruca lutea latifolia*, *Naſturtium Paluſtre Geſneri*, *Eruca Paluſtris Lugdunenſis*, (it is called alſo by all the Names in the former *Section*;) Common Winter Creſs. 2. *Barbarea flore pleno*, *ſive Eruca lutea Bauhini*, Double-flowred Winter Creſs. 3. *Barbarea minor*, *Herba ſancti Alberti Cæſalpini*, Small Winter Creſs, or Winter Rocket.

III. The Deſcriptions. *The firſt has a Root ſomething fibrous, which always periſhes after the perfecting of its Seed, from which ſpring up ſeveral Leaves indifferent large, and of a ſad green color, lying upon the Ground, and torn or gap't into ſeveral parts, ſomething like unto* Rocket *or* Turnep *Leaves, (but nothing like to* Creſſes*) which Leaves have ſmaller pieces next the bottom, and broad at the ends, which ſo abide all the Winter, (if it ſprings up in* Autumn*, when it is uſed to be eaten either green or ſtewed:) from among theſe Leaves riſe up divers ſmall round Stalks, which ſpread themſelves into many Branches, bearing in a ſpiked manner many ſmall yellow* Flowers*, each having four* Leaves *apiece; which being paſt, ſmall long* Pods *come forth, containing ſmall reddiſh Seed within them.*

IV. *The ſecond, or double-flowred, has a Root like the former, which periſhes not in Winter, but abides many Years: the Stalks are bigger than the former, and creſted withal. The Leaves are ſhorter, and are about an inch in length, cut in on the edges in the ſame manner as the others are. The Flowers are yellow, like the former ſingle, but ſomething larger; and double withal, which makes the greateſt part of the difference.*

V. *The third, or* Small Winter Creſs, *has a Root like the firſt, and periſhing as it; from which ſpring forth blackiſh green Leaves, ſomewhat jagged or torn in on the ſides, reſembling* Moth-mullein: *the Stalks and Leaves both are leſs than the firſt, nor does it grow ſo high. The Flowers are yellow alſo*

as the others, but ſingle and leſſer; and ſo alſo are the Cods which follow the Flowers, and yield much the ſame kind of Seed, but leſſer in proportion to the Magnitude of the Cods.

VI. *The Places.* The firſt grows oftentimes of its own accord in *Gardens*, as alſo in Fields by Paths and Ways ſides in ſeveral places of *England*; as in the next Fields beyond that called *Lambs-Conduit*, (from whence comes *Lambs-Conduit Water* a little below *Snow-hill*:) the other two are only nurs'd up in *Gardens*.

VII. *The Times.* They all flower in *May*, and the *ſingle ones* ſeed in *June*, and then periſh; but the *double kind* abides green both *Winter* and *Summer*. The *Italians* and *Spaniards* are ſcarcely acquainted with any of theſe *Winter-Creſſes*, or rather *Winter-Rockets*, they being more peculiar to theſe our colder Climates.

VIII. *The Qualities, Specification, Preparations, Virtues and Uſes* are the ſame with thoſe of *Garden-Creſs* in *Chap.* 163. aforegoing, to which you are referred: But beſides all that is there ſaid, we have theſe following Obſervations.

IX. *Obſervation* 1. *The Green Herb.* It is uſed as *Rocket* or *Creſs* to be eaten as a *Sallet* in *Winter*, and that with great pleaſure and ſatisfaction, when other Salleting is difficult to be gotten.

X. *Obſerv.* 2. *The Liquid Juice.* If it is drunk inwardly, it is found by good Experience to be a ſingular good Wound Herb, to cleanſe and heal inward Wounds; and being outwardly applied, to waſh filthy running Sores, and putrid old Ulcers, cleanſing them by its Sharpneſs, and removing the dead Fleſh, and hindering proud Fleſh from growing therein, and ſo healing them by its drying Quality. It is alſo profitable to provoke Urine, help the Strangury, and expel Gravel and the Stone. Doſe two or three ounces Morning and Night for ſome time, in ſome proper Vehicle.

XI. *Obſerv.* 3. *The Eſſence.* It has all the Virtues of the liquid Juice exalted; beſides which, it is a moſt powerful thing to be uſed againſt the Scurvy, Dropſie and Gout, in cold Conſtitutions: it may be taken Morning, Noon and Night, from 1. to 3. ounces, in ſome proper Vehicle, the Uſe of which is to be continued a Month, two or three, according as the occaſion or force of the Diſeaſe requires. It is truly a good thing againſt the Bloody-flux, and all other Fluxes of the Bowels whatſoever.

XII. *Obſerv.* 4. *The Seed.* It provokes Urine, is good againſt Dropſies and Gouts; warms and comforts a cold and moiſt Stomach, and cauſes a good Appetite and Digeſtion. And if it is made into a Lohoch with Honey, it is good againſt Aſthma's, Coughs, Colds, Wheezing, ſhortneſs of Breath and difficulty of Breathing, by cutting the tough, thick, viſcous Flegm or Matter, and cauſing an eaſy Expectoration. Doſe as much as a large Nutmeg three or four times a day.

XIII. *Obſerv.* 5. *The Spirit.* It comforts and warms a cold and weak Stomach, chears the Heart, exhilerates the Spirits, abſorbs Acidities, eaſes Pains and Gripings of the Bowels, expels Wind, prevails againſt the Colick, diſſipates inward Apoſtems, diſſolves coagulated Blood, and prevents or helps its Stagnation, and thereby refreſhes wearied Nature, and Strengthens the whole Body. Doſe 20, 30, or 40 drops in a Glaſs of Wine or Ale. But this is to be obſerved, That it is only to be given to ſuch as are of a cold Conſtitution, or Habit of Body; for ſuch as are hot, it puts all into a Flame, and therefore ſuch are to avoid it.

CHAP. CLXX.

Of CRESS Water.

I. *THE Names.* It is called in *Greek*, Κάρδαμον ὑδατῶδες: in *Latin*, *Naſturtium Aquaticum*; and in *Engliſh*, *Water-Creſſes.*

II. *The Kinds.* There are four ſeveral ſorts of this Plant, *viz.* 1. *Naſturtium aquaticum vulgare*, which is generally taken to be the *Siſymbrium alterum Dioſcoridis*, and by *Ceſalpinus* and *Tabernmontanus*, it is called *Siſymbrium aquaticum:* by *Cordus*, *Geſner* and *Thalius*, *Siſymbrium alterum*; by *Fuchſius* and *Lugdunenſis*, *Siſymbrium Cardamine*; The Common or Vulgar Water-Creſs. The ſecond is called, *Naſturtium aquaticum rotundifolium majus*, *Siſymbrium aquaticum Matthioli*, *Siſymbrii alterius Species ſecunda Thalii*; *Naſturtium aquaticum alterum*, *& aquaticum amarum Bauhini*; The Greater round-leav'd Water-Creſs. 3. *Naſturtium Aquaticum rotundifolium minus*, *Siſymbrium Aquaticum minus Matthioli*; The Leſſer round-leav'd Water-Creſs. 4. *Naſturtium Aquaticum erectum folio longiore Bauhini*, *Sium vulgare Matthioli*; *Sium Matthioli*, *& Sium Italorum Lobelii*, *& Lugdunenſis*; *Matthiolus* his Water-Creſs, or the *Italian* Water-Creſs.

III. The Deſcriptions. *The firſt has a long Root, which is filled with nothing but Knobs or Bunches of white Fibres or Threads; from whence ſpring forth many weak, hollow, ſappy Stalks or Branches, trailing upon the Water and gravelly Earth where it grows, taking hold in ſeveral places as it creeps, by which means it ſpreads it ſelf very much, ſhooting forth Fibres at the Joints. As the Stalks grow upwards, they are filled with long winged Leaves, having many ſmall Leaves ſet upon a middle Rib, one againſt another, excepting the point Leaf, which ſtands by it ſelf, as does that of the* Aſh-tree. *The upper*

upper Face of the whole Plant is of a brown green color, and the Leaves are green underneath, which, ſays Gerard, *is the perfect mark to know the Phyſical kind from the others. The Flowers are many and white, ſtanding on long Foot-ſtalks at the tops of the Branches: which being paſs'd away, are ſucceeded by a like number of ſmall long Pods, like Horns, which contain within them ſmall yellow Seed. The whole Plant abides green in the Winter, and taſtes ſharp and biting, ſomewhat like to other* Creſſes.

IV. *The ſecond, or* great round-leav'd, *has a Root almoſt like the former, ſhooting forth many Fibres at the Joints; from whence riſe one or more Stalks, which are hollow, weak and ſappy, with a great number of long winged Leaves, which are made up of ſeveral broad, ſappy, and almoſt round Leaves, of a reddiſh brown green color on the top, and green underneath: when it runs up into Stalk, the higher Leaves are longer and more pointed, yet round pointed withal. The Flowers grow at the tops of the Branches, like the former, nor does the Pods and Seed differ much therefrom.* Parkinſon *ſays, that it is ſo extreamly bitter, that it cannot be eaten till it is boiled in Water, and ſhifted again: I have ſeen it grow ſeveral times, and have gathered it, but never could find that bitter Taſte in it, but only a very ſharp biting Taſte, like other* Creſſes; Matthiolus *ſays,* Naſturtio ſimile quiddam guſtu præfert.

V. *The third, or* leſſer round kind, *has a white fibrous Root, from whence ſpring forth a great number of long winged Leaves, very like to the laſt, in their Subſtance and Form, being fat, broad and roundiſh like them, but very much leſs: from amidſt theſe Leaves ſpring forth ſeveral long Stalks, when run up to Seed, which are almoſt naked, ſave that here and there they have a ſingle winged Leaf, cut into five long ſlender parts, almoſt to the middle Rib. The Stalks at their tops, abound with a great number of little Branches, filled with ſmall fine whitiſh Flowers, which in the very tops of all, appear exceeding ſmall and diminutive, ſo as they are not eaſy to be ſeen aſunder.*

VI. *The fourth, or* Italian kind, *has a long Root, which creeps not ſo much as any of the former, nor is it ſo full of Fibres: the Leaves grow many on a winged Stalk, and differ not much from the firſt, ſaving that the Stalk is creſted, and the Leaves are dented or ſnipt in a little round the edges, being in ſhape between the* Garden-Creſs *and* Cuckow-flower, *the Stalks are creſted, and divided into many Branches: the Flowers are white, which being paſs'd away, are ſucceeded by Cods, like the* Ordinary *or* Common Water-Creſs, *and with like Seed. The Taſte of both Herb and Seed is more mild and pleaſant than that of the other* Water-Creſſes.

VII. *The Places.* They all grow for the moſt part in ſmall ſtanding Waters; and ſometimes in ſmall Rivulets of running Water: but the laſt is ſometimes found growing in *Gardens.*

VIII. *The Times.* They ſpring and grow green in *March* and *April.* That *Water-Creſs* which is eaten in Sallets, is beſt in *March* and *April:* they flouriſh all the Summer, and flower in *June* and *July*, their Seed ripening in *Auguſt.*

IX. *The Qualities.* They are hot and dry in the third degree: are Diuretick, Cephalick, Neurotick, Stomatick, Hyſterick, Nephritick, Alexipharmick and Antiſcorbutick.

X. *The Specification.* They are peculiar againſt the Scurvy in a cold Habit of Body.

XI. *The Preparations.* You may have, 1. *A Sallet.* 2. *A liquid Juice.* 3. *An Eſſence.* 4. *An Infuſion.* 5. *A Lotion.* 6. *A diſtilled Water.* 7. *A Spirituous Tincture.* 8. *An Acid Tincture.* 9. *An Oily Tincture.* 10. *A Saline Tincture.* 11. *A Spirit.* 12. *A fixed Salt.*

The Virtues.

XII. *The Sallet.* It is made of the green Herb, gathered in *March* and *April*, pickt and waſht clean, and dreſs'd up with Salt, Vinegar and Oil, or Sugar, and ſo eaten raw: it is generally eaten in the Spring time, to cleanſe and purifie the Blood, ſweeten the Juices of the Body, and cure the Scurvy.

XIII. *The liquid Juice.* It is more powerful than that of *Brooklime* againſt the Scurvy in a cold

habit of Body, for it cleanſes the Blood and Humors: it is alſo ſaid to be good to break the Stone, and to expel it, as alſo Sand, Gravel, and other Tartarous Matter; it provokes Urine and the Terms, if given in a proper time. If 3 parts of the Juice is mixed with 1 part of the Juice of Oranges, it will be ſtill more prevalent againſt the Scurvy. Doſe of the Juice is from 1 ounce to 2 or 3, twice or thrice a day, being mixed with any proper Vehicle.

XIV. *The Eſſence.* It has all the Virtues of the Juice, but much more Stomatick; it ſtrengthens the Stomack and warms it, creates an Appetite, and cauſes a good Digeſtion, and very powerfully provokes Urine and the Terms. Taken from 1 to 2 ounces or more, well ſweetned with Honey, it opens Obſtructions of the Lungs, and takes away Hoarſeneſs, Wheezing, difficulty of Breathing, and ſhortneſs of Breath. Both the Juice and the Eſſence, being bathed on, or applied to the Face or other parts of the Skin, it takes away Freckles, Lentils, Pimples, Spots, Sun-burning, Tanning, Yellowneſs, and other Deformities thereof.

XV. *The Infuſion in Water or Wine*, in a ſimmering or ſcalding heat. It has the Virtues of the Juice and Eſſence, but not full out ſo powerful. It is good to waſh filthy foul Ulcers, Fiſtula's, running Sores, Herpes, Scurf, Morphew, *&c.* cleanſing them, and making them much the more fit to be healed.

XVI. *The Lotion.* Take of the Juice 3 parts; of White-wine Vinegar 1 part, mix them. It is an excellent thing againſt almoſt all Deformities of the Skin, as Freckles, Pimples, Scurff, Leproſy, *&c.* and it is good alſo to bath the fore part of the Head therewith, Morning and Evening, for ſuch as have the Lethargy, or are dull, drowſie, and very ſleepy: but in this laſt caſe, the Patient ought to ſnuff up the Juice of *Water-Creſſes* every day for ſome time; both in the Morning, and at Night alſo, an hour before Bed-time; becauſe as an *Errhine*, it purges the Head and Brain of all cold, moiſt and noxious Humors cauſing the Lethargy, and other the like Diſeaſes of thoſe Parts.

XVII. *The diſtilled Water.* It has much Spirit and volatile Salt in it, and may be uſed as a Vehicle, to convey any of the other Preparations into the Body.

XVIII. *The Spirituous Tincture.* It cures the Scurvy in a cold Conſtitution, and is of excellent Uſe to rectifie the Diſtempers of the Stomach: it warms and comforts it, cauſes a good Appetite and Digeſtion, and prevails againſt Gripings, Colicks and Convulſions of the Bowels. It is a ſingular thing againſt cold and moiſt Diſtempers of the Head, Brain and Nerves; and is good againſt Dullneſs, Drouſineſs, Heavineſs, Sleepineſs, Apoplexy, Fallingſickneſs, Convulſions, Palſies, and the like Diſeaſes, being bathed outwardly upon the Parts affected, and taken inwardly Morning, Noon and Night from 1 dram to 3 drams, in any proper Vehicle. In Diſeaſes of the Head, it will be alſo good to ſmell to it often, and ſometimes to ſnuff it up the Noſtrils, by which it eaſes Pains of the Head, and helps againſt Vertigo's, and other cold and moiſt Diſtempers of thoſe Parts.

XIX. *The Acid Tincture.* It is more Stomatick than the former, and a powerful Reſiſter of the Scurvy, and all its Symptoms. It opens Obſtructions of the Viſcera, provokes the Terms, prevails againſt the Cachexia and Green-ſickneſs in young Women, more eſpecially if it is given with a proportional quantity of *Tinctura Martis.* It removes Lazineſs and Wearineſs of the Body, comforts the weak Bowels, and ſtrengthens the whole univerſal Frame. Doſe ſo much as may make the Vehicle pleaſantly ſharp; and may be taken three or four times a day, according as the Occaſion may require. Outwardly applied to the Skin, it is of ſingular good Uſe againſt Freckles, Lentils, Spots, Sunburning, Tanning, Yellowneſs and Brownneſs of the Skin, Scurff, Morphew, Leproſie, and other like Deformities thereof, being gently applied or laid thereupon.

XX. *The Oily Tincture.* It is a ſingular good thing againſt Palſies, Gouts, Lameneſs, Numbneſs, Coldneſs of any Part, Pains and Aches of the ſame; as alſo Cramps and Convulſions, being daily taken inwardly Morning, Noon and Night in any proper Vehicle, from 20 drops to 60, according to the Occaſions and Neceſſities for the ſame; but it is alſo to be uſed outwardly at the ſame time, by anointing it well upon all the parts affected, twice a day, *viz.* Morning and Evening. Inwardly taken, it is alſo good againſt the Stone, Gravel, Sand, or any Tartarous Matter in the Reins, Ureters and Bladder, opening Obſtructions of thoſe Parts, and cauſing Urine to be plentifully evacuated.

XXI. *The Saline Tincture.* It may be given inwardly againſt Obſtructions of the Urinary Paſſages from 40 to 80 drops, or more, in any Diuretick Vehicle; but is uſed chiefly externally againſt all ſorts of Defedations of the Skin, as Scurf, Morphew, Leuce, Leproſy, Tetters, Ring-worms, Puſhes, Boils, Pimples, and other like Diſaffections. It is alſo ſaid to cure the Itch, being well rubbed in twice a day upon all the Parts affected.

XXII. *The Spirit.* How this Spirit is to be made ſee the *Second Edition* of our *Pharmacopœia Bateana, lib.* 1. *cap.* 2. *ſect.* 67. It has all the Virtues of the Spirituous Tincture, with this Advantage, that it is a much finer and purer Medicine to ſee to, and a much pleaſanter Preparation to be taken. It may be given from 20 drops to 60 in any proper Vehicle, two or three times a day. It prevails againſt the Scurvy, Dropſie, Jaundice, Stone and Gout.

XXIII. *The fixed Salt.* It is admirably Diuretick and Antiſcorbutick, and carries off the Morbifick Cauſe of the Scurvy, Dropſie, Jaundice, Gout, Stone, Struma, Cachexia, Chloroſis, Rickets, *&c.* by Urine, opening all manner of Obſtructions. Doſe from 1 Scruple to 2 Scruples.

CHAP. CLXXI.

Of CROSS-WORT.

I. *THE Names.* This Plant, as it was unknown to the ancient *Greeks*, ſo it has no *Greek* Name retaining to it: but it is called in *Latin*, *Cruciata*, and *Crucialis*, from the Situation of the Leaves. *Thalius* calls it *Cruciata herniaria*; and *Lobel*, *Cruciata minor*, to diſtinguiſh it from *Gentiana Cruciata*. *Lugdunenſis* calls it *Aſperula aurea*; it is alſo called *Gallium Secundum Trago*, for his *primum* is *Gentiana Cruciata*; *Bauhinus* calls it *Cruciata hirſuta*: in *Engliſh*, *Croſs-wort*, and *Golden Croſs-wort.*

II. *The Kinds.* Authors make four kinds thereof, as the *Cruciata vulgaris*, our Common Croſs-wort: *Cruciata minor lutea*, Small yellow Croſs-wort: *Cruciata minor montana*, Small Mountain Croſs-wort; and *Cruciata minima muralis*, The leaſt Wall Croſs-wort: but as of theſe, there is but one, and that is the firſt of them which grows in *England*, ſo we ſhall take the Pains only to deſcribe it.

III. The Deſcription. *It has a Root which is very ſmall and full of Fibres, which taking hold of the Earth, ſpreads with the Branches over a great deal*

of

of Ground, which perishes not in the Winter, tho' the Leaves die away every Year, and spring again afresh. From this Root spring up square hairy brown Stalks, something more than a foot high, having four small, broad and pointed hairy, yet smooth, not rugged, yellow green Leaves, growing at every Joint, each against other cross-wise, from whence proceeds the Name. Towards the tops of the Stalks, at the Joints with the Leaves, in three or four rows upwards, stand small, pale, yellow Flowers, after which come small, blackish, round Seed, four for the most part contained in every Husk.

IV. *The Places.* It grows in many moist Grounds, as well Meadows as other wild and untill'd places about *London:* in the Church-yard at *Hampstead*, near *London:* at *Wye* in *Kent:* at *Rand*, near *Ringmore* in *Sussex*, along the High-way; and in a Pasture adjoining to the Church-yard at *Hampstead* by the Mill: also in a Lane or Highway beyond *Charlton*; a small Village near *Greenwich*, and in several other places.

V. *The Times.* It flowers for the most part from *May* all the Summer long, in one place or other, as it grows more or less in the Sun; and the Seed ripens soon after.

VI. *The Qualities.* It is temperate in respect of Heat or Cold; and dry in the second degree. It is singularly Astringent; and admirably Traumatick or Vulnerary.

VII. *The Specification.* It is dedicated to the Cure of green Wounds, Ulcers and Ruptures.

VIII. *The Preparations.* You may have therefrom, 1. *A liquid Juice.* 2. *An Essence.* 3. *A Decoction.* 4. *A Pouder.* 5. *An Ointment or Balsam.* 6. *A Cataplasm.* 7. *A Spirituous Tincture.* 8. *An Acid Tincture.* 9. *An Oily Tincture.*

The Virtues.

IX. *The liquid Juice.* Taken to 2 or 3 ounces in Red Port Wine, or Wine mixed with Water, it stops inward Bleedings, as also the Bleedings of inward Wounds, and consolidates and heals them: applied also outwardly to green Wounds, it does the same; for by closing the Lips of Wounds quickly together, the Cure soon after succeeds.

X. *The Essence.* It has the Virtues of the Juice, but more powerful for the same Intentions: *Camerarius* says it helps to expectorate Flegm out of the Thorax, and is good against the Obstructions of the Lungs or Stomach; as also other Obstructions in the Meseraick Veins, Lacteals, and other Viscera. Dose 2 or 3 ounces in Wine, *&c.*

XI. *The Decoction.* It has the same Virtues with the Juice and Essence, but not full out so effectual: nevertheless, (the Decoction being made in Wine, or in Water with Wine added to it) it is often given as a Wound-drink, in which way of Exhibition it is very efficacious: and mixed with Spirit of Wine, it is good to cleanse old running Sores, and putrid Ulcers; cleansing the same, and inducing them to a speedy healing. It cures also Ruptures.

XII. *The Pouder.* It is made of the dry'd Leaves. Taken to a dram Morning and Evening, it is good to stop any inward Bleeding, spitting of Blood, pissing of Blood, or Bloody-flux: the same it does also being applied to any bleeding Wound. It also dries up Moisture in Ulcers, and stops the Flux of any running Sore, being applied after washing the same with the Juice, Essence or Decoction of the same Plant before specified.

XIII. *The Ointment or Balsam.* They cleanse, and are admirably drying and healing; give Ease where the Pain is extravagant, allay the Inflammation, breed Flesh where it is wanting; dry up the Moisture, and produce the Cicatrize in a very short time.

XIV. *The Cataplasm.* Made of the green Herb with the Pouder of the dryed Herb, and applied, it stops the Bleeding in Wounds, prevents the Afflux of Humors, and so by consequence Pain and Inflammation. Applied to simple Contusions, it discusses them, and quickly restores the Part to its former State of Health.

XV. *The Spirituous Tincture.* It heals inward Wounds, and stops inward Bleedings, restores the Tone of the Bowels being hurt, is good against Ruptures, Bloody-fluxes, Diarrhea, Lienteria, and the Hepatick-flux, and has indeed all the Virtues of the Juice and Essence. Dose 1 or 2 ounces in Wine, or any other fit Vehicle.

XVI. *The Acid Tincture.* It is good to expectorate tough and viscous Humors, opens Obstructions of the Viscera, strengthens the Stomach, and helps a decayed Appetite: it may be taken inwardly in Wine to a grateful Acidity every day, two, three or four times a day: if mix'd with Water to a Gratefulness, and a little dulcified with Syrup of *Clove-gilliflowers*, it abates the Heat of Fevers, allays Inflammations of the Lungs, quenches Thirst, and represses Vapors, being taken as ordinary Drink.

XVII. *The Oily Tincture.* It is eminently good against Punctures of the Nerves, heals nervous Wounds, gives ease in the Gout tho' never so extream, and in a short time cures it: it strengthens the Joints, and is singularly good against Convulsions and Palsies, being duly anointed upon the Parts affected.

CHAP. CLXXII.

of CROWFOOT Meadow.

I. *THE Names.* It is called in *Greek*, Βατραχιον, (*Frog-wort:*) in *Latin*, *Ranunculus*, also *Pes Corvi*, and *Pes Corvinus:* in *English*, *Crowfoot*, *King Cob*, *Gold Cups*, and *Butter-flowers*.

II. *The Kinds.* Authors are in a Wood about this Plant, and make ſo many general kinds thereof, that it is difficult to reduce each Species to its proper *Claſſis.* However, ſince we intend only to treat of them which grow in *England*, (ſetting aſide the *Ranunculi Montani*, which were never known to grow with us in our Country) and that we may be intelligent to the Vulgar, we ſhall divide them into the five following *Claſſes*, *viz.* 1. Βατεάχιον λειμώνιον, *Ranunculus Pratenſis*, Meadow Crowfoot, of which in this *Chapter.* 2. Βατεάχιον πέδιον, *Ranunculus Agreſtis*, Field, or Fallow-field Crowfoot, of which in *Chap.* 173. 3. Βατεάχιον δυσκόλεον, *Ranunculus Nemoralis*, of which in *Chap.* 174. 4. Βατεάχιον ὕυδρεον, *Ranunculus Aquaticus*, Water Crowfoot, of which in *Chap.* 175. 5. Βατεάχιον κῆπεον, *Ranunculus Hortenſis*, Garden Crowfoot, of which in *Chap.* 176. following.

III. Of *Meadow Crowfoot* we have growing with us five ſeveral kinds, 1. *Ranunculus Pratenſis communis*, The Common Meadow Crowfoot. 2. *Ranunculus pratenſis dulcis, ſimplex* and *multiplex*, Meadow Crowfoot ſweet, (or not biting) ſingle and double flowred. 3. *Ranunculus pratenſis repens*, Common creeping Meadow Crowfoot. 4. *Ranunculus Bulboſus ſive Tuberoſus*, Knobbed or Tuberous Crowfoot. 5. *Ranunculus Globoſus*, Globe Crowfoot.

Common Meadow Crowfoot.

IV. The Deſcriptions. Common Meadow Crowfoot (*whoſe Branches or Stalks ſtand upright, and bend not down again unto the Ground, neither creep thereon, or ſpread, taking root again in divers places, as the third kind following does*) *has a white Root, which is almoſt wholly fibrous; from whence ſpring up many large dark green Leaves, cut into divers parts, ſomewhat reſembling the ſpreading of a Crows Foot, having a very ſharp, hot and burning Taſte, very much biting the Tongue, and bliſtering the Skin, if laid thereon, not much leſs than any other hot Corroding and Exulcerating Herb can do; which Leaves have now and then ſome blackiſh Spots upon them, but theſe Spots happen not in all, nor in all places. Among theſe Leaves riſe up ſmall twiggy Stalks, which ſtand upright, a foot high, or higher, ſometimes (according to the goodneſs of the Ground) a foot and half high; at the tops of the Stalks and Branches come forth many fine yellow Flowers, glittering of a Golden color, having five Leaves apiece; the middle part of which Flowers are filled with many ſmall Threads of like color; which being paſt, the Seed follows, contained in a rough Ball or Husk. Of this kind there is alſo one with double Flowers.*

Sweet Meadow Crowfoot

V. *The ſecond, or* ſweet kind, *has a Root conſiſting of many white Fibres, as the former, from whence riſes up ſeveral great, broad, dark, green Leaves, ſpread upon the Ground, a little hairy, cut in on the edges into five Diviſions, and a little dented alſo about, eſpecially at the ends, and of a paler yellowiſh green on the underſide, of a ſweet and not unpleaſant Taſte; for I call it* Sweet Crowfoot, *not becauſe it ſmells ſweet, but becauſe it has no ſharp, biting or exulcerating Taſte, as moſt of the other* Crowfoots *have, being ſo ſweet, ſoft and pleaſant, that the People in many places do ſtew the Leaves, when they are young, with other Herbs, to eat them after the manner of a boiled Sallet. From among theſe Leaves riſe up ſeveral hairy Stalks, a foot or foot and half high, with ſome Leaves upon them more divided, and cut into ſmaller and narrower parts than thoſe which are lower. At the tops of theſe Stalks and Branches ſtand many fair Golden yellow colored Flowers, with yellow Thrumbs in their middle, ſo very like to the former* Common Meadow Crowfoot, *that they are not eaſy to be diſcerned aſunder: the rough Heads and Seed following them are alſo like the other before deſcribed. Of this kind there is one alſo with double Flowers.*

VI. *The third, or* creeping kind, *has a white and thready Root, from whence ſpring forth ſeveral Leaves, which are divided into many parts, commonly into three, ſometimes into five, cut here and there in the edges, as if they were ſnipt, of a deep green color, upon which are found divers white Spots. From among theſe Leaves ſpring up the Stalks, which are round*

Creeping Meadow Crowfoot

round, and something hairy; some of them bend down towards the Ground, trailing as it were, and put forth many Roots at the Joints, which are small white Fibres, by which it takes hold of the Ground, and so encreases or spreads it self far about. Some of the principal Stalks stand upright, a foot high or higher, and sometimes they seem to be rather leaning than upright: at the tops of these Stalks and their Branches come forth the Flowers, consisting of five Leaves apiece, and of a glorious Gold yellow color, and a Golden-colored Thrumb in the middle, which being past, yield knobby rough Heads of Seed, very like to the first. The sharp Taste of the Leaves and Flowers are also like to the same. Of this kind there is also one with double Flowers, which is nurs'd up in Gardens.

VII. The *fourth, or* tuberous kind, *has a Root white and round, of the bigness sometimes of a* Wall-nut, *and sometimes much less, not much bigger than a* Bean *or large* Filbert, *with some long Fibres, especially at the end of it, which is of a more sharp and biting* Taste *than any of the former: from this Root spring up divers Leaves, much more cut in and divided than any of the former, every one of them standing on a short* Foot-stalk, *of an over-worn green color: among which rise up several slender Stalks, a foot or foot and half high, with some Leaves thereon at the Joints, more divided, and into longer and narrower parts than those below; at the tops of the Stalks and Branches come forth fair shining Gold-colored Flowers, consisting of five Leaves apiece, like the former kinds, with many* Threads *in the middle, standing about a green Head; which after the Flowers are past, grows to be more rough or prickly than the seedy Heads of any of the aforegoing. Of this kind is that thought to be which bears double yellow Flowers, one out of another, called* Anglicus bulbosus or tuberosus. *Also another, whose Flower is single, and red, like an* Orange.

VIII. *The fifth, or* Globe kind, *(called in the* Northern *Countries of* England, *where it grows,* Locker Goulous) *has a Root composed of many blackish Fibres or Strings, from whence rise many fair, broad, dark green Leaves next the Ground, standing upon long* Foot-stalks, *which Leaves are deeply cut or jagged into five, six or seven Divisions, and besides nipt in or dented on the edges; among which rises up a Stalk, divided towards the top into some Branches: on the Stalk are set such-like Leaves as are below, but smaller. On the tops of the Stalk and Branches grow several large fair yellow Flowers, consisting of five Leaves apiece, or rather of eleven Leaves for the most part, set or placed in three rows, and always folded inwards, or rouled up together like a round Ball or Globe, like a close Flower never blowing, (from whence came the Name:) they have many yellow Threads in the middle, standing round about a green rough Head, which in time grows to be full of small Knobs, wherein is contained small black Seed.*

IX. *The Places.* They all grow in Fields and Meadows, or Pasture-Grounds, thro' all *England*, especially the four first kinds. The fifth kind grows wild in most places of *Lancashire* and *Yorkshire*, and other bordering Shires in the *Northern* parts of this Kingdom, almost in every Meadow; but has not been yet found wild in any of the *Southern* or *Western* parts of *England*.

X. *The Times.* They flower in *May* and *June*, and the Seed is ripe in *July* and *August*.

XI. *The Qualities, Specification, Preparations, Virtues and Uses,* see in *Chap.* 176. following, where they will be handled at large.

CHAP. CLXXIII.

of CROWFOOT Field.

I. *THE Names.* It is called in *Greek*, Βατραχιον ἀγραῖον καὶ τὸ ἀρουσιον: in *Latin*, *Ranunculus arvus, vel arvorum*; and in *English*, *Field or Fallow-Field Crowfoot.*

Fallow field Crown foot

II. *The*

I. *The Kinds.* It is a ſingular Plant, and is called by *Lobel* in his Icones, *Ranunculus arvorum*; and is the ſame with *Ranunculus arvenſis Geſneri*, *Ranunculus arvenſis echinatus Bauhini*, *Ranunculus ſegetalis Cordi*; *Ranunculus Sylveſtris tertius Dodonæi & Lobelii in Obſervationibus*, Fallow-field Crowfoot.

III. The Deſcription. *It has a ſmall white fibrous Root, from whence ſpring forth ſome deeply jagged Leaves upon long Foot-ſtalks, but ſmaller than any of the former, and divided into many narrower parts, of an over-worn green color; they are fat and thick, much jagged, and ſomething reſembling (ſays* Gerard) *the Leaves of* Sampire, *but not near ſo green. From among theſe Leaves riſes up a Stalk about a foot or more high, which towards the top is divided into other Branches; the Leaves on the higher part of the Stalk are more jagged or divided than thoſe which are lower. The Flowers grow at the tops of the Branches, which are conſiſting of five ſmall Leaves, of a pale or faint yellow color, which being paſs'd away, there come Cluſters of rough and ſharp-pointed Seed, ſet as it were in Heads, many together.*

IV. *The Places.* It is found chiefly in Ploughed Lands and *Fallow Fields* in many parts of *England*; the *Latins* called it *Ranunculus arvorum*, becauſe it is commonly found in Fallow Fields, where Corn has lately been ſown, and ſo may be called *Corn Crowfoot.*

V. *The Times.* It flowers in *May* and *June*; the Seed ripening in the mean while in *Auguſt* and *September.*

VI. *The Qualities, Specification, Preparations and Virtues* thereof are the ſame with the *Common Meadow Crowfoot*, which may be found at large in *Chap.* 176. following.

CHAP. CLXXIV.

Of CROWFOOT Wood.

I. *THE Names.* It is called in *Greek*, Βατράχιον ὑλῶδες: in *Latin*, *Ranunculus Nemoralis*; and in *Engliſh*, *Wood Crowfoot.*

II. *The Kinds.* There are, 1. *Ranunculus nemoroſus albus ſimplex*, *Ranunculus Phragmitis Geſneri*, *Ranunculus Sylveſtris Tragi*, White ſingle-flowred Wood Crowfoot. 2. *Ranunculus nemoroſus albus minor*, *Ranunculus nemoroſus Anemones flore minor Bauhini*, The leaſt or leſſer white Wood Crowfoot. 3. *Ranunculus nemoroſus flore Carneo, & flore purpureo*, The ſingle bluſh and purple Wood Crowfoot. 4. *Ranunculus nemoroſus luteus*, The yellow Wood Crowfoot. 5. *Ranunculus nemoroſus dulcis*, *Ranunculus ſylveſtris ſecundus Tragi*, *Ranunculus Auricomus Lobelii*, Sweet Wood Crowfoot. 6. *Ranunculus montanus albus minor ſimplex*, *Ranunculus Alpinus albus*, The leſſer ſingle white Mountain Crowfoot. 7. *Ranunculus Virginenſis vel Virginianus albus*, White Virginian Crowfoot.

III. The Deſcriptions. *The firſt, or* White ſingle-flowred, *has a Root commonly of the bigneſs of a* Wheat *Straw, not growing right down, but creeping at length, under the upper Cruſt of the Earth, ſpreading into ſeveral ſmall Knobs, like Branches or Arms, of a dark brown color on the outſide, and white within, of a ſharp biting Taſte, inflaming the Mouth. From this Root riſe up two or three Stalks, about an Hand breadth high or more, about the middle whereof come forth uſually three Stalks of Leaves, each being ſomething broad, hard, and cut in on the edges into three parts, of a ſad green color, and dented alſo: the Stalk riſes up two or more inches high, bearing at the top one ſingle Flower, hanging down the Head for the moſt part, conſiſting of five Leaves, ſomewhat broad, and almoſt round-pointed, of a light blewiſh color on the outſide, before it is blown open, but white afterwards, and more white on the inſide, having a few white Threads in the middle, tipt with yellow, ſtanding about a green Head; which growing ripe in length of time, is ſomething like the other Heads of* Crowfeet, *compoſed of many ſmall Seeds compacted together.*

IV. *The ſecond, or* leaſt, or leſſer White kind, *has a Root ſmall and long, and creeping under the upper Cruſt of the Earth, like the former, and it has ſuch-like Leaves as the other* ſingle White kind, *divided into three parts, and each of them into others again, ſtanding upon little long Foot-ſtalks, but they are much leſſer, ſo that the whole Leaf hereof is not much bigger than one of the Diviſions or Parts of the other: the Stalk is very ſmall, with few Leaves thereon, divided in two places more than the lower, little more than two inches high: at the top grows a white Flower, conſiſting of ſix white Leaves, with a few yellowiſh Threads in the middle; which being paſs'd away, leaves a round Head compoſed of many ſmall Seeds, not much unlike the former.*

V. *The third, or* ſingle bluſh-colored Wood Crowfoot, *is in its Roots, Stalks, Leaves, Flowers, Heads, Seeds, and Form of Growing, like unto the former; ſo that until it is in flower, there can ſcarcely any difference be diſcerned: but when the Flower appears, it ſhews it ſelf much more reddiſh on the outſide, and of a fair pale purple or bluſh color on the inſide, which makes it a diſtinct Species of it ſelf, differing from the reſt. But ſometimes different Varieties are found of this kind, having its Stalk ſome-*

thing

thing browner, and its Flower of a pale purplish blew color, (from whence it is called Ranunculus nemorosus flore purpureo cœruleo*) like unto a pale* Violet *Flower, without any great Smell. These three aforegoing kinds the* Italians *call* Wild Ginger, *either because the Roots of them all are very sharp, hot, and biting the Tongue, like* Ginger; *or because their Roots do grow a little spreading into several Arms or Tuberosities, like to* Ginger.

VI. *The fourth, or* yellow kind, *has Roots very like to the first described in this* Chap. *from whence spring forth such-like Stalks of Leaves, and growing in the same manner; but the Leaves are not so broad, nor so hard in handling, and are more deeply cut into more long and narrower parts, each also dented about the edges, especially about the ends of the Leaves, which are of a darker green color. From between these Stalks of Leaves shoots forth sometimes but one, and sometimes two or three Stalks, at the top of each of which grows one Flower, something smaller than the former, consisting generally of six or seven, and sometimes of eight Leaves, which are of a fair pale yellow color, with many small* Threads *in the middle, which being pass'd away, there succeed like Heads of Seed, as in the others. These Flowers have the least Smell of them all. And unto this kind belongs that sort of* Anemone *(but rather* Crowfoot*) which* Dodonæus *calls* Trifolia, *having the Leaves parted into three, snipt about the edges, and which bears a whitish blush Flower.*

VII. *The fifth, or* Auricomus *of* Lobel, *which is the* sweet Wood kind, *has a Root composed of many white Strings or Fibres, like unto some others, but neither its Root nor Leaf, has any sharp biting Taste in them, but are almost Tasteless. From this Root spring up Leaves first of all, which are round, not much unlike to* Violet Leaves, *and not divided in the least; but those which spring up next after them, are more divided; and so also those which grow after upon the Stalk, are still more divided than the former. The Flowers are small, and of a fair shining Gold-yellow color, standing at the tops of the Stalks, like unto the* Common kinds *of* Crowfeet. *After the Flowers are pass'd away, come the rough Heads, like a small* Strawberry, *in like manner as other* Crowfeet *have, in which Heads are contained the Seed, many set together.*

VIII. *The sixth, or* lesser single white Mountain Crowfoot, *has Roots greater than any of the kindred of* Crowfeet; *from which Root spring forth fair, large, well-spread Leaves, (standing upon a long Foot-stalk) which are cut into five Divisions, and somewhat dented about the edges, green on the upper side, and paler underneath, having many Veins running thro' the Leaves: these Leaves are like those of the* Common Crowfoot, *but greater, of a deep green color, much like to those of the yellow* Aconite, *called* Aconitum luteum Ponticum: *it has great fat Stalks, about two feet or more high, spread into many Branches; at the tops of which come forth white Flowers, consisting of five Leaves apiece, with small yellow Chives in the middle, smelling like the Flowers of* May *or* Haw-Thorn, *but more pleasant; after which comes the Seed, which is contained in Heads, like to the other* Crowfeet.

IX. *The seventh, or* Virginian Crowfoot, *has a reddish, thick, tuberous Root, with some small Fibres springing from it: from which shoot forth three or four somewhat large, broad, whitish-green Leaves upon long Foot-stalks, rent or torn on the edges for the most part; among which rises up a slender, round, naked Stalk, five, six or more inches high, bearing one white Flower at the top, made of ten or twelve small, narrow and pointed Leaves, with a few yellowish Threads in the middle, set about a greenish Head, which in time grows to be a long slender Pod, in which is contained round whitish Seed.*

X. *The Places.* They are almost all found growing in *Woods, Groves* and *Orchards* in most places of this Land. The fourth is found as well by *Brook-sides*, which pass by Meadows, as in Woods, and by Hedge-sides. The sixth, is called *Ranunculus Alpinus*, because that those which first found it, met with it upon the *Alpine Mountains*; however, since it has been found to grow plentifully Wild in *England*, especially in *Hampstead Wood*, from whence it has been transplanted into *Gardens*. The seventh bears in its Name the place of its Growth, but it has been found in many other parts of *Florida*.

XI. *The Times.* They flower pretty early in the *Spring*, sometimes in *March*, but for the most part in *April*, and sometimes in *May*; and the Seed is ripe in *June*, *July* and *August*.

XII. *The Qualities, Specification, Preparations, Virtues and Uses*, see in *Chap.* 176. these being of the same Nature with those others, where you may have them at large.

CHAP. CLXXV.

Of CROWFOOT Water.

I. *THE Names.* It is called in *Greek*, Βατραχιον ὑδατιον: in *Latin*, *Ranunculus aquaticus*; and in *English*, *Water Crowfoot*.

II. *The Kinds.* Authors make several kinds of *Water Crowfoot*; as, 1. *Water Spear-wort*. 2. *Water Ivy*. 3. *Water Star-wort*; none of which we can admit into this Kindred; for tho' they be hot, like the

the Crowfoot, yet they have nothing of the Form, and we think that ſomething more than the Taſte ought to conclude the ſeveral Species, otherwiſe *Ginger* may as well be admitted into the ſame Stock, which I am ſure no Herbariſt will ever grant: for this Reaſon we refer you for the three afore-named kinds of Plants to their proper places, which you will find in ſome of the following Chapters of this Book.

III. The *Water Crowfeet* then, which we ſhall treat of in this Chapter, are four; 1. *Ranunculus aquaticus vulgaris major*; *Rananculus aquaticus Hepaticæ facie Lobelii*; *Ranunculus aquatilis Dodonæi*; *Hepatica aquatica Lugdunenſis*; *Hepatica paluſtris Thalii*; *Ranunculus aquaticus folio rotundo & capillaceo Baubini*; The Common greater Water Crowfoot. 2. *Ranunculus aquaticus Communis minor*; *Ranunculus Hederulæ folio aquaticus*; The leſſer Water Crowfoot. 3. *Ranunculus paluſtris Sardonius lævis*; *Strumea, & Apiaſtrum Plinii*; by ſome *Apium Riſus*; *Herba Sardoa Guilandini*, (who ſays, when he was taken Priſoner by Pyrates, and carried into *Sardinia*, he ſaw this Herb growing plentifully there:) *Apium aquaticum Tragi*; *Apiaſtrum Cordi*; *Scelerata Apulei*; *Ranunculus paluſtris Cordi in Hiſtoria Lugdunenſis, Thalii, &c. Ranunculus paluſtris Apii folio lævis Baubini*; *Ranunculus paluſtris rotundiore folio Lobelii*; Smooth-leav'd Marſh Crowfoot. 4. *Ranunculus paluſtris Sardonius languinoſus*; *Ranunculus Sardonius verus Dioſcoridis*; *Ranunculus Sardonius Anguilaræ*; *Apium Sylveſtre*; *Ranunculus paluſtris Apii folio languinoſus Bauhini*; *Ranunculus paluſtris ſecundus Matthioli, & Cordi in Hiſtoria*; The true *Sardinian* Marſh Crowfoot.

Water Crowfoot the Greater.

IV. The Deſcriptions. *The firſt*, or Common Water Crowfoot, *has a ſmall fibrous or thready Root, from whence comes forth a long trailing tender Stalk, with ſeveral Joints therein, at every one of which that are under Water, come forth fine jagged or feathred Leaves, almoſt like Fibres, but that they are green, but towards the tops of the Branches growing above the Water, there be none of thoſe fine Leaves at the Joints, or very few of them, but only round Leaves, growing upon ſhort Foot-ſtalks, cut in a little, and dented about the edges: and with them come forth likewiſe ſmall Milk-white Flowers, conſiſting of five Leaves apiece, with ſome Yellowneſs in the middle; after which come ſmall, rough, round Heads of Seed, almoſt like to thoſe of the* Land Crowfoot.

Water Crowfoot the Leſſer.

V. *The ſecond, or* Small Water Crowfoot, with Alehoof or Ground-Ivy Leaves, *has a great number of fibrous Roots, from whence come many long, ſlender, trailing Branches or Stalks, ſhooting forth at almoſt all the Joints under Water many other fibrous Roots, by which it ſpreads and very much encreaſes it ſelf. From the ſeveral Joints, as well under as above the Water, ſpring forth ſeveral ſmall, roundiſh, indented Leaves, not much unlike to thoſe of* Alehoof, *ſtanding each upon a pretty long Foot-ſtalk: from ſome of the Joints with the Leaves, and at the tops of the Stalks, come forth paliſh Flowers, having five pointed Leaves apiece; which being paſs'd away, leave roundiſh Heads of Seed after them.*

VI. *The third, or* Smooth-leav'd Marſh Crowfoot, *has for a Root a Buſh of ſmall white Fibres; from whence ſhoot forth ſeveral Leaves upon long Foot-ſtalks, rounder than thoſe growing higher upon the Stalk, and not ſo deep cut in, but dented about the edges: from among theſe Leaves ſhoot forth a round hollow Stalk, near a foot and half high, ſpreading it ſelf forth into ſeveral Branches; the lower Leaves whereof are more round than thoſe above, and are divided ſome into three parts, which are the firſt and loweſt, others into five* Diviſions, *and each of them dented about the edges, ſomewhat like unto* Coriander Leaves, *ſmooth, and of a pale green color; but thoſe up higher on the Stalk and Branches are ſtill more and more divided; ſo that ſome of the higheſt have no Diviſion or Dent in them. At the tops ſtand ſmall yellow Flowers, (but* Cordus *ſays, he has obſerved ſome to bear purpliſh:) which being paſs'd away, there come in their places ſmall, long, round Heads, of many crooked Seeds ſet together, as in ſome other ſorts is to be ſeen: the whole Plant is as hot, ſharp, biting, and as exulcerating as any of the other kinds, whether of the* Land *or* Water.

VII. *The fourth, or* True Sardinian Marſh Crowfoot, *has a Root conſiſting of a Bunch of white Strings, from which ſpring forth ſeveral large winged Leaves, upon Foot-ſtalks of a moderate length, divided into ſeveral parts, and dented about the edges: from among which ſpring up one or more Stalks, ſpreading themſelves out into divers Branches, on which grow Leaves, ſome winged, and ſome ſingle*

Leaves

Leaves not winged, more divided than the former kind, and ſo hairy withal, as if there was a ſmall ſoft Cotton upon them: at the tops of the Branches and Stalks come forth the Buds of Flowers, conſiſting of five broad-pointed Leaves apiece, each Leaf being on its end hollowed in a little; which being paſs'd away, there ſucceed Heads of Seed, much like to the former.

VIII. *The Places.* Theſe all grow in moiſt, wet and moriſh Grounds, and ſometimes by the ſides of Waters, Ponds and Ditches; and in plaſhy places. The firſt is common in many places of this Kingdom: the ſecond is more rare to be met with: the third and fourth are often found; but not altogether ſo frequent to be ſeen as the firſt.

IX. *The Times.* They all flower in *May* and *June*; and their Seed is ripe ſome time after.

X. *The Qualities, Specification, Preparations, Virtues and Uſes,* ſee in the following Chapter, theſe being of the ſame Nature and Temperature with the former and thoſe following.

CHAP. CLXXVI.

Of CROWFOOT Garden.

I. *THE Names.* It is called in *Greek,* Βατράχιον κηπευτὸν ἢ σπόριμον, ἢ ἥμερον: in *Latin, Ranunculus Sativus vel hortenſis:* in *Engliſh, Garden* or *Manured Crowfoot.*

II. *The Kinds.* Of the *Ranunculi* which Floriſts now ſtuff their Gardens withal, there is ſuch a great number of them, that it would not be eaſie to name them all, much leſs to deſcribe them; a great part of them being originally Exoticks or Foreigners, but being brought to us, and proſpering well by a Cultivating in our Gardens, they were made free Denizons, (as it were) and ſo at length became Natives of our Soil. The chief of thoſe which we ſhall take notice of in this Work, are the eighteen following.

III. 1. *Ranunculus montanus albus major*, Great ſingle white Mountain Crowfoot. 2. *Ranunculus montanus albus humilior duplici flore*, The low double white Mountain Crowfoot. 3. *Ranunculus albus flore pleno*, The double white Crowfoot. 4. *Ranunculus pratenſis flore multiplici*, The double yellow Field Crowfoot. 5. *Ranunculus Anglicus maximus multiplex*, Garden double yellow Crowfoot, called alſo Batchelors-buttons. 6. *Ranunculus Gramineus duplice flore*, Double-flowred Graſs-like Crowfoot. 7. *Ranunculus Creticus Latifolius*, Broad-leav'd *Candy* Crowfoot. 8. *Ranunculus Creticus albus*, The white *Candy* Crowfoot. 9. *Ranunculus Aſiaticus flore Rubro*, Single red *Aſian* Crowfoot. 10. *Ranunculus Aſiaticus flore Amplo rubro*, The large ſingle red *Aſian* Crowfoot. 11. *Ranunculus Aſiaticus flore rubro vario ſimplici*, The ſingle red ſtript *Aſian* Crowfoot. 12. *Ranunculus Aſiaticus flore luteo vario ſimplici*, The ſingle yellow ſtript *Aſian* Crowfoot. 13. *Ranunculus Aſiaticus flore rubro pleno*, The double red *Aſian* Crowfoot. 14. *Ranunculus Aſiaticus flore pleno prolifero*, The double-buttoned red *Aſian* Crowfoot. 15. *Ranunculus Thalictri folio major*, The greater Columbine-leav'd Crowfoot. 16. *Ranunculus Thalictri folio minor Aſphodeli radice*, Small Columbine-leav'd Crowfoot. 17. *Ranunculus Illyricus*, Illyrian Crowfoot. 18. *Ranunculus folio Plantaginis*, The Plantain-leav'd Crowfoot.

IV. The Deſcriptions. *The firſt, or* Great ſingle white Mountain Crowfoot, *has a Root conſiſting of many long, thick, whitiſh Strings, running out from a thick Head. From this Root ſpring forth large and green Leaves, divided into three parts, and ſometimes into five ſpecial Diviſions, and beſides each of thoſe parts are dented about the edges, ſomewhat reſembling the Leaves of* Globe Crowfoot, *but larger. The Stalk is two feet and half high, having three ſmall Leaves, ſet at the Joint of the Stalk, where it branches out into Flowers, which ſtand four or five together upon long Foot-ſtalks, made of five white Leaves apiece, very ſweet in Smell, with ſome yellow Threads in the middle, encompaſſing a green Head, which, with the Seed, is very like to other* Crowfeet *of the Wild kind. There is one of this kind which is alſo leſſer.*

V. *The ſecond, or* Low double white Mountain Crowfoot, *has a Root compoſed of many white Strings, from whence proceed three or four broad thick Leaves, almoſt round, and pretty deeply cut in on the edges, of a fine green and ſhining color on the upper ſide, but not ſo green underneath; among which riſes up a ſmall ſhort Stalk, bearing one Snow-white Flower on the top, pretty large, and a little double as it were, with two rows of Leaves, with divers yellow Threads in the middle, ſtanding about a green Head, which in time grows to be like to a ſmall green* Strawberry, *and full of Seed. There is alſo a ſingle ſort of this kind, having only one white Flower on the top of each Branch, which is leſſer, and conſiſts only of five round-pointed Leaves, being in all things elſe like the other.*

VI. *The third, or* Double white Crowfoot, *is of the ſame kind with the firſt, but leſſer; its Roots, Stalks and Leaves being alike in all reſpects: the chief Difference is in the Flowers, which in this Plant are very thick and double. The Leaves are fair, cut into five Diviſions, and a little dented about the edges, green on the upper ſide, and pale underneath, having many Veins running thro' the Leaves: the Stalk grows not very high, not much above a foot and half in height, which is ſpread into many Branches, whoſe tops are reaſonably ſtored with double white Flowers, as aforeſaid.*

VII. *The fourth, or* Double yellow Field Crowfoot, *has a Root running and creeping under the Ground, like as the ſingle does; from whence proceeds its Leaves and Stalks, in which there is but little difference from the ſingle Wild kind, which grow in every Meadow, being large, and divided into four or five parts, and indented about the edges, but they are ſomething ſmaller, and of a brisker green. The Flowers ſtand on the many Branches, much divided or ſeparated, being not very great, but very thick and double.*

VIII. *The fifth, or* Great *Engliſh* Garden double yellow Crowfoot, *called alſo* Batchelors-buttons, *has a Root round, like unto a ſmall white* Turnep, *with ſeveral Fibres adjoining to it: from which ariſe many great black, green Leaves, jagged and cut into three Diviſions, each to the middle Rib: from among theſe Leaves ſpring up the Stalks, which ſpread themſelves out into ſeveral Branches, and which have ſome ſmaller Leaves on them; and thoſe which are next under the Branches, are long and narrow, the higher up, the longer and narrower. The Flowers are of a greeniſh yellow color, very thick and double of Leaves; in the middle of which riſes up a ſmall Stalk, bearing another double Flower, like to the other out of which it grows, but ſmaller; which being paſs'd away, there comes a roundiſh rough Head of Seed, much like to the other* Crowfeet.

IX. *The ſixth, or* Double-flowred Graſs-like Crowfoot, *has a Root compoſed of many thick, long, round,*

round, white Strings, from whence proceed long and narrow Leaves, ſomewhat like unto Graſs, *or rather like to the Leaves of ſingle* Gilliflowers *or* Pinks, *being ſmall and ſharp-pointed, a little hollow, and of a whitiſh green color. From among theſe Leaves ſpring up ſeveral ſlender Stalks, bearing at the tops each one ſmall yellow Flower, which is double, as conſiſting of two rows of Leaves, with ſome Threads in the middle. There is alſo a ſingle ſort of this Species, the Flower being ſmall, and conſiſting of five yellow Leaves, with yellow Threads in the middle, like to other* Crowfeet.

X. *The ſeventh, or* Broad-leav'd *Candy* Crowfoot, *has a Root ſomewhat like thoſe of the* Aſian Crowfoot, *or compoſed of a number of tough Roots, like thoſe of the yellow* Aſphodil: *it has the greateſt and broadeſt Leaves of all the ſorts of* Crowfeet, *being almoſt round, and without any great Diviſions, dented a little about the edges here and there, as large or larger ſometimes than the Palm of ones Hand; of a light green color, yet ſome of the Leaves are here and there deeply divided. Among theſe Leaves riſes up a Stalk, not very high when it does firſt flower; but afterwards as the Flowers do open themſelves, it grows to be about a foot and half high, having ſome Leaves on it deeply cut in and divided. The Stalk is alſo thick, round and ſtiff, and ſhoots it ſelf forth into two or three Branches, at the ſetting on of which grow longiſh Leaves, a little dented about their ends. Theſe Branches bear many fair yellow Flowers, conſiſting of five round-pointed Leaves apiece, ſtanding each a little diſtance from other, ſo that the green points of the Cups ſhew themſelves between them, and having yellow Threads in the middle, but become ſomewhat whitiſh when the Flower has ſtood blown a little time.*

XI. *The eighth, or* White *Candy* Crowfoot, *has a Root conſiſting of many ſmall Grains or Kernels, of a dark or dusky greyiſh color, ſet together, and its Leaves are very like to the Leaves of the* Red Aſian Crowfoot, *being ſomewhat broad and indented about the edges, ſome of the Leaves being cut in or gaſht, making thereby as it were three Diviſions, of a pale green color, with many white Spots in them. The Stalk riſes up a foot high, with ſome Leaves on it, which are more divided than the lower, and divided at the top into two, and ſometimes into three Branches, each of them bearing a fair Snow-white Flower, ſomething large, included at firſt in a brownish Husk or Cup of Leaves, which afterwards ſtand under the Flowers, conſiſting of five white, large, round-pointed Leaves, having in their middle many blackiſh purple Thrumbs, encompaſſing a ſmall, long, green Head, compoſed of many Scales, or chaffie whitiſh Husks when they are ripe. They yield Seed, but it is unprofitable, as yielding no new Plants. Some of this kind have their Flowers purple-edged: ſome again have their Flowers with Veins of the ſame purple; and ſome of them are edged with a bright red color, not differing in any other particular.*

XII. *The ninth, or* Single red *Aſian* Crowfoot, *has a Root made of many Grains or ſmall Kernels ſet together, and cloſing at the Head, but ſpreading it ſelf, if it likes the Ground, under the upper Cruſt of the Earth into many Roots, encreaſing from long Strings which run from the middle of the ſmall Head of Grains, as well as from the Head it ſelf. The lower Leaves are always whole, without Diviſions, being only ſomewhat deeply indented about the edges: but the others which riſe after them, are more cut in, ſometimes into three, and ſometimes into five Diviſions, and notched alſo about the edges. The Stalk riſes higher than any of the former, and has on it two or three ſmaller Leaves, more cut in and divided than thoſe below; at the top whereof ſtands one large Flower, conſiſting of five Leaves, every one of them being narrower at the bottom than at the top, and not ſtanding round and cloſe one to another, but with a certain diſtance between, of a dusky yellowiſh red color on the outſide, and of a deep red on the inſide, the middle being ſet with many Thrumbs of a dark purple color. The Head for Seed is long, and ſcaly or chaffy, and not profitable for ſowing, as not ſpringing again.*

XIII. *The tenth, or* Large ſingle red *Aſian* Crowfoot, *has a Root much like the former, its Leaves are broader and greater. The Stalk is much of the ſame height as the other, and branched out, with like Leaves thereupon: the Flower is alſo larger, and the Leaves thereof broader, being ſometimes eight in a Flower, ſtanding round and cloſe one to another, of a deep red color, which makes it look the fairer, and have the more excellent ſhew: in all other reſpects, it is like the laſt.*

XIV. *The eleventh, or* Single red ſtript *Aſian* Crowfoot, *has a Root, Stalk and Leaf very like to the two laſt aforegoing, and in the manner of growing, differing chiefly in the Flower, which being red, like the two beforegoing, has yet ſome yellow Stripes or Veins thro' every Leaf: theſe Stripes are ſometimes but few and little, and ſometimes ſo much that it ſeems to be party colored red and yellow. It is a very tender Plant, and apt to periſh, unleſs carefully lookt after.*

XV. *The twelfth, or* Single yellow ſtript *Aſian* Crowfoot, *has a Root not much unlike to any of the three laſt deſcribed, but the Leaves are very different, being very much divided. The Flower is large, of a fine paliſh green yellow color, conſiſting of ſix and ſeven, and ſometimes of eight or nine round Leaves; the tops of which have reddiſh Spots upon them, and the edges alſo ſometimes, with like purpliſh Thrums in the middle as the other have. It has been obſerved, that none of the kinds of* Crowfeet *with theſe kernelly Roots, ever bear ſo good Seed, which being ſown, will ſpring up and grow in* England; *ſo that with us they can only be propagated from their Roots, by a careful and skilful looking after.*

XVI. *The thirteenth, or* Double red *Aſian* Crowfoot, *has a Root ſo like to the* Single red kind, *at* ſect. 12. *above, that none can perceive any difference between them, ſo alſo it is the ſame in its Stalk and Leaves, that the difference or kinds are not to be known till the Buds of the Flowers do appear, which after it is any thing forward, may be perceived to be greater and fuller than the Buds of the ſingle kind. This double ſort bears moſt commonly but one fair large double Flower on the tops of the Stalks, compoſed of many Leaves ſet cloſe together in three or four rows, of an admirable Crimſon color, declining to Scarlet, the outer Leaves being larger than the inner; and inſtead of Thrums, it has many ſmall Leaves ſet together. It has alſo ſix ſmall, narrow, green Leaves on the back-ſide of the Flower, where the Foot-ſtalk is joined to it.*

XVII. *The fourteenth, or* Double buttoned red *Aſian* Crowfoot, *has Roots, Stalks, Leaves and Flowers ſo like the former, that before the time of flowering they are not to be diſtinguiſhed one from another. The Flower is of the ſame Color and Duplicity, but herein they differ, that this has another double Flower growing upon a Foot-ſtalk iſſuing out of the middle of the firſt Flower, of the ſame color, but much ſmaller, which* Gerard *thinks does happen by reaſon of the Strength of the Root, and Goodneſs of the Soil where it is planted. It is a noble Flower, and of great Excellency.*

XVIII. *The fifteenth, or* Greater Columbine-leav'd Crowfoot, *has a Root made of a tufft of white Fibres*

or

or Strings, very bitter, and creeps here and there, putting up new Shoots. The Leaves of this Crowfoot *have long Stalks, and are very like unto the ſmaller Leaves of* Columbines, *or the* Great Spaniſh Thalictrum, *or* Meadow-Rue, *which has Leaves very like unto* Columbine *Leaves, four or five ſeveral ones riſing from the Root. The Stalk grows up to the height of about half a yard, ſomething reddiſh, and beſet here and there with the like Leaves: at the top ſtand ſeveral ſmall white Flowers, conſiſting of five Leaves apiece, with ſome pale white Threads in the middle: the Seed is round and reddiſh, and contained in ſmall Husks or Horns. This is the* Aquilegia minor Daleſchampii, *and* Ranunculus præcox ſecundus Thalietri folio Cluſii.

XIX. *The ſixteenth, or* Small Columbine-leav'd Crowfoot, *has a Root conſiſting of three, four or more, thick, ſhort and roundiſh or oval yellow Bulbs or tuberous Productions from the main Root or Head, like unto the* Aſphodil *Root. From this Root ſpring forth three or four winged Leaves ſpread upon the Ground, ſtanding upon long Stalks, and conſiſting of many ſmall Leaves ſet together, ſpreading from the middle Rib, every Leaf ſomewhat reſembling the ſmalleſt and youngeſt Leaves of* Columbines. *The Flowers are white, ſtanding at the tops of the Stalks, made of five round Leaves.*

XX. *The ſeventeenth, or* Illyrian Crowfoot, *has a Root which conſiſts of a Bunch of ſmall oval tuberous Roots or Grains, growing cloſe together, with ſome Fibres adjoining, not much unlike to thoſe of* Pilewort: *from whence ſpring forth (upon long Foot-ſtalks) three, four or more narrow greyiſh green Leaves, divided into four, five or more long ſlender parts, of a Silver-white ſhining color underneath, and covered with a certain Downineſs. The Stalks are firm and round, but ſmall, a foot high or more, having ſome ſuch-like Leaves thereon about the middle, and ſpreading into three or four Branches, every top bearing a ſmall ſhining pale yellow Flower, conſiſting of five Leaves, and ſometimes two together upon a Stalk. There is a greater kind of this Plant, like to it in all reſpects, but only that the Leaves, Stalk and Flowers are greater and larger, the Leaves broader and greener on the upper ſide, and not fully of ſo Silver a white color underneath: the Flowers are of a fair deep yellow color, and greater than the former; but the Root has not ſo many ſmall Grains of Kernels ſet together, from whence white Strings ſhoot forth, by which it is nouriſhed and encreaſed.*

XXI. *The eighteenth, or* Plantane-leav'd Crowfoot, *has a Root compoſed of many white Strings or Fibres, proceeding from a Head which is ſomewhat hairy, and abides many Years; the Leaves wholly periſhing in the end of Summer, and ſpringing again in* March: *from this Root riſe up three or four Leaves ſet on pretty long Foot-ſtalks, being ſomewhat long and broad, like unto* Plantane *Leaves, with Ribs therein, but more pointed at the ends, not divided or dented about the edges, but ſmooth and plain, with ſome Veins running thro' the length of them, and pointed at the ends, of a whitiſh grey green color, circled as it were with a white Down. The Stalk is firm, round and green, about half a yard high, bearing two or three longer Leaves, broad at the bottom, and encompaſſing the Stalk, which divides it ſelf at the top into two or three ſmall Branches, having every one of them a ſmall long Leaf at the foot thereof, and a reaſonable large Flower at the Head, (without any Smell) conſiſting of five white round-pointed Leaves, with many yellowiſh Threads in the middle, which growing ripe, has many Seeds ſet together, like to divers other kinds of* Crowfoot.

XXII. *The Places.* The Names of moſt of theſe Plants ſhew whence they originally came; however, by Tranſplantation, they are now Natives of our own Land, being all of them found in ſome one or other of our *Herbiſt's Gardens*, where they flouriſh admirably well.

XXIII. *The Times.* The *Broad-leav'd* Candy *Crowfoot* flower more early, *viz.* in *March* or *April*: the others flower from *April* to the end of *June*; and the Seed is ripe in *July* and *Auguſt*.

XXIV. *The Qualities.* The hot, biting and exulcerating kinds, (which are thoſe only whoſe Virtues we deſign to give you in this place) are hot and dry in the fourth Degree; and exulcerating.

XXV. *The Specification.* They are peculiar for curing the Scrophula or Kings-Evil.

XXVI. *The Preparations.* You may have therefrom, 1. *A liquid Juice of the Roots or Leaves.* 2. *An Eſſence.* 3. *A Pouder of the Roots, Flowers or Leaves.* 4. *A Cataplaſm of the ſame.* 5. *A Decoction.* 6. *An Ointment.* 7. *A diſtilled Water.* Some are for uſing the *Roots* only, ſome for the *Flowers*, ſome for the *Leaves*, but they may be all taken and uſed promiſcuouſly, according to the Intentions; but none of them to be uſed inwardly, being but little better than *Poyſon*, by reaſon of their exulcerating Property; more eſpecially the *Illyrian Crowfoot*, which ſome call *Apium Sylveſtre*, and ſome *Apium Riſus*, but is not the true *Apium Riſus*, of which we ſpeak in its proper place. But as to this *Illyrian* or *Laughing Crowfoot*, if it is taken inwardly, it is ſaid to cauſe the Perſon to ſee divers ſtrange Sights, and to kill them Laughing: without doubt, it hurts the Senſes and Underſtanding, and rather cauſes Cramps, Convulſions, and Wringings or Drawings of the Mouth and Jaws awry, ſeeming to the Standers-by as if the Patient Laughed, and dying in this Condition, to dye Laughing, whereas it was no Laughing, nor was the Party in any Condition to Laugh, but rather it was a violent Convulſion of the Nerves, cauſing the Man or Woman to die with great Torment.

The Virtues.

XXVII. *The liquid Juice.* It is ſharp and biting, good to bath gently thoſe Parts of the Skin which are affected with Scurff, Morphew, Leproſie, Freckles, Spots, Yellowneſs, Roughneſs, *&c.* The Skin is firſt to be waſhed with warm Water very well, to looſen and open the Pores thereof; then being wiped dry, to be immediately bathed with this Juice, which is to be done twice a day. It is good alſo to dry away Scabs and Itch.

XXVIII. *The Eſſence.* It is powerful to all the Intentions aforeſaid, but more drying. It is good to waſte away and conſume Warts, Corns, hard Scabs of the Skin, Ruggedneſs of the Nails, and other like Deformities of the *Cutis*. The Head being waſhed with it, it kills Worms at the Roots of the Hair, which eat the ſame and cauſe it to fall off. Neither Juice nor Eſſence, by reaſon of their Violence, are ever uſed inwardly.

XXIX. *The Pouder.* It is cleanſing and drying, and is good to be ſtrewed into old, running and putrid Sores, and Ulcers which have Worms in them. Snufft up the Noſtrils, it purges the Head and Brain by Sneezing.

XXX. *The Cataplaſm.* Laid to the Wriſts of the Hands, it is ſaid to drive away Agues, eſpecially if a little Bay Salt is alſo mixed with it. If it is made of the Root of the *Bulbous* or *Tuberous kind*, the *Germans*, as *Camerarius* ſays, apply it to Plague Sores and Peſtilential Bubo's, to induce Maturation: and it is not unlike, for it will ſuppurate and break

break other Apoſtems or Tumors, being wiſely applied. *Tragus* ſays, That a bit of this Tuberous Root put to Teeth which do ake, or into an hollow Tooth, takes away the Pain; but Authors alſo ſay, That many times it breaks thoſe which are hollow, or cauſes them to fall out. This Cataplaſm (or the ſimple Root) being applied to the Finger of one troubled with the Tooth-ach, eaſes the Pain, which it does by Attraction, and thereby cauſes a Pain in the Part to which it is applied. Applied to a foul Ulcer, it will cleanſe it, and take away all the filthy and corrupt Matter therein, leaving the Sore fair, and eaſily to be healed with other Vulneraries; but the Cataplaſm is not to lye too long upon the Sore, by reaſon of its Violence. Applied to Scrophulous Tumors or Kernels in the Neck, or under the Ears, called the Kings-Evil, it breaks them, and cauſes them to waſte away. Authors ſay, That applied to Hemorrhoids or Piles which ſwell and bleed not, it helps to diſcuſs or take them away; but that it is in no wiſe to be applied to thoſe which are open and bleed. Applied to a *Leuce* or ſpotted Leproſie, it kills the virulent Humor, and clears the Skin.

XXXI. *The Decoction.* It has the Virtues of the liquid Juice and Eſſence, but not full out ſo efficacious. It cures Scabs and Itch, they being often waſhed therewith; and is good to take away Tannings, Sun-burnings, Freckles, Lentils, Yellowneſs of the Skin, Scurff, Morphew, *&c.* It is good alſo to hinder the falling of the Hair, the Head being waſhed therewith warm; and then afterwards to be waſhed again with warm Water.

XXXII. *The Ointment.* It has all the Virtues of the Cataplaſm, being anointed upon the Parts affected. The Cataplaſm may alſo be made therewith, inſtead of Hogs-Lard, by which means it will be yet ſo much the more effectual.

XXXIII. *The diſtilled Water of the whole Plant*, whilſt it is in flower, is ſafe to all the Purpoſes aforeſaid; and, as ſome ſay, is given with good Succeſs inwardly, with Species *Lithontribon*, to provoke Urine when it is ſtopt, and to break the Stone: and being uſed as a Waſh, it takes away moſt of the uſual Deformities of the Skin.

XXXIV. *An Obſervation.* Tho' all theſe Preparations and Virtues aforegoing, are applicable to all the hot, biting and exulcerating *Crowfeet* promiſcouſly, whether of the Land or Water, and that probably they may all do the ſame things; yet they are generally and for the moſt part prædicated (except in the Caſes where any particular one of them is named) of the moſt *Common* and *Meadow Crowfoot*.

XXXV. *Obſerv.* 2. That the *Sweet Crowfoot*, or that which has no ſharp or biting Taſte, is held to be harmleſs, for the *Germans*, as *Tragus* ſays, do eat it familiarly among other Herbs. *Tragus* alſo ſays, That even this ſweet kind will diſcuſs and diſſolve hard Tumors in any Part of the Body, being applied.

CHAP. CLXXVII.

Of CROWN-IMPERIAL.

I. *THE Names.* It has no *Greek* Name that we know of: the *Turks* call it *Tuſai*, *Touſai*, *Tuſchai*, *Turſani* and *Turſandi*: in *Latin*, *Corona Imperialis*, & *Lilium Byzantinum*; *Cluſius* will have it to be the *Hemerocallis* of *Dioſcorides*: in *Engliſh*, *Crown Imperial.*

II. *The Kinds.* It is of the Stock or Kindred of *Lillies*; and among the wonderful Variety of *Lillies* known at this day, of which ſome are White, ſome Orange Tawny, ſome Red, ſome Yellow, ſome Bluſh, ſome Purple, ſome Spotted, others without Spots; ſome ſtanding upright, others turning downwards, *&c.* This *Crown Imperial*, for its excelling Beauty and Statelineſs, exacts the firſt place among them. Some have called it *Lilium Perſicum*, but there is another which is more uſually called by that Name, as ſhall be ſhewed hereafter; and therefore we rather chuſe to call it *Corona Imperialis*, the *Crown Imperial*, than by any other Name, for that this Name is now alſo more generally received. It is a ſingular Plant of the kind, yet ſome will have it, that there is a *ſingle* and a *double ſort*: but the Truth is, that as the Plant grows old, ſo does it grow rich, bringing forth a Crown of Flowers among the uppermoſt green Leaves, which is, their *double kind*, altho' indeed they are but one and the ſelf-ſame Plant, which in time is thought to grow to a *Triple Crown*; all which is but accidental, and happens by the Age of the Root, and Fertility of the Soil.

Crown Imperial.

III. The Deſcription. *It has a thick, firm and ſolid bulbous* Root, *covered with a yellowiſh* Film *or Skin, compoſed of fewer, but much thicker Scales than any other* Lilly, *except the* Perſian, *and does grow ſometimes to be as great as a pretty big* Childs Head, *and ſomewhat flat withal. From the ſides whereof, and not from the bottom, it ſhoots forth long thick* Fibres, *which periſh every Year, having a hole in the midſt thereof at the end of the Year, when the old Stalk is dry and withered, and out of the which a new Stalk does ſpring again (from a Bud or Head to be ſeen within the Hollowneſs on the one ſide) the following Year: the Stalk then filling up the Hollowneſs.*

Hollowneſs, and thus ſpringing up, riſes up to be three or four feet high, being great, round, and of a purpliſh color at the bottom, but green above, beſet from thence to the middle thereof, with many long and broad green Leaves, very like to the Leaves of our Common white Lilly, *but ſomething ſhorter and narrower, confuſedly without Order, and from the middle upwards it is bare or naked without Leaves, for a certain ſpace; and then it bears four, ſix or ten Flowers, more or leſs, according to the Age of the Root, and the Fertility of the Earth where it grows. The Buds at the firſt appearing are whitiſh, ſtanding upright among a Buſh or Tuft of green Leaves, ſmaller than thoſe below, and ſtanding above the Flowers; after a while they turn themſelves, and hang downwards, every one upon its own Foot-ſtalk, round about the great Stem or Stalk, ſometimes of an even depth, and ſometimes again one lower or higher than another, which Flowers are almoſt in Form like to thoſe of an ordinary* Lilly, *but ſomewhat leſſer and cloſer, conſiſting of ſix Leaves, of an Orange color, ſtriped with purpliſh Lines and Veins, which add a great Grace and Beauty to the Flowers. At the bottom of the Flowers next unto the Stalk, every Leaf thereof has on the outſide a certain Bunch or Eminence ſticking forth, of a dark purpliſh color; and on the inſide there lies in thoſe hollow bunched places, certain clear drops of Water, like unto Pearls, of a very ſweet Taſte, almoſt like to Sugar or Honey. In the midſt of each Flower is a long white Stile or Pointel, forked or divided at the end; and ſix white Chives tipt with yellowiſh Pendents, ſtanding cloſe about it: after the Flowers are paſt, ſix-ſquare Seed-Veſſels appear, ſtanding upright, winged as it were, or welted on the edges, yet ſeeming but three-ſquare, becauſe each couple of thoſe welted edges are joined cloſer together. In theſe Pods or Veſſels are contained broad, flat and thin Seeds, of a pale browniſh color, like unto other* Lillies, *but much greater and thicker alſo. The Stalk of this Plant does ſometimes grow flat, two, three or four Fingers broad, and then bears many more Flowers, but then generally they are ſmaller than when it bears round Stalks. Sometimes it happens that the Stalk is divided at the top, carrying two or three Tufts of green Leaves, without any Flowers on them: and ſometimes likewiſe it bears two or three Heads or Crowns of Flowers (as we have before hinted at* ſect. 2. *above) upon one Stalk; this is not often ſeen, but when it happens, it is meerly accidental. The whole Plant, and every part thereof, Roots, Leaves and Flowers do ſmell ſomewhat ſtrong, much like to the Scent of a* Fox; *which, if any do but come near it, they cannot chuſe but ſmell it.*

IV. *The Places.* This Plant was firſt brought from *Conſtantinople* into our Country among other bulbous Roots, and being made *Denizons* in our *Gardens*, they are now become Natives of our Land, where they thrive admirably well.

V. *The Times.* They flower in *April*, and ſometimes in *March*, if the Weather is mild; and the Heads with Seed are ripe in the end of *May* and in *June*. It is quick in its Growth, but it ſprings not out of the Ground till the end of *February* or beginning of *March*.

VI. *The Qualities, Specification, Preparations, Virtues and Uſes*, are the ſame with thoſe of the *White and Orange-tawny Lilly*, treated of in ſome of the following Chapters, to which you are referred.

VII. *Obſerv.* 1. *To obtain the true color of the Flowers of this noble Plant:* Take Sap-berries, and lay them in ſteep in a proportional quantity of fair Water for two hours, and mix a little Saffron in that Infuſion, and it will give the perfect color, to limne or illumine the Flower withal.

VIII. *Obſerv.* 2. As in the bottom of each of theſe Bells, there is placed ſix drops of moſt pure clear ſhining Water, ſweet in Taſte, like to Sugar, reſembling in Shew fair Oriental Pearls; theſe drops, if you take them away, new and freſh drops will immediately come in their places again. But if they may be ſuffered to continue in the Flower, they will never fall away, no, tho' you ſtrike the Plant till it is broken.

CHAP. CLXXVIII.

Of CUCUMBER Garden.

I. *THE Names.* It is called in *Arabick, Chathe & Chethete:* in *Greek,* Σικυς ἥμερος: in *Latin, Cucumis & Cucumer Sativus:* in *Engliſh, Garden Cucumber.*

II. *The Kinds.* Of theſe we make four ſeveral ſorts, *viz.* 1. *Cucumis vel Cucumer vulgaris*, The Common Garden Cucumber. 2. *Cucumis Anguinus*, The long Snake-like or Serpentine Cucumber. 3. *Cucumis vel Cucumer Pyriformis*, Pear-faſhioned Cucumber. 4. *Cucumis vel Cucumer Hiſpanicus*, The *Spaniſh* Cucumber.

Garden Cucumbers.

III. The Deſcriptions. *The firſt has a Root which is long and white, with divers Fibres adjoining to it, from whence ſpring forth many trailing rough green Branches, lying on the Ground; all along whereof grow ſeveral Leaves, which are rough, broad, uneven at the edges, and pointed at the ends, with long crooked twiſting Tendrels or Claſpers, coming forth at the ſame Joint with the Leaf, but on the other ſide thereof. Between the Stalks and the Leaves, at the Joints, come forth Flowers ſeverally, each ſtanding on a ſhort Foot-ſtalk, opening it ſelf into five Leaves, of a yellowiſh color; at the bottom of which grows*

the

the Fruit, long, and green at firſt; but when it is through ripe, a little yellowiſh, having many Furrows and uneven Bunchings out the whole length of it, with long yellowiſh white flat Seed, lying diſperſed in Rundles as it were, and very regularly thro' its whole Subſtance. The inward Pulp or Subſtance is clear or through ſhining, which together with the Seed is eaten a little before they be fully ripe: of this Cucumber *there is* the ſhorter, *which is of an equal bigneſs in the body thereof*; *and* the longer, *of an unequal bigneſs at both ends*; *and* a very long one, *which is near a foot in length: there is alſo* the early kind, *called* the French kind, *which are the worſt of all*; *and* the Dantisk kind, *which bears but ſmall Fruit, growing on ſhort Branches or Runners, of which kind the* Cucumbers *we uſually Pickle are.*

IV. *The ſecond, or* Long Serpentine Cucumber, *has a Root much like the former, having long trailing Branches, Tendrels and Leaves, (tho' leſſer) much like the former. The Fruit, ſays* Gerard, *is very long, (and ſomething twining, like a Serpent or Snake) which (ſays he) were at firſt made by Art and Manuring, and were afterwards ſo brought forth by Nature: for at firſt, when the Fruit was ſmall and little, it was put into ſome hollow Cane, or other like thing made of purpoſe, in which the* Cucumber *did grow, and that in length according as the Caſe it was encloſed in would permit it. It grew long by reaſon of the narrow Hollowneſs in which it was encloſed, which being filled up, it encreaſed in length. The Seeds of this kind of* Cucumber *being ſown, bring forth not ſuch as it were before this Application of Art; but ſuch as theſe are which Art has framed, which now of their own Growth are long, and oftentimes very crookedly turned; whence came the Name* Anguini, *or* Long Cucumbers.

V. *The third, or* Pear-like faſhioned Cucumber, *has a fibrous or thready Root, from whence come many trailing Branches, lying flat upon the Ground, rough and prickly; whereon do ſtand at each Joint, one rough Leaf, ſharp-pointed, and of an over-worn green color: among which come forth claſping Tendrels, and alſo ſlender Foot-ſtalks, on which do grow yellow Star-like Flowers: the Fruit is at firſt green and longiſh, which coming to its bigneſs, forms it ſelf much like to a Pear, greeniſh on one ſide, and of a whitiſh green on the other, and is much about the largeneſs of a great* Warden: *the Seed is long, flat and whitiſh, like the other.*

VI. *The fourth, or* Spaniſh kind, *(which were brought out of* Spain *firſt to* Strasburgh, *and from thence to us) is a rare and beautiful* Cucumber: *it has a fibrous* Root, *from whence come forth rough and hairy trailing Branches, ſet with very large rough Leaves, ſharp-pointed, in Form like unto the Leaves of the great* Bur-dock, *but more cut in or divided: among which at the Joints come forth upon tender Foot-ſtalks, fair, naked yellow Flowers; the which being paſt, the Fruit comes in its place a foot in length, green on the ſide towards the Ground, and yellowiſh on the Sunny part, ſtraked with many Spots and Lines of divers colors, whoſe Pulp or Meat is hard and faſt, like that of our* Melon *or* Pompion.

VII. *The Places.* Theſe *Cucumbers* all grow in *Gardens*, not only in *England*, but in moſt parts of the World, eſpecially in all the more *Southern* Countries, where the Heat of the Sun makes them to grow and flouriſh admirably well.

VIII. *The Times.* They are planted in *April*, and they are fit for eating in *June*, *July* and *Auguſt*; and the Seed is fully ripe about the latter end of *September*.

IX. *An Obſervation about Planting then.* About the middle of *April*, or ſomething ſooner, (if the Weather is warm) you muſt make a Bed or Bank of hot and new Horſe-dung, taken from the Stable, and not from the Dung-hill, of an Ell in breadth, and two feet and half in depth, but of what length you pleaſe, accordingly as it may hold the quantity or numbers of the Seed you intend to uſe: this Bank you ſhall cover with Hoops or long ſlender Sticks, ſo bent and bowed, that you may cover the whole Bank or Bed with Mats or ſome other warm Covering, Straw, or the like, to keep it from the Injury of cold froſty Nights, that the Seeds which are planted or ſown, may not be nipt: then ſhall you cover your Bed over with the beſt and fatteſt Earth, finely ſifted thro' a Wire Sieve, that it may be half a foot thick, in which you ſhall ſet or ſow your Seed: this being done, caſt your Straw or other Coverture over the ſame, and ſo let it reſt without looking upon it, or taking away of your Covering, for the ſpace of ſeven or eight days at moſt; for commonly in that ſpace of time they thruſt themſelves thro' the Earth. Then muſt you caſt upon them, in the hotteſt time of the day, ſome Water which has ſtood in the Houſe or the Sun a day before, or Water of which the Cold is juſt taken off; for otherwiſe, if the Water caſt upon them is juſt taken forth out of the Pump or Well, it will ſo cool and chill them, being brought forth and nouriſhed in ſuch a hot place, that preſently, even in one day, you will have kill'd all your Plants: your Plants will not only be kill'd, but your Bank alſo will be chill'd and looſe its Heat.

