XVI. *The liquid Juice of the Leaves.* Phyſicians ſeldom uſe any thing of this Plant beſides the Pulſe or Seed; yet Experience has informed us, that if the Juice of the Leaves is taken with Honey, that it purges the Body by Stool from all corrupt and obſtructive Humors, cleanſes the Stomach and Bowels, and by reaſon of its mucilaginous Subſtance, alleviates the Sharpneſs of the Juices, and eaſes the Tortions of the Guts: and by reaſon of its cleanſing and ſcouring Faculty, it expectorates tough and ſharp Humors out of the Breſt and Lungs: this it more effectually Performs, if it is made into a Lohoch, with Pulp of fat *Dates*.

CHAP. CCLVII.

Of FENUGREEG Wild.

I. *THE Names.* It is called in *Greek*, Τήλις ἄγρια: in *Latin*, *Fœnum Græcum ſylveſtre*; and in *Engliſh*, *Wild Fœnugreek*.

II. *The Kinds.* It is twofold, *viz.* 1. *Fœnum Græcum ſylveſtre majus*, The greater Wild Fœnugreek. 2. *Fœnum Græcum ſylveſtre minus*, The leſſer Wild Fœnugreek.

III. The Deſcriptions. *The firſt*, *or* Greater Wild kind, *has a Root which is thick, tough and pliant, having ſome Fibres adjoining thereto, from which ſpring forth ſeveral Stalks, which are round, and ſpread themſelves forth into many Branches, which are full of Knees or Joints, not much unlike to the* Garden kind. From each Joint proceeds a ſmall tender Foot-ſtalk, upon which do grow three Leaves, and no more, ſomewhat ſnipt about the edges, like as the former, or ſomewhat like to thoſe of *Saint Foine* or *Burgundy Hay*: and from the ſame Joints alſo come forth ſmall yellow Flowers, like unto the Manured, which ſtand more together at the end, bringing forth ſmall long Cods, like thoſe of the *Garden*, and which contain within them ſmaller and darker Seed.

IV. *The ſecond*, *or* Leſſer Wild kind, *has a tough creeping Root, with ſome Fibres thereat; from the Head of which Root riſes up but one ſlender Stalk, and but ſeldom branched, of about a foot high, and ſcaly, as it were, at the bottom; upon which does grow ſuch like Leaves as the former*; and at the Joints Flowers like to thoſe of the *Garden kind*, but which were leſſer, and alſo ſtanding ſingle; which being paſs'd away, Cods or Horns ſucceed, which are broader and more flat, and ending in a ſmall Thread, in which is contained the Seed, which is alſo leſs.

V. *The Places.* They both grow Wild in *Spain* and *Italy*, but with us are only nurs'd up in Gardens.

VI. *The Times.* They flower with us in *July*, and the Seed is ripe in *Auguſt* or *September*.

VII. *The Qualities, Specification, Preparations and Virtues* of theſe, are not declared by any Author; but if one may make a Judgment by the Form, Smell, Taſte, Subſtance and mucilaginous Properties of the Herbs and their Seed, they differ not from thoſe of the *Garden kind* in *Chap.* 256. aforegoing.

CHAP. CCLVIII.

Of FERN Male.

I. *THE Names.* This Plant is called in *Arabick*, *Sarax*: in *Greek*, Πτέρις ἢ Πτέριον, becauſe the Leaves are like to the Wings of Birds: in *Latin*, *Filix*; and in *Engliſh*, *Fern*.

Mal Ferne

II. *The Kinds:* There are many kinds of *Ferns*; as, 1. *Filix Mas*, called by *Nicander* in *Theriacis*, Βλῆθρον, ἢ Βλῆχνον, Male Fern, (and yet this very Species *Anguilara*, *Cæſalpinus* and *Geſner* call *Fœmina*) of which we ſhall treat in this Chapter: 2. *Filix Fœmina*, Female Fern, of which in Chap. 259. 3. *Filix Querna*, Oak Fern, of which in Chap. 260. 4. *Filix Saxatilis*, Rock or Stone Fern, of which in Chap.

Chap. 261. 5. *Filix Florida, Aquatica, vel palustris*, Water Fern, or Osmund Royal, of which in Chap. 262. To these you may add, 6. *Polypodium, Filicula, Polypodic.* 7. *Lonchitis aspera*, Rough Spleen-wort, or Estridges Fern. 8. *Asplenum cetcrach*, Smooth Spleen-wort; of all which in their proper places.

III. The *Male kind* is that which we treat of in this Chapter, and is called by *Nicander*, *Blethron.* It is, 1. *Filix mas vulgaris*, Our common Male Fern. 2. *Filix mas aculeata*, *Filix mas aculeata minor Baubini*, Prickly Male Fern. 3. *Filix mas aculeata major Baubini*, The greater prickly Male Fern.

IV. The Description. *The first, or* Common Male Fern, *has a Root consisting of a brown, scaly, thick Head; from which Head nothing but a multitude of small, black, hairy Fibres or Strings proceed, growing from the lower parts thereof: from this Head of the Root spring forth several hard, rough, unbranched Stalks of winged Leaves, naked or bare at the lower ends. These at the beginning of the Spring you may perceive to come forth of their folding Clusters, covered with brownish Scales at the Superficies of the Earth, very closely joined together. A young Plant has but a few Leaves, but an old one has ten, twelve, or more.* Each Stalk of Leaves, at its lower end, near the Joining to its Fellows, at its first appearing, before it is an inch long, has some of those black fibrous Roots for its Nourishment. The Leaves being come to their full Growth, have each of them a threefold Division, (as has the *Female Fern,*) 1. The main Stalk. 2. The side Branches growing from it. 3. The Nerves growing on those side Branches bearing the Leaves. The main Stalks of some of these Leaves, are sometimes one, two, three or four feet in Length or Height, which are full of those brownish Scales towards the Root, where they are naked of Leaves, as aforesaid. These Stalks of Leaves consist of many side Branches of Leaves up to the tops, with one Leaf at the end, and they are set on both sides thereof, not fully opposite, but, as it were, in the middle, between two Branches of Leaves on the contrary side, each Branch of Leaves not fully divided, but deeply nicked in on the edges, all of them of a pale green color, hard and dry, or without Sap, broadest at the bottoms, and smallest towards the tops: on the backside of which there are certain brownish small Spots, which are said to be the Seed; for by the falling of it this Plant does wonderfully encrease. The main Stalks of these Leaves are firm, flat on one side and round on the other side, naked of Leaves from ten to twenty inches, (according to the Height thereof) where the first side Branches of Leaves begin; the longest of which side Branches are the third pairs from the Root, being in some Plants, six, seven, eight or nine inches long; and from this longest pair they grow shorter and shorter towards the top, and are many times in number fourteen, eighteen or twenty pairs: for the most part towards the Root they grow by couples, almost opposite; but as they grow higher towards the tops, they grow not opposite, but in the middle, between their Opposites. The Leaves on the side Branches, are from an inch to almost an inch and half long, and so grow shorter and shorter towards the tops of the said side Branches or Wings, from twelve or fourteen to twenty in number on each side the longest Wing or side Branch. The small Leaves grow by couples for the most part on the Nerve, each Leaf being a little cut in on the edges, each Dent ending with a sharp Point, green on the upper side, and paler on the under side, each Leaf having two Rows of dusty red Scales, of a brown or blackish color. Towards the top of the main Stalk those side Branches change into Nerves, bearing only the Leaves. When the Leaves are at their full Growth, you may see in the midst of them at their Roots, the said scaley folding Cluster; and as the old Leaves, with their black thready Roots, wholly perish, so the said scaley folding Cluster springs up again; but in warm places, you will many times find the old Leaves green all the Winter.

V. *The second, or* Prickly Male Fern, *differs not much from the former, but only that the winged Leaves are not dented in, but whole, having a small Prick at the end of each of them, and growing not so high.* This *Parkinson* thinks to be the *Filix mas aculeata minor Baubini*; but thinks, that there is but little difference between it and his *major.*

VI. *Gerard* describes that which he thinks to be *Filix mas aculeata major Baubini* after this manner: *The Leaves of this are of a deeper green than either of the former, and are placed on the Nerve not very close together, but that you may plainly see between them; each Leaf (especially those next the Stalk) having on that side farthest off the Stalk, a large Ear or Outgrowing, ending with a very sharp Prickle, and very fine or small, as doth also the top of the Leaf. Some of the sides of the Leaves are also notched or dented in, ending with the like Prick or Hair; and each Leaf has two Rows of dusty Seed-Scales.*

VII. *The Places.* They all grow on Heaths and open places of Hills, as also in shadowy places by Fields sides; and are frequent in many Counties of *England.* The first grows plentifully in the boggy, shadowy Moors near *Durford Abby* in *Sussex*; as also on the moist shadowy Rocks by *Maple Durham* in *Hampshire*, near *Petersfield:* it has also been found growing on the old rotten Stocks or Bodies of *Oaks*, near the said Moors The second grows in shadowy Woods and Copses. The third Mr. *John Goodyer* found growing on the shadowy moist Rocks by *Maple Durham* near *Petersfield*, aforenamed.

VIII. *The Times.* They seldom keep their Stalks with their Leaves green in Winter, but send forth new from the Root in the Spring, which at their first rising are brownish and folded in round, as aforesaid: the time when these Heads or Scales on the back of them are ripe and do fall, is Midsummer; and falling on the Ground, do spring again, by which the Plant is encreased.

IX. *The Qualities, Specification, Preparations, Virtues and Uses* of the *Male Ferns*, are the same with those of the *Female*, related in the next Chapter, and thither I referr you.

CHAP. CCLIX.

Of FERN Female.

I. *The Names.* It is called is *Greek*, Θηλυπτεῖς, ἢ Νυμφαιαπτεῖς, *Thelypteris* and *Nymphæapteris:* in *Latin*, *Filix Fœmina*; and in *English*, *Female Fern*, *Brake* or *Common Fern.*

II. *The Kinds.* It is the second general Species, and is threefold, *viz.* 1. *Filix Fœmina vulgaris*, Our common Female Fern: but *Gesner in hortis* calls it *Mas*, and *Bauhinus* in his *Pinax*, *Filix ramosa pinnulis obtusis non dentatis.* 2. *Filix Fœmina pinnulis dentatis*, *Filix Fœmina altera tenuifolia Thalii*, Female

male Fern dented. 3. *Filix Fœmina pinnulis aculeatis*; *Filix ramosa minor pinnulis dentatis Bauhini*; *Pteridium masculam Cordi & Thalii*, Female Fern sharp-pointed.

Female Fern.

III. The Descriptions. *The first, or* Common Female Fern, *has a Root which is long, and slenderer than the former, of about a* Fingers *Thickness, and blackish for the most part, creeping under Ground: from this Root rises up but one Stalk, (seldom two) which is round, chamfered, and something edged, growing sometimes higher than the* Male, *and branched forth into such like winged Leaves, growing on both sides, like to the Leaves of the* Male Fern, *but lesser, set on both sides thereof, for the most part one against another, and more dented than the* Male, *yet not sharp, but round-pointed, of as strong a Smell as the former, and having the like Spots on the backsides of them.* This Stalk (as also the Root, as some say) being cut aslope somewhat long, will in the white Pith thereof have some certain Resemblance or Form of a spread Eagle.

IV. *The second, or* Dented Female Fern, *has a Root like the former; from which springs up one main Stalk, which is fuller of Branches, and grows not up so high as the other, nor so straight:* it has also small winged Leaves, like the first or *Common Female*, which are set on each side of the middle Rib, but somewhat sharp-pointed, of a more sad green color, and narrower than the other, and spotted on the backside; but in any thing else little differing from the first *Female kind.*

V. *The third, or* Sharp-pointed Female Fern, *from a pretty thick black Root, sends forth the main Stalk, which is about a foot in Height, and branches it self out into winged Leaves, each of which is not dented, but whole, and ending in a small Prick or Point.*

VI. *The Places.* The first grows more frequently than the *Male kinds* on barren Heaths and Hedgesides in most places thro' the Kingdom, and indeed in almost all barren, dry and desert places. The two latter grow rather on moist Rocks and shady Hills.

Female Fern Dented.

VII. *The Times.* They flourish at the same times that the *Male kinds* do; and their Leaves perish in Winter in like manner.

VIII. *The Qualities.* They are all of them, both *Male* and *Female*, hot and dry in the first Degree; Astringent, Aperitive, Absterfive, Cosmetick, Diuretick and Vulnerary; dedicated to the Liver, Spleen and Womb, Cathartick and Emmenagogick.

IX. *The Specification. Ferns* kill Worms, provoke the Terms in Women, heal Wounds and cure putrid Ulcers.

X. *The Preparations.* You may have therefrom, 1. *The green Leaves.* 2. *A Decoction of the Roots in Mead or White Port Wine.* 3. *A Pouder of the Roots.* 4. *An Oil or Ointment.* 5. *A Mixture.* 6. *Ashes*, of which *Spanish Barilla* is made.

The Virtues.

XI. *The green Leaves.* They being eaten purge the Belly, cleansing the Bowels of colerick and waterish Humors; but they also at the same time trouble the Stomach, and cause either Vomiting or Nauseousness.

XII. *The Decoction of the Roots in Mead or Wine.* It kills Worms in the Body, both long and broad, powerfully opens Obstructions of the Spleen, taking away its Swelling and Hardness, and represses Hypochondriack Melancholy. Dose half a pint Morning and Night, fasting an hour after it in the Morning, and taking it an hour after Supper.

XIII. *The Pouder of the Roots.* Taken to a dram inwardly in a Glass of White Port, it opens Obstructions of the Liver, Spleen and Womb, and provokes the Terms: but the often taking it causes Barrenness. It is used with success in foul, putrid and malign Ulcers, for it cleanses them, incarnates and drys up the putrid Moisture, and induces a speedy Healing. *The Pouder of the Leaves*, brings away both Birth and After-birth, being taken to one

dram in White Wine, and repeated as the Midwife ſhall ſee occaſion.

XIV. *The Oil or Ointment.* It is made by boiling the bruiſed Root either in Oil or in Hogs Lard till it is criſp, and ſo ſtraining it out, and repeating the boiling with freſh Roots, in like manner, two or three times. They are ſaid to be excellent for healing ſimple green Wounds and Punctures (tho' of the Nerves) in any part. If to every pound of the Oil or Ointment a quarter of a pound of Turpentine be added, it then proves an excellent thing to digeſt, cleanſe, incarnate, dry and heal old running Sores and putrid Ulcers.

XV. The Mixture. *Take Pouder of Fern Roots (Male or Female) one dram, Scammony or Black Hellebor Roots in fine pouder fifteen grains: mix them for a Doſe.* It effectually kills Worms in the Stomach or Belly of what kind ſoever: it alſo brings away the After-birth of Women in Labor.

XVI. *The Aſhes.* Country People make them of green *Fern*, and uſe them inſtead of Soap to waſh their Cloaths withal; for with the Salt of *Fern*-Aſhes much Soap is made. A Salt alſo for making of fair Cryſtaline Glaſs and Cryſtal is made of theſe Aſhes. They uſe them in *Spain*, and the Aſhes or Salt they make of *Fern*, is that they call *Barilla*, which is profitable not only for making Soap, Glaſs, Cryſtal, *&c.* but for many other Phyſical Uſes, as to break and diſſolve the Stone, or ſandy and gravelly Concretions. See the eighth Edition of our *Polygraphice*, *lib.* 10. *cap.* 1. *ſect.* 8, 9, 12, *ad* 18.

CHAP. CCLX.

Of FERN Oak.

I. *THE Names.* It is called in *Greek*, Δρυοπτεὶς: in *Latin*, *Filix Querna vel Quercina*; Βρυοπτεεις *Orobaſii*, *quaſi Filix muſcoſa*; and in *Engliſh*, *Oak Fern*: but here is to be noted, that there is another ſort of *Oak. Fern*, called *Polypodie*, which is no Species of the Plant we here intend; and therefore ſhall ſay nothing of it in this place.

II. *The Kinds.* This *Oak Fern* is threefold, *viz.* 1. Δρυοπτεὶς ἕρπων, *Filix Querna repens*, *Dryopteris repens Lobelii*, *Matthioli*, *Geſneri aliorumque*; *Dryopteris ſive Filix arborea Tragi*; *Pterion Fœmina Cordi & Thalii*, Creeping Oak Fern. 2. Δρυοπτεὶς λευκὴ, *Dryopteris alba*, *Dryopteris Candida Dodonæi*, *Adianthum album Plinii*, *Adiantum filicis folio Bauhini*, White Oak Fern. 3. *Onopteris mas*, Black Oak Fern.

III. The Deſcriptions. *The firſt*, *or* Creeping Oak Fern, *has a Root which is ſmall and blackiſh, creeping under the upper Cruſt of the Earth, with ſeveral ſmall black Fibres growing from it, and is ſomewhat like unto the Root of* Polypodie, *but much ſmaller and ſlenderer, and of a more harſh, auſtere and ſtyptick Taſte.* From this Root ſpring forth ſeveral ſlender blackiſh Stalks, little more than half a foot high, bearing many ſmall winged Leaves, each ſtanding againſt the other, ſomething like to thoſe of the *Female Fern*, but much ſmaller and finer, and of a darkiſh green color; the backſide of which are not brown, but with white Spots on them, ſet in a double Row, as *Lobel* affirms.

IV. *The ſecond*, *or* White Oak Fern, *has a thick Root, having a Bunch or Knot of blackiſh Fibres or Threads growing forth from it, ſo many as even to obſcure the thick part thereof.* From the Head of this Root ſpring up many Stalks of winged Leaves, but not much higher than the former, ſeldom exceeding ſeven or eight inches in Height; but the Leaves upon the Wings are broader than the other, and ſhorter; alſo more deeply cut in on the edges: they are likewiſe of a much paler green color, and ſpotted on the backſide with Spots ſomething like to thoſe of the *Male Fern.*

V. *The third*, *or* Black Oak Fern, *is both* Male *and* Female: *the* Male *has a Root made up of many Strings, not much unlike the firſt* Male Fern, *but leſſer.* From the Head of this ſpring forth ſeveral Stalks of winged Leaves, which are diverſly, but not ſo finely indented: the Stalks and the Ribs of the Leaves are blackiſh, but the Leaves themſelves of a deep green color. The *Female black Oak Fern* is almoſt like to the *Male*, ſaving that its Leaves are not ſo ſharp at the Points, and are more white and broad than the *Male*, in which conſiſts the chief Differences.

VI. *An Obſervation.* The firſt of theſe deſcribed at *ſect.* 3. above, ſome Authors ſay, 1. *does fold its Roots among themſelves, like the Roots of* Polypodium, but they are not above the Bigneſs of a *Wheat* Straw, coal black without, white within, and about ſix or ſeven inches long, having an innumerable company of ſmall Fibres like Hairs growing thereto, and is of an aſtringent Taſte, enclining to Sweetneſs. 2. *That the Stalks ſpring from the Roots in ſeveral places*, variable in number, according to the Length and Encreaſe of the Root: ſome Plants have but one or two Stalks of Leaves, others again have ſix, eight, ten, fourteen or fifteen, *&c.* 3. *That the Stalk has a twofold Diviſion*, firſt the Stalk growing from the Root ſix or ſeven inches high and no higher, (and yet ſome Authors ſay it is about a foot high:) ſecondly, the Nerve bearing the Leaves: the main Stalk is no bigger than a *Graſs* Stalk or *Bent*, flat on the one ſide and round on the other, ſmooth and green. 4. *That the firſt pair of Nerves grow*

grow about three inches from the Root, and all the reſt following grow by couples, almoſt exactly one againſt another, in number about eight, nine or ten pairs, the longeſt ſeldom exceeding an inch in Length. 5. *That the Leaves grow alſo on the Nerves by couples, eight or nine couples on a Nerve, of a yellowiſh green color, and without any Dents on the edges:* yet ſome other Authors ſay, that the Leaves are like thoſe of the *Female Fern*, but much leſſer, and more finely indented or jagged, ſo finely cut in, that in ſhew they reſemble Feathers, ſet round about a ſmall Rib or Sinew. 6. *That the backſides of the Leaves are ſprinkled, not with ruſſet or brown Spots or Specks, as the other* Ferns *are*, but are as it were painted with white Spots or Marks, not ſtanding out of the Leaves in Scales, as the Spots in the *Male Fern*, but ſmooth or flat, and double in each Leaf, cloſe unto the middle Rib or Sinew.

VII. *The Places.* Theſe do indeed grow in ſhadowy thick Woods on Mountains, and ſometimes in the open Vallies near them; as alſo among the *Moſs* growing on old Trees, chiefly *Oaks*, whence came the Name *Filix Muſcoſa*, which is a kind of *Moſs Fern*, growing amongſt the *Moſs* on *Oaks* and other Trees, and in the tops of their Trunks when they begin to rot.

VIII. *The Times.* Neither theſe nor any of the other *Ferns* (except *Water Fern*) have any manifeſt Flower or Seed, ſo that their Seaſons are not to be ſpecified. As for the Leaves, they periſh in Winter, and put forth afreſh in the Spring.

IX. *The Qualities.* The firſt is hot in the firſt Degree and dry in the fourth; Aſtringent, biting and very ſtyptick in Taſte, and, as *Rondeletius* thinks, of a deleterious or mortiferous Quality. The other three kinds are like in all their Qualities to *Engliſh Maiden-hair*; and therefore, as to their Specification, Preparations and Virtues, we ſhall referr you thither.

X. *The Specification.* The firſt of theſe kills Worms, and deſtroys the Roots of the Hair.

XI. *The Preparations.* You may have therefrom, 1. *A Pouder of the Root.* 2. *A Cataplaſm.*

The Virtues.

XII. *The Pouder of the Root.* *Matthiolus* ſays, that if it is mixed with Salt and Bran, and given to Horſes, that it kills Worms in them: but I ſuppoſe it muſt be repeated Morning and Night for ſeveral days.

XIII. *The Cataplaſm.* It is made of the Roots and Leaves bruiſed and beaten together. *Dioſcorides* ſays, that if it is applied to places troubled with Hair after Sweating, (becauſe then the Pores are open, and ſo give a more ready inlet to the Virtue of the Medicament) it is a Depilatory, or a good Remedy to deſtroy the Roots of Hairs.

CHAP. CCLXI.

Of FERN Rock *or* Stone.

I. *THE Names.* It is called in *Greek*, Πτεριοπτέρεις, Πτέρις πτερία: in *Latin*, *Filix Saxatilis*, *Chamæfilix*: in *Engliſh*, *Rock or Stone Fern*; alſo *Dwarf* or *Small Fern.*

II. *The Kinds.* Authors make many kinds hereof, as, 1. *Filix pumila ſaxatilis prima Claſii*, The firſt Small or Stone Fern of *Claſius*. 2. *Filix pumila ſaxatilis altera Claſii*, The ſecond Stone Fern of *Claſius*. 3. *Filix ſaxatilis foliis non ſerratis*, Small Stone Fern, with Leaves not dented. 4. *Filix ſaxatilis criſpa*, Small curled Stone Fern. 5. *Filicula fontana*, Small Rock Fern. 6. *Chamæfilix Anglica*, Engliſh Dwarf Fern, *or* Sea Fern. 7. *Filix ſaxatilis Tragi*, Naked Stone Fern.

III. The Deſcriptions. *The* firſt ſmall Stone Fern of Clufius, *has a long, black and ſlender Root, creeping under the upper Cruſt of the Earth, and ſpreading aſlant, with a few ſlender hard Fibres adjoining thereto.* From this Radicle ſpring forth ſeveral Stalks of winged Leaves, about a foot high, which is branched out into ſeveral Wings of Leaves, very like unto the *Female Fern*, but much leſs, much tenderer and delicate than they, and more finely dented on the edges, and ſpotted alſo on the Backs of them, like to the other *Ferns*.

IV. *The ſecond, or* Second Stone Fern of *Cluſius*, *has a thick Head of a Root, much like to that of the firſt* Male Fern. From which ſpring forth many ſmall Knobs, with a vaſt number of black Fibres or Threads. From this Head of the Root ſpring up ſeveral ſtrait round Stalks of Leaves, green at firſt, but blackiſh when full grown, about four or five inches high, ſhooting forth winged Leaves from the main Stalk upwards, with Dentings in on both ſides, like unto the *Male Fern*, but much leſs, and finer, and ſpotted on the back of them, as the former.

V. *The third, or* Small Stone Fern with Leave not dented, *has a Root like to the* Male Fern, *and grows very like it, with Stalks of winged Leaves* ſaving that they are very much leſs, (as is the whole Plant) and not indented on the edges, but whole or ſmooth, like unto the *Water Fern.*

VI. *The fourth, or* Small curled Stone Fern, *has a Root compoſed of many blackiſh Fibres, ſpringing out from the thick Head of a Root:* from which Head ſpring up ſmall Stalks, ſcarcely four or five inches high, which are ſet on both ſides with tender ſoft Strings of very ſmall Leaves, ſo finely divided and dented, that they ſeem curled; of a dark green color upwards, and paler below towards the bottom, having browniſh or reddiſh Duſt like Spots on the backſides, as *Spleen-wort* has.

VII. *The fifth, or* Small Rock Fern, *is a ſmall* Dwarf Fern, *reſembling in its Root, Stalks and Leaves the* Common Fern, *but very much leſs*, yea much leſs than any of the laſt deſcribed: tho' it grows low, yet it buſhes out with many ſmall and dark green Leaves, reſembling the *Ordinary Ferns.*

VIII. *The ſixth, or* Engliſh Dwarf Fern, *has a thick browniſh Root, compoſed of a multitude of Fibres or ſmall Strings.* From the Head of this Root ſpring up ſeveral bright, ſhining, blackiſh Stalks, two or three inches high, on which are placed many rough, thick, ſhining, blackiſh Leaves, with ſome browniſh Spots on them, as other *Ferns* have, and are finely ſnipt about the edges.

IX. *The ſeventh, or* Naked Stone Fern, *has a thick tufted Root, compoſed of a multitude of ſmall Fibres: from the Head of which ſpring forth many hard and rough Stalks, naked or bare, without Leaves, having ſome Spots on them, as the* Ferns *have*: theſe Stalks are only forked at the tops, divided into two, and ſometimes into three ſhort parts, bowing or bending down their Heads, having the Smell and Taſte of *Fern.* In my Opinion, as this has not the leaſt Reſemblance in its Form of *Fern*, but rather of *Gramen* or *Graſs*; ſo it ought to be

accounted one of the Species thereof; but for Company ſake with other Authors, I have not contended the Point, but have let it paſs among the *Ferns*: it is the *Holoſtium alterum Lobelii.*

X. *The Places.* They all grow in Rocky and Stoney places: the fifth, ſixth and ſeventh, *Lobel* ſays, grow near the Sea in *Cornwall*, in moiſt Rocky places.

XI. *The Times.* They ſpring up and flouriſh at the times when the other *Ferns* do, and periſh in the like Seaſons.

XII. *The Qualities, Specification, Preparations and Virtues*, are the ſame with the *Common Male* and *Female Ferns*; and therefore to *Chap.* 259. aforegoing, I referr you.

CHAP. CCLXII.

Of FERN Water,

OR,

OSMUND Royal.

I. *THE Names.* It was unknown to the *Greeks*, and therefore can have no *Greek* Name; but it is called in *Latin*, *Filix florida*, *Filix aquatica*, *Oſmunda Regalis*, *Filix paluſtris*, *Filix Lunaria Geſneri*, *Filix latifolia Cordi*, *Filicaſtrum*: in *Engliſh*, *Water Fern* and *Oſmund Royal.*

II. *The Kinds.* It is the fifth Species of *Ferns*, and a ſingular Plant of the kind.

III. The Deſcriptions. *It has a great and thick* Root, *folded, and covered over with many Scales, and interlacing* Roots, *having in the middle of the great and hard woody part thereof a ſmall white* Pith, *which by ſome is called the Heart of* Oſmund *the Water-man*: from this Root ſhoot forth in the Winter time ſeveral hard rough Stalks, half round, and hollowiſh or flat on the other ſide, which grow up to the height of two feet, having ſundry Branches of winged yellowiſh green Leaves, ſpread out on all ſides, and ſet one againſt another, longer, narrower, and not indented on the edges, as the *Common Ferns Male* and *Female*. From the tops of ſome of theſe Stalks grow forth a long Buſh of ſmall ſcaley Spikes, as it were, of a more yellowiſh green color, ſet on the ſame manner on the Stalks as the Leaves are, which by ſome Authors are accounted the Flowers and Seed, tho' others again as much deny it.

IV. *The Places.* It grows in Moors, Bogs and Watery places in many parts of *England*: it did grow in the midſt of a Bog, at the farther end of *Hampſtead Heath* from *London*, at the bottom of a Hill adjoining to a ſmall Cottage; alſo in divers Bogs on a Heath or Common near unto *Burnt Wood* in *Eſſex*, eſpecially near unto a place formerly digged in ſearch of a Gold Mine, but now it is ſaid to be rooted out of thoſe places: it grows in wonderous plenty in boggy places, Swamps and low moiſt Grounds thro' almoſt all *Carolina*: I found it in great plenty in moiſt and boggy Grounds, bordering upon *Wadmalaw River* in *South Carolina*, where Cart Loads of it might be had, as alſo in divers places adjacent to *Aſhly*, *Cooper* and *Wando* Rivers, and in ſeveral other parts of the ſame Collony.

V. *The Times.* It is green and flouriſhes all the Summer, as do the other *Ferns*; and the Spikes of Flowers and Seed are in Perfection in *June*, *July* and *Auguſt*; the Leaves decay and die away in Winter, but the Root continues good, and lives for many Years. *Gerard* ſays, That if it is tranſplanted into Gardens, it proſpers full as well as in its native Soil.

VI. *The Qualities, Specifications, Preparations and Virtues*, are the ſame with thoſe of the *Male* and *Female Fern* in *Chap.* 259. aforegoing, excepting that this is more effectual than they, both for inward and outward Diſeaſes, and therefore rather to be choſen than either of them, or any of them all: alſo over and above what has been there ſaid, the following Obſervations have been experimentally made.

VII. *The Decoction in Wine.* It is a ſingular good Wound-drink, and therefore of excellent Uſe in curing green Wounds, running Sores, old Ulcers, Fiſtula's, and the like. It gives eaſe in the Colick, and all Diſeaſes proceeding from Obſtructions of the Spleen, Womb, Reins, *&c.* and it alſo prevails againſt Ruptures or Burſtenneſs. If the Decoction is made in White Wine, it provokes Urine exceedingly, cleanſing the Reins, Ureters and Bladder.

VIII. *The Balſam, Oil or Ointment of the Root.* They cure any ſimple Contuſion, heal Wounds, running Sores and old Ulcers; and are ſingularly good againſt the Gout, broken Bones, and Bones out of Joint.

CHAP. CCLXIII.

of FIGWORT Great Common.

I. *THE Names.* It does not ſeem to be known to the *Greeks*, for it has no *Greek* Name; but it is called in *Latin* by many Names, as *Ficaria*, *Mille Morbia*, *Ferraria*, *Caſtrangula*, *Chryſippea Plinij*, as ſome think, *Galeopſis Dioſcoridis*, as *Fuchſius*, *Cordus* and *Dodonæus* think, alſo *Scrophularia major:* in Engliſh *Figwort.*

II. *The Kinds.* We make two Generical Kinds of this Plant, *viz.* 1. *Scrophularia major vulgaris*, The Common Great Figwort, of which in this Chapter. 2. *Scrophularia major Peregrina*, Foreign Great Figwort, of which in the next Chapter.

III. Of the firſt of theſe ſorts there are two Kinds, *viz.* 1. *Scrophularia major vulgatior*, *Ocimaſtrum alterum Tragi*, *Clymenum Mas Geſneri in Hortis*, *Galeopſis Fuchſij*, *& Cordij*, The more Common Great Figwort. It is called *Scrophularia* in moſt Authors, becauſe it is available *ad Scrophulas*; and *major*, to diſtinguiſh it from *Scrophularia minor*, which is *Pilewort*, of which in its place. 2. *Scrophularia major altera Elegans*, The Noble or Beautiful Great Figwort.

IV. The Deſcriptions. *The firſt, or* more Common Great Figwort, *has a Root which is great, white and thick, with ſeveral Knobs or Tubers growing at it, and running a ſloap under the upper Cruſt of the Earth, which abides many Years, the Green Herb dying away in the Winter.* From this Root ſpring forth ſundry great, ſtrong, hard, ſquare, brown Stalks, three or four Feet high, on which grow large, hard, and dark green Leaves, two at a Joint, which are larger and harder than any Nettle Leaves, but not ſtinging, and not much unlike in form to the Leaves of *Water Betony*, ſo that they are ſometimes miſtaken the one for the other, being difficult to be known aſunder, without a narrow view of them; but theſe Leaves are not ſo round dented about the edges, and are alſo ſmaller at the ends. At the tops of the Stalks come forth many Purple Flowers, ſet in Husks, which are ſomething gaping and open, but not ſo much as any of the *Galeopſes* or *Dead Nettles*, but cloſer and ſmaller, ſomewhat like thoſe of *Water Betony* aforenamed; which being paſt away, hard, round Heads come in their places, having a ſmall point in the middle, in which is contained ſmall browniſh Seed.

V. *The Second*, *or* Elegant Great Figwort, *has a great, thick, white, and knobbed* Root, *like the former, which ſends forth from it one or more great, hard, ſtrong, brown Stalks, with Leaves at the Joints, very like the other*, but they are fairer, and more ſometimes ſtanding at a Joint, eſpecially at the lower Joints. The Flowers are not gaping as the firſt, but made of four reddiſh Leaves, which commonly ſtand at the Joints with the Leaves; which being paſt, there comes in their places hard round Heads of Seed Veſſels, but without any point in the middle, in which are contained a ſmall kind of Seed.

VI. *The Places.* They are very frequent, eſpecially the firſt, in moſt places through the Kingdom, growing in moiſt and ſhadowy Woods, and in the lower parts of Fields and Meadows: it may be found in great abundance in *Hornſey Wood*, near *London*, as alſo in *Store Wood*, and *Shotover*, near *Oxford.*

VII. *The Times.* They Flower in *June* and *July*, and the Seed will be ripe in a Month after the Flowers are paſt.

VIII. *The Qualities.* Figwort is hot and dry in the Third Degree, Anodyne, Diſcuſſive, and Vulnerary.

IX. *The Specification.* It is peculiar for Curing the Scrophula or Kings-Evil, as alſo the Hæmorrhoids or Piles, Scabs, Leproſie.

X. *The Preparations.* You may have therefrom

1. *A Liquid Juice.* 2. *An Essence.* 3. *A Decoction in Wine.* 4. *A Distilled Water.* 5. *An Ointment.* 6. *A Cataplasm.* 7. *A Spirituous Tincture.* 8. *An Acid Tincture.*

The Virtues.

XI. *The Liquid Juice of Herb and Root.* It is a most admirable Vulnerary; taken to two Spoonfuls, or more, in the Distilled Water of the Plant, it is effectual to dissolve clotted or congealed Blood within the Body, which happens by means of any Wound, or by any Bruise or Fall; and is very powerful to waste away, consume, or destroy that Humor which is the Cause of Struma's, Scrophula's, Leprosies, Scabs, and other like Breakings out.

XII. *The Essence.* It has the same Virtues, but is more powerful to the Intentions above named, being outwardly applied, by bathing it upon Scrophulous Tumors, Hæmorrhoids, Scabs, Scurff, Morphew, Leprosie, it is of singular good use, because it resists the protrusion of the Humors which cause them, and also wastes away what is contained in the parts affected; it also cleanses, dries, and induces the healing of running Sores, old Ulcers, Fistula's, and the like; and may be taken inwardly as a Diet, in order to facilitate those Cures.

XIII. *The Decoction of the Roots and Herb in Wine.* It is a singular good Wound Drink, and of great efficacy (being constantly taken Morning, Noon, and Night to the quantity of half a Pint for a Dose, for some considerable time) to cure inveterate and malign Fistula's, or which yield a malign Ichor, known by its putrid substance, ill color, and fœtidity. The same is also no less effectual against the Kings-Evil, or any other Knots, Kernels, Bunches, or Wens, growing in the Flesh, in what part of the Body soever. It is also of very good use to be applied to the Hæmorrhoids or Piles when they grow painful and fall down, and for such other Knobs, Tumors, or bunchings out, (as *Ficus in Ano*) which sometimes happens to the Fundament.

XIV. *The Distilled Water from the whole Plant.* It is used for the same purposes, either to take inwardly, or apply outwardly, by bathing, *&c.* It is of good use for foul and putrid Ulcers, which are hollow or corroding, to stay the malignity, and to dry up the superfluous virulent moisture of them. It also takes away all Redness, Spots, Freckles, Scurf, *&c.* in the Face and Skin, or any other foul Deformity thereof, tho' inveterate, as the Leprosie, *&c.* but it will be more effectual if you dissolve therein a proportional quantity of Nitre, Salt of Tartar, or *Saccharum Saturni*, according to the nature of the Disaffection you apply it to.

XV. *The Ointment of Herb and Roots*, but more especially of the fresh Roots. It is made according to the usual Rule of making Ointments, but Authors have left this Prescription. Take the Roots, wash them clean, bruise them, and put them into a Jar Glass, or Earthen Pot, with a sufficient quantity of Butter, or Hogs Lard, or Beef Suet, mixt with an equal quantity of Oil Olive, which is the better of the three, tye over the Jar Glass or Pot with a Bladder, or Leather and brown Paper, and let it so stand in the hottest Sun for 15 or 20 days, then afterwards upon a gentle Fire boil softly for almost an hour, and whilst hot strain it forth, and keep it in a Jar Glass or Gally-pot close covered for use. You may also make it by boiling the bruised Roots and Leaves in Hogs Lard, or in Oil and Wax, and then straining it out as aforesaid. It is exceeding good to anoint with, in order to cure Scrophulous Tumors, or Swellings in the Neck, as also *Ficus in Ano*, and the Hæmorrhoids or Piles, it eases the pains, and many times discusses the Tumors, and if any of them are Ulcerated, it is of extraordinary use to heal all those kinds of Ulcers, as also Scabs, Leprosie, *&c.*

XVI. *The Cataplasm.* It is made of the Herb, or of the Root, or of Herb and Root, being beaten in a Mortar till they are soft; being applied it cures Simple Contusions, caused by any Blow or Fall, dissolves the coagulated Blood, and soon heals the Hurt or Wounded part; and it is also no less effectual against Struma's, or the Kings-Evil, and to dissolve any bunchings out, Wens, or Kernels in the Throat or other parts.

XVII. *The Spirituous Tincture.* It stops inward Bleedings, and expels Wind out of the Stomach and Bowels, corrects the cold pituitous Humor which breeds the Kings-Evil Kernels, and other like Tumors, in any part of the Body; and is very efficacious against the Colick, the pain of the Spleen, and Hypochondriack Disaffections. Dose from two drams to four in the Distilled Water, or in Wine, or other proper Vehicle, Morning and Night.

XVIII. *The Acid Tincture.* It strengthens and fortifies the Stomach, and rectifies the Juices in their first Concoction, preventing the generating and concreeting of that Matter, or those Humors which breed Struma, or the Disease called the Kings-Evil. It causes a good Appetite, and a strong Digestion, and powerfully opens the Obstructions of the Stomach, Liver, and Spleen, and therefore absolutely cures the Rickets in Children, of which I have had a particular Experience several times. Dose so many drops as to make the Ale, Beer, or Wine grateful.

CHAP. CCLXIV.

Of FIGWORT Great Foreign.

I. *THE Names.* It is called in *Latin Scrophularia major Peregrina*, and by reason the Roots are without Tubers, or Knobs, it is called by some *Scrophularia major absque Tuberculis:* in *English Foreign Great Figwort.*

II. *The Kinds.* Authors have given us many Kinds of this Plant, divers of which we can never come at, but so many of them as may be found growing in the Gardens of the Curious here in *England*, or may possibly grow in some of our Plantations beyond Sea in *America*, we shall here give you the Description of; and those are, 1. *Scrophularia major Americana*, *Scrophularia Cretica prima Clusij*, American or Cretick Great Figwort. 2. *Scrophularia major Americana altera, vel Indica altera*, *Scrophularia major Hispanica*, *Scrophularia foliis Laciniatis Bauhini*, The Second *Indian* or *American* Great Figwort. 3. *Scrophularia Flore luteo*, Bauhini, *Scrophularia maxima Montana Columnæ*, Great Figwort yellow Flowered.

III. The Descriptions. *The First, or* American or Cretick Great Figwort, *has a Root which is of about a Fingers thickness, which spreads it self out into several Branches, running under the Superficies of the Earth not very deep, and having many Fibres springing from the same.* From this Root rises up a square corner'd green Stalk, brownish on the side next the Sun, at the bottom of which grow several large and long Winged Leaves, set upon pretty long Footstalks, made of many parts, and almost in fashion like the *Common Thistle*, but without Prickles. The Leaf is large, and much cut in on the edges, making

making every Leaf look almoſt like to the Leaf of the *Red Rattle*. From the middle of the Stalk upwards it ſpreads it ſelf out into other Branches, almoſt tothe very top, thoſe Branches growing ſmaller and ſmaller as they grow higher and nearer to the top, having on all ſides ſuch like Leaves, but leſſer than thoſe growing below. At the tops of the Stalks and Branches are many ſmall Flowers, ſet almoſt like unto the firſt *Common Figwort*, but part of a deeper, and part of a paler Purple Color, with ſome yellow Threads riſing out of the middle.

IV. *The Second, or* Indian or American Great Figwort, *has a Root which is thick and buſhy, which periſhes in the Winter, if it comes up to Flowering, but if it Flowers not, it continues all the Year.* From this Root ſpring up divers thick, but weak, Stalks or Branches, all lying round about upon the Ground, full of Joints, with large and long dark green Leaves, cut in on the edges into five long Diviſions, all of them dented about the edges; and from the ſame Joints come forth alſo other leſſer Leaves, divided and dented, and with them, towards the tops of the Stalks, ſeveral large Flowers of a yellowiſh color on the outſide and lower parts, but of a reddiſh color, mixt with yellow within. The Flowers being paſt away, larger and harder Heads ſucceed than in the Common Kinds, and pointed at the end as the reſt, which contain within them ſmall blackiſh Seed.

V. *The Third, or* Yellow Flowered Great Figwort, *has a Root which is thick and blackiſh, with many Fibres or Strings thereat, but without any Tubers or Knobs at all.* From the Head of this Root ſpring forth ſeveral ſquare brown Stalks, a little hairy and ſoft, above two Feet high, at the Joints of which grow two large, broad, roundiſh, hairy, ſoft, green Leaves, deeply indented about the edges, and ſtanding upon very long Footſtalks, thoſe at the lower parts of the Stalks being largeſt, which in Winter lye in a compaſs upon the Ground about the Root, and thoſe which grovv on the Stalks leſſer, growing leſſer and leſſer till they come to the tops; at each Joint with the Leaves comes forth, even almoſt from the bottom, one ſmall naked Branch, bearing many Flowers in Tufts at the ends of them, which are round and yellow, ſomewhat like unto the *Ordinary* or *Common ſort*, parted or cut in at the brims into divers pieces, having ſome long yellowiſh Threads in the middle. After the Flowers are paſt, larger round Heads come than in the Common Kind, but not ſo large as thoſe in the laſt deſcribed, which have at the end a long point, a little crooked, and contain within them ſmall black Seed.

VI. *The Places.* The two firſt I have found growing in ſeveral parts of *Florida*, in the South of *Carolina*, and in thoſe parts leading to the Cape of *Florida*. The firſt alſo has been found growing in *Candia*, being *Cluſius* his firſt *Cretick* Species. The ſecond has been found growing in *Spain* likewiſe, but as I am informed was Tranſplanted thither from *America*. The third is a Native of *Germany* and *Hungary*, from the former of which places it was brought to us; but here in *England* they are all nurſt up in the Gardens of the Curious.

VII. *The Times.* They Flower in *July*, and the Heads of Seed will be ripe in *Auguſt* or *September*.

VIII. *The Qualities, Specification, Preparations and Virtues* are the ſame with thoſe of the *Common Kind* in the former Chapter, and therefore I ſhall ſay no more of them in this place.

CHAP. CCLXV.

Of FLAG Sweet Smelling,

OR,

True ACORUS.

I. *THE Names.* It is called in *Greek* Ἄκορος, ἢ Ἄκορον, in *Latin Acorus* or *Acorum*, *Acorus verus*, and *Acorum verum*: *Cluſius* ſays it is taken to be *Butomos Theophraſti*: and in *Engliſh The true ſweet ſmelling Flag.*

II. *The Kinds.* Authors make but one Kind thereof, which *Camerarius*, *Cluſius*, *Cordus*, *Geſner*, *Lugdunenſis*, *Lobel*, *Matthiolus*, *Monardus*, and others, call *Acorus*, or *Acorum*, which is the vulgar *Calamus Aromaticus Officinarum*, according to *Amatus*, *Braſſavolus*, *Cæſalpinus*, and *Fuchſius*, but it is not the true *Calamus Aromaticus* of the Ancients, for that was really a *Reed*, whereas this is really and truly a *Flag*, (but *ſweet ſmelling*) and the Root here intended the Root only of a Flag; as for the True and Ancient *Calamus Aromaticus*, I am apt to believe it is not to be found thro' all *Europe*, that is to ſay, not in the Shops; but of this we ſhall have occaſion to ſpeak more in our III. Book.

III. The Deſcription. *It has a Root like to the* Common Water Flag *in the next Chapter, but ſmaller, and not ſo red, of a ſweet ſmell and ſomewhat bitter taſte; it is thick and long, lying under the upper Face of the Earth, ſhooting forwards, and with ſmall Roots, as Suckers on all ſides, not much unlike to* Garden Valerian, *whitiſh on the outſide, or greeniſh if it lyes above Ground, and more pale or whitiſh on the inſide, conſiſting of many Joints, from which it ſhoots forth underneath many long thick Fibres, by which it takes hold in the Ground; the thick part of*

the

the Root is of a firm or fast ſubſtance, yet not woody, but eaſie to cut. From this Root riſe up ſeveral flaggy Leaves, like unto the *Water Flag*, or *Flower-de-luce* in the following Chapter, but narrower, and two or three Feet in length, of a freſh green Color, and Aromatick Smell; yet ſometimes they are brownish at bottom, the one Leaf growing out of the ſide of the other, after the ſame manner that other *Flags* or *Flower-de-luces* grow, which are thin on both ſides, and riged or thick in the midſt, the longeſt for the moſt part ſtanding in the midſt, and ſome of them curled or plaited towards the ends or tops of them, ſmelling very ſweet as well when they are dry, and kept a long time, as when they are freſh and green. Theſe Leaves abide a long time in the Garden, as tho' they never did, or never would bear any Flowers, they every Year dying down to the Ground, and ſhooting out freſh every Spring; but after two, three, or four Years continuance in a place without removing, it ſhoots forth Leaves as formerly, (but no Stalk, as other *Flags* or *Flower-de-luces* do) beſides which it ſhoots forth a long narrow Leaf by it ſelf, flat, like unto the other Leaves, eſpecially from the middle thereof upwards; but from the ſaid middle downwards it is thicker, narrower, and rounder, or rather almoſt triangular. From the middle of this lone Leaf comes forth one long round Head, very ſeldom two, in form and bigneſs like almoſt unto the *Aglet* or *Catkin* of the Haſle Nut Tree; it grows upright, an Inch and half, two Inches, or more in length, as thick as a large Reed, or ones little Finger, ſet with ſeveral ſmall Lines and Diviſions, like unto a green *Pine Apple*, and for the moſt part of a Purpliſh Green Color, or as *Gerard* ſays, of a Greeniſh Yellow Color, curiouſly Chequered, as if it were Wrought with a Needle, with green and yellow Silk intermixt; out of its Bunches ſmall pale whitiſh Flowers ſhoot forth, conſiſting of four ſmall Leaves apiece, (without any great ſmell) which quickly fall away, without giving any Seed, ſo far as any Author has obſerved.

IV. *The Places.* It is a Foreigner, and grows with us only in Gardens, but bears very rarely its Tuft or Head in our cold Country, for which reaſon ſome have ſaid that it is barren, but that doubtleſs is a miſtake, for *Cluſius* ſays that he had ſeen it bear its Flower or Head in that place where it grows naturally, tho' in *England* it ſometimes may be barren. Its Native places are in ſeveral parts of *Turkey*, where it grows in moiſt Grounds, and in ſuch like places it flouriſhes with us, where are found the largeſt Roots, the faireſt, firmeſt, whiteſt, and ſweeteſt, which being dryed are a little ſhrivelled. It grows in *Candia*, as *Pliny* ſays, as alſo in *Galatia*, and other adjacent places, and naturally at the Foot of a Hill near to *Pruſa*, a City of *Bithynia*, not far from a great Lake. It alſo grows in great plenty in ſome parts of *Raſſia*, but its Roots when dryed are more lank or ſmall, not ſo firm nor white, nor of ſo choice an Aromatick Smell.

V. *The Times.* It ſprings up with its Leaves in *March* and *April*, and bears its *Catkin* (in thoſe Countries where it does bear, or is not barren) in the beginning or middle of *July* and *Auguſt*. *Johnſon* upon *Gerard* ſays, that in *May* 1622. he received the *Julus* or *Catkin* from Mr. *Thomas Glynn*, of *Glynnthivon*, in *Carnarvonſhire*, from which it is manifeſt, that with careful looking after, it may with us be made to bear its Head of Flowers; yet here about *London*, tho' it grows well, and in great plenty in many Gardens, it has ſcarcely ever been ſeen to bring forth any thing of that kind.

VI. *The Qualities.* It is hot and dry in the ſecond degree, Aperitive, Abſterſive, Aſtringent, Carminative, Diuretick, Cephalick, Neurotick, Stomatick, Cordial, Sudorifick, and Alexipharmick.

VII. *The Specification.* It is a peculiar thing againſt Poyſon, the Plague, and all contagious Diſeaſes.

VIII. *The Preparations.* The Root is only of uſe, and you may have therefrom, 1. *A Liquid Juice.* 2. *An Eſſence.* 3. *An Infuſion in Wine.* 4. *A Decoction in Wine.* 5. *A Pouder.* 6. *A Cataplaſm.* 7. *A Spirituous Tincture.* 8. *An Acid Tincture.* 9. *An Oily Tincture.* 10. *A Spirit.* 11. *A Chymical Oil.* 12. *Poteſtates or Powers.* 13. *An Elixir.* 14. *A Collyrium.* 15. *A Preſerve.* 16. *A Syrup.*

The Virtues.

IX. *The Liquid Juice.* Taken to a Spoonful or two in a Glaſs of Generous Wine it provokes Urine, eaſes Pains and Stitches of the Sides, and prevails againſt the Bitings of Mad Dogs, and other Venomous Creatures, but it ought often to be repeated, at due intervals of time.

X. *The Eſſence.* It has the Virtues of the Juice, and eaſes pains of the Stomach and Bowels, eaſes the Colick, and Gripings of the Guts, prevails againſt Convulſions, and is an Antidote againſt all ſorts of Poyſon, and the Infection of the Plague it ſelf; and is a ſingular good thing to help a ſtinking Breath: it is alſo commended as an excellent thing againſt Ruptures or Burſtenneſs. Doſe one Spoonful, or more, Morning and Night, in a Glaſs of Generous Wine, or ſome other fit Vehicle.

XI. *The Infuſion in Wine.* It has the Virtues of the Juice and Eſſence, but not all out ſo powerful; it waſtes the Spleen, helps thoſe who have the Strangury, and frees thoſe from danger who are Bitten by any Venomous Serpent: it warms and comforts the Stomach, and cauſes a good Appetite and Digeſtion; expels Wind, drys up Rheums, and clears the Sight. Doſe five or ſix Ounces Morning and Night.

XII. *The Decoction in Wine.* It has the Virtues of the Infuſion, and being mixed with a little Wormwood Wine, and ſo drunk, it is of good uſe to comfort and ſtrengthen a cold and weak Stomach.

XIII. *The Pouder.* It is given to one Dram in the Morning faſting, and laſt at Night going to Bed, in a Glaſs of the Infuſion, againſt Poyſon, the Bitings of Mad Dogs, or other Venomous Creatures, to prevent, and alſo to cure the Infection of the Plague, or any Peſtilential Diſeaſe; it comforts a cold and weak Stomach, reſtoring the Tone thereof where depraved or hurt, and has all the Virtues of the Eſſence and the other Preparations aforenamed: it heals alſo inward Bruiſes.

XIV. *The Cataplaſm.* The Root being boiled in Wine to ſoftneſs, ſtamped, and then applied as a Cataplaſm to the Teſticles, it wonderfully abates their Swelling, diſcuſſing all hardneſs and collections of Humors: it alſo mollifies hard Tumors in any other part of the Body.

XV. *The Spirituous Tincture.* It is good againſt Coldneſs, pains and weakneſs of the Head, Brain, and Nerves, ſtrengthens the Sight, ſtops Defluxions of Rheum into the Eyes, and is excellent againſt the Megrim from a cold Cauſe, Vertigo, Carus, Lethargy, Palſie, Convulſions, and other like Diſaffections of the Nerves, Brain, and Womb; it warms and ſtrengthens the Stomach, cauſes a good Appetite, expels Wind, and gives eaſe in Cramps, Gripings of the Bowels, Colicks, and the Diſeaſe called *Tenaſmus.* Doſe half a Spoonful in a Glaſs of Wine Morning, Noon, and Night.

XVI. *The*

XVI. *The Acid Tincture.* There are but few things more excellent againſt the Infection of the Plague, whether it is taken as a Prophylactick, or a Curative; indeed in all Peſtilential Diſtempers it does Wonders, for it deſtroys the Poyſon and Malignity in its Root, and for the ſame reaſon it is good againſt the Bitings of Mad Dogs, Serpents, or any other Venomous Creature; it is good againſt Nauſeouſneſs of the Stomach, and ſtops Vomitings, when ſcarcely any thing elſe will prevail. Doſe ſo many drops as may make the Vehicle pleaſantly ſharp, to be often repeated in the day.

XVII. *The Oily Tincture.* Taken inwardly to ten, twelve, or fifteen drops, or more, in a Glaſs of White Port Wine, it provokes Urine, expels Stones, Sand, Gravel, or other Tartarous Matter in the Reins, Ureters and Bladder; and cures alſo all cold, moiſt, ſleepy, and Paralytick Diſeaſes of the Head, Brain, and Nerves. Outwardly anointed upon the Joints it cures the Gout, and well anointed upon the Back Bone twice a day, *viz.* Morning and Evening, as alſo upon the parts affected, it cures Cramps, Convulſions, and Palſies, and thoſe kind of troubleſom Pains, vulgarly called a Rheumatiſm.

XVIII. *The Spirit.* It is a Noble and Generous Cordial, chears the Heart, revives the Spirits, and ſtrengthens Univerſal Nature; it is good againſt Fainting and Swooning Fits, Hypochondriack Melancholy, and other Diſeaſes of like kind. Doſe a Spoonful, now and then upon occaſion.

XIX. *The Oil Diſtilled.* Being given from ſix drops to twelve in any proper Vehicle, it cures the Colick almoſt to a Miracle; it ſtrengthens the Stomach and all the other Viſcera, expels Wind, and prevails againſt a *Tenaſmus*; it is an excellent thing to be taken Morning and Night for ſome time, by thoſe who are affected with the Palſie, or any inward Convulſions, and is of ſingular uſe, being outwardly applied to the parts affected with the ſame Diſeaſes, and gives eaſe in the Gout proceeding from a cold Cauſe; anointed likewiſe upon parts affected with a Rheumatiſm, proceeding from cold, it cures it.

XX. *The Poteſtates* or *Powers.* They have all the Virtues of the Juice, Eſſence, Infuſion, Pouder, Tinctures, Spirit, and Oil, and are more ſubtil than any of them; being inwardly taken they diffuſe themſelves thro' the whole Body immediately, and being outwardly bathed upon any part, they immediately penetrate, even to the Bone it ſelf; yet they are ſo ſafe, tho' very hot and ſubtil, that they will cauſe no Contractions of the Nerves, but on the contrary, if they be applied to any thing of a Contracture, they will in a few times uſing it cure the ſame. Doſe inwardly from Forty to Eighty, or a Hundred drops, Morning and Night, in any Generous Wine.

XXI. *The Elixir.* This being the Powers exalted, and brought to their utmoſt perfection, may be ſaid to have all the ſame Virtues in tranſcendency. They are more Stomatick than any of the former Preparations, and therefore more proper to reſtore the Tone of the Viſcera, being hurt, and this more eſpecially upon the Cure of a Dropſie. Doſe Sixty or Eighty drops at a time, (ſeveral times in a day) in a Glaſs of ſtrong and fragrant Wine.

XXII. *The Collyrium.* Take of the Liquid Juice, clarified Honey, of each equal parts, mix them. It is good againſt Dimneſs of the Sight, Films, Cloudineſs, Pearls, Bloodſhot, and the like, being put into the Eyes Morning and Evening. Being taken inwardly it is good againſt Coughs, Colds, Hoarſeneſs, ſhortneſs of Breath, difficulty of Breathing, Poyſon, pains of the Spleen, and ſtoppage of Urine.

XXIII. *The Preſerve.* The Roots are taken green and cleanſed, then the whole Roots are to be boiled ſoft in White Port Wine, and ſo put into double refined Sugar, or clarified Honey, and boiled till the Sugar or Honey has penetrated them, and that they are brought to a conſiſtence. The dryed Roots may be preſerved alſo in the ſame manner, being firſt ſteeped till they are ſoft in White Wine; but yet the Preſerve of the Green Roots is moſt to be deſired. It is good to remove the coldneſs of the Viſcera, to warm and comfort a cold and moiſt Stomach, and cauſe Expectoration where Flegm is lodged in the Lungs.

XXIV. *The Syrup.* Take of the freſh Roots a Pound, being well cleanſed bruiſe them, and ſteep them three or four days in Vinegar, then extract the Juice and Vinegar with a Preſs; to every Pound of which add a Pound and half of clarified Honey, which by gentle boiling bring into a Syrup. It is an excellent Pectoral, cleanſes the Breſt and Lungs of tough Flegm, cauſing an eaſie Expectoration; opens Obſtructions of the Stomach, Spleen, and other Bowels, cauſes a good Appetite and a ſtrong Digeſtion, and repreſſes a Flux of Humors to the Glandulous parts of the Neck, Throat, and Meſentery.

CHAP. CCLXVI.

Of FLAG Water, *OR,* Water FLOWERDELUCE.

I. *THE Names.* It is called in *Greek* Ἶρις ὑδατία, ἢ Ψευδόιρις, in *Latin Acorus paluſtris, Pſeudoiris Dodonæi, Iris lutea paluſtris, Acorus adulterinus Tragi, Acorus falſus Cordi, Geſneri, & Matthioli; Acorus paluſtris Lobelij, Gladiolus luteus*: in *Engliſh Water Flag, Water Flowerdeluce, Segg,* and *Sceg.*

II. *The Kinds.* Some will have it that there are two Kinds of this Plant, becauſe ſometimes it is found ſo exceeding large, as four Feet or more high, and ſometimes again it is found not to be above a Foot and half high, or two Feet at moſt; but this difference in my Opinion ariſes only from the differing Qualities and Goodneſs of the Soil, it growing ſo exceeding large where the Soil is beſt, and more diminutive where it is worſer, there being otherwiſe no difference in the Roots, Blades or Leaves, Stalks, Flowers, Cods and Seed, nor yet in the manner and form of its growing.

III. The Deſcription. *It has a Root which is tuberoſe, but longer and ſlenderer than thoſe of the* Garden Flowerdeluces, *of a pale brownish Color on the outſide, and of an Horſe Fleſh Color on the inſide, with many hard Fibres ſpringing therefrom; the whole Root is very Styptick, and harſh in taſte.* From this Root ſpring up Sword like Leaves, like to thoſe of the *Garden Kind*, (the whole Plant growing almoſt exactly like to thoſe of the *Garden*) but that this has much longer and narrower ſad green Leaves, joined together in the ſame faſhion; ſometimes the Stalk grows to be between four and five Feet high, ſometimes not above two Feet high, or a little more, according to the Richneſs or Poorneſs of the Soil; at the tops of the Stalks come forth Flowers of a perfect yellow Color, and ſhaped ſomewhat like unto thoſe of the *Flowerdeluce*, with three falling Leaves, and other three arched which cover their

bottoms, but inſtead of the three upright Leaves, as the *Flowerdeluces* have, this has only three ſhort pieces ſtanding in their places, after which ſucceed thick and long three ſquare Cods or Heads, containing in each part ſomewhat large and flat Seed, very like to thoſe of the *Garden Flowerdeluces*, which are ſometimes reddiſh, purpliſh, and blackiſh.

IV. *The Places.* It grows uſually in watery Ditches, Ponds, Lakes, and Mooriſh Grounds, which are often overflowed, or kept wet with Water, as at *Lambeth*, on the *Bank Side* of the *Thames*, and Ditch Sides thereabouts; alſo in moiſt Meadows, low Grounds, Banks of Rivers, and the like: it grows in vaſt plenty in the Fens in *Cambridgſhire*, *Ile* of *Ely*, *Bedfordſhire*, *Lincolnſhire*, *&c.* And altho' it is by nature a Watery Plant, yet it will grow and proſper very well if planted in Gardens.

V. *The Times.* It grows up in the Spring, in *March* and *April*, Flowers in *July*, and the Seed is ripe in *Auguſt*.

VI. *The Qualities.* The Root is chiefly uſed, and is cold and dry in the ſecond degree, Aſtringent, Repercuſſive, Traumatick, Anodyne, and Arthritick.

VII. *The Specification.* It is known to bind the Bowels, and ſtop all Fluxes of Blood or Humors.

VIII. *The Preparations.* You may have therefrom, 1. *A Juice.* 2. *An Eſſence.* 3. *An Infuſion or Decoction in Wine.* 4. *A Pouder.* 5. *A Collyrium.* 6. *A Cataplaſm.* 7. *An Ointment or Balſam.* 8. *A Diſtilled Water.*

The Virtues.

IX. *The Juice.* Inwardly taken to a Spoonful or two in a Glaſs of Red Port Wine it is very aſtringent, and ſtops all Fluxes of the Bowels, whether of Blood or Humors, as alſo Piſſing of Blood, overflowing of the Terms, and other Fluxes of Blood at Mouth, Noſe, or other parts; in external Hæmorrhages it muſt be applied with Stuphes to the part.

X. *The Eſſence.* It has all the Virtues of the Liquid Juice, but is more effectual, being inwardly given, one or two Spoonfuls at a time, in any proper Vehicle, but it is to be repeated ſo often at due intervals of time as need ſhall require; It preſently ſtops the overflowing of the Loches of Women in Child-Bed, and ſtrengthens the Womb, and all the weakned parts.

XI. *The Infuſion or Decoction in Wine.* It has the ſame Virtues with the Juice and Eſſence, but is weaker, and therefore muſt be given in larger quantities, as five or ſix Ounces twice a day.

XII. *The Pouder.* Given to one Dram, or more, in Wine, it ſtops all internal Fluxes of Blood, whether in the Lungs, Stomach, Guts, Reins, Bladder, or Womb: outwardly applied alſo it ſtops Bleeding, and being ſtrewed upon old, moiſt, and running Sores, it cleanſes, dries up the moiſture, and induces their healing: ſtrewed upon a foul Bone it is ſaid to cleanſe it and cover it with Fleſh.

XIII. *The Collyrium.* Take of the Diſtilled Water four Ounces, Red Port Wine two Ounces, of the clarified Juice of the Root one Ounce, mix them. Dropt into ſore and watering Eyes it ſtops the Flux of Rheum, dries and heals them; Cloths or Spunges may alſo be wetted therein and applied upon the Forehead; it takes away alſo Clouds, Dimneſs, Films, Pearls, and the like.

XIV. *The Cataplaſm.* Applied to the Joints in the Gout it eaſes the Pain, and ſtrengthens the part afflicted, ſo that the Diſeaſe ſeldom or never returns any more upon that Foot; it alſo ſtops any Flux of Humors upon the part.

XV. *The Ointment or Balſam.* It is uſed after cleanſing of Wounds or Ulcers, to dry, incarnate, and heal, for as it breeds Fleſh, ſo it ſtops any defluxion of Humors thereupon, hindring the growing of proud Fleſh.

XVI. *The Diſtilled Water.* Dropt into the Eyes it is good againſt the watering of them, applied to the Forehead in wet Spunges it ſtops Defluxions, and fomented on hot Tumors and Inflammations of Womens Breaſts, as alſo upon Cancers, and *noli me tangere*, it cools and gives much eaſe, and this more eſpecially if it is mixed with a little *Saccharum Saturni*, and then it prevails againſt foul and putrid Ulcers happening in the Privy Parts of Man or Woman, or in any other part of the Body.

CHAP. CCLXVII.

Of FLAX Manured *or* Common.

I. *THE Names.* It is called by the *Arabians* *Bazarichichen*, or *Bezerchetan*, in *Greek* Λίνον, in *Latin Linum*, and in *Engliſh Flax*, and *Line*, which laſt Name ſome will have from making Lines of it; but I take it to be derived from the *Greek* Name.

II. *The Kinds.* Of *Flax* there are two principal Kinds, *viz.* 1. *The Manured*, of which we ſhall Treat in this Chapter. 2. *The Wild Kind*, of which in the next. *The Manured*, *Garden*, or *Common Kind*, is a ſingular Plant, (of the Peelings of which they make fine Cloths) and is deſcribed as followeth.

III. The Deſcription. *It has a ſmall fibrous Root, which periſhes every Year, from whence riſes up a round pliant Stalk, about a yard high, beſet with narrow, long, and ſoft Leaves, without any order, and is branched on the top into three or four ſmall Branches, each of them bearing two or three fair Blue Flowers, made of five round pointed Leaves apiece, with*

ſome

ſome threads in the middle, which being paſt away, round Buttons ſucceed, which are pointed above, and in which are contained flattiſh, ſmooth, ſhining, brown Seed.

Common Garden Flax

Flax

IV. *The Places.* It grows in *England*, *France*, *Germany*, *Italy*, and in molt Countries of *Europe*, the Seed being Sown every Year; it grows in *America* alſo, as in *Carolina*, where I have known it to grow and flouriſh very well: it proſpers beſt as *Columella* ſays, in a fat, moiſt, and fruitful Soil. Some, ſays *Palladius*, Sow it thick in a lean Ground, and ſo have a fine ſort of *Flax*. *Pliny* ſays that it is to be Sown in Gravelly places, eſpecially in Furrows. Experience has taught us that it grows admirably well in Light, Sandy and Gravelly Grounds, ſuch as *France* abounds with, where it grows in vaſt plenty, and in other Countries where the Ground is Sandy and Light, as in *Florida*.

V. *The Times.* *Flax* is Sown in the Spring, and Flowers in *June* and *July*, the Seed ripening in the mean Seaſon; after it is plucked up, or cut down, as *Pliny Lib.* 19. *Cap.* 1. ſays, the Stalks being bound up in ſmall Bundles, are put into Water ſubject to the heat of the Sun, and have ſome weighty things laid thereon, that they may the better ſteep, and they are ſo long to lye in the Water, till the Rind or Peeling ſeems to be looſened ſo as it may eaſily peel off, then it is taken up and dryed in the Sun; after which the Peelings are prepared for the Block and Hackle, to make the Fibres thereof very fine, in order for Spinning and Making Cloth.

VI. *The Qualities.* There is nothing of this Plant uſed in a Phyſical way but the Seed only, and that ſeems to be temperate in reſpect to heat or coldneſs, and is Emollient and Laxative, Pectoral and Antipleuritick.

VII. *The Specification.* It is peculiar againſt Pleuriſies, the Piles, and all Contractures of the Nerves and Muſcles.

VIII. *The Preparations.* You may have therefrom, 1. *The Seed prepared.* 2. *A Pouder of the Seed.* 3. *A Decoction.* 4. *A Balſam.* 5. *A Cataplaſm.* 6. *An Oil by Expreſſion.* 7. *A Fumigation.*

The Virtues.

IX. *The Seed prepared.* *Galen* ſays that ſome parched the Seed, and eat it with Honey for Food, and that others put it into their Bread, but ſays he *primo Alimentorum*, it troubles the Stomach, is hard of Digeſtion, and gives not much Nouriſhment to the Body; but as to the moving of the Belly downwards (ſays he) I will neither commend nor diſcommend it, but it in ſome ſmall meaſure provokes Urine, which it does beſt being parched.

X. *The Pouder of the Seed.* If it is mixt with an eighth part of Pepper in fine Pouder, and made into an Electuary with Honey, and taken to the quantity of a large Nutmeg every Morning faſting, and Night going to Bed, it prevails againſt Coughs, Colds, Hoarſeneſs, Wheezing, Obſtructions of the Lungs, and vehement Catarrhs.

XI. *The Decoction in Wine.* Sweetned with Honey and drunk it eaſes the Bellyach and Colick, Stitches, and all Inflammations of the Viſcera; if Raiſons are boiled in it it opens (ſays *Plin.*) the Obſtructions of the Liver; and if it is applied to any fretting or running Sore it dries it, and ſtays it from ſpreading farther.

XII. *The Balſam.* If it is made into a Balſam with Roſin, Pouder of Myrrh, and ſome of the Oil by Expreſſion, and applied to Ruptures, or Swellings of the *Scrotum* or Teſticles, it cures the one and diſcuſſes the other; it alſo diſcuſſes Tumors in any other part of the Body.

XIII. *The Cataplaſm.* If it is made with equal parts of Line Seed, Fenugreek Seed, and Mallows, and applied, it is of good uſe to mollifie and diſcuſs any Tumor or Hardneſs in any part of the Body. If it is made with *Sal Nitre* and Fig-Tree Aſhes it eaſes the Pains, and takes away the hardneſs of the Nerves, Tendons, and Muſcles. If it is made with Figs and Wild Cucumber Roots, and applied, it draws forth Splinters, Thorns, Nails, Prickles,

Splinters of Broken Bones, or any other thing ſticking in the Fleſh. If it is made with Creſſes it takes away the ruggedneſs of the Nails. If it is made with Olibanum, Myrrh, and Wine, and applied to the Forehead, it helps the Watering of the Eyes. If it is made with Honey, Suet, and Bees Wax, and applied, it helps Struma's, hard Kernels and Swellings under the Ears or Throat; it takes away alſo Spots and Blemiſhes of the Skin, Sunburnings, and other Diſcolorings.

XIV. *The Oil by Expreſſion.* It is ſaid to be a Specifick for curing a Pleuriſie, as alſo Stitches, Peripneumonia's, and other exquiſite pains of the *Thorax*, giving it to ſix or eight Ounces at a time, or more, and repeating the ſame at due intervals of time ſo long as need requires; it is an excellent thing to anoint with, to mollifie the ſhrinking and hardneſs of the Nerves, Tendons, or Muſcles, ſoften any hard Swelling, and to give eaſe, and cure the Piles, Chaps of the Fundament; to ſoften the hardneſs thereof, and eaſe the pain; it alſo ſoftens the hardneſs of the Mother; if it is beaten with Red Roſe Water, or rather with Water, in which Nitre, or *Saccharum Saturni* has been diſſolved, and then be applied to Burnings and Scaldings, it cures them; it is good to burn in Lamps, and will burn longer than Oil Olive will, yet it makes much more Smoak and Soot: beſides all theſe things, it is of excellent uſe for Painters to make their Drying Oil of, and to mix their Colors with to be applied to Cloth, or Wood, or Stone, Iron, Copper, or Glaſs, *&c.*

XV. *The Fumigation.* If a Woman ſits over the Fumes of the Decoction of the Seed in Water, or in Water and Vinegar, it ſoftens the hardneſs of the Womb, and eaſes the pains of the Mother.

CHAP. CCLXVIII.

Of FLAX Wild.

I. *THE Names.* It is called in *Greek*, Λινον ἄγειον: in *Latin*, *Linum ſylveſtre*, *Linum agreſte*; and in *Engliſh*, *Wild Flax*.

II. *The Kinds.* There are ſeveral kinds of this Plant, as, 1. *Linum ſylveſtre Catharticum*, *Linum Anglicum*, Our Engliſh Wild Flax, *or* Purging Wild Flax, called by the Country People, *Mil-Mountain*. 2. *Linum ſylveſtre anguſtifolium floribus albis*, *vel Cæruleis*, White Wild Flax. 3. *Linum ſylveſtre tenuifolium*, Thin or Narrow-leav'd Wild Flax. 4. *Linum ſylveſtre latifolium floribus Cæruleis*, Broad-leav'd Wild Flax, blew-flowred. 5. *Linum ſylveſtre latifolium floribus Luteis*, Broad-leav'd Wild Flax yellow-flowred. 6. *Chamælinum perpucillum*, *Linum ſylveſtre pumilum*, Dwarf Wild Flax. 7. *Linum ſylveſtre vulgatius*, The more common Wild Flax.

III. The Deſcriptions. *The firſt*, *or* Purging Wild Flax, *has a crooked Root, which is ſmall, white and fibrous, which ſends forth ſometimes one, but moſt commonly five, ſix or more round Stalks, about eight, ten, or twelve inches high, of a brown or reddiſh color; every Stalk dividing it ſelf near the top, or from the middle upwards into many Branches, of a greener color than the lower part of the Stalk.* The Leaves are ſmall, ſmooth, and of a green color, of the bigneſs of *Lentil* Leaves, and have in the middle one Rib or Nerve, and no more that may be perceived, and grow along on the Stalk, in very good Order, by couples, one oppoſite againſt another. At the tops of the ſmall Branches the Flowers grow, of a white color, conſiſting of five ſmall Leaves apiece, the Nails whereof are yellow. In the inſide are placed ſmall ſhort Chives alſo of a yellow color; after which come up little Knobs or Buttons, the tops of which, when the Seed is ripe, divide themſelves into five parts, in which is contained ſmall, ſmooth, flat, ſlippery yellow Seed. When the Seed is ripe, the whole Herb periſhes. The Plant is of a bitter Taſte and herby Smell.

IV. *The ſecond*, *or* White Wild Flax, *has a Root which is tough and ſmall, and grows like, and has Leaves like unto the* Manured Flax, *but narrower, and growing upon round, bright and ſhining Stalks, a foot long, having Flowers like the* Manured Flax, *but of a white color.* But this Plant is ſometimes found with deep blew Flowers, with *Violet* colored Flowers, and ſometimes with white Flowers, ſtreaked with purple Lines.

Wild Flax

V. *The third*, *or* Thin or Narrow leav'd Wild Flax, *has a tough ſlender Root, with ſeveral Fibres adjoining to it, which ſends forth many Stalks, furniſhed with narrow thin Leaves:* the Flowers conſiſt of five Leaves apiece, of a light Purple or Fleſh color, which do ſoon fade and fall away. The Stalks are of about a Cubit in height, beſet with ſmall Leaves, yea leſſer than thoſe of *Linaria purpurea*. The whole Plant is very like to the *Common Manured Flax*, but in every reſpect leſſer.

VI. *The fourth*, *or* Broad-leav'd blew-flowred, *has a Root which is great, and lives after Seed-time, ſhooting forth new Stalks, with woolly Leaves on them, and ſo abides all the Winter.* This Root, ſays *Gerard*, does continue many Years without Sowing, encreaſing by its Root into many other Stalks, riſing up with many thick, ſtiff and hairy Branches, ſometimes with but one, and ſometimes with more, a foot, or foot and half high, and beſet with many rough and hairy broad Leaves, (broader than in any of the other ſorts.) The Stalks towards their tops branch themſelves out, and are beſet with ſmaller Leaves than thoſe below. At the tops of the Stalks

do

do grow many blew flowers, much greater and larger than thoſe of the Common manured Flax, even as great almoſt and large as Mallows, ſometimes of a deeper, and ſometimes of a Paler blew; conſiſting of five Leaves a piece; which being paſt away, there ſucceeds ſmall ſharp pointed heads (in the green husk which held the flowers) which are full of Seed; and being ripe, open and ſhew the ſame, which is flat, and of a blackiſh ſhining Colour, like Line Seed.

VII. *The Fifth, or* Broad leav'd yellow flowred, *has a Root which is thick and crooked, with many Fibres thereat, which periſhes not, but abides many Years. It ſprings forth with many Stalks, about a Cubit high, ſomewhat red and ſtiff, alſo round and of a browniſh Colour, ſet with pretty large and thick Leaves, not rough and hairy, but ſmooth and hard.* The Flowers grow plentifully on the tops of the Stalks, being compoſed of five Leaves apiece, and are large, of a fair, ſhining, yellow Color, with five threads, coming forth in their middle, having alſo as many ſmaller and ſhorter hairs. The Seed is contained in Heads, flatter than in any of the other, and is of a blacker Color, but not ſhining like them.

VIII. *The Sixth, or* Dwarf Wild Flax, *has a Root which is ſmall and threddy, which ſends forth many ſlender Stalks, of about five, ſix, ſeven, eight,* or *nine Inches high, furniſhed with ſeveral ſmall, long Leaves,* and *growing on them by Couples.* At the tops of the Branches grow the Flowers, which are White, or of a pale yellow, leſſer than thoſe of the manured Flax, with yellow Threads in the middle. The Seed is contained in little round heads, and is ſmall. The whole plant is in all things like unto Flax; but in its Stalks, Leaves and Flowers, and all other parts thereof, it is four times leſſer.

IX. *The Seventh, or* more Common Wild Flax, *has a Root like the manured Kind, and grows alſo like it, but has greater and higher Stalks, more branched at the Tops, and bearing a greater ſtock of blew Flowers on them, with Seed alſo like to the ſame:* But the Seed Veſſels will hold or contain the ſame, and not break open, when ripe, with the heat of the Sun, as the manured kind will do.

X. *The Places.* The firſt grows plentifully in the unmanured Incloſures of *Hampſhire*, on *Chalky Downs*, and on *Purfleet Hills*, in *Eſſex*, as alſo in many other places of this Kingdom: *Geſner* would would have it to be the *Helleborine* of the Ancients. All the reſt grow in Gravelly Grounds: The ſecond and ſeventh, in well manured Places, as alſo in Gardens and other the like Soils. The fourth and ſixth, grow upon Rocks and Cliffs near the Sea-ſide, *Gerard* ſaw them grow upon the Sea-banks by *Lee* in *Eſſex*, and in many places in the Iſle of *Sheppy*: They grow alſo between *Queenborough* and *Sherland Houſe*. The third and fifth, in Borders of Fields, in untilled places, and Hilly Grounds.

XI. *The Times.* The firſt ſprings out of the Ground at the beginning of the Spring, and flowers all the Summer. All the reſt flower thro' all *June*, *July*, and *Auguſt*; the Seed ripening in the mean time.

XII. *The Qualities, Specifications, Preparations,* and *Virtues* of the ſix latter deſcribed Plants, are the ſame with thoſe of the manured Flax in *Chap.* 267. aforegoing, and therefore we ſhall ſay no more of them here; but come directly to conſider the firſt, or *Cathartick* kind, which is the moſt uſeful.

XIII. *The Qualities.* It is hot and dry, ſuppoſed in the ſecond Degree: *Stomatick, and Cathartick.* How this Herb came to be ſo known, as to be taken notice of, Mr. *Goodyer* (in *Johnſon* upon *Gerard*'s Herbal) has given us an account of going to an *Apothecaries* Shop at *Wincheſter* in *Hampſhire*, I ſaw (ſays he) this Herb lying upon the Stall, which I had ſeen long before, I deſired of him to know the Name of it; he told me, it was called *Mill Mountain*, and that Doctor *Lake*'s Man had given him the name of it, as alſo the Way how his Maſter the Doctor (who was afterwards Biſhop of *Bath* and *Wells*) did uſe it.

XIV. *The Virtues and Uſe.* Take a Handful of *Mill Mountain*, the whole Plant, Leaves, Seeds, Flowers and all, bruiſe it, and put it into a Pipkin, with a Pint of *White Wine*, and ſet it on hot Embers to Infuſe all Night, then pour off the clean Wine, and drink it the next Morning faſting. This will give eight or ten Stools, and purges and cleanſes the Stomach and Bowels admirably well. And this was the thing, which the ſaid Doctor *Lake* always uſed for his Purge.

CHAP. CCLXIX.

Of FLAXWEED Narrow leav'd, OR, TOAD-FLAX Narrow leav'd.

I. *THE Names.* It is not known to have any *Greek* Name, and yet Authors have called it Ψευδόλινον and Ὄσυρις: in *Latin*, *Pſeudolinum*, and *Linaria*: *in* Engliſh, *Flaxweed* and *Toad Flax*.

II. *The Kinds.* There are three General Kinds of this Plant, *viz.* 1. Ψευδόλινον τενόφυλλον, *Linaria, anguſtifolia*, narrow leaved Flaxweed, or Toad Flax; of which in this *Chapter*. 2. *Pſeudolinum, vel Linaria latifolia*, broad leaved Flaxweed; of which, in the next *Chapter*. 3. *Chamælinaria, Linaria pumila;*

mata, *Linaria repens*, creeping Flaxweed, or Toad Flax, of which in *Chapter.* 271. following.

III. *Of the first of these General Kinds*, there are these Species following. 1. *Linaria Vulgaris nostras*, *Pseudolinum Brunfelsii*, *Loneceri*, and *Dodonæi*, *Osyris*, *Matthioli*, *Fuchsii*, *Cordi*, and *Lobelij*: Our Common Flaxweed, or Toad Flax. 2. *Linaria Valentina Clusij*, *Hispanica tertia Clusij*, Spanish Flaxweed of *Clusius*. 3. *Linaria Pannonica major*, *vel Osyris alba*, White Flaxweed or Toad Flax. 4. *Linosyris Superorum Lobelij*, Golden Star fashioned Flaxweed, or Toad Flax. 5. *Linaria aurea Tragi*, Golden Flaxweed, or Toad Flax. 6. *Linaria sive Osyris*, *vel Scoparia Italorum*, Besom Flaxweed, or Toad Flax. 7. *Pseudolinaria montana alba*, *Anonymus Clusii*; *Anthylis Montana Lugdunensis*, *Linaria adulterina alba*, Bastard Flaxweed, or Toad Flax. 8. *Linaria purpurea*, Purple Flaxweed, or Toad Flax, variable Flaxweed.

IV. The Descriptions. *The first, or our* Common Flaxweed, *has a Root which is somewhat Woody, and White, especially the main down right one, with many Fibres, abiding many Years, shooting forth Roots, every way about, and new Branches every Year, which sends forth divers small, slender, blackish Stalks, full set with long and narrow Flax like, blew or ashcolored Leaves, and from the middle of them upwards, replenished with a number of pale yellow Flowers* (of a strong unpleasant Scent) having Spurs hanging to them like Larks spurs; and having a Mouth like to a Frogs Mouth, such as are to be seen in Common *Antirrhinum*, or *Snapdragon* (of which *Flaxweed* is said to be a Kind) which are deeper and yellow withall. After the Flowers are past away, round Heads come forth, having blackish flat Seeds. The whole Plant before it comes to Flower, is so very like to *Esula minor*, that the one is scarcely known from the other, but by this Old *Verse*: *Esula lactescit*; *sine lacte Linaria crescit*.

V. *The second, or Spanish* Flaxweed, *has a Root like the other, which perishes not in Winter, but abides for a long time, and by which the Plant multiplies it self and is increased.* From the Root spring up many small Stalks, about a Foot high or more, on which grow very plentifully many narrow Leaves of a greyish or Ashcolor, and at the tops of them, store of small Flowers, which are of a Whitish color on the out side, and more purplish inwardly; but about the gaping Mouth, being of a more yellow color, but yet pale also; the spur behind being of a purplish color; the Seed which succeds (when it has any, for it seldom bears) is like to the former.

VI. *The third, or* White Flaxweed, *has a great, thick and long Root with some Fibres or Strings adjoining to it, from which rise up many Branches or Stalks very large and pliant, beset towards the top with Flowers, but of a pale, whitish color, and the inner part of the Mouth is somewhat more wide and open than the first, and the Leaves like to the Common sort.* Indeed this is in many things like to our Common kind, but the Leaves hereof are larger, and the Flowers greater, and fewer of a pale yellow, but of a deeper yellow in the Mouth, with some hairiness therein.

VII. *The fourth, or* Golden Starfashioned, *has a Root compact of many Strings, intangled one within another; from whence rise up Stalks very stiff and Woody, beset with Leaves like the Common* Linaria *at* Sect. IV. *above, with Flowers at the tops of the Stalks, of a faint shining, yellow color, in form and shape somewhat like unto Conyza major.* This Herb is stalked and leaved like *Common Flax*, and thought by some to be the true *Osyris*; for which reason latter Writers have called it by a Compounded Name *Linosyris*, it grows to be three feet or more high, and is in taste sharp and bitter, having a Clammines or Glutinosity with all.

VIII. *The fifth, or* Golden Flaxweed, *has a great tufted Fibrous Root, from whence rise up many Stalks a Foot and a half high; which are divided towards the tops into many small Branches:* On the several Tops grow Tufts of small Flowers, each little flower being parted into five parts, with a little thread or pestle in the middle; so that it seems full of many golden Hairs or Thrums. The Seed is long and blackish, and is carried away with the Wind. *Fabius Columna* has proved this to be the Chrysocome described by *Dioscorides*, *Lib.* 4. *Cap.* 55.

IX. *The Sixth, or* Besom Flaxweed, *has a Root consisting of a great number of blackish Strings set together, which, with the whole Plant perishes every Year.* From this Root springs up most usually but one straight upright square Stalk, three foot and a half or more high, (as it grows in our Gardens) branching it self out divers ways; bearing thereon, many long, narrow Leaves like our Garden or Manured Flax, very thick set together, like unto a Bush, or rather like unto a fair green *Cypress-tree*, growing broad below, and Spire fashion upwards, of a very fair green Colour. At the several joynts of the Branches towards the Tops, and among the Leaves, come forth small reddish Flowers, not easily seen, nor much regarded, which turn into small round blackish grey Seed. This *Broom Flaxweed*, tho' it has no beautiful Flowers; yet the Curious Plant it in their Gardens, because the green Plant full of Leaves, is very delightful to behold; being in *Italy* and other places, planted not only in their Gardens, but also in Pots, to furnish and adorn their Windows; and even with us it grows to be so delectable a green Bush, that it is thought to be worthy to be enumerated among our Hortary rarities and delights.

X. Gerard *says that this* Besom, *or* Bushy Flaxweed, *from one small Stalk, has many Shoots or Branches, making the whole Plant to resemble a* Cypress-tree, *the Branches growing so handsomely; very thick and Bushy,*

Bury, ſo that in ſome places where it naturally grows, they make Beſoms of it, from whence came the name Scoparia. The Leaves are ſmall and narrow, almoſt like to the Leaves of *Flax*. The Flowers are ſmall, and of an Herby color, growing among the Leaves; it keeps Green to Winter, or till the Froſty weather comes, the hardſhip of which it never out lives.

Baſtard Toad Flax.

XI *The Seventh, or* Baſtard Flaxweed, *has a Root which is White, divided into ſeveral Branches, and lives long, every Year ſending up many Stalks, which are hard, pale, green and ſtraked; growing to be a Foot high or more; and upon theſe, without any order, grow many hard, narrow, long* Leaves, *like thoſe of* Flax; *at firſt of a very tart, but afterwards of a bitteriſh Taſte.* The tops of the Stalks are branched out into ſeveral Foot ſtalks, which carry little white Flowers, conſiſting of five ſmall leaves apiece, lying Star faſhion, with ſome threads in the midſt. Theſe being paſt away, a ſingle five cornered Seed comes forth, containing a white Pith, in a hard Film or Skin.

XII. *The Eighth, or* Purple Flaxweed, *has a Root which is ſmall and thready, periſhing for the moſt part every Year, and ſpringing again of its own ſowing, if it is ſuffered to ſhed its Seed, except the hardneſs of the Winter kills it.* From this Root riſe up ſeveral ſmall, thick, long, and ſomewhat narrowiſh Leaves, of a whitiſh green Color; among which riſe up divers Stalks of a Cubit height, beſet with long narrow Leaves, like unto thoſe of our Common *Flaxweed* at *Sect.* IV. aforegoing: Theſe Stalks towards the Tops are repleniſhed with many ſmall Flowers of a Purple Color, growing together one above another, ſpike faſhion, which are ſmall and ſomewhat ſweet, whilſt they are freſh, and formed much like unto our Firſt or Common *Flaxweed*, with a gaping mouth, but they are much ſmaller, and want that crooked Spur behind. Sometimes they are of a ſad Purple, near unto a Violet Color, and ſometimes of a Paler blew Color, having a yellow ſpot in the middle, or gaping place. The Flowers being paſt ſmall, hard, round heads come forth, in which are contained ſmall, flat, and greyiſh Seed.

XIII. *The Places.* The firſt grows almoſt every where thro' the whole Kingdom, both by the Way ſides, as in Meadows, and alſo by Hedge ſides, and upon the ſides of Banks and borders of Fields. The ſeventh grows on Mountainous places in *Germany*; and it has been found growing Wild in *England*, on the ſide of a Chalky Hill, in an Incloſure, on the right hand of the Way as you go from *Droxford* to *Poppie Hill* in *Hampſhire*; all the reſt are only nurſt up with us in Gardens.

XIV. *The Times.* They all flower in the Summer Months, from *May* to *Auguſt*, and the Seed is ripe ſoon after. The eighth, tho' it often ſows it ſelf, yet by reaſon a hard froſty Winter may kill the Seed, it ought to be ſown anew every Spring.

XV. *The Qualities.* They are hot and dry in the ſecond Degree; *Aperitive, Abſterſive, and Diuretick, Hepatick, Splenetick, and Nephritick, Cathartick, Emmenagogick, Sudorifick, and Alexipharmick.*

XVI. *The Specification.* They are peculiar againſt the Strangury, Dropſie, Jaundice, and Poyſon.

XVII. *The Preparations.* You may have therefrom, 1. *A Juice*, 2. *An Eſſence*, 3. *An Infuſion* or *Decoction in Wine.* 4. *A Pouder of the Seed.* 5. *A diſtilled Water from the whole Plant.* Of all theſe kinds, the firſt is the moſt effectual, and moſt uſed.

The Virtues.

XVIII. *The Liquid Juice.* Given to three or four ſpoonfuls Morning, Noon, and Night in a Glaſs of White *Lisbon* or *Port* Wine, it gives eaſe in the Strangury, powerfully provokes Urine when it is ſtopped by Sand, Gravel or Tartarous matter, and carries off by Piſſing the Water in Dropſies. It effectually provokes the Terms in Women, and drives forth the Dead Child and After-birth. Put into Foul Ulcers, whether they be Cancerous or Fiſtulous, with Tents rowled therein, or the parts waſhed therewith, or it being injected into them, cleanſes them throughly from the bottom, and in a ſhort time heals them up ſafely. It alſo cleanſes the Skin wonderfully from all ſorts of filthineſs and deformities, as Spots, Marks, Freckles, Lentils, Yellowneſs, tawnineſs, Wheals, pimples Scabs, Scurfs, Morphew, Leproſie, and other the like Defœdations.

XIX. *The Eſſence.* It has all the Virtues of the Liquid Juice, beſides which, it waſhes and cleanſes the Reins and Uretory parts from Stones, Gravel, Sand, and Tartarous Mucilage heaped up in thoſe parts; and taken from two to four Spoonfuls in *White Lisbon* or *Port Wine*, it moves the Belly downwards, and prevails both againſt the Dropſie and Yellow Jaundice. Dropt into the Eyes, it is a certain remedy againſt all Heat, Inflamations, and Redneſs therein. It opens obſtructions of the Liver and Spleen, purifies the Blood, and is good againſt Hypochondriack Melancholy.

XX. *The Infuſion, or Decoction in Wine.* It has all the Virtues of the Juice and Eſſence, but weaker in Operation, and therefore muſt be given in larger Doſes, as to ſix, ſeven or eight Ounces. It expels Poyſon, and is good againſt the Bitings of Mad Dogs, Serpents, or other venemous Beaſts.

XXI. *The Pouder of the Seed.* Given to One Dram with the Liquid Juice, or Eſſence, or Infuſion or Decoction as aforeſaid, and continued for ſeveral days together, it is held to be a ſingular Remedy

medy againſt the Dropſie, by reaſon it powerfully evacuates Watry Humors. It operates ſo much the more effectually, if the Pouder of the Bark of Dwarf Elder, be mixed therewith in equal quantities, and it be aromatiz'd with a little Cinnamon.

XXII. *The Diſtilled Water.* It has the Virtues of Juice, Eſſence and Decoction, but acts in a much weaker manner. It cools Inflamations in any part, and may ſerve as a Vehicle to convey the other preparations in.

CHAP. CCLXX.

Of FLAXWEED Broad leav'd, *OR,* TOAD-FLAX, Broad leav'd.

I. *THE Names.* It is called in *Greek*, (if what ſome Modern Writers ſay, may be admitted Ψευδόλινον πλατύφυλλον: in *Latin Pſeudolinum latifolium*, *Linaria latifolia*, *Oſyris latifolia*, alſo *Urinalis*, and *Urinaria*; from the Effects: in *Engliſh*, *Broad-leaved Flax-weed*, or *Toad-flax*.

II. *The Kinds.* Some have taken this to be the *Antirrhinum Plinij*; but it may poſſibly be the *Oſyris Dioſcoridis*, *Galeni*, *& Plinii:* Authors make five Kinds of this Broad leaved, *viz.* 1. *Linaria latifolia*, *Sive Oſyris latifolia*, *alba Lobelii*; White flowred broad leaved Flaxweed. 2. *Linaria Americana flore parvo*, *American* Flaxweed. 3. *Linaria Latifolia Dalmatica*, The Great *Dalmatian* Flaxweed. 4. *Linaria Latifolia Cretica Major*, The great broad leaved *Candy* Flaxweed. 5. *Linaria triphylla Cærulea Apula Fabii Columnæ*, The blew three leaved Flaxweed of *Naples*.

III. The Deſcriptions. *The firſt or white flowred bread leaved, has a Root which is white, long, thick, and great, enduring ſeveral Years, and not decaying; from which Root riſe up many tough, pliant Stalks, with many Leaves thereon, ſome broad, cut into many narrow long ſlips, and ſome of them long and narrow, without any cut or diviſion, ſomewhat like thoſe of our* Common narrow leaved Flaxweed *in* Chap. 269. Sect. 4. Set ſometimes upon a middle Rib, after a Winged faſhion, yet commonly at the end of the rib, broad, and divided into two or three, or more parts. At the tops of the Stalks grow ſeveral pale, whitiſh Flowers, reſembling the aforenamed common kind, but with a wider and more open mouth. The Seed is not unlike the other, being very ſmooth.

IV. *The ſecond, or* American kind; *has a Root like the former, which ſhoots forth ſeveral ſmall ſlender, reddiſh Stalks, ſpread into many branches, on which grow on both ſides of them* (but without any order) *many dark green Leaves, which are broad, in reſpect to the narrow leav'd kinds, but narrower than thoſe of* Dalmatia *or* Candy *next following, tho' not much ſhorter, and end in a ſharp Point.* The Flowers grow at tops of the Stalks, in the ſame manner which the Common narrow leaved kind do, at *Chap.* 269. *Sect.* 4. and are of a gold yellow color, but much leſſer than they.

V. *The third, or* Great Dalmatian, *has a Root which is white, and ſpreads it ſelf by ſeveal ramifications under Ground, not periſhing as the Wild kind does, but abiding in the Winter with both Root and Stalks, ſhooting forth freſh Leaves every Spring.* Theſe Leaves are fair, large, and green, ſpreading upon the Ground, being about 2 inches long, and an Inch broad, ending very ſharp pointed, without any foot-ſtalks at them, but riſing up with the Stalk, which is firm, hard and round, about 2 or 3 Feet high, and has like Leaves ſet thereon, without any order, up to the top, but leſſer and leſſer, as they grow higher. The Stalk is branched at the top, having at every one of the branches ſuch like ſpikes of deep, or gold-yellow Flowers as are in the Common Wild Kind at *Chap.* 269. *Sect.* 4. with Spurs behind them; but each of them are three or four times larger than the Common aforenamed; and the Seed is alſo like the ſame, and encloſed in like heads, but larger.

VI. *The fourth, or* Great broad leav'd Candy, *has a Root which is hard and white, bigger at the head, and ſmall below, with ſome Fibres adjoining to it.* This Root ſends forth a round thick Stalk, two or three feet high, ſpreading into many branches, on which are ſet ſometimes two, and ſometimes three Leaves together, on a ſmall foot-ſtalk on each ſide of them, ſometimes one againſt another, and ſometimes not, without keeping any order, each of which is larger and longer than thoſe of the *Dalmatian* kind, and of a greyiſh green color, with three veins or ribs in every one of them. At the tops of the branches grow Flowers made for the Form, like the other kinds, but of a differing color; for the gaping Mouth is of a pale blew, and more yellow underneath, with a pale or blewiſh, and ſometimes more purpliſh Spur behind; the Heads and Seed, are alſo like thoſe of our Common Wild kind at *Cap.* 269. *Sect.* 4. aforementioned.

VII. *The fifth, or* Blew three leav'd, *has a Root which is ſmall and white, which ſends forth ſometimes but one Stalk, ſometimes more than one, which are White: At whoſe joints is ſometimes but one, and ſometimes three Leaves ſet together, divided almoſt like Rue leaves, but larger, and cut deeper in, and pointed at the ends of a greyiſh green, or Aſh color.* The tops of the Stalks are repleniſhed with ſuch like Flowers, but ſmaller, and wholly of a blew color, excepting the Mouth which is yellow. They being paſt away, ſmall round Heads follow, containing large, flat, and blackiſh Seed.

VIII. *The Places.* Their Names or Title ſhew their Original, or in what places they are Natives; but being brought to us are Nurſt uponly in Gardens: and the firſt is a peculiar Garden Plant.

IX. *The Times.* They all flower in the Summer Months, from the end of *May* to the end of *Auguſt*, but with us, ſcarcely give any ripe Seed; The *American* kind flowers very late, as about the end of *Auguſt*.

X. *The Qualities, Specifications, Preparations and Virtues*, are the ſame with thoſe of the narrow leav'd kind, and in eſpecial with the firſt of that Species in the laſt *Chapter*, that being the moſt effecacious of them all; after which, theſe of the broad leav'd kind come next in place.

XI. *An Obſervation.* The broad leav'd Flaxweed is by much the more powerful opener of Obſtructions of the Reins, Ureters, and Blader, and the greater provoker of Urine; From which eminent faculty it was, that it obtained the Names of *Urinalis* and *Urinaria:* It gives preſent eaſe in the Srangury, heat, pain, ſharpneſs and ſcalding of Urine, and expels Stones, Gravel, Sand, and Tartarous Mucilage from the Urinary parts, being given the Juice, Eſſence, Infuſion, Decoction, Syrup or Pouder, *&c.*

CHAP.

CHAP. CCLXXI.

of FLAXWEED Creeping, OR, TOAD-FLAX Dwarf.

I. *THE Names.* It may be called in *Greek* Ψευδόλινον ἕρπον, in *Latin Pseudolinum repens*; *Linaria pumila*: and in *English Dwarf* or *Creeping Flaxweed*, or *Toad Flax.*

II. *The Kinds.* Authors make six or more kinds, most of them strangers to us in *England*; the chief which we shall take notice of in this place, are the three following, *viz.* 1. *Linaria cærulea repens*, The Creeping, or Dwarf, blew, or purple Flaxweed, or Toad Flax. 2. *Linaria pumila Hispanica*, Spanish Dwarf Flaxweed, or Toad Flax. This is *Osyris flava Sylvestris Bauhini*, and the *Osyris minor Tabern montani.* 3. *Linaria quadrifolia supina*, or *quadrifolia Alpina*; *Linaria Alpina Gesneri*; *Linaria tertia Styriaca Clusii*, Four leav'd Creeping Flaxweed, or blew Mountain Toad Flax.

III. The Descriptions. *The first, or* Creeping Dwarf, blew, or purple Flaxweed, *has a Root which is made up of many Fibres, and abides, not perishing in the Winter; this Root sends forth a number of small weak Stalks, leaning down to the Ground, scarcely being able to stand upright; set very full and without order, with little Leaves like those of manured Flax, which are very narrow, and Ashcolored, and are continued up to the tops of the Stalks, where they divide themselves into several other Branches, which have all of them long Heads or Spikes of Flowers, very small, and of a fine blewish purple color, with a yellow Spot in the Mouths of them.* The Seed is much like to that of our Common narrow leav'd kind, in *Chap.* 369. *Sect.* 4. aforegoing.

IV. *The second, or* Spanish Dwarf Flaxweed, *has a Root small, Fibrous and white, creeping under Ground, and perishing every Year; from which shoot up many weak Branches, not able to stand upright, rising to be about six Inches or more high*: on which do grow many long and narow Leaves, very like unto our Common narrow leav'd kind, as well for form as color; so also the Flowers at tops of the Stalks, and the Heads and Seed are like the same, the Flowers being yellow, and the Seed flat and blackish; only in this the Leaves, Flowers and Seed, are all of them much less than the said Common narrow leaved kind, in which consists the difference.

V. *The third, or* four leaved creeping Flaxweed, *has a Root which is small, or slender, and white, spreading it self under Ground several ways, and perishes not in Winter, but endures many Years. From this Root shoot forth several small weak Stalks, of the length of those last described, lying almost upon the Ground, and severally divided into many smaller branches, even from the bottom*; upon which are set a great many small, short, whitish green Leaves, very orderly one above another, that is, at some but two Leaves, at some three, and at others four, not keeping always exactly to the same number, especially below, they growing more exactly upwards: These Leaves are lesser than those of our *Common narrow leaved Flaxweed* in *Chap.* 269. *Sect.* 4. being thick and juicy, growing upon the Stalks at certain spaces, sometimes three, but most usually four together. The Flowers grow at the tops of the Stalks and Branches, and are in form like those of the Common narrow leaved kind aforementioned, but of a most perfect Violet color: They are somewhat great, and stand not so thick clustering together; the lower lip where it gapes, is of a gold yellow color, to wit, the Spot in the Mouth, the rest of the Flower being of a delicate purple blew. After the Flowers are past, come round Heads, which are somewhat great and thick, and contain within them a flat blackish Seed, in two partitions or Cells.

IV. *The Places.* The first grows Wild in many places, as upon Stone Walls, gravelly Grounds, barren Fields, and along by Hedge sides. The second is a Native of *Spain.* The third grows upon the higher *Alps*: with us they are only Nurst up in *Gardens* of the Curious.

VII. *The Times.* They all Flower from the end of *May*, to the end of *August*: The Seed ripening in the mean Season.

VIII. *The Qualities. Specifications, Preparations,* and *Virtues* are the same with our Common narrow leav'd Flax-weed in *Chap.* 269. to which we refer you, and therefore shall say no more of them here.

CHAP. CCLXXII.

Of FLEBANE Greater.

I. *THE Names.* It is called in *Greek* Κονίζα: in *Latin Conyza*; and in *English Flebane.*

II. *The Kinds.* We divide it into four kinds, *viz.* 1. *Conyza major*, The greater Flebane. 2. *Conyza minor*, The lesser Flebane. 3. *Conyza pumila*, Dwarf Flebane. 4. *Conyza palustris*, Water Flebane.

Eabane true Great

III. *Of the greater kinds of Flebane*, theſe offer themſelves, *viz.* 1. *Conyza Major vera Dioſcoridis*, The true gteater Fleabane of *Dioſcoridis*. 2. *Conyza major Montana Germanica*, great Mountain Flebane of *Germany*. 3. *Conyza Helenitis mellita incana*, Hoary mullet Flebane, with Elecampane Leaves. 4. *Conyza Helenitis foliis laciniatis*, Great jagged Flebane. 5. *Conyza Helenitis piloſa*, Hairy Mullet Flebane. 6. *Conyza media*, The middle kind of Flebane.

IV The Deſcriptions. *The firſt, or true greater* Flebane, *has a thick, long, durable and Fibrous Root, which ſends forth many Stalks, two or three Feet or more high, which are hard, woody, rough, hairy, fat, and of an overworn color.* The Leaves grow without order, alternately embrace the Stalks, and are many, long, ſomewhat narrow, and of a yellowiſh green color, dented a little about the edges, twice as large as thoſe of the Olive-tree, which are rough or hairy, and very fat or clammy, being as it were beſmeared with a fattineſs or gummineſs, which is much more in hot Countries than it is in this of ours; theſe Leaves are ſomething like unto thoſe of the *Italian Star Wort*, but larger, and more pointed at the ends. Towards the tops of the Stalks come forth the flowers, at every joint with the leaves a yellow flower, which is ſomewhat large, and round, almoſt like the Flower of Hawkweed or Groundſel, which when it is full ripe, turns into Down, and flies away with the Wind. The ſmell hereof is ſomewhat ſtrong, but ſweet withal, and not unpleaſant: It is ſo glutinous and clammy, that what ſmall thing ſoever, as Flies, Fleas, *&c.* ſhall happen to fall or light thereon, are held faſt and caught; and for this reaſon it was called *Flebane*, not for that it has any quality, of otherwiſe poyſoning or killing them.

Fleabane Common.

V. The *ſecond, or* Great Mountain, *has a Fibrous Root which ſends forth ſeveral round green Stalks, two feet or more high, but not near ſo clammy as the former, having many long pointed Leaves ſet thereon without order, of a ſad, or dark green color, each of which is four or five Inches long, and an Inch and half broad.* The Flowers are yellow, ſomewhat larger than the other, every one ſtanding at the tops of the Branches, upon a long Stalk, in the ſame manner as the former do, *viz.* with a Pale or Border of Leaves, and many ſmall thrums in the middle, which paſs into Down, and are carried away with the Wind, as the former are. *Note.* There is another of this ſort with longer leaves, and leſſer flowers

VI. The *third, or* Hoary Mullet Fleabane, with Elecampane Leaves, *has a Root which is compoſed of many black Strings or Fibres, by which it takes faſt hold of the Ground, which ſends up ſeveral long, and ſomewhat broad Leaves, almoſt in faſhion like to Foxglove Leaves, but that theſe are hoary or grey on the upper ſide, and of a browniſh green on the under ſide, herein ſomewhat like to the Leaves of* Rha Helenii folio, or *Baſtard Rhuburb with Elecampane Leaves.* The Leaves are very Hoary alſo, the Plant riſing to be two or three Feet high, ſet with the like Leaves as grow below, but ſmaller and ſmaller as they grow towards the tops, where many Flowers ſtand together, like unto the former *Flebanes*, and much greater than thoſe of *Gromwel*, which turn into Down, and fly away with the Wind. The whole Plant is ſomewhat clammy, yet much leſs than the firſt, and much ſweeter than it, ſmelling much like Honey.

Fleabane great Jagged.

VII. The *fourth or* Great Jagged Flebane, *has a buſhy Fibrous Root, from which ariſe thick, creſted, and hollow Stalks, divided towards the tops into ſeveral Branches.* The Leaves which encompaſs the Stalk, are deeply gaſht or cut in on the edges, being of a very conſiderable length, and broad in reſpect to that length, all of them extended to a ſharp point. The Flowers are Star faſhion, of a yellow color, turn into Down, and fly away with the Wind.

The

The whole Plant is covered over with a ſoft and tender Down, and ſmells ſomething like Honey.

VIII. *The fifth, or* Hairy Mullet Fleabane, *has a hairy Fibrous Root like to the laſt; but in its Stalks. Leaves and Flowers is ſo like the third aforegoing, that there is no other difference to be found,* but that in both Leaves and Stalks, beſides the hoarineſs, this is much more hairy and rough than it, which cauſes it to be a differing kind from it.

IX. *The ſixth, or* Middle kind, *has a Root which is pretty large and Fibrous, from whence ariſes a branched Stalk of about a Foot and half high; encompaſſed at certain ſpaces, with thick, rough, greyiſh, green Leaves.* At the tops of the Branches grow pretty fair yellow Flowers, of the largeneſs of a little Marigold, which being faded away, turn into Down, and are carried away with the Wind.

X. *The Places.* The firſt grows in *Syria*; *Cluſius* found it near *Lisbon*, and in divers parts of *Spain*; but with us it grows only in *Gardens*. The ſecond on *Mountainous places* in *Germany*, *England*, &c. as alſo in *Gardens*: *Johannes Thalius* found it in *Harcynia Sylva* in *Saxony*, and we in many places of our own Country, as near *Hampſtead*, &c. The third, fourth, and fifth, are found upon the Hills in *Artois*, and ſome *Hilly places in our own Land*. The ſixth is found growing in moſt places about Rivers and Ponds ſides, *&c.* and has been found in St. *James*'s *Park*, *Tuttle Fields*, &c.

XI. *The Times.* They all flower in the Months of *June*, *July*, and *Auguſt*, ſome earlier, and ſome later than others; the Seed ripening in the mean ſeaſon.

XII. *The Qualities.* Fleabane is hot and dry in the third Degree: it is Aperitive, Abſterſive, Diuretick, Nephritick, Hyſterick, and Alexipharmick.

XIII. *The Specification.* It is ſingular againſt the Strangury, Jaundice, griping of the Guts, Epilepſy, green Wounds, bitings of Mad Dogs, and all ſorts of Venemous Creatures, *&c.*

XIV. *The Preparations.* You may prepare therefrom, 1. *A Liquid Juice.* 2. *An Eſſence.* 3. *An Infuſion or Decoction in Wine.* 4. *An Oil by Inſolation.* 5. *A Balſam.* 6. *A Cataplaſm.* 7. *A Spirituous Tincture.* 8. *An Oily Tincture.*

The Virtues.

XV. *The Liquid Juice of Leaves and Flowers.* It provokes the Terms in Women, and expels the Dead Child and Afterbirth; it cures the Strangury, for it provokes Urine admirably when it is made by drops, by opening the Paſſages, and expelling the Morbifick Matter, be it what it will. Doſe two or three Spoonfuls, Morning and Night, taken in a Glaſs of fragrant Wine, or other fit Vehicle.

XVI. *The Eſſence.* It has all the former Virtues, beſides which it opens all Obſtructions of Gall, Liver, Spleen, Reins, and Womb; it is good againſt the Yellow Jaundice, and the Griping pains of the Belly, and being taken to three or four Spoonfuls in Vinegar or Wine, it prevails againſt the Epilepſie or Falling-Sickneſs; injected up the Womb it brings away both Birth and Afterbirth, being alſo at the ſame time taken inwardly: given in Red Port Wine it ſtops any Flux of the Belly.

XVII. *The Infuſion or Decoction in Wine.* It has all the Virtues of the Juice and Eſſence, but muſt be given in larger quantities, as to four, ſix, or eight Ounces: being given Morning and Evening it admirably warms and ſtrengthens a cold, moiſt, and weak Stomach, provokes Urine powerfully, and prevails againſt all ſorts of Pains and Griefs of the Womb: if the Decoction is made in Water, it is good for Women to Bath in whoſe Courſes are ſtopt, as alſo to eaſe all ſorts of Pains and Griefs of thoſe parts.

XVIII. *The Oil by Infuſion.* Anointed on the Head it eaſes the Headach and Megrim, coming from a cold Cauſe; anointed all along the Back Bone, on the Stomach, and on the Pulſes, it is very effectual to take away the ſhaking Fits of Agues, and thoſe Tremblings which come from cold.

XIX. *The Balſam.* It is an extraordinary thing for curing ſimple green Wounds, it brings to Digeſtion, cleanſes, dries, and heals after a ſingular manner; anointed on the Hæmorrhoids it gives eaſe in the extremity of Anguiſh, and in a little time cures them.

XX. *The Cataplaſm.* The green Leaves made into a Pultice, by beating in a Mortar, *&c.* and applied to any ſimple green Wound, or Cut, being firſt well waſhed or cleanſed, heals it in a very ſhort ſpace of time, warms and comforts parts chilled with cold, and applied to the Forehead is a good expedient to cure the Frenzy; ſo alſo being applied to the Soles of the Feet; and ſo applied, it is ſaid to ſtop any Flux of the Bowels.

XXI. *The Spirituous Tincture.* It is good againſt Vomiting and Nauſeouſneſs, expels Wind, and comforts and warms a cold, moiſt, and weak Stomach; it is good againſt Poyſons, the Bitings of Mad Dogs, Serpents, and all ſorts of other Venomous Creatures; it cures all ſorts of Fluxes of the Bowels, whether they be of Blood or Humors, and is an extraordinary thing to be taken two, three, or four times a day in any fit Vehicle, (from two to four, or ſix Drams) by ſuch as are affected with the Palſie.

XXII. *The Oily Tincture.* This uſed as the Inſolated Oil aforegoing, is much more powerful to warm thoſe parts which are chilled with cold, and to take away the cold and ſhaking Fits of Agues, as alſo to cure Tremblings, Numbneſs of any part, Palſies, Convulſions, Cramps, and the like; anointed on the Piles which are not broken, it preſently eaſes the Pain, diſcuſſes the Tumor, and in two or three times anointing cures them; it is an effectual thing againſt Punctures, Hurts, and Bruiſes of the

Nerves and Tendons; and given inwardly from ten to twenty or thirty drops, (dropt first into fine White Sugar) mixed with a Glass of White Port Wine, it facilitates the Birth, brings away the Afterbirth, or Dead Child, opens Obstructions of the Reins, Ureters, and Bladder, and brings present Relief in the Strangury, caused by small Stones, Sand, Gravel, or Tartarous Matter lodged in those parts.

CHAP. CCLXXIII.

Of FLEABANE the Lesser.

I. *THE Names.* It is called in *Greek* Κονίζα μικρὰ, in *Latin Conyza minor*, and in *English Fleabane the lesser.*

II. *The Kinds.* It is the second Species of *Fleabane*, and is twofold, *viz.* 1. *Conyza fœmina Theophrasti, Conyza minor vera Dioscoridis, Penæ, Clusij, Gesneri, & aliorum*, The true lesser Fleabane of *Dioscoridis.* 2. *Conyza cærulea acris, Tinctorius flos alter Tragi, Conyza odorata cærulea, Erigeron quartum Dodonæi, Dentelaria Gesneri, Conyza muralis, & Conyzoides Cærulea Gesneri, Conyza Cærulea Tabernamontani*; *Amellus Montanus Columnæ*; Blew floured Fleabane. There are are some others of this lesser kind, but they are not at all to be met with in *England.*

III. The Descriptions. *The first, or true small Fleabane, has a Root which is single, small and slender, with a few Fibres thereat, which perishes every Year. This Root sends forth seldom more than one Stalk, which is about a Foot and half high, sometimes not above a Foot, and sometimes not a Foot high, according to the goodness of the Soil it is planted in:* It is somewhat hairy and glutinous, or clammy, as the true greater *Fleabane*, but greener than that great kind. This Stalk is divided into many branches, which are also rough and glutinous. The Leaves are long and narrow; somewhat like those of *Linaria*, or *Flaxweed*, but three times less than those of the greater *Fleabane* in *Chap.* 272. *Sect.* 4. aforegoing, and are hairy and unctious or clammy also. With the small Leaves, at the tops of the Branches come forth small pale yellow Flowers, which are lesser, and less shining than in the said *greater Fleabane*, which passing away, the Heads are turned into Down, and are carried away with the Wind, as the others are. This whole Plant smells sweeter than most of the others do, and dies every Year, and raises it self of its own Sowing, or else must be new Sown every Year.

IV. *The second, or* Blew flowred Fleabane, *has a small Fibrous and yellow Root, of a very hot and biting taste, which from its Head sends up several longish Leaves, somewhat like those of the Garden Daisie, but a little writhed: The Stalk is about half a Yard high, and set alternately with twined longish, narrow, and somewhat rough Leaves, of an overworn green colour.* Some Authors say, the Stalk grows sometimes to be about two Feet high, brownish at the bottom, and is set here and there up to the top, with longer and narrower Leaves, where it is divided into small and short Branches; on which grow many Flowers one above another, in small, longish, scaly green Heads or Husks, composed of many small and narrow, blewish purple Leaves, something white at the ends or tips, with a small yellow flat Thrum in the middle; in which middle, there arises up several white threads, whereby each flower, consisting of three colors, White, Purple, and Yellow; makes it seem the more delectable to behold. After these Flowers pass away, there comes in those Husks or Heads which held them, small, long Seed, lying in the Down, each having some thereof at its Head, which together there (when ripe) is blown away with the Wind, if not gathered. The whole Plant is of a sharp taste, but the Root much more, and is nearly as hot as Pepper, of a strong, but not unpleasant smell.

V. *The Places.* The first grows in *Syria* and *Greece*, also in *Spain* near *Madrid* as *Clusius* says; and in the Woods at *Gramants* near *Mompelier*, as both he and *Lobel* say. The second was found in divers places of the Kindgdom of *Naples*, in moist Fields which are in the Mountains, as *Columna* says, as also in Sandy places near the River *Rhosne* by *Lions* in *France*, and upon the *Alps* in *Austria* as *Clusius* says. It grows upon many *Chalky Hills* in *England*; and *Gerard* says, that he in the Company of *George Bowles* and some others, found it near *Farmingham* in *Kent*; and one *William Broad* found it growing at the *Block-house* at *Gravesend. The first* grows with us only in *Gardens.*

VI. *The Times.* The first Flowers in *June* and *July*: the second in *August*, whose Flowers turn quickly into Down, and are carried away with the Wind.

VII. *The Qualities, Specification, Preparations, and Virtues* are the same with the *True greater Fleabane* in the former *Chapter*, to which we now refer you; but with this *Observation*, that these *lesser Fleabanes*, are much more efficacious to all the purposes aforementioned; and are much more powerful and effectual to help any Flux, or bloody Flux of the Bowels.

VIII. *Nota.* The Root of the Blew flowred, being held in the Mouth, absolutely Cures the Toothach.

CHAP. CCLXXIV.

Of FLEABANE Dwarf.

I. *THE Names.* It is called in *Greek*, Κονίζα νάνη, ἢ ναυώδης, ἢ Χαμαικόνιζα: in *Latin Conyza Pumila, Chamæconyza:* in *English Dwarf Fleabane.*

II. *The Kinds.* This is the third Species of *Fleabane*: And it is two fold, *viz.* 1. *Conyza Pumila, Conyza minor Tragi, Matthioli, Conyza minima Lobelii & Dodonei*; Our Vulgar Dwarf Fleabane. 2. *Conyza minor Rauwolfii, Conyza minor Syriaca*, Syrian small Fleabane.

III. The Descriptions. *The first, or* Vulgar Dwarf Fleabane, *has a small and Fibrous Root, from whence arises a branched Stalk, about a Foot high, set with small longish Leaves, somewhat roundish pointed, soft also and woolly, with a Smell not unpleasant as some of those going before.* The Flowers are repleniished with many yellow Threads, like to the middle part of Camomil Flowers, or those of Tansie; and as the former turn into Down, and are carried away with the Wind

IV. *The*

IV. *The second, or* Small Syrian Fleabane, *has a small Fibrous Root like the former, whence spring forth many small low Stalks or Branches, about a Foot or more high, whereof but few stand upright, the most of them leaning or lying down upon the Ground, and taking Root again in several places as they lie.* The Leaves which grow thereon, are small and long, somewhat like unto the Leaves of the *Olive-tree*: They are Hairy, Fat, and Clammy, of a strong Smell, yet something sweet withall. At the Tops of the Stalks, grow the Flowers, which are small and yellow like unto those of the first kind in *Chap.* 273. *Sect.* 3. aforegoing; which when they are ripe, turn into Down, and fly away with the Wind, as the others do.

V. *The Places.* The first grows plentifully in such Places as are *Plashy*, or Wet in Winter. The second *Rauwolffius* found growing about *Tripoly* in *Syria*; and here is only Nurst up in Gardens.

VI *The Times.* The first flowers in *July* and *August*, the Seed ripening in the mean Season: The second flowers in *August*, and with us something alter, if carefully lookt after.

VII. *The Qualities, Specification, Preparations,* and *Virtues* of these are the same with those of the *Greater Fleabane* in *Chap.* 272. aforegoing; so that no more need be said thereof.

CHAP. CCLXXV.

Of FLEABANE Water.

I. *The Names.* It is called in *Greek* Κονίζα ἕλεια, ἢ ἑλώδης: in *Latin Conyza paluſtris, Conyza aquatica, Conſolida paluſtris*; and in *English Water Fleabane.*

II. *The Kinds.* This is the fourth Species of *Fleabane*, and is twofold, *viz. Conyza paluſtris major, Conyza aquatica Geſneri, Conyza maxima serrati folia Thalii*; *Lingua major Dalechampii, & Lugdunenſis*; *Conſolida paluſtris Tabernamontani*, The Greater, Water or Marsh Fleabane. 2. *Conyza aquatica minor Thalii & Bauhini, Conyza paluſtris minor*, The lesser Water or Marsh Fleabane.

Water Fleabane

III. The Descriptions. *The first, or* greater Water Fleabane, *has a large Root, replenished with a vast number of Fibres, which sends forth hollow and crested Stalks, a Yard or more high, having several joints as it were, and branched out towards the top.* It bears its leaves in an unorderly manner, which are long and narrow, sharp pointed, and snipt about the edges like a Saw; hairy, and green on the upper side, and grey or woolly underneath. At the tops of the Stalks and Branches grow many yellow Flowers, pretty large, very like to those of *Ragwort*, which, when they are ripe, turn into Down, and are quickly carried away with the Wind.

IV. *The second, or* lesser Water Fleabane, *in its Root, Stalks and Flowers, is much like the former, as also in its manner of growing, saving that it is smaller and lower than that is*; and the Leaves are sometimes much less dented or jagged on the edges; and the Flowers likewise stand not, but One on a Stalk for the most part; which are like the former, also yellow.

V. *The Places.* They both grow near Water sides, and in Plashy and Wet Grounds, which are not often dry; but being planted in *Gardens* where there is a rich Mould, they prosper very well.

VI. *The Times.* They both of them flower in *August* and *September*, and their Seed is ripe not long after, and is suddenly carried away with the Wind.

VII. *The Qualities, Specification, Preparations* and *Virtues*, are the same with those of the *Great Fleabane* in *Chap.* 272. aforegoing, to which I refer you.

you. Authors ſay, that this *Water Fleabane* is as effectual and admirable a Wound Herb, as any of thoſe the moſt admired.

CHAP. CCLXXVI.

Of FLEAWORT.

I. *THE Names.* It is called in *Arabick Bazara Cathona, Bezer Cothume :* in *Greek* Ψύλλιον : in *Latin Pſyllium, Pulicaria, & Pulicaris herba :* in *Engliſh Fleawort.* This Name is given to it, not becauſe when it is brought green into the Houſe, that it drives away *Fleas*; but becauſe the Seed thereof is very like to them.

II. *The Kinds.* Authors make four kinds of this Plant; but becauſe ſeldom more than three come to our hands, we ſhall only deſcribe them. 1. The firſt of theſe is called Ψύλλιον κοινὸν, *Pſyllium Vulgare, Pulicaria Vulgaris, Cynops Theophraſti,* Common or ordinary Fleawort. 2. *Pſyllium majus ſemper Virens; Pſyllium alterum Geſneri; Pſyllium perenne Geſneri & Camerarii; Pſyllium Plinianum forte majus radice perenne Lobelii;* The great evergreen Fleawort. 3. *Pſyllium Indicum foliis Crenatis, Pſyllium Americanum, vel floridianum foliis crenatis,* The Indian or American Fleawort with dented Leaves. This is *Pſyllium primum Anguillaræ,* and the *Pſyllium verum Dioſcoridis* as *Bauhinus* thinks.

Fleawort.

III. The Deſcriptions. *The firſt, or* Common Fleawort, *has a Root which is not long, but white, hard and Woody, periſhing every Year, and raiſing it ſelf again of its own Seed for many Years, if it is ſuffered to ſhed it. From this Root comes forth a Stalk about two Feet high or more, full of Joints, and ſpreading it ſelf out on all ſides into many branches, almoſt from the bottom to the top; and at every Joint ſtand two ſmall, long, and narrow whitiſh green Leaves, ſomething hairy.* At the tops of the Stalks and Branches, ſtand ſeveral ſmall, ſhort, ſcaly or chaffy Heads, out of which come forth, ſmall whitiſh, yellow Threads, ſuch as Plantane Heads do give, which are the bloomings or flowers. The Seed is encloſed in thoſe Heads, and is ſmall, and ſhining whilſt it is freſh, very like unto Fleas, both for its color and bigneſs, (from whence came the Name) but turning black when it is old. The whole Plant is ſomewhat whitiſh, and hairy; ſmelling a little like Roſin.

IV. *The ſecond, or* Great evergreen Fleawort, *has a long, hard and Woody Root, which periſhes not, but lives in Winter, keeping its Leaves Green all that Seaſon, whence came its Epithite of* ſemper virens, *or never dying.* From this Root ſpring forth ſeveral long and tough Branches, of a Woody ſubſtance like the former, but that they, as alſo their Branches are ſomewhat greater, longer, and harder, and do a little more bow down to the Ground. The Leaves which grows forth at the joints, reſemble the former, but are much longer and much narrower. At the tops of the Stalks and Branches, and at the Joints come forth chaffy Tufts, ſtanding upon long foot-ſtalks, which are very like to the Ear of the *Alpiſti Phalaris,* or *Canary* Seed; in which Heads or Tufts is contained the Seed, which is like the former.

V. *The third, or* American Fleawort, *has a long Woody Root with ſome Fibres adjoining, which ſends forth a Woody, reddiſh, rough Stalk, next to the Ground, growing to be about a Foot high, and ſpreading it ſelf out into divers Branches.* The Leaves ſtand at the joints thereof, and are ſomewhat long, narrow pointed at the end, and a little dented in, or rather torn on the edges, and hairy alſo like the former. The tops of the Branches are more ſtored with Heads than the former, but of the ſame bigneſs and faſhion, with Flowers growing in the ſame manner, containing within them ſhining Seed like to the others.

VI. *The Places. The firſt* grows in *Italy* and *Spain,* in Fields, and untilled places, but with us only in *Gardens. The ſecond* grows plentifully in Fields, near the Sea-ſhoar or Coaſt, as alſo in many of our *Gardens. The third* is a native of the *Indies,* and has been found growing in *Florida,* and in the *Southern* parts of *Carolina :* From ſome parts of which Continent it was brought into the *European* parts of the World.

VII. *The Times.* They all flower with us in *June* and *July,* but in their native places all the Summer long.

VIII. *The Qualities.* The Seed of theſe Plants is that which is chiefly uſed in Medicine, and that both *Galen* and *Serapio* ſay, is cold in the ſecond Degree, but temperate in reſpect to moiſture or dryneſs. It is Emollient, Lubrificative, Anodyne, Pectoral, and a little Cathartick. Some Authors have written that the frequent inward uſe of this Seed is very dangerous, but it is no otherwiſe true, than as it falls out in other great cooling Herbs, as *Houſleek, Henbane, Lettice, Nightſhade,* and the like, which are all ſafe enough, if Wiſely and fittily applied: but Ignorance, Raſhneſs, and Indiſcretion, in the application of Medicaments, has oftentimes done harm, and brought diſcredit to thoſe Medicaments which (having been free from any dangerous effects) were in all appearance to Wiſe Phyſicians of the greateſt Uſe in the Art of Medicine: The ſame is to be ſaid in the uſes of this Plant, as to its Virtues and Effects. It is an excellent thing, and without any evil Qualities, if applied and uſed by a Wiſe and skilful Phyſician.

IX. *The*

IX. *The Specification.* It is good againſt burning Fevers, Inflammations, Hoarſeneſs, Pleuriſy, Hemorrhoids or Piles; cauſes Expectoration, and quenches the moſt vehement Thirſt.

X. *The Preparations.* You may have therefrom, 1. *A Mucilage of the Seed.* 2. *An Ointment.* 3. *The Seed fryed.* 4. *A Cataplaſm of the Seed.* 5. *A liquid Juice of the Herb.*

The Virtues.

XI. The Mucilage of the Seed. *It is made with Barley Water, or Damask Roſe Water, or with pure Spring Water, by a bare Infuſion of the Seed in the Water, without bruiſing of it, juſt as you make a Mucilage of Clary Seed.* If it is made with *Barley Water*, and is dulcified with Syrup of *Damask Roſes* or *Violets*, and ſo drank to four, ſix or eight Ounces, it opens the Stomach and Bowels, and evacuates downwards groſs Flegm and Melancholy, with other viſcous Humors: but withal it heals the Corroſion of the Bowels cauſed by hot, ſharp and cholerick Humors, or from the over-working of violent Medicines, ſuch as *Scammony*, *Roſin of Jallap*, *Coloquintida*, *Eſula*, &c. If it is made with *Spring Water*, and dulcified with Syrup of *Violets*, or Syrup of *Corn Poppies*, it is good againſt all hot, burning and malign Fevers and Inflammations of the Viſcera: it cools the Heat, quenches Thirſt, and lenifies the Drineſs of the Mouth, Tongue and Throat. It helps alſo the Hoarſeneſs of the Voice, and other Diſeaſes of the Breſt and Lungs, cauſed by Heat or ſalt ſharp Humors; and the Pleuriſy or *Peripneumony*, if given in time. If it is made with *Damask Roſe Water*, and ſweetned with Syrup of *Red Roſes*, it is good againſt Heat, Pain and Fluxes of the Bowels; and is a ſingular Remedy in a Tenaſmus.

XII. The Ointment. *Take the Yolk of one Egg, Unguentum Populeon one Ounce, Mucilage of Fleawort Seed a ſufficient quantity; mix and make all into an Ointment.* It is an extraordinary thing if it is applied to the Hemorrhoids or Piles, laying it on a Cloth, and binding it on them. It helps alſo all Inflammations in any part of the Body, and eaſes the Pains which are cauſed thereby. Applied to the Head and Forehead, it is good againſt the Head-ach and Megrim; and it is good againſt all hot Tumors or Breakings out in the Skin, as Blains, Wheals, Pimples, red Puſtles in the Face, Puſhes, and the like.

XIII. *The fryed or parched Seed.* If it is either eaten, or otherwiſe reduced to pouder, and ſo taken, it is of excellent Uſe to ſtop all ſorts of Fluxes of the Belly, and heals the Corroſions of the Bowels, cauſed by acrid or ſharp and malign Humors, or the Corroſiveneſs of violent and ſharp Purgers.

XIV. *The Cataplaſm:* Made of *the Mucilage with the bruiſed Seed, Oil of Roſes and Vinegar, with a ſufficient quantity of Rice or Bean Flower*, it is good againſt Pains of the Joints, and Weakneſs of the ſame cauſed by the Gout, Sciatica, *&c.* which Pains it eaſes, as alſo Ruptures in young Children, and the Swelling out of the Navel, being applied: it heals alſo ſore Nipples and ſore Breaſts of Women giving Suck.

XV. *The Juice of the Herb.* If it is mixt with a little Honey, and put into the Ears, it helps the Running of them, and kills Worms breeding therein. The ſame mixt with Hogs Lard, and applied to corrupt and filthy Ulcers, cools them, removes their Inflammation, eaſes the Pain, cleanſes and heals them, by repreſſing the ſharp Humors flowing to them.

CHAP. CCLXXVII.

Of FLIXWEED.

I. *THE Names.* It is called in *Latin*, *Sophia*, and *Sophia Cirurgorum*, by *Gerard*; alſo *Pſeudonaſturtium ſylveſtre*, and by ſome *Thalictrum* or *Thalictrum*, (tho' theſe two laſt are Names which more properly belong to *Meadow Rue*:) ſome will have it to be *Sophia Paracelſi*, by which, it is ſaid, he did ſuch Wonders: alſo *Seriphium Germanicum Tragi*, *Accipitrina Caſalpini*, *Naſturtium ſylveſtre tenuifolium diviſum Bauhini*, *Eruca Gelatina Italorum Lobelii*: in *Engliſh*, *Flixweed.*

II. *The Kinds.* Authors make two ſorts hereof, *viz.* 1. *Sophia anguſtifolia*, Narrow-leav'd Flixweed. 2. *Sophia latifolia*, Broad-leav'd Flixweed; which yet *Gerard* thinks may be both but one kind, the Leaf thereof growing fairer and larger according to the Richneſs or Goodneſs of the Soil. Their Deſcriptions follow.

Flixweed.

III. The Deſcriptions. *The firſt*, *or* Narrow-leav'd Flixweed, *has a Root which is long and woody, periſhing every Year; yet if it be ſuffered to ſeed, and ſhed its Seed, it will be wonderfully encreaſed the next Year.* From this Root it riſes up with a round, ſmooth, hard, upright Stalk, half a yard or two feet high, ſeldom more, and ſpreads it ſelf into ſeveral Branches, by which it becomes a beautiful (conſidering the Plant) or pleaſant kind of Buſh; on which Stalk and Branches do grow many Leaves, of an over-worn greyiſh green color, finely cut and divided into a number of fine Jaggs, like unto thoſe of *Roman Wormwood*, or ſmalleſt Leaves of *Coriander*. The Flowers grow upon the Stalk and Branches, Spike faſhion, which are very ſmall, and of a dark yellow color; which being paſs'd away, ſmall, long Pods ſucceed, containing much Seed, which when ripe, is of a yellow color.

IV. *The*

IV. *The ſecond, or* Broad-leav'd Flixweed, *differs not from the former in its Root, Stalk, Branches, Leaves, Flowers, Cods or Seed, or in its Height or Manner of Growing, ſaving, that the Leaves of this are broader, in which conſiſts the only Difference.* This was found out by *Tabernmontanus*, or firſt taken notice of by him; but ſome Botaniſts are of Opinion, that the former and this are but one and the ſame Plant, and have this Difference in the Leaves only accidentally, by growing in ſome more fertile place: however, *Parkinſon* ſeems to admit of the Difference. They are both of them of a ſtrong and unpleaſing Smell, and of a drying Taſte.

V. *The Places.* *Flixweed* grows in moſt places of *England*, almoſt every where, upon Aſh-dunghills, in the Ruins of old Buildings, by Highways, and in filthy, obſcure, baſe and barren places, alſo amongſt Rubbiſh.

VI. *The Times.* It flowers and ſeeds from the beginning of *June* to the end of *September*, the Seed ripening in the mean Seaſon.

VII. *The Qualities.* It is temperate in reſpect of Heat or Cold, and dry in the firſt Degree; Anodyne, Aſtringent, Vulnerary, Arthritick and Analeptick.

VIII. *The Specification.* It ſtops Fluxes of all ſorts, eaſes Pains of the Joints, conſolidates broken Bones, kills Worms, and heals Ulcers.

IX. *The Preparations.* You may have therefrom, 1. *A liquid Juice of the Herb.* 2. *An Eſſence of the ſame.* 3. *A Decoction in Wine or Smiths-forge Water.* 4. *An Ointment or Balſam.* 5. *A Cataplaſm.* 6. *A diſtilled Water.* 7. *The Seed, or Pouder of the Seed.*

The Virtues.

X. *The liquid Juice.* Drunk to two or three Ounces in Wine, it kills Worms in the Stomach or Belly; and outwardly applied, it kills the Worms, which ſometimes breed in filthy and putrid Ulcers.

XI. *The Eſſence.* Drunk to two or three Ounces mixed with Red Wine, it has the Virtues of the liquid Juice; beſides which, it ſtops the Bloody-fluxe, and all other Fluxes of Blood, and Fluxes of the Belly, and is no leſs powerful than *Plantane* or *Comfrey* in the aforeſaid Caſes, as alſo to conſolidate Bones which are broken or out of Joint.

XII. *The Decoction in Smiths-forge Water, or in Wine.* It has all the Virtues of the Juice and Eſſence, and performs the ſame Effects; but ought to be given Morning and Evening for ſome conſiderable time, and that to the quantity of ſix or eight Ounces. It may be uſed as a Diet-drink by all ſuch as have inveterate and putrid Ulcers, running and ill-conditioned Fiſtula's; for it alters the Habit of the Body, thickens the Juices, and ſo induces the healing. Fomented upon the Piles, it eaſes the Pain, and diſcuſſes them.

XIII. *The Ointment or Balſam.* It may be made either of the green Herb or the Juice; and is very beneficial to digeſt, cleanſe, incarnate, dry and heal old fretting and eating Ulcers, how foul and malignant ſoever they be; and is a good thing to be kept always in a Readineſs by rich and able People in the Country, for the Uſe of their poor Neighbours whenever there may be an occaſion.

XIV. *The Cataplaſm.* Being applied to green Wounds or recent Ulcers, it performs all that the Ointment or Balſam can do. It is good to be applied to Fractures and Joints lately diſlocated; for it eaſes the Pain, abates the Inflammation, prevents the Flux of Humors, and ſtrengthens the Part afflicted.

XV. *The diſtilled Water.* It participates of the Virtues of the Plant, but in a much meaner degree, having the Virtues of the Juice, Eſſence and Decoction: but its chief Uſe is for a Vehicle, to convey thoſe Internals into the Body. It is cooling, drying, binding and healing.

XVI. *The Seed, or Pouder thereof.* Given to a Dram in Red Port Wine, or in Smiths-forge Water, it has been found by Experience to be of excellent Uſe to ſtop the Bloody-flux, Spitting, Vomiting or Piſſing of Blood; as alſo other Fluxes of the Belly. It is alſo good againſt Naufeating and Vomiting.

CHAP. CCLXXVIII.

Of FLOWERGENTLE Great.

OR,

Great VELVET-FLOWER.

I. *THE Names.* It is called in *Greek*, Ἀμάραντος: in *Latin*, *Amaranthus*: in *Engliſh*, *Flowergentle*, or *Velvet Flower.* The *Greek* is derived from Ἀμαραίνω, *non marceſcens, vel non ſeneſcens*, from its never fading or waxing old.

II. *The Kinds.* It is divided into two principal kinds, *viz.* 1. Ἀμάραντος μέγας, *Amaranthus magnus*, The great Flowergentle, of which in this Chapter. 2. Ἀμάραντος μικρὸς, *Amaranthus parvus*, Flowergentle the leſs, of which in the following Chapter.

III. Of the greater Flowergentle, there are two ſorts, *viz.* 1. *Amaranthus purpureus major, & major panniculis ſparſis*, The greater Flowergentle, *or* Velvet-flower. 2. *Amaranthus maximus, coccineus elegans maximus*, The greateſt Scarlet Flowergentle, *or* Velvet-flower.

III. The

IV. The Deſcriptions. *The firſt, or* Greater kind, *has a Root which is a great Buſh of Strings, ſpreading in the Ground, whereby it is ſtrongly rooted, yet periſhes every Year after it has given its Seed.* From this Root ſprings forth one thick, tall, creſted, brown, red Stalk, four or five feet high; from whence ſpring many great broad Leaves, like to ſome of the other following kinds for the Form, but much larger, and redder for the moſt part, eſpecially the loweſt, which branches forth into ſeveral parts: from between theſe Leaves and the Stalks or Branches, as alſo at the tops of them, ſtand long ſpiky, round, and ſomewhat flat Tufts, of a more reddiſh purple color than the firſt of the following Chapter; and divided alſo into divers parts, wherein, when they are full ripe, are to be ſeen an innumerable company of white Seeds, ſtanding out among the ſhort Thrums, and do eaſily fall away with a little touching. Every one of theſe white Seeds has, as it were, a hole half bored thro' therein.

V. *The ſecond, or* Greateſt Scarlet Flowergentle, *has a pretty thick long Root, with ſome Fibres adjoining to it, which ſends up one or more very great, thick, round, tall Stalk, rather higher and greater than the* moſt ordinary great red Flowergentle, *with as large great Leaves on it, or rather greater*; but both the Stalks and they are of a freſh yellowiſh pale green color, with little or no Redneſs in them at all, (and this is one proper Mark to know this ſort from others, before it comes to flower.) The Flowers ſtand at the tops of the Stalks and Branches, more ſpread at the bottom into ſeveral parts, the middle being longeſt; and commonly when it is in the Perfection, hanging down like a Taſſel; the other parts, like ſhorter Spikes, compaſſing it round, which even for the Proportion, is very beautiful, but much more for the color, which is of a more excellent bright, ſcarlet red; and which being gathred in the prime, will hold the color a great while before it decays, eſpecially if it is kept from the Sun and Wind. The Seed encloſed in theſe Tufts, is almoſt as white and ſmall as the former, yet a little redder, whereby the Difference may be known.

VI. *The Places.* Both theſe were brought to us firſt out of the *Weſt Indies*, the latter from *Brazil*, or ſome other parts of *America*, where they both are much uſed, eſpecially the Seed. They are all nurs'd up with us in Gardens; but in backward or cold Years they do not ſo well thrive, becauſe they love much Heat; yet for the moſt part they give us every Year ripe Seed.

VII. *The Times.* They bear their ſpiky Flowers in *July* and *Auguſt*, and yield their ripe Seed in *Auguſt* or *September*.

VIII. *The Qualities.* They are temperate in reſpect to Heat or Cold, and dry in the firſt Degree; Aſtringent, Repercuſſive, Hyſterick, Arthritick and Antemmenagogick.

IX. *The Specification.* They are peculiar for ſtopping all ſorts of Fluxes, eſpecially Fluxes of Blood.

X. *The Preparations.* You may have therefrom, 1. *A Juice or Eſſence.* 2. *A Decoction in Red Port Wine.* 3. *The Seed, or Pouder thereof.* 4. *A Cataplaſm of the Leaves.*

The Virtues.

XI. *The liquid Juice of the Leaves, or Eſſence of the ſame.* I have made many Experiments of the Virtues of this Plant upon ſeveral of my Patients, who have been troubled with Fluxes of the Bowels, Bloody-fluxes, Spitting and Piſſing of Blood, as alſo the overflowing of the Terms: I have given the Juice or Eſſence of the ſame to three or four Spoonfuls at a time in a Glaſs of Red Port, or ſome other proper Vehicle, as Smiths-forge Water, *&c.* and have found it abundantly to anſwer my Expectation in the Cure of the aforenamed Diſeaſes; and I am ſatisfied, that ſometimes, and upon ſome Patients, it has done as much as any Vegetable can do: but I gave it Morning and Night, and ſometimes alſo at Noon, and continued the Uſe thereof for ſeveral days.

XII. *The Decoction in Red Port Wine.* It has all the Virtues of the liquid Juice and Eſſence, but is not full out ſo efficacious; yet it is ſomewhat more pleaſant to be taken, and may be given from three to ſix Ounces at a time, Morning, Noon and Night. Given Clyſterwiſe in any vehement Flux of the Belly, as alſo in a Bloody-flux, and in a Tenaſmus, it ſtops the ſame, heals the Guts, and ſtrengthens the Part afflicted: but it ought to be ſeveral times repeated, according as the Neceſſity or Occaſion may require.

XIII. *The Seed, or Pouder thereof.* It may be given from half a Dram to a Dram at a time, in a Glaſs of Wine, Morning and Night, againſt Nauſeouſneſs or Vomiting, Weakneſs of the Bowels, Bloody-flux, Hepatick-flux, and all other ſorts of Fluxes. If there is any Corroſion of the Guts, it heals it, ſtops the Flux of Humors to the Part, and reſtores the Tone thereof, if hurt or depraved.

XIV. *The Cataplaſm of the Leaves.* It repercuſſes Humors, ſtops Fluxions to any Part, eaſes Pains, and prevails much againſt the Gout: but in this laſt Caſe it will be ſo much the better, if an equal quantity of green *Comfrey* Roots be added and beaten up with it.

CHAP. CCLXXIX.

Of FLOWER GENTLE Small, *OR,* The Leſſer VELVET-FLOWER.

I. *THE Names.* It is called in *Greek*, Ἀμάραντος μικρὸς: in *Latin*, *Amaranthus parvus*; and in *Engliſh*, *The leſſer Flower gentle*, or *Leſſer Velvet-Flower.*

II. *The Kinds.* Authors make four ſorts of this leſſer kind, *viz.* 1. *Amaranthus purpureus minor*, The leſſer purple Flower gentle, *or* Velvet-flower: ſome do think this to be *Phlox*, *vel Flamma Theophraſti.* 2. *Amaranthus Coccineus minor*, The leſſer ſcarlet Flowergentle. 3. *Amaranthus Tricolor*, *Gelioſia*, *vel Celoſia Tragi*, Variable Flowergentle: this ſome, as *Spigelius*, think to be *Sophonia Plinii*; others that it is *Theombroton Plinii*; but theſe Suppoſitions are doubtful. 4. *Amaranthus Spica Carnea*, Carnation Flower gentle, *or* Velvet-flower.

Flowergentle. Purple.

III. The Deſcriptions. *The firſt*, *or* Leſſer purple Flower gentle, *has a Root conſiſting of a few thready Strings, which ſoon periſh, as the whole Plant does, at the firſt approach of Winter. From this Root a creſted Stalk riſes up, two feet or more high, purpliſh at the bottom, but green to the top, which ſpreads it ſelf forth into many Branches.* The Leaves on the Stalk and Branches are ſomewhat broad at bottom, and ſharp-pointed, of a full green color, and oftentimes a little reddiſh withal, like in Form unto the Leaves of *Blites* (of which this and the reſt are accounted Species) or *Small Beets.* The Flowers are long, growing in Spike faſhion, ſoft, and as it were gentle Tufts of Hairs, many growing in a manner together, broad at the bottom, and ſmall up at the top, Pyramis or Steeple faſhion, of ſo excellent a ſhining deep purple color, tending to a Murry, that in the moſt excellent colored Velvet a more orient or bright color cannot be ſeen; and I ſuppoſe from this Reſpect it is that the *French* give it the Name of out-paſſing Velvet. It has no Smell at all, but being bruiſed, gives the ſame admirable purple color on Paper; and being gathered in its full Strength and Beauty, will abide a great while (if it is kept in a dry place, out of Wind and Sun) in its full Beauty and Fineneſs. In theſe Tufts lye the Seed, ſcattered up and down, which is ſmall, very black and ſhining.

Leſſer Scarlet Flower gentle.

IV. *The ſecond*, *or* Leſſer ſcarlet Flower gentle, *has a ſlender or ſmall fibrous Root, which periſhes the ſooner, becauſe it is the more tender.* The Leaves of this Plant are longer, and ſomewhat narrower than the former: the Stalk grows ſomething higher, bearing its long Tufts at ſeveral Leaves, as alſo at the tops of the Stalk and Branches, many being ſet together, but ſeparate one from another, and each bowing or bending down its Head, like unto a Feather, ſuch as are worn in Gentlemens Caps and Hats, of an excellent Blood-ſcarlet color. In theſe Tufts or Heads is contained the Seed, which is black and bright, like the former.

V. *The third*, *or* Variable Flower gentle, *has a ſlender, knobby, fibrous and periſhing Root, like the aforegoing, which ſends up a Stalk, but it is nothing ſo high as the former, which ſpreads it ſelf out into many Branches, even from the Root up to the top thereof.* The chiefeſt Beauty of this Plant conſiſts not in the Flowers, but in the Leaves; the Flowers being ſmall Tufts, growing all along the Stalk, and at the Joints with the Leaves. The Leaves hereof are of the ſame faſhion with the former, and pointed alſo; but every Leaf is to be ſeen, parted into green, red and yellow, very orient and freſh, (eſpecially if it comes to its full Perfection, which is in hot and dry Weather) yet not divided all alike, but in

in ſome Leaves where the red or yellow is, there will be green, and ſo varying, that it becomes pleaſant to behold; the Seed hereof is black and ſhining, and not to be diſtinguiſhed from the former.

VI. *Gerard* ſaid that it far exceeded his Skill to deſcribe the Beauty and Excellency of this Plant, and that a Painter would be at a ſtay to depict it in its lively Colors; in few Words (ſays he) every Leaf reſembles in color the moſt fair and beautiful Feathers of a Parrot, having a ſtripe of Red, a line of Yellow, a daſh of White, and a Rib of green color, not eaſily in Words to be ſet forth, the ſeveral mixtures of the Colors, which Nature has beſtowed hereon, being ſo excellent and admirable. *Johnſon* ſays the Leaves are commonly of three colors, the lower part next the Stalk is green, the middle red, and the end yellow; or elſe, the bottom being green, the middle part is yellow, and the end red.

VII. *The fourth, or* Carnation Flower Gentle, *(which is more rare than all the reſt) has a Root conſiſting of a great many* Fibres or Strings, *from which riſe up very thick fat Stalks, creſted and ſtreaked, exceeding ſmooth, and of a ſhining red color, which begin at the Ground to divide themſelves into Branches*; upon which do grow many great large Leaves, of a dark green color, tending to redneſs, in ſhew like to thoſe of the *Red Beet*, ſtreaked and daſht here and there with red, mixed with green; the Flowers grow along the Stalks, from the midſt thereof, even to the top, in form like *Pannicum*, that is, a great number of Chaffie confuſed Ears thruſt hard together, of a deep purple, or rather of a deep bluſh, tending to a Carnation color: the form or ſhape of this cannot be ſo fitly compared to any thing as to the Velvet Head of a Stag, compact of ſuch like ſoft feeling ſubſtance, in which is contained the Seed, which is white, round, and bored thro' the middle.

VIII. *The Places.* All theſe Plants are Natives of the Eaſtern Countries, as *Perſia*, *Arabia*, *Syria*, *Turky*, *&c.* from whence they have been brought to us, and here are only nurſt up in Gardens.

IX. *The Times.* They Flower, or bear their gallant Tufts or Spikes in *Auguſt*, and continue Flowering until *September*, keeping in ſome meaſure their vigor, till Froſt overtakes them, at what time they periſh. As for the third, or *Variable Flower gentle*, it ought to be Sown in a hot Bed of Horſe Dung, with ſome Earth ſtrewed thereon, in the end of *March*, and ſo ordered as you do *Muſk Melons*, and the like.

X. *The Qualities, Specification, Preparations and Virtues*, are the ſame with thoſe in the former Chapter, to which you are referred.

CHAP. CCLXXX.

Of FLOWER *of* Conſtantinople, *OR,* FLOWER *of* Briſtol.

I. *THE Names.* It is called in *Greek* Λυχνὶς Βυζαντιακὴ, ἢ τῆς Κωνσταντινουπόλεως, ἢ Λυχνὶς Χαλκηδόνικη, in *Latin Lychnis Chalcedonica*, *Lychnis Byzantina*, *vel Conſtantinopolitana*, in *Engliſh Flower of Conſtantinople*, or *Briſtol Flower*.

II. *The Kinds.* It is one of the Kinds of *Lychnides*, or *Campions*, and is twofold, *viz.* 1. *Lychnis Chalcedonica Flore ſimplici miniato*, Single Noneſuch, or Flower of *Conſtantinople*, or *Briſtol* Flower. 2. *Lychnis Chalcedonica Flore pleno miniato*, Double Noneſuch, or Double Flower of *Conſtantinople*, or *Briſtol* Flower.

III. The Deſcriptions. *The firſt, or* Single Noneſuch, *has a Root which is very fibrous or Stringy, faſtning it ſelf very ſtrongly in the Ground, whereby it much increaſes it ſelf, from whence ſpring up many broad and long green Leaves, among which riſe up ſeveral ſtiff, round, hairy, jointed Stalks, three Feet high, with two Leaves at every Joint*; the Flowers ſtand at the tops of them, very many together, in a large Tuft or Umble, conſiſting of five ſmall long Leaves, broad pointed, and notched in the middle, of a bright red Orange color; which being paſt, there come in their places ſmall hard whitiſh Heads, or Seed Veſſels, containing black Seed, like to the Seed of *Sweet Williams*, and having but a ſmall ſmell.

IV. *Of this* Single Species *there are three other ſorts, which differ chiefly in the Colors of the Flowers*, viz. 1. *Lychnis Chalcedonica Flore ſimplici albo*, Single *Briſtol* Flower with a White Flower. 2. *Lychnis Chalcedonica Flore ſimplici Carneo*, Single Noneſuch with a Bluſh or Fleſh Color, without variability. 3. *Lychnis Chalcedonica Flore ſimplici Verſicolor*, Single Noneſuch Variable. This at firſt is of a pale Red, after a while it grows paler, and at laſt it becomes wholly white; and all theſe diverſities of Flowers it will have to be ſeen at one and the ſame time upon the Stalks.

V. *The ſecond, or* Double Noneſuch, *has a Root Fibrous, like the former, and increaſes in like manner, the Leaves and Stalks being hairy and high, and the Flowers growing in Tufts, altogether like the firſt Single Kind*; but in this conſiſts the chief difference, that this bears a larger Umble or Tuft of Flowers at top of the Stalk, each Flower conſiſting of three or

four rows of Leaves, of a deeper Orange Color than it, which adds the more Grace to it, but paſſes away without bearing Seed, as moſt other double Flowers do; it is a Glorious Flower, being as Magnificent as it is Beautiful.

VI. *The Places.* They were firſt brought to us out of *Turky*, and are now Planted in our Gardens, almoſt every where.

VII. *The Times.* They Flower all *June* and *July*, but not till the ſecond Year after Planted, and continue Flowering for many Years, having a Root full of Life, and endures long, being able to ſuſtain the cold of our Country.

VIII. *The Qualities, Specification, Preparations and Virtues* of theſe Flowers have never been mentioned by any Author, and therefore we have the leſs to ſay of them; but doubtleſs being Kinds of the *Lychnis*, or *Campion*, they may have the ſame Virtues, and therefore to *Chap.* 90. aforegoing we refer you for the ſame.

CHAP. CCLXXXI.

Of FLOWERDELUCE
Bulbous Unmatchable.

I. *THE Names.* The general Name of all the Plants of this kind is in *Arabick Aſmeni juni, & Dierſa*, in *Greek* Ἶρις, in *Latin Iris*, and in *Engliſh Flowerdeluce.*

II. *The Kinds.* Of this Plant there are two principal Kinds, *viz.* 1. Ἶρις βολβώδης, *Iris bulboſa*, The bulbous or Onion like Flowerdeluce. 2. Ἶρις φυμώδης, *Iris tuberoſa*, The tuberous or bunchy Flowerdeluce.

III. *Of the Bulbous Kind* there are ſeveral Species, as 1. *Iris bulboſa impar, ſive incomparabilis*, The unmatchable bulbous Flowerdeluce, of which in this Chapter. 2. *Iris bulboſa Anglica*, The *Engliſh* bulbous Flowerdeluce, of which in Chap. 282. 3. *Iris bulboſa latifolia*, The broad Leaved bulbous Flowerdeluce, of which in Chap. 283. 4. *Iris bulboſa anguſtifolia major*, The greater narrow Leav'd bulbous Flowerdeluce, of which in Chap. 284. 5. *Iris bulboſa anguſtifolia minor*, The leſſer narrow Leav'd bulbous Flowerdeluce, of which in Chap. 285.

IV. *Of the Tuberous Kind* there are theſe following Species, *viz.* 1. *Iris tuberoſa Chalcedonia*, The Turkey tuberous Orrice or Flowerdeluce, of which in Chap. 286. 2. *Iris tuberoſa alba Florentina*, The Florentine white tuberous Orrice or Flowerdeluce, of which in Chap. 287. 3. *Iris tuberoſa latifolia*, The broad Leav'd tuberous Orrice or Flowerdeluce, of which in Chap. 288. 4. *Iris tuberoſa anguſtifolia*, The narrow Leav'd tuberous Orrice or Flowerdeluce, of which in Chap. 289. 290. 5. *Iris tuberoſa pumila major, Chamæiris major*, The greater Dwarf Orrice or Flowerdeluce, of which in Chap. 291. 6. *Iris tuberoſa pumila minor, Chamæiris minor*, The leſſer Dwarf Orrice or Flowerdeluce, of which in Chap. 292. 7. *Iris Graminea*, The Graſs Flowerdeluce, of which in Chap. 293. 8. *Iris agria, Xiris.* Wild Flowerdeluce, or Stinking Gladdon, of which in Chap. 294. 9. *Iris Paluſtris*, Water Flowerdeluce, or Water Flag, of which we have already Treated in Chap. 266. aforegoing.

V. *Of the unmatchable Species* there are two kinds, *viz.* 1. *Iris bulboſa prima latifolia Cluſij*, Cluſius his firſt great bulbous Flowerdeluce. 2. *Iris bulboſa Perſica*, The Perſian bulbous Flowerdeluce.

VI. The Deſcriptions. *The firſt, or* Great bulbous Flowerdeluce, *has a reaſonable great, round, or Onion like Root, black on its outward Coats, and white within, having many long, thick, white Roots inſtead of Fibres, which make them look like* Aſphodel *Roots.* From this Root ſpring ſeveral long and broad Leaves, not ſtiff, like as all the other, but ſoft, and greeniſh on the upper ſide and whitiſh underneath; from among which riſe up ſometimes ſeveral ſmall, ſhort, ſlender Stalks, and ſometimes but one, about half a Foot high, bearing at the top one Flower apiece, ſomething like unto a *Flowerdeluce*, conſiſting of nine Leaves, of which, thoſe three which ſtand upright are ſhorter, and more cloſed together than in the other kinds of *Flowerdeluces*, the other three which fall down turn up their ends a little, and thoſe three which in other *Flowerdeluces* do cover them at the bottom, ſtand like the upright Leaves of the other kinds, but are parted into two ends, like unto two ſmall Ears; the whole Flower is of a fair Blew, or pale Sky Color in moſt, with a long ſtripe in the middle of each of the falling Leaves, and in ſome white, but more ſeldom; theſe Flowers are very ſweet of ſmell.

VII. *The ſecond, or* Perſian Flowerdeluce, *has a bulbous, or round Onion like Root, with Leaves ſomewhat like to the former, but that they are ſhorter, and a little narrower*; the Flower is much of the ſame faſhion with the other, and is of a pale blew ruſſetiſh Color, each of the three lower falling Leaves are almoſt wholly of a brown Purple, with a yellow ſpot in the midſt of them; this is a rare Plant, and does not often bear Flowers with us, unleſs planted in a good Soil, and in a warm place, where it may have much of the preſence of the Sun, and be ſhelter'd from Storms and cold Winds, which always keep it back.

VIII. *The Places.* The firſt is a Native of *Spain* and *Portugal*, the ſecond of *Perſia*, but with us they are only nurſt up in Gardens, and being very tender Plants, ought to be Houſed in Winter.

IX. *The Times.* The firſt Flowers with us in *May*, and ſometimes ſooner, but in *Spain* and *Portugal* it Flowers, as *Cluſius* ſays, in *January* and *February*; the ſecond when it Flowers with us, Flowers alſo in *April* or *May.*

X. *As to the Qualities, Specification, Preparations and Virtues* of theſe, and all the ſeveral Kinds of *Bulbous Flowerdeluces*, Authors have ſaid nothing, nor is any thing extant concerning the ſame; and therefore in the four next Chapters we ſhall take no further notice of them, this being ſaid here once for all; their cheif uſe has been, and yet is, to deck up and adorn the Gardens of the Curious.

CHAP. CCLXXXII.

Of FLOWERDELUCE
Bulbous Engliſh.

I. *THE Names.* It may be called in *Greek* Ἶρις βολβώδης Βρεταννικος, in *Latin Iris bulboſa Anglica, Iris bulboſa major, Iris bulboſa Anglica cerulea*, in *Engliſh Blue Engliſh bulbous Flowerdeluce.*

II. *The Kinds.* It is one of the greater Kinds of the broad Leav'd bulbous Rooted Plants.

III. The Deſcription. *The Root of this Kind is greater and longer than any of the ſmaller Kinds* which

which have narrow Leaves, it is round, or Onion like, covered with divers brown Skins, which seem to be repleat with long Threads, like Hairs, especially at the small, or upper end of the Root, which thing you will not find in any of the smaller Kinds. From this Root the Plant springs up early, sometimes in *January*, with five or six long Leaves, which are broad, yet narrow in comparison of their length, and in respect to the other Kinds, also of a whitish green color, crested or straked on the backside, and half round, being hollow, like a Trough or Gutter, white all along the inside of the Leaf, and blunt at the end; from among which rises up a thick round Stalk, a Foot and half, or two Feet high, at the top whereof, out of a skinny husk, comes forth one, and sometimes two Flowers, consisting of nine Leaves apiece, three of which that are turned downwards are larger and broader than the other, having in each of them a yellow spot, about the middle of the Leaf; other three are small, hollow, ridged, or arched, covering the lower part next the Stalk of those falling Leaves turning up their ends, which are divided into two parts; the other three stand upright, and are very small at the bottom of them, and broader towards the top; the whole Flower is of a fair blew Color: after the Flowers are past, Heads three square come up, which are somewhat long and lank, or loose, containing within them round yellowish Seed, which when it is ripe, will rattle by the shaking of the Wind in the dry Husks.

IV. *The Places.* *Lobel* says that this *Blew broad Leav'd bulbous Flowerdeluce* grows naturally in the *West of England*, whether this be true or no, I know not, but of this I am certain, that it grows admirably well in our Climate; and as it is a beautiful Flower, so by much Planting it, it is very much encreased; and it grows common in most Country Folks Gardens: it has also been found growing in *Spain*, and in *France*, by such as have Travelled thro' those Countries.

V. *The Times.* It Flowers usually in the end of *May*, or beginning of *June*, and the Seed is ripe in the end of *July*, or in *August*.

VI. *Nota.* *Lobel* calls this Plant *Hyacinthus Poetarum Flore Iridis*, because of its Hyacinth Color, but I think without any reason for the same; it is truly an *Iris* or *Flowerdeluce*, and is called by some *Iris bulbosa major, sive latifolia*, to difference it from the lesser with narrow Leaves.

CHAP. CCLXXXIII.

Of FLOWERDELUCE Bulbed broad Leav'd.

I. *The Names.* It is called in *Greek* Ἶρις βολβώδης πλατύφυλλη, in *Latin Iris bulbosa latifolia*, in *English Broad Leav'd bulbous Flowerdeluce.*

II. *The Kinds.* There are various sorts hereof, *viz.* 1. *Iris bulbosa major purpurea & purpureo Violacea*, The paler or deeper purple great bulbous Flowerdeluce. 2. *Iris bulbosa major purpurea variegata, sive striata*, The great purple striped bulbous Flowerdeluce. 3. *Iris bulbosa major Flore rubente*, The great Peach colored bulbous Flowerdeluce. 4 *Iris bulbosa major, sive latifolia alba*, The great white bulbous Flowerdeluce. 5. *Iris bulbosa major alba variegata*, The great white striped bulbous Flowerdeluce. 6. *Iris bulbosa major, sive latifolia versicolor*, The great party colored bulbous Flowerdeluce.

III. The Descriptions. *The first, or* paler or deeper purple great Bulb, *has a Root like the* English *in the former Chapter, nor differs from it in the Leaf*; the chiefest difference is in the Flowers, which in this are somewhat larger, and in the one of a deep Blew, or Violet Purple Color, in the other of a deep Purple Color, in all other respects it is like to the former *English*: there is also another, in all things like to this, saving, that the Flower is of a pale Blew, or an Ash Color.

IV. *The second, or* Great Purple Striped, *has a purple Flower, but with some Veins or Stripes of a deeper Violet Color, variously running thro' the whole Leaves of the Flower.* There is another of this sort, which is of a pale Blew or Ash Color, streaked with Lines and Veins of Purple in the Leaves of the Flowers, some more, some less than other. Another also of a Purple Color, like to the first, but that round about the yellow spot in the middle of each of the three falling Leaves is of a pale Blue or Ash Color, the rest of the Leaf remaining Purple, as the other parts of the Flower are.

V. *The third, or* Great Peach Colored, *is more rare than any of the former, and not differing from them in Root, Leaf, or Flower, but only that the Flower in this is of a pale reddish Purple Color, coming something near to the Color of a Peach Blossom.*

VI. *The fourth, or* Great White, *has a Root not differing from the others, but only greater, it springs not up so early out of the Ground as the* Blew *and* Purple *do, but about a Month or more after; the Leaves are something larger and broader than the others*; the Stalk is thicker and shorter, bearing usually two very large and great Flowers, one opening a little before the other, yet oftentimes both in Flower together in the end, and of a pale blewish white Color, which is called a Silver Color while they are in the Bud, and before they are blown open, but then of a purer white, yet with an eye or show of the Silver Color remaining in them; the three falling Leaves are very large, having that yellow spot in the middle of them; after the Flowers are past, Heads come forth like unto the *Blew* or *Purple Kinds*, but larger, containing Seed of a reddish yellow color like them.

VII. *The fifth, or* Great White Striped, *is in Root, Leaf, and Flower, also in its manner of growing, like unto the last* Great White Flowerdeluce, it differs only in the marking of the Flower, being various from it, for this has in the White Flower great Veins, Stripes, or Marks, of a Violet Blew, dispersed thro' the Leaves of the Flower variously, which adds a superexcellent beauty thereto.

VIII. *The sixth, or* Great Party Colored, *differs not from the last, but in the Flower, which is of a whitish color in the three falling Leaves, having a circle of Ash Color about the yellow spot*, the three ridged Leaves being whitish, but ridged and edged with that Ash Color, and the three upright Leaves of a pale blewish white Color, with some Veins therein of a blewish Purple: there are some of this last sort, in which more Varieties are to be seen than can easily be expresst, or remembred, which variety, it is very probable, might come from the Sowing of the Seed in differing Soils, as has been truly observed in other Plants.

IX. *The Places.* They are all planted, and grow in our *English* Gardens, where they thrive very well.

X. *The Times.* They all Flower in the end of *May*, and in *June*, and the Seed is ripe in *July* and *August*.

CHAP.

CHAP. CCLXXXIV.

Of FLOWERDELUCE
Bulbous narrow Leav'd Greater.

I. *THE Names.* It is called in *Greek* Ἶρις βολβώδης στενόφυλλα μεγάλη, in *Latin Iris bulboſa anguſtiſolia major*, and in *Engliſh The greater narrow Leav'd bulbous Flowerdeluce.*

II. *The Kinds.* There are Twenty Five ſeveral Species, whoſe Names and Deſcriptions follow in order.

III. The Deſcriptions. 1. *Iris bulboſa anguſtiſolia alba Flore majore*, The greater white narrow Leav'd bulbous Flowerdeluce. This has a Root like to the other Kinds, which is a little bigger and rounder in the middle, and in its ſpringing up and manner of growing is much like to the firſt deſcribed in the next Chapter in all its parts, ſaving, that it is a little larger and higher, both in Leaf, Stalk, and Flower, and much whiter than any of the mixed Kinds which follow, yet not ſo white as the ſmall Kind in the next Chapter: in theſe which follow we ſhall not make a ſeveral and large Deſcription to every Kind, for that would be to make often and many repetitions of one and the ſame thing, for the firſt of them being once deſcribed, (which we have already done) we will to all the following add only the eſpecial differences, either in Leaf or Flower, in Magnitude, Color, or Form, wherein they may vary from that firſt, or one from another, theſe being all of the greater Kind.

IV. 2. *Iris bulboſa anguſtiſolia albeſcens*, *The Milk white narrow Leav'd bulbous Flowerdeluce.* Its falling Leaves have a little ſhew of yellowneſs, and ſo are the middle ridges of the arched Leaves, but the upright Leaves are more white; in Root and Leaf it differs not from the firſt White.

V. 3. *Argentea, The Silver Colored narrow Leav'd bulbous Flowerdeluce.* Its falling Leaves are of a yellowiſh white, like the laſt, the arched Leaves are whiter, and the upright Leaves of a blewiſh white, which we call Silver Color, like that of *Silver Weed*, or *Wild Tanſie.*

VI. 4. *Albida, Whitiſh.* The falling Leaves are yellowiſh, and ſometimes with a little edge of white about them, and ſometimes without; the upright Leaves are whitiſh, as the arched Leaves are, the ridge yellower.

VII. 5. *Albida labris luteis*, *White with yellow Falls.* The falls are yellow, the upright Leaves white; all theſe Flowers are of the ſame bigneſs with the firſt.

VIII. 6. *Albida anguſtior, The more narrow White*, The Flower is ſmaller, and almoſt as white as the firſt, the lower Leaves are ſmall, and do as it were ſtand outright, not having ſcarcely any fall at all, ſo that the yellow ſpot ſeems to be the whole Leaf; the arched Leaves are not half ſo large as in the former, and the upright Leaves bow themſelves in the middle, ſo that the tops do as it were meet together.

IX. 7. *Lutea, The Yellow.* It is like the former, ſaving, that its falling Leaves are a little more eminent and yellow, with a yellow ſpot.

X. 8. *Aurea, ſive Lutea Hiſpanica, The Golden, or Spaniſh Yellow.* It riſes not up ſo high as commonly moſt of the reſt do, and is wholly of a Gold yellow Color.

XI. 9. *Pallida Lutea, The pale Yellow.* It uſually riſes higher than the former yellow, and is wholly of a pale yellow, but deeper at the ſpot.

XII. 10. *Albida lutea, Pale Straw Color.* It is like unto the laſt pale yellow, but that the falling Leaves are whiter than all the reſt of the Flower.

XIII. 11. *Verſicolor Hiſpanica cærulea labris albis, The Spaniſh party colored Blew.* Its falling Leaves are white, the arched Leaves of a whitiſh Silver color, and the upright Leaves of a fine blewiſh purple.

XIV. 12. *Labris Cæruleis, The Blew edged.* The falling Leaves will have either an edge of blew, circling the white Leaves, the arched Leaves being a little blewer, and the upright Leaves more purple, or the falls will be almoſt wholly blew, edged with a blewer color, the arched Leaves pale blew, and the upright Leaves of a purpliſh blew Violet color.

XV. 13. *Alba pallida, A pale White.* The falls are white, the arched Leaves pale white, ſo alſo the upright Leaves; ſome are a fair blewiſh purple: ſome of them will alſo have larger Flowers than others, and bear more; for the firſt ſort, which is the moſt ordinary, ſeldom bears above one Flower on a Stalk, yet ſometimes two: and of the others, ſome will bear two, and three Flowers, others again but one.

XVI. 14. *Cærulea, ſive Purpurea major, The greater Purple.* The Stalk is higher, Flower purple, and larger the Stalk of a very reddiſh purple color, a little above the Ground, at the foot or bottom of the Leaves and Stalk; this Flowers with the latter ſort of *Flowerdeluces.*

XVII. 15. *Purpurea ſerotina, The late Purple.* The Flower is wholly purple, except the yellow ſpot, and Flowers later than any of the other Purples.

XVIII. 16. *Purpurea rubeſcens labris cæruleis, The reddiſh Purple with blew falls.* Its upright Leaves are of a reddiſh purple, and the falling Leaves of a blew color.

XIX. 17. *Purpurea rubeſcens labris albido cæruleis, The reddiſh Purple with whitiſh blew falls.* It is of a reddiſh purple, and its falling Leaves of a whitiſh blew color, in nothing elſe differing from the laſt.

XX. 18. *Purpurea labris luteis, The Purple with yellow falls.* Its falling Leaves are of a fair Gold yellow, without any ſtripe, yet in ſome there are Veins running thro' the yellow Leaves, and ſome have an edge of a ſad dark color about them; the upright Leaves in every of theſe are of a Violet Purple.

XXI. 19. *Purpurea labris ex albido cæruleo, & luteo mixtis, Party colored Purple with ſtriped yellow falls.* This is like the laſt, but that the falling Leaves are of a pale blew and yellow, traverſing one the other, and the arched Leaves of a pale purpliſh color.

XXII. 20. *Subpurpurea labris luteis, The pale Purple with yellow falls.* Its upright Leaves are of a paler purple, and the falling Leaves yellow. There is another Species of this, a little differing from it, in that the arched Leaves are whitiſh.

XXIII. 21. *Subcærulea labris luteis, The Party colored blew and yellow.* Its upright Leaves are of a pale blew, and the falling Leaves yellow. There is another of this ſort, but of a little paler blew.

XXIV. 22. *Crinis coloris elegantiores, The fair Hair colored.* Its upright Leaves are of a fair brownniſh yellow, or Hair color, and the falling Leaves yellow.

XXV. 23. *Altera obſoletior, The dull Hair colored.* It is of the ſame color with the former, but ſomewhat deader.

XXVI. 24. *Iris bulboſa Africana, The Purple or Murry* Barbary *bulbous Flowerdeluce.* As to Root, Leaf,

Leaf, and Flower, and for its form, it is in all reſpects like unto the middle ſort of theſe *Flowerdeluces*, only the loweſt part of the Leaves and Stalk, for about an Inch next the Ground, are of a reddiſh color, ſpotted with many ſpots, and the whole Flower being of a mean ſize, is of a deep purpliſh Red, or Murry color, excepting the yellow ſpot in the midſt of the three falling Leaves; it is a Flower of much beauty.

XXVII. 25. *Purpurea cærulea obſoleta labris fuſcis*, *The dusky Party colored Purple.* This is the greateſt of all theſe *narrow Leav'd Flowerdeluces* in all the parts of it, the Root is greater than any of the other, being thick and ſhort, the Leaves are broader and longer, but of the ſame color, the Stalk is higher and ſtronger than any of them, bearing two or three Flowers, which are larger than any of the reſt, the falling Leaves are of a dusky yellow, ſometimes with Veins and Borders about the Brims of another dun color, having the yellow ſpot in the middle; the arched Leaves are of a ſad pale purpliſh yellow, the upright Leaves are of a dull or dusky blewiſh Purple, and the Heads or Horns for Seed are alſo greater, as is likewiſe the Seed.

XXVIII. *The Places.* All theſe *Flowerdeluces* came originally out of *Spain* and *Portugal*, and with us they are nouriſht up in Gardens, where they proſper very well.

XXIX. *The Times.* They Flower in *June*, and ſometimes continue Flowering until *July*, but Flower not commonly ſo early as the *Latifolia*, or *broad Leav'd Kinds*; they are ſoon ſpoiled with Wet in Flowering.

CHAP. CCLXXXV.

Of FLOWERDELUCE
Bulbous narrow Leav'd Small.

I. *THE Names.* It is called in *Greek* Ἶρις βολβώδης στενόφυλλη μικρότερος, in *Latin Iris bulboſa anguſtifolia minor*, in *Engliſh The leſſer narrow Leav'd bulbous Flowerdeluce.*

II. *The Kinds.* There are but three ſeveral Species of this ſort taken notice of by Authors, *viz.* 1. *Iris bulboſa anguſtifolia alba minor*, The ſmall white narrow Leav'd bulbous Flowerdeluce. 2. *Iris bulboſa anguſtifolia mauritanica ſerotina flava minor*, The leſſer yellow late narrow Leav'd bulbous Flowerdeluce of *Barbary*. 3. *Iris bulboſa anguſtifolia Cærulea, ſive Purpurea præcox minor Luſitanica*, The *Portugal* ſmall early Purple, or Blew narrow Leav'd bulbous Flowerdeluce.

III. The Deſcriptions. *The firſt, or* ſmall white narrow Leav'd bulbous Flowerdeluce, *has a Root which is ſmaller and ſhorter than thoſe of the* Latifolia, *and without any Hairs or Threads, covered with brown thin Skins, and more plentiful in yielding an increaſe*; its Flower is ſmaller than the firſt Kind of the former Chapter; it ſprings out of the Earth always before Winter, which afterwards breaks forth into four or five ſmall and narrow Leaves, a Foot or more long, of a whitiſh green on the inſide, which is hollow and channelled, and of a blewiſh green color on the outſide, and round withal; the Stalk is longer and ſlenderer than thoſe of the *Latifolia*, with ſome ſhorter Leaves upon it, at the top whereof, out of ſhort skinny Leaves, come forth one or two Flowers, ſmaller, ſhorter, and rounder than the Flowers of the laſt of the *broad Leav'd*, yet made after the ſame proportion, with nine Leaves, three falling downwards, with a yellow ſpot in the middle, other three made long, made like a long arch, which cover the lower part, next the Stalk of thoſe falling Leaves, and turn up at the ends of them, where they are divided into two parts; the other three ſtand upright, between each of the three falling Leaves, being ſomewhat long and narrow; the Flower is wholly of a pure white color, (ſaving the yellow ſpots) yet in ſome having a ſhow of ſome blewneſs throughout, and in others towards the bottom of the three upright Leaves: after the Flowers are paſt, ſo many long Cods or Seed Veſſels riſe up, as there were Flowers, which are longer and ſmaller than in the laſt of the *broad Leav'd*, and a little bending, like a Coronet, with three round ſquares, and round pointed alſo, which dividing it ſelf (when the Seed is ripe) into three parts, do ſhew ſix ſeveral Cells or places, wherein is contained ſuch like round reddiſh yellow Seeds as thoſe of the laſt *Latifolia*, but ſomething ſmaller.

IV. *The ſecond, or* leſſer yellow late narrow Leav'd, *is a ſmaller Plant, or* Dwarf Kind, *brought from the farther parts of* Barbary, *near the Sea, like unto the* yellow greater narrow Leav'd, viz. *the Ninth and Tenth of the former Chapter*, but that this is ſmaller and lower, and inſtead of upright Leaves, has ſmall ſhort Leaves like Hairs; it Flowers very late, after all others have yielded their ripe Seed.

V. *The third, or* ſmall early Purple Portugal, *is ſmaller in all its parts than the* alba pallida *at* Sect. XIII. *of the former Chapter*, the Stalk is ſlenderer, and not ſo high, bearing at the top one or two ſmall Flowers, all wholly of a fair blewiſh Purple, with a yellow ſpot in the middle of every one of the falling Leaves.

VI. *The Places.* Theſe, alſo all of them, came firſt to us from *Spain* and *Portugal*, but are here nurſt up in Gardens, where they thrive very well.

VII. *The Times.* The firſt Flowers in *June*, and ſometimes in *July*, but not ſo early as the former *broad Leav'd Kinds.* The ſecond Flowers very late, after moſt of the others, and the third uſually Flowers very early, even with the firſt *bulbous Flowerdeluces.*

VIII. *Nota.* It is poſſible that there may be many more Kinds or Differences of theſe *bulbous Flowerdeluces*, which may ariſe from the different goodneſs of the Seed, alſo from the Soil, and the time and manner of Sowing it, as many have obſerved from their own experience, every Year ſhewing forth ſome variety which was never ſeen before.

CHAP. CCLXXXVI.

Of FLOWERDELUCE
Tuberous Great Turky,

OR,

FLAG FLOWERDELUCE.

I. *THE Names.* It is called in *Greek* Ἶρις φυμώδης χαλκηδόνικη μείζων, in *Latin Iris tuberoſa Chalcedonica major*, in *Engliſh The great Turky tuberous Flowerdeluce.*

II. *The*

II. *The Kinds.* This is the firſt of the *Tuberous ſorts*, of which there are two ſpecial Kinds, *viz.* 1. *Iris Chalcedonica, ſive Suſiana major*, The great Turky Flowerdeluce. 2. *Iris Chalcedonica, ſive Suſiana minor*, The leſſer Turky Flowerdeluce. This latter, tho' it is called *minor*, or *leſſer*, yet it is only ſo in reſpect to the firſt *great Kind*, but it is *magnus* or *major*, in reſpect of the *little Kinds*, which hereafter follow.

III. The Deſcriptions. *The firſt, or* Great Turky Flowerdeluce, *has a Root which is brown on the outſide, and is very thick and tuberous, as all others of this ſort of* Garden Kinds *are.* From this Root ſpring forth ſeveral Heads of long and broad freſh green Leaves, yet not ſo broad as many others of thoſe which follow, one folded within another at the bottom, as all others of theſe *Flowerdeluces* are; from the middle of ſome one of theſe Heads, (for every Head of Leaves bears not a Flower) riſes up a round ſtiff Stalk, about two Feet high, at the top whereof ſtands one Flower, (it has not yet been obſerved to bear two) the largeſt almoſt, but the moſt excellent of all the reſt, conſiſting of nine Leaves, like the others which follow, but of the color almoſt of a Snakes Skin, it is ſo variouſly ſpotted; the three lower falling Leaves are very large, of a deep or dark purple color, almoſt black, full of greyiſh ſpots, ſtrakes and lines thro' the whole Leaves, with a black Thrum or Freez in the midſt of each of them; the three arched Leaves which cover them are of the ſame dark purple color, yet a little paler at the ſides; the three upper Leaves are very large, and of the ſame color with the lower Leaves, but a little more lively and freſh, being ſpeckled and ſtraked with whiter ſpots and lines, which Leaves being laid in Water, will tinge the Water of a Violet color, and if a little Alum be put therein, and then they be wrung or preſſed out, and the Juice of theſe Leaves is dryed in the ſhade, it will become a color almoſt as deep as Indico, and may ſerve for Shadows in the Art of Limning; the Flower has no ſmell which can be perceived, but is only commendable for its beauty and the rarity thereof; it ſeldom bears Seed in our Climate, but when it does, it is contained in great Heads or Cods, being browniſh and round, but not ſo flat as in the other Kinds which follow.

IV. *The ſecond, or* Leſſer Turky Kind, *differs little from the former*, the Leaf is of a more yellowiſh green color, the Flowers are neither ſo large nor ſo fair, nor the ſpots and marks ſo perſpicuous, nor the Color of that lively luſtre.

V. *The Places.* By ſome part of the Name, it ſeems that they might firſt come from *Suſis* in *Perſia* into *Turky*, but from *Turky* they were firſt brought to us; they grow and thrive very well in our Gardens.

VI. *The Times.* They Flower moſt commonly in *May*, before any of the other Species.

VII. As to their *Qualities, Specification, Preparations and Virtues*, ſee them declared at large in *Chap.* 288. following: And here is to be noted that all the *Tuberoſe Flowerdeluces* (except the *Florentine*, commonly called *Florentine Orrice*) more eſpecially thoſe which have the Blew or Purple Flower, have one and the ſame Virtues; and that our *Engliſh Blew Flowerdeluce* exceeds them all.

CHAP. CCLXXXVII.

Of FLOWERDELUCE White Florentine, OR, FLORENTINE ORRICE.

I. *THE Names.* It is called in *Greek* Ἶρις φυμώδὴς λευκὴ: in *Latin Iris Tuberoſa alba, Iris tuberoſa Florentina, Iris alba Florentina*: in *Engliſh White Flowerdeluce, Florentine Flowerdeluce, Florentine White Flowerdeluce, White Orrice*, and *Florentine Orrice.*

II. *The Kinds.* It is threefold. *viz.* 1. *Iris alba Florentina*, The White Flowerdeluce, or Florentine Orrice, which is the principal kind, and that of which the *ſweet Orrice Pouder* is made. 2. *Iris Flore Pallido Florentina*, The yellowiſh White, or Straw colored Florentine Orrice. 3. *Iris alba major Verſicolor*, The White party colored Flowerdeluce.

III. The Deſcriptions. *The firſt, or* Great White Florentine Flowerdeluce, *has a Root which is Tuberous or Knobby, thick, irregular, and ſhooting out from every ſide ſuch like Tuberous Heads, lying for the moſt part upon, or above the Ground, and faſtned within the Ground with long white Fibres or Strings.* From this Root riſe up many Heads of very broad, and flat long Leaves, encloſing or folding one within another at the bottom, and after a little ſpace divided one from another towards the top, thin edged on both ſides, like a two edged Sword, and thicker in the middle. From the middle of ſome of theſe Heads of Leaves, riſes up a round ſtiff Stalk, two or three Feet high, bearing at the top one, two, or three large Flowers, which break out of ſeveral Husks or Skins, conſiſting of nine Leaves apiece, as all the other *Flowerdeluces* do, and of a fair white color; having in the middle of each of the three falling Leaves a ſmall long yellow Freez or Thrum, as is moſt uſual in all the kinds of the following *Flowerdeluces*, both of the greater and ſmaller ſorts. After the Flowers are paſt, thick ſhort Cods or Pods come forth filled full with the Seed, which is red, roundiſh, and flat.

IV. *The ſecond, or* yellowiſh White, *is in its Roots, Leaves, Stalks, Flowers, Seed, and manner of growing very like unto the former, or* true Florentine Orrice; and differs in nothing from it, but in the color of the Flowers, this being indeed of a more yellowiſh White, commonly called a Straw color.

V. *The third, or* White party colored, *has a Root not ſo great as the former* White Florentine, *but a little ſlenderer and browner.* The Leaves are not ſo large and broad; but the Flower hereof is nearly as large, and as White as the firſt *Florentine*; yet it has a fair Liſt or Line, of a blewiſh purple, down the back of every one of the three upright Leaves, and likewiſe round about the edges, both of the upper and lower Leaves; and alſo a little more purpliſh upon the ridge of the arched Leaves, which cover the falling Leaves. In all other reſpects this variable *Flowerdeluce* is like to the former.

VI. *The Places.* The Name ſhews the Original place from whence it came to us, but the beſt comes

comes from *Illyria* in *Greece*; Here we only Nurſe it up in *Gardens*, where it flouriſhes as well as any of the *Blew* or *Purple* Kinds.

VII. *The Times.* They flower in *April*, *May*, and *June*, according as care is taken of them.

VIII. *The Qualities.* The *Illyrick Orrice* is accounted the beſt, but the Roots of both that and the *Florentine* are uſed, and the latter being moſt common, bears away the Bell in its Name. It is hot and dry in the ſecond Degree, incides, attenuates, expectorates, digeſts, opens, mollifies, abſterges, and is Pectoral.

IX. *The Specification.* It is good againſt Tartarous Mucilage in the Breſt and Lungs, Coughs, Aſthma's, ſtinking Breath.

X. *The Preparations.* You may prepare from the Root (for nothing elſe of the Plant is uſed) 1. *A Pouder.* 2. *Species Diaireos ſimplices, A Species.* 3. *An Electuary ſimple.* 4. *Diaireos Salomoni*, Electuary of Orrice Roots compound. 5. *An Extract.* 6. *A Spirituous Tincture.* 7. *An Acid Tincture.*

The Virtues.

XI. *The Pouder*, commonly called *Orrice Pouder.* It is uſed outwardly in making perfumes, and in ſweet Pouder for the Hair; alſo in Compoſitions of *Damask Pouders* and *Cypreſs Pouders.* The Root it ſelf is many times chewed in the Mouth, by ſuch who have a Stinking Breath; by which means it draws forth much Rheum, Flegm, and ill digeſted Humors, which cauſe the Breath to ſmell Strong. However the ſimple Pouder is given for the ſame purpoſe, from half a Dram to a Dram every Morning faſting, and every Night going to Bed, mixed with a ſufficient Quantity of double refined Sugar, and ſo ſwallowed, and waſhed down with a Glaſs of *White Lisbon* or *Port Wine.* It opens obſtructions of the Womb, provokes the Terms, expels Wind, eaſes gripings of the Belly, and pains of the Stomach.

XII. *Species Diaireos ſimplices*, Pouder of Orrice Root ſimple. See it in our *Pharmacopœia Londinenſis, Lib.* 4. *Chap.* 21. *Sect.* 10. It is good againſt Aſthma's, breathing obſtructed, Colds, Coughs, Hoarſneſs, Wheezing, Phthiſick, ſhortneſs of Breath, Pain of the Stomach, *&c.* Doſe from half a Dram to two Drams.

XIII. *The Electuary.* It *is made of the ſimple Pouder at Sect.* 11. *one part mixed with Clarified Honey two parts.* It has all the Virtues of the *Species Diaireos ſimplices* aforenamed; beſides which, it cauſes an admirable expectoration, and withal keeps the Body ſoluble; it cleanſes the Lungs, and heals Ulcers there, expels Wind, gives eaſe in the Colick, by opening the Bowels, and prevails againſt a ſtinking Breath, Doſe half an Ounce or more, Morning and Evening, drinking a Glaſs of White *Port Wine* after it.

XIV. *Diaireos Salomoni*, Electuary of Orrice Root compound. See it in our *Pharmacopœia Londinenſis Lib.* 4. *Chap.* 22. *Sect.* 57. It is a very good Pectoral, good againſt Aſthma's, belching up Wind, Coughs, Colds, Hoarſneſs, Wheezing, Obſtructions of the Lungs, Ulcers of the Lungs, ſpitting of Blood and matter: It cleanſes thoſe parts, dries, and heals them; is good againſt Colicks, Wind, gripings of the Bowels, Worms in Children, pain of the Stomach, weakneſs thereof, and want of appetite. Doſe from half an Ounce to an Ounce, two or three times a day, drinking a Glaſs of *Hippocras* or generous Wine after it.

XV. *The Extract.* It is given from half a Dram to a Dram in a Glaſs of *White Port Wine*, *Canary*, *Malaga*, *Sherry*, or *Madera Wine*, as alſo in *Mead* or *Metheglin.* It has all the Virtues of the Simple and Compound Pouders and Electuaries, but is more powerful and effectual to all the purpoſes and intentions there ſpecified. It warms and comforts a cold moiſt and depraved Stomach, ſtrengthens the Appetite, cauſes a good digeſtion, and powerfully opens obſtructions of the Lungs, Liver and Spleen.

XVI. *The Spirituous Tincture.* It reſtores the tone of the Stomach and other Viſcera to a Miracle; and ſtrengthens the Bowels upon the Cure of a Dropſie, making them able to reſiſt the return of the Diſeaſe, and ſo to prevent a Relapſe. It is a ſingular good thing againſt a Leucophlegmatia, wearineſs of the Body, Lazineſs, fainting and ſwooning Fits, and the Scurvy in a cold habit of Body. Doſe two Drams, to three or more, in any proper and ſpecefick Vehicle, Morning, Noon, and Night.

XVII. *The Acid Tincture.* It is highly deobſtructive and antiſcorbutick, good againſt all ſorts of Fevers which proceed from the corruption of the Juices, and putrefaction of the Humors; and therefore is very prevalent againſt the Plague, and all ſorts of Peſtilential and malignant Fevers, for that it ſtrikes againſt their Root and Eſſence. It is as well Preſervative as Curative; and by reaſon, that it ſo powerfully reſiſts putridity, and cleanſes, it becomes an extraordinary remedy againſt a ſtinking Breath, yea, tho' it has been of many years ſtanding. It incides tough Flegm, diſſolves it, and expels all the evil juices of the Stomach, and other Viſcera, is good againſt Stone, Gravel, Sand, and Tartarous Mucilage in the Reins, Ureters and Bladder. Doſe ſo many drops as to make the Liquor pleaſantly ſharp, and may be taken in all that the Patient drinks.

XVII. *The Oily Tincture.* Anointed upon the parts affected, it is good againſt Cramps, Convulſions, Tremblings of the Limbs, Numbneſs, Palſies, and all ſorts of Pains and Aches proceeding from a Cold cauſe. Given Cliſterwiſe to one Dram or more, it gives eaſe in Colicks, Tortions of the Bowels, Stone, *&c.*

CHAP. CCLXXXVIII.

Of FLOWERDELUCE Tuberous broad leaved, *OR,* FLAG FLOWERDELUCE broad leaved.

I. THE *Names.* It is called in *Greek* Ἶρις φυσώδης πλατύφυλλη: in *Latin Iris tuberoſa latifolia:* and in *Engliſh Broad leaved Tuberous Flowerdeluce.* Some of the *Greeks* call it Ἶρις, *quaſi ſacra*, for which reaſon ſome have given it the name of *Conſecratrix*, but is rather called *Iris à cæleſtis Arcùs ſimilitudine, quam flores ejus repreſentant*, from the Rainbow, whoſe diverſity of Colors, the Flower thereof doth imitate. Some have called it *Radix mariſca*, becauſe it is excellent againſt the *Piles*: and ſome have called it *Naronica*, from the River *Naron*, becauſe by its Banks and Shore it grows in great plenty. Some have made a difference between *Iris* and *Ireos*, according to the *Latin* Verſe, *Iris purpuream florem gerit, Ireos album:* making *Iris* to ſignifie the *Blew Flowerdeluce*; and *Ireos* the *White Flowerduce*, or *Florentine Orrice*; but this was purely a miſtake in the Poet: However

now, when Phyſicians write *Iris*, the Common *Blew* or *Purple Flowerdeluce* is intended; but when *Ireos*, they mean and intend the *Florentine Orrice*.

II. *The Kinds.* There are fourteen ſeveral kinds of this Broad leaved Tuberous, blew or purple Flowerdeluce, *viz.* 1. *Iris purpurea, ſive vulgaris*, The Common blew, or purple Flowerdeluce. 2. *Iris purpurea pallidior verſicolor*, The various colored paler purple Flowerdeluce. 3. *Iris cærulea labris purpureis*, The blew Flowerdeluce with purple ſtalks. 4. *Iris Dalmatica major*, The great *Dalmatian* Flowerdeluce. 5. *Iris Aſiatica Cærulea*, The Blew *Aſian*. 6. *Iris Aſiatica purpurea*, The Purple *Aſian*. 7. *Iris Damaſcena*, The Damaſco Iris. 8. *Iris biflora Luſitanica*, The Portugal double flowering. 9. *Iris purpurea verſicolor major Camerarii*, The great variable Purple. 10. *Iris purpurea verſicolor minor*, The leſſer variable Purple. 11. *Iris purpurea altera minus fuliginea*, Another Purple leſs ſmoakie. 12. *Iris Cærulea verſicolor*, The Blew variable. 13. *Iris lutea variegata*, The Yellow variable. 14. *Iris lutea labriis purpureis palladis*, The Yellow with pale purple Lips, or falls.

III. The Deſcriptions. *The firſt, or* Common blew or purple Flowerdeluce, *has a Tuberous Root, and differs little or nothing from the Great Turky kind, neither in its Root, Leaf or Flower, nor in its manner or form of growing*, only that the Leaves of this are not ſo large as ſome of the kinds are; and the Flower it ſelf is of a deep purple, or violet Color, and ſometimes a little declining to redneſs, in ſome particular places.

IV. *The ſecond, or* Various colored, paler Purple, *has Flowers of ſuch a pale Purple color, as that they come near unto a Blew*; and ſometimes it will have Veins or Stripes of a deeper blew or purple, and ſometimes of an Aſhcolor, running thro' all the higher and lower Leaves.

V. *The third, or Blew with Purple falls*, is another kind much like unto the former; but this is more purple in the falls, and more pale in the upright Leaves.

VI. *The fourth, or* Great Dalmatian, *has its Roots and Leaves as large and broad as any of the Flowerdeluces whatſoever*: Its Stalk and Flower do equal its other parts in proportion; ſaving that the color of the Flowers is differing, this being of a fair Watchet or pale blew color wholly, with the yellow Thrum down the middle of the Flower or falling Leaves, as before is ſaid to be Common to all *Flowerdeluces*. In all its other parts, it differs little, ſave only, that it is obſerved to have a ſmall ſhew of a purpliſh red about the bottom of the green Leaves.

VII. *The fifth, or* Blew Aſian, *is in largeneſs of Leaves like unto the* Dalmatian, *but bears a greater ſtore of Flowers on ſeveral Branches*, which are of a deeper blew color, and the arched Laves, whitiſh on the ſide, and purpliſh on the Ridges, but in other parts like unto it.

VIII. *The ſixth, or* Purple Aſian, *is nearly like to the former*, but that the Leaves of this are a little narrower, and its Flowers a little more Purple, eſpecially the upper Leaves.

IX. *The ſeventh, or Damaſco Flowerdeluce*, is altogether like to the Flowerdeluce of Aſia, excepting that it has ſome white Veins in its upright Leaves.

X. *The eighth, or* Portugal double flowering, *is very like the firſt kind of this Chapter, but that it is not ſo large in its Leaves, nor in its Flowers*: It ſometimes flowers twice in a Year, *viz.* in the Spring, and in the Autumn; but this double flowering is not often, unleſs the Soil in which it grows is very good, the Scituation proper, and the Seaſons warm and productive: But the Flowers of this have a better and ſweeter Smell than the firſt kind; and they are of a Purple or Violet Color, and come out of a purpliſh Skin or Husk.

XI. *The ninth, or* Great variable Purple, *has very broad Leaves, like unto the Leaves of the firſt kind in this Chapter, and ſo is the Flower alſo, but differing in Color*: For the three lower Leaves, are of a deep Purple, tending to redneſs: The three arched Leaves, are of the color of the upper Leaves; and the three upper Leaves, are of a pale color, tending to yellowneſs, ſhadowed over with a Smoaky purpliſh color, except the ridges of the arched Leaves, which are of a more lively Purple.

XII. *The tenth, or* leſſer variable Purple, *differs not in any thing from the laſt*, but only that it has narrower green Leaves, and ſmaller and narrower Flowers, otherwiſe if they be both compared together, the Colors will not ſeem to varie at all one from another.

XIII. *The eleventh, or* other Purple leſs ſmoaky, *comes ſomething near unto the two laſt Kinds*, whoſe Husks, from whence the Flowers do ſhoot forth, have purple Veins in them, and ſo have the falling purpliſh Leaves; and the three upright Leaves are not ſo dull or ſmoaky, yet of a dull purple Color.

XIV. *The twelfth, or* Blew variable, *has its Leaves of the ſame largeneſs with the leſſer Variable, at* Sect. 12. *above, and its Flowers are as diverſly marked*: for ſome have the falling Leaves blew at the edges, and whitiſh at the bottom of the arched Leaves, which are of a yellowiſh white; and the upright Leaves are of a whitiſh blew, with yellowiſh edges. Some again are of a darker blew, with browniſh Spots in them. And ſome are of ſo pale a Blew, that it may well be called an Aſhcolor. Some alſo there are whoſe upright Leaves are of a fair pale blew, with yellowiſh edges, and the falling Leaves are parted into two colors, ſometimes equally in halfs, each ſide differing from the other in color; and ſometimes one

Leaf

Leaf only is in that manner, and ſometimes with a various colored Liſt in them; in the other parts both of Flower and Leaf, it is like to the ſaid leſſer variable Purple.

XV. *The thirteenth, or* Yellow Variable, *has a Root which grows ſomewhat more ſlender and long, under ground, and of a darker color than many of the others:* This Plant loſes its Leaves in Winter, which is contrary to all the former *Flowerdeluces*, ſo that its Root remains under Ground, without any appearance of Leaves upon it: But in the beginning of the Spring, it ſhoots out fair broad Leaves, falling downwards at their points or ends, but ſhorter many times than any of the former, and ſo is the Stalk in like manner, not riſing much above a Foot or fifteen Inches high, on which are ſet two or three large flowers, whoſe three falling Leaves are of a reddiſh purple color: The three Leaves which ſtand upright are of a ſmoaky yellow; the three arched Leaves, having their Ridges of a pale color, inclining to purple, have their ſides or edges of the former ſmoaky yellow color, with ſome purpliſh Veins at the feet or bottoms of all the Leaves.

XVI. *The fourteenth, or* Yellow, with pale purple lips, or falls, *has its three upright Leaves of a pretty fair yellow, and ſtand more upright, not bowing down, as moſt of the others do; the three falling Leaves are purple with pale edges.* Some of theſe have their green Leaves party colored, white and green, more or leſs, and ſo are the husks of the Flowers. The three arched Leaves are yellow, as the upright Leaves are, with purpliſh Veins at bottom. Some have both upright and arched Leaves, of ſo pale a yellow, that we may in a manner call it a Straw color, but yellower at the bottom with purple Veins; and the falling Leaves are purple, with two purple Spots in them.

XVII. *The Places.* They are all Nurſt up, and grow in the *Gardens* of *Floriſts* with us in *England*, but grow alſo in many other Nations and Countries, according as their ſeveral Titles declare; as in *Turky*, *Hungaria*, *Dalmatia*, *Illyria*, *Spain*, *Portugal*, *France*, &c.

XVIII. *The Times.* They flower, ſome in *April*, ſome in *May*, ſome in *June*, and the Seed ripens not many Weeks after.

XIX. *The Qualities.* Theſe with the *Turkey* as foregoing, and all the reſt following are ſaid to be of one and the ſame Quality, Property and Effect; when green and full of Juice, they are hot and dry almoſt in the fourth Degree: but when they are dry, they are then hot and dry in the third Degree, and will yet in ſome meaſure burn the mouth and throat of ſuch as Chew them. They are Aperitive, Inciding, Digeſtive, Abſterſive, and Diuretick, Stomatick, Pectoral and Hyſterick, Cathartick, Emetick and Emmenagogick. They are ſaid to offend the Stomach, and to cauſe Blood to be voided, if given in too great a Doſe, and to weak Perſons. Of all theſe Plants, the firſt in this Chapter is thought to be moſt effectual, and of the ſame the Root is that which is chiefly uſed. It is not ſafe to be given to Women with Child, becauſe it forcibly brings down the Courſes, and is apt to cauſe Miſcarriage. And when exhibited, it ought to be given with good Correctives, as Maſtick, Juice of Liquorice, Extract of Juniper Berries, *&c.*

XX. *The Specification.* It is famous in Curing the Scurvy, Dropſie, Jaundice and Gout.

XXI. *The Preparations.* You may prepare therefrom, *viz.* from the Root, 1. *A Liquid Juice.* 2. *An Eſſence.* 3. *An Infuſion.* 4. *A Decoction.* 5. *A Syrup.* 6. *A Pouder.* 7. *An Electuary Simple.* 8. *An Electuary Compound.* 9. *An Oil, viz. Oleum Irinum.* 10. *A Balſam.* 11. *A Cataplaſm.* 12. *A Peſſary.* 13. *A Spirituous Tincture.* 14. *An Acid Tincture.* 15. *An Oily Tincture.* 16. *A Saline Tincture.*

The Virtues.

XXII. *The Liquid Juice.* Taken from one to three Spoonfuls (according to Age and Strength) mixt with a little Honey, and a Glaſs of Ale or Wine, it purges and cleanſes the Stomach of thick and tough Flegm, and ſharp Choler, which are ſaid by Authors to be the cauſes of Agues and Fevers. It Cures the Jaundice and Dropſie alſo (for which it is a famous thing) by evacuating the Humors which cauſe thoſe Diſeaſes, both upwards and downwards. And becauſe it does ſomewhat bite upon the Stomach, it is not to be given without being corrected with Honey, Spicknard, and aromatick Spices; applied to the Piles, it eaſes them.

XXIII. *The Eſſence.* Being taken from one, to three or four Spoonfuls in any proper Vehicle, it performs all the Liquid Juice can do, beſides which, it eaſes the pains and torments of the Bowels, or gripings of the Belly and Hypochonders, evacuates Melancholy, and takes away the ſhaking Fits of Agues; opens obſtructions of the Liver, Spleen, and Womb, kills Worms in the Stomach and Inteſtines; expels the Stone, Gravel, Sand, or Tartarous matter out of the Reins and Bladder; gives eaſe and reſtores in Cramps, Convulſions, and Palſies, which come from cold and moiſt Humors, by its Anodyne and healing property, whereby it warms and comforts the parts affected, and prevails againſt a ſimple Ghonorrhea: It provokes the Terms in Women, and brings away both Birth and After-Birth.

XXIV. *The Infuſion in Wine.* It has the Virtues of the Juice and Eſſence, but much inferior in Efficacy: it prevails againſt the bitings and ſtingings of Venemous Creatures, repreſſes Vapors in Women, and is good againſt Fits of the Mother: It opens obſtructions of the Viſcera, and cleanſes the Stomach.

XXV. *The Decoction in Wine.* If it is taken to fix Ounces, it provokes Urine, gives eaſe in the Colick, produces the Terms; uſed as an Errhine, adding to one part of the Decoction, three parts of the liquid Juice, it purges the Head admirably of Flegm, and tough viſcous Humors; and bathed upon the Hemmorrhoids or Piles, it gives much eaſe and diſcuſſes them. The Decoction made with Water and Vinegar, and ſo drank it is a remedy againſt the bitings of Mad Dogs and Serpents, and the ſtingings of Venemous Creatures.

XXVI. *The Syrup.* It has the Virtues of the Juice, Eſſence, Infuſion and Decoction, but acts more weakly by reaſon of its being ſo loaded with Sugar, and therefore may be given from one Ounce to two Ounces or more; but as a Pectoral and Bechick, it is more proper, becauſe it cauſes a better expectoration, cleanſing the Lungs of the Tartarous matter lodging in them. If an Ounce of the Syrup is mixed with four Ounces of the Decoction in Wine, and it be uſed as a Gargle for the Mouth, it eaſes the Toothach, cures Ulcers in the Mouth and Throat, and abolithes a ſtinking Breath.

XXVII. *The Pouder.* It has the Virtues of the Juice, Eſſence, Decoction and Syrup, but acts not with ſo much facility and ſpeed. Uſed as an Errhine up the Noſtrils, it purges and cleanſes the Head of Cold, groſs and viſcous Humors, and cures vehement and inveterate Headachs, tho' of many Years ſtanding. Taken inwardly from a Scruple to a Dram or more, according to Age and Strength, it purges Pituitous and Watery humors out of the Body, both by Vomit and Stool, expels the Jaundice, and powerfully evacuates the Morbifick cauſe of the Dropſie, Scurvy and Gout. Applied to Ulcers or Wounds, it cleanſes, incarnates, dries, and heals them; and where eating Ulcers have been, which have made the Bone bare of Fleſh, it breeds Fleſh there, covers the Bone therewith, and cauſes it ſo to grow up, as to fill the hollowneſs of the Ulcer again. It is alſo very good, to cleanſe, reſolve the Callus, incarnate, fill up with Fleſh, and heal Fiſtula's, old malign Ulcers and Cankers, which are difficult and hard to be Cured.

XXVIII. *The Electuary Simple.* Take Pouder of *Blew Flowerdeluce* Roots, three Ounces: Juice of the Roots, Clarified Honey, of each two Ounces, mix them. Doſe, from two Drams to five or more in the Morning faſting; it works both upwards and downward, and evacuates Flegm, Choler, Melancholy and Watery Humors, and by that means prevails againſt the Dropſie in an eſpecial manner, as alſo againſt the Jaundice, Scurvy, Green-ſickneſs, Kings Evil and Gout. It alſo kills Worms in Stomach and Belly.

XXIX. *The Electuary Compound.* It is thus made. *Take Pouder of the Root four Ounces: Pouder of Galanga, Soldanella, or Sea bindweed, two Ounces: Pouders of Galanga and Zedoary, of each one Ounce, Cloves and Cinnamon, of each half an Ounce: Juice of the Roots, Clarified Honey, of each twelve Ounces; mix them for an Electuary.* It is made for the Cure of the Dropſie, being taken to half an Ounce or more every Morning faſting, or according as the ſtrength of the Patient can bear it. It works alſo upwards and downwards, cleanſeing the whole Man of all ſuperfluous Humors.

XXX. *Oleum Irinum*, or the Oil. I do not mean here the Compound Oil, called *Oleum Irinum* in our *Pharmacopœia Londinenſis*, *Lib.* 5. *Chap.* 2. *Sect.* 49. for that is the Oil of the *Florentine Orrice Root*; but I mean an Oil made of the Flowers and Roots of the *Blew Flowerdeluce* in this Chapter, which is thus done. *Take Roots of the Blew Flowerdeluce three Pounds, bruiſe them well: Choice Oil Olive, Pound twelve, Juice of the Roots, Pound three: mix and boil them till they are Criſp, then preſs out; repeat the boiling with freſh Roots in like manner, and repeat it the third time: Strain all out, and add to the Oil Flowers of the Blew Flowerdeluce a Pound and half, mix and inſolate, or digeſt in a warm Sand Furnace for ſix or eight Weeks, ſtirring all with a Spatula once a day; after which, ſtrain out the clear Oil, by a gentle Expreſſion, and keep it for uſe.* It is an effectual thing to warm and comfort feeble and weakned parts, Joints, Nerves, Tendons, and Muſcles afflicted with Cold and moiſt Humors; ſoftens hard Tumors, and gives eaſe in the Gout and Sciatica: It diſcuſſes, diſſolves and waſtes hard and Kernelly ſwellings in any part of the Body tho' Scrophulous, or proceeding from the Kings Evil: It ſoftens the hardneſs of the Spleen and Womb; reſolves Cramps and Convulſions of the Nerves and Tendons, warming, comforting and helping their Extenſion: The hinder parts of the Head and Vertebræ of the Neck being anointed therewith; it prevails againſt Catarrhs: and the forepart and Temples of the Head being anointed therewith, it eaſes Megrims and Pains of the Head proceeding from a cold Cauſe. And dropt into the Ears, it helps againſt pains and noiſe in them; and anointed two, three or four times a day upon the Fundament and Hemorrhoidal Veins, it gives preſent eaſe and relief as to the Piles.

XXXI. *The Balſam.* It has all the Virtues of the Oil, but is more powerful in Curing green Wounds, old Ulcers and Fiſtula's: For it powerfully digeſts, cleanſes, incarnates, dries and heals, and raiſes up Fleſh after a very admirable manner in Ulcers that are very hollow. Applied to the Gout, it preſently gives eaſe, and in a ſhort time after Cures it; and after a ſingular manner ſoftens hard Tumors which happen in the fleſhy pars.

XXXII. *The Cataplaſm.* If it is made of the green Roots (being beaten, and applied) it gives eaſe in the Gout and Sciatica, and in ſome few applications is ſaid to Cure them. Another *Cataplaſm*, *Take of the Pouder of the Root, two Ounces, Nutmegs, Dill Seed in Pouder, of each one Ounce: Saffron two Drams: Extract of Juniper Berries, enough to make it into a Cataplaſm.* This applied to the *Scrotum* or Teſticles, tho' vehemently Tumified or ſwelled by a defluxion of Humors, gives preſent eaſe to the Pain, and in a ſhort time diſcuſſes the Tumor. *A Cataplaſm of the ſimple green Root*, being applied to the Face or other parts of the Skin, as Neck, Arms, Hands, *&c.* which are Tanned or Sun burnt, or are affected with Scurff, Morphew, black or blew Marks, or Scarrs, or other deformities, it takes them away, and clears the Skin: but they who uſe it had need to take heed, that they uſe it not too ſtrong, nor let it lie on too long, but rather waſh it off again with fair Water, within two or three hours after it is applied: But it is better after the Root is beaten to a Pulp, to tie it up in a fine thin Linnen Cloth, and to lay it for a day and a night in fair Water, or Damask Roſe Water; and then with this Water, you may wet or moiſten the Skin of the Face, Neck, Breaſts and Hands, which are deformed as aforeſaid, which is to be applied ſo long as need requires; but this Water you muſt alſo take heed of, that you uſe it not too ſtrong, *&c.*

XXXIII. *The Peſſary.* It is made either of the ſolid green Root, or the Root beaten to a Maſs, and ſo made up with Honey. This being put up into the Womb or Body, brings forth the Dead Child, much more does it facilitate the Birth, and forcibly draws forth the Afterbirth.

XXXIV. *The*

XXXIV. *The Spirituous Tincture.* It expels Wind and is good againſt the Colick, gripings of the Guts, and obſtructions of the Viſcera. It provokes the Terms in Women, ſtrengthens the Stomach and Womb, and Corrects thoſe cold and crude Juices which breed the Scurvy, Gout, Jaundice, and King's Evil: Doſe, one ſpoonful or two, firſt in the Morning faſting, and laſt at Night, in a Glaſs of White *Port* Wine.

XXXV. *The Acid Tincture.* It ſtrengthens the Stomach, cauſes a good Appetite and Digeſtion, and powerfully opens all manner of Obſtructions whatſoever. It Cures the Scurvy radically; and as it opens in a ſpecial manner the Urinary Paſſages, ſo it carries off the Morbifick Cauſe of the Dropſie by Urine: Doſe, ſo much as to make the Liquor pleaſantly ſharp, three, four, or more times a day.

XXXVI. *The Oily Tincture.* Given to thirty or forty Drops in a large Glaſs of White *Port* or *Liſbon* Wine, to a Woman in Labour, it not only haſtens, but facilitates the Delivery. Outwardly anointed Morning and Night upon any parts affected with Rheumatick Pains from a cold Cauſe, or with a Numbneſs, Trembling, Palſie, Cramps, or Convulſion, it gives relief in a ſhort time, and in ſome reaſonable time afterwards a Cure. It is alſo good againſt the Itch, Tettars, Ring-worms and the like.

XXXVII. *The Saline Tincture.* Its uſe is wholly External, and is applied to Scurffs, Morphew, Leproſie, Sunburnings, Tannings, Freckles, Lentills, Pimples, yellowneſs of the Skin, and other like defœdations thereof; being applied Morning and Evening for ſome conſiderable time.

CHAP. CCLXXXIX.

Of FLOWERDELUCE Tuberous Narrow-leav'd, Greater.

I. *THE Names.* It is called in *Greek*, Ἶρις φυμώδης στενόφυλλη μεῖζων: in *Latin*, *Iris tuberoſa anguſtifolia major:* in *Engliſh*, *The greater narrow-leav'd tuberous Flowerdeluce.*

II. *The Kinds.* There are four kinds hereof, *viz.* 1. *Iris anguſtifolia aurea Tripolitana*, The Tripoli golden or yellow narrow-leav'd Flowerdeluce. 2. *Iris anguſtifolia cærulea major*, The greater blew narrow-leav'd. 3. *Iris anguſtifolia purpurea marina*, The Sea purple narrow-leav'd. 4. *Iris anguſtifolia purpurea verſicolor*, The variable purple narrow-leav'd.

III. The Deſcriptions. *The firſt, or* Tripoli golden narrow-leav'd, *has a Root which is long and blackiſh, like unto the reſt which follow, but greater and fuller:* from whence ſpring up Leaves a Yard long, or thereabouts, and an Inch or more broad, of a ſad green color, but not ſhining. The Stalk riſes up to be four or five Feet high, being round and ſtrong, but not very thick, bearing at the top two or three long and narrow Gold-yellow colored Flowers, of the faſhion of the *Bulbous Flowerdeluces*, as the next to be deſcribed is, without any Mixture or Variation therein. The Heads for Seed are three-ſquare, containing within them many flat cornered Seeds. The Length of the Leaves of this Plant, compared with their Breadth, makes me call it a *Narrow-leav'd Flowerdeluce*; and yet, as it is broader than ſome of the aforegoing *Broad-leav'd*, and broader than any of the following *Narrow-leav'd*, the Length of them makes them ſeem narrow; for which Reaſon I thought good to let its place be in the firſt of this *Claſſis*.

Flowerdeluce Tuberous narrow-leav'd Greater.

IV. *The ſecond, or* Greater blew Narrow-leav'd, *has a ſmall tuberous Root, blackiſh and hard, ſpreading into many long Heads, and more cloſely growing or matting together:* from which riſe up Leaves which are very long and narrow, of a whitiſh green color, but neither ſo long nor ſo broad as the laſt, yet broader, thicker and ſtiffer than any of the reſt with narrow Leaves which follow. The Stalk riſes ſometimes no higher than the Leaves, and ſometimes a little higher, bearing at its top divers Flowers, ſucceſſively flowering one after another, and are like unto the Flowers of the *Bulbous Flowerdeluces*, but of a lighter blew color, and ſometimes deeper. After the Flowers are paſt, ſix cornered Heads riſe up, which open into three parts, in which is contained almoſt round brown Seed.

V. *The third, or* Sea purple Narrow-leav'd, *has its Root and Seed like the former:* from which ſpring up many narrow hard Leaves, as long as the laſt, and of a dark green color, which ſmell a little ſtrong. The Stalk bears two or three Flowers, like the former, but ſomewhat leſs, and of a dark purple or *Violet* color.

VI. *The fourth, or* Variable purple Narrow-leav'd, *has Roots and Seed not differing from the former* Sea purple. The Leaves of this are alſo like thoſe of that *Sea kind*, and do ſmell a little ſtrong, like them. The Flowers are differing, in that the upper Leaves are wholly Purple or *Violet*, and the lower Leaves have white Veins and purple, running one among another.

VII. *The Places.* The Titles ſhew their ſeveral places of Growth, but with us they are only nurſt up in Gardens: the *Sea kind* is found originally in *Spain.*

VIII. *The Times.* They flower in *April* and *May*

May, and the Seed ripens ſome Months afterwards.

IX. *The Qualities, Specification, Preparations and Virtues,* are the ſame with thoſe of the *Broad-leav'd tuberous Flowerdeluces* in *Chap.* 288, aforegoing.

CHAP. CCXC.

Of FLOWERDELUCE
Tuberous Narrow-leav'd, Smaller.

I. *THE Names.* It is called in *Greek,* Ἶρις φυμώδης ϛενόφυλλη μικρότερα: in *Latin, Iris tuberoſa anguſtifolia minor:* in *Engliſh, The leſſer narrow-leav'd tuberous Flowerdeluce.*

II. *The Kinds.* There are three ſeveral Species hereof, *viz.* 1. *Iris anguſtifolia minor Pannonica, verſicolor Cluſii,* The Hungarian ſmall variable Flowerdeluce of Cluſius. 2. *Iris anguſtifolia flore duplici Cærulea,* The blew double-flowered narrow-leav'd Flowerdeluce. 3. *Iris anguſtifolia alba minor Cluſii,* The Hungarian ſmall white Flowerdeluce.

III. The Deſcriptions. *The firſt, or* Hungarian ſmall Variable, *has a Root which is black and ſmall, growing thicker and cloſer together than any other, and ſtrongly faſtned in the Ground, with a number of hard fibrous Roots.* It ſprings up with ſeveral ſmall Tufts of Leaves, very long, narrow and green, growing thick together, eſpecially if it abides any time in a place: among which riſe up many long round Stalks, higher than the Leaves, bearing two, three or four ſmall Flowers, one above another, like the former, but ſmaller, and of great Beauty. The lower Leaves are variably ſtriped with white and purple, without any Thrum or Fringe at all. The upper Leaves are of a fine blewiſh purple or *Violet* color: and of the ſame color are the arched Leaves, yet having the edges a little paler. The Heads for Seed are ſmaller, and not ſo cornered as others, but contains Seed much like to them, which are alſo ſmaller.

IV. *The ſecond, or* Blew double-flowered, *differs not in Root or Leaf from the* Greater blew Narrow-leav'd *in cap.* 289. *ſect.* 4. *juſt aforegoing,* but only in this, that the Leaves of this grow thicker together, and that the Flowers of this kind are as it were double, with many Leaves confuſedly ſet together, without any diſtinct parts of a *Flowerdeluce,* and of a fair blew color, with many white Veins and Lines or Stroaks running in the Leaves. Oftentimes the Stalk of Flowers has but two or three ſmall Flowers, diſtinctly ſet together, riſing as it were out of one Husk.

V. *The third, or* Hungarian ſmall White, *differs but little from the firſt of this Chapter,* ſave, that the Leaf is of a little paler green, and the Flower is of a fair whitiſh color, with ſome purple, which ſhews it ſelf only at the bottom of the Leaves.

VI. *The Places:* The original Place of theſe is *Hungary:* with us, they are only nurſt up in Gardens.

VII. *The Times.* They all flower in the Spring, and their Seed is ripe in the Summer Months.

VIII. *The Qualities, Specification, Preparations and Virtues* of theſe, are the ſame with thoſe of the *Broad-leav'd tuberous Flowerdeluce* in *Chap.* 288. aforegoing; but theſe are not ſo efficacious as thoſe be.

CHAP. CCXCI.

Of FLOWERDELUCE
Dwarf Greater.

I. *THE Names.* It is called in *Greek,* Χαμαΐρις, Ἶρις νάνη ϗ νανώδης μείζων: in *Latin, Chamæiris major, Iris pumila major:* in *Engliſh, Dwarf Flowerdeluce the Greater.*

II. *The Kinds.* Of the *Dwarf Flowerdeluces* there are three principal kinds, *viz.* 1. *The Greater,* of which we ſhall ſpeak in this Chapter. 2. *The Leſſer,* of which we ſhall diſcourſe in the Chapter following.

III. Of the *Greater Dwarf kind,* there are three Species, *viz.* 1. *Chamæiris latifolia alba major,* The greater white Dwarf Flowerdeluce. 2. *Chamæiris latifolia purpurea major,* The greater purple Dwarf Flowerdeluce. 3. *Chamæiris latifolia purpurea major altera,* Another greater purple Flowerdeluce.

IV. The Deſcriptions. *The firſt, or* Greater white Dwarf, *has a Root which is ſmall, according to the Proportion of the Plant above Ground, but made after the faſhion of the* Greater kinds, *with tuberous pieces ſpreading from the ſides, and ſtrong Fibres or Strings, whereby they are faſtned in the Ground.* This *Dwarf Flowerdeluce* has its Leaves as broad as ſome of the *Leſſer kinds* aforegoing, but not ſhorter: the Stalk is very ſhort, not above ſix or ſeven Inches high, bearing moſt commonly but one Flower, ſeldom two, which are in ſome of a pure white color, in others paler, or ſomewhat yellowiſh thro' the whole Flower, except the yellow Freez or Thrum in the middle of every one of the falling Leaves. After the Flowers are paſt, come forth great Heads, containing round pale Seed.

V. *The ſecond, or* Greater purple Dwarf, *has no Difference either in Root, Leaf or Form of the Flower from the former* Dwarf kind, *but only in the Color of the Flower, which in ſome is of a very deep purple or black* Violet *purple, both the Tops and the Falls.* In others the *Violet* purple is more lively; and in ſome the upper Leaves are blew, and the lower Leaves purple, yet all of them have that yellow Freez or Thrum in the middle of the falling Leaves, which the other kinds have.

VI. *The third, or* Other great purple dwarf Flowerdeluce, *has the Flowers purple, like the former almoſt,* and may be reckoned, for the Smallneſs and Shortneſs of the Stalk, the very next Species to the laſt; but in this the Flowers and Leaves are as large as any of the former kinds of *Flowerdeluces.*

VII. *The Places.* Authors have ſaid nothing of their native places; but without doubt they may grow in *Greece,* elſe *Dioſcorides* had not diſcourſed of them: with us they are nurſt up in Gardens.

VIII. *The Times.* They come up in *February* and *March,* flower in the *Spring Months,* and the Seed is ripe in *Auguſt.*

IX. *The Qualities, Specification, Preparations and Virtues,* are the ſame with thoſe of the *Common blew Flowerdeluce* in *Chap.* 288. aforegoing, as *Dodonæus, Pempt.* 2. *lib.* 3. *cap.*3. in theſe words ſeems to inculcate: *Facultate autem & Viribus, hæc quoque Iris acris & impenſa calida eſt, aliiſque Iridibus ſimilis.*

CHAP.

CHAP. CCXCII.

of FLOWERDELUCE Dwarf Lesser.

I. *THE Names.* It is called in *Greek*, Χαμαίιρις μικρότερος, ἢ Ἶρις νάνη ἐλάττων: in *Latin*, *Iris pumila minor*, *Chamæiris minor*: in *English*, *Dwarf Flowerdeluce the lesser.*

II. *The Kinds.* There are seven kinds of these lesser Dwarfs, *viz.* 1. *Chamæiris latifolia alba minor*, The lesser white broad-leav'd Dwarf Flowerdeluce. 2. *Chamæiris latifolia minor Straminea*, The lesser Straw-colored Dwarf. 3. *Chamæiris latifolia minor purpurea*, The lesser purple Dwarf. 4. *Chamæiris latifolia minor suave rubens*, The lesser blush-colored Dwarf. 5. *Chamæiris latifolia minor lutea versicolor*, The lesser yellow variable Dwarf. 6. *Chamæiris latifolia minor cærulea versicolor*, The lesser blew variable Dwarf. 7. *Chamæiris Marina purpurea*, The purple Sea Dwarf Flowerdeluce.

III. The Descriptions. *The first, or* Lesser white Dwarf, *has a small tuberous Root; from which Leaves, for the most part somewhat smaller, narrower and shorter than the former, spring forth.* The Stalk with its Flowers upon it scarcely rises up above the Leaves, so that in most of them it may rather be called a Foot-stalk, (such as the *Saffron*-Flowers have) and therefore may be said to be ἄσκαυλοι, without Stalks. The Flowers are like unto the first described in the last Chapter, of a whitish color, with a few purplish Lines at the bottom of the upper Leaves, with a List of Green in the falling Leaves.

IV. *The second, or* Lesser Straw-colored Dwarf, *is in Roots, Leaves, Stalks, Flowers, and Manner of Growing very like the last*, excepting, that the Flowers thereof are of a pale yellow, called a Straw color, with whitish Stripes and Veins in the falling Leaves, and purplish Lines at the bottom of the upper Leaves.

V. *The third, or* Lesser purple, *differs not much from the last in its Form, Substance and Manner of Growing; the chief Difference consists mostly in the Color of the Flower, which is of a deep* Violet *purple, sometimes paler, and sometimes so deep, that it seems almost black:* and sometimes the falling Leaves are purplish, and the upper Leaves blew; and some of these have a sweet Smell, and some have none: also some of them are of a fine pale blew color throughout the whole Flower.

VI. *The fourth, or* Lesser blush-color'd, *has its falling Leaves of a reddish color, and the Thrums blew:* the upper and arched Leaves, of a fine pale red, or Flesh color, called a blush color: in all other things it differs nothing, and smells very little, or not at all.

VII. *The fifth, or* Lesser yellow Variable, *has its falling Leaves yellowish, with purple Lines from the middle downwards; sometimes of a deeper, and sometimes of a paler color, and white Thrums in the middle:* the upper Leaves are also of a yellowish color, with purple Lines in them: sometimes the yellow color is paler, and the Lines in both the upper and lower Leaves of a dull or dead purple color.

VIII. *The sixth, or* Lesser blew Variable, *has the upper Leaves of its Flower of a blewish yellow, spotted with purple in the broad part, and at the bottom very narrow.* The falling Leaves are spread over with pale purplish Lines, and a small shew of blew about the brims or edges. The Thrum is yellow at the bottom, and blewish above. The arched Leaves are of a blewish white, being a little deeper on the ridge: sometimes the upper Leaves are of a paler blew, rather whitish, with the yellow; and both these have no Smell at all.

IX. *The seventh, or* Purple Sea Dwarf, *is like unto the* Narrow-leav'd Sea Flowerdeluce *in* Chap. 289. Sect. 5. *aforegoing, in its Root, Leaf and Flower*, having no other Difference, but in the Smallness and Lowness of its Growth, being of the same purple color with it.

X. *The Places.* They are only nurst up with us in Gardens. The *Sea kind* have been found originally in *Spain, France* and other *Southern* Shoars.

XI. *The Times.* They flower in *April* and *May*, and the Seed is ripe in *July.*

XII. *The Qualities, Specification, Preparations and Virtues,* are the same with the *Blew Flowerdeluce* in *Chap.* 288. aforegoing.

CHAP. CCXCIII.

of FLOWERDELUCE Grass, *or* Narrow-leav'd.

I. *THE Names.* It is called in *Greek*, Χαμαίιρις στενόφυλλη: in *Latin*, *Chamæiris angustifolia*, and *Iris pumila angustifolia:* in *English*, *Narrow-leav'd Dwarf Flowerdeluce*, or *Grass Flowerdeluce.*

II. *The Kinds.* There are two special kinds hereof, *viz.* 1. *Chamæiris angustifolia major*, The greater Narrow-leav'd or Grass Flowerdeluce. 2. *Chamæiris angustifolia minor*, The lesser Narrow-leav'd or Grass Flowerdeluce.

III. The Descriptions. *The first, or* Greater Grass or Narrow-leav'd, *has Roots small, black and hard, growing thick together, fastned in the Ground with small blackish hard Fibres or Strings, which scarcely shoot again, if the Root is removed.* From this Root spring forth many long and narrow dark green Leaves, not so stiff as some of the former *Smaller Dwarfs* in the last Chapter, but pliant, and bending their ends down again: from among which rise up several Stalks, bearing at the top two or three sweet Flowers, as small as any of them set down before, of a reddish purple color, with whitish yellow and purple Strakes down the middle of the falling Leaves. The arched Leaves are of a Horse Flesh color all along the edges, and purple on the ridges and tips which turn up again. Under these appear three brown Aglets, like unto Birds Tongues. The three upper Leaves are small and narrow, of a perfect Purple or *Violet* color. The Heads for Seed have sharper and harder cornered edges than the former; and the Seeds are something greyish, like those in the last Chapter.

IV. *The second, or* Lesser Grass or Narrow-leav'd, *is in Roots, Leaves and Flowers so like the last described, that it is not to be distinguished therefrom*, but only by its Smallness and Lowness; in which it is considerably less, and by which it only differs.

V. *The Places.* These grow in several *Southern* Climates of the World, but are only Garden Plants with us.

VI. *The Times.* They flower sometimes in *April*, and

and ſometimes in *May*, according to the Warmth or Coldneſs of the Seaſon.

VII. *The Qualities, Specification, Preparations and Virtues*, are the ſame with thoſe of the *Blew Flowerdeluce* in *Chap.* 288. aforegoing, to which you are referred.

CHAP. CCXCIV.

Of FLOWERDELUCE Wild, *OR,* Stinking GLADWIN.

I. *THE Names.* It is called in *Greek*, ξύρις, ἡ Ἶρις πεδινὴ, ἡ ἄγρια: in *Latin*, *Xyris*, *Iris agreſtis*, *Spatula*, or *Spathula Fætida*, (for *Spatha* is taken for *Gladium*, a Sword:) in *Engliſh*, *Gladiol*, *Gladdon*, *Gladwin*, and *Stinking Gladdon* and *Stinking Gladwin*.

II. *The Kinds.* It is the laſt kind of the *Flowerdeluce*, being the *Wild ſort*, and a ſingular Species, called by the *Arabians*, *Caſoras*, by *Theophraſtus*, Ἶρις ἄγρια, *Iris agria*, and is the *Gladiolus Tragi*; but ſo called by a Miſtake, unleſs he had ſaid *Gladiolus Fætidus*.

Flowerdeluce Wild, or *Stinking Gladdon*

III. The Deſcription. *The Root, while it is young, is but ſmall, and full of Strings, but being grown older, it grows greater, and in Form like unto a* Flowerdeluce *Root, but reddiſh without, and whitiſh within, very ſharp and hot in Taſte, and of as ill a Smell as the Leaves.* From this Root riſe up ſeveral Leaves, very like thoſe of an *Iris* or *Flowerdeluce*, but that they are ſharp-edged on both ſides, and thicker in the middle, of a deeper green color, narrower, ſharper-pointed, and of a ſtrong ill Scent, if they are bruiſed between the Fingers. In the middle riſes up a pretty ſtrong Stalk, three Feet high at leaſt, bearing three or four Flowers at the top, made ſomewhat like the Flowers of the *Iris* or *Flowerdeluce*, with three upright Leaves, of a dead purpliſh Aſh color, having ſome Veins diſcolored in them; tho' other three do not fall down, nor are the other three ſmall ones ſo arched, nor do they cover the lower Leaves as thoſe of the *Garden Flowerdeluce* do, but ſtand looſe or aſunder from them. The Flowers being paſt, there come up hard Cods or Husks, three-ſquare, opening wide into three parts when they are ripe; in which are contained reddiſh Seed, which being perfectly ripe and dry, become black.

IV. *The Places.* It grows in up-land Grounds, as well as in moiſt places, in Woods and ſhadowy Groves, as alſo by the Sea ſide in many places of this Land; and it is alſo nurſt up in many Countries in Gardens.

V. *The Times.* It flowers not until *July*, and ſometimes in *Auguſt*, and the Seed is ripe in *Auguſt* or *September*; yet the Husks, after they are ripe, and do open themſelves, will hold their Seeds within them for two or three Months, and not ſhed them.

VI. *The Qualities.* The Root is chiefly uſed, and it is hot and dry in the third Degree: it is Aperitive, Abſterſive and Aſtringent; Hyſterick, Ptarmick, Emmenagogick and Cathartick.

VII. *The Specification.* It is peculiarly effectual againſt the Strangury, Obſtruction of the Courſes, and Kings-evil.

VIII. *The Preparations.* You may have therefrom, 1. *A Juice of the Roots.* 2. *An Eſſence.* 3. *A Decoction in Wine.* 4. *An Infuſion in Ale or Wine.* 5. *A Vinegar.* 6. *A Pouder of the Root.* 7. *A Pouder of the Seed.* 8. *A Cataplaſm.* 9. *A Juice of the Leaves.* 10. *A Peſſary.*

The Virtues.

IX. *The Juice of the Root.* It purges Choler and Flegm, both upwards and downwards in weak Stomachs and ill Habits of Body, cleanſing thoſe Parts very well. Snuffed up the Noſe, it cauſeth Sneezing, and clears the Head from much viſcous Water, Flegm and Puſs. Rubbed upon places troubled with the Itch, it is ſaid to cure it.

X. *The Eſſence.* It has the Virtues of the liquid Juice, but more powerful; and given inwardly two or three Spoonfuls in a Glaſs of White *Lisbon* Wine, it provokes the Terms in Women; but it ought not to be given to ſuch as are with Child, for fear of cauſing Abortion or Miſcarriage.

XI. *The Decoction in Wine.* It purges Choler and Flegm, as the Juice and Eſſence do, provokes the Terms, and has all the other Properties, but operates much more weakly, and therefore is more fit for the weaker Conſtitutions. It is good for ſuch as are troubled with Cramps or Convulſions, Gout, Sciatica, and the like; and gives eaſe to ſuch as are troubled with the Colick, Griping of the Guts, *&c.*

XII. *The Infuſion in White Port Wine or Ale.* It has the Virtues of the Juice and Eſſence, but works much more weakly. It is good againſt Gripings of the Bowels, Colick, Strangury, and all ſorts of Obſtructions of Urine, occaſioned from Sand, Gravel, tartarous Matter obſtructing the Reins and Bladder.

XIII. *The Vinegar.* Taken to four or ſix Ounces or

or more, it is gently Emetick, and cures Agues, Fevers, Spleen, &c.

XIV. *The Pouder of the Root.* Snuffed up the Noſtrils, it is a very good Errhine to purge the Head and Brain of cold, moiſt and pituitous Humors, drawing them from thence in great quantities. Taken inwardly to one Dram in White *Port* or *Lisbon* Wine, it helps ſuch as are troubled with Cramps and Convulſions, Gouts, Sciatica's, griping Pains in the Belly, Strangury, Heat, Pain and Stoppage of Urine. It is given with much profit to ſuch as have had long Fluxes thro' the Acrimony of ill Humors, which it ſtays, after it has firſt purged and cleanſed the Bowels.

XV. *The Pouder of the Seed.* Given from half a Dram to a Dram in White *Port* Wine, it helps the Strangury, and cauſes them to Piſs preſently, which before could not. If it is taken with Vinegar, it diſſolves the Hardneſs and Swelling of the Spleen, and prevails againſt Hypochondriack Melancholy.

XVI. *The Cataplaſm.* If it is made up into a Pultiſe with *Great Centory* Root, Honey and Verdigriſe, and applied, it is good againſt all Wounds of the Head, and draws forth Splinters, Thorns, broken Bones, or any other thing ſticking in the Fleſh, and that without pain. If the Root is made into a Cataplaſm by boiling in Vinegar, and be laid upon any Tumor or Swelling, it very effectually diſſolves or conſumes it, yea even thoſe Tumors of the Neck and Throat called the King's Evil.

XVII. *The Juice of the Leaves.* It is good againſt Scabs, Itch, Tettars, Ringworms, Scurf, Morphew, Tanning, Sunburning, Yellowneſs of the Skin, Leproſie, and other like deformities thereof.

XVIII. *The Peſſary.* Being made of the Root, or of the Juice and Pouder of the Root; and put up into the Womb, it brings down the Terms in Women where they have been long ſtopt; but you muſt have a care that it be not uſed to a Woman with Child, becauſe it may cauſe Abortion.

CHAP. CCXCV.

Of FLUELIN,

OR,

Female SPEEDWELL.

I. *THE Names.* It is called in *Greek* Ἐλατίνη: by the *Arabians, Athin: in Latin, Elatine, Veronica, Fœmina, Fuchſii, Matthioli, Camerarii, Dodonæi Lobelii, Loniceri:* in *Engliſh, Fluellin,* or *Female Speedwell.*

II. *The Kinds.* It is one of the ſorts of *Speedwell,* and the *Female Species* thereof, of which there are theſe three following kinds, *viz.* 1. *Elatine folio ſubrotundo, Veronica Fœmina folio ſubrotundo,* Round leaved Fluellin. 2. *Elatine ſive Veronica Fœmina folio accuminato,* Fluellin with corner'd Leaves. 3. *Elatine ſive Veronica fœmina flore cæruleo folioque accuminato,* Cornered Fluellin with Blew Flowers.

III. The Deſcriptions. *The firſt, or* round leav'd Fluellin, *has a Root which is ſmall and Thready, dying every Year, and raiſes it ſelf again of its own Sowing.* From whence ſhoot forth many long Branches, partly lying upon the Ground, and partly ſtanding upright, ſet with almoſt round Leaves yet a little pointed at the ends and ſometimes more long than round, without order thereon, being ſomewhat hoary, and of an ill greeniſh white color. At the joints all along the Stalks, and with the Leaves, come forth ſmall Flowers, one at a place, upon a very ſmall Footſtalk, gaping ſomething like thoſe of *Snapdragon,* or rather *Flaxweed,* whoſe upper jaw is of a yellow color, and the lower of a purpliſh, with a ſmall heel or ſpur behind, as the *Lunaria* has. The Flowers being gone, ſmall round Heads come forth, which contain ſmall black Seed.

Fluellin round Leav'd.

IV. *The ſecond, or* Cornered leaved Fluellin, *has a Root which is ſmall and Thready like the other, periſhing every Year;* from which comes forth longer Branches, wholly trailing upon the Ground two or three Feet in length, and ſometimes more fully, ſometimes more thinly ſet with Leaves thereon, upon ſmall or ſhort footſtalks, which are a little larger, and ſomewhat round, and cut in or cornered for the moſt part on the edges in ſome places: But the lower end or bottom of them, being the broadeſt part of the Leaf, has on each ſide a ſmall production, making it ſeem as if they were Ears, a little hairy withall, but not hoary, and of a better green color than the former. The Flowers come forth at the Joints with the Leaves, upon little long Footſtalks; every one by it ſelf, one above another, in form very like unto the other, but the Colors therein are more white than yellow, and the purple is not ſo fair. It is a larger Flower, and ſo is the Seed, and Seed Veſſels.

V. *The third, or* Cornered Fluellin with blew Flowers, *has a Root which is ſmall and thready, taking hold of the upper ſurface of the Earth, where it ſpreads it ſelf;* from whence riſe Stalks or Branches, with Leaves thereon which differ but little from the laſt, but that the Leaves are not ſo much cornered about the edges, and leſs pointed

alſo, at the top or loweſt part of them: The Flowers are almoſt all Blew, with ſome ſmall matter of White in them, which being paſt away, ſmall pouches or Seed Veſſels ſucceed, not unlike the former.

Fluellen with cornered leaves

Fluellin cornered with blew Flowers.

VI. *The Places.* They grow upon Banks and Borders of Fields, in Sandy Grounds and Woods almoſt every where; as alſo in Cornfields, and in Borders about them, and in other fertile Grounds, as about *Southfleet* in *Kent*, in great abundance; at *Buckworth* alſo, *Hamerton* and *Richwerſworth*, in *Huntingtonſhire*, and in ſeveral other places, both there and elſewhere.

VII. *The Times.* They all flower about *May*, *June* and *July*, and the whole Plant is Withered by the beginning of *September*.

VIII. *The Qualities.* *Fluellin* is Temperate in reſpect to heat or coldneſs, dryneſs or moiſture: is Cleanſing, Aſtringent, Incarnative, Vulnerary, Stomatick, Hepatick, Alexipharmick and Reſtorative.

IX. *The Specification.* It ſtops Fluxes of all ſorts, whether of the Blood or Humors, whether of the Bowels, or defluxions upon any part; it heals alſo old Ulcers, eating Cankers, Pocky eruptions and the like.

X. *The Preparations.* You may prepare from this Herb, 1. *A Liquid Juice.* 2. *An Eſſence.* 3. *A Decoction in Water or Wine.* 4. *A Balſam.* 5. *A Cataplaſm.*

The Virtues.

XI. *The Liquid Juice.* Given to three or four Spoonfuls at a time Morning and Evening in a Glaſs of Red Port Wine, it ſtops defluxions from the Head, alſo other defluxions upon any particular part, all fluxes of Blood or Humors, as a Diarrhœa, Dyſenteria, Lienteria, Hepatick Flux, and the overflowing of the Courſes in Women.

XII. *The Eſſence.* It has all the former Virtues, but more efficacious: It ſtops all ſorts of Bleeding, whether at the Noſe, or Spitting, Vomitting or Piſſing of Blood; alſo fluxes of Blood from any other parts, cauſed by the cutting or breaking of a Vein; and is a ſingular good thing againſt Contuſions whether inward or outward, ſtrengthening and conſolidating the parts which are hurt; and it is no leſs effectnal being uſed Dietetically to cleanſe, dry, and heal old Ulcers which are foul, fretting and eating; and outwardly being applied to dry, conglutinate and heal any ſimple green Wound. It is of ſingular uſe againſt the *French Pox*, and all fretting and eating Cankers proceeding from the ſame; ſo that ſcarcely any other Vegetable comes up to the height of its excellency in this Caſe. *Pena* gives a relation of one whoſe Noſe was almoſt conſumed with an eating Canker (I ſuppoſe proceeding from the *French Pox*) which was by the Phyſicians order to have been cut off, to preſerve the reſt of his Face and Body, now ready to fall into a [*Pocky*] Leproſie; a ſimple Barber being in Company, and hearing of it, deſired that he might firſt make tryal of an Herb which he had ſeen his Maſter uſe in like Caſe; it was granted, and he uſed only the Juice and Decoction of this Herb, giving of them inwardly, and applied the Herb outwardly: By this only means he recovered the Patient, and not only Cured the [*Pocky*] eating Ulcer of his Noſe, but alſo the [*Pocky*] Scabbineſs or Leproſie of his whole Body, which he was now fallen into; and by this alone means became perfectly well.

XIII. *The Decoction in Wine or Water.* It has all the Virtues of the Juice and Eſſence, but leſs efficacious, and therefore ought to be given in treble or quadruple quantity, two or three times a day.

XIV. *The Balſam.* It is no ways inferior to any Balſam made of any of the Vulnerary Herbs; it digeſts, cleanſes, incarnates, dries, and heals old Ulcers, putrid, fretting and eating Sores, and Cures at once or twice dreſſing any ſimple green Wound, in what part of the Body ſo ever.

XV. *The Cataplaſm.* It is made of the green Herb, bruiſed and mixed with Barly Flower; being applied to watering Eyes, occaſioned by defluxions from the Heads, where there is Heat and Inflammation withal, it very much helps them, and ſtops all other Defluxions of Humors, upon any other part whatſoever, wherethere is Pain, Diſlocation, Weakneſs, Wound, orUlcer, *&c.*

XVI. *An*

XVI. *An Observation.* The notable use of this Plant in curing some inveterate, malign, and almost supposed incurable Diseases, as is before hinted; makes me believe, that not only this Herb, but many other simple Herbs have been used by the *Ancients*, in curing many deplorable infirmities, of which we have at this day no particular account; by which it appears that they preferred *Simples* before *Compounds*: And were we now, but as industrious in the investigation of the *Virtues* and *Powers* of Herbs, as those of Ancient times were, and made but as many tryals of them as they did; I doubt not but we might be as happy in our pursuit of the same as they were, and do greater things with even simple Medicaments, than even the Learned profess to do with their most *pompous Compounds*. But of this enough.

CHAP. CCXCVI.

Of FLIE STONES, OR, FLIE ORCHIS, *or* Bee Flower.

I. THE *Names.* It is called in *Greek* Ὄρχις τῆς μυίας, ἢ Ὄρχις μυΐτης, ἢ μυΐων: in *Latin*, *Orchis muscaria*: and in *English* Fly Stones, Fly Orchis, and *Bee Flower.*

II. *The Kinds.* There are four kinds hereof, *viz.* 1. *Orchis Hermaphroditica Candida*, The White Butterfly Orchis. 2. *Orchis Melittias, sive apifera*, Bee Orchis, *or* Bee Flower. 3. *Orchis Sphegodes*, Gnat Orchis, *or* Gnat Satyrion. 4. *Orchis Myodes*, Fly Orchis, *or* Fly Stones.

III. The Descriptions. *The first, or* White Butterfly, *has a Root taking part of both Orchis and Palma Christi, being not altogether round, nor fully handed, from whence it took the Name* Hermaphroditica, *to signifie both Kinds.* The Leaves are two in number, seldom more, being fair and broad, like unto the Leaves of Lillies, without any Spot at all in them. At the Top of the Stalk stands many White Flowers, not so thick set as the *Palmata*, and every one of them being shaped like unto a White Butterfly, with the Wings spread abroad, with a spur behind it full of a honyed Liquor.

IV. *The second, or* Bee Orchis or Stones, *has Roots which are two together, round and white, having a certain Mucilaginity or Clammines within them, without any taste almost at all, as all or most part of these Kinds have.* This is a small and low Plant for the most part, with three or four small Leaves at the bottom. The Stalk is seldom above six Inches high, with four or five Flowers thereon, one above another, having round Bodies, and somewhat flat, of a kind of yellowish color, with purple Wings above them, so like unto an Hony Bee, that it might soon deceive one who had never seen such a Flower before.

V. *The third, or* Gnat Orchis or Stones, *has Roots which are two round Bulbs or Tubers, like as the others are.* The Leaves of this Plant are somewhat larger than of the Beeflower. The Stalk also is somewhat higher. The Flowers are fewer on the Top, but somewhat larger than of the former, or Bee Orchis, and shaped to the resemblance of a Gnat, or great long Fly.

VI. *The fourth, or* Fly Orchis or Fly Stones, *is in its Root and Leaf like to the last described, the difference is chiefly in its Flower*, which is neither so long as the *Gnat Orchis*, nor so great as the *Bee Orchis*; but the lower part of the Fly is black, with a list of Ashcolor crossing the Back, with a shew of Legs hanging at it. The natural Fly seems to be so in love with it, that you shall seldom come in the heat of the day, but you shall find one sitting thereon.

VII. *The Places.* All these grow in many places of *England*, some in Woods, as the Butterfly, others on dry Banks and barren Places in *Kent*, and several other Shires.

VIII. *The Times.* They Flower for the most part in the beginning or middle of *May*, seldom later.

IX. *The Qualities, Specification, Preparations, and Virtues*, are the same with those of the Cynosorchis or Dog-stones in *Chap.* 226. aforegoing, so that we shall say no more thereof in this place.

CHAP. CCLXXXXVII.

Of FOOLSTONES.

I. THE *Names.* It is called in Ὄρχις μωρὰ: in *Latin Orchis morio, Orchis morionis, Testiculus morionis*: in *English Fool-stones.*

II. *The Kinds.* There are many Kinds hereof, as, 1. *Orchis morio mas foliis maculatis*, The greater Male Fool-stones. 2. *Orchis morio altera maculata*, Other Fool-stones with spotted Leaves. 3. *Orchis morio mas foliis non maculosis*, Male Fool-stones not spotted. 4. *Orchis morio fœmina*, Female Fool-stones. 5. *Orchis morio minor folii maculatis*, small Fool-stones with spotted Leaves. 6. *Orchis Anthropophora oreades mas*, The Male Neopolitan Fool-stones.

III. The Deſcriptions. *The firſt, or* greater Male Fool-ſtones, *has a double round Tuberous Root like a pair of Man's ſtones, from whence riſe up five or ſix broad and ſmooth long Leaves, like to thoſe of Lillies, having black Spots on their upper ſides.* The Stalk alſo has ſome thereon, which compaſs it at bottom, but ſmaller: The Flowers grow in a Spike, which are ſmall and purple, each of them having an open hood, or helmet higheſt, with two ſmall Leaves like Ears, ſtanding upright at the ſides of them; the Belly which is loweſt is whiter, having on the backſide a crooked heel or Horn. The whole Flower is Sweet, and very pleaſant to behold.

IV. *The ſecond, or* Other Fool-ſtones with ſpotted Leaves, *has teſticles like the other, but not ſo large, nor ſo round, from which ſpring up five, ſix, or more Leaves, not altogether ſo large as the former, but lying on the Ground, and ſpotted in the ſame manner, but ſomewhat rounder pointed,* The Stalk of this grows bigger than the other; and the Flowers are not unlike the ſame for the form, but of a more blewiſh purple color, with a ſpur behind.

V. *The third, or* Male Fool-ſtones not ſpotted, *has a pair of Teſticles like thoſe beforegoing, from whence ſpring up a Stalk and Leaves which are large, and very like the laſt, but not ſpotted.* The Flowers are either of a deeper, or of a paler purple color, or ſomewhat Bluſh, or altogether White. The Belly which hangs down, is ſometimes ſpotted with purple Spots, and ſometimes it has none, more eſpecially in theſe Flowers which are all White.

VI. *The fourth, or* Female Fool-ſtones, *has a double Teſticulous Root, from whence ſpring up ſix or ſeven Leaves, which are leſſer and narrower than thoſe of the Male kind, and Ribbed almoſt like unto Ribwort Plantane,* lying on the Ground, and ſome of them lifting themſelves up higher, encompaſſing the Stalk, which is ſhorter than thoſe of the Male ſort. The Flowers at top of the Stalk, have gaping or open hoods like the former, but the Ears on each ſide ſtand not upright, but lie ſo cloſe thereon, that they are hardly diſcerned, with a heel behind them as the others have. This is either of a dark Violet purple color, the middle part whiter and ſpotted, or of a pale Red, whoſe Stalk is ſhorter, and Leaves leſſer, or elſe of a ſcarlet Red; the ſcarlet Head being thick and ſhort, and the Flowers ſmaller.

VII. *The fifth, or* Small Fool-ſtones with ſpotted Leaves, *has a double Teſticulous Root like the others,* from whence ſpring up two or three ſmall, long ſpotted Leaves, with a Stalk in the middle of them, which they ſeem to encompaſs, thoſe up higher being much ſmaller than they. The Flowers are purple, ſpotted, and very finely ſtriped.

VIII. *The ſixth, or* Male Neapolitan Fool-ſtones, *has a pair of Teſticles which are round, but much longer than the other kinds, from which ſpring up ſix, ſeven or more Leaves, the length of ones Hand, and an Inch broad, of a pale freſh green Color, waved about the edges, and at their bottoms encompaſſing the Stalk.* The Stalk is about a Foot high, more or leſs, and at its top has a ſpiked buſh of Flowers, which are Red before they open, and of a fair Bluſh color being blown. They are in form like to the others before the hood or helmet opens; having ſmall Leaves like Ears on the ſides, with ſhort Arms as it were hanging down by the Body, the lower parts of which are furniſht as it were with Thighs and Legs, the Feet being cut off: From this form of the Flowers being ſo much in the ſhape of a Man, came the Name *Anthropophora.*

IX. *Of this laſt ſort there is alſo a Female kind, which has a like Root and Stalk, ſave that it is higher.* The Leaves are larger but not broader than the laſt, ſpread on the Ground, with ſome ſmaller on the Stalk. The ſpike of Flowers is not ſo great, nor ſo thick; but the Flower it ſelf is like the laſt in ſhape, but of a pale color, ſpotted very thick, as ſmall as Sand, having the hood greeniſh with purple edges.

X. *The Places.* The firſt five grow for the moſt part in Fields, and by Wood ſides in many places of *England*; but the two laſt are Natives of *Italy*: however they are all of them nurſt up here with us in *Gardens.*

XI. *The Times.* The all flower in *May*, as the reſt of the Orchides do.

XII. *The Qualities, Specification, Preparations, and Virtues*, are the ſame with thoſe of *Cynoſorchis* or *Dog-ſtones* in *Chap.* 226. aforegoing, to which we ſhall refer you.

CHAP. CCXCVIII.

Of FOX STONES.

I. *THE Names.* This Plant is called in *Greek* Ὄρχις Σεραπίας, in *Latin Orchis Serapias, Teſticulus Vulpinus*, and in *Engliſh Fox Stones.*

II. *The Kinds.* There are many ſorts of *Fox Stones*, as 1. *Orchis Serapias Bifolia latiſſima*, The greateſt Twablade Fox Stones. 2. *Orchis Serapias latifolia altera*, Hungarian Twablade Fox Stones. 3. *Orchis Sphegodes major*, The great Bumble Bee Orchis or Fox Stones. 4. *Orchis Myodes major*, The greater Fleſh Fly Flower. 5. *Orchis Batrachites*, Frog Orchis or Frog Flower. 6. *Orchis Arachnitis*, The Spider Flower. 7. *Orchis Pſycodes Herbacei coloris*, The green Butterfly Orchis. 8. *Orchis Ornithophora folio maculoſo*, The White or Purple Birds Flower. 9. *Orchis Macrophyllos Columnæ*, Long Leav'd Fox Stones of Columna. There are many other Kinds of *Fox Stones*, but theſe are the chief.

III. The Deſcriptions. *The firſt, or* Greateſt Twablade Fox Stones, *has Roots or Teſticles which are great and ſomewhat long, like unto longiſh Turneps*, from whence two very large Leaves only ſpring up, not much leſs than thoſe of the *White Hellebor*, with ſeveral Veins running through them, green on the upper ſide and paler underneath, but ſhining withal; the Stalk riſes to be a Foot and half high, five ſquare, with a few Leaves or Skins thereon, cloſing it as it were about; the Flowers grow in a ſpiked Head, like unto others, but great and large, being either Purple, ſpotted with White, or wholly White.

IV. *The ſecond, or* Hungarian Twablade Fox Stones, *this in its Roots, Stalks, Leaves, and Flower, is very like the former*, but ſomewhat lower, and leſſer, both in Leaves, Stalks, and Flowers, the which are ſometimes both Purple and ſpotted, and ſometimes White, as the former is.

V. *The third, or* Great Bumble Bee Orchis or Fox Stones. *This has Teſticles leſs than the former, and rounder, from whence ſpring five or ſix long narrow Leaves, Ribbed, like* Ribwort Plantane, *yet a little leſs*; the Stalk is about Nine or Ten Inches high, bearing five or ſix Flowers at the head thereof, the form of which is ſomewhat like to a *Bumble Bee*, or *Drone Bee*, as it is commonly called, having

ving ſome few ſmall whitiſh Purple Leaves, like Wings, above, and a browniſh Belly or Body below.

Bumble Bee.

Fox Stones

VI. *The fourth, or* Greater Fleſh Fly Fox Stones, *has Teſticles like the other Kinds*, from whence ſpring up three or four ſomewhat broad and long ſmooth green Leaves next the Ground; the Stalk riſes about five or ſix Inches high, with a few large Flowers ſet at top, reſembling a great Fleſh Fly, made of four Leaves, three above, and one long one below.

VII. *The fifth, or* Frog Orchis, *or* Fox Stones, *has a pair of Teſticles large, and ſomething long, with a String or Strings at the bottom part thereof*; from this Root ſpring two or more broad and ſhort Leaves below, but narrower and longer as they grow up higher on the Stalk, at the top of which grow ſeveral yellowiſh Flowers, reſembling the Bodies of Frogs, with the Head and fore parts greeniſh, from whence it took the Appellation.

VIII. *Johnſon* on *Gerard* gives us another of the Frog Kind, which he calls *Serapias Batrachitis altera*, or another Frog Orchis; *this has a Root ſhaped between the* Orchis rotunda *and* Palmata, *it grows to the height of the former, with ſhort Leaves encompaſſing the Stalk at their ſetting on*; the Flowers grow on a Spiked Head, and reſemble a Frogs with their long Leaves; but if you look upon them in another manner, they will then ſomething reſemble little Flies, for which reaſon *Lobel* calls it as well *Myodes* as *Batrachites*.

IX. *The ſixth, or* Spider Flower, *has for its Root a pair of round Teſticles, from whence ſprings forth a Stalk much about the height of the* Frog Orchis; upon which grow ſix, eight or more Leaves, being more in number than grow upon the Stalk of the Frog kind, they are alſo narrower and longer. At the top of the Stalk come forth three or four Flowers, reſembling a Spider in the round Belly, and the ſmall Neck or partition, between it and the top Wings.

X. *The ſeventh, or* Green Butter-fly, *has bulbed Teſticles a little pointed at Bottom*; from whence ſpring up ſeveral large, ſmooth, green Leaves next the Ground; and others ſmaller and longer upon the Stalk. The Flowers are many and great, reſembling Butter-flies, with their Wings ſpread abroad, of a kind of Graſs green color, with a Spur behind.

White purple Birds Flower, or

Greater Fox-ſtones.

XI. *The eighth, or* White or Purple Birds Flower, *has a large pair of round Teſticles, but a little pointed at Bottom; from whence ſpring up four, ſix or more Leaves, which are ſomething large, and for the moſt part Checquered or Spotted* (for there is much diverſity herein; ſome having broad, large and pointed; others narrower, leſſer, and rounder pointed Leaves:) there are ſeveral other Leaves which grow upon the Stalk, which ſeem to encloſe or embrace it; being long, ſpotted alſo and ſharp pointed. The Flowers grow towards the top of the Stalk, Spike faſhion; which are large, and like the laſt, with a Spur alſo behind them; ſome of them are all White, others are Purple, and ſome between both, of a purpliſh White.

XII. *The ninth, or* Long leav'd Fox-ſtones, *has uſually but one ſound Teſticle (the other as it may ſeem, being decayed and gone) with ſome Fibres both at head, and on the ſides, which is not uſual in any of the other* Orchides. From this Root riſes up a Stalk about three Feet high, having two very long Leaves at bottom, but of an unequal length; thoſe which grow next on the Stalk are much longer, ſome being a Foot and half long, and very narrow; but thoſe up higher are ſhorter and broader: At the top of the Stalk grow the Flowers ſpike faſhion for a Foot in length, each of which ſtands like a croſs hollow Pipe, having a broad and long beard thereat, of a fine bluſh Color, with a more purpliſh Leaf like a Tongue, hanging down, broad above, and ſmall below.

XIII. *The Places.* Theſe grow not all of them in one kind of Soil or Ground, for ſome are found in

Wood Lands, ſome in *Clay Grounds*, ſome in *Fertile Fields*, other ſome in *Barren places*, dry and Sandy Soils, and ſome of them in a low, humid or moiſt Earth.

XIV. *The Times.* Theſe all Flower from almoſt the middle of *April*, until the end of *May*.

XV. *The Qualities, Specification, Preparations, and Virtues* of theſe Fox-ſtones, ſee in *Chap.* 226. before paſt, theſe having the ſame properties with thoſe Cynoſorchis or Dog-ſtones there treated of.

CHAP. CCLXXXXIX.

Of FOXGLOVE Garden, *OR*, FOX FINGER, Garden.

I. *THE Names.* This Plant was wholly unknown to the Ancient *Greeks* and *Latins*, ſo far as we know, for which reaſon it has no *Greek* Name, nor yet any *Latin* Name but what is very Modern and noval. Some of the latter Writers have called it *Digitalis*, which is the moſt common Name, and firſt ſo called as ſome think by *Fuchſius*; others call it *Alcima*, and *Damaſonium*; *Tragus* calls it *Campanula Sylveſtris*: *Dalechampius* upon *Pliny*, thinks it to be *Viola Calathiana Plinii*: in *Engliſh* it is called *Fox-Glove*, and *Fox Finger*; alſo *Finger Wort*.

II. *The Kinds.* There are two general kinds, *viz.* 1. *Digitalis Hortenſis*, *Digitalis Sativa*, Garden Fox Glove, of which we treat (God willing) in this Chapter. 2. *Digitalis Sylveſtris*, *Digitalis agreſtis*, *Digitalis vulgaris*, Common Field Fox Glove, or Finger Wort, of which in the next Chapter.

III. Of the *Garden kind* there are ſeven (properly but ſix) ſeveral Species, *viz.* 1. *Digitalis maxima Ferruginea*, Dun or Ruſt colored Fox-glove, *or* Finger-wort. 2. *Digitalis major flore carneo*, Bluſh-colored Fox-glove. 3. *Digitalis media flore luteo rubente*, Orange-tawney Fox-glove. 4. *Digitalis major alba*, The greater white Fox-glove. 5. *Digitalis minor alba*, The leſſer white Fox-glove. 6. *Digitalis major lutea flore amplo*, The great yellow Fox-glove. 7. *Digitalis minor lutea palida*, The ſmall pale yellow Fox-glove.

IV. The Deſcriptions. *The firſt, or* Dun or Ruſt colored Fox-glove, *has a Root which is fibrous or ſtringy, (like that of the* Common *or* Field kind) *which does uſually periſh, or ſeldom out-live its giving Seed.* From this Root ſpring up Leaves which are long and large, of a greyiſh green color, finely cut or dented about the edges. Among which comes up a tall ſtrong Stalk, which, when it is full grown, and with ripe Seed thereon, has been found to be ſeven Feet at leaſt in height; on which grow almoſt an innumerable company (reſpecting the great abundance) of Flowers, nothing ſo large as the *Common* or *Field kind*, and of a brown or yellowiſh dun color, with a long Lip at every Flower. They being paſſed away, then comes the Seed, much like the *Common kind*, but in ſmaller Heads.

V. *The ſecond, or* Bluſh-colored, *has Roots, Stalks, Leaves and Flowers, much like to the* Common Field kind, *but all leſs.* The Leaves are reaſonable large, but not full out ſo large as the *Common*. The Flowers are alſo conſiderably ſmaller than the *Field ſort*, and of a bluſh color.

VI. *The third, or* Orange Tawney, *has a fibrous Root, which periſhes always after bearing Seed, which is uſually the ſecond Year of its ſpringing up.* This Fox-glove *is none of the* Greateſt kinds, *nor yet is it any of the* Smalleſt, *but a* Medium *between both.* Its Leaves are in ſome Proportion correſpondent to the *Leſſer yellow*, but not ſo large as the *Leſſer white*. The Flowers are long and narrow, almoſt as large as the laſt *White*, but nothing ſo large as the firſt *White*, and of a fair yellowiſh brown color, as if the yellow was over-ſhadowed with a reddiſh color, and is that we uſually call an Orange-tawney color. The Seed of this is very like the former.

VII. *The fourth, or* Greater White Fox-Glove, *is in Root, Stalk, Leaves, Flowers, and Seed, as alſo in the manner of growing, ſo like to the* Common Field Kind, *that it can ſcarcely be diſtinguiſhed from it, except in the freſher greenneſs and largeneſs of the Leaves*; the Flowers are as large as thoſe of the ſaid *Common Kind*, but they differ in Color, for as thoſe are Purple, theſe are wholly White, without any ſpot in them; in the Seed and all other things they agree.

VIII. *The fifth, or* Leſſer White, *has a Fibrous Root, enduring as the others do, the Leaves are like unto the laſt deſcribed, but not altogether ſo long or large, and of a darker green Color*; the Stalk grows not ſo high, not being full three Feet; the Flowers are pure white, faſhioned like unto the former, but not ſo great or large, in all other things alike; the Seed is alſo like the former.

IX. *The ſixth, or* Greater Yellow, *has a Root which is greater at the Head, and more Woody than any of the reſt, with many ſmaller Fibres, ſpreading themſelves in the Ground, and abides almoſt as well as our* Common Purple Kind; the Leaves of this are in form ſomewhat like unto the *Common Kind*, but not altogether ſo large; the Stalk grows to be three or four Feet high, on which grow many long, hollow, pendulous Flowers, in ſhape like unto the *Common Field Purple*, but ſomewhat ſhorter, and more large and open at the brims, of a fair yellow Color, in which are long Threads, as in the others.

X. *The ſeventh, or* Small pale Yellow, *has a Root which is Fibrous, or Stringy, but durable, and ſeldom periſhes with the hardſhip of the extreameſt Froſt*; it has ſomewhat ſhort, broad, ſmooth, and dark green Leaves, ſnipt or dented about the edges very finely; the Stalk is two Feet high, beſet with ſuch like Leaves, but leſſer; the Flowers are more in number than in any of the reſt, except the firſt and greateſt, and grow along the upper part of the Stalk, being long and hollow, like the other, but very ſmall, and of a pale yellow Color, almoſt white.

XI. *The Places.* All theſe, except the fourth, or *Greater White*, are Strangers to us, but are all of them cheriſhed in our Gardens; the ſaid *Greater White Kind* has been often found growing wild in many places of *England*, and generally among, or hard by the *Common Field Purple Kind* in the next Chapter.

XII. *The Times.* They flower in *June* and *July*, and ſome in *Auguſt*, the Seed becoming ripe quickly after.

XIII. *The Qualities, Specification, Preparations and Virtues*, are the ſame with the *Common Field purple kind* in *Chap.* 300. next following, to which you are referred.

CHAP.

CHAP. CCC.

Of FOX GLOVE Common, or Field.

OR,

FINGER-WORT Wild or Ordinary.

I. *THE Names.* It has no *Greek* Name as aforesaid; nor any ancient *Latin* Name, as being unknown to any of the ancient *Greeks* or *Latins*: But our modern Authors have called it *Digitalis*; which we render in *English*, *Fox Glove*, or *Fox Finger*, or *Finger Wort*.

II. *The Kinds.* This is the second Species, being the common ordinary, or Field kind. *Cæsalpinus* calls it *Virga Regia major flore purpureo*, also *Alisma* and *Damasonium*, and *Fistula Pastoris*. *Tragus* calls it *Campanula Sylvestris flore purpureo*. *Columna* thinks it to be the *Ephemeron* of *Dioscorides*. And *Dalechampius* upon *Pliny* will have it to be *Viola Calathiana Plinii*, as is said before in the former *Chapter*; but it is generally called *Digitalis purpurea Vulgaris*, Common purple Fox Glove.

III. The Description. *Its Root consists of many small, husky Fibres, and some greater Strings among them; from whence spring up many long and broad Leaves, lying upon the Ground, dented about the edges, a little soft or Woolly, and of a kind of a hoary green color*: Among which rise up several Stalks sometimes, and very often but one, bearing such Leaves thereon from the bottom to the middle; from whence to the top it is replenished with large, and long, hollow, reddish purple Flowers, a little more long and eminent at the lower Edge, with some white Spots within them, one above another and with some small green Leaves at every one; but all of them turning their Heads one way, and hanging downwards, having some Threads also in the middle; from whence rise round Heads, pointed sharp at the ends, which contain within them small brown Seed. The Flower has no smell, but the Leaves have a bitter hot taste.

IV. *The Places.* It grows in dry Sandy Ground for the most part, and as well on the higher as lower places, under hedge sides, almost *in every County of this Kingdom.* There is also *a White Wild sort*, described in the former Chapter at *Sect.* VII. which does grow naturally about *Lanisdale* and *Craven*, in a Field called *Cragge Close* in the North of *England*; also by *Colchester* in *Essex*; and near *Exeter* in the West of *England*, and in several other places: Yet this Wild *White kind* is also nurst up in *Gardens*, as in the former Chapter we have declared.

V. *The Times.* They Flower and Flourish in *June* and *July*, but seldom before *July*; and the Seed is Ripe in *August*.

VI. *The Qualities.* *Fox Glove* is hot and dry at least in the second Degree, Sulphureous and Saline; Aperitive, Abstersive, Astringent, Digestive and Vulnerary: Pectoral, Hepatick and Arthritick; Emetick, Cathartick, and Analeptick.

VII. *The Specification.* It Cures Consumptions, King's Evil, Green-sickness and Falling-sickness; also Wounds, old Sores and running Ulcers.

VIII. *The Preparations.* You may have therefrom, 1. *A Liquid Juice.* 2. *An Essence.* 3. *A Syrup.* 4. *A Decoction or Infusion.* 5. *An Ointment or Balsam.* 6. *A Cataplasm.*

The Virtues.

IX. *The Liquid Juice.* It purges and cleanses the Lungs, Stomach and Bowels; but ought to be given not in too great a quantity, because of its violent Operation. It may be given from three Spoonfuls to Six, in Mead or White Port Wine, according to Age and Strength; it works strongly both upwards and downwards, and prevails against the Scurvy, Dropsie, Jaundice, Gout, and Rhumatism; and is found by experience to be an excellent thing against the King's Evil. Outwardly applied, it heals any fresh or green Wound, the Leaves being bruised and applied thereto also. It is frequently used in old and putrid Sores to cleanse them, dry up their moisture, and cause a speedy healing.

X. *The Essence.* It has all the Virtues of the Juice, and more excellent for the same purposes and intentions; besides which it rarifies or attenuates thick tough Flegm, and viscous Humors, affecting the Lungs, Breast and Stomach: It cleanses and purges the Body both upwards and downwards, freeing it both from Viscous and Watery humors: It opens Obstructions of Liver, Spleen, Gall and Womb, and resists those Diseases occasioned thereby. And by late Experience, it has been found effectual against the Falling-sickness, for that divers have been absolutely Cured thereby. Dose from two to six Spoonfuls or more, according to Age and Strength in the Morning fasting, to be given in any proper Vehicle.

XI. *The Syrup*, or *Rob of the Juice of the Herb and Flowers made with Honey.* It is a Specifick which transcends all other Vegetable Medicaments for the Cure of Consumptions; cleansing and healing after an admirable manner Ulcers of the Lungs. It opens the Obstructions of all the Viscera, cleanses, carries off, or expels the recrements of the Humors, by which means the daily Nutriment may be conveyed

veyed to all the Parts of the Body. It may be given Morning and Night, four or five Spoonfuls at a time, according to Age and Strength: some advise three Spoonfuls to be given in the Morning fasting in Mead, as much at Ten in the Morning, three Spoonfuls at Four in the Afternoon, and lastly, as much at going to Bed. This Medicine has relored (where the Patient has not been past Cure) beyond all Expectation. It cures a Phthisick or Ulceration of the Lungs, when all other Medicines have failed, and the Sick esteemed past Cure. It opens the Breast and Lungs, frees them from tough Flegm, cleanses the Ulcer, and heals it, when all other Remedies act without Effect. I have known it do Wonders, and speak here from a long Experience. Persons in deep Consumptions, and given over by all Physicians, have by the Use of this *Syrup* or *Rob* been strangely recovered, and so perfectly restored as to grow fat again. I commend it as a Secret, and it ought to be kept as a Treasure. These few Lines concerning this Medicament alone are worth ten times the Price of the whole Book. I am very confident of it, the deplorable wasted Patient, who has been long languishing in an inveterate and tedious Consumption, or a Phthisis, if they make use hereof, will give me Thanks for this Notice, whilst they may have Reason enough to Curse even the Memories of Quacking Blood-suckers, Issue-makers, and Blister-drawers, who, as they may have possibly drained them of a fair part of their Estate and Treasures, would, by a Continuance under their Hands, (for all their specious Methods of Cure) have fooll'd them out of their Lives too. But here is to be noted, That this Syrup ought chiefly or only to be made of the Flowers.

XII. *The Infusion or Decoction.* They have the Virtues of the Juice, Essence and Syrup, but much less efficacious, and therefore are to be given in a larger Dose. They powerfully open Obstructions of the Viscera; and may be given Dietetically in the Cure of Consumptions, Kings-evil, Ulcers, Fistula's, &c.

XIII. *The Ointment or Balsam.* The Ointment is said to be one of the best Remedies for a scabby Head that is: it is also good against Pimples, Tetters, Ringworms, Scurff, Morphew, or other Scabbiness and Breakings out in any Part of the Body. The Balsam is an excellent Vulnerary, curing simple Wounds at once or twice dressing: it also digests, cleanses, incarnates, dries and heals old and putrid Ulcers, fretting and eating Sores, and such as proceed from the Kings-evil.

XIV. *The Cataplasm.* The Flowers being stampt together with fresh Butter or Hogs-Lard, and so made into a Pultise, and applied to any Part affected with the Kings-evil, it has been found by manifold Experience to be very available for the Cure of that Disease. If the Flowers cannot be had, you may use the Leaves in like manner, or make them into an Ointment with Hogs-Lard and Beef-Suet; this will work the same, tho' not altogether so powerfully as that made with the Flowers.

XV. The discussive Cataplasm. *Take Fox-glove Flowers, or Leaves, if the Flowers are not to be had, a pound, Oat-meal a pint; boil the Oat-meal soft in a sufficient quantity of running Water, then add the Fox-glove, and boil to a Consistence.* This applied warm Morning and Evening to a Contusion in a Woman's Leg, where the Tumor made it four times as big as the sound Leg, being also in great Anguish, and full of Pain; it eased the Pain, discussed the Tumor, and in a little time did the Cure; but afterwards a strengthening Cerecloth was applied, to perfect it.

CHAP. CCCI.

Of FOXTAIL, *OR,* FOXTAIL-GRASS.

I. *THE Names.* It is called in *Greek*, Ἀλωπέκυρος: in *Latin*, *Alopecuros*, *Cauda vulpis*; *Lugdunensis* calls it *Gramen tomentosum Alopecuros vera Plinii* and *Theophrasti*: in *English*, *Foxtail-grass*.

II. *The Kinds.* Authors make three several sorts hereof, *viz.* 1. Στελεφῦρος, *Stelephuros Plinii*, *Gramen Alopecuros vera Plinii*, *Alopecuros genuina*, and *genuina Theophrasti*, The true Foxtail-grass. 2. *Alopecuros Dodonæi*, *Alopecuros altera Anglica & Flandrica*, Another Foxtail-grass English and Flemish, so called by *Lobel*, because he found it both in *England* and *Flanders*. 3. *Alopecuros maxima Anglica Lobelii*, The greatest English Foxtail-grass.

True Foxtail-Grass.

III. The Descriptions. *The first, or* True Foxtail-grass, *has a small Root made of a few Fibres, which perishes every Year.* This Root sends up two or three, or more, soft hoary Stalks, about a Foot high, with small, long and narrow soft Leaves on them, as hoary as the Stalks; on which stand soft, woolly or hoary Heads, somewhat long and round, beset round with soft Hairs, of a pale straw color, resembling a Foxes Tail, from whence it took its Name.

IV. *The second, or* Other Foxtail-grass, *has much alike fibrous Root, with Stalks and Leaves much like to the former*, saving, that they are longer, the Stalks growing higher. The Heads also are shorter and

and rounder, and nothing ſo woolly or hoary as the other are.

Great English Fox taile Graſs

V. *The third, or* Greateſt Engliſh Foxtail-graſs, *has a fibrous Root, from whence ſpring up Stalks about half a Yard or two Feet high*, having ſometimes fair large Leaves, like unto *Wheat*, but larger, ſet at the Joints, and bearing at their tops great, large, full, ſoft and woolly Heads, like the firſt, but that they are much greater and longer, and this is, whether the Stalk is higher or lower.