X. *Obſerv.* 2. This is alſo to be noted, That the young Plants muſt every day when the Sun ſhines warm, be opened and expoſed to its Beams, and at Evening every Night they muſt be covered again; this muſt be done from time to time, till the Plants have four or ſix Leaves apiece, and that the Danger of the cold Nights and nipping Seaſon is paſt; then they muſt be replanted with a great deal of Care, taking each Plant up with the Earth ſticking to its Root, and they muſt be placed as near as may be in the moſt fruitful and fat Soil; and in that part of the Garden which is moſt ſheltred from Cold and piercing Winds, and where the Sun ſhines warmeſt. Now, you muſt alſo obſerve, That upon this Replantation, you muſt cover them with ſome thin Mats or Wiſps of Straw, propped up with forked Sticks or ſome ſuch-like thing; and this thing is to be done every Night, to keep them from the Cold of the Night, and ſometimes in the Day-time, to keep them from the too great Heat of the Sun; otherwiſe, tho' you have brought your Work thus far on, all your Labor may be loſt: for they cannot, whilſt they be young and newly planted, endure either over-much Cold or over-much Heat, till they be well rooted and fixed in this their new Habitation.

XI. *Obſerv.* 3. Sometimes it falls out that ſome Seeds are more forward than the reſt, and therefore do commonly riſe up very nakedly, with long Necks, not much unlike to the Stalk of a ſmall *Muſhroom* of a Night old. This naked Stalk you muſt cover with the like fine Earth, even up to the green Leaves: you muſt alſo have that regard to your hot Bank, ſo to place it, that by its Situation it may be defended from the *North*, *North-Eaſt* and *Eaſt* Winds. If theſe Inſtructions be carefully obſerved, you never will have cauſe to complain that your Seeds were not good, nor your Clime too cold or intemperate, by reaſon of which you ſhould be fruſtrated in having of Fruit; but if your Seed is hard, plump, firm and good, it will certainly prove fruitful, tho' in the moſt *Northern* parts of *Scotland*.

XII. *The*

XII. *The Qualities.* They are all cold and moiſt in the ſecond Degree: Aperitive, Diuretick, Stomatick, Alterative, and highly Antiſcorbutick.

XIII. *The Specification.* It cures the Scurvy, and prevails againſt Heat of Urine.

XIV. *The Preparations.* You may have therefrom, 1. *A liquid Juice of the Fruit.* 2. *An Eſſence of the ſame.* 3. *The green Fruit* 4. *Pottage.* 5. *A Lotion or Waſh* 6. *A diſtilled Water* 7. *The Seed.* 8. *Pickled Cucumbers.* 9. *Pickled after the* Mango *faſhion.*

The Virtues.

XV. *The liquid Juice.* It is expreſſed from the *Cucumber*, either ripe, or almoſt ripe, or unripe, as they are moſt fit to be eaten. It opens, is cool and cleanſing, provokes Urine, and opens the Obſtructions of the Breſt, Lungs, Liver and Reins, and takes away Inflammations of thoſe Parts. It helps Heat, Sharpneſs and Scalding of Urine. Doſe from 1 to 3 ounces twice a day. Outwardly applied, it makes the Skin ſmooth and fair: and being taken for ſome conſiderable time, it perfectly cures the Scurvy in a hot Habit of Body.

XVI. *The Eſſence.* It has all the Virtues of the former, but not full out ſo cold; for which Reaſon this may be taken by it ſelf, from 1 to 3 ounces or more; whereas the other ought to be taken mixed with Ale or White Port Wine. It is an excellent Stomatick, very much pleaſing and gratifying the Viſcera, if inflamed or over-heated.

XVII. *The green or unripe Fruit.* It is firſt paſted, then ſliced thin; after which it is ſeaſoned with Pepper, Salt, Vinegar and Oil, an Onion or two being alſo thin ſliced and ſhred, and put thereto. It is grateful to the Stomach above all other Sallets; it cools the Heat thereof, as alſo the Inflammation of the Lungs and other Viſcera. It cures the Scurvy in a cold Habit of Body, nor is there a greater Antiſcorbutick in the World, and may be freely eaten two or three times a day, and in large quantities too, without any danger or hurt to the Stomach and Bowels, tho' ſome ignorant People may affirm the contrary. God and Nature has repleniſhed all the hot Regions and Countries of the World with them in a very ample manner; and it is my Opinion, that they are a great means of the Preſervation of Life in all thoſe ſultry hot Parts of the Earth, and a ſingular Preventive of Diſeaſes, eſpecially of all ſuch as proceed from Inflammation, violent Heat and Fevers, of what kind ſoever. It was not without ſome Reaſon that the Children of *Iſrael* luſted after them in the Wilderneſs: *Numb.* 11. 5. *We remember* (ſaid they) *the Fiſh which we did eat in* Ægypt *freely, the Cucumbers, and the Melons, and the Leeks, and the Onions, and the Garlick.* And by this it appears alſo, that *Ægypt* was very well ſtored with them.

XVIII. *The Pottage.* Take the Fruit, cut it in pieces, and chop it as Herbs to the Pot, and ſtew the ſame in a ſmall Pipkin (or Stew-pan) with a piece of Mutton, (Beef, Veal, Lamb, or other Fleſh,) adding in the ſtewing fine Flower of Oat-Meal, to give it the Conſiſtence of Pottage: *Gerard.* This may be made ſavory with a little Salt, and if you ſo pleaſe you may alſo add to it the Juice of an Orange, to make it grateful, of which you may eat from half a pint to a pint, or a good Porringer full every Morning to Breakfaſt, as much at Dinner, and the ſame again at Supper. Eaten in this manner for the ſpace of three Weeks together, without Intermiſſion, it will perfectly cure all manner of ſalt Puſtles, and copper or red Faces, red and fiery ſhining Noſes, (tho' as red as red Roſes) tho' the Skin is filled with Pimples, Rubies, Scurff, Morphew, Herpes, Tettars, Ringworms, and other like Breakings out.

XIX. The Lotion or Waſh. ℞ *ſtrong White Wine Vinegar a quart, Juice of* Cucumbers *a pint, Orrice-Root in fine flower or pouder, Flowers of Sulphur, or Sulphur in fine pouder; of each an ounce: Camphir in fine pouder half an ounce, beaten with four blanched Almonds; Juice of eight ſowre Limons, eight Oak-apples cut thro' the middle: put all theſe into a ſtrong double Glaſs, ſhake them together very ſtrongly, and ſet it in the Sun or an equivalent Sand heat for* 12 *or* 14 *days.* This does not only help red and fiery Faces, but alſo takes away Pimples, Rubies, Freckles, Lentils, yellow Spots, Scurff, Morphew, Herpes, Tettars, Ringworms, Tanning, Sun-burning, and all other Deformities of the Face and Skin. The Face or Skin ought firſt to be waſhed pure and clean with fair warm Water, to open the Pores thereof, and then to be dried with a Cloth; and then as ſoon as that is done, this Waſh is to be uſed and laid on, and ſo to be ſuffered to dry in of it ſelf, without wiping away. It is to be uſed Morning and Night, and always during the whole time of eating the above preſcribed Pottage.

XX. *The diſtilled Water.* It is good to cool the hot Diſtemper of the Liver and Blood, to quench thirſt, cool the Heat of Fevers, and take away the Dryneſs and Roughneſs of the Tongue. It is good againſt the Heat of the Reins, as alſo the Sharpneſs, Scalding and Stoppage of Urine. Outwardly uſed, it cools Inflammations, helps Blood-ſhot and Rednes of the Eyes, clears, cools and ſmooths the Skin, and is good againſt moſt Deformities thereof, being often applied thereto.

XXI. *The Seed made into an Emulſion with the diſtilled Water.* It wonderfully cools the Heat of the Reins, and takes away the Scalding and Sharpneſs of Urine; and that Pain which is cauſed by the Application of *Cantharides* in *Epiſpaſticks*, or Bliſtring-plaſters, which ſometimes, by their lying on too long, cauſe piſſing of Blood, and almoſt the greateſt Extremity; theſe ill Accidents this Medicine ſuddenly and eaſily cures, *&c.*

XXII. *Pickled Cucumbers.* There are various ways of pickling *Cucumbers*, which we have taught in our *Doron Medicum lib.* 2. *cap.* 19. *ſect.* 14, 15. and other ways in ſome other of our Books: but this following is beſt. Take a thouſand *Engliſh Cucumbers*, wipe them very clean with a dry Cloth, and lay them in a Stone Pot or Jar, with *Fennel* and *Dill*, and Cloves of *Garlick*, lay upon lay: upon which put boiling hot this Pickle. Take the beſt White Wine Vinegar four Gallons; ſalt Brine (made ſo ſtrong as it may bear an Egg) ſix quarts; choice Brandy or Sugar Spirits three quarts; white *Pepper* bruiſed three ounces; *Cloves* ſlit, *Mace*, of each half an ounce: having ſtood a day, ſtop them cloſe up; and they will be fit to eat in about a Weeks time. After three Weeks or a Month draw off or decant the Pickle, which boil, ſcum and put to the *Cucumbers* again, and ſo keep them for uſe. This is the uſual Method. But Experience has told me, 1. That there is no need of drawing off, and boiling the Pickle at all, for the Brandy or Sugar Spirits are a ſufficient Preſervative of it. 2. That the firſt adding of the Brandy or Spirits ought to be after the boiling of the Pickle, when you are juſt a going to put it upon the *Cucumbers.* Theſe pickled *Cucumbers* excellently ſtrengthen the Stomach, reſiſt the Scurvy, and cauſe a good Appetite.

XXIII. *Pickled Cucumbers after the* Mango *faſhion.* Take *Cucumbers* which are pretty large, but ſuch as are very hard and green; wipe them clean, ſlit them on one ſide, and take out all the Seeds and middle

middle Pulp; and put in, in the place thereof, three or four or more Cloves of *Garlick*, a slice of *Ginger*, and half a dozen or more of *Pepper* Corns, only crackt into three or four pieces; which done, tye them up with a Thread: then take the best White Wine Vinegar as much as will cover them, adding what Salt you think fit, with *Pepper*, *Ginger*, *Cloves* and *Mace*; make this Pickle just boil, and put it upon your *Cucumbers* boiling hot: repeat the boiling the next day, and pour it on hot as before. After this take a well glazed Stone Pot, into which put your *Cucumbers*, laying them smooth and well one by one, and then having put to every gallon of Pickle a pint of pure Lime Juice, not adulterated, put it upon the *Cucumbers*, which cover, and let them stand over a moderate Fire till the Liquor is scalding hot, taking care that it may not boil: when you see the *Cucumbers* green enough, take them out and put them into a Stone Jar, placing them one by one very smooth and well: this done, when the Pickle is cold, you may add to it to every gallon thereof, a quart of Brandy or Spirit of Wine, and half a pint of whole *Mustard* Seed tyed up loose in a Rag. *Note*, Some, in making of the Pickle, take pure White Wine Vinegar, to a gallon of which they add Lime Juice a quart, salt Brine strong enough to bear up an Egg three pints or better, not putting in any other Salt: with this they proceed as before is directed; and at the last add the aforesaid proportion of Spirit of Wine, which makes an absolute and singular Pickle, and so good, as will keep your *Cucumbers* all the Year round. These are more Stomatick than the former, more grateful to the Pallate, cause a good Appetite, resist the Scurvy, and have all the good Properties of the former, with many other Advantages.

CHAP. CLXXIX.

Of CUCUMBER Wild.

I. *THE Names.* It is called in *Greek*, Σίκυος ἄγριος: in *Latin*, *Cucumis & Cucumer agrestis*, and in the Shops, *Asininus*; *Cucumis Sylvestris Matthioli*, *Tragi*, *Dodonæi*; also by some, *Noli me tangere*, (because of the spirting of them, if rudely handled, when ripe:) in *English*, *Wild Cucumber*, *Spirting Cucumber*, and *Touch me not.*

II. *The Kinds.* It is a Species of *Cucumbers*, the Wild sort, but a singular Plant of the kind.

III. *The Inspissate Juice*, is the Juice of the Fruit, or rather a *Fœcula* thereof, which being dryed, is called almost in all places throughout *Europe*, *Elaterium*: *Pliny*, *lib.* 20. *cap.* 1. The *Greeks* call it also, ἐλατήριον ab ἐλαύνω, *Impellere*, *stimulare*, *instigare*, *pungere*; which is as much as to say, *to impel, stir up, or force violently, to purge vehemently*, and therefore *Elaterium est medicamentum vehementer purgans.* *Gaza* in his Translation of *Theophrastus* calls it, *Agitatorium.* 'Tis doubtless one of the strongest of all Purgers.

IV. The Description. *It has a Root white and firm, thicker and shorter than any other sort of* Gourd *or* Cucumber *has, having withal some adjoining Fibres, very bitter, as are all the other parts of the Plant. From this Root spring forth many juicy, fat, hairy, rough trailing Branches, spreading themselves over the Surface of the Earth, like to other* Cucumbers *or* Gourds, *on which grow very rugged, rough, hairy and ill-colored green Leaves, sharp-pointed, of an over-worn greyish green, something whitish underneath, little or nothing divided or parted at the edges. At the Joints between the Branches and the Leaves spring forth small pale yellow Flowers, opening into five Leaves, at the end of small green Heads for the most part, as all other kinds of* Cucumbers, Gourds, *&c. do: but such as have Flowers only, without such Heads, quickly fall away, without Fruit. For that green Head, as in all others, comes in time to be the Fruit, which is small, rough, long and round, and something of a greyish green when they are ripe. The Foot-stalks upon which the* Cucumbers *grow, are short and rough, crooked withal, and bend the Fruit downwards, which when they are throughly ripe, with a very little touch, will quickly open at the end next the Stalk, and spirt out its Juice and some of its Seed upon the Hands or Faces, or other Parts of those who touched it. The Seed when ripe is blackish and something rugged, but otherwise white, lying in a green moist Substance, which is very bitter and loathsome to the Taste. The Fruit when it is perfectly ripe, squirts forth its Water with the Seeds, either of its own accord, or being touched, tho' never so gently; and many times it strikes so hard, especially if it hits against the Face or Eyes, that it will smart for a pretty while after; but this Smarting arises purely from the Acrimonious Quality of the Juice. And from this voluntary spirting of the Seed came the Name of* Noli me tangere.

Wild Cucumber.

V. *The Places.* In *Italy*, *Spain* and other hot Countries, it is found among Rubbish, Gravel, waste and other untill'd places, where casting its Seed, it multiplies it self, and easily springs up again; but in the *Low Countries*, and thro' most parts of *England*, it grows only in *Gardens.*

VI. *The Times.* The Root many times abides in the Ground all the *Winter*, if it stands warm, and the Ground is rich; but in cold Grounds, and where it is not defended, it is apt to perish every Year: where the Root dies not, it comes up in the *Spring*; but if it springs from the Seed in *April* or *May*, it flowers in *June* and *July*; and the Fruit is

is usually ripe in *August*, at which time the *Elaterium* is also made of it.

VII. *The Qualities.* The whole Plant is hot and dry in the third Degree; Aperitive, Abstersive, bitter in Taste, and wasting away. *Galen* will have the Juice to be hot but in the second Degree, cleansing, and of thin parts: it purges watry Humors, and is certainly the best Cathartick in the whole Republick of Medicine.

VIII. *The Specification.* *Elaterium* is a peculiar Medicament for the Cure of Dropsies.

IX. *The Preparations.* You may have herefrom, 1. *A liquid Juice of the Leaves.* 2. *A liquid Juice of the Root.* 3. *An Errhine of the Juice of the Leaves or Root.* 4. *A liquid Juice of the Fruit.* 5. *A Syrup of the Juice of the Roots or Fruit.* 6. *An Infusion of the Root.* 7. *A Vinegar of the Root.* 8. *A Decoction of the Root.* 9. *A Pouder of the Root.* 10. *An Electuary of the Root.* 11. *An Oil of the Root.* 12. *A Cataplasm of the Root.* 13. *A Substitution of the Root.* 14. *A Cataplasm of the Leaves.* 15. *A Cataplasm of the Leaves with Goats-dung.* 16. Elaterium Viride, *Green* Elaterium, *or the Inspissate Juice of the Fruit.* 17. Elaterium album vel optimum, *White* Elaterium, *or the* Fœcula *of the Juice of the Fruit.* 18. *The distilled Water.*

The Virtues.

X. *The Liquid Juice of the Leaves.* Dropped into the Ears, it eases them of the Pains and Noises therein, and very much prevails against Deafness: bathed upon the Skin, it takes away Freckles, Lentils, Discolorings, yellow Spots, Scurff, Morphew, Tettars, Ringworms, Herpes, and other Deformities thereof, used Morning and Evening for some time.

XI. *The liquid Juice of the Root.* It is good against the Falling-sickness and Kings-evil, put into the Nostrils, and taken inwardly also; and the Strumatick Swellings being daily Morning and Evening bathed therewith; it provokes the Terms, but is not to be given to Women with Child, because it is apt to destroy the Fruit in the Womb. It purges viscous and watry Humors, and that strongly; and therefore it is used in Clysters. It has also all the Virtues of the Juice of the Leaves, as to external Disaffections, if it is applied in like manner. Being taken from 2 to 4 drams in any convenient Vehicle, it prevails against the Dropsie and the yellow Jaundice, and opens all Obstructions of the Liver and Spleen, powerfully evacuating Water.

XII. *The Errhine made of the Juice of Leaves or Roots.* It is made by mixing 2 parts of the Juice with 1 part of Water in which Nitre is dissolved. Some make it by mixing the Juice 2 parts, with Milk 1 part. Snuft up the Nostrils it cures an Epilepsy, as also an inveterate Megrim or Head-ach; for it wonderfully purges the Head and Brain from Excrements, and cures a stinking Breath coming from the Nostrils; and is a prevalent Medicine against Lethargies, Carus, Sleepiness and Apoplexies.

XIII. *The liquid Juice of the Fruit.* It has all the Virtues of the Juice of the Leaves and Roots, and may be used in the same manner to all those Intentions; but it is much more powerful, as being more Acrimonious, and therefore is to be used in a smaller Dose. And an Errhine, may be also made of it, as of the Juice of the Leaves or Roots, very beneficial and potent to all the same Purposes, being much stronger than is Juice of *Beets* or *Primroses.*

XIV. *The Syrup of the Juice of the Roots or Fruit.* It is good against the Scurvy, Dropsie, Jaundice and Gout, carrying off all sorts of putrid Humors, chiefly Flegm and Water, by which it gives a general Relief to the whole Body, and so prevails against Head-achs, Apoplexies, Epilepsies, Carus, Lethargy, Vertigo and Madness. It is good against Surfeits and Agues, and kills Worms in the Body. The Dose is from a spoonful to 2, 3 or 4, in the Morning fasting, mixed with a Glass of warm Posset-drink or White-wine: if it is acuated with choice *Sena*, it will be much more powerful and efficacious to all the Intentions and Purposes before enumerated.

XV. *The Infusion of the Root.* Take of the fresh or green Root well bruised a pound; put it into a pint and half of strong White Port Wine, in which let it infuse for 24 hours or more. Dose 3 ounces, for three or four days together, or until the Hydropick Swelling is plainly discerned to be very much wasted and fallen. This is *Dioscorides* his Medicine, for curing the Dropsy; which thing (says he) it doth, without any troubling of the Stomach.

XVI. *The Decoction of the Root.* It may be made in Wine or Water, or with a Mixture of both. This being drunk (says *Mesue*) helps the Dropsy, for it wonderfully evacuates watry Humors, and prevails against the Yellow Jaundice, and all Obstructions of both Liver and Spleen. This Decoction gargled in the Mouth, and held therein for some time, gives present Ease in the Tooth-ach.

XVII. *The Vinegar of the Root.* If the Root is infused or boiled in strong Vinegar, and that Vinegar is bathed upon the Skin two or three times a day, it is good to cure Tettars, Ringworms and a simple Herpe, as also to cure Scurff and Morphew, and to cleanse the Skin of all Discolorings, as Yellowness, Tawniness, Freckles, Lentils, and other Spots of that kind.

XVIII. *The Pouder of the Root.* Snufft up the Nostrils, it is a good Errhine to purge and cleanse the Head and Brain of cold moist and viscous Humors, which cause the Head-ach, Megrim, Vertigo, Lethargy, Apoplexy, Epilepsy, Palsy, *&c. Dioscorides* says, that being applied to the Skin or Face, it cleanses it from all Scurff, and takes away the Discoloring of Scarrs. Inwardly taken, to a scruple or half a dram, mixt with Cream of Tartar, it kills Worms, purges the Bowels, and carrys off slimy Humors.

XIX. *The Electuary of the Root.* It is made of the Pouder mixt with Honey. Taken inwardly, from a dram to two drams, according to Age and Strength, in the Morning fasting, it purges Flegm, Choler and watry Humors, and abates the rebellious Ferment of the King's-evil: it cleanses and heals old Sores and Ulcers, being used Plaister-wise, cleansing them throughly, and wonderfully healing them. Applied upon a Herpes, Tettar or Ringworm, or other like Breakings out, or put upon any Deformity or Scar, does attenuate the Skin, attract forth the malign Juices, and heal those Breakings out; taking away also Marks, Spots, Blackness and Blewness coming upon the Skin and Flesh by Contusions and Blows.

XX. *The Oil of the Root.* It is made of the bruised Root or of its Juice, by Insolation, or boiling in Oil Olive. Anointed often upon the Temples, it is said to cure an inveterate Megrim, an Errhine of the Juice, being snufft also up the Nostrils. Anointed well upon the Hip and Huckle-bone Morning and Evening, for half an hour together, it eases the Pain of the Sciatica, *&c.*

XXI. *The Cataplasm of the Root.* It may be made either of the Root bruised, *&c.* or of the Juice of the Root brought to a thickness, with Pouder of Elecampane-roots. Applied after anointing with the former Oil, it gives great ease in the Gout and Sci-

atica; diſcuſſes Tumors ariſing from ſimple Contuſions, abſorbs acid Humors lurking in the Skin and Scarf-skin, and takes away Deformities thereof, as Scurff, Morphew, Leproſy, Yellowneſs, and other Diſcolorings of the Skin.

XXII. *The Subſtitution of the Root.* Apothecaries, ſays *Parkinſon*, do moſt uſually take the Root of this *Wild Cucumber*, as a Subſtitute for the Root of *Coloquintida* or the *bitter Gourd*, that not being ſo frequent, or ſo eaſy to be had as this is.

XXIII. *The Cataplaſm of the Leaves.* It has all the Virtues of the Cataplaſm of the Root, but not full out ſo effectual, becauſe the Leaves have not the ſame Strength with the Root: yet, notwithſtanding, it is an excellent thing for the Purpoſes intended, exceeding many other things of like kind. It cleanſes the Skin from Diſcolorings and many other Deformities.

XXIV. *The Cataplaſm of the Leaves with Goats-Dung.* If it is laid upon any hard Tumors, Swellings or Kernels, ſuch as are thoſe of the Kings-Evil, it reſolves them; and alſo eaſes Pains of the Gout in what part of the Body ſoever; and reſiſts the Putrefaction of malign Ulcers.

XXV. *Green* Elaterium, *or the Inſpiſſate Juice of the Cucumber.* Take *Wild Cucumbers* almoſt ripe, open them on one ſide, and take or ſqueeze out their thinner Juice and Seeds, which ſtrain from the Seeds, reſerving the Juice: then beat the reſt of the *Cucumber* groſsly in a Marble Mortar; put all into a Bag, and in a Preſs force forth all the Juice: put this Juice to the former, which put into a Retort, and in a gentle Sand-heat draw forth all the Water, (which keep for a Coſmetick;) continue the ſaid gentle Heat till the Magma is perfectly dry'd; then break the Retort, take forth the Matter, and keep it in a Jar-Glaſs, tyed cloſe over with a wet Bladder, for Uſe. If you have no Retort, and care not for keeping the Water, you may evaporate it to dryneſs over the ſame gentle Sand-heat in an open flat-bottomed Glaſs, often ſtirring it, (to break the Skum) that it may evaporate the better, which then take and preſerve in a Jar-Glaſs, as before. It has the Virtues of the following, but not full out ſo ſtrong, and therefore may be given in double Doſe to it, *viz.* from 6 grains to 20 or 24, in any convenient Vehicle. 'Tis, notwithſtanding its being weaker than the following, a moſt noble Medicament.

XXVI. Elaterium album, *The white or common* Elaterium, which is indeed the ſtrongeſt and beſt. It is thus made: Take *Wild Cucumbers* almoſt ripe, open them with a Knife upwards, preſs out the Juice gently with your fore Fingers, let it run thro' a Sieve into a clean glaz'd Veſſel, let it ſettle, and decant the clear Water into another Veſſel: then dry the Settlings in the Sun, and in a Jar-Glaſs, tyed cloſe over with a Bladder, keep the *Elaterium* for Uſe. See our *Pharmacopœia Londinenſis*, *lib.* 1. *cap.* 6. *ſect.* 33. If you pleaſe, you may keep the clear Water for *Unguentum Artanita*. Some Authors ſay, that this *Elaterium* will keep two hundred Years, and yet be of wonderful Virtue, *Vix Credo*: others, as *Paracelſus*, ſay it retains its Virtues well fifty Years, at which Age it will be ſo abundant in Humidity, that put to the Flame of a Lamp or Candle, it will put it out: but *Dioſcorides* ſays it is good from two Years old until ten, and that that is the beſt which being put to the Flame of a Candle, will make it burn the more bright. *Theophraſtus* his *Elaterium* is *green*, (which is, as I ſuppoſe, the former Inſpiſſate Juice of the *Cucumber*:) *Dioſcorides* his *Elaterium* is *white*, which is the *Fæcula* of the Juice, as is taught in this Section, and this is that which *Meſue* ſays is the beſt. *The green* will continue moiſt many Years, after it is evaporated and dryed up hard, relenting or giving with the Air, ſo that it requires a long time to conſume its Humidity; whereas *the white* ſort being once dryed, will remain white, hard and dry for a great number of Years, unleſs it is left open in a moiſt Air, or ſtand in a moiſt place. This *white Elaterium* works very well, being given from 1 to 5 grains, in ſtrong Bodies; Authors ſay it may be given to 10 grains. *Parkinſon* ſays, that half a grain being put into a purging Medicine, to quicken it, has oftentimes been ſeen to trouble the Stomach, with very much diſquiet, and vomiting, and working alſo downwards with more Violence than it could be thought that double the quantity could do. *Dioſcorides* ſays the Doſe is from half an *Obolus* to a whole *Obolus*. Now, the *Obolus* is 10 grains, or 12 at the moſt, as ſome take it; which ſhews the large Doſes which the Ancients gave of this Medicine, which we dare ſcarcely follow. It purges Choler and Flegm from all parts of the Body, and drives forth watry Humors to a Miracle, being an extraordinary thing to open the Pipes of ſuch as are Purſy and ſhort Winded; and is indeed a Specifick for the Cure of the Dropſy, eſpecially of that kind called *Sarcites* or *Anaſarca*. When you give it for Purging, it may be given mixt with Milk, or rather Cream, becauſe the Unctuoſity thereof will not ſuffer it to ſtick to the Tunicles of the Stomach, but cauſe it to purge off the more ſpeedily. If you would have it to Vomit, *Dioſcorides* adviſes to diſſolve it in Water, and with a Feather dipt therein, to touch the lower part of the Tongue, as low as you can; but in my Opinion, it is much better to take the whole Doſe down into the Stomach. It is a prevalent thing againſt the Megrim, Head-ach, Carus, Lethargy, Vertigo, Apoplexy, Epilepſy, being uſed ſometimes as an Errhine, diſſolved in Water or Milk; and ſometimes taken inwardly to both Vomit and Purge. And thus taken, it is ſaid alſo to cure the Kings-evil, the Parts affected being anointed likewiſe with it outwardly. It provokes the Courſes in Women where they have been long ſtopt, and very much prevails againſt the Greenſickneſs in Virgins. It is ſo ſtrong and forcible, that it is ſaid to kill the Child in the Womb, ſo that a Woman Impregnated muſt by all means avoid it; but this is more eſpecially to be underſtood, being applied in a Peſſary or Ointment to the Womb. It cures the Gout in any Part, by its ſtrong Cathartick Faculty, carrying off the tartarous, viſcous or clammy Humors from the Joints, which breed it. The common Doſe is *à* gr. i. *ad* v. and to very ſtrong Perſons *à* gr. iii. *ad* x. well corrected with Nutmeg, Spicknard, Aniſeeds, Liquorice-pouder, *&c.* It cures Aſthma's, Jaundice, Scurvy and Hypochondriack Melancholy. Mixed with Ox Gall and applied, it helps the Quinſey and Gout, and clears the Skin of Scurff, Morphew, Tettars, Ringworms, Mange, Itch, Puſhes, Scabs, and other like Deformities.

XXVII. *The diſtilled Water from Roots or Fruit.* If *to every quart of it you add an ounce of fine Nitre, diſſolving it over a gentle Heat*; it becomes an excellent Coſmetick to beautify and clear the Skin of any Deformity, being two or three times a day or oftner laid on, and ſuffered to dry in, after it is firſt well cleanſed with fair warm Water. This Waſh is alſo an excellent thing againſt an *Eryſipelas* or *Anthony's-fire*, the Parts affected being bathed therewith, and Cloths wet therein being laid on, and ſo ſuffered to dry upon the Part. It abates Inflammations, and being given inwardly, (well ſweetned with white Sugar) it cools and abates the moſt violent Heat of Fevers. Parts affected with the Gout, being well bathed therewith Morning and Evening,

Evening, (after due and sufficient Purging) are presently eased of their Pains after a singular manner. Given inwardly from 1 ounce to 4, well sweetned with white Sugar, it purges well by Urine, carries off Water in Dropsies, prevails against the Scurvy in a hot Constitution, helps the Strangury, and expels Sand, Gravel, Slime, or any kind of Tartarous Matter.

CHAP. CLXXX.

Of CUDWEED Common, *OR,* COTTONWEED.

I. *THE Names.* It is called in *Greek*, Γναφάλιον: in *Latin*, *Gnaphalium*, *Centunculus*, *Centuncularis*, *Tomentum*, *Tomentaria*, *Tomentitia*, *Cottonaria*, *Bombax humilis*, *Albinum*, *Chamæxylon Plinii* and *Filago*: in *English*, *Cudweed* or *Cottonweed*.

II. *The Kinds.* There are four principal sorts of *Cudweed*, 1. *The Common*, of which in this Chapter. 2. *Gnaphalium Impium*, Wicked Cudweed, of which in Chap. 181. 3. *Gnaphalium Marinum, sive Cottonaria*, Sea Cudweed ~~or Cottonweed~~, of which in Chap. 182. 4. *Gnaphalium Americanum*, American Cudweed, of which in Chap. 183.

III. Of the Common kind there are, 1. *Gnaphalium vulgare majus Johannis Thalii*, *Gnaphalium Anglicum folio longiore Lobelii*, English Cudweed. 2. *Gnaphalium minus*, *Filago minor*, *Dodonæi*, *Gnaphalium vulgare minus*, *Gnaphalium medium Tabernmontani*, The Vulgar or Common lesser Cudweed.

English Cudweed

IV. The Descriptions. *The first*, *or* English Cudweed, *has a Root which is small and thready*; *from whence rise up one, two or three Stalks, set thick on all sides with long and narrow whitish or woolly Leaves, almost from the bottom of the Stalk up to the top: with every Leaf stands a small Flower, of a dun or brownish yellow color, but not so yellow as in some others; in which Heads, after the Flowers are fallen, come small Seed, enclosed in the Down, and which, when perfected, is carried away with the Wind.*

V. *The second*, *or* Lesser Cudweed, *has a fibrous Root, almost like the former; from whence shoots forth small hoary Stalks, full of Branches almost from the very Ground, with divers smaller, shorter and narrower Leaves thereon, of a more dusky hoary color, like fine Cotton or Wooll; some standing singly, and some more at a Space or Joint: the Flowers hereof stand at the tops of the Stalks and Branches only, and not all along, as in some of the other kinds, one Branch above another, but all of them rising almost to an even height, and are of an overworn yellow color: it grows commonly about nine or ten inches high, seldom to a foot, unless in choice Ground. The Flowers are yellow, and grow like Buttons at the tops of the Stalks, and the Seed is carried away with the Wind.*

VI. *The Places.* They both grow in barren, dry, sandy and gravelly Grounds in most places of *England*: the first has been found growing in *Hampstead Wood*, and in Woods near to *Deptford*, by *London*.

VII. *The Times.* They flower in *June*, *July* and *August*; and their Seed is ripe in a little time after.

VIII. *The Qualities.* They are temperate in respect of Heat or Cold, but dry in the third Degree; and therefore very Astringent, Hepatick, and withal Anodyne.

IX. *The Specification.* They are peculiar against Catarrhs, Fluxes of the Bowels, Profusions of Blood in any Part, and the Quinsey.

X. *The Preparations.* You may have theretrom, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *A Decoction in Wine.* 4. *A Pouder.* 5. *A Cataplaſm.*

The Virtues.

XI. *The liquid Juice.* Taken inwardly to an ounce or more, mixed with a Glaſs of Red Port Wine, or in ſome other proper Vehicle, it ſtops any inward Bleeding: it cleanſes old and filthy Ulcers, and cauſes them quickly to heal. Taken in Wine, or in Milk, it is (as *Pliny* ſays) a ſoveraign Remedy againſt Heat and Swellings in the Throat, and that which is vulgarly called the Quinſey: and he farther ſays, That whoſoever ſhall take it ſhall never be troubled with that Diſeaſe again. And for the ſame Reaſon Country People give it to their Swine, with this Obſervation, That whichſoever of them will not take it, will aſſuredly die.

XII. *The Eſſence.* It has the Virtues of the liquid Juice, but more powerful; and over and above in the curing of old running Sores and Ulcers, it is of admirable Excellency. It ſtops and cures all Fluxes of the Bowels, tho' of long ſtanding, and reſtores their Tone again to Admiration. It cures the Whites in Women, as alſo the overflowing of their Terms, is ſingular againſt rebellious Catarrhs, and diſcuſſes ſimple Contuſions; kills Worms in Children, and heals Ruptures.

XIII. *The Decoction in Wine.* It has the Virtues of the Juice and Eſſence, but in a lower degree, and may be given from 4 to 6 or 8 ounces, according to Age; 1. In the Morning faſting. 2. Half an hour before Dinner. 3. At Night going to Bed. Poſſibly this may be beſt for weak Stomachs.

XIV. *The Pouder.* It drys, binds and aſtringes, and therefore is profitable for Defluxions of Rheum from the Head upon the Lungs, as alſo to ſtop Fluxes of Blood whereſoever. Taken from 1 to 2 drams in Red Port Wine, it prevails againſt the Bloody-flux, and eaſes the Tortions of the Bowels coming thereby: it ſtops the overflowing of the Terms, and heals Wounds whether inward or outward, being made into an Electuary with the liquid Juice, and ſo uſed. This Pouder being either drunk or injected up the *Inteſtinum Rectum*, mixed with Red Port, cures the Diſeaſe called *Tenaſmus*, which is an often Provocation of going to Stool and doing nothing.

XV. *The Cataplaſm.* It may be made either of the green Leaves bruiſed with a ſmall quantity of Wine, or elſe of the Pouder of the Herb made into the Conſiſtence of a Cataplaſm with the liquid Juice. Being applied, it immediately ſtops the Bleeding of Wounds, and in a ſhort time afterwards cures them: it alſo cleanſes, drys and heals all old and filthy Ulcers.

CHAP. CLXXXI.

Of CUDWEED Wicked.

I. *THE Names.* It is called in *Greek*, γναφάλιον ἀνόσιον, γναφάλιον μικρότερον: in *Latin*, *Gnaphalium impium*, *Gnaphalium minus*: in *Engliſh*, *Wicked Cudweed*, *Wicked Herb*, *Cudweed the leſſer.*

II. *The Kinds.* Of theſe there are two ſorts, 1. *Gnaphalium minus*, *Herba impia*, *Gnaphalium Fuſchii*, *Matthioli*, *Lobelii*, *Lugdunenſis*, *Aliorumque*, *Filago* (*a foliorum inuſitata ſuperbia*) and *Cartafilago Anguilaræ*, The leſſer ſort of the leſſer Cudweeds, Wicked Cudweed the leſſer. 2. *Gnaphalium majus generis minoris*, *Filago major*, *Herba impia major*, *Gnaphalium impium major*, The greater ſort of the leſſer Cudweed, Wicked Cudweed the greater.

III. The Deſcriptions. *The firſt of theſe has a fibrous Root, from whence ſhoots up a low or ſhort Stalk, ſet with ſhorter Leaves than the former, but ſomewhat more white or hoary, and a little broader; at the tops whereof ſtand a larger and more open Flower than in the two others, and of a paler yellow color; from the ſides of this Stalk ſpring forth divers ſhort Branches, ſet with ſuch like, but ſmaller Leaves than thoſe which grow below, with ſuch a like yellow Flower as the other; which Branches, with their Flowers, do always riſe higher than the middle Stalk, and the Flower upon it: ſometimes alſo the Branches will have other ſmall Branches ſpring from them, bearing Leaves on them, and Flowers on the top of each; theſe alſo riſing above the Branches, with their Flowers in the ſaid manner, that the firſt Branches did unto the main Stalk: the Seed follows the Flowers in a downy Bed, and is carried away with the Wind, as the reſt are.*

IV. The *ſecond*, *or* Larger Wicked Cudweed, *has a large Root with ſeveral pretty thick Branches, and many Fibres ſpringing from the ſame; from which ſometimes ſprings up but one Stalk, and ſometimes two, three or more principal Stalks, very much, in their Magnitude, way of Growing, Shape or Form of the Leaves and Flowers, like the former, but much larger; and for the moſt part thoſe Flowers which appear firſt, are the loweſt and baſeſt, and are always overtopt by other Flowers which come on younger Branches, and grow higher, as Children ſeeking to overgrow or overtop their Parents, (as many wicked Children do;) for which Cauſe it obtained the Name of* Gnaphalium impium, *and* Herba impia, *Wicked Cudweed, or Wicked Herb, and not for any evil or malignant Quality in the ſame.*

V. *The Places.* They both grow in dry, barren, ſandy, gravelly and deſert places in many parts of *England.*

VI. *The*

VI. *The Times.* They both flower in *July*, and the Seed is ripe in *August.*

VII. *The Qualities, Specification, Preparations, Virtues and Uses*, are the same with the *Common Cudweed* in *Chap.* 180. aforegoing, to which I referr you.

CHAP. CLXXXII.

Of CUDWEED Sea.

I. *THE Names.* It is called in *Greek*, Γναφάλιον θαλασσίον: in *Latin*, *Gnaphalium Marinum*, *Elichrysum Sylvestre flore oblongo Bauhini:* in *English*, *Sea Cudweed.*

II. *The Kinds.* It is a singular Plant of the Sea kind; and is called for the most part, *Cottonaria*, or *Cottonweed:* also *Gnaphalium Maritimum tomentosum.*

III. The Description. *It has a long and woody Root, which perishes not yearly, as several of the other sorts do. From this Root rise up several small and very hoary white Stalks, seldom growing above a handful or half a foot high, set thick with many short, flat and very white, soft and hoary or woolly Leaves, so hoary as tho' they were nothing but Cotton, bearing at their tops small hoary or cottony Heads, with a yellow Thrumb breaking out in their middle; these are the Flowers, which, at the tops of the Stalks, look like small round Buttons, of Color and Fashion like to the* Common Cudweeds. *Within these Heads, in a downy Bed, the Seed is contained, which is somewhat longer than the Seed of the others.*

IV. *The Places.* It is found upon the *Western* Sea Coasts of *England*, in divers places. It is found growing also at a place called *Merezey*, six Miles from *Colchester*, near the Sea side. It has also been gathered upon the Sea Coasts of *Wales.*

V. *The Times.* It flowers from *June* to the end of *August*, and the Seed is ripe in *September.*

VI. *The Qualities, Specification, Preparations and Virtues*, are the same with the *English* and *Common Cudweed* in *Chap.* 180. to which you are referred: yet it is thought by some, who have made Tryal of both, that this *Sea Cudweed* is the stronger and more effectual Medicament to all the Purposes for which the *Common* is intended.

CHAP. CLXXXIII.

Of CUDWEED American.

I. *THE Names.* This Plant, as far as I can learn, was wholly unknown to the *Greeks*; yet modern Authors have given it this *Greek* Name, Ἀργυρόκομη, *Argyrocome*, (i. e. Silver-leav'd:) in *Latin* it is called, *Gnaphalium Americanum*; and in *English*, *American Cudweed*, also *Live-long*, and *Life-everlasting.*

II. *The Kinds.* It is a singular Plant of the kind: and is accounted one of the *Species* of *Gnaphalium Carolus Clusius*, from the Likeness of the Umbles or Tufts of Heads, tho' they are greater and whiter than those of the other kinds of *Cudweed*; all of which are of kin to the *Golden Tufts.* This Plant has been called by some of our *English*, *Live-long* and *Life-everlasting*, because of the Durability or long Duration of their Flowers in their Beauty.

III. The Description. *This* Silver Tuft *or* Indian Cottonweed, *has Roots which are long, and black on the outside, creeping very much under Ground: from whence spring up many white Heads of Leaves, covered with a hoary Woolliness, like Cotton, which rising into hard, thick, round Stalks, contain still the same Hoariness upon them, as also upon the long and narrow Leaves which grow thereon, more especially on the under side; for the upper sides are of a dark shining green color. The Stalks are divided at the top into many small Branches, each of which have many scaly, tufted Heads set together, covered over with Cotton before their opening, and then parting one from another, abiding very white on the outside when they are fully grown, but with a small yellow Thrumb in the middle of each Flower, which in time will turn into yellow Down, apt to be blown away with every Wind.*

IV. Gerard *says, that this Plant is of greater Beauty than the rest, and has straight upright Stalks, three feet high or more, covered with a moist soft and fine Wooll, and in such a plentiful manner, that a Man may with his Hands take it from the Stalk in great quantity. This Stalk is beset with many long and narrow Leaves, green on the inner side, and hoary on the other side, somewhat like in Form to* Rosemary *Leaves, but greater. The Flowers do grow at the tops of the Stalks in Bundles or Tufts, consisting of many small Flowers of a white color, and very double or compact, or as it were consisting of little Silver Scales thrust close together, which do make the same very double. When the Flower has long flourished, and is grown old, then comes there, in the midst of the Flower, a certain brown yellow-Thrumb, such as is in the midst of the* Daisy: *which Flowers being gathered when they are young, may be kept in such manner as they were gathered, to wit, in such Freshness and good Color, for the space of a whole Year after, and that in a close Chest or elsewhere: from this long keeping of their Freshness and Color, it was, that our* English *Gentlewomen called it* Live-long, *&c. to which, on this occasion, it very aptly answers.*

V. *The*

V. *The Places.* It grows plentifully in *America*, in ſeveral parts of the *Weſt Indies.* I found it growing in ſome of the *Southern* parts of *Carolina.* It grows naturally near unto the *Mediterranean Sea*, from whence it has been brought and planted in our *Engliſh* Gardens. *Bauhinus* ſays, that it grows frequently in *Braſil:* but *Cluſius*, who firſt ſet it forth by the Name of *Argyrocome* or *Gnaphalium Americanum*, had his Plants out of *England.* We have alſo had it brought to us out of *Florida*, ſo that now it grows well and plentifully with us, if Care be taken of it by a skilful Gardener.

VI. *The Times.* It flowers in *June* and *July*, and the Seed is ripe in *Auguſt.*

VII. *The Qualities, Specification, Preparations and Virtues* of this, are the ſame with the laſt and the others aforegoing, and therefore referr you to *Chap.* 180. for full Satisfaction.

CHAP. CLXXXIV.

Of CULLIONS Sweet,

OR,

LADY-TRACES.

I. *THE Names.* This Plant is called in *Greek*, Ὄρχις ἡδὺς: in *Latin*, *Orchis odoratus*, *Teſticulus odoratus*, *vel aromaticus*; and in *Engliſh*, *Sweet Cullions*, *Sweet Orchis*, *Sweet Lady-Traces.*

II. *The Kinds.* They are of the Kindred of the *Orchis* and *Ordinis quinti*, according to *Parkinſon:* of this Species he makes eight ſeveral ſorts; but there are four principal kinds of theſe *Sweet Cullions*, viz. 1. Thoſe with one ſingle Teſticle or Stone. 2. Thoſe with two Teſticles. 3. Thoſe with three and ſometimes with four Bulbs. 4. The Creeping or Baſtard kind.

III. *Of the ſingle bulbed Orchis*, there is but one Species, *viz.* 1. *Orchis puſilla odorata, ſeptima Cluſii*, The ſweet Musk Orchis.

IV. *Of the double bulbed*, there are three Species, *viz.* 2. *Orchis alba odorata minor, Orchis ſpiralis minor Lobelii*, The leſſer ſweet Cullions, or Lady-Traces. 3. *Orchis Friſia Litoralis Lobelii*, Friezland Orchis or Lady-Traces. 4. *Chamæorchis latifolia Zelandica, Orchis lillifolius Lobelii, Pſeudo Orchis Cluſii*, The dwarf Orchis of Zeland.

V. *Of the treble bulbed Orchis*, there are alſo three Species, *viz.* 5. *Triorchis alba odorata*, and *odorata major, Triorchis alba ſpiralis Lobelii*, The greater ſweet Lady-Traces. 6. *Triorchis lutea Leodienſis, Orchis minor Leodienſis Lobelii*, Lady-Traces of Liege. 7. *Triorchis lutea altera Gemmæ folio glabro, Triorchis lutea tertia Lobelii*, Lady-Traces yellow, with ſmooth Leaves.

VI. *Of the Creeping kind*, there is one only Species, *viz.* 8. *Orchis Radice repente*, Small Creeping or Baſtard Orchis.

VII. The Deſcriptions. *The firſt of theſe, or* Musk Orchis, *has a Root which conſiſts but of one ſmall round Bulb, of the bigneſs of a* Pea; *above which it has long Strings running forth, by which new Plants are encreaſed. From this Root ſpring up uſually but three ſmall and narrow green Leaves, among which grows up a Stalk of an Hand breadth in height, having a long narrow Spike of pale green Flowers, ending in three Points, and ſmelling like* Musk.

VIII. *The ſecond, or* Leſſer ſweet Cullions, *have their Roots growing by Couples or Pairs, which are ſmall, and ſomewhat long as well as round: from theſe* Roots *theſe* Leſſer Lady-Traces *have much ſmaller Leaves ſhooting forth, and lying next the Ground, than thoſe of the* Greater Lady-Traces *in* Sect. 11. *following*; *but they are of the ſame Faſhion with thoſe, and almoſt like unto a very ſmall* Plantane *Leaf*; *the Stalk is not above four, five or ſix inches high, with ſome ſmall ſhow of little pieces of Leaves thereon to the Flowers, which are of a white color, daſht over with a thin Bluſh, ſtanding in thin long Spikes, compaſſing the Stalk, which are of a very ſweet Smell.*

IX. *The third, or* Friezland Orchis, *or* Lady-Traces, *has a Root conſiſting of two ſmall round Bulbs, from whence ſpring up two or three ſmall, ſomewhat long and hairy Leaves, yet ſhorter than thoſe of the* Ribwort Plantane. *The Stalk is above a ſpan high,* viz. *about four or five inches, and bears round about it ſmall yellowiſh green Flowers, much like unto the former, and ſet in the ſame Order.*

X. *The fourth, or* Dwarf Zeland Orchis, *has a Root conſiſting of two Bulbs for the moſt part, and ſometimes of three, which are covered of whitiſh Coats or Skins, being greeniſh within, and ſweetiſh in Taſte, the lower of them being lank, as in others. It has two fair, but ſmall* Lilly *like Leaves, about two inches long, riſing up from them*; *and a Stalk about three or four inches high, the Flowers being not much unlike the former. This ſort is thought to be the* Pſeudo-orchis Cluſii.

XI. *The fifth*, *or* Greater ſweet Lady-Traces, *have triple bulb'd Roots, which by chance may ſometimes be fourfold, being round, and longer than any of the former* Orchides, *with ſeveral ſhort Fibres ſpringing out round about them, contrary to the* modus *of all the reſt. From this Root come forth ſeveral very ſad green ſhining Leaves, like unto the* Leſſer Plantane, *but ſharper pointed, which riſe up in* September, *after the Stalk, with the Flowers, are withered, which do abide green all the Winter, and periſh in* May. *The ſlender Stalk, which croketh and windeth it ſelf a little, riſes up in* Auguſt, *full ſet*

ſet for a great length, with many ſmall, white and ſweet Flowers, compaſſing it round, and hanging down round about it.

XII. *The ſixth, or* Lady-Traces of Liege, *have a triple bulb'd Root, and ſometimes Quadruple round and a little long, not much unlike in Shape to ſome kinds of* Pears, *the ſharper end tending downward into the Ground, of which two are for the moſt part large, one ſmall, out of which ſeveral ſmall* Fibres *proceed. The Leaves of this are ſomewhat more like unto thoſe of a broad-leav'd* Plantane, *but yet ſmaller and narrower, three or four at the bottom of the Stalk, which otherwiſe is bare, and has none upon it; and the Flowers are yellowiſh, like the others, at the top, one growing above another.*

XIII. *The ſeventh, or* Yellow Lady-Traces with ſmooth Leaves, *which has a Root compoſed of three ſmall Bulbs, almoſt perfectly round, the one full, the other lank; from which ſpring up longer and ſmoother Leaves than thoſe of the* Friezeland Orchis *at* Sect. 9. *aforegoing, but the Stalks and Flowers are very like them, yellow of color, and pleaſantly ſweet: the Figure of this Plant* Lobel *has given us from* Cornelius Gemma.

XIV. *The eighth, or* Small creeping Orchis, *has a Root very unlike all the reſt, being long and full of Strings, growing thick together, and interlacing themſelves one among another; yet have they at the upper part thereof, next under the Leaves, (as* Camerarius *ſays) ſome ſhew of ſmall Bulbs ſometimes to be ſeen. From theſe Roots ariſe Leaves which are thick and ſomewhat broad, like* Plantane, *of a dark green color: the Stalk is ſlender, and ſet full at the top with ſeveral white Flowers, ſpotted with Blood-red Spots.* Parkinſon *will have this to come nearer to an* Helleborine *than an* Orchis.

XV. *The Places.* Theſe all generally grow in dry Grounds, Heaths and waſte untill'd Places, in many places of *England*; but are for the moſt part nurs'd up with us in *Gardens.*

XVI. *The Times.* They all flower late in the Year, ſcarcely before *Auguſt* or *September.*

XVII. *The Qualities.* They are all (except the laſt) hot and moiſt in the ſecond Degree; ſome ſay hot in the firſt Degree, and moiſt in the ſecond. They attenuate, are Stomatick and Hyſterick, Alterative, Analeptick and Spermatogenetick.

XVIII. *The Specification.* They ſtir up Luſt, and cure Barrenneſs in either Sex.

XIX. *The Preparations.* You may prepare therefrom, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *Sanguis or Blood.*

The Virtues.

XX. *The liquid Juice.* Taken to 2 ſpoonfuls or more in Canary, or rather Alicant; 1. In the Morning faſting. 2. An hour before Dinner. 3. At Four in the Afternoon. 4. An hour and half after Supper, juſt at going to Bed; it breeds much Seed, ſtirs up Luſt, ſtrengthens the Inſtruments of Generation, and cures a ſimple Gonorrhœa, or Gleet of the thinner parts of the Seed.

XXI. *The Eſſence.* It has all the Virtues of the former, and may be taken in the ſame Doſe, and at the ſame times; but it is much more powerful to all the Intentions, and is effectual to cure even Ulcers of the Proſtatæ from a virulent Cauſe.

XXII. The Sanguis or Blood. ℞ *Pulp of the Roots made by well beating them in a Stone Mortar,* 4 *pounds: Crums of Rye and Wheat Bread, of each* 1 *pound: mix them well together, adding a little white Port Wine, to make them pretty moiſt: put all into a Bolt-head, ſtopping it well with Cork and* Spaniſh *Wax, or Sealing Wax, ſo that nothing may tranſpire, digeſt in a warm* Balneo *or Horſe-dung, till the Matter is changed into a Rubicund or Bloody Chyle; then force it ſtrongly out with a Preſs, putting the expreſſed Blood into a* Balneo Vaporis, *that by this ſecond Digeſtion it may acquire a greater Redneſs, and ſome Faces may ſettle; which continue till the Blood becomes abſolutely clear, and of a moſt perfect* Red, *which then ſeparate from the Faces by decanting it: put this into a Glaſs Alembick, and in* Balneo Vaporis *abſtract ſome of the thin, clear and limpid Water or Spirit, leaving the Bloody Extract at the bottom of a very red color.* This admirably corroborates the Womb, and the Veſſels and Inſtruments of Generation, both in Man and Woman: it is a Specifick to cauſe Conception in Women, to remove Barrenneſs and cauſe Fruitfulneſs. It alſo cures Impotency in Men, and reſtores them to their Priſtin Vigor. Doſe 1 ſpoonful Morning, Noon and Night in Generous Wine.

CHAP. CLXXXV.

Of CUMIN Garden.

I. *THE Names.* It is called in *Greek*, Κύμινον; in *Latin*, *Cuminum:* in *Arabick*, *Camun* and *Kemum*; and in *Engliſh*, *Cumin.*

II. *The Kinds.* It is twofold, *viz.* 1. Κύμινον ἥμερον, *Cuminum Hortenſe*, Garden Cumin. 2. Κύμινον πόδινον, *Cuminum agreſte*, Wild Cumin; of this we ſhall diſcourſe in the next Chapter.

III. *The Garden kind* is threefold, 1. Κύμινον δημόδες, *Cuminum vulgare*, Our ordinary Cumin. 2. Κύμινον γλυκὺ, *Cuminum dulce*, *Cuminum melitenſe dulce*, Sweet Cumin, and Small Cumin. 3. Κύμινον δριμὺ, *Cuminum acre*, *Cuminum melitence acre*, Sharp taſted Cumin, and Great Cumin.

IV. The Deſcriptions. *The firſt of theſe has a Root which is long, ſmall, white, and periſhing every Year; from whence ſpring up ſeveral ſlender Stalks, a foot and half high or more, and ſome of them not ſo high, each branching themſelves out gradually, and growing white at length, having ſtore of Leaves, which are ſmall and long, like unto thoſe of* Fennel. *The Flowers are ſomewhat reddiſh, growing in Umbles at the tops of the Stalks, which turn into ſmall, long and almoſt round whitiſh Seed, creſted or ſtraked on the rounder ſide, and ſmelling ſtrong.*

V. *The ſecond, or* Sweet ſmall Cumin, *has Roots, Stalks and Leaves like to the former, and like it in its manner of Growing; but its Seed is ſmall, and like unto* Aniſe *Seed, and ſweet as* Sweet Fennel *Seed: ſo that it ſeems to be nothing differing from the former, but in the Shape or Form, Magnitude, and very ſweet Taſte of the Seed.*

VI. *The third, or* Sharp-taſted great Cumin, *is like the* Ordinary *or* Common Cumin *in its Roots, Stalks, Leaves, Branches, Flowers and manner of Growing, ſaving that it is every ways greater; but it principally differs in its Seeds, for they are not only greater than thoſe of the firſt or* Ordinary Cumin, *but they are longer alſo, and pointed at both ends, creſted likewiſe on the rounder ſide, and of a much duller color, ſmelling more unpleaſantly, and taſting very ſharp upon the Tongue, hot, quick and biting, like* Cubebs *or* Pepper.

VII. *The Places.* They grow all of them in *England*, in our *Gardens*, the Seed being ſown; but they are Natives of other hotter Countries, as *Spain*, *Italy* and the Iſlands of the *Mediterranean Sea*, as alſo in *Syria*, *Paleſtina*, and other *Eaſtern* Countries, where they grow familiarly and plentifully. *The firſt* of theſe grows moſt common with us in our cultivated Grounds, but admirably well in the *South* parts of *Carolina*, and other parts of *Florida*, where I ſaw it in Perfection. *The ſecond* grows, beſides in all the places aforenamed, very plentifully in the Iſle of *Maltha*, where they put it into their Bread and other Meats, and Trade with it to other Parts in exchange for other Commodities. *The third* (as well as the firſt) grows in ſeveral parts of *Arabia*, *Æthiopia*, *Ægypt* and *Aſia*, where it more admirably obtains that acrid or ſharp Taſte: however, they delight to grow in putrified and hot Soils.

VIII. *The Times.* *Parkinſon* ſays they come not often to Perfection with us, unleſs in a kindly Year, and ſown in the middle of the Spring: ſo that tho' they flower and ſeed early in hot Countries, yet it is late with us before the Seed comes to Ripeneſs. *Gerard* ſays, that he had proved the Seeds (of the firſt ſort) in his Garden, where they brought ripe Seed, much fairer and greater than any which comes from beyond Sea. It is to be ſown in the middle of the Spring: *Ruellius* ſays, that a Shower of Rain preſently following its Sowing, hinders much the Growth thereof. *Gerard* ſow'd it in the midſt of *May*, and it ſprung up in ſix days after, and the Seed was ripe in the end of *July*.

IX. *The Qualities.* The Seed, which is principally uſed, is hot and dry in the third Degree, full of Sulphur and Mercury; it is Aperitvie, Anodyne, Aſtringent, Attractive, Carminative, Digeſtive, Diſcuſſive, Diuretick and Sudorifick; Cephalick, Neucuſſive, Diuretick and Sudorifick; Cephalick, Neurotick, Stomatick, Pectoral, Nephritick and Hyſterick; Emmenagogick, Lithontriptick, Alexipharmick, Analeptick and Spermatogenetick.

X. *The Specification.* It has been found, by Experience, to be a ſingular Cure for the Colick.

XI. *The Preparations.* You may have, 1. *A liquid Juice of the green Herb.* 2. *An Eſſence of the green Herb.* 3. *A Cataplaſm of the green Herb.* 4. *A Pouder of the Seed.* 5. *A Spirituous Tincture of the ſame.* 6. *An Acid Tincture thereof.* 7. *An Oily Tincture of it.* 8. *A Saline Tincture.* 9. *A Spirit of the Seed.* 10. *An Oil from the ſame.* 11. *A Spirituous Water.* 12. *A Balſam made of the Chymical Oil.* 13. *A Decoction of the Seed.* 14. *A Cataplaſm thereof.*

The Virtues.

XII. *The liquid Juice of the Leaves.* It expels Wind and Urine, provokes the Terms, and is good againſt the Bitings of Mad Dogs, Serpents, and other Venomous Creatures. Doſe 2 ſpoonfuls at a time Morning and Night, in a Glaſs of Wine or Ale.

XIII. *The Eſſence of the green Herb.* It has the former Virtues, beſides which, it prevails againſt the Colick and Fluxes of the Bowels, is good againſt Vapors in Women, is a good Pectoral, opening Obſtructions of the Breſt and Lungs. Doſe 1 or 2 ſpoonfuls Morning and Night in Wine.

XIV. *The Cataplaſm of the green Herb.* It diſcuſſes Wind in the Bowels, ſtrengthens the Joints, diſcuſſes windy Humors in thoſe or any other Parts, repercuſſes Humors in ſimple and recent Contuſions, diſcuſſes Flatulencies in the *Scrotum*, and prevails againſt the Gout.

XV. *The Pouder of the Seed.* Mixed with Honey, (a dram at a time) it is Pectoral, and very good againſt Coughs and Colds. Mixed with Vinegar and put up the Noſtrils, it is ſaid to ſtop Bleeding there. Made up into a Quilt, ſprinkled with good Wine-Vinegar, and made very hot upon a Warming-pan with Coals in it, and ſo applied to the Side, it takes away Pains and Stitches, and gives eaſe in the Pleuriſy. Taken to 1 dram in a Glaſs of Generous Wine, it eaſes Pains of the Stomach and Womb, gives Relief in the Colick, and is good againſt the Gripings of the Guts. It makes ſuch as uſe it much inwardly to look very pale.

XVI. *The Spirituous Tincture of the Seed.* It is a true Anticolick, given to 1 ſpoonful in Wine or Ale, ſtrengthens the Stomach, and reſtores the Tone thereof, and is a ſingular good thing againſt the Bloody-flux, and all other Fluxes of the Bowels.

XVII. *The Acid Tincture.* It is a moſt admirable Stomatick, expels Wind, ſtrengthens the Ventricle, cauſes a good Appetite and an excellent Digeſtion; and if a Loathing or Vomiting is preſent, it preſently removes them, reſtoring the Stomach to its priſtin State of Health. Doſe ſo much at a time as to make the Liquor pleaſantly ſharp. It gives eaſe in the Gout and cures it, if the Parts affected be bathed therewith for ſome time.

XVIII. *The Oily Tincture.* It immediately cures the Cholick to a Miracle, being given from 20 to 40 or 50 drops at a time, in a Glaſs of Wine, or ſome other proper Vehicle: it opens Obſtructions of the Womb, provokes the Terms, and removes Sand, Gravel and Tartarous Matter from the Reins, Ureters and Bladder, giving ſingular eaſe in a very ſhort time. Anointed outwardly upon the Joints affected with the Gout, it gives eaſe, and in a ſhort time after cures it. It cures Cramps and Convulſions to a Miracle, by anointing it on the Part affected.

XIX. *The Saline Tincture.* Given from 20 to 40 drops, or more, in a Glaſs of White Port Wine, it opens Obſtructions of the Reins and Ureters, cleanſes thoſe Parts of Sand, Gravel or Tartarous Matter, and cauſes the Patient to Piſs freely. Outwardly bathed upon places affected with the Gout,

it

it gives Eaſe and Relief. It attenuates, digeſts and diſcuſſes Humors.

XX. *The Oil of the Seed.* It is a Specifick againſt Pains of the Stomach and Bowels, gives preſent eaſe in the Cholick, as alſo in the Stone, provokes the Terms in Women, and has all the Virtues of the Spirituous and Oily Tinctures. Given ad gut. 12 or 20 in a Glaſs of Wine to a Woman in Travel, it facilitates the Delivery. It is good againſt Coughs, Colds, Aſthma's, ſhortneſs of Breath, difficulty of Breathing, Wheezings, Hoarſneſs and other like Diſtempers of the Breſt and Lungs. It encreaſes Seed, provokes Luſt, ſtrengthens the Inſtruments of Generation, reſtores in Conſumptions, breeds Milk in Nurſes, and reſiſts Poyſon: it is alſo prevalent againſt the Bitings of Vipers and other Serpents; alſo the Bitings of Mad Dogs, and other Venomous Beaſts, being inwardly taken, and outwardly applied to the place.

XXI. *The Spirituous Water.* It may be uſed as a Vehicle for any of the former internal Preparations, and has in ſome meaſure all their Virtues: it is a very good thing for Nurſes to take, becauſe it very much promotes the breeding of Milk.

XXII. *The Balſam.* It is made of the Chymical Oil, mixt with ſix times its quantity of pure Oil of Nutmegs by Expreſſion. It is of wonderful Uſe to anoint the Genitals of a Man, who is grown Impotent either by Age, Accident, or a long Diſuſe of the Act; the Oil of the Seed being in the mean Seaſon taken inwardly. Anointed upon Parts affected with Cramps and Convulſions, it generally cures them; and ſtrengthens any Part which is much weakened, either by the Gout or other Accidents. Anointed on the Stomach and Side, it comforts them, and eaſes the Pains of the Pleuriſy.

XXIII. *The Decoction of the Seed in Wine.* If Figs are added in the Boiling, it will be the more Pectoral, and ſo be good for ſuch as are ſhort-Winded, or are otherwiſe troubled with an old Cough, Hoarſneſs or Wheezing, difficulty of Breathing, and other Diſeaſes of thoſe Parts; and withal it expels Wind from the Stomach and Bowels: and if it is conſtantly drunk for a whole Year together, it obliterates the very Roots and Foundation of the Gout, and by keeping of the Body ſoluble, and ſweetning all the Juices, it carries off the Tartarous Matter which breeds that Diſeaſe, and that without either Purging or any other Medicine. But when it is thus generally uſed, the Decoction muſt be made ſometimes in Water and ſometimes in Wine, for the Stomach ſake, and it muſt be uſed as the Patients common Drink. I ſay all this from manifold Experience.

XXIV. The Cataplaſm of the Seed. *If it is bruiſed and fryed with Yolks of Eggs till they are hard, and then beaten up with a little Oil of Nutmegs by Expreſſion, or with ſome of the former Balſam,* and applied to the Head, (the Hair being firſt ſhaved off) it gives wonderful and ſpeedy Relief in an old Head-ach, tho' it be vehement, more eſpecially if it comes from a cold and moiſt Cauſe; and applied to the back part of the Head, it ſtops the Rheum which falls into the Eyes, and helps ſuch as are Blood-ſhotten; more eſpecially if withal it is made with Wax into the Form of an Emplaſter, and applied warm over the Eye-lids. The Cataplaſm made only with the Seed and Yolks of Eggs, and applied to a ſimple Contuſion, diſcuſſes it: but with the Oil of Nutmegs, being applied to the *Scrotum*, it is excellent to diſcuſs a windy Tumor of that Part.

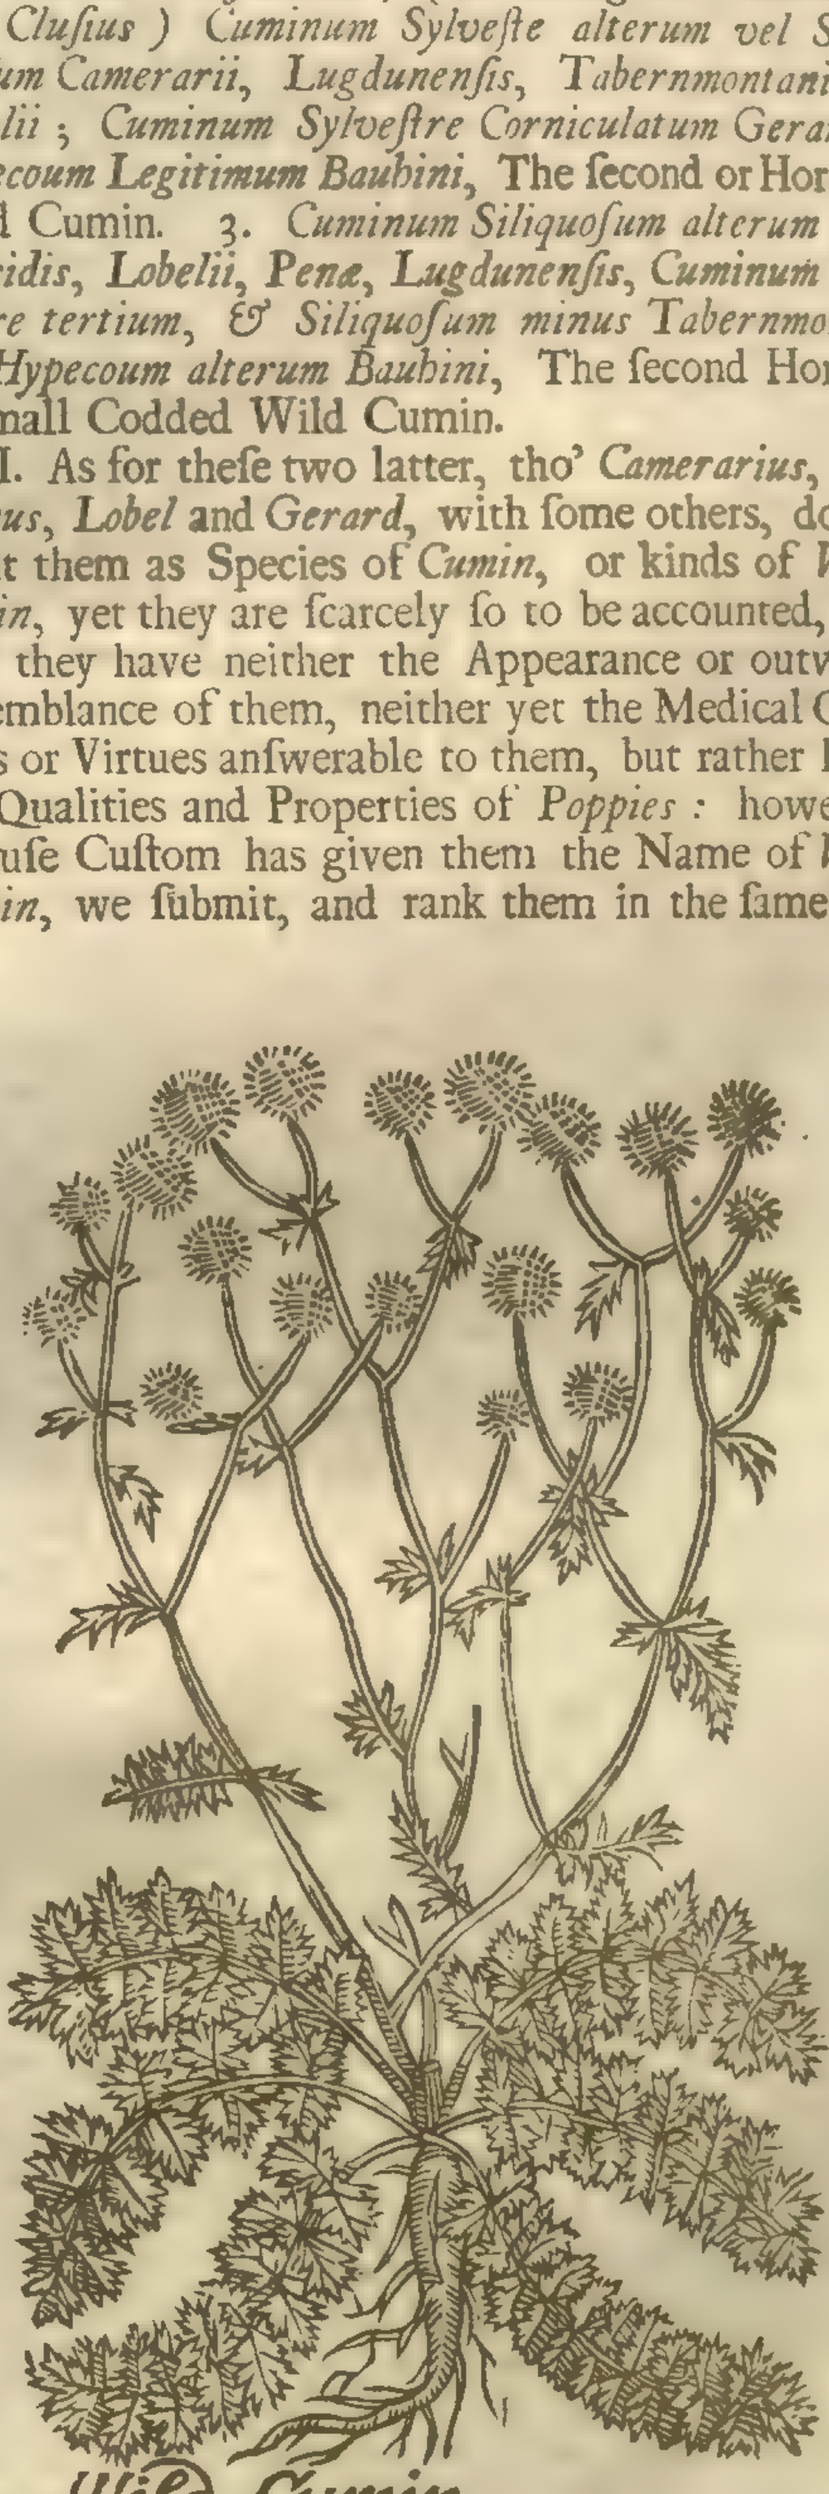
CHAP. CLXXXVI.

Of CUMIN Wild.

I. *THE Names.* It is called in *Greek*, Κύμινον πάδινον ἢ ἄγειον: in *Latin*, *Cuminum Sylveſtre*: in *Engliſh*, *Wild Cumin.*

II. *The Kinds.* Authors make three kinds hereof, *viz.* 1. Κύμινον ἄγειον, *Cuminum Sylveſtre*, *Cuminum primum Dioſcoridis*, (according to *Matthiolus*) *Cuminum globoſum Camerarii*, *Cuminum Capitulis globoſis Bauhini*, alſo *Leporum Cubile*, *Stalimene*, as it is called in the Iſle of *Lemnos*, Wild Cumin. 2. Ὑπήκοον, ἢ ὑπόφεον, *Hypecoum* and *Hypopheum*, *Hypecoum verum Dioſcoridis*, (according to *Dodonæus* and *Cluſius*) *Cuminum Sylveſte alterum vel Siliquoſum Camerarii*, *Lugdunenſis*, *Tabernmontani* & *Lobelii*; *Cuminum Sylveſtre Corniculatum Gerardi*, *Hypecoum Legitimum Bauhini*, The ſecond or Horned Wild Cumin. 3. *Cuminum Siliquoſum alterum Dioſcoridis*, *Lobelii*, *Penæ*, *Lugdunenſis*, *Cuminum Sylveſtre tertium*, & *Siliquoſum minus Tabernmontani*, *Hypecoum alterum Bauhini*, The ſecond Horned or ſmall Codded Wild Cumin.

III. As for theſe two latter, tho' *Camerarius*, *Dodonæus*, *Lobel* and *Gerard*, with ſome others, do account them as Species of *Cumin*, or kinds of *Wild Cumin*, yet they are ſcarcely ſo to be accounted, for that they have neither the Appearance or outward Reſemblance of them, neither yet the Medical Qualities or Virtues anſwerable to them, but rather have the Qualities and Properties of *Poppies*: however, becauſe Cuſtom has given them the Name of *Wild Cumin*, we ſubmit, and rank them in the ſame Order.



Wild Cumin.

IV. The Deſcriptions. *The firſt*, *or* Wild Cumin, *has a Root which is ſmall and white, with ſome Fibres adjoining to it, and quickly periſhes with the leaſt Blaſts or Dews of cold Nights, and therefore comes*

comes not often to Maturity in our Country: from this Root shoot forth several long, rough and somewhat hairy winged Leaves, consisting of many lesser Leaves, each of which are finely dented about the edges, which are in Fashion almost like the smallest Leaves of Wild Parsnep: *from among which Leaves springs up a slender, weak, bending Stalk, about a foot high, much like to* Pecten Veneris, *divided at the top into many parts, each of which has a round whitish soft and woolly or downy Head or Ball, standing upon a small Foot-stalk,* viz. *round and hairy Buttons or Knobs, like* Arction Montanum, *or* Bardana minor Montana, *as* Dioscorides *has observed, or like to the* Plane-tree *Heads or Balls: within which Heads is contained a downy Substance, amongst which is the Seed, like the Seed of* Dens Leonis, *but much lesser.*

V. *The second, or* Horned Wild Cumin, *which is the* Hypecoum Legitimum, *has a single, long and thick Root, with some Fibres appendent to it, which dies every Year, at the first approach of Winter, and is with us very hardly made to spring again, but by an* Autumn *Sowing: from this Root spring forth several long winged Leaves lying on the* Ground, *very much divided, and cut into many parts, not much unlike to the Leaves of* Seseli *or* Massilia, *of a pale or whitish green color, so like unto* Fumiterry *in the color of the Leaves, as also somewhat near to it in the many Divisions and Parts thereof, that it may easily deceive one who does but slightly look upon it, but the Leaves are smaller and thinner, and more gentle in handling, (tho' growing larger in* Spain, *as* Clusius *has observed.) In the midst of these Leaves rises up a Stalk (or two) a Cubit high or more, very smooth and whitish, with some fine jagged Leaves thereon, which is divided towards the top into several Branches; at the tops of which come forth fine small yellow Flowers, consisting of six Leaves apiece, two of which are larger than the rest, and edged with green on the outside, and stand one opposite to another, the rest being small, and scarcely to be discerned but when the Flower is blown open; the Flowers being pass'd away, there succeed long, crooked, flat Horns, Husks or Cods, crooked, large and full of Knots, Joints or Divisions, somewhat like unto the Husks or Horns of the* Scorpioides Matthioli, *but greater and longer; in the several Joints whereof lye several square yellowish Seeds, small and flat, and almost like to those of* Galega *or* Goats-Rue, *which are very difficultly to be taken out and separated from the Husks or Skins. The Taste of the whole Plant is unpleasant.*

VI. *The third, or* Small Codded Wild Cumin, *has a Root much like the former; the Leaves are also something like, not so broad and long as those, but more cut in, and finely dented and divided, somewhat like unto* Seseli *or* Hartwort *of* Marselles, *or* Wild Chervil. *The Stalks are smooth, small and tender, full of Branches and Leaves, much like unto the small Leaves of* Caraway *or* Pecten Veneris. *At the tops of the Stalks and Branches come forth pretty yellow Flowers, made of five pointed Leaves, and much like to those of* Great Celandine *or* Rocket, *saving that they are somewhat less. These being pass'd away, long Pods succeed them, which hang down, and stand not upright, nor are crooked, like the former; but the Seeds within the Cods are severally distinct, and separated one from another by equal Partitions, in small Cresses, yellow of color and somewhat long, larger than the other aforegoing, and not much unlike to* Galega *or those of* Goats-Rue.

VII. *The Places.* They are found Natives of *Galatia, Lycia,* several places of *Asia, Italy, Spain* and *France*; and grow in our *Gardens* here in *England*, only by sowing the Seed.

VIII. *The Times.* They flower not with us till the middle of Summer, *viz. July* and *August*, and give their Seed late, *viz.* in *September*; but the first seeds very late, and is seldom good. *Gerard* says, that the second did flourish and flower in his *Garden.*

IX. *The Qualities, Specification and Virtues* of the first, are the same with those of the *Garden Cumin* in the former *Chapter*, to which you are referred. But as for the two latter, tho' they seem to be of the Nature of *Poppies*, yet since no Author has said any thing of them, we shall be silent concerning the same.

CHAP. CLXXXVII.

Of CYPERUS Sweet, OR, HERB-CYPERUS.

I. *The Names.* It is called in *Arabick, Sahara de:* in *Greek,* Κύπερος: in *Latin, Cyperus, Juncus angulosus, Juncus quadratus, Juncus Triangularis, Aspalathum, Erysisceptron*; and in *English, Cyperus, Herb Cyperus, Sweet Cyperus, Galinga,* and *Galingal English.*

II. *The Kinds.* It is fourfold, *viz.* 1. Κύπερος στρογγύλος, *Cyperus rotundus,* Sweet or Herb Cyperus, or English Galingal round-rooted. 2. Κύπερος μακρὸς, *Cyperus longus,* Herb Cyperus or English Galingal long-rooted. 3. Κύπερος ἁλιμαλώδης, *Cyperus litoralis, vel litoreus rotundus,* Round Sea Marsh Cyperus, or Marsh English Galingal: all these are found growing in *England*, and shall be treated of in this Chapter; to these add 4. *Cyperus dulcis rotundus esculentus*, or *Trasi dulce Italorum*, Sweet Rush-Nut, which see hereafter in its proper place.

III. The *Greeks* have other Names for the Plants treated of in this Chapter, tho' Κύπερος is the general Name, and is that by which the first kind is called, (so called from the Roundness of the Root) which is the *Cyperus rotundus odoratus:* Κύπειρος, *Cyperis longus odoratus,* is the second, or *long-rooted sweet kind:* Κυπεῖρος, *Cypirus litoralis,* is the third, or *Marsh kind*; of all which in their Order.

IV. *Note.* This is to be taken notice of, That many *Apothecaries,* by reason of their Ignorance, do use the *long sweet Cyperus Roots* instead of the *round Cyperus Roots*; and others, tho' they know better, yet constantly make use of the long, instead of the other, contrary to the Appointment of the *Ancients*, nor do they desire to be furnished with the *Genuine* or *True*, because the one is much cheaper and easier to be had than the others are, thus substituting the *long* for the *round*; which, tho' upon necessity a Substitute may be admitted, yet no *Succedanum*, viz. a *quid pro quo*, is to be allowed of, when the true Ingredient is to be had; forasmuch as no Substitute can be so effectual to every Intention as the Genuine is: this Abuse ought indeed to be rectified for the future.

V. The Descriptions. *The first, or* Common sweet round kind, *has a Root which is composed of many long and round blackish brown small Roots, of the bigness of small* Olives, *or Roots of the* Greater Filipendula, *which are fastned together by long Strings, and are of a sweet Smell, even whilst they are green, but more when they are dry, which then*

are

are of a bitter Taſte, ſomewhat like unto Galanga: *from this Root ſhoot forth many Heads of long and narrow Leaves, ſomewhat ridg'd in the middle, every Leaf ſeeming thereby to be three ſquare, and ſomething hard and rough in handling; ſweet alſo in Scent: from among theſe Leaves riſe up many ſmooth ſquare Stalks, about a yard high, ſtuffed with a white Pith, and not hollow, without any Knot or Joint therein, unto the very tops, where there ſtand a few ſhort Leaves, and many ſmall Panicles or chaffy green Spikes, or Ears of ſmall Leaves above them, which afterwards contain the Seed within them.*

VI. *The ſecond, or* Long-rooted ſweet Cyperus, *has Roots which are of a moderate bigneſs, long and round, and of a black or blackiſh brown color on the outſide, but whitiſh within, full and firm, and creeping hither and thither, taking up much Ground, by reaſon of their ſpreading; it creeps under the Superficies of the Earth, round about, by which it is quickly much encreaſed; and is of a moſt pleaſing ſweet Smell when it is broken, tho' it be green and freſh, and yet more pleaſant when it is dry. From this Root ſpring forth long Leaves, which are as it were three ſquare, like the former, and as rough and hard in handling alſo, almoſt like unto the* Common Reed, *but that they are leſſer and ſhorter. The Stalk is ſmooth and three ſquare, ſtuffed with a white Pith, like the former, and riſing three feet high or more, and having alſo ſome ſhort narrow Leaves at the tops thereof; and ſmall long Panicles, like unto the other in all things, ſo that they are ſcarcely to be diſcerned aſunder above Ground, the only or chief Difference conſiſting in the Root.*

VII. *The third, or* Marſh kind, *has Roots which are tuberous and almoſt round, hard and black, and without Smell, many Tubers hanging ſometimes upon one String; they are not large, but grow almoſt after the manner of* Virginea Potatoes, *white and firm within. The Stalk and Leaves are much like to the firſt kind, but the Heads are unlike, for theſe are rough and blackiſh, about the bigneſs of a* Filbert, *hanging about ſix or ſeven in number, at top of the Stalk.*

VIII. *The Places.* The firſt and ſecond of theſe grow naturally in Fenny Grounds, yet they thrive very well in Gardens, as we daily ſee by Experience. The firſt grows naturally in *Italy* and *Spain*, as alſo in *Ægypt* by the River *Nilus*, as *Alpinus* ſays, but is only to be found with us in our *Gardens*, where, unleſs much Care be taken, it difficultly endures the Hardſhip of the Winter. The ſecond grows in *Syria* and *Candy*, but with us only in *Gardens*. The third and laſt grows about Ditches and the Banks of Rivers, where Salt or Sea Water comes: it is found plentifully in the Marſhes below *Graveſend*, in *Shipey*, *Tenet* and other like places.

IX. *The Times.* The firſt flowers or bears its buſhy Tops in *Auguſt*, with us here in *England:* The ſecond produces its tufted Head in *July*, or towards the end of that Month, for the moſt part: and the third Flowers always in *July* and *Auguſt*.

X. *The Qualities.* The Roots are only of Uſe, and are accounted hot and dry in the ſecond Degree: they Attenuate, are Aperitive, Abſterſive, Aſtringent, Carminative, Digeſtive and Diuretick; Cephalick, Stomatick, Nephritick and Hyſterick; Lithontriptick and Alexipharmick.

XI. *The Specification.* They are peculiar againſt the Stone, Gravel and Obſtruction of Urine.

XII. *The Preparations.* You may have therefrom, 1. *A Decoction in Wine or Water.* 2. *A Pouder.* 3. *A Cataplaſm.* 4. *Aſhes.* 5. *A Spirituous Tincture.* 6. *An Acid Tincture.* 7. *An Oily Tincture.* 8. *A Saline Tincture.*

The Virtues.

XIII. *The Decoction in Wine or Water.* If it is made in Wine, it ought to be White Port Wine: it cleanſes, ſweetens and purifies the Blood and Juices of the Body, provokes Urine, and helps to break the Stone in the Bladder, and to abate the Water in a Dropſy, to wit, in an *Anaſarca*, being drank Morning, Noon and Night, or oftner, half a pint at a time. It provokes the Terms, and is good againſt Pains of the Mother or Womb, more eſpecially, if, beſides taking it inwardly, it be injected up, and the Region of the Womb be alſo bathed therewith warm. It is good alſo to waſh all ſorts of foul and naſty Ulcers of the Gums, Mouth and Throat, as alſo eating Cankers, for that it cleanſes, drys and heals them. It opens Obſtructions, and provokes the Terms in Women: it alſo helps a ſtinking Breath, being drunk for ſome time.

XIV. *The Pouder.* It is an excellent Remedy for all running Sores, old Ulcers, Cankers, tho' ſpreading and eating, in any part of the Body; it ſtops Putridity, cleanſes, drys and heals, doing what it does without any thing of Heat or Sharpneſs. It drys up the over much Moiſture of Ulcers, and by its Aſtringent Quality, helps all ſorts of ſore Mouths, and Ulcers in the ſecret Parts. It is of an inciding or cutting Quality, and therefore given to one dram Morning and Night in a Glaſs of White Port Wine, it provokes Urine and the Terms, and helps ſuch as are troubled with the Stone; the Decoction in Wine being drunk inwardly alſo at the ſame time.

XV. *The Cataplaſm.* It is made of the Pouders of the Roots, and *Bay*-berries, mixed in equal quantities, and made up with Boys Urine. This being laid upon the Belly of one that has the Dropſy, is ſaid to help them very much, taking at the ſame time the Decoction inwardly oftentimes.

XVI. *The Aſhes.* They have the Virtues of the Pouder, but are more ſharp, by reaſon of the Salt contained

contained in them. *Alpinus* ſays, that the *Ægyptians* did much uſe both the Pouder of the Roots, and alſo the Aſhes of the ſame, to cure Ulcers both of the Mouth and ſecret Parts.

XVII. *The Spirituous Tincture.* Taken in the Morning faſting, as alſo an hour before Dinner, at Four in the Afternoon, and at Bed-time, to the quantity of 2 drams, in Canary or other Wine, or ſome other convenient Vehicle, it comforts and warms the Stomach, Brain, Nerves, Lungs, Womb and Blood: and if it is taken for ſome time together, it warms a cold Habit of Body, ſtrengthens the natural Faculties, fortifies the Heart and invigorates the Spirits.

XVIII. *The Acid Tincture.* It is a moſt admirable Stomatick, incides, opens, cleanſes, ſtrengthens, warms, comforts and reſtores the Tone of the Stomach and the other Viſcera. It provokes Urine and the Courſes, is good againſt the Stone, as alſo Vomiting, Sickneſs at Stomach, want of Appetite and Indigeſtion, and is good againſt Catarrhs proceeding from a cold and moiſt Cauſe. Doſe 30 or 40 drops, more or leſs, to a pleaſing Acidity. It gives comfort to ſuch, who, by long Sickneſs, are much ſpent, the whole Body being weak, the Stomach profligated, the Heart dejected, and the Spirits fainting.

XIX. *The Oily Tincture.* It comforts the Nerves, and being outwardly bathed upon Parts affected with Cramps, Convulſions, Numbneſs, Trembling, Palſy, extream Coldneſs of any Part, Pains or Aches, Gout or Sciatica from a cold Cauſe, it cures them, being conſtantly uſed Morning and Night for ſome conſiderable time. It is good alſo to prevent Gangrens, and cure the Contuſions or Punctures of the Nerves, immediately aſſwaging the Pain. Anointed on the Head, it cures a Head-ach from a cold Cauſe. Given inwardly Morning and Night from 15 to 30 or 40 drops, in White Port Wine or ſome other ſpecifick Vehicle, it helps Crudities, warms and comforts the Brain, Nerves, Stomach and Womb, expels Wind from the Bowels, is good againſt Barrenneſs from a cold and moiſt Cauſe, prevails againſt cold Catarrhs, fortifies the Senſes, helps againſt Coughs, Colds, ſhortneſs of Breath and difficulty of Breathing. It provokes Urine and the Terms, is good againſt Dropſies, and expels Sand, Gravel and other Tartarous Matter out from the Reins, Ureters and Bladder.

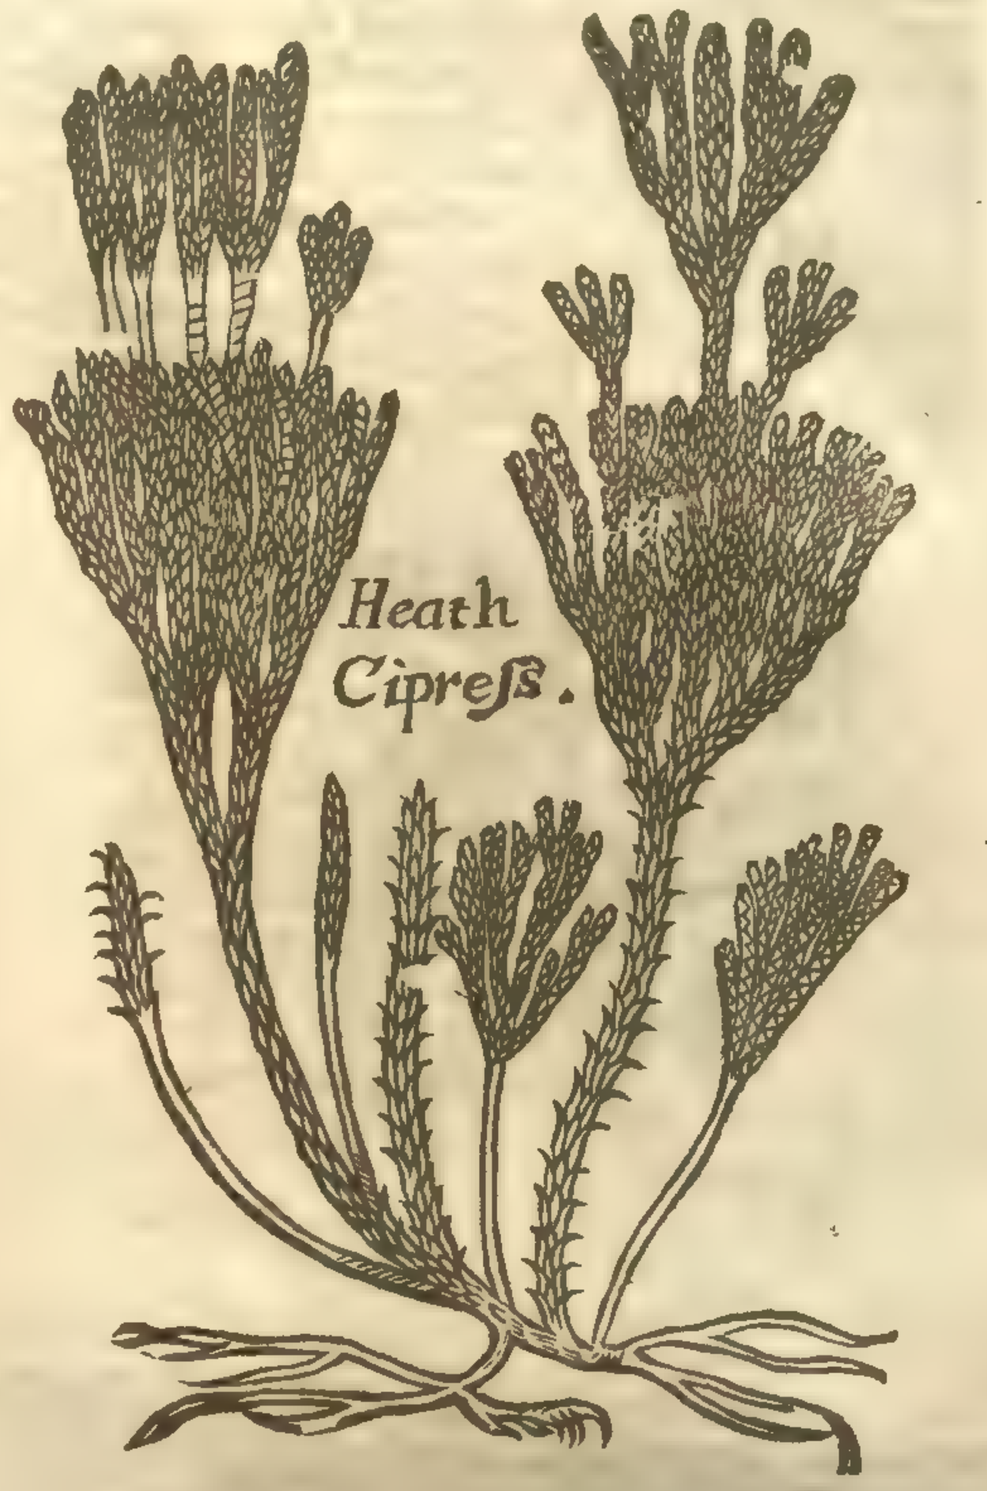
XX. *The Saline Tincture.* It gives eaſe by bathing therewith, in the Gout proceeding from a cold Cauſe. Inwardly taken, from 1 to 2 drams in ſome proper Vehicle, it is very Diuretick, provoking Urine, and expelling the Recrements of the Urinary Paſſages, as alſo Water in Dropſies.

CHAP. CLXXXVIII.

Of CYPRESS Moſs *or* Heath.

I. THE *Names.* It is called in *Greek*, Χαμαικυπάρισσος: in *Latin*, *Chamæcypariſſus*, *Cupreſſus*, *vel Cypreſſus pumila*, *(herbæ nomen) Cupreſſus vel Cypreſſus muſcoſus*: in *Engliſh*, *Moſs Cypreſs*, or *Heath Cypreſs.*

II. *The Kinds.* It is without doubt one of the kinds of *Moſs*, and *Singularis ſui generis*; for which Reaſon Authors have called it alſo, *Muſcus clavatus*, and *Cupreſſi formis*; *Muſcus clavatus foliis*, *Cupreſſi Bauhini*, *Selago Plinii*, *lib.* 25. *cap.* 11. *Savina Sylveſtris Tragi*, *Chamæcypariſſus*, *Tabernmontani & Turneri*; and in *Engliſh* it is not unfitly called, *Heath Cypreſs.*



III. The Deſcription. *It has a ſmall fibrous or ſtringy Root; from whence ſpring up ſeveral Stalks, ſome rough and others naked, being hard and branched, with very ſhort and thick Leaves growing on them, ſomething reſembling a Branch of the* Cypreſs-tree, *and of a dark green color, bitter in Taſte, but without Smell. From the tops whereof ſometimes ſpring forth ſmall and ſoft ſpiked Heads,* viz. *ſuch Ears or Catkins as are thoſe of the* Club *or* Woolf-Claw Moſs, *which are of a yellowiſh color, and growing on ſmall Foot-ſtalks. This Herb is a low Plant, and abides always green, both Winter and Summer.*

IV. *The Places.* It grows in Woody and Mountainous places, where they call it *Wild Savin.*

V. *The Times.* It flouriſhes and is in its chief Verdure in the Summer Months.

VI. *The Qualities.* It is temperate in reſpect of Heat or Cold, Drying, Binding, Incarnative and Vulnerary.

VII. *The Specification.* It is of ſingular Uſe for ſtanching of Blood, and other Fluxes of Humors.

VIII. *The Preparations.* You may prepare therefrom, 1. *A Decoction in Red Wine.* 2. *A Spirituous Tincture.* 3. *A Pouder.*

The Virtues.

IX. *The Decoction in Red Wine.* It is very Aſtringent, ſtops Bleeding, and cures any Flux of the Bowels, if it is recent. It alſo ſtops the overflowing of the Terms in Women, and is good againſt ſpitting and piſſing Blood; Wounds and Ulcers waſhed therewith, it drys and heals them.

X. *The Spirituous Tincture.* It ſtrengthens the Stomach, ſtops Vomiting and Fluxes of the Belly, and gives eaſe in griping Pains of the Bowels, and ſtops the Loches in Women in Child-bed. Doſe from 2 to 4 drams, Morning and Night, in Canary or other fit Vehicle, as the Occaſion requires.

XI. *The Pouder.* Inwardly given to one dram, it

it ſtops Fluxes and ſpitting of Blood: outwardly applied, it ſtops Bleeding in Wounds; and ſtrewed upon moiſt and running Ulcers, it cleanſes them, drys up the Humidities, ſtrengthens the Part and induces the healing.

CHAP. CLXXXIX.

Of DAFFODIL Broad-leav'd ſingle, one flowred.

I. *THE Names.* It is called in *Greek*, Ναρκίσσος: in *Latin*, *Narciſſus*; and in *Engliſh*, *Daffodil.*

II. *The Kinds.* It is divided into two principal kinds, 1. Ναρκίσσος ἀληθὴς, *Narciſſus verus*, The true or right Narciſſus or Daffodil. 2. Ναρκίσσος νόθος, *Narciſſus nothus*, Baſtard Daffodil.

III. *The true kind* is *genus* to four other ſubordinate Species, *viz.* 1. Ναρκίσσος πλατυφύλλος, *Narciſſus latifolius*, Broad-leav'd. 2. Στενόφυλλος, *Anguſtifolius*, Narrow-leav'd. 3. Σχοινώδης, *Funceus*, Ruſh Daffodil. 4. Ἑλώδης ἢ θαλάσσιος, *Marinus*, Sea Daffodil. And theſe four ſorts divide themſelves again into eight other inferior Species, *viz.* 1. *Narciſſus latifolius monanthos, ſimplici flore*, Broad-leav'd Daffodil, with one ſingle Flower, of which in this Chapter. 2. *Narciſſus latifolius polyanthos ſimplici flore*, Daffodil broad-leav'd, with many Flowers, ſingle-flowred, of which in Chap. 190. 3. *Narciſſus latifolius multiplici flore, vel flore pleno*, Broad-leav'd Daffodil, with a double Flower, of which in Chap. 191. 4. *Narciſſus anguſtifolius flore ſimplici*, Daffodil narrow-leav'd, with a ſingle Flower, of which in Chap. 192. 5. *Narciſſus anguſtifolius flore pleno*, Daffodil narrow-leav'd, with a double Flower, of which in Chap. 193. 6. *Narciſſus junceus flore ſimplici*, Ruſh Daffodil ſingle-flowred, of which in Chap. 194. 7. *Narciſſus junceus flore multiplici*, Ruſh Daffodil double-flowred, of which in Chap. 195. 8. *Narciſſus marinus, vel litoralis*, Sea Daffodil, of which in Chap. 196. following.

IV. *The Baſtard kind* is *genus* to four other ſubordinate Species, *viz.* 1. Ψευδονάρκισσος πλατυφύλλος, *Pſeudonarciſſus latifolius*, Baſtard Narciſſus broad-leav'd. 2. Ψευδονάρκισσος στενόφυλλος, *Pſeudonarciſſus anguſtifolius*, Baſtard Daffodil narrow-leav'd. 3. Σχοινώδης, *Funceus*, Baſtard Ruſh Daffodil. 4. Θαλάσσιος, *Marinus*, Baſtard Sea Daffodil. And theſe four ſorts divide themſelves again into ſix other inferior Species, *viz.* 1. *Pſeudonarciſſus latifolius ſimplici flore*, Baſtard Daffodil broad-leav'd ſingle-flowred, of which in Chap. 197. 2. *Pſeudonarciſſus latifolius flore pleno*, Baſtard Daffodil broad-leav'd double-flowred, of which in Chap. 198. 3. *Pſeudonarciſſus anguſtifolius flore ſimplici*, Baſtard Daffodil narrow-leav'd ſingle-flowred, of which in Chap. 199. 4. *Pſeudonarciſſus anguſtifolius flore multiplici*, Baſtard Daffodil narrow-leav'd double-flowred, of which in Chap. 200. 5. *Pſeudonarciſſus junceus*, Baſtard Ruſh Daffodil, of which in Chap. 201. 6. *Pſeudonarciſſus marinus*, Baſtard Sea Daffodil, of which in Chap. 202. following.

V. *Theſe are the moſt general Heads of* Daffodils; the particular *Species* of each are manifold, all which we will not promiſe to treat of in this Work; but the *moſt noted ſingulars* under each Head, we ſhall diſcourſe of, with what Brevity is poſſible, for the ſakes of ſuch as are *Floriſts*, or Lovers of a Flower-Garden. Thoſe then which we are to treat of in this Chapter, are the firſt of the aforenamed ſub-ſubordinate Species, *viz.* *Narciſſus latifolius monanthos ſimplici flore*, Daffodil broad-leav'd ſingle-flowred, having but one Flower upon a Stalk, and ſometimes by Accident but two Flowers at moſt.

VI. Authors make about twenty four ſingular kinds of this; we ſhall only deſcribe twenty of the moſt uſual, *viz.* 1. *Narciſſus latifolius omnium maximus, amplo calice flavo, ſive incomparabilis vel nompareille*, The incomparable or great none-ſuch Daffodil. 2. *Narciſſus omnium maximus flore & Calice flavo*, The incomparable great yellow Daffodil. 3. *Narciſſus griſeus maximus calice flavo*, The gray peerleſs Daffodil. 4. *Narciſſus latifolius flore flavo, amplo calice*, The leſſer yellow nompariil, with a large Cup. 5. *Narciſſus Indicus flore rubro, dictus Jacobæus*, The Weſt Indian Daffodil, with a red Flower. 6. *Narciſſus Trapezunticus flore luteo præcociſſimus*, The early Daffodil of Trebizond. 7. *Narciſſus albus præcox minor oblongo calice luteo*, The ſmall early white Daffodil, with a long Cup. 8. *Narciſſus pallidus præcox oblongo calice flavo*, The early Straw-color'd Daffodil, with a long yellow Cup. 9. *Narciſſus albus ſerotinus major oblongo calice luteo*, The great late-flowering white Daffodil, with a long yellow Cup. 10. *Narciſſus pallidus ſerotinus oblongo calice flavo*, The late Straw-color'd Daffodil, with a long yellow Cup. 11. *Narciſſus albus ſerotinus oblongo calice flavo, duobus floribus in caule*, The late white Daffodil, with a long Cup, and two Flowers on a Stalk. 12. *Narciſſus medioluteus vulgaris*, The common Engliſh white Daffodil. 13. *Narciſſus mediocroceus ſerotinus*, The late-flowering white Daffodil. 14. *Narciſſus medio purpureus præcox*, The early purple-ringed Daffodil. 15. *Narciſſus medio purpureus ſerotinus*, The late purple-ringed Daffodil. 16. *Narciſſus medio purpureus maximus*, The great white purple-ringed Daffodil. 17. *Narciſſus medio purpureus ſtellaris*, The ſtarry purple-ringed Daffodil. 18. *Narciſſus Perſicus*, The Perſian Daffodil. 19. *Narciſſus Autumnalis major*, The greater Autumn or Winter Daffodil. 20. *Narciſſus Autumnalis minor*, The leſſer Autumn or Winter Daffodil.

VII. The

VII. The Deſcriptions. *The firſt*, Incomparable, Nompareille, *or* None-ſuch Daffodil, *has a great bulbous Root, as large as other* Daffodils, *which bear large Flowers, which is covered over with a browniſh Coat or Skin; from whence comes three or four long and broad Leaves, of a greyiſh green color; among which riſes up a Stalk two feet or more high, at top whereof, out of a thin skinny Husk, which all* Daffodils *have, comes forth one large ſingle Flower, (commonly no more) conſiſting of ſix very pale, yellow, large Leaves, the bottom whereof, next unto the Stalk, is narrow and round, riſing wider to the Mouth, which is very large and open, and unevenly cut in or dented about the edges. The Calice or Cup much reſembles one of our old* Silver Beakers, *with a narrow bottom, and a wide Mouth. The Flower being paſt, there comes ſometimes (tho' not often) a round green Head, and a black round Seed therein, like to other* Daffodils, *but greater. This Plant does ſometimes bring forth a Flower with ten or twelve Leaves, and a Cup much larger, as if it was two, and as the Flower ſeems to be.*

VIII. *The ſecond, or* Incomparable great yellow Daffodil, *differs nothing in Form, Magnitude or manner of Growing, but only in the Color of the circling Leaves of the Flower, which are of the ſame yellow color with the Cup. This ſometimes degenerates, and alſo grows Luxurious, bringing forth two Flowers upon a Stalk, each diſtinct from other, and ſometimes two Flowers thruſt together, as if they were but one, but this is very rare. This Plant is a peculiar Plant, not conſtant to its kind, nor abiding yearly in the ſame Form.*

IX. *The third, or* Grey peerleſs Daffodil, *is wholly like to the two former in Root, Leaf, Stalk and Flower, ſave that the Leaves are ſomewhat greater, and the ſix outward Leaves of the Flower are of a glittering whitiſh grey color, and the Cup yellow as the former, but larger.*

X. *The fourth, or* Leſſer yellow Nompareil, *has, from a bulbous Root, Leaves riſing ſomewhat like to thoſe of the firſt kind, but not altogether ſo long or broad: the Stalk riſes not all out ſo high, and bears but one Flower, like the former, which is leſſer; and both Cup and Leaves are of one color, of a pale yellow, yet more yellow than the other: the Cup is alſo a little leſſer, and a little differing, neither fully ſo ſmall in the bottom, nor ſo large at the edges, nor ſo crumpled at the brims, ſo that theſe Differences ſhew, that it is manifeſtly of a quite differing kind from the others.*

XI. *The fifth, or* Weſt Indian Daffodil, *has a round large bulbed Root, of a browniſh color on the outſide, and white within, which ſends forth ſeveral broad Leaves, ſomewhat like to the* Common white Daffodil, *of a greyiſh green color; from the ſides of which, as from the middle of them, riſe up ſometimes two Stalks together, but moſt uſually one after another, (for it oftentimes flowers twice in a Summer) and often alſo but one Stalk alone, which is of a faint reddiſh color, about a foot high or more; at the top whereof, out of a deep red Skin or Husk, comes forth one Flower, bending downwards, conſiſting of ſix long Leaves, without any Cup in the middle, of an excellent red color, tending to a crimſon: three of theſe Leaves, which turn upwards, are ſomewhat larger than the three which hang downwards, having ſix Threads or Chives in the middle, tipt with yellow Pendents, and a three-forked Stile longer than the reſt, and turning the end thereof again. This* Aldinus, *Cardinal* Farneſius *his Phyſician, ſays, that at* Rome *it roſe up with Stalks of Flowers before any Leaves appeared.*

XII. *The ſixth, or* Early Daffodil of Trebizond, *has a bulbous Root, but not very great, blackiſh on the outſide, and yellow under that blackiſh or outwardmoſt Coat, ſo very like to the* Autumn Daffodil, *(excepting for that Yellowneſs) that they may eaſily be miſtaken one for another: it has three or four very ſhort green Leaves, very like to the Leaves of the* Autumn Daffodil, *excepting that theſe are not ſo broad or ſo long, nor ſpring up in Autumn. In the midſt of theſe Leaves riſes up a ſhort green Stalk, four, five or ſix inches high, bearing at the top, out of a whitiſh thin Skin, ſtriped with green, one Flower a little bending downwards, conſiſting of ſix Leaves, laid open almoſt in the ſame manner with the former* Weſt Indian Daffodil, *of which ſome do a little turn up their Points, of a fair pale yellow color, having ſix white Chives within, tipt with yellow Pendents, and a longer Pointel.*

XIII. *The ſeventh, or* Small early white Daffodil, *has a bulbous Root of a moderate largeneſs, yet leſſer than the Roots of the later kinds; from whence ſpring Leaves broad, very green, and not whitiſh, as others, three or four ſtanding together, about a foot long or better; among which riſes up a green Stalk, not full ſo high as the Leaves, bearing one Flower at top thereof, of an indifferent bigneſs, but not ſo great as the later kinds, which follow after, conſiſting of ſix whitiſh Leaves, but not perfect white, rather of a Cream color, and of a good ſweet Smell. In the middle is a long yellow Cup, half an inch long or better.*

XIV. *The eighth, or* Early Straw-color'd Daffodil, *from a bulbous Root has green Leaves, as the former, but much narrower; the Leaves of the Flowers are more enclining to yellow, but yet very pale, as if of a light Straw color, ſeeming to be a little more narrow, and pointed, as the former: the Cup is long and yellow, and the Smell ſweet, like the laſt.*

XV. *The ninth, or* Great late-flowring white Daffodil, *has a moderately large bulbous Root, covered rather with a pale than blackiſh Skin; from whence come greyiſh or whitiſh green-color'd Leaves, ſomewhat narrow and long; among which ſprings up a Stalk half a yard high, bearing one Flower at top, made of ſix white Leaves, having the Cup in the middle, as long as the former, and of a deep yellow. The edges of the Cup are ſometimes plain, ſometimes a little crumpled, and often circled at the brims with a* Saffron *color, and often alſo without it, the Smell of which is very pleaſant. This Flower ſometimes alters its Form into eight Leaves, which being narrow and long, ſeem like a white Star, compaſſing a yellow Trunk.*

XVI. *The tenth, or* Late Straw-color'd Daffodil, *has a bulbous Root, with Leaves and Stalk like the laſt, but the chief difference is in the color of the top of the Flower, for that this is of a more yellow color, and a little larger than it, and the brims or edges of the Cup are of a deeper yellow or* Saffron *color; the Smell of this being no leſs ſweet than the former.*

XVII. *The eleventh, or* Late white Daffodil, two Flowers on a Stalk, *altho' it is very like to the former, yet is certainly a kind of it ſelf. It is conſtant in its manner and form of Flowering, commonly bearing, without miſſing, two Flowers upon a Stalk, very like unto the former great kind, ſo that no difference ſeems to be between them, but in the Duality of the Flowers on one Stalk; the Cups of which have ſeldom any touch of a* Saffron *color on their edges, as ſome of the former have.*

XVIII. *The twelfth, or* Common Engliſh white Daffodil, *(called alſo* Primroſe Peerleſs*) has a moderate large bulbed Root, encreaſing more than a better Plant, from whence ſpring long limber broad Leaves, of a greyiſh green color; among which riſes up a Stalk, bearing at its top, out of a skinny Husk, ſometimes but one Flower, but moſt commonly two, ſeldom*

ſeldom three, (but larger for the moſt part than any which bear many Flowers upon a Stalk) of a pale whitiſh Cream color, near to that of a pale Primroſe, *with a ſmall round flat Crown, rather than a Cup, in the middle, of a pale yellow color, with ſome pale Chives ſtanding therein, and of a pretty ſweet Smell.*

XIX. *The thirteenth, or* Late-flowering white Daffodil, *has a bulbous Root, like the former, but the Leaves are ſhorter, and the Stalk riſes not ſo high by much, and bears but one Flower, of a pure white color, made of ſix ſmall Leaves, and ſomething narrow, ſtanding ſeverally one from another, and not ſo cloſe together as the former, but appearing like a Star; the Cup is ſmall and round, of a pale yellow color, but* Saffron *like about the brims, having ſix ſmall pale Chives in the middle, the Smell of which is much ſweeter than the former.*

XX. *The fourteenth, or* Early purple-ringed Daffodil, *from a bulbous Root, has many long greyiſh green Leaves, ſomewhat narrower and ſtiffer than the former* Common white Daffodil, *among which riſes up a long naked hollow Stalk, (as all other* Daffodils *have) bearing at the top one Flower, (ſeldom two) conſiſting of ſix long white Leaves, ſtanding cloſe together about the Stalk: the Cup is yellow, and ſo flat, that it might rather be called a Crown, for it ſtands very cloſe to the middle, and very open at the brims, circled with a reddiſh or purple color'd Ring, having alſo ſeveral Chives in the middle of it, whoſe Smell is very ſweet, exceeding ſeveral other kinds.*

XXI. *The fifteenth, or* Late purple-ringed Daffodil, *from a bulbous Root, greater than the laſt, has Leaves broader than it, ſome being near twice as broad. The Flower is like the former, being large, and its Leaves ſtanding cloſe, one to the ſides of another. The Ring alſo, which compaſſes the yellow Coronet, is ſometimes of a palér reddiſh purple, and ſometimes of as deep a red as the former, from which it differs not any thing elſe, but in the time of Flowering, which is not until the other is paſt and gone: the Smell is ſweet, like the former.*

XXII. *The ſixteenth, or* Great white purple-ringed Daffodil, *has a bulbous Root, greater than the former, as alſo its Leaves and Flowers, the largeneſs of which makes it only to differ from the laſt, and to be a diſtinct kind, it flowering with the later of the* Purple-ringed Daffodils.

XXIII. *The ſeventeenth, or* Starry purple-ringed Daffodil, *from a bulbed Root, has a little narrower and greener Leaves than the former kinds: the Flower has ſix white Leaves, not ſo broad, but narrower, and ſeeming longer than they, not cloſing together, but ſtanding apart one from another, making it ſeem like a white Star: it has alſo a yellow Coronet in the middle, circled about with purple, like the former, ſmelling ſweet, but nothing ſo ſweet as the* Early purple-ringed Daffodil.

XXIV. *The eighteenth, or* Perſian Daffodil, *has a bulbous Root, a little blackiſh on the outſide, ſomewhat like the Root of the* Autumn Daffodil *following. From this Root riſes up a naked Stalk about a foot high, bearing one pale yellow Flower, breaking thro' a thin Skin, which firſt encloſed it, compoſed of ſix Leaves, the three outermoſt being a little larger than the reſt, and having in its middle ſix ſmall Chives, and a larger Pointel, of an unpleaſant Smell. After the Flower is paſt, the Leaves come up, ſometimes before Winter, but moſt uſually after the deep of Winter is paſt, in the beginning of the Year, which are broad, long, and of a pale green color, like the Leaves of other* Daffodils, *but not green, as the* Autumn Daffodil *is; they alſo twine themſelves a little, as ſome of the* Pancratium *or* Baſtard Sea Daffodils *do. This differs from all other kinds of* Daffodils *in its manner of Growing, for it has never Leaves and Flowers at one time together, wherein it is like unto a* Colchicum, *but in Root and Leaf it is a* Daffodil.

XXV. *The nineteenth, or* Greater Autumn Daffodil, *has a Root great and round, covered over with a blackiſh Skin, from whence riſe up three or four fair broad and ſhort Leaves at firſt, but afterwards they grow longer, and of a very deep green color; in the middle of which riſes up a ſhort ſtiff round Foot-ſtalk, bearing one fair yellow Flower, enclosed at firſt in a thin Skin or Husk, and compoſed of ſix Leaves, as the former, with ſeveral Chives in the middle, as moſt other* Daffodils *have, which paſs away without any appearance of Seed, or Head for Seed, tho' under the Head there is a little green Knot, which poſſibly might contain and bear Seed, if the Clime was warm and friendly enough, or our ſharp Winters did not hinder it.*

XXVI. *The twenticth, or* Leſſer Autumn Daffodil, *has a Root like the former, but leſſer, and covered with a like blackiſh Skin; from whence ſpring forth deep green-color'd Leaves, as in the laſt, but ſmaller and narrower, a little hollow in the middle; and after them the Stalk and Flower, which is leſſer than the other, and a little paler, conſiſting in ſix ſuch like Leaves, narrow and ſharp-pointed.* Cluſius *ſays, that the flowering of this* Daffodil *is more like to the* Perſian Daffodil *at* ſect. 23. *above, than to the former* Great Autumn kind; *tho' with us it ſeems to imitate the latter or* Great Autumn *moſt, in ſending forth its Leaves firſt, then its Stalk and Flowers.*

XXVII. *The Places.* Whence the *firſt, ſecond, third* and *fourth* firſt came, is now unknown: the *fifth* the Title ſhews came out of the *Weſt Indies*, and was firſt brought into *Spain*, and from thence it was ſent to us, and into ſeveral other parts of *Europe:* the *ſixth* came from *Conſtantinople* or *Trapezuntia:* the *ſeventh, eighth, ninth, tenth* and *eleventh* are Natives of the *Pyrenæan* Mountains, from whence they have been brought to us: the *twelfth* is ſaid to grow naturally in *England*, and is plentiful enough in all Country Gardens: the Original of the *thirteenth* is unknown: the *fourteenth, ſixteenth* and *ſeventeenth* are *Turkiſh* Plants, and came to us from *Conſtantinople:* the *fifteenth* grows in many places of *Europe*, as in *France, Germany* and *Italy*, as *Cluſius* has ſaid: the *eighteenth* grows in *Perſia* and *Turkey*, and came to us from *Conſtantinople:* the *nineteenth* and *twentieth* are alſo *Turkiſh* Plants, and were ſent to us from that Metropolis. Now, by Tranſplanting and great Care, they are made Denizons, if not Natives, with us, and are to be found in moſt *Gardens* of our Great and Exact *Floriſts.*

XXVIII. *The Times.* The *firſt, ſecond, third* and *fourth* flower in *March*, but moſt in *April:* the *fifth* flowers in *June* and *July:* the *ſixth* flowers in *December*, if the former part of the Winter has been mild; but moſt uſually in the end of *January*, or in the beginning, middle or end of *February:* the *ſeventh, eighth, ninth, tenth* and *eleventh* flower in the latter end of *March* and thro' the Month of *April:* the *twelfth* flowers about the middle or end of *April:* the *thirteenth* flowers in *May:* the *fourteenth* flowers early in *March:* the *fifteenth, ſixteenth* and *ſeventeenth* flower about the middle or end of *April:* the *eighteenth, nineteenth* and *twentieth* flower about the end of *September* and in *October.*

XXIX. *The Qualities.* They are hot and dry in the firſt Degree; Attractive, Glutinative, Vulnerary, Emetick and Arthritick.

XXX. *The*

XXX. *The Specification.* They have been found by Experience to be good againſt Coughs, Aſthma's and Colicks.

XXXI. *The Preparations.* The Root is only in Uſe, and therefrom you may have, 1. *A liquid Juice.* 2. *A Loboch.* 3. *An Eſſence.* 4. *An Ointment or Balſam.* 5. *A Cataplaſm.* 6. *A Mixture.*

The Virtues.

XXXII. *The liquid Juice.* Taken to 2, 3 or 4 ounces, or more, according to Age and Strength, it cauſes Vomiting, and very much cleanſes the Stomach by that means, cauſing a good Appetite and Digeſtion. It may be mixed with White Wine, and taken in the Morning faſting, and ſo it is good againſt the Colick.

XXXIII. *The Loboch.* It is made of the Juice, mixt with half its weight of Honey. It is good againſt Coughs, Colds, Hoarſeneſs, Wheezings, ſhortneſs of Breath and difficulty of Breathing. Doſe 1 ſpoonful at a time, twice or thrice a day: or it may be often taken with a *Liquorice* Stick.

XXXIV. *The Eſſence.* It wonderfully cleanſes, dries and heals: it conglutinates or glews the Mouths of great Wounds together, yea, Inciſions of the Veins, Arteries, Nerves and Tendons; the Wound being waſhed therewith, and Lint dipt therein, being bound thereon.

XXXV. *The Balſam or Ointment.* It is ſingular againſt Burnings or Scaldings, whether with Fire, Water, Oil, Gun-powder, Pitch, *&c.* It cleanſes old Ulcers, dries and heals them: and being applied to green Wounds, it conſolidates or joins their Lips together, and quickly heals them. It alſo draws forth Pricks, Thorns, Splinters or other like things gotten into the Fleſh.

XXXVI. *The Cataplaſm.* If it is beaten and made up with Honey, and applied Emplaſter-wiſe, it is cleanſing and attractive, cures Burnings and Scaldings, and conglutinates Sinews which are cut aſunder: and ſo applied to Strains or Wrenches of the Wriſts or Ankles, or Joints pained with the Gout, it gives Relief. If to the Cataplaſm Meal or Flower of *Darnel* is added, it becomes very attractive, and draws forth Thorns, Splinters, *&c.* out of the Fleſh; and applied upon Sun-burnings and Morphew, it takes them away. The Root made into a Cataplaſm with Hogs-Lard and Rye-Bread, it haſtens the Suppuration of Apoſtems, even of thoſe which are not eaſily ripenned.

XXXVII. *The Mixture.* It is made of the Juice mixt with an equal quantity of White Wine Vinegar, and an eighth part of *Nettle* Seed in pouder. It is good to remove Defœdations of the Skin, as Scurff, Morphew, Tanning, Yellowneſs, Brownneſs, Pimples, Freckles, Lentils, Tettars, Ringworms, and other like Affects moleſting the ſame.

CHAP. CXC.

Of DAFFODIL broad-leav'd ſingle, many-flowred.

I. *THE Names.* It is called in *Greek,* Ναρκισσος πλατύφυλλος πολυανθὴς ἁπλοῦς: in *Latin, Narciſſus latifolius Polyanthus flore ſimplici:* in *Engliſh, Daffodil broad-leav'd many-flowred ſingle.*

II. *The Kinds.* There are about fifteen kinds of theſe many-flowred ſingle, *viz.* 1. *Narciſſus Africanus aureus major*, Daffodil the greater yellow African. 2. *Narciſſus Africanus aureus minor*, Daffodil the leſſer yellow African. 3. *Narciſſus Byzantinus totus luteus*, The yellow Turkey Daffodil. 4. *Narciſſus ſulphureus major*, The greater Limon-color'd Daffodil. 5. *Narciſſus ſulphureus minor*, The leſſer Limon-color'd Daffodil. 6. *Narciſſus totus albus polyanthos*, The many flowred Milk-white Daffodil. 7. *Narciſſus latifolius totus albus, mediocri calice reflexus*, The Milk-white Daffodil with the great Cup. 8. *Narciſſus Narbonenſis medio luteus præcox*, The early Narbone Daffodil. 9. *Narciſſus Narbonenſis vulgaris*, The common French Daffodil. 10. *Narciſſus Narbonenſis major flore amplo*, The Narbone Daffodil with great Flowers. 11. *Narciſſus Piſanus*, The Italian Daffodil. 12. *Narciſſus medio croceus polyanthos*, The French Daffodil with Saffron-color'd Cups. 13. *Narciſſus medio croceus alter*, The other Saffron-color'd Daffodil. 14. *Narciſſus Anglicus polyanthos*, The great Engliſh Daffodil. 15. *Narciſſus Narbonenſis medio luteus ſerotinus major & minor*, The late-flowering Narbone Daffodil, greater and leſſer.

III. The Deſcriptions. *The firſt, or* Great yellow African, *(a noble and ſtately Flower) has a great bulbous Root, covered with a blackiſh Skin; from whence ſpring many very long and broad Leaves, of a better green than many others, in the midſt of which comes up a Stalk, not riſing ſo high as the Leaves, bearing at the top, out of a skinny Husk, many fair, goodly and large Flowers, ten or twelve in number, if the Root is well grown, and it grows in a warm place, each Flower being larger than any of the* French, Spaniſh *or* Turkey Daffodils, *which bear many ſingle Flowers on a Stalk; (this coming near to the largeneſs of our* Engliſh Daffodil *(in* chap. 189. ſect. 18.) *before deſcribed, or the* French *deſcribed at* ſect. 12. *following, which indeed is alſo a kind of our* Engliſh *at* ſect. 16. *of this* chap. *but bearing more Flowers:) Theſe Flowers are of a fair ſhining color, having large, round and open Cups or Bowls, yellower than the*

the outward Leaves, and of ſo exceeding ſweet a Smell, that it is almoſt ready to overcome, at leaſt ſatiate the Senſes.

IV. *The ſecond, or* Leſſer yellow African, *is almoſt the ſame with the former, but wants ſomewhat of its ſtately Height, Largeneſs of its Flowers and Cup, and Beauty of Color, it being of a paler yellow, and is in all thoſe reſpects inferior to it; nor is its ſweet Smell altogether ſo ſtrong.*

V. *The third, or* Yellow Turkey Daffodil, *altho' from its bulbous Root it has very long Leaves, and a high Stalk, yet it comes ſhort of the Beauty of that which was laſt deſcribed; for in this the Flowers are not ſo many, not being above four or five, nor ſo large, being not much greater than the* Common French Daffodil *at* ſect. 11. *following, nor of ſo fair a color, but much paler; nor having a Cup ſo large, this being manifeſtly ſmaller; nor of ſo ſtrong or ſweet a Smell, this being alſo weaker.*

VI. *The fourth, or* Greater Limon-color'd, *from an indifferent large bulbous Root, has three or four very long and green Leaves, half a yard long at leaſt; among which riſes up a round, yet creſted Stalk, not ſo high as the Leaves, bearing five or ſix ſingle Flowers thereon, every one of them being greater than the* Common French Daffodil *at* ſect. 11. *following, or the* Italian *at* ſect. 13. *they are of a faint, yet pleaſant yellow color at firſt, but when they have been in flower a Fortnight, or thereabouts, change into a deeper yellow. The Cup in the middle is alſo larger than in thoſe aforegoing, and of a deeper yellow color than the other Leaves, having only three Chives within it; and is of a very pleaſant Smell.*

VII. *The fifth, or* Leſſer Limon-color'd, *from its bulbous Root has broader and ſhorter Leaves than the former, not green like them, but of the color of other* Daffodils. *The Stalk riſes up higher than the Leaves, bearing four or five Flowers upon ſhorter Foot-ſtalks, and no bigger than the* Common French Daffodil, *of a pale yellow, which ſome call a Brimſtone color: the Cup, or rather Crown in the middle, is ſmall, and broad open, of a little deeper yellow, having many Chives within it, and as it were, ſprinkled over with a kind of Mealineſs. It is not full out of ſo ſweet a Smell as the former.*

VIII. *The ſixth, or* Many-flowred Milk-white, *has its bulbous Root covered over with a blackiſh Skin; from whence ſpring Leaves of a mean ſize, both for length and breadth, greener than the ordinary ſorts, which have ſome Whiteneſs in them. The Flowers are many upon the Stalk, as ſmall for the moſt part as any of theſe kinds which bear many together, being wholly of a Milk, or rather of a Snow white color, as well the Cup, which is ſmall, as the outward Leaves, which encompaſs it: after which come ſmall Heads, in which is contained round black Seed, as all other* Daffodils *have, but ſome greater, ſome leſſer, according to the Magnitude of the Plants. The Smell of this is very ſweet.*

IX. *The ſeventh, or* Milk-white with the great Cup, *is threefold,* 1. *One which has its Leaves ſomewhat broader, and the Flowers greater than the former.* 2. *Another which has its Leaves ſmaller, and its Flowers alſo, whoſe Cups are likewiſe ſmall, and are never ſeen fully open, but as it were half cloſed at the brims.* 2. *Another ſort, whoſe Leaves are as broad as any of the leſſer ſorts, and whoſe Cup in the middle of the Flower is ſomething larger than in any of the leſſer kinds, but leſſer than in the greater kinds; the Leaves of whoſe Flowers do a little turn themſelves upwards, from whence it is called* Reflexus. *Theſe are uſually called* Narciſſus totus albus polyanthos, major, medius, minor, *according as the differences are.*

X. *The eighth, or* Early Narbone, *has from its bulbous Root, which is great, Leaves ſpringing up a Month or two before the following kind, being alſo ſhorter and narrower. The Stalk is not very high, bearing ſeveral Flowers at the top, breaking thro' a thin Skin, as is common with the* Daffodils, *every one of which is ſmall, conſiſting of ſix white Leaves, and a ſmall yellow Cup in the middle, of a pleaſant ſweet Smell, but nothing ſo ſtrong as many others. The Root of this ſeldom parts into off-ſets, as all the following do, which bear many ſingle Flowers.*

XI. *The ninth, or* Common French Daffodil, *has its bulbous Root covered with a blackiſh Skin, from which ſpring long and broad green Leaves, a little hollowiſh in the middle, and edged on both ſides: the Stalk is about half a yard high, bearing on its top ſeveral Flowers, ſomewhat larger than the former, conſiſting of ſix white Leaves, ſomething round. The Cup is yellow in the middle, ſmall and round, like unto an* Acorn Cup, *or a little fuller in the midſt. This is the Deſcription of theſe which came to us firſt out of* France; *but with us I think they either degenerate or alter in Form, making in ſome the Cup ſhorter, in others flatter, and ſome longer than the reſt; ſome of a paler and ſome of a deeper yellow color.*

XII. *The tenth, or* Narbone with great Flowers, *has a Root not ſo great or round as the former, but is more plentiful in Off-ſets than any other of the* French *or* Italian *kinds. The Leaves are almoſt like the laſt, not full out ſo broad, but full out as long, ſpring ſooner out of the Ground, yet not ſo early as the eighth at* ſect. 10. *aforegoing. The Stalk is flatter and riſes higher, bearing four or five Flowers, much larger than any of this kind, every one equalling the* Engliſh Daffodil (*in* cap. 189. ſect. 17.) *but whiter than it, and the yellow Cup larger and more open than in any of the reſt.*

XIII. *The eleventh, or* Italian Daffodil, *from its bulbous Root has Leaves as large or larger than the* Common French *at* ſect. 11. *above; but its Stalk is ſomewhat higher, bearing many white Flowers, very like to the ſaid* Common French, *but a little larger, as is alſo the yellow Cup in the middle, and rounder than is commonly ſeen in any of the* French *kinds, except the* Narbone with great Flowers *at* ſect. 12. *above.*

XIV. *The twelfth, or* French many-flowred, with Saffron-colored Cups, *has a bulbous Root, Leaves of a greyiſh green color, not ſo broad or ſo long as the* Italian, *but coming nearer to the* Common French. *The Flowers are white, and many upon a Stalk: the yellow Cup is ſomewhat large, and circled with a* Saffron *like brim or edge, which indeed makes the chiefeſt difference.*

XV. *The thirteenth, or* Other Saffron-color'd, *has alſo a bulbous Root, from whence ſpring Leaves large and long; in the midſt of which grows up a Stalk, bearing at its top ſeveral white Flowers, which are larger than any of the other* French, *except the* Narbone with great Flowers *at* ſect. 12. *above; but the Cup is ſmall and ſhort, rather ſeeming a Coronet than a Cup, of a deep* Saffron *color all about the brims or edges.*

XVI. *The fourteenth, or* Great Engliſh Daffodil, *has a bulbous Root, from whence ſpring Leaves not much broader or longer than the* Narbone with great Flowers *at* ſect. 12 *above. The Stalk with the Flowers riſes not fully ſo high as it, bearing many Flowers thereon, not altogether ſo white, yet whiter than the* Common Engliſh (*in* cap. 189. ſect. 17.) *but nothing ſo large, and with ſhort, broad, and almoſt round Leaves, ſtanding cloſe one unto another. The yellow Cup in the middle is Bowl-faſhion, ſomewhat deeper than in any of the former, but not much greater; and the Smell thereof is very ſweet and pleaſant.*

XVII. *The fifteenth, or* Narbone late-flowering, greater or leſſer. The greater *has its Root, as well as its Leaves, greater, larger, broader and longer than any of the other former* French, Narbone *or* Italian *kinds. The Stalk is as high as any of them, bearing at top five or ſix white Flowers, ſtanding open ſpread, like a Star, and not cloſe together, every one whereof is large, and round-pointed. The Cup is yellow, ſmall and ſhort, yet not lying flat to the Flower, but a little ſtanding out, with ſome* Threads *in the middle, as all the former* Daffodils *have. This is not ſo ſweet ſcented as the earlier kinds be.* The leſſer *differs not from the former, but only that it is every way leſſer, and the Cup in the middle of the Flower is yet ſhorter than it.*

XVIII. *The Places.* The *firſt* and *ſecond* grow in *Barbary*, about *Algier* and *Fez*, as ſome, who have been in thoſe Parts, relate: the *third* grows in *Turkey*, about *Conſtantinople:* the *fourth* and *fifth* have been brought to us from the *Pyrenæan Mountains*, as alſo out of *Italy:* the *ſixth* and *ſeventh* grow in *Spain*, in the *Southern* Parts of *France*, as alſo at *Conſtantinople:* the *eighth, ninth, tenth, twelfth, thirteenth* and *fifteenth* grow in *France*, as about *Mompelier:* the *eighth* and *ninth* grow alſo naturally in many places in *Spain*, which are open to the Sea; as alſo in *Turkey:* the *tenth* is a Native of *Italy*, growing about *Piſa* in *Tuſcany:* the *fourteenth* is accounted in Foreign Nations, as a Native of *England*. However, being brought to us from their native Places, they are nurs'd up here by the curious Floriſt only in *Gardens*, where they flouriſh well.

XIX. *The Times.* The *firſt, ſecond* and *third*, after they have been accuſtomed to our Climate, flower very early, even with the *firſt* ſort of *Daffodils*; but many times upon their firſt bringing over, they flower in *January* or *February*, if the Seaſon is mild and warm, becauſe they are tender Plants, and ſoon periſh by being left abroad: the *fourth* and *fifth* flower in *April:* the *ſixth* and *ſeventh* flower earlier in *Turkey* than the others; ſo alſo after accuſtomed to our Air, where they flower in the end of *March*, or in *April:* the *eighth* flowers earlier than the reſt by a Month, *viz.* in the beginning of *March*, or earlier, if the Weather is mild: the *ninth, tenth, eleventh, twelfth* and *thirteenth* flower in *April*, ſome of them a little one before another: the *fourteenth* and *fifteenth* flower not till *May*.

XX. *The Qualities, Specification, Preparations and Virtues*, are much the ſame with thoſe in *Chap.* 189. aforegoing, to which I referr you.

CHAP. CXCI.

Of DAFFODIL broad-leav'd, double-flowred.

I. *THE Names.* It is called in *Greek*, Ναρκισσος πλατυφύλλος πολλάπλος: in *Latin*, *Narciſſus latifolius multiplici flore, vel flore pleno:* in *Engliſh*, *Daffodil bread-leav'd, double-flowred.*

II. *The Kinds.* There are ſix ſeveral ſorts of this, *viz.* 1. *Narciſſus albus multiplex*, The double white Daffodil. 2. *Narciſſus medio purpureus multiplex*, The double purple-ring'd Daffodil. 3. *Narciſſus medio luteus corona duplici*, The double Crown'd Turkey Daffodil. 4. *Narciſſus Chalcedonicus flore pleno albo polyanthos*, The double white Daffodil, with many Flowers. 5. *Narciſſus Chalcedonicus fimbritus multiplex polyanthos*, The great double many-flowred purple-ring'd Daffodil of Conſtantinople. 6. *Narciſſus Cyprius flore pleno luteo polyanthos*, The many-flowred double yellow Daffodil of Cyprus.

III. The Deſcriptions. *The firſt, or* Double purple-ring'd, *from a bulbous Root has Leaves not very broad, but of a mean ſize, of the ſame Largeneſs of the* Purple-ring'd Daffodil *following. The Stalk riſes up to half a yard high, bearing at top thereof one Flower, and no more, conſiſting of many Leaves, of a fair white color: The Flower is larger than of any other* Double white Daffodil, *having every Leaf, eſpecially the outermoſt, as large almoſt as any Leaf of the* Single Daffodil with the yellow Cup, or purple Ring. *Sometimes the Flower is very little double, and almoſt ſingle, but then it is either in a bad Ground, or it has ſtood long in the place without removing; for then it has ſuch a great encreaſe of Roots, that they draw away the Nouriſhment, to the ſpoiling of the Flower: but if you tranſplant it, taking away the Off-ſets, and ſet the Root ſingle, it will thrive, and bear a goodly double Flower, and of a very ſweet Smell.*

IV. *The ſecond, or* Double purple-ring'd, *from a bulbed Root has broad Leaves ſpring up, little differing from the Leaves of the* Single purple-ring'd, *it being probably of the ſame Species. The Flower (being ſometimes but one on a Stalk, and ſometimes two) conſiſts of ſix white outer Leaves, as large as the Leaves of the* Single kind, *having many ſmall yellow pieces, edged with purple Circles round about them, inſtead of a Cup: and in the midſt of theſe pieces ſtand ſix other white Leaves, leſſer than the former, and a yellow Cup, edged alſo with a purple Circle, parted into pieces, and they comprehending a few other white Leaves, ſmaller than any of the other, having among them ſome broken pieces of the Cup, with a few Chives in the middle of the Flower, which is of a very ſweet Smell.*

V. *The third, or* Double-crown'd Turkey, *has a Root like unto the laſt, or ſomewhat larger, from whence ſpring forth three or four Leaves, as large and long almoſt as the* Great double white *next following; the Stalk is alſo near as great, and full as high, bearing at the top four or five Flowers, whoſe Leaves are as large as the* Early Narbone *or* Common French, *(in* cap. 190. ſect. 10, 11.) *but not full out of ſo pure a white color: they are ſix in number, and ſtand like the former* French Daffodils *now named, but that the yellow Cup in the middle of this is thick and double, or as it were crumpled together, not ſtanding very high to be ſeen, but keeping low and ſhort; ſo that it is not preſently taken notice of, unleſs preciſely lookt upon. This Flower is of an exceeding ſweet Smell.*

VI. *The fourth, or* Double white many-flowred, *has a Root great and thick, covered with a blackiſh Skin, which ſends forth many very broad and very long Leaves, more green than grey; among which riſes up a ſtrong round Stalk, being ſometimes almoſt flat and ribbed, bearing four or five, or more, white Flowers at the top, every one being very great, large and double, the Leaves being confuſedly ſet together, having little pieces of a yellow Cup running among them, without any ſhew of that purple Ring which is in the former; theſe fall away without bearing Seed, even as all or moſt other double Flowers do. It is a beautiful and goodly Flower, deſirable for its Beauty and Duplicity, as alſo for its exceeding ſweet and ſtrong Smell; one Stalk of Flowers being inſtead of a Noſegay.*

VII. *The fifth, or* Great double purple-ring'd, *differs little or nothing in Root or Leaf from the former; the only difference is in the Flowers, which, tho'*

tho' they are double, and bear many upon a Stalk, like unto the former, yet this has the pieces of the yellow Cups tipt with purple, as if they were ſhred or ſcattered among the white Leaves, whereas the other has only the yellow, without any appearance of purple Tips upon them: the Smell of this is as ſtrong and ſweet as any of the other.

VIII. *The ſixth, or* Many-flowred double yellow of Cyprus, *has a bulbed Root, like to the former, and its Leaves are almoſt as long and as broad as the other. The Stalk is a foot high and more, bearing on its top four or five Flowers, every one very double, of a fine pale yellow color, and of a ſtrong ſweet Smell.*

IX. *The Places.* The *firſt* was brought into *England* out of *Cambray*, where it grows Wild. All the reſt came from *Conſtantinople* at ſeveral times: the *laſt* alſo grows in *Cyprus*, and ſome alſo ſay in *Barbary*, about *Argiers* and *Fez*; and ſome of them grow in *Candia*, as alſo about *Aleppo*, and ſome other Places in the *Turks* Dominions. Now they are made Denizons of our Kingdom, and grow frequently in our *Gardens*.

X. *The Times.* The *firſt* flowers about the middle or end of *April*: all the other *Turkey* kinds flower very early, in the middle or end of *March*, or beginning of *April* at fartheſt.

XI. *The Qualities, Specification, Preparations and Virtues*, are the ſame with thoſe in *Chap.* 189. aforegoing, to which you are referred.

CHAP. CXCII.

Of DAFFODIL narrow-leav'd, ſingle-flowred.

I. *THE Names.* It is called in *Greek*, Ναρκισσος στενόφυλλος ἁπλοῦς: in *Latin*, *Narciſſus anguſtifolius ſimplex*: in *Engliſh*, *Single-flowred, narrow-leav'd Daffodil.*

II. *The Kinds.* The moſt obſerv'd are about nine in number, *viz.* 1. *Narciſſus anguſtifolius albidus præcox oblongo calice*, The early white narrow-leav'd Daffodil, with a long Cup. 2. *Narciſſus medio croceus tenuifolius*, The Saffron-crown'd narrow-leav'd ſmall Daffodil. 3. *Narciſſus minimus medio purpureus*, The leaſt purple-ring'd Daffodil. 4. *Narciſſus minimus flore juncifolii*, The leaſt Daffodil of all. 5. *Narciſſus Autumnalis minor albus*, The little white Autumn Daffodil. 6. *Narciſſus Autumnalis albus medio obſoletus*, The white Autumn Daffodil with a decayed Crown. 7. *Narciſſus anguſtifolius luteus ſemper florens*, The yellow Italian Daffodil, always flowering. 8. *Narciſſus anguſtifolius, vel juncifolius maximus amplo Calice*, The Great Junquilia with a large Flower or Cup. 9. *Narciſſus Virgineus, vel Virginianus, ſeu Lilionarciſſus Virginianus*, The Virginia Daffodil.

III. The Deſcriptions. *The firſt of theſe, or* Early white narrow-leav'd Daffodil, *from a bulbous Root has three or four narrow, long and very green Leaves, a foot long generally. The Stalk riſes not ſo high as the Leaves, on which grows one Flower, (not full out ſo large as the* Late-flowering Daffodil with a long Cup, *among the* Broad-leav'd kinds) *which conſiſts of ſix pale-color'd Leaves, not of a pure white, but with a mixture of a light yellow among the white. The Cup in the middle is round and long, (yet not ſo long as to be accounted a* Baſtard Daffodil) *within which is a middle Pointel, compaſſed with ſix Chives, having yellow mealy Pendents.*

IV. *The ſecond, or* Saffron-crown'd narrow-leav'd ſmall Daffodil, *has a Root ſmall, round and a little long withal, covered with a blackiſh Skin, which ſends forth four or five narrow Leaves, about a ſpan long; among which riſes up a Stalk eight, nine or ten inches high, bearing at top one ſmall white Flower, conſiſting of ſix Leaves, with a ſmall yellow Cup in the middle, ſhaddowed over at the brims with a* Saffron *color.*

V. *The third, or* Leaſt purple-ring'd, *has a bulbous Root, ſmall narrow Leaves, ſhorter by much than any of the* Purple-ring'd Daffodils *before deſcribed. The Stalk and Flower keep an equal proportion to the reſt of the Plant, being in Form and Color of the Flower like unto the* Star Daffodil *before deſcribed, but unlike in Magnitude. The purple color which encircles the brims of the Cup, is ſo ſmall, that ſometimes it is not eaſily perceived.*

VI. *The fourth, or* Leaſt of all, *has a Root ſmall, even the ſmalleſt of any* Daffodil, *and covered with a black Skin; from whence ſpring two or three whitiſh green Leaves, narrower than the two laſt aforegoing, and ſhorter by half, being not above two or three inches long: nor is the Stalk above three or four inches high, bearing one ſingle Flower at top, ſomething larger than the proportion of the Plant ſhould ſeem to admit, and not much unlike to the* Leaſt Ruſh Daffodil, *and of the ſame bigneſs, or rather ſomewhat bigger, being of a faint yellow color, both Leaves and Cup or Crown; for the middle part is ſpread very much, even to the middle of the Leaves almoſt, and lyes flat open upon the Flower.*

VII. *The fifth, or* Little white Autumn, *has a bulbous ſmall Root, and blackiſh on the outſide, which riſes with its Flowers firſt out of the Ground, without any Leaves at all. It firſt ſprings up with one or two Stalks three or four inches long, every one bearing, out of a ſmall Husk, one ſmall white Flower, laid open abroad, like unto the* Star white Daffodil *before deſcribed. In the midſt of the Flower is a ſmall yellow Cup, of a middle ſize. After the Flower is paſt, there comes in the ſame place a ſmall Head, containing ſmall, round, black Seed, like unto the* Autumn Hyacinth. *After the Seed is ripe and gone, then ſpring up the Leaves, which are ſmall and narrow, not much bigger than thoſe of the* Autumn Hyacinth *afore-named.*

VIII. *The ſixth, or* White Autumn with a decayed Crown, *from its bulbous Root has two or three Leaves at moſt, and very narrow, (ſo that ſome account it among the* Ruſh Daffodils) *ſomewhat broad at bottom, and more pointed at top; between which Leaves comes up the Stalk, bearing uſually two Flowers, and no more, made of ſix white Leaves apiece, pointed, and not round. The Cup is ſmall and round, like unto the Cup or Crown of the* Leaſt Ruſh Daffodil, *of a yellow color at bottom, but of a dun color towards the edge.*

IX. *The ſeventh, or* Yellow Italian always flowering, *has a bulbous Root, from whence ſpring a number of ſmall, long, narrow, and very green Leaves, broader than the Leaves of any* Ruſh Daffodil; *among which riſe up divers Stalks, bearing at their Heads two or three Flowers apiece, each of them being ſmall and yellow, with a ſmall Crown, of a deeper yellow than the former. It is ſaid never to ceaſe bearing Flowers, but that after one or more Stalks have been in flower together, and are paſt, others ſucceed in their places.*

X. *The eighth, or* Great Junquilia with a large Flower, *has a Root which is greater and longer than the* Ruſh Daffodils, *covered with a blackiſh Skin; from whence ſpring up ſeveral long green Leaves,*

like unto the Rush Daffodils, *but thicker and broader, ſo that it may very well be accounted among the* Narrow-leav'd Daffodils. *Every Stalk bears at its top two or three very fair large Flowers, with a large and more open Cup than in any of the ſaid* Rush Daffodils; *both of them of a fair yellow color, but the Cup a little deeper than the Flower, and a little crumpled about the edges, having a pretty ſtrong or ſharp pleaſant Smell. This Plant, by its Name, ſhould ſeem to be of the* Rush kind, *which Name it obtained by reaſon of the Likeneſs of its Leaf to them: but in Conſideration its Leaf is broader and larger than any of the* Rush Daffodils, *Authors have placed it among the* Narrow-leav'd, *tho' it might have indifferently been placed in the Rank of either Species.*

XI. *The ninth, or* Single white Virginian, *has a Root ſmall, long and round, blackiſh on the outſide, and white within; from whence riſe up two or three long, and very narrow, green, ſhining Leaves, growing ſometimes reddiſh about the edges: between theſe Leaves riſes up the Stalk, about five or ſix inches high, or more, bearing on the Head thereof one Flower, and no more, ſtanding upright, like a little* Lilly *or* Tulip, *made of ſix Leaves, wholly white, both within and without, except that at the bottom next to the Stalk; and a little on the backſide of the three outer Leaves, it has a ſmall daſh of a reddiſh purple color. It has alſo in the middle a few Chives, ſtanding about a ſmall pointed Head, which Head grows to be ſmall and long, containing ſmall, blackiſh, flat Seed.*

XII. *The Places.* The *firſt* and *ſecond* of theſe grows with the *Broad-leav'd ones* on the *Pyrenæan Mountains*, from whence they were brought into our *Gardens:* the native places of the *third* and *fourth* are unknown: the *fifth Cluſius* ſaw growing in *Spain:* the *ſixth* is alſo a Native of the ſame Country: the Original of the *ſeventh* is unknown: the *eighth* we only know to grow in our *Gardens:* the *ninth* was brought to us from *Virginia*, where they grow in great abundance. All theſe, by Tranſplantation and Care, are now found to grow in *Engliſh Gardens.*

XIII. *The Times.* The *firſt* flowers early, a Month before the other *Narrow-leav'd kinds*, viz. in the very beginning of *March*, if the Weather is mild: the *ſecond*, *third* and *fourth* flower in *April:* the *fifth* flowers in the beginning of *Autumn*, and the Seed is ripe in the end of *October*, in hot Countries; but in ours, it ſeldom comes to more than Flowering: the *ſixth* flowers in *Autumn:* the *ſeventh* flowers all the *Summer* long, whence came the Addition to its Name of *Semper florens:* the *eighth* flowers in *April*; and the *ninth* in the end of *April*, and beginning or fore part of the Month of *May.*

XIV. *The Qualities, Specification, Preparations and Virtues*, are accounted the ſame with the *Daffodils* in *Chap.* 189. aforegoing, ſo that no more need be ſaid thereof.

CHAP. CXCIII.

Of DAFFODIL narrow-leav'd, double-flowred.

I. *THE Names.* It is called in *Greek*, Ναρκίσσος στενόφυλλος πολλάπλους: in *Latin*, *Narciſſus anguſtifolius flore pleno:* in *Engliſh*, *Daffodil narrow-leav'd double-flowred.*

II. *The Kinds.* It is twofold, *viz.* 1. *Narciſſus anguſtifolius flore albo pleno*, Narrow-leav'd white double-flower'd Daffodil. 2. *Narciſſus anguſtifolius flore aureo pleno*, The narrow-leav'd double Golden-flower'd Daffodil.

III. The Deſcriptions. *The firſt*, *or* Double-flowred narrow-leav'd Daffodil, *has a Root very like unto the former* Single Virginian Daffodil (*in* cap. 192. ſect. 11.) *but it is a little larger and rounder, a little long withal, and blackiſh on the outſide, as that is; from whence riſe up two Leaves, ſomewhat broader than that, but of a like Greenneſs. The Stalk riſes up between theſe Leaves about a ſpan high, or not much higher, bearing one fair double Snow-white Flower, very like in the Form or Shape to the* Leſſer French double Baſtard Daffodil *hereafter to be deſcribed; for it is in like manner laid open flat, and compoſed of ſix Rows of Leaves, every Row lying in order juſt oppoſite, or one before another, whereof thoſe ſix Leaves, which make the firſt or outwardmoſt Courſe, are the greateſt, and all the reſt lying one upon or before another, every Row being ſmaller than the others: in the middle thereof comes forth a ſmall, long, pointed Fork or Horn, white in ſome ſort, like to the Flower it ſelf.*

IV. *The ſecond*, *or* Double Golden narrow-leav'd, *has a Root almoſt like the* Common Junquilia, *or* Rush Daffodil, *from which ſpring up very narrow Leaves, four or five inches long, of a whitiſh green color; from among which riſes up a Stalk, about a foot high, bearing at the top a Flower, conſiſting of ſome outward Leaves, which are of a yellow color, and of many other Leaves in the middle, being ſmaller, and ſet thick and round together, of a more yellow Gold color, but with ſome whiter Leaves among them, the middle part a little pointing forth: the Flower ſtands long before it does perfect its color, and abides long in Flower before its color decays.*

V. *The Places.* It has been found growing in ſeveral places of *Virginia*, from whence it has been brought to us: it has alſo been found growing in the Lawns of *Carolina.*

VI. *The Times.* It flowers in *Virginia* towards the latter end of *March*, or beginning of *April:* but with us here in *England* in the end of *April.*

VII. *The Qualities, Specification, Preparations and Virtues*, are ſaid to be the ſame with the *Daffodils* in *Chap.* 189. to which I referr you.

VIII. *An Obſervation.* I have been told by ſome of the *Indians*, that if the Juice of the Root be given for ſome conſiderable time, inwardly in the Spring of the Year; and that the Root it ſelf, by being beaten and made into a Cataplaſm, be alſo at the ſame time applied to Tumors in the Neck and Throat, it will cure them. I ſuppoſe the Tumors here meant, are *Strumous.*

CHAP. CXCIV.

Of DAFFODIL Ruſh, ſingle-flowred.

I. *THE Names.* It is called in *Greek*, Ναρκίσσος σχοινώδης ἁπλοῦς: in *Latin*, *Narciſſus Juncifolius flore ſimplici*, *Bulbus Vomitorius Dioſcoridis:* in *Engliſh*, *Daffodil Ruſh-leav'd ſingle-flowred*, or, *Single-flowred Junquilia.*

II. *The Kinds.* There are about twelve ſeveral ſorts of this Flower, *viz.* 1. *Narciſſus Junciſolius albus ſimplex*, The white Junquilia. 2. *Narciſſus Junciſo-*

Funcifolius albus magno Calice, The white Junquilia with a great Cup. 3. *Narciſſus Funcifolius flore albo reflexo*, The white turning Junquilia, or Ruſh Daffodil. 4. *Narciſſus Funcifolius flore luteo reflexo*, The yellow turning Junquilia, or Ruſh Daffodil. 5. *Narciſſus Funceus Calice albo foliis reflexis luteis*, The yellow turning Junquilia with a white Cup. 6. *Narciſſus Funceus Calice luteo foliis reflxis albidis*, The white turning Junquilia with a yellow Cup. 7. *Narciſſus Funcifolius luteus magno Calice*, The Junquilia, or Ruſh Daffodil with a great Cup. 8. *Narciſſus Funcifolius luteus vulgaris major*, The common or ordinary Junquilia, or Ruſh Daffodil. 9. *Narciſſus Funcifolius luteus medius*, The middle-siz'd Junquilia, or Ruſh Daffodil. 10. *Narciſſus Funcifolius luteus minor*, The leſſer Junquilia, or Ruſh Daffodil. 11. *Narciſſus Funcifolius luteus, lineis albicantibus diſtinctus*, The yellow Junquilia, or Ruſh Daffodil with white Lines. 12. *Narciſſus Funcifolius Autumnalis flore viridi*, The Autumn Ruſh Daffodil, or Junquilia, with a green Flower.

III. The Deſcriptions. *The firſt, or* White Junquilia, *has a ſmall bulbous Root, covered with a blackiſh Skin; from whence ſpring forth ſmall long Leaves, a little broader, and of a whiter green color than the* Ordinary yellow Junquilia, *or* Ruſh Daffodil. *The Stalk riſes up half a foot high or more, bearing two or three ſmall white Flowers upon a Stalk, yet ſomewhat larger than the* Common yellow Junquilia, *having a ſmall round Cup in the middle, white alſo as the Leaves are. The Seed is ſmall, black and round, as the Seeds of other* Daffodils *are.*

IV. *The ſecond, or* White with a great Cup, *has a Root, Leaves and Stalk in all reſpects like the former; the Flower and Seed is alſo like, but in this it differs, that the Cup in the middle of the Flower is a little larger than the former.*

V. *The third, or* White turning, *has a bulbous or round Root, ſmall, and a little long withal, covered with a blackiſh brown Skin; from whence ſpring up four or five long green Leaves, yet ſhorter and broader than the* Common yellow Junquilia, *and fully as green; from among which riſes up a ſlender green Stalk, a foot high, bearing at its top, out of a skinny Husk, three or four, or more Snow-white Flowers, ſtanding upon long green Foot-ſtalks, every Flower hanging down its Head, and turning up its ſix narrow and long Leaves, even to a very Foot-ſtalk again: from the middle of the Flower hangs down a long round Cup, as white as the Leaves; within which are contained three ſmall white Chives, tipt with yellow, and a ſmall long Pointel, thruſting out beyond the brims of the Cup: after the Flowers are paſt, there comes up in their places ſmall three-ſquare Heads, in which is contained very ſmall, round and black ſhining Seed. The Flower is white, without any good Smell, or indeed rather none at all.*

VI. *The fourth, or* Yellow turning up, *has a bulbous Root, from whence riſe up long Ruſh-like Leaves, but they are greater and longer than the former, and of a paler green color: the Stalk riſes ſomewhat higher, bearing two or three Flowers thereon, wholly of a Golden yellow color, both the Cup and the Leaves, which turn up again.*

VII. *The fifth, or* Yellow turning up with a white Cup, *has from a round Root ſeveral long Ruſh-like Leaves riſing up, and ſtanding upright, like the former, between which riſes up a green Stalk, about a foot or more high, bearing two or three Flowers thereon, whoſe turning up Leaves are of a fair pale yellow, and the Cup of a pale white, but not of ſo delicate or pure a white as the former.*

VIII. *The ſixth, or* White turning up Junquilia with a yellow Cup, *differs not much either in its Roots, Leaves, Stalk or Flowers, ſave, that as the laſt had the Leaves of the Flower, which turns up again yellow, and the Cup whitiſh; ſo this has contrariwiſe the turning up Leaves of a whitiſh yellow, and the long Cup yellower; otherwiſe the difference is inconſiderable.*

IX. *The ſeventh, or* Junquilia with a great Cup, *has a round or bulbous Root, from which ſpring larger Leaves, and longer than the* Ordinary *or* Common yellow Junquilia, *being a little flat on one ſide, and round on the other, but of the ſame Greenneſs with all the reſt: the Stalk riſeth up two feet high, bearing two, and ſometimes three Flowers thereon, being of a fair yellow color, with a large open Cup in the middle, of a little deeper yellow color, like unto the* Great Junquilia with the great Flower *before deſcribed, of which this doubtleſs is a kind, but that this is ſmaller and leſſer than that, both in Leaf and Flower, and Cup,* &c. *being ſomewhat leſſer in all its other parts.*

X. *The eighth, or* Common *or* Ordinary Junquilia, *has a round or bulbous Root, which is blackiſh on the outſide, from which ſpring four or five long, round, green Leaves, like unto* Ruſhes, *from whence came the Name; from among which Leaves riſes up a Stalk, round and green, a foot and half or more high, bearing at the top three or four Flowers, all yellow, but much ſmaller than the laſt, and ſo is the Cup alſo. The Seed is ſmall and black, encloſed in ſmall cornered Heads. The Smell of the Flower is very ſweet in all theſe ſorts of* Junquilia, *or* Ruſh Daffodils.

XI. *The ninth, or* Middle-siz'd Junquilia, *is like unto the former in its bulbous Root,* Ruſh-*like Leaves, Stalks and Flowers, ſave, that the Leaves are ſmaller and rounder, the Stalk riſes up not ſo high, nor are the Flowers ſo great, but the Leaves of the Flower are a little rounder, and not ſo pointed as in the former, but in all things elſe they are alike, this being only the leſſer.*

XII. *The tenth, or* Small Junquilia, *has a Root round, ſmall and black, very like unto the laſt, from whence ſpring up five or ſix ſmall green Leaves, a little broader, but not ſo long as the laſt; from among which riſes up a Stalk almoſt a foot high, bearing one or two ſmall Flowers at the top, of a paler yellow color than the former, with a yellow open Cup (or Crown rather) in the middle, bigger than in either of the two laſt.*

XIII. *The eleventh, or* Yellow Junquilia with white Lines, *has a Root not differing from the former, from which ſpring forth round, long, green Leaves, like to the* Ordinary *or* Common Ruſh Daffodil, *with a Stalk bearing two or three yellow Flowers, having Leaves ſomewhat round at the point or end, with a Line or Strake of white in the middle of every one of them: the Cup is ſhort and Crown-faſhion, and a little crumpled about the edges or brims. The Seed is like to the other kinds.*

XIV. *The twelfth, or* Autumn Ruſh with a green Flower, *ſends forth from its Root but one only Leaf, very long, round and green, which while this green Leaf is freſh and to be ſeen, bears no Flower; but that being faded away, a Stalk afterwards riſes up, very much like to the former green Leaf, round, naked and green up to the top, where two or three Flowers break forth out of a ſmall thin Skin, every one conſiſting of ſix ſmall and narrow green Leaves, very ſharp-pointed at the end, and as it were ending in a ſmall Prick or Thorn; in the middle of which is a ſmall round Cup, (or rather Crown) of the ſame color with the Leaves and Stalk; which Flower ſmells very ſweet, like unto the reſt of the* Ruſh Daffodils *or* Junquilia.

XV. *The Places.* The original or native places from

from whence these have been brought to us, were *Italy*, *Spain*, the *Pyrenæan Mountains*, and *Southern* parts of *France*: the *twelfth* is a Native of *Barbary*, and was brought to us from *France*. Now, by Industry and careful Cultivation, they are all become free Denizons, if not Natives of our Country, where, in the *Gardens* of our Florists, they thrive very well.

XVI. *The Times.* They most of them flower in the Spring, in *March*, (if it is mild) and *April* and *May*, the Seed ripening in some reasonable time after: but the last or *twelfth* flowers not till *October*, and the Frosts coming soon after, causes it suddenly to perish.

XVII. *The Qualities, Specification, Preparations and Virtues*, are much one and the same with those of the *Common Daffodils* in *Chap.* 189. to which I referr you.

CHAP. CXCV.

Of DAFFODIL Rush, double-flowred.

I. *THE Names.* It is called in *Greek*, Νάρκισσος σχοινώδης πολλάπλος, Βόλβος ἐμετικὸς: in *Latin*, *Narcissus Juncifolius flore multiplici*, *Narcissus Junceus flore pleno*, *Bulbus Vomitorius Dioscoridis flore pleno*: in *English*, *Rush Daffodil*, or *Junquilia double-flowred.*

II. *The Kinds.* There are but two usual kinds of this double sort, *viz.* 1. *Narcissus Juncifolius luteus flore pleno*, The double Junquilia, or Rush Daffodil. 2. *Narcissus Juncifolius luteus flore pleno minori*, The lesser Junquilia, or Rush Daffodil.

III. The Descriptions. *The first of these has a Root which is bulbous or round, and blackish brown on the outside, so like unto the* Common Rush Daffodil, *that it is almost impossible to know the one from the other; from which spring forth long, round, green Leaves, like the Leaves of the* Common *or* Ordinary Junquilia, *or* Rush Daffodil, *and of the same bigness, among which rises up a long, slender, green Stalk, bearing two or three, seldom more, small Flowers, yellow and double*, viz. *with several Rows of Leaves, having the yellow Cup such as is in the single* Flower, *broken into small shreds or pieces, running among the Leaves of the Flowers; which pieces in some Flowers are not so easily seen, being smaller than in others. This bears no Button or Head under the Flower, for Seed.*

IV. *The second, or* Lesser kind, *is in its Root, Leaves, Stalk and Flowers very like to the former, save that its Flowers are smaller, and not so double, being one, two or three at most upon a Stalk; and also of much less Beauty.*

V. *The Places.* They are Natives of *Italy*, *Turkey*, *Spain*, the *Pyrenæan Mountains*, and some *Southern* parts of *France*: but flourish very well with us in our *Gardens*.

VI. *The Times.* Their chief times of flowering are in *March*, *April* and *May*.

VII. *The Qualities, Specification, Preparations and Virtues*, are much the same with those of the *Common Daffodil* in *Chap.* 189. aforegoing.

VIII. An Observation. *The Juice of the Root, whether of single or double Junquilia's.* It may be given, to cause Vomit and cleanse the Stomach, from 1 spoonful to 2 or more, mixed with a Glass of White Wine or warm Water, in the Morning fasting; it carries off thick and viscous Humors, and the Matter which causes the King's-evil: Some mix it with Vinegar for the same purpose. It also purges downwards afterwards, the rest of those thick tough Recrements.

IX. Observ. 2. *The Decoction in Wine.* It does also the same thing with the Juice, but it is pleasanter, and works more gently, and mostly by Stool, if it is corrected with *Aniseed*, *Ginger* and other Spices, to abate the Churlishness of the Working. I have found it by Experience to be good against a Paralysis, if it was recent, and the Patients had Strength and Youth on their sides.

X. Observ. 3. *The Root made into a Cataplasm*, and applied, or *into an Ointment*, as you do *Pile-wort* Roots, is an excellent thing to be applied to Strumous Tumors or Swellings in the Throat or other Parts, whether they be whole, or broken and ulcerated.

CHAP. CXCVI.

Of DAFFODIL Sea.

I. *THE Names.* It is called in *Greek*, Νάρκισσος ἑλώδης ἢ θαλάσσιος: in *Latin*, *Narcissus Marinus vel Litoralis*; and in *English*, *Sea Daffodil.*

II. *The Kinds.* There are four kinds thereof: the *first* is commonly called, *Narcissus Marinus magnus, sive Tertius Matthioli*, The great white Sea Daffodil, or *Matthiolus* his third Daffodil. *Clusius* called it *Lilionarcissus Hemerocallis* and *Hemerocallidis facie*; and yet this seems not to be a proper Name, for that his *Hemerocallis* is a plain *Pancration*, or *Sea Bastard Daffodil*, whose middle Cup is longer than the Cup of any true *Daffodil*, which is the chiefest Note of Difference between a *True* and a *Bastard Daffodil.* It may most fitly be called, *Narcissus Marinus maximus*, The greatest Sea Daffodil, because it is a true Daffodil, and the greatest of all others; as also because it has been found chiefly in Islands, or Places near the Sea. 2. *Narcissus Indicus Autumnalis quorundam Lobelii*, *Pancratium Indicum*, The Indian Autumn Sea Daffodil of *Lobel.* 3. *Narcissus Marinus Africanus, sive Exoticus Lobelii*, The African Sea Daffodil. 4. *Narcissus Marinus Exoticus*, The strange Sea Daffodil: of all which in order.

III. The Descriptions. *The first*, *or* Great white Sea Daffodil, *has a Root which by Age or a long Continuance, standing in one place without being removed, grows to be much greater and larger than any other* Daffodil *whatsoever, sometimes to be as large as any* Ordinary Squil *or* Sea Onion, *being black on the outside, and having many long, thick and white Fibres or long Roots, variously branched, and spread under the upper part of the Earth, besides some others which grow downwards, and perish not every Year, as the Fibres of all or most of the other* Daffodils *do; for which Reason this Plant will not thrive and bear Flowers, if it is often transplanted, but delights to continue in one place without removing, and where it may not be overshadowed with other Herbs standing too near it, which then will flourish, and bear many fine* Flowers. *From this Root arise six or seven, or more Leaves, twice so broad almost as any of the former* Daffodils, *but not so long by half as many of them, being rather short in Comparison of the breadth, and of a white green color: from the midst*

midst of these Leaves, as also from the sides, springs up one Stalk, and sometimes two, or more, thick and roundish, and sometimes a little flat and cornered, a foot or more high, bearing at the top (out of a skinny Husk) eight, ten or twelve, or more very large Flowers, *consisting of six white Leaves apiece, spread or laid open, with a white or short Cup or Crown in the middle, lying flat upon the Leaves, cut or divided into six Corners, (and not whole, as the Cup or Crown of any other* Single Daffodil;) *from every of which Edges or Corners of this Cup or Crown proceeds one white long* Thread, *a little crooked or turning up at the end, tipt with a yellow* Pendent, *and some other white* Threads, *tipt with yellow* Pendents, *standing also in the middle. After the Flower is past, great three-square Heads come forth, in which the Seed is contained, which is great, black and round, like unto the Seed of other* Daffodils, *but greater. The Flower has a pretty good Smell, but not very strong.*

IV. *The second, or* Indian Autumn Sea, *has a Root, as* Lobel *says, a span long, and of the thickness of a Man's Arm, covered with many white Shells, of which the outwardmost are of a dark red, or* Chest-nut *color. The Flowers are eight or ten in number, every one by its self upon a short Foot-stalk, made of six Leaves apiece, somewhat long, narrow and pointed, like unto the Flowers of the* English Colchicum, *or* Meadow Saffron, *of a whitish yellow dun color, with six long* Threads *in the middle. The green Leaves are long and broad, and broad-pointed. Some are of Opinion, that this Plant comes nearer to the Resemblance of an* Hyacinth *than of a* Daffodil; *but* Lobel *has numbered it among the* Daffodils, *whom we here follow, yet leave it to others Judgments to determine of which kind it is.*

V. *The third, or* African Sea, *has a Root very great, made as it were of many scaly Cloves, from whence rises up a small short Stalk, bearing, a little above the Ground, two fair, broad, green, pointed Leaves, longer than they are broad, so encompassing the Stalk at the bottom, that it seems to run through them: the Stalk is spotted with divers discolored Spots, and is bare or naked from these two Leaves unto the top, where it bears one fair double Flower, like unto a* Double Anemone, *of a diluted reddish color, tending to a blush, with many* Threads *set about the middle Head.*

VI. *The fourth, or* Strange Sea Daffodil, *has a Root which is very great, yet like unto other* Great Daffodils; *the outward Skins of which are of a dark brown color. From this Root rise up five or six large and long Leaves, of a pale green color; from among which arises up a strong and large Stalk, bearing at top, out of a thin Husk or Skin, many very large Flowers, made of six long and pointed Leaves apiece, of a blewish purple color, with a large round open Cup in the middle, of a sadder color than the Leaves.*

VII. *The Places.* The *first* was found by the Sea side in the Isle of *Sardinia*, and on the high Mountains also of the same Isle, where it has born (by Report) *thirty five Flowers* upon a Stalk: it grows also about *Illyricum*, and other Maritime places of the *Mediterranean*. The *second* grows in the upper part of *Hispaniola* in the *West Indies*. The *third* grows near the *Cape of Good Hope*, from whence it was brought into *Holland*. The *last*, the place of its Origin is unknown, but now they are all nourish'd up in *Gardens*.