VI. *The Places.* The firſt grows naturally in ſeveral places about *Mompelier*; but we have it in our Gardens only for Curioſity. The ſecond *Lobel* found, growing Wild in both *England* and *Flanders*. The third *Lobel* found in the *Weſt* of *England*, between *Portſmouth* and the *Iſle of Wight*.

VII. *The Times.* They flouriſh with their Heads in *June*, *July* and *Auguſt*.

VIII. As to their *Qualities*, &c. this is ſaid by Authors, That no Medical Property or Virtue has been found in any of them; but they are many times uſed to be worn as an Ornament or Toy on Womens Hats, Hair, or Heads.

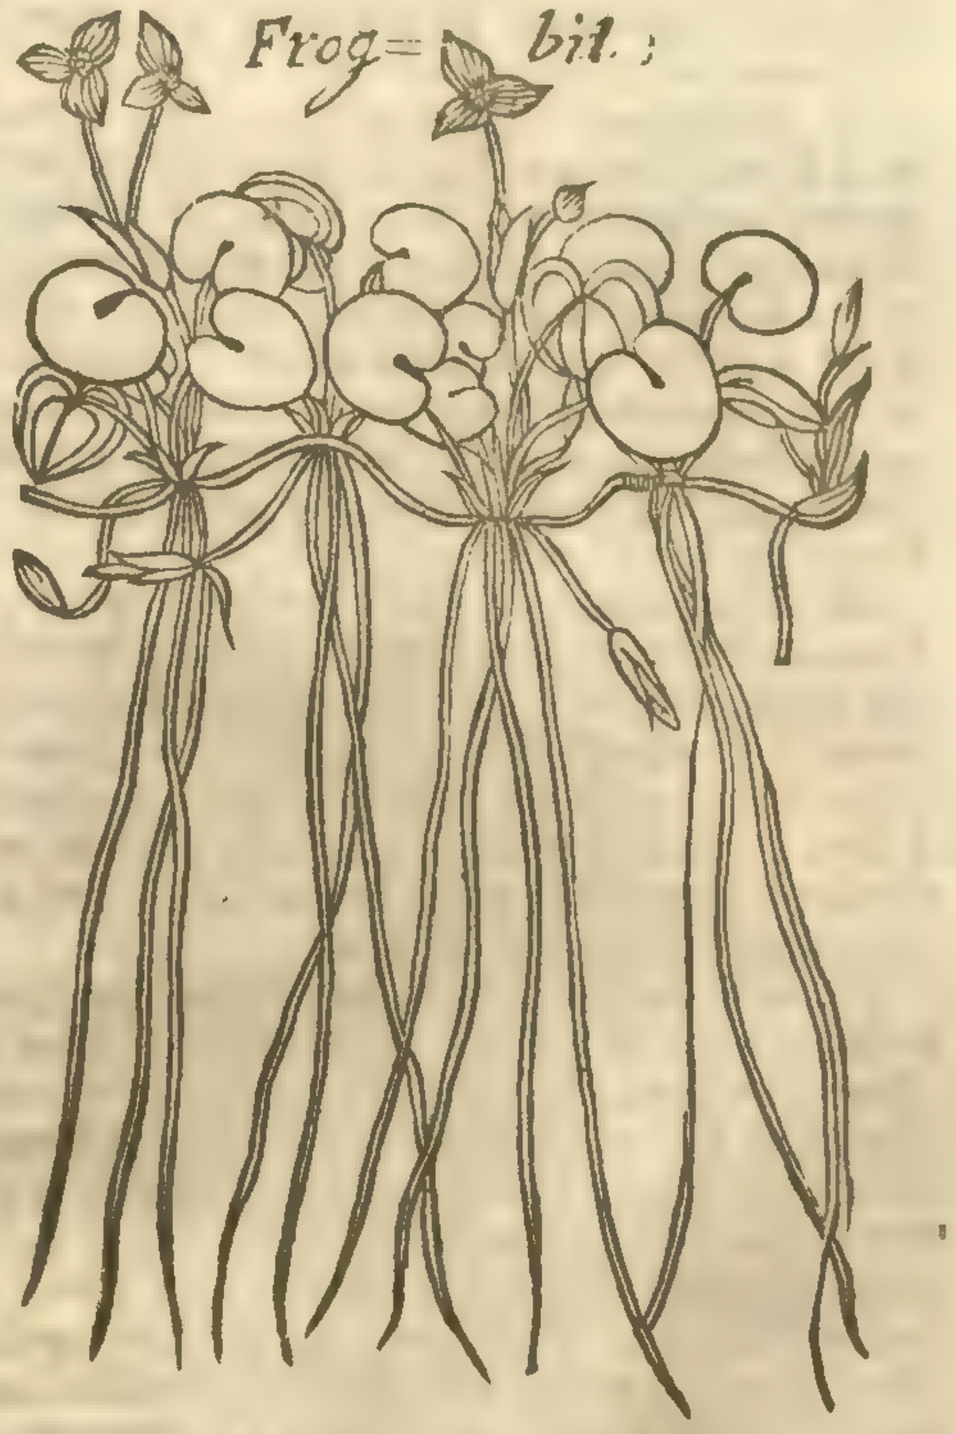
CHAP. CCCII.

Of FROG-BIT, *OR,* Smalleſt Water LILLY.

I. *THE Names.* It is called in *Greek*, Νυμφαία ἐλαχίστη: in *Latin*, *Morſus Ranæ*, and *Nymphæa minima*, and *alba minima*: in *Engliſh*, *Frog-bit*, and *Smalleſt Water Lilly*.

II. *The Kinds.* It is a ſingular Plant, and the very leaſt of the *White Water Lillies*. Some would have it to be one of the Kinds of *Pondweed*, but it is no ſuch thing, but of the Kind of *Water Lillies*.

Frog-bit.



III. The Deſcription. Frog-bit *has a Root which is long and creeping, full of Joints, ſending down from the ſaid Joints ſeveral long Fibres or Strings, and by the encreaſing of thoſe Joints, it multiplies it ſelf.* From the Joints of this Root, or Heads of thoſe Strings, ſpring forth ſeveral ſmall round Leaves, thick and full of Juice, very like to the *Leſſer White Water Lilly*, but much leſſer, or the Leaves of *Wall Pennywort*: from among which riſe other Stalks, bearing on each Head one ſmall white Flower, conſiſting of three ſmall and round pointed Leaves, with a certain yellow Thrum or Threads in the middle. This in all its parts more nearly reſembles the *Leſſer White Water Lilly* than any *Pondweed*, of which ſome have made it a Species.

IV. *The Places.* *Gerard* ſays it is found floating or ſwimming almoſt in every Ditch, Pond, Pool, or ſtanding Water; in all the Ditches about St. *George's Fields*, and in the Ditches by the *Thames ſide* near *Lambeth Marſh*, and in ten thouſand other places of this Land.

V. *The Times.* It flouriſhes and flowers the moſt part of all the Year; but it commonly begins to flower in *May*, and ſo continues on for ſome Months; and the Seed is ripening in the mean Seaſon.

VI. *The Qualities.* It is cold and moiſt in the ſecond Degree; Anodyne, Relaxive and Arthritick.

VII. *The Specification.* It is peculiar againſt Anthonies-fire, Inflammations, and the Gout in a hot Conſtitution of Body.

VIII. *The Preparations.* You may have therefrom, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *An Ointment.* 4. *A Cataplaſm.*

The Virtues.

IX. *The liquid Juice.* It is very cooling, and abates Inflammations. Bathed upon an Eryſipelas,

and wet Cloths dipt in the Same, it takes away the Sharpneſs and Heat thereof, and in a little time cures it. It is alſo good againſt ſharp Humors breaking out in the Head, and prevails againſt Scabbineſs, Scurff, Morphew, Pimples, Sun-burning, Tanning, Yellowneſs of the Skin, and other like Deformities.

X. *The Eſſence.* It has all the Virtues of the liquid Juice; beſides which, it may be given inwardly two or three Spoonfuls at a time in a Glaſs of Wine and Water againſt any malign or burning Fever. The Whey or Poſſet-drink made by turning Milk with it, has the ſame Effect. This Eſſence bathed upon the Head, for an extream Head-ach, ariſing from a hot Cauſe, gives Relief, and by continuing the Uſe thereof for ſome time, effects the Cure.

XI. *The Ointment.* Being anointed upon any Part afflicted with vehement Pain, from a violent hot Cauſe, it eaſes it. It alſo allays Inflammations in any Part of the Body; and anointed upon the Back-bone, it eaſes the Pain, tho' never ſo extream. I have applied it to Parts extreamly affected with the Gout, and it has given preſent eaſe, and in a ſhort time after abated the Tumor.

XII. *The Cataplaſm.* Applied to any ſimple and recent Bruiſe, it diſcuſſes the Tumor, hinders the Afflux of Humors to the Part, and in a little time after cures it: alſo applied to any old and running Ulcer, and bound to alſo above the Ulcer, it hinders the Defluxion, cleanſes and dries, and in a great meaſure contributes to its healing. It alſo gives preſent Relief in the Gout, being duly applied Morning and Evening for ſome conſiderable time. Applied to the Forehead, it hinders Defluxions upon the Eyes, and eaſes the Megrim, and other Pains of the Head.

CHAP. CCCIII.

Of FRIERS COWLE, *OR,* WAKE ROBIN Hooded.

I. *THE Names.* It is called in *Greek*, Ἄειραον, ϗ ἀείραες: in *Latin*, *Ariſarum*, *Ariſaris*, and *Aris*: in *Engliſh*, *Friers Cowle*, *Hooded Aron*, or *Hooded Cuckoepoint*, or *Wake Robin*.

II. *The Kinds.* It is of the Family or Stock of the *Arons*, and is twofold, *viz.* 1. *Ariſarum latifolium*, Broad-leav'd Friers Cowle. 2. *Ariſarum longifolium, vel anguſtifolium*, Long-leav'd or Narrow-leav'd Friers Cowle. *Dalechampius* upon *Pliny* calls the *Latifolium*, *Calle alterum genus Plinii*; but *Tragus* thinks it to be rather the *Arum Dioſcoridis*, which is indeed a Miſtake.

III. The Deſcriptions. *The firſt*, *or* Broad-leav'd, *has a Root which is ſomewhat round and white, and is encreaſed moſtly by Off-ſets. It grows in all things like unto the* Aron, *having divers fair green Leaves, whoſe middle Rib on the upper ſide, as alſo ſome other of the Veins, are ſometimes white, and ſomewhat thicker and rounder-pointed than thoſe of* Aron. The middle Stalk bearing the Flower (which is a crooked or bending Hoſe at the top, with a ſmall crooked whitiſh Peſtle in the middle, riſing out of it) is ſpotted with red Spots, and riſes not fully ſo high as the Leaves, which are nothing ſo ſharp in Taſte as thoſe of *Aron* or *Wake Robin*, and do always ſpring up in the end of *Autumn*, abiding green all the Winter. After the Husk or Flower is paſt, and the green Leaves withered and gone, which will be in the Summer, then the Berries do appear on the tops of the Stalks, green at the firſt, and of a yellowiſh red when they are ripe, which abide until the Froſts cauſe them to wither, and the green Leaves begin again to appear.

IV. *The ſecond*, *or* Narrow-leav'd, *has a Root which is round and white, ſmaller than the former, and encreaſing by Off-ſets, tho' not in ſo plentiful a manner. The Leaves of this Plant are very long,* and

and very narrow, not rising so high as the former, but rather lying on the Ground. It seldom bears any Fruit or Hose; but when it does, it is whitish, small and long, with a very long and small reddish Pestle in the middle, like unto a long Worm, scarce rising above the Ground; and the Berries which follow are white, and not red.

V. *The Places.* These Plants are Natives of *Italy*, and are found especially in *Tuscany*, about *Rome*, and in *Dalmatia*, as *Anguillara* says: they also grow in *Spain* and *Portugal*: but in *England* they are only nurst up in *Gardens*, where they thrive very well.

VI. *The Times.* They both shoot forth their green Leaves in *Autumn*, presently after the first have pulled down the Stalks with the Fruit, and abide green all the Winter, withering in Summer, before which their Husks appear.

VII. *The Qualities, Specification, Preparations and Virtues,* are the same with those of the *Dragons* or *Dragon-wort*, in *Chap.* 229. aforegoing, so that we need say no more thereof here.

CHAP. CCCIV.

Of FUMITORY Common.

I. *THE Names.* It is called in *Greek*, Καπνὸς, ἢ καπνιον, *Fumulus*, ἢ καπνίτης, *quasi*, *Fumus*, *Vapor*, *Nidor*; from whence the *Latins* called it, *Fumaria* and *Fumus Terræ*: in *English*, *Fumitory* and *Fumiterry*. The *Arabians* call it, *Schiteregi*. This Herb being of a whitish blew color, as Smoak is, it appears to those who behold it at a distance, as if the Earth was all in a *Fume* or *Smoak*; and from hence (as it is supposed) came the Name.

Broad-leav'd Common Fumitory.

II. *The Kinds.* There are three principal kinds hereof, (if the last sort may be accounted a kind thereof) *viz.* 1. *Fumaria Anglica*, English Fumitory, of which in this Chapter. 2. *Fumaria Indica, vel Virginiana*, American or Virginian Fumitory, of which in the next Chapter. 3. *Fumaria bulbosa vel tuberosa, Radix cava*, Hollow-root, of which in its place.

III. Of *Our English Fumitory*, there are these following Species, *viz.* 1. *Fumaria vulgaris, Capnos vulgaris Lobelii, Fumaria purpurea*, Common or Purple Fumitory. 2. *Fumaria tenuifolia, Fumaria minor*, The fine-leav'd, or lesser Fumitory. 3. *Fumaria latifolia alba, & alba claviculata, Capnos Lobelii, Fumaria altera Dodonæi, Capnos phragmites Gesneri, Corydalis, & Corydalion aliorum*, White broad-leav'd Fumitory, or Climbing Fumitory. 4. *Fumaria lutea, & lutea Montana Lobelii, Fumaria Coridalis Matthioli, Fumaria Montana Gesneri & Tabernmontani, Corydalis Anguillaræ & Camerarii, Split vulgo Cæsalpini, Split Illyrica, & Herba Selavonica aliorum*, Yellow or Mountain Fumitory.

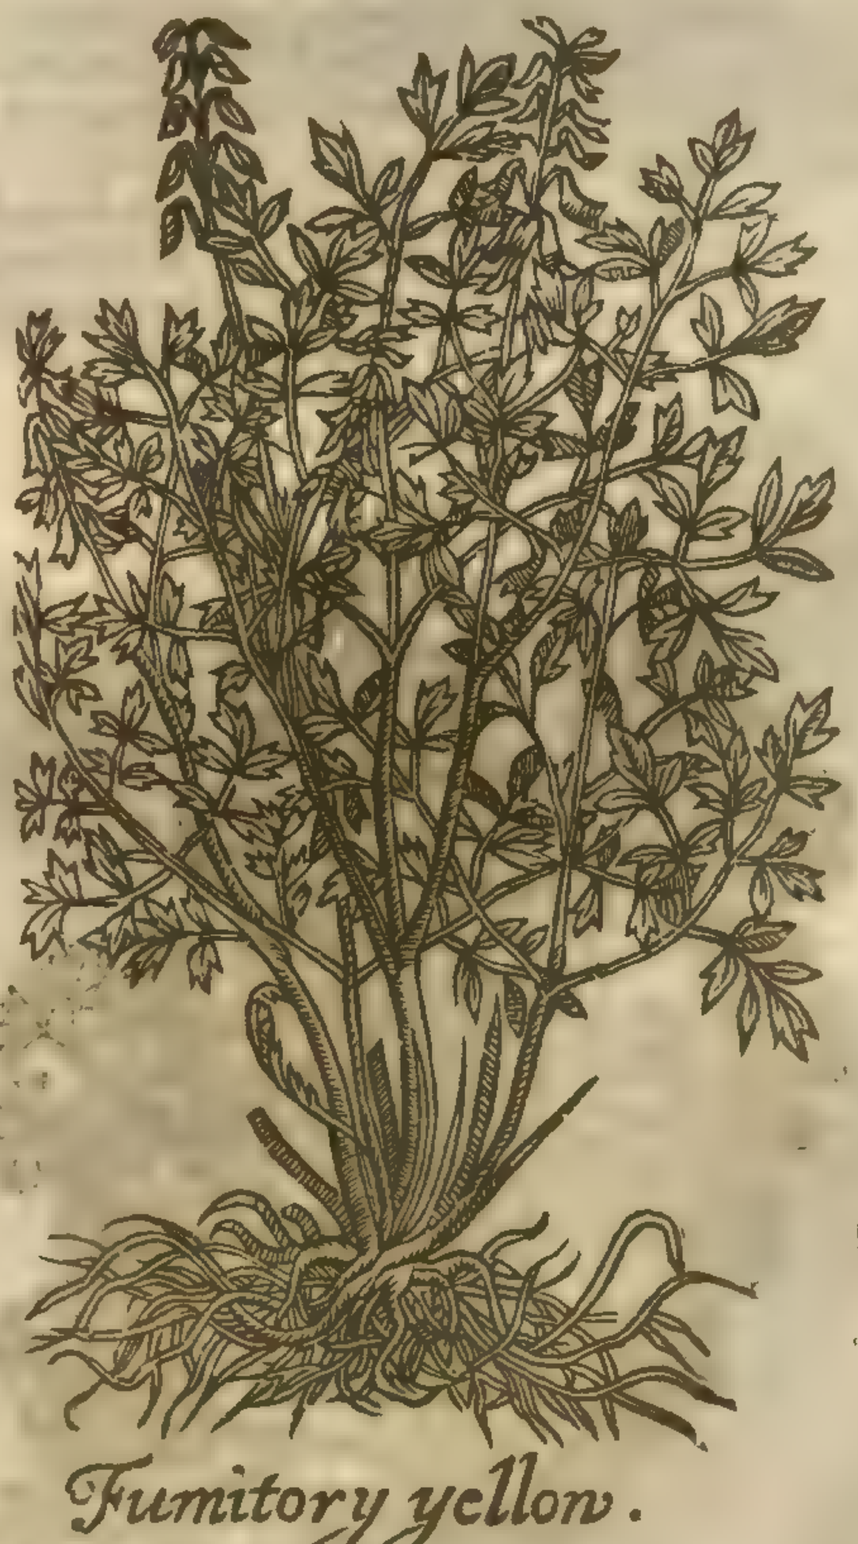
Common Purple Fumitory.

IV. The Descriptions. *The first, or* Common purple Fumitory, *has a Root which is yellow, small, and not very long, full of Juice while it is green, but quickly perishing after it has given ripe Seed.* This Plant is a tender sappy Herb, having Stalks which are square, slender and weak, with many little Knots or Joints, from whence many Branches spring forth, two or three Feet long, leaning downwards on all sides, so that they scarcely grow up from the Ground, without propping, but for the most part grow sidelong. The Leaves grow from the Branches upon long Foot-stalks, which are tender and brittle, and are finely cut or jagged, somewhat like to those of *Coriander*, being of a whitish, or rather blewish Sea green color. At the tops of the Branches stand many small Flowers, as it were, in a long Spike, one above another, as it were, in Clusters, made like little Birds, of a reddish purplish color, with white Bellies; after which come small round Husks, containing small blackish Seed. Note,

That in the Corn-fields of *Cornwall* this bears white Flowers. And *Johnson* upon *Gerard* says, That it is sometimes found with purple *Violet*-colored Flowers. There is also a *Broader-leav'd* of this kind, not differing from the former Description. See the first Figure in this Chapter.

V. *The second, or* Fine-leav'd Fumitory, *has a Root small and white, but like the former; from whence spring forth Stalks or Branches, not so long as the first, but standing more upright, being slender and square.* The lower Leaves are very like to those of the other *Fumitory*, and of the same color, but smaller; but those which grow above upon the Stalk are smaller, and finer cut in; and the higher, the finer and smaller, the highest being as small as *Fennel*, or *Southernwood*, or *Camomil* Leaves. The Flowers grow in the same manner which the other do, but rather in greater plenty, or more together, of a deeper reddish purple, mixed with white and yellow; which being passed away, Husks or Cods succeed, containing the Seed, which is much like that of the *Common or Purple kind.*

VI. *The third, or* White Broad-leav'd, *has a Root which is small and long, white, and growing deep into the Ground, abiding all the Winter, and shooting forth new Branches (after the old are perished) every Year.* From this Root rise up small slender Stalks, not strong enough to sustain themselves, but catching hold by certain Tendrels which it sends forth at the ends of the smaller Branches of any thing which stands nigh unto it, whether Hedges, Shrubs or large strong Herbs, it climbs up, and spreads it self out many ways, with several Stalks of small Leaves, set two or three, or more together, not dented or divided on the edges at all, but sharp-pointed at their ends, of a blewish green color, very like unto the *Common Fumitory.* At the tops likewise of the small Branches come forth many small whitish Flowers, tipt with blush, set together, but nothing like the former, made like small, long, hollow Husks or Bell-flowers, ending in six small Points: after which come small Seed, contained in small broad Husks or Cods.



VII. *The fourth, or* Yellow or Mountain Fumitory, *has a Root which is composed of many white, slender, long Fibres or Strings, bushing thick together, which perishes not as the Roots of the* Common Fumitory *do, but abides many Years, shooting forth new Stalks every Season, after the old ones are perished.* This *Yellow kind* grows like the other *Fumitories,*

mitories, about a Foot and half high, with many Leaves, like unto the *Common purple kind*, or like to thoſe of *Fumaria bulboſa*, or *Radix cava*, or *Hollow-root*, but ſmaller, and of the ſame blewiſh green color with them. The Flowers are yellow, and in ſome places white, and grow at the tops of the Branches, like the other, in form of little Birds, as *Matthiolus* ſets them forth, both by his Deſcription and Figure: but *Lobel* and *Lugdunenſis* ſay they are Star-faſhion, like unto the *Chelidonium minus*, or *Pile-wort*; and yet both of them give *Matthiolus* his Figure, with the Flowers of *Common Fumitory*, like little Birds, and not Star-faſhion, like thoſe of *Pile-wort*. After the Flowers are paſt, ſmall Horns come forth, or long Pods or Cods, like to the *Chelidonium majus* or *Radix cava*, but leſſer; in which are contained ſmall, whitiſh green Seed, ſomewhat round and flattiſh.

VIII. *The Places.* The firſt grows as well in Corn-fields, almoſt every where, as in Gardens alſo; and that with white Flowers in the Corn-fields in *Cornwall*: it grows in *Barley*-fields, and among other Grain; alſo in Vineyards, and other manured places. The ſecond grows in many places in *Spain*, and about *Mompelier*, and other places of *France*. The third grows by Hedge-ſides, and among Buſhes in ſeveral places of *Brabant* in the *Low Countries*, and about *Frontignana* and *Mompelier* in *France*; it is found about *Naples* with a yellow Flower, as ſome report: and *Gerard* ſays theſe ſecond and third kinds grow Wild in a Corn-field between *Charleton* and *Greenwich*; and very probably may be found in ſeveral other parts of this Kingdom. The fourth grows in hilly and mountainous places in *Italy*, as on the Hills of *Apulia* and *Calabria*, in the Kingdom of *Naples*, and in *Illyria*, and ſeveral other places: but with us it grows in Gardens.

IX. *The Times.* The firſt three flower from the beginning of *May*, and continue flowering thro' all the Summer Months; and their Seed ripens in the mean Seaſon. But the fourth or *Yellow kind* begins to flower much later, *viz.* not till *Auguſt*, and its Seed ripens quickly after. This is alſo to be noted, That if you would gather *Fumitory* to dry or diſtil, it ought to be done whilſt it is in flowering, and alſo in the prime of that time.

X. *The Qualities.* *Fumitory* is cold and dry in the firſt Degree; Aperitive, Abſterſive, Coſmetick and Diuretick; Pectoral, Hepatick, Splenetick and Nephritick; a little Cathartick and Alexipharmick.

XI. *The Specification.* It is ſingular againſt all ſorts of Scabs, Itch, Wheals, Pimples, Puſhes, Scurff, Morphew, Tettars, Ringworms, Herpes and other Defœdations of the Skin, ariſing from ſalt and ſharp Humors. It provokes Urine, helps the Strangury, and opens all Obſtructions of the Viſcera.

XII. *The Preparations.* You may have therefrom, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *A Syrup.* 4. *A Decoction in Water or Wine.* 5. *A Pouder of the dried Herb.* 6. *A Collyrium.* 7. *A Cataplaſm.* 8. *A diſtilled Water.* 9. *A Spirituous Tincture.* 10. *An Acid Tincture.* 11. *A Saline Tincture.* 12. *A Pouder of the Seed.*

The Virtues.

XIII. *The liquid Juice.* It opens, cleanſes and ſtrengthens, being taken four or five Spoonfuls at a time in the Morning faſting, mixt with a Glaſs of White Port Wine. It purges a little downwards, but more eſpecially if mixed with an Infuſion of *Sena* in Wine. It opens all Obſtructions of the Stomach, Liver, Spleen, Reins and Womb; purifies the Blood from ſalt, cholerick or viſcous Humors, which are the cauſe of Pimples, Wheals, Puſhes, Tettars, Ringworms, Scurff, Morphew, Scabs, Itch, Leproſy, and the like Breakings out. After purging, it ſtrengthens all the Viſcera, not leaving any evil Quality behind it.

XIV. *The Eſſence.* It has all the former Virtues, but more efficacious, and is accounted a moſt ſafe Remedy againſt all the Diſeaſes ariſing from the aforeſaid Humors, as alſo from aduſt Choler and Melancholy, or from Obſtructions, which are the cauſe of cholerick and putrid Fevers, the Jaundice, Strangury or Stoppage of Urine thro' Gravel, Sand or viſcous Matter, all which it expels in abundance. Doſe five or ſix Spoonfuls in White Wine or clarified Whey.

XV. *The Syrup.* Whether made of the Juice or green Herb, has all the Virtues of the Juice and Eſſence, but is weaker in Operation, and therefore ought to be given mixt with a ſufficient quantity of Syrup of *Damask Roſes*, or Syrup of *Peach* Bloſſoms, or Tincture of *Sena*, &c. ſo given, it not only opens all Obſtructions, but is very effectual againſt the Jaundice, Dropſy and Gout; and is a moſt ſingular thing againſt Hypochondriack Melancholy in any Perſon whatſoever.

XVI. *The Decoction in Water or Wine.* It has the Virtues of all the former Preparations, but is much weaker, and may be given in a Morning faſting to ſix or eight Ounces. If the Stomach is cold and weak, the Decoction ought to be made in Wine. It is an excellent thing againſt the Strangury, whether in Old or Young, and effectually cleanſes the Reins and Urinary Parts.

XVII. *The Pouder of the dried Herb.* A Dram of it being mixed with half a Dram of the Pouder of *Eſula* Root, and given in five or ſix Spoonfuls of the Eſſence or Juice, cauſes Vomiting and cleanſes the Stomach and Bowels, both upwards and downwards, of cold, viſcous and tough Humors; and effectually carries off watery Humors from all Parts of the Body; and has been found very effectual againſt the Dropſy, Scurvy, Jaundice, Gout and Rheumatiſm: but becauſe this Medicine ſtirs up much Wind, it may be good to correct it with a few drops of Oil of *Aniſe* or *Fennel* Seed, or with the Pouder of the ſame.

XVIII. The Collyrium. *Take of the Juice or Eſſence of Fumitory three Ounces, diſtilled Water of Fumitory, Honey, of each one Ounce, mix them.* It is an excellent thing againſt ſore, inflamed, running and watery Eyes. A ſore Mouth and Throat alſo being gargled therewith, it heals them. Dropt into the Eyes, it clears the Sight, and takes away the Redneſs and other Defects in them. If the Juice is mixed in equal parts with Juice of *Sharp-pointed Docks* and Wine Vinegar, and a contaminated Skin be waſhed therewith, it cures it of all ſorts of Scabs, Itch, Wheals, Pimples, Puſhes, Scurff, Morphew, &c. whether in the Face or Hands, or in any other Part of the Body.

XIX. *The Cataplaſm.* It is an excellent thing being applied to ſimple and recent Contuſions, diſcuſſing the Tumor, and hindering a farther Afflux of Humors to the Part: and being applied to any Defœdation of the Skin, it cleanſes it, removes it, and quickly cures the ſame. Applied to the Gout in Hands or Feet, it eaſes the Pain, and hinders the farther Afflux of Humors to the Part.

XX. *The diſtilled Water.* It has the Virtues of the Juice, &c. but very much weaker, and may be uſed as a *Vehiculum*, to convey any of the other Preparations in, down into the Body. *Tragus* ſays it conduces much againſt the Plague, being taken with

with good *Venice* Treacle, driving forth the Malignity by Sweat. If the diſtilled Water be thus good in this Caſe, doubtleſs the Eſſence muſt much tranſcend it.

XXI. *The Spirituous Tincture.* It is good againſt the Plague or Peſtilence, as alſo againſt all malign and Peſtilential Fevers, as Spotted Fever, Purples, Calentare, *&c.* and is an excellent thing againſt the Colick and Griping of the Guts, whether in Young or Old. Doſe two or three Drams in Canary or other fit Vehicle.

XXII. *The Acid Tincture.* It is an excellent Antiſcorbutick, good againſt Vapors, Fits of the Mother, Hypochondriack Melancholy, and all thoſe ſalt and ſharp Humors which cauſe fiery Eruptions in the Skin. It corrects Crudities, ſtrengthens the Stomach, cauſes a good Appetite and a ſtrong Digeſtion. It is to be given in all the Patient drinks, whether Ale, Beer or Wine, ſo many drops at a time as may give the Liquor a grateful or pleaſant Acidity; and ſo to be continued for ſome time.

XXIII. *The Saline Tincture.* It cures Scabs, Itch, Pimples, Scurff, Morphew, Leproſy, and other like Breakings out in the Skin, only by bathing or well waſhing the Parts affected therewith, as hot as can be conveniently endured, and continuing the Lotion for ſome conſiderable time.

XXIV. *The Pouder of the Seed.* It is ſtronger than the Pouder of the Herb, and is prevalent againſt the Dropſy, being given daily with about ten or twelve Grains of *Scammony* in Pouder: but the ſimple Pouder of the Seed being given to a Dram at a time for a Month together, every Morning faſting, and laſt at Night going to Bed, (in any fit Vehicle) it is ſaid to cure ſuch as are Melancholy: I believe, being given in an Infuſion of *Sena*, it may do Wonders of that kind.

CHAP. CCCV.

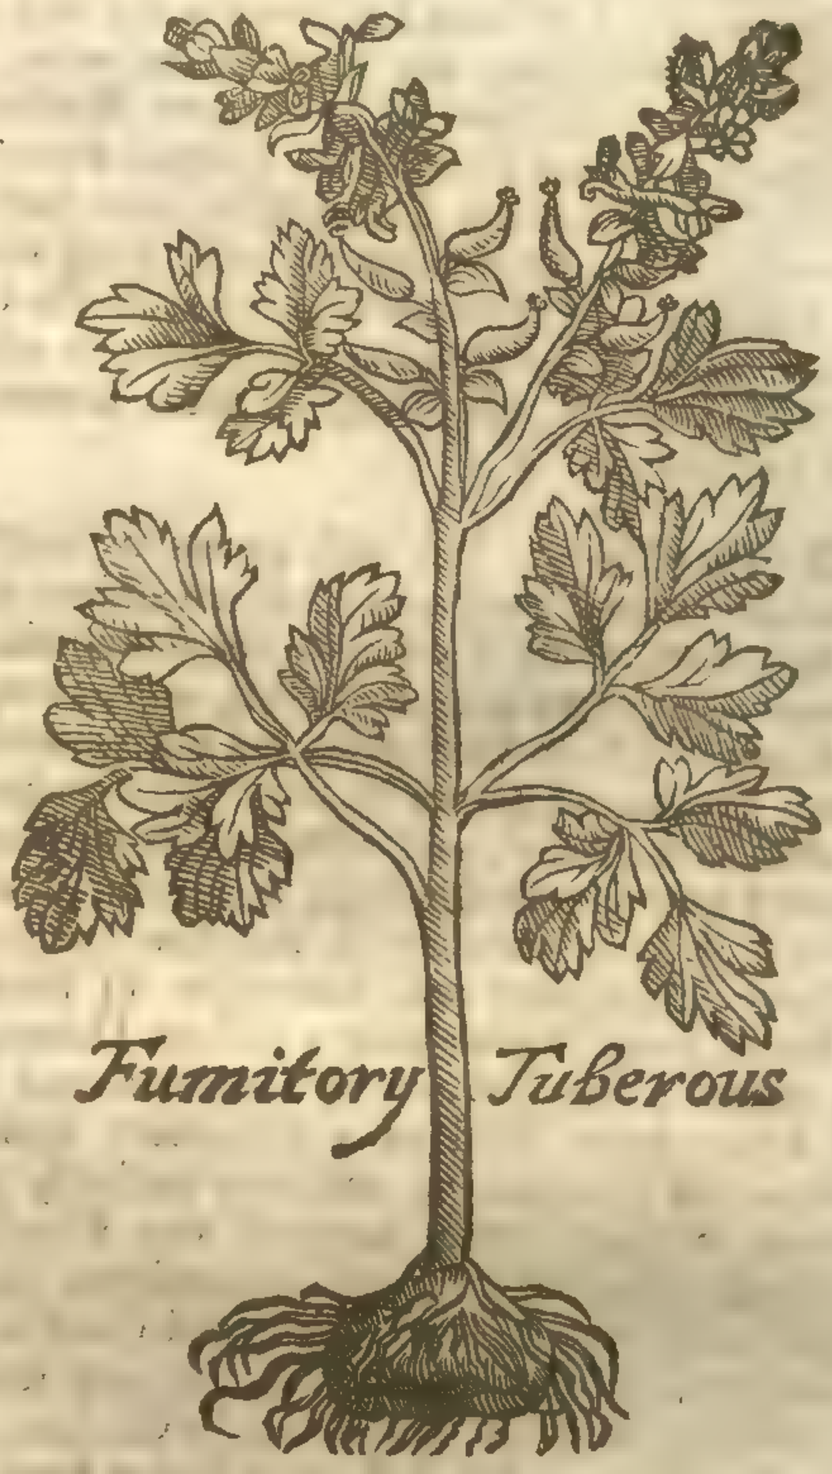
Of FUMITORY American.

I. *THE Names.* It is called in *Greek*, Καπνὸς Ἰνδικὸς: in *Latin*, *Fumaria Indica*, *Fumaria Americana*: in *Engliſh*, *American Fumitory*.

II. *The Kinds.* It is the ſecond general Species of *Fumitory*, and contains the two following kinds, *viz.* 1. *Fumaria ſiliquoſa Americana*, *Fumaria ſemper virens Americana*, Indian or American Fumitory Codded. 2. *Fumaria tuberoſa Americana*, Indian or American tuberous Fumitory.

III. The Deſcriptions. *The firſt, or* Codded Indian, *has a Root which is thick and fibrous, from whence riſes up a Stalk to be about a Foot high or more: the Leaves are like the* Common purple kind *in the former Chapter, but larger, and enduring green all the Winter.* The Flowers grow Spikefaſhion on to the top of the Stalk, formed like to thoſe of the *Radix cava* or *Hollow-root*, whoſe Bellies are Bluſh, and Mouths of a Gold color or paler yellow; which being paſſed away, long Pods or Cods come forth, which are almoſt round, and in which is contained the Seed, which is round, flattiſh and yellowiſh.

IV. *The ſecond, or* Tuberous American, *has a Root which conſiſts of two ſolid round parts, like Teſticles, with ſeveral ſmall Fibres ſpringing therefrom, as well from their tops as ſides and bottoms.* From between theſe Tubers or Teſticles riſes up a Stalk, which ſpreads it ſelf out into ſeveral winged Leaves, two ſet together at a Joint, and variouſly divided, and ſo ſmally, that they almoſt reſemble *Juniper* Leaves, of a blewiſh green color. The Flowers have ſeveral colors in them, but ſuppoſed of ſome to be but white: and the whole Plant is almoſt without either Taſte or Smell.



V. *The Places.* The firſt grows in *Virginia*, and the back-parts thereof, called *Canada*: I found it alſo in ſeveral parts of *South Carolina*. The ſecond grows in *America*, in the *Southern* Provinces of *Carolina*, in the up-land Country towards the Mountains.

VI. *The Times.* They flower from *May* during moſt of the Summer Months, and the Seed ripens in the mean Seaſon.

VII. *The Qualities, Specification, Preparations and Virtues,* are the ſame with the *Common purple Fumitory* in the former Chapter, to which I refer you: but this is to be noted, That of theſe *American kinds*, the firſt is by much the more powerful; and as the whole Plant of this firſt *American ſort* is much bitterer than the firſt or *Common purple kind* in the former Chapter, or indeed than any of the other ſorts there deſcribed, ſo it is alſo by much the more effectual.

CHAP. CCCVI.

Of FUSS-BALLS, OR, PUCK-FISTS.

I. *THE Names.* It is called in *Greek*, Κεφαλὴ, *pl.* κεφαλαὶ τῆς γαίας, ἢ φυμα, *pl.* φυματα γήινον: in *Latin*, *Caput*, *pl. Capita Terræ*, *Tuber*, *pl. Tubera Terræ*,

Terræ, *Fungus Ovatus*, *Pezicæ Plinii*, *Lupi Crepitus*: in *English*, *Fuſs-balls*, and *Puck-fiſts*, and *Fiſt-balls*, taken from the *German* Word, *Fiſt*, *quod Crepitum ſignificat*.

II. *The Kinds.* This is a ſingular Plant of the kind, and differs from the *Earth-balls* in *Chap.* 238. aforegoing very much; for they have a ſolid Subſtance or Pulp; whereas theſe are ſtuffed with nothing but Duſt.

Fuſs-Balls.

III. The Deſcription. *They are round Balls, growing in the Ground, without any Appearance of Root or Stem, and are of ſeveral ſizes, ſome of the Bigneſs of a Ball or Balloon, ſome as big as a large Cannon Shot, or a young Child's Head, more or leſs*; they ſeem to be very round, ſmooth and whitiſh at their firſt riſing, but grow in time to be of a dusky color, cracking in ſeveral places on the outſide. Theſe, while they are young and white, Children and School-boys, commonly in Sport, fling one at another; but when they come to their full Bigneſs and Ripeneſs, they contain within their Skin nothing but a fine, ſoft, brown, dry Duſt or Pouder, which, upon breaking of the Ball, is apt to fly all about.

IV. *The Places.* They grow in Vineyards plentifully, and in many dry Meadows and Fields, in ſeveral parts of this Kingdom: I have formerly found them in ſeveral Fields between *White Chappel* and *Bromly*, alſo in Fields near to *Stepney*, and other places adjacent.

V. *The Times.* Their growing time is in *March*, *April* and *May*, and they come to their juſt Magnitude and Maturity in *June*, *July* and *Auguſt*; after which, with much Wet, they rot and decay.

VI. *The Qualities.* It ſeems to be temperate in reſpect to Heat or Coldneſs, and dry in the ſecond Degree.

VII. *The Specification.* It ſtanches Blood, dries up Fluxions and the Humidities of running Ulcers.

VIII. *The Preparations.* You may have therefrom, 1. *A Pouder.* 2. *Pledgets made of the Balls.*

The Virtues.

IX. *The Pouder.* Being ſtrewed thick and in good quantity upon any bleeding Wound, it ſtops the Blood preſently: and being ſtrewed upon any old moiſt Sore or running Ulcer, it dries up the Humidities of the ſaid Sore or Ulcer; and being uſed for ſome time, it ſtops the Defluxion. If any of it ſhould get into the Eyes, it would vehemently moleſt them, and poſſibly endanger the making the Party Blind: it cures alſo Gallings and Kibed Heels.

X. Pledgets made of the Balls. *It is to be tyed round with Thread, and then preſſed hard together in a Screw-Preſs, letting it lye there for ſome few days.* This, when it comes to be impoſed upon a Wound, it again dilates it ſelf, and puts a ſtop to the Hœmorrhage or Flux of Blood. Than this, there is ſcarcely any thing to be named which can more powerfully and certainly do it; for it being of a Nature extreamly dry and drying, as it will no way admit of the flowing forth of the Blood, (which thoſe Medicaments do which are naturally moiſt, and therefore are leſs uſeful in ſtanching of Blood) ſo it will likewiſe ſubſiſt and ſtick faſt in the Veſſels. Applied alſo to moiſt and running Sores, and to Ulcers with an Afflux of Humors, it dries up the Humidity, and in a ſhort time puts a ſtop to the Fluxion.

CHAP. CCCVII.

Of GARLICK Garden.

I. *THE Names.* It is called by the *Arabians*, *Chaum*, *and Cairin*: in *Greek*, Σκόροδον: in *Latin Allium*; and in *Engliſh Garlick*.

II. *The Kinds.* There are ſeveral Kinds of this Plant, *viz. Allium Hortenſe*, Garden Garlick, of which in this Chapter. 2. *Allium Anguinum*, *ſeu Viperinum*, Vipers Garlick, of which in *Chap.* 308. 3. *Scorodopraſſum*, Turkey, Mountain or Leek Garlick, of which in *Chap.* 309. 4. *Allium Sylveſtre*, Wild or Crow Garlick, of which in *Chap.* 310. 5. *Moly*, Onion Garlick. 6. *Allium Latifolium Urſinum, & Anguinum*, Ramſons, or Bears and Snakes Garlick; of which two laſt in their proper places.

III. *Of the Garden ſort.* There are two Species, *viz. Allium Hortenſe commune*, Common Garden Garlick. 2. *Allium Hortenſe minus*, The leſſer Garden Garlick.

IV. The Deſcriptions. *The firſt*, Greater or Common Garden kind, *has a bulbous Root, which is covered with very thin Skins or Films, of a White and Purpliſh color, and conſiſts of many Cloves, ſeparated one from another, under which in the ground below, grows a Taſſel of Thready Fibres; theſe Cloves are of a very ſtrong Smell and Taſte, very much exceeding Onions or Leeks, and ſerve to ſet again for a new encreaſe.* From this Root ſpring up long green Leaves, almoſt like unto Onions, but much larger or broader, not hollow at all, as thoſe of Onions are, but ſolid like thoſe of Leeks. Among theſe Leaves riſes up a Stalk, at the end of the ſecond or third Year, about three Feet high, on the top

top of which does grow, a Tuft of purplish Flowers, not much unlike those of Onions or Leeks, covered with a white Skin; in which being broken, when it is Ripe, there is found round, black Seed, like to that of Leeks.

V. *The second, or* lesser Garden kind, *in its Root, as to its Cloves and its Stalk, Leaves, and manner of growing, it much resembles the former greater kind:* But the Cloves of the Roots are smaller and redder; and the Flower is of a more dark or dusky Color than the first above described.

VI. *The Places.* They both grow in *Gardens* with us in *England*: But the lesser has been found to grow Wild in some places of *France* and *Germany*.

VII. *The Times.* They are seldom sown of Seed, but the *Cloves* are planted in *November* and *December*, and sometimes in *February* and *March*. They Flower in the *Summer Months*, as *June* and *July*; and the Seed is ripe in *August*, or some short time after the flowering.

VIII. *The Qualities.* It is hot and dry in the fourth Degree: Aperitive, Absterstive, Attractive, Carminative, Digestive, Discussive, Anodyn, and Suppurative. It is Stomatick, Pectoral, Nephritick and Arthritick: Ptarmick, Emmenagogick, Sudoritick, and Alexipharmick.

IX. *The Specification.* It is good against Plague, Poyson, and biting of all sorts of venemous Creatures; it Cures Coughs, Asthma's, Strangury, Dropsie, and Gout, and powerfully provokes the Terms in Women.

X. *The Preparations.* You may prepare therefrom, 1. *A Liquid Juice.* 2. *An Essence.* 3. *An Infusion or Decoction.* 4. *An Oil by Coction or Insolation.* 5. *An Ointment.* 6. *A Cataplasm.* 7. *A distilled Water.* 8. *An Acid Tincture.* 9. *A saline Tincture.* 10. *An Oily Tincture.* 11. *A Spirit.* 12. *An Elixir.*

The Vertues.

XI. *The Liquid Juice.* Being snuft up the Nostrils, it is an excellent Errhine, and purges the Head and Brain admirably; freeing it from cold, raw, pituitous and viscous Humors; is good against the Lethargy, and eases all pains of the Head proceeding from a cold and moist Cause. A Spoonful or two, being taken inwardly in a Glass of White Port Wine, it kills Worms in the Bodies of Man, Woman or Child, Dropt into the Ears, it eases their Pains, and ripens and breaks Apostemations therein.

XII. *The Essence.* It has all the Virtues of the Liquid Juice, besides which, it provokes Urine, and the Terms in Women; and being given to two or three Spoonfuls in a Glass of Wine, or some of its own distilled Water, it prevails against the bitings of Mad Dogs, Rattle Snakes, Vipers, Spiders, the stinging of Scorpions, *&c.* fortifying the Heart against the Poyson, and expelling it by Sweating. It expels gross, raw, tough and viscous Humors out of the Stomach, Lungs, Bowels and other Viscera: It expels Wind, opens all Obstructions of Lungs, Liver, Spleen, Womb and Reins; provokes Urine powerfully, helps against the Strangury, carries of the Watery Humors which cause them. It expels Poyson which has been taken inwardly in Meat, Drink or Wine, for in its own nature, it resists all manner of Poysons. It clears the Voice, takes away Hoarseness, Cures an old Cough, and is of excellent use against Asthma's, shortness of Breath, difficulty of breathing, causing an expectoration of the Morbifick Matter. Held in the Mouth, it is good against the Toothach, and dropt into the Ears, it helps against Deafness, and difficulty of hearing. It is good against the Plague or Pestilence, Spotted, and all other Malign or Pestilential Diseases: Facilitates the delivery of Women in Child-birth, forces away the Dead Child, and drives forth the After-birth.

XIII. *The Infusion or Decoction, in Wine, Water, Broth or Milk.* It has all the former Virtues both of Juice and Essence, but less efficacious or powerful, and therefore ought to be given to five, six, or eight Ounces at a time, and that two or three times a day, according as you see the occasion may require.

XIV. *The Oil by Coction.* It is healing and comforting, and therefore may be applied to all cold and moist affections of any part, as Pains, Aches, Lameness, Numbness, besides which, it corroborates or strengthens the Tone of the part, making it able to resist any Fluxion of humors: Anointed on the Head in a Megrim or Cephalœa, from a cold Cause, it gives much relief.

XV. *The Ointment.* It has all the Virtues of the former Oil, and being mixed with *Sulphur* and *Rosin in fine Pouder*, and applied to putrid and corrupt Ulcers which breed Worms, it kills them, it dissolves strumous Swellings, draws forth the evil humors in Fistula's, and causes them to heal; and anointed upon Lousie Heads, it kills Lice and Nits; and if affected with a Scab or Scald, it dries up the moist Humors, and in a little time heals it: It is also good against Scurff, Dandriff, and falling of the Hair; eases Pains from a cold Cause, and gives relief in the Gout.

XVI. *The Cataplasm made of the green Root.* Being immediately applied to the biting of a Mad Dogs or of a Rattle Snake, Viper, Slow Worm, or other Serpent, the stinging of Scorpions, or of any Venomous Creature, it infallibly attracts to, and draws forth all the Poyson or Venom; and this it does

does ſo powerfully by reaſon of its Vehement attractive force, that it perfectly frees the Patient from all manner of Danger. But this will be the more effectually done, if at the ſame time, the Patient being laid in his Bed takes alſo a large Doſe of the Juice or Eſſence; and ſo Sweats upon it. Laid upon a Gout or Sciatica, from what Cauſe ſoever, and often renewed, as occaſion requires, it draws forth the whole Morbifick Cauſe and Eſſence of the Diſeaſe; in which Diſtempers it performs more than moſt other Vegetables, reputed the moſt efficacious; it not only eaſes the Pain at preſent, but if it has made any ſteps to the Stomach, or has indeed affected it, it recalls back the Humor, and draws it forth thro' the Pores of the Skin. Applied to any place in which there is any Prick, Splinter, Thorn, Bullet, Shot, bits of broken Bones, it powerfully looſens them, attracts and draws them forth. Being applied to any Plague Sore, Bubo, Phlegmon, or other Tumor which is poſſible to come to Suppuration, it adds Heat, bringing on the Maturation, to Admiration; and after it is broken, being yet applied, it draws forth all the Malignity and Poiſon of the Plague in a Peſtilential Bubo, and in other Apoſtems, the putrid and other offending Matter which repleats them.

XVII. *The diſtilled Water.* It has the Virtues of the Juice, Eſſence and Decoction, but in a much inferior degree, and therefore may be uſed as a *Vehiculum* to convey thoſe Medicines in, to ſuch Perſons, and in ſuch Conſtitutions where Wine would be too hot. But as this Water is drawn off from a very hot, ſubtil and ſpirituous Root, full of a volatile Salt, ſo it contains more of Life, Flame and Spirit in it, than is in moſt other ſimple and cold diſtilled Waters.

XVIII. *The Acid Tincture.* This is more powerfully againſt the Plague and all peſtilential and contagious Diſtempers than any of the former internal Preparations; for this deſtroys the Eſſence of the Poiſon and Malignity in its Root; and is of great Force and Efficacy againſt the Bitings of Serpents, mad Dogs, and other venomous Creatures. Doſe ſixty Drops at a time, two or three times a day, in any proper Vehicle.

XIX. *The Oily Tincture.* Anointed upon any Part full of Aches or Pains from a cold and moiſt Cauſe, it gives preſent eaſe: it is alſo good againſt the Wounds or Punctures of the Nerves and Tendons, for it preſently eaſes the Pain, prevents Convulſions, and induces a ſpeedy Cure. Anointed down the Back-bone, and upon the Parts affected with Trembling, Numbedneſs, Palſies and Convulſions, it ſuddenly gives Relief, and in a ſhort time after a perfect Cure, if the Medicine is well rubbed into the Parts afflicted for almoſt half an hour, twice a day, and is continued in like manner for ſome conſiderable time, provided the Inveteracy of the Diſeaſe, Weakneſs, and great Age of the Patient hinders not.

XX. *The Saline Tincture.* It is good againſt Worms in the Skin, Lentils, Freckles, Pimples, and other Breakings out: it kills Lice and Nits in the Head and Hair; and is ſingular againſt Tettars, Ringworms, Herpes, Scabbineſs, Scurff, Morphew, Black and Blewneſs of the Skin left after Contuſions, the Leproſy, running Ulcers of the Head, commonly called a Scald Head, and all other Mangineſs whatſoever, the Parts affected being well bathed therewith twice a day.

XXI. *The Spirit.* It is very ſubtil and full of volatile Particles; of extraordinary Uſe againſt fainting and ſwooning Hyſterick Fits, Vapors, Obſtructions of the Lungs, Coughs, Colds, Surfeitings, Colicks and Convulſions of the Bowels: it expels Wind, eaſes Griping, heals Excoriations of the Guts, and very much facilitates the Delivery of Women in Labor, forcing away both Birth and After-birth. Doſe from two Drams to four in any fit Vehicle.

XXII. *The Elixir.* It has all the Virtues of the Spirit, but more ſubtil and powerful to all the ſame Intentions; and may be given twice a day, *viz.* Morning and Night, or thrice a day, according as the Caſe may require. Doſe half an Ounce, more or leſs, in any proper Vehicle. It is ſaid to be a Specifick againſt Jaundice and Dropſy; as alſo againſt an inveterate Wheezing and Hoarſneſs.

CHAP. CCCVIII.

Of GARLICK Vipers.

I. *THE Names.* It is called in *Greek*, Ὀφιοσκόροδον, ἢ Ὀφεοσκόροδον: in *Latin*, *Ophioſcorodum*, *Allium Anguinum*, *Allium Viperinum*: in *Engliſh*, *Vipers Garlick.*

II. *The Kinds.* It is the ſecond Species of *Garlick*, and is a ſingular Plant of the kind; called by ſome Authors, *Scorodopraſſum convoluto Capite*, Leek Garlick, with a bulbed and twining Head.

III. The Deſcription. *It has a great and white Root, conſiſting of many Cloves, much like to* Garden Garlick, *which ſmell leſs ſtrong than* Garlick, *or partaking ſomewhat of* Leeks, *whence came the latter Name of* Scorodopraſſum, *as* Dioſcorides *ſays.* From this Root ſprings up a Stalk, three or four Feet high, and ſometimes higher, according as the Soil is in Goodneſs: it has alſo many Leaves, larger much than thoſe of *Common Garden Garlick*, and almoſt like thoſe of *Leeks*, which grow from the bottom of the Stalk to the middle thereof, having a Smell between that of *Leeks* and that of *Garlick.* The reſt of the Stalk is naked, green, ſmooth and almoſt ſhining, having at the top thereof a large Head, compoſed of many Bulbs, (not much unlike to the *Indian Moly*) covered with a whitiſh thin Skin, ending in a long green Point, which grows above it, growing ſmaller and ſmaller to the end: which Skin, by the Growth of the Bulbs, being broken, they ſhew themſelves at the firſt of a purpliſh color, but afterwards, as they grow riper, of a whitiſh color; among which are alſo ſome Flowers. The Head, with the top of the Stalk, at the firſt, does wind or twine it ſelf ſo, that in ſome ſort it repreſents a Viper, Snake or Serpent; which, when the Bulbs grow to Ripeneſs, does by little and little untwine it ſelf again, and bears its Head upright.

IV. *The Places.* It grows with us only in Gardens, and is the *Allium Sativum vel Hortenſe Dioſcoridis*, and the *Scorodopraſſum ſecundum Cluſii*: it is more ready to part into Cloves than the *Common Garden Garlick*; and by planting the ſame, it is encreaſed.

V. *The Times.* It flowers in *June* and *July*, and the Seed ripens not long after.

VI. *The Qualities, Specification, Preparations and Virtues*, are the ſame with thoſe of the *Common Garlick.*

CHAP. CCCIX.

Of GARLICK Leek, *OR,* Turkey *or* Mountain GARLICK.

I. *THE Names.* It is called in *Greek*, Σκοροδόπρασον: in *Latin*, *Scorodoprasum*; and in *English*, *Leek Garlick*, *Turkey Garlick*, and *Mountain Garlick.*

II. *The Kinds.* There are three ſorts hereof, *viz.* 1. *Scorodoprasum majus*, Greater Leek Garlick, *or* Turkey Garlick. 2. *Scorodoprasum magnum, ſeu primum Cluſii, vel alterum Lobelii*, The Great Leek Garlick, *or* Turkey Garlick. 3. *Scorodoprasum minus*, The leſſer Leek-leav'd Garlick; but this is called by *Parkinſon*, Great Turkey Garlick.

Greater Leek-Garlick.

III. The Deſcriptions. *The firſt, or* Greater Leek Garlick, *has a bulbous Root, of the Bigneſs of a great* Onion; *from whence riſe long and broad Leaves, like thoſe of* Leeks, *but much greater and longer, embracing or claſping about a great thick Stalk, ſoft and full of Juice, bigger than a Man's Finger, and bare towards the top; upon which is ſet a great Head, larger than a Tenniſe-Ball, covered with a Skin, after the manner of an* Onion. This Skin, when it comes to Perfection, breaks and diſcovers a great multitude of Flowers, which are whitiſh: they being paſt, black Seeds follow, incloſed in a triangular Husk. The whole Plant ſmells very ſtrong, like unto *Garlick*, and is in ſhew a *Leek*, upon which it was called *Scorodoprasum*, *Garlick Leek*, or *Leek Garlick*, participating both of the *Garlick* and *Leek*, or rather a degenerate *Garlick*, grown out of Form.

IV. *The ſecond, or* Great Leek Garlick, *has a great white bulbous Root, and almoſt tranſparent, at leaſt ſhining, ſeldom giving Off-ſets for Encreaſe.* From this Root ſhoot forth ſeveral great long Leaves, much bigger than the *Common Garlick*, and after ſeveral Years abiding, there ſprings up a great long Stalk, three or four Feet high, with ſome leſſer Leaves thereon, and is naked from the middle up to the top, where it bears a large Tuft of Flowers, encloſed at firſt in a thin Skin, and of a paler color than thoſe of *Homer*'s *Moly*, or rather whitiſh: which being paſſed away, three-ſquare Husks, with blackiſh Seed, like the other, ſucceed.

V. *The third, or* Leſſer Leek Garlick, *has a Root which is ſet about with longer and ſlenderer Bulbs, which are encloſed in browniſh Skins, looſer and more ſcaly.* The Leaves and Flowers are alike, yet ſmaller than *Garlick*: and the whole Plant is leſſer in all the parts than the former.

VI. *The Places.* They are Natives of *Turkey*, and grow about *Conſtantinople*; but with us they grow and are nurſt up in Gardens only.

VII. *The Times.* They flower in *June* and *July*, and perfect their Seed not long after, or in *Auguſt.*

VIII. *The Qualities, Specification, Preparations and Virtues* of theſe Plants, are the ſame with thoſe of *Garlick* in *Chap.* 307. aforegoing; but they are much leſs efficacious than *Garlick*, as being in a middle degree between *Garlick* and *Leeks*, and ſo partake of both their Tempers and Qualities: they attenuate and incide groſs and tough Flegm, and other viſcous Humors, and thereby cauſe eaſy Expectoration.

CHAP. CCCX.

Of GARLICK Crows, *OR,* Wild GARLICK.

I. *THE Names.* It is called in *Greek*, Σκόροδον ὄρειον, ἢ σκόροδον ἄγριον: in *Latin*, *Allium ſylveſtre*, *Allium ſylveſtre tenuifolium*: in *Engliſh*, *Wild Garlick*, and *Crows Garlick.*

II. *The Kinds.* It is the fourth Species of *Garlick* afore-mentioned in *Chap.* 307. *Sect.* 2. *Parkinſon* makes two ſeveral kinds hereof, *viz.* 1. *Allium ſylveſtre durifolium*, Hard-leav'd Crow Garlick. 2. *Allium ſylveſtre lævifolium*, Soft-leav'd Crow Garlick.

III. The Deſcriptions. *The firſt, or* Hard-leav'd, *has a Root with a ſmall Bulb or round Head, long withal, and covered with three ſeveral Coats or Peelings, being white on the outſide, not bigger than a ſmall* Haſle-*Nut, without any Cloves at all, having at the bottom thereof a Knot of Fibres or Strings.* From this Root ſpring up ſmall, hard, tough Leaves, almoſt like unto *Ruſhes*, ſmooth, and hollow within; among which grows up a naked Stalk, round, ſolid, hard and ſlippery or ſmooth, bearing on the top thereof a Tuft of purpliſh Flowers, which being gone, ſmall blackiſh Seed follows, made up in a round Cluſter, like ſmall Kernels, having the Smell and Taſte of *Garlick.*

IV. *The ſecond, or* Soft-leav'd, *has a long round Root,*

Root, in ſhape like the former, but of the three ſeveral Coats, the outwardmoſt is reddiſh, and is encreaſed by Off-ſets, yet is not parted into Cloves, as the Garden Garlick *is.* The Plant is of ſuch a ſtrong *Garlick* Smell, that the Milk of Cows which feed thereof will taſte of it. From this Root ſpring up ſeveral narrow Leaves, and long, like *Graſs*, ſofter than the former, and nothing near ſo ſtiff; and among theſe Leaves riſe up one or two ſlender bare Stalks, not ſo hard and ſtiff as the firſt, but bearing at their tops, like Tufts of purpliſh Flowers, and blackiſh Seed.

V. *The Places.* *Crow Garlick* grows in fertile Paſtures thro' all *England: Gerard* found it plentifully in Fields on the backſide of *Iſlington* near *London*: and I found it in ſeveral places by the Way-ſide, in thoſe Fields or Paſtures beyond *Iſlington*, leading to the *Boarded-River*, or *Hornſey-Wood.*

VI. *The Times.* They ſpring up in *April* and *May*; flower in *June* and *July*, and their Seed is ripe in *Auguſt.*

VII. *The Qualities, Specification, Preparations and Virtues* of theſe, are the ſame with thoſe of the *Common Garden Garlick* in *Chap.* 307. aforegoing: but *Galen* ſays, That *Crow Garlick* is ſtronger, and of more Force than the *Garden.* I can ſay little to this Opinion of *Galen*'s; but this I know, That being bruiſed and infuſed in White *Liſbon* or *Port* Wine, and being drank, it provokes Urine powerfully, gives preſent Eaſe in the Strangury, and is ſaid to break the Stone, and drive it out; but this is to be underſtood when it is made of a friable gritty Subſtance, not when it is hard and ſolid, like a Flint. The Leaves of both ſorts are gathered and cut or ſtampt and eaten by ſeveral People for Sawce, as we eat green Sawce made with *Sorrel*: and ſome People, which love *Garlick* or ſtrong *Onions*, will eat their Roots in *April* and *May*, with freſh Butter and Bread, or new Cheeſe, juſt as we eat young *Onions* in the Spring.

CHAP. CCCXI.

Of GENTIAN Great, *OR,* Great FELWORT.

I. *THE Names.* This Plant is called in *Arabick*, *Gentiana ſeu Genthiana*: in *Greek*, Γεντιανὴ: in *Latin*, *Gentiana*; and in *Engliſh*, *Baldmoney*, *Baldmoyne*, *Bitterwort*, *Felwort*, and *Gentian.* It was called *Gentian* from *Gentius*, King of *Illyria*, who was the firſt Finder of it out, and the firſt who uſed it in Phyſick, and ſo called it *Gentiana*, after his own Name.

II. *The Kinds.* There are two generick Species of this Plant, *viz.* 1. Γεντιανὴ μεγαλη, *Gentiana magnus vel major*, The great or Greater Gentian, of which in this Chapter. 2. Γεντιανὴ μικρὰ, *Gentiana parva vel minor*, The leſſer Gentian, of which in the next Chapter.

III. *The Kinds* of the *Greater.* It is, 1. *Gentiana major flore purpureo*, Great purple Gentian. 2. *Gentiana major flore flavo*, Great Gentian with a yellow Flower. 3. *Gentiana major folio Aſclepiadis*, Great Swallow-wort Gentian. 4. *Gentiana major Concava*, Great Concave or Hollow Gentian, or Engliſh Gentian. There are three other Species of *Great Gentians*, as, *Flore albo*, White-flowered; *Flore pallido punctato*, Pale yellow-ſpotted; *Flore cæruleo*, Blew-flowered; all which differ nothing in Root, Stalk, Leaf, Magnitude or Manner of Growing from the firſt *Purple kind*, but only in the Color of the Flowers; but by reaſon they are not ſo uſually found in our Gardens as the other kinds, we ſhall ſay no more of them in this place.

Greater Purple Gentian,
AND
Greater Yellow Gentian.

IV. The Deſcriptions. *The firſt, or* Great purple Gentian, *is very like to the next* Great yellow Gentian *in moſt things, having a great, thick, brownish yellow Root, divided into two or three great Branches, with great Fibres adjoining to them, but a little more hard and woody, of a very bitter Taſte, like the other* Gentians, *which ſends forth at the ſeveral Heads thereof many fair, broad, three-ribbed, dark, green, ſhining Leaves, ſo like unto the following, that it is ſomewhat hard to diſtinguiſh them:* many of theſe Heads among the Leaves ſhoot forth thick and ſtrong Stalks, three or four Feet high, with ſeveral Joints on them, and two Leaves at them, one againſt another: towards the tops whereof come forth the Flowers, encompaſſing the Stalks at two or three of the uppermoſt Joints, with two Leaves apiece under them, like as in the following, which are not laid open Star-faſhion, like the *Yellow*, but keep cloſe and hollow, the brims being only divided into ſix or more round parts, of a purple color, but paler at the bottom, where they are ſpotted with purple Spots on the inſide, having ſo many yellowiſh Threads in the middle as the Flower has corners, ſtanding about a long, green, forked Head, which growing ripe, is the Seed-Veſſel, and contains therein ſuch like flat browniſh Seed as in the *Yellow kind*, but ſomewhat leſs.

V. *The ſecond, or* Great Gentian with a yellow Flower, *has a Root which is great, thick and long, yellow, and very bitter. From this Root riſes up at firſt a long, round and pointed Head of Leaves, cloſing one another, which, after opening themſelves, lye upon the Ground, and are fair, long and broad, ſomewhat plaited or ribbed, like unto the Leaves of* White Hellebor, *but not ſo fairly or eminently plaited, nor ſo ſtiff, but rather reſembling the Leaves of a* Great Plantane: from among which riſes up a ſtiff round Stalk, three Feet or more high, and full of Joints, having two ſuch Leaves, but narrower, and ſmaller at every Joint, ſo encompaſſing the Stalk at their lower ends, that they will almoſt hold Water, if it falls upon them. From the middle of the Stalk to the top it is garniſhed with many Coronets or Rundles of Flowers, with two ſuch green Leaves likewiſe at every Joint, and wherein the Flowers do ſtand, which are yellow, and when laid open like Stars, riſing out of ſmall greeniſh Husks, with ſome Threads in their middle, but having no Smell at all, yet ſtately to behold, as well for the Order as for the Height and Proportion of the Plant. The Seed is brown and flat, contained in round Heads, ſomewhat like unto the Seed of the *Fritillary* or *Chequered Daffodil*, but browner.

Swallow-wort Gentian.

VI. *The third, or* Great Swallow-wort Gentian, *has Roots, but they are nothing ſo large as the former, but are yellow, ſmall and long, of the Bigneſs of a Man's Thumb: from this Root ſpring forth many Stalks, about two Feet high; on which grow many fair, pale, green Leaves, ſet by couples, with three Ribs in every one of them, reſembling ſomewhat the Leaves of* Aſclepias *or* Swallow-wort, *which is broad at bottom and ſharp at the point.* The Flowers grow at the ſeveral Joints of the Stalks from the middle upwards, two or three together, which are long and hollow, like unto a *Bell-flower*, ending in five Corners, or pointed Leaves, and folded before they are open, as the Flowers of the *Bindweeds* are, of a fair blew color, ſometimes deeper, and ſometimes paler. The Heads or Seed-Veſſels have two Points or Horns at the top, and contain within them flat greyiſh Seed, like unto the former, but leſſer.

VII. *The fourth, or* Great Concave Gentian, *or* Engliſh Gentian, *has many long tough Roots, diſperſed hither and thither under the upper Cruſt of the Earth, with ſome few Fibres adjoining thereto: from which ſpring immediately a fat thick Stalk, jointed or kneed by certain Diſtances, ſet at every Knot or Joint with one Leaf, and ſometimes more, keeping no certain number:* which Leaves do at the firſt encloſe the Stalk round about, being one whole and entire Leaf, without any Inciſure at all, as it were a hollow Trunk; which, after it is come to its full Growth, breaks on one ſide or other, where it is thinneſt, tendereſt and weakeſt, and becomes a flat ribbed Leaf, like unto the *Great yellow Gentian* or *Plantane* aforegoing. The Flowers come forth from the Boſoms of the upper Leaves, ſet upon tender Foot-ſtalks, in ſhape like thoſe of the *Small Bindweed*, or rather the Flowers of *Soapwort*, of a whitiſh color, and toucht about the brims with a little light Carnation; which being paſt away, the Seed follows, contained in little Cods or Seed-Veſſels.

VIII. *The Places.* The firſt three grow on mountainous places in *Germany*; but with us, are only nurſt up in Gardens; of which the ſecond or *Yellow-flowered* is the moſt uſual or common. The fourth or *Engliſh kind*, *Gerard* ſays he found in a ſmall Grove of a Wood, called the *Spinie*, near to *Lickbarrow*, a ſmall Village in *Northamptonſhire*.

IX. *The Times.* All the firſt three flower for the moſt part in *June*, and in part of *July*, bringing forth their Seed in *Auguſt*. The fourth ſprings out of the Ground in *April*; flowers in the end of *July* and beginning of *Auguſt*, and perfects its Seed in the end of that Month, or beginning of *September*.

X. *The Qualities, Specification, Preparations and Virtues*, are the ſame with thoſe of the *Small Gentians* in the next Chapter, and thither we refer you.

CHAP. CCCXII.

Of GENTIAN Small, OR, Small FELWORT.

I. *THE Names.* It is called in *Greek*, Γεντιανὴ μικρά: in *Latin*, *Gentiana minor, ſive Gentianella*; and in *Engliſh*, *Small* or *Leſſer Gentian*, or the *Leſſer Felwort*.

II. *The Kinds.* There are three generick kinds hereof, *viz.* 1. *Gentiana minor, ſeu Gentianella vernalis*, The Spring Gentian. 2. *Gentiana minor, ſeu Gentianella æſtiva*, Small Summer Gentian. 3. *Gentiana minor, ſeu Gentianella autumnalis*, Small Autumn Gentian. Of each of theſe three generick kinds, there are ſeveral Species; all of which, it is not our Buſineſs to declare in this Work, and therefore we ſhall only diſcourſe of ſo many of them as either grow Wild with us, or are to be met withal in our Gardens, and that in the following order.

III. *The various Species.* Of the firſt or *Spring kind*, we have theſe, *viz.* 1. *Gentianella verna latifolia*, Broad-leav'd Gentian of the Spring. 2. *Gentiana verna anguſtifolia*, Narrow-leav'd Gentian of the

the Spring. 3. *Gentianella minor Verna*, The ſmaller Spring Gentian. Of the *Summer Kind* we have theſe, *viz.* 4. *Gentiana minor Cruciata*, alſo *Cruciata*, Croſswort, alſo the leſſer Croſswort Gentian. 5. *Gentiana minor, ſeu Gentianella cærulea punctata Pennæi*, Pennys blew ſpotted Gentian. 6. *Gentiana Anglica pallida punctis diſtincta*, An *Engliſh Gentian*, which we here place among the ſmaller *Gentians*, tho' *Cluſius* has enumerated it among the *Greater Gentians*, but according to its magnitude, it cannot be ſaid to be either a *Great* or a *Small Gentian*, but a *medium* between them both, as is that alſo of *Pena*, but being both *Summer Gentians*, we thought good to put them both in this Claſſis. Of the *Autumn Kinds* we have theſe, *viz.* 7. *Pneumonanthe*, *Gentiana Autumnalis*, Calathian Violet, or Autumn Gentian. 8. *Gentianella Autumnalis Centaureæ minoris folijs*, *Gentianella fugax minor Gerardi*, Autumn Gentian with *Small Centory* Leaves, Baſtard or Dwarf Autumn Gentian of Gerard. 9. *Gentiana fugax Cluſij*, *Gentiana decima Cluſij*, Small Autumn Gentian, ſimply ſo called.

IV. The Deſcriptions. *The firſt, or* Broad Leav'd Gentian of the Spring, *has a ſmall yellowiſh creeping Fibrous Root, from which ſpring up Leaves pretty large and green, broader than thoſe of the* Third Kind *following*, being about two Inches long, and one Inch broad, and ſomewhat round pointed, with three Veins or Ribs running through them, as the others have; the Stalk riſing from the middle of theſe Leaves grows about four Inches high, or ſomething better, with a ſmall Leaf or two thereon, bearing at the head or top thereof a large Husk, ſuſtained by two ſmall and long Leaves, from the middle of which ſhoots forth a very large and great hollow blew Flower, ending in five ſmall points.

V. *The ſecond, or* Narrow Leav'd Spring Gentian, *has a Root which is long and ſlender, ſpreading it ſelf much under the Ground, and of a yellowiſh color, from which ſpring many Heads of ſeveral ſmall, long, and narrow Leaves ſet together, ſomewhat longer than the next which follows*; from ſome of theſe Heads, which Flower not in one and the ſame Year, thoſe Flowering the Year following which Flowered not the Year before, and thoſe which Flowered the Year before not Flowering again the next Year after) riſes up a ſmall ſlender Stalk, ſomewhat higher than the former, bearing thereon two ſuch like ſmall Leaves at a Joint, and at the top one Flower, for the moſt part, (ſeldom more, unleſs the Stalk is branched) much ſmaller than the laſt, narrow, long, and hollow, like a Hoſe or Husk, of one entire Leaf at the lower part, but ending above in five Corners, or ſmall pointed Leaves, laid open like a Star, having ſmall pieces of Leaves, like, as it were, Ears, ſet at the bottom of the diviſions of them, both of them of a perfect blew color, but not ſo deep as the former, having a white Line in the middle of each of them, and the Ground, or bottom of the Flower, whitiſh alſo, with a few threads ſtanding about a ſmall head, not to be ſeen until the Flower be almoſt or fully paſt, unleſs one open it, which, after it is ripe, or full blown, is ſmall and long, containing very ſmall browniſh Seed.

VI. *The third, or* Smaller Spring Gentian, *has a Root conſiſting of ſmall, long, pale, yellow Strings, which ſhoot forth here and there divers heads of Leaves, and thereby increaſes reaſonably well, if it grows in a fit place, or is nurſt up in good Ground, (otherwiſe it will ſcarcely grow with all the Care and Diligence imaginable.)* From this Root ſpring ſeveral ſmall hard green Leaves, lying upon the Ground, as it were in Heads or Tufts, ſomewhat broad below, and pointed at the end, with five Veins or Ribs therein, as conſpicuous as in the former *Gentians*; among which riſes up a ſmall ſhort Stalk, with ſome ſmaller Leaves thereon, at the top whereof ſtands one fair, large, hollow Flower, made Bell faſhion, with wide open Brims, and ending in five Corners or Diviſions, of the moſt excellent deep blew color that can be ſeen in any Flower, with ſome white ſpots in the bottom on the inſide; after the Flower is paſt, long and round Pods or Cods do appear, in which are contained ſmall blackiſh Seed; the whole Plant is bitter, but not ſo ſtrong by much as the former.

Croſswort Gentian.

VII. *The fourth, or* Croſswort Gentian, *has Roots which are ſmall and whitiſh, diſperſing themſelves many ways in the Ground, of as bitter a taſte almoſt as the reſt.* From this Root riſes up many Branches, which lye upon the Earth, ſcarcely lifting themſelves upright, and are full of Joints, at which grow uſually two Leaves, one oppoſite unto another, in manner of a Croſs, from whence it took its Name, in ſhape very like unto *Saponaria*, or *Soapwort*, but ſhorter, and of a darker green color; at the tops of the Stalks ſtand many Flowers thick thruſted together, almoſt like *Sweet Williams*, and likewiſe at the next Joint underneath, every one of them ſtanding in a dark green Husk, and conſiſting of five ſmall Leaves, the points or ends of which only appear above the Husks in which they ſtand, and are hardly to be ſeen, but that they are of a fine pale blew color, and that many grow together; the Seed is ſmall and brown, hard, and ſomewhat like unto the Seed of the *Marian Violet*, or *Coventry Bells*.

VIII. *The fifth, or* Pennys blew ſpotted Gentian, *has a Root which is ſmall and yellow, with many Fibres adjoining to it, from which ſprings up a jointed Stalk about half a yard high, ſomewhat reddiſh towards the bottom next to the Root, with two Leaves, like to the* Great Gentian, *ſet at each Joint, but much ſmaller, and with more Veins or Ribs therein than it, ſtanding each upon a reddiſh Footſtalk, greater below than thoſe above, where they do in a manner encompaſs the Stalk.* From the middle of the Stalk upwards come forth the Flowers at the Joints, with the Leaves,

on

on both ſides of the Stalk, three for the moſt part ſtanding together, except the uppermoſt of all, where they ſtand five together, each of them with a ſhort Footſtalk under them, conſiſting of five ſmall ſharp pointed Leaves, ſpread like a Star, of a pale blew color, finely ſpotted, with many ſmall black ſpecks on the inſide, having a ſmall umbone in the middle, and five ſmall Threads tipt with yellow ſtanding about it; the Seed, which follows the Flowers, is ſmall, and encloſed in ſuch Heads or Husks as the *Gentians* uſually have.

Engliſh Gentian Small.

IX. *The ſixth, or* Engliſh Gentian, *has, according to* Cluſius, *a ſmall Root, repleniſhed with a few Fibres or Strings, of a yellowiſh color, from which riſes up a round ſtiff Stalk, or Stalks, firm and ſolid, ſomewhat reddiſh at bottom, and jointed or kneed ſomewhat like unto* Croſswort Gentian; the Leaves are broad, ſmooth, and full of Ribs or Sinews, ſet about the Stalk by couples, one oppoſite againſt another; the Flowers grow upon ſmall ſlender Stalks, compoſed of five ſlender blewiſh Leaves, very curiouſly ſpotted, with many black Spots and ſmall little Lines, having in the midſt five ſmall Chives, which paſſing away, give Seed ſmall like Sand.

X. *The ſeventh, or* Autumn Gentian, *called the* Calathian Violet, *has a Root which is ſmall, long, and manifold, running down for the moſt part deeper into the Ground than moſt of the former, which* Gerard *ſays periſhes after it has perfected its Seed, ſpringing up again from the falling of its Seed, which is a miſtake, and is rectified by* Parkinſon, *for the Root is truly a ſtringy, and ſomewhat creeping, (tho' deep in the Earth) and living Root, abiding after Seed time, and not periſhing as the reſt*; it riſes up ſometimes with more and ſometimes with fewer Stalks, ſometimes they alſo riſe higher, as to be two Feet high, and ſometimes not above a Foot high, according to the Fertility of the Soil, of a browniſh green color, having many long and narrow dark green Leaves, ſet by couples on them up to the tops, which ſeldom branch forth, but bear every one of them a reaſonable large Flower, which is hollow, and larger than any other of the *Autumnales*, and is in moſt of a very deep blewiſh purple color, but in ſome a little paler, and ending in five points or corners.

Small Autumn Gentian,
Calathian Violet,
Or
Autumn Bell Flower.

XI. *The eighth, or* Autumn Gentian with *ſmall Centory* Leaves, *has a Root which is ſmall, ſtriking down into the Ground, with ſeveral Fibres adjoining to it, from which ſpring up ſeveral Stalks, not a Foot high, divided into ſeveral ſmall Branches, on which ſtand two ſmall Leaves together, as is uſual in all the* Gentians, *very like unto thoſe of the* Leſſer Centory, *which are not ſo long as the former, a little broader, and of a whiter green color*; at the tops of the Stalks and Branches grow ſeveral Orient Blew Flowers, not ſo large as thoſe of the laſt deſcribed, but ſet in ſmall long Husks, half way riſing up above the tops of them; after which comes ſmall Seed in long horned Cods or Veſſels.

XII. *The ninth, or* Small Autumn Gentian, ſimply ſo called, *has a Root like the former, but a little larger, which ſends up a pretty ſtiff round Stalk, of a Span high, or ſomething more, which at certain ſpaces is ſet with ſuch Leaves as the laſt deſcribed, but larger*, and out of the boſoms of theſe Leaves, from the bottom to the top of the Stalk, ſpring forth little Footſtalks, which uſually carry three Flowers apiece, two ſet one againſt another, and the third upon a Stalk ſomewhat higher, and ſomtimes there comes forth a ſingle Flower at the Root of theſe Footſtalks; the Flowers in their ſhape or form, magnitude, and color, are like to thoſe in the laſt deſcribed, as alſo their Seed and Seed Veſſels; the manner of the growing of this is very well repreſented by the *Gentiana major Flore cæruleo*, mentioned in Chap. III. Sect. 3. aforegoing, ſaving, that that is very large, and this is very ſmall, and of the periſhing Kind.

XIII. *The*

XIII. *The Places.* The first grows upon the *Alps*, near *Switzerland*, as *Bauhinus* says, the second grows on the Mountains of *Savoy*, but neither of them grow wild in *England*, being only nurst up in Gardens; the third grows upon the Hills of *Austria* and *Hungary*, *Gerard* says he found it on *Salisbury* Plane, as also in some places in *Sussex*, and likewise near St. *Albans*: The fourth, or *Crosswort Gentian*, grows in a Pasture at the West End of *Little Rayne* in *Essex*, on the North side of the way leading from *Braintree* to *Much-Dunmow*, and in the Horse way by the same Close: The fifth, *Pæna* says, grows upon *Bockmet*, a Hill of *Switzerland*, and in several places on the *Alps*, with us only in Gardens: The sixth is an *English* Plant, which was found by Mr. *Heshet*, (a Gentleman very skilful in *Botonology*) in the North parts of *England*, *viz.* in *Lancashire*, but the exact place where he met with it is not named: The seventh, or *Calathian Violet*, grows in many places of *Germany*, and other parts beyond the Seas; it grows also in several places of *England*, as near *Longfield*, by *Gravesend*, near *Greenhith* and *Cobham* in *Kent*, and in the Fields belonging to the House formerly Sir *Percival Harts*, at *Lellingstone* in *Kent*, and in a Chalk Pit, hard by a Paper Mill, not far from *Dartford* in *Kent*; in the West Country also in several places, and that as well in wet Grounds as dry; *Johnson* upon *Gerard* says, that he found it once on a Wet Moorish Ground, two or three Miles on this side *Caster*, in a place called *Nettleton More*, in *Lincolnshire*: The eighth, or *Autumn Gentian* with *Small Centory* Leaves, grows in *Kent* in several places, as about *Southfleet* and *Longfield*, upon the Downs, as also upon *Barton* Hills in *Bedfordshire*, upon a piece of waste Chalky Ground, as you go out of *Dunstable* way towards *Gorkambury*, and not far from the Ruines of the old City *Verulam*, near St. *Albans*: The ninth is found at the Chalk Dale near *Dartford* in *Kent*, in *Waterdown* Forest in *Sussex*, in the way leading from *Charlewood's* Lodge to the Lord *Abergavenie's* House, called *Eridge House*, by a Brook side there, also on a Heath by *Colebrook*, near *London*, and in the way turning off from *Salisbury Plane* to the Earl of *Pembroke*'s House at *Wilton*, and upon a Chalky Bank between *Gorkambury* and St. *Albans*.

XIV. *The Times.* As to the times of Flowering, they are in part declared in the Section of the Kinds, the two first Flower in *April*, and the third in *May*, if they Flower at any other time it is but casual; and their Leaves abiding green all the Winter, they increase at the Root, and may be easily parted; the fourth Flowers in *June* and *July*, the fifth Flowers in *July* and *August*, and not before, the Seed growing ripe soon after, which shedding themselves continue their Kinds, but will scarcely endure Transplantation, or rise of the Seed sown in the Garden, as *Camerarius* and others have observed; the seventh Flowers not until about the end of *August*, and in *September*, in which time this Noble Flower is in all its bravery: The eighth and ninth Flower also from the end of *August*, and continue Flowering to the latter end of *October*.

XV. *The Qualities.* All the *Gentians*, both the *Greater* and the *Smaller*, are said to be of one Property, and to have the same Qualities and Virtues, but the *Greater* are more used with us in Physick than the *Smaller*; but in places where the *Greater* are not to be gotten, and where the *Smaller* are in plenty, the *Lesser* may very well be used in their stead. *Gentian* is hot and dry in the end of the second degree, Aperitive, Abstersive, Astringent, Carminative, Diuretick, and Traumatick, Stomatick, Hepatick, Splenetick, Nephritick, and Hysterick, Sudorifick, Alexipharmick, and Analeptick.

XVI. *The Specification.* It is a peculiar thing against the Plague, Poyson, malign Diseases, and all sorts of Agues and Fevers whatsoever, and is a famous thing for the Cure of Wounds and Ulcers of all kinds.

XVII. *The Preparations.* You may have these from 1. *A Juice of the Herb, and also of the Root.* 2. *An Essence of the Herb, or rather Root.* 3. *An Infusion of the Herb.* 4. *A Decoction of the Root.* 5. *A Pouder of the Root.* 6. *A Pessary of the Root.* 7. *A Distilled Water of the Herb and Root.* 8. *A Spirituous Tincture of the Root.* 9. *An Acid Tincture of the Root.* 10. *An Oily Tincture of the Root,* 11. *A Saline Tincture of the Root.* 12. *An Ointment or Balsam of the Root.*

The Virtues.

XVIII. *The Liquid Juice of the Root.* It is good against the Stinging or Bitings of Hornets, Scorpions, Vipers, Rattle-Snakes, Mad Dogs, or other Venomous Creatures, taken Morning and Evening, two Ounces at a time, in a Glass of Wine, for a Week together; but in case of the Bitings of Mad Dogs, it ought to be taken for a whole Month round, till the Moon has perfected her revolution, at what time the Poyson for the most part exerts it self, and commonly kills the Patient, and therefore for security sake, it ought to be taken one whole Lunar revolution; the Wound also ought to be kept open all that time, and for the three or four first days nothing but Cloves of raw Garlick a little bruised ought to be applied to it, the Wound it self being wash'd every time with the Juice of *Gentian*, because by this means the Poyson of the Mad Dog, or of any Viper or Serpent will be drawn forth.

XIX. *The Juice of the Herb.* It is given very often to Cattel to drink, to free them from the Bots and Worms, and many other Diseases; as also when they begin to swell, being Poysoned by any Venomous thing, which they often pick up with the Grass, as also when any poysonous or hurtful Creature has bitten a Cow by the Udder, or any other tender part, which presently thereupon swells, and puts the Creature to pain, making them forbear their Meat; with this Juice the place bitten is then to be bathed several times, and five or six Spoonfuls of the Juice to be given inwardly, mixed with a Pint of Ale, by this means the poor Beast is quickly cured, and restored to its Health.

XX. *The Essence of the Root.* It has all the Virtues of the Juices before going, being used in the same manner; besides which, being taken from one Ounce to two Ounces, or more, Morning and Night in Generous Wine, it opens all sorts of Obstructions of Liver, Spleen, Gall, Reins, and Womb, and is profitable for such as are Liver-grown, as the Vulgar call it, or have any Scirrhus breeding there, because the long and constant taking hereof wastes away those Humors which cause the same; it gives ease in the most vehement pains of the Stomach, is good for such who cannot relish their Meat, have a dejected Appetite, and a bad Digestion; it is good likewise against piercing pains of the Sides, Stitches, or the like; it is good for such who are bruised by Blows or Falls, dissolving the congealed Blood, and easing the pain; the same is also very effectual against all sorts of Agues, being taken to three or four Ounces, three Hours before the coming of the Fit, in a Decoction of the same Root; it opens Obstructions of the Womb, provokes the Terms, facilitates the Delivery of Women in Travail, and brings away the Afterbirth; it is effectual against the Strangury, and brings away Sand, Gravel, or Tartarous Matter obstructing the Urinary Passages, and is said

to

to be very good for such as have a Rupture, or are Burſten; it is good againſt Coughs, Colds, Hoarſeneſs, Wheeſing, ſhortneſs of Breath, or any difficulty of Breathing, being made into a Syrup with Honey, and ſo taken; it is good againſt the Yellow Jaundice, expels Wind, and is available againſt all Diſeaſes proceeding of Cold, whether inward or outward, and as *Galen* ſays, it is moſt effectual where there is any need to attenuate or make thin thick Flegm, or groſs and tartarous Humors; it cleanſes filthy running Sores, and putrid Ulcers, carrying off the peccant Humors, and freeing the parts affected from any Diſeaſes affecting them; dropt into the Eyes it takes away inflammation and redneſs, and clears them from Films growing on them.

XXI. *The Infuſion of the Herb or Root.* It has the former Virtues, but much weaker, and may be given Morning and Night for the ſame purpoſes from four Ounces to eight, ſweetned with Sugar or Honey; it is a very good thing for thoſe ſorts of Agues which come by obſtructions of Humors, or putrifaction of the Blood.

XXII. *The Decoction of the Root in Wine or Water.* It has all the Virtues of the Juice and Eſſence, but much leſs effectual, and may be given from three Ounces to ſix Morning and Night, being uſed Dietetically for ſome time, in the Cure of old running Sores, putrid Ulcers, and inveterate or rebellious Fiſtula's, *&c.* It is more powerful for the Cure of Agues than the Infuſion of the Herb, tho' leſs powerful than the Eſſence; it heals all Wounds which are freſh, by waſhing them therewith, and this more eſpecially, if it is made with Wine; it is good alſo to waſh therewith all ſorts of foul, putrid or rotten Ulcers, yea, tho' they be hollow, or Fiſtulous, running, and fretting, or Cancrous, for it mightily cleanſes and dries, and heals alſo; and taken inwardly for ſome time, it very much prevails againſt the Kings-Evil, ſpeedily and certainly healing thoſe Ulcers up.

XXIII. *The Powder of the Root.* It has all the Virtues of Juice, Eſſence, and Decoction, but operates not with that celerity or ſpeed which they do; it may be given from half a Dram to a Dram every Morning faſting, and every Night at Bed time, in ſome convenient Vehicle, and to be continued for ſome conſiderable time, as the reaſon of the thing, or occaſion may require; if it is taken, with a ſmall addition of Myrrh, or Rue, or Pepper, it is the more powerful againſt the Stinging of Scorpions, or Bitings of Serpents or Mad Dogs, the Wound being kept open with Vinegar and Salt Water, and dreſt, with the application of *Garlick*, which draws the Venom or Poyſon out the moſt powerfully of all Vegetables: Outwardly applied to foul, putrid, or rotten Sores and Ulcers, it powerfully deterges, or cleanſes, and dries them, cauſing them ſpeedily to heal: Mixt with Honey, and taken in the Morning faſting, and at the uſual Medical Hours, it opens Obſtructions of the Lungs, and cauſes eaſie expectoration of thick tough Flegm, and other groſs Humors; it provokes the Terms, and expels the Dead Child and Afterbirth, and is indeed a ſingular thing for killing Worms in the Belly and Stomach.

XXIV. *The Peſſary.* It is made of the ſolid Root, either green or dry. Being put up into the Womb, and kept there, it induces a flux of the Terms, by opening the Mouth of the Womb; it alſo attracts in the Birth, and brings away the Child, whether alive or Dead, and alſo clears the Womb of the Afterbirth.

XXV. *The Diſtilled Water of Herb and Root.* It has the Virtues of the Infuſion or Decoction, but not ſo efficacious or powerful: Authors ſay, that being drank, it has been often proved to cure in a wonderful manner all ſorts of Agues generated of the putrifaction of the Blood and Humors, to kill Worms in the Belly, and to cleanſe the Skin from all ſorts of Spots, Freckles, Morphew, and other Defœdations whatſoever, it being often, *viz.* five or ſix times a day bathed therewith.

XXVI. *The Spirituous Tincture of the Root.* It is profitable againſt the Yellow Jaundice, ſtrengthens and fortifies the Stomach, prevails againſt the Colick, and other grievous and vehement pains of the Stomach and Belly; it warms, comforts, and ſtrengthens a cold and moiſt Liver, occaſioned by long Sickneſs, or bad Diet, and is of good uſe for ſuch who are in a pining Conſumption; the Hæmorrhoids or Piles being bathed herewith it comforts the part, gives eaſe in the pain, and diſcuſſes the Tumor or Swelling; it is good againſt Cramps and Convulſions, being often bathed upon the part affected, and prevails againſt Fainting and Swooning Fits, being inwardly given in any fit Vehicle from one Dram to three, at time of the Paroxyſm.

XXVII. *The Acid Tincture.* It is one of the greateſt Stomaticks in *Rerum Natura*, for it opens the Obſtructions of the Stomach, incides and diſſolves Flegm, and all ſorts of thick, tough, viſcous and tartarous Humors adhering to the Tunicles thereof, cleanſes it of all its Fæculencies, warms and comforts it, reſtores its Tone, being hurt or depraved, and after a ſingular manner cauſes a good Appetite and a ſtrong Digeſtion, and being conſtantly taken, it is one of the moſt abſolute Cures that is for the Rickets in Children; it cures Aſthma's, cauſing a free reſpiration or breathing, and takes away Hoarſeneſs, Wheeſings, *&c.* Doſe is ſo many drops as to make the Vehicle pleaſantly ſharp, and it is to be given in all that the Patient drinks, whether Ale, Beer, or Wine, and that while they uſe it they ought to drink nothing without it.

XXVIII. *The Oily Tincture.* Inwardly taken from ten drops to twenty or thirty, firſt dropt into Sugar, and then mixt with any fit Vehicle, it is of excellent uſe againſt the Colick, and pains in the Stomach, proceeding from Wind; it opens Obſtructions of the Reins and Ureters, and expels ſmall Stones, Gravel, Sand, and other Tartarous Subſtances, which cauſe the Strangury: It is a ſingular thing againſt the Palſy and convulſions of the Viſcera, being inwardly taken as aforeſaid, and morning and night anointed well upon the parts affected, as alſo along down the Back Bone: It is good alſo againſt numbneſs of Limbs, Trembling of any of the parts of the Body, weakneſs of the Joints, and the Gout it ſelf proceeding from a cold Cauſe.

XXIX. *The Saline Tincture.* Being bathed upon the place, it is good againſt the bitings and ſtinging of Venomous creatures, for it attracts the Poyſon out of the Part: it eaſes the pain of the Gout after a ſingular manner; opens the Pores of the Skin, diſcuſſes contuſions, being applied very hot, by way of Fomentation, and cleanſes the face, hands and other parts from ſpots, freckles, Tanning, Sun burning, yellowneſs, black and blueneſs occaſioned by Blows, as alſo ſcurf, morphew, and other like defœdations of the *Cutis* and *Cuticula.*

XXX. *The Ointment or Balſam.* It is an extraordinary Vulnerary, healing ſimple Wounds at once or twice Dreſſing. It alſo heals Wounds and Punctures of the Nerves and Tendons. It is likewiſe an excellent thing againſt all running Sores, old and inveterate Ulcers, putrid or malign Fiſtula's, for in the one it potently digeſts, cleanſes, incarnates if need be, dries and admirably heals; and in the other it takes away the Callous, *&c.* and in both ſtrengthens the part, being much weakened through the length or continuance of the Diſeaſe.

CHAP.

CHAP. CCCXIII.

Of GERMANDER Garden.

I. *THE Names.* It is called in *Arabick*, *Chamedrius*, *Damedrios* and *Kemadriut*: in *Greek*, Χαμαίδρις, ἢ χαμαίδρυς, as *Dioſcorides* ſays: in *Latin*, *Trixago*, *Triſſago*, *Herba Febrium*, *Febrifuga*, (from the Effects) and *Chamædrys*, *Quercula minor*; *quaſi humilis aut parva quercus, a foliorum ſimilitudine*: in *Engliſh*, *Germander*.

II. *The Kinds.* There are many Varieties of this Plant, moſt of which grow in other Countries, and are unknown in *England*: we make only four generick kinds, *viz.* 1. Χαμαίδρυς ἥμερος, *Chamædrys ſativa*, Garden Germander, of which in this Chapter. 2. Χαμαίδρυς ἄγρια, *Chamædrys ſylveſtris*, Wild Germander, of which in Chap. 314. 3. Χαμαίδρυς δενδρικὴ, πύρειον, *Teucrium*, *Quercula major*, Tree Germander, of which in Chap. 315. 4. Χαμαίδρυς ἑλώδης, ἢ ὑγρόφιλος, Σκόρδιον, *Scordium*, *Chamædrys aquatica*, Water Germander, of which in Chap. 316. following.

III. *The Garden kinds.* Of this there are many Species deſcribed in Authors; we ſhall only enumerate two, which are common with us in our Gardens, *viz.* 1. *Chamædrys ſativa vulgaris*, *Chamædrys vulgaris*, and *Chamædrys mas*, *Febrifuga*, *Trixago*, and *Triſſago minor*, The common Germander, *or* Leſſer Garden Germander. 2. *Chamædrys major*, *Trixago*, and *Triſſago major*, The greater Germander.

IV. The Deſcriptions. *The firſt, or* Small Garden Germander, *has a Root compoſed of divers Sprigs, and variouſly diſperſed with many Strings, ſhooting forth a great way round about, and quickly over-ſpreading a Ground, ſpringing up again in many places.* From this Root riſes up a little ſtraight Stalk, about a Span long, and ſometimes longer, nearly a Foot in Height; (but *Parkinſon* ſays it ſprings up with ſeveral Stalks) which are woody and hard, like unto a little *Shrub*, which is afterwards divided into very many little ſmall Branches. Upon theſe Stalks and Branches grow ſmall Leaves, almoſt round, and a little indented about the edges, leſſer than the Leaves of the following *Great Germander*. The Flowers grow at the tops, and alſo near the Leaves on the upper parts of the Sprigs, of a deeper purple color than the following, and oftentimes tending to Blewneſs.

V. *An Obſervation.* This Herb was in former times much uſed, and is yet ſtill uſed in ſeveral Places, to hedge up, or border Beds in Gardens, becauſe it will grow thick, and may be alſo kept in ſome Form and Proportion with cutting, and that the Cuttings are much uſed as a ſtrewing Herb for Houſes, Flores and Chimney-hearths, being pretty, and ſweet withal; for which Reaſon it is much affected: but this is to be taken notice of, That it will often die, and grow out of Form; and beſides that, the Stalks will grow too great and hard, and ſtubby; and the Roots, by far ſhooting under Ground, will, upon a little continuance thereof, ſpread into many places within the Knot, which, if they be not continually pluckt up, will ſpoil the whole Knot it ſelf; and therefore once in three or four Years at moſt, it muſt be taken up and new Set, or elſe it will grow too rank and cumberſom.

VI. *The ſecond, or* Greater Germander, *has a Root which is more buſhy with Fibres, and creeps leſs than the former: from this Root riſes up greater and harder ſquare Stalks, twelve, fifteen or eighteen Inches high, ſpreading into ſeveral Branches from the very bottom*; on which grow two Leaves at a Joint, ſomewhat larger than thoſe of the *Ordinary* or *Common kind* juſt before deſcribed, and more dented about the edges, green above, and ſomewhat greyiſh underneath. The Flowers ſtand in a long ſpiky Head, and are larger than the former, gaping like them, and of a paler purple color.

VII. *The Places.* They are both found growing Wild in *Germany*, and in many other Countries, as *Cluſius* ſaith; but with us, they are only found in Gardens.

VIII. *The Times.* They flower in *June* or *July*, and the Seed is repened in ſome little time after.

IX. *The Qualities.* *Germander* is hot and dry in the third Degree, and more ſharp and bitter than *Teucrium*, as *Dioſcorides* ſays: it is highly Aperitive, Inciſive, Abſterſive, Aſtringent, Cephalick, Neurotick, Stomatick, Pectoral, Hepatick, Splenetick, Arthritick, Alexipharmick and Analeptick.

X. *The Specification.* It cures all ſorts of Agues and Fevers, and is principal againſt the Plague or Peſtilence: it is good againſt Diſeaſes of the Lungs; ſtops all ſorts of Fluxes of the Bowels, and is a certain Remedy for the Gout.

XI. *The Preparations.* You may have herefrom, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *An Infuſion.* 4. *A Decoction.* 5. *A Syrup.* 6. *A Pouder of the Herb.* 7. *An Ointment or Balſam.* 8. *A Cataplaſm.* 9. *A Spirituous Tincture.* 10. *An Acid Tincture.* 11. *An Oily Tincture.* 12. *A Saline Tincture.* 13. *A Spirit of the Herb.* 14. *A Pouder of the Seed.*

The Virtues.

XII. *The liquid Juice.* If it is mixt with Honey and ſo taken, it is good againſt Coughs and Colds, Hoarſeneſs, Wheezings, Shortneſs of Breath, and Pains of the Spleen. It is profitable for ſuch whoſe Spleens are become hard, and ſuch as have the Strangury, or make their Water difficultly; and

helps thoſe who are falling into a Dropſy, being taken in the beginning of the Diſeaſe. Doſe two, three or four Spoonfuls Morning and Night.

XIII. *The Eſſence.* It has all the former Virtues; beſides which, it opens Obſtructions of the Stomach, Liver, Spleen, Reins and Womb; provokes the Terms in Women, and helps to expel the dead Child, and the After-birth. If it is mixt with Vinegar, and ſo taken, it does waſte or conſume the Spleen, and is very effectual againſt all ſorts of Poiſon, chiefly the Bitings of Serpents and mad Dogs. Uſed outwardly with Honey, it cleanſes old and running Sores and putrid Ulcers, hindering their ſpreading and eating: and ſo mixed with Honey and put into the Eyes, it helps their running and watering, and removes the Dimneſs of Sight. Taken inwardly, three or four Spoonfuls at a time, it is good againſt Pains and Stitches of the Side, Colicks, and other the like Diſaffections. It cures alſo *Tertian* and *Quartan* Agues, being taken every day in the Morning faſting, and on the day of the Fit, three hours before the Fit comes: and Experience has found it a moſt effectual Remedy againſt the Plague it ſelf.

XIV. *The Infuſion.* It has the Virtues of the Juice and Eſſence, but not full out ſo effectual: it prevails againſt Diſeaſes of the Brain, continual Pains of the Head, Melancholy, Epilepſy, Carus, Lethargy and Dulneſs of Spirits, Palſies, Convulſions, *&c.* Doſe ſix Ounces Morning, Noon and Night.

XV. *The Decoction.* It has the Virtues of the Juice, Eſſence and Infuſion, but is ſomething more efficacious than the Infuſion, but not ſo pleaſant to be drank by the Patient, becauſe it taſtes ſtronger; yet it may be given to ſix Ounces or more, as the Infuſion aforeſaid is given. Put into the Ears, it kills Worms in them, and alſo kills Worms in the Belly, ſo alſo the Juice and Eſſence. A Decoction of the Herb or Root rather, made in Wine, and taken for ſixty days continually, four hours before Meat, it is a certain Remedy for the Gout.

XVI. *The Syrup.* *Durantes* makes a Syrup for the Spleen after this manner: *Take Germander, Ground Pine, Ceterach, Madder, of each a Handful; Raiſons ſtoned an Ounce; Bark of Caper-roots, Roots of Smallage, Elecampane, Blew Flowerdeluce, Orrice, Liquorice, of each half an Ounce; Bark of Tamariſk, Cyperus, Seeds of Aniſe, Fennel, Smallage, of each two Drams: boil all in a ſufficient quantity of a Mixture of equal parts of Water and Vinegar: then ſtrain, and with a ſufficient quantity of Honey, make a Syrup, aromatizing it with five or ſix Ounces of ſtrong Cinnamon-water.* The Doſe is four Ounces every Morning faſting. It is good alſo againſt Coughs, Colds, Aſthma's and other Diſtempers of the Lungs; as alſo againſt the Colick, Stitches in the Side, *&c.*

XVII. *The Pouder of the Herb.* It has the Virtues of the Juice, but more aſtringent, being very good to ſtop all manner of Fluxes, whether of the Belly or of Blood; as alſo the Courſes in Women, and to ſtop Vomiting, being given from half a Dram to a Dram and half, in Vinegar or any other proper Vehicle.

XVIII. *The Pouder of the Seed.* It may be given from half a Dram to a Dram and half in a Glaſs of White Port Wine, for ſome days; and ſo taken, it expels Choler by the Urinary Paſſages, and is profitable againſt the Yellow Jaundice: it alſo comforts the Stomach, and ſtrengthens all the Viſcera, tho' under long Weakneſſes.

XIX. *The Ointment or Balſam.* It heals ſimple green Wounds in a ſhort time; and being applied to foul running Sores, and old putrid Ulcers, it digeſt them, cleanſes, incarnates, dries, and quickly heals them up. Applied to the Gout, it eaſes the Pain in twenty four hours time; and by the conſtant Uſe of it afterwards, in a ſhort time cures it, and that ſo perfectly, as to return no more again upon that Baſis.

XX. *The Cataplaſm.* Being beaten and boiled in Vinegar, and brought to a Conſiſtence with a little Leaven, and ſo applied to the Stomach, it ſtops and cures all thoſe Vomitings which ariſe from hot and cholerick Cauſes: and applied to the Forehead and Temples in caſe of an Hæmorrhage or Bleeding at Noſe, it preſently ſtops it.

XXI. *The Spirituous Tincture.* It warms and comforts a cold Stomach, and ſo ſtrengthens it, as to cauſe a good Appetite and a ſtrong Digeſtion. It is cordial and excellent good againſt fainting and ſwooning Fits, Fits of the Mother, and a vehement Sickneſs at Heart, which it eaſes almoſt in a moment. It expels Wind powerfully, and gives eaſe in the Colick; and is a ſingular thing in reſiſting even the Violence of Convulſions. Doſe two Drams.

XXII. *The Acid Tincture.* It is ſo powerful an Opener of all Obſtructions of the Stomach and other Viſcera, that there are but few other things which equal it. It cures and prevents the Rickets in Children; is powerful againſt a Cachexia in Virgins and other young People; and a ſingular thing againſt the Green-ſickneſs in young Women. It excites a good Appetite where it is languid or is wanting; incides, diſſolves and expels thick, tough, viſcous Flegm, and other tartarous Humors lodged in the Stomach and Bowels, cauſing Tortions, Gripings, Colicks, *&c.* let it be given Dietetically in all that the Patient drinks, whether Ale, Beer or Wine, ſo many Drops at a time as may give the Vehicle a pleaſant Acidity, continuing its Uſe as long as need requires.

XXIII. *The Oily Tincture.* Outwardly bathed upon any Part, or Parts affected with Lameneſs, Numbedneſs, Trembling, Palſy, Convulſions, Cramps, from a cold Cauſe; as alſo upon Punctures of the Nerves or Tendons, it in a ſhort time gives eaſe, and by Continuation of the ſame, (doing it Morning and Night) in no long time a perfect Cure. It eaſes Pains upon the Shin-bones, as alſo Pains in the Joints, the Gout and Rheumatiſm; and is an excellent thing to be bathed upon any Part which has contracted any Weakneſs by the long Continuance of any Diſeaſe: But in Palſies and Convulſions it is to be noted, That the Back-bone muſt alſo be anointed with the ſame in like manner, twice a day, rubbing it very well in.

XXIV. *The Saline Tincture.* Inwardly given from one Dram to two in a Glaſs of White Port Wine, it opens Obſtructions of the Urinary Paſſages, and provokes Urine powerfully, expelling Gravel, Sand, and ſlimy or viſcous Matter, which ſtops the Urine and cauſes Pain. Bathed upon a recent and ſimple Contuſion, it hinders the Aggregation of Humors, diſcuſſes thoſe which are preſent, and quickly cures the ſame, taking away alſo the Blackneſs and Blewneſs thereof. It is alſo good againſt Pimples, Freckles, Sun-burning, Tanning, Yellowneſs, Scurff, Morphew, and other like Breakings out of the Skin.

XXV. *The Spirit from the Herb.* It is highly Stomatick and Cordial, good againſt all Diſeaſes of the Head, Brain, Nerves, Heart and Vitals, comforting the Parts affected, reſiſting the malign Vapors which oppreſs the Spirits, and reviving the univerſal Man. Doſe from one to two Drams, either alone or in a Glaſs of choice and generous Wine, as oft as occaſion requires, *viz.* in fainting, ſwooning, *&c.*

CHAP.

CHAP. CCCXIV.

of GERMANDER Wild.

I. *THE Names.* It is called in *Greek*, Χαμαίδρυς ἄγρια: in *Latin*, *Chamædrys ſylveſtris*: in *Engliſh*, *Wild Germander.*

II. *The Kinds.* This is twofold, *viz.* 1. *Chamædrys ſylveſtris Cluſii*, *Chamædrys ſpuria ſylveſtris*, *Chamædrys vulgaris fœmina Fuchſii*, *Turneri*, *Loniceri*, *Lugdunenſis*, *Pſeudochamædrys Thalii*, *Teucrium pratenſe Lobelii*, Common Wild Germander. 2. *Chamædrys anguſtifolia*, *Chamædrys ſpuria minor anguſtifolia Bauhini*, who takes it to be the third Variety of the fourth kind of *Cluſius* his *Teucrium*, Narrow-leav'd Wild Germander.

Wild-Germander.

III. The Deſcriptions. *The firſt*, *or* Common Wild Germander, *has a Root which is ſmall and thready*, *which ſends forth ſeveral ſquare upright Stalks*, *yet ſometimes a little bending*, *having two Leaves ſet at each Joint*, *one againſt another*, *the lower ones ſomewhat large*, *and almoſt round*, *yet pointed at the ends*, *and dented about the edges*, *but ſmaller as they grow up higher.* The tops of the Stalks are ſpiked with ſeveral blew Flowers, ſet about them, made of four ſmall round Leaves apiece, with a little white Eye in the middle, ſmall-pointed, and ſome Threads alſo; after which ſucceed ſmall flat Pouches, containing ſmall Seed.

IV. *The ſecond*, *or* Narrow-leav'd Wild Germander, *has a Root which is blackiſh*, *hard and fibrous or ſtringy*; *from which ſpring ſeveral round reddiſh Stalks*, *ſomewhat rough*, *hard and hairy*, *about an Hand Breadth or ſomething more high*, *and bending downwards*, whoſe lower Leaves are ſomewhat long and broad, round at the ends, and not dented at all about the edges; but thoſe which grow up higher upon the Stalks, are ſhorter and narrower pointed alſo at the ends, and ſnipt about the edges. The Flowers grow towards the tops of the Stalks, Spike-faſhion, being either of a pale blew color or bluſh, made of four Leaves, like the other; having alſo like Heads and Seed.

V. *The Places.* The firſt grows almoſt in every Meadow thro' the Land, as alſo by Ditches and Hedge ſides: *Gerard* ſays it grows in many places about *London*, in Meadows and fertile Fields, and in every place whereſoever I have travelled (ſays he) in *England.* The other grows in like places, but is nothing near ſo common.

VI. *The Times.* They flower and flouriſh from the end of *May* to the latter end of *Auguſt.*

VII. *The Qualities*, *Specification*, *Preparations*, *and Virtues*, are the ſame with thoſe of the *Common Garden Germander* in the former Chapter, and thither I refer you.

CHAP. CCCXV.

of GERMANDER Tree.

I. *THE Names.* It is called in *Greek*, Τεύκριον: in *Latin*, *Teucrium*, (*à Teucro inventore*, *teſte Plinio*) alſo *Quercula major*; and in *Engliſh*, *Tree Germander.*

Tree Germander.

II. *The Kinds.* There are three kinds hereof which grow in our Gardens, *viz.* 1. *Teucrium majus vulgare*, *Teucrium Matthioli*, *Lobelii*, *& aliorum*, *Teucrium vulgare fruticans Cluſii*, *Chamædrys alterum*, *ſeu aſſurgens Dodonæi*, Common or vulgar Tree Germander. 2. *Teucrium Creticum Cluſii*, *Teucrium Creticum incanum Bauhini*, Tree Germander

der of Candia. 3. *Teucrium Bæticum*, *Teucrium fruticans Bæticum Cluſii*, *Lugdunenſis*, *Tabernmontani*, *& aliorum*, *Teucrium Perigrinum folio ſinuoſo Baubini*, Spaniſh Tree Germander.

III. The Deſcriptions. *The firſt*, *or* Common Tree Germander, *has a Root which is ſomewhat woody*, *ſpreading it ſelf about*, *with many Strings and blackiſh Fibres adjoining to them. From this Root ſpring up hard*, *woody*, *brittle Stalks*, *(growing much like a little Shrub) a Foot or two*, *and ſometimes a Yard high*, *where Care is taken of it*, *and it is preſerved and defended from the Injuries of the Winters.* Theſe Stalks branch themſelves forth on all ſides, from the very bottom, bearing always Leaves by couples, ſmaller, ſmoother and thicker than thoſe of *Germander*, of a dark ſhining green color on the upper ſide, and greyiſh underneath, and dented alſo about the edges, like them. The Flowers which are gaping, ſtand about the tops of the Branches, Spike-faſhion, one above another, of a pale whitiſh color, as *Cluſius* ſays, but of a purple, as *Lobel* ſays, of both which colors it has been oft ſeen bearing; but the Flowers are ſomewhat larger than thoſe of *Germander*, and without any Hood above, having a few Threads ſtanding forth. The Seed is ſmall, blackiſh and round, contained in ſmall round, but pointed Husks. The whole Plant is of a fine, pleaſant, but weak Smell, yet ſomewhat ſtronger, if it is a little bruiſed, holding the Stalks and green Leaves continually, if it is not expoſed to the Sharpneſs of the Winter Seaſon.

IV. *The ſecond*, *or* Cretian Tree Germander, *has a Root like the former*, *and ſprings up and grows like a little Shrub*; *it riſes up with ſuch like woody Stalks*, *and brittle*, *as the other*, *but ſomething ſmaller and whiter*; *on which do grow ſuch like Leaves*, *and in the ſame manner*, *but ſomething leſſer*, *leſs green and ſhining above*, *and more hoary underneath*, *two always ſet at a Joint*, *one oppoſite to the other:* with the Leaves towards the tops, come forth five or ſix Flowers, ſtanding in a Husk, like unto the other, but a little leſs, and of a purple color, which being paſt away, ſmall round ſeed follows like to the former. The whole Plant is a little ſweeter than that firſt deſcribed.

V. *The third*, *or* Spaniſh Tree Germander, *has a woody Root*, *branching it ſelf forth under Ground*, *with many Fibres adjoining to it*, *from whence riſes up a ſhrubby Plant*, *growing ſometimes to be three or four Feet high*, *and many times lower. It riſes up for the moſt part but with one woody Stalk*, *which is of a greyiſh color*, *and divides it ſelf into ſeveral Arms or Branches*, *but fewer than that of* Candy, *two always ſet at a Joint.* The Leaves likewiſe ſtand two together, ſomething greater, and waved a little at the edges, of a ſad green color above, but not ſhining, and more hoary underneath. The Flowers ſtand at the Joints with the Leaves, towards the tops of the Stalks, of a white color, without any Hood above, and with ſeveral Threads in the middle, the lower Leaves hanging downwards. The Scent hereof is leſs odoriferous or ſweet, and the Taſte is more bitter than the former, but abides with its Stalks and Leaves thereon, green, like the reſt, but requires a little more Care for its Winter-Security in our Country.

VI. *The Places.* They all grow with us in Gardens, where they flouriſh very well, and delight to grow in rough ſtoney places, which are mountainous and expoſed to the Air and Sun. The ſecond was brought to us from *Candia*; the third from *Spain*; and therefore are not ſo hardy Plants as the firſt of them.

VII. *The Times.* Theſe *Tree Germanders* flower ſomewhat later than the other *Germanders* do, *viz.* in *July* and *Auguſt*; and the Seed is ripe in ſome little time after.

VIII. *The Qualities*, *Specification*, *Preparations and Virtues*, are the ſame with thoſe of the *Common Germander* in *Chap.* 313. aforegoing, to which we refer you.

IX. *An Obſervation.* It is to be noted, That *Galen* makes *Tree Germander* to be hot in the ſecond Degree, and dry in the third, to be of thin parts, and inciding alſo, whereby, he ſays, it is helpful for the Spleen. *Dioſcorides* ſays it is uſed either green or dry, and is good to conſume the Spleen, being inwardly and outwardly applied; it is alſo uſed againſt the Stinging or Biting of poyſonous Creatures.

CHAP. CCCXVI.

Of GERMANDER Water; *OR,* SCORDIUM.

I. *THE Names.* It is called in *Greek*, Σκόρδιον; ſome call it Δύοσμον, (from the ſtrong Smell;) and it may alſo be called Χαμαίδρυς ὕνυδρος: in *Latin*, *Scordium*, *Trixago paluſtris*, and *Triſſago paluſtris*, *Chamædrys aquatica:* in *Engliſh*, *Water Germander*, *Garlick Germander*, and *Scordium.*

The True Scordium, or Water Germander.

II. *The Kinds.* *Tabernmontanus* makes two kinds hereof, *viz.* a *Leſſer* and a *Greater.* 1. *Scordium legitimum*, *Scordium minus*, *Scordium verum*, *Trixago paluſtris minor*, The leſſer Scordium, The true Scordium, *or* Water Germander. 2. *Scordium majus*;

majus, *Scordotis Plinii*, *Scordium alterum*, *Scordotis legitimum Plinii*, The Greater Scordium, having Leaves almoſt as large as *Bawm*. I know that *Johnſon* and *Parkinſon* will ſcarcely allow of this *Greater kind*, and make no Difference between them, but only in reſpect to the place of its Growth, making it to be either *Greater* or *Leſſer*, according as the Soil is either richer and fatter, or poorer and more lean; but doubtleſs they were miſtaken, for the two differing Species are manifeſt.

III. The Deſcriptions. *The firſt, which is the* Smaller kind, *and is the* True Scordium *or* Water Germander, *has a ſmall Root, full of white Strings or Fibres, ſpreading in the Ground, and creeping round about; from whence ſhoot forth ſeveral weak, ſquare, hairy Branches, which take Root in ſeveral places, as they lye, and ſpread; by which means it much encreaſes.* Upon theſe Stalks or Branches grow many Leaves, two always at a Joint, which are ſomething larger and longer than the Leaves of *Garden Germander*, of a ſad or dark green color, whereon there is yet a ſhew of Hoarineſs, ſomewhat ſoft in handling, full of Veins, and dented about the edges, of a Scent ſomewhat ſtrong, and reſembling *Garlick*, whence came the *Greek* and *Latin* Name. The Flowers are ſmall, red and gaping, or of a purple color, like the Flowers of dead *Nettles*, and ſtand at the Joints with the Leaves, towards the tops of the Branches.

Water Germander the Greater.

IV. *The ſecond, or* Greater Scordium, *or* Water Germander, *has a ſmall long Root, and very fibrous, creeping deep into the Ground, and far about, abiding long, and not periſhing every Year; from which many ſquare, white, hairy Stalks or Branches ſpring forth, ſome riſing up higher, and others dwarf like, keeping nearer the Ground.* Upon theſe Stalks or Branches grow Leaves, two at a Joint, broader and rounder than the former *Scordium*, and all of a hoary white, being ſomewhat like unto the Leaves of *Horehound* or *Water Mint*, and almoſt as large as thoſe of *Bawm*. From the middle of the Stalks upwards, towards their tops, come forth the Flowers, ſtanding as it were in a long ſpiky Head, with Leaves at the bottoms of Husks or ſhort Foot-ſtalks. Theſe Flowers are of a pale purpliſh color, almoſt white, like unto *Horehound*, gaping, and very like to thoſe of dead *Nettles*; which being paſſed away, there follows ſmall, round, black Seed. The whole Plant ſmells of *Garlick* as much as the former, or *True Scordium*; and thereby it is known to be of the kind, tho' the Leaves, by being larger, do ſomewhat differ.

V. *The Places.* The firſt grows in many wet Grounds, and by Water-ſides in many places of *England*. *Dioſcorides* ſays, That it grows as well on Hills as by Water-ſides; and it will flouriſh well, if it is tranſplanted into a Garden: *Camerarius* ſays, That it is found to be ſtronger and ſharper which grows on high Grounds, than that which grows on low and moiſt places. It grows near to *Oxenford*, by *Ruley*, on both ſides of the Water; and in a Meadow by *Abington*, called *Neitford*: alſo in great plenty in the Iſle of *Ely*, and in a Meadow by *Harwood* in *Lancaſhire*, and in ſeveral other places. The other grows alſo in low and moiſt places, but is not ſo generally to be found as the firſt is: in *Candia* the People gather it promiſcuouſly with the firſt ſort.

VI. *The Times.* They flower in *June*, *July* and *Auguſt*, in which Months it is beſt to gather it and keep it dry: it periſhes not in Winter, but only looſes the Stalks, the Root ſending up freſh again in Summer.

VII. *The Qualities.* *Germander* is hot and dry in the ſecond Degree: it is Aperitive, Abſterſive, Aſtringent, Carminative, Digeſtive, Diuretick, Anodyne and Traumatick; Cephalick, Neurotick, Stomatick, Cordial, Hepatick, Nephritick, Sudorifick and Alexipharmick.

VIII. *The Specification.* It is a counter Poiſon againſt all Poiſons and Infections of Contagious and Epidemick Diſeaſes, as Stingings or Bitings of Serpents, mad Dogs, *&c.* all ſorts of malign Fevers, the Meaſles, Small-Pox, Purples, Spotted Fever and Calenture, as alſo the Plague or Peſtilence it ſelf: it is an eſpecial Help againſt the Strangury, and provokes the Terms in Women.

IX. *The Preparations.* You may prepare hereof, *viz.* 1. *A liquid Juice.* 2. *An Eſſence.* 3. *An Infuſion in Wine, or Decoction.* 4. *A Syrup.* 5. *A Pouder.* 6. *An Electuary.* 7. *Diaſcordium.* 8. *An Ointment or Balſam.* 9. *A Cataplaſm.* 10. *A diſtilled Water.* 11. *A Spirituous Tincture.* 12. *An Acid Tincture.* 13. *An Oily Tincture.* 14. *A Spirit.* 15. *An Elixir.* The Herb is only uſed.

The Virtues.

X. *The liquid Juice.* It is a little ſharp and penetrating, and ſo is effectual to provoke Urine, and give eaſe in the Strangury. It opens Obſtructions of the Womb, and provokes the Terms in Women, facilitates the Birth, and brings away the After-birth. It is good againſt the Bitings or Stinging of Vipers, Rattle Snakes, and other Serpents, mad Dogs, Scorpions, Hornets, *&c.* and reſiſts all other deadly Poiſons. Doſe two, three or four Spoonfuls in the diſtilled Water of the ſame, or in any other fit or proper Vehicle, Morning and Night, to be continued for ſome time.

XI. *The Eſſence.* It has all the former Virtues, and may be given in like manner in the ſame Doſe: and as it is a counter Poiſon, ſo it reſiſts all contagious

gious and infectious Diſeaſes, even when Epidemical, as Meaſles, Small-Pox, Spotted Fever, Purples, the Plague alſo, and all Peſtilential Diſtempers. It is given with good Succeſs before the Fits of Agues, to divert or hinder the Acceſs, and to drive them away: in this Caſe it may be given to four, five or ſix Ounces. It is a moſt certain Remedy to kill Worms in Old or Young, whether in the Stomach or Belly. And by reaſon of its Abſterſive and Sanative Properties, it is an excellent thing to be uſed Dietetically againſt the Poiſon and Malignity of the *French*-Pox, and to clear the Patient of the Reliques of the ſame. It powerfully provokes Sweat, and therefore is good againſt the Plague, digeſts Humors, diſſolves and diſcuſſes Swellings; and is an excellent thing for ſuch who are hurt by Blows, Falls or Bruiſes, where ſome inward Veſſel may be broken, to diſſolve, diſperſe and expel the congealed Blood, and to conſolidate the Vein; and becauſe of its Conglutinating Property, it is good for ſuch as are troubled with any Rupture or Burſtenneſs, this being daily drunk inwardly, and the Herb applied outwardly.

XII. *The Infuſion in Wine, or Decoction.* Theſe have both of them the Virtues of the Juice and Eſſence, but in a much leſs degree, for which Reaſon they ought to be taken in a much larger Doſe, and to be oftener repeated. They are good againſt the gnawing Pains of the Stomach, as alſo Pains of the Sides and Pleura: and if they are made in Red Wine, are very profitable againſt the Bloody-flux, and all other Fluxes of the Belly.

XIII. *The Syrup.* It has the Virtues of the Infuſion and Decoction, and is available againſt an old Cough, Hoarſeneſs, Wheezing and Shortneſs of Breath: it opens Obſtructions of the Lungs, and helps to expectorate tough Flegm and other viſcous Humors out of thoſe Parts. Mixt with the Pouder of *Scordium*, and applied to foul and putrid Ulcers, it abſterges them, dries, and very much contributes to their healing.

XIV. *The Pouder.* It has the Virtues of the Juice, Eſſence, Infuſion and Decoction, but operates not ſo ſpeedily, and may be given in any convenient Vehicle, as in the diſtilled Water, Infuſion, Decoction or Syrup of the ſame Herb, from half a Dram to a Dram. It facilitates the Labor, provokes the Terms, opens Obſtructions of the Urinary Veſſels, is good againſt Ruptures, is an excellent counter-Poiſon, kills Worms, and prevails powerfully againſt the Bloody-flux, more eſpecially if it is mixt with Pouder of *Tormentil*-Roots a third part. It is very good for moiſt running Sores and Ulcers in the Legs or other Parts, to cleanſe and dry them, and cauſe them ſpeedily to heal.

XV. *The Electuary.* It is made of the *Pouder of Scordium a Pound, mixed with three Pounds of the Rob of Juice of Cheſſes made with Honey, adding at the end, Rosin in fine Pouder half a Pound.* It is a noble Electuary for the Lungs; it not only cures Aſthma's, Coughs, Colds, Wheezing, *&c.* but alſo heals Ulcers of the Lungs, helping to expectorate the rotten and putrid Matter from thence. Doſe one Ounce Morning and Night.

XVI. *Diaſcordium.* It is a compound Confect or Electuary in our *Pharmacopœia Londinenſis*, *lib.* 4. *cap.* 22 *ſect.* 19. It was compoſed by *Fracaſtorius*, and inſerted there for its great Virtues and general Uſe. It is given againſt Plague, Poiſon, malign Fevers, Fluxes of all ſorts, Catarrhs, Vomiting, Coughs, Watchings, Aſthma's, Pleuriſies, Conſumptions, Whites and Reds in Women, *&c.* Doſe from one to two Drams at Night going to Bed, and as much in the Morning faſting, as the Occaſion may require: and it may be given to Children from a Scruple to half a Dram, in any convenient Vehicle. It is thus made: *Take Scordium in fine pouder one Ounce; fine Bole an Ounce and half; Terra Lemnia, Biſtort, Cinnamon, Caſſia Lignea, Dittany of Creet, Gentian, Tormentil, (all theſe in fine pouder) Gum Arabick, Galbanum, Storax Calamita, of each half an Ounce; Ginger, long Pepper, Seeds of Sorrel, of each two Drams in fine pouder; Opium a Dram and half; Canary eight Ounces; Sugar of Roſes a Pound, clarified Honey two Pounds and half: mix and make an Electuary according to Art.* The *Opium* in this Preſcript is much too little, being to the whole Compoſition only as 1. to 310. which is an inconſiderable Proportion. Should *Opium* one Ounce be the Proportion, it would yet be but as 1. to 58. which is ſtill conſiderably too little, where any Effects from the *Opium* are expected.

XVII. *The Ointment or Balſam.* They are excellent Wound-Medicaments, and cure ſimple green Wounds at two or three times dreſſing. If to every Pound of the Balſam three Ounces of the Pouder of *Scordium* be added, and one Ounce of Pouder of *Tobacco*, it will be one of the beſt Topicks for digeſting, cleanſing, incarnating, drying and healing any running old Sore, putrid Ulcer or Fiſtula, in what Part of the Body ſoever.

XVIII. *The Cataplaſm.* If it is made of the dryed Herb mixed with Honey, and applied to ſimple green Wounds, it heals them. If it is applied to foul and putrid Ulcers, it cleanſes, dries and heals them. If it is applied to Excreſcencies in the Fleſh, as Wens, and the like, it repercuſſes the Matter, hinders them from encreaſing, and prevails againſt them ſo as to diſcuſs or diſperſe them. Applied to the Gout, it eaſes the Pains thereof.

XIX. *The diſtilled Water.* It is Cordial and Alexipharmick, and is good againſt fainting and ſwooning Fits, Sickneſs at Heart, cauſed by any malign or peſtilential Miaſmata or Vapors, *&c.* but it is chiefly uſed as a Vehicle, to convey the other Preparations of this Herb into the Body.

XX. *The Spirituous Tincture.* It is highly Cordial, good againſt all the Deliquiums of the Spirits, Faintings, cold Sweats, Weakneſs, Poiſons and poiſonous Vapors, Sickneſs at Heart, Agues, *&c.* and has all the Virtues of the Juice and Eſſence, but is to be given in a much leſſer Doſe, *viz.* from one to three Drams, in ſome fit Vehicle.

XXI. *The Acid Tincture.* There are but few things in the whole Republick of Medicine, which are ſo powerful againſt the Plague and all Peſtilential Poiſon, as this Medicament is, becauſe it ſtrikes at the Root of the Malignity and Venom, undoing it in its Principle and Eſſence. It not only cures the Plague and all Peſtilential Diſeaſes, but it is alſo a noble Prophylactick, or Preſerver from the Contagion and Infection. I commend it againſt the Spotted Fever, the Purples, Calenture, all burning and malign Fevers, the Bitings of mad Dogs, Serpents, Vipers, Rattle Snakes, Stinging of Scorpions; becauſe, if wiſely given, and in a due or fit Doſe, it will do more in an Hour than many other Medicines will do in a Week: it is to be given in all that the Patient drinks, whether Ale, Beer, Wine, Poſſet-drink, Grewel or Broth, and ſo many Drops at a time as to make it pleaſantly ſharp, reſembling the Acidity of a *Limon*. It is a noble Medicine, and ought to be kept always in a Readineſs by one.

XXII. *The Oily Tincture.* Anointed on the Back-Bone, and upon the Parts affected, Morning and Night, it is an excellent thing againſt Numbneſs, Trembling of the Limbs, Palſies, Convulſions, *&c.* it is alſo of extraordinary Uſe, being applied to Punctures of the Nerves or Tendons, for it preſently eaſes the Pain, abates the Tumor, prevents Convulſions,

vulſions, and induces the Cure almoſt to a Miracle. Inwardly given from twelve to thirty Drops, being dropt into Sugar, and ſo mixt with any proper Vehicle, it has not only all the Virtues of the Juice and Eſſence, but after a ſingular manner opens Obſtructions of the Reins and Womb, provokes Urine, eaſes the Strangury, and forces away Stones, Gravel, Sand, Tartar, or any other Fœculency reſiding in thoſe Parts. It alſo provokes the Terms in Women, facilitates the Labor, but brings away alſo the After-birth, and prevents After-pains, *&c.*

XXIII. *The Spirit.* It is one of the greateſt Cordials in the World, it chears the Heart, revives the Spirits, ſtrengthens the *Archeus*, and prevails againſt fainting Fits, Swooning, Vapors, Fits of the Mother, Convulſions, Palſies, Lethargies, and all other like Diſeaſes proceeding from Cold and Moiſture, or from any poiſonous or venene Cauſe. It is alſo a Preſervative from the Infection of the Plague. The Doſe is from one Dram to two or three, in any fit Vehicle.

XXIV. *The Elixir.* It has all the Virtues of the liquid Juice, Eſſence, Tinctures and Spirit exalted, and may be given from one Dram to two, either in a Glaſs of generous Wine in a Morning faſting, as a Prophylactick againſt the Plague, or at any other time, when need requires it, as in any fainting Fit, or Paroxyſm, to Women in Labor, and to ſuch as labor under any preſent Sickneſs at Heart. 'Tis an excellent Cordial, and an Antidote againſt all manner of Poiſon and Infection.

CHAP. CCCXVII.

Of GILLIFLOWER the Greateſt, *OR,* Carnation GILLIFLOWER.

I. *THE Names.* This Plant, as it was unknown to the *Greeks*, ſo it has no *Greek* Name allotted it; but it is called in *Latin*, *Caryophyllus hortenſis*; the Epithite is added, to diſtinguiſh it from *Caryophyllus Indicus*, the Indian Spice called *Cloves*; theſe in the Garden being ſo called in ſome reſpect from their Smell, it in ſome meaſure being like to that of the *Indian Spice*; and in another reſpect from the Form, the Flower it ſelf, in its lower part, being very like to the *Indian Clove*: in *Engliſh* we call it, *Gilliflower*, (*quaſi July-flower*, from its flowering in the Month of *July*:) but if we will aſſign it a *Greek* Name, we may call it Καρυόφυλλον ἥμερον, *Caryophyllus hortenſis*, and ſo it is diſtinguiſhed from Καρυόφυλλον ἰνδικὸν, *The Indian Clove or Spice.*

II. *The Kinds.* Of the *Gilliflowers* there are three generick kinds, *viz.* 1. *Caryophyllus hortenſis rubrum*, The deep Blood-red Clove-Gilliflower, of which we have already treated in Chap. 139. aforegoing. 2. *Caryophyllus hortenſis maximus*, The greateſt Gilliflower *or* Carnation Plant, of which in this Chapter. 3. *Caryophyllus hortenſis major*, The greater Gilliflower, called ſimply by the Name of *Gilliflower*, of which there are ſeveral Species, which ſhall be treated of (God willing) in Chap. 318. following. The generick Deſcription of theſe two latter, ſee in Chap. 139. ſect. 5 and 6.

III. *The Kinds of Carnations.* Of the *Greateſt Gilliflower* or *Carnations*, there are many kinds: Authors account about twenty ſeveral Species, which, becauſe of the immediate Repetition, we ſhall forbear to name here, but give you them each in their own order, as we ſhall now deſcribe them.

Gilliflower Greateſt.

IV. The Deſcriptions. 1. *Caryophyllus maximus, dictus, Hulo rubro varius, The grey Hulo.* It has as great Leaves as the *Old Carnation*, (deſcribed in *Cap.* 139. *ſect.* 5.) and as deeply jagged on the edges; it has a great high Stalk, whereon ſtand the Flowers, of a deep red color, ſtriped and ſpeckled very cloſe together, with a darkiſh white color.

V. 2. *Caryophyllus maximus, i. e. Hulo ruber non variatus*, The red Hulo. It is a fair large Flower, of a Stamel color, deeply jagged, as the former, and grows very gallantly, without any ſpot at all in it, ſo that it ſeems to be but a *Stamel Gilliflower*, ſaving, that it is much greater.

VI. 3. *Caryophyllus maximus dictus Hulo cæruleo purpureus, The blew Hulo.* It is a goodly fair Flower, being of a fair purpliſh Murry color, admirably Marbled with White, but ſo ſmally to be diſcerned, that it ſeems only Purple, it has ſo much the Maſtery in it; it reſembles the *Brazil*, but that it is much bigger.

VII. 4. *Caryophyllus maximus dictus Grimelo, ſive Princeps, The Grimelo, or Prince.* It is a fair Flower alſo, as large as any Cryſtal, or larger, being of a fair Crimſon Color, equally for the moſt part ſtriped with White, or rather more White than Red, thro' every Leaf from the bottom, and grows beautifully.

VIII. 5. *Caryophyllus maximus Incarnadinus Albus, The White Carnation, or Delicate.* It is a goodly delightful fair Flower when in its Pride and Perfection, that is, when it is both Marbled and Flaked, or ſtriped and ſpeckled with White, upon an Incarnate Crimſon Color, being a very ſweet and delicate Flower, but abides not conſtant, changing oftentimes to have no Flakes or Strakes of White, but Marbled or Speckled wholly.

IX. 6.

IX. 6. *Caryophyllus maximus Incarnadinus Gallicus, The French Carnation.* It is very like to the *White Carnation*, but that it has more Specks or Spots, and fewer Stripes or Flakes of White in the Red, which has the Maſtery of the White.

X. 7. *Caryophyllus maximus Incarnadinus Grandis, The Ground Carnation.* It is almoſt like to the *Grand* or *Old Engliſh Carnation* deſcribed in Chap. 129. Sect. 5. aforegoing, it is a thick Flower, but ſpreads not its Leaves abroad as others do, having the middle ſtanding higher than the outward Leaves, and turning up their brims or edges, and is a ſad Flower, with few Specks or Stripes in it; it is very ſubject to break its Husk or Pods, ſo that the Flower ſeldom comes fair and right; the green Leaves are as great as the *Hulo*, or *Lumbard Red.*

XI. 8. *Caryophyllus maximus Cryſtallinus, The Cryſtal, or Cryſtalline.* It is a very delicate Flower when it is well marked, but it is inconſtant in the marks, being ſometimes more ſtriped with White and Crimſon Red, and ſometimes leſs, or little or nothing at all, and changing ſometimes to be wholly red, or wholly bluſh.

XII. 9. *Caryophyllus maximus Flore Rubro, The Red Cryſtal.* The Red hereof, which is changed, is the moſt Orient Flower of all other *Red Gilliflowers*, becauſe it is both the greateſt, as coming from the Cryſtal, as alſo, that the Red hereof is a moſt excellent Crimſon.

XIII. 10. *Caryophyllus maximus dictus fragrans, The fragrant.* It is a fair Flower, and thought to come from the *Cryſtal*, being as large, but of a bluſh red color, ſpotted with ſmall ſpecks, no bigger than Pin points, but not ſo thick as in the *Pageant.*

XIV. 11. *Caryophyllus maximus Subaudicus varius, The ſtriped Savoy.* It is for form and bigneſs equal with the *Cryſtal*, or *White Carnation*, but as inconſtant as either of them, changing into Red or Bluſh; ſo that few Branches with Flowers contain their true mixtures, which are a whitiſh bluſh, fairly ſtriped with a Crimſon Red Color, thick and ſhort, with ſome ſpots alſo among them.

XV. 12. *Caryophyllus maximus Subaudicus Carneus, The Bluſh, or Fleſh Colored Savoy.* It is the ſame with the former, the ſame Root of the *ſtriped Savoy*, as aforeſaid, yielding one ſide or part, whoſe Flowers will be wholly bluſh, or having ſome ſmall ſpots, or ſometimes few or none in them.

XVI. 13. *Caryophyllus maximus Subaudicus ruber, The red Savoy.* It is like the bluſh when the color of the Flower is wholly red, without the mixtion of any Stripes or Spots, and ſo abides long, yet it is ſometimes ſeen, that the ſame ſide or part, or Root, being ſeparate from the firſt or Mother Plant, will give ſtriped and well marked Flowers again.

XVII. 14. *Caryophyllus maximus Oxonienſis, The* Oxford *Carnation.* It is very like to the *French Carnation*, as well for form as largeneſs and color, but that this is of a ſadder red color, ſo finely Marbled with White thereon, that the Red having the Maſtery, it ſhews it like a very ſad Flower, not having any Flakes or Stripes at all in it.

XVIII. 15. *Caryophyllus maximus Regius, ſive Briſtolinenſis major, The Kings Carnation, or Ordinary Briſtol.* It is a reaſonable great Flower, deeply jagged, of a ſad red color, very finally ſtriped and ſpeckled with White; ſome of the Leaves of the Flower on the one ſide will turn up their brims or edges; the green Leaf in this is very large.

XIX. 16. *Caryophyllus maximus Granatenſis, The greateſt Granado.* It is a very fair large Flower, bigger than the *Cryſtal*, and almoſt as big as the *blew Hulo*, it is almoſt equally divided, and ſtriped with Purple and White, but the Purple is ſadder than in the *Ordinary Granado* **Gilliflower**, elſe it might be ſaid to be the ſame, but greater, ſeveral have taken this Flower to be the *Grand Pere*, but the difference will manifeſtly appear in the deſcription of the next Flower.

XX. 17. *Caryophyllus maximus dictus Camberſine, The Camberſine.* It is a fair great Flower, red colored, and well marked or ſtriped with White, ſomewhat like unto a *Savoy*, as ſome ſay, but that the Red is not Crimſon, as the *Savoy* is; or ſomething like to the *Dainty*, as others ſay, but not ſo gallant and ſweet a form; the Leaves of the Flowers are many, cluſtering together, without any due form of ſpreading.

XXI. 18. *Caryophyllus maximus dictus Gran Pere, The Grand Pere.* It is a fair great Flower, and ſweet enough for the form, but of no great beauty for Color, becauſe, although it is ſtriped Red and White, like the *Queens Gilliflower*, yet the Red is ſo ſad, that it takes away all the pleaſantneſs of the Flower.

XXII. 19. *Caryophyllus maximus Longobardicus ruber, The great Lombard red.* It is a great ſad red Flower, ſo double and thick of Leaves, that it moſt commonly breaks its Husk or Pod, and ſeldom ſhews or gives one Flower of twenty perfect; the Blades or green Leaves are as large as the *Hulo.*

XXIII. 20. *Caryophyllus maximus Anglicus, The greateſt Engliſh Carnation*, or *Old Carnation.* It is already deſcribed at large in Chap. 139. Sect. 5. aforegoing of this Book, and is the very Head and Principal, as well as the greateſt and largeſt of all the *Carnations* that are yet known, and to the place now cited I refer you; the Deſcription of this is general, and ſerves to all the nineteen afore enumerated.

XXIV. *The Places.* Theſe all of them are only Garden Plants, and therefore are under the conſtant care of Curious and Diligent Floriſts; they are many times nurſed up in Pots, that they may be removed out of the cold.

XXV. *The Times.* They Flower about the end of *June*, and through all *July*, unleſs the Seaſon is very hot, but if the Weather is temperate, they ſometimes continue Flowering till the end of *Auguſt*, or later.

XXVI. *The Qualities, Specification, Preparations, and Virtues*, are the ſame with thoſe of the *Clove-gilliflower*, of which we have Treated at large in Chap. 139. from Sect. 9. to Sect. 20. and to that we refer you.

CHAP. CCCXVIII.

Of GILLIFLOWER the greater,

OR,

GILLIFLOWER ſimply ſo called.

I. *THE Names.* As we ſaid of the *Great Carnation Gilliflower* in the laſt Chapter, ſo we ſay of this, that it was a Plant wholly unknown to the *Greeks*, though from the *Latin* Name a *Greek* Name, (and very proper in the Language) may eaſily be derived; we call it in *Latin Caryophyllus Hortenſis major*; I know that in Chap. 139. Sect. 3. aforegoing we have called this *Gilliflower Caryophyllus minor*, that is, accounting the *Great Carnation* in the laſt Chapter to be the *Greater Gilliflower*, viz. *Caryophyllus Hortenſis major*, it follows from the reaſon of the Name, that this being a leſſer *Gil-*

liflower

liflower than that, that it may very well be called *Caryophyllus Hortenſis minor*; but if we allow the *Carnation* in the former Chapter to be *Caryophyllus Hortenſis maximus*, then it follows from the ſame reaſon, that this muſt be called *Caryophyllus Hortenſis major*, as aforenamed, and in *Greek* it may be called Καρυόφυλλον ἥμερον μεῖζον, *The Greater Garden Clove*, or *Greater Gilliflower*.

II. *The Kinds.* Of the *Gilliflower* there are alſo many Kinds, Authors account about Thirty Four ſeveral Species, which, becauſe of their great number, and the immediate after repetition of their Names, we ſhall forbear to enumerate them here, and give you their ſeveral Appellations, juſt going before their ſingular Deſcriptions, and that in the following order.

The Gilliflower.

III. The Deſcriptions. 1. *Caryophyllus Hortenſis major Flore pleno miniato*, *The yellowiſh red Gilliflower*, called alſo *Caryophyllus Sileſiacus*, *The Sileſian Gilliflower*, but it has been now ſo long Planted in *England*, that it is become perfectly a Native of our own Country, ſee its Deſcription at large in Chap. 129. Sect. 6. aforegoing, which is alſo a general Deſcription to all the following enumerated in this Chapter.

IV. 2. *Caryophyllus major Weſtmonaſterienſis*, *The Gallant*, *or Weſtminſter*. Some would make this Flower to be two, one bigger than the other, others again make it but one; it ſhews at firſt blowing open of the Flower, to be of a reaſonable Size and Beauty, but after it has ſtood blown ſome time it ſhews ſmaller and thinner, it is of a bright red Color, much ſtriped and ſpeckled with White.

V. 3. *Caryophyllus major Briſtolienſis Purpureus*, *The Briſtol Blew or Purple*. It has large green Leaves, ſo large, that it would ſeem to bring forth a greater Flower than it doth, yet the Flower is of an indifferent Size, and very like unto the *Ordinary Granado Gilliflower*, ſtriped and flaked in the ſame manner, but that the White of this is purer than that, and the Purple is more light, and tending to a Blew; this Flower does not abide conſtant, but changes into a Purple or Bluſh.

VI. 4. *Caryophyllus major Briſtolienſis Carneus*, *The Briſtol Bluſh*. It is very like the laſt both in Leaf and Flower, the Color only ſhews the difference, which ſeldom varies, to be ſpotted, or to change its Color.

VII. 5. *Caryophyllus major Cantij*, *The fair one of Kent*, or *Ruffling Robin*. It is a very beautiful Flower, and almoſt as large as the *White Carnation*, the Flower is white, thick poudered with Purple, in which the White has the Maſtery by much, which makes it ſo much the more pleaſant and delectable.

VIII. 6. *Caryophyllus Sileſiacus magnus*, *Caryophyllus fulvus magnus*, *The great Tawney*. It is for form of growing, in Leaf and Flower altogether like unto the *Ordinary Tawney*, the Flower only, becauſe it is the faireſt and greateſt, makes the difference, as alſo that it is of a deep Scarlet Color.

IX. 7. *Caryophyllus fulvus variabilis*, *The variable Tawney*. There are ſeveral Tawnies, ſome lighter ſome ſadder, either leſs or more double, ſo as they are ſcarcely to be numbred, all riſing from ſowing the Seed of ſome of them, beſides the diverſity of other Colors, both ſimple and mixed, every Year and place yielding ſome variety not ſeen before, which I leave to curious Spectators to give proper Names to, as they ſhall ſee fit.

X. 8. *Caryophyllus major Carneus variabilis*, *The variable Bluſh colored*. Of this there are many ſorts, as the deep Bluſh, the pale Bluſh, the Infants Bluſh, the great Bluſh, and the Bluſh inclining to a Red; but the great Bluſh is the faireſt and moſt double of all the other Bluſhes, of which there are many, both ſingle and double.

XI. 9. *Caryophyllus Ruber variabilis*, *The variable Red*. Of Reds there are ſome varieties, but not ſo many as of the other Colors, for as they are moſt dead or deep Reds, and very few of a bright Red, or Stamel Color, ſo neither Purple nor White riſe from this Seed, that any one has obſerved; they are either ſingle, like Pinks, either ſtriped or ſpeckled; or more double, ſtriped and ſpeckled variably.

XII. 10. *Caryophyllus Heroina*, *didus Elegans*, *The Lady*, *called the Beautiful or Noble*. This may compare for Beauty with moſt of the *Gilliflowers*, the Flower is very neat and fine, tho' ſmall, with a fine ſmall jag, and of a fine white color on the under ſide of all the Leaves, as alſo all the whole jag for a pretty compaſs, and the bottom or middle part of the Flower on the upper ſide alſo, but each Leaf is of a fine bright pale red color on the upper ſide, from the edge to the middle, which mixture is wonderfully delectable.

XIII. 11. *Caryophyllus major Regineus*, *The Queens Gilliflower*. It is a reaſonable fair Flower, altho' very common, and is ſtriped Red and White, ſome great and ſome ſmall, with long ſtripes.

XIV. 12. *Caryophyllus major Carneus*, *The Bluſh Gilliflower*. It differs not much from the Red colored, or Stamel, as to its magnitude or form, but only in the color of the Flower, which is Bluſh.

XV. 13. *Caryophyllus Albus Londinenſis optimus major*, *The greater and beſt London White Gilliflower*. It is admirable to look upon, grows upright, and very double; the blades grow upright alſo, not crawling on the Ground.

XVI. 14. *Caryophyllus Albus Londinenſis vulgaris*, *The common White London Gilliflower*. This is greater and whiter than the *Common White Gilliflower*, and is indeed wholly of one color.

XVII. 15. *Caryophyllus major Dorobornienſis Ruber*, *The Red Dover*. It is a reaſonable large *Gilliflower*, and conſtant, being of a fair Red, thick poudered with white ſpots, and ſhews ſomething like the *Ground Carnation*.

XVIII. 16. *Caryophyllus major Dorobornienſis Dilutus*,

Latas, ſive Albus, The Light, or White Flower. It is for form and all other things more beautiful or delectable than the former; the color of the Flower is Bluſh, thick ſpotted with very ſmall ſpots, that it ſeems all grey, and is very delightful to look on.

XIX. 17. *Caryophyllus major Braſilienſis, The Braſil Gilliflower.* It is but of a middle ſize, being of a ſad purple color, thick poudered and ſpeckled with White, the Purple therein is the chief, which makes it ſhew the ſadder, it is unconſtant, varying much, and often to be all purple; the green Leaves lye matting on the Ground.

XX. 18. *Caryophyllus Roſeus rotundus, The round Gilliflower.* It is of the Kindred of the Tawnies, being raiſed from the Seed of ſome of them, yet it is a different ſort from all others, in that its Leaves are round, without any jag at all upon the edges, of a fine Stamel full color, without any ſpot or ſtrake therein, very like unto a ſmall Roſe, or rather much like unto the *Red Roſe Campion*, both for form, color, and roundneſs, but larger for its ſize.

XXI. 19. *Caryophyllus Sileſiacus ſtriatus, The ſtriped Tawney.* It is either greater or leſſer, deeper or lighter in its Flowers, there being above twenty varieties of them, all ſtriped with ſmaller or larger ſtripes, or equally divided, of a deeper or lighter color; and ſome alſo for the ſhape or form will be more near, cloſe and round, others more looſe and unequal.

XXII. 20. *Caryophyllus Sileſiacus punctatus, The ſpeckled Tawney.* It is of divers ſorts, ſome bigger ſome leſs, ſome more and ſome leſs ſpotted than others, uſually it is of a deep Scarlet, ſpeckled or ſpotted with White, having alſo ſome ſtripes among the Leaves, and ſome more ſtriped than others.

XXIII. 21. *Caryophyllus major Elegans, The Delicate or Delectable.* It is a noble fine Flower, altho' it be not great, and for the ſmallneſs and thinneſs of the Flower, being red, ſo finely marked, ſtriped and ſpeckled, that for the livelineſs of the Colors, it becomes delectable to the Eye, and much to be deſired, being inferior to very few *Gilliflowers*.

XXIV. 22. *Caryophyllus major Granatenſis, The Granado Gilliflower.* It is Purple and White, flaked and ſtriped very much; this is alſo much ſubject to change Purple: there is of this Kind a greater and a leſſer, beſides the greateſt, which is formerly deſcribed.

XXV. 23. *Caryophyllus Sileſiacus Plumatus, The Feathered Tawney.* This is more rare to meet with than many of the others, it is moſt uſually a fair large Flower, and double, equalling the *Lumbard Red* in its perfection, the Color hereof is commonly a Scarlet, a little deeper or paler, very curiouſly Feathered, and Streamed with White thro' the whole Leaf.

XXVI. 24. *Caryophyllus Sileſiacus Marmor æmulans, The Marbled Tawney.* This has not ſo many varieties as the Striped, but is of as great beauty, and as delectable as it, or more, the Flowers are greater or ſmaller, deeper or lighter colored one than another, and the Veins or Marks more conſpicuous, or more frequent in ſome than in others; but the moſt beautiful of all is the *Princeſs* following.

XXVII. 25. *Heroina Florum Rudolphi Imperatoris, The Princeſs.* This is the greateſt and faireſt of all theſe ſorts of Variable Tawnies, or Seed Flowers, being as large fully as the *Prince* or *Cryſtal*, or ſomething greater, ſtanding comly and round, not looſe or ſhaken, or breaking the Pod or Husk, as ſome other ſorts will; the marking of the Flowers is in this manner, it is of a Stamel Color, ſtriped and marbled, with white Stripes and Veins quite thro' every Leaf, which are as deeply jagged as the *Hulo*, ſometimes it has more Red than White, and ſometimes more White than Red, and ſometimes ſo equally matched or marked, that you cannot diſcern which is moſt; yet which of theſe has the predominance, the Flower is ſtill very beautiful and delightful to behold.

XXVIII. 26. *Caryophyllus Sileſiacus aſſuloſus, The flaked Tawney.* This is another diverſity of theſe variable or mixt colored Flowers, being of a pale reddiſh color, flaked with White, not always down right, but oftentimes athwart the Leaves, ſome more or leſs than others, the marking of them is much like the *Cryſtal*; theſe alſo, as well as the others, will be greater or ſmaller, and of greater or leſſer beauty than others.

XXIX. 27. *Caryophyllus Turcicus, The Turky Gilliflower.* This is but a ſmall Flower, but of great delight, by reaſon of the well marking of the Flower, being moſt equally ſtriped with Red and White.

XXX. 28. *Caryophyllus purpureo cæruleus, The blew Gilliflower.* This is neither very double nor very great, yet round and handſom, with a deep jag at the edge, and is of an exceeding deep Purple Color, tending to a Tawney, it differs from all other ſorts, in that the Leaf is as green as Graſs, and the Stalks many times Red or Purple; by the green Leaves it may be known in the Winter as well as in the Summer.

XXXI. 29. *Caryophyllus Cambrenſis Poole, The Cambrey, or Poole Flower.* It grows naturally upon the Rocks, near *Cogſhot Caſtle*, in the *Iſle of Wight*, is a ſmall Flower, but very delectable to the Eye, becauſe of the ſweet and beautiful proportion thereof; it is of a bright pale Red, thick ſpeckled, and very ſmall, with White, ſo that it ſeems to be but one color; the Leaves of the Flower are but ſmally jagged about, and it keeps conſtant to its form.

XXXII. 30. *Caryophyllus Perſico Violaceus, The Gredeline Gilliflower.* It is a very neat and handſom Flower, of the bigneſs of the *Red Clove-Gilliflower*, of a fine pale reddiſh Purple, or Peach Color, enclining to a Blew or Violet, which is that Color which is uſually called a Gredeline Color; it has no affinity with either *Purple*, *Granado*, or *Pageant*.

XXXIII. 31. *Caryophyllus Pegma dilutior, The light or pale Pageant.* It is a Flower of a middle ſize, very pleaſant to behold, and is both conſtant and beautiful, if it was not ſo common, it would be much more valued than it is; the Flower is of a pale bright Purple, thick poudered, and very equally, with White, which has the Maſtery, and makes it much the more pleaſant and graceful.

XXXIV. 32. *Caryophyllus Purpureus major & minor, The Purple Gilliflower greater and leſſer.* The Stalk of it is ſo ſlender, and the Leaves upon it ſo many and thick, that it lyes and trails on the Ground, the greateſt is almoſt as large as the *Cryſtal*, but not ſo double; the leſſer has a ſmaller Flower.

XXXV. 33. *Caryophyllus Pegma ſaturatior, The ſad or deep colored Pageant.* It is the ſame with the former in Sect. 33. aforegoing as to its form and bigneſs, the difference is chiefly in the Color, for the Purple in this is the chief, which makes it ſo ſad, that it reſembles the *Braſil* for color, but not ſo large as it by half.

XXXVI. 34. *Caryophyllus ruber major & minor, The Stamel Gilliflower greater and leſſer.* It is well known, almoſt to every Body, and differs little from the *Common Red Clovegilliflower*, but only in its being of a brighter or light red color; of this Kind there is both a greater and a leſſer.

XXXVII. *The Places.* Theſe all grow in the Gardens of Induſtrious Floriſts in many parts of this Kingdom,

Kingdom, and are to be found in the Flower Gardens of moſt other parts of *Europe*.

XXXVIII. *The Times.* They begin to Flower about the end of *June*, and keep on Flowering thro' all *July* and *Auguſt*, and many times thro' all *September*, even almoſt to the latter end of *October*, if the Weather is mild.

XXXIX. *The Qualities, Specification, Preparations and Virtues*, are the ſame with thoſe of the *Clovegilliflower* in Chap. 139. from Sect. 9. to Sect. 20. to which I refer you; but theſe wanting that wonderful deep Red, cannot give ſo admirable a Tincture to a Syrup, as the *Clovegilliflower* can do, and therefore (tho' full as Cordial, yet) are leſs uſed in Phyſick.

XL. *Nota.* It is ſaid by our Moderns, that none of theſe Flowers were in the leaſt known to the Ancients, and yet ſome will have them to be the *Cantabrica Plinij*, others to be the *Iphium Theophraſti*, mentioned in *Lib.* 6. *Cap.* 6. and 7. among his Garden and Summer Flowers; others to be his *Dios Anthos*, or *Flos Jovis*, mentioned in the former and other places; we will not determine the Controverſie, but leave every one to his Conjectures.

GLADDON Stinking. *See* FLOWER-DELUCE Wild *Chap.* 294.
GLADIOLUS. *See* CORN-FLAG *Chap.* 154.

CHAP. CCCXIX.

Of GOATS--BEARD,

OR,

NOON--FLOWER.

I. *THE Names.* It is called in *Greek* Τραγοπώγων, ἢ Τραγοπώγων, in *Latin Tragopogon*, *Barba Hirci*, *Barbula Hirci*, alſo Τραγοπωγων, *Barba Senis*, in *Engliſh Goats-Beard*, *Noon-Flower*, *Noon-Tide*, *Joſephs Flower*, and *Star of Jeruſalem.*

II. *The Kinds.* There are ſeveral Kinds hereof, *viz.* 1. *Tragopogon luteum*, Garden Yellow Goats-Beard. 2. *Tragopogon purpureum*, Purple Goats-Beard. 3. *Tragopogon luteum anguſtifolium*, Common Goats-Beard with narrow Leaves. 4. *Tragopogon Flore cæruleo*, Blew Goats-Beard. 5. *Tragopogon Apulum ſuave rubens*, *Tragopogon Americanum*, American or Roſe colored Goats-Beard. There are five or ſix other Kinds, but not being found growing in our Country, or in our Gardens, nor in any of our *American* Plantations, we ſhall here paſs them by.

III. The Deſcriptions. *The firſt, or* Garden Yellow Goats-Beard, *has a Root which is long and round, ſomewhat like unto a* Parſnep, *but far ſmaller, blackiſh on the outſide and white within, which being broken yields a milky Juice, as all the reſt of the Plant does, and of a very good and pleaſant taſte*; from which Root riſes up a Stalk, or Stalks, of two or three Feet high, ſmooth and hollow, bearing many long and narrow Leaves, broader at the bottom, and ſharper at the end, with a ridge down the back of the Leaf, and of a pale green color; the higher theſe Leaves grow on the Stalks, the ſmaller and ſhorter they are, and at the tops on every Branch grows a great double yellow Flower, like almoſt to the Flower of a *Dandelion*, which turns into a head, ſtored with Down, and long whitiſh Seed therein having on the head of every one ſome part of the Down, which (if neglected) is carried away with the Wind.

Goats-Beard Yellow.

IV. *The ſecond, or* Purple Goats-Beard, *has a Root which is long and ſingle, (much like to the former) with ſome few Threads thereto adjoining, which periſhes when it has perfected its Seed, yielding a great quantity of a milky Juice when it is cut or broken, as does all the reſt of the Plant*; from whence riſes a hollow Stalk, or Stalks, ſmooth, and of a whitiſh green color, which ſpreads it ſelf out into other Branches, on which Stalks and Branches do grow long Leaves, creſted down the middle with a ſwelling Rib, and ſharp pointed, yielding a milky Juice when it is broken, and are in ſhape like thoſe of *Garlick*; from the bottom of which Leaves ſmall tender Stalks ſpring forth, ſet with the like Leaves, but leſſer; the Flowers grow at the tops of the Stalks, conſiſting of a number of Purple Leaves, daſhed over, as it were, with a little yellow duſt, ſet about with nine or ten ſharp pointed green Leaves; the whole Flower reſembles a Star when it is ſpread abroad, for it ſhuts its ſelf at Twelve of the Clock, and ſhews not its open face until the next days Sun doth make it ſpread its ſelf, or open again, for which reaſon it was called *Noon-Flower*, and by ſome *go to Bed at Noon:* when theſe Flowers are come to their full maturity, they grow into a Downy Head, like thoſe of *Dandelion*, which is carried away with the Wind; the Seed is long, having at its upper end ſome ſmall portion of that downy matter faſtned to it.

V. *The third, or* Common Goats-Beard with narrow Leaves, *is very much like to the firſt* Yellow Kind, *it has a thick Root full of a milky Sap, from which riſes up many Leaves ſpread upon the Ground, very long, narrow, thin, and like unto thoſe of* Graſs, *ſaving, that they are thicker and groſſer*; from among which riſe up tender Stalks, on the tops of

when do hand fair double yellow Flowers, like to the firſt afore deſcribed, but leſſer; the whole Plant yields a milky Juice, as the others do; it periſhes alſo as the others do, after it has perfected its Seed; indeed it is very much like to the former *Yellow Kind*, but that it is not ſo great, nor riſes ſo high, has much narrower Leaves, even like to *Graſs*, and almoſt as long, but not ſo manifold, the Flower only differing in its magnitude, as aforeſaid.

VI. *The fourth, or* Blew Goats-Beard, *has a Root which is long, and not very great, periſhing as ſoon as it has born Seed, ſpringing up again of the falling Seed, and ſo remaining green all Winter, and Flowering the next Year following.* From this Root riſes up a Stalk greater and ſtronger than that of *Scorzonera*, or *Vipers-Graſs*, it is repleniſhed with long, narrow, and ſomewhat hollow, whitiſh green Leaves, with a white Line down the middle of every one, on the upper ſide; at the top of the Stalk grows a great long Head or Husk, compoſed of nine or ten long narrow Leaves, the ſharp points or ends of which riſe up above the Flower in the middle, which is thick and double, ſomewhat broad and large ſpread, of a blewiſh Aſh Color, with ſome whitiſh Threads among them, ſhutting or cloſing it ſelf within the green Husk every day at Noon, (for ſo long time as the Flowers continue) and not opening again until the next Morning; after the Flower is paſt, the Head or Husk, the Seed being near ripe, opens it ſelf, the long Leaves thereof, which cloſed not before now, falling down round about the Stalk, and ſhewing the Seed, ſtanding at the firſt cloſe together, and the Down at the top of them, but after a while it ſpreads it ſelf round, and if not gathered, will be carried away with the Wind; the Seed is long, round, and rough, like the Seed of *Vipers-Graſs*, but greater and blacker.

VII. *The fifth, or* American, *or* Roſe colored Goats-Beard, *has a Root which is long and ſlender, and is the ſmalleſt Root of all the* Goats-Beards, *white downwards, and ſomewhat hard, but more reddiſh at the top*, which ſends forth many long and narrow Leaves, like unto *Graſs*, with a white Line in the middle of them, ſmooth and ſoft if you ſtroak them upwards, but as rough as Barley Leaves ſtroaking them downwards, and broadeſt at their joining to the Stalk; the Stalk is about two Feet high, ſcarcely dividing it ſelf into any Branches, but bears at the top one great and large head, (which is great in reſpect to the Plant) parted into eight long Leaves or Beards, in the middle of which is the Flower, conſiſting of ten or twelve Leaves, of a pale purple, or rather of a bluſh color, near unto a Damask Roſe, having ſeveral blackiſh blew Threads in the middle, with a mealy duſt upon them, which being paſt, the Head or Husk grows ſomewhat narrow, with a long Neck, containing within it the Seed, which is not faſhioned into a round Globe like form, with Down at the heads of the ſeveral Seeds, as in all the former, but it has five longer and greater Seeds on the outſide, with little or no Down at the ends of them, and ſome leſſer Seeds in the middle, which have a little Down on their heads, being yellowiſh and ſmooth, but the leaſt of all others.

VIII. *An Obſervation.* Theſe *Goats-Beards* are very like to the *Scorzonera's*, or *Vipers-Graſſes*, in their outward form and manner of growing, and therefore are *Species ejuſdem generis*, but the *Tragopogon*, or *Goats-Beard*, is the Genus or Standard, and the *Scorzonera's* are *Species* of the *General Kind*, but herein they chiefly differ, that whereas all the ſorts of *Tragopogon's* are Annual Plants, periſhing every Year, after they have born their Seed; it is certain that all the ſorts of *Scorzonera's* are Perennial Plants, enduring after Seed time for many Years, as in their proper place we ſhall hereafter at large declare.

IX. *The Places.* The firſt and third grow in Gardens with us, but are alſo found wild in many places of this Land, *Gerard* ſays they grow in Meadows and Fertile Paſtures in moſt places of *England*, they grow plentifully in moſt of the Fields about *London*, as at *Iſlington*, and in the Meadows by *Redriff*, *Deptford*, and *Putney*, and in divers other places; the third is found in Meadows (as aforeſaid) about *London*, and many other places of the Kingdom, but not ſo plentifully as the firſt Kind; the ſecond, or *Purple Kind*, came to us from *Italy*, where it is ſaid to grow wild; it has alſo been found growing wild in ſome parts of *Lancaſhire*, on the Banks of the River *Chalder*, near to the Houſe formerly the Lady *Heskiths*, two Miles from *Whaley*, but it is now Sown in Gardens almoſt every where, for the beauty of the Flowers; the fourth, or *Blew Kind*, came to us alſo out of *Italy*, where it is ſuppoſed to grow wild, but with us is only nurſt up in Gardens, for its pleaſant Flowers; the fifth Kind is found growing on the Hills in *Naples*, as *Columna* reports, and I have found it growing wild in ſeveral parts of *Florida*, but with us in *England* it is purely a Garden Plant.

X. *The Times.* They all of them Flower from the latter end of *May* thro' all *June* and *July*, and the Seed comes to perfection in the mean time, being ripe in *July* and *Auguſt*.

XI. *The Qualities.* *Goats-Beard* is temperate in reſpect of heat or cold, drineſs or moiſture, a little Aſtringent, Stomatick, Hepatick, Alexipharmick, and Analeptick.

XII. *The Specification.* They are all Reſtoratives in Conſumptions, and expel Gravel from the Reins and Bladder.

XIII. *The Preparations.* You may have therefrom, 1. *The boiled Roots, or Roots raw.* 2. *A Decoction.* 3. *A diſtilled Water from the Root.* 4. *Sanguis, or Blood of the Root*, there being no other part of the Plant uſed.

The Virtues.

XIV. *The Root it ſelf.* The Roots of any of the Kinds being boiled, but more eſpecially of the firſt *Yellow Kind*, and of the third alſo, and dreſſed as *Parſneps*, are much more delicate and pleaſant to the Taſte in eating, they comfort the Stomach, are good againſt Heart-burnings, ſtrengthen the whole Body, and reſtore in Conſumptions; the Roots of the *Yellow Kind* are many times eaten raw, as a Sallet, being ſliced, and ſo eaten with Pepper, Salt, and Vinegar, by which means the Stomach is alſo ſtrengthened, and they are reſtored which are going into a Conſumption, or are become Spare and Lean by long Sickneſs; the *Yellow Kinds* are chiefly uſed as *Parſneps*, and for Salleting; the other Kinds are not altogether ſo fit for that purpoſe, being more bitter, aſtringent, and abſterſive, having a more cleanſing and binding quality than the others have, and therefore are moſtly uſed in a Medicinal way; the *Yellow Kinds* make a pleaſant Diſh of Food, far ſurpaſſing the *Parſnep*.

XV. *The Decoction.* It is good againſt the pain of the Stomach, and to expel the malignity of the Plague, and all ſorts of Peſtilential Diſeaſes; it prevails againſt Heartburnings, and a dejected Appetite, inciting and ſtirring it up; and it is good alſo againſt Affects of the Breaſt, Liver, Reins, Ureters and Bladder, expelling Sand, Gravel, Stones, and Tartarous Matter from thoſe parts, for which reaſon the *Italians* call it *Saſſi Frica*, Break-Stone.

XVI. *The*

XVI. *The Distilled Water* *Tragus* says it is the most present Remedy that is, to help or break inward Apostems, and to give Relief in the Pleurisie, and other Pains and Stitches in the Sides, to help the Heartburn, strengthen the Stomach, and stir up Appetite

XVII. *Sanguis*, or, *The Blood of the Roots.* It is made as that of *Satyrion*, *Parsnep*, *Comfrey*, *&c.* and has all the Virtues of the boiled Root, Decoction, or Distilled Water; it is indeed a most excellent thing to restore such as are in deep Consumptions, being constantly taken Morning, Noon, and Night, for some considerable time, with Milk warm from the Cow, and sometimes with a Glass of Generous Wine.

CHAP. CCCXX.

Of GOATS-RUE,

OR,

GOATS-HERB.

I. *THE Names.* It is an Herb which was unknown to the *Greeks*, but is called by the *Latins Galega*, and *Ruta Capraria*, some have erroniously called it *Gralega*, and *Fracastorius* called it *Herba Gallica*, and some only *Capraria*, (from the Goats eating it) some call it *Thorina*, or *Taurina*, *Sarracena*, and *Capragina*, also *Giarga*, as *Brassavolus* saith, and by us in *English Goats-Rue.*

II. *The Kinds.* There are two Kinds of this Plant, *viz.* 1. *Galega vulgaris*, *Ruta Capraria vulgaris*, Our Common Goats-Rue. 2. *Galega Montana Dalechampij Lugdunensis*, Mountain Goats-Rue.

III. The Descriptions. *The first, or* Common Goats-Rue, *has a Root which is white and Woody, spreading well in the Ground, and abiding several Years*; from this Root come forth many round hard Stalks, four or five Feet high, on which grow one above another at several Joints, long winged Leaves, *viz.* many smaller Leaves set on each side of a middle Rib, which Leaves are small, yet somewhat broad and long, and sharp pointed at the ends, and smooth on the edges, without any dents, something like unto the Leaves of *Vetches* or *Tares*, and of a faint green color; at the tops of the Stalks stand many small Leguminous Flowers, one above another, of a pale blewish purple color, and in some Plants purely white, which being past away, small round Pods or Cods come in their places, about an Inch and half long, a little bunched out in some places, but nothing so much as the *Orobus*, or *Bitter Vetch*, in which lye three, four, or five pale Seeds, like unto those of the *Vetch* or *Tare.*

IV. *The second, or* Mountain Kind, *has a Root which is somewhat great and black, sending forth very long Strings, whereby it Roots its self deep in the Ground*; from which several round hard Stalks shoot forth, but nothing so high as the former, on which grow such like winged Leaves at every Joint, but broader, and thicker set together, smooth also on the edges, but having the middle Rib of every Leaf raised up a little high; at the tops of the Stalks stand divers such like Flowers as the former, but all on one side, of a pale color, tending to yellow, which afterwards yield small long blackish Pods, in which lye small flatish Seed, like to *Lentils.*

V. *The Places.* The first grows commonly wild by the Way sides of moist Fields and Meadows in *Italy*, *Savoy*, and other Southern Climates; it is also found growing wild in *England*, as in the Meadows by *Linton* in *Cambridgshire*: the second grows on the tops of Mountains, where any Planes are found; and I am informed by a very good Botanist, that he has met with it upon some of the Mountains in *Wales.*

VI. *The Times.* They Flower about the latter end of *June*, and thro' all *July*, and the Seed is ripe in *August.*

VII. *The Qualities.* It is temperate in respect of heat and cold, driness and moisture; it is Aperitive, Absterstive, and Carminative, Cephalick, Neurotick, Stomatick, and Cardiack, Sudorifick, and Alexipharmick.

VIII. *The Specification.* It cures all sorts of Poysons, whether inwardly taken, or outwardly received, by the Bitings of Serpents, as Vipers, Rattle-Snakes, or other venomous Creatures; or impressed by Contagion, as that of the Plague, Spotted Fever, or any other kind of Pestilential Distemper.

IX. *The Preparations.* You may have therefrom, 1. *A Sallet of the Herb.* 2. *A Liquid Juice.* 3. *An Essence.* 4. *An Infusion or Decoction in Wine or Water.* 5. *An Electuary.* 6. *A Cataplasm.* 7. *A Distilled Water.* 8. *An Acid Tincture.* 9. *An Oily Tincture.* 10. *A Spirituous Tincture.*

The Virtues.

X. *The Sallet.* The Herb it self is eaten, being boiled with Flesh, as we use to boil and eat *Cabbage* and *Coleworts*; it is also eaten as boiled *Spinage*, and other Sallets, with Pepper, Salt, Vinegar and Oil; and being so eaten, it is said to be exceilent against all sorts of Poysons, and the malignity or infection of the Plague or Pestilence, or the Bitings of venomous Creatures, *&c.*

XI. *The Liquid Juice.* It is effectual against the Biting of Vipers, Rattle-Snakes, or other Serpents, Bitings of Mad Dogs, the Stinging of Scorpions,

or the Poyſon of other venomous Creatures; it is alſo effectual againſt Vegetable Poyſons, as alſo the malignity of the Plague, or Peſtilence it ſelf, and the infection of other Peſtilential or Contagious Diſeaſes, as Purples, Meaſles, Small Pox, Spotted Fever, and Calenture; againſt all theſe Diſeaſes it is admirable, for it both preſerves from the infection, and perfectly cures ſuch as are infected; Doſe two or three Spoonfuls every Morning faſting in a Glaſs of Generous Wine, and as much at Night going to Bed, by way of prevention; but for Cure, it ought to be given in *Angelica* Water, in the ſame, or larger Doſe, according to the Age and Condition of the Patient, and to be repeated as often as the exigency or vehemency of the Diſeaſe requires. This Juice given alſo in a Morning faſting, kills Worms in Children, or Elder People, and cures the Falling-Sickneſs if given before it grows too old and ſtrong upon the Patient: when it is given in the Plague, *&c.* Bitings of Mad Dogs, Vipers, *&c.* the Patients ought to be in their Naked Bed, and made to Sweat thereupon for two or three Hours or more together.

XII. *The Eſſence.* It has all the Virtues of the Liquid Juice, but acts more ſpeedily and powerfully, it expels the Poyſon and Malignity by Perſpiration, and ſo defends the Heart and Vital Powers; it is an extraordinary thing to cleanſe, dry, and heal green Wounds, as alſo old and running Ulcers, putrid Sores, and virulent Fiſtula's, deſtroying the malignity, hindring their eating and ſpreading, and defending the Principal Parts and Vital Powers from danger; it is a ſingular good Cordial, ſuppreſſes Vapors, reſiſts Melancholy, is good againſt Tremblings and Convulſions, prevails againſt Swooning Fits, revives the Spirits, and chears the Heart, preſerving it from Palpitations, and other illneſſes which oppreſs it, Doſe one or two Spoonfuls in a Glaſs of Canary, or other fit Vehicle.

XIII. *The Infuſion or Decoction in Wine or Water.* Either of them may be given in all the Caſes in which the Juice or Eſſence are given in, but as they are much weaker in their Effects, ſo they muſt be given in much greater Doſe, as from a Quarter of a Pint to Half a Pint, and alſo to be oftener repeated, as the neceſſity may require.

XIV. The Electuary. *Take Pouder of Goats-Rue four Ounces, Zedoary in Pouder, Contra-yerva, Virginia Snake-root, all in fine Pouder, of each one Ounce, Saffron, Cochenele, of each two Drams, Rob of Goats-Rue twenty Ounces, mix and make an Electuary.* It is good againſt all ſorts of Poyſons, both Vegetable and Animal, as alſo againſt the Plague, and all other infectious Diſeaſes, and has indeed all the Virtues of the *Liquid Eſſence* and *Juice*; Doſe from one Dram to two Drams, in any proper Vehicle.

XV. *The Cataplaſm.* It is made of the bruiſed Herb, fryed or made hot with Vinegar, and then brought to a conſiſtence with Mithridate and Pouder of Bay Berries, adding alſo a little Aloes in fine Pouder; applied to the Region of the Heart, it is good againſt the infection of the Plague, and other malign Diſeaſes; applied to the Navel, and over the whole *Abdomen*, it eaſes the Cholick, and is very effectual to kill Worms in Children; applied to, and bound pretty hard upon the Pulſes of the Wriſts, it is good againſt remitting Fevers, and cures Agues of all ſorts, hindring their return; applied to putrid and malign Ulcers, it cleanſes them, deſtroys the malignity, ſtops the flux of Humors, dries them, and in a very great meaſure induces their healing; applied to Gangreens it ſtops their proceeding.

XVI. *The Diſtilled Water.* It has the Virtues of the Juice and Eſſence, but in a much lower degree, and therefore muſt be given in a much larger Doſe; however it is uſed as a *Vehiculum* to convey the former Preparation in, where the Phyſician ſhall judge Wine to be too hot; to nice and delicate Palates the Diſtilled Water is oftner given than either Juice or Eſſence.

XVII. *The Acid Tincture.* It has all the Virtues of the Juice and Eſſence, whether inwardly taken, or outwardly applied; it is a Specifick againſt the Plague, as alſo againſt all other Malign and Peſtilential Diſeaſes, and cures the moſt violent burning Fevers in a very ſhort time, taking away the violence of their burning heat in the ſpace of an Hour, Doſe ſo many drops as to make the Vehicle pleaſantly ſharp, and to be given in all that the Patient drinks.

XVIII. *The Oily Tincture.* It is good againſt the Bitings of Venomous Creatures, being taken from ten to twenty drops in any proper Vehicle; it is alſo good againſt Convulſions, Palſies, Lameneſs, Numbedneſs, Tremblings, weakneſs of the extream parts, Gripings of the Bowels, Wind, Stone, Gravel, Sand, and Tartarous Matter obſtructing the Urinary parts, as alſo againſt the Colick, Gout in Hands, Arms, Hips, Knees, or Feet, being inwardly taken, and outwardly applied to the parts affected, as the Skilful Phyſician ſhall direct; in the Palſie, beſides giving it inwardly, and applying it to the afflicted parts, it ought alſo to be anointed upon the Back Bone every Morning and Evening.

XIX. *The Spirituous Tincture.* It has all the Virtues of the Juice, Eſſence, and Electuary, and as it is finer and more Spirituous, ſo it is more ſubtil and penetrating, and when dulcified with double refined Sugar, more pleaſant to be taken, and a more delicate Cordial, and therefore more fit to be given to the more curious and nice Palates; it may be taken a Spoonful or more at a time, (as you may ſee convenient) either alone by it ſelf, or mixt with ſome other Vehicle, as Canary, White *Lisbon*, or other like Generous Wines; it is indeed an excellent thing againſt Sickneſs at Heart, as alſo againſt Fainting and Swooning Fits; it is indeed good againſt all cold and moiſt Diſeaſes of the Head, Brain, Nerves, Joints, Bowels, Reins, and Womb; it rectifies and enlivens the depauperated Juices, revives the Spirits, tho' never ſo much oppreſt, and gives relief in the moſt profound Melancholy; it is good againſt a Vertigo, and Megrim, and is excellent againſt a Coma, Carus, and Lethargy, or where the Patient is inclined to Sleepineſs and Drowſineſs; and if it is given with a few drops of the Acid Tincture, it repreſſes Vapors, and effectually cures Fits of the Mother.

CHAP. CCCXXI.

Of GOATS--STONES, *OR,* HARES--STONES.

I. *THE Names.* This Plant is called in *Greek*, Τραγόρχις: in *Latin*, *Tragorchis*, *Teſticulus Hircinus*, *Scincophora*, and *Orchis ſaurodes*: in *Engliſh*, *Goats-ſtones*, and *Hares-ſtones*.

II. *The Kinds.* There are two principal kinds hereof, *viz.* 1. *Tragorchis mas*, *Teſticulus Hircinus mas*, *Scincophora mas*, The Male Goats-ſtones. 2. *Tragorchis fœmina*, *Scincophora fœmina*, The Female Goats-ſtones. Theſe *Orchides* are thus named, not only

only because they have a foul strong Scent, like that of the Goat, but also that most of them have long Tails, like Beards, hanging down from them.

III. Of the *Male kind*, which is the *Greater Goats-stones*, there are two Species, *viz.* 1. *Tragorchis mas maxima*, The greatest Male Goats-stones. 2. *Tragorchis mas magna*, *Tragorchis vulgaris magna*, The common great Goats-stones.

IV. Of the *Female kind*, which is the *Lesser Goats-stones*, there are three Species, *viz.* 1. *Tragorchis fœmina minor*, *Tragorchis minor verior*, The true lesser Goats-stones. 2. *Tragorchis Batavica Clusii*, *Tragorchis minor Batavica*, The Dutch Goats-stones, *or* Hares-stones. 3. *Tragorchis minor Austriaca*, *Tragorchis altera purpurea*, Austrian Goats-stones, Goats-stones with purple Flowers.

V. The Descriptions. *The first, or* Greatest Male Goats-stones, *has Roots consisting of two Testicles, like to other* Orchides, *but greater, from whence rise up Leaves, lying upon the Ground, which are broad, large, and ribbed in some sort like to our* Plantane, *but somewhat shorter.* From among these Leaves grows up a Stalk, about half a yard high, set with such like great Leaves, but growing a little narrower as they grow higher, growing up even to the top of the Stalk by equal Distances. The Bush of Flowers grows at top of the Stalk in Spike-fashion: the Flowers are small and flat, open, and wholly of a purple color, set in a Row, and in an excellent Order; each Flower has a long crooked Thread or String proceeding from its middle part, and hanging down, which twine themselves one in another, like to the small Tendrils of the *Vine*, or rather the Laces or Strings which grow upon the Herb *Savory*: both the Hood and the Tail are spotted, and have a strong Scent.

Great Common Goats-stones.

VI. *The second, or* Common great Goats-stones, *has a double tuberous or testiculous Root, like the former, saving that the Testicles are something less; from whence spring up Leaves, like to those of the* Garden Lilly, *with a Stalk a Foot or more long, wrapped about, even to the Tuft of the Flowers with those kinds of Leaves:* the Flowers which grow in this Bush, shoot forth in a Spike Form, and are very small, in Form like to a Lizard, because of the twisted or writhen Tails, and spotted Heads. Every one of these small Flowers is at first like a round close Husk, of the Bigness of a *Pea*; which, when it opens, there comes out of it a little, long and tender Spur or Tail, white towards the setting of it to the Flower; the rest spotted with red Dashes, having upon each side a small thing adjoining unto it, like to a Leg or Foot: the rest of the said Tail is twisted crookedly about, and hangs downwards. The Leaves of this sort are indeed longer and narrower than the former; the Flowers are smaller, whiter, and spotted with reddish Spots, and the Tails are more twining. The whole Plant is as strong as the first, and has a rank, stinking Smell or Savor, like the Smell of a Goat, from whence this, as well as the former and all the following, have derived their Names.

VII. *The third, or* True lesser Goats-stones, *has its Root or Testicles much less than either of the former, with several narrower and long* Leaves *(a little ribbed) rising from the same, which do as it were enclose a single Stalk, which is also enclosed about with like but smaller Leaves, to the beginning of the spiked Head of Flowers.* These Leaves are much less than those of the two first described, and the Flowers are without Spurs or Tails, and somewhat like in Shape to those Insects called Sows or Wood Lice for their Proportion; and they are somewhat of a brownish color. *Gerard* says, That the Flowers much resemble our common Flesh Flies. The Smell of the whole Plant does much more resemble the rank Smell of a Goat, than any of the other kinds.

VIII. *The*

VIII. *The fourth, or* Dutch Goats ſtones, *is a very ſmall Plant, not much above a Span long or in Height, having a ſmall teſticulous Root, like the laſt:* from which riſes up a Stalk eight or nine Inches high, having three or four Leaves encompaſſing it. The top of the Stalk ends in a ſmall ſpiked Head of Flowers, of a fine purpliſh red color on the inſide, and paler without, having a Belly or Lip hanging down, which is terminated in three ſhort and equal parts.

IX. *The fifth, or* Auſtrian Goats-ſtones, *has, like all the former, a teſticulous Root, which ſends forth* Lilly *like Leaves, of a pale green color, with ſome ſmaller about the Stalk, which is about a Span high:* towards the top it has a ſpiked Head of Flowers, which are either of a whitiſh or pale color, without any Spots, or elſe purple, with ſome purple Leaves under them, each of which is hooded and eared, with a hanging Belly, notched as it were at the bottom. The whole Plant ſmells of a rank Goat like Smell, for which Reaſon it is brought into the Claſſis or Rank with the four former.

X. *The Places.* All the ſorts grow chiefly in fat Clay Grounds, and are ſeldom to be found in any other Soil. The fourth has been found not only in *England*, but alſo in *Holland*, about the *Hague*; as alſo in other Parts, about their Sea-Coaſts. The laſt is a Native of *Auſtria*, and not to be found with us, except in Gardens of the moſt exact Floriſts.

XI. *The Times.* They flower in *May* and *June*, when other kinds of *Orchides* flower.

XII. *The Qualities, Specification, Preparations and Virtues*, are the ſame with the *Cynoſorchides* or *Dogs-ſtones* in Chap. 226. aforegoing, ſo that no more need be ſaid thereof in this place: but *Lugdunenſis* from *Dodonæus* ſays, That the Roots of theſe *Orchides* are preferable to all others.

CHAP. CCCXXII.

Of GOLD--LOCKS, OR, GOLDEN--TUFTS.

I. *THE Names.* It is called in *Greek*, Χρυσοκόμης: in *Latin*, *Chryſocome*, and *Coma aurea*; and in *Engliſh*, *Gold-locks*, or *Golden-tufts*.

II. *The Kinds.* Authors make ſeveral ſorts hereof, but the following three are chief, *viz.* 1. *Chryſocome verior*, *Coma aurea Dioſcoridis*, The true Gold-locks of Dioſcorides. 2. *Chryſocome lutea*, *Coma aurea, & Amarantlus luteus Lobelii & Fuchſii*, Yellow Tufts, *or* Caſſidony. 3. *Chryſocome peregrina ſecunda Claſii*, *Chryſocome Cretica altera*, Wild Gold-tufts. The firſt of theſe is doubtleſs the *True Chryſocome* of *Dioſcorides* and *Pliny*; but is called by ſeveral other Names by later Authors, as, *Linaria aurea Tragi*, *Lunaria auſtriaca Camerarii*, *Oſyris auſtriaca Claſii*, *Lanoſyris nuperorum Lobelii*, *&c.*

III. The Deſcriptions. *The firſt, or* True Gold-locks of Dioſcorides, *has a Root which is hard and woody, at its Head ſhooting forth many blackiſh Fibres into the Ground. From this Root ſpring forth many hard round Stalks, half a Yard high, ſomewhat thick ſet, but unorderly, with narrow, long, green Leaves up to the tops*, where they branch forth into divers ſmall Sprigs, with ſmaller and ſhorter Leaves thereon than on thoſe below, and bearing round Heads of Flowers, compoſed of Gold-yellow Threads, riſing from the middle of a few green Leaves, which are as a Husk to each of them, and abiding a long time in Flower, and alſo in their full Beauty; but *Columna* ſays theſe Flowers laſt not full out a Month, at the end of which time, fading, they turn into Down, which, with the ſmall yellow Seed, of a greyiſh color, flies away with the Wind. The Stalks die and periſh yearly, and new ones riſe up again in the Spring.

True Gold-locks of Dioſcorides.

IV. *The ſecond, or* Yellow Tufts, *or* Caſſidony, *has a ſmall and black Root, with ſome Fibres adjoining to it; from which ſpring up one or more Stalks, eight or nine Inches in Height, ſpread out into ſeveral hoary Branches, with long and narrow whitiſh Leaves, diſperſedly growing thereon, up to their tops, where the Flowers appear in Umbles*, each Branch bearing a large Tuft of ſcaly, yellow Flowers, like a looſe or ſparſed Umble, keeping their color long before they wither; and being gathered in a fit dry time, when they are in their Perfection, will ſo abide, and be kept a long time after. The Seed is red, ſmaller than that of *Marjoram*, and ſharper. The whole Plant is of a ſtrong ſweet Smell, and very pleaſant.

V. *The third, or* Wild Gold-tufts, *has a long, ſmall, ſlender Root, black and woody, with a pretty many Fibres adjoining thereto; from whence ſprings up ſometimes but one Stalk, and ſometimes more, growing up to be about half a Yard high, covered over with an hoary Down*, having ſeveral long and narrow Leaves on them, ſometimes diſperſedly ſet, and ſometimes more near together, green on the upper ſide, and hoary underneath; at the tops grow ſmall Branches, bearing one or two ſcaly long Heads of yellow Flowers, ſomewhat like to thoſe of *Maudlin*, and conſiſting of many Threads or Thrums. The woolly

woolly Leaf of this Plant reſembles *Gnaphalium vulgare*, but that it is ſomewhat broader in the middle. The Flowers grow cluſtering together upon the tops of the Branches, of a yellow color, and almoſt like thoſe of *Maudlin*, as aforeſaid.

VI. *Note* 1. Theſe Plants are known alſo by the Name of *Golden Flower Gentle*; and by reaſon of the long continuance of its Flower in Perfection, they are alſo called (but more eſpecially the firſt and ſecond,) *Yellow Everlaſting*, and *Flower Everlaſting*, alſo *Flower Never-fading*, becauſe it ſcarcely ſeems to die.

VII. *Note* 2. *Johnſon* upon *Gerard* has another ſort of our ſecond kind, *having a long ſlender Root, very full of ſmall Fibres: from the Head of which Root ſpring forth three, four, or more Stalks, a Foot or more in Height, which are all of them (almoſt up to the tops) very well repleniſhed with long, white, downy Leaves, like the former, ſaving that they are ſomewhat broader. The Flowers are longer, but in larger Umbles, every ways greater, and ſeem to be of a more ſhining Gold color. Theſe Flowers being gathered alſo in their Beauty and Perfection, will be of as long Continuance, and carry their Glory to as late a Date as thoſe at Sect. 4. aforegoing.* Whether this be any differing Species from that ſecond kind aforementioned, I can hardly determine, they being ſo very much like one another, and ſeem to me to differ chiefly in their Magnitude, which may probably be from the differing Goodneſs of the Soil in which they may be found growing; which ſelf-ſame Difference (from the ſame Reaſon) may be obſerved in many other Plants, which Authors will never admit to be various Species or Kinds of the ſame Plant.

VIII. *The Places.* They grow in moſt untilled places of *Greece*, *Spain* and *Italy*; in Meadows where the Soil is barren; as alſo about the Banks of Rivers. The firſt grows not only in *Greece* and *Italy*, but alſo in ſeveral places of *Germany*, in moiſt ſandy Borders of unmanured Fields, as *Tragus* ſays They are all Strangers in *England*, and only grow with us in Gardens, being nurſt up by the Curious. The ſecond and fourth grow in *Candy* and *Spain*. The third *Cluſius* found in *Spain* and *Portugal*, and *Lobel* about *Mompelier* in *France*.

IX. *The Times.* Tho' theſe Plants in their native Countries may flower earlier than in our colder Climes, as in *April* or *May*; with us in our Gardens they flower much later, *viz.* not till *July* and *Auguſt*, and ſometimes later ſtill.

X. *The Qualities.* They are hot and dry in the latter end of the ſecond Degree, or beginning of the third; are both Aperitive and Aſtringent; Pectoral, Hyſterick and Nephritick, and alſo Alexipharmick.

XI. *The Specification.* They provoke the Terms, and force away the After-birth; reſiſt Poyſon, and prevail againſt Convulſions.

XII. *The Preparations.* You may have therefrom, 1. *The Herb it ſelf.* 2. *A Decoction of the Herb and Flowers in Wine.* 3. *A Pouder of the dried Flowers.* 4. *A Bath of the Herb and Flowers.*

The Virtues.

XIII. *The Herb it ſelf.* It is uſed to be laid in Cheſts and Wardrobes, to preſerve Garments from Moths and Worms.

XIV. *The Decoction of the Herb and Flowers in Wine.* Being drunk to ſix or eight Ounces once or twice a day, it is ſaid to expel all ſorts of Poyſons, help Cramps, Convulſions and Ruptures, diſſolve congealed Blood in the Thorax and Bowels, provoke the Terms in Women, and expel the After-birth.

XV. *The Pouder of the Flowers.* It may be given to two Drams in any convenient Vehicle, as in the Tincture of *Catechu* made in Water, or in Red Port Wine, or in a Mixture of Wine and Water. This being taken firſt in the Morning faſting, and laſt at Night going to Bed, it thickens a thin Rheum, prevails againſt Coughs and Colds, and ſtops Catarrhs, or Diſtillations of Rheum down the Throat, which ſometimes is ſaid to fall upon the Lungs.

XVI. *The Bath made of the Herb and Flowers, either in Water or Wine.* It is good to ſit over the warm Fumes thereof, for ſo it opens Obſtructions of the Womb, and eaſes Pains thereof: it gives eaſe alſo in the Piles, cauſing them to be diſcuſſed: it eaſes them alſo who are afflicted with Pain in the Reins; gives eaſe in the Sciatica, and is very effectual to draw down Vapors, and prevent Fits of the Mother.

CHAP. CCCXXIII.

Of GOLDEN-ROD.

I. *THE Names.* This is that which is ſuppoſed to be the Λευκογαφὶς, *Plinii*: and is called in *Latin*, *Virga aurea*, (becauſe the Stalks being reddiſh, make the buſhy tops of Flowers ſeem as if they were of a Gold-yellow;) and in *Engliſh* it is called, *Golden-Rod.*

II. *The Kinds.* There are three ſeveral ſorts of this Plant, *viz.* 1. *Virga aurea vulgaris*, *Virga aurea anguſtifolia*, Our common ordinary Golden Rod, which is the *Virga aurea Villanovani*, and is with

Leaves unſnipt or ſmooth on the edges. 2. *Virga aurea foliis ſerratis Camerarii*, Golden-Rod with dented Leaves. 3. *Virga aurea Americana*, Golden-Rod of America, which is not very much unlike to the ſecond kind.

Common Golden-Rod.

III. The Deſcriptions. *The firſt*, *or* Common Golden-Rod, *has a Root conſiſting of a Bunch of very ſmall Fibres, which run not deep into the Ground, but abide all the Year therein. From this Root ſpring up ſeveral ſmall, round, browniſh Stalks, half a Yard or two Feet high, (but higher, if it grows in a fat Soil, or in a Garden well manured)* having upon them many narrow and long dark green Leaves, very ſeldom with any dents about the edges, and as ſeldom with any Strakes or white Spots upon them; and yet ſometimes, and in ſome places, they are ſo to be found, divided at the tops into ſome ſmall Branches, with ſeveral ſmall yellow Flowers on every one of them, which are turned one way, and not looking ſundry ways at once; which being ripe, do turn into Down, and are carried away with the Wind: the old Stalks die away and periſh every Year, and new ones ſpring up every Spring following.

IV. *The ſecond*, *or* Golden-Rod with dented Leaves, *has a Root like the other, ſmall, and compaſted of many Strings or Threads; from which riſe up Stalks, as in the other, not ſo high as the former, but full as great.* The Leaves are ſmall and thin, but broader and ſhorter than thoſe of the aforegoing, ſmooth, ſharp-pointed, and dented about the edges, like a Saw, of a hot and harſh Taſte in the Throat, being chewed in the Mouth; which Leaves grow upon a fair reddiſh Foot-ſtalk. The Branches bear ſuch like Flowers as the firſt, facing one ſide of their Stalks, as the former does. Theſe growing at the tops, are of a Gold-yellow color, from whence the Plant took its Name. The Flowers being paſſed away, the Heads turn into Down, and are carried away with the Wind, as the other are.

V. *The third*, *or* American Golden-Rod, *has a Root not much unlike to the former, compoſed of a Bunch of Fibres or Strings, which abide under Ground all Winter in the ſame manner, looſing all its old Stalks.* From this Root ſpring up Leaves as large as thoſe of the laſt, before it runs up to Stalk, being long, but not very broad, yet broadeſt in the middle, and very ſharp-pointed at the ends, and a little dented about the edges, yet not ſo much as the ſecond; they grow upon Foot-ſtalks, and are of a dark green color. The Stalk or Stalks are a little hairy, riſing higher than the laſt, not above a Foot and half high at moſt, bearing on their various tops yellow Flowers, of a Gold-yellow color, facing all on one ſide, as the others do; which being paſſed away, turn into Downy Heads, and are carried away with the Wind, as all the others are. This Plant is ſo like to the ſecond, that the Figure of that may very well ſerve for this, without any conſiderable Error.

Golden-Rod with dented Leaves.

VI. *The Places.* The firſt grows plentifully enough in ſeveral places of *England*, in open places of Woods and Copſes, both in moiſt and dry Grounds. It grows plentifully in *Hampſted-Wood*, near unto the Gate which leads out of the Wood to *Kentiſh-Town*, not far from *London*; in a Wood by *Rayleigh* in *Eſſex*, near to a Houſe formerly Mr. *Leonard*'s, dwelling upon *Daws-Heath*; alſo in *Southfleet*, and in *Swainſcomb-Wood* near to *Graveſend*. The ſecond alſo grows in many places of this Land, but not ſo plentifully as the former: it is to be found in ſome places in *Hampſted-Wood*, but more ſparingly than the former. The laſt has been brought to us from *America*, but from what parts of the Continent, is not known. It grows with us in Gardens.

VII. *The Times.* The firſt flowers later than the ſecond, but they both flower and flouriſh in *July* and *Auguſt*. The *American* kind flowers indeed very late in the Year.

VIII. *The Qualities.* *Golden-Rod* is hot and dry in the ſecond Degree; Aperitive, Abſterſive, Aſtringent, Diuretick and Traumatick or Vulnerary, Neurotick,

Neurotick, Stomatick, Nephritick and Analeptick.

IX. *The Specification.* It is one of the moſt noble Wound-Herbs, cures Wounds and Ulcers after an admirable manner, provokes Urine, prevails againſt the Stone and Gravel in the Reins and Bladder; ſtops Fluxes of Blood in the Lungs, Bowels, Reins or Womb, and is prevalent in curing all ſorts of Ruptures.

X. *The Preparations.* You may have therefrom, 1. *A Juice.* 2. *An Eſſence.* 3. *A Decoction in Wine.* 4. *A Pouder.* 5. *An Ointment.* 6. *A Balſam.* 7. *A Cataplaſm.*

The Virtues.

XI. *The liquid Juice.* It is of good Uſe to be given againſt Sand, Gravel, Stone or tartarous Matter in the Reins, Ureters or Bladder, for it provokes Urine in abundance, and ſo forces away that tartarous Matter which engenders the Stone or Gravel in the Urinary Parts, and cauſes Sand and Gravel to be voided with the Urine. Doſe from two to four Spoonfuls, Morning, Noon and Night, in a Glaſs of White Port Wine, or other fit Vehicle.

XII. *The Eſſence.* It has all the Virtues of the liquid Juice; it alſo evacuates all raw and tough viſcous or flegmatick Humors, carrying them off by Urine. It is very effectual againſt all inward Bruiſes, as alſo to be outwardly applied to the ſame. It ſtops Bleeding in any Part of the Body; and is an excellent thing for the Cure of Wounds. It ſtops the overflowing of the Terms in Women, the Flux of the Whites, and heals the Bowels in a Diarrhæa, Dyſenteria, Lienteria or Hepatick Flux. It ſtops Catarrhs, and a Flux of Humors falling down upon any Part of the Body; and it is prevalent in curing all ſorts of Ruptures in Man or Woman, this being drunk inwardly, and the Cataplaſm outwardly applied. It is one of the moſt ſovereign of all Wound-Herbs; and therefore the Eſſence thereof, for the curing of Wounds inward or outward, will do as much as any other can: green Wounds, it quickly cures them; and old Sores and Ulcers, it digeſts, cleanſes, dries, and ſpeedily induces their healing; drying up, ſtopping, or removing that Moiſture and Flux of Humors which hinders their Cure. Doſe two, three or four Spoonfuls in Wine, or any other proper Liquor.

XIII. *The Decoction in Wine.* It is made of either green or dried Herb: it has all the Virtues of the Juice and Eſſence, ſaving that it is not ſo powerful; and therefore may be given from four to eight Ounces, dulcified with a little white Sugar, and that Morning and Night. It is an excellent thing to waſh filthy, foul and running Sores or Ulcers with; and makes a good Lotion for Sores and Ulcers in the Mouth and Throat, or Privy Parts of Man or Woman: and being often uſed, it is ſaid to faſten looſe Teeth.

XIV. *The Pouder of the Herb.* Given to one or two Drams in Red Wine, it ſtops all inward Bleedings; as alſo all ſorts of Fluxes of the Bowels. Strewed upon old, moiſt Ulcers and running Sores, it cleanſes and dries them, ſtrengthens the Part, and if need be, incarnates them, and heals them.

XV. *The Ointment.* It is made as all other Ointments are made, but before it is quite cold, you are to mix with every Pound of the Ointment, two Ounces of the Pouder of the Herb, or an Ounce and half of Tobacco in fine Pouder. It is a famous Vulnerary, curing green Wounds in a very ſhort time: and as for Fiſtula's, old and inveterate Ulcers, and malign running Sores, it brings them (if need be) to Digeſtion, cleanſes, incarnates, dries and heals them after an admirable manner, and ſo ſtrengthens the Part, as to hinder the future Afflux of Humors. It is not inferior to any other Vulnerary Ointment.

XVI. *The Balſam.* It has all the Virtues of the Ointment, but more powerfully cleanſes and heals: it ripens Apoſtems; and is effectual againſt Ruptures, being externally applied, and renewed as often as need requires. It is alſo a very excellent thing to heal Wounds and Ulcers of the Head, being applied.

XVII. *The Cataplaſm.* It is made of the green Herb, with ſome Pouder of the ſame, and a little Red Wine. Outwardly applied, it ſtops Bleeding, as alſo the Afflux of Humors upon any Part. It ſtrengthens weak Limbs; and is profitable, being applied to Ruptures.

CHAP. CCCXXIV.

Of GOLD of PLEASURE,

OR,

OILY-SEED.

I. *THE Names.* It is called in *Greek*, Μύαγρον, and μυάγριον, alſo μελάμπυρον, as *Dioſcorides* ſays: in *Latin*, *Myagrum*, *Myagrium* and *Melampyrum*; and in *Engliſh*, *Gold of Pleaſure*, and *Oily-Seed*.

Garden Gold of Pleaſure.

II. *The Kinds.* Authors make about ſeven kinds hereof, but four of them not being to be met with in *England*, or in any of our *American Engliſh Plantations*, that I know of, I ſhall ſay nothing of them in this place: of the other three which grow with

us, two of them only are properly called by this Name: the third is called, *Camelina* and *Engliſh Wormſeed*, and under the Title of *Wormſeed Engliſh* you may meet with it, which is its proper place. The two which we ſhall handle in this Chapter, are, 1. *Myagrum Sativum*, Garden Gold of Pleaſure, and this is ſaid to be the *Myagrum verum Dioſcoridis*. 2. *Myagrum ſylveſtre*, *Pſeudomyagrum*, Wild Gold of Pleaſure, *or* Wild Oily-ſeed. There is a great Conteſt in Authors about the Names of theſe Plants, which is both troubleſome and unprofitable to be read; and therefore, being of no Uſe to us, I ſhall wholly decline it.

III. The Deſcriptions. *The firſt, or* Garden Gold, *has a Root which is ſmall and long, periſhing every Year after Seed-time: from this Root riſes up one or more upright round Stalks, about two Feet high, ſet with ſeveral long and ſomewhat narrow Leaves, of a whitiſh green color, and ſomething deeply dented about the edges, or deeply waved, compaſſing them at the bottom.* The Stalk or Stalks are ſpread from the middle upwards into ſeveral Branches, bearing at their tops very ſmall yellow Flowers; which being fallen, there ſucceed in their places ſmall flat Seed-Veſſels, containing within them Seed, which, when ripe, is of a Gold-yellow color, ſomewhat long in Form, ſmall, and very fat or oily.

IV. *The ſecond, or* Wild Gold, *has a ſmall long Root, with ſome Fibres or Strings adjoining to it; from whence ſprings up but one Stalk, which is round, and nearly half a Yard high*, and is ſet about with long and ſomewhat narrow Leaves, much reſembling thoſe of *Woad*, but longer and ſmaller pointed, broad at the bottom, where they compaſs the Stalk about, with a point end ſticking out on each ſide, ſhooting forth many Branches from the very bottom almoſt: at the tops of the Stalk and Branches come forth divers whitiſh Flowers, very like unto thoſe of *Flax*; which being paſſed away, ſmall round Heads riſe up, with a ſmall Point at the top, very like in Faſhion to the former, and full of ſmall yellowiſh Seed, like unto that of *Creſſes*, exceeding bitter when it is green or freſh, (as the green Herb alſo is) but when dry, ſweet in Taſte, without any Acrimony, and very fat and oily.

V. *The Places.* The firſt grows in ſome places of *Italy* Wild, but yet both they and we do ſow it in Gardens for Pleaſure, and in Fields for the Seeds ſake, out of which is preſſed an Oil, which ſerves the Poor to Eat, and the Rich for Lamps; and ſerves alſo, with ſtrong Lye of Pot Aſhes, to make Soap withal; for which laſt Purpoſe, in *Germany* they ſow many whole Fields therewith. The ſecond is frequent in *Germany*, moſt uſually in all their *Flax* Grounds, which being in Stalk like it, (tho' not of that Uſe) is accounted a Weed, and caſt away, except of ſuch as ſave the Seed, to give to ſmall Birds, when it is ripe. This Seed, whilſt green, is bitter beyond Expreſſion; but being ripe and dry, it looſes its Bitterneſs, and becomes very ſweet and pleaſant, and is very acceptable to ſmall Birds, as Larks, Linnets, Finches, *&c.* to feed on: alſo by Expreſſion, it yields as ſweet an Oil as the former.

VI. *The Times.* They flower in the latter end of *May*, and thro' *June* and *July*, and in *Auguſt*; and the Seed is ripe in *Auguſt* and *September*.

VII. *The Qualities.* Theſe Plants are hot and dry in the third Degree; the Oil is only hot in the firſt, and rather moiſt than dry. The Oil is alſo Diſcuſſive, Emollient and Emplaſtick; Anodyn, Arthritick and Analeptick.

VIII. *The Specification.* It is peculiar to cure the Colick, and help the Contraction of the Nerves.

IX. *The Preparations.* You may have therefrom, 1. *The Decoction of the Herb and Seed.* 2. *The Seed it ſelf.* 3. *The Oil of the Seed by Expreſſion.*

The Virtues.

X. *The Decoction of the Herb or Seed, or both, in Wine or Water.* Sweetned with Honey, it is good for thoſe who are troubled with the Cough, Shortneſs of Breath, Wheezing, Difficulty of Breathing, the Pleuriſy or hard Scirrhus Swellings of the Liver. It lenifies the Roughneſs or Hoarſeneſs of the Throat and Voice, making it clear and eaſy. The Decoction in Water is good for Women to ſit in, whoſe Wombs are hard or ſwoln, and to bring down their Courſes when ſtopt; as alſo to waſh their Heads with, who are troubled with Scurff, Dandriff, Morphew or dry Scabs.

XI. *The Seed it ſelf.* If it is bruiſed and taken in an Egg, it ſtops Vomiting, and encreaſes Seed: ſo alſo the Pouder of the Herb. If the Seed is uſed in Bread, it makes it ſweet and pleaſant, and gives it a good Reliſh.

XII. *The Oil of the Seed by Expreſſion.* Uſed in Clyſters, it looſens the Belly, and is good againſt the Colick: taken in by the Mouth, it is very fat, and not very eaſy of Digeſtion, (being eaten as Oil Olive) except by Ruſticks, and ſuch as are accuſtomed to it. It yields a groſs Nouriſhment, reſtores in Conſumptions, and quickly makes fat and fleſhy. It is good againſt Coughs, Hoarſeneſs, Shortneſs of Breath, and Pleuriſies or Stitches in the Side, being given from one or two Ounces, to four, ſix or eight. It breeds Fleſh and encreaſes Seed; and is of great Uſe to anoint the Face or Hands, or any other Part of the Body, to cleanſe the Skin, and to take away Sun-burnings, Morphew, Freckles, Spots, Scars, or any other Defœdation of the Skin. It is good alſo againſt Burnings with Fire, or Scalding with Water, and cauſes an Extenſion or Relaxation of thoſe Nerves or Sinews which are hard, contracted, or ſhrunk up.

CHAP. CCCXXV.

Of GOOSE-FOOT, *OR,* ARACH Wild, Broad-leav'd.

I. *THE Names.* It is called in *Greek*, Ἀτράφαξις πλατύφυλλη, ἢ Χηνόπους: in *Latin*, *Atriplex ſylveſtris latifolia*, *Pes Anſeris & anſerinus*, *Chenopodium Gerardi & Tabernamontani*; and in *Engliſh*, *Broad-leav'd Wild Arach*, or *Gooſe-foot*.

II. *The Kinds.* *Gerard* makes two ſorts of this Plant, *viz.* 1. *Pes anſerinus vulgaris*, The common Gooſe-foot. 2. *Pes anſerinus laciniatior*, The more jagged or divided Gooſe-foot.

III. The Deſcriptions. *The firſt, or* Common Gooſe-foot, *has a pretty long Root, divided into ſeveral Arms or Branches, beſides a great many ſmall Fibres or Strings; from whence riſes up a Stalk, a Cubit high or more, ſomewhat chamfered, and branched out on every ſide.* The Leaves are broad, ſmooth, ſharp-pointed and ſhining, having ſeveral deep Cuts about the edges, not much unlike to a Gooſe-foot: at the tops of the Branches are long Spikes of Flowers,

ers, which are ſmall, and ſometimes enclining to a reddiſh color. The Seed is ſmall, and grows in Cluſters, according to the Diſpoſition of the Spikes, being very like the Seed of other *Wild Arraches*.

Common Gooſe-foot.

IV. *The ſecond, or* more jagged Gooſe-foot, *has a Root almoſt like the other, but more fibrous; from whence riſes up a Stalk, repleniſhed with Branches and Leaves, not much differing from the* Common, ſaving that the Leaves are ſharper cut, and more divided; and the Flowers and Seed (which grow in a ſpiked Form) are much ſmaller: the whole Color alſo of the Plant, is of a darker green.

V. *The Places.* They grow plentifully in fat, moiſt and ſtinking places, as upon Dung-hills, and by Highway-ſides.

VI. *The Times.* They ſpring up and flouriſh in the Spring Months; flower in *June* and *July*, and their Seed is ripe ſoon after.

VII. *The Qualities.* They are cold and moiſt in the third Degree: Anodyne or ſomething Narcotick, Repercuſſive, Arthritick, and (as ſome Authors think) Deleterious, or Venefick, I ſuppoſe, becauſe it is found certainly (as they ſay) to kill Swine.

VIII. *The Specification.* It certainly cures *Ignis ſacer* or Anthonies-fire, and gives eaſe in the Gout.

IX. *The Preparations.* You may have therefrom, 1. *A liquid Juice.* 2. *An Ointment.* 3. *A Cataplaſm.*

The Virtues.

X. *The Liquid Juice.* Bathed upon the parts afflicted it cools Inflammations, and cures *Anthonies* Fire; if it is mixed with Vinegar and Nitre, and parts affected with the Gout be bathed therewith warm, it eaſes the pains thereof, and is very prevalent againſt Bloody Falls, and Kibed Heels.

XI. *The Ointment.* It has the Virtues of the Liquid Juice, but not ſo fit for *Ignis Sacer* as the Juice is, becauſe of its unctuous body, which that Diſeaſe agrees not withal; it eaſes all Aches or Pains proceeding from a hot and dry cauſe, and is very beneficial to be applied to hot Apoſtems, and Diſeaſes of the Joints, chiefly the Gout and Oedema.

XII. *The Cataplaſm.* If it is made with a little Vinegar, and Nitre diſſolved therein, it is an excellent thing to be applied to recent Contuſions, to prevent the afflux of Humors, as alſo to any other part where a Fluxion is preſent; it ſtops the ſpreading of *Anthonies* Fire, cools the inflammation, and diſpoſes it to healing; it is alſo an excellent thing to give eaſe in the pains of the Gout, and alſo to cure it, Univerſals being firſt premiſed.

CHAP. CCCXXVI.

Of GOUTWORT, *OR,* HERB GERARD.

I. *THE Names.* It does not appear to have any *Greek* Name, unleſs Πυκνόκομον *Dioſcoridis* be it, *Brunfelſius* called it *Pycnomos*, Geſner *Coroborus quibuſdam*, Cordus on Dioſcorides *Elaphoboſco ſimilis*, Tabernamontanus *Ægopodium*, Tragus *Oſteritium Sylveſtre, & Angelicæ Vitium*, Camerarius *Angelica Sylveſtris Communis*, Thalius *Angelica Erratica*, Bauhinus *Angelica Sylveſtris minor, ſive Erratica*, Dodonæus *Herba Gerardi*, becauſe in the Low Countries it is called *Gerarnt*, Lobel *Podagraria Germanorum, & Herba Podagraria*; in *Engliſh* it is called *Aſhweed*, *Axweed*, *Gout-Wort*, and *Herb Gerard*, from the Low Country Name.

II. *The Kinds.* There are two ſeveral ſorts hereof, *viz.* 1. *Herba Gerardi, Podagraria vulgaris*, The Comonn

Common Herb Gerard, or Goutwort. 2. *Podagraria Hirſuta*, *Herba Podagraria Cognata*, *Angelica Sylveſtris Hirſuta inodora*, Hairy Herb Gerard, or Goutwort.

III. The Deſcriptions. *The firſt*, *or* Common Herb Gerard, *has a Root which runs and creeps in the Ground like* Quitchgraſs, *ſoon ſpreading over a great deal of room*; *this is but a low Plant*, *ſeldom riſing half a yard high*, having ſeveral like Leaves ſtanding upon browniſh green Stalks by threes, as in *Maſterwort*, but they are ſmaller and narrower, and not cut deep in, but only ſnipped about, and of a ſtrong unpleaſant Savour; at the tops of the Stalks and Branches grow Umbles of Flowers, which are white, which being paſt away yields blackiſh Seed, ſomething like to, but leſs than that of *Maſterwort*.

IV. *The ſecond*, *or* Hairy Herb Gerard, *has a thick Fibrous Root*, *of a blackiſh brown Color on the outſide*, *but white within*, *enduring many Years*, *and of a good Smell*, from whence ſprings up a Stalk about a Cubit high, blackiſh at the bottom, and a little Hairy, ſpreading into ſeveral ſhort Branches, bearing Leaves thereon, much divided, like to *Wild Angelica*, or the former *Herb Gerard*, ſaving, that they are more deeply gaſhed, and of a green Color, and Hairy all over; the Footſtalks, as alſo the Umbles of Flowers, are ſmall and white, and followed with blackiſh Seed.

V. *The Places.* The firſt grows by Hedges and Walls ſides, and oftentimes in the Borders or Corners of Fields, and ſometimes alſo in Gardens, if it is not plucked up, or Weeded out, it is ſo fruitful in its increaſe, that where it has once taken Root, it will hardly be gotten out again, ſpoiling the Ground every Year more than other; the other grows in ſome parts of *Germany*, and it has been found alſo upon the Borders of *Wales*, and other places.

VI. *The Times.* They both Flower from the beginning of *June* to the end of *Auguſt*, the Seed ripening in the mean Seaſon.

VII. *The Qualities.* It is temperate in reſpect to heat or cold, and drying in the firſt degree; it is Anodyne, Aſtringent, Vulnerary, Diſcuſſive, a little Repercuſſive, Neurotick, Arthritick, and Analeptick.

VIII. *The Specification.* It is ſaid to cure the Gout and Sciatica, Weakneſſes, and all other Diſeaſes of the Nerves and Joints.

IX. *The Preparations.* You may have therefrom, 1. *A Liquid Juice.* 2. *An Eſſence.* 3. *An Acid Tincture.* 4. *An Oily Tincture.* 5. *An Ointment or Balſam.* 6. *A Cataplaſm.*

The Virtues.

X. *The Liquid Juice.* It may be given inwardly as a Wound Drink, for it mightily contributes to the curing of ill conditioned Wounds, old Ulcers, running Sores, and Fiſtula's; alſo outwardly waſhing them therewith it contributes to the ſame purpoſes, for it cleanſes, incarnates, dries, and heals; Gouty parts alſo bathed therewith warm two or three times a day it eaſes the pain, but more eſpecially if it is taken inwardly from three to ſix Spoonfuls Morning and Night, in any proper Vehicle; Ulcers in the Lungs, Guts, or other Bowels, it likewiſe cures.

XI. *The Eſſence.* It has all the Virtues of the Liquid Juice, but more efficacious, and better to be taken than it, becauſe of its fineneſs; it cures Diarrhœa's, Dyſenteria's, Lienteria's, as alſo the Hepatick Flux, being timely given in a Glaſs of Spirit of *Angelica*, the greater Compoſition. Doſe three or four Spoonfuls Morning and Night.

XII. *The Acid Tincture.* It rectifies the Juices in the Stomach and inferior Viſcera, deſtroying their Tartar and Viſcoſity, which being thruſt forth into the Joints, breeds the Gout and Sciatica; it comforts the Stomach, cauſing a good Digeſtion, opens Obſtructions, cleanſes, and evacuates the ſlimy matter by Urine. Doſe from twenty to forty drops in a Glaſs of Ale or Wine, as often as the Patient has an occaſion of Drinking.

XIII. *The Oily Tincture.* Inwardly taken from ten drops to twenty five, according to Age and Neceſſity, in a Glaſs of White Port Wine, or other fit Vehicle, it powerfully opens the Obſtructions of the Urinary parts, cauſing a free Piſſing, and thereby carries off the tartarous, viſcous, or ſlimy matter which breeds the Gout, Sciatica, Stone, and Gravel, bathed upon the Puncture of any Nerve, it eaſes the pain and ſoon cures it; it is good alſo againſt Convulſions, Cramps, Palſies, numbedneſs of any Member, *&c.* being well bathed upon the Back Bone Morning and Evening, and likewiſe upon the part affected, rubbing it well in before a good Fire.

XIV. *The Ointment or Balſam.* It cures Simple Green Wounds, and old Ulcers, of what kind ſoever, it abſterges, incarnates, and heals them after an admirable manner, it draws Splinters out of Wounds, and Thorns or Prickles gotten into any part of the Fleſh; applied to any part afflicted with vehement pain it preſently gives eaſe, and being continued upon Joints afflicted with the Gout it cures it, and ſtrengthens the part afflicted.

XV. *The Cataplaſm.* Applied to Simple Contuſions it diſcuſſes them, and prevents their Apoſtemating, gives eaſe in the Gout, abates Inflammations, diſcuſſes the preſent matter, and prevents Defluxions of Humors; it is an extraordinary thing to be applied to the Forehead, to cure ſore, running and watery Eyes, *&c.*

CHAP. CCCXXVII.

Of GRASS, *or* HERBAGE.

I. *The Names.* It is called in *Greek* Ἄγρωσις, ἡ Χόρτος, in *Latin Gramen*, *Agroſtis*, in *Engliſh Graſs*; it is true that Χόρτος *Omne Genus Herbæ comprehendit*, yet Χορτώδης ſignifies *Gramineus*, a Graſſy place, or Ground over ſpread with Graſs, from whence *Graſs* is alſo called with us *Herbage*.

II. *The Kinds.* They are manifold, and the ſeveral ſorts of each *Species* are almoſt infinite, ſo that it will be difficult to decipher or deſcribe them all; the chief of the principal Kinds are the thirty five following, *viz.* 1. *Bent-Graſs.* 2. *Canary-Graſs.* 3. *Catstail-Graſs.* 4. *Corn-Graſs.* 5. *Cocksfoot-Graſs.* 6. *Caponstail-Graſs.* 7. *Cotton-Graſs.* 8. *Creſted-Graſs.* 9. *Cyperus-Graſs.* 10. *Darnel-Graſs.* 11. *Dogs-Graſs.* 12. *Dwarf-Graſs.* 13. *Feather-Graſs.* 14. *Foxtail-Graſs.* 15. *Fern-Graſs.* 16. *Hairy-Graſs.* 17. *Haver-Graſs.* 18. *Hedge-hog-Graſs.* 19. *Kneed-Graſs.* 20. *Meadow-Graſs.* 21. *Mountain-Graſs.* 22. *Millet-Graſs.* 23. *Oat-Graſs.* 24. *Pannick-Graſs.* 25. *Quaking-Graſs.* 26. *Ruſh-Graſs.* 27. *Reed-Graſs.* 28. *Sea-Graſs.* 29. *Silver-Graſs.* 30. *Spiked-Graſs.* 31. *Toad-Graſs.* 32. *Water-Graſs.* 33. *Wood-Graſs.* 34. *Way or Wall-Graſs.* 35. *Woolly-Graſs.* The Deſcriptions

ſcriptions of all which Species, with their various ſorts, you ſhall have in the following Sections.

Gramen Arvorum venti Spica, *Gramen Scopulæ*, vel *Scopularium*, Bent-Graſs, or Bents.

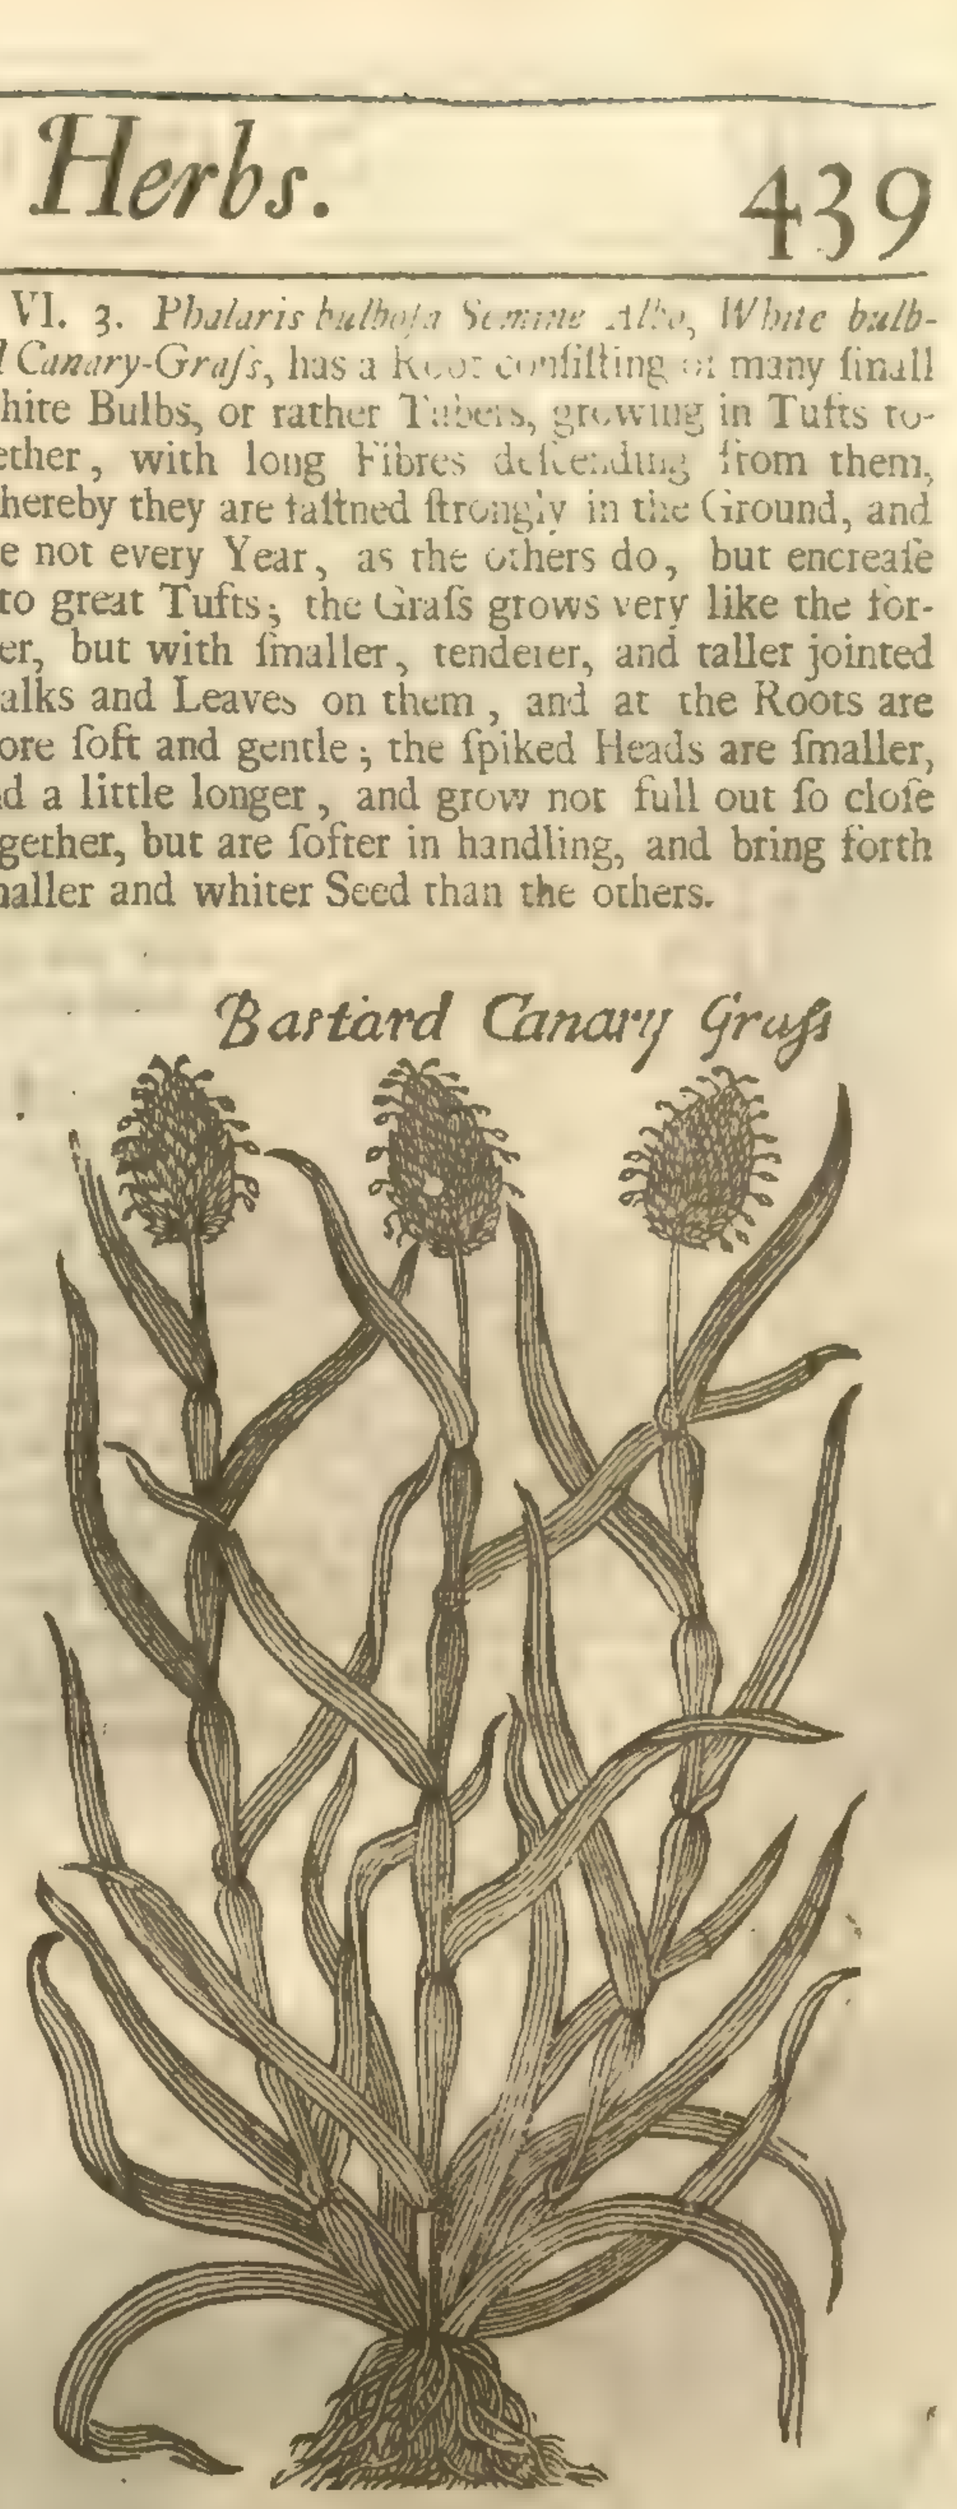
III. The Deſcriptions. *This is a ſingular Plant of its kind, and called by* Gerard *Harundinaceum, becauſe its buſhy top has Pannicles reſembling thoſe of* Common Reed, *it has a ſmall and Fibrous Root, and grows up to be a Yard or an Ell high, with many thin Graſſy Leaves here and there jointed*, and its tufted Heads or Pannicles, ſpread almoſt like unto the Sprigs of Feathers, ſtanding for the moſt part all one way, and hanging down their Heads, of a fine brown ſhining green Color, which are, being fine and ſlender, eaſily ſhaken with the Wind, from whence ſome call this in *Engliſh Windlegraſs*; this is that Graſs which the vulgar commonly call *Bents*, of which many Country People make Beſoms, and is many times ty'd in rows together, and ſerves in Summer time to be ſet againſt the backs of Chimneys, to deck up, cool, and refreſh the Room; it is *Gramen Pratenſe tertium Dodonæi*, and *Gramen Arundinaceum arvenſe Tabernamontani.*

Φαλαρίς, *Phalaris*, Canary-Graſs, ſeven Species, three true and four baſtard.

IV. 1. *Phalaris vulgaris*, *Common Canary-Graſs*, has a Fibrous Root, dying with us every Winter, and therefore is but an Annual Plant, to be new Sown every Year; it has jointed Stalks half a Yard high, with Graſſie Leaves on them like *Barley*, and at the top a long round Chaffie Head, ſomewhat pointed above, whoſe Bloomings are yellowiſh, wherein lies flat, round, ſhining Seed, bigger than *Millet*, and leſs than *Linſeed*, of a yellowiſh Color, and ſomewhat like to the Seed of *Seſamum.*

V. 2. *Phalaris Semine nigro*, *Canary-Graſs with blackiſh Seed.* The Root hereof is like, and periſhes as the other, it differs not from the former, but in being ſomewhat leſſer, both in Stalk, Leaf, and Head, but chiefly in the Seed, which is of a pale, blackiſh, ſhining Color.

VI. 3. *Phalaris bulboſa Semine Albo*, *White bulbed Canary-Graſs*, has a Root conſiſting of many ſmall white Bulbs, or rather Tubers, growing in Tufts together, with long Fibres deſcending from them, whereby they are faſtned ſtrongly in the Ground, and die not every Year, as the others do, but encreaſe into great Tufts; the Graſs grows very like the former, but with ſmaller, tenderer, and taller jointed Stalks and Leaves on them, and at the Roots are more ſoft and gentle; the ſpiked Heads are ſmaller, and a little longer, and grow not full out ſo cloſe together, but are ſofter in handling, and bring forth ſmaller and whiter Seed than the others.



VII. 4. *Phalaroides majus*, *Gramen Phalaroides*, *vel Alopecuroides*, *ſive Italicum majus*, *The greater Baſtard Canary-Graſs*, has a Root ſmall and Fibrous, periſhing every Year, and grows up very like to the true *Phalaris*, or *Canary-Graſs*, both in Stalk, Leaf, and Head, but that the Stalks are ſingle, and with fewer Leaves on them; the Head alſo or Ear is ſmaller, hoary, and ſofter, and the Seed not much unlike.

VIII. 5. *Phalaroides minus*, *The leſſer Baſtard Canary-Graſs*, is in all things like to the laſt, but the Ear or Head is ſmaller and longer, and the Leaves do ſo encompaſs the Stalk at bottom, that it ſeems to run thro' them, as thro' a Trunk.

IX. 6. *Phalaroides Spica molli*, *Gramen Phalaroides Germanicum*, *Soft headed Baſtard Canary-Graſs*, has a Fibrous Root, from which ſprings a Stalk, or Stalks, of a Foot and half high, ſomewhat larger than the laſt, with a Joint or two thereon, and ſhort Leaves at them, encompaſſing the Stalk at the lower end; the Head is ſhorter and ſmaller than the laſt, of a ſhining Aſh Color, and ſoft to the feeling.

X. 7. *Phalaroides Spica Hirſutiore*, *Baſtard Canary-Graſs with a more hairy Spike or Ear.* It has a Perennial Fibrous Root, from whence ſpring up Stalks and Leaves like the laſt, but furniſhed with a greater ſtore of Leaves and Stalks; the Spiked Head

is

is alſo longer and narrower, and ſet with ſhort Hairs.

XI. *The Places.* All the three firſt ſorts have been found growing in *Spain*, and brought to us by *Boel*, with ſome of the Baſtard ſorts; the firſt has been known many Years, and was brought from the *Canary* Iſlands with thoſe ſweet Singing Birds called *Canary Birds*, which feed upon this Seed; *Lobel* ſays that it grows in *Provence* in *France*; the ſecond *Bauhinus* ſays came to us from *Malta*, where thoſe Birds feed on it; all the firſt three grow with us in our Gardens; the fourth grows as well in our Fields in *England*, as in other Countries; the fifth and ſixth grow about *Ulmes*, where they are frequent, and call them *Onocordon*, from their color: where the ſeventh grows is uncertain.

XII. *The Times.* They all of them flouriſh in the Summer Months, and their Seeds are ripe in *July* and *Auguſt*.

XIII. *The Virtues.* *Canary Seed* in ſome Places and Iſlands is made into Bread, which nouriſhes much like that of *Millet*, or rather leſs, and therefore to mend it, ſome mix it with Wheat, that the Bread may be the faſter, which otherwiſe would be apt to crumble and dry. *The Liquid Juice, or Eſſence of the Herb*, are good to eaſe the pains of the Stone and Gravel, open Obſtructions of the Urinary parts, and abate the ſcalding heat thereof. *The Cataplaſm of the Seed* has the Virtues of that of *Millet*, and is good to dry and repreſs the flux of Humors upon any part.

Gramen Typhinum, Catstail-Graſs, three ſorts.

XIV. 1. *Gramen Typhoides, vel Typhinum maximum*. *The greateſt Catstail-Graſs*, has very ſmall Roots, compacted of many ſmall Skins or Threads, which may be eaſily taken from the whole Root, from which riſe up very fair large Leaves, like *Wheat*, and triangular Stalks two Feet high, or more, on whichgrow long, round, ſpiked Heads, four times larger than thoſe of the following Kind, and almoſt of an equal bigneſs and roundneſs from the bottom of the Spike to the top; this Plant is ſometimes found with Stalks four or five Feet high, and the Spike ſomewhat ſhorter, and ſmaller at the top.

Small common Cats tail Graſs

XV. 2. *Gramen Typhinum minus vulgatiſſimum*, *The leſſer moſt common Catſtail-Graſs*, has Roots which have ſmall round Heads, like Tubers or Bulbs, from the Heads of which ſpring forth the Leaves and Stalks; this is the moſt common with us, and differs not from the former but in the Roots, this being bulbed, as aforeſaid, and in magnitude, the Stalks in this riſing not above a Foot high, and the round Spike not being above two or three Inches long.

XVI. 3. *Gramen Typhinum minus*, *The ſmall Catstail-Graſs*, has for its Root a little Bulb, or Bulbs, from whence riſes up the Stalk, about two Feet high, ſet at each Joint with long Graſſie Leaves, with a Spike or Ear four or five inches long, cloſely and handſomly made, like the former; it differs not from the laſt, but in having a greater ſtore of narrow green Leaves, a longer Stalk, and larger ſpiked Heads.

XVII. *The Places.* They are all of them found in many places of *England*, but moſtly in watery places, and near Water; the third is found growing plentifully in many places about *London*, as by the Bridge entring into *Chelſea Field*, as you go from St. *James's* to little *Chelſea*.

XVIII. *The Times.* They Flouriſh and Seed in *June* and *July*, keeping the ſame time with other Graſſes.

Gramen Segetum, vel Segetale, *Gramen Triticeum*, Corn-Graſs, or Wheat-Graſs, ſix Kinds.

XIX. 1. *Gramen Segetum vel Triticeum latifolium Spica compacta*, *Broad Leav'd Wheat-Graſs cloſe Ear'd*, has from a Fibrous Root a Stalk, or Stalks ſpring up, about half a yard high, having two or three

three Joints, and fair Wheat-like Leaves at them a Foot long, bearing at the tops a longer Spike or Ear than *Wheat*, and broader, made of ſeveral parts, like the Husks of Corn, but ſeparated more aſunder, thereby ſhewing it to be a Graſs, and no true Corn, yet the Spike grows cloſer than the next, and without any ſhew of Awnes or Beard thereon.

XX. 2. *Gramen ſegetale, vel Triticeum latifolium Spica divulſa, Broad-leav'd thin-ear'd red Wheat Graſs.* It differs little from the former, but in the Spike, which has the ſmall parts thereof more ſeparated, and ſet on both ſides of the Stalk, and armed every one with a ſmall ſhort Awne or Beard.

XXI. 3. *Gramen ſegetale, vel Triticeum anguſtifolium Spica compacta, Broad-leav'd cloſe-ear'd red Wheat Graſs.* It has a Stalk which is ſmooth and round, two Feet high, ſet with long narrower white Leaves, rough and pointed. The Spike is about a Span long, ſomewhat like unto *Red Wheat*, cloſely ſet, but each of the Husks has a ſharp rough Awne thereat.

XXII. 4. *Gramen ſegetum, vel Triticeum anguſtifolium ſpica mutica, Narrow-leav'd or Ruſh-leav'd white-ear'd Wheat Graſs, without Awnes.* It has a Root which is white, knotty and creeping, from whence ſpring up Leaves which are long and round, like *Ruſhes*, and pointed at the ends, ſet on round Stalks, a Foot and half high, whoſe ſpiked tops are long and ſlender, without any Awnes at the tops of the Husks, and ſomewhat like unto *White Wheat* without Beards.

XXIII. 5. *Gramen ſegetum, vel Triticeum majus ſpica Brizæ, The greater Spelt Wheat Graſs.* Its Roots and Stalks are like unto *Corn*, four or five Feet high, or more, ſet with narrow Leaves: the tops of the Stalks have ſeveral long Spikes, about a Hand breadth long, ſet on both ſide of them, one above another, each whereof is very like a ſmall Ear of *Wheat*, armed with ſmall Awnes, but very ſhort.

XXIV. 6. *Gramen ſegetum, vel Triticeum minus ſpica Brizæ, The leſſer Spelt Wheat Graſs.* It grows not above an Hand breadth high, with ſmall, ſhort, ſoft and hoary Leaves; and at top of the Stalk there is ſometimes but one, and ſometimes two or three Spikes or Ears, of an Inch long, and bearded.

XXV. *The Places and Times.* They grow in many parts of *England*, in Paſtures and Corn Grounds in *Kent*, not far from the *Thames*; and flouriſh and ſeed in the Summer Months, when other *Graſſes* do.

V. Ἰσχαίμων, *Iſchæmon & Gramen Iſchæmon, ſive Dactyloides*, Cocks-foot *or* Finger Graſs, *Six kinds.*

XXVI. 1. *Iſchæmon ſylveſtre folio latiore, Common Cocks-foot Graſs.* It is called, *Galli Crus Apuleii*, and has a Root conſiſting of a great many ſmall Fibres; from whence ſpring forth ſeveral clear, reddiſh, jointed Stalks, with fair Graſſy Leaves on them, a little dented on the edges, broad at the bottom, and ſmall at the end, of a harſh or binding Taſte. At the tops of the Stalks grow divers long, ſlender, rough Spikes, of a gliſtering purple, or rather *Violet* color, but of a browniſh color when they are ripe, and are divided into four or five Spikes, which are ſpread or ſtretched out abroad, like a Cock's Foot, when it is ſet down upon the Ground, or the Fingers of a Man's Hand, when they are ſpread abroad.

XXVII. 2. *Iſchæmon ſylveſtre ſpicis Villoſis, Wild Cocks-foot Graſs, with a bearded or hairy Spike or Ear.* Its Root is a Buſh of Fibres, like the other: it has purpliſh Stalks, a Cubit high, with fewer and much narrower Leaves on them. The ſpiked Heads are more in number than the former, and more hairy, having, as it were, ſhort yellow Beards, ſet on both ſides of the Panicles, in which lye the Seed.

XXVIII. 3. *Iſchæmen ſativum, ſive Gramen mannæ Eſculentum, Gramen aculeatum* Thalii, *Frumentum Germanicum Cordi*, (upon *Dioſcorides*) becauſe they account it *Oryzæ Species*; *Sanguinaria, Sanguinella*, and *Capriola Italica, Dea Graſs.* It has a Root greater and more buſhy than any of the former, the whole Plant differing from the two aforegoing no otherwiſe almoſt, than a Manured Plant from a Wild. It has fair jointed purpliſh Stalks, and large *Graſſy* or *Reed* like Leaves on them, ſomewhat hairy or woolly at their bottoms; and about the Joints at the tops of the Stalks ſtand larger Spikes or Pannicles, and more alſo ſet together than in the former, which are made of many ſmall, chaffy Husks, with long white Seeds in them, ſomewhat greater than *Millet*, and leſſer than *Rice*, ſtanding all, as it were, on one ſide.

XXIX. 4. *Gramen ſcoparium Iſchæmi paniculis, Beſom or Bruſh Graſs.* It has a Root conſiſting of many very long hard Fibres or Threads, a Foot and half long, or more, (whereof are made, in *France*, where it grows naturally, thoſe kinds of Bruſhes with which we uſually bruſh our Heads, *&c.*) the Stalks are hard, ſlender, and jointed, about a Cubit high, with ſmall long Leaves on them, like unto the ſecond *Iſchæmon* aforegoing, but ſweeter in taſte; at the tops of the Stalks ſtand five or ſix, or more, bright long Panicles, like unto the *Cocksfoot*, but larger, flatter, and leſs dented.

XXX. 5. *Gramen Iſchæmon Canarium, Dogs-Graſs like Cocksfoot.* It has running jointed Roots, like to the *Common Quitch-Graſs*, and ſo both Stalks and Leaves ſomewhat reſemble it, ſo that it might have as well been enumerated among the *Quitch-Graſſes*, or *Dogs-Graſſes*, as among the *Cocksfoot-Graſſes*, becauſe it is, as it were, indifferent between them both; but the Head is diſperſed or ſpread into ſuch like ſlender long Panicles as the *Cocksfoot-Graſs* is, the ſmall Chaffie Husks whereof contain the Seed.

XXXI. 6. *Gramen Dactylon repens, Creeping Cocksfoot-Graſs.* It has a ſparſed thready Root, which ſends forth many long, ſlender, and weak Branches, trailing or creeping upon the Ground, and ſhooting forth Roots at the Joints; the Leaves which grow at the Joints are ſmall and Graſſie, long and narrow; and at the tops of the Stalks, which riſe not much above a Span high, four or five ſmall, ſlender, blackiſh Spikes or Ears come forth, within the Husks whereof the Seed is found to lye.

XXXII. *The Place and Time.* The two firſt Kinds are found growing naturally in ſeveral places of *Italy*, as alſo at *Narbone* in *France*, and in divers places of *England*, but the third is uſually Sown in Fields, as Corn, in many places of *Germany*, where with the Seed thereof they make Pottage or Broth, as we here in *England* do with Rice and Oatmeal, and it is ſent into *Middleburgh*, and other Towns of the Low Countries in great Quantities for the ſame purpoſe, as *Lobel* has affirmed, but with us it only grows in Gardens, tho' ſhould we Sow it as the *Germans* do, in Fields, it is probable that it might thrive full as well with us as it does with them; the fourth, fifth and ſixth grow in *France*, but with us chiefly in *Gardens*; the fifth has been found growing in *Spain*, and the firſt *Gerard* ſays he found growing upon the Hilly Banks near *Greenhith* in *Kent*, and that it grows upon the rough Banks of Fields, *&c.* They all Flouriſh and Seed in the Summer Months when the other *Graſſes* do.

The Virtues.

XXXIII. 1. *The Liquid Juice.* Put into the Eyes which run and water, or where is a Defluxion of Rheum, cauſing redneſs or bleareдneſs, and drunk, chiefly the Juice of the *Dew-Graſs*, it diſcuſſes the hardneſs of Womens Breaſts, eſpecially being alſo bathed thereon. 2. *The Cocksfoot Quitch-Graſs*, has all the Virtues of *Quitch-Graſs*, to be diſcourſed of in ſome of the following Chapters of this Book. 3. *The Decoction.* It is of uſe (made of the Roots in White Port) to expel the Terms, and it drives forth the Meaſles, Small Pox, and is good in the Purples, Spotted, and other Peſtilential Fevers. 4. *The Ointment or Balſam of the Roots and green Graſs*, is good for the Bitings of Mad Dogs, diſſolves hard Tumors, and not only heals green Wounds, but alſo old Ulcers. 5. *The Cataplaſm of Herb and Roots* applied to any place which bleeds, ſtops the Blood preſently, whether it be from the Noſe, or a Wound.

VI. Ἀλεκτρυόνες, *Gramen murorum Spica longiſſima*, *Gramen Spica nutante longiſſima*, Caponstail-Graſs, or Graſs with a long bending Spike, a ſingle Species.

XXXIV. *This* Gramen murorum Spica nutante *is a ſingular Plant, which has a fibrous or ſtringy Root, from which ariſes Leaves long and narrow, like other* Graſs *Leaves, which by Time and Age growing old, grow ſomewhat rounder, as thoſe of* Spartum, *or* Matweed; from among theſe Graſſie Leaves there grows up a ſlender Stalk about two Feet high, ſcarcely ſtanding upright, but oftentimes hanging down its Head, or top of its Ear, after the manner of a Capons Tail; this Stalk has two or three ſmall Leaves at the Joints up to its top, where grows a very long Spike, bending a little downwards, compoſed of ſmall and hairy Tufts, which grow of a greyiſh or whitiſh Color being ripe, containing within them ſmall whitiſh Seed. This was found out by Mr. *Goodyere.*

XXXV. *The Place and Time.* This Elegant Graſs Mr. *Goodyere* found growing upon the Walls of the Ancient City of *Winchester*, and was not deſcribed by any Author before him, he gave it the Name; *Gerard* had ſome of the Seed thereof, which he did Sow, which grew up, took root, and flouriſhed, Seeding in the Summer Months.

VII. Καλαμάγρωστις *quorundam*, *Gramen Tomentoſum*, *vel Tomentarium*, Cotton-Graſs, or Cotton Reed-Graſs.

XXXVI. *It is a ſingular Plant of the Kind, having a Root ſomewhat hard and rough, very tough, ſmall and thready, with many long Fibres iſſuing from it.* This *Cotton Reed-Graſs* is in roughneſs, dryneſs, and form of the Leaves, not much unlike to *Foxtail-Graſs*, called *Pſeudoſchænanthum*, but much greater, and not Downy; the Stalks riſe up to be three, four, or more Feet high, and but with few Joints, which are rough, garniſhed with many hard Graſſie Leaves, bearing at the top Heads, which are Spiked, ſet all along a Panicle, reddiſh for ſome time, but growing to ripeneſs, are of a ſhining Silver like whiteneſs, and as ſoft as Wooll in handling, from whence it took the Name. This Deſcription is according to the *Dutch* Copy, tranſlated by *Lobel* himſelf.

XXXVII. *The Places.* It grows in the borders of dry Fields, and by Hedge ſides, in many Counties of *England*, eſpecially in *Dorſetſhire*; *Gerard* ſays it grows upon Boggy and ſuch like Mooriſh places, and is to be ſeen in Bogs upon *Hampſted Heath*; it grows likewiſe in *Highgate Park*, near *London.* This with long ſpiked Heads is doubtleſs the *Gramen Tomentoſum Arundinaceum* of *Gerard*, deſcribed in *Lib.* 1. *Cap.* 9.

VIII. Ευλοφόγρωστις, ἢ Ἄγρωστις ἔυλοφη, *Gramen Criſtatum*, Creſted-Graſs, or Cockscomb-Graſs, four Species.

XXXVIII. 1. *Gramen Criſtatum lene*, *Smooth, Creſted, or Cockscomb-Graſs*, has white Roots, which Mat themſelves in the Ground very much, from whence ſpring up divers ſmooth ſlender Stalks, two Feet or more high, with few, or no Joints on them, and with ſmall ſhort green Leaves at them; the tops of the Stalks have ſlender long ſpiked Heads, divided into many parts, each whereof is like unto the Creſt of a Bird: this Ear, ſays *Gerard*, is ſmall, long, of a pale green Color, ſomewhat bending, ſo that in ſome ſort it reſembles the Comb of a Cock, (whence the Name) or the Seed Veſſel of that Plant which is called *Caput Gallinaceum:* the Spike or Ear is of a pale yellowiſh green, and ſometimes of a reddiſh Color, which made *Bauhinus* to compare it to *Criſta Galli*, or *Cocks-Comb.* This is *Gramen Pratenſe Criſtatum*, *Gramen Spica Criſtata Bauhini.*

XXXIX. 2. *Gramen Criſtatum Subhirſutum*, *Hairy Creſted-Graſs.* This ſeems to be a Species of the former, and differs from it only in theſe particulars, the Roots are of a reddiſh yellow color, the Stalks are lower and ſmaller, and a little Hairy or Woolly at the bottoms, with longer Leaves, and a more ſparſed white Head, not ſo finely ſet together, and grows rather among Hedges and Buſhes.

XL. 3. *Gramen Criſtatum Anglicum*, *Engliſh Creſted-Graſs.* This has fewer and longer Roots, not matting and increaſing in the former manner, the Stalks are ſtraight, with longer and narrower Leaves on them; the Spiked Head differs from the former, in being longer and cloſer ſet, and not ſpread

into

into Tufts, but as it were into cloſe ſhort Husks, the whole Spike ſomewhat reſembling a ſmall long *Foxtail-Graſs*.

XLI. 4. *Gramen Criſtatum Spica multiplici*, *Double Engliſh Creſted-Graſs.* This is very like the laſt in its Roots, Stalks, and Leaves, and ſeems to be a variety of the ſame, but it differs in this, that it is ſpread out in its top, and parted or divided into ſeveral ſmaller Spikes from the greater main one, otherwiſe very little differing from it in any thing elſe.

XLII. *The Places and Times.* The firſt of theſe is ordinarily to be found in Meadows about Midſummer time, that, as alſo the ſecond, uſually growing in Fields and Paſtures, and near Hedges and Buſhes, and places near them; the third grows plentifully in many By-places near *Hackney*, not far from *London*; the fourth being a variety of the laſt, is found growing always not far from the places where the third grows.

IX. Κυπειρώγρωσις, ἢ ἄγρωσις κυπειρώδης, *Gramen Cyperoides*, Cyperus-Graſs, twenty two Species.

Cyperus Graſs

XLIII. 1. *Cyperus Typhinus Gerardi*, *Gramen Typhinum Tabernamontani*, *Gramen Typhoides Spica multiplici Bauhini*, *Catstail Cyperus-Graſs.* It has a Buſhy Root, from whence ſpring forth many long, narrow, three ſquare, hard, green Leaves, among which riſe up ſtiff green Stalks, half a yard, or two Feet high, or better, with ſome Joints and Leaves at them, not much unlike to the *Common Reed*; at and towards the tops of theſe Stalks grow two or more long ſlender rough Heads, growing one above another, Spike faſhion, almoſt reſembling a Cats Tail, very chaffie, rough and rugged, of a dark Green, tending to Purple.

XLIV. 2. *Gramen Cyperoides anguſtifolium majus*, *The greater narrow Leav'd Cyperus-Graſs.* It has a reaſonable ſtrong Fibrous Root, from whence ſtiff, long, and narrow Leaves, like thoſe of other *Cyperus-Graſſes* ſpring; the Stalks alſo, (as it is proper to all the Plants of this Kindred) are three ſquare, bearing at their tops three browniſh Ears, ſoft and chaffie, like the reſt of this Kind, ſtanding upright, and not hanging down, as ſome others do.

XLV. 3. *Gramen Cyperoides Sylvarum Tenuius Spicatum*, *Slender Ear'd Wood Cyperus-Graſs.* It has a great yellowiſh and fibrous buſhy Root, from whence ſpring three ſquare Stalks, a Foot or more high, with fair, but hard and rough Graſſie Leaves, four or five Inches long; the Spiked Heads which grow at the tops are many, one above another, ſlender and long, yet ſome more than others, ſome one Inch, ſome two Inches, or leſs, of a yellowiſh green color, with long yellowiſh Seeds in them.

XLVI. 4. *Gramen Cyperoides elegans Spica multifera*, *A fine or beautiful Cyperus-Graſs with many Heads.* It has a thick fibrous Root, which ſends up ſlender triangular Stalks, about two Feet high; the Leaves are long and narrow, with a long pointed Spiked Head, made of many ſmall ones, ſo cloſe ſet together, that they ſeem to be but one Spike or Head.

XLVII. 5. *Gramen Cyperoides echinatum Montanum*, *Mountain prickly Cyperus-Graſs.* It has a thick buſhy fibrous Root, as the former, which ſends up three ſquare Stalks, about a Span long, or not much more, the Leaves below and on them are very long and narrow, the Heads are ſhort, with many rough Burs on them, ſome ſeparated and ſome cloſe.

XLVIII. 6. *Gramen Cyperoides ſparſa Panicula*, *Land Cyperus-Graſs with a diſperſed Tuft.* It has a Root which is full of Fibres, which ſends forth long Leaves, of a brown green color, and ſomewhat flat, between a *Ruſh* and a *Graſs*; the Stalk is alſo ſomewhat more flat than ſquare, ſometimes but half a yard high, ſometimes three, four, or five Feet high, the top whereof is furniſhed with a large round ſpread Panicle, made of many parts, and each ſmall prickly Head ſtanding on a ſlender Footſtalk, which is oftentimes bent down with the weight of the Heads.

XLIX. 7. *Gramen Cyperoides parum Lanoſum*, *Cyperus-Graſs a little Wooly.* It has a Fibrous Root, which ſends forth ſlender Stalks, about two Spans high, the bottoms of them being a little Wooly, and having at the middle only a Joint with a Leaf; the lower Leaves are ſet cloſe upon the Ground, three or four Inches long, ſomewhat like thoſe of the *Graſs-Crowfoot*; the heads of the Stalks have ſmall round ſhining Spikes or Ears on them, of a pale brown Color, with a ſmall long Leaf under every head: This is *Gramen Cyperoides parvum.*

L. 8. *Gramen Cyperoides Norwegicum*, *Norway Cyperus-Graſs.* It has a number of long narrow Leaves, ſome three or four Inches, others ſix or ſeven Inches long; the Stalks are clear and ſmooth, half a yard high, bearing at the top many Cone like Heads, ſet cloſe together.

LI. 9. *Gramen Cyperoides Spicatum Latifolium*, *Broad Leav'd Cyperus-Graſs.* It has long black creeping Roots, with many Fibres at them, very like unto the ſweet long *Cyperus*, and has broad Leaves, almoſt a Foot long, among which come forth the Stalks, being about a Foot high, which bear three Chaffie Spiked Heads at the top, of an Inch, or Inch and half long, of which the middlemoſt is the longeſt, each of them like unto the ſmall *Catstail-Graſs.*

LII. 10. *Gramen Cyperoides latifolium alterum*, *The higher broad Leav'd Cyperus Graſs.* It has a Root which is ſomewhat long, but ſcaly, with many long Fibres adjoining thereto; the Leaves are as long as the laſt, but the Stalks are much higher, bearing at the tops four or five ſmall long Ears of

Spikes one above another, an Inch or two long, with a ſmall Leaf at the foot of each of them.

LIII. 11. *Gramen Cyperoides Paluſtre*, *Great Water Cyperus-Graſs.* The Root is compact of many long and tough Strings, or Threads, the Leaves are long and broad, like unto the *Sedge*, called *Carex*, from among which riſe up ſeveral long three-ſquare Stalks, at the top of each of which there is a Spike or Ear, like to a *Plantane* Head, commonly of a yellowiſh green color, and very prickly.

LIV. 12. *Gramen Cyperoides Miliaceum*, *Cyperus Gramineus Miliaceus*, *Pſeudocyperus Gramineus Miliaceus*, *Millet Cyperus-Graſs*, or *Baſtard Cyperus-Graſs Tufted.* It has a thick fibrous black buſhy Root, from whence riſes divers fair, long, and ſomewhat broad, alſo ſhorter green Leaves, paler than thoſe at Sect. 43. above, from among which ariſe threeſquare Stalks, like thoſe of *Cyperus*, about half a yard high, ſet with Leaves from the bottom to about ſix or ſeven Inches high of the Stalk, and encompaſſing the Stalk alſo at their bottoms; the tops are furniſhed with a large Tufted Head, (almoſt like the *True Cyperus*) and greater than is proportional to the Plant, where two or three pretty large Leaves come forth, between which riſe up many ſmall Footſtalks, very much Branched, which bear many black Seeds, ſomewhat like *Millet*, or *Ruſhes*.

LV. 13. *Gramen Cyperoides Paluſtre Panicula ſparſa*, *Aquaticum vulgatius Lobelij*, *Marſh Cyperus-Graſs with ſparſed Heads.* It has a Root which ſpreads ſomewhat like the *True Cyperus*, but harder, fuller of blackiſh Fibres, and without ſmell; the Leaves are long, and ſomewhat narrow, hard, and cutting on both edges; the Stalk is triangular, tall, without any Leaves thereon to the top, where, between two long Leaves, and very narrow, divers ſhort Footſtalks ſpread forth, bearing each of them four or five ſmall rough Heads.

LVI. 14. *Gramen Cyperoides Paluſtre majus*, *Gramen junceum triquetum Thalij*, *The greater Marſh Cyperus-Graſs* The Root is a buſh of many blackiſh Fibres, like unto *Graſs* Roots, it has ſeveral long and narrow hard cutting Leaves like the laſt, and among them divers upright Stalks, without any Leaves at all on them, each of them bearing a long, round, and ſomewhat large prickly head, in which lies the Seed.

LVII. 15. *Gramen Cyperoides Paluſtre minus*, *The leſſer Marſh Cyperus-Graſs.* The Root of this is like unto the former, but is leſſer, as is the whole Plant; the Stalk bears ſharp, rough, ſpiked heads, four or five together, one above another, on both ſides thereof, with a long Leaf at the foot of them.

LVIII. 16. *Gramen Cyperoides Paluſtre ſpicis minus compactis*, *The leſſer Marſh Cyperus with more open heads.* Its Root is ſomewhat hard or woody, and full of Fibres, bearing many long and narrow Leaves, like to *Graſs*, among which riſes up a rough threeſquare Stalk, bare of Leaves for the moſt part up to the top, where ſtand ſeveral ſmall rough Heads or Spikes, more looſe or open than the former, having ſharp pricking Seed within them.

LIX. 17. *Gramen Cyperoides Paluſtre Subflaveſcente Panicula ſparſa*, *Carex minus Lonicerus*, *Yellowiſh Marſh Cyperus-Graſs open headed.* The Root is great at the head, with ſeveral Fibres thereat, it has ſmaller and ſhorter Leaves than any of the former, and naked Stalks, bearing at the tops of the Stalks, between two ſmall long Leaves, a head ſevered into many ſmall parts or ſpikes, of a yellowiſh color. Of this ſort there is another, differing very little from it, but in the color of the ſmall Spikes, which are blackiſh.

LX. 18. *Gramen Cyperoides Paluſtre majus latifolium Lobelij & Camerarij*, *Carex Tragi & Lugdunenſis*, *The greater broad Leav'd Cyperus-Graſs.* It has a browniſh Root, and folding it ſelf one within another, with many Fibres adjoining, it has ſeveral large and long Leaves, like unto thoſe of *Reeds*, among which riſe up ſeveral threeſquare Stalks, bearing three or four cloſe ſpiked browniſh heads thereon, one above another. There is another of this great broad Leav'd kind, called by *Baubinus Gramen Cyperoides majus latifolium*, *ſpica Spodicea viridi*, whoſe Roots are more buſhy and fibrous, and the ſpiked heads more green, having a long narrow Leaf under the loweſt Spike or Head.

LXI. 19. *Gramen Cyperoides Paluſtre majus anguſtifolium*, *The greater Cyperus-Graſs with narrow Leaves.* This differs little from the laſt, but in its growing lower, with narrower Leaves, and ſpiked heads, which are thinner and longer, but of the ſame brown greeniſh color with it.

LXII. 20. *Gramen Cyperoides Paluſtre minus anguſtifolium*, *The leſſer narrow Leav'd Cyperus-Graſs.* It has a Root with long Strings and Fibres thereat, ſhooting forth like *Cyperus*, has narrower Leaves, and threeſquare Stalks, bearing ſmaller and more ſpiked long heads, three uſually ſet together, one a little from the other, more ſtiff alſo and upright.

LXIII. 21. *Pſeudo Cyperus ſpica brevi pendula*, *Lobelij*, *Geſneri*, *Dodonæi*, *Baſtard Cyperus-Graſs with ſhort pendulous heads.* The Roots of this do ſomewhat reſemble the *True ſweet long Cyperus*, but looſer, and not ſo firm, fuller alſo of Fibres, and not ſmelling ſweet at all; it grows alſo ſomewhat like unto the *True long Cyperus*, having large and long graſſie Leaves, in a manner threeſquare, and ſo is the Stalk alſo; at the top whereof, among divers Leaves, come forth great ſpiked, thick and ſhort heads, hanging downwards, every one by a ſhort Footſtalk.

LXIV. 22. *Pſeudo-Cyperus*, *ſive Gramen Cyperoides Paluſtre ſpica pendula longiore*, *Another Baſtard Cyperus-Graſs with longer heads.* It has a Root like the former, with a triangular ſtriped Stalk, about a yard high, bearing long and narrow Leaves thereon, which encompaſs the Stalk at bottom with a Skin, or hollow Sheath, having at top ſeveral long and narrow pendulous heads, five or ſix Inches long each, with a long Leaf under each head.

LXV. *The Places and Times.* They all grow in low, moiſt, and Mooriſh Grounds, in many places of this Kingdom, as alſo in ſeveral other Countries, as their Names expreſs, and do all Flouriſh and Seed in the end of Summer.

X. Φοίνιξ χορτώδης, *Phœnix Graminea*, *Darnel-Graſs*, ſix kinds.

LXVI. 1. *Phœnix ſimplici*, *& tariſſima Gluma*, *The ſmalleſt ſingle Darnel-Graſs.* It is very like to *Red Darnel*, but that it has very few ſlenderer and ſhorter Stalks than it, and the Leaves alſo narrower; the ſpiked head has a few ſingle Husks ſet very ſparſedly.

LXVII. 2. *Phœnix altera brevioribus denſioribuſque ſpicis*, *The greater ſingle Darnel-Graſs.* The Roots and Leaves hereof are like the *Red Darnel*, the Stalks grow a yard high, jointed and ſtraked, and the Spike is thinly ſet with chaffie heads, but they are bigger, rounder, and thicker.

LXVIII. 3. *Phœnix aceroſa aculeata*, *Small prickly Darnel-Graſs.* It has a Root conſiſting of ſmall white Threads or Fibres, the Stalks hereof are about five, ſix, or ſeven Inches high, being rough, hard, full of Joints, pointed or prickly at the ends, and with a few ſhort Leaves on them, and have withal

ſmall,

ſmall, ſhort, rough, and chffie like Tongues, ſharp at their ends, ſet at the Joints.a

LXIX. 4. *Phœnix multiplici ſpicata Panicula, Branched Darnel-Graſs.* It has ſlender jointed Stalks, half a yard or more high, with narrow Leaves; the ſpiked head is as it were branched into others, in which conſiſts the chiefeſt difference.

LXX. 5. *Phœnix multiplici ſpica nutante, Double Darnel-Graſs with a bowing top.* It differs little or nothing from the laſt, but in the ſpiked heads, which are thicker ſet together, and the tops of them bow down, or turn a little round.

LXXI. 6. *Phœnix Paluſtris & longius ſpicata, Branched Marſh Darnel-Graſs.* It has a Root which is creeping, white, and jointed, with many Fibres adjoining thereto, from which ſhoot forth two or three jointed Stalks, two Feet or more high; the ſpiked head is a Foot long, branched as the fourth is, each Branch four or five Inches long, with winged Husks, like unto Oats.

LXXII. *The Places and Times.* All theſe grow either in Fields of Corn, or in the Borders or Pathways of other Fields which are Fallow, and the laſt ſometimes in Marſh and Wet Grounds, as well as in the edges of Ploughed Grounds.

XI. Ἄγρωσις κυνικὴ, Κυνόγρωσις, *Gramen Caninum*, Dogs-Graſs, fourteen kinds, nine Land kinds, five Water.

LXXIII. 1. Κυνόγρωσις, *Gramen Caninum vulgatius, Common Dogs-Graſs.* It creeps far about under Ground, with long white jointed Roots, and ſmall Fibres at every Joint, very ſweet in taſte, as the reſt of the Herb is, and interlacing one another, from whence ſhoot forth many fair and long graſſie Leaves, ſmall at the ends, and ſharp or cutting on the edges; the Stalks are Jointed like Corn, with the like Leaves on them, and a long ſpiked head, with long husks on it, and hard rough Seed in them.

Dogs Graſs upright.

LXXIV. 2. *Gramen Caninum longius Radicatum & Paniculatum, Dogs-Graſs with a longer Root and more ſparſed Panicles.* The Root is fuller, larger, longer, and farther ſpread, the whole Plant differs but very little from the former, but in the Tuft or Panicle, which is more ſpread into Branches, with ſhorter and broader husks.

LXXV. 3. *Gramen Caninum latiore Panicula minus, The leſſer Dogs-Graſs with a ſparſed Tuft.* The Root is ſmall, and Jointed, but creeps not ſo much as the former, and has many more Fibres among them than the others have, and is a little browner, and not ſo white, but more ſweet; it is a ſmall ſort of *Graſs*, and has ſlender Stalks, about ſix or ſeven Inches high, with many very narrow Leaves, both below and on the Stalks; the Tuft or Panicle at the top is ſmall, according to magnitude of the Plant, and ſpreads into ſeveral parts or branches.

Dogs-Graſs low bending.

LXXVI. 4. *Gra-*

LXXVI. 4. *Gramen Caninum ſupinum arvenſe*, *Low bending Dogs-Graſs.* It has a Root which creeps much under Ground, but in a differing manner, the Stalks taking Root in ſeveral places, and ſcarcely raiſing themſelves up a Foot high, with ſuch like green Leaves as the firſt kind, but ſhorter; the ſpiked head is bright and ſparſed, or ſpread abroad, much like to the *Field-Graſs.*

Dogs-Graſs lying along.

LXXVII. 5. *Gramen Murorum Radice repente*, *Wall-Graſs with a creeping Root.* Its Root is blackiſh, and ſpreading abroad, from which ſpring forth many ſmall Stalks, a Foot high, bending or crooking, with a few narrow ſhort Leaves on them, at whoſe tops ſtand ſmall white Panicles, of an Inch and half long, conſiſting of many ſmall chaffie husks.

LXXVIII. 6. *Gramen Caninum bulboſum vel nodoſum vulgare*, *Common bulbed or knobbed Dogs-Graſs.* It has for its Roots three, or four, or more round white Bulbs or Knobs, one ſet upon the head of another, with ſeveral Fibres underneath them, from the uppermoſt of which ſpring forth ſeveral long hard graſſie Leaves, ſharp at the edges, and in the middle of them a jointed Stalk, with three or four ſuch like Leaves upon them, at the top of which is a long Panicle, ſpread into many parts, like to that of *Oats*, whereunto ſome have compared it. *Lobel* has another ſort hereof, differing little in any part but the Roots, which are ſmall and round, and ſet at diſtances all along the Roots, and full as ſweet as the other. The firſt of theſe is the *Gramen nodoſum avenacea pluma Bauhini*, who queſtions whether it be not the *Ægilops Plinij*, which has a kind of bulbous or tuberous Root.

LXXIX. 7. *Gramen Caninum nodoſum ſpica parva*, *Tuberous or Knobbed Graſs with a ſmall round ſpike.* It has a ſmall whitiſh round Bulb or Knob for the Root, with ſmall Fibres under it, ſhooting forth from the head thereof another, ſomething like unto a Bulb, but much ſmaller, and like a ſlender knob, with a ſmall jointed Stalk above it, and a long narrow pointed Leaf at each of them, being four or five Inches long, and at the top one ſhort ſoft ſpiked head, ſomething like to the head of *Catstail-Graſs.*

LXXX. 8. *Gramen Caninum Geniculatum majus*, *The greater Kneed Graſs.* It has a large fibrous buſhy Root, from whence ſpring many long trailing Branches upon the Ground, with ſeveral great Joints on them, and ſhooting out Fibres from thoſe Joints which lye next the Ground, ſo that it does ſometimes run twenty Foot in length, with one long Leaf at each Joint, ſmall at the end, but broadeſt below, from which, as well as at the top, come forth divers ſmall long ſpikes of chaffie husks, of an over worn color, which Stalks and Joints are ſo full of a moſt pleaſant Juice, that it feeds Cattel much better than any other Hay, and therefore thoſe Husbandmen who have it growing in their Grounds do keep the Hay thereof for their chief Winter ſtore, and inſtead of Provender; this is that which is commonly called *Dutch Graſs*, and grows very plentifully in Plantations in *Florida*, and other parts of the *Weſt Indies.*

LXXXI. 9. *Gramen Geniculatum minus*, *The leſſer Kneed-Graſs.* The Root is fibrous or thready, like the former, this *Graſs* creeps not ſo much on the Ground as the *greater* does, but ſpreads more upright with its Stalks, whoſe Joints are not altogether ſo great as the other, and have at their tops ſpiked heads, which are ſomewhat larger than thoſe of the *greater Kind*, and of a ſadder overworn color.

LXXXII. 10. *Gramen Caninum Geniculatum Maritimum ſpicatum*, *Sea ſpiked Dogs-Graſs.* It has a long creeping Root, full of Joints, with many ſmall Fibres running from the Joints, and creeping much under Ground; from ſeveral of the Joints of this Root ſpring up ſeveral jointed Stalks, about a Foot high,

high, with hard Leaves thereon a Span long, and like to the other *Dogs-Graſs*; the ſpiked heads are ſhorter by much, and harder than the *Common Kind* at Sect. 72. aforegoing.

LXXXIII. 11. *Gramen Caninum Maritimum vulgatio Canario ſimile, Sea Dogs-Graſs.* This is a ſlenderer, harder, and lanker *Graſs* than the *Common Kind*, and of a more blewiſh green color, and differs not in any thing elſe; but there are two other ſorts hereof, the one differing in the Roots, which at the ſeveral Joints as it runs does ſhoot up the like Stalks, Leaves, and ſpiked Tufts, and will be ſometimes twenty Foot in length, with a number of thoſe Stalks and Leaves at them; the other differing in the ſpikes, which have two orders or rows in them.

LXXXIV. 12. *Gramen Caninum alterum Maritimum longius Radicatum, Sea Dogs-Graſs with long Roots.* It has a very long Root, and differs little from the former, either in the hard Leaves or in the running Roots, but that they ſpread more, and inſtead of ſpiked heads at the tops of the Stalks, this has chaffie heads among the Leaves.

LXXXV. 13. *Gramen Caninum Maritimum ſpicatum Americanum, American Sea ſpiked Dogs-Graſs.* It has ſlender woody Roots, with but few Fibres adjoining thereto, from whence ſpring up ſeveral trailing Stalks, a Foot or more high, with ſeveral Joints and Branches at them, and ſhort narrow *Reed* like Leaves on them, at the tops whereof grow ſpiked heads, three Inches long, of a dark Aſh color.

LXXXVI. 14. *Gramen Caninum Maritimum aſperum, Rough Sea Dogs-Graſs.* It has a Root which is a buſh of long white Fibres, from whence ſpring many reddiſh round ſmall Stalks, about a Foot high, which at firſt lean downwards; they are encompaſſed with hard, ſhort, and ſharp pointed Leaves, ſtanding as it were in a Tuft together, with hard rough dents about the edges; the ſpiked heads are ſomewhat like unto ſmall rough hard Burs, breaking out of a Skin, in which they were firſt encloſed.

LXXXVII. *The Places and Times.* The firſt of theſe is common to be found throughout all *England* in Ploughed Fields, and other like Grounds; the ſecond and third are nothing ſo frequent as the former, but are more natural to Sandy and Chalky Grounds; the fourth is likewiſe found in Fields which have been Plowed and do lye Fallow; the fifth is often found growing on old decayed Stone or Brick Walls in ſeveral places; the ſixth grows not ſo common as the *firſt kind*, or *Creeping Rooted-Graſs*, yet ſufficiently plentiful in many Plowed Fields of this Kingdom; the ſeventh is alſo found in Plowed Fields, and borders of moiſt Meadows, near Copſes, Hedges, or Thickets of Wood, and in ſome places near *Baſil*; the eighth and ninth grow in moiſt Meadows in ſeveral places of this Land, but have been eſpecially obſerved the eighth to grow about *Wilton*, in a great Meadow lying among the Bridges, at the Towns end, belonging to the Earl of *Pembrook*, and the ninth at *Warminſter*, both of them in *Wiltſhire*; the tenth, eleventh and twelfth have been obſerved on our Sea Coaſts, eſpecially upon the *Kentiſh* Shoar; the thirteenth upon our Southern Coaſts, in *Florida* alſo, likewiſe about *Mompelier* and *Narbone* in *France*; the fourteenth on ſome of our Shoars, as alſo on the *Venetian* and *French* Shoars, about *Mompelier*, &c. The firſt nine Flower and Seed in the beginning and height of the Summer, the laſt five flouriſh and perfect their Seed at the latter end of Summer.

The Virtues.

LXXXVIII. The firſt five of theſe *Graſſes* have all one and the ſame Virtues, but the firſt of them, as it is moſt common, ſo it is eſteemed to be of greateſt effect; the Eſſence, or Decoction of its Roots, opens obſtructions of the Liver, Spleen, Gall, Bladder, and Reins, eaſes Gripings of the Belly, and waſtes the Morbifick or Tartarous Matter which breeds the Stone in the Bladder, and heals Ulcers there; being bruiſed and applied it conſolidates Wounds; the Decoction provokes Urine, ſtrengthens the Stomach, and ſtops Vomitings; the Roots are cold in the firſt degree, and temperate in reſpect of moiſture and dryneſs; the Diſtilled Water is given to Children for the Worms, but it is much more effectual if Worm-Seed be added to it.

LXXXIX. *The Bulbous, Tuberous, or Knobbed Dogs-Graſs, viz.* the ſixth and ſeventh, are found by experience to be very effectual to provoke Urine, and more powerful than the firſt *Dogs-Graſs* for the ſame purpoſe, as alſo to break the Stone, and eaſe thoſe torments of the Belly which come by Fluxes, Bloody Fluxes, crudity of Humors, and obſtructions of the Viſcera; and may be uſed in any caſe to which the other may be applied.

XC. *The Kneed Dogs-Graſſes, as alſo all the Sea Dogs-Graſſes*, are generally held to be as effectual as the firſt, or *Common kind*, but this is to be obſerved, that the *Sea Kinds* are more effectual for ſuch as live by the Sea ſide, and Marſhy, or Maritime places, and the *Land kinds* for ſuch as live in the Midland, or far from the Sea Shoar, or Salt Water ſides.