VIII. *The Times.* The *first* springs later out of the Ground than any other *Daffodil*, viz. about the latter end of *March* or beginning of *April*, and flowers in the end of *May* or beginning of *June*; and the Seed is ripe in the end of *July* or beginning of *August*. The *second* flowers in *Autumn*, viz. in *September* and *October*. The *third* and *fourth* flower in the Summer Months, earlier or later, as the Season is in Warmth.

IX. *The Qualities, Specification, Preparations and Virtues*, are the same with those of the *Common Daffodil* in *Chap.* 189. aforegoing, which see in their places.

CHAP. CXCVII.

Of DAFFODIL Bastard, broad-leav'd single-flowred.

I. *THE Names.* It is called in *Greek*, Ψευδονάρκισσος πλατυφύλλος ἁπλοῦς: in *Latin*, *Pseudonarcissus latifolius flore simplici*: in *English*, *Bastard Daffodil broad-leav'd, with single Flowers.*

II. *The Kinds.* There are nine several kinds commonly taken notice of, *viz.* 1. *Pseudonarcissus Anglicus vulgaris*, Our common English Bastard Daffodil. 2. *Pseudonarcissus Anglicus vulgaris alter*, Another common English white Bastard Daffodil. 3. *Pseudonarcissus tubo sexangulari*, The six-cornered Bastard Daffodil. 4. *Pseudonarcissus aureus Hispanicus maximus*, The great yellow Spanish Bastard Daffodil. 5. *Pseudonarcissus Pyrenæus Hispanico & Anglico similis*, The Mountain Bastard Daffodil of divers kinds. 6. *Pseudonarcissus Pallidus præcox*, The early Straw-colored Bastard Daffodil. 7. *Pseudonarcissus Hispanicus flore albo major*, The greater white Spanish Bastard Daffodil. 8. *Pseudonarcissus Hispanicus maximus albidus*, The greatest Spanish white Bastard Daffodil. 9. *Pseudonarcissus Hispanicus flore albo medius & minor*, The lesser and meaner white Spanish Bastard Daffodils.

III. The

III. The Deſcriptions. *The firſt, or* Common Engliſh, *has a Root which is bulbous and ſomewhat blackiſh on the outſide; from whence ſpring forth three or four greyiſh green* Leaves, *long and ſomewhat narrow; among which riſes up the* Stalk, *about a ſpan or ſomewhat more high, bearing at the top, out of a skinny Husk, (as all other* Daffodils *have) one* Flower, *and ſometimes two, ſomething large, having the ſix* Leaves *which ſtand like Wings of a pale yellow color, and the long* Trunk *in the middle of a fair yellow, with the edges or brims a little crumpled or uneven. After the* Flower *is paſt, it bears a round Head, ſeeming three-ſquare, containing round black Seed.*

IV. *The ſecond, or* Our common Engliſh white, *is in Root, Leaves and Stalk, like to the other in almoſt all reſpects: but the Wings of its* Flower *are much more white than the former, and in a manner of a Milk-white color, the* Trunk *remaining almoſt as yellow as that in the aforegoing, but not differing in any thing elſe.*

V. *The third, or* Six-cornered, *has a* Root *like to the others, from whence ſpring two or three long and ſomewhat broader* Leaves *than in the two aforegoing; between which comes forth a Stalk, bearing one* Flower, *ſomewhat large, having the ſix outward* Leaves *of a pale yellow color, and the long* Trunk *plaited or cornered all along, unto the very edge, into ſix parts, of a little deeper yellow than the Wings.*

VI. *The fourth, or* Great yellow Spaniſh, *has a reaſonable great Root, and blackiſh on the outſide, preſſing deep into the Ground, and therefore will run down, where it will encreaſe into many Off-ſets; from whence riſe up many thick, long and ſtiff* Leaves, *of a greyiſh green color; among which riſes up a round ſtrong Stalk, ſometimes a yard high or higher, bearing at the top one only fair large yellow* Flower, *ſtanding forth right, and not pendulous, conſiſting of ſix ſhort and ſomewhat broad* Leaves, *with a very great, large and long* Trunk, *of an equal Bigneſs, but open at the Mouth, and turning up the brims a little, which are ſomething crumpled. When the* Flower *is paſt, there comes in the place a three-ſquare Head, containing round black Seed, like to other* Daffodils.

VII. *The fifth, or* Mountain Baſtard, of divers kinds; *they have all of them a bulbous Root, which is blackiſh on the outſide: but of this there are ſeveral ſorts, as,* 1. *One which has very broad and whitiſh green* Leaves, *ſomething ſhort in Compariſon with others of that breadth: the* Flower *is wholly yellow, but a little paler than the former* Spaniſh kind, *having the* Leaves *of its* Flower *long and a little narrow, ſtanding like Wings about the middle of the* Trunk, *which is as long as the* Leaves, *and ſmaller than in many others of this kind, but a little yellower than the Wings.* 2. *One which has narrower green* Leaves *than the former, and longer; the* Flower *is all yellow, but the* Trunk *is larger, wider and more open at the Mouth than the other, and almoſt as large as the former* Spaniſh, *but not ſo high as the laſt.* 3. *One which has the Wings of the* Flower, *of a Straw color, but the* Trunk *is long and narrow, of a fair yellow.* 4. *One which has ſuch like* Flowers, *but that it is ſhorter, both in the Wings and the* Trunk. 5. *Another which has the Wings of the* Flower *longer than the long* Trunk, *and ſometimes ſhorter.* 6. *Another which has its Wings all yellow, or only a little more pale or white, like to the* Engliſh kind. 7. *Others which have their* Trunks *long and narrow, or larger, and wider open, and crumpled at the brims.*

VIII. *The ſixth, or* Early Straw-colored, *from a bulbous* Root, *has* Leaves *riſing up, of a mean ſize, between the broadeſt and narrower kinds, of a greyiſh green color, and not very long: the Stalk riſes up a foot high or more, on the top of which grows one large fair* Flower, *equalling the largeſt* Spaniſh Baſtard Daffodil, *before deſcribed, in the Largeneſs of its* Trunk, *and having the brims turned up a little, which makes it ſeem the larger. The Wings or outward* Leaves *are in a manner as ſhort as they are in the greateſt* Spaniſh kind, *(and not long flagging down, like unto the* Mountain kinds) *and ſtand ſtraight outright. All the whole* Flower *is of one even color,* viz. *of a fine pale yellow, not much unlike to the color of a freſh* Limon Peel, *but a little whiter, which we commonly call a Straw-color. It is a large* Flower, *and early in the Spring.*

IX. *The ſeventh, or* Greater white Spaniſh, *has a* Root *greater and thicker than the firſt* Spaniſh *at* ſect. 6. *above, but does not encreaſe ſo much, nor is covered with a black, but rather with a whitiſh Skin. From this* Root *divers* Leaves *riſe up together, long and broad, ſomewhat like to the firſt* Spaniſh kind *at* ſect. 6. *but a little broader, and of a whiter green color, yet not ſo white as in the* Leſſer Spaniſh white kinds, *after deſcribed. From among theſe* Leaves *riſes up a round ſtrong Stalk, about two feet high, bearing at its top one white* Flower, *bending down the* Head, *as all theſe* White kinds *do, but is not of ſo pure a white as the* Leſſer kinds *which follow, yet whiter than the* Greateſt white Spaniſh kind, *next to be deſcribed in* ſect. 10. *The whole* Flower, *as well* Trunk *as Wings, is much larger than the* Leſſer white kinds, *and almoſt equalling the firſt* Spaniſh yellow, *but a little longer and narrower, a little crumpled, and turning up at the brims; after which, there follows a Head and Seed, like to the firſt.*

X. *The eighth, or* Greateſt Spaniſh white, *has a* Root *like to the former, but greater, being white on the outſide, and not black. In the manner of its Growing, it is very like to the laſt, both in its* Leaves *and* Flowers, *but larger in both. The* Flower *of this is not full out ſo white, but has ſome ſhew of Paleneſs therein, and more upon the firſt opening of the* Flower *than afterwards, and is as great altogether as the* Spaniſh yellow, *at the leaſt with a longer and ſomewhat narrower* Trunk, *after which come Heads of Seed, like the former.*

XI. *The ninth, or* Leſſer and mean white Spaniſh, *are two other, one leſſer than another, and both leſſer than the two former* White Spaniſh Daffodils. *The* Roots *of both are like one another, but do differ in Greatneſs. The* Leaves *of both are of a whitiſh green color, one a little broader than the other. The* Flowers *of both are pure white, and bending down their Heads, that they almoſt touch the Stalk again: the greater* Flower *has the longer and narrower* Trunk; *and the leſſer* Flower, *the ſhorter and wider open; yet both a little crumpled at the edges or brims. From the Seed of theſe has ſprung great Variety, few or none keeping either the Color or Height of their Original.*

XII. *The Places.* The firſt is common thro' all *England*, in *Copſes*, *Woods* and *Orchards*, inſomuch that by its growing Wild, it is of the leſſer value in our *Gardens*. The ſecond is alſo *Engliſh*, yet is found growing on the *Pyrenæan Mountains*. The third grows in *Gardens*. The fourth was brought out of *Spain*. The fifth, ſixth, ſeventh, eighth and ninth came from the *Pyrenæan Mountains*; and are alſo found in ſome parts of *Spain*: but with us they all grow in *Gardens* only.

XIII. *The Times.* The firſt, ſecond and ſixth are the moſt *early*: all the reſt flower in *April*: and the greateſt yellow, ſomewhat *earlier* than the other greater or leſſer white.

XIV. *The Qualities, Specification, Preparations and Virtues*, are much the ſame with the *Common*

or

or *Vulgar Daffodils* in *Chap.* 189. aforegoing, to which you are referred.

CHAP. CXCVIII.

Of DAFFODIL Baſtard, broad-leav'd double-flowred.

I. *THE Names.* It is called in *Greek*, Ψευδονάρκισσος πλατυφύλλος πολλάπλος: in *Latin*, *Pſeudonarciſſus latifolius flore multiplici*; and in *Engliſh*, *Baſtard Daffodil broad-leav'd, with double Flowers.*

II. *The Kinds.* Of this ſort there are five kinds, *viz.* 1. *Pſeudonarciſſus Anglicus flore pleno*, The Engliſh double Baſtard Daffodil, or *Gerard*'s double Daffodil. 2. *Pſeudonarciſſus aureus maximus Anglicus flore pleno, ſive Roſeus Tradeſcanti*, The greateſt Engliſh yellow double Baſtard Daffodil, or *Tradeſcant* his great Roſe Daffodil. 3. *Pſeudonarciſſus aureus major Anglicus*, The Engliſh great yellow double Baſtard Daffodil, or *Wilmer*'s great yellow double Baſtard Daffodil. 4. *Pſeudonarciſſus aureus Hiſpanicus flore pleno*, The great double yellow Spaniſh Baſtard Daffodil, or *Parkinſon*'s Baſtard Daffodil. 5. *Pſeudonarciſſus Gallicus major flore pleno*, The greater double French Baſtard Daffodil.

III. The Deſcriptions. *The firſt*, *or* Engliſh double Baſtard, *has a Root which is ſmall, very like unto the* French double kinds, *eſpecially the* Leſſer, *to which it is ſo like, that it is hard to know the one from the other. From this Root ariſe Leaves very like unto the* Single kinds, *being of a whitiſh green color, and ſomething broad, a little ſhorter and narrower, yet ſtiffer than the following* French kind. *The Stalk riſes up about a foot high, bearing at top one very double Flower, the outermoſt Leaves being of the ſame pale color which is to be ſeen in the Wings of the* Single kind; *thoſe which ſtand next them are ſome of as deep a yellow as the Trunk of the* Single, *and other ſome of the ſame pale color, with ſome green Stripes on the back of divers of the Leaves. Thus is the whole Flower variably mixt with pale and deep yellow, and ſome green Stripes among them, when it is fully open, and the Leaves diſperſed and broken. Sometimes the Flower ſhews a cloſe and round yellow Trunk in the middle, ſeparate from the pale outward Wings; which Trunk is very double, ſhewing ſome pale Leaves within it, diſperſed among the yellow: and ſometimes the Trunk is more open, or in part broken, ſhewing forth the ſame colors intermixt within it. At length the Flower paſſes away, and without giving any Seed, as all other bulbous Roots do, which bear double Flowers.*

IV. *The ſecond*, *or* Greateſt Engliſh yellow double, (*called by* Parkinſon, The Prince of Daffodils) *has a great round Root, like unto other* Daffodils, *covered with a browniſh Skin; from whence riſe up four or five ſomewhat large and broad Leaves, of a greyiſh green color, yet not fully ſo long and large as the next following: from the midſt of which riſes up a Stalk, almoſt as high and as great as it, bearing at its top, out of a skinny Husk, one fair, large, double Flower, (the Bud, before it breaks open, being ſhorter and thicker in the middle, and ending in a longer and ſharper Point than any of the other* Daffodils) *very much ſpread open, conſiſting of ſmaller and ſhorter Leaves than the next following, but more in number, and thicker and rounder ſet together, making it to ſeem as great and double as any* Province Roſe, *and intermixt with divers yellow and pale Leaves, as it were in Rows, one under another. It continues long in Flower, and ſpreads by ſtanding long, to be the broadeſt in Compaſs of any of the* Daffodils; *but it fades away at laſt without giving any Seed, as all double* Daffodils *do.*

V. *The third*, *or* Engliſh great yellow double Baſtard, *has a thick great bulbous Root, which encreaſes as well as any other* Daffodil; *from which ſpring three or four large, long and broad Leaves, ſomewhat longer and broader than the former, and of a whitiſh green color. The Stalk riſes to be about two feet high, if it grows in a fat and fruitful Soil, and is ſtrong and ſomething round, bearing at the top, out of a thin Husk or Skin, one large and fair double Flower, each Leaf of which is twice as large and broad as the laſt deſcribed, variouſly intermixt with a Row of paler, and a Row of deeper yellow Leaves, wholly diſperſed throughout the Flower, the pale color as well as the deeper yellow, in this as well as in the* Small Engliſh kind, *growing deeper by ſtanding: ſometimes the Leaves thereof are ſcattered and ſpread wholly, making it ſhew a fair, broad, open Flower; and ſometimes the outer Leaves ſtand ſeparate from the middle Trunk, which is whole and unbroken, and very thick of Leaves; and ſometimes the middle Trunk will be half broken, neither expreſſing a full open double Flower, nor a cloſe double Trunk, as it is alſo ſeen in the* Small Engliſh kind: *at length the Flower paſſes off without bearing any Seed. This* Great double Baſtard Daffodil *does ſo near reſemble our* Common double Engliſh kind, *that there is little other Difference found between them, but in the Largeneſs of the Leaves and Flowers, and in its Statelineſs, and magnificent way of Growing.*

VI. *The fourth*, *or* Great double yellow Spaniſh, *has a great bulbous Root, covered with a dark-colored Skin, and whitiſh on the inſide: from this Root divers Leaves riſe up, ſtiffer, narrower, and not of ſo whitiſh a green color as the former, but more dull or greyiſh, plainly reſembling the Leaves of the* Single great kind; *from whence 'tis ſaid this took its Original: The Stalk hereof alſo riſes almoſt as high as it, and near the height of the laſt deſcribed, bearing one double Flower at top, always ſpread open, and never forming a double Trunk, like the former; yet not ſo fair and large as it; the outermoſt Leaves whereof, being of a greeniſh color at firſt, are afterwards more yellow, and do a little turn themſelves back again to the Stalk: the other Leaves are ſome of a pale yellow, others of a more Gold yellow color: thoſe which ſtand in the middle are ſmaller, and ſome of them ſhew as if they were hollow-trunked; ſo that they ſeem to be greeniſh, whitiſh, yellow and Gold-yellow, all mixed one among another.* Parkinſon *thinks himſelf to be the firſt that ever had this Flower in* England, *his being of his own raiſing, and flowering firſt in his Garden.*

VII. *The fifth*, *or* Greater double French, *has a Root very like unto the* Leſſer kind, *but a little bigger and longer; from which ſpring whitiſh green Leaves, longer and broader than the* Smaller French kind, *hereafter to be deſcribed, and broader and longer, and more limber than the* Double Engliſh kind *at* ſect. 3. *above. The Stalk riſes up not much higher than the* Smaller French kind, *but a little bigger, bearing at its top one great double Flower, which when it is perfectly blown open, (which is but ſeldom, by reaſon of the Leaves cleaving very faſt one to another) becomes a fair and goodly Flower, larger by half than the* Smaller kind, *and fuller of Leaves, of the ſame pale whitiſh yellow or* Limon *color with*

the Leſſer, *or rather a little whiter, and not ſet in the ſame Order of Rows, as that is, but more confuſedly together, and turning back the ends of the outermoſt Leaves to the Stalk again, neither of which is found in the* Leſſer kind.

VIII. *The Places.* The firſt is natural of our own Country; for *Gerard* found it in an old Womans *Garden* in the *Weſt* of *England*, where it grew before the Woman came to dwell there: and *Parkinſon* ſays, That he heard that it was a Native of the *Iſle of Wight*. The ſecond is unknown as to its Original, but it ſeems to be a Native in *John Tradeſcant* his Garden. The third, as far as we can learn, is an *Engliſh* Plant, growing in the Garden of *Vincent Sion*, (a *Fleming*) dwelling on the *Bank ſide* of the River *Thames*, from whom Mr. *Wilmer* of *Stratford Bow* had it; after which it went by *Wilmer*'s Name. The fourth, *Parkinſon* ſays, was of his own raiſing: he ſays it was aſſuredly raiſed from the Seed of the *Great Spaniſh ſingle kind*, which he ſowed in his own *Garden*, and cheriſhed it, till it gave ſuch a Flower as is deſcribed. The laſt, its Origin is not certainly known; ſome think it came from *France*, others from *Germany*.

IX. *The Times.* They all flower much about one time, *viz.* from the middle of *March*, as the Year is in forwardneſs, unto the middle of *April*.

X. *The Qualities, Specification, Preparations and Virtues*, are much the ſame with thoſe of *Common Daffodil* in *Chap.* 189. aforegoing, which ſee in the place cited.

CHAP. CXCIX.

Of DAFFODIL Baſtard, narrow-leav'd ſingle-flowred.

I. *THE Names.* It is called in *Greek*, Ψευδονάρκισσος στενόφυλλος ἁπλοῦς: in *Latin*, *Pſeudonarciſſus anguſtifolius flore ſimplici*: in *Engliſh*, *Baſtard Daffodil narrow-leav'd with ſingle Flowers.*

II. *The Kinds.* Of this there are three ſeveral ſorts, *viz.* 1. *Pſeudonarciſſus anguſtifolius flore flaveſcente Tubo quaſi abſciſſo*, Baſtard Daffodil narrow-leav'd, with a clipt Trunk. 2. *Pſeudonarciſſus Hiſpanicus medius & minor luteus*, Spaniſh yellow Baſtard Daffodils, the two leſſer kinds. 3. *Pſeudonarciſſus Hiſpanicus luteus minimus*, The leaſt Spaniſh yellow Baſtard Daffodil.

III. The Deſcriptions. *The firſt, or* Narrow-leav'd Baſtard, with a clipt Trunk, *has a bulbous Root, from which ſpring long and narrow greyiſh green Leaves, bearing one ſingle Flower at the top of its Stalk, like unto the former* Single Baſtard kinds, *having its outer Leaves of a pale yellow color, and its Trunk of a deeper yellow. The chief Differences of this from the* Engliſh double Baſtard *in the former Chapter, is in the Leaves, being narrow, and then in the Trunk of the Flower, which is not crumpled or turned up, as moſt of the others are; and that the brims or edges of the Flower, are as if they had been clipt off or cut even.*

IV. *The ſecond, or* Spaniſh yellow Baſtard leſſer kinds, *have a Root which is but ſmall, and covered with a darkiſh Skin. Theſe two* Leſſer kinds *do differ but in Greatneſs the one from the other, and not in any thing elſe; ſo that in deſcribing the one, you may underſtand the other. The* Leſſer *then has three or four narrow, ſhort, whitiſh green Leaves; from among which comes forth a ſhort Stalk, not above an Hand Breadth or half a foot high, bearing one ſingle Flower, not fully ſtanding out right, but a little bending down, conſiſting of ſix ſmall Leaves, ſtanding as Wings about a ſmall but long Trunk, a little crumpled at the brims. The whole Flower, as well Leaves as Trunk, are of one deep yellow color, like unto the* Great Spaniſh kind.

V. *The third, or* Leaſt Spaniſh yellow Baſtard, *has a Root ſmaller than either of the former; the Leaves of this* Small kind *are ſmaller and ſhorter than the laſt, ſeldom exceeding the length of three inches, and very narrow withal, but of the ſame greyiſh green color with the former; every Flower ſtands upon a ſmall and ſhort Foot-ſtalk, ſcarce riſing above the Ground; ſo that its Noſe, for the moſt part, does lye on or touch the Earth, and is formed after the ſame Faſhion, and of the ſame color with thoſe immediately going before, but much leſſer.*

VI. *The Places.* The firſt is a Native of the *Pyrenæan Mountains.* The ſecond are Natives of *Spain:* and the third was alſo brought from thence to us: and are all now nurs'd up in our *Gardens.*

VII. *The Times.* The firſt flowers at the end of *March.* The ſecond and third about the beginning of *March:* but with us they flower ſomething later, becauſe of the Coldneſs of our Clime.

VIII. *The Qualities, Specification, Preparations and Virtues*, differ not much from the *Common Daffodils* in *Chap.* 189. aforegoing; but theſe are ſuppoſed to be ſomething weaker.

CHAP. CC.

Of DAFFODIL Baſtard, narrow-leav'd double-flowred.

I. *THE Names.* It is called in *Greek*, Ψευδονάρκισσος στενόφυλλος πολλάπλους: in *Latin*, *Pſeudonarciſſus anguſtifolius flore multiplici, vel pleno*; and in *Engliſh*, *Baſtard Daffodil narrow-leav'd, with a double Flower.*

II. *The Kinds.* It is *ſingularis ſui generis*, without any ſub-ordinate Species; and is vulgarly called, *Pſeudonarciſſus Gallicus minor flore pleno*, The leſſer French double Baſtard Daffodil.

III. The Deſcription. *The Roots of this* Leſſer French kind, *are like unto the* Double Engliſh kind, *as alſo to the former* Double greater French kind; *and the Leaves are of the ſame whitiſh green color alſo, but narrower, and not longer: the Stalk riſes a little higher than the* Engliſh, *and not fully ſo high as the* Greater French, *bearing one fair double Flower on its top, of a pale yellow or* Limon *color, conſiſting of ſix Rows of Leaves, every Row growing ſmaller than other unto the middle, and ſo ſet and placed, that every Leaf of the Flower does ſtand directly almoſt in all, one upon or before another, unto the middle, where the Leaves are ſmalleſt, the outermoſt being the greateſt, which makes the Flower ſeem the more beautiful. This and the* Greater kind *has no Trunk, or ſhew of any other thing in the middle, as all or moſt of the other former* Double Baſtard Daffodils *have, but are Flowers wholly compoſed of Leaves, ſtanding double even to the middle.* Parkinſon *doubts whether this or the* Greater French Baſtard, *ought to be called* Baſtard Daffodils *or not, becauſe the Flower in neither of them is made after the Faſhion of other* Baſtard Daffodils, *but rather reſembles the Form of the* Double white Daffodil.

IV. *The*

IV. *The Places.* This *French double kind* grows about *Orleance* in *France*, where it plentifully abounds; but with us in *England*, it is only nurs'd up in *Gardens*.

V. *The Times.* It flowers from the middle of *March* to the middle of *April*.

VI. *The Qualities, Specification, Preparations and Virtues*, are the same with the *Common Daffodil*, all which are discourſed in *Chap.* 189. aforegoing.

CHAP. CCI.

Of DAFFODIL Baſtard, Ruſh-leav'd.

I. *THE Names.* It is called in *Greek*, Ψευδονάρκισσος σχοινώδης: in *Latin*, *Pſeudonarciſſus Juncifolius, vel Junceus:* in *Engliſh*, *Baſtard Ruſh Daffodil.*

II. *The Kinds.* Authors make four ſeveral ſorts of this Plant, *viz.* 1. *Pſeudonarciſſus Juncifolius albus*, The white Baſtard Junquilia, or Ruſh Daffodil. 2. *Pſeudonarciſſus Juncifolius luteus major*, The greater yellow Baſtard Junquilia, or Baſtard Ruſh Daffodil. 3. *Pſeudonarciſſus Juncifolius luteus minor*, The leſſer yellow Baſtard Junquilia, or Ruſh Daffodil. 4. *Pſeudonarciſſus Juncifolius luteus ſerotinus*, The late yellow Baſtard Junquilia, or Ruſh Daffodil.

III. The Deſcriptions. *The firſt, or* White Baſtard Junquilia, *has a bulbous Root, from which riſe up two or three long and very green Leaves, very like unto the* Small yellow Junquilia, *or* Ruſh Daffodil *before deſcribed, but not altogether ſo round: from among which riſes up a ſhort Stalk, about ſix inches high, bearing at top, out of a skinny Husk, one ſmall white Flower, ſometimes declining to a pale color, having ſix ſmall and ſhort Leaves ſtanding about the middle of the Trunk, which is long, and much wider open at the mouth than at the bottom. The ſmall outward Leaves or Wings are a little tending to green, and the Trunk, as I ſaid, is either white or whitiſh, having the brims or edges a little uneven. The Seed is ſmall, black and round, like unto other* Junquilia, *or* Ruſh Daffodils, *but ſmaller.*

IV. *The ſecond, or* Greater yellow Baſtard Junquilia, *has a bulbous Root, bigger than the former; and the Leaves of this* Greater kind *are longer, greater and a little broader than the laſt deſcribed. The Stalk alſo is higher, and the Flower larger, more open at the Mouth, and more crumpled than the* White, *but wholly of a yellow color. The Seed is alſo larger, according to the Proportion of the Plant.*

V. *The third, or* Leſſer yellow Baſtard Junquilia, *is in Root, Leaves, Stalk and Flower, and manner of Growing, yea, in all things ſo like unto the laſt, it is needleſs to trouble you with any farther Deſcription thereof; the only Difference is in the Magnitude of the Plants, this being ſmaller in all its Parts.*

VI. *The fourth, or* Late yellow Baſtard Junquilia, *is in Root, Leaves, Stalk and Flower, alſo in manner of Growing, very like unto the former* Greater yellow Baſtard Junquilia, *but with this Difference, that this is rather the larger Plant, and bears the fairer Flower, and flowers alſo ſomething later than that does.*

VII. *The Places.* Theſe all came to us from the *Pyrenæan Mountains*; and being tender Plants, are with much Care, nurs'd up in our *Gardens.*

VIII. *The Times.* The three firſt flower in *April:* the laſt flowers a Month later, *viz.* in *May.*

IX. *The Qualities, Specification, Preparations and Virtues*, are much the ſame with the *Common Daffodil*, of which we have ſpoken in *Chap.* 189. aforegoing.

CHAP. CCII.

Of DAFFODIL Baſtard, Sea.

I. *THE Names.* It is called in *Greek*, Ψευδονάρκισσος θαλάσσιος: in *Latin*, *Pſeudonarciſſus Marinus*; and in *Engliſh*, *Sea Baſtard Daffodil.*

II. *The Kinds.* So far as we know, it is a ſingular Plant of the kind; tho' Authors report, that there are other ſorts of it, ſome of which bear yellow Flowers, and others which bear red; but of thoſe we can ſay nothing in this place.

III. *An Obſervation.* Some have called this Plant *Pancratium flore Lilii*; but this was a Miſtake. Others thought it to be a kind of *Scylla*, and uſed it inſtead of *Squills* in *Theriaca*; but this was a dangerous Error. Others, as *Cluſius* ſaith, call'd it *Hemerocallis*, thinking it to be a *Lilly*; and *Cluſius* does thereupon call it *Hemerocallis Valentina*, but was wholly in the wrong: for it is neither *Pancratium*, nor *Scylla*, nor *Lillium*; but it is certainly a kind of *Daffodil*, as the Form of Root, Leaf, Stalk and Flower demonſtrate.

IV. *Obſervat.* 2. 'Tis true, *Dioſcorides* will have *Pancratium* to be a kind of *Scylla*; and ſo it was called in his time, *viz. Scylla radice rubra*, which had a Leaf like a *Lilly*, but longer, and was uſed both with the ſame Preparation and Quantity, and for the ſame Diſeaſes that *Scylla* was uſed for, only that it was ſaid to be weaker. But beware of uſing of this *Sea Baſtard Daffodil* by ſuch a Miſtake, becauſe of its dangerous Effects, which are ſaid to be deadly: for it is reported, that one, out of Malice, did before hand cut the Root of this Plant with the Knife which another was preſently after to cut his Meat withal, and that with an Intention to kill him by the Poiſon thereof, with which the Knife was poiſoned.

V. The Deſcription. *It has a large white bulbous Root, from which ſpring ſeveral broad whitiſh green Leaves, but not very long; among which riſes up a ſtiff round Stalk, at the top whereof break out of a great round skinny Husk, five or ſix Flowers, every one made ſomewhat of the Faſhion of the* Greater Baſtard Ruſh Daffodil, *but greater, and wholly white; the ſix Leaves being larger and longer than in the* Junquilia *or* Ruſh kind, *and extending beyond the Trunk, are tipt with green at the point of each Leaf, and down the middle likewiſe, on the backſide. The Trunk is longer, larger and wider open at the Mouth, cut in or indented at the brims or edges, and ſmall at the bottom, with divers white Threads in the middle, and is very ſweet. Under the Flower is a round green Head, which grows very great, having within it, when it is ripe, flat and black Seed.*

VI. *The Places.* It grows near the *Sea ſide* in *Italy*, *Spain* and *France*, within the *Straights*, and for the moſt part upon all the *Levant* Shore, and Iſlands of the *Mediterranean*, but does not often flower in our colder Climates; but it proſpers, and I ſaw it grow admirably well in ſome parts of the *Southern Carolina*, and other parts of *Florida.*

VII. *The Times.* It flowers towards the latter end of *Summer*, *viz.* in *Auguſt* and *September.*

VIII. As to the *Qualities and Medicinal Virtues* hereof, Authors have ſaid nothing about it, but do account it a virulent Poiſon, rather than any thing elſe: and yet it is poſſible it may be prepared for external Applications, with ſingular Advantage againſt many ſtubborn and rebellious Diſeaſes, ſuch as are Struma's, Oedema's, and other Infirmities of like kind.

CHAP. CCIII.

Of DAFFODIL Chequer'd.

I. *THE Names.* This Plant was unknown to the *Greeks*, as far as we can learn, and ſo has no proper *Greek* Name belonging to it: but it is called in *Latin*, by Authors, *Fritillaria*, by *Dodonæus*, *Flos Meleagridis*, (*The Ginny Hen-Flower*, becauſe of the Variety of the Colors in the Flower, agreeing with the Colors of the Feathers of a *Ginny* Hen:) by *Lobel*, *Lilio-narciſſus*, *Variegatus*, & *Purpureus Variegatus*, & *Teſſulatus*, (making it a kind of *Tulip:*) others, *Lilium variegatum:* in *Engliſh*, *The Chequer'd Daffodil*, *The Chequer'd Lilly*, *The Ginny Hen-Flower*, and *Fritillary*, by which laſt Name it is moſt known.

II. *The Kinds.* Some Authors will have it to be of the kind of the *Daffodil*; ſome of the *Tulip*; ſome of the *Lilly*, and others as partaking of ſomething of all of them, and therefore have placed it between them: but becauſe it is now moſt commonly called, *A Chequer'd Daffodil*, we have placed it immediately after the *Daffodils*. Hereof there are many Species found out of late, as *White*, *Red*, *Purple*, *Yellow*, *Black*, of each of which there are alſo ſeveral ſorts; but the *Purple kind* was that which was firſt known.

III. Authors make ſeveral Species hereof, ſome more, ſome leſs: thoſe which we ſhall take notice of in this Chapter, are the thirteen following, *viz.* 1. *Fritillaria vulgaris*, The common Chequer'd Daffodil. 2. *Fritillaria vulgaris pallidior*, *præcox & Serotina*, The early and late common Chequer'd Daffodil. 3. *Fritillaria flore atro rubente*, The Blood-red Fritillary. 4. *Fritillaria maxima purpurea, ſive rubra*, The great purple or red Fritillary. 5. *Fritillaria alba*, The white Chequer'd Daffodil. 6. *Fritillaria flore duplici albicante*, The double bluſh Fritillary. 7. *Fritillary flore luteo puro*, The abſolute yellow Fritillary. 8. *Fritillaria flore luteo varia ſive punctato*, The variegated yellow Fritillary. 9. *Fritillaria lutea maxima Italica*, The great yellow Italian Fritillary. 10. *Fritillaria polyanthos flore parvo Italorum*, The ſmall Italian Fritillary. 11. *Fritillaria lutea Juncifolia Luſitanica*, The Portugal ſmall yellow Fritillary. 12. *Fritillaria Pyrenæa, ſive Apennina*, The Pyrenæan black Fritillary. 13. *Fritillaria Umbellifera Hiſpanica*, The Spaniſh Umbelliferous black Fritillary. Some think, that the Name *Fritillaria* was given to it from *Fritillus*, the *Chequer'd Board*, upon which Gameſters play at Dice; this delightful Flower being Chequer'd in like manner on its Leaves.

IV. The Deſcriptions. *The firſt*, *or* Common Chequer'd Daffodil, *has a ſmall white bulbous Root, but ſomewhat flatiſh, made as it were of two Cloves, and divided in a manner into two parts, yet joining together at the bottom or ſeat of the Root, which holds them both together. From between this Cleft or Diviſion, the Bud for the Stalk appears, which in time riſes up to be a foot or foot and half high, being round and of a browniſh green color, more eſpecially near unto the Ground, whereon there ſtands diſperſedly four or five narrow, long and green Leaves, being a little hollow. At the top of the Stalk, between the upper Leaves, (which are ſmaller than the loweſt) the Flower ſhews it ſelf, hanging or turning down the Head, but not turning up again any of its Leaves, as ſome* Lillies *do. Sometimes this Stalk bears two Flowers, and ſometimes, yet but very ſeldom, three, conſiſting of ſix Leaves apiece, of a reddiſh purple color, ſpotted diverſly with great Spots, appearing like unto ſquare Chequers, of a deeper color. The inſide of the Flower is of a brighter color than the outſide, which has ſome Greenneſs at the bottom of every Leaf. Within the Flower do appear ſix Chives, tipt with yellow Pendents, and a three-forked Stile or Pointel, compaſſing a green Head, which, when the Flower is paſt, riſes upright again, and becomes the Seed-Veſſel, being ſomething long and round, yet having a ſmall ſhew of Edges, flat at the Head, like the Head of a* Lilly, *and without any Crown, as the* Tulip *has, in which is contained pale-colored flat Seed, like unto thoſe of the* Lilly, *but ſmaller.*

V. *The ſecond*, *or* Early and late common Chequer'd Daffodil, *are of the ſame kind with the former, but with theſe following Differences,* viz. 1. *That ſome of them do flower early, with or before the* Early-flowering Tulips; *and ſome of them flower later, to wit, a Month or more after the former.* 2. *That in ſome the Color is paler; and in others again of a very high or deep color.* 3. *That ſometimes they have eight Leaves, and ſometimes ten or twelve Leaves, as if two Flowers were made one, which ſome call a* Double Fritillary. *The Flowers at top of the Stalk are Chequer'd moſt admirably, and yet in the ſame, Nature has kept a wonderful Order, ſurpaſſing the moſt curious Painting which Art can perform: one ſquare is of a greeniſh yellow color; the other purple, keeping the ſame Order, as well on the backſide of the Flower as on the inſide; ſometimes they are blackiſh in one Square, and of a Violet-color in another; ſo that Nature ſeems in a ſimple Flower to bring forth Variety in Perfection.*

VI. *The*

VI. *The third, or* Blood-red Fritillary, *has a Root ſom. what rounder and cloſer than the firſt; from whence the Stalk riſes up, being ſhorter and lower than in any other of theſe kinds, having one or two Leaves thereon, and at the top thereof two or three more ſet cloſer together, which are broader, ſhorter and whiter than any of them before, almoſt like unto the Leaves of the* Yellow Fritillary; *from among which top Leaves comes forth the Flower, ſomewhat bending down, or rather ſtanding forth, being larger than any of the former, and almoſt equal in Largeneſs to the* Yellow Fritillary, *of a dusky grey color on the outſide, and of a very dark red color on the inſide, diverſly ſpotted or ſtraked: this very hardly encreaſes by the Root, and as ſeldom gives ripe Seed, but flowers with the other firſt or early ſorts, and before the black kind, and abides a leſs time in Flower than any.*

VII. *The fourth, or* Great purple *or* red Fritillary, *has a Root equal to the Largeneſs of the reſt of its parts; from whence riſes up one, and ſometimes two Stalks, having one, two or three Flowers apiece on them, as Nature and the Seaſon ſerves: each one of theſe Flowers are larger and greater than any of thoſe before deſcribed, and pendulous in like manner as they are, of a ſad red or purpliſh color, with many thwart or croſs Lines on them, and ſmall long Marks, which ſcarcely appear Chequerwiſe, nor are ſo eminent or conſpicuous as in the former. The Stalk is ſtrong and high, whereon are ſet ſeveral long whitiſh green Leaves, larger and broader than thoſe of the former.*

VIII. *The fifth, or* White Fritillary, *has a Root ſo like unto the former, as not to be diſtinguiſhed, and the whole Plant is ſo very like unto the firſt, that it is needleſs to make any Deſcription, but only ſhew the chief Differences. In this the Stalk and Leaves are wholly green, by which this is diſtinguiſhed from that, which is browniſh at bottom. The Flower in this is white, without almoſt any ſhew of Spot or Mark in it, tho' in ſome they are more plainly to be ſeen; and in ſome there is again a kind of faint bluſh color to be ſeen in the Flower, eſpecially on the inſide, the bottoms of the Leaves of every one of which are greeniſh, having alſo a ſmall Liſt of green coming down towards the middle of each Leaf: as for the Head or Seed-Veſſel and Seed, they are ſo like to the firſt, as not to be differenced from them.*

IX. *The ſixth, or* Double bluſh Fritillary, *has a white round flattiſh Root, like unto the laſt, bearing a Stalk with long green Leaves thereon, little differing from it, or the firſt deſcribed kind. The Flower is conſtantly the ſame, compoſed of many Leaves, being ten at the leaſt, but moſt uſually twelve, of a pale whitiſh purple color, ſpotted like unto the* Paler ordinary early Fritillary, *ſo that one would think it to be an accidental kind thereof; whereas it is (as is aforeſaid) conſtant in its Appearance and manner of Flowering.*

X. *The ſeventh, or* Abſolute yellow Fritillary, *has a whitiſh Root, more round and not ſo flat as the former kinds, and of a mean Largeneſs. From the middle riſes up a Stalk a foot and half high, and ſometimes higher, on which grow, without any Order, ſeveral long and broadiſh Leaves, of a whitiſh green color, like unto the Leaves of the* Black Fritillary, *but not above half ſo broad: the Flower is ſomewhat ſmall and long, not much unlike to the* Black *for Shape or Form, but that the Leaves are ſmaller and rounder pointed, of a faint yellowiſh color, without any ſhew of Spots or Chequers at all, either within or without the Flower, having ſome Chives and yellow Pendents in the middle, as are to be ſeen in them all. The Seed is like to that of the firſt kind.*

XI. *The eighth, or* Variegated yellow Fritillary, *has a Root like to the other, but not ſo flat. It grows not much lower than the former, and browniſh at the riſing up, having its Leaves whiter, broader and ſhorter than it, and almoſt round-pointed. The Flower is greater and larger ſpread than any of the afore-deſcribed, and of a fair pale yellow color, ſpotted in very good order with fine, ſmall, yellow Chequers, which give it a wonderful pleaſing Beauty. It has alſo ſome Liſts of green running down the back of every Leaf; and ſeldom yields any Seed.*

XII. *The ninth, or* Great yellow Italian Fritillary, *from a Root ſomewhat like to the others before, it ſends up a round and brown green Stalk, on which grow ſeveral Leaves, ſomewhat broad and ſhort, which encompaſs the Stalk at their bottom, of a dark green color; at the top of which Stalk, which bends a little downwards, do moſt uſually grow three or four Leaves, between which comes forth moſt commonly but one Flower, which is longer than the laſt, hanging down the Head, as all the others do, conſiſting of ſix Leaves, of a dark yellowiſh purple color, ſpotted with ſome ſmall red Chequers. This flowers late, or not till all the other are paſt.*

XIII. *The tenth, or* Small Italian Fritillary, *has much alike Root and Stalk, but ſmaller: the Stalk has ſeveral ſmall, ſhort, green Leaves thereon to the very top, but it bears a greater ſtore of Flowers than the former, but they are much ſmaller, and of a yellowiſh green color, ſpotted with long and ſmall dark red Marks or Chequers.*

XIV. *The eleventh, or* Portugal ſmall yellow Fritillary, *has a Root much like the others beforegoing: the Leaves are ſo ſmall, narrow and long, that it has cauſed it to obtain the Name of* Ruſhes, *or* Fritillaria Juncifolia, Ruſh Fritillary, *which grow upon a long, weak, round Stalk, ſet without Order. The Flower is ſmall and yellow, but thicker Chequer'd with red Spots than any of the other* Yellow Fritillaries; *the Stalk of the Flower at Head thereof being alſo of a yellowiſh color.*

XV. *The twelfth, or* Pyrenæan black Fritillary, *has a Root which does often grow ſo great, that it ſeems like unto the Root of a* Small Crown Imperial. *The Stalk is ſtrong, round and high, ſet without Order, with broader and whiter green Leaves than any of the former, bearing one, two or three Flowers, not being ſo large as thoſe of the* Common purple Fritillary, *but ſmaller, longer and rounder, ſometimes turning up the brims or edges of the Leaves again, and are of a yellowiſh ſhining green color on the inſide, ſometimes ſpotted with red Spots, almoſt thro' the whole inſide of the Flower, unto the very edge, which abides of a pale yellow color; and ſometimes again there are very few Spots to be ſeen, and thoſe from the middle only on the inſide, (for on the outſide of this ſort there never appears any Spots at all) and ſometimes without any ſhew of Spots; ſometimes alſo of a more pale green, and ſometimes of a more yellow color. The outſide of the Flowers do likewiſe vary; for in ſome the outſide of the Leaves are of a dark dull yellow, ſometimes of a more pale yellow, and other times of a dark purpliſh yellow, which in ſome is ſo deep and ſo much, that it rather ſeems black than purple or yellow, and this chiefly about the bottom of the Flower, next to the Stalk, but the edges are ſtill of a yellowiſh green. The Head and Seed are like unto the former, but larger in all reſpects.*

XVI. *The thirteenth, or* Spaniſh Umbelliferous black Fritillary, *is no doubt of kin to the laſt deſcribed; but is in its Root, Stalk, Leaves and Flowers greater than it, and ſo greater in the whole, as if growing in a fatter or richer Soil, it were the ſtronger, and ſo more proliferous and able to bear a greater ſtore of Flowers. The Flowers grow four or*

five

five from the Head together, hanging down, round about the Stalk, like unto a Crown Imperial, *and are of a yellowish green color on the inside, spotted with a few red Spots, the outside being blackish as the former.*

XVII. *The Places.* The first of these came from *France*, where, about *Orleance*, it grows plentifully: the other sorts grow in those Countries which their Titles indigitate, but are all of them nurs'd up with us in *Gardens* of *Florists*, and are most of them become Natives of this Kingdom.

XVIII. *The Times.* The early kinds do flower in the beginning of *April*, according to the Mildness or Hardness of the aforegoing *Winter*: the others flower after the first are past for a Months space, one after another; and the *Great yellow* is very late, not flowering till about the middle or the end of *May*.

XIX. *As to the Qualities, Specification, Preparations and Virtues* of these Plants, or any of them, Authors have said nothing at all, whether inwardly to be taken or outwardly to be applied; nor have I had any Experience of their Effects in my fourty Years Practice: they are a glorious and admirable Flower, of an extraordinary Beauty, and their chief Use with us, is to be an Ornament for Gardens, which they nobly beautify, and therefore deserve our Cultivation, Entertainment and Observation; especially of *Florists*, and other Lovers of Curiosities of this kind.

CHAP. CCIV.

Of DAISIE Garden.

I. *THE Names.* The *Daisie* is called in *Greek*, (as some suppose, from *Theophrastus lib.* 7. *cap.* 9.) Ἀστερὶς; but this I judge to be a Mistake, for it does not plainly appear in any *Greek* Author, that the *Grecians* had the Knowledge thereof: in *Latin*, *Bellis*, *Pliny lib.* 26. *cap.* 5. and in *English*, *Garden Daisie*. The *Latins* also call it, *Herba Margarita*.

II. *The Kinds.* The chief kinds are, 1. *Bellis hortensis*, The Garden Daisie, of which in this Chapter. 2. *Bellis agrestis*, The Field Daisie, of which in Chap. 205. 3. *Bellis major vulgaris*, The greater common Daisie, of which in Chap. 206. 4. *Bellis spinosa*, The Thorney Daisie, of which in Chap. 207. 5. *Bellis Americana*, The West India or American Daisie, of which in Chap. 208. following.

III. *Bellis hortensis*, or the Garden Daisie is manifold, *viz.* 1. *Bellis minor flore rubro simplici*, Single red Daisies. 2. *Bellis major flore albo pleno*, The great double white Daisie. 3. *Bellis minor flore pleno variorum colorum*, The lesser double Daisies of divers colors. 4. *Bellis minor prolifera*, Double double Daisies. 5. *Bellis Globularia cerulea*, Blew Globe Daisies. 6. *Bellis Globularia lutea*, Yellow Globe Daisies.

IV. The Descriptions. *The first, or* Single red Daisie, *has Roots which are small, white and fibrous or thready; from whence rise many smooth, green, round-pointed Leaves, lying on the Ground, a little snipt about the edges: from among which rise up many slender round Foot-stalks, rather than Stalks or Stems, about an hand breadth high at most, and sometimes not so high, bearing one Flower apiece, consisting of many small Leaves, as a Pale or Border, set about a middle Thrum: the Leaves are almost wholly red, whereas in the middle they are white or whitish, enclining to red on the edges, the middle being yellow.*

V. *The second, or* Great double white Daisie, *has a white fibrous or stringy Root: the whole Plant is so like to the* Great single kind, *which grows by Highways, and in Meadows and Fields, that there is no difference between them, but in the Flower, which in this is double. It has many long and somewhat broad Leaves, lying upon the Ground, deeply cut in on both sides, somewhat like unto an* Oaken *Leaf: but those which are on the Stalks, are shorter, narrower, and not so deeply cut in, but only notched on the edges. The Flowers at the top are white and double, consisting of several Rows of Leaves, being greater in Compass than any of the* Double Daisies *which follow, but nothing so double of Leaves.*

VI. *The third, or* Leſſer double Daiſie, *has a white fibrous Root, from whence riſe Leaves, lying upon the Ground, in Form like to the* Common ſingle ones, *from which they differ little or nothing, but that they are ſmaller, and little or nothing ſnipt about the edges. The Stalks likewiſe are ſmaller and lower, but bearing as double Flowers as any, being compoſed of many ſmall Leaves, thick thruſt together, of various colors; for ſome are wholly of a pure white, others have a little red, either diſperſed upon the white Leaves or on the edges, and ſometimes on the backs of the Leaves: ſome again ſeem to be of a whitiſh red, more red than white, when indeed they are white Leaves, diſperſed among the red: others are of a deep or dark red color; and ſome are ſpeckled or ſtriped with white and red through the whole Flower: and in ſome the Leaves will be red on the upper ſide, and white underneath: and ſome (tho' but very rare) are of a greeniſh color. Of this kind ſome have Stalks and Heads which are round; and ſome again which are flat: which laſt I have known to degenerate into round, and ſo to continue.*

VII. *The fourth, or* Double double Daiſie, *has no difference in Root, Leaf or Stalk from the former kind, but only in the Flower; which in this bears many ſmall double Flowers, ſtanding upon very ſhort Stalks round about the middle Flower, which is uſually as great and double as any of the other double kinds, and is either wholly of a deep red or ſpeckled with white and red, as in ſome of the former kinds, or elſe greeniſh, all the ſmall Flowers about it being of the ſame color with the middlemoſt.*

VIII. *The fifth, or* Blew Globe Daiſie, *has a hard and fibrous Root, and a great Affinity with the Plant laſt deſcribed, both in Form of its Leaf and Flower. It has many narrower, ſhorter and blacker green Leaves than the former, lying round about upon the Ground; among which riſe up ſlender, but ſtiff and hard Stalks, ſix inches or more high, ſet here and there with ſmall Leaves, and at the top a ſmall round Head, compoſed of many ſmall blew Leaves, ſomewhat like unto a* Scabious *Head; and ſometimes it is alſo found with white Heads of Flowers. The whole Plant is of a bitter Taſte.*

IX. *The ſixth, or* Yellow Globe Daiſie, *has a Root of a Fingers length, round and hard, with a thick Rind, and a woody Pith in the middle, of a ſharp drying Taſte and ſtrong Smell: from whence riſe up many thick, ſmooth, round, pointed Leaves, ſpread upon the Ground like the former: among which ſpring up ſeveral ſmall round ruſhy Stalks, a foot high, bearing about their middle two ſmall Leaves at the Joints, and at the tops round Heads of Flowers thruſt thick together, ſtanding in purpliſh Husks, every one of which Flowers do blow or ſpread into five Leaves Star-faſhion, and of a fair yellow color, ſmelling not much unlike to* Broom *Flowers, with many ſmall Threads in the middle, encompaſſing a flat Pointel, horned or bended two ways. After the Flowers are faded, riſe up Seed-Veſſels, which are round, ſwelling out in the middle, and divided into four parts at the tops, containing within them round, flat, black Seed, with a ſmall Cut or Notch in them. The Leaves of this Plant are of a ſharp and bitter Taſte.*

X. *The Places.* The firſt four are planted and found only in *Gardens*; and require to be often replanted, otherwiſe they degenerate into ſingle Flowers, or at leaſt into leſs double. The two laſt are alſo Garden-Flowers, but more rarely to be met with than the others; the *Blew Daiſie* is a Native of *Montpelier* in *France*, and of the Mountains in many places of *Italy*; the *Yellow kind* is *Italian*, and found up and down in the Kingdom of *Naples*.

XI. *The Times.* All ſorts of *Daiſies* almoſt flower betimes in the Spring, during *April* and *May*, and ſome of them in *June*; but the former *Blew* and *Yellow* flower not until *Auguſt* or *September*.

XII. *The Qualities.* They are cold and dry in the firſt Degree; and are Abſterſive, Aſtringent, Incarnative and Vulnerary; Hepatick, Arthritick and Analeptick.

XIII. *The Specification.* They are dedicated to the Curing of Wounds; for which Reaſon Authors have accounted them among the *Conſolidæ*, or Wound-Herbs.

XIV. *The Preparations.* You may prepare therefrom, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *A Decoction.* 4. *A compound Decoction in Wine.* 5. *An Ointment.* 6. *A Balſam.* 7. *A Cataplaſm.* 8. *A diſtilled Water.* 9. *An Acid Tincture.* 10. *An Oily Tincture.*

The Virtues.

XV. *The liquid Juice.* It is good to heal Wounds, whether inward or outward: it unites with and ſtrengthens the Balſam of the Blood, and ſo induces the Healing, by drying, ſtrengthning and conglutinating. It abates Heat, and alleviates the Boiling of Choler, refreſhing the Liver and other inward Parts. It is good to cure the Wounds made in the Cavity of the Thorax or Breſt, being taken two or three ounces at a time, three or four times a day, either alone or mixed with a little Wine: dropped into running Eyes, it much helps them.

XVI. *The Eſſence.* It has all the former Virtues to a great Advantage, excepting that it heals more; but it much more powerfully conſolidates Wounds. It may be given alone, from one ounce to two or three ounces, or it may be mixed with a Syrup made of the Juice of the ſame Herb.

XVII. *The Decoction.* It cures inward Wounds of the Breſt as the former Preparations do; but it is not altogether ſo powerful. If it is made with Wine, it cleanſes, incarnates and cures all Ulcers and Pulſtes in the Mouth or Tongue, or in the Secret Parts.

XVIII. *The compound Decoction.* Take *Daiſie* Leaves and Roots five handfuls: *Agrimony, Dwarf, Elder*, of each three handfuls: being bruiſed, boil all in three quarts of Wine till a quart or more is conſumed: then ſtrain out for Uſe. It is good againſt Palſie, Gout and Sciatica, to foment the parts therewith two or three times a day, ſo hot as the Patient can endure; it comforts the Nerves, and eaſes the Pains of the Parts afflicted.

XIX. *The Ointment.* It cleanſes, dries and heals old Ulcers, and diſſolves or diſperſes Tumors, Knots or Kernels in the fleſhy Parts of the Body: it diſcuſſes ſimple Contuſions, which come thro' Falls or Blows; and abates Tumors or Swellings in the *Scrotum*, being duly applied: it is ſaid to cure wonderfully all ſorts of ſimple Wounds accompanied with Inflammation, and ſuch as are kept long from healing by reaſon of the Afflux of Humors to them, whether in the Joints, Arms or Legs.

XX. *The Balſam.* It has all the Virtues of the Ointment, but it cleanſes putrid and corrupt Sores, and foul Ulcers, much better than that: and ſometimes it cures ſimple green Wounds at one Dreſſing. It gives eaſe in the Gout and Sciatica, and ſtrengthens the Nerves and weak Joints, being applied.

XXI. *The Cataplaſm.* It diſcuſſes recent Tumors and ſimple Contuſions; and is effectual, being applied, to Swellings of the *Scrotum*: applied to a ſimple recent Wound, after it has been waſhed with Spirit of Wine, it many times conglutinates the Lips thereof at the firſt Application.

XXII. *The*

XXII. *The diſtilled Water.* It is cooling, and has the Virtues of the liquid Juice, but very much weaker; however, it may be uſed as a Vehicle to convey refrigerating or cooling things in: it abates the Heat of Fevers, abates inward Inflammations, and allays the Turgency of Choller.

XXIII. *The Acid Tincture.* It is ſingular good to cure Fevers, eſpecially ſuch as are burning, malignant or peſtilential: it cools powerfully, quenches Thirſt and compoſes the Spirits. Doſe 30, 40 or 60 drops or more in ſome convenient Vehicle, or in any thing the Patient drinks, and to be as often repeated as they call for any thing to quench their Thirſt with.

XXIV. *The Oily Tincture.* It is a ſingular thing againſt all Wounds and Punctures of the Nerves: it alſo cures Convulſions in what part of the Body ſoever; and is a famous thing againſt Palſies, if the Back-bone, as alſo all the Parts affected, be well anointed therewith by a cheerful Fire, and it is well rubbed in for half an hour at a time, and this twice a day, *viz.* Morning and Evening.

CHAP. CCV.

Of DAISIE Field.

I. *THE Names.* It is called in *Latin*, *Bellis agreſtis*, *Herba margarita*; and by ſome, *Conſolida minor*: and in *Engliſh*, *Daiſie*, and *Field Daiſie*.

II. *The Kinds.* There are two principal kinds thereof, which are very common, *viz.* 1. *Bellis minor Sylveſtris*, The leſſer Wild Daiſie. 2. *Bellis major vel media Sylveſtris*, The greater or middle Wild or Field Daiſie.

III. The Deſcriptions. *The firſt, or* Small common ſingle Field Daiſie, *has a Root which is ſmall, white and fibrous; from the Head of which ſprings forth many thick and ſomewhat long green Leaves, lying upon the Ground, ſmall at the bottom, but broad, and almoſt round towards the point or end, and a little dented about the edges. From among this heap or tuft of Leaves riſe up many very ſlender, weak and naked Stalks, or rather Foot-ſtalks, of three, four or five, or more inches high, bearing every one of them a ſmall green Head, from whence riſe many ſmall white Leaves, encompaſſing a yellow Thrum, which is in the middle. Sometimes the green Leaves will be found much larger in one place than in another; and the Flower likewiſe will in ſome be reddiſh at the ends, and ſometimes under ſtained; and yet notwithſtanding all this difference, they are but one kind or ſort, and not divers, as ſome maintain.*

IV. *The ſecond, or* Greater or middle Field Daiſie, *tho' it is another Species, yet it agrees with the former in moſt reſpects, ſaving that its main Root is thicker and longer, with many ſmall white Fibres proceeding therefrom: the Leaves are larger and dented in almoſt in like manner on the edges: the Stalks are thicker, but round and ſomewhat higher; and the Flowers, like the other, white, and ſometimes on the tips of their Leaves with a bluſh of red, but they are larger every way: the Thrum in the middle is alſo bigger, but of the ſame yellow color with the before deſcribed.*

V. *The Places.* They grow wild almoſt every where, in moſt Meadows and Paſture-Grounds of this Kingdom.

VI. *The Times.* They flower in moſt of the Summer Months, *viz.* in *April*, *May*, *June* and *July*.

VII. *The Qualities, Specification, Preparations and Virtues*, are the ſame with *Garden Daiſies*, only they are with this Advantage, that the *Field Daiſie* is more effectual for all the Purpoſes deſigned: ſee *Chap.* 204. ſect. 12. ad 24. aforegoing.

CHAP.

CHAP. CCVI.

Of DAISIE Great.

OR,

MAUDLIN-WORT.

I. *THE Names.* It is called in *Latin*, *Bellis magna*, *Maxima & Major*; and in *English*, *The great Daisie*, (but it is the greateſt of all the ſorts of *Daiſies*) and *Maudlin-wort*.

II. *The Kinds.* It is *Singularis ſui generis*; and is called by ſome Authors, *Conſolida media*, The middle Conſound; but the true middle Conſound is *Bugula*; others, to make a Difference in the Name between *Bugle* and this, call it *Conſolida media Vulnerariorum*: however, it is taken by all to be *Conſolida medii generis*, or a kind of middle Conſound, from the Virtues it is endowed with.

Great Daisie

III. The Deſcription. *It has a Root which is a Buſh of white Fibres or Strings, which abide many Winters with the Leaves, ſhooting forth every Spring anew: from the Head of this* Root *ſpring forth many long, narrow and narrow-pointed Leaves, lying next the Ground, but cut in on both ſides, making it ſeem almoſt like the Diviſions of ſome ſorts of* Oaken *Leaves, or rather like to the Leaves of* Groundſel: *the Stalks grow to be ſomewhat tall,* viz. *about a foot and half in height, with divers Leaves thereon, much in Shape like the other, but ſmaller and leſſer divided than the lower; and growing yet ſmaller and leſſer divided, the nearer they grow to the top. At the tops of the Stalks grow pretty large Flowers, with white Leaves, and a yellow Thrum in the middle, like the Flower of the* Single Field Daiſie, *or thoſe of* May-weed, *but ſomething leſſer than this laſt named; each Flower grows upon a ſeveral Foot-ſtalk, and the white and narrow Leaves are as a Pale or Border round about the middle yellow Thrum and are of no Smell at all: after the Flowers are paſt, then comes the Seed, which is ſomewhat long, and is blown away with the Wind.*

IV. *The Places.* It grows almoſt every where, by Hedge-ſides, in Meadows, the Borders of Fields, and other waſte Grounds.

V. *The Times.* It flouriſhes and flowers in the Months of *May* and *June*.

VI. *The Qualities.* It is cold in the firſt Degree, and temperate in reſpect to Dryneſs and Moiſture, but in ſome Authors Opinions it enclines to Dryneſs. It is Aſtringent, Conglutinative and Vulnerary, appropriated to the Liver and Joints, and is Analeptick.

VII. *The Specification.* It conſolidates and conglutinates the Lips of Wounds to a Miracle.

VIII. *The Preparations.* You may have therefrom, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *A Decoction.* 4. *A diſtilled Water.* 5. *A Wound Drink.* 6. *An Ointment or Balſam.* 7. *A Cataplaſm.* 8. *A Clyſter.*

The Virtues.

IX. *The liquid Juice.* It is given to very good Purpoſe to heal any inward Wound, conſolidate the Rupture of any Veſſel in the Thorax, cure Spitting or Piſſing of Blood, and helps Ruptures of the Inteſtines. Doſe two or three ounces Morning and Evening in a Glaſs of old Malaga or Red Port Wine.

X. *The Eſſence.* It has all the former Virtues; beſides which, it is excellent againſt Bloody-fluxes, and all other Fluxes of the Bowels: and has ſometimes been found of good Uſe in overflowing of the Loches, or of the Terms in Women. Doſe two, three or four ſpoonfuls Morning and Night, in a Glaſs of Generous Wine.

XI. *The diſtilled Water.* It is ſaid to be good againſt Ruptures of the Bowels; and may be uſed as a Vehicle to convey other Medicines in: ſweetned with Sugar Candy, it is very good againſt a Cough.

XII. The Wound Drink. ℞ *of this* Daiſie *Leaves ſix handfuls:* Sanicle, All-heal, *of each three handfuls:* Bugle *two handfuls:* Angelica *one handful: boil all in Water ſix quarts to three: ſtrain out and add thereto an equal part of white Port Wine, which ſweeten a little with white Sugar as it is taken.* Doſe eight ounces Morning, Noon and Night: it is of great Effect in the Cure of all ſorts of old and malign Ulcers, Fiſtula's, and the like.

XIII. *The Ointment or Balſam.* It is made with Oil, Turpentine and Wax, and is excellent for Wounds, eſpecially thoſe in which there is any thing of Inflammation, and will not come to Digeſtion or Maturation, as are thoſe *Sinoviæ* or weeping Wounds made in the Knees, Elbows and other Joints.

XIV. *The Cataplaſm.* It is good againſt all burning Apoſtems and Ulcers, as alſo an Inflammation and Running of the Eyes, being applied thereto: it likewiſe eaſes the extream Pain of the Gout, being applied, and renewed as often as need requires.

XV. *The Clyſter.* It gives eaſe in the vehement Torments of the Guts, Gripings of the Bowels, and is profitable in the violent Heat of Agues; and alters the Habit of the Belly where there is a great Stypticity or Binding: and in a Bloody-flux, Diarrhea or Lienteria, it does much good.

CHAP. CCVII.

Of DAISIE Thorney.

I. *THE Names.* It is called in *Latin*, *Bellis ſpinoſa flore luteo nudo*, alſo *Bellis major ſpinoſa*: in *Engliſh*, *The Thorney Daiſie*, or *The naked-flowered yellow Daiſie, with prickly Leaves.*

II. *The Kinds.* It is a ſingular Plant of its kind, and noted becauſe of its naked Flower.

Thorney Daisy.

III. The Deſcription. *It has a Root conſiſting of a great Tuft or Buſh of long blackiſh Strings, or long Fibres, whoſe Taſte is bitter and unpleaſant, and its Smell ſomething ſtrong; from the Head of which ſtringy Root, ſpring up divers Heads of very ſmall green Leaves, dented about the edges, and every dent ſharp at the point, which ſhooting up into Stalks, with the like, but leſſer Leaves on them, become hard and woody up to the tops, ſometimes branched and ſometimes not, but bearing on their various tops ſeveral ſmall round Flowers on ſeveral ſmall Foot-ſtalks, which Flowers have no Border of Leaves, either white or yellow, to encompaſs them, but are like to thoſe of the* Naked Cammomil *or* Fetherfew, *yet ſomewhat leſſer, being a yellow round Knob, ſomething hollow in the middle. When the Flower is paſt, there come in their places ſmall Heads with Seed, each of which is ſmall, long and whitiſh, which muſt be quickly gathred when it is ripe, or otherwiſe it quickly falls, or is blown away with the Wind.*

IV. *The Places.* It was firſt brought out of *Italy* by Dr. *Hud*, from the Garden of *Piſa*, in the Duke of *Florence* his Dominions; but is only nurs'd up with us in *Gardens.*

V. *The Times.* It is in its Vigor in *June*, and flowers in *June*, *July* and *Auguſt*; and ſeeds in ſome little time after.

VI. *As to its Qualities, Specification, Preparations and Virtues*, Authors have ſaid nothing, and therefore we ſhall be ſilent concerning the ſame. It is a Curioſity valued by *Floriſts*, and ſerves chiefly as an Ornament for the *Garden.*

CHAP. CCVIII.

Of DAISIE American.

I. *THE Names.* It is called in *Latin*, *Bellis Americana*, *Bellis Americana Umbelliſera*, and *Bellis major Ramoſa Americana*: in *Engliſh*, *The great white*, or *American Daiſie.*

II. *The Kinds.* This is alſo *ſingularis ſui generis*, and therefore admits but of a ſingle Deſcription.

III. The Deſcription. *It has a fibrous or ſtringy Root, from which ſpring up one, two or more Stalks, which grow higher and greater than the* Great Daiſie *in Chap.* 206. *aforegoing: the* Leaves *are alſo larger, and broadeſt towards the ends, but longer and ſmaller at the bottoms, dented likewiſe about the edges, ſhooting forth ſeveral Branches, and all of them bearing many white Flowers at their tops, as it were in an Umble, yet not ſo great, nor the white* Leaves *ſo large as it, but ſmaller, and more in number, with a greeniſh yellow Thrum in the middle, ſome of which are a little larger than others: the Seed is alſo ſmaller than that in* Maudlin-wort.

IV. *The Places.* It was firſt brought to us from *Virginia*, and grows well enough in our Gardens, being looked after with a little Care: I alſo found it growing in ſeveral places in the *Southern* parts of *Carolina*, and other parts adjacent thereto.

V. *The Times.* It flowers in *May* and *June*, and the Seed is ripe in ſome ſhort time after.

VI. *The Qualities, Specification, Preparations and Virtues*, are the ſame with thoſe of the *Great Daiſie* in *Chap.* 206. aforementioned. It is indeed a ſingular Wound-Herb, and ought to be commended for the ſpeedy curing of ſimple green Wounds, being made into proper *Ointments* or *Balſams*, or applied in the Form of a *Cataplaſm.*

CHAP. CCIX.

Of DANDELION,

O R,

PISS-A-BED Common.

I. *THE Names.* This Plant ſeems to be unknown to the *Greeks*, and therefore can have no *Greek* Denomination, tho' ſome Authors will have it to be the Ἡδύπνοον, *Plinii lib.* 20. *cap.* 8. and others, that it is the Ἀχάνη, *Theophraſti*, which is *Ambubeia*, a kind of *Cichory*, or *Prieſts Crown*: but in *Latin* it is called, *Dens Leonis*, *Roſtrum Porcinum*, and *Corona vel Caput Monachi*; and in *Engliſh*, *Dandelion*, or *Piſs-a-bed.*

II. *The Kinds.* It is doubtleſs one of the kinds of *Wild Succory*; of which there are ſeveral Species, *viz.* 1. *Dens Leonis vulgaris*, Our common Dandelion,

Dandelion, of which in this Chapter. 2. *Dens Peregrinus*, Outlandiſh Dandelion, of which in the next Chapter.

III. This our *Common Dandelion* is alſo twofold, *viz.* 1. *Dens Leonis latifolius vulgaris, Urinaria, Hieracium majus Tragi, Hieracium parvum Cordi, (in Hiſtoria) Hieracium minus Geſneri, (in Hortis) Chondrilla altera Thalii, Dodonæi, Cæſalpini, Hedypnois major Fuchſii, Hedypnois Dalechampii & Lugdunenſis, Taraxicon minus Loniceri, Taraxacon verum* of *Serapio & Avicen:* and ſo it is uſed with us in all Compoſitions wherein *Taraxacon* is named; Our Common broad-leav'd Dandelion. 2. *Dens Leonis anguſtioribus foliis: Aphaca anguſtioris folii Cæſalpini*, The narrow-leav'd Dandelion.

Dandelion.

IV. The Deſcriptions. *The firſt, or* Broad-leav'd kind, *has a Root which grows downwards very deep, which being broken off within the Ground, will nevertheleſs ſhoot forth again anew, and with difficulty be deſtroyed when it has once taken deep Rooting: from the Head of this Root ſpring forth ſeveral long and deeply gaſhed Leaves, lying round about it on the Ground; the ends of each Gaſh or Jag on both ſides looking downwards to the Root again, the middle Rib being white, which being broken, yields much bitter Juice, of a Milk-white Color and Subſtance, but the Root much more. From among theſe Leaves (which alwaies abide green) ariſe many ſlender, weak, naked Foot-ſtalks, (rather than Stalks) of about ſix, eight or ten inches high, very rarely a foot long, every one of them bearing at the top one large yellow Flower, conſiſting of many Rows of yellow Leaves, broad at the Points, and notched in, with a deep Spot of yellow in the middle, which growing ripe, the green Husk, in which the Flower ſtood, turns it ſelf down to the Stalk, and the Head of Down becomes as round as a Ball, with long reddiſh Seed underneath, each Seed bearing a part of the Down on its Head; which Seed, together with the Down, is blown away with the Wind, and when perfectly ripe, may with a Blaſt of ones Mouth be blown perfectly away.*

V. *The ſecond, or* Narrow kind, *as to its Root, Stalks, Flowers, Down, Seed and manner of Growing is wholly like the before deſcribed: the Leaves in ſpringing forth, growing round the Root, the Number and Deepneſs of the Gaſhes or Diviſions on the edges, are much like the former alſo; but in this the Difference is, that the Leaves of this latter Plant are narrower; and by this one Note it may be diſtinguiſhed.*

VI. *The Places.* They grow almoſt every where, in all Meadows and Paſture-Grounds, in Cloſes near to Water-Ditches, as alſo in Gardens and Highways. The firſt is common almoſt every where; but the ſecond is ſomewhat rarer, yet often to be met with.

VII. *The Times.* They flower thro' all the *Summer Months*; and the firſt is found in ſome place or other in flower every Month of the Year, eſpecially if the Winter is mild, and not extream cold.

VIII. *The Qualities. Dandelion* is cold and dry in the firſt Degree: Aperitive, Abſterſive, Diuretick and a little Aſtringent; Stomatick, Hepatick, Splenetick and Nephritick.

IX. *The Specification.* It is ſingular againſt Obſtructions of the Viſcera, and Hypochondriack Melancholy.

X. *The Preparations.* You may have therefrom, 1. *A Sallet.* 2. *A liquid Juice.* 3. *An Eſſence.* 4. *A Decoction.* 5. *A diſtilled Water.* 6. *An Ointment or Balſam.* 7. *A Cataplaſm.*

The Virtues.

XI. *The Sallet.* Whether eaten raw with other Herbs, or boiled, and ſo dreſs'd up with Butter, Vinegar, Salt and Pepper, it is ſaid to be a good Dith to open Obſtructions of the Bowels, cleanſe the Stomach, cauſe a good Appetite, and purify the Blood: the *French* and *Dutch* are ſaid to eat them often in the Spring; but I believe for the moſt part as a boiled Sallet.

XII. *The liquid Juice of Leaves and Roots.* It may be given to two or three ounces in a Morning faſting, and likewiſe at Night going to Bed, either alone by it ſelf, or mixt with a Glaſs of White Port Wine, to purify the Blood and Juices, open all ſorts of Obſtructions of the Bowels, expel the Jaundice, provoke Urine, reſiſt Hypochondriack Melancholy, and eaſe the Pain of the Spleen.

XIII. *The Eſſence of Leaves and Roots.* It has all the Virtues of the liquid Juice, being more powerful to thoſe Intentions: beſides which, this ripens and digeſts inward Apoſtems of the Viſcera and Urinary Paſſage, breaks, cleanſes and heals them, and more powerfully opens the Paſſages of the Urine, whether in Young or Old. Dole three or four ſpoonfuls in White *Lisbon* Wine, Morning and Night.

XIV. *The Decoction in Wine or Water.* It has the Virtues of the former Preparations, but in a lower degree: however, it is good to be drank half a pint at a time Morning and Evening, by ſuch as are inclining to a Conſumption, or have an ill Diſpoſition of the whole Body, called by the Learned, *Cachexia*; in which caſes being uſed for ſome conſiderable time, it gives a wonderful Relief; beſides, being made in Water, and acuated with a few drops of Oil of Sulphur, it prevails againſt all ſorts of burning, putrid, malign and peſtilential Fevers.

XV. *The diſtilled Water.* Acuated with Oil of Sulphur, it prevails againſt the Spotted-Fever, and the Plague it ſelf: mixed with the liquid Juice or

Eſſence, it is good to waſh and cleanſe old Sores, running Fiſtula's and putrid Ulcers, and ſo to diſpoſe them to a ſpeedy healing.

XVI. *The Ointment or Balſam.* It digeſts, ripens, cleanſes, dries and heals old and running Sores, and is a very good thing in all ſtubborn and rebellious Ulcers, to bring them to a Cicatrize.

XVII. *The Cataplaſm.* Being applied hot, and often renewed, it brings Apoſtemations to Maturity: and being applied cold made of the green Herb, it diſcuſſes Tumors ariſing in ſimple Contuſions, hinders the Aggregation or Flux of Humors, and eaſes the Pain.

CHAP. CCX.

Of DANDELION Outlandiſh.

I. *THE Names.* It has no *Greek* Name; but is called in *Latin*, *Dens Leonis peregrinus*; and in *Engliſh*, *Outlandiſh Dandelion.*

II. *The Kinds.* There are five Species hereof, *viz.* 1. *Dens Leonis tenuiſſimo folio*, *Hieracium Fœtidum Columnæ*, Fine jagged Dandelion. 2. *Dens Leonis minor ſoliis radiatis*, *Trinciatella Italorum Camerarii*, Sweet Dandelion. 3. *Dens Leonis minor folio aſpero*, Small rough Dandelion. 4. *Dens Leonis altera Dioſcoridis*, *Dens Leonis Monſpelienſium*, *ſive Aſphodeli bulbulis*, *Bauhini*, Bulbed Dandelion. 5. *Dens Leonis Gadenſis*, *Cichorium Conſtantinopolitanum*, Spaniſh Dandelion.

III. The Deſcriptions. *The firſt*, *or* Fine jagged Dandelion, *has a thick reddiſh Root full of Fibres, ſending forth many very green and finely cut Leaves, each of them about a Hand breadth long, and two inches broad, being deeply jagged or divided again into two or three other ſmall Rents or Diviſions, and ending in a ſmall point. The Flowers which ſtand at tops of the Stalks (which are naked) are yellow, and much ſmaller than thoſe in the former Chapter, which being paſs'd away, the downey Heads and Seed proceed, as in the former.*

IV. *The ſecond*, *or* Sweet Dandelion, *has a ſmall and blackiſh Root, which is white within, and very ſweet in Taſte, (as are the Leaves alſo) which is ſo very tender, that it periſhes with the firſt Cold it feels; and therefore with us is always to be houſed in Winter and cold Weather, by which means it will endure many Years, and yield its Seed in the due Seaſon. From this Root ſpring up many Leaves, which ſpread themſelves on the Ground, about three inches long and half an inch broad, cut in on the ſides with very deep Gaſhes, whoſe ends have each of them three very deep Dents, each of them having divers Points ſtanding like a Star or Spur, the Foot-ſtalks whereof are a little hairy: from among theſe riſe up many ſmooth, ſlender, naked Stalks, one of which ſtands upright, not above a Hand breadth high; the reſt are lower, and bend downwards, each of them bearing a ſmall yellow Flower, like unto other* Dandelions, *which being paſt, turns into Down, and flies away with the Wind, carrying the Seed with it, which is ſomething long and broad, with hard Hairs, like a Beard, at the top of each Seed.*

V. *The third*, *or* Small rough Dandelion, *has a Root ſmall and whitiſh, which ſends forth ſeveral ſmall Leaves, lying round about the Root upon the Ground, about two or three inches long and one inch broad, cut, divided or torn in on the ſides, and each of them ſet with ſmall, ſmooth, ſharp Pricks or Hairs, not much unlike to the* Prickly Sowthiſtle. *The Stalks are about two or three inches high, and bear each of them a large, pale, yellow Flower, like to the other* Dandelions; *which being once paſs'd away, do preſently after turn into Down, with Seed like unto the former.*

VI. *The fourth*, *or* Bulbed Dandelion, *has a Root branched or ſpread out into ſeveral long tuberous Clogs, which ſome call long Bulbs, much like to thoſe of the* Aſphodil, *but ſmaller, ſhorter and more pointed at the ends. From the Head of theſe Roots ſpring forth many large and blewiſh green hairy Leaves, lying upon the Ground, unevenly waved or cut in on the edges, but not deeply gaſht, like the* Common Dandelion, *but which are of a ſharp and bitter Taſte like it: from among which riſe up ſeveral bare or naked Stalks, with Flowers at their tops, larger and more double than thoſe of the* Common kind, *but of a paler yellow color, which paſs into Down, like the other kinds, having alſo like faſhioned Seed.*

VII. *The fifth*, *or* Spaniſh kind, *has a Root of a moderate Largeneſs, long, white, tender and fibrous, which lives with us all the Winter, if it is mild, otherwiſe, if we have hard Froſts, it periſhes: from this Root ſpring up ſeveral long Leaves, a ſpan or more in length; the middle Leaf of the Root is bare from the Root to the half length of the Leaf, and then it has many Rents or Cuts on each ſide, very much reſembling the Leaf of the* Common Dandelion, *but ſmaller and narrower: from among theſe Leaves riſe up likewiſe long Foot-ſtalks, as in the* Dandelion, *upon whoſe tops grow ſmall and yellow Flowers, which turn into Down, that is carried away with the Wind, with the Seed alſo, which is ſmall, long and reddiſh, like unto ſome of the* Hawkweeds.

VIII. *The Places.* The firſt is found in *Meadow* and *Paſture* Grounds. The ſecond is an Original of *Italy*, and from thence it came to us. The third grows about *Florence*, and other parts of *Italy*, as alſo about *Mompelier* in *France*. The fourth is alſo of *Italian* Origination. The fifth came from *Spain*, and grows in the Iſland of *Gades* or *Cadiz*, as *Boel* ſaith, who called it *Cichorium Gadenſe*; but *Cluſius Curæ poſteriores* calls it, *Cichorium ſylveſtre pumilum*, *ſive Hedypnois.*

IX. *The Times.* They all flower thro' all the *Summer* Months: but the fifth or *Spaniſh kind* flowers in *July*, *Auguſt* and *September*; and the Seed is ſoon ripe after the Flower is paſt.

X. *The Qualities*, *Specification*, *Preparations and Virtues*, are the ſame with the *Common Dandelion* in *Chap.* 209. aforegoing, and therefore we ſhall ſay no more thereof.

CHAP. CCXI.

Of DARNEL.

I. *THE Names.* It is called in *Greek*, Αἶρα ἢ ζιζάνιον by moſt *Greek* Authors, and ὄρυζον by ſome: in *Latin*, *Lolium*, and *Æra Plinii*; *Triticum temulentum*, *Triticum ſatuum Loniceri*: in *Arabick*, *Zizania*; and in *Engliſh*, *Darnel.*

II. *The Kinds.* There are three ſorts hereof, *viz.* 1. *Lolium album*, *Hordeum murinum Dodonæi*, White Darnel. 2. *Lolium Rubrum*, φοινιξ, *Phœnix Dioſcoridis*, (*a ſeminis colore phœnicea*) Red Darnel. 3. *Lolium alterum avenacea gluma*, Another Darnel with Oaten tops.

III. The

Darnell White.

III. The Deſcriptions. *The firſt, or* White Darnel, *has a bunchy fibrous Root, from whoſe Head, all the Winter long, ſpring forth ſeveral fat and rough Leaves, which, the higher they grow upon the Stalks, grow alſo narrower, but with their continued Roughneſs: and with theſe firſt ſpringing forth Leaves, ſeveral Stalks alſo ariſe, with many thick Joints, almoſt like Knees; from which Knees ariſe thoſe aforeſaid narrower Leaves, continued up to the ſpiky tops of Seed; for on the top of each Stalk is a long Spike, compoſed of many Heads, as it were at ſo many Joints, ſet one above another on each ſide of the Stalk, containing two or three ſmall chaffy Husks, with ſharp, but ſhort Beards or Awnes at the ends; in which Husks, being ſomewhat tough, is contained the Seed, which is leſs than that of* Wheat, *and which is eaſily ſhaked out of the Ear.*

Red Darnell.

IV. *The ſecond, or* Red Darnel, *has a Root more buſhy or fibrous, from whence ariſe Leaves ſhorter and narrower than thoſe of* Barley, *as alſo ſeveral jointed Stalks, with Leaves ſpringing from each Joint; but as the Joints are leſſer than the former, ſo the Leaves ſpringing from them are alſo narrower and ſomewhat ſhorter. The Stalks are reddiſh, with reddiſh Joints, about ſeven or eight inches high, ſeldom attaining to the height of a foot, unleſs the Ground is very good: at the top of each Stalk is a ſmall and tender flat Spike or Ear, very like the former, but ſmaller and ſhorter, and ſomewhat reddiſh alſo, more eſpecially when it is found growing in the dryer ſort of* Land.

V. *The third, or* Darnel with Oaten Tops, *in its Roots, Leaves and Stalks differs little from the firſt kind, ſaving that the Stalks grow ſomewhat higher, and the Leaves are a little larger: but in this it differs from the firſt, that the ſeveral Heads of Seed are more like to winged* Oaten *Heads, growing on ſlender Foot-ſtalks; and which Heads of Seed are alſo armed with ſharp Points.*

VI. *The Places.* Theſe all grow in Arable Land, in Fields of Corn, as of *Wheat* and *Barley*, and are to be found in ſuch like places, in moſt parts of the Kingdom.

VII. *The Times.* They flouriſh in *Summer*, and the Grain is ripe in *Harveſt* time, *viz.* in *Auguſt*.

VIII. *The Qualities.* *Darnel* is hot in the third Degree, and dry in the ſecond, as *Galen* ſays: it abounds with a Volatile, Narcotick, Salt and Sulphur, which is thought to be detrimental to the Head and Brain: it was accounted hurtful to the Eyes and Sight, as appears from that Verſe in *Ovid*, *lib.* 1. *Faſtorum*; *Et careant Loliis oculos vitiantibus agri*: and from this Cauſe it ſeems came, that the old Proverb in *Plautus*, *Mileſ. act.* 2. *ſc.* 2. *verſ.* 50. *Lolio victitare*, was wont to be ſpoken to one dim-ſighted.

IX. *The Specification.* It is ſaid to be peculiar againſt Defœdations of the Skin, and to ſtop Gangrenes.

X. *The Preparations.* You may have therefrom, 1. *A Decoction.* 2. *Meal or Flower.* 3. *An Ointment.* 4. *A Waſh.* 5. *A Cataplaſm.* 6. *The Fumigation.*

The Virtues.

XI. *The Decoction in Red Port Wine.* It ſtops the Terms, and all ſorts of Fluxes of the Bowels; and prevails againſt a Diabetes: Doſe two or three ounces: but it is apt to cauſe a kind of Giddineſs in the Head. It is alſo good to waſh places affected with Scurff, Morphew, Leproſy and Ringworms, and ſtop the Progreſs of a Gangrene: made with Water and Honey, it is good to bathe with for the Sciatica.

XII. *The Meal or Flower.* Being applied, mixt with Spirit of Wine or ſtrong Wine, it is of ſpecial Uſe to ſtop the Running of Gangrenes, and hinder the Fretting and Eating of old putrid Sores, Cankers and Phagedenick Ulcers; and to cleanſe the Skin of Leproſy, Tettars, Ringworms, Herpes, Scurff, Morphew, and other the like Diſtempers.

XIII. *The Ointment.* It is made thus: ℞ *of the Flower or Meal eight ounces: Sulphur Vive in fine pouder four ounces: Oil of Roſes three ounces: Vinegar enough to make it into the Form of an Ointment.* It has all the Virtues of the Meal or Flower aforegoing, and much more powerful to all thoſe Intentions, being applied freſh Morning and Evening.

XIV. *The*

XIV. *The Waſh.* It is thus made: ℞ *of the Flower or Meal two ounces: Water eight ounces: Juice of Radiſhes five ounces: Vinegar four ounces: Salt of Tartar a dram: mix them*; and therewith very warm Morning and Evening waſh the Face and Hands, letting it dry on; and after an hours time you may waſh again with fair warm Water. It clears and cleanſes the Skin admirably of almoſt all Deformities attending it.

XV. The Cataplaſm. ℞ *of the Meal twelve ounces: Linſeed bruiſed four ounces: Pigeons dung ſix ounces: boil all in a ſufficient quantity of Wine, to the Thickneſs of a Cataplaſm.* It is Diſcuſſive, diſſolves Knots and Kernels of the Kings-evil, and breaks thoſe which will not be diſſolved.

XVI. The Fumigation. ℞ *of the Meal or Flower a pound: Frankincenſe eight ounces: Myrrh four ounces: mix, melt and make the Maſs up into Troches.* Theſe being put upon live Charcoal, and the Fume from thence being received up the Womb by a Funnel, warms, comforts and ſtrengthens thoſe Veſſels of Generation, and is ſaid to help towards Conception.

CHAP. CCXII.

Of DARNEL-GRASS.

I. *THE Names.* It is called in *Greek*, Φοῖνιξ ἀγρώσεως, *Lolium Gramineum*, and ἄγρωστις φοινίκεος, *Gramen Phœniceum:* in *Latin*, *Phœnix Gramineus*; and in *Engliſh*, *Darnel Graſs.*

II. *The Kinds.* There are about ſix kinds hereof, *viz.* 1. *Phœnix ſimplici & ariſſima Gluma*, The ſmalleſt ſingle Darnel Graſs. 2. *Phœnix altera denſioribus ſpicis*, The greater ſingle Darnel Graſs. 3. *Phœnix aceroſa aculeata*, Small prickly Darnel Graſs. 4. *Phœnix multiplici ſpicata panicula*, Branched Darnel Graſs. 5. *Phœnix multiplici nutante*, Double Darnel Graſs, with a bowing or bending down Top. 6. *Phœnix paluſtris & longius ſpicata*, Branched Marſh Darnel Graſs.

III. The Deſcriptions. *The firſt, or* Smalleſt ſingle Darnel Graſs, *has a fibrous Root, from whence ſpring up ſeveral graſſy Leaves and Stalks, which are very like the* Red Darnel, *from the firſt, but that it has very few, ſlenderer and ſhorter Stalks, and the Leaves narrower; and the ſpiked Head has a few ſingle Husks ſet very ſparſedly thereon.*

IV. *The ſecond, or* Greater ſingle Darnel Graſs, *has Roots and Leaves like to the* Red Darnel; *but the Stalks grow a yard high, jointed and ſtraked: and the Spike is thinly ſet with chaffy Heads, but they are bigger, rounder and thicker.*

V. *The third, or* Small prickly Darnel Graſs, *has a ſmall white fibrous* Root, *whence ſpring narrow graſſy Leaves, ſix or ſeven inches high, being rough, hard and full of Joints, pointed or prickly at the ends, and with a few ſhort Leaves on them, which have withal ſmall, ſhort, rough and chaffy like Tongues, ſharp at the ends, and ſet at the Joints.*

VI. *The fourth, or* Branched Darnel Graſs, *has like Roots, Leaves and Stalks, which are jointed as the others are, and ſlender, half a yard or more high, and narrow Leaves,* Graſs *like: the ſpiked Head is as it were branched into others, wherein conſiſts the chiefeſt Difference.*

VII. *The fifth, or* Double Darnel Graſs, *in Roots, Stalks, Joints and Leaves, differs little or nothing from the laſt, but in the ſpiked Heads, which are thicker ſet together, and the tops of them bow down, or turn a little round.*

VIII. *The ſixth, or* Branched Marſh Darnel Graſs, *has a creeping white jointed Root, with many Fibres adjoining to it; from which ſhoot forth two or three jointed Stalks, two feet or more high: the ſpiked Head is a foot long, branched as the fourth above is, each Branch of a Fingers length, with winged Husks, like unto* Oats.

IX. *The Places.* They grow in *Meadows, Corn-fields, Fallow-fields*; in *Paths-ways* and *Borders* of *Fields*, almoſt every where: but the laſt in *Marſh* and *Wet Grounds*, and on the *Edges* of *Plowed-fields.*

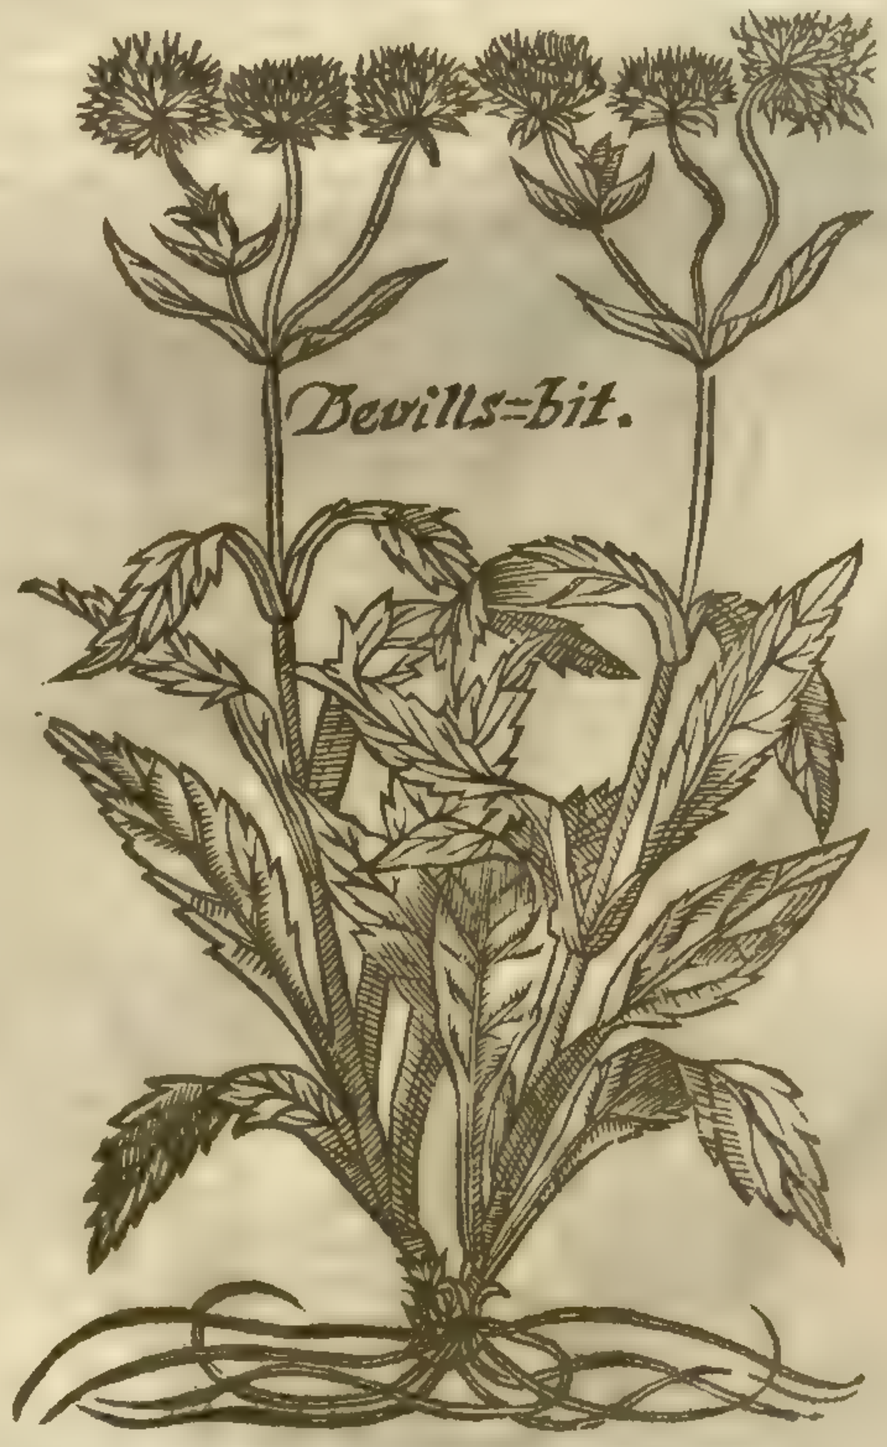
X. *The Times.* They ſpring and flouriſh with Corn, and the Seed or Grains are ripe in *Auguſt.*

XI. *The Qualities, Specification, Preparations and Virtues*, Authors have ſaid nothing of: however, it is manifeſt that they are of a cleanſing, drying and aſtringent Faculty.

CHAP. CCXIII.

Of DEVILS-BIT Common.

I. *THE Names.* It ſeems to be unknown to the *Greeks*, for which Reaſon it has no *Greek* Name: but it is called in *Latin*, *Succiſa*, and *Morſus Diaboli*; and in *Engliſh*, *Devils-bit.*



II. *The Kinds.* It is certainly a Species of *Scabious*;

bious: ſome have thought it to be the *Geum* of the Ancients; others to be *Nigina Plinii*; but *Fabius Columna* referreth it to *Picnocomon Dioſcoridis:* it is either *Common*, called, *Morſus Diaboli vulgaris*, of which in this Chapter; or *Various*, of which in the Chapter following.

III. The Deſcription. *It has a Root which is ſomewhat thick, but ſhort and blackiſh, with many Strings faſtned thereto, and abiding after Seed-time many Years: from this Root riſes up a round, green, ſmooth (not hairy) Stalk, about two feet high, ſet with divers long, and ſomewhat narrow, ſmooth, dark green Leaves, ſnipt a little about the edges for the moſt part, being otherwiſe all whole, and not divided at all, or but very ſeldom, even to the tops of the Branches, which yet are ſmaller than thoſe below, with one Rib only in the middle, and being broken, yield not ſuch Threads, as the* Scabious *does. At the end or top of each Branch, ſtands a round Head of many Flowers ſet together in the ſame manner, or more neatly and ſuccinctly than thoſe of the* Scabious, *and of a more blewiſh purple color, (not of a dark red, as* Gerard *ſays) which being paſs'd away, there follows Seed, like unto that of* Scabious, *which falls away in the ſame manner.*

IV. *Nota.* 1. Some make of this kind *a Greater* and *a Leſſer:* but this, in my Opinion, comes from the Nature of the Soil or Ground, rather than from the Nature of the Plant; that being the larger and fairer which grows upon the richer or fatter Ground, and that the leſſer which grows on the poorer Soil.

V. *Nota.* 2. Some are of Opinion, that the *Scabioſa rubra Auſtriaca Cluſii* belongs to this Plant, becauſe it has a ſhort Root with many Strings: *Bauhinus* makes mention of one of this kind, which has hairy Leaves, and not differing in any thing elſe, and he, from *Geſner*, calls it *Morſus Diaboli hirſuta.*

VI. *Nota.* 3. Some Monks and Fryers (as I ſuppoſe) have fabled, that the Devil, envying the Good which this Herb might do to Mankind, bit away part of the Root, by which means it became ſo ſhort a Stump as it is, and from thence it came to have the Name of *Morſus Diaboli*, or *Succiſa*, *Devils-bit:* but the Fable is ſo rediculous, that one which has but a Grain of Senſe or Reaſon can never believe ſuch a Fiction.

VII. *The Places.* It grows as well in dry Meadows and Fields, as moiſt in many places of our Land; as alſo in Woods and by Highways ſides: a great deal of it has been found growing in *Hampſtead Wood* near *London*, at *Lee* in *Eſſex*; alſo at *Raleigh* in *Eſſex*, in a Wood called *Hammerel*, and in ſeveral other places.

VIII. *The Times.* It flowers in *Auguſt*, which is ſomething later than the *Scabiouſes*; and is hardly to be known from *Scabious*, but when it is in Flower.

IX. *The Qualities.* It is hot and dry in the end of the ſecond Degree; and is Stomatick, Cordial, Sudorifick and Alexipharmick.

X. *The Specification.* It is a peculiar Antidote againſt the Plague, Poyſon and Bitings of Venomous Beaſts.

XI. *The Preparations.* You may prepare therefrom, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *A Decoction.* 4. *A Pouder of the Root.* 5. *An Ointment or Balſam.* 6. *A Cataplaſm.* 7. *A diſtilled Water.* 8. *A Spirituous Tincture.* 9. *An Acid Tincture.* 10. *An Oily Tincture.* 11. *A Saline Tincture.* 12. *A Salt.*

The Virtues.

XII. *The liquid Juice.* Taken inwardly to two, three or four ounces, according to the Age of the Patient, it is powerful againſt the Meaſles, Small-Pox, Calenture, malign and ſpotted Fever, as alſo againſt the Plague, and all malign and peſtilential Diſeaſes, Poyſon, and the Bitings of Vipers, Rattle Snakes, or any other Venomous Beaſt: and is an excellent thing to induce the Healing of Wounds and Ulcers.

XIII. *The Eſſence.* It has all the former Virtues, but is more powerful to the ſaid Intentions: beſides which, it is good againſt Fits of the Mother and Vapors, and provokes the Terms in Women. Doſe two, four or ſix ſpoonfuls Morning and Night, in a Glaſs of the Diſtilled Water, or in a Glaſs of White Wine.

XIV. *The Decoction in Wine.* It has all the Virtues of the Juice and Eſſence, but is yet leſs powerful: it may be uſed as a Wound-drink by ſuch Patients as have Wounds, Ulcers or Fiſtula's which are inveterate, or of difficult Cure. If it is ſweetned with Honey of Roſes, it is ſaid to be very effectual to help inveterate Tumors and Swellings of the Almonds and Throat, which do hardly come to Ripeneſs; for it digeſts, cleanſes, conſumes the Flegm ſticking thereto, and diſcuſſes the Tumors by often gargling therewith. Doſe four or ſix ounces Morning and Night.

XV. *The Pouder of the Root.* If it is taken in any convenient Vehicle, it kills Worms, and drives them forth of the Body. It breaks and diſcuſſes Wind in the Bowels, and reſiſts Poyſon and all ſorts of malign Fevers. Doſe one dram mixt with Honey, the Eſſence aforegoing, or any other proper Vehicle.

XVI. *The Ointment or Balſam.* It cures ſimple green Wounds, many times at once dreſſing; for it is an incomparable Vulnerary. It ripens Apoſtems, and ſuch other Tumors as will in time come to Suppuration. It digeſts old Ulcers, cleanſes, incarnates, dries, and in a ſhort time induces the Cicatrize, or cauſes them to be healed. Applied to the Gout, it eaſes the Pain, and in a ſhort time cures it.

XVII. *The Cataplaſm.* It is made of the green Herb and Root, and applied, it diſcuſſes Tumors in ſimple Contuſions, and is profitable to be applied to any place hurt or bruiſed by any Fall, Blow, or the like, or cruſhed by any Caſualty, diſſolving the clotted or congealed Blood, and taking away the black and blew Marks, which may afterwards remain.

XVIII. *The diſtilled Water.* It is good to waſh green Wounds and old Sores, cleanſing and drying them: and given inwardly with the Juice or Eſſence, it cleanſes the Body inwardly. If a little white Vitriol is diſſolved in it, it is then good againſt Scurff, Morphew, Herpes, Tettars, Ringworms, Itch, Pimples, running Sores and Ulcers, Freckles, Yellowneſs of the Skin, and other like Deformities, if the Parts affected be two or three times a day waſhed therewith, and ſo ſuffered to dry on without wiping.

XIX. *The Spirituous Tincture.* It is powerful againſt Poyſon, and the Malignity of burning and peſtilential Fevers, as alſo the Bitings of Mad Dogs, Serpents, and other poyſonous Creatures. It has all the Virtues of the Juice and Eſſence, but more effectual than they are, where the Heart and Vitals are immediately concerned. It is good againſt Convulſions, Lethargies, and all other cold and moiſt Diſeaſes of the Head, Brain, Heart and Nerves. Doſe two or three drams.

XX. *The Acid Tincture.* It is a ſingular Medi-

cament against the Plague and Spotted Fever: it abates the Heat, and quenches the Thirst, tho' never so extream, in the most violent malign and burning Fever, and that almost upon the Spot, even to a Miracle: besides, it resists all sorts of Poyson, more especially such as are volatile Poysons, destroying them in their very Root and Essence. It admirably comforts and strengthens the Stomach, resists Vomiting, creates an Appetite and causes a good Digestion. It suppresses Vapors and Hysterick Fits in Women, resists Hypochondriack Melancholy, and is good for such as are inwardly bruised by a Fall, or any other Casualty, dissolving the clotted or congealed Blood, and causing it to be excreted. Dose so much as will make the Vehicle pleasingly sharp, and to be repeated three, four, five, six or more times a day.

XXI. *The Oily Tincture.* It is good against inward Convulsions of the Stomach and other Viscera, it gives ease in the Cholick, and other Torments of the Bowels, whether given by the Mouth in any proper Vehicle, or exhibited Clysterwise in Broth or Posset-drink. It provokes the Courses, eases the Pains of the Mother, breaks and discusses Wind in the Belly and Stomach, opens Obstructions of the Reins, and other Urinary Parts, cleanses them of Sand, Gravel, and other Tartarous Matter, and so gives ease in the Stone and Strangury. Dose from ten to thirty drops in any fit Vehicle.

XXII. *The Saline Tincture.* Given inwardly to one dram or more in a proper *Medium*, it provokes Urine, opens Obstructions of the Womb, Reins and Ureters, and gives ease in the Strangury and Stone: outwardly applied, it is good against Scabs, Itch, Pimples, Pustles, Scurff, Morphew, Leprous Spots, Freckles, Lentils, Sun-burning, Tanning, Yellowness of the Skin, and other the like Defœdations, the Parts affected being bathed therewith two or three times a day, or sometimes oftner.

XXIII. *The fixed Salt.* It is Diuretick, Alexipharmick, Aperitive and Antifebritick: it opens Obstructions of the Urinary Parts, expelling Sand, Gravel and Tartarous Matter: it resists Poyson, the Bitings of Serpents and Mad Dogs, and the Plague: it opens the Passages of the Womb, cleansing it from Impurities; and given in a proper Vehicle, abates the Heat of burning Fevers, carrying off the Morbifick Matter by Urine. Dose one scruple, or half a dram, in the distilled Water aforegoing.

CHAP. CCXIV.

Of DEVILS-BIT Various.

I. *THE Names.* It is called in *Latin*, *Morsus Diaboli versicoloratus*, and *Morsus Diaboli diversus*: in *English*, *Various Devils-bit*.

II. *The Kinds.* It is twofold, *viz.* 1. *Morsus Diaboli flore albo*, Devils-bit with a white Flower. 2. *Morsus Diaboli flore carneo*, Devils-bit with blush-colored Flowers.

III. The Descriptions. *The first of these* with the white Flowers, *has a short Stump of a Root, like the former, from whence many thready Radiculæ spring: from the Head of this Root arises a round, green, smooth Stalk, near two feet high, with long, narrow, smooth, dark green Leaves, a little notcht about the edges, but not at all divided; which Notches or Dents grow smaller and smaller, as they grow nearer to the tops of the Branches; and on the top of each Branch stands a round Head of many Flowers, like the former* Devils-bit, *saving that these are only white, whereas they are of a blewish purple: and indeed this Plant differs not from the former in any other thing but in the Color of the Flower, which is of a pure white, as some other sorts of the* Scabiouses *are, and that the green Leaf is not altogether of so dark a green.*

IV. *The second, or* that with the blush-colored Flowers, *is in Root, Stalk, Leaf, Color of the Leaf, and Form of the Flower, the same with the former; but in this it differs therefrom, that the Flowers hereof are of an incarnate or blush color, whereas in the* Common *they are of a blewish purple, and in the former of a white color only.*

V. *The Places.* These two are more hard and rare to be met with than the *Common kind*, yet they are both found growing Wild about *Appledore*, near *Rye* in *Sussex*; and in several other places of this Kingdom.

VI. *The Times.* They flower later than any of the *Scabiouses*, and commonly not until *August*.

VII. *The Qualities, Specification, Preparations and Virtues*, are the same with the *Common Devils-bit* declared in the former Chapter, so that no more need be said of it here, saving, that neither of these are in the least inferior to the Vulgar in any of their Preparations or Virtues.

CHAP. CCXV.

Of DILL Garden.

I. *THE Names.* It is called in *Greek*, Ἄνηθον, (παρὰ τὸ ἄνω θεῖν; *quòd citò crescat*) *Matth.* 23. 23. *Theophrast. lib.* 5. *cap.* 67. *Plin. lib.* 20. *cap.* 18. in *Latin*, *Anethum*, and *Anethum hortense*, as *Bauhinus* has it: in *Arabick*, *Zebet*, and *Sebet*; and in *English*, *Dill*.

II. *The*

II. *The Kinds.* There are two principal kinds hereof, *viz.* 1. *Anethon Hortense*, Garden Dill, of which in this Chapter. 2. *Anethum Sylvestre*, Wild Dill, of which in the following Chapter.

III. The Description. *It has a Root which is small and woody, perishing every Year after Seed-time, and is unprofitable as to Physick, never being put to any Use. From this Root rises up for the most part but one Stalk, seldom more, nothing so large, nor seldom above half the height of* Fennel, *being round, and with fewer Joints thereon, whose Leaves are sadder, and somewhat long, divided almost into an infinite number of fibrous parts, almost like unto* Fennel, *but harder in handling, and somewhat thicker, of a stronger Smell also, and not so pleasant. The tops of the Stalks have fewer Branches, and are repleat with Umbles of yellow Flowers, smaller than those of* Fennel, *which pass into small Seed, somewhat flatter and thinner than* Fennel *Seed, and of a stronger and more picquant Taste.*

IV. *The Places.* It is most usually sown in Gardens, and such like Ground for the purpose; and is also found Wild with us in some places: but if so found, yet it is not of the Wild kind.

V. *The Times.* It flowers in *July*, and the Seed is ripe in the end of *August*.

VI. *The Qualities.* It is hot in the third Degree, and dry in the second; more especially being green: but when the Herb or Seed are dry, they are hot and dry in the third Degree; and abound very much with Mercury and Sulphur; being Aperitive, Carminative, Digestive, Discussive and Diuretick; Neurotick, Stomatick, Pectoral, Splenetick and Hysterick; Sudorifick, Alexipharmick, Analeptick, Galactogenetick and Spermatogenetick.

VII. *The Specification.* It is a peculiar Remedy for the Cholick, and Windiness of the Stomach and Bowels.

VIII. *The Preparations.* You may prepare herefrom, 1. *A Juice of the Herb.* 2. *An Essence of the Herb.* 3. *A Syrup.* 4. *A Decoction of Herb and Seed.* 5. *A Pouder of the Seed.* 6. *An Ointment of Herb and Seed.* 7. *A Cataplasm of Herb and Seed.* 8. *A distilled Water of Herb and Seed.* 9. *A Spirituous Tincture of the Seed.* 10. *An Acid Tincture of the Seed.* 11. *An Oily Tincture of the Seed.* 12. *A Saline Tincture of the Seed.* 13. *A distilled Oil thereof.* 14. *A Spirit therefrom.* 15. *Potestates or Powers.* 16. *An Elixir of the Seed: of all which in order.*

The Virtues.

IX. *The liquid Juice of the Herb.* Mixt with the distilled Water, one or two spoonfuls of the Juice to four of distilled Water, and so taken Morning, Noon and Night, it encreases Seed, as also Milk in Nurses: it expels Wind, and eases Pains of the Bowels, being drunk. If two or three spoonfuls of the Juice is mixt with Chicken-Broth, and exhibited as a Clyster, it helps in a *Tenasmus*.

X. *The Essence of the Herb.* It has the Virtues of the Juice; besides which, if it be given two or three spoonfuls at a time in the Morning fasting, in a Glass of Generous Wine, it wonderfully strengthens the Stomach, eases the Pains and Windiness of the Womb, and stops Vomiting; and is very effectual to digest raw and viscous Humors in the Stomach and Bowels.

XI. *The Syrup of the Herb or its Juice.* It is Pectoral, good against Coughs, Colds, Hoarseness, Wheezing, and other Obstructions of the Lungs from what Cause soever. Mixt with Nurses Milk, it encreases Milk in her Breasts, and makes it more wholesome for the Child. It is a singular thing also against a tickling Catarrh, or an inveterate Flux of Rheum upon the Lungs, being often taken.

XII. *The Decoction of the green Herb and Seed.* If it is made in Water, it encreases Seed, as also Milk in Nurses. If it is made in Wine, it stirs up Lust, and provokes to Coition; and if it be too much taken, may provoke so vehemently for a time, as at length, quite to extinguish Venery, by a too Lascivious Ejection of the Sperm.

XIII. *The Pouder of the Seed.* Taken to one dram in any fit Vehicle, it warms and comforts the Stomach and Bowels, and powerfully expels Wind: mixed with Honey, it is good against Coughs, Colds and tickling Catarrhs, and is good against Hoarseness, Wheezing and loss of Voice. Drank mixed with Wine, it is good against the Hiccough, Vomiting, Loathing and Convulsions of the Stomach and other Viscera.

XIV. *The Ointment of the Herb and Seed.* It is heating and drying, warms Parts which are cold and chilled; and is good to ease Pains in any Part proceeding from Cold, Moisture and Wind. It discusses and dissolves recent Tumors; but digests and maturates Apostems, and is good to anoint with for the Piles, and to discuss any other like Tumor in the Fundament; and dries up all moist and running Sores wheresoever, but more especially in the secret Parts. It is an Anodyn or Easer of Pain, and gives Rest.

XV. *The Cataplasm.* It discusses recent Tumors, and is profitable to be applied to any simple Contusion, provided it is done upon the spot: applied to the Gout, whether in Hands, Arms, Knees or Feet, it has been found to give Relief: if it is heat very hot in a Frying-pan, and applied to the Side, it eases the Pains of the Pleurisy, and takes away Stitches: and so applied to the Region of the Abdomen or Belly, it prevails against the Cholick and Griping of the Guts. Applied very hot to an Apostem, and often renewed, it brings it quickly to Suppuration, and breaks it.

XVI. *The distilled Water of the Herb and Seed.* It is a good Vehicle to take any of the Preparations in, whether Galenick or Chymick: and being drank sweetned with double-refined Sugar, breeds much Milk in Nurses Breasts, whatever *Galen* may say to the contrary.

XVII. *The Spirituous Tincture of the Seed.* It powerfully warms, comforts and strengthens the Stomach, expels Wind, and causes a good Appetite and Digestion. It is good against Loathing and Vomiting, stops Fluxes of the Bowels, and digests raw and viscous Humors in those Parts. It may be given from two drams to half an ounce, in a Glass of fragrant Wine, in the Morning fasting.

XVIII. *The Acid Tincture of the Seed.* It strengthens a weak Stomach, incides tough and viscous Humors in the Bowels, and dissolves them, making them fit for Excretion. It cuts tough Flegm and tartarous Humors in the Stomach and Lungs, and makes it fit for Expectoration; for which Reason it prevails against Hoarseness, Loss of Voice, Shortness of Breath and Difficulty of Breathing. It abates the Heat of Fevers, and resists Putridity in what part of the Body soever. Dose so much as may make the Vehicle pleasantly sharp, whether it be Ale, Beer or Wine.

XIX. *The Oily Tincture of the Seed.* It is good against the Pally, as also Convulsions, Cramps, Numbness, and Pains in any part of the Body, proceeding from Cold and Moisture, outwardly anointed upon the Parts affected, and inwardly given in any proper Vehicle, from fifteen to thirty drops or

more, as the Exigency or Extremity may require. It provokes Urine admirably, and gives eaſe in the Strangury and Stone, cleanſing the Reins and Bladder from Gravel, Sand and tartarous Slime lodged in thoſe Parts. It is a ſingular thing alſo to cure a Puncture of the Nerves and Tendons, in which, being applied, it gives preſent eaſe to the Pain, aſſwages the Tumor, and ſoon after cures the Affect.

XX. *The Saline Tincture of the Seed.* Mixt with the diſtilled Water aforementioned, it makes a good Waſh for moiſt and running Ulcers and Sores, cleanſing and drying up the Moiſture, and diſpoſing them to healing. Given to two drams in a Clyſter, it prevails againſt the Cholick: and taken inwardly to one dram in White Port Wine, it opens and cleanſes the Urinary Paſſages, *&c.*

XXI. *The diſtilled Oil of the Seed.* It has all the Virtues of the Juice, Eſſence, Decoction, Pouder, Spirituous, Acid and Oily Tinctures, but it is more powerful than any of them; and may be given to ſtrengthen the Stomach, reſiſt Loathing and Vomiting, cauſe Appetite and a good Digeſtion, expel Wind, eaſe the Cholick and Tortions of the Bowels from ſharp Humors, cure Convulſions, Apoplexies, Lethargies, Palſy, Gout, Stone, Obſtructions of the Reins, Ureters, Bladder and Womb, *&c.* Doſe from eight to twenty drops, being firſt dropt into white Sugar, and then mixt with ſome proper Vehicle, in which it is to be given Morning and Night.

XXII. *The Spirit of the Seed.* It has all the Virtues of the Spirituous, Acid and Oily Tinctures, but not all out ſo powerful; yet it is much more grateful or pleaſant to the Pallate; and may be taken, being dulcified, either alone or mixt with ſome proper Vehicle, from two drams to ſix.

XXIII. *The Poteſtates or Powers of the Seed.* They have all the Virtues of the Chymical Oil, Juice, Eſſence, Tinctures and Spirit, but more powerful and ſubtil, piercing admirably thro' all Parts of the Body. By outward Application, being bathed upon the Parts affected, they are good againſt Pains, Aches, Numbneſs, Palſy, Lameneſs, Convulſions, Spaſms proceeding from a cold and moiſt Cauſe: they reſolve Humors, diſcuſs Tumors, and reſiſt Defluxions upon any Part, by ſtrengthning the ſame. Doſe inwardly from one dram to three or four, in any proper Vehicle Morning and Night.

XXIV. *The Elixir of the Seed.* This has all the Virtues of the diſtilled Oil, Eſſence, Tinctures, Spirit and Powers, and is more ſubtil and powerful than any of them; and therefore may very profitably be uſed to all thoſe Intentions, both by inward Exhibition and outward Application. It is indeed an admirable Stomatick, ſcarcely any better in the whole Republick of Medicine: and for provoking Luſt, one of the moſt powerful of Vegetables. Doſe from one dram to two, in a proper Vehicle.

CHAP. CCXVI.

Of DILL Wild.

I. *THE Names.* It is called in *Greek*, Ἄνηθον πρόσινον: in *Latin*, *Anethum Sylveſtre*; and in *Engliſh*, *Wild Dill.*

II. *The Kinds.* It is the ſecond Species of *Dill*: and of this Species there are two ſorts, *viz.* 1. *Anethum Sylveſtre majus*, Great Wild Dill. 2. *Anethum Sylveſtre minus*, Small Wild Dill.

III. The Deſcriptions. *The firſt, or* Great Wild Dill, *has a Root like to the* Garden kind; *and in its Stalks, Leaves, Flowers and Seed differs little from it, but in its Largeneſs, being much greater in all its parts than the* Garden kind *is: and the Smell thereof is much the ſame.*

IV. *The ſecond, or* Small Wild Dill, *has a Root like to the firſt or* Garden kind, *but ſmaller than it: and ſo likewiſe, as the firſt of theſe was greater in all its parts than the* Garden Dill, *ſo is this leſſer in its Stalks, Leaves, Flowers and Seed; the Stalk growing not above a foot high: the Leaves are fine and ſmall on the Stalks, the Flowers yellow, and the Seed ſmall and long, like the* Garden kind, *but only leſſer, in which the Difference chiefly lyes.*

V. *The Places.* Their native Place is *Sicily*, and *Lisbon* in *Portugal*: from the firſt place they were ſent by *Columna* to *Bauhinus*; and from the ſecond place they were ſent by *Boel* to us, and are now nurs'd up in our *Gardens.*

VI. *The Times.* They both flower in their native places in *June*, but with us in *July*; and their Seed is ripe in *Auguſt*, or ſome ſmall time after.

VII. *The Qualities, Specification, Preparations and Virtues*, are the ſame with thoſe of the *Garden kind*, and full out as effectual; and therefore for the ſame you are referred to the aforegoing Chapter.

CHAP. CCXVII.

Of DITTANDER, OR, PEPPER-WORT.

I. *THE Names.* It is called in *Greek*, Λεπίδιον, *quod* λεπίδας, *id eſt, maculas & ſquammas in cute delent*: or as ſome think, ἀπὸ τῦ λεπίζειν, *quod acrimonia urenti ulceret*: in *Latin*, *Lepidium*, (but it is not the *Lepidium Dioſcoridis & Galeni*, for that is *Iberis Cardimantica*, of which we have already treated in *Chap.* 168. aforegoing: in *Engliſh*, *Dittander*, or *Pepper-wort.*

II. *The Kinds.* Authors make three ſorts hereof, *viz.* 1. *Lepidium vulgare, ſive Piperitis, Fuchſii & Loniceri, Tragi, Matthioli & Camerarii*; *Lepidium magnum Turneri, Cordi & Fuchſii*; *Lepidium Plinii*, according to *Lobel & Dodonæus*; *Lepidium Pauli & Plinii*, according to *Matthiolus, Lugdunenſis & Cæſalpinus*; *Raphanus Sylveſtris officinarum*, according to *Lobel*, and *Lepidium latiſolium Bauhini*, The vulgar Dittander or Pepper-wort. 2. *Lepidium Monſpeliacum, Flammula Geſneri (in hortis) Herba Sancti Anthonii, Dentillaria Lobelii & Lugdunenſis*; *Dentaria Rondeletii*; *Molybdena Plinii*, according to *Anguilara & Camerarius*; *Plumbago Cluſii & Tabernmontani*; *Glaſtum Sylveſtre Cæſalpini*, French Dittander, or Scar-wort. 3. *Lepidium Annuum Lobelii, & Lugdenenſis*; *Lepidium Glaſtiſolium Bauhini*, Annual Dittander, or Scar-wort.

III. The

Ditlandar.

III. The Deſcriptions. *The firſt, or* Common Dittander, *has a Root which is ſlender, and runs much under Ground, and ſhooting up again in many places: both Leaves and Roots are very hot and ſharp in Taſte, biting like* Pepper, *whence came the Name of* Pepper-wort: *from this Root ſpring forth ſomewhat long and broad Leaves, of a light blewiſh green color, finely dented about the edges, and pointed at the ends, ſtanding upon round hard Stalks, three or four feet high, ſpreading many Branches on all ſides, and having many ſmall white Flowers at the tops of them, after which follow ſmall Seed in ſmall Heads.*

IV. *The ſecond, or* French Dittander, *commonly called* Dentillaria Rondeletii, *has a Root which is compoſed of many great Strings, with a woody Pith in the middle, running down deep into the Earth, and abiding many Years, altho' both Stalks and Leaves periſh every Year, freſh ſpringing up again in the Spring. This Root Annually ſends up a number of long and limber Stalks, reddiſh at the bottom, lying down upon the Ground, and not ſtanding upright, becauſe of their length, which are ſometimes four, five or ſix feet long, ſet with Leaves on all ſides, which are ſomewhat narrow, long and ſmooth, of a ſad green color, ſmaller at the lower end, and encompaſſing the Stalk about, but leſſer ſtill as they grow nearer to the tops of the Stalks, where they are a little branched, and do break forth into ſeveral dark purpliſh Flowers, ſet together, conſiſting of five ſmall pointed Leaves apiece, ſtanding in round browniſh Husks, in which afterwards is contained ſmall, round and blackiſh Seed, very ſharp in Taſte, exulcerating the Skin, and burning it, being laid thereon, as the Leaves alſo do.*

V. *The third, or* Annual Dittander, *has a Root which is ſmall and fibrous, periſhing every Year: from which Root riſe up Stalks more upright than the laſt, about three or four feet high, ſet with ſuch like Leaves as the laſt, but ſomewhat larger, and encompaſſing them at the bottoms. The Flowers are white, and ſtand upon ſmall Branches one above another, Spike-faſhion, which afterwards give ſmall, round and pointed Husks, like ſome of the* Thlaſpies *or* Treacle-Muſtards, *in which the Seed is contained, no leſs hot and fiery in Taſte, and exulcerating the Skin, than the Seed of the former.*

VI. *The Places.* The firſt of theſe is found growing naturally in many places of *England*, as *Clare* in *Eſſex*, alſo near *Exceſter*, and upon *Rocheſter-Common* in *Kent*; at *Swale-Abby* near *Whawley*, in *Lancaſhire*: it delights to grow in ſandy and ſhadowy places which are ſomething moiſt; and is alſo nurs'd up in *Gardens*. The other two are of *French* Origination, growing about *Mompelier*; but with us are nouriſht up in *Gardens*.

VII. *The Times.* The firſt flowers about the end of *June* and in *July*. The ſecond late with us, in *Auguſt*, but ſcarcely ever gives ripe Seed in *England*. The third flowers in *July*, and the Seed is ripe in *Auguſt*.

VIII. *The Qualities.* They are hot and dry in the fourth Degree; Pyrotick, Stomatick, Arthritick, Ptarmick and Alexipharmick.

XI. *The Specification.* They are peculiar for the Cure of the Sciatica or Hip-Gout.

X. *The Preparations.* You may have therefrom; 1. *A liquid Juice.* 2. *An Eſſence.* 3. *An Infuſion in Wine.* 4. *A Pouder.* 5. *A Cataplaſm.* 6. *A Spirituous Tincture.* 7. *An Acid Tincture.* 8. *An Oily Tincture.* 9. *A Saline Tincture.*

The Virtues.

XI. *The liquid Juice. Parkinſon* ſays, that the Women of *Bury* in *Suffolk* do uſually give the Juice thereof in Ale or Beer to Women in Labor, to procure a ſpeedy Delivery in Travail. You may give it from one ſpoonful to two at a time.

XII. *The Eſſence.* It has the former Virtues; beſides which, it is powerful to provoke the Terms in Women where they are ſtopt, dry up Catarrhs and tickling Rheums which fall upon the Lungs; and being held in the Mouth, gives eaſe in the Tooth-ach to Admiration. Doſe one ſpoonful or more at a time, in a Glaſs of Ale, Beer or Wine.

XIII. *The Infuſion in Wine.* It warms and comforts a cold Stomach, expels Wind, provokes Appetite, and helps Concoction, and gives eaſe in all Pains of the Stomach and Bowels proceeding from Wind, or Sharpneſs of Humors, the Cholick, *&c.* being drunk for ſome time by Women, it is ſaid to cauſe Fruitfulneſs. Doſe a ſmall Gill of three or four ounces Morning and Night.

XIV. *The Pouder.* Snuft up the Noſtrils, it is a good Errhine to purge the Head and Brain of cold, moiſt and flegmatick Humors, which it does very effectually. Taken inwardly from a ſcruple to half a dram, or two ſcruples in the Morning faſting, it kills Worms in Children, and expels Wind out of the Stomach: and uſed as a Topick to moiſt and running Sores and Ulcers, it cleanſes, dries and induces their Healing.

XV. The Cataplaſm. *It is made of the green Leaves, either alone or mixed with Hogs-Lard, by beating them together in a Mortar.* It is hot, fiery and ſharp, as is that of *Sciatica Creſſes*, and works the ſame Effects; for both *Paulus Ægineta* and *Pliny* ſay, that it is effectual for the Cure of the Sciatica or Hip-Gout, or any other Pain or Gout in the Joints, or any other inveterate Grief, being applied in the ſame manner as *Sciatica Creſſes*; and uſed in the ſame order, it alſo is good againſt the Deformities or Diſcolorings of the Skin, and takes away Marks and Scars, Scabs, and Deformities made by burning with Fire, or the like.

XVI. *The Spirituous Tincture.* It cures the Pain

of the Stomach and Bowels, the Cholick, and Tortions of the Bowels arising from sharp and corrosive Humors. It strengthens the Viscera admirably, and stops Fluxes of the Belly of all sorts, as the Diarrhœa, Dysenteria, Lienteria, Hepatick-flux, and withal restores the Tone of the Parts hurt, by warming and comforting them. Dose half a spoonful at a time in a Glass of Wine.

XVII. *The Acid Tincture.* It cuts thick and tough Flegm, dissolves tartarous Matter in what part of the Body soever, strengthens the Stomach, restores its depraved Tone, causes a good Appetite and a strong Digestion: and by its Insinuation into the Mass of Blood, it destroys its Discrasy, and so effectually roots out the Scurvy, whether in Old or Young. Dose so many drops as to make the Vehicle pleasantly sharp.

XVIII. *The Oily Tincture.* It is good against Rheumatick Pains and Aches in any Part of the Body, the Sciatica and Gout proceeding from a cold Cause, as also Palsies, Convulsions, Spasms or Cramps; in all which Cases it is to be bathed twice a day upon the Parts affected, rubbing it every time well in: in a Palsy, it ought also to be anointed all along upon the Back-bone, as well as upon the Part affected.

XIX. *The Saline Tincture.* It prevails against Tettars, Ringworms, Herpes, Scurff, Morphew, Itch, Pimples, Pustules, Scabs, Leprosy, and other like Breakings out: it also takes away Sunburning, Tanning, Freckles, Lentils, Redness, Yellowness, and such other like Defœdations of the Skin, being only bathed Morning, Noon and Night upon the Part affected, and then suffering it to dry in.

CHAP. CCXVIII.

Of DITTANY Bastard White.

I. *THE Names.* It is called in *Greek* by some, Χαμαιμελία, ἡ Χαμαιμέλιον, (as if it was *Fraxinus humilis*, but that it is not:) in *Latin*, *Fraxinella*, *Diptamum* and *Dictamnum*; also *Dictamus vel Dictamnus albus:* in *English*, *White Dittany*, *White Bastard Dittany*, and *Fraxinella.*

II. *The Kinds.* There are three kinds, *viz.* 1. *Fraxinella vulgaris*, *Fraxinella flore rubente*, Common or vulgar Bastard Dittany with a reddish Flower. 2. *Fraxinella flore rubro*, Bastard Dittany with a red Flower. 3. *Fraxinella flore albo cæruleo*, Bastard Dittany with an Ash-colored Flower.

III. The Descriptions. *The first*, or Common Bastard Dittany, *has a white large Root, spreading many ways under Ground, if it stands long: it is a goodly Plant, and rises up with several round, hard, brownish Stalks, near two feet high, the lower parts whereof are furnished with many winged Leaves, somewhat like unto* Liquorice *or a small young* Ash-tree, *consisting of seven, nine or eleven Leaves set together, which are something large and long, hard and rough in handling, of a darkish green color, and of an unpleasant strong resinous Smell. The upper parts of the Stalk are furnished with many Flowers growing Spike-fashion, at certain distances one from another, consisting of five long Leaves apiece, of which, four which stand on the two sides are somewhat bending upwards, and the fifth hanging down. but turning up a little the end of the Leaf again, of a faint or pale red color, striped thro' every Leaf with a deeper red color, and having in the middle a Tassel of five or six long purplish Threads, which bow down with the lower Leaf, and turn up also the ends again, with a little Frieze or Thrum at the ends of every one. After the Flowers are past, arise hard, stiff, rough, clammy Husks, horned or pointed at the end, four or five standing together, somewhat like unto the Seed-Vessels of* Wolfs-bane *or* Columbines, *but greater, thicker and harder, in which is contained round, shining, black Seed, larger than any* Columbine-*Seed by much, and smaller than* Peony-*Seed. The whole Plant, as well Roots as Leaves, is of a strong Scent, not so pleasing for the Smell as the Flowers are beautiful to the Sight.*

IV. *The second*, or Bastard Dittany with a red Flower, *for Root, Stalks, Leaves, Flowers and Seed, with the Form and Manner of Growing, are all very like to the former, excepting that the Stalks and Leaves are of a darker green color, and that the Flowers are of a deeper red color, and growing in a little longer Spike; in which things the Difference chiefly consists.*

V. *The third*, or Bastard Dittany with an Ash-colored Flower, *is also in Root, Stalks, Leaves, Flowers, Seed, Form and Manner of Growing, like to the second, excepting that the Leaves and Stalks are of a fresher green color than any of the former, and the Flowers are of a very pale or whitish blew color, tending to an Ash color, in which the Difference chiefly consists.*

VI. *The Places.* All these kinds are found to grow naturally in many places both of *Germany* and *Italy*; but with us they are only nurs'd up in *Gardens.*

VII. *The Times.* They flower in *June* and *July*; and their Seed is ripe in *July* or *August.*

VIII. *The Qualities.* It is hot and dry in the second Degree; Anodyne, Aperitive, Attenuating, Inciding, Digestive, Stomatick, Nephritick, Hysterick, Emmenagogick and Alexipharmick.

IX. *The*

IX. *The Specification.* It is peculiar againſt Poyſon, Plague, Stoppage of Urine, and the Courſes in Women.

X. *The Preparations.* You may have therefrom, 1. *A liquid Juice of the Leaves and Root.* 2. *An Eſſence of the ſame.* 3. *An Infuſion of Leaves and Roots in Wine.* 4. *A Pouder of the Seed.* 5. *A Fumigation.* 6. *A Pouder of the Root.* 7. *A Spirituous Tincture.* 8. *An Acid Tincture.* 9. *An Oily Tincture.* 10. *A Spirit.* Theſe four laſt from the Root chiefly, or Root and Herb.

The Virtues.

XI. *The liquid Juice of Leaves and Root.* Taken from one ſpoonful to two in White Port Wine, it is good againſt the Strangury, provokes Urine, and is ſaid to break the Stone in the Bladder, and expel it: it alſo provokes the Terms, and brings away both Birth and After-birth.

XII. *The Eſſence of Roots and Leaves.* It has all the former Virtues; beſides which, it is good for Weakneſs and Illneſs of the Stomach, prevails againſt all cold and moiſt Diſeaſes of the Womb, and is profitable againſt the Stingings and Bitings of Hornets, Scorpions, Serpents, Mad-Dogs, and other venomous Beaſts; it prevails againſt deadly Poyſons, and all ſorts of malign and peſtilential Diſeaſes. Doſe one or two ſpoonfuls Morning and Night, in a Glaſs of Generous Wine.

XIII. *The Infuſion of Leaves and Roots in Wine.* It has all the former Virtues, but not full out ſo powerful, and may be given to four or ſix ounces: it expels Wind, and eaſes the Cholick.

XIV. *The Pouder of the Seed.* Given to a dram or more in White Port Wine, it prevails againſt the Strangury, provokes Urine, and breaks the Stone (as Authors ſays) in the Bladder, and drives it out.

XV. *The Fumigation.* The Root made into little bits, or a very groſs Pouder, and the Fume of it, being caſt upon live Charcoal, and received by a Funnel up the Womb, it warms and cleanſes that Part, and is ſaid to bring away the After-birth; ſome of the Eſſence thereof being taken at the ſame time inwardly.

XVI. *The Pouder of the Root.* If it is given to a dram with fifteen grains of *Rhubarb*, it kills and drives forth Worms: and being given from one to two drams, it effectually reſiſts Poyſon and the Venom of Serpents, Mad-Dogs, *&c.* prevails againſt the Plague and other contagious Diſeaſes, kills Worms in the Stomach and Belly, and gives eaſe in the Stone.

XVII. *The Spirituous Tincture of the Root, or of Root and Leaves.* It has all the Virtues of the Juice and Eſſence, but more powerfully warms and comforts a cold, weak and ſick Stomach, reſtores a depraved Appetite, and cauſes a good Digeſtion: it expels Wind, and gives eaſe in the Cholick. Doſe two or three drams.

XVIII. *The Acid Tincture.* It heals inward Wounds, and prevails againſt the Epilepſy or Falling-ſickneſs, Vertigo, Lethargy, Head-ach, Megrim, and other cold and moiſt Diſeaſes of the Head and Brain. It cuts tough Flegm, opens Obſtructions of the Lungs and other Viſcera, helps to break the Stone, and expels Sand and Gravel, as alſo any kind of tartarous Matter from the Breſt, Lungs, Reins, Ureters and Bladder. Doſe ſo many drops as may make the Vehicle pleaſantly ſharp, to be taken three or four times a day.

XIX. *The Oily Tincture.* It is good againſt Convulſions and Cramps, as alſo Lamenels, Numbedneſs, Pains, Aches, Palſies, and other like cold and moiſt Diſeaſes of the Nerves, being well bathed upon the Parts affected Morning and Night: alſo taken inwardly, from ten to twenty five drops, in a Glaſs of White Port Wine, it is an excellent thing againſt the Strangury and Obſtructions of Urine by Sand, Gravel, or any tartarous or ſlimy Matter in the Reins, Ureters and Bladder. Given to forty drops, as aforeſaid, to a Woman in Travil, it brings forth both Birth and After-birth.

XX. *The Spirit of Herb and Root.* It is a ſingular Stomatick, warming and comforting a cold and weak Stomach: it reſtores its Tone, expels Wind, prevails againſt the Cholick, and cauſes a good Appetite, and an excellent Digeſtion, being taken an hour before Dinner. Doſe (dulcified) one or two ſpoonfuls.

XXI. *Nota.* If the green Herb is bruiſed, and applied outwardly, it draws Prickles, Thornes, Splinters, and ſuch other like things out of the Fleſh.

CHAP. CCXIX.

Of DITTANY Baſtard, Outlandiſh.

I. *THE Names.* It is called in *Greek*, Ψευδοδίκταμνος ἢ ψευδοδίκταμον: in *Latin*, *Pſeudodictamnum*, *Pſeudodictamus*: in *Engliſh*, *Outlandiſh Baſtard Dittany.*

II. *The Kinds.* It is oppoſed as the falſe kind of the *Dittany of Creet*, of which we ſhall treat (God willing) in the Third Book of this *Herbal.* Of this *Baſtard Dittany* there are two principal ſorts, *viz.* 1. *Pſeudodictamnus primus*, (which, as *Anguilara* ſays, is called by the now *Greeks*, Καλυκωάθια) Baſtard Dittany. 2. *Pſeudodictamnus alter Theophraſti, Dictamnum alterum Dioſcoridis*, The other Baſtard Dittany.

Baſtard Dittany.

III. The

III. The Deſcriptions. *The firſt has a pretty long Root, which is blackiſh, hard and woody, ſhooting down deep into the Ground, with divers Strings ſpringing from it. From this Root riſe up Stalks or Branches, half a yard long ſometimes, on which are ſet ſuch like round and hoary Leaves as the* True Dittany of Creet *has, but neither ſo thick in handling, nor ſo thick ſet on the Branches, but more diſperſed, yet two always together, one againſt another: from the middle of theſe Branches, to the tops of them, come forth the Flowers round about the Stalks at the Joints with Leaves, which are gaping, like thoſe of the* True Cretian Dittany, *as* Pennyroyal, Mint, Calamint, *and divers the like Herbs have; which Flowers are of a dull purpliſh color, ſtanding in hoary Husks; after which comes the Seed, which is greater and blacker than that of the* True Cretian. *This Herb is ſomewhat hot and ſharp, but not by half ſo much as is the* True, *or as is the* Fraxinella *in the former Chapter.*

IV. *The ſecond has a fibrous Root, which ſpreads it ſelf, ſhooting pretty deep in the Earth; from which riſe up many ſquare hoary Stalks, more than a foot high, ſet with two Leaves at a Joint, like unto the former, but ſomething larger and longer: towards the tops whereof, with the Leaves, come forth hoary Husks, like unto thoſe of the* Great Aſſyrian Bawm, *but ſhallower; out of which ſtart gaping Flowers, mixed with white and red. The whole Plant ſmells very well, and abides all Winter, as the other does; and is encreaſed (as is alſo the former) by Slipping.*

V. *The Places.* The firſt grows in many places of *Italy*, as near *Piſa* and *Leghorn*; the other is a Native of the Iſland *Cerigo*; they have been both brought to us, and flouriſh very well in our Gardens, if the Winter is not too violently ſharp and long. The firſt has been many times raiſed with us from Seed brought from *Italy*; but it grows very well alſo of the Slips, being put into the Ground about the middle of *April*, and a little defended from the Heat of the Sun for a time, after the ſetting, and now and then watred in the mean Seaſon.

VI. *The Times.* The firſt flowers with us all the latter part of the *Summer*, but ſeldom gives any good Seed: but the Seaſons of the other have not been obſerved.

VII. *The Qualities, Specification, Preparations and Virtues*, differ not from thoſe of the *True Cretian Dittany*; nor much from thoſe of *Fraxinella* in the laſt Chapter, to which you are referred.

CHAP. CCXX.

Of DOCK Common.

I. *THE Names.* It is called in *Greek*, Λάπαθον, ἀπὸ τῦ λαπάζειν, *quod valet exinanire, vel Ventrem levare*, for that it looſens the Belly: in *Arabick*, *Hamad* and *Humadh*: in *Latin*, *Lapathum* and *Rumex*; and in *Engliſh*, *Common Dock.*

II. *The Kinds.* There are ſeveral kinds of this Plant, *viz.* 1. *Lapathum ſylveſtre vulgare, vel Rumex communis*, Common Dock, of which in this Chapter. 2. *Oxylapathum Dioſcoridis, Lapathum acutum, Rumex acutus*, Sharp-pointed Dock, of which in Chap. 221. 3. *Hydrolapathum, Rumex aquaticus*, Water Dock, of which in Chap. 222. 4. *Lapathum Maritimum*, Sea Dock, of which in Chap. 223. To theſe you may add, 5. *Lapathum Sanguineum*, Blood-wort, of which we have already treated in Chap. 182. aforegoing. 6. *Hippolapathum Sativum*, Patience, or Monks Rhubarb, of which in the following Part of this Work, in its proper place.

III. The Deſcription. *The* Common Wild Dock *has a great long Root, of a blackiſh brown on the outſide,*

ſide, and of a yellow color within : from this Root ſprings up one large, ſtiff Stalk, and ſometimes more, of a foot, and ſometimes a foot and half high, (according to the Goodneſs of the Ground) as alſo a great many long and broad Leaves on long Foot-ſtalks lying upon the Ground, and ſome ſtanding almoſt upright, ſomething round-pointed, having a great Rib in the middle, and full of Veins on each ſide the Rib, ſmooth, and not dented round the edges. The Stalk is of a browniſh green, ſet with long narrow Leaves, and ſomewhat branched towards the top; the Branches abound with Flowers and Seed in a ſpiked Form: the Flowers are reddiſh, and the Seed triangular, almoſt like a Tetrahedron in Geometry, contained in a browniſh red Husk, much reſembling Chaff or Sawduſt.

IV. *The Places.* It grows in Field and Meadows, waſte Grounds, Orchards, by Ditch-ſides, and High-way-ſides, more eſpecially in the moiſter Grounds, in moſt parts of *England*.

V. *The Times.* It flowers in *June* and *July*, and the Seed is ripe in the end of *Auguſt*, and ſometimes earlier.

VI. *The Qualities.* It is temperate in reſpect to Heat or Coldneſs, and dry in the ſecond Degree, more eſpecially the Seed, which is very Aſtringent. The whole Plant is very Aſtringent and Abſterſive, with a kind of opening Faculty; and is Traumatick or Vulnerary and Hepatick.

VII. *The Specification.* It is peculiar for curing all Fluxes of the Bowels, chiefly the Bloody-flux.

VIII. *The Preparations.* The Root and Seed are moſtly in Uſe, the Leaves only whilſt they are young. From this Plant you may have theſe Preparations, 1. *The liquid Juice of the Root, extracted with White or Red Port Wine.* 2. *A Decoction of the Root.* 3. *A Pouder of the Root or Seed.* 4. *A Vinegar of the Root.* 5. *The diſtilled Water of Herb and Root.* 6. *A Spirituous Tincture of the Root.* 7. *An Acid Tincture of the Root:* of all which in order.

The Virtues.

IX. *The liquid Juice of the Root.* It opens Obſtructions of the Liver and Spleen, cleanſes and ſtrengthens the Stomach and other Viſcera, ſtops a Diarrhea and Lienteria, and heals the Corroſion of the Guts in a Dyſenteria, ſtrengthening them admirably; and prevails againſt the Jaundice after a ſingular manner. Doſe four ounces or more, firſt at Night going to Bed, and as much in the Morning faſting.

X. *The Decoction of the Root.* It has all the former Virtues, but performs not full out ſo effectually; it is good againſt the wambling Pains and Sickneſs of the Stomach, the Bloody-flux, and Bitings of venomous Creatures; and prevails againſt the Jaundice, Strangury or Stoppage of Urine, Stone, Gravel, *&c.*

XI. *The Pouder of the Root or Seed.* It cures Fluxes of the Belly, and ſtops the over-flowing of the Courſes in Women. Strewed upon moiſt and running Sores or Ulcers, it cleanſes, dries and diſpoſes them to a Healing. Given to a dram or dram and half in choice Red Port Wine, it helps a *Diabetes*.

XII. *The Vinegar of the Root.* It is Alexipharmick, being inwardly taken, and prevails againſt malign and peſtilential Diſeaſes: outwardly, it is good againſt Scurff, Morphew, Itch, Mange, Pimples, Puſtules, Scabs, and other like Defœdations of the Skin, the places affected being bathed therewith two or three times a day.

XIII. *The diſtilled Water of the Herb and Root.* If it is mixt with the Vinegar juſt aforegoing, or with Juice of Limons, it is good to clear the Skin of Morphew, Freckles, Lentils, Sun-burning, Tanning, Yellowneſs, and other Diſcolorings of the Skin.

XIV. *The Spirituous Tincture of the Root.* It admirably ſtrengthens the Bowels, and is good againſt all their various Fluxes, as Diarrhea, Dyſentery, Lientery, and Heparick Flux: it is ſingular againſt fainting and ſwooning Fits, and Gripings of the Guts, proceeding from cold, ſharp and ſlimy Humors. Doſe one ſpoonful Morning and Night in a Glaſs of White or Red Port Wine.

XV. *The Acid Tincture of the Root.* It is good againſt the Yellow Jaundice, being taken in all that the Patient drinks, whether Ale, Beer or Wine. It ſtrengthens and fortifies the Stomach, provokes Appetite, and cauſes a good Digeſtion; cuts thick and tough Flegm, and carries off tartarous Matter lodged in the Stomach, Lungs, Reins, Ureters and Bladder; and deſtroys thoſe Humors which are the Ground and Foundation of the Kings-evil.

CHAP. CCXXI.

Of DOCK Sharp-pointed.

I. *THE Names.* It is called in *Greek*, Ὀξυλάπαθον: in *Latin*, *Oxylapathum*, *Lapathum acutum*, *Rumex acutus*; and in *Engliſh*, *Sharp-pointed Dock*.

larg red sharp pointed Dock

II. *The Kinds.* It is threefold, *viz.* 1. *Oxylapathum majus*, *Lapathum acutum majus*, *Rumex acutus Cordi*, The greater ſharp-pointed Dock. 2. *Oxylapathum*, *vel Lapathum acutum minus*, *Rumex acutus minor*, The leſs or ſmall ſharp-pointed Dock. 3. *Oxylapa-*

Oxylapathum, vel Lapathum acutum minimum, Rumex acutus minimus, The ſmaller or leaſt ſharp-pointed Dock.

III. The Deſcriptions. *The firſt, or* Greater, *has a Root which is great, long, and many times forked, being blackiſh on the outſide, and ſomewhat reddiſh and yellowiſh within, abiding many Years, but ſometimes periſhing by the Extremity of Winter.* From this great and long blackiſh Root ſpring forth many long, hard and narrowiſh green Leaves, very ſharp-pointed at the ends, much more ſharp than in the former ſort: from among which Leaves riſes up a ſtiff hard Stalk, two or three feet high, ſet with the like Leaves, but ſmaller ſtill up to the top, not much unlike to *Sorrel*, but that it is neither ſo tender nor ſour, but rather of a bitteriſh Taſte. This Stalk is branched forth towards the top into ſeveral large Branches or Sprigs, bearing ſmall reddiſh Flowers in long Spikes; after which, in brown reddiſh, or dun-colored Husks, is contained ſmall triangular Seed.

IV. *The ſecond, or* Leſs ſharp-pointed Dock, *has a Root which is long and ſlender, parted diverſly with ſmall Fibres appendent thereto: which Root is of a yellow color on the inſide; and from which riſes up a ſtrong, ſtiff Stalk, about a foot, and ſometimes a foot and half high, having Leaves thereon, which are long and narrow, waved in on the edges, as if they were crumpled:* this Stalk is branched forth into ſeveral other large Branches, almoſt from the bottom to the top; all which Branches are alſo beſet at due diſtances, with the like long and narrow Leaves, crumpled in like manner: the Stalks, Branches and Flowers, with the Seed following them, are like unto the former, but that they ſtand not on ſuch long Sprigs or Twigs, but cloſer together, ſome at the Joints, or compaſſing the Stalks, and others at the tops of, a darker color.

V. *The third, or* Smaller kind, *has a Root which is ſmall, and more yellow than the firſt of this kind at* ſect. 3. *above; but it differs little therefrom in its Form and Manner of Growing, except in its Greatneſs, this being much leſſer, ſmaller and lower.* The Stalk is not much above half the height of the firſt, and the Leaves very ſmall, narrow, long and ſharp-pointed, not near the quarter part of the Largeneſs of the firſt of this Species: the Flower is ſmall, as is the Seed, which is triangular, and contained in the like chaffy Husks.

VI. *The Places.* They are all found moſt commonly in *moiſt Meadows*, and ſometimes in upland Grounds alſo; at lower ends of Grounds which are moiſt and plaſhy, and near or bordering on Water-Courſes.

VII. *The Times.* They riſe up in the Spring of the Year; flower in *June* and *July*, and their Seed is ripe in *Auguſt*.

VIII. *The Qualities, Specification, Preparations and Virtues*, are the ſame with thoſe of the *Common Dock* declared in *Chap.* 220. aforegoing, excepting that the *Great ſharp-pointed Dock* is much more efficacious and powerful to all the Intentions there named.

IX. *Obſervation.* The *Great ſharp-pointed Dock* is eſteemed by almoſt all Authors, to be a great Aperitive or Opener, and a powerful thing againſt Scurff, Morphew, Leproſy, Pimples, Puſtules, Redneſs, Tawnineſs, Tettars, Ringworms, Herpes, and all ſorts of Scabbineſs happening to the external Parts of the Body; and indeed it is the moſt excellent of all the kinds of *Docks* for thoſe Intentions: and therefore the Juice of the Root is commonly put into thoſe Ointments, which are made againſt Morphew, Leproſy, Herpes, Tettars, Scabbineſs, *&c.* it being a powerful Abſterſive, to remove thoſe Defœdations of the Skin.

CHAP. CCXXII.

Of DOCK Water.

I. *THE Names.* It is called is *Greek*, ὑδρολάπαθον, ἢ λάπαθον ὕνυδρον: in *Latin*, *Hydrolapathum*, and *Lapathum aquaticum*, *Rumex aquaticus*: in *Engliſh*, *Water Dock*.

II. *The Kinds.* It is twofold, *viz.* 1. *Hydrolapathum majus*, *Rumex paluſtris Tragi*; *Lapathum paluſtre Tabernmontani*; *Hippolapathum ſylveſtre Geſneri*, *Matthioli*, *Dodonæi*; *Hydrolapathum magnum*, *vel majus aquaticum*, The greater or great Water Dock. 2. *Hydrolapathum minus*, *Rumex aquaticus minor*, *Lapathum aquaticum minus*, The leſſer or ſmall Water Dock.

III. The Deſcriptions. *The firſt, or* Great Water Dock, *has a thick Root, blackiſh on the outſide, but of a dark reddiſh, or reddiſh yellow within, which is ſhorter than the* Great ſharp-pointed Dock, *and fuller of Fibres: from this Root ſpring up ſeveral large Leaves, ſtanding upon pretty long Foot-ſtalks; which Leaves very much reſemble the* Common Dock *Leaves, but that they are much larger and longer, a little crumpled as to their Subſtance, but ſmooth on the edges, and for the moſt part ſharp-pointed.* There grows up alſo one large brownith green Stalk, which is ſometimes ſpotted towards the Root with a few reddiſh Spots: the Leaves growing upon this Stalk are much like thoſe juſt now deſcribed, but leſſer, and growing leſſer and leſſer as they approach near the top, with ſome little or leſſer

Leaves

Leaves ſpringing from the ſame Joints of the Stalk, where the greater Leaves grow, which leſſer Leaves ſeem to grow in the Boſom, as it were, of the greater Leaves. The top of the Stalk ſhoots it ſelf forth into ſeveral ſmall Sprigs or Twigs; each of which, when in Flower and Seed, are of a ſpiked Form, and all together with the main top of the Stalk make one great ſpiked Head of Flowers and Seed; which Flowers and Seed differ nothing in Appearance from thoſe of the *Common Dock*, excepting that they always grow cloſer together.

IV. *The ſecond, or* Leſſer Water Dock, *has a Root like the former, but it is ſmaller, and full of long Fibres or Strings: the firſt Leaves alſo are like the firſt Leaves of the former, but much leſſer, long and narrower, being alſo ſharp-pointed.* The Stalk is lower, and fuller of Branches, with Flowers and Seed like to the former, and to the reſt of the *Docks*: ſo that there ſeems to be little or no other Difference between this and the *Greater*, but in the Magnitude of all the Parts, this being leſs every ways; but in its Form and Manner of Growing, it is much the ſame with the other.

V. *The Places.* They both grow in wet and plaſhy places, and by the edges of ſtanding Waters and Ditch-ſides: I have found them growing plentifully in the *Fens* in *Cambridgeſhire*, in Ditches, and by Ditch-ſides, and in the midſt of ſtanding ſhallow Waters; as alſo in low midland Grounds, at the lower parts of the Land, bordering upon the fenny parts, where the Earth is moiſt and watry, and by ſhallow Rivers-ſides.

VI. *The Times.* Theſe alſo flower in *June* and *July*, and the Seed is ripe in *Auguſt*.

VII. *The Qualities, Specification, Preparations and Virtues* of theſe, are the ſame with thoſe of the *Common* and *Sharp-pointed Dock*; and therefore to the two former Chapters I referr you: but this you may take notice of, That the Roots and Seed of the *Water Dock* are little inferior to thoſe of the *Sharp-pointed Dock*; and ſome learned Men which I know, affirm, that they exceed in Efficacy.

VIII. *An Obſervation.* The Roots of *Water Docks* or *Sharp-pointed Docks*, being boiled in Water till they are ſoft, and then beaten in a Mortar with Hogs Lard, and ſo made into an Ointment, is good againſt Scabs, Itch, Mange, Scurff, Morphew, Leproſy, *&c.* the Patient being daily anointed with it.

CHAP. CCXXIII.

of DOCK Sea.

I. *THE Names.* It is called in *Greek*, Λάπαθον ἑλώδες, ἢ θαλάσσιον: in *Latin*, *Lapathum Maritimus*, *Rumex Maritimus*: in *Engliſh*, *Sea Dock.*

II. *The Kinds.* It is *ſingularis ſui generis*, and becauſe it is a very ſtrong-ſcented Plant, Authors are pleaſed to call it *Lapathum Maritimum fœtidum*, Stinking Sea Dock.

III. The Deſcription. *It has a long* Root, *which is pretty thick with ſome* Fibres *thereat, and goes ſomewhat deep into the Earth, it being generally very light and ſandy Ground in thoſe marſhy places.* From this Root riſes up a Stalk which is reddiſh, a foot, and ſometimes half a yard high or long, which bends ſeveral ways. The Leaves grow at the gouty Joints upon long Foot-ſtalks, which are broad at bottom, long with a breadth, roundiſh towards the top, and then ſharp-pointed; they are of a dark red color, waved about the edges, and winged uſually at bottom, with two ſmall pieces like Ears. The Stalk ſpreads it ſelf into many Branches, with the like, but leſſer Leaves on them, and a little dented about the edges. At the top of the Stalk ſtands a Spike of Flowers, compoſed of four moſſy Leaves apiece; after which follow leaved round Heads, which contain the Seed.

IV. *The Places.* It grows in Salt Marſhes, by the ſides of Rivers and Brooks which daily flow with Salt Water, and in ſtanding Waters which are ſometimes overflowed with Salt Floods, or where the Salt Water flows ſo high as to reach the Roots thereof. I found it growing in and near the *Marſhes* by *Kings-Lynn* in *Norfolk*, and near the *Sea-ſhore* in many other places.

V. *The Times.* It flowers in *June* and *July*, and the Seed is ripe not long after.

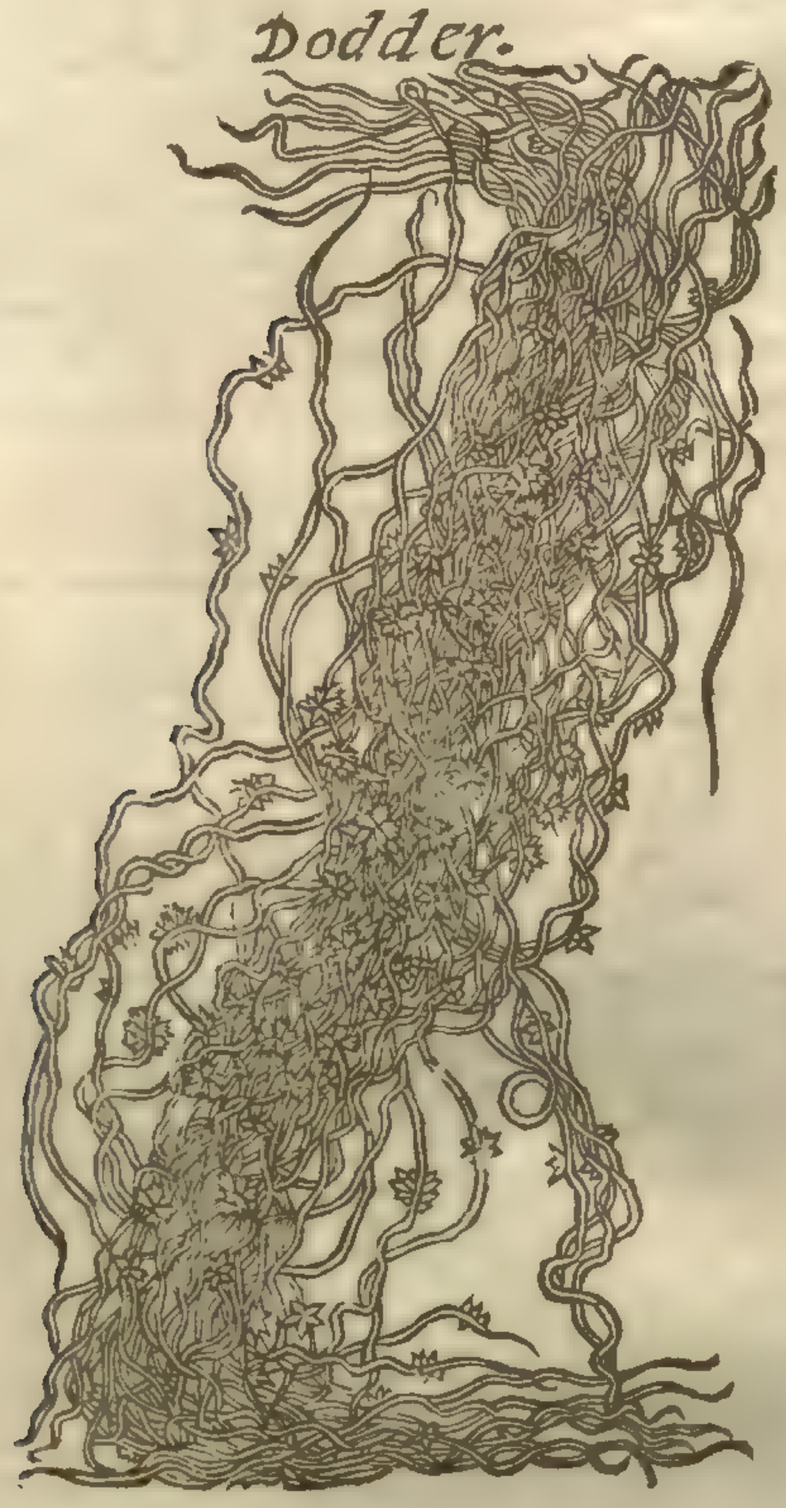
VI. *As to its Qualities and Virtues*, Authors have been ſilent thereon, and I knowing nothing by Experience concerning it, ſhall forbear any farther Diſcourſe about it.

CHAP. CCXXIV.

Of DODDER.

I. *THE Names.* It is called in *Arabick*, *Chaſſuth*, and *Cuſcuth*: in *Greek*, Κασύθα, ϗ κασούτας: in *Latin*, *Cuſcuta*, *Caſſuta*, *Caſſyta*, *Podagra lini*, *Angina lini*: in *Engliſh*, *Dodder*.

Dodder.



II. *The Kinds.* It is a ſingular Plant of the kind, and yet is various; for being a Climer, it is ſaid by Authors to be as manifold as are the Plants upon which it climbs, and accordingly has gotten as many Surnames; as, Ἐπίθυμον, *Epithymum*, Dodder of Time: ἐπιθύμαλ⊙, *Epitithymalus*, Dodder of Spurge: ἐπιάρτικη, *Epiurtica*, Dodder of Nettles: ἐπηρυγγιον, *Eryngionium*, Dodder of Eryngo: ἐπιάοακη, *Epiaphace*, Dodder of Tares: ἐπικίκιον, *Epicicium idem*: ἐπιγένιστον, *Epigeniſton*, Dodder of Broom: ἐπιδίκταμνον, *Epidictamnus*, Dodder of Dittany: ἐπίθυμβρα, *Epithymbra*, Dodder of Savory: ἐπίβατον, *Epibaton*, Dodder of Brambles: ἐπίλινον, *Epilinum*, Dodder of Flax: ἐπιλιβάνωτις, *Epilibanotis*, Dodder of Roſemary, or Herb Frankincenſe: ἐπιμαεσν, *Epimaeſyn*, Dodder of Herb Maſticha: ἐπικάνναβις, *Epicannabis*, Dodder of Hemp: ἐπίβρυον, *Epibryon*, Dodder of Hops: ἐπιπόλιον, *Epipolium*, Dodder of Polimountain: ἐπίσταβη, *Epiſtæbe*, Dodder of Knapweed: ἐπιμάραχον, *Epimaracum*, Dodder of Marjoram: ἐπαψίνθιον, *Epabſinthion*, Dodder of Wormwood: ἐπιχάμαιδρυς, *Epichamædrys*, Dodder of Germander: ἐπιχαμαίακτη, *Epichamæacte*, Dodder of Dwarf Elder: ἐπίσσωπ⊙, *Epihyſſopus*, Dodder of Hyſſop, &c. And yet, notwithſtanding all this Variety of Names, it is but one Plant or Herb, and has but one Deſcription.

III. The Deſcription. *This Herb taking Root in the Ground from Seed, ſhoots forth Threads or Strings groſſer or finer, as the Property of the Climate, Quality of the Earth, and Nature of the Plant on which it grows will admit, creeping and ſpreading on that Plant on which it faſtneth, or upon which it climbs, be it high or low, claſping about the very* Graſs, *if it meets with nothing elſe.* Theſe Strings are many, but have no Leaves at all, and winde and interlace themſelves ſo thick many times upon a ſmall Plant, that it deprives it (as it were) of the Heat of the Sun, and ſeemingly choaks it: after theſe Strings are riſen up to that height and ſtrength, that they may draw Nouriſhment from the Plant upon which they climb, you ſhall ſcarcely ſee any Appearance of the Riſe of thoſe Strings from the Earth, they being broken off by ſome Accident, or withred by the Heat of the Sun, or otherwiſe decayed; (from which Appearance I believe it was, that *Matthiolus* and ſome others did think it to grow without Root, and not firſt to ſpring out of the Earth, as it certainly does, and as they who may be pleaſed to ſow the Seed in a Pot by it ſelf, may obſerve, and ſee its ſpringing up; but if they meet with no Herb or Plant, upon which they may twine themſelves and clamber, they ſoon periſh and die away:) and from this Reaſon I ſuppoſe it is, that ſeveral have thought them to grow as *Moſs* upon Trees, or like *Miſſelto*: but after they have loſt their Ground-roots, I am apt to think, that the whole Plant draws its Nouriſhment (like as *Ivy*) from thoſe Plants on which it grows. Upon theſe Strings or Threads, which are ſometimes white and ſometimes red, according to the Herb or Plant on which they grow, are found Cluſters or ſmall Heads of Husks, out of which proceed whitiſh Flowers; which being paſt away, do afterwards give ſmall pale-colored Seed, ſomewhat flat, and twice as large as *Poppy* Seed.

IV. *Obſervation* 1. *Pliny lib.* 26. *cap.* 8. makes two ſorts of *Epithymum*, making the one to be the Flowers of *Time*, as *Dioſcorides* before him did, both green and white: the other to be red Threads or Strings growing without Root. This Duplicity of kinds *Matthiolus* has confuted, and now moſt of our modern Authors acknowledge but one kind, tho' it may have ſometimes white and ſometimes red Strings, as *Tragus* firſt obſerved, growing on ſeveral Herbs, according to which, they are found to be of thoſe two differing Colors.

V. *Obſervat.* 2. By this alſo it may appear, that neither *Time* nor *Savory*, nor any other Herb, do naturally, of their particular Seed, bring forth theſe Strings, but that they ſpring from their own Seed, either ſhed or ſcattered of themſelves upon the Ground, or coming among the Seeds of other Herbs which are ſown. As alſo they creep upon various Plants, ſo in the hotter Countries they cloſe upon hot Herbs, as on *Thyme*, *Savory*, *Hyſſop*, *Marjoram*, *Roſemary*, &c. but in *England* they, for the moſt part, climb upon colder Plants, as on *Fearn*, *Flax*, *Hemp*,

Hemp, *Nettles*, *Dwarf-Elder*, *Tares*, on which laſt it grows abundantly in ſome places, where it deſtroys the *Pulſe*, or at leaſt makes it much worſe; and is called by the Country People, *Hell-weed*, becauſe they know not how to deſtroy it.

VI. *The Places.* *Dodder* grows in *Aſia minor*, or *Natolia*, *Greece*, the *Morea*, *Spain*, *Italy*, and other hot Countries; as alſo plentifully in *England*: I found it growing Wild in ſeveral places in *Cambridgeſhire*, upon *Dwarf-Elder*, and upon *Nettles*, as alſo in ſeveral *Hemp*-lands upon *Hemp*. It grows on ſeveral Plants upon *Hamſtead-heath*, as upon *Fern*, &c. as alſo on ſeveral places on *Black-heath* in *Kent*, where *Parkinſon* ſays he found it. It grows plentifully upon *Nettles* in *Somerſetſhire*, and in ſeveral other parts of this Kingdom; as alſo upon *Tares* near *London*.

VII. *The Times.* It flouriſhes in *July* and *Auguſt*, in which times, and alſo after, it bears its Flower and Seed.

VIII. *The Qualities.* It is ſaid to be hot and dry in the ſecond Degree: but I am of the Opinion, that that *Dodder* which grows on the hot Plants, as *Thime*, *Marjoram*, *Savory*, *Hyſſop*, is hot in the ſecond Degree; but that which grows on the colder and more temperate Plants, as *Fern*, *Nettles*, *Flax*, *Hemp*, &c. does not exceed the firſt Degree of Heat: for the Qualities and Properties of this Herb much follows thoſe of the Plants upon which it grows, and ſo in ſome meaſure changes and alters accordingly; ſo that enquiring into the Nature of the Plant upon which it is nouriſhed, you may in part ſee into what Nature and Properties it may be altered. It is Abſterſive, with an aſtringent or binding Quality, eſpecially that which grows upon the *Bramble*, and other aſtringent Plants; ſince it is manifeſt, that it receives a certain Quality from its Parents, by whoſe Juices it is nouriſhed. That which grows upon hotter Herbs, as *Thyme* and *Savory*, becomes hotter and drier, and of thinner parts. That which grows upon *Broom* is Diuretick, and provokes Urine more forcibly, and withal makes the Belly more ſoluble. That which grows upon *Flax* is leſs drying. It is dedicated to the Liver and Speen, as alſo the other Bowels; and has a gentle ſort of Cathartick or Purging Faculty with it.

IX. *The Specification.* It is a peculiar thing againſt Oppreſſions of the Spleen, and Hypochondriack Melancholy.

X. *The Preparations.* This Herb admits not of many Preparations; the chief are, 1. *A Juice or Eſſence.* 2. *An Infuſion or Decoction.*

The Virtues.

XI. *The liquid Juice or Eſſence.* It opens Obſtructions of the Liver and Spleen, and purges Melancholy and aduſt Choler from the Spleen and Hypochonders, and indeed from the whole Body. Doſe three ounces, ſweetned with an ounce of choice Manna diſſolved in it. It evacuates Flegm from the Head and Viſcera, diſcharges the Lungs, and is profitable againſt a Vertigo, Megrim, and other inveterate Pains of the Head. It prevails againſt fainting and ſwooning Fits, by carrying off the ſharp and acrid Humors which cauſe them. It is powerful againſt Madneſs and Agues, eſpecially Quartanes, tho' they have been of a long continuance. And as it is good againſt Hypochondriack Melancholy, ſo alſo it prevails againſt thoſe Diſeaſes which that Humor breeds, as Scirrhus, Cancer, Hardneſs of the Spleen, Pain and Windineſs of the Spleen, Stoppage of the Reins, Itch, Scabs, Leproſy, Elephantiaſis, malignant and cancerous Ulcers, as alſo the Malignity of the *French*-Pox. It very much cleanſes the Blood from Melancholy and adult Humors, is good againſt the Yellow Jaundice, and tho' it has a purging Property, yet it alſo ſtrengthens both Liver and Spleen, and cures Agues in Children, if a little Worm-ſeed be added to it. It provokes Urine ſingularly, and cleanſes the Urinary Paſſages from Sand, Gravel and tartarous Matter, eſpecially if a little of the Pouder of *Aniſeed* and Tincture of *Wormwood* be added, and then it alſo [illegible]ings in the Bowels, and brings down the Terms in Women. Mix the Doſe with a Glaſs of White Port Wine, and ſo let it be drunk.

XII. *The Infuſion or Decoction in White Wine.* If you make a Decoction thereof, the Boiling muſt not be much, for it will not endure long boiling, becauſe it will looſe it ſelf. It has all the Virtues of the liquid Juice or Eſſence aforegoing, and may be taken to half a pint, more or leſs, at a time, ſweetned by diſſolving an ounce of pure Manna in the ſame. It is ſaid to cure Children of Agues, being given from two to four ounces, as aforeſaid.