XII. Ἄγρωστις νάνος, *Gramen Pumilam vel nanum*, Dwarf-Graſs, three Kinds.

XCI. 1. Ξηροπέλινος, *Gramen Xerampelinum*, *Gramen Pratenſe rubrum minimum, Red Dwarf-Graſs.* It has a Root conſiſting of many little Bulbs, covered with a reddiſh Film or Skin, with very many ſmall, hairy, and white Fibres or Threads; the Stalk is ſhort and round, and the Ear is of a reddiſh color, not much differing from the *Graſs* called *Iſchæmon*, but the Ear is ſofter, broader, and more beautiful.

XCII. 2. *Gramen minimum Pratenſe album, White Dwarf-Graſs.* This has many Fibrous or Hairy Roots, the Leaves are ſmall and ſhort, as alſo the Stalk, the top of which bears a Panicle, not much unlike the *Small Meadow-Graſs*, but leſſer; the color thereof is ſometimes white, and ſometimes reddiſh.

XCIII. 3. *Gramen minus duriuſculum, Small hard Graſs.* It has ſmall Roots, compact of little Strings or Threads, from which ſpring forth many harſh, ſowre, or Ruſhy Leaves, about an Inch and half long; the Tuft or Ear is compact of many Panicles, or very little Ears, which in feeling are very hard or harſh; the *Graſs* is unpleaſant, and not good Food for Cattel.

XCIV. *The Places and Times.* Theſe all grow in Fields and Meadows, more eſpecially on Heathy, rough, and dry barren Grounds, in moſt places of *England*; they grow, flouriſh, and come to perfection in the Summer Months, as other *Meadow-Graſſes* do.

XIII. Ἄγρωστις πολύπτερα, *Gramen Plumoſum*, Feather-Graſs, two Species or Kinds.

XCV. 1. *Gramen Plumoſum, Gramen Tomentoſum, vel Arundinaceum, Feather-Graſs.* It has a Root which is tough and hard, from whence ariſes a long benty Stalk, three Feet high, or more, naked, without any Blades or Leaves for the moſt part, at the tops of which grow long ſpiky Heads or Ears, repleniſhed with Chaffie and Downie Tufts, which make a very pretty ſhow.

XCVI. 2. *Spartum*

XCVI. 2. *Spartum Auſtriacum Cluſij*, *Gramen Pinnatum Dalechampij*, *Gramen Plumoſum Hiſpanicum*, *Spaniſh Feather-Graſs*. It has a Root conſiſting of many ſmall graſſie Fibres, from whence ſpring ſmall Leaves, a Foot high, round, green, and ſharp pointed, and among theſe Leaves riſe up many ſmall Stalks, not exceeding the height of the Leaves, which bear a Spike, having three or four Seeds, ending in, or ſending up very fine white Feathers, reſembling the ſmaller ſort of Feathers of the Wings of the Bird of Paradice; it is a Native of *Spain*, but grows with us in our Gardens.

XCVII. *The Places and Times.* The firſt grows in very Fertil Fields and Paſtures, and by their borders near Hedges, and flouriſhes in Summer.

XIV. Ἄγρωστις πολυανθὴς, *Gramen Polyanthum*, *Graſs many Flowered*, *Gramen Filiceum*, Fern-Graſs.

XCVIII. It is alſo called *Heragroſtis Græcè*, *Gramen Paniculatum*, *Gramen Paniculoſum Phalaroides Lobelij*, and is a ſingular Plant. It has Roots and Leaves not much unlike the *Common Meadow-Graſs*, the Stalk riſes to be about a Foot high, and at top thereof it bears a beautiful Panicle, (for which reaſon the *Spaniards* and *French* call it the *Lovely-Graſs.*) This Head conſiſts of many little Ears, ſhaped much like thoſe of the *Ordinary Quaking-Graſs*, but longer and flatter, being compoſed of more Scales, ſo that each of them ſomewhat reſembles the Leaf of a *Small Fern*, whence the Name. Theſe tops when they are ripe and white, are gathered where they naturally grow, to beautify and adorn Garlands.

XCIX. *The Places and Times.* It grows wild in *Spain* and *France*, but with us in Gardens, and Flowers in the Summer Months.

XV. Ἀλωπέκουρος, *Alopecuros*, *Cauda Vulpis*, *Gramen Tomentoſum Alopecuros vera Plinij*, Foxtail-Graſs, three Kinds.

Ἄγρωστις ἀλωπεκοειδὴς, *Gramen Alopecuroides*, Baſtard Foxtail-Graſs, nine Kinds.

Foxtail Graſs true.

C. 1. Σπλοῦρος, *Gramen Alopecuros vero Plinij*, *Alopecuros genuina Theophraſti*, *Stelepburos Plinij*, *The true Foxtail-Graſs*, has a periſhing Fibrous Root, grows up with two or three ſoft hoary Stalks, a Foot high, with ſmall, long, narrow, ſoft Leaves, as hoary as the Stalks, on the tops of which grow ſomewhat long, round, ſoft, woolly or hoary heads, ſet with ſoft hairs, of a pale Straw Color, reſembling a Fox Tail.

CI. 2. *Alopecuros altera Anglica & Flandrica*, *Another Engliſh and Flemiſh Foxtail-Graſs.* In Roots and Leaves it is much like the former, but the Stalks grow not ſo high, the heads are alſo ſhorter and rounder, and not ſo woolly or hoary.

Great English Fox taile Graſs

CII. 3. *Alopecuros maxima Anglica*, *The greateſt Engliſh Foxtail-Graſs.* From a like Fibrous Root the Stalks grow up to be half a Yard, or two Feet high, having fair large Wheat like Leaves ſet at the Joints, and at the tops great, large, full, ſoft, and woolly heads, like the former, ſaving that they are much greater and longer, and this whether the Stalk is higher or lower.

CIII. 4. *Gramen Alopecuroides majus*, *The greater Baſtard Foxtail-Graſs.* It has a Fibrous Root, and riſes up with a Stalk three Feet high, with a few Leaves long and narrow thereon, the Spike is ſomewhat great and long, but not ſo ſoft and woolly as the former.

CIV. 5. *Gramen Alopecuroides Cuſpidatum maximum Anglicum*, *Our greateſt Baſtard Foxtail-Graſs.* From a buſhy fibrous Root ſpring up many long narrow Leaves, and among them Stalks three Feet high, with few Joints and Leaves on them, at top of which ſtands the longeſt ſpiked head of any other, ſomewhat pointed at the top, and broad at bottom, with white Hairs on the Husks, ſomewhat like thoſe of *Oats.*

CV. 6. *Gramen Alopecuroides Cuſpidatum majus.* *The great Spiring or Spiked Baſtard Foxtail-Graſs.* This is like that at Sect. 103. N°. 4. above, but that

that the ſpiked head is longer, and ſpiring upwards, is ſmall at the top, but ſomething broad below, with Oaten like Husks ſet on them; the Leaves alſo are more, and much ſhorter.

CVI. 7. *Gramen Alopecuroides ſpica aſperſa brevi, Short rough Ear'd Baſtard Foxtail-Graſs.* It has a ſmall white periſhing Root, from whence ſpring up two or three upright ſmall Stalks, with ſomewhat narrow and ſoft Leaves on them, at whoſe tops ſtand thick ſhort rough heads, an Inch and half long, not fully, but as it were half round the Stalk, the backſide being as it were bare, ſo that they ſeem to ſtand but on one ſide; in theſe heads is contained the Seed, which is ſmall and white.

CVII. 8. *Gramen Alopecuroides Spica longa majus & minus, Baſtard Foxtail-Graſs long Ear'd great and ſmall.* Theſe Graſſes are much like one another, one being greater, the other ſmaller, both in Stalk and Leaf; the ſpiked heads are long and ſlender, and of a whitiſh color.

CVIII. 9. *Gramen Alopecuroides minus Spica aſpera longa, Small Baſtard Foxtail-Graſs long rough Ear'd.* It differs from the laſt, in being greener, more repleniſhed with Stalks and Leaves, the ſpiked heads being more ſlender, long alſo, and rougher.

CIX. 10. *Gramen Alopecuroides Cuſpidatum minus, Baſtard Foxtail-Graſs ſmall ſharp pointed.* It grows about a Foot high, ſtored but with few Joints, and ſhort narrow Leaves on them, having a Spike or Ear almoſt as big as the laſt, but ſharper pointed, with ſome pieces growing out of the ſides.

CX. 11. *Gramen Alopecuroides Cuſpidatum minimum, Smalleſt Baſtard Foxtail-Graſs pointed.* This is leſſer than any of thoſe going before, in Stalks and Leaves, but longer in both, as is alſo the Spike or Ear, which is very ſmall, ſlender, and pointed at the end.

CXI. 12. *Gramen Alopecuroides alterum Radice repente, ſive Pſeudoſchænanthum, Another Baſtard Foxtail-Graſs with a creeping Root*, called alſo *Baſtard Schænant.* It has a creeping Root, which ſpreads it ſelf under Ground, ſhooting forth Leaves and Stalks in ſeveral places; the Plant ſomewhat reſembles the *greateſt Engliſh Foxtail-Graſs* (at Sect. 102. N°. 3. above) ſaving that this has thicker, harder and ſtiffer Leaves, like unto *Ruſhes*; the Head or Spike is long and cloſe, five or ſix Inches long, of a Silver like ſhining color, but the Blooms are of a pale red, and the Husks redder, which when it has ſtood long, begins to open it ſelf, expoſing its Downy ſubſtance to the Wind.

CXII. *The Places and Times.* The firſt and twelfth grow with us only in Gardens, the other ten grow in Fields and Meadows in many places of *England*, ſome of them about *Hackney*, near *London*, and ſeveral others of them in *Kent*; I have found them all in Fields, Paſtures, and Meadows in many parts of *Norfolk*; and they all keep the times of Flouriſhing and Seeding with other *Meadow-Graſſes*.

XVI. Ἄγρωστις λάσια, *Gramen Hirſutum, & Hirſutum Nemoroſum*, Hairy-Graſs, and Hairy Wood-Graſs, nine Kinds.

CXIII. 1. *Gramen Hirſutum latifolium Nemorum majus, The greater Hairy Wood-Graſs broad Leav'd.* It has a Root conſiſting of a tuft of many ſmall long Fibres or Threads, and has ſeveral long and ſomewhat broad Leaves riſing from the Root, ſmaller to the end, greyiſh underneath, and green above, ſet about the edges with whitiſh ſmall long Hairs; the Stalk riſes up from among them, and comes to be about two Feet high, with Leaves at the Joints, having at the top ſeveral ſmall greeniſh Flowers in little Husks, containing within them ſmall Seed.

Hairy Wood-Graſs broad Leav'd greater.

Hairy Wood-Graſs narrow Leav'd leſſer.

CXIV. 2. *Gramen Hirſutum Nemorum minus anguſtifolium, The leſſer narrow Leav'd Hairy Wood-Graſs.* It has a Root ſomewhat long, like a *Cyperus* Root, with a buſh of ſmall long Fibres or Threads; the Plant is leſſer than the ſixth following,

ing, having many long and narrow Leaves growing at the Root, as hairy as any; the Stalk has two or three Joints, and ſhort Leaves on them, and at the top ſeveral ſmall heads ſtanding upright on a ſmall hairy Footſtalk.

CXV. 3. *Gramen hirſutum Nemorum præcor majus tuberoſa Radice, A greater early hairy Wood-Graſs with a tuberous Root.* The Root is thick, ſomewhat ſhort and brown, almoſt like a *Tormentil* Root, with a great number of ſmall browniſh hairs covering it very thick; the Leaves are larger than the firſt, of a deeper green color, and as hairy alſo; at the joints of the Stalks are Leaves, as in the other, and ſuch like heads or knops of Flowers as in the firſt.

CXVI. 4. *Gramen hirſutum Nemorum latifolium minus Juncea Panicula, The leſſer broad Leav'd hairy Wood-Graſs with Ruſh like Panicles.* It is very like in its growing to the firſt, but that the Leaves hereof are narrower, and the Panicle or tufted head at top of the ſmall Stalks is ſmaller, and ſomething reſembling the tops of *Ruſhes.*

CXVII. 5. *Gramen hirſutum Nemorum majus anguſtifolium, The greater narrow Leav'd hairy Wood-Graſs.* The Root is ſmall and long, with ſmall Fibres adjoined thereto; this Plant is very like in its manner of growing unto the firſt *broad Leav'd Kind*, but that the Leaves are much narrower, ſhorter, and turning downwards at firſt; the Stalk is bare, without Joint or Leaf, having at the top three ſmall, rough, and almoſt round ſcaly heads ſet together.

CXVIII. 6. *Gramen hirſutum Nemorum majus anguſtifolium alterum, Another great narrow Leav'd hairy Wood-Graſs.* It has a ſmall reddiſh fibrous Root, from whence riſes up a Stalk, about two Feet high, and ſmooth, bearing commonly at top a ſoft white Panicle, ſomewhat ſpread abroad, and compoſed of ſeveral ſmall Scales as it were, in every one of which lies a ſmall round blackiſh Seed; the Leaves are few, a little hairy, and ſome of them encompaſſing the Stalk; the whole Panicle has two ſmall Leaves ſet at bottom thereof, the one riſing higher than it, the other lower.

CXIX. 7. *Gramen hirſutum Nemorum minimum, The ſmalleſt hairy Wood-Graſs.* This has a greater ſtore of long hairy Leaves than the ſecond, but in all things elſe, as in its Heads and Flowers, it agrees therewith, but is indeed whiter than the reſt.

CXX. 8. *Gramen hirſutum Nemorum, ſive exile ferrugineum, Small brown hairy Wood-Graſs.* It has a Root which is ſmall and fibrous, and the *Graſs* it ſelf is as ſmall as the laſt, but with leſſer ſtore of Leaves; the heads on the Stalks are woolly, and not fully round, but a little flat, and of a yellowiſh brown color, and the Stalks themſelves are about four or five Inches high.

CXXI. 9. *Gramen hirſutum capitulis Globoſis, Globe headed hairy Wood-Graſs.* The Root is ſmall and thready, from whence riſes long Leaves, as broad as the fourth Kind aforegoing, with ſome ſmall ſoft hairs about the edges; the Stalks are about a Foot high, with Joints and Leaves on them, the tops being furniſhed with two or three round, ſoft, white woolly heads, compoſed of many ſmall Silver like Threads.

CXXII. *The Places and Times.* All theſe grow in many Woods throughout *England*, ſome about *Highgate*, and in *Hornſey Wood*, and other places, and Flower all of them in the Summer Months, or near the end of Summer, except the third, which Flowers a Month or two earlier than the reſt.

XVII. Ἄιλωψ, *Feſtuca, Oculus Caprinus*, Haver-Graſs, or Peter-Corn, two Kinds.

CXXIII. 1. *Ægilops Italica, Ægilops Narbonenſis, Feſtuca Italica, Ægilops Dioſcoridis, Frumentum Sylveſtre Sicilie, Italian Havergraſs*, or *Peter-Corn.* It has a Root compoſed of a ſmall head, with many long Fibres growing from it, from which ſpring ſeveral Graſs-like Leaves, of a pale green color; the Stalk is jointed in three or four places, with Leaves at them, and at the tops two or three heads, ſet one above another, which are round, and ſomewhat long, hard and ſtriped, having ſeveral Beards at the ends of them; the Seeds are a little ſmaller than *Barley*, each Seed wrapped up in a creſted Skin, out of which the Awnes put themſelves forth.

CXXIV. 2. *Ægilops Bromoides Belgarum Lobelij, Feſtuca prior Dodonæi, Avena Sylveſtris, ſive nigra Thalij, Dutch Havergraſs*, or *Peter-Corn.* It has a Root which is ſomewhat like the former, but the head from whence the Fibres proceed is not ſo conſpicuous, and indeed the *Graſs* is very like the laſt both in Stalk and Leaf, the top only is in part like to the *Naked Oat*, and in part to the former *Havergraſs*, having ſome Beards ſet at every husk, within which lye long rough brown Seed.

CXXV. *The Places and Times.* The firſt is frequent in *Italy* and *France*, where it is found among their Corn, being a degenerate kind of *Barley*, and in ſome places the Poorer People uſe it to make Bread of, with us it is only Sown in Gardens; the ſecond is found as plentifully in *England* as the Low Countries, and they are both ripe in *July* and *Auguſt.*

The Virtues.

CXXVI. *Lobel* ſays that he had often tryed the *Ægilops* to be effectual in curing that hollow Ulcer in the Eyes called *Ægilops*, or *Fiſtula Lachrymalis*, for it has a drying quality without ſharpneſs; he alſo ſays that the Seed put into Drink cauſes a kind of Drunkenneſs, and that the burnt Aſhes of the Stalks

Stalks are good againſt Pituitous Tumors, and the Gout, bathing with the Lye made thereof; and that it diſſolves hard Tumors and Kernels in the Fleſh, diſcuſſing Swellings of the Joints. *For the* Fiſtula Lachrymalis. *Take the whole Plant, Root and green Seed three parts, Roots of* Wild Oats *one part, boil in a ſufficient quantity of Water till a third part is conſumed, ſtrain, and add an equal quantity of Honey, and boil to the thickneſs of a Syrup, to every Quart of which add fine Aloes in fine Pouder one Ounce, mix and diſſolve, in which wet Tents, and put them up the Noſtrils.* Dodonæus. *Alſo the Juice of the Plant mixed with Barley Meal to a ſoft Paſte and inſpiſſated, is good for the ſame purpoſe; mix a little of it with Damask Roſe Water to a thickneſs, and apply it Plaiſterwiſe to the* Ægilops *or* Fiſtula, *and it will cure it; it alſo ſoftens and diſcuſſes hard Tumors in other parts of the Body.*

XVIII. Ἄγρωστις ἐχινωδὴς, *Gramen Echinatum*, Hedge-Hog-Graſs, or prickly headed Graſs, four kinds.

CXXVII. 1. *Gramen Echinatum vulgare, Common Hedge-Hog, or prickly headed Graſs, Gramen Paluſtre Echinatum Lobelij, Gramen aculeatum Dalechampij.* It has a fibrous or thready Root, which ſends up divers Graſſie Leaves, and among them ſeveral ſlender Stalks, leaning this way and that way, on which are ſet ſhort ſpiked heads, very rough and ſharp, made of many husks, in which lies the Seed.

CXXVIII. 2. *Gramen Echinatum Italicum aculeatum Matthioli*, Matthiolus *his Hedge-Hog, or prickly headed Graſs.* It has a fibrous Root, which ſends up ſmall Graſs Leaves and Stalks, much like the *Small common Graſs*, but at the Joints with the Leaves come forth ſmall prickly heads, folded in husks, and ending in three points, in which lye ſmall long pointed Seed.

CXXIX. 3. *Gramen Echinatum planum, Gramen Spica plana Echinata Bauhini, Flat Hedge-Hog, or prickly headed Graſs.* It riſes up not much higher than a Palm or Hand breadth, and from a white Root, made of many Fibres, it ſends forth a few ſmall hairy Leaves, an Inch long, as alſo a fine and ſmall Stalk, with a flat ſpiked head, and very ſharp Awnes at the ends of the Husks.

CXXX. 4. *Gramen Echinatum Montanum Tribuloides Echinata Bauhini, Gramen Spica ſubrotunda Echinata Columnæ, Gramen Echinato Capitulo, vel Capitulato, Hedge-Hog, or round prickly headed Graſs.* It has a Root compoſed of many white Threads, ſending forth ſome few narrow rough Leaves, two or three Inches long, among which riſe up ſlender Stalks, ſome higher ſome lower, with one or two Joints, and Leaves at them, each having at the top a ſmall round head, ſet with very ſharp prickles, within the husks whereof lyes clear white Seed.

CXXXI. *The Places and Times.* The firſt grows in Watery Meadows and Fields, as in St. *Georges* Fields, near *London*, and ſuch other like places; the other three grow in dry places, and old Mud Walls, they all Flouriſhing and Seeding at the uſual times with other *Graſſes*.

XIX. Ἄγρωστις γονατώδης, ἢ πολυγόνατη, *Gramen Geniculatum*, Kneed-Graſs, two Kinds.

CXXXII. 1. *Gramen Geniculatum Pratenſe* has a fibrous and hairy Root, from whence come ſtraight upright ſtrawy Stalks, with manifold Joints, like to thoſe of *Corn*, which are very large and conſpicuous, having theteat many ſmall Graſſie Leaves, and bearing at their tops ſpiky rough Panicles, of a dark brown color.

CXXXIII. 2. *Gramen Geniculatum Aquaticum, Water Kneed-Graſs.* It has a thready Root like the former, from which riſe many long and ſlender Stalks, jointed with many large, knobbed and gouty Knees, almoſt like unto *Reed*, ſet with broad flaggy Leaves, ſomething ſharp pointed, bearing at their tops Tufts or Panicles, divided into ſeveral ſmall Branches, of a duskiſh color.

CXXXIV. *The Places and Times.* The firſt grows in fertile and moiſt Meadows, the other in moiſt and plaſhy Fields, and places apt to retain much Wet, alſo at the bottoms of Banks, by Ditch and Hedge ſide, and flouriſh when the other *Graſſes* do.

XX. Ἄγρώστις λειμώνια, *Gramen Pratenſe*, Meadow-Graſs, five kinds.

CXXXV. 1. *Gramen Pratenſe vulgatius majus, The greater common Meadow-Graſs.* It has a buſhy

fibrous Root, from whence riſe up many Graſſie Leaves, and among them ſeveral Stalks, half a yard high, bearing a ſparſed Tuft at the top of them, ſomewhat reſembling the Feather like heads of the *Water Reed.*

Leſſe tufted Meadow Graſs

CXXXVI. 2. *Gramen Pratenſe minus, The ſmall Meadow-Graſs.* This in its Roots, Leaves and Stalks is not much unlike the former, ſaving that it is every way ſomething leſs, and its ſpiked Panicles are manifold, growing upon the Stalk leſs and leſs, till they come to the very top. Of this kind there are two other ſorts, both ſmaller than this, the one with white tufted tops, and the other with reddiſh tufted tops, the firſt more ſparſed, the laſt more cloſe together.

CXXXVII. 3. *Gramen multiplici Panicula Pratenſe, Meadow-Graſs with manifold Tufts.* The Root is a thick buſh of white Fibres, from whence riſe up divers Stalks, a Span long, jointed, and a little bending downwards; the Leaves are ſmall Graſs Leaves, and the Tufted Head or Panicle is manifold, and much divided, which when ripe grows hard, and is of a ſad reddiſh color.

CXXXVIII. 4. *Gramen Pratenſe Paniculatum molle, Soft Tufted Meadow-Graſs.* It has a ſhort buſhy fibrous Root, from whence ſeveral long and ſomewhat broad, ſoft, or woolly Graſs Leaves ſpring, from among theſe Leaves riſe up two or three Stalks, a Cubit high, with ſome Leaves upon it, and at top comes forth a ſoft woolly ſpiked head, much divided, whoſe Bloomings are reddiſh.

CXXXIX. 5. *Gramen odoratum Paniculatum Germanicum, Sweet Dutch-Graſs with tufted heads.* It has a Root which creeps in the Ground, which is white, and full of Joints, ſhooting out Fibres at every one of them; the Stalks are two or three Feet high, with but few Joints on them, whoſe Leaves are almoſt as long, and ſome of them exceed the height of the Stalks, being narrow, and ſmall at the ends; at the top of each Stalk grows a Panicle, but nothing near ſo much ſpread as the former, the which for their ſweetneſs ſome uſe to lay among Garments, or Linnen, to perfume it.

XXI. Ἄγρωσις Οἰνὸν, Οἰνόγρωσις, *Gramen Paniculatum Montanum*, Mountain Tufted-Graſs, five Kinds.

CXL. 1. *Gramen Montanum Panicula ſpadicea delicatiore, Soft Mountain-Graſs with a reddiſh or bright bay Panicle.* It has a ſmall white Root, with ſhort Fibres, which ſends up three or four jointed Stalks, a Foot high, having a few ſmall and ſhort Leaves on them, and ſuch likewiſe at the foot of the Stalks, but few in number; at the top ſtands a browniſh or bay colored Panicle, three Inches long, compoſed of many very ſmall husks: this is ſometimes found growing higher, and with larger Panicles.

CXLI. 2. *Gramen Montanum Paniculatum altiſſimum, Tall Tufted Mountain-Graſs.* It has a Root which creeps in the Ground, and furniſhed with ſeveral Fibres, whence riſe two or three very tall *Reed* like Stalks, two or three Feet or more high, bearing fair broad green Leaves on them, like unto *Cyperus*, and at the tops of the Stalks many ſmall tufted Panicles; both Stalks and Leaves are ſo tough, that ſome Country People make them Coats or Garments thereof, to defend them againſt the Weather, and Husbandmen make Ropes and Traces thereof for their Horſes, wherewith to draw their Ploughs.

CXLII. 3. *Gramen Montanum avenaceum, Mountain Havergraſs*, or *Oat Graſs.* It has ſmall creeping Roots: the Stalks are about a Foot and half high, ſlender, jointed, and ſet with ſhort narrow Leaves. At the tops of the Stalks grow the Ears, which are long, ſlender and bending, compoſed of Downy Husks, containing a Seed like to a naked *Oat.*

CXLIII. 4. *Gramen Montanum ſpicatum Cluſii, Mountain ſpiked Graſs.* It has a Root of about a Fingers thickneſs, parted ſometimes into two or three Strings, with many Fibres thereat, and ſomewhat hairy at top, which ſhoots forth ſeveral Heads of Leaves, each containing five or ſix, ſomewhat long, thick, and half hollow, like a Gutter, very like to thoſe of the *greater Thrift*, compaſſing one another at the bottom, a little bitter and ſharp in Taſte; from the middle of which ſpring up ſtiff, ſmooth, bare and knotleſs Stalks, about a Foot high, bearing at the tops ſeveral ſmall Flowers, ſet Spike-faſhion, and of a greeniſh color.

CXLIV. 5. *Gramen Montanum ſpicatum anguſtifolium, Spiked Mountain Graſs with narrow Leaves.* It has a Root which runs under the upper Cruſt of the Ground, full of ſmall browniſh Fibres, running one within another: its Leaves are long and narrow, and its Stalks long and ſlender; at the tops of which are ſpiked Heads, not much unlike the former.

CXLV. *The Places and Times.* They all grow upon Hills and Mountains in many places of *England*, as alſo in other Countries; and they flouriſh and ſeed when other *Graſſes* do. The Seed of the third is ripe in *July.*

XXII. Ἄγρωσις μιγχειαῖα, *Gramen Miliare, vel Miliarium, vel Miliaceum*; Millet-Graſs, ſix Kinds.

CXLVI. 1. *Gramen Miliaceum vulgare, Common Millet Graſs.* It has a buſhy and fibrous Root; from whence riſe up ſlender jointed Stalks, with two or three ſomewhat large Leaves thereon: at the top of each Stalk is a buſhy ſpreading Tuft, of many

many long Feather-like Sprigs, conſiſting of many ſmall chaffy Husks; within which is contained ſmall Seed, which Birds greedily eat.

CXLVII. 2. *Gramen Miliaceum* Panicula *ſpecioſa, Gramen ſegetum* Panicula *ſparſa, Millet Graſs with a fair* Panicle, or *Corn Graſs with a ſparſed Panicle.* It has a buſhy fibrous Root, like the former; and grows up with a few long, ſoft, green Leaves, like to thoſe of *Millet*, ſome below, and others upon a ſtiff, tall, round, ſmooth, green, jointed Stalk, a Yard and half high, bearing on its top a buſhy, large, ſpreading Tuft, ſpread round into many ſlender Branches, very like in its Form, Parts and manner of Growing to the former *Millet Graſs*, ſaving that it is not only larger, but alſo more beautiful.

CXLVIII. 3. *Gramen Miliaceum alterum, Another Millet Graſs.* The Root is fibrous and reddiſh; it has but a ſmall weak Stalk, not much above a Foot and half high, with a few narrow Leaves, four or five Inches long, growing at the bottom, and two or three thereon at the Joints. The Feather-like Tuft at the top is ſpread abroad, like the former, but the chaffy Husks are much ſmaller and finer.

CXLIX. 4. *Gramen Miliacea* Panicula *arundinaceum, A Reedy Graſs with Millet like* Panicles. It has a white fibrous Root, which ſends forth ſeveral *Reed* like Leaves, yet ſhorter than the laſt; among which riſes up a Stalk or two, about a Foot and half high, with two Joints thereon towards the tops, and narrower and longer Leaves growing at them: at the top ſpreads forth a Feather like Tuft, not much unlike the firſt, and of about three Inches long.

CL. 5. *Gramen Miliaceum Indicum, vel Gramen Sorghinum, Indian Millet Graſs*, or *Pipe Graſs.* It has a fibrous Root; from whence ſpring up *Reed* like Stalks, half a Yard high, or ſomething more, with fair long *Lilly* like Leaves thereon, and a ſpread ſpiked Top, conſiſting of many Panicles or Parts above, ſomewhat like unto the *Indian Millet*, but with larger Seeds therein than in the *Millet*. *Lobel* calls it *Gramen ſonarum Flandrorum*, becauſe Boys there make Pipes of its Stalks.

CLI. 6. *Gramen Miliaceum Indicum alterum, vel Gramen ſorghinum alterum, Another Indian Millet Graſs.* It has hollow Stalks, like the laſt, but they are weak, bending down to the Ground, and ſhoot out Fibres at their Joints, whereby it roots it ſelf afreſh; having narrow long Leaves on them, the Stalk ſeeming, as it were, to run thro' them, like to a Pipe; and at the top ſuch alike ſpread ſpiked Head as the former, whoſe Husks in the ſeveral parts of it are ſmaller.

CLII. *The Places and Times.* The ſecond grows in the Borders of Corn-fields, and Grounds which have been Plowed, and flouriſhes chiefly in the beginning of Summer. All the other grow alſo in Fields, and by Hedge-ſides, as well in *England* as in other Countries, tho' obſerved but by few who are curious in Herbariſm, and flouriſh in *June*, *July* and *Auguſt*.

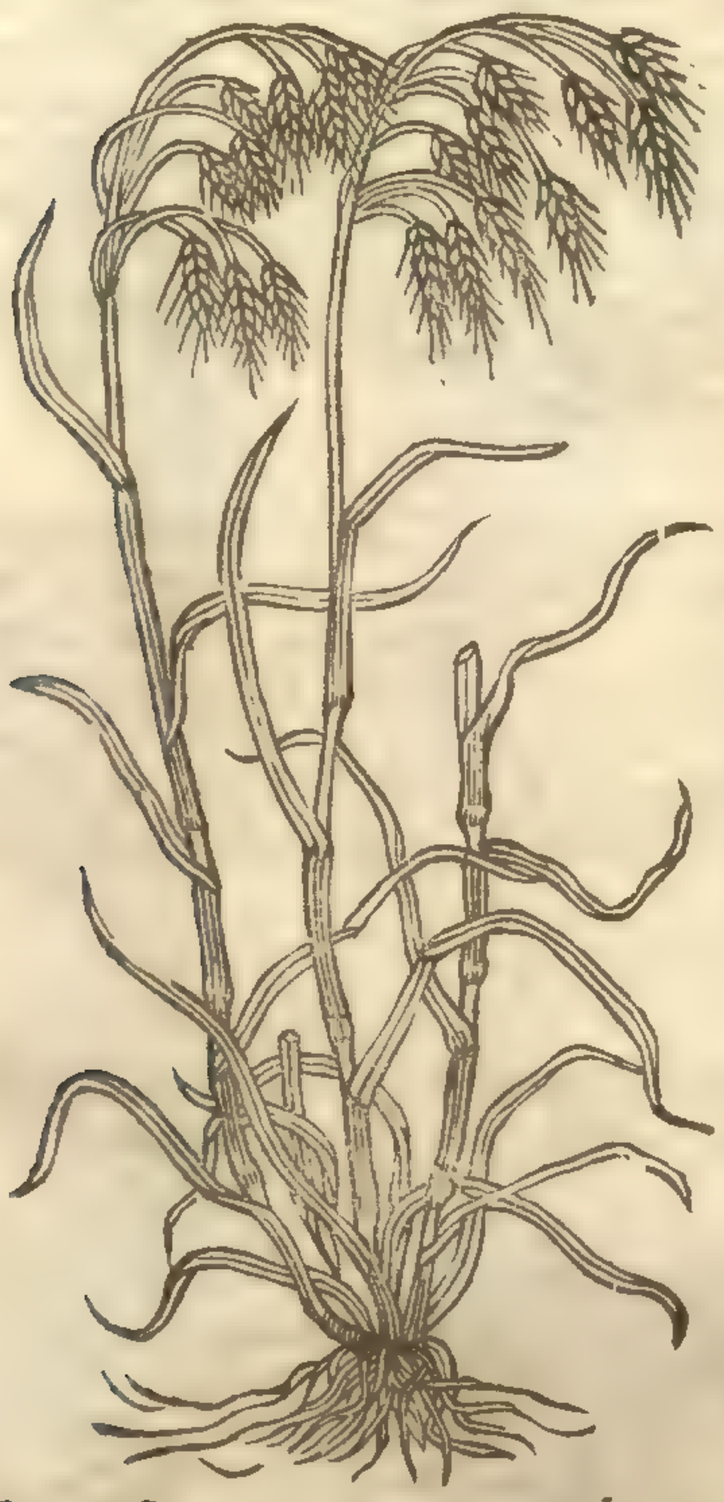
XXIII. Ἄγρωστις Βρώμεια, ἢ Βρομοειδης, *Gramen Avenaceum*, Oat Graſs. Twenty two Kinds.

CLIII. 1. *Gramen Bromoides maximum hirſutum, The greateſt hairy Oat Graſs.* It has a buſhy fibrous Root, and the Plant is all hairy: the Stalks and Leaves are greater than thoſe of *Oats*, being four, five, ſix or ſeven Feet high ſometimes, whoſe Panicle at top ſpreads into many chaffy bearded Ears, hanging down their Heads. It is found in Paſtures about *London*, as alſo in *Eſſex*.

CLIV. 2. *Gramen Bromoides ſegetum* Panicula *latiore, Great Corn Oat Graſs.* It has *Oat* like Stalks, four,

four, five or ſix Feet long; the Leaves are ſhorter and narrower; the top is much ſpread, having divers Ramifications, with many branched chaffy Ears coming forth at a Joint, broadeſt below, and ſpringing ſmall upwards.

Great Corn Oat-Graſs.



CLV. 3. *Gramen Avenaceum incanum*, *Great hoary Oat Graſs.* It has ſhort narrow Leaves, ſomewhat hairy, and a little hoary withal. The Stalk has but few Joints. The Panicle is ſpread, like the laſt, but leſſer, and is ſomewhat hoary. This is ſometimes found leſſer; and grow both of them in the Borders of Corn-fields, both in *Eſſex* and *Kent*.

CLVI. 4. *Gramen Avenaceum Pratenſe*, *Meadow Oaten Graſs.* It has many Leaves growing next the Root, which are long and narrow; and the Stalk is leſſer and lower than any of the former, but the Panicles or Ears ſtand at top, leſſer ſpread, and not hoary, every one upon its own Foot-ſtalk.

CLVII. 5. *Gramen Avenaceum ſquamoſa gluma*, *Scaley-ear'd Oaten Graſs.* It has narrow Leaves, eight or nine Inches long, a little hairy. The Stalk is ſlender, and has ſuch alike Panicle as the laſt; but that the ſcaley Ears ſtand ſingle, every one upon its own Thread like Foot-ſtalk.

CLVIII. 6. *Gramen Avenaceum pinnata longiuſcula ſpica*, *Winged Oaten Graſs.* It has a ſlender Stalk, higher or lower, according to the Place and Goodneſs of the Soil. The Leaves are narrower than the laſt. The Panicle is ſomewhat long, but ſmall, and not much ſpread, each Part being, as it were, winged or divided into ſeveral pieces, upon one Rib or Foot-ſtalk.

CLIX. 7. *Gramen Avenaceum filicea Panicula Xerampelina*, *Red Fern like Graſs.* It has red ſhining Stalks, a Foot high. The Leaves are ſoft and narrow. The Panicle at the top is three or four Inches long, of a whitiſh green color, divided into many winged Branches, many Parts being ſet on both ſides the Branch, and each Part divided, like a *Fern* Leaf.

CLX. 8. *Gramen Avenaceum murorum erectum*, *Upright Wall Oat Graſs.* It grows upright, ſometimes a Span, and ſometimes a Foot high. It has as many Leaves almoſt as any *Graſs*. The ſpiked Head is three or four Inches long, and ſparſed or divided, each ſmall Ear being bearded. It is often found upon old Mud-walls which commonly encloſe Fields.

CLXI. 9. *Gramen Avenaceum ſupinum Arvenſe*, *Low Meadow Oat Graſs.* Its Leaves are as ſmall as the laſt, an Inch or Inch and half long. The Stalks are ſlender and weak, leaning downwards, with a few bearded Husks, and Spike-faſhioned at top.

CLXII. 10. *Gramen Avenaceum ſupinum floſculis ſecalinis*, *Long-winged Oat Graſs with Rie like Flowers.* It ſprings with many Stalks, but they ſeldom riſe up to be a Foot and half high; are full of Joints, and have ſmall ſhort Leaves on them, of a whitiſh green color. The tops are repleniſhed with four or five *Oat* like Heads, but more winged, and with ſhort Awnes, ſomewhat hard, and flowering like *Rie*.

CLXIII. 11. *Gramen Avenaceum exile*, *foliis mollicellis*, *Small ſoft-leav'd Oat Graſs.* It is very like the *Gramen exile durus*, ſo that it may be eaſily miſtaken for it, and differs therefrom only in the Leaves, theſe being longer, and ſoft, as the whole Plant is, and not above half a Foot high, and ſpiked at its top, its parts being alſo winged.

CLXIV. 12. *Gramen Avenaceum altero alteri innatum*, *Small Oat-Graſs one head ſet on another.* It is a fine ſmall Graſs, and much reſembles the *Gramen Britanicum Maritimum*, having divers hard Hair like Leaves, with very ſmall Stalks, a Span, or eight or nine Inches high, ſome of which bear their ſmall ſharp Husks at their tops only, as ſome others do, and others of them out of a Tuft of Leaves in the middle of the Stalk ſend forth another ſhort Stalk, with ſuch like ſharp Husks on them as on the other.

CLXV. 13. *Gramen Avenaceum Montanum Cluſij*, *Mountain Oat-Graſs with hoary husks.* It has a Root conſiſting of ſeveral long Fibres, the Stalks are ſlender and jointed, a Foot and half high, with very narrow and long Leaves, and at the tops a long ſpiked head, bowing the head cloſe, with woolly ſhort husks, containing Seed like to thoſe of *Naked Oats*.

CLXVI. 14. *Gramen Avenaceum Montanum alterum*, *Another Mountain Oat-Graſs without hoary husks.* It differs not in any thing from the former, but in the ſpiked head, whoſe husks are not hoary, as thoſe others are.

CLXVII. 15. *Gramen Avenaceum gluma rariore ſpicatum*, *Spiked Oat-Graſs with a ſparſed, looſe, chaffie Ear.* It has a fibrous or ſtringy Root, and hairy, running under Ground, it has ſlender, weak, clear Stalks, a Foot high, with long Leaves on them, and at their tops weak, bending, ſpiky heads, thinly or ſparſedly ſet with ſmall husks, containing *Oat*-like Seed or Grain.

CLXVIII. 16. *Gramen Avenaceum Xerampelinum*, *Red Oat-Graſs.* This is ſomewhat like the laſt, but with much lower Stalks, clear and reddiſh, the husks at the top of them are more upright and longer, having the like *Oat* Seed in them. A leſſer ſort hereof has been found about *Greenwich*, in a hungry Soil.

CLXIX. 17. *Gramen Avenaceum locuſtis rubris*, *Oat-Graſs with red husks.* It has a Root which is long and white, like unto *Dogs-Graſs*, or *Quitch-Graſs*, creeping in the Ground, having next to the Earth narrow ſhort Leaves, where the Stalk is reddiſh, but they are longer up higher; the husks are ſet ſparſedly at the tops, all on one ſide for the moſt part, and are of a dark reddiſh Purple color, but white within, with ſmall Grains within them.

CLXX. 18. *Gramen*

CLXX. 18. *Gramen Avenaceum glumis varijs, Oat-Graſs with party colored husks.* It has a Root which is thick, and is covered with a rough white Bark, the Leaves are green, long and narrow, from among which riſe up two or three ſmooth and brittle naked Stalks, a Foot high, bearing a ſhort ſpike of ſmall husks, of divers colors.

CLXXI. 19. *Gramen Bromoides, ſive Avenaceum pauci Granum Coma nutante ſpicata, Oat-Graſs with few Seeds.* It is ſomewhat hairy all over, the Leaves are of a ſad green color, ſet on Stalks three, four, or five Feet high, at whoſe tops is a ſpiked bending head, having ſeven or eight ſmall long husks, with few Seeds in them: this grows near Woods ſides in many places.

CLXXII. 20. *Gramen Avenaceum Sylvarum, Wood Oat-Graſs.* It has a Root which runs creeping under the Earth, the Stalks are ſmall in all the parts, and weak, being not above half a Yard high, with long, narrow, ſoft Leaves on them, and at their tops a few ſhort husks, and open, like unto ſome of the *Oat-Graſſes* before.

CLXXIII. 21. *Gramen Avenaceum exile, Small Wood Oat-Graſs.* This has a fibrous Root, and the Stalks are ſlender and ſmaller in all their parts, yet notwithſtanding ſtand a little more upright; the husky tops are like the former.

CLXXIV. 22. *Gramen Avenaceum gluma villoſa Sylveſtre, Hairy Wood Oat-Graſs.* It has fibrous and yellowiſh Roots, the Stalks hereof are three Feet high, with ſmall narrow Leaves, four or five Inches long, the ſpiked heads have ſomewhat long and hairy husks, diſtinctly ſet one above another, and is often found leſs by the half than the other.

CLXXV. *The Places and Times.* The firſt twelve of theſe grow in many Fields throughout *England*, ſome in one place, ſome in another, ſome in Meadow Land, ſome in Plowed Grounds, and ſome in Fallow; the thirteenth, fourteenth, fifteenth, ſixteenth, ſeventeenth and eighteenth grow upon Mountains, and on Hilly Grounds, the fifteenth and ſixteenth have alſo been found growing in *Denmark*; the laſt four grow in Woods, and by Wood ſides, in Mountainous Woods, and other Woody places: they all flouriſh in the Summer Months.

XXIV. Ἄγρωστις μελινοίδης, *Gramen Melinoides, Gramen Paniceum*, Panick-Graſs, ſix Kinds.

CLXXVI. 1. *Gramen Paniceum, Panicum Sylveſtre Herbariorum, Wild Panick, or Panick-Graſs.* It has a fibrous Root, like unto *Panick*, it has ſome near reſemblance alſo unto *Millet* in the ſpreading of the tufted head, being compoſed of ſeveral parts, each part by it ſelf near reſembling a *Panick* head; the jointed Stalk, with the Leaves thereon, are very like unto *Panick*, yet much leſs in all, for which reaſon it is rather referred to *Panick* than to *Millet*.

CLXXVII. 2. *Gramen Paniceum Spica ſimplici, Panick-Graſs with ſingle Ears.* It has weaker and ſmaller Stalks than the former, and ſcarcely riſing upright, with ſhorter Leaves on them; the tops of the Stalks are ſeverally furniſhed with a ſpiked rough head, ſticking to any Garment it touches; it is ſmall at the top, and full of ſmall whitiſh Seed.

CLXXVIII. 3. *Gramen Paniceum Sylveſtre, Panicum Sylveſtre Dalechampij, Wild Panick-Graſs of Dalechampius.* This differs from the laſt, in that it grows more upright, and about two Feet high, the Stalks have ſeveral *Graſs* like Leaves on them, but longer and broader, with one uſually under the hairy ſpiked head, which ſticks ſo faſt to their Garments which touch it, that it is difficultly plucked off. There is another of this ſort, which is found with us in *England*, which is ſmaller, elſe but very little differing.

CLXXIX. 4. *Gramen Paniceum ariſtis longis armatum, Panick-Graſs bearded.* It has a Root conſiſting of many long Fibres, the Stalks and Leaves are not much unlike to the ſecond ſort of *Panick-Graſs* aforegoing, but larger and taller having divers brown heads at the tops, one above another, armed with long and ſharp Beards or Awnes, like unto *Wheat* or *Barley*.

CLXXX. 5. *Gramen Paniceum minus, Panick-Graſs the leſſer.* This is leſſer than any of the others going before, having low bending Stalks, eight, nine, or ten Inches long, and ſharp long Leaves thereon, with ſmall, long, chaffie Ears, like *Cocksfoot-Graſs*, ſet ſparſedly at the tops.

CLXXXI. 6. *Gramen Paniceum Sylveſtre Anglicum & Africum, Panick-Graſs Wild of England and Barbary.* It is a kind of *Wild Panick Graſs*, growing in ſeveral Woods with us, whoſe Spike reſembles *Panick:* the like hereof has been brought to us out of *Barbary*, having like Leaf and Head, and differs from ours only in largeneſs.

CLXXXII. *The Places and Times.* Theſe *Graſſes* grow all of them in *England*, and the firſt of them in *France*, uſually among Rubbiſh, and in waſte Grounds, as alſo in good and Manured Fields, and bear their Heads and Spikes in the Summer Months, as other *Graſſes* do.

XXV. Ἄγρωστις φαλαρώδης, ἢ φαλαριοειδὴς, *Gramen Phalaroides,* Ἄγρωστις ἄντεμη, ἢ παρήτεμη, *Gramen Tremulum, vel Tremulentum*, Quaking-Graſs, Maiden hair-Graſs, five Kinds.

Quaking-Graſs Greater.

CLXXXIII. 1. *Gramen Tremulum maximum, Phalaris Pratenſis major, Gramen Phalaroides Paniculoſum, Gramen Paniculis Elegantiſsimis*, vel Ἐφέγρωστις *majus Bauhini, The greateſt Quaking-Graſs, or Maidenhair-Graſs.* It has many narrow *Graſs* like

like Leaves both below and upon the jointed Stalks, which are a Foot high and better; on the tops of the Stalks grow a number of ſmall, flat, and long ſcaly like heads, greater than the following, and each of them on a fine hairy Footſtalk, and pendulous, which are ſometimes of a whitiſh color when they are ripe, and ſometimes of a browniſh green color, and are to be ſhaken with the leaſt Wind imaginable.

Quaking-Graſs Leſſer.

CLXXXIV. 2. *Gramen Tremulum medium, Phalaris Pratenſis minor Lobelij, Ægilops Tragi & Geſneri in Hortis, Gramen Polyanthos Lugdunenſis, The middle or leſſer Maidenhair, or Quaking-Graſs.* It has a fibrous Root like the other, and grows ſomething like it in form, but with fewer Leaves and Stalks, and a large Panicle or tufted head of greener, ſhorter, and rounder Scale like pointed Ears, ſtanding on ſmaller or finer hairy Footſtalks than the former, which are in ſuch continual motion, that the moſt ſteady Hand cannot hold them ſtill, or from ſtirring. Of this ſort *Boel* has another, which is ſomewhat larger, and of a dull or brown black color.

CLXXXV. 3. *Gramen Tremulum parvum, Small Maidenhair, or Quaking-Graſs.* Of this there are two ſorts, little differing in Leaves or Stalks from the laſt, the heads only are a little leſſer, and ſo is the whole Panicle alſo, the one of which is Party Colored, of Purpliſh and Green, the other is of a Straw Color and White.

CLXXXVI. 4. *Gramen Tremulum minus, vel minimum Panicula parva Bauhini, The ſmall or ſmalleſt Maidenhair, or Quaking Graſs.* The Roots are reddiſh, creeping here and there, from whence riſe up two or three ſhort Stalks, with few Joints and ſmooth, narrow, green Leaves at them, as the many which grow below are; but out of the uppermoſt Joint and the Leaf, as it were out of a Hoſe, breaks forth a ſmall, long, ſingle Spike of ſmall ſcaly heads, of a browniſh color, with yellowiſh Bloomings, at their Seaſon.

CLXXXVII. 5. *Gramen Tremulum maximum album Bauhini, Gramen elegans Lupuli glumis Cluſij, The white greateſt Maidenhair, or Quaking-Graſs.* It has a ſmall and fibrous Root, periſhing every Year with us, it is a ſmall *Graſs*, with ſlender Stalks, and a few ſoft green Leaves on them, at the tops whereof ſtand flattiſh, ſoft, ſcaly heads, greater by much than any of the aforegoing, and of a Silver ſhining white color, very beautiful to behold, each of them much like to the head of an Hop, hanging upon a ſmall Thread-like Footſtalk, as the others do, and are almoſt as moving and ſtirring as they are.

CLXXXVIII. *The Places and Times.* All theſe ſorts of *Graſſes* grow in Corn Fields, and in Lay Grounds, which have been formerly Plowed, and ſome of them in dry Meadows and Paſtures; the firſt, ſecond, third, and fourth kinds grow not only in *England*, but alſo in *Spain*, *Italy*, *Weſt Indies*, and other Countries; the third ſort is found growing in Upland Corn Fields, as at *Hatfield*, *&c.* on the Graſſie Banks there; the fifth kind is a Native of *Spain*, and grows with us only in Gardens, which tho' it periſhes every Year, yet ſeldom riſes again of its own Sowing, but of the Sowing thereof in the Spring; but in *Spain* it Sows it ſelf, and abides all Winter, in regard they have there no Froſts; the fourth ſort flouriſhes, and is in Bloom with us in *May* and *June*.

XXVI. Καλαμώγρωτις, *Calamogroſtis*, Ἄγρωτις καλαμοειδὴς, *Gramen Arundinaceum*, Reed-Graſs, thirteen Kinds, of which ſeven are of the *Land Kind*, three of the *Marſh Kind*, and three of the *Water Kinds*.

CLXXXIX. 1. *Calamogroſtis, ſive Gramen Arundinaceum majus, Gramen Arundinaceum Spica multiplici Bauhini, The greater Reed-Graſs.* It has a Root full of white Strings or Threads, and ſome jointed ones, which ſpread in the Ground, from whence riſe up many jointed Stalks, alſo large, ſharp, cutting Leaves on them, like to thoſe of the *Water-Reed*, but leſſer; the tops of the Stalks are furniſhed with ſeveral hard long Spikes or Heads, ſomewhat like to the *Common Reed*, which when they have ſtood long do open, and having a flocky ſubſtance in them, are carried away with the Wind. Another Kind is leſſer, and not having above one or two Spikes thereon.

CXC. 2. *Calamogroſtis altera minor, ſive Gramen Arundinaceum minus Norwegicum, The leſſer Reed-Graſs.* The Root conſiſts of many long Strings, from which riſe up Stalks, not ſo high as the former, which, as well as the Leaves, are ſomewhat harder or rougher than the former, (which yet in *Norway* are much more hard and rough) the ſpokie Tuft at the top is larger, more ſpread into ſeveral Panicles, ſharper alſo, and a little rougher in handling.

CXCI. 3. *Calamogroſtis noſtras Sylvæ Joannis, Reed-Graſs of John's Wood.* It has a white Root, with thick Strings, which ſometimes ſpread under the Ground, it is in its Stalks and Leaves a little like the next *Woolly Reed-Graſs*, but the Stalks are jointed in two or three places to the height of three or four Feet, or more, with narrower Leaves, ſharper, and almoſt three Feet long, being a little ſtriped withal; the top Panicles are ſometimes a Foot or more long, parted into many long Spikes, which are as ſoft as Silk, and of a ſhining, overworn, Murry color.

CXCII. 4. *Calamogroſtis, ſive Gramen Tomentoſum, Woolly Reed-Graſs.* It has a Root which is

ſomewhat

ſomewhat hard and rough at top, with ſeveral long Fibres proceeding from it; the Stalks are three or four Feet high, or more, having but few Joints; theſe Stalks are rough, and bear large ſpiked heads, ſet up a long Panicle, which are reddiſh for ſome time, but growing to ripeneſs are of a ſhining Silver like whiteneſs, and as ſoft as Wooll in handling; this Plant in its roughneſs, dryneſs, and form of Leaves, is not much unlike to that *Baſtard Foxtail-Graſs* called *Pſeudoſchænanthum*, or *Baſtard Squinanth*, at Sect. 111. aforegoing, but much greater.

CXCIII. 5. *Calamogroſtis Panicula Toroſa, Large, round, Tufted Reed-Graſs.* Its Root is ſmall and ſtringy, it has narrow Leaves, ſomething ſofter and gentler in handling than the others before, yet not eaten by any Cattel except Goats; the Tuft or Panicle it ſelf is more round and thicker, with ſhorter heads, ſet cloſe together like ſmall Knots or Knobs, but ſomewhat flat on one ſide; its Bloomings are of a yellowiſh purple color, and ſome of its Panicles are found to be more long than round.

CXCIV. 6. *Calamogroſtis Montana Enodis, Scirpus primus Tragi, The greater Mountain Reed-Graſs.* It has a Root of ſome ſmall ſubſtance, hard, and having many Fibres adjoining to it, it grows up with ſtrong Stalks as high as a Man, without any Joints on them, or having but one at the moſt, having thereat not hard, but ſoft long Leaves; at the tops of the Stalks are many long, ſlender, chaffie Spikes, growing more ſparſedly than the others, each of which is of a bright reddiſh yellow color, and ſtanding upright.

CXCV. 7. *Calamogroſtis Montana Enodis minor, The leſſer Mountain Reed-Graſs.* The Root is like the former, but the reſt of the Plant is much lower and ſmaller; the Spikes are alſo ſmaller and ſhorter, and not ſtanding ſo upright.

CXCVI. 8. *Calamogroſtis Paluſtris maxima, Gramen Arundinaceum Paluſtre maximum, Great Marſh Reed-Graſs.* It has a Root which creeps far about in Wet Marſhy places, from which it ſhoots forth great, thick, and very tall Stalks, four, five, or ſix Feet high, jointed up to the tops, with long and ſomewhat broad, hard, rough, and ſtraked Leaves ſet thereon, but leſs than thoſe below; towards the tops of the Stalks with the Leaves come forth many ſparſed Tufts of chaffie heads, ſtanding on ſmall long Footſtalks, the whole Panicle being at leaſt a Foot long, and ſometimes more.

CXCVII. 9. *Calamogroſtis noſtras gluma Aceroſa Paluſtris, Our great Marſh Reed-Graſs with chaffie heads.* It has a jointed reddiſh Root, from whence ſpring many fair large *Reed* like Leaves, not much unlike to thoſe of *Millet-Graſs*, but harder, rougher, and ſtraked all the length of them, having great *Reed* like Stalks, three, four, or five Feet high, jointed alſo and branched, and towards the tops having large and ſomewhat hard Panicles of ſpiky chaffie heads, each of them about ſeven, eight, or nine Inches long, of a whitiſh color in ſome places, and reddiſh in others, in which chaffie or husky Heads there lyes ſmall Seed.

CXCVIII. 10. *Calamogroſtis, vel Gramen Arundinaceum Paluſtre Sericea molliore ſpica, Soft headed Marſh Reed-Graſs.* The Root is compoſed of ſeveral ſmall Fibres or Strings ſet together at a head, it grows ſomething like the laſt, but leſſer, with narrower and ſhorter Leaves, and lower Stalks, having but few Joints and Leaves on them; the tufted Heads which ſtand at the tops are ſomething like to the *Ruſh* which is called *Baſtard Schænanthum*, and turn into Down, which is carried away with the Wind.

CXCIX. 11. *Calamogroſtis Aquatica major, Gramen Arundinaceum Aquaticum majus, Great Water Reed-Graſs.* It has Roots which run and ſpread themſelves far, ſhooting up in ſeveral places, the Stalks are great and tall, full of Joints, with large *Reed* like Leaves at them, ſtriped with White and Green, like Ladies Laces, but not ſo evidently to be ſeen, up to the top almoſt, where ſtands a large and ſoft tufted Panicle, conſiſting of many Branches and parts, almoſt like to the *Vulgar* or *Common Reed.*

CC. 12. *Calamogroſtis, ſeu Gramen Arundinaceum Aquaticum magnum, The great Water Reed-Graſs.* The Root is almoſt like, but creeps not ſo much as the former, the Stalks are great and high, having broader and longer Leaves than the former, and ſomething harder alſo; the Joints likewiſe are fewer, and the tufted Panicle is much more ſpread, and ſoft in handling, and of a purpliſh green color, and its Bloomings are white.

CCI. 13. *Calamogroſtis, ſive Gramen Arundinaceum Aquaticum Panicula ſpecioſa, Fair headed Water Reed-Graſs.* It riſes to be three Feet or more high, the Leaves are broad, and a Foot long, but ſlenderly ſet on the Stalks, a little rough on the edges, ſome of which will be hollow, like a Trunk, that the Stalk will go thro' it half way; the top Panicle is made of many fine, ſoft, ſcaly Tufts, very beautiful to behold.

CCII. *The Places and Times.* The firſt and ſecond grow in moiſt Meadows, which are Sandy, and rather Barren than Fertile; the ſecond alſo is found growing in ſome moiſt Fields near *Hackney*; the third is expreſſed in its Title; the fourth in the borders of dry Fields, and by Hedge ſides, in many Countries of this Kingdom, eſpecially in *Dorſetſhire*; the fifth grows in the like places; the ſixth and ſeventh grow in moiſt Woods which are on Mountains and Hills; the eighth grows in Marſhy places, and Ditches overflowed with the Tide, I have found it growing in ſome parts of *Carolina*; the ninth and tenth grow in low moiſt Grounds by *Ratcliff*, near *London*; the eleventh, twelfth, and thirteenth grow in Ditches, Ponds, and Lakes in ſeveral places of *England*, as alſo in other Countries; the firſt ſeven, as alſo the other ſix, flouriſh in the Summer Months, and their Stalks periſh before Winter.

XXVII. Σχοινογρωστις, *Schœnogroſtis*, Αγρωστις σχοινώδης, ἡ σχοινινὴ, *Gramen Junceum*, Ruſh-Graſs, ſeventeen Kinds, *viz.* ſeven of the *Land*, ſix *Marſh Kinds*, and four *Water Kinds*, of all which in order.

CCIII. 1. *Schœnogroſtis communis, vel Gramen Junceum vulgare, The common Ruſh-Graſs.* Its Root conſiſts of browniſh yellow Fibres or Threads, the Leaves are almoſt round, ſeven or eight Inches long, from among which ſpring up the Stalks, which are about eight or nine Inches high, which bear at their heads ſeveral ſmall Panicles Spike faſhion, one above another.

CCIV. 2. *Schœnogroſtis Montanum ſpica Subcærulea Cambro Britanicum, Welſh Mountain Ruſh-Graſs.* From a fibrous or ſtringy Root ſpring up a great many fine, ſlender, *Ruſh* like Leaves, nearly a Foot and half long, from among which riſe up two or three ſlender ſmall Stalks, eight or nine Inches long, and much lower than the Leaves, bearing at their tops, from between two Leaves, which are rather like Skins, being broad below and ſmall towards their ends, yet always the one longer than the other, a ſmall, ſpiked, ſcaly head, of a fine blewiſh color.

CCV. 3. *Schœnogroſtis, ſeu Gramen Junceum Specioſum minus, Another Noble or Excellent ſmall*

Ruſh-Graſs. It is very like the former, but has much ſmaller *Ruſh* like Leaves, not above three or four Inches long, riſing out of a hard brown Husk or Hoſe, ſet at the top of a ſmall Fibrous Root, from among which ſpring up ſeveral jointed Stalks, with ſuch like Leaves on them, and a ſmall head at the top, like unto the former, but of a brown, clear, Cheſtnut color, and ſmaller, as the whole Plant is, having two ſmall Leaves thereat, as in the ſecond aforegoing.

CCVI. 4. *Schœnograſtis, ſive Gramen Junceum Dalechampij, Dalechampius his* ***Ruſh-Graſs.*** It has a very long, white, and fibrous Root, from which riſe up a very great number of ſmall, round, *Ruſh* like green Leaves, and among which ſpring up divers jointed Stalks, with ſome few Leaves on them, and at the top a ſparſed ſpiked head, ſomething like unto the *Holoſteum Salamanticum Cluſij*, or *Spaniſh Sea Plantane*, conſiſting of many purpliſh Husks.

Wood Ruſh-Graſs with jointed Leaves.

CCVII. 5. *Schœnograſtis Sylvarum, ſeu Gramen Junceum Sylveſtre articulato folio majus, The greater jointed Wood Ruſh-Graſs.* It has a Root which creeps a little, repleat with many ſmall Fibres, the Stalks are ſomewhat flat, and very green, the Leaves are almoſt round, with many ſeveral croſs Joints on them, the tufted heads at the tops of the Stalks, which are near three Feet high, are ſpread into many *Ruſh* like Panicles, and alſo ſomewhat flat.

CCVIII. 6. *Schœnograſtis Sylvarum, ſive Gramen Junceum Sylvarum articulato folio minus, The leſſer jointed Wood Ruſh-Graſs.* It has a Root which is hard, ſpreading abroad, with many Fibres adjoining to it, from whence ſpring up many Stalks, which take Root again in the Ground, and bear ſuch like jointed Leaves (as in the laſt) at the tops of the Stalks are ſmall, ſpread, Panicle Heads, very like to the former, but ſmaller by half in each: there is another of this kind which is yet ſmaller, whoſe Leaves are ſmall and ſlender, but not jointed, the Panicle of which is ſmaller, and ſparſed in like manner.

CCIX. 7. *Schœnograſtis, ſeu Gramen Juncoides ſparſa Junci Panicula, Ruſh-Graſs with Ruſh like ſparſed heads.* It has a Root which is yellowiſh, ſpreading it ſelf under the Ground, with long Fibres; the Stalks are ſlender, ſomething flat, and near two Feet high; the Leaves are ſmaller than the common ſort, being about fifteen or ſixteen Inches long; the tops are alſo ſmaller, and ſpread with whitiſh heads.

CCX. 8. *Schœnograſtis, ſive Gramen Junceum Paluſtre racemoſo Semine, Marſh Ruſh-Graſs with Seeds in cluſters.* It has a blackiſh thready Root, from which riſe a few ſmall *Ruſh* like Leaves, and from among them ſpring up ſeveral Stalks, a Foot and half high, bearing at their tops, between ſmall long Leaves, a ſmall head, much like to a Bunch of Grapes, in which the Seed lyes.

CCXI. 9. *Schœnograſtis, ſeu Gramen Junceum Maritimum majus, The greater Sea Ruſh-Graſs.* It has a tufted fibrous Root, from which ſpring many hard ſmooth Leaves, ſomething like *Ruſhes*, and from among them ſeveral ſlender naked Stalks, about a Foot high, with *Ruſh* like heads growing at their tops, but much ſmaller.

CCXII. 10. *Schœnograſtis, vel Gramen Junceum Maritimum denſe ſtipatum, Sea Ruſh-Graſs thick ſet.* It has a *Ruſh* like Root, and long hard Leaves, like *Ruſhes*, growing thick and cloſe together; the Stalks are ſlender, and not much longer than the Leaves, every one of them bearing at their tops a ſmall Head, ſomething like to thoſe of *Ruſhes*.

CCXIII. 11. *Schœnograſtis, ſive Gramen Junceum Maritimum minimum Zelandicum, The leaſt Sea Ruſh-Graſs of Zeland.* It has a fibrous Root, from whence riſes a ſmall buſh of Leaves; the whole Plant ſcarcely exceeds eight or nine Inches in height; from among this well ſpread buſh of Leaves riſes up the Stalks, with ſmall hairy like Leaves, and a ſmall thick head at its top.

CCXIV. 12. *Schœnograſtis, ſeu Gramen Junceum Maritimum exile Plimoſtij, Small Sea Ruſh-Graſs of Plimouth.* It has a Root conſiſting of many ſmall long Fibres, coming from one Head; the Leaves are many, growing thick together, and as fine almoſt as Hairs or Threads, from among which riſe up ſeveral ſlender unjointed Stalks, bearing exceeding ſmall ſharp pointed heads thereon, the Stalks being continued, and appearing above them, and pointed. This *Graſs* has been found as well at *Dover* as *Plimouth*, in their Wet Marſh Grounds.

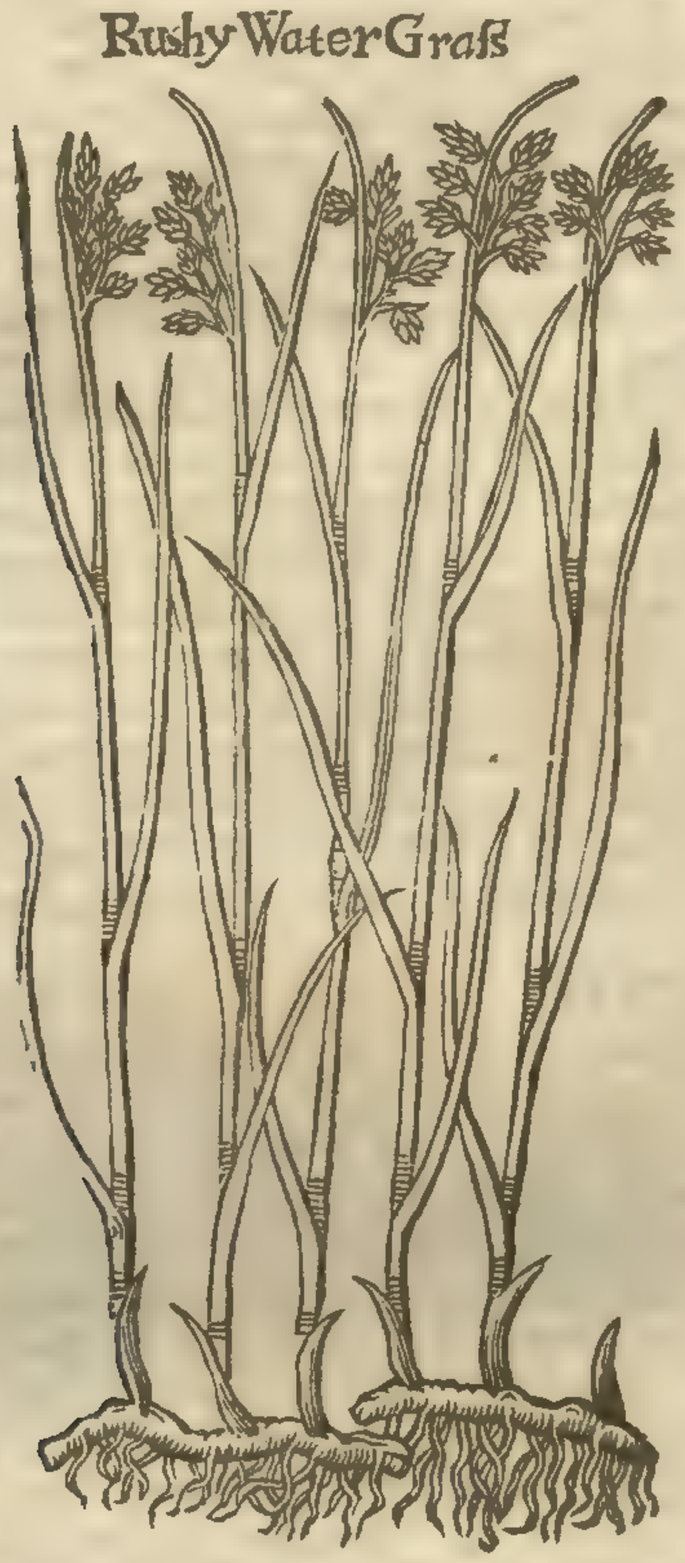
CCXV. 13. *Schœnograſtis, ſeu Gramen Junceum Maritimum magis exile pauci ſolium, A leſſer Marſh Ruſh-Graſs with fewer Leaves.* It has a ſmall and ſlender Root, and fewer and ſhorter Stalks and Leaves than the laſt, more ſoft and delicate in feeling, and whoſe Heads are a little bigger, and prickly, the Stalk riſing above them, as in the other.

CCXVI. 14. *Schœnograſtis, ſive Gramen Junceum Aquaticum minimum capitulo ſquamoſo, A very ſmall Water Ruſh-Graſs.* It has as few, but ſmaller Leaves than the Eighth Kind aforegoing, being about two Inches long; the Stalks are about four or five Inches high, each of them bearing a ſmall, reddiſh, ſcaly head, with the top of the Stalk growing up above it.

CCXVII. 15. *Schœnograſtis, vel Gramen Junceum Aquaticum magis ſparſa Panicula, Water Ruſh-Graſs with a more ſparſed Panicle.* It is very like the laſt in growing, the chiefeſt differences are in the Stalks, for they are greater and riſe higher; and in the Leaves, for they are Jointed, like to the *Wood Ruſh-Graſs*; and in the Heads, theſe being ſmaller, and more diſperſed.

CCXVIII. 16. *Schœ-*

CCXVIII. 16. *Schœnogroſtis, ſive Gramen Junceum Aquaticum Baubini, Baubin his Water Ruſh-Graſs.* It has jointed Leaves, from among which riſe up Stalks, a Hand high, or more, with certain chaffie Heads, parted into many Threads.



CCXIX. 17. *Schœnogroſtis, ſeu Gramen Junceum Aquaticum vulgare, The common Water Ruſh-Graſs.* It has a long, thick, ſpreading Root, which ſends up ſeveral jointed Stalks, and at each Joint a narrow *Ruſh* like Leaf; at the tops of the Stalks ſtand ſeveral, ſomewhat like unto thoſe of *Ruſhes.*

CCXX. *The Places and Times.* The firſt ſeven of theſe *Graſſes* grow upon dry Land, and in dry places, ſome of them upon Hills, ſome on Mountains, and others in Woods; the ſecond grows on a high Hill in *Wales* called *Berwin*, continually covered with Clouds and Miſts, and Watered with Showers, whilſt at the ſame time the Sun ſhines fair in the Valleys below it; others of them grow in the Woods near *Highgate*, in *Hornſey Wood*, and in many other Woods of this Kingdom, as alſo in Meadows adjacent to the ſame, and do all of them flouriſh in the Summer Months, *viz.* in *June* and *July*; the next ſix *Marſh Ruſh-Graſſes* grow in Salt Marſhes, and near the Sea ſide, and other like places, in many parts of this Kingdom; the laſt four grow in Watery places, and in or near Waters, whether ſtanding or running, and flouriſh in the Summer time, as all the reſt do.

XXVIII. Θαλασσιόγρωσις, Ἄγρωσις ἑλώδης, *Gramen Marinum, vel Maritimum*, Sea-Graſs, Eight Kinds.

CCXXI. 1. Ὀξυάγρωσις ἑλώδης, *Oxyagroſtis Maritima Dalechampij, Sharp pointed Sea-Graſs.* The Stalks are buſhy, and about two Feet long, full of Joints, and narrow *Graſs* like Leaves at every one of them, of a dark green color, and ſo ſharp at the points, that they are ready to prick their Legs who paſs by them unawares.

CCXXII. 2. *Gramen Maritimum aſperſum, Rough Sea-Graſs.* Its Root is a buſh of long white Fibres, which ſends up ſeveral reddiſh, round, ſmall Stalks, a Foot or more high, leaning at firſt downwards, encompaſſed with hard, ſhort, and ſharp pointed Leaves, ſtanding as it were in a Tuft together, with hard rough dents about the edges; the ſpiked heads are like rough hard Burs, breaking out of a Skin which encloſed them.

CCXXIII. 3. *Gramen Maritimum, vel Marinum exile vicinorum aggerum, A very ſmall Sea Down-Graſs.* It has a Root which is ſmall and thready, which ſhoots forth divers ſhort Stalks, two Inches long, full of ſmall long Leaves like Hairs ſet cloſe together, and among them at the tops ſmall Heads, like to the *Catkins* of the *Dwarf Willow.*

CCXXIV. 4. *Gramen Maritimum, vel Marinum Spicatum, Spiked Sea-Graſs.* It has a Root compoſed of a buſh of many long Fibres or Strings, from whence riſe up many long, hollowed, or Gutter Leaves, encompaſſing one another at the bottom, from among which ſpring up two or three Stalks, bare of Leaves unto their tops, where they bear long ſpiked Heads of greeniſh Flowers, ſet cloſe together.

CCXXV. 5. *Gramen Marinum ſpicatum alterum, Another ſpiked Sea-Graſs.* It has long, ſlender, narrow, hard, and ſharp pointed Leaves, growing often on low places ſo near the Sea, that ſometimes it waſhes over it; the Stalks are many and low, with ſmall, long, and round Heads thereon.

CCXXVI. 6. *Gramen Marinum majus Statice quibuſdam, Great Sea-Graſs, or Sea-Thrift.* called by ſome Σταπκὴ. It has a pretty large long Root, with ſome Fibres adjoined, which ſends up many fair, long, and ſomewhat broad, and whitiſh green Leaves, lying cloſe together upon the Ground, from which riſe up ſlender Stalks, naked to their tops, except in one place towards their middle, where they have two ſmall Leaves turning downwards, contrary to almoſt all other Herbs, and at their tops a Tuft of bluſh colored Flowers, opening by degrees.

CCXXVII. 7. *Gramen Marinum Americanum,* Σταπκὴ *Statice Americana major, Great Sea Thrift of America.* It has a long Root, with but few Fibres thereat, from whence ſpring up a vaſt number of Leaves, almoſt like the laſt, but they are narrower, of a ſadder green color, and ſomewhat ſhining, with two Ribs in each, and blunt at the ends; it has ſlender Stalks, which bear alſo ſuch a Tuft of Flowers, but of a white color, and break out of a Skin, which falls down about the Stalk.

CCXXVIII. 8. *Gramen Marinum minus, Small Sea-Graſs, Sea-Thrift, or Sea-Cuſhion.* It has many ſmall, hard, ſhort, green Leaves, growing thick together, and ſpreading on the Ground; the Stalks are many, of a Span high, without any Leaves on them, but at their tops, where grow ſmall round Tufts of bluſh colored Flowers.

CCXXIX. *The Places and Times.* They all of them have been obſerved to grow upon our Sea Coaſts, eſpecially on the *Kentiſh* and *Suſſex* Shoars; the ſixth grows on the *Mediterranean* Shoars, the ſeventh on the *American*; and they all Flower and Seed in the end of Summer.

XXIX. Ἄγρωσις ἀργύρεια, *Gramen Argenteum*, Silver-Graſs, three Kinds.

CCXXX. 1. *Gramen Argenteum capitalis globoſis, Silver-Graſs round headed.* It is the *Gramen Lucidum Tabernamontani*, and is thought to be the *Com-*

bretum Plinij; it has a ſmall, buſhy, and fibrous Root, which ſends up long Leaves, like thoſe of *Wheat*, which have ſome ſmall, long, white Hairs upon them, and about their edges; from among theſe Leaves riſe up ſeveral Stalks, about a Foot high, with Joints and Leaves on them; at the tops of theſe Stalks on each Stalk grow two or three round Heads, which are ſoft, white, and woolly, conſiſting of many ſmall Silver like Threads, which are ſaid to ſhine in the Night, and therefore called by the *Italians Luciola.*

CCXXXI. 2. *Gramen Argenteum ſtriatum, Silver-Graſs ſtreaked*, called by ſome *Lady-Laces, Lady-Lace-Graſs*, and *Painted-Graſs.* Its Root is ſmall and hairy, and of a white color, like unto *Meadow-Graſs*; it has Leaves like to *Millet* in form, and rough or ſharp pointed, like to the *Reed*, with many white Veins or Ribs, and Silver Streaks running along thro' the midſt of the Leaves, faſhioning them like to Ribbons or Laces made of white and green Silk, very beautiful and delectable to behold; it grows to the height of *Wild Panick*, with a ſpoky top, not very much unlike, but more compact, ſoft, and chaffie.

CCXXXII. 3. *Gramen Argenteum Spicis Tomentoſis, Silver-Graſs with Cotton Spikes or Heads.* It has a hard, long, thready Root, from whence proceed many ſoft, downy, graſſie Leaves, of a mean length, ſeldom exceeding two Feet, or two Feet and half in height, from among which riſe up ſeveral Stalks, a Yard or Yard and half high, having but few Joints on them, not above one or two, with like graſſie Leaves growing up from them; at the tops of theſe Stalks are long ſpiky Heads, ſet upon a long Panicle, which are a kind of chaffie and downy Tufts, regularly placed, from the bottom to the top, commonly at firſt of a reddiſh, or Murry like color, which when they come to ripeneſs are of a ſhining Silver like whiteneſs, and as ſoft as Cotton or Wooll in handling.

CCXXXIII. *The Places and Times.* The firſt of theſe grows in Woods, Copſes, Groves, and other like Woody places, in many places of this Land; the ſecond grows in borders of Woods, and upon Woody and Hilly places in *Savoy*, but with us only in Gardens; the third in borders of dry Fields, and by Hedge ſides, in many parts of *England*, and all flouriſh with the *Common Meadow-Graſs*, or in the middle and end of Summer.

XXX. Ἄγρωστις ταχυηδὴς, ἢ ταχυώδης, *Gramen Spicatum*, Spiked or Eared Graſs, eleven Kinds.

CCXXXIV. 1. *Gramen ſpicatum purpureum Pratenſe Dalechampij, Purple ſpiked Meadow-Graſs.* Its Root is a buſh of white Fibres, from whence riſe many *Graſs* like Leaves, but narrower, ſofter, and greener, having ſeveral ſhort Stalks, not a Foot high, with two or three Joints on them, ſet with Leaves, at the tops of which, out of a round Skin or Husk, picked at the end, being the uppermoſt Leaf, breaks forth a thick, ſhort, and ſomewhat flat Spike, of a delicate reddiſh purple color.

CCXXXV. 2. Ἀνθόξανθη Ἄγρωστις, *Gramen Anthoxanthon Lugdunenſis*, (*i. e.* Yellow Flowered) *Gramen ſpicatum flaveſcens Pratenſe, Yellow ſpiked Meadow-Graſs.* It differs little from the laſt, either in Roots, Leaves, Taſte, or Quality, ſo that ſome Authors have called the one the Male, the other the Female, the only difference is, that the Head or Spike of this is of a pale yellow color, and in ſome higher Grounds of a more reddiſh and ſhining color, and not encloſed in any Skin or Leaf, as the other, but ſtanding naked or bare, being alſo ſlenderer and longer.

CCXXXVI. 3. *Gramen Spicatum, Spica multiplici rubra Pratenſe, Red Spiked Meadow-Graſs.* It has a ſmall Root, made of a few Hair like Fibres, whence riſe long and narrow Leaves, Ribbed thro' their whole length, and ſo compoſed as is ſcarcely to be ſeen in any other Herb, for ſome of them are ſo jointed, as if one Leaf grew out of another; on the top of the Stalk ſtands a very long Head, conſiſting of a good number of reddiſh Spikes ſet together one above another, which are ſomewhat rough in handling.

CCXXXVII. 4. *Gramen Spicatum Folijs Caryophylleis Pratenſe, Spiked Meadow-Graſs with Gilliflower Leaves.* Its Roots run under the upper Cruſt of the Ground, folding one within and over another, its Leaves are ſomewhat hard, thick and ſhort, and greener than thoſe of *Gilliflowers* or *Pinks*, but ſo hard and Sapleſs, that Cattel will not eat thereof; the Stalks are ſix Inches high, at the tops of which ſtand ſmall Spikes, ſometimes more, ſometimes fewer, browniſh at firſt, and afterwards ſomewhat reddiſh, with many yellow Threads mixt among them.

CCXXXVIII. 5. *Gramen Spicatum Folijs Caryophylleis ſpica ſquamata, Spiked-Graſs with Gilliflower Leaves and a ſcaly Spike.* Its Roots are ſmall blackiſh Threads, it has ſmall long Leaves, narrow, and bowing, the Stalks are ſmall, about eight or nine Inches high, bearing a ſhort ſcaly Head.

CCXXXIX. 6. *Gramen Spicatum album anguſtifolium Sylvaticum, White Spiked narrow Leav'd Wood-Graſs.* This differs from the aforegoing, in that its Root is yellowiſh, with ſmall Fibres, growing aſlope in the Ground, the Leaves are many, but very ſhort and narrow, ſcarcely four or five Inches long; the Stalks many times exceed not the length of the Leaves, having ſmall ſpiked Heads, beſet with ſhort Hairs, ſcarcely an Inch long.

CCXL. 7. *Gramen Spicatum Caryophylleum Spica multiplici, Double Spiked-Graſs with Gilliflower Leaves.* Its Root is a buſh of many reddiſh hairy Fibres, whence riſe ſeveral ſhort narrow Leaves, like thoſe of *Gilliflowers*, among which ſpring up very many ſlender Stalks, naked, without Joints or Leaves, ſcarcely growing higher than the Leaves, which bear ſhort reddiſh Spikes, many ſet together.

CCXLI. 8. *Gramen Spicatum Caryophylleum Spica varia, Variable Spiked-Graſs.* It Roots are ſmall, long, and fibrous, buſhing thick together, whence ſpring long, narrow, *Gilliflower* like Leaves, from among which grow up ſeveral ſmall naked Stalks, bearing a ſlender, long, ſpiked Head, ſometimes ſingle, and ſometimes divided or branched into ſeveral long parts, made of many Husks.

CCXLII. 9. *Gramen Spicatum Caryophylleum Rabinum Bauhini, Gramen Rabinum Geſneri, The chief or principal Gilliflower-Graſs.* It has a fibrous Root, proceeding from one Head, from which riſe up many thick, firm, or fleſhy, and long pointed Leaves, like to thoſe of *Gilliflowers*, lying in a round compaſs at the head of the Root, not having any Nerves or Veins in them to be ſeen, and of which Cattel will very well Feed.

CCXLIII. 10. *Gramen Spicatum, Spica Gemina Columnæ, Double Spiked-Graſs of Columna.* It has a ſmall, whitiſh, fibrous Root, which ſends up ſeveral weak and leaning jointed Stalks, with ſmall *Graſs* like Leaves upon them; at the top of each Stalk grows two ſeveral Spikes, jointed together at their Feet, dented on their edges, with a middle Rib between, and conſiſting of three or four rows of Leaves like Scales, containing ſmall, brown, cornered Seed.

CCXLIV. 11. *Gra-*

CCXLIV. 11. *Gramen Spicatum Virginianum Spica articulata*, *Spiked Virginia-Graſs having a jointed Spike.* It has a buſhy Root, which lives long, and is a goodly *Graſs*, growing great, with many fair, large, and broad Graſſie Leaves, very ſmall pointed, and ſomething hard in handling; the Stalk is alſo great and tall, bearing a long Spike at the top, jointed in ſeveral parts, each of them almoſt half an Inch a piece, being almoſt round, yet a little flat.

CCXLV. *The Places and Times.* The firſt five grow in Fields, Meadows, or Paſtures, or near to them; the next five grow on Hills, Mountains, Woods, and Woody places, in many parts of *England*, as alſo in other Foreign Countries; the eleventh grows particularly in *Virginia*, and they all Flouriſh much about the ſame times when other *Graſſes* do.

XXXI. Μυοξόγρωσις, *Gramen Bufonum*, *vel Bufonis Flandrorum*, *Gramen Junceum parvum*, *Holoſtium Matthioli*, Toad-Graſs, three Kinds.

Toad Graſs

CCXLVI. 1. *Gramen Bufonum*, *vel Gramen Junceum parvum*, *The greater Toad-Graſs.* It has a fibrous reddiſh Root, and grows not to be above eight or nine Inches high, the Leaves are very ſmall, and thoſe on the ſlender Stalks and Branches from the Joints leſſer, whereat, and likewiſe at the tops, come forth ſmall, yellowiſh, chaffie Heads or Husks, with ſhort Awnes at the ends, each upon a ſhort Footſtalk, one above another.

CCXLVII. 2. *Gramen Bufonum medium*, *The middle ſiz'd Toad-Graſs.* It differs from the former only in its magnitude, this being of a middle ſize between the former and the leaſt; there is alſo one ſomething ſmaller than this, whoſe Heads are cloſer or thicker ſet together.

CCXLVIII. 3. *Gramen Bufonum minimum*, *Gramen Junceum minimum Holoſtio Matthioli Congener*, *The ſmalleſt Toad-Graſs*, *or ſmalleſt Ruſh-Graſs*, like the former *Toad-Graſs* at Sect. 246 above. It has a very ſmall and fibrous Root, and grows with ſeveral ſmall and Thread like Leaves, ſcarcely an Inch and half long, with yet ſmaller Leaves on the Stalks, which are not above three or four Inches high, at whoſe tops ſtand two or three ſmall Heads, like to thoſe of *Ruſhes*, but with rounder Grains or Seeds therein, and ſet cloſer together.

CCXLIX. *The Places and Times.* The firſt grows in moiſt and wet Grounds, the ſecond in moiſt or wet places near *Highgate*, the third in low, moiſt, and Marſhy Land; they all Flouriſh and Seed in the Summer Months, *viz.* in *June* and *July*.

XXXII. Ἄγρωσις ὑγρὰ ἑπτά, καὶ ὑδατώδης, *Gramen Aquaticum*, Water-Graſs, ſeven Kinds.

CCL. 1. *Gramen Aquaticum Paniculatum minus*, *Small Bearded Water-Graſs.* It has a thick, hard, fibrous Root, which ſends forth a round ſtraked Stalk, about two Feet high, encompaſſed with ſeveral broad, rough, pale green Leaves, nearly a Foot long; the top Panicle is a Span long, ſparſedly or thinly placed, compoſed of many whitiſh Heads, having long Awnes or Beards.

CCLI. 2. *Gramen Aquaticum aculeatum majus*, *The greater prickly headed Water-Graſs.* It has a ſmall Root, which runs deep into the Mud, and ſends up a Stalk or Stalks two Feet high or more above the Water in Ditches where it grows; the Leaves are long and narrow, bearing at the tops of the Stalks ſeveral ſmall prickly Heads, with long Leaves at them.

CCLII. 3. *Gramen Aquaticum aculeatum minus*, *The leſſer prickly headed Water-Graſs.* This is like to the laſt both in Stalks, Leaves, and prickly heads, but ſmaller, nor has it any Leaves growing with them as the others have.

CCLIII. 4. *Gramen Aquaticum aculeatum alterum*, *Another prickly headed or Bur headed Water-Graſs.* It has long, ſmooth, and tender Leaves, among which riſes up a Stalk, about half a Yard high, with a few Leaves ſet thereon, and at the top many ſmall rough Heads like Burs.

CCLIV. 5. *Gramen Aquaticum*, *vel Fluviatile Cornutum*, *Horned Water-Graſs.* It has a ſmall and fibrous Root, which ſends up a ſlender Stalk, about two Feet high, jointed at ſeveral places, and two ſmall Ruſhy Leaves for the moſt part ſet at each of them, growing ſomething broad, and compaſſing it at the bottom with a large Skin, from whence alſo riſe one or two Stalks, ending in a skinny Head, which has at the end three or four narrow Leaves, turning downwards, and ſeeming like Horns.

CCLV. 6. *Gramen Fluviatile Spicatum*, *vel Aquaticum Spicatum*, *Spiked Water or Float-Graſs.* It has a Root compact and Tufted, or buſhy in the Mud, compoſed of many Strings and Fibres, it has ſeveral weak Stalks, leaning every way, full of crooked Joints, which are knobby, or round, taking Root again in divers places, having long and narrow Leaves upon them, which lye floating under and upon the Water; that part which grows up has ſome Leaves likewiſe thereon, and a long, ſlender, brown ſpiked Head at the top.

CCLVI. 7. *Gramen Fluviatile*, *vel Aquaticum Spica multiplici*, *Many Spiked Water or Float-Graſs.* It has a long and round Root, ſomewhat thick, like unto *Dogs-Graſs*, ſet on even Joints, with ſmall Strings and Fibres, from which riſe up long and crooked Stalks, croſſing and winding, and folding one within another, with many flaggy Leaves on them, more in number than the former, which Horſes and other Cattel eat greedily; at the tops of theſe Stalks, and ſomewhat lower down upon them, come forth very many little Spikes or Ears, of a whitiſh color, compoſed of two ranks of ſmall chaffie Seeds, ſet alternately on the Stalks, each of theſe ſmall Ears being almoſt an Inch in length.

CCLVII. *The Places and Times.* They all grow in watery Ditches and Ponds in many parts of this Land,

Land, but the two laſt grow moſtly in ſhallow Rivers, Brooks, and Rills, where the Water runs ſoftly, ſmoothly and eaſily; they are alſo found ſometimes growing in ſtanding Waters, and many times by freſh Rivers ſides; they all Flouriſh and Seed in *June*, *July*, and *Auguſt*, according to the kindneſs of the Seaſon.

XXXIII. Ὁδόγρωσις, Ἄγρωσις τειχική, Ἄγρωσις τῆς ὁδοῦ, Ἀγρωστὶς, *Halcus Plinij*, *Gramen de via*, *Gramen Muriale*, *Gramen Semitæ*, *vel Semitale*, Way or Wall-Graſs, four Kinds.

Way or Wall-Graſs Greater.

CCLVIII. 1. *Gramen Semitale, vel Muriale majus*, *Gramen Hordeium*, *vel magis Secalinum majus*, *The greater Way Graſs or Wall-Graſs*, *Barley-like-Graſs*, or rather *Rye-Graſs*. It has a buſhy and fibrous Root, which periſhes not in Winter, tho' never ſo cold, from which ſpring up many *Graſs* Leaves, but ſomewhat harder in feeling, and not altogether ſo juicy; from among theſe green Leaves ſpring up ſeveral *Benty* Stalks, a Foot or more high, having ſome few Joints on them, with Leaves thereat, every one of which bears at the top a ſmall, long, whitiſh, yellow Ear, an Inch and half, two or three Inches long, having ſome Awnes or Beards, within which are contained ſmall, long, lank Seeds or Grain: This Ear Authors think has ſome reſemblance of *Barley*, but it much more reſembles *Rye*, and therefore may not improperly be called *Rye-Graſs*.

CCLIX. 2. *Gramen Semitale*, *vel Muriale minus*, *Gramen Hordeium*, *vel Secalinum minus*, *The leſſer Way or Wall*, *Barley or Rye-Graſs*. It is in its Roots, Stalks, Leaves, Ears, and manner of growing very like the former, but it is ſhorter and lower, and looks as if it was a *Dwarf-Graſs* of the ſame kind; I know many have taken it to be the ſame, but it does really differ, the Stalk is ſeldom above nine or ten Inches high, whereas the former comes to be ſometimes ſixteen or ſeventeen Inches, if in good Ground; the Ear is alſo much leſs, and ſhorter, and almoſt without Awnes, or elſe they are very ſhort ones.

Way or Wall-Graſs Leſſer.

CCLX. 3. *Gramen Semitale maximum*, *vel Gramen Secalinum maximum*, *The greateſt Way or Rye-Graſs*. It has a running and jointed Root, with many Fibres adjoining, the Stalks riſe up to be ſometimes two Feet high, and better, having but few and ſhort Leaves thereon; the Spike is ſometimes two, three, or four Inches long, bearded, and very like unto an Ear of *Rye*.

CCLXI. 4. *Gramen Semitale magnum*, *vel Gramen Secalinum minus*, *The great*, *or rather leſſer Rye-Graſs*. The Root in this is wholly Fibrous, but otherwiſe it differs not from the former, ſaving that it is every ways leſs, and the Ear (very like to *Rye*) is many times not above half the length of the former.

CCLXII. *The Places and Times.* They grow upon waſte and untilled Grounds, by Ways and Path ſides, and the ſecond of them by Walls ſides, and upon Walls, eſpecially upon Mud Walls, in almoſt all places of this Kingdom; they Flouriſh and Seed in the Summer Months, *viz.* in *June*, *July*, and *Auguſt*.

XXXIV. Ἄγρωστις ὑλώδης, *Gramen Nemorale*, *vel Nemoroſum*, Wood-Graſs, four Kinds.

CCLXIII. 1. *Gramen Nemorale*, *vel Nemoroſum majus Spica rufeſcente*, *The greater brown Wood-Graſs*. The Root is a buſh of very ſmall Strings or Fibres, from whence ſpring up many narrow graſſie Leaves, and among which riſe up many ſmooth round Stalks, without any Joint or Leaf on them, at the tops whereof ſtand looſe, ſmooth, browniſh

brownish spiked Heads, separated a little one from another, and as it were a little Bearded.

Wood-Grass Greater.

CCLXIV. 2. *Gramen Nemorosum, vel Sylvaticum Capillaceum Panicula alba, White Tufted Wood Grass.* It has a tufted or bushy fibrous Root, as small as Hairs, from the head of which bush of Fibres spring small *Grass* Leaves, which grow thick and close together in a Tuft in a great number, and rising to be about a Foot long; the Stalks come up from among the Leaves, about a Foot and half or more high, smooth, and bare, almost without Joint or Leaf on them, the tops of which end in a white Panicle, two or three Inches long, composed of small Husks with Beards.

CCLXV. 3. *Gramen Sylvaticum, vel Nemorale minus, The lesser Wood-Grass.* This differs not from the first or *greater*, but that it is in all its parts lesser and lower, the small, chaffie, bearded Ears being smaller, and nothing so soft, but rather hard, and a little more sparsed.

CCLXVI. 4. *Gramen Nemorosum, vel Sylvaticum exile durum, Small hard Wood-Grass.* The Roots are small and fibrous, being in a bush, from whence rise up many small hard Leaves, about a Span long, or a Span and half; the Stalks are slender, with very few Joints and Leaves on them, at which Joints, and at the tops also, come forth small, long, chaffie Spiked Heads.

CCLXVII. *The Places and Times.* These all grow in Woods, almost every where throughout *England*, and they flourish when other *Grasses* do, *viz.* in the Summer Months; they are never used in Physick, nor are they good Fodder for Cattel, but Goats will grow fat therewith.

XXXV. Ἐριόφορος, Ἄγρωστις ἐριοφόρα, καὶ ἐριώδης, *Gramen Lanatum, vel Bombycinum*, Woolly-Grass, two Kinds.

CCLXVIII. 1. *Gramen Lanatum, sive Bombycinum, Gramen Juncoides Lanatum vulgaris, Common Woolly or Cotton-Grass.* It has a Root very bushy, small, and fibrous, thrusting its Fibres somewhat deep into the Moorish Ground in which it grows, from whence rise up many long, slender, and Grassie Leaves, almost like unto *Rushes*, whence the Name *Juncoides Lanatum*, or *Lanceas Rushy mus*; from among these Leaves rise up a small, slender, hard Rushy Stalk, about a Foot high, sometimes with a few Grassie Leaves thereon, and sometimes without either Leaf or Joint, bearing at their tops a Bush or Tuft, sometimes one, some times two, three, four, or more, of most pleasant, fine, soft white Down, Wooll, or Cotton, as fine and soft and white as fine White Silk, so that they seem to be rather fine soft White Silk like Heads, finer than the finest whitest Wooll that is, and usually about the bigness of a Walnut, with its outward green Husk, which are so eminent in ones Eye a far off, that they give much Delight and Admiration to the Beholders; these being full ripe pass away with the Wind.

Feather or Cotton-Grass.

CCLXIX. 2. *Gramen Lanatum, seu Bombycinum minus, Gramen Junceum Lanatum minus, Small Woolly or Cotton-Grass.* The Root is somewhat black, and not much unlike the former, but this has many more Rushy Leaves than that, but the Stalks rise not much higher, they bear at their Heads Tufts of Woolly or Cottony Heads, not so large as the former, but are small, and somewhat long, which being ripe fly away with the Wind, leaving a small Head of Seed, like a *Crowfoot* Head, behind it.

CCLXX. *The Places and Times.* They grow in moist, wet, Boggy, and Moorish places, the first on the Bog on *Hampstead Heath*, near *London*, as also in *Highgate Park*, not far from the same; the second has been found about *Mompelier* in *France*; they Flower in *July*.

The Virtues.

CCLXXI. *Cordus* says, that the Decoction of the first in Wine, being taken warm, gives ease in the griping pains of the Belly. The Woolly Heads are gathered by some to stuff Pillows, Bolsters, and Cushions with, far excelling in softness and goodness any *Thistle* Down. Thus have we given you a short History of *Grasses*, which we think is enough, tho'

tho' poſſibly not the half of what are known, and yet in this Chapter we have Named and Deſcribed Two Hundred Twenty Six.

CHAP. CCCXXVIII.

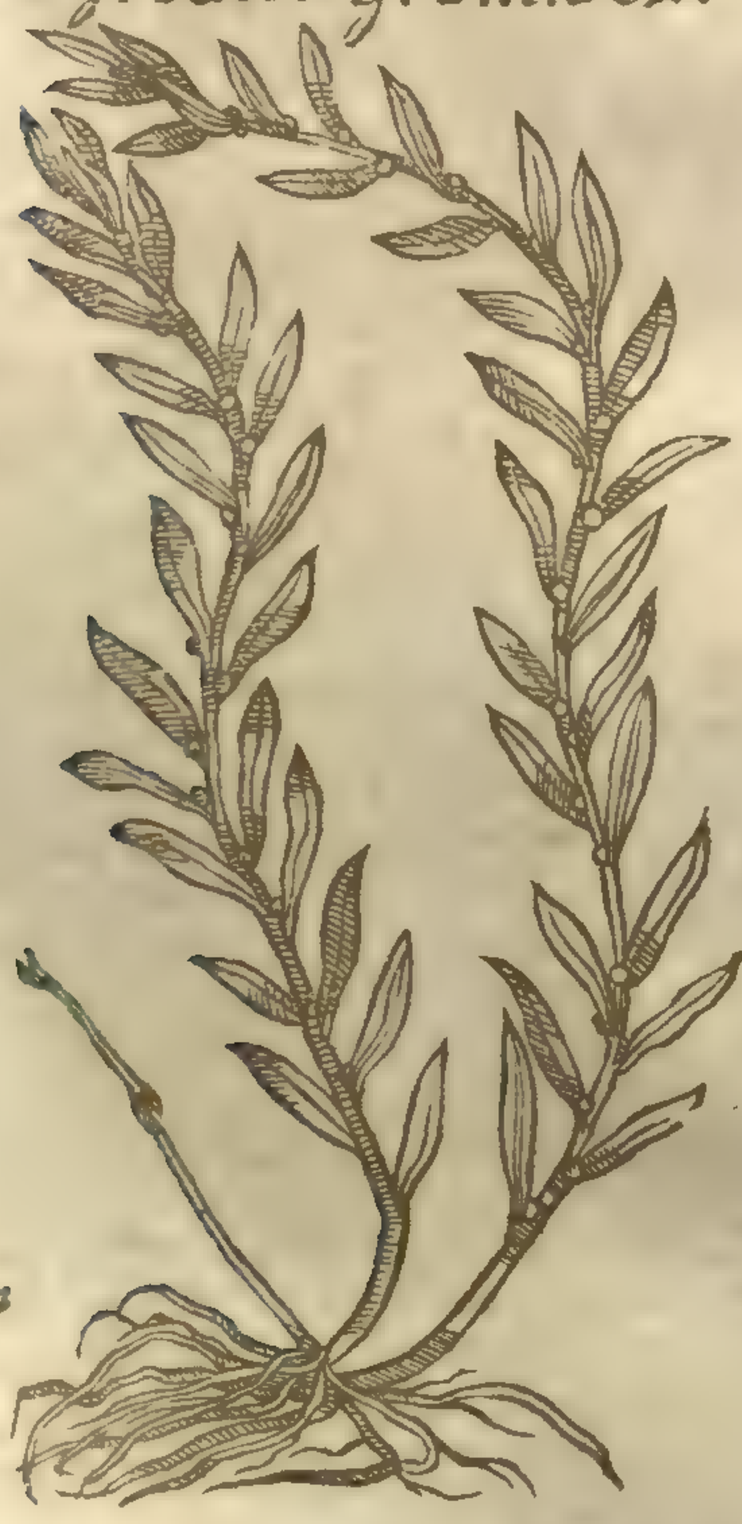
of GROMEL the Greater.

I. *THE Names.* It is called in *Arabick Kilb, Cult, Colt*, and *Calub*, in *Greek* Λιθοσπερμον, i. e. *Lapidem Semen obduritiem*, in *Latin Lithoſpermum, & Milium Solis*, alſo *Granum Solis*, but *Serapio* ſays, from the Authority of *Aben Julia*, that it ſhould be called *Milium Soler*, from the form of the Seed, being ſmall, as *Milium*, and the *Mountain Soler*, upon which it grew; it is the *Gorgonium Æginoclos, & Heraclea Plinij*; in *Engliſh* it is called *Gromel*, alſo *Pear-Plant*, and *Litchwale*.

II. *The Kinds.* It is twofold, *viz. greater*, of which we ſhall Treat in this Chapter, and *leſſer*, of which in the next.

III. *The greater Kind.* Of this there are two ſingular Species, *viz.* 1. *Lithoſpermum majus erectum, vel majus Legitimum, Lithoſpermum Hortenſe*, Great Garden Gromel, or Great upright Gromel. *Saxifraga tertia Brunfelſii, Milium Solis Sativum Tragi, vel Legitimum Clutii, Lithoſpermum alterum Fruticoſum Johannis Thal.* 2. *Lithoſpermum majus repens, Lithoſpermum majus vulgare*, The Greater creeping Gromel, or Greater common Gromel.

Greater Gromwel.



Garden *Gromel.*

IV. The Deſcriptions. *The firſt, or* Great upright Garden Gromel, *has a Root which is long and hard, or ſomething Woody, with divers Branches and Fibres thereat, which periſhes not, altho' the Stalks die away and periſh every Year*; from this Root riſe up ſeveral upright, ſlender, woody, hairy, brown, and creſted Stalks, very little, or not branched at all, on which do grow, without order, long, hard, rough, and dark green Leaves, ſharper pointed, and ſomewhat longer and narrower than the next; at the tops of the Stalks grow ſeveral ſmall white Flowers, in rough brown Husks, wherein, after they are paſt, is contained a white, hard, round, ſtony, ſhining Seed, greater than that of the following, and almoſt like unto Pearls.

Great Creeping Gromel.

V. *The ſecond, or* Greater creeping Gromel. *It has a Root like the aforegoing, abiding all the Winter, and ſhooting forth Stalks freſh in the Spring*, which Stalks grow up ſlender, hard, and hairy, trailing, and taking Root in the Ground as they lye thereon, being alſo divided or parted into many other ſmaller Branches, with ſuch like hairy, dark, green Leaves, but ſhorter and broader than the former; at the Joints with the Leaves come forth very ſmall blew Flowers, and after them ſuch like hard, roundiſh, ſtony Seed, but ſmaller, and not fully ſo white and ſhining.

VI. *The Places.* The firſt grows with us in Gardens only, but Wild in ſome places of *Italy*, and *France* next to it; the ſecond grows Wild in many places of *England*, in barren or untilled places, and by the Way ſides.

VII. *The Times.* They Flower from the beginning or middle of *June* until *September*, the Seed ripening in the mean while.

VIII. *The Qualities.* They are hot and dry in the ſecond Degree, Inciſive, Diuretick, Abſterſive, and Nephritick.

IX. *The Specification.* They are peculiar in curing the Strangury, provoking of Urine, and in breaking and expelling the Stone.

X. *The Preparations.* You may have therefrom, 1. *A Liquid Juice of the Herb.* 2. *An Eſſence of the Herb.* 3. *A Decoction of the Seed.* 4. *A Powder of the Seed.* 5. *A Compoſitum of the Seed.*

The Virtues.

XI. *The Liquid Juice of the Herb.* It provokes Urine, helps the Strangury, and is good againſt the Stone

Stone and Gravel in Reins or Bladder, but is not ſo effectual as the Seed; you may give it Morning and Night, two or three Ounces for a Doſe, in a Glaſs of White Port Wine.

XII. *The Eſſence.* It has all the Virtues of the Juice, and of the Seed, being uſed in the ſame manner and Doſe, but is not ſo powerful or ſpeedy in its Effects as the Pouder of the Seed is.

XIII. *The Decoction of the Seed.* It is to be bruiſed, and then to be boiled in Broth, or Poſſet-Drink, or rather in White Wine: Doſe from four to eight, or ten Ounces, according to the Age of the Patient, two or three times a day, againſt Strangury, Stone, Gravel, and Tartarous Mucilage impacted in the Reins, Ureters, and Bladder; where note, it is to be uſed for ſome conſiderable time.

XIV. *The Pouder of the Seed.* It is found to be of ſingular force to break the Stone and expel it, whether it be in the Reins or Bladder, it alſo provokes Urine being ſtopt, and helps the Strangury, or making Water by drops, cauſed by Sand, Slime, or Tartarous Mucilage obſtructing thoſe parts; it is indeed a pleaſant, ſafe, and effectual Medicine for the Stone and Gravel, being taken every Night going to Bed, and every Morning faſting, for ſeveral days together; when the Patient is troubled with a Paroxyſm of the Stone it quickly gives relief, *probatum eſt.* Doſe from two Scruples to a Dram and half in White Port Wine, or in Broth, or in Barley Cream, or in Almond Milk, or in an Emulſion of the four greater cold Seeds; if it is given to two Drams in Womens Breaſt Milk, or in White Wine, or in Parſly Water, it is very effectual to cauſe ſpeedy Delivery to Women in Travail, who are not eaſie to be delivered.

XV. *The Compoſitum. Take Pouder of the Seed three Drams, White Amber in Pouder one Dram, Ceterach or Spleenwort in Pouder half a Dram, mix them.* This being taken a Dram at a time, or more, in the Morning faſting, and laſt at Night going to Bed, in the Juices of *Plantane*, *Purſlane*, and *Lettice*, and that for ſeveral days together, it certainly cleanſes, heals, and cures a Gonorrhœa, or running of the Reins.

CHAP. CCCXXIX.

Of GROMEL the Leſſer.

I. THE *Names.* It is called in *Greek* Λιθόσπερμον μικρὸν, ἢ ἧττον, in *Latine Lithoſpermon minus*, or *Milium Solis minus*, and in *Engliſh Gromel the leſſer*, and *Wild Gromel.*

II. *The Kinds.* Of this there are ſix Kinds, *viz.* 1. *Lithoſpermum minus vulgare Matthioli, Dodonæi, Camerarij, Geſneri, Lobelij, & aliorum*, Our common ſmall Wild Gromel. 2. *Lithoſpermum anguſtifolium Umbellatum Bauhini, vel anguſtifolium fruteſcens Matthioli*, Narrow Leav'd Umbelliferous Gromel. 3. *Lithoſpermum Anchuſæ facie Lobelij, Lithoſpermum erectum minus Bauhini*, Small Gromel with tufted tops, or Alkanet like Gromel. 4. *Lithoſpermum Arvenſe Radice rubente, Lithoſpermum Sylveſtre Tragi, Fuchſij, & Camerarij, & tertium Dodonæi, Echium minus Lithoſperma congener Geſneri, Anchuſa degener facie Milij Solis Lobelij, Anchuſa Arvenſis alba Thalij, Lithoſpermum Arvenſe Radice rubra Bauhini*, The ſmall red Rooted Corn Gromel. 5. *Lithoſpermum minimum Germanicum, Paſſerina Tragi & Camerarij, Lingua Paſſerina Tabernamontani, Lithoſpermum Quartum Dodonæi, Paſſerina Linaria Gerardi, Lithoſpermum Linariæ folio Germanicum Bauhini*, Small German Gromel, or Sparrow Wort. 6. *Lithoſpermum Linariæ folio Monſpelienſe Lobelij & Lugdunenſis*, Small French Gromel with Flax Leaves.

III. The Deſcriptions. *The firſt, or* Common ſmall Wild Gromel, *has a Root which is not very long, but is repleniſhed with many Fibres or ſmall Strings*, which ſends forth ſeveral upright, hard, branched Stalks, full of Joints, two or three Feet high, at every of which Joints grow ſmall, long, hard, and rough Leaves, leſſer than the ſecond of the former, and of a dark green color, among which Leaves come forth ſmall white Flowers, and in their places, when they are paſt, greyiſh round Seed, like the other.

IV. *The ſecond, or* Narrow Leav'd Umbelliferous Gromel, *has a Root which is hard and woody, covered with a browniſh red Bark*, from which riſe up ſeveral woody rough Stalks, yet eaſie to break, ſpread into ſeveral Branches, about ſix, ſeven, or eight Inches high, with very many narrow rough Leaves growing on them, without any order, the middle Rib in them being ſomething great; the Flowers ſtand at the tops of the Branches, and ſometimes from the upper Joints, divers being ſet together, as it were in an Umbel, which conſiſt of five ſmall round pointed Leaves, of a blew color; or rather, being long and hollow, are parted, and cut into five parts, ſet in rough green Husks, in which, after the Flowers are paſt, there uſually grow two white and hard long pointed Seeds, ſet together.

V. *The third, or* Small Gromel with Tufted tops, *or* Alkanet like Gromel. *Its Root is long and woody, ſpreading under Ground, and covered with a rough browniſh red Bark*, from which riſe many hard, brittle, woody, low, and hairy Stalks, riſing little above ſix, ſeven, or eight Inches high, dividing themſelves, even from the Ground, into many ſmaller Branches, on which are ſet diſperſedly ſmall, long, and narrow, rough green Leaves, whoſe mid-

dle Rib rifes up fomewhat high; the Flowers for the moft part ftand at the tops of the Branches in a Tuft or Umble, many making a Tuft together, and fometimes alfo at the Joints with the Leaves, ftanding in rough Husks, which are fomewhat larger than any of the other, and of a fine blew color in fome, and white or reddifh in others, which being paft away, fmall, and fomething long, pointed, hard and white Seed follows, two for the moft part joined together.

VI. *The fourth, or* Small red Rooted Corn Gromel. *It has a Root which is fomewhat reddifh, but little or nothing coloring the Fingers of fuch who touch it*; from this Root fhoot forth three or four rough Branches or Stalks, divided into other fmaller ones, having many fmall, long, narrow, hairy, dark green Leaves growing on them, very like thofe of the former *Gromels*, but not fo hard or long, but fet without order in like manner; the Flowers grow at the tops, with many fmall Leaves among them, confifting of five fmall white Leaves, which being paft away, fmall blackifh Seed fucceeds, two, three, or four, fet together in the fame Husk.

VII. *The fifth, or* Small German Gromel, *or* Sparrow Wort, *has a Root which is fmall and thready, and perifhes every Year*; from this Root rifes up for the moft part but one flender Stalk, fpreading it felf out into one, or two Branches at the moft, fcarcely a Foot high, and fet here and there with fmall, long, and narrow Leaves, fomething like unto *Line* or *Flax*, upon which, up towards the top, ftand fmall white Flowers, which being paft away, there comes in their places fmall, fmooth, round, blackifh Seed, very like unto *Gromel* Seed.

VIII. *The fixth, or* Small French Gromel. *It has a Root which is fmall and fibrous, or ftringy*, from which rifes up but one Stalk, branched out into two or three parts at the top thereof, on which grow long and narrow Leaves, fomewhat larger than the former, and not rough, as the other *Gromels* are; the Flowers are fmall, of a pale whitifh yellow color, like unto the former, but ftand many together at the tops of the Branches, where, after they are paft, fmall round Heads, like *Coriander Seed* arife, in which are contained round, hard, blackifh Seed, like unto that of *Gromel*.

IX. *The Places.* The four firft grow Wild in many places of *England*, in barren or untilled places, and by the Way fides; the two firft of them are faid to grow upon the Sea Shoar and Beeches in the Ifle of *Thanet*, near *Reculvers*, among the Kinds of *Wild Bugloſs* there growing; the fourth has been found growing in Corn Grounds, as alfo in the way from *Briſtol* to *Bath*, as *Lobel* fays.

X. *The Times.* They all Flower from Midfummer to *September*, the Seed ripening in the mean while.

XI. *The Qualities, Specification, Preparations, and Virtues* of thefe are the fame with thofe in the aforegoing Chapter, faving that thofe in the former Chapter are much the more effectual; and of thofe in this Chapter the firft is only ufed in Phyfick.

CHAP. CCCXXX.

Of GROUND-PINE, *OR,* GOUT-IVY, *OR,* FIELD CYPRESS.

I. *THE Names.* It is called by the *Arabians Hamafitees, & Chamafithios*, in *Greek* Χαμαιπίτυς, in *Latine Chamæpitys, (quaſi Humi Pinus, vel Picea;)* it is called alſo *Ajuga, & Abiga, (ab Abietis odore*, as *Pena* thinks, but as moſt think, *ab Abigenda partu & procurando Abortu*; *Pliny* fays, *dicitur propter Abortus, & ab alijs Thus Terræ.)* Some call it *Iva Arthritica, (*becauſe of its Virtues in curing the Gout, and other Joint Diſeaſes.) We in *Engliſh* call it *Ground Pine*, alſo *Gout Ivy*, and *Field Cypreſs*.

II. *The Kinds.* There are ſeveral Species, as 1. Of the *Field Kind*, of which in this Chapter. 2. Of the *Heath Kind*, of which in Chap. 331. 3. The *Sea Kind*, of which in Chap. 332. of all which in order, as follows.

III. *The vulgar Field Kinds.* Of theſe we make five ſeveral Species, *viz.* 1. *Chamæpitys vulgaris*, which *Matthiolus* takes to be the firſt of *Dioſcorides*, Our Common Ground Pine. 2. *Chamæpitys odoratior, Chamæpitys minor*, The leſſer Ground Pine. 3. *Chamæpitys Mas*, which I take to be the third of *Dioſcorides*, and is his Male Ground Pine. 4. *Chamæpitys Auſtriaca Cluſij*, *Chamæpitys cærulea Bauhini*, The Auſtrian Ground Pine. 5. *Chamæpitys Adulterina*, *Pſeudochamæpitys Lobelij & Cluſij*, *Chamæpitys Spuria Dodonæi*, Baſtard Ground Pine.

IV. The Deſcriptions. *The firſt, or* Common Ground Pine, *has a Root which is woody, and periſhing every Year*; the Herb grows low, and ſeldom riſes above an Hand bteadth high, ſhooting forth ſeveral ſmall Branches, ſet with ſlender, ſmall, long, narrow,

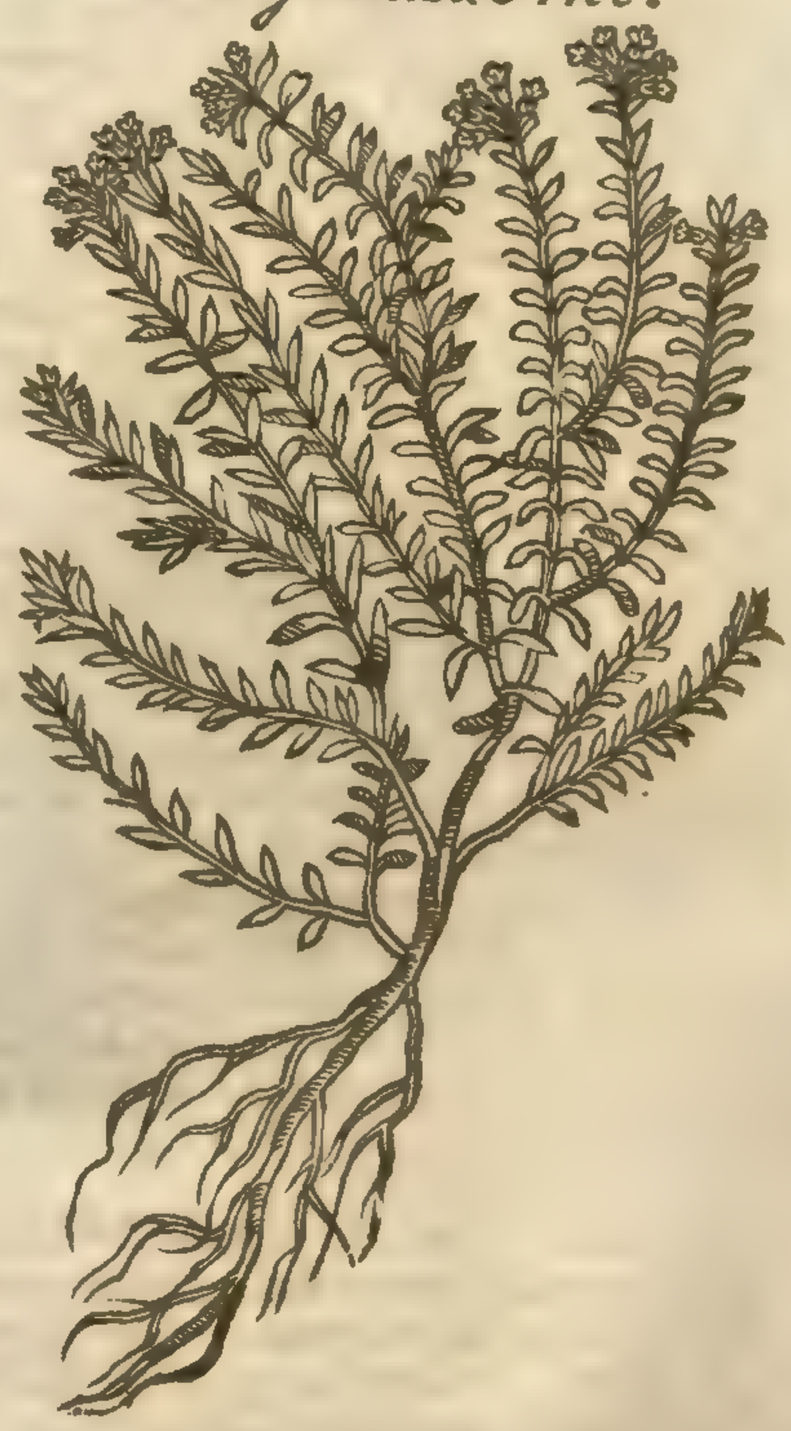
narrow, greyiſh, or whitiſh Leaves, ſomewhat hairy, and divided into three parts oftentimes, many buſhing together at a Joint, and ſome of them growing ſometimes alſo ſcatteredly upon the Stalks, ſmelling ſomething ſtrong, like unto Roſin, or the ſmell of the Pine Tree; the Flowers are very ſmall, and of a pale yellow color, growing from the Joints of the Stalks all along among the Leaves, after which come ſmall, long, and round Husks.

Common Ground Pine.

V. *The ſecond, or* Leſſer Ground Pine, *has a Root which is ſomewhat long and fleſhy, like the Root of* Succory, *or* Dandelion, *with many Fibres thereat, but ſmaller*; it is alſo a ſmall Herb, growing up with many hairy and hoary white ſlender Branches, not above a Hand breadth high, on which are ſet many ſmall long Leaves, yet ſhorter than the former, hairy alſo and hoary white, not in Tufts or Buſhes, but growing by couples, cloſe together all along the Stalks, cut in, or divided into ſome parts, of a ſtrong but ſweet ſcent, much ſweeter than the former; at the tops of the Branches grow the Flowers, many together, of a pale yellowiſh white color.

VI. *The third, or* Auſtrian Ground Pine, *has a Root compoſed of many black Strings, and hard, growing deep into the Ground, and ſpringing again freſh every Year*; from this Root riſe up ſeveral ſquare, ſtrong, hairy Stalks, a Foot long, with many Joints on them, at which grow two ſomething long and hard Leaves, a little like unto the firſt, but broader, green, and ſhining on the upper ſide, but ſomewhat hoary and full of Veins on the under ſide, divided into three or four parts, and ſometimes into more, a little hot in taſte, but not unpleaſant, nor of any diſpleaſing ſcent; from the Joints ſpring forth ſmaller Branches, with the like Leaves on them, but leſſer divided, and towards the tops nothing at all, but ſmooth and long, like unto *Roſemary* Leaves; from the upper Joints, and ends of the Stalks and Branches, grow ſeveral gaping Flowers, like unto *Germander*, of a deep Purple or Violet Color for the moſt part, but ſometimes of a lively Red Color, and ſometimes of a bleaker Blue, or Sky Color, the lower Leaves or Chaps of the Flowers being whitiſh, ſpotted with red Spots; after which come black, ſhining, longiſh, and cornered Seed, four for the moſt part encloſed in every of thoſe rough Husks, in which the Flowers ſtood before.

Small Ground Pine.



Male Ground Pine.

VII. *The fourth, or* Male Ground Pine, *has a ſmall ſingle Root, of a woody ſubſtance, which ſtrikes pretty deep into the Ground, with ſome few Fibres ſhooting from it.* It is a ſmall Herb, and very ten-

der, creeping upon the Ground, having ſmall and crooked Branches, full of Joints; at every Joint from the bottom comes forth two long Leaves, one on each ſide the Joint, which are long, narrow, and ſlender at the bottom, but as they proceed in length are hairy, and cut or jagged deeply, almoſt to the middle Rib, into two, three, or four deep Jags, not much unlike to a Bucks Horn, ſaving that the ends of theſe Jags are rounder pointed, or broader; at every of theſe Joints, with the Leaves, at their bottoms grow the Flowers, without any Footſtalk, one at the foot of each Leaf, and ſpring out of a little rough Husk, being ſmall, and of a pale yellow color, and ſometimes alſo white; the Leaves growing on the upper Joints, as they approach the top, are for the moſt part divided into three long parts, not very much unlike to *Roſemary* Leaves.

VIII. *The fifth, or* Baſtard Ground Pine, *has a Root which is ſomewhat thick and white, abiding all the Winter.* It grows like a ſmall buſhy Herb, very like unto the *Common Kind*, having ſmall hairy Stalks, ſet full of long hairy Leaves all along them, parted into three long parts, of almoſt no ſcent, but an unpleaſant Herby one; the Flowers ſtand at the Joints with the Leaves at the tops of the Branches, very like to thoſe of the *Common Ground Pine*, but ſomewhat greater, and of a white color; after the Flower the Seed follows, which is greyiſh, greater and rounder than the *Common Kind*, four for the moſt part contained in every one of thoſe browniſh rough Husks.

IX. *The Places.* The firſt grows Wild in *England*, chiefly in *Kent*, (not growing in many other Shires that we know of) very much about *Dartford*, along to *Southfleet*, *Graveſend*, *Cobham*, *Rocheſter*, *Horton*, and *Sutton*, and upon *Chatham Down*, hard by the *Beacon*, and half a Mile from *Rocheſter*, nigh a Houſe called *Salſey*; the other four are chiefly nurſed up in Gardens, but grow Wild in *Italy*, *Savoy*, *Genoua*, *Spain*, and *Auſtria*.

X. *The Times.* They all Flower in *June*, *July*, and ſometimes in *Auguſt*, and give their ripe Seed in the mean time, or not long after.

XI. *The Qualities.* *Ground Pine* is hot in the ſecond degree, and dry in the firſt, it is Inciding, Aperitive, Abſterſive, Diuretick, Hepatick, Splenetick, Nephritick, Hyſterick, and Arthritick, Emmenagogick, a little Sudorifick, Chylifick, Spermatogenetick, and Alexipharmick.

XII. *The Specification.* It is peculiar againſt the Strangury, and Hyſterick Fits, provokes the Terms, facilitates the Labour, and expels the Dead Child and Afterbirth.

XIII. *The Preparations.* You may prepare therefrom, 1. *A Liquid Juice.* 2. *An Eſſence.* 3. *A Decoction.* 4. *A Diet Drink.* 5. *A Conſerve of the Tops and Flowers.* 6. *Pills.* 7. *An Ointment or Balſam.* 8. *A Cataplaſm.* 9. *A Lotion.* 10. *A Diſtilled Water.* 11. *A Spirit.* 12. *An Acid Tincture.* 13. *A Spirituous Tincture.* 14. *An Oily Tincture.*

The Virtues.

XIV. *The Liquid Juice.* It does admirably prevail againſt the Strangury, and all ſtoppages of Urine, or any inward pain ariſing from thoſe Diſeaſes of the Reins, Ureters, and Bladder; it may be given Morning and Night, from two to four Spoonfuls, in a Glaſs of White Port Wine.

XV. *The Eſſence.* It has all the former Virtues, beſides which it ſingularly opens obſtructions of Liver and Spleen, cleanſes the Blood, removing its groſsneſs and impurities, it expels that which is congealed in the Stomach, or other Bowels, and gently opens the Body; it alſo wonderfully helps all Diſeaſes of the Mother, taken inwardly, and outwardly uſed, by injection; it provokes the Terms, facilitates the Delivery of Women in Travail, and expels the Dead Child and Afterbirth; yea, it is ſo powerful upon thoſe parts, that it is forbidden to Women with Child, for that it is apt to induce Abortion, or Delivery before the time; it is powerful and effectual alſo in all Pains and Diſeaſes of the Joints, as Gouts, Sciatica, Rheumatiſm, Cramps, Convulſions of the Nerves, Palſies, Falling-Sickneſs, and other Diſtempers of like kind, being uſed both inwardly, and outwardly applied, or bathed upon the parts affected; it is alſo an eſpecial good help againſt the Jaundice, griping pains of the Belly, or any pains in the other *Viſcera*, proceeding from Cold and Flegmatick Humors. Doſe four, five, or ſix Spoonfuls, mixt with ſome Generous Wine, Morning, Noon, and Night, according as the weakneſs of the Patient, and neceſſity of the occaſion may require.

XVI. *The Decoction in Wine.* It has all the Virtues of the Liquid Juice and Eſſence, and may be given Morning, Noon, and Night, half a Pint at a time; it ought to be made of the Plant or Herb, when it is in Flower chiefly, for then it is ſtrongeſt and moſt powerful; it provokes Sweat, if taken when the Patient is in a naked Bed, and covered warm down upon it; it prevails alſo againſt the Poyſon of the *Aconites* of all ſorts, and of other Poyſonous Herbs, as alſo againſt the Biting of Mad Dogs, and other Venomous Creatures, the Stinging of Scorpions, Hornets, Waſps, Bees, *&c.* and is a ſingular good thing againſt a Cough, eſpecially in the beginning, before it is grown inveterate.

XVII. *The Diet Drink.* It is made by Tunning it up in new Ale or Beer when it is firſt ſet on working, four Handfuls to a Gallon, and may be drunk after four or five days, Dietetically, againſt all thoſe Diſeaſes for which the Juice, Eſſence, or Decoction are given, and is more pleaſant for queaſie Stomachs.

XVIII. *The Conſerve.* The Conſerve of the Flowers participates of all the former Virtues, but in a much weaker degree, however *Matthiolus* commends it againſt the Palſie; it may be taken to the quantity of a Walnut every Morning faſting, and laſt at Night going to Bed, for ſome time.

XIX. *The Pills.* There are three ſorts of Pills made with this Herb. 1. *Pilulæ Chamæpityos Simplices*, Simple Pills of Ground Pine. They are made of the Pouder of the Herb, and Mucilage or Pulp of Figs, and have the Virtues of the Juice, Eſſence, and Decoction, given Morning and Night, from one Dram to two Drams, waſhing them down with a Draught of the Decoction of *Ground Pine* in Wine aforementioned. 2. *Pilulæ Chamæpityos Compoſitæ*, Pills of Ground Pine Compound. *Take Pouder of Ground Pine five Ounces, fine Pouder of Hermodacts three Ounces, Sal Nitre two Ounces, Scammony in fine Pouder one Ounce, Venice or Strasburgh Turpentine a ſufficient quantity, mix, and make a Maſs of Pills.* Doſe one Dram, or more, in the Morning faſting. They cure the Dropſie, Jaundice, Gout, Sciatica, Kings-Evil, Strangury, and all ſtoppages and heat of Urine. 3. *Pilulæ Chamæpityos Matthioli*, Matthiolus his Pills of Ground Pine. *Take Ground Pine, Betony, Roſemary Flowers, Stœchas, all in fine Pouder, of each one Ounce, of Agarick in Pouder two Ounces, of Rhubarb, Turbith in Pouder, of each an Ounce and half, Colocynthis in Pouder half an Ounce, Diagredium, or rather Scammony in Pouder, one Ounce, Hiera Picra ſimplex four Ounces, Ginger, Spicknard, Sal Gem, of each in*

in Pouder two Drams, mix them, and with Juice, or rather Syrup of Ground Pine, make a Maſs of Pills. Doſe one Dram, or Dram and half, at Bed time. Theſe Pills he commends againſt the Palſie, and ſays they will give a preſent and ſpeedy help; I have ſeveral times uſed them againſt the Scurvy, Dropſie, Jaundice, Gout, Rheumatiſm, Kings-Evil, Obſtructions of the Lungs, and in malignant and putrid Ulcers, Fiſtula's, *&c.* with admirable ſucceſs.

XX. *The Ointment or Balſam.* Anointed on the Fundament it prevails againſt the Piles, tho' ulcerated, it diſcuſſes hard Tumors, as well in Womens Breaſts as in other parts of the Body, but for this purpoſe the Ointment is only to be uſed; the Ointment or Balſam do not only cleanſe putrid, ſtinking, foul, malignant and virulent Sores and Ulcers of all ſorts, but they alſo conglutinate the Lips of Green Simple Wounds in any part, and quickly heal the ſame; the Balſam is an excellent thing againſt the Gout and Sciatica, being often and long applied.

XXI. *The Cataplaſm.* Made of the Green Herb, with Pulp of Figs, or Honey, and being applied to Womens Breaſts, it diſſolves the hardneſs of them, as alſo other hard Tumors in any other part of the Body; it cleanſes alſo putrid, malign, and virulent Ulcers and old Sores in what part ſoever.

XXII. *The Diſtilled Water.* It is a good thing againſt Sand and Gravel, the Strangury, and other Diſtempers of the Urinary parts and Womb, but it is much more effectual if it is drank ſix Ounces at a time, mixt with one or two Ounces of the Liquid Juice or Eſſence of the Herb.

XXIII. *The Lotion. Take of the Juice or Eſſence four Ounces, of the Diſtilled Water ſix Ounces, Madder in fine Pouder three Drams, Alum two Drams, Honey four Ounces, mix, digeſt over a ſimpering heat for an Hour, then uſe it as a Gargariſm*; it cures a ſore Mouth or a ſore Throat in a very little time, after an admirable manner, and that when many other things have failed.

XXIV. *The Spirit.* It comforts the Head, Brain, and Nerves admirably, and is prevalent againſt Lethargies, Palſies, Convulſions, Numbedneſs, and other like Diſtempers, given from one to two, three, or four Drams, either alone dulcified, or mixt with any other proper Vehicle; it alſo is ſingularly good againſt Sickneſs at Heart, Fainting and Swooning Fits, and other Diſaffections of like kind.

XXV. *The Acid Tincture.* It powerfully opens Obſtructions of the Reins and Bladder, repreſſes Vapours from the Spleen and Womb, is good againſt Sand, Gravel, and Stone, and of excellent uſe againſt the Scurvy; it rectifies the obliquity of the Stomach, cauſes a good Appetite and Digeſtion and opens Obſtructions of the Lungs, helps Wheezings, Hoarſeneſs, difficulty of breathing, ſhortneſs of Breath, Coughs, Colds, and the like. Doſe ſo many drops as to give the Vehicle a pleaſing acidity, and to be uſed in all that the Patient drinks.

XXVI. *The Spirituous Tincture.* It is good againſt Heart Qualms, Palſies, Convulſions, Lethargies, and other Diſeaſes of the Nerves; it ſtrengthens the Stomach, and being given to three or four Drams it provokes Sweating, and is good againſt the Bitings of Mad Dogs, Serpents, and other Venomous Creatures. Doſe ordinarily two Drams, in a Glaſs of Wine, or any other convenient Vehicle, twice or thrice a day.

XXVII. *The Oily Tincture.* Inwardly taken it prevails againſt the Stone and Gravel, or Tartarous Matter in the Reins or Bladder, and by fortifying the Stomach and Head, as alſo the Original of the Nerves, it is found by experience powerfully to reſtore in the Palſie; outwardly applied, (by well anointing upon the part) it eaſes all Pains and Aches proceeding from Cold, ſtrengthens weak Limbs and Joints, gives eaſe in the Gout and Sciatica proceeding from a cold Cauſe, prevails againſt Cramps and Convulſions of the Nerves, and is a ſingular thing againſt the Palſie, the *Spina Dorſi* being well anointed therewith Morning and Night, together with the parts affected.

CHAP. CCCXXXI.

Of GROUND-PINE Sea, *OR,* Sea GOUT-IVY.

I. *THE Names.* It is called in *Greek* Χαμαιπίτυς θαλάσσια, Ἀνθυλλὶς ἐλώδης, in *Latin Chamæpitys Maritima, Anthyllis Herbariorum, Anthyllis altera Dioſcoridis, Anthyllis Chamæpityoides*, alſo *Iva Moſchata* by ſome, in *Engliſh Sea Ground Pine.*

II. *The Kinds.* It is the ſecond generick Species of *Ground Pine*, mentioned in *Chap.* 330. *Sect.* 2. aforegoing, and a ſingular Plant of the Kind; it is the *Anthyllis altera Cluſij*, who ſays it is very like unto *Chamæpitys*; but *Bauhinus* refuſes to Name this with the *Anthyllides* in his *Pinax*, and therefore puts it among his *Chamæpityoides.*

III. The Deſcription. *It has a Root which is ſomewhat thick and white, which ſends forth ſeveral hard hairy Stalks, without Branches upon them*, upon which do grow many ſomewhat long and narrow Leaves, without order, one above another, buſhing thick at the top, ſomewhat like unto thoſe of *Chamæpity*, or *Ajuga*, but dented about the edges, and hairy alſo, ſomething of a warming hot taſte, and ſtrong unpleaſant ſavour; the Flowers grow among the Leaves upon the Branches, like unto the Flowers of *Chamæpitys*, or *Ground Pine*, but of a purple reddiſh color, after which come ſmall, greyiſh, rough Seed, a little long, and four for the moſt part in every Husk.

IV. *The Places.* It grows upon the Sea Coaſt in ſeveral Countries and Kingdoms, I found it in ſeveral places on the Sea Coaſt of *Florida.*

V. *The Times.* It Flowers in *July* and *Auguſt*, and the Seed is ripe in *September.*

VI. *The Qualities.* It is hot and dry in the ſecond degree, Aperitive, Abſterſive, and Diuretick, Nephritick, Hyſterick, and Alexipharmick.

VII. *The Specification.* It is prevalent againſt Sand, Gravel, and Tartarous Matter in the Reins and Bladder, and to cure the Scurvy.

VIII. *The Preparations.* You may have therefrom, 1. *A Liquid Juice, or Eſſence.* 2. *An Oil by Coction in Oil Olive.*

IX. *The Liquid Juice, or Eſſence.* It powerfully provokes Urine, and cleanſes the Reins and Bladder of ſmall Stones, Gravel, Sand, and Tartarous Matter, thereby giving a Cure in the Strangury; if it is given to one or two Ounces, according to Age and Strength, in the Morning faſting, and laſt at Night going to Bed, in a Glaſs of *Oxymel*, or White Port Wine, it does much good againſt the Falling-Sickneſs, and taken daily for ſome time, a Spoonful at a time, in a Glaſs of Wine, it repreſſes Vapors, and Fits of the Mother.

X. *The Oil by Inſolation or Coction in Oil Olive.*

Injected

Injected into the Womb it ſoftens the hardneſs thereof, and by anointing diſcuſſes hard Tumors in other parts of the Body.

CHAP. CCCXXXII.

Of GROUND-PINE Heath, *OR,* GOUT-IVY Wild.

I. *THE Names.* It is called in *Greek* Κόεις, *ob pulchritudinem, verùm* Hippocrates *& Antiqui* Κόρην, i. e. *Pupillam, vocarunt propter Semen, Oculi Pupillæ, ſeu anteriori Humeri Cryſtallino, ambitu Sphærico, haud abſimile cernitur*; in *Latine Coris*, and in *Engliſh Heath Ground-Pine*, and *Fair Heath Ground-Pine.*

II. *The Kinds.* It is the third Generick Species of *Ground-Pine* mentioned in *Cap.* 330. *Sect.* 2. and of this Species Authors have enumerated three ſeveral Kinds, *viz.* 1. *Coris Matthioli*, ſo called by *Camerarius*, *Geſner*, *Lacuna*, *Lonicerus*, *Lobel*, *Lugdunenſis*, *Tabernamontanus*, *& alijs*; *Coris lutea Bauhini*, The Common, or moſt vulgar Fair Heath Ground-Pine. 2. *Coris Legitima Ericæ ſimilis Belli*, *Coris Legitima Cretica Belli*, Fair Heath Ground-Pine of Candia. 3. *Coris Monſpelienſium*, *Coris Monſpeliaca Penæ & Lobelij*, *Camerarij & Tabernamontani*, *Coris quorundam Cluſij*, *Coris cærulea Maritima Bauhini*, *Coris Purpurea*, Purple Fair Heath Ground-Pine.

Heath Ground Pine.

III. The Deſcriptions. *The firſt, or* Common Heath Ground-Pine, *has a Root which is ſomewhat long and woody, with many fibrous Threads thereto adjoining*, from which ſpring up ſeveral hard, woody, reddiſh Stalks, full of Joints, riſing up to the height of a Foot, or more, and having alſo on them many ſmall and long, thick and fat Leaves, ſet together at every Joint, ſomething like unto *Spergula*, or *Frank Spurry*; at the tops of the Stalks grow ſeveral Flowers, each of them upon a ſhort Footſtalk, conſiſting of five or ſix Leaves, not much unlike to *Hypericon*, or *Ornithogalum*, *Star of Bethlem*, as *Lobel* compares them, but of a whitiſh red color, with yellow Threads in the middle, yet *Matthiolus* and others ſay the Flowers are all yellow, like *Hypericon*, ſmelling a little ſweet, which being paſt away, the Seed is found encloſed in round Heads. This Plant keeps its green Leaves all the Winter, but turn of a ſomewhat yellowiſh red color towards *Autumn.*

IV. *The ſecond, or* Fair Heath Ground-Pine of Candy, *has a Root which is long, ſpreading, and woody, abiding with green Leaves thereon all the Winter.* This Plant, as *Bellus* ſaith, grows in good Ground to be a Cubit and half high, Branching forth many ways, and bearing many ſmall Leaves, like unto *Heath*, on woody Stalks and Branches; the Flowers grow at the tops of the Branches, and are much like to thoſe of *Hypericon*, and of a yellow color, which being paſt away the Seed follows, being encloſed in Husks like the former.

V. *The third, or* Purple fair Heath Ground-Pine, *has a Root which is reddiſh, hard, and woody, greater than the proportion of the Plant ſhould ſeem to require, giving a Dye or Color, not only to the Fingers of them which touch it, but ſerves alſo to Dye Linnen Cloth withal, among thoſe People where it grows naturally; it abides all Winter, altho' the Leaves are then more reddiſh than in Summer, but requires ſome care to preſerve it with us.* From this Root riſe up many round, woody, and reddiſh Stalks, not ſo high as the former, having many ſmall, long, thick, and roundiſh Leaves ſet thereon, moſt commonly without order, and yet ſometimes conformable one to another, ſomewhat like unto the greater Kind of *Heath*; the tops of the Stalks are furniſhed with a great Spiked Tuft or Buſh of Purpliſh Blew Flowers, (but of a pale Red with us) ſmelling ſomething ſweet, each conſiſting of four Leaves apiece, double forked as it were at the ends, two whereof which ſtand uppermoſt are greater than the other two which are lower, which will continue long in their perfect color, being gathered in their prime, and each of them ſtanding in a browniſh Husk, parted at their tops into five points, and ſpotted with five blackiſh ſpots on the outſide, wherein afterwards grows the Seed, which is ſmall, round, and blackiſh, wrapped up as it were in many Coats or Films, whoſe Husks then do grow ſomewhat hard, and ſharp at the ends, when as before, while the Flower laſted, they were not ſo.

VI. *The Places.* The firſt *Matthiolus* ſays grows in many places in *Italy* in dry and Hilly Grounds, which *Pena* confirms; it grows by *Carara*, a Village in *Liguria*: the ſecond grows in *Candy*; the laſt, as *Pena* ſays, about *Mompelier*, alſo near the Sea in *Valentia*, and in dry Grounds about *Salamanca* in *Spain*, as *Cluſius* ſays; with us in *England* they only grow in Gardens, but I have found them all growing in dry Hilly Ground in ſeveral parts of *Florida.*

VII. *The Times.* They Flower early in all thoſe hot Countries, even in *March* in ſome places, and in others in *April* and *May*, but with us in *England* later, as in *June* and *July*, but do ſeldom perfect their Seed with us.

VIII. *The Qualities, Specification, Preparations, Virtues and Uſes*, are fully the ſame with the *Common Ground-Pine* in *Chap.* 330. *Sect.* 11. to *Sect.* 26. and therefore to the ſame we refer you.

IX. *Note*, 1. *The Seed of Heath Ground-Pine*, either bruiſed and drunk, or made into a Decoction in

in White Port Wine, powerfully provokes Urine, and the Terms in Women where they are ſtopped, and alſo cures the Strangury, if the Bladder is not exulcerated; it is alſo a Remedy for thoſe who are bitten with the *Phalangium*, and for thoſe troubled with the Gout and Sciatica, if bathed therewith: and taken with Pepper in ſubſtance, it repreſſes the ſhaking Fits of Agues: the ſame things do the Juice, Eſſence, or Decoction of the Herb.

X. *Note*, 2. *An Oil, Ointment, or Balſam, made of the Seed or Herb*, eaſe the Gout and Sciatica, anointing therewith; they alſo heal any old or running Sore or Ulcer, and dry up that ſuperfluous moiſture, which by an afflux upon the part, hinders the Cure.

CHAP. CCCXXXIII.

Of GROUNDSEL Common.

I. *THE Names.* It is called in *Greek* Ἐρίγηρον, *Erigeron, quia vere Seneſcit*, in *Latine Erigerum, Senetio, & Seneſcio, quia citò Seneſcit*; and in *Engliſh Groundſel*, and *Grunſel.*

II. *The Kinds.* There are two ſeveral ſorts of *Groundſel*, 1. The *Common Kind*, of which in this Chapter. 2. The *Cotton Groundſel*, of which in *Chap.* 334. following. Of the *Common Kind* there are alſo two ſorts, 1. *Seneſcio, vel Senetio vulgaris*, (called by ſome Authors *Senecio minor*, becauſe they call *Jacobea*, or *Ragwort*, *Senecio major*) and *Erigerum*, from the *Greek* Name, Common or Vulgar Groundſel. 2. *Senecio, vel Erigerum Montanum*, *Senetio Montanus*, *Senecio ſecundus Tabernamontani*, Mountain Groundſel.

III. The Deſcriptions, *The firſt, or* Common Groundſel, *has a Root which is ſmall and thready, and ſoon periſhes, from whence riſes a round, green, and ſomewhat browniſh Stalk, ſpreading it ſelf towards the top into ſome Branches, ſet with long, and ſomewhat narrow green Leaves, very much jagged, or cut in on the edges, ſomething like unto* Rocket, *or rather an Oaken Leaf, but leſſer, and round at the ends*; at the tops of the Stalks and Branches grow many ſmall green Heads, out of which grow ſmall yellow Threads or Thrums, which are the Flowers, which continue many days blown in that manner before they paſs away into Down, and with the Seed, (which is long) is carried away with the Wind; but from this Seed which is thus ſhed it ſoon riſes again, ſo that it may be ſeen many Months in the Year young and green, and in Flower, and in Seed, for it will ſpring up and Seed twice in a Year at leaſt, if it is ſuffered to grow in a Garden.

IV. *The ſecond, or* Mountain Groundſel, *has a Root like unto the former, and riſes up with a like round and green Stalk, which is branched in the ſame manner*; it is almoſt wholly like the other, but it grows not altogether ſo high, and its Leaves are greater, and more cut in on the edges.

V. *The Places.* The firſt is found every where almoſt, as well on the tops of Walls as on the Ground amongſt Rubbiſh, and in untilled Grounds, but more eſpecially in Gardens; the other grows upon Hills and Mountains, both in *England* and places beyond the Sea.

VI. *The Times.* The firſt is found to Flower almoſt in every Month of the Year, perfecting its Seed in the mean ſeaſon; the ſecond comes ſomewhat near unto the firſt, but its Flowers do not ſo ſuddenly decay.

VII. *The Qualities.* It is cold and moiſt in the firſt degree, is Digeſtive, Abſterſive, Diuretick, and Emetick.

VIII. *The Specification.* It is a peculiar Remedy againſt the Yellow Jaundice, ſtoppage of Urine, Diſeaſes of the Eyes, and the Falling-Sickneſs.

IX. *The Preparations.* You may make therefrom, 1. *A Liquid Juice.* 2. *An Eſſence.* 3. *A Decoction in Ale, Beer, Wine, or Water.* 4. *A Pouder of the Herb.* 5. *A Balſam or Qintment.* 6. *A Cataplaſm.* 7. *A Diſtilled Water.*

The Virtues.

X. *The Liquid Juice.* If it is drunk from one Ounce to two Ounces, mixed in any proper Vehicle, it cleanſes the Stomach from all corrupt and crude Humors by Vomiting, whereby it eaſes the Pains of the Stomach cauſed from the abounding of Choler; it is alſo good againſt the Jaundice and Falling-Sickneſs, in which two Caſes it ought to be ſeveral times repeated; it alſo takes away the heat, ſcalding, ſharpneſs, and ſtoppage of Urine, and the pain in making Water, expelling Sand, Gravel, Stones, and Tartarous Matter from the Reins and Bladder.

XI. *The Eſſence.* It has all the former Virtues, and is much more pleaſant to take; it prevails againſt the Colick, and Griping of the Guts, as alſo the Gout, Sciatica, and Rheumatiſm, it purges the Liver of its Recrements, and provokes the Terms in Women, giving it from two Spoonfuls to four in White Port Wine; it Vomits as the Juice does, and therefore muſt be given with the ſame caution.

XII. *The Decoction in Ale, Beer, Wine, or Water.* It has all the Virtues of the Juice and Eſſence, and works in the ſame manner, but not all out ſo ſtrongly, and therefore may be given from four to eight, or ten Ounces, according to Age and Strength.

XIII. *The Pouder of the Herb.* It may be given to a Dram or more in *Oxymel*, proportioning the Doſe

Dole according to Age and Strength of the Patient; it effectually cleanſes the Stomach, and prevails againſt Gout, Sciatica, Rheumatiſm, Jaundice, Dropſie, and Epilepſie; it is alſo ſaid to expel Sand and Gravel from the Urinary parts; it dries up alſo Humidities in Wounds and Ulcers.

XIV. *The Balſam or Ointment.* It may be made with the green Herb, or with the juice of the Leaves, adding ſome fine Frankincenſe, or Olibanum in Pouder; it cleanſes and heals Ulcers and old Sores, and cures Wounds, whether in the Fleſhy or Nervous parts, ſtrengthens the Joints, gives eaſe in the Gout, diſcuſſes hard Tumors, and prevails againſt the Hæmorrhoids or Piles in Man or Woman.

XV. *The Cataplaſm.* Made of the freſh Herb by boiling, *&c.* and applied to Womens Breaſts which are ſwoln with heat and pain, as alſo to the Privy Parts of Man or Woman, and to the Hæmorrhoids, or *Ficus* in *Ano*, tho' much ſwelled and inflamed, it gives preſent relief; if Salt is added to it it diſſolves Knots or Kernels in any part of the Body, yea tho' proceeding from the Kings-Evil.

XVI. *The Diſtilled Water.* It is ſaid to be effectual againſt all the aforenamed Diſeaſes, beſides which it is eſpecially good againſt Inflammations of the Eyes, and to help the watering of them, proceeding from a defluxion of Rheum, and weakneſs of the part.

XVII. *Note. Pliny* has a Relation for the Cure of the Toothach, which, tho' it ſeems Fabulous, we ſhall here relate. *You muſt dig up the Plant without any Iron Tool, and then touch the aking Tooth therewith five times, Spitting three times after every ſuch touch, which done, Plant or Set the Herb again in the ſame place, ſo that it may grow, and the Toothach ſhall preſently ceaſe and be perfectly cured.*

CHAP. CCCXXXIV.

Of GROUNDSEL Cotton.

I. *THE Names.* It is called in *Greek* Ἡιγεσων γναφαλιδες, in *Latine Erigeron Tomentoſum, Senecio Tomentoſus, Senecio Tragi*, and in *Engliſh Cotton Groundſel*, or *Woolly Groundſel*, alſo *Clammy Groundſel*, from the Leaves ſticking as it were unto ones Fingers.

II. *The Kinds.* There are three ſeveral Species of this Kind, *viz.* 1. *Sentio incanus, Erigerum Tomentoſum, Senecio Tragi*, Cotton Groundſel. 2. *Erigerum Tomentoſum alterum, Senecio fœtidus, Erigerum fœtidum Thalij, Senecio incanus pinguis Bauhini, Jacobæa Pannonica prima Cluſij*, Stinking Cotton Groundſel. 3. *Senetio odoratus, Senecio Flore elegata Camerarij*, Sweet ſmelling Cotton Groundſel.

III. The Deſcriptions. *The firſt, or* Common Cotton Groundſel, *has a Root which is ſmall, and full of fibres*; it has much larger Leaves, and more jagged or torn in on the edges than the former *Common ſort*, and of a greyiſh or Aſh Color, ſoft and hairy, or rather hoary all over; the Stalks are higher and greater, but with ſuch like yellow Flowers upon them, and as ſoon fading and turning into Down as the other: this differs chiefly from the former *Common ſort* in the hoarineſs and largeneſs, as well of the whole Plant as of the Leaves.

IV. *The ſecond, or* Stinking Cotton Groundſel, *has a Root which is very fibrous, yet laſteth not after Seed time, but periſhes as the* Common *does, and ſprings again of the ſhed or fallen Seed*: It has many fair, large and long Leaves lying next the Ground, very much jagged or torn in on the edges, whereby they conſiſt of many diviſions, ſomewhat like unto thoſe of *Mugwort*, for which reaſon ſome have called it *Arthemeſia fœtida*, but it is ſoft, and in handling very hairy, being alſo bedewed with a fatty clammineſs, ſo much that the Leaves will ſtick to the Fingers of thoſe that touch them, and one Leaf will alſo ſtick unto another, ſo as with ſome difficulty to be taken aſunder; it ſmells ſomewhat ſtrong, and of an ill ſcent, (tho' not unpleaſantly to ſome) as *Cluſius* ſays, but like *Scrophularia*, or *Ebulus*, as others ſay; from among which Leaves riſe up hairy creſted Stalks, half a Yard high, ſpread out into ſeveral Ramifications or Branches, but bearing at their tops fewer Flowers, leſſer, and of a paler yellow color than the *Common Groundſel*, and upon longer Footſtalks, which quickly fade, and turn into Down, as the others do.

V. *The third, or* Sweet ſmelling Cotton Groundſel, *has a fibrous periſhing Root, as the others have, from which riſe up Leaves and Stalks, like the others*; and indeed this *Groundſel* is ſomewhat like the laſt kind in the ſoft and woolly Leaves, but not ſo much jagged or torn on the edges as it; its ſmell is ſweet, ſomething like unto *Ambroſia*, or *Oak of Cappadocia*, or the *middle Coniza*, or *Fleabane*; the Flowers are like the reſt, and as ſoon growing old and Downy, as the others do.

VI. *The Places.* The firſt grows by Wood ſides, and borders of Fields, as alſo upon old Walls, in many

many places; the second grows also in woody, barren, and untilled places; the third was sent by *Josephus de Casabona*, Herbarist to the Great Duke of *Tuscany*, to *Camerarius* out of *Italy*.

VII. *The Times.* The first Flowers almost every Month, as the *Common Kind* does, the two last Flower in *May*, *June*, *July*, and *August*.

VIII. *The Qualities*, *Specification*, *Preparations and Virtues* of these are the same with those of the *Common Kind*, delivered in the former Chapter from Sect. 7. to Sect. 18. and therefore we shall say no more thereof in this place.

CHAP. CCCXXXV.

Of HARES-BELLS English, *OR*, English HYACINTH.

I. *THE Names.* It has no known *Greek* Name, but in *Latine* it is called *Hyacinthus Anglicus*, *Hyacinthus Belgicus*, and *Hyacinthus Hispanicus*, in *English Hares-Bells*, or *English Hyacinth*.

II. *The Kinds.* Of this Plant there are four Kinds, *viz.* 1. *Hyacinthus Anglicus Cæruleus*, *Hyacinthus non scriptus Dodonæi*, (because none wrote of it before him) Blew English Hares-Bell, and Blew English Hyacinth; but it is as well called *Belgicus*, and *Hispanicus*. 2. *Hyacinthus Anglicus Albus*, *Hyacinthus Belgicus Candidus*, White English or Dutch Hares-Bells, or White English or Dutch Hyacinth. 3. *Hyacinthus Anglicus*, *aut Belgicus Flore Incarnato*, Carnation English or Dutch Hares-Bells, or Hyacinth. 4. *Hyacinthus Hispanicus major*, *Flore Campanulæ instar*, The greater Spanish Hares-Bells, or Bell-Flowered Hyacinth.

Blew English Hare Bell.

III. *The Descriptions.* *The first, or* Blew English Hares-Bells. *The Roots of all these sorts agree, and are alike, being white, and very slimy, some of which will be great and round, others longer and slender, and those which lye near the top of the earth bare, will be of a green color.* From this Root rises up several long and narrow green Leaves, not standing upright, nor yet fully lying upon the Ground, among which springs up the Stalk, bearing at the top many long and hollow Flowers, hanging down their Heads, all forwards for the most part, and divided at the brims into six Leaves or Divisions, turning up their points a little again, of a sweetish but heady scent, somewhat like unto the Grassie Flower; the Heads for Seed are long and square, in which are contained much black Seed; the color of the Flowers are in some a deeper Blew, tending to a Purple, in others of a paler Blew, or of a bleak Blew, tending to an Ash Color; and some are Party Colored.

IV. *The second, or* White English Hares-Bells, *has Roots, Leaves, Stalks and Flowers very like the former*, saving, that the Leaves in this are somewhat broader, and the Flowers more open, and of a very white color, yet sometimes they are White and Blew mixt together.

V. *The third, or* Carnation English Hares-Bells. *These in their bulbous Roots, Leaves, Stalks, Flowers, and Seed, as also in their magnitude and form of growing, are very like to the first and second Kinds*, saving that the Flowers in this are of a fine *Carnation* Color for the most part, or of a fine delayed purplish Red, or bluish Color, which some call a Peach Color.

VI. *The fourth, or* Greater Spanish Hares-Bells. *It has a bulbous Root, from whence spring up several long and narrow green Leaves, which have not strength enough in themselves to stand upright, but a little incline or bend downwards.* This Plant is very like to the first aforegoing, but that it is greater in all its parts, as well of Leaves as Flowers, many growing together at the top of the Stalk, with many short green Leaves among them, hanging down their Heads, with larger, greater, and wider open Mouths, like unto Bells, of a dark Blew Color, and of no pleasing smell.

VII. *The Places.* The first *Parkinson* says is so common every where, that it scarcely needed any Description, and that it is more frequent in *England* than in the Low Countries, or in *Spain*; it grows in Woods, Copses, and in the borders of Fields, every where throughout *England*; the second and third are not so common, but they grow in the Woods by *Colchester*, in *Essex*, in the Fields and Woods by *Southfleet*, near unto *Gravesend*, in *Kent*, as also in a piece of Ground by *Canterbury* called the *Clapper*, also in the Fields by *Bath*, and in the Woods by *Warrington*, in *Lancashire*, and in other places.

VIII. *The Times.* They Flower from the beginning of *May* to the end of *June*, and the Seed ripens in the mean Season, and in some little time after.

IX. *As to their Qualities*, *Specification*, *Preparations and Virtues* Authors have said nothing, nor do we know any thing by Experience concerning the same, saving, that an Ointment being made of the Roots hereof, is of singular use to strengthen weak Joints.

X. *Note.* The Root of *Hares-Bells*, as it is generally bulbous, so it is full of a thick, slimy, Emplastick Juice, which is of so strong a body, that it will serve to set Feathers upon Arrows, instead of Glew, or to paste Books with; and hereof was formerly made the best Starch, next to that of *Aron*, or *Wake-Robin* Roots.

CHAP. CCCXXXVI.

Of HARES-EARS.

I. *THE Names.* This Plant is called in *Greek* Βûπλευρον, *Bupleurum Plinij*, ἰσοφυλλον *Cordi*, in *Latine Bupleurum*, *Auricula Leporis*, *Herba Vulneraria Tragi*, who takes it to be *Panax Chironium Theophrasti*, in *English Hares-Ears.* It is doubtless the *Bupleurum Hippocratis*, mentioned by *Pliny Lib.* 22. *Cap.* 22. and by *Nicander in Theriacis.* *Gesner* says that the *French* call it *Elaphoboscum*, and *Gratia Dei.* Some take it to be *Panax Chironium Dioscoridis*, but falsly. Some will have it to be *Ammi vulgatius*, others to be *Sanamunda.* *Cordus* in his History of Plants calls it *Isophyllon*, so that there is great difference of Opinions among Herbarists in judging to what Plant of the Ancients it ought to be assigned; however, as long as we know what Plant it is to which we give the present Names it is sufficient.

II. *The Kinds.* There are three Kinds hereof, *viz.* 1. *Bupleurum Angustifolium*, *Auricula Leporis Angustifolia*, Hares-Ears narrow Leav'd. 2. *Bupleurum Latifolium*, *Auricula Leporis*, *Herba Vulneraria*, *Isophyllum*, Hares-Ears broad Leav'd. 3. *Bupleurum Angustifolium Montanum*, *Sedum petreum Bupleuri Folio*, *vel potius Bupleurum petreum Gramineo Folio Penæ*, *Perfoliata Alpina Gramineo Folio*, *sive Bupleurum Angustifolium Alpinum*, *Bupleurum Angustissimo Folio Bauhini*, Narrow Leav'd Mountain Hares-Ears.

Hares Ears narrow leaved

III. The Descriptions. *The first*, *or* Common narrow Leav'd Hares-Ears, *has a Root which is somewhat long, but small, and white on the outside, much like to a* Parsly *Root*, *with divers Fibres adjoining, which with us in* England *perishes every Year.* This Plant rises up with a round, stiff, green Stalk, two Feet high, at the several Joints whereof grow several long and narrow, very dark, green, smooth, shining Leaves, broadest at the bottom, and narrower *gradatim* unto the ends, with divers Ribs running thro' them, the middlemost whereof is greatest, yet nothing so narrow as *Grass* Leaves, tho' some Authors do compare them with them; these Leaves stand one above another up to the top, growing smaller and smaller, being placed likewise at the Joints; from the middle of the Stalks, at the least, upwards (if it grows in any good Ground) come forth small Branches, (and sometimes with few or no Branches at all) at the tops whereof stand many small Tufts or Umbles of yellowish Flowers, which turn into small Seed, not much unlike to *Parsly* Seed, but of a darker color, and somewhat longer.

Hares Ears broad Leaved.

IV. *The second*, *or* Broad Leav'd Hares-Ears, *has a Root like the former*, *and grows in the same manner*, *with like Stalks*, *Branches*, *Flowers*, *and Seed*; but herein this chiefly differs from that, *viz.* that this bears broader but shorter Leaves, smallest at the foot, broadest in the middle, and ending in a small sharp point, somewhat hollow, and bowing downwards, with several long Nerves or Ribs therein, as in the former, and the middle Ribs most eminent, or raised highest.

V. *The third*, *or* Narrow Leav'd Mountain Hares-Ears, *has a round thick Root*, *about a Foot long*, *set with Knobs or Bunches instead of Branches*, *which has a thick Bark*, *of a dark red on the outside*, *and pale within*, *and divided at the head into many parts*; from these Knobs or Heads arise several long and narrow green Leaves, lying on the Ground, compassing one another at the bottom, like a Star, for the form of them like to the first *Hares-Ears*, but narrower; from divers of these Tufts of Leaves rise up dark round Stalks, about an Hand breadth high, bearing at the tops many pale yellow Flowers, made of seven pointed Leaves apiece, and in the middle of them several small Seeds set thick together, something like unto *Thorow-Wax*, or as the former *Hares-Ears*,

Lares-foot, which smell very strong, the whole Plant else tastes like an *Artichoke*.

VI. *The Places.* The two first *Lobel* says grew about *Montpelier* in *France*, and *Tragus* says in dry stony places in *Germany*, and are both of them found in several places of *England*; the third *Pena* says grows upon *Mount Baldus*, and has been found upon Mountainous places in *Florida*, near the *English* Plantations

VII. *The Times.* They all Flower late, *viz.* not until the end of *July*, and in *August*, and their Seed is ripe in *September*.

VIII. *The Qualities.* They are temperate in respect to the first Qualities, as to heat and cold, driness and moisture, are Absterfive, Vulnerary, Diuretick, Cardiack, Nephritick, Hysterick, and Alexipharmick.

IX. *The Specification.* They are peculiar for healing of Wounds in any part, whether inward or outward.

X. *The Preparations.* You may have therefrom, 1. *A Juice or Essence of the Leaves.* 2. *A Decoction in Wine.* 3. *A Pouder of the Root or Seed.* 4. *An Ointment or Balsam.* 5. *A Cataplasm.*

The Virtues.

XI. *The Juice or Essence.* Taken to three or four Spoonfuls, either alone, or mixt with Wine, it is good against the Bitings or Stinging of Serpents, or other Venomous Creatures, the place also outwardly bathed with the same; it also provokes Urine, and prevails against the Strangury, and is of good use to bring down Womens Courses when stopt, being taken Morning and Night in White Port Wine; taken also inwardly Dietetically it singularly contributes to the Curing of Wounds, old running Sores, and rebellious Ulcers.

XII. *The Decoction in Wine.* It has all the Virtues of the Juice or Essence, but not full out so powerful, yet it more excellently chears the Heart and revives the Spirits, and is prevalent against Fainting and Swooning Fits in Men or Women.

XIII. *The Pouder of the Seed.* Being given to one Dram in a Glass of White Port Wine, it resists the Poyson of Vipers, Rattle-Snakes, and other Venomous Beasts, is also Diuretick, cleanses the Reins and Bladder of Tartarous Matter, and prevails against the Strangury.

XIV. *The Ointment or Balsam.* It heals simple Wounds at once or twice dressing, and is good against all sorts of Sores, whether they be fresh and green, or old and malign, when rebellious and difficult to be Cured.

XV. *The Cataplasm.* Applied to the Biting of Serpents, Mad Dogs, and other Poysonous Animals, it attracts and draws forth the Venom.

CHAP. CCCXXXVII.

Of HARES-FOOT, *OR,* TREFOIL Spiked.

I. THE *Names.* It is called in *Greek* Λαγώπους, in *Latine Lagopus*, *Lagopodium*, *Trifolium Humile*, *Leporis Cuminum*, & *Pes Leporis*, *a Leporis Pilosa Pede*, from the hairy foot of an Hare, also *Lagophyon*, by *Hippocrates*, *quasi Triticum Leporinum*, because it grew among Corn, and in *English* it is called *Hares-foot*, *Spike Trefoil*, and *Corn Trefoil*.

II. *The Kinds.* Authors make six several Species of this Plant, but we shall take notice only of three, as being those chiefly which are to be found with us, or in some of our Plantations beyond the Seas. They are, 1. *Lagopus vulgaris*, *Lagopus minor*, *Lotus Campestris Tragi*, Our common Hares-Foot. 2. *Lagopus maximus flore rubro Lobelij & Clusij*, *Lagopus major folio Trifolij Lobelij & Dodonæi*, The greatest Hares-Foot. 3. *Lagopus major folio Pinnato*, *Lagopus altera folio Pinnato Lobelij*, *Trifolium majus tertium Clusij*, *Trifolium magnum Loniceri & Cordi*, *Cytisus Tragi & Columellæ*, *Trifolium Spicatum Thalij*, The longer headed Hares-Foot.

III. The Descriptions. *The first, or* Our Common Hares-Foot. *It has a small, long, stringy Root, which sends forth Stalks, with small, whitish, woolly,* Trefoil *Leaves set upon them, with short Footstalks*; the Heads at the tops are with their roundness somewhat long, and composed, as it were, all of a hairy or hoary Downiness, whose Flowers in some are of a White, in others of a Blush Color; it is an Annual Plant, as are the two following, but this is especially to be noted in this Stock of *Hares-Feet*, or *Spiked Trefoil*, that these perish Yearly, whereas most of the other sorts of *Trefoils* do not: This *Common Hares-Foot* is well known to be a small Plant, but it grows greater and higher in some places, and smaller and lower in others, according to the goodness of the Soil or Ground it is found in.

IV. *The second, or* Greatest Hares-Foot, *has an Annual, small, long, thready Root also, which sends forth several* Trefoil *Leaves, each standing on a long Footstalk, being almost round, and dented about the edges, very like to the* Meadow Trefoil, *as well in bigness as form, very soft, and of a pale green color*; from among these rise up weak bending Stalks, a Foot or more high, branched out, and bearing the like, but somewhat longer Leaves on them, and at their tops close Spiked Heads, with many small Flowers round about them, each in a five cornered Cup, of a delicate Crimson Color, in which Husks,

after the Flowers are paſt, grow ſmall yellowiſh round Seed, one only in a Husk, whoſe brims or corners then ſtand diſplayed, ſomething like unto a Star.

V. *The third*, *or* Longer headed Hares-Foot, *has a Root much like the former, its Leaves are hoary, large, and longer than the former, with ſeveral conſpicuous Veins in them, making them ſhew like Wings,* the middle Rib on the back of them being ſomewhat great alſo; the Flowers are like the ſecond above, both in form and color, but the whole Head is longer and larger.

VI. *The Places.* The firſt grows with us almoſt every where throughout *England* in dry Grounds; the two latter grow chiefly with us in Gardens, but are found growing wild in many places of *Italy*, *France*, and *Germany*.

VII. *The Times.* They Flouriſh and Flower in the Summer Months only, and their Seed is ripe in *Auguſt* and *September*.

VIII. *The Qualities.* They are temperate in reſpect to heat or cold, and dry in the firſt degree, Aſtringent, Vulnerary, and Stomachick.

IX. *The Specification.* They are peculiar againſt Fluxes of the Bowels, chiefly the Bloody Flux, and other Fluxes of Blood, as Spitting Blood.

X. *The Preparations.* You may have therefrom, 1. *An Eſſence.* 2. *A Decoction of the Herb in Wine.* 3. *A Pouder of the Heads and Seed.* 4. *Aſhes of the Heads.* 5. *An Ointment or Balſam.*

The Virtues.

XI. *The Eſſence of Leaves, Stalks, Spiked Heads.* It dries and binds admirably, and it is known by moſt certain Experience to ſtop a Looſeneſs, and other Fluxes of the Bowels, chiefly the Bloody Flux, being taken two, three, or four Spoonfuls at a time in a Glaſs of Red Port Wine; but if a Fever is preſent, it may be given in a Decoction of the Herb in Water; it is good againſt Cholerick Belchings of the Stomach, and griping pains of the Belly, and is profitable to be given to ſuch as have foul and hollow Ulcers, which are ſtubborn and of difficult Cure.

XII. *The Decoction in Wine.* It has all the former Virtues, but not full out ſo powerful; being mixt and taken with Juice or Eſſence of *Mallows*, or *Marſh Mallows*, it eaſes the pains of the Bladder and *Urethra*, and abates the ſcalding and heat of Urine; and this Decoction, as alſo the Eſſence, is ſaid to be admirably good againſt the Running of the Reins in Men or Women, and may be uſed as a Vulnerary Diet-Drink.

XIII. *The Pouder of the Heads and Seed.* Taken to one Dram Morning and Night in a Glaſs of Red Port Wine, or in a Decoction of the Plant in Wine or Water, (according as the Nature of the Diſtemper and Habit of the Patient may require) it helps Spitting or Piſſing Blood, prevails againſt the Bloody Flux, and is ſingular good in the Cure of a Gonorrhœa, (Univerſals being premiſed) it is an Abſterſive, and not only cleanſes foul and hollow Ulcers, but alſo incarnates, or fills them up with Fleſh, and Cicatrizes them.

XIV. *The Aſhes of the Heads, &c.* Being applied to the Hæmorrhoids or Piles, it ſtops their bleeding, eaſes their pain, and heals them.

XV. *The Ointment or Balſam.* It is Vulnerary, cleanſes, incarnates, dries, and heals old running Sores, and rebellious Ulcers, *&c.*

HARES--STONES, *See* GOATS--STONES, *Chap.* 321. aforegoing.

CHAP. CCCXXXVIII.

Of HARTICHOKE Garden, *OR,* ARTICHOKE.

I. *THE Names.* It is called in *Greek* Κυνάρα, alſo Κάρδος, in *Latine Cinara*, and *Cynara*, (from *Cinus*, as being of an Aſh Color) and in *Engliſh Artichoke*, and *Hartichoke*.

II. *The Kinds.* There are three principal Kinds, *viz.* 1. *Cinera Hortenſis*, Garden Hartichokes, of which in this Chapter. 2. *Cinara Sylveſtris*, *vel Spinoſa*, Wild Hartichokes, of which in the next Chapter. 3. *Helianthimum Canadenſe*, Jeruſalem Hartichokes, of which in Chap. 340. following.

III. *The Garden Kinds.* They are manifold, as 1. *Cinara Rubra*, The Common Great Red Hartichoke. 2. *Alba*, The White Hartichoke. 3. *Viridis*, The Green Hartichoke. 4. *Procera*, The Tall Hartichoke. 5. *Pumila*, The Dwarf or Low Hartichoke. 6. *Gallica*, The French Hartichoke. 7. *Moſchata*, The Musked Hartichoke. 8. *Spinoſa*, The

The Thiſtle like Hartichoke. 9. *Aculeata*, The Prickly Hartichoke, of all which in order.

An Hartichoke

IV. The Deſcriptions. *The firſt*, *or* Common Great Red Kind, *has a Root which ſpreads it ſelf in the Ground pretty largely, whereby it yields divers heads of Leaves, or rather Suckers, by which it is multiplied or increaſed*; from this Root ſpring up ſeveral great, large, and long hollowed Leaves, much cut in or torn on both edges, without any great ſhew of prickles on them, of a kind of whitiſh green, like unto an Aſh Color, from whence it took the *Latin* Name *Cinara*; the Stalk is thick, round, and ſtrong, with ſome Skins as it were down all the length of them, bearing at the top one ſcaly Head, made at firſt like a *Pine-Apple*, but after, growing greater, the ſaid Scales are more ſeparate, yet in the beſt Kinds lying cloſe, and not ſtaring, as ſome other Kinds do, which are either of a reddiſh brown, whitiſh, or greeniſh color, and in ſome broad at the ends, and in others ſharp or prickly; the Stalk, Leaves, and Skins which incloſe the Stalk, are extreamly bitter in taſte, beyond expreſſion; after the Head has ſtood a great while, if it is ſuffered, and the Summer proves hot and kindly, in ſome there will break forth at top a Tuft of blewiſh purple Thrums, or Threads, under which grow the Seed, wrapped in a great deal of Downy ſubſtance, but that Root which yields Flowers will hardly abide the next Winter, but elſe, being cut off when it is well grown, that Downy ſubſtance abides cloſe in the middle of the Head, having the bottom thereof flat and round, which is that matter or part which is uſually eaten.

V. *The ſecond*, *or* Great White Hartichoke, *is in all things like to the former* Red Kind, *but that the head thereof is of a whitiſh Aſh color, like the Leaves, whereas the former is reddiſh.* The head of this is more apt to dilate or ſpread it ſelf farther abroad, not being ſo cloſely compacted together, in which it alſo differs from the firſt Kind.

Hartichoke common.

VI. *The third*, *or* Green Kind. *It is not much unlike the two former* Kinds, *ſaving, that the head of this is green, and very ſharp upwards*, and is found very common in many places; nor does it differ much in goodneſs from the former Kinds, but it is not altogether ſo ſweet in taſte.

VII. *The fourth*, *or* Tall Kind. *It grows to a Mans height, and is branched into divers Stalks or Arms, every one bearing a head thereon, almoſt as large as thoſe of the firſt Kind.* This, though common formerly, is more rare to be met withal now.

VIII. *The fifth*, *or* Dwarf or Low Hartichoke. *This is a* French *Kind, and grows much about* Paris, *and which the* French *eſteem more than any other.* It is lower than the following *French* Kind, the head of which, as well as the Leaves, are of a lighter green Color, almoſt yellowiſh.

IX. *The ſixth*, *or* French Hartichoke. *It has a white head, the ſcales of which ſtand ſtaring far aſunder one from another at the ends, which are ſharp*: it is well known by this Quality, that whilſt it is hot, after it is boiled, it ſmells ſo ſtrong, that one would verily think that it had been boiled in ſtinking Water: this Kind was brought over to us in *England* after a great Froſt, which had almoſt deſtroyed our beſt Kinds, but we have now almoſt loſt them again, not being willing they ſhould take up the room or place of better.

X. *The ſeventh*, *or* Musked Hartichoke. *It is a Kind which grows much like the former* French, but it is much better in ſpending, though it has a leſſer bottom.

XI. *The eighth*, *or* Thiſtle like Hartichoke. *It is almoſt like the* Wild Kind *in its manner of growing*, but it grows ſmaller, and with a more open and prickly head than any of the former.

XII. *The ninth*, *or* Prickly Hartichoke, *which the* French *call* Chardon, *or* Cardon, *becauſe it is almoſt of the form and nature of a* Thiſtle, *or* Wild Hartichoke; it grows high, and full of ſharp prickles, of

a greyish color; *John Tradescant* said that he saw Three Acres of Land about *Brussels* Planted with this Kind, which the owner whited like *Endive*, and then sold them in Winter for Winter Salleting.

XIII. *The Places.* These all grow in Gardens, but the first two or three are the most common with us; we find by daily experience that our *English Red Hartichoke* is the most delicious of them all; they have been sent from us to *France*, *Holland*, *Italy*, and other Countries, where they have grown well for a Season, but they have not in these places retained their excellency and goodness for above Two Years, but have much degenerated, whereas with us they daily improve, so that it seems our Soil and Climate has the preheminence, and is the most natural to this Plant in exalting it to its highest perfection.

XIV. *The Times.* All these Kinds are increased by slipping the young Shoots from the Roots, which being replanted in *February*, *March*, or *April*, have many times the same Year, but the next at furthest, born very good Heads: The *Hartichoke* is to be Planted in a very fat and fruitful Soil, and they love Water, and a moist Ground; it is a great Error to cut away the side, or superfluous Leaves which grow by the sides, thinking thereby to increase the greatness of the Heads, when as in truth they deprive the Root of much Water by that means, which would nourish it, to the feeding and inlarging of the Heads; for if you mark the Trough or hollow Channel which is in every Leaf, it will appear very evidently, that those Furrows were designed, even from the extream point of the Leaf to the Ground, where it is fastned to the Root, for no other purpose, but to guide that Water which falls far off unto the Root, for that without such store of Water the whole Plant would wither, and the Heads pine away and come to nothing; they are Planted for the most part about *October*, or somewhat sooner, the Plant must be set, and nourished with good store of Ashes, for that kind of Manure is thought to be best for the Planting thereof, and every Year the Slips must be taken or slipt off from the Root, and are to be set in *April*, as aforesaid, which will be fruitful about *August* following, as *Columella*, *Palladius*, and others, as also daily experience teaches.

XV. *The Qualities.* They are, *viz.* the nails or bottoms of the Scales or Flakes, as also the bottoms, on which Down and Seed stand, hot and moist in the first degree, Diuretick, Analeptick, and Spermatogenetick.

XVI. *The Specification.* Being much eaten, they are said to be singular in stopping the involuntary course of the Seed in Man or Woman.

XVII. *The Preparations.* You may have therefrom, 1. *An Essence, or Blood of the Heads.* 2. *A Decoction of the Root in Wine, the Pith being first taken away.* 3. *A Pouder of the Seed.* 4. *The Sallet.*

The Virtues.

XVIII. *The Essence, Sanguis*, or *Blood.* It is made of the bottoms, as the Blood of *Parsneps*; it is Diuretick, nourishes much, and restores in Consumptions, tho' of the Lungs; and being taken from two to four Drams in Red Wine Morning, Noon, and Night, it stops the involuntary flux of Seed, commonly called *Gonorrhœa simplex*, yet it provokes Lust extreamly, for it strengthens the whole Body.

XIX. *The Decoction of the Root in Wine*, Being drank liberally, it takes away the rank smell of the Arm Holes, for it sends forth plenty of stinking Urine, whereby the rank and rammish savour of not only the Armpits, but of the whole Body is much amended.

XX. *The Pouder of the Seed.* It opens obstructions of the Urinary parts, provokes Urine, and cleanses those Vessels from Sand, Gravel, small Stones, and other Tartarous Matter, and much amends the evil smell of the Body, carrying off the fœtidness by Urine.

XXI. *The Sallet.* It is manifold, 1. Made of the Heads, by boiling them soft, after which they are eaten with melted Butter, Vinegar, Salt, and Pepper; this being much and often eaten nourishes very much, and restores in deep Consumptions; it also very much increases Seed, and stirs up Bodily Lust. 2. The Leaves of the heads and their bottoms pickled; eaten with Meat they are very pleasing and grateful to the Stomach. 3. The raw Sallet. It is made of the Ninth Kind, being whitened like *Endive*, and so used as a Winter Sallet, being eaten raw, with Pepper, Salt, Vinegar, and Oil, as you dress whitened *Endive*, *Sallary*, &c.

CHAP. CCCXXXIX.

Of HARTICHOKE Wild, *OR*, Wild ARTICHOKE.

I. *THE Names.* It is called in *Greek* Σκολύμος *Dioscoridis*, and is doubtless Κάκτος *Theophrasti*, in *Latine Cynara*, and *Cinara Sylvestris*, and *Scolymus*, in *English Wild Artichoke*, or *Hartichoke.*

Wild Artichoke.

II. *The Kinds.* There are two several Kinds, *viz.* 1. *Scolymus Dioscoridis*, *Cynara Sylvestris Lobelij*, (because it so nearly resembles the *Cinara aculeata*, *Scolymus*

Scolymus Sylveſtris, *Cynara Sylveſtris Latifolia Bauhini*, The Wild Hartichoke, or Artichoke Thiſtle. 2. *Cynara Sylveſtris Cretica Honorij Belli*, *Agrioanzinari* by the *Cretians*, *Agriocinara Cretica Penæ*, in his *Italian Baldus*, The Candy Wild Hartichoke. To which Authors add. 3. *Scolymus Theophraſti*, *Eryngium luteum*, *Carduus Chryſanthemus*, The Golden Thiſtle.

III. The Deſcriptions. *The firſt*, *or* Wild Hartichoke, *has a great Root*, *which ſpreads much*, *and ſends forth ſeveral thick*, *long*, *hard*, *but narrow Leaves*, *ending in long points*, *very conſiderably ſcolloped in on the edges*, *ſet with ſtrong great pricks*, *and very ſharp*, *which growing on the Stalks encompaſs them at the bottom*, *and are of a dark green color*; at the tops of each Stalk and Branch grows one ſcaly and prickly Head, leſſer than thoſe of the Ninth Kind in the former Chapter, which are kept to be eaten, from the middle of which put forth ſeveral bright, purpliſh, Crimſon Threads, which compoſe the Flower, which, after they have ſtood ſome time, paſs away, the Seed in their Heads being flat, and like other *Thiſtles*.

IV. *The ſecond*, *or* Candy Wild Hartichoke. *It has a very long Root*, *which grows deep*, *which ſends up long and hoary white Leaves*, *ſomething broader than the former*, *very much indented or cut in on the edges*, *and thick armed with long and ſharp prickles*; from among which Leaves riſe up ſeveral round Stalks, ſet with but few Leaves, and branched ſometimes into two or three parts, bearing at their tops ſmall, ſcaly, ſharp, prickly Heads, which are eaten by the Peaſants of the Country both green and boiled, with Pepper, Salt, Vinegar, and Oil, and are as pleaſant to them as the beſt *Hartichoke* is to us.

V. *The third*, *or* Golden Thiſtle, *has a Root which is long*, *of the bigneſs of a Finger*, *very ſweet and pleaſant to eat*, *like unto* Eryngium, *or* Sea-Holly, *which ſends forth ſeveral skinny and prickly Stalks*, *which in ſome Countries*, *as in* Spain, Italy, &c. *ſtand upright*, *but in other Countries*, *as in* France *and* England, *bends with them unto the Ground*, bearing at every Joint both a Branch and a Leaf, which is long, and ſomewhat narrow, ſmaller at bottom than any where elſe, much cut in on the edges, and ſet with ſmall white prickles, in ſome places marked with white ſpots on the deep green Leaves, but in other places none at all; at the Joints, between the Leaves and the Stalks, and at the tops alſo, come forth ſeveral ſmall Heads, ſmaller than any of the former, compoſed of ſmall Scales, with very ſharp prickles at the ends, out of the middle of which come forth many Gold yellow Threads, which abide not long, and are the Flower, in which, when they are paſt, is contained the Seed, being ſmall and thin Scales lying cloſe together.

VI. *The Places*. The firſt grows in *France*, *Germany*, and *Italy*, the ſecond is natural to *Candy*, the third is a native of *Spain* and *Italy*, but they all grow with us here in *England* in Gardens.

VII. *The Times*. They all Flower in *July* and *Auguſt*, or in the end of Summer, and their Seed ripens in *September*, or quickly after.

VIII. *The Qualities*. They are temperate in reſpect to heat or cold, dryneſs or moiſture, are Aperitive, Abſterſive, and Diuretick.

IX. *The Specification*. The *Wild Hartichoke* is found to be of ſingular uſe to take away the ſtinking or rank ſmell of the Armpits.

X. *The Preparations*. You may have therefrom, 1. *A Juice or Eſſence*. 2. *A Decoction in Wine*. 3. *A Milky Juice*. 4. *The Flowers*. 5. *A Sallet*.

The Virtues.

XI. *The Juice or Eſſence*. It opens the obſtructions of the Reins, Ureters, and Bladder, and is very Diuretick, thereby expelling much ſtrong and ſtinking Urine, and by that means amends the ſtrong, rank, or ſtinking ſmell of the Armpits, and of the whole Body. Doſe three or four Spoonfuls Morning, Noon, and Night, in a Glaſs of Generous Wine, or other fit Vehicle.

XII. *The Decoction in Wine*. It has the ſame Virtues, but not altogether ſo powerful; if it is made in Red Port Wine, it is a ſingular good thing to prevent Abortion, and ſo to ſtrengthen the Womb, as to cauſe a Woman to go out her time.

XIII. *The Milky Juice*. *Cluſius* ſays, that with this the People in ſome parts of *Spain* do coagulate or curdle their Milk, in order to the making of Cheeſe, but this is to be underſtood chiefly of the Juice of the third Kind.

XIV. *The Flowers of the firſt Kind*. They are uſed by the *Italians*, as *Pena* and *Lobel* ſay, to curdle Milk, of which they make Cheeſe; and that the ſaid Flowers, being given to Women with Child, in their Broth, or Drink, do hinder Abortion, and cauſe them to go out well their whole time; they are alſo very good for ſuch Women as are barren, and to cauſe Fruitfulneſs.

XV. *The Sallet*. The young Shoots of the firſt are eaten like *Aſparagus*, as alſo the young Heads, (in *Spain*) before they Flower, but they uſe to raiſe the Earth over the young Shoots till they are riſen a good height, which are then white, and very tender and delicate to be eaten raw with Peppet, Salt, Vinegar, and Oil, or elſe boiled, as you eat *Aſparagus*. *Theophraſtus* ſays, that his *Scolymus*, *viz.* the *Golden Thiſtle*, is very pleaſant eaten raw, or boiled, but chiefly when in Flower, and that the inner ſubſtance of the Heads is eaten; and with the Flowers they counterfeit *Saffron*, as we do with the *Baſtard Saffron*, or *Safflower*.

CHAP. CCCXL.

Of HARTICHOKE Jeruſalem, *OR*, Canada POTATO.

I. *THE Names*. It was unknown to the *Greeks*, but has variety of Names given to it by the *Latine* Writers: *Pelleterius* calls it *Heliotropium Indicum Tuberoſum*, *Columna* in the ſecond Part of his *Phytobaſanos* calls it *Flos Solis Farneſianus*, (becauſe growing in the Cardinal's Garden) alſo *Aſter Peruanus Tuberoſus*; *Bauhinus* in his *Prodromus* calls it *Chryſanthemum Latifolium Braſilianum*, but in his *Pinax*, *Helianthemum Indicum Tuberoſum*; but our *Parkinſon* in his *Paradice*, as alſo in his *Theater of Plants*, calls it *Battatas de Canada*, which he Engliſhes, *Potato's of Canada*; but our uſual *Engliſh* Name is *Jeruſalem Hartichoke*. *Bauhinus* alſo in his *Pinax* calls it *Ariſtochi ſub Terra*.

II. *The Kinds*. It is a ſingular Plant of the Kind, but how it ſhould be accounted among the Species of *Hartichoke* is difficult to conceive, becauſe it has no reſemblance to any of theſe Plants in any of its parts, but the vulgar ſeldom give Names to Plants according to Judgment, and therefore it is not to be wonder'd

wonderd at; all that can be ſaid for the Name is, that when it is boiled and dreſt, it has a little likeneſs in taſte to the bottom of an *Hartichoke*; but why it ſhould be called *Jeruſalem*, is more to be admired at, for that it came not out of *Aſia*, or *Europe*, but from *America* to us, with whom it grows as well and as naturally and plentifully as ever it grew in its Original Native Clime.

III. The Deſcription. *This admirable Plant has at firſt but one ſmall Tuberous Root, which ſends up ſometimes one or more ſtiff round Stalks, which grow in our Country to be eight or ten Feet high*, but ſcarcely blow or ſhew their Flowers, whereas the Head of Flowers in their Native Countries, (as *Columna* ſays) being of a Pyramis or Sugar-Loaf faſhion, ſpreading broad below, and growing ſmaller upwards, almoſt to a point, is nearly of the ſame length, on which are ſet large and broad, rough, green Leaves, very like unto the Leaves of the *Sun-Flower*, but ſmaller, and growing in the very ſame manner round about the Stalks; at the very latter end of Summer, or beginning of Autumn, if the Root is well planted and defended, it will give a ſhew of a few ſmall yellow Flowers at the tops, like to the Flowers of *After*, or *Starwort*, and much ſmaller than any *Sun-Flower*, which come to no perfection with us; the Root, while the Plant is growing above Ground, increaſes not to its full growth, but when the Summer is well ſpent, and the ſpringing of the Stalks is paſt, which is about the end of *Auguſt*, or in *September*, then the Root is perceived to be increaſed in the Earth, and will (before Autumn is ſpent) in *October*, ſwell like a Mountain or Hillock round about the feet of the Stalks, and will not have its Roots fit to be taken up, until the Stalks be half withered at ſooneſt, but after they are withered, and ſo all the Winter long, until the Spring again, they are good and fit to be taken up and uſed, which are a number of almoſt roundiſh Tuberous Roots, growing cloſe together, ſo that it has been obſerved, that from one Root, being ſet in the Spring, there has been forty or more taken up again, and to have done more than to have filled a Peck Meaſure, which Roots are of a pleaſant good taſte, much like to the bottoms of the Heads of the *Common Red Hartichokes*.

IV. *Another Deſcription from* Gerard. *Flos Solis Pyramidalis parvo Flore, Radice Tuberoſa.* This wonderful Plant has growing up from one Root one, ſometimes two, three, or more round, green, rough, hairy, ſtraked Stalks, commonly about twelve Feet high, ſometimes ſixteen Feet, or higher, as big as a Childs Arm, full of a white ſpongy Pith within; the Leaves grow all along the Stalks, out of order, of a light green color, rough, ſharp pointed, about eight Inches broad, and ten or eleven Inches long, deeply notched or indented about the edges, very like the Leaves of *Flos Solis Peruanus*, but nothing crumpled, nor ſo broad as they; the Stalks divide themſelves into many long Branches, even from the Roots to their very tops, bearing ſmaller Leaves and ſmaller towards the tops of the Plant, making the Plant appear like a little Tree, narrower and ſlenderer towards the top, in faſhion of a Steeple or Pyramid; the Flowers with us grow only at the tops of the Stalks and Branches, like thoſe of the ſaid *Flos Solis*, but no bigger than *Our Common ſingle Marigold*, conſiſting of twelve or thirteen ſtraked, ſharp pointed, bright, yellow, bordering Leaves, growing forth of a ſcaly, ſmall, hairy Head, with a ſmall yellow thrummy ſubſtance within; theſe Flowers, by reaſon of their late Flowering, which is commonly two or three Weeks after *Michaelmas*, never with us bring their Seed to perfection, and it makes a ſhew of abundance of ſmall Heads near the tops of the Stalks and Branches, forth of the boſoms of the Leaves, which never open and Flower in our Clime, by reaſon they are prevented with the Froſts, which otherwiſe might poſſibly be a noble Sight; the Stalks ſend forth many ſmall creeping Roots, by which the nouriſhment is received, which are full of hairy Threads, even from the upper part of the Earth, ſpreading far abroad, among which, from the main Root, grow forth many Tuberous Roots, cluſtering together, ſometimes faſtned to the great Root it ſelf, ſometimes growing on long Strings, a Foot or more from the main Root, raiſing or heaving up the Earth above them, and ſometimes appearing above the Earth, producing from the increaſe of one Root thirty, fourty, or fifty in number, or more, making in all commonly about a Peck, and many times near half a Buſhel, if the Soil or Earth be good; theſe Tuberous Roots are of a dirty reddiſh color without, and of a ſoft white ſubſtance within, bunching out many ways, ſometimes as large as a Mans Fiſt, or not ſo big, with white protuberances, whence they will ſprout out or grow up again the next Year; the Stalks are bowed down, and ſometimes ſome part of them covered over with Earth, and ſend forth ſmall creeping thready Roots, and alſo Tuberous Roots, like the former, as by experience has been found; theſe Tuberous Roots will abide and live in the Earth all Winter, tho' the Stalks and Roots by which they were nouriſhed do abſolutely rot and periſh away, and will begin to ſpring up again at the beginning of *May* following, ſeldom ſooner.

V. *The Places.* It is a native of *Brazil*, *Canada*, and *Peru*, and ſeveral other parts of *America*, and now it grows as plentifully with us in *England* as in any of the places where it grew naturally; Mr. *Goodyer* ſays that he received two ſmall Roots of this Plant from one *Franquevill* of *London*, no bigger than Hens Egs, the one he gave to a Friend, and the other he Planted, and it brought him forth a Peck of Roots, wherewith he ſtored *Hampſhire*; and now it grows in great plenty in many other parts of this Kingdom.

VI. *The Times.* It Flowers generally in *October*, but Seeds not with us, and its Roots are in perfection all the Winter Months.

VII. *The Qualities, Specification, Preparation, Virtues and Uſes*, are the ſame with thoſe of *Hartichokes* in Chap. 338. aforegoing, ſave, that whereas in theſe the Heads of the *Hartichoke* were only uſed and eaten, in theſe the Tuberous Roots only are taken.

VIII. *Note.* They are boiled in Water till they are tender, after which they are peeled, ſliced, and Stewed with Butter, Salt, Pepper, and a little Red Port Wine, by which means they become an Excellent Diſh, and more pleaſant than the bottom of an *Hartichoke*; being now very plentiful and cheap, they may become good Food for Poor People, and keep Thouſands from Starving, which might otherwiſe periſh.

HARTSHORN, *See* BUCKSHORN, *Chap.* 91. aforegoing.

CHAP.

CHAP. CCCXLI.

Of HARTS-TONGUE True, *OR,* DEERS-TONGUE.

I. *THE Names.* It is called in *Greek* φυλλίτις, *Phyllitis quaſi foliosa*, in *Latine* alſo *Phyllitis*, and *Lingua Cervina*, in *Engliſh Deers-Tongue*, and *Harts-Tongue*, I ſuppoſe from the form of the Leaf.

II. *The Kinds.* It is either, 1. *Phyllitis vera*, of which in this Chapter, or 2. *Phyllitis Notha*, *Baſtard Harts-Tongue*, of which in the next. The *Phyllitis vera*, or *True Harts-Tongue*, is alſo threefold, *viz.* 1. *Phyllitis, ſive Lingua Cervina vulgaris*, Our Common or Ordinary Harts-Tongue. 2. *Phyllitis laciniata* Jagged Harts-Tongue, or Finger Harts-Tongue. 3. *Phyllitis ramoſa Alpini*, Branched Harts-Tongue of *Alpinus*, which he has notified in *Libro de Exoticis.*

III. The Deſcriptions. *The firſt*, or Common True Harts-Tongue. *It has a Root which is a bunch of many black Fibres or Threads, folded or interlaced together, which ſends up ſeveral Leaves, every one of them riſing up ſingly from the ſame Root, which, as other* Ferns, *fold themſelves in their firſt ſpringing and ſpreading*; theſe Leaves when they are full grown are about a Foot long, ſmooth and green above, but hard, or with little Sap in them, and ſtraked on the back athwart on both ſides of the middle Rib with ſmall and ſomewhat browniſh marks; the bottoms of the Leaves are a little bowed on each ſide of the middle Rib, ſomewhat narrow with the length, and ſomething ſmall at the end. Some do make two ſorts hereof, and diſtinguiſh them by the Epithets of *Latifolia* and *Anguſtifolia.*

Finger Harts tongue

IV. *The ſecond*, or Jagged Harts-Tongue, *differs nothing from the former neither in Root, Leaf, nor manner of growing, but only in the deciſion of the tops of the Leaves, which in this are diverſly, torn or jagged*, ſome Leaves much and ſome little, according to the place of growing and time of abiding: Now it is to be obſerved, that neither of theſe Plants have either Stalk, Flower, or Seed.

V. *The third*, or Branched Harts-Tongue. *It has a Root which is ſomething woody, with black Fibres thereat, ſhooting forth many ſlender broad Stalks with Leaves, of two or three Feet long*, a little Downy at bottom, divided into many long and narrow Leaves dented about the edges, and ſet one againſt another with an odd one at the end, each reſembling the Head of a Javelin, marked thick with ſtraight Lines on both ſides unto the middle Rib; the whole Plant is without ſmell, but of an auſtere taſte, containing ſome heat, which is not preſently felt, but continues long.

VI. *The Places.* The firſt, or *Common Harts-Tongue*, grows by the way ſides in great plenty as you go from *London* to *Exeter*, in ſhadowy places, and in moiſt ſtony Vallies and Wells, and is much planted in Gardens; the ſecond grew in the Garden formerly one *Darwich's*, a Chirurgian, living at *Much Dunmow* in *Eſſex*; the third is purely a ſtranger with us.

VII. *The Times.* They are green all the Year long, but leſs green in Winter, and in Spring and Summer they ſometimes bring forth new Leaves.

VIII. *The Qualities.* They are drying and binding in the firſt degree, Aperitive, Aſtringent, Hepatick, Splenetick, and Alexipharmick.

IX. *The Specification.* They eaſe the Spleen, ſtop Fluxes of the Bowels, and Bloody Fluxes, and wonderfully ſtrengthen the *Viſcera.*

The Virtues.

X. *The Préparations.* You may have therefrom, 1. *A Decoction in Wine or Water.* 2. *An Acid Tincture.* 3. *A Spirituous Tincture.* 4. *A Diſtilled Water.*

XI. *The Decoction in Wine or Water.* It opens obſtructions of Liver and Spleen, taking away alſo the pain and hardneſs of the Spleen, and it is a ſingular good thing againſt the Rickets in Children, and the Cachexia in Virgins and Young Women; it ſtops all ſorts of Fluxes of the Belly, more eſpecially the Bloody Flux, ſtrengthens the Stomach, and reſtores the Tone of the Bowels, being depraved or hurt; made in Water it abates the heat of the Liver and Stomach, and is good againſt the falling of the Pallate. Doſe four or ſix Ounces.

XII. *The Acid Tincture.* It more powerfully opens obſtructions of Stomach, Liver and Spleen than the former, and therefore is a ſingular thing to cure the Cachexia and Green-Sickneſs in Virgins; and being continued to be given to Children troubled with the Rickets, it perfectly cures them; give it to them in all that they drink, ſo many drops at a time as may make their Drink be gratefully pleaſant; it opens the obſtructions of the Lungs and Stomach in little Ones, and makes them breath freely; it is good againſt the bleeding of the Gums, and a ſingular thing againſt the Bitings of Serpents, or other Venomous Beaſts.

XIII. *The Spirituous Tincture.* It ſtrengthens the Stomach, Liver, and Spleen, and more powerfully ſtops Fluxes of the Belly, and in eſpecial Bloody Fluxes, than the Decoction in Wine, or any other Preparation of the Herb; it is good to reſiſt the force of Poyſon, and reſtores the Tone of the Bowels being hurt, ſtrengthening them to admiration. Doſe from one Dram to three Drams, in any

proper Vehicle, Morning, Noon, and Night, for ſome time.

XIV. *The Diſtilled Water.* Taken with ſome of the Spirituous Tincture it is good againſt Faintings, Swoonings, and other Paſſions of the Heart; and ſo mixed it ſtops the bleeding of the Gums, and faſtens the Teeth if looſe.

CHAP. CCCXLII.

Of HARTS-TONGUE Baſtard, *OR,* MULES-FERN.

I. *THE Names.* It is called in *Greek* Ἡμιονῖτις, ἢ Σπλήνιον, in *Latine Hemionitis*, and *Splenium*, the former *quaſi Mularia*, the latter *Splenium, ex Splen, á Splenis figura*; in *Engliſh* it is called *Baſtard Harts-Tongue*, *Mules-Fern*, and *Moon-Fern*.

II. *The Kinds.* It is threefold, *viz.* 1. *Hemionitis major*, *Hemionitis vulgaris Bauhini*, *Hemionitis vera Cluſij*, The Common, True, or Greater Baſtard Harts-Tongue. 2. *Hemionitis minor Penæ, ſeu altera*, *Hemionitis ſterilis Lobelij*, The leſſer, or barren Harts-Tongue. 3. *Hemionitis peregrina Cluſij*, *Lobelij*, *Dodonæi*, Strange Baſtard Harts-Tongue.

Baſtard Haristongue

III. The Deſcriptions. *The firſt, or* Common Baſtard Harts-Tongue, *in its Roots, Leaves, and manner of growing, does very much reſemble the former firſt, or* True Harts-Tongue, *both in form and color*, but that the Leaf is ſomewhat broader or larger, and that the Leaves, being broadeſt below, have a large hollow bowing, like unto an Half Moon, on each ſide of the middle Rib, and the ſtrakes on the backs of them are more ſloping.

IV. *The ſecond*, leſſer, *or* Barren Baſtard Harts-Tongue, *has a ſmall thready Root like the former, quickly withering*; its Leaves exceed not the breadth of three Fingers, not hard, nor rough, but ſmooth and gentle, and without any marks on the back ſides of them, yet with a hollow roundneſs at the bottom of them, as in the former, and beſides ſomewhat unevenly dented about the edges: *Cluſius* ſays, that *Lobel* having ſent him ſome Plants of this Species, after that he had kept them in a Pot, becauſe of their tenderneſs, in two Years time they changed their form into the *Jagged Hartſhorn*, at which he much wonder'd, for afterwards, (as he ſays) when he came into *England*, he gathered with his own Hands in the ſame place the like Plants, which there held the form of *Hemionitis*, or *Baſtard Harts-Tongue*.

V. *The third, or* Strange Baſtard Harts-Tongue, *differs in nothing from the firſt of theſe three kinds, but in the bottoms of the Leaves*, which have a ſmall Ear, or piece of Leaf, ſet on each ſide of the arched or hollowed bottoms.

VI. *The Places.* Theſe all grow upon ſhadowy Rocks, and moiſt hollow places, where little heat of the Sun comes, and are green all the Year, as is the *True Harts-Tongue* in the former Chapter: The ſecond of theſe *Lobel* ſays he found on St. *Vincent*'s Rock, not far from *Briſtol*, in a hollow Cave or Hole.

VII. *The Times.* They are in their perfection in the advance of the Spring, but keep their greenneſs all the Year long.

VIII. *Their Qualities, Specification, Preparations and Virtues*, are the ſame with the *True Harts-Tongue* in the former Chapter; they are ſpecially good againſt Diſeaſes of the Spleen, and may be uſed inſtead of the true *Lingua Cervina* to all Intentions and Purpoſes.

CHAP. CCCXLIII.

Of HARTWORT.

I. *THE Names.* It is called in *Greek* Σέσελι, in *Latine Seſeli*, and of ſome *Sile*, and in *Engliſh Hartwort*.

II. *The Kinds.* Authors make many Kinds hereof, but the following fourteen are chief, *viz.* 1. *Seſeli verum, quod Dioſcoridis cenſetur*, *Seſeli Maſſilienſe Folio Fæniculo Lobelij & Cluſij*, The True Seſeli or Hartwort of Dioſcorides. 2. *Seſeli Creticum*, *Seſeli Maſſilienſe Lobelij Ferulæ aut Dauci Cretici facie*, *Seſeli Maſſilienſe Matthioli*, *Seſeli Maſſilienſe nonnullorum Camerarij*, Candy Hartwort, or another Hartwort of Marſelles. 3. *Seſeli Maſſilienſe Pratenſe*, *Seſeli Pratenſe Monſpelienſium*, *Hippomarathrum Tabernamontani*, Meadow Hartwort of Marſelles or Mompelier. This *Geſner in Horto* thinks to be *Liguſticum Matthioli*. *Dodonæus* calls it *Siler alterum Pratenſe*, and *Bauhinus* thinks it to be *Silaus Plinij*, in *Lib.* 26. *Cap.* 8. and ſays it is *Paſtinaca nigra Cordi*, but that of *Cordus* has divided Leaves, like *Wild Carrots*, and has yellow Flowers, whereas this is more like *Fennel*, and has white Flowers. 4. *Seſeli Peloponeſiacum recentiorum*, *Seſeli Peloponeſe verum*, *Seſeli Peloponeſe Folio Cicutæ Dioſcoridis*, as *Lobel* ſays, The Common or True Hartwort of Peloponeſus of Dioſcoridis. 5. *Seſeli Pratenſe tenuifolium Bauhini*, *ſive Daucoides Pratenſis tenuifolius*, which is the true *Paſtinaca nigra Cordi*, Narrow

row Leav'd Meadow Hartwort of Germany. 6. *Seseli Paluſtre Lacteſcens Camerarij & Baubini*, Milky Marſh Hartwort. 7. *Seseli Creticum majus Lobelij & Lugdunenſis, & Camerarij, Tordylion Lobelij, Pimpinellæ Romanæ alterum genus Sylveſtre Cæſalpini*, The Greater Candy Hartwort. 8. *Seseli Creticum minus, Ordilion Nicandri, Tordylion Dioſcoridis*, as *Angularia* ſays, *Tordylion* and *Gordilion Dodonæi, Geſneri, & aliorum, Caucalis Cretica, & Græcorum Belli, Pimpinella Romana, Caſcalitra Bellonij*, The ſmall Candy Hartwort. 9. *Seseli Creticum majus luteum, Tordylion majus alterum luteum Columnæ*, Great yellow Hartwort of Candy. 10. *Seseli Apulum Creticum minimum, Tordylium minimum Apulum alterum Columnæ*, The ſmalleſt Candy Hartwort. 11. *Seseli Montanum Folio Cicutæ glabrum, Seseli primum Montanum Cluſij*, Mountain Hartwort with ſmooth Hemlock like Leaves. This *Baubinus* thought to be *Leviſticum alterum Lobelij & Lugdunenſis*, and *Liguſticum ſecundum Herbariorum Tabernamontani*, alſo the *Seseli Peloponetiacum Dioſcoridis*. 12. *Seseli Montanum Folio Cicutæ ſub hirſutum*, Hairy Mountain Hemlock Leav'd Hartwort. 13. *Seseli Æthiopicum frutex, Seseli Æthiopicum verum Dioſcoridis*, as *Lobel* ſays, Shrub Ethiopian Hartwort. 14. *Seseli cretenſe nodoſum*, Great jointed Hartwort of Candy.

The true Hartwort.

III. The Deſcriptions. *The firſt, or* True Hartwort of Dioſcorides, *has a very white, long, ſlender Root, like unto* Fennel, *but ſmelling better, and taſting hotter and ſharper, having a few Fibres adjoining thereto*; from whence riſe one or more Stalks, having but few Leaves, thinly ſet thereon, which are thicker and ſhorter and harder than *Fennel* Leaves, turning downwards, of a greyiſh Aſh color, as all the reſt of the Plant is, more eſpecially in the hotter Countries, for in ſome places they are thicker, or longer, or ſhorter than they are in others, as *Baubinus* has obſerved. the middle Stalk ſeldom riſes up above a Foot high, bowing to and fro ſometimes, having many Branches from its bottom, with the like Leaves on them, and each bearing Umbles of white Flowers, but ſometimes purpliſh, though ſeldom; after the Flowers are gone, ſmall long Seed follows, more like to *Aniſeed* than *Fennel* Seed, pretty pleaſing in taſte, yet ſharp and hot.

IV. *The ſecond, or* Candy Hartwort, *being another* Hartwort of Marſelles. *It has a thick, long, and white Root, with ſeveral Strings and Fibres adjoining thereto*, from whence riſe up ſeveral Stalks, the middlemoſt of which is about a Yard or more high, of a Fingers thickneſs, creſted, jointed, and ſpread forth into ſeveral Branches, and other ſmaller parts; the Leaves are *Fennel* like, but thicker, and ſhorter divided, green, and hard, with white points; its winged Stalks or Branches are large, and more ſpread out than *Fennel*; at the top of each Stalk and Branch is an Umble of white Flowers, which turn into flat Seed, not much unlike to *Angelica* Seed, but larger than *Dill* Seed, hot, and very Aromatical.

Hartwort of Candia

Maſſilien Hartwort.

V. *The third, or* Meadow Hartwort, *has a Root which is black without and white within, divided into ſeveral Branches, with Fibres adjoining to them*; from this Root riſe ſeveral Stalks of Leaves, as alſo one main Stalk, two or three Feet high, with ſeveral large ſpread Stalks of winged Leaves, very finely cut into many parts, each being like unto *Fennel*, but larger, harder, and of a dark green color, ſet at the Joints, and branching forth towards the tops, bearing Umbles of white Flowers, which being paſt, ſmall, long, and ſomewhat flat Seed comes in their place, which is larger and blacker than *Fennel* Seed, and near unto *Meum*, or *Spignel*, of little ſmell, and a ſmall ſharp taſte.

VI. *The fourth, or* Common or True Hartwort of Peloponeſus of Dioſcorides. This *Græcian Hartwort* has a great Root, blackiſh on the outſide, and white within, growing deep into the Ground, like *Ferula*, or *Thapſia*, ſomething ſweet in ſmell, and hot in taſte; the Stalk grows to be about two Feet high, or more, as thick as ones Finger, with ſeveral large ſpread Leaves at the bottom, as great as *Hemlock*, but crumpled, rough, and hairy; the Stalk and Branches bear large Tufts or Umbles of yellow Flowers, which being paſt away yield broad, flat, winged Seed, of a pale yellow color, ſomewhat like unto *Angelica*, but greater, and nothing ſo thick, of a very ſweet ſmell, as ſweet as the *Seſeli Æthiopicum*; this, ſays *Lobel*, the moſt Learned and Judicious Herbariſts of *Mompelier* acknowledge to be the true *Seſeli Peloponeſe Dioſcoridis*, though formerly they took it to be a kind of *Thapſia*, but the true *Thapſia* is much differing from it both in form and color, as thoſe who pleaſe to obſerve may find.

VII. *The fifth, or* Narrow Leav'd Meadow Hartwort of Germany, *has a Root as thick as ones Finger, and very long, black without, and white within, of a ſharp and ſomewhat bitter taſte*; from this Root ſprings up a round, creſted, or ſtraked Stalk, three Feet or more high, with ſeveral Joints and Leaves at them, very like for their form and diviſions unto *Wild Carrot* Leaves, but ſmooth, and not rough, and of a deep green color, ſpreading it ſelf forth into ſeveral Branches, bearing at their tops Umbles of whitiſh yellow Flowers, after which follow ſmall long Seed, ſomewhat like to thoſe of *Fennel* or *Caraway*, or between them both, and a little Aromatical in taſte.

VIII. *The ſixth, or* Milky Marſh Hartwort. *It has a long Root, which is brown on the outſide, white within, and of an unpleaſant taſte, joined with much heat, by which it inflames the Throat*; but being Planted in a Garden it looſes much of that evil taſte and burning quality, becoming much more mild; this Root ſends up a Stem or Stalk four or five Feet high, with Joints, and long Stalks, or Branches of well ſpread Leaves ſet at them, the diviſions of which are ſmall, and much cut in, almoſt like to thoſe of *Carraways*, or between them and *Fennel*; at the top of the Stalks it ſpreads forth into Branches, which bears at their tops ſmall Umbles of white Flowers, which being paſt away, flat, thin, winged Seed follows; the whole Plant, or any part thereof being broken, there flows from it a certain Milk like Juice, as there likewiſe does from many other Umbelliferous Plants.

IX. *The ſeventh, or* Greater Candy Hartwort. *It has a Root which is white, ſomewhat long, and woody after it has Seeded, and then periſhes, riſing again plentifully from the Sowing of its own Seed*: This Root ſends forth rough, hairy, round Stalks, about two or three Feet high, ſet with long Stalks of winged Leaves, much reſembling *Parſnep* Leaves, both in form and magnitude, yet ſomewhat longer and narrower, dented about the edges, and pointed at the ends, being rough and hairy likewiſe, and turning themſelves a little backwards to the Stalk; towards the tops of the Stalks they ſpread themſelves forth into Branches, and have ſmaller Leaves ſet at the Joints than grow below, bearing Heads or Umbles of purpliſh white Flowers, whereon, after they are gone, grow whitiſh, flat, round Seed, circled about, as it were, with a border, and cut in round about it alſo with round dents, of little or no ſmell or taſte.

X. *The eighth, or* Small Candy Hartwort. *It has a Root which is unprofitable, and as periſhing as the laſt*, which ſends up ſuch like Stalks of winged Leaves as the former, but ſmaller, rounder, and ſhorter, a little hairy, and whitiſh; the Stalks are leſſer and lower, fuller of Branches, bearing paler purpliſh Flowers in Umbles, and Seed after them, of the ſame form or ſhape, but quicker, as the Herb alſo is, and therefore the more accepted, and uſed as a Sallet Herb in *Italy*, and other Southern and hot Climates.

XI. *The ninth, or* Great yellow Candy Hartwort. *This has a like Root, and grows very like the ſeventh, or* Greater Candy Hartwort, having the like Leaves on the Stalks, but ſomewhat broader and ſhorter, a little ſharp in taſte, and not above two or three pairs together, ſet on the like Stalks, but ſmaller on the Branches, and bearing Umbles of yellow Flowers, like *Dill*, without any Leaves under them, as the others have, which being paſt away the like whitiſh, flat, round, Buckler like Seeds, ringed and dented about the edges follow, but they are larger and ſmoother, and divided in the middle, with a brownish ſtroke or line, making the Seed ſeem like unto a kind of *Thlapſi*, or *Treacle Muſtard Seed*: *Columna* ſays that this Flowers and Seeds at *Naples* in *May*, and grows only in Gardens there.

XII. *The tenth, or* Smalleſt Candy Hartwort. *It has a Root which is ſmall, white, hard, and a little hot in taſte*; this Plant is very like unto the *Leſſer Candy* aforegoing at Sect. X. above, but it has Leaves like to the lower Leaves of *Coriander*, ſoft, but a little hairy, the firſt Leaves being of an Inch and

half

half long, and an Inch broad, and dented about the edges with round dents; the second Leaf is of two Inches long, the third has a longer Stalk, with two Leaves set thereon, smaller and rounder than the other, about half an Inch broad, and a bigger Leaf at the end, yet smaller and longer than the first Leaf; the next are lesser and longer, and the Stalk is naked of Leaves below, being small, hairy, hard, and straked, and carrying thick Umbles of white Flowers, with yellow Threads in the middle, and underset with long hairy Leaves, the outward Flowers being larger than the inner, thereby making the Umble resemble that of the *Wild Carrot*; after which come such like Seed as the former, but not half so large, the middle part being of a darker color; before they are ripe they look of a purplish green, but when they are full ripe white, of an aromatick taste, somewhat bitter, and a little sweet in smell.

XIII. *The eleventh, or* Mountain Hartwort with smooth Hemlock like Leaves. *It has a long Root, divided into two or three Arms or Branches, of a brownish black on the outside, and white within,* from whence springs up a Stalk, which is hollow, and rises up to the height of two Feet, or two Feet and a half, from which Stalk comes forth (at Joints) large spread Leaves, divided into many smaller parts, like unto *Hemlock*, or *Seseli Peloponese*, the higher up the Stalk the smaller and longer the Leaves, which are smooth, and more finely divided; at the top of the Stalk comes forth larger Umbles of white Flowers, which turn into yellowish crested Seed, two joined together, of a hot and aromatick taste.

XIV. *The twelfth, or* Mountain Hartwort with hairy Hemlock Leaves. *It has a long, thick, dark colored Root, which sends forth broad* Hemlock *like Leaves,* or like to the *Greater sweet Chervil*, of a dark green color, and something rough and hairy, especially the footstalks of the Leaves, from the midst of which rises up a thick, hollow, crested, hairy, and jointed Stalks, about two Feet high, divided into several Branches, with some few Leaves thereon, but much lesser, and in like manner divided; near the top of the Stalk it shoots it self forth into many Arms or Branches, at the tops of every one of which grows a pretty large Umble of white Flowers, succeeded by long sharp pointed Seed, two joined together.

XV. *The thirteenth, or* Shrub Æthiopian Hartwort. *It has a Root which is great and woody, spreading it self out into several Arms or Branches, with several Fibres issuing therefrom, and which abides many Years, if it is defended from the cold*; from this Root shoot forth several woody rough Stems, covered with a blackish Bark, divided into many Branches, two, three, or four Feet, or more long, beset with many fair, large, thick, hard, smooth, pale green Leaves, being long, and somewhat like unto *Woodbind* Leaves, but not so broad, smooth or even on the edges, and not snipt or dented at all; on the tops of the Branches stand small Tufts of yellow Flowers, which afterwards bear brownish, round, and long Seed, bigger than *Sweet Fennel* Seed; the whole Plant smells very fragrant, and the Seed best, being of an Aromatick taste, somewhat bitter, and sharp withal: This is commended by *Dioscorides* to be the best of all the *Hartworts*, beyond that of *Candy* or *Marselles*.

XVI. *The fourteenth, or* Great Jointed Hartwort of Candy. *It has a Root which is composed of several slender, long, white, woody Strings, which perishes Yearly*, which Root sends up four or five hard, round, rough, or rather prickly Stalks, about two Feet high, whose Joints are great, and bunched out like Knees, with a rough, large, winged Leaf or two at each of them, some consisting of three, and some of five parts, and every one of them also divided into several parts, of a sad green color, changing reddish at Seed time; the Stalk is rough and crested, and the several Branches hereof do carry several small Tufts or Umbles of white Flowers, which being past away, there comes in their places great, long, round, and rough Seed.

XVII. *The Places.* Most of these *Sesel's* or *Hartworts* grow about *Mompelier*, *Marselles*, and *Narbone* in *France*, as also in *Italy* and *Candy*, some in the *Morea* in *Greece*, and some in *Æthiopia*, and some of them in *Germany*, and almost all of them grow with us in *England*, where they thrive well, but are with us nursed up only in Gardens.

XVIII. *The Times.* They Flower most of them in *June* and *July* in their native places, but with us in *July* and *August*, and do bear ripe Seed in *September*, or before the end of Summer, if care be had in ordering and keeping them, so as they be Planted in the warmest places, and in a Southern Sun.

XIX. *The Qualities.* They are all of them hot and dry in the second degree, Aperitive, Abstersive, Carminative, and Diuretick, Stomatick, Pectoral, Nephritick, Neurotick, and Hysterick, Antiemetick, and Alexipharmick.

XX. *The Specification. Hartwort* opens Obstructions of the Lungs and Urinary parts, helps Coughs, and the Strangury, Asthma's, Colick, obstruction of the Terms, and Hysterick Fits, and facilitates the Delivery of Women in Travail.

XXI. *The Preparations.* Of all these Kinds the four first are chiefly used in Physick, (tho' it is possible all the rest may have as excellent Virtues, and be fully as efficacious) but the *Æthiopian* is preferred for its singular Virtues beyond all the other sorts, and is doubtless that which ought to be put into the Compositions of *Mithridate* and *Venice Treacle*; and this *Lobel* gathered in great plenty about *Mompelier* in *France*: As to the parts of the Plant, the Roots, the Herb, and the Seed, are all used, and from them the following Preparations are made, *viz.* 1. *A Juice of the Herb.* 2. *An Essence of the Herb and Root.* 3. *A Decoction in Wine or Water of the Herb, Root, and Seed.* 4. *A Pouder of the Seed.* 5. *A Cataplasm of Root, Herb, or Seed.* 6. *An Acid Tincture of Root or Seed.* 7. *A Spirituous Tincture of Root or Seed.* 8. *An Oily Tincture of Root or Seed.* 9. *A Distilled Water from Root, Herb, or Seed, or from all of them.*

The Virtues.

XXII. *The Juice of the Herb.* It is commended by *Dioscorides* to help the Strangury, and difficulty of breathing, as also the Suffocation of the Womb, to provoke the Terms, and expel the dead Child; it is prevalent also against the Falling-Sickness, and pains of the Kidnies. Dose three or four Spoonfuls, twice or thrice a day, mixed with a Glass of White Port Wine; mixed with Honey and taken, it is good against Coughs, Colds, Wheezings, and Obstructions of the Lungs.

XXIII. *The Essence.* It has all the former Virtues, being given in like manner and Dose, besides which it facilitates the Delivery of Women in Travail; the Essence or Juice taken with the Pouder of the Seed for ten days together in White Wine, gives ease in the pains of the Reins, and is said to expel the Stone lodged in those parts; if the Stone is great I am confident it can do nothing at all, but if it is Tartarous Matter, Sand, Gravel, or small Stones, then possibly it may expel them, and clear the parts of those Recrements: The Essence made of the Root is powerful in heating, and opening Obstructions,

by

by reſtoring of its then parts, for which reaſon it powerfully provokes Urine, and helps the Epilepſie, and this Author ſpeaks of all the *Hieracia* in general, and *Dioſcorides* ſays they have the ſame Faculties and Operations.

XXIV. *The Decoction of Root, Herb, or Seed in Water or Whey.* It has the Virtues of both the former Preparations, but in a much lower degree, however it is often given againſt the Strangury, ſtoppage of Courſes, and to facilitate the Delivery of Women, &c.

XXV. *The Powder of the Seed.* It is ſaid to prevail againſt the Stone, Gravel, Strangury, Colick, obſtructions of the *Viſcera*, &c. Made into an Electuary with Honey, it is good againſt Aſthma's, Coughs, Colds, obſtructions of Flegm, and cauſes eaſie Expectoration. Doſe of the Powder is one Dram, Morning, Noon and Night, in any proper Vehicle, as White Wine, *Paſſy* Water, *Arſmart* Water, &c.

XXVI. *The Cataplaſm of the Root.* If it is beaten into a Pulp, or boiled ſoft, and then beaten, and brought into a conſiſtence with *Terra Samia*, or to two parts of the Root, one part of *Terra Samia*, and an eighth part of Honey, being then applied, it is of good uſe to diſcuſs ſimple Contuſions, or Bruiſes, and to take away the black and blew marks or ſpots of the ſame, coming by Blows, Pinching, or otherwiſe.

XXVII. *The Acid Tincture of Root or Seed.* It is good againſt all ſorts of malign and burning Fevers, the Small Pox, Spotted Fever, Calenture, and the Plague or Peſtilence it ſelf; it is alſo prevalent againſt the Bitings of Serpents, or Mad Dogs, or the Stinging of Scorpions, Hornets, or other Venomous Creatures; it cleanſes powerfully the Urinary paſſages, is good againſt Stone and Strangury, as alſo ſhortneſs of Breath, difficulty of breathing, Hoarſeneſs, Wheezing, and the like. Doſe twenty, thirty, or forty drops at a time, (more or leſs, according to the quantity of the Vehicle) in Ale, Wine, or other Liquor, three or four times a day.

XXVIII. *The Spirituous Tincture.* It powerfully provokes the Terms, reſiſts Vapors, and gives eaſe in the Colick, and is good againſt the Poyſon of any Venomous Creature; it is good againſt the Epilepſie, and other Diſeaſes of the Nerves, Head, and Brain, proceeding from cold and moiſture; it ſtrengthens the Stomach, cauſes a good Appetite and a ſtrong Digeſtion, cleanſes and ſtrengthens the Womb, and cauſes Conception. Doſe from one Dram to three, Morning and Night, in Ale, Beer, or Wine, or in any other fit Vehicle, as Decoction, Diſtilled Water, &c.

XXIX. *The Oily Tincture.* It is good againſt weakneſs of the Nerves, Palſies, numbedneſs of any part, Pains or Aches, whether external or internal, proceeding from cold and moiſture, or any over ſtraining of the part; it facilitates the Birth, and cauſes a ſpeedy and ſafe Delivery; it gives eaſe in the Gout, alleviating the pain in a ſhort time; it cauſes an evacuation of Sand, Gravel, and Tartarous Matter from the Reins, and other Urinary parts, and prevents the breeding of the Stone; it alſo gives eaſe in the Colick. Doſe from twelve to thirty drops in any fit Vehicle, or in the Diſtilled Water of the ſame Plant; it allays itching in any place, by allaying the ferment of the Humors.

XXX. *The Diſtilled Water.* It is good for all Diſtempers abovenamed, but is much weaker, and is therefore uſed as a Vehicle; outwardly applied to the Skin, it takes away its diſcolorings, as yellowneſs, Tanning, Sunburning, black and blew ſpots, redneſs from Pimples, &c.

CHAP. CCCXLIV.

Of HAWKWEED Common.

I. *The Names.* It is called in *Greek* Ἱεράκιον, *ab* Ἱέραξ, *Accipiter*, An Hawk, (*ſic dictum volunt quod Accipitres ſibi hujus ſucco aciem Oculorum acuere dicuntur*) in *Latine Hieracium*, and by ſome Authors *Accipitrina*, in *Engliſh Hawkweed.*

II *The Kinds.* Authors make a vaſt number of the Kinds of this Plant, many of which grow not with us in *England*; *Parkinſon* divides ſo many as he Treats of into nine general Heads, making them in all Fifty Five ſeveral Species, *viz.* 1. *Sharp pointed Dandelion like* **Hawkweeds**, Seven Kinds. 2. *Blunt pointed Dandelion like* **Hawkweeds**, Ten Kinds. 3. *Gum Succory like* **Hawkweeds**, Four Kinds. 4. *Garden Succory like* **Hawkweeds**, Three Kinds. 5. *Wild Succory like* **Hawkweeds**, Four Kinds. 6. *Smooth Mountain* **Hawkweeds**, Five Kinds. 7. *Hairy Mountain* **Hawkweeds**, Thirteen Kinds. 8. *Meadow* **Hawkweeds**, Three Kinds. 9. *Buſhy* **Hawkweeds**, Six Kinds. We ſhall not follow this Diviſion, nor yet Treat of all thoſe ſeveral Species, but only of ſo many as are to be found growing in *England*, and therefore we divide them but into two principal Kinds, *viz.* 1. *Of the more common Kinds of Hawkweed*, of which in this Chapter. 2. *Of the leſs common Kinds*, of which in Chapter 345 following.

III. *The more common Kinds.* Theſe are in number Eleven, *viz.* 1. ***Hieracium majus Sonchites***, *Hieracium majus Matthioli*, *Fuchſij*, *Dodonæi*, *Lobelij*, *& aliorum*; *Taraxacon majus Lonicери*, *Intubus ſecundus Tragi*, ***Hieracium Sonchi folio varierum***, *Hieracium minus Lugdunenſis*, (becauſe he makes the *Chondrilla prior Dioſcoridis* to be his *Hieracium magnum*) Common Great Hawkweed with Sow-Thiſtle Leaves. 2. ***Hieracium Dentis Leonis folio aſperum***, and *birſute aſperum*, and *magis laciniatum Lobelij*, ***Hieracium alterum Saxatile Montanum Columnæ***, Rough Dandelion like Hawkweed. 3. *Hieracium Dentis Leonis folio obtuſo minus Flore magno*, Dandelion like Hawkweed. 4. ***Hieracium Dentis Leonis folio floribus parvis***, Dandelion Hawkweed with ſmall Flowers. 5. ***Hieracium aſperum Hypocheris***, *ſive Porcellia dictum Tabernamontani*, *Hieracium minus Dentis Leonis folio ſub aſpero*, Swines Hawkweed with rough Leaves. 6. ***Hieracium folijs***, *& facia Chondrillæ Lobelij*, Gum Succory like Hawkweed of Lobel. 7. ***Hieracium Chondrillæ folio glabrum***, Smooth deep jagged Hawkweed. 8. *Hieracium minus Radice præmerſa Lobelij*, *Hieracium minus Matthioli*, *Tragi*, *Fuchſij*, *Geſneri*, *Tabernamontani*, *Gerardi*, *& aliorum*, *Hieracium Leporinum*, *Succiſa Tertia Tragi*, *& Lactuca Leporina*, *Picris Dalechampijs & Lugdunenſis*, (becauſe of its bitterneſs) *Hieracium Chondrillæ folio Radice Succiſa Bauhini*, Hares Hawkweed, or Yellow Devils-bit. 9. ***Hieracium ſinuatum profunde Pratenſe***, Meadow Hawkweed with deep cut Leaves. 10. ***Hieracium Pratenſe non ſinuatum majus***, Greater undented Meadow Hawkweed. 11. ***Hieracium Pratenſe non ſinuatum minus***, The leſſer undented Meadow Hawkweed. This being ſaid, it is to be underſtood, that the *Hawkweeds* ſtand as in a *medium* between the *Succories* and the *Sow-Thiſtles*, as in ſome meaſure partaking of them both.

IV. The Deſcriptions. *The firſt, or* Great Hawkweed, *has a Root which is long, and ſomewhat great, with many ſmall Fibres thereat, from whence ſpring*

uf

up many large hairy Leaves, lying on the Ground, much rent or torn on the ſides into ſeveral gaſhes and jags, ſomewhat like unto *Dandelion*, but with greater parts, more like unto thoſe of the *Smooth Sow-Thiſtle*, the whole Plant being full of a bitter Milk; from among which riſes up a hollow rough Stalk, two or three Feet high, Branched forth from the middle upwards, on which are ſet, at every Joint where it Brancheth, longer Leaves, little or nothing rent or cut in, bearing at their tops ſeveral pale yellow Flowers, conſiſting of many ſmall narrow Leaves, broad pointed, and notched in at the ends, ſet in a double row, or more, the outermoſt being larger than the inner, which form moſt of the *Hawkweeds* do keep in all their Sorts or Varieties, which being paſt away turn into Down, and with its ſmall brownish Seed is blown away with the Wind.

Great Hawkweed

V. *The ſecond*, *or* Rough Dandelion like Hawkweed. *It has a Root which is ſmall, ſomewhat like a Finger, with a few Fibres adjoining thereto*, from whence ſpring up ſeveral long and narrow hairy Leaves, reddiſh at the bottom next the Root, deeply waved or torn in on the edges, being about two Inches long, from among which riſe up one, or two, or more bare or naked Stalks, rough or hairy, bearing each of them a double yellow Flower, like unto the *Hawkweeds*, which being paſt away turns into Down, as the former does.

VI. *The third*, *or* Dandelion like Hawkweed, *has a ſmall and fibrous Root, which ſends forth ſix or ſeven thick rough Leaves, lying on the Ground*, about two Inches long, and half an Inch broad, round pointed, and jagged about the edges, as other *Hawkweeds* are; the Stalk is hoary alſo, and Branched, about a Span, or eight or nine Inches high, having ſmaller Leaves thereon, with ſmaller diviſions; at the tops ſtand very yellow Flowers on very ſhort Footſtalks, ſhooting out very fine hoary Husks, pointed at the brims with many points.

VII. *The fourth*, *or* Dandelion Hawkweed with ſmall Flowers, *has a Root which is ſmall, white, woody, and fibrous*; the Stalk is round, a Foot high, and ſomewhat hoary, at the bottom of which grow a few rough Leaves, bitten in (as it were) about the edges, and about three Inches long, and half an Inch broad, having but few Leaves thereon, and thoſe about the middle, which are but only dented, and encompaſs it at the bottom, bearing very many ſmall yellow Flowers together at the tops thereof, which grow upon very ſhort Footſtalks.

VIII. *The fifth*, *or* Swines Hawkweed with rough Leaves. *It has a ſmall and long Root, and is but a ſmall Plant*, having ſeveral ſomewhat long and rough Leaves lying on the Ground, ſmaller at the bottoms, and broader towards their ends, unevenly waved about the edges; the Stalks are a little rough, ſlender, and bare of Leaves, Branching into ſeveral long Stalks, about half a Foot in length, bearing every one a large yellow Flower, like unto the *Hawkweeds*. There is another Plant of this ſort, whoſe Leaves are ſmooth and narrower, but differing little in any thing elſe.

IX. *The ſixth*, *or* Gum Succory like Hawkweed. *This grows not ſo high as ſome others, and has its Leaves thicker jagged, but not ſo large*, each jag ſomething dented alſo, and ſomething hairy; the Flowers are yellow, but not ſo thick or double, but growing in a Tuft together, which being ripe, and turned into Down, are, with its Seed at bottom, blown away with the Wind, as the Down of other *Hawkweeds* are.

X. *The ſeventh*, *or* Smooth deep jagged Hawkweed. *This differs not much from the laſt, but that the Leaves hereof are ſmooth, and very much and very deeply jagged*, even to the middle Rib, each jag being ſmall, narrow, and pointed; its Stalks, Flowers, Down, and Seeds are like unto the former.

Small Hares Hawkweed.

XI. *The eighth*, *or* Hares Hawkweed. *or* Yellow Devils-Bit. *Its Root is made up of many Strings, like a* Plantane *Root, but the middlemoſt part, which is greateſt, is ſhort, as if it had been bitten off, like the Root of* Devils-Bit: This Root ſends up many Leaves, of which thoſe which lye next the Ground are ſomewhat long and narrow, cut in on the edges into ſmall

and

and ſhort pointed gaſhes; the Stalks are ſmall, and ſcarcely grow to be a Foot high, ſpread out into a few Branches, with ſome Leaves here and there upon them, which have no diviſion or dents on the ſides; at the tops of the Branches ſtand the Flowers, which are much ſeparated one from another, each upon a long Footſtalk, conſiſting of fewer Leaves, or being leſs double, of a Gold yellow Color, which being paſt away, are ſucceeded with Down, like the other *Hawkweeds*; the whole Plant, and every part thereof is very bitter, rather more bitter than any of the others.

XII. *The ninth*, *or* Meadow Hawkweed with deep cut Leaves. *The Root is blackiſh and woody*; the Leaves lying next the Ground are many, long, and narrow, and deeply cut or torn in on the edges, and pointed at the ends, each Leaf ſtanding upon a long Footſtalk, and covered with a Downy hairineſs, as the whole Plant beſides is; the Stalk is hollow, round, and about a Yard high, having a few ſuch like deep cut Leaves thereon; it is ſpread forth into ſeveral Branches, at the tops of which ſtand Gold yellow Flowers on ſeveral long Footſtalks, ſucceeded by Down, as the others are.

XIII. *The tenth*, *or* Greater undented Meadow Hawkweed, *has a ſmall and black Root, with ſeveral long Strings adjoining to it*, from whence riſe up ſeveral rough Leaves, lying upon the Ground, each about five Inches long, and an Inch and half broad, without any gaſh or dent on the edges, being very green, and ending in a round point, from among which riſes up one ſingle, ſtraight, and creſted Stalk, about a Foot and half high, wholly naked, or deſtitute of Leaves, bearing at the top a number of ſmall yellow Flowers, ſet cloſe together, as it were in a Tuft, every one upon a ſhort Footſtalk, which being paſt away, do, like the reſt, turn into Down, and paſs away with the Wind.

XIV. *The eleventh*, *or* Leſſer undented Meadow Hawkweed. *Its Root is ſomething long, and of a mean thickneſs*; the Plant is leſſer than the former, and has many leſſer Leaves undented lying upon the Ground, of an Inch and half long, and an Inch broad, being almoſt round, and rough; the Stalk which riſes from the middle of them ſtands upright, and is creſted, bearing at the top a few ſuch like Flowers as the former, which being paſt away turn into Down, which is alſo carried away with the Wind.

XV. *The Places.* The firſt and ſecond grow in ſeveral places about Fields and Pathways in dry Grounds; the third, fourth and fifth grow alſo in Fields, waſte Grounds, Lanes, and By-Ways in many places of *England*; the ſixth, ſeventh and eighth grow alſo plentifully enough in many places of our Land, and ſometimes in Gardens; the ninth, tenth and eleventh grow in Fields and Meadows, and by Wood ſides which lye open to the Sun.

XVI. *The Times.* They all Flower, and the Down flies away in the Summer Months, *viz.* in *June*, *July*, and *Auguſt*, and riſe again of their own Sowing.

XVII. *The Qualities.* They are all cold and dry in the firſt degree, Abſterſive, Aſtringent, Anodyn, Diuretick, Pectoral, Stomatick, and Alexipharmick.

XVIII. *The Specification.* It eaſes pains of Liver and Spleen, and opens obſtructions of the Lungs.

XIX. *The Preparations.* You may have therefrom, 1. *An Inſpiſſate Juice.* 2. *An Eſſence.* 3. *A Decoction in Wine.* 4. *A Collyrium.* 5. *A Cataplaſm.* 6. *A Diſtilled Water.* 7. *An Acid Tincture.* 8. *A Saline Tincture.*

The Virtues.

XX. *The Inſpiſſate Juice.* A Dram thereof diſſolved in White Port Wine, adding a little Vinegar when it is given, opens the obſtructions of the Reins, Ureters, and Bladder, provokes Urine, and prevails againſt the Dropſie; it is alſo good againſt the Stinging of Scorpions, and Biting of Serpents, or other Venomous Beaſts; it is alſo good againſt the pain and hardneſs of the Spleen, and procures Reſt and Sleep.

XXI. *The Eſſence and Liquid Juice.* It is cooling, drying, and binding, and therefore good for the heat of the Stomach, and gnawing thereof, for Inflammations, and the hot Fits of Agues; the Juice given to two or three Spoonfuls in Wine helps Digeſtion, diſcuſſes Wind, hinders Crudities, helps the depraved Tone of the Stomach, is good againſt the Strangury, or ſtoppage of Urine, and prevails againſt all the Diſeaſes for which the Inſpiſſate Juice is given.

XXII. *The Decoction in Wine.* It has the Virtues of the Juice and Eſſence, but not full out ſo powerful; made with *Wild Succory* and taken, it helps the Wind Colick, pains and hardneſs of the Spleen, procures Reſt and Sleep, hinders Venery, and Nocturnal Pollutions, cools and purifies the Blood, opens obſtructions, and cleanſes the Stomach, Reins, and Bladder: The Decoction mixed with Honey and taken, it digeſts thin Flegm in the *Thorax* or Lungs, helps the Cough, Hoarſeneſs, Wheezings, obſtructions of the *Viſcera*, and cauſes Expectoration. Doſe ſix or eight Ounces twice a day, *viz.* Morning and Night.

XXIII. *The Collyrium.* It is thus made. *Take clarified juice of* Hawkweed *eight Ounces*, *Honey four Ounces*, *Roch Alum ſix Drams*, *mix*, *melt*, *and make a Collyrium.* It is ſingular good for all Defects and Diſeaſes of the Eyes, in tender Sighted People it may be mixed with Womens Breaſt Milk, or with Cows Milk, and ſo uſed; it is alſo uſed with good ſucceſs in curing fretting and eating Ulcers in any part, eſpecially in their beginning.

XXIV. *The Cataplaſm.* Outwardly applied it is good for hot Diſtempers of the Eyes; if it is made of the green Herb bruiſed, and with a little Salt applied to any place burn'd with Fire, before Bliſters do ariſe, it takes out the Fire, and gives eaſe; it alſo allays Inflammations, and St. *Anthonies*-Fire, cures Puſhes and Eruptions in the Skin, abates heat, and draws forth ſalt virulent Humors; if it is made by boiling with a little Milk and Barley Flower, or White Bread, and applied to any place affected with Convulſions, or the Cramp, or where there is a ſimple Contuſion, it reſolves the Tumor, and eaſes the pain.

XXV. *The Diſtilled Water.* It is ſaid to cleanſe the Skin, and take away Freckles, Spots, Morphew, or Wrinkles in the Face and Skin.

XXVI. *The Acid Tincture.* It removes the præternatural heat of the Stomach, cools the heat of Fevers, and helps a hot and dry Liver. Doſe ſo many drops as to make the Ale, Beer, or Wine pleaſantly acid, and to be drunk in all that the Patient drinks; it cures alſo a hot Scurvy.

XXVII. *The Saline Tincture.* It is good againſt the Gout, whether in Hands or Feet, the parts affected being well bathed therewith as hot as can be endured; it is alſo good againſt Tanning, Sunburning, yellowneſs of the Skin, black and blue ſpots thro' Blows, or Bruiſes, Freckles, Lentils, Scurff, Morphew, Pimples, and other hot, ſalt, and fiery breakings out of the Skin, in what part of the Body ſoever, being skilfully applied.

CHAP.

CHAP. CCCXLV.

Of HAWKWEED Less Common.

I. *THE Names.* It is called in *Greek* Ἰεράκιον μανὸν, ἢ ἱεράκιον ἄγθος, in *Latine Hieracium incommune, vel rarum, Hieracium minus commune*, in *English Hawkweed less common*, or not so easie to be met with, as being either rare, or otherwise, Exoticks, and so only Garden Plants with us.

II. *The Kinds.* All the various Kinds enumerated in Authors, as aforementioned, we shall not trouble you withal here, many of them being absolutely Foreign, and so never to be seen with us, some of them only various, or degenerated, or otherwise altered, from the poorness or richness of the Soil, or other qualifications of the Ground, and so never to be met withal again in Nature; those which we shall now describe are the twenty following, *viz.* 1. *Hieracium asperum, Hieracium Intybaceum asperum Tabernamontani*, Sharp, *or* Sharp pointed Hawkweed. 2. *Hieracium majus alterum*, The other Great Hawkweed. 3. *Hieracium longius Radicatum Lobelij*, and *Microphyllon Tabernamontani, Hieracium minus primum Dodonæi*, *Apargia Dalechampij*, of which *Theophrastus* speaks Lib. 7. Cap. 9. *Hieracium Dentis Leonis Folio obtuso majus Bauhini*, Long Rooted Hawkweed. 4. *Hieracium Intubaceum Flore luteo Bauhini*, Garden Succory like Hawkweed with yellow Flowers. 5. *Hieracium Intubaceum Flore magno albido*, Garden Succory like Hawkweed with white Flowers. 6. *Hieracium Intubaceum Flore Carneo, Hieracium Ramosum Penæ, Hieracium Apulum Flore suave rubente Columnæ*, Garden Succory like Hawkweed with blush Flowers. 7. *Hieracium Folio Hedypnoidis*, Wild Succory like Hawkweed with yellow Flowers; it is called *Rhagadiolus* by *Cæsalpinus*. 8. *Hieracium Montanum Latifolium glabrum majus Tabernamontani*, Great broad Leav'd smooth Mountain Hawkweed. 9. *Hieracium Montanum Latifolium glabrum minus Tabernamontani*, Small broad Leav'd smooth Mountain Hawkweed. 10. *Hieracium Montanum Rapifolium*, Turnep Leav'd Hawkweed. 11. *Hieracium Montanum Folijs dentatis Flore magno*, Dented Mountain Hawkweed with a great Flower. 12. *Hieracium Ramosum Flore magno*, Great Flowered Hawkweed. 13. *Hieracium Montanum Latifolium villosum magno Flore Clusij*, Hairy broad Leav'd Mountain Hawkweed with a large Flower. 14. *Hieracium Montanum Dentis Leonis Folio incano, Hieracium Folio Hedypnoidis Clusij, Hieracium Montanum Angustifolium Folijs Cichoraceis Tabernamontani*, Mountain hoary Dandelion like Hawkweed. 15. *Hieracium Britanicum Conyzæ Folio Clusij*, English Fleabane like Hawkweed. 16. *Hieracium Latifolium Clusij*, *Hieracium Phlomoides Tabernamontani*, *Hieracium Latifolium Pannonicum Camerarij Flore magno luteo*, Broad Leav'd Hawkweed with a great yellow Flower, which is the *Primum Clusij*. 17. *Hieracium fruticosum Folio sub rotundo Bauhini*, Round Leav'd bushy Hawkweed. 18. *Hieracium fruticosum Latifolium hirsutum*, Rough broad Leav'd bushy Hawkweed. 19. *Hieracium fruticosum Angustifolium majus*, The Greater narrow Leav'd bushy Hawkweed. 20. *Hieracium fruticosum minus*, The Lesser bushy Hawkweed.

III. The Descriptions. *The first, or* Sharp pointed Hawkweed. It has a Root which is tough, and fibrous, or thready, from whence rise up many Leaves, which are long and narrow, like those of *Languebeef*, or *Ox-Tongue*, but much narrower, which are sharp about the edges, rough in the middle, and withal sharp pointed; the Stalks are long and slender, set with the like Leaves, but lesser; the Flowers grow at the tops, which are yellow colored and double, which being past, are succeeded by Down, which is carried away with the Wind.

IV. *The second, or other* Great Hawkweed. *The whole Plant is bitter, and perishes at the first approach of Winter, being but Annual, and to be new Sown every Year*; its first Leaves are little or nothing dented, but something like *Endive*, yet those which follow are cut in on the sides, not so much as the *Sow-Thistle*, else not much unlike, which are more tender, yet larger than the first in the former Chapter, as the Stalks are likewise, bearing on the Branches greater Husks, wherein the Flowers grow, which pass into Down, with rough crooked Seed lying therein, and are both dispersed and blown away with the Wind.

V. *The third, or* Long Rooted Hawkweed. Its Root is white, small, and long, running down as deep into the Ground says *Lobel* as the Stalk is high, yet some of it has been observed with more and shorter Roots; the Leaves which lye upon the Ground are long and narrow, much torn and jagged on the edges, somewhat like unto *Dandelion*, but cut into many short round pointed pieces, of a dark green color; the Stalks which arise from among the Leaves are smooth and blackish, scarcely a Foot high, bare, or without Leaves on them unto the tops, but at the upper Joint, from whence spring several Flowers; each standing upon a long Foot-stalk, which are of a yellow color, like unto other *Hawkweeds*, and being once past away, the Heads are filled with Seeds covered with Down, which is carried away with the Wind.

VI. *The fourth, or* Garden Succory like Hawkweed with yellow Flowers. It has a long down right Root, of a mean size for thickness, and some Fibres adjoining to it, which sends forth a slender smooth Stalk, about a Foot high, yet somewhat leaning

downwards, ſpread into many Branches, at the foot of which grow long, ſmooth, dark green Leaves, about four Inches in length, and an Inch and half in breadth, ſome of them without diviſions, and others very much rent, torn, or jagged, very irregularly, almoſt (in ſome places) to the middle Rib, as are all thoſe eſpecially which grow higher and upward on the Stalk and Branches, each of the Branches and Stalk being about an Hand breadth below the tops, bare of Leaves, and at the tops of each of which grows a yellow Flower, of a middle ſize, which turns into Down, and is carried away with the Wind.

VII. *The fifth, or* Garden Succory like Hawkweed with White Flowers. This Plant in its Root, Stalk, Branches, Leaves, and Flowers, is very like unto the former fourth Kind, but that the Leaves in this are ſomething larger and broader, and more cut in, or jagged and torn on the ſides, even to the middle Rib, (tho' they can hardly be more irregularly torn or jagged than the former) the Flowers alſo in this Plant are of a whitiſh color, and more yellow in the middle, alſo ſomewhat reddiſh underneath, which paſſing away turn into Down.

VIII. *The ſixth, or* Garden Succory like Hawkweed with bluſh Flowers. It has a Root which is compoſed of a down right Stem, with ſeveral Fibres adjoining thereto, which always periſh after Seed time; from this Root ſpring up ſeveral long and ſomewhat narrow rough Leaves, lying next the Ground, very much rent or torn in on the edges, and from among theſe Leaves riſe five, or ſix, or more, ſlender, ſhort, brown, and hairy Stalks, about a Foot or more high, ſhooting forth into one or two Branches, with leſſer Leaves, and leſs divided, up to the tops, where are ſeveral large Flowers, conſiſting of two or three rows of Leaves, of a deep bluſh color, and of a ſomewhat ſtrong *Opium* like ſmell, which Leaves of Flowers are broad pointed, and nicked at the ends, the outwardmoſt row being larger than the inner, ſtanding in rough ſcaly Husks, in which afterwards the ſlender, long, brown Seed is contained, which lying among much Down, are carried away together with the Wind.

IX. *The ſeventh, or* Wild Succory like Hawkweed with yellow Flowers. It has a Root which is long and white, with ſome ſmall Fibres adjoining thereto, which ſends up ſome few Leaves, lying next the Ground, ſomething long and narrow, waved, or unevenly dented about the edges, in ſome more, in others leſs, and ſometimes hairy withal, yet when Planted in Gardens has little or none at all; it alſo ſends forth many ſlender Stalks, with a few Leaves ſet diſperſedly upon them, which are ſmaller than thoſe below, and ſharp pointed; theſe Stalks branch forth at their tops, on which ſtand ſeveral green ſcaly Husks, with yellow Flowers in them, a little bending their Heads before they are blown, in which grow crooked Seed, lying in the Down, which after the Flowers are paſt away, are both carried away with the Wind.

X. *The eighth, or* Great broad Leav'd ſmooth Mountain Hawkweed. It has a buſhy Root, wholly made up of a great number of Fibres or Strings, which ſends forth ſeveral fair great Leaves, ſomething narrow at the lower ends, and broader to the middle, where they are broadeſt, then declining in their breadth, and ending in a point, being unevenly dented or waved about the edges, and encompaſſing the Stalk or Branches as they riſe up, the Stalk and Branches bear every one of them three or four Flowers, yet not in an Umble like manner; theſe Flowers ſeldom appear open, but when they do they are yellow, like unto others, which afterwards paſs into Down, and are alſo carried away with the Wind.

XI. *The ninth, or* Small broad Leav'd ſmooth Mountain **Hawkweed.** This Plant in its Roots, Stalks, Leaves, Branches, Flowers, and Seed, as alſo in its manner of growing, differs not from the former great Kind, but only in its magnitude, this being in all reſpects ſmaller, and the whole Plant lower and leſſer.

XII. *The tenth, or* Turnep Leav'd Hawkweed. The Root is ſomething long and ſtringy, of a reddiſh yellow color, which ſends forth a few Leaves, ſtanding upon long and rough reddiſh Footſtalks next the Ground, ſomething like unto *Turnep* Leaves, being rough, and torn in on the ſides into round pointed jags, from among which riſes up a rough, reddiſh, ſtraked Stalk, a Foot and half or more high, with one or two ſmall ſhort Leaves thereon, divided towards the top into many ſmall Branches, on each whereof ſtands one Flower for the moſt part, and ſometimes two, of a middle ſize, and a yellow color, which being paſt away turn into Down, which, (as the reſt) is carried away with the Wind.

XIII. *The eleventh, or* Dented Hawkweed with a great Flower. The Root is much like the former, which ſends forth Leaves, lying for the moſt part all on the Ground, being four or five Inches long, and an Inch broad, a little woolly or hoary, and finely dented about the edges, of a ſad green color; the Stalk riſes up to be about a Foot high, and is in a manner bare of Leaves, rough, and hollow, bearing one reaſonable large deep yellow Flower at the top, ſtanding in a fine ſcaly Husk, which turns into Down, as the reſt do, and is blown away with the Wind.

XIV. *The twelfth, or* Great Flowered Hawkweed. This is a large *Hawkweed*, and has a round rough Stalk, three Feet high, ſpread out into many Branches, on every one of which ſtands a large Gold yellow Flower, like unto *Dandelion*; the Leaves are three or four Inches long, and two or three Inches broad, with a great Rib in the middle, and many Veins running thro' them, of a pale green color, ſomething rough, waved about the edges, and ſet about with ſmall Hairs, and many Veins running from the ſaid Rib.

XV. *The thirteenth, or* Hairy broad Leav'd Mountain Hawkweed with a large Flower. It has a pretty thick Root, with many Fibres ſpringing from it; and tho' it is a *Broad Leav'd Hawkweed*, yet its lower Leaves are long, and ſomething narrow, covered with a long hairy Down, almoſt hoary, but thoſe which grow up higher upon the hairy Stalk, which is about a Foot high, are ſomething ſhorter, but three times broader, pointed at the ends, and leſs hairy; the Stalk ſpreads it ſelf out into two or three Branches, every one bearing commonly one Flower, and ſometimes two or three, out of woolly or very hoary Husks, of the form and color of other *Hawkweeds*, turning alſo in like manner into Down.

XVI. *The fourteenth, or* Mountain hoary Dandelion like Hawkweed. The Roots of this Plant lye ſpreading themſelves under the upper Cruſt of the Earth, ſending forth ſeveral Fibres, ſhooting downwards; from this Root come up divers heads of Leaves, which are not all of an equal length, but ſome longer, and ſome ſhorter than others, as being one, two, or more Inches long, and half an Inch broad, with a great or thick middle Rib, covered over with a ſoft hairy Down or Cotton, the lower parts of them being narrower, and much torn in on the ſides, and the upper part broader, and but only dented, from among which riſe up two or three Stalks of a Foot long without any Leaves, and bearing at top one large Flower, of a deeper yellow color than in many others.

XVII. *The fifteenth, or* Engliſh Fleabane like Hawkweed. It has a Root which is compoſed of

many

many black Strings, which periſh not, but abide many Years; this Plant riſes up with round, ſtraked, reddiſh, green Stalks, a Foot and half high, ſet with ſomewhat large rough Leaves, like unto thoſe of *Elecampane*, without any order, but not ſo fat or thick, and dented about the edges, encompaſſing them at the bottom, and pointed at the ends; the Flowers are yellow, like to other *Hawkweeds*, ſet in hairy Husks upon long Footſtalks, which turn into Down, and with the whitiſh long Seed is blown away with the Wind.

XVIII. *The ſixteenth, or* Broad Leav'd Hawkweed with a great yellow Flower. It has divers large hoary Leaves lying next the Ground, ſometimes a little waved, ſometimes again torn on the edges, ſometimes with black ſpots on them, and ſometimes without any, from among which riſes up an hairy Stalk, with very few Leaves thereon, ſpread out at the top into two or three other Branches, at the tops of each of which is a large yellow Flower, like to the *Great Hawkweeds*.

XIX. *The ſeventeenth, or* Round Leav'd buſhy Hawkweed. It grows about a Foot and half high; the Stalk being ſtraked, round, and ſomewhat rough, ſpread out at top into ſeveral Branches, three or four Inches long apiece, every one having at its head a pale yellow Flower; the Leaves encompaſs the Stalk at their lower ends, and are ſomewhat round, about an Inch and half broad, yet ending in a little point, dented about the edges, hoary, and of a light green color.

XX. *The eighteenth, or* Rough broad Leav'd buſhy Hawkweed, has a Root wholly compoſed of Strings and ſmall Fibres, which being cut or broken yield a Milk like Juice, as moſt of the *Hawkweeds* do; it has broad and ſomething long, hard, rough, dark green Leaves lying on the Ground, without any inciſſures or dents on the edges; the Stalk which riſes up among them is two or three Feet high, thick ſet with ſuch Leaves unto the top, but leſs, and growing leſſer and leſſer; at the tops ſtand a few yellow Flowers, compoſed of fewer Leaves than the Flower of the other Kinds, conſiſting but of one row, which are as the border to the middle Thrum, and being paſt away turn into Down; ſometimes this is found to vary, with leſs rough, or rather with ſoft Leaves, ſometimes broader and ſhorter.

XXI. *The nineteenth, or* Greater narrow Leav'd buſhy Hawkweed. It has a Root which is whitiſh, very long, and deeply ſpreading into the Earth, quickly over running a great deal of Ground, for every little piece being broken off will grow, and ſo is not eaſie to be rooted out of that place where it has once taken poſſeſſion; this *Hawkweed* grows very like the laſt, but has longer and narrower Leaves, ſomewhat rough, and dented or waved about the edges; the Stalk is more Branched at the top, where the Flowers are more and thicker, the Leaves of which are of a fair yellow color.

XXII. *The twentieth, or* Leſſer buſhy Hawkweed. It has a Root which is ſhort, and as it were bitten off, without any Fibres at it; this leſſer buſhy Kind riſes up with a ſingle Stalk, about a Foot and half high, ſet about with ſeveral ſhort and ſmooth Leaves in ſome places, and with almoſt round rough Leaves in others, dented about the edges, and at the top bearing ſeveral yellow Flowers upon ſhort Footſtalks, much like the laſt.

XXIII. *The Places.* The firſt ſix are Planted for the moſt part in Gardens, having been firſt brought to us out of *Italy*, yet the ſecond of them has been found growing Wild in *England*; the ſeventh is a native of *France*, but tranſplanted hither; the eighth and ninth only grow with us in Gardens; the tenth, eleventh, twelfth, thirteenth, fourteenth, fifteenth, and ſixteenth, grow upon Mountains and Hills in ſeveral parts of *England*, are alſo Natives of *Italy* and *Germany*, and are many of them tranſplanted alſo into our Gardens; the four laſt Kinds grow with us in Gardens, as alſo naturally Wild in ſeveral places of *England* and *Germany*; the eighteenth and nineteenth have been found growing in the way going from *London* to *Hampſted Heath*, as alſo in ſeveral other places.

XXIV. *The Times.* They all Flower, and their Down flies away in the Summer Months, and riſe again of their own Seed, but ſome of them will abide until the cold of *Autumn* cauſes them to periſh, but the moſt tender of them will Flower with us till the end of *Auguſt*, the Seed ripening in the mean time.

XXV. *The Qualities, Specification, Preparations and Virtues* of all theſe are the very ſame with the *Common Kinds* in the former Chapter, and are thought to be no leſs effectual than they in all the Effects and Properties pertaining to them, to which you are referred.

XXVI. *An Obſervation.* It is to be noted, that tho' the properties and force of all theſe Plants may be ſaid to be one and the ſame with the former *Common Kinds*; both from their form and their bitter taſte, which indicates in a great meaſure their Qualities and Virtues, yet the *ſixteenth*, or *Broad Leav'd Hawkweed* aforegoing, is particularly commended by *Camerarius* as a thing ſingularly good for the Phthiſick, or Conſumption of the Lungs, being made into a Conſerve or Syrup, or the Pouder of the Herb being taken with Honey; he ſays that in *Myſia* they put it into their Sallets, Broth, and Meats, for the ſame purpoſe; and that it is available for the Pleuriſie alſo, being ſo affirmed by ſeveral Authorities, and that without any help of Blood letting: If the Pouder, Conſerve, or Syrup, be ſo effectual as *Camerarius* ſays, then without doubt the Liquid Juice or Eſſence muſt very much tranſcend any of thoſe Preparations: The Eſſence may be given three or four Spoonfuls at a time, Morning, Noon, and Night, either alone, or elſe mixed with any proper Vehicle, and ſo to be continued till the Ulceration of the Lungs is digeſted, cleanſed, and healed, which you may eaſily know by the freſh Countenance of the Diſeaſed Patient, and by his getting a new production of Fleſh upon his Back, as alſo by his ceaſing to ſpit Matter and Corruption.

CHAP. CCCXLVI.

Of HEARTS-EASE Garden, OR, PANSIE.

I. *THE Names.* It is called in *Greek* Ἰὸς τριχρὲς, it ſeems to be the *Viola Flammea*, which *Gaza* will have to be Φλὸξ, or Φλόγιον, in *Theophraſtus Lib. 6. Cap. 6.* in *Latine Viola Tricolor, Herba Trinitatis, Herba Clavellata*, and of ſome *Jacea*, but this laſt Name is moſt proper to *Knapweed*, of which in its place; in *Engliſh Hearts-Eaſe, Herb Trinity*, and *Panſie*.

II. *The Kinds.* It is of three principal Kinds, *viz.* 1. *Viola Tricolor, Viola Trinitatis*, or *Flos Trinitatis Hortenſis*, Garden Hearts-Eaſe, of which in

this Chapter. 2. *Flos Trinitatis Sylveſtris*, Wild Hearts-Eaſe, of which in *Chap.* 347.

III. *The Garden Kinds.* There are three ſorts of the Garden Kinds, *viz.* 1. *Flos, ſeu Viola Tricolor Hortenſis communis, Viola Flammea major & minus*, The Greater, or Common Garden Hearts-Eaſe. 2. *Flos, ſeu Viola Tricolor Hortenſis, Viola Flammea Hortenſis Flore duplici*, Hearts-Eaſe with double Flowers. 3. *Viola Flammea lutea maxima*, The Great yellow Hearts-Eaſe.

Greater Garden Heartsease

Leſſer Garden Hearts-ease.

IV. The Deſcriptions. *The firſt* Greater or Common Garden Hearts-Eaſe. *It has a Root compoſed of nothing elſe but a bunch or knot of fibrous Strings, and periſhes every Year, the Plant raiſing it ſelf up plentifully by its own Sowing, where it is ſuffered*; its Leaves are longer, and more indented or cut in on the edges than thoſe of the *Violet*; the Stalks are upright, yet weak, and ready to fall down and lye upon the Ground, ſet here and there with the like Leaves, from whence come forth the Flowers, having little or no ſmell, and made in form like unto a Violet, yet more open, and with larger Leaves, but ſo variably mixed with Blew, or Purple, White and Yellow, that it is difficult to ſet down all the varieties; for ſome Flowers will be more White, and but ſome ſpots of Purple or Blew in the two upper Leaves, and the lower Leaves with ſome ſtripes of yellow in the middle; others will have more Purple in them than any other color, both in the upright and lower Leaves, the ſide Leaves Blew, and the middle Yellow; and others White and Blew, with yellow ſtripes, as Nature is pleaſed to vary the Colors: The Seed is ſmall, whitiſh, and round, and contained in ſmall round Heads. The leſſer is like to this.

V. *The ſecond, or* Hearts-Eaſe with double Flowers. *This is a very pleaſing Plant, and bears Flowers with more Leaves than the former, making it ſeem to be twice double, and that only in Autumn*, for the firſt Flowers, which come in Summer, are ſingle; this is of that ſort which bears Purple Flowers, and it is to be noted, that the Seed of this Kind will not all bring double Flowers, but only ſome of them, where the Ground is fit, and the Plant thrives and takes a liking to it; ſo that if you have once had of this *Double Kind*, you ſhall ſeldom miſs to have double Flowers again every Year of its own growing or ſowing.

VI. *The third, or* Great yellow Hearts-Eaſe. *This is another Species which decks and adorns our Gardens, and therefore is not to be left out*; its Leaves and Flowers are like the former, but more plentiful in Stalks and Branches, and better abides our Winters; the Flowers are larger than any of the former, of a fair pale yellow color, with ſome yellow ſtripes now and then about the middle, for it is ſometimes without any ſtripes, and alſo of a little deeper yellow color; this Plant is to be encreaſed by ſlips, which will ſoon multiply in a fertil and moiſt Ground, for it has ſcarcely ever been obſerved to bear Seed.

VII. *The Places.* All theſe Plants were firſt Wild, and by being brought into the Garden, and Manuring, they have been brought to a very great fairneſs of color, and the beauty which they now poſſeſs, and alſo to a better ſmell than when they grew Wild; and in the ſame manner I believe many other Wild Plants might have been improved, even to a kind of perfection.

VIII. *The Times. Hearts-Eaſe* ſeldom Flowers until *May*, but then ſome will abide to Flower until the end of *Autumn* almoſt, if Froſts, by their being too early, hinder not, as thoſe of the *Double Kind*.

IX. *The Qualities. Hearts-Eaſe* ſeems to be temperate as to its firſt Qualities, it is Emollient and Glutinous, in all its Parts and Qualities like unto *Violets*, but in its glutinous quality more like to *Mallows*; it is Coſmetick, Vulnerary, Pectoral, and Alexipharmick.

X. *The Specification.* It is ſaid to be good againſt Ulcers of the Lungs, and the Epilepſie.

XI. *The Preparations.* You may have therefrom, 1. *A Juice or Eſſence.* 2. *A Decoction in Water or Wine.* 3. *A Syrup.* 4. *A Cataplaſm.* 5. *An Ointment or Balſam.* 6. *A Powder of the Herb and Flowers.*

Flowers. 7. *A Distilled Water.* 8. *An Acid Tincture.*

The Virtues.

XII. *The Juice or Essence.* They are very viscous, and emollient, good against hot Diseases of the Breast and Lungs, and against Agues, being taken three Hours before the coming of the Fit, as also against Convulsions, and the Falling-Sickness in Children; it is also good to bath the places troubled with the Itch, Tettars, Scabs, or other breakings out in the Skin, and to cleanse old Sores and fœtid Ulcers, being washed therewith: You may take from three to six Spoonfuls at a time in the Morning fasting, and last at Night going to Bed, either alone by it self, or mixed with some fit Vehicle.

XIII. *The Decoction in Water or Wine.* It has all the Virtues of the Juice or Essence, but not altogether so powerful, but is something better to wash old Sores and Ulcers withal, because it cleanses more, dries and heals; inwardly it may be given from four to eight, or ten Ounces, according to the Age and Condition of the Patient. *Lugdunensis* says that many Sacks full of the Herb and Flowers are Yearly Transported from *Marseilles* in *France* unto *Alexandria*, and other parts of *Ægypt*, where they use them boiled in Water, which only (by their Religion) they are enjoined to drink; and this they do, not only thereby to make the Water the more wholsom to be drunk, but are also perswaded that it helps against Diseases of the Breast and Lungs.

XIV. *The Syrup. It may be made of the Juice or Essence, with Honey, or of the Flowers, exactly in the same manner as you make Syrup of Violets.* They are both admirable Pectorals, cause easie Expectoration, and cleanse the *Thorax*, or Breast, Lungs, and Stomach, from crude salt Flegm, frothy and viscous Humors, and other like Tartarous Matter, which causes Coughs, Wheezing, Hoarseness, shortness of Breath, difficulty of Breathing, and other like Diseases of those parts; it is also said to heal a *Phthisis*, or Ulceration of the Lungs, being timely and assiduously taken. The Syrup of the Flowers mixed with fair Water, and the Juice of Limons, and so made as it may be freely potable, being largely drank, it quenches Thirst, abates præternatural heat, and extinguishes burning Fevers.

XV. *The Cataplasm.* It is good to be applied to simple Contusions, as also to places broken out with the Itch, Scabs, Tettars, Pimples, Scurff, Morphew, *&c.* for it discusses, opens the Pores, cleanses, and absorbs the sharpness of the Humor.

XVI. *The Ointment or Balsam.* They may be made of the Liquid Juice, or Green Herb, according to the usual Method; they digest, cleanse, dry and heal Wounds, and ill conditioned Ulcers; the Balsam many times heals a simple green Wound at once or twice dressing; it is also a very good thing to be applied in the extremities of the Gout, giving ease in a very short time.

XVII. *The Pouder of Herb and Flowers.* It is Vulnerary, being applied dry upon Ulcers, it sucks up their moisture, cleanses, incarnates, and dries, thereby inducing a speedy healing, more especially if the Sore or Ulcer be every time, before it is applied, well washed with the Juice or Essence.

XVIII. *The Distilled Water.* *Costæus* in his Book of the Nature of Plants says, that the Distilled Water of *Hearts-Ease* is commended in the *French* Disease to be profitable, being taken for nine days, or more, and Sweating upon it; how true this is I will not say, but wish that by Experience it might be confirmed; if the Distilled Water can have such Virtues, what may the Liquid Juice or Essence be able to do in the same Case? I doubt not but they exceed the Distilled Water ten times at least in their Power and Effects; but the Distilled Water mixed with the Juice Liquid, or Inspissate, becomes an excellent thing for the conglutinating and healing of simple green Wounds.

XIX. *The Acid Tincture.* It is a singular thing to abate the burning Fit of Agues, and extinguish the most vehement heat, even of malign Fevers; it is good against all malign Diseases, and resists the Plague or Pestilence it self. Dose so many drops as to make the Vehicle gratefully sharp and pleasant, and to be taken in all that the Patient drinks; it also quenches Thirst admirably.

CHAP. CCCXLVII.

Of HEARTS-EASE Wild, *OR,* HERB TRINITY Wild.

I. *The Names.* It is called in *Greek* Ἰὸν φλόμου ἄγρίου, in *Latine Viola Flammea Sylvestris*, *Herba Trinitatis Nemoralis*, *Flos Trinitatis Nemorosus*, *vel Sylvestris*, and in *English Wild Hearts-Ease*, *Wild Pansies.*

II. *The Kinds.* There are four Species of this Plant, *viz.* 1. *Viola Tricolor Sylvestris communis*, The Common Wild Hearts-Ease. 2. *Viola Tricolor assurgens*, Upright Wild Hearts Ease. 3. *Viola Tricolor lutea Sylvestris*, Wild yellow Hearts-Ease. 4. *Viola Tricolor Petræa*, Stoney Hearts-Ease.

Hearts-Ease Wild.

III. The Descriptions. *The first*, *or* Common Wild Hearts-Ease. *It has a fibrous Root, which sends*

up

up at firſt many round Leaves, afterwards they grow ſomething longer, and are ſlightly cut about the edges, and by their weakneſs lye upon the Earth; the Stalks are weak and tender, and tho' they ſeem to grow a little upright, yet they ſeem to trail, or lean towards the Ground, upon which grow ſeveral like Leaves, as alſo Flowers, like to *Violets*, upon long Footſtalks; the chief difference between theſe *Wild* and the former firſt *Garden Kind* is in the color, and largeneſs of the Flowers, (for in the Leaves and form of growing there is but little variation) the Flowers in this being for the moſt part ſmaller than thoſe of the *Garden*, and of as little ſmell; but as to the Colors they are various, yet there is ſcarcely a Flower among many which has three colors, for they are chiefly White, and pale Blue, more or leſs marked or ſpotted, and ſometimes yellow in the bottom; the Flowers being paſt away, little round Heads ſucceed, ſomething leſs than a Tare, about the bigneſs of a large great Pins head, which being ripe, do open themſelves, and in a little time after let their Seed fall forth.

IV. *The ſecond, or* Upright Wild Hearts-Eaſe. *It has a Root compoſed of Fibres or Strings, which periſh after Seed time, the Plant riſing again of the fallen Seed*: This *Hearts-Eaſe* grows to be about a Foot high, or more, with hard upright Stalks, which yet at their tops bend a little again, they have two Leaves ſet at each Joint, but longer, and more dented about the edges than the firſt *Garden Kind* in the former Chapter; at theſe Joints with the Leaves, on both ſides of the Stalks, comes forth a larger Flower, and more ſpread open than thoſe of the firſt *Garden Kind*, yet very like to them, of a pale purpliſh color, and almoſt as ſweet as a *Violet*, as *Matthiolus* ſays, but without ſmell, as *Lobel* ſays; *Dodonæus* deſcribes this Kind with variety of Colors, and therefore calls it *Viola aſſurgens Tricolor*, whereas *Matthiolus* declares his to be only Purple; after the Flowers are paſt, longer Seed Veſſels follow than thoſe of the *Garden Kind*, in which is contained ſmall whitiſh Seed.

V. Gerard *has this Deſcription of it.* The upright *Panſie*, or *Hearts-Eaſe*, brings forth long Leaves, deeply cut in on the edges, ſharp pointed, of a bleak or pale green Color, ſet upon ſlender upright Stalks, cornered, jointed, or kneed, about a Foot high, or higher, upon which grow very fair Flowers, of three colors, *viz.* Purple, Blue, and Yellow, in form or ſhape like unto the firſt *Common Garden Hearts-Eaſe*, but greater and fairer, which Colors are ſo excellently and orderly placed, that they bring great delight to the beholders, tho' at the ſame time they have little or no ſmell at all in them; for it happens oftentimes that the uppermoſt Flowers are differing from thoſe which grow upon the middle of the Plant, and thoſe again vary from the lowermoſt, as Nature is pleaſed to play with things of ſuch beauty.

VI. *The third, or* Wild Yellow Hearts-Eaſe. *This in its Root, Stalk, Leaves, and manner of growing, is much like to the firſt aforegoing, and has been taken by ſome young Herbariſts to be the* Yellow Violet; the Flowers are of a faint yellow color, without mixture of any other color, yet having a deeper yellow ſpot in the loweſt Leaf, with four or five blackiſh purple Lines, in which it differs from the firſt *Wild Kind*.

VII. *The fourth, or* Stoney Hearts-Eaſe, *is a mean and low Plant, the Leaves are rounder, and not ſo much cut about the edges as the firſt is*; the Stalks or Branches are weak and feeble, trailing upon the Ground; the Flowers are likewiſe of three Colors, *viz.* White, Blue, and Yellow, but void of ſmell; and the Root periſhes having perfected the Seed.

VIII. *The Places.* They grow in waſte and Corn Fields, about their borders, and in Fallow Grounds, and borders of Groves and Forreſts; the firſt and ſecond, tho' they grow Wild in the Fields, yet they ſometimes alſo grow in Gardens; the ſecond, or *Upright Kind*, grows on Mount *Baldus* in *Italy*; *Lobel* ſays it grows in *Languedock* in *France*, and on the tops of ſome Hills in *England*; the third, with yellow Flowers, has been found by a Village in *Lancaſhire*, called *Latham*, about four Miles from *Kircham*; the laſt grows only in Rocky, Stoney, Gravelly, and barren Grounds, and other like places.

IX. *The Times.* They Flower not only in the Spring, but for the moſt part all Summer long, thro' *April*, *May*, *June*, and *July*, even to *Auguſt*.

X. *The Qualities, Specification, Preparations, and Virtues*, are the ſame with thoſe of the *Garden Kind* in the former Chapter, ſo that no more need be ſaid concerning the ſame in this place.

CHAP. CCCXLVIII.

Of HELLEBOR BLACK True,

O R,

CHRISTMAS FLOWER.

I. *THE Names.* It is called in *Arabick Cherbachem*, and *Charbach aſued*, in *Greek* Ἑλλέβορος, and ſometimes without the Aſpirate Ἔλλεβορος, in *Latine Elleborus*, and *Helleborus*, alſo *Helleborum*, and *Veratrum, quod Mentem vertat*, in *Engliſh* alſo *Hellebor*, and *Chriſtmas Flower*.

II. *The Kinds.* There are two principal Kinds, *viz.* 1. Ἑλλέβορος μελας, ἢ Ἑλλέβορον μελαμπόδιον, *Helleborum nigrum, Veratrum nigrum*, Black Hellebor, of which we ſhall Treat in this Chapter, and in Chap. 349. and 350. Ἑλλέβορος λευκὸς, *Helleborus albus, vel Helleborum album, Veratrum album, Sanguis Herculeus, Conſiligo vegetij, Abſyrti Columellæ & Plynij*, White Hellebor, and Sneeze-Root, of which we ſhall (God willing) Diſcourſe in *Chap.* 351. and 352. following.

III. *The Kinds of Black Hellebor.* There are ſeveral Kinds of this Plant, as 1. *Helleborus niger verus*, The true Black Hellebor, called alſo *Veratrum nigrum verum*, of which in this Chapter. 2. *Helleborus niger nothus maximus, Helleboraſter maximus*, *Conſiligo*, Baſtard Black Hellebor, or Bears-Foot, called by ſome Country People *Setterwort*, *quaſi Setonwort*, being applied to the Ears, Neck, and other parts, after the manner, or in place of a *Seton*. 3. *Helleborus niger nothus minor*, *Helleboraſter minor*, The leſſer Baſtard Black Hellebor, which is alſo called *The leſſer Bears-Foot*, of both theſe we ſhall Treat in *Chap.* 349. 4. *Elleborine*, *vel Helleborine nigra Saniculæ Folio major*, Wild Black Hellebor with Sanicle Leaves the Greater; it is called alſo *Aſtrantia nigra* by *Lobel* and *Geſner*, *Oſteritium Montanum Tragi*, *Imperatoria nigra Tabernamontani*, but *Dodonæus* takes it to be *Elleborus niger*, or *Veratrum nigrum Dioſcoridis*, and *Bauhinus* calls it *Elleborus niger Sanicule Folio major*. 5. *Elleborine nigra Sanicule Folio minor*, *Helleborus niger Sanicule Folio minor*, Wild Black Hellebor with Sanicle Leaves the Leſſer, or The Leſſer Sanicle like Hellebor. 6. *Elleborine Ferulacea, Helleborus niger Ferulaceus*, *Pſeudohelleborum Matthioli*, *Buphthalmum majus Anguillaræ Cluſij, & aliorum*, Wild Baſtard

ſtard Black Hellebor Fennel Leav'd, of which three laſt in *Chap.* 350. following.

IV. The Deſcription. *The firſt*, *or* True Black Hellebor, *called* Chriſtmas Flower. *It has a Root which conſiſts of a great number of browniſh black Strings, which run down deep into the Ground, and are faſtned to a thick head, of the bigneſs of ones Finger, growing ſmaller from its top or head downwards*; from this Root riſe ſeveral fair green Leaves, each of them ſtanding upon a thick, round, ſtiff, green Stalk, about a Hand breadth high from the Ground, divided into ſeven, eight, or nine parts, or Leaves, and each of them nicked or dented from the middle of the Leaf to the pointward on both ſides, abiding green all the Winter, at which time the Flowers riſe on the like ſhort Stalks as the Leaves grow on, without any Leaf thereon for the moſt part, yet ſometimes having a ſmall, ſhort, pale green Leaf, reſembling rather a Skin than a Leaf, a little under the Flower, and grow but little higher than the Leaves; each Stalk alſo bears uſually but one Flower, very rarely two, conſiſting of five large, round, white Leaves apiece, like unto a great ſingle White Roſe, chancing ſometimes to be either daſht with a Purple about the edges, or to be wholly Purple, without any White in them, as the Seaſon, Weather, or time of continuance does contribute to effect the ſame; this Flower has many pale yellow Thrums in the middle, ſtanding about a green Head, which afterwards grows to be the Seed Veſſel, divided into ſeveral Cells or Pods, like unto a *Columbine* Head, or *Aconitum Hymeale*, but greater and thicker, in which is contained ſomewhat long and round blackiſh Seed, like to the Seeds of the *Baſtard Kinds*, or *Bears-Ecots*.