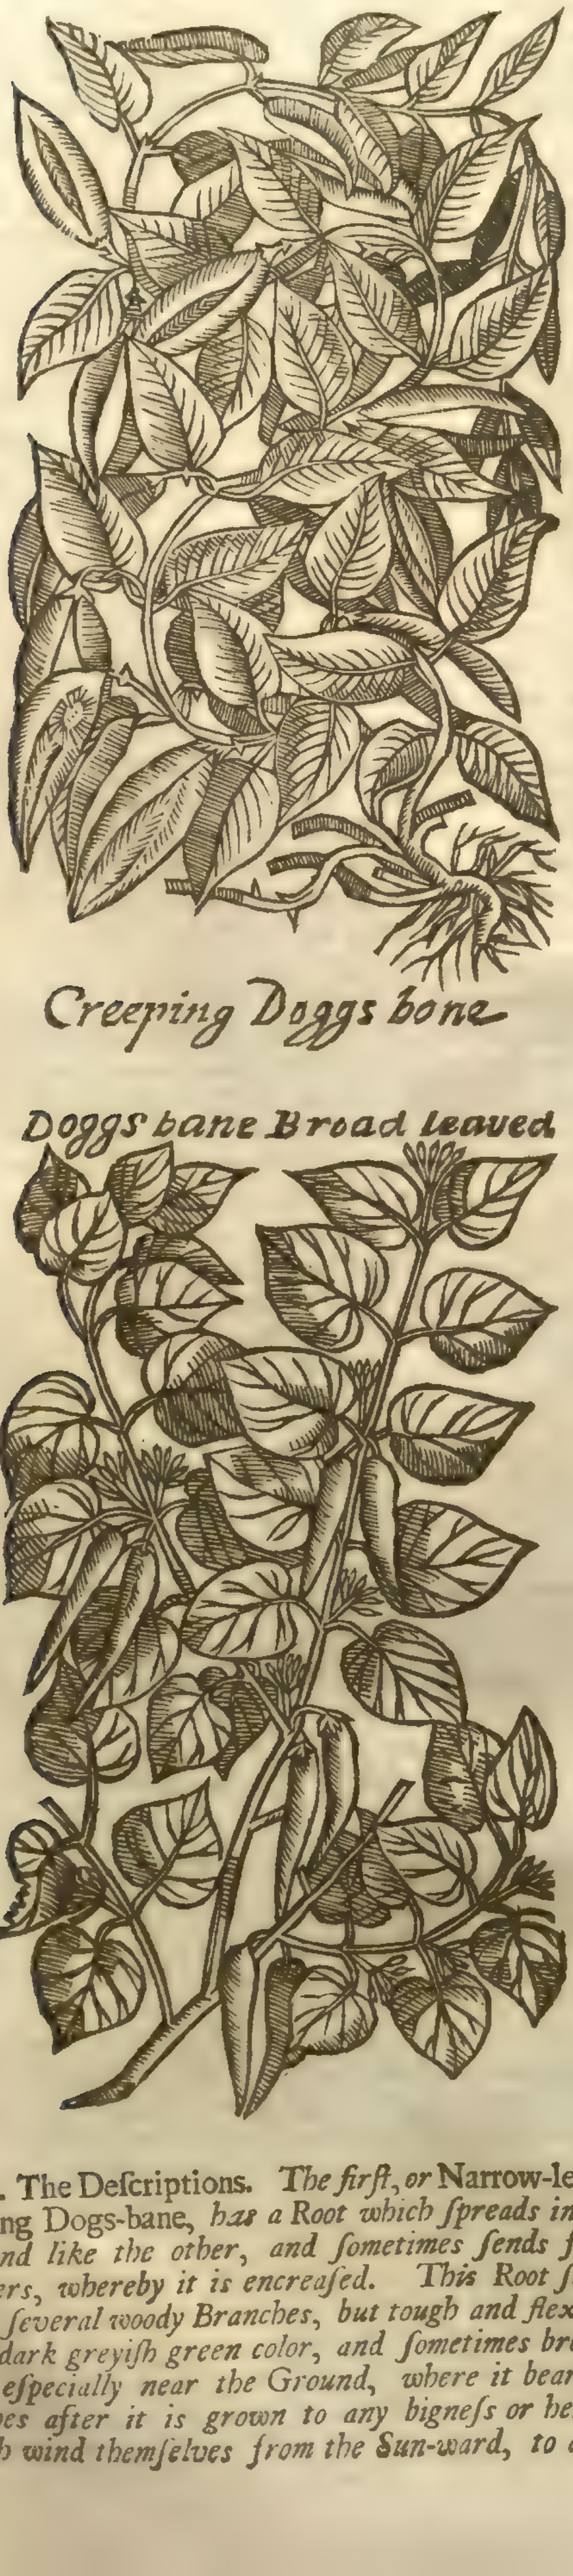
XIII. Nota. *Dodder of Flax* is peculiar for opening Obſtructions of Liver, Spleen and Gall. *Dodder upon Brambles* is good againſt the Yellow Jaundice, and ſtrengthens the Viſcera much. *Dodder of Nettles* provokes Urine, opens Obſtructions of the Womb, and looſens the Belly. *Dodder of Thyme* comforts and warms a cold Stomach, and rectifies the Diſcraſy of the Blood and Humors, prevailing againſt old Head-achs, the Megrim, Vertigo, Madneſs, Epilepſy, purging downwards black Choler and Melancholy. *Dodder of Broom* is good to open Obſtructions of the Reins, Ureters and Bladder, provoke Urine, expel Sand, Gravel and tartarous Matter, and give eaſe in the Strangury, expelling watry and hydropick Humors. In a word, *Dodder of all other Plants*, in like manner, partakes of the Nature, Qualities and Properties of them on which they grow, (as aboveſaid) whether they be hot or cold, cathartick or aſtringent; and it is thought to work more effectually for thoſe Diſeaſes, whereunto the Herb it ſelf is applied. But *Epithymum*, or *Dodder of Thyme*, is that which, by all Phyſicians, is accounted the moſt principal and moſt powerful *Dodder*; and doubtleſs is the beſt of them all, to be uſed to cold and moiſt Habits and Conſtitutions of Body.

CHAP. CCXXV.

of DOGS-BANE.

I. *THE Names.* It is called in *Greek*, Ἀπόκυνον, ἢ Κυνόμεζον, (*quia Canis interficit*;) the *Greeks* alſo call it περίπλοκα, from its climing Property: in *Latin*, *Apocynum*, and *Periploca*: in *Engliſh*, *Dogs-bane*.

II. *The Kinds.* There are five kinds hereof, *viz.* three *European* kinds, and two *American*. The *European* kinds are, 1. *Apocynum anguſtifolium ſive repens*, Climing Dogs-bane, or Narrow-leav'd Dogsbane. 2. *Apocynum latifolium non repens*, Broad-leav'd upright Dogs-bane. 3. *Apocynum folio anguſto Salicis*, Willow-leav'd Dogs-bane. The *American* kinds are, 4. *Apocynum rectum minus anguſtifolium Americanum*, The leſſer upright narrow-leav'd American Dogs-bane. 5. *Apocynum rectum majus latifolium Americanum*, The greater upright broad-leav'd American Dogs-bane, *or* Virginian Silk.



Creeping Doggs bane

Doggs bane Broad leaved

III. The Deſcriptions. *The firſt, or* Narrow-leav'd climing Dogs-bane, *has a Root which ſpreads in the Ground like the other, and ſometimes ſends forth Suckers, whereby it is encreaſed. This Root ſends forth ſeveral woody Branches, but tough and flexible, of a dark greyiſh green color, and ſometimes brownish, eſpecially near the Ground, where it bears no Leaves after it is grown to any bigneſs or height, which wind themſelves from the Sun-ward, to a very great height, twenty foot high, or more ſometimes, if any thing grows or ſtands by it, upon which it may climb higher, or elſe falling down again with its top, on which ſtand at ſeveral good diſtances (ſaving at the tops, where they ſtand thicker ſet together) two Leaves longer and narrower than the next deſcribed, and pointed at the ends, ſomewhat thick, and of a deep green color, almoſt ſhining.* The Flowers ſtand in the ſame manner as thoſe in the next, and conſiſt of five thick Leaves, each of them pointed, and bending ſomething backwards, ſeeming to have two Leaves apiece, one lying upon another, like unto thoſe of *Barren-wort*, the undermoſt being greener and larger than the upper Leaves which lye upon them, and are not ſo large to cover them wholly, but leave the green brims or edges of the lower Leaves to be ſeen round about them; which upper Leaves are of a dark purple or reddiſh color, and cleave ſo faſt to the lower, that it is very hard to ſeparate them. In the middle of each Flower ſtands a green Pointel, encompaſſed with five dark yellow Chives, each of them twining inwards. After the Flowers are fallen, ſmall long Cods appear, (in warm Countries, but ſcarcely in *England*) two always joined together, but more ſtrictly than in the following Plant, bending ſomething more outward in the middle, and meeting together almoſt at the points, in which lyes flat Seed, wrapped in a kind of ſilken Down. This Plant looſes its Leaves, but not its Stalks, in the Winter, freſh coming forth again in the Spring.

IV. *The ſecond, or* Broad-leav'd upright Dogsbane, *has a Root which grows down into the Ground, ſpreading it ſelf out into ſeveral Branches, with divers ſmall Fibres adjoining: from this Root ſprings up a woody Stem, of the thickneſs of ones Finger, covered with a greyiſh Bark; from whence ariſe ſeveral woody, but flexible greeniſh Branches, eaſy to twiſt or winde about any thing, being very tough and hard to break, ſtanding for the moſt part upright, and ſeldom trailing, or laying hold of any thing which may grow near it; having two broad dark green Leaves, but ſharp-pointed, and not round, ſet at every Joint all along, but not very near one unto another, full of Veins, and ſomething ſofter than* Ivy-*Leaves, but thick withal; whoſe Stalks and Branches being broken, yield a pale yellow-colored Milk or Juice.* But as *Dioſcorides* and other Authors ſay, of a much deeper yellow; which thing may be admitted when it grows in warmer Climates than is this of ours. The Flowers ſpring forth at the Joints with the Leaves, growing upon Foot-ſtalks not very long; and at the tops three or four or more of them ſtand, ſometimes together, which conſiſt of five ſmall pointed Leaves, of a whitiſh color, yet larger than thoſe of *Aſclepias* or *Swallow-wort*. After which (in the hotter Climates, but ſcarcely in ours) grow long, crooked and pointed Cods, ſomething more hard and woody than thoſe of *Swallow-wort*, altho' nothing ſo much as thoſe of the *Oleander* or *Roſe Bay-tree*, two moſt uſually ſtanding together upon one Stalk, but ſevered at the ſetting to the Stalk, and are full of a ſilken white Down, (like the former) in which lye diſperſed many flat, blackiſh brown Seeds. This Plant looſes not its Branches in the Winter, but only its Leaves, they every Spring ſhooting forth new again.

V. *The third, or* Willow-leav'd Dogs-bane, *has a Root much like the firſt, from which ſpring woody Stems or Branches, having ſet at every Joint of the climbing* Twigs *two narrow* Leaves *apiece, like to the firſt kind, but they are not ſo thick, rather a little thinner, and much narrower than they, almoſt reſembling the* Form *of a* Willow *Leaf.* The Flowers are like the firſt, and blow as late, being very much

much like to the former *Narrow-leav'd* in its Form and Manner of Growing; and it looſes its Leaves in the Winter, as that other does, renewing them again in the Spring.

VI. *The fourth, or* Leſſer upright narrow-leav'd American Dogs-bane, *has a thick Root, but it creeps not in the Ground, as the* Greater American *doth; but from many long Fibres, it ſhoots forth a round brown Stalk, about half a yard high, having at each Joint a pair of long narrow Leaves, and ſuch a large Tuft of Flowers at the top, as the following has, but of a deeper purple color,* which have a certain Clamminess on them, which will detain Flies or other light things which happen to fall thereon. After which come long and ſtrait Cods, (not crooked, like the *Greater ſort* following) with flat brown Seed therein, lying in a white kind of Down, like unto *Aſclepias* or *Swallow-wort*. This being broken, yields a milky Sap or Juice, like the other.

VII. *The fifth, or* Greater upright broad-leav'd American Dogs-bane, *called* Virginia Silk, *has a Root which is long and white, of the thickneſs of a Man's Thumb, running under Ground very far, and ſhooting up again in divers places, the Heads being ſet full of ſmall white Knobs or Knots, ſending forth many Branches, if it ſtands any long time in a place. From this Root riſes up one Stalk, and ſometimes more, being ſtrong and round, and three or four feet high, on which are ſet, at the ſeveral Joints thereof, two fair, long and broad Leaves, round-pointed, with many Veins therein, growing cloſe to the Stem, without any Foot-ſtalk.* At the tops of the Stalks, and ſometimes at the Joints with the Leaves, grows forth a great Buſh of Flowers, out of a thin Skin, to the number of twenty, and ſometimes of thirty or forty, every one with a long Foot-ſtalk, hanging down their Heads for the moſt part, eſpecially thoſe which are outwardmoſt, every one ſtanding within a Husk of green Leaves, turned to the Stalk-ward, like to the *Lyſimachia* or *Looſtrife* Flower of *Virginia*, and each of them conſiſting of five ſmall Leaves apiece, of a pale purpliſh color on the upper ſide, and of a pale yellowiſh purple underneath; both ſides of each Leaf being as it were folded together, making them ſeem hollow and pointed, with a few ſhort Chives in the middle. After the Flowers are paſt, long and crooked Cods, pointed, and ſtanding upright, ſucceed, in which are contained flat brownish Seed, diſperſedly lying within a great deal of fine, ſoft and whitiſh brown Silk, very like unto the Cods, Seed and Silk of *Aſclepias* or *Swallow-wort*, but that the Cods are greater, and more crooked, and harder alſo in the outward Shell. The whole Plant, as well Leaves as Stalks, being broken, will yield a pale kind of Milk or Juice.

VIII. *The Places.* The firſt and third grow in *Italy*, *Apulia* and *Calabria* in the Kingdom of *Naples*. The ſecond grows in *Syria* and the *Eaſtern* Countries, as alſo in *Italy*, as *Matthiolus* reports; but with us they grow in *Gardens*. The two laſt came from our *Engliſh* Plantations in *America*. The laſt, *Parkinſon* ſays, came to him from *Virginia*, where it grows abundantly; he raiſed it from the Seed which he had from thence.

IX. *The Times.* The three firſt flower late in the Year, if they flower at all with us, *viz.* about the end of *Auguſt*, and to the middle of *September*. The two latter flower in *July* and *Auguſt*; and their Seed is ripe in *Auguſt* and *September* following.

X. *The Qualities.* Theſe Plants are hot and dry in the fourth Degree, δηλητήριοι, Venefick or Poyſonous; they are ſo great Poyſons, as to kill Dogs, the which they will do, if the Herb is mixed with their Bread, Broth or Meat, and ſo given them; and therefore they are not to be given to Mankind. The three firſt are ſaid to exceed in Malignity both *Woolfs-bane* and *Oleander* or *Roſe-Bay*: but as moſt Poyſons have their Antidotes, as that of *Thora* is *Anthora*, that of *Pardalianches* is *Herba Paris*; ſo the Antidote to this *Apocynum* is *Aſclepias* or *Swallow-wort*. Some may object it as a Fault to me, that I have put into my *Herbal* ſuch poyſonous Plants as this is; but to ſuch I anſwer, That the more poyſonous they are, the more neceſſary to be known, that People may take notice of them, and beware of uſing them; yet theſe Poyſons are not without their Virtues alſo; for tho' they are not fit to be given inwardly, yet ſometimes they may be applied outwardly to advantage. As to the aforegoing Plants, all Authors have concluded the firſt three under the Character of being Deleterious or Deadly: as for the other two, nothing is yet known of them by Experience; yet by their milky Juice, which is burning, fiery and exulcerating, they may almoſt be concluded in the ſame Claſſis; for which Reaſon I ſhould deſire every one to be cautious in their Uſe.

XI. *The milky Juice of any of the three firſt Plants,* is very hot and burning, and being outwardly applied, it is good againſt Tettars, Ringworms, Scurff, Morphew, Leproſy; and to fetch Hair off from Hides, if they be ſteeped in it. Even in the outward Application it is to be uſed with Caution.

XII. *A Cataplaſm made of the Leaves of either of the* American *kinds*, by being beaten either crude or boiled in Water, and ſo applied, it is ſaid to be good for Tumors and Pains proceeding from a cold Cauſe.

XIII. *Gerard* ſays, that the Cods of the laſt, or *Greater upright broad-leav'd American Plant*, are ſtuffed full with a moſt pure Silk, of a ſhining white color: The Cods (ſays he) are not only full of Silk, but every Nerve or Sinew, wherewith the Leaves are ribbed, are likewiſe moſt pure Silk; as alſo are the Peelings or Bark of the Stems or Branches, like as is the Peeling or Bark of *Flax* or *Hemp*, Cordage for making Linnen. But the *Indians* have not the Underſtanding in them to make uſe of it, ſo as to cover their Nakedneſs, notwithſtanding (ſays he) the Earth is covered over with this Silk. This they daily tread under their Feet, which would be ſufficient to Cloath many Kingdoms, if it was carefully Cheriſhed and Manured.

XIV. This laſt Plant *Parkinſon* tells us he raiſed up in *England*, from Seed which was ſent to him from *Virginia*; but he ſays there is another Plant growing in *Virginia*, called *Silk-Graſs*, which is very much differing from this.

CHAP. CCXXVI.

Of DOGS-STONES.

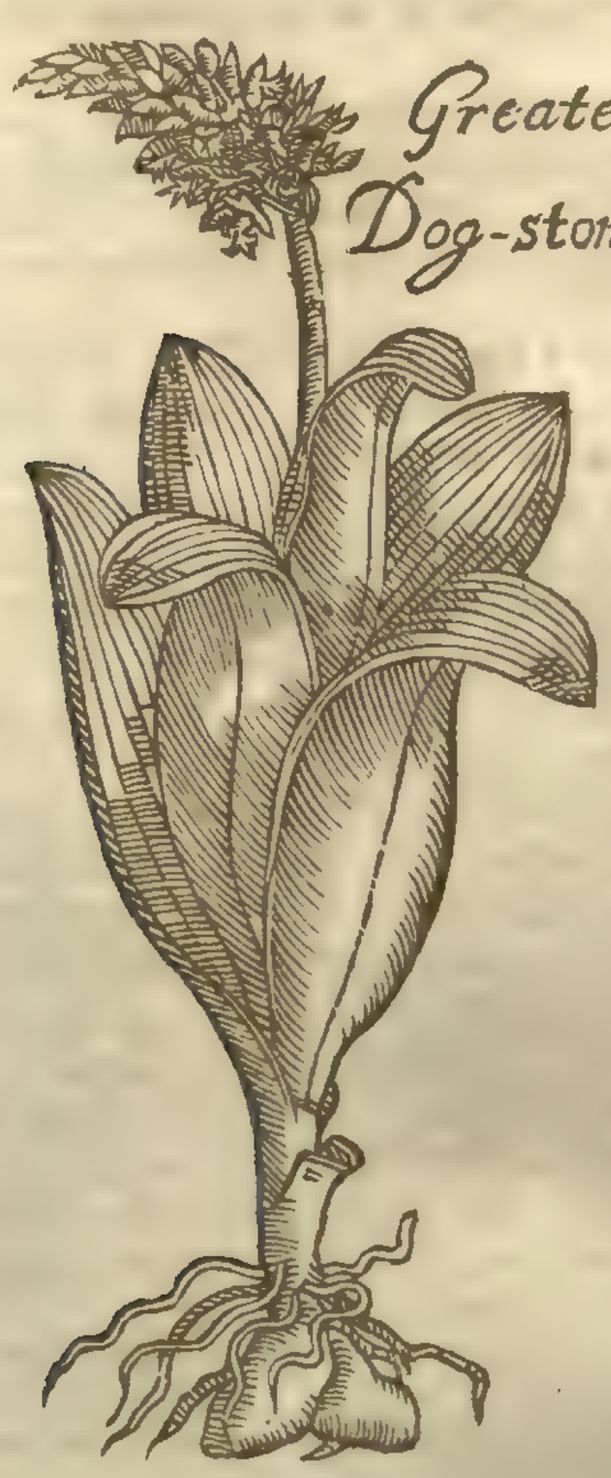
I. *THE Names.* This Plant is called in *Greek*, Κυνοσόρχις: in *Arabick*, *Chaſi alkes*, and *Chaſi alchels*: in *Latin*, *Cynoſorchis*, and *Teſticulus vel Teſticuli Canis*: in *Engliſh*, *Dogs-ſtones*.

II. *The Kinds.* This Plant is of the kinds of *Orchis*; now, how manifold the chief and principal Species or Kinds of *Orchis* are, we think neceſſary to declare here, that things may be ſet in a true and clear Light. *Orchides* then are divided into nine principal kinds, *viz.* into, 1. *Cynoſorchis*, Dogs-

ſtones,

ſtones, of which only in this preſent Chapter. 2. *Orchis morio*, Fools-ſtones. 3. *Orchis Serapias, vel Teſticulus Valpinus*, Fox-ſtones. 4. *Tragorchis*, Goats-ſtones. 5. *Orchis odoratus, Teſticulus odoratus*, Sweet Cullions, which ſee in Chap. 184. aforegoing. 6. *Orchis abortiva, vel Nidus avis*, Stones miſ-ſhapen, or Birds-neſt, which ſee in Chap. 73. of this Book. 7. *Orchis palmata*, Handled Orchis. 8. *Orchis paluſtris*, Fenny-ſtones. 9. *Orchis Maccaria*, Fly Orchis; of all which (not yet treated of) we ſhall ſpeak hereafter in their proper places.

III. *Dogs-ſtones* (the ſubject Matter of this Chapter) are accounted by Authors to be about fourteen or fifteen ſeveral kinds, but we ſhall only treat of thoſe which are found to grow in *England*, which are theſe following, *viz.* 1. *Cynoſorchis major latifolia*, The greater broad-leav'd Dogs-ſtones. 2. *Cynoſorchis major purpurea latifolia*, The greater broad-leav'd purple Dogs-ſtones. 3. *Cynoſorchis major ſpica compacta*, Marſh Dogs-ſtones, or The greater pale purple-flowred Dogs-ſtones. 4. *Cynoſorchis latifolia minor*, The ſmaller pale purple Dogs-ſtones. 5. *Cynoſorchis maculata*, Spotted Dogs-ſtones. 6. *Cynoſorchis militaris, ſive Strateumatica major*, The greater Soldiers Dogs-ſtones. 7. *Cynoſorchis militaris minor*, The leſſer Soldiers Dogs-ſtones. 8. *Cynoſorchis militaris minima, ſive Pannonica*, The leaſt or Hungarian Soldiers Dogs-ſtones.



IV. The Deſcriptions. *The firſt, or* Great broad-leav'd Dogs-ſtones, *has a Root which is compoſed of two round white Bulbs, ſet together, like the two Stones of a Dog, with long Fibres at the Heads of them, one ſomewhat higher ſometimes than another; and always one of them, which is the higher, is firm, full and hard, the other lank, wrinkled and ſoft, which waſteth away to nothing, leaving the firm Root, which ſo abides all the Winter, and in the Spring another is engendred, and encreaſes from the ſide of the old one, and then that begins to grow lank, whilſt the other new one encreaſes.* This Root ſends forth five or ſix broad Leaves near the Ground; from among which riſes up a round green Stalk, half a yard high, bare or without Leaves, or but one or two ſmaller ſtanding below, at the top of which ſtands a ſpiked Head of purpliſh Flowers, ſet thick and cloſe together, made like unto open Hoods, from the middle whereof hangs down a ſmall Body, as it were, of a Dog, or other ſuch Creature, being of a pale purple color it ſelf, ſpotted with deeper purple Spots, and Lines; after which come ſomewhat long and round ſmall Husks, containing therein rather ſmall Duſt than Seed, it is ſo ſmall.

V. *The ſecond, or* Greater broad-leav'd purple Dogs-ſtones, *has a Root like the former; but this ſort has Leaves ſomething narrower than the other:* the Stalk is nearly of the ſame height, and the ſpiked Head of Flowers is neither ſo long nor ſo thick; and the Flowers are of a whitiſh purple color, marked with ſome purple Spots and Lines more inward, formed like open Hoods, and ſmall Bodies hanging forth, like the former; the Seed being alſo like the ſame.

VI. *The third, or* Marſh Dogs-ſtones, *has a Root like the firſt alſo; and the Leaves of this are ſomewhat narrower than in the laſt; and the Stalk alſo is ſomewhat lower*, with Leaves upon it, which are ſometimes ſpotted; and the ſpiked Head ſhort and cloſe; with the like Flowers for Form, but ſomewhat leſs, thick ſet together, which are of a whitiſh purple color, and ſpotted.

VII. *The fourth, or* Smaller pale purple Dogs-ſtones, (*which* Gerard *calls* White Dogs-ſtones) *has Roots altogether like the firſt aforegoing, from which ſprings up a Stalk almoſt a foot high, ſet with five or ſix Leaves, claſping or embracing the ſame round about:* and the firſt Leaves riſing up, are likewiſe ſmooth, long, broad Leaves, but leſſer and narrower than thoſe of the firſt kind. The ſpiky Head of Flowers is ſhort, thick, buſhy, compact of many ſmall whitiſh purple-colored Flowers, and ſpotted on the inſide with many ſmall purple Spots, and little Lines or Streaks. The ſmall Flowers are like an open Hood or Helmet, having hanging out of every one, as it were, the Body of a little Man, without a Head, with Arms ſtretched forth, and Thighs ſtradling abroad, after the ſame manner almoſt that the Children are wont to be pictured, hanging out of *Saturn*'s Mouth.

VIII. *The fifth, or* Spotted Dogs-ſtones, *have Roots like the others, but leſſer; from whence come forth narrow Leaves, ribbed in ſome ſort like unto the Leaves of* Narrow Plantane *or* Ribwort, *daſht with many black Streaks and Spots.* The Stalk is a foot and half or more high; at the top of which does grow a Tuft or Ear of Violet-colored Flowers, mixt with a dark purple, but in the Hollowneſs thereof whitiſh, not of the ſame Form or Shape which the others are of, but leſſer, and as it were reſembling ſomething the Flowers of *Larks-Spur*.

IX. *The ſixth, or* Greater Soldiers Dogs-ſtones, *has round bulbous Roots, great and thick; from the Heads of which Bulbs many Fibres or Threads ſpring forth.* This Root ſends forth ſeveral large Leaves below, and ſome leſſer on the Stalk, which ſeem to encloſe it. The Stalk is ſmooth, green, and about half a yard high. The ſpiked Head of Flowers ſtands ſomewhat looſe, the Flowers being a little ſeparated one from another: each Flower is alſo like unto a Man, whoſe Body has its Arms and Legs cut off, and a Hood ſet thereon; or a Leg-leſs Soldier with his Helmet on, the Hood or Helmet being white, and the Body ſpotted with purple Spots.

X. *The ſeventh, or* Leſſer Soldiers Dogs-ſtones, *has Roots, Leaves, Stalks and Spike of Flowers altogether like the laſt, but that they are all of them every ways leſs, and the Flowers ſomewhat whiter.*

XI. *The eighth, or* Leaſt Hungarian Soldiers Dogs-ſtones, *has Roots like the others, but ſmaller much;*

much; from whence five or six little Leaves spring forth; the Stalk is about six or seven inches high, set about with somewhat lesser Leaves. The Tuft of Flowers at the top of the Stalk are of a purple color, small, with a white Lip, divided into four Partitions, hanging down, which is also spotted lightly with purple. It has a little Spur hanging down on the hinder part of each Flower. The Seed is small, and contained in such twined Heads as in other Plants of this kind.

XII. *The Places.* These all grow in many places of this Kingdom, in moist and fertile Meadows. The *Marsh Dogs-stones* grow for the most part in moist and watersh Woods, as also in Marsh Ground. The last grows in *Austria*, *Germany*, *Hungary*, and in many places of *England*.

XIII. *The Times.* They flower from the beginning of *May* till the end of *June*; but, says *Gerard*, to the end of *August*.

XIV. *The Qualities.* *Dogs-stones* are temperate in respect to Heat and Coldness, and the *full Testicle* moist in the second Degree. The *wrinkled or soft one* temperate in respect to Dryness or Moisture. The *full Testicle* seems to be Digestive, Diuretick, Hysterick, Chylifick and Spermatogenetick. The *soft or withred Stone* is opposite to all the foregoing Qualities, and rarely used Physically. All the sorts or kinds of *Testiculi* provoke or stir up Lust, and they are promiscuously used for that Purpose; but the best and most effectual for that Purpose, are the *Testiculi Canini*, of which the *harder and fuller Bulb* is to be chosen, as aforesaid. The fuller Root is not always the greater, but oftentimes the lesser, especially if they are gathered before the Plant has shed its Flower, or when the Stalk first comes up; nor does it attain to be the greatest till the Seed comes to be perfectly ripe. For since that every other Year, by course, one Bulb or Stone grows full, the other empty, and so perishes; it cannot be, that the harder and fuller of Juice should be always the greater; for at such time as the Leaves come forth, the harder and fuller Stone begins to encrease, and as that encreases, so the other, by little and little, decreases and withers away, till the Seed is ripe, at what time the whole Plant above Ground does forthwith decay and perish, and that which all this while has been encreasing, remains still fresh and full till the next Year.

XV. *The Specification.* They are peculiar for the curing Impotency in Men.

XVI. *The Preparations.* You may have, 1. *The Essence.* 2. *The Sanguis or Blood.*

The Virtues.

XVII. *The Essence.* Being taken daily, first in the Morning fasting, and last at Night going to Bed, from one spoonful to three in a Glass of generous Wine, it not only provokes Lust, but it also takes away the Imbecility or Impotency of the Instruments of Generation, but also promotes a plentiful Generation of Seed.

XVIII. *The Sanguis or Blood.* It has all the Virtues of the Essence, but is indeed more powerful to all the mentioned Intentions; it comforts and warms the Instruments of Generation, making a liberal encrease of Animal Spirits, stirring up the Person who takes it to an ardent desire of Coition. The Dose is one or two spoonfuls in a Glass of *Madera* or other generous Wine, Morning and Night.

CHAP. CCXXVII.

Of DOGS-TOOTH.

I. *THE Names.* Some will have this to be Σατύριον ετερον, *Dioscoridis*, i. e. *Satyrion habens Radicis Corticem rubrum*, *Dioscor. lib. 3. cap.* 144. but this other Authors will not allow of: *Parkinson* will have that (and I believe rightly enough) to be our *Tulip*. Others will have this Plant to be a kind of *Violet*, (tho' there is nothing like a *Violet* in it) and so call it *Dogs-tooth Violet*. It is called it *Latin*, *Dens caninus*, *Dentali Clusii & Lobelii*, *Hermodactylus Gesneri*, *Pseudohermodactylus Matthioli*; and in *English*, *Dogs-tooth*.

II. *The Kinds.* It is doubtless one of the kinds of *Satyrion*, tho' not the true *Satyrion Dioscoridis*, and our Moderns have given to it the Name of *Dens caninus*. It is threefold, *viz.* 1. *Dens caninus flore albo*, Dogs-tooth with a white Flower. 2. *Dens caninus flore purpurascente*, Dogs-tooth with a purple Flower. 3. *Dens caninus flore rubro*, Dogs-tooth with a red Flower.

Dogs Tooth.

III. The Descriptions. *The first*, *or* White-flowred, *has a white bulbed Root, long and small, yet commonly larger than either of the two following, bigger below than above, with a small piece adjoining to the bottom of it. From this Root, in the beginning of the Spring, after the Winter-Frosts are past, two Leaves for the most part (very rarely three) rise up, when it will flower, (otherwise but one) which are closed together when they first come up out of the Ground, and enclose the Flower between them.* The Leaves, when they are opened, do lay themselves flat on the Ground, or not much above it, one opposite unto the other, with the Stalk, and the Flower upon it, standing between them; which Leaves are of a whitish green color, long and narrow, yet broader in the middle than at both ends, growing less

leſs by degrees each way, ſpotted and ſtriped all over the Leaves with white Lines and Spots. The Stalk riſes up ſeven or eight inches high, bearing at its top one Flower, and no more. This Flower hungs down its Head, and is larger than any of the following kinds, and conſiſts of ſix white, long and narrow Leaves, turning themſelves up again after it has felt the Warmth of the Sun, that they do almoſt touch the Stalk again, very like to the Flowers of *Cyclamen* or *Sowbread*: it has in the middle of the Flower ſix white Chives, tipt with dark purple Pendents, and a white three-forked Stile in the midſt of them. The Flower has no Smell at all, but is commendable chiefly for its Beauty and Form. After the Flower is paſt, there comes in its place a round Head, ſeeming three-ſquare, containing therein ſmall yellow Seed.

IV. *The ſecond*, with a purple Flower, *has a white bulbed Root, like unto the former, but leſſer, as aforehinted: the Leaf hereof is not ſo long as that, but broad and ſhort, ſpotted with darker Lines and Spots.* The Flower is like the other, but ſmaller, and of a delayed purple color, very pale ſometimes, and ſometimes a little deeper, turning it ſelf as the other, with a Circle round about the middle. The Chives hereof are not white, but declining to purple: in all other Reſpects it is like to the aforegoing.

V. *The third*, with a red Flower, *has a like white bulbous Root. The Form and Largeneſs of the Leaf is like to the laſt deſcribed; ſo alſo the Form and Bigneſs of the Flower*: but in this the chief Difference conſiſts, that the Leaves of this are of a yellowiſh, mealy, green color, ſpotted and ſtreaked with redder Spots and ſtripes, and the Flower of a deeper reddiſh purple color; and the Chives alſo more purple than the laſt; but in all other things they are very like one another.

VI. *The Places.* All the ſorts of *Dens caninus* grow in Foreign Countries, as in *Italy* on the *Euganean Hills*, on the *Apenine*, alſo about *Gratz* the chief City of *Stiria*, and about *Bayonne*, and in ſeveral other places: they alſo grow in the *Gardens* of our *Floriſts* in *England*.

VII. *The Times.* They moſt commonly flower in *March*, and many times in *April*, according to the Warmth or Coldneſs of the Seaſon.

VIII. *As to the Qualities, Specification, Preparations and Virtues*, they are much the ſame with the *Orchides* or *Dogs-ſtones* in the former Chapter, to which I refer you: only it is ſaid, that theſe are more efficacious for Venereous Actions than any of the *Orchides* and *Satyrions*.

IX. *Obſervation.* The Pouder of the Root being given inwardly in Broth, Milk or Wine to one or two drams, is ſaid to be effectual againſt Worms in the Belly; to eaſe the Pains of the Cholick, to ſtrengthen and nouriſh the whole Body, and to cure the Falling-ſickneſs in Children.

CHAP. CCXXVIII.

Of DOVES-FOOT.

I. *THE Names.* It is called in *Greek*, Γεράνιον περιστερειδὲς, ἢ πᾶς περιστερειδὲς: in *Latin*, *Geranium Columbinum*, *Pes Columbinus*; and in *Engliſh*, *Doves-foot*.

II. *The Kinds.* There are many kinds of this Plant, but the principal which grow in *England* are the three following, 1. *Geranium Columbinum vulgare*, *Pes Columbinus communis*, The common Doves-foot. 2. *Geranium Columbinum Laciniatum*, *Pes Columbinus alter*, The jagged Doves-foot. 3. *Geranium Saxatile*, *Pes Columbinus Saxatilis*, The Stone or Rock Cranes-bill, or Doves-foot.

III. The Deſcriptions. *The firſt, or* Common Doves-foot, *has a Root which is ſomething long and woody, having ſome Fibres adjoining to it; from whence ariſe ſeveral ſmall, round, pale, green Leaves, cut in about the edges, much like unto* Mallows, *or rather a Doves* Foot, *ſtanding upon long, reddiſh, hairy Stalks, lying in a round Compaſs upon the Ground*; from among which riſe up two or three or more jointed, reddiſh, hairy Stalks, ſlender and weak, with ſome ſuch like Leaves thereon, but ſmaller, and more cut in up to the tops, where grow many very ſmall, bright, red Flowers of five Leaves apiece; after which follow ſmall Heads, with ſmall ſhort Beaks pointing forth, as all the other ſorts of *Cranes-bills* do, of which this is a kind, whereby they are known to be of this Family, how differing ſoever the Face or Form of their Leaves may be.

IV. *The ſecond*, *or* Jagged Doves-foot, *has a Root like the former, from whence ſpring up Leaves, which are greener, not full out ſo round, and ſomewhat more cut in on the edges, making the Leaf to ſeem of ſeveral parts more than the other, or like the* Vervain Mallow, *but ſomething leſſer.* The Stalks are weak and leaning, like the former, as alſo are the Flowers and Seed with its long Beak.

V. *The third*, *or* Rock or Stone Doves-foot, *is a leſſer Plant than the* Common Doves-foot, *and has a Root which is ſmall and yellowiſh, yet abides many Years and periſhes not, and alſo encreaſes plentifully of the Seed it lets fall. From this Root ſpring forth many ſmall Leaves, very like to thoſe of the* Common Doves-foot, *which are ſomewhat cut in on the edges,*

edges, very green and ſhining, ſo very like to a ſmall Sanicle *Leaf, that it may eaſily deceive the unaware; theſe Leaves grow upon reddiſh foot-ſtalks, and lye upon the Ground all the Autumn, Winter and Spring until the Summer that the Stalks riſe up, which are about ſeven, eight or ten inches high or more, bearing a few Leaves on them, and very ſmall, purpliſh red Flowers, brighter and redder than thoſe of the* Common Doves-foot, *which being paſs'd away, yield very ſmall Seed, but like the others in its Beak-like Shape or Faſhion.*

Stone or Rock Doves-foot.

VI. *The Places.* The firſt grows in Meadows and Paſture-grounds, by Ditch-ſides, and Banks of Ditches, and by Path-ſides, almoſt every where. The ſecond is alſo found in Meadow and Paſture Grounds, where the Ground is fat, and near Ditch-ſides, but not ſo frequent as the former. The third grows in ſtoney, rocky and gravelly Grounds, in *Harcynia ſylva*, as *Camerarius* and *Thalius* ſay, and about *Naples*, as *Columna* ſays: and it has been often found in ſeveral rocky, ſtoney and gravelly places of this our Kingdom of *England*.

VII. *The Times.* They all flower in the Summer Months, in *June*, *July* and *Auguſt*, ſome more early than the others; and their Seed is ripe in ſome ſhort time after.

VIII. *The Qualities.* They are cold and dry in the firſt Degree; Aſtringent, Carminative and Traumatick or Vulnerary; Arthritick and Analeptick.

IX. *The Specification.* It is a peculiar thing to ſtop Bleeding, and cure Wounds and Ruptures.

X. *The Preparations.* You may make therefrom, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *A Decoction in Wine.* 4. *A Pouder of Herb and Root.* 5. *A Balſam.* 6. *A Cataplaſm.*

The Virtues.

XI. *The liquid Juice.* Given to two or three ſpoonfuls in a Glaſs of Sherry, Madera, or other generous Wine, it prevails againſt the Cholick, as alſo againſt Wind and Pains in the Stomach, and other Viſcera: and if given in White Wine, it is good to expel the Stone and Gravel in the Reins.

XII. *The Eſſence.* It has all the former Virtues; beſides which, it is good for ſuch as have inward Wounds, Hurts or Bruiſes; it ſtops inward Bleedings, and diſſolves and expels the congealed Blood. It is found alſo by Experience to be a ſinguiar good thing for Ruptures or Burſtenneſs, whether in Old or Young. You may give two or three ſpoonfuls Morning and Night, in a Glaſs of White or Red Port, Sherry, *&c.*

XIII. *The Decoction in Red Port Wine.* It is an exceeding good Wound-drink for ſuch as have inward Wounds or Bruiſes; it ſtops the Bleeding, cleanſes and heals the Parts, and has indeed the Virtues of the Juice or Eſſence, but in a lower Degree. Doſe five or ſix ounces twice a day.

XIV. *The Pouder of the Herb and Root.* *Gerard* ſays, that if it is given half a ſpoonful at a time in the Morning faſting, and half a ſpoonful at Night going to Bed, in Red Wine or old Claret, for the ſpace of one and twenty days together, it will miraculouſly cure Ruptures or Burſtenneſs, as he had oftentimes proved, by which he had gotten much Money and Reputation. If the Rupture is in an aged Perſon, it ſhall then be needful to add thereto (ſays he) the Pouder of red Snails, (thoſe without Shells) to the number of nine, dried in an Oven; by which the Pouder of the Herb will be fortified, ſo as it ſhall not fail of a Cure, tho' (ſays he) the Rupture be great, and of long continuance. It is good alſo for thoſe who are wounded in the Body, to ſtop the Flux of Blood, and heal the Wound, as has been often proved. Doſe one dram Morning and Night in Red Port Wine.

XV. *The Balſam.* It is admirable in curing of Wounds ſimple or contuſed, as alſo in healing of Sores, Ulcers and Fiſtula's: it digeſts, cleanſes, incarnates, dries and heals to Admiration.

XVI. *The Cataplaſm.* If it is made only of the Herb bruiſed, and ſo applied, it heals ſimple green Wounds after a ſingular manner. It is good alſo to diſcuſs ſimple Contuſions; and applied to Parts pained with the Gout, it gives eaſe in the ſame. It ſtops the Bleeding of green Wounds, allays the Heat of Inflammations, and diſcuſſes hot Tumors. It gives eaſe in any Pains of the Extream Parts, proceeding from a hot Cauſe, or from Defluxion of Humors, or from any over-ſtraining of the Nerves or Joints, by ſtrengthening the ſame.

CHAP. CCXXIX.

Of DRAGON Greater and Leſſer.

I. *THE Names.* It is called in *Greek*, Δρακόντιον: in *Arabick*, *Luf* and *Alluf*: in *Latin*, *Dracontium*; and in *Engliſh*, *Dragon* or *Herb-Dragon*, and *Dragon-wort*.

II. *The Kinds.* It is manifold, 1. Δρακόντιον μέγα, ἢ δρακοντία μεγάλη: in *Latin*, *Dracontium majus*, and in the Shops, *Serpentaria major*, of ſome, *Biſcaria* and *Colubrina*, The great Dragon, or Dragon-wort. 2. Δρακόντιον μικρὸν, δρακοντία μικρά: in *Latin*, *Dracunculus*, *Dracunculus minor*, *Dracunculus Polyphyllos Cordi*: in *Engliſh*, Small Dragon, *or* Dragon-wort. To theſe we may add, 3. Δρακόντιον μεῖζον: in *Latin*, *Dracontium magnum*, *vel majus*, The great or greater Dragon; this is the *Dracontium major Matthioli*, which ſeems not to me to be of the Stock

of *Dragons*, but rather a very large kind of *Biſtort*: of theſe three kinds we ſhall treat in this Chapter.

4. Δρακόντιον ὕυδρον: in *Latin*, *Dracontium aquaticum*, *vel Dracunculus aquaticus*; and in *Engliſh*, Water Dragon, *or* Dragon-wort; of which in the next Chapter.

Dragons Greater.

Leſſer Dragon.

III. The Deſcriptions. *The firſt*, *or* Greater Dragon, *has a thick tuberous Root, like to a Knob, many times of the Magnitude of a middle-ſized* Apple, *white, covered with a thin Peel, full of white little Fibres appendent thereto, continuing many Years, very white within, and like unto* Aron-root, *taſting ſomewhat ſharp, like to it.* From this Root riſes up a ſtraight Stalk, a Cubit and half high or higher, which is thick, round, ſmooth, whitiſh and bare or naked, but ſpotted very much with purpliſh Spots and Strakes, or with Spots of divers colors, like thoſe of the Adder and ſome other Serpents. This Stalk bears a few green Leaves, ſtanding upon long Foot-ſtalks, much divided on all hands; they are great and wide, each Leaf conſiſting of ſeven or more joined together in order, every one of which is long and narrow, much like to the Leaves of *Dock*, ſmooth and ſlippery. Out of the top of the Stalk, in the middle thereof, comes forth a great long Husk or Hoſe, (if the Root is old enough) greater than that of the *Cuckow-pint* or *Aron*, of a greeniſh color on the outſide, and of a crimſon or dark purpliſh color on the inſide; with a long ſlender Peſtel or Clapper in the middle thereof, which is blackiſh and pointed like a Horn, the Skin or Film whereof, when the Seed grows big, being ſtretched or broken aſunder, there appears the Fruit, like to a Bunch or Cluſter of *Grapes*; the Berries whereof at firſt are green, afterwards red and full of Juice, in which is contained Seed, which is ſomething hard.

IV. *The ſecond*, *or* Small Dragon, *has a Root not unlike to* Aron-root, *having the Form of a Bulb, full of Fibres or Strings, with divers rude Shapes of new Plants, by which it greatly encreaſes.* The whole Plant is much like to *Aron* in its Leaves, Hoſe or Husk, Peſtel and Berries, (and ſeems to me to be the leſſer ſort of *Aron*;) the Leaves are ſpotted either with white or browniſh Spots, and periſh not preſently, but endure together with the Berries, even till Winter; and the Berries are not of a deep red, but of a color enclining to *Saffron*.

Greater Dragon.

V. *The third*, *or* Great Dragon of Matthiolus, *has a round bulbous Root, larger ſomething than the former, with many Fibers at bottom thereof*; from which riſes one large, high, upright Stalk, with very great Leaves thereon, folded and lapped one within another: at the top of the Stalk comes forth

a ſpike of Flowers, not much unlike to thoſe of *Biſtort*, with like ſmall Seed. Some Authors will not have this to be a *Dracontium* or *Dragon-wort*, but rather a very large ſort of *Biſtort*. *Dodonæus* ſays, ----- *qui, ſi in rerum natura eſt, Biſtortæ Speciès videtur.*

VI. *The Places.* *Dragons greater* and *leſſer* delight to grow in ſhadowy places; and with us they grow in *Gardens.*

VII. *The Times.* They flower in *July*, and the Fruit or Berries are ripe in *Auguſt* and *September.*

VIII. *The Qualities.* *Dragons* or the *Dragon-worts* are hot and dry in the third Degree; Aperitive, Attractive, Suppurative, Stomatick, Pectoral, Hyſterick and Alexipharmick.

IX. *The Specification.* *Dragon-wort* is an Antidote againſt Poyſon, Plague and Bitings of Venomous Creatures.

X. *The Preparations.* You may have therefrom, 1. *The prepared Root* 2. *A liquid Juice of Leaves or Roots.* 3. *An Eſſence of the ſame.* 4. *A Pouder of the Root.* 5. *A Lohoc of the Root.* 6. *A Cataplaſm of the freſh and green Leaves.* 7. *The Fruit or Berries.* 8. *A Spirituous Tincture of the Root.* 9. *An Acid Tincture of the ſame.* 10. *An Oily Tincture.* 11. *A Saline Tincture.* 12. *A diſtilled Water of Leaves, Root and Fruit.*

The Virtues.

XI. *The prepared Root.* It is prepared by boiling it till it is ſoft, and all the Acrimony paſs'd off. It then nouriſhes and is good for Food, it is alſo good to expel thick and clammy Humors from the Breſt and Lungs: they alſo reſtore in Conſumptions.

XII. *The liquid Juice of Leaves or Root.* It is ſaid to remove the Pin and Web, as alſo Spots and Pearls in the Eyes, being put into *Collyriums* or Medicines which are made for the Eyes. *Dioſcorides* ſays, that the Juice being dropped into the Eyes, cleanſes them, and helps Dimneſs of Sight. The ſame mixed with Oil Olive and dropped into the Ears, eaſes their Pain.

XIII. *The Eſſence of the ſame.* It has all the Virtues of the liquid Juice; beſides which, being taken inwardly (Univerſals being premiſed) to one ſpoonful at a time in the diſtilled Water, or in White Wine, and repeated as oft as need requires, it powerfully provokes the Terms in Women.

XIV. *The Pouder of the Root.* If it is made into an Electuary with Honey, it is good for ſuch as are troubled with vehement Coughs and Catarrhs, Convulſions, Cramps, *&c.* for it incides, abſterges and conſumes groſs, tough and tartarous Humors, and cleanſes all the inward Parts. Doſe of the Pouder from half a dram to a dram. Outwardly applied, it cleanſes all fretting and malign Ulcers, which are difficult to be healed: it alſo removes all Scorbutick Breakings out in any part of the Body.

XV. *The Lohoc of the Root.* It is made of the Root prepared by boiling, (at *ſect.* 11. above) by beating it in a Mortar with twice its weight of Honey. It is an excellent thing againſt Coughs, Salt Catarrhs and Defluxions of thin Rheum.

XVI. *The Cataplaſm of the freſh and green Leaves.* Being applied, it is good for Ulcers and green Wounds, and heals them after an admirable manner. Being dry, they are more ſharp or biting, and not ſo fit for Vulneraries.

XVII. *The Fruit or Berries.* They are of greater Power than either Leaves or Root, and therefore are ſaid to cure virulent and malign running Sores; and to eat away that cancerous Excretion in the Noſtrils called *Polypus:* they are alſo good to be laid to Cankers, and ſuch like fretting, eating and conſuming Ulcers.

XVIII. *The Spirituous Tincture of the Root.* Given to one dram or two in any proper Vehicle Morning and Evening, (after the Uſe of Univerſals) it opens Obſtructions of the Womb, and provokes the Courſes. It eaſes Pains of the Stomach and Bowels proceeding from Wind, or from cold, ſlimy and tartarous Humors, prevails againſt the Cholick, and warms and comforts all the inward Parts; and is an excellent thing againſt Poyſon, Plague, ſpotted Fever, or any other malign Diſtemper.

XIX. *The Acid Tincture.* It is a famous Stomatick, takes away Nauſeouſneſs and Vomiting, warms and comforts a cold Stomach, cauſes a good Appetite and Digeſtion; and ſtrikes at the Root of all Poyſons Vegetable or Animal, eſpecially it reſiſts the Biting of Vipers, and the Malignity of Mad Dogs. It is alſo a ſingular thing againſt malign Fevers, ſpotted Fever, and the Plague or Peſtilence, by overturning the very Fountains of the infectious *Miaſmata.* Doſe from thirty, forty to ſixty or eighty drops in the diſtilled Water, or any other ſpecifick Vehicle, *viz.* ſo much as may make it pleaſantly acid, according to the quantity given at a time.

XX. *The Oily Tincture.* It is good againſt Cramps, Convulſions, Numbneſs, Palſies, rheumatick Pains and Aches proceeding from Cold and Moiſture, or in a cold and moiſt Habit of Body: it is to be anointed upon the Parts affected Morning and Evening, and to be well rubbed in.

XXI. *The Saline Tincture.* It is good againſt Blackneſs, Greenneſs and Yellowneſs of the Skin, and to take away Tanning, Sun-burning, Scurff, Morphew, Leproſy, Scabbineſs, Freckles, Lentils, and other the like Deformities of the *Cuticula* or Scarff-Skin.

XXII. *The diſtilled Water.* It is uſed as a *Vehiculum*, to convey many of the aforegoing Preparations in: it is alſo a Coſmetick, fit for the beautifying the Skin, or to mix other Coſmeticks with for that Purpoſe. It prevails alſo againſt the Peſtilence, or any malign and peſtilential Fever; as alſo the Poyſon of Serpents or mad Dogs, being drunk warm, with a dram or two of *Mithridate* or other like Antidote mixed with it.

CHAP. CCXXX.

Of DRAGON,

OR,

DRAGON-WORT Water.

I. *THE Names.* It is called is *Greek*, Δρακόντιον ὑδατώδες, ἢ ἔνυδρον: in *Latin*, *Dracontium aquaticum*, *Dracunculus aquaticus*, *Arenia aquatica*, *Dracunculus paluſtris ſive aquatilis:* in *Engliſh*, *Water Dragon*, and *Water Dragon-wort*, *Marſh Dragon-wort.*

II. *The Kinds.* It is the laſt Species of *Dragon-wort* mentioned in *Chap.* 229. *Sect.* 2.

III. The Deſcription. *It has a Root which is not round like a Bulb, but very long, creeping, jointed, and of a moderate bigneſs; out of the Joints whereof ariſe the Stalks of the Leaves, which are round, ſmooth, and ſpungy within, certain white and ſlen-*

der Strings growing downwards. The Fruit ſprings forth at the top upon a ſhort Stalk, together with one of the Leaves, being at the beginning covered with little white Threads, which are inſtead of the Flowers, (ſee the ſecond Figure annexed;) after that it grows into a Bunch or Cluſter, at the firſt green, and when it is ripe, red; leſſer than that of *Aron*, but not leſs biting. The Leaves are broad, greeniſh, ſmooth and ſhining as it were, in Faſhion almoſt like thoſe of *Ivy*, yet leſſer than thoſe of *Aron* or *Cuckow-point:* and that Subſtance to which the cluſtred Fruit grows is alſo leſſer; and in that part which is towards the Fruit, *viz.* its upper part, it is white.

Water Dragon-wort.

Water Dragons.

IV. *The Places.* *Water Dragon* or *Dragon-wort* grows in marſh and watry places, and for the moſt part in fenny and ſtanding Waters in many parts of this Kingdom.

V. *The Times.* It flowers in *July*, and the Fruit is ripe in *Auguſt* or *September*.

VI. *The Qualities, Specification, Preparations and Virtues*, are the ſame with the firſt and ſecond kinds in the former Chapter, ſo that no more need be ſaid thereof in this place.

CHAP. CCXXXI.

Of DROPWORT Common.

I. *THE Names.* It is called in *Latin*, *Filipendula*, (*quod numeroſi illi in Radice bulbilli, quaſi ex filo pendere videantur:*) alſo *Saxifraga rubra*, (Red Break-ſtone:) in *Engliſh*, *Dropwort*.

II. *The Kinds.* It is threefold, *viz.* 1. Φιλιπέιδουλα, *Nicholai Myrepſi*, *Filipendula vulgaris*, *Filipendula major vulgaris*, The common great Dropwort. 2. *Filipendula altera major*, Another great Filipendula or Dropwort. 3. *Filipendula minor*, Small Dropwort. Some will have this *Common Dropwort* to be Οἰνάνθη, *Oenanthe Dioſcoridis*, in *lib.* 3. *cap.* 132. but it is a Miſtake.

Dropwort the greater

III. The Deſcriptions. *The firſt, or* Great common Dropwort, *has a Root which conſiſts of many ſmall, black, tuberous Pieces or Drops, faſtned together by many ſmall, long, blackiſh Strings, which run from one to another. From this Root ſhoot forth ſeveral long winged Leaves,* viz. *many ſmall Leaves, ſome bigger and ſome leſſer, ſet on each ſide of a middle Rib, and each of them dented about the edges, almoſt*

almoſt like a Saw, ſomewhat reſembling Burnet *or* Wild Tanſie, *or rather* Agrimony, *or between them all, but harder in handling: among which Leaves riſes up one Stalk, and ſometimes more, two or three feet high, having ſome ſuch Leaves thereon as grow below; and ſometimes alſo divided into other Branches, ſtreading at the top into many white, ſweet-ſmelling Flowers, compoſed of five Leaves apiece, with ſome Threads in the middle of them, ſtanding together in a Tuft or Umble, each upon a ſmall Foot-ſtalk; which after they have continued for a good while open or blown, they fall away, and in their places ſmall chaffy Heads appear, like Buttons, in which is contained a kind of chaffy Seed.*

IV. *The ſecond, or* Other great kind, *has a Root conſiſting of very many ſmall Tuberoſities, ſomewhat longer, and whiter than the former, enclining to redneſs, which are faſtned together by many long Fibres or Strings, as the other are.* The Stalks and Leaves are ſo like the former, that this Plant can ſcarcely be diſcerned from that: the Flowers at tops of the Stalks are of a white color, enclining to a purple, and made of five Leaves apiece, like the other; after which come the Heads, which when fully ripe, contain within them round and blackiſh Seed.

V. *The third, or* Small Filipendula *or* Dropwort, *has a Root manifoldly ſpread out into ſeveral glandulous or tuberous Knobs, like the firſt, but ſmaller and redder, and tyed together by Strings, like them. From this Root riſe two, three or four ſuch like Leaves as in the firſt, but much ſmaller, and more nearly reſembling* Wild Tanſie *Leaves, but not white, as they are, but of the ſame dark green color with the former.* From among theſe Leaves ariſes up a Stalk, not above an hand breadth high, which is ſometimes without Diviſion, and ſometimes ſpread out into two or three ſeveral Branches, on which ſtand many ſmaller white Flowers, and ſweeter than in the former, but with Threads therein, like them, and ſet together in an Umble in the ſame manner: which being paſs'd away, then come the Heads of Seed, many ſet together, and formed almoſt like unto a ſmall Bunch of *Grapes.*

VI. *The Places.* The firſt grows plentifully upon ſtony Rocks or Mountains, and rough places, as alſo in fertile Paſtures: it is found upon St. *Vincent's Rock* by *Briſtol*; and in great plenty in a Field adjoining to *Sion-houſe*, ſome time a *Nunnery*, near *London*, on the ſide of a Meadow called *Sion-Meadow*; as alſo in the corners of dry Fields and Cloſes, by their Hedge-ſides. The ſecond grows on the tops of rocky, ſtoney or mountainous places. The laſt alſo on ſtoney and rough Grounds, eſpecially about *Mompelier* in *France*; and in many the like places in *England.*

VII. *The Times.* They all flower in *May*, *June* and *July*, and the Seed is ripe in *Auguſt.*

VIII. *The Qualities.* *Dropwort* is hot and dry in the third Degree; Aperitive, Inciſive, Carminative, Diuretick; Stomatick, Pectoral, Nephritick, Hyſterick, Emmenagogick and Alexipharmick.

IX. *The Specification.* It is famous againſt the Strangury, Stone and Gravel in Reins and Bladder.

X. *The Preparations.* You may have therefrom, 1. *A liquid Juice of the Roots or Leaves.* 2. *An Eſſence of the ſame.* 3. *A Decoction of the ſame in Wine.* 4. *A Pouder of the Roots, Leaves or Seed.* 5. *A Balſam of the Root.* 6. *A diſtilled Water.* 7. *A Spirituous Tincture of the Root.* 8. *An Acid Tincture of the ſame.* 9. *An Oily Tincture thereof.* 10. *A Saline Tincture.* 11. *The Spirit.* 12. *The fixed Salt:* where note, that you may uſe Roots or Leaves; but the Roots are much more effectual.

The Virtues.

XI. *The liquid Juice.* Taken three or four ſpoonfuls at a time in a Glaſs of White Port Wine, is very effectual in opening all the Urinary Paſſages, to help the Strangury, and to expel Sand, Gravel, ſmall Stones, and other tartarous Matter in the Reins, Ureters and Bladder. Authors ſay it is very helpful in breaking the Stone; and this the Juice will do, whether taken from Roots or Leaves; but that from the Roots is moſt effectual, as aforeſaid.

XII. *The Eſſence.* It has all the Virtues of the liquid Juice; beſides which, it is very effectual to force away the Birth, as alſo to expel the Secundine or After-birth, and prevails againſt the Yellow Jaundice, Epilepſy, as alſo Obſtructions of the Breſt and Lungs, it expels Wind and helps difficulty of Breathing. Doſe two or three ſpoonfuls in a Glaſs of generous Wine, Morning and Night.

XIII. *The Decoction in Wine.* It has the Virtues of the Juice and Eſſence, but not full out ſo powerful: it may be ſweetned with Honey, and given Morning and Night, or upon an Exigency from four to ſix ounces: it very much comforts and ſtrengthens the Stomach.

XIV. *The Pouder of the Root.* Taken from one to two drams in White Port Wine, it provokes Urine powerfully, opens Obſtructions of the Reins and Bladder, and is ſaid to diſſolve or break the Stone, and expel it; but this muſt be underſtood, where the Stone is compacted of a Subſtance friable or brittle and gritty, and not grown to any great Magnitude. If it is made into an Electuary with Honey, it is an excellent thing for the Wind and Gout in the Stomach, as alſo to open Obſtructions of the Breſt and Lungs, help Coughs and Colds, Hoarſneſs, Wheezing, loſs of Voice and ſhortneſs of Breath, cauſing an Expectoration of the cold, tough and viſcous Flegm from all the Parts of Reſpiration.

XV. *The Balſam of the Root.* It is good to digeſt, cleanſe, dry and heal old Sores, and ſuch as proceed from the Kings-evil, and moiſt and running

Ulcers.

Ulcers. Applied to Parts afflicted with the Gout, it quickly eaſes the Pain, and in ſome meaſure attracts forth the ſharp Humors and morbid Matter thro' the Pores of the Skin.

XVI. *The diſtilled Water.* It is a good Vehicle to convey any of the other Preparations in: it is Diuretick, opening the Obſtructions of the Urinary Parts.

XVII. *The Spirituous Tincture of the Root.* It is Alexipharmick, good againſt Poyſon, Plague and all ſorts of peſtilential and malign Diſeaſes; it warms and comforts the Bowels, reſtores the Tone of the inward Parts; and is ſingularly good againſt Fluxes of the Bowels of all ſorts, and forces away the Birth of a Woman in Travil. Doſe from two drams to four in any proper or ſpecifick Vehicle. It powerfully expels Wind, corrects ſharp and acrid Humors in the Stomach and Guts, and gives preſent eaſe in the Cholik.

XVIII. *The Acid Tincture.* It is a high Stomatick, warms, comforts and ſtrengthens it, cauſes Appetite and a good Digeſtion; diſſolves crude and tartarous Humors, and makes them fit for Expulſion; cleanſes the Urinary Parts, and promotes the breaking or diſſolving the Stone in the Reins or Bladder. It ſtrikes at the Root of thoſe Humors which are the Cauſe of the King's-evil, and of Tumors or Swellings in the Throat or other glandulous Parts, cutting and diſſolving them, preventing their Encreaſe or Generation, and making thoſe which are preſent to be fit for Excretion. Doſe ſo many drops as to make the Vehicle pleaſantly ſharp.

XIX. *The Oily Tincture.* It is good againſt Cramps, Convulſions, Numbneſs, Palſy, *&c.* being bathed well in twice a day upon the Parts affected. Given inwardly to twenty or thirty drops in the diſtilled Water aforeſaid, or in ſome other appropriate Vehicle, it is an admirable thing againſt all manner of Obſtructions of the Reins, Ureters and Bladder, expels ſtoney and tartarous Concretions, and carries off the morbifick Cauſe of the Yellow Jaundice by Urine. It alſo prevails againſt Lethargies, Vertigo, Apoplexy, Convulſions, Epilepſy, Paralyſis, and all other cold and moiſt Diſeaſes of the Head, Brain and Nerves; and provokes the Terms in Women.

XX. *The Saline Tincture.* It is dedicated to Diſeaſes of the Reins, Bladder and Ureters; prevails againſt the Strangury, and diſſolves the Matter breeding the Stone. Outwardly, it is good againſt Scurff, Morphew, Scabs, Itch, Tettars, Ringworms, and other Defœdations of the Cuticula, being bathed therewith twice a dry.

XXI. *The Spirit.* It is a ſingular Cordial, chears the Heart, revives the Spirits, ſtrengthens the Stomach, and fortifies the whole univerſal Frame. It is good againſt fainting and ſwooning Fits, Sickneſs at Heart, Wind, and the Cholick Tortions of the Bowels, occaſioned thro' either Flatulency or ſharp and acrid Humors. Doſe from two drams to four, either alone or mixt with a little Glaſs of Canary, as oft as occaſion requires.

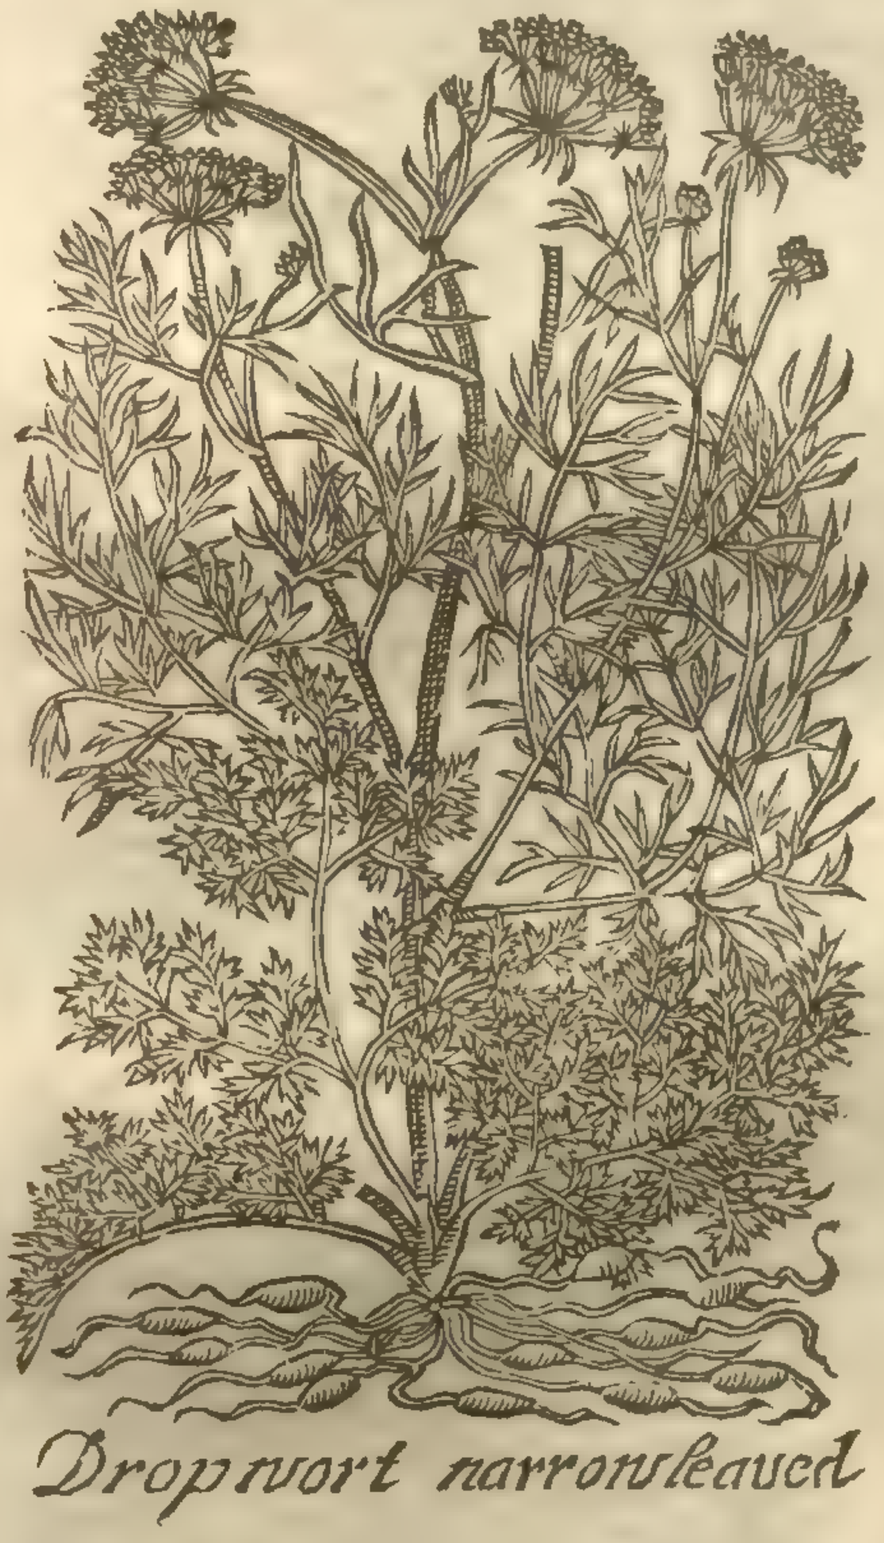
XXII. *The fixed Salt.* It is a ſtrong Diuretick, opens all the Urinary Paſſages, and expels large quantities of watry Humors in the Dropſy by Urine, and the morbifick Cauſe of all Fevers. Doſe from twelve grains to a ſcruple or half a dram, in the diſtilled Water above-mentioned, or in White Wine.

CHAP. CCXXXII.

Of DROPWORT Narrow-leav'd.

I. *THE Names.* Authors aſcribe the *Greek* Name Οἰνάνθη to this Plant, tho' it is not the true *Oenanthe Dioſcoridis:* and therefore it is called in *Latin*, *Oenanthe recepta herbariorum*, or *Filipendula anguſtifolia:* in *Engliſh*, *Narrow-leav'd Dropwort.*

II. *The Kinds.* It is the ſecond general Species of *Dropworts*; and is threefold, *viz.* 1. *Oenanthe Apii foliis major*, *Filipendula folio Apii major*, The common or ordinary great Parſly-leav'd Dropwort. 2. *Oenanthe vel Filipendula Apii foliis minor, duarum ſpecierum*, Two ſmaller ſorts of Parſly or Smallage leav'd Dropworts. 3. *Oenanthe anguſtifolia Lobelii*, Lobel's Narrow-leav'd Dropwort.



Dropwort narrowleaved

III. The Deſcriptions. *The firſt, or* Great Parſly-leav'd Dropwort, *has for Roots many round, white, and ſomewhat long* Aſphodil *like Clogs, joined together at the tops, making one Head of a Root, and ending in ſmall Fibres: from this Root riſe many green winged Leaves, made of many parts, cut into the Form almoſt of* Parſly *or* Smallage *Leaves, but much ſmaller, even as ſmall as* Garden Creſs *Leaves:* and from among them ſpring forth two or three ſtiff, round Stalks, a foot and half high, and ſometimes two feet high, beſet with ſuch like Leaves as grow below, but as they grow higher on the Stalk, grow much ſmaller, leſſer and narrower, to the perfect looſing of the Form of thoſe below. At the tops of the Stalks grow Umbles of white Flowers, which being paſs'd away, there follows *Fennel* like Seed, but ſmaller, and of a dark whitiſh color.

IV. *The ſecond, or* Small Smallage-leav'd Dropwort, *which is twofold. The Roots of theſe two kinds are much alike, but only differing in Greatneſs, each of*

of them consisting of several small Tubers, with many Strings among them. Their Leaves are winged, and like in their Divisions to the former, but both smaller by much, and more green, the one of these being also smaller than the other; and the lesser of them a little finer jagged, which evidently shews the Difference as well as the Seed: the Flowers in both are white, but differing in Greatness. The Seed of the greater of these is smaller by half than the Seed of the former *Great kind*; and the Seed of the lesser is yet smaller and rounder, and something like unto *Dill* Seed.

V. *The third, or* Lobel's Narrow-leav'd Dropwort, *has a Root composed of many white, long, tuberous parts, sending forth many Strings from their lower parts, and on their tops all uniting in one Head of a Root.* From this Head or Root arises a strong crested Stalk, two feet high, dividing it self towards the top into several Arms or Branches. From the hollow Place or Bosom of every Joint, out of which do grow those Branches; the Leaves do also proceed, very much cut or jagged, like *Fennel.* At the tops of these Branches come forth spoky Rundles or Umbles of white Flowers, fashioned like Stars.

VI. *The Places.* They grow in many places of *England*, but for the most part near Ditch-sides, and Brooks or Rivers sides, and upon the Borders of Ground near standing Waters.

VII. *The Times.* They flower from *May* to the end of *June*, and the Seed is ripe not long after.

VIII. *The Qualities, Specification, Preparations and Virtues*, are the same with the *Common Dropwort* in *Chap.* 231. so that no more need be said of them here.

CHAP. CCXXXIII.

Of DROPWORT Hemlock like.

I. *THE Names.* It is called in *Latin*, *Oenanthe Cicutæ facie*; also *Filipendula Cicutæ facie*: and in *English*, *Hemlock-leav'd Dropwort*, *Lobel's Hemlock like Dropwort.*

II. *The Kinds.* It is *singularis sui generis*, there being neither a greater nor lesser sort of it.

III. The Description. *This Plant has a Root which is white and glandulous, or repleat with many long and gouty Glandules*, Asphodil *like*, *which are soft and tender, but sharp and unpleasant in Taste, yielding a white Milk at the first, and turning yellow afterwards, which is said to be poysonous, virulent and exulcerating.* From this Head or Root spring forth several winged Leaves, standing upon a long Foot-stalk, more like *Meadow Rue* than *Smallage* or *Hemlock*; having many small ones set together, of a dull, dark green, and somewhat like *Hemlock* in color; as also in the Flowers; but more in its Effects.

IV. *The Places.* It grows many times in moist Plowed Land, as in the moist and wet Furrows of a Field belonging to *Battersea* near *London:* it grows also in great abundance in many places by the *Thames*-side, as a little above the *Horse-Ferry* against *Lambeth*, &c.

V. *The Times.* It flowers in *May* and *June*, and some part of *July*; and the Seed is ripe in *July* and *August.*

VI. *The Qualities.* It is hot and dry in the fourth

[illegible] Arthritick, and *Hectick* Fevers, or Paltring.

VII. *The Specification.* It troubles and overturns the Brain and Senses, causing Madness, and if taken in a considerable quantity, Death.

VIII. *The Preparations.* You may make therefrom, 1. A *Cataplasm.* 2. *An Ointment.*

The Virtues.

IX. *The Cataplasm.* It exulcerates, or is blistering, and is of good Use to be applied in a Sciatica, or Gout in Hands or Feet: it also draws forth the Poyson if it is immediately applied to the Biting of a mad Dog, or the Biting of a Viper or Rattle-Snake, or other venomous Creatures.

X. *The Ointment.* It is good to anoint with in all sorts of Scrophulous or strumous Tumors, and to be applied in Kings-evil Sores, where it is not used without a singular Advantage.

CHAP. CCXXXIV.

Of DROPWORT Water.

I. *THE Names.* It is called in *Greek*, (according to our Moderns) Οἰνάνθη ὑδατώδης, ἢ ἔνυδρος: in *Latin*, *Oenanthe aquatica*, and *Filipendula aquatica*: in *English*, *Water Dropwort.*

II. *The Kinds.* It is the fourth grand Species of the *Dropworts*; and is twofold, *viz.* 1. *Oenanthe, vel Filipendula aquatica major*, The greater Water Dropwort. 2. *Oenanthe, vel Filipendula aquatica minor*, The lesser Water Dropwort.

III. The Descriptions. *The first, or* Greater Water Dropwort, *has a Root like to the other* Dropworts, *replenished with many small, white Tubers or Knobs growing among the Strings, joining together above, and making one Head of a Root.* From this rise several large spread Leaves next the Ground, and lying thereon, being winged and cut into many small Divisions, somewhat resembling *Parsly*, but much smaller, and divided into smaller parts than any of the former kinds. From among these Leaves rise up crested, thick, hollow Stalks, with Leaves on them, cut into longer and finer Divisions, bearing at the top Umbles of white Flowers, which turn into small, flat, greyish Seed, somewhat lesser than *Fennel* Seed, and not much unlike *Hemlock* Seed.

IV. *The second, or* Lesser Water Dropwort, *has a Root made up with several small Tubers or Knobs, and fastned among the Fibres, which are as small as Hairs.* From the Head of which Roots spring up many small Leaves, lying upon the Ground, which are very finely cut in: after them springs up the Stalk, which carrying up the first sprung up Leaves with it, they scarcely seem to be Leaves, but rather like the Ribs of Leaves, of a dark and shining green color, as the Stalk also is, which very nearly resembles a *Rush*; and below the top thereof, which is pointed like a *Rush*, comes forth a small Umble of small whitish sweet Flowers, which turn afterwards into as small Seed as *Smallage*, but blacker.

V. *The Places.* They both grow in wet Grounds and near Brook-sides in many places in *England*; yet will they both flourish being nurs'd up in our *Gardens*, but grow not there all out so large and fair, as in their natural places: and as it grows by the sides of Rivers and Water-streams, so it has been found near the River of *Thames*, as, near St. *George's-fields*, and about the Bishop of *London*'s House at *Fulham*, and in such other like places.

VI. *The Times.* The second or *Lesser*, flowers earlier than the *Greater*; and commonly the flowering time of the *Lesser* is past before the other comes, which is not until *August*.

VII. *The Qualities, Specification, Preparations and Virtues*, are the same with those of the *Common Dropwort* in *Chap.* 231. aforegoing, so that no more need be said of them here.

CHAP. CCXXXV.

Of DUCKS-MEAT.

I. *THE Names.* It is called in *Arabick*, *Taleb, seu Tabaleb:* in *Greek*, Φακὸς ὁ ἐπὶ τῶν ὑδάτων: in *Latin*, *Lens palustris*, *Lens aquatica*, *Lenticula palustris, vel aquatica:* in *English*, *Ducks-meat*; and by some, *Water Lentils.*

II. *The Kinds.* Authors make four kinds hereof, as, 1. *Lens palustris vel aquatica vulgaris*, Common or vulgar Ducks-meat. 2. *Lens palustris quadrifolia*, Cross-leav'd Water Lentils or Ducks-meat. 3. *Lens palustris latifolia punctata*, Broad-leav'd spotted Water Lentils. 4. *Lens vel Lenticula aquatica bifolia Neapolitana*, Neapolitan Water Lentils. Of all these, 'tis only the first which grows in *England*, which we shall treat of in this place: the rest being Strangers, we shall have nothing at this time to say concerning them.

III. The Description. *This small Plant has for a Root only certain small fine Fibres or Threads, which*

which grow only from the middle of each Leaf on the underside, and pass down into the Water, but reach not to the bottom, to draw Nourishment from the Earth: besides this Root, the whole Plant consists of nothing but small, round, green Leaves, lying on the Surface or Top of standing Waters, in Pools, Ditches and Ponds, without either Flower or Seed that could be ever observed.

IV. *Nota. Matthiolus*, and from him *Lugdunensis*, makes a strange Relation concerning this Plant, scarcely to be believed; and it is this: That if it should happen (as sometimes it may) by Inundations, or any other Accident, that these small *Lentils* or *Ducks-meat* be carried away into running Waters, as Rivers, Brooks, small Streams, *&c.* as soon as they stick to or touch the Shoar, they are wonderfully encreased; for by their Roots, which grow from them like Threads, they penetrate and fasten themselves into the Ground, and then growing, come to be Plants, like unto *Sisymbrium*, *Water Mint*, or *Ladies Smocks*; and that this thing has been observed by the diligent Searchers of Nature, and not without much Admiration of the Matter of Fact. *Vix credo*, indeed I know nothing of it.

V. *The Qualities.* According to *Galen*, *Ducks-meat* is cold and moist in the second Degree; Anodyne, Repercussive, Arthritick and Alexipharmick; but this last it is by Accident.

VI. *The Specification.* It resists and cools Inflammations after a peculiar manner.

VII. *The Preparations.* You have, 1. *The green Herb.* 2. *An Ointment.* 3. *A Cataplasm.* 4. *A distilled Water.*

The Virtues.

VIII. *The green Herb.* Applied to the Forehead, it eases the Head-ach coming of Heat. Applied in Extremity of the Pains of the Gout, it alleviates them; but sometimes endangers the sending of the Humor up into the Stomach; therefore Universals ought to be premised, and to be used at the same time. *Dioscorides* says it is a Remedy against St. *Anthony*'s-fire, all manner of Inflammations, and the burning Fits of Agues. Ducks greedily devour it; also Hens, if mingled with Bran and given them.

IX. *The Ointment.* It is a fine cooling thing, good against Phlegmons and hot Pains of the Joints, and the Hæmorrhoids or Piles, whether broken or not broken, if anointed thereon.

X. *The Cataplasm.* If it is made of the Herb beaten up with *Barly*-flower, it prevails against the Gout, and consolidates Ruptures in young Children; and is profitable against the Swelling of the Cods, and of Womens Breasts before they be grown too much, because it does not weakly repel the Humors. If it is made with *Wheat* Flower or Meal, it prevails much against hot Tumors, as Phlegmons and the like, as also Pains of the Joints proceeding from Heat; and helps the falling down of the Fundament in young Children.

XI. *The distilled Water.* It is good against an Erysipelas; and *Matthiolus* esteems it highly for resisting all inward Heats and Inflammations, as also pestilential Fevers, to help the Redness of the Eyes and the Swellings of the Testicles, by repelling of the Humor, Cloths four times doubled being wet therein and applied: and so applied, it cools an Eryspelas or St. *Anthony*'s-fire.

CHAP. CCXXXVI.

Of DYERS-WEED,

Called,

WOLD *or* WELD.

I. *THE Names.* It is a Plant which was unknown to the *Greeks*: the *Latins* call it *Luteola* and *Herba Lutea*; it is the *Lutea Plinii lib.* 33. *cap.* 5. *Vitruvius lib.* 7. *cap.* 14. calls it *Luteum*; and *Virgil Bucol. Eclog.* 4. calls it *Lutum*: in *English*, *Dyers-weed*, also *Wold* or *Weld.*

II. *The Kinds.* It seems to me to be an Herb of its own kind; but *Bauhine* referrs it to the *Genista Tinctorum*, or *Green-weed*, of which we shall, God willing, treat in the next Chapter, but to that we think it has no Relation. Some thought it to be the *Reseda* of *Pliny*, because they agree well in divers parts. *Cæsalpinus lib.* 9. *cap.* 35. makes it the *Myagrum*, *vel Melampyrum Dioscoridis*: but all these things are to be disputed. It took its Name of *Lutea* and *Luteola*, not only from the yellow color of the Herb and its Flowers, when it is dry, but chiefly from the yellow color which it Dyes things into. *Tragus* took it to be *Antirrhinum*, because the Seed-Vessels have (as it were) holes therein. Some will have it to be *Phyteuma Dioscoridis*; others *Struthium Dioscoridis*, as *Lacuna* and *Gesner*. *Matthiolus* calls it *Pseudostruthium*. *Dodonæus*, *Herba Lutea*. *Lobel*, *Luteola*. *Lonicerus* and *Tabernmontanus*, *Catenance*: but all these things it is impossible to be; I am induced therefore to hold to my own Opinion before declared.

III. It is twofold, *viz.* 1. *Lutea vel Luteola vulgaris*, Common Wold, Weld or Dyers-weed. In *Candia* there grows a small sort of *Luteola*; which some Authors would make to be a different kind from that just now named, which *Honorius Bellus Epist.* 2. *ad Clusium* will have to be *Struthium verum*

rum Dioscoridis, and says it is called *Cumene* thro' all *Greece*: but this we think to be one and the same Plant with the aforegoing, *viz.* Our *Luteola vulgaris*; and of this Opinion is *Camerarius in Horto*, who makes it and *Our common sort* all one. 2. *Lutea Cretica maxima*, which is *fœcunda & infœcunda*, or *fertilis & sterilis*, The great Wold, Weld or Dyers-weed of Candia, which is both fruitful or bearing Seed, and barren bearing no Seed, and differ one from another only as our *Hemp*, which is, bearing Seed, and barren bearing no Seed.

IV. The Descriptions. *The first*, or Our common Wold, Weld or Dyers-weed, *has a Root which is long, thick and white, abiding all the Winter. The Plant grows bushing out, with many long and narrow flat Leaves upon the Ground, of a dark, blewish green color, somewhat like unto Wood, but nothing so large, a little crumpled as it were, and somewhat round-pointed, which do so abide the first Year.* And the next Spring rise up from among them several round Stalks, two or three foot high, beset with many such like Leaves, but smaller and shooting forth some small Branches, which with the Stalks bear very many small yellow Flowers, in a long spiked Head at tops of them; after which come the Seed, which is small and black, enclosed in Heads, which are divided at the top into four parts.

V. *The* Great Candia Dyers-weed *has a Root which is very great and woody, and shoots it self forth into many long Arms or Branches, which in the native or natural places of its Growth, and other warm Countries, will abide many Years, but with us will scarcely endure our cold Winters, (unless housed) as has been several times proved.* From this Root this great Plant rises up (in *Candy*) with several great Stalks, some of them as big as a Man's Arm, and in height five, six, seven or eight Cubits; sometimes nine or ten Cubits high, which yet perish in Winter: they are bare or naked of Leaves next the Ground for a foot and half high, the lowest Leaves being without Foot-stalks, joining close at the bottom: the other growing higher up towards the tops, have all of them Foot-stalks, of a span long: the Leaves of themselves are very large, made of many somewhat broad and long green shining ones, set one against another on a middle Rib, and not yet always directly opposite one to another; every one of them being something like unto the Leaves of *Hemp*, (of which it is most likely to be a Species) ragged or dented about the edges, yet none of them divided, but the end Leaf, which is sometimes parted, seldom into two, but sometimes into three Divisions, each ending in a long Point. The Stalks are branched, but has only divers small Stalks or long Spikes of Flowers thrust forth, which are yellowish, green and mossy, bowing downwards, with many long and narrow Leaves among them, and stand in yellowish green Husks; in which, after the Flowers are fallen, come Heads full of very small reddish Seed. The barren Plant is like the former, save that it bears no Seed.

VI. *The Places.* The first grows every where by the Way-sides, as well in moist Grounds as in the dry, and in corners of Fields and By-Lanes, in and about Villages almost every where: in some places in *Kent* they sow it in their Fields after their *Barley*, which abides until the next Year, and then it is gathered. The other is a Native of *Candia*, and is nurs'd up with us only in *Gardens*.

VII. *The Times.* The first flowers in *June* and *July*. The second flowers late with us, and sometimes not at all.

VIII. *The Qualities.* It is hot and dry in the third Degree, the Root, as also the whole Herb. It is Aperitive, Digestive, Attenuating, Inciding and Resolutive; Arthritick and Alexipharmick.

IX. *The Specification.* It is peculiar against Punctures of the Nerves, Bitings of Serpents, mad Dogs, and other poysonous Creatures, outwardly applied, and inwardly taken; and prevails against the Infection of the Plague; for which Reason, as *Matthiolus* says, it is called *Theriacaria*.

X. *The Preparations.* You may have therefrom, 1. *The green Herb bruised.* 2. *A liquid Juice.* 3. *An Essence.* 4. *A Decoction in Wine.* 5. *A Pouder of the Root.* 6. *A Balsam or Ointment.* 7. *A Spirituous Tincture.* 8. *An Acid Tincture.* 9. *An Oily Tincture.* 10. *A Spirit.*

The Virtues.

XI. *The green Herb bruised.* Applied to Cuts or simple Wounds in Hands or Legs, it heals them. It is good to be applied also to the Bitings of Serpents, mad Dogs, or other venomous Creatures, to draw out the Poyson.

XII. *The liquid Juice.* It provokes the Terms in Women, opens Obstructions, incides or cuts tough Humors, and resists Poyson, as also the Malignity of the Plague, being taken from one to three spoonfuls at a time in a Glass of generous Wine, and repeating the Dose as Reason requires.

XIII. *The Essence.* It has all the Virtues of the liquid Juice; besides which, it strengthens the Stomach admirably, expels Wind, and gives ease in the Cholick; it also facilitates the Labor of a Woman in Travail. Dose two or three spoonfuls at a time in a Glass of Canary, Madera or Sherry Wine, or in White Port.

XIV. *The Decoction in Wine.* It has all the Virtues of the Juice and Essence, but much less efficacious or powerful; and therefore may be given (dulcified with white Sugar) from three ounces to six ounces or more, Morning and Evening. It is a good Gargle also for a sore Mouth and Throat.

XV. *The Pouder of the Root.* It is good against the

the Plague or Peſtilence, the ſpotted Fever, and other peſtilential and malign Fevers; reſiſts both Vegetable and Animal Poyſons, and is good againſt Sickneſs at Heart. Doſe one dram in a Glaſs of Wine. Applied to Wounds, it heals them, and cleanſes, incarnates, dries and induces the Healing of moiſt running Sores, old Ulcers, and the like, being ſtrewed on them.

XVI. *The Balſam or Ointment.* They are admirable Vulneraries. The Balſam cures ſimple Wounds many times at one or two Dreſſings. It cleanſes foul and filthy Ulcers, dries, incarnates and heals. And it is profitable to any Part affected with the Gout; giving eaſe to all ſorts of Pains from a cold Cauſe.

XVII. *The Spirituous Tincture.* It reſiſts Poyſon, and particularly the Poyſon of mad Dogs, of Vipers, Rattle Snakes, and other Venom's of like kind. It removes Sickneſs at Heart, fainting and ſwooning Fits, is good againſt Cramps, Convulſions, Lethargies, Apoplexies, Palſies, and ſuch other like cold Diſtempers of the Brain and Nerves. It is good againſt Punctures of the Nerves, and gives preſent eaſe to the Pain, the Part wounded being well bathed therewith, and Cloths wet therein being laid thereon. Doſe inwardly is from two to three or four drams in a Glaſs of choice Wine.

XVIII. *The Acid Tincture.* It reſiſts the Infection of the Plague to a Miracle, as alſo of the ſpotted Fever, and of all other malign and peſtilential Fevers. It cuts tough Flegm in the Breſt and Lungs, and is good againſt Hoarſeneſs, Wheezings, ſhortneſs of Breath, and difficulty of Breathing, cauſing an admirable Expectoration. It opens Obſtructions in the Urinary Parts and Paſſages, expelling Sand, Gravel and tartarous Matter thence; and powerfully reſiſts the Poyſon of mad Mogs. Doſe ſo much at a time as may make the Vehicle, whether Mead, Cyder or Wine, pleaſantly acid.

XIX. *The Oily Tincture.* Outwardly applied, it is good to give eaſe in the Pain and heal the Puncture of a Nerve or Tendon. It gives eaſe alſo in the Gout in any Part, ariſing from a cold Cauſe. Inwardly taken alſo from ten to twenty or thirty drops (according to Age and Exigency) in any proper Vehicle, it expels Wind, prevails againſt the Cholick, and alleviates all ſorts of inward Convulſions; is a good Hyſterick, and a ſingular thing againſt the Strangury, or any Obſtruction of the Urinary Parts.

XX. *The Spirit.* It is purely an Antipeſtilential and Alexipharmick Cordial; wonderfully comforting and warming the Stomach and all the other Viſcera. It gives eaſe in Convulſions, and the Tortions of the Bowels proceeding from Wind, Poyſon, or the Prevalency of acrid and ſharp Humors. Doſe one or two ſpoonfuls at a time, (being firſt dulcified) as need requires.

XXI. *An Obſervation.* The great Uſe we in *England* make of this Plant, is to Dye Cloth, Linnen or Woollen, Yarn, Silk, woven or raw, *&c.* into a yellow color; and alſo to give a green color to thoſe Cloths or Silks, Yarn, *&c.* which have been firſt Dyed with Woad, into a blew color. And of this *Vitruvius* ſeems not to be ignorant, for that in his time he ſays, in *lib.* 7. *cap.* 14. That a *yellow* color coming upon a *blew*, changes it into a *green*. And for this purpoſe, there is a great deal of this Herb made uſe of in all Countries, and many Fields ſown therewith, for this very Purpoſe of Dying Cloths, Stuffs, Silks, *&c.*

CHAP. CCXXXVII.

Of DYERS GREEN-WEED.

I. *THE Names.* It has no known *Greek* Name: it is called in *Latin*, *Geniſta Tinctoria*; and in *Engliſh*, *Dyers-weed*, and *Dyers Green-weed.*

II. *The Kinds.* It is certainly of the Stock or Family of *Geniſta* or *Broom*; and is a ſingular Plant of the kind: and by reaſon it is our *Common Green-weed*, it is called *Geniſta Tinctoria vulgaris.* It is alſo called *Geniſtella infectoria*; *Geniſtella Tinctoria*; *Flos Tinctorius Brunfelſii*; *Fuchſii*, *Loniceri*; *Corneolæ Anguillaræ & Cæſalpini*; *Chamæluce Cordi*, *& Geniſta Tinctoria Germanica Bauhini*: in *Engliſh*, *Dyers-weed*, *Green-weed*, and *Dyers Green-weed.*

III. The Deſcription. *It has a thick and woody Root, much diſperſed under Ground: from whence riſe up many ſmall, tough, green Stalks, ſome of them having ſeveral Branches, about two feet in height or thereabouts; upon which do grow (without any order) a great many ſmall, long Leaves, ſomewhat like thoſe of* Flax, *of a ſad green color.* The Flowers grow at the tops of the Branches, not much unlike the Flowers of *Broom*, (of which this is a Species) but ſmaller, of an exceeding fair yellow color, but ſomewhat paler than thoſe of *Common Broom*: the Flowers being paſs'd away, there come in their places ſmall flat Pods or Cods, leſſer than thoſe of *Broom*, in which is contained a little, flat, *Broom* like Seed.

IV. *The Places.* It grows in many untilled or unmanured Grounds throughout *England*; as alſo by the Hedges and Way ſides, and in many open Commons. It grows alſo in fertile Paſtures and Fields almoſt every where. Now it is ſown in Fields on purpoſe for the Profit which is made thereof.

V. *The Times.* It flowers from the end of *June* to the end of *Auguſt*, and the Seed is ripe ſoon after.

VI. *An Obſervation.* *Cluſius* ſets forth another kind of *Dyers Green-weed*, which *Dodonæus* calls alſo *Geniſta Tinctoria*; but then it ought to be *Geniſta Tinctoria altera. It has a thick and woody Root, which ſends up Stalks, almoſt like thoſe of the* Spaniſh Broom. *Upon theſe Branches do grow long and ſmall Leaves, like* Flax, *green on the upper ſide, and of an houry ſhining color on the other. The Flowers grow at the tops of the Stalks Spike-faſhion, which are in Color and Form like the former. But this Plant grows not commonly in* England, *unleſs it is planted by the Curious in their Gardens.*

VII. *The Qualities, Specification, Preparations and Virtues* of this our *Common Dyers Green-weed*, are the ſame with thoſe of our *Common Broom*, which we have already at large declared in *chap.* 84. *ſect.* 7. *ad* 29. of this Book aforegoing, to which you are referred.

VIII. *An Obſervation.* Tho' the Medical Virtues of this Plant are admirable, and not in the leaſt interior to thoſe of our *Common Broom* aforementioned; yet the chief Uſe our People in *England* have of it, is, for Dying of Cloth, Stuffs, Silks, Yarn, Woollen and Linnen, *&c.* for the Dyers do Dye a yellowiſh green Color with it, *viz.* with the Leaves and Stalks; and therefore provide themſelves of it in great Stores: and for which Reaſon, in ſome places, whole Fields are ſowed with it, as with the *Luteola* or *Dyers-weed* in the Chapter juſt aforegoing.

CHAP. CCXXXVIII.

Of EARTH-BALLS.

I. *THE Names.* This kind of Plant is called in *Greek*, ὕδνον, ἢ ὕδνα, *ab imbribus*; *vel*, ὀιδνα, *ab humore*: in *Latin*, *Tuber Terræ*, *pl. Tubera Terræ*: in *Arabick*, *Ramæch*, *Alchamech*, *Tamer* and *Kema*: in *Engliſh*, *Earth-balls*, and *Under-ground Muſhromes.*

II. *The Kinds.* *Matthiolus* will have three ſorts of theſe *Balls*; but then with the *Tubera Cervina*, there will be four. We divide them into two kinds, *viz.* 1. *Tuber Terræ vulgare*, The common Earth-ball. 2. *Tuber Cervinum*, *pl. Tubera Cervina*, Deers Earth-balls. Of the *Vulgar* or *Common* *Matthiolus* makes three ſorts, *viz.* 1. One whoſe Pulp is white. 2. One whoſe Pulp is more brown; and the Rinds of both of them black and full of Chaps. 3. One which is leſs pleaſant or inſipid in Taſte, and whoſe Rind is ſmooth and more brown.

III. The Deſcriptions. *They*, viz. *the* Common Earth-balls, *have no Roots, but grow under Ground*, viz. *under the Superficies of the Earth, yet not cleaving thereto, cauſing it ſometimes to ſwell, and ſometimes to break, gape or cleave, by which it is diſcerned where they grow, being of a black or brown color on the outſide, and of a ſoft white Subſtance within, having, as* John Baptiſta Porta *ſays, under the outward Skin certain ſmall black Subſtances, which are the Seed, (tho'* Pliny *ſays they have none.) The Seed is like unto the Seed of the* Cypreſs-tree, *by which they not only propagate themſelves where they grow naturally; but as it has been often obſerved, they have ſometimes been found growing where the Parings of them have been caſt.* Theſe Tubera *are unequally round, blackiſh and rough, whoſe Skins, Shells or Outſides, are without Roots, Fibres or Leaves; and within, their Pulp is white or whitiſh.*

IV. *The* Tubera Cervina, *or* Deers Earth-balls, *which I ſuppoſe* Matthiolus *intends in his Epiſtles*, lib. 3. Epiſt. ult. *growing under Ground in the Woods of* Bohemia, *&c. are always unevenly round, and rugged; their outward Skin is blackiſh, and the inner Pulp or Subſtance whitiſh: while they are freſh they have a ſtrong and evil Smell, which in drying, they looſe.*

V. *The Places.* The firſt kinds grow plentifully in *Tuſcany*, and ſeveral other places of *Italy*: they alſo grow in *Spain*, *Germany*, *France* and *England*, not only in dry and ſandy Grounds, but alſo in ſuch as are more moiſt, and in places where Shrubs grow, as in Copſes, Groves, Parks, woody Land, *&c.* The *Deers Earth-balls* grow alſo in Woods, and where *Deer* do much haunt, eſpecially where they Couple, (as the former alſo do.) Hunts-men and Country People immagine, that theſe *Deers-balls* grow up out of the Sperm of thoſe Beaſts, which ſometimes falls on the Ground; others think, that they are firſt produced by their Urine; but theſe are wild Conjectures and Country-mens Philoſophy, and ſo not much to be truſted to; however, it is probable, that in ſome places that Beaſt's Urine, *&c.* may add to their Growth, and the Encreaſe of their Subſtance.

VI. *The Times.* They flouriſh and encreaſe in *April*, *May* and *June*, and are in Perfection in *June*, *July* and *Auguſt.*

VII. *The Qualities.* *Galen* and *Matthiolus* ſay they have no manifeſt Quality in them: *Avicen* ſays they have a more earthy than watry Subſtance, and ſo abound more with ſaline than with ſulphureous or

or ſpirituous Principles. The *Deers Earth-balls* ſeem to be temperate in Quality, as to Heat or Cold, Moiſture or Dryneſs; and are Alexipharmick, Galactogenetick and Spermatogenetick.

VIII. *The Specification.* The *Common*, if much eaten, are ſaid to breed Wind, and to engender the Palſy and Apoplexy. The *Deers* are ſaid to provoke Luſt to the laſt Degree.

IX. *The Preparations.* The firſt are uſed moſtly in, 1. *A Pickle.* 2. *A Decoction in Wine.* The *Deers Earth-balls* are uſed in, 3. *A Pouder.* 4. *A Decoction in Wine.* 5. *A Fumigation.*

The Virtues.

X. *The Pickle* of the *Common kind.* They are uſed as Sawce, and are very pleaſant to the Palate, but breed groſs and melancholy Humors more than any other Food; they are hard of Digeſtion, and in ſome People riſe again in the Stomach. Some eat them roſted in the Embers; and ſome boiled in Broth, and ſo eat them with Pepper, Salt, Vinegar and Oil; they certainly encreaſe Luſt.

XI. *The Decoction in Wine.* It provokes Luſt, as the Sallet before does: but after the Decoction is made, you may dreſs the Subſtance with Pepper, Salt, Vinegar and Oil, to be eaten as before. *Pamphylus* or *Diphulus* in *Athenæus* will have it, that they yield a good Juice, eaſe the Belly by excreting the Excrements, are windy and encreaſe Seed.

XII. *The Pouder* of the *Tubera Cervina.* They are firſt cut into pieces, then dried by hanging them on a String; after which they are reduced to Pouder, by beating in a Mortar. Doſe of the Pouder a dram and half in a Glaſs of generous Wine, or ſome other Vehicle provoking Luſt: it wonderfully incites to Coition, by breeding much Seed, and encreaſes Milk in Nurſes Breaſts: it may be taken alſo in ſome Ptiſan, with a little Sugar and Long Pepper added thereto.

XIII. *The Decoction in Wine.* It has all the ſame Virtues with the Pouder, more eſpecially if a dram or dram and half of the Pouder be given at a time in it. Thus taken, the Medicament expels Poyſon, and defends againſt the poyſonous Bitings of venomous Creatures.

XIV. *The Fumigation.* If the dried pieces of the *Tubera Cervina* be put upon live Charcoal, and the Fumes be received up the Womb by a Funnel, help Women troubled with the Mother, and open the Paſſages of the Womb when they are cloſed, thereby in ſome meaſure provoking the Terms.

CHAP. CCXXXIX.

Of EARTH-NUTS, *OR,* GROUND-NUTS.

I. *THE Names.* Some Authors ſay, that this Plant has no *Greek* Name, but what it has acquired from the *Latin*, which is, Ἀγριοκάστανον, καὶ Βολβοκάστανον, which laſt word is taken from *Trallianus lib.* 7. in *Latin*, *Agriocaſtanum*, *Bolbocaſtanum* and *Nucula Terreſtris*: in *Engliſh*, *Earth-nuts*, *Ground-nuts*, *Earth Cheſt-nuts*, and *Kipper-nuts.*

II. *The Kinds.* It is twofold, *viz.* 1. Ὀινάνθη, *Matthioli* (*folio* 627.) of *Bauhinus* his Edition, *Bulbocaſtanum majus*, *Agricaſtanum majus*, *Apios Turneri*, *Puncaſeolus Cæſalpini*, (becauſe the Vulgar eat the Root of it inſtead of Bread and Cheeſe) *Bulbocaſtanon grandius Lugdunenſis*, *Nucula Terreſtris major*, The greater Earth-nut, or Ground-nut. I am almoſt of Opinion, that this Plant or Species is the true *Oenanthe Dioſcoridis.* 2. *Agricaſtanum, vel Bulbocaſtanum minus*, *Bulbocaſtanum mas Trallian*, *Bulbocaſtanum alterum foliis & bulbis minoribus Camerarii*; *Ornithogali Species Loniceri*, *Nucula Terreſtris minor*, The leſſer Earth or Ground Nut.

III. The Deſcriptions. *The firſt*, *or* Greater Ground-nut, *has a large tuberous Root, not fully round or ſmooth, but bunching out in one place or another, and ſomewhat rough, of a blackiſh brown color on the outſide, and white within, of a pleaſant Taſte, between a* Cheſt-nut *and a* Filberd; *for the moſt part eaten raw, by reaſon of its* Pleaſantneſs, *tho' ſome have alſo roaſted it by the Fire, or under the Embers.* From this Root come forth ſeveral long Stalks of Leaves, of a bright green color, which are finely cut in and divided, ſomething like unto *Parſley* Leaves, which grow on the middle or top of the Stalk, as *Dodonæus* ſays, when he compared them; but they are larger than the next, or *Small Earth or Ground Nuts*: from among theſe Leaves riſes up a ſlender Stalk, a foot or more high, having many Leaves like our *Engliſh Saxifrage*, bearing at the tops many ſmall white Flowers in an Umble, which turn into ſmall, long, blackiſh Seed, ſmelling ſomething ſweet.

IV. *The ſecond*, *or* Leſſer Earth or Ground Nut, *has a ſmall tuberous or roundiſh brown Root, like the former, but leſſer; from whence riſes up a long, ſlender, whitiſh Stalk or String, (call it by which Name you pleaſe) which is as it were the Clew, which leads you from the upright Stalk to the Root in the Ground, and runs four or five inches deep into the Earth, but folding or crumpling it ſelf to and fro unto the top of the Ground*, from whence it riſes up a little bigger, but naked or bare of Leaves for an inch or two, and

then

then ſends forth from the ſides of the ſame Stalk ſeveral ſmall Stalks, of very fine cut Leaves, almoſt like them of *Parſley* or *Hemlock*, but much ſmaller and finer jagged, of a ſad green color. At the top of the Stalk grow ſeveral Branches of white Flowers in Umbles, not unlike to the former, or thoſe of *Dill*, but much leſſer, and ſuch like Seed as in the *Greater kind*, but that it is leſſer; and is ſharp in Taſte.

V. *The Places.* The firſt grows Wild, and very frequently in *France*, *Germany* and *Italy*, and in ſome places in *England*; but with us it is for the moſt part nurs'd up in *Gardens*. The ſecond grows with us in Corn-fields, and in Meadows, almoſt every where, as in the Meadows in *Lynn Regis*, near *Alhallows Church*, and in the Paſtures going from *Hardwick*, within a Mile of *Kings-Lynn* to *Weſtwench*: alſo in ſome of the Meadows by *Hampſtead*, near *London*: in all which places I have gathred it. There is a Field adjoining to *Highgate*, on the right ſide of the middle of the Village, covered over with the ſame; and likewiſe in the next Field to the *Conduit-head* by *Maribone*, near the Way which leads to *Paddington*, not far from *London*: I have found it to grow alſo in many Meadows in *Kent* and in *Surry*, and in ſeveral other places.

VI. *The Times.* They flower in the beginning of *June* (juſt at which time their Roots are in Perfection) and in *July*; and the Seed is ripe in ſome little time afterwards.

VII. *The Differences.* The *Greater* differs from the *Leſſer*, for that the Leaves are larger and greener: the Root alſo of the *Greater* is not ſo far within the Ground; and it alſo ſends forth ſome Leaves from the Tuber or Bulb it ſelf; whereas the *Smaller kind* has only the end of a ſmall Root, (like a String as it were) which carries the Stem and Leaves upon it, as you may ſee expreſs'd in the Figure.

VIII. *The Qualities.* They are hot and dry in the firſt Degree; the Seed in the ſecond: they are Aperitive, yet Aſtringent and Diuretick; Stomatick, Nephritick, Spermatogenetick and Analeptick.

IX. *The Specification.* They provoke Urine, and peculiarly help ſuch as Spit or Piſs Blood.

X. *The Preparations.* The Seeds and Roots are chiefly uſed; and therefore you may have therefrom, 1. *A Pouder of the Seed.* 2. *A Spirituous Tincture of the Seed.* 3. *The raw Roots.* 4. *The Roots prepared.* 5. *Sanguis, or Blood of the Roots.*

The Virtues.

XI. *The Pouder of the Seed.* You may give it to a dram or dram and half in a Glaſs of White Port Wine, Morning and Night, againſt the Strangury, Sand, Gravel and tartarous Matter in the Reins, Ureters and Bladder; it opens Obſtructions of the Paſſaſſes, provokes Urine, and expels Wind.

XII. *The Spirituous Tincture.* It has the former Virtues, and may be given from one to three drams in any fit Vehicle. It is very Stomatick, warming, comforting and ſtrengthening a cold and weak Stomach. It expels Wind from the Stomach and Bowels, gives eaſe in the Cholick, and is of good Uſe againſt all ſorts of Fluxes of the Belly.

XIII. *The raw Roots.* They are commonly eaten as *Filberds* and raw *Cheſt-nues* are eaten; they yield a good Juice, which cleanſes the Urinary Paſſages, pleaſes the Stomach, and nouriſhes in Conſumptions.

XIV. *The Roots prepared.* They are prepared by baking in an Oven, covered with Milk; or by boiling them in Water as *Turneps*, *Parſneps* or *Carrots*; and then dreſſing them up with Butter, Pepper, Salt, and a little Vinegar: they gratify, pleaſe and ſtrengthen the Stomach, reſtore in Conſumptions, and provoke Urine. The Root roaſted in Embers, ſtops Bleeding, and is good for them who Vomit, Spit or Piſs Blood, or have a Bloody-flux, or any other Flux of the Bowels. The raw Root does alſo the ſame thing.

XV. *The Sanguis or Blood.* It is prepared as is that of *Cullions Sweet* in *chap.*184. *ſect.*22. *Parſneps*, *Carrots*, *Orchis*, *Satyrion*, and other like Roots. It has all the former Virtues of the Roots, whether raw, roaſted, baked or boiled; and is much more powerful, being given from half an ounce to an ounce or more, drinking with it a Glaſs of generous Wine. It is of ſingular Uſe for all Conſumptive Perſons, breed good Juices and plenty of Seed, and provokes Luſt.

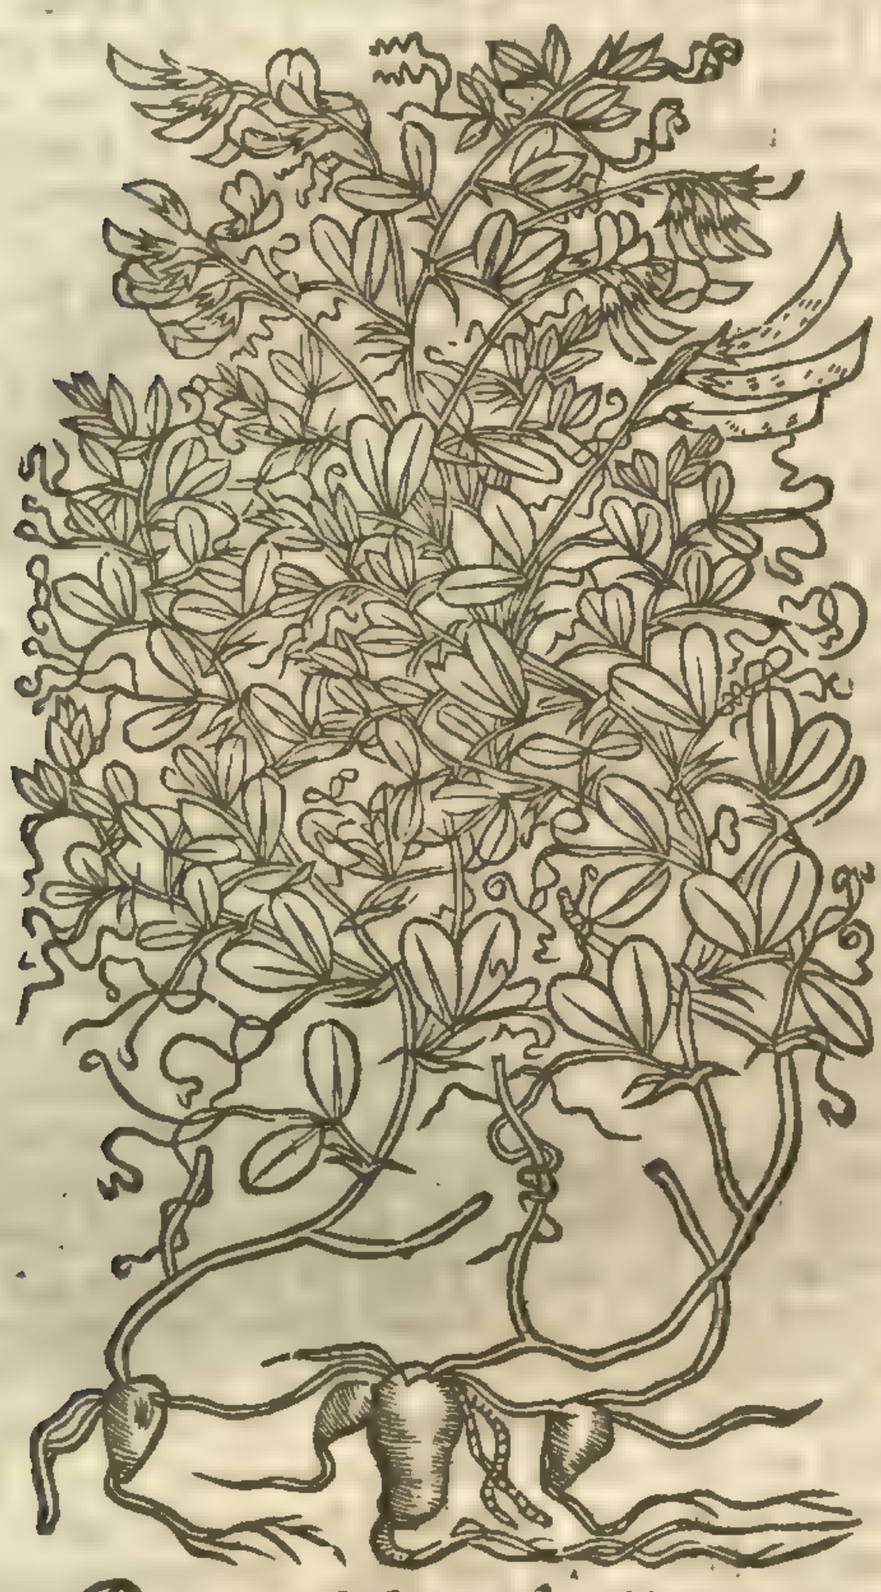
CHAP. CCXL.

Of EARTH-NUTS Peaſe and Wood.

I. *THE Names.* It is called in *Greek*, Ἄμπος, *Fuchſii* and *Tragi*: Ψευδάμπος, *Matthioli*: Χαμαιβάλανος, *Dodonæi* and *Tabernmontani*: in *Latin*, *Apios Tragi*, (I ſuppoſe from its Form, being *Pear* faſhion;) *Pſeudoapios Matthioli*, *Chamæbalanus Dodonæi*, (from its ſomewhat Reſemblance to an *Acorn*;) *Terræ glans pl. glandes Lobelii & Penæ*, *Glandes Terreſtres Cluſii*: in *Engliſh*, *Wood* and *Peaſe Earth-nuts.*

II. *The Kinds.* There are three ſorts of them, *viz.* 1. *Balanus Lathyrine*, *Terræ glandes*, *Balanus Piſanæ*, with all the reſt of the Names in a foregoing

ing Section: Peaſe Earth or Ground Nuts. 2. *Aſtragalus ſylvaticus Thalii*, *Lathyrus ſylveſtris*, Wood Earth-nuts, or Ground-nuts. 3. *Terræ glandes Americanæ, vel Virginianæ*, American or Virginia Earth-nuts.



Peaſe Earth Nuts.

Wood Earth nut

III. The Deſcriptions. *The firſt, or* Peaſe Earth-nut, *has Roots which are glandulous or tuberous, (not much unlike in Shape to an* Acorn, *or ſome ſorts to* Pears) *which are black and ſmall, but much greater than* Acorns, *faſtned to long Strings, and ſpread much under Ground; in Taſte very like to a dry* Cheſt-nut; *out of which beneath does hang one or more long, ſlender Fibres or Strings; and out of which does alſo grow other Strings, near to the Head of the Root or ſetting on of the Stalk; unto which, creeping aſlope under the Surface of the Earth, other kernelled or glandulous Roots do grow, by which way this Plant does very much multiply it ſelf.* From this Root ſpring ſeveral weak, ſlender, ſquare, trailing Stalks, running upon the Ground four or five feet in length. The Leaves are thin and ſmall, uſually ſet two and two together upon ſlender Stalks, each having a Claſper at its end, taking hold of what ſtands next to it. The Flowers come forth at the Joints towards the tops of the Stalks, and at the tops of the ſame, ſtanding upon long Foot-ſtalks, in Shape like thoſe of *Peaſe*, but leſs, many growing together, being narrow, and of a deep reddiſh purple color, and bright, in Smell not unpleaſant. They being paſs'd away, there ſucceed, in their places, ſlender long Cods, in which are contained three or four ſmall round Seeds.

IV. *The ſecond, or* Wood Earth-nut, *has not only greater, but longer and harder Roots, conſiſting of many black Particles, here and there ſending forth Fibres, almoſt woody, or more hard than the former; the Stalks alſo are harder, and ſtraked or cornered, and riſe up to be about a foot high, ſmall below, and ſomewhat larger above:* the Leaves grow forth at the Joints of the Stalks, conſiſting ſometimes of two, and ſometimes of four, which are longiſh and narrow, and ſometimes five on a Branch, faſtned to one Foot, which at the ſetting on has two little Leaves or Ears, and one Claſper or Tendrel at the end. Out of the Boſoms of theſe Ears grow Stalks about two inches long, each of which uſually carry a couple of *Peaſe* faſhioned Flowers, of a crimſon or purple color, which fading, uſually become blew: after which Cods ſucceed, which are long, narrow, ſtraight, round and black when they grow old, within which are contained in each Cod nine or ten white, round Seeds ſomething leſs than a Tare.

V. *The* Virginian Earth-nut *has a Root which ſpreads it ſelf under Ground many ways, each String of Tubers or Glands conſiſting of a ſmall String and a Gland, a ſmall String and a Gland to the end of the ſame, each Gland being almoſt of an Oval faſhion, thick in the middle, and narrow-pointed at both ends, where it is held by the Strings, and having many ſmall Fibres proceeding from its Body in ſeveral places:* from this Root riſes up a Stalk, which ſpreads it ſelf forth into many large Arms or Branches, and every one of them again are divided into ſeveral others, which are manifold. The Leaves are long and green, which are many, and ſet on both ſides of a middle Stalk, the main Stalk it ſelf winding it ſelf upon any thing ſtanding next unto it, and riſing from a tuberous brown Root, as aforeſaid. At the Joints of the Stalks with the Leaves, and in other places of the Stalks, come forth the Flowers, many ſtanding together Spike faſhion, of a dull bluſh color, made almoſt like Hoods: after which, in *Virginia*, come Cods of Seed, but not bearing any with us: the Leaves and Stalks periſh before Winter, and ſprout from the old Root again in the Spring.

VI. *The Places.* The firſt grows in many places of *Germany* in Corn-fields, both with the Corn it ſelf and alſo about the Borders of Fields among Briers and Brambles. The ſecond, *Gerard* ſays, grows in *Hampſtead* and *Come Parks*, near *London*; as alſo

on

on *Richmond-heath*, and in ſeveral other places. That which grows in the Woods has a Root which is more hard and woody; but if it is planted or ſown in Gardens, in a good Soil, it is more pulpy and tender. That from *America* grows not with us but in Manured Grounds; and with us they are all planted in *Gardens*.

VII. *The Times.* They all flower in *June*, *July* and *Auguſt*, and then the Nuts are dug up and gathered.

VIII. *The Qualities, Specification, Preparations and Virtues*, are much the ſame with the *Earth* or *Ground Nuts* in the former Chapter; ſo that we ſhall not need to ſay any more of them in this place.

CHAP. CCXLI.

Of EDDO of Carolina.

I. *THE Names.* It is called in *Greek*, Ἄρον Αἰγύπτιον, ἢ Ψευδοκολοκασία: in *Latin*, *Aron Ægyptium*, & *Pſeudocolocaſia*, (for the true *Colocaſia* is the *Faba Ægyptia Dioſcoridis:*) in *Engliſh*, *Eddo*, *Eddo of Carolina*, and *Carolinian Eddo*.

II. *The Kinds.* It is certainly of the Family of the *Arons* or *Wake Robins*, and is here only a ſingular Plant.

III. The Deſcription. *It has a great and bulbous or rather tuberous Root, in ſome more round than in others, ſome of which are ſmall and long with the Roundneſs, as large as the Root of a great* Squill, *or thick, big, round* Turnep, *having a thin browniſh Skin on the outſide, and white within, cutting very firm or faſt, cloſer than a heavy cloſe* Turnep; *ſome of them are reddiſh on the outſide, having by ſmall Strings many bulbous or tuberous Heads, ſhooting from all ſides thereof, whereby the Root encreaſes, from whence many Fibres ſhoot deep into the Ground.* From this Root ſhoot forth ſeveral very large ſhining green Leaves, almoſt of the Shape or Faſhion of *Arum* or *Wake Robin*, pointed at the ends, but much rounder, each of them a foot and half, and ſome of them near two feet long, and a foot, fifteen inches, or foot and half broad, not ſo thick and ſappy as *Aron* Leaves, but thinner and harder, full of Veins running every way, and refuſing Moiſture, tho' they be laid in Water, ſtanding every one upon a very thick Stalk, about three feet or ſomething more in height, as I have ſeen them in *America*, eſpecially in *Carolina*; or about five feet high, as they grow in *Ægypt*, as Authors relate. This Stalk is not ſet to or faſtned to the Leaf at the very Diviſion of the Leaf into two parts, as the *Aron* or *Wake Robin* is, but more towards the middle, ſomewhat like unto the *Water Lillies*; the Diviſion of each Leaf at bottom, being much rounder than thoſe of the *Wake Robin*. As this Plant is long, and the Leaves thereof very great, without any other main Stalk (for a long time) but only the Stalks of Leaves, ſo it has been reported to be without Flower and Seed, but very falſely; becauſe the Encreaſe which it uſually has, is by the Fibres, which run and ſpread themſelves from the Root, or by bits of the Root caſt into holes or hills in mellow Ground: they uſually cut one tuberous Root, as big as a large Apple, into twenty or thirty pieces, ſo as every piece may have a ſmall quantity of the outſide Skin upon it; theſe being planted in thoſe made or prepared holes, in Artificial Hillocks of moiſt fat Earth in the Spring time, will all for the moſt part of them grow, ſo that a Crop of the Roots may be gathered in *July* and *Auguſt* following; which is the Reaſon that never any Stalk of Flowers, Fruit or Seed are ſeen upon them. But if theſe great Roots are ſuffered to continue for many Years in a place, (ſo as they may be defended and preſerved from the Froſt) you will find, that between theſe very tall Stalks of Leaves that there will riſe up one Stalk, and ſometimes two or three, according to the Years of the Age and Strength of the Plant; which length of time helps to the fructifying thereof, for otherwiſe it would not bear any ſhew of Hoſe, or Peſtel, or Flower, as I my ſelf, who have planted them, have manifeſtly ſeen. Each of theſe Stalks are much ſhorter than thoſe of the Leaves, at the tops of which they bear a long open Husk; in the midſt of which riſes up for the moſt part three ſeveral narrow Husks or Hoſes, (never one alone, as the *Arum* or *Ariſarum* do) with every one their Peſtel or Clapper in the middle of them, which is ſmall, whitiſh, and about ſix or ſeven inches long; from the middle downwards it is bigger, and ſet round about with ſmall whitiſh Flowers, ſmelling very ſweet, the lowermoſt firſt flowering, and ſo by degrees upwards, which laſt not above three days, and from the middle upward bare or naked, ending in a ſmall long point. After the Flowers are all paſt, the lower part abides, and bears many Berries, like as *Arum* or *Ariſarum* do, but much paler and ſmaller.

IV. *The Places.* It grows plentifully in *Ægypt*, being planted there for their only Uſe in Meats, and for Food, which they ſeldom take without it. It grows naturally in *Candia*, as *Bellonius* ſays; and in *Portugal*, as *Cluſius* reports. It grows alſo in *Italy* in many places, and in the Country of *Salerne* in the Kingdom of *Naples*, as *Columna* relates. It grows alſo in the Iſlands of *Java* and *Surrat*, where they uſe it as familiarly as they do in *Ægypt*, as the *Dutch* have declared in their Navigation thither, *Anno* 1595. It is alſo found in ſeveral places of *Africa*, and in divers other places, which *Theophraſtus* remembred. Some will not have it called *Arum Ægyptium*, becauſe our late Travellers ſay, that

for

for ſome Ages it has not been known to grow there at all; 'tis poſſible, that for ſome Years paſt it may have been neglected and diſuſed; yet I am apt to believe, if good ſearch was made for it there, by induſtrious and skilful Botaniſts, it might be found again. It grows in a vaſt plenty in *Carolina*, it being a great part of the Food of the Country, inſomuch as moſt Families in that Colony plant whole Fields with it, conſiſting of many Acres, for the principal and almoſt ſole Subſiſtance of their Families, it being there of a very great Encreaſe.

V. *The Times.* It comes up from the planted bits in the Spring time, and the Roots come to their Perfection in *July*, *Auguſt*, *September* and *October*, proportionally according to the times they were planted in. It Flowers (when it is of Age, ſo as to come to the Perfection of Flowering) with its Hoſe and Peſtels or Clappers very late, even in warm Countries, ſeldom before *October* or *November*, and yet the Fruit or Berries do not often come to Perfection.

VI. *The Qualities.* The Root (for nothing elſe of this Plant is uſed) is hot and dry in the end of the third Degree: it is Aperitive, Abſterſive, Inciding, Digeſtive, Diſcuſſive and Carminative, Stomatick, Pectoral, Hyſterick and Arthritick; Alexipharmick, Chylifick and Analeptick: it is very ſharp and biting in the Mouth, not to be taſted of without Caution; yet it is more biting in ſome Countries.

VII. *The Specification, Preparations and Virtues,* are the ſame in every Reſpect with thoſe of *Aron* or *Wake Robin* Roots in Chap. . following of this Work, ſo that I need ſay no more thereof in this place; this Plant being indeed a kind of *Aron* or *Wake Robin.*

VIII. *An Obſervation.* In *Carolina* they boil them in Water till they are ſoft, then they eat them with Butter, Vinegar, Salt and Pepper; they are incomparable Food, and the very beſt of all Roots in the World which are eaten boiled: they are grateful to the Palate, pleaſing to the Stomach, very Nutritive and Reſtorative in Conſumptions: but in the boiling of them, you muſt be ſure to do it ſo well as to take away all the biting Quality of them; leſt, being hot and biting in the Throat, they ſhould cauſe an Inflammation in thoſe Parts, and alſo diſoblige the Stomach.

IX. *Obſervat.* 2. In that Country, when I was there, they made the greateſt part of their Bread of the Roots boiled ſoft, by mixing therewith fine Flower of *Maize* or *Indian Wheat*, and kneading it in with their Hands. It made wholſome, good-taſted Bread, which was very nouriſhing, and which would keep moiſt a great deal longer than that which was made of *Maize* or *Wheat* alone.

X. *Obſervat.* 3. Of the boiled Root a *Sanguis* or *Blood* may be made, as you make it of *Comfrey*, *Orchis*, *Satyrion* and *Parſnep* Roots, which not only nouriſhes much and reſtores in Conſumptions, but alſo breeds Seed, and cures Impotency in Men.

CHAP. CCXLII.

Of ELDER Dwarf.

I. *THE Names.* It is called in *Greek*, Χαμαιάκτη: in *Latin*, *Chamæacte*, *Ebulus*, *Sambucus humilis*; and in *Engliſh*, *Dwarf Elder*, *Dane-wort*, and *Wall-wort.*

II. *The Kinds.* It is twofold, *viz.* 1. *Ebulus, Sambucus humilis vulgaris*, The common Dwarf Elder, Wall-wort or Dane-wort. 2. *Ebulus foliis laciniatis*, Jagged Dwarf Elder, or Wall-wort.

III. The Deſcriptions. *The firſt, or* Common Dane-wort, *has a Root which creeps under the upper Cruſt of the Ground, ſprings up afreſh in divers places, being of the Bigneſs of a Man's Finger or Thumb; it is tough, and of a good reaſonable Length, having a very great many Branches and Fibres ſpringing from it, being more excellent for Medical Uſes than the Leaves. From this Root riſes up a four-ſquare, rough, hairy Stalk, which is full of Joints, like to young Branches and Shoots of* Elder, *and riſing to be four or five feet high.* The Leaves are winged, and grow by couples, with wide Diſtances, each Leaf conſiſting of many ſmall Leaves, ſomewhat narrower than the *Elder-tree* Leaves, but elſe ſo like, that they might eaſily deceive one not very well vers'd in the Plants: theſe Leaves ſtand upon a thick ribbed Stalk, of which every one is long, with a fit Breadth, and finely cut in on the edges, like a Saw, yet the Dents are wider and greater than in the Leaves of the *Common Elder.* At the tops of the Stalks grow Tufts or Umbles of white Flowers, daſht or tipt with red; they grow in Umbles, very like thoſe of the *Elder-tree*, but more ſweet in Smell, with five little Chives in them, pointed with black: which being paſs'd away, black Berries ſucceed, very like *Common Elder* Berries, full of a red Juice whilſt they are freſh, and in which are contained ſmall, hard, long Kernels or Seed. This Plant is very like to *Elder* in Leaves, ſpoky Tufts and Berries, but has not a woody Stalk, but only brings forth green herby Stalks, which wither away in Winter, riſing again every Spring from the old Root; but it is doubtleſs a kind of *Elder*, as may appear by the Leaves, Flowers and Fruit, as alſo by the Smell and Taſte; in all which Particulars, this is very like to that.

IV. *The ſecond, or* Jagged Dwarf Elder, *has a Root like to the former, very full of Branches and Fibres, from which ſpring up Stalks like the other alſo, and indeed in all things, excepting in the*

Leaves, it is ſo like to the former, that there is no Difference: but the Form of the Leaves does ſo alter the whole Face of the Plant, and put it out of Knowledge, like the *Jagged Elder*, that ſcarcely any one would think it to belong to the firſt kind; the Flowers, Fruit and Smell only making us to judge of the Species, and whereunto it is to be referred; for the Leaves are almoſt as much jagged and divided as the *Jagged Elder*, which is the only thing in which this differs from the firſt before deſcribed.

V. *The Places.* The firſt grows Wild in many places of *England*, where, if it is once gotten into the Ground, it will ſo creep and run, that it will be difficult to get it forth again. It grows in untill'd places near to Hedges, Ditches and common Ways, and in the Borders of Fields. It grows plentifully in the *Lane* at *Kilbury Abby* by *London*; as alſo in a Field by St. *Joans* near *Dartford* in *Kent*, and in the Highway at *Old Brantfold* Towns-end next towards *London*, and in many other like places. The ſecond is only nurs'd up with us in *Gardens*.

VI. *The Times.* They flower in *July*, and the Berries are ripe in the latter end of *Auguſt*, but for the moſt part in *September*.

VII. *The Qualities.* It is ſaid to be hot and dry in the third Degree; Aperitive, Abſterſive, Diſcuſſive, Diuretick, Pectoral, Hepatick, Nephritick, Hyſterick, Arthritick, and Emetick or Cathartick.

VIII. *The Specification.* It is peculiar for curing the Dropſy. The Roots and Seed are of greateſt Force to purge away watry and pituitous Humors, and the Leaves have the chiefeſt Strength next, to digeſt, waſte away and conſume: the Juice of the Berries are weakeſt of all.

X. *The Preparations.* You may have therefrom, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *A Decoction or Infuſion in Wine.* 4. *A Pouder of the Grains or Seeds.* 5. *An Oil or Ointment.* 6. *A Cataplaſm of the Leaves.* 7. *Ebuli-mel, or Honey of Wall-wort:* of all which things we ſhall now treat in Order.

The Virtues.

X. *The liquid Juice.* This and all other Preparations of *Dwarf Elder* are more efficacious or powerful than thoſe prepared from *Common Elder*, in all the Diſeaſes, and for all the Purpoſes unto which that is applied, but more eſpecially in thoſe Caſes in which *Elder* is little or nothing prevalent. The Juice of the Root applied to the Throat, prevails againſt the Quinſey and Kings-evil. The Fundament bathed with it, prevents the falling of it down; the ſame alſo put up the Womb in a Peſſary, or injected with a Syringe, brings down the Terms in Women. It is alſo a mighty Purger of flegmatick and watry Humors, and has been approved as the moſt effectual thing againſt an Anaſarca or Dropſy of the whole Body. Doſe from two to four ſpoonfuls or more in White Port Wine, Morning and Night, according as the Strength of the Patient will bear it.

XI. *The Eſſence.* It has all the former Virtues; and given before the coming of a Fit of an Ague, it prevails ſo effectually againſt it, that it will either put it off or make it much more eaſy; and at ſecond taking ſeldom fails of perfectly curing it. It opens Obſtructions of the Breſt and Lungs, incides and diſſolves pituitous and tartarous Matter in thoſe Parts, or the Urinary Veſſels, carrying off the morbifick Matter of Catarrhs, Stone, Gravel, Gout, Kings-evil, Jaundice, Dropſy, and other like Diſeaſes. Doſe two or three ſpoonfuls in White Wine, Morning and Night.

XII. *The Decoction or Infuſion in White Port Wine.* They have all the Virtues of the liquid Juice and Eſſence, but much weaker in Operation, and therefore much better and ſafer to be given to Children, Women kind, and weak People. It cures Agues in Children in two or three Doſes, given two hours before the coming of a Fit. And being taken to five, ſix or eight ounces in the Morning faſting, and ſometimes alſo at Night going to Bed, it prevails againſt a Cachexia and Leucophlegmatia; and has had a good Effect in curing the Kings-evil and Dropſy.

XIII. *The Pouder of the Grains and Root.* The Pouder of the dryed Berries or Seed, given to a dram in White Port Wine faſting, has the Virtues of the liquid Juice, Eſſence and Decoction; for it mightily provokes the Terms, and carries off the Water in Dropſies, and cures Struma's. Being given in Decoction of *Chamæpitys* or *Ground Pine*, with a little *Cinnamon*, it is an approved Remedy for all Joint-Aches, Rheumatiſms, Gouts, Sciatica, Dropſies, and even the *French* Diſeaſe it ſelf; for it eaſes the Pains, by withdrawing and expelling the Humors which are fluent, peccant and offenſive. The Pouder of the Root works after the ſame manner, and does the ſame things.

XIV. *The Oil or Ointment made of the green Leaves, or Roots in* May. It is ſaid to be an admirable Remedy for all external Aches, Pains, Cramps, Gouts, ſhrinking of Nerves or Tendons, and Lameneſs cauſed by Blows, Falls, Cold or other Accidents; and to warm, comfort and ſtrengthen all the external Parts ſo affected; to mollify the Hardneſs, to open the Pores, and eaſe the Spleen, the grieved Parts being therewith anointed: it alſo cures the Piles or Hemorrhoids by anointing.

XV. *The Cataplaſm of the Leaves.* It is Diſcuſſive and Arthritick; and of ſingular Uſe to be applied to the Throat in a Quinſey, and to diſſolve ſtrumous Tumors in the Neck. Applied to the Region of the Reins or Bladder, it is held to give eaſe in thoſe Pains. Applied to the Teſticles which are ſwoln and hard, it quickly eaſes the Pain and diſcuſſes the Tumor: and put to the Fundament, it ſtrengthens the Sphincter Muſcle thereof.

XVI. *Ebuli-mel*, or *Honey of Dwarf Elder.* Often taken to two or three drams or more, as Age and Neceſſity require, it diſſolves the Tartar of the Lungs, opens their Obſtructions, as alſo the Obſtructions of the Reins and Ureters, purging away gently Choler, Flegm and watery Humors; is good againſt the Bitings of Serpents, or of a mad Dog; prevails againſt the Colick and Stone, as alſo the Strangury or other Difficulty of making Water. It helps Coughs, Catarrhs, Hoarſeneſs, Shortneſs of Breath, and Difficulty of Breathing. And outwardly applied, is good againſt old running Sores, putrid and fiſtulous Ulcers: and diſſolved in Wine, it cures Sores and Ulcers in the Mouth.

CHAP. CCXLIII.

Of ELECAMPANE.

I. *The Names.* It is called in *Greek*, Ἑλένιον: in *Arabick*, *Faſin & Raſen*: in *Latin*, *Helenium*, *Inula*, *Enula*, *Enula Campana*: in *Engliſh*, *Elecampane*; but in ſome parts of *England* it is called, *Scab-wort* and *Horſe-heal.*

II. *The Kinds.* It is a ſingular Plant of its kind. But

But *Anguilara* and *Cordus* took it to be the *Panax Chironium Theophrasti.* There is another Plant which is called *Helenium*, or *Helenium alterum Dioscoridis*, which is *Heliunthemum* or *Dwarf Cistus*; but it is not akin, nor has any Relation to this, the which you may see (with all its kinds) in *Chap.* 131. aforegoing.

Elecampan

III. The Description. *It has a Root which is great, thick and long, branched forth several ways, blackish on the outside and white within, of a very bitter Taste, but good Smell when it is dryed, of a very compact and solid Substance whilst it is fresh and newly gathered. From this Root shoot forth many large Leaves, lying near the Ground, which are long and broad, small at both ends, somewhat soft in handling, yet rough withal to look upon, and very full of Veins; of a whitish green on the upper side, and grey underneath, slightly nicked on the edges, each of them standing upon a short Foot-stalk. From among these Leaves rise up several great and hairy Stalks, three or four feet high, with some Leaves thereon, compassing them about at the lower ends; and are branched towards the tops, bearing several large Flowers, like unto those of the* Corn Marigold, *both the Border and Leaves, the middle Thrum being yellow, which afterwards turn into Down, with some long, small, browniſh Seed among it, all which is carried away with the Wind.*

IV. *The Places.* It grows in moist Ground and shadowy places, more than in the dry; in the Borders of Fields and Lanes, and in other waste places almost every where, but more especially in fat and fruitful Land: it is sometimes found also upon Mountains, and shadowy places which are not altogether dry. It grows very much in the Fields on the left Hand going from *Dunstable* to *Puddle-hill*; also in an Orchard going from *Colebrook* to *Ditton-Ferry*, in the Way to *Windsor*, at *Lidde* and *Folkstone* near to *Dover*, by the Sea-side. I have often found it growing in *Orchards* in many parts of this Kingdom.

V. *The Times.* It flowers in *June* and *July*, and the Seed is ripe in *August*. The Roots are gathered for Use as well in the *Spring*, before the Leaves come forth, as in the *Autumn* or *Winter*.

VI. *The Qualities.* The Root is the chief thing which is used, and is hot and dry in the third Degree; full of *Mercury* and *Sulphur*: it is Aperitive, Abstersive, Astringent, Anodyne, Carminative, Digestive, Relaxive, Incarnative and Vulnerary; highly Pectoral, Stomatick, Neurotick and Hysterick; Emmenagogick, Sudorifick, Alexipharmick, Spermatogenetick and Analeptick.

VII. *The Specification.* It is peculiar against old Coughs, Catarrhs, and tartarous Matter obstructing the Lungs.

VIII. *The Preparations.* From the Root of this Herb you may make the following Preparations, *viz.* 1. *A Juice.* 2. *An Essence.* 3. *A Syrup.* 4. *A Decoction or Infusion.* 5. *A Powder.* 6 *An Electuary.* 7. *An Ointment.* 8. *A balsam* 9. *A Cataplasm.* 10. *A distilled Water.* 11. *A Spirituous Tincture.* 12. *An Acid Tincture.* 13. *An Oily Tincture.* 14. *A Saline Tincture.* 15. *A Spirit.* 16. *A distilled Oil.* 17. *Potestates or Powers.* 18. *An Elixir.* 19. *A fixed Salt.* 20. *Sanguis or Blood.* 21. *The Preserve or Conserve.* 22. *Enulæ-mel or Honey of Elecampane.*

The Virtues.

IX. *The liquid Juice.* It expels Wind in the Stomach and Bowels, and takes away pricking Pains and Stitches in the Side, caused by the Spleen: it is also good against Coughs, Colds, Wheezings, Shortness of Breath, and Obstructions of the Lungs by tartarous Matter. Dose two or three spoonfuls in a Glass of generous Wine, Morning and Night.

X. *The Essence.* It has all the Virtues of the liquid Juice; besides which, it strengthens the Viscera much more, and secures a Person lately cured of a Dropsy, that the Disease shall not return again upon the old Foot. It is good against the Obstruction of Urine, provokes the Terms in Women, and facilitates the Delivery of a Woman in Travail, brings forth both Birth and After-birth; it is good against Vapors and Fits of the Mother, resists Poyson, and prevails against the Venom of the Viper, Rattle-Snake, and other Serpents, as also the Bitings of mad Dogs; it destroys the Putridity of malign and pestilential Fevers, contending even with the Plague or Pestilence it self. Dose two spoonfuls Morning, Noon and Night, in a Glass of generous Wine, if it is upon an Exigency; otherwise twice a day may be enough.

XI. *The Syrup of the Juice.* It is highly Pectoral, and causes Expectoration to a Miracle, being admirably good against Coughs, Colds, Catarrhs, Hoarseness, Wheezing, Shortness of Breath, Difficulty of Breathing, and all other Stoppages and Oppressions of the Lungs, dissolving the tartarous Matter lodged there, as also in the Reins, Ureters and Bladder: it gives ease to such as are pained with the Stone in the Reins or Bladder: in a word, it has all the Virtues of the Juice and Essence, but must be taken in a larger Dose, because the truly Medicinal part of the Plant is so much clogged with Sugar.

XII. *The Decoction or Infusion in Wine.* It has all the Virtues of the aforegoing Preparations, but less powerful; and therefore may be taken to three, four or five ounces, Morning and Evening: this being daily drunk, besides being a Pectoral, it is said to be good for such as have weak and dim Eyes; for it clears, strengthens and quickens the Sight admirably; kills and drives forth all manner of Worms

in Belly, Stomach or Maw. Gargled in the Mouth, and the Root chewed alſo, it eaſes the Tooth-ach from a cold Cauſe, and faſtens looſe Teeth, and helps to keep them from Putrefaction.

XIII. *The Pouder of the Root.* It warms and comforts a cold Stomach, rectifies the Indiſpoſition of the Bowels, expels Wind, and gives eaſe in the Colick: it is good for ſuch as ſpit or piſs Blood, and prevails againſt the Bloody-flux, and other Fluxes and Weakneſs of the Bowels proceeding from a cold and moiſt Cauſe; and has indeed all the Virtues of the Juice, Eſſence and Syrup aforegoing. Doſe from two ſcruples to a dram and half in Wine or ſome proper Vehicle, Morning and Night.

XIV. *The Electuary.* It may be made ſimply with the Pouder of the Root, but it is commonly compounded thus: ℞ *fine Flower of* Elecampane *ſeven ounces, Nutmegs in pouder five ounces, Flowers of Sulphur three ounces,* Crocus Martis *aperitive two ounces, Oil of Aniſeeds one ounce, clarified Honey fifty four ounces: mix and make an Electuary.* Doſe as much as a *Cheſt-nut*, or ſomething more, waſhing it down with a Glaſs of prompt Wine, and this to be done Morning and Evening by all ſuch as have any Obſtruction of the Lungs, or Ulcer of the ſame, or ſpit or piſs Blood, or have a Bloody-flux; it is of ſingular Uſe for all ſuch Perſons who have a Cachexia or Leucophlegmatia, and for Virgins who have the Green-ſickneſs, and want their monthly Purgations. It ſtrengthens the Tone of the Viſcera ſo admirably, that ſuch Perſons who, by reaſon of vehement Obſtructions, long Sickneſs, or Debilities of Age, or ſome other Accident, have not been able to go croſs a Room, or up Stairs, have, by the taking hereof, in four or five days time, been able to go three or four Miles, and that ſo ſtoutly as to do it without complaining of any Weakneſs or Wearineſs. It opens Obſtructions of the Thorax, eaſes Coughs, and ſtops the moſt profuſe Catarrhs, tho' inveterate.

XV. *The Ointment.* It is good againſt Convulſions, Cramps, Aches, Rheumatick Pains, the Gout, Sciatica, Weakneſs of the Joints, and other like Diſtempers of the extream Parts: if it is made *of the Pulp of the Root, or the Juice thickned by boiling four pound, mixed with Oil of Trotters, Beef-ſuet, of each one pound, Vinegar half a pound,* Sal Nitre *ſix ounces,* Saccharum Saturni *three ounces*; it will be an excellent Remedy for any Scab or Itch in Old or Young. It will yet be ſo much the better if *Flowers of Sulphur four ounces* be alſo added to the Compoſition.

XVI. *The Balſam.* It is an extraordinary thing to cure Wounds and Punctures of the Nerves and Tendons: it heals green Wounds at two or three times dreſſing: and it digeſts, cleanſes, incarnates, drys and heals moiſt and running Sores, old Ulcers and rebellious Fiſtula's, ſome good inward Wound-drink being taken in the mean while. Applied in the Gout, it gives eaſe to the Pain.

XVII. The Cataplaſm. *It is made of the Meal or fine Pouder of the Root, mixt with white Bread, Milk and* White Lilly *Roots.* It ſuppurates Tumors or Apoſtems, eaſes in arthritick Pains; and applied to the ſide, gives eaſe in Pains of the Spleen. It diſcuſſes windy Tumors of the Cods; and where the Swelling is ſuch, that it cannot be diſſipated without breaking, it quickly brings it to Maturation.

XVIII. *The diſtilled Water.* It is Pectoral and Carminative, and good to be uſed as a Vehicle, to convey other Preparations of the Root in; it is good to cleanſe the Skin of any common Defœdation, and to be mixed with white Sugar Candy to put into the Eyes, to clear the Sight of Clouds, Films, or any other thing which may obfuſcate or dim the ſame.

XIX. *The Spirituous Tincture.* It warms, comforts and ſtrengthens the Stomach and other Viſcera, reſiſts Poyſon, and the Venom of Serpents and mad Dogs, helps Digeſtion, and repreſſes Melancholy; kills Worms in Children, and provokes the Terms in Women, where they have been long ſtopt; and is a ſingular thing in all Coughs, Colds, Catarrhs and Defluxions of Rheum upon the Joints and extream Parts of the Body. Doſe two or three drams in a Glaſs of generous Wine, or in the diſtilled Water dulcified.

XX. *The Acid Tincture.* It has all the Virtues of the liquid Juice and Eſſence, powerfully opens all manner of Obſtructions, and fortifies the Stomach and Bowels to a Miracle. It creates a good Appetite, cauſes a good Digeſtion, incides or cuts tartarous Humors which breed the Stone and Gout, diſſolving and expelling them: it opens all Obſtructions of the Lungs and Urinary Paſſages, cauſing a free Breathing and Expectoration, and cleanſing the Reins and Bladder from Gravel, Sand and tartarous Mucilage, which cauſes the Strangury and Difficulty of Piſſing. Doſe ſo much as to make the Vehicle pleaſantly ſharp, three, four, five or ſix times a day.

XXI. *The Oily Tincture.* It is an admirable thing againſt Punctures and Contuſions of the Nerves and Tendons: it gives eaſe in Convulſions, Cramps and Contractures of the Nerves, Tendons and Muſcles; and is a mighty Relief in a cold Gout, if it is diligently anointed therewith, and well rubbed in. It gives eaſe in the Stone and Gravel, and in the Strangury, from what Stoppage ſoever: it expels Wind in the Bowels, and gives eaſe in the Colick, and this it does in this latter caſe, whether it is given by the Mouth or exhibited Clyſterwiſe. If you give it inwardly by the Mouth, you may give it from ten drops to twenty or thirty, according to Age and Strength: if Clyſterwiſe, you may give it to a dram: outwardly anointed upon Paralytick Members, it wonderfully ſtrengthens and reſtores them.

XXII. *The Saline Tincture.* It is uſed for the moſt part outwardly to bathe all ſuch Parts and Places as are affected with Scurff, Morphew, Spots, Blemiſhes, Yellowneſs or Tawnineſs of the Skin, Herpes, Tettars, Ringworms, Scabs, Leproſy, or any other Defœdation of the *Cutis.*

XXIII. *The Spirit.* It is highly Cordial and Pectoral, good againſt fainting and ſwooning Fits, Sickneſs at Heart and Stomach, and gives eaſe in the Colick, and Griping in the Guts. It ſtrengthens a weak Stomach, and cauſes a good Appetite and Digeſtion. It gives eaſe in a Cough, exterminates Colds, and conduces to the ſtopping of Catarrhs. It reſiſts Poyſon and the Venom of Serpents and mad Dogs; as alſo the Malignity of the Plague, and all ſorts of malign and peſtilential Fevers. Doſe a ſpoonful or more at a time.

XXIV. *The diſtilled Oil.* It has all the Virtues of the liquid Juice, Eſſence, Pouder, Electuary and Spirit, and may be given in place of all or any one of them, being much more powerful than them all. I have had great Experience of it in facilitating the Birth, and bringing away the After-birth. It powerfully provokes the Terms in Women where they are ſtopt; cures Vapors and Hyſterick Fits. There is nothing better againſt Coughs, Colds, Catarrhs, Hoarſeneſs, Wheezing, Shortneſs of Breath and Difficulty of Breathing; as alſo the Colick in Stomach or Bowels, than this Oil. You may give it from ſix drops to fourteen or twenty, dropping it firſt into white Sugar, and mixing them well; and then mixing all with a Glaſs of good generous Wine,

and

and ſo drinking it off. It opens Obſtructions of Reins and Bladder, and provokes Urine powerfully.

XXV. *The Poteſtates or Powers.* They have all the Virtues of the Juice, Eſſence, Pouder, Spirit and Oil, and may be uſed to all the ſaid Intentions, both internally and externally, but are indeed much more ſubtil and penetrating, ſtriking to the Bone in a moment. They eaſe the Pain of the Head tho' extream, by ſnuffing them often up the Noſtrils, and alſo bathing the Forehead and Temples therewith. Doſe is fifty drops, more or leſs, in a Glaſs of generous Wine, and in caſe of Vapors or Fits, in a Glaſs of fair Water.

XXVI. *The Elixir.* This Medicament is only the *Poteſtates* exalted, and brought to the higheſt degree of Perfection. It is one of the greateſt of all Pectorals and Anticolicks; and provokes the Terms in Women after an admirable manner. In a word, it has all the Virtues of the Powers, and performs whatever they can do, with Advantage. Doſe from forty to ſixty drops in any proper Vehicle.

XXVII. *The fixed Salt.* It is made of the whole Plant, burnt to Aſhes whilſt it is green. It is highly Diuretick, and a great Purifier of the Blood, deſtroying all præternatural Acids in the Juices and Humors, more eſpecially in the Stomach, and other places of Digeſtion. Being mixed about a ſcruple or half a dram at a time with a ſpoonful of Juice of Limons, it takes away Vomiting immediately, tho' never ſo extream, and gives eaſe in the moſt pertinacious Colick.

XXVIII. *Sanguis or Blood.* It acuates the Juices of the Body, fortifies the Stomach, comforts the Faculties, chears the Heart, revives the Spirits, and puts whole Nature into an excellent Habit and Condition. And as it is one of the moſt admirable things in the World againſt Coughs, Colds, Catarrhs, Aſthma's and ſpitting of Blood; ſo it is a moſt ſingular thing to reſtore in Conſumptions, there being not many better things upon Earth. Doſe from two drams to three, or more, according as the Neceſſity may require, in a Glaſs of homogeneous Wine, ſuch as the Prudence of the Phyſician ſhall direct.

XXIX. *The Conſerve or Preſerve.* It may be taken in a Morning faſting againſt malign and infectious Airs; and in contagious and peſtilential Times, there being very few things much better. I commend it for ſuch as have had an Aſthma of long continuance; for the conſtant taking of it for ſome conſiderable time, diſſolves the Tartar of the Lungs, and cauſes free Breathing.

XXX. *Enulæ-mel or Honey of Elecampane.* It is highly Pectoral, and is very efficacious to warm and comfort a cold and windy Stomach, and to eaſe Prickings and ſtitches in the Sides; as alſo Pains of the Spleen, and to help Coughs, Catarrhs, Wheezing and Shortneſs of Breath. It is an excellent thing alſo for provoking of Urine, and to open Obſtructions of the Womb where the Courſes are ſtopt, ſuppreſſing Vapors, and preventing Fits of the Mother. Doſe as much as a Wall-nut Morning and Night for ſome time.

CHAP. CCXLIV.

Of ENDIVE Garden.

I. *THE Names.* It is called in *Greek*, Σέρις: by the *Arabians*, *Dumbebe*, *Anubebe* and *Endeba*: in *Latin*, *Intubus & Endivia*: in *Engliſh*, *Endive.*

II. *The Kinds.* It is either *Garden*, of which in this Chapter; or *Wild*, of which in the next. The firſt kind is called *Endivia hortenſis*, *Intubus major Matthioli*, *Intubum ſativum*, Garden Endive.

Garden Endive.

III. The Deſcription. *It has a Root which is long, white, with Fibres or Strings appendent to it, which withers and dies away after it has perfected its Seed. From this Root ſpring forth long Leaves, broad, ſmooth, and more green than white, like almoſt to thoſe of* Lettice, *ſomething notched in on the edges The Stalk grows up among the Leaves, being round and hollow, divided into ſeveral Branches: out of which, being broken or cut, there iſſues a Milk like Juice, a little bitter. The Flowers grow at the tops of the Branches, and conſiſt of many Leaves, in color commonly blew, ſeldom white.*

IV. White Endive. *It is raiſed of the Seed of the former* Garden Endive *ſowed (not in the Spring, as is uſual, but) in* July, *whereby it remains till Winter, at which time it is taken up by the Roots, and laid for two hours in the Sun or Air, by which means the Leaves will become tough, and eaſily endure to be wrapped up into a heap; after which they are buried in the Earth, or in Sand, as ſome ſay, with the Roots upwards, ſo as no Earth or Air can get within, (which, if they could would cauſe Rottenneſs:) the which ſo covered may be taken up as need requires, and ſo uſed in Sallets all the Winter, as is uſual in* London, *and many other places.* This is called *White Endive*, and it ſeems, that the ancient *Romans* were not ignorant of it, *Pliny*, *lib.* 20. *cap.* 8. ſpeaking to the ſame purpoſe.

V. Curled Endive. *There is alſo another ſort of* Garden Endive, *called* Endivia Calamiſtrata, Intubum intortum, Intubus Criſpus vel Criſpiſſimus: *this has a thick Root, with Fibres annexed, as the former has, which Root periſhes, as does the whole Plant, after it has brought forth its ripe Seed. From this Root ſpring up many* Leaves, *not much unlike to the*

the Leaves of the Curled Cabnage-Lettice, *but much larger. From among theſe Leaves ſpring up ſtrong and thick Stalks, ſet with the like Leaves, but leſs, and not ſo amply curled or criſped as thoſe below, or as the Leaves were, before it ran up to Seed. The Flowers grow at the tops of the Stalks, much like the former, and are of a like blew color. This (as well as the firſt kind) being whited according to the following Directions, is called* White Endive, *and is much uſed in Winter time as a Sallet, with great Pleaſure and Satisfaction: but this* Curled Endive *is much the tenderer, and far the fairer and better for that purpoſe.*

VI. *The Places.* Theſe grow in *Gardens* only, but not only with us, but alſo thro' all *Europe.*

VII. *The Times.* They are ſown in the *Spring*, and they flower in *June* and *July*, and their Seed is ripe in *Auguſt*, the whole Plant periſhing before *Winter*. But when they are ſown in *July*, then they will remain till *Winter*, and ſo taken up, may be whitened, (by the former Directions) and ſo be preſerved for Salleting all the Winter.

VIII. *The Qualities.* They are cold and dry in the ſecond Degree; Aperitive, Aſtringent and Hepatick.

IX. *The Specification.* They are peculiar againſt burning Fevers, the burning Heat and alſo Stoppage of Urine.

X. *The Preparations.* You may have therefrom, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *A Syrup.* 4. *A Decoction.* 5. *A Cataplaſm.* 6. *A diſtilled Water.* 7. *A Pouder of the Seed.* 8. *A Sallet.*

The Virtues.

XI. *The liquid Juice.* It is a ſingular Cooler, and therefore cools the exceſſive Heat of the Stomach and Liver; and is profitable againſt Inflammations of the other Viſcera, and, Heats in any other Parts of the Body: it is of very good Uſe to be uſed in the hot and burning Fits of Agues, to cool the ſame, being given three or four ſpoonfuls at a time, mixed with fair Water or diſtilled Water of the Plant.

XII. *The Eſſence.* It has the Virtues of the Juice; beſides which, it cools the Heat and Sharpneſs of Urine, opens Obſtructions of the Liver, Spleen and Urinary Parts, and heals the Excoriations of the ſame. Doſe three or four ſpoonfuls at a time in a Glaſs of the diſtilled Water.

XIII. *The Syrup.* It is good in thin Rheums, cauſes Expectoration, helps the Strangury, and takes away the Burning and Scalding of the Water. Doſe two ſpoonfuls or more at a time.

XIV. *The Decoction.* It has all the Virtues of the Juice, Eſſence and Syrup, but nothing near ſo powerful. It is uſually made in Water, becauſe it is more cooling, and more agreeable to the Nature of the Plant; and ſo it cools inward Inflammations, and heals admirably: it opens Obſtructions of the Liver, Spleen, Gall, Reins, Bladder and Womb, and is ſaid to be profitable againſt the Yellow Jaundice.

XV. *The Cataplaſm.* It being applied, ſerves to attemperate and cool the Sharpneſs and Heat of the Humors, and quality the ſharp and corroding Matter which proceeds from ill-natured and fretting Ulcers. It is alſo good againſt hot and inflamed Tumors or Swellings, and peſtilential Sores; and admirably helps not only the Redneſs and Inflammations of the Eyes, but alſo the Dimneſs of Sight: and gives preſent eaſe in the Gout.

XVI. *The diſtilled Water.* It is finely cooling, and a ſingular *Collyrium* to be uſed to ſore, hot, inflamed, red and blood-ſhot Eyes, being dropt into them four, five or ſix times a day. It ſerves alſo for a Vehicle to convey ſome of the other Preparations in.

XVII. *The Pouder of the Seed.* It has all the Properties and Virtues of the Juice and Eſſence; and if we may give Credit to Authors, it is rather the more powerful; beſides, it is available for Faintings and Swoonings, and other Paſſions of the Heart, given in a Glaſs of generous White Port Wine or Madera, Morning and Evening. Doſe one dram or dram and half at a time.

XVIII. *The Sallet.* It is ſingularly cooling; and being made of the *Whited curled Endive*, it is very tender and delicate, agreeable to the Stomach, cooling and refreſhing the weak and fainting Spirits; and is one of the beſt Sallets, to be uſed both in Autumn and Winter time.

CHAP. CCXLV.

Of ENDIVE Wild.

I. *THE Names.* It is called in *Greek*, Σέρις ποιὰ, ἢ ἄγρια: in *Latin*, *Endivia ſylveſtris*, *Intubum ſylveſtre*; and in *Engliſh*, *Wild Endive.*

II. *The Kinds.* It is twofold, *viz.* 1. *Endivia ſylveſtris anguſtifolia*, Narrow-leav'd Wild Endive. 2. *Endivia ſylveſtris, vel Campeſtris latifolia*, Broad-leav'd Meadow Wild Endive.

III. The Deſcriptions. *The firſt, or* Narrow-leav'd Wild Endive, *has a pretty thick, tough and fibrous Root, which periſhes every Year, as that of the* Garden *does.* From this Root ſeveral very long, ſmooth, green Leaves ariſe, lying on the Ground, narrower than the *Garden Endive*, and ſomething more bitter. The Stalk is ſlenderer and lower than the other, yet growing many times half a yard high, being towards its top more full of Branches. On the tops of all which it bears ſmall blew Flowers, like the *Common Garden Endive*; which being paſs'd away, there follows the like Seed alſo.

IV. *The ſecond, or* Broad-leav'd Meadow Endive, *has*

has a thick, tough and woody Root, with many Strings adjoining thereto; from which rise up many broad Leaves, spread upon the Ground, like to those of Garden Endive, *but lesser, and somewhat rougher:* among which rise up many Stalks, immediately from the Root, every one of which are divided into several Branches, upon which do grow many blew Flowers, in Fashion like the former, save that they are lesser.

V. *The Places.* The second grows in Meadows, and Borders of Meadows in many places. The first is found to grow Wild in several High-ways, and upon the Heads of Ploughed Lands in several Parts of the Kingdom, as also upon wild and untilled barren Grounds, especially in chalky, stoney and gravelly places.

VI. *The Times.* They flower from the latter end of *July* to the end of *August*, the Seed ripening soon after.

VII. *The Qualities, Specification, Preparations and Virtues*, are the same with those of the *Garden Endive* in the former Chapter, so that no more need be said of them in this place.

VIII. *Nota.* In the Spring time the vulgar People are used to boil these Herbs in Pottage or Broths, for sickly Persons, and such as have weak and ill-disposed Stomachs; for so they correct the ill Ferment of the Part, strengthen the Ventricle, and purify the Mass of Blood.

CHAP. CCXLVI.

Of ERYNGO, OR, SEA-HOLLY.

I. *THE Names.* It is called in *Greek*, Ἐρύγγιον: in *Latin*, *Eryngium*, *Erynge Plinii*, *Centum Capita*; and by some Apothecaries it is called, *Iringus:* in *English*, *Eryngo* and *Sea Holly.*

II. *Nota.* Some referr *Acanos* to *Eryngium*; but *Lobel* doubts thereof, and referrs it to *Drypis Theophrasti*; but *Cæsalpinus* to the *Crocodilion Dioscoridis:* *Lacuna* calls it *Glycyrrhiza spinosa.*

II. *The Kinds.* Authors make six several kinds of this Plant; but there are but two which are known to, and grow with us, *viz.* 1. *Eryngium Marinum*, *Eryngium Maritimum Bauhini & Gesneri in hortis*, *Glycyrrhiza spinosa Lacunæ*, Our common or vulgar Sea Holly. 2. *Eryngium Mediterraneum Gesneri*, *Turneri*, *Gerardi*, *Lobelii*, *Eryngium Campestre Lobelii*; *Eryngium vulgare Bauhini*, *Clusii*, *Camerarii*, (because in *Germany* there is no other so frequent;) *Eryngium Montanum*, *Matthioli & Lugdunensis*; *Eryngium Lacunæ*, *Cordi*, *Cæsalpini & Tabernmontani*, simply so called without any Epithite, and we in *England* call it, *Mediterranean*, *Mountain* or *Land Eryngo.*

IV. The Descriptions. *The first*, or Common Sea Holly, *has a Root of an admirable Length, even to eight or ten feet long, so that it can scarcely ever be all pulled up, and about the Thickness of a Man's Finger, set with Knots, Rings or Circles here and there towards the upper part, but smooth and without Joints down lower, brownish on the outside, and very white within, with a Pith in the middle, of a very pleasant Taste, but much more delicate, being Preserved or Candied with Sugar.* From this Root spring up several Leaves, broad, almost like to *Mallow* Leaves, but cornered on the edges, and deeply dented or cut in, set round about with hard Prickles, sharp-pointed, and also a little crumpled, fat, of a blewish white, of an Aromatick or Spicy Taste, and each standing upon a long Foot-stalk, but they which grow up higher with the Stalk, do as it were encompass it at the bottom: these Leaves are gentle, or nothing so hard and prickly as when they grow older. The Stalk it self is round and strong, yet somewhat crested, having Joints, and Leaves on those Joints, more divided, sharp and prickly than the lower; this Stalk is thick, about a Cubit in Height, now and then something red below, branching it self out towards the top, which Branches have also several other Branches proceeding from them, each of them bearing on their tops several blewish, round, prickly Heads or Knots, about the Bigness of a Wallnut, held in for the most part with six small, jagged, prickly Leaves under them, or encompassing the top of the Stalk round about, and standing like a Star; which Leaves, as well as Heads, are of a glistering blew, and sometimes are found greenish or whitish. The Flowers coming forth of the Heads are likewise blew, with white Threads appearing in the middle.

Eryngo, or, *Common Sea Holly.*

V. *The second*, or Mediterranean Eryngo, *has a long Root, like the former, but shorter and slenderer, yet nearly a Fingers Thickness, black without and white within, being of a Taste and Smell like the other, which whilst new sprung up, and that they are young, are also tender and fit to be eaten, tho' not altogether so sweet to be Eaten, nor fit to be Preserved, nor full out of so Aromatick a Taste.* The Leaves are diverslly cut into several parcels or pieces, being all full of Prickles along the edges, they are more divided, more prickly, and less Aromatick than the former. The Stalk and Branches are not so thick as the first; but the Stalk is divided or spread out

(like

(like it) into many Branches, which bring forth prickly Heads, but leſſer than thoſe of the other; from whence there alſo come forth blew Flowers, ſeldom yellow. There grow likewiſe, under every one of theſe Heads, ſix rough and prickly Leaves, like to thoſe of the other, but thinner and ſmaller.

Sea Holly or Eryngo Mediterranean.

VI. *The Places.* The firſt is found upon the Sea Shore or Coaſt almoſt in every Country, as in *Spain*, *Italy*, *France*, *England*, *Holland*, and in moſt of the other *Northerly* Countries; it grows upon the Sea-ſide upon Beechy and Stoney Ground. It has been found growing plentifully at *Whitſtable* in *Kent*; at *Rye* and *Winchelſea* in *Suſſex*; and in *Eſſex* at *Landamer Lading*, at *Harwich*; and upon *Langtree Point*, on the other ſide of the Water; as alſo in *Gardens*, where it is ſometimes planted. The ſecond grows naturally on the *Mediterranean* Coaſts, upon the Shores of the *Levant* Sea; as alſo in moſt parts of *Germany*, and in *Eſpecial* in *Franconia*, in the Vineyards and Highways every where; as alſo in the upper and farther remote parts from the Sea, about *Narbone* in *France*, as *Lobel* and *Pena* ſay; but with us it is only nurs'd up in *Gardens*, where it very well thrives.

VII. *The Times.* They both flower in *June* and *July*, after the Summer ſolſtice; and give ripe Seed in about a Month after, *viz.* in *Auguſt*.

VIII. *The Qualities.* They, *viz.* the Roots, are temperate in reſpect to Heat and Coldneſs, and dry in the firſt Degree, having a Thinneſs of Subſtance, as *Galen* ſays; Aperitive, Abſterſive, Anodyne, Carminative, Diuretick, Pectoral, Nephritick, Alexipharmick, Analeptick and Spermatogenetick.

IX. *The Specification.* They are peculiar againſt Stone, Sand, Gravel and Tartar in the Reins, Ureters and Bladder, Strangury, and all Obſtructions of thoſe Parts, eaſe the Colick, and ſtrongly provoke Luſt.

X. *The Preparations.* You may have therefrom, 1. *The Root, raw, roaſted or boiled.* 2. *A Conditure of the ſame.* 3. *A Juice thereof.* 4. *An Eſſence.* 5. *A Decoction in Wine.* 6. *A Pouder thereof.* 7. *An Ointment.* 8. *A Cataplaſm.* 9. *A diſtilled Water of the whole Plant.* 10. *The Juice of the Leaves.*

The Virtues.

XI. *The Root, raw, roaſted or boiled.* They are thus eaten to provoke Luſt and encreaſe Seed: they open Obſtructions of the Liver, are good againſt the Bitings of poyſonous Beaſts, provoke the Terms in Women, prevail againſt Convulſions, Cramps, Epilepſies, and other like Diſtempers of the Head and Brain.

XII. *The Conditure. The way of this dry Preſerving them is thus:* Take double or treble refined Sugar a pound or more, fair Water a pint or better; boil them together till they become a good ſtrong Syrup: to which Syrup add (being almoſt cold) two ounces or more of choice Damask-Roſe Water, an ounce of ſtrong Cinnamon Water, and a grain and half of Musk in fine pouder, (the three laſt muſt be mixed, and the Musk infuſed together firſt for twenty four or forty eight hours, and then ſtrained out; and ſo put into the Syrup, being firſt half cold.) This being done, your Roots being waſhed, are to be laid to ſoak in fair Water for twenty four hours, and then very well pickt and cleanſed; after which they muſt be boiled in fair Water for the ſpace of four hours, till they are ſoft; after which they are to be taken out, and peeled clean, as you do *Parſneps*, and the Pith muſt be drawn out at the end of the Root; but if there is any whoſe Pith cannot be ſo drawn out, then you muſt ſlit them, and ſo take it out: theſe you muſt alſo keep from much handling, that they may be clean; put them into the afore prepared Syrup, in which let them remain to the next day, then ſet them on the Fire, in a fair broad Confecting Pan, (made of Copper or Braſs double Tinned over) until they be very hot, but without any boiling at all; let them remain over the Fire an hour or more, removing them gently in the Pan from one place to another with a wooden Slice. This done, have in a Readineſs a great Cap or Royal Paper, upon which ſtrew ſome Sugar double or treble refined, upon which lay your Roots, having taken them out of the Pan. Theſe Papers you muſt put into a Stove or Hot-houſe, or a warm Oven, to dry and harden; but for want of ſuch a place, you may dry them over a gentle Sand Heat, in a Sand Furnace, or by laying them before the Fire. After this manner you may Condite or Preſerve any other Roots whatſoever. The Roots thus Condited or Preſerved are exceeding good for old and aged People, ſuch as are withred and conſumed with Age, and which want natural Moiſture, or the *Humidum Radicale*, as it is called, and therefore of conſequence muſt be good for ſuch as are in Conſumptions: they are alſo good for ſuch as have almoſt loſt the Deſire or Appetite to Venereal Acts, nouriſhing and reſtoring the Aged, and helping againſt the Defects of Nature in the Young.

XIII. *The liquid Juice of the Root.* It may be taken to two or three ounces Morning, Noon and Night in a Glaſs of generous Wine, as White Liſbon, White Madera, Mountain White Wine, *&c.* It breeds Seed admirably, and is ſaid to cure Impotency in Men. It prevails againſt the Kings-evil, the Colick, expels Wind, breaks the Stone, and drives forth Gravel, Sand, and other tartarous Matter out of the Reins, Ureters and Bladder, provokes Urine, and cures the Strangury, being drunk for about fifteen days together. One would not grutch to drink it for a Month, to have all theſe great things performed by it. It may be taken to four ounces, upon occaſion.

XIV. *The*

XIV. *The Eſſence.* It has all the Virtues of the liquid Juice; and by reaſon of its Fineneſs, much the better and pleaſanter Medicine to be taken. It powerfully opens Obſtructions of the Liver and Spleen, Reins, Bladder and Womb; is good againſt the Yellow Jaundice, Dropſy and Gout, and provokes the Terms in Women. It is good againſt the Bitings of Serpents, and the Poyſon of the *Aconite*, or other poyſonous Herbs; but in caſe of the Stone, Gravel, Sand, Strangury, *&c.* it ought to be taken for twenty or thirty days together, firſt faſting in the Morning, and laſt at Night going to Bed. If the Uſe of this Medicine is continued longer, it not only removes the Stoppage of Urine and piſſing by drops, with the Sand, Gravel and Tartar of the Reins, and all other Defects of the Urinary Parts, but it is ſaid perfectly to cure them, as alſo thoſe who are troubled with the Stone, ſo as that thoſe Pains ſhall never return again; which thing Authors ſay has been proved by Experience, on ſuch as have been a long time troubled therewith. Doſe three or four ſpoonfuls at a time in generous Wine.