V. *The Places.* It grows in *Greece*, *Italy*, *England*, *France*, and *Germany*, in many places of thoſe Countries, as alſo in *Anticyra*, an Iſland over againſt the Hill *Oeta* in *Theſſaly*, where it is ſaid to grow in an extraordinary plenty, whence came the Proverb (ſpeaking to a Melancholy or Mad Man, as to his Cure) *Naviga ad Anticyras*; but with us in *England* it only grows in Gardens.

VI. *The Times.* It Flowers in *December*, and *January*, if the Seaſon or Weather be any thing temperate, if the Air is mild and warm, it generally Flowers about *Chriſtmas* time, from whence with us came the Name of *Chriſtmas Flower*.

VII. *The Qualities.* It is hot and dry in the third degree, Aperitive, Abſterſive, Coſmetick, Hepatick, Splenetick, Arthritick, Cathartick, Emetick, and if given by an unskilful Hand φαλτικὸν, or Venefick.

VIII. *The Specification.* It is peculiar againſt Madneſs and Melancholy, Quartan Agues, Scabbineſs, and Leproſie, kills Worms, and cures the Kings-Evil, Dropſie, Yellow Jaundice, and Gout.

IX. *The Preparations.* You may have therefrom, 1. *The Liquid Juice of the Leaves.* 2. *An Eſſence of the ſame.* 3. *An Infuſion or Decoction of the green Leaves.* 4. *An Infuſion or Decoction of the Root.* 5. *A Syrup.* 6. *A Powder of the Leaves or Root.* 7. *A Seton of the Root.* 8. *An Extract of the Root.* 9. *A Peſſary of the Root.* 10. *A Lotion of Herb or Root.* 11. *An Ointment of the Herb.* 12. *A Diſtilled Water of the Green Herb.* 13. *An Acid Tincture of Herb or Root.* 14. *A Spirituous Tincture.* 15. *An Oily Tincture.* 16. *A Saline Tincture.*

The Virtues.

X. *The Liquid Juice of the Leaves.* It is uſed for moſt Diſeaſes in which *White Hellebor* is available, but it is nothing ſo violent or dangerous; the Juice of the Leaves made up with Flower into ſmall Cakes and baked, has been uſed to good purpoſe againſt the Dropſie, Jaundice, Cachexia, and other evil diſpoſitions of Liver, Spleen, and Gall; it may be given from half a Dram to two Drams, according to Strength and Age.

XI. *The Eſſence.* It is uſed to open and purge the Body in ſeveral Caſes (as well as the Extract of the Roots) and is of great uſe and effects againſt all Melancholy Diſeaſes, long and tedious Agues, as the Quartan, and the like; it eaſes the Megrim, and Cephalæa, or old inveterate Headach, Yellow and Black Jaundice, Leproſie, Falling-Sickneſs, Conſumption, either of the Lungs or whole Body, pains of the Belly, Sciatica, Cramps, Convulſions, or ſhrinking of the Nerves, as alſo all other Griefs and Pains of the Joints or Nerves, as Gout, Inflammation, and the like, it being taken Morning and Evening, half a Dram at a time, in any convenient Vehicle, always increaſing or diminiſhing the Doſe, according to the Age and Strength of the Patient, and as you find it by obſervation to work.

XII. *The Infuſion or Decoction.* It may be made with Water (if for hot Diſeaſes) or Wine (if for cold Diſtempers) but Authors adviſe, that the Herb or Root be firſt corrected, by ſteeping it in Vinegar, (becauſe of its dangerous and obnoxious Qualities) a day and a night, and then dryed again; yet our *Engliſh* Kind ſeems not to be ſo violent as that which grows in hotter Countries, nor has it ſuch a violent operation in working, for which reaſon that prævious correction of it may be forborn; theſe have all the Virtues of the Juice and Eſſence, but work with more moderation, and are much ſafer to be taken, and may be uſed in all the Caſes aforenamed. Doſe from half an Ounce to two, three, or four Ounces, according to Age, &c.

XIII. *An Infuſion or Decoction of the Root.* It has all the Virtues of thoſe of the Leaves, but it yet operates more moderately, and therefore is the more ſafe to be taken; Country People give the Infuſion or Decoction of either Leaves or Roots to kill Worms in Children, I confeſs they may be given to ſuch

ſuch as are come to Mans ſtrength and growth, but to Children it ought to be given with a great deal of caution, or elſe forborn, ſince there are many other things which will do the ſame ſafely, and fully as effectually as theſe can.

XIV. *A Syrup.* It is made of the Infuſion or Decoction of Herb or Root, boiled up to a conſiſtency with Honey, or as ſome will have it, with Honey and Vinegar, which is indeed better; it is both Emetick and Cathartick, and evacuates Tartarous Matter from the Lungs; it cleanſes alſo the Tunicles of the Stomach and Guts from evil juices adhering to the ſame. Doſe from one Spoonful to two, or three.

XV. *The Pouder of the Leaves or Root.* It has all the Virtues of the Liquid Juice, Eſſence, Infuſion, Decoction, or Extract, but it works much more churliſhly, cauſing Gripings, Fainting, vehement Sickneſs at Heart, and ſometimes Swooning away; it kills Worms, and is good to give in Madneſs, and to ſuch as are troubled with a Hypochondriack Melancholy; if an Iſſue is cut in any fleſhy part, yea, in the Neck, or upon the Shoulder, or brawn of the Arm, or Thigh, or Leg, and a Pea be put into it for a day or two, and then the hole of the Iſſue be ſtopped up with the Pouder of *Hellebor* Leaves, and left there for one, two, three, or more days, it will make a Tumor nearly as large as an Egg, and draw all the ill Humors from all, yea, the moſt remote parts of the Body to that place, and expel them there, and by this means the Kings-Evil, Leproſie, Gout, Sciatica, and Pocky Symptoms, have been cured, yea, after that a number of Purgings, Vomitings, Bleedings, and Salivations, have all been uſed in vain, and had no effect upon the Patient.

XVI. *The Seton of the Root.* It is uſed to Rowel Cattel withal, as Country People call it. *Pliny Lib.* 25. *Cap.* 5. ſays, that a piece of the Root of *Black Hellebor* being drawn through a hole made in the Ear of a Beaſt troubled with the Cough, or having taken any poyſonous thing, cures it, if it be taken out the next day at the ſame Hour: *Abſyrtes* and *Hierocles* ſay the ſame thing, as alſo *Columella.* This manner of Curing is uſed with us, but the place is changed from the Ear to the Dew-lap in Oxen, and to the fore Leg or hinder Leg of an Horſe above the Paſtern.

XVII. *The Peſſary.* Being applied to the Womb, it mightily prevails to bring down Womens Courſes, and if there is any callous or hard fleſh grown in the *Vagina*, leading to the Womb, or in a Fiſtula, the Root being left therein for two or three days, it will totally conſume it; *Galen Lib. 6. de Simp. Med.* affirms this, and *Julius Alexandrinus* ſays he often tryed it to be true.

XVIII. *The Extract of the Root.* This has all the Virtues of the Juice, Eſſence, Infuſion, Decoction, and Syrup aforegoing, and is more mild and fit to be taken than any of them, and as it may be always ready at Hand, ſo it may be given in all thoſe Diſtempers for which thoſe Preparations are to be exhibited. Doſe from a Scruple to a Dram, or Dram and half, in the Morning faſting.

XIX. *The Lotion of Herb or Root.* It is made by Infuſion or Decoction in Wine Vinegar, or in half Vinegar half Wine; it is good to waſh any place troubled with Scabs, Wheals, or Puſhes, Leproſie, or any other like breaking out, yea, altho' it be a Gangrenous or Phagedenick Sore or Ulcer, it ſtays their ſpreading or eating, and preſerves the Fleſh from putrifaction; this ſame Lotion helps alſo the Toothach, if the Mouth be gargled therewith, and it be held ſome ſmall time therein; alſo dropped into the Ears, it eaſes the pain, helps againſt the noiſe of the Ears, and removes the deafneſs; if any foul or callous Ulcer or Fiſtula be waſhed with this Lotion, and then the Pouder of the Root be ſtrewed thereupon, it dries, heals, and ſuddenly cures them.

XX. *The Ointment of the Herb.* If People afflicted with Lice be often waſhed with the Decoction of *Hellebor* hot, and then the Head or other parts anointed with this Ointment, it kills them, and perfectly deſtroys the breed.

XXI. *The Diſtilled Water.* It is of good uſe to remove black and blew ſpots or marks from the Skin, and to take away the yellowneſs thereof, as alſo Tanning by the Air, Sunburning, Pimples, Morphew, and other like deformities of the ſame.

XXII. *The Acid Tincture.* Given to a grateful acidity in any proper Vehicle, it kills Worms in Old or Young, it gently Purges, and prevails againſt all the Diſeaſes the Herb or its Root is good for; it alſo overcomes Poyſon, if the Patient takes it ſoon after the receiving of the Poyſon; mixed with Damask Roſe Water, it is good to waſh Pimples in the Face and Skin, as alſo Lentils, Freckles, *&c.* it ſoon takes them away, and reſtores the Skin to its true and natural color.

XXIII. *The Spirituous Tincture.* It is an extraordinary thing to bath hot withal in a Gangreen, preventing and curing the ſame; it may be given inwardly from half a Dram to two Drams, and more, according to Age and Strength, againſt the Kings-Evil, Jaundice, Dropſie, Gout, Leproſie, *French Pox*, and other Diſeaſes of like kind; it ſomething troubles the Stomach, otherwiſe it works well enough.

XXIV. *The Oily Tincture.* It is very good againſt the Sciatica, Gout, and weakneſſes and pains of the Joints and Nerves, it reſolves Convulſions, and yet ſtrengthens the Nerves, and reſtores in a Palſie; it is good alſo to anoint withal upon any ſtraining of the Nerves, or when the Bones are out of Joint, becauſe it warms and comforts the part, and reſtores the Tone thereof being hurt.

XXV. *The Saline Tincture.* It is to be uſed as hot as can be endured upon the part or parts afflicted with Scabbineſs, Tettars, Ringworms, Pimples, or other breakings out, as alſo againſt yellowneſs, blackneſs and blewneſs of the Skin, Lentils, Freckles, Sunburning, Tanning, Scurff, Morphew, Leproſie, or any other like defœdation; if it is conſtantly uſed two or three times a day for ſome time, it certainly cures thoſe deformities, and leaves behind it a pleaſing ſmoothneſs and beauty.

CHAP. CCCXLIX.

Of HELLEBOR BLACK Baſtard.

OR,

BEARS-FOOT.

I. *THE Names.* It is called in *Greek* Ἐλλέβορος νόθος, in *Latine Helleborus nothus*, and *Helleborum nothum*, in *Engliſh Baſtard Black Hellebor*, and *Bears-Foot.*

II. *The Kinds.* There are two Kinds hereof, *viz.* 1. *Helleboraſter, Helleboraſtrum maximum, Helleborus nothus maximus, Conſiligo*, The Greater Baſtard Black Hellebor, or Bears-Foot, called alſo *Setwort*, and *Setterwort.* 2. *Helleboraſter, Helleboraſtrum minus, Helleborus niger nothus minor*, The Leſſer Baſtard Black Hellebor, or Leſſer Bears-Foot. *Fuch-*

ſius

sius calls this *Helleborus adulterinus Hortensis*, and *Consiligo minor Lugdunensis*, but the *Helleborus niger vulgaris Gesneri*.

III. The Descriptions. *The first, or* Greater Bastard Black Hellebor. *It has a single Root, with nothing so many Strings growing to it as the* True *in the former Chapter has, and oftentimes perishes after it has given Seed, yet not always, nor in all places*; from this Root proceed several sad green Leaves, each upon a long Footstalk, which are divided into seven or nine Leaves, each of which are narrower than those of the *Lesser Bastard Hellebor* in the next Section, a little dented about the edges, but not so deeply as the *Lesser*, and abiding above Ground green all the Winter, whereas the following perishes every Year, and rises again in the spring; from among these Leaves shoots up a reasonable large and tall Stalk, higher by half than the *Small* following, with such like Leaves thereon as grow below, but smaller up to the top, where it spreads it self out into divers Branches, bearing many hollow Cup-like Flowers, divided at the brims into five parts, but do seldom spread themselves open, of a whitish yellow green color, somewhat like the next *Bastard Kind*, and sometimes purplish about the brims or edges, with a green Head in the middle, and a few white Threads about it, by which it seems to be *Veratrum nigrum quartum peregrinum Clusij*: This green Head growing to be the Vessel, wherein the black Seed is contained, shoots forth into four, five, or six Horns, fashioned like the following *Bastard Kind*, saving, that it is smaller, as the Seed also is for the most part; the whole Plant, and every part thereof, is of a worse smell than the following; the Root of this, with the lower part of the Stalk next to it, is of that *Bears-Foot*, or *Setterwort*, which Country People use to Rowel their Cattel with.

IV. *The second, or* Lesser Bastard Black Hellebor. *It has Roots which are more stringy, black and hard than the former in* Chap. 348. it is in most things like unto that *True Black Hellebor*, for it bears also many Leaves, as seven, eight, or nine, upon short Stalks, divided into many parts, but each of them are longer and narrower, of a darker green color, and dented on both sides, feeling something hard. these perish every Year, but rise again the next Spring; the Flowers hereof stand on higher Stalks than the *True*, with some Leaves on them also, yet very few, and are of a pale green color, like the *True* in the former Chapter, but smaller by half at least, having likewise many greenish yellow Threads or Thrums in the middle, and such like Seed Vessels, and blackish Seed in them.

V. *The Places.* The first grows, as *Tragus* says, in the borders of Stoney Fields and Grounds, also on Rocky Hills, as by the *Mosella* and *Rhine*, also in *Sylva Harcynia*, and as *Pena* says, in *Aquitane* in *France*, and by the River *Lanes* at *Montpelier*; it grows Wild in many Woods and shadowy places in *England*, as also in almost all our Gardens about *London*, and several other parts of the Kingdom; the second has been found in some Woods in *Northamptonshire*, and in other places of this Land, as also in some places within Eight or Ten Miles of *London*.

VI. *The Times.* They both Flower in *February* or *March*, according as the preceeding Winter and Spring Season are in mildness, and their Seed is ripe in *May*, or towards *June*.

VII. *The Qualities, Specification, Preparations and Virtues* of these *Bastard Black Hellebors* are the same with those of the *True* in the former Chapter, so that no other declaration need be made thereof.

VIII. *Observat.* 1. That the *Greater Bastard Black Hellebor*, *Bears-Foot*, or *Setterwort*, was held by *Dodonæus* to be a kind of venomous *Aconite*, or *Woolfs-bane*, not to be used, and that it would kill Woolves, Foxes, Dogs, *&c.* I have known it used in Decoction to kill Worms in the Belly, which it would effectually do, but it had a deleterious or poysonous quality, which some Bodies could not overcome, where it killed not the Patient, it would indeed kill the Worms; but it is so dangerous a Medicine, that it ought not to be internally used, but by a very Skilful and Prudent Hand, and yet nothing scarcely is more common to be used by Women in the Country than the Decoction of this Herb for the purpose aforesaid; I knew a little Youth take it to kill Worms, but it killed him first; also a Woman between Forty and Fifty Years of Age, whom it killed in about three Hours time; at the same time, by a Womans Advice, the Decoction was given to my self, being then about Eight Years of Age, but I met with a better Fate in the use thereof, yet my danger was great, it vehemently Vomited me, and made me Heart-sick, to swooning away; the Vomiting being over, I revived, but it had such an effect upon me, that it made me loose my Hair, and Nails both of Fingers and Toes, and all the Skin of my whole Body peeled off, from Head to Foot; whether my good hap was from the strength of my Constitution, or the small Dose of the Medicine, I leave others to determine, but from these bad effects it is manifest that it is not very safe to be given, no not to very strong Bodies, but outwardly applied it may be of good use.

IX. *Observat.* 2. That the Pouder of the Leaves of this is much more effectual than the Pouder of the Leaves of the *True* in *Chap.* 348. *Sect.* 15. to all the external Intentions and Purposes there mentioned, and that the Leaves of this ought rather to be chosen than the Leaves of that, especially being applied or put into the hole of an Issue, as is there directed; it is a wonderful thing to see what a vast quantity

of Humor it will draw away from all parts of the Body for many days together, doing therein what a Salivation it ſelf could never be able to perform, and that in the moſt deplorable, ſtubborn and rebellious Diſeaſes; indeed it is beyond what Words can ſpeak. The Root alſo of this uſed as a Peſſary, is much more effectual than the Root of the *True*, eſpecially being put into a Fiſtula, or part where there is any callofity, becauſe it ſo admirably diſſolves the ſame.

X. *Obſervat.* 3. That the *ſecond Kind*, or *Leſſer Baſtard Black Hellebor*, or *Smaller Bears-Foot*, (from the great Experience which I have had thereof) is much more violent and churliſh in working, whether by Vomit or Stool, than the *True Black Hellebor* deſcribed in the former Chapter, you may adventure to give the Infuſion of a Dram of the Root, being infuſed all Night in Pouder in White Wine or Canary, to be drunk the next Morning faſting, ſo exhibited it powerfully prevails againſt all the Diſeaſes which the *True Hellebor* is ſaid to be good againſt, for which reaſon there is no need in this place to repeat thoſe things again; and the uſe of the Pouder of the Leaves or Root are in like manner uſeful in all outward Caſes for Scabs, old running Sores, foul Ulcers, Fiſtula's, *&c.*

CHAP. CCCL.

Of HELLEBOR BLACK Wild.

I. *THE Names.* It is called in *Greek* Ἑλλέβορος μέλας ἄγριος, in *Latine Helleborine nigras*, *Helleborus niger Sylveſtris*, and in *Engliſh Wild Black Hellebor.*

II. *The Kinds.* There are three Kinds of *Helleborine nigra*, viz. 1. *Helleborine nigra Saniculæ Folia major*, *Helleborus niger Saniculæ Folio major Sylveſtris*, *Sanicula fœmina Fuchſij*, *Aſtrantia nigra Geſneri*, *Oſtcritium Montanum Tragi*, *Imperatoria nigra Tabernamontani*, *Elleborus niger*, *vel Veratrum nigrum Dioſcoridis*, as *Dodonæus* thinks, The Greater Wild Black Hellebor, or The Greater Helleborine with Sanicle Leaves. 2. *Elleborine nigra minor*, *Helleborus niger Saniculæ Folio minor Sylveſtris*, The Leſſer Sanicle Leav'd Wild Black Hellebor, The Leſſer Black Helleborine, or Wild Black Hellebor. 3. *Helleborine nigra Ferulacea*, *Buphthalmum majus Anguillaræ Cluſij*, *& aliorum*, *Helleborum nigrum Fœniculæ Folio*, *Pſeudohelleborus niger Matthioli*, Fennel Leav'd Wild Black Hellebor.

III. The Deſcriptions. *The firſt*, *or* Greater Wild Black Hellebor Sanicle Leav'd. *It has a Root compoſed of ſmall black Strings*, *ſhooting forth from a top head*, *like unto the Root of* Bears-Foot; from this head of a Root come forth ſeveral broad dark green Leaves, each of them growing upon a long Footſtalk, which are cut in on the edges into five diviſions for the moſt part, and dented about beſides, ſomething reſembling the Leaves of the *Common Sanicle*, but more truly the Leaves of the Field *Ranunculus*, or *Crowfoot*, or *Geranium Batrachoides*, or *Crowfoot Cranes-bill*; from among which riſe up ſeveral ſlender ſmooth, green Stalks, having ſome Leaves upon them, and at the tops of them two, or three, or more Flowers together, each of them conſiſting of many ſmall, hard, whitiſh Leaves, as a pale border, encompaſſing many Threads in the middle, which being fallen, there riſe up many flat, whitiſh, and long Seed, ſomewhat like unto *Sweet Fennel* Seed, but not altogether ſo big, nor ſo yellow.

IV. *The ſecond*, *or* The Leſſer Wild Black Hellebor Sanicle Leav'd. *It has a ſmall black fibrous Root*, *like the former*, from the head of which riſe up ſeveral ſmall and ſomewhat round Leaves, every one of them upon a long Footſtalk, being not much broader than the Nail of a Mans Thumb, yet divided, even to the middle Rib, into ſeven parts, every one of them being ſhort, narrow, and dented about the edges; the Stalks are many, and ſmall, not above an Hand breadth high, with one or two Leaves on them, more cut in and divided than the lower are, at the tops of them ſtand ſeveral ſmall Flowers, very thick ſet together in Tufts or Umbles, like unto the laſt, but ſmaller, after which come ſmall flat Seed, ſomething like the former, but leſſer by much, as it is alſo in all the other parts thereof.

V. *The third*, *or* Fennel Leav'd Wild Black Hellebor. *Its Root conſiſts of many long and blackiſh Strings ſet together*, *and proceeding from one head*, *very like unto the* Leſſer Black Hellebor, *or* Bears-Foot, *in* Chap. 349. Sect. 4. *aforegoing*, *but harder*, *ſtiffer*, *or more brittle*, *and ſeeming to be without any moiſture in them*, *but abide and encreaſe every Year*, *tho' the Stalks with green Leaves do Annually periſh:* This Kind of *Wild Black Hellebor* ſhoots forth many green Stalks, ſometimes lying or leaning to the Ground, and ſometimes ſtanding a little upright, beſet very thick with ſmall Leaves, finer and ſhorter than *Fennel*, ſome of them ending in a Tuft of ſuch like fine green Leaves, and ſome having at their tops one large Flower apiece, ſomewhat reddiſh or brownish on the outſide while they are in bud, and a while after, which being open conſiſt of twelve or fourteen long and narrow Leaves, of a fair ſhining yellow color, ſet in order round about a green Head, with yellow Thrums in the middle, laying themſelves open in the Sun, or a fair day, but elſe remaining cloſe; after the Flower is paſt, the Head growing greater, ſhews it ſelf, compact of many round whi-

tiſh

tiſh Seed, very like unto the Head of *Adonis Flower*, but much greater.

VI. *The Places.* The firſt and ſecond grow upon Hills in *Germany*, and Mountains in *Italy*, on the *Alps*, and *Pyrænean* Hills; the third grows, as *Cluſius* ſays, near *Vienna* in *Auſtria*, and in both the Upper and Lower *Hungary*; but they all three grow with us here in *England* only in Gardens, where they flouriſh very well.

VII. *The Times.* The two firſt flower not in Winter, but in Summer Months, as in *May* and *June*, and they abide green all the Year through; the third Flowers in *April*, if the Weather is warm, and its Seed ripens in the Month following.

VIII. *The Qualities, Specification, Preparations and Virtues* agree exactly with thoſe of the *True Black Hellebor* in *Chap.* 348. aforegoing, and therefore need not be repeated again in this place.

IX. *Obſervat.* 1. *Aſtrantia nigra*, the firſt of the aforegoing, is doubtleſs no *Maſterwort*, as the purging faculty does ſhew, and it is certain, and ſeveral Experienced Phyſicians can teſtify, that the Roots hereof do purge Melancholy, and other Humors, and that they have perfectly cured Melancholy Mad People therewith; and that it has this Purging Faculty, *Geſner* does likewiſe teſtify in a certain Epiſtle written to *Adolphus Occo*, in which he ſhews that *Aſtrantia nigra*, or *Greater Wild Black Hellebor with Sanicle Leaves*, is almoſt as ſtrong as *White Hellebor*, and that he himſelf had made Experiment of the Purging Faculty thereof by Stool, which thing beſpeaks it to be a *Black Hellebor*, if not the *True* of *Dioſcorides*.

X. *Obſervat.* 2. *Dodonæus* ſuppoſes this *Greater Sanicle Leav'd Black Hellebor* to be *Helleborus verus Dioſcoridis*, (in which I am of Opinion he was deceived) and therefore aſcribes all the Virtues of the *True Black Hellebor* which grows in *Anticyra* to it; but in a word, this may be ſaid of it, that it has been found by often and good Experience to open and Purge the Body of Melancholy Humors, and that ſafely, without ſuch perturbation and trouble as is ſaid to be in the uſe of the other *Black Hellebors*.

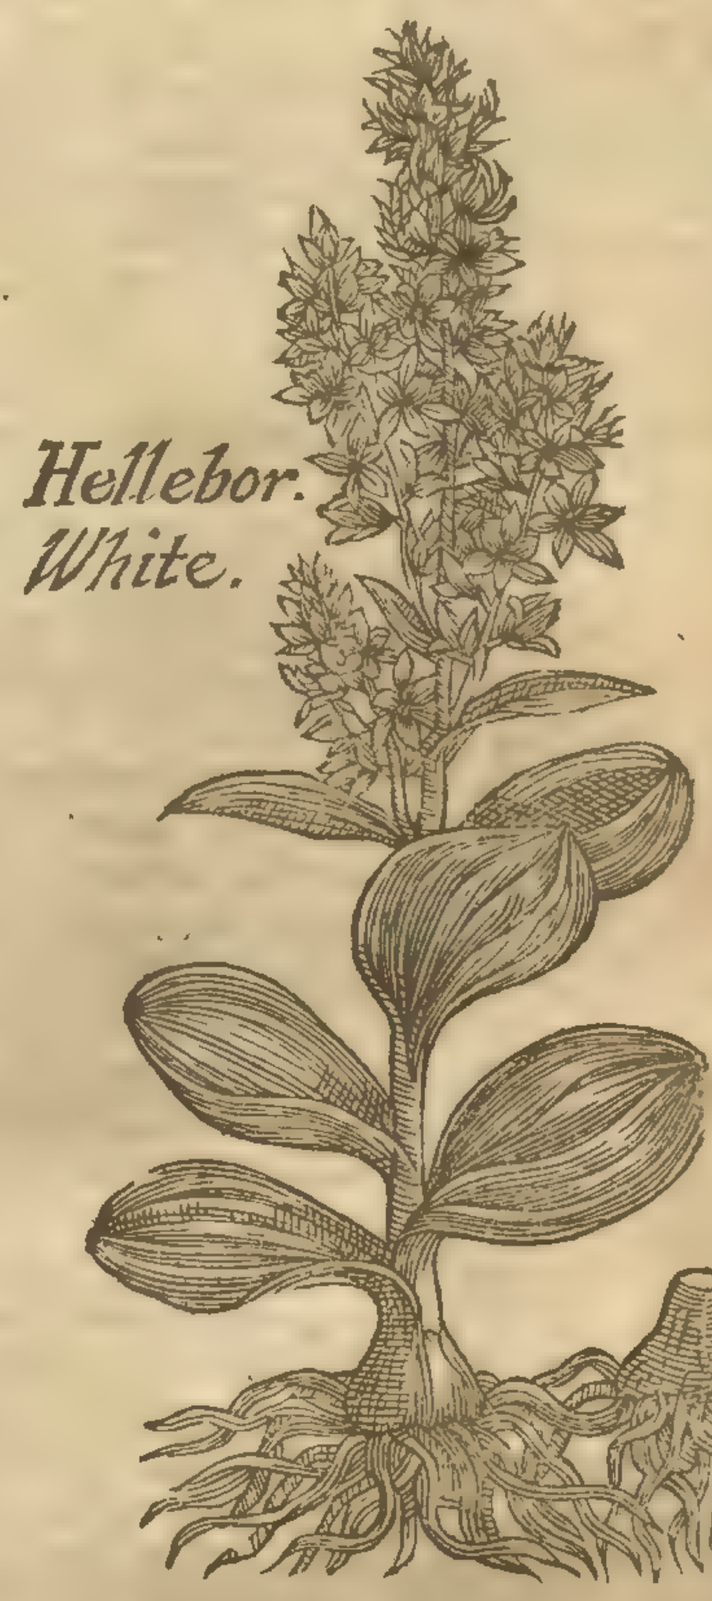
CHAP. CCCLI.

Of HELLEBOR White, *OR,* SNEEZE-ROOT.

I. *THE Names.* It is called in *Arabick Charbachem*, in *Greek* Ἑλλέβορος λευκὸς, in *Latine Helleborus albus*, *Veratrum album*, and *Sanguis Herculeus*, in *Engliſh White Hellebor*, and *Sneezeroot*.

II. *The Kinds.* It is twofold, *viz.* 1. *Garden* or *True*, called ſimply *Helleborus albus*, *Elleborum album*, and *Veratrum album*, of which in this Chapter. 2. *Helleborine*, *vel Elleborine alba*, Wild White Hellebor, of which in *Chap.* 352.

III. *The Kinds of the Garden or True.* Its twofold, *viz.* 1. *Helleborus albus*, *Helleborus albus verus*, *Helleborus albus vulgaris*, *Veratrum album vulgaris*, *Helleborus Candidus*, and *Bauhinus* adds for diſtinction ſake *Flore ſub viridi*; and it is certainly the *Conſiligo Vegetij*, *Abſyrti*, *Columellæ* & *Plinij*, The Common White Hellebor. 2. *Helleborus albus præcox*, *Elleborum Flore atro rubente*, *Veratrum album præcox purpura nigricante*, The early Flowering White Hellebor, or Early Sneezeroot with dark red Flowers.



IV. The Deſcriptions. *The firſt*, *or* Common White Hellebor. *It has a Root which is great, and reaſonable thick at the head, having a number of great white Strings, running down deep into the Ground, by which it is ſtrongly feſtned*; this Plant riſes at firſt out of the Ground with a great, round, whitiſh green Head, which growing up opens it ſelf into many goodly, fair, large, green Leaves, plaited as it were with eminent Ribs all along the Leaves, compaſſing one another at the bottom, from the middle whereof riſes up a ſtrong round Stalk, with ſeveral ſuch like Leaves, but ſmaller, to the middle thereof, from whence to the top it is divided into many Branches, having many ſmall yellowiſh or whitiſh green Star like Flowers all along upon them, which being paſt away turn into ſmall, long, three-ſquare, whitiſh Seed, ſtanding naked, without any Head or Husk to contain them, tho' ſome Authors have wrote to the contrary.

V. *The ſecond*, *or* Early Flowering White Hellebor. *It has no ſuch tuberous headed Root as the former, but as it were a long bulbous ſcaly head, from whence ſhoot as many long white Strings as the other:* This *Hellebor* is very like that juſt now deſcribed, but that it ſprings up a Month at leaſt before it, and that the Leaves are broader, longer, thinner, and no leſs plaited, folding themſelves backwards oftentimes, and ſooner periſh, falling away from the Plant; the Stalk hereof is higher than the other, with fewer Leaves thereon, bearing ſuch like Starry Flowers, but of ſo dark or blackiſh a red color, that they are ſcarcely diſcernable, but at a near diſtance, after which come ſmall Seed, very like the former; both theſe Plants loſe their Leaves wholly, freſh ſpringing up again every Year.

VI. *The Places.* Both theſe grow in ſeveral places of *Germany* and *Auſtria*, as *Cluſius* ſays, as alſo in ſome of the Iſlands about *Ruſſia*, where a large Ship might be Fraighted with the Roots of the firſt or vulgar ſort, as *Tradeſcant* the Elder affirmed; it alſo is ſaid to grow on the *Alps*, and ſuch like Mountains where *Gentian* grows: *Gerard* ſays that the Bithop of *Norwich* told him that *White Hellebor* grows in a Wood of his own, near to his Houſe at *Norwich*: Some ſay likewiſe (ſays he) that it grows upon the Mountains in *Wales*; this, tho' he laid it upon report, yet he thought it might be true, but they both are generally nurſed up in Gardens in *England*.

VII. *The Times.* The firſt Flowers before the ſecond, tho' the ſecond ſprings earlier out of the Ground; the firſt Flowers in *May*, the ſecond in *June*.

VIII. *The Qualities.* It is hot and dry in the third degree, Aperitive, Abſterſive, Splenetick, Arthritick, Cathartick, Emetick, and Venefick.

IX. *The Specification. White Hellebor* is peculiar for curing the Kings Evil, Dropſie, Scurvy, Jaundice, Gout, Sciatica, Rheumatiſm, Frenzy, Melancholy, Madneſs, Falling-Sickneſs, old running Sores, Ulcers, and Fiſtula's.

X. *The Preparations.* Neither Leaves, Flowers, nor Seed of this Plant have been in uſe at any time, but the Root only, ſo far as ever I could learn by Reading of Authors, or from the Practices of other Men; and from the Root the following Preparations may be made. 1. *A Pouder of the Root unprepared.* 2. *A Pouder of the Root prepared.* 3. *The Juice of the Root.* 4. *Mel Elleboratum.* 5. *Oxymel Elleboratum.* 6. *Elleboriſmus.* 7. *A Lotion.* 8. *A Veneſick.* 9. *A Spirituous Tincture.* 10. *An Oily Tincture.* 11. *A Saline Tincture.* 12. *A Peſſary, or Tent.* 13. *A Sternutatory.*

The Virtues.

XI. *The ſimple Pouder of the Root.* It works very ſtrongly and churliſhly with any that ſhall take it, provoking ſtrong Vomitings, not much inferior to Poyſon, yet being given to very ſtrong Conſtitutions, and with convenient preparations of the Body before hand, and Dieted by advice, as *Dioſcorides* directs, it may do much good; it cauſes an evacuation of much tough, viſcous, clammy, and corrupt Humors which offend the Stomach, it provokes Womens Courſes, but is to be forborn by Women with Child, for it will kill the *Fœtus*; it removes a deep Melancholy, even Fury, or Madneſs, abating the peccant Humors, and giving eaſe to the Patient; it prevails alſo againſt the Falling-Sickneſs, Lethargy, Megrim, Cephalæa, or old Headach, Scabs, Itch, Tettars, Ringworms, Puſhes, Herpes, Leproſie, Scurf, Morphew, or any other deformities of the Skin, Quartan Agues, Phthiſicks, old Coughs, Dropſies, Jaundice, Sciatica, Gout, Rheumatiſm, Vertigo, and other Diſeaſes of like kind. Doſe from eight Grains to twelve, or ſixteen, in Syrup of Quinces, or Juice of the ſame mixed with White Wine; it is not to be given faſting, but a little after eating, and always to robuſt and very ſtrong Bodies, with direction to drink five, ſix, or more Quarts of Poſſet-Drink, Water-Gruel, or Mutton Broth in the time of its working, and after Vomiting ſtill to drink a hearty draught of Poſſet-Drink, *&c.* thereby to keep the Stomach always full, for by this means it works ſo much the eaſier; but becauſe of the extraordinary danger of it, I ſhould never adviſe the unskilful or unlearned to give it thus crude and unprepared, but rather to make uſe of the following Preparation, which will do full as well, and operate much more ſafely.

XII. *The Pouder of the Root prepared. It is done by affuſion of Water, impregnated with Spirit or Oil of Vitriol, (after the diſſolution of Coral) upon the Root reduced to Pouder, digeſting for twenty four Hours, and drying it, and repeating the Work the ſecond and third time. Doſe from half a Scruple to half a Dram.* It is the nature of Acids to deſtroy the power of any mixture whatſoever, and if they will do it in Antimonial Preparations, as in the correction of Flowers of Antimony, *Vitrum Antimonij*, *Mercurius Vitæ*, *&c.* much more may it be ſuppoſed to be done in Vegetable productions; and therefore as Vegetables are more porous and apt for penetration than Metals or Minerals, ſo a weaker Acid may be imployed in the performance of that Work; for if the ſtrongeſt Acids, as Oils of Vitriol, Salt, Sulphur, *&c.* were made uſe of, they would totally enervate and deſtroy all the faculties and operation of the Vegetable they ſhould be applied to or mixed withal. This Preparation is ſafe enough, and in many will work only downwards, but in weak Stomachs, and where the Tone of the *Viſcera* is debilitated or much weakened it will (notwithſtanding all this Preparation) work upwards; in this caſe the Doſe ought to be a little larger, for the former Doſe will only make Sick, and ſcarcely induce Vomiting, whereby the Patient will truly be made more Sick and out of order (for want of its due operation) than if a larger Doſe had been given; it is deſigned againſt Melancholy, and all the efforts of a Manical diſpoſition of the Mind; it removes Vapors, and helps obſtructions of the Spleen and Hypochonders, reſtoring the Imagination and Reaſon to their right ſtations and habitudes; in a word, it has all the Virtues of the crude Pouder mentioned in the laſt Section, and may be given to all thoſe purpoſes and intentions, but with much more ſafety.

XIII. *If you give it only as Cathartick*, you may give it thus. *Take Jallap, Scammony, of each ſix Grains, of this prepared Hellebor from ten Grains to twenty, mix them for a Doſe.* Or thus. *Make an Infuſion of Sena half an Ounce in half a Pint of White Wine, ſtrain out, then add the prepared Pouder of Hellebor from half a Scruple to half a Dram, (according to Age and Strength) and let it be taken in the Morning faſting*, againſt Melancholy, Madneſs, Gout, Sciatica, *&c.*

XIV. *If you deſign it for a Vomit*, you may give it either *per ſe* in any proper Vehicle, from fifteen Grains to two Scruples, or you may compound it as follows. *Take the prepared Pouder of Hellebor aforegoing from half a Scruple to half a Dram, Tartar Emetick from one Grain to two, mix for a Doſe*, to be given in the Morning faſting, with all the precautions of a Vomit.

XV. *Another Preparation of the Root.* Moſt Authors prepare it by ſlicing it very thin, or beating it into Pouder, and infuſing it in juice of Quinces, (which is ſaid to be a true corrector of its venene quality) for twenty four Hours, drying of it, and repeating the Infuſion again the ſecond or third time; being thus prepared, it may be given from ten Grains to twenty Grains in any proper Vehicle to all the purpoſes and intentions before ſpecified: You may alſo prepare it by ſteeping it twenty four Hours in Wine Vinegar, it will be pretty well corrected by a ſingle Infuſion, and may be given from half a Scruple to half a Dram.

XVI. *The Juice of the Root.* If it is mixed with Juice of Quinces, or with Wine Vinegar, it may be inſpiſſated, and afterwards given inwardly to all the intentions and purpoſes aforeſaid. The Liquid Juice mixed with Flower and Honey, and ſet where Flies, Gnats,

Gnats, *&c.* come, it kills them upon the ſpot; mixed with Crumbs of Bread, Cheeſe, and Butter, and ſet in proper places, it kills Rats, Mice, and the like; if Hens, Ducks, or Geeſe ſhould chance to eat it, it would quickly kill them; being made up into a Maſs with Meal and Butter, and put into Mole Holes, or their Burrows, it will quickly deſtroy them: The Liquid Juice dropt into the Ears takes away the noiſe and finging in them, and kills Worms in that Organ, if any be, which is known by their extraordinary itching, and ſometimes by a pain in the Ear; mixed with White Wine in equal quantities it is good to cleanſe the Hands, or other parts of the Skin troubled with Scurf, Morphew, Leproſie, Tettars, Ringworms, Herpes, Scabs, Itch, Freckles, Lentils, and other like deformities thereof

XVII. *Mel Elleboratum.* Honey Helleborated, or impregnated with the Virtues of Hellebor. *Take Roots of White Hellebor dryed and cut a Pound, fair Water fourteen Ounces, digeſt three days, then boil gently till the half be conſumed, ſtrain it carefully out, and with clarified Honey three Pounds boil again to the conſiſtence of Honey.* It is a ſtrong Medicament, and to be given but in a ſmall Doſe, *viz.* from one Dram to two, or but three at moſt; it is prevalent againſt Melancholy, Dotage, Frenzy, Madneſs, Gout, Sciatica, Rheumatiſm, Dropſie, Lethargy, Vertigo, Palſie, Apoplexy, Epilepſie, and ſuch like deſperate diſaffections; you may mix it with clarified Whey, or Decoction of *Sena*, or *Epithymum.*

XVIII. *Oxymel Elleboratum.* Honey and Vinegar impregnated with Hellebor. *Take Leaves of Rue, tops of Tyme, Dittany of Crete, tops of Hyſſop, Pennyroyal, Horchound, Carduus, Roots of Celtick Nard, of each a handful, Calamint two Pugils, Seeds of Aniſe, Baſil, Dill, Fennel, Roman Nettles, of each two Drams, Roots of Angelica, Aron, Squills prepared, Birthwort long, round, and climbing, Coſtus, Flowerdeluce, Polypody, Turbith, Limon Peels, of each an Ounce, Strings of Black Hellebor, Spurge, Agrick, (added towards the end of the boiling) of each two Drams, Strings of the Roots of White Hellebor four Drams, all being dryed and bruiſed digeſt in a Glaſs or glazed Veſſel cloſe ſtopt in the heat of the Sun, or of a Furnace, in Poſca, (which is a mixture made of equal parts of Wine Vinegar and Water) eight Pounds, Rob or Sapa two Ounces, three days digeſtion being paſt, boil it gently till it is waſted a little more than half away, ſtrain it, preſſing it gently, and to the ſtrained Liquor add Honey of Roſes, (in which Citron Peels two Ounces have been infuſed) a Pound and half, boil to the thickneſs of Honey, and with Cloves, Saffron, Ginger, Galangal, Mace, of each a Dram, aromatize it according to Art.* It is Emetick, and ought to be given after other general Remedies, being then profitable againſt Madneſs, Frenzy, Epilepſie, Apoplexy, Convulſions, Melancholy, Vertigo, Lethargy, Megrim, obſtructions of the Stomach, Liver, Spleen, Meſentery, Reins, and Womb, it provokes Urine and the Courſes, and is prevalent againſt Agues. Doſe four or ſix Drams to an Ounce in a Glaſs of White Wine.

XIX. Another *Oxymel Helleboratum. Take Strings of Black Hellebor well bruiſed half an Ounce, Strings of White Hellebor well bruiſed an Ounce, Wine Vinegar, Juice of Quinces, Parſly Water, of each three Pints and half, Winters Cinnamon, Jamaica Pepper, both in Pouder, of each two Ounces, mix, digeſt in a Glaſs Veſſel in a gentle Sand heat for four days, then boil gently in* Balneo *till almoſt half is waſted away, ſtrain out, and to the Liquor add clarified Honey three Pounds, Cremor Tartar in fine Pouder one Pound, boil to the conſiſtence of Honey, being cold add Chymical Oil of Limons one Ounce, mix well, and keep it in a Veſſel cloſe ſtopt for uſe.* This Preparation has not the tenth part of the trouble and difficulty of the former, yet is double in its effects and operations, having all the Virtues aſcribed to the former; you may give it from half an Ounce to an Ounce, or more, according to Age and Strength.

XX. *Elleboriſmus*, or an Electuary of White Hellebor. *Take White Hellebor Root cut thin one Pound; Spring Water twelve Pounds, digeſt warm three whole days, then boil to the conſumption of the half, ſtrain out, preſſing it ſtrongly, adding Honey three Pounds, boil it again to the conſiſtence of Honey; this Electuary put into a Glaſs or glazed Veſſel and keep it for uſe.* This is no Electuary, but rather a Lohoch; it cures Melancholy, Frenzy, and Madneſs, and is appropriated to all the Diſeaſes the two former Preparations are applied to; it may be given from two Drams to four, or more, in a Glaſs of White Port Wine.

XXI. *The Lotion. The Root very thinly ſliced, or in groſs Pouder boiled in Vinegar, or in Juice of Quinces, or in an equal mixture of both, makes an excellent Gargle* for a Canker in the Mouth, as alſo to eaſe the pains of the Toothach; it is alſo good againſt Tanning of the Skin, Sunburning, yellowneſs of the Skin, Scurf, Morphew, Scabs, Itch, Leproſie, Freckles, Lentils, and other like defœdations of the *Cutis*; it alſo cleanſes and drys old running Sores, foul Ulcers, callous Fiſtula's, and the like, in the Legs, Thighs, Feet, Arms, Hands, *&c.* and is alſo of good uſe againſt Kings-Evil Sores; if it is boiled in Lye made of Pot Aſhes it kills Lice in the Head, being waſhed therewith Morning and Evening, and heals running Sores and Scabs of the Head, Scald Heads, Kings-Evil Sores, *&c.* being often waſhed therewith, and a little kind of Cataplaſm be alſo laid thereon made in this manner. *Take fine Pouder of White Hellebor Root two Ounces, Wheat or Barley Flower ſix Ounces, Honey enough to make it up into a Cataplaſm,* mix and apply it; ſome inſtead of the Honey uſe freſh Butter, ſome Hogs Lard, others White Bread ſoftned with Milk, *&c.*

XXII. *The Venefick. Take the Juice of White Hellebor Roots, put it into a Horn, or ſome wooden Cup, and let it ferment for ſome little time.* Take a Needle and Thread and wet them therein, and draw it thro' a Frog, or Chicken, and if it die preſently it is good and ready, if not, you muſt ferment it for ſome little time longer, till it will upon tryal exquiſitely perform that Work. This is the Poyſon the *Spaniards* uſe in poyſoning their Arrow heads, they dip their Arrow heads therein, and then what Beaſt ſoever ſhall be Wounded therewith ſhall ſuddenly die. This thing *Matthiolus* ſays he tried on Dogs and on Chickens, which died preſently after they were Wounded. This Poyſon is only uſed while it is freſh, for if the juice drys upon the Arrow head it loſes its ſtrength, and therefore to keep them the better they uſe to keep them in a Caſe, the Iron heads being wrapped in Wool, and Cloths dipt therein. But this is very admirable, as it is related, that this Poyſon being drunk gives almoſt no harm to them that drink it, unleſs they take too much; and it is ſaid that Hunters often take it themſelves, to purge them from evil Humors, and preſerve their Healths. This is alſo remarkable, that the Fleſh of thoſe Beaſts killed by this Poyſon is not in the leaſt hurtful, but is more tender and pleaſant in eating than the Fleſh of other Beaſts not killed therewith, more eſpecially that part about the Wound.

XXIII. *The Spirituous Tincture. It ought to be corrected with Vinegar, or Juice of Quinces, added in equal quantity after the Tincture is made, and kept in Digeſtion in a gentle Sand heat for one whole*

Month

Month or more. Being thus prepared, it may be given inwardly for all thoſe Diſeaſes the Pouder it ſelf is good for; it works much gentler, and may be given from half a Dram to two, three or four Drams, mixt with any convenient Vehicle, as ſharp Wine mixt with Water, *&c.* Outwardly, it is good againſt Freckles, Lentils, Pimples, Scurff, Morphew, and other Breakings out in the Skin.

XXIV. *The Oily Tincture.* It is good againſt Contractures of the Nerves, Pains of the Joints, Gout, Sciatica, *&c.* being anointed upon the Parts afflicted Morning and Night for ſome time. Anointed upon the Reins, it gives Eaſe in Pains of the Back, proceeding either from Weakneſs or Obſtructions of thoſe Parts. It digeſts and haſtens the Maturation of Tumors which Nature determines to break.

XXV. *The Saline Tincture.* It is a peculiar thing againſt Scurff, Morphew, Dropſy, Elephantiaſis, Puſhes, Pimples, Tettars, Ring-worms, Kings-evil Sores, Pocky-eruptions, Herpes, Itch, Scabbineſs, Freckles, Lentils, Yellowneſs and other Vices of the Skin. It may be uſed either ſimply of it ſelf, or mixt with Vinegar, ſharp Wine or Water, according to the Nature and Condition of the Part to which it is applied. It alſo eaſes the Gout and Sciatica, being bathed hot upon the Parts affected Morning and Night for ſome time.

XXVI. *The Peſſary or Tent.* Being put into any Callous Fiſtula, or up the Womb, where the *Vagina* is Callous, it ſoftens and reſolves the Calloſity, mundifies the Fiſtula or Ulcer, and takes away the Callous Matter which hinders Curation; after which the Ulcer may be healed with ſome incarnative Balſam or Ointment fit for the purpoſe. I have been told, that if it is put up the Womb as a Peſſary, it provokes the Terms, and brings away the dead Child; but it ought to be uſed with Caution and good Advice.

XXVII. *The Sternutatory.* 1. Some make it of the fine Pouder or Flower of the Root alone; but ſo uſed, it is much too ſtrong. 2. Some make it thus: ℞ *fine Flower or Pouder of White Hellebor Roots, Pouder of Roſemary, of Sweet Marjoram, and of Winter Savory, of each equal parts; mix them.* 3. Some make it thus: ℞ *fine Pouder of Tobacco, or rather of Tobacco Stalks, three Ounces; Pouder of Roſemary Flowers an Ounce and half; Pouder of Cloves one Ounce; fine Pouder of White Hellebor Root ſix Drams; mix and keep them for Uſe.* Being ſnuft up the Noſtrils, it cauſes much Sneezing, and evacuates the Head and Brain of cold, moiſt, viſcous Humors and Feculencies, and is very good againſt Vertigo's, Megrims, Head-aches, Lethargies, Apoplexies, Falling-ſickneſs, and other cold and moiſt Diſeaſes of thoſe Parts.

XXVIII. *Conradus* his Vomit. *Take Roots of White Hellebor one Ounce, waſh, dry and pouder them; Roots of Bryony and Sowbread in pouder, of each two Drams; add Spirit of Wine ſo much as to overtop them two Inches or more: digeſt in Balneo for twenty four hours, then diſtil by an Alembick, take out the Faces, beat them, and add the Spirit drawn off: digeſt a Week in a cloſe Veſſel, then decant the clear, filter and keep it for Uſe.* Dip a Feather in it, and put it into a Glaſs of Sack, and drink it; repeating it as you ſee occaſion.

XXIX. *Heurnius* his Vomiting-Wine. *Take groſs Pouder of White Hellebor Roots a Scruple; Canary one Pint: mix, and infuſe in the Sun for a Week.* One Spoonful of it will Vomit; but half a Spoonful, with other Laxatives, will purge downwards, and evacuate cold, viſcous, ſlimy and griping Humors out of the Bowels, Hypochonders and Parts adjacent.

XXX. *An Obſervation.* That the *Black* and *White Hellebors* much ſympathize together, with relation to their Virtues; and what the one will do, the other will do alſo; but the latter much more powerfully, and with far greater Violence, inſomuch that by reaſon of its Violence, and dangerous Uſe, the Internal Practice with the Root of *White Hellebor* uncorrected, is wholly almoſt given over, and left off: otherwiſe, as to the Virtues and ſeveral Preparations of the *True black Hellebor* in Chap. 348. aforegoing, the ſame things in a manner may be ſaid of the *True White*, with Advantage.

CHAP. CCCLII.

Of HELLEBOR White Wild.

I. *THE Names.* It is called in *Greek*, Ἑλλέβορος λευκὸς ἄγριος: in *Latin*, *Helleborus albus ſylveſtris*, *Elleborine alba agreſtis*; and in *Engliſh*, *Wild White Hellebor.*

II. The Kinds. 1. *Elleborine recentiorum Cluſii*; *Elleborine alba major*, *Calceolus mariæ*, *Calceolus Marianus*; *Elleborine ferruginea Lugdunenſis*, *Dalechampij*; *Aliſmatis Species Geſneri & Thalij*; *Damaſonium nothum*, and *Pſeudodamaſonium aliorum*; The great wild white Hellebor, *called alſo* Ladies Slipper. 2. *Elleborine minor flore albo*, *Elleborine alba minor*; *Aliſma*; *Damaſonium*, and *Epipactis aliorum*; The leſſer wild white Hellebor with a white Flower. 3. *Elleborine alba minor purpurante flore*, The leſſer wild white Hellebor with bluſh Flowers. 4. *Elleborine alba flore Viridante*, Wild white Hellebor with whitiſh-green Flowers. 5. *Elleborine alba Americana*, American wild white Hellebor.

III. The Deſcriptions. *The firſt, or* Great wild white Hellebor, *or* Ladies Slipper. *It has a Root compoſed of a number of Strings, interlacing themſelves one within another, lying within the upper Cruſt of the Earth, and not ſpreading deep, of a dark browniſh color.* This Root ſends up one, two, or more Stalks, a Foot and half high, bearing broad green Leaves on each ſide, one by one, ſomewhat like thoſe of the *Vulgar true white Hellebor*, but ſmaller, and not ſo ribbed, and each compaſſing the Stalk at the lower end. At the top of the Stalks ſtands ſometimes but one Flower, and ſometimes two, or but three at moſt, one above another, upon ſmall ſhort Foot-ſtalks, with a ſmall Leaf at the foot of every one. Each of theſe Flowers are of a long oval Form, and hollow withal, eſpecially at the upper part, the lower being round, and ſwelling like a Belly: at the hollow part there are pieces like Ears or Flippers, which at firſt do cover that hollow place, and afterwards ſtand apart one from another, all which are of a fine pale yellow color in moſt Plants; but ſome have been found of a browner color, as tending to purple. There are alſo four long, narrow and dark colored Leaves, at the ſetting on of the Flower upon the Stalk, wherein the Flower, as it were, at the firſt was encloſed. The whole Flower is of a pretty ſweet Smell: the Seed is very ſmall, and like unto that of the *Orchides* or *Dog-ſtones*, and is contained in the like kind of Pods.

IV. *The ſecond, or* Leſſer wild white Hellebor with a white Flower. *It has Roots like the former, but ſmaller:* and this ſmall Plant grows up in like manner,

manner, and not much lower, bearing the like Leaves, but ſmaller, and of a white green color, much like thoſe of *Lilly Convally*. The top of the Stalk has many more Flowers, but leſſer, growing together Spike-faſhion, with ſmall ſhort Leaves at the Stalk of each Flower, which conſiſts of five ſmall white Leaves, with a ſmall cloſe Hood in the middle, without any Smell, and having alſo like Seed.

V. *The third, or* Small wild white Hellebor with bluſh Flowers. *The Roots, Stalk, Leaves, Flowers and Seed, as alſo its Manner of Growing, are all much like the laſt*; but herein this differs from that, that the Leaves hereof are narrower than thoſe, and the Stalk and Flowers are ſmaller, the Flowers in this being of a pale purpliſh or bluſh color, with very ſmall duſty Seed.

VI. *The fourth, or* Wild white Hellebor with whitiſh green Flowers. *This is alſo one of the ſmall kinds of the* Wild white, *and differs not much from the laſt, either in its Root, Stalk, Leaves, Flowers or Seed, but only in the Color of its Flower*; for whereas that was of a bluſh color, this is greeniſh-colored on the outſide, and of a whitiſh color within, with like ſmall Seed.

VII. *The fifth, or* American wild white Hellebor. *This is a Species of the firſt Great kind of* Wild white Hellebor, *or* Ladies Slipper; which ſort has been brought to us from the *Northern* parts of *America*, and differs in this only, That it is greater in its Stalks, Leaves and Flowers, which are not yellow, but white, with reddiſh Strakes thro' their Bellies.

VIII. *The Places.* The firſt four grow not only beyond Sea, as in *Germany*, *Auſtria*, *Hungaria*; but alſo are found Wild in many places of *England*. The fourth particularly in a Wood called the *Helks* in *Lancaſhire*, near the Borders of *Yorkſhire*. The fifth grows in the *Northern* parts of *America*, as *New-England*, *New-York*, *Maryland*. The ſecond was found in the Woods by *Digweed-Pastures*, half a Mile from *Welwen* in *Hertfordſhire*; it grows alſo in a Wood five Miles from *London*, near a Bridge called *Lock-bridge*; and by *Robin Hood's Well*; in the Woods by *Dunmore* in *Eſſex*; by *Southfleet* in *Kent*, in a little Grove of *Juniter*; and in a Wood by *Clare* in *Eſſex*.

IX. *The Times.* The firſt flowers about the middle of *June*; the other four in the Month of *May*, and if the Weather proves cold, in the beginning of *June*: ſome earlier and ſome later than others, according to the Richneſs of the Soil, and Warmth of the Situation; and perfect their Seed in *Auguſt*.

X. *The Qualities, Specification, Preparations and Virtues* of theſe, are the very ſame with thoſe of the *True black* and *True white Hellebors* in *Chap.* 348. and *Chap.* 351. aforegoing, tho' poſſibly not full ſo ſtrong, and therefore the more fit, and the rather to be choſen for the more vulgar Uſe.

XI. *An Obſervation.* The ſecond of theſe is ſuppoſed to be the *Epipactis* of *Dioſcorides*; but if either that or any of the two following be it, he ſays it is good againſt the Diſtempers of the Liver, and againſt Poiſon, and to procure Vomiting, which *Theophraſtus* alſo affirms: and *Gerard* ſays, that the Decoction of *Wild white Hellebor* being drunk, opens the Obſtructions of the Liver, and helps any Imperfections of the ſame. This is certain, That the Juice, or a very ſtrong Decoction of any of them is good to waſh and bathe the Skin withal; in order to the taking away of Scurff, Morphew, Scabs, Itch, Leproſy, Herpes, Pimples, Freckles, Lentils, Yellowneſs of the Skin, or any other Defedation thereof.

CHAP. CCCLIII.

Of HELMET--FLOWER; *OR,* MONKS--HOOD.

I. *THE Names.* It may be called in *Greek*, Θώες: in *Latin*, *Napellus*, *Thora*, and *Cappa*; alſo *Cappa Monachi*, and *Luparia*: in *Engliſh*, *Helmet-flower* and *Monks-hood*.

II. *The Kinds.* It is a Species, or of the Stock of the *Aconita* or *Wolfs-bane*; and is manifold; but thoſe which we ſhall take notice of, are only the three following, *viz.* 1. *Napellus Verus*, (*Verus* is added becauſe it is the *True Napellus* of the Ancients, which they ſo termed from the Form of a long *Turnep*, called *Napus* in *Latin*:) *Cappa, & Cappa Monachi*, The true Helmet-flower, *or* Monks-hood. 2. *Napellus minor, Lycoctonum cæruleum parvum facie Napelli Lobelij, Thora Italica Geſneri & Bauhini*; *Aconitum Lycoctonum tertium cæruleum parvum Dodonæi*; *Aconitum decimum Cluſij*, The ſmall blew Helmet-flower, *or* Monks-hood. 3. *Napellus tertius Bauhini*, *Napellus purpureus*; *Aconitum neubergenſe Cluſij*, The purple Helmet-flower, *or* Monks-hood.

III. The Deſcriptions. *The firſt, or* True Helmet-flower, *or* Monks-hood: *its Roots are browniſh on the outſide, and white within, ſomewhat big, and round above, and ſmall downwards, ſomething like*

to a ſmall Carrot *Root, or not much unlike to a long* Turnep; *and ſometimes two of them are joined at the Head together.* This Root ſends forth divers Leaves of a freſh green color on the upper ſide, and greyiſh underneath, much ſpread abroad, and cut into many Slices and Notches, more than any of the *Wolfs-banes.* The Stalk riſes up two or three Feet high, beſet to the top with the like Leaves, but ſmaller. The top is ſometimes divided into two or three Branches, but more uſually without, on which ſtand many large Flowers, one above another, in Form very like unto a Hood or open Helmet, being compoſed of five Leaves, the uppermoſt of which, and the greateſt below is like unto an Helmet or Head-piece; two other ſmall Leaves are at the ſides of the Helmet, cloſing it like Cheeks, and come ſomewhat under; and two others, which are the ſmalleſt, hang down like Labels, or as if a cloſe Helmet was opened, and ſome pieces hung by, of a perfect or fair blew color, (but grow darker, having ſtood long) which cauſes it to be nurſed up in Gardens, that their Flowers, as was uſual in former Times, and yet is in many Country Places, may be laid up among green Herbs in Windows, and put in Pots to ſtand in Chimneys, in the Summer time. But tho' they may be thus entertained for their Beauty, and put to the Uſes aforeſaid, yet you muſt beware that they come not near your Tongue or Lips, leſt they diſcover, to your Coſt and Peril, their virulent, poiſonous and dangerous Qualities. In the middle of the Flower, when it is open, and gapes wide, are ſeen certain ſmall Threads, like Beards, ſtanding about a middle Head; which, when the Flower is paſt, grows into three or four or more ſmall blackiſh Pods, containing black Seed within them.

Helmet-Flower.

IV. *The ſecond, or* Small blew Helmet-flower, *has a kind of round bulbous Root, big below, and ſmall above, and encreaſes thereby, giving ſuch like Roots, with ſmaller Fibres thereat than at the greater Roots.* From this Root riſes up a round green Stalk, two or three Feet high, whereon grow ſeveral dark, green, ſhining Leaves, cut into five Partitions very deeply, each of them ſomewhat cut in on the edges, very like unto the Leaves of the *Greater* or *True Helmet-flower*, but that theſe are not ſo finely divided, and the Diviſions are ſomewhat broader. The top of the Stalk is divided into two or three Branches, each whereof bears one Flower, and ſometimes (tho' ſeldom) two or three, of a very fair deep blewiſh purple color, very like in Form unto the former *Helmet-flower*, but that this is ſmaller, and the Creſt of the Helmet riſes higher than in that; after which come ſmall Pods, much like to the other, giving alſo ſuch like Seed.

V. *The third, or* Purple Helmet-flower. *It has Roots much like to the firſt, or* True kind: it has larger Leaves than the other, of a ſadder green color, and ſhining withal, inciſed or cut in after the ſame manner: the Stalk alſo grows very high, and often ſpreads it ſelf out into ſeveral Branches, bearing large purple blew Flowers, in longer Spikes than the firſt; which being paſſed away, like Seed comes in their places, not much differing from the former.

VI. *The Places.* They all grow naturally Wild on Mountains, and in Woods and ſhadowy places in *Italy*, *Germany* and other places: and it is ſaid, that they grow upon ſome Hills in *England:* however, with us they are chiefly nurſed up in Gardens, where they flouriſh extraordinarily well.

VII. *The Times.* They all flower in the principal Summer Months, *viz.* in *June* and *July*; and their Seed is generally ripe in *Auguſt.*

VIII. *The Qualities.* They are hot and dry in the Ultimate of the fourth Degree; Deleterious, and a moſt mortal Poiſon both to Man and Beaſt; and therefore they are called *Wolfs-bane*, becauſe they kill Wolves, Dogs, Rats, Mice, *&c.* whether the Juice of the Herb or Root, or the Herb or Root it ſelf, being mixed with their Food or Fleſh, and ſo given them to eat. And that this *Monks-hood* as well as *Wolfs-bane* is as deſtructive to Mankind alſo, is manifeſt from that accidental Tryal had thereof at *Antwerp*, at a Treat there, where certain ignorant Perſons gathering of a Sallet in the Garden, among the Variety of Herbs, gathered alſo *Napellus* or *Luparia*, which with the other things was ſerved up at Table; where all who did eat thereof, were taken with moſt cruel Symtoms; and after the violent Tortures which they endured for ſome conſiderable time, died miſerably.

IX. *The Specification. Helmet-flower* (as alſo *Wolfs-bane*) is a peculiar thing to kill Lice and Nits in the Head, and to cure the ſame of Scurff, Dandriff, Scabs, *&c.* to cleanſe old and fretting Sores, running Ulcers, take away dead Fleſh, (provided theſe Sores, Ulcers, *&c.* be not in the Mouth, Noſe, Eyes or Privy Parts, by reaſon of their Vicinity to the principal or more noble Parts:) as alſo to cure Diſeaſes of the Eyes by a ſpecial Application.

X. *The Preparations.* You may have therefrom, 1. *A liquid Juice.* 2. *A Pouder of the Herb or Root.* 3. *An Oil or Ointment of the Juice, green Herb or Root.* 4. *A Decoction or Lye of Roots, Leaves or Seed.* 5. *A diſtilled Water.*

The Virtues.

XI. *The Juice.* It is a deadly Poiſon taken inwardly any way: it is alſo as deadly to Wolves, Dogs or other Creatures who ſhall take thereof, or eat in any manner of ways of the Herb or Root. The Juice of the Roots eſpecially Hunters of Wild Beaſts do uſe, dipping the Heads of their Arrows into the ſame; by which means they quickly kill the Beaſt

Beast which is wounded with the same: yet it is certain, that the Flesh of the Beast so killed is not at all poisonous, but very safe, and eats more tender than if it had been otherwise killed, more especially if it be kept for a Day and Night.

XII. *The Pouder of the Herb or Root.* Mixt with Cheese or Bacon-fat, and put in proper places for Rats and Mice, it kills them, if they eat it. Mixt with Pouder of *Liquorice*, and strewed upon foul filthy Ulcers, it cleanses them, drys in some measure, (if skilfully applied) and disposes them for healing, which may afterwards with proper Incarnatives and Ulceratives, be perfected.

XIII. *The Oil or Ointment of the Juice, or green Herb, or Root.* It kills Lice and Vermine, if the Head or any part of the Body, in which Lice and Vermine breed, be anointed therewith, it quickly kills them, and frees the Patient from the same.

XIV. *The Decoction or Lye of the Roots, Leaves or Seed.* If it is a simple Decoction, it is then made in simple fair Water only: but if it is a Lye, it is made in a small *Lixivium* of Pot-ashes. It cleanses the Head and other Parts from Morphew, Scurff, Dandriff, Scabs, Itch, Pimples, Tettars, Ringworms, Leprosy, and other like Breakings out, the Parts affected being bathed therewith.

XV. *The distilled Water.* Being dropped into the Eyes, it takes away the Inflammation or Redness in them; also clears them from any Haw, or Pin and Web, growing in or upon them. The same thing is said of the Juice; but I fear it is dangerous, and if it is used to the Eyes, it must be done with much Caution, and by such as have Judgment and Skill, and not by Fools. It ought to be mixt with a sufficient quantity of *Damask-Rose* Water, both to allay its Heat, and to take off the Violence of its Operation.

XVI. *To Cure such as are Poisoned herewith.* The first thing you are to do, is to give an Emetick, as two, three, four, five or six Grains of *Emetick Tartar*; from half an Ounce to an Ounce or Ounce and half of *Infusion of Crocus Metallorum*, or *Vinum Benedictum*, or *Vinum Antimoniale*, or a Dose of any other proper Emetick which you have at hand, proportioning the Dose according to Age and Strength. The next thing you are to do, is to exhibit *Cathartick Clysters*; or this following, if the Patient is weak: *Take Posset-drink or Mutton-broth a Pint, brown Sugar four Ounces: mix, melt or dissolve, and exhibit it warm.* This is to be done, that the Body be effectually, and as soon as may be, discharged of the Poison: which being performed, *Cordials* and *Antidotes* are to be given, the one to defend the Heart, preserve and keep up the Vital and Animal Spirits; the other to enervate and destroy the force and power of the Poison; for the first of these, we commend our *Aqua Bezoartica*, *Tinctura Bezoartica*, or some other like Cordial Water, Spirit or Tincture, to be mixt and given with some noble and generous Wine. The Antidotes we commend in this Case, are, *Mithridate*, *Venice Treacle*, the Antidote in our *Phylaxa*; or for want of them, to drink *a Decoction in Wine of Origanum, Pennyroyal, Savory, Sage, Southernwood, Wormwood, Gentian, Winters Cinnamon*; *Elect. Diatessaron* is good, so also is a mixture of *Castoreum, Pepper, Cubebs and Rue, of each a like quantity, being in fine Pouder, and mixt up with Honey into a Bolus.* *Petrus Aponensis* commends a Dram or two of *Terra Lemnia* to be taken in warm Drink or Wine; but above all he says, that *Aristolochia longa* is the most especial Antidote or Remedy against all *Aconites*. *Avicen* has an Antidote against this Poison, which is made of the *Fly* which feeds upon this Poisonous Plant, which he found to be very effectual, not only against other Poisons, but chiefly against that of *Napellus* or *Helmet-flower*, and Poison of the *Tarantula*. It is thus made: *Take Aristolochia longa, fine Bole, each in fine pouder, a Dram*; *Flies which feed upon the Napellus number twenty: make a fine Pouder, and mix them:* Dose a Dram at a time in a Glass of Wine. *Guainerius* his Antidote is this: *Take Bay-berries, Terra Lemnia, both in fine pouder, Mithridate, of each two Ounces*; *Flies which have fed upon Napellus number twenty four in pouder: mix them, and with a sufficient quantity of Honey and Oil, make an Electuary.* Dose from a Dram to two Drams at a time, with a Glass of generous Wine. But the true Antidote against this Poison is the *Anthora* or *Antithora* in the Chapter following, of which we shall there speak more largely.

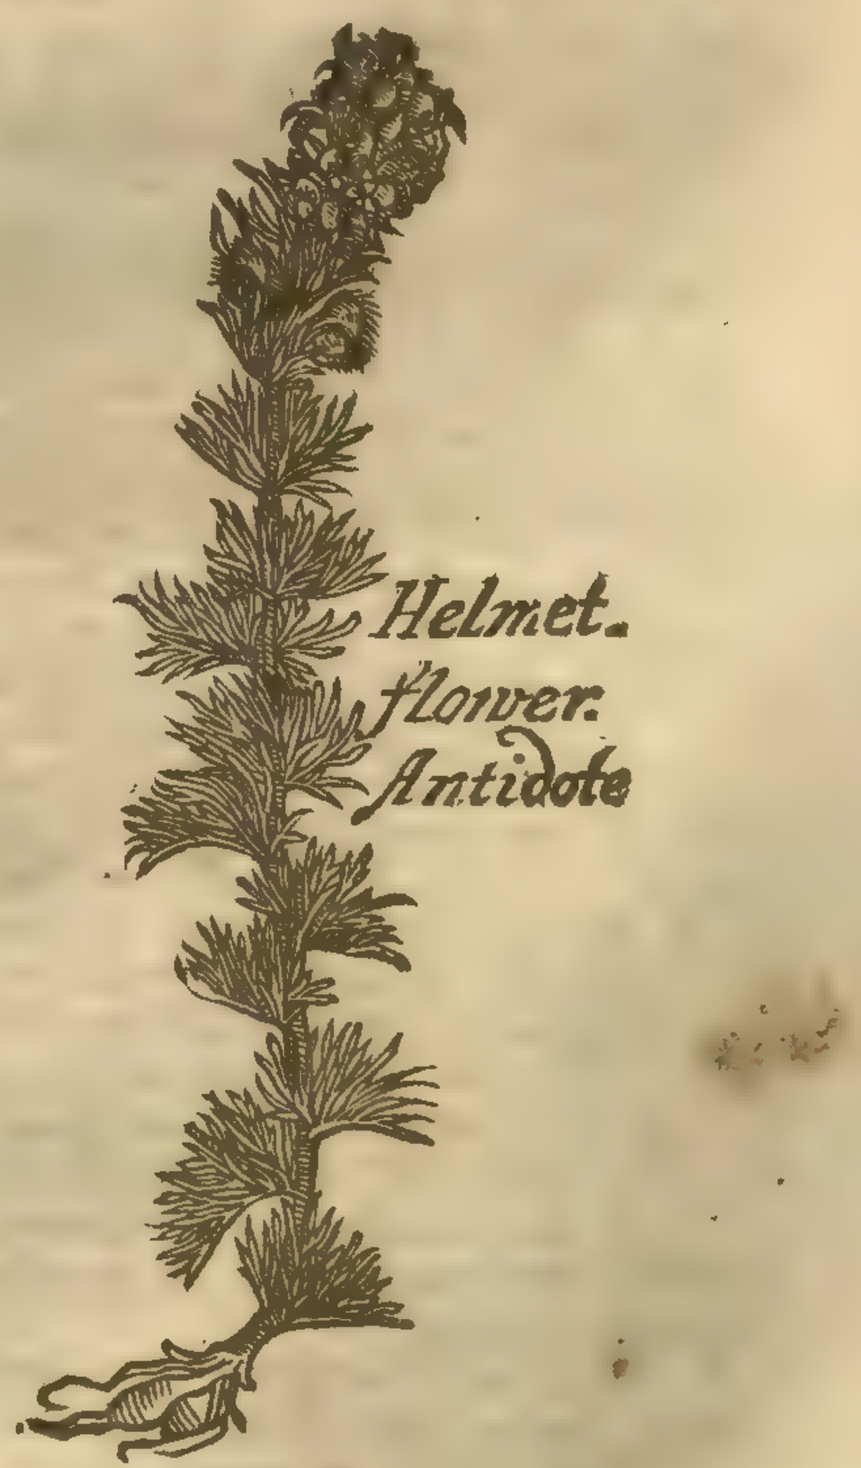
CHAP. CCCLIV.

Of HELMET-FLOWER Alexipharmick,

OR,

MONKS-HOOD Antidotal.

I. *THE Names.* It is called in *Greek*, Ανθορα: in *Latin*, *Antiphthora* or *Antithora*, but most commonly, for Shortness sake, *Anthora*, (as being the Opposite or Antidote to Φθορὰ, *Helmet-flower* or *Woolfs-bane:*) in *English*, *Helmet-flower Alexipharmick.*



II. *The Kinds.* It is a singular Plant of the Kind, and is called by the *Piemontoise*, *Anthora, quasi Antithora*, that is, the Remedy against the Poisonful Herb *Thora*: *Avicenna*, the *Arabian* calls it *Napellus Moysis* in *lib.* 2. *cap.* 500. and in *cap.* 745. calls it *Zedoaria*, by which it is manifest that this *Zedoaria Avicennæ* is not our *Common Zedoaria* or

Zerumbeth of the Shops: it is alſo called *Aconitum Solutiſerum*, *Napellus Alexipharmicus*, and *Antora*. *Thora* and *Anthora*, or *Tura* and *Antura*, ſeem to be new Words, and yet they are uſed in *Marcellus Empiricus*, an old Writer, who teaches us a Medicine to be made of *Tura* and *Antura* againſt the Pin and Web in the Eyes.

III. The Deſcription. *The Roots hereof are ſmall and tuberous, round, and ſomewhat long, ending for the moſt part in a long Fibre, and with ſome other ſmall Threads from the Head downwards:* from the Head whereof riſe up ſeveral green Leaves, every one ſeverally upon a Stalk, which Leaves are very much divided, as finely almoſt as the Leaves of *Larks-heells* or *Larks-ſpurs:* among which riſes up a hard round Stalk, a Foot or more high, with ſome ſuch Leaves thereon as grow below; at the top of which ſtand many ſmall yellowiſh Flowers, formed very like unto the *Whitiſh Wolfs-bane*; bearing many black Seeds in Pods afterwards in like manner.

IV. *The Places.* It grows on the *Alps*, and on Mountains and Hills near the Lake *Lemane*, and in ſome places in *Germany:* with us it is nurſed up only in Gardens.

V. *The Times.* It flowers at the latter end of *June*, thro' all *July*, alſo in *Auguſt*, and the Seed is ripe in *Auguſt* and *September*.

VI. *The Qualities.* It is hot and dry in the third Degree; and is Cardiack, Emetick, Cathartick and Alexipharmick.

VII. *The Specification.* Its chief Deſignation is for the enervating or deſtroying and expelling of Poyſons of all ſorts, chiefly thoſe of *Helmet-flower* or *Monks-hood*, *Wolfs-bane* and *Leopards-bane*.

VIII. *The Preparations.* You may have therefrom, 1. *A Pouder of the Root.* 2. *A Decoction thereof in Wine.* 3. *A Spirituous Tincture.* 4. *An Acid Tincture.*

The Virtues.

IX. *The Pouder of the Root.* *Hugo Solerius* ſays, that it will purge the Body very ſtrongly of vicious and watery Humours, both by Vomit and Stool, the quantity of a *Bean* being taken in Broth or Wine. And by reaſon of the exceeding Bitterneſs of the Root, it kills all ſorts of Worms in the Body. *Guainerius* ſays, that by his own Experience and Sight, he found it to be as effectual as *Dictamnus* unto all the Purpoſes unto which that ſerves. The Pouder of the Root taken in Wine, (from half a Dram to a Dram) is a ſpeedy and ſpecial Remedy againſt the Wind-Colick, which the *Savoyards* about *Diam* (where it grows in great plenty) familiarly uſe with great Succeſs, and call it the *Wind-Colick Herb*. This ſame Root alſo uſed inwardly, is not only the chief and principal Antidote or Remedy againſt the Poiſon of *Monks-hood* or *Helmet-flower*, and *Wolfs-bane*, but alſo of *Leopards-bane*, or any other Poiſonous Herb whatſoever, being given firſt and laſt Morning and Night.

X. *The Decoction in Wine.* It has all the former Virtues, but not full out ſo efficacious as the Root in Subſtance. If you ſo pleaſe, the Pouder of the Root may be given in this Vehicle for the ſame Purpoſes.

XI. *The Spirituous Tincture.* It has the Virtues of the Pouder and Decoction; beſides which, it is good againſt Surfeits, the Meaſles and Small-Pox; for by gently provoking Sweat, it expels the Malignity to the Surface of the Skin, and ſo defends the Heart and Vital Spirits from the Poiſon and Force of thoſe Diſeaſes, cauſing them orderly to come forth: you may give from one Dram to two Drams, (according to Age and Strength) in any proper Vehicle. It defends the Heart, and ſtrengthens the Spirits as a moſt Soveraign Cordial.

XII. *The Acid Tincture.* It has the Virtues of the Root, Decoction and Spirit; beſides which, it is more effectual than any of them againſt the Plague or Peſtilence, and all ſorts of Malign or Peſtilential Diſeaſes, as alſo againſt all malign and burning Fevers, deſtroying the Malignity, and extinguiſhing the burning Heat of the Diſeaſe. It is alſo good againſt the Venom and Poiſon of Mad Dogs, Serpents of all kinds, as Viper, Rattle-ſnake, Slow-worm, *&c.* and the Stinging of Scorpions, Hornets, Waſps, Bees, *&c.* Let the Patient take it in all that they drink, ſo many Drops at a time as may make the Vehicle pleaſant, and continuing the Uſe of it for ſome days. The Figure which we have given you in this place, is from *Matthiolus* his *Epitome*.

CHAP. CCCLV.

Of HEMLOCK Common.

I. *THE Names.* It is called in *Arabick*, *Sucatam:* in *Greek*, Κώνειον, παρὰ το κωνᾶν, *à circum vertendo, quod Vertiginem, & imaginem earum rerum quæ aſpiciuntur, tanquam circumagantur ac in tenebras inducat ijs quæ eam biberunt:* in *Latine*, *Cicuta*; and in *Engliſh*, *Hemlock*.

II. *The Kinds.* There are three principal kinds, *viz.* 1. *Cicuta vulgaris*, The Common Hemlock. 2. *Cicuta minor*, *Cicuta fatua*, *Cicuta Apiifolia*, The leſſer or Parſley-leav'd Hemlock, in Cap. 356. 3. *Cicuta paluſtris*, *Cicuta aquatica*, Water or Marſh Hemlock, in Cap. 357. following.

Common Hemlock.

III. *The*

III. *The Common Kinds.* Of this there are two ſeveral ſorts, *viz.* 1. Κώνειον κοινὸν, *Cicuta vulgaris, Cicuta major*, (by almoſt all Writers) *Cicutaria Cluſij*, Our Common Hemlock. 2. Κώνειον μέγα, καὶ μέγιστον, *Cicuta magna, vel maxima, Cicutaria latifolia fœditiſſima, Cicutaria maxima Brancionis* by *Lobel*, *Cicutaria Myrrhis Thalij*; *Seſeli Peloponeſe Matthioli, Geſneri* and *Lugdunenſis*, which *Lobel* contradicts; The great or greateſt Hemlock. That this is a *Hemlock*, and no *Seſeli* or *Hartwort*, no doubt is to be made of it.

IV. The Deſcriptions. *The firſt, or* Common Hemlock, *has a Root which is long, white, and ſometimes crooked, and hollow within:* from the Head of which Root it grows up with a hollow green Stalk, three or four Feet high or more, full of red Spots ſometimes, and having at the Joints very large winged Leaves, one ſet againſt another, dented about the edges, of a ſad green color, branched towards the top, where it is full of Umbles of white Flowers; which being paſſed away, give white, flattiſh, long Seed. The whole Plant and every part has a ſtrong, heady, ill-conditioned Smell, offending the Senſes.

V. *The ſecond, or* Great or greateſt Hemlock. *It has a Root which is very great and white, growing as well deep into the Ground, as ſpreading many great Branches therein, which ſometimes dies after it has given Seed, and ſometimes not, abiding all Winter in ſome Seaſons, and in ſome Places.* This *Hemlock* has much larger winged Leaves than the former, thicker ſet, more ſpread, and of a ſadder green color, having a Smell which *Lobel* calls *Fœtidiſſima*: yet *Parkinſon* ſays, that tho' he had it growing many Years in his Garden, he never found any offenſive Smell it had. The Stalk is great, but riſes not ſo high as the *Common ſort* does; but bears as large Umbles of white Flowers; where, afterwards grow large and thick white crooked Seed, of no evil Smell.

VI. *The Places.* The firſt grows in all Countries throughout *England* by Walls and Hedge-ſides, and in waſte Grounds and untilled Places, as alſo in Gardens of a fat and rich Soil. The ſecond I have found in moiſt and fertil Medows abounding with other Weeds near their Borders, but grows with us moſtly in Gardens, where it is generally weeded out.

VII. *The Times.* They both flower in *July* and *Auguſt*, and ſeed in *Auguſt* and *September*.

VIII. *The Qualities.* *Hemlock* is cold in the fourth Degree, and dry in the ſecond; Repercuſſive, Anodyne, Aſtringent, Arthritick and Veneſick.

IX. *The Specification.* It is chiefly of External Uſe, for the Cure of the Gout, Scirrhus Tumors, Eryſipelas, Inflammations, Wheals, Puſhes, creeping Ulcers.

X. *The Preparations.* You may have therefrom. 1. *A liquid Juice.* 2. *A Cataplaſm of the Leaves.* 3. *A Cataplaſm of the Root.* 4. *A Veneſick.* 5. *An Emplaſter.*

The Virtues.

XI. *The liquid Juice.* It is applied outwardly to the Teſticles of ſuch as have Venereous Dreams, or the like, to ſuppreſs them: alſo to Maidens and Womens Breaſts, to repreſs their Swellings, and repel their Milk: yet by reaſon thoſe places are ſo principal, and full of Vital Spirits, it ſometimes happens that the Remedy is worſe than the Diſeaſe. It may ſafely be applied to an Inflammation, an Eryſipelas, Pains of the Gout, ariſing from hot or fiery Humors; and to Wheals, Puſhes and creeping Ulcers, accompanied with a hot and ſharp Matter, for by cooling and repelling the Heat, it puts a ſtop to the Humor.

XII. *The Cataplaſm of the Leaves.* A Cataplaſm being made of the raw Leaves by only bruiſing, and ſo laid to the Brows and Forehead, is good to ſtop Defluxions of Rheums falling into ſwoln and red Eyes, ſo as quickly to eaſe the Pain, and take away the Swelling and Redneſs. And being applied with a mixture of Bay Salt in fine pouder to the Wriſt, (renewing it twice a day for three or four days) it takes away a Pin and Web growing in the Eye: but it ought to be applied (as they ſay) to the contrary Wriſt. Applied in Pains of the Joints, it eaſes them.

XIII. *The Cataplaſm of the Root.* It is to be roaſted under the Embers, wrapped in double wet Papers, until it becomes ſoft and tender; then to be beaten in a Mortar to a Pulp, and applied: it prevails admirably againſt the Gout in Hands or Fingers, as alſo in other Parts, quickly eaſing the Pain.

XIV. *The Veneſick.* The Juice mixed with Wine, if it is given to any one, is preſent Death, as *Tragus* ſays. And this poſſibly might be the Veneſick which the *Athenians* adjudged the Wife *Socrates* to die by, for not thinking reſpectfully of their Gods, or rather Devils, being accuſed by *Ariſtus* and *Melitus*. *The Cure.* If any one has taken the Juice of *Hemlock*, or this Veneſick, or by miſchance has eaten this Herb inſtead of *Parſley*, or its Root inſtead of *Parſneps*, which cauſes a Frenſy, or Perturbation of the Senſes, as if ſtupified or drunk: the firſt thing I ſay in this Caſe which is to be done, (if it is ſoon enough) is to give the Patient a Vomit of *Vinum Benedictum*, *Vinum Antimoniale*, or *Tartar Emetick*: which being effected, a good Draught of Wine (in which *Gentian* has been infuſed) is to be drunk, as *Pliny* adviſes. *Tragus* ſays, he cured a Woman who had eaten the Root, by giving her a Draught of good Vinegar: and this may be prov-

the Vinegar, for that if the Vinegar was given in a good large quantity it would cauſe plentiful Vomiting, to evacuate the poyſonous matter, and withal, by reaſon of its acidity, it would enervate and deſtroy the force of the Poyſon, making it of no effect.

XV. *The Emplaſter, called* Emplaſtrum è Cicuta cum Ammoniaco. *Take juice of Hemlock four Ounces, Vinegar of Squills, Gum Ammoniacum, of each eight Ounces, diſſolve the Gum in the Juice and Vinegar, by a gentle infuſion in a warm Sand heat, then ſtrain, and reduce it to the conſiſtence of an Emplaſter.* Here note, that if the quantity of the Juice was doubled it would be ſo much the better; it was invented to eaſe pains, chiefly of the Spleen and Gout, my Experience has confirmed it, and ſuch as ſhall uſe it upon my Word may have cauſe to return me Thanks for this Recommendation; it is alſo an excellent thing to diſſolve Scirrhus, and other like hard Tumors in any part of the Body, chiefly Tumors of the Liver, Spleen, Hypochonders, and Joints.

XVI. *Nota.* It has been found by obſervation that ſome Countries bring it forth in greater ſtrength than other ſome do, and where it is produced in greater ſtrength it is a greater Poyſon; and tho' it is a kind of Poyſon with us here in *England*, yet it ſeems not to be ſo great a Poyſon as in *Greece*, and other hot Countries, nor attended with ſuch violent effects.

CHAP. CCCLVI.

Of HEMLOCK the Leſſer, *OR,* HEMLOCK Parſly Leav'd.

I. *THE Names.* It is called in *Greek* Κώνειον μικρὸν, in *Latine Cicuta parva, vel minor*, and in *Engliſh The Small or Leſſer Hemlock.*

II. *The Kinds.* This is the ſecond general Species of this Plant, and tho' it is a ſingular one of its Kind, yet Authors have given it a plurality of Names, as *Cicuta minor Cordi & Camerarij*, *Cicutaria Fatua Lobelij*, *Cicuta Fatua*, *Apium Cicutarium Thalij*, *Petroſelinum Caninum Tabernamontani*, *Petroſelini vitium Tragi*, and *Apij Comes Cicutarium Geſneri in Hortis*, Fools Hemlock, Parſly Leav'd Hemlock, &c.

III. The Deſcription. *This* Smallet Hemlock *has a ſmall, tough, white Root, which periſhes every Year*, from which riſe up divers ſtiff Stalks, ſcarcely a Yard high, hollow, ſomewhat reddiſh towards the Sun, otherwiſe they are whiter than the former, ſmaller, and not ſpotted at all, and jointed or kneed at certain diſtances, from which Joints ſpring forth long Leaves, very green, and finely jagged, like the *Common Chervil*, or *Parſly*: indeed as the Leaves are much ſmaller than the *Common Hemlock*, ſo they come ſo near unto *Parſly*, that many are miſtaken in gathering one for another, being often found (tho' a Wild Weed) in Gardens, of a paler green color, and with few Branches: the Flowers are white, and grow at the tops of the Stalks in ſmall ſpoky Umbles, with ſmall, longiſh green Leaves about them; the Seed follows, like that of the *Common Hemlock*, of a white color, or as they grow together on the tops of the Stalks, reſembling *Coriander* Seed, but leſſer; the whole Plant ſeems not to me to be of any evil ſmell.

Hemlock Parſly Leav'd.

IV. *The Places.* It grows amongſt Stones and Rubbiſh by old Walls and ruinous places, by the Walls of Cities and Towns, and on Banks ſides, and by Hedges, almoſt every where, as alſo in Gardens very plentifully.

V. *The Times.* It Flowers in *July* and *Auguſt*, and its Seed is ripe in *Auguſt* and *September*, and in warm and ſeaſonable Years much ſooner.

VI. *The Qualities, Specification, Preparations and Virtues* of this are the ſame with thoſe of the *Common Kinds*, ſaving, that it is found by experience that this is not full out ſo Venefick as they are, yet doubtleſs is dangerous to be taken inwardly.

CHAP. CCCLVII.

Of HEMLOCK Water *or* Marſh.

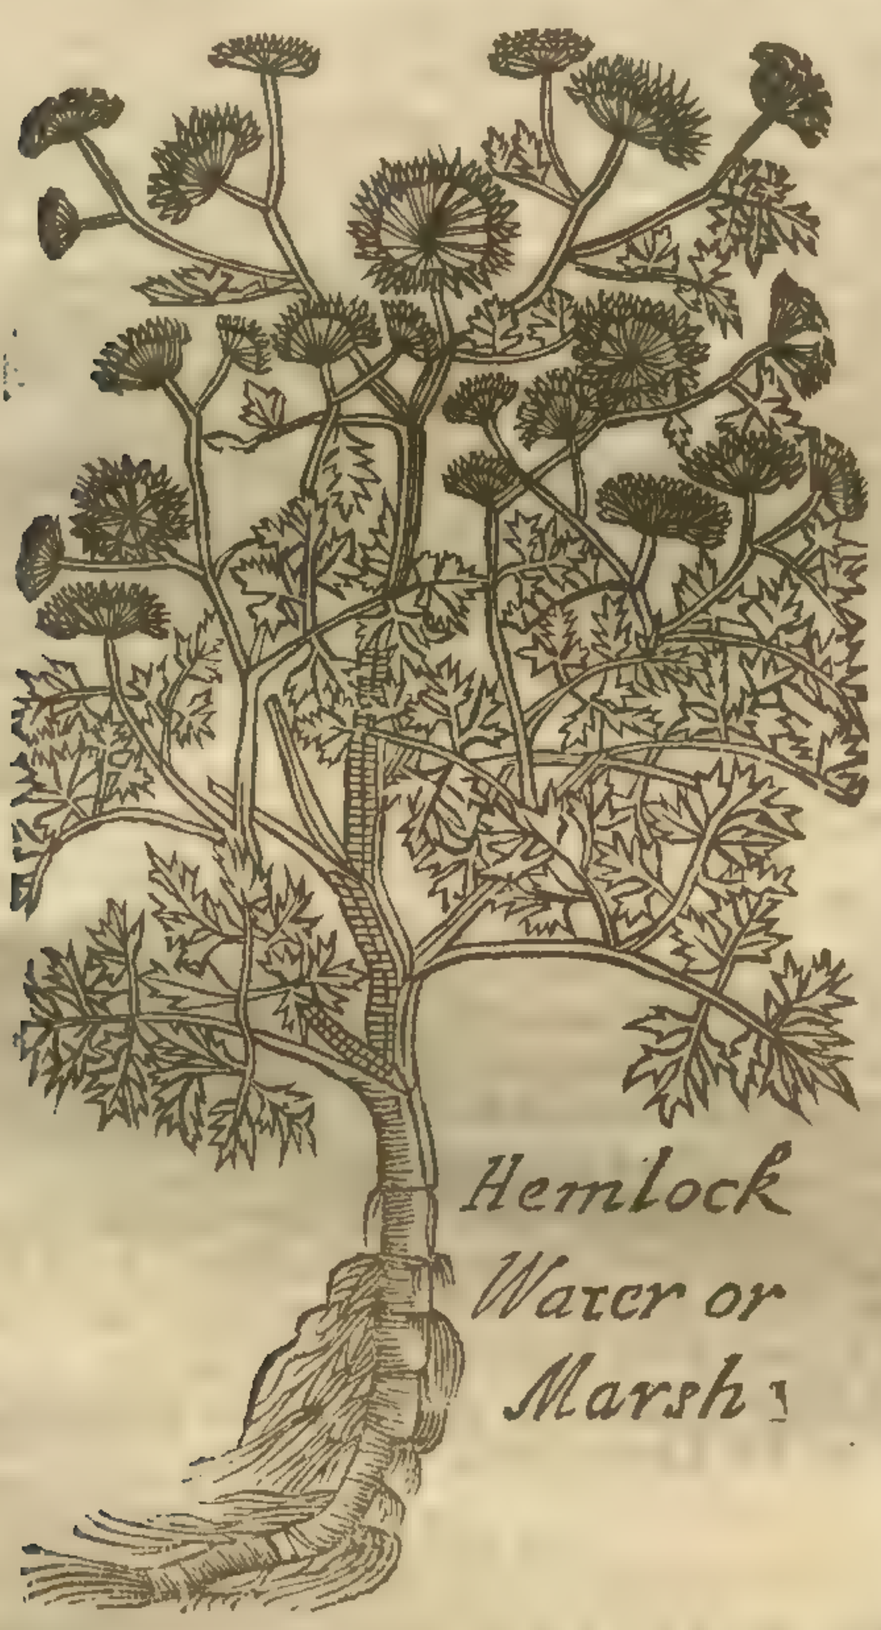
I. *THE Names.* It is called in *Greek* Κώνειον ὕδατος, ἢ ἑλώδες, in *Latine Cicuta Aquatica, vel Paluſtris*, in *Engliſh Water or Marſh Hemlock.*

II. *The Kinds.* There are three Kinds hereof, *viz.* 1. *Cicutaria Paluſtris alba*, *Cicutaria Paluſtris Flore albo*, *Cicutaria albo Lugdunenſis*, White Water Hemlock. 2. *Cicutaria Paluſtris rubra*, *Cicutaria rubra*, *Cicutaria Paluſtris Flore purpureo Bauhini & Camerarij*, Red Water Hemlock. 3. *Cicutaria Paluſtris Tennifolia Lobelij*, *Cicuta Paluſtris & Aquatica Cordi*, *Geſneri*, *& Thalij*, Marſh or Water Hemlock.

III. The Deſcriptions. *The firſt*, *or* White Water

ter Hemlock. *It has a white, thick, long Root, like that of* Fennel, *but divided into many parts, being of a sweet scent, and an hot sharp taste*; from this Root rise up several Stalks of winged Leaves, much cut in on the edges, from among which rises up a slender crumpled Stalk, and Branched a Foot and half or more high, bearing Umbles of white Flowers, and long, black, well smelling Seed, and when ripe tasting sharp, two always joined together, with a small Thread between them.

IV. *The second, or* Red Water Hemlock. *It has a thick, black, and jointed Root, with several Fibres thereat; the Leaves are in form like the former, but larger, and not so much cut into parts, and paler of color*; the Stalk is round, and jointed, about a Foot in height, bearing at its tops flat Umbles, with pale red, or blush Flowers, and long black Seed after them, sweet in smell, and sharp in taste.



V. *The third, or* Marsh or Water Hemlock. *It has a long and blackish Root, with several Joints and Fibres growing from them*; from this Root springs up a great, thick, and hollow Stalk, three, four, and sometimes almost five Feet high, full of Joints, and Leaves at them; at the Joints with the Leaves, which are cut into divers parts, somewhat like unto *Parsly*, but smaller, come forth the Branches up to the top, bearing small Umbles of White Flowers; the Seed is sweet in smell, and black, somewhat greater than *Aniseed*: This is that Plant which *Dodonæus* and *Lugdunensis* take to be *Phellandrium Plinij*, and they make it to be *Sium*, or *Laver*, the *Ligusticum Sylvestre Thalij*, which *Cæsalpinus* and others think to be the *Silaus Plinij*.

VI. *The Places.* They all grow in moist and watery places in several Countries of *Europe*, the third, or last of them, grows by many Rivers sides in many parts of *England*, in several places by the *Thames* side, also in the midst of Water Ditches, and standing Pools and Ponds, in most places of this Land; it grows very plentifully in the Ditches by a Causey going from *Redriff* to *Deptford*, near *London*, and in many other places.

VII. *The Times.* They Flower thro' all *July* and *August*, and perfect their Seed in *August* and *September*, as other *Hemlocks* do.

VIII. *The Qualities, Specification, Preparations, Virtues and Uses* are the same (as Authors think) with the *Common Hemlock* in *Chap.* 355. aforegoing, but of this I confess I very much doubt, seeing they are cold in the fourth degree, and these on the contrary are hot, at least in the second degree, and aromatick, as the hot and spicy taste of the Seed seems to indicate, however, since Authors have said nothing in particular of the matter, nor we have had any experience of our own concerning the same, we shall cease any farther declaration thereof.

CHAP. CCCLVIII.

Of HEMP Manured.

I. *THE Names.* It is called in *Arabick Canab*, and *Schebedenegi*, in *Greek* Κάνναβις, in *Latine Cannabis*, and in *English Hemp*.

II. *The Kinds.* It is twofold, *viz.* 1. κάνναβις σπόιμη, *Cannabis Sativa*, Manured Hemp. 2. κάνναβις ὑπόβλητη, *Cannabis Sylvestris*, *Cannabis Spuria*, Wild or Bastard Hemp.

III. *The Manured Kinds.* The Manured is also twofold, *viz.* 1. *Cannabis Mas*, The Male Hemp, or that which bears Seed. 2. *Cannabis Fœmina*, The Female Hemp, or that which bears Flowers and no Seed.

IV. The Descriptions. *The first, or* Male Kind, *has generally one downright Root, six or seven Inches long, with many strong Strings, which take fast hold in the Ground, but die and perish every Year*; from this Root rises up one Stalk, four, five, six, or seven Feet

Feet high, according to the goodneſs of the Soil, with many Leaves ſet thereon at diſtances; this Stalk is rough and buſhy, with many Leaves alſo on the Branches, every one of them ſtanding upon a long Foot-ſtalk, and divided into five, ſix, or ſeven ſeveral Leaves, joined together at the bottom of them, and dented about the edges, ſomething like unto the form of the Leaves *Palma Chriſti*, or *Baſtard Black Helleber*, of a dark green color, and of a ſtrong ſmell, but not unpleaſing; towards the tops, from the bottoms of the Wings and Leaves, comes forth the Seed on long Branches, without any ſhew of Flowers, which is round, ſomewhat hard, and full of an oily Nut like white ſubſtance, and contained in round Heads; every particular Leaf is narrow, long, and ſharp pointed, finely notched in about the edges; this is called *Winter Hemp*.

V. *The ſecond, or* Female Kind, *has like Root and Stalk as the former, but the Leaves are leſſer, and of a lighter green color, yet like in form and ſhape*; the Stalk is ſingle for the moſt part, with few or no Branches, having a like ſtrong ſmell as the other, it bears a great number of Flowers, which are ſmall, and of a whitiſh yellow color, ſtanding many together upon long Branches, which turn into duſt, and are carried away with the Wind, not leaving any Seed after them, for which reaſon it is called *Barren Hemp*, and by reaſon of its bearing no Seed it comes to ripeneſs ſooner than the other by a Month, or more, being the tenderer and weaker Plant, the Stalk being hollower, and not ſo ſtrong, for which reaſon it is uſually called *Summer Hemp*.

VI. *An Obſervation.* Theſe two ſorts *Male* and *Female* are not originally two differing Kinds, but both ariſe from one and the ſelf ſame Seed, that is, they both ſpring from the Seed, growing upon one and the ſame Stalk or Plant, being herein ſomewhat like unto the *Fixed Mercury*; but how this change in Nature ſhould be, or how it is brought to paſs, is very hard to determine: The *Summer Hemp*, as it is the tenderer and weaker Plant, ſo it makes the finer Stalk or Ture, and that makes the finer Thread, and by conſequence the finer and ſofter Linnen Cloth. The *Winter Hemp*, as it is the ſtronger Plant, and harder peeling, ſo it makes the courſer and harder Thread and Cloth, and of this ſort it is they uſually make their Cordage. As for the way and manner of ſteeping or watering of *Hemp*, and how it is dryed, picked, cleanſed, and beaten, *&c.* ſo as to be made into Cloth or Cordage, as it is not pertinent to, or the buſineſs of this Work, ſo it is pretermitted, and you are referred to the proper place in my *Agriculture*, which, if it ſhall pleaſe God to Bleſs me with Life, ſhall in due ſeaſon be emitted into the World, for the general Benefit of Mankind.

VII. There is alſo a third Kind of *Hemp* growing in *Virginia*, and other of our *Floridian* Plantations, which in Roots, Stalks, Leaves and Seed differ not much from our *Manured Kind*, ſaving, that the whole Plant is much bigger, the Stalks are greater, and the Leaves and Flowers much larger.

VIII. *The Places.* *Pliny Lib.* 20. *Chap.* 23. ſays that *Hemp* was formerly found growing Wild, but we in our days can find no ſuch thing, for in all places of the World it is now Sown in encloſed Fields choſen on purpoſe for the ſame; *Columella* ſays it delights to grow in a Fat, Dunged, and Watery Soil, or in plain and moiſt Grounds deeply Ploughed.

IX. *The Times.* It is Sown in the end of *March*, or beginning of *April*, and is ripe in *Auguſt* or *September*, according as the two ſorts grow ripe and fit to be gathered; the ſecond of theſe, or *Summer Hemp* is ripe and fit to be gathered in the end of *July*, and beginning of *Auguſt*; the firſt, or *Winter Hemp*, is gathered a full Month after, *viz.* in the end of *Auguſt*, or beginning of *September*.

X. *The Qualities.* It is hot and dry in the end of the firſt degree, it is Aſtringent, Carminative, Diſcuſſive, opening Obſtructions of the Gall Bladder, and is Anodyne, Neurotick, and Arthritick.

XI. *The Specification.* It is a peculiar thing in curing the Jaundice and Colick, in killing Worms, and eaſing pains of the Gout.

XII. *The Preparations.* You may prepare therefrom, 1. *A Liquid Juice of the Leaves.* 2. *A Decoction of the Leaves.* 3. *A Decoction of the Root.* 4. *A Decoction or Emulſion of the Seed.* 5. *A Diſtilled Water of Root and Herb.* 6. *An Oil by Infuſion.* 7. *The Leaves fried.*

The Virtues.

XIII. *The Liquid Juice of the Leaves.* Taken to an Ounce or two in a Glaſs of Wine it is an extraordinary thing to kill Worms, whether in Man or Beaſt; dropt into the Ears it kills Worms in the Ears, and draws forth any other living Creature which has crept into them: And to ſhew the ſtrength hereof for this purpoſe, *Matthiolus* ſays, that if it is poured, (yea but the Decoction of the Herb) into the holes of Earth-Worms, it will drive them forth, and that Fiſhermen and Anglers have uſed this Feat to get Worms to bait their Hooks.

XIV. *The Decoction of the Leaves.* It has the former Virtues, but not altogether ſo ſtrong, and may be given from three to eight Ounces, according to Age and Strength, but is no very agreeable thing for the Stomach.

XV. *The Decoction of the Root.* It has the ſame Virtues alſo, but this in eſpecial it is ſaid to be good againſt, *viz.* to allay Inflamations in the Head, or any other part, to eaſe the pains of the Gout, to help hard Tumors or Knots in the Joints, Cramps, and ſhrinking of the Sinews, and to eaſe the pains of the Hip, or Sciatica, being applied thereto by Fomentation.

tation, and afterwards mixed applied made up into a Cataplasm with Barley Flower, renewing of it every day.

XVI. *A Decoction or Emulsion of the Seed.* The Decoction in Water or Wine is hot and dry, and consumes Wind, and by the much use thereof it does disperse it so much, that it consumes and dries up the Natural Seed of Generation. The Emulsion of the Seed in Water or Milk stops continual Fluxes of the Bowels, and is good against a Gonorrhœa, it eases the pains of the Colick, and quiets and allays troublesom and griping Humors in Stomach and Belly, it is good against a Bloody Flux, and stops bleedings, whether at Mouth, Nose, Yard, or Womb. The Emulsion made in Milk, by boiling the Seed so long in it till it is perfectly broken, and then strained out, as *Sylvius de Le Boe Prax. Med. Lib.* 1. *Cap.* 47. *Sect.* 74. *Pag.* 306. *b. quarto Edition* Printed 1680. has taught, if it is taken five or six Ounces at a time twice or thrice in a day, it will, as he says (from great Experience) cure the Jaundice; it is also good for such as have a hot and dry Cough, opens obstructions of the Lungs, and obstructions of the Gall Bladder, and causes a digestion of Choler.

XVII. *The Distilled Water of the Herb.* It allays Inflamations, and has all the Virtues of the Juice and Decoction of the Leaves, and may be used to be mixed with some other Preparations, as a Vehicle.

XVIII. *The Oil by Insolation, Infusion, or Decoction.* It is good to be applied to any place which is burn'd with Fire, and to remove inflamations in any part; so also if an Oil or Ointment is made, by mixing the fresh Juice with Oil Olive, or Hogs Lard, or fresh Butter, it heals Burnings or Scaldings after an admirable manner.

XIX. *The Leaves fried.* In a Hæmorrhage if some of the Blood which comes from the Patient be taken, and the fresh Leaves of *Hemp* be fried therein, and then given to the Sick to eat, it stops the bleeding presently, and if they be so fried as that the Leaves may be crumbled into Pouder, this Pouder blowed up the Nostrils, or put upon any Wound where there is a flux of Blood, it presently stops it, and given to a Dram or more inwardly in a Spitting of Blood, Vomiting Blood, Pissing Blood, Bloody Flux, or flux of the Terms, it quickly stops it, and by repeating the exhibition quickly cures it; and given to such as are troubled with Worms in the Bowels it kills them.

XX. *Nota. Matthiolus* says that *Hempseed* given to Hens in the Winter, when they lay fewest Egs, will make them lay more plentifully.

CHAP. CCCLIX.

Of HEMP Bastard *or* Wild.

I. *THE Names.* It is called in *Greek* Κάνναβις ὑπόβλητη, ἢ νόθη, in *Latine Cannabis Spuria, vel Notha*, and *Cannabis Sylvestris*, in *English Bastard Hemp*, and *Wild Hemp*.

II. *The Kinds.* Authors make three several sorts hereof, *viz.* 1. *Cannabis Spuria prima, Cannabis Sylvestris Tragi & Lugdunensis, & Spuria altera Lobelij, Cannabina alba Tabernamontani, Urtica aculeata Folijs serratis Bauhini*, The first Bastard Hemp, or White Bastard Hemp. 2. *Cannabis Spuria secunda. Cannabis Sylvestris Spuria tertia Lobelij, Alyssum Arvense album Tabernamontani, Urtica aculeata Folijs serratis altera Bauhini*, who thinks it to be the *Sideritis Cordi*, The second Bastard or Wild Hemp, 3. *Cannabis Spuria tertia, Cannabis Spuria facie Urticæ Lobelij, Urtica aculeata Folijs non serratis Bauhini, Sideritis altera Matthioli*, The third Bastard or Wild Hemp.

III. The Descriptions. *The first, or* First Bastard Hemp, *has a Root which is hard and white, and a little spreading, but dying before Winter*, from the head of which rises up a reasonable great, hairy, square Stalk, not very strong, nor upright, but as it were leaning down, with several Joints bunching out like Knees, and two Leaves set at every one of them, somewhat long, hairy, and pointed, of a fresher green color than the Leaves of the *Manured Kind*, and dented about the edges; at the Joints also come forth several Branches, jointed and set with Leaves in like manner, whereabout, towards the tops, grow several hooded and gaping Flowers, like those of the *Dead Nettle*, but larger and greater, of a pale purplish color, standing in small, green, prickly Husks, in which, after the Flowers are past, grows the Seed, which is small and round, three or four growing together.

IV. *The second, or* Second Bastard Hemp, *differs not much in Root or Stalk from the former*, but the Leaves are shorter and rounder; the Flowers hereof are of the same fashion, but not so great as they, the uppermost part or hood whereof is of a pale color, tending to yellow, and the lower part of a deeper Red, or Purple Color; the Husks of the Flowers are somewhat more prickly also than the other.

V. *The Third, or* Third Bastard Hemp, *is in its growing much like the last, but its Root is a bush of Fibres and Strings*, from whose head comes forth one short body of a Stalk, which quickly divides it self into two, three, or four others, which growing up with several Joints, spread themselves out into many Arms or Branches, two and two at every Joint, but

but the Leaves at the Joints are somewhat long and narrow, a little sadder, and not dented about the edges in most of them; the Flowers hereof are hooded and gaping, but they are wholly of a pale yellowish color, with little or no shadow or spot in them, and stand thicker about the Joints; whose Husks have longer and sharper points than the rest.

VI. *Nota. You are to take notice that there is another variety of the first of these Kinds, whose Flower is for the most part of a perfect white color, or a little pale whitish*, which does manifestly express the difference, and therefore is called in *Latine Cannabis Spuria prima Flore albo*, Bastard Hemp of the first sort with a white Flower.

VII. *The Places.* These Kinds of *Bastard* or *Wild Hemp* do all grow as well in moist Grounds as dry, by Ditch sides, and by Pathways, and under Walls, and some of them will be found in Gardens, whence they are continually plucked up as Weeds; the first Kind with a white Flower mentioned at Sect. VI. above has been found by the Pathways near *Clapham*, and in the Ditches by *Redriff*, or *Rotherhithe*, as it was formerly written; they all grow also upon barren Hills and Mountains, as *Gerard* says, and especially on Earable Land; and they have been oftentimes found in the Corn Fields of *Kent*, near *Gravesend* and *Southfleet*, and in all the way from thence to *Canterbury*, and in many places about *London*.

VIII. *The Times.* They all Flower for the most part in *July*, and from *July* to the end of *August*, the Seed ripening in the mean time.

IX. *As to their Qualities, Specification, Preparations and Virtues*, they are thought to be nearly the same with those of the *Common Hemp* in the former Chapter, as some Authors are of Opinion, but they are seldom used in Physick, either inwardly or outwardly, when and where the others are to be had.

X. But *Lobel* says they are used as an assured Remedy against Nodes and Wens, and other like hard Tumors in the Flesh, and that after other things have failed and done no good; 'tis very possible that they may be of extraordinary use in curing the Kings-Evil, if prudently prepared and applied, and by a Wise and Skilful Hand.

HEMP Water. See AGRIMONY Water.

CHAP. CCCLX.

Of HENBANE Common *or* Black.

I. *THE Names.* It is called in *Arabick Altercum*, and *Altercangenum*, and by the *Arabian* Physicians *Bengi*, which differs but little from the *Indian* and *Persian* Name *Bangue*, as *Garcias ab Orto*, and *Christopher Acosta* declare, in *Greek* Υοσκυαμος *quasi Faba Porcina*, in *Latine* also *Hyoscyamus*, and corruptly *Jusquiamus*, also *Apollinaris, ab Apolline Medicinæ inventore, vel quia opplet Cerebrum vitioso & fætido halitu, ecque Mentem percellit, quasi Apollinis Æstro. Scribonius* says that the *Latines* also call it *Altercum, ab Altercando, quia cum Verborum Altercatione rixaque se torquent Hyosciamo dementati. Camerarius* saith it is also called *Priapeia, quia Itali Semine utuntur ad Priapismum sedandum.*

II. *The Kinds.* There are several sorts of this Plant, but the principal Kinds are, 1. Υοσκυαμος μέλας, *Hyoscyamus niger*, called also *Hyoscyamus vulgaris*, and by *Fuchsius Hyoscyamus Flavus*, Our Common Henbane, which is the *Black Henbane*, and is a singular Plant, of which in this Chapter. 2. Υοσκυαμος λευκὸς, *Hyoscyamus albus*, so called by all Authors, *White Henbane*, of which in *Chap.* 361. following.

III. The Description. *It has a Root which is great, white, and thick, branching or spreading it self several*

ral ways under Ground, ſo like unto a Parſnep *Root, (but that it is not ſo white) that it has deceived ſeveral*; from this Root ſpring up ſeveral very large, thick, ſoft, woolly Leaves, lying upon the Ground, much cut in or torn on the edges, of a dark or very dull grayiſh green color; among theſe Leaves riſe up divers thick and ſoft Stalks, two or three Feet high, and ſometimes higher, which ſpread themſelves out into ſeveral ſmaller Branches, with ſome ſmaller Leaves on them, and many hollow Flowers Bell faſhion ſcarcely appearing above the Husks, and commonly torn on the one ſide, ending in five round points, growing one above another, of a deadiſh, faint, yellow, white color, ſomewhat paler towards the edges, with many purpliſh Veins therein, and of a browniſh color, or dark yellowiſh purple in the bottom of the Flower, with a ſmall Pointel of the ſame color in the middle, each of them ſtanding in a hard cloſe Husk, which, after the Flower is paſt, grows very like the Husk of a *Pomgranet* Flower, or the Flower or Husk of *Aſarabacca*, and ſomewhat ſharp at the top points, in which is contained much ſmall Seed, very like unto *Poppy* Seed, but of a dusky grayiſh color, almoſt enclining unto black, whence came the Name *Black Henbane*.

IV. *The Ægyptian Henbane. I ſhall put this Plant into this Chapter, and deſcribe it here, tho' an Exotick, becauſe* Parkinſon *ſays it is, or will have it to be, a Species of the* Black, *and withal it is not a very great ſtranger in ſome of our* Engliſh *Gardens, it has a ſmall white Root, with ſome Fibres adjoining to it, which periſhes every Year*; this Root ſends up a ſtrong woolly Stalk, about two Feet high, on which are growing leſſer Leaves than thoſe of the *Common Kind* afore deſcribed, and almoſt as much torn on the edges, eſpecially thoſe towards the bottom, but thoſe which grow up higher towards the top are little or nothing indented on the edges, and the higher the ſmoother edged, all of them being very white and hoary; the Flowers ſtand every one of them at the Joints with the Leaves, and at the tops likewiſe, in ſuch like Husks as the *Common* does, and of the ſame pale yellow color, with purple Veins therein, at the firſt blowing of them, but afterwards, as they grow larger, ſo the color changes to be of a dark reddiſh color, with Veins of a deeper Dye, and a whitiſh bottom, with a Purple Pointel, encompaſſed with yellow Threads in the middle, which being paſt away, there ſucceeds ſuch like prickly Heads as the *Common Kind* has, and alſo ſuch like Seed.

V. *The Places.* The firſt is commonly found growing by the Way ſides, and under Hedge ſides, and old Walls, about the borders of Fields, on old Dunghills which have lain long, and in other rude and untilled places; the other is an Exotick, common to be had in *Ægypt*, as the firſt is with us, but by tranſportation of the Seed to us, is now to be found in ſeveral of our Gardens.

VI. *The Times.* They ſpring out of the Ground all *April*, and in *May*, and do both Flower in *July*, and in *Auguſt*, the Seed being perfected in *October*, when growing ripe, if it is ſuffered to ſhed or fall, it ſprings up again every Year.

VII. *The Qualities.* They are cold in the fourth degree, and dry in the ſecond or third, they are Anodyne, Aſtringent, Emphractive, Repercuſſive, Arthritick, and Venefick.

VIII. *The Specification.* They are good againſt inflamations of the Eyes, Sciatica, Gout, Rheumatiſm, Kings-Evil, hot Tumors of the Cods, and of Womens Breaſts, noiſe, deafneſs, and pains in the Ears, it prevails againſt Coughs, and Fits of the Mother.

IX. *The Preparations.* You may have, 1. *The Leaves whole and in ſubſtance.* 2. *A Juice of the Leaves and Roots.* 3. *An Eſſence of the ſame.* 4. *A Juice or Emulſion of the Seed.* 5. *An Oil of the Seed by Inſolation or Expreſſion.* 6. *The Seed in ſubſtance.* 7. *A Decoction of Root, Herb, and Seed.* 8. *A Vinegar of the Root or Herb, or green Husks of the Flowers.* 9. *An Extract of the Juice of the Roots and Leaves.* 10. *An Oil or Ointment of the Root, or Leaves, or of their Juice.* 11. *A Cataplaſm of the Roots or Leaves boiled in Red Port Wine.* 12. *A Fomentation.* 13. *Fumes of the Herb or Seed.* 14. *A Diſtilled Water of Root, Herb, Flowers.* 15. *A Venefick.* 16. *The Cure of the Poyſon of Henbane.* 17. *A Hiſtory.*

The Virtues.

X. *The green Leaves in ſubſtance.* Applied they cool all inflamations, either in the Eyes, or in any other part of the Body, and are good to aſſwage all manner of ſwellings, whether of the Cods, or of Womens Breaſts, or in any other part; the ſame applied to the Joints give eaſe in pains of the Gout, and Sciatica, and to the Forehead and Temples they eaſe a vehement Headach, proceeding from a hot cauſe, or for want of Sleep in Fevers, and are very good againſt ſimple Contuſions while recent.

XI. *The Liquid Juice of the Leaves.* It has all the former Virtues, being bathed warm or fomented upon the parts affected, and ſeems to me to be the more powerful of the two, but after bathing it will be neceſſary to lay Linnen Cloths four, ſix, or eight times doubled dipped in the ſame Juice upon the diſaffection; dropped into the Ears it takes away any noiſe therein, deafneſs, thickneſs of hearing, or pain there; held often in the Mouth of one who has the Toothach it gives relief and eaſe, and if there is Worms in the Teeth or Gums it kills them.

XII. *The Eſſence of the Roots and Leaves.* It has all the Virtues of the green Leaves and Juice aforegoing, and for the excellent uſe which may be made hereof it ought always to be kept in a readineſs in the Houſe; if it is mixed with Wine, or Wine and Water in equal quantities, and a louſie Head bathed therewith, it will kill Nits and Lice, and this it will do in Man and Beaſt; the ſame thing the Liquid Juice will do alſo.

XIII. *The Juice or Emulſion of the Seed.* An Ounce of the Seed will make twenty or twenty four Doſes for a Man or Woman, it is an excellent thing againſt hot, ſalt, and ſharp defluxions of Rheum falling upon the Lungs, eaſes Coughs, tho' never ſo extream, and is good againſt pains of the Spleen, and Womb, and Hyſterick Fits, or Fits of the Mother; it ſtops all ſorts of Fluxes of the Bowels, as Diarrhœa's, Diſenteria's, Lienteria's, and Hepatick Flux, as alſo the overflowing of the Terms, and the Whites in Women.

XIV. *The Oil of the Seed by Inſolation or Expreſſion.* Dropped into the Ears it is good againſt noiſe and pain there, as alſo againſt thickneſs of hearing, and kills Worms in the Ears; anointed on the Joints of Gouty People, it gives eaſe to the pain and aſſwages the ſwelling of the part: The Oil by Inſolation is good for all the aforenamed things, but the Expreſſed Oil is five times more powerful and efficacious, and therefore the rather to be choſen.

XV. *The Seed in ſubſtance.* It has all the Virtues of the Juice or Emulſion of the Seed at Sect. XIII. above, beſides which it is a moſt excellent thing to be given about ten or fifteen Grains at a time (according to the Age of the Perſon) to ſuch as Piſs a Bed, or cannot hold their Water, being continued for ſome time; and by this Remedy alone I have

cured ſeveral Young Perſons, (even Women kind, which are the moſt difficult) who had been troubled with the ſame many Years, the Cure ſucceeding beyond expectation: The Emulſion of the Seed will alſo do the ſame thing, but whether it is ſo powerful as the Seed in ſubſtance I will not determine, becauſe a great Virtue may reſide in the Hulls or Husks of the Seed, which in the Emulſion are all caſt away; but if the Emulſion be made with all the Husks of the Seed in it, I know not but then it may do as well as the Seed in ſubſtance it ſelf; if the Seed is given in ſubſtance, it ought firſt to be all bruiſed in a Stone or Glaſs Mortar, and then mixed with the pulp of a roaſted Apple, or other proper Vehicle, and ſo given (for ſome time) every Night going to Bed.

XVI. *The Decoction of Roots, Herb, or Seed.* If the Feet are waſhed herewith it cauſes Sleep, and given in a Clyſter it does the ſame, ſo alſo bathed upon the Temples and Forehead, and a little ſnuffed up the Noſtrils alſo; it has all the Virtues of the green Leaves, Liquid Juice and Eſſence at Sect. X. XI. XII. if in like manner applied, but the Decoction is much the weaker Preparation, and ought therefore to be the oftner uſed: The Decoction of the green Husks of the Flowers has alſo the ſame Virtues.

XVII. *The Vinegar of the Root, green Herb, or green Husks.* It is made by Infuſion in ſharp White Wine Vinegar, either by Inſolation, Digeſtion in a Sand heat, or gentle boiling, or digeſting in a boiling *Balneo*; if it is held in the Mouth it eaſes the pains of the Teeth, given inwardly in a ſmall Doſe, as from half a Dram to a Dram, or more, in ſome fit Vehicle, it cauſes Reſt and Sleep, more eſpecially if it is alſo bathed upon the Noſtrils, Forehead, and Temples, and a Roſe Cake dipped in the ſame be applied to the Temples; bathed upon places inflamed, tumified, or pained, or affected with the Gout, it eaſes them; it alſo aſſwages the ſwelling of the Spleen, and eaſes its pain.

XVIII. *The Extract of the Juice of the Roots and Leaves. The Juice being produced by expreſſion is to be inſpiſſated in a gentle Sand heat, or in the Sun, till it comes to perfect dryneſs of a Gum, which done it is to be reduced, by beating in a Mortar, to a groſs Pouder, and then it is fit for extraction; this is done two ways,* viz. *either with fair Water, or with Spirit of Wine; you muſt diſſolve it in either the one or the other Menſtruum in a gentle* Balneo, *or in a gentle Sand heat, and keep it in that digeſtion forty eight Hours, ſhaking it two or three times a day; then being ſettled till it is perfectly fine, decant off the clear Tincture, which reſerve, put more, either fair Water, or Spirit of Wine, and extract again as before, till no more Tincture will ariſe; decant this clear Tincture, which put to the former reſerved Tincture, caſting the faces away; this Tincture, whether Aqueous or Vinous, put into a proper Veſſel, if it is an Aqueous Tincture, you may put it into a Glaſs Baſon, or well glazed Earthen Baſon, and in a gentle Sand heat evaporate to dryneſs, and then it is done; but if it is a Spirituous Tincture, put it into a Glaſs Body or Veſica, which fit with a Glaſs Head, and in a gentle Sand heat, or in* Balneo, *draw off the Spirit, till the* Magma *remaining is of the thickneſs of new Honey, or ſomething thicker; the Spirit you may keep for the like uſe again, the Extract you may take out, (by breaking the Glaſs Body) and keep it in a Pot or Box cloſe covered from the Air.* It is Soporiferous and Narcotick, diſſolved in Water or Vinegar, and uſed outwardly, it will do all that the green Leaves, Liquid Juice, Eſſence, or Decoction can do; if it is diſſolved in Canary, or other Wine, it is good againſt Deafneſs, or dulneſs of hearing, noiſe and pains in the Ears, and held in the Mouth it gives eaſe in the Toothach; and ſo diſſolved in Wine, or otherwiſe in Spirit of Wine, it may be given from twenty to thirty, or forty drops, or more, in any convenient Vehicle, to cauſe Reſt and Sleep, and to eaſe the pains of the Spleen and Bowels, or pains in other parts of the Body, it operating not much different from an Opiate; and this Extract is that Juice of *Henbane* which you ought to put into the Compoſition when you Confect the *Laudanum Opiatum Paracelſi.*

XIX. *The Oil or Ointment of the Roots, or green Leaves, or of their Juice. It is made by a trebble addition of the Vegetable matter to the Oil Olive, or Hogs Lard, or mixture of Oil and Sheeps Suet, every time inſolating and boiling till the aqueous particles are all conſumed.* It is good to cool inflamations, and eaſe pain proceeding from a hot cauſe; if it is made (inſtead of the Hogs Lard, or mixture, *&c.*) with *Unguentum Populeon*, it will give admirable eaſe in the Gout, aſſwage the pain and ſwelling of the Teſticles, and the Inflamations and Tumors in Womens Breaſts; it eaſes all pains of the Joints, and in any other part, and will perform what the Leaves, Juice or Eſſence can do.

XX. *The Cataplaſm of the Roots or Leaves.* If applied to ſimple recent Contuſions it diſſipates the Tumor, or prevents its riſing, and quickly cures it; if made by boiling them ſoft in Red Port Wine, and applied to Womens Breaſts, or to the Teſticles, or other like painful Tumors, it eaſes the pain and aſſwages the ſwelling; applied to the Temples and Forehead it eaſes the Headach, gives Reſt, and induces Sleep; that made without Wine is good to be applied to pains in the Reins, and to the brawny parts of the Arms and Legs, but it ought to be applied hot; that made with Wine is an excellent thing againſt the Sciatica, and the Gout in Hands or Feet.

XXI. *The Fomentation.* It is made of the Wine in which the former Cataplaſm was boiled, adding to every Pint thereof a Dram or two of *Oleum Tartari per deliquium*; it allays Inflamations, diſcuſſes Tumors or Swellings proceeding from heat; and eaſes any pain proceeding from a hot cauſe, or hot and ſharp Humors; it is good alſo to bath therewith Hands and Feet which are apt to be hard and dry; it is alſo good to hold in the Mouth for the Toothach, and to foment that ſide of the Cheek and Jaw therewith, it giving preſent eaſe to the pain.

XXII. *The Fumes of the dryed Root, Herb, or Seed.* The Fume of dryed Root, Herb, Stalks, or Seed, being burned, and the Hands held over the Fume thereof, will quickly cure ſuch as are troubled with Swellings or Chilblains in the Winter, the ſame done to ſuch as have Kibes in their Heels it will quickly heal them, tho' inveterate and very bad; it alſo cures the Toothach.

XXIII. *The Diſtilled Water of the Root, Herb, Flowers.* It is effectual to all the purpoſes for which the green Leaves, Juice, Eſſence, Infuſion, Decoction, *&c.* are uſed, but is much weaker than they; it clears the Skin, being waſhed with it, of heat, Pimples, hot eruptions, or breakings out, Herpes, Scurf, Morphew, Yellowneſs, and other Deformities, *&c.*

XXIV. *The Veneſick.* It is made of the expreſſed Juice of Root or Herb, digeſted in a Glaſs Body in a very gentle Sand heat for a Week; mixed with any proper matter, as Paſte, Bread, Meat, *&c.* it kills Rats and Mice, or other Vermine: this Veneſick mixed with ſome of the Diſtilled Water kills Nits and Lice, the Head and parts affected being waſhed therewith; it alſo aſſwages Tumors, cools inflama-

inflamations, alleviates pain, and gives eaſe in the Gout, the parts affected being often bathed therewith.

XXV. *The Cure of ſuch as are Poyſoned with Henbane.* If it is recent, the firſt and only thing which is to be done is, to give an Emetick, which may be *Tartar Emetick*, *Vinum Antimoniale*, *Vinum Benedictum*, or ſome ſuch Antimonial Vomit, which, when it has almoſt done working, its force downwards ought to be encouraged, by giving this Clyſter. *Take Mutton Broth or Poſſet-Drink a Pint, brown Sugar four Ounces, mix, melt, and exhibit it warm*; by this means all the Viſcera or Bowels will be effectually cleared of the Poyſon, then give to the Patient Goats Milk, or Mead, or Honied Water, or Pine Kernels with ſweet Wine, or if theſe be not at Hand, give *Fennel*, or *Dill*, or *Caraway* Seed in Pouder, *Nettle* Seed, or Seed of *Muſtard* or *Raliſhes* in Wine; alſo Onions or Garlick taken in Wine do all help to free them from the danger, and reſtore them to their due Temper again; laſtly, being put to Bed give two or three Drams of *Mithridate* or *Venice Treacle* in a Glaſs of Canary, cover them down warm, and let them reſt upon it.

XXVI. *A Hiſtory.* *Parkinſon* gives a Relation of one who digging up ſome *Parſnep* Roots in a Garden, by chance alſo dug up ſome *Henbane* Roots which grew among them, they being both very like one another, as is before related; theſe *Henbane* Roots were boiled with the *Parſneps*, and dreſſed with them, and they were eaten at Supper; the Perſon who gave the relation hereof ſaid that he eat of them, and was preſently after very dry, and the drought was ſo great, that nothing he could take would quench it, his Taſte was depraved, and his reliſh of things was taken away; ſuddenly alſo his Sight was troubled, ſo that he could not diſcern things as they were, but as if they were three or four fold; his Urine was alſo quite ſtopped, ſo that notwithſtanding he had a great deſire to make Water, yet it was wholly obſtructed; in this ſaid Condition he continued for moſt part of the Night, neither could he reſt or ſleep being in Bed, but his Urine, by the ſtoppage thereof, grew ſo hot within him, that it added much to his Grief; at length he bethought himſelf of a Medicine, which was good againſt the Stone, it was a Pouder, he preſently took it, and it cauſed him to make Water, and thereby he felt incredible eaſe in his whole Body, for all things which he had taken before did him no good; but by this means he quickly recovered his Sight, and the other Symptoms vaniſh'd, and by Morning he was very well: The Servants alſo who did eat of this Meſs were Diſtemper'd, ſome more, ſome leſs, according to their feeding, and the ſtrength of their habit of Body, or Conſtitution, operating together.

XXVII. *An Obſervation.* Mountebanks and Quack-Salvers pretend to cure the Toothach with the Fumes of the burned Seed, and to bring many Worms out of the Teeth and Gums therewith, it is true that the Fumes of the Seed will give eaſe in that pain, but the pretence of Worms falling out of the Teeth is a Cheat which they put upon the byſtanders, for theſe Vile Fellows, to deceive thoſe from whom they would get Money, cauſe the Patients to hold their Mouths over a Baſon or Bowl of fair warm Water, they receive the Fumes of the burning Seeds up a Funnel; theſe Seeds are ſtuck faſt upon a ſtick, with a great many ſmall bits of very fine Lute String, which being mixed with the Roſin, and fixed on the ſtick, with the Seeds afterwards, while the Roſin is hot, as the Roſiny ſtick is then kindled and burns, melting the Roſin, and as the Roſin burns the Fumes go up the Funnel into the Mouth, and the Seeds burſt, and the very ſmall bits of the Lute String fall into the Water, which ſeem to move or ſtir themſelves, whereby the lookers on think them to be live Worms come out from the Teeth and Gums, whereas in truth they are nothing but theſe bits of Lute String mixed and blended with the Roſin juſt fallen down by means of the Fire, for it is the property of thoſe Lute Strings, that feeling the heat of the Fire, and alſo falling into warm Water, to ſeem to ſtir and to move about in the Water as if they were alive.

CHAP. CCCLXI.

Of HENBANE White.

1. *THE Names.* It is called in *Greek*, Ὑοσκυαμος λευκὸς: in *Latin*, *Hyoſcyamus albus*; and in *Engliſh*, *White Henbane*.

Henbane White.

II. *The Kinds.* There are ſeveral ſorts, as 1. *Hyoſcyamus albus*, (ſo called by all Authors) White Henbane, and this is *major*, the greater kind, for *Bauhinus* makes two of them. 2. *Hyoſcyamus albus minor*, The leſſer white Henbane: whether they be one and the ſame Plant (as *Parkinſon* ſays they are) is hard to determine, ſince difference in Soil may make a very ſenſible difference both in Growth and Magnitude: however with *Bauhinus* we ſhall here admit them to be two; and ſo *Johnſon* upon *Gerard* allows them. 3. *Hyoſcyamus Creticus*; *Hyoſcyamus albus Creticus*, White Henbane of Candy; and this *Cluſius* makes to be twofold, as alſo does *Bauhinus*, which are a greater and a leſſer, tho' *Parkinſon* will have them to be but one, and this larger ſort is that which he thinks to be the *Hyoſcyamus Luteus Dioſcoridis*: but theſe in their Figure and

Deſcription are much different. 4. *Hyoſcyamus albus Creticus Cluſij*, *Hyoſcyamus albus Creticus alter*, The other white Henbane of Candy; and this is that which is deſcribed by *Johnſon* in his *Gerard*.

III. The Deſcriptions. *The firſt, or* White Henbane, *(which is the greater kind) has a Root which is not much unlike to that of the* Common Henbane, *but leſſer, and periſhes every Year after it has given Seed:* this has divers large Leaves, but not ſo large as the *Common*, yet more ſoft and woolly; and tho' very much torn in or jagged on the edges, yet not ſo much as the former, ſomething rounder alſo, and of a paler green color: the Stalks grow higher, and with fewer Branches on them. The Flowers are in Form like to the *Vulgar*, but ſmaller, and of a pale color, enclining to a whitiſh yellow: the Seed likewiſe grows in ſuch like hard Husks, but leſs prickly, and is whiter; but the Smell of the whole Plant is nothing ſo ſoporiferous, offenſive and heady as the firſt kind in the former Chapter.

IV. *The ſecond, or* Leſſer white Henbane. *This differs not much in the Root, Stalk, Branches, or manner of Growing from the former* White Henbane, *but that it ſeems to be every ways leſs:* the Leaves alſo, as they are ſmaller, ſo they are much rounder, having indented Scallops upon them, and hanging upon pretty long Foot-ſtalks. The Flowers and Seed-Veſſels are very like to thoſe laſt deſcribed in the former Section.

V. *The third, or* White Henbane of Candy, *has a Root which is ſomewhat thick and ſhort, like a* Navew *Root, dying with us every Year.* It has leſſer and thinner Leaves than the firſt *White*, more white and woolly, and much more cut in on the edges, dented alſo, and ſtanding upon longer Foot-ſtalks. The Stalks are more tender and ſhort, having ſuch like Flowers, ending in full round Leaves, ſtanding higher above the Husks, of a fair yellow, and ſometimes of a pale yellow color, and purple at the bottom. After which (being paſſed away) there comes forth Heads of Seed much like the *Common kind*, but ſomewhat yellower, or of a lighter color, and in rounder Heads or Husks.

VI. *The fourth, or* Other white Henbane of Candy. *It has a Root which is ſufficiently thick and large, with many Fibres or Strings adjoining to it.* This is a ſofter and tenderer Plant than the ſecond or third before deſcribed; the Leaves alſo hang upon long Foot-ſtalks, and are covered over with a ſoft Downineſs, and they are ſomewhat broader than the ſecond above, and more ſinuated, and ſomewhat reſemble the Form of a *Vine* Leaf, being alſo ſnipped or notched about the edges. The Stalks are alſo covered with a white color. The Flowers are of a Gold yellow, with a Velvet kind of Circle in their middle. This is the Deſcription of that which *Cluſius* had from his Friend *Jaques Plateau*, who had the Plant in his Garden, growing from the Seed which he received from *Candy*.

VII. *The Places.* The firſt of theſe grow in *Narbone* in *France*, near the Sea ſide. The ſecond grows alſo in hot Climes, and where the firſt of theſe grows. The third and fourth are Natives of *Candy*, and grow alſo in *Spain*: but all theſe kinds grow with us here in *England* only in Gardens.

VIII. *The Times.* They all flower towards the latter part of *July*, and alſo in *Auguſt*; and their Seed is ripe in *October*; but it does not often come to Perfection with us, by reaſon of the Coldneſs of our Cline.

IX. *The Qualities, Specification, Preparations and Virtues* of theſe are exactly the ſame with thoſe of the *Black Henbane*, ſaving that theſe are not ſo cold as thoſe, as not exceeding the third Degree.

X. *Nota.* The *Black Henbanes* are both accounted to be more dangerous than the *White*, and therefore to be avoided as much in inward Medicines as may be, unleſs adminiſtred by a skilful Hand, or except in the caſe of Neceſſity, when the *White* is not to be had. The *White* is chiefly to be uſed in internal Phyſick; and is very available for all the good Intentions which the *Black* are ſaid to be uſeful for, and therefore to be choſen.

CHAP. CCCLXII.

Of HENBIT, *OR,* CHICKWEED Ivy-leaved.

I. *THE Names.* It has no known *Greek* Name; but it is called in *Latin*, *Hederacea*, *Alſine Hederula*, *Morſus Gallinæ*; and in *Engliſh*, *Henbit*, or *Ivy-leav'd Chickweed*.

II. *The Kinds.* There are two Kinds hereof, *viz.* 1. *Hederacea major*, *Alſine Hederula major*, *Alſine Hederulæ folio major*, *Alſine folio Hederulæ major Lobelij*, *Morſus Gallinæ major*, The greater Henbit. 2. *Hederacea minor*, *Alſine folio hederulæ minor*, *Elatine prior Thalij & Lugdunenſis*, *Alſine ſpuria prior Dodonæi*, *Alſine Hirſuta Camerarij*, *Centunculus hirſutior Cæſalpini*, *Alſine Hederacea minor*, *Morſus Gallinæ minor*, and *Morſus Gallinæ hederulæ folio Lobelij*, The leſſer Henbit.

Hen bit or Ground Ivy leaved Chickweed

III. The Deſcriptions. *The firſt, or* Great Henbit. *It has a bunched fibrous Root, which is tough, ſtriking*

ſtriking ſtrait into the Ground, and periſhes every Year. From this Root ſpring forth ſeveral feeble Stalks, growing almoſt upright, or a little enclining towards the Ground, having at certain diſtances ſeveral Joints thereon. The Leaves are of an *Alehoof* or *Ground Ivy* Form, almoſt round, and not much unlike thoſe of the *Dead Nettle*, they are a little dented in on the edges, of a dull green color, and ſomewhat hairy, as the Stalks alſo are, which have at every Joint ſuch round dented Leaves as grow below; but whereas thoſe which grow below, grow upon pretty long Foot-ſtalks, theſe which grow higher at the Joints of the Leaves, are without Foot-ſtalks, and encompaſs the Stalk at their bottoms. From the Boſoms of theſe Leaves, from the middle of the Stalk upwards, come forth ſlender blew Flowers, tending to purple, and hooded, not much unlike to thoſe of *Germander*, or like thoſe of the *Small Dead Nettle*, which being paſt away ſmall Seed follows after them in their places.

IV. *The ſecond, or* Small Henbit. *It has a Root which is ſmall, and fibrous or thready*: This Plant grows lower, and more leaning upon the Ground with its Stalks and Branches, which are ſomewhat hairy, alſo ſmall, and more tender than the former, with ſeveral Joints thereon; the Leaves are thin and hairy, ſomething broad, yet nothing ſo large as thoſe of the *Greater*, which very much reſemble a *Dead Nettle*, or *Ground-Ivy* Leaf, whereas the Leaves of theſe are dented in with two gaſhes in the ſides, which makes them a little repreſent the *Climbing Ivy*, whence the Name in both of them, and in ſome ſort theſe Leaves reſemble the back of a Bee when ſhe flies; the Joints of the Stalks and Branches are ſet alſo with two Leaves of like form at a Joint, even up to the tops of the ſame; the Flowers grow at the tops, and come forth alſo from the bottoms of the Leaves, at the Joints, upon long Footſtalks, conſiſting of five ſmall, blew, round pointed Leaves; and the Seed is ſmall, contained in little round Heads.

V. *The Places.* Theſe Plants grow upon Hills and Mountains in ſeveral parts of *Italy*, *Spain*, *France*, and *England*, and I have found them growing alſo in the Hilly and Mountainous parts of *Florida*; they grow in Fields alſo after the Corn is off, and in ſome Gardens.

VI. *The Times.* They both Flower in *June* and *July*, and the Seed ripens in *Auguſt*.

VII. *The Qualities, Specification, Preparations and Virtues* of theſe are probably the ſame with the other *Chickweeds* in *Chap.* 127. aforegoing, but otherwiſe Authors have ſaid nothing of them from Experience of what they may poſſibly perform, but it is very likely, that being in taſte very much agreeing unto the common ſorts of *Chickweed*, their Qualities and Virtues may not be much differing.

CHAP. CCCLXIII.

Of HERB CHRISTOPHER.

I. *THE Names.* It has no known *Greek* Name, nor ſcarce any good *Latine* Name, but it is called by moſt Authors *Chriſtophoriana*, alſo *Herba Chriſtophori*, *& Sancti Chriſtophori*, but for what cauſe or reſpect is not known, and in *Engliſh Herb Chriſtopher.*

II. *The Kinds.* *Gerard* ſays, that tho' this Plant be none of the *Bindweeds*, or of thoſe which have need of ſupporting, ſo as it might climb up upon any thing, yet becauſe it bears Grapes, or cluſters of Berries, it might have been numbred among the Ἄμπελοι, or Vine like Plants: There are two Kinds of this Herb, *viz.* 1. *Chriſtophoriana vulgaris*, Our Common Herb Chriſtopher. *Lugdunenſis* calls it *Napellus Leucanthemos*, ſome *Aconitum Bacciferum*, others *Napellus Racemoſus*, ſome call it *Coſtus niger*, but that is a vain Name; *Pena* and *Lobel* almoſt make it *Actæa Plinij Lib.* 7. *Cap.* 7. becauſe his *Actæa* bears black Berries, but doubtleſs *Pliny*'s *Actæa* is *Ebulus*, which has a rough Stalk, whereas this has a ſmooth; but *Paulus Ægineta* interprets the Root of *Actæa* to be the Root of *Sambucus*: *Bauhinus* calls it *Aconitum Racemoſum*; ſome call it *Scrophularia Chriſtophori*: *Camerarius* calls it *Luparia*, which is a kind of *Wolfsbane*, but *Parkinſon* not finding therein by the taſte any pernicious quality, could not judge it to be any of theſe dangerous and pernicious Herbs. 2. *Chriſtophoriana Americana*, *Chriſtophoriana Canadenſis*, *Chriſtophoriana Americana vel Floridiana Baccis niveis & rubris*; *Jacobus Cornutus* in his *Canadenſium Plantarum Hiſtoria* calls it by the Name *Panaces* χάρπιον, *ſive Racemoſum Canadenſe*;

nadenſe; but why he calls it *Panax* is very obſcure, ſince it is not manifeſt that it is any Wound Herb; we in *Engliſh* call it *Herb Chriſtopher of America.*

III. The Deſcriptions. *The firſt, or* Our Common Herb Chriſtopher, *has a thick long Root, black without and yellowiſh within, like* Box, *with ſeveral great Fibres or blackiſh Strings adjoining thereunto, trailing and creeping far abroad in the Earth, by which it greatly increaſes, not periſhing in the Winter, altho' the Stalks and* Leaves *die away every Year, freſh ſpringing up again from the ſame Root the next Spring*; it firſt ſhoots forth divers green Stalks of Leaves half a Foot long, which are divided or made into three parts, and ſometimes into five, the lower parts ſtanding for the moſt part one againſt another, or not much diſtant, and the other at the end of the Stalk, each of theſe parts conſiſts of three Leaves, ſeparate aſunder, ſtanding upon ſmall Footſtalks, which Leaves are ſomething broad, and ending in a point, ſome of them cut in on the edges more deeply, and all of them dented about the edges, of a ſad green color; from among theſe Leaves riſe up ſeveral ſomewhat weak, ſmooth, and round Stalks, half a Yard or two Feet high, yet not bending, but ſtanding upright, having three or four ſuch like Leaves thereon as grew below, but with ſhorter Footſtalks; at the tops of the Stalks ſtand a Tuft or Buſh of white Flowers, every one conſiſting of five ſmall Leaves, with many whitiſh Threads in the middle, after which, when fallen, come ſmall round Berries, green at the firſt, and afterwards black when they are ripe, having upon one ſide a ſtreaked furrow or hollowneſs, and growing near together, after the manner of a Cluſter or Bunch of Grapes: where note, that *Gerard* in his Deſcription ſays, 1. That the Stalks are not much above a Foot long or high. 2. That the Leaves are of a light green color. 3. That the Flowers growing at the tops of the Stalks in ſpokie Tufts, conſiſt but of four little white Leaves apiece. 4. That the Berries, or Fruit, tho' they are round, yet they are alſo ſomewhat long withal.

IV. *The ſecond, or* Herb Chriſtopher of America. *It has a thick, ſhort, crooked, black Root, not growing downwards, nor creeping, but having many Fibres adjoining to it*; it ſhoots forth in the Spring many reddiſh Stalks, about a Foot high, with ſeveral Leaves thereon, divided into many parts, ſomewhat reſembling the former, but larger, rougher, and of a ſadder green color, at the tops whereof ſtand a large Tuft of white Flowers, compoſed in a manner wholly of Threads, yet if they be more nearly viewed, there will appear for every Flower ſix ſmall white Leaves, with their Threads in the middle, encompaſſing a round green Button, which coming to maturity is either white, with a purpliſh tip, ſtanding on a ſhort Footſtalk, or wholly reddiſh; I found many of them in *Carolina*, but the Berries were of ſo deep a red as they ſeem'd to be black, and when dead ripe were indeed perfectly black.

V. *The Places.* The firſt grows generally in the Woods or Mountains which are ſomewhat open, and not too much ſhadowed, and other like places, as well in *England* as other Countries; it grows in the North parts of this Land, near unto the Houſe formerly Sir *William Bowes*; alſo *Gerard* ſays he had it growing and flouriſhing in his Garden, being Plants which he received from *Robinus* of *Paris*; I alſo once found it growing near Forty Years agone in *Hornſey-Wood*: The ſecond grows both in ours and the *French* Plantations in *Florida*, as thoſe of *Carolina*, and *Canada*, and that in much plenty.

VI. *The Times.* They Flouriſh and Flower in the end of *May*, alſo in *June* and *July*, and the Fruit is ripe in *July* and *Auguſt.*

VII. As to the *Qualities, Specification, Preparations or Virtues* of the firſt we can ſay little or nothing, having had no experience thereof, and Authors are not agreed about them, ſome, as *Camerarius, Lugdunenſis*, and *Gerard*, taking it to be a kind of *Aconitum*, or *Wolfsbane*, will have it to be of a pernicious, poyſonous, and deadly quality, whereas *Pena* and *Lobel* ſeem to think otherwiſe; and *Parkinſon* ſays, that tho' many good Authors held it dangerous, yet he in his Judgment could not think ſo, not finding therein by the taſte any pernicious quality, as is before noted; and whereas it is reported that the Inhabitants of the Mountains and places where it grows do generally hold it to be a moſt dangerous and deadly Poyſon, both to Man and Beaſt, and that they uſe to kill Wolves herewith, yet *Parkinſon* does think that the Herb which thoſe Inhabitants do think to be ſo dangerous and Mortal, is the *Aconitum Lycoctonum*, or *Lupicida*, which grows in thoſe places, and that it is not this Our *Herb Chriſtopher*, but that theſe dangerous Qualities are put upon it purely by a miſtake.

VIII. As to the *Qualities and Virtues* of the ſecond, or *American Herb Chriſtopher*, the ſaid *Jacobus Cornutus* ſays that it is eaten familiarly both by the Natives and by the *French* which inhabit in thoſe parts as a Sallet Herb, and I my ſelf who have been in thoſe parts for ſome Years, have ſeveral times eaten of the Fruit without any danger.

CHAP. CCCLXIV.

Of HERB FRANKINCENSE Narrow Leav'd,

OR,

ALLHEAL Fennel Leav'd.

I. *THE Names.* It is called in *Greek* Λιβανωτὶς στενόφυλλη, in *Latine Libanotis Anguſtifolia*, in *Engliſh Herb Frankincenſe narrow Leav'd*, or *Fennel Leav'd Allheal.* The *Arabians* call it *Xair Almariani, Aſpinalfach, Calchata*, or *Cachola.*

II. *The Kinds.* There are many Kinds of *Herb Frankincenſe* in Authors, we ſhall only deſcribe the following principal Kinds, *viz.* 1. *Libanotis Anguſtifolia*, Narrow Leav'd Herb Frankincenſe, of which in this preſent Chapter. 2. *Libanotis Latifolia*, Broad Leav'd Herb Frankincenſe, or Frankincenſe Allheal, of which in the next Chapter.

III. *The Kinds* of the *Narrow Leav'd Herb Frankincenſe*, or *Fennel Leav'd Frankincenſe Allheal.* Authors make ſeveral varieties of this Plant, we ſhall only Treat of the following Seven Kinds, as being chief, *viz.* 1. *Libanotis Ferulæ Folio Dioſcoridis, Theophraſti, Galeni*, (whoſe Seed is called *Cachrys*, or *Canchrys*, as it is in ſome Copies, becauſe of its fiery taſte) It is the *Libanotis Cachryfera Camerarij, Cachrys vera vel verior Lobelij, Libanotis Galeni, Libanotis Candida Cæſalpini*, Fennel Leav'd Herb Frankincenſe. As for Κάχρυς, *vel* Κάγχρυς, it is ſaid by *Dioſcorides Lib.* 3. *Cap.* 87. to be *Fructus vel Semen Libanotidis*, and ſo we take it, ſee *Theophraſtus Lib.* 9. *Cap.* 12. 2. *Libanotis Ferulæ Folio & Semine Bauhini, Panax Aſclepium Ferulæ facie Lobelij, Panaces Aſclepium Dodonæi*, Lobel his Fennel Leav'd Herb Frankincenſe, Allheal, or Wound-Wort of *Eſculapius.* 3. *Panax Aſclepium Matthioli, Panaces Aſclepium Lugdunenſis, & aliorum, Panax*

Aſclepium

Aſclepium primum Libanotidi ſecundæ ſimilis Bauhini, Matthiolus his Eſculapius Allheal, or Woundwort. 4. *Panax Aſclepium Apulum Columnæ*, *Panax Semine Folioſo Bauhini*, Columna his Eſculapius Allheal, or Woundwort of Naples. 5. *Panax Aſclepium Anguilaræ & Camerarij*, *Libanotis ſecunda Tabernamontani*, *Libanotis nigra Cæſalpini*, Camerarius his Herb Frankincenſe Fennel Leav'd, or Eſculapius his Allheal of Candy. 6. *Libanotis minor Umbella candida*, *Libanotis Septentrionalium Herbariorum Lobelij*, *Libanotis minima Lugdunenſis*, Small Fennel Leav'd Herb Frankincenſe, or Allheal. 7. *Libanotis Ferulacea Germanica*, *Thalius* in his *Harcynia Sylva* calls it *Libanotis* παςδνικόιδες, German Fennel Leav'd Herb Frankincenſe, or Allheal.

Herb Frankincenſe. fennel leaved

IV. The Deſcriptions. *The firſt*, *or* Fennel Leav'd Herb Frankincenſe. *It has a Root which grows deep, and ſpreads much, and with many Branches fixes it ſelf in the Ground, larger than a great* Parſnep *at the top, and white both on the outſide and on the inſide, with a* Pith *in the middle, but it is ſo brittle, that you muſt handle it very tenderly if you deſire not to break it, and when cut or broken it ſends forth a clammy pale Juice, of an odoriferous, ſharp, piercing ſmell, not much unlike to that of* Limons, *and endures in the Earth many Years*; from the head of this Root ſhoot ſeveral buſhy, great, reddiſh Stalks of Leaves, of a freſh green color, being ſomething thicker and longer than thoſe of the *Ferula*, and ſhorter than thoſe of *Peucedanum*, or *Hog-Fennel*, yet often and in many places ſet three together, of a quick aromatick ſmell, coming ſomewhat near to that of a *Limon*; from among theſe Leaves riſes up (ſometimes, but not every Year with us in *England*) a good large Stalk, but neither ſo great nor half ſo high as the *Ferula*, not much exceeding a Yard in height, nor much higher than the Stalks with Leaves, ſpreading it ſelf out into very many Ramifications or Branches, which at their tops bear Umbles of yellow Flowers, which being paſt away are followed by a good large ſort of whitiſh yellow Seed, round, and a little long withal, ſomewhat creſted on the outſide, being joined two and two together, as is very uſual in moſt Ferulous Plants, which makes one ſide flat, the ſmall Footſtalk of the Leaves running up between, and is ſaid to be Cauſtick, or burning, for which reaſon the Name Κάγχρυς, *Canchrys*, is given to it: This, as it is a rare, ſo it is a moſt excellent, goodly, and noble Plant, of a vaſt value in many Caſes.

V. *The ſecond*, *or* Lobel his Fennel Leav'd Herb Frankincenſe. *It has a Root which is ſmall, and not growing deep into the Ground, nor abides after it has given Seed, its ſmell and taſte not being much reſinous or ſharp*; this Plant grows nothing ſo high or great as the *Ferula*, but with fine Leaves like unto it, and at the tops of all the Branches Umbles of yellow Flowers, but the Seed which follows is broad, not ſo ſmall as *Fennel*, but more like to that of the *Ferula*, of a little quick or brisk taſte and ſmell.

VI. *The third*, *or* Matthiolus his Eſculapius Allheal. *Its Root like to the laſt is ſmall, but no ways anſwerable to a* Ferula; the whole Plant is leſs than *Ferula*, the Stalks are not ſo large nor ſo tall, the Leaves are finer, ſmaller, and ſhorter than thoſe of that Plant, the Umble of Flowers is ſmaller alſo, and the Seed leſſer in proportion to all the reſt of its parts.

VII. *The fourth*, *or* Columna his Eſculapius or Woundwort of Naples, *It has a ſmall ſlender Root, with a buſh of hairs at the top, of the bigneſs of ones Thumb, with a thick rugged Bark, of a whitiſh yellow color on the outſide, and a ſpungy, white, and woody Pith within, full of a clammy white Milk, hardning quickly into a Gum, which is bitter and ſharp in taſte, and unpleaſant, but yet aromatical*; the Stalks of Leaves which are ſpread next the Ground in a round form at head of the Root are cut into ſeveral long hairs, as it were thick ſet together, ſomewhat like unto *Common Yarrow*, and hairy withal, which is not ſeen in the other Kinds, or rather like unto *Fennel* Leaves, but bigger, having ſeven winged Leaves ſet on a pretty large Stalk, five bigger and two ſmaller, which are next the hairy Stalk, being green at the firſt, but changing yellow when it grows towards Flowering; which with the Leaves is about half a Yard long; from among theſe Stalks of Leaves riſes up but one main Stalk, which is ſlender, and about two or three Feet high ſometimes, having ſome Joints, but no Leaves thereon to the very top, where uſually grow but one or two ſmall Tufts or Umbles of yellow Flowers, but ſpread a little largely, and growing cloſer and rounder as it turns to Seed, which are flat, and winged on both ſides, two growing together, as is uſual in all other Umbelliferous Plants, whereon, as alſo on the Stalk, is often found a ſweet ſmelling Gum, as clear as Turpentine, or Gum *Arabick*, which will ſcarcely diſſolve in Water without heat; the like alſo is taken from the Root cut in pieces, but it is yellower, becauſe it muſt be forced out by the Fire. *Columna* ſays that this *Panax Aſclepium* is the trueſt of any which has been deſcribed by any other Author, and that it grows frequently in *Apulia*, anſwering in every part the Deſcriptions thereof in *Dioſcorides* and *Theophraſtus*.

VIII. *The fifth*, *or* Camerarius his Herb Frankincenſe Fennel Leav'd, *or* Eſculapius his Allheal of Candy. *It has Roots like the former, and riſes up with a round* Fennel *like Stalk ſix or ſeven Feet high, or more*, with ſeveral Joints thereon, divided into Branches of Leaves, larger than *Fennel*, and ſmaller than *Ferula*, of a dark green color on the upper ſide, and of a blewiſh green underneath, with large Umbles of yellow Flowers at the tops, which being paſt away will turn into broad, flat, winged Seed, of a reſinous ſmell and taſte, the Leaves being much more mild, and yielding a whitiſh Milk, nothing ſo hot or ſtrong in ſmell as *Ferula*.

IX. *The*

IX. *The ſixth, or* Small Fennel Leav'd Herb Frankincenſe, or Allheal. *It has a great and white Root, divided into ſeveral Branches, and with a buſh of hairs above*; it is a ſmall Herb, and has divers Leaves lying upon the Ground, much cut and divided into longer parts than *Peucedanum*, or *Hogs-Fennel*, and narrower than *Our green Engliſh Saxifrage*; the Stalk has but few Joints, and Leaves on them, bearing ſmall Umbles of white Flowers, like *Meum*, or *Spignel*, which being paſt away leave ſmall Seed after them, almoſt like the Seed of *Ammi*, or *Biſhopſweed*.

X. *The ſeventh, or* German Fennel Leav'd Herb Frankincenſe. *It has a blackiſh long Root, as thick as ones Finger, full of a reſinous Juice, ſharp, and well ſmelling, ſet with a buſh of hairs at the top*, from whence ſpring Stalks of fine *Fennel* like Leaves, but ſhorter than they, the Stalk riſes to be a Foot and half high, on the tops of which ſtand bowing white ſweet ſmelling Flowers. There is of this a leſſer ſort alſo, differing nothing from it but in its univerſal ſmallneſs.

XI. *The Places.* The firſt ſix Kinds have been found growing in many Countries, as *Italy*, *Sicily*, *Candy*, *France*, *Florida*, *&c.* the ſeventh in ſome places in *Germany*; I know not that they grow wild in *England*, but with us are only nurſt up in Gardens.

XII. *The Times.* They all Flower in *July* and *Auguſt* if the Year is ſeaſonable, and their Seed comes to ripeneſs in *Auguſt* and *September*.

XIII. *The Qualities.* They are ſaid to be hot and dry in the ſecond degree, Aperitive, Abſterſive, Digeſtive, Diſcuſſive, Diuretick, Traumatick, Cephalick, Neurotick, Stomatick, Arthritick, Sudorifick, and Alexipharmick.

XIV. *The Specification.* They conglutinate ſimple green Wounds, digeſt, cleanſe, incarnate, and heal old Ulcers and running Sores, and eaſe pain in any part, proceeding from Blows, Falls, Strains, or cold and moiſt Humors.

XV. *The Preparations.* You may have here from, 1. *The green Leaves bruiſed.* 2. *Green Root bruiſed.* 3. *Juice of the Herb and Root.* 4. *An Eſſence of the ſame.* 5. *A Decoction or Infuſion in Wine of Herb and Root.* 6. *A Vinegar of the Seed.* 7. *A Pouder of the Root.* 8. *A Pouder of the Seed.* 9. *A Pouder of the Seed Canchrys.* 10. *An Electuary.* 11. *An Oil of the Seed by Infuſion.* 12. *An Ointment of Root and Herb.* 13. *A Balſam of Root and Herb.* 14. *A Cataplaſm of the Seed.* 15. *A Diſtilled Water.* 16. *An Acid Tincture of Root and Herb.* 17. *An Acid Tincture of the Seed Canchrys.* 18. *A Spirituous Tincture of Root and Herb.* 19. *An Oily Tincture of Root and Herb.* 20. *A Saline Tincture of the ſame.*

The Virtues.

XVI. *The green Leaves bruiſed.* Being applied *Dioſcorides* ſays that they ſtay the bleedings of the Hemorrhoidal Veins, and eaſe the heat and inflamation and ſwelling of the Fundament; they do alſo digeſt the Kernels of the Kings-Evil, and Apoſtems in any part of the Body, tho' hard to be cured.

XVII. *The green Root bruiſed.* If it is applied to Wounds of any kind, eſpecially to ſimple green Wounds, it quickly heals them; if it is not preſently applied it then cauſes digeſtion, then cleanſes and heals.

XVIII. *The Juice of the Herb or Root.* Taken inwardly to two, three, or four Spoonfuls in Wine or other proper Vehicle twice a day, it heals all inward Wounds and Bruiſes; mixed with Honey and anointed on the Eyes, it clears and ſharpens the Sight, takes away Miſts, Clouds, or any thing which is growing over the Eyes, and heals Wounds and Ulcers in the ſame.

XIX. *The Eſſence of the ſame.* It has all the Virtues of the Juice, beſides which, being taken inwardly, it diſpoſes ill conditioned Wounds, old Ulcers and Fiſtula's to a ſpeedy healing, let them be in what part of the Body ſoever; Wounds and old Ulcers being alſo outwardly waſh'd with the ſame it cleanſes, incarnates, dries, and heals them.

XX. *The Decoction.* It has the Virtues of the Juice and Eſſence, if it is made in Wine and ſweeten'd with Honey, it makes a good Gargle to heal a ſore or ulcerated Mouth and Throat, alſo ſore and ulcerated Eyes.

XXI. *The Vinegar of the Seed.* Uſed as a Lotion it cleanſes the Skin from Pimples, Freckles, Scurf, Morphew, Leproſie, Tettars, Ringworms, Scabbineſs, and other like deformities of the ſame.

XXII. *The Pouder of the Root.* If it is mixed with Honey and applied, or anointed, or put into the Eyes, it clears from any thing which may grow on them or offend them, heals Wounds or Ulcers in them, and quickens or ſharpens the Sight; being taken alſo inwardly in a Glaſs of Wine from half a Dram to a Dram, Morning and Night for ſome conſiderable time, it does the ſame thing, it provokes Urine and Womens Courſes, and it helps alſo thoſe who have the Falling-Sickneſs, or have an old pain in the Stomach, Liver, or Spleen; and if it is given with an equal quantity of Pepper in Wine, it is found profitable againſt the Kings-Evil.

XXIII. *The Pouder of the Seed.* Given to a Dram in White Port Wine, it opens obſtructions of the Reins and Ureters, and provokes Urine and the Terms, it expels Wind, ſtrengthens and fortifies the Stomach, reſiſts Poyſon, and is good againſt the deleterious quality of the Biting of Mad Dogs, Serpents, *&c.* being put into Ulcers it cleanſes, dries, and heals them.

XXIV. *The Pouder of the Seed* Cachrys *or* Canchrys. By reaſon of its burning property Authors do not adviſe to give it inwardly, for they ſay it is too ſharp, and will exaſperate the Throat: *Dioſcorides* ſays it is of a heating and mighty drying faculty, and therefore is good to be put into Waſhballs, or ſuch things as cleanſe the Skin; but if the whole Seed is infuſed twenty four Hours in Vinegar, and dried again, and then beaten into Pouder, it then may be given inwardly, and has all the Virtues of the former, exhibited in the ſame Doſe and manner.

XXV. *The Electuary. It is made of equal parts of the Pouder of the Root and Seed, mixed with a half part of Nutmegs in Pouder, and eighth part of Cloves, and a ſixteenth part of Pepper in fine Pouder, and made up with a treble proportion of clarified Honey.* It is a good Stomatick, prevalent againſt the Scurvy in a cold habit of Body, ſtrengthens the Tone of the Stomach, cauſes a good Appetite and Digeſtion, ſtrengthens the Head and Brain, clears and ſharpens the Eyeſight, and provokes the Terms in Women. Doſe one or two Drams in a Glaſs of Wine Morning and Night.

XXVI. *The Oil of the Seed by infuſion or boiling.* Being anointed upon the parts affected it is ſaid to help ſuch as are Burſten, and to cure Cramps, Convulſions, Pains, Aches, Lameneſs, and the Gout.

XXVII. *The Ointment of the Root and Herb.* It digeſts and ripens Tumors, cleanſes, incarnates, dries, and heals Wounds and Ulcers, conſolidates Fractures, and ſtrengthens the Nerves, Tendons, and Ligaments in Diſlocations; it alſo eaſes pain in any part being anointed on the place.

XXVIII. *The*

XXVIII. *The Balſam of Root and Herb.* It is a moſt admirable Vulnerary, not inferior to any made of *Prunella*, or *Self-heal*, *All-heal*, or any of the *Woundworts*, it digeſts contuſed or otherwiſe complicated green Wounds and Phagedenick or eating Ulcers, and cleanſes them, and if there is a want of Fleſh it admirably incarnates, dries, and heals them; it is good alſo againſt fretting and running Cankers, Wheals, Puſhes, and the like breakings out of the Skin.

XXIX. *The Cataplaſm of the Seed.* *Take Pouder of the Seed*, Darnel *Flower*, *of each a like quantity*, *Vinegar a ſufficient quantity*, *to make it into a Cataplaſm.* Being applied it diſcuſſes ſimple Contuſions, and prevails againſt Scabs, Pimples, Wheals, Herpes, Scurf, Morphew, Leproſie, diſcolorings of the Skin, and other defœdations.

XXX. *The Diſtilled Water.* It has the Virtues of the Juice, Eſſence, Decoction, or Infuſion of the Herb and Root, but much leſs efficacious, and is chiefly uſed as a Vehicle to convey ſome of the aforegoing or following internal Preparations down into the Body.

XXXI. *The Acid Tincture of Root and Herb.* It reſiſts Poyſon, and the Plague, and all ſorts of Malign and Peſtilential Diſeaſes, it prevails againſt the bitings of Spiders, as the *Tarantula*, of Mad Dogs, Vipers, Rattle-Snakes, and other Serpents, as alſo the biting or ſtinging of any venomous Creature; it is prevalent alſo againſt all hot and burning Fevers, it quenches Thirſt, extinguiſhes the heat, and deſtroys the Febritick Ferment. Doſe from ten drops to forty, fifty, or ſixty, in any proper Vehicle, and according to the quantity of the Liquor it is taken in.

XXXII. *The Acid Tincture of the Seed Canchrys.* It is Stomachick, cauſes good Appetite and Digeſtion, reſiſts Plague and Poyſon, opens obſtructions of Stomach and Lungs, takes away Hoarſeneſs and Wheezing, and thereby cauſes free reſpiration or breathing; it has all the Virtues of the Tincture in the former Section, and is to be taken in the ſame Doſe and manner.

XXXIII. *The Spirituous Tincture of Root and Herb.* It is prevalent againſt Poyſon, expels Wind, and gives preſent eaſe in the Colick and Gripings of the Guts from cold, crude, and ſharp Humors, it provokes Sweat, and is good againſt the Plague or Peſtilence, expelling the malignity thro' the Pores of the Skin; being taken in Wine it is good againſt the bitings of poyſonous Serpents, provokes Urine, and facilitates the Birth of Women in Labor. Doſe from one Dram to two or three Drams in Wine.

XXXIV. *The Oily Tincture of Root and Herb.* Outwardly applied it eaſes the Gout, and all external pains proceeding from cold, ſtraining of the part, Blows, Falls, or the like; it gives eaſe in Cramps and Convulſions, and very much ſtrengthens the parts weaken'd by thoſe Diſeaſes; it is alſo prevalent againſt the Palſie, being anointed upon the *Vertebræ* of the Back, and alſo upon the part afflicted.

XXXV. *The Saline Tincture.* It is of great uſe againſt Freckles, Lentils, Sunburning, Tanning of the Skin, black and blew Marks, Scurf, Morphew, and other like defilements thereof.

CHAP. CCCLXV.

Of HERB FRANKINCENSE Broad Leav'd, *OR,* Frankincenſe ALLHEAL.

I. *THE Names.* It is called in *Greek* Λιβανώτις πλατύφυλλη, in *Latine Libanotis Latifolia*, and in *Engliſh Broad Leav'd Herb Frankincenſe*, or *Broad Leav'd Frankincenſe Allheal.*

II. *The Kinds.* This is the ſecond Species of the Generick Kind, and is fourfold, *viz.* 1. *Libanotis major Theophraſti*, *Libanotis fertilis prima Theophraſti Lib.* 9. *Cap.* 2. *Seſeli Æthiopicum Herba Dodonæi*, *Seſeli prima Tragi*, *Dauci alterum genus Fuchſij*, *Turneri*, *Lugdunenſis*, The Greater White Herb Frankincenſe. 2. *Libanotis Theophraſti minor*, *Libanotis fertilis ſecunda Theophraſti*, The Leſſer White Herb Frankincenſe. 3. *Libanotis Apij Folia Cretica Theophraſti*, *Siler Creticum*, *& Libanotis vera Theophraſti*, *Camerarij*, The trueſt Herb Frankincenſe of Theophraſtus. 4. *Libanotis Aquilegiæ Folio Latifolia*, *Seſeli Æthiopicum alterum*, Columbine Leav'd Herb Frankincenſe.

III. The Deſcriptions. *The firſt*, *or* Greater White Herb Frankincenſe, *has a Root which grows great and long*, *whitiſh on the outſide*, *with a Tuft of hair at the top*, *abiding long*, *and having a ſtrong ſmell and taſte*, *like the Roots of many other Umbelliferous Plants*; from this Root ſpring forth many great long Stalks, with wings of large broad Leaves, ſome eight Inches long apiece, and almoſt four Inches broad, five being ſet together, two and two, one againſt another, and one at the end, three or four Inches broad below, and ſmaller to the end, being ſomewhat hard in handling, of an overworn greeniſh color, and a little dented about the edges, among which riſes up a round ſtrong Stalk, oftentimes four or five Feet high, having ſuch like Leaves on the Joints, but fewer, and leſſer than grow below, and a few Branches riſing from the upper Joints, bearing large ſpread Umbles of whitiſh Flowers, after which comes ſomewhat flat and round light Seed, two of them joined together, white on that ſide where it is joined, and ſtraked with rough crumpled ſtrakes on the back or round ſide, and of a pale brown color when it is ripe, but a little purpliſh below.

IV. *The ſecond*, *or* Leſſer White Herb Frankincenſe, *has a Root not much unlike the former*, *white*, *but more bitter than it*; this agrees with the former in the ſhape or form of the Leaves, Flowers, Seeds, and ſhape of the Root, but that they are all leſs, and the number of the Leaves are more, ſet together on every Stalk, being alſo more deeply dented about the edges: There is another ſort of this Plant, which *Bauhinus* calls *Libanotis Latifolia minor Semine criſpo*, which differs only in having fewer Leaves on the Stalks, altho' as ſmall, and but one or two deep cuts on the edges.

V. *The third*, *or* Trueſt Herb Frankincenſe of Theophraſtus, *has a Root which is covered with a blackiſh Bark*, *and very white underneath*, *ſmelling ſtrong*, *like* Frankincenſe, from which ſprings up a Stalk about a Foot and half high, divided into ſome Branches, with Leaves ſet ſparingly both below and above, ſomething reſembling *Smallage* for the largeneſs of the Leaves, and dented about the edges, bear-

ing white Flowers, and large, rough, crooked, brownish Seed, having a pretty strong smell.

VI. *The fourth, or* Columbine Leav'd Herb Frankincense, *has a thick, rough, fibrous, brown Root, with a white Path in the middle, smelling somewhat sweet, but bitter in taste, having a Tuft of blackish Hairs at the top*; from this rise several Leaves upon long Footstalks, broad, and hollow at the bottom, like a skinny Husk, compassing one another, as those do also on the upper Stalks, they are hard in handling, yet of a shining dark green color above, and whitish underneath, with several purplish Veins running thro' them, not all of them divided like unto *Columbine* Leaves, but many of them parted into five Leaves, with three divisions apiece, others into three Leaves, each standing on a Stalk, straked with purple, rising up above four, or almost five Feet high, with several Joints thereon, and branched towards the tops, bearing every one a large Umble of small white Flowers, and after them long and broad striped Seed, of a purplish color, a little bitter, hot, and drawing Water into the Mouth if it is a little chewed therein, being also somewhat sweet of smell.

VII. *The Places.* The first two sorts are found in many places in *Germany*, and parts near adjoining, the third is a Native of *Candia*, and the last is said to come out of *Æthiopia*, but they are all of them now made free Denizons of *England*, by being planted and nurs'd up in our *British* Gardens.

VIII. *The Times.* The two first Seed with us Yearly after they are well grown, *viz.* about *July* and *August*, but the two last very seldom, unless the Year proves hot and very kindly.

IX. *The Qualities, Specification, Preparations and Virtues* of these are the same with those of the *Angustifolia*, or *Narrow Leav'd* in the former Chapter, to which we refer you, yet these being extraordinary Traumaticks or Vulneraries, and of an extreamly mollifying and digesting power, we shall make these following farther Observations concerning the same.

X. *The Liquid Juice, or Essence.* They are good against Chronick Diseases of the Breast and Lungs, and prevail against the Epilepsie and Jaundice, more especially if a little Pepper in fine Pouder is added, and so given in Wine; given in Posset-Drink they increase Milk in Nurses Breasts, and ease pains in the Stomach and Belly proceeding from sharp Humors, or Wind; they are also good against Poyson, and the bitings of Mad Dogs, Venomous Beasts, and Serpents, or the stinging of Scorpions, they provoke Urine powerfully, and the Courses, being stopt; the juice of the Leaves and Roots clears the Eyesight, and sharpens it, and diverts the Rheum which falls into the Eyes, by strengthning the parts, being dropt into the Eyes, and Cloths dipt therein and applied over the Forehead and Eyebrows.

XI. *The Decoction in Wine.* It has all the Virtues of the Juice and Essence, but much weaker, and therefore may be given in a greater Dose, as from four to six Ounces; it is highly Traumatick or Vulnerary, and may be used Dietetically, as well as outwardly to wash any Sore, Wound, or Ulcer therewith.

XII. *The Balsam or Ointment.* They cure Wounds and Ulcers after an admirable manner, and if a little Pouder of *Birthwort* Root, or of Tobacco be added to them, they do wonders in these kinds of Cures, beyond expression.

XIII. *The Cataplasm of the bruised Leaves.* Being applied it stops bleeding in any part, and cures the Hæmorrhoids or Piles, removes the heat, and discusses the tumor or swelling of the Fundament, bringing the same (if Nature intends it) to a speedy maturity or ripeness; the Cataplasm being made with *Darnel* Meal and a little Vinegar, and applied, gives ease in the Gout, Cramps, and Convulsions, and takes away Scurf or Morphew, Leprosie, and any discoloring of the Skin.

XIV. *The Pouder of the Root.* Used either alone by it self, or mixed with Honey and applied, it throughly cleanses foul Ulcers, and heals them, and is of extraordinary use in curing Fistula's, more especially if Pouder of Tobacco about a third part be added thereto.

CHAP. CCCLXVI.

Of HERB MASTICH, *OR,* MARUM.

I. *THE Names.* It is called in *Greek* Μαρὸν, in *Latine Marum*, from *Maron*, a certain King of *Thracia*, who is said to have found it out, *vel ab Amaraco per Apocopen, utpote cum Amaraci Species videatur Marum*, in *English Herb Mastick*, or *Mastich*, also *Marum.*

II. *The Kinds.* Some Authors will have it to be a Species of *Marjoram*, others a Species of *Thyme*, others again make it a middle Plant between them both, it seems to me to be rather a particular of its own Kind; there are three Species hereof, *viz.* 1. *Marum vulgare, Clinopodium Camerarij, Dodonæi, Gesneri, Tragoriganum primum Clusij, Sampsuchus Dioscoridis Clusij, Helenium odorum Theophrasti*, Common Herb Mastich. 2. *Marum supinum Lobelij, Marum ex Sicilia allatum Cæsalpini, Marum repens verticillatum Bauhini, Amaracus serpens*, Creeping

ing Herb Maſtich. 3. *Marum Syriacum Lobelij, Dodonæi, Tabernamontani, Marum Cretenſe Alpini, Majorana Syriaca, vel Cretica Bauhini*, Syrian or Candy Marum, or Herb Maſtich.

III. The Deſcriptions. *The firſt, or* Common Herb Maſtich, *has a fibrous or thready Root, which ſends up greater and more woody Stalks than any of the* Marjorams, it riſes up to be two Feet or more high in ſome places, where the Ground is agreeable to it, and the Air warm and clear, it branches it ſelf out on all ſides towards the upper parts, leaving the Stem bare below, if it is old, otherwiſe if it is young, thinly furniſhing the Branches from the bottom with ſmall green Leaves, larger than the Leaves of any *Thyme*, and near to the largeneſs of the Leaves of *Marjoram Gentle*; at the tops of the Branches ſtand ſmall Flowers on a Head, which afterwards turn into a looſe Tuft of a long, white, hoary ſubſtance, like unto ſoft down, with ſome Leaves under and about them, which abide not long on the Stalks, but are blown away with the Wind; the Seed is ſo very ſmall, that it is ſcarcely to be obſerved; the whole Plant is of a ſweet reſinous ſmell, ſtronger than *Marjoram*, and abides our Winters if it is carefully planted and look'd after.

IV. *The ſecond, or* Creeping Herb Maſtich, *has a long ſlender Root, and fibrous withal, from whence ſpring up ſeveral ſlender weak Stalks, not ſtanding upright, but lying upon the Ground, therein reſembling* Wild Thyme *rather than* Sweet Marjoram *or* Herb Maſtich; the Leaves are many, and ſmaller than thoſe of *Mother of Thyme*, growing at ſeveral diſtances upon the Branches; the Flowers are ſmall and purpliſh, growing at the tops, with Leaves among them, the ſmell of which is very ſweet and ſtrong, coming neareſt unto *Sweet Marjoram*, and of a hot and bitter taſte.

Aſſyrian Herb Mastick.

V. *The third, or* Syrian, *or* Candy Herb Maſtich, *has a very fibrous or thready Root, like unto the firſt*, from whence ſpring up ſeveral upright Stalks, about half a Yard high, not ſo woody as the firſt *Herb Maſtich*, but more tender and ſlender, on which grow many ſmall whitiſh green Leaves, very like to the *Small fine Sweet Marjoram*, but ſomewhat rougher up to the very tops, which bear ſmaller Heads or Knots than thoſe of *Sweet Marjoram*, and white Flowers out of them; all the Herb is of a moſt fragrant ſweet ſmell, which endures a long time after it has been dried; it is very tender to keep, and will not endure our cold Nights, which come in *Auguſt*, or *September*, but is quickly deſtroyed by them.

VI. *The Places.* They all grow Wild on the Mountains of *Spain*, *Candia*, and *Syria*, but with us they are all nurs'd up in Gardens, the laſt indeed with ſome difficulty.

VII. *The Times.* They Flower about *Auguſt* with us, and ſometimes later, if the Summer Seaſon proves cold, and the Seed is perfected not long after.

VIII. *The Qualities. Herb Maſtich* is hot and dry in the beginning of the fourth degree, it attenuates, opens, is Abſterſive, Aſtringent, Anodyn, Carminative, Digeſtive, Diſcuſſive, and Strengthning; it is Cephalick, Neurotick, Stomatick, Hyſterick, Arthritick, Emmenagogick, and Alexipharmick.

IX. *The Specification.* It is good againſt Poyſon, the bitings of Mad Dogs, Serpents, and other Venomous Beaſts, Convulſions, Cramps, Lethargies, Palſies, Epilepſies, Hyſterick Fits, Vapors, and other Diſtempers of the Womb.

X. *The Preparations.* You may have therefrom, 1. *A Liquid Juice.* 2. *An Eſſence.* 3. *An Infuſion or Decoction in Wine.* 4. *A Decocted or Infuſed Oil.* 5. *A Diſtilled Water.* 6. *A Spirit.* 7. *A Chymical Oil.* 8. *An Acid Tincture.* 9. *A Spirituous Tincture.* 10. *An Oily Tincture.* 11. *A Pouder.* 12. *A Compound Decoction.*

The Virtues.

XI. *The Liquid Juice.* Given from one Spoonful to two in a Glaſs of Wine, or other proper Vehicle, it prevails againſt Convulſions, Epilepſies, Lethargies, Headachs, Palſies, and diſaffections of the Womb, it attenuates tough Flegm, opens obſtructions of the Womb and Reins, provokes Urine and the Terms, and digeſts crude Humors.

XII. *The Eſſence.* It is good againſt Coughs, Colds, Wheezings, Hoarſeneſs, ſhortneſs of Breath, difficulty of breathing, and other Diſeaſes of the *Thorax*, it opens obſtructions of Liver and Spleen, and frees them from the morbifick matter which offends them, it has indeed all the Virtues of the Liquid Juice aforeſaid, beſides which it opens, cleanſes, ſtrengthens, and confirms the Womb, corrects the windineſs thereof, or of any other part, which are commonly called Vapors, and is beneficial for ſuch as are falling into a Dropſie, and helps the loſs of Speech, by the reſolution of the Tongue; it provokes Urine, and eaſes the Colick.

XIII. *The Infuſion or Decoction in Wine.* It has all the Virtues of the Liquid Juice and Eſſence, it is very Stomatick, powerfully provokes Urine, eaſes the Strangury, and all pains and torments of the Belly. Doſe to ſix Ounces.

XIV. *The Oil by Infuſion or Decoction.* It warms and comforts the outward parts, being Morning and Evening anointed upon the ſame, it is good againſt the Gout, eaſes pains of the Joints, Nerves, Tendons, and Muſcles, diſcuſſes Tumors, is good againſt Convulſions, Cramps, Lameneſs, Numbedneſs, and the Palſie, and anointed upon the lower Region of the Belly it helps cold griefs of the Womb, and gives eaſe to pains of thoſe parts.

XV. *The Distilled Water.* It has the Virtues of the Juice and Essence, but very much weaker in all respects, but it may be used as a Vehicle, to convey some of the other Preparations in; sweetned with Sugar and given to Children troubled with Convulsions it cures them.

XVI. *The Spirit.* It is Cephalick, Neurotick, Hysterick, and Cordial, and therefore is good against Apoplexies, Epilepsies, Lethargies, Convulsions, Palsies, Vapors, Fits of the Mother, palpitation of the Heart, Fainting and Swooning Fits, sickness at Stomach, Colick, and other like disaffections of those parts. Dose from one Dram to four Drams, either in the Distilled Water, or in Wine; or some Neurotick, Cordial, or Hysterick Syrup, it may be given in the Morning fasting, and last at Night going to Bed, and also two or three times besides in the day time if need requires.

XVII. *The Chymical Oil.* It has all the Virtues of the Juice, Essence, and Spirit aforegoing, but operates in a more ample and powerful manner; inwardly it may be given from five drops to ten, or twelve, and that Morning and Evening, you must first drop it into White Sugar, or into Honey, or some proper Syrup, and mix them well together, then mix it with the Vehicle you intend to take it in, for all cold and moist Diseases, as Palsies, Cramps, Gouts, Numbedness, Trembling, weakness of the Nerves, *&c.* it ought to be taken in a Glass of Generous Wine; in Vapors, Fits of the Mother, *&c.* it may be given in the Distilled Water, or Barley Water, or Black Cherry Water; in the Colick it may be given in Juniper Water; outwardly for the Palsie it is to be anointed on the Back Bone, as also the parts affected; so also for Convulsions, Cramps, defluxions of Humors, *&c.*

XVIII. *The Acid Tincture.* It is a powerful Medicament against the Plague, and all sorts of Malign and Pestilential Fevers, it destroys the putrefactive ferment in the Blood and Juices, allays Vapors, and rising up of the Mother, cools preternatural heats, and resists malignity in its Root, *&c.* Dose from fifteen drops to thirty, forty, or more, according to the quantity of the *Vehiculum* in which it is taken.

XIX. *The Spirituous Tincture.* It is a kind of Heavenly Medicament, and a Noble Cordial, it chears the Heart, revives the Spirits, strengthens Nature, resists Vapors, Faintings, Swoonings, sickness at Heart, and other Diseases of like kind, it takes away sickness at Stomach, pains there, restores its Tone being hurt or depraved, and admirably strengthens it. Dose from one Dram to two, or three Drams, in the Morning fasting, an Hour before Noon, and at Bed time, in a Glass of Generous Wine, or in Syrup, or other proper Vehicle, it causes a good Appetite and a strong Digestion.

XX. *The Oily Tincture.* Inwardly given from ten drops to twenty, or more, in some proper Vehicle, it prevails against the Palsie, Convulsions, pains and weaknesses of the Back, the Stone, Sand, Gravel, and Tartarous matter in the Reins, Ureters, and Bladder, *&c.* for Palsies it ought also to be anointed on the Back Bone and parts affected twice a day, and to be applied upon the part and well rubbed in in Convulsions, Cramps, *&c.*

XXI. *The Pouder of the Herb.* If it is snuffed up the Nose it provokes sneezing, and thereby purges the Head and Brain of cold pituitous Humors; the Herb being chewed in the Mouth it draws forth much Rheum and Flegm, causing pains and aches in the Head, Jaws, Throat, *&c.* given inwardly from half a Dram to a Dram in any proper Vehicle it strengthens the Stomach, expels Wind, eases the Colick, and facilitates the Birth of Women in Labor, bringing away also the Afterbirth.

XXII. *The Compound Decoction. Take Herb Mastick two Ounces, Origanum, Pellitory of Spain, of each six Drams, Acorus, Long Pepper, of each three Drams, White Port Wine twenty Ounces, put all into a Tinn'd Copper Vessel, or Glass Body, which cover with a Blind Head, and let it simmer over a gentle Fire for an Hour, then let it cool, and decant the clear for use.* Dose two or three Ounces at a time for the Palsie, Epilepsie, Lethargy, *&c.* two or three times a day; it is good also to gargle the Mouth for a Palsie of the Tongue; when it is taken inwardly it may be dulcified with Syrup of Clovegilliflowers, or other proper Syrup.

CHAP. CCCLXVII.

Of HERB ROBERT, *OR,* Robin's CRANESBILL.

I. *THE Names.* We cannot learn that it has any *Greek* Name, the *Latines* call it *Herba Roberti*, and *Geranium Robertianum*, and we in *England Herb Robert*, and *Robin's Cranesbill.*

II. *The Kinds.* It is certainly a Species of *Geranium* or *Cranesbill*, and thereof there is two special Kinds, *viz.* 1. *Geranium Robertianum vulgare, Geranium Rupertianum commune, Herba Roberti, vel Ruperti communis, Panax Heracleum Anguillare, Sideritis tertia Dioscoridis*, which most of our modern Authors take it to be, and it is easily to be perceived that they are both one, for *Dioscorides* has three sorts of *Sideritis*, *viz.* one with a *Hirsutum*

Leaf,

Leaf, one with a *Fern* Leaf, and one with a *Chervil* or *Coriander* Leaf, which is this preſent Herb; it is alſo called *Herba Roberti*, *vel Ruperti minor*, *Geranium Robertianum minus*, The Vulgar, Common, or Leſſer Herb Robert. 2. *Geranium Robertianum majus*, *Herba Roberti*, *vel Ruperti altera*, *Herba Roberta major*, *Gerani Robertiani altera Species Lobelij*, *Geranium Grainale Dodonæi*, *Geranium Violaceum Tabernamontani*, *Sanguinaria Radix Germanorum*, The Greater Herb Robert.

III. The Deſcriptions. *The firſt*, Common, or Small Herb Robert, *has a ſmall and thready Root*, *which ſmells as the whole Plant does*, *very ſtrong*, *and almoſt ſtinking*, which ſends up a reddiſh Stalk, commonly two Feet high, having ſeveral Leaves thereon, upon very long and reddiſh Footſtalks, divided at the ends into three or five diviſions, and each of them cut in on the edges, ſome with deeper cuts than others, and all dented likewiſe about the edges, which oftentimes turn reddiſh; at the tops of the Stalks come forth ſeveral Flowers made of five Leaves, much leſs than thoſe of *Muſk Cranesbill*, or *Dovesfoot*, theſe Flowers *Lobel* ſays are larger in ſome than in others, and of a more reddiſh color, which being paſt away, there come in their places Beakheads, as in other *Cranesbills*, which are not very ſmall nor very great; the Stalks are ſlender, weak, and brittle, ſomewhat hairy, and reddiſh; the Leaves are alſo jagged, reddiſh, ſtalked, and deeply cut, like to thoſe of *Chervil*, and the Flowers are many times of a bright purple color.

Herb Robert.

IV. *The ſecond*, *or* Greater Herb Robert, *has a Root which is wholly red*, *both within and without*, *not ſmelling ſo ſtrong as the former*, and it ſends up ſeveral ſlender hairy Stalks, three Feet high, at the Joints of which ſtand Leaves upon ſhorter yet redder Footſtalks, divided at the ends moſt commonly but into three parts, as large or rather larger than the former, and turning red likewiſe; the Flowers are purpliſh red, and of the ſame magnitude, and ſo alſo are the Beakheads and Seed.

V. *The Places* They both grow almoſt every where by Way ſides, upon Ditch Banks, and waſte Ground, whereſoever one goes, but the ſecond is not ſo frequent as the other, yet often ſeen and found; the firſt grows alſo upon old Walls, as well thoſe made of Brick and Stone, as thoſe made of Mud or Earth; it grows too among Rubbiſh, and in the bodies of Trees ſometimes which are cut down, and other like ruinated places.

VI. *The Times.* They Flower all *May*, *June*, *July*, and *Auguſt*, and the Seed is ripe ſoon after; they are hardy Plants, being green generally all Winter, nor are they eaſily hurt by cold.

VII. Their *Qualities*, *Specification*, *Preparations and Virtues* are the ſame with *Field Cranesbill* in *Chap.* 162. aforegoing, and to that you are referred.

VIII. *Nota.* *Herb Robert* is not only commended againſt the Stone, but alſo to ſtay Blood, where or howſoever flowing, as alſo ſpeedily to heal all green Wounds; it cures likewiſe Wounds and Ulcers of the Dugs, or Womens Breaſts, and in the ſecret parts.

CHAP. CCCLXVIII.

Of HERB TERRIBLE, OR, GUTWORT.

I. THE *Names.* It is called in *Greek* Ἄλυπον, *ab* α, *privativa*, and λύπα, *Triſtitia*, *quaſi indolens inoffenſumque Remedium*, but this ſeems to be ſpoken κατ' ἀντίφρασιν, *per contrarium*, ſome think it may be derived from ἁλικὸν, *Salſum*, *vel Maritimum*, becauſe it grows near the Sea; in *Latine* it is called *Alypum*, and *Herba Terribilis*, alſo *Alypias* by *Matthiolus*; the Root hereof is called by the ſame *Matthiolus Turpetum album*, as the Root of *Eſula minor* is called *Turpetum nigrum*; and in *Engliſh Herb Terrible*, or *Gutwort*, becauſe *Dioſcorides* ſays it lightly exulcerates the Guts.

II. *The Kinds.* Some Authors will have this Plant to be of the Kind of *Tithymals*, becauſe of its moſt violent purging and ſharp exulcerating quality, but without doubt it is rather a Plant of its own Kind, there are three ſeveral ſorts hereof, *viz.* 1. *Alypum*, *Alypum Monſpelienſium*, *Herba Terribilis*, *Thymelæa Foliis acutis*, *Capitule Succiſæ*, Herb Terrible of Mompelier. 2. *Tartonraire*, *Herba Terribilis Maſſilienſium Lobelij & Lugdunenſis*, Gutwort, or Herb Terrible of Marſeilles, *Alphonſus Pontius* of *Ferraria* took it to be *Cneorum Theophraſti*, the Root of which, as *Pena* ſays, is like unto the *Turbith* of *Alexandria*, not having ſo much heat and bitterneſs therein, nor other evil taſtes, as the others have; *Bauhinus* calls it *Thymelæa Foliis candentibus Serici inſtar mollibus*. 3. *Alypum Montis Ceti*, which the People of *Valentia* call *Hippogloſſum*, and is *Hippogloſſum Valentinum Cluſij*, Herb Terrible, or Gutwort of Valentia.

III. The Deſcriptions. *The firſt*, *or* Herb Terrible of Mompelier, *has a Root which is of a Finger's thickneſs*, *long*, *woody*, *and of a browniſh color*, *ſomewhat Salt if it grows near the Sea Shoar*, *where it may receive as its* Pabulum *ſome of the Sea Water*, *or elſe not ſalt at all*, *but bitter*, *if it grows further off*, *the Leaves taſting alſo after the ſame manner*;

tion

from this Root riſes up many woody Stalks, two or three Feet high, dividing themſelves into ſmaller Branches, covered with a thin Bark, the elder Branches being of a dark purpliſh color, and the youngeſt more red, thick ſet with ſmall, hard, dry Leaves, without order from the bottom to the top, which are ſomewhat long, and ſmall at the ſetting on, broader in the middle, and ſharp pointed, ſomewhat like unto *Small Myrtle* Leaves, of a greeniſh color on the upper ſide, and whitiſh underneath; at the top of every Branch ſtands a round Flower in a ſcaly Head, conſiſting of many purpliſh Thrums or Threads, paler in the middle than round about, ſomething like unto the Head of a *Scabious*, or rather *Knapweed.*

Herb Terrible

IV. *The ſecond, or* Gutwort, or Herb Terrible of Marſeilles, *has a Root which is alſo ſmall, long, and woody, with many Fibres at it, it is yellowiſh on the outſide and white within, nothing ſo hot, bitter, or unpleaſant as the Leaves or Seed, yet leaving a ſmall hot taſte at the end, without any ſmell, and not giving any Milk, it is, as* Pena *ſays, very like unto the* Turbith *of* Alexandria, *or of the Shops, and in the form thereof*; from this Root ſpring forth very many hoary, or Silver white, ſlender, and very tough Branches, two Feet high, divided into many other ſmaller, on which grow many ſmall, white, hoary Leaves round about them, ſmaller than thoſe of the former; the Flowers are white and ſmall, ſet cloſe together in a long Tuft, but ſo covered with the white woolineſs, that they can ſcarcely be perceived, which being paſt away, ſmall black Seed come in their places, bitter and unpleaſant, and ſo fiery hot, that if any one ſhould chew the ſame, or the Leaves of the Plant in their Mouth, they will ſo heat the Mouth, Lips, and Jaws, that no waſhing will for a long time remove it or take it away.

V. *The third, or* Herb Terrible of Valentia, *is a ſmall Shrub, three or four Feet or more high, its Root is two Fingers thick, brown of color, and of a woody ſubſtance*; from this Root ſprings forth one or more Stalks, which ſpread themſelves forth into many other ſmall Branches, having a thin Rind, which is firſt brown, then purple, with many little and thin Leaves thereon, not much unlike to thoſe of the *Myrtle*; the Flowers grow at the tops of the Stalk and Branches, and are as it were ſcaly and rough, like *Scabious* Flowers, of a blew purple color; the whole Plant is very bitter, and of an unpleaſant taſte, like *Chamælæa*, but ſomewhat ſtronger.

VI. *The Places.* The firſt grows on the Mountain or Hill *Ceſtius*, called *Cap de Ceſte*, and on other Rocky and Stony places in *France*; the ſecond grows near *Marſeilles*, by the Sea ſide, on a ſmall Hill near thereunto called *Mondrond*, as *Pena* ſays, and all along the Coaſt of *Liguria*, and the Iſles of *Corſica* and *Sardinia*; the third grows about *Valentia* in *Spain*, as *Cluſius* declares; they all grow on Mountains and Hills, as alſo in other places which are Gravelly Grounds; with us they are only nurs'd up in Gardens.

VII. *The Times.* They Flower not until it is late with us, as in *Auguſt* and *September*; *Cluſius* found ſome of them in *Spain* Flowering in the Months of *February* and *March.*

VIII. *The Qualities.* They are all of them hot and dry in the fourth degree, Attractive, almoſt Pyrotick, and vehemently Cathartick, its purging faculty being much like the *Tithymals*; but the ſecond of theſe is far more powerful or violent than the others, and comes nearly to the quality of *Mezereon*, ſo that by reaſon of its great heat and violence it is very dangerous.

IX. *The Specification.* They expel Watery, Flegmatick, and Cholerick Humors in abundance, and *Cluſius* ſays that the Landlopers in *Spain* do exhibit it with good ſucceſs for the Cure of the *French* Pox.

X. *The Preparations.* You may have therefrom, 1. *A Pouder of the dryed Leaves or Root.* 2. *A Decoction of Leaves or Root.* 3. *A Pouder of the Seed.*

The Virtues.

XI. *The Pouder of the dried Leaves or Root.* It is given in Broth to purge Choler and Flegm, alſo watery Humors in Dropſies, which it evacuates in abundance, and prevails alſo againſt the *French* Diſeaſe: *Pena* ſays that Empericks, tho' they find it to purge with ſuch violence, do often give it with Wine or Broth: *Pliny* ſays the ſmalleſt quantity to be taken at a time in Chicken Broth is two Drams, a mean quantity is four Drams, and the greateſt Doſe to be given at once is ſix Drams; but in proportioning the Doſes the Phyſician ought to act warily, and to begin with a ſmaller Doſe at firſt, as half a Dram, to ſee the operation, and then to increaſe it to larger proportions as he ſhall ſee needful, to perfect its operation.

XII. *The Decoction. Cluſius* ſays the *Spaniards* give the Decoction of the Root, Leaves, Flowers and Seed, to thoſe who are troubled with the *French* Diſeaſe, and that with great ſucceſs.

XIII. *The Pouder of the Seed.* It purges downwards black Choler or Melancholy if taken with a little Salt and Vinegar, and in like quantity with *Epithymum*, but it is ſaid a little to exulcerate the Bowels; it prevails againſt the Dropſie, Pox, Kings-Evil, and Gout. Theſe Preparations of this Plant, if skilfully corrected, and given in a fit Doſe, agreeing with the ſtrength of the Patient and violence of the Diſeaſe, (the Body being before hand prepared) may be admitted of, where better and ſafer things are not at hand to be had.

CHAP.

CHAP. CCCLXIX.

Of HOLLIHOCK, *OR,* TREE MALLOW.

I. *THE Names.* It is called in *Greek* Δενδρομαλάχη, in *Latine Malva Arborea, Malva Rosea, Malva Hortensis, Malva major*, in *English Hollihock*, or *Garden Mallow*, also *Tree Mallow*; this is the μόσχευτον, *Mosceuton Plinij Lib.* 21. *Cap.* 4. so called I suppose *à suavitate odoris*, or from μοσχεύειν, *quòd avulsis surculis plantetur.*

II. *The Kinds.* There are two principal Kinds hereof, *viz.* 1. Δενδρομαλάχη κοινὴ, *Malva Hortensis vulgaris*, The Common Hollihock. 2. Δενδρομαλάχη μέγαλη, *Malva Rosea magna*, *Malva Rosea Arborea*, The Great or Tree Hollihock.

III. *Of the Common Garden Kind* there are two Species, *viz.* 1. *Malva Hortensis vulgaris simplex*, *Malva Rosea Hortensis simplex*, Single Flowered Hollihock. 2. *Malva Hortensis vulgaris multiplex*, *Malva Rosea communis multiplex*, The Double Flowered Hollihock. *Of the Great or Tree Hollihock* there are likewise two Species, *viz.* 3. *Malva Arborea, Malva Rosea magna Arborea, Malva Arborea magna peregrina*, The Outlandish Tree Hollihock. 4. *Malva Arborea Marina nostras*, *Malva Rosea Arborea Marina nostras*, Our English Sea Tree Hollihock.

IV. The Descriptions. *The first, or* Common single Flowered Hollihock. *It has a long, white, tough Root, easily bowed, and grows deep into the Ground, not much unlike to the Root of the* Common Mallow, *but greater, and generally abides all the Winter, rising up again the next Spring*; the Stalk grows up straight, almost like a Tree, of five, six, seven, or eight Feet high, according as the Ground is in goodness, the lower Leaves growing upon which are almost round, and somewhat large, with many corners, but not cut in or divided, and soft in handling, but those which grow up higher are much more produced into corners; from the middle of this Stalk upwards to the top grow the Flowers upon slender Footstalks, where they stand and make as it were a long Spike of small Leaves and Buds for Flowers together; the Flowers are single, and consist of five broad and round Leaves, standing round, like unto single Roses, with a middle long Stile, and some Chives about them; these Flowers are of divers Colors, as pure White, or Reddish, some are of a pale Blush, almost like a White, some are more blush, fresh and lively, of a Rose Color, some are Scarlet, and of a deeper Red, like Crimson, some of a dark Red, like black Blood, some of a deep Purple, varying in their Colors, as Nature is pleased to play with them; after the Flowers are past, there grows up round Knobs or Heads, but flattish withal, being round about the bottoms, and compact or made up with a multitude of round, flat, whitish Seed, in form of a Cheese.

V. *The second, or* Double Flowered Hollihock, *in its Roots, Stalks, Leaves, magnitude, manner and form of growing, and Seed, is exactly like the former, so that those parts need no other description than what we have already just now given*, the difference between the former and this is only in the Flower, for whereas the former are single, these are manifoldly double, and are like unto double Roses, set very thick with Leaves, so that no Stile or Pointel is seen in the middle, the outwardmost row of Leaves in the Flowers are largest, the innermost being smaller, and thick set together, the Colors of which are manifold and various, according as we have described them in the former Section.

VI. *The third, or* Outlandish Tree Hollihock. *It has a pretty large long Root, with some Fibres adjoining to it, which, tho' the Stalk perishes every Year, yet endures with us for about two Winters, and then decays:* This *Tree Hollihock* grows with us to be a great tall Tree, more likely than an Herb, having its Stalk or Body something woody, and oftentimes so great in compass, that no Man can grasp it round with both his Hands; the Leaves are twice as large as any *Common Mallow*, and as soft and woolly in handling as the *Marsh Mallow*, but not so white and downy, and many times crumpled about the edges; it Flowers not in the first Year of its springing up with us, but in the second Summer, if a preceeding sharp Winter has not killed its Stalk in the first Year, (not then being grown to its full strength) being then more tender than afterwards; this main Stalk spreads it self out into several Branches, with Leaves on them, but smaller, among which stand fair, great, and large deep purple Flowers, with Stripes and Veins in them, like to the *Common Mallow*, after which come forth such like round Cases, with blackish Seed in them, but larger, according to the proportion of the Plant, which seldom comes to maturity in our Country.

VII. *The fourth, or* English Sea Tree Hollihock. *It has a Root which is white, great, and woody, with many long Fibres or Strings adjoined to it*, and in its Stem, Leaves, and manner of growing, is very like to the last described; its Stalk is woody, and as great as a Mans Arm, of a russet or hoary Color, upon which grow soft, whitish, woolly Leaves, almost as large as the other, and as soft and smooth as Velvet; the Flowers hereof are large, and of a whitish or diluted purple color, like in form to the Flower of a *Wild Mallow*, but much larger, yet not so large as the last.

VIII. *The*

VIII. *The Places.* The firſt two grow only in Gardens, and are almoſt every where to be met with; the third grows near *Venice*, all along the *Tirrhene* Shoar, as alſo on the *African* Shoar, where the Root lives many Years, tho' with us it ſcarcely ever out lives two Years; the fourth and laſt grows in an Iſland called *Dinnie*, three Miles from *Kings-Road*, and five Miles from *Briſtol*, as alſo about the Cottages near *Hurſt Caſtle*, over againſt the *Iſle of Wight*.

IX. *The Times.* The two firſt Flower thro' all the Summer Months, even till the approach of Winter, but the *Tree Hollihocks* begin to Flower later, ſo that the firſt of them does not often perfect its Seed with us, but the laſt of them brings forth its ripe Seed in a little time after its Flowering.

X. *The Qualities, Specification, Preparations and Virtues* of *Hollihocks* are the ſame with thoſe of *Common Mallow*, *Marſh Mallow*, and *Vervain Mallow*, hereafter in their proper places to be declared, and to which we refer you.

CHAP. CCCLXX.

Of HOLLOW ROOT,

OR,

Caveous FUMITERRY.

I. *THE Names.* It is called in *Greek* Κάπνος κοῖλος, Ῥίζα κοῖλη, in *Latine Radix cava*, *Fumaria Radice cavata*, in *Engliſh Hollow Root*, *Caveous Fumiterry*, and *Hollow Rooted Fumiterry.*

four yellowiſh green Leaves, with ſome Threads in them.

VII. *The Places.* Theſe Plants grow about Hedges among Brambles and Briers, and in the borders of Fields and Vineyards in low and fertile Grounds in *Germany* and the *Low Countries*, but the three firſt of them grow with us only in Gardens; the fourth is found in its times of flouriſhing among Buſhes in ſeveral parts of *England*, as about *Chiſleburſt* in *Kent*, eſpecially in a Wood formerly belonging to one *Pits*, and at the farther end of *Cray Heath* on the Left Hand under a Hedge among Briers and Brambles, which is its proper ſeat.

VIII. *The Times.* The three firſt, as alſo the fourth, may be accounted Vernal Plants, for they riſe not out of the Ground till the Spring comes in, and are gone likewiſe before it is paſt, remaining under Ground all the reſt of the Year, yet the leſſer abides longer above Ground than the greater; the fourth Flowers in *April*, the other three Flower in *March*, and their Seed is ripe in *April*, and the Leaves and Stalks are gone in *May*, nothing remaining ſave only the Roots, ſo ſmall a time do they continue.

IX. *The Qualities.* *Hollow Root* is hot in the ſecond degree and dry in the third, Aperitive, Abſterſive, Aſtringent, and Diuretick, Pectoral, Hepatick, Arthritick, and Alexipharmick.

X. *Their Specification, Preparations and Virtues* are the ſame with thoſe of *Fumiterry* in *Chap.* 304. *Sect.* 11. *ad* 24. to which for the particulars you are referred, there being little or no difference in their operations and effects; but with them you may take theſe following Notes.

XI. *Nota.* 1. *The Pouder of the Roots.* Given to a Dram or more in Wine, or any Alexipharmick Vehicle, it is very effectual againſt Poyſon, the bitings of Mad Dogs, and of venomous Serpents, as alſo againſt the Plague or Peſtilence, the Patient being laid down to ſweat upon the ſame; it alſo provokes Urine, and helps againſt the Jaundice, and being ſtrewed upon putrid and running Ulcers it cleanſes, dries up, and heals the ſame.

XII. *Nota.* 2. *The Pouder of the Seed.* Drunk from one to two Drams in Red Port Wine, or in our *Aqua Bezoartica*, it ſtops Vomiting, ſtops all ſorts of Lasks or Fluxes of the Belly, and ſtrengthens all the Viſcera.

XIII. *Nota.* 3. *The Decoction of the Roots in Wine.* It is good againſt Tumors in the Throat, and the long continued ſwellings of the Almonds, it prevails againſt ſtrumous productions, and the pain of the Jaws with an afflux of Humors.

XIV. *Nota.* 4. *The Oil or Ointment of the Roots.* Anointed on the Fundament it is good againſt the ſwelling and pain of the Hæmorrhoids, or Piles, diſcuſſing the one and eaſing the other; it diſcuſſes alſo ſcrophulous Tumors of the Throat.

CHAP. CCCLXXI.

Of HONEWORT,

OR,

Corn PARSLY.

I. THE *Names.* It is an *Engliſh* Plant, and has no known *Greek* Name belonging to it, but is called in *Latine Selinum Segetale*; *Goodier* called it firſt *Sium Terreſtre*, afterwards it was called *Apium Sij Folijs*, and from the compoſure of the Leaves *Sium odoratum Tragi*; *Gerard* called it *Sium Segetum*, and *Sium Agrorum*, but at length the firſt *Latine* Name *Selinum Segetale* obtained above the reſt, from whence it is Named in *Engliſh Corn Parſly*, but the Country People call it *Honewort*.

II. *The Kinds.* It is accounted among the Umbelliferous Plants, for ſuch it is, and is certainly one of the Stock of *Selina*, or *Apia*, for which reaſon it was called *Apium Sij Folijs*, but with us *Corn Parſly*, as aforeſaid.

Hone wort

III. The Deſcription. *It has a Root which is ſmall, long, and white, which periſhes every Year after it has Seeded, and riſes again of its own Sowing*; it is a ſmall low Herb, having ſeveral long winged Leaves lying on the Ground, many being ſet one againſt another, finely dented about the edges, with one ſingle Leaf at the end, which are each of them longer than *Burnet* Leaves, and pointed at the ends, from among which riſe up ſeveral round Stalks, half a Yard high, with the like, but leſſer Leaves on them, branching forth likewiſe from the Joints, and all of them bearing ſmall Umbles of white Flowers, which turn into ſmall blackiſh Seed, leſs than *Parſly* Seed, but as hot and ſharp in taſte as it. *Gerard* has a more ample Deſcription of this Plant, which take in the following Words.

IV. *Gerard*'s Deſcription. *The Root is ſmall, and whitiſh, with many Threads adjoining to it, but not ſo big as* Parſly *Roots*; the Herb comes up at firſt from Seed, like *Parſly*, with two ſmall, long, narrow Leaves, the next which ſpring up are two ſmall round Leaves, ſmooth, but nick'd about the edges, and ſo for two or three couples of Leaves of the next growth there are ſuch round Leaves, growing on a middle Rib by couples, and one round one alſo at the top or end of the Wing; afterwards, as more Leaves ſpring up, ſo the faſhion of them alſo

change, that is to ſay, every winged Leaf has about eight or nine ſmall, ſmooth, green Leaves, finely ſnipt or indented about the edges, growing on each ſide of a middle Rib, one oppoſite to another, and one growing by it ſelf at the top or end, in form reſembling thoſe of *Sium odoratum Tragi*, but not ſo large or long, or at all browniſh, from among which riſe up many ſmall, round, ſtraked Stalks or Branches, about two Feet in height, ſometimes above twenty Stalks from one Root, ſometimes growing upright, ſometimes creeping not far from the Ground, jointed or kneed, and dividing themſelves into very many Branches; at every Joint grows one Leaf, ſmaller than the former, which, together with the lowermoſt, periſh betimes, ſo that ſeldom one green Leaf is to be ſeen on this Plant when the Seed is ripe; the Flowers are white, and grow moſt commonly at the tops of the Stalks and Branches, ſometimes at moſt of the Joints, even from the Ground, in uneven or unorderly Umbles, every Flower having five exceeding ſmall Leaves, flat and broad at the top, and in the middle very ſmall Chives with purple tops, the whole Flower not much exceeding the bigneſs of a ſmall Pins head, which being paſt away, there comes up in the place of each Flower two ſmall, grey, crooked, ſtraked Seeds, like *Parſly* Seed, but larger, in taſte hot and aromatical.

V. *The Places.* It grows in Corn Fields among Corn, or where Corn has been Sown, in ſeveral places of *England*; it grows in Clay Grounds, and has been found in Wheat Lands about *Maple Durham* in *Hampſhire*, and ſeveral other places.

VI. *The Times.* It begins to Flower about the beginning of *July*, and ſo continues Flowering a long time; *Parkinſon* ſays it Flowered not with him till *Auguſt*, and that the Seed ripened about a Month after, but part of the Seed is many times ripe in *Auguſt*, and ſome other parts of it ſcarcely in the beginning of *October*, in the mean ſeaſon ſome of it falls, whereby it renews it ſelf, and grows with flouriſhing green Leaves all the Winter.

VII. *As to the Qualities, Specification, Preparations and Virtues*, they come very near, or are the ſame with thoſe of Our *Common Parſly*, for the Seed is in form and taſte almoſt like *Parſly* Seed, and therefore to that you are referred.

VIII. *Nota. The Liquid Juice.* *Goodyere* related that the juice of a Handful of the Leaves being drunk in a draught of Ale or Beer every Morning faſting for a Fortnight, did cure one that had a ſwelling in her Cheek, Yearly there ariſing, but its original cauſe was unknown, yet it was attended with great heat, redneſs, and itching, by the uſe of this Herb it was perfectly cured, and roſe no more; it is poſſible it may be an excellent thing againſt ſtrumous Tumors, or the Kings-Evil in any part of the Body.

CHAP. CCCLXXII.

Of HONEYWORT, *OR,* WAX-FLOWER.

I. *THE Names.* It is called in *Greek* Κηρίον by *Theophraſtus Lib.* 6. *Cap.* 7. in *Latine Cerinthe*, and in *Engliſh Honeywort*, and *Wax Flower.*

II. *The Kinds.* Some will have it to be *Telephium maculoſum*, or *Telephium Dioſcoridis*, and as ſuch they nurſe it up in their Gardens in *Paris*; *Dodonæus* and *Cluſius* ſay that many took it to be *Maru*, or *Almara Avicennæ*, in *Cap.* 464. of which he makes five ſorts, but *Cluſius* takes *Avicen* to mean either our *Borage* or *Bugloſs*, and that this Plant is rather the *Leucographis Plinij* in *Lib.* 27. *Cap.* 11. becauſe of the white ſpots of the Leaves; *Geſner* ſays it was called by ſome *Cynogloſſus Montana*, and *Bauhinus* thereupon calls it *Cynogloſſum Montanum*; *Dalechampius* took *Calendula* to be *Cerinthe*, *à Cerei ipſius Flore ſic appellata*; but *Cluſius* refers it rather to the Kinds of *Borage* or *Bugloſs*, to which in temperature he ſays it is neareſt. Authors make at leaſt ſix Kinds thereof, but we ſhall deſcribe no more than grow in our Gardens, which are the following, *viz.* 1. *Cerinthe major Flore luteo & rubro Lobelij & Camerarij*, *Cerinthe quorundum major Flore verſicolore Cluſij*, *Cerinthe, ſeu Cynogloſſum Montanum majus Bauhini*, The Greater Yellow and Red Honeywort. 2. *Cerinthe minor Flore luteo & rubro*, *Cerinthe quinta Cluſij*, *Cerinthe Folia non maculato viridi Bauhini*, The Leſſer Yellow and Red Honeywort. 3. *Cerinthe major flavo Flore*, *Cerinthe Flore flavo aſperior Bauhini*, *Cerinthe quorundam major flavo Flore Cluſij*, The Greater Yellow Honeywort. 4. *Cerinthe minor flavo Flore*, *Cerinthe quorundam minor flavo Flore*, *Cerinthe minor Lobelij*, *Camerarij*, *& Tabernamontani*, *Cerinthe Plinij*, The Leſſer Yellow Honeywort. 5. *Cerinthe major Flore purpurante*, *Cerinthe tertia Cluſij*, *Cerinthe Flore rubro purpuraſcente Bauhini*, Purple Honeywott.

III. The Deſcriptions. *The firſt, or* Greater Yellow and Red Honeywort, *has a Root which is ſomewhat great and thick, ſending therefrom many Fibres within the Earth, but periſhes every Year after Seed time*; this party colored Plant riſes up with divers thick hairy Stalks, almoſt two Feet high, on which are ſet long large Leaves, of a blewiſh green color, ſpotted with great white ſpots, round at their farther ends, and ſo much encompaſſing the Stalk at the lower ends, that it ſeems to go thro' them, ſet with ſome ſmall Pricks or Thorns thereon, and a little hairy withal; the Stalks are branched toward the tops in other ſmaller ones, and full of Leaves, but much leſſer, whoſe ends do turn inwards, like the *Turnſole* Heads, at every Leaf whereof comes forth a long hollow Flower, like unto a *Comfrey* Flower, and as large, which in ſome are all yellow, with a reddiſh circle about the middle thereof, but in others from the middle forwards is of a yellow color, the other part next the Stalk being of a purpliſh red color, with ſome Threads in the middle, taſting ſweet like Honey, wherewith Bees are much delighted, each Flower ſtanding in a green Husk, divided into five parts at the tops, in which, after they are paſt, grow the Seed, which is blackiſh, a little cornered, and flat at bottom, where it is joined to the Husk.

IV. *Gerard* deſcribes it thus. *The Root periſhes at the firſt approach of Winter*; it riſes forth of the Ground after the falling of its Seed, with two ſmall Leaves, like thoſe of *Bazil*, between the which Leaves comes forth a thick, fat, ſmooth, tender, and brittle Stalk, full of Juice, dividing it ſelf into many other Arms, which are alſo divided into many other Branches, bowing or leaning towards the Ground, being not able without props to ſuſtain it ſelf, by reaſon of the great weight of Leaves, Branches, and much Juice, with which the whole Plant is ſurcharged; upon theſe Arms or Branches are placed many thick rough Leaves, ſet with very ſharp prickles, like the rough Skin of a Thornback, of

of a blewiſh green color, ſpotted very notably with white ſtrakes and ſpots, like the Leaves of the *True Pulmonaria*, or *Cowſlip of Jeruſalem*, and in ſhape like thoſe of the *Codded Thorowax*, which Leaves do embrace or encompaſs the Stalk round about, from the boſom whereof comes forth ſmall cluſters of yellow Flowers, with a circle or band of bright Purple round about the midſt of the yellow Flower; the Flower is hollow faſhioned, like a little Box, and of a ſweet or Honey taſte when it is ſuck'd, in the hollowneſs whereof are many ſmall Chives or Threads, which being paſt away, round black Seed does come in place, contained in ſoft skinny Husks; the Flowers are very various in color, which are of yellow or purple, and ſometimes of both mixed together.

V. *The ſecond, or* Leſſer Red and Yellow Honeywort, *has a long Root, full of Fibres, periſhing every Year*; its Branches are both ſhorter and leaning downwards, not ſtanding upright, on which grow long green Leaves, without any ſpots on them, and leſſer than the former; the tops of the Branches are as full of Leaves and Flowers as the foregoing, but turn not in the ſame manner; the Stalks which ſuſtain the Flowers, and ſo likewiſe the ſmall Leaves at the foot of every Stalk, are ſomewhat purpliſh, but the Husk in which the Flower grows is green, and cut into five diviſions; the Flower is long and hollow, like the former, and almoſt as great, of a Gold yellow color, dented at the ends, and with a Red or deep Crimſon circle about the middle thereof; and the Seed which follows is like the other, but ſomewhat leſſer.

VI. *The third, or* Greater Yellow Honeywort. *It has a Root like the others, which periſhes after Seed time in the ſame manner*; it riſes up with a reaſonable great Stalk, Branched on all ſides from the bottom to the top, many of the lowermoſt lying upon the Ground, and the other ſtanding more upright, on which grow long and large blewiſh green Leaves, ſpotted as the firſt is, but not ſo large at bottom, where they encompaſs the Stalks, and having ſome prickles thereon in the middle, as the firſt has, and a little hoary about the brim or edges; the tops of the Branches do bend downwards, ſet with ſmall Leaves, and Flowers at them, as the firſt, and as large as they, but without any circle or bottom of Purple, being wholly of a fair yellow color, with ſuch like Threads as the reſt have, and Seed alſo much the ſame; the Leaves of this ſeem to be rougher than the Leaves of the firſt, but narrower at their ſetting on, as aforeſaid.

VII. *The fourth, or* Leſſer Yellow Honeywort. *It has a Root which is white alſo, and long, and abides in more Southern Climes all the Year long, but with us periſhes in Winter*; it has a ſlenderer Stalk than the former, near two Feet high, ſet with ſmaller, narrower, and ſpotted Leaves thereon, without order, one above another, on both ſides the Stalks, which ſpreads it ſelf out into many ſmall but longer Branches, from the middle thereof, thick ſet with Leaves and Flowers, which are like the laſt, all yellow, but ſmaller, and dented about their brims; after which come ſuch like Seed as the laſt, but ſmaller.

VIII. *The fifth, or* Purple Honeywort, *has a white long Root, which periſhes every Year, and therefore muſt be new ſown every Spring*; it grows very like the *Great Yellow Kind*, with low bending Branches, and ſomewhat large blewiſh green ſpotted Leaves, like as the reſt have; the Flowers grow in the ſame manner as the others do, and as large, wholly of a dark purpliſh color, on the ſuperficies whereof a little whiteneſs is perceived; the Seed which follows is like the others, but greater than any of them, and two for the moſt part ſtanding together in a Husk.

IX. *The Places.* The firſt, third, and fifth, grow wild in *Spain*, the firſt in *Bætica* and *Portugal*, the third in *Valentia*, alſo in *Monte Palatino* at *Rome*; and in *Germany* in *Auſtria*, *Stiria*, *Bohemia*, and *Hungary*: the Originals of the ſecond and fourth are unknown, they none of them grow wild in *England*, but are only nurſt up in Gardens.

X. *The Times.* They Flower all *June*, *July*, and *Auguſt*, and ſometimes ſo late, that we do not gather good Seed from any of them, but from the *Red*, if the Year proves not warm enough, and wet withal to ripen them, or if they be not well watered when it is a dry Summer, to bring them the faſter forward; they periſh at the firſt approach of Winter, and muſt be ſown the next Spring.

XI. *The Qualities.* They are temperate in reſpect to heat or cold, and dry in the firſt degree, Aſtringent and Vulnerary.

XII. *The Specification.* They are peculiar to ſtop Bleedings of all ſorts, the overflowing of the Terms, Bloody Flux, Hepatick Flux, *&c.*

XIII. *The Preparations.* You may have therefrom, 1. *A Liquid Juice or Eſſence of the Herb.* 2. *A Decoction thereof in Wine.* 3. *A Pouder.*

The Virtues.

XIV. *The Juice or Eſſence of the Herb.* Taken inwardly from one Ounce to two, or three, it is good to ſtop inward bleeding, whether of any Veſſel broken in the Lungs, or Piſſing Blood, or the Bloody Flux; it ſtops alſo bleeding at Mouth and Noſe, the overflowing of the Terms in Women, and other Fluxes of the Bowels; if it is mixed with a little Saffron, it is good for bleared and watering Eyes, and being uſed in foul Ulcers after they are cleanſed, it helps to incarnate them, eſpecially ſuch as are in the more nice and tender parts of the Body.

XV. *The Decoction in Wine.* It has all the Virtues of the Juice or Eſſence before related, and does the ſame things, but not ſo effectually, nor ſo ſpeedily, and therefore is to be given or uſed oftner, and in a greater quantity or Doſe.

XVI. *The Pouder.* It ſtops inward Bleedings and Fluxes, as the Juice, *&c.* does, and being applied outwardly to any flux of Blood, it preſently ſtops it; ſtrewed alſo upon moiſt and running Sores, or putrid Ulcers, it cleanſes and dries them, and diſpoſes them to healing.

XVII. *Nota.* *Pliny* and *Virgil* affirm, that Bees are much delighted with the Flowers of theſe Plants, being ſweet, or abounding with Honey, and that they gather from them more Honey and Wax than from many other Flowers; and from thence doubtleſs it obtained the Name of *Cerinthe*.

CHAP. CCCLXXIII.

Of HOPS Garden and Wild.

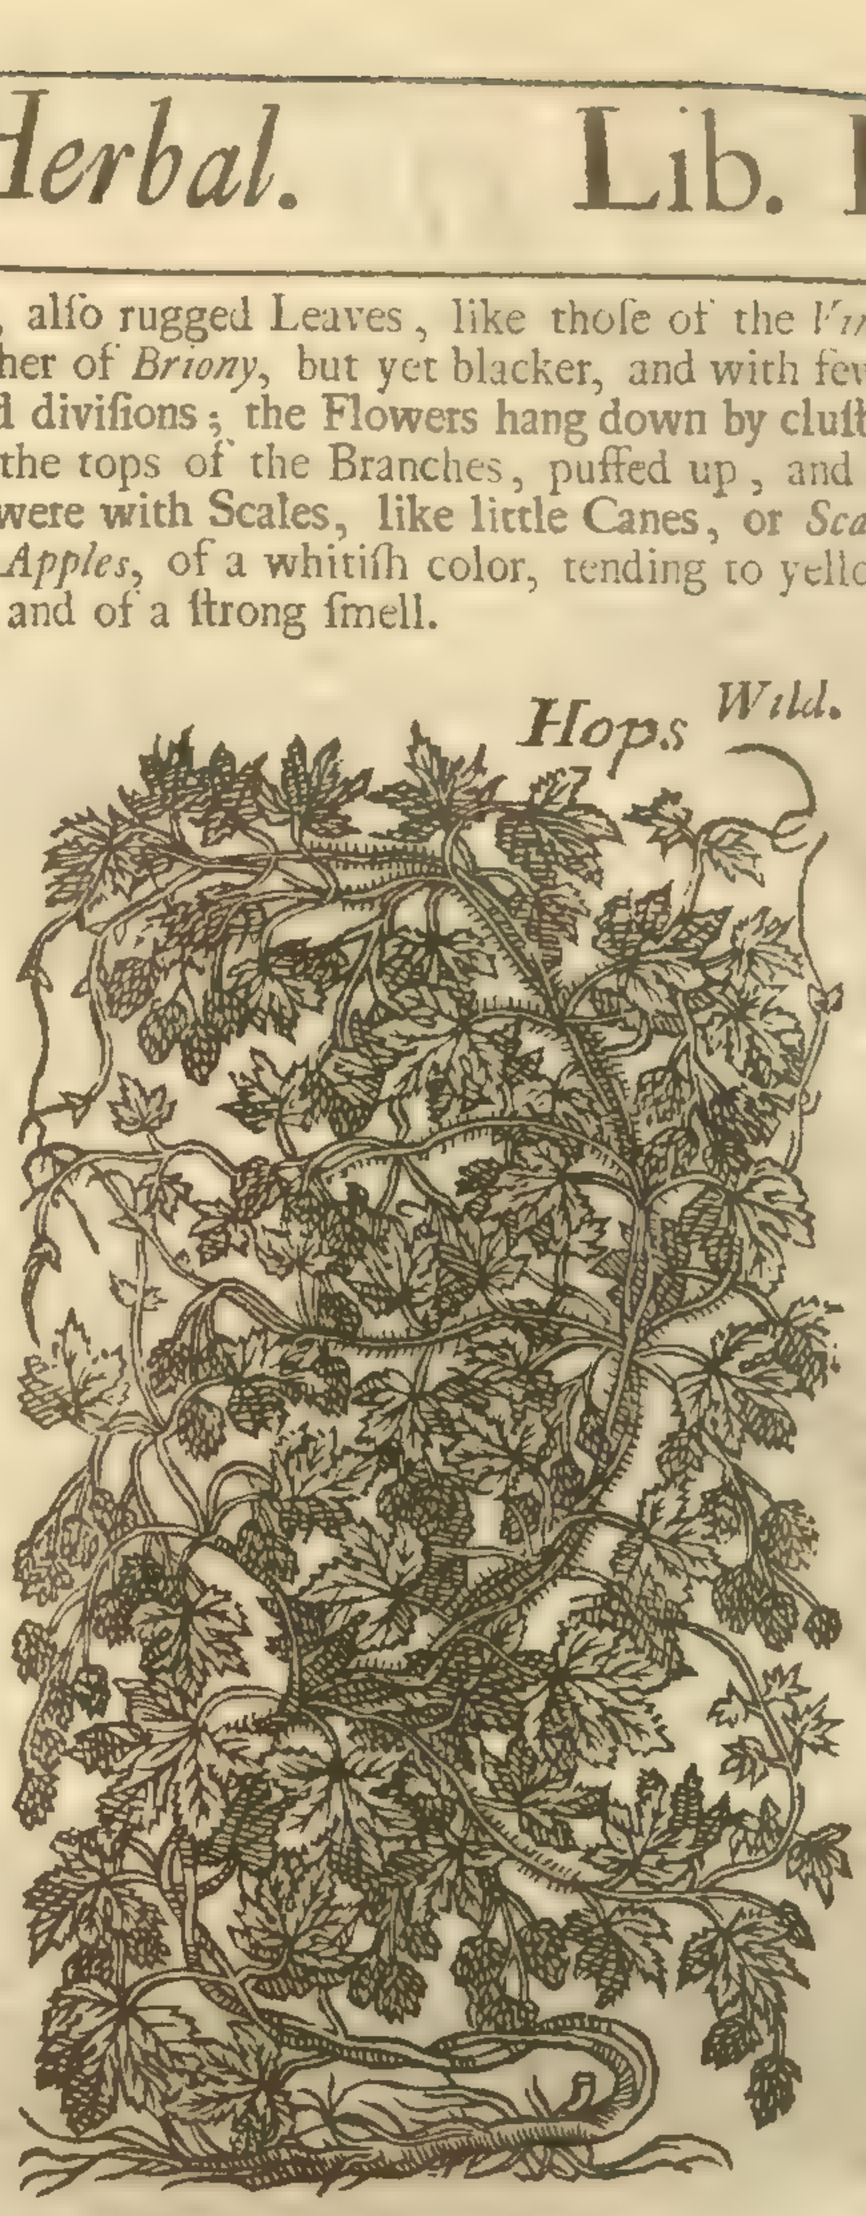
I. *THE Names.* *Dioſcorides*, *Galen*, nor any of the Ancient *Greek* Writers make any mention of this Plant, nor yet any of the Ancient *Latine* Authors, except *Pliny* only, who *Lib.* 21. *Cap.* 15. does but only name it, and number it among thoſe Herbs which grow of themſelves, and are uſed for Meat with divers Nations. The *Arabians* have not

only remembred it, but commended it highly for many Diſeaſes. The *Greeks* at this day call it Βρύον, ϗ Βρυωνία, *Bryon* and *Bryonia*, it is likely for the form of the Leaves, and running of the Branches. The *Latines* call it *Lupulus*, *Lupus Salictarius*, *Lupulus Salictarius* (*qui ad Salices aſſurgit*, *vel qui Salictum curat*, *vel quia ſalit & reptat per Arbores*, *aut quia ſcandit Salices*) *Meſue* makes it his third kind of *Volubilis*, *Lobel* calls it *Vitis Septentrionalem*, (The Northern Vine) and *Tragus Smilax aſpera*, which it is not; we in *Engliſh* call it *Hop*, or *Hops*.

II. *The Kinds.* It is twofold, *viz.* 1. *Lupulus Hortenſis*, The Garden or Manured Hop. 2. *Lupulus Sylveſtris*, *Lupulus Fœmina*, The Wild Hop.

III. The Deſcriptions. *The firſt*, *or* Garden Hop, *has a Root which is great at the head*, *ſhooting forth many blackiſh ſtrings*, *taking faſt hold of the Ground*; it riſes up at firſt with ſeveral great brown heads, like unto *Aſparagus*, but larger, which afterwards ſpreading it ſelf out into rough Branches, climb up upon great, long, or high Poles, which are ſet on purpoſe for them to run upon; it has many hard and rough dark green Leaves, cut into three or five diviſions, ſomewhat like unto *Bramble* Leaves, and dented alſo about the edges; at the tops of the Branches, which hang down again for the moſt part, come forth many ſcaly heads, being as it were a number of ſmall yellowiſh green Leaves growing thick together, from among which come forth the Flowers, of a whitiſh yellow color, which being paſt, and the heads changing their color to a more browniſh yellow, they are then fit to be gathered to keep; in this Flower at the bottom thereof is contained the Seed, which is brown, or of a reddiſh brown color, ſmall and round.

IV. *Gerard* deſcribes the *Hop* thus. *The Roots are ſlender*, *and diverſly folded one within another*; *it lives and flouriſhes by embracing and taking hold of* Poles, Pearches, *and other things upon which it may climb*; it brings forth very long Stalks, rough and hairy, alſo rugged Leaves, like thoſe of the *Vine*, or rather of *Briony*, but yet blacker, and with fewer dented diviſions; the Flowers hang down by cluſters from the tops of the Branches, puffed up, and ſet as it were with Scales, like little Canes, or *Scaled Pine Apples*, of a whitiſh color, tending to yellowneſs, and of a ſtrong ſmell.



V. *The ſecond*, Wild, *or* Female Hop, *has a Root like the former*, *and grows up in the ſame manner*, *form*, *or faſhion*, *climbing upon Trees or Hedges*, *or what ſtands next unto it*, with rough Branches and Leaves like the former, but this bears much ſmaller Heads, and in far leſs plenty or number than the *Manured* does, and ſometimes in ſome Years there are but few Heads to be ſeen upon ſome Plants, and herein conſiſts the eſpecial difference.

VI. *The Places.* Theſe Plants grow more frequently in our colder Climates, than in the hotter or more Southern, they delight to grow in low moiſt Grounds, where they may have moiſture enough, and yet not too much, for which cauſe they are planted on Hillocks as it were, and Trenches are made to receive or carry off any great quantity of Water, that the Plants may not ſtand drowned, by which it appears they delight to grow in a fat and fruitful Soil: The *Wild Kind* grows among Briers and Thorns about the borders of Fields; theſe by being tranſplanted into Gardens, and being manured as the *Garden Kind* is, much alters it ſelf, and becomes little inferior to that of the *Garden*, and in proceſs of time comes to the ſame goodneſs and perfection.

VII. *The Times.* They ſpring not up till *April*, when from the old Roots, which remain all the Winter, new Shoots or Buds come forth; they flower not till the latter end of *June*, and the *Hops* themſelves are not gathered till the middle of *Auguſt*, and the beginning and middle of *September*, when they are dried, and ſo kept all the Year for uſe.

VIII. *The Qualities.* They are hot and dry in the third degree, Inciding, Aperitive, Abſterſive, Subaſtringent, Digeſtive, Diſcuſſive, and Diuretick, Neurotick,

Neurotick, Stomatick, Hepatick, Nephritick, Hysterick, and Arthritick, Emmenagogick, Sudorifick, Alexipharmick, and Lithontriptick.

IX. *The Specification.* They are of special use to cleanse the Blood, provoke Urine, help the Strangury, break and expel the Stone, Gravel, Sand, and Tartarous Mucilage from the Reins, Ureters, and Bladder, kill Worms, expel Poyson, and provoke the Terms in Women: The *Garden* and *Wild* are equal in virtue.

X. *The Preparations.* You may have therefrom, 1. *A Sallet.* 2. *A Liquid Juice of the Leaves, Roots, and green Hops.* 3. *An Essence of the same.* 4. *An Infusion in Wine or Water.* 5. *A Syrup of the Juice.* 6. *A Decoction of the Roots.* 7. *A Pouder of the Seed.* 8. *A Spirituous Tincture of the Flowers or Hops.* 9. *An Acid Tincture.* 10. *An Oily Tincture of the same.* 11. *A Saline Tincture.* 12. *A Spirit from the Hops.* 13. *The Bath.*

The Virtues.

XI. *The Sallet.* The first Buds of the *Hops* being laid a while in Sand will make them tenderer, and being boiled are used to be eaten after the same manner as the Buds of *Asparagus* are, and with as great delight to the taste; they open the obstructions of Liver and Spleen, cleanse the Blood, loosen the Belly, expel Gravel and Sand from the Reins, and give ease in the Strangury.

XII. *The Liquid Juice of the tops of Hops.* It has all the former Virtues, but much more powerful, it effectually cleanses the Blood, and is a good expedient for the cure of the *French* Disease, as also all sorts of Scabs, Itch, Pimples, Herpes, Tettars, Ringworms, Morphew, Scurf, spreading Sores, and all sorts of discolorings of the Skin, being taken daily Morning and Night, from two Ounces to four, in any fit Vehicle; it is found by experience to expel Poyson.

XIII. *The Essence.* It has all the Virtues of the Liquid Juice, but much more powerful to the Intentions; besides which, being taken two or three Hours before the coming of the Fit of an Ague, it is said to cure it at some few times taking; it kills Worms in the Body, provokes the Terms, and powerfully expels Urine; dropt into sore and ulcerated Ears, cleanses them from their Corruption, takes away their stinking smell, and heals them; it purges Choler, but more effectually if given in Whey of Goats Milk; if the use of it is continued for some time, Spring and Fall, it has been found to cure the Kings-Evil, and the Scurvy.

XIV. *The Infusion of Hops in Wine or Water.* It cures the Strangury, or such as make their Water with heat and difficulty, and brings away Stones, Sand, Gravel, or Tartarous Mucilage, obstructing the passages of the Reins, Ureters, and Bladder; if Decoction of *Hops* is used in making of Bread, it is said to make the Dough to rise better, and the Bread to be the lighter; it has all the Virtues of the Juice and Essence, but not full out so powerful, and therefore may be given to six or eight Ounces Morning and Night.

XV. *The Decoction of the Roots.* *Clusius* says, that the Women in *Spain* use it to cure the falling of the Hair, caused by the *French* Disease. Take fair Water a Gallon, *Hop* Roots cleansed and bruised a Pound, or more, boil them together to the consumption of a third part, or better, strain out, and give half a Pint of it to drink every Morning fasting, letting the Patient sweat upon it; some add to the Decoction Roots of *Parsly* and *Quitchgrass*, with a few Raisons of the Sun.

XVI. *The Syrup of the Juice.* It has all the Virtues of Juice, Essence, and Infusion, but must be given in three times a larger quantity, because the Medicament is so much clogged with Sugar; it cures such as have the Yellow Jaundice, eases the Headach which comes of heat, attemperates the calidity of Stomach and Liver, and is very profitably given in long and hot Agues, arising from inflamed Blood and Choler; it loosens the Belly, and effectually cures the Scurvy, Dropsie, Gout, and Kings-Evil.

XVII. *The Pouder of the Seed.* Being given to the quantity of a Dram in the Morning fasting, and last at Night going to Bed, it kills Worms in Children, or elder People, provokes Urine powerfully, and brings down Womens Courses.

XVIII. *The Spirituous Tincture of Hops.* It is not inferior to any Diet-Drink which can be given to such as labour under the Scurvy, Gout, Dropsie, Pox, and Kings-Evil; it singularly purifies the Blood after a Salivation, but it is best to be given to such as are of a cold and moist habit of Body, fat and corpulent, and not to such as are thin, hollow, and seem to be emaciated or consumed; it may be given from a Dram to two Drams, or more, in Ale, Beer, Wine, or other proper Vehicle.

XIX. *The Acid Tincture of Hops.* It has the Virtues of the Spirituous Tincture, but much more fit to be given to such as are of hot habits of Body, because it cools and refreshes; it exterminates all malignity of the Pox, Plague, or Poyson, and is singularly good against the Bitings of Mad Dogs, Vipers, and other venomous Serpents, *&c.* it eradicates the Scurvy, Gout, and Kings-Evil, and after an admirable manner cures Agues and Fevers, and kills Worms in Old or Young.

XX. *The Oily Tincture of Hops.* As a Topick it gives ease in the Gout and Sciatica, and eases all pains of the Joints and Limbs coming of cold and moisture; it is an excellent thing against the Palsie, being anointed upon the Back Bone, and upon the parts affected, giving it inwardly also at the same time; you may give from ten to twenty, or thirty drops for a dose, being dropt into White Sugar, and then mixed with a Glass of White Wine, and so taken it gives ease in the Strangury, provokes Urine and the Terms, and effectually cures the Colick, and cleanses the Reins, Ureters and Bladder from small Stones, Gravel, Sand, and Tartarous Matter lodging therein; if the Dose is doubled or trebbled, and given two hours before the Fit of an Ague, it commonly cures it at three or four times taking.

XXI. *The Saline Tincture of Hops.* It cures by bathing therewith Scurf, Morphew, Leprosie, Tettars, Ringworms, Herpes, and other like breakings out, and clears the Skin of Tanning, Sunburning, black and blew Spots, Yellowness, and other like discolorings thereof.

XXII. *The Spirit of Hops.* It is truly Cordial, chears the Heart, and refreshes the Animal and Vital Spirits; it is good in Fainting and Swooning Fits, represses Vapors, and other Hysterick Diseases, and after a singular manner prevails against Convulsions, whether in Old or Young, and is helpful against Paralytick Distempers.

XXIII. *The Bath.* It is made of the *Hops*, by boiling in fair Water; if Women sit in it, and continue the use of it for some time, it brings down the Terms, tho' long stopt, provokes Urine, eases pains of the Joints and Limbs, as also the exquisite tortures of the Strangury, and takes away the swelling and hardness of the Womb.

XXIV. *Nota.* *Hops* are now very much used to put into Ale, for thereby it not only makes it keep longer, and makes it finer, but also more wholsom, and gratefuller to the Stomach and Palate; but this

is

is to be obſerved, that becauſe *Hops* have an admirable fragrancy and ſubtil odor, and abound wonderfully with volatile parts, they are never to be boiled in making of Beer, (for ſo all their volatile parts will be loſt) but only ſcalded and infuſed in the ſame, by which means you will extract into the Liquor all their volatile and excellent ſubſtance, leaving the earthy or deviliſh parts behind, which the way by boiling only extracts; and this Truth all ſuch as are accuſtomed to make Tea can demonſtrate, who, if they boil their Tea, always ſpoil their Liquor, for which reaſon they only ſcald, and infuſe it in the ſame, if they would have it admirable: The ſame thing is to be underſtood of *Hops*, and of all other Vegetable ſubſtances, which conſiſt of fragrant, odoriferous, and volatile parts, if ſo be you would preſerve them.

CHAP. CCCLXXIV.

Of HOREHOUND White.

I. *THE Names.* This kind of Plant is called in *Greek* Πράσιον, in *Latine Praſium*, and *Marrubium*, in *Engliſh Horehound.*

II. *The Kinds.* There are four generick Kinds hereof, *viz.* 1. πράσιον λευκὸν, *Praſium, vel Marrubium Album*, White Horehound. 2. *Praſium Nigrum*, Black Horehound. 3. *Praſium Aquaticum*, Water Horehound. 4. *Praſium Fœtidum*, *Praſium Silveſtre*, Wild Horehound, or Stachys.

III. *The Kinds of the White.* Of this there are five Species, *viz.* 1. *Marrubium Album Vulgare*, *Praſium Album Commune*, *Praſium Anguilaræ*, Our Common White Horehound. 2. *Marrubium Candidum alterum*, *Marrubium Candidum Hiſpanicum, vel Pannonicum Lobelij & Cluſij*, *Marrubium Candidum Gerardi*, *Marrubium Creticum Camerarij*, *Marrubium Album Latifolium Peregrinum Baubini*, White Spaniſh Horehound. 3. *Marrubium Creticum Angustiore Folio Lobelij*, *Marrubium Creticum Camerarij*, *Dodonæi*, *Lugdunenſis*, *& aliorum*, *Marrubium Album Anguſtifolium Peregrinum Baubini*, Sweet Candy Horehound. There is another Species of this, which is unſavory, or without ſmell, called *Marrubium Creticum Anguſtifolius inodorum* by *Eſſtyenſis*, which is *Marrubium Album Peregrinum brevibus & obtuſis Foliis Baubini.* 4. *Marrubium Album Viloſum Baubini*, thought to be *Praſium Dioſcoridis*, White Hairy Horehound, called by ſome French Horehound. 5. *Marrubium Criſpum*, and *Marrubium Album Criſpum*, White Curled Horehound.

IV. The Deſcriptions. *The firſt, or* Common White Horehound, *has a Root which is blackiſh, hard, and woody, with many Fibres or Strings thereat, which dies not every Winter, but abides many Years*; from this Root ſpring up ſeveral ſquare hoary Stalks, half a Yard or two Feet high, ſet at the Joints with two crumpled, or as it were rough Leaves, of a dull, hoary, green color, and of an agreeable good ſmell, but of a very bitter taſte; the Flowers are ſmall, white, and gaping, ſet in rough, hard, prickly Husks round about the Joints with the Leaves, from the middle of the Stalk upwards, in which afterwards is found ſmall, round, blackiſh Seed.

V. *The ſecond, or* White Spaniſh Horehound, *has Roots like the former* Common Kind, which ſends forth ſeveral fourſquare Stalks, more white and hoary than it, on which Stalks are ſet by couples Leaves ſomewhat longer, thicker, whiter, and more woolly than it, and ſomewhat dented about the edges; the Flowers grow at the tops of the Stalks in rundles, at the ſeveral Joints with the Leaves, which are of a pale purpliſh color, like the *Common ſort*, and ſtanding in the like rough Husks: *Gerard* calls this *Snow white Horehound.*

Horehound White Common.

VI. *The third, or* Sweet Candy Horehound. *It has a long ſlender Root, furniſhed with a great buſh of Fibres*, from which ſpring up ſeveral crooked, or not very ſtraight Stalks, which are round, and not ſquare, and ſlenderer than the laſt; on theſe Stalks grow ſometimes broader, and at ſome times and in ſome places ſmaller, longer, and narrower Leaves than thoſe of the ſecond Kind, (of which in my opinion this is a Species) theſe Leaves are ſet by couples at the Joints, more dented about the edges, and more white or hoary than the former *Horehounds*, as the Stalks alſo are, which branch forth into many ſlender Branches, having Flowers at the Joints like the former, but ſmaller, and purpliſh, and ſet in ſmaller and ſharper Husks, the Seed being alſo like it: The *Unſavory* or *ſmell leſs Kind* has only theſe differences, that the Leaves are ſhorter, narrower, and rounder pointed, and in a manner without any ſmell.

VII. *The fourth, or* White Hairy Horehound, *called by ſome* French Horehound. *It has a woody fibrous Root, which ſends forth Stalks, riſing up not above a foot high*, round, and of a hard woody ſubſtance, white and hoary, ſpreading into divers Branches, on which grow thick Leaves, in the ſame manner as the former, but ſmaller and rounder, and a little dented at the edges, and ſo white, ſmooth, and woolly underneath, as no *Cottonweed* is more, but ſomewhat blackiſh and rugged on the upper ſide; the Flowers ſtand at diſtances at the tops of the Branches, of a pale purpliſh color, and in the like rough Husks.

VIII. *The*

VIII. *The fifth, or* White Curled Horehound. *It has hard, round, white, woolly, or downy Stalks*; the Leaves are ſmaller than the laſt, and a little crumpled and curled at the edges, and a little dented alſo; they are of a greyiſh color on both ſides, but not ſo woolly as the laſt; the Flowers ſtand in the ſame manner as the reſt, in prickly Husks, but whiter than any of the former.

IX. *The Places.* The firſt, being the *Common Kind*, grows plentifully in all places of *England*, in dry Grounds, and waſte Greens, alſo near unto old Walls, Banks, Ditch ſides, High Ways, and beaten Paths, in untilled places; it grows in all other Countries alſo, where it alters ſomething, according to the ſituation and nature of the Countries, for commonly that which grows in *Candia* and *Hungaria* is much whiter, and of a ſweeter ſmell, and the Leaves oftentimes narrower and leſſer than that which grows in *England*, and other Northern Countries; the ſecond grows naturally in *Spain*, the third in *Candia*, the fourth about *Paris* in *France*, the fifth in *Germany*, all which four latter grow with us only in Gardens, being firſt raiſed of Seed brought from thoſe places.

X. *The Times.* They all Flower in *July* and *Auguſt*, (and that in the ſecond Year after the ſowing of them) and their Seed is ripe not long after.

XI. *The Qualities. White Horehound* is hot in the ſecond degree, and dry in the third, bitter in taſte, Aperitive, Digeſtive, Abſterſive, Pectoral, Hepatick, Splenetick, Hyſterick, Sudorifick, Emmenagogick, Alexipharmick, and Analeptick.

XII. *The Specification.* It is good againſt Coughs and ſhortneſs of Breath, cures Ulcers of the Lungs, eaſes pains of Liver and Spleen, expels Poyſon, and heals old filthy Ulcers.

XIII. *The Preparations.* You may have therefrom, 1. *A Liquid Juice.* 2. *An Eſſence.* 3. *Praſimel.* 4. *A Decoction.* 5. *A Syrup.* 6. *A Wine.* 7. *A Vinegar.* 8. *A Pouder.* 9. *An Ointment or Balſam.* 10. *A Cataplaſm.* 11. *An Acid Tincture.* 12. *A Spirituous Tincture.* 13. *An Oily Tincture.* 14. *A Saline Tincture.* 15. *A Decoction Compound.*

The Virtues.

XIV. *The Liquid Juice.* Being given to two or three Spoonfuls, and repeated twice a day, in a Glaſs of White Port Wine, to Women whoſe Courſes are obſtructed, it brings them down; being dropt into the Ears it eaſes their pain, and taken in a Glaſs of Wine it helps Stitches and Pains in the Sides; ſnuft up the Noſtrils it is a good Errhine to purge the Head and Brain of mucous Humors and filthineſs obſtructing that Ventricle; it opens obſtructions of Liver and Spleen, as *Galen* ſays: *Matthiolus* ſays it is available for ſuch as have bad Livers, and have an Itch, or running Tettars upon them.

XV. *The Eſſence.* It has all the Virtues of the Liquid Juice, beſides which it is good for ſuch as are purſie and wheaze, or are ſhort winded, for ſuch as are weakned by long Sickneſs, and are waſted and fallen into a Conſumption; it brings forth both Birth and Afterbirth, and is good to facilitate the Birth of ſuch who have long and hard Labor; it expels Poyſon of any Vegetable, and cures ſuch as are bitten by mad Dogs, Serpents, or other venomous Beaſts; it kills Worms in Children, and prevails againſt the Yellow Jaundice. Doſe two or three Spoonfuls Morning and Night in a Glaſs of Wine.

XVI. *Praſimel*, or Honey of Horehound. *It is made by mixing a Quart of the Juice with a Pint of Honey, and clarifying it with the White of Eggs.* It is good for Coughs, Colds, Conſumptions, or Ulcers of the Lungs, Hoarſeneſs, Wheezing, ſhortneſs of Breath; it expectorates tough Flegm out of the *Thorax*, but all this it does more effectually if it is mixt with a proportionable quantity of the Pouder of *Florentine Orrice* Root; if old, foul, and running Ulcers be dreſt with it, it cleanſes and heals them; dropt into the Eyes it mightily clears the Eyeſight, and dropt into the Ears kills Worms, and heals Ulcers therein; ſnuft up the Noſtrils it purges the Head admirably; taken ordinarily Morning, Noon, and Night, it is excellent good for Old Men, and others, whoſe Lungs are afflicted with thin, ſalt, cold Rheum, cauſing it to be expectorated, for which reaſon it is ſingularly good againſt Aſthma's.

XVII. *The Decoction.* It has all the Virtues of the Liquid Juice, Eſſence, and Praſimel, but nothing near ſo powerful, for which reaſon it may be given in double or trebble quantity, Morning, Noon, and Night; it is an excellent Lotion to waſh old Sores withal, and to make an Injection of to cleanſe the Womb.

XVIII. *The Syrup.* It is an extraordinary Pectoral, very good for old Coughs, and to ripen tough Flegm; it is alſo good for ſuch as are Aſthmatick, or ſhort Winded, and breath difficultly, it has all the Virtues of the Praſimel, and nearly as good as it to all thoſe Intentions. Doſe one or two Spoonfuls Morning and Night, to be given alone by it ſelf.

XIX. *The Wine.* It has the Virtues of all the former Preparations, but not ſo powerful as the Eſſence; it is good againſt the Plague or Peſtilence, as alſo for old People, and cold Conſtitutions.

XX. *The Vinegar.* It is good againſt the Plague, given a Spoonful or two at a time in any proper Vehicle, and prevails againſt any Vegetable or Animal Poyſon; outwardly uſed it clears the Skin of Morphew, Scurf, Pimples, Redneſs, Tettars, Ringworms, Herpes, and other like ſalt eruptions.

XXI. *The Pouder.* Given to a Dram in the Morning faſting, and laſt at Night going to Bed, it kills Worms in Children, ſtrengthens the Stomach, and provokes Sweat in elder People, reſiſts Poyſon, provokes the Terms, and educeth the Birth; uſed as an Errhine it purges the Head and Brain of cold, moiſt, viſcous and pituitous Humors; if it is ſtrewed thick upon old, rotten, putrid, and filthy Ulcers, it cleanſes them, dries up the humidity, and induces their healing.

XXII. *The Ointment or Balſam.* It is a ſingular Vulnerary, curing green Wounds in a ſhort time; it is good alſo for running Sores, old Ulcers, and the like, for if need be it digeſts, cleanſes, incarnates, dries, and heals, it is good againſt Puſhes, Pimples, Boils, Scabs, and other like breakings out, being applied.

XXIII. *The Cataplaſm.* The Leaves being made into a Cataplaſm with Honey do cleanſe foul Ulcers, and put a ſtop to running and ſpreading Sores, which are eating and rebellious; if the Cataplaſm is made of the green Leaves boiled with Hogs Lard, and applied to the bitings of mad Dogs preſently, it draws forth the Venom or Poyſon, it diſcuſſes the ſwellings of Womens Breaſts, eaſes pains, and draws forth Thorns, or any other thing out of the Fleſh; it heals alſo any ſort of Scab, whether dry or moiſt.

XXIV. *The Acid Tincture.* It is a ſingular Antidote againſt the Plague or Peſtilence, and all ſorts of peſtilential and malign Diſeaſes, it opens all ſorts of obſtructions of the Viſcera, chiefly of the Lungs, ſtrengthens and fortifys the Stomach, cauſes a good Appetite and a ſtrong Digeſtion, and poſſibly it may be one of the beſt things againſt the Rickets in Children in the World; let it be given in all that the Patient drinks, ſo many drops at a time, to make the Vehicle pleaſantly ſharp.

XXV. *The*

XXV. *The Spirituous Tincture.* It is Cordial and Hyſterick, it provokes the Terms, reſiſts Poyſon, warms and comforts the Stomach, ſtops Fluxes, and gives eaſe in the Colick, and gripings of the Guts; as it expels Wind, ſo it reſiſts Vapors; and being ſweetned well with Honey, is an extraordinary reſtorative in Conſumptions. Doſe half a Spoonful Morning, Noon, and Night, in any convenient Vehicle.

XXVI. *The Oily Tincture.* It provokes the Terms as powerfully as any of the former Preparations, gives eaſe to pains in the Back, and opens obſtructions of the Reins and Bladder; it is good againſt pain and ſickneſs of Stomach, and any external pain of the Nerves in any part of the Body; it is a ſingular thing againſt the Palſie, being inwardly taken, and outwardly applied to the parts affected, being alſo bathed along down the Back Bone Mornings and Evenings; anointed upon hurts or punctures of the Nerves, it eaſes the pain and cures them; it gives eaſe alſo in ſtitches and pains of the Side, and in the Colick, as alſo in pains of the Gout, proceeding from what cauſe ſoever. Doſe from ten drops to twenty, or more, dropping them firſt into Sugar, and then mixing the Sugar with a Glaſs of White Port Wine, and ſo drinking it Morning and Night as long as need requires.

XXVII. *The Saline Tincture.* It is good againſt the Itch, and all ſorts of itching of the Body, prevails againſt Ringworms, Tettars, Herpes, Scurf, Morphew, Pimples, Scabs, and all other breakings out of the Body; it is alſo ſaid to clear the Skin of Yellowneſs, Redneſs, Tanning, Sunburning, Freckles, Lentils, and the like, in what place ſoever they happen in, by waſhing the parts affected therewith Morning and Evening, and letting it dry in.

XXVIII. *The Decoction Compound. Take freſh Horehound two Ounces, Roots of Agrimony, of Bugloſs, and of Elecampane, of each half an Ounce, Lignum Aloes, Rhubarb, of each three Drams, choice White Port Wine three Pints, or two Quarts, boil covered till half be conſumed, then ſtrain out, and dulciſy it with White Sugar.* It is an excellent Medicine to open obſtructions of the Lungs, Liver, Spleen, Gall, and Womb. Doſe two Ounces every Morning faſting, as much at Two after Noon, and the like at Bed time, for fourteen or twenty days together, for the Cure of the Yellow Jaundice.

CHAP. CCCLXXV.

Of HOREHOUND Black.

I. *THE Names.* It is called in *Greek* πράσιον μέλαν, *Plinij Lib.* 27. *Cap.* 8. in *Latine Praſium, vel Marrubium Nigrum*, and in *Engliſh Black Horehound.*

II. *The Kinds.* It is the ſecond of the Generick Kinds, and comprehends theſe following Species, *viz.* 1. *Marrubium Nigrum Latifolium Bauhini, Marrubium Hiſpanicum Tabernamontani & Gerardi, Marrubium Nigrum Hiſpanicum Parkinſoni, Marrubium Hiſpanicum odore Stæchadis Lobelij, Ocimaſtrum Valentinum Cluſij*, (becauſe ſo called at *Valentia* in *Spain*) Black Horehound, and Spaniſh Horehound. 2. *Marrubium Nigrum Longifolium Bauhini, Sideritis Monſpelienſium, & Parietaria Monſpelienſium Cordi & Lugdunenſis, Herba Venti & Rondeletij aliorum*, Long Leav'd Black Horehound, and Black French Horehound. This *Lobel* queſtions whether it be not the *Othonna Dioſcoridis*, rather than the *Flos Africanus*, which wears that Title.

Horehound Black.

III. The Deſcriptions. *It has a Root which is ſmall, and without any long Fibres or Strings, and ſends up ſquare hairy Stalks, about a Foot high*; the Leaves grow on the Stalks by pairs or couples at the Joints, which are ſomewhat long, and round pointed, thinner, and fuller of Veins than the *Wild Black Horehound*, like unto the middle ſort of *Baſil*, as *Cluſius* ſays, but longer, and of no ſcent at all, as *Cluſius* ſays, but *Lobel* ſays it has the ſmell of *Stœchas*, or *Caſſidony*; the Flowers grow at the tops of the Stalks in prickly Husks, in Wharls or Rundles, of a white color, as *Cluſius* ſays, but of a purpliſh color according to *Lobel*; after which comes black Seed, like the other Kinds, and growing in like prickly Husks.

IV. *The ſecond, or* Long Leav'd Black Horehound. *It has a thick Root, which ſpreads it ſelf with many blackiſh Strings, by which it takes hold and fixes it ſelf in the Earth, and keeps it ſelf alive from Year to Year, ſhooting out freſh Stalks every Spring*; theſe Stalks are ſquare, and rough, riſing up a Foot and half, or two Feet, and ſpreading themſelves into divers Branches, ſet with two long and ſomewhat broad Leaves at every Joint, longer and broader than *Sage* Leaves, and longer pointed, dented about the edges, and of a ſad overworn green color, which in the Winter time remaining withered on the Branches, without falling off, are to be ſeen full of holes, as if they had been eaten with Worms, all the Ribs and Veins abiding as they grew, till Froſt comes and cauſes their Stalks to fall away; the Flowers are of a purpliſh color, greater than any of the *Horehounds*, and more gaping; after which, (being paſt away) comes the Seed in hard prickly Husks, like unto *Horehound:* This Plant has no ſmell, good or bad; to be found in it, but is as it were ſmell-leſs.

V. *Nota.* Theſe two Plants ſome Authors will have to be no *Horehounds*, but yet for their likeneſs ſake they are referred by others to this Stock, nor can

can I tell to what other Family they can be ſo well joined, for as much as they have the very ſame Virtues with the former *White Horehounds.*

VI. *The Places.* The firſt of them is a native of *Spain*, the ſecond of *France*, and grows about *Mompelier* in fat Grounds, and ſometimes in Wheat Fields, with us they grow in Gardens, being produced from Seed brought to us from thence.

VII. *The Times.* They both Flower in *July* and *Auguſt*, and their Seed is ripe within a Month after.

VIII. *The Qualities, Specification, Preparations, and Virtues*, are the ſame with thoſe of the *White Horehound*, declared in the former Chapter, ſo that no more need be ſaid of them in this place.

IX. *A Cataplaſm. Dioſcorides* ſays, that the Leaves being ſtamped with Salt and applied, it cures the biting of a mad Dog, againſt which it is of great efficacy; a Cataplaſm being made alſo of the Leaves roaſted in hot Embers, and applied, does waſte or conſume away hard lumps or knots *(Ficus)* in the Fundament; it alſo cleanſes foul and filthy Ulcers, as the ſame Author affirms.

CHAP. CCCLXXVI.

Of HOREHOUND Water.

I. *THE Names.* It is called in *Greek* Πεγιον ὑνδεγ, in *Latine Praſium Aquaticum*, *Marrubium Aquatile*, in *Engliſh Water Horehound*, and *Marſh Horehound.*

Horehound Water.

II. *The Kinds.* There are ſeveral ſorts hereof, *viz.* 1. *Marrubium Aquaticum Vulgare Lobelij, Lugdunenſis, Dodonæi, & Tragi*; *Lobel* and *Lonicerus* put it alſo for *Sideritis ſecunda Dioſcoridis*, but *Anguilara, Geſner, Camerarius, Lacuna, Lugdunenſis, Thalius*, and *Matthiolus*, puts it for *Sideritis prima Dioſcoridis*; it is alſo *Lancea Chriſti Geſneri, Marrubium Paluſtre glabrum Bauhini, Marrubium Paluſtre alterum*, Our Common or Ordinary Water Horehound. 2. Βαλλωτη, *Ballote*, *Marrubium Nigrum Fœtidum Bauhini*, Πεγιον μελαν ὑνδεγ, Black Water Horehound, or Stinking Water Horehound, alſo *Marrubium Nigrum*, as moſt Authors call it; but ſome call it *Marrubaſtrum*, and *Lobel Marrubium Spurium.* 3. *Marrubium Aquaticum Hirſutum Bauhini, Marrubium Aquaticum alterum*, Hoary or Hairy Marſh or Water Horehound. 4. *Marrubium Nigrum, Marrubium Nigrum Creticum Alpini*, Candy Black Horehound.

III. The Deſcriptions. *The firſt*, *or* Common Water Horehound, *has a Root which conſiſts of a buſh of blackiſh Fibres or Strings*, which ſends forth Stalks which are ſomething great and high, ſquare and ſtrong, having two ſomewhat large and long Leaves ſet at every Joint, deeply dented or cut in about the edges, not hairy or rough at all, but ſmooth and green; at the Joints with the Leaves, towards the tops, grow ſmall whitiſh Flowers in rough green Husks, encompaſſing the Stalk about; which being paſt away the Seed follows, which is round, and of a blackiſh color, four uſually ſet together in the Husk.

Black Water Horehound.

IV. *The ſecond, or* Black Water Horehound, *has a black thready Root, from whence riſe up ſeveral ſquare, blackiſh, hairy, green Stalks*, on which grow upon long footſtalks ſomewhat roundiſh dark green Leaves, full of veins, a little hairy, and indented about the edges, two always at a Joint, and of a ſtrong ſmell; the Flowers are gaping, and of a pur-

 pliſh

pliſh color, ſomewhat like the *Red Archangel*, or *Dead Nettle*, growing in greeniſh Husks, and encompaſſing the Stalk, as the others do; the Seed alſo is black and round, four ſet together, as in the other: This Plant *Parkinſon* ſays he has found ſometimes with white Flowers.

V. *The third*, *or* Hairy Marſh or Water Horehound. *It has ſquare hoary Stalks, a little hairy and rough, on which grow Leaves by pairs or couples, as in the former*, which are hairy, hard, and hoary, much more cut in on the edges than the firſt at Sect. 3. above, cut in ſo deep, as to reach ſometimes even to the middle Rib, making them ſeem like the Leaves of the *Great Mountain Scabious*, the ends being pointed and ſharp; the Flowers are ſmall and whitiſh, ſtanding in rough green Husks, encompaſſing the Stalk about, which being paſt away the Seed follows, which is blackiſh and round at the bottom of the Husk.

VI. *The fourth*, *or* Candy Black Horehound, *has a fibreus or ſtringy Root, which ſends forth its firſt Leaves ſomewhat like to thoſe of a* Primroſe, being many, larger and longer than thoſe of the *White Horehound*, dented about the edges, and ſharp pointed, as large as thoſe of *Bawm*; and of ſo black a color, as it may ſeem to be ſo colored or dyed by Art; from among theſe Leaves ſprings up a ſquare Stalk, or Stalks, upon which, as it were at Joints, grow many ſuch like Leaves together, but leſſer, up to the tops, where the Flowers ſtand encompaſſing them, being in form like to thoſe of *Horehound*, but blackiſh alſo, the Plant being wholly without ſmell or taſte.

VII. *The Places.* They all grow in moiſt and wet Grounds, the two firſt in ſeveral places of *England*, the ſecond has been found in the way to *Rocheſter*, about half a Mile from *Graveſend*, the third grows in *Auſtria*, the fourth in *Candy*, but the two laſt not with us, unleſs planted in Gardens.

VIII. *The Times.* They all Flower in the Summer Months, as in the latter end of *June*, in *July*, and *Auguſt*, and give their Seed ſoon after.

IX. *The Qualities, Specification, Preparations and Virtues* of the three laſt are the ſame with thoſe of *White Horehound* in *Chap.* 374. aforegoing, and the ſecond of theſe are ſaid to have the Virtues of the *Black Horehounds* in *Chap.* 375. *Sect.* 9. being uſed and applied in the ſame manner.

X. As to the Qualities and Virtues of the firſt of theſe in this Chapter Authors have ſaid nothing, but this I have found by experience, that it is an excellent Vulnerary, whether inwardly taken in Juice, Eſſence, Decoction, Wine, or Tincture, or outwardly applied in Oil, Balſam, Ointment, Cerate, or Cataplaſm, &c.

CHAP. CCCLXXVII.

Of HOREHOUND Wild, *OR,* STACHYS.

I. *THE Names.* It is called in *Greek* Σταχὺς, in *Latine* alſo *Stachys*, and in *Engliſh Wild Horehound*, *Baſe Horehound*, and *Stachys*.

II. *The Kinds.* Authors make about ſeven Kinds, but by reaſon the moſt of them are not to be had in *England*, we ſhall only treat of the three following, *viz.* 1. *Stachys Gerardi, Dodonæi, Lugdunenſis, Tabernamontani, Matthioli, Stachys minor Cumerarij, Stachys Floribus gratioris odoris Geſneri, Stachys Lychnitis, Stachys Spuria Flandrorum Lobelij, Stachys Italica minor Bauhini, Salvia Sylveſtris tertia Cæſalpini*, Wild Horehound, Baſe Horehound, Leſſer Horehound, and Italian Horehound. 2. *Stachys Fuchſij, Stachys Germanica Geſneri, Stachys Germanica major Camerarij, Pſeudoſtachys Matthioli, & Lugdunenſis, Stachys minor Germanica Bauhini, Marrubium Montanum Album Thalij, Sideritis Heraclea Columnæ, Fabij, Salvia Sylveſtris Cæſalpini*, Great Wild Horehound, or Great Baſe Horehound. 3. *Stachys Paluſtris Geſneri & Camerarij, Marrubium Aquaticum acutum Gerardi, Betonica fœtida Geſneri, in Collatione Stirpium, Sideritis prima gravis odoris Dalechampij & Thalij, Clymenum minus Lugdunenſis, Terziola Cæſalpini*, (becauſe it cures Tertian Agues) *Lyſimachia Galericulata Adulterina Beſleri* in his *Hortus Eyſtetenſis*, Marſh Wild Horehound, or Baſe Horehound.

III. The Deſcriptions. *The firſt*, *or* Wild Horehound, *which is thought to be the* Stachys vera Dioſcoridis, *has a Root which is woody and durable, made of divers blackiſh Strings, which periſhes not after it has given Seed*; from this Root riſe up ſeveral ſoft, woolly, green Leaves, lying upon the Ground, and abiding all the Winter, ſomewhat broad and long, of about two Inches in breadth, and three in length, ſmooth, and not dented at all, or very little about the edges; from the middle of theſe Leaves ariſes ſometimes but one Stalk, and ſometimes divers Stalks, bearing divers ſuch like Leaves thereon, but leſſer, and ſet by pairs or couples one oppoſite to another at the Joints, ſomewhat hard, and a little longer and whiter than thoſe of *Common Horehound*, (to which the whole Plant is very like) the Stalks alſo are high and jointed, and ſet with ſoft hairs; from the middle of the Stalks, and ſo upwards, come forth ſeveral Flowers, of a yellow color, as *Lobel*, *Camerarius*, and *Gerard* ſay, but of a purpliſh color as *Parkinſon* ſays, (he having never ſeen

ſeen any of the *Yellow*) theſe Flowers ſtand in ſofter Husks than thoſe of the former, or *Common Horehounds*, and with a narrower Wharle encompaſs the Stalk, after which come blackiſh round Seed; the tops are ſmall and long, and end as it were in a Spike, being of a ſweet ſmell, as *Gerard* ſays, but *Parkinſon* ſays the ſmell is ſmall with us, and not ſo pleaſant as others ſay it is, for any thing that ever he could obſerve.

IV. *The ſecond, or* Great Wild Horehound, *(which is the* Great Dutch Baſe Horehound.) *It has a Root which is hard, and ſomewhat yellow*; the Stalks hereof are thick, fourſquare, and hoary, ſometimes two or three Feet high; the Leaves are broad, long, hoary, nicked in the edges, and hairy, as alſo are the Stalks; theſe Leaves are indeed ſomewhat like unto great *Sage* Leaves for the color on both ſides, but larger, and much broader than thoſe of the *Common Horehound*, and a little dented about the edges; the joints of the Stalks are ſet with ſuch like Leaves, but ſomewhat leſſer than thoſe below, two at each Joint, encompaſſing the Stalk; the Flowers grow at the Joints alſo in Wharls, which encompaſs the Stalk likewiſe about with Flowers of a purpliſh color towards the tops of the Stalks, which are greater than thoſe of the *Common Horehounds*, as indeed all the reſt of the Plant is, and which has a much ſtronger ſmell than the others have; the Flowers being paſt away, the Seed follows at the bottoms of the Husks, which is round, and of a blackiſh color.

V. *The third, or* Marſh Wild Horehound. *It has a Root which is ſomewhat long and thick, jointed at ſeveral ſpaces, with Fibres at them, which ſends up ſquare, round, and hairy Stalk or Stalks, about two feet high*, with two ſomewhat long and narrow dark green Leaves, but grey underneath, and pointed at the ends, dented about the edges with round dents, like to *Betony*, ſet at every Joint, and having ſomewhat a ſtrong unſavory ſmell; at the upper Joints with the Leaves come forth ſeveral pale reddiſh Flowers, ſet in ranks, like unto *Betony*; after which comes ſmall, roundiſh, blackiſh, or brown Seed.

VI. *The Places.* The firſt grows plentifully in *Italy*, in the Fields about *Rome*, as *Matthiolus* and *Caſtor Durantes* ſay, and alſo in *Germany*, as others affirm, with us it grows only in Gardens; the ſecond is a native of *Germany*, as *Camerarius*, *Lonicerus*, *Thalius* and *Geſner* ſet down; it is alſo a native of *England*, and has been found growing wild in *Oxfordſhire*, in the Field adjoining to *Whitney* Park, about a Mile from the Town: the third grows in plaſhy places in low Grounds in ſeveral Countries, and in divers places in *England*.

VII. *The Times.* They all of them flower in the Month of *July*, from the beginning to the end, and the Seed is ripe in *Auguſt*, or not many Weeks after the flowering.

VIII. *The Qualities.* The two firſt are hot and dry in the third degree, a little bitter, opening, digeſting, and cleanſing, Pectoral, Hepatick, Splenetick, Hyſterick, Sudorifick, Emmenagogick, Alexipharmick, and Analeptick.

IX. *The Specification, Preparations, and Virtues*, are the ſame with thoſe of the *White Horehound* in *Chap.* 374. *Sect.* 12. *ad* 28. aforegoing, ſo that no more need be ſaid thereof.

X. *Nota.* But theſe things in particular has been obſerved of theſe *Wild Kinds*, that their Juice, Eſſence, Decoction, Wine or Tincture, have been powerful in provoking Womens Courſes, and to expel both Birth and Afterbirth, for which reaſon they are dangerous to be given to Women with Child, becauſe they are apt to cauſe Abortion, or Miſcarriage; they alſo provoke Urine being ſtopped, given inwardly, and the parts alſo being fomented with the Decoction in Water, and the Patient ſitting over the warm fumes of the ſame.

XI. *The third, or* Marſh Wild Horehound, is a ſingular good Wound Herb, ſerving both to heal green Wounds, running Sores, and old filthy Ulcers, the Juice, Eſſence, Decoction, or Wine thereof being given inwardly, and an Oil, Ointment, Balſam, Cataplaſm, or Pouder thereof being alſo outwardly applied.

CHAP. CCCLXXVIII.

Of HORSEFOOT, *OR,* COLTSFOOT Strange.

I. *THE Names.* It is called in *Greek* Καλὰλια, ἡ Λεοντικὴ *Dioſcoridis*, Καλαγον *Galeni*, in *Latine Cacalia*, and *Cacanum*, (not *Cancanum*, as ſome write it) in *Engliſh Horſefoot*, and *Strange Coltsfoot*.

II. *The Kinds.* Authors make three Species hereof, *viz.* 1. *Cacalia incana Folio rotundo*, Hoary Horſefoot. 2. *Cacalia Folio glabro acuminato, Tuſſilago Alpina vel Montana Dalechampij*, Smooth Leav'd ſharp pointed Horſefoot. 3. *Cacalia Americana, vel Virginiana*, Horſefoot of Virginia.

III. The Deſcriptions. *The firſt, or* Hoary Horſefoot, *has a long white Root, divided into many heads, with many long Strings and Fibres thereat, of a glutinous or clammy taſte, like unto* Gum Tragacanth, *encreaſing thereby very much*; from theſe Heads ſhoot up ſtriped reddiſh Stalks, with large round Leaves on them, larger and thicker than *Coltsfoot*, and more woolly alſo on the upper ſide, yet with a greenneſs to be ſeen in them, but very woolly and white underneath, with ſome Ribs and Veins in them, of a little bitteriſh unpleaſant taſte; from among theſe Leaves riſe up ſtriped, woolly, and reddiſh Stalks, two or three Feet high, having ſeveral leſſer Leaves on them, and all of them dented about the edges, branching forth at the top into ſeveral ſmall Sprigs of pale purpliſh Flowers, made of four ſmall Leaves apiece, with ſome Threads in the middle, which after they have been a while blown do turn into Down, which is carried away with the Wind: *Dalechampius* ſays, that in the middle of the Flowers are found hanging down ſmall white Grains like Pearls, to make it anſwer *Pliny*'s Deſcription.

IV. *The ſecond, or* Smooth Horſefoot, *has a Root like the former, and has Leaves as large, but thicker, harder, ſmoother, and greener*, not hoary or woolly at all, but dented or waved about the edges, and pointed alſo with the roundneſs, but not open at the Stalks, as the other is; the Stalks are in like manner ſtriped, but ſmooth, bearing the like Flowers at the tops, but ſomewhat paler.

V. *The third, or* Horſefoot of Virginia, *has a Root conſiſting of a buſh of blackiſh Fibres or Threads, which abides the extremity of Winter, the Stalks and Leaves both periſhing yearly, but growing browniſh towards the end*; it riſes up with many round Stalks, about a yard high, and two ſomewhat round, but pointed Leaves, a little dented about the edges, at each joint of them, the upper Leaves being ſmaller, and little or nothing dented; at the tops of the Stalks come forth ſeveral Branches, with pure white

Flowers, divers ſmall ones growing almoſt together, and conſiſting of five Leaves apiece, each Flower riſing out of a ſmall Husk, which being paſt ſmall Seed follows, each ſticking to a little Down, which are carried away together with the Wind; this Plant has no ſmell neither in its Root, Leaf, nor Flower, tho' *Cornutus* ſeems to affirm it.

VI. *The Places.* The firſt and ſecond Kinds grow in the Vallies of Mountains, by Baths, and places abounding with moiſture, in many Countries of *Europe*, but very rarely in *England*, unleſs planted in Gardens; the third grows in *America*, as in *Canada*, *Virginia*, *New-England*, *Maryland*, and *Carolina*, in which laſt place I have found much of it.

VII. *The Times.* They all Flower and Seed in the Summer Months, much about the time (as Authors ſuppoſe) when *Coltsfoot* Flowers and Seeds.

VIII. *The Qualities, Specification, Preparations, and Virtues*, are the ſame with *Coltsfoot* aforegoing, to which you are referred; I have had experience of that which grows in *America*, and I found it to have the ſame Qualities and Virtues with our *Engliſh Coltsfoot*, and to be fully as effectual.

IX. *Nota.* 1. Authors ſay, that the Root ſteeped in Wine and eaten prevails againſt Coughs and Hoarſeneſs, (for that it is a Plant without any ſharpneſs) and the ſame things *Galen* affirms of his *Cacanum*; the Root moderately dries, is without any biting quality, and is of a groſs and emplaſtick ſubſtance; being beaten raw, and applied as a Cataplaſm to the Gout, it eaſes the pain thereof, ſtops the afflux of Humors, and ſtrengthens the parts: *Gerard* ſays, that if you chew the Root and ſwallow down the juice, it is no leſs available than the Juice of Liquorice in all the Caſes to which that Root and Juice is ordinarily applied.

X. *Nota.* 2. *Dioſcorides* ſays, that the Pearl like Grains which are found in his *Cacalia* being made into a Pouder, and mixed with ſome proper Ointment or Cerate, will make the Skin ſmooth, and as *Pliny* ſays, will ſtay the falling of the Hair.

CHAP. CCCLXXIX.

Of HORSETAIL Meadow, *OR,* SHAVEGRASS.

I. *THE Names.* It is called in *Arabick Dhenben Alcail*, *Dhemb Alchi*, and *Dhaneb Alcail*, in *Greek* Ἵππουρις, ᾗ Ἵππουρις, in *Latine Hippuris*, *Equiſetum*, *Canda Equina*, *Equinalis*, (from the form of a Horſe Tail) and by *Pliny Equiſetis*, by ſome *Salix Equina*, and *Sanguinalis*, from its effects of ſtopping of Blood; in *Engliſh Horſetail.*

II. *The Kinds.* Authors have made ſeveral ſorts hereof, and very much multiplied the Species, we ſhall in this Work divide them into three principal Kinds, and under each give you the chief of thoſe ſorts which are uſeful in Phyſick, and commonly grow with us in *England*; you ſhall have then, 1. *Equiſetum Paluſtre*, Marſh or Water Horſetail, of which in this Chapter. 2. *Equiſetum Pratenſe*, Meadow Horſetail, of which in Chap. 380. 3. *Equiſetum Nudum*, Naked Horſetail, of which in Chap. 381. following.

III. *The Kinds of the Marſh or Water Horſetail.* It is fivefold, *viz.* 1. *Equiſetum majus Paluſtre Lobelij*, *Hippuris major Dodonæi*, which *Anguilara* thought to be *Caucon Plinij*, The Greater Marſh Horſetail. 2. *Equiſetum Paluſtre Linariæ Scopariæ Folio*, Broad Leav'd Marſh Horſetail. 3. *Equiſetum Paluſtre minus*, *Equiſetum Paluſtre Lobelij*, The Leſſer Marſh Horſetail. 4. *Equiſetum Paluſtre alterum*, *Equiſetum alterum brevioribus Folijs*, *Cauda Equina Fœmina Gerardi*, which is taken by many to be the *Polygonum Fœmina Dioſcoridis*, and *Polygonum tertium*

tertium Plinij (from the many joints it has) of *Matthiolus*, *Geſner*, and others, *Polygonum Fœmina Semine Vidua Lobelij*, *Sanguinalis Fœmina Cordi*, Barren Marſh Horſetail, Marſh Horſetail with ſhorter Leaves. 5. *Equiſetum minus tenuifolium*, which is the ſmalleſt and fineſt Leav'd Horſetail, and is very like to *Equiſetum tenuiſſimis & longiſſimis Folijs Baubini*. 6. *Equiſetum Fœtidum*, Stinking Horſetail.

IV. The Deſcriptions. *The firſt, or* Greater Marſh Horſetail. *It has a pretty thick Root, which creeps under Ground, having Joints at ſeveral places, and Fibres ſpringing therefrom*; at its firſt ſpringing up it has Heads, ſomething like to thoſe of *Aſparagus*, which afterwards grow to be hard, rough, hollow Stalks, jointed at ſeveral places up to the top, growing to be a foot high, ſo made as if the lower part were put into the upper, at which grow on each ſide a buſh of ſmall, long, hard, Ruſh-like Leaves, each part reſembling a Horſe Tail, (from which it came to be ſo called, (as is above hinted) at the tops of the Stalks come forth ſmall Catkins, like to thoſe of Trees.

V. *The ſecond, or* Broad Leav'd Marſh Horſetail, *has a Root which is creeping, and jointed, like the former*; the Stalks are about a Foot and half high, hollow, and jointed in the ſame manner, ſet with Leaves after the ſame faſhion, but that they are broader than thoſe of *Toad-Flax*, green, rough, long, and eaſie to break; what Julie or Catkin it bears has not been obſerved.

VI. *The third, or* Leſſer Marſh Horſetail. *It has a very long Root, according to the depth of the Water, groſs, thick, and jointed, with ſome few Fibres or Threads adjoining thereto*; from the heads of this Root riſe up great, thick, jointed Stalks, on which grow long, rough, Ruſhy Leaves, Pyramid or Steeple faſhion; the whole Plant is alſo rough, hard, and fit to rub, ſhave or ſmooth wooden things, as ſome of the others; it differs not much in the manner of growing from the former, the chiefeſt difference is, in that it is ſmaller, and the Leaves or Briſtles, (as ſome call them) which are ſet at the Joints, are fewer and ſhorter.

VII. *The fourth, or* Barren Marſh Horſetail. *It has a long Root, like that of* Couch, *or* Quitch-Graſs, *from which, as from a kind of Joints, come forth many Fibres or Threads*; and from which Root at certain diſtances riſe up ſeveral hollow Stalks, which at ſeveral ſpaces are ſet with ſmall Leaves in rundles, like to thoſe of *Woodroof*, altogether barren of Flowers and Seed, for which reaſon *Lobel* called it *Polygonum Fœmina Semine Vidua*; but *Johnſon* ſays, that it is ſometimes found with ten or more Seeds at each joint, for which reaſon *Baubine* called it *Equiſetum Paluſtre brevioribus Folijs Polyſpermon*; this differs little from the laſt, ſaving that it is often found to bear no Seed, as the others do.

VIII. *The fifth, or* Smalleſt and fineſt Leav'd Horſetail. *It has a kind of jointed and fibrous Root, from whence riſes up one pretty thick Stalk, and very full of Joints*, ſpreading it ſelf out into many long Branches, and making of the whole a kind of Buſh, every of which Branches are repleat with very ſmall and fine Leaves, and growing much after the ſame manner as the others do.

IX. *The ſixth, or* Stinking Horſetail. *It has a long jointed Root, ſet with Fibres, and the Stalk grows to be many times about a yard long, growing ſometimes wholly under Water, and ſometimes both in and out of the Water*; the Stalks are repleniſhed with ſeveral Branches, but ſtriped athwart, and ſet with ſhort Leaves at every joint, as in the other *Horſetails*, but they are ſomewhat jagged or divided towards the tops, and at the joints under Water come forth ſeveral ſmall Fibres or Threads; the Plant is green whilſt it is in the Water, but taken forth and dried it becomes grey and brittle, eaſily to be rubbed into pouder with ones Fingers, and falling alſo into pouder of its ſelf by lying; it ſmells ſomewhat like to *Brimſtone*, whence came the Epithet *fœtidum*.

X. *The Places.* They all grow in wet and moiſt places, and ſome of them in ſtanding Waters, in many parts of this Kingdom; the firſt and ſecond in moiſt or wet Grounds, the third and fourth in ſtanding Waters, the fifth in low wet Grounds in Woods, as near *Highgate*, not far from *London*, &c. the ſixth *Gerard* ſays may be found towards the latter end of the Year in ſeveral Ditches on the back ſide of *Southwark*, near St. *George*'s Fields, covered over with Water, as alſo in the ſtanding Waters of St. *James*'s Park; and this is that which is taken to be *Baubinus*'s *Equiſetum fœtidum ſub Aqua repens*.

XI. *The Times.* They ſpring up with their blackiſh Heads in *April*, their blooming Catkins appear in *July*, and their Seeding time is for the moſt part in *Auguſt*, after which they periſh and fall to the Earth, ſpringing up afreſh again the next Spring.

XII. *The Qualities.* It is temperate in reſpect to heat or coldneſs, and dry in the third degree, it has ſome bitterneſs, and mightily dries without biting; it is Aſtringent, Diuretick, and Traumatick, Nephritick, Arthritick, and Pectoral.

XIII. *The Specification.* It ſtops all ſorts of Fluxes, and fluxes of Blood, whether inward or outward, heals Ulcers and Excoriations, and cures Catarrhs, Coughs, and Colds, and prevails againſt the Strangury.

XIV. *The Preparations.* You may prepare therefrom, 1. *A Liquid Juice.* 2. *An Eſſence.* 3. *A*

Decction

Decoction in Water. 4. *A Decoction in Wine.* 5. *A Pouder.* 6. *A Diſtilled Water.* 7. *A Sallet.*

The Virtues.

XV. *The Liquid Juice.* It is of a binding quality, and dries without ſharpneſs, and is very powerful to ſtop bleeding in any part, inward or outward, being drank from one Ounce to two, or three, or outwardly applied, if the bleeding is external.

XVI. *The Eſſence.* It has all the former Virtues, beſides which it ſtops all fluxes of the Bowels whatſoever, fluxes of Seed in Man or Woman, and alſo ſpitting, vomiting, or piſſing of Blood; it heals alſo not only the inward Excoriations and Ulcers of the Guts, Reins, Ureters, and Bladder, *&c.* but all other kinds of inveterate, moiſt, running, and foul Ulcers, whether internal or external; it is alſo an extraordinary good Vulnerary, for it quickly and eaſily conglutinates the lips of ſimple green Wounds, not ſuffering them to come to digeſtion; it is an excellent thing to cure Ruptures in Children, for by inſinuating it ſelf into the Maſs of Blood and other Juices, it diſpoſes them for conglutination, and by circulation the edges of the *Peritonæum* become conſolidated; it is ſaid to cure Ruptures in elder Perſons, being uſed with a long *continuando*, according as the Habit of the Patient may be, the Diſeaſe being recent; being drunk to one, two, or three Ounces, mixed in a Glaſs of White Port Wine, it gives eaſe in the Strangury, Stone, and Gravel, opens the obſtructions of the Urinary parts, provoking the Urine, and expelling the tartarous Mucilage; it ought in this Caſe to be given Morning, Noon, and Night; it gives eaſe in the Colick, and mixed with Honey into a Lohoch, it is effectual againſt Coughs, Colds, and Catarrhs; being externally uſed warm to hot Puſtules, red Wheals, inflamations of the Skin, and other like Eruptions, it eaſes the pain, diſcuſſes the tumor, and allays the inflamation.

XVII. *The Decoction in Water.* Outwardly uſed in Baths it abates the heat of inflamations, and being fomented upon excoriations in the privy parts of Man or Woman, or uſed as an Injection in a Gonorrhœa, it cleanſes, dries, and heals the ſame.

XVIII. *The Decoction in Wine.* It has all the Virtues of the Liquid Juice and Eſſence, but ought to be uſed in a larger Doſe, as from two Ounces to four, or ſix; it ſtrengthens the Stomach wonderfully, and is good againſt Vomiting, ſoreneſs of the Ventricle, and other diſtaſtes of the ſame.

XIX. *The Pouder.* Given inwardly to one Dram in any proper Vehicle, it has all the Virtues of the Juice and Eſſence, but operates not altogether ſo effectually, nor ſo ſpeedily; outwardly applied to any Hæmorrhage, it preſently ſtops it, it cleanſes, dries up the humidity, and heals old Ulcers, and cauſes the lips of green Wounds to conſolidate, *&c.*

XX. *The Diſtilled Water.* It has the ſame Virtues with the Juice, Eſſence, and Decoctions, but is much inferior to them, yet it is very good to waſh foul Ulcers with to cleanſe them, and to be uſed as a Vehicle for the other Preparations, as alſo to make an Eye Water with, and Injections for the Yard, Womb, Fiſtula's, *&c.*

XXI. *The Sallet.* It is made of the young buds or heads a while after they are ſprung out of the Ground, you are to boil them as *Aſparagus*, and to dreſs them up in like manner, or being firſt boiled, they may then be ſtrewed with Flower, then fryed, and ſo eaten.

XXII. *Nota.* Many Country Women make uſe of the rough ſorts of *Horſetail* for to rub and ſcower their Pewter and wooden Veſſels, and ſometimes to poliſh and ſmooth things which are rough and uneven; but the Leaved and ſmoother Kinds are rather to be choſen for Medicinal uſes, and are moſt commonly uſed in Phyſick.

CHAP. CCCLXXX.

Of HORSETAIL Meadow, *OR,* Meadow SHAVEGRASS.

I. *THE Names.* It is called in *Greek* Ἱππουρὶς λειμωνία, in *Latine Equiſetum Pratenſe*, and in *Engliſh Meadow Horſetail*, or *Meadow Shavegraſs.*

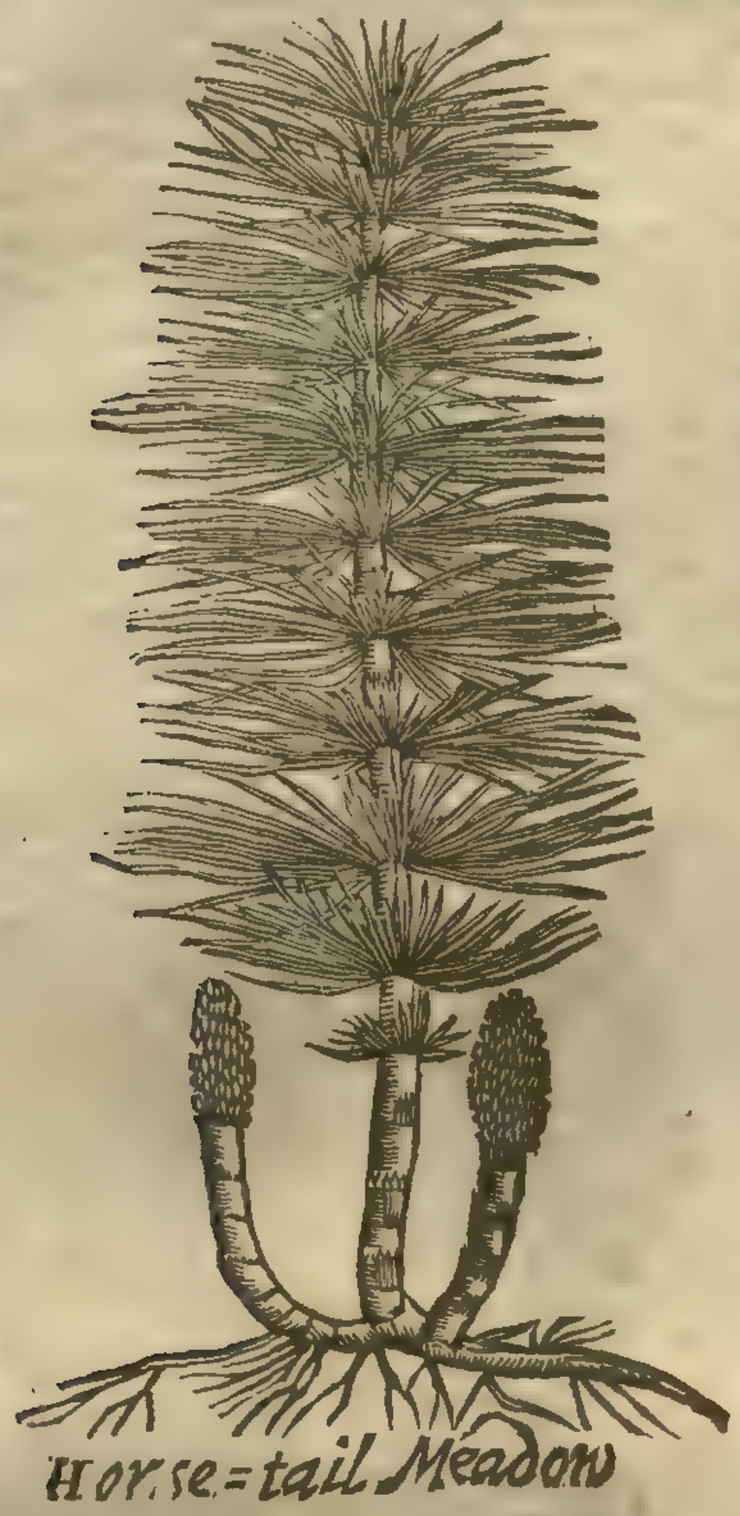
II. *The Kinds.* It is twofold, *viz.* 1. *Equiſetum Pratenſe majus, Equiſetum alterum Matthioli, Lugdunenſis, aliorumque, Hippuris altera Tragi, Hippuris Fontalis Lobelij, Equiſetum Pratenſe ſetis longiſſimis Bauhini*, The Greater Meadow Horſetail. 2. *Equiſetum Pratenſe minus*, The Leſſer Meadow Horſetail.

III. The Deſcriptions. *The firſt, or* Great Meadow Horſetail, *has a ſmall Root, and ſingle, with ſome few fibres or ſtrings adjoining to it*, from which riſes up a rough chamfered Stalk, jointed at certain ſpaces, having at each joint two buſhes of rough briſtly Leaves, ſet one againſt another; in the form and manner of growing it differs but little from ſome of the former, ſave that it grows greater, and buſhy, with more ſtore and longer Leaves than any at the joints, each Leaf for the moſt part being jointed alſo with little, but ſcarcely diſcernable joints.

IV. *The ſecond, or* Leſſer Meadow Horſetail, *has a Root not much unlike to the* Greater Marſh Horſetail, *with ſeveral Fibres or Strings adjoining to it, creeping under Ground, with joints as it were*; from which Root firſt ſpring up ſcaly heads, like thoſe

of

of *Broom Rape*, or rather *Asparagus* heads, which afterwards grow up to be hollow, rough, jointed Stalks, eight or ten Inches high, these Stalks are jointed up to the top, and at those joints come forth as it were a bush of small, long, hard Leaves, much longer and more in number than those of the *Greater Marsh Horsetail* aforenamed, with Catkins not much differing therefrom.



Horse-tail Meadow

V. *The Places.* They both grow in Meadows, near Hedges, and Groves, and by Wood sides in moist Grounds, in many places of this Land; they are also oftentimes to be found in dry Lands, and by the borders of Land Ground where it adjoins to Fenny Ground.

VI. *The Times.* Their Heads spring up early in the Spring, and grow up in the Summer Months, the Catkins blooming in *July*, and Seeding for the most part in *August*.

VII. *The Qualities, Specification, Preparations, and Virtues*, are the same with those in *Chap.* 379. last aforegoing, so that we shall say no more of them in this place.

CHAP. CCCLXXXI.

Of HORSETAIL Naked, *OR,* Naked SHAVEGRASS.

I. *THE Names.* It is called in *Greek* Ἱππουρις γυμνὴ, in *Latine Hippuris Nuda, Equisetum Nudum*, and in *English Naked Horsetail*, or *Naked Shavegrass.*

II. *The Kinds.* There are three Kinds hereof, viz. 1. *Hippuris Tragi, Equisetum Junceum Tragi, Lugdunensis, Sanguinalis Jasminæ similis Cordi,* Ἵπ-πουρις ἄγυμνος, *sive Equisetum Foliis Nudum non ramosum, sive Junceum Bauhini, Equisetum Nudum*, Naked Horsetail. 2. *Equisetum Junceum ramosum, Equisetum Matthioli & Lugdunensis, Hippuris minor Lobelii & Dodonæi*, Branched Horsetail, and Branched Naked Horsetail. 3. *Equisetum Nudum minus variegatum Bauhini*, Small Naked Horsetail variegated or party colored.

Naked-Horstaile.

III. The Descriptions. *The first, or* Naked Horsetail, *has a Root which is jointed, and creeps, like the others, from whence rise up many straight naked Stalks, jointed, but without any Leaves at the joints*; sometimes the Stalks are single, and sometimes with one or two other like Stalks springing out of their sides, which are likewise jointed, naked, and growing straight upright; these Stalks are of a rough and *Rush* like substance, growing to be a Foot or more high, sometimes to two or three Feet high, according to the goodness of the Ground; by its nakedness of Leaves it is known from all the other Kinds of *Horsetail*, and is more used by several Workmen to smooth and polish their Works of Wood, Bone, Varnish, and Japan, than any of the others.

IV. *The second, or* Branched Rush Horsetail, *has Roots like the former*, and differs only from it in its growing with many Stalks from the top of one that first rises out of the Ground, and that many of those Stalks do branch themselves forth into others, all of them full of joints, and without Leaves, so that the whole seems to be a kind of Bush.

V. *The third, or* Small Naked Horsetail variegated. *It has a small, blackish, creeping Root, from which spring up several small, hollow, pale green Stalks, of a Foot high, and sometimes not so much, and full of joints*, the lower joints of which are blackish, and the upper whitish, without Leaves, (which is probable to be the same which *Johnson* on *Gerard* says he found with small Leaves, and called *Horsetail Coralline*, tho' this may sometimes seem to differ both from his and that of *Gesner*) at the tops whereof

whereof ſtand ſmall red Heads, reſembling a ſmall Catkin, the Crown of which, being white, has eight or ten very ſmall ſharp pointed Leaves under it, which being trodden on will crack and make a noiſe.

VI. *The Places.* They grow in moiſt Grounds, in the furrows and borders of Corn Lands, near Ditch ſides in Woods, and in the Fenns, in ſeveral places of *England*, *Holland*, and *Flanders*.

VII. *The Times.* They come out of the Ground early in the Spring Time, and flouriſh all the Summer Months to Autumn.

VIII. *The Qualities, Specification, Preparations and Virtues* of theſe are the ſame with thoſe of the *Marſh Kinds* Treated of in *Chap.* 379. aforegoing, to which you are referred.

IX. *Nota. The Powder.* It is one of the moſt powerful driers that is, and being ſtrewed upon old, moiſt, and running Sores and Ulcers, it preſently dries them up and heals them.

CHAP. CCCLXXXII.

Of HORSETONGUE, *OR,* DOUBLETONGUE.

I. *THE Names.* It is called in *Greek* Ἱππόγλωσσον, and ὑπόγλωσσον, in *Latine Hippogloſſum*, i. e. *Lingua Equina*, *Lingua magna*, alſo *Hypogloſſum*, i. e. *Biſlingua*, Tongue upon Tongue; *Victoriola Apuleij*, *Lingua Pagana aliorum*, *Bonifacia Anguillara*, *Ovularia Brunfelſij*, *Loniceri*, *Tabernamontani*, *aliorumque*; in *Engliſh Horſetongue*, and *Doubletongue*, alſo *Tongue upon Tongue*.

II. *The Kinds.* Authors make but two Kinds hereof, *viz.* 1. *Hippogloſſum*, *Hypogloſſum*, *Biſlingua*, *Cauda Equina minor*, The Leſſer Horſetongue, or Doubletongue. 2. *Hippogloſſum*, *Biſlingua major*, The Greater Horſetongue, *&c.*

Horſe=Tongue ſmall.

III. The Deſcriptions. *The firſt, or* Leſſer Horſetongue, *has a Root which is white and tough, and of a ſweet and pleaſant ſmell, which conſiſts of many long, hard, whitiſh ſtrings, growing from a Head:* The Plant is very like unto the *Chamædaphne vera Dioſcoridis* for the manner of its growing, for this from the head of the Root aforementioned ſhoots forth ſeveral hard Stalks, with Leaves on them, one above another, as that Plant does, and much about the ſame length; the Leaves are long, narrow at the lower part next the Stalk, broad in the middle, like a Belly, and very ſharp pointed, having Ribs running thro' their whole length, ſometimes three or four, and ſometimes five Ribs; upon each Leaf grows another ſmaller Leaf or Tongue, which grows out of the greater Leaf from the middle Rib, on the upper ſide, and about the middle of the Leaf, which makes it to differ from all other Plants which grow upon the Earth, from which double Leaf came the Name of *Doubletongue*; under the ſmaller Leaf, at the bottom where it joins unto the greater, comes forth one ſmall, whitiſh, green Flower, and ſometimes two, ſtanding upon ſhort footſtalks, where afterwards ſtand the Berries, which when they are ripe are very red, very like unto the Yew Tree Berries, and in which is contained a white hard Seed.

Horſe. Tongue Greater.

IV. *The ſecond, or* Greater Horſetongue. *It is in all reſpects very like to the former*, ſaving that the Stalks are ſomewhat higher, the Leaves longer, and having longer Tongues upon them than the former; but this ſays *Fabius Columna* is much more rare to find.

V. *The Places.* They both grow upon Hills and in Woods in ſeveral places of *Italy* and *Germany*, the firſt more common to be met withal, and with us is only nurs'd up in Gardens.

VI. *The Times.* They flower in *June* in the natural places where they grow, *viz.* in warm Countries, and the Berries are ripe in *September*, or fall of the Leaf.

VII. *The Qualities.* *Horſetongue* is hot and dry in the ſecond degree, it is Aperitive, Hyſterick, Emmenagogick, and Traumatick.

VIII. *The Specification.* It is an abſolute thing againſt the ſuffocation of the Womb, provokes the Terms,

Terms, cauſes a ſpeedy delivery to Women in Labor, drives forth the Afterbirth, helps the Strangury, and expels Stones, Sand, Gravel, and Tartarous Matter out of the Reins and Bladder, and opens all obſtructions of the Viſcera.

IX. *The Preparations.* You may have therefrom, 1. *A Liquid Juice.* 2. *An Eſſence.* 3. *A Decoction in Wine.* 4. *A Pouder of Leaves or Roots.* 5. *An Acid Tincture.* 6. *A Spirituous Tincture.* 7. *An Oily Tincture.*

The Virtues.

X. *The Liquid Juice.* It is one of the moſt powerful things againſt Hyſterick Fits, or the ſuffocation of the Womb, and other Diſeaſes of that Bowel, it ſuppreſſes Vapors, repreſſes the Fits, and gives ſudden eaſe; it provokes Urine, opens the obſtructions of the Reins, Ureters, and Bladders, gives eaſe in the Strangury, provokes the Terms, facilitates the delivery of Women in Labor, and forces away the Afterbirth. Doſe two or three Spoonfuls at a time in a Glaſs of Wine, or other fit Vehicle, in the Morning faſting, and laſt at Night going to Bed; as alſo at the time of a Paroxiſm, or when the Patient is in extremity.

XI. *The Eſſence.* It has all the former Virtues of the Liquid Juice, and is very good to expel the Stone, Gravel, Sand, or Tartarous Mucilage, out of the Urinary parts, being given two or three Spoonfuls at a time in any proper Vehicle for ſeveral days together; it is ſaid alſo to be good for ſuch as have a Rupture, for which Diſeaſe it is thought that there is no better Remedy, for that by the continuance of its uſe it will knit and heal the part, provided alſo that the Patient be accommodated with a convenient Truſs for a good while after as well as during the whole time of the Cure.

XII. *The Decoction in Wine.* It has all the Virtues of the Juice and Eſſence, but much leſs powerful in its operation or effects, for which reaſon it is the oftner to be given, and that from four to ſix Ounces at a time; it is good for ſuch as have an imperfection in their Speech, it not being natural, or from the conformation of the parts; it is profitable alſo againſt Sores and Ulcers in the Mouth and Throat, and ſo ſtrengthens the Uvula, as to confirm and fix it in its natural ſtate, drying up the humidities, which many times relax it, and hurt its Tone.

XIII. *The Pouder of the Leaves or Roots.* It has all the Virtues of the Liquid Juice, Eſſence, and Decoction, and may be given from a Dram to two Drams, repeating a Dram at a time till three or four Drams are given, if need ſo require, being given to a Woman in Labor; it may be given in Canary, Malaga, or Tent, or any other proper Wine or Vehicle, as the Phyſician ſhall think moſt fit, *&c.* it cures old and filthy Ulcers in any part of the Body.

XIV. *The Acid Tincture.* It opens obſtructions powerfully, ſuppreſſes Vapors, cures Fits of the Mother, and is one of the beſt things in the World to cure the Rickets in Children, kill Worms in their Stomach and Bowels, cauſe in them a good Appetite, and reſtore them in Conſumptions. Doſe ſo many drops (in any Ale, Beer, or Wine) as to make it pleaſantly and gratefully ſharp.

XV. *The Spirituous Tincture.* It has the Virtues of the Juice, Eſſence, and Pouder, but is much more Cordial and refreſhing; it is good againſt Convulſions, Palſies, Fainting and Swooning Fits, ſtrengthens the Stomach, eaſes pains and gripings in the Bowels, as alſo after pains of Women in Childbed, and is a good thing to be given with a *continuando* to Childbed Women, to cauſe a compleat cleanſing, and to reſtore the Tone of the Womb. Doſe from one Dram to two, or three, Morning and Night in any proper Vehicle; it may alſo be given at any other time upon an exigency, or in any extremity of pain, or fainting.

XVI. *The Oily Tincture.* This is a powerful thing againſt the Colick, or any oppreſſion of Wind in any of the Bowels, it opens powerfully the Urinary paſſages, and gives eaſe in the Strangury, Stone: or ſuppreſſion of Urine by reaſon of Gravel, or any Tartarous Matter lodged in any of the Urinary parts; it is an excellent thing alſo againſt the Palſie, being inwardly given, and alſo outwardly anointed along upon the *Spina Dorſi*, and the parts affected with the ſame; outwardly anointed with in any Ach or Pain, in what part of the Body ſoever, as alſo upon parts affected with the Gout from a cold cauſe, it gives eaſe and relief. Doſe from ten drops to thirty drops, firſt dropt into Sugar, and then mixt with any fit Vehicle for the purpoſe you intend it; it may be given Morning and Night ſo long as need requires.

CHAP. CCCLXXXIII.

Of HOUNDSTONGUE, *OR,* DOGSTONGUE.

I. *THE Names.* It is called in *Greek* Κυνόγλωσσον, ἢ Κυνόγλωσσος, in *Latine Cynogloſſum*, and *Cynogloſſos*, i. e. *Canina Lingua, à foliis Caninam Linguam imitantibus*, in *Engliſh Houndſtongue*, and *Dogſtongue*; but *Gerard* ſays it is rather to be called *Hounds-Piſs*, becauſe there is nothing in the World which ſmells ſo like to *Dogs Piſs* as the Leaves of this Plant.

Common Hounds tongue

II. *The Kinds.* Authors make many Kinds of this Herb, but we ſhall in this Diſcourſe take notice of no more than the ſix following Kinds, *viz.* 1. *Cynogloſſum*, *Cynogloſſum vulgare*, *Cynogloſſum majus vulgare*, *Cynogloſſa vulgaris*, Our Common Houndstongue, and Common Great Houndſtongue. 2. *Cynogloſſum maximum Lobelij*, The Greateſt Houndstongue. 3. *Cynogloſſum maximum Montanum*, *Cynogloſſa maxima Montana Regionum frigidarum Fabij Columnæ*, *Cynogloſſum Syluaticum Caule rubente Bauhini*, which he thinks to be the ſame with the *Cynogloſſum Syluaticum Harcynicum Thalij*, and the *Cynogloſſum Montanum Cæſalpini*, The Great Mountain Houndſtongue. 4. *Cynogloſſum ſemper virens Bauhini*, *Cynogloſſa media Folio virente Columnæ*, Ever green Houndſtongue. 5. *Cynogloſſum minus*, *ſive puſillum*, *Cynogloſſum puſillum Narbonenſe Lobelij*, Small Houndſtongue. 6. *Cynogloſſum minus Flore cæruleo*, *Cynogloſſa minor Cordi*, *Cynogloſſum Italicum Camerarij*, *Cynogloſſum puſillum Narbonenſe Lugdunenſis & Eyſtetenſis*, Small Houndſtongue with blew Flowers.

Hounstongue th ru flowers.

III. The Deſcriptions. *The firſt*, *or* Common Houndſtongue. *It has a black, thick, and long Root, which is tough, or difficult to break, and full of a viſcous or clammy juice, ſmelling of a ſtrong ill ſcent, much like to Dogs Piſs, as the Leaves alſo do, which ſome call a ſoporiferous ſmell*; from this Root ſpring up many long and ſomething narrow, ſoft, and as it were hairy, darkiſh green Leaves, lying on the Ground, ſomewhat like unto the Leaves of *Bugloſs*, but not altogether ſo harſh in feeling to, from among which riſes up a rough hairy Stalk, about two Feet high, with ſome ſmaller Leaves thereon than thoſe which grow below, and branched at the top into ſeveral parts, with a ſmall Leaf at the foot of every Branch, which is ſomething long, with many Flowers ſet along thoſe Branches, which are crooked, or turn inwards, before it flowers, and gradually opens as the Flowers blow, which Flowers conſiſt of four ſmall, purpliſh, red Leaves, ſomething of a dad or dead color, ſcarcely riſing or ſhewing themſelves out of the rough green Husks in which they ſtand, with ſome Threads in their middle; this Plant has ſometimes been found with a white Flower; after the Flowers are paſt, flat rough Seed come in their places, which has a ſmall Thread or Pointel in the middle, and by reaſon of its roughneſs eaſily cleaves to any Garment which it touches, not being readily pulled off again.

IV. *The ſecond*, *or* Greateſt Houndſtongue. *This differs not either in its Root, Stalk, Branches, Leaves, Flowers, Seed, Smell, or manner of growing*, from the firſt *Common Kind* but now deſcribed, but only in its magnitude, this being twice as large, which is indeed the only difference.

Houndstong com: th ru out flow:

V. *The third*, *or* Great Mountain Houndſtongue. *The Root is blackiſh on the outſide, and whitiſh within, being ſomething like the former*; it has alſo ſpringing from the Root many large, but hairy and ſoft Leaves, lying on the Ground, above a Foot long, and an Hand breadth broad, of a whitiſh green color, having in every one of them the middle Rib reddiſh, with many green Veins running thro' them, and reddiſh Footſtalks to ſuſtain them, thoſe which are in the middle of them ſtanding more upright; from among which riſes up a thick, hollow, creſted, reddiſh, woolly, or hairy Stalk, two Feet or more high, repleniſhed on all ſides with ſuch like Leaves, but leſſer and leſſer up to the top, where it ſpreads it ſelf out into four or five branches of Flowers, ſtanding all on one ſide, yet forming at firſt a round Head, very pleaſant to behold for the variety of colors therein, the hairy ſtalks of the Flowers being green, and ending in five points, the Flowers being alſo hollow and long, and conſiſting of five purpliſh red

red Leaves, ſomewhat ſweet, ſtanding above the Husks and green Leaves which grow among them, with red Ribs in them, which in the ſhadow, where it delights to grow, is the more conſpicuous and beautiful; after which in the ſaid Husks come longer Seed than in the *Common Kind*, four uſually together, which on the upper ſide are flat, and circled about with a few ſhort prickles, whereby it commonly cleaves faſt to Peoples Garments if it touches them.

Ever green Houndſtongue the leſſer.

VI. *The fourth, or* Ever green Houndſtongue. *It has a Root which is thick, and blackiſh on the outſide, like the others going before*; nor does it much differ from the *Common* or *Ordinary* ſort of *Houndstongue* firſt deſcribed, but that the Leaves are always freſh and green, ſomewhat long and narrow, with a great whitiſh green Rib in the middle, ſmooth on the upper ſide, and more hoary underneath; the Stalk at firſt is but low, with many narrow long Leaves compaſſing it about, but more thinly than in ſome other Kinds; the Flowers are red, but ſomewhat larger than the *Ordinary*, ſtanding in like manner upon ſmall Branches, which are writhed or turned like the *Heliotropium*, or the firſt Kind; the Seed which follows ſtands all on the one ſide, and is ſmaller, and leſs rough, but the Stalk will then be grown much higher; this has no manner of hoarineſs, nor has it ſo ſtrong or rank a ſmell as the former have; it does alſo ſpring forth with freſh Leaves, before the old Stalk with its Seed is quite dry and wither'd away.

VII. *The fifth, or* Small Houndſtongue. *It has a ſmall black Root, not much differing from* Our Common Kind, *but it is every ways ſmaller in all its particulars*, having ſuch like Leaves, but ſmaller and ſhorter, yet greener, and more ſhining, the Flowers being ſmall, are alſo of a pale red color; the whole Plant has not ſo ſtrong or rank a ſmell as have ſome of the former, but this ſmallneſs may be thought by ſome to be from the barrenneſs of the Soil in which it grows, which is not ſo, becauſe it is oftentimes found in the ſame Ground where the greater grows, and beſides, being either tranſplanted, or the Seed ſown in Gardens, it will continue much ſmaller than the other.

VIII. *The ſixth, or* Small Houndſtongue with blew Flowers. *It has a ſmall long Root, but annual, which ſends forth one round, ſmall, hairy Stalk, ſometimes but a* Foot, *and ſometimes two Feet high, brownish below, and green above*, on which are ſet on both ſides without order ſeveral ſmall, and ſomething long, but narrow Leaves, of a blewiſh green color, covered with a long hairy down, which is tough and ſticking, the middle Rib is ſomewhat great and eminent, and the whole Plant of a hot bitter taſte; from the bottom of theſe Leaves, eſpecially upwards, come forth ſometimes other ſmaller Leaves in a Tuft together, and is parted into divers Branches, the tops of which are bended, as in ſeveral other ſorts, bringing forth very ſmall Flowers, of a fair blew color, with a yellow Star in the bottom, ſtanding in ſuch like Husks, in which after they are paſt is contained very ſmall roundiſh Seed, without any prick in the middle, as ſome others have, but very rough or prickly, and ready to ſtick upon Garments or Cloaths, as the others will.

IX. *An Obſervation.* There has been a great Controverſie amongſt Botaniſts whether the *Cynogloſſum* here firſt deſcribed, which is our *Ordinary* and *Common*, and is the moſt common in all Countries, be the *Cynogloſſum verum Dioſcoridis*, becauſe he ſays it bears neither Stalk nor Flowers, which this does, which Plant, wanting Stalks and Flowers, *Matthiolus* ſays he found in ſome ſandy Grounds in *Rome*, behind or beyond *Mount Adrianus*, but both *Pena* and *Lobel* tax him with want of knowledge, for ſay they it will in the ſame and other places bear both Stalk and Flowers, altho' in divers Years and places it does not bear, yet will after ſome reſpite of time in any place, as not only they, but ſeveral other good Authors have acknowledged, as well in this as in other Plants; I confeſs I my ſelf have oftentimes found the firſt deſcribed Plant, *viz. Our Common Houndſtongue*, in ſeveral parts of *England* without either Flowers or Stalk, and that at the ſame time, and near the ſame places, where other Plants of the ſame Species have had both, and therefore without all doubt *Our Common Kind* is the true Plant which *Dioſcoridis* has deſcribed under that Name ſo defectively.

X. *The Places.* The firſt grows in moſt places of *England*, in waſte and untilled Grounds, alſo by high Ways, Lanes, and Hedge ſides; the ſecond grows in the Low Countries, but chiefly in their and our Gardens; the third grows on Mountains near *Naples*, with us only as it is manured in Gardens; the fourth in ſhadowy Woods in *Germany*, *&c.* the fifth grows in many places of *England*, as alſo in *Germany*, diſcourſed of by *Cordus* upon *Dioſcorides*, and poſſibly is that ſame Kind, which in the *Adverſaria* is ſaid to grow about *Mompelier*, and called *Puſillum Narbonenſe*; the ſixth grows in *Auſtria*, as *Cluſius* ſays, and in other parts of *Germany*, as *Tragus* ſays, and at *Naples*, as *Columna* ſays, alſo very plentifully in *England*, by high Way ſides, as you go from *London* towards *Colcheſter*, between *Eſterford* and *Wittam* in *Eſſex*, as *Gerard* ſays.

XI. *The Times.* They all Flower about *May* and *June*, and ſome in *July*, if the Seaſon and place be cold, and the Seed is ripe not long after.

XII. *The Qualities. Houndſtongue* is temperate in reſpect to heat and cold, and dry in the firſt de-

gree, Aſtringent, Anodyne, Emphractive or Obſtructive, (and yet ſome Authors will have it to have an Emollient property) Traumatick or Vulnerary, Arthritick, Hyſterick, and Alexipharmick.

XIII. *The Specification.* It is prevalent againſt Catarrhs, Coughs, Aſthma's, green Wounds, old Ulcers, and Sores ariſing from the *French* Pox.

XIV. *The Preparations.* You may have therefrom, 1. *The green Leaves.* 2. *The Root.* 3. *A Juice.* 4. *An Eſſence.* 5. *A Decoction in Water or Wine.* 6. *A Pouder.* 7. *Pills.* 8. *A Balſam.* 9. *An Ointment.* 10. *A Cataplaſm.* 11. *A Lotion.* 12. *A Diſtilled Water.*

The Virtues.

XV. *The green Leaves.* Bruiſed and applied they cure the falling away of the Hair, which comes of hot and ſharp Humors, they are good alſo to be applied to any place ſcalded, or burn'd with Fire, and laid to any green Wound they heal it quickly; the ſame is profitable alſo againſt *Anthonies* Fire, and other Inflamations.

XVI. *The Root.* Being roaſted under Embers, wrapped up either in Paſte, or double wet Papers, and then a Suppoſitory made thereof, and applied to, or put up the Fundament, it is effectually good againſt the Hæmorrhoids, or Piles; and applied as a Cataplaſm to the Gout it eaſes the ſame.

XVII. *The Juice of Roots or Leaves.* Made into a Syrup with Honey it is good againſt vehement ſalt Catarrhs, old Coughs, Colds, Aſthma's, and all ſharp and thin defluxions of Rheum which fall upon the Eyes, Noſe, Ears, Stomach, or Lungs, cauſing wheezing, ſhortneſs of Breath, *&c.* Doſe one or two Spoonfuls, (according to Age, *&c.*) Morning and Night.

XVIII. *The Eſſence.* It has all the Virtues of the Juice, and more powerful, and may be given in the ſame Doſe in a Glaſs of generous Wine; it is good alſo (inwardly taken and outwardly applied) againſt the bitings of mad Dogs.

XIX. *The Pouder of Roots or Leaves.* It has all the Virtues of the Juice and Eſſence, and may be given from a Scruple to a Dram, or Dram and half, in any convenient Vehicle; outwardly applied to green Wounds it quickly heals them, and ſtrewed very thick upon old moiſt Sores and running Ulcers, it admirably cleanſes them, dries up the flux of humors, and diſpoſes them to healing.

XX. *The Decoction in Wine or Water.* It has all the Virtues of the Juice, Eſſence, and Pouder, but muſt be given in larger quantities, as from an Ounce to two, three, or four, as the Patient is in Age and Condition; it cleanſes, dries, and heals Wounds and Ulcers; if the Patient is of a hot Conſtitution, the Decoction ought to be made in Water, after which, (if you think fit) a little Wine may be added.

XXI. *Pilulæ de Cynogloſſo,* Pills of Houndſtongue. *Take the dried Bark of Houndſtongue Roots, White Henbane Seed, Opium prepared,* (i. e. *extracted with fair Water, and reduced to pouder*) *of each one Ounce, Myrrh an Ounce and half, Olibanum ten Drams, Saffron, Caſtoreum, Storax Calamita, of each three Drams; let the Roots of Houndſtongue and Henbane Seeds be poudered together, the Myrrh, Olibanum, and Saffron, each by themſelves, then mix altogether, and with Syrup of Stœchas, (or any other proper Syrup) make a Maſs for Pills.* They were deſigned to ſtop Catarrhs, or defluxions of Rheum upon the Lungs, Stomach, or other parts, to alleviate Coughs, cure Aſthma's and Pleuriſies, which they perform beyond other Medicines; they ſtop Looſneſſes, all ſorts of Fluxes of the Bowels, and fluxes of Blood or Humors in what part of the Body ſoever; they cure the overflowing of the Terms in Women, as alſo fluxes of the Whites, and a Gonorrhœa in Men, (Univerſals being premiſed) they give eaſe in and cure pains and ſtitches of the Side, Pleuriſies, the Colick, and all manner of internal pains; eaſe and cure the Toothach, and are one of the moſt abſolute things againſt the Gout in the World. Doſe from ſix Grains to fifteen Grains, every Night going to Bed.

XXII. *The Balſam.* The green Leaves and Roots, or Juice, made into a Balſam with Beef Suet and Turpentine, and applied, is good againſt an *Alopecia,* draws out the fire in any place which is burn'd, and applied to the biting of a mad Dog, draws out the poyſon, and heals it; it digeſts and cleanſes old Ulcers, and is profitably applied to Venereal Sores, as alſo the Gout in Hands or Feet.

XXIII. *The Ointment.* It has the Virtues of the Balſam, but does not draw nor cleanſe ſo powerfully; it is excellent for ſuch Ulcers as are old, and deep, or ſpread much in the Legs, or other parts of the Body, and takes away the inflamation, which may any ways by accident happen to them.

XXIV. *The Cataplaſm.* Applied to the Piles, whether broken or not, it gives eaſe to the pain, and in a ſhort time diſcuſſes the Tumor; it eaſes alſo the Gout ariſing from a hot cauſe, and allays inflamations in what part of the Body ſoever.

XXV. *The Lotion.* It is the ſame with the Saline Tincture, and is of excellent uſe againſt Scabs, Scurf, Morphew, Dandriff, Pimples, or other breakings out in the Head and other parts of the Body; it alſo takes away Tanning, Sunburning, Yellowneſs, black and blew ſpots, and other diſcolorings of the Skin.

XXVI. *The Diſtilled Water of Herb and Roots.* It is good for all the purpoſes aforeſaid, to be uſed as well inwardly to drink, as outwardly to waſh any ſore place, for it heals all manner of Wounds and Punctures, as alſo foul Ulcers ariſing from the *French* Pox.

CHAP. CCCLXXXIV.

Of HOUSLEEK, *OR,* SENGREEN.

I. *THE Names.* It is called in *Arabick Bejahalalem,* and *Hajalhalez,* in *Greek* Ἀειζωον, in *Latine Sedum, Sempervivum,* and as *Pliny* ſays, *Buphthalmon, Zoophthalmum, Steigethron,* and *Hypogeſon*; ſome call it *Oculus,* and *Digitellus*; and *Apuleius* calls it *Vitalis,* and *Jovis Barba,* but *Sedum* and *Sempervivum* are the uſual *Latine* Names; in *Engliſh Houſleek,* and *Sengreen,* or *Evergreen.*

II. *The Kinds.* It is divided into three principal ſorts, *viz.* 1. Ἀειζωον τὸ μέγα, *Aizoon magnum,* or *majus, Sedum majus,* The Great or Greater Houſleek. 2. *Sedum minimum,* The Smalleſt Houſleek. 3. *Aizoon, vel Sedum minus,* The Smaller Houſleek, which is *Prickmadam,* and *Stonecrop,* of which we ſhall Treat (God willing) hereafter in their proper places.

III. *The Kinds of the Greater Houſleek.* There are three ſorts hereof, *viz.* 1. *Sedum majus vulgare, Sempervivum Theophraſti, Aizoon magnum,* Κοτυληδὼν *altera Dioſcorides,* as *Cluſius* has it, *Sempervivum majus,*

majus, *& majus vulgare*, *Umbilici Veneris Species altera Angularis*, Our Common or Vulgar Houſleek. 2. *Sedum majus legitimum Cluſij*, *Aizoon magnum verum Dioſcoridis*, *Sempervivum majus*, *Sempervivum Arboreſcens Matthioli*, *Sedum Arboreſcens*, *Aizoon Arboreſcens*, The True Great Houſleek, or Tree Houſleek. 3. *Sedum majus Marinum Anglicum*, *Sedum Portlandicum Lobelij*, Great Engliſh Sea Houſleek. This *Lobel* makes to be a ſort or kind of the ſecond abovenamed, or *Tree Houſleek*.

IV. The Deſcriptions. *The firſt*, *or* Our Common Houſleek, *has a ſmall fibrous Root*, *creeping all about*, *and from ſmall ſtrings multiplies into many heads of Leaves*, *round the original Root*, *taking up thereby a large compaſs of Earth*; and as this Root ſends forth on all ſides ſeveral heads of pale, green, thick, fat, broad Leaves, pointed at the ends, lying circlewiſe one unto, and as it were upon another, and upon the Ground, from the middle of each head of Leaves riſes up a ſtraight Stalk, two Feet high, all covered with ſmaller and longer green, thick, fat Leaves, (than thoſe below) which often dry and fall away before the top thereof has perfected its Flowers, which grow on long Branches, bending their ends or tops downwards, with a ſingle Leaf at the foot of every one of them, which conſiſt of many Leaves, Star faſhion, of a dark reddiſh color, after which come Heads, with ſmall blackiſh Seed in them.

V. *The ſecond*, *or* True Great Houſleek. *It has a Root conſiſting of ſtrings*, *like the former*, *which divides it ſelf into ſeveral off-ſprings*; this Herb grows great, to the form of a Shrub, or woody Plant, of two or three Feet, or more high, in its native places, which are warm, and its Stem or Trunk below is of the bigneſs of four Fingers, and the other Branches are the thickneſs of ones Thumb, of a greyiſh color on the outſide, and ſpotted as it were round about, but they are the marks of the old Leaves which are fallen, the like of which may be ſeen in *Wood Spurge*, and ſome other Plants; it ſpreads it ſelf out into ſeveral limber ſmaller Branches on all ſides, and Leaves at the ends of them, ſtanding in a compaſs, like the Heads of the former *Common Houſleek*, but nothing ſo cloſe, every Leaf being formed ſomewhat like a Tongue, ſmall at the bottom, and broader towards the end, where it is broadeſt, roundiſh at each ſide of the end, and a little dented in about the middle of the ſaid end, not much unlike the form of a Heart, they are alſo finely dented about the edges, and as it were a little hollow, like a Spoon, and full of juice, and of a pale green color; from the tops of ſome of the Branches thruſts forth a long Stalk, divided into many leſſer Branches or Twigs, with ſome few ſmall Leaves on them, and at the ends of them ſeveral Star like Flowers, conſiſting of many ſmall Leaves, of a pale yellowiſh color, with ſundry ſmall Threads in their middles; the greater Stalk becomes dry and ſmooth, as the Heads, which have ſmall black Seed in them, which being ripe they utterly periſh after Seed time, but the other Heads of green Leaves abide freſh all the Year, which ſend forth Flowers the next Year after, and may be taken before hand from the main Stock to be planted, and will take root being put into the Ground; in the warmer Climates it ſpreads it ſelf much more into Branches than in theſe our colder Countries.

VI. *Gerard* deſcribes it thus. It riſes up with a Stalk a Foot and half, and ſometimes three Feet high, which is thick, hard, woody, and ſo tough, that it can hardly be broken, parted into divers Branches, and covered with a thick groſs Bark, which in the lower part reſembles certain prints, or impreſs'd marks of the Leaves which are fallen away; the Leaves are fat, well bodied, full of juice, an Inch long, and ſomewhat more, almoſt like little Tongues, very curiouſly minced or nipt on the edges, ſtanding upon the tops of the Branches, having in them the ſhape of an Eye; the Flowers grow out of the Branches, which are divided into many Sprigs, which Flowers are ſlender, yellow, and ſpread like a Star, which being paſt away, there comes up in their places very fine Seed, the Sprigs withering away; the Root is parted into many off-ſprings, and the Plant is always green, nor in its native Soil is it hurt by the cold of Winter, for which reaſon it obtained the Name of *Sempervivum*.

VII. *The third*, *or* Great Engliſh Sea Houſleek. *It has a long ſlender Root*, *or Roots*, *with ſome few Fibres adjoining*, *from whence ſpring up one or two*, *or more Heads*, *which at length become Leaves and Stalks*; the Leaves imitate *Laureola*, growing among the *Tithymals*, but thicker, ſhorter, more fat, and tender; the Stalk is of a woody ſubſtance, like *Laureola*, participating of the Kinds of *Sempervivum*, *Craſſula*, and *Tithymal*, of which laſt ſome Authors have thought it to be a Kind; others have thought it to be a Shrub, degenerating from all thoſe Plants: *Pena* and *Lobel*, who firſt diſcovered it and ſet it forth, knew not what to think of it; others ſince them have been as uncertain; however, its ſomething like to our ſecond Kind, or *Tree Houſleek*, above deſcribed, its Stem is woody, but it grows neither ſo high, nor with ſo many Branches, the Leaves alſo, although ſomething like to them, yet are not ſo thick or ſappy, in its other parts it differs not much from the ſaid *Tree Houſleek*.

VIII. *The Places.* The firſt grows naturally both in *England* and *Germany*, as alſo in the Low Countries, *France*, *&c.* it grows upon Stones or Mountains, upon old Walls and ancient Buildings, as alſo upon the tops of Houſes, and more eſpecially being planted in Clay, or in Clay Ground; its form does ſometimes differ, according to the nature of the Soil, for in ſome places the Leaves are narrower and leſſer, but more in number, and have one only circle; in ſome places they are fewer, thicker,

and

and broader, they are green, and of a deeper green in ſome places than in others, in ſome places of a lighter green, *&c.* the ſecond grows in *Greece*, *Italy*, *Portugal*, *Spain*, *France*, *Illyria*, *Sclavonia*, *Sicily*, *Sardinia*, *Corſica*, *England*, *&c.* in divers places of *Italy*, *Spain*, and *Portugal*, it is kept in Pots, as *Cluſius* ſays, and carefully preſerved in Winter; and in *Lisbon* it grows on the tops of Houſes, as our *Common Kind* does with us, but it does not very well endure the cold of the more Northern Countries of *Europe*, with all the care that can be, unleſs kept in a Room with a Stove in it; yet *Lobel* ſays he found it growing in the Iſland of *Holmes*, near *Briſtol*; it grows in the Iſlands of the *Mediterranean* Sea, as aforenamed, as alſo in *Zant*, *Rhodes*, *Candia*, and in many Provinces of the Eaſt, and of *Greece*, *&c.* the third grows by the Sea ſide in many places of *England*, and in the Iſland of *Holmes*, not far from *Briſtol*; it grows alſo in the Iſle of *Portland*, for which reaſon it has obtained the Name of *Sedum Portlandicum.*

IX. *The Times.* The firſt Flowers in the Summer Solſtice, which is in *June*, about the eleventh day, and generally Flowers from that time thro' all *June* and *July*, and now and then in the Month of *Auguſt*; it ſpreads it ſelf into Heads from ſeveral Sprigs of the Root in *April*, which Sprigs or Strings of the Root are the Ground Work of the great Circle, and of other Circles, by which it multiplies it ſelf, and by which, being at length full grown, it ſpreads it ſelf into many other Circles; the ſecond Flowers, as *Cluſius* ſays, in the warmer Climes, as *Spain*, *Portugal*, *&c.* in *November* and *December*, but ſcarcely ever with us; the third, or *Sedum Portlandicum*, which grows by the Sea ſide, Flowers in *July* and *Auguſt*, whilſt the Weather is warm.

X. *The Qualities.* *Houſleek* is cold in the third degree, and drying in the firſt, it is Anodyn, Aſtringent, Repercuſſive, and Arthritick.

XI. *The Specification.* It cures an Eryſipelas, or *Anthonies* Fire, ſo called, and allays the heat of all Inflamations, Burnings, Scaldings, *&c.*

XII. *The Preparations.* You may have therefrom, 1. *The green Leaves.* 2. *A Juice.* 3. *A Poſſet.* 4. *An Oil.* 5. *A Cataplaſm.* 6. *A Diſtilled Water.*

The Virtues.

XIII. *The green Leaves.* Applied twice a day upon Corns and Warts in the Hands and Feet, it diſſolves or conſumes them, and takes them away; the Leaves bruiſed and laid upon the Crown or fore part of the Head, ſtops the bleeding at Noſe very quickly; and being applied to the Temples and Forehead it eaſes the Headach, and allays the heat and diſtemper of the Brain thro' Fevers, Frenzies, or want of Sleep.

XIV. *The Liquid Juice.* It is good againſt all heats and inflamations, as well inward as outward; dropped into the Ears or Eyes, ſtops all hot defluxions of ſharp ſalt Rheum into thoſe parts, and being taken inwardly it is good to ſtop all fluxes of humors upon the Viſcera, and the immoderate flux of the Terms in Women; it kills alſo Worms in Young or Old, and is profitable againſt the biting of the *Phalangium*; being often bathed upon Warts and Corns, it is ſaid to take them away, the more eſpecially if the green Leaves be applied alſo over the ſame; outwardly it abates and allays all ſorts of inflamations in any part of the Body, as in an Eryſipelas, or *Anthonies* Fire, and all other hot Eruptions of the Fleſh and Skin, Shingles, Pimples, Ringworms, Tettars, Puſhes, Cankers, fretting Ulcers, Burning, Scalding, Morphew, Scurf, and other the like defœdations of the Fleſh and Skin; and bathed upon the part warm it eaſes the pain, and is very profitable againſt the Gout.

XV. *The Poſſet.* It is made with the Juice, and has all the Virtues of the Juice, being inwardly given; it is alſo ſingularly good againſt the hot Fits of Agues, for it cools and attemperates the Blood and Spirits, quenches thirſt, and ſtops Catarrhs; it may be given in a fourfold quantity to the Juice, for as the Juice may be given from a Spoonful to two Spoonfuls in a Glaſs of Wine, or other fit Vehicle, ſo the Poſſet may be given from four Spoonfuls to eight, a little ſweetned with Sugar, for all the aforeſaid Intentions.

XVI. *The Oil.* It is thus made. *Take juice of Houſleek, choice thick Cream, of each a Quart, boil them over a gentle Fire till a ſeparation is made, and the Oil ſwims on the top, of a yellow or greeniſh color, which when cold take off, and keep it for uſe.* In all external Caſes, (excepting an Eryſipelas) it has the Virtues of the Juice, and is good to anoint Pimples, Shingles, Tettars, Ringworms, Scurf, Morphew, *&c.* with, as alſo places pained with the Gout; given inwardly from half an Ounce to an Ounce in any convenient Vehicle it gives eaſe in the Strangury, Stone, Gravel, heat and ſcalding of Urine, and cleanſes the Urinary paſſages from tartarous mucilage.

XVII. *The Cataplaſm.* Being made with Hogs Lard and Barley Flower it is good againſt all the Diſeaſes the Liquid Juice is uſed againſt, except an Eryſipelas, becauſe experience has taught us that all greaſie or oily bodies rather exaſperate than abate that Diſeaſe; applied in the Gout it gives ſudden eaſe and cure.

XVIII. *The Diſtilled Water.* It is profitable for all the purpoſes aforeſaid, being in outward Diſtempers bathed upon the parts affected, and in inward Diſeaſes given from two to four Ounces, ſweetned with Syrup of Clovegilliflowers; if it is bathed upon any place ſtung with Nettles or Bees it preſently takes away the pain, ſo alſo the Juice, being uſed in like manner, as alſo the green Leaves, being rubbed upon the parts wounded or affected.

XIX. *Nota.* If the Cataplaſm of the Leaves is made with Vinegar and Barley Flower (inſtead of Hogs Lard) it may profitably be applied to an Eryſipelas, or *Anthonies* Fire.

CHAP. CCCLXXXV.

Of HOUSLEEK Small.

I. *THE Names.* It has no *Greek* Name that we know of, but it is called by *Cluſius* in *Latine Sedum Alpinum ajugæ Folio*, and in his *Hiſtory of Plants Sedum decimum tertium*, alſo *Sedum laciniatis Folijs*, in *Engliſh Jagged Houſleek*, *Houſleek with Jagged Leaves*, and *Small Mountain Houſleek with jagged Leaves.*

II. *The Kinds.* Authors make two Kinds hereof, *viz. Sedum Alpinum laciniatis ajugæ Folijs*, Small Mountain Houſleek with jagged Leaves, of which in this Chapter. 2. *Sedum Monſpelienſe & Pyrenæum laciniatum*, French jagged Mountain Houſleek, the which not growing in *England* we ſhall ſay nothing of it in this Work.

III. The Deſcription. *It has a ſmall blackiſh Root, which ſpreads much*, from which Root it ſhoots forth on

on all ſides with many ſmall heads of Leaves from ſmall Strings, as is uſual with the *Houſleeks*, each Leaf whereof is long and narrow, cut in deeply into three diviſions, one on each ſide, and the end longeſt, ſomething like to the Leaves of the *Sweet Groundpine*, but ſmaller and greener, not having any hoarineſs on them, aſtringent and drying alſo in taſte, as much as any of the others; the Stalks are reddiſh, very ſlender, and not above two Inches high, as *Cluſius* ſays, but they grow three Inches or more high with us, which is ſpread out at top into ſome few Branches, bearing every one of them one ſmall Flower, (but with us it is large, with reſpect to the bigneſs of the Plant) which conſiſts of five Leaves apiece, of a pale green color, ſays *Cluſius*, but with us as on that Plant which came from one Mr. *Hesket* out of *Lancaſhire*, of a pale whitiſh color, with ſome yellow threads encompaſſing a middle round Head.

IV. *The Places.* *Cluſius* ſays it grows on the Mountains called *Sneberg*, or *Snowhill*, among the Stones, with us it grows on Mountains in *Lancaſhire*, as the aforenamed *Hesket* reported.

V. *The Times.* *Cluſius* ſays that it Flowers in thoſe Months which are preſently after the Snow is diſſolved, but with us towards the latter end of *April*, or in *May*, but yet ſomewhat later on thoſe Mountains before named.

VI. *As for the Qualities, Specification, Preparations, and Virtues,* they are much the ſame with thoſe of *Our Common Houſleek* in the former Chapter, ſo that no more need be ſaid of them in this place.

HYACINTH *Engliſh*, See *Hares-Bells*, Ch. 335.

CHAP. CCCLXXXVI.

Of HYSSOP Common.

I. *THE Names.* It is called in *Arabick Cyſe, Javes, Jufa*, in *Greek* Ὑσσωπος, in *Latine Hyſſopus*, in *Engliſh Hyſſop.*

II. *The Kinds.* There are two principal Kinds hereof, *viz.* 1. Ὑσσωπος κοινὸς, ἢ ἡμερὶς, *Hyſſopus Vulgaris*, Our Common Hyſſop. 2. Ὑσσωπος σπάνιος, *Hyſſopus infrequens, Hyſſopus incelebris, vel inſolitus*, Hyſſop Strange, and not Vulgar or Common, of which in the next Chapter.

III. *The Kinds.* Of *Our Common Garden Hyſſop* there are only two Kinds, *viz.* 1. *Hyſſopus Vulgaris, Hyſſopus Arabum*, Our Vulgar or Ordinary Hyſſop. This *Hyſſop* is not the *Hyſſop* of *Dioſcorides* and other *Greek* Authors, as all our modern Botaniſts do acknowledge, except *Matthiolus*, who earneſtly contends that *Our Garden Hyſſop* is it againſt all reaſon; nor do any of our Herbariſts know (as far as I can find) what the true *Hyſſop* of the *Greeks* was. As for *Our Common Garden Hyſſop*, it is certainly the true *Hyſſop* of the *Arabians*, and ſo we take it. 2. *Hyſſopus Arabum Floribus rubris vel albis*, White or Red Flowered Hyſſop.

IV. The Deſcriptions. *The firſt, or* Our Vulgar Ordinary Hyſſop, *has a Root which is ſomewhat woody, with many thready ſtrings thereat*; it is a ſmall bushy Plant, which riſes up with many woody but tender Branches, ſomething more than a Foot high, on the Stalks and Branches whereof are ſet at certain diſtances ſeveral ſmall, narrow, and long green Leaves, not dented at all on the edges; at the tops of the Stalks and Branches grow blewiſh purple gaping Flowers in ſpiked Heads, one row above another, after which follows the Seed, which is ſmall and blackiſh; the whole Plant is of a vigorous or ſtrong, ſweet, pleaſant ſmell.

V. *The ſecond, or* White or Red Flowered Hyſſop. *They have a Root like the former, but are ſcarcely to be diſtinguiſhed in their form and manner of growing from the* Common Garden Kind, *(of which this is a ſort)* the chief difference is, that they do both uſually bear white or red Flowers, all on one ſide of the Spike, yet continue not conſtant in that form, but change into the form of the former *Common Kind*, and ſo become (as it were) the ſame Plant, and after that change not to be diſcerned therefrom.

VI. *The Places.* They grow with us only in Gardens, and that thro' the whole Kingdoms of *England* and *Ireland*, but they grow wild in *Arabia*, and other hot Countries, as alſo on the Hills of *Romania*, about *Verona*, and near unto *Mount Baldus*.

VII. *The Times.* They Flower in the Summer Months, *viz.* in *June* and *July*, and their Seed is ripe in the beginning or middle of *Auguſt*.

VIII. *The Qualities.* It is hot and dry in the third degree, Aperitive, Abſterſive, Aſtringent, Anodyn, Carminative, Digeſtive, Diuretick, it incides, rarifies, and makes thin; it is Stomatick, Pectoral, Cordial, Splenetick, Nephritick, and Arthritick, Emmenagogick, Alexipharmick, and Analeptick.

IX. *The Specification.* It is peculiar againſt Aſthma's, Coughs, Colds, Catarrhs, Wheezing, Hoarſeneſs, ſhortneſs of Breath, difficulty of breathing, cures Conſumptions, Strangury, Falling-Sickneſs, and green Wounds.

X. *The Preparations.* You may prepare therefrom, 1. *A Liquid Juice.* 2. *An Eſſence.* 3. *A Decoction in Wine or Water.* 4. *A Lohoch, or Syrup.* 5. *A Pouder.* 6. *Pills.* 7. *A Lotion or Gargariſm.* 8. *An Oil by Decoction.* 9. *A Balſam or Ointment.* 10. *A Cataplaſm.* 11. *A Diſtilled Water.* 12. *A Spirituous Tincture.* 13. *An Acid Tincture.* 14. *An Oily Tincture.* 15. *A Saline Tincture.* 16. *A Spirit.*

Spirit. 17. *An Oil Diſtilled.* 18. *Powers.* 19. *An Elixir.* 20. *A fixed and volatile Salt.* 21. *A Wine.*

The Virtues.

XI. *The Liquid Juice.* Mixed with Honey and taken it kills Worms in the Belly, and helps Aſthma's, Coughs, Colds, Wheezing, ſhortneſs of Breath, and other Diſtempers of the Lungs, cauſed by a plenitude of Humors. Doſe from one Spoonful to three, Morning and Night.

XII. *The Eſſence.* It has all the Virtues of the Juice, beſides which it is excellent againſt the Falling-Sickneſs, Agues, Catarrhs, or diſtillations of Rheum upon the Lungs, and other parts; it amends and cheriſhes the native heat, and color of the Body, &c. and is a powerful Remedy againſt the Colick, Strangury, obſtruction of the Terms in Women, Poyſon, the bitings of mad Dogs, Serpents, and other venomous Creatures; it cuts tough Flegm, and cauſes expectoration. Doſe two or three Spoonfuls in the Diſtilled Water, or ſome other proper Vehicle.

XIII. *The Decoction in Wine or Water.* It has all the Virtues of the Juice and Eſſence, but nothing near ſo powerful, and therefore may be given Morning, Noon, and Night to ſix or eight Ounces, ſweetned with new Honey; if Rue and Honey is boiled with it, and ſo drunk, it ſtops Catarrhs upon the Lungs, and has the other Virtues of the Juice and Eſſence; if the Decoction, Juice, or Eſſence, is mixed with *Oxymel* it purges groſs Humors by Stool, and kills Worms in Children; if any of theſe three Preparations are mixed with pulp of Figs and *Sal Nitre* it looſens the Belly, and works downwards alſo; if either of them are mixed with juice of *Garden Creſs* and *Blew Flowerdeluce* Roots, or pouder of the ſaid *Flowerdeluce* Roots, in a fit proportion, this mixture will purge the Bowels yet more forcibly, carry off the cauſes of the Colick, cure the Yellow Jaundice, Dropſie, obſtructions of Liver, Spleen, and Womb, and reſtore the true color of the Skin, this more eſpecially if it is taken twice or thrice a Week, as the Body can bear it.

XIV. *The Lohoch or Syrup. Take of the clarified Juice two Pounds, of choice Honey four Pounds, mix, and boil to the conſiſtence of a Rob or Quiddony.* It has the Virtues of the Juice, Eſſence, and Decoction, and may be taken three, four, five, or ſix times a day, or more, as the nature and reaſon of the Diſeaſe requires; it cauſes an admirable expectoration of the morbifick matter out of the *Bronchia* of the Lungs; take a little of it at a time with a ſmall little Spoon, and let it diſtill down the Throat gradually.

XV. *The Pouder.* It is made of the Leaves, Heads, and Flowers; ſtrewed upon green Wounds it preſently heals them, upon old running Ulcers it cleanſes, dries, and heals them alſo; applied with pouder of *Cumin Seed*, Salt, and Honey, it is good againſt the bitings of Vipers, Rattle-Snakes, mad Dogs, and other venomous Creatures; given inwardly to one Dram, or Dram and half, it gives eaſe in the Colick, provokes the Terms, and opens the obſtructions of the Urinary parts; it cauſes to break Wind, and prevails againſt the cold fits of Agues.

XVI. *The Pills. Take Hyſſop in pouder, Male Peony Roots in pouder, of each two Drams, Caſtoreum in pouder one Dram, Horehound in pouder, Aſſafœtida, of each half a Dram, Cryſtals of Luna in pouder a Scruple, with Rob of Hyſſop (made* per ſe *without Honey)* q. s. *mix, and make a maſs of Pills, for ſeven Doſes,* to be given every Night at Bed time: This is ſaid to be a ſpecifick and effectual Remedy againſt the Falling-Sickneſs, to be repeated every New and Full Moon ſo long till the Cure is compleated: Theſe Pills cure alſo a vehement Headach, tho' of very long ſtanding, and are prevalent againſt a Vertigo.

XVII. *The Lotion or Gargariſm. Take Hyſſop four good handfuls, White or Red Port Wine three Pints, Sal Nitre an Ounce, mix, and boil for a quarter of an hour, then ſtrain off the clear.* It is a ſingular good thing againſt the Quinſie, or any ſoreneſs of Throat or Mouth, it abates the inflamation of the Throat, and diſcuſſes the ſwelling thereof, being often gargled therewith; it takes away inflamations in other parts of the Body, as alſo black and blew ſpots and marks, which are occaſioned by Falls, Blows, or Bruiſes; if Wine Vinegar is uſed to make the Lotion with inſtead of the Wine, it will eaſe the Toothach, and the fumes thereof being received thro' a Funnel into the Ears eaſes their pains, and abates an inflamation if any is preſent, and alſo takes away their ſinging noiſe.

XVIII. *The Oil by Decoction or Inſolation.* Being anointed upon the Head it is ſaid to kill Lice and Nits therein, and take away the itching; taken inwardly to one or two Ounces mixed with Honey it opens obſtructions of Stomach and Lungs, and cauſes the pituitous matter to paſs off thro' the Guts; anointed upon any part ſwollen and pained thro' cold, it eaſes the pain and diſcuſſes the ſwelling.

XIX. *The Balſam or Ointment.* Being applied they quickly heal any ſimple green Wound in the Hand, or other parts of the Body; applied alſo to old running Sores and foul Ulcers they cleanſe, dry, and heal them quickly, more eſpecially if the Pouder of the Herb afore named be alſo ſtrewed upon the ſame; the Balſam applied upon any part pain'd with the Gout gives eaſe in the pain, and by continuing the application in a ſhort time cures it.

XX. *The Cataplaſm.* Made of the green Herb by bruiſing, adding alſo thereto Sugar and Salt, with a few Crumbs of White Bread, and applied, it is admirable to diſcuſs any recent ſimple Contuſion, or heal any ſimple green Wound, in what part of the Body ſoever.

XXI. *The Diſtilled Water.* It has the Virtues of the Juice, Eſſence, and Decoction, ſweetened with Sugar or Honey, and ſo taken from two Ounces to four Ounces, but it is moſtly uſed as a Vehicle to convey the other Preparations down in; outwardly uſed ſweetened with Honey it is of good uſe to cure ſore and running Eyes.

XXII. *The Spirituous Tincture.* It is Cephalick, Neurotick, Stomatick, and Pectoral, it is good againſt Wind in the Stomach, gives eaſe in the Colick and gripings of the Guts, and ſweetened with Honey it eaſes the vehemency of the Cough, and cauſes expectoration; it is good againſt Vapors from the Womb, Fits of the Mother, and the Falling-Sickneſs. Doſe one Spoonful in the Morning faſting, another an Hour before Dinner, and the like at Night going to Bed, in the Diſtilled Water.

XXIII. *The Acid Tincture.* It is good againſt the Plague, all ſorts of malign and peſtilential Diſeaſes, it reſiſts Poyſon, and is efficacious againſt the bitings of mad Dogs, Vipers, and all other kinds of venomous Creatures; it cleanſes the Stomach, ſtrengthens it, and cauſes a good Appetite and Digeſtion, ſuppreſſes Vapors, and reſiſts Hyſterick Fits; it powerfully opens obſtructions, and attenuates thick and groſs Humors which clog and ſtuff the Viſcera, cauſing the ſame to be carried off by Stool and Urine. Doſe ſo many drops as to make the Vehicle pleaſantly ſharp.

XXIV. *The Oily Tincture.* It opens the obſtructions of the Urinary parts, as alſo of the Womb, provokes Urine and the Terms, expels Wind powerfully,

erfully, and gives eaſe in the Colick, gripings of the Guts, Stone, Gravel, Strangury, *&c.* Doſe from ten to twenty drops in any proper Vehicle Morning and Night; it gives eaſe in the vehement pains of the Back, and outwardly uſed is good againſt Convulſions, Cramps in any particular part of the Body, as alſo the Palſie and Gout, *&c.*

XXV. *The Saline Tincture.* Inwardly taken in a Glaſs of White Port Wine from half a Dram to a Dram, or Dram and half, it is prevalent againſt the Strangury, and cauſes a Piſſing freely; outwardly uſed it is good againſt Scabs, Pimples, breakings out, Tettars, Ringworms, Scurf, Morphew, Tanning of the Skin, Sunburning, Yellowneſs, and other deformities thereof, the Skin (after being firſt waſh'd clean with warm Water) being well bathed therewith Morning, Noon, and Night.

XXVI. *The Spirit.* Being dulcified with double refined Sugar it is a moſt excellent Stomatick and Cordial, it expels Wind, gives eaſe in the Colick and gripings of the Guts, it prevails againſt fainting and ſwooning Fits, ſickneſs at Heart, and other Diſtempers of the Stomach and *Præcordia.* Doſe from half to one Spoonful in Canary, or ſome other Wine or proper Vehicle.

XXVII. *The Diſtilled Oil.* It is a Specifick againſt an old inveterate Cough, Catarrh, and Aſthma, it cures the Colick to a Miracle, expels Wind powerfully, and cures Convulſions, Lethargies, Vertigo, and the Palſie after a ſingular manner; it admirably ſtrengthens the Nerves and Brain, and is good againſt all cold and moiſt Diſeaſes affecting thoſe parts, let them come from what cauſe ſoever; it eaſes the Headach coming by reaſon of cold, and is a ſingular Antidote againſt the Gout, being both inwardly taken and outwardly applied; it is powerful againſt Agues, as alſo againſt the Headach, Megrim, Vertigo, Carus, Lethargy, and other Diſeaſes proceeding from cold and moiſture, but more eſpecially it is ſaid to be a peculiar Remedy for the Falling-Sickneſs, tho' in Perſons paſt their Minority, and who are advancing towards their middle Age; in the Palſie the Back Bone is to be anointed therewith Morning and Night, rubbing it well in, and inwardly it is to be given from four drops to ten, fifteen, or twenty, according as the Patient is in Age and Strength, and the Doſe to be repeated Morning and Evening ſo long as need requires, let it be dropp'd into White Sugar, with which it is to be well mixed, then add to it the Vehicle you deſign to give it in, and ſo let the Patient drink it.

XXVIII. *The Poteſtates* or *Powers.* They have all the Virtues of the Diſtilled Oil, and are much more thin and penetrating, ſinking into the Fleſh as faſt as they are put on, they are to be outwardly uſed in the ſame manner as the Oil, and to the ſame parts in the ſame caſes, and likewiſe to be inwardly given Morning, Noon, and Night, from thirty to eighty, or an hundred drops, in a Glaſs of Wine, or other proper Vehicle.

XXIX. *The Elixir.* The Virtues hereof are juſt the ſame with the Diſtilled Oil and Powers, and to be uſed alſo outwardly and inwardly in the ſame manner, ſaving that the Doſe of the Elixir is only from twenty drops to ſixty in Wine, or ſome fit Vehicle; given in Sherry or *Madera* Wine to ſixty drops or more in a Pleuriſie it gives preſent eaſe, and in a little time after a perfect cure; in particular alſo it is a very excellent thing to kill Worms in Children.

XXX. *The Salt Fixed and Volatile.* They are both Alcalies, and ſo abſorb Acids, infallibly cure the pain of the Stomach, tho' inveterate and never ſo vehement, they have been given with good ſucceſs in all ſorts of Colicks, they open obſtructions of all the Viſcera, but more particularly of the Spleen, Reins, and Womb; they ſuppreſs Vapors, prevail againſt Hyſterick Fits, conquer Hypochondriack Melancholly, deobſtruct the Urinary paſſages, and give preſent eaſe in the Strangury, cauſing the Patient to piſs plentifully and eaſily; and being continued for ſome convenient time cure the Yellow Jaundice. Doſe from ten to twenty grains, or more, in a Glaſs of generous White Port Wine Morning and Night, or oftner, in the day time, if need ſo require.

XXXI. *The Wine.* *Take Hyſſop chopped ſmall a handful, choice ripe Figs ſlit three Ounces, White Sugarcandy an Ounce and half, Muſcadine a Quart, boil all together till half a Pint is conſumed, then ſtrain out and keep it for uſe.* Doſe three Spoonfuls Morning and Evening againſt an old Cough, it cauſes the tough Flegm to be the more eaſily expectorated, gives eaſe in the Strangury, by opening the paſſages of the Urine when they are ſtopped; it is alſo Carminative, helps to break Wind, and provokes the Terms in Women when preternaturally ſtopped.

CHAP. CCCLXXXVII.

Of HYSSOP Rare or Strange.

I. *THE Names.* It is called in *Greek* Ὕσσωπος σπάνιος, Ὕσσωπος ἀλλη, in *Latine Hyſſopus Infrequens, Hyſſopus Incelebris, vel Inſolita,* in *Engliſh Strange,* or *Rare,* or *Uncommon Hyſſop.*

II. *The Kinds.* There are no leſs than Thirteen Kinds of this *Strange Hyſſop,* viz. 1. *Hyſſopus Foliis Niveis,* White Leav'd Hyſſop. 2. *Hyſſopus Foliis Aureis,* Yellow Hyſſop. 3. *Hyſſopus Foliis Cinerijs,* Ruſſet Leav'd Hyſſop. 4. *Hyſſopus Surculis Denſis,* Double Hyſſop. 5. *Hyſſopus Latifolia,* Broad Leaved Hyſſop. 6. *Hyſſopus Foliis Crenatis,* Jagged or Dented Hyſſop. 7. *Hyſſopus Moſchata, vel de Cliſſa,* Musked Hyſſop. 8. *Hyſſopus Coronata, vel Comoſa Cluſij,* Tufted Hyſſop. 9. *Hyſſopus Foliis Criſpis,* Curled Hyſſop. 10. *Hyſſopus Anguſtifolia Spicata,* Narrow Leav'd Spiked Hyſſop. 11. *Hyſſopus Foliis Origani,* Round Leav'd Hyſſop. 12. *Hyſſopus minor, ſive Hiſpanica,* Dwarf Spaniſh Hyſſop. 13. *Hyſſopus Montana,* Mountain Wild Hyſſop.

III. The Deſcriptions. *The firſt, or* White Leaved Hyſſop, *ſeems to me to be one of the ſorts of the firſt* Common Kind *in the former Chapter,* and to differ only in the party coloring of the Leaves, this having ſeveral Leaves parted white and green in the midſt, and ſome or all for the moſt part white, and ſome wholly green, or with ſome ſtripes in the green.

IV. *The ſecond, or* Yellow Hyſſop, *is without doubt one of the ſorts alſo of the firſt Kind in the former Chapter,* it has ſeveral Leaves parted yellow and green in the midſt, and come all or moſt part yellow; the uppermoſt Leaves are uſually wholly yellow in the Summer time, parted with green, but the lower Leaves often abide without diſcoloring.

V. *The third, or* Ruſſet Leav'd Hyſſop. *This alſo differs from the former ſcarcely in any thing elſe but in the color of the Leaves,* which are of a greyiſh or Aſh color, called by ſome Ruſſet; and this ſeems to be that very ſort which *Bauhinus* ſays was ſent him from *England,* it growing very freely in ſome of our Gardens.

VI. *The fourth, or* Double Hyſſop. *This* Hyſſop *grows lower and thicker than the former Kinds*, being thicker ſet with ſlender and not ſo woody Branches, bending their Heads ſomewhat downwards, and much more thick ſet with Leaves of a dark green color; in the Flower and other particulars it differs not from the firſt Kind deſcribed in the former Chapter.

VII. *The fifth, or* Broad Leav'd Hyſſop. *This differs very little from the firſt* Common Hyſſop *in the former Chapter*, neither in Root, Stalk, Leaves, nor Flowers, ſaving that in this the green Leaves are larger and broader, and the Stalks are more woody than it, keeping the ſame form and ſubſtance.

VIII. *The ſixth, or* Jagged or Dented Hyſſop. *In its tops and top Branches it differs not much from* Our Common Garden Hyſſop, but otherwiſe the Stalks are ſomewhat bigger and higher, and the Leaves a pretty deal larger and longer, and regularly cut in or dented on the edges, which makes it another or differing Species of the ſame Plant.

IX. *The ſeventh, or* Musked Hyſſop. *This differs ſcarcely any thing from* Our Common Garden Hyſſop, *as* Geſner in Hortis Germaniæ *has declared*, but in the ſmell, which is ſo fragrant, grateful and pleaſant, that it comes very near to the ſmell of Musk.

X. *The eighth, or* Tufted Hyſſop. *It is in Roots, Stalks, Leaves, Flowers, and manner of growing, ſomething like unto the* Garden Kind *firſt deſcribed in the former Chapter*, but a little ſmaller and lower, the Leaves being of a paler green color, and the top Branches ſpreading a little broader, having ſhorter Spikes of Leaves and Flowers, growing as it were in Tufts, which has cauſed the Name, and is indeed the principal difference.

XI. *The ninth, or* Curled Hyſſop. *In its Roots, Stalks, Branches, and manner of growing, it differs not much from the* Common Garden Kind, *having alſo much the ſame ſmell*; but herein conſiſts the chief difference, that the Leaves thereof are curled or crumpled at or about the edges, and that each Leaf ſeems to be compoſed of many.

XII. *The tenth, or* Narrow Leav'd Spiked Hyſſop. *Its Root is like that of the* Common Hyſſop, it is a fine ſort, and has many ſlender hard Stalks, on which are ſet at diſtances, (as in the *Common Hyſſop*) many ſmall green Leaves, but longer and narrower than they, and ending in a longer point; the Flowers likewiſe grow at ſeveral diſtances, as it were in Roundles, almoſt from the middle of the Stalks up to the tops, of a blewiſh purple color, like the *Common Kind*, but much ſmaller, and ſo is the Seed alſo; the Branches hereof will take root and grow being laid into the Ground, the Root ſpreading much in the Earth.

XIII. *The eleventh, or* Round Leav'd Hyſſop. *It has a hard, woody, and fibrous Root*, alſo hard woody Stalks, on which grow ſeveral ſmall and almoſt round Leaves, one againſt another, but pointed at the ends; the Heads or Spikes of Flowers are like unto *Our Ordinary Garden Sort* in the former Chapter, and the Flowers themſelves are of a blewiſh purple color; the ſmell is alſo much the ſame with the *Common Kind*.

XIV. *The twelfth, or* Dwarf Spaniſh Hyſſop, *which* Lobel *calls* Hyſſopus Parva Anguſtis Folijs. *This has a ſmall, woody, fibrous Root, which ſends forth Stalks ſmaller and lower than the* Common Kind, nor do its Branches riſe ſo high as the *Vulgar Garden Sort*, but bend a little downwards, the Leaves alſo being ſmaller and thicker, and of a ſadder green color, and the Heads or Spikes ſhorter; but the Flowers are purple, like the *Garden Kind*.

XV. *The thirteenth, or* Mountain Wild Hyſſop. *Its Root is ſmall, woody, and with many fibres or ſtrings*; in its manner of growing it is very like unto the *Common Garden Sort*, but the Leaves are not ſo many at a joint, and are ſomewhat harder and rougher, and a little hairy, and ſomething narrower withal, which, as *Matthiolus* ſays, being brought into Gardens, and there nurſed up, will in length of time put off that roughneſs, and become more ſmooth and ſoft; the taſte of this is much more bitter, and nothing ſo hot or ſweet as the *Common Kind*; the Flowers and Seed are like to the *Garden Sort* both for form and color.

XVI. *The Places.* They are all of them nurſed up with us only in the Gardens of the Curious, and grow as well as the *Common Kind*, but the *Dwarf* or *Spaniſh Hyſſop*, as alſo the *Mountain Hyſſop*, grow naturally on the Hills in many places of *Spain* and *Germany*, and on the Hill *Salvatin* in the Country of *Goritia*.

XVII. *The Times.* They all Flower in the Summer Months, *viz.* thro' *June* and *July*, and beginning of *Auguſt*, and their Seed is ripe in the beginning or middle of *Auguſt*.

XVIII. *The Qualities, Specification, Preparations, and Virtues*, are fully and exactly the ſame with thoſe of the *Garden Kind* declared at large in the former Chapter, ſo that nothing more need be ſaid thereof in this place.

CHAP. CCCLXXXVIII.

Of HYSSOP Hedge True,

OR,

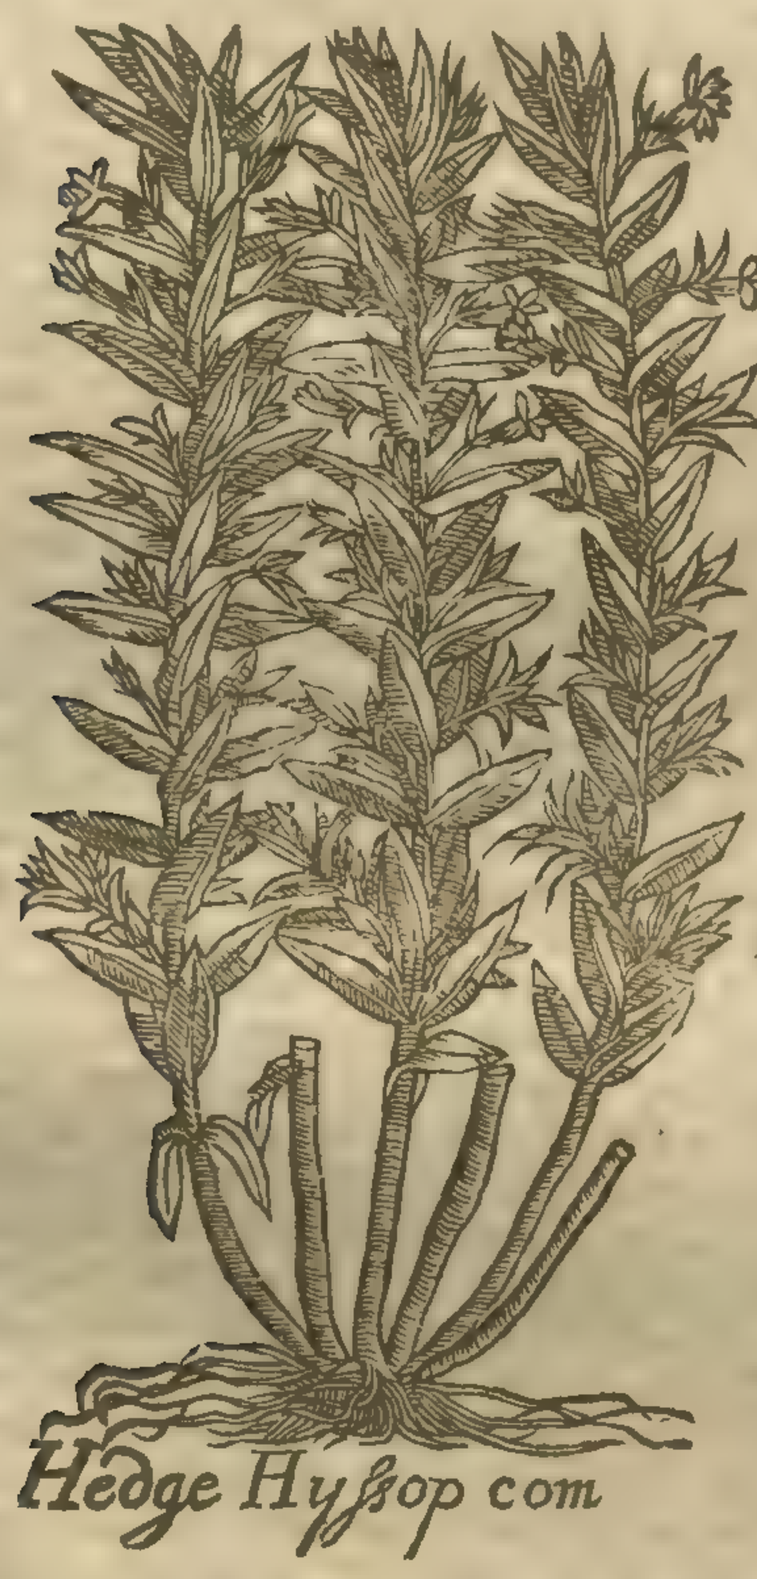
HYSSOP Marſh.

I. *THE Names.* It was unknown to the Ancient *Greeks*, the *Arabians* call the Seed thereof *Gelbenech*, the *Latines* call the Plant *Gratiola*, ſo it is named by *Dodonæus*, *Geſner*, *Lobel*, *Lugdunenſis*, *Matthiolus*, and others; by ſome it is called *Gratia Dei*, and ſome call it *Gratia Dei altera*, becauſe there is another Herb among the *Gerania* ſo called; *Cordus* calls it *Limneſium*, or *Centauroides*, becauſe many for the bitterneſs thereof did think it a Species of *Centaurium minus*; *Geſner* calls it *Gratiola, ſive Centaurium Aquaticum*, alſo *Seſamoides*; *Columna* ſays that it is uſually called *Gratiola*, yet ſays it is thought of ſome more truly to be taken for a *Common Hyſſop*; *Bauhinus* in his *Pinax* calls it *Gratiola Centauroides*, and we in *Engliſh* call it *Hedge Hyſſop*, for diſtinction ſake, not that it grows by any Hedge ſide, but uſually in moiſt and watery places, for which reaſon it might more properly be called *Marſh Hyſſop*.

II. *The Kinds.* It is twofold, *viz.* 1. *Gratiola Vera*, The True Hedge Hyſſop, which is a ſingular Plant, and of which we treat in this Chapter. 2. *Gratiola Notha*, Baſtard Hedge Hyſſop, of which we ſhall treat in the next Chapter following.

III. The Deſcription. *It has a Root which ſhoots forth to and fro under Ground very much, with many joints and ſmall fibres at them, thereby increaſing and quickly ſpreading very far about, eſpecially if it ſtands in any moiſt place, becauſe it will ſcarcely endure long in any dry Ground*; it is but a ſmall low Plant, ſeldom growing above a Foot high, its Branches

Branches are ſlender, bending, and fourſquare, having ſeveral ſmall Leaves ſet thereon, very like to thoſe of the *Ordinary Garden Hyſſop*, but a little ſhorter and broader, and of a pale green color, of a very bitter unpleaſant taſte; from about the middle of theſe Branches, at the joints of the Leaves, up to the tops of them, come forth the Flowers every one at a place, ſtanding upon very ſhort footſtalks, which are ſomewhat long and hollow, ending in four Leaves, two of the loweſt ſtanding out, as it were Lips, and the other two above, ſhorter by the half, of a whitiſh yellow color, tending to a black blew, and ſometimes more blewiſh or purple; after which come ſmall round Heads, in which is contained ſmall Seed.



IV. *Nota.* *Camerarius* ſays that (not far from *Geneva*) he has found another Kind of this Plant, *viz. Gratiola Flore luteo*, Hedge Hyſſop with a yellow Flower, but not differing from the former in any other particular.

V. *The Places.* It delights to grow in moiſt, watery, and Marſh Grounds, if you would have it to live and flouriſh, it grows naturally in many places of *Italy*, and near *Padua* plentifully, but with us it is only nurſed up in Gardens.

VI. *The Times.* It Flowers in *June* and *July*, and its Seed is ripe not long after, but it ſeldom gives ripe Seed in *England*.

VII. *The Qualities.* It is hot and dry probably in the third degree, Inciſive, Attractive, Abſterſive, Aperitive, Traumatick, Hepatick, Splenetick, Arthritick, and Cathartick.

VIII. *The Specification.* It is a good Antifebritick, and peculiar for the curing of the Dropſie, Scurvy, and Gout, kill Worms, and heal all ſimple green Wounds, running Sores, and putrid Ulcers.

IX. *The Preparations.* You may have therefrom, 1. *A Liquid Juice of the Herb.* 2. *An Eſſence.* 3. *A Decoction in Water or Wine.* 4. *A Pouder.* 5. *An Extract.* 6. *A Balſam or Ointment.*

The Virtues.

X. *The Liquid Juice.* It works very ſtrongly and churliſhly both upwards and downwards, expelling much viſcous and groſs Flegm, alſo Choler, and watery Humors, for which reaſon it is profitable for ſuch as are troubled with a *Sarcites*, or Dropſie *Anaſarca*, as alſo the *Aſcites* or *Tympanites* in beginning, and for ſuch as are affected with the Gout or Sciatica; it cures both Tertian and Quartan Agues, and kills Worms in the Belly, whether in Old or Young, but by reaſon of its churliſhneſs it ought to be corrected with Aniſeeds, Caraways, Cloves, Cinnamon, *&c.* Doſe half a Spoonful, increaſing it according to Age and Strength gradually to two, three, or four Spoonfuls; it may be given mixed with Poſſet-drink, Sack-Whey, or Mutton Broth, *&c.*

XI. *The Eſſence.* It has all the Virtues of the former, but nothing near ſo churliſh, but ought to be corrected with Powers of Angelica, Pennyroyal, Aniſeeds, Caraways, *&c.* it cures Quotidian and Tertian Agues, opens obſtructions of Liver and Spleen, reſiſts putrifaction, kills Worms, and evacuates peccant Humors; the Doſe is the ſame with the Liquid Juice, and to be given in the ſame manner.

XII. *The Decoction or Infuſion in Water or Wine.* It has all the Virtues of the Juice and Eſſence, but is to be given in a greater quantity, it cleanſes the Stomach and other Viſcera, opening their obſtructions, it alſo induces old running Sores and filthy Ulcers to a ſpeedy healing, it works both upwards and downwards, but much more gently than either Juice or Eſſence.

XIII. *The Pouder.* It has all the Virtues of Liquid Juice, Eſſence, or Decoction, but operates not ſo ſpeedily, it kills Worms effectually in Old or Young, and prevails wonderfully againſt the Scurvy and Jaundice, as alſo obſtructions of the Womb, but it ought to be corrected with Camphir, Pouder of Aniſeeds, *&c.* Doſe from a Scruple to a Dram, or more, according to the Age of the Patient, Strength, and other Circumſtances; outwardly ſtrewed upon old running Sores, or putrid Ulcers, it cleanſes and dries them, and induces their ſpeedy healing; it alſo admirably conſolidates green Wounds, *&c.*

XIV. *The Extract.* It may be made into Pills with Pouders of Aniſeed, or Cinnamon; *Camerarius* commends it not only to be available againſt the Dropſie, but againſt all ſorts of Agues, and ſo much the more if a little of the Inſpiſſate Juice of Calamint be added; it has all the Virtues of Juice, Eſſence, Decoction, and Pouder, but works with much more ſafety and gentleneſs. Doſe from a Scruple to a Dram in any fit Vehicle.

XV. *The Balſam or Ointment.* It is excellent good againſt the Gout or Sciatica being applied to the parts affected, it alſo digeſts green Wounds, or malign Ulcers, cleanſes, dries, and heals them in a very ſhort time, but this more eſpecially if the pouder of Tobacco, be mixed with the ſame.

CHAP. CCCLXXXIX.

Of HYSSOP Hedge Baſtard.

I. *THE Names.* This can have no *Greek* Name, any more than the former, in *Latine* it is

called *Gratiola Notba*, and in *Engliſh Baſtard Hedge Hyſſop.*

II. *The Kinds.* There are three ſorts hereof, *viz.* 1. *Gratiola Anguſtifolia*, and *Anguſtifolia minor*, *Gratiola minor Geſneri*, alſo *Hyſſopoides* by *Camerarius*, *Hyſſopi Folia Cordi & Bauhini*, Small Hedge Hyſſop, alſo Small Narrow Leav'd Hedge Hyſſop. 2. *Gratiola Cærulea*, *Gratia Dei Cæſalpini*, *Tertianaria Tabernamontani*, *Herba Judaica altera Dodonæi*, *Sideritis Cærulea Thalij*, *Lyſimachia Flore Cæruleo Camerarij*, *Lyſimachia Galericulata Lobelij*, *Gratiola Latifolia*, and *Latifolia major*, The Greater Broad Leav'd, or Blew Flowered Hedge Hyſſop. 3. *Gratiola Latifolia minor*, and *Latifolia noſtras minor Parkinſoni*, The Leſſer Broad Leav'd Hedge Hyſſop.

III. The Deſcriptions. *The firſt, or* Small Narrow Leav'd Hedge Hyſſop. *It has a Root which is white, and ſhoots forth many Fibres, whereby it takes good rooting and hold in the Earth*; from this Root ſhoot forth ſometimes many, and ſometimes but one or two round reddiſh Stalks, half a Yard high, which are branched towards the tops, on which are ſet one above another, and ſometimes one againſt another, divers ſmall and ſomewhat long Leaves, ſomething ſmaller than thoſe in the former Chapter, and nearly reſembling *Hyſſop* Leaves, of a pale green color, and joining cloſe to the Stalks and Branches, without any Footſtalk at all; at the Joints with the Leaves come forth Flowers, every one by it ſelf, ſtanding in a long Husk, and conſiſting of four Leaves, of an excellent blew color, after which comes in their places ſmall brown Seed, contained in long round Pods; the Herb and every part thereof is without any the leaſt ſmell, and almoſt without any taſte, tho' ſome will have it to be of a little nitrous, others of a little ſweetiſh taſte; ſometimes in the moiſter Grounds this is found with larger Leaves, and growing higher, and ſometimes in dry Grounds with ſmaller and longer Leaves, ſcarcely growing a Span high.

IV. *The ſecond, or* Greater Broad Leav'd Hedge Hyſſop. *It has a Root which ſpreads much, and with many Branches under Ground, quickly thereby poſſeſſing a large circuit or compaſs*; it is a ſmooth low Plant, riſing about a Foot high, with many ſquare Stalks variouſly branched from the bottom to the top, having thereon ſeveral Joints, and two ſmall Leaves at every one, which ſtand upon ſhort Footſtalks, being broad at the bottom, and ſmaller towards the end, a little dented about the edges, and full of Veins, of a ſadder green color than the former, longer alſo, and broader; the Flowers are gaping, ſomething like unto thoſe of *Dead Nettles*, of a fair blewiſh purple color, with ſome white ſpots in them, every one ſtanding at the Joints with the Leaves, up to the tops, after which come forth ſmall Seed Veſſels, formed ſomething like unto the top of the Thigh Bone of a Man or Beaſt, in which the ſmall Nut or Huckle Bone is placed, the upper part of which does firſt open when the Seed is ripe, and falls away when it is touched, thereby ſhewing within it ſmall yellow Seed: There is a leſſer ſort hereof, differing only in the ſmallneſs of the Plant, which I am apt to believe ariſes only from the different goodneſs of the Soil; this Herb is referred to *Gratiola*, not only from its place and manner of growing, but eſpecially for its bitterneſs, in which it is ſo like to it.

V. *The third, or* Leſſer Broad Leav'd Hedge Hyſſop. *It has a Root which is ſmall, long, and white, ſpreading it ſelf under Ground ſeveral ways, which periſhes not in Winter, nor runs like the laſt, but ſpreads forth new Branches every Year*; from this Root ſprings up one or more ſmall Stalks, about half a Foot high, round, but creſted as it were all the length, which ſpread forth other ſmaller Branches, on which do grow many ſmall Leaves, ſet by couples one againſt another, being ſomething broad, but very ſhort withal, ſeeming almoſt round, and ending in a ſharp point, a little dented about the edges; at the Joints with the Leaves come forth the Flowers, every one by it ſelf, on a ſmall Footſtalk, being in form ſomewhat like unto the laſt, a gaping Flower, but ſhorter, of a pale reddiſh color, ſpotted in the middle of the lower Leaf with many ſmall white ſpots; after the Flowers are fallen come in their places Seed Veſſels, in ſhape ſomething like unto the Nut of a Croſs-Bow, in which is contained ſmall yellowiſh Seed; the taſte of this Plant is as extreamly bitter as the laſt; this Herb is alſo referred to the *Gratiola Latifolia*, as well for the reſemblance of the Flower to the laſt before deſcribed, as for the bitterneſs thereof.

VI. *The Places.* The firſt has been found growing naturally in ſeveral places of *England* in moiſt and wet Grounds, as at *Dorcheſter* in *Oxfordſhire*, at the back ſide of the encloſed Grounds, on the Left Hand of the Town, as you go from thence to *Oxford*, in the Graſſie places of the *Champion Corn Fields*; the ſecond grows likewiſe in ſeveral places of this Land, in wet low Grounds, and by Water ſides; the third is not known to grow in any other Country but in *England*, ſo far as we can yet hear or learn; and it was firſt found out by *Gerard*, who called it ſimply *Gratiola Latifolia*, in wet boggy Grounds among the Graſs; I found it (ſays he) growing on the Bog or Marſh Ground at the farther end of *Hampſtead Heath*, and upon the ſame Heath towards *London*, near unto the Head of the Springs that were digged *Anno* 1590. for Water to be conveyed to that City.

VII. *The Times.* The two firſt Flower in *June* and *July*, the third in *July* and *Auguſt*, their Seeds ripening in a ſhort time after their Flowers are paſt.

VIII. *As to their Qualities, Specification, Preparations, and Virtues,* Authors have ſaid nothing; the

the firſt of theſe has never yet been applied to any Medicinal uſe by any Author that I could ever yet ſee, nor yet the ſecond or third Kinds, but their bitterneſs coming ſo near to that of the *Gratiola Vera*, or *True Hedge Hyſſop*, induces me to think that they muſt have ſome of the Virtues of the *True Hedge Hyſſop*, and if they be not full out ſo effectual to Purge, yet by their bitterneſs they may be Aperitive, and have a virtue to open the obſtructions of the Viſcera, and cleanſe them from their pituitous and viſcous Excrements; they may alſo by the ſame bitterneſs be Analeptick, and ſo ſtrengthen the Stomach, and other Bowels, reſtoring their depraved Tone, *&c.*

CHAP. CCCXC.

Of JACK-by-HEDGE, *OR,* SAWCE-ALONE.

I. *THE Names.* This ſeems to be a Novel Plant, not known to the *Greeks*, and therefore has no *Greek* Name, the *Latines* call it *Alliaria*, *Geſner* in *Hortis Alliaſtrum*, and *Ericius Cordus Rima Marina*, which is the *Rima Marina Anguilaræ*, and *Alectorolophus Plinij*, as *Dalechampius* and *Lobel* thought; ſome take it to be *Thlaſpidium Cratevæ*, as alſo *Thlaſpidium Cornutum Tragi*, becauſe they anſwer to its deſcription; we in *Engliſh* call it *Jack-by-Hedge*, and *Sawce-alone*, becauſe it ſerves of it ſelf for Sawce, inſtead of many others.

II. *The Kinds.* Some would have it to be *Scordium*, but that it is not, others *Scordij Species*, a Kind of *Scordium*, or *Water Germander*, but indeed it has no relation to any of thoſe Plants, that being a real miſtake of former Authors; it is a ſingular Plant of its Kind, which *Gerard* ſays is Named of ſome *Pes Aſininus*, Aſſes Foot, and may be called (ſays he) in *Latine Allium non bulboſum*, a Kind of *Garlick*, ſo eſteemed from its ſmell; it ſeems to be, 1. *Alliaria Communis, vel minor*, The Common Jack-by-Hedge. 2. *Alliaria major*, The Greater Kind.

III. The Deſcriptions. *The firſt, or* Common Jack-by-Hedge. *It has a long ſlender Root, which is fibrous or ſtringy, and thready, periſhing every Year after it has given Seed*; from this Root riſe up ſeveral ſlender Stalks, about a Foot and half high, the Leaves are broad, of a light green color, nicked round about, and ſharp pointed; the lower Leaves are rounder than thoſe which grow upward towards the tops of the Stalks, and are ſet ſingly one at a Joint, being longiſh round the higher they grow, and alſo pointed at the ends, and dented about the edges, tho' ſomewhat leſs dented than thoſe growing below, they ſomewhat reſemble *Nettle* Leaves for the form, but are of a freſher green color, and not rough or pricking; upon the Branches of the Stalks near the tops grow very ſmall white Flowers, one above another, like *Rocket*, which being paſt come ſmall, ſlender, and round long Pods, not very much unlike to thoſe of *Flixweed*, ſaving that theſe are rougher, and grow ſomewhat cloſer to the Stalk, in theſe Pods are contained ſmall, round, and ſomewhat blackiſh Seed; this Plant raiſes it ſelf every Year again of its own ſowing, and it has affinity to *Garlick* in its Name, yet not in Name only, but in its ſmell, for any part of it being bruiſed ſmells of *Garlick*, but more pleaſantly, and taſtes ſomething hot, ſharp, and biting, almoſt like unto *Rocket*, for which reaſon it becomes an admirable Sawce, to ſuch as love that taſte.

IV. *The ſecond, or* Greater Kind of Jack-by-Hedge, *has like Roots, Stalks, Leaves, Branches, Flowers, and Seed, and the ſame manner of growing*, and differs only in this, that the Leaves grow larger and rounder.

V. *The Places.* It grows of it ſelf by Garden Hedges, by old Walls, by high Way ſides, and ſometimes in the borders of Fields, in moſt places of this Kingdom.

VI. *The Times.* It Flowers chiefly in *June* and *July*, and the Seed grows ripe in the mean ſeaſon, or not long after the Flowers are gone; the Leaves are uſed for Sawce in *March* and *April*.

VII. *The Qualities.* It is hot and dry in the third degree, and is repleat with much Salt, Sulphur, and Mercury, it is Inciſive, Apetitive, Attractive, Abſterſive, Carminative, Digeſtive, Diſcuſſive, and Diuretick, Neurotick, Stomatick, Pectoral, Nephritick, and Hyſterick, Ptarmick, Emmenagogick, and Alexipharmick.

VIII. *The Specification.* It is peculiar againſt the Scurvy, Coughs, Colds, Wheezing, ſhortneſs of Breath, Stone, Strangury, Colick, and Fits of the Mother.

IX. *The Preparations.* You may have therefrom, 1. *A Juice of the Leaves and Roots.* 2. *An Eſſence of the ſame.* 3. *An Infuſion or Decoction in Water or Wine.* 4. *A Syrup.* 5. *The Root.* 6. *The Seed bruiſed, or infuſed in Wine.* 7. *A Cataplaſm.* 8. *An Acid Tincture.* 9. *A Spirituous Tincture.* 10. *An Oily Tincture.* 11. *A Saline Tincture.* 12. *A Spirit.* 13. *A Sawce.*

The Virtues.

X. *The Liquid Juice.* Taken from a Spoonful to two or three Spoonfuls in a Glaſs of White Port, Madera,

Madera, or Canary Wines, it provokes Urine, helps the Strangury, expels Gravel, Sand, Tartarous Mucilage, eases the Colick, and suppresses Vapors and Fits of the Mother.

XI. *The Essence.* It has all the former Virtues, besides which it potently resists the Scurvy, Dropsie, Jaundice, and Gout, resists Vomiting, strengthens the Stomach, causes a good Appetite and a strong Digestion; it admirably corrects Crudities, warms the Stomach, and restores the Tone thereof being hurt or weakned. Dose one, two, or three Spoonfuls Morning and Night, (and sometimes at Noon) in a Glass of generous Wine.

XII. *The Infusion or Decoction.* It has all the Virtues of the Juice and Essence, but much weaker, and therefore may be given to six or eight Ounces Morning and Night; but the Infusion is better than the Decoction, because consisting mostly of volatile parts, those by boiling will evaporate away in a great measure, whereas by a close infusion they may be all preserved.

XIII. *The Syrup.* It ought to be made with clarified Honey, and then it will be as good as *Erysimum*, or *Hedge-Mustard*, to warm the Stomach, and ease Coughs, Colds, help Wheezings, shortness of Breath, and difficulty of breathing, as also to help Catarrhs, and to cause expectoration of thick tough Flegm and putrid Humors out of the Breast and Lungs.

XIV. *The Root.* It tastes sharp, like unto *Radish* Roots, and therefore may be used in the same manner and to the same purposes; if it is scraped thin, and the scrapings are put into Wine Vinegar, with a little Salt, it makes a very good Sawce for Meat: The Juice of the Root given in White Wine is excellent against the Colick, Strangury, Stone, *&c.* it gives ease also in all those Cases if exhibited in a Clyster, *&c.*

XV. *The Seed bruised, or infused in Wine.* It is a present Remedy for a vehement pain in the Stomach, as also for the Colick, Strangury, Stone, Gravel, or any Tartarous Matter obstructing the Urinary passages; it suppresses Vapors, abates Melancholy, and cures Hysterick Fits. Dose of the Seed from half a Dram to a Dram and half, either in substance (mixed with Honey) or in infusion in Wine.

XVI. *The Cataplasm.* Made of the green Leaves, or of Leaves and Root, and applied to old running Sores and foul Ulcers, whether in the Legs, Arms, or other parts, it abates the pain (if any) cleanses the Sore or Ulcer, dries them, and induces a speedy healing.

XVII. *The Acid Tincture.* It is possibly one of the greatest Medicines in the World against the Scurvy, it restores the Tone of the Stomach, strengthens it, causes a good Appetite and Digestion, suppresses Vapors, and has all the Virtues of the Liquid Juice and Essence above declared; it is also Antifebritick, and Alexipharmick, it cures all sorts of hot, burning, and putrid Fevers, and all such as are pestilential, and is powerful even against the Plague it self; it resists Poyson internally taken, or otherwise given by the bitings of mad Dogs, Vipers, or other Serpents, or other venomous Creatures, being inwardly taken, and outwardly applied to the parts wounded, by bathing. Dose so many drops as may make a Glass of generous Wine, or other proper Vehicle, pleasantly acid or sharp, and to be repeated three or four times a day, or as oft as need requires.

XVIII. *The Spirituous Tincture.* It is Cephalick, Neurotick, Stomatick, Cardiack, and Hysterick; it warms and comforts the Head, Brain, Nerves, and Stomach, chears the Heart, revives the Spirits, and is powerful against fainting and swooning Fits, Convulsions, Palsies, Vertigo, Lethargy, Carus, Coma, Epilepsie, Hysterick Passion, and other Diseases of like kind affecting any of those parts; it causes a good Appetite and Digestion, gives present ease in the Colick, and alleviates pains of the Stomach and gripings of the Guts arising from cold, crude, and undigested Humors. Dose from half a Spoonful to a Spoonful, or more, two or three times a day, in a Glass of generous Wine.

XIX. *The Oily Tincture.* It has all the Virtues of the Juice, Essence, Infusion, and Tinctures, and may be given from eight drops to twenty drops, or more, being first dropped into and mixed with White Sugar, and then mixed with a Glass of Wine, or other proper Vehicle; it is a potent thing against the Stone, Gravel, Sand, or Tartarous Matter obstructing the Reins or Urinary passages, it gives ease in the Colick and Strangury, and is a present Remedy against the Pleurisie, Stitches in the Side, and other like pains of the *Thorax* and Stomach; it cures Cramps by anointing therewith, and is of excellent use against Convulsion Fits in Elder Persons, as also against Vapors, and obstructions of the Womb; it provokes the Terms, and facilitates the Birth of Women in Labor, bringing away the Afterbirth or dead Child; it gives present ease in after pains anointed upon the lower parts of the Belly, and taken inwardly in a Glass of Canary; it prevails against the Palsie taken daily in Wine, bathing the Back Bone therewith, together with the parts affected, and continuing the use thereof for some considerable time; it also gives ease in the Gout.

XX. *The Saline Tincture.* It seems to be a Specifick against Arthritick pains, proceeding either from a hot or cold cause; it is good against Spots, Marks, Tanning, Sunburning, black and blewness, and other discolorings of the Skin, it removes yellowness of the Scarf Skin, Freckles, Lentils, Scurf, Morphew, and other like deformities of the *Cutis*, but it must be made pretty strong, and applied two or three times a day, and suffered to dry on, for by that means the fuliginous matter will be drawn forth, and the Skin will peel off in manner of Scurf, leaving a fine, young, tender, pure, clear Skin underneath.

XXI. *The Spirit.* It is truly Cordial, Neurotick, Cephalick, and Hysterick, it revives the Spirits, chears the Heart, and refreshes the whole Universal Man; it is good against Convulsions in Children and Elder People, prevails against Palsies, Apoplexies, Lethargies, Epilepsies, and Pleurisies, giving in those Diseases present relief; it is singular against Vapors and Fits of the Mother, and wonderfully resists and restores out of Fainting and Swooning Fits; it is strongly Aperitive, and removes the obstructions of the Lungs, Liver, Spleen, Reins, and Womb, dissolving the congelation of Humors causing the same. Dose from one Dram to two or three Drams in Wine, or any other fit Vehicle.

XXII. *The Sawce. It is made of the Leaves shred small, or of the Root scraped, or of their Juice expressed, adding a proportional quantity of White Sugar, Wine Vinegar, and Salt.* Being thus compounded it is eaten in the Spring Time with Meat, as Mutton, Lamb, Beef, Veal, *&c.* either boiled or roasted; it corrects Crudities, expels Wind, strengthens the Stomach, creates a good Appetite, and causes a good Digestion.

JACINTH *English*, See *Harebells English* Ch. 335.

CHAP.

CHAP. CCCXCI.

Of JACINTH American.

I. *THE Names.* This Plant its general Name is called in *Greek* Ὑάκινθος, in *Latine Hyacinthus*, in *Engliſh Jacinth*, and *Hyacinth*; the *Spaniards* call it *Maios Flores*.

II. *The Kinds.* There are various Species of this Plant, and ſeveral ſorts of each generick Kind, *viz.* 1. *Hyacinthus Anglicus*, Engliſh Hyacinth, of which there are four Species, *viz.* 1. *Hyacinthus Anglicus Cæruleus*, Blew Engliſh Jacinth. 2. *Hyacinthus Anglicus Albus*, White Engliſh Jacinth. 3. *Hyacinthus Anglicus Incarnato Flore*, Carnation Engliſh Jacinth. 4. *Hyacinthus Anglicus vel Hiſpanicus major Flore Campanulæ inſtar*, Greater Engliſh or Spaniſh Jacinth; all theſe growing in *England* are commonly called *Haresbells*, and of which we have already treated in the foregoing part of this Book, *viz.* in Chap. 335. and therefore ſhall now overpaſs them in this ſuccinct Diſcourſe of Jacinths. 2. *Hyacinthus Americanus*, American or Weſt Indian Jacinth, of which there are two Kinds, which are the peculiar Subject of this preſent Chapter. 3. *Hyacinthus Botroides*, Grape Flowered Jacinth, of which there are ſix Species, Treated of in Chap. 392. 4. *Hyacinthus Botroides Muſcatus*, Musked Grape Flowered Jacinth, of which there are four Species, which are Treated of in Chap. 393. 5. *Hyacinthus Comoſus*, The Haired Jacinth, of which there are five Species, which are Treated of in Chap. 394. 6. *Hyacinthus Orientalis*, The Oriental Jacinth, of which there are eight Species, which are Treated of in Chap. 395. 7. *Hyacinthus Orientalis Flore duplici*, Double Oriental Jacinth, of which there are three Species, and are Treated of in Chap. 396. 8. *Hyacinthus Æſtivus*, The Summer Jacinth, of which there are five Species, and are Treated of in Chap. 397. 9. *Hyacinthus Fuſcus*, The Brown or Dun Colored Jacinth, of which there are three Species, and are Treated of in Chap. 398. 10. *Hyacinthus Stellatus Peruanus*, Weſt Indian Starry Jacinth, of which are four Species, and are Treated of in Chap. 399. 11. *Hyacinthus Stellatus Vulgaris*, The Common Starry Jacinth, of which there are ſeven Kinds, and are Treated of in Chap. 400. 12. *Hyacinthus Stellatus Byzantinus*, The Turky Starry Jacinth, of which are four Species, and are Treated of in Chap. 401. 13. *Hyacinthus Stellatus Autumnalis*, The Autumn Jacinth, of which there are three Species, and are Treated of in Chap. 402. 14. *Hyacinthus Stellatus Lilifolius*, The Lilly Leav'd Starry Jacinth, of which there are three Species, and are Treated of in Chap. 403. I know ſome Authors account the *Squil* or *Sea Onion* in the Claſſis of Jacinths, making it a Marſh or Sea Kind, but I am of a contrary Opinion, and therefore ſhall not rank it with thoſe aforegoing, but Treat of it hereafter in its proper place of the Alphabet.

III. *The Kinds of the American Jacinth.* There are only two Species of this, *viz.* 1. *Hyacinthus Indicus vel Americanus major Radice Tuberoſa*, The Greater American Tuberoſe Rooted or Knobbed Jacinth. 2. *Hyacinthus Indicus vel Americanus minor Radice Tuberoſa*, The Leſſer American Tuberoſe Rooted or Knobbed Jacinth. *Cluſius* leaves out the Word *minor* in the Name of the ſecond, becauſe, as it is thought, he never knew or heard of the firſt; ſome would have theſe *Hyacinths* to be *Hyacinthi Eriophori Indici*, The Indian Woolly Jacinth, becauſe when they are broken they have much Wooll in them, which I think to be a miſtake; and ſome think that theſe two Plants are not two ſeverals, as greater and leſſer, but that the greatneſs of the one is cauſed by the goodneſs or richneſs of the Soil where it grows, but whoſo ſhall conſider the particular Deſcription of each, and compare them, will ſoon become of another Mind.

IV. The Deſcriptions. *The firſt, or* Greater American Tuberoſe Rooted Jacinth. *It has a thick knobbed Root, (yet formed into ſeveral Heads, ſomewhat like unto bulbous Roots) with many thick fibres at the bottoms of them*; from the divers Heads of which Root riſe up ſeveral ſtrong and very tall Stalks, beſet with divers fair, long, and broad Leaves, joined at the bottom cloſe unto the Stalk, where they are greateſt, and grow ſmaller to the very end, and thoſe which grow higher to the top being ſmaller and ſmaller, which being broken many fine Threads appear like Wooll in them; the tops of the Stalks are beautified with many fair, large, white Flowers, each of which does conſiſt of ſix Leaves, lying ſpread open, as the Flowers of the *White Daffodil*, with ſome ſhort Threads in the middle, and of a very ſweet ſmell, ſo ſweet as ſome account it ſtrong and heady; this is the greateſt and talleſt of all the *Jacinths*, and the Flowers are ſomething near in reſemblance unto thoſe of the *Daffodil*, but its Root is tuberoſe, as aforeſaid, and not bulbous, as all the reſt are.

V. *The ſecond, or* Leſſer American Tuberoſe Rooted Jacinth. *The Root of this* Jacinth *is knobbed, like the Root of* Arum, *or* Wake-Robin, *or like the Root of the* Carolina Eddo, *from whence many Fibres ſpring forth*; from this Root come forth many Leaves, lying upon the Ground, and encompaſſing one another at bottom, being long and narrow, and hollow guttered to the ends, which are ſmall and pointed, and no leſs woolly and full of Threads than the former; from the middle of theſe Leaves riſes up a Stalk, which is very long and ſlender, three or four Feet in height, which, unleſs it is propped up, will bend down, and lie upon the Ground, on which are ſet at certain diſtances many ſhort Leaves, being broad at the bottom, where they do almoſt encompaſs the Stalk, and are ſmaller towards the end, where it is ſharp pointed; at the top of the Stalk ſtand many Flowers, with a ſmall piece of a green Leaf at the bottom of every footſtalk, which ſeem to be ſo many *White Oriental Jacinths*, being compoſed of ſix Leaves, which are much thicker than the former, with ſix Chives or Threads in the middle, tipt with pale yellow Pendents.

VI. *The Places.* They both grow naturally in the *Weſt Indies*, from whence they were firſt brought into *Spain*, and from thence have been brought to us, and into ſeveral other parts of *Europe*.

VII. *The Times.* They Flower not in *England* and other like cold Countries till the middle of *Auguſt*, and ſometimes not at all, unleſs they be carefully preſerved from the injuries of our cold Winters, and then if the precedent Summer has been hot they may Flower a Month ſooner.

VIII. *The Qualities.* They are cold and drying in the firſt degree, or beginning of the ſecond, Aſtringent and Diuretick.

IX. *The Specification.* They ſtop fluxes of the Bowels, give eaſe and relief in the Strangury, and are profitable againſt the Jaundice and Kings-Evil; the Roots are only of uſe in Medicine, but being often uſed are thought to cauſe Barrenneſs; but 'tis certain, that being taken inwardly by Young Perſons it keeps them from growing ripe too ſoon.

X. *The*

X. *The Preparations.* There are but few Preparations from these Plants, *viz.* about five, 1. *A Liquid Juice.* 2. *An Essence.* 3. *A Decoction or Infusion.* 4. *A Pouder.* 5. *An Ointment.*

The Virtues.

XI. *The Liquid Juice.* It cools and abates Fevers, and given in Red *Florence* or *Port* Wine stops fluxes of the Bowels; given in White *Port* Wine, or *Parsly*, or *Arsmart* Water, it cleanses all the Urinary passages, provokes Urine, and cures the Strangury; given in Milk of *Hempseed* made with *Parsly* Water it prevails against the Jaundice, and daily taken in Mutton Broth, or a gentle Infusion of *Sena*, it eradicates the Kings-Evil. Dose from one Spoonful to two, or more, increasing the Dose gradually, as you find the Patients Body does agree with it.

XII. *The Essence.* It has all the Virtues of the Juice, and is something more prevalent than it, for which reason it is to be given in a lesser Dose, but in the same manner, and in the same Vehicles, and may be given twice a day, as you see need requires, or the Constitution of Body will bear it.

XIII. *The Decoction or Infusion.* It may be made in *Arsmart* Water, or *Parsly* Water, in which a Scruple or half a Dram of Salt of Tartar is dissolved, or in White or Red Port Wine, (according to the Intention) or in a mixture of the former Waters with those Wines, as the Physician in Prudence shall direct; they have all the Virtues of the Juice and Essence, but must be given in a much larger Dose, *viz.* from three Ounces to eight Ounces, according to Age, *&c.*

XIV. *The Pouder.* It may be given for all the Purposes that any of the aforegoing Preparations are given for. Dose from half a Dram to a Dram, or Dram and half, once or twice a day in any proper Vehicle, it does not so speedily pass off as those liquid things do, but commonly lies longer in the Stomach, and if the Stomach is weak, or foul, will be apt sometimes to make it sick; outwardly applied to old running Sores, or putrid Ulcers, also Ulcers of the Kings-Evil, it cleanses them and dries up their humidities, and induces them to a speedy healing.

XV. *The Ointment.* It is good to heal old Sores and Ulcers, but is chiefly good against Tumors and Ulcers of the Kings-Evil, for by anointing them first therewith Morning and Evening, chafing the Ointment well in, it insensibly consumes those Kernels or Swellings, and in time perfectly dissolves them; and if you mix therewith Pouders of Scammony and Tobacco, *ana*, and apply it to strumous Ulcers, it cleanses, takes away dead or proud Flesh, dries them up, and quickly heals them.

XVI. *Nota.* What we have said of the Qualities, Specification, Preparations and Virtues of these *Tuberose Jacinths*, the same is to be understood of all the *Bulbous Jacinths* hereafter following, (excepting only the *Musk Grape Flowered Jacinth* in Chap. 393. which is said to be the *Bulbus Vomitorius Dioscoridis*, and the *Lilly Leav'd Starry Jacinth* in Chap. 403.) and this I thought good to give notice of here once for all, that in the following Chapters of this Plant we might not often repeat the same in vain.

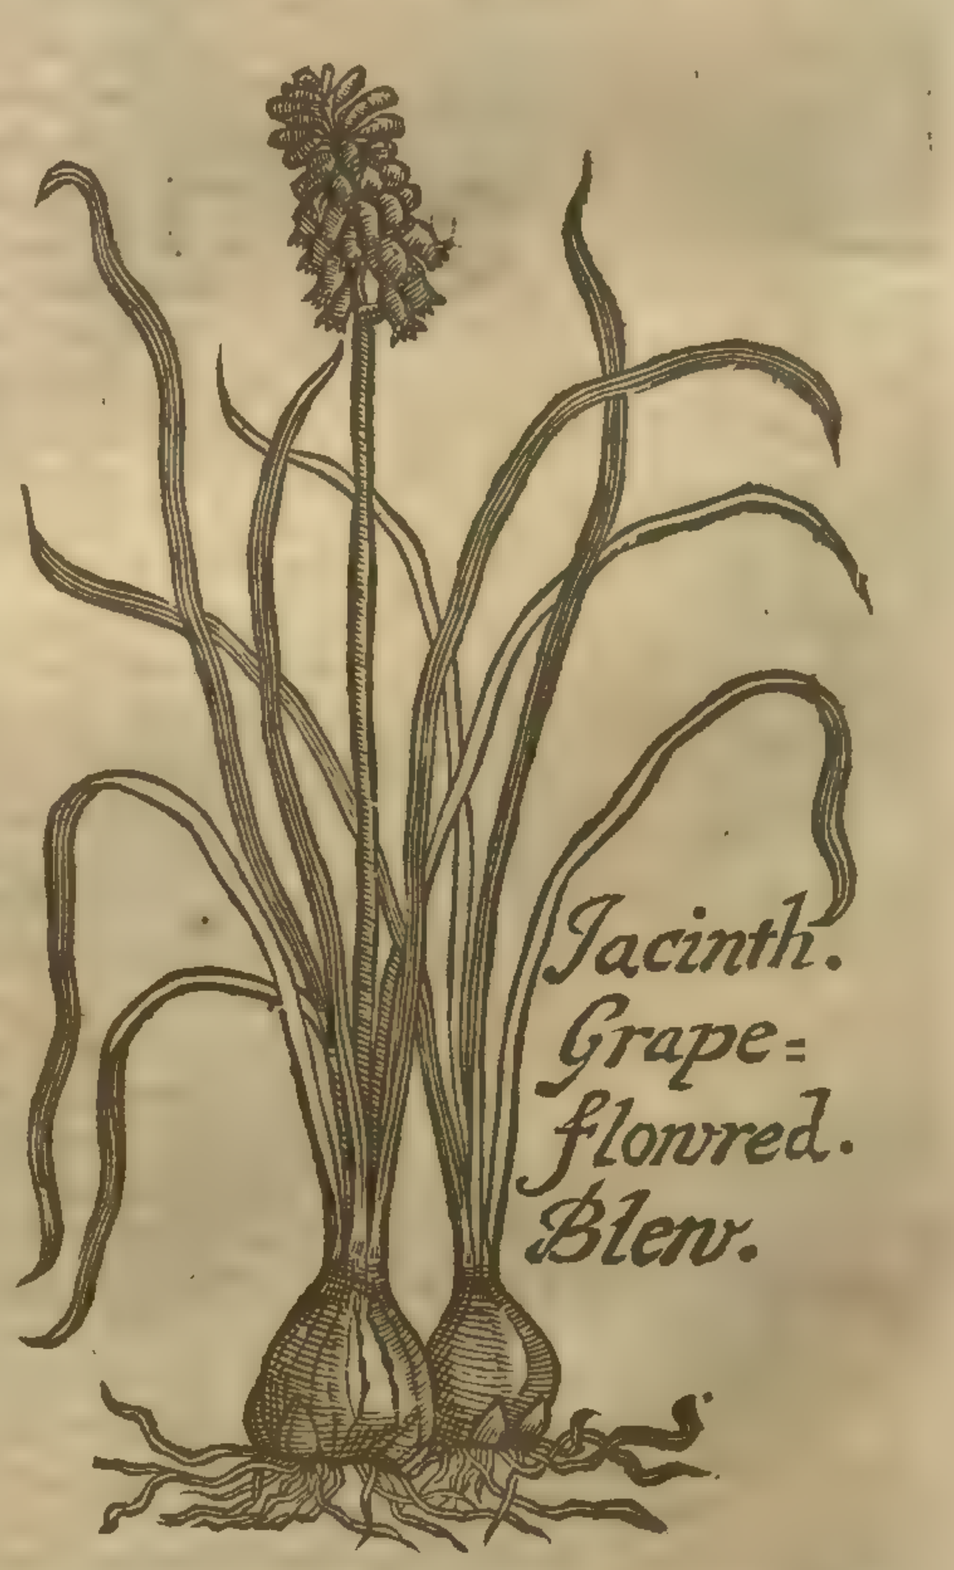
CHAP. CCCXCII.

Of JACINTH Grape Flowered.

I. *THE Names.* It is called in *Greek* Ὑακινθος Βοτρυώδης, in *Latine Hyacinthus Botroides*, and in *English Grape Flowered Jacinth.*

II. *The Kinds.* The *Grape Flowered Jacinth* has two principal or generick Kinds, *viz.* 1. *Hyacinthus Botroides vel Racematus non Moschatus*, The Grape Flowered Jacinth not Musked, of which in this Chapter. 2. *Hyacinthus Botroides vel Racematus Moschatus*, The Musked Grape Flowered Jacinth, of which in the Chapter following.

III. *The Kinds of the Grape Flowered Jacinth not Musked.* Of this there are these six varieties, 1. *Hyacinthus Botroides vel Racematus minor Cæruleus obscurus*, The Lesser dark Blew Colored Grape Flowered Jacinth. 2. *Hyacinthus Racematus major Cæruleus*, The Greater dark Blew Colored Grape Flowered Jacinth. 3. *Hyacinthus Botroides Cæruleus Amænus*, The Pleasant Sky Colored Grape Flowered Jacinth. 4. *Hyacinthus Botroides Ramosus*, The Branched Grape Flowered Jacinth. 5. *Hyacinthus Botroides Flore albo*, The White Grape Flowered Jacinth. 6. *Hyacinthus Botroides Flore albo rubente*, The BlushGrape Flowered Jacinth.



IV. The Descriptions. *The first, or* Lesser dark Blew Colored Grape Flowered Jacinth. *It has a Root which is round, and blackish without, being encompassed with a number of small Roots or Off-sets round about it, so that it will quickly choak a Ground if it is suffered long in it, for which cause many do cast it out into some by corner, if they intend to preserve it, or else cast it out of the Garden quite*; it has many small and fat weak Leaves, lying upon the Ground, which are somewhat brownish at their first coming

coming up, and of a ſad green afterwards, hollow on the upper ſide and round underneath, from among which riſe up round, ſmooth, weak Stalks, bearing at the top many ſmall, heavy, Bottle-like Flowers, in ſhape like to the *Muſcari* (in the following Chapter) but very thick thruſt together, ſmaller, and of a very dark or blackiſh blew color, of a very ſtrong ſmell, like unto *Starch* when it is new made and hot.

V. *The ſecond, or* Greater dark Blew Colored Grape Flowered Jacinth. *This Plant in its Root, Leaves, Stalk, Flowers, Color, and manner of growing,* is in all reſpects like unto the *Leſſer* before deſcribed, and differs nothing from it but in the magnitude, this in its Stalk, Leaves, and Flowers, being greater than them.

VI. *The third, or* Sky Colored Grape Flowered Jacinth. *The Root of this is whiter than the former, but does not increaſe ſo much as it, yet produces plenty enough of Plants*; it ſprings up with fewer Leaves than the firſt, and not reddiſh, but green at its firſt appearing; the Leaves when they are full grown are long and hollow, like the firſt, but greener, ſhorter, and broader, ſtanding upright, and not lying along upon the Ground as they do; the Flowers grow at the top of the Stalk, more ſparſedly ſet thereon, and not ſo thick together, but like a thin Bunch of Grapes, and Bottle like, as the former, of a perfect Blew, or Sky Color, every Flower having ſome white ſpots about their brims, this has a very ſweet ſmell, yet nothing like the foregoing.

VII. *The fourth, or* Branched Grape Flowered Jacinth. *This is a true Species of the former Kinds, and is found to grow with many Branches of Flowers,* breaking out from the ſides of the greater Stalks or Branches; the Leaves, as is all the reſt of this Plant, are greater than the former.

VIII. *The fifth, or* White Grape Flowered Jacinth. *It has a bulbous Root, as the others, its Leaves are green, but a little whiter than the* Blew or Sky Colored Jacinth; its Flowers are purely white, and alike ſparſedly ſet on the Stalks, but a little lower and ſmaller than it; in all other things there is no difference.

IX. *The ſixth, or* Bluſh Grape Flowered Jacinth. *The bulbous Root of this* Grape Flower *is greater than either of the Roots of the* Sky Colored *or* White *aforegoing, and has ſeldom any ſmall Roots or Off-ſets as the others have*; its Leaves alſo are larger, and ſomewhat broader, the Flowers are of a pale, or bleak bluſh Color out of a white, and are a little larger, and grow a little higher, and fuller of Flowers than the *White*.

X. *The Places.* They are Natives of many places of *Germany* and *Hungary*, and grow alſo in *Spain*, and on *Mount Baldus* in *Italy*, and near *Narbone* in *France*, about the borders of Fields, with us they grow only in Gardens.

XI. *The Times.* They Flower from the begining of *March*, and ſometimes ſooner if the Weather is mild, and continue Flowering till the begining of *May*.

CHAP. CCCXCIII.

Of JACINTH Grape Flower Musked.

I. *THE Names.* It is called in *Arabick Zir*, in the *Turkiſh* Language *Dipcadi*, and *Moſchoromi*, by which Names they were ſent to us from *Turky*, in *Greek* Ὑάκινθος βοτρυώδης μοσχώδης, in *Latine Hyacinthus Botroides Moſchatus*, and in *Engliſh The Musked Grape Flowered Jacinth.*

II. *The Kinds.* There are four ſeveral ſorts of this Musked Plant, *viz.* 1. Βόλβος ἐμετικὸς, *Bulbus Emeticus*, *Hyacinthus Botroides Moſchatus major*, *Hyacinthus Moſchatus Bauhini*, *Muſcari*, and *Muſcari Flore flavo*, The Greater Yellow Musked Grape Flowered Jacinth, or Yellow Muſcari. 2. *Hyacinthus Botroides Moſchatus major, ſeu Muſcari Flore Cineritio*, The Great Aſh Colored Musked Grape Flowered Jacinth. 3. *Hyacinthus Botroides Moſchatus major, ſive Muſcari Flore rubro*, The Great Red Musked Grape Flowered Jacinth. 4. *Hyacinthus Botroides Moſchatus major, ſive Muſcari Flore albo*, The Great White Musked Grape Flowered Jacinth.

III. The Deſcriptions. *The firſt, or* Greater Yellow Musked Grape Flowered Jacinth. *It has a Root which is long, round, and very thick, and white on the outſide, with a little woollineſs thereon when broken, and full of a ſlimy juice, to which are adjoined thick, fat, and long Fibres, which periſh not, as in moſt of the other* Jacinths, *and therefore need not to be often removed, as ſome of the other ſorts are:* This *Musked Jacinth*, or *Grape Flower*, has five or ſix Leaves ſpread upon the Ground in two or three Heads, which at the firſt budding or ſhooting forth out of the Ground are of a reddiſh purple color, and afterwards become long, thick, hollow, or gutrered on the upper ſide, of a whitiſh green color, and round, and dark colored underneath; in the middle of theſe Heads of Leaves riſe up one or two hollow, weak, browniſh Stalks, ſometimes lying on the Ground with the weight of the Flowers, (but eſpecially of the Seed) yet for the moſt part ſtanding upright when they are laden towards the top with many Bottle like Flowers, which at their firſt appearing, and until the Flowers begin to blow open, are of a brown red color, and when they are blown of a

fair yellow, flowering firſt below, and ſo upwards by degrees; every one of theſe Flowers is made like unto a little Pitcher or Bottle, being big in the belly and ſmall at the mouth, which is round, and a little turned up, very ſweet in ſmell, like unto Musk, from whence it took the Name *Muſcari*; after the Flowers are paſt there come threeſquare thick Heads, puffed up, like as it were Bladders, made of a ſpongy ſubſtance, in which are here and there placed black round Seed.

IV. *The ſecond, or* Great Aſh Colored Musked Grape Flowered Jacinth. *It has a Root like the former, but yields more encreaſe, and will better endure our cold Climate, altho' it does more ſeldom give ripe Seed:* This *Muſcari* differs not in Roots or form of Leaves or Flowers from the former, excepting in theſe following particulars, the Leaves do not appear ſo red at firſt budding out of the Ground, nor are ſo dark when they are fully grown, the Stalk alſo has commonly more ſtore of Flowers thereon, the color of which at their firſt budding is a little dusky, and when they are full blown are of a bleak, yet bright Aſh color, with a little ſhew of purple in them, and by long ſtanding change a little more grey, being full as ſweet, or ſweeter, as ſome think, than the former.

V. *The third, or* Great Red Musked Grape Flowered Jacinth. *This Plant in its Root, Leaves, Stalk, Flowers, Seed, and manner of growing, is abſolutely like to the firſt*, excepting only in the color of the Flowers, for that this when its Flowers are blown are of a red color, tending to a yellow.

VI. *The fourth, or* Great White Musked Grape Flowered Jacinth. *The Root of this (as well as the Root of the third aforegoing) does not uſually grow ſo large as the Root of either of the firſt two, in all other reſpects it is like to them*; the Leaves are like unto the ſecond kind, but they are of a little whiter green, the Flowers alſo are like in form and manner of growing, but of a pale color, tending to a white.

VII. *The Places.* The Roots of the two firſt have often been brought from *Conſtantinople* to us, and poſſibly may come thither from beyond the *Boſphorus* in *Aſia*, but with us they are nurſed up only in Gardens; the latter two ſorts are thought to be degenerates from the firſt two Kinds, to wit, from their Seed coming to ripeneſs in our Country, and ſo ſown here.

VIII. *The Times.* They Flower in *March* and *April*, according to the warmth or temperature of the Seaſon, but the firſt of them ſprings firſt out of the Ground.

IX. *The Qualities and Virtues. Galen Lib.* 8. *Simp. Med.* ſays its temperature is hotter than that of the *Bulbus Eſculentus*, or *Ornithogalum luteum*, and *Dioſcorides* ſays that the Root eaten, or the Decoction thereof drunk, cures Diſeaſes of the Bladder, but that it cauſes Vomiting, without doubt it ought to be applied by a Wiſe and Prudent Hand; outwardly, made into an Ointment, it is good againſt the Kings-Evil, for by daily anointing therewith it diſcuſſes and conſumes thoſe ſcrophulous Tumors, Kernels, or Swellings.

CHAP. CCCXCIV.

Of JACINTH Haired.

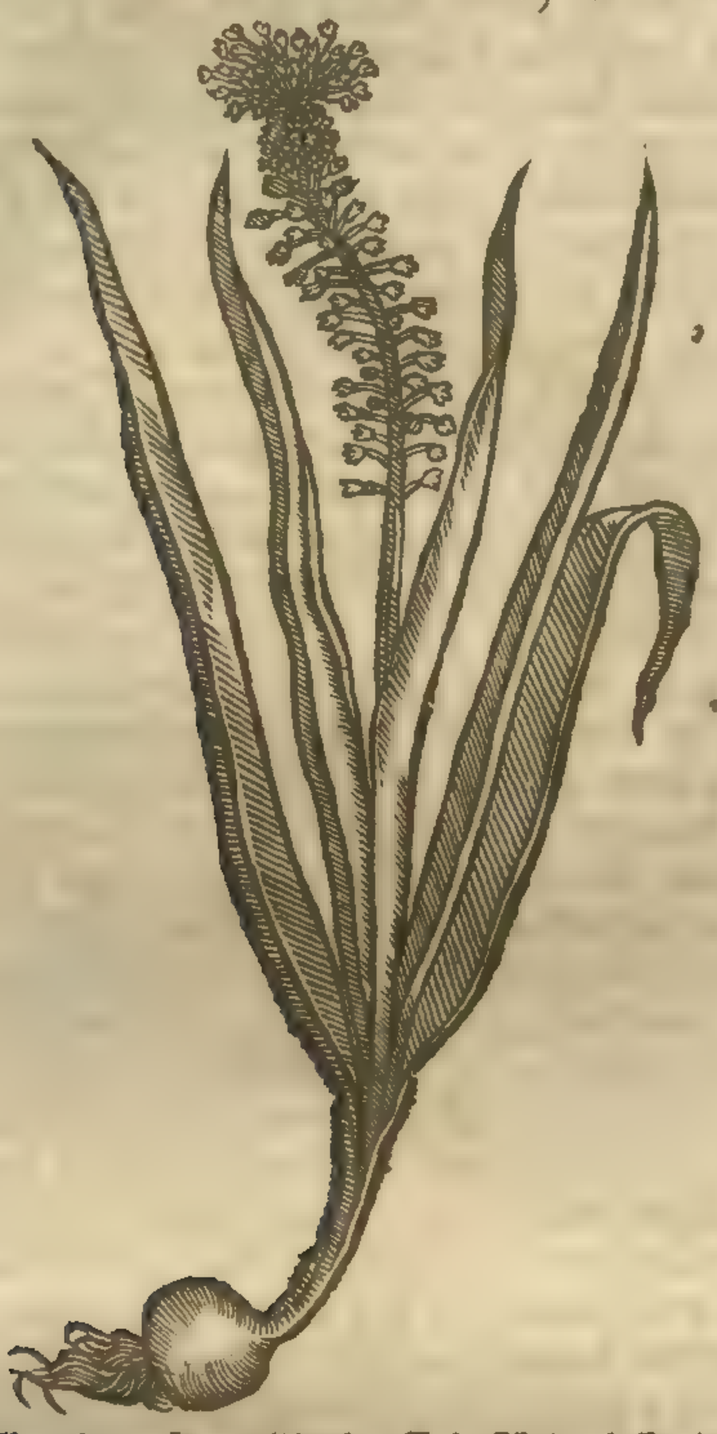
I. *THE Names.* It is called in *Greek* Ὑάκινθος τριχώδης, in *Latine Hyacinthus Comoſus*, in *Engliſh The Haired Jacinth.*

II. *The Kinds.* There are five ſeveral ſorts of the Haired Kind, *viz.* 1. *Hyacinthus Comoſus albus*, The White Haired Jacinth. 2. *Hyacinthus Comoſus Byzantinus*, The Turky Fair Haired Jacinth. 3. *Hyacinthus Comoſus major purpureus*, of ſome its called only *Hyacinthus major*, and of others *Hyacinthus Comoſus major*, but we in *Engliſh* call it *The Purple*, or *Great Purple Fair Haired Jacinth*, becauſe of its Tufts or Taſſels of purple Threads like Hairs at the top. 4. *Hyacinthus Comoſus Ramoſus purpureus*, ſome call it only *Hyacinthus Comoſus Ramoſus*, others *Hyacinthus Calamiſtratus*, others *Hyacinthus Comoſus Parnaſſi*, The Fair Haired Branched Jacinth. 5. *Hyacinthus Comoſus Elegantior*, *Hyacinthus Comoſus Ramoſus Elegantior*, *Hyacinthus Pennatus*, and *Hyacinthus Comoſus Parnaſſi*, Fair Curled Haired Jacinth; ſome will have it to be called alſo *Hyacinthus Calamiſtratus*, others think *Cincinnatus* more fit and proper, for that the curled Threads which ſeem like Hairs are better expreſſed by the Word *Cicinnus*, which ſignifies the curled buſh of Hair it ſelf, than by the Word *Calamiſtrum*, which ſignifies only the Criſping-Pin or Inſtrument, wherewith of Old they uſed to frizze or curl the Hair.

III. The Deſcriptions. *The firſt, or* White Haired Jacinth. *It has a bulbous blackiſh Root, a little long and round, from whence riſe up three or four Leaves, ſmooth and whitiſh, long, narrow, and hollow, like a Trough or Gutter on the upper ſide*; from among which ſprings up the Stalk, about a Foot or more high, bearing at the top ſeveral Flowers, ſmall, and ſomewhat like to the *Grape Flower*, but not ſo thick ſet together, being a little longer and larger, and wider at the mouth, and as it were divided into ſix edges, of a dark whitiſh color, with ſome blacker ſpots about the brims on the inſide; the Heads or Seed Veſſels are threeſquare, and ſomewhat larger than the Heads of any of the former *Leſſer Grape Flowers* in Chap. 392. in which are contained round black Seed; this *Jacinth* does more nearly reſemble

ſemble the *Grape Flowered Jacinths* juſt above named than the *Hair Flowered Jacinths* which follow, and which Name it bears for that it has no Hairs or Threads at the top of the Stalk, or ſides, as they have; but becauſe Authors have given it this Name we thought not fit to change it, and therefore have put it into the Claſſis of *Haired Jacinths*, as ſome others have done.

Jacinth Haired Fair White, or Turkey.



IV. *The ſecond, or* Turky Fair Haired Jacinth. *It has a bulbous Root, like the former, but it is bigger, and larger alſo in its Leaf and Flower*, and bears greater ſtore of Flowers on the head of the Stalk; the lower Flowers, altho' they have ſhort Stalks at their firſt flowering, yet afterwards the Stalks grow longer, and thoſe which are lower ſtand out farther than thoſe which are higheſt, whoſe footſtalks are ſhort, and almoſt cloſe to the Stem, and of a more perfect Purple than any below, which are of a dusky, greeniſh, Purple Color; the whole Stalk of Flowers does ſometimes ſeem like a *Pyramis*, broad below and ſmall above, yet neither of theſe *Jacinths* have any Threads at the tops of the Stalks, as the others following have; this *Jacinth* came from *Conſtantinople*, and is ſomething like to that before deſcribed, ſaving that it is every way bigger.

V. *The third, or* Great Purple Fair Haired Jacinth. *It has a great bulbed white Root, with ſome redneſs on the outſide*; it is a *Fair Haired Jacinth*, whoſe Leaves are ſofter, longer, broader, and leſs hollow than the former, lying for the moſt part upon the Ground; the Stalk riſes up from amidſt the Leaves, being ſtronger, higher, and bearing a greater and longer Head of Flowers alſo than they; the Flowers of this ſtand not upon ſuch very long Footſtalks, but are ſhorter below, and cloſe almoſt to the Stalk above, having many bright, purpliſh, blew Threads, growing higheſt above the Flowers, as it were in a buſh together, every one of theſe Threads having a little Head at its end, ſomewhat like unto one of the Flowers, but much ſmaller; the reſt of the Flowers below this Buſh are of a ſadder or deader Purple, and not of ſo bright a Color, and the loweſt worſt of all, rather inclining to a green, like unto the laſt *Turky* Kind; the whole Stalk with the Flowers upon it does ſomewhat reſemble a long Purſe Taſſel, and therefore ſeveral Perſons have ſo Named it; the Heads and Seeds are like to that juſt aforegoing, but greater.

VI. *The fourth, or* Fair Haired Branched Jacinth. *Its Root is greater and ſhorter than that of the next, and encreaſes faſter*; the Leaves hereof are broader, ſhorter, and greener than of the laſt, not lying ſo weakly on the Ground, but ſtanding ſomething more upright; the Stalk riſes up as high as the former, but branched out on every ſide into many Tufts of Threads, with Knops, as it were Heads of Flowers, at the ends of them, like unto the Head of Threads at the top of the former *Jacinth*, but of a little darker, and not ſo fair a blewiſh purple color; this *Jacinth* does ſometimes reſemble the next *Curl'd Hair'd Jacinth*, but that the Branches are not ſo fairly compoſed altogether of curled Threads, nor of ſo excellent a fair Purple, or Dove Color, but of a much more dusky hue.

VII. *The fifth, or* Fair Curl'd Hair'd Jacinth. *It has a bulbous Root, not ſo great as the laſt, but white on the outſide*; it is an admirable *Jacinth*, and riſes up with three or four Leaves, ſomething like unto the Leaves of the *Musked Grape Flowered Jacinth*, but leſſer, from between which Leaves riſes up the Stalk, about a Foot high, or ſomewhat more, bearing at the top a Buſh or Tuft of Flowers, which at the firſt appearing is like unto a *Cone*, or *Pine-Apple*, and afterwards opening it ſelf ſpreads into many Branches, yet ſtill retaining the form of a *Pyramis*, being broad ſpread below and narrow above; each of theſe Branches are again divided into many Tufts of Threads or Strings, twiſted or curled at the ends, and of an excellent Purple or Dove Color, both Stalks and Hairs; this continues a great while in its beauty, but afterwards all theſe Flowers (if you will ſo call them) do fall away without any Seed at all, ſpending it ſelf as it were in its abundance of Flowers.

VIII. *The Places.* The two firſt have been ſent to us from *Conſtantinople*, the third is found wild in many places of *Europe*, as well in *Germany* as in *Italy*; the native places of the two laſt are as yet unknown; they all grow and are nurſed up with us in Gardens only.

IX. *The Times.* The three firſt Species do Flower in *April*, the two laſt Kinds in *May*.

CHAP. CCCXCV.

Of JACINTH Oriental Single.

I. *THE Names.* It is called in *Greek* Ὑάκινθος ἀνατολικὸς, in *Latine Hyacinthus Orientalis*, in *Engliſh The Oriental Jacinth.*

II. *The Kinds.* Of this there are eight ſeveral Species, *viz.* 1. *Hyacinthus Orientalis Brumalis, ſive Præcox Flore albo*, The White Winter Oriental Jacinth. 2. *Hyacinthus Orientalis Brumalis, ſive Præcox Flore Purpureo vel Cæruleo*, The Purple Winter Oriental Jacinth. 3. *Hyacinthus Orientalis major præcox, dictus Zumbul Indi, & Indicum*, alſo corruptly *Simboline*; the *Turks* call all *Jacinths Zumbul*, and by adding the Title of *Arabi*, or *Indi*, ſhew from what place they originally came, The Greateſt Oriental Jacinth. 4. *Hyacinthus Orientalis vulgaris diverſorum Colorum*, The Ordinary Oriental Jacinth. 5. *Hyacinthus Orientalis Flore Purpureo Violaceo Lineis albicantis in dorſo*, The Purpliſh Violet Oriental Jacinth. 6. *Hyacinthus Orientalis Floribus antrorſum reſpicientibus*, The Oriental Jacinth whoſe Flow-

ers open all one way. 7. *Hyacinthus Orientalis ſerotinus Floribus erectis diverſorum colorum*, The late Flowering Oriental Jacinth. 8. *Hyacinthus Orientalis Folioſo Caule*, The Buſhy or Leafy Stalked Oriental Jacinth.

Jacinth Oriental Winter White.

Jacinth Oriental Winter Purple or Blew.

Jacinth Oriental Blew.

III. The Deſcriptions. *The firſt, or* White Winter Oriental Jacinth. *It has a bulbous Root, which ſends forth green Leaves, (which are in all reſpects like to the* Ordinary Oriental Jacinths, *but ſomething narrower) before Winter*, and ſometimes is in its Flower alſo in the middle or begining of Winter and is in form and color a plain *White Oriental Jacinth*, but ſomewhat leſſer, differing in no other particulars, but in the time of its Flowering, which is always certain to be long before the other Kinds.

IV. *The ſecond, or* Purple Winter Oriental Jacinth. *In its Root, Stalk, Leaf, and Flower, it is like to, and ſhews it ſelf to be of the Stock or Kindred of* Oriental Jacinths; the difference of color in this Flower makes it to be diſtinguiſhed chiefly, and it is, as the former, more early than the reſt which follow; this ſeems to be the very ſelf ſame Kind with the former, ſaving that this has fine blewiſh purple Flowers, whereas that has white.

V. *The third, or* Greateſt Oriental Jacinth. *The Root of this* Jacinth *is uſually greater than any other of its Kind, and moſt commonly white on the outſide*, from which riſe up one or two great round Stalks, ſpotted from within the Ground, with the lower part of the Leaves alſo upward to the middle of the Stalks, or rather higher, like unto the Stalks of *Dragons*, but darker, being ſet among a number of broad, long, and ſomewhat hollow green Leaves, almoſt as large as the Leaves of the *White Lilly*; at the tops of the Stalks ſtand more ſtore of Flowers than in any other of this Kind, every Flower being as great as the greateſt ſort of *Oriental Jacinths*, ending in ſix Leaves, which turn at the points, of a fair blewiſh purple color, and all ſtanding many times on one ſide of the Stalks, and many times on both ſides.

VI. *The fourth, or* Ordinary Oriental Jacinth. *It has a Root which is great, and white on the outſide, and oftentimes purpliſh alſo, flat at the bottom and ſmall at the head*; it has many green Leaves, long, ſomewhat broad, and hollow, from among which riſes up a long, green, round Stalk, beſet from the middle thereof almoſt with ſeveral Flowers, ſtanding on both ſides of the Stalks one above another unto the top, each of which next unto the Footſtalk is long, hollow, round, and cloſe, ending in ſix ſmall Leaves, laid open, and a little turning at the points, of a very ſweet ſmell; the Colors of theſe Flowers are divers, for ſome are pure white, without a ſhew of any other color in them, another is almoſt white, having a ſhew of blewneſs, eſpecially at the brims and bottoms of the Flowers, others are again of a very faint bluſh, tending towards a white, ſome are of as deep a purple as a Violet, others of a purple, tending to redneſs, and ſome ſo pale a blew, as it were more white than blew; after the Flowers are paſt threeſquare Heads appear, bearing round black Seed, great and ſhining; this is called the *Common Oriental Jacinth*, becauſe it is now ſo plentifully to be found in all Gardens, that it is not very much eſteemed; of this Species are the three next following ſorts.

VII. *The fifth, or* Purple Violet Oriental Jacinth. *It is very much like the fourth Kind*, but its Flowers are of a deep purpliſh Violet color, having whitiſh lines down the back of every Leaf of the Flower, which turn themſelves a little backwards at the points.

VIII. *The ſixth, or* Oriental Jacinth whoſe Flowers open all one way. *This in its Root, Stalk, and Leaves, is like the fourth Species aforegoing*, but in this it differs, *viz.* that its Flowers ſtand and open all one way, and not on all ſides, as ſeveral other *Jacinths* do, and are therefore herein like to the *Great Zumbul Indi* before deſcribed.

IX. *The ſeventh, or* Late Flowering Oriental Jacinth. *This, which ſeems to be a Species alſo of the fourth Kind*, Flowers later than all the reſt of them, and

and the Flowers are ſmaller, and ſtand more upright, and they are either white or blew, or mix'd with white and purple.

X. *The eighth, or* Buſhy or Leafy Stalked Oriental Jacinth. *This ſtrange* Jacinth *has its Roots, Leaves, and Flowers, like unto the former* Oriental Jacinths, *but the chief difference is in this*, that its Stalk is not bare or naked, but has very narrow long Leaves, growing upon it diſperſedly and without order, with the Flowers thereon, which are blew, and having for the moſt part one Leaf, and ſometimes two at the foot, or ſetting on of every Flower, yet ſometimes it chances ſome Flowers to be without any Leaf at the bottom, as it pleaſes Nature, which in this Plant is very variable; the Heads and Seed are black and round, like to thoſe of the other *Jacinths*.

XI. *The Places.* All theſe Plants have been brought to us out of *Turky*, and from *Conſtantinople*, but the place of their true original is ſcarcely known, with us they grow only in Gardens.

XII. *The Times.* The two firſt Flower the earlieſt, ſometimes before *Chriſtmas*, but more uſually after, and thro' the whole Month of *January*, and later ſometimes, they abide a great while in Flower, and in great beauty, more eſpecially if the Weather is mild, when few or ſcarcely any other Flowers are able to appear; the third Kind Flowers alſo earlier than any of thoſe which follow; the other *Ordinary Kinds* Flower ſome from the middle to the end of *February*, ſome in *March*, and ſome in *April*.

CHAP. CCCXCVI.

Of JACINTH Oriental Double.

I. *THE Names.* It is called in *Greek* Ὑακινθος ανατολικὸς διπλοῦς, in *Latine Hyacinthus Orientalis duplex*, *Hyacinthus Orientalis Flore duplici*, in *Engliſh The Double Oriental Jacinth.*

II. *The Kinds.* This *Double Kind* is threefold, *viz.* 1. *Hyacinthus Orientalis Flore duplici*, The Once Double Bleak Oriental Jacinth. 2. *Hyacinthus Orientalis Flore pleno Cæruleo vel Purpuro Violaceo*, The Fair Double Blew or Purple Oriental Jacinth. 3. *Hyacinthus Orientalis Flore pleno candidiſſimus*, The Pure White Double Oriental Jacinth.

III. The Deſcriptions. *The firſt, or* Once Double Oriental Jacinth, *has a bulbous Root, like the former* Single Kinds, it has ſeveral long Leaves, like unto the other *Oriental Jacinths* almoſt, ſtanding upright, among which riſes up a Stalk, browniſh at firſt, but growing green afterwards, bearing many Flowers at the top, made like the Flowers of the former *Jacinths*, and ending in ſix Leaves, green at the firſt, and of a blewiſh white when they are open, yet retaining ſome ſhew of greenneſs in them, the brims of the Leaves being white; from the midſt of each Flower ſtands forth another ſmall Flower, conſiſting of three Leaves, of the ſame color with the other Flower, but with a green line on the back of each of theſe inner Leaves; in the middle of this little Flower ſome Threads ſtand, which are tipt with black; the ſmell of this Flower is not ſo ſweet as thoſe of the former *Single Kinds*, but the Heads and Seed are very like to them.

IV. *The ſecond, or* Fair Double Blew or Purple Oriental Jacinth. *The Leaves of theſe* Jacinths *are ſmaller than the Leaves of moſt of the other* Oriental Sorts, *whether* Single *or* Double, the Stalks are ſhorter and ſmaller, bearing but three or four Flowers on the Heads of them for the moſt part, which are not compoſed like the laſt, but are more fair, full, and double of Leaves, where they ſhew out their full beauties, and of a fair blew color in ſome, and purple in others, ſmelling pretty ſweet, but theſe do ſeldom bear out their Flowers fair, and beſides have ſeveral other Flowers, which will be either ſingle or very little double upon the very ſame Stalk.

V. *The third, or* Pure White Double Oriental Jacinth. *This* Double White Flower *or* Plant *has its Leaves like unto the* Single White Oriental Jacinth *in the former Chapter*, its Stalk is likewiſe long, ſlender, and green, bearing at the top two or three Flowers at moſt, very double, and full of Leaves, of a pure white color, without any other mixture therein, hanging down their Heads a little, and of a reaſonable ſweet ſmell.

VI. *The Places.* They came hither from *Conſtantinople*, but which is their native place of growth is uncertain, with us they are only nurſed up in Gardens.

VII. *The Times.* Some of them Flower in *March*, and ſome in *April*, and ſome ſooner, like as ſome of the latter *Single Kinds* do.

CHAP. CCCXCVII.

Of JACINTH Summer.

I. *THE Names.* It is called in *Greek* Ὑακινθος θερινὸς, in *Latine Hyacinthus Æſtivus*, and in *Engliſh Summer Jacinth.*

II. *The Kinds.* There are five Kinds of the *Summer Jacinth*, *viz.* three *Small Oriental Summer Jacinths*, and two *Starry Summer Jacinths.* 1. *Hyacinthus Hiſpanicus minor Orientalis facie*, *Hyacinthus Orientalis ſerotinus minor*, The Little Summer Oriental Jacinth. 2. *Hyacinthus Hiſpanicus minor Flore albo*, The Small White Summer Oriental Jacinth. 3. *Hyacinthus Hiſpanicus minor Flore rubente*, The Small reddiſh Colored Oriental Jacinth. 4. *Hyacinthus Stellatus Æſtivus major*, *Hyacinthus Luſitanicus major*, The Greater Summer Starry Jacinth. 5. *Hyacinthus Stellatus Æſtivus minor*, *Hyacinthus Luſitanicus minor*, The Leſſer Summer Starry Jacinth.

III. The Deſcriptions. *The firſt, or* Little Summer Oriental Jacinth. *It has a bulbous Root, which is ſmall and white*, from which riſes up four or five long, narrow, green Leaves, lying upon the Ground, among which riſes up a ſlender ſmooth Stalk, about a Span high, or more, bearing at the top many ſlender bleak blew Flowers, with ſome white ſtripes and edges to be ſeen in moſt of them, faſhioned very like unto the Flowers of the *Oriental Jacinth*, but much ſmaller; the Flowers have no ſmell at all, and the Seed is like the Seed of the *Engliſh Jacinth*, or *Haresbells*.

IV. *The ſecond, or* Small White Summer Oriental Jacinth. *This ſeems to be of the ſame Kind with the former, being in Root, Leaf, Stalk, Flower, and manner of growing, the ſame with it*, and differs nothing therefrom but in the color of the Flower, which is purely white.

V. *The*

V. *The third*, or Small reddish Colored Oriental Jacinth. *It is another of the same Kind, whose Flowers are likewise striped lengthwise*, with some deeper colored Veins running along the three outward Leaves of the Flower, and differing in no other particulars from the first of these *Summer Jacinths*.

VI. *The fourth*, or Greater Summer Starry Jacinth. *It has a Root which is round and white, having some long thick Roots under it, besides the Fibres, as is usual in many other* Jacinths; from this Root rises up several narrow green Leaves, lying upon the Ground, somewhat like the Leaves of the *English Jacinth*, or *Harebells*, but stiffer and stronger, among which rises up a round stiff Stalk, bearing many Flowers at the top thereof, and at every foot-stalk of the Flowers a small short Leaf, of a purplish color; the Flowers are Star-like, of a fine delayed purplish color, tending to a pale Blew, or Ash Color, striped on the back of every Leaf, and having a pointed Umbone in the middle, with some whitish purple Threads about it tipt with blew; the Seed is black, round, and shining, like unto the Seed of the *English Jacinth*, or *Harebells*, but not half out so big.

VII. *The fifth*, or Lesser Summer Starry Jacinth. *It has a small bulbous Root, and white, covered with a brown Coat, and having some such thick Roots among the Fibres as are among the others*; this *Lesser Jacinth* has several very long, narrow, and shining green Leaves, spread upon the Ground round about the Root, from among which rises a very short round Stalk, not above two or three Inches high, bearing six or seven small Flowers thereon on each side of the Stalk, like both in form and color unto the *Greater Summer Jacinth* before described, but lesser by far; the Seed is black, and contained in three cornered Heads or Husks.

VIII. *The Places*. The first three have been gathered on the *Pyrenean* Mountains, on those sides next to *Spain*, from whence they have been brought to us; the fourth and fifth grow naturally in *Portugal*, and from thence have been transplanted into our Gardens.

IX. *The Times*. The first three Flower very late in respect to the *Early Flowering Jacinths*, *viz.* in *May* or *June* for the most part; the two latter Flower also in *May*, towards the latter end of it, and sometimes also in *June*, and their Seed is ripe in *July*.

CHAP. CCCXCVIII.

Of JACINTH Dun or Brown.

I. *THE Names*. It is called in *Greek* Ὑάκινθος φαιὸς, in *Latine Hyacinthus Fuscus vel obsoletus*, in *English The Dun or Brown Colored Jacinth*.

II. *The Kinds*. There are three Species of this Plant, *viz.* 1. *Hyacinthus Hispanicus Coloris obsoletioris*, *Hyacinthus Hispanicus obsoletus vel fuscus*, The Spanish Dun or Brown Colored Jacinth. 2. *Hyacinthus Mauritanicus fuscus vel obsoletus*, The Barbary Brown Colored Jacinth. 3. *Hyacinthus Æthiopicus fuscus vel obsoletus*, *Hyacinthus Æthiopicus maximus*, The Æthiopian Dun or Dusky Colored Jacinth.

III. The Descriptions. *The first*, or Spanish Dun or Brown Colored Jacinth, *has a bulbous Root, which is reasonable great, and white on the outside, with many strong white Fibres at it, which perish not Yearly as the Fibres of many other* Jacinths *do*; it springs late out of the Ground, bearing four or five short, hollow, and soft, whitish green Leaves, with a white line in the middle of every one of them, from among which rise up one or more Stalks, bearing several Flowers at their tops, all looking one way, or standing on one side, hanging down their heads, consisting of six Leaves, three of which, being the outwardmost, lay open their Leaves and turn back their ends a little, the other three Leaves, which are innermost, do as it were close together in the middle of the Flower, without laying themselves open at all, being a little whitish on the edges; the whole Flower is of a purplish yellow color, with some white and green as it were mixed amongst it, of no smell at all; after the Flowers are past great three cornered and bunched out Heads or Husks come in their places, which contain black and flat Seed; this Plant as it springs up late, so it keeps its green Leaves almost until Winter.

IV. *The second*, *or* Barbary Brown Colored Jacinth. *This Plant in its Root, Leaves, Stalks, Flowers, Seed, and manner of its growing*, and in all other respects (except its magnitude) is very like the former, nor does it differ at all from it, but that this is every ways much greater.

V. *The third*, *or* Æthiopian Dun or Dusky Colored Jacinth. *Its Root is bulbous, and like the former*, its Leaves are stronger and greener than it, and the Stalk also thicker, bearing divers Flowers, confusedly standing upon longer foot-stalks, yet made after the same fashion, but that the three inner Leaves are whitish, and dented about the edges, otherwise the Flowers are greenish on the inside.

VI. *The Places*. The native Country of the first of these is *Spain*, the second is a native of *Barbary*, growing about *Fez* and *Morocco*, the third is a native of *Æthiopia*, and was brought hither from the *Cape of Goodhope*; with us they are only nursed up in Gardens.

VII. *The Times*. The first Flowers not until *June*, because it springs late out of the Ground, as aforesaid, holding its green Leaves all *September*, the Seed ripening in the mean season; and much about the same times the other two Flower and Seed.

CHAP. CCCXCIX.

Of JACINTH Starry Common.

I. *THE Names*. It is called in *Greek* Ὑάκινθος ἀστέριος, in *Latine Hyacinthus Stellatus*, and in *English The Starry Jacinth*.

II. *The Kinds*. There are six generick Species of the *Starry Jacinths*, viz. 1. *Hyacinthus Stellatus Æstivus*, three Species of which we have already Treated of among the *Summer Jacinths* in Chap. 397. aforegoing. 2. *Hyacinthus Stellatus Communis*, The Common Starry Jacinth, of which in this Chapter. 3. *Hyacinthus Stellatus Americanus*, The American Starry Jacinth, of which in Chap. 400. 4. *Hyacinthus Stellatus Byzantinus*, The Turky Starry Jacinth, of which in Chap. 401. 5. *Hyacinthus Stellatus Autumnalis*, The Autumn Starry Jacinth, of which in Chap. 402. 6. *Hyacinthus Stellatus Lilifolius*, The Lilly Leav'd Starry Jacinth, of which we shall Treat in Chap. 403. following.

III. *The*

III. *The Kinds of the Common Starry Jacinth.* Of this there are ſeven Species or Sorts, *viz.* 1. Υάκινθος ἀστέρις ἁπλῆ, *Hyacinthus Stellatus Communis vel Vulgaris, ſive Biſolius Fuchſij, Hyacinthus Stellatus Fuchſij, Hyacinthus Stellatus Germanicus*, The Common Blew Starry Jacinth. 2. *Hyacinthus Stellatus Flore albo*, The White Flowered Starry Jacinth. 3. *Hyacinthus Stellatus Flore rubente*, The Bluſh Colored Starry Jacinth. 4. *Hyacinthus Stellatus Martius, ſive Præcox Cæruleus*, The Early Blew Starry Jacinth. 5. *Hyacinthus Stellatus præcox Flore albo*, The White Early Starry Jacinth. 6. *Hyacinthus Stellatus Flore Niveo, vel albiſſimo*, The Purely White Starry Jacinth. 7. *Hyacinthus Stellatus præcox Flore ſuave rubente*, The Early Bluſh Colored Starry Jacinth.

Starry Jacinth Common

IV. The Deſcriptions. *The firſt, or* Common Blew Starry Jacinth. *Its Root is bulbous, ſomewhat long, and covered with a yellowiſh Coat*; it riſes out of the Ground commonly with but two brown Leaves, yet ſometimes with three, incloſing within them the Stalk of Flowers, the Buds appearing of a dark whitiſh color as ſoon as the Leaves open themſelves, which Leaves being grown are long and hollow, of a whitiſh green on the upper ſide, and brown on the under ſide, and half round, the brown Stalk riſing up higher, bearing five or ſix ſmall Star like Flowers, conſiſting of ſix Leaves, of a fair deep blew, tending to a purple; the Seed is yellowiſh and round, contained in round pointed Heads or Husks, which by reaſon of their heavineſs and the weakneſs of the Stalk lie upon the Ground, and often periſh with Wet and Froſt; this *Starry Jacinth* has been longeſt known, and is the moſt common.

V. *The ſecond, or* White Flowered Starry Jacinth. *This* White Kind *has its Leaves like the former, but green and freſh, not brown, and alſo a little narrower*; the Buds for the Flowers appear at firſt a little bluſh, but when they are blown they are white, but yet retain in them a ſmall ſhew of that bluſh color.

VI. *The third, or* Bluſh Colored Starry Jacinth. *This in its Root, Leaves, and Stalk, is exactly like the former*, and differs nothing therefrom but in the Flowers, which are of a fair bluſh color, much more eminent than in the others, in all other particulars it is exactly alike.

VII. *The fourth, or* Early Blew Starry Jacinth. *Its Root is bulbous, and a little whiter than the others on the outſide*; its Leaves are alſo a little broader, of a freſher green, and not brown at all, as the firſt *Blew Jacinth* aforegoing is; the Buds of the Flowers while they are incloſed within the Leaves, and after when the Stalk is grown up, do remain more blew than the Buds of the former; the Flowers when they are blown open are like the former, but ſomething larger, and of a more lively blew color; this Kind of *Jacinth* does more ſeldom bear Seed than the others aforegoing.

VIII. *The fifth, or* White Early Starry Jacinth. *This is alſo one other of the fourth Kind*, the green Leaves whereof are a little narrower than the former, and its Flowers are purely white, in any other reſpect there is no difference from it at all.

IX. *The ſixth, or* Purely White Starry Jacinth. *This ſeems to be a Species of the ſecond Kind aforegoing*, its Leaves are of a pale freſh green, and a little narrower than thoſe, and its Flowers are ſmaller than them, and of a pure Snow white color.

X. *The ſeventh, or* Early Bluſh Colored Starry Jacinth. *The Root is bulbous, and like to the other* Starry Jacinths; the Leaves differ not from the fifth Kind, or *White Early Starry Jacinth*, and its Flowers are bluſh colored, and as large as thoſe of the fifth Kind, and ſomewhat larger than the Flowers of the fourth Kind; this *Bluſh Colored Jacinth* is very rare, but it is very pleaſant.

XI. *The Places.* All theſe *Jacinths* have been found in the Woods and Mountains of *Auſtria, Bohemia, Germany, &c.* as *Fuchſius* and *Geſner* affirm, and in *Italy*, near *Naples*, as *Imperatus* and others ſay, but with us they are all of them nurſed up in Gardens, more eſpecially the *White* and *Bluſh Kinds*, for that they are more tender, and therefore require the more care to keep them from periſhing.

XII. *The Times.* The firſt, ſecond, and ſixth Kinds Flower much about the middle of *February*, if the Weather is mild and gentle, the other Kinds about fourteen or twenty days after, *viz.* in *March*, but many times as early as the firſt three.

CHAP. CCCC.

Of JACINTH Starry Peruvian.

I. *THE Names.* It is called in *Greek* Υάκινθος ἀστέρις ἐριοφόρος, in *Latine Hyacinthus Eriophorus, vel Hyacinthus Laniferus, Eriophorus Peruanus, Hyacinthus Stellatus Peruanus vel Americanus, Hyacinthus Peruanus, Hyacinthus Stellatus Bæticus*, in *Engliſh The American or Peruvian Starry Jacinth*, and *The Spaniſh Starry Jacinth.*

II. *The Kinds.* We make four ſeveral Species of this Plant, *viz.* 1. *Hyacinthus Stellatus Cæruleus Peruanus major, Hyacinthus Cæruleus Stellatus Bæticus major, Hyacinthus Cæruleus Americanus major*, The Greater Blew Starry American or Peruvian Jacinth, The Greater Blew Starry Spaniſh Jacinth. 2. *Hyacinthus Stellatus Peruanus Flore albo, Hyacinthus Stellatus Albus Bæticus*, The Great White Peruvian

ravian Starry Fourth, The Great Spanish White Starry Fourth, 2. *Hyacinthus Stellatus Peruanus flore Carneo Hyacinthus Stellatus Baticus flore Carneo*, The Great Blush Colored Starry American or Peruvian Jacinth, The Great Blush Colored Starry Spanish Jacinth. 3. *Hyacinthus Eriophorus sive Lanuginosus, bulbus Eriophorus vel Lanuserus*, The Woolly Jacinth.

Great Blew Starry Jacinth of Peru.

III. The Descriptions. *The first*, *or* Greater Blew Starry American or Peruvian or Spanish Jacinth. *It has a great bulbous Root, and somewhat yellowish on the outside, with a knob or bunch at the lower end of the Root, (which is called the seat of the Root) like unto that of the* Muscari, *or* Scylla, *and many other bulbous Roots, from which hang down several white, thick and long Fibres, by which it is fastened into the Ground, which perish not every Year, but abide continually, and therefore does not desire much removing*; from this Root spring up five or six or more very broad and very long green Leaves, spread upon the Ground round about the Root, which being broken are woolly, or full of very fine Fibres, (whence came part of the *Greek* Name) from the middle of these Leaves rises up a round short Stalk, (in comparison of the greatness of the Plant, (for the Stalk of the *Oriental Jacinth* is sometimes twice as high, whose Root is not so great) bearing at the top a great Head or Bush of Flowers, fashioned in the begining, before they are blown or separated, very like to a *Cone*, or *Pine-Apple*; they begin to Flower below, and so upwards by degrees, every Flower standing upon a long blackish blew footstalk, which when they are blown open are of a perfect blew color, tending to a Violet, and made of six small Leaves laid open like a Star; the Threads likewise are blewish, tipt with yellow Pendents, standing about the middle Head, which is of a deep blew, not having any pleasant smell to be perceived in it, but commendable only for the beauty of the Flowers; after the Flowers are past threesquare or cornered Heads come in their places, containing round black Seed; this *Jacinth* is the greatest of those whose Flowers are spread like a Star, except the two first *American* ones described in Chap. 391. aforegoing.

IV. *The second*, *or* Great White Peruvian Jacinth. *The Roots and Seed of this are like unto the former, so it is also in most of its other parts*, but that its Leaves are not so large, nor of so deep a green, the Stalks of Flowers likewise have not such thick Heads or Bushes on it, but the Flowers are fewer and thinner set; the Flowers themselves also are whitish, yet having a small dash of blush in them, and the Threads are whitish, tipt with yellow Pendents, these are the chief particulars in which it differs from the former.

V. *The third*, *or* Great Blush Colored Starry American or Peruvian Jacinth. *This is found growing among the other, and differs but little from the two former, but only in the color of the Flowers*, for this has its Head of Flowers as great and large as the first, but the Buds of its Flowers before they are open are of a deep blush color, which being compleatly opened are more delayed, and of a pleasant pale purple or blush color, standing upon purplish Footstalks; the Heads in the middle are whitish, and so are the Threads encompassing it, tipt with yellow.

VI. *The fourth*, *or* Woolly Jacinth. *Its Root is bulbous and white, somewhat like to the Root of a* Muscari, *which is as full of Wooll or fine* Fibres *as the Leaves, or rather more than they, or any other part of it*; this *Woolly Jacinth* has many broad, long, and fair green Leaves, very like unto some of the *Jacinths*, but stiffer, or standing more upright, which being broken do yield a multitude of small, fine, soft Fibres, as if a little fine Cotton Wooll was drawn out, from among these Leaves rises up a long, round, green Stalk, a Foot and half high, or more, on which is set a great long Bush of Flowers, which blowing open by degrees, first below, and so upwards, are very long in flowering; the top of the Stalk with the Flowers, and their little small Footstalks, are all blew, every Flower standing outright with its Stalk, and spreading like a Star, divided into six Leaves, having many small blew Threads standing about the middle Head, which, as far as is yet discovered, never yet gave ripe Seed.

VII. *The Places.* The first has been formerly Named *Eriophorus Peruanus*, and *Hyacinthus Stellatus Peruanus*, The Starry Jacinth of Peru, and the three first are generally known and received by the Name of *Hyacinthus Peruanus*, for which reason we also have retained it; but all the first three grow naturally in *Spain*, in the Meadows not far from the Sea, as also in the Island of *Gades*, commonly called *Cales*, as likewise in other parts along the Sea side going from thence to *Port St. Maria*, which when they are in Flower grow so thick together, that they seem to cover the Ground, as *Guil. Boel* affirms, who says that himself gathered these and many others in the places named with his own Hands, but saying withal that the *White* and *Blush Colored* are far more rare than the *Blew*, or first Kind; yet notwithstanding all that has been hitherto said, it is very probable that they have been found growing also in *Peru*, otherwise they could never have so generally obtained that Name, with us they are only nursed up in Gardens; the fourth has many times been sent out of *Turky* into *England*, where in our Gardens it has flourished for a long time, as well as several others; 'tis possible that that in *Theophrastus Lib.* 7. *Cap.* 13. is this very Plant, where he declares that Garments were made of the woolly substance of a bulbous Root taken from between the Core or Heart of the Root and the outermost Coats or Peelings; but *Clusius* will have this *Bulbus Eriophorus*

phorus, or *Laniferus*, or *Woolly Jacinth*, to be a Species of the first Kind in this Chapter, for which reason we have put it in this place among the *Peruvian* Kinds, it being a *Jacinth* both in its Root, Leaf, and Flower.

VIII. *The Times.* The first three Flower in *May*, and the Seed is ripe in *July*; the fourth Flowers not often, and is rare to be seen Flowering with us, but when it does Flower it Flowers also in the Month of *May*, as the others do.

CHAP. CCCCI.

Of JACINTH Starry Turky.

I. *THE Names.* It is called in *Greek* Ὑάκινθος ἀστερίας Βιζαντιὸς, in *Latine Hyacinthus Stellatus Byzantinus*, and in *English The Turky Starry Jacinth, The Starry Jacinth of Constantinople.*

II. *The Kinds.* There are four Species of this Plant, *viz.* 1. *Hyacinthus Stellatus Byzantinus Radice nigra*, The Turky Starry Jacinth with a black Root. 2. *Hyacinthus Stellatus Byzantinus major*, The Greater Starry Jacinth of Constantinople. 3. *Hyacinthus Stellatus Byzantinus alter*, *Hyacinthus Flore Boraginis*, The other Turky Starry Jacinth, or Starry Jacinth of Constantinople. 4. *Hyacinthus Stellatus Constantinopolitanus Flore Cinereo*, *Hyacinthus Stellaris Someri*, The Turky Ash Colored Starry Jacinth, or Somer's Starry Jacinth.

III. The Descriptions. *The first, or* Turky Starry Jacinth with a black Root. *It has a Root which for the most part does run downwards, something deep into the Ground*, from which rise up several fresh, green, thin, and long Leaves, of the bigness of the *English Jacinth*, but not so long, between which rises up a slender low Stalk, bearing five or six Flowers, dispersedly set thereon, spreading open like a Star, of a pale or bleak blew color; the Leaves of the Flowers are somewhat long, and stand as it were somewhat loosely, one off from another, and not so compactedly together as the Flowers of other Kinds; it seldom bears with us ripe Seed, because the Heads are so heavy, that lying upon the Ground they rot with the Wet, or are bitten with the Frosts, or both, so that they seldom come to good; the Root is small in some, and reasonable big in others, round and long, white within, but covered with deep reddish or purplish peelings next unto it, and darker and blacker purple on the outside, with some long and thick white Fibres like Fingers hanging at the bottom of them, as is to be seen in many other *Jacinths*.

IV. *The second, or* Greater Starry Jacinth of Constantinople. *The Root of this is like the former, saving that it is not black on the outside, as the other, but three times bigger*; this Jacinth may truly be referred to the former *Jacinth of Constantinople*, and called the *Greater*, it is so very like thereunto, that any one who knows that cannot but know or think that this is another of that sort, but greater, as it is in all its parts, bearing larger Leaves by much, and more store, lying upon the Ground round about the Root; it bears many low Stalks of Flowers, as bleak and standing as loosely as the former.

V. *The third, or* Other Turky Starry Jacinth, *or* Starry Jacinth of Constantinople. *Its Root is of a dark whitish color on the outside, and sometimes a little reddish withal*; it has for the most part only four Leaves, broader and greener than the first, but not so large or so long as the second; the Stalk has five or six Flowers upon it, bigger and rounder set, like other *Starry Jacinths*, of a more perfect or deeper blew than either of the former, having a whitish green Umbone or Head in the middle, beset with six blew Chives or Threads tipt with black, so closely encompassing the Umbone or Head, that the Threads seem to be so many pricks stuck into a Club or Head, some have therefore liken'd it to a *Borage* Flower, and so have called it; after the Flowers are past come up round white Heads, in which is contained round and white Seed.

VI. *The fourth, or* Turky Ash Colored Starry Jacinth, *or* Somer's Starry Jacinth. *Its Root is like to that of the* English Jacinth, *or* Haresbells, *being great, round, and white, so like that it is hard to know the one from the other*; its Leaves are also very like to the Leaves of the *English Jacinth*, and spread themselves upon the Ground in the same manner, from among which rise up one or two Stalks, repleniished at top with a number of small Star like Flowers, bushing out more below than above, of a very pale or white Blew, tending to an Ash Color, and very sweet in smell; the Seed is black and round, like unto the Seed of the *English Jacinth*, or *Haresbells*.

VII. *The Places.* The Titles of the three first shew you their native places, the third of them, as *Lobel* says, was brought to *England* from *Constantinople* by the Lord *Zouth*; the fourth *Somers* brought from *Constantinople*, or out of *Italy*, as *Lobel* says, into the Low Countries, from whence it has been brought to us, but they all flourish admirably well in our Gardens.

VIII. *The Times.* The first of these Flower earlier than the other three, and presently after the *Early Starry Jacinth*; the three last Flower all of them in *April*.

CHAP. CCCCII.

Of JACINTH Starry Autumn.

I. *THE Names.* It is called in *Greek* Υάκινθος ἀστερίας ὀπωρινὸς, in *Latine Hyacinthus Stellatus Autumnalis*, and in *Engliſh The Autumn Starry Jacinth.*

II. *The Kinds.* There are three Species of this Plant, *viz.* 1. *Hyacinthus Stellatus Autumnalis major*, The Greater Autumn Starry Jacinth. 2. *Hyacinthus Stellatus Autumnalis minor*, The Leſſer Autumn Starry Jacinth. 3. *Hyacinthus Stellatus Autumnalis Flore albo minor*, The Leſſer Autumn Starry Jacinth with white Flowers.

III. *An Obſervation.* *Dalechampius* with many Words would have us to believe that theſe Plants can be no *Jacinths*, becauſe their Flowers appear before their Leaves in *Autumn*, contrary to the true *Jacinth*, as he ſays, and therefore will have it to be the *Bulbus* of *Theophraſtus Lib.* 1. *Cap.* 12. which he calls his *Tiphyum* (there mentioned) as alſo *Bulbus Aſtivus Dalechampii*; this may carry ſome probability with it, yet the likeneſs of both Roots, Leaves, and Flowers, have perſwaded very Learned Botaniſts to believe them to be true *Jacinths*, and ſo we take them in this place.

IV. The Deſcriptions. *The firſt, or* Greater Autumn Starry Jacinth. *It has a Root which is great, bulbous, and white on the outſide*; from this Root ſpring up five or ſix or more very long and narrow green Leaves, lying upon the Ground; the Stalks are furniſhed at top with many Star like Flowers, of a pale blewiſh purple color, with ſome pale colored Threads tipt with blew ſtanding about the Head in the middle, which in time growing ripe contain therein ſmall, black, and roundiſh Seed.

V. *The ſecond, or* Leſſer Autumn Starry Jacinth. *This* Leſſer Jacinth *has a bulbous Root like others*, which ſends forth ſuch like long and ſmall Leaves as the former, but narrower, the Stalk is not full out ſo high, but bears as many Flowers on it as the other, which are of a pale or bleak purple color, very like to it alſo, as is the Seed too, but that it is ſmaller; both theſe for the moſt part bear their Flowers and Seed before the green Leaves riſe up much above the Ground.

VI. *The third, or* Leſſer Autumn Starry Jacinth with white Flowers. *This in its Root, Stalk, Flowers, and Seed, as alſo in its manner of growing, differs nothing from the former* Leſſer Purple Kind *laſt deſcribed, excepting in the color of the Flowers, which in this Plant are always white.*

VII. *The Places.* The native places of the firſt and third are as yet unknown to us, where poſſibly they may grow wild, here they are only nurſed up in Gardens; the ſecond grows wild in many places of *England*, as on the foot of a high Bank by the *Thames* ſide at the hither end of *Chelſea*, before you come at the *Barge-Houſe*, and other places, from whence Plants have been taken for Gardens.

VIII. *The Times.* The firſt or greateſt Flowers in the end of *July*, and in *Auguſt*, the other two in *Auguſt* and *September*; you ſhall rarely ſee any of theſe Plants with Flowers and green Leaves together at one time.

CHAP. CCCCIII.

Of JACINTH Starry Lilly Leaved.

I. *THE Names.* It is called in *Greek* Υάκινθος ἀστερίας λειριοφύλλινος, in *Latine Hyacinthus Stellatus Liliſolius*, and in *Engliſh Lilly Leaved Starry Jacinth.*

II. *The Kinds.* There are three ſeveral Species of this Plant, *viz.* 1. *Hyacinthus Stellatus Liliſolius Flore Cæruleo, Hyacinthus Stellatus Cæruleus Liliſolio & Radice*, The Blew Flowered Lilly Leaved and Lilly Rooted Starry Jacinth, (its Root being as like to a *Lilly* Root as its Leaves to *Lilly* Leaves.) 2. *Hyacinthus Stellatus Liliſolius albus, vel Liliſolius Flore albo*, The White Flowered Lilly Leaved Starry Jacinth. 3. *Hyacinthus Stellatus Liliſolius Flore Carneo*, The Bluſh Colored Lilly Leaved Starry Jacinth. Now becauſe the Roots of theſe Plants as well as the Leaves are ſo very like to a *Lilly*, they have been called *Hyacinthus Stellatus Liliſolio & Radice*, but for brevity ſake *Hyacinthus Stellatus Liliſolius*, The Lilly Leaved Starry Jacinth. *Cluſius* ſays that the People who Dwell near its native place of growth call it *Sarahug*.

III. The Deſcriptions. *The firſt, or* Blew Flowered Lilly Leaved Starry Jacinth. *It has a Root which is bulbous, longiſh, big below and ſmall above, like unto the ſmall Root of a* Lilly, *and compoſed of yellow Scales, as a* Lilly, *but the Scales are greater and fewer in number*; from this Root riſe up ſix or ſeven broad green Leaves, ſomewhat like unto *Lilly* Leaves, (from whence it took part of its Name, as well as from the Root) ſpread upon the Ground,

and

and lying close and round; before the Stalk rises out from the middle of these Leaves there does appear a deep hollow place, like a hole, to be seen a good while, which at length is filled up with the Stalk, rising up to a Foot or more in height, bearing many Star like Flowers at top, of a perfect blew color, near unto a *Violet*, and sometimes of a paler or bleak blew color, having as it were a small Cup in the middle, divided into six pieces, without any Threads therein; the Seed is black and round, but not shining.

IV. *The second, or* White Flowered Lilly Leaved Starry Jacinth. *This Plant in its Root, Leaves, Stalk, Flower, Seed, and manner of growing, is wholly like the former*, (so that all the aforesaid description may here be avoided) that we may not say the same thing over again; but there is something in which it varies, and that is in the color of the Flowers, which in this is white, whereas the former is blew, and that is all the difference.

V. *The third, or* Blush Colored Lilly Leaved Starry Jacinth. *This Plant is like also to the first and second before described in all the parts of the same, and in the magnitude and manner of its growing*, varying only in the color of the Flowers, for whereas they are blew in the first and white in the second, these are of a blush color, which is the whole of the observed difference.

VI. *The Places.* These *Jacinths* have been found Natives of the *Pyrenæan* Hills, in that part of *France* called *Aquitane*, and in several other places; I have found them to grow plentifully in many Plantations in *Carolina*, and other parts of the *West Indies*; but that with the white Flower is most usual or common.

VII. *The Times.* They Flower in *April*, and sometimes later, I have found them Flowering in *Carolina* in *March*, and in *April*, as also in *May*, and sometimes later if the Weather prove hard or cold.

VIII. *The Virtues.* Authors have assigned to them no Medical Virtues, but account them rather as Poysons, for that by Experience it has been found, that Cattel who have eaten of the Leaves hereof have presently swelled and so died; this I know, that in *Carolina* if their Calves, young Bullocks, or Cows eat thereof they are presently taken with a swimming, and in a short time turn round with a *Vertigo*, and then in a little time after it die, and all this without Remedy, this I have seen; nor could I find that they had any Cure for it, their Death being so sudden: An Ointment or Balsam made of the Roots is an excellent thing against scrophulous Sores and Ulcers, and being duly applied cures them to a Wonder.

JAMESWORT, See *Ragwort.*

CHAP. CCCCIV.

Of JEWSEARS.

I. *THE Names.* This Plant is called in *Greek* Μύκης Ἀκτῆς, ἢ μύκης ἄκτιν@, in *Latine Fungus Sambuci*, and *Fungus Sambucinus*, *Gummi Sambuci*, and of some *Auriculæ Judæ*, in *English Jewsears*, also *Mushroom of the Elder Tree.*

II. *The Kinds.* It may well be accounted of the Stock of *Mushrooms*, as is also *Agarick*, but this growing upon the Alder Tree is a singular Species.

III. The Description. *It is an Excrescence, which is soft, blackish, covered with a Skin, or otherwise like a thick Skin, somewhat like now and than to a Mans Ear, which being plucked off and dried shrinks together and becomes hard.*

IV. *The Places.* It is found growing only upon Elder Trees, and generally such as are old, in most places of this Kingdom.

V. *The Times.* They ought to be gathered when they are come to their largeness, or perfection, in the fore part of the day, in a fair and dry Season, and in the Months of *August* or *September*, when they have participated of the full ascending Virtues and Juices of the Tree.

VI. *The Qualities.* They are temperate in respect of heat or cold, and dry in the begining of the second degree, they are Anodyn, Astringent, and Discussive, a little Repercussive, and Vulnerary.

VII. *The Specification*, They are peculiar for curing the Quinsie, and other Tumors of the Throat, Almonds, and Jaws.

VIII. *The Preparations.* You may have therefrom 1. *A Decoction in Wine or Water.* 2. *A Compound Decoction.* 3. *A Cataplasm.*

The Virtues.

IX. *The Decoction in Wine or Water.* It is used as a Gargle to heal all Tumors or Swellings, and Sores or Ulcers in the Mouth, Gums, Throat, Almonds, *&c.* those parts being washed or gargled therewith three, four, five, or six times a day as hot as can be endured, by this means exquisite Quinsies have been cured therewith, but in case of a Quinsie the Decoction will be best to be made in Vinegar, adding thereto after it is boiled a fitting proportion of Wine.

X. *The Compound Decoction in Wine or Water. Take Wine or Water three Pints, Jewsears, Elm Bark bruised, of each six Drams, Columbine Leaves half an Ounce, Madder three Drams, Cremor Tartari in pouder five Drams, Black Pepper in pouder*

half a Dram, boil to the conſumption of three quarters of a Pint, ſtrain out, and keep the Decoction for a Gargle, which you may dulciſie, or not, as the occaſion requires. It is an excellent Remedy for the cure of a Quinſie, being uſed as hot as can be endured, as alſo for any other Tumor of the Almonds, or parts adjacent, and cures all ſorts of Sores and Ulcers of the Mouth, Jaws, Gums, Throat, or Almonds of the Ears; it ſo ſtrengthens the *Uvula*, or Palate of the Mouth, that when it is down it reſtores it to its proper tone and ſtate; it alſo takes away vehement inflamations of thoſe parts, they being often gargled therewith.

XI. *The Cataplaſm. It is made by cutting the* Auriculæ *or* Fungi *into very ſmall bits, and then boiling them in Wine, or in Vinegar, adding a little Barley Flower to bring it to a conſiſtency.* Applied outwardly to the Throat as hot as can be endured in a Quinſie, (whilſt the Decoctions are uſed inwardly as a Gargariſm) it much contributes to the abating of the Inflamation and diſcuſſing of the Tumor; applied to any other recent Inflamation or Tumor whilſt in begining, in what part of the Body ſoever, it cools, abates the inflamation, alleviates the pain, and diſcuſſes the ſwelling.

CHAP. CCCCV.

Of JOHNSWORT Great Common,

OR,

HYPERICON.

I. *THE Names.* It is called in *Greek* Ὑπερικὸν, in *Latine Hypericon*, in *Engliſh Hypericon* alſo, and *Johnswort*; the *Arabians* call it *Reafricon, Reofaricon, Henſericon, Nelifricon,*

II. *The Kinds.* There are two generick Kinds of *Hypericon*, or *Johnswort*, viz. 1. *Hypericon vulgare*, which ſome have called *Fuga Dæmonum*, i. e. Drive Devil, and ſome *Androſæmum*, becauſe the Flowers yield a bloody color, and others *Chamæpytis*, becauſe of the reſinous ſmell of the Seed, but theſe are the proper Names of other Plants, this our *Hypericon* (Treated of in this Chapter) is the *True Hypericon of Dioſcorides*, or *Common Great Johnswort*, as both the bloody color of the Flowers and reſinous ſmell of the Heads and Seed do declare, which are two principal Notes thereof. 2. *Hyperiſum minus*, The Leſſer Hypericon, or Johnswort, of which in Chap. 406. following.

III. *The Deſcription.* Common Great Johnswort, *or* Common Hypericon, *has a Root which is hard and woody, with divers Strings and Fibres at it, and of a browniſh color, which abides in the Ground many Years, ſhooting forth afreſh every Spring*; from this Root ſhoots forth browniſh, hard, upright, round Stalks, about two Feet high, ſpreading many Branches from the ſides up to their tops, having two ſmall Leaves ſet one againſt another at every place, which are of a deep green color, ſomething like to the Leaves of the *Leſſer Centory*, but narrower, and full of ſmall holes in every Leaf, which cannot be ſo well perceived as when they are held up to the light; at the tops of the Stalks and Branches ſtand yellow Flowers, conſiſting of five Leaves apiece, with many yellow Threads in the middle, which being bruiſed do yield a reddiſh Juice, like Blood, after which do come ſmall round Heads, in which is contained ſmall blackiſh Seed, ſmelling like Roſin

Johnswort the Greater.

IV. *The Places.* It grows in Woods, Groves, and Copſes, as well in ſhady places as in ſuch as are open to the Sun, in many parts of this Kingdom.

V. *The Times.* It Flowers about the latter end of *June*, as alſo in *July*, and the Seed is ripe towards the end of the ſame Month, or the begining of *Auguſt*.

VI. *The Qualities.* It is hot and dry in the firſt degree, thin, and of ſubtil parts, Anodyn, Digeſtive, Aperitive, Abſterſive, Diuretick, Diſcuſſive, Traumatick or Vulnerary, Neurotick, Stomatick, Nephritick, Hyſterick, Arthritick, and Alexipharmick.

VII. *The Specification.* It is peculiar for curing Wounds and Ulcers, Spitting, Vomiting, and Piſſing Blood, Bitings of Venomous Creatures, Stone and Gravel in the Reins, Strangury, and heat of Urine, ſtoppage of the Terms in Women, Tertian and Quartan Agues, the Sciatica, Palſie, Epilepſie, and other Diſeaſes of like kind.

VIII. *The Preparations.* You may have therefrom theſe following Medicaments, *viz.* 1. *A Juice of Leaves and Flowers.* 2. *An Eſſence.* 3. *An Infuſion or Decoction in Wine of Herb, Flowers, and Seed.* 4. *A Pouder of Herb or Flowers.* 5. *A Pouder of the Seed.* 6. *An Oil Simple.* 7. *An Oil Compound.* 8. *An Oil Magiſtral.* 9. *A Diſtilled Water.* 10. *An Acid Tincture.* 11. *A Spirituous Tincture.* 12. *An Oily Tincture.*

The Virtues.

IX. *The Juice.* It is a good Vulnerary, whether inwardly taken or outwardly applied, and given to two, three, or four Spoonfuls at a time mixed with a Glaſs of Wine it heals inward Wounds, Hurts, or Bruiſes; it is of ſubtil parts, opens obſtructions of the *Viſcera*, diſſolves Tumors, conſolidates the lips of

of Wounds, ſtrengthning the parts which are weak and feeble.

X. *The Eſſence.* This is yet more effectual to all the aforeſaid Intentions, beſides which it is good againſt all manner of Spitting and Vomiting Blood, occaſioned by the rupture of any Vein, or by Bruiſes, Falls, or any other means whatſoever; it is an Antidote againſt Poyſon, and prevails againſt the ſtinging or biting of any Venomous Creature; it has been found effectual by experience to give eaſe in the Strangury, to expel Sand, Gravel, and ſmall Stones out of the Reins and Bladder, and to provoke the Terms in Women, taken to three or four Spoonfuls, (according to Age) warm, mixed with a Glaſs of Wine, before the Fits of Agues, for ſome days, it helps them and alters the Fits, whether they be *Tertians* or *Quartans*, and by continuing the uſe of it for ſome time perfectly cures them.

XI. *The Infuſion or Decoctionn in Wine of Herb and Flowers, as alſo of the Seed.* They have the Virtues of the Juice and Eſſence, but muſt be given two or three times a day, and in a much larger Doſe, *viz.* from four Ounces to eight Ounces, according to Age and Neceſſity; they open obſtructions of Reins and Womb, and kill Worms in the Belly or Stomach.

XII. *The Pouder of Herb and Flowers.* It is an effectual thing for Wounds and Sores, to cleanſe dry, conglutinate, and heal them, being ſtrewed thick upon the ſame, and dreſſed therewith Morning and Evening.

XIII. *The Pouder of the Seed.* It has the Virtues of Juice, Eſſence, and Decoction, but not altogether ſo effectual; if it is taken to a Dram in Juice or Eſſence of *Knotgraſs* it cures Spitting, Vomiting, and Piſſing of Blood, as alſo Bloody Fluxes, and conſolidates any Vein which is inwardly broken; if it is taken to the quantity of two Drams in ſome Broth it does gently purge Choler, cleanſes the Veſſels of the Meſentery, and expels congealed Blood out of the Stomach; it is alſo much commended, being drank for forty days together, for the Cure of the Epilepſie, Palſie, Gout, and Sciatica, as alſo to remove and eaſe Rheumatick Pains in any part of the Body.

XIV. *The Simple Oil. Take Expreſſed Oil of the Seeds of Hypericon, or for want thereof Expreſſed Oil of Ben, or choice Oil Olive, a Gallon,* Red Port *or* Lisbon *Wine a Pint and half, Flowers of Hypericon thirty two Ounces, inſolate, or digeſt in a equivolent Sand heat for fourteen days, then boil in* Balneo *to the conſumption of the Wine, ſtrain out by Expreſſion, and repeat the Infuſion with like quantity of Flowers, Boiling and Expreſſing, as aforeſaid, adding alſo more freſh Wine, repeating the ſame Work the third time with freſh Flowers, then ſtraining out, keep it for uſe; ſome add to the aforeſaid Oil* Venice, Strasburgh, *or rather* Scio *Turpentine, one Pound, diſſolving it therein, and ſo keep it for uſe.* Or thus. *Take Oil Olive eight Pounds, Leaves, Flowers, and Seeds of Hypericon bruiſed, of each four Ounces, inſolate, or digeſt in an equivolent Sand heat fourteen days, boil a little in* Balneo, *and ſtrain out, which Work repeat the ſecond and third times with freſh Herbs, Flowers,* &c. *till the Oil becomes of a Blood red color.* Gerard *makes it thus. Take Oil Olive ſix Pounds, fine Turpentine, White Wine, of each three Pounds, Leaves, Flowers, and Seeds of Hypericon bruiſed, of each twenty four Ounces, inſolate, or digeſt in a Sand heat ten days, boil in* Balneo, *and ſtrain out, and with freſh Herbs, Flowers,* &c. *repeat this Work the ſecond and third times, which at laſt being hot ſtrain out, and keep it for uſe.* This Oil being uſed hot cures Punctures of the Nerves, and Contuſions of the ſame, as alſo Burnings, Scaldings, all Wounds and Ulcers, tho' made with poyſoned Weapons, Gout, Sciatica, and Rheumatick Pains; it is ſaid to heal green and deep Wounds which run into the Body, it ſtrengthens and refreſhes the Joints, comforts the Nerves and Tendons, helps Tremblings, Cramps, Convulſions, and Palſies, is Emollient, Digeſtive, and Diſcuſſive; I have found it by Experience to be an excellent thing to diſſolve Strumous Tumors, and to digeſt, cleanſe, dry up, and heal Kings-Evil Sores and Ulcers.

XV. *The Compound Oil. Take White, or rather Red* Port, *or* Lisbon *Wine, three Pints, freſh Flowers of Hypericon, with the Seeds or Heads, four handfuls, beat or bruiſe them, and digeſt in a Glaſs Veſſel cloſe ſtopped for two days, boil them in* Balneo, *and preſs them out ſtrongly; to this ſtraining put new Flowers and Tops of the Herb, as before, and repeat it the third time, and then ſtrongly preſs out by ſtraining; to every Pound hereof add of pure* Florence *Oil four Pounds, of choice* Venice *or* Scio *Turpentine ſix Ounces, Oil of Wormwood three Ounces, Dittany, Gentian, Carduus, Tormentil, Calamus Aromaticus, Carline, or Carduus Mariæ, all of them in pouder, of each two Drams, Earth Worms ſlit and often waſhed in White Wine two Ounces, ſet them to inſolate for five or ſix Weeks, or elſe digeſt as long in a moderate Sand heat, and keep the Oil for uſe.* Or thus. *Take of either of the Simple Oils in the former Section four Pounds, Oil of Juniper Berries rectified half a Pound, Chymical Oil of Nutmegs a quarter of a Pound, Balſam Copaybe two Ounces and half, Camphir one Ounce, mix, diſſolve, and keep it for uſe.* This has all the Virtues of the Simple Oil with advantage, being more comfortable to the Nerves, drawing and cleanſing than it, is a moſt excellent Vulnerary, diſcuſſes Tumors, eaſes Pain, heals Contuſions, Punctures, or other Hurts and Wounds of the Nerves and Tendons, and is admirable for old Aches, Rheumatiſms, Bruiſes, Strains, Palſies, Numbneſs, Cramps, Convulſions, Headach, Megrim, Lethargy, Burnings, Scaldings, *&c.*

XVI. *The Magiſtral Oil. Take of the Simple Oil of Hypericon made with Oil of Ben at Sect.* 14. *aforegoing four Pounds, Balſam of* Peru *a Pound and half, Balſam of* Tolu, *Storax Calamita ſtrained, Tincture of Saffron and Cochenele abſtracted to the thickneſs of new Honey, of each half a Pound, Chymical Oils of Angelica, Lavender, Limons, Mint, Nutmegs, Oranges, and Saſſafras, of each three Ounces, mix, digeſt in a warm* Balneo *or Sand heat for a Week, ſhaking altogether once a day, and keep it for uſe.* This has all the Virtues of the Simple and Compound Oils aforegoing, but for any extream or inveterate Pain in any part of the Body, or for any Contuſion, Punctture, or any other Wound or Hurt of the Nerves or Tendons, there is nothing ſuperior to it in the World; eſteem it as a Jewel.

XVII. *The Diſtilled Water. Take the Flowers, Leaves, and Tops of Hypericon twelve good handfuls, White* Port *Wine three Quarts, mix, digeſt two days in a warm* Balneo, *then in* Balneo *draw off the Water to dryneſs.* It may ſerve as a Vehicle to convey the Juice or Eſſence in, being good for all the ſame purpoſes; if it is dulcified with White Sugar and drank, it is thought to be as effectual as the Infuſion or Decoction, beſides it is ſaid to kill Worms in the Stomach and Belly.

XVIII. *The Acid Tincture.* It is good againſt Poyſon inwardly or outwardly received, being given from twenty to ſixty drops at a time in any proper Vehicle, as the Diſtilled Water, *&c.* it is Aperitive, Abſterſive, and Stomachical, comforts and fortifies the Ventricle, and reſtores its Tone being hurt or depraved; it cauſes a good Appetite and ſtrong Digeſtion, and allays the fermentation of the Humors

or

or Juices in the Body; it prevails alſo againſt the Plague or Peſtilence, and all ſorts of malign and peſtilential Diſeaſes.

XIX. *The Spirituous Tincture.* It warms and comforts the Stomach, is good againſt Crudities, and expels Wind; a green Wound waſhed with it it cleanſes it, comforts it, reſtores its heat, and preſently conſolidates or heals it, and is profitable for ſuch as are affected with a *Vertigo*, Lethargy, Epilepſie, Palſie, Convulſions, or other like Diſeaſes of the Head, Brain, and Nerves. Doſe from one to two Drams in any fit Vehicle.

XX. *The Oily Tincture.* It opens obſtructions of the Reins, Ureters, and Bladder, expels Sand, Gravel, ſmall Stones, or other Tartarous Mucilage out of thoſe parts, and gives preſent eaſe in the Strangury; it gives inſtant relief in the Colick, and gripings of the Guts, alleviates the pain in the Back, tho' never ſo extream, and reſtores and ſtrengthens the Tone of any or all the *Viſcera*, tho' very much hurt and depraved; outwardly it eaſes Aches and Pains in the Limbs, proceeding from a cold Cauſe, and gives preſent help to Contuſions and Punctures of the Nerves and Tendons, tho' the extremity is ſo great as to cauſe Convulſions, performing the Cure in a ſhort time after. Doſe of this Oily Tincture is from eight to twenty drops, according to Age and Strength, firſt dropped into Sugar, and then mixed with the Vehicle you intend to give it in.

CHAP. CCCCVI.

Of JOHNSWORT Small, *OR*, Leſſer HYPERICON.

I. *THE Names.* It is called in *Greek* Ὑπερικὸν μικρὸν, in *Latine Hypericum minus*, and in *Engliſh The Smaller Johnswort*, or *Leſſer Hypericon.*

II. *The Kinds.* We ſhall take notice but of five Species of this Plant, being all that are yet known to grow in our Countries, *viz.* 1. *Hypericum minus erectum Bauhini*, *Hypericum pulchrum Tragi*, (as it is thought) *Hypericum minus Thalij*, *Hypericum Syriacum Lobelij*, Small Upright Hypericon, or Johnswort. 2. *Hypericum minus Supinum*, *vel Supinum glabrum Bauhini*, *Hypericum Exiguum Tragi*, *Hypericum minus Dodonæi & Geſneri*, *Hypericum minimum Supinum Septentrionale Lobelij*, *Hypericum Supinum tertium minimum Claſij*, Small Creeping Hypericon, or Johnswort. 3. *Hypericum Numulariæ folio*, *Hypericum tertium Tragi*, *Hypericum minus ſecundi Bauhini*, Round Leav'd Hypericon, or Johnswort. 4. *Hypericum minus Supinum Tomentoſum Bauhini*, *Hypericum alterum Tomentoſum Lobelij*, *Hypericum minus Supinum Monſpeliacum*, *Androſæmum album Dalechampij*, The Small Creeping Woolly Hypericon, or Johnswort. 5. *Hypericum Americanum*, *Hypericum Fruteſcens Americanum Flore albo*, American Hypericon, or Johnswort, White Flowered American Johnswort.

III. *An Obſervation.* Altho' what I have to ſay here ought to have been put in the former Chapter, yet it is better to have a place out of its order than no where; it is the Opinion of ſome Authors concerning the Generick Kinds of *Hypericon* that they are fourfold, *viz.* 1. *Hypericon vulgare*, Hypericon, or Johnswort, properly ſo called, of which we diſcourſe in the former and this preſent Chapter. 2. Ἄσπρεον, and Ἀσπρεγίδας, *Aſcyrum*, and *Aſcyroides*, *Hypericon magnum*, Peterswort. 3. Ἀνδρόσαιμον, *Androſæmum*, *Hypericum maximum*, Tutſan, or Park-Leaves, of both which we ſhall ſpeak (God willing) in their proper places of the Alphabet or Book. 4. Κόρις, *Koris* and *Coris*, Heath Groundpine, of which we have already ſpoken Chap. 332. aforegoing. It is true that the ſecond, or *Peterswort*, may very well be admitted to be a great or large Kind of *Hypericon*, becauſe not only the Flowers, but the whole form of the Plant beſpeak it, but how far *Tutſan* or *Parkleaves* will admit of being a Kind we ſhall leave to the Readers Judgment, I confeſs one of the Species thereof, *viz. Androſæmum Matthioli*, very much reſembles *Hypericon* in its manner of growing, Leaves, and Flowers, but that it is very much larger, and ſo may be accounted the greateſt Kind of *Johnswort*; but the chief thing which enforces the Argument of *Tutſan* to be a Species of *Hypericon* is the form of the Flowers, and their yielding a bloody Juice: As to *Coris*, or *Heath Groundpine*, I cannot ſee how it has any relation to *Johnswort*, farther than what the form and color of its Flowers may induce.

Johnswort Leſſer.

IV. The Deſcriptions. *The firſt, or* Small Upright Hypericon, *or* Johnswort. *It has a ſmall and long Root, and fibrous withal, enduring all the Winter in the Ground*; this Plant is very rare to meet with, but it is very like that in the former Chapter, ſaving that it is ſmaller, yet the Leaves do not fully anſwer the form of the other, but are a little broader, and not ſo ſharp pointed; the Stalks are reddiſh, and the Flowers leſſer, not fully ſo yellow, nor do they give full out ſo bloody a Color when they are bruiſed between the Fingers, and ſometimes they ſtand in Circles at the joints of the Stalks as well as at the tops; the Seed is alſo reſinous, as the former.

V. *The*

V. *The ſecond, or* Small Creeping Hypericon, *or* Johnswort. *Its Root is very like the former, nor does the whole Plant differ much from it*; its Stalks are reddiſh, and not much above an Hand breadth high, yet ſtand not fully upright, but leaning downwards; the Leaves are ſmall, narrow, and ſmooth, and the ſmall Flowers are yellow.

VI. *The third, or* Round Leav'd Hypericon, *or* Johnswort. *The Root is ſmall and long, and fibrous, as the others aforegoing*; this Plant is as ſmall as the laſt, and its ſmall, reddiſh, ſquare Stalks or Branches riſe no higher than it, having two Leaves ſet one againſt another at every Joint up to the tops, and are almoſt round, like unto *Moneywort*, or *Herb Twopence*, of a dark or ſad green on the upper ſide, and whitiſh underneath, ſpotted ſometimes with reddiſh ſpots, and ſtrakes; the Flowers are of a paler yellow color than the former, but ſomewhat large in compariſon to the ſmallneſs of the Plant, with ſeveral yellow Threads in the middle.

VII. *The fourth, or* Small Creeping Woolly Hypericon, *or* Johnswort. *It has a ſmall, ſlender, long, woody, and fibrous Root*, from which ſpring up ſeveral hairy, whitiſh, ſmall, woolly Branches, lying upon the Ground and ſhooting forth Fibres, ſet with woolly Leaves, but not very cloſe together, much like to thoſe of the *Common Hypericon* in the former Chapter, but hoary and white, and a little rounder; at the joints towards the tops ſtand the Flowers, which are ſmaller than thoſe of the *Common Hypericon*, and of a paler yellow; the Seed Veſſels are like unto the other Kinds, as is alſo the Seed it ſelf.

VIII. *The fifth, or* White Flowered American Hypericon, *or* Johnswort. *It has a long, ſlender, woody, fibrous Root, which abides all the Winter*; from this Root ariſe Yearly ſeveral woody Stalks, almoſt to a Mans height, covered with a whitiſh Bark, from whence are thruſt forth on all ſides various Branches ſet with thick green Leaves, narrow below, broad about the middle, and round at ends, ſometimes two or three at a place, from which joints alſo ariſe divers white Flowers, conſiſting of four Leaves apiece, the Leaves fall away every Year, and appear again in the Spring.

IX. *The Places.* The three firſt Kinds grow in Woods and Copſes as well in thoſe which are ſhady as thoſe which are open to the Sun; the fourth grows in Mooriſh and Wet Fields, as alſo on dry barren Ground; the laſt grows with us, but is nouriſhed up in Gardens, being brought hither from the North Weſt parts of *America*.

X. *The Times.* They all Flower about the middle or latter end of *June*, and in *July*, and the Seed is ripe in the end of *July*, or in the begining of *Auguſt*.

XI. *The Qualities, Specification, Preparations, and Virtues* of the firſt four are the ſame with thoſe of the *Common Hypericon* in the former Chapter, but ſcarcely or not altogether ſo powerful and effectual to all thoſe Intentions: The Qualities and Virtues of the *American* are not yet well known, or but only gueſt at.

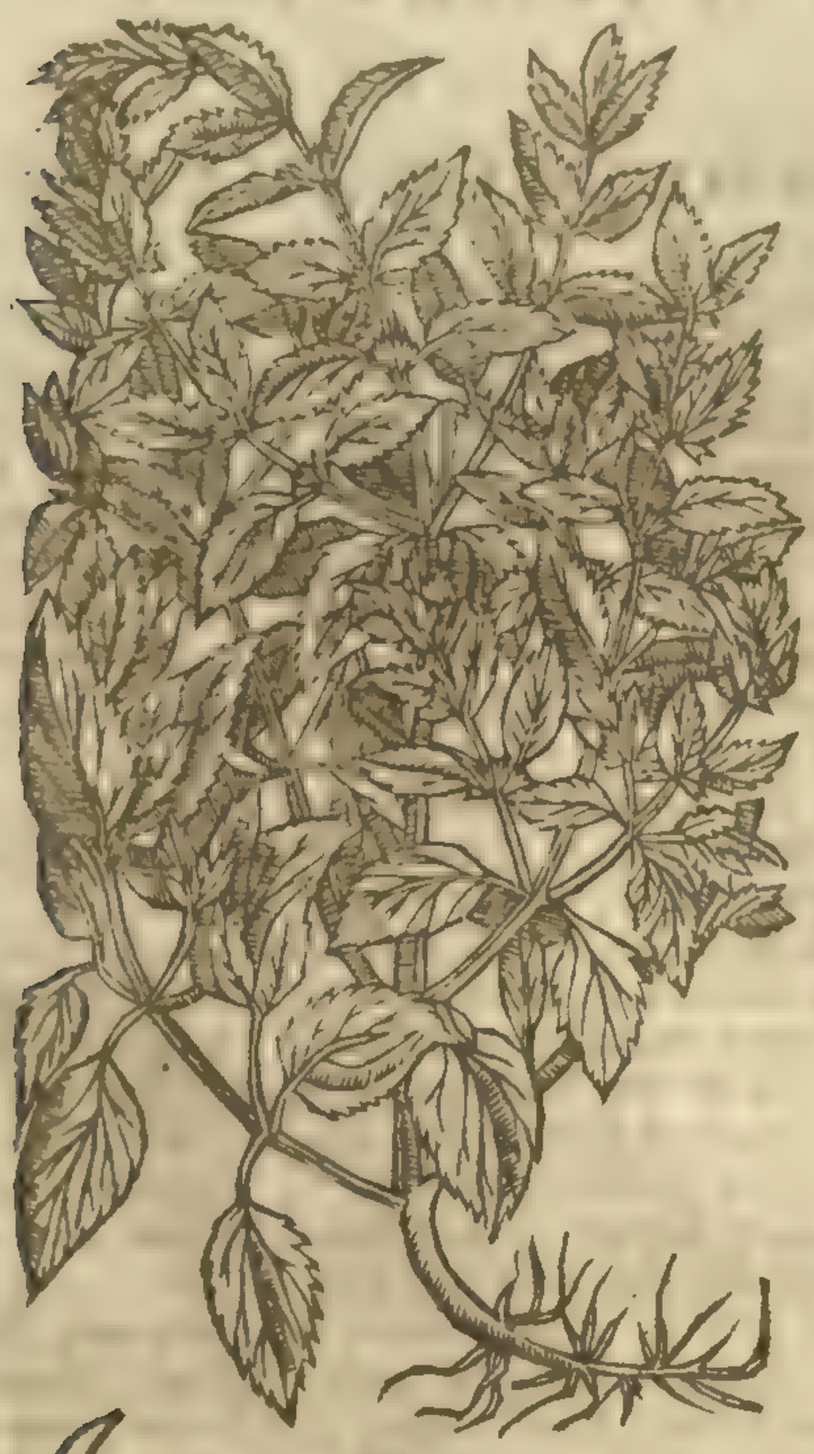
CHAP. CCCCVII.

Of IRONWORT, OR, SOLDIERS HERB.

I. *THE Names.* It is called in *Arabick Sidrachis*, in *Greek* Σιδηρίτις, ἢ Στρατιώτης, *Dioſcoridis Lib.* 4. *Cap.* 102. in *Latine Sideritis, ſive Ferrum inatrix, ſic dicta à Ferro, quod Vulneribus Ferro factis ſuit Medela*, for that it did cure Wounds made by the Sword, or with Iron; it was alſo called *Stratiotes*, as *Dioſcorides* and *Pliny* ſay, and *Militaris*, becauſe *Milites*, Soldiers, had uſually great need of the ſame; in *Engliſh Ironwort*, and *Soldiers Herb*.

II. *The Kinds.* Authors make many Species of this Plant, *viz.* 1. *Sideritis vulgaris Cluſij, Sideritis prima Cluſij*; this is without doubt *Sideritis ſecunda Matthioli*, others that of *Dioſcoridis*, which ſome Authors, as *Anguillaræ, Columna, Tragus*, and *Parkinſon*, will have to be *Burnet*, tho' it is plainly manifeſt by the Deſcriptions of each Plant and by their Heads of Flowers that they are differing Plants, Vulgar or Common Ironwort. 2. *Sideritis Arvenſis rubra, Tetrahit Anguſtiſolium, Sideritis Arvenſis Flore rubro Camerarij & Thalij, Sideritis alia in Vineis Cæſalpini, Alyſſum Galeni Flore purpureo, Sideritis Arvenſis Latifolia glabra Bauhini*, Meadow Ironwort with red Flowers. 3. *Sideritis prima vel Herculea, Herba Judaica, Tetrahil, Tetrahit, Sideritis procumbens Ramoſa Gerardi*, Creeping Branched Ironwort, called alſo Jews Ironwort, becauſe the *Jews* which Practiſed Phyſick in *Italy* made much uſe of it. 4. *Sideritis parva procumbens, Sideritis quarta Cluſij, Sideritis procumbens non Ramoſa*, Small Creeping Ironwort not Branched, or Small Jews Ironwort. 5. *Sideritis altera parva, vel Sideritis quinta Cluſij*, Another Small Jews Ironwort. 6. *Sideritis Montana parvo Flore nigro purpureo Columnæ, Sideritis Montana Apula verſicolor*, Mountain Ironwort with a ſmall black purple Flower, or Mountain Ironwort of Naples. 7. *Sideritis Folijs Alſines Triſſaginis Bauhini*, Ironwort with Germander Chickweed Leaves. 8. *Sideritis Germanica parva, Sideritis ſexta Cluſij*, Small Germany Ironwort, this ſays *Cluſius* is common at *Vienna* in *Auſtria*. 9. *Sideritis Hederculæ Folio, Sideritis Anglica*, Engliſh Ironwort, or Ironwort with Alehoof Leaves. 10. *Sideritis Folio ſplendente oblongo glabra*, Ironwort with ſmooth long Leaves. 11. *Sideritis Arvenſis Latifolia glabra Bauhini, Sideritis Herculea altera Cæſalpini, Sideritis Arvenſis Flore palido Camerarij, Sideritis Arvenſis Species altera Thalij, Alyſſum Germanicum aliorum*, Broad Leav'd Meadow Ironwort, this *Bauhinus* would have to be *Sideritis ſecunda Matthioli*, which it is not, and *Lobel* would have it to be a Species of *Cannabis Spuria*, others that it is *Marrubium Pannonicum Cluſij*, all which are much to be doubted. To the former Eleven Kinds may be added the two following, *viz.* 12. *Sideritis Anglica Radice ſtrumoſa, Panax Coloni Gerardi, Sideritis primi Thalij, Betonica fœtida Geſneri*, Clowns Woundwort, or Engliſh Ironwort with ſtrumous Roots, of which we have Treated at large in Chap. 9. aforegoing. 13. *Sideritis Arvenſis gratis odoris, Pimpinella Sanguiſorba*, Ironwort having a pleaſant ſmell, or Our Common Burnet, whether greater or leſſer; and this we have here added to the number,

number, because several Authors will have it to be a Species of the *Sideritides*, or *Ironworts*, of which we have Treated also at large in Chap. 101. aforegoing of this Work.



Ironwort

III. The Descriptions. *The first, or* Vulgar or Common Ironwort. *It has a Root which is white and woody, continuing all Winter, and shooting forth new Stalks every Year*; it grows greater and higher than the other *Ironworts*, as *Clusius* says, with larger hairy rough pointed Leaves set by couples one against another at the joints of the square hairy Stalks, dented about the edges, but set at somewhat farther distances, which branching themselves forth are set from the middle upwards with many Wharls of gaping white Flowers at the joints with the Leaves, spotted with Blood red spots in the upper parts of them, ending in a long Spike; the Seed which follows is small, uneven and black, contained in fine square Heads.

IV. *Nota.* This our first *Sideritis* I take to be truly the *Sideritis secunda Matthioli*, which very much appears from his description of it, tho' it is very short, in his Epitome, and is in these Words, *Exit in hac Caule quadrato, dodrantali, aut majori, Ramosque, Foliis Marrubio longioribus, ad Salviæ faciem accedentibus, crispis, albicantibus, & per ambitum laciniatis, sapore haud ingrato, Floribus verticillatim in Caule, & Ramis prodeuntibus Marrubij modo.*

V. *The second, or* Meadow Ironwort with red Flowers. *The Root of this Herb is very fibrous, or full of Threads, from whence rises up a square brown Stalk, full of Branches*, and thereon several narrow, long, and pointed, rough Leaves, somewhat dented about the edges, set by pairs or couples, at the tops of which stand the Flowers, encompassing them, as the others do, of a dark red color, and sometimes of a white color; the whole Plant is of an austere or harsh binding taste, without smell, and perishes every Year.

Ironwort Meadow Red Flowered.

VI. *The third, or* Creeping Branched Ironwort, *called also* Jews Ironwort. *It has a Root which is small and woody, yet living all Winter, and shooting forth afresh every Spring*; it is a small low Herb, neither wholly standing upright, nor wholly leaning down to the Ground, but has several weak, rough, hoary, square Stalks, not much above a Foot high, full of joints, at the several distances whereof grow two small Leaves, somewhat long, rough, or as it were crumpled, hard and hairy, not half so broad as *Horehound* Leaves, dented about the edges, smelling and tasting somewhat strong, which spread abroad into divers Branches, the upper parts whereof are repleniſhed with many rough small Wharls of pale purplish gaping Flowers, with hoary Leaves at the joints under them also, where after they are past come small blackish Seed, contained in those Husks wherein the Flowers stood before.

VII. *The fourth, or* Small Creeping Ironwort not Branched, *or* Small Jews Ironwort. *The Root of this Plant is small, and perishes every Year; the Herb is also small, and somewhat like the former in the hairy square Branches, but more trailing or leaning*; the Leaves also are hairy, somewhat larger, and less snipt about the edges, that is, they are dented only from the middle to their ends; the Flowers grow in the bosoms of those Leaves, and encompass the Stalks or Branches of the Plant in Rundles at certain distances, as the others do, from their bottoms to their very tops, being of a whitish color, and shaped like the other Kinds.

VIII. *The fifth, or* Other Small Jews Ironwort. *The Root is much like the beforegoing, and perishes every Year*; it is a small *Ironwort*, and has the middle Stalk upright, square, and something hairy, spreading it self into many smaller Branches, even from

from the bottom upwards, which in a manner lye upon the Ground, with two ſuch like Leaves at the Joints as in the laſt, but little or nothing dented at all; the Flowers are white, without ſpots, but gaping in like manner.

IX. *The ſixth, or* Mountain Ironwort with a ſmall black purple Flower. *It has a Root which is ſmall, hard, and yellowiſh, from which riſes up a reddiſh, hoary, hard, hairy, ſquare Stalk, about half a Yard high, divided into two Branches, about the middle thereof,* on which are ſet at the joints two ſmall and long pale green Leaves one againſt another, covered with an hoary Down, and having three dents or notches on each ſide at the ends of them, which at the lower end of the Stalk next the Ground ſtand upon long footſtalks, but up higher towards the top are without any; the Flowers ſtand in ſharp pointed Husks, and are gaping, or hooded, as the reſt are, but very ſmall, whoſe head and jaws are of a dark purpliſh color, the middle of the Flower is yellow, and the long neck of the Flower which riſes out of the Husk is whitiſh; after the Flowers are paſt there come four blackiſh Aſh Colored Seed, ſomewhat cornered, which are contained in the hairy or hoary Husks.

X. *The ſeventh, or* Ironwort with Germander Chickweed Leaves. *It has a Root which is ſmall and thready, which ſends forth a Stalk a Foot long, ſpread out into Branches from the bottom, and thoſe again ſending forth other ſmaller ones,* all of them inclining to the Ground, like the *Germander Chickweed*, but much greater, on which ſtand a few hairy Leaves by pairs or couples, in form like unto that *Chickweed*, but larger, and dented about the edges, the Flowers grow at the joints with the Leaves towards the tops, and like unto the others in faſhion, but ſomewhat longer, and of a blewiſh color, ſtanding in ſharp and rough Husks, in which is contained ſmall round Seed.

XI. *The eighth, or* Small Germany Ironwort. *The Root is white and woody, and periſhes every Year; it is a ſmall Plant, and has low ſquare Stalks, of about a Foot high, Branched out almoſt from the very Ground,* being ſoft and hoary, as the Leaves alſo are, which ſtand at the joints by couples, being long, and ſomewhat narrow, without any dents at all about the edges, yet larger at or near the bottom of the Stalks and Branches than towards their tops; the Branches have Flowers growing about them upwards as ſoon almoſt as they ſhoot out, in ſhape as the other ſorts are, but they are ſo ſmall that they ſcarcely appear out of the Husks, of a dusky color, the jaws and lower parts on the inſide being whitiſh, after which follows blackiſh Seed, ſmaller than in the others.

XII. *The ninth, or* Engliſh Ironwort, *or* Ironwort with Alehoof Leaves, *It has a Root which is ſmall and thready, periſhing every Year, but abundantly raiſing it ſelf from its own ſowing, in any Garden where it has once taken poſſeſſion*; it is a ſmall Herb, not much above an Hand breadth, or four or five Inches high, having ſmall, broad, and roundiſh green Leaves, with round dents about the edges, like to *Alehoof*, or rather like to *Red Archangel* Leaves; the Flowers are hooded, ſmall, and purpliſh, and the Seed ſmall and blackiſh.

XIII. *The tenth, or* Ironwort with ſmooth long Leaves. *Its Root is whitiſh, fibrous, woody, and periſhing every Year, from whence riſe up ſquare and jointed Stalks, ſmooth below, but with ſome ſmall kind of hairineſs at their tops*; the Leaves are ſmooth and thin, ſet by couples, the lowermoſt three Inches long, and one broad, not dented at all about the edges; the Flowers are hooded, like the *Common ſort*, but white, larger than they, and longer alſo, ſtanding in rough Husks about the Stalks, even from the bottom almoſt, after which come ſmall, blackiſh, uneven Seed, in Heads like thoſe of *Plantane*, but ſhorter.

XIV. *The eleventh, or* Broad Leaved Meadow Ironwort. *The Root of this is like the ſecond Kind aforegoing, and it has larger ſmooth green Leaves below than thoſe above, a little dented about the edges*; the Stalks are ſquare, about a Foot and half in height, and Branched out; the Flowers grow in Roundles at the tops of the Branches, being hooded, and of a pale yellow color, and in ſome purpliſh, tending to white, without any ſmell at all.

XV. *The Places.* Some of theſe grow wild in *England*, in Meadows, and on Mountains, in many places, being moſt of them natural to our Country; the ſecond of theſe *Gerard* ſays grows frequently in the Corn Fields in *Kent*, and by *Purfleet* in *Eſſex*; the ſeventh *Gerard* alſo found in Flower and Seed among Corn in a Field joining to a Wood ſide not far from *Greenhive* in *Kent*; the ninth *Parkinſon* ſays he found growing wild in the Fields, from whence he tranſplanted it into his Garden, where it continued to encreaſe and flouriſh.

XVI. *The Times.* They all Flower in *June* and *July*, and their Seed is ripe ſoon after.

XVII. *The Qualities. Ironwort* is temperate in reſpect to heat or cold, and dry in the firſt degree, or begining of the ſecond; it is Anodyn, Aſtringent, Incarnative, and Vulnerary.

XVIII. *The Specification.* It is very powerful to ſtop all fluxes of Blood, Catarrhs, the Reds and Whites in Women, and ſpeedily to heal all ſimple green Wounds, and that, (as Authors ſay) without ſuppuration; it dries up alſo fluxes of Humors in old fretting Ulcers, cleanſes the Ulcer, incarnates, and quickly heals it.

XIX. *The Preparations.* You may prepare therefrom, 1. *A Liquid Juice.* 2. *An Eſſence.* 3. *A Syrup.* 4. *A Decoction.* 5. *A Pouder of the Herb.* 6. *A Balſam or Ointment.* 7. *A Cataplaſm.*

The Virtues.

XX. *The Liquid Juice.* Given inwardly two, three, four, or five Spoonfuls at a time, either alone by it ſelf, or mixed with rough Red Wine, it is prevalent againſt all internal fluxes of Blood, as Spitting or Vomiting Blood, Piſſing Blood, the Bloody or Hepatick Flux, and the overflowing of the Terms in Women.

XXI. *The Eſſence.* It has all the Virtues of the Liquid Juice, beſides which it is powerful againſt Catarrhs, or fluxes of Rheum falling down the Throat upon the Lungs; it prevails againſt ſour and Cholerick Belchings of the Stomach, is ſaid to cure Ruptures or Burſtenneſs, and the Whites in Women, as alſo a ſimple Gonorrhœa in Men, being taken inwardly, and outwardly injected into thoſe parts with a Syringe, for being very drying and binding, and ſtrengthening withal, it not only reſtores thoſe parts, but preſerves their Tone intire; it is admirably good alſo to waſh all green Wounds and old running Sores or Ulcers, healing the firſt, (if ſimple) without ſuppuration, and cleanſing, ſtopping the defluxion of Humors, and drying the other, in order to its ſpeedy healing; and if there be any Inflamation, or begining of a Gangreen about the parts, it prevents it, and ſoon ſecures it againſt any dangerous Accident. Doſe two, three, or four Spoonfuls in any convenient Vehicle Morning and Night.

XXII. *The Syrup.* It helps Coughs, Colds, Catarrhs, and Aſthma's, prevails againſt obſtructions

of the Lungs, thickens the pituitous matter, and cauſes expectoration; mixed with Gargariſms it heals Sores and Ulcers of the Mouth and Throat.

XXIII. *The Decoction in Wine, or Wine and Water.* It has all the Virtues of the Liquid Juice and Eſſence, but ought to be given in a greater quantity, and that Morning, Noon, and Night: *Gerard* ſays it is no leſs available in the ſtopping a flux of Blood, or flux of Humors, than the Herb or Juice.

XXIV. *The Pouder of the Herb.* Given inwardly to a Dram, or more, it ſtops inward fluxes of Blood, whether by the Mouth, *Anus*, or Bladder; it cures fluxes of the Bowels, and is good againſt Catarrhs; outwardly applied to any green or freſh ſimple Wound it preſently conglutinates the lips thereof, and heals it, and applied to any inveterate running Sore, or old Ulcer, it (in ſome little time) ſtops the fluxion, cleanſes it from its *ſordes*, incarnates where Fleſh is wanting, dries, and in a little time heals it.

XXV. *The Balſam or Ointment.* If to every Pound of the Ointment or Balſam three or four Ounces of the Pouder of Tobacco be added, they will become moſt admirable Medicaments or Topicks for the curing of old running Sores, inveterate and putrid Ulcers, and malign Fiſtula's, being firſt waſh'd by injection or otherwiſe with the Juice, Eſſence, or Decoction, and then (twice a day) dreſſed up with one of theſe Preparations; they are alſo profitable againſt the Gout, or other Aches and Pains in any part of the Body.

XXVI. *The Cataplaſm.* It may be made of the Herb alone, or of the Juice mixed with the Pouder of the Herb, or with Barley Flower, *&c.* applied to fluxes of Blood in Wounds it ſtops the bleeding, it ſtrengthens parts weakened by any Diſeaſe, as the Joints by the Gout, the Nerves by Palſies, *&c.* and hinders the afflux of any Humor to the weakened parts; applied alſo to a ſimple recent Contuſion it diſcuſſes the Tumor, and reſtores the part hurt.

CHAP. CCCCVIII.

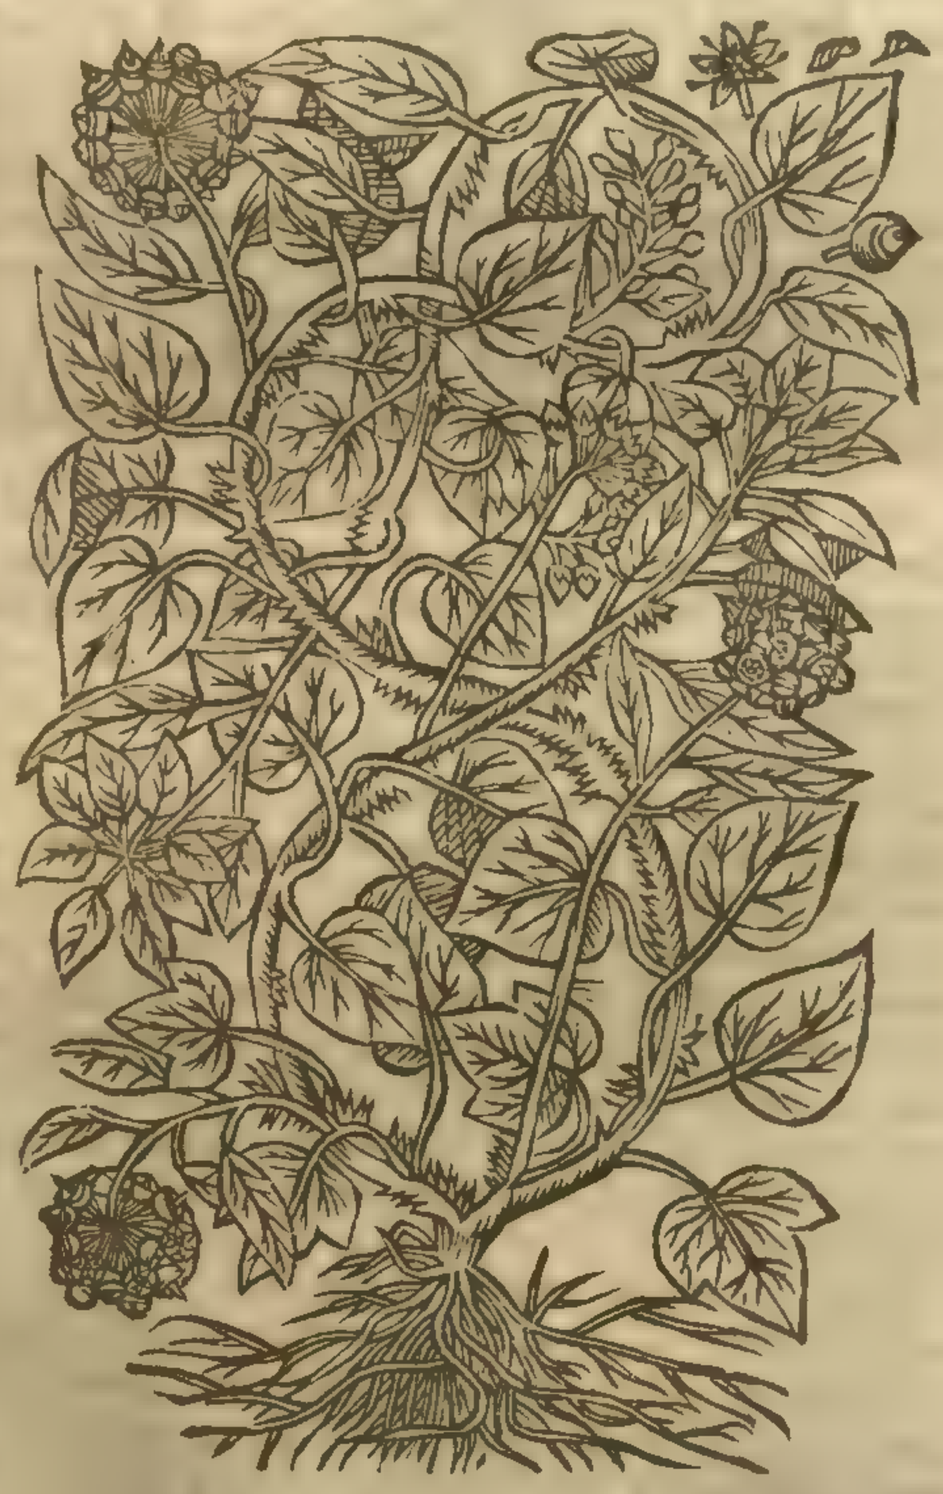
Of IVY Tree or Wall.

I. *THE Names.* It is called in *Arabick Cuſſus*, in *Greek* Κισσὸς, ϗ Κιττὸς, in *Latine Ciſſus*, and *Cittus*, and *Hedera*; the firſt of theſe Names ſome have thought to be derived from Κισσηὶς, *Pumex, ſive Lapis poroſus, quia ut ille Aquam, ita hoc Lignum textura poroſa, & ſpiraculis innumeris pervia Vinum tranſmittit, unde* Catoni & Varroni *Ciſſimbion Poculum Hederaceum eſt.* And probably it might be that from this *Coſtæus* might ſay, *That a Cup made of Ivy Wood will not hold any Wine therein.* The latter Name, *Hederam vero* Pompeius *dictum cenſet, quod hæreat, vel potius edita petat, vel quia id cui adhæſerit edit & enecat*; and in *Engliſh* it is called *Ivy*.

II. *The Kinds.* There are five ſeveral ſorts of *Ivy*, viz. 1. *Hedera Arborea, ſive Scandens, Hedera Corymboſa nigra, Orthociſſos, Hedera recta, Hedera rigens Plinii*, Common Ivy, Tree Ivy, or Wall Ivy, and this is that which all Authors call *Hedera* ſimply, which is *Our Vulgar Tree Ivy*, called alſo *Hedera nigra*, Black Ivy, becauſe it bears black Berries. 2. *Hedera Corymboſa alba, Hedera Corymbia*, White Berry bearing Ivy. 3. *Hedera Helix, Hedera Sterilis, Hedera Helix provoluta*, which is thought to be the *Helix Dioſcoridis, Theophraſti & Plinii*, which they make to be the third Species of their *Climbing Kinds*, yet it is ſeldom ſeen to climb up in the manner of the former, but lyes for the moſt part on the Ground; but *Johannes Thalius* in his *Hercynia Sylva* ſays he found it climbing as well upon Trees as creeping upon old Walls and Stones; this ſome ſay is barren, as not bringing forth any Fruit, yet others ſay this is rather for want of Age, for that in time it would bear, and change into the other ſort, as *Theophraſtus* and *Pliny* ſay; this is that we call *Barren Ivy.* 4. *Hedera Virginiana, Hedera Trifolia Virginienſis*, Three Leav'd Virginian Ivy. 5. *Hedera Quinquefolia Virginiana, vel Virginienſis*, Five Leav'd Virginian Ivy.

III. *Hederula Tragi, Bauhinus* makes to be a differing ſort from *Hedera Helix, vel Sterilis*, Our third ſort, or Barren Ivy above mentioned, and calls it *Hedera Humi repens*, which yet *Tragus* himſelf diſtinguiſhes not, but ſays, that that *Ivy*, which whilſt it is young brings forth no Fruit, when it is grown older does, and that there is no difference in his two Kinds of *Hedera* and *Hederula* but in the Age; this *Barren Kind*, ſays *Parkinſon*, which creeps upon the Ground, will yet with its claſping Branches take hold of whatever is next unto it.

Ivy Tree or Wall.



IV. The Deſcriptions. *The firſt, or* Our Common Ivy, Tree Ivy, or Wall Ivy. *The Root hereof is woody and fibrous, running under the upper Cruſt of the Earth*; from this Root it grows up with a thick woody Trunk or Body, which is ſometimes, (tho' rarely) found as big as ones Arm, ſhooting forth on all ſides many woody Branches, and grows ſometimes alone by it ſelf into a pretty Buſh, as *Lobel* ſays he ſaw in our Country, but it uſually climbs up upon Trees or Walls, and as the Branches riſe it ſends forth ſeveral ſmall Roots into the Body or Branches of the Tree upon which it clambers, whereby it climbs up almoſt into all parts of the Tree, or if it clambers upon a Wall it climbs up and lays it ſelf in the Chinks or Joints of the ſaid Wall, whether

ther Brick or Stone, on which Trees it runs up ſo ſtrongly, faſtning its Claws or Roots therein, that it draws the nouriſhment out of the Tree, and thereby in time kills it, by conſuming the life and moiſture thereof, and by choaking it with the abundance of ſhadow and humidity of its Leaves and Branches, which are ever green, (and ſerves as an Ornament thereto when it is Leafleſs, but in the end is its deſtruction and utter ruin) theſe Branches having thus faſtned themſelves by their Claws or Roots in a Tree or Wall will live thereby upwards, tho' the Trunk or Body of the Shrub is cut off from the Root below, and it will live as well as if it was not cut away from its ſaid Root at all, only by the faſtning of its little Claws or *Radiculæ* into the ſaid Tree or Wall, and there growing great they will oftentimes ſo crack it, that it will in time utterly ruin it, as is ſaid before; while the Plant is young the Leaves of moſt of it will be cornered, but when it grows older it has no corners on the ſides, but grows only round, or ſomewhat long, and pointed at the end, the young Leaves which ſpring forth from the Branches keeping oftentimes the ſame order, and are of a dark ſhining green color above, and ſomewhat of a yellowiſh green underneath, ſtriped with white, and ſometimes with red ſpots, abiding freſh and green Winter and Summer; from the joints of the Stalks and tops of the Branches grow forth upon ſhort Stalks ſmall moſſie yellow Flowers, ſtanding in an Umbel, or cloſe round Tuft; after the Flowers are paſt ſmall round Berries come in their places, which are green until they grow ripe, and then turn black, with a ſmall point at the end of each Berry, in each of which are uſually contained four Seeds, three-ſquare in a manner, but round on the one ſide; this Shrub or Buſh yields either voluntarily or by being bruiſed in hot Countries a kind of reddiſh hard Gum, called Κισσοῦ κόμμι, *Hederæ Gummi*, The Gum of Ivy, which is ſaid by Authors to be dangerous being inwardly uſed in Phyſick, becauſe ſay they it has a cauſtick or burning faculty.

Tree Ivy, or Wall.

V. *The ſecond, or* White Berry bearing Ivy. *This in its Roots, Stalks, Branches, Claws, or* Radiculæ, *Leaves, Flowers, Berries, and manner of growing, differs very little from the former*, and is chiefly diſtinguiſhed in theſe things, *viz.* that the Leaves are thinner and finer, and of a lighter green color, and that the Berries are of a whitiſh or greyiſh color when they are ripe, and not black, as the Berries of the *Common Sort* are.

VI. *The third, or* Barren Ivy. *From a woody ſtringy Root, as the former, it ſends forth ſeveral ſlender and woody Branches, trailing upon the Ground, and for the moſt part lying thereon*, but ſometimes it is found to wind it ſelf and climb up the Trees, Buſhes and Hedges under which it grows; with the ſmall Tendrels or Claws it ſhoots forth at the ſeveral joints of the Branches, where the Leaves come forth, being ſomewhat leſſer than the firſt *Common Kind*, and of a dark ſhining green color, uſually formed into three corners, and ſometimes into five; at the Joints with the Leaves there thruſts forth underneath ſmall white Fibres, Claws, or *Radiculæ*, by which it takes hold as it creeps; this very rarely has been ſeen to bear either Seed or Flowers.

VII. *The fourth, or* Three Leav'd Virginian Ivy. *The Roots of this Plant do ſhoot under Ground, and ſend forth young woody Stalks*, ſome whereof will ſtand upright, others lye down, and take root again as they ſpread, as alſo on any Wall they ſtand nigh unto, like unto our former *Barren Ivy*; the Leaves are broad and large, three always ſet together upon a long footſtalk; at the Joints with the Leaves come forth pale Flowers in a looſe Tuft or Cluſter, which turn into pale yellow Berries, with ſmall, hard, round, Aſh Colored Seed in the dry wrinkled Skins or Husks, without any moiſture at all in them; this Plant yields a white Milk, without any taſte in it, being broken in any part thereof, which Milk after it has lain a while will change to be as black as Ink, and therefore is thought to be a good Material to color Hair or any other thing Black.

VIII. *The fifth, or* Five Leav'd Virginian Ivy. *This* Slender, *but* Tall Climbing Virginian Ivy, *has a Root which ſpreads here and there under the Ground, but not very deep*, from whence riſe up ſeveral Stems or Stalks, none much bigger than a Mans Thumb, many leſs, from whence ſhoot forth ſeveral and many long weak Branches, not able to ſtand upright unleſs they be ſuſtained, yet being planted near unto a Wall or Pale, or Houſe ſide, the Branches at ſeveral diſtances of the Leaves will ſhoot forth ſmall ſhort Tendrels or Claws, not twining themſelves about any thing, but ending in four, five, or ſix, or more, ſhort and ſomewhat broad Claws, which will faſten like a Hand with Fingers ſo cloſe thereunto, that it will bring part of the Wall, Mortar, Board, Glaſs, Brick, or Stone, away with it if it is pulled from it; and by theſe Claws it ſtays it ſelf, and climbs up to the top of the higheſt Tree, Wall, Houſe, or Chimney, being planted by them: the Leaves are crumpled, or rather folded together, at their firſt coming forth, and very red, which afterwards growing forth are very fair, large, and green, divided into four, five, ſix, or ſeven Leaves, (not regular to a certain number) ſtanding or growing together upon a ſmall footſtalk, and ſet without order on the Branches, at the ends whereof, as alſo at other places ſometimes, come forth ſeveral ſhort Tufts of Buds for Flowers, which here in *England* never come to that perfection, as to open themſelves and ſhew what kind of form they would be of, much leſs what Berries or Seed would follow; the uſe of this is chiefly to furniſh a Garden, and to be an Ornament to the place it is planted in.

IX. Or thus, according to *Gerard*. *There is kept for Novelties ſake in divers Gardens a* Virginian *Vine, but which is indeed an* Ivy; *the Stalks hereof*

grow to a great height if they be planted nigh any thing which may ſuſtain them, or bear them up, and they take faſt hold by certain ſmall Tendrels, (or Claws) upon what Body ſoever they grow near, whether Trees, Wood, Brick, Stone, or Glaſs, and that ſo firmly, that oftentimes when you pluck them off from the ſame they will bring pieces of the matter they cling to off with their Claws, (or Radiculæ*) it puts forth its Leaves in* April, *which are large, and conſiſting of four, five, or more particular Leaves, each of them being long, and deeply cut, ſo that they ſomewhat reſemble the Leaves of the* Cheſtnut *Tree; the Stalks with the Rudiments of Flowers are to be ſeen in* Auguſt, *which Flowers grow cluſtering together after the manner of* Ivy, *but never with us ſhew themſelves open, ſo that we can ſay little or nothing of their Color, or Fruit which ſucceeds them.*

X. *The Places.* The firſt is known almoſt to every Child to grow and climb up upon Trees, Hedges, Buſhes, Brick or Stone Walls, Houſes, Churches, *&c.* in moſt parts of this Kingdom; the ſecond has been brought to us out of *Turky*, *Italy*, and *France*; the third grows almoſt as common as the firſt, in woody, ſhady, and moiſt places, under Hedges, and in corners of waſte Grounds, Lanes, and the like; the fourth and fifth are Natives of *Florida*, and North Weſt parts of *America*, where our *Engliſh* Colonies are planted, as in *New England*, *Maryland*, *Penſilvania*, *New York*, *Virginia*, and *Carolina*, but being tranſplanted grow very well with us in *England*.

XI. *The Times.* *Our Ivy* Flowers not till *July*, and the Berries are not ripe till about the latter end of *December*, after they have felt the Winter Froſts, and the *American ſorts* Flower very late with us, if at all.

XII. *The Qualities.* *Ivy* is hot and dry in the end of the ſecond degree. Aſtringent, Biting, Coſmetick, Vulnerary, and Pramick, as the juice of the Leaves, *&c.* The Berries are alſo hot and dry in the ſecond degree, Aſtringent, Diuretick, and Alexipharmick.

XIII. *The Specification.* It ſtops Fluxes, and heals Bloody Fluxes, Jaundice, provokes the Terms, reſiſts Poyſon, and the Bitings of Venomous Creatures, cures the Plague, and heals running Sores and old Ulcers, in what part of the Body, and of what kind ſoever.

XIV. *The Preparations.* You may have therefrom theſe following things, 1. *The Leaves.* 2. *The Wood.* 3. *A Gum.* 4. *A Liquid Juice of Roots, Leaves, and Berries.* 5. *An Eſſence of the ſame.* 6. *A Decoction of Leaves and Berries.* 7. *A Powder of the Flowers.* 8. *A Powder of the Berries.* 9. *A Bath of the Leaves and Berries.* 10. *A Peſſary of Leaves and Berries.* 11. *A Fume of the Branches.* 12. *An Acid Tincture of the Berries.* 13. *A Spirituous Tincture of the Berries.* 14. *An Oily Tincture of the Berries.*

The Virtues.

XV. *The Leaves.* The freſh Leaves are commonly uſed to be laid upon Iſſues whereſoever, in Arms, Legs, *&c.* to keep them open, and to draw forth the Humors which fall upon the ſame parts.

XVI. *The Wood.* It is of uſe to make little round Balls of, about the bigneſs of high Swan Shot, or white or grey Peaſe, which are uſed for Iſſues inſtead of Peaſe, drawing forth the Humor eaſier, and keeping the Sore better open, and this they do by reaſon of their ſpongineſs or porofity, being much more porous than Peaſe, and ſo more apt to be filled with the ſeroſities of the Iſſue; if the Wood is made into a Cup, and Ale, Beer, or Wine be put into it, ſo as to ſtand in it for ſome time, and then drank off, and this continually done for ſome days, it is ſaid to help ſuch as are troubled with the Spleen, and to give eaſe in the pains thereof. *Cato* ſays that the Deceits of Vintners may be found out by one of theſe Cups, if they mix any Water with their Wine, for the ſaid mix'd Wine being put into one of theſe Cups of *Ivy* Wood, the Wine will ſoak thro' the Wood and leave the Water behind; for *Cato* and *Varro* both ſay it is the nature of *Ivy* Wood not to hold any Wine, ſo great an Antipathy there is between them.

XVII. *The Gum.* That which is gathered in hot Countries from the Body and Branches of the *Ivy*, (either by a voluntary iſſuing therefrom, or by bruiſing thereof) is exceeding ſharp and hot, burning and exulcerating the Skin, yet is uſed, being diſſolved, to take away ſuperfluous Hair in any place, and to deſtroy Nits and Lice, alſo Crab-Lice, in what parts ſoever; being diſſolved in Vinegar and put into a hollow aking Tooth eaſes the pain, and being often uſed will cauſe it to fall out; ſome uſe this Gum with other things as a Bait to kill Fiſh; ſee more hereof in my *Sepſaſium*, or *Druggiſts Shop*, *Lib.* 9. *Cap.* 29. where you may find the farther Uſes thereof, and alſo the Signs how to know it, and to diſtinguiſh the true from the falſe, that ſold in the Druggiſts Shops being for the moſt part counterfeit, having neither the form or appearance, nor the Virtues of the true Gum, the falſe being for the moſt part full of ſticks, droſs, and filth, brittle, and of an inſipid taſte, whereas the true is of a yellowiſh red color, clean, of a ſtrong ſmell, and of a ſharp, biting, and exulcerating taſte.

XVIII. *The Liquid Juice of Roots, Leaves, and Berries.* If it is much taken inwardly it is apt to cauſe Barrenneſs in Man or Woman, it alſo cauſes a weakneſs and trouble in the Brain or Underſtanding, and affects the other Senſes, for which reaſon Authors ſay uſed much inwardly it is an Enemy to the Nerves, but much ſtrengthens them being outwardly applied; the juice of the Root is ſaid to be good againſt the biting of the *Phalangium*, or poyſonous Spider; the juice of the Leaves or Berries taken inwardly provoke the Terms in Women, facilitate the Birth, and bring away the Afterbirth; the juice of Leaves or Berries uſed as an Errhine, by ſnuffing it up the Noſe, purges the Head and Brain of thin Rheum, which cauſes Catarrhs or Defluxions into the Glandules of the Throat, Jaws, Eyes, Noſe, or other parts adjacent, and cures ſtinking Ulcers in the ſame; dropped alſo into the Ears it cures old and running Sores and Ulcers in them. Doſe one or two Spoonfuls inwardly in a Glaſs of Wine, or other fit Vehicle.

XIX. *The Eſſence of Roots, Leaves, or Berries.* It has all the Virtues of the Liquid Juice, but is more powerful as being depurated, and ſo is to be given in leſſer quantity, as from three quarters of a Spoonful to a Spoonful and half, increaſing the Doſe as the Age and Strength of the Patient will bear; it is very good againſt the Yellow Jaundice, provokes Urine, and is ſaid to be good to break the Stone, and expel Sand, Gravel, and ſmall Stones from the Urinary parts; taken alſo Morning, Noon, and Night in a Glaſs of Wine it is a good preſervative againſt the Plague, or any other infectious Diſeaſe, and is of ſingular uſe to cure the ſame after infection.

XX. *The Decoction of Leaves or Berries.* It has all the Virtues of the Juice and Eſſence, but nothing near ſo powerful, and therefore may be given from three to ſix Spoonfuls ſweetned with White Sugar; a Decoction in Vinegar mixed with Damask Roſe Water and Oil of Roſes, and applied to the Fore-

head

head and Temples gives eaſe in the Headach, tho' it be of long continuance, and applied warm to the Sides of ſuch as are troubled with the Spleen, Aches, or Stitches in the Side, reſolves the *Coagulum* if any be, and gives preſent eaſe; the Decoction of Leaves or Berries in Wine is of excellent uſe to cure old running Sores and filthy Ulcers, which are difficult to be healed, it admirably cleanſes, dries, and heals them; and it is alſo effectual for the ſpeedy cure of green ſimple Wounds, by uniting the Fleſh and conſolidating their lips; the ſame is good to heal Scaldings with Water and Burnings with Fire, and the Exulcerations which happen thereby, occaſioned by the ſaltneſs, heat, or ſharpneſs of Humors flowing thereto.

XXI. *The Pouder of the Flowers.* A Dram of the Flowers (being dried carefully and reduced to pouder) being drank twice a day in Red Wine cures a Diarrhœa, or Looſeneſs, yea a Bloody Flux, as *Dioſcorides* ſaith.

XXII. *The Pouder of the Berries.* It is good againſt the Jaundice, kills Worms in Old or Young, and prevails againſt the biting of the *Phalangium*; it is a ſingular Remedy both to prevent the Plague or Peſtilence before infection, and to cure the ſame after it has ſeized the Patient, by drinking the Pouder from half a Dram to a Dram, (according to Age and Strength) in any fit Prophylactick Vehicle, or proper Antidotal Liquor, Morning, Noon, and Night, for two, three, or four days together; and being taken in White Port Wine for ſome certain time it opens the obſtructions of the Reins, Ureters, and Bladder, gives eaſe in the Strangury, provokes Urine, and breaks the Stone, expelling Sand, Gravel, and Tartarous Mucilage from the Urinary parts and paſſages: *Tragus* ſays that it provokes the Terms in Women, and is ſo powerful in its operation on thoſe parts, in driving forth the dead Child and Afterbirth, that it ought to be cautiouſly uſed, and not but upon neceſſity.

XXIII. *The Bath of the Leaves and Berries.* It is a ſtrong Decoction of them made in Water; if a Woman which has a dead Child ſit therein as hot as ſhe can conveniently bear it, it forces away the Child and Afterbirth, and being once or twice repeated cauſes a due cleanſing; if a Woman whoſe Courſes are ſtopp'd ſit therein, and repeat it for ſome few times, it effectually brings them down, but a Woman with Child ought cautiouſly to forbear the uſe thereof, becauſe it will endanger Abortion.

XXIV. *A Peſſary of Leaves and Berries.* It has all the Virtues and Operations of the Bath in the former Section, but not altogether ſo powerful, yet it very much prevails to bring down the Terms when ſtopp'd, and being often repeated forces away the dead Child, *&c.* as is before expreſſed.

XXV. *The Fume made of the Branches being burnt.* It expels peſtilential and infectious Vapors, corrects a putrid Air, which cauſes malignity and putrifaction, and drives away Bats, Gnats, and other troubleſom Inſects of that kind.

XXVI. *The Acid Tincture of the Berries.* It opens all obſtructions of the Urinary parts, breaks and expels the Stone, reſiſts Vomiting, ſtrengthens the Stomach, and is a good Prophylactive and Curative of the Plague or Peſtilence; it deſtroys the malignity and putrifactive heat of all Fevers, cools, and allays Thirſt. Doſe ſo many drops as to give the *Vehiculum* a pleaſing acidity, which may be repeated two, three, or four times a day, or more, as need requires.

XXVII. *The Spirituous Tincture of the Berries.* It has the Virtues of the Juice, Eſſence, Decoction, and Pouder, but a much more pleaſing Medicament, becauſe finer, purer, conſiſting of more ſubtil parts, and given in a much ſmaller Doſe, and by reaſon of its preparation with Spirit of Wine is alſo more Cordial and Stomatick. Doſe fifty or ſixty drops Morning and Night in a Glaſs of Wine, but it is not long to be continued leſt it induces Barrenneſs; outwardly bathed upon Nervous and Tendonous parts it comforts and ſtrengthens them, and alleviates aches and pains coming from a cold and moiſt cauſe.

XXVIII. *The Oily Tincture.* Inwardly given it prevails againſt the Palſie and Lethargy, gives eaſe in the Strangury, provokes Urine, breaks and expels the Stone and Gravel in Reins or Bladder, and alleviates the pains of the Colick; outwardly applied in the Gout, (a little Camphir being diſſolved therein) it gives eaſe in pains and ſtitches of the Side and Spleen, diſcuſſes cold Tumors, and gives relief in a Gout proceeding from a cold cauſe. Doſe inwardly from ten to twenty, or twenty five drops, dropp'd firſt into Sugar, and then the Sugar mixed with the *Vehiculum* you deſign to give it in.

CHAP. CCCCIX.

Of IVY Water, *OR* Ivy Leav'd CROWFOOT.

I. *THE Names.* I know not of any *Greek* Name it has, but it is called in *Latine Hederula Aquatica* by *Gerard* and *Lobel*, alſo *Ranunculus Hederaceus Dalechampij & Lugdunenſis*, *Lenticula Aquatica triſulca Bauhini*, *Ranunculus Hederaceus Aquaticus*, in *Engliſh Water Ivy*, or *Ivy Leav'd Crowfoot.*

II. *The Kinds.* It is certain it is no Species of *Ivy*, properly ſo called, but a ſingular Plant of its Kind, obtaining the Name *Hederula* meerly from the form of its Leaf, and ſeems from the nature and qualities of the Herb to be more allied to the Stock of the *Crowfeet* than any other Plant.

Water-Ivie.

III. The Deſcription. *This* Hederula Aquatica, *or* Water Ivy, *has ſmall thready Strings inſtead of Roots*

Roots or Stalks, which ſpread themſelves very much under the Water; from this ſtringy Root grow forth ſeveral ſlender trailing Stalks, riſing from the bottom of the Water to the top; theſe Stalks ſhoot forth at the lower Joints and with the Leaves under the Water ſeveral other ſmall Fibres, which ſerve as Roots alſo with the former: from the Stalks likewiſe at the Joints come forth divers triangular Leaves, in form of an *Ivy* Leaf, which Leaves, thoſe which grow near the tops of the Stalks, float upon the top of the Water, and are many, each of their three parts, formed alſo in a triangular or three cornered manner, like thoſe of *Barren Ivy*, or *Noble Liverwort*, and are ſometimes marked with a black ſpot; and with theſe Leaves from the Joints come forth ſmall knots of yellow Flowers, ſtanding upon indifferent long footſtalks, but *Gerard* ſays it is barren of Flowers or Seed.

IV. *The Places.* *Gerard* ſays it is very rare to find, and that he found it once in a Ditch by *Bermondſey Houſe*, near *London*, and never elſewhere; but *Parkinſon* ſays it is found plentifully enough in divers places of this Land; I have found it in Ditches, Pools of ſtanding Water, and other like wet and plaſhy Grounds in ſeveral places of *Cambridgſhire*; but it always grows in Water.

V. *The Times.* It Flowers in *May* and *June*, and gives its Seed in ſome ſmall time after.

VI. *The Qualities, Specification, Preparations and Virtues* are exactly the ſame with thoſe of *Common Crowfoot*, and therefore I refer you thither, where they are handled at large in *Chap.* 176. *Sect.* 24. *ad* 24. ſo that no more need be ſaid thereof in this place.

CHAP. CCCCX.

Of KATHERINE-FLOWER, *OR* Roman NIGELLA.

I. *THE Names.* It is called in *Arabick Xanim, Sunis, Sunici, ſeu Sunizi*, in *Greek* Μελάνθιον, and Μελανοσπερμον, in *Latine Melanthium*, and *Nigella*, in *Engliſh Katherine-Flower*, *Fennel-Flower*, and *Roman Nigella*.

II. *The Kinds.* There are ſeveral ſorts of *Nigella, Gith*, or *Fennel-Flower*, viz. 1. *Melanthium, ſive Nigella Romana*, Roman Nigella, or Katherine-Flower, properly ſo called, of which in this Chapter. 2. *Nigella Cretica*, Gith, Fennel-Flower, or Nigella of Candia. 3. *Nigella Hiſpanica & Damaſcena Flore ſimplici & multiplici*, Spaniſh Gith, Fennel-Flower, or Nigella Single and Double, of which we Treat under the Title of *Nigella* in ſome of the following Chapters of this Book.

III. *The Kinds of Roman Nigella, or Katherine-Flower.* Of this there are the three following ſorts, 1. *Nigella Romana, ſive Sativa*, Roman Nigella, Sweet ſmelling Nigella, or Sweet ſcented Katherine-Flower. 2. *Nigella Romana Silveſtris inodora*, Wild Fennel-Flower, or Katherine-Flower. 3. *Nigella Romana Arvenſis*, Field Fennel-Flower, or Field Katherine-Flower.

IV. The Deſcriptions. *The firſt, or* Roman ſweet ſmelling Nigella, or Katherine-Flower, *has a Root which is ſmall, thready, yellow, and periſhing every Year*; this ſweet Plant grows up to be two Feet high, more or leſs, with ſeveral ſlender Branches, and many finely cut and divided Leaves on them, nearly as fine or ſmall as *Fennel*, (whence one of the Names) and very like unto thoſe of the *Larkſheels*; at the top of every Branch ſtands one Flower, made of five blew Leaves, laid abroad like a Star, without any green Leaves under the Flower, as in ſome *Single*, and another *Double blew ſort*, with a green Head in the middle, compaſſed with ſome few Threads, which Head grows to be the Seed Veſſel, being a little long and round, with five ſmall ſhort Tops, like Horns, ſtanding at the tops of the Heads, in which lye in ſeveral Cells ſmall, black, and very ſharp, ſweet, ſtrong ſmelling Seed.

V. *The ſecond, or* Wild Fennel-Flower, or Katherine-Flower. *This grows very like the former for its green Leaves, but a little ſmaller and ſhorter*; the Flowers are blew, and like the former, but the Head with its Seed is larger, and the Horns longer; the Seed within is uſually black, ſometimes a little whitiſh, and ſometimes yellowiſh, without any ſmell at all: there is another likewiſe of this ſort, differing in nothing from this, but only that its ſingle Flowers are white, and its black Seed without ſcent.

VI. *The third, or* Field Fennel-Flower, or Katherine-Flower. *This* Field Sort *is very like the laſt, but it grows thinner of Branches and Leaves, and they alſo ſhorter*; the Heads are ſmaller and longer, as the Flowers alſo are, but of a pale blew color, the Seed being black likewiſe, and without ſcent: there is another of this ſort, differing little from that now deſcribed, but in the Flowers, which being ſingle and blew like it, have green Leaves under them, and the Seed being black is ſomewhat ſweet.

VII. *The*

VII. *The Places.* The firſt is uſually Sown in Gardens, even in *Italy*, and other Countries, the others grow wild, and in Corn Fields of *Italy*, and other Southern Countries, with us they all grow in Gardens only.

VIII. *The Times.* They are all Annually to be Sown in the Spring, if they do not Sow themſelves, and they Flower in *June* and *July*, giving their ripe Seed in *July* and *Auguſt*.

IX. *The Qualities.* The Seed, (which is chiefly uſed) is hot and dry in the third degree, it is Aperitive, Abſterſive, Carminative, Digeſtive, Diuretick, Pectoral, Nephritick, Alexipharmick, and of thin and ſubtil parts; where note, the firſt Kind is only uſed in Phyſick.

X. *The Specification.* It wonderfully prevails againſt thin and ſalt Catarrhs, expels Wind, kills Worms, helps ſhortneſs of Breath, provokes the Terms, eaſes the Strangury, expels Stone and Gravel, and is an Antidote againſt Poyſon.

XI. *The Preparations.* You may have therefrom 1. *A Liquid Juice of the Herb.* 2. *An Eſſence of the ſame.* 3. *An Infuſion of Herb or Seed in Wine.* 4. *The Seed whole.* 5. *A Pouder of the Seed.* 6. *An Oil of the Seed by Expreſſion.* 7. *An Acid Tincture of Leaves or Seed.* 8. *A Spirituous Tincture.* 9. *An Oily Tincture.* 10. *A Decoction of the Seed in Vinegar.* 11. *A Fume of Herb or Seed.* 12. *A Spirit from Herb or Seed.*

The Virtues.

XII. *The Liquid Juice.* It opens obſtructions of the *Viſcera*, chiefly of the Lungs, Reins, and Womb; mix'd with equal parts of Honey, and ſo taken, it helps againſt Aſthma's, cauſes free breathing, removes Hoarſeneſs and Wheezing, provokes Urine, eaſes the Strangury, expels Sand, Gravel, and Tartarous Matter out of the Urinary parts, gives eaſe in the Colick, and forces down the Terms in Women, kills Worms, and dries up Catarrhs. Doſe one Spoonful to two Morning and Night for ſome conſiderable time; it may alſo be mix'd with White Port Wine, and ſo taken.

XIII. *The Eſſence of the Herb.* It has all the Virtues of the Liquid Juice, is ſomething more pleaſant to be taken, and more powerful in its operation, and therefore ought to be given in ſomewhat a leſſer quantity; taken with Honey it is a Remedy againſt Poyſon, the Stinging of Scorpions, and the Biting of the Spider *Phalangium*; given mixed with a ſimple diſtilled Water of *Angelica*, *Aniſeeds*, or *Fennel*, it is ſaid to increaſe Milk in Nurſes Breaſts.

XIV. *The Infuſion of Herb or Seed in Wine.* It has all the Virtues of the Juice and Eſſence, but muſt be given in larger quantities, *viz.* from four to ſix, or eight Ounces; it helps ſhortneſs of Breath, provokes Urine, and is good againſt the Bitings of Venomous Creatures, *&c.*

XV. *The whole Seed.* It is ſaid that it was eaten familiarly in former Times, being ſtrewed upon their Bread, or rather put into their Bread in making, and ſo put in as *Poppy* Seed was; tied in a Cloth and ſmelled to, being of hot, dry, and thin parts, it helps to dry up Rheums and Diſtillations from the Head, as *Galen* ſays, and being put into a Cap among other things for that purpoſe it does much good; being often ſmelled to it is ſaid to reſtore the Senſe of Smelling to thoſe who have loſt it; it ſerves well to put into odoriferous Pouders and ſweet Bags among other ſweet things.

XVI. *The Pouder of the Seed.* Being taken from half a Dram to a Dram in Wine it is a Remedy againſt ſhortneſs of Breath, and difficulty of breathing, diſcuſſes and expels Wind, provokes Urine and the Terms in Women, increaſes Milk in the Breaſts of Nurſes, nor being too much taken; it kills and drives forth Worms in the Stomach and Belly, whether taken in Wine or Water, and this it does the more effectually if it is applied Plaſterwiſe, or in a Cataplaſm, to Stomach and Navel; it is an excellent Remedy (as *Galen* ſays) where there is need of heating, cleanſing, and drying.

XVII. *The Oil of the Seed by Expreſſion.* It has all the ſelf ſame Virtues of the Seed, expreſſed in the former Section, and may be given from twenty to forty drops, firſt mixed with Honey, or Syrup of Clovegilliflowers, or other proper Syrup, and then taken in a Glaſs of Wine, Sack-Whey, Barley-Broth, or other proper Vehicle, Morning, Noon, and Night.

XVIII. *The Acid Tincture.* It is good againſt burning and malign Fevers, the Plague or Peſtilence, and other contagious Diſeaſes, it reſiſts Poyſon, is good againſt the Stinging of Scorpions, the Biting of Mad Dogs, and other Venomous Creatures, and has all the Virtues of the Juice, Eſſence, Decoction, or Infuſion and Pouder of the Seed aforegoing. Doſe ſo many drops as to give the Vehicle a pleaſing acidity, ſeveral times a day.

XIX. *The Spirituous Tincture.* It chears the Heart, revives the Spirits, reſiſts Fainting and Swooning Fits, prevails againſt palpitation of the Heart, dries up Catarrhs and Rheums, diſcuſſes and expels Wind, ſtrengthens the Stomach, cauſes a good Digeſtion, provokes Urine, and is profitable againſt Gravel and Stone; given to a Woman in Labor from one to three Drams in a proper Vehicle it facilitates the Delivery, and brings away the Afterbirth.

XX. *The Oily Tincture.* It is good againſt the Colick and inward Convulſions of the Bowels, opens obſtructions of the Womb, Reins, Ureters, and Bladder, gives eaſe in the Strangury, and expels Sand, Gravel, Stones, and other Calculous or Tartarous Mucilage out of the Urinary parts. Doſe from ten to twenty, or thirty drops, firſt dropped into White Sugar, and well mixed therewith, and then given in a Glaſs of White Port Wine; it gives eaſe in the Gout outwardly applied, is excellent againſt the Wounds or Punctures of Nerves and Tendons, and haſtens the Birth of Women in Labor.

XXI. *The Decoction of the Seed in Vinegar.* If it is held in the Mouth of ſuch as are troubled with the Toothach it eaſes the pain, bathed upon hard Swellings it ſoftens and diſcuſſes them, it cleanſes the Eyes of filth, and being daily applied to the deformities of the Skin, as Tettars, Ringworms, Scurf, Morphew, Yellowneſs, Spots, Freckles, *&c.* it is ſaid to cure them.

XXII. *The Fume from the Herb or Seed being burnt.* It drives away Flies, Gnats, Musketoes, *&c.* out of the Room in which it is uſed in Summer time.

XXIII. *The Spirit from Herb or Seed.* It is Cordial, expels Wind, eaſes the Colick, prevails againſt Convulſions in Children or Elder People, and cures Fainting and Swooning Fits.

CHAP. CCCCXI.

Of KALI, or GLASSWORT, Called alſo SALTWORT.

I. *The Names.* It is called in *Arabick Kali*, it knows no *Greek* Name, but in *Latine* it is called

called *Kali* alſo, and *Salicornia*, *Salſicornia*, and *Salſolæ genus*, in *Engliſh Kali*, *Glaſswort*, and *Saltwort*. The Aſhes hereof are called *Soda*, and *Rochetta*, and the Salt *Alkali*, or *Sal Alkali*, the Salt of Kali, or Glaſswort; *Kal* is an *Arabick* Word, and in that Language ſignifies Salt.

II. *The Kinds.* There are four Kinds of *Kali*, or *Glaſswort*, viz. 1. *Kali Geniculatum*, *Salicornia*, *Salſolæ genus aliud Ceſalpini*, *Salſicornia*, Jointed Glaſswort, or Saltwort. 2. *Kali majus Cochleatim*, *Kali magnum Sedi medij Foliis Semine Cochleato Lobelij*, *Kali Cochleatum majus Camerarij*, *Anthyllis Salſa majoris*, *Kali majus Cochleato Semine*, *Salſolæ genus Cæſalpini*, Great Glaſswort, or Kali with Snail like Seed. 3. *Kali minus album*, *Kali minus villoſum Baubini*, *Anthylloides Thalij*, Small White Glaſswort. 4. *Kali Ægyptiacum Foliis valde longis hirſutis Baubini*, *Kali Ægyptium Alpini*, Ægyptian Kali, Glaſswort, or Saltwort.