XV. *The Decoction in Wine.* It has all the Virtues of the liquid Juice and Eſſence, but is leſs powerful, and therefore ought to be taken three or four times a day, ſweetned with a little double-refined Sugar. It is uſually taken (as well as the other things) to excite Coition; and is ſaid to be good againſt the *French* Diſeaſe it ſelf.

XVI. *The Pouder of the Root.* This being taken to a dram in a Glaſs of White *Lisbon* Wine, with the Addition of half a dram of *Daucus* or *Wild Carrot* Seed, expels Stone and Gravel from the Reins and Bladder, provokes Urine and the Terms, eaſes the Colick, reſiſts Poyſon, and cures the Bitings of Serpents and other venomous Creatures. It is ſingular good againſt the Scrophula, or thoſe Tumors and Kernels in the Throat called the Kings-evil, being often taken Morning and Night in two or three ounces of the Eſſence aboveſaid.

XVII. *The Ointment.* It is made of the bruiſed Root, boiled in Hogs Lard. This being applied to broken Bones, Splinters, Thorns, *&c.* remaining in the Fleſh, does not only draw them forth, but heals up the place again, making new Fleſh where it was conſumed or eaten away.

XVIII. *The Cataplaſm.* It is made of the Roots beaten into a Pulp, or raw, or boiled, and then beaten into a Maſs. This being applied to Struma's, or Kings-evil Sores, or to the Bitings of mad Dogs, Serpents, or of any other venomous Creature, it draws out the Malignity and Poyſon, and quickly heals the Sore. In the Gout, whether of Hands or Feet, it gives preſent eaſe; and applied to Apoſtems, it quickly ripens and breaks them.

XIX. *The diſtilled Water.* It is drawn from the whole Plant when the Leaves and Stalks are young: and is profitably taken for all the Purpoſes aforeſaid: it removes Melancholy from the Heart, and is good for Quartan and Quotidian Agues, as alſo for them who, by Convulſions, have their Necks drawn awry, or cannot turn them without turning their whole Bodies: but in all theſe Caſes the Juice or Eſſence are more powerful; and they may be taken in this diſtilled Water for a Vehicle.

XX. *The liquid Juice of the Leaves.* Being dropt into the Ears, it is ſaid to ſuppurate Apoſtems therein. And *Gerard* ſays, that being drunk with Wine, it is a Remedy for thoſe who are troubled with a Gonorrhœa or Running of the Reins.

CHAP. CCXLVII.

Of EYE-BRIGHT Common or Meadow.

I. *THE Names.* It is called, as ſome ſay, in *Greek*, Ἐυφρασύνη: in *Latin*, *Euphragia*, *Eufragia*, *Euphraſyne*, (which is alſo a Name of *Bugloſs*) *Ocularis*, *Ocularia*, *Ophthalmica* and *Eufraſia*: in *Engliſh*, *Eye-bright*.

II. *The Kinds.* There are many kinds of this Plant; but there are but two principal Species which are known to us, or at leaſtwiſe grow in our Country, *viz.* 1. *Eufraſia*, *Eufragia*, and *Euphragia vulgaris*, Our common Meadow Eye-bright, of which in this Chapter. 2. *Euphragia*, and *Eufragia liniſolia Columnæ*, (yet the Leaves are far leſs than thoſe of *Flax*:) *Euphragia ſylveſtris*, *Euphragia*, *vel Eufragia Lignoſa*; Woody Eye-bright, of which in the next Chapter.

III. The Deſcription. *It has a Root which is long, ſmall and thready at the end, from which uſually riſes up one ſmall, low, blackiſh green Stalk, a ſpan high, or not much more, ſpread out from the bottom into ſeveral Branches, on which are ſet ſmall, long, dark green Leaves, pointed at their ends, and dented about the edges, almoſt like a Saw, two always ſet together, and very thick.* At the Joints with the Leaves, from the middle upwards, come forth ſmall white Flowers, ſtriped with purple and yellow Stripes, and Spots mixed therewith; after which follow ſmall round Heads, with very ſmall Seed therein. This being found on ſome hilly Ground, does ſometimes vary in Color of the Flower, as being ſometimes more whitiſh, ſometimes more yellowiſh, and ſometimes more purple.

IV. *The Places.* It grows in dry Meadows, in green and graſſy Ways, and Paſtures lying to the

Son. I have found it in ſeveral Meadows near *Lyn Regis* in *Norfolk*, within a Mile or ſomething more of the Town; in Meadows near *Hardwick*, and between *Hardwick* and *Weſtwench*: alſo in many places in *Kent*, in the barren Fields and waſte Grounds near *Graveſend*, and in the places thereabouts; and indeed it is frequent in Meadows and Graſſy places in moſt parts of the Kingdom.

V. *The Times.* It flowers in *Auguſt* and continues to *September*, the Seed ripening ſoon after.

VI. *The Qualities.* It is hot in the firſt Degree and dry in the ſecond, and is eſpecially appropriated to the Eyes: it is gently Aſtringent and Diſcuſſive.

VII. *The Specification.* It is a ſingular Remedy (confirmed by Experience) againſt all Diſeaſes of the Eyes.

VIII. *The Preparations.* You may have therefrom, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *A Decoction or Infuſion in Wine.* 4. *A Pouder of the Herb.* 5. *A Conſerve thereof.* 6. *A Drink.* 7. *A Cataplaſm.* 8. *A diſtilled Water.*

The Virtues.

IX. *The liquid Juice.* Taken inwardly Morning and Evening to two or three ſpoonfuls, in a Glaſs of generous Wine, it ſtrengthens the Eyes and Optick Nerves, helps a weak Brain and Memory, ſtrengthens a weak Sight, and reſtores it, being decayed, in a ſhort time. Outwardly dropt into the Eyes five or ſix times a day, it takes away Clouds, Films, Blood-ſhot, and other things which obfuſcate the Sight.

X. *The Eſſence.* It has the Virtues of the liquid Juice, being inwardly uſed and outwardly applied: it may be given inwardly to two or three ſpoonfuls in a Glaſs of Wine, Morning and Night.

XI. *The Decoction or Infuſion in Wine.* It may be made in White *Lisbon* or *Madera* Wine, or your *Spaniſh* Mountain Wine. It has the Virtues of the liquid Juice and Eſſence, but not altogether ſo powerful: a quarter of a pint of it may be drunk in the Morning faſting; then half an hour before Dinner; as much at five in the Afternoon; and laſtly, the like quantity at going to Bed. It ſtrengthens the Stomach admirably, and by conſequence the Head and Optick Nerves.

XII. *The Pouder.* Its Virtues are the ſame with the Juice, Eſſence and Wine aforegoing, but it exerts not its Virtue ſo obviouſly, or ſo ſoon: it may be given to one dram Morning and Night, in a Glaſs of Wine. If the Pouder be thus compounded, you will find it much better: *Take Pouder of Eye-bright five ounces, Pouder of Roſemary-flowers three ounces, Pouder of Nutmegs one ounce, Pouder of Mace half an ounce, Pouder of white Pepper two drams: mix them.* Doſe one dram, as before.

XIII. *The Conſerve.* It has the Virtues of the Pouder, but not altogether ſo efficacious, becauſe of its being clogged with Sugar. You may take as much as a Wallnut of it Morning and Night, drinking after it a Glaſs of good Wine. If you make it of equal parts of *Eye-bright* and *Roſemary*-flowers, it will be ſo much the more effectual; for *Roſemary* ſeems to be a Specifick to cure Diſeaſes of the Eyes.

XIV. *The Drink.* It is to be put into, or Tunn'd up with new Ale before it has done Working; to every Gallon you may put eight handfuls of the Herb, which you may gently bruiſe, and put into a thin Bag made of a Dairy-Wives Milk-cloth, with a Stone in it, to make it ſettle. This is to be put into the Ale or Beer whilſt it is Working; which, after three or four days, may be drunk as ordinary Drink: the conſtant Uſe of it admirably ſtrengthens the Eyes and clears the Sight.

XV. *The Cataplaſm.* The green Herb made into a Cataplaſm by beating in a Mortar, and then applied to the Eyes, is good againſt hot, ſharp and ſcalding Rheums, Weeping of the Eyes and Blood-ſhot, abates the Inflammation, eaſes the Pain, takes away the Dimneſs, and clears the Sight.

XVI. *The diſtilled Water.* It is ſaid to have the Virtues of the Juice and Eſſence, but much more weak; but may ſerve as a Vehicle to take ſome of the other Preparations in. Outwardly uſed to the Eyes, (eſpecially if a little white Sugar Candy is diſſolved in it) it is of good Uſe againſt an Ophthalmy, Pains and ſharp Humors; it takes away Clouds, Films and Pearls, and clears the Sight.

CHAP. CCXLVIII.

Of EYE-BRIGHT Woody.

I. *THE Names.* It is called in *Greek*, Ευφρασία ξυλοειδὴς: in *Latin*, *Eufragia*, *vel Euphragia Lignoſa*; *Eufragia pratenſis rubra*: in *Engliſh*, *Woody Eye-bright*, *Red Woody Eye-bright.*

II. *The Kinds.* There are two Species hereof, *viz.* 1. *Euphragia lignoſa major*, *Eufragia pratenſis rubra major*, The greater red woody Eye-bright. 2. *Eufragia*, *vel Euphragia lignoſa minor*, *Eufragia pratenſis rubra minor*, The leſſer red woody Eye-bright.

III. *Nota.* The firſt of theſe is the *Eufragia altera Dodonæi*, *Lobelii & Aliorum*: the *Sideritis pratenſis rubra Lugdunenſis*: the *Odontites Tabernmontani*: the *Ericoides rubrum Thalii*; and the *Cratægonon Euphroſyne Gerardi*, who makes it a kind

kind of *Cratægogonon*, againſt the Evidence of *Dodonæus*, which is indeed an Error. The ſecond is the *Brunella Italica Bauhini*, (in his *Phytopinax*;) but the *Euphraſia pratenſis latifolia Italica*, (in his *Pinax*;) and *Eufraſia purpurea minor*, (in his *Prodromus*;) and the *Eufraſia non ſcripta tertia Columnæ*.

IV. The Deſcriptions. *The firſt of theſe, or* Greater red woody Eye-bright, *has a Root which is made of ſeveral hard and woody Strings; from which riſes up one woody, ſquare, browniſh Stalk, divided into ſeveral Branches, a little above the Ground, ſo that it ſeems to be a pretty Buſh, about half a yard or two feet high,* ſet with ſomewhat long and narrow Leaves, pointed at the ends, and a little dented in about the edges, two always ſet together at a Joint, one againſt another, which will, in the Heat of Summer, turn reddiſh: the Flowers are gaping and Hooded, of a purpliſh red color.

V. *The ſecond, or* Smaller red woody Eye-bright, *has a ſmall woody Root, ſtringy and black,; from whence riſes up one ſquare, reddiſh, hairy Stalk, an handful or more high, ſometimes without Branches, and uſually but with two, very ſeldom more,* which are compaſſed with a few thick, hairy and almoſt round Leaves, ſet two together, and deeply cut into parts; the lower Leaves, which are the leſs, but into three parts, but the upper, which are the greater, into five or ſix parts. The Flowers come forth ſometimes from between the Leaves and the Stalks, and ſometimes they ſtand in Tufts at the tops, two ſtanding together, Hooded, and of a purpliſh color, coming out of long green Husks; ſometimes the Flowers have been obſerved to be white, yet but very ſeldom: which being faded or paſs'd away, there comes after them (contained in the ſaid Husks) long and cornered white Seed.

VI. *The Places.* They are found in ſeveral parts of *England*, the firſt chiefly in many places of *Kent*, in barren Fields and waſte Grounds, and in ſome places near and about *Graveſend*.

VII. *The Times.* They flower about the latter end of *July*, and in *Auguſt*, the Seed ripening ſoon after.

VIII. *The Qualities, Specification, Preparations and Virtues* of theſe Plants, are much one and the ſame with thoſe in the former Chapter, ſo that no more need be ſaid thereof in this place.

CHAP. CCXLIX.

Of FETHERFEW Garden.

I. *THE Names.* It is called in *Greek*, Παρθένιον, *(quaſi planta Virginalis, quia mulierum morbis uterinis medetur, & inde vulgo matricaria:)* in *Latin*, *Parthenium*, *Matricaria & Febrifuga:* in *Engliſh*, *Fetherfew* and *Feverfew*, (from the *Latin* Name) it being good againſt Fevers or Agues.

II. *The Kinds.* It is twofold, *viz.* 1. *Parthenium, vel Matricaria hortenſis*, The Garden Fetherfew, of which in this Chapter. 2. *Parthenium, vel Febrifuga ſylveſtris*, Wild Fetherfew, of which in the next Chapter.

III. The *Garden kind* is alſo twofold, *viz.* 1. *Parthenium, Matricaria, vel Febrifuga vulgaris flore ſimplici*, Thecommon Fetherfew, with a ſingle Flower. *Galen* ſays this was called *Anthemis*, *Helxine* and *Linozoſtis* in his time: *Pliny* ſays, that *Helxine* was called *Perdicium* and *Parthenium*, alſo *Leucanthemum* and *Tamnacum*, ſo that it ſeems *Parthenium* was a word applied to many Herbs; but it is only proper to our *Matricaria*. 2. *Parthenium, vel Matricaria flore pleno*; *Arthemeſia tenuifolia flore pleno*, Double-flowered Fetherfew.

Sweet Garden Featherfew

IV. The Deſcriptions. *The firſt*, *or* Single-flowred, *has a Root which is ſomewhat hard and ſhort, with a multitude of ſtrong fibres at it, making it like a Buſh of them: from the Head of this Root ſpring up many large, freſh, green, winged Leaves, very much cut in on the edges:* the Stalks are hard and round, ſet with many ſuch like Leaves, but ſomething ſmaller, and at the tops ſtand many ſingle Flowers, growing upon many ſmall Foot-ſtalks, conſiſting of ſeveral ſmall white Leaves, longiſh and pointed, ſtanding about a yellow Thrum in the middle. The Smell of the whole Plant is ſtrong, but agreeable enough to that Senſe, and of a very bitter Taſte.

V. *The ſecond, or* Double-flowred Fetherfew, *has a Root like the former; and in its Stalk and Leaves, as alſo the Smell and Manner of Growing, it is ſo like the other, as not to be eaſily diſcerned from it till it comes into Flower, and in that is the only Difference*; for whereas in the former the Flower was only ſingle, in this they are very thick, and double filled, as it were, with white Leaves, ſo that only a little yellow Spot is to be ſeen in the middle.

VI. *The Places.* They both grow in Gardens with us, and yet they have both been found growing Wild in this Kingdom, which is a Rarity. I rather think, that where they have been found growing ſo, that it was by ſome Accident they grew there, as the ſcattering of ſome Seed, or Weeding the Plants out, and caſting them into ſome other place, where poſſibly they might take root again, and ſo grow up and ſeed, and ſhed their Seed in the ſame place.

VII. *The Times.* They flower in *June* and *July*, and their Seed is ripe not long after.

VIII. *The Qualities.* They are hot in the third Degree, and dry in the ſecond; are Aperitive, Inci-

five, Abſterſive, Aſtringent, Carminative, Digeſtive, Diuretick and Suppurative; Cephalick, Neurotick, Stomatick, Pectoral and Hyſterick; Emmenagogick and Alexipharmick.

IX. *The Specification.* It is peculiar for provoking the Terms in Women, and forcing away both Birth and After-birth.

X. *The Preparations.* You may have therefrom, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *A Decoction of the Herb and Flowers in Wine.* 4. *A Wine.* 5. *A Syrup.* 6. *A Pouder of the Herb and Flowers.* 7. *A Cataplaſm.* 8. *A diſtilled Water.* 9. *A Spirituous Tincture.* 10. *An Acid Tincture.* 11. *An Oily Tincture.* 12. *A Saline Tincture.* 13. *A Spirit.* 14. *A diſtilled Oil.* 15. *Poteſtates or Powers.* 16. *An Elixir.*

The Virtues.

XI. *The liquid Juice.* It is good againſt the Fits and Riſing of the Mother, the Hardneſs and Inflammation of the Womb, being taken once or twice a day, two or three ſpoonfuls at a time, in a Glaſs of Wine.

XII. *The Eſſence.* It has the Virtues of the Juice, and comforts and warms the Womb and all the Parts of Generation afflicted with Cold and Moiſture, and obſtructed with thick, tough and tartarous Humors; it provokes the Terms powerfully, and brings away the Child, either dead or alive; as alſo the After-birth: it cleanſes the Reins, Ureters and Bladder, expelling Stone, Gravel, Sand or viſcous Matter obſtructing them. It provokes Urine, and gives eaſe in the Strangury. Doſe two ſpoonfuls in the diſtilled Water, or in White *Lisbon* Wine.

XIII. *The Decoction in White Port Wine.* It has the Virtues of the Juice and Eſſence, but leſs powerful; and therefore muſt be given to all the ſaid Intentions in a much greater quantity, *viz.* to five or ſix ounces, dulcified with white Sugar, and to be taken thrice a day, *viz.* Morning, Noon and Night.

XIV. *The Wine.* It is made by a reiterated Infuſion of the Herb and Flowers in White *Lisbon* or Port Wine, for a Week or more. It admirably ſtrengthens the Stomach, warms and comforts the Viſcera, and cleanſes them from cold, pituitous and viſcous Humors: if it is drunk for ſome Months, it is ſaid to rectify and ſtrengthen the Conſiſtency of the Seed, and to cure Barrenneſs in either Sex: it is good againſt Melancholy, and Heavineſs or Sadneſs of the Spirits. Doſe a quarter of a pint three or four times a day.

XV. *The Syrup.* It is dedicated to the Breſt and Lungs, and is uſed with good Succeſs againſt Coughs, Colds, Stuffings of the Lungs, Aſthma's, Wheezing, Shortneſs of Breath and Difficulty of Breathing; it opens the Pipes, and cleanſes them of the tough and viſcous Matter adhering to them. Doſe one or two ſpoonfuls, to be lick'd alone with a *Liquorice* Stick, that it may diſtil down the Throat *gradatim.*

XVI. *The Pouder of the Herb and Flowers.* If it is taken, as *Dioſcorides* ſays, in Wine, to a dram or ſomewhat more, mixed with *Oxymel*, it will purge like to *Epithymum*, both Choler and Flegm, and will be available for all ſuch as are Short-winded, or are Aſthmatick, Bechick, or are troubled with Hypochondriack Melancholy, Heavineſs, Grief or Sadneſs of the Spirits. It is good for ſuch as have the Vertigo, or Pains or Aches from Stuffings of Humors, or from a cold and moiſt Cauſe.

XVII. *The Cataplaſm.* Being made of the green bruiſed Herb, and applied to the Crown of the Head, it eaſes all Pains thereof, as *Camerarius* ſays, coming from a cold Cauſe: it is alſo profitable for ſuch as have a Giddineſs or Swiming in the Head. Applied to the Wriſts, with ſome Salt mixt with it, two hours before the coming of the Fit of an Ague, the Patient withal drinking at the ſame time half a pint or more of the aforementioned Decoction in Wine, it cures the ſame, being four or five times uſed.

XVIII. *The diſtilled Water.* Authors ſay, that it is good to take away Freckles and other Deformities in the Face and Skin. This I know, that if to every quart thereof you put one ounce of *Sal Nitre* or of *Sal Tartari*, mixing, diſſolving and filtering it thro' brown Paper; you will then have an excellent Coſmetick to clear the Skin of Tanning, Sun-burning, Yellowneſs, Freckles, Lentils, Pimples, Scurff, Morphew, and other like Defœdations of the *Cutis.*

XIX. *The Spirituous Tincture.* It expels Wind, and is powerful againſt the Colick, whether in Stomach or Bowels: it warms a cold Stomach, comforts and ſtrengthens it, revives the Spirits, chears the Heart, fortifies the Womb, and makes it vigorous and fit for Conception. Doſe half a ſpoonful or more in a Glaſs of White *Lisbon*, Morning and Night, or two or three times a day.

XX. *The Acid Tincture.* It is good againſt Nauſeating, and ſtops Vomiting, ſtrengthening the Stomach after an admirable manner. It is prevalent againſt the Cachexia, and the Green-ſickneſs in Virgins, makes a good Stomach and a ſtrong Digeſtion, opens the Obſtructions of the Womb and provokes the Terms, and rectifies the Defects of the Inſtruments of Generation, occaſioned thro' Weakneſs. Doſe ſo many drops as to give the Vehicle a pleaſant Acidity, and that three or four times a day or more.

XXI. *The Oily Tincture.* It is good againſt all cold and moiſt Diſeaſes of the Head, Brain and Nerves, as Head-achs, the Megrim, Vertigo, Apoplexy, Epilepſy, Convulſions, Palſy, Rheumatick Pains, Colicks, and other like Diſtempers of thoſe Parts. It is inwardly to be taken Morning and Evening from twelve drops to twenty four or thirty, dropping it firſt into Sugar, and mixing them well together; then mixing them with a Glaſs of Wine, and ſo drinking it off; it powerfully opens Obſtructions of the Womb, Reins, Ureters and Bladder, prevails againſt the Strangury, and expels Gravel, Sand and tartarous Matter from the Urinary Parts. Outwardly againſt Pains and Aches, Convulſions and Palſies, it is to be well anointed upon the Parts affected Morning and Night.

XXII. *The Saline Tincture.* Tho' it provokes Urine and opens Obſtructions of Reins and Ureters, yet it is moſtly uſed againſt Pains of the Gout, external Affects and Defœdations of the Skin, ſuch as we have enumerated at Sect. 18. aforegoing; for which Purpoſes the Parts affected are firſt to be bathed with warm Water, to open the Pores of the Skin; then being wiped dry with a Cloth, this Saline Tincture is to be laid on, bathing the Parts well with it twice or thrice a day, and letting it dry on.

XXIII. *The Spirit.* It is highly Cordial, good againſt fainting and ſwooning Fits, reſiſts the Power of malign Fevers, and the Poyſon of the Plague it ſelf. Given in a little Poſſet-drink, it drives out the Meaſles and Small-Pox powerfully, and ſo ſecures the Life of the Patient. It is ſingular alſo againſt Convulſions.

XXIV. *The diſtilled Oil from the whole Plant dryed.* It has all the Virtues of the liquid Juice, Eſſence, Tinctures and Spirit, but is much more powerful

powerful than them all, and may be given to all the ſame Intentions, from eight drops to ſixteen or twenty, firſt dropt into Sugar, and then mixt with the Vehicle you deſign to give it in, whether it be Wine or any other ſpecifick Liquor. It may be given twice a day, *viz.* Morning and Evening; but in caſe of a Woman in Labor, or in any Fits, whether of the Mother, Colick, Convulſions, Apoplexies or Falling-ſickneſs, it ought to be given at that moment of time.

XXV. *Poteſtates or Powers.* They have all the Virtues of the Juice, Eſſence, Tinctures, Spirit and Oil exalted; in which the Virtue and Efficacy of the Plant is ſo ſubtilized, as that it penetrates momentarily into any Part they are applied to, whether they be inwardly given or outwardly uſed. Doſe is from one to two drams, and upon Extremity to three, mixed with a Glaſs of Wine, or any other ſpecifick Vehicle.

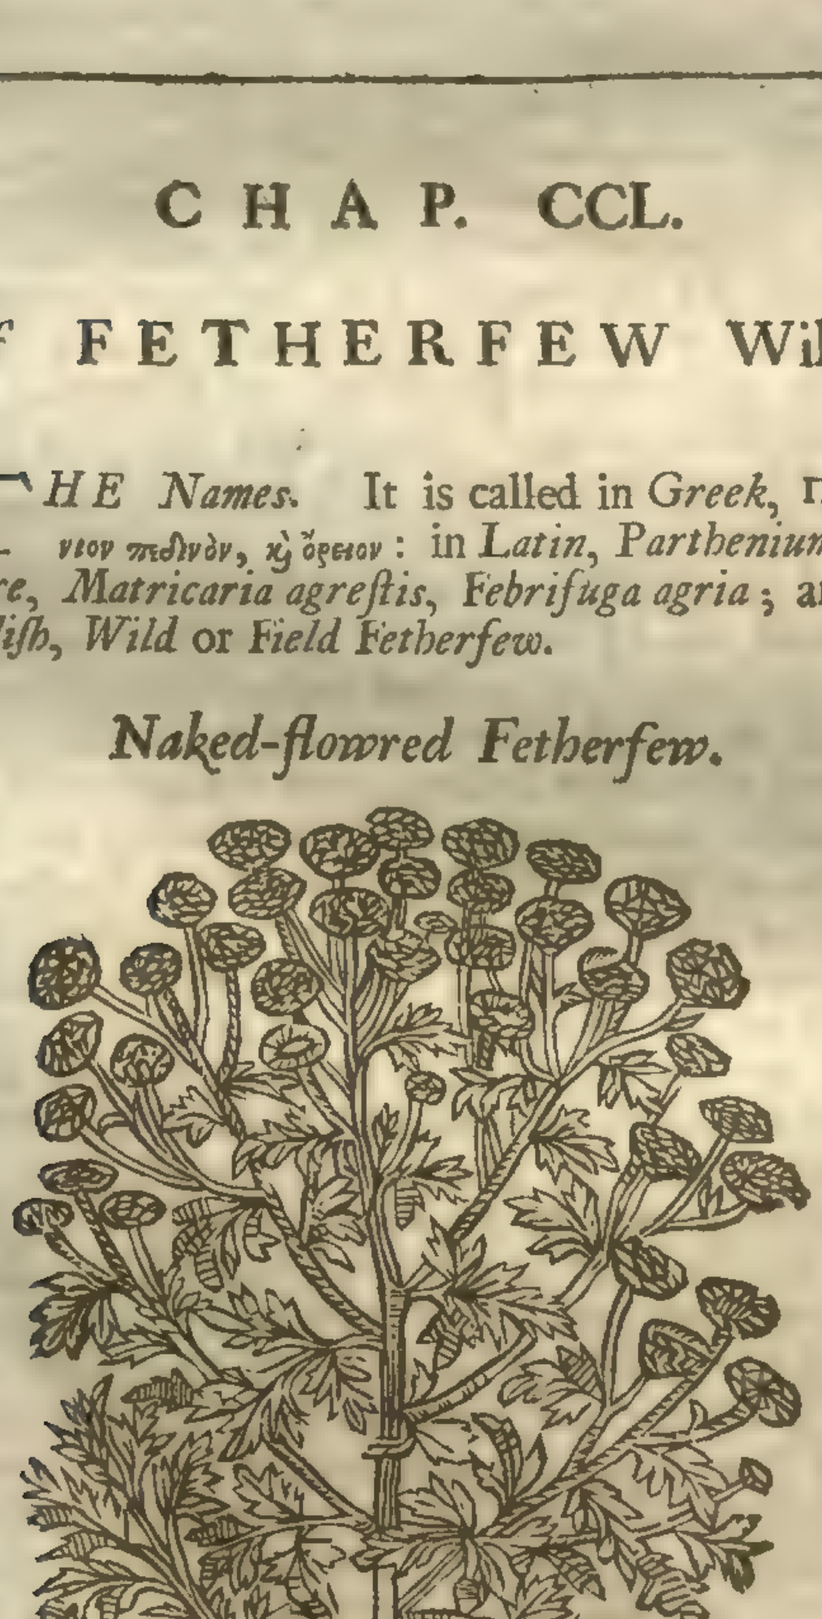
XXVI. *The Elixir.* This is the Powers elixirated and brought yet to a greater degree of Efficacy in Operation; being vehemently ſubtil, and ſtill much more exalted in their Virtues and Effects. It may be given inwardly from half a dram to a dram and half or two drams (according as the Neceſſity may require) in a Glaſs of Wine or other fit Vehicle, Morning and Night, or oftner, as you ſee fit.

CHAP. CCL.

Of FETHERFEW Wild.

I. *THE Names.* It is called in *Greek*, Παρθένιον πεδινὸν, ϗ ὄρειον: in *Latin*, *Parthenium ſylveſtre*, *Matricaria agreſtis*, *Febrifuga agria*; and in *Engliſh*, *Wild* or *Field Fetherfew.*

Naked-flowred Fetherfew.



II. *The Kinds.* This is the ſecond Species of *Fetherfew*, and is twofold, *viz.* 1. *Parthenium, vel Matricaria bullatis floribus aureis*, Naked Fetherfew. 2. *Parthenium, vel Matricaria grati odoris, Matricaria altera Camerarii, Arthemeſia tenuifolia odorata Tabernmontani, Matricaria odorata Badani.* Sweet-ſcented Fetherfew.

III. The Deſcriptions. *The firſt, or* Naked Fetherfew, *has a buſhy fibrous Root, like to the others, from whence ſpring up Leaves and Stalks, ſpreading themſelves forth into many Branches, not at all differing from the former in Shape or Manner of Growing.* At the tops of the Stalks and Branches grow the Flowers, not like the former; for this is a Head of naked yellow Thrums, without any Pale or Border of white Leaves, as are in the others, which is the only thing by which this kind differs from the other two, and for which Reaſon it is called *Naked Fetherfew.*

Sweet-ſcented Wild Fetherfew.

IV. *The ſecond, or* Sweet-ſcented Fetherfew, *has a buſhy fibrous Root, like the firſt* Common kind, *and in its Leaves, Stalks, Branching forth and Flowers, it differs not at all from the firſt, being in all things ſo like, that there can no Difference be perceived between them, till you come to ſmelling to it,* and then you will find it to be of a more pleaſant and odoriferous Smell, which ſo continues in the kind, and is not altered, nor made ſo by Art, but is the Work of Nature only; nor yet degenerates from this Excellency by any Accident or Caſualty whatſoever.

V. *The Places.* The firſt grows in *Eſſex*, and was there found growing by one Mr. *William Coys.* The ſecond has been found Wild in many places of *England*, (as well as the former naked kind.) *Camerarius* alſo ſays, that it grows in an Iſland called *Ilva*, in the *Levant Seas*: but they are alſo (both of them) nurs'd up with us in our Gardens.

VI. *The Times.* They flower both of them in *June*

June and *July*, and the Seed ripens in the mean time.

VII. *The Qualities, Specification, Preparations and Virtues* of both theſe, are the ſame with the two former in the Chapter juſt aforegoing, ſo that no more need be ſaid thereof in this place: but this is to be noted, That theſe two Plants fall no ways below the other two, in their Power, Force and Efficacy.

CHAP. CCLI.

Of FENNY-STONES, *OR,* MARSH-PALMS.

I. *THE Names.* We know of no *Greek* Name belonging to them: but in *Latin* they are called, *Serapias, vel Orchis paluſtris*, and *Orchis palmata paluſtris*: in *Engliſh*, *Fenny-ſtones*, and *Palmed Fenny-ſtones*, or *Marſh-Palms.*

II. *The Kinds.* There are ſeveral kinds of them, as, 1. *Serapias vel Orchis palmata paluſtris latifolia*, Fenny or Marſh handed Stones with broad Leaves. 2. *Serapias vel Orchis palmata paluſtris Leptophylla*, Thin-leav'd Fenny or Marſh handed Orchis or Stones. 3. *Serapias vel Orchis palmata paluſtris lævifolia*, Marſh or Fenny handed Orchis ſmooth-leav'd. 4. *Serapias vel Orchis palmata paluſtris maculata*, Spotted Marſh or Fenny handed Stones. 5. *Serapias vel Orchis palmata paluſtris Dracontias*, Marſh or Fenny Dragon handed Orchis or Stones. 6. *Palma Chriſti paluſtris maxima*, The greateſt Fenny handed Stones. 7. *Palma Chriſti paluſtris radice repente*, Creeping Fenny or Marſh Palms.

III. The Deſcriptions. *The firſt, or* Marſh handed Stones with broad Leaves, *has a Root which has long Diviſions at the bottoms of the Hands; the top of the Root is thick and knobby, divided into Fingers, like thoſe of* Palma Chriſti, *of which this may be ſaid to be a kind.* From this Root riſe up thick, fat and ſpongy Stalks, ſet with broad, ſmooth, green Leaves, like thoſe of *Plantane*, but much longer: theſe are growing in order upon the Stalk, even from the bottom to the top or beginning of the Spike of Flowers, growing ſmaller as they grow higher, and appear nearer to the Spike. The Tuft or Spike of Flowers is large, conſiſting of many ſmall hooded Flowers, of a ſomewhat whitiſh or pale bluſh color, ſpotted within with deep purple Spots, the backſides of which Flowers are of a *Violet* color mixt with purple: and every Flower, at its riſing up from the Stalk, has a ſmall greeniſh Leaf accompanying it.

IV. *The ſecond, or* Thin-leav'd Fenny handed Stones, *has Roots exactly like to thoſe laſt deſcribed; the Stalk is alſo like; but it differs from the former ſomething in the Leaves*, for in this Plant they are ſmaller, being neither ſo broad nor yet ſo long, ſometimes ſpotted, but more uſually without; neither is the ſpiky Tuft of Flowers ſo large or long, tho' they are thick ſet, like the firſt, nor has it ſo many green Leaves or long Leaves mixed with, or growing between the Flowers, which are of a *Violet* purple color, but not altogether of ſo dark a purple as the former are.

V. *The third, or* Fenny or Marſh handed Stones ſmooth-leav'd, *has a handed and fingred Root, with ſome Strings adjoined to the upper parts of them, like unto the two others: the Stalks are much alike: the Leaves are like the laſt, but ſmaller and narrower, and without Spots:* and the Flowers are of a whitiſh color, but more purely white; the Flowers and the whole Plant being in Magnitude, Shape or Form, and Manner of Growing, but little differing from the others.

VI. *The fourth, or* Fenny or Marſh handed Stones ſpotted, *has a Root faſhioned like a Hand, with ſome Strings faſtned to the upper parts thereof:* from the Head of which Root riſes up a fair ſtiff Stalk, armed with large Leaves, very notably daſht with blackiſh Spots, clipping or embracing the Stalk round about. At the top of the Stalk ſtands a fair Tuft or Spike of purple Flowers, with many green Leaves mingled among the ſame, which makes the Buſh or Tuft much greater. The Seed is nothing elſe but Duſt, as it were, (like all the reſt of the kinds) and is contained in ſmall twined Veſſels, which Veſſels are not peculiar to this alone, but common to moſt of the other *Orchides.*

VII. *The fifth, or* Fenny or Marſh Dragon-handed Stones, *has cleft or divided Roots, like Fingers, much like unto the Roots of* Palma Chriſti, *of which this is a kind*; and from this Root riſes up a Stalk of a foot high, ſet here and there with very fair *Lilly* like Leaves, of a red color, and which do clip or embrace the Stalks almoſt round about, like the Leaves of *Thorow-wax.* At the top of the Stalk grows a fair Buſh of very red Flowers, among which Flowers do grow many ſmall ſharp-pointed Leaves. The Seed is a thing hard or difficult to be obſerved, being much like Duſt, which is blown away with the Wind.

VIII. *The ſixth, or* Greateſt Fenny handed Stones, *commonly called*, Great Fenny or Marſh Palma Chriſti, *has handed Roots, like to the others, from which riſes up a large Stalk, ſometimes to the height of three feet:* the Leaves are much like to thoſe of the former kinds of *Fenny-ſtones* before deſcribed; and the Growing on a large ſpiky Head are of an elegant purple, with little Hoods, like the top of an Helmet; whence *Gemma* called the Plant, *Cynoſorchis*

[*Conopſæa*, and *Macrocaulos*, from its height.] Theſe Flowers ſmell ſweet, and are ſucceeded by Seed, like that of the reſt of the Kindred.

IX. To theſe *Gerard* gives us another, which he calls, *Palma Chriſti (paluſtris) radice repente*, Creeping Fenny or Marſh Palm, *or* Creeping Palma Chriſti: *it has creeping Roots, without Teſticles, which are many and long, creeping far abroad in the Ground, contrary to all the reſt of the* Orchides; *which Roots are of the Bigneſs of large* Wheat *Straws, in Subſtance like thoſe of* Soap-wort; from the which do immediately riſe four or five broad ſmooth Leaves, like unto *Small Plantane* Leaves: from among which ſhoot up a ſmall and tender Stalk, at the top of which grows a pleaſant ſpiky Head of Flowers, of a whitiſh color, ſpotted on the inſide with little bloody Specks, which leave Veſſels containing very ſmall Seed.

X. *The Places.* They all of them grow in fenny Grounds, or in marſh or moory Grounds, alſo in ſhadowy Woods or Groves which are watery and marſhy, and often over-flowed with Water. The ſixth, or *Great Palmi Chriſti*, delights to grow in Grounds of an indifferent Temper, not too moiſt nor too dry. The ſeventh, or *Creeping Palme*, was found by Mr. *Robert Abbot* of *Biſhops Hatfield*, in a boggy Grove, where a Conduit-head does ſtand, which ſends Water to the then *Queens-houſe* in the ſame Town. It alſo grows plentifully in *Hampſhire*, within a Mile of *Petersfield*, in a moiſt Meadow, called *Wood-mead*, near the Path leading from *Petersfield*, toward *Beryton*.

XI. *The Times.* The firſt flowers more early than the *Ordinary Orchis* or *Cynoſorchis*. The ſecond flowers after the former: but they all flower from the latter end of *April* thro' all *May* and *June*, ſome of them flowering more early, as the firſt and ſecond kinds; and otherſome more late.

XII. *The Qualities, Specification, Preparations and Virtues*, are the ſame with thoſe of the *Cynoſorchis* or *Dog-ſtones*, which we have declared at large in *Chap.* 226. aforegoing, ſo that no more need be ſaid thereof: yet this is to be noted, That theſe *Fenny-ſtones* are not of ſo great Power and Force as are the *Cynoſorchis*, and ſeveral other kinds of the *Orchides* or *Teſticuli*, of which we ſpeak in their proper places.

CHAP. CCLII.

Of FENNEL Common.

I. THE *Names.* It is called by the *Arabians*, *Raienigi:* in *Greek*, Μάραθον: in *Latin*, Fœniculum; and in *Engliſh*, *Fennel.*

II. *The Kinds.* There are four principal kinds of *Fennel*, *viz.* 1. *Fœniculum vulgare*, of which in this Chapter. 2. *Fœniculum dulce*, Sweet Fennel, of which in Chap. 253. 3. *Fœniculum ſylveſtre*, Wild Fennel, of which in Chap. 254. 4. *Peucedanum*, Hog or Sow Fennel, of which in Chap. 255. following.

III. Of the *Vulgar* or *Common Garden Fennel*, there are two ſorts, *viz.* 1. *Fœniculum majus vulgare*, The greater common Garden Fennel. But *Cæſalpinus* calls it *Fœniculum ſylveſtre: Camerarius in horto* ſays, that ſome took it to be *Hippomarathrum*; but that was a Miſtake, as we ſhall ſhew in Chap. 254. 2. *Fœniculum minus*, *Fœniculum ſemine rotundo minore*, Small Fennel, *or* Fennel with a ſmaller round Seed.

Fennell.

IV. The Deſcriptions. *The firſt, or* Common Garden Fennel, *has a Root which is long and white, running down deep into the Ground, ſpreading it ſelf out into ſeveral Branches: from this Root riſe up divers round ſtiff Stalks, four or five feet high, which ſpread themſelves out (at many of their Joints) into divers Branches of long Stalks, of fine, ſmall, long, fibrous Leaves, ſmelling ſomewhat ſtrong, but not unpleaſant:* and at the tops, on ſeveral Branches, there are Tufts or Umbles of ſmall yellow Flowers, which turn into ſmall, long, roundiſh-cornered, bitteriſh, greeniſh Seed, two always together, as in the other Umbelliferous Plants; which being ripe, and once dryed, become of a ſad grey color. Of this Plant there are truely two ſorts, (tho' one Deſcription does ſerve them both;) the one wholly with green Leaves; the other with reddiſh Leaves, or with reddiſh green Leaves, they not differing one from another in any thing elſe.

V. *The ſecond, or* Small Fennel with ſmaller round Seed, *in its Roots, Stalks and Leaves differs not from the former, but only that they are every way leſs, being much lower than it*; and that the Umbles at the Heads of the Stalks are white, and the Seed which follows is leſs than the ordinary ſort, being more like to *Carum* or *Caraway* Seed: the whole Plant, both in Smell and Taſte, and in its Form and Manner of Growing, is the ſame with the other *Common Garden kind.*

VI. *The Places.* Theſe Plants grow in all hot Countries, in *Aſia*, *Africa* and *America*, and in ſome of the *Weſt India* Iſlands, 'tis ſaid, they feed their Cows with it: but with us in *England* it grows only in Gardens.

VII. *The Times.* They flower in *June*, *July* and *Auguſt*, and the Seed is ripe not very long after.

VIII. *The Qualities.* According to *Galen*, it is hot in the third Degree, and dry in the firſt: it is admirably Aperitive, Inciſive, Anodyne, Carmina-

tive

tive, Digeſtive, Diſcuſſive, Suppurative and Traumatick; Neurotick, Stomatick, Pectoral and Hyſterick; Emmenagogick, Sudorifick, Alexipharmick, Analeptick, Galactogenetick and Spermatogenetick.

IX. *The Specification.* It is peculiar for healing Ulcers in the Lungs, helping againſt the Straugury, and to open Obſtructions of the Womb and all the Urinary Paſſages, ſtrengthening the Tone of all thoſe Parts.

X. *The Preparations.* You may have therefrom, 1. *The whitned Leaves and Stalks.* 2. *A liquid Juice.* 3. *An Eſſence.* 4. *A Decoction of Leaves and Roots.* 5. *A Syrup.* 6. *A Pouder of the Seed.* 7. *An Oil by Inſolation.* 8. *A Balſam of the Leaves and Roots.* 9. *A Cataplaſm of the Leaves.* 10. *A diſtilled Water from the Herb or Seed.* 11. *A Spirituous Tincture of the Seed.* 12. *An Acid Tincture of the ſame.* 13. *An Oily Tincture thereof.* 14. *A Saline Tincture of Herb, Root and Seed.* 15. *A Spirit.* 16. *An Oil diſtilled.* 17. *A Balſam.* 18. *Poteſtates or Powers.* 19. *An Elixir.* 20. *A fixed Salt.* 21. *A Liquor of Fennel.* 22. *The Gum.*

The Virtues.

XI. *The whitned Leaves and Stalks.* They are whitned after the ſame manner as you whiten *Curled Endive*, or *Sallery* or *Smallage* Stalks, *&c.* being thus whitned, the *Italians* are ſaid to take great delight in eating them as a Sallet, for then they are very tender, and pleaſant to the Taſte: they comfort and warm a cold Stomach, help to digeſt crude flegmatick Humors bred from viſcous Meats. *Fennel* being thus eaten, it breeds Milk in Nurſes Breaſts, provokes Urine, and encreaſes the Seed; opens Obſtructions, expels Wind, and provokes Urine. The conſtant eating of this whitned *Fennel* for ſome conſiderable time, I have known to cure a vehemently ſtinking Breath, and to make it as ſweet as theirs which never ſmelt amiſs.

XII. *The liquid Juice.* Mixt with a Glaſs of Wine or Ale, and ſo taken by Nurſes, it encreaſes Milk in their Breaſts, expels Wind, provokes Urine, eaſes the Pains of the Strangury and Stone, expelling all the præternatural Matter in the Urinary Parts. It is ſaid to break the Stone, more eſpecially if it is made of a gritty Subſtance. Doſe three or four ſpoonfuls Morning, Noon and Night in any fit Liquor.

XIII. *The Eſſence.* It has all the Virtues of the Juice; beſides which, it encreaſes Seed, prevails againſt the Colick, eaſes the Tortions of the Bowels or Griping of the Guts from acrid or ſharp Humors, ſtrengthens the Stomach, and cauſes a good Digeſtion. It opens all the Obſtructions of Liver, Spleen and Gall, and thereby much conduces to the Cure of all ſuch Diſeaſes as ariſe from thoſe Cauſes, as windy Swellings of the Spleen, Hepatick-flux, Yellow Jaundice. Being dropt into the Eyes, it cures almoſt all Diſeaſes affecting that Part. It opens Obſtructions of the Womb, and provokes the Courſes effectually. Doſe three or four ſpoonfuls.

XIV. *The Decoction of the Leaves and Roots, or Seeds, in Wine.* Tho' this has not altogether ſo much Force as the Juice and Eſſence, yet it is very good for all the ſame Intentions, and is much more uſed than either of them, becauſe it is pleaſanter; but then it muſt be taken in a much greater Doſe. It is an excellent thing to open all Obſtructions in the whole Body, to cleanſe the Blood, to ſtop the Hiccough, and take away Nauſeating, to provoke Urine and the Menſtrues, to amend the ill Color in the Face after a long Sickneſs, and to cauſe a good Habit thro' the whole Body. If ſuch as are grown over fat ſhould often drink of it, it would leſſen their Fat, abate their Fleſh, and much remove their Unweldineſs, making them more nimble, agil and pleaſant.

XV. *The Syrup.* It is one of the greateſt of Pectorals; for as it is a powerful Opener of Obſtructions of the Lungs, and Diſſolver of their Tartar, ſo it famouſly cauſes Expectoration, and gives eaſe in Aſthma's, Coughs, Colds, Hoarſeneſs, Wheezing, Shortneſs of Breath, Difficulty of Breathing, and other like Diſaffections of thoſe Parts. If herewith you ſweeten well either the Juice, Eſſence or Decoction, and let the Patient take two or three ounces three or four times a day, it cures Ulcers of the Lungs, or any Sourneſs of the Stomach, and much reſtores in Conſumptions: in which laſt caſe it is good for the Patient to uſe a Milk-Diet, and to drink a quart of Milk warm from the Cow, well ſweetned with this Syrup, every Morning faſting; as much Milk ſo ſweetned at Eleven before Noon; another quart at Five in the Afternoon; and laſtly, another quart at Bed-time in like manner. If the Patient cannot drink a whole quart, let him drink as much as he can; and continue this Courſe for ſeveral Weeks, or till he recovers; by this Method I have known ſeveral perfectly reſtored out of very deep Conſumptions.

XVI. *The Pouder of the Seed.* It ſtrengthens the Stomach, gives eaſe in the Colick, opens Obſtructions, and helps Shortneſs of Breath. You may give it Morning and Evening from half a dram to two drams in any convenient Vehicle. The conſtant Uſe of it wonderfully ſtrengthens the Sight.

XVII. *The Oil by Inſolation or Boiling.* It is Anodyne, and eaſes all ſorts of Pains in any Part of the Body, coming from a cold and moiſt Cauſe. It gives eaſe alſo in Inflammations, by gently diſcuſſing ſome part of the thinner Matter. If it is an Apoſtem, which will come to Suppuration, it haſtens it, and brings it as much as may be to a point. It eaſes the Gout and other Pains of the Joints and Nerves.

XVIII. *The Balſam of the Leaves and Roots.* It is one of the greateſt of Vulneraries, and cures ſimple Wounds at one Intention, for the moſt part at one Dreſſing. I am apt to believe, that this Balſam, for the Curing of Wounds and Ulcers, *&c.* is not inferior to any Balſam made of the greateſt Wound-Herbs, as *Sanicle*, *Self heal*, *Clowns Wound-wort*, *All-heal*, &c. It digeſts ſordid and eating Ulcers, cleanſes, incarnates, dries and heals after a very admirable manner.

XIX. *The Cataplaſm.* It gives preſent eaſe in the Gout, being applied, as alſo diſcuſſes and heals any ſimple Contuſions; and applied as hot as can be endured to the Sides or Hypochonders, it eaſes the Pains of the Sides, takes away Stitches, and gives Relief to the Diſtempers of the Spleen and Parts adjacent.

XX. *The diſtilled Water.* It is of good Uſe, as a Vehicle, to convey other Preparations of this Plant in, and has all the Virtues of the aforegoing Preparations, but in a much lower degree: it is uſed to be dropt into the Eyes againſt Ophthalmies or Inflammations and Blood-ſhot, as alſo againſt hot and ſharp Rheums, with which the Eyes are commonly afflicted, which cauſes Clouds, Films, Pearls, *&c.* to breed in them; but it is better for all thoſe Purpoſes, if white Sugar-Candy or clarified Honey be diſſolved therein; then if ulcerated, it cleanſes the Ulcer or Sore, prevents the Afflux of Rheum, dries and heals them.

XXI. *The Spirituous Tincture of the Seed.* It is famous againſt Pains, Aches and Sickneſs of the Stomach, Pains of the Spleen and Womb; it gives eaſe

eaſe in the Colick, and prevails againſt the Yellow Jaundice. You may take from two drams to four in a Glaſs of White Port Wine, at time of Extremity, otherwiſe Morning and Night, ſo long as Need requires. Bathed upon places affected with the Gout or Sciatica, Cramps or Convulſions, in a ſhort time it gives Eaſe and Relief.

XXII. *The Acid Tincture.* It cures præternatural Vomitings, Nauſeating of Food, want of Appetite and Digeſtion, the Colick and the Gout, when by conſent it afflicts the Stomach; it warms and wonderfully corroborates that Bowel, reſtoring and ſtrengthening its Tone, tho' very much depraved. It is powerful againſt the Bitings of mad Dogs, Vipers, Rattle-Snakes, and all other Serpents and venomous Creatures whatſoever: and after a ſingular manner prevails againſt Aſthma's, and all ſorts of Obſtructions of the Lungs, inciding, diſſolving and cauſing an Excretion of the tartarous Matter affecting them. Doſe ſo many drops as to make the Vehicle gratefully pleaſant in all the Patient drinks.

XXIII. *The Oily Tincture.* It prevails againſt Cramps and Convulſions of the Nerves; is powerful againſt the Colick, and all Obſtructions of the Reins, Ureters and Bladder, whatſoever; breaking any gritty Stone in thoſe Parts, and cauſing it, as alſo Sand, Gravel and tartarous Matter to be expelled by Urine. Bathed upon the Back-bone, and upon the Parts affected with the Palſy, it is very effectual in the Cure of that Diſeaſe, but then you muſt anoint therewith Morning and Night, rubbing it very well in for a conſiderable time. It gives preſent eaſe in the Gout and Sciatica proceeding from a cold Cauſe, and by a conſtant Application thereof many times cures thoſe Diſeaſes. Inwardly, to give Relief againſt Stone and Strangury, you may take from ten drops to thirty in any fit Vehicle.

XXIV. *The Saline Tincture.* It is good againſt Strangury, Stone and Gravel, being given a dram or more at a time in White *Lisbon* Wine. Outwardly bathed upon Parts affected with Herpes, Tettars, Ringworms, Pimples, Redneſs, Yellowneſs, Tawnineſs, Blackneſs or Blewneſs of the Skin, as alſo Scurff, Morphew, Scabs, Leproſy, Freckles, Lentils, *&c.* it quickly takes them away and cures them, being uſed two or three times a day.

XXV. *The Spirit from the Seed, or Juice fermented.* It is a ſingular Stomatick and Cordial, it refreſhes, comforts and ſtrengthens the Stomach after an admirable manner, taking away Vomiting, Nauſeating, want of Appetite and Indigeſtion, *&c.* It chears the Heart, revives the Spirits, fortifies the whole Habit, and makes the Body able to withſtand Diſeaſes. It ſingularly expels Wind, and gives eaſe in all griping Pains in the Stomach or other Viſcera. It may be taken to one ſpoonful or two, either alone of it ſelf (being dulcified) or mixt with a Glaſs of Wine, every Morning faſting.

XXVI. *The Oil diſtilled out of the Seed.* It has all the Virtues of the Juice, Eſſence, Decoction, Syrup, Pouder, Tinctures and Spirit, and much exceeds them all in its Potency and Might of its Operation. It may be given from four drops to twelve, ſixteen or twenty, according to the Age, and as the Neceſſity of the Occaſion may require. In the uſing of it, drop it firſt into white Sugar, and mix them well together; then mingle all in a Glaſs of Wine, and ſo drink it off. This may be done Morning and Evening, or at the time of any Paroxyſm, ſo long as you ſee need. Outwardly anointed upon the Wound or Puncture of a Nerve, it gives immediate Eaſe and Relief; anointed down the Back-bone, and upon the Parts affected with a Paralyſis Morning and Evening, it wonderfully reſtores the Paralytick Parts, and in a little time after compleats the Cure.

XXVII. *The Balſam.* This Balſam is two-fold, 1. *Balſamum Vulnerarium.* It is thus made: *Take of Balſam Capivi three ounces, Balſam of Peru, Beef-ſuet, of each an ounce and half, Chymical Oil of Fennel-ſeed one ounce, fine Bees-wax half an ounce: melt, mix, and make a Balſam.* It is one of the beſt of Balſams for green Wounds, eſpecially thoſe of the Nerves and Tendons, and commonly cures ſimple green Wounds at once Dreſſing. 2. *Balſamum Pectorale.* It is thus made: *Take choice Oil of Nutmegs by Expreſſion four ounces, Balſam of Tolu, Chymical Oil of Fennel-ſeed, of each one ounce, Balſam of Peru and Capivi, of each half an ounce; melt, mix, and make a Balſam.* It is an excellent Pectoral; and being taken to the quantity of a Nutmeg at a time, it not only helps againſt Colds, Coughs, Catarrhs, Hoarſeneſs, Wheezing, Shortneſs of Breath and Difficulty of Breathing, but alſo cures Ulcers in the Lungs. It may be taken Morning and Evening. It alſo heals, by outward Application, Wounds of the Nerves and Tendons, and eaſes and takes away any Ach or Pain proceeding from a cold Cauſe, in any Part of the Body, being anointed upon the Parts affected Morning and Evening.

XXVIII. *The Poteſtates or Powers.* They have all the Virtues of Juice, Eſſence, Decoction, Tinctures, Spirit and Oil, and are alſo more volatile and ſubtil than any of them; for which Reaſon they more effectually pierce any Part they are applied to. Inwardly you may give from one dram to three in any ſpecifick Vehicle. Outwardly you may bathe any pained, numbed or Paralytick Part with the ſame twice a day, rubbing the ſame well in.

XXIX. *The Elixir.* As this is the Powers ſtill more fortified, ſo it is more efficacious in Operation, and may be given to all the Intentions and Purpoſes for which the Poteſtates are given. You may give from one dram to two in a Glaſs of Wine, Morning and Evening; and in caſe of a Paroxyſm or any great Neceſſity, at the ſame time. It is one of the greateſt of all Pectorals, and therefore profitable againſt all Diſeaſes of the Lungs from a cold and moiſt Cauſe; and being given in a moſt vehement Colick, it gives immediate Eaſe; provokes Urine, and prevails againſt the Strangury.

XXX. *The fixed Salt.* It admirably abſorbs Acids in the Stomach and Lungs, deſtroys the Tartar of the Lungs, Reins, Bladder and Joints, and therefore prevails againſt all ſuch Diſeaſes as proceed from that Cauſe. It is alſo peculiar in opening all Obſtructions of the Viſcera, and in particular thoſe of the Womb. Doſe from ten grains to a ſcruple or more in any fit Liquor.

XXXI. *The Liquor of Fennel.* It is made two ways: 1. Take the green Stalks of *Fennel* towards the end of Summer, and whilſt green put one of their ends into the Fire, which hold there for a little while, ſo will a certain Liquor drop out therefrom at the other end, which receive and keep for Uſe. It is a very good thing for the Eyes, for it ſtops any Rheum or Defluxion, heals Blood-ſhot, and clears the Sight from any Miſts, Clouds or Films. 2. Cut a hole in a green *Fennel* Stalk as it grows, about a foot or more from the Ground, near the upper part of the Joint, and put thereinto white Sugar-Candy in fine pouder, as much as it will hold, then ſtop it cloſe up with Wax, and Leather tied over it, ſo as no Rain or Wet may fall into it: when it has remained three or four days or more, place a good piece of ſoft Wax a little below the lower Joint of the ſame Internode, ſo formed as that it may make a little hollow Gutter; and a little above this Gutter, at the lower part of the Joint, cut another hole, ſo will a Liquor diſtil therefrom,

which, by means of the Gutter, you may receive in a Veſſel, which keep for Uſe. This has all the Virtues of the former, and full as beneficial for ſore, blood-ſhot, dim, cloudy and blemiſhed Eyes as the other, being dropt into them three, four, five or ſix times a day, as you ſee need requires.

XXXII. *The Gum of Fennel*, or *its Inſpiſſate Juice.* It has all the Virtues of the liquid Juice, and may be given from one dram to two, diſſolved in any ſpecifick Liquor or Wine. If this Gum or Juice is diſſolved in ſome of the diſtilled Water, and ſweetned a little with white Sugar-Candy, and it is given to Nurſes to drink, it breeds much Milk in their Breaſts: and if it is dropt into the Eyes, it very much clears the Eyes from Clouds, Miſts, Films, Blood-ſhot, and other like Matters which obfuſcate the Sight. In *Southern* Climes, and very hot Countries, if *Fennel*-Stalks are wounded whilſt they are green and growing, the Juice will exſudate and become this natural Gum: but in our cold Countries, it yields not to this Operation; therefore we are obliged to make the Juice by Expreſſion; and then to inſpiſſate it by a gentle Evaporation on a Sand Heat, till it is perfectly dry.

CHAP. CCLIII.

Of FENNEL Sweet.

I. *THE Names.* It is called in *Greek*, Μάραθον γλυκεῖον: in *Latin*, *Fœniculum dulce Matthioli*, *Fœniculum vulgare Lugdunenſis*; and in *Engliſh*, *Sweet Fennel.*

II. *The Kinds.* It is the ſecond general Species of the *Fennels*; but differs in Sweetneſs according to the Country in which it grows.

Sweet Fennel.

III. The Deſcriptions. *This in its Roots, Stalks, Leaves, Flowers and Manner of Growing, is perfectly like our* Common Fennel, *excepting that it neither in Foreign Climates, where it grows naturally, nor yet here with us in* England, *does grow ſo large, or riſe to ſo great a height as the* Common large Garden kind *does: and with us it with ſome difficulty endures the Hardneſs of our Winters:* but the Seed of this is much larger and longer than that of the *Common kind*, yellower, and very much ſweeter in Taſte, coming near to the Sweetneſs of *Aniſeed*, which ſo continues in hot Countries, but holds not out any long time to that Perfection; neither as to its Magnitude, Color or Sweetneſs; but decaying yearly, does at the third Years Sowing yield as ordinary Seed as the *Common kind.*

IV. *Nota.* 1. From this you may obſerve, that it is the Clime and change of Soil which cauſes this Alteration, making it either larger or ſmaller, longer or ſhorter, yellower or paler colored, and makes it to be either ſweeter or bitterer in Taſte; which Change of Accidents has made ſome think, that there were divers ſorts of this *Sweet kind*, whereas indeed there is no more than one.

V. *Nota.* 2. There is a kind of *Fennel*, which the *Italians* call *Carduus Fennel*, and which they would make different from this *Sweet kind*; but it is no ſuch thing, for it is only the Art of ordering it, which ſeemingly makes the Difference from this *Sweet*, which is done by Tranſplanting and Whitening it, by which means the Leaves are made to grow much more thick and buſhing together than the *Ordinary*; the Whitning of it alſo giving it a ſweeter Reliſh, a pleaſanter Taſte, and a ſhorter Criſpneſs in eating.

VI. *The Places.* It grows univerſally in almoſt all hot Countries; and flouriſhes well enough in our Gardens, being ſown with Foreign Seed every Year, where the Seed it ſelf comes to Perfection; but you ought to ſow every Year new Foreign Seed, not the Seed of the *Engliſh* Production, becauſe that is very apt to degenerate.

VII. *The Times.* It flowers and ſeeds with us in *July* and *Auguſt*, and if it is an early and warm Spring, towards the latter end of *June*; and the Seed is ripe in *Auguſt* or *September.*

VIII. *The Qualities, Specification, Preparations and Virtues* of this, are the ſame with the *Common Fennel* in the former Chapter, ſaving that this is accounted the more excellent and efficacious of the two; and therefore to the Diſcourſe and Sections of the former Chapter I ſhall wholly referr you.

CHAP. CCLIV.

Of FENNEL Wild,

OR,

HORSE-FENNEL.

I. *THE Names.* It is called in *Greek*, Μάραθον ὄρειον, ἢ Ἱππομάραθον: in *Latin*, *Marathrum agreſtis*, *Fœniculum ſylveſtre*, *Hippomarathron*; and in *Engliſh*, *Wild Fennel*, and *Horſe Fennel.*

II. *The Kinds.* It is the third Species of *Fennel*, and is threefold, *viz.* 1. *Fœniculum ſylveſtre communis*, *Fœniculum erraticum Matthioli*, The vulgar or

or common Wild Fennel. 2. *Fæniculum ſylveſtre Creticum*, *Hippomarathrum Creticum*, *Honorii Belli*, *Platecumino Creticorum*, Great or Horſe Fennel of Candy. 3. *Hippomarathrum ſphærocephalum*, Great round-headed Horſe Fennel. *Anguillara* ſuppoſes the firſt of theſe to be *Hippomarathrum verum*.

III. The Deſcriptions. *The firſt*, *or* Common Wild Fennel, *has a Root like to the* Common Garden kind, *and grows up with great Stalks, but fewer than it, having alſo but few Leaves, and thoſe very thinly ſet thereon, but ſomewhat ſtiffer or harder in handling, and ſhorter alſo.* At the tops of the Stalks grow ſmall Umbles of yellow Flowers, not much unlike the *Common*, ſaving that they are leſſer, which being paſs'd away, the Seed follows, being ſmall and a little roundiſh.

IV. *The ſecond*, *or* Great Horſe Fennel, *has a great whitiſh Root, not much unlike the former, from whence ſprings up a round, but creſted Stalk, three, four or five feet high, about the Thickneſs of ones middle Finger or Thumb, having very fine Leaves thereon, but ſhorter than the* Ordinary ſort. This Stalk is divided into ſeveral Branches, bearing at their tops Tufts or Umbles of yellow Flowers, which being paſs'd away, there comes in their places great, large, and almoſt round Seed. This is the Plant which *Bellus* makes mention of in his firſt Epiſtle to *Cluſius*, which is extant in the end of his *Hiſtory of Plants*, whoſe Seed, as he there ſays, is as large as thoſe of *Cachrys* or *Canchrys*, Herb Frankincenſe, nearly as big as *Hordea Decorticata*, or Hull'd Barley.

V. *The third*, *or* Great round-headed Horſe Fennel, *has a Root which is long and white, and endures many Years; from whence riſe up large Stalks, four or five feet high, with* Fennel *like Leaves, and ſpreading themſelves forth towards the tops into many Branches.* At the tops of which Branches grow round, Globe like Umbles of Flowers, of a purpliſh *Violet* color; which being paſs'd away, there comes in their places large *Fennel* like Seeds, but of a very ſtrong Smell, almoſt ſtinking. This Plant is taken notice of by *Alpinus libro de Exoticis.*

VI. *The Places.* They all grow naturally in hot places, as *Turkey*, *Barbary*, *Spain*, *Italy*, &c. The firſt was brought to us out of *Spain* by *Bocl*; and the reſt grow well in our Gardens, being raiſed from the Seed brought to us out of their native Countries.

VII. *The Times.* They all flower in the end of Summer and beginning of Autumn, as in *July*, *Auguſt* and *September*; and the Seed is ripe not very long after.

VIII. *The Qualities*, *Specification*, *Preparations and Virtues* of all theſe, are the ſame in all reſpects with thoſe of our *Common Engliſh Garden Fennel* in *Chap.* 252. aforegoing; ſo that nothing more need be ſaid of them. Authors ſay, that theſe *Wild Fennels* are hotter and ſtronger than the *Common Garden* or *Sweet Fennel*, and therefore more powerful againſt the Stone; but not ſo effectual to encreaſe Milk in Nurſes Breaſts, becauſe dryer in Quality. *Bellus* ſays, that in *Candia* they uſe the Seed of the ſecond ſort to Dye their Hair yellow.

CHAP. CCLV.

Of FENNEL Hogs,

OR,

SULPHUR-WORT.

I. *THE Names.* It is called in *Arabick*, *Harbatum*: in *Greek*, Πευκέδανον: in *Latin*, *Fæniculum Porcinum*, *Peucedanus* and *Peucedanum*; by *Apuleius*, *Pinaſtellus*, (I ſuppoſe from its Pitchy Smell;) and in *Engliſh*, *Hogs Fennel*, *Sow Fennel*, *Hoar-ſtrange* and *Sulphur-wort.*

II. *Names.* Authors make generally three kinds of this Plant, *viz.* 1. *Peucedanum vulgare, Peucedanum Germanicum Lobelii, Peucedanum Tragi, Fuschii, Dodonæi, & aliorum*; *Fœniculum Porcinum, Caules Porcina Tabernæmontani*, Common or Ordinary Hogs Fennel. 2. *Peucedanum Matthioli, Anguillara & aliorum, Peucedanum majus, & majus Italicum Lobelii & Anglicum*, The greater Hogs Fennel. 3. *Peucedanum minus, Peucedanum facie Serpatillæ Lobelii, Peucedanum Pannonicum Clusii*, Small Hogs Fennel: this both *Bauhinus* and *Clusius* suppose to be the *Saxifraga secunda Matthioli.*

III. The Descriptions. *The first, or* Common Hogs Fennel, *has a Root thick and long, sometimes almost as large or thick as a Man's Thigh, black without and white within, of a strong and sulphureous Smell, and full of a yellow Sap or Milk, which being extracted, quickly grows hard and dry, smelling not much unlike to Sulphur or Brimstone, which induced some to call it* Sulphur-wort, having also at the top, towards the upper Face of the Earth, a certain Bush of Hair, of a brown color; from among which the Leaves and Stalks do spring up. From this Root then, springs up a stiff and hard Stalk, full of Knees, Knots or Joints, beset with Leaves, like to *Fennel*, but greater, coming nearer to *Ferula*, or rather like to the Leaves of the *Wild Pine-tree*, (from whence, as also from the Smell, might come the Name *Pinastellus.*) At the tops of the Stalks grow round spoky Tufts, full of little yellow Flowers; which being pass'd away, do turn into broad brown Seed.

IV. *The second, or* Great Hogs Fennel, *has a Root growing great and deep into the Earth, with many other Branches and Fibres about them, having a strong Smell, like hot or melted Sulphur, which being cut, yields forth a yellowish Milk or clammy Juice, almost like to a Gum.* From the Head of this Root proceeds several long branched Stalks, of thick and somewhat long Leaves, three for the most part joined together at a place; among which rises up a crested Stalk, strait, and near as thick as a *Common Fennel* Stalk, with some Joints thereon, and Leaves growing thereat; towards the top of which it spreads it self out into several Branches, and on the tops of the Stalk and Branches grow several Tufts of yellow Flowers, which being pass'd away, there comes somewhat flat, thin and yellowish Seed, twice as large as *Fennel* Seed.

V. *The third, or* Small Hogs Fennel, *which is the* Dwarf kind, *has a Root about the Bigness or Thickness of a Man's Thumb, sometimes greater, sometimes lesser, with a Bush of Hairs at the top, blackish or brownish on the outside and whitish within, with a thick Bark, of a pleasant sweet Taste at first, and afterwards sharp:* the whole Plant is less than the first kind before described, having smaller and shorter Leaves, of a blewish green color, of a little bitter Taste, but almost of no Smell. The Stalk is slender and round, about half a yard high, which spreads it self into several Branches, at the tops of which grow small Tufts of white Flowers in an Umble; which being pass'd away, there succeeds thick short Seed, almost like *Parsley* Seed, but of an Ash color, and of a bitter sharp Taste.

VI. *The Places.* The first grows in many places of this *Kingdom*, as in the salt low Marshes near *Feversham* in *Kent*, and in the Meadows adjoining, where it is found plentifully; also on the *South* side of a Wood belonging to *Waltham*; at the *Nase* in *Essex*, by the Highway side; also at *Whitstable* in *Kent*, in a Meadow near to the Sea side, some time belonging to Sir *Henry Crisp*, and adjoining to his House there. The second grows upon the Sea Coasts of *Italy*, *Spain* and *France*, and is only found with us in Gardens. The third was found on *Vincent's-Rock* by *Bristol*, where *Lobel* gathered it, and some others: as to this third kind, *Gerard* says, *that it grows not above a foot high, and is in Shape and Leaves like to the* True Peucedanum, *or our first kind:* but *Johnson* (the successive Author of that *Herbal*) says *the Stalk is about half a foot high, divided into sundry Branches, crested, broad, bearing at their tops little Umbles of white Flowers, consisting of five Leaves apiece.* The Reason for these various Differences, as to the Height of the Stalk or Plant, I suppose must be from the Variety of the places where it grows, and from the Richness or Poverty of the Soil, which makes many Plants differ in that Respect, making one and the same Herb to be sometimes greater, sometimes lesser.

VII. *The Times.* They all flower in the end of Summer, *viz.* in *July* and *August*, and the Seed is ripe soon after.

VIII. *The Qualities.* *Hogs Fennel* is hot in the second Degree and dry in the third: it is Attractive, Astringent, Cleansing, Anodyne, Carminative and Traumatick or Vulnerary; Cephalick, Neurotick, Pectoral, Hysterick and Arthritick; Cathartick, Ptarmick and Alexipharmick.

IX. *The Specification.* It is singular good against Asthma's, Strangury, Fits of the Mother, and Obstructions of the Spleen.

X. *The Preparations.* You may have therefrom, 1. *A liquid Juice of the Root.* 2. *An Inspissate Juice.* 3. *A Decoction of the Root in Wine or Water.* 4. *A Pouder of the Root.* 5. *A Cataplasm.* 6. *A Balsam.* 7. *A Spirituous Tincture.* 8. *An Acid Tincture.* 9. *An Oily Tincture.*

The Virtues.

XI. *The liquid Juice of the Root.* If it is mixed with a little Vinegar and Rosewater, or with a little *Euphorbium* in fine pouder, it makes a good Errhine

rhine to purge the Head of pituitous, cold and moiſt Humors, and ſo does good to thoſe who are troubled with the Megrim, long and inveterate Headachs, Vertigo, Lethargy, Epilepſy, Apoplexy, Phrenſy, Madneſs, Palſy, and moſt other Diſeaſes of the Nerves and Tendons. Given to two or three ſpoonfuls in a Glaſs of White *Lisbon*, it purges the Belly gently, expels Wind, diſcuſſes the Hardneſs of the Spleen, and eaſes the After-pains of Women in Child-bed.

XII. *The Inſpiſſate Juice.* It has all the Virtues of the Liquid, being diſſolved in Wine or Water, and uſed in the ſame manner: diſſolved in Wine and dropped into the Ears, it eaſes the Pains in them, and put into an hollow Tooth, it eaſes the Pain thereof: diſſolved in Water, and given to ſuch as are troubled with Vapors or Fits of the Mother, it cures them: diſſolved in Wine to the Thickneſs of Turpentine, it cures the Ruptures of Childrens Navels when they ſtick forth, being applied with good Bandage: and given to one or two drams, diſſolved in White *Lisbon* or Port Wine, it provokes the Terms in Women, and facilitates the Birth, brings forth both Child and After-birth.

XIII. *The Decoction of the Root in White* Lisbon *or Port Wine.* It has all the Virtues of the liquid and inſpiſſate Juices, but in a much leſs degree of Efficacy: ſweetned with Honey or Sugar-Candy, it is good for Coughs, Colds, Catarrhs, Aſthma's, Shortneſs of Breath and Difficulty of Breathing, expels Wind, and gives eaſe in the Colick. Doſe four, ſix or eight ounces three or four times a day. It is a good Lotion to waſh moiſt running Sores withal, for it cleanſes and dries them, ſtrengthens the Part, and induces the Healing.

XIV. *The Pouder of the Root.* Being put into inveterate and foul Ulcers, running Sores, and ſuch like of difficult Cure, it cleanſes them throughly, removes any Splinters of broken Bones, or other things in the Fleſh, ſtrengthens the Part admirably againſt Defluxions, dries them, induces their Cicatrizing, and perfectly heals them; and therefore is alſo of extraordinary Uſe to be put into ſuch Ointments and Balſams as are Vulnerary, and applied to the Cure of ſtubborn and rebellious Ulcers, Fiſtula's, and the like. This Pouder being taken to a dram or more, mixed with the Seed of *Garden Rue* half a dram, and taken in Wine and Water mixt, or in Water alone, it allays Vapors from the Spleen and Womb, and cures Fits of the Mother.

XV. *The Cataplaſm.* It is good to be applied to the Bitings of mad Dogs, Vipers, Rattle-Snakes, and other Serpents and venomous Creatures; for by its powerful attractive Force, it draws forth all the Venom and Poyſon from the Part, and ſecures the Life of the Patient: but this is to be underſtood, that it muſt be made of the green Root beaten to a Pulp, and it will be ſo much the better, if half the quantity of *Garlick* be added to it, and alſo that it be applied to the Wound whilſt it is recent, or preſently after it is made. This Cataplaſm draws forth likewiſe Thorns, Splinters, and ſuch like things which are got into and ſtick in the Fleſh; and it is good againſt Pains and Aches of the Joints, or any other Parts, proceeding from Cold and Moiſture.

XVI. *The Balſam.* It is good for cleanſing, drying and healing of old Sores, putrid and fœtid Ulcers, and the like, in any Part of the Body. It is an excellent thing againſt the Sciatica and Gout, whether in Hands, Arms, Legs or Feet; and gives eaſe in any other Pain, as alſo in Tumors or Swellings, bringing Apoſtems to Suppuration in a little time: it warms, comforts and ſtrengthens any Part debilitated thro' Cold, or a Flux of Humors upon the ſame.

XVII. *The Spirituous Tincture* [illegible] powerfully warms and comforts [illegible] cleanſes and incalidates the Womb [illegible] the Birth, and brings both [illegible] It is good againſt fainting, and [illegible] all cold and moiſt Diſtempers of the Head, Brain and Nerves, as Vertigos, Apoplexies, Epilepſies, Lethargies, Convulſions, Palſies, and the like, being inwardly taken, and outwardly applied to the Parts affected. Doſe from one to two drams in ſome ſpecifick Vehicle Morning and Night.

XVIII. *The Acid Tincture.* It cures Naſtineſs and Vomiting, and ſo abſolutely ſtrengthens a weak Stomach, that there are for that purpoſe but few things better. It is a ſingular thing to ſuppreſs Vapors and the Fits of the Mother, expels Wind, and gives eaſe in the Colick. Bathed upon places affected with the Gout for ſome time, it abſolutely cures it. It cauſes a good Appetite and a ſtrong Digeſtion, rectifies the Diſcraſy of the Blood and Humors, purifies them, and abſolutely cures the Scurvy, whether in a hot or cold Habit of Body. Doſe ſo many drops at a time as may make a Draught of Wine, Beer or Ale pleaſantly acid.

XIX. *The Oily Tincture.* It cures Diſeaſes of the extream Parts ariſing from Cold and Moiſture, ſtrengthens the Nerves and Tendons, being anointed upon the Parts affected, and is a truly noble thing againſt Convulſions and Palſies. It opens Obſtructions of the Reins, and cleanſes the Ureters and Bladder from Stones, Gravel, Sand and tartarous or viſcous Matter adhering to them, and gives preſent Relief in the Strangury: it alſo repreſſes the Fits of Agues, being given in ſome fit Vehicle two hours before the coming of the Fit. Doſe from ten to twenty drops or more in a Glaſs of generous Wine, being firſt well mixt with white Sugar, and that Morning and Night.

CHAP. CCLVI.

Of FENUGREEK Garden.

I. *THE Names.* It is called in *Arabick*, *Olla Hebbe* and *Helbe*: in *Greek*, Τῆλις by *Dioſcorides*; Βούκερως *Theophraſti*, a *Cornu humilitudine ſive ſit Capri vel Bovis*, the crooked Seed-Veſſels being ſo like to their Horns; κεραΐτης, ἢ ἀτραγίσκος *Hippocratis*: in *Latin*, *Fœnumgræcum*, *Fœnum Græcum*, for that *Columella lib.* 2. *cap.* 11. ſays the *Greeks* had two times of ſowing it, the one before Winter, to be Fodder for their Cattel, the other in *February*, for Seed; for which Reaſon he calls it, *Siliqua*; *Pliny* calls it, *Silicia*; and *Varro*, *Siliqua*: in *Engliſh* we call it, *Fœnugreek*, which is as much as to ſay, *Greek Hay*.

II. *The Kinds.* They are principally two, *viz.* 1. *Fœnumgræcum ſativum*, Garden Fœnugreek, of which in this Chapter. 2. *Fœnumgræcum ſylveſtre* Wild Fœnugreek, of which in the next.

III. The Deſcription. *It has a Root which is ſmall, and made of many Fibres, periſhing every Year after it has perfected its Seed, before Winter: from this Root ſpring forth ſometimes but one, ſometimes two or three long, ſlender, trailing, hollow, green Stalks, which ſpread themſelves out into ſeveral Branches; on which do grow, at ſeveral ſpaces, many Leaves, almoſt like thoſe of the* Meadow Trefoil, *but rounder and leſſer, green on the upper ſide, but*

tending

tending to an Aſh color or grey on the lower ſide; they are always three ſet together on a foot ſtalk, almoſt round at the ends, and a little dented about the edges. From the Joints of the Stalks, with theſe Leaves, come forth ſmall white Flowers, not much unlike to *Peaſe* Blooms, but much leſs; which being paſs'd away, after them, follow long, ſlender, narrow, flattiſh, crooked Cods or Horns, ſmall or ſharp pointed, in which are contained ſmall, uneven cornered Seeds, of a yellowiſh color; which being dryed, have indeed a pretty ſtrong Smell, but not unpleaſant.

IV. *The Places.* It grows almoſt in all parts of the World: in Foreign Countries they ſow whole Fields of it, for Fodder for their Cattel; but with us it is only ſown in Gardens, and yet it grows as well here as in any other place.

V. *The Times.* In Foreign Nations they ſow it for Seed in the end of *January* or beginning of *February*; but we in *England* ſow it not until *April*; and it flowers with us in the beginning of *July*, and the Seed is ripe in the end of *Auguſt* or beginning of *September*: but for Food for Cattel, it is ſown before Winter, as is before hinted.

VI. *The Qualities.* *Galen* ſays it is hot in the ſecond Degree and dry in the firſt: it is Aperitive, Cleanſing, Aſtringent and Vulnerary; a good Pectoral and Hyſterick; and withal Cathartick, purging away groſs Humors.

VII. *The Specification.* It is peculiar againſt the Dyſentery and other Fluxes of the Bowels, as alſo a Gonorrhœa.

VIII. *The Preparations.* You may have therefrom, 1. *The prepared Pulſe or Seed.* 2. *A Decoction in Wine.* 3. *A Bathe.* 4. *A Meal.* 5. *A Mucilage.* 6. *An Oil.* 7. *A Cataplaſm.* 8. *A Juice from the Leaves.*

The Virtues.

IX. *The prepared Pulſe.* They bury it a while in Earth or Sand till it ſprouts a little, to make it ſweet; then it is carried to the Market to be ſold for Food. This, ſays *Alpinus*, the *Ægyptians* eat; and *Galen* ſays it was uſed (among the *Grecians*) in his time, for that it makes ſuch as eat it to grow fat, and therefore is thought to cure Conſumptions, and to be good for Conſumptive People. Thoſe *Eaſtern* People did uſe to eat it as they did *Lupins*, for that it was more agreeable than *Lupins*, having nothing in its own proper Subſtance which is obnoxious: ſometimes the Pulſe is preſerved in Pickle, and ſo eaten to keep the Body ſoluble.

X. *The Decoction in Wine.* It mollifies the Hardneſs of the Spleen and Womb, and eaſes the Pains of thoſe Parts, opens their Obſtructions, and is good againſt Hypochondriack Melancholy, makes ſmooth the Bowels, and helps the Diſeaſe called *Tenaſmus*, which is a deſire often to go to Stool, without doing any thing. It prevails againſt a Dyſentery or Bloody-flux, and all other Fluxes of the Bowels. Applied to the Forehead with Cloths dipt therein, it ſtops the Flux of Humors to the Eyes, eaſes their Pains, and takes away their Inflammation. Uſed alſo in Clyſters, it is ſaid to be good againſt the Stone, by opening and mollifying the inward Parts. It cures Ulcers in the *Inteſtinum Rectum* and the other Guts: drunk to the quantity of half a pint, it purges and cleanſes the Stomach of groſs and evil Humors. If the Decoction is made with Dates and Honey, it mundifies or cleanſes the Breſt and Lungs, cauſes Expectoration, and heals Ulcers of thoſe Parts. The Decoction being made in Wine or Water, and given inwardly half a pint or more at a time, Morning and Night, for ſome days together, cures a Gonorrhœa. *Alexis.*

XI. *The Bath.* It is made by boiling the Seed in Water till it is broken. If Women ſit in it as hot as they can endure, it opens Obſtructions of the Womb, and (if it be about the time) provokes the Terms. Bathed upon Parts affected with the Gout, it eaſes the Pain thereof, and removes Aches which come of Cold: it is alſo good to waſh the Hair and Head, and to cleanſe it from Scurff, Morphew and dry Scabs. It heals Ulcers of the Womb, ſtrengthens the Part, cleanſes, dries and reſtores its Tone.

XII. *The Meal or Pouder.* Taken to two drams mixed with a little Honey, it is Pectoral, and cauſes an Excretion of many pernicious Humors which lodge in the Stomach and Guts, matutates inward Apoſtems, cleanſes Ulcers in the Breſt and Lungs, and heals them, and eaſes the griping Pain of the Bowels: but in ſome People it is apt to overturn the Stomach or cauſe a Loathing, eſpecially in ſuch as are weak and tender; but troubles not ſuch as have ſtrong Stomachs, as have moſt of your robuſt Country People.

XIII. *The Mucilage.* Applied to the Joints, it gives eaſe in the Gout and other like Pains. Applied to the Forehead with Cloths dipt therein, it ſtops Fluxes of Humors to the Eyes, eaſing their Pains and Inflammations. Taken inwardly with Honey, it is Pectoral, and cauſes an Expectoration of thick, tough and groſs Humors out of the Breſt and Lungs, and is profitable againſt Coughs, Colds, Catarrhs, Aſthma's, and other Diſeaſes of thoſe Parts.

XIV. *The Oil, made by Expreſſion or Inſolation.* *Lobel* ſays it is of more Virtue than will be believed; and that it is good to diſſolve hard Tumors or Kernels, diſcuſſes ſcirrhous Swellings, mollifies the Intrails, Womb and other Parts, removes Scurff and Morphew, and cleanſes, dries and heals Ulcers of the privy Parts.

XV. *The Cataplaſm.* It is always made of the Meal, mixed with other proper Ingredients. If it is made by boiling it to a Thickneſs with Mead, it is

is Emollient, and waſtes away hard Swellings. If it is made with Vinegar and Nitre, it cools all manner of Inflammations, ſoftens hard Tumors, and cauſes them to waſte away, it eaſes the Pain, and ſoftens the Hardneſs of the Spleen. Applied to the running Sores of the Head, called *Ἀχωρες*, *Achores*, it cleanſes, dries and heals them: and if it is alſo applied to weak and feeble Parts, whether ulcerated or not ulcerated, it ſtrengthens them; and if ulcerated, cleanſes, dries and heals them. Made with Linſeed and *Marſh Mallow* Roots, it is an excellent Emollient, and alſo a Maturative, where the Tumor will be brought to Suppuration. The Meal beaten up with Gooſe-Greaſe made into a Peſſary, and put up the Womb, ſoftens the Hardneſs thereof, opens its Obſtructions, and mollifies all the Parts adjacent to it. Made into a Cataplaſm, by boiling it up with the beſt White Wine Vinegar, and applied to the Teſticles, it is an excellent thing to ſoften and abate any hard Tumor or Swelling there, and to eaſe the Pains thereof. Applied alſo to the Joints, it eaſes the Pains of the Gout.