III. The Deſcriptions. *The firſt, or* Jointed Kali, Glaſswort, or Saltwort, *has a Root which is ſmall, long, and thready*; it riſes up uſually with but one Stalk, upright, round, thick, and almoſt tranſparent, a Foot, or Foot and half high, thick ſet, and full of Joints, or Knots, without any Leaves at all on them, but ſhooting forth Joints one out of another, or one at the end of another, with ſhort Cods at the heads of them, and alſo ſuch like ſmaller Branches on all ſides, and they are alſo divided into other ſmaller ones; this is thought to bear neither Flower nor Seed: there are ſome other Kinds hereof, as *Kali Geniculatum breve*, differing a little in the form of the Joints one from another, and *Kali Geniculatum rubrum*, one which is wholly reddiſh, not differing in any thing elſe from any of the other Jointed ones.

IV. *The ſecond, or* Great Glaſswort, or Kali with Snail like Seed. *It has a Root which is ſomewhat long, with many fibres adjoining to it, and periſhes every Year for the moſt part after it has given Seed*; it riſes up with a big, round, reddiſh, fleſhy Stalk, very like unto *Purſlain*, about two Feet high, divided into many Branches, on which do grow many thick, long, round, fleſhy Leaves, pointed at the ends, growing without order, ſometimes but one or two, and oftentimes more ſtanding at a place; here and there diſperſed upon the Branches come forth alſo ſmall yellowiſh Flowers, and after them ſmall browniſh Heads, turned round like Snails, in which lye ſmall round Seed; this Plant has an ill taſte, but ſaltiſh.

V. *The third, or* Small White Glaſswort, or Kali. *It has a Root likewiſe which is ſmall and woody, which periſhes after it has given Seed*; it ſprings up from the Root with ſeveral whitiſh green Stalks, or Branches, nothing ſo high as the former, and bending or leaning down to the Ground, ſpreading it ſelf into other ſmaller Branches full of Joints, whereon grow more ſtore of ſmaller and ſhorter, round and pointed Leaves, nothing ſo fleſhy as the former, and of the ſame pale green color with the Stalks; the Flowers are white, and ſtand ſingly on the tops of the Branches, after which come ſmall Husks, in which lies the Seed, which is ſmall, black, and ſhining, like unto *Sorrel* Seed.

VI. *The fourth, or* Ægyptian Kali, Glaſswort, or Saltwort. *It has a Root like the others, and grows up with one ſlender Stalk, bending it ſelf downwards, and branching forth at the Joints into other ſmall ones, which for the moſt part ſtand more upright*, and at every of the joints two very long and ſomewhat hairy Leaves, bowing themſelves downwards becauſe of their length; the ſmall Branches are bare, without Leaves unto the tops or ends of them, where grow many ſmall and long Leaves, hairy, like to the former, but nothing ſo long, from among which grow ſmall, whitiſh, purple Flowers, with many ſmall Threads in their middle; of this ſort there are ſome with ſhorter Leaves, differing in little elſe.

VII. *The Places.* The firſt as well as the fourth grows in *Ægypt*, and it generally grows among other Sea Plants on the Sea Coaſts in all Countries; I found it growing plentifully in the Salt Marſhes in South *Carolina*, as up *Wadmalaw* River, and on the Sands and Marſhes of *Wando* River, not far from the Sea ſide, and in other Salt Marſhes of the ſame Country; it grows alſo on our Coaſts of *England*, *&c.* in many places, in *Saxony*, and other parts of *Germany*, where there are Lakes of Salt Water; the ſecond grows by the Sea ſides in ſeveral places of *Syria*, *Africa*, *Italy*, and *Spain*, as alſo in *Provence* and *Aquitane*, where they Sow large Fields thereof, for the Profit they make of the Salt or Aſhes of the Plant in making Glaſs and Soap; the third grows not only in the aforenamed places, but in other colder Climates likewiſe, not by the Sea only, but by the Salt Pits in *Saxony*, as *Camerarius* ſays, and is found alſo on the Sea Coaſts of *England* and *Ireland*; the fourth, as *Alpinus* ſays, is more peculiar to *Ægypt*, but *Columna* ſays it is frequent on the Weſtern *Neapolitan* Shoar.

VIII. *The Times.* They all flouriſh in the Summer, and they which periſh give their Seed in *Auguſt*, or ſomething later; the firſt of them abides all the Winter.

IX. *An Obſervation.* Out of this Herb is made the *Alkali* of the *Arabians*, *Levant*, *Ægypt*, *&c.* or Pot Aſhes, as we in *England* call them, called alſo by other Names, as *Polverine*, *Pulverine*, *Rochetta*, and *Soda*, which are all the ſame thing, made of the ſame Matter, but do each differ in goodneſs, according to the place the Matter comes from, and the Method or Order of making of it; the Matter is the Herb *Kali*, (alſo *Alga*, or *Kelp*, which is *Sea-Girdles*, *Sea-Weed*, *Sea-Thongs*, or *Sea-Laces*) the goodneſs of the Herb is taken from the places of its growth, that which grows on the Coaſts and Banks of *Syria*, *Ægypt*, the *Levant*, *&c.* is the beſt, that which grows on the Coaſts of *Spain*, *Italy*, and *Venice*, is the next beſt, that which grows on the Coaſts of *France* is worſe, but that which grows on the mouth of the *Thames*, and other Maritime places of *England*, is the worſt of all, as making Aſhes, which yield the leaſt Salt, or *Sal Alkali*, of any of them.

X. *The Qualities.* The Herb is hot and dry in the end of the firſt degree, the Aſhes or Salt is hot and dry in the fourth degree, Aperitive, Abſterſive, Digeſtive, Diuretick, Pyrotick, or Cauſtick, Nephritick, Hyſterick, Arthritick, Emmenagogick, Sudorifick, and Alexipharmick.

XI. *The Specification. Kali* purges pituitous, watery, and melancholy Humors, provokes Urine, is good againſt the Dropſie, opens obſtructions of Liver and Spleen, brings down the Terms, and expels the dead Child.

XII. *The Preparations.* You may have therefrom 1. *A Liquid Juice.* 2. *A Pouder of the Herb.* 3. *The Aſhes, called Pot Aſhes.* 4. *A Salt called Sal Alkali.* 5. *Soap.* 6. *Sandiver.*

The Virtues.

XIII. *The Liquid Juice.* Taken in Drink or Wine from one Spoonful to two, or more, it purges downwards ſuperfluous Humors, and therefore is often uſed for the Dropſie, to provoke Urine and the Terms, facilitate the Birth, and to expel a dead Child;

Child; it opens obſtructions of the Liver and Spleen, and diſcuſſes the hardneſs thereof; it gives eaſe in the Strangury, and expels Sand, Gravel, Stones, *&c.*

XIV. *The Pouder of the Herb.* It has all the former Virtues of the Juice, but not full out ſo effectual as it, and may be given from half a Dram to a Dram and half in White Port Wine, or other proper Vehicle, it is ſometimes mixed with thoſe things which are uſed as Corroſives, to conſume ſuperfluous, proud, or ſpongy Fleſh, which grows in foul and virulent Ulcers, if it is taken in too great a quantity it is miſchievous and deadly, as *Gerard* ſays.

XV. *Pot Aſhes.* They have all the Virtues of the Juice and Pouder, and are equivolent in operation to the Aſhes of Tartar; they are powerfully aperient, provoke Urine in the laſt degree, and carry off a Dropſie by Urine, being made into a *Lixivium* with Water, and given in Wine; they are very ſharp and biting, like a Cauſtick, and the Lye which is made thereof is ſo ſtrong, that it will fetch off the Skin from the Hands, or any other parts of the Body it is applied to, and therefore if any uſe it to cleanſe the Skin from Spots, Freckles, Lentils, Yellowneſs, Sunburning, Tanning, Scurf, or Morphew, or other like Defilements, they ought to be cautious in uſing of it, and apply it very ſparingly, or uſe it not made too ſtrong, and ſo it may do much good. How theſe Aſhes are made ſee in our *Seplaſium*, or *Druggiſts Shop*, *Lib.* 2. *Cap.* 4. *Sect.* 11. and 12. where, and in the other Sections of the ſame Chapter, you may find abundant ſatisfaction, and you may alſo ſee to what Mechanick Uſes they are to be applied, as alſo in *Sect.* 22. of the ſame the reſt of their Medical Uſes; ſo alſo our *Polygraphice Lib.* 10. *Cap.* 1. of the Eighth Edition.

XVI. *The Salt, or Sal Alkali.* This Salt is made out of the Pot Aſhes, and has all the Virtues of Salt of Tartar, and almoſt in the ſame degree of goodneſs: how this Salt is made in perfection ſee in our *Polygraphice Lib.* 10. *Cap.* 1. *Sect.* 12, 13, 14, 15, 16. Thoſe Aſhes which come from *Spain* and the *Levant* are good, where, by reaſon of the heat of the Climate, *Kali* grows in great quantities, and is green all the Winter; but thoſe Aſhes which come from *Ægypt*, where there is never any Rain, are the ſtrongeſt, and make the ſtrongeſt and ſharpeſt Salt. The Aſhes coming from the *Levant* are called *Pulverine*, becauſe they are in Pouder, and have no ſuch Preparation as *Soda* and *Rochetta* have, for the Herb is only burn'd on Iron Grates, and afterwards when cold the Aſhes are gathered up and kept in proper Veſſels for uſe; theſe Aſhes have indeed leſs Salt than *Rochetta* and *Soda*, but for the quantity it is nothing inferior in virtue and goodneſs. Our *Dutch* Pot Aſhes, which are purely white, and in great hard lumps, are the beſt in the World, yield moſt and pureſt Salt, and of the ſtrongeſt kind, and therefore of excellent uſe in making Soap, Glaſs, *&c.* This Salt prevails againſt the Jaundice, Dropſie, Scurvy, and Gout. Doſe a Scruple or half a Dram in a Glaſs of White Port Wine.

XVII. *The Soap.* If it is ſpread upon a piece of courſe thick brown Paper and applied to the Soles of the Feet of thoſe who are taken Speechleſs, it brings them to their Speech again in a little time, if there be any hopes of reſtoration; anointed over the Face of one who has Lentils or Freckles thereon it obliterates or takes them away, but it is by a gentle taking away of the Skin, after the manner of a Scurf as it were; ſpread upon Leather and applied to the Hips in a Sciatica it cures it, being renewed as need requires; the ſame it does being applied to places pained with the Gout, and repeated accordingly.

XVIII. *The Sandiver, or Glaſs-Salt.* It is uſed often being made into Pouder to be blown into the Eyes thro' a Quill, or being diſſolved in Water and ſquirted into them, to take away the Skin which grows over the Sight; it takes away alſo Scabs and Mangineſs, if the parts affected be often bathed therewith, and ſerves to dry up running Sores and Scabs, helps againſt the Itch, and kill Tettars, Ringworms, and the like, being often waſhed therewith, and ſuffered to dry on; it ſerves to make Metals run, and a little thereof put into Antimony and Nitre for making *Crocus Metallorum*, increaſes the quantity of the *Crocus*, and it will therewith the better ſeparate from the *Scoria*. Glaſs being made with Pot Aſhes and other Materials, as Sand, Cryſtal, *&c.* this *Sandiver* is that Salt which is ſcummed off from the top of the Glaſs in the making thereof; ſee more of it in my *Seplaſium*, or *Druggiſts Shop*, *Lib.* 2. *Cap.* 15. where you may have farther ſatisfaction.

XIX. *To find out the quantity of* Sal Alkali *which is contained in any quantity of Pot Aſhes. Take a Pound of Pot Aſhes, diſſolve them, by boiling in eight or ten Pounds of fair Water, more or leſs, then being well ſettled decant off the clear* Lixivium *from the* Fæces, *the* Fæces *dry either in the Sun or before a Fire, or in an Oven, or over a Sand heat, and then weigh them, for ſo much as they want of a Pound, ſo much Salt is contained in each Pound of Aſhes, and ſo many Ounces of Salt you have in your* Lixivium. In ſome of your Oriental Pot Aſhes coming from *Syria*, *Ægypt*, *&c.* you may have about ten Ounces in a Pound, and in ſome again not above nine, or eight Ounces, and ſome of the worſer ſorts of Aſhes do not contain above ſeven or ſix Ounces in a Pound, ſo great a difference is there in the goodneſs of the Aſhes, but out of a Pound of the beſt, ſtrongeſt, and whiteſt *Dutch* Pot Aſhes we have obtained ſeveral times thirteen and fourteen Ounces of pure Salt, very rarely ſo little as twelve Ounces; the ſtrongeſt and beſt Aſhes are thoſe which are in greateſt lumps, very hard, and white, as it were of a blewiſh white, (which color ariſes from the well burning) and ſuch contain the greateſt plenty of Salt.

CHAP. CCCCXII.

Of KELP, SEA-LACES, *OR,* SEA-THONGS.

I. *THE Names.* It is called in *Greek* Φύκος θαλάσσιον, and Φύκος θαλάσσιον, in *Latine Alga*, and *Alga Marina*, alſo *Alga Maris*, and *Phycos*, or *Phycus*, or *Fucus Marinus*, *Marinus* being added thereto to diſtinguiſh it from *Fucus Herba*, which is *Anchuſa*, in *Engliſh Kelp*, and *Seaweed*.

II. *The Kinds.* Of *Seaweeds* there are ſeveral Kinds, *viz.* I. *Alga Marina*, *Fucus Marinus*, Kelp, Sea-Laces, Sea-Thongs, or Sea-Girdles, of which in this Chapter. II. *Muſcus Marinus*, *Lichen Marinus*, Sea Liverwort, and this is twofold, *viz.* 1. *Lactuca Marina*, *Lichen Marinus*, Oiſter green. 2. *Opuntia Marina*, *Lichen Marinus rotundifolius*, Round Leaved Oiſter green, or Round Leaved Sea Liverwort. III. *Alga Quercina*, *Fucus Quercinus*, Sea-Wrack, and this is ſixfold, *viz.* 1. *Quercus Marina major*, The Greater Sea-Oak, or Sea-Wrack.

2. *Quercus Marina minor*, The Leſſer Sea-Oak, or Sea-Wrack. 2. *Quercus Marina Tertia*, The Third Kind of Sea-Oak, or Sea-Wrack. 4. *Quercus Marina quarta*, Jagged Sea-Wrack. 5. *Fucus, ſive Alga intubacea*, Sea Curled Endive. 6. *Fucus ſpongioſus nodoſus*, Sea Raggedſtaff. Theſe two laſt generick Species ſee in their proper places under the Titles *Oyſter green*, and *Sea-Wrack*.

III. *The Kinds of the firſt of the three aforegoing Heads.* *Alga Marina*, *Fucus Marinus*, or *Kelp*, called alſo *Sea-Girdles*, *Sea-Laces*, and *Sea-Thongs*, is ſeven-fold, *viz.* 1. *Alga Marina*, (properly ſo called) *Fucus Marinus*, *Alga Marina Grammea Lugdunenſis*, *Fucus Marinus alter Dodonæi*, *Alga Anguſtifolia Vitrariorum Baubini*, the broader ſort of which is called *Imperatus*, *Fucus Giganteus*, and *Palmifolium Giganteum*, Kelp, peculiarly ſo called, Sea-Girdles, Sea-Laces, Sea-Thongs. 2. *Fucus Marinus craſſus Latifolius*, Thick Broad Leaved Alga, Kelp, or Sea-Girdles. 3. *Fucus Marinus Latiſſimo Tenuifolio*, Broad and Thin Leaved Alga, Kelp, or Sea-Thongs. 4. *Fucus Alatus, ſive Phoſganoides*, Winged Alga, Kelp, or Sea-Girdles. 5. *Alga, ſeu Fucus maximus Polyſchides*, Great Alga, or Kelp, or Sea-Girdles with many Labels, or Sea-Girdles with Hangers. 6. *Fucus Marinus ſecundus Dodonæi, Fucus longo, anguſto, & craſſo Folio*, Long, Narrow, and Thick Alga, Kelp, or Sea-Girdles. 7. *Fucus Membranaceus Ceranoides*, *Alga Marina Membranacea*, Kelp, or Seaweed with skinny Horns.

IV. The Deſcriptions. *The firſt, or* Kelp peculiarly ſo called, Sea-Girdles, Sea-Laces, or Sea-Thongs. *It has roundiſh Roots, which are hairy and blackiſh on the outſide*, from whence riſe up ſmall, round, long, white, hairy Heads, breaking out at the ſides as it were into Branches, on the tops whereof ſtand or grow three or four very long and narrow ſoft green Leaves, ſome being an Ell or more long, and about an Inch broad; this has neither Seed nor Stalk, but lies on the Ground, until the Tide raiſe it to float on the Water, which being broken by the force of the Waves is carried to the Shoar, where it is gathered and kept for many uſes.

V. *The ſecond, or* Thick Broad Leaved Alga, Kelp, or Sea-Girdles. *This differs from the former, in that the Root is wholly fibrous, the Stalk riſing from thence thick and round, two or three Inches high*, and the Leaf, which is ſometimes but one, and ſeldom two, of a very great length, even divers Feet, or rather Yards or Ells long, and above four Inches broad, equal from a little above the ſetting on to the end, but ſomewhat waved and crumpled on the edges, being thick, and of a deep green color, ſo ſoft and moiſt while it is freſh, that it is like unto moiſt Glew or Gelly, and will hardly dry, unleſs it lies long in the Sun, and will not be fit to be kept without rotting until after it has been many days dried.

VI. *The third, or* Broad and Thin Leaved Alga, Kelp, or Sea-Thongs. *This is in all reſpects like unto the laſt, but that the Leaves are thinner, broader, and ſhorter, yet crumpled on the edges, and of a paler green color, and like unto thin Parchment.*

VII. *The fourth, or* Winged Alga, Kelp, or Sea-Girdle. *This grows faſt upon Stones, and Shells of Fiſhes, both in the deeper and ſhallower places of the Sea*, having a round, dark, reddiſh Stalk, of the bigneſs of a Gooſe Quill, which being grown to the full length is very weak, lying on the Ground, unleſs the Water raiſe it, and about four Feet long, on each ſide of which grows a Wing all the whole length of it, like unto a Skin or Parchment, with Veins therein, which being like the Feathers of an Arrow, is ſmall below and broader above, equally to the top, of two or three Inches breadth; the Leaves which grow next the Ground are many, (and ſome grow alſo on the Stalk) of a yellower greeniſh color, and of an Hand breadth, being four, ſix, or eight Inches long, tough and pliable, or of a skinny ſubſtance, like unto the other *Girdles*; the Stalk does very well reſemble a two edged Sword: this Kind of *Alga* or *Kelp* is uſed to be dreſſed and eaten by the Inhabitants of the Sea Coaſts where it grows, after it is cleared from the skinny Wings, and has a little ſweet taſte with its ſaltneſs, which makes it the more acceptable to the Palate.

VIII. *The fifth, or* Great Alga, or Kelp, or Sea-Girdles with Labels or Hangers on. *The manner of growing of this with its uſe is like the laſt, but this is the greateſt of all theſe* Seaweeds, *having a Stalk as thick as that of* Angelica, *of a brown* Cheſtnut *Color on the outſide, and ſo are the round Leaves likewiſe, which are ſometimes four, five, or ſix Feet long, not being ſo thick as ones little Finger, and ending in ſeveral broad and ſhort skinny Labels, in like manner as the lower part of the Sword Hangers, which are of a yellowiſh color.*

IX. *Theſe fourth and fifth Kinds* Johnſon *upon* Gerard *has thus deſcribed.* This *Seaweed* has a various Face, for ſometimes from a fibrous Root, which commonly grows to a Pibble Stone, or is faſtned to a Rock, it ſends forth a round Stalk, ſeldom ſo thick as ones little Finger, and about half a Foot in length, at the top of which grows out a ſingle Leaf, ſometimes an Ell long, and then it is about the breadth of ones Hand, ending in a ſharp point, ſo that it very well reſembles a two edged Sword; ſometimes from the ſame Root come forth two ſuch faſhioned Leaves, but then commonly they are leſſer; ſometimes at the top of the Stalk it divides it ſelf into eight, nine, ten, or twelve parts, more or leſs, and that juſt at the top of the Stalk, which leſſer diviſions never come to that length which the ſingle Leaves do; this I judge to be the *Fucus Polyſchides Baubini*: now that theſe two Varieties are not ſeveral Kinds I am certain; at *Margate* in *Kent*, where they grow, they call them *Sea-Girdles*, which Name well befits the ſingle one, and the divided they call *Sea-Hangers*, for if you hang the tops downwards they do reaſonably well reſemble the old faſhioned Sword Hangers; thus much for their Shape: now for their Color, which is not the ſame in all, ſome are more green, and theſe can ſcarcely be dried, others are whitiſh, and they do quickly dry, and then both in Color and Subſtance are ſo like Parchment, that ſuch as know them not would at the firſt view take them to be nothing elſe; this is of a glutinous ſubſtance, and of a little ſaltiſh taſte, and are ſaid to be good Meat being boiled tender, and ſo eaten with Butter, Vinegar, and Pepper.

X. *The ſixth, or* Long, Narrow, and Thick Alga, Kelp, or Sea-Girdles. *The Root hereof is round and flat, from whence ſpring two or three narrow thick Leaves, about a Foot and half long, divided into ſeveral flat thick Thongs, like Leather*, ſome long, and ſome ſhorter, and they again divided into ſmaller ones, with no ſwoln Knots or Bladders thereon; but there is another ſort of this, which has ſhorter and narrower Leaves, the Stalks ending all in ſwoln points. *Johnſon* upon *Gerard* has a better Deſcription hereof, *viz.* This grows to the length of five or ſix Feet, is ſmooth and membranous, being about half a Fingers breadth, and variouſly divided, like to wet Parchment, or Leather cut into Thongs, without any ſwoln Knots or Bladders; but the other ſort has long and flat Stalks, like the other, but the Stalks are thick, and ſet with ſwoln knots or Bladders, out of which grow ſometimes little Leaves, but in other reſpects it is not unlike the former;

theſe

these two Kinds are the *Fucus Marinus secundus & tertius Dodonæi.*

XI. *The seventh, or* Kelp, or Seaweed with skinny Horns. *It has a Stalk a little above an Hand breadth long, an Inch and half broad, divided into several Branches, some broader, and others narrower, varying wonderfully, each of which ends in short parts, like unto small Horns; of this there are divers sorts, differing somewhat, tho' not much one from another: these are said to cure the longing of Women with Child.*

XII. *The eighth, or* Dying Red Sea Alga, Kelp, *or* Moss. *It grows unto some Rock or Stone, without any appearance of a Root, unless it is a flat kind of Skin, from whence rise up several Stalks, which are soft, and not above four or five Inches high,* from each Stalk of which shoot forth several Branches on both sides, and some of them again divided into lesser, all of them stored with fine small Leaves, as small as *Camomil* Leaves, or rather like unto *Fennel* Leaves, of a substance much like to that of the Stalks, soft in handling at first, easie to be bended, and almost transparent, if they be interposed to the Light, of a reddish or purplish Color, but with some whiteness mixed together; this is not so brittle as *Coralline* when it is dried, but grows more tough thereby, and being put into Water and steeped a while therein it grows soft again; it is used by several Mechanicks to strike a deep Crimson, or reddish Purple Color, which will last long; and out of this a *Red Lake* may be made, as well as out of *Kermes Berries, Brasil, Madder, Corn Poppies, Red Roses, Carnations, Sun-Flower, Saffron, Broom-Flowers,* and other things of like kind.

XIII. *The Places.* These are all of them found on many of our *English, Scottish,* and *Irish* Shoars, on the Coasts of *Holland* and *France,* as also on the Shoars of warmer Countries; the fourth and fifth were found at *Margate.*

XIV. *The Times.* They flourish in the Summer, and end of Summer, those being the chief times of their beauty and use.

XV. *Their Qualities, Specification, Preparations and Virtues* are much the same with those of *Kali* in the aforegoing Chapter, and out of these as good Pot Ashes are made as out of any of the *Kali's,* or *Glassworts.*

KIDNEYWORT, See *Navelwort* Chap.
KIK, See *Spurge Great Indian* Chap.
KINGCOB, See *Crowfoot* Chap. 172.
KINGSCROWN, See *Melilote* Chap.

CHAP. CCCCXIII.

Of KINGS-SPEAR, *OR,* Small Yellow ASPHODIL.

I. *THE Names.* It has no known *Greek* Name, the *Latines* call it *Asphodelus luteus minor, Hastula Regia,* and *Fœmini Dionysij Dodonæi,* in *English Kings-Spear,* or *Small Yellow Asphodil.*

II. *The Kinds.* It is the fourth Species of the *Asphodil* Treated of in Chap. 35. Sect. 2. aforegoing, and a singular Plant of the Species.

III. The Description. *It has Roots proceeding from one Head, which are many, long and slender, smaller than those of the other* Yellow sort, *and by its long slender Strings spreading in the Ground it does much increase:* This *Small Yellow Asphodil,* or *Kings-Spear,* has many long, narrow, edged Leaves, which are chamfered, or furrowed, which makes them seem threesquare, of a blewish or whitish green color; the Stalk is round, and rises up to be sometimes two or three Feet high, beset with small long Leaves up unto the very Flowers; the Flowers which grow thereon from the middle to the top are very many, in shape like to the Flowers of the other Kinds, they grow thick together, and Spike fashion, one above another, for a great length, and wholly yellow, laid open like a Star, somewhat smaller than the *Great White Asphodil,* and somewhat greater than the *Lesser Asphodil,* which when they are past small round Heads or Seed Vessels come in their places, in which is contained small, black, cornered Seed, almost threesquare.

IV. The Cut which we have exhibited in the third place in Chap. 35. Sect. 6. aforegoing is that which *Gerard* has given us for *Kings-Spear,* and the Cut for *Gerard*'s fourth Kind of *Asphodil* is that which *Parkinson* has exhibited for *Kings-Spear* in his *Theatrum Botanicum* Pag. 1218. but that which *Matthiolus* has set forth in his *Compendium* Pag. 342. is much more like the true Plant, excepting in its Head of Flowers, which is the true form of the Head before it shoots up into its long Spike, for afterwards when it grows up and dilates it self it differs not much from the spikedness of the other *Asphodils;* and this Figure of *Matthiolus* is that which we have given you in this place.

V. *The Places.* It grows naturally in *Italy, Spain,* Southern parts of *France,* and other hot Countries, from whence it has been brought to us, and is only nursed up in our Gardens.

VI. *The Times.* It Flowers in the latter part of Summer, as in *July,* and *August,* and the Seed is ripe about a Month after.

VII. As to the *Qualities, Specification, Preparations and Virtues* hereof, they are much the ſame with thoſe of the *Common Aſphodil* in Chap. 35. Sect. 9. *ad* 23. aforegoing.

CHAP. CCCCXIV.

Of KNAPWEED Common,

OR

MATFELLON.

I. *The Names.* It has no *Greek* Name, nor any ancient *Latine* Name that I know of, but by the modern *Latines* it is called *Jacea*, and in *Engliſh Knapweed*, or *Matfellon.*

II. *The Kinds.* *Knapweed* is agreed upon by all Authors to be a kind of *Scabious*, and therefore *Tragus* makes it to be *Scabioſa Quarta*; *Geſner in Hortis* takes it for a Kind of *Great Centory of the Meadow*, and thinks it to be that Plant which *Scaliger* calls *Gethya nigra*; *Thalius in Hercynia* calls it *Cyanus Sylveſtris Anguſtifolius*, but generally it is called *Jacea*, (*à lanthino Colore Florum*) We have divided the Productions hereof into three Species, *viz.* 1. *Jacea vulgaris*, Our Vulgar or Common Knapweed, of which in this Chapter. 2. *Stæbe*, Silver Knapweed, of which in Chap. 415. next following. 2. *Jacea Spinoſa*, Thorny Knapweed, which third Species, becauſe it is not found growing in *England*, nor in any of our Foreign or *Weſt Indian* Plantations beyond Sea, we ſhall ſay no more of it in this Work.

Knapweed black common

III. *The Kinds of the firſt or Common Knapweed.* Authors make ſixteen or eighteen Kinds or Varieties hereof, of which not above five or ſix grow in *England*, of which we ſhall only ſpeak in this Chapter, letting the others alone for a more general Work. 1. *Jacea nigra vulgaris*, *Jacea nigra Pratenſis Latifolia Bauhini*, Our Common Knapweed, or Matfellon; this *Bauhine* doubts whether it may not be *Solidago Saracenica Loniceri.* 2. *Jacea nigra vulgaris laciniata Bauhini*, *Jacea major Lobelij. Jacea ſexta Cluſij*, *Jacea hirſuto capite Camerarij*, Our other Common Wild Knapweed, or Great Knapweed. 3. *Jacea laciniata alba*, White Jagged Knapweed. 4. *Jacea nigra Anguſtifolia Bauhini*, *Jacea nigra Lithoſpermi arvenſis foliis*, Narrow Leaved Knapweed. 5. *Jacea Montana Narbonenſis Lobelij*, *Jacea Muſcata*, *& quinta Tabernamontani*, *Jacea Montana incana odora Bauhini*, Narbone or French Mountain Knapweed. 6. *Jacea Montana candidiſſima Bauhini*, *Jacea Montana laciniata*, Hoary White Mountain Knapweed.

IV. The Deſcriptions. *The firſt, or* Our Common Knapweed, *has a Root which is white, hard, and woody, with ſeveral Fibres annexed thereto, which periſhes not, but abides with Leaves thereon all the Winter, and ſhoots out freſh again every Spring*; from this Root riſe up many long and ſomewhat broad dark green Leaves, ſomething deeply dented about the edges, and ſometimes a little rent or torn as it were on both ſides in two or three places, and a little hairy withal, from among which riſes up a ſtrong round Stalk, four or five Feet high, divided into many ſmall Branches, at the tops whereof ſtand great ſcaly green Heads, from whoſe middle there is thruſt forth a great number of dark, purpliſh, red Thrums or Threads, (and ſometimes, tho' but rarely, white) in which after they are withered and paſt away ſeveral black Seeds are found, lying in a great deal of Down, ſomewhat like unto *Thiſtle* Seed, but ſmaller.

Great Knapweed

V. *The ſecond, or* Our other Common Wild Knapweed, *or* Great Knapweed. *The Roots are like*

like the former, blackish, and hard, with many Fibres; this Other Wild Knapweed *grows with us among Corn very much, as well as in Meadows, and it grows with greater and taller Stalks than the former*; the Leaves both below and above upon them are much divided on both sides, even to the middle Rib, almost like the *Great Scabious of Matthiolus*, but of a dark green color, and as rough, or rougher than the former, or first *Common Kind*, the scaly Heads on the tops of the Branches are greater, and the Flowers larger, and of a deeper red color; the Seed is also like to the first aforegoing.

Knapweed white flowred

VI. *The third, or* White Jagged Knapweed. *It has long creeping Roots, which are fibrous, or thready, and spread themselves somewhat under Ground*; from this Root rise up several Stalks, furnished with pretty large whitish green Leaves, very much jagged, divided or cut in on each side to the middle Rib; these Stalks rise up to be sometimes about two Feet high, repleniſhed with like Leaves from the bottom almost to their tops, and they likewise branch out almost from the Ground on all sides with lesser Branches, which are also beset with like Leaves, but lesser and less jagged as they approach near the tops; at the tops of the Stalks and Branches grow such like scaly Heads as on the former, and with the like pleasant Flowers, made of fine Threads, as the others are, rising out of them, saving that these are purely of a white color.

VII. *The fourth, or* Narrow Leaved Knapweed. *Its Root is long, hard, and blackish, and repleat with many small Fibres; from this rises up a round, rough, green Stalk, about a Foot and half high, on each side of which are set narrow, rough, short, and somewhat hoary green Leaves, compassing it at the bottom*, and divided into some other Branches above, on the top of each of which stands a scaly, whitish, green Head, out of the middle of which rise many small long Threads, like unto the former, but smaller, and of a pale reddish color, after which follows small black Seed, like the other; of this sort also there is one whose Stalk and Leaves are longer, and smooth, all over hairy, soft, and woolly.

VIII. *The fifth, or* French Mountain Knapweed. *It has a Root which is long, slender, with some Fibres adjoining to it, and of a bitter taste, from which Root spring forth several long winged Leaves, very much divided on both sides into other small, long, and narrower ones, but they little or nothing again divided*, of a light green color on the upper side, and hoary white underneath, and a little rough or hard withal, somewhat like unto the *Yellow Knapweed with prickly Heads*; from among these Leaves rises up a round Stalk, something rough also, and about a Foot high, without many Branches, but bearing three or four scaly Heads at the tops, with each of them a long, narrow, divided Leaf at the foot, and thrusting forth for a Flower many purple Threads in the middle, smelling sweet, after which comes the Seed, not unlike the other *Knapweeds*, but lesser.

IX. *The sixth, or* Hoary White Mountain Knapweed. *It has a thick woody Root, which sends forth divers winged Leaves, lying upon the Ground round about it, very much jagged, rent or torn on both sides into many small Leaves, which are each of them deeply dented on the edges, somewhat like unto the Leaves of the false* Stœbe *in the next Chapter*, all covered over with a hoary white Cotton or Wooll, or as it were sprinkled with fine Wheat Flower, or Meal, from among which rises up a crested, white, hoary Stalk, a Foot, or Foot and half high, scarcely having any Leaves thereon to the top, where it bears only two or three scaly Heads of Flowers, like the others, with purple Threads rising out of their middle, which being past away leave Seed like the rest.

X. *The Places.* The first grows with us in most Fields and Meadows, and about their borders, and near Hedge sides, and in many waste Grounds, almost every where; the second grows in many places of this Land, also among Corn, as well as in other Fields, and grows in an especial manner about *Coventry*; the third is also found growing wild in several places of *England*, *Johnson* says he found it growing wild in a Field near *Martin Abby* in *Surry*, as also in the *Isle of Tenet*; the fourth grows about *Padua* in *Italy*, and *Mompelier* in *France*, and other like warm Countries; the fifth upon the Hills of *Castrum novum*, near *Mompelier*; the sixth about *Capua* in *Italy*, but with us these three last grow only in Gardens.

XI. *The Times.* They all Flower in *June* and *July*, and their Seed is ripe in *July*, or *August*, or *September*, according as their Flowering is, either early or late.

XII. *The Qualities.* *Knapweed* is temperate in respect of heat, and dry in the begining of the second degree, Astringent, Absterſive, Traumatick or Vulnerary, Antiemmenagogick, and Analeptick.

XIII. *The Specification.* It is a peculiar Cure for all fluxes of Blood, whether internal or external, whether in the Stomach or other Bowels, whether by ruptures of any Blood Vessel or opening of their Mouths; it is good also to stop the flux of Humors to any Wound, Sore, Ulcer, or Fistula, to dry up the moisture, and gently to heal the same, without any sharpness or biting.

XIV. *The Preparations.* You may have therefrom 1. *A Liquid Juice.* 2. *An Essence.* 3. *A Decoction or Infusion in Wine or Water of Herb and Roots.* 4. *A Pouder of Herb and Roots.* 5. *A Gargarism.* 6. *A Balsam.* 7. *A Cataplasm.*

The

The Virtues.

XV. *The Liquid Juice.* It is a very good aſtringent, and helps to ſtay fluxes both of Blood and Matter, as ſpitting or vomiting Blood, bleeding at Noſe, and other outward parts, piſſing of Blood, alſo the violent overflowing of the Courſes in Women; it heals inward Wounds, alſo thoſe Veins which are inwardly broken, and cures fluxes of the Bowels, as Diarrhœa's, Lienteria's, and Dyſenteria's, or Bloody Fluxes. Doſe three, or four, or more Spoonfuls in Red Port Wine two or three times a day, or as oft as need requires.

XVI. *The Eſſence.* It has all the Virtues of the Juice, but is much more powerful for Fluxes of the Belly; it ſtrengthens the Stomach, and ſtops Vomiting, it prevails againſt Catarrhs, or diſtillations of thin and ſharp Humors falling upon the Lungs, and is good for ſuch as are bruiſed by Falls, Blows, or other Accidents. Doſe two or three Spoonfuls in a Glaſs of Wine Morning, Noon, and Night.

XVII. *The Decoction of Herb and Roots in Wine or Water.* It has all the Virtues of Juice and Eſſence, but much leſs powerful; it is good to waſh green Wounds, old running Sores, putrid Ulcers, Fiſtula's, and the like, for it waſhes off, and cleanſes them of their putrid matter and ſanies, dries and heals them, without any ſharpneſs or biting; it does the like in running Sores and Scabs of the Head and other parts. Doſe inwardly is five, ſix, or eight Ounces, ſweetened with a little Sugar.

XVIII. *The Pouder of Herb and Roots.* It is admirably drying and aſtringent, for being ſtrewed thick upon any bleeding part it preſently ſtops the afflux of Blood, and conglutinates the lips of a ſimple green Wound; ſtrewed thick upon old and putrid running Sores and Ulcers it cleanſes them, dries up the Humors flowing, and diſpoſes them to healing; a Dram of the Pouder given inwardly in Red Port Wine Morning and Evening ſtops all inward fluxes of the Bowels.

XIX. *The Gargariſm. Take of the Eſſence two Ounces, of the Decoction four Ounces, Alum two Drams, Honey an Ounce, mix and diſſolve.* It heals foreneſs of Mouth, Gums, and Throat, and aſſwages the ſwellings of the Uvula and Jaws; it is alſo good for green Wounds, to ſtop the bleeding, and conglutinate the lips of the Wound.

XX. *The Balſam.* It digeſts, cleanſes, incarnates, dries, and heals all ſorts of Wounds, Ulcers, and putrid running Sores in what part of the Body ſoever, and put ſcalding hot into Fiſtula's it diſſolves the callous, and cauſes them in a ſhort time to be cured.

XXI. *The Cataplaſm.* Made of the Herb and Roots boiled ſoft, and brought to a thickneſs with Pouder of *Comfrey* Roots, and applied, it is ſaid to be available for the Cure of Ruptures, the Decoction in Wine being alſo taken inwardly for ſome conſiderable time.

XXII. Laſtly, it is to be noted, that the *Qualities, Specifications and Virtues* of this Herb are in a manner the ſame with thoſe of *Scabious*, this being a Species thereof, and therefore for a more full account thereof we ſhall refer you thither.

CHAP. CCCCXV.

Of KNAPWEED Silver, *OR* Falſe STOEBE.

I. *THE Names.* This Plant was doubtleſs unknown to the Ancient *Greeks*, as alſo to the Ancient *Latines*, but the Moderns call it *Stœbe*, which is not the true *Stœbe* of *Dioſcorides* and *Theophraſtus*, that being the *Pimpinella Spinoſa*, or *Thorney Burnet*, whereas this *Falſe Stœbe* ſeems truly to be of the Stock of the *Knapweeds*, and therefore may more properly be called in *Latine Stœbe Notha vel Spuria*, and in *Engliſh Baſtard* or *Falſe Stœbe*, or *Silver Knapweed.*

II. *The Kinds.* Authors have made many ſorts of this *Silver Knapweed*, but the chief which we ſhall take notice of are theſe following, *viz.* 1. *Stœbe Salamantica prima Cluſij, Aphyllanthes prima Dodonæi, Stœbe major Folijs Cichoraccis mollibus languinoſis Bauhini*, Cluſius his firſt Spaniſh Silver Knapweed. 2. *Stœbe Salamantica ſecunda Cluſij*, alſo *Stœbes Salamanticæ primæ altera Species ejuſdem Authoris, Stœbe Argentea incana Lobelij, Aphyllanthes tertia Dodonæi, Stœbe major Folijs Erucæ mollibus languinoſis Bauhini*, Cluſius his ſecond Spaniſh Silver Knapweed. 3. *Stœbe Salamantica Argentea Lobelij*, alſo *Stœbe Salamantica Argentea minor, Stœbe Salamantica tertia Cluſij, Aphyllanthes quarta Dodonæi, Stœbe Calyculis Argenteis Bauhini*, Lobel's Silver Headed Knapweed. 4. *Stœbe Auſtriaca elatior Cluſij, Stœbe Gallica, Stœbe Calyculis Argenteis major Bauhini*, The Greater Silver Knapweed of Auſtria. 5. *Stœbe Auſtriaca humilior & humilis Cluſij, Centaurij majoris Species minor Geſneri* in *Collectione Stirpium, Stœbe incana Cyano ſimilis tenuifolia Bauhini*, Silver Knapweed of Auſtria the Leſſer. 6. *Stœbe Argentea Flore albo minor, Stœbe Calyculis Argenteis minor Bauhini, Jacea Flore albo Gerardi & Tabernamontani*, The Leſſer Silver Knapweed with a white Flower. 7. *Stœbe Plantaginis Folio Alpini* (in *Lib. de Plantis exoticis*) Narrow Leaved Silver Knapweed of Candy.

III. The Deſcriptions. *The firſt, or* Cluſius his firſt Spaniſh Silver Knapweed. *It has a Root which is white, long, and woody, when it is grown above two Years old, and then oftentimes periſhes in the Winter, otherwiſe it abides well, and will uſually Flower and Seed two Winters, if they be not too extreamly cold, or do not ſtand too much in the Weather*; from this Root riſe up ſeveral large winged Leaves, lying on the Ground, very much cut in on both ſides into large pieces, but each of them ſet cloſer together than the next, of a ſad green Color on the upper ſide, and ſomewhat whitiſh underneath, very hairy all over, as alſo the ſtrait ſtrong Stalks, which riſe up to be three or four Feet high, or more, with ſeveral ſuch like divided Leaves on them as grow below, but much leſſer, and every one ſharp at the points, divided in the top into divers Branches, bearing upon long, bare, or naked Stalks, and ſomewhat long, ſmall, ſcaly, ſmooth, round, green Heads, but ſeeming more neatly contrived together than any of the Heads of the former *Knapweeds*, from the ſmall tops whereof riſe many fine Purpliſh or Crimſon Threads or Thrums, or of a Color between both, ſtanding round together, and ſomething

whiter

whiter at the bottoms of them, which ſo ſtand in the Flower near a Month before they fade, in the mean ſeaſon the Seed ripens in the Heads, which is ſmall, not much bigger than the *Cyanus*, but not ſo great as the *Ordinary Knapweed.*

IV. *The ſecond, or* Cluſius his ſecond Silver Knapweed. *It has a Root which is white and long, not enduring after Seed time*; it has many divided hairy and ſomewhat hoary Leaves, lying on the Ground, divided into ſeveral parts on both ſides, but more ſeparate one from another than the former; the Stalks are ſomewhat hairy or hoary alſo, but ſtand not ſo upright as the former, rather leaning downwards, by reaſon of their weakneſs; theſe Stalks are divided into many Branches, bearing at their tops ſcaly Heads, a little larger, from whence ſhoot forth larger Flowers alſo than the former, whoſe outward Leaves are made like thoſe of the *Cyanus*, or *Cornflower*, of a fair purpliſh red Color, with ſuch like colored Threads or Thrums in their middles as are in that juſt aforegoing, with whitiſh and yellowiſh bottoms; the Seed ripens in the time of Flowering, and is like the former.

V. *The third, or* Lobel's Silver Headed Knapweed, *which is the third Kind of* Cluſius. *The Root is ſomething thick and long, and abides ſometimes after Seed time, it has many Leaves riſing from the Root, but they are much more divided, and into ſmaller parts than either of the aforegoing*, being more hoary, or of a whiter green Color than they, the Stalks are in the ſame manner hoary, and riſes up as high as the firſt, with thin, cut, or divided Leaves upon them, ſharp at the points, but ſmaller and ſmaller up to the tops, where they are much divided into Branches, and bearing at their ends ſcaly green Heads, but more white edged Leaves, ſeeming as if they were Silvered, out of which come forth ſmall purple Flowers, like the reſt, but ſmaller, the Seed hereof lying in the Downy Heads, as the others do, but are ſomething blacker than they, each having an hairy top on them.

VI. *The fourth, or* Greater Silver Knapweed of Auſtria. *This does not much differ from the laſt neither in its manner of growing, nor in its form of the Leaves, nor in its height, nor in its Stalk, but only in its ſcaly Heads, which are not of ſuch a ſhining white Silver like Color, and in this conſiſts the whole difference.*

VII. *The fifth, or* Silver Knapweed of Auſtria the leſſer. *There is likewiſe but very little difference in any particulars between this and the laſt, its chief variation is in the lowneſs of its growing and ſlenderneſs of the Stalk, by which it is made a diminutive Plant of the kind.*

VIII. *The ſixth, or* Leſſer Silver Knapweed with a white Flower. *Nor is there much difference or variety between this and the laſt, but only in the Flower, which conſiſts wholly of white Threads or Thrums, without having any other Color joined or mixed with it.*

IX. *The ſeventh, or* Narrow Leav'd Silver Knapweed of Candy. *It has a white Root, and of a Fingers thickneſs in magnitude, it is but a ſmall Plant, and has divers long, ſoft, fat, and narrow Leaves, lying next the Ground, a little dented on the edges, but thoſe which grow up upon ſlender Stalks, of about a handful long, are not dented at all, but reſemble* Ribwort Plantane *Leaves, and are of a yellowiſh green Color, the tops of the Stalks are repleniſhed with ſmall long Husks or Heads, out of which grow yellow Flowers, and after them ſmall long Seed, like unto that of* Scabious.

X. *Nota. Cluſius* ſays that the *Spaniards* call the firſt by the Name of *Cabeſuela, id eſt Capitulum*, a little Head, and they uſually make Brooms or Beſoms thereof to ſweep their Houſes, and that the Learned Phyſicians there do uſe the third Kind inſtead of *Scabious* for all the Purpoſes thereof.

XI. *The Places.* The firſt three Kinds do grow in ſeveral places of *Spain*, eſpecially about *Salamanca*, as *Cluſius* ſays; the fourth, fifth and ſixth grow in *Auſtria*, and the ſeventh, (as its Title teſtifies) in *Candy*, but by tranſplantation they are nurſed up in ſeveral Gardens of the Curious here in *England.*

XII. *The Times.* The firſt ſix do all Flower in the Summer Months of *June* and *July*, that of *Candy* Flowers ſomething later, *viz.* in *Auguſt*, if any early Froſt takes them they immediately wither, altho' in their own natural places, which are the warm Countries, and where they continue many Years.

XIII. *The Qualities, Specification, Preparations and Virtues* are the ſame with thoſe of the *Vulgar* or *Common Knapweeds* in the former Chapter, and to that I refer you; Authors ſay that all the ſorts of *Knapweed* come ſomewhat nigh unto the Qualities of *Scabious*, to which for their full Virtues you ought to be directed, and know that what Remedies may be had from and what Diſeaſes *Scabious* may be applied to, the ſame the *Knapweeds* are productive of and equally efficacious in.

CHAP. CCCCXVI.

Of KNAWEL,

OR,

German KNOTGRASS.

I. *THE Names.* It has neither *Greek* nor Ancient *Latine* Names that I know of, our Moderns call it *Polygonum Germanicum*, and we in *Engliſh Knawel*, or *German Knotgraſs.*

II. *The Kinds.* We have two Kinds hereof, *viz.* 1. *Polygonum Germanicum*, *Knawel Germanorum*, *Polygoni Species Tragi*, *Polycarpon*, (from the abundance of Seed) and *Polycnemon*, (from its many Virtues) *Polycarpon Lugdunenſis*, *Polygonum exiguum Dodonæi*, in his *Pemptades*, *Polygonum Selinoides Gerardi*, but this is an improper Name, for it has no Leaves like *Selinum*, or *Parſly*, *Common Knawel*, or *German Knotgraſs*; I know ſome would have this Plant to be *Saxifraga Anglicana Lobelij*, but I think it may be a Species thereof, the form and ſtrong ſweet ſmell which *Tragus* ſays it has inducing me to think ſo, (this being the *Knawel Tragi*) but the ſmall green Flowers and Seed in them are much differing from the Pink-like white Flowers in that. 2. *Polygonum Germanicum alterum*, *Polygonum Litoreum minus Floſculis ſpadiceo albicantibus*, The ſecond Knawel, or other German Knotgraſs; *Bauhinus* ſays that there is ſeveral Varieties of this *German Knawel*, of which this ſecond Kind is one of them, and the two following are alſo thought to be Species of the ſame Plant, *viz.* 3. *Polygonum Montanum Niveum Lobelij*, *Polygonum Montanum minimum Niveum & Sericeum*, *Polygoni Hiſpanici genus Cluſij*, *Paronychia Hiſpanica Cluſij*, *Polygonum Montanum Tabernamontani & Gerardi*, *Polygonum minus candicans Bauhini*, White Mountain Knotgraſs, or Knawel. 4. *Polygonum Valentinum*, *Polygonum Montanum*, *Anthyllidis Species*, *Anthyllis Valentina Cluſij*, Spaniſh Mountain Knotgraſs, or Knawel;

tho' this may be accounted a Kind of *Anthyllis*, (*Bauhinus* accounting it among his *Anthyllides*) yet it cannot be the *Anthyllis quinta Dioscoridis*, because that has upright Stalks, which this has not.

Knawell.

III. The Descriptions. *The first, or* Common Knawel, or German Knotgrass. *It has a Root which is small, slender, and fibrous or thready, from whence come forth several small Branches, not fully lying down on the Ground, half a* Foot *long, or more, and full of Joints, thickly set together,* at every one of which stand many very small and long pointed Leaves, of a greyish green, or Ash Color, which are of an unequal length, two for the most part longer than the other; at these Joints with the Leaves come forth divers small, Herby, or green Star-like Flowers, thick set together, which being fallen away there appears in very small Husks, no bigger than *Millet* Seed, a great store of very small Seed, like Dust, of the Seed of *Herniaria*, or *Rupturewort*, which are of a quick hot smell, and somewhat sweet.

IV. The second Knawel, or other German Knotgrass. *It has a Root which is small, long, and white, the whole Plant very much resembling the former, both in its manner of growing and in its slender trailing Branches*, which have small, long, hoary or grayish green Leaves, many set together at a Joint, but that they are longer than they, some of these being two Inches long, especially of those next the Root; the Flowers hereof stand or grow not at the Joints with the Leaves, but at the tops of the Stalks and Branches, many clustering together, which are very small, and white on the inside, but of a brownish red Color on the outside, which afterwards turn into a plentiful Crop of very small Seed.

V. *The third, or* White Mountain Knotgrass, or Knawel. *It has a Root which is small, long, and tobute, not perishing in Winter in its native Clime or place of growth, no not so much as its Branches or Leaves, but it will not endure our cold Nights and piercing Blasts, and therefore dies with us, unless preserved with great Care and Circumspection.* This Herb is a fine, white, and Silver like Plant, especially growing in the hotter Climates, and when it is grown old, so that it gives much delight to the beholders; it spreads many weak trailing Branches upon the Ground, in some places not past a Hands breadth, in others a Foot long, as full or fuller of Joints than any of the Kinds of *Knotgrass* in Chap. 418. following, which are thick set also with smaller Branches, on which are placed very small long Leaves, lying almost like Scales upon the whitish hard Stalks; these Leaves are green at the first, and tender, but when they are grown old they will be of a shining Silver Color, and hard, like Skins or Parchment; the tops of the Stalks and Branches are thick set with small, white, Silver like Leaves, and at the Joints come forth very small white Flowers, scarcely to be discerned, which being past away are followed by exceeding small Seed.

VI. *The fourth, or* Spanish Mountain Knotgrass, or Knawel. *Its Root is small, long, and blackish on the outside, it is a small Plant, and by some referred to the* Anthyllides, *but by others accounted a small kind of* Knotgrass, *or* Knawel, it shoots forth many small, weak, reddish Branches, lying upon the Ground, and not able to stand upright, about a Foot long, parted into many other smaller Branches, on which grow at several joints and spaces many small Leaves together, like unto those of *Time Spurge*, on which, as well as on the Stalk, there appears a shew of mealiness, as many Sea Plants have; with the Leaves come forth small, purplish, white Flowers, consisting of four Leaves apiece.

VII. *The Places.* The two first grow in several places of *England*, the first of them about *Chipnam*, in the West Country, and the second in dry, Sandy, and Rocky places; the third grows in *Spain*, and the Southern parts of *France*, and the fourth about the Castle of *Valentia* in *Spain*, and other places, with us they are only nursed up in Gardens.

VIII. *The Times.* They all flourish and are fresh and green in the Summer Months, and continue their verdure till cold Weather comes in, which causes them to wither and dry, in the mean season they Flower and perfect their Seed.

IX. *The Qualities.* They are Aperitive, Abstersive, Vulnerary, Diuretick, Nephritick, and Lithontriptick.

X. *The Specification.* They are powerful to break the Stone, and give ease in the Strangury, especially the first and second Kinds.

XI. *The Preparations.* You may have therefrom, 1. *A Liquid Juice.* 2. *An Essence.* 3. *A Decoction in Wine.* 4. *A Pouder.* 5. *A Mixture.*

The Virtues.

XII. *The Liquid Juice. Tragus* says that *Knawel* has the same Properties which *Knotgrass* has, and may serve to all Intentions instead thereof, as well for inward as outward Remedies; it opens obstructions of the Reins, Ureters, and Bladder, gives ease in the Strangury, and is said to be very powerful to break the Stone. Dose three, four, or six Spoonfuls, mix'd with any proper Wine, or other Vehicle.

XIII. *The Essence.* It has all the Virtues of the Juice, but much more powerful to the Intentions. Dose three or four Spoonfuls in some fit Vehicle in the Morning fasting, and at Night; outwardly used to Wounds and Ulcers it cleanses, dries, and heals them admirably, by only washing therewith, and applying Stuphs dipt therein, it conglutinates the lips of green Wounds in a very short time.

XIV. *The Decoction in Wine.* It has the Virtues of the Juice and Essence, but not altogether so powerful, it cleanses the Reins, Bladder, and Womb very forcibly, and is a good Lotion for the cleansing and drying of foul and running Ulcers.

XV. *The Pouder.* It provokes Urine, expels Sand, Gravel, and Tartarous Matter from the Urinary parts, and strewed upon simple Wounds it conglutinates and heals them, it stops a flux of Blood in green Wounds, and a flux of Humors in Ulcers, being strewed thick thereon. Dose inwardly a Dram at a time, Morning and Night, in a Glass of White Port Wine.

XVI. *The Mixture.* By washing a simple green Wound herewith it conglutinates the lips thereof upon the spot, it cleanses Ulcers, represses fluxions of Humors upon the same, the part and parts adjacent being fomented warm therewith, it dries up their humidities, and disposes them to a speedy healing. *This Mixture is made by mixing the Liquid*

quid Juice or Essence three parts, with choice Brandy one part, and digesting them together twenty four Hours.

CHAP. CCCCXVII.

Of KNEEHOLM, *OR* BUTCHERS-BROOM.

I. *THE Names.* It is called in *Greek* Ὀξυμυρσίνη, *Oxymyrsine*, i. e. *Myrtus acuta*, Μυρσίνη ἀγεία, *Myrtus Sylvestris*, (but there is another *Myrtus Sylvestris* among the Ancients, which is like the Tame or Manured Kind, which *Pliny Lib.* 15. *Cap.* 7. confounds together) Μυρτάκανθα, *Myrtacantha*, *Myrtus Spinosa*, Μυάκανθα, *Murina Spina*, and by *Theophrastus* Κεντρομυρρίνη, *Centromyrrhine*, in *Latine Ruscus*, and *Ruscum*, and by the Apothecaries *Bruscus*, and of some, as *Marcellus* says, *Scopa Regia*; *Pliny* says it is called *Chamæmyrsine*, and *Acaron*, or rather *Aceron*, which is one of their bastard Names, in *English Kneeholm*, and *Butchers-Broom.*

II. *The Kinds.* Authors have not yet found out more than one singular Species of this Plant.

III. The Description. *It has a Root which is thick, white, and great at the head, and from which spring forth several thick, long, and tough white strings*; the first Shoots which sprout from the Root are thick, whitish, and short, somewhat like unto those of *Asparagus*, but greater, which in some places are eaten in the same manner as we eat *Asparagus*; these rising up to be a Foot and half high are spread into divers Branches, green, and somewhat crested with the roundness, which are tough, pliant, and flexible, on which are set somewhat broad and almost round hard Leaves, sharp and prickly pointed at their ends, of a dark green Color, and somewhat like unto *Myrtle* Leaves, two for the most part set at a place, very close or near together; about the middle of the Leaf, on the back or lower side, from the middle Rib, comes forth a small whitish green Flower, consisting of four small round pointed Leaves, standing upon a very short or no footstalk, in whose place, (being past away) comes a small round Berry, green at the first, but when it is ripe red, much like to an *Asparagus* Berry, but greater, in which are contained two or three white, hard, round Seeds.

IV. *The Places.* It grows generally in most places throughout *England*, in Copses, and upon Heaths, and on rough, barren, and waste Grounds, and oft times under or near Holly Bushes; it grows upon *Hampsted Heath*, not far from *London*, and in many places in *Kent*, *Essex*, and *Barkshire*, almost in every Copse and low Wood.

V. *The Times.* It shoots forth its young Buds in the begining of the Spring, which are eaten in some places (as aforesaid) as our young *Asparagus*; the Berries are ripe in *August* and *September*, the Branches and Leaves abiding green all the Winter.

VI. *The Qualities.* The whole Plant, Roots, Leaves, and Berries are powerfully Aperitive, Absterssive, Diuretick, and Vulnerary, Pectoral, Nephritick, Hysterick, and Arthritick.

VII. *The Specification.* It is a peculiar thing against the Dropsie, especially that called an *Ascites*, opens Obstructions of the Urinary passages, and consolidates broken Bones.

VIII. *The Preparations.* The Root is chiefly made use of to all the Intentions for which the Plant is used, and the same is accounted one of the five opening Roots; therefrom you may make, 1. *A Juice or Essence.* 2. *A Decoction in Wine.* 3. *Of the young Sprouts a Sallet.* 4. *Of the Branches, Brooms or Besoms.* 5. *A Decoction of Leaves and Berries.*

The Virtues.

IX. *The Juice or Essence.* It powerfully opens Obstructions of Liver, Spleen, Gall Bladder, Reins, Ureters, and Bladder, provokes Urine, and amends the ill smell thereof, it helps to expel Gravel and the Stone, gives ease in the Strangury, and provokes Womens Monthly Courses, it helps the Yellow Jaundice, and the Headach, and made into a Lohoch with Honey it expectorates Flegm, and cleanses the *Thorax*, or Lungs, and Stomach of Flegm and clammy Humors gathered together therein. Dose from one Spoonful to two, three, or four, in a Glass of White Port Wine twice a day.

X. *The Decoction in Wine.* It has all the former Virtues, tho' not altogether so powerful, and may be given Morning and Evening from four to eight Ounces, or ten in Dose, besides which it is effectual in knitting and consolidating of broken Bones, and strengthning parts out of joint, and other weak Limbs, for which it is not much inferior to *Comfrey*, or *Solomon's-Seal*, drinking this Decoction, and applying the said Roots Pultice-wise unto the parts affected. *Riverius* in his Observations says, that a Beggar-Man was affected with the Dropsie three Months, whereby his Belly grew exceeding big, and because his Poverty would not afford him the choicer Medicaments, he used, by the Advice of a Country Woman, a Decoction of the Roots of *Kneeholm*, or *Butchers-Broom*, and was purged twice or thrice with an Infusion of *Sena*, and with these Remedies

alone he was perfectly cured; a ſtrong Decoction or Infuſion alſo of it in Water having been plentifully uſed Morning and Night by it ſelf, alſo boiled in Wine or Broth, and eaten as Food with the Wine or Broth for a Month or five Weeks ſpace, has been found by Experience to cure an *Aſcites*, and it cured this kind of Dropſie in two Young Maidens, the one of which lived in good Health many Years after it; another Woman was cured of a Dropſie of the Womb, as was ſuppoſed, with this Medicament, from whom it brought away with a kind of *impetus* or violence about ten Gallons of Water; a Decoction of this Root, Roots of the *Blue Flowerdelice*, and *Fennel* Roots in Water or Wine being uſed for ſome time has been found of admirable uſe for the cure of theſe kind of Dropſies of the Belly, and *Dodonæus* is not ſparing in its Praiſes for this purpoſe.

XI. *The Sallet made of the young Sprouts.* It is prepared as are thoſe of *Aſparagus*, and eaten in the ſame manner, and ſo eaten the ſaid Sprouts open Obſtructions of Liver, Spleen, Reins, Ureters, and Bladder, cleanſing thoſe parts of Fœculencies, but they are nothing near ſo effectual as are the Juice, Eſſence, or Decoction of the Roots in Sect. 9. and 10. aforegoing.

XII. *Brooms or Beſoms.* Formerly Huſwives made uſe of this Plant to make Beſoms of to ſweep the Houſe, from whence came the Name *Scopa Regia*, as being uſed alſo in Kings Chambers, but now thro' the Revolution of Times they are changed to Bruſhes, for cleanſing Butchers Stalls, from whence came the Name of *Butchers-Broom.*

XIII. *The Decoction of Leaves and Berries in Wine.* This, according to *Dioſcorides*, has all the ſame Effects with the Decoction of the Roots, but in my Opinion the Preparation of the Roots is much the more powerful.

CHAP. CCCCXVIII.

Of KNOTGRASS, *OR,* SWINESGRASS.

I. *THE Names.* It is called in *Greek* Πολύγονον, *quod multis genubus creſcit*, in *Arabick Baſia Trabagi*, in *Latine Polygonum, Sanguinaria, Sanguinalis, Seminalis, Proſerpinaca*, in *Engliſh Knotgraſs, Swinesgraſs*, and *Birdstongue.*

II. *The Kinds.* Authors make ſeven ſeveral ſorts of this Plant, *viz.* 1. Πολύγονον ἄρρεν, *Polygonum Mas, Polygonum vulgare majus, Polygonum Maſculum*, Our Greater or Common Knotgraſs. 2. *Polygonum vulgare minus*, The Leſſer Common Knotgraſs. 3. *Polygonum minus breviore Folio*, Small ſhort Leaved Knotgraſs, this *Bauhinus* in his *Pinax* takes to be *Polygonum Maſculum Fruticoſum Thalij* in his *Hercynia Sylva*, alſo the *Sedum minimum Arboreſcens Vermiculatum Lobelij.* 4. *Polygonum Saxatile Bauhini*, Stone or Rock Knotgraſs. 5. *Polygonum Marinum majus & maximum Lobelij, Polygonum Marinum primum Lugdunenſis & Dalechampij, Polygonum Marinum Latifolium Bauhini*, The Greater or Broad Leaved Sea Knotgraſs. 6. *Polygonum Marinum minus*, *Polygonum Marinum alterum Dalechampij, Polygonum Maritimum Anguſtifolium Bauhini*, The Leſſer or Narrow Leaved Sea Knotgraſs. 7. *Polygonam Germanicum Bauhini*, Knawel, of which we have already diſcourſed in Chap. 416. aforegoing.

III. The Deſcriptions. *The firſt, or* Common Knotgraſs. *It has a Root which is reddiſh, ſmall, ſhort, and round, abiding all Winter, and putting forth anew every Year*; it comes up with many long ſlender Branches, full of Joints, lying upon the Ground, with many long and narrow Leaves ſet thereon, one for the moſt part at a Joint, on which Branches, eſpecially from the middle upwards, come forth Flowers, which are ſo ſmall, that for the moſt part they are not ſeen or diſcerned, but in ſome they are white, in others of a whitiſh Purple Color, which afterwards turn into very ſmall ſquare Seed, like unto *Sorrel* Seed, where note, that the Joints have commonly a ſmall white Skin, which covers them.

IV. *The ſecond, or* Leſſer Common Knotgraſs. *This in its Roots, Stalks, Joints, Leaves, Flowers, and Seed, grows like the former, ſaving that they are leſs, chiefly the Leaves, being neither ſo broad nor ſo long, and the Flowers hereof are always white.*

V. *The third, or* Small ſhort Leaved Knotgraſs. *It has a Root like to the former, from whence riſe up many ſlender jointed Branches, but more weedy than the other, ſpread alſo into ſome other ſmaller ones, on which grow ſmall ſhort Leaves, leſſer than thoſe of the* Small Johnswort, *the Flowers are ſmall and white, like the other.*

VI. *The fourth, or* Stone or Rock Knotgraſs. *It has ſmall, white, fibrous Roots, from whence ſpring up many weak trailing Branches, lying upon the Ground round about it, on which grow Leaves which are ſomewhat round, being an Inch in length, and about half an Inch in breadth, but growing ſmaller to the Stalkward, green on the upper ſide, and of a whitiſh mealy Color underneath, at the Joints come forth ſmall, pale, reddiſh Flowers, like unto the other, and after them follows ſuch like ſmall Seed.*

VII. *The fifth, or* Greater broad Leaved Sea Knotgraſs. *It has a Root which is ſomewhat great, thick, black, long, and ſomething woody, it runs out into many and much larger Branches than the firſt, full of Joints, and lying on the Ground. The Joints ſet very*

cloſe

close together, with Leaves thereon, something like to the Common Kind, *but thicker, a little shorter, and broader, and of a dark green color above, and whiter underneath; the Flowers stand at the joints in the same manner, having small white Skins, which cover the Joints, which in some are also of a white, in others of a purplish color, after which come small Seed, inclosed in whitish shining Skins; the taste of the Plant, and of every part thereof, is astringent, but somewhat salt withal.*

VIII. *The sixth, or* Lesser or Narrow Leaved Sea Knotgrass. *It has a Root which is long, black, and woody, with a few Fibres adjoining thereto: This lesser Kind has longer Stalks than the last, and covered with a reddish Bark, also more divided into smaller Branches, having fewer Joints on the greater Stalks, but the Branches are thick, and set with smaller* Leaves *than the former, which are something fat, and thick, long, and narrow, like the first* Common Kind; *the Flowers are small and whitish, and the Seed is much like that of the fifth Kind.*

IX. *Nota.* Whereas the first great sort is called before in this Chapter *Mas*, or the *Male Kind*, that seems to bespeak a *Female Kind* also, but there is indeed no Female Species of *Knotgrass*, for that which some Authors call *Polygonum Fœmina*, or *Fœminæum*, is one of the Kinds of *Equiseta*, or *Horsetails*, as being likest unto them, although not rough, but differing totally in form from *Polygonum*, or *Knotgrass*, for which reason we take no farther notice of it in this Chapter.

X. *The Places.* The first, or great Kind, as also the second, or lesser, grow almost every where, and in every County in *England*, as well by the Foot Ways in Fields as on the sides of High Ways which are green, by the sides of old Walls, and on the borders of Fields, where in some places it even overspreads them; the third and fourth grow on higher Grounds, on Gravelly, Stony, and Rocky places, upon Hills and Mountains; the two last grow in Salt Marshy Grounds, and by the Sea side in many places.

XI. *The Times.* They come forth late in the Spring, and continue all the Summer, Flowering and Seeding in the mean season, and so endure till Winter, in which Season all their Branches perish.

XII. *The Qualities.* They are cold in the first degree, and dry in the second, Astringent, Abstersive, Diuretick, Traumatick, Nephritick, and Alexipharmick.

XIII. *The Specification. Knotgrass* is a peculiar thing against spitting of Blood, and all fluxes of Blood in any part, Bloody Flux, and other Fluxes of the Bowels, the Gonorrhœa in Men and Whites in Women, (Universals being premised) heat and sharpness of Urine, also the Strangury, or stoppage of Urine, cools Inflamations, cures Wounds, and cleanses and heals old and filthy Ulcers, *&c.*

XIV. *The Preparations.* You may have therefrom 1. *A Liquid Juice.* 2. *An Essence.* 3. *A Decoction in Wine or Water.* 4. *A Pouder of the Herb.* 5. *A Distilled Water.* 6. *A Balsam.*

The Virtues.

XV. *The Liquid Juice.* It is cooling, drying, and binding, and is very effectual to stay any bleeding at Mouth or Nose being drank in Steeled or Red Port Wine, and being applied to the Forehead or Temples, as also squirted up the Nostrils with a Syringe; it is no less effectual to cool and temper the heat of Blood, or of the Stomach, and to stop any flux of Blood or Humors, either of the Belly, as Lasks, or Bloody Fluxes, fluxes of cholerick and sharp Humors, or of the Womb, as the overflowing of the Terms in Women, and the Whites, or of the Spermatick parts, as the running of the Reins, *&c.* Dose four Spoonfuls; it cures running Ulcers of the Ears.

XVI. *The Essence.* It has all the Virtues of the Liquid Juice, besides which, if it is given before the Fit of an Ague comes, whether Tertian or Quartan, it is said to determine it, and cure the same; it is also singular good to provoke Urine when it is stopped, as also when it passes away by drops and with pain, which is called the Strangury, it takes away the heat and sharpness thereof, and is said powerfully to expel the Stone, Gravel, Sand, Urine, and other Tartarous Matter from the Reins, Ureters, and Bladder; it is a Sovereign Remedy to cool all manner of Inflamations, to stop the progress of *Anthonies*-Fire, or any other breakings forth of heat, and gives ease in all hot Swellings and Apostems, and prevents the future burning, fretting and eating of dangerous, old, running and gangrenous Sores and Ulcers, yea, tho' in the Privy parts of Men or Women, resisting the Humors for falling into them, cooling them, and drying up the hot, sharp, and moist matter which causes them to be inflamed. Dose two or three Spoonfuls in some proper Vehicle Morning and Night.

XVII. *The Decoction in Water or Wine.* It has the Virtues of the Juice and Essence, but not altogether so strong or effectual, and therefore is to be given in larger Doses, as from a quarter of a Pint to half a Pint, or more. The Vinous Decoction is good for those who are stung or bitten by Scorpions, Serpents, or other Venomous Creatures; and the same is very effectual to stop all defluxions of Rheum falling upon the Stomach or Lungs; it kills also Worms in Stomach or Belly, and eases all inward pains of the Bowels arising from heat, sharpness, and corruption of Humors, as the Colick, *&c.*

XVIII. *The Pouder of the Herb or Seed.* It is good against the Stone, Gravel, Sand, and Tartarous Matter in the Urinary parts, being drank to a Dram or more Morning and Night in Wine for many days together; applied outwardly to bleeding Wounds, or other fluxes of Blood, it presently stops it, and if it is a simple Wound conduces to its speedy healing.

XIX. *The Distilled Water.* It has the Virtues of the Juice, Essence, and Decoction, but nothing near so powerful as either of them; being taken by it self to four or five Ounces it is effectual to all the Purposes aforesaid, and is a very excellent thing to cool all sorts of Inflamations, proceeding from what cause or in what part of the Body soever.

XX. *The Balsam.* It speedily cures all simple green Wounds, by resisting the flux of Blood, and consolidating their lips; it strengthens weak Joints, comforts the Nerves and Tendons, and is prevalent against the Gout, being duly and rightly applied Morning and Evening.

XXI. *Nota.* It has been observed that the Sea Kinds of *Knotgrass* have not been so cooling and operative in the above enumerated Diseases as the Common Kinds, by reason of their abundant saline substance, yet effectual in several Cases where there is need of greater penetration, and therefore a Cataplasm made thereof and applied has been found much more effectual against the Gout.

CHAP. CCCCXIX.

Of LADIES-BEDSTRAW, *OR,* CHEESE-RENNET.

I. *The Names.* It is called in *Greek* Γάλλιον, and Γάλιον, and, as *Dioscorides* says, of some γαλίεων, and γαλάεων, and was so called from γαλα, Milk, from the effect, which was to make Milk turn into a Curd when they set it to make Cheese, for which it serves very well; in *Latine Gallium*, and in *English Ladies-Bedstraw*, *Cheese-Rennet*, and *Maidshair.*

II. *The Kinds.* Authors make six or seven Kinds of this Plant, or more, but because several of them are not to be met withal in *England* or our Plantations abroad, we shall only describe the five following, *viz.* 1. *Gallium*, & *Gallium luteum*, Our Common Ladies-Bedstraw. 2. *Gallium album Camerarij & Penæ*, *Mollugo*, *Mollugo vulgatior Lobelij*, *Gallium tertium Tragi*, *Mollugo prima Dodonæi*, *Lugdunensis*, & *Tabernamontani*, Our Common white Flowered Ladies-Bedstraw. 3. *Mollugo Montana Dodonæi*, *Clusij*, *Lobelij*, *Lugdunensis*, *Thalij*, & *Tabernamontani*, *Rubia Sylvatica altera Gesneri*, White Flowered Mountain Ladies-Bedstraw. 4. *Gallium Flore rubro*, *Gallium Flore nigro purpureum Montanum Tenuifolium Clusij & Columnæ*, Red Flowered Ladies-Bedstraw. 5. *Gallium Montanum Creticum*, *Gallium Americanum vel Floridianum*, Candia or American Ladies-Bedstraw.

III. The Descriptions. *The first*, *or* Our Common Ladies-Bedstraw. *It has a Root which is reddish, having many small* Fibres *or* Threads *fastned to it, which take strong hold of the Ground, and creep a little also; from this Root rise up several small, brown, square, upright Stalks, three Feet or more high, sometimes branched forth into divers parts, full of Joints, and with several very fine small Leaves at every one of them, little or nothing rough at all; at the tops of the Branches grow many long Tufts of yellow Flowers, very thick set together, one above another, from the several Joints, which consist of four small Leaves apiece, and smell somewhat strong or resinous, but not unpleasant; the Seed is small and black, like* Poppy *Seed, two for the most part joined together; some of the Branches leaning down to the Ground take root at their Joints, whereby it much increases.*

IV. *Gerard* thus describes it. *It has a small and thready Root, from which come forth small, round, even Stalks, weak and tender, creeping hither and thither upon the Ground, on which do grow very fine Leaves, cut into small parts, finer than those of* Dill, *set at certain spaces, as those of* Woodrooff, *among which come forth Flowers of a yellow color in clusters or bunches, thick thrust together, of a strong sweet smell, but not unpleasant.*

V. *The second*, *or* Our Common white Flowered Ladies-Bedstraw. *It has a Root which is fibrous or thready, and abiding all Winter, and the whole Plant is in all things like to that next to be described, saving, that the Branches are so weak, that unless they be sustained by Trees, Bushes, Hedges, or other things near which it grows, it will lye down upon the Ground, and the Leaves are smaller and narrower, yet not so small as the first with yellow Flowers; the Flowers are also small and white, but not plentifully abounding: Some Authors make a smaller sort hereof, which is not a proper Species, for upon transplanting it will grow as great as the other.*

VI. Gerard *describes this second sort thus:* Ladies-Bedstraw with white Flowers *is like unto* Cleavers *or* Goosegrass *in Leaves, Stalks, and manner of growing, yet nothing at all rough, but smooth and soft; the Flowers are white, the Seed round, the Roots slender, creeping within the Ground; the whole Plant climbs upon Bushes, Shrubs, and all other like things which are near unto it, otherwise it grows not upright, but falls to the Ground.*

VII. *The third*, *or* White Flowered Mountain Ladies-Bedstraw. *It has a Root which is black, and very fibrous or thready, from whence shoot forth a number of slender and weak Stalks, which yet stand upright of themselves, directly branching forth into many parts, so that it seems to be a pretty well spread Bush, having many shorter and broader smooth green Leaves set at the Joints than any of the former, or the next which follows; the Flowers are very small and white, standing at the tops of the Branches, more thick or plentifully set than the following with red Flowers, which being past away turn into small, black, round Seed.*

VIII. *This* Gerard *says that it is called* Mollugo, *and has Stalks which need not be propped up, but of it self stands upright, and is like unto our second Species, or* Common White Flowered Ladies-Bedstraw, *but that it has a smoother Leaf.*

IX. *The fourth*, *or* Red Flowered Ladies-Bedstraw. *Its Root is of a reddish color, but greater than the first* Common Kind, *creeps not, abiding many Years and not perishing*: The Plant is small, and has slenderer and lower Stalks than the first Kind, yet divided into many Branches, at whose Joints stand four, five, or six long Leaves, and not of so dark a green Color as the first; the Flowers are of a red color, not so thick clustering or set together as those of the first Kind, and consist of four small pointed Leaves, with a yellow Pointel in the middle, but five or six or more growing together at the tops of the Branches, which afterwards turn into

small

ſmall black Seed, like the firſt. *Columna* will have *Gallium nigra purpureum Montanum*, &c. to be a differing Species from this now deſcribed, but they ſeem to me to be all one Kind, the Flower being in ſome places only a little darker, but in all other particulars alike.

X. *Gerard* ſays this *fourth or* Red Flowered Ladies-Bedſtraw *has been taken for a Kind of* Wild Madder, *but it is truly a Kind or Species of* Ladies-Bedſtraw, *or* Cheeſe-Rennet, as appears both by its Qualities of turning Milk into Curds, as alſo by its form, being in each reſpect like unto the *Gallium luteum*, or *Our Common Ladies-Bedſtraw*, and differs in the color of the Flowers, which are of a dark red color, with a yellow Pointel in the middle conſiſting of four ſmall Leaves.

XI. *The fifth, or* Candy or American Ladies-Bedſtraw. *It grows like the firſt, or* Common, *or* Yellow Ladies-Bedſtraw, *but much leſſer, yet with greater Roots and Branches. It is a more effectual Rennet than any of the former, hot and aſtringent, ſtopping Fluxes of Blood.*

XII. *The Places.* The firſt and ſecond grow frequently in many places in this Land, in Meadows and Paſtures both wet and dry, as alſo by Hedge ſides; the firſt grows alſo upon Sunnie Banks near the borders of Fields, in fruitful Soils almoſt every where; the ſecond grows in Marſh Grounds, and other moiſt places; the third grows on Hills and Mountains and in Hedges among Buſhes in moſt places; the fourth grows on Mountainous and Hilly places in *Germany*, and was ſent to us from *Strasburgh*, ſince which it is nurſed up with us in Gardens; the fifth grows in *Candy*, and in ſeveral parts of *America* upon the *Floridian* Continent, in ſeveral places of which I have often found it.

XIII. *The Times.* They all Flower early, *viz.* in *May*, except the *Red Flowered*, which Flowers in *June*, and the Seeds are ripe in *June*, *July*, and *Auguſt*; but *Gerard* ſays they Flower moſt of the Summer Months.

XIV. *The Qualities.* They are hot and dry in the firſt degree, Aſtringent, Abſterſive, and Traumatick or Vulnerary; they are alſo Nephritick, Lithontriptick, and Arthritick.

XV. *The Specification. Ladies-Bedſtraw* is a peculiar thing to ſtop bleeding inwardly, or at Noſe, to heal inward or outward Wounds, to help burning with Fire and ſcalding with Water, to ſtrengthen the Nerves, Tendons, and Joints, give eaſe in the Gout, to help the Strangury, and to fret and break the Stone.

XVI. *The Preparations.* You may have therefrom, 1. *A liquid Juice.* 2. *A Decoction.* 3. *A Pouder of the Root.* 4. *A Naſale of Herb and Flowers.* 5. *An Ointment.* 6. *Cheeſe Rennet.*

The Virtues.

XVII. *The liquid Juice.* It is powerful to provoke Urine, to help the Strangury, to break the Stone, and to expel Gravel, Sand and Tartarous Matter from the Reins, Ureters and Bladder, being taken two or three Ounces at a time, two or three times a Day, in a Glaſs of pure White Port Wine. The ſame drank helps to ſtop inward Bleeding and the overflowing of the Terms in Women, as alſo to heal inward Wounds, by its heating and drying Qualities.

XVIII. *The Decoction of Herb and Flowers in Wine or Water.* It has all the Virtues of the liquid Juice, but is much weaker. It is good to bathe the Feet of Travellers in, who are wearied and tired with Travel, and whoſe Feet are ſwoln, or bruiſed, or galled thereby; and for ſuch whoſe much and long Running cauſes not only Wearineſs, but Stiffneſs in the Nerves and Joints; for all which things this Decoction uſed as hot as it can be well endured, is very available. It is alſo good againſt Scurff, Morphew, Dandriff, dry Scabs, Itchings, and other like Defœdations of the Skin, chiefly in Infants.

XIX. *The Pouder of the Root.* It may be taken to one Dram in choice Canary, Madera, or other like generous Wines; and as *Dioſcorides* writes, it provokes Venery or Bodily Luſt, as do alſo the Pouder of the Flowers, taken in the ſame Doſe and Manner Morning and Night, or two or three times a Day.

XX. *The Naſale of the Herb and Flowers.* They being bruiſed, and put up the Noſtrils, are ſaid to ſtop a vehement Hæmorrhage in thoſe Parts; and it may be ſo much the better, if ſome of their Juice be firſt ſnuft up, or ſyringed in.

XXI. The Ointment. *It is made by boiling the bruiſed Herb and Flowers in Oil Olive to Criſpneſs; and ſtraining out, and ſo repeating this Work three or four times, then adding a little Bees-wax to bring it to a Conſiſtency:* But ſome adviſe it to be made with *Hogs-Lard.* Or you may make *an Oil thus: Put the bruiſed Herb and Flowers into pure Oil Olive, and inſolate till the Oil becomes white: preſs all out, and repeat this Work three or four times, and ſtrain out for Uſe: but it is ſooner done by boiling the bruiſed Herbs and Flowers in the Oil to Criſpneſs, ſtraining out by preſſing, and repeating the Work three times more; then ſtraining out the clear Oil, keep it for Uſe.* It is good againſt Burnings with Fire, and Scalding with Water, and is good to be anointed upon Limbs and Joints, which are weak, and become ſtiff with Walking, for it ſtrengthens the Nerves, Tendons and Joints. It prevails alſo againſt Scurff, Morphew, Mange, dry Scabs, and the Itchings and Gallings of Children, and other Deformities of the Skin. Applied alſo to the Parts affected, it gives Eaſe in the Gout, and other like Pains; and by Continuation of the Application, cures the ſame.

XXII. *The Cheeſe-Rennet.* It is made of the bruiſed Herb, by ſqueezing out its Juice, being firſt moiſtened with a little choice Canary or Sherry, to which a quarter part of Spirit of Wine is firſt added. Or thus: Take the expreſſed Juice, defecate it by ſettling, or clarify it with Whites of Eggs: to a quart of this prepared Juice, put Sherry Wine four ounces, firſt mixt with Spirit of Wine two ounces: mix them, digeſt ſome Days, then decant the clear, and keep it for Uſe. But many Country People make uſe of the ſimple Juice only. *Matthiolus* ſays, That the People of *Tuſcany* do uſe to Turn their Milk with it, that the Cheeſe which they make of Sheep and Goats Milk, may be the ſweeter, and the more pleaſant in Taſte, and alſo more wholeſome, as to break the Stone, *&c.* And the *Cheſhire* Women, eſpecially thoſe about *Nantwich*, where the beſt Cheeſe is made, do uſe it in their *Rennet*, (*viz. by putting the bruiſed Herb into their Rennet-bags;*) much more eſteeming of that Cheeſe which is made with it, than of that which is made without it.

XXIII. *Nota.* The Ancients thought the *Gallium album*, or *White-flowered Ladies Bed-ſtraw*, to have no Virtues, or to be of no Uſe. But *Cluſius* ſays, That in *Auſtria*, *Hungaria*, and other places of *Germany*, the People have found it by Experience to be good to ſtrengthen the Arteries, Nerves, Tendons and Joints, thoſe Parts being bathed either with the Juice, Decoction or Rennet made thereof; and that it takes away Wearineſs and Weakneſs after Travelling, and eaſes Pains cauſe by Cold, Over-walking, Blows.

Blows, or Over-ſtraining. Parts affected with the Gout, being well bathed with the Rennet made thereof, Morning and Night, as hot as it can be endured, cures the Pain, and in a ſhort time eaſes the Diſeaſe; but it is much more effectual, if after Bathing, a Cataplaſm be applied, made of the Juice or Rennet, (of any of the Kinds of *Ladies Bed-ſtraw*) by bringing it to a Conſiſtence with fine Barley-flower, or Crums of White-bread, mixed with a little Oil of *Poppy*-ſeed, or Oil of *Ben*, the Application being made as hot as the Patient can well endure.

CHAP. CCCCXX.

Of LADIES-BOWER,

OR,

CLIMERS.

I. *THE Names.* It is called in *Greek*, Κλήματις: in *Latin*, *Clematis*; and in *Engliſh*, *Ladies-Bower*, *Virgins-Bower*, and *Climer*.

II. *The Kinds.* Authors make many ſorts hereof, ſome of which grow not in *England*, nor in any of our *Engliſh* Plantations: thoſe which are to be had with us, are the following. 1. *Clematis urens*, *Clematis altera flore albo*, *Clematis altera Dioſcoridis*, *Clematis peregrina*; Ladies-Bower, *or* Virgins-Bower Burning, Burning Climer, *or* Cauſtick Climer. 2. *Clematis peregrina*, *vel Clematis altera Dioſcoridis flore ſimplici rubro*; Red Ladies-Bower, *or* Virgins-Bower, *or* Single red-flowered Climer. 3. *Clematis peregrina flore ſimplici purpureo*; Single purple Ladies-Bower, *or* Single purple-flowered Climer. 4. *Clematis peregrina flore purpureo pleno*; Double purple-flowered Ladies *or* Virgins Bower, Double purple-flowered Climer. 5. *Clematis Maritima repens Bauhini*; Creeping fiery Sea Climer. 6. *Clematis Virginiana*; The Virginian Ladies-Bower, *or* Climer, which the Natives call *Maracoc*. 7. *Flammula Jovis ſurrecta* or *erecta*, *Flammula frutex*, *Clematis erecta* or *ſurrecta*; Upright Ladies-Bower, *or* Virgins-Bower. Here is to be noted, That the *Sixth* or *Virginian Kind*, is called by the *Spaniards* in the *Weſt Indies*, *Granadillus*, or *Granadillo*, becauſe the Fruit is in ſome ſort like a ſmall *Pomgranate* on the outſide, yet the Seed within is flattiſh, round and blackiſh.

III. The Deſcriptions. *The firſt*, *or* Ladies-Bower, *or* Virgins-Bower Burning, *or* Burning Climer. *The Root is white and thick, fleſhy and tender, or eaſy to be broken, inſomuch that one can ſcarcely handle it (tho' very tenderly) without danger of breaking it.* This *Cauſtick* or *Burning Climer*, has very long and tender climing Branches, yet ſomething woody below, which wind about thoſe things which ſtand near it, covered with a browniſh green Bark; from the Joints of which ſhoot forth many winged Leaves, conſiſting for the moſt part of five ſingle Leaves, *viz.* two and two together, and one at the end, which are a little cut in, or notched on the edges here and there; but every part of them is leſſer than the Leaves of the next following *Climer*, without any claſping Tendrels, to winde about any next adjacent thing. Towards the upper part of the Branches, with the ſaid Leaves, come forth long Stalks, on which ſtand many white Flowers cluſtering together, opening the Brims into ſix or eight ſmall Leaves, ſpreading like a Star, very ſweet of Smell, or rather of a ſtrong heady Scent, which after turn in blackiſh flattiſh Seed, plumed at the Head, which Plume or Feather flies away with the Wind, after it has ſtood long, and leaves the Seed naked or bare.

IV. *The ſecond*, *or* Red Ladies *or* Virgins Bower, *or* Single red-flowered Climer. *Its Roots are a Bundle of ſtrong browniſh yellow Strings, running down deep into the Earth from a large Head above.* This *Climer* has many limber and weak climing Branches, like the former, covered with a brown thin outward Bark, and green underneath. The Leaves ſtand at the Joints, conſiſting but of three Leaves or Parts, whereof ſome are notched on one ſide, and ſome on both, without any claſping Tendrel, as the former, but winding with its Branches about any thing which ſtands next it. The Flowers in like manner come from the ſame Joints with the Leaves, but not ſo many together as the former, upon long Foot-ſtalks, conſiſting of four Leaves apiece, ſtanding like a Croſs, of a dark red Colour. The Seed is flat and round, and pointed at the end; three or four or more ſtanding cloſe together upon one Stalk, without any down upon them at all, as in the former.

V. *The third*, *or* Single purple Ladies-Bower, *or* Single purple-flowered Climer. *This is like to the former in its Roots, Stalks, Branches, Leaves, Flowers and Seed*, and differs from the former in this only, that the Color hereof is of a ſad bluiſh purple: So that the one is not poſſible to be known from the other, till they come to the Seaſon of Flowering.

VI. *The fourth*, *or* Double purple-flowered Ladies *or* Virgins Bower, *or* Double purple-flowered Climer. *This in its Root, Branches and Leaves, does ſo near reſemble the* Single Kinds, *that no Difference can be known between them, but in theſe Particulars*, viz. that this grows more bold and

great

great, and yields both more ſtore of Branches from the Ground, and more ſpreading above: alſo that the Flower in this is very thick and double, conſiſting of a number of ſmaller Leaves, ſet cloſe together, in order, in the middle, the four outermoſt Leaves which encompaſs them, being much broader and larger than any of the inward, but all of a dull or ſad bluiſh purple Color; the Points or Ends of the Leaves ſeeming a little darker than the middle of them. This bears no Seed, ſo far as has yet been ſeen or heard of from any Perſon of Credit, notwithſtanding the Affirmations of ſome falſe and ignorant Gardeners, which affirm the contrary.

VII. *The fifth, or* Creeping fiery Sea Climer. *It ſpreads abroad many creeping, pliant, jointed and creſted Branches, about two Feet long, covered with a very dark green Bark*; from whence ſhoot forth many winged Leaves, a little dented about the edges, very like unto the *Flammula Jovis erecta* in *Sect. 9. following*, conſiſting of five Leaves, but moſt commonly of three upon a Stalk, being narrower, harder and longer pointed: at the ends whereof comes forth a ſmall claſping Tendrel; but thoſe which grow up higher upon the Stalks, and nearer unto the tops, where the Flowers do ſtand, are much ſmaller and narrower. The Flowers come forth many together, as in the other, ſet upon long Foot-ſtalks, which are white and with many hairy Threads in their middle. After they are paſſed away, many round, flat, reddiſh Seed are produced, ſmaller than in ſome others, three or four upon a Stalk together, plumed with a white Feather at the Head of each of them. The whole Plant is hot and ſharp, like unto the others.

VIII. *The ſixth, or* The Virginian Ladies-Bower *or* Climer. *Its Root is compoſed of a number of exceeding long and round, yellowiſh brown Strings, ſpreading far abroad under the Ground, ſometimes as long as any Roots of* Sarſaparilla, *and a great deal bigger, which to be conveniently and cleverly laid in the Ground, muſt be coiled up like a Cable: and theſe Roots, by ſhooting up in ſeveral places, a good diſtance one from another, make a great Encreaſe of the Species.* This noble and much deſired Plant riſes out of the Ground very late in the Year, about the beginning of *May*, if it is a Plant which has ſprung up from the Seed of our own Sowing; but if it is an old one, ſuch as has been brought to us from *Virginia*, not till the end of *May*. It ſprings up with a round Stalk, not above a Yard and half high, or thereabouts with us, but in hotter Countries, as ſome Authors ſay, much higher; bearing one Leaf at every Joint, which from the Ground to the middle thereof, has no Claſpers; but from thence upwards, has at the ſame Joint with the Leaf, both a ſmall twining Claſper, like unto a Vine, and a Flower alſo. Every Leaf is broad at the Stalk thereof, and divided about the middle on both ſides, making it ſomewhat reſemble a *Fig*-Leaf, ending in three Points, of which the middlemoſt is longeſt. The Bud of the Flower, before it does open, is very like unto the Head or Seed-Veſſel of the *Ordinary ſingle Nigella*, having at the Head or Top five ſmall crooked Horns, which when this Bud opens, are the Ends or Points of five Leaves, which are white on the inſide, and lay themſelves flat, like unto an *Anemone* or *Wind-flower*, and are a little hollow, like a Scoop, at the end, with five other ſmaller Leaves, and whiter than they, lying between them, which were hid in the Bud before it opened; ſo that this Flower, being full blown open, conſiſts of ten white Leaves, laid in order, round, one by another: from the bottom of theſe Leaves on the inſide, riſe up ſeveral twined Threads, which ſpread and lay themſelves all over theſe white Leaves, reaching beyond the Points of them a little, and are of a reddiſh Peach Color: towards the bottoms likewiſe of theſe white Leaves, there are two red Circles, about the Breadth of an *Oaten* Straw, one ſomething diſtant from another, which add a great Grace to the Flower; (but in ſome Flowers there is but one of theſe Circles ſeen.) By their means the white Leaves ſhew their Color thro' the Peach-colored Threads; and theſe red Circles or Rings upon them being perſpicuous, make a tripartite Shew of Colors very delightful. The middle part of this Flower is hollow, and yellowiſh; in the bottom of which riſes up an Umbone, or round Stile, ſomewhat big, of a whitiſh green Color, ſpotted with reddiſh Spots, like the Stalks of *Dragons*, with five round Threads or Chives, ſpotted in like manner, and tipt at the ends with yellow Pendents, ſtanding about the middle part of the ſaid Umbone or Stile, and from thence riſing higher, ends in three long crooked Horns moſt uſually, (and ſometimes in four, as *Aldinus* in his *Farneſian Garden* obſerved at *Rome*) ſpotted like the reſt, having three round Buttons at their ends. Theſe Flowers are of a comfortable, pleaſant, ſweet Smell, and very acceptable, but periſh without yielding Fruit with us, becauſe of the ſo late Flowering: but in the natural place, and in hot Countries, it bears a ſmall round whitiſh Fruit, with a Crown at the top thereof, in which is contained (whilſt it is freſh, or not over-dried) a ſweet Liquor; but when it is dry, the Seed within it is ſmall, flat, black, and ſomewhat rough, and will make a rattling Noiſe.

IX. *The ſeventh, or* Upright Ladies-Bower, *or* Virgins-Bower. *Its Root ſpreads in the Ground from a thick Head, into many long Strings, and faſtens it ſelf ſtrongly in the Earth.* From this Head of Roots ſpring more upright Stalks than in any of the former, which grow to be ſometimes four or five Feet high or more, yet leaning or bending a little, ſo that it has ſome need of ſuſtaining, which are covered with a brownish Bark; from whence come forth

forth on all sides, divers winged Leaves, consisting of five or seven Leaves, set on both sides of a middle Rib, of which the odd one is always at the end. The tops of the Stalks are divided into many Branches, bearing many white, sweet-smelling Flowers on them, like in Fashion to the *White Virgins-Bower*: after which come such like Feather-topt Seed, which remain and shew themselves, being flat like the other, when the Plumes or Down is blown abroad. The Stalks die away every Year, and spring again afresh in the beginning of the next.

X. *The Places.* These Plants delight to grow in the Sun, and prosper better in a fruitful Soil than in a barren. The first four grow in our *English* Gardens, where they flourish much. The fifth, *Bauhine* says, grows in many places of the *Adriatick* Sea Shore, and in Islands thereabouts belonging to the *Venetians*. The sixth grows not wild in *England*, but flourishes well in our Gardens. The seventh, which is the surpassing Delight of all Flowers, came to us from *Virginia*, and now is become a free Denizen of *England*, by being planted in our Nurseries or Gardens.

XI. *The Times.* They all flower in the end of *June* or *July*, and sometimes in *August*, and perfect their Seed in *September*. The *Virginian Climer* flowers in *August*, yet sometimes, tho' not often in *July*, but perfects no Seed here.

XII. *The Qualities.* They are all hot and dry in the fourth Degree; Caustick and Burning, or Blistering the Skin.

XIII. *The Specification.* Authors say they are peculiar against Scurff, Morphew, Scabs, Leprosy, and other Defœdations of the Skin, but are not safe to be taken inwardly, unless to purge Water in Dropsies.

XIV. *The Preparations.* Altho' these Plants are never or very seldom used in Physick, unless in outward Application; yet these following Preparations have been made of them, *viz.* 1. *A Pouder of the Seed of the first or* Burning Ladies-Bower, *and of the seventh or* Upright Ladies-Bower. 2. *An Oil by Insolation or Boiling of the same Plants.* 3. *A distilled Water of the same.* 4. *The Liquor of the* Virginian Climer. 5. *A Cataplasm of the* Climers.

The Virtues.

XV. *The Pouder of the Seed.* Given to a Scruple or half a Dram, more or less, in fair Water or in Mead, it is said to purge Choler, Flegm, and watery Humors.

XVI. *The Oil by Insolation or Boiling.* It cures Aches and Cramps, Sciatica's, and other Pains coming of Cold: it is also good against the Stone, and provokes Urine, some small quantity of it being taken inwardly in any proper Vehicle. It also takes away Scurff, Morphew, Scabs, Leprosy, and other Deformities of the Skin, by anointing therewith.

XVII. *The distilled Water of the* Upright Ladies-Bower. It clears the Skin of Defœdations, and is effectual against any cold Griefs in any part of the Body.

XVIII. *The Liquor of the* Virginian Climer. This Liquor within the Fruit, is very pleasant to the Taste, as if *Musk* or *Ambergrise* were mixed with it: and having a little Acidity with it, it does not cloy the Stomach, tho' it be taken in large quantity, nor gives any bad Symptom, but is said rather to move the Belly downwards, and make it soluble. *Aldinus* gives us many Virtues of it, which seem to me to be spoken Hyperbolically, for by Experience nothing has yet been observed thereof. But he says, that the Leaves of the Plant have a somniferous Property, and smell like to *Nightshade*, having (as he thinks) some deleterious or deadly Quality in them, because it kills Flies which rest thereon.

XIX. *The Cataplasm of the Leaves of the other* Burning Climers. Being applied to the Sciatica or Gout, or any Pain in other Parts proceeding from Cold, it cures them, being cautiously used; for it quickly Blisters.

XX. *Nota. Matthiolus* says, that the *Pouder of the Leaves* of the *Upright Ladies-Bower*, being prepared and given, helps against a Quartan Ague. However, all the other *Climers* may serve very well to make Arbors in Gardens and Orchards, or other like places for Pleasure; for to those Purposes they are most fit, if any please to Plant them.

CHAP. CCCCXXI.

Of LADIES--MANTLE, *OR,* LIONS--FOOT.

Called also, Great SANICLE.

I. *THE Names.* It does not appear that this was known to the ancient *Greeks*: but *Brunfelsius* says it is Λεοντοπόδιον, *Leontopodium*, Lions-Foot: yet others say it is not that which *Dioscorides*

des ſpeaks of. It is called in *Latine*, *Alchimilla*, by moſt Writers; *Stellaria Matthioli*, *Lugdunenſis*, *&c.* *Pes Leonis*, and *Pata Leonis*; *Droſera*, and *Droſium Cordi*; *Sanicula major*, (as much reſembling *Sanicle*:) and in *Engliſh*, *Ladies-Mantle*, *Lions-Foot*, and *Great Sanicle*.

II. *The Kinds.* Authors make two ſorts hereof, *viz.* 1. *Alchimilla major vulgaris*, *Stellaria*, *Sanicula major*, Common Ladies-Mantle. 2. *Alchimilla minor*, *vel Alpina quinquefolia*, Five-leaved Ladies-Mantle, *or* Ladies-Mantle cinkfoil-leaved.

Ladies-Mantle.

III. The Deſcriptions. *The firſt*, *or* Common Ladies-Mantle, *has a Root which is ſomewhat long and black, with many Fibres, and Strings thereat.* It is ſomething like to our *Common Sanicle*, having many Leaves riſing from the Root, ſtanding upon long hairy Foot-ſtalks, being almoſt round, but a little cut in on the edges into eight or ten parts, more or leſs, making it ſeem like a Star, (whence the Name *Stellaria*) with ſo many Corners and Points, and dented round about, of a light green Color; ſomething hard in handling, and as if it was folded or plaited at firſt, and then crumpled in divers places, and a little hairy, as the Stalk is alſo, which riſes up among them, which grows to the Height of two or three Feet, with a few ſuch Leaves thereon, but ſmaller, and being weak, is not able to ſtand upright, but bends ſometimes down to the Ground, divided at the top into two or three ſmall Branches, with ſmall yellowiſh green Heads, and Flowers of a whitiſh green Color, breaking out of them, which being paſt, there comes ſmall yellowiſh Seed, like unto *Poppy* Seed.

IV. *The ſecond*, *or* Five-leaved Ladies-Mantle. *It has a ſmall black fibrous Root*, *from which ſpring a few ſmaller and ſmoother green Leaves*, *ſet upon long Foot-ſtalks*, but divided at the edges into five Corners or Points, and ſomething more deeply dented about the Brims than the former: from among which come forth two or three ſmall weak bending Stalks, about ſix or ſeven Inches high. The Flowers which grow at tops, are ſmaller, but like to the other, according to the Bigneſs of the Plant, and of the ſame Herby or green Color.

V. *The Places.* The firſt grows naturally in many Paſtures and Wood-ſides, both in *Hartfordſhire* and *Wiltſhire*; as alſo in *Kent*, as in *Kingſwood* near *Feverſham*, in the Paſtures nigh *Tidnam* and *Chepſtow*, and in other places of this Land. *Gerard* ſays it grows of it ſelf Wild in divers places, in the Paſtures at *Andover*, and in other parts of *Hampſhire* and *Barkſhire*, in their Cloſes and Copſes, or low Woods; as alſo upon the Bank of a Moat which encloſes a Houſe in *Buſhy*, called *Bourn-Hall*, fourteen Miles from *London*; and in the Highway from thence to *Watford*, a ſmall Mile diſtant from it. The ſecond grows on *Bernards Hil* in *Switzerland*, but is to be found with us only in Gardens.

VI. *The Times.* The firſt flowers in *May* and *June*. The ſecond not till *Auguſt*: but they both abide after Seed-time, and flouriſh and keep green all Winter after, as well as in Summer.

VII. *The Qualities.* It is hot and dry in the ſecond Degree; Abſterſive, Aſtringent, Strengthning and Vulnerary.

VIII. *The Specification.* It is peculiar to ſtop Bleeding, whether inward or outward, all Fluxes of the Bowels in Man or Woman; and the Whites, or Weakneſs of the Womb. It cures Wounds after a moſt ſingular manner, being one of the moſt noble Wound-Herbs, being extolled by the *Germans* with exceeding great Praiſe, who never cure any Wound, whether inward or outward, but they give of the Decoction hereof to drink.

IX. *The Preparations.* You may make hereof, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *A Decoction or Infuſion.* 4. *A Pouder of the Leaves.* 5. *A Balſam or Ointment.* 6. *A Cataplaſm.* 7. *A diſtilled Water.* 8. *A Spirituous Tincture.* 9. *An Acid Tincture.* 10. *An Oily Tincture.*

The Virtues.

X. *The liquid Juice.* It is not ſo hot as that of *Sanicle*, and therefore more fit for thoſe Wounds, which are accompanied with Inflammation, and ſo is more drying, aſtringent, or binding and cleanſing. It is effectual againſt all ſorts of Bleedings both inward and outward, ſtops the Over-flowing of the Terms in Women, and cures the Bloody-flux, as alſo all other Fluxes of the Bowels. Doſe from two to four or ſix Spoonfuls Morning and Night in a Glaſs of the diſtilled Water, or in Ale or Wine.

XI. *The Eſſence.* It has all the Virtues of the former; beſides which, it cures Bruiſes by Falls or otherwiſe, whether inwards or outwards: it heals Ruptures of the *Peritonæum*, as alſo Ruptures of the Blood-Veſſels, which cauſe Spitting or Piſſing of Blood; and is a peculiar thing to ſtop the Whites in Women, being eſteemed more powerful for this Purpoſe than moſt other things; for which Intention it is not only to be given inwardly by the Mouth, but is alſo outwardly to be applied as an Injection up the Womb, with a Womb-Syringe. Doſe three or four Spoonfuls in Red Port Wine, or ſome other proper Vehicle, two or three times a Day. Inwardly alſo taken, and outwardly applied to Womens Breaſts, which are great and over-much flag, it cauſes them to grow leſſer and hard. This Eſſence being taken for twenty or thirty Days together, by ſuch Women as are Barren, or have a Slipperineſs of the Womb, it is ſaid to cauſe them to Conceive, and to retain the Birth after Conception; for that it drys up the too great Humidity, and ſtops

the Flux of Humors to the Matrix, and ſo ſtrengthens the Womb, as to prevent Abortion, reducing it to a perfect State of Health: but the Patient ought as well to take it inwardly by the Mouth, to ſit in a ſtrong Decoction thereof Bathwiſe.

XII. *The Potion* or *Infuſion.* This has all the Virtues of the Liquid Juice and Eſſence, but weaker in its Effects: however, it may ſerve as a Vehicle to convey other Preparations of this Herb in, and may be given from four Ounces to eight Ounces or half a Pint. It makes a good Injection for hollow Wounds and Ulcers, cleanſes them, makes them breed Fleſh, and brings them to a ſpeedy Healing.

XIII. *The Pouder of the Leaves or Root.* It is an excellent Styptick, and ſtops Bleeding in any Part it is applied to. Inwardly given from half a Dram to a Dram and half, in the Decoction, Infuſion, or diſtilled Water, or in Red Port Wine, it has all the Virtues of the liquid Juice, Eſſence, *&c.* provided it is given Morning and Night for ſome conſiderable time. Tents may be dipt into the Juice or Infuſion, and then rouled in this Pouder, and ſo put into any hollow Sore or Ulcer; by which means it wonderfully drys up all Humidities of the Ulcer, incarnates it, and induces a ſpeedy Healing, yea, altho' it be fiſtulous, with a Flux of Humors appending; and abates alſo Inflammations, if any be preſent.

XIV. *The Balſam or Ointment.* It is one of the beſt of Vulneraries, for it digeſts if need be, abſterges or cleanſes, incarnates, drys and heals, almoſt to a Miracle: and in ſimple green Wounds or Cuts, it has ſuch an exquiſite Faculty of ſpeedy Healing, that it cures it at the firſt Intention, conſolidating the Lips thereof, without the breeding Matter, or any Danger of breaking out again, by ſuffering any Corruption to remain behind. Outwardly applied to the Gout, Sciatica, or other like Pains of the Joints, proceeding from Blows, Over-ſtraining, or the like, it gives Eaſe, and ſpeedily cures them, adding alſo Strength to the Part.

XV. *The Cataplaſm.* It is an excellent thing to be preſently applied to a ſimple green Wound; for it ſtops the Afflux of Blood, and conſolidates the Lips thereof by the firſt Intention of Curing. It alſo allays Inflammations coming upon the Joints in the Gout, and gives Eaſe in the Pain. Applied to a recent ſimple Contuſion, it prevents the Afflux of Humors; diſcuſſes thoſe which are preſent, if any be, and ſafely reſtores the Part.

XVI. *The diſtilled Water.* Authors ſay, that if it is taken continually for twenty Days together, that it cures Barrenneſs in Women, *viz.* ſuch as cannot Conceive, or ſuch as cannot retain the Conception. But doubtleſs the liquid Juice or Eſſence is much better than this, and therefore either of them may be given in this as a Vehicle, for which it is very proper, and may be given Morning and Night, from four to eight Ounces.

XVII. *The Spirituous Tincture.* Inwardly taken, it warms and comforts the Bowels, ſtrengthens the inward Parts, expels Wind, and is an excellent Traumatick, is drying and aſtringent, and therefore good againſt all Fluxes of the Bowels, Over-flowing of the Terms, and other Weakneſſes of the Generative Parts. It is good to be uſed Dietetically in the Cure of Wounds, old Sores, running Ulcers, and Fiſtula's accompanied with Fluxion of Humors: it has all the Virtues of the Juice and Eſſence, and may be given Morning and Night, from two Drams to three or four, in the diſtilled Water, or in Red Wine.

XVIII. *The Acid Tincture.* It has all the Virtues of the Spirituous Tincture, but is more Traumatick or Vulnerary, and more Stomatick, whereby it effectually ſtops Vomiting, ſtrengthens the Stomach, and cauſes a good Appetite and a ſtrong Digeſtion: but it ſtops not Fluxes of the Bowels ſo well as ſome of the former Preparations; but it therefore opens the more, and removes Obſtructions of Stomach, Liver, Spleen, and other Bowels. It is a moſt excellent thing againſt a virulent Gonorrhea in Men, being taken every Day in all that the Patient drinks, whether Ale, Beer, Wine or Water, ſo much at a time as to give the Vehicle a pleaſing Acidity; and it ought to be ſo often taken in a Day that the whole quantity taken may amount to at leaſt four or five Spoonfuls.

XIX. *The Oily Tincture.* It is a famous thing againſt a cold Gout, and all Pains or Aches proceeding from a cold Cauſe in any Part of the Body, being twice a Day anointed upon the Part for ſome time. It is an excellent thing alſo againſt Bruiſes, Cuts or Punctures of the Nerves and Tendons; for it ſuddenly eaſes the Pain, and alleviates the Inflammation, and thereby induces the Cure, a Plaiſter of the Balſam being alſo laid thereon. Inwardly given, it gives Eaſe in the Colick, expels Wind; and opens Obſtructions of the Reins, Ureters and Bladder, expelling Gravel, Stones and Sand from thoſe Parts, and cleanſing them from any Tartarous Mucilage lodged therein.

CHAP. CCCCXXII.

Of LARKS-SPUR, *OR,* LARKS-HEEL.

Called alſo, KNIGHTS-SPUR.

I. *THE Names.* It is called in *Latine*, *Delphinium*, but whether it be the *Delphinium Dioſcoridis*, is very doubtful: it is alſo called, *Flos Regius*; *Buccinus*, *Buccinum Romanorum*; *Cuminum Sylveſtre alterum Matthioli*; *Cuminum Sylveſtre alterum Dioſcoridis*; *Calcaris Flos*; *Conſolida Regalis Sylveſtris*; *Conſolida Regalis peregrina parvo flore Bauhini:* in *Engliſh*, *Larks-Spurs*, *Larks-Heels*, *Knights-Spurs*; and *Monks-Hood.* It has no *Greek* Name yet known.

II. *The Kinds.* Authors make ſix Kinds of this Plant, *viz.* 1. *Delphinium majus, ſive vulgare*, Ordinary or Common Larks Heels or Spurs. 2. *Delphinium vulgare flore pleno*, Double Common Larks-Spur. 3. *Delphinium arvenſe*, Wild Larks-Spur. 4. *Delphinium Hiſpanicum parvum*, *Delphinium latifolium trigonum*, (ſo called from the Diviſion of the Leaves, or from the Pods, which uſually come three together) Spaniſh Wild Larks-Spur. 5. *Delphinium elatius flore ſimplici diverſorum Colorum*, Single upright bearing Larks-Heel of many Colors. 6. *Delphinium elatius flore pleno diverſorum Colorum*, Double upright Larks-Spur of many Colors.

III. The

Larks-Spur Common.

III. The Deſcriptions. *The firſt, or* Ordinary or Common Larks Heel or Spur, *has a Root which is hard after it is run up to Seed, ſpreading both abroad and deep, yet periſhes every Year, raiſing it ſelf uſually from its own Sowing, as well as from the Seed ſown in the Spring time.* From this Root riſe many Branches, which ſpread much more Ground than the others, rather leaning or bending down to the Ground, than ſtanding upright; on which are ſet many long green Leaves, finely cut, almoſt like to *Fennel* Leaves. The Branches end in a long Spike of hollow Flowers, with a long Spur or Heel behind them, (whence the Name) very like unto the Flowers of *Hollow-Root*, (before deſcribed) and are of ſeveral and various Colours, as of a blewiſh purple Color, or white, or Aſh color, or red, paler or deeper, as alſo party-colored, of two Colors in a Flower. After the Flowers are paſt, (which in this Kind abide longer than in the other) long round Cods come forth, containing very black Seed.

IV. *The ſecond, or* Double Common Larks-Spur. *Of this* Common Kind, *there is ſome Difference in the Flower, altho' in nothing elſe:* the Flowers grow many upon a Stalk, like the former, but every one of them are as if three or four ſmall Flowers were joined together, with every one his Spur behind, the greateſt Flower being outermoſt, and as it were containing the reſt, which are of a pale red or deep bluſh Color. Another of the Kind will bear its Flowers with three or four Rows of Leaves in the middle, making a double Flower, with one Spur only behind: and of this Kind there is with purple, blew, bluſh and white Flowers, as alſo party-colored. And theſe all bear Seed like the *Single*, whereby they are increaſed every Year.

V. *The third, or* Wild Larks-Spur. *Its Root is much like the former, whence riſe up ſmaller and lower Branches, with ſmaller and ſhorter Leaves, and more ſperſedly or thinly growing upon them, than upon any of the former.* The Flowers likewiſe are neither ſo large as any of the aforegoing, nor ſo many growing together: the Cods likewiſe have ſmaller Seed, and is harder to grow in Gardens than any of the others. The moſt uſual Color hereof, is a pale reddiſh or bluſh Color, yet ſometimes they are found both white and blew, and ſometimes mixt of blew and bluſh, variably diſpoſed, as Nature ſometimes pleaſes; but theſe are much more rare.

VI. *The fourth, or* Spaniſh Wild Larks-Spur. *It has a Root which is ſmall and thready, ſuddenly periſhing with the firſt Cold which overtakes the Plant.* It has ſeveral long and broad Leaves next the Ground, cut in on both ſides, ſomething like to a *Scabious* Leaf, but it is ſmooth on the edges, and not indented beſides the Cuts; it is of a whitiſh green Color, and ſomething ſmooth and ſoft in handling. From among the Leaves riſes up a whitiſh green Stalk, having many ſmaller Leaves upon it, which grow below, and not divided; branching out into many ſmall Stalks or Arms, bearing Flowers like unto the *Wild Larks-Spur*, but ſmaller, and of a bleak blewiſh Color; which being paſt, there comes forth two or three ſmall Cods, joined together, in which is black Seed, and ſmaller and rounder than any of the former.

VII. *The fifth, or* Single upright bearing Larks-Spur of many Colors. *The Difference between this and the third, or* Wild Larks-Spur *aforegoing, is, that the Leaves of this are not fully ſo green, nor ſo large: the Stalks grow upright to the Height of a Man, and ſometimes higher, having ſome Branches thereon, but fewer than the former, and ſtanding likewiſe upright, and not leaning down as the others.* The tops of the Stalks are better ſtored with Flowers than the other, being ſometimes two Feet long, and above, of the ſame Faſhion, but not altogether ſo large, and of ſeveral and more various Colors, as white, pale, bluſh, red, deeper and paler, aſh-colored, purple or violet, and of an over-worn blewiſh purple, or Iron Color. For all theſe we have ſimple without any Mixture or Spot. We have alſo other ſorts among the ſimple Colors, which riſe from the ſame Seed, and will have

Flowers which will be half white, and half bluſh or purple; or one Leaf white, and another bluſh or purple, or elſe variably mixt and ſpotted. The Seed and Seed-Veſſels are like thoſe of the three firſt Kinds, but larger and harder.

VIII. *The ſixth, or* Double upright Larks-Spur of many Colors. *Theſe* Double Larks-Spurs *cannot be known from the* Single *of the ſame Kind juſt afore deſcribed, until they come towards Flowering*; for there appear many Flowers upon the Stalks, in the ſame manner, and of as many Colors almoſt as the *Single*, except the party-colored, which ſtand like little *Double Roſes*, laid or ſpread open, as the *Roſe Columbine*, without any Spurs or Heels behind them. very delightful to behold, conſiſting of many ſmall Leaves growing together; which after they are fallen, three or four ſmall Cods ſet together come up in their places, wherein is contained here and there (for all are not full of Seed as the *Single Kinds*) black Seed, like unto all the reſt, but ſmaller, which being ſown, will bring Plants, which will bear both ſingle and double Flowers again. And it often happens, that it variably alters in Colors from its own Sowing; for none of them hold conſtantly its own Color, (ſo far as has yet been obſerved) but change into others as Nature pleaſes.

IX. *An Obſervation.* This laſt Plant Mr. *Rea*, in his *Ceres Chap.* 10. ſays is only worth the preſerving; and he deſcribes it thus. Double upright Larks-Heel, *from a Root which periſhes in Winter ſends forth ſmall jagged Leaves, tall upright Stalks, branched at top, and bearing many fine double Flowers, in Form like to the* Roſe Columbine, in ſeveral Plants of as many ſeveral entire Colors, as Blew, Purple, Aſh, White, pale Bluſh, Roſe-color; theſe are the moſt uſual Colors, yet ſometimes ſome Roots will bring Flowers which are ſtriped, and variegated with blew and white, and often with ſome Leaves blew, and others purple; after the Flowers are paſt, come forth ſmall horned Pods, which contain Seed black and round, and which being ſowed, will bring ſome Plants with ſingle, but moſt with double Flowers.

X. *The Places.* The firſt, or *Greateſt Wild Kinds*, grow among Corn in many Countries beyond Sea, but for its Beauty, is brought to us, and nouriſhed in our Gardens. The third, or *Leſſer Wild Kind*, grows in ſeveral Fields of our own Country. The *Spaniſh Kind* was brought to us in Seeds, and grow alſo in our Gardens. The firſt *Double* and *Single* have been common for many Years in all Counties of *England*; but the tall *Upright ſingle Kinds* have been made Natives but of late Years: and of them all, the *Double Kinds* are the moſt rare.

XI. *The Times.* The *Spaniſh Kind* flowers very late, ſo that many times in *England* the Winter takes it before it can give ripe Seed. The other Kinds flower in the Summer Months only. The *Double Kinds*, as well the *Upright*, as the *Wild* or *Common*, are very choice and tender, many times not yielding good Seed. The ſixth Kind flowers according to the time of ſowing it, ſooner or later, in *July* or *Auguſt*; and many times Plants come up of themſelves from the Seeds fallen out of the Pods before Winter, which have continued and born fair double Flowers in *June* following, which have brought again much good Seed. The uſual time to Sow theſe Seeds in, is the beginning of *April*: but to get good Seed, (which is a chief Conſideration in theſe Plants) you ought to ſow them as ſoon as they are ripe, in ſome place where they may be defended from long Froſts in Winter; and one of theſe Winter Plants is worth ten of thoſe raiſed in the Spring, and will yield more good Seed; yet in ſome kindly Summers thoſe of the Spring will feed reaſonably well.

XII. *Yellow Larks-Heels*, called *Delphinium luteum*, which is *Naſturtium Indicum*, Mr. *Rea*, in his *Ceres*, puts into the Claſſis of *Larks-Spurs*, and deſcribes them in the following Words. *The Root, which periſhes in Winter, ſends forth many ſpreading long trailing Branches, four or five Feet long, which unleſs ſupported, lye on the Ground, and take up much Room.* The Leaves are ſmooth and round; the Flowers of a fair yellow Color, in Faſhion ſomething like to a *Single Larks-Heel*, but the Leaves ſtand plainer, and ſome of them are ſtreaked with red. The Flower is ſo well known, that it is needleſs to be over-curious in deſcribing it, for few Gardens of any Note are without it. The Seeds are rough and uneven, falling of themſelves, which are gathered off the Ground and preſerved.

XIII. *Place and Time.* They were firſt brought by *Monardus* from the *Weſt Indies*; now they grow in almoſt all our Gardens throughout *England*. It flowers in *July*, and the Plant continues flowering till it is checkt by Froſts. The Seed is ſown in *April*, and if it is ripe and good, will be apt enough to come up: and the trailing Branches, as they grow, may be laid upon a Pack-thread faſtned upon Sticks, into what Form you pleaſe; or they may be bound unto Rods ſtuck in the Earth, that they may not lye upon the Ground. But we ſhall ſay no more of this *Indian* Plant, becauſe we have already diſcourſed of it in a Chapter by it ſelf, *viz. Chap.* 164. aforegoing.

XIV. To theſe Mr. *Rea*, in the place cited, adds another *Larks-Spur*, which is *Balſamina fœmina*, and deſcribes it in theſe Words. *It has a Root which dies at the firſt approach of Winter. The Stalks are thick and reddiſh, like* Purſlane, *bunched, and ſet with Leaves, like thoſe of the* Peach-Tree. About the Stalk, from the middle upwards, come the Flowers on ſhort Foot-ſtalks, which are of two or three Shadows of Purples, with Spurs behind, like *Single Larks-Heels*, but bending downwards. Theſe Flowers are ſucceeded by round rough Heads, pointed at the end, in which are contained ſmall round blackiſh Seeds. The Flowers come forth in *July* and *Auguſt*, but rarely yield any good Seed in *England*. The Plant is tender, and muſt be ſowed in a hot Bed, and removed into good Ground, and carefully attended with Watering in the Heat of Summer, elſe it will quickly periſh. Of this we have alſo wrote before, in a Chapter by it ſelf, *viz. Chap.* 52. *Sect.* 3. where there is a Diſcourſe of it at large, ſo that we ſhall ſay no more of it in this place.

XV. *As to the Qualities, Specification, Preparations, and Virtues of* Larks-Spur, thoſe ſix firſt Plants which are properly ſo called, Authors have ſaid nothing. But *Gerard* ſays, they are temperate and warm of Nature: and he ſays, that the Seed of *Larks-Spur* drank, (I ſuppoſe he means it to be in Pouder) is good againſt the Stinging of Scorpions: and that ſome make it to be one of the Kinds of *Conſounds* or *Comfries*.

XVI. It is alſo to be noted, That tho' ſome have given to *Larks-Spur*, the Name of *Monks-Hood*; yet it is not that poyſonous *Monks-Hood* or *Helmet-Flower*, of which we fully diſcourſed in its place, in Chap. 353. aforegoing.

XVII. *Flowers of Larks-Spur. Crollius* ſays, That three or more of the Flowers eaten, are good againſt Pains and Stitches of the Side. And *Brunſelſius* ſays, That the Flowers help the Redneſs of the Eyes, Heat of the Body, Coughs, Strangury, Stoppage of Urine by Gravel and Sand, and give Eaſe in the Sciatica.

CHAP.

CHAP. CCCCXXIII.

of LAVENDER, OR, LAVENDER Spike.

I. *THE Names.* This is a Plant unknown (as far as I can learn) to the ancient *Arabians* and *Greeks*: the *Latines* call it *Lavendula* and *Spica*; and we in *English*, *Lavender*, alſo *Spike*.

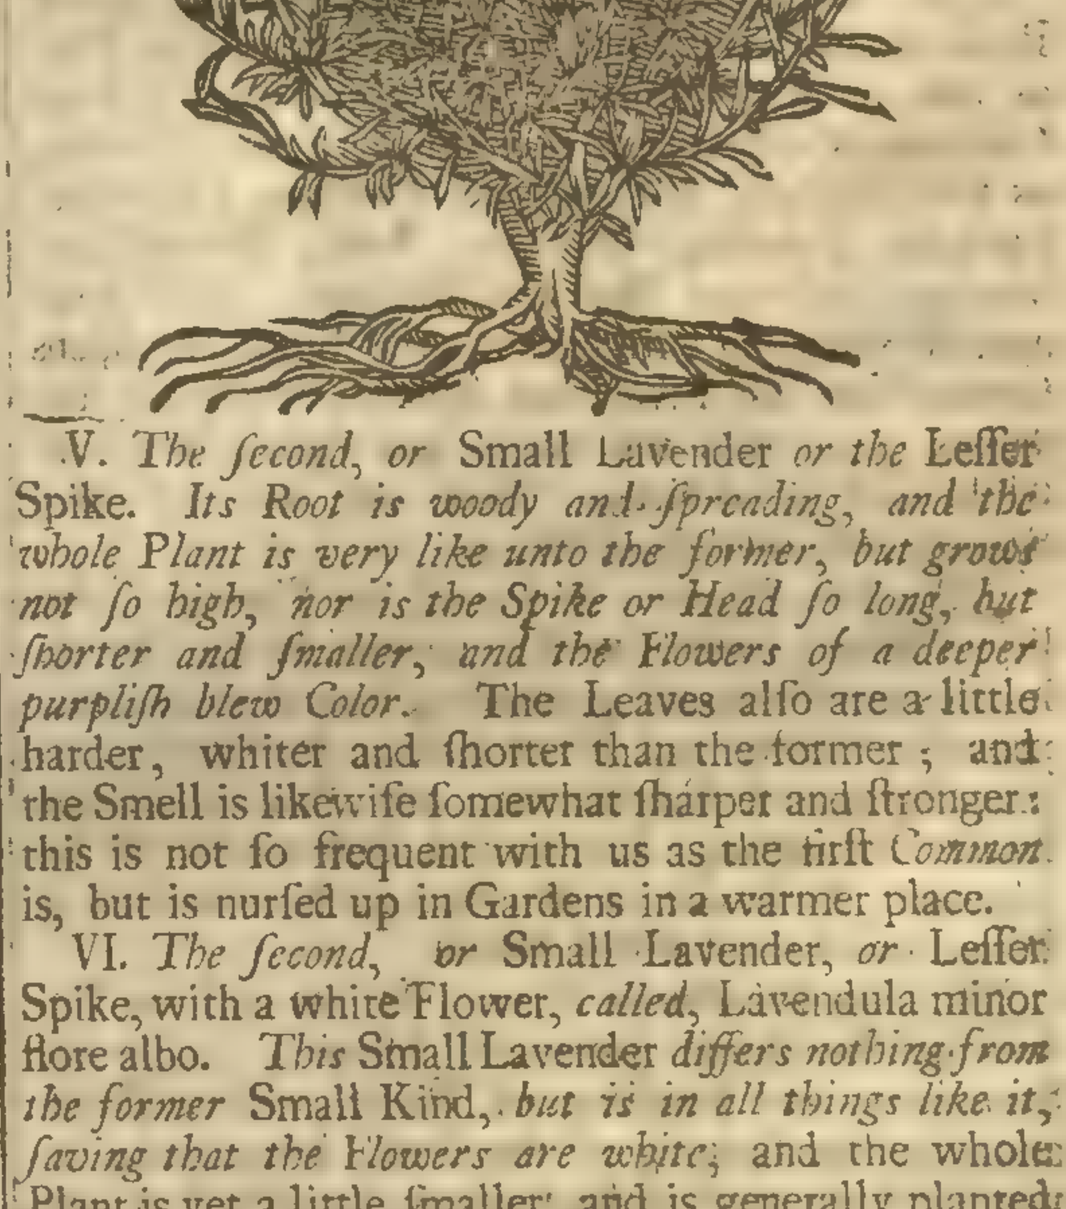
II. *The Kinds.* There are three Kinds of this Plant, *viz.* 1. *Lavendula major ſive vulgaris*; *Nardus Italica Matthioli*; *Lavendula mas*, *Pſeudonardus mas*, *vel major*; *Spica Tragi*; *Caſſia albi Dalechampii* upon *Pliny*; ſome will have it to be the *Iphium Theophraſti*; and it is thought by many to be the *Cneorum* which *Pliny* ſaith *Higinus* called *Caſia*. which is a ſweet Herb, frequently planted in the Gardens of *Italy*, for the Uſe of their Bees. This firſt Kind is our *Common Great Lavender*. 2. *Lavendula minor*, *Lavendula fœmina*; *Spica*, and *Spica minor*, *Pſeudonarus fœmina*, *& minor*, Small Lavender, or the Leſſer Spike. Of theſe Greater and Leſſer Kinds, there are alſo two ſorts, *the one having a purpliſh blew Flower*, the other *a white Flower*; which latter is the more rare. 3. *Lavendula folio multifido*, (which *Gerard* calls *Stœchas multifido*, but erroniouſly) Jagged Lavender.

Common Male Lavender.

III. The Deſcriptions. *The firſt*, *or* Common Garden Lavender. *It has a Root which is woody, and ſpreads much under Ground, not dying in the Winter time.* It ſprings up with a hard woody Stalk, parted into many ſmall Branches, on which grow long, narrow and whitiſh Leaves, ſet by couples, one againſt another; from among which riſe up naked ſquare Stalks, with two Leaves at a Joint, and at the tops ſeveral ſmall Husks ſtanding round about them, formed in long round Heads or Spikes, with purple gaping Flowers ſpringing out of each of them. The whole Plant is of a ſtrong ſweet Smell, but the Spikes of Flowers much more, and more piercing the Senſes.

IV. *The firſt*, *or* Common Garden Kind, white-flowered, *called* Lavendula major flore albo. *This differs nothing from the former, but in the Flowers, which are always white, and in the Leaves, which are ſomewhat broader.* It is a very rare Plant, and preſerved with us in our Gardens only as a Rarity, being more tender than the former, and not ſo able to endure our cold Winters.

Common Female Lavender.



V. *The ſecond*, *or* Small Lavender *or the* Leſſer Spike. *Its Root is woody and ſpreading, and the whole Plant is very like unto the former, but grows not ſo high, nor is the Spike or Head ſo long, but ſhorter and ſmaller, and the Flowers of a deeper purpliſh blew Color.* The Leaves alſo are a little harder, whiter and ſhorter than the former; and the Smell is likewiſe ſomewhat ſharper and ſtronger: this is not ſo frequent with us as the firſt *Common* is, but is nurſed up in Gardens in a warmer place.

VI. *The ſecond*, *or* Small Lavender, *or* Leſſer Spike, with a white Flower, *called*, Lavendula minor flore albo. *This* Small Lavender *differs nothing from the former* Small Kind, *but is in all things like it, ſaving that the Flowers are white*; and the whole Plant is yet a little ſmaller; and is generally planted in very warm places.

VII. *The third*, *or* Jagged Lavender. *Its Root is hard and woody, like unto the others.* It is a ſmall Plant, and riſes up with ſquare, rough and hoary Branches, to a Foot and half high, bearing thereon many hoary whitiſh Leaves, very much jagged or torn on the edges, into many parts, even to the middle Rib, and each part cut or jagged, of a ſharp Taſte, and of a pleaſant Smell, yet much weaker than in the other *Small Lavender*. From among theſe Leaves riſe up four-ſquare hoary Stalks, without any Leaves on them up to the tops, where they bear ſmall Spikes of purple Flowers, like unto the firſt *Lavender* or *Spike*, but that the Flowers ſeem to ſtand ſquare, or in four Parts or Corners.

VIII. *The Places.* The four firſt are found naturally in many places of *Spain*, and about *Narbone* in *France*, where the laſt alſo grows; but both the ſorts with white Flowers, are much more rare than the firſt or *Common Kind*. The fifth was found by *Cluſius* about *Malaga* in *Spain*, and *Murcia* in the Kingdom

Kingdom of *Granado*: but with us they all of them grow only in our Gardens; of which, the firſt is by much the more common.

IX. *The Times.* They all flower in *England* about the end of *June*, or beginning of *July*: but *Cluſius* ſays, that he found the fifth about *Malaca* in *Spain* to flower in *February*; and about *Murcia* to flower in *March*; yet in theſe our colder Climates, it flowers not until *June* at the ſooneſt, or in the Month of *July*.

X. *The Qualities.* *Lavender* is hot and dry in the third Degree: it is Abſterſive, Aperitive, Aſtringent, Diſcuſſive, Diuretick and Inciſive. It is Cephalick, Neurotick, Stomatick, Cordial, Nephritick, and Hyſterick. It is Alexipharmick, Analeptick, and Antiparalitick, being of very ſubtil and thin parts.

XI. *The Specification.* It is a peculiar thing for the Cure of Convulſions, Epilepſies, Palſies, Tremblings, Vertigo's, Lethargies, Swoonings, Hyſterick Fits, and other like Diſeaſes of the Head, Brain, Nerves and Womb.

XII. *The Preparations.* You may have herefrom, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *An Infuſion.* 4. *A Pouder.* 5. *A Water diſtilled.* 6. *A Spirituous Tincture.* 7. *An Acid Tincture.* 8. *An Oily Tincture.* 9. *A Spirit.* 10. *An Oil diſtilled.* 11. *Powers.* 12. *An Elixir.*

The Virtues.

XIII. *The liquid Juice.* It is of good Uſe againſt Pains of the Head, and other Diſeaſes of that Part, as alſo of the Brain and Nerves, proceeding from Cold and Moiſture, or the Afflux of cold Humors, as the Apoplexy, Convulſions, Cramps, Cephalæa, Epilepſy, Fainting, Lethargy, Palſy, Tremblings, Vertigo, and other like Diſaffections. It is good againſt Swooning, ſtrengthens the Stomach, opens Obſtructions of Liver and Spleen, provokes the Terms, facilitates the Birth, and expels the dead Child and After-birth. Doſe one, two or three Spoonfuls in a Glaſs of Wine.

XIV. *The Eſſence.* It has all the Virtues of the liquid Juice; beſides which, gargled in the Mouth, it eaſes the Tooth-ach proceeding from a cold Cauſe, provokes Urine, and gives Eaſe in the Colick: it prevails againſt Palpitation, and Paſſions of the Heart, Strangling, Vapors and Suffocation of the Mother. Doſe one or two Spoonfuls in a Glaſs of Wine, or of the diſtilled Water.

XV. *The Infuſion in Wine.* It has all the Virtues of the liquid Juice and Eſſence, helps the Strangury, and Scalding of Urine, expels Wind, and eaſes the Griping of the Guts, being given inwardly from two to ſix Ounces, according to Age and Extremity of the Diſeaſe. But it is to be noted, that tho' this Infuſion may be made of the green Leaves, yet it is much more powerful being made of the Spikes of Flowers, which is moſt uſual.

XVI. *The Pouder.* It ſtrengthens the Stomach, expels Wind, and is good againſt the Colick. Outwardly applied to old running Sores and Ulcers, it drys up the Humidity, repreſſes the Virulency and Putridity, and diſpoſes them to healing: where note, That it ought to be made of the ſpiked Heads of Flowers. Mixed with Pouder of *Euphorbium* it is good to ſcale foul and corrupted Bones. Given to one Dram in White Port Wine to Women in Travel, it facilitates the Birth, and expels the Secundine.

XVII. *The diſtilled Water.* This may be made of Leaves and Flowers together. It has the Virtues of the Juice, Eſſence and Infuſion, but in a much lower degree, ſo that it is to be uſed in a greater quantity, as from three to ſix Ounces, a little dulcified with double-refined Sugar: but it is moſt commonly uſed as a Vehicle to convey down into the Stomach the other Preparations of this Herb. Two Spoonfuls thereof does help ſuch as have loſt their Speech or Voice by Convulſions, Palſies, Lethargies, or otherwiſe, reſtoring it them again. It helps alſo the Tremblings and Paſſions of the Heart, fainting and ſwooning Fits, not only drunk, but even applied to the Temples, or to the Noſtrils to be ſmelt unto. That which is made of the Flowers alone, is much the beſt.

XVIII. *The Spirituous Tincture.* It is made of the ſpiked Leaves of Flowers, (as are alſo all the following Preparations) and is a noble Cephalick, Neurotick, and Stomatick. It very much ſtrengthens the Head, Brain and Nerves, and reſiſts all Diſeaſes thereof proceeding from Cold and Moiſture of thoſe Parts. It gives Eaſe in an inveterate or old Head-ach, called *Cephalæa*; as alſo in an accidental Head-ach, called *Cephalalgia*; and in a half Head-ach, called the *Megrim*: It ſtrengthens the Stomach to a Miracle, is good againſt Coldneſs, and Waterineſs thereof, Wind and Over-turnings of the Stomach, fainting and ſwooning Fits, Sickneſs at Heart, and indeed all thoſe Diſeaſes for which the Juice, Eſſence, Infuſion and diſtilled Water are preſcribed. Doſe from one Dram to three or more alone, if dulcified: or otherwiſe mixed with ſome generous Wine, or with a fit quantity of the diſtilled Water.

XIX. *The Acid Tincture.* This is a great Stomatick, and very fit for a hot Stomach, becauſe by reaſon of the Acidity it allays the Heat thereof, acuates it, ſtrengthens it, and cauſes a ſingular good Appetite and Digeſtion; ſuppreſſes Vapors, as alſo a *Flatus*, or Hypochondriack Melancholly, and Fits of the Mother. It prevails againſt the Scurvy in a cold and moiſt Habit of Body, and all the Symptoms of that pernicious Diſeaſe; carrying off the Morbifick Matter or Cauſe by Urine, which it cauſes a plentiful Evacuation of; and therefore is good againſt Stones, Gravel, Sand and Tartarous Matter or Slime in the Reins, Ureters or Bladder. It is to be taken daily, in all that the Patient drinks, whether Ale, Beer or Wine, ſo much at a time as to give it a pleaſing Acidity. Outwardly bathed upon places affected with the Gout, it gives Eaſe in the Pain, and in a ſhort time cures it.

XX. *The Oily Tincture.* It is powerful againſt Palſies, being anointed upon the *Spina dorſi*, according to Conjugations of Nerves repleniſhing the Parts affected, as alſo upon the Paralytick Part it ſelf: it prevails againſt Convulſions, a Catalepſis, Cramps, Lethargies, Falling-ſickneſs, Trembling, Vertigo, and other Diſaffections of the Nerves, being anointed upon the grieved places, and alſo taken inwardly from ten to thirty Drops in any proper Vehicle: and ſo given Morning and Night, it is good againſt the Stone, Gravel, Sand, and any Tartarous Mucilage in the Urinary Parts: it powerfully provokes Urine, gives Eaſe in the Strangury, and takes away the Pain, Heat and Scalding thereof: outwardly, it is good to cure Hurts and Punctures of the Nerves and Tendons, to diſcuſs Flatulencies, and eaſe Pains of the Joints and other Parts, proceeding from Cold and Moiſture.

XXI. *The Spirit.* It is one of the greateſt of Vegetable Cephalicks and Cordials: it comforts the Head, Brain, Nerves and Womb, ſuppreſſes Vapors, and reſiſts Hyſterick Fits. It powerfully prevails againſt Palpitation of the Heart, Sickneſs at Heart, Fainting and Swooning, and all other Diſtempers of that Part. It revives the Spirits, cheers the Heart, and ſtrengthens all the Faculties of the Body: it is prevalent againſt a ſevere Cold, and cures a Lethargy in a ſhort time. It may be taken two or three

times

times a Day, or in a Paroxyſm, either alone, it allayed, and dulcified with fine white Sugar, or mixt with any proper Vehicle. The Patient troubled with any of the aforeſaid Diſeaſes, ſhall not take it in vain, eſpecially ſuch as are Paralytick. Doſe from one Dram to two or three Dams or more, according as the Age of the Patient will admit, and Extremity of the Diſeaſe may require.

XXII. *The diſtilled Oil.* It has all the Virtues of the Juice, Eſſence, Infuſion, Tinctures and Spirit; and almoſt an hundred times more powerful than them all, ſo that the Virtues hereof need not now be again repeated in vain: but this in particular, it is one of the greateſt Antiparalyticks, Antepilepticks and Antiſparmaticks in the World; and beſides, being given to Women in Travel, it facilitates the Birth, and expels the After-birth, and gives Eaſe in After-pains, beyond any other Medicine I know in the World. The Doſe is from four Drops to twelve, ſixteen or twenty, (in Extremity) in any proper Vehicle. Firſt drop it into Sugar, mixing them well together with the Point of a Knife; then put it into the Wine, diſtilled Water, or other fit Vehiculum, and ſo give it the Patient to drink, repeating the Doſe as oft as you ſee convenient.

XXIII. *The Powers.* This Preparation has all the Virtues of the Oil aforegoing, and may be given in the ſame Vehicle: but as it is a more diluted Subſtance, it may be given in a much larger quantity, *viz.* from half a Dram to two Drams or more, as the Exigency may require. It is very ſubtil and penetrative, and pierces more than the Oil does. Outwardly applied, it is admirable againſt the Sciatica, as alſo againſt the Gout from a cold Cauſe: and is good againſt a Lethargy, being bathed upon the Forehead and Temples, ſnuffed up the Noſtrils, and taken alſo inwardly, as is before directed.

XXIV. *The Elixir.* This is the Powers elixirated, has all the Virtues of the Powers exalted, and ſo operates in a leſs Doſe, *viz.* from a Scruple to a Dram, or from twenty Drops to ſixty Drops, which may be given Morning, Noon and Night in ſuch proper Vehicle as the Phyſician ſhall aſſign. It is peculiarly commended againſt Palſies, and Diſeaſes of the Womb, as Suffocation; as alſo the Epilepſy in younger Perſons. It gives Eaſe in and cures the Strangury, inwardly taken; and prevails againſt the Colick even by bathing the outward Parts therewith. An Ounce of the Elixir being mixed with ſix Ounces of the diſtilled Water, makes an excellent Lotion for the Head in Pains thereof, as alſo in Lethargies, and to ſtrengthen the ſame.

CHAP. CCCCXXIV.

Of LAVENDER-COTTON, *OR*, SANTOLINE.

I. *THE Names.* It is called in *Greek*, Χαμαικυπάρισσος, *Chamæcypariſſos*; and Ἀβρότονον θῆλεια *Abrotonon Theleia*: in *Latine*, *Chamæcypariſſus*, *Abrotonum fœmina*, and *Santolina*; and in *Engliſh*, *Lavender-Cotton*, and *Santoline*.

II. *The Kinds.* Authors make nine or ten Kinds of this Plant; we ſhall be contented with ſix of them, which we find growing in our Gardens, or in ſome of our Plantations beyond Sea, *viz.* 1. *Abrotanum fœmina vulgare*, *Santolina communis Anguillara*; *Cheſſolina Capaipini*; *Chamæcypariſſus Herba Plinii*; Our Common Garden Lavender-Cotton. 2. *Abrotanum fœmina magnum*; *Abrotanum fœmina ſecundum Cluſij*; *Abrotanum fœmina foliis rigidioribus Camerarij*; *Pelion alud Columnæ*; Great Lavender-Cotton. 3. *Abrotanum fœmina narbonenſe magno flore*; *Santonicum majus Cordi*; *Abſinthium marinum primum Tabernamontani*; *Seriphium verum Dioſcoridis*, according to *Pena* and *Lobel*, who ſays it has the Form of *Abrotanum fœmina*; *Santolina prima Dodonæi*; *Abrotanum fœmina tertium Cluſij Narbonenſe*; *Polij altera Species major Columnæ*; *Abrotanum fœmina flore majore Baubini*; French Lavender-Cotton. 4. *Abrotanum fœmina Ericæ foliis Baubini*; *Santolina tertia Dodonæi*; *Unguentaria Lutetianorum*; *Chamæcypariſſus Dalechampij*, (as *Baubine* thinks) Heath-leaved Lavender-Cotton; Fine leaved Lavender-Cotton. 5. *Abrotanum fœmina foliis Roſemarini majus & minus Baubini*; *Abrotanum fœmina quartum Cluſij*, (which is his firſt *Spaniſh* Kind) *Abrotanum fœmina Roſemarini foliis minus Baubini*, (which is the leſſer Species) and is the *Second Spaniſh Abrotanum fœmina Cluſij*; Rosemary-leaved Lavender-Cotton, both Greater and Leſſer. 6. *Abrotanum fœmina viridis minor Baubini*, (ſo called in reſpect to the ſecond green Kind abovenamed) and is the *third Spaniſh* of *Cluſius*, called, *Abrotanum fœmina Salamanticenſis*; Small green Lavender-Cotton.

III. The Deſcriptions. *The firſt, or* Our Common Garden Lavender-Cotton. *It has a Root which is woody, and ſpreads it ſelf under Ground with ſeveral hard Fibres.* From this Root riſe up ſeveral woody, brittle, hoary Branches, on which grow many long, four-ſquare, hoary, or whitiſh Leaves, dented about the edges. At the tops of the Branches grow up naked Stalks, bearing every one a large yellow Head or Flower, like unto *Tanſy* or *Maudlin*, but greater, of a Gold-yellow Color; abiding a long time upon the Stalks, if kept but very dry: after which comes ſmall dark-colored Seed. The whole Plant is of a very ſtrong ſweet Smell, but not unpleaſant, nor much unlike *Southernwood*.

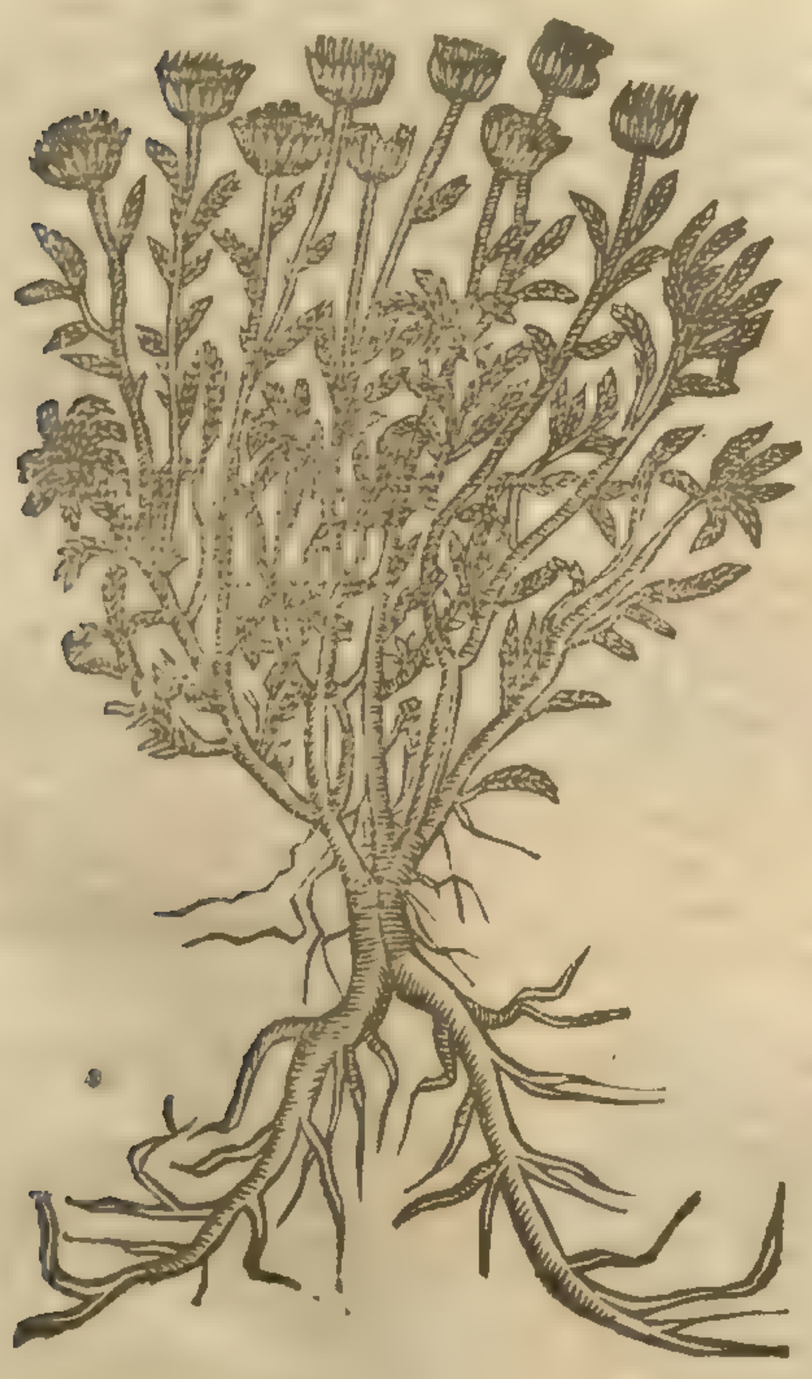
IV. *The ſecond, or* Great Lavender-Cotton. *It has a Root which ſpreads it ſelf in the Ground, with hard woody Branches, like the other, and endures the Extremity of Winter, as well as the other doth.* This is very like to the former *Ordinary Garden Kind*, but not buſhing out ſo thick with Stalks, growing to have a great height, and a thick Stem or Stalk, not ſet with ſo many Branches thereon, but ſomewhat bigger than the other, on which grow fourſquare dented Leaves, like thereunto, but ſomewhat larger, thicker and greener; the Flowers ſtand in the ſame manner, every one upon its long Stalk, being as yellow and large as the former, and which being paſt away give the like Seed. The ſmell of the whole Plant and every part thereof is ſtrong, but not ſo pleaſant to a great many as the other; this will be propagated by ſlipping as well as the former.

V. *The third, or* French Lavender-Cotton. *It has a Root which is as great and as woody as either of the aforegoing, and ſpreads as much in the Ground.* This Plant grows not to be ſo high as the firſt or *Common Garden Kind*, but has many woody, ſhort, little Branches, not above half a Yard high, variouſly ſpread into many other ſmall ones, on which are Leaves like the others, but ſomewhat ſmaller, and more ſperſedly or thinly ſet on the Branches, of a greeniſh white Color, neither ſo green as the laſt or ſecond, nor fully ſo white as the firſt or *Common Kind*, of a ſtrong Smell, ſomething like to our firſt.

The

The Flowers ſtand upon the tops of the ſmaller Sprigs or Stems, each bearing one alone by it ſelf, upon a bare or naked Stalk, void of Leaves for a good ſpace, which are of a paler yellow Color than the others, and much larger, and giving Seed of ſomewhat a darker Color.

Lavender-Cotton French.



VI. *The fourth, or* Heath-leaved Lavender-Cotton. *This has a Root much like for Form and Subſtance to the others:* but the Plant it ſelf grows not ſo great or high as the *French Kind* does; but has many ſhort woody Branches, on which do ſperſedly grow ſmaller, ſhorter and finer whitiſh green Leaves, very like to the Leaves of our *Common Heath.* The Flowers are yellow, ſtanding in like manner as all the former do. And the whole Herb has a very pleaſing (but not ſtrong) Smell to commend it, ſomewhat reſinous, and not very faintiſh or weak.

VII. *The fifth, or* Roſemary-leaved Lavender-Cotton both Greater and Leſſer. *The* Greater Kind *has a woody ſpreading Root, like to the others aforegoing:* and it ſhoots forth from this Root many ſlender hoary Stalks, ſomething above a Foot long; about which grow many very narrow, ſmall and flat Leaves, like unto the Leaves of *Roſemary*, which while they are young, are of a more hoary white, and have but a ſmall Shew of denting about the edges; but when they are grown old, they are more green, and the denting about the edges is more apparent, of a ſweet Smell and bitter Taſte. From theſe Stalks come forth ſeveral ſhort Stems, with very few Leaves on them, on the tops of which ſtand ſeveral yellow Flowers, like to *Common Lavender-Cotton*, but much larger, which die down to the main Stalks every Year, after perfecting the Seed as the others do. The *Leſſer Roſemary-leaved Kind*, differs not from the *Greater* in its Leaves and Flowers, but in their Smallneſs, this being lower, more ſlender and ſmall in every part, which is not by reaſon of the place, its being more dry and barren, (as ſome have thought) but it has been found, that growing in the ſame place with the former or *Greater Kind*, and the Seed being ſown in the ſame places, that it ſtill retains the Form and Magnitude it had, as growing in its natural place.

VIII. *The ſixth, or* Small green Lavender-Cotton. *The Root is woody, like the former, and repleniſhed with ſmall Fibres.* This Plant is very like to the laſt *Small Kind*, but that it grows ſomewhat greater and higher, having green, and not hoary Stalks at all; as the Leaves alſo are, being a little longer, and as bitter in Taſte as the others, but not of ſo ſweet a Smell, having rather an Oily Scent. The Flowers grow in the ſame manner upon ſlender Stalks, and of the ſame Faſhion, but of a paler yellow Color.

IX. *The Places.* The firſt grows naturally in *Germany.* The ſecond in the *Low-Countries.* The third about *Narbone* in *France.* The fourth and fifth *Cluſius* found growing about *Salamanca* in *Spain.* The ſixth is unknown, as in what place it is a Native: but they all grow well with us, being nurſed up in Gardens.

X. *The Times.* They all of them flower in *July* and *Auguſt*, and the Seed is ripe in ſome little time after.

XI. *The Qualities.* *Lavender-Cotton*, but more eſpecially the Flowers and Seed, are hot and dry in the third Degree. It is Aſtringent, Diſcuſſive, Neurotick, Hyſterick, and Alexipharmick.

XII. *The Specification.* It ſtops the Whites, reſiſts the Poyſon of Serpents and other Venomous Creatures, kills Worms in Children, and cures Itch and Scabs of all ſorts in whomſoever. *Dioſcorides*, and ſo all other Writers generally after him, ſay, that the Virtues of *Lavender-Cotton*, and of *Southernwood*, are the ſame, and of like Effects, and that the Medicines made from this Plant are applied to all the Diſeaſes to which *Southernwood* is appropriate.

XIII. *The Preparations.* You may make all the ſame Preparations hereof as we teach you to make from *Southernwood*, which ſee hereafter in its proper Chapter. But theſe following Preparations are more particular and ſpecial, *viz.* 1. *A Pouder of the dried Leaves.* 2. *An Infuſion of the Leaves.* 3. *A Pouder of the Seed.* 4. *A Spirituous Tincture of the dried Leaves or Seed.*

The Virtues.

XIV. *The Pouder of the Seed.* It kills Worms, (as will alſo the green Seed, being bruiſed and drank.) It is thought to be equal, if not ſuperior to our *Uſual* or *Common Wormſeed*, and has the ſame Virtues againſt Worms, avoiding them with greater Force. Doſe from half a Dram to a Dram in the Morning faſting, and at Night going to Bed, in any proper Vehicle. It is good alſo againſt the Bitings of Serpents, Mad Dogs, or any other Venomous Creatures, being inwardly given as aforeſaid, and applied Pultice-wiſe to the Part wounded.

XV. *The Pouder of the Leaves.* *Matthiolus* ſays, that being given to half a Dram (it may be given to a Dram) in *Featherfew*-Water, every Morning faſting for ten Days at leaſt together, and afterwards every other Day, for ſome time. It is a very profitable Medicine to ſtop the Whites in Women, and to cure them. *Pliny* ſays it is alſo good againſt the Poyſon of all Venomous Serpents and Scorpions, being taken in Wine. It kills Worms alſo, and has all the Virtues of the Seed, but not altogether ſo powerful; and therefore may very well be uſed, when the Seed cannot be gotten, but in ſomewhat a greater Doſe.

XVI. *The*

XVI. *The Infusion of the Leaves in Wine.* It has all the Virtues of the Pouder of Seeds and Leaves, but not full out so effectual as the Pouder in Substance, and may be given from three Ounces to six, every Night going to Bed, and every Morning fasting. *Clusius* says, that in *Spain* they use the Infusion or Decoction thereof to cure all sorts of Itch and Scabs in whomsoever, but he advises, that there should be Caution used in giving it. This is certain, that in all the Diseases afore-named, for which these Plants may be proper, it will be yet more effectual, that the Pouder of Leaves or Seed be given in the Infusion now spoken of.

XVII. *The Spirituous Tincture of the dried Leaves or Seed.* This Preparation has all the Virtues of the former, and is much better to be given than they, because it is given in a smaller Dose, and in some other proper Vehicle more pleasant, as in *Angelica*, or *Penny-Royal*, or *Mint-Waters*, or in *Red Port Wine*, or some other proper Astringent Wine. It strengthens the Womb, and all those Parts belonging to Generation, powerfully resists Vapors, and if prudently given, cures Hysterick Fits, tho' vehement and of long standing. But in many Cases, in the Exhibition of Medicaments, the Judgment of a Learned and Experienced Physician ought to be taken along with them: for such a one, by his discreet and prudent Administration, shall do Wonders with that Medicament, with which an unlearned and unskilful Man can do nothing at all. There is a great Matter in the true Dose of a Medicine, according to Age, Strength, Temperature, Sex, and Stubbornness of the Disease. There is something in the Choice of the Preparation to the intended Purpose. There is more yet to be observed as to the right time of Administring; and a great deal as to the Continuance of it, or Alteration of the same, as the Stomach, or Nature and State of the Disease is found to change or alter, *&c.*

LEAD-WORT, *see* Scar-Wort, *Chap.*
LAVENDER-SEA, *see* Limonade, *Chap.*

CHAP. CCCCXXV.

Of LAUREL Dwarf *or* Ground.

I. *THE Names.* It is called in *Greek*, Χαμαιδάφνη: in *Latine*, *Chamædaphne*; *Chamædaphne vera Dioscoridis*, *Laureola*, *Laurus Alexandrina altera Matthioli*; *Laurus Alexandrina Columnæ*, *Lugdunensis*, *Tabernæmontani*, *Clusij*, *& Bauhini*; *Ruscо affinis altera Cæsalpini:* in *English*, *Ground* or *Dwarf Laurel.*

II. *The Kinds.* It is a singular Plant of the Kind, tho' some would make it to be a second sort of *Laurel* of *Alexandria*, which I can no ways believe it to be.

III. The Description. *It has hard Root, and very fibrous; from whence rises up one Stem or Stalk, and sometimes two or more, which seem to be covered with Leaves set thereon, one above another, on both sides thereof, the lower being larger than the upper, which Leaves are long and narrow, also sharp pointed, very like to a* Common Bay *Leaf*, having many Ribs therein of a deep green Color on the upper side, and paler underneath, full of Ribs or Veins also, not much unlike to *Horse-tongue*, saving that they are without any second small Leaf or Tongue, such as *Horse-tongue* has, but as hard in handling. This has Flowers, and red Berries in the middle of the Leaf, (and upon so short a Stalk, that it seems to have none) growing out of the middle Rib; but these grow on the under side for the most part, which may make it to be thought a Species of the *Laurus Alexandrina*, but indeed is not.

Dwarf or *Ground Laurel.*

IV. *The Places.* It grows naturally on several Hills in *Italy*, which for its Rarity was brought into their Gardens; and by the means of *John Tradescant*, it was brought into our Country and Climate, where it flourishes very well.

V. *The Times.* It flowers in *June*, and the Berries are ripe in *September*, in its native Country; but here in *England* its Fruit comes not to Perfection.

VI. *The Qualities.* It is hot and dry in the end of the second Degree; Aperitive, Vulnerary and Diuretick.

VII. *The Specification.* It eases the Belly-ach, powerfully provokes Urine and the Courses, and is good against Heart-burnings.

VIII. *The Preparations.* You may have therefrom, 1. *A Decoction or Infusion of Herb and Roots in Wine.* 2. *A Pouder of the Herb and Roots.* 3. *A Bath or Fumigation.*

The Virtues.

IX. *The Infusion or Decoction of Herb or Roots in Wine.* It powerfully provokes Urine and the Terms in Women, cleanses the Womb of Fœculencies, and the Reins and Bladder of Sand or Gravel, Mucilaginous or Tartarous Matter, and gives Ease in the Strangury. *Dioscorides* says it hastens and facilitates the Birth of Women in Labor: and it is of singular Use to dry up the Moisture of old running Sores and Ulcers, tho' rebellious and inveterate, it cleanses them, and induces a speedy Healing, and this by washing the Sores or Ulcers herewith twice a Day. Dose from three Ounces to six twice a Day, *viz.* Morning and Evening. The Head being also bathed herewith, it is said to ease the Pain thereof.

X. *The Powder of Herb or Root.* It has all the Virtues of the Infusion beforegoing: besides which, it eases and cures the Heart-burning, and gives Ease in the Colick, Gripings of the Guts, and other Distempers of the Bowels, being taken Morning and Night in a Glass of generous Wine, from half a Dram to a Dram and half.

XI. *The Bath or Fumigation made with Water.* It is very good for Women to sit over, to receive the hot Fumes up the Womb, or to sit in as a Bath; or to have it injected up the Womb, in case of falling down of the Womb, and to settle it in its right place again.

CHAP. CCCCXXVI.

Of LEEKS.

I. *The Names.* This Plant is called in *Arabick*, *Curat seu Kurat*: in *Greek*, Πράσον: in *Latine*, *Porrum*; and by *Palladius*, *Porrus*: in *English*, *Leek*.

II. *The Kinds.* Of *Leeks* there are several sorts, as, 1. Πράσον κεφαλωτὸν, *Porrum Capitatum*, Common headed or set Leek. 2. Πράσον τμητὸν, *Porrum Sectile*, *Porrum Sectivo aut Tonsile*, Common cut or unset Leek. 3. Ἀμπελόπρασον, *Ampeloprasum*, *Porrum Vitium*, *Porrum Vitigineum*, The Vine-Leek; and this *Parkinson* says is the best of all the Kinds. 4. Πράσον σιλβὸν, *Porrum Sylvestre*, The Wild Leek.

Common headed or set Leek.

III. The Descriptions. *The first, or* Common headed or set Leek. *The Root is a kind of bearded Bulb, white, long and slender, that growing in some to a considerable Thickness.* From this Root rises up broad flat Leaves or Blades, which grow out long, and very many of them, having a Crest or Ridge on the back-side; in Smell and Taste very strong, not much unlike *Onions*, or between *Onions* and *Garlick*. The Stalks (if the Blades are not cut often, but are suffered to grow uncut) will in the second or third Year after Sowing, send forth a round and slender Stalk, of an Evenness quite throughout, and not swoln, or bigger in the middle, as is that of an *Onion*; which bears at the top a round Head or Ball, like to that of the *Onion*, consisting of purplish Flowers and black Seed after them, so very like unto *Onion*-Seed, that it is hard to distinguish them.

Leeks Unset, or *Cut Leeks.*

IV. *The second, or* Common cut or unset Leek, *has a Root which is also white, long, and slenderer than the former, with a great Bush of Fibres hanging at it, like a Beard; but this being transplanted, grows thicker and greater.* The Stalk, Blade, Heads, Flowers and Seed, are much like the other above. Now, tho' most Writers distinguish the *Common Leek* in two Kinds, *viz. Porrum Capitatum, & Sectivum*, the *Headed and Cut Leek*, yet *Gerard* says, they both grow of the same Seed, and that they differ only in Culture: for that which is often cut for the Use of the Kitchen, is called, *Sectivum*: the other which is headed, is not cut, but spersed, and removed in *Autumn*. *Matthiolus* says, *Non differt à Capitato, nisi quod Capite sit tenuiore, ac etiam Cervice.*

V. *The third, or* Vine-Leek, *which some call the* French-Leek. *Its Root or Bulb is headed or round, hard and sound, and is quickly multiplied by sending forth many Bulbs; and it will encrease altogether by the Root, as* Garlick *does.* It grows up with Blades like those of *Common Leeks*: the Stalk is a Cubit high, on the top of which stands a round Head or Button, covered at the first with a thin Skin, which being broken: the Flowers and Seed come forth like those of the *Onion*.

Vine-

Vine-Leek.

Wild Leek.

VI. *The fourth*, or Wild Leek. *The Root is a bearded Bulb, of a longish or oval Form. Its Leaves and Stalk are much like unto those of* Crow-Garlick, *but much larger, and more acride, or sharp and strong.* The Flowers and Seed also resemble those of the *Crow-Garlick* in *Chap.* 310. afore-described: the Seeds being about the Bigness of Grains of *Wheat*, with small Strings coming forth at their ends.

VII. *The Places.* The first three grow with us in Gardens only, which ought to be a good Earth, fat, well dunged and digged, and are common to be had in all Countries, as well as in *England*. The *Vine-Leek* grows of it self in Vineyards, and near unto Vines, in hot Countries, from whence came the Name. The *Wild Leek* grows wild in several Regions, and is many times nursed up in our Gardens.

VIII. *The Times.* *Leeks* may be sown in *March* or *April*, and removed in *September* or *October*. The *Vine-Leek* bears its green Leaves in *Winter*, and withers away in *Summer*.

IX. *The Qualities.* They are all of them hot and dry in the fourth Degree. They are Apperitive, Abstersive, Anodyne, Attractive, Digestive, Diurerick, Emollient, Incisive, Attenuating and Suppurative; Stomatick, Pectoral, Nephritick, Emmenagogick, Alexipharmick, Analeptick and Spermatogenetick.

X. *The Specification.* They cure the Scurvy in a cold habit of Body, help a dejected Appetite, ease the Strangury, and other Diseases of the Reins and Bladder, as also Ulcers of the Lungs.

XI. *The Preparations.* You may have from *Leeks* 1. *A liquid Juice.* 2. *An Essence.* 3. *An Infusion.* 4. *A Broth.* 5. *A Lohoc.* 6. *A boiled Sallet.* 7. *A distilled Water.* 8. *A Spirit.* 9. *A Spirituous Tincture.* 10. *An Acid Tincture.* 11. *An Oily Tincture.* 12. *A Pouder of the Seed.* 13. *A Cataplasm of Root and Blades.*

The Vertues.

XII. *The liquid Juice of Roots and Blades.* A Spoonful of it being mixed with Honey, and drunk, it is good against the Bitings of Venomous Beasts and Serpents, the Roots or Leaves being also beaten to a Pulp, and laid thereon. It wonderfully provokes Urine, eases the Strangury, and brings down the Terms in Women; cures the Bitings of Mad Dogs and other Poysonous Creatures; but these things the Juice of the *Vine-Leek* more especially performs.

XIII. *The Essence.* It has all the Virtues of the liquid Juice, and may be given in any proper Vehicle from half a Spoonful to a Spoonful and half: mixt with Vinegar, or Milk, or Oil of Roses, and dropt into the Ears, it eases their Pain, and takes away any Noise in them.

XIV. *The Infusion in Wine.* It has all the Virtues of the Juice and Essence; and being given from three Spoonfuls to six or more, it facilitates the Birth of Women in Labor, brings away the Afterbirth, eases After-pains, and causes a due cleansing.

XV. *The Broth.* It is made by boiling them in Barly Broth, or Barly Cream, till they are soft or dissolved, and so they are eaten with it, and may be called Leek Pottage. It concocts, and causes Expectoration of crude and undigested Flegm, and other Humors lodged in the *Thorax*, or Lungs and Stomach, and Parts adjacent: besides, it nourishes much, and is good to be eaten by such as are in Consumptions.

XVI. *The Lohoch.* *Lobel* prepares it thus: *Take blanched Almonds three Ounces, Juice of Liquorice two Ounces, choice Figs one Ounce, soft Bdellium half an Ounce, Sugar-Candy in fine Pouder two Ounces, dissolved in Juice of Leeks, a sufficient quantity: boil all in* Balneo *till they come into the Form of an Eclegma.* *Lobel* commends it as very effectual against a flegmatick Quinsey, and cold Catarrhs, which are in danger to cause Suffocation. It is an excellent thing against Coughs, Colds, Hoarseness, Difficulty of Breathing, Wheezing, *&c.*

XVII. *The boiled Sallet.* It is made by boiling them in Water or Broth to Softness, then dressing them up with Butter, Vinegar or Lime-Juice, Salt

and Pepper. It is a very grateful thing to the Stomach and Bowels. We find in Scripture, in ancient Times, as in the time of the Children of *Israel*'s being in *Egypt*, and probably a long time before, those *Eastern* Nations fed much upon *Leeks*, and *Onions*, and *Garlick*, which possibly they might either eat alone, or baked, or roasted, or boiled, in Water or in Broth with Flesh; and this same manner of Feeding on them, seems to be in all Nations alike: in *Muscovia* and *Russia* they are commonly eaten, and the *Turks* (as *Bellonius* says) have them served up in their Dishes at Table, yea, to their Greatest Lords or Bassa's. They are eaten also much in *Spain*, and thro' all the *West Indies*, in all the *Spanish*, *French*, *Dutch* and *English* Plantations. We in *England* likewise universally eat them, and they are a great and general Feeding in *Wales*, even among the Gentry there; and in *Lent*-time we almost every where make Pottage of them, and it is a profitable Food for poor People in hard Times.

XVIII. *The distilled Water.* It is a singular Diuretick, good against Gravel, Sand, Mucilaginous and Tartarous Matter in the Reins, Ureters and Bladder. It has the Virtues of the Juice, Essence and Infusion; but being much weaker, is to be given in greater quantity, and may serve as a general Vehicle to give other Preparations of *Leeks* in. Dose from four to eight Ounces.

XIX. *The Spirit.* It is good to free the *Thorax* or Stomach, Lungs, &c. from putrid or rotten Flegm, and prevails against Coughs, Colds, Catarrhs, or Distillations of Rheum, by which many have been brought into a Consumption. It invigorates the Instruments of Generation, warms and comforts the Womb, provokes Urine and the Terms, and is profitable against Barrenness in both Sexes. Dose two or three Drams, two or three times a Day.

XX. *The Spirituous Tincture.* It has all the Virtues of the Spirit, but much more powerful to all the Intentions, being given from one Dram to three in any convenient Vehicle, two, three or four times a Day, but chiefly every Morning fasting, and every Night going to Bed.

XXI. *The Acid Tincture.* It attenuates, cuts and incides tough Flegm which sticks fast in the *Bronchia* of the Lungs, and frees them and the Parts adjacent from putrid or rotten Humors lodged therein, which is otherwise difficult to be avoided. It restores their Voice which has been lost thro' Hoarseness; and after an admirable manner strengthens the Stomach and Bowels: and cures such as have been poysoned, or surfeited by eating of Mushromes. Dose so many Drops as to make the Wine or other Vehicle pleasantly acid.

XXII. *The Oily Tincture.* It is good against Lameness and Weakness of the Nerves, Joints and Limbs, and therefore is of singular Use against the Palsy, and Gout from a cold Cause, being anointed upon the Parts affected. Inwardly taken from eight to twenty Drops, being first dropt into White Sugar, and mixed well with it, and so given in White Port Wine, or in the distilled Water, or some other proper Vehicle, it gives present Ease in the Strangury, opens Obstructions of the Urinary Parts, and expels Gravel, Sand, Mucilage or Tartarous and Slimy Matter affecting those Parts. Given to a Woman in Labor, it facilitates the Birth, brings away the After-birth, and causes a due Cleansing.

XXIII. The Pouder of the Seed. *Take Leek-Seed three Drams, Mirtle-Berries two Drams, make each into a fine Pouder, and mix them.* This Mixture given from one Dram to two in Red Port, or Red *Barcelona* Wine, or other proper Vehicle, will stop any Spitting of Blood, tho' it has been of long Continuance. It is said, that if these Ingredients be put into Wine, they will keep it from Sorweing; and if it be already Sower, it will amend the same. This Pouder will cut gross and tough Humors, and cure Fluxes of the Bowels, yea, the Bloody-flux it self.

XXIV. *The Cataplasm.* The Roots and Blades being boiled soft in Water, or Milk, or Wine, and so made into a Pultice, and applied to swoln *Hæmorrhoids* or Piles, it discusses the Tumor, gives Ease in the Pain, and in a short time after cures them. If the Cataplasm is made of the raw Roots, by beating them in a Mortar, adding a few Crumbs of White Bread, as you see occasion, and be applied to any place bitten by a Mad Dog, Viper, Rattle-Snake, or other Venomous Creature; it infallibly attracts to, and draws out all the Poyson; and this it does by reason of its vehement attractive Force, by which means it perfectly frees the Patient from all manner of Danger.

CHAP. CCCCXXVII.

Of LENTILS.

I. *THE Names.* This Plant is called in *Arabick*, *Hades*: in *Greek*, Φακὸς and Φακὴ, *Phacos* and *Phace*: in *Latine*, *Lens* and *Lenticula*: in *English*, *Lentil* and *Lentils*.

II. *The Kinds.* There are three Kinds hereof, *viz.* 1. *Lens major*, The greater Lentil. 2. *Lens minor*, The lesser Lentil. 3. *Lens maculata*, The spotted Lentil.

Great and Small Lentils.

III. The Descriptions. *The first, or* Greater Lentil, *has a Root which is fibrous, and perishes every Year.* From this Root rise up several weak Branches, somewhat hard, about two Feet long; from whence shoot

ſhoot forth at ſeveral places long Stalks of ſmall winged Leaves, that is, having many ſmaller Leaves on each ſide of a middle Rib, without any odd one at the end; for the middle Rib of each Stalk of Leaves, ends in a ſmall Claſper. The Flowers are ſmall, and riſe up from between the Leaves and the Stalks, two for the moſt part at the end of a long Foot-ſtalk, of a ſad purpliſh Color, ſomewhat like to thoſe of *Vetches*; after which come ſmall ſhort, and ſomewhat flat Cods, within which are contained two or three flat, round, ſmooth Seed, of a pale yellowiſh Aſh-color.

IV. *The ſecond, or* Leſſer Lentil. *It has a ſmall ſlender fibrous Root, periſhing every Year: from whence proceed ſmall, tender and pliant Branches, a Foot and half high, on which do grow winged Leaves, like the former*, divided or conſiſting of other ſmaller Leaves, growing aſlope from both ſides of the Rib or middle Stalk, narrow, and many in number, like to thoſe of *Tares*, or thoſe of the *Wild Vetch*, ſaving that they are narrower and leſſer, and ending at the middle Rib with ſome claſping Tendrel, wherewith it takes hold of ſuch things as are near to it. From among theſe come forth ſmall browniſh Flowers, mixed with White, which turn into ſmall flat Cods, containing little flat brown Seed, and ſometimes white. *Parkinſon* ſays, that this is leſſer in Stalks, Leaves and Seed; the Flowers are more pale, and the Seed in the Cods is whiter, in which conſiſts the whole Difference.

V. *The third, or* Spotted Lentil. *This differs little or nothing from the laſt, but in the Seed, which in this Plant is blackiſh, and ſpotted with blacker Spots.*

VI. *The Places.* The two firſt, even beyond Sea, are only ſown in Fields, as other manured Pulſes are, and ſo are they in ſome Counties of *England*, eſpeciallly the ſecond or ſmaller ſort, which is every where the more pleaſant and acceptable; but the greater does with very great Difficulty come to Maturity with us, if the Seaſon or Weather is not kindly and dry. *Gerard* ſays, that it had been told him by Perſons of good Credit, that Husband-men about *Watford* in *Middleſex*, and other places in *England*, do ſow them for their Cattel, even as others do *Tares*. The third grows wild in *Portugal*; with us only in Gardens.

VII. *The Times.* They all flower, and their Seed grows ripe in *July* and *Auguſt*, and ſometimes later.

VIII. *The Qualities.* The *Lentil* is temperate in reſpect to Heat or Cold, and dry in the ſecond Degree: Aſtringent, Stomatick, Hyſterick and Vulnerary.

IX. *The Specification.* The Fruit or Grain ſtops Fluxes, and the Terms in Women, cleanſes and heals old Sores, Kibes, Ulcers, *&c.*

X. *The Preparations.* You may have therefrom, 1. *A Decoction of the Grains, or of the whole Cods and Grains, in Wine or Water.* 2. *A Compound Decoction of the ſame.* 3. *A Meal or Flower.* 4. *Pottage.* 5. *A Mixture with Honey.* 6. *A Cataplaſm with Vinegar.* 7. *A compounded Cataplaſm.* 8. *A Cataplaſm made with Sea-water.*

The Virtues.

XI. *The Decoction of the Cods or Grains in Wine or Water.* Made with the Cods and Grains, it is Aſtringent or Binding; it ſtops the Terms, Fluxes and Vomiting, and ſtrengthens the Bowels. If it is made with the Grains alone, it is ſaid to looſen the Belly; but their ſecond Decoction binds the Belly, and ſtops Fluxes.

XII. *The compound Decoction.* It is made by joining a half quantity of *Catechu, of Red Beet Roots, Pomgranate Peels, Myrtle Berries, Service Berries, Unripe Pears, Quinces, Galls, Sumach Berries, Medlars Unripe, Red Roſe Leaves, and Plantane Leaves, and boiling them all in rough Red Wine.* It has all the Virtues of the former, and much more powerful, good againſt the Overflowing of the Terms in Women, and the Bloody-flux, alſo Spitting and Piſſing Blood, and any other Flux of Blood, whether inward or outward. It allays Inflammations, and dries up great and deep Ulcers.

XIII. *The Meal or Flower.* It ſtrengthens the Stomach, being taken from half a Dram to a Dram, in any convenient Vehicle. Strewed very thick upon old moiſt or running Sores or Ulcers, it drys up the putrid Humidity, and diſpoſes them to Healing.

XIV. *The Pottage.* It nouriſhes, but is ſaid to breed a thick and heavy Juice, which paſſes ſlowly thro' the Veſſels; and therefore is a very bad Food for ſuch as have the Leproſy, or are ſubject to the Scab, Cankers, Tettars, Ring-worms, Scirrhus, Melancholy, *&c.* alſo for ſuch as have dry and withered Bodies, are conſumptive, or are fallen into a Pining, or have a Dimneſs of Sight. But for ſuch as have a Dropſy, or are in danger of a Dropſy, or abound with wateriſh Humors, it is very good to feed upon.

XV. *The Mixture of the Meal made with Honey.* It cleanſes corrupt and rotten Sores and old Ulcers, filling them up with Fleſh again; and is a moſt ſingular thing to be put into the common Digeſtives which are uſed for green Wounds: and applied to Apoſtems, it maturates and breaks them.

XVI. *The Cataplaſm with Vinegar or ſour Wine.* It (being applied) eaſes the Pains of the Gout, ſoftens Womens Breaſts which are made hard with curdled Milk; waſtes away Wens and other hard and ſcrophulous Tumors of the Throat.

XVII. The compounded Cataplaſm. *It is made of the Meal, with Pulp of raw Quinces, adding a little Juice of Melilote and Oil of Roſes.* Applied, it helps the Hæmorrhoids or Piles, giving preſent Eaſe: all Inflammations of the Fundament, as alſo Inflammations of the Eyes. *Note*, That it will be ſo much the ſtronger, if *Pouder of Pomgranate Peels, and of Red Roſes, be added, with a little Honey.*

XVIII. The Cataplaſm made with Sea Water. *Made by boiling the Flower in Sea Water, and afterwards adding a little Vinegar to it when it is uſed:* it is good againſt Wheals, Puſhes, watery or running Sores, Tettars, Ring-worms, Kibes, Anthonies-Fire, Womens Breaſts-ſwelled hard with curdled Milk, the Gout, *&c.*

CHAP. CCCCXXVIII.

Of LENTIL Sea.

I. *THE Names.* It has no *Greek* Name, becauſe, I ſuppoſe, unknown to the *Greeks*: but it is called in *Latine, Lenticula Marina, Uva Marina*: in *Engliſh, Sea Lentil.*

II. *The Kinds.* Authors make two Kinds thereof, *viz.* 1. *Lenticula Marina vulgaris, Lenticula Marina Anguſtiſolia*, Common Sea Lentil, *or* Narrow-leaved Sea Lentil. And this *Lobel* calls *Lenticula Marina Serapionis*; and alſo do *Tabernæmontanus* and *Lugdunenſis*: and this is the *Fucus folliculaceus*

folliculaceus Linariæ folio Baubini; and the *Acinariæ Marinæ altera Species Imperati.* 2. *Lenticula Marina Serratis foliis, Fucus foliaceus Serrato folio Baubini, Acinariæ Marinæ tertia Species Imperati,* The Jagged or Saw-leaved Sea Lentil. This Broad-leaved or Saw-leaved Sea Lentil, *Clusius* in his *Scholia* on the laſt Chapter of *Acoſta*, his Book of Simples, puts it to the Queſtion, whether this with the *dented Leaves* be not that Herb which is called *Sarguaſo* or *Sargazo?* but *Baubinus*, in his *Pinax*, determines it as certain.

Common narrow-leaved Sea Lentil.

III. The Deſcriptions. *The firſt, or* Common narrow-leaved Sea Lentil. *It has many winding Stalks, on which grow ſhort Branches, ſet thick with narrow Leaves, like thoſe of* Belvidere *or* Beſomflax, and among theſe grow many skinny, hollow, empty, round Berries, of the Bigneſs and Shape of *Lentils*, from whence it takes its Name: they are ſometimes of a pale Amber-color, and ſometimes that Color is ſpeckt with Red.

IV. *The ſecond, or* Jagged or Saw-leaved Sea Lentil. This Deſcription you ſhall have from *Acoſta. In that famous and no leſs to be feared Navigation* del Sergazo, *(for ſo they that ſail into the* Indies *call that Space of the Ocean from the 18th to the 34th Degree of* North *Latitude) is ſeen a deep and ſpacious Sea, covered with an Herb called* Serguazo, *being a Span long, wrapped with the tender Branches, as it were into Balls, having narrow and tender Leaves, about half an Inch long, or ſomewhat longer, a little bread, and ſnipt about the edges, of Color reddiſh, of Taſte inſipid, or without any ſenſible Biting, but what is rather drawn from the Salt Water, than naturally inherent to the Plant.* At the ſetting on of each Leaf grows a Seed, round, like a *Pepper* Corn, of a whitiſh Color, and ſometime of White and Red mixt: it is very tender when it is firſt drawn forth of the Water, yet hard when it is dried; but by reaſon of its Thinneſs, very fragil and full of ſalt Water. There is no Root to be obſerved in this Plant, but only the Marks of the Breakings off appear. And it is likely it grows in the deep and ſandy Bottom of the Sea, and there may have ſmall Roots. Yet ſome are of Opinion, That this Herb is plucked up and carried away by the rapid Courſe of the Waters which fall out of many Iſlands into the Ocean. Now, the Maſter of the Ship in which I was, did ſtiffly maintain this Opinion: and in ſailing here, we were becalmed; but as far as ever we could ſee, we ſaw the Sea wholly covered with this Plant. And ſending down ſome young Sailors, to drive the Weeds from the Ship, and clear the Water, we plainly ſaw round heaps thereof to riſe up from the bottom of the Sea, where, by ſounding, we could find no bottom.

Jagged or Saw-leaved Sea Lentil.

V. *The Places and Times.* The firſt is found in many places of the *Mediterranean* and *Adriatick Seas*, as alſo in other *Southern Seas.* The ſecond is found in many places of the *Atlantick Ocean* toward the *South*, in the Latitude and place aforementioned, as alſo in ſeveral other parts of that Sea. They are to be found, by Report of Sailors, all the Year long, their Growth and Cauſe of Appearance being the ſame.

The Virtues.

VI. They are as yet unknown: but *Acoſta* ſays, That if this Plant is pickled with Salt and Vinegar, it will have the ſame Taſte as *Sampire* has, and may be uſed inſtead thereof; and is alſo eaten by ſuch as ſail inſtead of *Capers. Acoſta* cauſed it to be given, when it was freſh taken forth of the Sea, to Goats which they carried in the Ship, and they fed upon it greedily: He confeſſes himſelf ignorant of its Qualities: but one of the Sailors, troubled with a Difficulty of making Water, by reaſon of Gravel

Gravel or Sand and groſs Humors, eat thereof by chance, both raw and boiled, only for that the Taſte thereof pleaſed him: after a few Days he told me, that he found great Good by the eating thereof; and he took ſome of it with him, that ſo he might uſe it when he came aſhore.

CHAP. CCCCXXIX.

Of LEOPARDS-BANE, *OR,* Round-leaved WOLFS-BANE.

I. *THE Names.* It is called in *Greek*, Ἀκόνιτον παρδαλιαγχές, by *Dioſcorides*, becauſe the Herb uſed to kill Leopards, Wolves, and other like Creatures very ſpeedily. It is alſo called, Φθορά, *i.e. Corruptio, Venenum, Mors*; and Θηλύφονον, (*quod tactis genitalibus fœminei ſexus animalium, eodem die inferat mortem*) as *Theophraſtus*, *lib.* 9. *cap.* 9. has named and deſcribed it: in *Latine* it is called, *Thora*, and *Aconitum Pardalianches*, alſo *Thelyphonon Theophraſti*. *Geſner* and others take it to be the *Limeum Plinij* in *lib.* 17. *cap.* 10. which he ſays is an Herb ſo called by the *Gauls*, wherewith they do make a Medicine, to dip their Arrow-heads in when they Hunt Wild Beaſts, and which they alſo call *Cervaria*. *Geſner* ſays, that ſome called it *Lunaria*, becauſe the Leaves were round, like to a full Moon; but he himſelf called it *Thora Venenata*, and *Toxicum Valdenſium*. *Lobel* calls it *Phthora Valdenſium*; and *Cluſius* makes it to be *Ranunculus grumoſa radice tertius*: in *Engliſh*, *Leopards-bane*, or *Round-leaved Wolfs-bane*.

II. *The Kinds.* Authors make two or three Kinds hereof, *viz.* 1. *Aconitum Pardalianches, ſeu Thora minor*, The leſſer Leopards-bane. 2. *Aconitum Pardalianches, ſive Thora major*, The greater Leopards-bane. 3. *Aconitum Pardalianches commentitium Matthioli*, Matthiolus his fained Leopards-bane.

III. The Deſcriptions. *The firſt, or* Small Leopards-bane, *has a Root which is compoſed of ſeven, eight or ten ſmall, long, round, very white, ſhining Roots, ſomewhat uneven, as it were branched out like Knots or Joints in ſeveral places, plainly to be diſcerned in ſome, but in others not, being plain and ſmooth, ending in a ſmall long* Fibre, *and all of them faſtned at the Head thereof, like unto* Aſphodil *Roots, of the moſt poyſonous Quality, which has been found in any other Vegetable.* It is a ſmall low Herb, riſing up with a ſmall, ſlender, round Stalk, little more than half a Foot high, bearing about the middle thereof but one ſmall ſtiff or hard Leaf, for the moſt part; but ſometimes two or three, one above another, and ſometimes two together, which are round, and ſomething like the Leaf of *Aſarum*, but leſſer, ſmooth, and of a blewiſh green Color, and full of Veins, ſomething unevenly dented about the edges, not compaſſing the Stalk, but ſtanding a little from it, upon ſhort Foot-ſtalks. The top of the Stalk is oftentimes divided into two or three Branches, with a ſmall narrow Leaf at the Joint, and one ſmooth pale yellow Flower at the top thereof, ſomewhat like to thoſe of *Cinkfoil* or *Five-leaved Graſs*, conſiſting in many of four, and in ſome of five round pointed Leaves, with a ſmall grecniſh Head in the middle, which when the Flower is fallen, grows to be a ſmall Head, conſiſting of many ſmall Seeds ſet together, like unto the Heads of ſeveral ſorts of *Ranunculi* or *Crowfeet*.

Small Leopards-bane.

IV. *The ſecond, or* Greater Leopards-bane. *Its Root is much like the former; and it is in all things like unto the* Leſſer *before deſcribed, but that it is greater, and riſes up higher, having larger Leaves, and finely dented about the edges*, and two or three ſtanding together about the middle of the Stalk, ſome ſmaller than others, and ſometimes one above another, and ſome ſmall long and narrow ones at the Joints, branched forth into two or three parts or more, bearing every one of them its ſmall yellow Flowet, like to the former, with like Seed contained therein. Theſe two ſorts differ chiefly in the Magnitude of the Plants, and that this latter bears more Leaves than the former; which *Parkinſon* thinks may rather be attributed to the Fertility or Sterility of the Soil wherein they grow, than to any differing Species, they being ſo very like one another.

V. *The third, or* Matthiolus his fained Leopards-bane. *It has a Root which conſiſts of many Knots and Joints, like unto a Scorpion's Tail, in the ſame manner as* Matthiolus *has ſet forth in his Figure.* It riſes up early in the Year, if the Spring be mild, with its Stalk, before any of the lower Leaves appear, as the *Coltsfoot* and *Butter-bur* do, having four ſmall, round, hairy Leaves upon the Stalk, ſet by couples at diſtances. The Flowers are many, growing in a Tuft or round Head together at the top thereof, of a pale yellow Color, with many yellowiſh Threads in the middle. When the Flowers are paſt, then come up the Leaves, which are four for the moſt part, and are almoſt round, hairy, and green on the upper ſide, and of a hoary White underneath, full of Veins running thro' them, and full of ſmall Spots.

VI. *Nota.*

Matthiolus *his fained Leopards-bane.*

VI. *Nota. Matthiolus* indeed, desirous to express this last described Plant with some near Resemblance to *Dioscorides* his Description of *Aconitum Pardalianches*, has set it forth with four round rough Leaves, and one long crooked Root, bunched out in divers places, like unto the Tail of a Scorpion, which Figure bred a great Contention between *Gesner* and him; *Gesner* laying to his Charge, that he had but fained it, and that there was no such Herb *in rerum natura*, because it was made so artificially, and wanted Fibres, which almost all other Roots have, by which they draw Nourishment out of the Earth. *Matthiolus*, in his Defence, alledges, That *Dentaria*, which we call *Lung-wort*, has no Fibres, being a Root consisting only of Scales, as it were set together; and that the other Root, called *Dentaria Bulbifera*, which the *Germans* call *Sanicula alba*, is without Fibres also: but *Dalechampius*, whom most Authors call *Lugdunensis*, in his great Herbal Printed at *Lyons*, defends *Matthiolus* his Sincerity, and gives the same Figure, with a Stalk of Leaves and Flowers added to it, and withal the former Description. This he saith he saw with his own Eyes; and that an Apothecary of *Trevers* had divers Plants thereof growing in his own Garden, and abiding many Years, from whom he obtained the whole Plant to set forth, to end the Controversy between two such worthy Men. And yet some other Authors, as also *Baubinus* and *Fabius Columna*, in his *Minus Cognitarium Stirpium*, *pag.* 44. do much suspect even this of *Dalechampius* or *Lugdunensis* to be counterfeit also. Others will have it to be the *Doronicum brachiata radice*, which has round Leaves, and such a like Root: but the Matter is yet in Controversy. The Figure is from *Dalechampius*.

VII. *The Places.* These poysonous Plants do grow on the Alps and the Mountains of *Savoy* and *Switzerland*. The second grows plentifully in the Country of the *Valdens*, who inhabit part of those Mountains towards *Italy*, called *Underflamen* and *Engronia*, from whence came the Sirname *Valdensis*. The first on *Mount Baldus*, a Mountain of *Italy*, as also in shadowy places, on the Snowy Hills in *Savoy*, near unto *Alura*, and on the top of *Jura*, where there is scarcely any Crust of Earth for the Roots to grow in: both which are now nursed up in our *English* Gardens. The third *Dalechampius* says grows on the *Alps* of *Savoy*, nor far from the chief Monastery of the *Carthusians*, in a rough rocky place, which they call *Les Æscheles*, i. e. *the Ladder*, because the way of the Rock is cut out into Steps, to get up unto the top thereof.

VIII. *The Times.* The first and second, *Gerard* says, flower in *March* and *April*, and that their Seed is ripe in *June*: but *Parkinson* says they flower in *June* and *July*, which are the Spring Months of the *Alps*, and that their Seed is ripe in *August*.

IX. *The Qualities. Leopards-bane* is hot and dry in the Ultimate of the fourth Degree. It is reported by all Authors to be a deadly Poyson, and that the Natives of the place where it grows, do very much use it to Poyson their Arrow-heads, the more speedily and fatally to destroy Wild Beasts, which greatly infest those Mountains of the *Alps*: for which Purpose it is also brought into their Mart-Towns near those places, to be sold unto the Hunters; the Juice of which is prepared by pressing forth, and so kept in Horns for ready Use, being the most vehement Poyson of all Vegetables: for an Arrow-head touched therewith, leaves the Wound incurable, (if it but so pierces the Skin as to fetch Blood) unless that round about the Wound the Flesh be speedily cut away in good Quantity. This Plant may therefore be well accounted the first and chief of all the *Aconites* or *Wolf-banes*, by reason of its deleterious and poysonous Qualities aforesaid: and without doubt there is no worse, nor any more speedy Vegetable Venom in the World, nor any other *Aconite* or *Toxicum* comparable hereunto. It is reported, that if any Beast or Man be wounded with an Arrow, Dart, or other Instrument poysoned with the Juice hereof, that remedyless they will die in half an Hour after. *Gesner* in *Libro de Lunariis* says, that if Man or Beast be wounded with Sword, Dart, or Arrow, touched with the Juice hereof, that the Malignity so soon pierces inwardly, that it presently kills, by congealing all the Blood, unless the Flesh round about be instantly cut away, as aforesaid: and yet (which is admirable) he says, that the Flesh of that Beast so killed, is not dangerous or hurtful to any who shall eat thereof. *Pliny* saith, that being given to Fish in a Bait, it kills them presently, which shews, says he, that this Poyson is an Enemy to the Blood. It is said to be so pernicious, that if it is but held in the Hand for some little time, that it will almost take away the Senses: and also that one smelling thereto, after he had gathered it, fell down as Dead, and with some Difficulty was recovered again.

The Virtues.

X. *Dioscorides* says, That being mixed with other Medicines for the Eyes, it gives Ease in their Pains. And *Theophrastus*, and *Pliny* after him, say, that it is a Remedy against the Scorpion, being taken in warmed Wine: but that it destroys Nature, if it finds not an Enemy in Nature to contest withal, and destroy: but if it finds such an Enemy, that then it spends it Strength and Force upon that, to overcome it, and so frees Nature from the Danger. Thus *Pliny*. All the other Preparations and Virtues of *Leopards-bane* are the same with *Helmet-flower* or *Monks-hood*, and the Cure of the Poyson of this, the same with that; of which we have at large treated in *Chap.* 353. aforegoing in this Book: so that we need speak no more thereof in this place

But however, after all that we have ſaid of the Virtues of theſe deleterious or poyſonous Plants, it is in my Opinion, much better to let them wholly alone, than to run any Hazard in making uſe of them, by reaſon of their dangerous Qualities; beſides, many times the Folly and Ignorance of ſuch as may adventure the making of ſuch dubious Tryals; foraſmuch as there are other Herbs and Plants enough, proper for all ſuch Purpoſes and Intents, and poſſibly more effectual for the Cure of the ſame Diſeaſes, which are free from any ill Effects, of what kind ſoever; and by reaſon of their innocent Properties, may be ſafely adventured upon by ſuch as but very indifferently underſtand Phyſick.

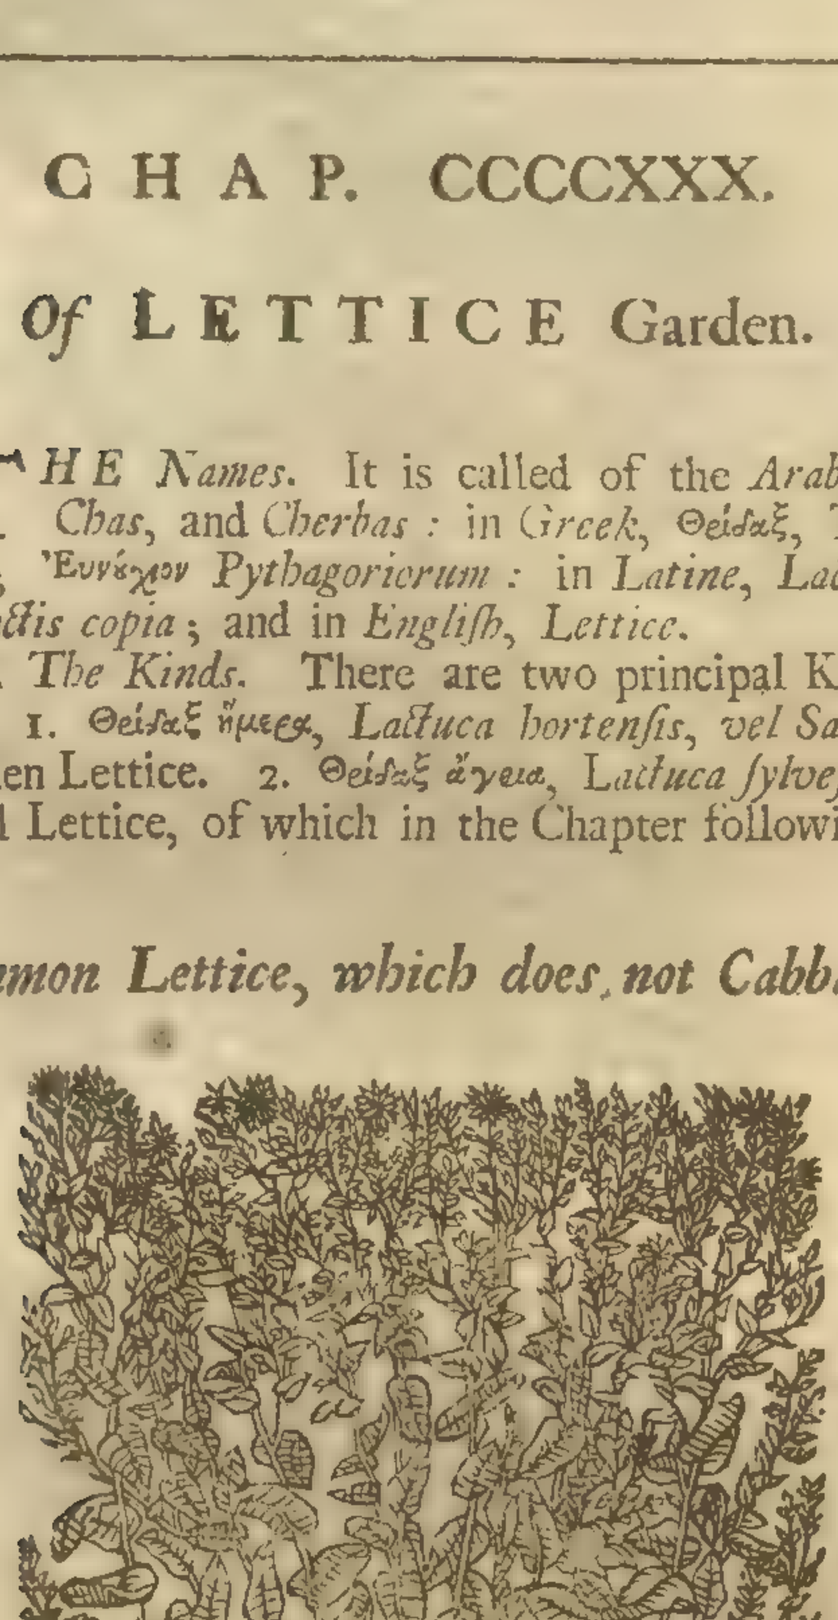
CHAP. CCCCXXX.

Of LETTICE Garden.

I. *THE Names.* It is called of the *Arabians*, *Chas*, and *Cherbas*: in *Greek*, Θρίδαξ, *Thridax*; Εὐνάχιον *Pythagoricorum*: in *Latine*, *Lactuca*, *à Lactis copia*; and in *Engliſh*, *Lettice*.

II. *The Kinds.* There are two principal Kinds, *viz.* 1. Θρίδαξ ἥμερος, *Lactuca hortenſis, vel Sativa*, Garden Lettice. 2. Θρίδαξ ἄγρια, *Lactuca ſylveſtris*, Wild Lettice, of which in the Chapter following.

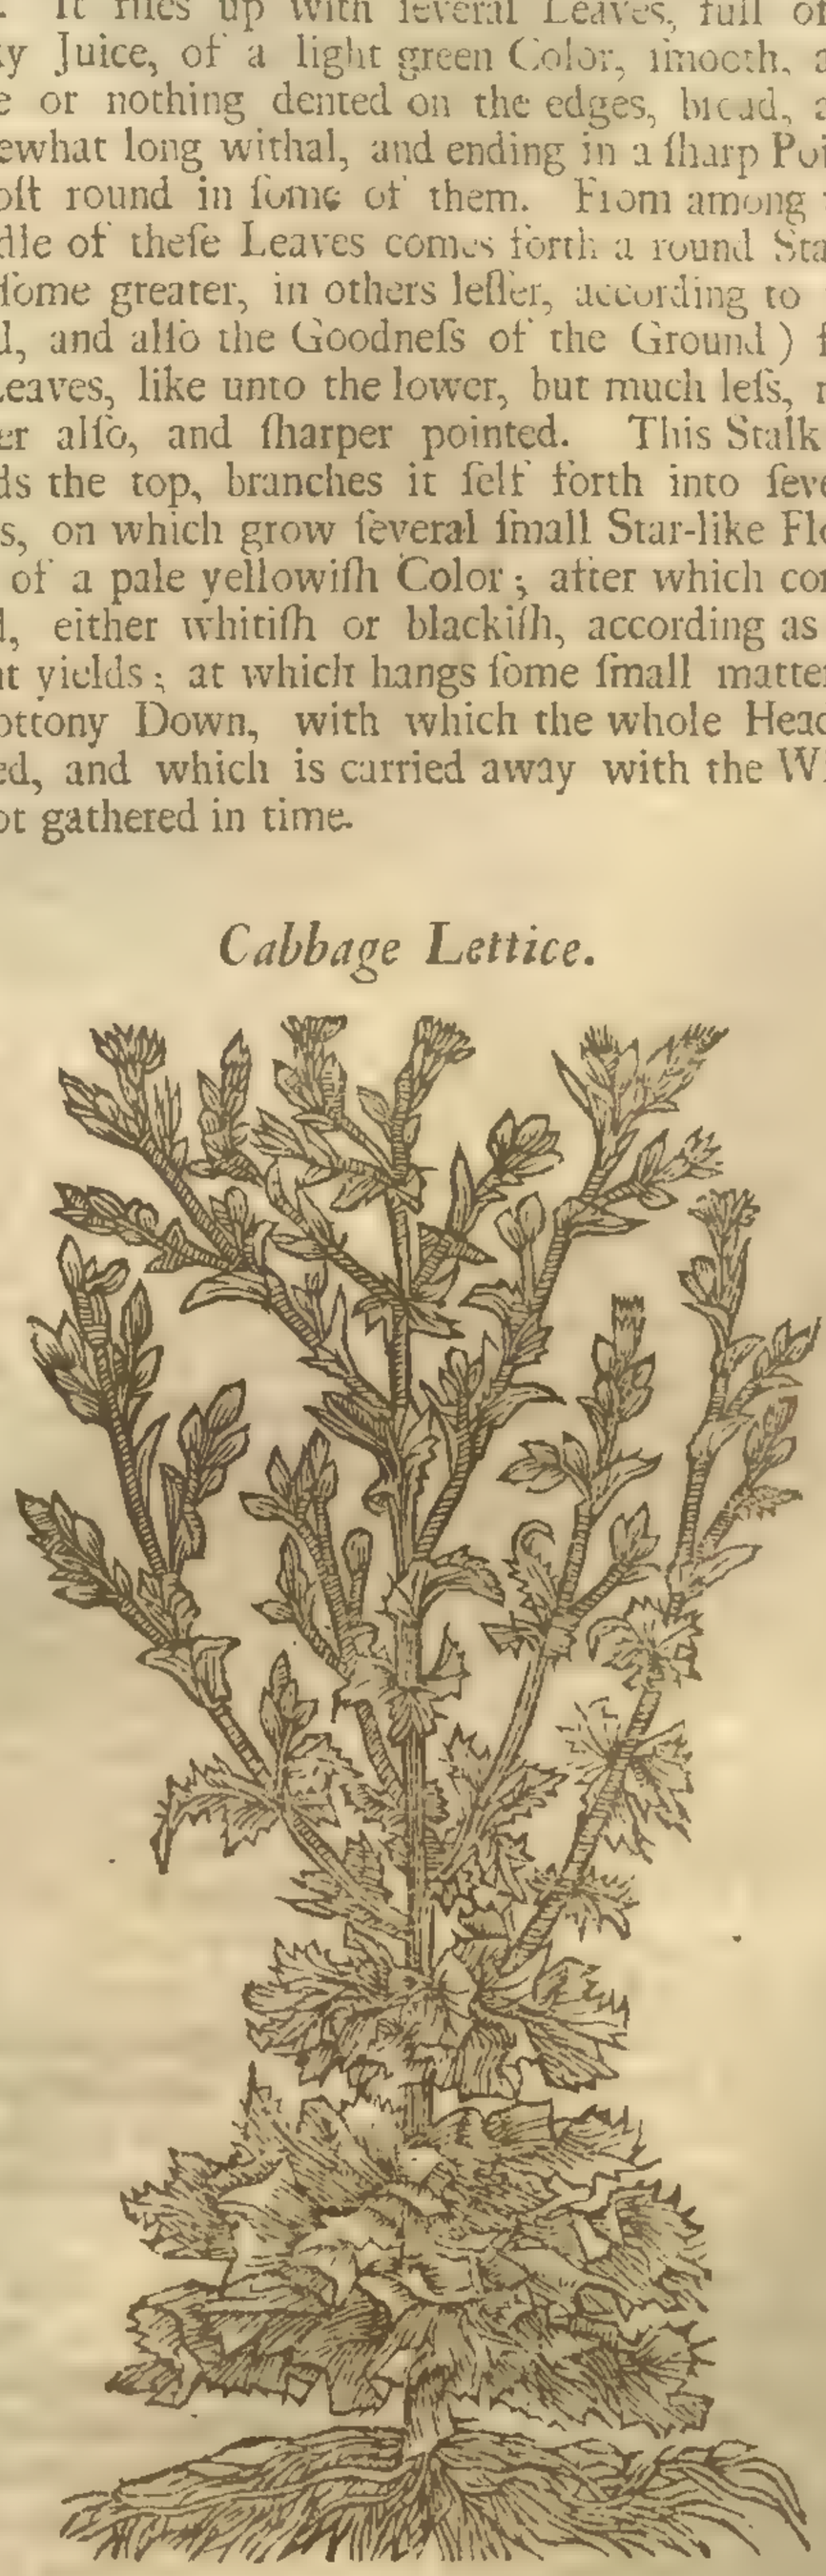
Common Lettice, which does not Cabbage.



III. *The Garden Kinds.* Authors make many Kinds of this *Lettice*; but we ſhall content our ſelves with the chief of them, which are the following, *viz.* 1. *Lactuca communis*, Our common Lettice, which does not Cabbage or Head. 2. *Lactuca Capitata*, *Lactuca ſeſſilis*, called by *Pliny*, *Lactuca Laconica*, Cabbage Lettice. 3. *Lactuca Criſpa Plinij*, *Lactuca Cecilliana Columellæ*, Curled or Crumpled Lettice. 4. *Lactuca Romana Petri Creſcentij*. Roman Lettice. 5. *Lactuca Belgica*, Flanders Lettice. 6. *Lactuca Cypria Columellæ*, Red Lettice. 7. *Lactuca Hyemalis*, Our Winter Lettice. 8. *Lactuca Virginiana*, Virginia Lettice. 9. *Lactuca Sabaudica*, Savoy's, or Savoy Lettice. 10. *Lactuca Venetiæ*, Venice Lettice.

IV. The Deſcriptions. *The firſt, or* Common Lettice, which does not Cabbage. *It has a Root which is ſomewhat long and white, with white Fibres adjoining, which periſhes immediately after Seed time.* It riſes up with ſeveral Leaves, full of a milky Juice, of a light green Color, ſmooth, and little or nothing dented on the edges, broad, and ſomewhat long withal, and ending in a ſharp Point, almoſt round in ſome of them. From among the middle of theſe Leaves comes forth a round Stalk, (in ſome greater, in others leſſer, according to the Kind, and alſo the Goodneſs of the Ground) full of Leaves, like unto the lower, but much leſs, narrower alſo, and ſharper pointed. This Stalk towards the top, branches it ſelf forth into ſeveral parts, on which grow ſeveral ſmall Star-like Flowers, of a pale yellowiſh Color; after which comes Seed, either whitiſh or blackiſh, according as the Plant yields; at which hangs ſome ſmall matter of a Cottony Down, with which the whole Head is ſtored, and which is carried away with the Wind, if not gathered in time.

Cabbage Lettice.



V. *The ſecond, or* Cabbage Lettice. *This has a Root like the former, and ſprings up in like manner with plain ſmooth Leaves*, which after a time cloſes it ſelf, and becomes a kind of *Cabbage* Head, and hard; after which, from the middle thereof, ſprings up a Stalk, which for Subſtance, Branching out, Flowering and Seeding, is like the former, but bears black Seed.

Cabbage Lettice.

VI. *The third, or* Curled *or* Criſped Lettice. *It has a Root like the former, and it has great and large Leaves, deeply cut or gaſht on both ſides, not plain or ſmooth, as the former, but intricately curled, and cut into many parts.* The Flowers are ſmall, of a bleak Color, the which do turn into Down, which is carried away with the Wind. The Seed is like the former, ſave that it ſometimes becomes black. There is a leſſer ſort of this *Curled Kind*, which has many Leaves, hackt and torn in pieces, very confuſedly, and withal curled in ſuch an admirable ſort, that every great Leaf ſeems to be made of many ſmall Leaves, ſet upon one middle Rib, reſembling a Fan of curled Feathers, which Gentlewomen have ſometimes uſed. The Roots, Flowers and Seeds agree with the former.

VII. *The fourth, or* Roman Lettice. *It is threefold.* 1. The green Roman, *which is of a dark green Color, growing as low as moſt Kinds: it is an excellent ſort of* Lettice, *and bears black Seed.* 2. *The white Roman Lettice.* It has long Leaves, like to a *Teaſil*, and is in Goodneſs next unto the *Red*, but muſt be whited, that it may eat kindly: the Seed hereof is white. 3. *The Red Roman Lettice.* This is the beſt and the greateſt of all the reſt. *John Tradeſcant* was the firſt which brought it into *England*, and ſowed it; and he ſaid, that after one of them had been bound and whited, after the Refuſe was cut away, the reſt weighed ſeventeen Ounces. This has black Seed.

VIII. *The fifth, or* Flanders Lettice. *This is a ſort of* Curled Lettice, *which does Cabbage, and is called* Flanders Croppers. This grows loweſt, and has the loweſt Head, but it is very hard and round, and white whilſt it grows; and bears black Seed.

IX. *The ſixth, or* Red Lettice. *It is a large* Lettice, *with larger Leaves, of a red or reddiſh Color, and an excellent ſort of Salletting:* it grows up with a ſmooth Stalk, and has Branches, Flowers, Seed, and Down, like other *Lettices.*

X. *The ſeventh, or* Our Winter Lettice. *It is a very hardy Plant, and able to endure our Cold*; but it is ſingle, and muſt be ſown at *Michaelmas*, but will be very good before any other of the more excellent ſorts, ſown in the Spring, will be ready to be uſed. It bears white Seed.

XI. *The eighth, or* Virginian Lettice. *It is of the* Single Kind, *and has very broad reddiſh Leaves.* which by good Husbandry and Tranſplanting, may be very much improved, and be made an excellent *Lettice.* It bears black Seed.

XII. *The ninth, or* Savoy's, *or* Savoy Lettice. *It has very large Leaves, which ſpread themſelves upon*

upon the Ground; at the firſt coming up, broad, cut or gaſht about the edges, criſping or curling lightly this or that way, like in ſome meaſure to the Leaves of *Garden Endive*, with Stalks, Flowers and Seeds, like the former, as well in form as yielding that milky Juice, with which they do all abound. Of theſe *Lettices* ſome are open, with very curled Leaves, of a green Color; and ſome of a yellow or yellowiſh green Color. Others are Headed or Cabbaged, and ſometimes grow ſo large, even to reſemble a ſmall *Cabbage*, of a yellow or yellowiſh green Color. This *Lettice* is ſeldom eaten raw, but is for the moſt part boiled like a *Cabbage*, and makes indeed the beſt boiled Sallet.

XIII. *The tenth, or* Venice Lettice. *It is an excellent* Cabbage Lettice, *and is beſt to be ſown at the latter end of* June, *or beginning of* July: *it grows ſometimes to be as large as the Crown of a Man's Hat: it riſes to a moderate Height, and the Seed is white.* There is another ſort which does a little Cabbage, and the Seed is white: and another ſort which does not Cabbage, but is looſe; this has many great Leaves ſpread upon the Ground, like unto thoſe of *Garden Endive*, but leſſer; it riſes up to be about three Feet high; its Flowers are yellowiſh, which turning into Down, fly away with the Wind, and its Seed is white as Snow. Theſe two laſt ſome call *Lumbard Lettices*.

XIV. *How to gather the Seed, that it may be good.* Mark out thoſe Plants which you intend ſhall run up for Seed, which let be the beſt and moſt flouriſhing; and after they have begun to ſhoot forth Stalks, ſtrip away the lower Leaves for two or three Hands breadth above the Ground; for thereby, in taking away the loweſt Leaves, the Stalk ſhall not rot, nor the Seed be hindered from ripening.

XV. *The Way and Manner of Whitening* Lettice, *to make it eat the more tender.* It is done two ways. The one is by raiſing up Earth like Mole-Hills round about the Plants, while they are growing, which will make them grow white. The other is, by tying up all the looſe Leaves round about together while it grows; for ſo the cloſe-growing thereof will make it white, and be thereby the more tender and pleaſant.

XVI. *The Places.* The ſeveral Names tell you whence they came to us; but here are now nurſed up in many of our Gardens. *Palladius* ſays, that *Lettice* delights to grow in manured, fat, moiſt and dunged Ground, and in places where there is plenty of Water: and *Columella* ſays it proſpers beſt, if it is ſown very thin.

XVII. *The Times.* *Palladius* ſays, that it is certain that *Lettice* may be ſown at any time of the Year, but eſpecially at Spring time, and afterwards till Summer is nigh ſpent; and after that again as ſoon as Winter is done: however, it ought to be ſown in fair Weather.

XVIII. *The Qualities.* *Lettice* is cold and moiſt in the ſecond Degree: Anodyne, Digeſtive, Emollient, Relaxive, and Galactogenetick.

XIX. *The Specification.* It allays Inflammations, gives Eaſe in the Strangury, induces Sleep, and repreſſes Bodily Luſt.

XX. *The Preparations.* You may have therefrom, 1. *A Juice.* 2. *An Eſſence.* 3. *An Oil or Ointment.* 4. *A Cataplaſm.* 5. *A diſtilled Water.* 6. *A Sallet.* 7. *The Seed.*

The Virtues:

XXI. *The liquid Juice.* Inwardly taken from one Spoonful to two or more, (according to Age and other Accidents) it breeds Milk in Nurſes, quenches Thirſt, cools the inward Heat of Fevers, abates Inflammations of the Lungs, cools the Heat of Urine, and repreſſes Bodily Luſt. Mixed with a little *Camphir* diſſolved in Oil of *Ben*, and a little Vinegar being alſo added, and applied by anointing or bathing to the Cods, it eaſes Pain, and abates an Inflammation in thoſe Parts, abates Luſt and repreſſes Venereal Dreams, which cauſe Nocturnal Poillutions.

XXII. *The Eſſence.* It has all the Virtues of the Juice, and is rather to be choſen to be adminiſtred to cold Conſtitutions: it alſo induces Sleep and Reſt, being taken at Bed-time in any convenient Vehicle. The Eſſence, as alſo the former Mixture of the liquid Juice, being anointed or bathed upon the Reins, cools any burning Heat there, and eaſes the Pain of the Back.

XXIII. The Oil or Ointment. *It is made either of the Juice or green Herb, by boiling them in Oil Olive, Hogs Lard, or Mutton Suet, mixed with Oil.* Anointed on the Forehead and Temples, it eaſes the Head-ach proceeding from an hot Cauſe, and procures Sleep and Reſt. Anointed alſo on other Parts which are Inflamed, or are full of Pain, it cools the Part and gives Eaſe.

XXIV. *The Cataplaſm.* Applied to the Gout, it eaſes the Pain; and mixt with *Camphir*, and applied to the Region of the Heart, Liver, or Reins, it repreſſes their Heat and Inflammation, comforts and ſtrengthens thoſe Parts, and allays the Heat of Urine. Applied to the Head in a vehement Head-ach, it eaſes the Pain, and gives great Relief, cauſing the Patient to reſt and ſleep.

XXV. *The diſtilled Water.* It allays great Inflammations, encreaſes Milk in Nurſes, quenches Thirſt, abates the burning Heat of Fevers, repreſſes Luſt, takes away Nocturnal Pollutions, and has all the other Virtues of the Juice and Eſſence, but muſt be taken in a much larger quantity, as from two Ounces to four or ſix, a little dulcified with double-refined Sugar.

XXVI. *The Sallet.* The beſt is that which is made of the *Cabbage Lettice*, and is generally eaten raw, with Vinegar, Salt, Onions, or Pepper, and good Oil. *Galen* adviſes Old Men to uſe it with Spices; and where Spices are wanting, to add *Mint*, *Rocket*, *Creſſes*, *Tarragon*, and ſuch like hot Herbs, as Correctives thereof. It is very grateful to the Stomach, comforts and ſtrengthens it, and cauſes a good Appetite. Some make a Sallet of *Lettices* by boiling them: ſo eaten, they are agreeable enough, are cooling and grateful to the Stomach, help Digeſtion, cleanſe the Stomach, and looſen the Belly; and this *Galen* ſays he found by Experience; for by moiſtening the Belly, it becomes the more ſlippery. This boiled Sallet is ſaid to be ſooner digeſted, and to nouriſh more. It eaſes all the griping Pains of the Stomach or Belly which come from Choller.

XXVII. *The Seed.* It is ſaid to have all the Virtues of the Herb, being given in Pouder from a Dram to a Dram and half, in any proper Vehicle, Morning and Night.

CHAP. CCCCXXXI.

Of LETTICE Wild.

I. *The Names.* It is called in *Greek*, Θριδακίνη, *Thridacine*, and Θριδακ ἄγρια by *Dioſcorides*: in *Latine*, *Lactuca agreſtis*, *Lactuca Sylveſtris*; *Eu-*

ruchion Plinij, lib. 19. cap. 8. and it is called, *Lactuca, à Lacteo ſucco* : in *Engliſh*, *Wild Lettice.*

II. *The Kinds.* It is the ſecond generick Species of *Lettice*, and has the three following Varieties, viz. 1. *Lactuca ſylveſtris, Endiviæ folus odore viroſo* ; *Lactuca ſylveſtris major odore Opij Gerardi* ; *Endivia major Tragi*, which he alſo calls, *Lactuca ſylveſtris altera* ; *Lactuca ſylveſtris ſcariolæ hortenſis ſimilis, Lactucæ flore Opij odore vehementi Sopori fero & Viroſo* ; *Lugdunenſis* ſets it down for *Lactuca ſylveſtris vera Dalechampij*, and in the 14th Chapter of the ſame Book calls it *Theſion Dalechampij*, of which *Pliny*, out of *Theophraſtus*, makes mention. *Lactuca ſylveſtris Anglica odore Opij*, Broad-leaved Wild Lettice. 2. *Lactuca ſylveſtris laciniata* ; *Lactuca ſylveſtris Matthioli, Fuchſij, Dodonæi, Ceſalpini, Thalij & aliorum, Endivia Vulgaris Tragi* (becauſe that generally in all the *German* Apothecaries-Shops it was ſo accounted and uſed) *Seris domeſtica lactucæ Dioſcoridis* ; *Scarriola Ericij Cordi*, Jagged-leaved Wild Lettice. 3. *Lactuca ſylveſtris flore purpureo Geſneri in hortis* ; alſo *Sonchus arborejcens puniceo flore*, Ἐρυθράνθεμον *Thalij* ; *Sonchus Montanus purpureus*, παρθένιον *Columnæ* ; *Sonchus tertius Tabernæmontani*, *Lactuca Montana purpureo cærulea major Bauhini*, (his *minor* being the *Lampſana Auſtriaca* of *Parkinſon*) Wild Lettice with purple Flowers.

The Deſcriptions.

III. *The firſt, or* Broad-leaved Wild Lettice. *It has a Root which is white, long, and woody, when it bears Seed, and periſhes preſently after.* It riſes up with four or five ſomewhat long and large Leaves, ſmaller at the bottom, and broader at the ends, being round-pointed, unevenly dented about the edges, but not cut in or torn at all, of a pale or whitiſh green Color, and very like unto the *Garden Lettice*, or *Garden Endive* Leaves, ſo that it will ſoon deceive one that never ſaw it before, which do ſo abide the firſt Winter after the Sowing, whether in the Spring or Autumn, of the ſhed Seed : but in *May* following it begins to riſe up to a Stalk, and then thoſe lower Leaves will have the middle Rib on the backſide grown full of ſmall ſharp Prickles. The Stalk has riſen to be ſometimes ſeven or eight Feet high at leaſt, and as big as the Thumb of any Man's Hand at the lower Joint ; ſomething brown, and ſpreading it ſelf into ſeveral very long Branches, on which grow large Leaves, like the others, but more crumpled, the lower, and ſo to the middle of the Stalk, ſet with Prickles in the manner of the bottom Leaves, but leſſer and higher, and ſomething jagged or divided on the edges, all and every part yielding plenty of a Milk Juice and Clammy, being broken, which ſmells ſtrong, and very like unto *Opium*, being of a bitter Taſte. The Flowers are very ſmall and ſingle, ſomething like unto *Lettice*, but ſmaller, and of a paler yellow, ſcarcely opening themſelves, and hardly abiding half a Day open, but turn into Down, with ſmall black Seed, very like unto *Black Lettice* Seed, and is carried away with the Wind.

IV. *The ſecond, or* Jagged-leaved Wild Lettice. *It has a Root which abides after the Seeding-time, when as the other does not.* This *Wild Lettice* grows like the laſt, but not ſo high or great : the firſt Leaves are of a greyer green Color, ſmaller and narrower than the other, which ſo abide, and afterwards has Prickles growing on its backſide, as the other has. Thoſe which follow, are much more jagged than the others, and ſet with ſharp Prickles alſo, and being broken, yields Milk as plentifully as the former, and as bitter as it ; and ſmells alſo as ſtrongly of *Poppy* or *Opium*. The Flowers and Seed are like it too, and fly likewiſe away with the Wind.

V. *The third, or* Wild Lettice with purple Flowers. *It has a Root which is thick ſet with Nodes in ſeveral places, not growing downwards, but ſpreading forwards, and having long Fibres ſhooting from it, which periſh not.* It is a great Plant, and riſes up ſometimes (in moiſt Ground) to be ſix, ſeven, or eight Feet high, but uſually three, four or five Feet, with a ſtrong great Stalk, ſet on each ſide with Leaves, ſmalleſt at the bottom, and larger as they riſe up higher, being largeſt about the middle of the Stalk, and then grow ſmaller again up to the top ; all of them unevenly waved about the edges, and encompaſſing the Stalk at the bottom ; of a dark, blewiſh green Color, on the upper ſide, and greyiſh underneath, yielding a Milky Juice when it

is

is broken. The Flowers ſtand upon ſmall long Stalks, coming forth from the Joints, with the Leaves from the middle upwards, with many Flowers on them; conſiſting of four dark purple-colored Leaves, with divers Threads in the middle, tipt with a yellow Duſt, and a three-forked Stile in the midſt, which ſtands in long purpliſh green Husks, hanging down their Heads, and turn into Down, with ſmooth greyiſh Seed among it, which flies away with the Wind.

VI. *The Places.* The two firſt grow in ſeveral places of *England*, as well as beyond Sea: the firſt in the Borders of Fields, and by Hedges and Lane ſides in *Buckinghamſhire* and *Cambridgeſhire*. The ſecond on the Bank-ſide by the Foot-way going from *Grays-Inn-Lane* to *Bradford-Bridge* or *Pancridge-Church*, and in many other places. The third is found upon Mountains and Hills in divers parts of *Germany*, as *Geſner*, *Thalius*, and others ſay; alſo about *Naples*, as *Columna*: I have alſo been told by an *Engliſh* Gentleman, and a good Herbariſt, who has been a great Traveller in many parts of *England*, that he had found it growing upon ſeveral Mountains and Hills in *Wales*, and in ſome other parts of the Kingdom.

VII. *The Times.* They come up in the *Spring*, and ſometimes ſooner; and they all flower about *July* and *Auguſt*, and their Seed ripens in the mean Seaſon, and is blown away whilſt it is in Flower, and has young Buds of Flowers upon it.

VIII. *The Qualities.* *Wild Lettice* is cold in the end of the ſecond Degree, and moiſt in the end of the firſt. It has nearly the ſame Properties of Cooling which the *Garden Kind* has: but the Bitterneſs of this makes it the more Aperitive; and yet it is more ſomniferous than the manured ſorts, and comes up, as it is thought by ſome, almoſt to the Degree of *Opium*; but this Opinion I can never aſſent to, my Experience having proved the contrary.

IX. *The Specification.* Some Authors are of Opinion alſo, that it may be uſed, inſtead of the *Garden*, for any of the Intentions or Purpoſes for which that is uſed. However, it is ſaid to be a peculiar thing againſt Dropſies, to provoke the Terms, and to reſiſt the Poyſon of the Spider, *Phalangium*, *Scorpion*, &c.

X. *The Preparations.* You may make all the ſame Preparations from this as from the *Manured*: but theſe are particularly taken notice of, *viz.* 1. *A liquid Juice.* 2. *A Milky Juice inſpiſſated.* 3. *A Decoction.* 4. *A diſtilled Water.* 5. *A Pouder of the Seed.* 6. *A Cataplaſm.*

The Virtues.

XI. *The liquid Juice.* Given inwardly to one Spoonful, more or leſs, according to Age and other Accidents, in Syrup of *Violets*, *Clove-gilliflowers*, Wine, or other proper Vehicle, at Bed-time, it cauſes Reſt and Sleep, eaſes Internal Pains of the Bowels, opens Obſtructions of Liver, Spleen, Reins, Bowels and Womb, provokes the Terms, expels watery Humors out of the Body, prevails againſt the Dropſy, and reſiſts Poyſon, chiefly the Stinging of Scorpions, the Biting of the *Phalangium*, of Mad Dogs, and of other Venomous Creatures. Outwardly applied, or bathed upon any place pained, over-ſtrained or inflamed, it eaſes the Pain, abates the Inflammation, and ſtrengthens the Part grieved.

XII. *The Milky Juice inſpiſſated.* It may be inſpiſſated either in the Sun or in a Sand Furnace. If it is given from one Dram to two or more, according to the Judgment of the Phyſician, diſſolved in diſtilled Vinegar, it is ſaid to evacuate Water in Dropſies, to provoke Womens Courſes, and reſiſt Poyſon, and has indeed all the Virtues of the liquid Juice aforegoing. This Juice, diſſolved in White *Port* Wine, or White *Liſbon*, and a little Honey mixt therewith, being dropt into the Eyes, it does wonderfully ſtrengthen the Sight, and clears them from Miſts, Clouds, Films or Skins growing over them, and removes any thing which obfuſcates the Sight.

XIII. *The Decoction.* It may be made in Wine or Water. It has the Virtues of the liquid and inſpiſſated Juice; but as it is much weaker, ſo the Doſe muſt be much larger, as from three Ounces to four, five or ſix; and it is alſo the oftner to be repeated, as Morning and Night at leaſt.

XIV. *The diſtilled Water of the whole Herb.* It is ſingular good to quench Thirſt in any Burning or Peſtilential Fever: and this it will do more effectually, if a few Drops of Oil of Sulphur, or Vitriol, or Spirit of Salt, is dropt into it, and very well mixt therewith. This Water may be given from four Ounces to eight Ounces: if you pleaſe, you may ſweeetn it with a little double-refined Sugar.

XV. *The Pouder of the Seed.* It has the Virtues of the Juice and Decoction, but it cools not ſo powerfully. It is very grateful to a hot Stomach, troubled with Heart-burnings and Vapors aſcending from the Womb. If it is given at Night from half a Dram to a Dram in the diſtilled Water, or in any other Vehicle, it cauſes Reſt, and induces Sleep, and therefore is profitable for ſuch as are ſubject to much Watching.

XVI. The Cataplaſm. *It is made of the green Herb beaten in a Mortar, and brought to a Conſiſtence either with Barly-flower, or Crumbs of Barly or Wheaten Bread.* Applied to Inflammations in their beginning, it abates their Heat, and diſcuſſes them. Applied immediately upon a ſimple Contuſion, where the Skin is not broken, it hinders the Aggregation of Humors, abates the Swelling, and cures it: being applied to the Head in a Megrim, or other Head-ach, it preſently gives Eaſe of the Pain, more eſpecially if it proceeds from a hot Cauſe. Applied to Parts pained with the Gout, whether Hands, Arms, Knees or Feet, it preſently gives Eaſe to the Pain, and diſcuſſes the Tumor; and being continued for ſome time, does cure it, provided Univerſals and other proper Internals be uſed in the mean time. Applied to the Forehead and Temples in a Frenzy, it abates the Symptoms, and reſtores in a great meaſure the Patient to his Senſes again.

CHAP. CCCCXXXII.

Of LIGUSTICK, *OR,* Baſtard LOVAGE.

I. *THE Names.* It is called in *Greek* by *Dioſcorides*, Λιγυστικὸν; by *Galen*, Λιβυστικὸν; taking its Name from *Liguria*, the Country where the beſt of it, and the moſt ſtore of it grew, and there they call it, *Sier Montano*: in *Latine*, it is called, *Ligueſticum*, and *Libueſticum*, as *Matthiolus*, *Lugdunenſis*, *Caſtor Durantes*, and others have it: *Siler Montanum*, as *Tragus*, *Lobel*, *Dodonæus* and *Cluſius*

Latins have it: formerly in Shops, *Seſelies*, but falſely: for the true *Seſeli* or *Hartwort* is another Plant, as we have declared *Chap.* 342. aforegoing, for it is like none of the *Seſelies*: *Ser Montanum*, and *Ser Peloponenſe*, as *Caſalpinus* has it: *Pliny* ſays, that *Chaldeus* called it *Cunila bubula*; and ſome called it *Panaces*: we in *Engliſh* call it *Liguſtick*, *Libuſtick*, *Siler Mountain*, and *Baſtard Lovage*.

II. *The Kinds.* There are two ſorts of this Plant, *viz.* 1. *Liguſticum verum*; *Liguſticum latifolium*; *Liguſticum commune*; *Siler montanum vulgo Seſelios*, *Liguſticum ligurienſe*; The true Liguſtick, *or* Baſtard Lovage. 2. *Liguſticum Auſtriacum*; *Siler Montanum Auſtriacum*, *Siler Montanum Anguſtifolium*; Liguſtick, *or* Baſtard Lovage of Auſtria.

Liguſtick True or Common.

The Deſcriptions.

III. *The firſt, or* True Liguſtick, *or* Baſtard Lovage. *It has a Root which is long, great, and whitiſh on the outſide, of a hot ſharp Smell and Taſte, and abiding long in the Earth.* This *True Liguſtick of Liguria* riſes up with a round jointed Stalk, two or three Feet high, bearing both at the bottom and at the Joints, large, ſpread, winged Leaves, divided into many ſmall Leaves, whoſe ſmall Foot-ſtalks bear uſually two Leaves, and ſometimes four, ſet one againſt another, and three always at the end, each being much broader and ſhorter than *Sow Fennel* Leaves, almoſt equal to thoſe of *Melilot*, for which Reaſon it is called alſo *Latifolium*, or Broad-leaved, reſpect being had to the Breadth of the Leaves of the next following. Theſe Leaves, if they be a little rubbed, have a ſweet Smell. The Stalk ſpreads at top into a few Branches, bearing very large Umbels of white Flowers, and after them, long, thick, full, browniſh, yellow Seed, larger by half than *Cumin* Seed, two always joined together; ſtriped on both ſides, and winged with yellow ſhining Wings at the edges, and of a quick, ſharp, hot Smell and Taſte.

IV. *The ſecond, or* Auſtrian Liguſtick, *or* Baſtard Lovage. *This differs not much from the former, but that it is much leſſer, and comes not up to half the Height thereof, being not above a Foot and half high*; whoſe Stalk is alſo divided towards the top into Branches, which bear ſmall Umbels of white Flowers. It bears winged Leaves, (being but few) which are compoſed of many other Stalks of Leaves, growing not much unlike to the other, or like *Sow Fennel*, two Leaves, and ſometimes four or more, ſet one againſt another, and three generally at the end. Theſe Leaves are much ſhorter than thoſe of the former, and alſo narrower, for which Reaſon it is called by ſome Authors *Angueſtifolium*, or Narrow-leaved, reſpect being had to the Breadth of the Leaves of that juſt aforegoing. Theſe Leaves, as they grow nearer the top, are yet more finely cut, being narrower and leſſer.

Liguſtick Auſtrian.

V. *The Places.* The firſt is found growing Wild upon the *Appenine* Mountains or Hills in *Liguria*, within the Dominions of *Genoua*. The ſecond grows upon the Hills in *Auſtria*; but with us they both grow in Gardens, but do not often bear ripe Seed, unleſs the Seaſon be very kindly and warm.

VI. *The Times.* They flower from *June* to the end of *Auguſt*; and the Seed is found to ripen in the mean Seaſon.

VII. *The Qualities.* The Herb, Root and Seed are hot and dry in the third Degree. It is Aperitive, Aſtringent, Abſterſive, Carminative, Digeſtive, Diuretick, Cephalick, Neurotick, Stomatick, Nephritick, Hyſterick, Emmenagogick, Sudorifick and Alexipharmick.

VIII. *The Specification.* It expels Wind, eaſes the Colick, provokes Urine and the Terms, is good againſt Poyſon and the Bitings of Venomous Beaſts.

IX. *The Preparations.* You may prepare therefrom, 1. *A liquid Juice.* 2. *An Eſſence.* 3. *An*

Infuſion

Infusion or Decoction. 4. *A Pouder of Leaves or Seed.* 5. *An insolated Oil.* 6. *A distilled Water.* 7. *A Spirituous Tincture.* 8. *An Acid Tincture.* 9. *An Oily Tincture.* 10. *A Spirit.* 11. *An Oil distilled.* 12. *An Elixir.* 13. *A Cataplasm.*

The Virtues.

X. *The liquid Juice.* Taken in any proper Vehicle, it gives Ease in the Colick, expels Wind, provokes Urine and the Terms,and helps the Suffocation of the Womb. Dose two or three Spoonfuls or more in the distilled Water, or in Wine, or any other fit Vehicle.

XI. *The Essence.* It has all the Virtues of the liquid Juice, but more powerful to all those Intentions: it is of a warming and digesting Quality, gives Ease in the Gripings of the Guts, Pains of the Stomach, and Swellings proceeding from Wind. It prevails against the Bitings of Mad Dogs, Vipers, Rattle-Snakes, and other Venomous Creatures, and suppresses Vapors and Hysterick Fits in Womenkind. Dose two Spoonfuls or more.

XII. *The Infusion or Decoction of Herb, or Seed, or both.* It has all the Properties, Qualities and Virtues of the Juice and Essence, and may be given from two Ounces to four,Morning, Noon and Night, as occasion may require.

XIII. *The Pouder of the Seed.* If it is taken from half a Dram to a Dram and half, (according to Age) in a Glass of *Wormwood*-Wine, Morning and Evening, for some few Days before the expected time, it produces the Terms in Women in great abundance: it precipitates Vapors, and cures Hysterick Fits, causing the Womb to settle in its right place again. So drunk, it provokes Urine powerfully, and eases the Colick and Gripings of the Guts proceeding from Grossness and Crudity of Humors: it strengthens the Stomach, and causes a good Appetite and Digestion: it expels Wind, and discusses the Swelling of the Stomach.

XIV. The insolated Oil. *It is made of the bruised Seed, by Insolation, or Coction, or Digestion in a Sand Heat; one Pound of the bruised Seed being mixed with two Pounds of Oil of Ben, or choice Oil Olive.* It is Anodyne, and eases Pains and Aches proceeding from a cold Cause. It eases the Gout, and strengthens the Nerves, Tendons, and Parts afflicted.

XV. The distilled Water. *It may be made either from the whole Plant, being green, or from the Seed, according to the usual manner.* It has the same Virtues with the Juice, Essence, Decoction and Seed, but in a much lower Degree of Strength; and therefore is to be given in a much greater quantity: however, it may well serve as a Vehicle for to convey down into the Stomach some of the other Preparations.

XVI. *The Spirituous Tincture of the Seed.* It gives Ease in Colick Pains, strengthens the Stomach and other Bowels, expels Wind, and has all the Virtues of the Juice, Essence, Decoction, and Seed afore expressed, but this warms and strengthens more, and therefore is more profitable for cold Stomachs, and such as have a cold Constitution or Habit of Body. Dose two or three Drams in the Morning fasting, in a Glass of generous Wine.

XVII. *The Acid Tincture of the Seed.* It is good against Vomiting, represses Vapors and Fits of the Mother, provokes the Terms and Urine, facilitates the Birth, and brings away the After-birth. Dose so many Drops in a Glass of Wine as to make it pleasantly sharp.

XVIII. *The Oily Tincture of the Seed.* It eases the Strangury after an admirable manner, provokes Urine, and opens all Obstructions of the Urinary Parts, has all the Virtues of the Juice, Essence, Pouder, Spirituous and Acid Tinctures, brings away the After-birth, and gives Ease in the After-pains, tho' never so vehement. Dose from ten to twenty Drops in any proper Vehicle, Morning and Night, or at any time of Extremity.

XIX. *The Spirit of the Seed or Root.* It is Cordial, good against fainting and swooning Fits, Convulsions, Sickness at Heart, Coldness of the Stomach, want of Appetite, Wind in the Bowels, Colick, Pleurisy, Palsy, Lethargy, and the like cold and moist Distempers of the Head, Brain, Nerves and Bowels. Dose two or three Drams in a Morning fasting, also half an Hour before Dinner, or at time of any Paroxysm, either alone, (being dulcified) or mixt in a Glass of some Stomachick or Cordial Wine.

XX. *The Oil of the Seed by Distillation.* It has all the Virtues of Juice, Essence, Tinctures, Spirit, and is very powerful against the Palsy, so that there is scarcely a better Vegetable Medicament in the World: it is to be taken inwardly from eight Drops to sixteen, Morning, Noon and Night; first drop it into white Sugar, and mix it well with that, and then mix it with a Draught of choice White *Lisbon*, or other Stomatick Wine, and so let the Patient drink it. Outwardly you must also anoint it along the Back-bone, chiefly upon those *Vertebræ*, from whence those Conjugations of Nerves proceed, which repleniish the Parts afflicted; if all the Limbs are affected, then it will be necessary to anoint the whole Back-bone, from the very Nape of the Neck, almost to the *Anus*, which is to be done twice a Day, and to be very well rubbed in, for almost a quarter of an Hour at a time; and besides the *Spina dorsi*, the Parts or Limbs afflicted are also to be anointed therewith in like manner. This Oil is very hot, and therefore some tender Constitutions may not be able to bear it, being used alone: in this Case, it will be necessary to mix it with some other Chymical Oil less hot, which may be also penetrating and efficacious to the same Intention, as Oils of *Turpentine*, of *Anise*, of *Fennel*, or *Sassafras*, &c.

XXI. *The Elixir of the Seed.* It is efficacious to all the Purposes afore-mentioned, but is not so strong as the distilled Oil; but in Lethargies, Palsies, Convulsions, Faintings, Swoonings, Sickness at Heart, Colicks, Gripings of the Guts, Pleurisies, Stitches, Hystericks, Hypochondriacks, Strangury, Vomiting, Weakness of the Stomach, want of Appetite and Digestion, you may give it Morning and Night, or in time of the Paroxysm, from twenty to fifty Drops, in a Glass of Wine, or other fit Vehicle.

XXII. *The Cataplasm of the Root.* It is excellent against the Bitings of Mad Dogs, Vipers, Rattle-Snakes, and other Venomous Creatures, being beaten raw in a Mortar, and applied warm to the Part hurt: if it is made with equal parts of *Garlick*, it will be so much the more effectual.

CHAP. CCCCXXXIII.

Of the LILLY White.

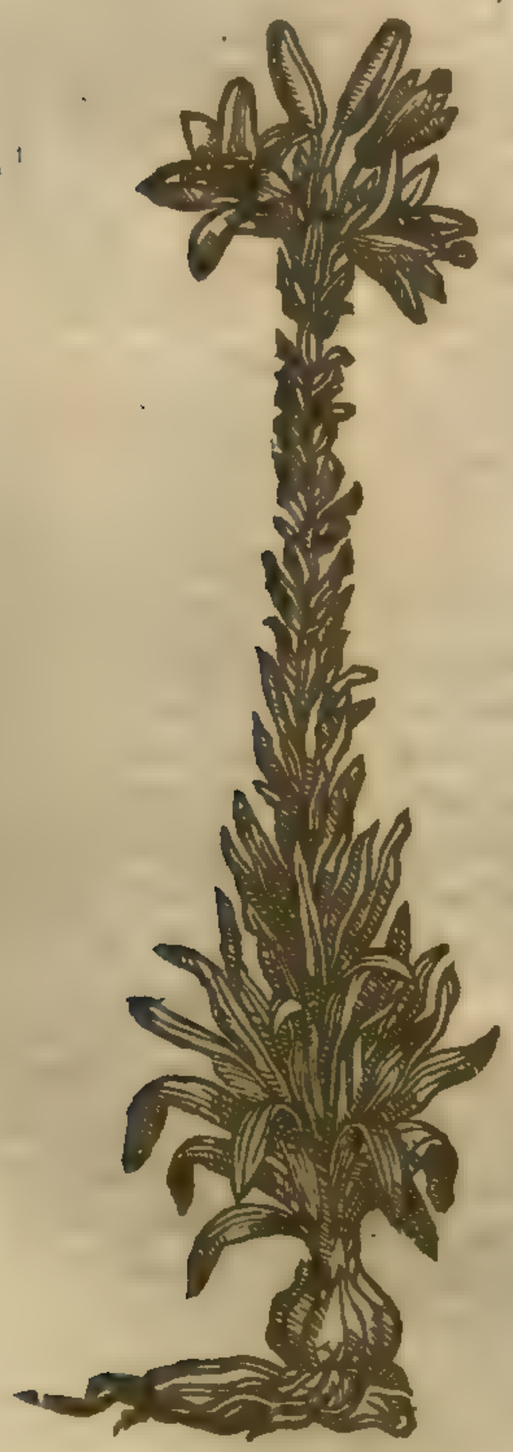
I. *THE Names.* Of the *Lilly* there are many Species or Kinds: the Names of all which in general, are, in *Arabick*, *Susen*: in *Greek*, Κρίνον: in *Latine*, *Lilium*; and in *English*, *Lilly*.

II. *The*

II. *The Kinds.* There are ſeveral generick Species of *Lillies*, *viz.* 1. Κρίνον λευκὸν, *Lilium album*, The White Lilly. 2. Κρίνον κλωσὸν, ξανθὸν, *Lilium luteum & rubrum*, The Yellow and Red Lilly: of which in Chap. 434. 3. Κρίνον θεῖον, *Lilium Montanum Martagon*, The Mountain Lilly, *or* Martagon: of which in Chap. 435. 4. Κρίνον Βυζαντινὸν, *Lilium Turcicum, vel Byzantinum*, The Turky Lilly: of which in Chap. 436. 5. Κρίνον περσικὸν, *Lilium Perſicum*, The Perſian Lilly: of which in Chap 437. 6. Κρίνον πρώϊμον, *Lilium Præcox, vel Pomponeum*, The Pomponian or Early Lilly: of which in Chap. 438. 7. Κρίνον βασιλικὸν, *Lilium Imperiale, Corona Imperialis*, The Imperial Lilly, *or* Crown Imperial: of which in Chap. 439. 8. *Lilium Americanum vel Floridianum*, The American or Floridian Lilly: of which in Chap. 440. 9. Ἡμεροκαλλὶς, *Lilium non bulboſum, Liliaſtrum, Liliaſphodelus*, The Baſtard or Day Lilly: of which in Chap. 441. 10. Κρίνον ὑδατῶδες λευκὸν, *Lilium aquaticum album*, The White Water Lilly: of which in Chap. 442. 11. Κρίνον ὑδατῶδες κλωσὸν, *Lilium aquaticum luteum*, The Yellow Water Lilly: of which in Chap. 443. 12. Κρίνον τῆς γυναικείας ἢ τῶν γυναικῶν, *Lilium Convallium*, Lilly of the Vallies: of which in Chap. 444. following.

III. *The Kinds of the White Lilly.* Authors have taken notice of three ſeveral ſorts of this Plant, *viz.* 1. *Lilium album vulgare, Roſa Junonis*, The Common White Lilly. 2. *Lilium album flore pleno*, The Double White Lilly. 3. *Lilium album Byzantinum*, The Conſtantinople White Lilly.

Common White Lilly.



The Deſcriptions.

IV. *The firſt, or* Common White Lilly. *It has a cloved ſcaly Root, larger and yellower than any of the* Red Lillies. The Stalk is of a blackiſh green Color, tall, and riſes as high as moſt of the *Lillies*, having many fair, broad, and long green Leaves thereon, larger and longer beneath, and ſmaller upon the Stalk upwards: the Flowers are many or few, according to the Age of the Plant, Fertility of the Soil, and Time of ſtanding where it grows: they ſtand upon long green Foot-Stalks, of a fair white Color, with a long Pointel in the middle, and white Chives, tipt with yellow Pendents about it. The Smell is very pleaſant and ſweet.

V. *The ſecond, or* Double White Lilly. *It is in all things like the before deſcribed* White Lilly, *the Flowers only excepted, which in this are usually five or ſix on one Stalk, and all of them conſtantly double*, conſiſting of many ſmall, long, white Leaves, which grow on their Foot-Stalks, one above another, forming a double Flower: their Leaves are long, green before they open, and afterwards turn white; but unleſs the Seaſon is very fair, they never open at all. This is eſteemed for the Rarity of the double Flowers, more than for any Beauty which is in them.

VI. *The third, or* Conſtantinople White Lilly. *This other* White Lilly *differs but little from the firſt of theſe, either in Root, Leaf or Flower*; ſaving only that this grows with a greater number of Flowers than ever was ſeen in the *Common White Lilly*: the Stalk of this *Lilly* many times turns flat, of the Breadth of an Hand, bearing ſometimes near two hundred Flowers upon an Head; but moſt commonly it bears not above a dozen or twenty Flowers, which are ſmaller than the ordinary, as the green Leaves alſo are.

VII. *The Places.* They all grow in Gardens with us: but the third was ſent hither firſt from *Conſtantinople*, and they flouriſh here as well as in the places of their natural Growth.

VIII. *The Times.* They flower in *June* and *July*; but ſhoot forth green Leaves in *Autumn*, which abide green all the Winter, the Stalk ſpringing up between the lower Leaves in the Spring.

IX. *The Qualities.* 'Tis the Roots of *Lillies* which are chiefly uſed; but both Roots and Flowers are hot and moiſt in the firſt Degree, Emollient, Suppurative, and Alexipharmick.

X. *The Specification.* It is of great Uſe to ripen and digeſt Tumors and break Apoſtems, reſiſts the Plague or Peſtilence, and prevails againſt the Dropſy.

XI. *The Preparations.* You may have therefrom, 1. *A liquid Juice of the Root.* 2. *Bread made with the Juice.* 3. *A Cataplaſm of the Roots with Honey.* 4. *A Cataplaſm of the Roots with Henbane Leaves.* 5. *A Cataplaſm of the Roots roſted or boiled.* 6. *A Decoction of the Leaves in Red Wine.* 7. *A Cataplaſm of the Leaves boiled.* 8. *An Oil of the Flowers by Inſolation.* 9. *A diſtilled Water of the Flowers.*

The Virtues.

XII. *The liquid Juice of the Root.* If it is ſtamped and ſtrained out with Wine, (for it is of too ſlimy a Subſtance of it ſelf) and given to drink for ſome few Days together, it expels the Poyſon and Malignity of the Plague or Peſtilence, and cauſes it to break forth into Bliſters on the outward parts of the Skin, as has been found by Experience.

XIII. The Bread made with the Juice. *Take Barly-Flower, and with Juice of White Lilly-Roots, make it into Paſte or Dough, of which make Cakes, and bake them.* The Bread ordinarily eaten (as *Gerard* ſays) for ſix Weeks or ſome Months together with Meat, (abſtaining from all other Meat the mean while) does cure the Dropſy; and that it had cured many of that Diſeaſe.

XIV. *The Cataplaſm of the Roots with Honey.* The Roots being beaten in a Mortar with Honey, and

and applied to ſimple green Wounds, or Sinews cut aſunder, is ſaid to conglutinate them, or join them together again. It cleanſes thoſe Ulcers of the Head called *Achores*, or Scald-head, and the Mangineſs or Scabbineſs of the Beard and Face, called *Mentagra*.

XV. *The Cataplaſm of the Roots with Henbane-Leaves.* It is made by ſtamping the Roots with *Henbane* Leaves and *Barley* Flower. Being applied, it cures Tumors and Apoſtems of the privy Parts: it brings Hair again upon bald places, and places which have been burned or ſcalded, being mixt with Bears Oil or Greaſe, and ſo applied to the place.

XVI. *The Cataplaſm of the Roots roaſted, baked, or boiled.* The Roots ſo prepared, are to be beaten into a Cataplaſm with Crums of *Rye*-Bread, or Hogs-Lard, or Oil of *Lilly*-Roots. Being applied to any Peſtilential Bubo or Sore, it ripens and breaks it: it alſo ripens and breaks other Tumors or Apoſtems in the Groin, or in other Parts, proceeding from the Venereal Diſeaſe, or any other Cauſe.

XVII. *The Decoction of the Leaves.* It is made by boiling them in Red Wine. If old running Sores, or putrid Ulcers, be often waſhed herewith, it cleanſes and drys them, and induces a ſpeedy Cure.

XVIII. *The Cataplaſm of the Leaves.* It is made of the former Leaves, boiled in Red Wine, as aforeſaid. Applied to rotten putrid Ulcers, or to Ulcers, or Wounds undigeſted, it cauſes Digeſtion, cleanſes them from their Filth, and cauſes them ſuddenly to heal.

XIX. *The Oil of the Flowers by Inſolation or Boiling.* It is made with Oil Olive, or rather Oil of Ben, which will not grow rank, by Infuſion in the Sun, or in a boiling *Balneo*, or in a Sand Heat, repeating the Infuſion or Digeſtion two, or three, or more times. It is emollient, and ſoftens the Hardneſs of the Nerves, and extends Sinews ſhrunk: it alſo ſoftens the Hardneſs of the Womb. You may make an Oil alſo of the Roots, after the ſame manner, and for the ſame Purpoſes: it is good to bring to Digeſtion and Suppuration, Tumors and Apoſtems, and to ſoften hard Swellings.

XX. *The diſtilled Water of the Flowers.* According to *Julius Alexandrinus*, being drank from four Ounces to eight, it cauſes a ſpeedy and eaſy Delivery to Women in Labor, and expels the Secundine and After-birth with much Facility, as *Matthiolus* and *Camerarius* report. It is uſed alſo outwardly as a Coſmetick to cleanſe the Face and Skin, and make them freſh, white and clear.

CHAP. CCCCXXXIV.

Of LILLY Yellow *or* Red.

I. *THE Names.* It is called in *Greek*, Κρίνον κλωβὸν, ἢ ἐυθὺν: in *Latine*, *Lilium Luteum, vel Rubrum*; and in *Engliſh*, *The Yellow, or Red, or Orange-tawney Lilly.*

II. *The Kinds.* The following Sorts offer themſelves to our View. 1. *Lilium Aureum*, The Golden, or Orange-tawney, Yellow or Red Lilly: This is *Lilium Aureum majus Tabernæmontani*, *Hemerocallis Matthioli*; *Martagon Chymiſtarum Lobelij*; and *Porta* thought it to be the *Hyacinthus* and *Coſmoſandalos* of the Poets. 2. *Lilium pumilum cruentum*; *Lilium purpureum minus*, The Dwarf Red Lilly. 3. *Lilium rubrum flore multiplici*, The double-flowered Red Lilly. 4. *Lilium majus bulbiferum*, The greater bulbed Red Lilly. 5. *Lilium minus bulbiferum*, The Dwarf or leſſer bulbed Red Lilly. 6. *Lilium cruentum bulbiferum*, *Martagon bulbiferum Claſij*, The Fiery-red bulbed Lilly. 7. *Lilium cruentum flore pleno*, The Fiery-red double Lilly not bulbed.

Orange-tawney, Yellow or Red Lilly.

The Deſcriptions.

III. *The firſt, or* Golden, or Orange-tawney, Yellow or Red Lilly. *It has a Root which is white and ſcaly; it grows much higher than the next following, and nearly as high as the* Common White Lilly, *or any other* Lilly. The Leaves are ſomewhat longer, and very much narrower, of a dark or ſad green Color: the Flowers are many and large, ſtanding upright, as all theſe Sorts of *Red Lillies* do, of a paler red Color, tending to an *Orange* on the inſide, with many black Spots and Lines on them, as in the following, and more yellow on the outſide. The Seed-Veſſels are like unto the roundiſh Heads of other *Lillies*, and ſo are the Seeds in them likewiſe.

IV. *The ſecond, or* Dwarf or low Red Lilly. *This has a ſcaly Root, like unto other* Lillies, *but white, and not yellow at all; and the Cloves or Scales thicker, ſhorter, and fewer in number than in moſt other* Lillies. The Stalk is ſeldom above half a Yard high, unleſs it grows in extraordinary Ground ſuited to the Nature of the Plant; it is round and green, ſet confuſedly with many fair and ſhort green Leaves, on the top of which do ſtand ſometimes but a few Flowers, and ſometimes many, of a fair purpliſh red Color, and a little paler in the middle, every Flower ſtanding upright, and not hanging down: on the Leaves whereof, here and there, are ſome black Spots, Lines or Marks; and in the middle of the Flower, a long Pointel, with ſome Chives about it, as is in the reſt of theſe *Lillies.*

V. *The third, or* Double-flowered Red Lilly. *This Kind is ſometimes found to yield double Flowers, as if all the ſingle Flowers ſhould grow into one*, and ſo make it to conſiſt of many Leaves, which notwithſtanding

withſtanding its ſo continuing for ſeveral Years, will yet upon Tranſplanting *redire ad ingenium*, viz. quickly come or return to its old Form again.

VI. *The fourth, or* Greater bulbed Red Lilly. *It riſes up with a ſtrong high Stalk, and is the moſt common Kind of the* Lillies *bearing Bulbs.* It has many Leaves about the Stalk, but not of ſo ſad a green Color as the following, or ſome others. The Flowers are of as pale reddiſh yellow Color as any of the following, and come neareſt to the Color of the firſt, or *Golden or Orange-tawney Lilly.* This is more plentiful in Bulbs among the uppermoſt Leaves, than any of the others; as alſo in ſhooting forth Fibres or Strings, to encreaſe the Roots under Ground.

VII. *The fifth, or* Dwarf *or* Leſſer bulbed Lilly. *It has a white bulbed ſcaly Root, like other* Lillies, *and bears Bulbs on its Stalk, which riſes up ſmall and round, not much higher than the ſecond, or* Dwarf Lilly *afore-deſcribed, ſeeming to be edged, and having many Leaves thereon, of a ſad green Color, ſet about it, thruſt cloſe together.* The green Heads for Flowers have a kind of Woolineſs on them, before the Flowers begin to open, and between theſe Heads of Flowers, as alſo under them, and among the uppermoſt Leaves, appear ſmall Bulbs or Heads, which being ripe, if put into the Ground, or if they fall of themſelves, will ſhoot forth Leaves, and bear Flowers, within two or three Years, like the *Maternal* or *Mother Plant*; and ſo will the Bulbs of that juſt before-deſcribed, and of theſe other which immediately follow. The Flowers of this *Lilly* are of a fair Gold-yellow Color, ſhadowed over with a ſhew of Purple, but not ſo red as the firſt, or the next to be deſcribed. This *Lilly* ſhoots Strings under Ground, like as the laſt *Red Lilly* will do alſo, at which will grow white bulbed Roots, like the Roots of the *Maternal* or *Mother Plant*, and ſo thereby, in a ſhort time, encreaſes it ſelf.

VIII. *The ſixth, or* Fiery-red bulbed Lilly. *This third* Bulbed Lilly *riſes up with its Stalk as high as any of theſe* Lillies, *carrying many long and narrow dark green Leaves about it,* and at the top many fair red Flowers, as large or larger than any of the former, and of a deeper red Color, with Spots on them likewiſe, having greater Bulbs growing about the top of the Stalk, and among the Flowers, than any elſe.

IX. Mr. *Rea* deſcribes it thus: *The* Fiery-red bulbed Lilly *riſes up from a great ſcaly Root, (as all the* Lillies *have) with a ſtrong tall Stalk, ſet with many ſtrong dark green Leaves, and at the top adorned with many large Flowers, each compoſed of ſix broad thick Leaves, of a fiery-red Color at the tops, and towards the bottoms of an* Orange *Color, with ſmall black Specks, bearing among the Flowers, and along the Stalk, divers Bulbs, like little Roots, which being ſet, in time, will bring forth Flowers, like unto thoſe of the Original.*

X. *The ſeventh, or* Fiery-red double Lilly not bulbed. *This* Lilly *is without Bulbs; and the chief Difference thereof does conſiſt in the Flower,* which is compoſed of many Leaves, as if many Flowers went to make one, when it thus beareth, which is but accidental, as the former double *Lilly* is ſaid to be.

XI. Mr. *Rea* thus deſcribes it: *This* Double Red Lilly *is like unto the former in Root, Stalk and Leaves, but without Bulbs, not ſo big, nor of ſo dark a green Color. It commonly bears many* Orange-*colored ſingle Flowers on one Stalk, with many ſmall brown Specks on the inſides thereof, and ſometimes but one fair double Flower, as if the Leaves of many Flowers were united in one, which altho' it be but accidental, yet it happens in this Kind more frequently than in any other* Red Lilly; *for if you have many Roots of this ſort, you will always have ſome double Flowers, and many more in ſome Years than in others.*

XII. *The Places.* The Native places of the Growth of theſe *Lillies*, are on the Mountains, and in the Vallies near them in *Italy*, as *Matthiolus* ſays, and in many Countries of *Germany*, as *Auſtria, Bohemia, Hungaria, Stiria*, as *Cluſius* and others report; and with us they grow almoſt in all Gardens, where they admirably thrive.

XIII. *The Times.* Theſe *Red* or *Yellow Lillies* flower a little before the *White Lillies*, and ſometimes together with them; but they flower for the moſt part in *June*; but the ſecond of them, or *Dwarf Red Lilly*, is the earlieſt of all the reſt.

XIV. *The Qualities.* The Flowers of the *Red Lilly* are hot in the firſt Degree, and temperate in reſpect to Dryneſs or Moiſture, of a thin and ſubtil Subſtance. The Roots and Leaves are hot and dry in the firſt Degree, Diſcuſſive, Digeſtive, and Abſterſive, Vulnerary, and Alexipharmick; and indeed theſe Plants have almoſt all the ſame Qualities and Virtues of the *White Lilly*, but not all out ſo efficacious or powerful.

XV. *The Specification.* The *Red Lilly* is a peculiar thing for the Cure of Burnings, Scaldings, green Wounds, and Wounds made by Venomous Beaſts.

XVI. *The Preparations.* You may make therefrom all the ſame Preparations which you make from *White Lillies*; but theſe following are uſual, *viz.* 1. *A Cataplaſm of the Leaves.* 2. *A boiled Cataplaſm of the Leaves.* 3. *A Cataplaſm of the Root with Oil of Roſes.* 4. *A Cataplaſm of the Root with Honey.* 5. *A Cataplaſm of the Root with Vinegar and Henbane-Leaves.* 6. *A Cataplaſm of the Roots boiled in Wine.* 7. *A Decoction of the Roots in Wine or Honied-Water.* 8. *A Juice of the Roots in Mead or Honied-Water.*

The Virtues.

XVII. *The Cataplaſm of the Leaves.* It is made by bruiſing them raw in a Mortar. Applied to places bitten by Serpents or Mad Dogs, it is ſaid to draw out the Venom and heal them.

XVIII. *The boiled Cataplaſm of the Leaves.* It is made by boiling them in Vinegar. It is good againſt Burnings and Scaldings, and to heal green Wounds; alſo to cleanſe, dry, and heal old Ulcers.

XIX. *The Cataplaſm of the Root with Oil of Roſes.* It is made by roaſting it in the Embers, and beating it up with Oil of Roſes. Applied, it cures Burnings and Scaldings, and ſoftens a *Scirrhus*, or Hardneſs of the Womb.

XX. *The Cataplaſm of the Root with Honey.* It is made of the roaſted Root, beaten up with Honey. It ſtrengthens and confirms Parts out of Joint, or Joints new Set, heals wounded Nerves, and takes away Scurf, Morphew, Diſcolorings, and other Deformities of the Skin.

XXI. *The Cataplaſm with Vinegar.* It is made with the roaſted Root, (or raw, as ſome uſe it) beaten up with Vinegar, *Henbane*-Leaves, and Crumbs of white Bread. Applied, it diſcuſſes and cools hot Tumors of the Groin, Teſticles, Yard, and Womb.

XXII. *The Cataplaſm of the Roots boiled in Wine.* Being beaten up, and applied to Corns of the Feet and Toes, it is ſaid to take them away in a few Days time, renewing the Application Morning and Night till the Cure is effected.

XXIII. *The*

XXIII. *The Decoction of the Roots in Wine or Honied-Water.* Being drunk to ſix, eight or ten Ounces, according to Age and other Circumſtances, it is ſaid to help the Bloody-flux, and expel clotted Blood out of the Bowels.

XXIV. *The Juice of the Root extracted with Mead or Honied-Water.* It purges gently, eaſes the Colick, and cleanſes the Bowels of ſharp, acrid and putrid Humors, and carries off the Morbifick Cauſe of a Bloody-flux.

CHAP. CCCCXXXV.

Of the LILLY Mountain, *OR,* MARTAGON.

I. *THE Names.* It is called in *Greek*, Κεῖνον ὄεῖνον: in *Latine*, *Lilium Montanum*, and *Martagon*: in *Engliſh*, *The Mountain Lilly*, and *Martagon*, alſo *Martagon Lilly*.

II. *The Kinds.* There are many ſorts of theſe *Martagons* or *Mountain Lillies*, viz. 1. *Martagon flore albo majus*, *Lilium Montanum majus flore albo*, of ſome *Martagon Imperiale flore albo*, The great white Martagon, *or* Great white Mountain Lilly. 2. *Martagon flore albo maculato*, The white ſpotted Martagon, *or* Mountain Lilly. 3. *Martagon flore Carneo*, The Bluſh or Fleſh-colored Martagon, *or* Mountain Lilly. 4. *Lilium Montanum minus*, *Lilium ſylveſtre minus*, *Hemerocallis Dodonæi*, The leſſer Mountain Lilly. 5. *Martagon luteum punctatum*, The yellow ſpotted Martagon. 6. *Martagon luteum non maculatum*, The yellow ſpotleſs Martagon. 7. *Martagon luteum ſerotinum*, The late-flowering yellow Martagon. 8. *Lilium Montanum non maculatum*, The ſmall Mountain Lilly not ſpotted.

The Deſcriptions.

III. *The firſt*, *or* Great white Martagon, *or* Great white Mountain Lilly. *The Root of this, as alſo of the two next which follow, are of a pure yellow Color, the Cloves or Scales of them being brittle, and not cloſely compact, yet ſo as if two, and ſometimes three Scales or Cloves grew one upon the Head or upper part of another; which Difference is a ſpecial Note to know theſe three Kinds, from any other Kind of* Mountain Lilly, *as in all old Roots are to be ſeen, as alſo in thoſe which are reaſonably well grown, which in young Roots is not yet ſo evident.* This has its Stalk and green Leaf greater than thoſe of the *Martagon Imperial* in *Chap.* 439. following; the Stalk is a little higher, but not bearing ſo thick a Head of Flowers, altho' much more plentiful than in the *Leſſer Mountain Lilly* at *Sect.* 6. following; being altogether of a fine white Color, without any Spots, or but very few, and thoſe but ſometimes alſo. The Pendents in the middle of this Flower are not red, as the *Martagon Imperial*, but yellow.

IV. *The ſecond*, *or* White ſpotted Martagon, *or* Mountain Lilly. *Its Root is variouſly cloved, like the former, as aforeſaid; and the Plant it ſelf is like unto it in all things, excepting in this*, that the Flowers hereof are not altogether ſo white, and beſides, it has many reddiſh Spots on the inſide of the Leaves of the Flower: the Stalk likewiſe is not ſo green, but browniſh.

V. *The third*, *or* Bluſh or Fleſh-colored Martagon, *or* Mountain Lilly. *The Root of this, as is ſaid, is like the firſt, and in all its other parts it is like to that, ſaving*, that the Flowers of this are wholly of a decayed or pale Fleſh Color, with many Spots upon them, and in this it only or chiefly differs from the former.

VI. *The fourth*, *or* Leſſer Mountain Lilly. *This* Lilly *is ſo like in Root to the* Martagon Imperial, *or* Greater Mountain Lilly, *in* Chap. 439. *following, that it is difficult to diſtinguiſh them aſunder; but when this is ſprung up out of the Earth, which is about a Month after the ſaid* Imperial. It alſo bears its Leaves in Rundles about the Stalk, altho' not altogether ſo great and ſo many. The Flowers are more thickly ſet on the Stalks, one above another, with more diſtance between each Flower, than the former, and are of a little deeper Fleſh or Purple Color, ſpotted in the ſame manner. The Buds or Heads of Flowers in ſome of theſe, before they are blown, are hoary, white or hairy, whereas in others there is no Hoarineſs at all; but the Buds are ſmooth and purpliſh; in other Particulars this differs not from the former.

VII. *The eighth*, *or* Small Mountain Lilly not ſpotted. *This differs not from the laſt, neither in Roots, Stalks, Leaves, Flowers, or manner of Growing, ſaving*, that the Color of the Flower in this is paler, and that it has no Spots upon it, or if it has any, they are but very few.

VIII. *The fifth*, *or* Yellow ſpotted Martagon. *It has a great ſcaly or cloved Root, and yellow, like unto all theſe ſorts of Turning* Lillies, from whence ſprings up a round, green, ſtrong Stalk, three Feet high at leaſt, confuſedly ſet with long, narrow, green Leaves, white on the edges, up to the very top thereof almoſt, having ſeveral Flowers on the Head, turning up again, as other *Martagons* do, of a faint yellowiſh, or greeniſh yellow Color, with many black Spots or Strakes about the middle of the Leaf of every Flower, and a forked Pointel, with ſix Chives about it, tipt with reddiſh Pendents, of a ſtrong ſweet Smell, very pleaſant to ſome, tho' not to others, who love not the beſt Smells, if they be ſtrong and pungent. It bears a great plenty of Seed, in great Heads, like unto other *Lillies*, but a little paler.

IX. *The ſixth*, *or* Yellow ſpotleſs Martagon. *This Plant, in its Root, Stalk, Leaves, Flowers, Seed, and manner of its Growing, differs not from the* Lilly *laſt deſcribed*, excepting only that the Flowers of this have no Spots at all upon any of their Leaves; in all things elſe it is exactly alike.

X. *The ſeventh*, *or* Late-flowering yellow Martagon. *This is the third* Yellow Martagon, *which is a Species of the fifth Kind at* Sect. 8. *above*; but there is no other Difference betwixt this and that, ſaving only in its time of Flowering, which is not until *July*, and that its Color is of a deeper Yellow.

XI. *The Places.* The firſt, ſecond, third, fourth, and eighth Sorts have been found in ſeveral Countries of *Germany*, as *Auſtria*, *Hungary*, *Stiria*, &c. but are all made Denizons of our Gardens near *London*, where they are now become Natives, and flouriſh as well here as in the places of their natural Growth. The fifth, ſixth, and ſeventh, have been found to grow on the *Pyrenæan* Mountains, as alſo on Mountains in the Kingdom of *Naples*, from whence they have been brought home to us, with whom they thrive alſo very well.

XII. *The Times.* The firſt, ſecond, third, fourth,

and eight. flower about the latter end of *June*, for the moſt part, and flower ſooner than the *Martagon Imperial* in *Chap.* 420. following, tho' that ſprings out of the Ground a Month before theſe at the leaſt, it being the more early up, yet never the nearer. The fifth and ſixth *Yellow Martagons* flower ſomething more early than the *Red Martagons*, and ſometimes at the ſame time with them. The ſeventh, or *Late-flowering yellow Martagon*, flowers a Month later or more, and is in Flower when the *Red Martagon* of *Conſtantinople* flowers, which is in *July*.

XIII. *As to the Qualities, Specification, Preparations and Virtues* of theſe, as alſo of thoſe in the five following Chapters, Authors have ſaid nothing at all, ſo that we have not much to write concerning them, as having had no Experience of them; but if one may be allowed to judge of them, by the uſual Criterions, then we muſt allow them to be much of the Nature and Quality of the *White* and *Orange Lillies* before-deſcribed, whoſe Virtues in their reſpective Chapters aforegoing are at large laid down.

CHAP. CCCCXXXVI.

Of the LILLY Turky, OR, Byzantine MARTAGON.

I. *THE Names.* It is called in *Greek*, Κρίνον Βυζαντινὸν: in *Latine*, *Lilium Turcicum*, *Lilium Byzantinum*, *Lilium vel Martagon Conſtantinopolitanum*: in *Engliſh*, *The Turky Lilly*.

II. *The Kinds.* There are no great Varieties of this Plant; yet as few as there are, Authors deliver them confuſedly, theſe following are the chief or moſt obſerved, *viz.* 1. *Lilium rubrum Byzantinum*, *Hemerocallis Chalcedonica*, *Martagon Conſtantinopolitanum rubrum*, The Red Turky Lilly, *or* Red Martagon of Conſtantinople. 2. *Lilium rubrum Byzantinum maculatum*, *Martagon rubrum Conſtantinopolitanum maculatum*, The Red ſpotted Turky Lilly, *or* Red ſpotted Martagon of Conſtantinople. 3. *Lilium Byzantinum flore purpureo ſanguineo*, The purpliſh ſanguine colored Turky Lilly. 4. *Lilium Byzantinum flore dilute rubente*, The light Red Turky or Byzantine Lilly. 5. *Lilium Byzantinum miniatum Polyanthos*, The Vermilion many-flowered Turky or Byzantine Lilly. The *Turks* call theſe *Lillies*, *Zuffiniare* or *Zuffinare*. 6. *Martagon flore ſpadiceo Pannonicum*, The bright Red Martagon of Hungary.

The Deſcriptions.

III. *The firſt, or* Red Turky Lilly, *or* Red Martagon of Conſtantinople. *It has a great, thick, yellow, ſcaly Root, which ſends out early in the Spring, before many other* Lillies, *a round browniſh Stalk, beſet with many fair green Leaves confuſedly thereon, but not ſo broad as the* Common White Lilly; upon the top of which ſtands one, two, or three, or more Flowers, which hang down their Heads, and turn up their Leaves again, of an excellent Red Crimſon Color, and ſometimes paler, having a long Pointel in the middle, compaſſed with ſix whitiſh Chives, tipt with looſe yellow Pendents, of a pretty good Smell, but ſomething faint. After the Flowers, come Heads or Cods of Seed, like to other *Lillies*, but greater. It is a fair beautiful Flower, and was at firſt very much eſteemed with us, and yet notwithſtanding its Increaſe and Plenty, deſerves its Commendations; for its being ſo common every where, and ſo well known, does not at all diminiſh from its Excellency.

IV. *The ſecond, or* Red-ſpotted Turky Lilly, *or* Red-ſpotted Martagon of Conſtantinople. *This is another of the former Kind, and grows ſomething greater and higher, with a larger Flower, and of a deeper Color*, ſpotted with ſeveral black Spots or Strakes and Lines, as are to be ſeen in the *Mountain Lillies*, and in ſome other Kinds, which is not ſo in the former but juſt now deſcribed, that having no ſhew of Spots at all. This whole Plant is rare, and of much more Beauty than the former.

V. *The third, or* Purpliſh Sanguine-colored Turky Lilly. *It has a large* Lilly *like Root, from which ariſes a Stalk a Foot and half or two Feet high*, ſet confuſedly with Leaves, like the firſt above: the Flowers alſo reſemble thoſe before deſcribed in *Sect.* 3. but are uſually more in Number, and of a purpliſh Sanguine Color.

VI. *The fourth, or* Light Red Turky or Byzantine Lilly. *This is very like the laſt in Root, Stalk, Leaves, Flowers, and Seed, ſaving*, that in the Color of the Flowers, theſe are of a lighter Red than thoſe firſt deſcribed in *Sect.* 3. aforegoing: the Leaves and Stalks alſo, as *Cluſius* obſerves, are of a lighter green Color.

VII. *The fifth, or* Vermillion many-flowered Turky or Byzantine Lilly. *This is alſo a Variety of the firſt, but according to* Cluſius, *the Difference is in theſe things*, that the Flowers grow equally from the top of the Stalk, and the middle Flower riſes higher than any of the reſt, and ſometimes conſiſts of twelve Leaves, as it were a Twin, which thoſe who obſerve it, will find.

VIII. *The ſixth, or* Bright Red Martagon of Hungary. *This ſeems to be a Species of the firſt, (tho' it may grow in* Hungary) *by reaſon of the Likeneſs both of Leaf and Flower thereunto.* Its Root is very like the ſame, but the Leaves are ſomething larger, and more ſperſedly ſet upon the Stalks, elſe not much unlike. The Flowers bend down, and turn up their Leaves again, but ſomewhat larger, and of a bright Red, tending to an *Orange* Color, *viz.* ſomewhat yellowiſh, and not Crimſon, like the other.

IX. *The Places.* The firſt, ſecond, third, fourth, and fifth, grow naturally in *Turky*, at or near *Conſtantinople*, formerly called *Byzantinum*: the laſt on the Mountains or Hills of *Hungary*, but now they are made free Denizons in our *Engliſh* Gardens.

X. *The Times.* They generally flower in *June*, when other *Lillies* do, ſome earlier, others later, and continue flowering till the beginning of *July*.

XI. *Their Qualities, Specification, Preparations, and Virtues*, have not been obſerved in any Author, yet they all ſeem to be of the Nature and Properties of the *Common White* and *Red Lilly*.

CHAP. CCCCXXXVII.

Of the LILLY Perſian.

I. *THE Names.* It is called by the *Perſians* or *Turks*, or ſome coming from thence, *Pennaco*,

naco, or *Pennacio*, or *Pennachio Persiano*: in *Greek*, Κεῖνον περσικὸν: in *Latine*, *Lilium Persicum*, *Lilium Susianum*, (as coming from the City *Susa*, or the Province *Susiana*, in *Persia*:) in *English*, *The Persian Lilly*.

II. *The Kinds.* It is a singular Plant of its Kind, but the fifth of the generick Species of *Lillies*. *Clusius* says it was sent into the *Low Countries* under the Name of *Susam Guil*, for which Reason he thought it might come from *Susa*, the chief City of *Susiana*, in *Persia*.

The Description.

III. *Its Root is very like unto the Root of the* Crown Imperial *described in* Chap. 177. *aforegoing, and loosing its Fibres in like manner every Year, having a Hole therein likewise, where the old Stalk grew, but whiter, rounder, a little longer, smaller, and not stinking at all like it.* From whence springs up a round, whitish green Stalk, not much lower than the *Crown Imperial*, but much smaller, beset from the bottom to the middle thereof, with many long and narrow Leaves, of a whitish or blewish green Color, almost like to the Leaf of a *Tulip*. From the middle upwards, to the top of the Stalk, grow many Flowers, one above another, round about it, with Leaves at the foot of every one of them, each whereof is pendulous, or hanging down the Head, like unto the *Crown Imperial*, not turning up any of the Flowers again, but smaller than in any other Kind of *Lilly*, not altogether so large as the Flower of a *Fritillaria*, consisting of six Leaves a piece, of a dead or over-worn purplish Color, having in the midst a small long Pointel, with several Chives, having yellow Pendents adjoined to them. After the Flowers are past, (which abide open for a long time, and for the most part flower by degrees, the lowest first, and so upwards) if the Weather is seasonable and temperate, come forth Heads of Seed-Vessels, six-square, yet seeming to be but three-square, by reason of the Wings, very like to the Heads of the *Crown Imperial* in *Chap.* 177. aforegoing, but smaller, and shorter; in which are contained such like flat Seed, but smaller also, and of a darker Color.

IV. *Nota.* *Gerard* has this short Description hereof. *The* Persian Lilly *has* (says he) *for its Root, a great white Bulb, differing in Shape from the other* Lillies, *having one great Bulb, firm or solid, and full of Juice, which commonly each Year sets off or increases one other Bulb, and sometimes more, which the next Year after is taken from the Mother-Root, and so brings forth such Flowers as the old Plant did.* From this Root rises up a fat, thick, and strait Stem, of two Cubits or three Feet high, whereon is placed long narrow Leaves, of a green Color, declining to Blewness, as do those of *Woad*. The Flowers grow along the naked part of the Stalk, like little Bells, of an over-worn purple Color, hanging down their Heads, every one having his own Foot-stalk, which is about two Inches long; as also its Pestel or Clapper from the middle part of the Flower: which being past and withered, there is not found any Seed at all, as in other Plants, but it is increased by its Root.

V. *The Places.* It is said to be first brought from *Persia* to *Constantinople*, and from thence sent to us, by means of several *Turky* Merchants, or their Factors, which Dwelt and Traded there: but now it is become a Native of *England*, and flourishes as well in our Gardens, as in the places where it first grew.

VI. *The Times.* It springs out of the Ground nearly a Month before the *Crown Imperial*, but does not flower till the latter end of *April*, or beginning of *May*. The Seed (when it comes to Perfection, which it does not often) is not perfectly ripe till *July*.

VII. *As to its Qualities, Nature or Virtues,* &c. of this *Persian Lilly*, esteemed for its Rareness and fine Figure it makes, there is not any thing written by any Author, only it is thought to participate of the Qualities, *&c.* of the other *Lillies*.

CHAP. CCCCXXXVIII.

Of the LILLY Early, OR, LILLY Pompony.

I. *The Names.* It is called in *Greek*, Κεῖνον πρώϊμον: in *Latine*, *Lilium rubrum Præcox*, *Lilium Pomponeum*, *Lilium rubrum Macedonicum*; *Martagon rubrum Præcox*, *Martagon Pomponeum*, *Martagon rubrum Macedonicum*: in *English*, *The Early Red Lilly*; *Early Red Martagon*; *Martagon Pompony*, and *Early Red Macedonian Martagon*.

II. *The Kinds.* Authors make four Kinds hereof, *viz.* 1. *Lilium rubrum Præcox angustiore folio Clusij*, *Martagon Pomponeum vel Macedonicum rubrum angustifolio*, The narrow-leaved early Red Lilly, Narrow-leaved Red Pompony or Macedonian Martagon. 2. *Lilium rubrum Præcox angustifolio aliud*, Another narrow-leaved Early Red Lilly, *or* Red Martagon Pompony. 3. *Lilium rubrum Præcox latiore folio Clusij*; *Martagon Pomponæum vel Macedonicum rubrum latifolio*, The broad-leaved Early Red Lilly, *or* Broad-leaved Red Pomponean or Macedonian Martagon. 4. *Lilium rubrum Præcox flore Phœniceo*, *Martagon flore Phœniceo*, The Lilly or Martagon of Macedonia, with Golden-red Flowers.

The Descriptions.

III. *The first, or* Narrow-leaved Early Red Lilly *or* Narrow-leaved Red Pompony or Macedonian Martagon. *This rare* Martagon *has a scaly Root, closely compact, with broader and thinner Scales than others, growing in time very great, and of a more deep yellow Color than in the former* Martagon's; *from whence springs up a round green Stalk in some Plants, and flat in others, growing to be two or three Feet high, bearing a number of small, long, narrow, green Leaves, very like unto the Leaves of* Pinks, *but greener, set very thick together, and without Order, about the Stalk, up almost unto the top, and lesser by degrees upwards, where stand many Flowers, according to the Age of the Plant, and its thriving in the place where it grows:* in those which are young, but a few, and more sparsedly; and in others, which are old, many more, and thicker set; threescore Flowers, yea, fourscore and more have been counted, growing thick together upon one Plant, and an hundred Flowers upon another. These Flowers are of a pale or yellowish red Color, not of so deep a Red as the *Red Martagon of Constantinople* in *Cap.* 436. *Sect.* 3. and 4. nor fully so large, yet of the same fashion, *viz.* every Flower hanging down, and turning up his Leaves again. This is not so plentiful in bearing of Seed, as the other *Lillies*; but when it does, it differs not, but in being less.

IV. Mr.

Pomponeau Lilly.

IV. Mr. *Rea*, in his *Flora*, *Cap.* 6. thus deſcribes the former Plant. *The* Martagon of Pompony *has a great yellowiſh, brown, ſcaly Root, from whence ſprings up a green Stalk, two or three Feet high, promiſcuouſly thick ſet, with many ſmall, long, green Leaves, almoſt to the top*, where ſtand many Flowers, in number according to the Age of the Plant: for in ſome which have ſtood long unremoved, I have had fourſcore or an hundred Flowers upon one Stalk, which are of a yellowiſh *Orange* Color, with ſmall black Specks on the inſide thereof, in faſhion like to the *Red Martagon of Conſtantinople*, but ſmaller.

V. *The ſecond, or* Other narrow-leaved Early Red Lilly, *or* Red Martagon Pompony. *This differs from the former only in two things*, viz. 1. That the narrow Leaves are not ſo thick ſet upon the Stalk. 2. That when it flowers, it is a Fortnight later. In other Particulars it differs not.

VI. *The third, or* Broad-leaved Early Red Lilly, *or* Broad-leaved Red Pomponean or Macedonian Martagon. *This is ſo like to the former in Root, Stalk, Flower, Seed, and manner of Growing, that the Difference is ſcarcely to be diſcerned*; but it conſiſts chiefly in theſe two things: 1. That the Leaves of this are a little broader, and ſhorter than the former. 2. That it bears its Flowers a Fortnight earlier than the firſt. In the Color or Form of the Flower, there is no Difference to be diſcerned, nor yet in any other thing elſe.

VII. *The fourth, or* Lilly or Martagon of Macedonia, with Golden-red Flowers. *This has come to our Knowledge later than the former Kinds*: its Leaves are broader and ſhorter than the laſt, and the Flowers of a paler red, tending to yellow, of ſome called a Golden-red Color.

VIII. *The Places.* The Knowledge of theſe *Early Martagons* came firſt to us from *Italy*, from whence they were ſent into the *Low-Countries*, and into *England*; but it ſeems by their Name, that their original or native place ſhould be upon the Mountains in *Macedonia*: with us they grow only in Gardens.

IX. *The Times.* All theſe *Lillies* do ſpring very late out of the Ground, even as the *Yellow Martagon's* do; but are ſlower in Flower than any other. They flower in the end of *May*, or beginning of *June*, and that is a Month at leaſt before thoſe of *Turky* or *Conſtantinople*, in *Cap.* 436. *Sect.* 3. and 4. aforegoing.

X. *Of the Qualities, Natures and Virtues* of theſe, Authors have alſo ſaid nothing; but doubtleſs they are much of the Properties of our *Common Lillies*.

CHAP. CCCCXXXIX.

Of the LILLY Imperial.

I. *THE Names.* It is called in *Greek*, Κρίνον βασιλικὸν: in *Latine*, *Lilium Imperiale*: in *Engliſh*, *The Imperial Lilly*.

II. *The Kinds.* There are ſeveral Species of this Plant, as, 1. *Corona Imperialis*, called alſo *Lilium Byzantinum*; the *Turks* call it *Cauale lale*, and *Tuſai*, *Toujai*, *Tuyſchiachi*, *Turſani*, and *Turſanda*; and *Cluſius* judges it to be the *Hemerocallis Dioſcoridis*, The Crown Imperial: of which we have diſcourſed at large in *Chap.* 177. aforegoing; but in this Chapter we ſhall give you another Deſcription thereof from *Gerard*. 2. *Corona Imperialis flore multiplici*, The double Crown Imperial. 3. *Corona Imperialis flore luteo*, The yellow Crown Imperial. 4. *Corona Imperialis anguſtifolia flore rubente*, The narrow-leaved Crown Imperial, with a reddiſh Flower. 5. *Lilium Imperiale*, *Martagon Imperiale*, *Lilium Montanum majus*, (becauſe it is the greateſt *Mountain Lilly*) and by ſome, *Lilium Saraſenicum*, but not very fitly; The Imperial Martagon. 6. *Lilium Imperiale non Maculatum*, *Martagon Imperiale flore non punctato*, The Imperial Martagon not ſpotted.

The Deſcriptions.

III. *The firſt, or* Single Crown Imperial, *has for its Root a thick, firm and ſolid Bulb, covered with a yellowiſh Film or Skin; from the which riſes up a great, thick, fat Stalk, two Cubits high, in the bare and naked part, of a dark, over-worn, dusky purple Color.* The Leaves grow confuſedly about the Stalk, encompaſſing it round, in form of an Imperial Crown, (from whence it took its Name) hanging their Heads downwards, as it were Bells: in Color, it is yellowiſh; or to give you the true Color, which by Words cannot otherwiſe be expreſſed, if you lay *Sap*-Berries in ſteep in fair Water, for the ſpace of two Hours, and mix a little *Saffron* in that Infuſion, and lay it upon Paper, it ſhews the perfect Color to Limn or Illuminate the Flower withal. The back ſide of the ſaid Flower is ſtreaked with purpliſh Lines, which do greatly ſet forth the Beauty thereof. In the bottom of each of theſe Bells, there is placed ſix Drops of moſt clear, ſhining, ſweet Water, in Taſte like Sugar, reſembling in ſhew, clear Orient Pearls; the which Drops, if you take away, there do immediately appear the like Drops again. Notwithſtanding, if they may be ſuffered to ſtand ſtill in the Flower, according to their own Poſition, they will never fall away; no, if you ſtrike the Plant till it is broken. Among theſe Drops there ſtands forth a Peſtel, as alſo ſundry ſmall Chives, tipt with ſmall Pendents, like thoſe of the *Lilly*. Above the whole Rundle of Flowers,

Flowers, there grows a Tuft of green Leaves, like thoſe upon the Stalk, but ſmaller. After the Flowers are faded, there follow Cods or Seed-Veſſels, ſix-ſquare, wherein is contained flat Seeds, tough and limber, of the Color of *Mace*. The whole Plant, as well Roots as Flowers, do ſmell very like a Fox. As the Plant grows old, ſo does it wax rich, bringing forth a Crown of Flowers among the uppermoſt green Leaves, which ſome make a ſecond Kind, altho' in Truth they are but one and the ſelf ſame, which in time is thought to grow to a triple Crown, which comes to paſs from the Age of the Root, and Fertility of the Soil. The Figure we have thought good to ſubjoin here.

Single Crown Imperial.

IV. Mr. *Rea*, in his *Flora*, *Cap.* 7. gives this following ſhort Deſcription thereof. *It has a great round Fox-ſcented Root, from whence ſprings up a tall and ſtrong Stalk, garniſhed from the Ground unto the middle thereof, with many long ſhining green Leaves, from whence it is naked upwards, bearing at the top a Tuft of ſmall green Leaves*, and under them eight or ten Flowers, according to the Age of the Plant, hanging down round about the Stalk, in Faſhion like unto a *Lilly*, conſiſting of ſix Leaves of an *Orange* Color, with many Veins of a deeper Color on the back ſides of the Flowers. Next the Stalks every Leaf thereof has a Bunch or Eminence of a ſadder *Orange* Color than the reſt of the Flowers, and on the inſide thoſe Bunches are filled with ſweet-taſted clear Drops of Water, like unto Pearls; each Flower having in the middle a Stile, compaſſed with ſix white Chives, tipt with yellow Pendents.

V. *The ſecond, or* Double Crown Imperial. *This is of a late Diſcovery, and in much more Eſteem than the former; and it is indeed a gallant Plant, and deſerving Eſteem, which in ſome meaſure makes the other to be the leſs regarded.* It chiefly differs from it in the Flowers, which in this are conſtantly double, each Flower containing fifteen or ſixteen Leaves, whereas thoſe of the other *Common Kind* have but ſix. The Leaves of thoſe double Flowers are narrower, with a Drop or Pearl at the Head of each of them, of the ſame Color with thoſe of the *Common Kind*, and as many Flowers on one Stalk. The Plant at firſt coming up, is redder, and continues longer ſo than the *Ordinary*; the green Leaves are of a darker Color, and the Tuft on the top above the Flowers, bigger, and conſiſting commonly of more Leaves.

VI. *The third, or* Yellow Crown Imperial. *It in its Root, Stalk, Leaves, Flowers, Seed, and manner of Growing, differs not from the firſt* Common Kind, *but only in this, that the Flowers are of a fair yellow Color.* This is more rare than that with the double Flowers.

VII. *The fourth, or* Narrow-leaved Crown Imperial with a reddiſh Flower. *This likewiſe in its Root, Stalk, and manner of Growing, differs not from the other* Single Kinds; but in this the Leaves are much narrower, and the Flowers of a light Red, or of a pale *Roſe* Color.

Imperial Martagon.

VIII. *The fifth, or* Imperial Martagon. *This* Imperial Lilly *has a ſcaly Root, like unto all the reſt of the* Lillies, *but of a paler yellow Color, cloſely compact or ſet together, being ſhort and ſmall oftentimes in reſpect of the Greatneſs of the Stem growing from it. This Root is very apt to increaſe or ſet off, as it is called, whereby the Plant ſeldom comes to ſo great a Head of Flowers, but riſes up with many Stalks, and ſo then bears the fewer Flowers.* The Stalk is browniſh, and round at the bottom, and ſometimes flat from the middle upwards, three Feet high or more, beſet at certain diſtances with Rundles or Circles of many broad Leaves, larger and broader for the moſt part than any other of this Kind, and of a dark green Color: it has two or three, and ſometimes four, of theſe Rundles or Circles of Leaves, and bare, without any Leaf between: but above, towards the tops of the Stalks, it has here and there ſome Leaves upon it,

it, but ſmaller than any of the other Leaves. At the top of the Stalk come forth many Flowers, ſometimes three or four ſcore, thick thruſt, or confuſedly ſet together, and not thin or ſparſedly one above another, as in the leſſer of this Kind of *Mountain Lilly*, in *Cap.* 435. *Sect.* 6. It has been ſometimes alſo obſerved in this Kind, that it has born many Flowers at three ſeveral places of the Stalk, one above another, which has made an excellent Shew; each Flower whereof is pendulous, or hanging down, and each Leaf of the Flower turning up again, being thick or fleſhy, of a fine delayed purple Color ſpotted with many blackiſh or brownish Spots, of a very pleaſant ſweet Smell, which makes it the more acceptable. In the middle of the Flower hangs down a Style or Pointel, knobbed at the end with ſix yellow Chives, tipt with looſe Pendents, of an Orient Red or Vermilion Color, which will eaſily ſtick like Duſt upon any thing that touches them. The Heads or Seed-Veſſels are ſmall and round, with ſmall Edges about them, wherein is contained flat brown Seed, like as in other *Lillies*, but leſſer.

IX. *The ſixth, or* Imperial Martagon not ſpotted. *This is a Species of the laſt Kind, which is found in ſome Gardens.* It is in its Root, Stalk, Leaves, Flowers, Seed, and Form of Growing, very like that, but its Flowers are without any Spots: the Leaves thereof, and Stalk likewiſe, are of a paler Color; but otherwiſe not differing.

X. *The Places.* The firſt four were brought to us without doubt out of *Turky*, and places near about *Conſtantinople*; but ſome think them, eſpecially the firſt, to be Natives of *Perſia*. The two laſt come from ſeveral Countries of *Germany*, as *Auſtria*, *Hungaria*, *Stiria*, *Tirol*, &c. but now are free Denizons of *England*, and Natives in our Gardens.

XI. *The Times.* The firſt four ſpring out of the Ground about the end of *February* or beginning of *March*, and the Heads with the Seed are ripe in the end of *May* or beginning of *June*. The two laſt flower about the latter end of *June* for the moſt part, and yet they ſpring out of the Ground before the other *Martagon's* or *Mountain Lillies* in *Chap.* 435. aforegoing.

XII. As to their *Qualities, Natures, and Properties*, Authors have ſaid nothing; but by their *Taſtes* and other *Criteria*, they ſeem to have the Virtues of *Our Common White* and *Orange-tawny Lillies.*

CHAP. CCCCXL.

Of the LILLY American *or* Floridian.

I. *THE Names.* This Plant being but of late Invention or Diſcovery, can have no *Greek* Name: but modern Authors call it in *Latine*, *Lilium Americanum*, *Lilium Indicum*, and *Lilium Floridianum*; and in *Engliſh* it is called, *The American or Floridian Lilly.*

II. *The Kinds.* Mr. *Rea*, in his *Flora*, *Cap.* 7. gives us two ſeveral ſorts of the *American Lilly*, viz. 1. *Martagon Canadenſe maculatum*, *Lilium Canadenſe punctatum*, *Lilium Floridianum maculatum*, The ſpotted Lilly, *or* Martagon of Canada. 2. *Lilium Americanum*, *Martagon Americanum*, *Martagon Virginianum*, and *Lilium Virginianum*, The Virginian Lilly or Martagon, The American Lilly or Martagon.

The Deſcriptions.

III. *The firſt, or* Spotted Lilly or Martagon of Canada. *It has a ſmall ſcaly Root, with many long ſmall Fibres thereat, from whence riſes up a reaſonable great Stalk, almoſt as high as any of the former Kinds*, bearing at three or four Diſtances many long and narrow green Leaves, but not ſo many nor ſo broad as ſome others, having divers Ribs in them; from among the uppermoſt Rundle of Leaves, break forth four or five Flowers together, each one ſtanding on a long ſlender Foot-ſtalk, being almoſt as large as a *Red Lilly*, but a little bending downwards, of a fair yellow Color, ſpotted on the inſide with ſeveral blackiſh purple Spots or Strakes, having a middle Pointel and ſix Chives, with Pendents on them.

IV. Mr. *Rea*, in his *Flora*, deſcribes it thus: *The Root of this Stranger is ſmaller, and the Stalk lower than any of the former* Martagon's: *the green Leaves grow on the Stalk in Rundles*; and the Stalk bears four or five Flowers on long Foot-ſtalks, in Form like a *Red Lilly*, hanging down their Heads, of a fair yellow Color, with many black Spots on the inſide, a Pointel, and ſix Chives tipt with red Pendents.

V. *The ſecond, or* Virginian Lilly or Martagon. *It has a cloſe compacted, round, ſcaly, pale yellow Root, from the ſides whereof, more frequently than the top, come forth the Stalks, about three Feet high, ſet with ſmall, ſharp-pointed, whitiſh green Leaves in Rundles*, bearing at the Head three, four, or more ſomething large Flowers, turning back like that of *Conſtantinople*, of a Gold-yellow Color, with many brown Spots about the bottoms of the Flowers, with the Points or Ends of the Leaves that turn up, of a Scarlet or Red Color, and without Spots. It is a tender Plant, and muſt be defended from Froſt in Winter. There is another of this Kind, which bears more Flowers on a Stalk, and differs from the former, in that theſe are of pale Colors, but ſpotted as the others are.

VI. *The Places.* The firſt was brought into *France* from *Canada*, and from thence to us. The ſecond was brought by ſome of our Merchants and Captains of Ships from ſome of our Plantations in *Virginia.*

VII. *The Times.* They flower about the end of *June*, and the Cods of Seed come to Ripeneſs towards the end of *July*, or in *Auguſt.*

VIII. The *Qualities, Specification, Natures, Properties and Virtues*, are unknown as to us; ſo that no more can be ſaid of them.

CHAP. CCCCXLI.

Of the LILLY Baſtard,

OR,

DAY-LILLY.

I. *THE Names.* It is called in *Greek*, Ἡμεροκαλὲς by *Theophraſtus*, Ἡμεροκάλλες by *Dioſcorides*, Ἡμεροκάλλους ῥίζα by *Galen*; *Hemerocalles* by *Pliny*, and *Hemerocallis* by others; *Lilium eſt agreſte, quod* &

& in hortis ſerebant ad Coronamenta, vide Plin. lib. 21. *cap.* 10. in *Latine* it is called, *Hemerocallis*, and it is doubtleſs the true Plant which ought to be called by that Name; alſo *Lilium non bulboſum*, *Liliaſphodelus*, *Liliage*, and *Liliaſtrum*: in *Engliſh*, *The Baſtard Lilly*, or *Day Lilly*.

II. *The Kinds.* Authors make mention but of four ſorts of this *Lilly*, viz. 1. *Liliago Phœnicea*, *Liliaſtrum Phœniceum*, *Liliaſphodelus Phœniceus*, *Lilium non bulboſum puniceum*, *Hemerocallis*, *ab ἡμέρα dies, & καλὸς, pulchritudo, à floris fugacitate, quia uno tantum die pulchritudinem ſuam tuetur*; i. e. *flos, utro die vigens*; The Gold-red Baſtard Lilly, *or* Gold-red Day Lilly. 2. *Liliaſtrum luteum*, *Lilium non bulboſum luteum*, *Liliaſphodelus luteus*, The Yellow Baſtard Lilly, *or* Yellow Day Lilly. 3. *Liliaſphodelus flore albo*, The Lilly Aſphodil with a white Flower. 4. *Liliaſphodelus flore Carneo*, The Lilly Aſphodil with a Bluſh-colored Flower.

The Deſcriptions.

III. *The firſt*, *or* Gold-red Baſtard Lilly, *or* Gold-red Day Lilly. *It has for its Root many thick and long knobbed Strings, like unto the* Small yellow Aſphodil-*Roots, but ſomewhat greater, running under Ground in like ſort, and ſhooting out young Heads round about.* From this Root ſpring up divers broad and long freſh green Leaves, folded at the firſt, as it were double, which after open and remain a little hollow in the middle; among which riſes up a naked Stalk, three Feet high, bearing at the top many Flowers, one not much diſtant from another, and flowering one after another, not having commonly above one Flower blown open in a Day, and that but for a Day, not laſting longer, but cloſing at Night, and not opening again, whereupon it obtained the *Engliſh* Name of *Day Lilly*, or *Lilly for a Day*. Theſe Flowers are almoſt as large as the Flowers of the *White Lilly*, and made after the ſame faſhion, but of a fair Gold-red or Orange-tawny Color. Seed is very ſeldom ſeen to follow theſe Flowers, for they ſeem the next Day after they have flowered, (except the Seaſon is very fair and dry) to be ſo rotten, as if they had been laid in Wet to rot them.

IV. *Nota. Gerard* ſays, That this Plant brings forth its Bud in the Morning, which at Noon is full blown or ſpread abroad, and the ſame Day in the Evening it ſhuts it ſelf; and in a ſhort time after becomes as rotten and ſtinking as if it had been trodden in a Dunghil a Month together, in foul and rainy Weather; which is the Cauſe that the Seed ſeldom follows, as in the other Kind, ſcarcely ever bringing forth any at all.

V. *The ſecond*, *or* Yellow Baſtard Lilly, *or* Yellow Day Lilly. *It has a Root conſiſting of many Knobs or tuberous Bunchings out, proceeding from one Head, like thoſe of the* White Aſphodil *or* Peony. From this Root proceed long Haggy Leaves, chamfered or channelled, hollow in the midſt like a Gutter; among which riſes up a naked or bare Stalk, about three Feet high, branched towards the top, with ſeveral brittle Arms or Branches, on which do grow many fair Flowers, like unto thoſe of the *Common White Lilly* in Shape and Proportion, and of a ſhining yellow Color; which being paſt, three-cornered Cods or Husks ſucceed, full of black ſhining Seed, like thoſe of *Peony*.

VI. Mr. *Rea*, in his *Flora*, *Cap.* 14. ſays, *That this* Yellow Day Lilly, *or* Lilly Aſphodil, *riſes up with many long ſedgy Leaves, out of the middle of which comes up a naked Stalk*, bearing at the top thereof four or five ſmall *Lilly*-like yellow Flowers, blowing one after another, like the firſt *Gold-red Day Lilly*, but continuing many Days before they fade. The Leaves die to the Ground before Winter, and the Roots are many, long, yellow Strings, very much increaſing.

VII. *The third*, *or* Lilly Aſphodil with white Flowers. *This* Lilly *is in all the parts thereof, as Roots, Leaves, Stalk, Cods, Seed, and in its manner of Growing, like the former, ſaving*, that the Leaves are of a freſher green Color, and the Flowers of a Snow white, like unto the *Saxy Spiderwort*, but that the Stalk is higher, and the Flowers larger.

VIII. *The fourth*, *or* Lilly Aſphodil with a Bluſh or Fleſh colored Flower. *This is very like to the* White *in every of its parts, and in the manner of its Growing*: the greateſt Difference is in the Flowers, which in this are of a fine bright Bluſh or Fleſh Color.

IX. *The Places.* They are all of them of *German* Production, and are found in many Gardens in *Germany*; from whence they have been brought into our Gardens in *England*, where they thrive very well, if the Earth or Soil is moiſt.

X. *The Times.* They all of them flower about the latter end of *May*, and almoſt throughout all *June*, as the Seaſon proves.

XI. *The Qualities, Specification, Preparations and Virtues* of the *Lilly Aſphodil* or *Day Lilly*, are ſaid to be the ſame with *Our Common Aſphodil*, which you may ſee at large in *Cap.* 35. *Sect.* 9. *ad* 23. of the ſame Chapter aforegoing. Some make a Cataplaſm of them, and apply in the Caſes following.

XII. *The Cataplaſm.* The Roots and Leaves beaten in a Mortar to a Pultice, and applied to hot Swellings in Womens Breaſts, in their Lying-in, cools, diſcuſſes and eaſes the Pain: applied alſo to Inflammations of the Eyes, it cools and takes them away. Applied to Burnings and Scaldings, it draws forth the Fire, and heals them. If it is made into a Peſſary with a little Honey and Wooll, and put up the Womb, it provokes the Terms, bringing forth both Water and Blood.

CHAP. CCCCXLII.

Of LILLY Water White.

I. *THE Names.* This Plant is called in *Greek*, Νυμφαία: in *Latine*, *Nymphæa, quod loca aquoſa amet*, as *Dioſcorides* ſaith; it is alſo called by *Apuleius*, *Mater Herculana*, *Alga paluſtris*, *Papaver paluſtre*, *Clavus Veneris*, *Digitus Veneris*; and *Marcellus*, an old Writer, ſaith, that it was called *Clava Herculis*: in the Shops, *Nenuphar*. The *Arabians* call it, *Nilafur*, and *Niufar*: and we in *Engliſh*, *Water Lilly*.

II. *The Kinds.* There are two principal Kinds hereof, *viz.* 1. Νυμφαία λευκὴ, *Nymphæa alba*, The White Water Lilly. 2. Νυμφαία ξανθὴ ἢ ὑακεὶ, *Nymphæa lutea*, The Yellow Water Lilly: of which we ſhall ſpeak in the next Chapter.

III. *The Kinds of the White Water Lilly.* Of this there are two ſorts, *viz.* 1. *Nymphæa alba major*, The greater White Water Lilly. 2. *Nymphæa alba minor*, The leſſer White Water Lilly. 3. To theſe we may add a third, which is an Exotick, and not to be found in our Country; but I have been told by a Gentleman well skilled in *Botany*, that he had

had met with it in ſeveral Marſhy places in *Florida*. It is *Nymphæa alba maior Ægyptia, ſive* **Lotus** *Ægyptia*, The great White Water Lilly of Ægypt. Some add a fourth Kind, *viz. Nymphæa alba minima*, which is, *Morſus Ranæ*, or *Frogbit*: of which we have already diſcourſed in *Chap.* 302. aforegoing.

Greater White Water Lilly.

The Deſcriptions.

IV. The *firſt*, or Greater White Water Lilly, *has a great, thick, round, long, tuberous Root, ſpungy or looſe, and with many Knobs thereon, like Eyes, and whitiſh within: from whence proceed very large and very round, thick, dark, green Leaves, lying upon the Water, (like unto thoſe of* Faba Ægyptia, *as* Dioſcorides *ſays, and that very truly) ſuſtained by long and thick Foot-ſtalks*: from the middle alſo, and other places of this Root, riſe other the like thick and great Stalks, ſuſtaining one large and white Flower thereon; green on the outſide, but exceeding white on the inſide, white as pure Snow, conſiſting of ſeveral Rows of long, and ſomewhat thick and narrow Leaves, ſmaller and thinner, the more inward they grow, encompaſſing a Head within, with many yellow Threads or Thrums in the middle; where after they are paſt, ſtand round *Poppy* like Heads, full of broad, oily, bitter, blackiſh and glittering Seed.

V. *The ſecond*, or Leſſer White Water Lilly. *It has a ſingle Root, with ſome few Fibres adjoined thereto; from whence riſe up many long round Foot-ſtalks of Leaves, which Leaves float alſo upon the Water, as the other does; being fair, of a light green Color, broad, ſmooth, ſoft, round, and Buckler-like in Form*: and from the ſame Root riſe up alſo ſeveral long, round, ſmooth, ſoft, lightiſh green Stalks (but leſſer than thoſe of the *Greater Lilly*) of Flowers, bearing at their tops fine ſmall white Flowers, ſtanding upon Foot-ſtalks, ſome longer, ſome ſhorter, each Flower conſiſting of five ſmall Leaves apiece, having a little yellow in the middle thereof.

Leſſer White Water Lilly.

Leſſer White Water Lilly.

VI. *Parkinſon* ſays, *That this* Leſſer Water Lilly *differs not from the former*, or Greater, *but in the Smallneſs both of Root and Leaf, and in the Singleneſs of the Flower*, which conſiſts but of five ſmall pointed Leaves, ſpread open and laid abroad, (as you may ſee by one of the Figures) with yellow Threads

Threads in the middle, and ſmall Heads, with ſmall Seed in them.

VII. *The third, or* Great White Water Lilly of Ægypt. *It has a Root in Form not like any of the former, but ſmall, round, and almoſt* Pear-*faſhioned, of the Bigneſs of a Hens Egg, black on the outſide, and yellowiſh within, with many ſmall Fibres thereat; the inner Subſtance is fleſhy, firm and hard, ſomewhat ſweet and aſtringent withal, which when it is boiled, or roaſted under Embers, becomes as yellow as the Yolk of an Egg. The Ægyptians familiarly eat it with Broth, and oftentimes raw, as well as roaſted.* This Root ſends up out of the Water ſeveral fair broad Leaves, like thoſe of the *Greater* afore-deſcribed, but that theſe are ſomewhat leſs, more waved about the edges, and with more Veins in them, lying on the Superficies of the Water, as they do upon ſeveral Foot-ſtalks alſo. The Flowers are fair, large and double, that is, conſiſting of many Rows of Leaves in like manner, incloſed in a Husk, conſiſting of four Leaves, green on the outſide, and white within. The middle Leaves of the Flowers are often, upon the firſt opening, ſomewhat folded inwards at the ends, but growing to their Perfection, they grow ſtrait forth; all of them being white in the middle part, and yellowiſh toward the edges, of a ſweet *Violet* like Smell: in the middle of which, when they begin to decay, a ſmall Head riſes up, which growing greater, becomes the Seed-Veſſel, not much unlike to the firſt *Greater* aforegoing, and is as large as a good *Medlar*; parted on the inſide into Cells longwiſe, containing round Seed, like unto that of *Coleworts*. This Herb loſes both its Leaves and Stalks after Seed-time, eſpecially upon the decay of the Water wherein it grew, and in which it delights, and the Root abides all the Year; for which Reaſon it may be accounted among the Number of the *Perennial* Plants.

VIII. *The Places.* The two firſt are found growing with us throughout all *England*, in fenny and watery Grounds, in great Pools, in large Ditches of Water, and other ſtanding Waters, in ſlow running Brooks and Rivers, eſpecially near thoſe Brooks and Rivers ſides, and ſometimes in their very middle, if the Water is not deep, and the Current ſoft and ſmooth. The third grows in *Ægypt*, as alſo in *Florida*, and other *Southern* Climes, agreeing with the Latitudes of thoſe Countries, or lying in the ſame Parallels.

IX. *The Times.* They commonly flower about the end of *May*, or ſoon after in *June*; and their Seed is ripe in *Auguſt*.

X. *The Qualities.* The Leaves and Flowers of *Water Lillies* are cold and moiſt in the end of the firſt Degree; but the Root and Seed are cold and dry in the firſt Degree. They are Aſtringent, Coſmetick, Repercuſſive, Emphractive, and Antiſpermatogenetick.

XI. *The Specification. White Water Lilly* cools Inflammations, abates the Heat of Fevers, procures Reſt, ſtops Fluxes of Blood or Humors, whether of Wounds or of the Belly; cures the Heat of Urine, helps in a Gonorrhœa, ſtops the Overflowing of the Terms, and extinguiſhes Venereal Heats and Deſires.

XII. *The Preparations.* You may have therefrom, 1. *A liquid Juice of the Flowers or Root.* 2. *A Decoction of the Root.* 3. *A Syrup of the Flowers or Root, or of their Juice.* 4. *A Conſerve of the Flowers.* 5. *A Pouder of the Seed.* 6. *An Oil of the Flowers.* 7. *An Ointment of the Root.* 8. *A Cataplaſm of Leaves or Roots.* 9. *A diſtilled Water of the Flowers.*

The Virtues.

XIII. *The liquid Juice of Flowers or Root.* That of the Flowers is the finer Juice; but that of the Root is the ſtronger. It ſtops Fluxes of the Belly and Womb, and the Overflowing of the Seed in Nocturnal Pollutions. Prevails againſt Spitting, Vomiting, or Piſſing Blood, or the Bloody-Flux: and being conſtantly uſed for ſome time inwardly, it is ſaid to extinguiſh the Seed, and thereby Luſt and all Venereal Deſires. It cools the Head and Brain, is profitable in Frenſies, and helps the Diſtemperature of thoſe Parts. And as it cools and binds, ſo it ſtops Catarrhs, and cures a Gonorrhœa, or Running of the Reins, and is alſo profitable againſt the Whites in Women. Doſe one, two, or three Spoonfuls, mixt with a little Red Port Wine, according to Age, Sex, and other Accidents, Morning and Night.

XIV. *The Decoction of the Root in Red Port Wine.* It has all the Virtues of the Juice, but not full out ſo powerful. It may be taken inwardly from three to eight Ounces, Morning and Night. It is peculiar againſt Spitting and Piſſing Blood, and other Diſeaſes of the Reins and Bladder. If the Decoction is made in Water, it helps againſt the Strangury, powerfully reſiſts Luſt, and abates hot burning Fevers.

XV. *The Syrup of the Flowers or Root, or of their Juices.* It is good againſt burning Fevers, and Ravings in malign Fevers; and indeed has all the Virtues of the liquid Juice or Decoction, but may be given in double the quantity the Juice is given in. It procures Reſt, ſettles the Brain, and ſtops Defluxions of Humors upon Wounds, Ulcers, Fiſtula's, *&c.*

XVI. *The Conſerve of the Flowers.* It has the Virtues of the Syrup, and may be given Morning and Night againſt Coughs, Catarrhs, Watchings, Pinings, Waſtings, and Conſumptions, as alſo to abate Luſt. Doſe as much as a Cheſtnut or Wallnut at a time, waſhing it down with a little of the diſtilled Water, ſweetned with white Sugar.

XVII. *The Pouder of the Seed.* It has all the Virtues of the Root, and may be given Morning and Night, from half a Dram to a Dram and half, in any convenient Vehicle, as Conſerve of *Sloes*, or of *Hips*, Conſerve of *Barberries*, or in Syrup of the Juice of the Root, *&c.* It is good againſt Venereal or Fleſhly Deſires, deſtroys Luſt, cools the Reins, drys up the Seed, and hinders its Generation, thereby cauſing Chaſtity in Man or Woman. Some give it in Water-gruel or Mutton-Broth.

XVIII. *The Oil of the Flowers.* It is made by Inſolation or Boiling, with a treble or fourfold Repetition, juſt as we make Oil of *Roſes*, &c. It is profitable to cool Inflammations and hot Tumors, as alſo the Inflammations of Wounds and Ulcers, to eaſe Pains and heal running Sores. It cauſes Reſt and quiet Sleep, repreſſes Venerous Dreams and Nocturnal Pollutions: anoint therewith the Temples, Forehead, Noſtrils, Reins of the Back, and Teſticles, Evening and Morning. It is good alſo againſt black and blew Spots, Yellowneſs of the Skin, Sunburnings, *&c.*

XIX. *The Ointment of the Root.* It is made by boiling the bruiſed Root in Tar till it is criſp, ſtraining it out, and repeating it three times more, adding a little Oil Olive, if it is too thick. It is good againſt Scurff, Morphew, Tettars, Ringworms, Serpigo, Mentagra, Scabbineſs, Leuce, Leproſy, and ſuch other like Defedations of the Skin. It is ſaid alſo to be a kind of Depilatory for taking off of Hair: but of this I can ſay nothing by Experience.

XX. *The Cataplasm of Leaves or Roots.* It is made by beating in a Mortar. Laid upon a Wound, it ſtops the Bleeding, and if it is burning or hot, it abates the Inflammation: Laid upon the Region of the Back, over the Reins, it gives Eaſe in Pains of the Back, takes away the Preternatural Heat thereof, ſtops the involuntary flowing of the Seed, hinders Nocturnal Polutions, and abates Luſt, being repeated freſh three or four times in twenty four Hours. It does the ſame thing, being applied to the Teſticles.

XXI. *The diſtilled Water of the Flowers.* At ſuch times as the Flowers cannot be gotten, a Water may be diſtilled both from the Herb and Root. It is very effectual againſt all the Diſeaſes aforementioned, but it cannot have the Strength of the Juice; for which Reaſon it is to be given in greater quantities, as from three to ſix Ounces, ſweetned with double-refined Sugar, and the oftner to be repeated, as three or four times a Day, as the Phyſician ſhall ſee fit. Outwardly applied, it cools all ſorts of Inflammations, is good againſt *Anthonies-fire*, eaſes Pain proceeding from Heat, as Head-ach, Megrim, Gout, *&c.* and is much commended againſt Lentils, Freckles, Sun-burning, Tanning, Yellowneſs of the Face, black and blew Spots, Scurff, Morphew, or other Deſœdations of the Skin, being applied three or four times a Day or more: but it will be much more powerful, if it is mixed in equal quantities with the liquid Juice of the Root.

CHAP. CCCCXLIII.

Of LILLY Water Yellow.

I. THE *Names.* It is called in *Greek*, Νυμφαία ξανθὴ ϗ ὠχρὰ: in *Latine*, *Nymphæa lutea*; and in *Engliſh*, *Yellow Water Lilly.*

Greater Yellow Water Lilly.

II. *The Kinds.* There are three Species of the *Yellow Kind*, viz. 1. Νυμφαία μεγάλη ξανθὴ, *Nymphæa lutea major*, The greater Yellow Water Lilly. 2. Νυμφαία ὠχρὰ ἐλάττων. *Nympha lutea minor*, The leſſer Yellow Water Lilly. 3. Νυμφαία ξανθὴ ἐλάχιστη, *Nymphæa lutea minima*. The leaſt Yellow Water Lilly, *or* Yellow Water Lilly with a leſſer Flower.

The Deſcriptions.

III. *The firſt, or* Greater Yellow Water Lilly. *It has a Root which is great, thick and long, very like unto the Root of the* Greater White Water Lilly. *ſet with certain Dents, not blackiſh on the outſide, but whitiſh, and alſo white within, of a looſe or ſpongy Subſtance, and ſomewhat ſweet in Taſte, as is that alſo of the* White Kind. This grows likewiſe much like the *Great White*, with Leaves almoſt as large as they, but ſomewhat longer, and ſtanding on cornered Stalks: the Flowers alſo which grow upon the tops of the creſted Stalks, are not ſo thick of Leaves as the *White*, but conſiſt only of five large round or ſhort Leaves, of a ſhinning yellow Color, with a round green Head in the middle, compaſſed with yellow Threads; which Head, when it is ripe, contains within it greater Seed than thoſe of the *White*, and more ſhining; but leſſer than Grains of *Wheat.*

Leſſer Yellow Water Lilly.

IV. *The ſecond, or* Leſſer Yellow Water Lilly. *This has a large Head, but a ſingle Root, with ſome few Fibres adjoining to it, creeping in the bottom of the Water, and diſperſing it ſelf far abroad:* from which riſe up many long, round, ſmooth and ſoft Foot-ſtalks, ſome of which do bring forth at their ends, ſmall, fair, round, Buckler-like Leaves, like to the former, but leſſer, yet larger than thoſe of the *Leſſer White ſort:* on other ſome of thoſe Foot-ſtalks, grow pretty Tufts of ſmall yellow Flowers, floating on the Waters as the others do, but yet larger than the Flowers of the ſmall *White Water Lilly* before deſcribed.

V. *The third, or* Yellow Water Lilly with a leſſer Flower, *which is ſaid to be the* Leaſt Water Lilly.

ly. *This differs not much from that last described: the Root in this abounds with long Strings, which are strongly fastned in the Mud.* The Leaves are smaller than the former, and grow with a sharper Point, and the Flowers are also much less than those; for which Reason, and for Distinction sake, it is called by some, *Nymphæa lutea minor flore parvo.*

VI. *The Places.* They do all of them grow in Pools and standing Waters, well watered broad Ditches, drowned fenny Grounds, sides of shallow Rivers, and in Rivolets having a soft or almost no Stream, and in such other like places in most parts of this Kingdom; and indeed in most places where the *White Water Lilly* grows.

VII. *The Times.* They all flower commonly in the two last Weeks of *May*, or beginning of *June*, and in some places hold on to the end of *June*; and their Seed is ripe towards the latter end of *July*, or beginning of *August*, according as the Seasons may prove.

VIII. *The Qualities, Specification, Preparations and Virtues*, are the same with those of the *White Water Lilly*, declared in the last Chapter, which having respect to, no more need be said of them in this place.

CHAP. CCCCXLIV.

Of LILLY Convally, *OR,* MAY-LILLY.

I. *THE Names.* This is an Herb not known to the *Greeks*, but may well enough be called by this *Greek* Name, Κρίνον τῶν ϑυναγλείων: in *Latine*, *Lilium Convallium*: some will have it to be *Lilium Vernum Theophrasti*; others *Oenanthe Theophrasti*, *Calliorymus Gesneri*, *Cacalia Loniceri*, and *Ephemerum non Lethale Fuchsij*; but they all of them, for the most part, are mistaken in those Names. In *English* we call it, *Lilly Convally*, *Lilly of the Valley*, and *May-Lilly*.

II. *The Kinds.* Authors have given us two special Kinds hereof, *viz.* 1. *Lilium Convallium flore albo*, The White Conval Lilly, *or* Lilly of the Valley, with white Flowers. 2. *Lilium Convallium flore rubente*, The Red Lilly Convally, *or* Lilly of the Valley, with red Flowers.

The Descriptions.

III. *The first, or* White Conval Lilly, *or* Lilly of the Valley, with white Flowers. *It has a small, slender, stringy Root, which runs far abroad under the Ground, creeping every way, with many small white Fibres, and springing up again in divers places.* From this Root rise up together three or four Leaves, one inclosed within another, each of which, when it is open, is long and broad, of a greyish green Color, something resembling the Leaves of the *Small Elleborine*, or *Small Wild White Hellebor*, at the sides whereof, and sometimes from the middle of them, rises up a small, short, naked Foot-stalk, an Hand breadth high, or somewhat more, bearing at its top, one above another, many small white Flowers, like little hollow Bottles, with open Mouths, nickt or cut into five or six Notches, running all downwards one way, or on one side of the Stalk, of a very strong sweet Smell, and comfortable to the Memory and Senses; which being past away, turn into small Berries, of a red Color, something like unto *Asparagus*, in which is contained white hard Seed.

White Conval Lilly.

IV. *The second, or* Red Lilly Convally, *or* Lilly of the Valley, with red Flowers. *This in its Root, Leaves, Stalk, Flowers, Seed and manner of Growing, is exactly like the other*, and differs from that only in the Color of the Flowers; for whereas those are of a white Color, these are of a fine pale red Color, of a sweet Smell, but not altogether so sweet as the former.

V. *The Places.* The first grows abundantly Wild in many places of *England*. *Gerard* says it grows on *Hampstead-Heath*, not far from *London*, in great plenty: also near to *Lee* in *Essex*, and upon *Bushy-Heath*, about thirteen Miles from *London*; and in many other places. The second is a Stranger in *England* as to its Original; but both of them (for their excellent Virtues) are nursed up in our *English* Gardens.

VI. *The Times.* They both flower in *May*, and their Berries are ripe in *August* and *September*.

VII. *Nota.* These Plants increase wonderfully, even too fast for the Bigness of some Gardens: they flourish best in the Shade, and in a Soil which is not too fat, or in a mean between rich and poor: if the Earth is too rich, they many times rot and die, and so come to nothing: in a meaner Ground they do better.

VIII. *The Qualities.* This *Lilly* is hot and dry in the beginning of the second Degree; strongly Aperitive and Absterstive; Cephalick, Neurotick, Stomatick, Antepileptick, Antapoplectick, Antiparalitick and Alexipharmick.

IX. *The Specification.* It is a peculiar thing against

gainſt the Head-ach, Megrim, Lethargy, Vertigo, Epilepſy, Apoplexy, Palſy and Gout.

X. *The Preparations.* Of this Plant the Root is moſt efficacious; the Flowers next; then the Leaves, which are the meaneſt part thereof. You may have, 1. *A Juice of the Root or Flowers, or of the whole Plant.* 2. *An Eſſence of the ſame.* 3. *An Infuſion of Root or Flowers in Wine.* 4. *A Pouder of the Root, or Flowers, or Leaves.* 5. *An Oil by Infuſion or Inſolation.* 6. *A Liquor of the Flowers.* 7. *A diſtilled Water of Roots or Flowers.* 8. *A Spirit of Roots or Flowers.* 9. *An Errhine.*

The Virtues.

XI. *The Juice of Roots or Flowers, or of the whole Plant.* It ſtrengthens the Brain and Nervous Parts, is good againſt the Lethargy, Vertigo, Megrim, Falling-ſickneſs, Apoplexy and Palſy, revives the Animal and Vital Spirits, ſtrengthens a weak Memory, and is profitable againſt the Gout. Doſe a Spoonful or two Morning and Night in a Glaſs of *Canary* or White *Lisbon*, ſnuffing ſome of it alſo (as a liquid Errhine) up the Noſtrils, every Evening, an Hour before Bed-time.

XII. *The Eſſence of Flowers or Roots, or both.* It has all the Virtues of the liquid Juice, but of greater Strength, and pleaſanter to be taken, and may be given in the ſame quantity with that, and uſed in both the ſame Methods. 'Tis doubtleſs a Specifick againſt the Epilepſy and Palſy, and for which Purpoſes it is not to be deſpiſed. If places affected with the Gout be bathed therewith, as hot as can be endured, it gives Eaſe, and in a ſhort time removes the Diſeaſe. Dropt into the Eyes, it eaſes their Pain, abates their Inflammation, and cures an Ophthalmy, as alſo that Diſeaſe called the Pin and Web.

XIII. *The Infuſion of the Root or Flowers in Wine.* It has all the Virtues of the Juice and Eſſence, but leſs powerful; and therefore may be given from three to ſix Ounces, in the Morning faſting, an Hour before Dinner, and laſt at Night going to Bed. It comforts the Heart and Vital Spirits, ſtrengthens the Brain, and makes a ſtrong Memory. It is good againſt the Palpitation or Trembling of the Heart or other Members, opens Obſtructions of the Bowels, and prevails againſt Hypochondriack Melancholly, Dullneſs, Drouſineſs, Lethargy, and other cold and moiſt Diſeaſes of the Head, Brain and Nerves. It ſo opens Obſtructions of the Nervous Parts, and of the Brain, that being taken for ſome time, it prevents the coming of an Apoplexy, or the Induction of that Diſeaſe, by ſtrengthening the Parts, and preventing the Cauſe.

XIV. *The Pouder of the Root, or Flowers, or Leaves.* Inwardly taken, it has all the Virtues of the Juice, Eſſence and Infuſion, but operates not ſo ſpeedily nor ſo powerfully as the two firſt, becauſe the Force or Power thereof is firſt to be extracted out of the Subſtance of the Pouder, by the Stomach; the which, if the Stomach is weak, will be but very faintly performed. It may be given from half a Dram to a Dram, or more, every Night at Bed-time, in Wine or ſome other convenient Vehicle; and the ſame Doſe every Morning faſting, in like manner. If it is ſnuft up the Noſtrils, it purges the Head and Brain of ſuperfluous Humors, which proceed from Cold and Moiſture, and prevails againſt all thoſe Diſeaſes of the Head and Brain which proceed from the ſame. It is an excellent Medicine, and not to be deſpiſed.

XV. *The Oil by Infuſion or Inſolation.* It is made by Infuſion of the Flowers or Roots in choice *Florence* Oil, or rather in Oil of *Ben*, becauſe this latter Oil never grows rank. It is made either by Inſolation, or Digeſtion in *Balneo*, or a Sand Heat, for fourteen Days or more, then preſſed out, and the Inſolation or Digeſtion repeated thrice more, for the compleating thereof. Anointing herewith, it hinders the ſpreading of the Leproſy, and takes away Scabs and Ringworms, Scurf, Morphew, Yellowneſs, Tanning, Sun-burning, and other Deformities thereof; and this it does ſo much the more effectually, if the Parts affected be firſt well bathed with either Juice or Eſſence, as hot as the Patient can endure, every time before the Anointing. It gives Eaſe in the Gout, being anointed upon the Part.

XVI. *The Liquor of the Flowers.* It is thus made according to *Gerard.* Take a Glaſs, which fill with Flowers of *May-Lillies* or *Lilly Convally*, ſtop it cloſe with a Cork dipt into Wax, or with a Glaſs Stopper, and ſet it in an Ant-hill for a Months ſpace or longer, and then take it out: ſo will you find a Liquor in the Glaſs, which decant from the Flowers, and keep it for Uſe in another Glaſs cloſe ſtopt with a Glaſs Stopper. Outwardly applied, it gives Relief in the Gout, and other Pains of the Nerves and Joints. Inwardly taken Morning and Night, a Spoonful at a time in a Glaſs of Wine, or of the Infuſion at *Sect.* 12. aforegoing, it is an excellent thing againſt the Epilepſy, Palſy, Lethargy, and other cold and moiſt Diſeaſes of the Head and Brain.

XVII. *The diſtilled Water of Roots or Flowers.* Authors aſcribe the ſame Virtues to it which is given to the Juice, Eſſence and Pouder, but as it is much weaker than thoſe Preparations, ſo it ought to be given oftener, and in larger Doſes, as from two Ounces to four or ſix Ounces, either alone by its ſelf, dulcified with double-refined Sugar, or mixt with ſome of the Infuſion in Wine. If it is dropt into the Eyes, it is ſaid to help their Inflammations, Pin and Web, Cloudineſs, Dimneſs of Sight, but this it more excellently performs, if you dulcify it a little with choice Honey. It is good againſt Scurf, Morphew, Scabs, Tettars, Ringworms, and other Deformities of like kind, by waſhing the Parts affected therewith; but it will do it more effectually, if it is mixed with a proportional part of *Oleum Tartari per deliquium.* The Water alſo eaſes the Pain and aſſwages the Swellings coming by the Stinging of Bees, Waſps and Hornets, being applied to the Part. Taken to the quantity of ſix Ounces, it helps thoſe who are poyſoned by the Biting of a Mad Dog; but I am confident that the Juice or Eſſence being taken inſtead of it, will be much more effectual: and being drunk for forty Days together, it cures the Epilepſy or Falling-ſickneſs. The ſame Water drank, is ſaid to help the Strangury, as alſo the Pain at Heart, the Inflammation of the Liver, and to ſtop the Overflowing of the Courſes.

XVIII. *The Spirit of the Roots or Flowers.* It may be diſtilled from new Wine, or from Brandy, after ſome ſmall time of the Flowers Digeſtion therein. A Spoonful of this Spirit being drunk, reſtores Speech to ſuch as have loſt it thro' the Dead Palſy: it comforts the Heart, ſtrengthens the Brain, revives the Spirits, fortifies the Memory, and refreſhes the whole Human Frame; is good againſt Faintings, Swoonings, and Palpitation, or Trembling and Beating of the Heart: 'it is alſo good againſt the Epilepſy, Vertigo, Lethargy and Apoplexy; for being drunk with a few Grains of *Pepper*, and two Drams of the Powers of *Lavender*, it is ſaid to prevail againſt the Apoplexy, cure the Colick, and defend the Heart againſt the Biting of Mad Dogs, or the Poyſon of other Venomous Beaſts.

XIX. The

XIX. The Errhine. *Take Pouder of the Flowers of Lilly Convally half an Ounce, Pouder of the Leaves of Asarabacca one Ounce: mix them.* It is to be snuffed up the Nostrils every Night, an Hour or Hour and half before Bed-time, because it wonderfully purges the Head, Brain, Original of the Nerves and Ventricles, of the Recrements of those Parts, and of all cold and moist Humors, so it wonderfully opens all the Parts adjacent, whereby the Patient is made apt to get Cold upon the least occasion; for which Reason the Use of it is ordered by the Physician, to be a little before Bed-time, that the Patient going to Bed may prevent the same. It is used in the Cure of Rheumatisms, Megrim, inveterate Head-ach, Epilepsy, Apoplexy, Palsy of the Head, Lethargy, Vertigo, Obstructions of the Brain, being daily applied with a *Continuando*, for so long time as the Physician shall see fit.

CHAP. CCCCXLV.

Of LIMONADE,

OR,

Sea Marsh BUGLOSS.

I. *THE Names.* It is called in *Greek*, Λειμώνιον ἢ Νευροειδὲς *Dioscoridis*, because it grows ἐν λειμῶσι, *in pratis riguis, vel palustribus:* in *Latine*, *Limonium*, I suppose from the *Greek* Name, tho' some will have it to be from *Malus Limonia*, the *Limon-Tree*, because the Leaf of this Plant is something like to the Leaf of the *Limon-Tree*. In *English*, *Limonade*, and *Sea Marsh Bugloss*. *Gerard* calls it *Sea Lavender*, which is an improper Name, for that it has no Resemblance to *Lavender* of what Kind soever.

II. *The Kinds.* Mr. *Ray* makes eleven Species of this Plant, *Parkinson* seven, *Gerard* but four; yet in our late Times, a greater Number has been found out, as appears from Mr. *Ray's Historia Plantarum*. But many of them grow neither upon our *Brittish* Shores, or in our *Brittish* Marshes, nor yet in any of our Plantations in the *West Indies*; and some of them seem to differ in their Effects from the more common and usual, so that no Virtues have been assigned them; of all these we have nothing to say in this Work; those which we intend, are, 1. *Limonium majus vulgatius, Valerianæ rubræ similis Dodonæi*, Our Common Limonade, *or* Sea Marsh Bugloss, (which some Apothecaries formerly mistook for *Ben* or *Behen rubrum*, whereas it is no such thing.) 2. *Limonium Medium Anglicum*, Colchester Limonade, *or* Marsh Bugloss. 3. *Limonio congener Clusij*, The hollow-leaved Plant of Clusius, *or* Limonade of Virginia: of which three Kinds we have already treated at large in *Chap.* 97. aforegoing; but some few following, which we omitted in that Chapter, we shall treat of here, *viz.* 4. *Limonium parvum*, Small Limonade, *or* Small Rock Bugloss. 5. *Limonium folio sinuato, Limonium Peregrinum Rauwolfij*, Limonade with indented Leaves, *or* Spanish Sea Marsh Bugloss.

Common Limonade.

The Descriptions.

III. *The first, or* Common Limonade, *or* Sea Marsh Bugloss. *We have already largely described this Plant in* Chap. 97. *but some few Observations more offer themselves to Consideration, and therewith a more elegant Cut of the Plant. The Root then is thick and long, somewhat like unto a* Small Red Beet *Root, or* Small Dock *Root*. From this spring up several fair, long, thick, flat, green Leaves, like to those of the *Limon* or *Orange* Tree, but of a darker green, and sometimes a little crumpled, or not much unlike to those of the *Small Beet*. From among these Leaves spring up several naked, hard, brittle Stalks, of a Foot or Foot and half high, divided towards the top into sundry other small Branches, which Branches grow for the most part upon one side of the Stalk, and are replenished with many small blewish purple Flowers, somewhat like unto *Bugloss* Flowers, but that they are less, or as some Authors say, in shew like to *Lavender* Flowers; which Flowers grow also, all of them for the most part, on one side of the said Branches; which being passed away, long red Seed follows, contained in the Husks which the Flowers stood in before. See the Figure annexed.

IV. *The fourth, or* Small Limonade, *or* Small Rock Bugloss. *This differs but little from the first, saving that it grows much lower:* It has a small long reddish Root, parted at the top into several Points; from whence come forth in a kind of Tuft, a number of small, thick, fat, smooth, and somewhat roundish Leaves next the Ground, in form and manner of a small *House-Leek*, some of the Leaves being not pointed at all. It grows not above six Inches high, the Stalks being some higher, and some lower than others, bare, and without Leaves to the tops, where they spread into several small Branches, bending a little backwards, bearing

ing a number of small Flowers, of a reddish or faint reddish blew Color.

V. *The fifth, or* Limonade with indented Leaves, *or* Spanish Sea Marsh Buglos. *It has a long slender Root, with some few Fibres adjoining.* From the Head of which Root spring forth long green Leaves, lying spread upon the Ground, being also deeply sinuated or indented on both sides, and somewhat rough. From among these Leaves grow up the Stalks, welted with slender indented Skins: towards their tops they are divided into several Branches, after the manner of the *Ordinary Kind*; but these Branches are also winged, and at the tops they carry Flowers, some four, five, six, or more clustering together, consisting of one thin, crisp, or crumpled Leaf, of a light blew Color, (which continues long, if you gather them in their perfect Vigor, and so dry them) and in the midst of this blew, comes up little white Flowers, consisting of five little round Leaves, with some white Threads in the middle.

VI. Or thus, as *Parkinson* describes it. *This* Limonade of Rauwolfius, *has a Root which is small and long, and blackish on the outside, perishing at the first approach of Winter. From this Root spring forth many long, narrow, and somewhat rough Leaves, lying upon the Ground, waved or cut in on both sides like an Indenture, something like the Leaves of* Ceterach *or* Spleen-wort: among which rise up two or three Stalks, somewhat rough also, and with thin Skins like Wings, indented on both sides thereof also, like the Leaves, having three small, long, rough, and three-square Leaves at every Joint, where it branches forth; at the tops whereof stand many Flowers, upon their Foot-stalks, in such a manner as is not seen in any other Plant: for altho' that some of the small winged Foot-stalks, are shorter and some longer, standing as it were flat-wise, or all on one side, and not round like an Umble, yet are they even at the top, and not one higher than another; each of which small Foot-stalks do bear four or five greenish Heads or Husks, joined together; out of each of which do arise other pale or bleak blew stiff Husks, as if they were Flowers, made as it were of Parchment, which hold their Color after they are dry, a long time. And out of these Husks likewise do come (at several times one after another, and not all at one time, or together) white Flowers, consisting of five small round Leaves, with some white Threads in the middle. After these Flowers are past, there come in their places small long Seed, enclosed in many Husks, many of those Heads being unfruitful, or not yielding any good Seed, but Chaff, especially in our Country, for want of a sufficient Heat of the Sun.

VII. *The Places.* The first grows in several Marshes and moist places in *Kent*, as is related in *Cap.* 97. *Sect.* 8. aforegoing. The fourth grows upon the Chalky Cliff going from the Town of *Margate* in *Kent*, down to the Sea side, on the left Hand. The fifth was first observed by *Rauwolfius* at *Joppa* in *Syria*: it grows also on the Coasts of *Barbary*, and *Cadiz* in *Spain*, from whence it has been brought to us, and is now nursed up in our Gardens.

VIII. *The Times.* They most usually flower in *June* and *July*, and yield their ripe Seed the next Month after.

IX. *The Qualities, Specification, Preparations, and Virtues,* are much the same with those of the first Kind, which we have declared at large in *Cap.* 97. *Sect.* 10. *ad* 17. aforegoing.

CHAP. CCCCXLVI.

Of LIONS-FOOT, *OR,* LIONS-CUDWEED.

Called also,

Mountain COTTON-WEED.

I. *THE Names.* It is called in *Greek,* Λεοντοπόδιον, ἢ Κήμος: in *Latine, Leontopodium,* and *Cemos* or *Camos*; and in *English, Lions-foot, Lions Cudweed,* and *Mountain Cotton-weed,* or *Cudweed.* Some affirm, That the Title of *Leontopodium* is not found in some Coppies of *Dioscorides,* but only *Cemos* or *Camos*; but by that it may appear, that *Leontopodium* and *Cemos* are one and the same thing; which latter Name you may also find in *Pliny, lib.* 27. *cap.* 8. where he speaks of *Catenance,* which was only used about Love Matters.

II. *The Kinds.* This Plant is certainly a Species of the *Cudweeds* or *Cotton-weeds*; tho' various Authors speak variously of the Plant to which the Name *Leontopodium* properly belongs, or which should be the right; some accounting one Plant, and some another, and some none, to which it has been yet applied. *Lonicerus* has his *Leontopodium,* which is the *Echium scorpoides palustre Bauhini,* or the *Myosotis scorpioides Lobelij. Apuleius, Ætius,* and *Oribasius,* will have it to be *Leontopetalon,* or *Lion-leaf*; but that it is not, however for Satisfaction sake, we will describe that Plant in the third place of this Chapter. *Clusius* (from *Josephus de Casabona*) applied it to some of the *Holosteums* or *Sea Plantanes,* by the Name of *Leontopodium Creticum,* which is also far from the true thing. *Bauhinus* fixes no Herb for the true *Leontopodium Dioscorides,* but with *Lugdunensis,* thinks *Pliny* his *Leontopodium* to be much differing from that of *Dioscorides,* and that those of *Matthiolus, Lobel,* and others, are only Kinds of *Gnaphalium* or *Cudweed,* as we here determine them. *Brunfelsius* makes our *Alchymilla* or *Ladies-Mantle* to be it, as is hinted in *Cap.* 421. aforegoing, but that is not the *Leontopodium Dioscoridis,* nor any ways agrees with his Description of the Plant.

III. *The Kinds of this our Lions-foot.* There are two sorts which Authors have taken notice of, *viz.* 1. *Leontopodium majus, Pes Leoninus major,* The greater Lions-foot, *or* Mountain Cotton-weed. 2. *Leontopodium minus, Pes Leoninus minor, Pes Leonis minor,* The lesser Lions-foot, *or* Mountain Cudweed. 3. To these we add, (tho' not of the Stock or Kindred) for the Name sake, Λεόντοπέταλον, *Leontopetalon folium Leonis,* Lions-Leaf, Lion-leafed Turnep, *and* Black Turnep. This *Apuleius* and *Ætius* calls *Leontopodium,* but how truly, may be seen, if compared with the Description of the first Kind of that Name. It is also called in *Latine, Rapeium, Papaverculum, Brumaria, Semen Leoninum, Pes Leoninus,* and *Pata Leonis,* but very improperly these three latter; the last save one, belonging to the first and second aforegoing, and the last of all, to the Plant called *Alchymilla,* or *Our Ladies-Mantle.*

The Descriptions.

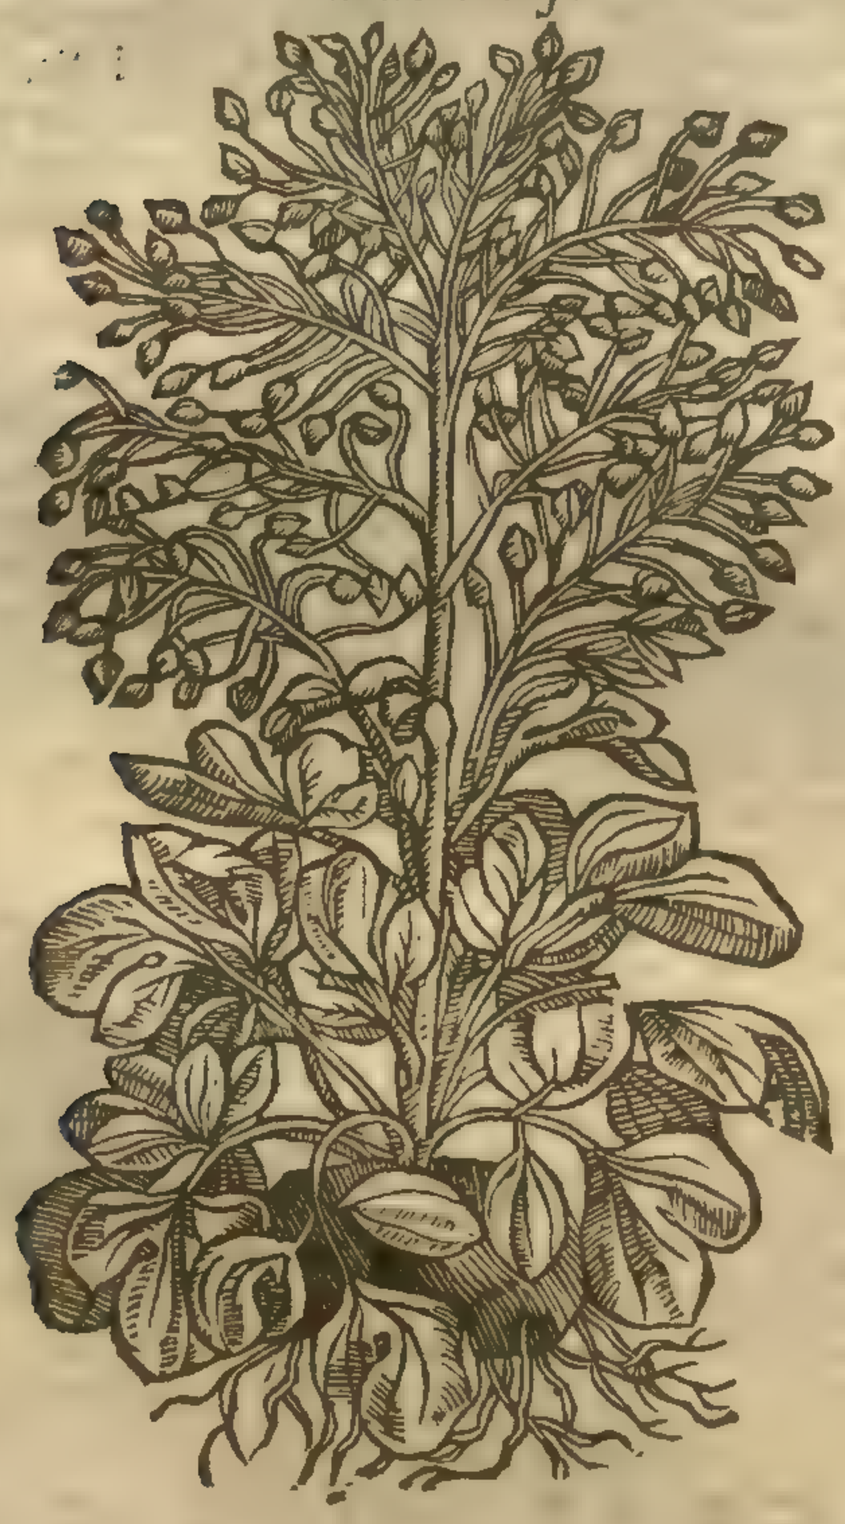
IV. *The first, or* Greater Lions-foot, *or* Mountain Cotton-weed. *It has a Root which is small and long,*

and

and ſomething woody, with ſeveral Strings and Fibres adjoining to it. From this Root ſpring forth ſeveral ſmall and ſomething narrow Leaves, lying upon the Ground, hoary or woolly all over, yet more hairy white underneath than above: the Stalks riſe up above half a Foot or more high, ſet with ſuch like Leaves thereon unto the tops, where ſtands one great brown Head apiece, compaſſed about with many woolly or hoary white Leaves, repreſenting the hairy Foot of a Lion, Hare, or Dove, or ſuch like Creature, from whence came the Name. Out of this Head comes forth many ſhort Threads, which make the Flowers ſeem to have Holes therein, in which lies afterwards ſmall browniſh Seed, wrapped up in ſo much Down, that it is hardly to be found or ſeen.

V. *The ſecond, or* Leſſer Lions-foot, *or* Mountain Cudweed. *The Root is ſmall, long, a little woody, with ſeveral Strings or Fibres adjoining to it.* It riſes up with one Stalk for the moſt part, with ſeveral Leaves thereon, ſomewhat longer, but not broader than the former: at the tops whereof ſtand divers woolly Leaves, and in the middle of them, three or four or more Heads of Flowers, like unto the other *Small Cudweeds*, conſiſting of Thrums, of a pale yellow Color, with ſome black Hairs among them; after which follows the Down, as alſo the Seed like the other.

Lions-Leaf.



VI. Lions-Leaf, Lions-leafed Turnep, *or* Black Turnep. *The Root of this Plant is tuberous, ſomewhat like to a* Turnep, *or* Sow-Bread, *or* Great Ground-Nut, *being of a blackiſh grey Color, with ſeveral ſmall Bunches or Knobs on the ſides*; from whence ſpring up ſeveral large and long Leaves, much divided or cut into divers parts, (like unto *Coleworts* or *Poppies*, as *Dioſcorides* ſays, or more like unto *Peony* Leaves, as *Pena* and *Lobel* ſay, but we find they are more jagged or cut in) of a dark yellowiſh green Color, as it grows with us, but of a darker yellow Color in thoſe places where it is a Native, coming nearly unto the Color of a *Lion*'s Skin or Hair; from whence it is ſuppoſed came the Name of *Lions-Leaf*, more than from the Form. From among theſe Leaves ſpring up a ſtraked Stalk, ſpotted with pale purpliſh Lines and Strakes, divided into many Branches, ſet at the Joints with ſmaller Leaves, and leſſer cut in: on the tops of which ſtand ſeveral ſmall Flowers, made of five Leaves apiece, of a dark or browniſh yellow Color, red like an *Anemone* on the outſide; and therefore called by ſome Ἀνεμόνε, as *Dioſcorides* ſays, and yellow on the inſide: after which come ſmall Pods, thicker and ſhorter than thoſe of *Hollow-Root* or *Radix Cava*, in which is contained ſmall round Seed.

VII. *Gerard* thus deſcribes it. *The Root is great, roundiſh like a* Turnep, *and black without: from which ſpring forth broad Leaves, like unto* Coleworts, *or rather like unto* Peony, *cut and divided into ſeveral great Gaſhes. The Stalk is two Feet long, thick, and full of Juice, dividing it ſelf into divers Branches or Wings; in the tops whereof there ſtand red Flowers, which being paſſed away, red Cods come in their places, in which lies the Seed, like unto* Tares *or* Wild Chiches.

VIII. *The Places.* The firſt has been found growing on the *Alps* of *Germany*, and on Mount *Baldus* in *Italy*. The ſecond on divers Mountains in *Germany* and *Italy* alſo. The *Lions-Leaf* is a Native of *Syria*, *Grecia*, *Candia*, *Naples*, &c. but they are all of them nurſed up with us in Gardens.

IX. *The Times.* The two firſt flower in *July*, and ſometimes in *Auguſt*. The laſt in Winter-time in *Candy*, as *Bellonius* ſays; but with us very late.

X. *The Qualities, Specification, Preparations and Virtues* of *Lions-Foot* or *Mountain Cudweed*, are the ſame with thoſe of our *Common Cudweed*, which we have expreſſed at large in *Cap.* 180. *Sect.* 8. *ad* 15. aforegoing. *Parkinſon* ſays, that the Taſte hereof being aſtringent and drying, with ſome Bitterneſs in it alſo, does ſignify, that it is very available againſt all Fluxes of Blood or Humors; as alſo very effectual for all Sores, either green Wounds or old Ulcers, and conducible for whatſoever Cures the other *Cudweeds* may be applied to.

XI. *A Decoction in a Lixivium of Pot Aſhes.* It cleanſes the Hair from Nits and Lice: and being made not too ſtrong, it is good againſt Scurff, Morphew, Leuca, Leproſy, Yellowneſs, and other Deformities of the Skin.

XII. *A Decoction in Wine.* Being drunken, it kills Worms, and expels them; and is prevalent againſt the Bitings and Stinging of Serpents, and other Venomous Creatures.

XIII. *The Fume of the Herb.* Being taken as *Tobacco*, in a Tobacco-pipe, it is good againſt the Cough of the Lungs, cleanſes the *Thorax* of pituitous Matter, and eaſes vehement Pains of the Head.

Of *Lions-Leaf.*

XIV. *The Qualities.* It is hot and dry in the third Degree; Abſterſive, Digeſtive, Vulnerary and Alexipharmick.

XV. *The Specification.* It cleanſes old and filthy Ulcers; is profitable againſt the Sciatica, and is an Antidote againſt Poyſon, the Bitings of Serpents and other Venomous Creatures.

XVI. *The Preparations.* You may make therefrom, 1. *A liquid Juice or Eſſence of the Root.* 2. *A Decoction of the ſame in Wine.* 3. *A Powder of the older and greater Roots.* 4. *A Clyſter.* 5. *A Cataplaſm of the Root.*

The Virtues.

XVII. *The liquid Juice or Eſſence of the Root.* Taken from three to ſix Spoonfuls in a Glaſs of generous Wine, it reſiſts and expels Poyſon, and is prevalent againſt the Bitings of Vipers and other Serpents, *&c.* it preſently profligates the Poyſon, and eaſes the Pain. It is alſo good to waſh old Sores and Ulcers, to cleanſe, dry, and induce their Healing.

XVIII. *The Decoction in Wine.* It has all the Virtues of the liquid Juice or Eſſence, but leſs efficacious, and therefore may be given from four to eight Ounces, *pro re nata*, Morning and Evening. It is ſingularly good againſt Obſtructions of the Lungs.

XIX. *The Pouder of the Root.* *Rauwolfius*, in his *Hodeporico* or *Journal*, ſays, that the Inhabitants in and about *Aleppo*, do uſe the Pouder of the older and greater Roots, to take away Spots out of their Garments, by rubbing them therewith: by this it appears, that it is of a very abſterſive Nature.

XX. *The Clyſter.* It is made by mixing the Juice with Mutton-Broth, in equal quantities. It is exhibited to give Eaſe in the Sciatica: it moves the Bowels, and cleanſes them of putrid Excrements.

XXI. *The Cataplaſm of the Root.* Applied to indigeſted Wounds, Sores, and Ulcers, it cauſes Digeſtion, then cleanſes and drys them, and ſo induces their Healing.

CHAP. CCCCXLVII.

Of LIONS-TAIL, *OR,* KILL-HERB, *OR,* HERB-BANE.

I. *THE Names.* It is called in *Greek*, Αιμόδωρον, and by *Dioſcorides* Ὀρεβάγχη: in *Latine*, *Hæmodoron*, *Limodoron*, *Orobanche*, and *Cauda Leonis*: in *Engliſh*, *Lions-Tail*, *Kill-Herb*, and *Herb-Bane*.

II. *The Kinds.* There are three ſorts of this Plant, *viz.* 1. *Hæmodoron vel Limodoron majus*, *Cauda Leonis major*, Great Lions-Tail of Mompelier. 2. *Hæmodoron vel Limodoron majus*, *vel Cauda Leonis flore majore purpuraſcente*, Great purple Lions-Tail. 3. *Hæmodoron vel Cauda Leonis*, *vel Orobanche ramoſa*, Branched Lions-Tail.

The Deſcriptions.

III. *The firſt, or* Great Lions-Tail of Mompelier, *has a long and round ſmall Root, without Scales, and with ſome Fibres under it.* The Stalk is great and thick, with very ſhort Leaves thereon, from the bottom unto the middle thereof, where the Flowers begin to grow; and with every one of them a larger and longer Leaf. The Flowers are long, and of a browniſh Color.

IV. *The ſecond, or* Great purple Lions-Tail. *This has ſuch a like Root, with Fibres thereat, as the former*; which ſends forth ſeveral Stalks, with many thick and ſhort Leaves on them, ſharp at the ends, having ſometimes Branches riſing therefrom, and ſometimes two or three Stalks from the Root; which at the tops are ſet with longer Flowers than thoſe of *Broom Rape*, and on longer Foot-ſtalks, each ſtanding in a Huſk, with a long Thread as it were growing out of the Flower, which turns up again. The whole Stalk, Leaves, and Flowers, are of a blewiſh purple Color.

V. *The third, or* Branched Lions-Tail. *It has a ſtringy fibrous Root, like the former*; *from whence ſprings up a ſtalk, which is branched forth ſeveral ways*, (and yet many of theſe Herbs are found with ſingle and unbranched Stalks, thoſe with branched Stalks being or growing for the moſt part lower than the others, which are unbranched:) they are of differing Colors, ſome whitiſh, ſome more yellow, ſome browniſh yellow, and ſome blewiſh or purpliſh, for ſo they are found in ſeveral places. *Bauhinus* takes notice of a ſmall ſort hereof, which grows lower, under *Fir*-Trees, *Pine*-Trees, and *Pitch*-Trees, differing in nothing elſe but in being of a darker Color, and the Flowers whiter.

VI. *Nota.* Theſe Kinds of Plants are Excreſcencies of the Earth, of which the Ancients knew but one or two ſorts, *viz.* *Hypociſtis* from *Ciſtus*, and *Orobanche* or *Broom-Rape* from *Broom*: but latter Times have diſcovered more, of which theſe three above-deſcribed are chief: ſome (becauſe they are Excreſcencies of the Earth) would have them to be *Muſhromes*; but ſuch they are not: ſome a Species of *Orchides*, becauſe their Flowers and Seed do more near reſemble ſome of the Kinds; but from theſe they alſo manifeſtly differ: for which Reaſons I judge them to be Plants of their own Kinds.

VII. *The Places.* They grow many times from the Roots of ſeveral Herbs, and by their Juicineſs, draw forth their Nouriſhment, thereby ſpoiling them: they are ſometimes found in Corn-Fields, alſo among *Pulſe*, *Hemp*, &c. and ſometimes alſo among Graſs and Herbs by the ſides of Hedges, and under the Shadow of Trees, and many times alſo in places which are not ſhadowed, where the Earth has a natural kind of Moiſture in it.

VIII. *The Times.* They flouriſh in *May* and *June*; but ſome have been found to flower in *July* and *Auguſt*.

IX. *The Qualities, Specification, Preparations, and Virtues*, are the ſame with thoſe of *Broom-Rape* in *Chap.* 86. *Sect.* 6. *ad* 14. to which you are referred. *Galen* ſays this Plant is cold and dry in the firſt Degree. And *Dioſcorides* ſays, that in his time it was uſed to be eaten as other Herbs are, either raw or boiled with *Pulſe*, which would help their Digeſtion.

CHAP. CCCCXLVIII.

Of LIQUORICE Garden *and* Wild.

I. *THE Names.* It is called in *Arabick*, *Sus*: in *Greek*, Γλυκυῤῥίζα: in *Latine*, *Glycyrrhiza*: in *Engliſh*, *Liquorice*.

II. *The Kinds.* It is twofold, *viz.* 1. Γλυκυῤῥίζα κηπευτὴ, *Glycyrrhiza hortenſis*, Garden Liquorice. 2. Γλυκυῤῥίζα ἄγρια, *Glycyrrhiza ſylveſtris*, Wild Liquorice. Of the *Garden Liquorice*, there are two Kinds, *viz.* 1. *Glycyrrhiza hortenſis*; *Liquiritia officinarum*; *Dulcis radix Tragi* and *Cordi*; *Glycyrrhiza*

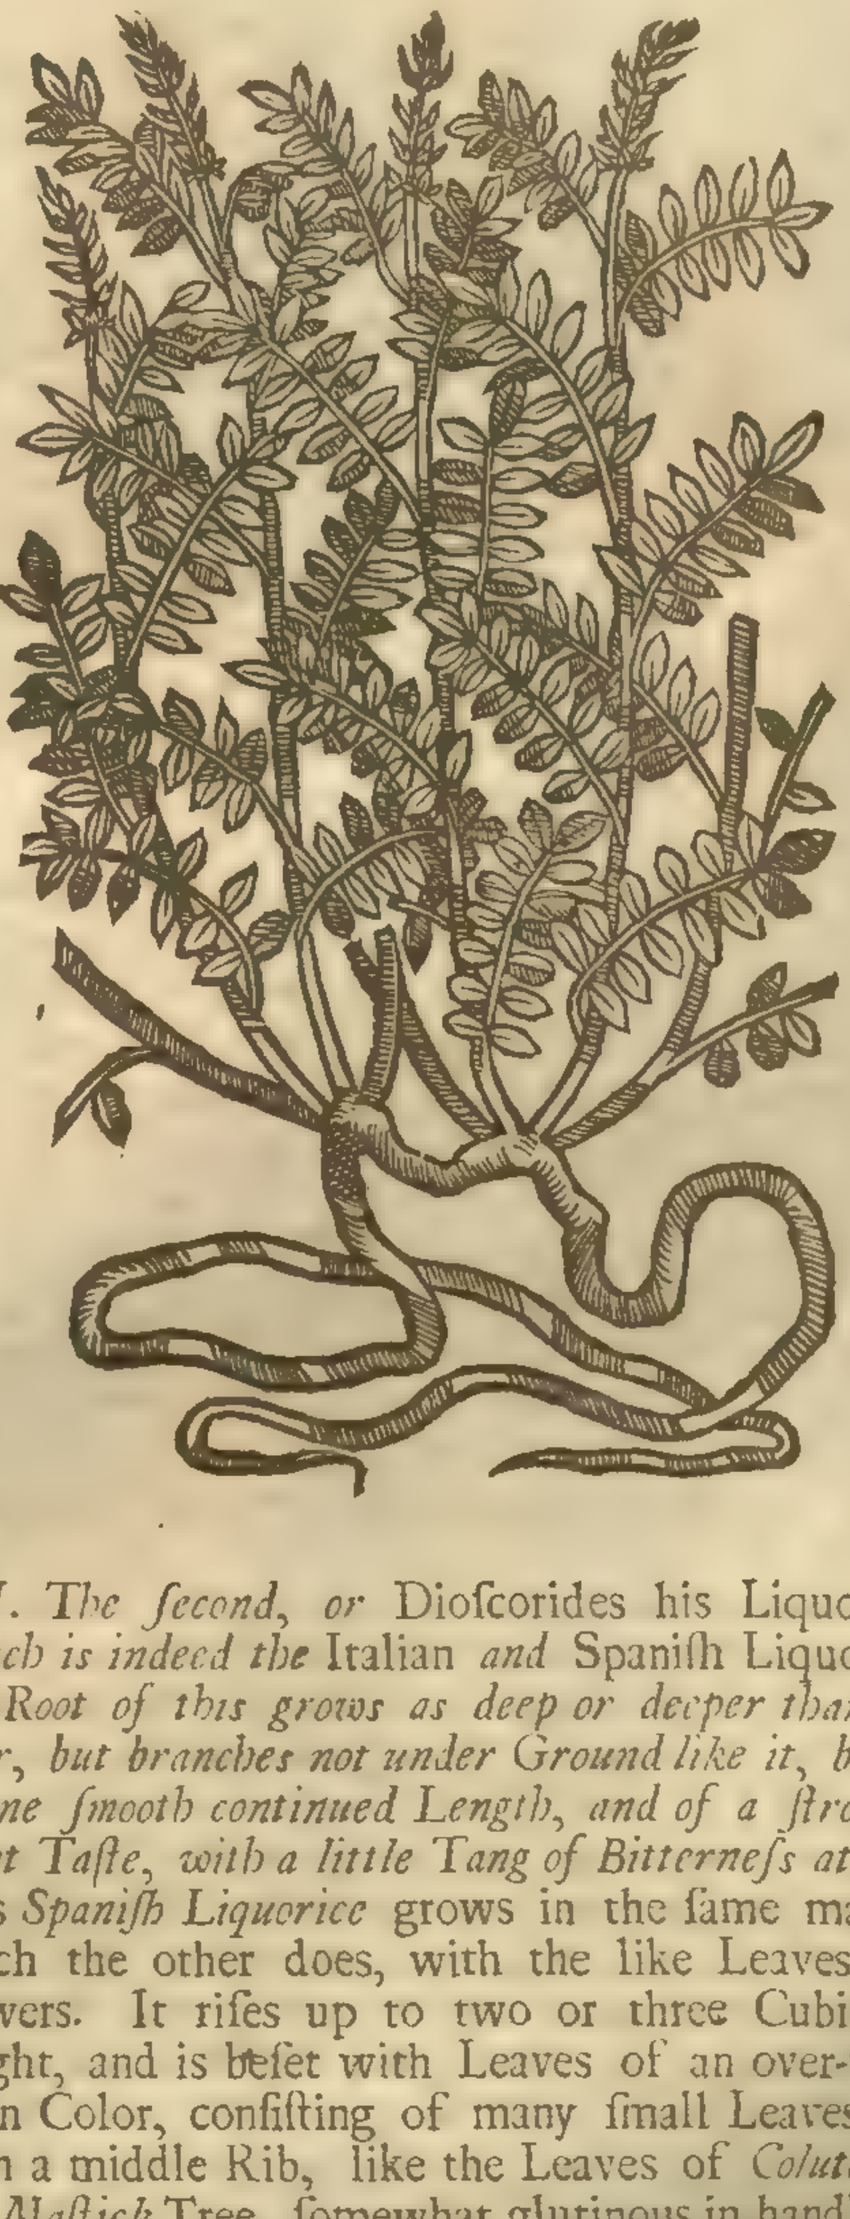
Glycyrrhiza ſiliquoſa Lobelii; *Glycyrrhiza lævis & non echinata & Germanica aliorum*; Our Common Engliſh Liquorice. 2. *Glycyrrhiza Dioſcoridis*; *Glycyrrhiza echinata Dioſcoridis, Lobelij, & Lugdunenſis*; *Glycyrrhiza Italica Geſneri & Dodonæi*; *Herba Scythica Theophraſti*; *Glycyrrhiza Matthioli, & Glycyrrhizon aliorum*; Dioſcorides his Liquorice. The *Wild Liquorice* is alſo twofold, *viz.* 3. *Glycyrrhiza ſylveſtris Geſneri in hortis, Camerarij & Dalechampij*; *Polygalon Cordi apud Dioſcoridem*; *Polygalon Cordi*, by *Thalius*; *Glaux, & Glaux vulgaris Lobelij & Cluſius*; *Fœnum Græcum ſylveſtre Tragi & Dodonæi*; *Glycyrrhiza ſylveſtris floribus luteis palleſcentibus Bauhini*; *Hedyſarum Glycyrrhizatum Gerardi*; *Glaux vulgaris leguminoſa Parkinſoni*; The moſt Common Liquorice Vetch. 4. *Glycyrrhiza ſylveſtris Thalij, Glycyrrhiza ſylveſtris alia Camerarij in horto*; *Glauca Lobelij, & Glaux quædam Leguminoſa herbariorum Lobelij*; *Glycyrrhiza ſylveſtris altera floribus puniceis foliis Arachi Bauhini*; *Glaux altera Leguminoſa*, The other Liquorice Vetch.

Common Engliſh Liquorice.

The Deſcriptions.

III. *The firſt, or* Our Common Engliſh Liquorice. *It has a Root which grows deep into the Ground, as large as a Man's Thumb, or larger, at the Head thereof, and ſpreads it ſelf out into divers other long Roots, downwards and ſideways, by which it much increaſes; of a brown Color on the outſide, and yellowiſh within, of a very ſweet Taſte.* From the Head of this Root riſes up many round woody Stalks, ſet at ſeveral diſtances with many winged Leaves, made of many ſmall long ones ſet on both ſides of a middle Rib, very well reſembling the Leaves of a young *Aſh* ſprung up from the Seed; and having an odd Leaf at the end. This Plant, by many Years continuance in a place, without removing it, and not elſe, will bring forth Flowers, many ſtanding together, Spike-faſhion, one above another upon the Stalks, of the Form of *Pease* Bloſſoms, but of a very pale or bleak blew Color, which convert into long and ſomewhat flat and ſmooth Cods, containing three or four ſmall, round, hard Grains or Seed within them. The ſweet Taſte of this our *Engliſh Liquorice* Root, is much more pleaſing to us, than that of the *Out-landiſh* or *Spaniſh Liquorice*, (which we ſhall deſcribe in the next place) becauſe that being of a ſtronger ſweet Taſte, has a kind of Bitterneſs joined with it, which makes it ſomething leſs acceptable and pleaſing.

Liquorice of Dioſcorides.



IV. *The ſecond, or* Dioſcorides his Liquorice, *(which is indeed the* Italian *and* Spaniſh Liquorice. *The Root of this grows as deep or deeper than the other, but branches not under Ground like it, but is of one ſmooth continued Length, and of a ſtronger ſweet Taſte, with a little Tang of Bitterneſs at laſt.* This *Spaniſh Liquorice* grows in the ſame manner which the other does, with the like Leaves and Flowers. It riſes up to two or three Cubits in Height, and is beſet with Leaves of an over-worn green Color, conſiſting of many ſmall Leaves, ſet upon a middle Rib, like the Leaves of *Colutea* or the *Maſtick* Tree, ſomewhat glutinous in handling: from among which come up ſmall Knobs or brown Heads, like to the Burs of the *Platanus*, or *Plane-Tree*, as *Dioſcorides* compares them, which grow upon ſhort Stems or Foot-ſtalks, between the Leaves and the Branches, cluſtering together, and making a round Form or Shape; out of which grow ſmall blew Flowers, of the Color of an *Engliſh Hyacinth*, after which ſucceed round prickly Heads, conſiſting of many rough ſcaly Husks or Cods, cloſely and thick compact together, being rough like thoſe of *Lentils*; in every of which Cods is contained one black Seed. This *Liquorice* grows in the ſame manner which the former does, with the like Leaves and Flowers, ſaving that theſe are of a deeper blew Color, and growing for the moſt part at the tops

of the Branches, in round rough Heads, as before described.

V. *The third, or* Most Common Liquorise Vetch. *It has a Root which is thick and long, dividing it self into two or three long Strings, running very deep into the Ground, sweet in Taste, like unto* Liquorice *Root, which dies not, but abides long, shooting forth new Branches every Year in the Spring.* From the Head of this Root spring forth many weak, round, hard Stalks, trailing on the Ground, branched upwards, set somewhat thick with winged Leaves, made of many small ones, set on both sides a middle Rib, something like to a *Vetch* or *Tare*, but much larger and pointed. The Flowers come forth at the Joints, at the end of a long Stalk, many together, of a bleak white Color, tending to yellow; which being passed away, crooked Cods come in their places, containing two Rows of Seed, cornered and greyish, of the Taste of other *Pulses*.

VI. *The fourth, or* Other Liquorice Vetch. *Its Root is like the last beforegoing, growing deep and spreading, and as sweet as the former, insomuch that* Thalius *says, that this Plant is very like to the* True Liquorice, *excepting in some few things.* This *Wild Liquorice* rises up also with such like Stalks and Leaves as the last, but spreads not so far, nor leans down so much, nor are the winged Leaves altogether so large; but they are of a darker green on the upper side, and grey underneath. The Flowers are of a purplish Color, and the Cods are of a brownish Color, long and round; and the Seed within them more round.

VII. *The Places.* The first sort of *Liquorice* grows plentifully in *Germany*, about *Nuremberg*, and is planted with us in *England* in Gardens: in the Northern parts of this Kingdom, it is manured with great Care and Diligence, where it is produced in very great plenty, replanting it once in three or four Years. The second grows plentifully in *Spain*, *Italy*, and *France*; but with us only in Gardens. The third grows in many places of *Cambridgeshire*, in *Claringdon Park* by *Salisbury*, and at *Thrapston* in *Northamptonshire*, and in many other places of our Land. *Gerard* says he found it growing in *Suffolk*, in the Highway on the right Hand as you go from *Sudbury* to *Corner Church*, about an hundred Paces from the end of the Town, and in several other places of the same County; and in *Essex*, about *Dunmow*; and in the Towns called *Clare* and *Henningham*: it grows also by *Purfleet*, about the foot of the Hill on which the Wind-Mill stands, and in several parts of *Kent*. The fourth grows Wild in *Germany*, but has not been found in *England*, except nursed up in Gardens.

VIII. *The Times.* *Gerard* says, that the two first flower in *July*, and their Seed is ripe in *September*: the other in *June*, and that their Seed is ripe in *August*; but *Parkinson* says they flower with us late, and seed as late, if at all.

IX. *The Qualities.* *Liquorice* (the Root which is chiefly used in Physick) is temperate in respect to Heat, Coldness, Dryness or Moisture: if there is any thing of Intemperature in it, it is something hot and moist. It is a little Abstersive, Diuretick, Relaxive and Traumatick; Pectoral, Nephritick, and Analeptick.

X. *The Specification.* It is prevalent against Coughs, Colds, Wheezing, Hoarseness, Obstructions of the Lungs, Catarrhs, Consumptions, Strangury, Obstructions of the Reins and Bladder, Ulcers of the Bladder, *&c.*

XI. *The Preparations.* You may have therefrom, 1. *A liquid Juice.* 2. *An Inspissate Juice.* 3. *A Decoction.* 4. *A Ptisan.* 5. *A Lohoch.* 6. *An Electuary Compound.* 7. *A Pouder.* 8. *A Spirituous Tincture.* 9. *An Acid Tincture.*

The Virtues.

XII. *The liquid Juice.* It may be given from a Spoonful to two, every Morning fasting, an Hour before Dinner, and at Bed-time, in a Glass of soft Wine, against Coughs, Colds, Hoarseness, Wheezing, Shortness of Breath, Difficulty of Breathing, and all sorts of Obstructions of the Lungs, causing easy Expectoration: it also provokes Urine, cleanses the Reins, Ureters and Bladder, takes away the Heat of Urine, and gives Ease in the Strangury.

XIII. *The Inspissate Juice.* It comes from *Spain*, and ought to be sliced very thin, or bruised in a Mortar into gross bits. Take of this Juice thus prepared an Ounce, fair Water a Quart, boiling hot, or White *Lisbon* Wine, spring Water, of each a Pint: mix, and put this on boiling hot upon the sliced or bruised *Liquorice*: let them stand two, three or four Days without the least stirring them, so will all the Tincture or fine Juice of *Liquorice* rise up into the Body of the Water, or Water and Wine, leaving only unprofitable Fæces at bottom: decant this clear Tincture into another Vessel, without the least disturbing the Fæces or Bottom, which keep for Use, casting the Fæces away as a thing of no worth. It has all the Virtues of the liquid Juice, but is vastly finer and purer than it. It may be given from two to four or six Spoonfuls, in all the Cases or Distempers before-named. It is a singular good thing against Catarrhs, Consumptions, Ulcers of the Lungs, Ulcers of the Reins and Bladder, *&c.* being frequently taken according to the Direction of the Physician.

XIV. *The Decoction.* It has the Virtues both of the Liquid and Inspissate Juice, but is much weaker, and therefore must be given in larger quantities. It may be made by boiling bruised *Liquorice* in Wine, or in Wine and Water, or in Water alone, in which last, if it is boiled with a little *Cinnamon* added to it, it serves instead of Drink in many places, especially if it is set to work with Yeast, as Ale or Beer is, and then Tunn'd up, which in a small time will become clear, strong and heady, as Ale and Beer do.

XV. The Ptisan. *Take Liquorice well bruised four Ounces, Maiden-hair three Ounces, Figs slit three Ounces, spring Water three Quarts: boil till half is consumed, strain out, and keep it for Use.* It is good for such as have a dry Cough, digests Flegm and corrupt Humors in the Lungs, and causes Expectoration: it helps Catarrhs and salt Distillations, also Consumptions, and is prevalent against all the Diseases for which the Liquid and Inspissate Juices are applied to. Dose four or six Spoonfuls.

XVI. The Lohoch. *It is made of the Spanish Juice, by extracting its Tincture with Rose Water, and making it thick with Gum Tragacanth, evaporating away the Water to a due Consistency.* It is good against Hoarseness, Wheezing, and all manner of Roughness of Mouth or Throat: it helps to expectorate tough Flegm, and to condensate thin Humors falling into Throat and Mouth.

XVII. The Electuary Compound. *Take fine Pouder of Liquorice twelve Ounces, fine Pouder of Elecampane eight Ounces, Ginger in fine Pouder four Ounces, Black Pepper in fine Pouder two Ounces: mix them, and with Honey a sufficient quantity make an Electuary.* Dose from half a Dram to a Dram every Night at Bed-time, every Morning fasting, and an Hour before Dinner, washing it down with a Glass of generous Wine, or Wine mixt with Water.

ter. It comforts and warms a cold Stomach, causes a good Appetite and Digestion, and is one of the best things in the World against a vehement Cough, an inveterate Catarrh, prevails against Wheezing, Hoarsness, and Shortness of Breath, and a singular Remedy against Consumptions and Ulcers of the Lungs. I commend it to all Consumptive People, and such as are troubled with Catarrhs, Coughs, and Shortness of Breath, as a Jewel.

XVIII. *The Pouder.* It may be given to a Dram or more: it has all the Virtues of the liquid and inspissate Juices, Decoction and Ptisane. The fine Pouder blown thro' a Quill into the Eyes which have a Pin and Web, as they call it, or are troubled with a Distillation or Rheum, does cleanse, clear, and heal them.

XIX. *The Spirituous Tincture.* It has all the Virtues of the liquid and inspissate Juices; but it is said to be a Specifick for curing Ulcers of the Stomach, Lungs, Bowels, Reins, Uteters and Bladder. Dose Morning, Noon and Night, from one Ounce to two. It is made of the Extract of the *Spanish* Juice, made with Water and inspissated again to the Thickness of new Honey, by digesting it in a gentle Sand Heat, mixt with very good Brandy.

XX. *The Acid Tincture.* It is more Stomatick than the former, and more Absterstive or Cleansing; and if the Tincture is made very strong, so as the Body of the *Menstruum* is full of it, it will be of an extraordinary Force to heal internal Ulcers, more especially if as much pure or clarified Honey is mixed with it, till it becomes thick like a Balsam. This being often lickt of, does Wonders in curing Ulcers of the Lungs, as also Ulcers of the Reins and Bladder. A Wise Physician well knows what extraordinary Uses this Medicament will serve for.

XXI. *Nota.* The two last *Wild Kinds*, tho' they may possibly have the same Virtues with the *True Liquorice*, of which we have hitherto spoken; yet they have not been used in Physick, In *Husbandry*, as they increase much, so they make Ground rich, and may be made very profitable to the Husbandman, because they become an admirable sort of Food for Cattel of all sorts.

CHAP. CCCCXLIX.

Of LIVER-WORT Common *or* Great.

Called also

Ground LIVER-WORT.

I. *THE Names.* It is called in *Arabick*, *Azer* and *Alsachel*: in *Greek*, Λειχὴν: in *Latine*, *Lichen*, *Lution* of some, *Hepatica*, and *Fecoraria*: in *English*, *Liver-wort*.

II. *The Kinds.* There are two principal sorts thereof, *viz.* 1. *Lichen*, *sive Hepatica vulgaris*, *Hepatica major*, The Greater or Common Liver-wort, Great or Common Ground Liver-wort: of which in this Chapter. 2. *Lichen*, *sive Hepatica minor*, Small Liver-wort: of which in the following Chapter.

The Descriptions.

III. *The* Common or Great Ground Liver-wort, *has Roots which are very fine and small, whereby it lives, and with which it draws its Nourishment.* It grows close, and spreads much upon the Ground in moist and shadowy places, with many sad green Leaves, lying, or rather as it were sticking flat one upon another, very unevenly cut in on the edges, and crumpled; from among which rise up small slender Stalks, an Inch or two high at the most, bearing small Star like Flowers at the tops.

Common or Great Ground Liver-wort.

IV. *The Places.* It is often found in moist and shadowy places upon the Surface of the Ground, and in moist places near Highways, and other common Paths, where the Beams of the Sun seldom come, and in places not often frequented by Travellers, as also on shadowy and moist places on Rocks and Rocky Grounds, *&c.*

V. *The Times.* It brings forth its blazing Stars and Leaves oftentimes in *June* and *July*.

VI. *The Qualities.* It is cold and dry in the first Degree, and somewhat Astringent or Binding.

VII. *The Specification.* It is a peculiar thing against the Rickets in Children, to allay Inflammations, cure the Yellow Jaundice, to help the Gonorrhœa in Men, and the Whites in Women.

VIII. *The Preparations.* You may have therefrom, 1. *A liquid Juice or Essence.* 2. *A Decoction.* 3. *A Syrup.* 4. *An Ointment.* 5. *A Cataplasm.*

The Virtues.

IX. *The Juice or Essence.* It is singular good against the Inflammation or Heat of the Liver, being taken from two Spoonfuls to four in clarified Whey or *Barley* Broth: it cures the sharp Fits of Agues, and Tertians which proceed of Choler. I have known several Children which have been troubled with the Rickets, (which the Vulgar call Liver-grown) to be cured by the constant taking thereof for some time. It cools the Inflammation of the Tongue, as also the Yellow Jaundice, which proceeds from an Inflammation of the Liver. It cools also the Heat of the Reins and Bladder, and cures a Gonorrhœa in Men, and the Whites in Women: and

and bathed often upon Tettars and Ringworms, and other running Sores and ſpreading Scabs, it is ſaid to dry and heal them.

X. *The Decoction.* It may be made in Water or Wine, according to the Nature of the Diſeaſe. It has all the Virtues of the Juice or Eſſence, but much weaker, and therefore is to be given in a greater quantity, as from a quarter of a Pint to half a Pint, and that Morning and Evening.

XI. *The Syrup.* It is made of the Juice with Honey or Sugar. It has all the Virtues of the Juice, but is chiefly made for Children which have the Rickets, by reaſon it is pleaſanter to take, and then they generally add to it *Maiden-hair*, *Raiſons of the Sun ſtoned*, *and Figs ſlit*, and ſo give it to the Child, a Spoonful at a time, five or ſix times a Day.

XII. *The Ointment.* It is made of the Juice, or rather of the green Herb boiled in Hogs Lard, or in Beef Suet mixt with Oil Olive, of each equal parts, till the Herb is criſp; then ſtrained out, and repeated three times in like manner. It is good againſt Scabs, running Sores, old Ulcers, Tettars, the Ringworm, called in *Greek*, λειχὴν, *Lichen*, (whence the Name of the Plant for curing this Diſeaſe) and other like Deformities of this kind.

XIII. *The Cataplaſm.* It cools and allays Inflammations, and is prevalent againſt an *Eryſipelas* or *Anthonies* Fire, and has all the Virtues of the Ointment, and may be uſed when that cannot be had. It is made by beating the green Plant in a Mortar, and applying it. *Dioſcorides* ſays, that being applied to an *Hæmorrhage*, or Flux of Blood, (I ſuppoſe he means in a Wound) that it will ſtop the Bleeding: but *Galen* doubts of this, tho' ſo great a Man as *Dioſcorides* reports it.

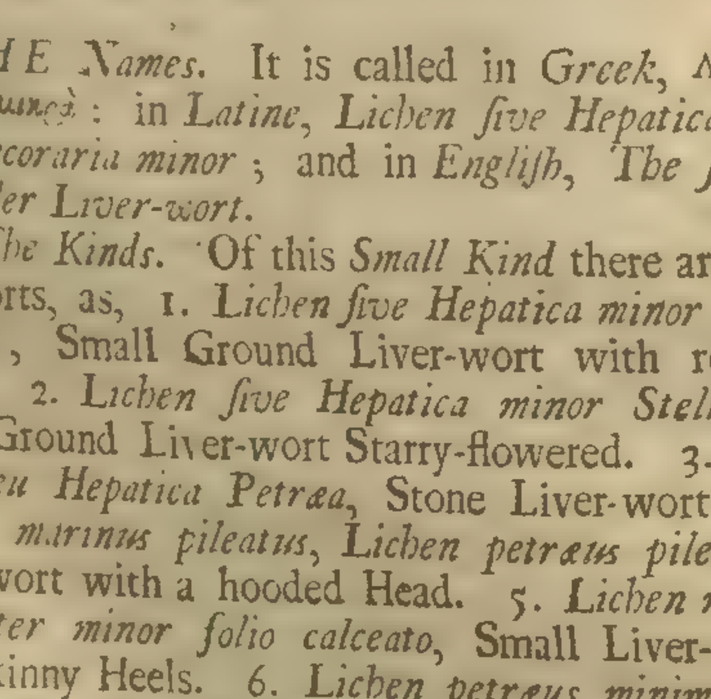
CHAP. CCCCXL.

Of LIVER-WORT Small.

I. THE *Names.* It is called in *Greek*, λειχὴν μικρὸς: in *Latine*, *Lichen ſive Hepatica minor*, *Jecoraria minor*; and in *Engliſh*, *The ſmall or ſmaller Liver-wort.*

II. *The Kinds.* Of this *Small Kind* there are ſeveral ſorts, as, 1. *Lichen ſive Hepatica minor Umbellatus*, Small Ground Liver-wort with round Heads. 2. *Lichen ſive Hepatica minor Stellaris*, Small Ground Liver-wort Starry-flowered. 3. *Lichen ſeu Hepatica Petræa*, Stone Liver-wort. 4. *Lichen marinus pileatus*, *Lichen petræus pileatus*, Liver-wort with a hooded Head. 5. *Lichen marinus alter minor folio calceato*, Small Liver-wort with skinny Heels. 6. *Lichen petræus minimus acaulis*, The ſmalleſt Liver-wort without Stalks. 7. *Lichen petræus purpureus Derbienſis*, Purple Liver-wort, *called* Cork *or* Archal.

Small Ground Liver-wort with round Heads.



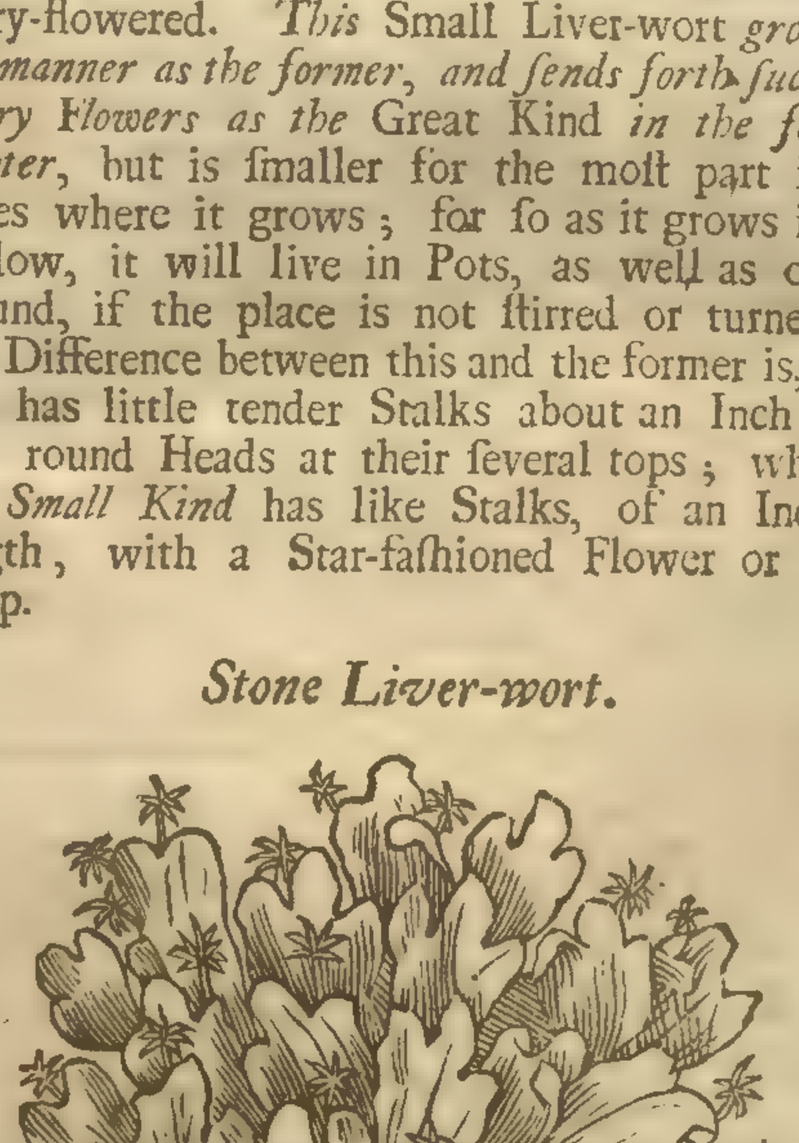
The Deſcriptions.

III. *The firſt, or* Small Ground Liver-wort with round Heads. *This differs not from the* Great Kind *in the former Chapter, but in its Stature, this being altogether leſs, and more ſmooth or even:* the Flowers on the tops of the ſlender Stems, are not ſo much laid open like a Star; but the eſpecial Difference conſiſts in this one chief thing, *viz.* that this Kind being planted in a Pot, and ſet in a Garden above the Ground, yet will it ſpread it ſelf round about, and increaſes in great plenty, where never any did grow before.

Small Ground Liver-wort Starry-flowered.

IV. *The ſecond, or* Small Ground Liver-wort Starry-flowered. *This* Small Liver-wort *grows in like manner as the former, and ſends forth ſuch like Starry Flowers as the* Great Kind *in the former Chapter*, but is ſmaller for the moſt part in all places where it grows; for ſo as it grows in the Shadow, it will live in Pots, as well as on the Ground, if the place is not ſtirred or turned up. The Difference between this and the former is, that that has little tender Stalks about an Inch long, with round Heads at their ſeveral tops; whereas this *Small Kind* has like Stalks, of an Inch in Length, with a Star-faſhioned Flower or Head at top.

Stone Liver-wort.



V. *The third, or* Stone Liver-wort. *It grows flat upon the Stones, and creeps not far abroad, as the* Ground

Ground Liver-wort *does:* it only reſts it ſelf in Spots and Tufts, ſet here and there, of a duſty ruſſet Color above, and blackiſh underneath: among the crumpled Leaves riſe up ſeveral ſmall Stems or Stalks, on which do grow little Star like Flowers, of the Color of the Leaves. The Leaves are leſſer than the former, of a lighter green Color, and a little hairy: the Stalks are ſlender, naked; and about two inches high.

VI. *The fourth, or* Liver-wort with a hooded Head. *It has a Root conſiſting of ſmall Fibres, fine and white.* Its Leaves lie one upon another, of a yellowiſh green Color, daſht over with an Aſh-color, and ſpotted a little in their middle. The Stalk grows to be about three or four Inches high, being white, ſmooth, clear or tranſparent, and of the thickneſs of a *Ruſh*, on which grows a ſmall Head, ſomething like unto an Hat, divided underneath into five parts, of a ſpongy Subſtance, green at the firſt, then yellow, and laſtly reddiſh; under which are growing the Fruit, which are of a dark purple Color, and juicy while they are freſh; but being dry, have a ſmoaky Pouder within them, inſtead of Seed.

VII. *The fifth, or* Liver-wort with skinny Heels. *Its Root is compoſed of Fibres as ſmall as Silk.* Its Leaves are ſmooth and tranſparent, more tender and ſmall than any of the former, growing in time to be of a blackiſh purple Color, and not lying or ſticking one to another, as the others do; from the back whereof grows forth a Skin or Sheath, ſhaped like a Shooe, whoſe brims or edges are a little crumpled, and raiſed higher than the reſt; from whence riſe up about four little, dark, green, ſhining Heads, of the Bigneſs of the ſmalleſt *Peaſe*, which afterwards open into yellow Flowers, having four Leaves apiece, ſtanding on yellowiſh Stalks four Inches high, with divers impalpable Threads in the middle.

VIII. *The ſixth, or* Smalleſt Liver-wort without Stalks. *Its Root conſiſts of very fine ſhort white Fibres, which cleave to the Leaves, by which the Plant is nouriſhed and lives.* This is the ſmalleſt of all the *Liver-worts*, and its Leaves are no larger than the Nails of ones Finger, green and rough, with white Spots. It has alſo certain ſad purpliſh Skins, ſet on both ſides of the lower part of the Leaf, before any Flower appears; but when the Leaf grows greater, it becomes of a ſad purpliſh Color, like the Skins, and ſwells at the end, ſending forth a ſmall Fruit, as big as a ſmall *Pea*, being of the ſame Color with the Leaf, ſappy, or full of a whitiſh watery Juice, which afterwards, as the Fruit grows ripe, changes yellow, and being broken, has then a yellow Pouder, which will color the Fingers which touch it.

IX. *The ſeventh, or* Purple Liver-wort, *called* Cork *or* Archal. *It is a kind of Herb or Plant much reſembling* Liver-wort, *of a ſad purpliſh Color*, which the poor People in *Derbyſhire* gather, and grinding it, make it into a moiſt Maſs, which they keep in Barrels, and therewith they make a kind of Murry or purpliſh Dye, which, tho' it will not hold Color long in Cloth, but will ſtarve and change, yet it ſerves poor People for their Wearing very well.

X. *The Places.* The firſt and ſecond grow in moiſt ſhadowy places in Gardens, and other like Grounds, and ſometimes they are planted in Pots, which ſet in ſhady moiſt places, thrive very well. The third grows upon Stones by Wells and Springs, and is found upon Rocks and Stony places, as well near unto the Sea, as farther on the Land; and it is often found at the bottoms of high Trees, growing upon high Mountains, eſpecially in ſhadowy places. The fourth, fifth and ſixth grow alſo in the like moiſt Stony and Rocky places. The ſeventh grows in *Derbyſhire*, on the Mountains there, and is found in great plenty.

XI. *The Times.* They bring forth their Flowers for the moſt part in *June* and *July*, and are in a flouriſhing Condition all the Summer Months.

XII. *The Qualities, Specification, Preparations, and Virtues*, are the ſame with thoſe of the *Great Liver-wort* in the former Chapter, ſo that no more need be ſaid thereof in this place.

CHAP. CCCCLI.

Of LIVER-WORT Noble; *OR,* Golden TREFOIL.

I. *THE Names.* It does not appear that this Plant was ever known to the *Greeks*, and therefore has no *Greek* Name; but it is called in *Latine*, *Hepatica*, *Hepatica nobilis*, *Hepatica aurea*, *Hepatica trifolia*, *Hepaticum trifolium*, *Hepatica Trinitatis*, alſo *Herba Trinitatis*; (but there is another Plant, which is the proper or true *Herb Trinity*, viz. *Hearts-eaſe*, of which we have already treated in *Chap.* 246 and 347 aforegoing.) It is alſo called *Trifolia aurea*, *Trifolium aureum*, *Trifolium nobile*, *Trifolia nobilis*, and *Trinitas:* in *Engliſh*, *Noble Liver-wort*, *Golden Liver-wort*, *Noble Trefoil*, and *Golden Trefoil*, and *Hepatica*.

II. *The Kinds.* There are various ſorts of this Plant, *viz.* 1. *Hepatica flore cæruleo ſimplici major*, *Hepaticum Trifolium*, The great ſingle blew Hepatica, *or* Noble Liver-wort. 2. *Hepatica minor flore palido cæruleo*, The ſmall blew Noble Liver-wort *or* Hepatica. 3. *Hepatica flore purpureo*, Purple Noble Liver-wort. 4. *Hepatica flore albo minor*, The leſſer White Hepatica. 5. *Hepatica alba magno flore*, The great White Hepatica. 6. *Hepatica albida ſive argentea*, Aſh-colored Noble Liver-wort, or that of a Wild Tanſy-color. 7. *Hepatica alba ſtraminibus rubris*, White Hepatica or Noble Liver-wort with red Threads. 8. *Hepatica flore rubro*, *Hepatica trifolia rubra*, Red Noble Liver-wort or Hepatica. 9. *Hepatica Americana, vel Virginiana*, The American or Virginian Noble Liver-wort or Hepatica. 10. *Hepatica flore purpureo multiplici ſive pleno*, *Hepatica multiflora Lobelij*, Double-flowered purple Hepatica, or Noble Liver-wort. 11. *Hepatica flore cæruleo pleno*, Double-flowered blew Noble Liver-wort.

The Deſcriptions.

III. *The firſt, or* Great ſingle blew Hepatica, or Noble Liver-wort. *The Roots are compoſed of a Buſh of blackiſh Strings or Fibres: from the ſeveral Buttons or Heads whereof the Flowers ſpring up, blow open, and ſometimes ſhed and fall away, before any Leaves appear or ſpread open.* Theſe Flowers ſtand every one upon their own Foot-ſtalks, of the ſame Height with the Leaves for the moſt part, which is much about four Inches high, and ſometimes a little more, which uſually conſiſt of ſix Leaves, (but ſometimes they have ſeven or eight) of a fair blew Color, with many white Chives or Threads in the middle, ſtanding about a middle green Umbone or Head, which after the Flowers

are

are fallen, grows greater, and ſhews many ſmall Grains or Seeds ſet cloſe together, (with three ſmall green Leaves compaſſing them underneath, as they did the Flower at the bottom) very like to the Heads of Seed of many of the *Crowfoot*. After the Flowers are riſen and blown, ſpring up many freſh Leaves, of a green Color, each ſeverally ſtanding upon its own proper Foot-ſtalk, folded together, and ſomewhat brown and hairy at their firſt coming forth, which afterwards are broad, and divided at the edges into three parts, as is fully demonſtrated by the Figure.

Great Blew Noble Liver-wort.

Double Noble Liver-wort.

IV. *The ſecond, or* Small blew Noble Liver-wort or Hepatica. *The Roots or fibrous Strings of this, are like the former: the Leaves of it are alſo like to thoſe, but ſmaller by half, and grow more abundantly or buſhing thick together.* The Flowers are of a pale or bleak blew Color, and not ſo large as the aforegoing. It very ſeldom bears Flowers, for *Parkinſon* ſays he had the Plant half a ſcore Years in his Garden, and yet never ſaw it bear Flowers above twice in all that time.

V. *The third, or* Purple Noble Liver-wort. *This Plant in its fibrous Roots, Stalks, Flowers, Seed, Leaves, and manner of Growing, is wholly like unto the firſt deſcribed*; ſo that there is no need to reiterate the former Deſcription at *Sect.* 3. above: but the only Difference in this is, that the Flowers are of a deeper blew, tending to a *Violet* purple Color.

VI. *The fourth, or* Leſſer White Hepatica, or Noble Liver-wort. *The Flowers of this* Noble Trefoil, *are wholly white, of the Largneſs of the* Red *or* Purple-colored; and the Leaves of the Plant are ſomewhat ſmaller, and of a little whiter or paler green Color; in all things elſe it is wholly agreeing with the firſt.

VII. *The fifth, or* Great White Hepatica, *or* Noble Liver-wort. *There is no Difference between this and the laſt deſcribed, neither in its Root, Stalks, Leaves, Flowers nor Seed*, ſaving that the Flowers of this being full as white as the former, are as large as thoſe which we ſhall deſcribe in the next *Section.*

VIII. *The ſixth, or* Aſh-colored Noble Liver-wort, *or* that of a Wild Tanſy Color. *Both the Leaves and the Flowers of this* Hepatica, *are larger than any of the former, except the laſt:* the Flowers hereof, at firſt opening, ſeem to be of a bluſh Aſh-color: which ſo abide for three or four Days, decaying ſtill, until they turn almoſt white; having yet ſtill a ſhew of that bluſh Aſh-color in them, till the very laſt.

IX. *The ſeventh, or* White Hepatica, *or* Noble Liver-wort with red Threads. *There is very little Difference between this* Noble Liver-wort, *and the firſt* White One *at* Sect. 6. *aforegoing*, ſaving that the Threads in the middle of the Flower are purely white, as in the laſt they are tipt at the ends of a pale reddiſh Color, which adds a great Beauty to the Flower.

X. *The eighth, or* Red Noble Liver-wort, *or* Hepatica. *The Leaves of this* Trefoil *are of a little browner red Color, both at their firſt coming up, and afterwards, eſpecially in the middle of the Leaf, more than any of the former:* the Flowers are in Form like unto the reſt, but of a bright bluſh or pale red Color, very pleaſant to behold, with white Threads or Chives in the middle of them.

XI. *The ninth, or* American or Virginian Noble Liver-wort or Hepatica. *This differs ſomewhat from the other ſorts already deſcribed:* it bears very dark green Leaves, much of the Form of the other Kinds. The Flower is ſmall and white, with white Threads in the middle: in other Reſpects the Difference is very ſmall.

XII. *The tenth, or* Double-flowered Hepatica, *or* Noble Liver-wort. *This* Double Hepatica *is in all things like unto the* Single purple Kind, *ſaving only, that the Leaves are larger, and ſtand upon longer Foot-ſtalks*; and that the Flowers are ſmall Buttons, but very thick of Leaves, and as double as a Flower can be, like unto the *Double White Crowfoot*, but not ſo big, of a deep blew or purple Color, without any Threads or Head in the middle, which fall away without giving any Seed.

XIII. *The eleventh, or* Double-flowered blew Noble

Noble Liver-wort. *This differs but very little from the last* : the whole Plant is a little leſs ; the Flower is not full out ſo large, but altogether as double or manifold in the Leaves.

XIV. *The Places.* The ninth is a Native of *Virginia*, and was brought from thence by *John Tradeſcant*. Moſt of the reſt grow naturally in the Woods in *Germany*, and ſome of them in *Italy*, as thoſe with the blew Flowers, and the double-flowered, as *Cluſius* ſays ; but with us they only grow in Gardens, nurſed up for the Flowers ſake, which are beautiful in their Kind, more eſpecially being conſidered as to their early Appearance.

XV. *The Times.* Theſe Plants do flower very early, and are ſome of the firſt Flowers which appear after the hard Froſts in *January* or *February* : ſo that next unto the *Winter Woolfs-bane*, theſe ſhew themſelves towards the latter end of Winter, which becauſe they are ſo early in the Year, are ſo much the more to be valued. The *Double Kinds* flower not altogether ſo early, ſometimes in *March* and *April*, yet they continue when the others are paſt. The Seeding Kinds perfect their Seed in *April* and *May*.

XVI. *The Qualities.* All theſe Kinds of *Noble Liver-wort*, are cold and dry in the firſt Degree, Aſtringent, Traumatick or Vulnerary, Stomatick, Hepatick and Analeptick.

XVII. *The Preparations.* You may have, 1. *A liquid Juice or Eſſence of the whole Plant.* 2. *A Decoction of the whole Plant.* 3. *A Pouder of the Root.*

The Virtues.

XVIII. *The liquid Juice or Eſſence.* Either of theſe Preparations admirably comforts and ſtrengthens the Liver, refrigerates it, and takes away any preternatural Heat of the Bowels: being given in Red Port Wine, it cleanſes and ſtrengthens the Ventricle, cures Fluxes and Bloody-fluxes, helps Piſſing Blood, and the Over-flowing of the Courſes in Women, and is of very good Uſe in Spitting Blood, reſtoring ſuch as are in Conſumptions. Being taken as a Diet, they are of excellent Effects in curing of Wounds, old Sores, Ulcers, and the like : and outwardly uſed as a Waſh in thoſe Caſes, they diſpoſe the ſame to a ſpeedy Healing. Doſe two, three or four Spoonfuls at a time Morning and Evening, in any fit Vehicle.

XIX. *The Decoction.* It has all the Virtues of the liquid Juice and Eſſence ; and may be made in Wine or Water, according as the Occaſion may require. It may be given Morning, Noon and Night, from three Ounces to ſix or eight : and outwardly it may alſo be uſed as a Lotion for Sores and Ulcers, which are of difficult or hard Cure. It is an excellent thing for the Hepatick Flux.

XX. *The Pouder of the Roots.* The Pouder has poſſibly the Virtues of the Juice and Eſſence. *Baptiſta Sardus* commends it, and writes, that if a Spoonful thereof is given at a time in Wine, for ſeveral Days together ; or in Broth, it is very beneficial againſt the Diſeaſe called *Enterocele* or Burſtenneſs.

LIVE-LONG, *ſee* Orpin-Spaniſh.

LONG-WORT, *ſee* Mullein.

CHAP. CCCCLII.

Of LOOSE-STRIFE Yellow *or* Common.

OR,

Yellow WILLOW-HERB.

I. *THE Names.* It is called in *Greek*, Λυσιμάχιον, ἢ Λυσιμάχειον : in *Latine*, *Lyſimachia*, and *Lyſimachion*, (ſo called from *Lyſimachus*, King of *Illyria*, (as I ſuppoſe) who was the firſt Finder of it out ;) it is alſo called *Salicaria*, *aut quod inter Salices oritur*, *aut quod Salicis folio habet*, viz. *Willow-Herb*, either becauſe it grows among *Willows*, or that it has *Willow* like Leaves. In *Engliſh*, *Looſe-Strife*, or *Willow-Herb.*

II. *The Kinds.* We make four principal Kinds of this Plant, *viz.* 1. Λυσιμάχιον κλωμὸς, μεῖζον, ἢ κοινὸς, *Lyſimachia lutea*, *major & communis*, The Yellow, *or* Greater, *or* Common Looſe-ſtrife : of which in this Chapter. 2. *Lyſimachia ſpicata*, Spiked Looſe-ſtrife, or that with ſpiked Heads of Flowers : of which in Chap. 453. 3. *Lyſimachia non ſpicata*, Looſe-ſtrife not ſpiked : of which in Chap. 454. 4. *Lyſimachia ſiliquoſa*, Codded Looſe-ſtrife : of which in Chap. 455. following.

Common Yellow Looſe-Strife.

III. *The Kinds of the Common or Yellow Looſe-ſtrife.* We have, 1. *Lyſimachia lutea & vera*, *Lyſimachia verum & Legitimum Cordi apud Dioſcoridem*, *Lyſimachia lutea major*, *quæ eſt Dioſcoridis Baubini* ; *Salicaria Tragi & Geſneri* ; *Corneola Leoniceri*, The Common Yellow Looſe-ſtrife, *or* Willow-Herb. 2. *Lyſimachia lutea altera Cluſij*, *Lyſimachia lutea in alis foliorum ſtorens Cæſalpini*, *Lyſimachia lutea minor foliis nigris punctis notatis Baubini*, The leſſer Yellow Looſe-ſtrife, *or* Willow-Herb. To theſe

Authors add a third, *viz.* 3. *Lyſimachia lutea tertia Cluſii*, *Lyſimachia lutea altera Lobelij*, *Lyſimachia ſpuria Dodonæi*. *Lyſimachia lutea flore globoſa*, Yellow Looſe-ſtrife round headed.

The Deſcriptions.

IV. *The firſt, or* Common Yellow Looſe-ſtrife, *or* Willow-Herb. *It has a Root which creeps under Ground much like to* Quitch-Graſs *or* Dogs-Graſs, *but greater, which ſhoots up every Spring with brownish Heads, that afterwards grow up into Stalks.* This is the moſt common Kind, which grows in rank moiſt Ground, to be four or five Feet high or more, with great round Stalks, a little creſted, and diverſly branched from the middle of them to the tops into great and long Branches; on all which, at the Joints, there grow long and narrow Leaves, but greater and broader below, moſt commonly two at a Joint, yet ſometimes three or four, ſomething like unto *Willow* Leaves, without Nicks or Dents on the edges, and of a faint green Color: from the upper Joints of the Branches, and at the tops of them alſo, ſtand many yellow Flowers of five Leaves apiece, with ſeveral yellow Threads in the middle, which turn into ſmall round Heads, in which are contained ſmall cornered Seed.

V. *The ſecond, or* Leſſer Yellow Looſe-ſtrife, *or* Willow-Herb. *It has a Root which creeps under Ground, and ſhoots up again in the ſame manner as the former.* This Plant riſes not up ſo high as the firſt, with its round jointed Stalks, which are ſomewhat woolly or hairy; the Leaves being alſo woolly, and ſomething like them, are narrower and ſhorter than they, four for the moſt part, and ſometimes but three ſet together at a Joint, ſpotted with blackiſh Spots on their under ſides, not compaſſing it at the bottom, but every one ſtanding upon a ſhort Foot-ſtalk, and not at all dented about the edges. From the middle of the Stalk almoſt, upwards at every Joint come forth the Branches, which are ſhort, nothing ſo long as the former, and ſtanding cloſer together, on which grow a few Leaves, leſſer than thoſe below. At the tops of the Branches, and at ſome of the upper Joints alſo, grow a few Flowers, leſſer than thoſe in the before-deſcribed, which are of a yellow Color, and conſiſting of five Leaves as they do, with many yellow Threads in them, of a ſtrong ſweet Smell, which ſo join together at the bottom, that the whole Flower falls away together, and not any Leaf apart. The former Plant has no Smell or Taſte, but only Styptick, or Aſtringent and Drying; whereas this *Smaller* now deſcribed, has a little Acrimony it it, which will cauſe one to ſpit, after chewing it a while in the Mouth.

VI. *The third, or* Yellow Looſe-ſtrife round headed. *Its Roots are long, creeping under Ground with many Joints therein, and ſhooting forth Fibres at every one of them.* The Stalks of this Plant riſe not up to be above a Foot in Height, bearing only two Leaves, and no more at a Joint, which are ſhorter and narrower, yet very like to thoſe of the *Common ſort*, and of a pale green Color. At the Joints of the Stalks, which are creſted and hollow, with the Leaves come forth long Stalks of Flowers, without any Leaves on them, which are cloſe ſet together, almoſt round, or rather of an oval Form, but yet ſhewing the ſmall yellow Flowers, conſiſting of five Leaves apiece.

VII. *The Places.* The firſt grows in many places of *England*, in moiſt Medows, and by Water-ſides, eſpecially along the Medows as you go from *Lambeth* to *Butterſey*, near *London*, &c. The ſecond grows alſo near ſtill Rivers and Water-ſides, and in Valleys and moiſt Fields, it is a Native of the Hills in *Auſtria*, and of the moiſt Fields on the *Alps*. The third *Lobel* found in the Ditches near *Gaunt* in *Flanders*, and among *Reeds* near *Amſterdam* in *Holland*; and *Cluſius* ſays, that it was alſo found in places near the *Alps*. With us the two laſt are only nurſed up in Gardens.

VIII. *The Times.* All thoſe Plants flower in *June* and *July* to *Auguſt*, and the Seed is perfected ſome time after.

IX. *The Qualities.* *Looſe-ſtrife* is cold and dry in the end of the firſt Degree; Aſtringent, Traumatick, and Coſmetick.

X. *The Specification.* It is an excellent thing for curing Wounds in any Part, to ſtop Bleeding inward or outward, as alſo to cure ſore Throats, and help Diſeaſes of the Eyes.

XI. *The Preparations.* The Plant moſt uſed in Phyſick, is the firſt or *Common great yellow Kind*, from which you may have, 1. *A liquid Juice or Eſſence.* 2. *A Decoction.* 3. *A Clyſter.* 4. *A Fumigation.* 5. *An Ointment.* 6. *A Cataplaſm of the green Herb bruiſed.* 7. *A diſtilled Water.* 8. *An Acid Tincture.*

The Virtues.

XII. *The liquid Juice or Eſſence.* It is of an exceeding binding Quality, and therefore *Dioſcorides* ſays it is good to ſtay all manner of Bleedings at Mouth or Noſe, or of Wounds, or any other Bleeding whatſoever: it ſtops all Fluxes of the Belly, even the Bloody-flux it ſelf, given either to drink, or taken as a Clyſter; it ſtops alſo the Over-flowing of the Terms in Women. It is of good Uſe for green Wounds, to ſtop their Hæmorrhage, and to conglutinate their Lips, being applied to them. It is often uſed as a Gargle for ſore Mouths, and to cure Sores and Ulcers in the ſecret Parts. It is beneficial for the Eye-ſight, and of good Uſe to clear the Eyes of any thing gotten into them. Doſe two, three, or four Spoonfuls.

XIII. *The Decoction in Wine or Water.* It has all the Virtues of the Juice or Eſſence, but much weaker, and may be given in any of the Caſes aforementioned, from three Ounces to eight Morning and Night. It makes an excellent Gargle for ſore Mouths and Throats, as alſo old Sores and running Ulcers in other Parts of the Body.

XIV. *The Clyſter.* It is made of the *liquid Juice or Eſſence two parts, Chicken-Broth one part: mix them for a Clyſter.* It is good againſt a Diarrhæa, Dyſenteria and Lienteria, and other Weakneſſes of the Bowels.

XV. *The Fumigation.* It is found by Experience, that the Smoak of *Looſe-ſtrife* being burned, drives away Flies and Gnats, and other ſuch like troubleſome Inſects, which abound near Fenns, Marſhes, Water-ſides and Pools, which are troubleſome by biting and ſucking the Blood in the Night Seaſon, leaving Marks and Spots upon the Skin. It is ſaid alſo to drive away Serpents and other Venomous Creatures, being made where they uſually haunt.

XVI. The Ointment. *Take Bees-Wax, Sugar, Oil Olive, Beef-Suet, of each an Ounce; Juice of Looſe-ſtrife four Ounces: mix and boil all together in Balneo to the Conſiſtence of an Ointment.* I know ſome, inſtead of Oil and Suet, uſe *May* Butter, but that I avoid, becauſe the Butter will quickly make the Ointment grow rank. It is an excellent thing againſt Wounds and Punctures of the Muſcles, Nerves and Tendons: let Tents be dipt in it, and put into the Wound, and the place covered with a Linnen Cloth doubled, and ſpread with the Ointment.

ment. This was experimented on a Captain, who was Shot in two places with Bullets, the one thro' his Breſt, the other thro' his Thigh, who was perfectly cured of both Wounds without any Scar, only by applying them as aforeſaid, after he could not be cured by other Medicines. It alſo cleanſes and heals all foul Ulcers and Sores whereſoever, and abates their Inflammations, they being alſo waſhed with the diſtilled Water.

XVII. *The Cataplaſm.* It is made of the green Herb, being beaten in a Mortar. It is good to ſtop the Bleeding in green Wounds, and to conglutinate the Lips of ſimple Wounds and heal them, being applied. Uſed to the Inflammations of Wounds or Ulcers, it abates the Inflammation, and eaſes the Pain.

XVIII. *The diſtilled Water.* It is a preſent Remedy for Hurts and Blows on the Eyes, as alſo for Blindneſs, provided the Cryſtalline Humor is not let out, or the Sight it ſelf periſhed. This Experiment was found true upon a Boy, whoſe Eye by Chance was prickt, who was reſtored to his Sight thereby. There was alſo another who was hurt in the Eye by a Dart, and was cured by applying this Water only to the ſame. This Cure has been performed by this Water upon ſeveral Perſons, by one who kept it as a Secret for a long time. It is of good Uſe to clear the Eyes from Duſt, external things fallen into them, as alſo from Miſts, Clouds, Inflammations, Bloodſhot, and other Diſtempers which obfuſcate the Sight. It abates Inflammations in any Part, being bathed therewith, laying over the ſame a green Leaf or two. This Water uſed as a Gargle very warm, and alſo ſometimes drunk, cures the Quinſy in the Throat, and is helpful againſt Tumors and Ulcers of the Kings-Evil. The ſaid Water applied warm, is ſaid to take away all Spots and Marks, Diſcolorings and Scars in the Skin, cauſed by the Small-Pox, Meaſles, or the like.

XIX. *The Acid Tincture.* Given conſtantly in ſome proper Vehicle, ſo much at a time as to make it gratefully ſharp, it will abate and exterminate the Humors which cauſe the Kings-Evil: it is profitable againſt the Scurvy in all its Appearances: it prevails againſt all ſorts of hot, burning, malign and peſtilential Fevers, yea, and cures the Plague or Peſtilence it ſelf. It powerfully quenches Thirſt, opens Obſtructions of the Viſcera, ſtrengthens the Stomach, and cauſes a good Appetite and Digeſtion.

CHAP. CCCCLIII.

Of LOOSE-STRIFE Spiked,

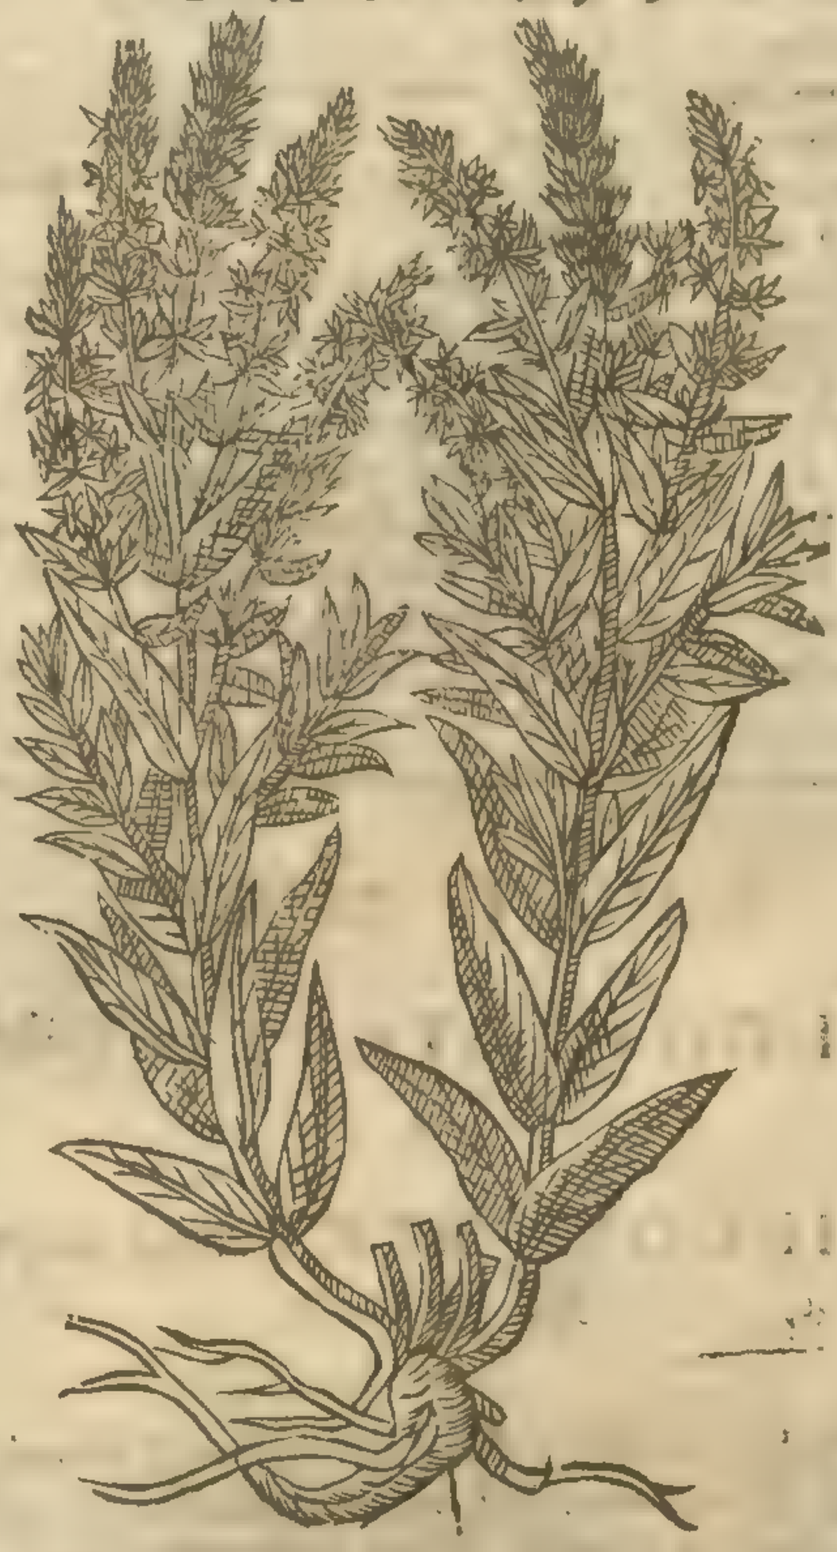
OR,

WILLOW-HERB with ſpiked Heads of Flowers.

I. *THE Names.* It is called in *Greek*, Λυσιμάχιον σταχυηρὸς: in *Latine*, *Lyſimachia ſpicata*; and in *Engliſh*, *Spiked Looſe-ſtrife*, or *Willow-Herb*, or *Looſe ſtrife with ſpiked Heads of Flowers.*

II. *The Kinds.* There are two ſorts of this Plant, *viz.* 1. *Lyſimachia ſpicata purpurea*, *Lyſimachia altera Matthioli*, *Lyſimachia Pliniana Lobelij*, *Lyſimachia purpurea Communis major Cluſij*; *Pſeudolyſimachium purpureum alterum Dodonæi*; *Solidaginis Saraſenicæ alia ſpecies Tragi*; Purple ſpiked Looſe-ſtrife. 2. *Lyſimachia ſpicata cærulea*, *Lyſimachia flore cæruleo Cluſij*, *Lyſimachia cærulea hortenſis Lobelij*; *Pſeudolyſimachium Cæruleum Dodonæi & Ludgunenſis*; Blew ſpiked Looſe-ſtrife.

Purple ſpiked Looſe-ſtrife.



The Deſcriptions.

III. *The firſt, or* Purple ſpiked Looſe-ſtrife, *has a Root which creeps under Ground like unto the* Yellow, *but is greater than it, and ſo are the Heads of Leaves, when they firſt appear out of the Ground, and are more brown than thoſe of the* Yellow. It grows up with many woody ſquare Stalks, full of Joints, about three Feet high or more; at every one whereof ſtand two long Leaves, not altogether ſo great and large as thoſe of the *Common Yellow*, but ſhorter, narrower, and of a deeper green Color, and ſome browniſh: the Stalks are ſpread out into many long Branches or Stems of ſpiked Flowers, half a Foot long or longer, growing in Rundles one above another, out of ſmall Husks, very like unto the ſpiked Heads of *Lavender*; each of which Flowers have five round pointed Leaves, of a *Purple Violet* Color, or ſomewhat enclining to Redneſs: in which Husks ſtand ſmall round Heads, after the Flowers are fallen, in which is contained ſmall Seed.

IV. *The ſecond, or* Blew ſpiked Looſe-ſtrife. *Its Root creeps not as the firſt does, but ſhoots forth many Sprouts round about it, by which it does much encreaſe.* This Plant grows ſomewhat lower than the former, with ſome Branches in like manner at the tops of the ſquare Stalks, and with dark green and narrower Leaves, ſet by Couples at the Joints towards the tops, but with three or four at a Joint lower, ſomewhat more deeply ſnipt or dented about the edges. The Flowers grow in the ſame manner as the former do, in long ſpiked Heads, ſet round about with blew Flowers, of four Leaves apiece, which turn into ſmall flat Heads, with browniſh Seed therein.

V. *The Places.* The firſt grows uſually by Rivers and Ditch-ſides in wet Grounds, as upon *Lambeth* ſide, about the Ditches there in many places; as alſo under the Biſhop's Houſe-Wall at *Lambeth*, by the *Thames* ſide. It grows in places of great Moiſture, yea, almoſt in running Streams, as well as in ſtanding Waters hard by them, and in moiſt Ditches in moſt places of *England.* The ſecond grows in *Auſtria* and other places of *Germany* plentifully. *Gerard* ſays, that it grows Wild in many places of this Kingdom; but it is uſually nurſed up with us in Gardens.

VI. *The Times.* They both flower in the Months of *June* and *July*, and ſometimes longer; and the Seed is ripe not long after.

VII. *The Qualities, Specification, Preparations and Virtues* of theſe, are the ſame with thoſe of the firſt *Yellow Kind* in the foregoing Chapter; and the firſt of theſe is not inferior to that; but in the Opinion of ſome Phyſicians, ſuperior thereto: and therefore to the former Chapter you are referred.

CHAP. CCCCLIV.

Of LOOSE-STRIFE not ſpiked, OR, WILLOW-HERB with diſperſed Flowers.

I. *THE Names.* It is called in *Greek*, Λυσιμαχία ἡ σαχυηβὴς: in *Latine*, *Lyſimachia non ſpicata*; and in *Engliſh*, *Looſe-ſtrife not ſpiked*, or *Willow-Herb with diſperſed Flowers.*

II. *The Kinds.* There are two ſorts of this Plant alſo, *viz.* 1. *Lyſimachia purpurea non ſpicata, vel rubra minor*, *Lyſimachia purpurea ſecunda ſive minor Cluſij*, *Lyſimachia rubra non ſiliquoſa Bauhini*, The ſmall purple-flowered Looſe-ſtrife not ſpiked, *or* Leſſer purple Willow-Herb. 2. *Lyſimachia purpurea non ſpicata minima, ſive rubra minima*, *Lyſimachia rubra minima Cluſii*, *Lyſimachia linifolia purpurea cærulea Bauhini*, The leaſt purple-flowered Looſe-ſtrife not ſpiked, *or* Leaſt purple Willow-Herb.

The Deſcriptions.

III. *The firſt, or* Small purple-flowered Looſe-ſtrife not ſpiked, *or* Leſſer purple Willow-Herb. *Its Root creeps not as the others do, but is hard and ſomewhat woody, with many ſmall Fibres ſpringing from the ſides thereof.* This ſmall Herb is much lower than that of the *Purple ſpiked Head*, or firſt Kind deſcribed in the former Chapter, being but about a Foot and half high, with ſmooth and ſquare Stalks, whoſe tops are parted into many Branches: on the lower part thereof ſtand long Leaves, ſmaller and narrower than the other purple ſpiked Head in the laſt Chapter; two always ſet together at a Joint, one againſt another; but thoſe which grow towards the tops of the Stalks, are ſmaller than the lowermoſt, and keep not that Order, but ſtand confuſedly thereon, one above another; near unto which, at the Joints with the Leaves, come forth ſeveral Flowers, but not Spike-faſhion, uſually in ſix ſquare Heads, whoſe tops are not ſo pointed, nor laid ſo open as in the other, but being more cloſe, thruſt forth their Flowers out of them, which conſiſt of ſix ſmall reddiſh purple Leaves, with ſome Threads in the middle.

IV. *The ſecond, or* Leaſt purple-flowered Looſe-ſtrife not ſpiked, *or* Leaſt purple Willow-Herb. *It has a ſmall, long and brown Root, from whence it riſes up (being the leaſt Kind) to be about a Foot high.* The Stalks branch forth themſelves from the very bottom, and are ſet thick with ſmall, long and narrow Leaves, almoſt like thoſe of *Line* or *Flax*, but ſhorter; with whom, at the Joints, come forth the Flowers, ſometimes two at a place, but more uſually one, ſtanding in green Husks, like unto the laſt, compoſed of five ſmall blewiſh purple Leaves, enclining to red: in which Husks, after the Flowers are fallen, ſtand ſmall skinny Heads, wherein is contained ſmall whitiſh Seed.

V. *The Places.* The firſt grows in moiſt Medows and Grounds near unto Water-Courſes, as alſo in wet places about Ditches and moiſt Woods. The ſecond grows in the like wet places alſo. The firſt is a Native of *Hungary*, as we gather from *Cluſius*. The ſecond grows in *Italy* and *Germany*: but with us they are only nurſed up in Gardens.

VI. *The Times.* They both flower in *June* and *July*, as the former do, and perfect their Seed in ſome ſmall time after.

VII. *The Qualities, Specification, Preparations and Virtues* of theſe, are ſaid to be the ſame with thoſe in the two former Chapters: and it is not to be doubted, they being ſo like in Face and outward Form unto them, as alſo in Smell and Taſte, and other Properties, and as being a Specie of the ſame; and therefore we refer you to *Chap.* 452, where they are handled at large.

CHAP. CCCCLV.

Of LOOSE-STRIFE Codded, OR, Codded WILLOW-HERB.

I. *THE Names.* It is called in *Greek*, Λυσιμαχία λοβώδης: in *Latine*, *Lyſimachia ſiliquoſa*; and in *Engliſh*, *Codded Looſe-ſtrife*, or *Codded Willow-Herb.*

II. *The Kinds.* Of this Plant Authors have recounted the following Species, *viz.* 1. *Lyſimachia ſiliquoſa anguſtifolia*, *Chamænerium Geſneri dicta*, (but this latter Name more properly belongs to the ſeventh Species following; and *Geſner* himſelf rather calls this firſt Kind ἀμπλόκιον, *Epilobium*, a Word made of three, *i. e.* ἐπὶ, λοβὸς, ἰὸν, *quia viola, id eſt flos ſuper ſiliqua naſcitur*, of which he accounts ſix ſeveral ſorts, at the end of *Cordus* his Hiſtory of Plants,) The narrow-leaved Codded Looſe-ſtrife. 2. *Lyſimachia Chamænerium dicta Alpina*, The Mountain Codded Looſe-ſtrife, 3. *Lyſimachia ſiliquoſa major*, *Onagræ genus alterum Cæſalpini*, The greater Codded Looſe-ſtrife. 4. *Lyſimachia ſiliquoſa minor vulgaris ſylveſtris*, The Wild leſſer Codded Looſe-ſtrife. 5. *Lyſimachia ſiliquoſa ſylveſtris hirſuta*, The hairy Wild Codded Looſe-ſtrife. 6. *Lyſimachia ſiliquoſa Virginiana*, The Virginian Codded Looſe-ſtrife, *or* Tree Primroſe of Virginia. 7. *Onagra Cæſalpini*, *Pſeudolyſimachium purpureum minus Dodonæi*, *Chamænerium Geſneri*, *Chamænerium flore Delphinij*, *Delphinium Buccinum Lobelij*, as it is thought, which yet *Parkinſon* will hardly

hardly allow of; Willow-Flower, *or* Leſſer purple Baſtard Looſe-ſtrife. 8. *Lyſimachia cærulea galericulata*, Hooded Looſe-ſtrife. This is taken to be a Kind of *Gratiola*, and which we have already deſcribed in *Chap.* 389. *Sect.* 4. aforegoing; and it ſeems that it is rather a Kind of *Hedge-Hyſſop*, than any of the ſorts of *Looſe-ſtrife*, becauſe of its extream Bitterneſs, and that it has hooded Flowers; both which are proper to the *Gratiola*, and not to the *Lyſimachia*: and ſome have properly enough called it *Gratiola cærulea*, Blew Hedge-Hyſſop, with other Names, as you may ſee in *Sect.* 2. of the aforeſaid Chapter: However, in this Chapter we ſhall give you the proper Cut or Figure of the ſaid Plant, which was omitted there.

The Deſcriptions.

III. *The firſt, or* Narrow-leaved Codded Looſe-ſtrife. *It has a Root which creeps after the ſame manner which the* Yellow *and* Blew *do. It riſes up with hard Stalks, ſometimes two, and ſometimes three Feet high, with many very narrow long green Leaves thereon, ſomething like unto* Roſemary *Leaves, ſet very thick, two at a Joint; thoſe below being ſhorter than thoſe higher up.* At the tops of the Stalks come forth many Flowers, made of four ſmall round pointed Leaves, of a fine reddiſh Color, and ſome Threads in the middle, every one ſtanding on the top of a ſmall, long, almoſt ſquare Cod, whitiſh on the outſide, and ſtuffed with fine Cotton or Down; within which does lie bright red Seeds. Theſe Cods with Seeds therein appear before the Flowers break forth at end of them, upon which ſome have called it *Filius ante Patrem*. This *Codded Looſe-ſtrife* we have put in the firſt place, for its Rarity and Beauty, as well as for its ſpecial Qualities and Virtues. *Geſner*, *Cluſius* and *Thalius* ſay, that there is another of this Species, *flore albo*, with white Flowers, not differing in any thing elſe from that even now deſcribed.

IV. *The ſecond, or* Mountain Codded Looſe-ſtrife. *It has a Root which creeps not, but is compoſed of many Fibres, which whether it be Annual or Perennial has not yet been obſerved.* It has very ſhort Stalks, ſeldom exceeding a Foot in Height, on which grow very narrow Leaves, like unto the former, yet ſome longer than others, and ſet without Order; for the ſmaller come ſometimes from the middle of the longer, and ſometimes ſtand at the Joints. At the tops of the Stalks ſtand the Flowers, upon ſlender long purpliſh Stalks, and ſometimes whitiſh, of a purpliſh or reddiſh blew Color, and in ſome of a whitiſh blew Color, conſiſting of four pretty large Leaves, even as great as the former, which the Smallneſs of the Plant does ſcarcely admit of, with ſome Threads in the middle, every one of them ſtanding in a ſmall Husk, compoſed of four ſhort green Leaves, in which, after the Flowers are fallen, grow up ſmall long Pods or Cods, with ſmall Seed in them, encloſed in Down like the other.

V. *The third, or* Greater Codded Looſe-ſtrife. *It has a Root which is ſomewhat great and white, creeping every way under the Earth, and quickly poſſeſſing a good quantity of Ground, which (tho' the Stalks die away every Year) abides all the Winter.* This *Greater Looſe-ſtrife* ſhoots forth ſeveral round green Stalks, a Yard high at the leaſt, bearing thereon at the ſeveral Joints, two Leaves apiece, which are ſomewhat like to the *Common yellow Looſe-ſtrife*, but ſmaller and ſmoother, green on the upper ſide, and of a yellowiſh green underneath, and dented about the edges. The Stalks ſend out from the middle upwards, many Branches; at the tops whereof come forth many ſmall long Pods or Cods, of a whitiſh green purple Color, wherein the reddiſh Seed lying in its Down, is contained. And at their ends, after they have appeared a good while, come forth the Flowers, conſiſting of four round pointed Leaves apiece, with ſome Threads in the middle, of a faint reddiſh or purpliſh Color. Of this Kind there is another ſort found, *flore albo*, with white Flowers, but it is very rare.

Greater Codded Looſe-ſtrife.

Wild leſſer Codded Looſe-ſtrife.

VI. *The*

VI. *The fourth, or* Wild leſſer Codded Looſe-ſtrife. *Its Root is but ſmall and fibrous, dying away every Year.* This leſſer ſort grows Wild in many places, and riſes up nearly two Feet high, but in ſome places not above a Foot high, with ſmaller Stalks and narrower Leaves, not ſo green, but rather of a greyiſh duſty green Color, ſpread out into ſeveral Branches, bearing its Flowers, of four Leaves apiece, at the ends of long Pods or Cods, of a deeper red Color, as the former does, and has like Seed involved in Down, but ſmaller.

VII. *The fifth, or* Hairy Wild Codded Looſe-ſtrife. *This in its Leaves, Cods and Flowers, manner of Growing, Height, and yearly Dying away, is like unto the laſt deſcribed*; the only Difference between them, is, that the Leaves are more hairy, and as it were woolly, and the Flowers alſo ſmall and paler.

VIII. *The ſixth, or* Virginian Codded Looſe-ſtrife. *Its Root is longiſh, white, and about the thickneſs of ones Thumb*; *from whence grows up a tall Stalk, divided into many Branches, of an over-worn Color, and a little hairy. The Leaves are like thoſe of the* Globe-headed yellow Kind, *but ſomewhat ſinuated along the edges, and having their middle Vein of a whitiſh Color.* Towards the tops of the Branches, among the Leaves, come forth very pretty thick Cods, which growing ſmaller on their tops, ſuſtain very fine large Flowers, conſiſting of four Leaves apiece, with a Peſtle in the middle, upon which ſtand four yellowiſh Thrumbs in faſhion of a Croſs. And there are alſo eight Threads, with their Pointels in the middle of them. Theſe Flowers have ſomething of the Smell of a *Primroſe*, whence *Parkinſon* gave it the Name of *Tree Primroſe* of *Virginia.* After the Flowers are fallen, the Cods grow to be about two Inches long, being thicker below, and ſharper on the top or end, and ſomething twined, which at length open themſelves into four parts, to ſcatter their Seed, which is black and ſmall: this being ſown, grows not the firſt Year into a Stalk, but ſends up many large Leaves, lying handſomely one upon another, *Roſe*-faſhion.

IX. *The ſeventh, or* Willow-Flower, *or* Leſſer purple Baſtard Looſe-ſtrife, *called alſo by* Gerard, Roſe-bay Willow-Herb. *Its Roots are like the Roots of* Lyſimachia, *or* Common yellow Looſe-ſtrife, *but greater, running and ſpreading under Ground, and ſhooting up in many places, whereby it quickly fills a Ground which it is pleaſed to grow in: the Root is perennial, but the Stalks die away every Year, ſpringing up afreſh in many places far aſunder.* This Root ſends up many ſtrong, woody, round, browniſh great Stalks, three or four Feet high, beſet here and there without Order, with one broad and long whitiſh green Leaf at each Joint, ſomething like unto *Looſe-ſtrife* or *Willow-Herb*, as alſo unto a *Peach* Leaf, but larger and longer. At the tops of the Branches ſtand many Flowers, one above another, of a pale, reddiſh, purple Color, conſiſting of five Leaves, ſpread open, with an Heel or Spur behind them, and many yellow Threads in the middle, much larger than any *Larksſpur* Flower, and ſmelling ſomething ſweet withal. It bears a ſhew of long Pods or Cods with Seed, but the Seed has never been obſervable.

X. *The eighth, or* Hooded Looſe-ſtrife. *It has a Root which is ſmall and fibrous, diſperſing it ſelf under the Earth far abroad, by which it much increaſes.* It has many ſmall tender Stalks trailing upon the Ground, beſet with divers Leaves, ſomewhat ſnipt about the edges, of a deep green Color, like to the Leaves of *Scordium* or *Water Germander*, among which are placed ſeveral ſmall Bell-Flowers, faſhioned like a little Hood, in ſhape reſembling thoſe of *Ale-hoof.* Thus *Gerard.* But eſteeming this Plant to be rather a Kind of *Gratiola* than a *Lyſimachia*, we have given a more ample Deſcription thereof in *Chap.* 389. *Sect.* 4. aforegoing, to which you are referred; but whereas the Figure is wanting in that place, we have cauſed it to be put in here.

Hooded Looſe-ſtrife.

XI. *The Places.* The firſt grows more often in moiſt Grounds, than in dry; but *Geſner* and others ſay, that it grows in ſuch places as are open to the Sun all Day, yet it will ſcarcely live in our Gardens, unleſs it be put in ſome ſhady place. The ſecond is a Native of the *Alps*, with us it is nurſed in Gardens. The third grows in ſeveral moiſt places, and in the Shade. The fourth, fifth and ſixth grow Wild in dry Grounds, as by the Way-ſides, and in Lanes and Borders of Fields. But the *Virginian* grows with us only in Gardens. The ſeventh grows in *Yorkſhire* in a place called the *Hook*, near to a Cloſe called the *Cow-Paſture*, from whence it has been tranſplanted into Gardens, it being a very goodly Plant to behold for Ornament ſake, and it generally grows in the out Corners of Gardens, to augment the Number of pleaſant Flowers. The eighth grows by Ponds and Water ſides, alſo in St. *James*'s *Park*, and in *Tuthil-Fields*, and many other places, in wet low Grounds, and by Water-ſides. The firſt is alſo found growing in moiſt Medows, eſpecially in the Grounds as you go from *Lambeth* to *Batterſey*, and in many other places throughout the Kingdom. The third grows near Water, and in Watery places, and ſometimes in the Water it ſelf for the moſt part. The fourth grows near the *Thames* ſide, near *Redriffe*, and upon the Bank of the *Thames*, among the Planks which hold up the ſame Bank. The eighth grows near to the Banks of Rivers and Water-Courſes; and it has been found growing in a watery Lane leading from *Theobalds* to the backſide of formerly the Lord Treaſurer's Houſe. The ſeventh is accounted a Baſtard Kind of *Looſe-ſtrife*, but it is the moſt

moſt goodly and ſtately Plant of all the reſt, *having Leaves like the* Greateſt *or* Largeſt Willow: *the Branches come out of the Ground in great Numbers, growing to the height of about ſix Feet, adorned with brave Flowers, of great Beauty, conſiſting of four Leaves apiece (as aforeſaid) of an Orient purple Color, having ſome Threads in the middle, of a yellow Color; after which are Cods, long and full of Down, which when opened, flies away with the Wind.*

XII. *The Times.* Moſt of theſe Herbs flower thro' all *June* and *July*, and ſometimes till *Auguſt*; but the ſeventh, or *Willow-Flower*, flowers in *May*, and continues a long time in flowering.

XIII. *The Qualities, Specification, Preparations, and Virtues* of theſe *Codded Looſe-ſtrifes*, are the ſame with thoſe of the *Common yellow Looſe-ſtrife* in *Chap.* 452. aforegoing: but the Virtues, *&c.* of the *Hooded Looſe-ſtrife*, being the ſame with *Gratiola* or *Hedge-Hyſſop*, you may ſee them in *Chap.* 388. and 389. aforegoing of this Work.

CHAP. CCCCLVI.

Of LOVAGE Common *and* German.

I. *THE Names.* This is a Plant which was unknown to the *Greeks*, and therefore can have no *Greek* Name; but it is called in *Latine*, *Leviſticum, Libyſticum & Smyrnium Fuchſij*, *Laſerpitium tertium Dodonæi*, *Hippoſelinum Dioſcoridis*, according to *Lugdunenſis*, but this I believe is a Miſtake, for I cannot find that thoſe Ancients knew any thing of it; it is alſo by *Bauhinus* accounted among the *Libanotides*, and is thought to be the *Libanotis fertilis Theophraſti*: in *Engliſh*, *Lovage*.

II. *The Kinds.* We have only two Species of this Plant, *viz.* 1. *Leviſticum vulgare*, *Leviſticum hortenſe vel ſativum*, Our Common Garden Lovage. 2. *Leviſticum Germanicum*, *Leviſticum vulgare Germanicum*, German Lovage.

The Deſcriptions.

III. *The firſt, or* Our Common Garden Lovage. *It has a Root which grows great and deep, ſpreading much, and enduring long, of a browniſh Color on the outſide, and whitiſh within. It has many long and great Stalks of winged Leaves, divided into many parts, ſomewhat like unto* Smallage, *but much larger and greater, every Leaf being cut about the edges, broadeſt at or towards the end, and ſmalleſt at the Stalk, of a ſad green Color, ſmooth and ſhining.* From among which riſe up ſeveral ſtrong and hollow green Stalks, five or ſix Feet high, and ſometimes ſeven or eight Feet high, according to the Goodneſs of the Soil, full of Joints and ſuch like, but leſſer Leaves ſet at them than thoſe which grow below. And with the Leaves come forth towards the tops, long Branches, bearing at their tops large Umbels of yellow Flowers, like unto thoſe of the *Wild Parſnep*; and after them flat browniſh Seed, larger by much than *Dill*, but leſſer than that of *Parſneps*, and thicker alſo.

Common Lovage.

German Lovage.

IV. *The ſecond, or* German Lovage. *It differs not much from the aforegoing, but chiefly in the following things. Whereas the Roots of the former are great and thick, and not at all fibrous, in this they are ſmall and very full of fibrous Strings: and the Flowers of the former are yellowiſh, but in this they are white, as* Dodonæus *ſays, and of the ſame Magnitude*

nitude and Form. The whole Plant, and every part thereof, both in the former and in this, have a ſomewhat ſtrong and aromatick Smell, as alſo a hot and ſharp biting Taſte. The Figure of this latter we have given you from *Camerarius* his Epitome of *Matthiolus*.

V. *The Places.* They grow no where Wild in *Europe*, but are only planted in Gardens, where they generally proſper very well, and will grow large and great, if ſuffered.

VI. *The Times.* They flower for the moſt part in *July* and *Auguſt*, and the Seed is ripe in *Auguſt* or *September*, or in ſome ſhort time after their Flowering.

VII. *The Qualities.* *Lovage* is hot and dry in the third Degree, of ſubtil and thin parts, Aperitive, Digeſtive, Abſterſive, Carminative, Diuretick, Cephalick, Neurotick, Stomatick, Nephritick, Hyſterick, and Alexipharmick.

VIII. *The Specification.* It powerfully provokes Urine and the Courſes, as much as any of the Kinds of *Parſley*; powerfully reſiſts Poyſon, gives Eaſe in the Colick, and prevails againſt Agues, Quinſies, Pleuriſies, *&c.*

IX. *The Preparations.* You may have therefrom, 1. *A Juice of the Root.* 2. *An Eſſence of the Root.* 3. *A Decoction or Infuſion of Herb, or Root, or Seed, or of all of them.* 4. *A Pouder of the Root.* 5. *A Pouder of the Seed.* 6. *A Preſerve of the Root.* 7. *A Pickle of the Root.* 8. *A Cataplaſm of the Herb.* 9. *A diſtilled Water of Herb, Root, or Seed, or of all of them.* 10. *A Spirit of the Seed.* 11. *An Oil of the Seed.* 12. *An Elixir of the Seed.* 13. *A Spirituous Tincture of the Seed.* 14. *An Acid Tincture of the Seed.* 15. *An Oily Tincture of the Seed.*

The Virtues.

X. The Juice of the Root. *It is made by beating it in a Mortar, and waſhing it out with Water or Wine*, &c. It digeſts and cuts crude and tough Humors, cauſes Expectoration, wonderfully provokes Urine and the Terms, conſumes ſuperfluous Moiſture, and therefore is good againſt the Dropſy, eaſes Gripings of the Bowels and the Colick, and reſiſts Poyſon, and the Infection of the Plague. Doſe two, three or four Spoonfuls at a time, as the Phyſician ſhall think fit.

XI. *The Eſſence of the Root.* It has all the Virtues of the Juice; beſides which, it admirably quenches Thirſt, whether in a Fever, or out of a Fever, or from what Cauſe ſoever. It is prevalent againſt all ſorts of Agues Quotidian, Tertian or Quartan, ſimple or compound, expels Wind, and eaſes all Pains of the Viſcera proceeding from a cold Cauſe. Doſe from two Spoonfuls to four.

XII. *The Decoction or Infuſion of Herb, Root, or Seed.* They have all the Virtues of the Juice and Eſſence, but muſt be given in much larger quantities, as from a quarter of a Pint to half a Pint; it quenches Thirſt much, is good againſt Poyſon, and reſiſts the Force of malignant Fevers: and uſed as a Gargle, it is good againſt a ſore Mouth and Throat: and drunk down, it is profitable againſt the Pleuriſy, Pains and Stitches in the ſide.

XIII. *The Pouder of the Root.* It may be given from half a Dram to a Dram in Wine, to warm and comfort the Stomach, expel Wind, eaſe the Colick, provoke the Appetite, and help Digeſtion.

XIV. *The Pouder of the Seed.* If it is taken to a Dram for ſeveral times, in a Glaſs of Wine or other fit Vehicle, it is good againſt the Pleuriſy and Colick, provokes Urine and the Terms powerfully, and prevails againſt Sand, Gravel, Stone or Tartarous Matter in the Reins, Ureters and Bladder, and has indeed all the Virtues of the Juice, Eſſence, Decoction and Pouder of the Root; but as it is in the groſs Body, ſo it is longer before it comes into Act, and therefore Allowances muſt be given for the time of its Operation.

XV. *The Preſerve of the Root.* It is cordial and ſtomatick, expels Wind, comforts the Viſcera, warms the Stomach, and cauſes Digeſtion: it may be eaten as other ſweet Meats are.

XVI. *The Pickle of the Root.* It is an admirable thing to provoke Appetite, warm a cold Stomach, and cauſe a good Digeſtion.

XVII. *The Cataplaſm of the Herb.* The Leaves being bruiſed, are Fried in a Frying-pan, or other proper Veſſel, with Hogs Lard, and ſo made into a Poultice. Applied hot to any Botch or Boil, it quickly brings it to Suppuration, and breaks it.

XVIII. *The diſtilled Water of the Herb, Root, or Seed, or of all of them.* It is ſaid by Authors to be good againſt the Quinſey in the Throat, by gargling the Mouth and Throat therewith. It is ſaid alſo to help the Pleuriſy, if it is drunk three or four times or oftner. The ſaid Water dropt alſo into the Eyes, takes away their Redneſs and Dimneſs. And uſed as a Lotion to the Face or Skin, it takes away Spots and Pimples in the Face, and other Diſcolorings, as Yellowneſs, Tawnineſs, *&c.* of the Skin.

XIX. *The Spirit of the Seed.* Mixt with ſome few Drops of Spirit of Harts-horn, or Volatile Spirit of Man's Blood, or of other Blood, it eaſes the Pain of the Stomach, gives preſent Relief in a Pleuriſy and Quinſey, and cures the Colick. Doſe from one Dram to two, three or four, according to the Age of the Patient and Force of the Diſeaſe.

XX. *The Oil of the Seed.* It has all the Virtues of the Juice, Eſſence, Decoction, Pouder, Water and Spirit, and may be given in all the Caſes for which thoſe things are given, from three Drops to ten or twelve Drops: firſt drop it into fine Sugar, mixing them well together; then mix them with a Glaſs of Wine, or other Vehicle, and ſo let the Patient drink it up. It gives preſent Eaſe in the Colick.

XXI. *The Elixir of the Seed.* It has all the Virtues of the Oil, but is much more ſubtil and penetrating: it may be given from a Dram to two Drams or more, in choice generous Wine, or in any other proper Vehicle. It is a moſt excellent thing againſt the Spotted Fever, and all other malign and peſtilential Fevers; as alſo againſt the Plague it ſelf.

XXII. *The Spirituous Tincture of the Seed.* It provokes Urine and the Terms in Women, facilitates the Birth, and brings away the After-birth, prevails againſt the Colick, Strangury, Stone, Sand, Gravel, or Tartarous Matter in the Urinary Parts, and eaſes the After-pains of Women in Child-bed. Doſe one Spoonful at a time, in a Glaſs of Wine.

XXIII. *The Acid Tincture of the Seed.* It may be given to a grateful Acidity againſt all ſorts of burning, malign and peſtilential Fevers, againſt which it cannot be given without Succeſs; and deſtroys even the Poyſon and Eſſence of the Plague it ſelf. It ſtops Vomiting, admirably ſtrengthens the Stomach, and cauſes a good Appetite.

XXIV. *The Oily Tincture.* It cures the Colick upon the ſpot, gives Eaſe in the Strangury, provokes Urine and the Terms, facilitates the Birth, and brings away the dead Child, giving Eaſe in all After-pains of Women in Child-bed. It is good againſt Sand, Gravel and Stone, or Tartarous Matter

ter in the Reins, Ureters and Bladder; and an excellent thing againſt the Palſy in Old or Young, taken inwardly in ſome proper Vehicle from eight to twenty Drops, and outwardly anointed upon the Back-bone and other Parts affected, Morning and Night, for many Days together.

LOUSIE-GRASS, *ſee* Hellebor black Wild, *Chap.* 350.
LOUSE-WORT, *ſee* Staves-Acre, *Chap.*
LOURY, *ſee* Spurge Laurel, *Chap.*
LUNG-FLOWER, *ſee* Gentian ſmall, *Chap.* 312.
LUNG-WORT, *(the Herb) ſee* Cowſlip ſpotted, *Chap.* 158.

CHAP. CCCCLVII.

Of LUNG-WORT Golden.

I. *THE Names.* It has no *Greek* Name that we know of; but is called in *Latine*, *Pulmonaria*, *Pulmonaria aurea*, *Pulmonaria Gallorum*, *Corchorus Dalechampij*: in *Engliſh*, *Lung-wort Golden*, and *French Lung-wort*.

II. *The Kinds.* There are two Kinds hereof, *viz.* 1. *Pulmonaria Gallorum*, *Pulmonaria Gallica*, *Pulmonaria aurea latifolia*, *Pulmonaria Gallorum Hieracij facie*, *Pulmonaria vera Tragi*, (as the *French* take it to be) *Hieracium flore aureo*, *Piloſella major*, *Piloſella vel Auricula Muris major flore aureo*, *Chondrilla flore aureo*, *Corchorus Dalechampij*, Golden Lung-wort, *or* Golden Mouſe-Ear broad leaved. 2. *Pulmonaria Gallorum anguſtifolia Lobelij*; *Pulmonaria Gallica Anguſtifolia*; *Hieracium Murorum Bauhini*; *Pulmonaria aurea anguſtifolia*, *Pulmonaria Gallorum flore Hieracij*, Golden Lung-wort, or Golden Mouſe-Ear, or *French* Lung-wort narrow-leaved.

Golden Lung-wort.

The Deſcriptions.

III. *The firſt, or* Golden Lung-wort, *or* Golden Mouſe-Ear broad-leaved. *It has a Root which is fibrous and ſtringy, which ſpreads under Ground, and ſhoots up in divers other places, by which it much increaſes, more eſpecially if it grows in any moiſt or ſhady place.* From this Root riſe up many longiſh broad green Leaves, ſpread upon the Ground, ſpotted with pale Spots, yet more conſpicuous at one time than at another, ſomewhat hairy, both on the upper and under ſide, ſoft and unequally divided, and commonly cut in the deepeſt the nearer the Stalk. Theſe Leaves are of a dark green Color, ſometimes broader and ſhorter, and ſometimes narrower and longer, (whence *Tabernæmontanus* makes three ſorts of this, which yet are nothing but different Appearances of the ſame Species.) From the midſt of theſe Leaves riſe up one, two or more blackiſh hairy Stalks, about a Foot and half or two Feet high, bare or naked up to the top, or having at moſt no more than one Leaf apiece, and that about the middle of the Stalk. Theſe Stalks are divided at their tops into ſeveral Branches, which bear double yellow Flowers of an indifferent Bigneſs, in Form or Faſhion almoſt of the *Hawkweeds*, or *Common Mouſe-Ear*, of a deep Gold or Orange Tawney Color, with ſome Threads in the middle, and of little or no Smell at all. After the Flowers are faded, the Heads turn into Down, which contain ſmall ſhort black Seed, which are commonly carried away with the Wind when fully ripe. The whole Plant is milky, as the *Hawkweeds* are.

IV. *The ſecond, or* Golden Lung-wort, *or* Mouſe-Ear narrow-leaved. *Its Root is ſmall and fibrous. The Leaves are ſmall, of the Bigneſs, and ſometimes of the Shape (but yet withal a little indented or ſinuated) of* Daiſy *Leaves, whitiſh, and hairy or hoary.* The Stalk is about an handful high, creſted, hoary, and ſet with many longiſh narrow Leaves, and at the top one ſhort Foot-ſtalk; it bears four or five Flowers, of a bright yellow Color, and pretty large, conſidering the Smallneſs of the Plant. The Flowers, like as others of this Kind, fly away in Down, and carry their Seed with them.

V. *The Places.* *Lobel* ſays the firſt grows in the ſhady Woods of *France* near *Lions* and *Mompelier*; but with us it is only nurſed up in Gardens, in ſhady rather than in ſunny places. Yet Mr. *John Goodyer* found it in *May* 1632, in a Copſe in *Godlyman* in *Surry*, adjoining to the Orchard of an Inn-keeper there, whoſe Sign was the *Antilope*. The ſecond was found growing in *England* by one *William Coot*, on a Hill in the then Lady *Bridget Kingſmil*'s Ground at *Sidmonton*, not far from *Newbury*, in an old *Roman* Camp, cloſe by the *Decuman Port*, towards the *Weſt*, *South Weſt*, upon the Skirts of the Hill.

VI. *The Times.* The firſt Flowers in Summer, and ſometimes again in *September*. Mr. *Goodyer* found it flowering in *May* 1631, in the place, I ſuppoſe, afore-mentioned, and is ſaid to flower from *May* to *Auguſt* and longer. The ſecond flowers in *June*, *July* and *Auguſt*, about the latter part of which Month, they both ripen their Seed.

VII. *Nota.* It is to be taken notice of, That there is another Plant which is called *Pulmonaria*, or *Lung-wort*, as well as this, which Name I think not to be ſo proper to that, as to this. That is, the *Spotted Cowſlip*, which ſome call *Sage of Jeruſalem*, the Deſcriptions of the chief Kinds of which you may ſee in *Chap.* 158. aforegoing, which Names are more fit for it than this of *Lung-wort*, which

truly belongs to the Plants deſcribed in this Chapter: in that, *Chap.* 158. you have three of theſe Plants deſcribed. The Cut or Figure there inſerted, belongs to the ſecond of them, *viz.* the *Bugloſs-leaved Jeruſalem Cowſlip*; but the Figure of the firſt or *Common Kind*, was there overſlipt by the Printer, which that it might not be wholly loſt or forgotten, (ſince in this Chapter we treat of *Lung-wort*) we have cauſed to be placed here.

Spotted Lung-wort, or *Jeruſalem Cowſlip.*

VIII. *The Qualities.* Theſe Plants are temperate in reſpect to Heat or Cold, and probably dry in the firſt Degree. They are Abſterſive, Aſtringent, Vulnerary, Analeptick, and Pectoral.

IX. *The Specification.* They are peculiar for healing of green Wounds, as alſo of Ulcers, and other Diſtempers of the Lungs.

X. *The Preparations.* You may have therefrom, 1. *A Juice or Eſſence.* 2. *A Decoction.* 3. *A Syrup.* 4. *A Pouder.* 5. *A Conſerve.* 6. *A Cataplaſm.* 7. *An Ointment or Balſam.* 8. *A diſtilled Water.*

The Virtues.

XI. *The Juice or Eſſence.* Given inwardly to two or three Spoonfuls, it is profitable againſt a *Phthiſis* or Ulceration of the Lungs: being alſo inwardly taken, and outwardly applied, it conduces much to the cleanſing and healing of green Wounds. If it is dropt alſo into the Ears, it takes away any Noiſe, and eaſes any pricking or ſhooting Pain with which they may be troubled.

XII. *The Decoction in Wine.* It has the former Virtues, but muſt be given in a larger Doſe. It is an extraordinary Vulnerary, and good to be given to wounded Patients inwardly (as the Phyſician ſhall direct) as well as outwardly to be applied.

XIII. *The Syrup.* It is Pectoral, good againſt Coughs, Colds, Hoarſeneſs, Wheezing, Ulcers of the Lungs, Excoriations of the Viſcera, and other the like Diſeaſes of thoſe Parts.

XIV. *The Pouder.* It has the Virtues of the Syrup and Juice, and is peculiarly good againſt an Excoriation of the Stomach. Doſe from half a Dram to a Dram, mixt with a little Honey, and ſo ſwallowed. Outwardly applied to Ulcers and running Sores, it cleanſes, drys, and induces their healing.

XV. *The Conſerve.* It is peculiar for the curing of ulcerated Lungs and deep Conſumptions, but where it is not come to the degree of a *Maraſmos*, it ought to be taken four or five times a Day, drinking after it half a Pint of warm Milk or more, and to be continued for ſome conſiderable time.

XVI. *The Cataplaſm.* It is made of the Herb by boiling in Wine. It is good againſt foul and running Sores and Ulcers, being applied to the Parts affected: it ſtops the Afflux of Humors, ſtrengthens the Part, and induces the healing.

XVII. *The Ointment or Balſam.* It is a ſingular Digeſtive, cleanſes, drys, heals: but if it is immediately applied to a ſimple green Wound, it commonly conglutinates it, and heals it at one Intention. It is an admirable thing for curing of Whitloes.

XVIII. *The diſtilled Water.* It has the Virtues of the Juice, Eſſence and Decoction, and may be taken for Diſtempers of the Lungs, ſweetned with fine Honey, or double-refined Sugar. Simple of it ſelf, it is good againſt internal Inflammations, and hot Diſtempers of the Stomach, Heart, Liver and Lungs.

CHAP. CCCCLVIII.

Of LUNG-WORT Tree.

I. *THE Names.* This Plant was unknown to the *Greeks*, but is called in *Latine*, *Lichen arborum*, *Pulmonaria*, and *Pulmonaria fungoſa*, *Muſcus Pulmonarius*, *Lichenis genus*: in *Engliſh*, *Tree Lung-wort*, and by ſome *Tree Liver-wort.* It is called *Pulmonaria* or *Lung-wort*, from the Likeneſs it has to Lungs or Lights; and by ſome called *Oak Lungs.*

II. *The Kinds.* It is a ſingular Plant of the Kind; but by ſome Authors is taken to be a Species of the *Moſſes*, and therefore is by them called *Muſcus*: by others it is taken to be a Species of the *Muſhrooms*, and therefore to the Name *Pulmonaria*, *Lobel* has added the Epithite *Fungoſa*, which I think is proper enough.

The Deſcriptions.

III. *The Leaves hereof are pretty large, and diverſly folded one in another, not ſo ſmooth as* Liverwort, *but more wrinkled, rough and thick, almoſt like to a Fell or Hide, and tough withal.* On the upper ſide it is whitiſh, and on the neather ſide blackiſh or duſty, ſo that it ſeems after a ſort to reſemble Lungs or Lights.

IV. Parkinſon *ſays it grows with broad Aſh-colored Leaves, or of a greyiſh Color and tough, variouſly folded, crumpled and gaſhed in on the edges*; and ſpotted alſo in ſome places, with many ſmall Spots on the upper ſide. It is only a *Foliоſa*, for it was never ſeen to bear any Stalk or Flower at any time.

V. *The Places.* It grows upon the Bodies of old *Oaks*, *Beeches*, and other Forreſt Trees in dark and thick

thick Woods; and it is ſometimes found alſo growing upon Rocks, and in other ſhady places. That which grows upon *Oak* is moſt valuable, and moſt in Uſe, and is by many called for that Reaſon, *Oak-Lungs*, as is before hinted.

VI. *The Times.* It is ſaid to be in its flouriſhing Condition thro' all the Summer Months.

VII. *The Qualities.* It is temperate in reſpect to Heat or Cold, and dry in the firſt Degree. It is Abſterſive, Aſtringent, Traumatick or Vulnerary, Pectoral and Analeptick.

VIII. *The Specification.* It is peculiar for curing of Conſumptions, more eſpecially thoſe which proceed from an Ulceration of the Lungs.

IX. *The Preparations.* You may have therefrom, 1. *A Pouder.* 2. *A Decoction in Wine.* 3. *A Syrup.*

The Virtues.

X. *The Pouder.* Given from half a Dram to a Dram Morning and Evening, mixt with Honey, or in ſome proper Syrup, it cleanſes, drys and heals Ulcers of the Lungs, and thereby reſtores ſuch as are in Conſumptions. It is good againſt Inflammations of the Lungs, being drunk in Water. Shepherds and Farriers give it mixt with Salt, to their Sheep and other Cattel with good Succeſs, which are troubled with the Cough, or are ſhort or broken Winded. Applied to bloody and green Wounds, as alſo Ulcers in the ſecret Parts, it heals them: and helps Women who are troubled with the Overflowing of the Terms. It is alſo a very excellent thing againſt the Bloody-flux, and all other Fluxes of the Bowels, given for ſome little time in generous Wine, or given Clyſterwiſe. Given in Red Wine, it is alſo profitable againſt Vomiting.

XI. *The Decoction in Wine.* It has all the Virtues of the Pouder, and may be given Morning, Noon and Night with ſome of the Syrup of the ſame. Uſed as a Gargariſm for a ſore Mouth and Throat, it quickly cures it. And is a good Lotion for Ulcers in any part.

XII. *The Syrup.* It is a thing of excellent Uſe for ſuch as are in Conſumptions, or have an Ulcer of the Lungs, cleanſing the ſame, drying and inducing the Healing. It is good againſt the Rickets in Children, as alſo Coughs, Colds, Wheezing, Hoarſneſs, Shortneſs of Breath, Difficulty of Breathing, vehement Catarrhs, Spitting of Blood, *&c.*

CHAP. CCCCLIX.

Of the LUPINE, *OR,* FLAT-BEAN.

I. *THE Names.* It is called in *Arabick*, *Tarmus* and *Tormus*: in *Greek*, Θέρμος: in *Latine*, *Lupinus*; and in *Engliſh*, *Lupine* and *Flat-Bean.*

II. *The Kinds.* There are ſeveral Kinds of this Plant, *viz.* 1. Θέρμος ἥμερος, *Lupinus ſativus*, *Lupinus ſativus albus*, The White Garden Lupine. 2. *Lupinus alter albus*, The ſpotted White Lupine. 3. *Lupinus luteus*, *Lupinus flore luteo*, The Yellow Lupine. 4. *Lupinus cæruleus maximus*, The greater Blew Lupine. 5. *Lupinus cæruleus minor*, The leſſer Blew Lupine. 6. *Lupinus cæruleus minimus*, The ſmalleſt Blew Lupine. Where note, That the Grains of the firſt or *Garden Lupine*, are generally called *Lupini*: and *Plautus* calls them *Aurum Comicum*, becauſe they were uſed in Comedies inſtead of Money, when in any Scene thereof there was a ny ſhew of Payment.

White Garden Lupine.

The Deſcriptions:

III. *The firſt, or* White Garden Lupine. *It has a Root which is not very great, but woody, and full of ſmall Fibres, by which it faſtens it ſelf ſtrongly in the Ground, yet periſhes every Year, as all the reſt of theſe Kinds do.* It riſes up with a great round Stalk, hollow, and ſomewhat woolly, with ſeveral Branches, on which grow, on long Foot-ſtalks, many Leaves, conſiſting of five, ſix or ſeven diſtinct parts, or other ſmaller Leaves, equally ſtanding round about as it were in a Circle, much like thoſe of the *Chaſt-Tree*, of a whitiſh green Color on the upper ſide, and white and downy on the under ſide, which in the Evening, about the ſetting of the Sun, hang a little flagging downwards, as if they were a going to wither. Among theſe, at ſeveral Joints, come forth Tufts of Flowers, ſtanding many together, like unto *Beans*, of a white Color in ſome places, and in others of a very bleak Blew, tending to white, and in others a pale or light bluſh Color, (as *Gerard* has it.) After the Flowers are paſt, there come in their places great, long, broad, flat and rough Cods, in which are contained round and flat Seed, like a Cake, covered with a tough white Skin, but yellowiſh on the inſide, and of a very bitter Taſte; where they cleave unto the Cods in that part, they have a certain Dent, like a little Navel.

IV. *The ſecond, or* Spotted White Lupine. *This in its Root, Stalks, Branches, Leaves, Flowers, Seed, and manner of Growing, is altogether like to the former, ſave in the Magnitude, this Plant being leſs than that*; and in the Flower, this being ſpotted with Blew on the Heads of the innermoſt Leaves, and in the Hollows of the uppermoſt.

V. *The third, or* Yellow Lupine. *It is like to the firſt* Garden One *in Stalks and Flowers, which are both leſſer and ſlenderer, but the Leaves are larger than thoſe of the* Small Blew Lupine. The Flowers grow in two or three Rundles or Tufts round about the Stalk and the Branches, of a beautiful, delicate, and exceeding fair Gold-yellow Color, in Faſhion and Form like unto the other Kinds, being larger than thoſe of the *Leſſer Blew Lupine*, but nothing ſo large as thoſe of the *Greater Kinds*. They are ſweet of Smell, and made up into an Ear, of the Color of the *Yellow Violet*, and ſomething of the Smell. The Cods are ſmall, hard, and ſomewhat hairy. The Seeds are little, flat, and round, ill-favoured, much about the Form and Bigneſs of the *Small Blew*, or ſomewhat bigger, but far leſſer than thoſe of the *White Garden Kind*, of an extream bitter Taſte, of ſeveral Colors, or rather of a whitiſh Color on the outſide, ſpotted with many Spots.

VI. *The fourth, or* Greater Blew Lupine. *The Stalk of this* Lupine *is greater than that of the firſt or* White Garden Kind, *and the Leaves are more ſoft and woolly than thoſe.* The Flowers are of a moſt perfect blew Color, with ſome white Spots in the middle. The Cods are long, rough, greeniſh, and very large or great, in which are contained hard, flat and round Seed, not ſo white on the outſide as the firſt or *Garden Kind*, but ſomewhat yellower, greater alſo, and more rough or hard in handling.

VII. *The fifth, or* Leſſer Blew Lupine. *This Kind of* Wild Lupine *differs not in the Form of Leaf or Flower from the former, but only that it is much ſmaller; the Leaves are greener, and have fewer Diviſions in them:* the Flower is of as deep a blew Color as the laſt. The Cods are ſmall and long, containing ſmall round Seed, not ſo flat as the former, but more diſcolored or ſpotted on the outſide, than the *Greater Blew ſort* is.

VIII. *The ſixth, or* Smalleſt Blew Lupine. *This ſmall Plant is very like unto the laſt deſcribed in its form and manner of its Growing:* it is little or nothing woolly, but is ſmaller both in its Stalks and Leaves. The Flowers likewiſe are wholly blew, as they are, or very ſeldom with a white Spot in them. The Seed is ſmaller alſo, and a little ſpotted.

IX. *The Places.* The firſt is accounted the only *Garden* or *Tame Kind*, the others are ſaid to be Wild in the places where they are Natives. They all require, as *Theophraſtus* ſays, a ſandy and poor Soil, and difficultly grow in tilled or rich Land, becauſe they are naturally Wild Plants. The firſt is a Native in many places of *Greece*, and the *Eaſtern* Countries beyond it, where it was anciently ſown for their Food, being often watered to take away the Bitterneſs. The *Yellow Lupine* is a Native of *Spain*, from whence it was brought to us. The *Great Blew Lupine* is thought to come from beyond *Perſia*, and to be a Native of *Carmania*. The *Leſſer Blew* is found plentifully Wild in many places both of *Spain* and *Italy*. The laſt or *Smalleſt Blew Lupine* was brought by *Boel* out of *Africa:* but they all grow now in our Gardens, with ſuch as are great Lovers of Flowers.

X. *The Times.* They are planted in *April*, and they bring forth their Fruit at two or three ſeveral times, ſeeming as if they did flower often, and bring forth as many Crops. The firſt flowers in *May*; the third in *July*, and ſo alſo the fourth and fifth; the ſixth in *September*, but that ſeldom comes to Ripeneſs; but the others, after the times of their Flowering, ſoon bring their Seed to Perfection.

XI. *The Qualities.* *Lupines*, i. e. the Grain or Meal, is hot and dry in the firſt Degree; Aperitive, Digeſtive, Diſſolutive and Abſterſive, ſo long as the Bitterneſs remains in them; but if that is taken away by ſteeping in Water, they become of an Earthy, clammy Subſtance, Emplaſtick, and hard of Digeſtion.

XII. *The Specification.* They are peculiar to open Obſtructions of the Viſcera, provoke Urine and the Terms, facilitate the Birth, expel the dead Child, and kill Worms; but theſe things they do as not diveſted of their Bitterneſs.

XIII. *The Preparations.* You may have therefrom, 1. *A Meal.* 2. *A Paſte.* 3. *A Decoction.* 4. *A Cataplaſm.* 5. *An Ointment.*

The Virtues.

XIV. *The Meal.* Strewed upon old rotten Sores and Ulcers, it is ſaid to digeſt, cleanſe, dry and heal them. Mixt with Honey and Vinegar, and given to drink, it kills Worms in the Belly. Boiled in Lye, it cleanſes the Head and other Parts from Ulcers, Scurff, Morphew, and other like Defilements.

XV. *The Paſte.* It is made of the Meal of *Lupines* after they have been ſo often or long ſteeped in Water, as to be diveſted of all their Bitterneſs, whether it is made into Puddings or into Bread, it ſeems to be hard of Digeſtion, and to breed no very good Nouriſhment, engendring groſs and clammy Humors.

XVI. *The Decoction in Wine or Water.* It is good againſt the loathing of Meat, and provokes Appetite. Drank ſweetned with Honey, it cures Worms in the Belly, and if a little *Rue* and *Pepper* are added to it, it will be ſo much the more effectual. Taken three or four Ounces Morning and Night, it opens Obſtructions of the Liver and Spleen, provokes Urine and the Terms, expels the Birth and dead Child, as alſo the After-birth; and being uſed as a Lotion or Waſh, it is good againſt Spots, Freckles, Tanning, Sun-burning, Diſcolorings of the Skin, Pimples, Scurff, Morphew, and other Defœdations of the *Cutis:* it alſo cleanſes, drys and heals Scabs, running Sores, old Ulcers, and is ſaid to take away the Marks of the Small-Pox, which are left after healing; as alſo all other black, blew, red and yellow Spots of the Skin. The Decoction of the Root in Water being drunk, provokes Urine. If the Decoction of *Lupines* in Wine be made with the Addition of *Wormwood*, *Centory*, and Bay Salt, it is good to ſtop the running or ſpreading of a Gangrene, being applied thereto very hot; and corrects ſpreading Ulcers, being applied very hot thereto with Stuphs of Tow or Flannel.

XVII. *The Cataplaſm.* It is made of the bitter Meal with Vinegar by boiling. Being applied, it takes away Pimples, and diſſolves Nodes or Kernels ariſing in ſeveral parts from the King's-Evil, or other Cauſes. It ripens and breaks hard Tumors and Apoſtems, and is ſaid alſo to break Carbuncles, if uſed by a skilful Hand. Applied to the Stomach and Belly, it helps to kill Worms in the Body, the Decoction being alſo given inwardly at the ſame time. It likewiſe cures Clefts, Bunchings out, Ulcers, and *Ficus in Ano*, being for ſome time applied to the Part.

XVIII. *The Ointment.* It is made of the bitter Meal by mixing it either with Honey, or with the Gall of an Ox, Sheep or Goat, or with both of them. Externally applied, it has the Virtues of the Decoction and Cataplaſm: ſome add alſo the Juice of *Limons* to it, and ſo it cleanſes the Face and Skin of all Deformities accruing thereto, as Freckles,

kles, Diſcolorings, Scurff, Morphew, Pimples, and other Breakings out, *&c.* It is good againſt Scabs, malign Ulcers, Ragades, *Ficus in Ano*, &c. being duly applied.

XIX. *Nota.* Here is to be obſerved, that the *Wild Lupine* is ſaid to be much the ſtronger, and to exceed the *Manured* or *Garden Kind*, for all the Purpoſes aforementioned.

CHAP. CCCCLX.

Of MAD-WORT.

I. *THE Names.* It is called in *Greek*, Ἀλύσσον and Ἀλυσσος: in *Latine*, *Alyſſum*; and in *Engliſh*, *Mad-wort*; ſo called becauſe it is a preſent Remedy for the Biting of a Mad Dog, as *Galen de Antidotis*, *lib.* 2. writes, being an Herb very like to *Horehound*, but rougher, and more full of Prickles about the Flowers, which are of a Color tending to blew.

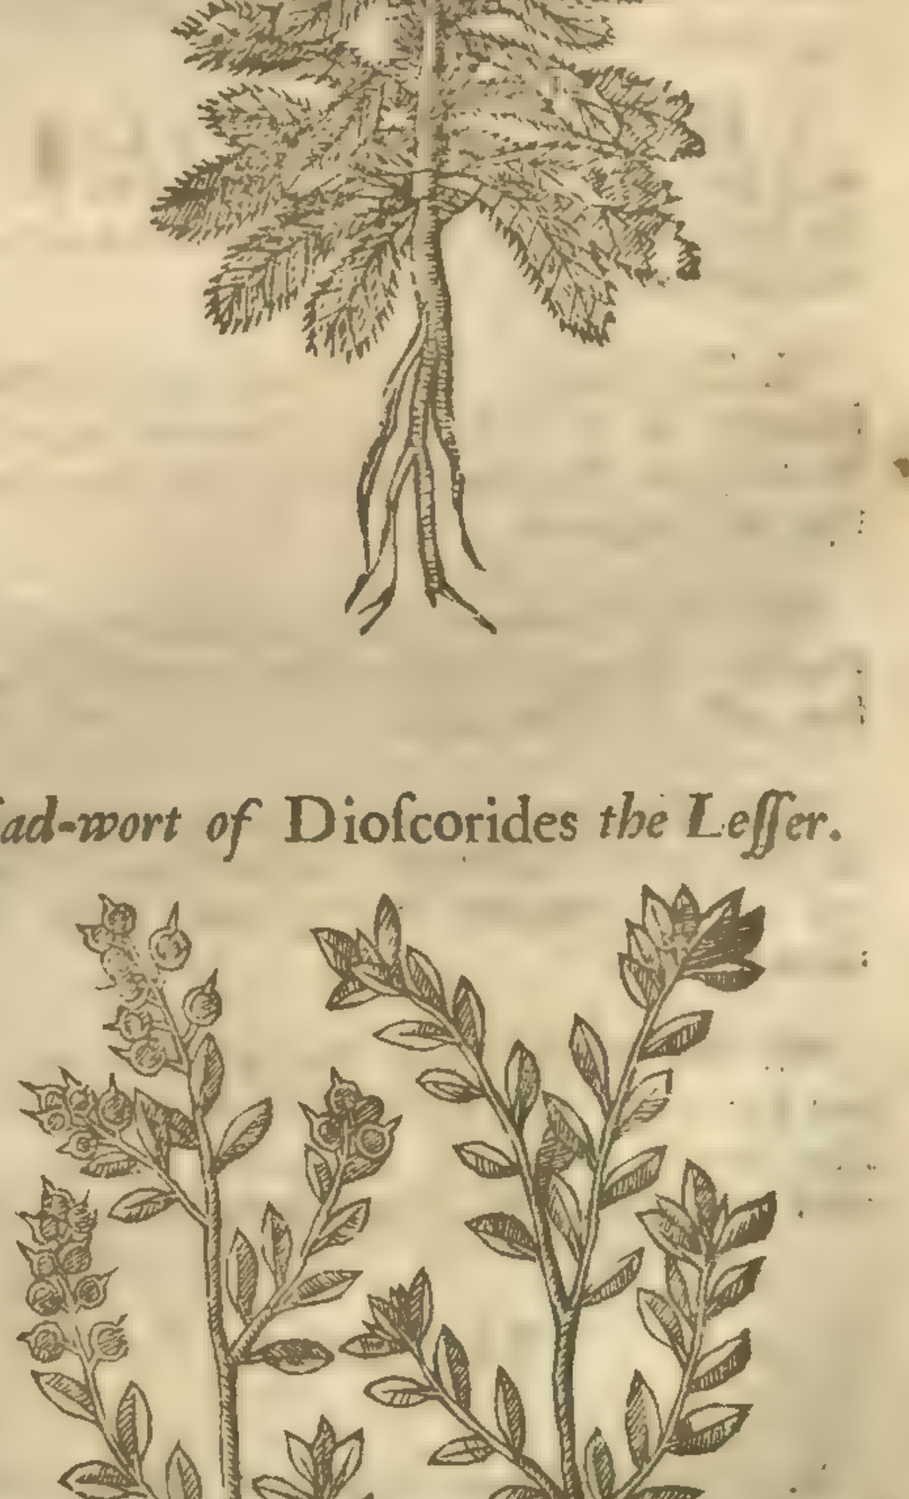
II. *The Kinds.* Authors have found out five ſeveral ſorts of this Herb; but by Reaſon the moſt of them are not to be found in *England*, we ſhall only deſcribe that of *Dioſcorides* his *Greater* and *Leſſer*, viz. 1. *Alyſſum & Alyſſos Dioſcoridis major*, as *Dodonæus*, *Camerarius*, *Cluſius*, *Lugdunenſis* and *Lobel* think; and *Lobel* ſays farther, That there is no Herb to be found which better agrees with *Dioſcorides* his *Alyſſum* in all things, than this doth. Some will have it to be *Lunaria Græca*, and call it *Lunaria major*, and *Lunaria lutea*; *Cæſalpinus* calls it *Lunaria Græca tertia*, and *Geſner*, *Lunaria aſpera*, making it a Kind of *Moon-wort*; but is doubtleſs the *Greater Mad-wort* of *Dioſcorides*. 2. *Alyſſum Dioſcoridis alterum & minus*, *Leucoium Alyſſoides clypeatum minus Bauhini*, (for he calls the firſt *Leucoium Alyſſoides Clypeatum majus*) The leſſer Mad-wort of Dioſcorides.

The Deſcriptions.

III. *The firſt, or* Greater Mad-wort of Dioſcorides. *It has a Root which is ſmall and woody, dying every Year after it has given Seed, but ſeldom periſhes the firſt Year before it runs up to a Stalk.* It has many hoary, hard and rough Leaves lying on the Ground, ſomewhat broad and round for the firſt Year of their Springing; but the next Year, when the Stalk begins to grow up, they grow thereon both greater and longer, and a little torn in on the edges in ſome places, which Stalk is hoary, and about a Foot and half high, ſpreading it ſelf into two or three Branches; at the tops of which come forth ſeveral pale, yellow, and very ſmall Flowers, ſtanding one above another ſeverally, on both ſides of the Stalks, which convert into ſomewhat large and round, flat, thin, hoary, hard, rough Husks, reſembling little Bucklers; or rather moſt like the yellow Husks with Seed of *Bolbonoch*, or *Lunaria major*, which is the *White Sattin*, but that theſe are ſmaller, rougher and harder; and in which lies ſmall, flat, reddiſh Seed, in a double order, on both ſides of the thin middle Skin, which in this is not white, like that of the *Sattin*, but elſe very like.

Greater Mad-wort of Dioſcorides.

Mad-wort of Dioſcorides *the Leſſer.*



IV. *The*

IV. *The ſecond, or* Leſſer Mad-wort of Dioſcorides. *It has a Root which is ſmalll and long, with divers Fibres adjoining, which abides and ſhoots forth anew, and is more ſharp in Taſte than the Leaves, which are drying and aſtringent.* From this Root ſpring forth ſeveral long Leaves, lying on the Ground, a little waved on the edges, of a pale or blewiſh green Color, about three Inches long, and one broad, rough and hairy, but ſofter than the former. From among which Leaves riſe up ſlender, weak, rough Stalks, ſcarce able to ſtand upright, parted into ſeveral Branches, on which grow the Leaves by Couples, one oppoſite to another, ſmaller, but not leſs hairy and rough than the aforegoing. The Flowers firſt begin to break forth at the tops, and afterwards on the ſides or Wings, which are many ſet together in Tufts, conſiſting of four white Leaves, notched in the middle, which makes every Leaf ſeem like a Heart, with divers yellowiſh Threads in the middle of them, and each ſtanding in a green Husk; the outſides whereof have longer Foot-ſtalks than thoſe more inward; and each Flower larger than the inner ones; which being paſt, round Seed-Veſſels ſucceed, in Form like Bucklers, a little ſmaller than the former, hard and rough on the outſide, in which are contained flat Seed, in four round reddiſh Cells or Partitions, divided by a certain thin ſhining Skin, two Seeds lying in each Cell or Diviſion.

V. *The Places.* They grow in Gardens both with us and in *Italy*, *France*, and the *Low-Countries*, but their original or native place is ſcarcely or not well known.

VI. *The Times.* They flower in the Summer Months, as in *May*, *June*, *July* and *Auguſt*, the ſecond year after their ſowing, and their Seed is ripe not long after.

VII. *The Qualities*, It is hot and dry in the firſt Degree. Digeſtive, moderatly Abſterſive, Expulſive, and Alexipharmick.

VIII. *The Specification.* It is peculiar for curing the Bitings of Mad Dogs, as alſo of Green Wounds, and of old running Sores, and filthy rotten Ulcers.

IX. *The Preparations.* From the Green Herb you may have, 1. *A liquid Juice or Eſſence.* 2. *A Decoction in Wine.* 3. *A Pouder.* 4. *An Ointment or Balſam.* 5. *A Cataplaſm.*

The Virtues.

X. *The liquid Juice or Eſſence.* Being taken in Broth or Wine, it cures the Bitings of Mad Dogs, and perfectly takes away the Venom or Poyſon thereof, which *Galen* affirms *Simplicium Medicamentorum*, l. 6. and this ſome think to be manifeſt from the ſignature of the Plant, or likeneſs of its whole ſubſtance, and that this is the Virtues thereof, had been found from great Experience; and that it would perform many other Cures, from its drying, digeſting, and moderately cleanſing faculties: and therefore *Galen* and *Dioſcordes* both ſay of each of theſe Plants, that they cleanſe the Skin from Wheals and Pimples, from Spots and other diſcolorings, as Morphew, Sunburnings, *&c.* which is preſumed to be done by the Juice or Eſſence.

XI. *The Decoction.* It may be made with Water or Wine, but the latter is the better. It has the Virtues of the Juice or Eſſence but much weaker, and therefore may be taken to half a Pint or more, according to Age, *&c.* It is good for the Cure of Wounds either inward or outward, to digeſt congealed or clotted Blood which is gathered together by any fall, blow or bruiſe, and to cleanſe and heal old rotten and filthy Ulcers, and other creeping Sores.

XII. *The Pouder of the Herb.* It has the Virtues of the Juice and Decoction, and particularly it has a virtue to ſtop the Hiccough, and this it will do if the Pouder, or green Herb it ſelf is but held in the Mouth, and alſo ſmelt to. Doſe one Dram at a time twice a day, in Ale, Beer, Wine, or Poſſet Drink, *&c.* Outwardly ſtrewed upon running and putrid Ulcers, it drys up the moiſture, and contributes much to their healing.

XIII. *The Ointment or Balſam.* It is of ſingular uſe to be applyed to the Bitings of Mad Dogs, becauſe it recalls, or draws forth the Venom or Poyſon out of the Wounds, and ſome are of Opinion, that it might have the ſame Operation, if it was applyed to the Biting of a Viper or Rattle-Snake: however outwardly applyed to running Sores, inveterate Ulcers, Fiſtulaes, *&c.* it has been found to digeſt, cleanſe powerfully, then to dry, and induce a ſpeedy healing, and this ſo much the more if the Pouder of the Herb be ſtrewed thick upon the Sore or Ulcer.

XIV. *The Cataplaſm.* It is of great uſe, being immediately applied to attract or draw the Poyſon or Venom out of the Bitings of Mad Dogs, and to diſcuſs Tumors or Swellings cauſed by ſimple Contuſions; as alſo to open the Pores ſo as to cauſe an eduction of the Morbifick cauſe of the Scurff, or Morphew, *&c.*

XV. Note, That the ſecond Figure, which is that of the Leſſer Madwort of *Dioſcorides*, is taken from *Matthiolus* his Epitome; in this Cut, the Seed Veſſels are very exact, but the poſition of the Leaves are not Juſt, for they ought to ſtand by Couples, and be of three times that length.

CHAP. CCCCLXI.

Of MADDER Great.

I. *THE Names.* It is called in the *Arabick* *Pave*, and *Fove alſa bagin*: in *Greek* Ερυθροδανον ἡ ερευθεδανον, *Eruthrodanum* and *Eruthedanum*: *Nicander in Theriacis*, calls it Σχυριον *Schyrium*: in *Latine*, *Rubea*, and *Rubia*, (from the color of the Root, and from its Dying Cloth or Leather into a Red color:) and in *Engliſh*, *Madder*. *Paulus Ægineta* ſays, it is called *Thapſon*: and in the Shops it is called *Rubia Tinctorum*.

II. *The*

II. *The Kinds.* It is either *Great*, of which in this Chapter: or *Small*, of which we ſhall Treat in the next. The great Kind of Madder, is, 1. *Rubia*, *Rubia Sativa*, *Rubia Tinctorum*, Garden Madder or Red Madder, which ſome call *Dyers Madder*, and *Crop-Madder*. 2. *Rubia Sylveſtris*, Wild Madder. 3. *Rubia Sylveſtris foliis longioribus*, Wild Madder with long Leaves. 4. *Rubia Marina*, Sea Madder. 5. *Synanchia Dalechampij*, Quinſey-wort or Quinſey Madder of Dalechampius. 6. *Mollugo Montano*, *Rubia Sylveſtris altera Geſneri*, Great Baſtard or Mountain Madder. There are other Herbs which ſome Authors will have to be kinds hereof, as *Aparine*, *Aſperula*, *Cruciata*, *Gallium*, which we can ſcarcely admit of, and therefore you will find them in other Parts of this Book, in their proper places of the Alphabet.

The Deſcriptions.

III. *The firſt, or* Garden Madder. *Its Root is fat and full of ſubſtance, yet not very great, but very long, running down half a mans depth into the ground, red in color, and very clear whileſt it is*

freſh, ſpreading ſeveral ways. From this Root ſhoot forth many very long, four ſquare, reddiſh ſtalks, trailing on the ground a great way, very rough or hairy, (which therefore *Pliny* terms *Spinoſus* prickly) and full of Joints. At every of theſe Joynts come forth ſeveral long and ſomewhat narrow Leaves, ſtanding like a Star, or the Rowel of a Spur, about the Stalks, rough alſo and hairy: towards the Tops whereof come forth many ſmall, pale, yellow Flowers; after which come ſmall round Heads, green at the firſt, and reddiſh afterwards, but black when they are thorough ripe, in in which are contained the Seed.

IV. *The ſecond, or* Wild Madder. *In this the Root grows greater, but not fully ſo red nor clear as that of the* Garden *Kind.* It grows up in

Wild or Field *MADDER.*

form, very like to the *Garden Madder* before deſcribed, but the Stalks are ſmaller, not ſpreading ſo far; nor are the Leaves ſo rough and hairy, but rather (as *Gerrard* ſays) ſmooth and ſhining; and leſſer alſo, and the Flowers white.

V. *The third, or* Wild Madder with long Leaves. *Its Root is ſmaller, but red like the former, from whence ſpring up divers round jointed Stalks, two or three feet long, and ſometimes longer, ſomthing ſmooth, or at leaſt nothing ſo rough as the other Wild ſort.* The Leaves which ſtand at the Joints are a little rough, narrower, and longer than the other, ſeven or eight at a diſtance: at the tops of the Stalks, ſtand many white Flowers, made of four ſmall Leaves a piece, which turn into ſmall round Seed like the former.

VI. *The fourth, or* Sea Madder. *Its Root is more red on the outſide than within, harder and more Woody than the other:* from this Root ſpring forth many ſquare, hard, and ſomthing rough Stalks, round about it, which are full of Joints, and from whence grow many ſmall, long Leaves, a little rough, broadeſt at the bottom, and pointed at the end; more white in the natural Places, than when Tranſplanted: from among which, (growing leſſer at the Tops,) come forth ſmall whitiſh Flowers Star faſhion, like the other, but longer.

VII. *The fifth, or* Quinſey Wort, *or* Quinſey Madder *of* Dalechampius. *It has a Root which is crooked, blackiſh without, yellow underneath the Skin, and white within and Woody, which is about five or ſix Inches long, with many hairy ſtrings:* From this Root ariſe many four ſquare Branches, trailing upon the Ground, and ſometimes reddiſh, towards the Root. The Leaves are ſmall and ſharp pointed, like thoſe of *Gallium*, or *Ladies Bed Straw*, and grow along the Stalk on certain

Knees or Joints, four or five together, and ſometimes fewer. From theſe Joints the Stalk divides it ſelf towards the Top into many parts, on which grow many Flowers, each Flower having four Leaves, ſomtimes white, ſomtimes of a fleſh color, and every Leaf of theſe fleſh colored Leaves is artificially ſtreaked in the middle, and near the ſides with three lines of a deeper red, but of no pleaſant ſmell. After which comes the Seed, ſomthing round, growing two together like ſtones, or as it is ſeen in Gooſe Graſs.

VIII. *The ſixth, or* Great Baſtard or Mountain Madder. *The Root is black without, Fibrous, and abiding all Winter.* From this Root ſhoot forth a

Great Baſtard *or* Mountain *MADDER.*

number of ſlender and weak Stalks, but yet ſuch as have ſo much ſtrength in them, as that they need no propping, but will ſtand upright of themſelves, which diverſly branch forth themſelves into many parts, ſo that it ſeems to be a pleaſant buſhy Plant, well ſpread; and having many ſhorter and broader ſmooth green Leaves ſet at the Joints, than either the Common, or red, or white Flowered *Ladies Bed Straw.* The Flowers are very ſmall and white, ſtanding at the tops of the Branches, pretty thick or plentifully, which being paſt away, turn into ſmall, black, round Seed.

IX. *The Places.* The firſt is only Manured either in *Gardens* or *Fields* in many Countrys of *Europe* for the profit which is made thereof: and is very Common, in moſt places of *England.* The ſecond grows in moiſt Medows and Mooriſh grounds, and under Buſhes almoſt every where: it is ſaid to grow alſo in Fields and Hedge ſides near to *Spire*, and in many other places of *Germany.* The third alſo grows in many places in *England*, as at a place called *Hod-hill* in *Dorſetſhire*, on the ſide which is next the River, in the Pariſh of *Stompaine*, two miles from *Blanford*, and at *Warham* likewiſe in the ſame Shire, on a Mud-wall in the ſame Town, and at a place called *Sommerpill* near to a Chapel by the Landing place, coming from *Aſtferry* to *Cheſell*, in great abundance. The fourth grows by the Sea ſide in moſt places; as alſo by the Sea ſide in *Provence*, and near *Mompelier* in *France*, and in *Spain* alſo as *Cluſius* ſays. The fifth grows in dry chalkie Grounds abundantly, being found Wild in many places; it has been found in great plenty on the Hill beyond *Chattam* in the way to *Canterbury.* The ſixth is found on divers Hills in *Germany*; and grows in Hedges and among Buſhes in many places.

X. *The Times.* The firſt, ſecond, and third, Flower towards the end of *Summer*, and the Seed is ripe quickly after; but *Gerard* ſays, they flouriſh from *May* unto the end of *Auguſt*; and that the Roots of the firſt are gathered in *Autumn* for the uſe of the Dyers, and for Phyſical purpoſes. The fourth or Sea Kind, ſeldom gives ripe Seed in our Climate. The fifth Flowers all the *Summer* long. The ſixth Flowers in *May*, *June*, and *July*, and the Seed is ripe in *July* and *Auguſt.*

XI. *The Qualities.* Madder is Temperate in reſpect to heat or cold, but is manifeſtly dry in the end of the firſt, or beginning of the ſecond Degree: it is Aperitive, and alſo Aſtringent, and admirably Traumatick or Vulnerary.

XII. *The Preparations.* The firſt Kind is moſt in uſe, and of that the Root, chiefly; and alſo the Seed: From the Root are prepared, 1. *A Decoction in Water or Wine.* 2. *A Decoction in Mead or Honied Water.* 3. *A Bath, or Fume, or Fomentation.* 4. *A Pouder.* 5. *An Eclegma or Electuary.* 6. *A Cataplaſm of the Roots and Leaves.* 7. *A Pouder of the Seed.* 8. *A Decoction in Wine of Quinſey Madder.* 9. *A Pouder and Cataplaſam of the ſame.*

The Virtues.

XIII. *The Decoction in Water or Wine.* It opens obſtructions of the Viſcera, and cleanſes the body of tough Flegm and groſs Humors; it provokes Urine plentifully, as alſo the Courſes in Women, and expels the dead Child and After-birth. It makes the Urine red like Blood, but it is from the Tincture of the Root, like as Rhubarb makes it yellow by virtue of its Tincture: and opens and aſtringes, as Rubarb purges and binds: inſomuch that it is ſaid to be good againſt Ruptures, and to ſtop the flux of the Whites in Women: It is profitable againſt the Hemorrhoids or Piles by Fomentation: and taken inwardly to ſix or eight ounces, it is ſaid to ſtop a Diarrhœa.

XIV. *The Decoction in Mead or Honied Water.* It opens obſtructions of the Gall, Liver and Spleen, and is profitable againſt the yellow Jaundice, Hypochondriack Melancholy; and is good for ſuch as have the Palſie, numneſs, and trembling of the Limbs: being alſo often taken it is effectual for the healing of inward Wounds.

XV. *The Bath, Fomentation or Fume.* It is made by boiling a great quantity of the Green Herb, Stalks, and Roots in Water. Being ſat in, as hot as it can well be endured, it is good againſt the Palſie, Gout, Sciatica and Rheumatick Pains: It is a good Fomentation for Women to ſit in, to provoke their Courſes, and to cleanſe the Womb from filth, or any putrid Matter.

XVI. *The Pouder of the Root.* Given inwardly to one Dram it ſtops Fluxes of the Belly. The Groſs Pouder is often times uſed in Vulnerary Diet Drinks, for the curing of Wounded Perſons, and ſuch as are afflicted with running Sores, old Ulcers, Fiſtula's, and the like; and is of excellent uſe for

ſuch as have had outward or inward Bruiſes by falls or blows, or any internal flux of Blood, which it effectually ſtops.

XVII. *The Eclegma or Electuary. Take choiſe Honey clarified twelve Ounces: Madder Roots in very fine Pouder ſix Ounces: Roch Alum in fine Pouder three Ounces: mix them and let them ſimmer over a gentle Fire, till the mixture is of a good ſcarlet color, which being cold put into a Gally-pot, and keep it cloſe covered for uſe.* It quickly cures all Sores and Ulcers in the Gums, Mouth, Throat or Gullet, and Wind-pipe; and eaſes the pain and ſtrengthens a weak Back. It may be taken Morning and Night, and ſeveral times a day, as much as a ſmall Cheſtnut upon a Knives point, letting it diſtil down the Throat very leiſurely; and for the pain and weakneſs of the Back, a Spoonful of it may be given at a time in a Glaſs of ſtrong Ale, Tent, or Alicant.

XVIII. *The Cataplaſm of Roots and Leaves.* Being beaten and applyed to any part which is diſcolored with Sunburnings, Tanning, Freckles, black and blew Spots, Scurf, Morphew, or any other like deformity of the Skin, it cleanſes it, and cures all thoſe defœdations,

XIX. *The Pouder of the Seed.* Taken from half a Dram to a Dram with Vinegar and Honey, it prevails againſt the ſwelling and hardneſs of the Spleen, opens its obſtructions, and removes Hypochondriack Melancholly.

XX. *The Decoction in Wine of Quinſey Madder.* It drys without biting, and is excelent againſt the Quinſey, being inwardly taken twice a day to ſix or eight Ounces, and outwardly applyed, both as a Gargariſm, and a Fomentation.

XXI. *A Pouder and Cataplaſm of the ſame.* A Cataplaſm is to be made of the Root and Herb green, and to be brought to a Conſiſtency with the Pouder of the Herb or Root, and then it is to be applyed to the Neck and Throat of ſuch as are affected with a Quinſey, renewing it twice or thrice a day, as often as it grows to be abſolutely cold.

CHAP. CCCCLXII.

Of MADDER Small.

I. *THE Names.* It is called in *Greek*, Ερυθροδανον μικρον: in *Latine*, *Rubia minor*, & *Rubia parva*; and in *Engliſh*, *Small Madder.*

II. *The Kinds.* There are 1. *Rubia ſpicata Cretica*, *Cluſij*, Candia Madder with ſpiked Heads. 2. *Rubia minor pratenſis cærulea*, ſmall creeping Madder with purpliſh blew Flowers. 3. *Rubia minima Saxatilis*, ſmall Rock Madder. There are about five other Kinds of theſe ſmall *Field or Wild Madders*, but not being Natives or Inhabitants of our Country, and of little uſe in Phyſick, we ſhall ſay nothing more of them here.

The Deſcriptions

III. *The firſt*, or Candia Madder with ſpiked Heads. *It has a Root which is ſmall, hard, woody, crooked or ſcragged, with many little Strings or Threads, red with out, and white with in, which always periſhes when the Seed is ripe.* From this Root ſpring up many knotty, four ſquare rough little Stalks, about a foot high, divided immediately from the Root into many Branches, having but one ſide Branch growing forth at one Joint: about which Joints grow and ſpread abroad four or five, and ſometimes ſix narrow ſhort ſharp pointed Leaves, ſomewhat rough. The tops of the Stalks and Branches are nothing but long, ſmall, fourſquare ſpikes or ears, made of three Leaved green husks; Out of the Top of each husk grows a very ſmall greeniſh yellow Flower, having four exceeding ſmall Leaves, ſcarcely to be ſeen: after which follows in each husk, one ſmall blackiſh Seed, ſomething long, round on the one ſide, with a dent or hollowneſs on the other.

IV. *The ſecond, or* ſmall Creeping Madder with purpliſh blew Flowers. *Its Root is ſmall and of a reddiſh yellow color, abiding all the Winter with green Leaves thereon, and will encreaſe plentifully from the Seed it ſheds every Year.* This ſmall Plant creeps upon the Ground, with many ſmall, ſquare, ſmooth Branches, much divided or ſpread out into other ſmaller ones; full Joints, and at every of them, five or ſix ſmall, round, and very freſh green Leaves, ſmooth alſo, or but very little rough. From theſe Joints, and roundles of Leaves, as well as from the Tops of the Branches, come ſeveral ſmall Flowers, made of five, blewiſh purple round pointed Leaves, with ſome ſmall Threads in the middle. The Seed is ſmall and long pointed, two for the moſt part ſtanding together.

V. *The third, or* ſmall Rock Madder. *Its Root is ſmall and reddiſh, as all the other ſorts are.* This ſmalleſt *Madder* grows not much above an hand breath high, with a ſquare Stalk, ſpreading ſmall Branches from the Joints; at which grow ſeven or eight ſmall long pointed Leaves, even the ſmalleſt and narroweſt of any before mentioned, being ſomwhat rough alſo. The Flowers are ſmall, and of a pale red or bluſh color, ſtanding in Tufts or Umbles at the Tops of the Branches.

VI. *The Places.* The firſt is a Native of *Candia*, but with us grows in Gardens only. The ſecond grows plentifully in many places of *England.* The third grow alſo in many places of our *Britiſh* Continent; as upon the Chalky Hills near *Drayton*, over againſt the Iſle of *Wight.* It grows alſo upon *Vincents* Rocks not far from *Briſtol.*

VII. Nota. *Lobel* ſays this laſt very ſmall Kind has its Leaves of the bigneſs of *Rupture-Wort*, ſharp pointed, and growing after the manner of thoſe of *Madder*, upon little creeping Stalks, an Inch and half high, on which grows yellowiſh ſmall Flowers: and that the Root is ſmall and of the color of Corall.

VIII. *The Times.* They all Flower in the *Summer* Months, as *May*, *June*, and *July*, and their Seed is ripe ſoon after.

IX. *The Qualities, Preparations, Virtues* and *Uſes*, of theſe are all the ſame with thoſe of the *Great Madder*, in the former Chapter, and therefore I referr you thither: but neither any of theſe

ſmall *Madders*, nor yet any of the other five laſt Kinds in the ſaid aforegoing Chapter, are any ways equal or to be compared to thoſe of the *firſt great Garden Kind*, for which ſpecial reaſon, that is only or chiefly in Uſe.

CHAP. CCCCLXIII.

Of MAIDEN-HAIR Engliſh.

I. *THE Names.* It is called in *Greek*, Ἀδίαντον *Anglicum:* in *Latine*, *Capillus Veneris Anglicus:* and in *Engliſh*, *Engliſh Maiden-Hair.*

II. *The Kinds.* There are four ſeveral ſorts of it, *viz.* 1. Τρίχομανες, *Græce*: *Trichomanes Latine*, alſo *Capillaris*, and *Filicula*, as *Gaza* has it: in *Engliſh*, *Engliſh Maiden-Hair*, and *Common Maiden-Hair.* 2. Ἀδίαντον ἄφυλλον, *Thalij*; *Politricum aureum majus Bauhini:* and of ſome, *Adiantum aureum majus*; *muſcus Capillaris*, *Polytrichum Apulei Fuchſij*, the greater Golden Maiden-Hair. 3. *Polytricum aureum minus Bauhini*, *Adiantum aureum minus*, the leſſer Golden Maiden-Hair. 4. *Capillus Veneris Tragi*, *Adiantum album Cordi*, *Saxifraga major Brunfelſij*, & *Fuchſij*; *Ruta muraria Matthioli*, who afterwards took it be *Paronychia Dioſcoridis*, *Salvia Vitæ Lobelij* & *Lugdunenſis*; in *Engliſh*, Common White Maiden-Hair, *or* Wall-Rue.

The Deſcriptions.

Common English Maidenhair.

III. *The firſt*, *or* Engliſh Maiden-Hair. *Its Roots are ſmall, hard, black, and Fibrous or Thready*, from whence come forth a great many blackiſh ſhining little Stalks, ſcarcely a Span in length, and in many Plants not half ſo long; on each ſide ſet very thick with ſmall round dark green Leaves, and ſpotted on their backs like *Ceterach*, and other ſmall Ferns.

IV. *The ſecond*, *or* Greater Golden Maiden-Hair. *It has a ſmall and thready Root, whoſe Fibres are wonderful fine.* It is a kind of Moſs, and its Stalks are not above a handful high, covered with ſhort hairs ſtanding very thick together, of an obſcure yellow green color, out of which Stalks, ſpring up ſometimes very fine naked Stems ſomewhat black; upon the tops of which hang as it were little Grains like Wheat Corns.

V. *Parkinſon* ſays it has a very ſmall and Thready Root: and that it has a company of ſmall browniſh red Hairs to make up the form of Leaves, growing about the Ground from the Root: and in the middle of them in *Summer* time, riſe up ſmall Stalks of the ſame color, ſet with very fine yellowiſh green Hairs on them, and bearing a ſmall gold yellow Head, leſſer than a Wheat Corn, ſtanding in a great Husk.

VI. *The third*, *or* Leſſer Golden Maiden-Hair. *of this there are two Kinds*, viz. *the Leſſer*, *and the Leaſt*, both of which are very like the former, but that the Stalks grow not to much more than half the height of the greater.

VII. *The fourth*, *or* Common white Maiden-Hair, *commonly called Wall Rue, but is generally accounted one of the Capillary Herbs or Maiden-Hairs, and that not of the leaſt account. It has a Root which is black and full of ſtrings, from whence ſpring forth many Leaves almoſt round and ſlender ſtanding upon ſhort foot Stalks.* It has riſing up from among thoſe Ground Leaves fine pale green Stalks, almoſt as fine as Hairs, ſet confuſedly, with divers pale green Leaves, on very ſhort foot Stalks, ſomewhat near unto the color of *Garden Rue*, and not differing much in form, but ſomewhat more like unto the true *Adianthum* in the next Chapter, being more and more diverſly cut in on the edges, and thicker; ſmooth on the upper part, and ſpotted finely on the under.

VIII. *The Places.* The firſt grows upon old Stone Walls in the Weſt of *England*, and in *Wales*; in *Kent*, and in ſeveral other places of this Land: it delights alſo to grow by Springs and Wells, and in Rocky, moiſt and ſhadowy places, and Mr. *Goodyer* ſaid, that in *January* 1624, he ſaw enough to lade a Horſe, growing on the Banks in a Lane, as he rode between *Rake* and *Headly* in *Hampſhire*, near *Woolmer Forreſt.* It was alſo found growing in a ſhady ſandy Lane in *Betſome*, in the Pariſh of *South-fleet* in *Kent*: as alſo upon Stone Walls at her Majeſties Palace of *Richmond.* The ſecond is ſeldom found but upon Bogs and Mooriſh places, yet ſometimes alſo in ſhady dry Ditches, where the Sun does not come: *Gerard* found it in great abundance in a ſhadowy Ditch upon the left hand, near unto a Gate which leads from *Hampſtead Heath* towards *Highgate.* The third is found in or near the ſame places where the ſecond is ſaid to grow. The fourth is found in many places of *England*, as at *Dartford*, and the bridge at *Aſhford* in *Kent*, at *Beckonsfield* in *Buckingham-ſhire*; at *Woolly* in *Huntington-ſhire*: on *Framlingham* Caſtle in *Suffolk*: on the Church Walls at *May-field* in *Suſſex*, and on the Rocks near *Weſton ſuper Mare* in *Sommerſet-ſhire:* on the Walls of the Church-yard at *Sittingburn* in *Kent*, in the middle of the Town near a Lake of Water; and upon the Church Walls of *Raily* in *Eſſex*, and other places.

IX. *The*

IX. *The Times.* Theſe Plants are always green both *Summer* and *Winter*, but have neither Flowers, nor Seed.

X. *The Qualities.* All theſe ſeveral ſorts of *Maiden-Hair* are temperate in reſpect to heat or cold, but dry in the firſt Degree. They are Aperitive, and Diuretick, Pectoral, Hepatick, Nephritick, and Alexipharmick.

XI. *The Preparations.* They are almoſt equally in Uſe; but if there is any difference, the firſt and fourth are moſt in Vogue. And from any of them, or all of them, you may have 1. *A Decoction in Wine or Water.* 2. *An Infuſion or Tincture in Wine.* 3. *A Pouder of the Herbs.*

The Virtues.

XII. *The Decoction in Water or Wine.* It is very effectual againſt Coughs, Colds, Catarrhs, and other Diſtempers of the Breſt and Lungs, cauſing an eaſy expectoration; it opens the obſtructions of the Liver, Spleen and Reins, and is available to break the Stone, eſpecially in the Reins, expel Sand, Gravel, and other Tartarous Matters, to provoke Urine, and give eaſe in the Srangury. It is alſo of good uſe for ſuch as are troubled with the Spleen, or affected with the Falling-ſickneſs. The Head waſhed therewith, it ſtrengthens the Roots of the Hair, ſtays it from ſhedding or falling, and cauſes it to grow thick where it is thin.

XIII. *The Infuſion or Tincture in Wine.* It has all the former Virtues, but much more pleaſant to be taken, for it has leſs of the Styptick, Terrene or Earthy parts, than the Decoction, the which are extracted by boiling; and more of the fine, ſubtil, and volatile parts, moſt of which in the former are loſt, but in this retained, becauſe not tortured with the violence of the Fire. Doſe from 4 to 6 Ounces, Morning, Noon, and Night, as the Phyſician, ſhall think fit, of the former alſo, as well as of this. But this is to be noted, That they may be both ſweetned with Clarified Honey, which alſo contributes to the ſame ends.

XIV. *The Pouder.* It has all the Virtues of the Decoction, or Infuſion or Tincture: and being mixed with Clarified Honey and made into an Electuary, it cauſes Expectoration, and is a ſingular Experiment againſt the Aſthma, or ſhortneſs of Breath, and difficulty of Breathing, as alſo againſt all Tartarous Mucilage in the Urinary parts, Stone and Gravel, Ulcers in the Reins and the like. The Pouder may be given from half a Dram to a Dram, in Wine or other Vehicle; but ſeems to me to be beſt made up into an Electuary with Clarified Honey, and ſo taken. Theſe *Maiden-Hairs* treated of in this Chapter have been found by Experience, to be of the ſame Nature, Qualities and Virtues, and to have as good Effects, as the *True Maiden-Hair*, of which we ſhall treat in the next Chapter; and becauſe eaſier to be come by, the oftener made uſe of.

CHAP. CCCCLXIV.

Of MAIDEN-HAIR True.

I. THE *Names.* It is called in *Greek*, Ἄδιαντον (becauſe the Rain reſts not on it, but ſlides off; and Πολύτριχον *Dioſcoridis, quaſi multicomum, quod Capillos multos & denſos faciat*; & Καλλίτριχον *Aputei, quaſi Pulchricomum, quod Capillos tingit pulchrioreſque reddit*: in *Latine*, *Adiantum, Polytrichum, Callitrichum, Capillus Veneris*, (*à ſpecioſis reddendis Capillis*;) *Capillus Terræ*; *Supercilium Terræ, & Crinita*: and in *Engliſh*, *Maiden-Hair.*

II. *The Kinds.* The *True Maiden-Hair* is but twofold, *viz.* 1. *Adianthum minus* (which is *verus*) *Capillus Veneris verus*, The *True Maiden-Hair.* 2. *Adiantum majus* (which is alſo a kind of the *Verus*, and grows only larger according to the Region it grows in) *Adiantum Syriacum, Capillus Veneris Syriacus*, the *True Syrian Maiden-Hair.* To theſe we may add, 3. *Adiantum nigrum Vulgare*; *Onopteris nigra Dodonæi*; *Adiantum pulchrum Lugdunenſi ſimile Thalij*, Common black *Maiden-Hair.* 4. *Adiantum album Plinij*; *Adiantum filicis folio Bauhini*, Δρυόπτερις λευκὴ, *Dryopteris alba, Dryopteris Candida Dodonæi*, of which we have already written in *Chap.* 260. *Sect.* 4. and 9. aforegoing. 5. *Adiantum Fruticoſum Americanum.* The *American Maiden-Hair.*

The Deſcriptions.

The true Maiden hair.

III. *The Firſt or* True Maiden-Hair, *has a Root which conſiſts of a number of blackiſh brown Fibres, or Threads*; from whence ſprings up a ſmall low Herb, not above a Span high, whoſe Stalks are

ſmaller, finer, redder, and more ſhining than thoſe of *Trichomanes*, or our Common *Engliſh Maiden-Hair*, on which are placed delicate fine Leaves on both ſides, without order, one above another, ſomewhat like unto the lower Leaves of *Coriander*, or like the Leaves of *Aniſe*, but larger, cut in unequally on the edges, and ſpotted on the back with very ſmall brown Marks ſcarce to be diſcerned.

IV. *The ſecond*, *or* True Syrian Maiden-Hair. *Its Root is tough, and thready like the firſt*; *and the whole is an humble or low Plant*, having Leaves

True Syrian MAIDEN-HAIR.

flat, ſmooth, and plain, ſet upon a blackiſh middle rib, like unto that of the other true *Maiden-Hair*, cut or notched on the edges, Nature keeping no certain form, but making one Leaf of this faſhion, and another of another, far different from it. But yet in the main, this *Syriacum* is but one and the ſame Herb and Species with the former, tho' ſomewhat larger, which is from the Country, and nature of the Soil; for which reaſon, *Lobel* calls it, *Capillus Veneris Verus*.

V. *The Third*, *or* Common black Maiden-Hair, *This differs little or nothing from the* Dryopteris Candia Dodonæi, *which is the fourth Species next following, as is declared in the Kinds, and of which we have already written in the place aforecited*; but that the Stalks of this are blacker, and the Leaves of a ſadder green, whereas that is greener and paler, ſo that that aforenamed to come in the fourth place here, may very well be accounted a Species of this: There are many Stalks of winged Leaves, not much higher than the aforegoing, ſcarcely exceeding 6, 7, or 8, Inches in heighth, but the Leaves on the Wings are broader, ſhorter, and more deeply cut in on the edges.

VI. *The fifth*, *or* American Maiden-Hair. *It has a Fibrous Root, and grows up like unto a* Fern, *with a ſlender blackiſh brown Stalk, branched forth into others*, about which on each ſide, ſtand from 12 to 20 freſh green Leaves, ſmall and ſomewhat long, joined together by ſmall foot Stallks, ſomewhat like unto the firſt true *Maiden-Hair*, but cut in on the out ſide at the tops of the Leaves only, and not at the bottom.

VII. *The Places.* All theſe ſorts grow on Stone Walls, and by the ſides of Rocks, or Gravelly Springs, and other ſhady and moiſt places. The firſt plentifully, as *Pena* and *Lobel* ſay; about *Mompelier* in *Narbone* in *France*; as alſo in ſome parts of *Glouceſterſhire*, and in divers parts of the Weſt of *England*. The ſecond grows in *Syria*, and is not to be found with us unleſs in *Gardens*. The third in many Barren, Rocky, and Untilled places, eſpecially where Springs are near. The fourth upon Oaks and among Oak Moſs. The fifth in *Virginia*, *Carolina*, *New-York*, *Mary-land*, *Penſylvania*, and other parts of *Florida*.

VIII. *The Times.* They all abide green through the whole year but have not any of them, either Flower or Seed.

IX. *The Qualities.* *Maiden-Hair* is temperate in reſpect of Heat or Cold, and dry in the firſt Degree, Aperitive, Diuretick, Traumatick, Pectoral, Splenetick, and Nephritick.

X. *The Specification.* It opens Obſtructions of the Lungs, Liver and Spleen, prevails againſt Ulcers of the Lungs, Coughs and Aſthma's, and cures the Rickets in Children.

XI. *The Preparations.* The Preparations are much the ſame with thoſe in the former Chapter, *viz.* 1. *A ſimple Decoction in Water or Wine.* 2. *A Compound Decoction.* 3. *A Pouder.* 4. *A Tincture in Wine.* 5. *A Lye.*

The Virtues.

XII. *The ſimple Decoction in Wine and Water.* It prevails againſt the Cough, ſhortneſs of Breath, difficulty of breathing, the yellow Jaundice and diſeaſes of the Spleen; it is ſaid to break the Stone, open obſtructions of the Reins and Ureters, and provoke Urine: it provokes the Terms in Women, rectifies the Blood, and cleanſes the Lungs of Tartarous and putrid matter, by Expectoration. Doſe four Ounces four or five times a day.

XIII. The Compound Decoction. *Take Maiden Hair* 12 *Handfuls*; *Ceterach, or Spleen-wort*, *Liver-wort*, *Oſmond Royal, of each* 4 *Handfuls*; *Liquorice bruiſed* 2 *Ounces*; *Fennel Seeds bruiſed* 1 *Ounce*; *Raiſons of the Sun Stoned, blew Currants, of each half a Pound*; *blew Figs ſlit* 4 *Ounces*; *Spring Water* 3 *Quarts*; *mix and Boil, then ſtrain out and keep it for Uſe*. Let it be taken in the Morning faſting, an hour before Dinner; at 5 in the Afternoon, and at Bed-time; always ſqueezing into it, at the time of taking it the Juice of an Orange, or ſome of the Juice of a Limon. It not only opens Obſtructions of Lungs, Liver, Spleen Reins and Womb, having all the Virtues of the ſimple Decoction, but cleanſes the Lungs of Ulcerated or putrid Matter, heals Ulcers of the Lungs, and cures the Rickets in Children. It provokes Urine, gives eaſe in the Strangury, prevails againſt inveterate Aſthma's; and being long taken, profligates the Gout and Rheumatick pains to a Miracle.

Doſe

Doſe four Ounces or more at a time, as often as before directed.

XIV. *The Pouder of the Herb.* Being taken a Dram at a time in Red *Barcelona* Wine, or other like Styptick Wine, Morning and Night for 40 or 50 days together, it is ſaid to cure Ruptures. It is profitable againſt the Bitings of Vipers or other Serpents and Venomous Creatures, and has indeed all the Virtues of the Decoction and Tincture; but for the other Diſeaſes, it is beſt to be made up into an Electuary with twice or thrice its weight of Clarified Honey, and the Electuary to be given from 2 to 4 Drams.

XV. *The Lye.* It is made of the Aſhes by Elixiviation in fair Water. It is ſingular good to cleanſe the Head of Scurff, Morphew, Dandriff, and to heal a Scald Head, whether it be a dry or running Sore: It ſtays the falling of the Hair, and is ſaid to make it grow thick, fair, and well colored, for which purpoſe ſome make the Lixivium in Wine, and others uſe the Decoction of the Herb in Wine. And ſome boil the Aſhes in Oil, and anoint therewith to cure Baldneſs, Scurff, Dandriff, Scald-Heads, *&c.*

CHAP. CCCCLXV.

Of MALLOW Common.

I. *THE Names.* It is called in *Arabick*, *Chubeze* and *Chubes*, and the Seed thereof *Bizeri Chubeir*: in *Greek*, Μαλάχη, *ab emoliendo Ventre*, but in the Coppies of *Epichames* and *Antiphanes* it is written Μολόχη: in *Latine*, *Malva*, *quaſi Molva*, *quod alvum Molliat*: in *Engliſh*, *Mallow*.

II. *The Kinds.* There are ſeveral principal ſorts of *Mallows*, as 1. *The Common Kind*, of which in this Chapter. 2. *The Marſh Mallow*, of which in the next Chapter. 3. *The Vervain Mallow*, of which in Chapter 467. 4. *The Tree or Shrub mallow or Marſh Mallow*, of which in Chapter 468 following.

III. *The Kinds of the Common Mallow.* Of this there are theſe Species following. 1. *Malva vulgaris Flore purpureo*, The Common Mallow with Purpliſh Flowers. 2. *Malva vulgaris Flore albo*, The Common Mallow with white Flowers. 3. *Malva Sylveſtris minor*, *Malva Sylveſtris repens pumila*, The Small, or Dwarf Wild Mallow. 4. *Malva Montana*, The Mountain Mallow. 5. *Malva Hiſpanica Flore carneo amplo*, The Spaniſh Bluſh Mallow.

The Deſcriptions.

IV. *The firſt, or* Common purpliſh Mallow. *It has a Root which is long and white, tough and ſomewhat Woody, and running deep into the Ground.* From this Root ſpring forth many large, ſoft, green, roundiſh Leaves, yet ſomwhat cornered and dented about the edges, ſtanding upon long foot Stalks next the Ground; from among which riſe up ſeveral round, green Stalks, growing in time to be 3 or 4 feet high, eſpecially when growing in good Soil, and to be more hard and almoſt Woody, eſpecially at the bottom; divided into many Branches, towards the tops, and with many leſſer Leaves, and more divided upwards; where it brings forth many Flowers, ſtanding in ſoft husks; which Flowers twine themſelves, at their firſt ſhooting forth, before they open themſelves into five, large, broad pointed Leaves of a fine delayed purpliſh red color, with many ſtripes or Veins running through every Leaf, of a deeper color, which makes the Flower ſeem very beautiful: after which come round flat Cakes, with many blackiſh Seeds ſet in order round about them.

Common Purpliſh *MALLOW.*

V. *The ſecond, or* Common white Mallow. *The Roots of this are like to thoſe of the former*: and in its Springing up, Stalks, Leaves, Flowers and Seeds, height, and manner of growing, it is ſo like to the firſt that it cannot be diſcerned from it, till it is in Flower, in which conſiſts the whole difference: Theſe Flowers being not full out ſo large as they, and of a pure white color, without any ſtripe or Vein of any other color running through them.

VI. *The third, or* Small, or Dwarf Wild Mallow. *The Roots are like thoſe of the two former: ſo alſo its Stalks, Branches, Leaves, Flowers, and Seeds:* ſaving that this Kind lies with its Branches more upon the Ground, and that it has many ſmaller and rounder Leaves, not ſo much cut in, or very ſeldom, and leſs dented on the Edges than the firſt Common; the Flowers are alſo ſmaller and more white, otherwiſe it is in all reſpects like the Vulgar *Mallow.*

MAL-

MALLOW Dwarf.

VII. *The fourth, or* Mountain Mallow. *The Root is like to that of the Common Mallow:* Its lower Leaves are as large as thoſe of the firſt or Common Kind, but a little longer, with ſome round diviſions or cuts in them, but not deep, and not much unlike in ſhape to an Ivy Leaf: the Stalk grows not ſo great and high as the firſt Common, and with ſomthing ſmaller Leaves thereon, and upwards they are ſomewhat rounder and leſſer: the Flowers and Seed are wholly like to thoſe of the firſt.

VIII. *The fifth, or* Spaniſh Bluſh Mallow. *It has a Root which is ſmall and long, and periſhes every Year:* This Spaniſh Mallow, is in form and manner of Growing, very like unto our firſt or Common Field Mallow, having upright Stalks two or three feet high, ſpread into divers Branches; and from the bottom to the Top, beſet with round Leaves, like unto our Mallows, but ſomewhat ſmaller and rounder, and leſs divided, yet larger below than above: the Flowers plentifully grow upon the ſmall Branches, folding or writhing their Leaves, one above another, before they be blown, and being open conſiſts of five Leaves, with a forked Clapper therein, of the ſame color with the Flower: the chiefeſt difference from the firſt Common Kind, conſiſt in this, that the Leaves of theſe Flowers are larger and more wide, open at the brims (almoſt like a Bell Flower) and of a fair bluſh or light Carnation color, opening all the day time, and cloſing at night. After the Flowers are paſt, there come ſuch like round heads, with ſmall black Seed like to thoſe of the firſt Common Kind, but ſomething ſmaller.

IX. *The ſixth, or* Curled Mallow, *or* French Criſped Mallow. *It has a Root like to the firſt Common Kinds, which periſhes when it has perfected its Seed.* This Criſped or Curled Mallow, (which is called by the common People *French Mallow*, tho' it grows as frequently and naturally in *England* in our *Gardens*) has many ſmall upright Stalks growing a foot and a half or two feet high, and ſometimes higher, as I have ſeen it, which is according to the goodneſs of the Soil; on theſe Stalks and Branches do grow broad Leaves ſomewhat round and ſmooth, of a light green color; which are Crumpled or Curled about the Edges, and alſo into the ſubſtance of the Leaf like a Ruff, very admirable and pleaſant to behold. The Flowers are ſmall and white, much like the former Kinds.

X. *This Kind* Parkinſon *thus deſcribes. The Root uſually abides the firſt year; and the ſecond year it runs up to Flower and Seed, but ſoon after the Seed is perfected it periſhes*: from this Root ſhoots up an upright green round Stalk, as high ſometimes as a Man; on which from all ſides grow forth round whitiſh green Leaves, Curled or Crumpled about the Edges like a Ruff, elſe very like to our firſt or Common great Mallow Leaf. The Flowers grow both upon the Stalk, and on the other Branches, which ſpring from it, being ſmall and white; after which come ſmall Caſes, with black Seed like the other Mallows. This Kind is much uſed as a Pot-herb, eſpecially when there is cauſe to move the Belly downwards, which by its ſlippery quality it helps forward. It has formerly, and is at this time in ſome places, uſed to be boiled or ſtewed, either by it ſelf, or with Butter, or with Spinage, or other Herbs, and ſo eaten.

XI. *The ſeventh, or* Summer Mallow *(called* Malva trimeſtris, & Malva æſtiva.) *It has a ſmall Root which periſhes with the firſt Cold or* Froſt *which comes; but ſometimes if the* Summer *is kindly, it gives its ripe Seed before the coming of Froſty Nights.* It has ſoft, round, green Leaves, without diviſions, yet dented about the Edges, and ſomething pale underneath. The Stalk riſes up to be about a Foot and a half high, and ſometimes higher, bearing ſmaller Leaves, and a little divided, ſomewhat like unto thoſe of Marſh Mallows. The Flowers are of a paler purpliſh color, than the Common and Leſſer, the bottom of whoſe Leaves are of a deeper color, ſtanding upon longer foot Stalks, and not ſo many together; after which comes ſmall Seed.

XII. *The Places.* The three firſt grow commonly by Ways, and Hedg, and Ditch ſides in Fields, and untilled places, almoſt every where thro' the whole Land; but the ſecond Kind with white Flowers is not ſo plentiful; it has been found at *Aſhord* in *Kent*, and at *Thrapſton* in *Northamptonſhire*, and in ſeveral other places. The fourth is found on Hills and Mountainous Grounds. The fifth, and ſeventh are Natives of *Spain*, from whence they have been brought to us and are nouriſhed up in our *Gardens*. The ſixth grows plentifully both in *England* and *France*, in *Gardens*, for it grows not Wild, that ever I heard of.

XIII. *The Times.* They all Flower all the *Summer* Months, from *May*, even to *Auguſt*, or later, till the Coldneſs of the Weather nips them; and the Seed comes to ripeneſs in the mean ſeaſon.

XIV. *The Qualities.* Theſe Plants are all temperate in reſpect of Heat and Cold; and moiſt in the firſt Degree. They are Deobſtructive, Emollient and Traumatick; Peſtoral, Nephritick and Hyſterick.

XV. *The Specification.* They expel Tartarous Mucilage out of the Breſt and Lungs, as alſo from the Guts, Reins, and Womb: are profitable againſt

the

the Bloody Flux; and prevails againſt the Stone and Gravel, whether in the Reins, Ureters or Bladder.

XVI. *The Preparations.* You may prepare therefrom 1. *A Liquid or Inſpiſſate Juice.* 2. *An Eſſence.* 3. *A Decoction in Water or Wine.* 4. *A Syrup.* 5. *A Pouder.* 6. *An Ointment or Balſam.* 7. *A Cataplaſm.* 8. *A Diſtilled Water.* And all theſe Preparations may be made either of the Leaves or Roots alone, or of both together.

The Virtues

XVII. *The Liquid or Inſpiſſate Juice.* The firſt taken to 3 or 4 Ounces, or the latter to half an Ounce diſſolved in Barly Water, opens the Body, and cauſes an Evacuation of Hot, Cholerick, and other offenſive Humours; eaſes the Pains and Torments which come by Obſtructions of the Bowels and Conſtipation of the Belly; and therefore is good to be uſed in Clyſters conducing to thoſe purpoſes: Taken by Nurſes which give Suck to Children, it encreaſes their Milk, and helps to expectorate pituitous and tough Humours from the Breſt and Lungs, heals exoriations of the Stomach and Guts, prevails againſt the Phthiſick, the Pleuriſie and other like Diſeaſes. Given in Wine, it cauſes ſpeedy and eaſy delivery to Women in Travel, is profitable againſt the Bloody Flux, as alſo other Fluxes of the Bowels.

XVIII. *The Eſſence.* It has all the Virtues of the *Liquid or Inſpiſſate Juices*, and being take to an Ounce or two in a Glaſs of Generous Wine, it is profitable againſt inward Convulſions of the Stomach, and Tortions of the Guts. It is alſo profitable againſt Poiſon, ſo as the Poiſon be preſently voided by a Vomit. Bathed upon the affected parts, it is good againſt Scurffs, Morphew, Dandriff, or dry Scabs, whether in the Head or other places, and is profitable againſt Scalding with Water, or Burning by fire, and to help an Eryſipelas or *Anthonies* Fire, and to diſcuſs all other hot, red and painful Swellings in any part of the Body.

XIX. *The Decoction in Wine or Water.* It has the Virtues of the *Juice* and *Eſſence*, but not full out ſo powerful; but prevalent againſt moſt external Defœdations. The Feet being Bathed therewith, it helps much againſt Defluxions of Rheum from the Head, riſing from the Stomach; and if the Head is waſhed therewith, it prevents the ſhedding or falling of the Hair: if a little Honey and Roch Alum be diſſolved in it, it makes an excellent gargle for any ſore Mouth or Throat, for it cleanſes and heals them in a very ſhort time.

XX. *The Syrup.* It may be made of the *Juice*, *Eſſence* or *Decoction*, with Honey. It is effectual againſt all the Diſeaſes before Specified, but is an admirable Pectoral and Nephritick. It looſens the Belly gently, and is effectual in Clyſters for to eaſe all pains of the Bowels, opening the obſtructed paſſages and making them ſlippery: given inwardly by the Mouth, it cauſes Expectoration, and helps moſt Diſeaſes of the Breſt and Lungs, as Coughs, Colds, Hoarſneſs, Wheezing, ſhortneſs of Breath, difficulty of Breathing: It is profitable alſo againſt Excoriation of the Guts, Bloody Fluxes, and other Fluxes of the Bowels, by qualifying the ſharpneſs and acrimony of the Cholerick Humour: and by its Mucilaginous property, it eaſes the Pains and heals the Ulceration or Soreneſs. It may be given from an Ounce to 3 Ounces, in Parſly Water, againſt the Stone, Gravel, Sand, and other Tartarous Matter in the Reins, Ureters and Bladder, it eaſes the Pain and cauſes ſmall Stones and Gravel the more eaſily to deſcend and to be expelled, for which thing it is a moſt celebrated Remedy. But tho' for all theſe purpoſes *Common Mallow* may be uſed, yet we generally take the *Marſh Mallow* firſt deſcribed in the next Chapter, which is the chieteſt *Mallow* of all others, and is called *Biſmalva*, for that it is twice as powerful in its effects as the others, and you may make uſe either of the Leaves or Roots, or of both.

XXI. *The Pouder.* It may be made either of the Leaves or Roots, or of both, and that either of the *Common Mallow*, or of the *Althæa* or *Marſh Mallow.* Given to a Dram, more or leſs, it has the Virtues of the former Preparations, and is peculiarly good againſt the Strangury. It is good to be given to ſuch as are troubled with Ruptures, given in red *Barcelonia* Wine, or other Styptick Wine; and is profitable againſt Scrophulous or Strumous Tumors in the Neck and Throat called the Evil: it diſcuſſes Swellings in Womens Breſts: and being given with Milk and Honey, it is ſpecial good againſt the Chin-Cough: and given in a ſtrong bodied Wine, induces the healing of Wounds and Ulcers, and reſtores ſuch as are ready to faint thro' the loſs of Blood, or are otherwiſe hurt by falls or blows, or Stripes, or have any Ach, Pain, or Swelling in the Nerves, Tendons or Muſcles in any part of the Body. Applyed to green Wounds it preſently conglutinates and heals them.

XXII. *The Ointment or Balſam.* If made of the Mucilage, chiefly of the Roots, and rather of the *Althæa*, than of any other, it takes away the roughneſs of the Skin, diſcuſſes Inflammations; and ſtrengthens Fractures and Diſlocations; mollifies and digeſts hard Tumors, or ſuch as will Apoſtemate; digeſts and cleanſes putrid Wounds and Eating Ulcers, making them fit for a Cure.

XXIII. *The Cataplaſm.* Made of the green Herb and Root it is good againſt hardneſs and ſhrinking of the Sinews: laid to the Eyes with a little Honey, diſcuſſes their Inflammations, and if apoſtemated, prevents the coming of a Fiſtula. The *Cataplaſm* made of the bruiſed Leaves applyed to the Stinging of Bees, Waſps, Hornets, yea of the Scorpion, and the biting of that poyſonous Spider the *Phalangium*, is ſaid preſently to take away the Pain, redneſs and ſwelling ariſing thereupon, and keeps them from putrifaction. If it is made of the Leaves boiled and beaten, with Bean or Barly Flower, and Oil of Roſes, it is an eſpecial remedy againſt Inflamations, and hard Tumors, Apoſtems, and ſwellings of the Teſticles and other parts, and eaſes their Pain, as alſo the pain and hardneſs of the Liver and Spleen, being put upon the place grieved. The *Cataplaſm* made of the green Leaves beaten up with *Nitre*, and applied, draws Splinters, and Thorns out of the Fleſh. If made of the mucilage of the Roots with the flower or pouders of *Lin-Seed* and *Fœnugreek-Seed* and applyed, it gives eaſe to pains in any part of the Body.

XXIV. *The Diſtilled Water.* This being made when the Plant is in Flower, is good for all thoſe Diſeaſes the *Juice*, *Eſſence*, or *Decoction* are applyed to, but acts more weakly; yet it is much commended to be uſed in Burning Fevers, and the hot Fits of Agues.

XXV. *The Flowers of Mallows.* A *Decoction* of them in water ſweetned with Honey, and in which a little Alum is diſſolved, is good againſt Rheum

Rheum in the Eyes, and Inflamations of thofe parts, as alfo makes a good Gargle for fore Mouths and Throats, cleanfing and healing them in a very little time.

XXVII. *The Seed.* If green it is bruifed, and Infufed in Vinegar, or being dry, it is made into Pouder, and fo Infufed, it will cleanfe the Skin from Freckles, Tanning, Sunburning, Scurff, Morphew, and all other denlements thereof, being well bathed therewith. And being made into Pouder (more efpecially the Seed of the *Althea* or *Marfh-Mallow*) and given to a Dram, or a Dram and half at a time, it gives eafe in the Stone, Gravel and Strangury, and provokes Urine, and this more efpecially if it be feveral times repeated; where note, that it is beft to be given in *Parfley*, or *Arfmart*, or *Onion Water*, or fome other proper Diuretick.

CHAP. CCCCLXVI.

Of MALLOW Marfh.

I. *THE Names.* It is called in *Arabick*, *Chitini*, *Chateni*, and *Rofa Zameni*, and by *Serapio*, in one place *Alfam:* in *Greek*, Ἀλθαία, *Althaia*, & Ἰβίσκος, *Ibifcus*; Ἱβίσκος, *Hibifcus*; & Ἐβίσκος, *Ebifcus*: in *Latine*, *Althæa*, *Malva Marina*, *Ariftalthæa* (from the excellency of its effects:) of fome *Olus Judaicum*, the *Jews* Pot-Herb: and by fome Authors, *Bifmalva*, *and Malvavifcus* (as it were from *Malva* and *Ibifcus*:) in *Engliſh*, *Marfh-Mallow.*

II. *The Kinds.* Authors make many forts of this Plant: but we fhall defcribe only thefe five varieties following, *viz.* 1. *Althæa vulgaris*, *Bifmalva*; *Malva Paluſtris Cordi*; *Malvæ agreſtis genus Geſneri: Malvaviſcus Angularæ*; *Althæa Ibiſcus Lobelij*, Our *Common Marſh Mallow.* 2. *Althæa paluſtris Cytini Flore*, Water Mallow. 3. *Althæa ſemper virens Bryoniæ folio*, *Althæa fruteſcens Bryoniæ Folio Bauhini*, Evergreen Marſh Mallow. 4. *Althæa lutea*, *Althæa floribus luteis Lobelij*; *Althæa Peregina Geſneris in hortis*; *Althæa Theophraſti*; *Althæa floribus luteis paluſtris Penæ*, yellow Marſh Mallow. 5. *Althæa roſea peregrina, vel Americana*, Roſe Marſh Mallow of *America.*

The Deſcriptions.

III. *The firſt*, *or* Common Marſh-Mallow, *It has a Root which is long, ſpreading it ſelf into manifold parts from one Head, of the bigneſs of a Thumb or finger, very pliant, tough and bending like* Liquorice, *of a whitiſh yellow color on the out ſide, and more white within, full of a viſcous or ſlimy Juice, which being laid in Water, will ſo thicken it, as if it were Gelly.* From this Root ſpring forth ſeveral ſoft hoary white Stalks, riſing to be three or four Foot high, ſpreading forth many Branches, the Leaves of which are ſoft and hoary or woolly, ſomewhat leſſer than

MARSH-MALLOW.

thoſe of the *Common Mallow*, but longer pointed, cut for the moſt part into ſome few Diviſions, but not deep, the Flowers are many, but ſmaller than thoſe of the *Vulgar Mallow*, and white, or tending to a bluſh color; after which come ſuch like round caſes and Seed, as in the *Mallow* firſt deſcribed.

WATER-MALLOW.

IV. *The*

IV. *The ſecond, or* Water Mallow, (*or* Marſh Mallow *red Flowered.*) *It has a Root which is long, white, and tough, ſomewhat like the former, but nothing ſo great or mucilaginous.* From which come forth many ſoft Leaves, ſomewhat like unto thoſe juſt before deſcribed, but not ſo ſoft or whitiſh, but of a pale green color on the upper ſide, and whiter underneath, longer alſo, and dented ſomething deeper about the edges, ſtanding upon long Foot Stalks; among which riſe up divers round green Stalks, 3 or 4 feet high, bearing the like Leaves on them, at ſeveral diſtances: from the Joints of the Leaves, towards the tops of the Stalks, and at the tops of them likewiſe come forth the Flowers, conſiſting of five Leaves, longer and narrower than in other *Mallows*; not broad but pointed at the Ends, of a deep reddiſh purple color, tending to an Orange, and ſometimes paler or more diluted, and in ſome Plants of a white color, with divers threads ſtanding in the middle, about a ſmall green head, which in time becomes the Seed Veſſel, or round Bladder, in ſhape like the Fruit or Seed Veſſel of round *Ariſtolochia*, or *Birth-wort*, of a ſad browniſh color, in which is contained (in five diviſions) ſmall blackiſh or browniſh Seed.

V. *The third, or* Evergreen Marſh Mallow. *Its Roots are diſperſed into ſeveral parts under Ground, and die not, but retain ſome of the Leaves upon them all the* Winter, *altho the Stalks die and periſh away.* This *Evergreen Althæa* has many fair large, whitiſh green Leaves, ſomewhat thick, full of Veins, and rough or hairy, but whitiſh or hoary underneath, cut in or divided uſually into five parts ſomewhat like to a *Bryonie* Leaf. The Stalks are hoary, white, and round, riſing to be two or three Feet high, having ſuch like large Leaves upon them, and ſmaller alſo among them, ſtanding all of them upon long Foot Stalks. The Flowers are like unto thoſe of the *Mallows*, and much about the ſame color, conſiſting of five broad pointed Leaves, having many red threads in the middle: after which come flat Leav'd Heads, ſuch as other *Mallows* have, wherein is contained ſuch like ſmall Seed.

VI. *The fourth, or* Yellow Marſh-Mallow. *Its Root is not great or long, but with divers Fibres at it, and periſhes every year.* This *Althæa* riſes up with one ſoft, woolly, green, round Stalk for the moſt part, ſeldom with more; divided oftentimes even from the bottom into divers Branches. At every Joint ſtand ſeveral large round Leaves, as ſoft as Velvet, pointed at the Ends, and dented about the Edges, hanging down at the end of long Stalks which ſtand forth right. The Flowers ſtand ſingly but one at a Joint with the Leaf, which is ſmall and yellow, compoſed of five ſmall pointed Leaves, ſtanding in a ſmall green Husk; which being paſt, there ſucceed ſoft green Pods or Seed Veſſels, turning black when they are ripe, compoſed of many ſmall Horns or Pods ſet together, like unto an Head, or Seed Veſſel of *Fraxinella*, in every one of which is contained ſmall, black, roundiſh Seed.

VII. *The fifth, or* Roſe Marſh-Mallow of America. *It has a Root which is thick, white, and fleſhy, which abides ſafe in the Earth all the* Winter, *tho the Stalks die away, and periſh every year.* This Plant ſhoots forth about *May*, ſeveral round greeniſh, ſoft, branched Stalks like to the firſt *Althæa* or *Marſh-Mallow*, beſet with ſeveral ſoft green Leaves, which are grey underneath, reſembling the firſt *Althæa* but longer pointed: at the tops of the Stalks and Branches ſtand ſeveral white Flowers, made of five large Leaves apiece, ſomewhat like a *Hollihock*, with a tuft of white threads, compaſſing a middle Umbone or Pointel, iſſuing out of a great Button or Husk, which is as it were Ribbed, and broad at the bottom, narrowing to the top, before the Flower blows, and without any ſmell.

VIII. *The Places.* The firſt grows in moſt of the Salt Marſhes from *Woolwich* down to the Sea, both on the *Kentiſh*, and *Eſſex* Shore, and may be found near *Woolwich*, *Erith*, *Greenhith*, *Graveſend*, *Tilbury*, *Lee*, *Colcheſter*, *Harwich*, and in moſt Marſhes about *London:* being Planted in *Gardens*, it proſpers well, and continues long. The ſecond *Camerarius* ſays, he found in *Italy*, and in abundance, about the River *Ameſis* hard by *Anguilara*, where men paſs over that River; and in the moiſt and Marſhy places of *Ferraria* between *Padua* in *Italy* and the River *Eridanus*. The third is not known in what place it is a Native. The fourth, its Seed is brought to us from *Italy* and *Spain*, where it grows in wet Grounds near Lakes, Rivers, and Ponds; we yearly Sow it in our *Gardens*, the which does ſeldom or never bring forth Seed to ripeneſs, for which cauſe ſake, we are forced to have freſh Seed from the afore named places. The fifth was brough (as *Cornutus* ſays) out of *Africa*, but now, this, as all the other four Kinds, are Nurſt up with us in *Gardens*.

IX. *The Times.* They all Flower in the *Summer* Months, from *May* to the end of *Auguſt*, and the Seed ripens in the mean Seaſon; ſaving that the yellow and red Flowered, do Flower in the latter end of *Summer*, but ſo, that if the Seaſon is not fair and warm, they never yield ripe Seed.

X. *The Qualities, Specification, Preparations, Virtues*, and *Uſes* of theſe, are the ſame with thoſe of the *Common Mallow* in the laſt Chapter, ſaving that the firſt *Althæa*, or *Common Marſh-Mallow* in this Chapter, is of more than double Virtue to any of them, or any other in this or in the following Chapters; and therefore ought to be choſen, and have the preference before them all, for all the purpoſes and uſes before expreſſed, and to which they are intended.

CHAP. CCCCLXVII.

Of MALLOW Vervain.

I. *THE Names.* It is called in *Greek*, Ἀλθαία: *ab* ἀλκὴ, *robur*, *præſidium*, *quaſi cæteris robuſtior & efficatior foret*, as *Lobel* ſays: in *Latine*, *Alcea*, and by ſome *Malva Salvatica:* in *Engliſh*, *Vervain Mallow.*

II. *The Kinds.* Authors make many Kinds of this Plant, as 1. *Alcea Vulgaris*, *Malva Verbenaca*, *Alcea major*, *Herba Ungarica Anguilaræ*, Our Common Vervain Mallow. 2. *Alcea Vulgaris Flore Corneo*, Common Vervain Malllow with bluſh Flowers. 3. *Alcea Vulgaris Flore albo*, Common Vervain Mallow with white Flowers. 4. *Alcea minor Matthioli*, *Tragi*, *& aliorum*, ſmall Vervain

Mallow. 5. *Alcea minor, Alcea Villosa Dalechampij & Lugdunensis*; small hairy rough Vervain Mallow. 6. *Alcea Vesicaria, Alcea Peregrina, Alcea Veneta*, Venice Vervain Mallow, Venice Mallow, and good Night at Noon. 7. *Alcea pentaphyllea, Alcea fruticosa Cannabina, Alcea fruticosa pentaphyllea, Alcea Cannabini folio, & pentaphylli folio*, Cinkfoil or Hemp like Vervain Mallow. 8. *Alcea Americana, Sabdariffa or Sabdarifa*, American Vervain Mallow, or Thorney Mallow.

The Descriptions.

III. *The first, or* Common Vervain Mallow. *It has a Root which is long, tough, and white, but somewhat more Woody within.* The lower Leaves of this Plant are soft and green, something like to the *Wild Common Mallow* Leaves, but Lesser, and more cut in on the Edges, besides the denting: but those which grow up higher upon the Stalk, (whose Bark may be broken into herds or threads like *Hemp*, and sometimes as high as the ordinary Wild Kind is) are more cut in and divided, somthing like unto *Vervain*: The Flowers are of a paler purple color than those of the *Common Mallow*; but in most, not so much divided into several Leaves, and laid so open, but abiding more close, or less spread, and oftentimes without those Stripes, being smooth and a little shining; the Seed and Seed Vessels, are like those of the *Common Mallow.*

IV. *The second, or* Common Vervain Mallow with blush Flowers. *Its Root is much like, and lives as the Root of the* Common Mallow *does.* This has long Stalks, and Flowers like unto the Common Wild Kind, and of the same deep color; so that you can scarcely know it from that ordinary Kind, (and is found growing Wild together with it,) but only by the Leaf, which is as round and as large as the former, but cut into many fine Divisions, even to the Stalk which upholds it; so that it seems to consist only of Rags, or pieces of Leaves, there is also another Plant of this Kind growing in all respects, like to this just now described, but differing only in the color of the Flowers, which are of the same blush or light *Carnation* color, not much differing, but with some Veins therein, of a deeper color.

V. *The third, or* Common Vervain Mallow with white Flowers. *The Roots of this are like the first; from which it differs something in its Leaves,* for that these are more finely cut in on the edges than that is: but in the Flower consist the chief difference, for that this is white, yet tending to a little blush: the Seeds are also like the first.

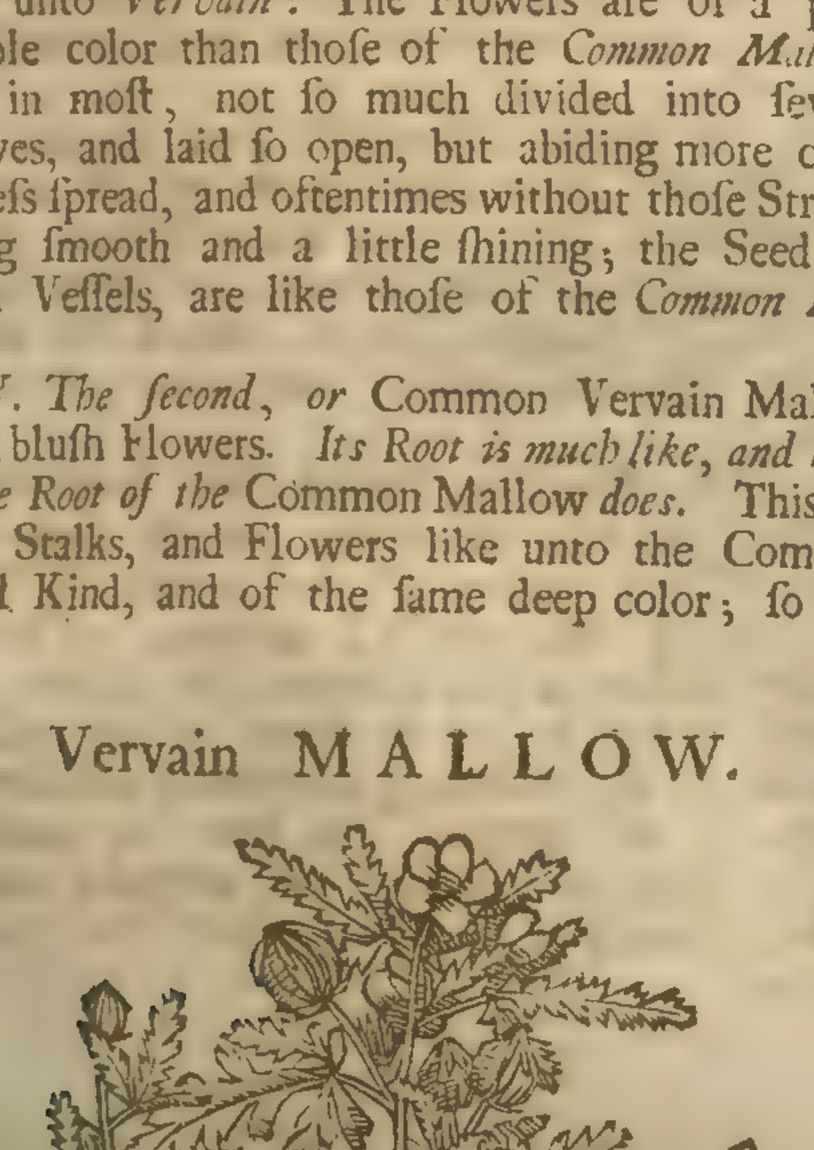
VI. *The fourth, or* Small Vervain Mallow. *This is a lesser Kind, never growing so great or high as the others, but is lower like as the* Small Mallow. The Leaves hereof, are more divided, and cut in on the Edges, and most usually into five parts, being deeply dented also. The Flowers are purple, like the *Common Vervain Mallow*, but lesser, in which consists the difference.

VII. *The fifth, or* Small, hairy, rough, Vervain Mallow. *Its Root is of a pale brown color, about the length of a Mans Hand, with small Fibres adjoyning to it.* It has many very low and hairy Stalks, not above a foot high, divided into lesser Branches, set with several small hoary hariy Leaves, cut into three or more divisions. At the top of the Stalks and Branches come forth several large purple Flowers, like unto the first Kind, but every one standing in a hairy Husk, so as it is almost prickly: after which comes black Seed, contained in those hairy Husks, but more closely inclosed in them, than in the others.

VIII. *The sixth, or* Venice Vervain Mallow. *It has a Root, which is long and small perishing every Year.* It has long and weak Stalks, most usually lying or leaning upon the Ground: having here and there upon them long Leaves and somewhat broad, cut in or gashed very deeply on both edges; so that it seems as if it were divers Leaves set together, every one standing upon a long foot Stalk; at the Joints of these Stalks where the Leaves are set, come forth several Flowers, standing upon long foot Stalks, which are some what larger than any of the former Flowers, consisting of five Leaves, small at the bottom, and wide at the brims, of a whitish color tending to a blush, and sometimes all white, with spots at the bottoms of the Leaves on the insides, of a very deep purple or murrey color, which adds a pleasing grace to the Flower, which has a long pointel or pestel in the middle as yellow as Gold. These Flowers are so quickly faded and gone, that you can scarcely see any of them blown open, unless it be betimes in the Morning, before the Sun shines warm upon them; for as soon as they feel the heat of the Sun they close up, and never open again; so that you shall very seldom see a Flower blown open in the day time, after nine a Clock in the Morning. After these Flowers are past, there come up in their places, thin, round, shining, or transparent Bladders, pointed at the top, and ribbed down all along; in which are contained small, round, blackish Seed.

IX. *The seventh, or* Cinkfoil *or* Hemp-like Vervain-Mallow. *It has Roots which are great and long, spreading in the Ground like unto the Roots of* Marsh-Mallow, *and springing up a fresh every year*

Vervain MALLOW.



year from the same Root. Its Stalks are very long, hard, or Woody, more than any of the other *Mallows*: at the lower part whereof, and up to the middle, stand several Leaves upon long Foot-Stalks, parted or divided into five Parts or Leaves, and dented about the edges. But upwards from the middle to the top, the Leaves have but three Divisions. Among these Leaves stand large wide open Flowers, of the color of the *Common-Mallow*, after which follows the Seed, which is smaller than in any other *Mallow*.

X. *The eighth, or* American Mallow, *or* Thorney Mallow. *It has a Root which is fibrous or stringy, and quickly perishes; for it will scarcely endure in our cold Country to yield Flowers, much less Seed, unless it happens in a kindly year, and be planted in a good warm place, and well tended.* It has green Leaves, which ly next the Ground, which are almost round, but pointed at the end, and dented very much about the edges. The other Leaves which grow upon the Stalk, are divided into three parts like unto *Trefoil*, and some of them into five Divisions, all of them dented about the edges. The Stalk is reddish, with some harmless prickles in several places upon it, and in a good Soil rises up to be 3 or 4 feet high, especially if the place is warm, and the year kindly, bearing plenty of Flowers upon the Stalks, one at the foot of every Leaf, the top it self ending in a long Spike, as it were of Buds and Leaves together. The Flowers are of a very pale yellow, tending to a white color, spotted in the bottom of each of the five Leaves with a deep purple spot, broad at the lower part, and ending in a point about the middle of the Leaf, which are quickly fading, and not abiding above one day, with a long Pointel in the middle, divided at the top. After the Flower is past, there comes forth a short prickly Pod, set within a small green Husk or Cup, which bore the Flower, in which is contained whitish, or rather browniish yellow Seed, flat and somewhat round like unto the Seed of the *Hollihock*.

XI. *The Places.* The first grows very commonly in *Kent*, and in many other Counties of *England*, being in some places more frequent than the first *Common Mallow* is: It grows in a Field as you go to *Hampsted* Church from the Town. The second grows also in many places of *England*. The third has been found at *Westerham* in *Kent*. The fourth has also been found in some places in *Kent*. The fifth has likewise been found Wild in several parts of *England*. The sixth grows in *Italy* and *Venice* in Gardens, as also with us, being more plentiful in these colder Climes, than in those hotter. The seventh grows, as *Clusius* says, in many places of *Germany*, with us only in *Gardens*. The eighth was first brought to us out of the *West-Indies*, but by reason it has an *Arabick* Name adjoyned to it, I am apt to believe it may also be a Native of *Africa* also, and has been found in some parts of *Arabia*.

XII. *The Times.* They all Flower from the beginning of *June*, to the beginning of *August*, in which times, and not long after, the Seed is said to ripen.

XIII. *The Qualities, Specification, Preparations, Virtues and Uses*, are much the same with those of the *Common Mallow*, in *Chap.* 465. aforegoing, to which we refer you.

CHAP. CCCCLXVIII.

Of MALLOW Tree *or* Shrub.

I. *THE Names.* I know no *Greek* Name that this Plant has, but you may call it Μαλάχη θαμνώδης ἢ δενδρεώδης, & Ἀλθαία θαμνώδης ἢ δενδρεώδης: in *Latine*, *Malva, vel Althæa arborea, vel fruticosa*: in *English*, *Tree or Shrub Mallow.*

II. *The Kinds.* There are several sorts of this Plant, as 1. *Malva arborea marina nostras, vel Anglica*; our *English* Sea Tree Mallow. 2. *Malva Rosea arborea Indica, Rosea Sinensis Ferrarij*; *Malva Japonica arborea*; *Indian* Tree Mallow. 3. *Althæa Frutex flore albo vel purpureo, Althæa arborea*, Shrub Mallow with white or purple Flowers.

The Descriptions.

III. *The first or* English Sea Tree Mallow. *It has a white great and Woody Root, having many long strings annexed to it.* Its Stalk is Ligneous or Woody, 5 or 6 Inches in Diameter, and of a brown hoary color, whereon grow whitish and hoary or woolly Leaves, which are soft in feeling,

English Sea Tree MALLOW.

and almost as large as the Leaves of the Tree *Hollihock*, being as smooth as Velvet. The Flowers are of a considerable largeness, and of a Diluted purple color, not much unlike to the form of the *Common Wild Mallow* Flower.

IV. *The second, or* Indian Tree Mallow. *It has a Root which is long, white, and Woody, diversly spread under Ground, with some small Fibres coming from those Ramifications.* In two or three years time, in a warm Country, this Plant rises up to be a

pretty great Shrub, or ſmall Tree, whoſe Stem or Trunk, being ſomewhat white and woody, and 5 or 6 Inches thick, covered with a ſmooth whitiſh Bark, whoſe lower Branches being Prun'd, the upper Ramifications ſpread into a round Compaſs, on which grow ſeveral broad rough Leaves ſomething like to Vine Leaves, cut into ſeveral parts, and dented about the edges, of a fair green color on the upper ſide, and greyiſh underneath, on thick; long and rough reddiſh foot Stalks, ſometimes but one, and oftentimes two or three at a Joynt, which abide all the *Winter* without falling away. At the tops of the Branches come forth the Flowers ſtanding in green Husks, divided at the tops into five parts: in ſome of theſe Plants, the Flowers will be ſingle, conſiſting of five, ſix, eight or ten large crumpled Leaves, all white, or a little bluſh about the edges: in others the Flowers will be very double, and as large as a *Province Roſe*, of the ſame colors; but after they have abiden awhile blown open, they change more Bluſh, and on the fading, deeper: theſe changes are often ſeen in one and the ſame day, yet many times not in two or three days continuance: in the middle of the Flowers, ſtands a green Head, encompaſſed with many yellow threads as the *Roſe* has: which Head growing to Maturity has ſeveral ridges and furrows on the out ſide, and full of Seed within, diſtinguiſhed by ſeveral Partitions; and are of a rediſh color, ſomewhat ſmall, long, round, crooked, and a little hairy on the back ſide. An Hundred ſixty and three Seeds have been taken out of one Seed Veſſel.

V. *The third, or* Shrub Mallow with white or purple Flowers. *This Kind of* Shrub Mallow *has ſomewhat large, long, and divided Leaves, of a whitiſh green color, ſoft alſo, and as it were woolly in handling, ſet diſperſedly on the whitiſh, hard and woolly Stalks.* The Flowers are large like unto a ſingle *Roſe*, or *Hollihock*, in the one, being white, with purple ſpots in the bottom: in the other of a deep red color, or elſe of a pale purple with a deeper bottom, and with Veins running in every Leaf, they are ſomewhat tender, and will not ſuffer to be uncoverred in the *Winter* time, or abide abroad in the *Garden*; but in a Pot or Tub to be preſerved in a Houſe or warm Cellar, if you would have them live.

VI. *The Places.* The firſt grows in *England*, in an Iſland called *Dinnie*, three miles from *Kingroad*, and five miles from *Briſtol*; as alſo about the Cottages, near *Hurſt* Caſtle, over againſt the *Iſle of Wight.* The ſecond was firſt brought from *Japan* in Seed unto *Rome*, or ſome parts of *Italy*, where it was Sown, from whence it was Communicated to ſeveral Countrys of *Europe*, and in particular to *England.* The third, grows both in *France* and *Spain*, and with us in *England* in *Gardens*, as the ſecond alſo does.

VII. *The Times.* They all Flower late in the year, or in the latter end of *Summer*, ſometimes in *Auguſt* and *September.*

VIII. *The Qualities, Specification, Preparations, Virtues*, and *Uſes*, are the ſame with thoſe of the *Common Mallow*, of which we have written in *Chap.* 465. aforegoing.

CHAP. CCCCLXIX.

of MANDRAKE.

I. *THE Names.* It is called in *Arabick*, *Jabora* and *Jabrohach:* in *Greek*, Μανδραγόρας: in *Latine*, *Mandragoras:* and in *Engliſh*, *Mandrake. Dioſcorides* ſays, that in his time ſome called it Ἀντίμαλον, and Κιρκαία, *Circæa*, (from *Circe* the great Enchantreſs:) *Pythagoras* called it Ἀνθρωπόμορφος *Anthropomorphos*, *a forma humana*, becauſe the Root has in ſome Meaſure the likeneſs of an Human Body, with a kind of Breſt and Belly (as it were) and two Legs.

II. *The Kinds.* It is twofold, *viz.* 1. Μανδραγόρας ἀρρὴν ἢ Μόριον, *Mandragoras mas, Candidus, Morion*, The *Male Mandrake.* 2. Μανδραγόρας, θήλεια ἢ γυνή, Τριδάκιας: *Mandragoras famina, Tridacias* (of the *Lettice* like Leaves) and *Mandragoras Femineus & nigre*: The *Female Mandrake.*

The Deſcriptions.

III. *The firſt, or* Male Mandrake. *It has a Root which is long and thick, Blackiſh on the out ſide and white within, conſiſting many times but of one long Root, and ſometimes divided below its Head or Belly,*

MANDRAKE Male.

into

into two main Roots running down right into the Ground, like to a Mans Thighs and Legs; and ſometimes (tho not often) three of thoſe Roots have been obſerved, which ſome by Tranſplanting have Occaſionally cut off for humor or admiration ſake, and to amuſe Fools, to which are annexed uſually ſeveral ſmall Fibres. From this Root ſprings up many Leaves together, which being full grown, are fair, large and green, lying round about the ſaid Root, and are larger and longer than the Leaves of any *Beet*, to which it is likened by ſome. From the middle among theſe Leaves riſe up many Flowers, each one upon a long, ſlender foot Stalk, ſtanding in a whitiſh green Husk, conſiſting of five pretty large round pointed Leaves, of a greeniſh white color, which turn into ſmall round Apples, being green at firſt, and afterwards when they are through ripe, as yellow as Gold, very ſmooth and ſhining, and as big as a reaſonable Pippin, of a ſtrong ſuffocative or heady Smell, in which are contained ſeveral whitiſh, round, flat Seeds.

IV. *Mandragoras mas alter*; another Male Mandrake. This was formerly found growing in the Lord *Wotton*'s Garden at *Canterbury*. Its Leaves were of a more greyiſh green color, and ſomewhat folded together, differing in theſe particulars, from the before deſcribed Plant, which grew there hard by it alſo: but as to its Fruit it is unknown for at that time the Plant had not born any.

V. *The ſecond, or* Female Mandrake. *It has a Root like the former, blackiſh without, and white with in, near unto the ſame form with the* Male, *but ſometimes with more, and ſometimes with fewer Parts, or Legs.* This has likewiſe many Leaves,

MANDRAKE Female.

lying on the Ground, but ſmaller, narrower, more crumpled, and of a darker green color, reſembling thoſe of *Lettice*, as *Dioſcorides* compares them, being more ſhining, and of a ſtronger ſmell. The Flowers alſo riſe up from among the Leaves, each upon a ſlender foot Stalk as in the former, but of a blewiſh purple color. The Fruit which follows, is much ſmaller than that of the Male, but round like it, (and not Pear faſhion, as ſome have thought and ſaid, and which *Claſius*, who ſaw ſeveral of them growing, alſo denies) of a paler yellow color when ripe, and of a more pleaſing, or rather of a leſs heady ſmell, than thoſe of the Male, in which are contained ſuch like Seed, but ſmaller and blacker.

VI. *The Places.* They grow in Woods and ſhady places in many places beyond the *Alps*, and in many places in *Italy*, eſpecially on Mount *Garganus* in *Apulia*, in *Græcia*, *Candia*, and other parts of the *Mediteranean Sea*, and in *Spain*, and other hot Regions, but not naturally on this ſide the *Alps*. *Cluſius* ſays he found the Female in many wet Grounds in *Spain*, as alſo in the Borders of thoſe Meadows which ly near unto Rivers and Water Courſes. But with us they are only Nurſed up in *Gardens*, for pleaſure, as well as for uſe: And the Female, as it is the more Tender, ſo it is the more Rare, and only kept by ſuch as are very Curious.

VII. *The Times.* The Male Kind Flowers in *March*, and the Fruit is ripe in *July*: *Gerard* ſays it Flowers in the end of *April*, and the Fruit is ripe in *Auguſt*. *Cluſius* ſays, he found the Female in *Spain*, in Flower in *February*, and that in ſeveral places of *Spain*, he had ripe Fruit in the ſame Month. But with us, where it is beſt preſerved and taken care of, it Flowers not untill *Auguſt* or *September*; but without extraordinary Care, (as by its Situation, help of Glaſſes, Coverings and the like) the Fruit ſeldom or never ripens or comes to perfection.

VIII. *The Qualities.* The Herb, Flower and Fruit, are ſaid to be cold in the third Degree: but the Root in the fourth Degree, and moiſt in the ſecond. It is Stupefactive or Soporiferous; has a Cathartick or Emetick quality withall; and if taken in too great a quantity, Deleterious.

IX. *The Specification.* It cools Inflamations, helps againſt *Anthonies* Fire, ſoftens the hardneſs of Tumors, and induces Sleep.

X. *The Preparations.* You may make therefrom, 1. *A Liquid Juice of the Root.* 2. *An Inſpiſſate Juice of the ſame* 3. *A Decoction in Wine.* 4. *An Ophthalmick.* 5. *A Juice from the Apples* 6. *The Seed.* 7. *A Suppoſitary.* 8. *A Peſſary.* 9. *A Cataplaſm of the Leaves.* 10. *A Cataplaſam of the Root.* 11. *An Oil.* 12. *A Diſtilled Water.*

The Virtues.

XI. *The liquid Juice of the Root.* It is good in all cooling Ointments, and is profitably put into the Ointment *Populeon*; and applied outwardly in an Eryſipelas, it helps on the Cure. And mixed with Honey or Oil, and applyed, it cures the Stinging of Scorpions, Hornets, Waſps, Bees, *&c.*

XII. *The*

XII. *The Inſpiſſate Juice.* Given to a Scruple in ſweet Wine, it purges Flegm and Melancholy by Vomit, like unto *Heliebor*; but taken in a greater quantity, it Kills: but for ordinary uſe 10 Grains is enough to be taken at a time.

XIII. *The Decoction of the Root or Bark in Wine.* It may be given from half an Ounce to an Ounce or two, according to Age and Strength; It is Soporiferous, or cauſing Sleep, and eaſes extream Pains in any part: and it is ſometimes given to ſuch, where an Amputation is to be performed, or have a Limb or Member to be cut off, to take away in great meaſure the Sence of Pain.

XIV. *The Ophthalmick.* It is made either of the *Liquid Juice*, or of the *Inſpiſſate Juice*, being diſſolved in *Fennel* or *White Roſe Water*, and ſweetned with a little *Honey.* Being often put into the Eyes, it cures their Inflamations and eaſes the Pain.

XV. *The Juice of the Apples.* It is not ſo cold as that of the Root, and may be uſed in all the ſame caſes: mixt with *Fennel*, *Eyebright*, or other proper Water, it makes a good Collyrium for Sore, Inflamed, and pained Eyes. Bathed upon the Head, Temples, Fore-head and Noſtrils, it induces Sleep and Reſt.

XVI. *The Seed.* Taken to half a Dram in any proper Vehicle, it is ſaid to cleanſe and cool the Womb; and to give eaſe to ſuch as have any Cancer, or other Humour in thoſe parts; the Doſe being often repeated.

XVII. *The Suppoſitary.* It may be made of the *Liquid* or *Inſpiſſate Juice of the Root*; or of the Root it ſelf in ſubſtance, which being put up the Fundament, will cauſe Sleep and Reſt.

XVIII. *The Peſſary.* This may likewiſe be made of the *Juices*, or of the Root it ſelf in Subſtance, being put up the Womb, at the Seaſon, it provokes the Courſes; it alſo brings away the dead Child, and the Afterbirth.

XIX. *The Cataplaſm of the Leaves.* Being beaten up into form with Hogs Lard, or Barley Flower, and applyed, it will help all hot Tumours and Inflamations; diſcuſs all Hardneſs, Knots, and Kernels in the Fleſh; otherwiſe if Apoſtemated, it will maturate and cauſe ſuppuration, and is good to eaſe the Pain of hot and Inflamed Ulcers.

XX. *The Cataplaſm of the Roots.* Applied to the Head it eaſes the Megrim and other vehement pains thereof; It cools the heat of *Anthonies* Fire, being beaten up into form with the beſt *Dutch* white Wine Vinegar, and ſo applied it eaſes any hot pain in any part of the Body, and performs all that the *Cataplaſm* of the Leaves can do.

XXI. *Oleum Mandragoræ*, Oil of Mandrakes. The Compoſition you have in our *Pharmacopœia Londinenſis*, *lib.* V. *chap.* II. *ſect.* 52. which becauſe every one has not that Book in their Hands, we will incert here. It is thus made, *Take Oil Olive* 2 *Pounds*; *Juice of Mandrake Apples, or Juice of the Leaves*, 4 *Ounces*; *Juice of white Henbane* 2 *Ounces*; *Juice of black Poppy Heads* 3 *Ounces*; *Juice of Violets, and young Hemlock, of each* 1 *Ounce*; *Opium, Storax Calamita, of each half an Ounce*; *mix all together, except the Opium and Storax*; *and Inſolate for ten days*; *after which boil to the Conſumption of the Juices and ſtrain out*; *then put in the Opium in fine Pouder*; *and after that the Storax diſſolved in half an Ounce of fine* Strasburg *Turpentine, and mix them according to Art.* It is very Cold, and may be anointed upon the Temples and Noſes of ſuch as have a Frenſy; if the Patient Sleep too long, dip a Spunge in Vinegar and hold it to the Noſe. It eaſes vehement pains of the Head, as alſo the Toothach, anointed on the Forehead, Temples, Noſtrils Cheeks and Jaws; and for Watchfulneſs and Reſtleſneſs, upon the Pulſes and Soales of the Feet. It is good alſo againſt the Gout, running Gout, and other Inveterate Pains.

XXII. *The diſtilled Water.* If a little Honey be diſſolved in it, it is an excellent thing for Hot, Inflamed and Sore Eyes, and bathed upon Womens Breaſts, which are hard, or pained, or are Cancerated, it ſoftens the hardneſs, and eaſes the Pain.

XXIII. *The Antidote.* If any one is Poyſoned herewith, if but juſt done, the only remedy is a Vomit made of *Vinum Benedictum*, *Tartar Emetick*, &c. but if it has been of continuance, the Antidotes are *Caſtoreum*, *Contrayerva*, *Muſtard*, *Origanum*, *Rue*, *Scordium*, *Virginia Snake Root*, *and Wine*: and Preparations made from them.

CHAP. CCCCLXX.

Of MARIGOLD Garden.

I. *THE Names.* It is called in *Greek*, (if it has any ancient *Greek* Name) Χρυσάνθεμον ἥμερον; in *Latine*, *Chryſanthemum hortenſe*, *Caltha hortenſis*, *& Calendula hortenſis*; in *Engliſh*, *Garden Marigold.*

II. *The Kinds of Marigolds.* There are a great Variety of this Plant, which to deſcribe all would be very troubleſome; thoſe which we ſhall take notice of in this Work are the following, *viz.* 1. *Caltha, vel Calendula hortenſis*, the *Garden Marigold*: of which in this Chapter. 2. *Flos Africanus*, The *African* or *French Marigold*, of which in Chap. 471. 3. *Chryſanthemum ſegetum*, the *Corn Marigold*, of which in Chap. 472. 4. *Chryſanthemum vel Caltha Paluſtris*, the *Marſh-Marigold*, of which in Chap. 473. following.

III. *The Kinds of the Garden Marigold.* There are alſo ſeveral Kinds of this Plant, as 1. *Calendula ſimplex vel ſimplici Flore*, the *Single Marigold*: where note, that the Name *Calendula* comes from the *Calends* or firſt days of the Months, wherein they were thought chiefly to Flower. 2. *Chryſanthemum* (from its golden color) *Polyanthinum*, *Caltha vel Calendula major Polyanthos*, the *greater double*

double Marigold. 2. *Caltha vel Calendula Polyanthina vulgaris*, the common double Marigold. 4. *Calendula Polyanthina minor*, the lesser double Marigold. 5. *Calendula multiflora Orbiculata*, the double Globe Flowering Marigold. 6. *Calendula Prolifera*, the many headed Marigold, called by some *Jack an Apes on Horse-back*, and this is also twofold.

The Descriptions.

IV. *The first, or* Common single Marigold. *It has a white Root which spreads it self under Ground, sometimes abides after Seeding and sometimes perishes, rising again of its own Seed; there is little or no difference between this and the following Kind, but in the Flowers*, this consisting only of one single row of gold colored or yellow Leaves, and some of a paler, and some of a deeper yellow, standing about a great brownish yellow Thrum in the Middle; the Seed also, is alike, but for the most part, greater than that of the double Kind.

MARIGOLD.

V. *The second, or* Greater double Flowred Marigold. *The Root of this is also white, and spreads in the Ground, abiding in some places after the Seeding time, tho' for the most part it perishes, and rises again of its own Seed.* It has pretty large, round, green Stalks, branching out from the Ground, into many parts, on which are set long, flat, green Leaves, broader and rounder at the point than any where else, and smaller also at the setting to of the Stalks, where it encompasses it about. The Flowers are sometimes very thick and double (breaking out of a Scaly, clammy, green head) composed of many rowes of Leaves, set so close together one within another, that no middle Thrum can be seen: and sometimes less double, having a small brown spot or a Thrum in the middle, and sometimes but of two or three rows of Leaves, with a large brown Thrum in the middle, every one of which is somewhat broader at the point, and nicked into two or three corners, of an excellent fair, gold yellow colour in some, and paler in others, and of a pretty strong and resinous smell. After the Flowers are past, Heads of crooked Seed follow turning inwards, of which the outward most are the biggest, and the innermost least.

VI. *The third, or* Common double Marigold. *The Root of this thick is and hard with some fibres or Threads adjoyning thereto.* From this Root spring up many fat thick crumpled Leaves, set upon a gross and spungy Stalk: upon which do grow fair, double, yellow Flowers, having for the most part in the middle, a bunch of Threads, thick set together; which being past, Heads of crooked Seed follow, such like as are described in the former.

VII. *The fourth, or* Lesser double Marigold. *The Root of this is like the former*; It is a smaller, and finer double Leaved Plant, and grows upright, having for the most part one Stem, or spungy Stalk, repleat with thick and fat Leaves confusedly. The Flowers grow at the tops of the small Branches, very double, but lesser than any of the former, consisting of a more fine Jaggedness, and of a fair, yellow, gold color.

VIII. *The fifth, or* Double Globe Flowering Marigold. *It has a Root much like the others, from which rise up many large broad Leaves (immediately out of the Ground)* and from among which rises up also a Stalk about a foot and a half high, dividing it self towards the top into other smaller Branches, repleat and set with the like Leaves, but confusedly, or without any order. The Flowers grow at the Tops of the Stalks very Double; the small Leaves of which are set in a very regular order, by certain Ranks or Rows, as several lines are in a Globe, traversing the whole Compass of the same; whereupon it took the Name *Orbiculata*. There is another of this Kind, which differs nothing in its Description from it, excepting in the color of the Flowers, these being Flowers of a very light yellow orStraw color, in which consists the only difference.

IX. *The sixth, or* Many Headed Marigold. *Its Roots, Stalks, and Leaves, are like to the* Common *sort of* Marigold, *differing only in the shape of the Flowers*; for this Plant does bring forth at the top of the Stalk, one Flower like the other *Marigolds*, from the which come forth several other small Flowers, yellow likewise, and of the same fashion; This is thought by some Authors to be *per accidens*, or *lusus Naturæ*, which sometimes comes to pass in several other Flowers also; as some Children are born with two Thumbs on one Hand or with two great Toes, or with six or seven Fingers, and sometimes two Arms or Hands on one side, *&c.* And such is the Seed of this *Marigold*, which yet, if it be sown, it brings forth not one Flower in a thousand, like the Plant from whence it was taken. There is another prolifick, or many *Headed Marigold*, coming from the Seed of the *Double Marigold*, and is doubtless a Degenerate Kind: whereas the former many Headed, always springs from the Seed of the single Kind, and produces the diminutive Flowers upon very much the longer foot Stalks.

X. *The*

X. *The Places.* We know of no Native place whence these Plants should come, with us they never grow Wild, but always in *Gardens*, where they prosper admirably; but the first single Kind is said to grow Wild in *Spain.*

XI. *The Times.* The Flower from *April* and *May*, thro' all the *Summer* Months, even till *Winter*; and sometimes even in *Winter* time if the Season be warm.

XII. *The Qualities.* The Flowers are hot in the first Degree, and temperate in respect of dryness or moisture. The Herb is hot almost in the second Degree, and moist in the first. They are Emollient, Cardiack, and Alexipharmick.

XIII. *The Specification.* They resist Poyson, as also Malign and Pestilential Feavers, provoke the Terms and bring away both Birth, and After-birth.

XIV. *The Preparations.* You may have therefrom, 1. *A Juice of the Leaves.* 2. *A Juice of the Flowers.* 3. *A Conserve of the Flowers.* 4. *A distilled Water of the Leaves and Flowers.*

The Virtues.

XV. *The Juice of the Leaves.* Given from one Ounce to three it loosens the Belly, and Purges by Stool: and used as a Gargarism in the Tooth-ach, it eases the Pain.

XVI. *The Juice of the Flowers.* It is Cordial, comforts and strengthens the Heart very much, resists Poyson, and is prevalent against Pestilential Fevers. Dose from half an Ounce to an Ounce in a Glass of Generous Wine.

XVII. *The Conserve of the Flowers.* Taken in the Morning Fasting, it Cures the Palpitation or Trembling of the Heart; and is given as a Prophylactick or Prefervative in time of Plague or Pestilence.

XVIII. *The Distilled Water of Leaves and Flowers.* Dropt into Red and Rheumatick Eyes, it cools the Inflamation, stops the Rheum, and eases the Pain.

CHAP. CCCCLXXI.

Of MARIGOLD African.

I. *THE Names.* It has no *Arabick* nor *Greek* Name that I know of; in *Latine*, it is called *Flos Indicus*, *Caryophylus Indicus*, & *Flos Africanus*, *Caltha Africana*, *Flos Tunitensis*, *Pedna Pœnorum:* in *English*, *African Marigold*, and by some *French Marigold*, (tho it is no more *French* than *English.*) Where note, that some, as *Lacuna* think it to be *Othona Plinij*: others *Lycopersicum Galeni*, but with what truth is uncertain.

II. *The Kinds.* There are several Kinds of this Plant, as, 1. *Flos Africanus major simplex, vel simplici Flore*, the Great single African Marigold. 2. *Flos Africanus minor simplex, vel simplici Flore*, the Lesser single African Marigold. 3. *Flos Africanus major multiplex, Flos Africanus marinus multiplex vel Polyanthos*, the Great or Greater double African Marigold. 4. *Flos Africanus minor multiplex*, the Lesser double African Marigold. 5. *Flos Africanus Flore Fistuloso simplex & multiplex*, the Hollow or Fistulous African Marigold, both single and double, as *Fabius Columna* calls it.

The Descriptions.

III. *The first, or* Greater single African Marigold. *It has a Root spreading much in the Ground and full of small strings: and it is in all things so like to the double greater Kind, that it is hard to distinguish it from it, but by the Flowers, only the Stalk of this is browner than that of the double; and it has been observed that this single Kind does every year rise from the Seed of the double Flower:* So that when they are in Flower, you may see the difference (or not much before, *viz.* when they are in Bud:) this single Flower ever appearing with a Head of Thrums in the middle, and the Leaves, which are the border standing about them, shewing hollow or Fistulose, which afterwards lay themselves flat and open (the double Flower appearing with all its Leaves folded close together, without any Thrums at all:) and are of a deeper or paler color, as in the double.

MARIGOLD African single small.

IV. *The*

IV. *The ſecond*, *or* Leſſer ſingle African Marigold. *This very much reſembles the Leſſer double in every proportion*, *in the Roots*, *Stalks*, *Leaves*, *and Seeds:* Only the Flowers of this are ſingle, having five or ſix broad Leaves, of a deep yellow crimſon color, with deep yellow Thrums in the middle, and of a ſtrong ſtinking ſmell, more than thoſe of the leſſer double.

V. *The third*, Great, or Greater double African Marigold. *It has a Root which is ſmall and full of ſtrings*, *ſpreading much under Ground.* It is

MARIGOLD African double great.

a Noble Double Flower, which is the Grace and Glory of the *Garden* in the time of its Flowering and Beauty: The Plant riſes up with a ſtraight and hard, round, green Stalk, having ſome creſts or edges all along the Stalk, beſet with long winged Leaves; every one whereof is like to an *Aſh* Leaf, being compoſed of many long and narrow Leaves, ſnipt or dented about the edges, ſtanding by couples one againſt another, with an odd one at the end, of a dark or full green color. The Stalk riſes to be three or four feet high, and divides it ſelf from its middle upwards, into many Branches, ſet with ſuch like Leaves to the Tops of them, every one bearing one double Flower, of a gold, yellow color above, and paler underneath: yet ſome are of a pale yellow, and ſome between both, and all theſe riſing from the Seed of one and the ſame Plant. The Flower before it is blown open, has all its Leaves hollow: but when it is full blown, it ſpreads it ſelf larger than any *Damask* or *Province Roſe*, or equal to it at the leaſt, if it grows in good Soil, and riſes out of a long green Husk ſtriped or furrowed; in which after the Flower is paſt (which ſtands in its full Beauty a Month, and ſometimes more; and being gathered, may be preſerved in its full Beauty for two Months after, if ſet in Water) the Seed is contained; ſet thick and cloſe together upright, of a black color, and ſomething flat and long. The Flower of this, as well as of the ſingle, is of the very ſmell of New Wax, or of an Honey Comb, and not of that Poyſonous Scent of the ſmaller Kinds.

VI. *The fourth*, *or* Leſſer double African Marigold. *The Roots are like the former but leſſer.* Its Leaves alſo are in all things like unto the former, but ſmaller, which are ſet upon rownd brown Stalks, not ſo ſtiff or upright, but bowing and bending ſeveral ways, and ſometimes leaning, or lying upon the Ground. The Stalks are branched

MARIGOLD African double leſſer.

out variouſly, on which grow fair double Flowers, like the former, and in the like green Husks, but leſſer; and in ſome, the outwardmoſt Leaves will be larger than any of the reſt, and of a deeper orange color, almoſt crimſon, the innermoſt being of a deep gold yellow color, tending to crimſon. The whole Flower is ſmaller, and of a ſtranger and more unpleaſant ſmell: but for its doubleneſs, beautiful color, and pleaſantneſs to the Eye, it ſurpaſſes almoſt all other Flowers which grow. The Seeds are like to the former.

VII. *The fifth*, *or* Single and Double African Marigold, with hollow or pipe Leaves. *As the former greateſt ſorts of* Africans *ſingle and double*, *have riſen from the Seed of one and the ſame Pod or Husk of double Flowers*, *ſo is it in this Pipe Kind*, *the ſingle and double Kinds riſing both of them from the Seeds of one and the ſame Plant*; nor does it differ in any thing from them, but that theſe are lower, and have ſmaller green Leaves; and that the Flower being ſmaller, has every Leaf abiding hollow, like unto a hollow Pipe, broad open at the Mouth, and is of as deep a yellow color for the moſt part, as the deepeſt of the former; and yet ſometimes it is alſo pale.

VIII. *The Places.* They grow naturally in *Africa*, about *Tunis*, and where old *Carthage* ſtood; from whence long ago, they were brought into *Europe*; where with us, they are only kept in *Gardens*, and flouriſh wonderous well, being Sown for the moſt part every year, unleſs in ſome mild *Winters*. But that Kind with hollow or Pipe-Leaves, comes not from *Africa*, but from *Mexico* in *America*, and is ſo denominated according to *Fabius Columna*.

IX. *The Times.* They are to be Sown in the beginning of *April*, if the Seaſon falls out to be warm, otherwiſe they muſt be Sown in a Bed of Dung, or in very good Earth, and in a warm place. They bring forth their pleaſant Flowers very late, not till towards the end of *Summer*, eſpecially the greater Kinds; but the leſſer, if they abide all the *Winter*, do Flower more early; for this reaſon thoſe which are of the later flowering, ought to be Sown the more early, that they may Flower and Seed ſo early, as not to be overtaken with the Froſt, before the Seed is ripe.

X. *As to the Qualities*, They are unknown farther than that have been found by experience to be of a *deleterious* nature: and therefore no other Obſervations have been made of them as to their Virtues and Uſes in Phyſical Practice: their chief deſign in this Book, being to bring them in Courſe, for the Ornament of our *Engliſh Gardens*, where they already appear ſo Beautiful and deſirable to the Eye.

CHAP. CCCCLXXII.

Of MARIGOLD Corn.

I. THE *Names.* It is called in *Greek*, Χρυσάνθεμον: in *Latine*, *Chryſanthemum*; *ab aureo Floris colore ſic Dictum*: and in *Engliſh*, *Corn Marigold.*

II. *The Kinds.* There are many ſorts of this Plant, but not above two or three varieties grow in *England*; one in our *Cornfields*, the other in our *Gardens*; yet becauſe ſeveral others of them are found in ſome of our Plantations in the *Weſt-Indies*, we ſhall deſcribe the following, *viz.* 1. *Chryſanthemum ſegetum noſtras, Bellis lutea Bauhini*, the *Corn Marigold* of our Country. 2. *Chryſanthemum Creticum*, the *Candy Corn Marigold.* 3. *Chryſanthemum ſegetum Baticum*, the *Spaniſh Corn Marigold.* 4. *Chryſanthemum latifolium Americanum, vel Braſilianum*, Broad Leaved *American* or *Braſilian Corn Marigold.* Authors make five or ſix Kinds more of this Plant, but being wholy ſtrangers with us, we ſhall ſay no more of them in this place.

The Deſcriptions.

III. *The firſt, or* Corn Marigold of our Country. *Its Root periſhes every year, and the Plant riſes again of its own Sowing.* It riſes up with ſeveral tender, pale, green, Herby Stalks, breaking forth into ſome few Branches, with ſeveral long, blewiſh, green Leaves, ſet without order on them, being narrow at the Bottom, and broader

CORN-MARIGOLD.

at the end, cut in a little on both edges: the Flowers grow ſingly at the top of every Branch, being large, growing out of green Scaly heads, and of a ſhining yellow color, both the Thrums, and the borders of the Leaves about it: each Leaf being broad or flat pointed, and cut into three or four parts, ſmelling a little ſweet.

IV. *The ſecond, or* Candia Corn Marigold. *It has a Root which periſhes every year, and riſes again (as the other does) of its own Sowing or Seed.* It is a fair Flower, and has for the moſt part one upright Stalk, two feet high, on which are ſet many winged Leaves, at every Joint one; divided and cut into ſeveral parts; and they again parted into ſeveral pieces or Leaves. The Flowers grow at the tops of the Stalks, riſing out of a ſcaly Head, compoſed of ten or twelve large Leaves, of a fair, but pale yellow color; and more pale, almoſt white at the bottom of the Leaves, round about the yellow Thrum in the middle, being

MARIGOLD Corn of Creet.

OR,

Mathiolus *his Corn MARIGOLD.*

being both larger and ſweeter than any of the the other *Corn Marigolds.* After which follows the Seed which is whitiſh and Chaffie.

V. *The third, or* Spaniſh Corn Marigold. *The Stalks hereof are harder and browner than thoſe of the firſt, and ſtand more upright*: the Leaves are greener and not ſo much divided or cut in on the edges as they are: the Flowers are not of ſo ſhining a yellow color, but of ſomewhat a deeper yellow: and the Seed is ſmall and whitiſh, and is bitter as the firſt is; tho' the Herb is ſweet and eaten as a Sallet Herb: and in theſe things conſiſt the difference.

VI. *The fourth, or* Broad Leav'd American or Braſilian Corn Marigold. *Its Root periſhes every year in like manner as the others do.* It is a *Marigold* which is ſweet, and ſprings up with a Stalk about half a yard high, ſomething rough and creſted, having ſeveral Leaves ſet thereon, of four or five Inches long, and two broad, encompaſſing it at the bottom, and growing ſmaller to the end, ſomething dented about the edges, with ſharp dents: from the Boſom of whom, come forth ſomewhat long foot Stalks, ſuſtaining each of them a fair yellow Flower, ſet in a green Husk or Cup; having ſeven or eight Leaves for a Border, dented at the ends, and encompaſſing a middle Thrum, conſiſting of long Threads, in which afterwards lies the Seed, very like unto the *Spaniſh* Kind.

VII. *The Places.* The firſt of theſe grows commonly in *Corn-fields*, and about their Borders, or where *Corn* has been formerly Sown, both in *England* and beyond the Sea: The others grow alſo in Tilled and *Corn* Lands in Foreign Countries; but with us are Nurſt up only in *Gardens.*

VIII. *The Times.* The firſt Flowers in *Auguſt*; the ſecond in *June*; the others in the end of *Summer*, and ſometimes ſo late, that the early Froſts taking it, never ſuffers its Seed to come to its ripeneſs.

IX. *The Qualities.* They are ſaid to be temperate in reſpect to heat, or coldneſs; dryneſs or moiſture.

X. *The Preparations.* You may have therefrom, 1. *A Liquid Juice.* 2. *A Balſam or Cerote.* 3. *A Sallet.*

The Virtues.

XI. *The Liquid Juice*, being drank by ſuch as have the yellow Jaundice, after coming out of a Bath, or from Bathing, it quickly reſtores them to their natural color.

XII. *The Balſam or Cerote.* It is made of the Flowers boiled in Oil to criſpneſs, then ſtrained, and made up with Wax, Frankincenſe, and Roſin: or, beaten up with Oil and Wax; applyed it cures that Tumor called *Steatoma*, which contains in it a Subſtance like Fat or Tallow, and diſſipates other cold and hard Swellings.

XIII. *The Sallet.* The Stalks and Leaves of the *Corn Marigold* are eaten (as *Dioſcorides* ſays) in the manner of a Sallet, as other Sallet Herbs are: But I ſuppoſe this is meant of the *Candy* Kind; tho' I know not, but that ours when very young may be ſo eaten alſo.

CHAP. CCCCLXXIII.

Of MARIGOLD Marſh.

I. *THE Names.* I know no *Greek* Name that it has; but it is called in *Latine*, *Caltha Paluſtris* by *Geſner*; and *Caltha Virgillij* by *Tragus*: ſome call it *Ferraria*, from the likeneſs of its Leaf to a *Horſe Shooe*: *Cordus* calls it *Chelidonia Paluſtris*: and *Tabernæmontanus*, *Populago*, tho' its Leaf is not like either to the Leaf of the *Poplar Tree*, nor of *Colts-Foot*: in *Engliſh* we call it *Marſh Marigold.*

II. *The Kinds.* Some Authors make three ſeveral ſorts hereof, *viz.* 1. *Caltha paluſtris Vulgaris ſimplex major*, the Greater ſingle *Marſh Marigold.* 2. *Caltha paluſtris ſimplex minor*, the Leſſer ſingle *Marſh Marigold.* 3. *Caltha paluſtris multipelx, vel flore pleno*, the Double *Marſh Marigold.*

The Deſcriptions.

III. *The firſt, or* Greater ſingle Marſh Marigold. *It has a Root which is compoſed of ſeveral long ſtrings, which run down deep into the Mire.* From this Root riſe up ſeveral great, broad, round, deep, green, ſhining Leaves, a little dented or waved about the Edges; each one, on a long,

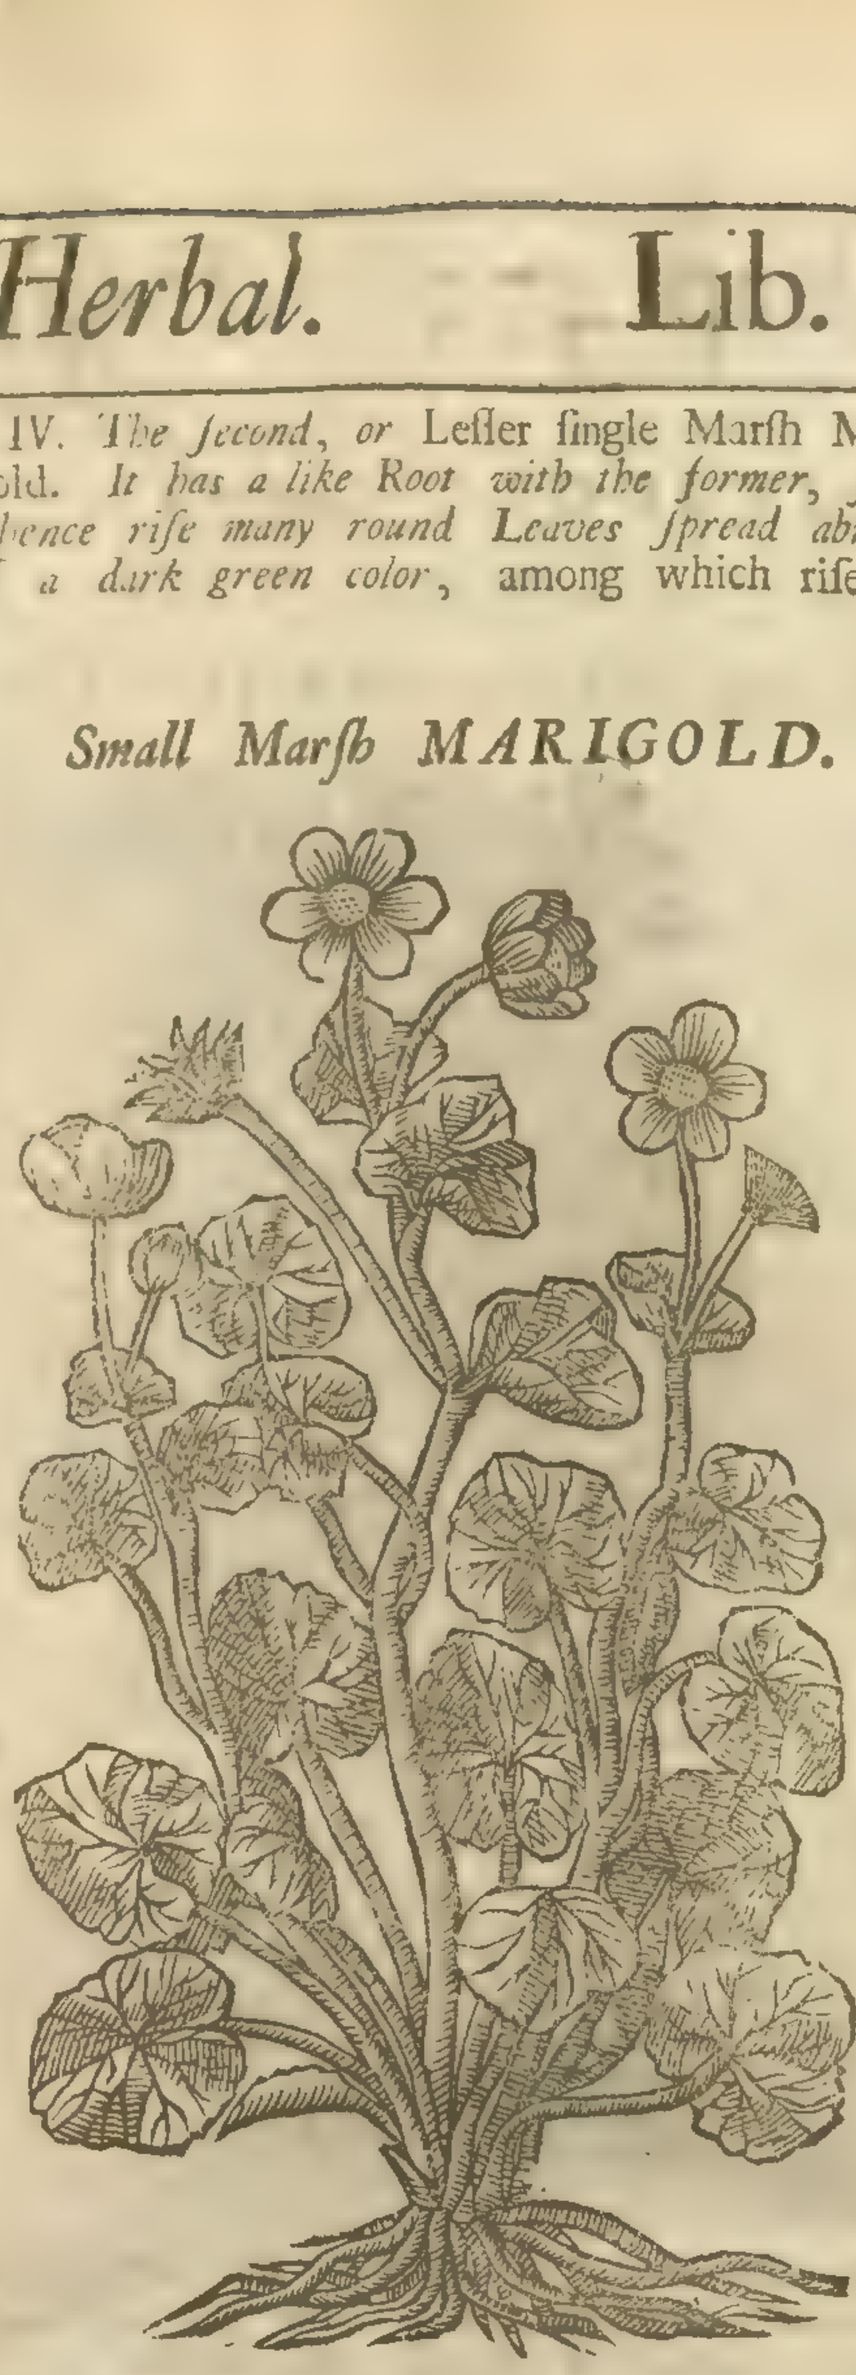
Great Marſh Marigold, Common, Single.

Single Great Marſh Marigold.

thick, round, fleſhy Stalk by it ſelf; among which riſe up, fat, thick Stalks, almoſt a yard high, with ſome Leaves thereon: and at the tops ſeveral fair, great, gold-yellow Flowers, like unto *Crow-foot* Flowers, but much larger, and ſhining. We have here exhibited to you two Figures of this ſame Plant for information ſake.

IV. *The ſecond, or* Leſſer ſingle Marſh Marigold. *It has a like Root with the former, from whence riſe many round Leaves ſpread abroad, of a dark green color,* among which riſe up

Small Marſh MARIGOLD.



divers Branches, charged with the like Leaves. The Flowers grow at the tops of the Branches, of a moſt ſhining yellow color. This *Parkinſon* will have to be one and the ſame with the former, being only leſſer or greater in one place than in another.

V. *The third, or* Double Marſh Marigold. *It has Roots which are compoſed of many thick, long and round, whitiſh Strings, which run down deep into the Ground, and there are faſtned very ſtrongly.* From this Root come forth many broad and round green Leaves, a little indented or waved about the edges, like unto the ſingle Kind, but not altogether ſo large, eſpecially in a *Garden* where it ſtands not a little Moiſt. The Stalks are weak, round, hollow and green, divided into three or four Branches at the top, with Leaves at the ſeveral Joints; on which ſtand very double Flowers, of a gold yellow color, the five outward Leaves being larger than any of the reſt which are encompaſſed by them which fall away after they have ſtood blown a conſiderable time (for it continues in Flower a month or more, eſpecially if it grows in a ſhady place) without bearing any Seed.

VI. *The Places.* The two firſt grow only in Waters and watery Ditches, and by their Bankſides, as alſo in Marſhy and Watery Medows, The third grows naturally in *Marſhes* and Moiſt Grounds, (in ſome places more double than in others) but with us it has been for a Long time Nurſed up in our *Gardens.*

VII. *The*

VII. *The Times.* The two first Flower in the *Spring*, when the *Crow-feet* do, and often times in *Summer*, The Leaves keeping their greenness all the *Winter*. The double, Flowers in *April*, or *May*, as the Year proves earlier or later, and its Leaves do in a manner perish in *Winter*, and spring afresh in the end of *February*, or thereabouts.

VIII. *The Qualities.* The Root hereof is sharp and Hot in the fourth Degree, comeing near the Qalities and Properties of *Crow-foot*: but for any of its Medical Virtues, no thing yet has been observed by Experience: but I am apt to believe, from its hot, sharp and burning Nature, it may perform all the same things which the *Crow-foot* will do.

CHAP. CCCCLXXIV.

Of MARJEROM.

I. *THE Names.* It is called in *Greek*, Σάμψυχον & Ἀμάρακον: in *Latine*, *Sampsucum*, *Amaracum* & *Marjorana*: in *English*, *Marjerom*: of the *Arabians* it is called *Merfenius* & *Morsangus.*

II. *The Kinds.* There are several Species of this Plant, as 1. *Majorana æstiva vulgaris*, Our Common Garden sweet Marjerom. 2. *Majorana tenuifolia*, Marjerom gentle. 3. *Majorana odorata perennis*, Winter sweet Marjerom. 4. *Majorana Latifolia*, *Majorana Anglica*, Winter Marjerom, or Pot Marjerom. 5. *Majorana latifolia aurea*, yellow broad Leav'd Marjerom. 6. *Majorana Sylvestris*, *Cunila bubula Plinij & Dioscoridis*: Wild or Field Marjerom.

The Descriptions.

III. *The first, or* Our Common Garden Sweet Marjerom. *It has a Root which is composed of several small Fibres or Strings, which perish with the whole Plant every year.* This Herb is commonly Sown Annually in our *Gardens* of Foreign Seed, and is a small low Plant, little above a foot high, full of Branches and small Whitish and soft roundish Leaves on them, smelling very sweet. At the tops of the Branches grow several small long and round scaly Heads or Knots (and therefore by some called *Knotted Marjerom*) of a whitish green color, out of which come here and there small white Flowers, and after them small reddish Seed.

Garden sweet *MARJEROM.*

IV. *The second, or* Marjerom Gentle. *Its Root is like the other, from whence grow up several small Stalks and Branches, not exceeding the former in height*; but it has finer and smaller Leaves, hoary and soft, and much sweeter than the former; the Heads are like unto that, and so are the Flowers and Seed, the whole Plant being more tender than the the first *Common sweet Marjerom*, and abiding but a *Summer* in like manner.

V. *The third, or* Winter sweet Marjerom. *This is an excellent Plant, and abides green all the* Winter, *if it is not to violent, growing in the same manner and form which the first does*, and its Leaves are a little smaller and greener than it, but with the like Heads and Knots. Yet some take this to be but the *Common Summer sweet Marjerom.* which by Transplanting, is made more strong, and able to abide the *Winter.*

VI. *The fourth, or* Winter or Pot Marjerom. *It has a Root which is white and thready, not perishing in* Winter, *but abiding many years, and is encreased rather by Slipping and sets, than by Sowing the Seed.* It is a small low bushy Herb, not growing much higher than any of the others, but spreading its Branches wider, on which grow broader and greener Leaves, set by couples, or pairs, with some smaller Leaves also, at the several Joints, all along the Branches: at the Tops whereof grow a number of small, purplish, white Flowers, set together in a Tuft, which turn into small and round Seed, larger than the Seed of the *Common sweet Marjerom.* The whole Plant is of a sweet smell, but much less and inferior to the other, being also nothing so bitter as is the *Common sweet Marjerom*, and therefore the more fit for a Pot-Herb.

VII. *The*

VII. *The fifth, or* yellow broad Leav'd Sweet Marjerom. *This is of the same sort with the* Pot-Marjerom, *differing only in the color of the Leaves, which are in* Summer *wholly yellow, in some Plants*, or but a little green, or parted with yellow and green, more or less, as Nature is pleased to play her part; the smell being small like that of the *Pot-Marjerom* last described: there is also another of this Species consisting of party colors, white and green.

VIII. *The sixth, or* Wild *or* Field Marjerom. *Its Root creeps under Ground, and encreases much, abiding from year to year.* It sends forth several brownish hard square Stalks, with many small, dark, green Leaves set by pairs on them, very like to those of the *Sweet Marjerom*, but harder, and a little broader. At the top of the Stalks grow Tufts of dark or deep purplish red Flowers, which turn into small Seed, like that of the *Garden Marjerom*, but blacker: The whole Plant smells sweet, but very strong.

IX. *The Places.* The first five grow Wild on the *Mountains* in *Spain*, and in other places, but with us they are all Nursed up in *Gardens*. The sixth grows Wild in the borders of *Corn-Fields*, and *Pastures*, and in some Common Ground, and near the High Ways, in several places in *England*.

X. *The Times.* They are Sown in *April* or *May*, and bring forth their scaly or chaffy Husks in *August*. They are to be Watered in the middle of the day, when the Sun shines hottest, (as *Basil* ought also to be) and not in the Evenings or Mornings.

XI. *The Qualities. Sweet Marjerom* is hot and dry in the second Degree. It digests, attenuates, opens and corroborates: is Cephalick, Neurotick, Stomatick Hysterick and Alexipharmick.

XII. *The Specification.* It is peculiar against the Lethargy, Palsie, Convulsions of the Nerves, Obstructions of the Viscera, and cold and moist Diseases of the Head, Nerves Stomach and Womb: provokes the Terms, and gives ease in the Colick.

XIII. *The Preparations.* You may prepare from Sweet Marjerom, *&c.* 1. *A Liquid Juice.* 2. *An Essence.* 3. *An Infusion or Decoction in Wine.* 4. *A Pouder of the Herb.* 5. *An Infused or Decocted Oil* 6. *A Distilled Water.* 7. *A Spirit.* 8. *A Chimical Oil.* 9. *A Spirituous Tincture.* 10. *An Oily Tincture.* 11. *A Cataplasm.*

The Virtues

XIV. *The Liquid Juice.* It is good against all Diseases of the *Thorax*, which cause shortness of Breath, or difficulty of breathing, opens the obstructions of Liver, Spleen, Reins and Womb, clearing them of those Tartarous Humours, which stuff them, and strengthens and confirms the Viscera. It expels Wind, gives ease in the Cholick, provokes the Terms in Women, brings down the Loches, and causes a due cleansing to Women in Child-bed. It is also very profitable for such as have the Strangury, or cannot easily make their Water, being taken Morning and Evening from one Spoonfull to three in good white *Port*, or white *Lisbon* Wine: Dropt into the Ears, it ease their Pain.

XV. *The Essence.* It has all the Virtues of the *Liquid Juice*, but is more powerful to all the intentions and purposes aforementioned, being given from one Spoonful to two Morning and Night, in any fit Vehicle.

XVI. *The Infusion or Decoction in Wine.* It has all the Virtues of the *Juice*, and strengthens the Nerves, Head and Brain: If it is made with the addition of a sixth part of *Pellitory of Spain*, *Long Pepper* and *Acorus*, it prevails against the Paralysis of the Tongue, and loss of Speech: and the Power of cold Poysons, which have been inwardly taken. It is thin, and of a digesting quality; and being drank from 4 to 8 Ounces, it is good for such as are beginning to fall into a Dropsy: mixt with an equal quantity of the *Juice*, and dropt into the Ears, it eases the singing noise of them.

XVII. *The Pouder of the Herb.* Being used as an Errhine, by being blown, or snuffed up the Nostrils, it provokes Sneezing; and thereby purges the Brain, of cold, moist, watery, and Pituitous Humors: The Herb made into a very gross Pouder, (or the green Herb it self) being long chewed in the Mouth, draws forth much Flegm, and other cold and moist Humours afflicting the Teeth, Gums, Throat, Almonds, and other parts adjacent, and thereby eases pains caused therefrom.

XVIII. *The Infused or Decocted Oil.* It is thus made. *Take of the Herb a little bruised 4 Ounces; Generous White Wine 6 Ounces; old Oil 12 Ounces; them together and Insolate, or Digest in an equal Sand heat: press out strongly; and repeat it thrice more with the same quantity of fresh Herbs; and then boil in Balneo to the consumption of the Wine.* It is a good Cephalick, eases Pains of the Head, and helps all cold Diseases thereof; as also cold Distempers of the Stomach, Liver, Spleen, Womb, Nerves and Joints, noise in the Ears, bitings of Venomous Beasts, Strengthens the Ventricle, helps indigestion, warms, comforts, digests, and discusses Wind, *&c.*

XIX. *Oleum Majoranæ Compositum.* The Compound Oil of Sweet Marjerom. *Take Sweet Marjerom 4 Handfuls; Mother of Time 2 Handfuls; Myrtle Leaves or Berries 1 Handful; Water Mint, Southernwood, of each half a Handful; Cassia Lignea 2 Ounces: Cut bruise and put them into a Glass in the Sun, or in a Bath, affusing thereon Oil Omphacine 3 Pounds; after 8 days press them out: to the expressed Oil, add fresh Simples, or Ingredients, which repeat the third time exactly in the same manner, and then perfect the Oil according to Art.* It is a very good Anodyn, and eases Pains of the Head, Stomach, Bowels, Hypochonders, Joints, and other parts; it comforts the Brain and Nerves, and is prevalent against the Palsie, Dead Palsie, Tremblings, Numbness, Cramps, Convulsions, Gouts, Sciatica, and pains of the Ears, Jaws, and Back, by anointing it on the parts affected. It is good against the bitings of Venomous Beasts: and Clysterwise, it expels Wind, and gives ease in the Colick.

XX. *The Distilled Water.* It has the Virtues of the *Juice* and *Essence*, but much weaker, and may be given to 6 Ounces, or more, sweetned with white Sugar, or mixed with an equal quantity of Generous Wine: it may also, being dulcified, be used as a Vehicle, to convey some of the other Preparations in, down into the Body. It is good against Inflamations and weakness of the Eyes, and is mixed with other sweet Waters, to make a sweet Wash of.

XXI. *The*

XXI. *The Spirit.* It is very Cordial, Neurotick, Cephalick, and Stomatick, expels Wind, gives present ease in the Cholick, is good against the Apoplexy, Lethargy, Palsy, Convulsions, pain in the Stomach, want of Appetite, Indigestion, and loathing of Food; it comforts the Heart, chears the Spirits, and prevails against Fainting and Swooning Fits, and other like Distempers of the Head and *Thorax*. Dose (being first dulcified with double refined Sugar) is from 2 Drams to 4, either alone, or mixed with a Glass of Generous Wine.

XXII. *The Chymical Oil.* It is a Specifick against the Colick, Palsie, Lethargy, Convulsions, Cramps, Hysterick Fits, and the Poyson of Serpents. Dose from 3 or 4 drops to 10 or 12, in white Sugar, or *Syrup of Clove Gilliflowers*, mixing the Oil very well therewith, and then with a Glass of some Generous Wine, or Sack Whey, and so to drink it off, Morning and Night.

XXIII. *The Spirituous Tincture.* It has all the Virtues of the *Juice*, *Essence*, *Spirit*, and *Chymical Oil*; but not so powerful as the last: it gives ease in the Cholick almost in a moment: Dose from 1 Dram to 3 Drams, in a Glass of Generous Canary Morning Fasting, and at Night going to Bed.

XXIV. *The Oily Tincture.* Given from 10 Drops to 20, 30, 40, or a Dram in any convenient Vehicle, it gives present relief in the most vehement Colick; cleanses the Reins, Ureters, and Bladder, of Sand, Gravel, or small Stones, provoking Urine powerfully, and expelling the recrements of those Parts, which stop the Urine and cause pain: Anointed well on the Back Bone, as also on the parts affected, it many times cures the Palsie, Numbness, and Trembling of the Limbs, beyond most other Medicaments, and has had a good effect in those cases when all other things have failed.

XXV. *The Cataplasm.* Made either of the *Pouder of the Herb*, or of the *Green Leaves*, beaten up to a Consistency with Honey, and applyed, it takes away the black and blew marks of Blows, Bruises, Pinchings and the like: If it is made up of the *Green Herb* beaten with Salt and Vinegar, and *Pouder of Ginger*, and *Long Pepper*, and so brought to a Consistency and applyed, it is good against the Poyson of the Scorpions Sting, as also the Bitings of Mad Dogs, Vipers, Rattle-Snakes, *&c.* being immediately applyed after the Hurt done.

XXVI. *The Pessary.* Made of the *Green Herb* beaten, and brought to a Consistency with Pouder of the Roots of *Pellitory of Spain*, a little Salt, and Vinegar, and Bees Wax, and then reduced into Form, and put up the Womb, and so contained there for some time, it is said to produce effectually the Terms in Women.

CHAP. CCCCLXXV.

Of MARJEROM Goats.

I. *THE Names.* It is called in *Greek*, Τραγοριγανος: in *Latin*, *Tragoriganum*: and in *English*, *Goats Marjerom.*

II. *The Kinds.* There are four especial Kinds which Authors take notice of, *viz.* 1. *Tragoriganum Creticum*, *Tragoriganum Cretense apud Venetos Lobelij & Penæ*; *Tragoriganum Clusij*; *Tragoriganum tertium Hispanicum Casp. Bauhini*, Goats Marjerom of Candy. 2. *Tragoriganum latifolium*, *sive*, *Marum Cortusi Matthiolo*, *Tragoriganum alterum Gesneri & Lobelij*; *Tragoriganum latifolium Bauhini*, Broad Leav'd Goats Marjerom: this second is that *Marum* which *Cortusus* sent unto *Matthiolus*, for *Thymum Creticum*; and by the Name of *Marum*, it is called by *Durantes*, and *Lugdunensis*: and *Lobel* says, that among all the Plants which are called *Tragoriganum*, he could find none which came nearer to those of *Dioscorides*, than these two first Kinds we have here Named. 3. *Tragoriganum Hispanicum*, *Tragoriganum secundum Clusij*, *Dodonæi*, *Camerarij*, *Lugdunensis & Tabernæmontani*, Spanish Goats Marjerom. 4. *Tragoriganum Matthioli*, *Lugdunensis*, *& Tabernæmontani*, *Tragoriganum serpillifolium*, *Matthiolus* his Goats Marjerom, or Goats Marjerom with Wild Time Leaves.

The Descriptions.

III. *The first*, *or* Goats Marjerom of *Candia*. *The Root spreads it self with many small* Fibres, *and the Plant abides green all the* Winter, *if care-*

Goats MARJEROM.

fully

fully preſerved and look'd to, but left without Defence, it for the moſt part periſhes. It is a low Plant, and has ſeveral ſmall low Branches, not above a Foot high, ſomething Woody, on which are ſet at ſeveral Joints, two Leaves, and ſome times more, which are ſomewhat broader, rougher, and harder than the Leaves of *Thymum Creticum*, and ſomething like unto *Summer Savory*, but of a ſadder green color; the ſmall, hooded, gaping Flowers, ſtand at the tops of the Branches, in ſeveral diſtances about the Stalks, of a purpliſh red color. The whole Plant, and every part thereof, taſtes very hot and ſharp, and ſmells very ſweet, with a very ſtrong ſweetneſs, and very quick and piercing.

IV. *The ſecond, or* Broad Leav'd Goats Marjerom. *It has for its Root, a blackiſh Buſh of many Fibres, ſet together like thoſe of* Marjerom. This Herb grows up to be a fine ſmall buſhy Plant, little above half a foot high, whoſe Stalks are not ſo woody, but tenderer like *Marjerom*, with many ſmall, ſmooth, gentle Leaves, two for the moſt part ſet together at a joint; ſomething broader than our *Maſtick-Thyme*, of ſo ſtrong, hot, and quick a ſmell, that being a little bruiſed, and ſmelt unto, it percies the Senſes more than the former; and comes ſomewhat near unto the ſmell of *Calamint* or *Penny-royal*. The Flowers are ſmall, and purple, growing up to the tops of the Branches, from between the Joints. This abides green all *Winter* as the former, but requires as much care in preſerving it in the *Winter*, as that does.

V. *The third, or* Spaniſh Goats Marjerom. *The Root of this is more woody, and leſs buſhy than the former.* And this Plant riſes up ſomewhat higher than the laſt, with whiter and harder Stalks: the Leaves are whiter alſo, ſmaller, narrower, and longer than they, and more ſtore of them uſually at every Joint; ſmelling ſomething Sweet, but nothing ſo ſtrong or quick, nor taſting ſo hot as they. The Flowers are white, and grow at ſeveral diſtances, towards the tops of the Stalks, but larger and more gaping, ſtanding in browniſh green Husks. This alſo abides green in the *Winter*, but is preſerved with more difficulty than either of the former.

VI. *The fourth, or* Matthiolus his Goats Marjerom, or Goats Marjerom with Wild Thyme Leaves. *This Plant* Matthiolus *firſt ſet forth, and called it* Tragoriganum. *It has a buſhy Fibrous Root, from whence ſpring up ſeveral hard Stalks and ſmall Leaves growing upon them, at ſeveral diſtances, which are like unto the ordinary* Wild Thyme. The Flowers are purple, ſtanding in roundles at the tops of the Branches; and the whole Plant ſmells not much unlike to *Penny-Royal*.

VII. *The Places.* The firſt grows in *Crete* and in *Spain* alſo. The ſecond is unknown. The third in *Valentia* in *Spain*. The fourth in the Province of *Ferojulium*, and ſeveral parts of *Italy*: but all of them grow with us in *Gardens*.

VIII. *The Times.* They all Flower with us very late in the year, *Gerard* ſays in *Auguſt*; others ſay that we ſcarcely ſee any Flowers till *September*, or *October*, and ſometimes ſcarcely ſee any at all.

IX. *The Qualities.* They are (eſpecially the two firſt) hot and dry in the third Degree: and much more Strong, piercing and effectual, in all their other Properties, than either *Sweet Marjerom*, or *Origanum*, of which we have and ſhall ſpeak in their proper places.

X. The *Specification*, *Preparations* and *Virtues*, are alſo the ſame with thoſe of *Sweet Marjerom*, of which we have largely diſcourſed in the former Chapter: ſaving that as theſe the two firſt eſpecially, are more ſtrong and potent, than any of the *Marjeroms*; ſo all the Preparations of theſe are much more effectual, to all the intentions and purpoſes there ſpecified.

CHAP. CCCCLXXVI.

Of MASTR-WORT.

I. *THE Names.* It has no *Greek* Name, as being unknown to the *Greeks*: but is called in *Latine*, *Imperatoria, & Aſtrantia:* in *Engliſh*, *Maſter-wort.*

II. *The Kinds.* Authors make but two Species hereof, *viz.* 1. *Imperatoris, ſive Aſtrantia vulgaris*; *Laſerpitium Germanicum Fuchſij*; *ſimpernium hortenſe Tragi, & Oſteritium*; but the generality of Authors call it by the two firſt Names. In *Engliſh*, our Common Maſter-wort. 2. *Imperatoria Alpina*, *vel Aſtrantia Alpina Camerarij*, Mountain Maſter-wort.

The Deſcriptions.

III. *The firſt, or* Our Common Maſter-wort. *It has a Root which is ſomething great, and rather grows ſide wiſe, than deep into the Ground, ſhooting forth ſeveral Heads, which taſte ſharp and biting on the Tongue, and is the hotteſt and ſharpeſt part of any of the reſt of the Plant, (to which the Seed in heat comes next) this Root is blackiſh on the out ſide, with ſeveral Fibres or ſtrings adjoining to it, and ſmells very well.* From this Root ſpring up ſeveral Stalks of winged Leaves, divided into divers parts, three for the moſt part ſtanding together, at a ſmall foot Stalk, on both ſides of the greater, and three likewiſe at the end of the Stalk; each of which Leaves are ſomewhat broad, and cut in on the edges into three or more diviſions, and all of them dented about the brims, of a dark green color, ſomewhat reſembling *Angelica* Leaves at firſt ſight, till they be better viewed, as that theſe grow lower to the Ground, and upon leſſer

MASTER-WORT.

leſſer Stalks; from among which Leaves riſe up two or three Stalks, which are ſhort in compariſon of *Angelica*, being about two feet high, and ſlender, with ſuch like Leaves at their Joints, as grow from the Root below; but leſſer, and with fewer diviſions, bearing Umbles of white Flowers: and after them ſmall, thin, flat, blackiſh Seed, ſomething larger than *Dill* Seed.

IV. *The ſecond, or* Mountain Maſter-wort. *The Root grows in like manner as the former, and is black on the out ſide, but is more hot, ſharp and biting upon the Tongue, than the Root of the firſt or Common Kind.* This Plant grows alſo in form much like to the firſt, but leſſer in every part, having nine Leaves ſtanding on each Stalk by three and three, but they are ſmaller and narrower, and have fewer Inciſions in them, but finely dented about the edges: The Flowers and Seed of this are alſo very like to the firſt, without any material difference, unleſs it be in the magnitude, theſe being ſomething the leſſer.

V. *The Places.* The firſt grows Wild on the Hills in *Italy* and *Germany*, in *Woods* alſo and *Deſarts:* The ſecond was found growing on the *Alps* in *Switzerland:* With us they only grow, and are Nurſt up in *Gardens.*

VI. *The Times.* They are ſaid to Flower from the beginning of *June* to the beginning of *Auguſt*, but if the Seaſon is cold, and very moiſt, they Flower and Seed late with us, as not untill the end of *Auguſt.*

VII. *The Qualities.* They are hot and dry in the fourth Degree, being hotter than *Pepper*, and of very ſubtil parts. It is Attractive, Aperitive, Carminative, Digeſtive, Diſcuſſive, and Diuretick; Cephalick, Neurotick, Stomatick, Cordial, Nephritick, and Hyſterick; Ptarmick, Emmenagogick, Sudorifick and Alexipharmick.

VIII. *The Specification.* It is ſaid to cure the Cholick, expel Sand, Gravel, and ſmall Stones, provoke the Terms, reſiſt Catarrhs, and is profitable againſt the Falling-ſickneſs, Hyſterick fits, the Gout from a cold cauſe; expels all ſorts of cold Poyſons, and heals wounds made by Poyſoned Weapons.

IX. *The Preparations.* The Root is chiefly uſed, and then the Seed for want of it, the Leaves very ſeldom, you may have therefore from the Root, 1. *A Liquid Juice.* 2. *An Eſſence.* 3. *A Decoction, or Infuſion in Wine.* 4. *A Pouder of the Root.* 5. *An Infuſion, or Decoction of the Seed in Wine.* 6. *A Pouder of the Seed.* 7. *A Diſtilled Water of the Herb, Root, or Seed.* 8. *A Spirituous Tincture of the Root or Seed.* 9. *An Acid Tincture of the Root or Seed.* 10. *An Oily Tincture of the ſame.* 11. *A Lohoch.* 12. *A Cataplaſm.*

The Virtues.

X. *The Liquid Juice.* It is good againſt all cold Griefs and Diſeaſes both of the Stomach, and other Bowels, expels Wind powerfully both upwards and downwards: it provokes Urine; and helps to break the Stone, and expell it from the Reins, Ureters and Bladder, and powerfully brings down the Courſes in Women, and forces away both Dead Child and After-birth: It is profitable againſt Vapors and Hyſterick Fits: and being mixed with White Wine, and uſed as a Gargariſm, it attracts Flegm, Rheum, and cold and watery Humours out of the Jaws, Gums, Throat, Almonds, Head, Brain, and other parts adjacent. Being put into old Ulcers and putrid running Sores, or Tents, or Pledgets dipt therein, and applied to the ſame, as alſo into Green Wounds, it ſoon recovers, cleanſes and heals them, yea tho' a Gangrene, ſeems impending: And applyed to the Gout from a cold Cauſe, it gives eaſe in the pain. Doſe from half a Spoonful, to a Spoonful, or more, in any proper Vehicle.

XI. *The Eſſence.* It has all the Virtues of the *Juice*, and may be given in the ſame Doſe and Vehicle, Morning and Evening; beſides which it ſtops Vomiting, wonderfully ſtrengthens the Stomach, cauſes a good Appetite, and a ſtrong Digeſtion, diſcuſſes Wind, and gives preſent eaſe in the Cholick; and is profitable againſt the Dropſie, Jaundice, Epilepſie, Lethargy, Drowſineſs and Sleepineſs, and other cold and moiſt Diſeaſes of the Head and Brain: it has alſo a ſingular Virtue and Power againſt all ſorts of cold Poyſons, as alſo againſt any malign Diſeaſe, and the Plague it ſelf: it provokes Sweat, and defends the Heart againſt any Venom, Malignity or Infection.

XII. *The Infuſion, or Decoction in Wine.* It has all the Virtues of the *Juice* and *Eſſence*, but not altogether ſo powerful, and may be given from 2 to 4 Ounces, or more, Morning and Night, or as need requires, being dulcified with *Syrup of Clovegilliflowers*, or *Syrup of Violets*; and uſed as a Waſh to any putrid or rotten Ulcer, it ſtops the Putrifaction, cleanſes it, and induces the healing. *Tragus* ſays that the *Decoction of the Root in Wine*, being drunk, does reſtore the Ability of Generation in ſuch as are Impotent, or where it is almoſt extinct, and this he ſpeaks as a certain Truth.

XIII. *The Pouder of the Root.* It has the Virtues of *Juice* and *Eſſence*, and may be given inwardly from 15 Grains to a Dram, mixt with a little

Honey: It is good againſt Quartans, and expels the *Fœtus* and After birth: uſed as an Errhine, it Purges the Head and Brain of Cold Humors, and is profitable againſt Apoplexies, Convulſions, Cramps, Epilepſies, Lethargies, Vertigo's, Megrims, and other like diſtempers of thoſe parts. And inwardly taken, it excites alſo the Generative Faculty, and powerfully corrects the cold and moiſt habit of the Stomach and Bowels: And being ſtrewed upon old running Sores, and putrid Ulcers, it corrects the Putridity, cleanſes them of the Corruption, and induces the healing.

XIV. *The Infuſion or Decoction of the Seed in Wine.* It has all the Virtues of the *Infuſion or Decoction of the Root*, and may be given in the ſame manner and the ſame Doſe. It is a ſingular Prophylactick againſt peſtilential Airs, and againſt the very Infection of the Plague it ſelf. Taken in the Morning Faſting, it comforts the Stomach, helps Digeſtion, creates an Appetite, and expels Ventoſities out of the Viſcera.

XV. *The Pouder of the Seed.* It has all the Virtues of the *Pouder of the Root*, and may be given to a Dram, before the coming of the Fit of a Quartan Ague (ſo alſo the *Pouder of the Root*) for the Cure of the ſame; it takes away the extream rigor of the cold, provokes Sweat, and prevails againſt the Dropſie: it may alſo be uſed as an Errhine, as well as the *Pouder of the Root*.

XVI. *The Diſtilled Water of Root, Herb, and Seed.* It has the Virtues of the *Juice*, but much weaker, and may be given from 1 Ounce to 6 Ounces, it may alſo ſerve as a Vehicle to convey the other Preparations in, which are to be given inwardly. It may alſo be mixed with the *Juice* for a Gargariſm, or for a Lotion to waſh old Sores, Ulcers, *&c.* for it notably cleanſes and drys them.

XVII. *The Spirituous Tincture of the Root or Seed.* Tho' it has all the Virtues of *Juice*, *Eſſence*, *Infuſion*, *Pouder*, &c. yet in an eſpecial manner, it rectifies the cold and moiſt habit of the Stomach, taking away all Pains and Aches there, and almoſt in a moment cures the Cholick. And it is profitable for ſuch as have inward Bruiſes, occaſioned by falls, blows, or other accidents, diſſolving the concreted Blood, and ſo giving relief to the Patient. Doſe from 1 Dram to 2 Drams, in any proper Vehicle, Morning Faſting, and laſt at Night going to Bed.

XVIII. *The Acid Tincture of the Root or Seed.* It is a potent thing againſt the Plague, and all ſorts of Peſtilential or Malign Fevers, uſed either as a prophylactick, or as a Curative: it prevails againſt Poyſons of all ſorts, and the Bitings of poyſonous and venomous Creatures, as of Mad-Dogs, Vipers, Rattle-Snakes, and other Serpents: it cauſes Appetite and helps Digeſtion: is powerful in breaking the Stone, and expelling Gravel, both from the Reins and Bladder: it is good alſo againſt cold Catarrhs, or diſtillations of Rheum upon the Thorax or Lungs, gives eaſe in vehement Coughs, and helps ſuch as are troubled with Hoarſeneſs, Wheezing, ſhortneſs of Breath, difficulty of Breathing. It is to be taken in all that the Patient drinks, whether at Meals, or otherwiſe, ſo many Drops at a time as to give the Ale, Beer, or Wine, a pleaſing Acidity.

XIX. *The Oily Tincture of the Root or Seed.* It has the Virtues of the *Juice*, *Eſſence*, *Decoction*, *Pouder*, and *Tinctures*; but in particular it is good againſt Palſies, Tremblings, Numbneſs, Cramps, Convulſions, Lethargies, Colicks, Gouts of all ſorts, and the Stone and Gravel, whether in Reins or Bladder; provoking Urine, and giving eaſe in the Strangury, beyond many other Medicines, being outwardly anointed on the Back-bone, and other parts affected; and inwardly taken from 10 drops to 60, according to Age and ſtrength, in any proper Vehicle. It provokes the Terms, facilitates the Birth, brings away the Dead Child, and After-birth, cauſe a good cleanſing, and gives preſent eaſe in After pains, *&c.*

XX. *The Lohoch.* It is made of the *Liquid Juice*, mixt with a half part of Honey, firſt purified with whites of Eggs, and then by the heat of a Bath brought to a Conſiſtency. It gives eaſe in Coughs, Colds, Aſthma's, and moſt other Diſtempers of the Breſt and Lungs, proceeding from Cold, and a Viſcous Flegm.

XXI. *The Cataplaſm.* It is made of the Roots and Leaves, beaten in a Mortar, and brought to the Form of a Pultiſe. Being applyed, it is ſaid to cure Peſtilential Carbuncles and Botches, and other like Apoſtems, Bubo's and Tumors: it cures Contuſions, diſcuſſes congealed Blood; and is an abſolute Remedy for the biting of a Mad-Dog, Viper or other Serpent, or venomous Creature, by ſtrongly attracting or drawing forth the Poyſon, *&c.* but this is to be underſtood, of ſuch an Application as is made, when the Biting is newly done: applyed alſo to poyſoned Wounds, or putrid Ulcers, it draws forth the Poyſon, and deſtroys the Putridity.

MATCH-WOOD, *ſee* Touch-Wood, *Chap.*
MATFELLON, *ſee* Knapweed, *Chap.* 414.

CHAP. CCCCLXXVII.

Of MAT-WEED; OR, MAT-RUSHES.

I. *The Names.* It has no *Greek* Name, but is called in *Latine*, *Spartum Herba*; and in *Engliſh*, *Matt-Weed.*

II. *The Kinds.* Authors have many ſpecies of this Plant; we ſhall content our ſelves with theſe following, 1. *Spartum Marinum noſtras*, *Spartum Herba tertia Maritimum Cluſij*, Our Engliſh Mat-weed, or Marram. 2. *Spartum marinum noſtras alterum Lobelij & Bauhini*, *Gramen Sparteum Spicatum latifolium*, Our other Sea Mat weed. 3. *Spartum parvum Batavicum & Anglicum*; *Spartum noſtras parvum Lobelij*, *Spartum Herba Anglica*, *Gramen Sparteum Juncifolium*, ſmall Mat-weed. 4. *Spartum minimum Anglicum*, Our ſmalleſt Engliſh Mat-weed. 5. *Spartum Herba Plinij*; *Juncus Hiſpanicus*, *Gramen Sparteum primum pannicula Comoſa Bauhini*, Spaniſh Mat-weed or Ruſhes, or Frail-

Frail-weed. 6. *Spartum Herba alterum mollius Plinij*, *Spartum Herba Plinij alterum*, *Gramen Sparteum ſecundum panniculâ brevi ſolliculo incluſa Bauhini*, The leſſer Spaniſh Ruſh, or Mat-weed.

The Deſcriptions.

III. *The firſt*, *or* Our Engliſh Mat-weed. *Its Roots creep in the Ground, and faſten themſelves ſtrongly therein*: It has divers long, hard, and very ſharp pointed Ruſhes, piercing their Legs who go among them that are not Booted. The Stalks have ſoft ſpiked long Heads, like unto the Ears of *Rye*, and Blooming like it alſo.

IV. *The ſecond*, *or* Our other Sea Mat-weed. *Its Roots creep likewiſe under the Ground, and are ſtrongly faſtned to the Earth, as the others are:* and this *Mat-weed* is in the growing like the former, but that the Ruſhes are broader and ſhorter, and ſo alſo the Heads or ſpikes.

V. *The third*, *or* Small Mat-weed. *The Roots of this are likewiſe long, hard, and ſomewhat tough, fit to be wrought into little Baskets or the like.* It has ſhorter, ſmaller, and harder Ruſhes: the Stalks are about a foot and a half high, having ſmall, thin, long Spikes, and harder at the tops than the former.

VI. *The fourth*, *or* Our ſmalleſt Engliſh Mat-weed. *The Roots are long and yellow, like the former ſmall Engliſh Kind.* From which riſe up many ſmall, ſlender, round Ruſhes, like Threads, almoſt 4 or 5 Inches long, growing thick together; among which, the Stalks which are very ſmall, have ſmaller Heads, and ſingle; that is conſiſting but of one or two ſmall Rows.

VII. *The fifth*, *or* Spaniſh Mat-weed or Frail-weed. *The Roots ſpread in the Ground into many Tufts, matting therein, that in ſome places they take up two feet ſquare of Ground or more:* From which riſe up a number of round Ruſhes, a foot and a half long, each of which is parted a little above the Ground, into 3 or 4, or more, ſlender, long, tough, and green Ruſhes, ſomething broader at the firſt, being whitiſh in the middle, which ſoon after have both their edges ſo drawn together, that it makes them ſeem round, ſo that the Partition is ſcarcely diſcerned, and then grow harder and whitiſh, when they are dry (as we ſee them in Raiſon Frails, *&c.* and in the round Matts, with which the Floors of Chambers are Matted, as they are wrought there, and brought over here to us) from among which riſe up ſeveral Stalks, ſomething higher than the Leaves, bearing at the top a ſmall long Head of many ſharp pointed Husks; after which come ſmall long Seed, like unto ſome other Graſſes.

VIII. *The ſixth*, *or* Leſſer Spaniſh Ruſh or Mat-weed. *The Roots of this do matt like the other, but grow in moiſter places.* From whence riſe up the Ruſhes or Frails in the very ſame manner and order as the other Spaniſh kind do; Theſe Ruſhes are more fine and ſlender, ſofter alſo, and bear a ſhorter Tuft at the Top, breaking out of a ſhining Husk or Hoſe.

IX. *The Places.* The firſt, ſecond, third, and fourth, grow very well with us in *England*; very plentifully on the Coaſts of *Norfolk*, and *Suffolk*, and in many other places on the Sea Shore. And the firſt of them has been found growing alſo in the Iſle of *Tenet*, near the Sea ſide, between alſo *Margate* and *Sandwich*, the two laſt grow in *Spain*, the *Canaries*, *Madera's*, and other warm Climates.

X. *The Times.* They bear or bring forth their Heads in the middle, and towards the latter end of *Summer*.

The Virtues and Uſes.

XI. Theſe Plants are all uſeleſs in Phyſick, as having no known Medical Virtue, and alſo hurtful to Cattel, but ſerve to make *Matts* and *Frails* withall.

CHAP. CCCCLXXVIII.

Of MAUDLIN.

I. *THE Names.* It is called in *Greek*; Ἀγήρατον: in *Latine*, *Ageratum*: (*quaſi non Seneſcens*, *vel Senectutum non Sentiens*; becauſe the Flowers thereof gathered in a fit time, will not wax old or decay by Age:) and in *Engliſh*, *Maudlin*.

II. *The Kinds.* Authors make about five ſeveral ſpecies hereof, *viz.* 1. *Ageratum Dioſcoridis Camerarij*, *Caſtoris*, *Durantis*, *Geſneri*, *Lugdunenſis*, *Matthioli*, *Tabernæmontani*; *Eupatorium Meſues*; *Balſamita fœmina*, *& minor*, *Dodonæi*; *Coſtus Hortenſis minor Geſneri*; *Mentha Corymbifera minor Cordi*; *Camphorata Cæſalpini*; *Herba Julia Anguillaræ & Geſneri*; *& Eupatorium meſues*, *Geſneri*, *Loniceri*, *Matthioli & Tragi*; and in ſhort, this is that Plant, which moſt of the beſt and latter Writers, or Authors affirm to be the true *Ageratum Dioſcoridis*, and the true *Eupatorium Meſues*, and is our *Ageratum Vulgare* or *Common Maudlin*. 2. *Ageratum Flore albo*, *Ageratum ſecundum Lugdunenſis*, *& Matthioli*; *Ageratum Floribus Candidis Lobelij*; *Camerarij*, *& Tabernæmontani*, our white Flowered Maudlin. 3. *Ageratum minus Lobelij*, *Camerarij*, *& Tabernæmontani*; *Ageratum foliis non ſerratis Bauhini*; Small Maudlin. 4. *Ageratum purpureum Lugdunenſiis*; *Ageratum ſerratum Alpinum Bauhini*: *Moſchaſellæ cærulea Germanorum* (but it is not the *Moſchatella Cordi*) Purple Sweet Maudlin. 5. *Ageratum ferulaceum Lugdunenſiis*; *Chryſanthemum Alpinum foliis Abrotani Multifidis*, Fennel Leav'd Maudlin. This ſort *Bauhinus* referrs to the *Achillea Montana Arthemiſiæ tenuifoliæ facie Lobelij*, and to the *Achillea Montana Lugdunenſiis & Tabernæmontani*.

The Deſcriptions.

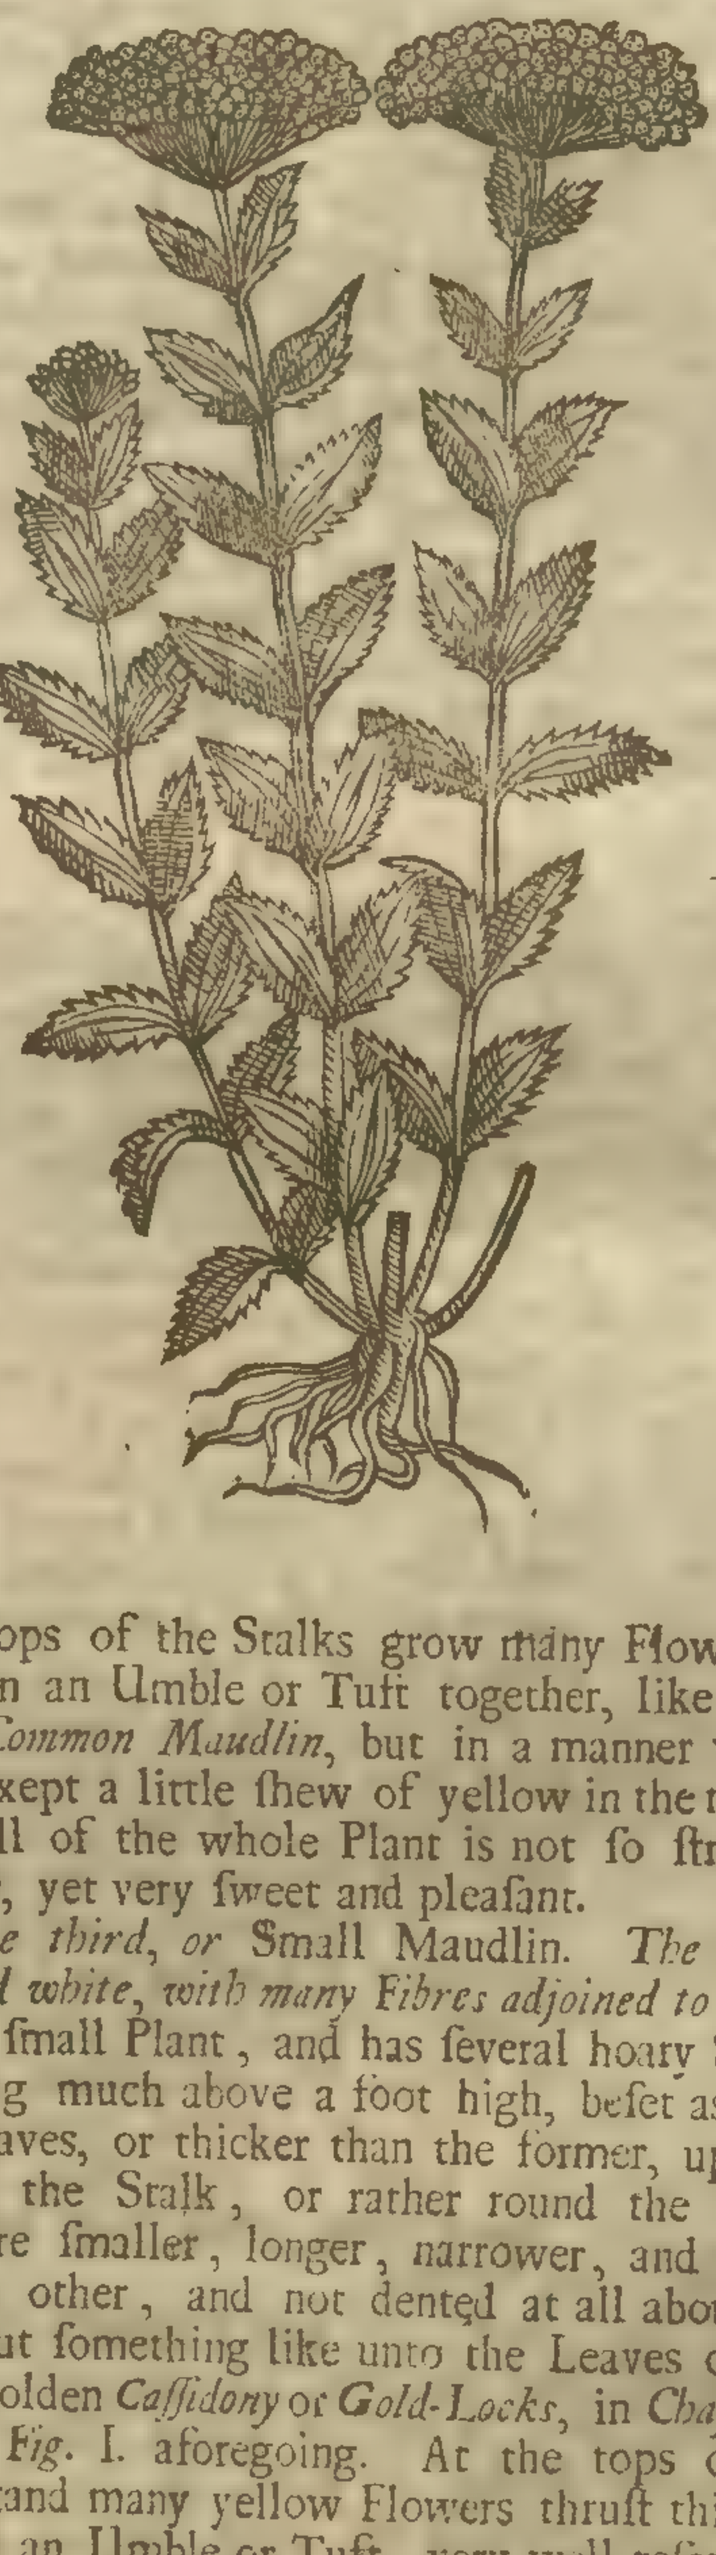
III. *The firſt*, *or* Our Common Maudlin. *It has many Roots with Fibres adjoined, which are long, laſting, or abiding all* Winter *for ſome years.* It is ſomewhat like to *Coſtmary*, (of which

it is ſaid to be a Kind,) and has ſomewhat long and narrow Leaves, ſnipt about the edges; The Stalks are about 2 feet high, bearing at the tops many yellow Flowers ſet round together, and all in Umbles, of an equal height, much like to *Tanſie*; after which follows ſmall whitiſh Seed, almoſt as large as *Worm-Seed*; the whole Herb, is Sweet ſcented and of a bitter taſte, and is increaſed as well by ſlipping, as by ſowing. *Gerard* ſays it is ſomething like to *Coſtmary* in color, ſmell, taſte, and in the golden Flowers ſet upon the tops of the Stalks in round Cluſters, or Tufts.

IV. *The ſecond, or* Our white Flowered Maudlin. *The Root is ſmall and Fibrous or ſtringy, like the other.* It has woody Stalks, and many ſmall Leaves ſet thereon like the other, but ſomething ſmaller, and leſſer dented in on the edges

MAUDLIN.

White MAUDLIN.



At the tops of the Stalks grow many Flowers, as it were in an Umble or Tuft together, like to the former *Common Maudlin*, but in a manner wholly white, exept a little ſhew of yellow in the middle. The ſmell of the whole Plant is not ſo ſtrong as the other, yet very ſweet and pleaſant.

V. *The third, or* Small Maudlin. *The Root is ſmall and white, with many Fibres adjoined to it.* It is but a ſmall Plant, and has ſeveral hoary Stalks, not riſing much above a foot high, beſet as thick with Leaves, or thicker than the former, upon all ſides of the Stalk, or rather round the Stalk, which are ſmaller, longer, narrower, and whiter than the other, and not dented at all about the edges, but ſomething like unto the Leaves of yellow or golden *Caſſidony* or *Gold-Locks*, in *Chap.* 322. *Sect.* 3. *Fig.* I. aforegoing. At the tops of the Stalks ſtand many yellow Flowers thruſt thick together in an Umble or Tuft, very well reſembling the firſt or *Common Garden Maudlin*, of a very good and Quick ſmell, which convert into Down, and is carried away with the Wind. The flowers of this and the firſt Kind, are very Beautiful, and will not loſe their glory in growing, till they are very old, from whence came the Name ἀγήρατον or ἀγήρων, *non ſeneſcens*, and are like in the Tuft to *Eliochryſon Theophraſti*, which ſome will have to be the *Gold-Locks* aforenamed, others the *Aurelia, Coma aurea*, or *Golden Moth-wort.*

VI. *The*

VI. *The fourth, or* Purple Sweet Maudlin. *The Root is yellow, small and short, bushing forth many small Fibres, by which it takes fast hold of the Ground.* This rare and delicate Plant, has many small Leaves lying upon the Ground, round about the top of the Root, something like to the Leaves of the first *Maudlin*, above described, dented in on the edges, towards their points, and not backwards or towards the foot Stalk, or sticking on to the Stalk: it is bitterish in Taste, but not so bitter as the first or common. From among the Leaves rise up many small Stalks, beset with such like Leaves as grow below, but something smaller, unto the very tops; where many Flowers Stand, one above another, every one upon a short foot Stalk, consisting of five small green Leaves, of an admirable *Violet* like purple color, coming forth of small green Husks, of so excellent and desirable sweet smell, that it much exceeds the *Violet*, and may be compared with *Musk* it self. After the Flowers are past, several small Seed Vessels rise up, containing in them small Seed.

VII. *The fifth, or* Fennel Leav'd Maudlin. *Its Root is something long, black, and woody, rugged, and a little Writhed, with several Fibres growing to it.* It has many Fennel like Leaves, lying upon the Ground round about the Root, which shoot forth several crested or cornered Stalks half a Yard high, on which do grow at certain distances, on each side, one above another, such like Leaves encompassing the Stalk at the feet of them, as those of *Fennel* do. At the tops of the Stalks stand large Umbles of Flowers; some of the Stalks not rising so high as the others, yet all making a round compacted Tuft of yellow Flowers, very like to those of *Groundsel* for the Form, but of a more excellent Gold yellow Color, which being gathered before they be grown to full Maturity, will abide a long time in their perfect Beauty: and this is that which has chiefly caused this Plant to be joined to the *Maudlins* for that the Flowers decay not being gathered, for a very considerable Season.

VIII. *The Places.* The two first grow Wild in rough and untilled places in *Italy* and *France*; The third on dry Grounds, and out of old Mud and Stone Walls. The fourth upon *Rocks* and *Clifts*, where there is sometimes but little Earth upon the Root, it growing or running many times into the Chinks, and moistned only by the Vapors of some Waters passing near it, or Dews falling on it. The last grows in dry and hungry Wood Lands: but with us they are all Nurst up in *Gardens*.

IX. *The Times.* They bring forth their Tufts of yellow Flowers in the *Summer* Months, *viz. June* and *July*, in most *Gardens* where they are Planted and prosper.

X. *The Qualities, Specification, Preparations, and Virtues* of *Maudlin*, are the same with those of *Costmary*, which we have at large declared in in *Chap.* 156. *Sect.* 6. *ad* 25. aforegoing of this Book, so that we need say little more of it in this place.

XI. Nota. *A Compound Balsam of Maudlin* is thus made. *Take fresh gathered Maudlin, Adders-tongue, of each* 12 *Handfuls: Oil Olive* 2 *Quarts: White Wine a Pint: Boil to a Crispness, and press out; this repeat twice more, straining out at last with very gentle pressure: to this add Turpentine* 12 *Ounces: Bees-wax* 8 *Ounces: Rosin in fine Pouder* 4 *Ounces: mix and in a Bath make a Balsam, Boiling till the moisture is evaporated.* It is an Excellent Balsam for Burnings and Scaldings; as also for cleansing, incarnating and healing old and running Sores, and rotten Ulcers, and to raise and bring up the Flesh from a deep and hollow Wound, which things have been proved by a long Series or Number of Experiments.

CHAP. CCCCLXXIX.

Of MAY-WEED.

OR,

Stinking CAMOMIL.

I. THE *Names.* It is called in *Greek*, Κυνάνθεμις, & Κυνοβοτάνη, *Cynanthemis & Cynobotane*, i. e. *Camomilla Canina & Canina Herba:* in *Latine*, *Cotula:* and in *English*, *May-Weed.*

II. *The Kinds.* There are three Kinds hereof, *viz.* 1. *Cotula fœtida*, Stinking or strong May-weed. 2. *Cotula non fœtida*, May-weed not stinking, or with out smell. 3. *Cotula Multiplex vel flore pleno:* double Flowered May-weed.

The Descriptions.

III. *The first, or* Stinking or strong Scented May-weed. *It has a Root which is Woody, and perishes when*

when the Seed is perfected. From whence ſhoot forth round Stalks, green, brittle, and full of Juice, divided into many Branches, much thicker and higher than thoſe of our *Common Garden Camomil*; the Leaves in like manner are broader, and of a blackiſh green color; the Flowers are like in form and color to thoſe of *Camomil*, but commonly larger, and of a rank ſmell; the whole Plant giving alſo a rank or ſtinking ſmell. This grows more upright than either the *Common Garden Kind*, or the *non fœtida* which follows, and its Leaves are longer and greater than it, as alſo are the Flowers, by the ſmell of which alone this ſort is diſtinguiſhed from the others.

IV. *The ſecond, or* May-weed not ſtinking or without ſmell. *The Root of this is like the former; and its manner and form of growing alſo:* but it grows not altogether ſo high, yet creeps not or runs on the Ground, nor takes Root at the Joints or Branches, as the *Garden* ſort does; but the Leaves hereof are longer and greater than thoſe of that, yet very like, but of a paler green color, having no ſmell at all: the Flowers are alſo very like to the former, and to thoſe of the *Garden Kind*, but larger, both in the white row or border of Leaves, and in the yellow middle Thrum: by which this ſort is diſcerned from that of the *Garden*.

V. *The third, or* Double Flowred May-weed. *This is very like to the firſt Kind here deſcribed, and differs nothing at all from it, but in the Flowers*, which are commonly very double, and almoſt as large as double *Camomil* Flowers.

VI. *The Places.* They grow plentifully Wild, in moſt Counties of *England*, in *Corn-Fields*, and in, or near unto Furrows in Plowed-Lands, and by Path-ways in the borders of *Fields*. The double Kind has been often found in ſeveral parts of *England*, growing Wild, as the Single Kinds do.

VII. *The Times.* They Flower in the *Summer* Months, ſometimes in *June*, alſo in *July* and *Auguſt*; ſometimes earlier, and ſometimes later, according as the ſeaſon of the year is kindly.

The Virtues.

VIII. Theſe Plants as they are never uſed for Food, nor yet ſcarcely for Medicine, ſo their Medical Qualities and Properties are for the moſt part unknown. Yet,

IX. *The Juice or Eſſence of the firſt, or ſtinking Kind*, is Commended as *Gerard* ſays, againſt Diſeaſes of the Womb, and Hyſterick Fits, and therefore may be profitable againſt Vapours, and other fainting Fits and Diſeaſes of like Kind. Doſe a Spoonful or two in a Glaſs of fair Water, or in *Angelica* Water, or in ſome other fit Vehicle.

X. *The Ointment and Cataplaſm made of the Herb.* They are ſaid to be good to diſſolve Tumors or Swellings; to diſcuſs Wind; and to eaſe Pains and Aches in the Joints; eſpecially being made of the Stinking Kind, and applyed Morning and Night to the parts affected.

MEDOW-PARSNIP. *ſee* Parſnep-Cow, *Chap.*

CHAP. CCCCLXXX.

Of MEDE -- SWEET:

OR,

QUEEN of the Meddows.

I. *THE Names.* It is thought to be unknown to any Ancient *Greek* or *Latine* Authors: but later Writers call it *Ulmaria, à foliorum Ulmi ſimilitudine*, from its likeneſs to *Elme* Leaves; in *Engliſh*, *Mede-ſweet*, *Meddow-ſweet*, and *Queen of the Meddows.*

II. *The Kinds.* There are two Species hereof, *viz.* 1. *Ulmaria Vulgaris*; *Regina Prati Dodonæi*; *Barba, vel Barbula Capræ*, or *Barba Caprina Tragi*; *Barba Capri Fuchſij*; *Barbi Capra Lobelij*; *Mede-ſuſium Cordi*, our Common Mede-ſweet, or Meddow-ſweet: ſome have thought it to be *Rodora Plinij*, but that cannot be poſſitively affirmed: *Tragus* thought it might be *Picnocomon Dioſcoridis*, as did alſo, *Geſner in hortis & Lonicerus.* 2. *Ulmaria major, ſive altera, Potentilla major prima Anguillaræ*; *Argentina major Thalij*, The Greater Mede-ſweet, or Meddow-ſweet. *Lugdunenſis* ſays, ſome took it to be *Melandrum Plinij*; and ſome call it *Drymopogon. Camerarius* ſays the *Germans* call the firſt *Wormkraut*, Worm-wort, becauſe ſays he, the Root is often found; as if it were eaten by Worms: but it is more likely, from its curing Horſes of the Botts and Worms, for which purpoſe the Country people uſed it.

The Deſcriptions.

III. *The firſt, or* Our Common Mede-ſweet. *It has a Root which is ſomewhat Woody and blackiſh on the out ſide, and browniſh within, with ſeveral greater Strings, and leſſer Fibres adjoining; of a ſtrong ſmell, but nothing ſo pleaſant as the Flowers or Leaves; it periſhes not in* Winter, *but abides many Years, ſhooting forth a new every* Spring. Its Stalks are reddiſh and eaſy to break, riſing to be 3 Feet high, and ſometimes to 4 or 5; having at the Joints thereof, large winged Leaves, ſtanding one above another at Diſtances; which are made of many ſomewhat broad Leaves ſet on each ſide of a middle Rib, being hard, rough, or rugged, and Crumpled much like to *Elme* Leaves, from whence it took its Name; but having alſo ſome ſmaller Leaves with them, like as *Agrimony* has,

has, something deeply dented about the edges, of a sad green color, on the upper side, and greyish underneath; of a prety sharp smell and taste, very like unto *Burnet*; and will no less give a fine relish to a Glass of Wine, if a few Leaves thereof be put therein. At the tops of the Stalks and Branches, stand many Tufts of small white

MEDE--SWEET.

Flowers, thrust thick together, which smell much sweeter than the Leaves; which being fallen, in their places come crooked and cornered Seed, crookedly turning or winding one with another, and so making a fine little Head.

IV. *The second, or* Greater Mede-sweet, *or* Meddow-sweet. *The Root of this is more Woody than the former, with many blackish strings, which smell strong, and taste somewhat harshly.* This Plant grows higher than the former, with longer winged Leaves, set one above another upon the Crested browniſh Stalks, having long foot Stalks supporting them; each being usually divided into three parts, the two lowest one against another; and every part also consisting of three or five smaller Leaves than the other, separate each from the other, being hard, crumpled and finely dented about the edges, at the tops of the Stalks grow the Flowers in longer Spikes, more spatedly and not so thick thrust together, turning down their Heads, which are white like the former, and smelling very sweet also, more nearly resembling a *Goats Beard*, (which Name some Authors have given to it) than the first kind here described. *Gerard* says, it has Leaves of the bigness of *Wild Angelica*, and grows somewhat after the manner of *Wild Angelica*; that the Stalks are crested and divided into several Branches, which carry long bending Spikes or Ears of white Flowers or Seeds; each single Flower and Seed being something like the former.

V. *The Places.* The first grows in moist *Medows* which ly much wet, or near Watercourses, as the sides of *Rivers*, and watery *Ditches*, almost every where. The second grows in Woods, Copses, and shady places in *Germany* and other Countries, but here in *England*, only in *Gardens*.

VI. *The Times.* They are found in Flower through all the three *Summer* Months, *viz. June*, *July*, and *August*, and their Seed is ripe in some short time after.

VII. *The Qualities.* *Mede-sweet* is temperate in respect to heat or cold, but dry in the first Degree. Absterſive, Astringent, and Traumatick, or Vulnerary; Cephalick, Neurotick, Stomatick and Hysterick.

VIII. *The Specification.* It stops Bleeding, and cures Fluxes of the Bowels of all sorts, stops the Whites and Terms in Women, and gives ease in the Colick and Gripings of the Guts. And heals Wounds and old Ulcers.

IX. *The Preparations.* You may make from either Flowers, Leaves, or Root, or from all of them, 1. *A Liquid Juice.* 2. *An Essence.* 3. *A Decoction or Infusion in Wine.* 4. *A Pouder.* 5. *An Oil.* 6. *An Ointment or Balsam.* 7. *A Cataplasm.* 8. *A Distilled Water.* 9. *A Spirituous Tincture.* 10. *An Acid Tincture*

The Virtues.

X. *The Liquid Juice.* It stops all sorts of Fluxes, Bleedings, and Vomitings, as also the overflowings of the Terms in Women, and the Whites. It is said to alter and take away the fits of Quartane Agues, eases the Gripings of the Guts and moves the Belly downwards. Outwardly applyed it heals old Ulcers, which are cancerous or eating, and fills up fistulous or hollow Ulcers with Flesh, and cures Sores in the Mouth and secret parts. Dose from 2 to 6 Spoonfuls Morning and Night, or other in any Convenient Vehicle.

XI. *The Essence.* It has the Virtues of the *Juice*, and is more powerful to all the Intentions before specified, and is only to be given from 1 to 3 or 4 Spoonfuls in any proper Liquor, Morning and Night. It is Cordial and very much Cheers the Heart.

XII. *The Decoction or Infusion in Wine.* They have the Virtues of the *Juice* and *Essence*, but may be given from 2 to 6 or 8 Ounces, sweetned a little with white Sugar: It is very Stomatick, strengthens the Bowels, and causes a good Appetite.

XIII. *The Pouder.* It has the Virtues of the former *Preparations*, taken from half a Dram to a Dram in any proper Vehicle: if mixt with Honey and taken, it is good against Coughs, Catarrhs, Colds, Wheezings, Hoarseness, Shortness of Breath, and difficulty of breathing. Strewed plentifully upon old, moist and running Sores and Ulcers, it drys them, and induces a speedy healing: it is also said to kill Worms in Children.

XIV. *The Oil by Insolation or Boiling.* It eases Pains being applyed, and strengthens weak Joints, which have been lately Set, or where the Bones have been Broken.

XV. *The*

XV. *The Ointment or Balſam.* It digeſts, cleanſes, and induces the healing of old running Sores, putrid Ulcers, Fiſtula's and the like, and breeds Fleſh where it is wanting. Apply'd to parts or Joints pained with the Gout, it eaſes them.

XVI. *The Cataplaſm.* Made of the green Herb, and laid upon the Skin, it will in a ſmall time (as *Tragus* ſays) raiſe Bliſters thereon. Apply'd immediately to the Biting of a mad Dog, or Stinging of a Scorpion, Hornet, *&c.* it draws out the Poyſon and gives eaſe.

XVII. *The Diſtilled Water.* It has the Virtues of the *Juice*, but nothing near ſo powerfull: and being dropt often into the Eyes, it eaſes their pain, and allays their Heat and Inflamation. It may alſo ſerve as a Vehicle to take ſome of the other *Preparations* in.

XVIII. *The Spirituous Tincture,* It is Cordial, ſtrengthens the Stomach and other Bowels, ſtops Fluxes of all kinds, cauſes an Appetite and good Digeſtion, and is profitable againſt inward Bruiſes: and gives preſent eaſe in the Colick.

XIX. *The Acid Tincture.* It mightily ſtrengthens the Stomach, and cauſes a good Appetite; and ſtops Vomiting tho' of long continuance. It may be taken in all the Patient Drinks, whether Ale, Beer, or Wine; ſo much at a time as to give the Liquor a pleaſing ſharpneſs; and that as well at Meals, as between Meals.

CHAP. CCCCLXXXI.

Of MELILOTE:

OR,

KINGS-CLAVER.

I. *THE Names.* It is called in *Arabick, Alchilelmelick:* in *Greek,* Μελίλωτος; *quaſi Mellea lotus*, from *Lotus*, which ſmells ſweet like Honey: in *Latine, Melilotus:* and in *Engliſh, Melilote.* This Plant was anciently called in *Latine, Sertula Campana*, from its growing in *Campania*, where they uſed to put it in *Garlands:* alſo *Corona Regia*, becauſe the yellow Flowers Crown the Tops of the Stalks: and *Trifolium Odoratum*, from its pleaſant ſweetneſs, but improperly, becauſe the *Trifolium Odoratum*, truly ſo called, is *Our Garden Trefoil*, of which we ſhall ſpeak hereafter in its proper place. It is alſo called *Trifolium Equinum, & Caballinum*, becauſe Horſes delight to eat it, and thrive well with it: and ſo in many places of *England* it is called *Hart-Claver* (from Deer and Stags greedly feeding on it;) and in ſome places *Hart-wort*; but it is generally called with us *Kings-Claver* (as being the Nobleſt and chiefeſt of all the *Trefoils* or three Leaved Graſſes:) and *Melilote*, from the *Latine* and *Greek*, as being the Name now moſt uſed, and indeed beſt underſtood.

II. *The Kinds.* Authors have given us fourteen or fifteen ſeveral ſorts of this Plant, but the moſt of them being unknown and not growing in *England*, nor in our *Engliſh Plantations* beyond Sea, we ſhall only deſcribe the four following Species, *viz.* 1. *Melilotus Vulgaris, Melilotus major Vulgaris Tragi, Melilotus Germanica Camerarij, & Dodonæi; & Lobelij; Trifolium Odoratum Thalij & Dodonæi; Lotus urbana & ſativa Matthioli, & Lugdunenſis; Saxifraga Lutea altera, Fuchſij & Loniceri:* but *Serta* and *Sertula Campana*, the old *Latine* Name, is now quite out of uſe: Common Melilote. 2. *Melilotus Flore albo; Melilotus major candida Tragi; Lotus Sylveſtris Flore albo Dalechampij*; white Flowered Melilote. 3. *Melilotus Italica Camerarij; Melilotus Italica folliculis Subrotundis Baubini*, Italian Melilote. 4. *Melilotus Syriaca; Meliloti vulgaris Species tertia Tragi; Melilotus Italica Dodonæi, Fuchſij, Geſneri, & Matthioli; Melilotus Syriaca odora Lobelij*, (becauſe it came from *Aleppo*, as he ſays, but is uſed in *Italy* for the true *Melilot*, and therefore called by other Authors, as aforeſaid, *Melilotus Italica*; and this *Tragus* thinks to be the *Melilote* of *Serapio*:) Aſſyrian Melilote.

The Deſcriptoins.

III. *The firſt, or* Common Melilote. *It has a Root which is long, white, and tough, or pliant, with ſeveral Fibres or ſtrings adjoining thereto, which dies not every Year:* From this Root riſes up ſeveral weak green Stalks, about two or three feet high; on which grow longiſh Leaves, ſet round about at the Joints, three always ſet together like a *Trefoil*, of a freſh green color, and ſomewhat ſweet ſmelling, being unevenly dented or ſnipt about the

MELILOTE.

edges,

edges, and oftentimes eaten about the ſame. Out of the boſoms of the Leaves come ſmall ſlender Stalks about a handful long, ſet thick on their tops with little yellow Flowers, hanging down and turning up again; each Flower being compoſed of two little yellow Leaves, of which the uppermoſt turns up again; and the undermoſt ſeems to be parted into three: they are made much like other *Trefoils*, but ſmall and ſtanding in long Spikes, one above another for an hand breadth or better: which being paſt away, turn afterwards into long crooked Cods, in which is contained the Seed, which is brown and ſomething flat.

IV. *The ſecond, or* white Flowered Melilote. *Its Root is tough, white and ſlender, with many ſtrings or threads adjoining, periſhing commonly after it has given Seed, but ſprings up again of its own Sowing, Flowering the next year after its ſpringing, or after the Seeding.* This *Melilote* is very like the former, but has more Woody Stalks, riſing up higher, greater, and with ſmaller green Leaves, ſmelling much like the former, but weaker. The Flowers grow alſo in long Spikes and more in Number, of a white color, and leſſer alſo, which turn into ſmall round Heads, and not crooked like the other.

V. *The third, or* Italian Meliote. *Its Root is ſmall long and Woody, periſhing every year, and ſeldom riſes again of its ſhed Seed, but muſt be new ſown every Spring.* It has ſeldom more than one Stalk riſing from its Root, which quickly grows whitiſh and a little Woody, ſet here and there with three Leaves at a Joint, which are much larger than the former, and the end Leaf larger than the other two; ſomething unevenly waved or cut in on the edges, of a ſmell almoſt as ſtrong as the firſt, but ſomewhat more pleaſant. At the tops of the Stalks grow many Flowers, ſpike faſhion, but of a more deep yellow color, and ſomething larger alſo than the firſt, which turn into round whitiſh Heads, greater than the laſt, which uſually contain but one Seed or grain apiece.

VI. *The fourth, or* Aſſyrian Melilot. *Its Root is Woody, and periſhes every year, after it has given Seed.* It riſes up with ſeveral Stalks about two feet high, ſet with Joints: at every one of which grow three Leaves, ſomething larger than thoſe of the firſt, but not ſo large as thoſe of the laſt or third deſcribed, and a little dented about the Edges. The Stalks ſpread themſelves forth in Branches towards their tops, on which grow many pale yellow Flowers, ſet in order one above another, as in the former, which turn into ſmall, long, and ſomewhat flat Cods, a little crooked or bending at the end like an Hawks Bill, in which is contained the Seed. The whole Plant, as well Flowers as Leaves and Seed, did ſmell very ſweet at their firſt bringing out of *Aſia*, or *Syria*, into *Europe*; but gradually, it grew every year weaker and weaker, ſo that as it ſeems, it has not now near half ſo good a ſmell as it had formerly. This Kind *Pena* ſays, is uſed in *Italy* inſtead of the true *Melilot* (which is the firſt deſcribed in this Chapter) for that there is great ſtore of it growing in that Country.

VII. *The Places.* The firſt grows plentifully in *Germany*, and alſo is very common in moſt parts of *England*, as in the edge of *Suffolk*, and in *Eſſex* in divers places; alſo in *Huntington-ſhire*, *Cambridge-ſhire*, and the *Iſle of Ely*; but moſt uſually in *Corn-Fields*, in the corners of *Medows*, and on plowed Lands ends, and in the *Furrows* of *Corn-Fields*, and ſometime among the Corn it ſelf: and certain it is, that it grows not more plentifully in any part of the World, than in *England*, eſpecially in the Counties aforenamed. It grows between *Sudbury* in *Suffolk*, and *Clare* in *Eſſex*, and from *Clare* to *Henningham*, and from thence to *Ovendon*, *Pulmare* and *Pedmarſh*, where many Acres of Ground are overgrown with the ſame, inſomuch, as that it becomes almoſt an annoyance both to the Land and Corn, generally overſpreading that part of the Shire. The ſecond grows not Wild with us, but is Nurſed up in *Gardens*; in *Germany* it grows plentifully as the other does. The third grows in *Italy*. And the fourth in *Syria* about *Aleppo*, from whence it was brought to *Venice*, and theſe two laſt grow here alſo in *Gardens*, as the ſecond does.

VIII. *The Times.* They all Flower in the *Summer* Months, in *June*, *July*, and *Auguſt*, and their Seed is ripe quickly after.

IX. *The Qualities.* It is hot and dry in the firſt Degree; Aſtringent, and Maturative; and yet withall Diſcuſſive, where Suppuration cannot be expected, alſo Traumatick or Vulnerary, Diuretick, Nephritick and Lithontriptick.

X. *The Specification.* It diſcuſſes Tumors, heals Wounds and Ulcers, provokes Urine, expels Stone and Gravel, and cleanſes the Reins, Ureters and Bladder of Pituitous Humors and Tartarous Matter.

XI. *The Preparations.* You may have herefrom, 1. *A Liquid Juice.* 2. *An Eſſence.* 3. *A Decoction in Wine or Water.* 4. *A Vinegar.* 5. *An Inſolated Oil.* 6. *An Emplaſter ſimple.* 7. *An Emplaſter Compound.* 8. *A Balſam.* 9. *A Cataplaſm.* 10. *A Diſtilled Water.*

The Virtues

XII. *The Liquid Juice.* It comforts the Stomach and Bowels, and is good to ſtop Fluxes of the Bowels. Dropt into the Eyes it is ſingular good againſt Pains and Inflamations there, and to take away Clouds, Films or Pannicles growing upon the Sight, and to ſtrengthen the Eyes. And it is effectual to be given to thoſe who are in fear of an Apoplexy, or have ſuddenly loſt their Senſes by a Paroxyſm, to ſtrengthen the Head and Brain, and reſtore the Memory, the Head being alſo externally bathed with the ſame. Doſe 2 or 4 Spoonfuls in a Glaſs of Wine Morning and Night.

XIII. *The Eſſence.* It has all the Virtues of the *Juice*, and may be given from one to three Spoonfuls in ſome proper Vehicle. Dropt into the Ears it eaſes their Pains; and dropt into ſore and running Eyes, it ſtops the Flux of Rheum. Applyed to hard Tumors or Swellings, it diſcuſſes and ſoftens them; and is profitably applyed to ſimple Contuſions.

XIV. *The Decoction in Wine or Water.* Bathed upon the Head it gives eaſe in the Head-ach: ſpreading Ulcers being waſhed therewith it cleanſes and drys them. The *Decoction of the Flowers* with *Camomil* in *Mutton Broth*, and uſed *Clyſter-wiſe*, expels Wind, and eaſes pains of the Belly. Made with Wine and Drank, it is good to ſtrengthen the Memory.

XV. *The Vinegar.* It is admirably diſcuſſive, eaſes Pain and diſolves Tumours by bathing the part affected therewith: and ſo uſed, it comforts the Head, Brain, and Nerves: It diſſolves Hardneſs, diſcuſſes Wind, and Tumors of the Spleen, Liver,

Belly, and Hypochonders, mightily easing the Pains of those Parts.

XVI. *The Infolated Oil.* It mollifies hard Tumors and Inflamations, discusses Swellings in the privy parts of Man, or Woman; it is a most Sovereign thing both for green Wounds, and old Sores, for Tumors, Cramps, Convulsions, Pains and Aches in any part of the Body whatsoever, whether in the Musculous or Fleshy parts, or among the Nerves, Tendons, Veins, Arteries, *&c.* It is made of the *Flowers and Herb with Oil Olive, Infolated, or boiled in* Balneo, *and then strained forth, repeating this with fresh Herbs and Flowers three times.*

XVII. *The simple Emplaster.* It is thus made, *Take green Melilote cut small* 5 *Pounds*; *pure Rosin* 8 *Pounds*; *yellow Wax* 4 *Pounds*; *Sheeps Suet* 2 *Pounds*; *Turpentine* 1 *Pound*; *mix, boil, strain out, and make an Emplaster according to Art.* It ripens Tumors, breaks and cures them, draws, cleanses and heals Wounds admirably in any part of the Body; only be cautious of applying it to Wounds of the Legs, or other depending parts, for fear it should cause a flux of Humors, not easily to be diverted.

XVIII. *The Compound Emplaster. Take Flowers of Melilot 6 Ounces: Camomil Flowers, Fænugreek Seed, Bay Berries, husked, Althæa Roots, Tops of Wormwood and Marjerom, of each 3 Drams: Seeds of Parsly, Bishops-weed and Carduus, Roots of Orrice, Cyperus and Spicknard, Cassia lignea, of each a Dram and half: Ammoniacum 10 Drams: Storax Calamita, Bdellium, of each 5 Drams: Turpentine an Ounce and half: Pulp of fat Figs, N° xij: Goats Suet, Rosin, of each 2 Ounces and half: Wax 6 Ounces: Oils of Sweet Marjerom and Spicknard, of each 3 Ounces: Beat those things which are to be beaten; Extract those things which are to be extracted, as the Pulp of Figs, Althæa Roots, and Fænugreek*, &c. *Dissolve the Ammoniacum and Bdellium in Vinegar*, &c. *Then mix and make the Emplaster according to Art, adding the Oils of Sweet Marjerom and Spicknard, towards the end of the Operation.* It is Maturative, Emolient and Anodyn, draws, cleanses and heals, strengthens the Stomach, Liver, Spleen, and Bowels, discusses Wind and Tumors, helps Hypochondriack Melancholy, Vomiting, Indigestion, Rickets, *&c.*

XIX. *The Balsam.* It is made by *boiling the green Herb bruised 2 Pounds, in Oil Olive 3 Pounds, to Crispness, then straining out, and renewing this Work three times: at length to every Pound of the strained Liquor add Bees Wax half a Pound: Chio Turpentine, Balsam Capivij, Gum Elemi Extracted, Balsam of Peru, of each 4 Ounces: mix and compleat the Balsam.* It heals green Wounds commonly at the first intention, and many times at one dressing: It digests eating Ulcers, cleanses putrid running Sores, incarnates, drys and heals; eases Pains in any parts, chiefly of the Nerves and Tendons, and cures the Gout, being fitly applyed.

XX. *The Cataplasm.* It is made of the *Flowers and Leaves boiled in Wine, and brought to a Consistency with Meals of Fænugreek and Lin Seed, or Barly Flower, or Poppy Seed beaten soft and small, or Yolks of Eggs boiled hard.* It softens all hard Tumors and Inflamations in the Eyes, Nerves, Tendons, Muscles, *&c.* in any part of the Body, Fundament, Testicles, or private parts of Man or Woman; ripens and breaks Apostems, stops the course of eating and spreading Ulcers, resists the putridity, digests and eases the Pain, *&c.*

XXI. *The Distilled Water.* It is made of the *Herb and Flowers, by an Alembick with a naked fire, or in Balneo.* Some use it as a Perfume; but mixt with an equal quantity of common Spirit of Wine, it makes a *Collyrium*, which dropt into the Eyes, cools, takes away Inflamations, and hot Rheums, clears the Sight, eases the Pain, and strengthens the part, thereby preventing any new or future Fluxion of Humors to the same.

CHAP. CCCCLXXXII.

Of MELON Garden:

OR,

POMPION Garden.

I. *THE Names.* It is called in *Greek*, Πέπων: in *Latine*, *Pepo*: and in *English*, *Melon*, *Million*, and *Pompion.*

II. *The Kinds.* There are four principal sorts of this Plant, *viz.* 1. *Pepo Hortensis*, the Garden Melon or Pompion, of which in this Chapter. 2. *Pepo Sylvestris*, the Wild Melon, or Pompion, of which in Chap. 483. 3. *Melopepo, Melo moschatus*, the Musk Melon, of which in Chap. 484. 4. *Melo vel Pepo aquaticus, Citrullus*, the Citrul or Water Melon, of which in Chap. 485. following.

III. *The Kinds of the Garden Melon or Pompion.* There are these following Species, *viz.* 1. *Pepo maximus oblongus*, the great long Melon or Pompion. 2. *Pepo maximus rotundus*, the great round Melon or Pompion. 3. *Pepo maximus compressus*, the great flat bottomed Melon or Pompion. 4. *Pepo maximus clypeatus*, the great Buckler-like Melon or Pompion. 5. *Pepo minor, sive Virginianus*, the smaller or Virginian Melon or Pompion, called also *Virginian Macock.*

The Descriptions.

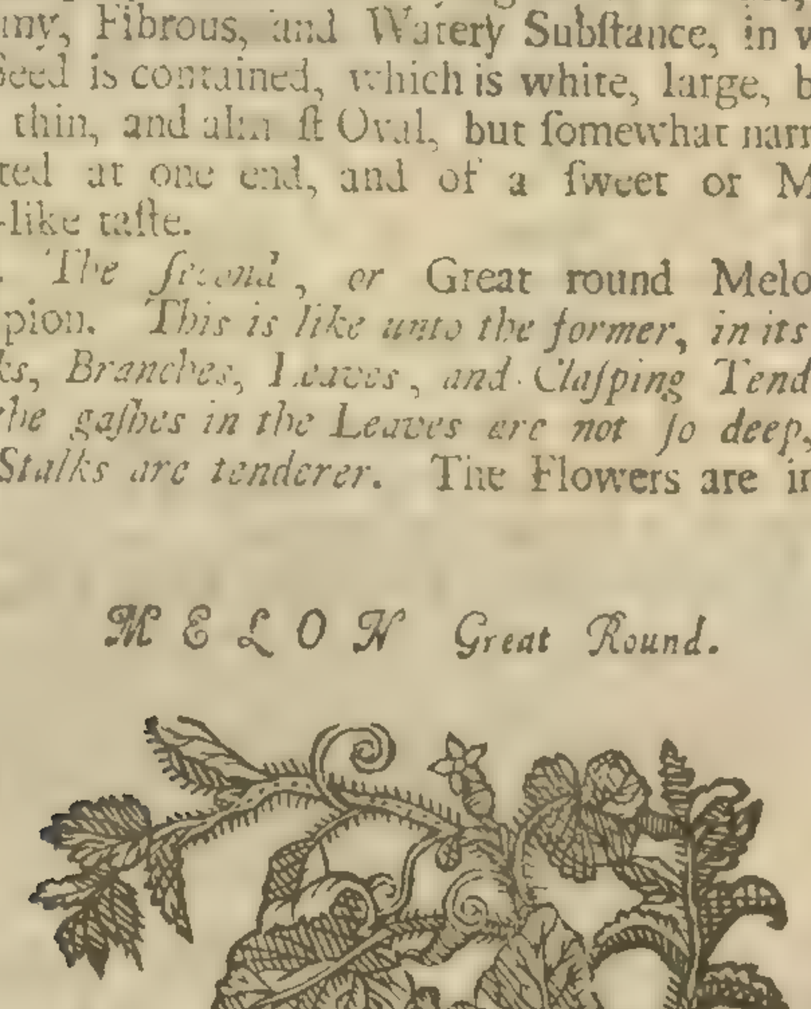
IV. *The first, or* Great long Melon or Pompion. *Its Root is of the bigness of a Mans Thumb, or larger, dispersed under Ground, with many small Fibres thereto adjoined.* From this Root come forth thick and rough prickly Stalks or Branches, which creep upon the Ground, if nothing is near it to take hold of, otherwise with its clasping Tendrels, it climbs upon such things as are near to it, as Poles, Arbors, Pales, Hedges, Shrubs, *&c.* upon which great, ribbed, rough Branches, grow very large, rough Leaves, cut in on the edges with deep gashes, and dented also round about like a Saw, with many Claspers, which winde about every thing they meet withall. The Flowers

are

are great and large, hollow and yellow, like unto a Bell Cup, divided in the brim into five parts or points ſtanding out like Teeth. At the bottom of which, (as is in all the reſt) grows up the Fruit, which is very great, thick, round, and long, or of an Oval form, ſometimes of the bigneſs of an ordinary Mans Body, ſet round with bunched Ribs in ſome, and more plain and flat in others. The Rinde is either of a green, or grey, or yellow color, or whitiſh, or party colored, as Nature is pleaſed to vary it, and of a mean hardneſs. The harder pulp of the Fruit is yellowiſh, or of a whitiſh yellow, and of a ſtatuent taſte: but the thinner pulp within that, lying in the middle, is of a Slimy, Fibrous, and Watery Subſtance, in which the Seed is contained, which is white, large, broad, flat, thin, and alſo ſt Oval, but ſomewhat narrower pointed at one end, and of a ſweet or Milky, Nut-like taſte.

V. *The ſecond*, *or* Great round Melon or Pompion. *This is like unto the former, in its Root, Stalks, Branches, Leaves, and Claſping Tendrels; but the gaſhes in the Leaves are not ſo deep, and the Stalks are tenderer.* The Flowers are in like

MELON Great Round.



manner yellow, gaping, cornered or pointed at the top, as thoſe of the former; but the Fruit is ſomething rounder, ſometimes greater, and ſometimes leſſer, and often times of a green color, with an harder Bark, and ſometimes now and then ſofter and whiter. The harder pulp within is like the other, and the Seeds have alſo the ſame form, with very little difference in their magnitude.

VI. *The third*, *or* Great flat bottomed Melon or Pompion. *This differs not much from the other two in its Root, rough Stalks, or Branches, and in its gaſhed or dented Leaves.* The Flower is alſo great and yellow, like thoſe of the others: but the Fruit (which is of a great bigneſs) is compreſſed or flat bottom'd and ſ Rinde is full of little hilly Welks, not much unlike to thoſe of the *Green* Rinde or Peel, which when it is ripe, is in like manner yellow.

VII. *The fourth*, *or* Great Buckler-like Melon, or Pompion. *This very much differs from the others in ſome: the Roots, Stalks, Leaves, and Flowers, are much like the others*; but the Fruit is not long nor globular, but altogether broad, and in a manner flat, like unto a Shield or Buckler, thicker in the middle, but thinner in the circumference, and curled, hilled, or bumped, up and down about the edges, like the rugged or uneven Peel of the *Citron*: and this Rinde is very ſoft, thin and white. The ſolider pulp within, is hard and durable, and the Seed in form, color, and taſte, like the former Kinds, but ſomewhat leſs.

VIII. *The fifth*, *or* Smaller or Virginian Melon or Pompion. *Its Root conſiſts of many whitiſh Branches, creeping far abroad in the Earth, which periſh at the firſt approach of* Winter. From whence ſpring up rough cornered or ſtraked Branches, trailing upon the Ground, 8 or 9 feet long or longer, which ſpread themſelves and run upon the ſurface of the Earth, and are again divided into other Branches of a blackiſh green color, covering and taking up a great deal of room, ſending forth broad, cornered rough Leaves, on great, groſs, long, rough, hairy foot Stalks; like and full as large as the Leaves of the firſt or common *Melon or Pompion*; with claſping tendrels, and great, broad, ſhriveled, yellow Flowers, like to thoſe of the common *Pompion*. After them comes the Fruit, upon the Stalks, not commonly ſo near the Root, but towards the tops or ends of the Branches; ſomething round, and not extending in length, but flat like a Bowle, and not ſo big as an ordinary Bowle, being ſeldom above 3 Inches in thickneſs or length, and 4 Inches in breadth; of a blackiſh green color when it is ripe. The eatable pulp is of a whitiſh yellow color, containing within that, a great deal of a thinner, ſoft, ſlimy, fibrous Subſtance, in which the Seed lyes in certain rows, like that of the firſt or common *Pompion*, but much ſmaller.

IX. *The Places.* Theſe are all planted in *Gardens* in *England*, and other Countries, and delight in a rich and fruitful Soil, and even in our Country, they come to great perfection.

X. *The Times.* They are planted in the latter end of *March*, or the beginning of *April*: Flower in the latter end of *July*, and *Auguſt*, and their Fruit is ripe in *September* and *October*.

XI. *The Qualities.* The Fruit (which is that which is chiefly made uſe of) is cold and moiſt in the ſecond Degree; Abſterſive, Anodyn, Diuretick, Lenitive, Nephritick, and Lithontriptick.

XII. *The Preparations.* You may have herefrom. 1. *A Liquid Juice of the Fruit.* 2. *The Pulp of the Fruit.* 3. *An Emulſion of the Seed.* 4. *A Cataplaſm of the Pulp.* 5. *A Diſtilled Water of the Fruit.*

The Virtues.

XIII. *The Liquid Juice.* Given from a Spoonful to two, in the *Diſtilled Water*, and ſweetned with *Syrup of Clove-Gilliflowers*, it quenches Thirſt, abates the violent heat of Burning Fevers, allays the heat and inflamation of the Stomach and other

Bowels, prevails againſt the Scurvy in a hot habit of Body, provokes Urine, and gives eaſe in the Stone and Strangury, being taken Morning and Night. It is alſo good againſt Vapors, and a *Flatus*, proceeding from the Spleen or Diſtemper of the Hypochonders.

XIV. *The Pulp of the Fruit.* It is never eaten raw but boiled, for ſo it more eaſily deſcends, and by it's lenitive property, makes the Belly Soluble. It has all the Virtues of the *Liquid Juice*, and being dreſt with Butter, Pepper, Salt, and Vinegar, it may be eaten in quantity, according to pleaſure: it nouriſhes not much, but being boil'd in Milk, and eaten as aforeſaid, it makes a good and wholeſome Food, cooling and grateful to a hot Stomach, and inward parts which are inflamed. The ſame Pulp ſliced, and fried in a Pan with Butter, is alſo good and wholeſom: but Baked in an Oven with Apples, it is very flatulent or windy; unleſs it be ſo often Baked, or in ſuch a violent hot Oven, that the Pulp becomes red, then it looſes its windy property, and becomes very wholeſom, with an Emollient and cooling property.

XV. *The Emulſion of the Seed.* It has the Virtues of the *Liquid Juice of the Fruit*, but cleanſes the Reins and Bladder much more, and more powerfully provokes Urine, being very good for ſuch as are troubled with the Stone in the Reins: It is an excellent thing againſt the Strangury, takes away the heat and ſcalding of the Urine, and cures the piſſing of Blood.

XVI. *The Cataplaſm of the Pulp.* Applyed to pained Joints, and parts affected with the Gout it gives eaſe, and diſcuſſes the Humor, abating the heat. It is good againſt Inflamations, and diſcuſſes ſimple contuſions being immediately applyed to them. It alſo gives eaſe in the vehement pain of the Head, proceeding from heat and Inflamation, and takes away the Inflamation and Blood-ſhot of the Eyes.

XVII. *The Diſtilled Water.* It is good againſt an Eryſipelas by bathing the parts affected often therewith, and applying Linnen Cloths four or ſix times double thereupon, wet in the ſame. Taken inwardly, it has the Virtues of the *Liquid Juice of the Fruit*, and *Emulſion of the Seed*, and may ſerve as a Vehicle, for conveying other Medicaments in, appropriated to the Reins and Bladder: mixed in equal quantities, with a Spirit drawn from Sugar, it makes an incomparable Eye water, to eaſe the pain of the Eyes, ſtop Rheums and Defluxions, take away Inflamations and Blood-ſhot, to heal Ulcers and Sores therein, clear the Sight, and ſtrengthen the part againſt any future Defluxions.

CHAP. CCCCLXXXIII.

Of MELON-WILD.

OR,

POMPION-WILD.

I. *THE Names.* It is called in *Greek*, Πεπων ἄγριος: in *Latine*, *Melo vel Pepo Sylveſtris*: and in *Engliſh*, *Wild Melon or Pompion.*

II. *The Kinds.* There are two ſorts of this Plant, *viz. Melo vel Pepo Sylveſtris major*, The Greater Wild Melon or Pompion. 2. *Melo vel Pepo Sylveſtris minor*, The Leſſer Wild Melon or Pompion.

The Deſcriptions.

III. *The firſt, or* Greater Wild Melon or Pompion. *It has a Root which is thick, round, and ſharp pointed, having ſeveral Fibres adjoining to it.* From which come forth rough, uneven Stalks, ſet with ſharp, thorny Prickles: The Leaves are alſo rough, and jagged or much cut in on the edges, of an unpleaſing green color, and the Flowers are of a yellow color, much like thoſe of the *Garden Kind.* The Fruit is thick, round, and long, almoſt of an Oval faſhion, ſharp pointed, and having a hard green Rind, whoſe firſt Pulp or Meat is hard like the others: but the middle Pulp ſoft and ſlimy, in which is contained the Seed, which is like that of the *Garden Pompion*, but the whole very bitter in taſte.

IV. *The ſecond, or* Leſſer Wild Melon or Pompion. *This in its Root, Stalks, Branches, Leaves, Flowers, Fruit, Seed, and manner of growing, is very like the former but now deſcribed*, and differs from it only in its Magnitude, this being every ways much leſs than it.

V. *The Places.* Theſe Plants grow Wild in *Barbary*, and moſt parts of the *Weſt-Indies*; but with us in *England*, they only grow (being Sown) in *Gardens.*

VI. *The Times.* They ſpring up, and Flower in the ſame Seaſons, with thoſe of the *Garden Kinds.*

VII. *The Qualities.* Theſe *Melons* are hot and dry in the third Degree; and are very bitter: they are alſo Abſterſive, Hyſterick, and Cathartick.

VIII. *The Specification.* They are peculiar for the curing of Dropſies and the Kings Evil: and to provoke the Terms in Women.

IX. *The Preparations and Virtues*, of theſe *Wild Melons or Pompions*, are the ſame with thoſe of the *Wild Cucumber*, in *Chap.* 479. & *Sect.* 9, *ad* 27. where you may have abundant ſatisfaction.

X. *Nota.*

X. *Nota.* If into the Shell or Rind (after the Pulp or Substance of the Seed is taken forth) you put in White *Port* or *Lisbon* Wine, and it let remain therein so long, till it becomes bitter, it admirably purge the Belly, and will educe Pituitous, Cholerick, and Watery Humors, and carry off the the Morbifick cause of the *Dropsy Sarcites*, or *Anasarca*, as also of the Kings Evil and the Gout.

XI. *The Inspissate Juice of the Fruit.* It has the same Operation with that of *Elaterium*, or *Inspissate Juice*, or *fœcula* of the *Wild Cucumber*; and may be very well used in place thereof, for all those Diseases to which the *Elaterium* is applyed; but I am apt to believe it must be given in a larger Dose, *viz.* in full the Double quantity.

CHAP. CCCCLXXXIV.

Of MELON -- MUSK.

I. THE *Names.* It is called in *Greek*, Μῆλον: (which signifies an Apple: and therefore some Authors have called it) Μηλοπέπων, *Melopepon*: (or *Pepon* smelling like an *Apple:*) in *Latine*, *Melo*, *Melopepo*, *Melo moschatus*, and *Melo Muschatellinus*: in *English*, *Musk Melon.*

II. *The Kinds.* Authors make four Species of this Plant, to which we shall add a fifth, growing in *America*, *viz.* 1. *Melo*, *vel Melopepo vulgaris*, Our Common Musk-Melon. 2. *Melo Hispanicus*, the Spanish Musk-Melon. 3. *Melo Pyriformis*, the Pear-fashon'd Musk-Melon. 4. *Melo Saccharinus*, the Sugar Musk-Melon. 5. *Melo Americanus*, *vel Floridianus*, *Melo Carolinianus*, *vel Virginianus*, the American or Carolinian Musk-Melon.

The Descriptions.

III. *The first*, *or* Out Common Musk Melon. *It has a long Root with many Fibres at it, running not very deep into the Earth, but in a great measure under the upper crust of the Ground.* From this Root shoot forth Stalks, Branches and Leaves, much resembling those of the *Cucumber*, both in the manner of growing, and in its trailing Branches, which are rough, with rough uneven Leaves, with yellow Flowers: after which come the Fruit, which is rounder, thicker, bigger, and rugged, than any *Cucumber*; and spotted on the out side, of a russet color, and green underneath, which when it comes to be full ripe, will change a little yellowish, being deep furrowed and ribbed, and sometimes without Ribs, and having many times chaps and rifts in some places of the Rind. The inward hard Pulp, is yellow, and of a pretty fast or solid Substance, and is only eaten: The Pulp

within that, is very soft, slimy, and watery, and of a pretty deep yellow color, in which is contained the Seed, which is something larger and yellower than that of the *Cucumber*. The Fruit coming to be of a strong sweet smell, and changeing its color, either to yellowness, or a green yellow, shews its coming to ripeness: but it requires much watering in the hot time of the day, to induce its sooner ripening.

IV. *Gerard* has this Description of it. *It is like to the* Common Cucumber *in its Stalks, lying flat upon the Ground, long, Branched and rough.* The Leaves are much alike, but lesser, rounder, and not so cornered. The Flowers in like manner are yellow. The Fruit is bigger (than the *Cucumber:*) at first something hairy, something long, and somewhat round; often times greater, and many times lesser. The Bark or Rind is of an over-grown russet green color, ribbed and furrowed very deeply, having chaps or Chinks, and a confused roughness. The Pulp which is to be eaten is of a faint yellow color, the middle part of which is of a slimy moisture, in which is contained the Seed, much like to that of the *Cucumber*, and of a browner color.

V. *The second*, *or* Spanish Musk-Melon. *It has from its Root which is like the former, long trailing Branches, on which grow broad Leaves, slightly indented about the edges, not divided at all as are all the rest of the* Melons. The Fruit is large for the most part, and grow near unto the Stalk, like unto the *Common Garden Melon or Pompion*, very long, not crested or furrowed at all, but spotted with very many such marks or spots as are on the back side of the *Harts-tongue* Leaf. The Pulps (both the firmer and the softer) as also the Seed, are much like the former.

VI. *The third*, *or* Pear fashioned Musk-Melon. *It has many long Viney Branches, upon which grow cornered Leaves, like those of the Vine*; as also great

great ſtore of long Tendrels, claſping and climbing, and taking hold almoſt of any thing they touch. The Fruit grows upon ſlender foot Stalks, and is faſhioned ſomething like a Pear, and of the largeneſs of a very great Quince.

VII. *The ſweet*, *or* Sugar Musk-Melon. *It has long trailing Stalks or Branches, lying upon the Ground*, on which grow ſmall claſping Tendrels, like thoſe of the *Vine*; and alſo Leaves like unto the *Common Cucumber*, but of a greener color: the Fruit comes forth among thoſe Leaves, growing upon ſlender foot Stalks, and round as a *Colequintida Apple*, and of the ſame bigneſs, being of a moſt pleaſant taſte like Sugar, from whence it took its Epithite or Sir-Name.

VIII. *The fifth*, *or* American, *or* Carolinian Musk-Melon. *It differs but very little from the firſt deſcribed in this Chapter, neither in its Root, Stalks, Branches, Leaves, nor Flowers, nor in its form or manner of growing, ſaving that the Plant is in all its parts much bigger.* The Fruit is big, round ribbed; and very large, ſometimes as large as *Our Great Common Garden Pompions*, and almoſt of the ſame ſhape, both of the firſt long Kind, and of the ſecond round Kind, ſaving in the ribbing hereof, and when it is ripe, it is in its Rind of a whitiſh yellow color, and of the thickneſs of *Our Common Pompion*. The more ſolid Pulp, as alſo the ſoft ſlimy, and the Seeds contained therein are like for ſubſtance and color, to the firſt here deſcribed, and very pleaſant in taſte: but the Seed is larger.

IX. *The Places*. They delight to grow in hot Countries, as *Spain*, *Italy*, *Africa*, the Coaſts of *Barbary* and *Ægypt*, in ſeveral parts of *Aſia*, and the *Eaſt* and *Weſt Indies*, yet they thrive and come to perfection here in *England*, being Huſbanded with Care: and the laſt grows plentifully in *Carolina*, an *Engliſh* Settlement in *America*, and in other parts of that Continent.

X. *The Times*. They are ſown in the latter end of *March*, and in *April*; and their Fruit is ripe in *Auguſt*, from the beginning of the Month to the end thereof.

XI. *The Qualities*. The Fruit and Seed are cold and moiſt in the ſecond Degree; cleanſing, and very grateful and refreſhing to the Stomach and other Bowels.

XII. *The Specification*. The Fruit and Seed cool in Fevers, and admirably repreſs Luſt.

XIII. *The Preparations*. You may have therefrom, 1. *The more ſolid Pulp*. 2. *A Liquid Juice of the Fruit*. 3. *An Emulſion of the Seed*. 4. *A Diſtilled Water of the Fruit*.

The Virtues.

XIV. *The Liquid Juice of the Fruit*. Given from one Spoonful to two mixt with ſome of the *Diſtilled Water*, and ſweetned with *Syrup of Clove-Gilliflowers*, or of *Violets*; it cools and takes away the heat of Burning Fevers, and by repeating it at due diſtances of time cures it: it alſo much abates Luſt, and takes away the Potency of Generation.

XV. *The more ſolid Pulp of the Fruit*. It is uſed to be eaten as a Sallet, the outward Rind being firſt pared off pretty thick, and alſo being freed from the inward ſoft ſlimy matter: It is then ſliced and eaten raw with Pepper and Salt, and by ſome with Sugar only; by which way, it very much cools and refreſhes the Stomach, more eſpecially if a Glaſs of Wine be drank after it.

XVI. *The Emulſion of the Seed*. It cures the hot burning fits of Fevers, quenches Thirſt, cools the Stomach and Bowels; looſens the Belly, cleanſes the Reins, Ureters and Bladder, provokes Urine, eaſes the Strangury, takes away the heat and ſcalding of Urine, helps ſuch as make bloody Water, and repreſſes Luſt, (being long uſed) after a ſingular manner.

XVII. *The Diſtilled Water*. It has all the Virtues of the *Liquid Juice of the Fruit*, and of the *Emulſion of the Seed*: and may be taken from four to ſix or eight Ounces ſweetned with ſome proper *Syrup*. Uſed as a Topick, it cools Inflamations, helps blood-ſhot and ſore Rheumatick Eyes; and clears, ſoftens, and whitens the Skin, removing Scabs, Itching, Scurf, Morphew, black and blew Spots, Tanning, Sunburning, and other defœdations thereof: and this more eſpecially if a little *Juice of Limons*, or very ſharp white Wine Vinegar, be mixed with it, (but is not then to be uſed to the Eyes.)

CHAP. CCCCLXXXV.

Of MELON-WATER: OR, CITRUL.

I. *THE Names*. It is called in *Arabick*, *Batec*, *& Batecha*: of the *Ægyptians*, *Chate*, *Abdolavi*, *Chajar*; and is thought to be the *Dulbaba Serapionis*: in *Greek* by *Ætius* (who firſt Named it in that Language) Ἀγγούριον, or Ἀγγούρια, (which with the *Greeks* did ſometimes ſignifie a *Cucumber*.) In *Latine*, *Anguria*, *Citrulus*, *& Citrullus*; *à Citreo colore & forma*: alſo by ſome *Cucumis Citrullus*, to diſtinguiſh it from the *Cucumber*: in *Engliſh*, *Water Melon*, and *Citrul*, or *Turky Melon*.

II. *The Kinds*. There are ſeveral ſorts of this Plant, but the three following are chief, *viz.* 1. *Anguria ſive Citrullus vulgatior*, The Common Citrul, Water Melon, or Turkey Melon. 2. *Anguria Americana*, *Citrullus Floridianus*, *Citrullum Carolinianum*; The American or Carolinian Water Mellon, or Citrul. 3. *Anguria Ægyptiaca*, the Ægyptian Citrul or Water Melon.

The Deſcriptions.

III. *The firſt*, *or* Common Citrul, Water Melon, or Turkey Melon. *The Root ſpreads under the Ground, with ſeveral Ramifications and Fibres or Threads adjoining to them, and dies every year as the reſt do.* In its form and manner of growing, it is like other *Melons* and *Cucumbers*, trailing and lying upon the Earth, with its Vine-like Branches: the

the Leaves of which are hairy, longer, and narrower than in any other, and more divided into ſeveral parts, having ſmall Claſpers and yellow Flowers: but the Fruit is greater than a *Musk-Melon*, and ſomething near the faſhion of a *Pompion*, with a ſmooth greeniſh Bark or Rind, which will grow yellowiſh in time, having ſome ribs thereon. The Pulp or inward Subſtance is wateriſh, in ſome ſweet, in others a little tart, or acid, but in the whole very pleaſant and delectable to the Taſte. The Seed is contained therein, and is ſmaller, rounder, blacker, and harder Shell'd, than that of the Ground.

Turkey Water Melons: or, *Citruls.*

IV. *The ſecond, or* American, or Carolinian Water-Melon or Citrul. *Its Root is like the former; and the whole Plant varies but little from it in its Stalks, Branches, Leaves, Flowers, and manner of Growing:* But the chiefeſt difference is in the Fruit, which is as great as a middle ſiz'd *Melon* or *Pompion*, ſome of which are a Foot or ſixteen Inches long, and thick in proportion to that length, having a diſcolored Rind, variably ſpotted and ſtriped with white ſpots upon the green; the inner Pulp of which in ſome is white, in ſome reddiſh, and in ſome almoſt a purpliſh color, very watriſh, and of a moſt pleaſant and delectable Taſte; but tho' it is watriſh, yet it is of firmer Subſtance than the former, and will keep after it is ripe for ſome ſmall time. The Seed within this is like the other, but longer, greater, redder or browner, and more ſmooth or ſhining.

Citruls: or, *Water-Melons American.*

V. *The third, or* Ægyptian Citrul or Water-Melon. *This in its Roots, Stalks, Branches, Leaves, and Flowers, differs but little from the former; but its Fruit is much larger than thoſe.* For ſome of theſe are ſo great, as *Bellonius* ſays, that about ſix of them will load a Camel, and one or two of them a Man: the outward Rind is yellow, the inner Meat or Subſtance very little and almoſt empty, filled in the middle with much Water which is very ſweet, and much deſired and drank by the People of the places where this Fruit grows; with which ſome mix *Damask Roſe Water*, others *Musk* and *Ambergriſe* to perfume it, and offer it as a great thing, for the Entertaining of their Friends: The Seed is not in great quantity, but ſmaller than the Seed of the former; in other things there is but little difference.

VI. *The Places.* The firſt grows throughout *Turky*, and in all *Italy*, as alſo in *Spain*, the *Weſt-Indies*, and other hot Countries. The ſecond grows peculiarly in *America* or the *Weſt-Indies*, and in a very great plenty in *Carolina*, both North and South. And in *Virginia*, and other places of the *Floridian* Continent. The third is a Native of *Ægypt*, as *Proſper Alpinus* ſays in his Book of *Ægyptian* Plants, and *Bellonius* in his *Obſervations*, *Lib.* 2. *Chap.* 75.

VII. *The Times.* They all are Planted of the Seed in the *Spring* time, *viz.* in *March* and *April*, and Flower in *June* and *July*, and the Fruit is ripe in *Auguſt*, or about the ſame time in which the others are ripe.

VIII. *The Qualities.* The Fruit and Seed, are cold and moiſt in the ſecond Degree: The Seeds being reckoned one of the four cold Seeds. They are Abſterſive, Diuretick, Nephritick and Antifebritick, even beyond all the other ſorts of *Melons.*

IX. *The*

IX. *The Specification.* They abate the heat of Fevers, ſtrengthen the Stomach, refreſh the whole Body, and help the Strangury, ſharpneſs, heat and ſcalding of the Urine, *&c.*

X. *The Preparations.* You may have therefrom, 1. *The Pulp, or Sallet.* 2. *The Liquid Juice.* 3. *An Emulſion of the Seed.* 4. *A Diſtilled Water from the Fruit.*

The Virtues.

XI. *The Pulp of the Fruit, or Sallet.* It is uſually eaten raw, being pared from the Rind and cut into ſlices, or pieces. It cools and refrigerates admirably, quenches thirſt, refreſhes the Spirits, abates the heat of the moſt burning and malign Fevers, cleanſes the Bowels, provokes Urine, takes away the heat and ſcalding thereof, and gives eaſe in the Strangury. People in the *Weſt-Indies*, eat of this Fruit very liberally, and tho' even without meaſure, (becauſe of its pleaſantneſs) yet it has never been known once to Surfeit: it is good for hot, dry, and waſted Bodies, and ſuch as are grown feeble and weak by long Sickneſs, and the intenſe heat of Fevers.

XII. *The Juice of the Fruit.* It may be drank Plentifully, and has all the Virtues of the *Pulp* afore enumerated; it prevails wonderfully againſt the hot intemperature of the Stomach, Liver, Spleen, Reins, Womb, and Blood, quenches thirſt, and takes away the dryneſs and roughneſs of the Throat and Tongue.

XIII. *The Emulſion of the Seed.* It takes away the Febritick Diſtemper of the Blood: it gives eaſe in the Strangury, abates the heat and ſcalding of the Urine, and cures Piſſing of Blood: and repreſſe Luſt, (being uſed for ſome time) in an admirable manner. It has been given alſo with good ſucceſs in a Virulent *Gonorrhœa*, for it cleanſes the Ulcer, eaſes the pain, and induces the healing.

XIV. *The Diſtilled Water from the Fruit.* It is uſed as a Coſmetick, and ſo it is in an eſpecial manner, being mixed with *Juice of Lemons*, or choice Vinegar: and Inwardly taken, it abates the heat of all ſorts of Fevers, and has the Virtues of the *Juice of the Fruit*, but in a weaker Degree: mixt with *Spirit of Wine* in an equal proportion, it is an excellent thing for Cloudy, Dim, Weak, Sore, and Rheumatick Eyes, it ſtrengthens the part, removes the matter afflicting, and ſtops the defluxion.

CHAP. CCCCLXXXVI.

Of MERCURY Herb *Engliſh*:

OR,

GOOD-HENRY.

I. *THE Names.* It has no *Greek* Name that I know of, but it is called in *Latine*, *Bonus Henricus*; and in *Engliſh*, *Good Henry*, alſo *Herb-Mercury:* which to diſtinguiſh from other *Herb-Mercuries*, we call it *Engliſh Herb-Mercury.*

II. *The Kinds.* Of *Herb-Mercuries* there are three eſpecial ſorts, viz. 1. *Mercurialis Anglica*, Engliſh Herb-Mercury: of which in this Chapter. 2. *Mercurialis Gallica*, French Herb-Mercury, of which in *Chap.* 487. 3. *Mercurialis Sylveſtris*, Wild Herb-Mercury, of which in *Chap.* 488. following.

III. *The Kinds of Engliſh Herb-Mercury.* It is a Plant of a Singular Species, and not at all referable to the *Mercuries*, tho' it has obtained that *Engliſh* Name, ſome Authors account it a Species of the *Wild Araches*: others a Species of the *Lapatha* or *Docks:* I am of a contrary opinion to both thoſe, and think it a ſingular Plant of its own Kind. But from thoſe Opinions and conceptions of what Kind it may be, it has obtained ſeveral Conformable Names; as, *Rumex unctuoſus Tragi*; *Rumicis genus Fuchſij*; *Lapatha Sylveſtris ſecundum genus Dalechampij*; *Atriplicis ſpecies Geſneri*; *Atriplex canina Sylveſtris Loniceri*; *Lapathum unctuoſum Bauhini*, *Tota bona Dodonæi & Lobelij*; *& Bonus Henricus Mathioli*, *Brunfelſij*, *Tragi & aliorum*: with us in *England*, *Engliſh Herb-Mercury*, and *Good Henry.*

The Deſcriptions.

IV. *It has a great, thick, and long Root, ſpreading out into many parts or diviſions, and of a yellow color within like the ſharp pointed Dock.* From this Root ſpring forth ſeveral thick, flat, broad, and long, dark green Leaves, upon long foot Stalks, pointed at the ends, and double pointed at the bottoms, in ſhape ſomething like to *Aron*, or *Wake Robin*, or to the Leaves of *Medow Sorrel*, but very much larger. From among theſe Leaves ſpring forth ſeveral thick, flat, green Stalks about two feet high, full or thick ſet with Leaves like the former, but growing leſs as they approach towards the tops. On the Branches, and their ſeveral Tops or Heads grow as many ſpiked Heads of Flowers of a greeniſh color, growing in cluſters, and thick ſet together: in which is contained the Seed, which is flat, and much like that of the *Arach.* The whole Plant is ſoft in feeling, and often times overſpread with

English Herb Mercury.

Or, *Good Henry.*

with a greyiſh or whitiſh green Duſt, as if it was covered with a fine Meal, like unto *Arach*, for which reaſon, it is, as I ſuppoſe, that ſome have accounted it a Species or Kind of that Plant.

V. *The Places.* It is commonly found growing in untill'd Land, by Hedge ſides in *Orchards* and *Gardens*, and Ditch ſides in ſome *Paſture Grounds*, and among Rubbiſh, near common Ways, old Walls, Pales, and other like places, in moſt Counties of *England.*

VI. *The Times.* It Flowers in *June* and *July*; and the Seed is ripe in *July* and *Auguſt*, or ſome little time after.

VII. *The Qualities.* It is Temperate in reſpect of heat or coldneſs, dryneſs or moiſture; Abſterſive or Cleanſing, and Emollient or Looſening, by reaſon of its Fatneſs and ſlipperyneſs.

VIII. *The Specification.* It heals Green Wounds, and cleanſes and cures old and putrid Ulcers.

IX. *The Preparations.* You may have therefrom, 1. *A Liquid Juice of the Herb or Root.* 2. *A Cataplaſm of the Herb or Root.* 3. *An Ointment or Balſam.* 4. *A Sallet.*

The Virtues.

X. *The Liquid Juice.* Mixed 3 or 4 Spoonfuls of it with as much, or half as much *Hony*, and given inwardly, it looſens the Belly and Purges away Cold, glaſſy and ſlimy Humors; it opens obſtructions of the Lungs, and is good againſt Coughs, Colds, Wheezing, ſhortneſs of Breath, difficulty of Breathing, and Ulcers of the Lungs: but then the *Hony* ought to be clarified, and mixt in equal quantities with it: and ſo applyed to Green Wounds it heals them: and digeſts, cleanſes, incarnates, and drys up old and rotten Ulcers.

XI. *The Cataplaſm.* Applyed to Green Wounds or ſimple Contuſions it quickly cures them: and applyed to old and running Sores, it reſiſts the Putridity, cleanſes them, and afterwards wonderfully conſolidates and heals them.

XII. *The Ointment or Balſam.* It is a ſingular good Vulnerary, healing ſimple Green Wounds at a few times Dreſſing: and if they are Compoſed or Complicate, it cauſes Digeſtion in a very ſhort time, then cleanſes, incarnates and heals them. It heals alſo old Ulcers and Fiſtulas, Kibed Heels, and other Diſtempers of like Kind: and applyed to the Gout from what cauſe ſoever, whether hot or cold, it eaſes the Pain and cures it.

XIII. *The Sallet.* It is made of the Herb, being Boiled in Water, or in Broth, made of Fat Pork, or Bacon, or Fat Beef, or Veal; being dreſt up with Butter, Vinegar and Pepper, and ſo eaten, it makes the Belly ſoluble, and cleanſes the Pituitous Humors.

CHAP. CCCCLXXXVII.

Of MERCURY Herb *French.*

I. *The Names.* It is called in *Greek*, Λινοζωστις, *Linozoſtis*, & Ἑρμοῦ βοτανον, ἢ Ἑρμῆ πόα, *Mercurij Herba*: alſo Παρθενιον, *Parthenion*, (but not truly:) in *Latine*, *Mercurialis*: and in *Engliſh*, *Herb-Mercury*, and *French Herb-Mercury.*

II. *The Kinds.* There are two principal Kinds hereof, *viz.* I. *Mercurialis vulgaris*, *vel Hortenſis*, The Common or Garden French Mercury, which is twofold, *viz.* 1. *Mercurialis vulgaris Mas*, The Common Male French Mercury. 2. *Mercurialis vulgaris Fœmina*, The Common Female French Mercury. II. Φυλλὸν, *Phyllum*, & Ἐλαιόφυλλον, *Elæophyllum*, *quaſi Oleæfolium*: in *Latine*, *Phyllum*; and in *Engliſh*, Childs Mercury; and this is twofold, *viz.* 3. Φυλλὸν θηλύγονον, *Phyllum thelygonon*, Dioſc. lib. 3. *Phyllum fœminificum*, *vel fœminiparum*, *Phyllum Spicatum Bauhini*, Female Childs Mercury. 4. Φυλλὸν ἐλαιόφυλλον; *Phyllum Elæophyllum*, Φυλλὸν ἀρρηνόγονον, *Phyllon Arrhenogonon*, *Phyllum Teſticulatum Bauhini*, *Phyllum Marificum*, & *Mariparum*, The Male Childs Mercury. Of all which in order.

The Deſcriptions.

III. *The firſt*, *or* Common Male French Mercury. *It has a long ſender Root, very well furniſhed with a Buſh, as it were, of long and ſmall Fibres:* Which ſends up a ſquare green Stalk full of Joints, about two Feet high more or leſs, with two Leaves at every Joint, and Branching likewiſe from both ſides of the Stalks, ſet

MERCURY *Male.*

with freſh green Leaves, ſomething broad and long, like unto the Leaves of *Pellitory of the Wall*, but leſſer, and much about the bigneſs of the Leaves of *Baſil*, finely dented about the edges. Towards the tops of the Stalks and Branches at every Joint come forth, (in this *Male Kind*) two ſmall, round, green Heads, ſtanding together upon a ſhort foot Stalk, which growing ripe are the Seed, not having any Flower that ever we could ſee.

IV. *The ſecond*, *or* Common Female French Mercury. *This in its Roots, Stalks, Branches, Leaves, and manner of growing is ſo like the former, that it is not to be diſtinguiſhed from it, but by its Flower and Seed.* All Authors agree, that this Plant as well as that before Deſcribed, both riſe from the Seed of one and the ſame Plant, as the ſeveral ſorts of *Hemp* do; and they both are ſo like one to another, that if it was not for the Flowers and Seed which ſhew the difference, they could not be diſtinguiſhed one from another. In this *Female* the foot Stalk of the Seed is longer, Spike faſhion, and ſet round about with ſmall green Heads, which are the Flowers, and are made up in Form like the ſmall Branches of Grapes, which give no Seed that ever we could find, but abide in that manner a great while upon the Stalks without ſhedding. The

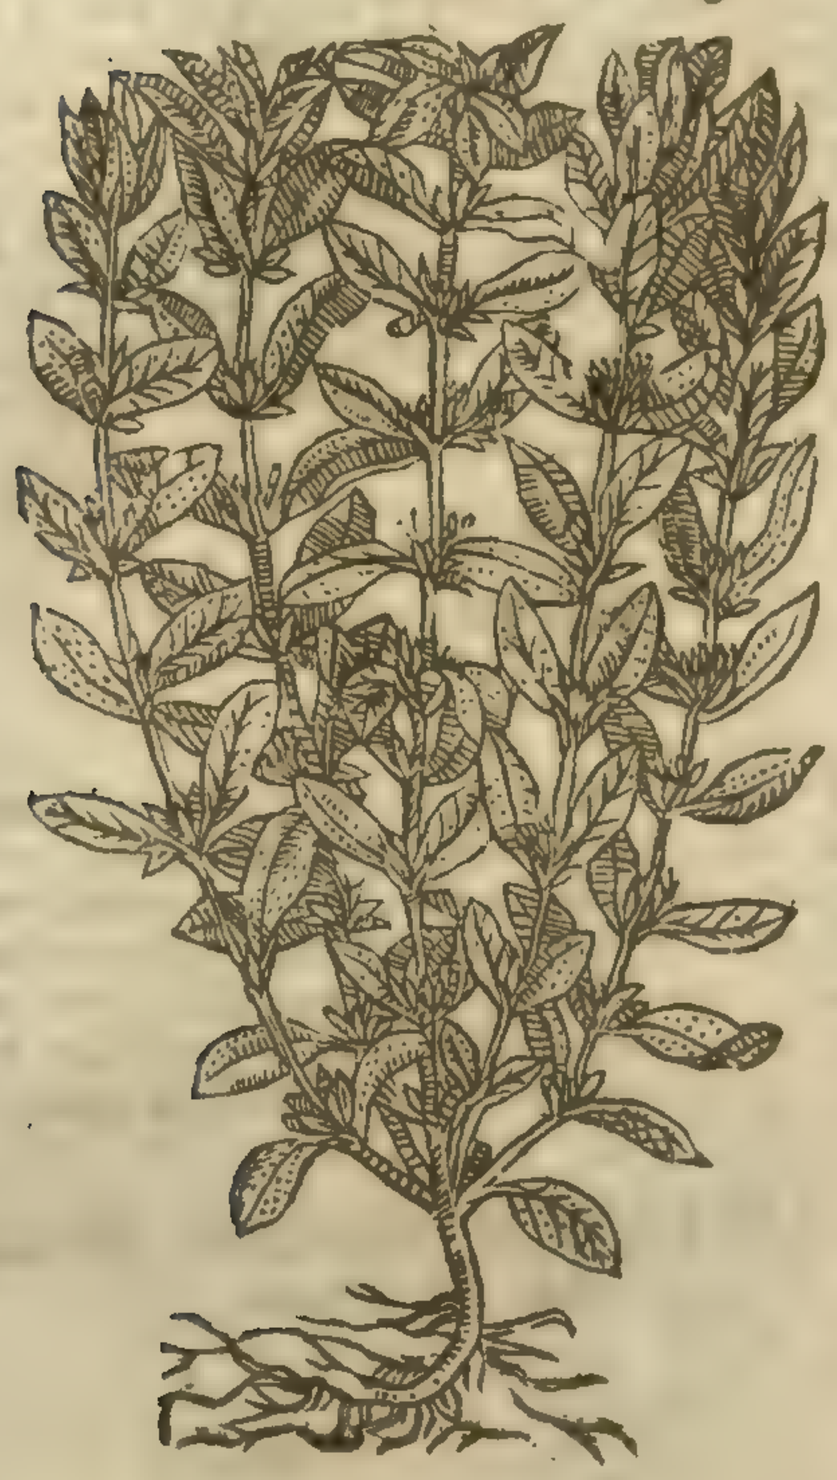
MERCURY *Female*

Roots both of the Male and Female periſh every Year at the firſt approach of *Winter*, and ſpring up again of their own Sowing. Where once they are ſuffered to Sow their Seed, the Ground will never want them afterwards, even of both ſorts, ſo admirably they encreaſe.

V. *The third*, *or* Female Childs Mercury. *Its Root is white, hard, and Woody, of the bigneſs and length of ones Finger, periſhing every Year, and riſing again from its own Seed, or the Seed of the* Male Kind, *in the Natural places.* From this Root riſes up a branched ſquare Stalk, full of Joints and Branches, but weaker than thoſe of the *Male* following, and more full of Leaves, higher alſo, and more buſhy: at the Joints always ſtand two ſoft woolly Leaves, ſomewhat longer, and narrower, than in the former *Common Kinds*, and not dented (or but very ſeldom) about the edges, of an Acid and Saltiſh taſt: at the Joints of this *Female* come forth long foot Stalks, of Seeds and Flowers, which are longer than thoſe of the *Male Kind* following. Theſe Flowers which are in a cluſter as it were, are ſmall, pale, and Mealy; rarely bearing any Seed, but when they do, it is contained in little round Heads, and is ſmall, and round like the *Male Kind*. ſometimes two, and ſometimes three or more, growing in a Cluſter together. This and the *Male* has a ſtronger ſmell and taſte, than any of the other *Mercuries*.

VI. *The*

Childrens MERCURY.



VI. *The fourth, or* Male Childs Mercury. *This in its Roots, Stalks, Branches, Leaves, and manner of Growing, is so like the Female just now described, that it is difficult to distinguish them asunder, but by their Flowers and Seeds.* At the Joints of this *Male Kind* come forth short foot Stalks, bearing at their tops two small round Seeds, like to those of the first *Common Male Mercury*, and without giving any Flowers like that also; which Seeds are of an Ash color, before they be perfectly ripe: but when they come to ripeness, they become of a blewish aspect, and not much unlike to *Spurge* Seed, growing as they do, two and two together: the Leaves are not much unlike the Leaves of the *Olive Tree*, covered over with a soft Down or Wool, and of a gray color. Some Authors will have that these *Childrens Mercuries Male and Female*, are the same with the first *Common French Mercuries Male and Female*, only differing as they grow in a differing Clime: but if they do but consider only the forms of the Leaves of each, and compare them (not taking notice of the Seed) they may be easily convinced in their own understandings of the contrary.

VII. *The Places.* The two first Kinds are found growing Wild in *France*, as also in several parts of *England*, as very plentifully by a Village called *Brookland* in *Rumney Marsh* in *Kent*: it grows also in *Vineyards*, *Orchards*, and other shady places, *Gerrard* found it under the dropping of the *Bishops* House at *Rochester*; and are generally Sown with us in *Kitchin Gardens* among *Pot-Herbs*. The two last grow about *Mompelier* in *France*, as alse in *Spain* and *Italy*, but with us only in *Gardens*.

VIII. *The Times.* They all Flower in hot Countries in *June*, *July*, and *August*; and give their Seed in some little time after: But the two latter Flower so late here in our Country, that they scarcely bear ripe Seed.

IX. *The Qualities.* *Herb Mercury* is hot and dry in the second Degree: Absterssive, Digestive, Hysterick, and a little Cathartick.

X. *The Specification.* *Matthiolus* makes it a Specifick against the Yellow Jaundice. It Provokes the Terms, eases the Strangury, and prevails against Stabs, Tetters, Ringworms, and other like Deformities.

XI. *The Preparations.* You may have herefrom, 1. *A Liquid Juice of the Leaves.* 2. *A Decoction of the same.* 3. *A Powder of the Seed.* 4. *A Lotion.* 5. *A Cataplasm.* 6. *A Clyster.* 7. *A Distilled Water of the Herb.*

The Virtues.

XII. *The Liquid Juice.* Taken to 4 or 5 Ounces in Broth or Drink, sweetned with a little Sugar, it purges Cholerick and Waterish Humors. *Hippocrates* commends it wonderfully for Womens Diseases; and he applyed it to the Womb, to ease the Pains of the Mother: and he gave it to provoke the Courses in Women, and to expel the After-birth. He dropt the *Juice* into Sore and Watering Eyes, and applyed it for Deafness and Pains in the Ears. It is good against Agues, and cleanses the Brest and Lungs of Flegm, but with some little Offence to the Stomach. Snuffed up the Nostrils, it purges the Head, Brain, and Eyes of cold, sharp, and salt Rheums afflicting them, and is very good against *Catarrhs* which fall upon the Lungs. Bathed upon Warts, it is said to take them away.

XIII. *The Decoction in Water, or Mutton or Veal Broth.* It has all the Virtues of the *Juice* afore declared, but much weaker, and therefore may be given to 8 Ounces or more. If it is made with *Myrrh*, and *Pepper*, it is good against the Strangury, and other Diseases of the Reins and Bladder. It purges also the Stomach and Bowels, of gross Humors, but more weakly than the *Juice*. And used as an Errhine, it purges the Head, Brain, Eyes, *&c.*

XIV. *The Pouder of the Seed.* It may be given to a Dram, or a Dram and a half, either in the *Decoction*, or *Distilled Water*, and so it helps the Yellow Jaundice. The *Seed* of both *Male* and *Female*, boiled in Water or Wine with *Wormwood*, and the *Decoction* drank, is said to cure the Jaundice perfectly, in a most admirable manner, and that in a very little time.

XV. *The Lotion.* It is made of the *Liquid Juice* mixt with *Vinegar*. Being applyed to Scabs, Itch, Tettars, Ringworms, and other like breakings out in the Skin, it cures them.

XVI. *The Cataplasm of the Leaves.* Applyed to Warts it takes them away, as also other Defœdations of the *Cutis*. It is Digestive, being applyed to Tumors or Swellings in any part; it is also Discussive, (where the Swelling will not come to suppuration) and will spend the Humor which is the cause of the Tumor, and allay the Inflamation, by cooling and easing the Pain.

XVII. *The Clyster.* It is made of the *Liquid Juice*, and of the *Decoction of the Leaves in Mutton Broth*, of each equal parts. Exhibited

warm, it evacuates from the Belly all sorts of cold, sharp, acid, Salt, or other evil Humors, which are apt to offend the Bowels, and cause Belly aches, and other vehement and sick Pains; and works as well in this manner, as if a sufficient quantity of *Sena* had been infused in the *Decoction.* But if to the *Clyster*, 4 Ounces of brown Sugar be added, it will work so much the better, and the more powerfully.

XVIII. *The Distilled Water of the Herb.* It has the Virtues of both *Juice and Decoction*, but acts, in a much weaker manner. But if white Sugar Candy is dissolved in it, it will make a good *Collyrium* for weak, sore, and running Eyes. And if a few Grains of *Scammony* in fine Pouder be dissolved in it, and used as an *Errhine*, it will notably purge the Head and Brain, of thick, gross, clammy, salt, sharp, and acid Humors, and therefore may be profitable against Colds, Catarrhs, Apoplexies, Epilepsies, Palsies, Vertigo's, Megrims, Head-aches, Lethargies, and other like Diseases of those parts. If sweetned with white Sugar and taken to 6 or 8 Ounces in a Morning fasting, it opens the Body and purges off gross, Viscous, and Melancholy Humors: And Authors say, if it is mixt with *Manna*, and *May Dew*, taken off *Rose* Bushes (for which reason some Writers call it *Rhodomanna*) it will purge Choler also.

CHAP. CCCCLXXXVIII.

Of MERCURY Herb Wild:

OR,

DOGS-MERCURY.

I. *THE Names.* It is called in *Greek*, Κυνὶα & Κυνοκράμβη, *Cynea & Cynocrambe*; which is *Canina Brassica*, but for what reason is hard to determine, for that it has no agreement with, nor is any thing akin to *Cabbage*, or *Coleworts*: it might properly enough have been called *Mercurialis Canina*, (*propter ignobilitatem:*) but some Authors have rather called it *Mercurialis Sylvestris*, as *Cordus*, *Lonicerus*, *Thalius*, & *Tragus:* it is the *Cynocrambe*, *Camerarij*, *Dodonæi*, *Fuchsij*, *Lobelij*, & *Matthioli: Mercurialis Canina Columnæ*, & *Mercurialis Montana Bauhini*, (these two last thinking *Cynocrambe*, to be wholly improper:) in *English*, *Wild Herb Mercury*, and *Dogs-Mercury.*

II. *The Kinds.* The Principal of the Wild sorts of *Herb Mercury*, are these four following, *viz.* 1. *Mercurialis Sylvestris vulgaris*, *Cynocrambe dicta aliquibus*; *Mercurialis Montana testiculati Bauhina*; *Mercurialis Sylvestris vulgaris Mas*, The Common Male Wild Mercury. 2. *Mercurialis Sylvestris vulgaris Fœmina*, *Mercurialis Montana Spicata Bauhini*, The Common Female Wild Mercury. 3. *Cynocrambe Legitima Dioscoridis Bauhini*; *Cynocrambe vera Belli*; *Alsines facie Planta nova Columnæ*, The true Dogs-Mercury of Bauhinus. 4. *Mercurialis Sylvestris siliquosa*; *Persicaria siliquosa Camerarij*, *Thalij*, *Lobelij*, & *Lugdunensis*; *Mercurialis Sylvestris altera Tragi*; *Tithymalus Sylvestris Lonicери*; *milium Caprearum Gesneri*; *Impatiens Herba Dodonæi*; *Catenance altera Cæsalpini*, *Balsamita altera Columnæ*; *Chrysea Lugdunensis*; *Balsamita lutea Bauhini*, & *Noli me tangere Bauhini*, *Camerarij*, *Gesneri*, *Lobelij* & *Tabernæmontani*, Codded Wild Mercury, by some, Codded Arsmart, Quick-Seed, Impatience, and Touch me not.

The Descriptions.

III. *The first, or* Common Male Wild Mercury. *It has a manifold Root, full of small Fibres, which run under Ground and in time mat themselves very much, not perishing Annually as the former* Mercuries *do, but abiding the Winter, shoot forth new Stalks and Branches every Year, the old ones dying away and Perishing.* From this Root spring up

MERCURY Herb Wild, Common, Male and Female.

several Stalks, slenderer and lower than the *Common Mercury*, and with no Branches at all upon them. This Male Kind is set with two Leaves at every Joint, something greater than the Leaves of the next following Female, more pointed and full of Veins, and somewhat harder also in handling, of a darker green color, and lesser snipt or dented about the edges: at the Joints with the Leaves come forth longer Stalks than in the former, with two hairy, round Seeds upon them, twice as large as those of the *first Common Male French Mercury:* the taste hereof is Herby, and the smell something strong and heady.

IV. *The*

IV. *The ſecond*, *or* Common Female Wild Mercury. *Its Root, Stalks, and manner of growing is much like the former:* Its Leaves are leſſer, not ſo ſharp pointed, have fewer Veins, and ſofter in feeling; and ſtanding upon longer foot Stalks. From the Joints come forth ſuch like long Stalks, having long ſpikes of greeniſh Flowers, and which are longer than the Spikes of the former *Common Female French Mercury*, with many ſmall Threads in them, which yield no more Seed than the Spikes and Flowers of that other *Female Mercury* does.

V. *The third*, *or* True Dogs Mercury of Bauhinus. *It has a white, long, and Fibrous Root, ſpreading it ſelf round about in the Earth.* The Plant it ſelf is tender, ſmall, and ſappy, and Springs up like unto the *firſt Common French Mercury*, with a round, green, creſted Stalk, about a Foot or more high, ſet with many Joints, and branching forth from every Joint; from whence come forth, at the firſt, two ſmall Leaves, and ſomewhat round like unto *Chick-weed*; after which, ſpring forth two others, from the ſame Joint, which are much larger and broader: and from the ſame place alſo come afterwards ſeveral other Leaves, ſmaller than the firſt two: and this proportion it holds, not at one Joint alone, but at every Joint through out the whole Plant, from the loweſt Joint almoſt of the Stalk and Branches, up to the top. From whence come forth three or four ſmall, whitiſh green Flowers, with many Threads in the midſt of them, which turn into ſmall, hard, round Seed, like unto thoſe of the *Common Male French Mercury*, but ſomething leſſer; which are green at the firſt, but of a blackiſh aſh color when they are ripe.

VI. *The fourth*, *or* Codded Wild Mercury, *&c. Its Root is blackiſh and thready, periſhing every year:* which ſends up a round Jointed Stalk, about two Feet high ſometimes, branching it ſelf, from thence in many places, whereat continually grows but one Leaf, upon a very ſlender rough foot Stalk, moſt like unto thoſe of the *French Common Mercury*, but longer pointed, and ſomething ſmaller at the Stalk; not ſo finely, but as it were groſly indented about the edges, being thinner, ſofter, and of a blewiſh green color. From every Joint with the Leaf, from the middle upwards, and at the tops of the Branches alſo, comes forth one long brown foot Stalk, as ſmall and fine almoſt as a Horſe Hair, bearing one Flower thereon, and ſometimes two or three, ſomewhat cloſe together, hanging downwards, and compoſed of ſix Leaves apiece, ſome thing like to thoſe of *Hollow Root* or *Cavious Fumitory*, but greater, of a fair Gold-yellow color, which are ſometimes alſo as *Bauhinus* ſays, found of a paler color: two of them which ſtand like Wings at the ſides, are larger than the other two which ſtand under them, which are ſmall and round; the loweſt is longer than the other two ſmall ones, and broad at the end; the uppermoſt ends in a ſhort crooked Horn or Heel, like a Spur, behind; the bottom on the inſide is whiter than the reſt, which have ſometimes red ſpots in them. After theſe Flowers are paſt, ſmall, long pointed Pods come up in their places, which hang downwards, and are ſtriped as it were all the length of them, in which is contained ſmall, long, and ſomewhat flat Seed of a dusky color, which is very difficult to be gathered, for that even before it is through ripe, if it be but very lightly handled, or but juſt touched, the Pods will break, and twine and twiſt themſelves a little, as the Husk or Pods of ſome certain *Pulſes* will do, and the Seed will leap forth of its own accord, with ſuch a kind of violence, that it is not to be caught; yea for the moſt part, the very ſhaking of the Branches by the wind, will cauſe the Podds to break open, and ſhed their Seed on the Ground, where the ripeſt may beſt be gathered or pickt up, if it lookt after in Time. The taſte of this Herb is poor and wateriſh while green, as *Columna* ſays, and much the ſame when dried; yet *Lobel* ſays, it is Venomous; but whether there be any danger in taking of it inwardly, is uncertain, we knowing nothing of it by experience, but what vulgar hear-ſay has delivered to us.

VII. *The Places.* The firſt and ſecond of theſe are found growing Wild in ſeveral places in *Kent* and elſewhere, but the *Female Kind* is more ſeldom found than the *Male*: *Gerard* ſays, he found it in many places about *Green-hithe*, *Swamſcombe* Village, *Graveſend* and *Southfleet* in *Kent*, alſo in *Hampſted Wood* four Miles from *London*, and in all the Villages thereabouts. The third is not found Wild with us, as it is in *Spain* and *Italy*, but is only Nurſed up in *Gardens*. The laſt grows in the ſhady Woods of *France*, *Germany*, and *Italy*; it has alſo been found by the ſhady Woods ſide of the Mountains and Vallies in *Wales*, by one Mr. *George Bowles*, but is alſo Nurſt up in our *Gardens*, for its rarity, where in ſhadie places, it grows and flouriſhes very well.

VIII. *The Times.* The firſt three Flower in the *Summer* Months, as *June*, *July* and *Auguſt*; all the *Summer* long ſays *Gerard*, until extream Froſt comes and nips them. The fourth or laſt Flowers about the middle and end of *Auguſt* in the Fields, but in our *Gardens* in *June* and *July*, and preſently after its Flowering it yields its Seed, which cannot be gathered from the Plant, without very much care.

IX. *The Qualities, Specification, Preparations, and Virtues* of the three firſt of theſe, are ſaid to be the ſame with thoſe of the *French Mercury* in the former Chapter, ſo that we ſhall ſay no more of them here.

X. As to the *Codded Mercury*, or *Noli me tangere*, Authors ſay it has a ſtronger Purging Quality, but it is by Vomit, and therefore it is thought that *Lonicerus* and *Tragus*, did rank it among the *Tithymales*, giving it ſuch a Name, as neareſt partaking of their Natures and Qualities; and for this reaſon I ſuppoſe it may be that *Lobel* and *Pena*, accounted it *Deleterious* or *Deadly*; tho' at the ſame time they ſay, it wants not its praiſe, as to its other Virtues: And *Camerius in horto*, ſays that *the Diſtilled Water of the Herb*, is applyed by ſome, to places pained with the Gout with good Succeſs.

CHAP.

CHAP. CCCCLXXXIX.

Of MILK-WORT Common:

OR,

CROSS-FLOWER.

I. *THE Names.* It is called in *Greek*, Πολύγαλα & Πολύγαλον: in *Latine*, *Polygala*, *Polygala recentiorum Lobelij*; *Amarella Gesneri* & *Flos crucis*: in *English*, *Milk-Wort* and *Cross-Flower.*

II. *The Kinds.* There is 1. *The Land* or *Field Milk-wort*, of which in this Chapter. 2. *The Sea Milk-wort*, of which in *Chap.* 490. following. Of *The Land* or *Field* sort, we shall give you the five Descriptions ensuing, *viz.* 1. *Polygala major*; *Polagyla vlgaris major Clusij*, Our Common greater Milk-wort. 2. *Polygala minor*, *Polygala vulgaris minor Clusij.* Out Common smaller Milk-wort. 3. *Polygala Repens Lobelij*, & *aliorum*, Creeping Milk-wort. 4. *Poligala Monspeliaca*, *Polygala foliis acutioribus Bauhini*, *Onobrichis tertia purpurea Lugdunensis Bauhini*, French Milk-wort. 5. *Polygalæ affinis Bauhini*, *Chamæmyrsine quorundam Lugdunensis*, Bastard Milk-wort.

The Descriptions.

III. *The first*, *or* Common Milk-wort. *It has a Root which is hard and Woody, with several Fibres adjoining to it, endures all* Winter, *and abides*

MILK-WORT Greater.

long. From this Root Spring forth five or six hard, slender, and flexible Stalks, about a Foot or more high; thick set with somewhat long and narrow Leaves like those of *Dyers-weed*, or *small Hyssop*; the Flowers grow at the tops, in long Spikes, thick set together, something like to those of *Fumitory*, but larger, and of a fine diluted reddish purple color, and shining withall; *Gerard* says, they are fashioned like a little Bird, with Wings, Tail, and a Body easie to be discerned by such as will observe the same: which being past away, small, flat Pouches succeed, like those of *Bursa Pastoris*, but lesser, having usually two Seeds in them, which are long, blackish, and hairy.

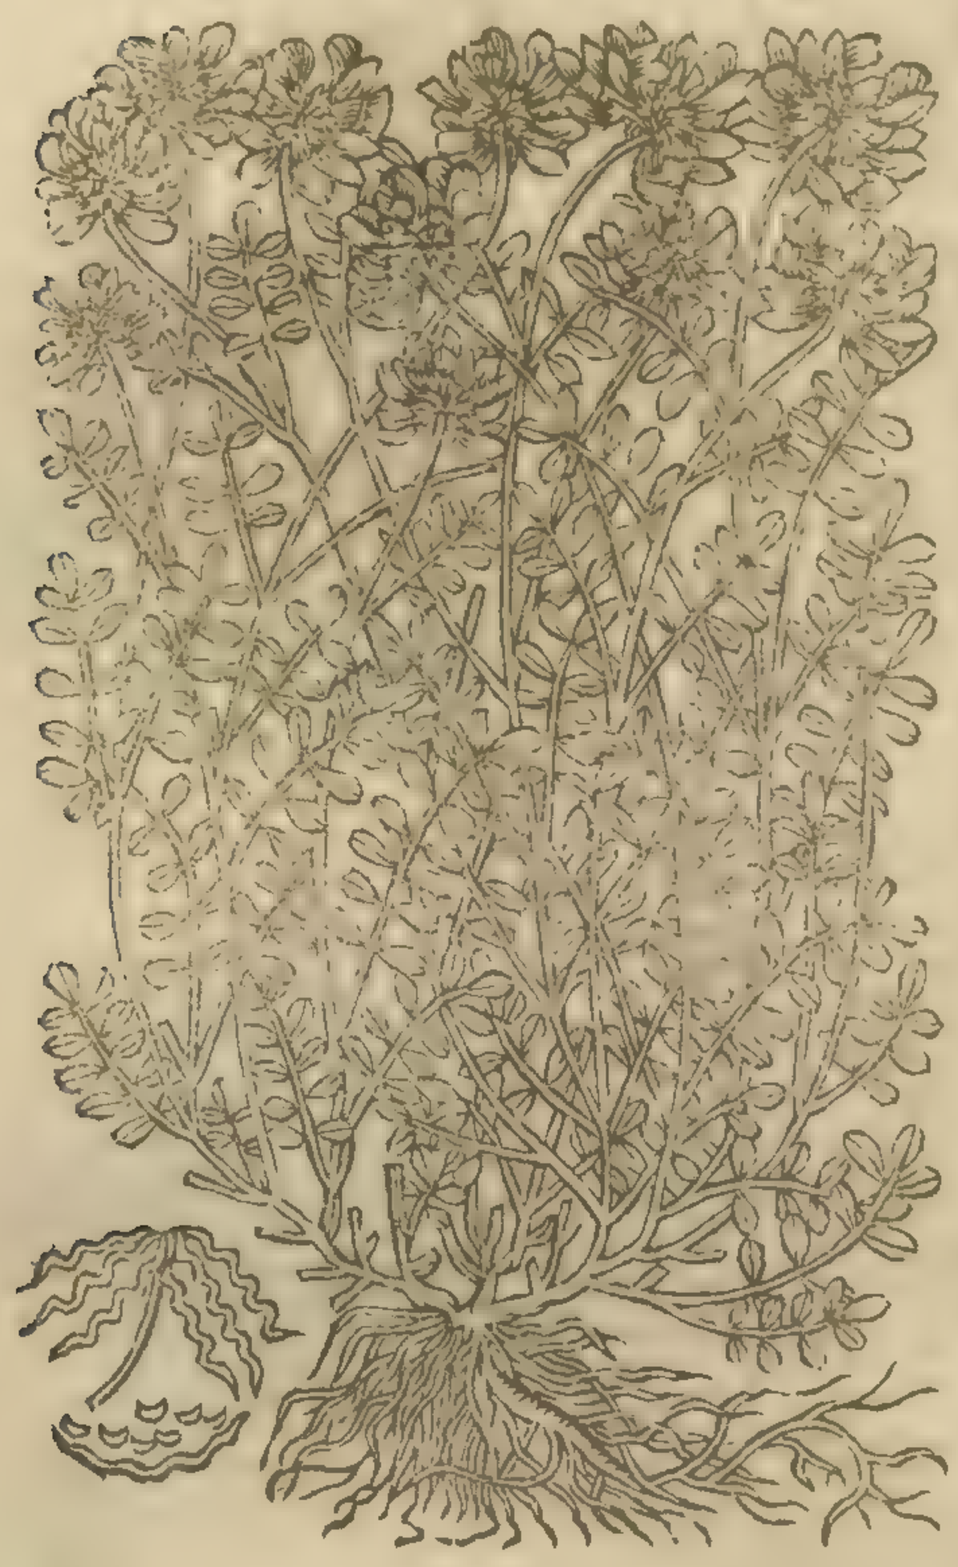
IV. *The second*, *or* Our Common smaller Milk-wort. *This in its Root, Stalks, Leaves, Flowers, Form and manner of Growing, is like to the former, yet somewhat hard or Woody, and not so many Stalks rising up from the Root, which have also fewer, and smaller Leaves on them.* The Flowers are also alike, but smaller, and vary as much, or rather more in their

MILK-WORT Lesser.

color; being some of a blewish purple; others purple and white, some all white, others reddish, or of a wan color, or over-worn red, *&c.* There is also another sort hereof, whose lower Leaves which spread on the Ground, are many, and rounder than in any of the former, but those which grow on the Stalks are long like the rest; the Flowers of which are only blew, without mixture or variation.

V. *The third*, *or* Creeping Milk-wort. *This small Plant has a number of Stalks, full of Branches, creeping, or lying and spreading on the Ground, not above a span long*, set thick by couples

KILKWORT Creeping.



couples with very ſmall Leaves, like thoſe of *Herniaria* or *Rupture-wort*. The Flowers are of a whitiſh color, ſtanding among the Leaves, at the tops in wharles, encompaſſing the Stalk, one above another.

VI. *The fourth, or* French Milk-wort. *It has a Root which is much like the firſt and ſecond Kinds, being ſmall, long, and white*, from whence ſpring up ſeveral upright Stalks, a foot or more high, having ſeveral longer and narrower Leaves on them, than thoſe of the two firſt ſorts, and ſet without order. The Flowers grow one above another, in longer Spikes, than in the ſecond ſmaller Kind, and not fully like them, but of a reddiſh color. The Seed which follows is ſmall, and contained in long cornered Husks.

VII. *The fifth, or* Baſtard Milk-wort. *Its Root conſiſts of ſmall, long, and white Fibres.* This ſmall Plant ſpreads it ſelf much, with many weak, ſlender, round Stalks, upon the Ground, a ſpan long or more, ſet with ſeveral ſmall Leaves without order, in faſhion ſomething like unto *Myrtle* Leaves, but not ſo much pointed. The Flowers are very Beautiful, ſtanding in a ſmall Spike, one above another, with Leaves among them, conſiſting of ſix Leaves apeice, of a fine bright ſhining purple color; after which comes ſmall Seed contained in ſmall Husks.

VIII. *The Places.* *Gerard* ſays, that theſe Plants or *Milk-worts* grow commonly in every Wood, or Fertil Paſture, and that he had found them, where ever he had Travelled. The firſt grows alſo in *Germany*, and *Auſtria*, and parts thereabouts. The ſecond is more frequent with us, and is found in Barren and Untilled places, Heaths and the like, as well as in Fertil and Paſture Grounds. The other three in *France* [illegible] and ſeveral other places.

IX. *The Times.* They all flower from the beginning or middle of *May*, and continue flowering a Month or more. *Gerard* ſays, till *Auguſt*, and perfect their Seed not long after.

X. *The Qualities.* They are all hot and dry in the ſecond Degree, highly Abſterſive, and with all Cathartick. 'Tis more than probable, that theſe *Medicaments*, not any of them, can be the *Polygalon Dioſcorides*, becauſe that, as *Dioſcorides* ſays, breeds Milk in Womens Breaſts; whereas theſe do rather the contrary, diminiſh the ſame, which is manifeſt from its Cathartick or Purging faculty, for as much as all purging things are inimical to that intention.

The Virtues.

XI. *The Infuſion in Wine.* *Geſner* who calls it *Amarella*, becauſe of its bitterneſs, ſays, that a Handful hereof ſteeped all Night in Wine, and drank in the Morning faſting, will purge Choler effectually by Stool, without any danger; and this he had made tryal of upon himſelf.

CHAP. CCCCXC.

Of MILK-WORT Sea:

OR,

GLAUX.

I. *THE Names.* It is called in *Greek*, Γλαυξ, (from γάλαξ or γλάξ, which is Milk:) in *Latine*, *Glaux*, from the *Greek* Name, and not *à Glauco Colore* as ſome would have it: and in *Engliſh*, *Sea Milk-wort*, and *Glaux*, alſo *Black Salt-wort*.

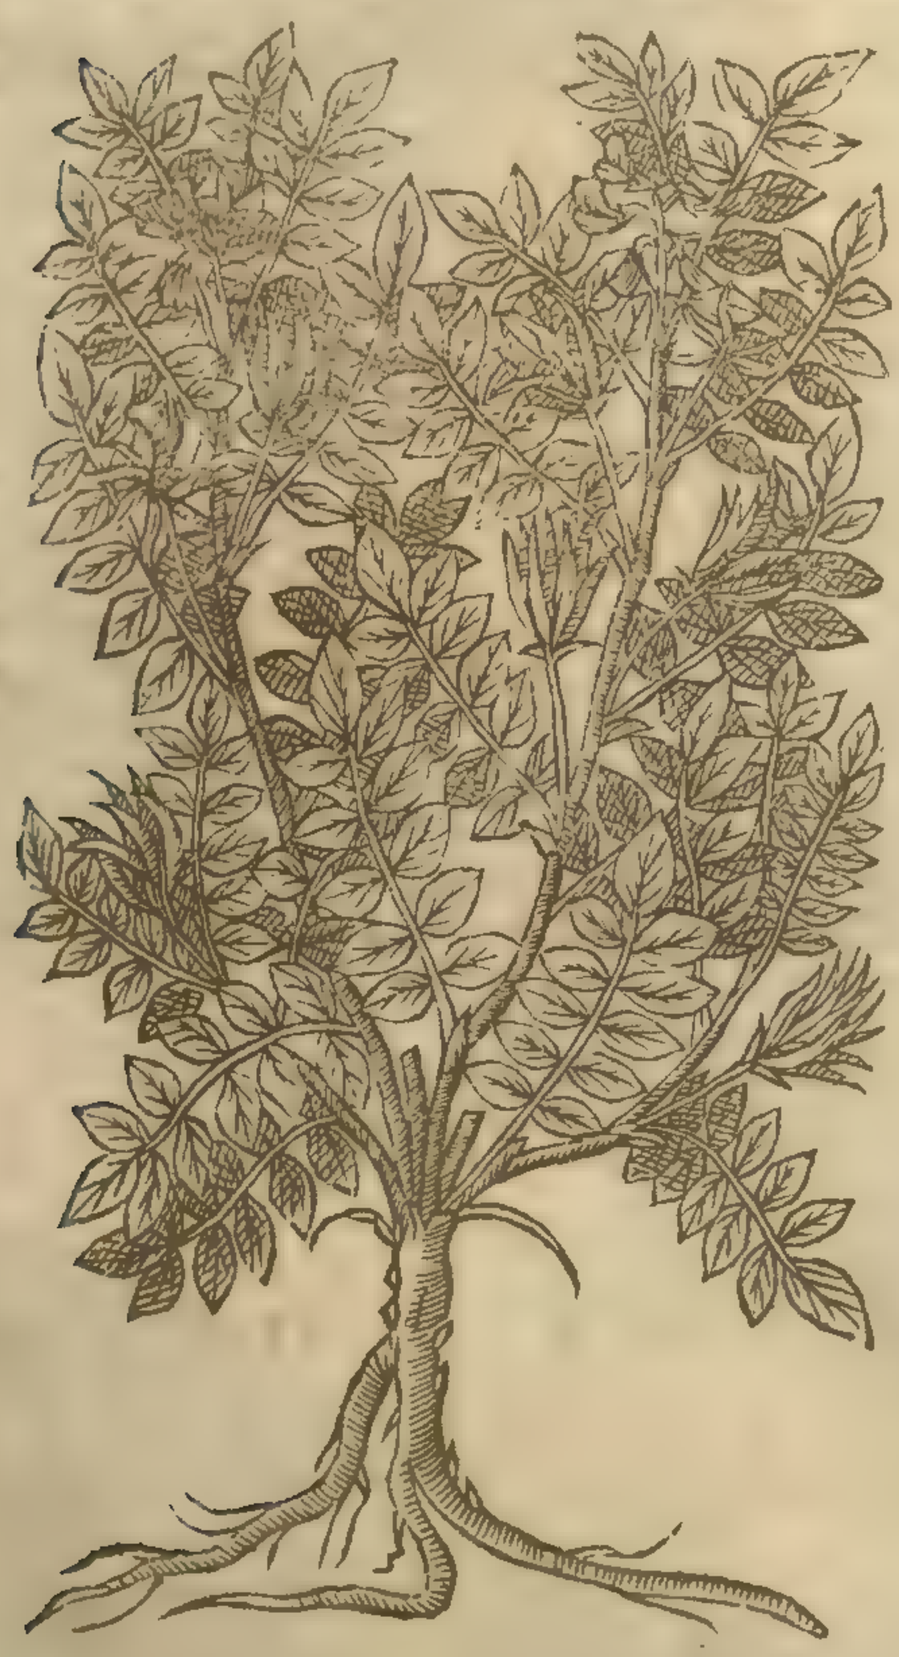
II. *The Kinds.* Authors have ſeveral ſorts hereof, but the following three are chief, *viz.* 1. *Glaux Maritima Major, Glaux latiore folio Thuringiaca Bauhini*, Γάλακτον *Plinij*; The Greater Sea Milk-wort. 2. *Glaux Maritima Minor*; *Glaux exigua Maritima Camerarij, Dodonæi, Lobelij, Lugdunenſis, & Tabernæmontani*, The Leſſer Sea Milk-wort. 3. *Glaux Maritima Veneta Alpino, Glaux in Maritimis, Dorychnio congener Cluſij Bauhino*, The Venetian Sea Milk-Wort of *Alpinus*: but *Bauhinus* would have this laſt, to be of the Family of the *Trefoils* or *Lotus*, becauſe they are in ſome things alike; yet with *Alpinus* we think them to be differing Plants, and that this comes as near, or more nearly to the *Glaux Dioſcoridis*, than any other.

The

The Deſcriptions.

III. *The firſt, or* Greater Sea Milk-wort. *It has a ſmall Root which ſhoots forth down right ſeveral Branches or Arms, and ſome Fibres adjoining to them:* from this Root ſhoots up ſeveral weak Stalks, which ſpread themſelves upon the Ground, and raiſe their Heads upwards, beſet with ſeveral *Lentil* like Leaves,

MILK-WORT Sea Greater.



yet a little larger, and of a grayiſh green color on the upper ſide, and more grayiſh underneath. The Flowers are ſet with the Leaves at the Joints of a purple color; after which come ſmall Buttons, with Seed in them. The Branches as they ſpread and lean upon the Ground take Root again, by which the Plant very much increaſes. *Bauhinus* ſays, that there is a great Variety obſerved in this Plant, it ſometimes having much larger Leaves, and ſometimes Leaves much narrower.

IV. *The ſecond, or* Leſſer Sea Milk-wort. *This leſſer ſort, in its Roots, Stalks, Branches, Leaves, Flowers, and manner of growing, differs little from the former, but in the ſmallneſs of the Stalks and Leaves;* ſome of the Stalks creep on the Ground, ſome ſtand upright, being tender, and ſmall, and beſet with many little flat Leaves, like *Tribulus Sylveſtris*, or *Herniaria*, growing along the Stalks by couples, between which grow the ſmall purple Flowers, which being paſt, little Bullets or Seed Veſſels ſucceed; and its Root is ſmall and Fibrous, taking hold of the upper Face of the Earth, as well as running

MILK-WORT Sea Leſſer.

much down right, and by its Fibres ſpreading abroad it much encreaſes. *Bauhinus* ſays, that this leſſer ſort, has its Stalks thicker ſtored with Leaves, than the former greater ſort, eſpecially upwards, the lower being fallen away, leaving the Stalks bare as if they had great Joints.

V. *The third, or* Venetian Sea Milk-wort of Alpinus. *The Root is long, ſlender, woody, and divided into ſeveral Branches.* From which ſpring up four or five ſlender Stalks a Cubit or more high, ſet at equal diſtances, with ſeveral ſomewhat long and narrow Leaves, green on the upper ſide, and hoary white underneath; and at the Tops four or five Flowers ſtanding together as it were in an Umbel for form and bigneſs, being very like unto the *Baſtard Scorpion*, like *Podded Senna of Candia*, but of a whitiſh bluſh color, which are ſucceeded by ſmall, ſhort round Podds, having ſmall, round Seed within them, taſting a little ſweetiſh.

VI. *The Places.* The firſt grows in many places in *Germany*, as alſo in *Scotland*, from which laſt place *Bauhinus* ſays he had it; but with us in *Gardens*. The ſecond grows very plentifully in moiſt places and *Salt Marſhes* near the Sea, from whence it has been taken and Planted in *Gardens*: and is found in many places upon the *Kentiſh* and *Eaſtern* Shores: *Gerard* found it between *Whitſtable* and the *Iſle of Thanet* in *Kent*, and by *Gravesend* in the ſame County; by *Tilbury Block-Houſe* in *Eſſex*, and in the *Iſle of Sheppy* going from *Kings-Ferry* to *Shoreland-Heath*. *Bauhinus* ſays, that this leſſer ſort is found growing near the Sea and Salt Lakes; but that the former greater Kind, is found growing on Hills as well as near the Sea. The third Kind grows as *Alpinus* ſays, in the Salt Marſhes near to *Chioza*, a City of the *Venetians*.

VII. *The*

VII. *The Times.* They Flower in *May* and *June*, and the Seed is ripe in the Months following, or towards the end of *Summer*.

VIII. *As to the Qualities, Specification, Preparations, and Virtues* of these Plants, Authors have said as good as nothing, at most, have been very sparing concerning the same: but they have been generally eaten as a Boiled Sallet, being boiled with Beef, Mutton, or Pork, and then dresst up with Oil, or Butter, Pepper, Salt, and Vinegar: This Sallet has been a common Food for Nurses, because it not only increased, but also bred Milk in Nurses Breasts; and for which purpose it is now so dresst, and eaten at this Day.

CHAP. CCCCXCI.

Of MILLET.

I. *THE Names.* It is called in *Arabick*, *Hareomen*, *Geguers*, and *Giavers*: in *Greek*, Κέγχρος, Πασπάλη, ὁ πασπάλος, *Galeni*: in *Latine*, *Milium* (à *Miliaria Summa derivatum ait Festus*: *Meline*, as *Varro* thinks; but both *Dioscorides* and *Galen* make *Meline*, to be *Panicum*: also *Paspilos*, & *Paspile*: in *English*, *Millet*.

II. *The Kinds.* Authors make three several Species hereof, *viz.* 1. *Milium vulgare album*, Common white Millet. 2. *Milium vulgare nigrum*, Common black Millet. 3. *Milium Indicum Matthioli*; *Milium Turcicum*; *Milium Saracenicum Fuchsij*; *Melica Dodonæi*; *Sorgho*, & *Sorghum Italorum Lobelij*; *Panicum Indicum Gesneri*; *Panicum Dioscoridis & Plinij Trago*: Indian or Turkey Millet.

The Descriptions.

III. *The first, or* Common white Millet. *It has a bushy Root which spreads it self round in the Earth, and perishes every Year after Seed times, as the Roots of other Grain do.* From this Root rise up several hard jointed tall Stalks, full of a white Pith, yet soft, and a little Hairy or Downy on the outside, with long and large Reed like Leaves at them, encompassing one another: at the tops of the Stalks are a great number of whitish yellow long Spriggs like Feathers, bowing down their Heads; set all along with white Seed, inclosed in a whitish Husk, which being taken out, are of a shining, pale, yellowish or whitish color, something hard, and a little larger than the Seed of *Fleawort*.

Common MILLET.

IV. *The second, or* Common black Millet. *This in its Roots, Stalks, Leaves, Head, and manner of growing, differs very little from the former*: saving that it is somewhat less with us, and that the Juba or Tuft is brownish, and the whole Plume or Head more loose and large, the Seed or Grain is also somewhat bigger, and of a blackish shining color.

V. *The third, or* Indian, or Turky Millet. *The Root of this bushes out more than the others, and perishes every Year after Seeding as the others do.* This Plant is in all its parts

Indian. Millet.

larger, or greater, and higher than the former, riſing to be five or ſix Feet in height, or more. The Stalks are full of Joints with long large Leaves at them. The Juba or Tuft ſtands upright, not bowing down its Head as the other, on which grows the Seed, which is as big, but not as flat as *Lentills*; ſomething round, either whitiſh, yellow, red, or blackiſh colored, hard and ſhining.

VI. *The Places.* All theſe Grains came firſt to us out of the Eaſtern and Southern Countries, as *Turkey*, *Barbary*, *Syria*, the *Eaſt-Indies*, *Spain*, *Italy*, &c. and now they grow plentifully through all the *Weſt-Indies*, and in moſt of our *Engliſh Plantations*. They delight to grow in a light and looſe Mould, provided it is fat and well watered, for they ſoon empoveriſh the Ground, and they thrive beſt in a moiſt and Rainy Seaſon. They grow as *Columella* ſays, in great plenty in *Campania* in *Italy*.

VII. *The Times.* They are to be Sown in *April* or *May*, and not before, for they cannot endure the Cold: and in the hotter or more Southern Climates, the Grain will be ripe in *Auguſt* or *September*.

VIII. *The Qualities.* The Grain is temperate in reſpect to heat or coldneſs, and is drying in the ſecond Degree. It has a tenuity of parts, Abſterſive, Aſtringent, Diuretick, and Antifebritick.

IX. *The Specification.* It reſtores in Conſumptions and abates the heat of Fevers: Stops Fluxes of the Bowels and of the Womb.

X. *The Preparations.* You may have herefrom, 1. *The Grain, and its Meal.* 2. *The parched Grain.* 3. *A Decoction or Syrup*, called *Syrupus Ambroſij.* 4. *An Emplaſter.* 5. *A Diſtilled Water.* 6. *Aſhes of the Stalks.* 7. *A Pouder of the Flowers.*

The Virtues.

XI. *The Grain, and its Meal. Made into Bread or Cakes, or Puddings*, and eaten, it reſtores in Conſumptions, and Strengthens the Stomach and Belly: Milk thickned with its Flower and given daily, ſtops Diarrhæas and other Fluxes of the Bowels: Broth made of choice Beef, and thickned with the fine Flower hereof reſtores the Tone of the Stomach and Intrails admirably.

XII. *The parched Grain*: eaten alone, it ſtops Vomiting: being applyed in Linnen Bags as hot as it can be endured, and applyed to the Stomach and Belly, it gives eaſe in the Belly-ach and Cholick, and helps the Griping of the Guts, Stitches, Pleuriſies, and other Illneſſes of like Kind.

XIII. *The Decoction, or Syrup of Ambroſe. Take* Millet *a Pound, Boil it in Water* 2 *Quarts, till it breaks, and then ſtrain out by preſſing: to* 4 *or* 5 *Ounces hereof add White* Port *or* Lisbon *Wine* 2 *Ounces: mix them.* Let it be given to the Patient as hot as it can be endured: it prevails againſt Fevers and Agues, chiefly Tertians; is Diuretick, and yet ſtrongly provokes Sweating, and quenches Thirſt, the Sick being well covered down in a Bed; but it ought to be given in the declination of the Fit.

XIV. *The Emplaſter. It is made of a mixture of the Flower and Tar, to a juſt conſiſtence.* Being applyed to the Bitings of any Venemous Beaſt, it draws forth the Poyſon, and ſecures the Life of the Patient.

XV. *The Diſtilled Water from the green Plant, whileſt in Flower.* Being taken to 4 or 6 Ounces at a time, it is a ſingular preſervative againſt the Stone, Sand, Gravel, and Tartarous Mucilage in the Reins, Ureters, and Bladder.

XVI. *The Aſhes of the Stalks.* Being drank, or rather the *Lixivium* of them, they are good againſt Kernels under the Ears, and in the Throat, and to abate Strumous or Scrophulous Swellings. *The Aſhes mixed with an equal quantiy of the Aſhes of a red Sponge, and with an eighth part of Pepper in fine Pouder, and made up with Wheat Paſte into a Cake, and Baked under hot Embers*, and eaten, two or three Ounces at a time, is an excellent thing againſt the Kings Evil, eſpecially being taken in the Wane of the Moon.

XVII. *The Pouder of the Flowers.* The red Flowers in Pouder, given to a Dram in red Stiptick Wine Cures the Reds in Women, ſo alſo the Pouder of the white Flowers given in the ſame Doſe and Vehicle Cures the Whites; and they both of them, or either of them, cure all ſorts of Fluxes of the Belly.

CHAP. CCCCXCII.

Of MINT Garden.

I. *THE Names.* It is called in *Arabick*, *Nabanaha*; in *Greek*, by the Ancient *Grecians*, Μίνθη: but by the latter *Greeks*, Ἡδύοσμος (from Ἡδύς, *Suavis vel jucundus*; and ὀσμὴ, *odor*, *ſmell*) becauſe it has a ſweet or pleaſing Scent: in *Latine*, *Mentha*: and in *Engliſh*, *Mint*.

II. *The Kinds.* There are ſeveral principal Kinds of this Plant, as 1. *Mentha Hortenſis*, Garden Mint, of which in this Chapter. 2. *Mentha Sylveſtris*, Wild Mint, of which in *Chap.* 492. 3. *Mentha Aquatica*, Water Mint, of which in *Chap.* 494. 4. *Mentha Montana*, Mountain Mint, or Calamint, of which we have already Treated, *Chap.* 104. *and* 105. 5. *Mentha Cataria vel Felina*, Cats Mint, or Nep, of which we ſhall treat (God willing) in the Chapter of *Nep*, following.

III. *The Species of the Garden Kind.* Authors have given us many of the *Garden* Production, but theſe following are chief, *viz.* 1. *Mentha Romana Anguſtifolio, ſive Cardiaca, Mentha Hortenſis*, Our Common Spear Mint, called alſo Heart Mint. 2. *Mentha fuſca, Mentha rubra vulgaris* Our Common Red Garden Mint. 3. *Mentha Cruciata, & rotundifolia altera Flore Spicato*, Croſs Mint. 4. *Mentha Criſpa, Balſamita Camerarij, Siſymbrium horten-*

hortense Matthioli, *Mentha Crispa verticillata Bauhini*, *Mentha vulgata Serpens rotundoresolio*, *Pulegij Flore Lobelij*, Bawm Mint, or Orange Mint. 5. *Mentha Crispa Germanica Speciosa*, Great Curled Mint of Germany.

The Descriptions.

IV. *The first, or* Our Common Spear Mint. *It has a stringy Root, with many Fibres adjoining, spreading far abroad under Ground, as all the rest do.* From this Root spring forth several round Stalks, having longer and narrower Leaves dented

Spear Mint.

on the edges set thereon, than those of the next sort, growing also something lower and smaller, of a pleasing green color. The Flowers stand in spiked Heads, at the tops of the Branches, being of a pale blush color; the smell is strong but very pleasant and grateful to the Sense.

V. *The second, or* Our Common red Garden Mint. *The Root is much like the former and spreads like it, running and creeping under the Ground, so that when it has gotten place, it is difficult to be extirpated or rooted out.* From this Root rises up several square brownish Stalks, with somewhat long and round pointed Leaves, dented (as the former) about the edges, of a dark green, and sometimes of a reddish color, standing by couples at the Joints, and of a very sweet and pleasing smell. The Flowers are reddish, and stand by Spaces about the tops of the Stalks.

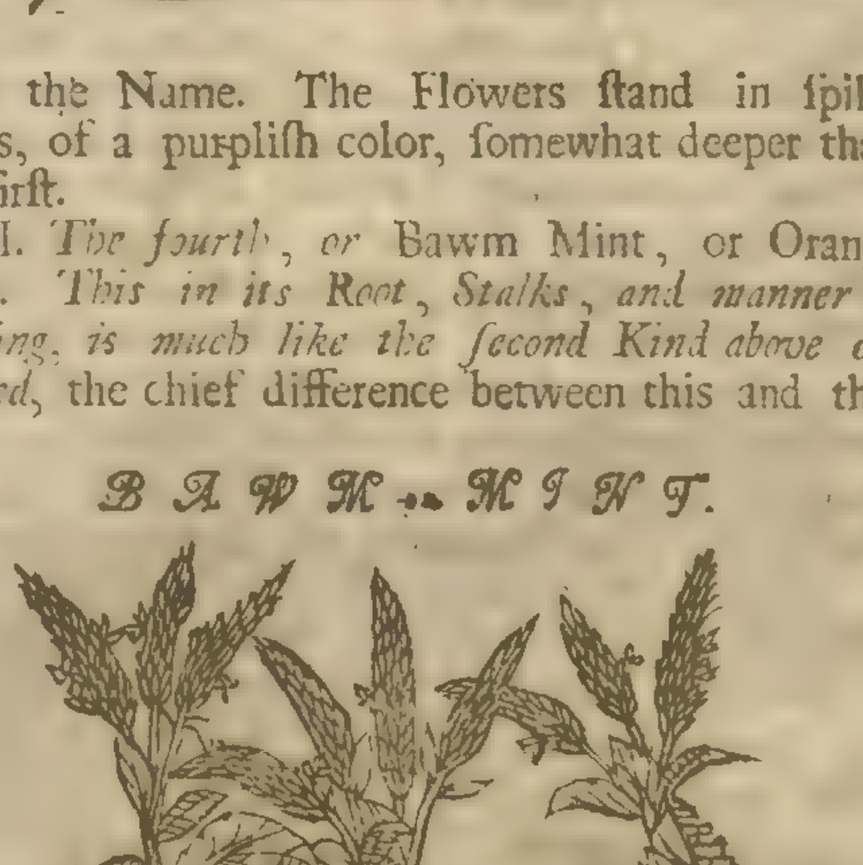
VI. *The third, or* Cross Mint. *This has a Root very like the others also, which sends forth square Stalks a little hoary, as are also the Leaves, which are rougher, broader, and rounder than the second Kind*, which stand on all sides the Stalks, one against another, two at a joint, and then cross against them at the next joint, so that they Represent a Cross, from whence

CROSS-MINT.

came the Name. The Flowers stand in spiky Heads, of a purplish color, somewhat deeper than the first.

VII. *The fourth, or* Bawm Mint, or Orange Mint. *This in its Root, Stalks, and manner of growing, is much like the second Kind above described*, the chief difference between this and that

BAWM-MINT.



is, first in the Leaves, which are almost as round as those, but more rough or crumpled: then, in the Flowers, which are of a purplish color, standing in Rundles about the tops of the Stalks, and lastly in the smell thereof; this being full as sweet as any of them, but smelling more like unto *Baum*, or rather coming near to the smell of an *Orange*, for which reason, some People gave it the Name of *Orange Mint*.

VIII. *The fifth*, *or* Great Curled Mint of Germany. *This excellent Plant creeps with its Roots, as the other* Mints *do, from whence Spring forth several high Stalks, which Spread themselves out into Branches, with two Leaves at every Joint*, something broad and large, but more deeply cut in on the edges, and as it were curled or crumpled together, more especially the lower Leaves: for those which rise up with the Stalk, are not so much torn or cut in on the edges, but are a little deeper dented than the former. The Flowers stand rounder, and in somewhat larger spiky Heads than others, and are of a pale purplish color. The smell hereof is sweet and pleasant, but not so quick or hot as some of the former Kinds.

IX. *The Places.* All these sorts of *Mints* grow in *Gardens*, in most places throughout the Kingdom, and delight in the Sun, and in a rich and fat Soil; yet will grow also in shady Places.

X. *The Times.* They all Flower about the beginning of *August* for the most part, but seldom give any good Seed; but make a recompence another way, by the encrease of the Root; which as it lives all Winter, so it continues long, and advances its Stock so plentifully, that being once Planted in a *Garden*, it will be difficult to get rid of it again, every small bit of it being left in the Ground, Springing up afresh in a small time after.

XI. *The Qualities. Mint* is hot and dry in the third Degree; Aperitive, Absterssive, Astringent, Anodyn, Carminative, Digestive, Discussive, Diuretick, Cephalick, Neurotick, Stomatick, Cordial, Sudorifick, Alexipharmick, and Spermatogenetick.

XII. *The Specification.* It cures Vomiting, Green Wounds, Punctures of the Nerves and Tendons, Convulsions, Palsie, Lethargy, provokes the Terms, and facilitates the Birth, of Women in Labor, helps the Headach, provokes Urine, and gives ease in the Stone, Gravel, Strangury, and other Diseases of the Reins and Bladder.

XIII. *The Preparations.* You may have therefrom, 1. *A Juice of the whole Plant.* 2. *An Essence of the same.* 3. *A Syrup.* 4. *A Decoction or Infusion.* 5. *A Pouder of the Leaves and Heads when in Flower.* 6. *A Decocted or Insolated Oil.* 7. *An Ointment.* 8. *A Balsam.* 9. *A Cataplasm.* 10. *A Distilled Water from the whole Plant when in Flower.* 11. *A Spirit.* 12. *An Oil Distilled.* 13. *A Balsam Chymical.* 14. *A Spirituous Tincture.* 15. *An Acid Tincture.* 16. *An Oily Tincture.* 17. *A Saline Tincture.* 18. *Potestates or Powers.* 19. *An Elixir.* 20. *A Salt by Incineration.* 21. *A Mixture.* 22. *A Sauce or Sallet.* 23. *Observations.*

The Virtues.

XIV. *The Liquid Juice. Dioscorides* says, that if it is mixt with Vinegar and taken, it will stop Bleeding; and I have found by Observation that so taken it, will stop Vomiting, tho' never so extream: mixt with a *Syrup of Mint*, and a few Grains of *Long Pepper*, it is not only extreamly Stomachical, but also provokes Venery or Bodily Lust exceedingly, and to kill long, round Worms in the Stomach and Guts. Mixt with the *Juice of Sower Pomgranats*, it stops the Hiccough, Vomiting, and Fainting, and allays the heat and violence of Choler. Some Authors say that it stops the Courses in Women: but I have found by great Experience, that it on the contrary powerfully provokes them, facilitates the Birth, and brings away the After-Birth, as also the Dead Child. Dose from an Ounce to 4 Ounces, either alone, or mixt with a Glass of Wine, or with its proper *Syrup*: as an Errhine, it Purges the Head.

XV. *The Essence.* It has all the Virtues of the *Juice*, besides which, being Dulcified with its proper *Syrup*, or mixt with a Glass of *Canary* (from one Ounce to three) it prevails against all cold and moist Distempers of the Breast and Lungs, as Loathing, Sickness at Heart, Pain of the Stomach, want of Appetite, Indigestion, Coughs, Colds, Rheums, shortness of Breath, difficulty of Breathing, Hoarseness, Wheezing, *&c.* Bathed upon the Forehead and Temples, it eases their Pains: and is good to wash the Heads of Young Children, to take away all manner of breakings out thereon, as Scurff, Morphew, Pimples, Sores, Scabs, *&c.* Taken with 30 or 40 Drops of Our *Stomach Tincture*, or with 2 or 3 Drops the *Chymical Oil of Mint*, it is good against the Poyson of Venomous Creatures. Taken to 3 or 4 Ounces, it stops Bleeding at Nose, and provokes Venery admirably: Dropt into the Ears, it eases their Pains.

XVI. *The Syrup.* It is Stomatick, and Pectoral, good against Coughs, Colds, Hoarseness, Wheezing, Asthma's, and other Distempers of the Breast and Lungs. Dose 2 or 3 Spoonfuls in a Glass of White *Port* or *Lisbon* Wine Morning and Night: so taken it opens Obstructions of the Reins, Ureters, and Bladder, gives ease in the Strangury, and expels Sand, Gravel, Stones and Tartarous Matter; and is much more powerful for these Intentions, being taken mixt with an equal part or more of the *Juice* or *Essence*.

XVII. *The Decoction or Infusion.* They have both of them the Virtues of the *Liquid Juice*, *Essence* and *Syrup*, and may be taken from 4 to 8 Ounces or more, Morning, Noon or Night, sweetned with *Syrup of Mint*: the *Infusion* is the Stronger of the two (because by its Decocting it looses many of its Volatile parts) and it ought to be made in some Generous sort of Wine, as White *Port* or *Lisbon*, in *Alicant*, *Barcelona*, or *Canary*, &c.

XVIII. *The Pouder of the Leaves and Heads.* It is very Stomatick, and may be given from half a Dram to a Dram. It stirs up Lust; and taken with *Oxycrate* it stops Vomiting of Blood. It is good against Pain and Gnawing at the Stomach, and provokes Appetite: taken after Eating, it helps Digestion, expels Wind, and is good for such as are troubled with the Spleen.

XIX. *The Decocted or Insolated Oil.* It is good against Pains and Aches in any part, proceeding from Cold: and taken inwardly a Spoonful or two at a time, it is good against Coughs, Colds, Wheezings, Asthma's, *&c.* and open all Obstructions of the Lungs; and if given in time is prevalent against Stitches in the side, Pleurisies, *&c.*

XX. *The Ointment.* It cures Wounds and Ulcers, old and running Sores, and is good to Anoint any old Pain or Ach in any part of the Body: it is an Excellent thing to Anoint with in the Hemorrhoids or Piles, as also against *Ficus in Ano*: and put up the Fundament (being melted) in a *Clyster*, it is good against a *Tenasmus*, and the Weakness of the *Intestinum Rectum*.

XXI. *The*

XXI. *The Balsam.* It is a thing singular for Wounds and Ulcers, and not inferior to the *Balsams* made of any other Wound Herb, except only *Angelica*, which I take (by my own Experince) to be one of the greatest of all Vegetable Vulneraries: This *Balsam* cures simple Green Wounds at once or twice dressing; and Contused Wounds, it causes to Digest immediately, suppurates Apostems, cleanses, incarnates, drys and heals them in a very short time: It is profitable also against old running Sores and Ulcers, it digests and cleanses them, and strengthens the part, resists the Defluxion of Humors, and induces their speedy healing: Injected scalding hot into Fistula's, it softens the Calous, and in time dissolves it, resists the fluxion, drys, incarnates and heals them to admiration.

XXII. *The Cataplasm.* The green Herb beaten, and made into a *Cataplasm* with *Barly Flower*, and applyed to Tumors not yet brought to Suppuration, discusses them: it represses Milk in Womens Breasts when Swoln therewith; and is good for such as have swoln, great or flagging Breasts. If Salt be added to it, it is good against the Bitings of Mad Dogs, and of other Venomous Creatures. Applyed to the Fore-Head or Temples, it eases the Head-ach. The Green Herb made into a *Cataplasm* with Honey and white Bread, and applyed to blear-ed Eyes, it is said to Cure them. Made into a *Cataplasm* with the Pouders of *Ani-seeds*, *Caraways*, and *Coriander-seeds*, and applyed to a simple Contusion, it Cures it: it also gives ease in the pains of the Joints, and the Gout. Applyed warm to Kernels in the Throat and Neck, and recent Tumors of the Kings Evil, it discusses them. Applyed to places affected with the Leprosie (mixt with Vinegar) it is said to Cure it, more especially if the *Juice* and *Essence* be also taken inwardly.

XXIII. *The Distilled Water from the whole Plant when in Flower.* It is an admirable Stomatick, and stays Vomiting, having all the Virtues of the *Juice*, *Essence*, *Syrup*, and *Infusion*, but is to be taken in much greater quantity, as from 4 to 8 Ounces sweetned with *Syrup* of *Juice of Mint*. It causes Milk in Womens Breasts, and hinders it from curdling: and taken as aforesaid, it is good against the Strangury, Stone, and Gravel.

XXIV. *The Spirit.* It is a singular Stomatick and Cordial, good against Nauseousness, Vomiting, Indigestion, want of Appetite, Fainting, Swooning, Palpitation, and Sickness at Heart; and is a most excellent thing to be given to Children against Convulsion Fits, the Falling Sickness and other Distempers of the Head, Stomach, Heart, and other Bowels. Dose from 2 Drams to 4 to Elder People, mixt with *Syrup of Mint*, but from a Scruple to a Dram, being given to Children.

XXV. *The Distilled Oil.* It is a powerful Medicament against Stone, Gravel and Tartarous Matter in the Reins, Ureters and Bladder, gives present ease in the Strangury, strengthens the Stomach to a Miracle, stops Vomiting, causes a good Appetite and Digestion, restores in Consumptions, stops Coughs, and Distillations of Rheum, takes away Hoarseness, Wheezings, and obstructions of the Lungs, cures Asthma's, and is a potent thing against Fainting and Swooning Fits, Palpitation and Sickness at Heart, Apoplexies, Convulsions, Palsies, Lethargies, Carus, and other cold and moist Diseases of Head, Brain and Nerves: It cures Punctures and other Wounds of the Nerves and Tendons, gives ease in the Gout, Sciatica, Cramps, and other like Pains of the Muscles and Joints. It provokes the Terms in Women, facilitates the Birth, brings away the After-Birth, and Dead Child, and is a potent thing against the Cholick Vapors and Hysterick Fits; causes Fruitfulness, powerfully provokes Lust, helps forward Conception: and in a word, is one of the greatest Vegetable Productions that ever Nature produced. Dose from 3 to 12 or 20 Drops in any fit Vehicle.

XXVI. *The Chymical Balsam.* This is a peculiar thing, and is thus made, *Take choice Oil of Mace by Expression*, 2 *Ounces*; *Balsam of Peru, and of Tolu, of each* 1 *Ounce*; *Chymical Oil of Mint*, 1 *Ounce*; *Melt and mix them well together in Balneo, or in a Sand Heat, and keep it for use.* It has all the Virtues of the *Chymical Oil* beforegoing, besides which it is an excellent thing for the Lungs, as also for the Reins and Bladder, to provoke Urine, ease the Strangury, expel Stone and Gravel, and to heal Ulcers in the Reins and Bladder. If prudently given, it is an excellent thing against a Virulent *Gonorrhœa*. Dose from a Scruple to half a Dram, in any proper Vehicle Morning and Night.

XXVII. *The Spirituous Tincture.* It stops Vomiting, eases the Pain of the Stomach upon the spot, and cures the Cholick, after a singular manner. It has all the Virtues of the *Juice*, *Essence*, *Infusion*, and *Chymical Oil*; being a most admirable Cordial, and prevails against Convulsions upon the spot. Dose from 1 Dram to 2 or 3; mixt with a Spoonful or two of the *Syrup*.

XXVIII. *The Acid Tincture.* It is more Stomatick than the former, stops Vomiting, creates a good Appetite and a strong Digestion. It is a potent thing against the Plague, or Pestilence, Spotted and Purple or Scarlet Fever, and against all sorts of Burning and Malign Fevers whatsoever, taking away the Fever in less than an Hours time. It may be thus used. *Take Mint Water a Quart, of this Acid Tincture almost an Ounce, Double Refined Sugar, enough to make it very pleasant and drinkable*; and of this the Sick may drink at pleasure.

XXIX. *The Oily Tincture.* It is profitable against the Stone, Gravel, and Tartarous Matter in the Reins and Bladder, provokes Urine, and gives ease in the Strangury; and Anointed along upon the *Spina Dorsi*, and other parts affected with the Palsie, it cures it. It facilitates the Birth, provokes the Terms, and brings away the After-Birth, and Dead Child. Dose from 10 Drops to 20 or 30, in some convenient Vehicle.

XXX. *The Saline Tincture.* It has the Vertus of the *Juice*, *Essence*, *Decoction*, and *Oily Tincture*, in all respects, but not so Stomatick, by reason of the *Menstruum* with which it is Drawn. Dose from 20 to 60 Drops, or more, in *Parsly Water*, or in white *Lisbon*, or in *Canary*, or *Canary* mixt with *Parsly Water*. Outwardly it is good against Scurf, Morphew, Itch, Scabs, and other Defœdations of the Skin.

XXXI. *The Potestates or Powers.* They have all the Virtues of the *Juice*, *Essence*, *Decoction*, *Spirit*, and *Chymical Oil* in perfection, and may be given from 40 to 80 Drops, yea to an 100, in a Glass of Wine 2 or 3 times a Day.

XXXII. *The Elixir.* It has all the Virtues of *Juice*, *Essence*, *Tincture*, *Spirit*, *Chymical Oil*, and *Powers*, with this preference, that it is more Excellent than the last, and operates in somewhat a less Dose, being one of the greatest Stomaticks in the World; Dose from 30 to 60 Drops in a Glass of White *Lisbon* or *Canary*, or other fit Vehicle, as the Physitian shall advise, and as oft as need shall require.

XXXIII. *The Salt by Incineration.* It admirably strengthens the Stomach and other Bowels, by absorbing

abſorbing the preternatural Acid which afflicts them: is good againſt Surfeits, Gluttony and Drunkenneſs, and gives eaſe in the Strangury, cleanſing the Reins, Ureters, and Bladder of Stones, Gravel, Sand, or Tartarous Mucilage, which may any ways obſtruct them. Doſe from 15 Grains to 25 or 30 in a Glaſs of *Parſly Water.* It carries off the Recrements of the Blood and Humors, and the cauſes of many Diſeaſes by Urine, for which reaſon it is of extraordinary Uſe in Fevers.

XXXIV. *The Mixture. Take Powers or Elixir of Mint* 5 *Drams*; *Powers of Cloves* 2 *Drams*; *Powers of Angelica* 2 *Drams*; *Acid Tinſture of Caraways* 1 *Dram*; *mix them.* Doſe from 60 to 80 Drops in any proper Vehicle againſt the Cholick, obſtructions of the Terms in Women, Hyſterick Fits, Vomiting, and weakneſs of the Stomach. It is profitable alſo againſt Convulſions, Fainting and Swooning Fits, Sickneſs at Heart, and a Conſumptive habit of Body.

XXXV. *The Sauce or Sallet.* It is made of the green Herb ſhred ſmall, and made grateful with the beſt White Wine Vinegar, a little Salt, and a ſufficient quantity of double Refined Sugar. It is acute and grateful to the Stomach, cauſes an Appetite, and is uſed as Sawce for Lamb, when in Seaſon, and ſome other Meats.

XXXVI. *Obſervations.* In ancient times, the uſe of *Mint* was forbidden to Soldiers, not for any hurt it did them, but becauſe, it did too much incite to Venery, and thereby took away, or abated their Courage and Valor. It is alſo farther obſerved, that a *Lotion made of the Juice, Eſſence, or Decoction, by mixing with them a little of the Acid Tincture, and Honey of Roſes*, that it cures the Scurvy in the Gums and a Sore Mouth and Throat. And a *Gargariſm* made with the *Eſſence, Juice, Decoction, Powers or Elixir, by mixing with either of them, the Spirituous or Acid Tincture of Coriander Seed and Rue, or by infuſing thoſe two things in them*, is an admirable remedy againſt a Stinking Breath, by gargling the Mouth and Throat therewith, and alſo oftentimes holding it in the Mouth: and it cauſes the *Uvula* or *Palate* of the Mouth when down, to return to its place and ſtrength again. And an *Errhine* made with the *Juice or Eſſence, two parts mixt with the Diſtilled Water one part, and the Acid Tincture half a part*, is an Excellent thing againſt the Megrim, Head-ach, Vertigo, Lethargy, *&c.* by purging the Head of cold groſs Humors. Being Snuffed up the Noſtrils, and held in the Mouth, it is good againſt a Stinking Breath, which proceeds from rotten or corrupted Teeth.

CHAP. CCCCXCIII.

Of MINT Wild;

OR,

Horſe MINT.

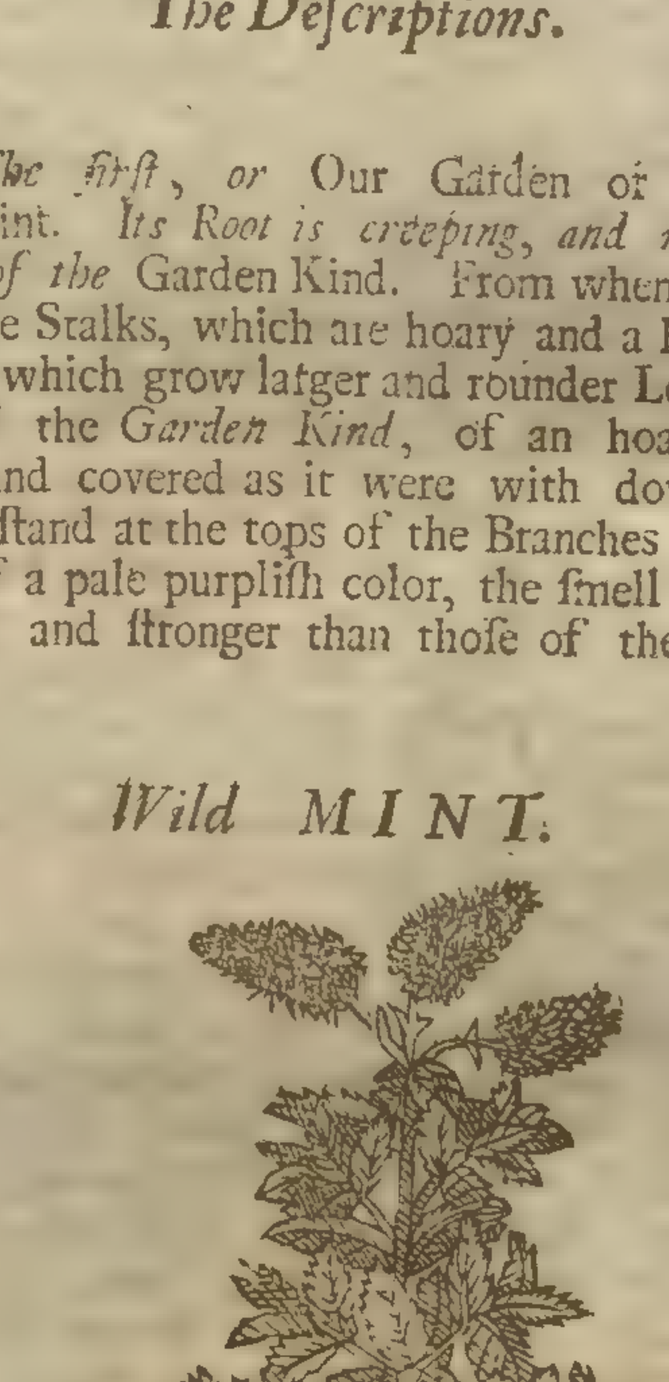
I. THE *Names.* It is called in *Greek*, Ἡδύοσμος ἄγριος, ϗ Μίνθα vel μίνθη πολυὴ, ϗ ἄγρια: in *Latine*, *Mintha Sylveſtris*, *Mintha agreſtis*, *Mentaſtrum*: in *Engliſh*, *Wild Mint* and *Horſe Mint*.

II. *The Kinds.* There are ſeveral ſorts of this *Wild Mint*, as, 1. *Mentaſtrum Hortenſe*, *Mentha Sylveſtris Hortenſis*, *Siſymbria Mentha agreſtis Lobelij*, Our Garden or Manured Wild-Mint. 2. *Mentaſtrum niveum Anglicum*, Our white or party colored Wild Mint, or Horſe Mint. 3. *Mentaſtrum folio Longiore*; *Mentaſtrum aliud Lobelij*; *Mentaſtrum Campenſe Lugduneſis*; *Siſymbrium Sylveſtre Matthioli*, Long Leav'd Wild Mint, or Horſe Mint. 4. *Mentaſtrum Montanum*; *Mentaſtrum Pannonicum Cluſij*, Mountain or Hungarian Wild or Horſe Mint. 5. *Mentaſtrum Tuberoſum Cluſij*; *Mentaſtrum Radice Tuberoſa*; Tuberoſe or Knobbed Wild or Horſe Mint. 6. *Mentha geniculata Radice*, Wild or Horſe Mint with Kneed or Jointed Roots. 7. *Mentaſtrum hirſutum*; *Mentaſtrum minus Spicatum Lugdunenſis*; *Mentaſtrum aliud hirſutum Camerarij*; *Mentaſtrifolia aquatica hirſuta*, & *Calamintha tertia Dioſcoridis Lobelio*, *Mentha paluſtris folio oblongo Bauhini*, Hairy Wild or Horſe Mint. 8. *Mentaſtrum rotundifolium minus*, & *Mentha rotundifolia Paluſtris Minor Bauhini*, Small ronnd Leav'd Wild or Horſe Mint.

The Deſcriptions.

III. *The firſt, or* Our Garden or Manured Wild Mint. *Its Root is creeping, and much like to that of the* Garden Kind. From whence ſpring up ſquare Stalks, which are hoary and a little hairy alſo, on which grow larger and rounder Leaves than thoſe of the *Garden Kind*, of an hoary white color, and covered as it were with down. The Flowers ſtand at the tops of the Branches in ſpiked Heads of a pale purpliſh color, the ſmell of which is heady and ſtronger than thoſe of the *Garden Kind.*

Wild MINT.



IV. *The*

IV. *The second, or* Our white or party colored Wild Mint. *This is much less, and better smelling than the former:* Its Leaves are partly green and partly Milk white; and sometimes its Leaves are some of them wholly white: but more commonly all green: the Roots, Stalks, Flowers and other parts, are like those of the former but lesser. This is also Nurst up, and found growing in many of our *English Gardens.* It is the *Mentastrum alterum Dodonæi.*

V. *The third, or* Long Leav'd Wild Mint, or Horse Mint. *This has square brownish Stalks, and somewhat broad, but longer Leaves growing on them than the last,* nothing at all hoary, but rather of a dull green color. The Flowers stand at the tops of the Branches, in rounder Tufts, of a pale purplish color: and the smell of the Leaves and Branches, is something more pleasant than the other.

VI. *The fourth, or* Mountain or Hungarian Wild or Horse Mint. *It has a pretty hard, thick, long Root, with many Fibres springing forth from it, more like to* Nep *than* Mint. From which spring up several square Stalks, on which grow by couples at every Joint, somewhat large Leaves, like as on the others, which are more green than the last, and dented also about the edges. The Flowers are whiter than the former, standing about the Stalks, at several spaces, and ending in small long Spikes. The whole Plant much resembling *Common SpearMint*, and is of a hot and sharp taste, smelling very like to the other *Wild Mints.*

VII. *The fifth, or* Tuberous or Knobbed Wild or Horse Mint. *Its Root is something reddish within, and brownish on the out side, having several tuberous Heads joined thereto, which being separated will grow into Plants.* From this Root spring up square hairy green Stalks, full of Joints, with two Leaves set at every Joint, which are long and rough, dented about the edges, somewhat hoary, of a whitish green color, and of a strong smell. The tops of the Branches do end in Spikes of hoary Leaves, among which, at certain distances, the Flowers stand, with two Leaves at a space of, a whitish color: after which follows small black Seed.

VIII. *The sixth, or* Wild or Horse Mint with Joined or Kneed Roots. *Its Root is something thick, and set with Joints or Knees, at certain spaces, shooting forth Fibres at the same.* The Stalk rises not above a Foot high, being something hard, rough, and square, on which grow at the Joints, two long dark green Leaves, being soft in handling, but a little wrinkled and dented about the edges. The Flowers stand at the tops of the Branches in short Tufts or Spikes, like unto *Nep*, of a pale purplish color; after which come small, round, sweet smelling Seed, like in scent to the whole Plant.

IX. *The seventh, or* Hairy Wild or Horse Mint. *This has square hairy Stalks, spread forth into many Branches*, higher and greater than the Common sort of *Wild Mint*; on which grow hairy long Leaves at the Joints thereof, and many purplish Flowers at their several tops.

X. *The eighth*, or small round Leav'd Wild or Horse Mint. *The Stalk is square, hairy, and reddish, much about a Foot high, having two Leaves at a Joint, somewhat long and round, soft, hairy, and dented about the edges, of a sad green on the upper side, and hoary underneath*; from the Joints spring forth some Branches, set with the like Leaves, and round Heads of Flowers at the tops, of a purplish color; the smell of the Plant is heady, and of a strong sweetness.

XI. *The Places.* These are all of them Wild by Nature, and grow in moist and watery Places, as in Medows near unto Ditches which have Water in them, and in Grounds many times overflowed with Water, as in Fenny Grounds, *&c.* but the two first are Nurst up in our *Gardens*, and so are also the others in many Places.

XII. *The Times.* These Flower when the *Garden Mints* do, *viz.* about the latter end of *July*, or beginning of *August*; and spring up again the next year from their old Roots, by which they also very much encrease.

XIII. *The Qualities, Specification, Preparations, and Virtues* are exactly the same (if not more Powerful) with those of the *Garden Kinds* declared in the former Chapter, to which I refer you.

CHAP. CCCCXCIV.

Of MINT Water.

I. *The Names.* It is called in *Greek*, Σισύμβριον: in *Latine*, *Sisymbrium*, *Mentha aquatica*: and in *English*, *Water Mint.*

II. *The Kinds.* Of this there are two sorts, *viz.* 1. *Mentha aquatica rubra*, *Sisymbrium majus*; *Sisymbria Mentha Lobelij:* Beyond-Sea Apothecaries call it as *Tragus* says, *Balsamina*, as also *Balsamita*, as *Besler in horto Eystetensi* says, *Aquatica sive Sisymbra Mentha folio rubro Lobelij*, *Sisymbrium agreste aquaticum Gesneri*; *Sisymbrium Sylvestre Lugdunensis*, Red Water Mint, or Water Mint the Greater. 2. *Mentha Aquatica sive palustris minor*; *Mentha rotundifolia palustris minor Bauhini*, *Sisymbrium minus*, The lesser Water Mint.

The Descriptions.

III. *The first, or* Red Water Mint. *It has a creeping Root, running and spreading in Muddy and Watery Places*; From whence spring forth many square brownish Stalks, Branched forth almost from every Joint, with a Couple of somewhat broad, but pointed and dented Leaves, of a brownish or reddish color, and of a strong sweet *Mint* like smell. The Flowers are small and of a purplish color, standing at the tops of the Stalks or Branches, in loose round Tufts, one above another.

IV. *The*

Water red Lebb'd.

IV. *The ſecond*, *or* Leſſer Water Mint. *It has a Root like the former*, *which ſends forth a ſquare reddiſh hairy Stalk*, *and ſometimes a little hoary*, *of about a Foot in height*; on which grow ſoft, hairy, round and ſomewhat long Leaves, two always at a Joint, dented about the edges, on the upper ſide of a dark green color, and grayiſh or hoary underneath. From the Joints with the Leaves come forth long Branched Stalks, with purpliſh Flowers at their tops, ſtanding in round Heads. The whole Plant is of a ſtrong ſweet *Mint* like ſmell.

V. *The Places*. They both grow by Ditches and Water ſides, and in wet and plaſhy places, as alſo in Fen Grounds, where they very much delight.

VI. *The Times*. They Flower late in the *Summer*, *viz.* about the beginning of *Auguſt*.

VII. *The Qualities*, *Specification*, *Preparations*, *and Virtues*, are the ſame with thoſe of Out *Garden Mint*, declared in *Chap.* 492. And probably may exceed them in many reſpects.

CHAP. CCCCXCV.

Of MOLY:

OR,

ONION-GARLICK.

I. THE *Names*. It is called in *Greek*, Μώλυζα *Pſellio*, vel *μόλυζα Hipp.* i. e. *Allium habens caput ſimplex*, *neque in ἄγλιθας nuvleos diviſum*, as *Galen* Interprets it. Or Μωλυ *Plinii*, *παρὰ τὸ μαλύνειν τὰς νόσους*, *à mitigandis ſedandiſque morbis*: vel *à μωλύω*, i. e. *ἀναιρέω*, *quod Venena deleat*: in *Latine*, *Moly*, *Allium Scipeum*: in *Engliſh*, *Moly*, *Onion Garlick*, and *Scorcers Garlick*.

II. *The Kinds*. There are many ſorts of this Plant, as, 1. *Moly Theophraſti*, *vel Moly Homericum*, Theophraſtus or Homers great Moly. 2. *Moly Indicum Lobelij*, *Cluſij*, *aliorumque*, *caucaſon*; The Indian Moly. 3. *Moly Montanum Pannonicum bulbiferam primum*, The firſt bulbed Hungarian Moly. 4. *Moly Montanum bulbiferum ſecundum*, The ſecond bulbed Hungarian Moly. 5. *Moly Serpentinum*, Serpents Moly. 6. *Moly Caule & foliis triangularibus*, The Cornered Moly. 7. *Moly foliis Narciſſinis*, Daffodil Leav'd Moly. 8. *Moly Montanum latifolium Flore Luteo*, Yellow broad Leav'd Moly. 9. *Moly Pyrenæum purpureum*, Purple Mountain Moly. 10. *Moly Montanum latifolium purpureum Hiſpanicum*, Purple broad Leav'd Spaniſh Moly. 11. *Moly purpureum Neapolitanum*, Purple Naples Moly. 12. *Moly Pyxidatum argenteum Hiſpanicum*, Silver Cupp'd Spaniſh Moly. 13. *Moly Serotinum coniferum*, The late ripe Pine Apple Moly. 14. *Moly Dioſcorideum*, Dioſcorides his Moly. 15. *Moly Dioſcorideum Hiſpanicum*, Spaniſh Moly of Dioſcorides. 16. *Moly Muſchatinum*, *Moly Zibettinum Monſpelienſe*, Sweet ſmelling Moly of Mompelier. 17. *Moly Pannonicum latifolium Primum Cluſij*, The firſt broad Leav'd Hungarian Moly of *Cluſius*. 18. *Moly Pannonicum Flore odorato*, Sweet ſmelling Hungarian Moly. 19. *Moly Montanum Capite rotundo purpureo*, Purple round Headed Mountain Moly. 20. *Moly Africum umbella purpuraſcente*, Purpliſh Headed African Moly. 21. *Moly Italicum album Caule Triangulo*, Italian white Moly with a triangular Stalk.

The Deſcriptions.

III. *The firſt*, *or* Theophraſtus and Homer's great Moly. *Its Root grows very great*, *ſometimes greater than any Man's Fiſt doubled or cloſed*, *which is one great Bulb*, *and not divided into Cloves as* Garlick *is*, *but ſmells ſtrong like* Garlick, *being whitiſh on the out ſide*, *and green at the top*, *if it be but a while bare from the Earth about it*. It riſes up moſt commonly with two, but ſometimes with three great, thick, long, and hollow guttered Leaves, of a whitiſh green color, very near to the color of a *Tulip* Leaf: having ſometimes at the end of ſome of the Leaves, and ſometimes a part by it ſelf, a ſmall whitiſh round Button, like unto a ſmall Bulb, the like of which alſo, but greater, does grow between the bottom of the Leaves and the Stalk, near the Ground, which being planted when it is ripe, will grow into a Root of the ſame Kind. Among theſe Leaves riſe up a round, ſtrong, and tall Stalk, a Yard or more high, bare or naked unto the top, where it bears a great Tuft or Umble of pale, purpliſh Flowers, all of them almoſt, ſtanding upon equal foot Stalks, or not one much higher than another, conſiſting of five Leaves apiece, ſtriped down the Back with a ſmall pale Line, having a round Umbone or Head with ſome Threads about it in the middeſt. Theſe Flowers abide a great while blown, before they fade, but ſmell not ſtrong like thoſe of *Onions* or *Garlick*, but have a faint ſcent. When they are paſt, the Seed comes, which is black, and encloſed in white cloſe Husks.

IV. *The*

IV. *The second*, *or* Indian Moly. *Its Root is white and great, covered with a dark Coat or Skin, which encreases but little under Ground.* It has such like Leaves as the former, but shorter and broader. In the middle of which rises up a short weak Stalk almost flat, not having any Flowers upon it, but a Cluster or Head of greenish, scaly Bulbs, inclosed at the first in a large thin Skin, which being open, every Bulb shews it self, standing close one unto another upon its foot Stalk, of the bigness of an *Acorn*, which being planted will be a Plant of the same Kind: but besides that Head, it bears small Bulbs above the Ground, at the bottom of the Leaves, next the Stalk, like unto the former.

V. *The third*, *or* First Bulbed Hungarian Moly. *Its Root is not great, but white on the out side, very like unto the Root of* Serpents Moly, *described at* Sect. VII. *following, increasing much under Ground, and smelling strong.* It has three or four broad and long, green Leaves, folded together at the first, which after open themselves, and are carried up with the Stalk, standing thereon, one above another, which is not above a Foot high. At the top of which does grow a few sad reddish Bulbs, and between them long foot Stalks, bearing Flowers of a pale purplish color. After which Flowers, black Seed ensue enclosed in roundish Heads.

VI. *The fourth*, *or* Second Bulbed Hungarian Moly. *Its Root is like the former, and covered with a blackish purple Coat or Skin.* It has narrower green Leaves than the former: the Stalk is about the same height, at the top a great Cluster of small green Bulbs, which after turn of a darker color: from among which come forth long foot Stalks, on which grow purplish Flowers.

VII. *The fifth*, *or* Serpents Moly. *Its Root is small, round, and whitish, encreasing into a number of small Roots, no bigger than* Pease, *round about the greater Root.* This Plant is of the Species of the *Bulbed Molys*, but of greater Beauty and Delight; because the Bulbs on the Heads of the small Stalks, are redder, and more pleasant to behold. The Stalk is lower, and its grassie winding Leaves, which twine themselves like Serpents (whence came its Name) are smaller, and of a whiter green color. It bears among its Bulbs purplish Flowers also, but more Beautiful, whose smell is nothing so strong as some others.

VIII. *The sixth*, *or* Three cornered Moly. *Its Root is white on the out side, and very like the* yellow Moly. It has four or five long, and something broad, pale, green Leaves, flat on the upper side, and with a ridge down the back of the Leaf, which makes it seem three square or cornered. The Stalk rises up a Foot and half high or better, and is triangular or three cornered also, bearing at the top, out of a shining Husk, several white Flowers something large and longe, almost Bell fashion, with stripes of green down the middle of every Leaf, and a few Chives tipt with yellow in the middle about the Head; wherein, when it is ripe, is enclosed small black Seed. Both Root, Leaf, and Flower have a *Garlick* smell, but not very strong.

IX. *The seventh*, *or* Daffodil Leav'd Moly. *Its Root is sometimes knobbed, but more often bulbed, having in the Knobs some marks of the old Stalks to be seen in them, and of a* Garlick *smell, by which the Plant may be known.* It has many long, narrow, and flat, green Leaves, very like unto the Leaves of a *Daffodil* (from whence came its Name) or rather of the early greater *Leucoium Bulbosum*, or *Bulbed Violet*. From among which rise up two or three Stalks sometimes, each of them about a Foot and half high, bearing each at top (as all the *Molys* do) a number of small, purplish Flowers, enclosed in a shining Husk, which abide not long, but quickly fade; after which comes black Seed, like as in the others.

X. *The eighth*, *or* Yellow broad Leav'd Moly. *Its Root is whitish, two for the most part joined together, which quickly encreases and smells with a strong* Garlick *like scent, as both Flowers and Leaves also do.* It has but one long, and broad Leaf, when it bears no Flowers; but when it bears Flowers, it has two long, broad Leaves, yet one always longer, and broader than the other, which are both of the same color, and near of the bigness of a *Tulip* Leaf. Between those Leaves grows a slender Stalk, bearing at the top a Tuft or Umble of yellow Flowers out of a skinny Husk, which parts three ways, made of six Leaves apiece, laid open like a Star, with a greenish back, or out side, and with some yellow Threads in the middle, after which follows black Seed, like as in the others.

XI. *The ninth*, *or* Purple Mountain Moly. *It has a Root which is whitish, of a strong* Garlick *smell, but quickly perishes with the extremity of our cold* Winters, *which it will not endure without defence.* It has two or three Leaves, a little like the former *Yellow Moly*, but not so broad, nor so white. The Stalk has not so many Flowers thereon, but more sparingly, and of dull purple color.

XII. *The tenth*, *or* Purple, broad Leav'd Spanish Moly. *Its Root is small, and bulbous or round, with many Fibres adjoining, from which other small Bulbs shoot.* It has two broad, and very long, green Leaves, like unto the *Yellow Moly*, at *Sect.* X. above; but in this they encompass one another at their bottoms; between which rises up a strong round Stalk, two Feet or more high, bearing at the top out of a thin Husk, a great many fair, large Flowers, upon long foot Stalks, consisting of six Leaves apiece, spread open like a Star, of a fine diluted purple or blush color, with several Threads of the same color, tipt with yellow, standing about the middle Head: between the Stalk and the bottom of the Leaves, some small Bulbs grow, which being planted, will soon spring and encrease. Neither the Root, Leaf, nor Flower, have any *Garlick* like smell in them.

XIII. *The eleventh*, *or* Purple Naples Moly. *Its Root is white, round, and bulbous, quickly encreasing as the other* Molys *do; and has a more* Garlick *like smell than the other parts of the Plant.* It has three or four small green Leaves, growing upon the Stalk, after its springing up, which bears a round Head of fine purple Flowers, made of six Leaves apiece, but so closing together at the edge, that they seem like unto small Cups, never laying themselves open as the others do.

XIV. *The twelfth*, *or* Silver Cup'd Spanish Moly. *Its Root is small and round, white, and in a manner transparent, at least so shining as if it were so; and increases nothing so much as many of the other sorts.* It has two or three very long Rush like Leaves, which rise up with the Stalk, or rather dye away when the Stalk is risen up, to be about three Feet or more high, bearing a great Head of Flowers, standing close at the first, but afterwards spreading much one from another, every Flower standing upon a long foot Stalk, being of a white Silver color, with stripes or lines on every side, and shaped small and hollow like a Box or Cup. The Seed has scarcely been observed with us, because it Flowers so late, that the *Winter* hinders it for the most part, from coming to perfection.

This Plant has no ill ſmell at all, but rather pleaſant, and not to be refuſed.

XV. *The thirteenth, or* Late ripe Pine Apple Moly. *Its Root is ſmall and round, and ſhining like the laſt; and very tender, not being able to endure our cold Winters, which commonly cauſes it to periſh.* It riſes up with one long green Leaf, hollow and round unto the end, towards which, on the one ſide, breaks out a Head of Flowers, encloſed in a thin skin, which after it has ſo ſtood for a good while, (the Leaf in the mean time riſing higher, and growing harder, becomes the Stalk) breaks, and ſhews a great Head, or Buſh of Buds for Flowers, which are thick thruſt or crouded together, ſhaped very like to the form of a *Pine Apple* (from whence came the Name) of the bigneſs of a *Wall-Nut.* After this Head has ſtood in this manner a Month, or thereabouts, the Flowers ſhow themſelves, which are of a fine diluted or whitiſh purple color, with ſeveral ſtripes in every one of them, and of the ſame Cup faſhion with the former, but not opening ſo plainly, ſo that they can't be diſcerned to be open, without good obſervation. It Flowers ſo late in *Autumn*, that the early Froſts do quickly ſpoil its Beauty, and ſoon cauſe it to rot.

XVI. *The fourteenth, or* Dioſcorides his Moly. *The Root of this* Small Moly, *is tranſparent within, and covered with a thick yellow Skin, of the largeneſs of a* Haſle-Nut, *or ſomewhat bigger,*

MOLY.

which ſends forth three or four long, narrow, graſſy Leaves which are Hollow, and a little bending downwards, of a whitiſh green color; among which riſe up a ſlender weak Stalk a Foot and half high, bearing at top out of a thin skin, a Tuft of Milk white Flowers, very like unto thoſe of *Ramſons*, which continue a pretty while in their Beauty, and then paſs away, for the moſt part without yielding any Seed: the Plant nor its Root, ſmell little or nothing of *Garlick.*

XVII. *The fifteenth, or* Spaniſh Moly of Dioſcorides. *This in its Root, Leaves, Stalks, Flowers, and manner of Growing is altogether like unto that laſt deſcribed,* ſaving that this is fairer, larger, and of much more Beauty, as having its Flowers twice as big as thoſe of the former. But it ſeems not to be pleaſed with the cold of our *Winters* here in *England*, nor can it at all endure them, unleſs very great care be taken of its timely Houſing, for otherwiſe it quickly periſhes.

XVIII. *The ſixteenth, or* Sweet ſmelling Moly of Mompelier. *This is the ſmalleſt and fineſt of all the reſt, having four or five ſmall green Leaves, almoſt as fine as Horſe-Hairs, or like the Leaves of the* Feather-Graſs. The Stalk is about a Foot high, bearing about five or ſix or more ſmall white Flowers, laid open like Stars, made of ſix Leaves apiece, of an excellent ſweet ſmell, reſembling *Muſk*; It Flowers late in the Year, ſo that if the preceding *Summer* is over moiſt, or the *Autumn* be early cold, it looſes much of that very ſweet ſmell, which it will have, if thoſe Seaſons be hot and dry: beſides it muſt be carefully looked after, and timely houſed in a warm place; otherwiſe, it will not endure with us in the *Winter* time.

XIX. *The ſeventeenth, or* Firſt broad Leav'd Hungarian Moly of *Cluſius. Its Root is white and bulbous or round, having ſeveral ſmall Bulbs growing thereto.* It has ſeveral long, and ſomewhat broad Leaves riſing from the former Root. Its Stalk riſes up, to be about two or three Feet high, with thoſe Leaves thereon, but naked or bare from the midle to the top, where it bears a round Tuft of purpliſh Flowers, after which comes blackiſh Seed in three cornered Husks.

XX. *The eighteenth, or* Sweet ſmelling Hungarian Moly. *Its Root is white and bulbous, or round like the former, with ſome little Bulbs growing thereto.* It has a very ſweet ſmell, and in its form and manner of growing, very like to the laſt, but with leſſer Leaves and Flower Stalks, which bear at their tops, a Tuft of pale colored Flowers upon longer foot Stalks, hanging down their Heads, of a pretty, fine, freſh, pleaſing, ſweet ſmell, which abides not long, but quickly Vaniſhes. The triangular Heads that follow, bring forth blackiſh Seed, ſomething like to that of *Pinks* or *Gilliflowers.*

XX. *The nineteenth, or* Purple round Headed Mountain Moly. *Its Root is white and bulbous or round alſo, with ſome ſmall Bulbs adjoining to it.* It has a few long, narrow, green Leaves ſet on the Stalk like unto the other; and at its top, a large Tuft of delicate purple Flowers, which grow on ſhort foot Stalks, never fully opening themſelves; and having a ſtrong *Garlick* like ſmell.

XXII. *The twentieth, or* Purpliſh Headed African Moly. *Its Root is bulbous or round, from whence ſpring up but one Stalk ſometimes (and ſometimes two or three) of about three Feet in height*; with a few ſomewhat broad and long Leaves, pointed at the ends, and a little hairy about the edges. The Tuft at top of the Stalk conſiſts of purpliſh Flowers each of five Leaves which grow upon long foot Stalks.

XXIII. *The twenty firſt, or* Italian white Moly with a triangular Stalk. *Its Root is ſmall and bulbous or round, of a ſhining purpliſh color, ſmelling like* Garlick. This ſmall Plant has but one or two long, hollow Leaves, but ſomewhat broad, and ending in a point. The Stalk is triangular or three cornered, growing to be about ſix or ſeven Inches high, with ſeveral ſmall, white Flowers at the top.

XXIV. *The Places.* Theſe *Molys* are peculiar to ſeveral Countries of the Earth, as, *England, France, Germany, Hungary, Italy, Spain, Turky, &c.*

but

but they all or moſt of them grow with us in our *Gardens*, being Nurſt up, and carefully lookt after, but the moſt of them are hardy enough to endure the coldeſt of our *Winters*.

XXV. *The Times.* They Flower for the moſt part in the *Summer* time, *viz.* in *June*, and *July*; and their Seed is ripe in ſome little time after.

XXVI. *As to their Qualities, Specification, Preparations, and Virtues*, they are altogether the ſame with thoſe of the *Garden Garlick* (tho' I think not full out ſo powerful) which we have declared in *Chap.* 307. *Sect.* 8. *ad* 22. aforegoing of this Book. ſo that no more need to be ſaid of them in this place.

CHAP. CCCCXCVI.

Of MONEY-WORT. *OR,* Herb TWO-PENCE.

I. *THE Names.* It was unknown to the Ancient *Greek* and *Latine* Writers; Modern *Latine* Authors call it *Numularia*; from the form of its Leaf, being round like unto Mony: alſo *Centummorbium*, *Centummorbia*, and of *Geſner*, *Centimorbia*, from its wonderful effects in curing many Diſeaſes: and of *Brumfelſius* and others *Serpentaria*, either becauſe Serpents haunt it, and ly under it, or for their being hurt or wounded, they heal and cure themſelves therewith by eating it: in *Engliſh*, *Money-wort*, *Herb Two-Pence*, or *Two Penny Graſs*.

II. *The Kinds.* There are three ſorts of this Plant, *viz.* 1. *Numularia vulgaris*, *Numularia Major*, Common Money-wort, or the Greater Money-wort. 3. *Numularia Minor*, The Leſſer Money-wort. 3. *Numularia Flore purpuraſcente*, *Numularia Minor Flore purpuraſcente*, *Numularia Minima*, The ſmalleſt Money-wort, or Money-wort with purpliſh Flowers.

The Deſcriptions.

III. *The firſt*, *or* Common or greater Money-wort. *It has a ſmall, tender, and thready Root, which ſpreads and diſperſes it ſelf far about under the Ground.* From which Root ſpring forth ſeveral long, weak, and ſlender Branches, lying and running upon the Ground, two or three Feet long, or more; ſet on both ſides with Leaves, two at a Joint, one againſt another, at equal diſtances, which are almoſt round but pointed at the ends, ſmooth, and of a good green color. At the Joints with the Leaves from the middle forward, come forth at every Joint ſometimes two yellow Flowers, and ſometimes but one, ſtanding each on a ſmall foot Stalk, and conſiſting of five narrow, ſharp pointed Leaves; with ſome yellow Threads in the middle, which being paſt, ſmall, round, Heads of Seed follow in their places.

MONEY-WORT *Small.*

IV. *The ſecond*, *or* Leſſer Money-wort. *This in its Root, Stalks, Branches, Leaves, Flowers, Seed, and manner of Growing, is ſo like the former greater Kind, that it needs no other Deſcription*; and differs only from it in this, that it is every ways and in all reſpects much leſſer than it.

V. *The third*, *or* Smalleſt Money-wort, or Money-wort with purpliſh Flowers. *The Root of this is like to thoſe before Deſcribed, but much leſſer.* From which riſe up, very many ſmall, ſlender, creeping Branches, ſpreading and running on the Ground, in the ſame manner that the other do, which here and there put forth Fibres, and take Root again. The Leaves are ſmall, and round, ſtanding by couples one againſt another, at ſeveral Joints, and a little pointed at the ends. And out of their Boſoms as the ſaid Joints, ſpring forth ſlender foot Stalks, bearing at their tops pretty little Flowers, much ſmaller than any of the former, of a whitiſh purple, and ſometimes of a purpliſh red color, conſiſting of five little Leaves, ſtanding together in the manner of a little *Bell Flower*: after which come ſmall, round Heads, (ſmaller much than any of the former) in which is contained ſmall Seed.

VI. *The Places.* The two firſt grow in moiſt Grounds, and by Hedg-ſides, near to Ditches and Streams, and other watery Places, and ſometimes in moiſt Woods, in many places of *England*; the firſt is more plentiful and common, almoſt every where. *Gerard* ſays, he found it on the *Thames-Bank*, on the ſide oppoſite to *White-Hall*, and almoſt in every Country where he had Travelled. The third, *Gerard* ſays, he found in the *Biſhoprick of Durham*, and in two or three places in *Yorkſhire*: It grows alſo on the Bogs upon the Heath near *Burnt-wood* in *Eſſex*.

VII. *The Times.* They all of them Flower from *May*, thro' *June* and *July*; and the third in *Auguſt* alſo; and their Seed is ripe not long after.

VIII. *The Qualities.* *Money-wort* is cold in the firſt Degree, and dry in the ſecond. It is Aſtringent, Vulnerary, and Pectoral.

IX. *The Specification.* It ſtops all ſorts of Fluxes of the Bowels and Womb, heals Wounds and Ulcers, and prevails againſt Conſumptions of the Lungs.

X. *The Preparations.* You may make therefrom, 1. *A Liquid Juice.* 2. *An Eſſence* 3. *An Infuſion or Decoction in Water or Wine.* 4. *A Syrup or Loboch.* 5. *A Pouder of the Herb or Seed.* 6. *An Ointment or Balſam.* 7. *A Cataplaſm.*

The Virtues.

XI. *The Liquid Juice.* It is very Aſtringent, binding, and drying; and is good to ſtop all Fluxes of Blood in Man or Woman, whether it be a Diarrhæa, Dyſenteria, Lienteria, Hepatick Flux, or the overflowing of the Courſes in Women; it ſtops alſo all ſorts of Bleedings, whether outward, or inward, as Spitting, Vomiting, or Piſſing of Blood; rectifies the Weakneſs of the Stomach, ſtrengthens it, and ſtops Vomiting; healing all excoriations or Ulcers thereof, as alſo of the Lungs, and of other inward parts. Doſe 3 or 4 Spoonfulls at a time either mixt with Honey, or in a Glaſs of red *Port*, or red *Florence* Wine, Morning and Night.

XII. *The Eſſence.* It has all the Virtues of the *Liquid Juice*, and may be given in the ſame manner, from 2 to 4 Spoonfuls: beſides which, it is an excellent thing to heal all ſimple green Wounds; and to digeſt, cleanſe, incarnate, dry, and heal all ſorts of old Ulcers, not yet become cacoethick, ſtopping the Fluxion of ſharp and moiſt Humors which attends them, cauſing them either to ſpread, or to be long in curing.

XIII. *The Infuſion or Decoction in Water or Wine.* Theſe have the Virtues of the *Juice* and *Eſſence*, but nothing near ſo powerful, and therefore may be taken Morning and Night, from 4 to 6 Ounces, ſweetned with a little of the *Syrup.*

XIV. *The Syrup or Loboch.* Theſe are made of the *Juice*, the firſt of them with fine Sugar; the latter with Clarified Honey. They have all the Virtues of the *Liquid Juice* and *Eſſence*, beſides which, they are excellent againſt Coughs, Colds, Hoarſneſs, Wheezings, ſhortneſs of Breath, difficulty of Breathing, Excoriations and Ulcers of the Lungs, ſpitting of Blood, *&c.* Doſe from an Ounce to two Ounces, every Morning Faſting, an Hour before Dinner, and laſt at night going to Bed.

XV. *The Pouder of Herb or Seed.* Drunk in Water in which red hot Iron has been quenched, it ſtops Fluxes of the Bowels: and any old Sore or running Ulcer waſhed therewith, it cleanſes, drys and heals it in a ſhort time: ſo alſo the dry Pouder beſtrewed upon the ſame pretty thick every time it is dreſt.

XVI. *The Ointment or Balſam.* They cleanſe running Sores and old putrid Ulcers, it incarnates, drys, and heals the ſame: and are of eſpecial uſe for Green Wounds in any part of the Body: Applyed to the Gout it eaſes the Pain in a ſhort time, and ſo ſtrengthens the parts afflicted, as to prevent a new flux of Humors to the ſame.

XVII. *The Cataplaſm.* The Flowers and Leaves ſtamped and laid upon Wounds and Ulcers, cure them: but it is much more effectual being ſtamped and boiled in *Oil Olive*, with an addition of *Roſin*, *Wax*, and *Tupentine.* Authors ſay, that there is not a better Wound Herb than this, no not *Tobacco* it ſelf, nor any other Herb whatſoever.

CHAP. CCCCXCVII.

Of MOON-WORT.

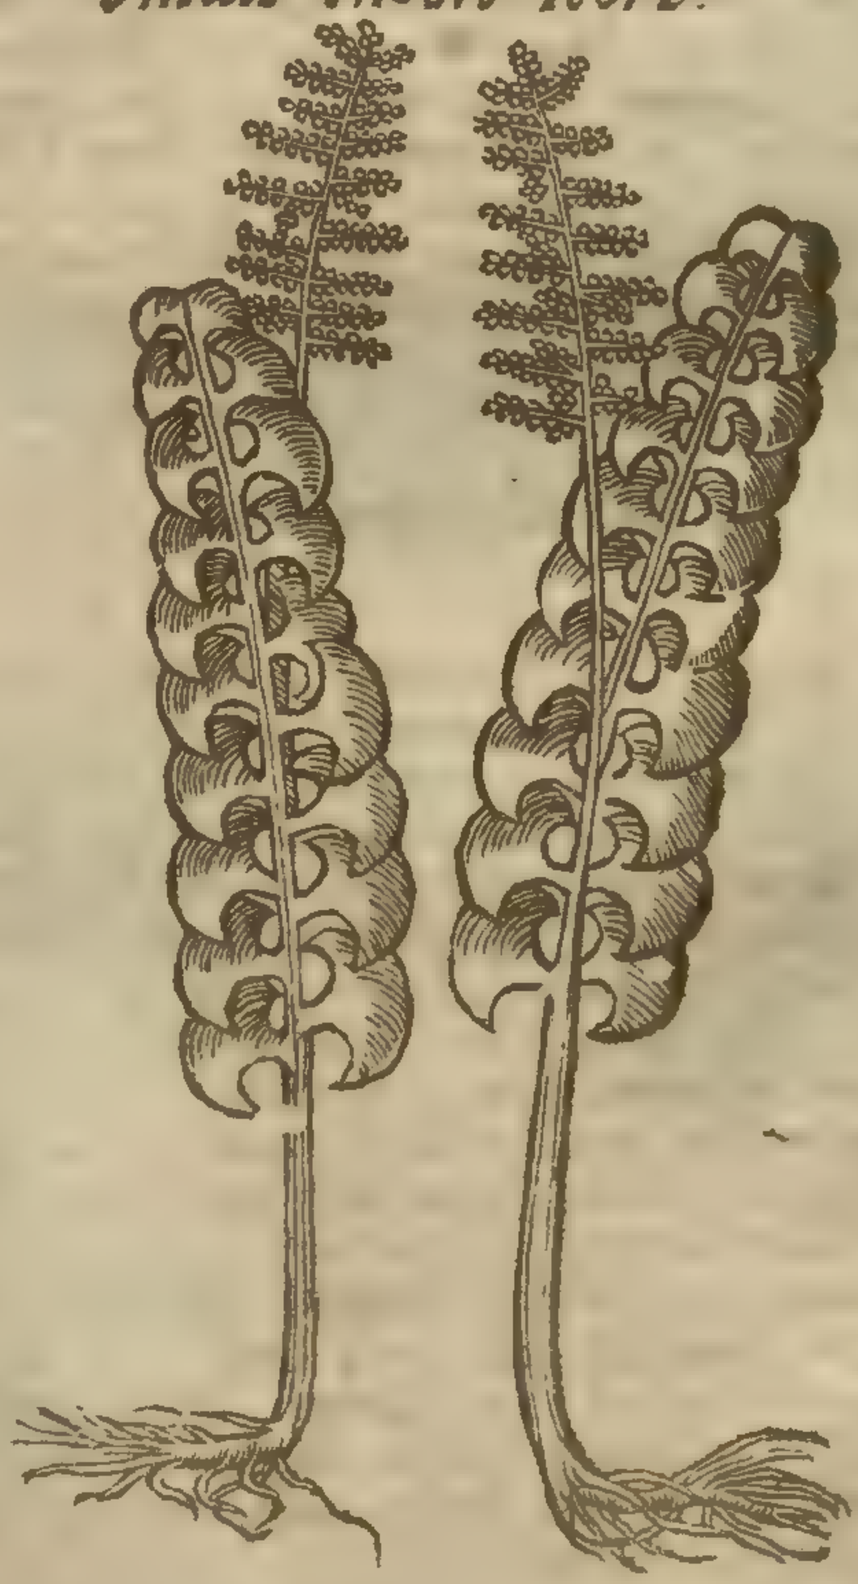
I. *THE Names.* This Plant was not known to the Ancient *Greek* or *Latine* Writers, tho' ſome would have it to be the *Ceratia Plinij:* ſome to be *Tragium ſecundum Dioſcoridis*, which growing on the Mountains, has the Leaf of *Scolopendrium*, or *Spleen-wort*, but I think erroneouſly. All out Modern Authors call it *Lunaria minor (à foliis Lunæ, Creſentis modo falcatis:) Geſner* calls it *Lunaria petræa & Taura:* it is the *Ruta Lunaria vel jecoraria Tabernæmontani:* and is called in *Engliſh*, *Moon-wort.*

II. *The Kinds.* Authors make ſeveral kinds of this Herb, as, *Lunaria minor*, the Leſſer Moon-wort, of which in this Chapter; and it is thought by ſome to be *Hemonitis altera, & Selenitis*; becauſe they make, *Lunaria major*, to be *Hemionitis*, or, Mules Fern, in *Chap.* 242. Alſo, *Viola Lunaria, Bulbonack*, or Sattin Flower, which ſee in its order. 2. *Lunaria minor ramoſa Cluſij*, ſmall Branched Moon-wort; but this latter being totally a Stranger in *England*, and Native of *Sileſia*, we ſhall ſay no more of it in this Place.

The Deſcriptions.

III. *The firſt, or* ſmall Moon-wort, *has a ſmall and Fibrous Root, from which ſprings up uſually but but one dark, green, thick, and fat Leaf, ſtanding*

Small Moon wort.



upon

upon a ſhort ſoft Stalk, not above two or three fingers breadth; but when it comes to Flowering, it then bears a ſmall, ſlender Stalk, of about 4 or 5 Inches high, having but one Leaf growing from it in the middle thereof, which is much divided on both ſides, ſometimes into 5 or 7 parts, or more on a ſide, each of which parts is ſmall next the middle Rib, but broad forwards, and round pointed, reſembling therein an half Moon, (from whence came the Name) the uppermoſt parts or divitions being leſs than the lower. The Stalk riſes above this Leaf 2 or 3 Inches, bearing many Branches of ſmall, long Spikes or Tongues, every one of them almoſt like to the ſpiky Head of *Adders-Tongue*, of a browniſh color, which whether they are to be called Flowers or Seed, is ſcarcely determinable. Theſe Spikes after they have continued a while, reſolve into a mealy duſt. Sometimes this Plant is found with ſeveral ſuch like Leaves, as the Leaf above deſcribed, with ſo many Branches or Tops ariſing from one Stalk, each divided from the other.

IV. *The Places.* It grows on Hills and Heaths, yet where there is much Graſs, for therein it delights to grow. *Gerard* ſays he found it growing about *Bath* in *Somerſetſhire* in many places, eſpecially at a place called *Carey*, two miles from *Bruton*, in the next Cloſe to the Church Yard: on *Cocks-Heath* between *Lowſe* and *Linton*, three miles from *Maidſtone* in *Kent*; as alſo in ſome Grounds by *Colcheſter*, in the Ground of the then Mr. *George Sayer* called *Mucs-end*: it grows likewiſe on the ſide of *Black-Heath*, near the Stile leading to *Eltham Houſe*, about an hundred Paces from the Stile: and in *Lancaſhire* near to a Wood called *Faireſt* by *Latham*: in *Nottingham-ſhire* by the *Weſt-wood* by *Gringley*, and at *Weſton* in the *Layfield* by the Weſt ſide of the Town: in *Biſhopsfield* at *York*: near unto *Wakefield*, in the Cloſe where formerly Sir *George Savil*'s Houſe ſtood, called *Heath Hall*, and in many other places.

V. *The Times.* It is to be found only in *April* and *May*, for in *June* and the following Months, when the hot Wether comes, it for the moſt part whiters and dyes away.

VI. *The Qualities.* It is cold in the firſt Degree, and drying in the ſecond, Abſterſive, Aſtringent, and Vulnerary.

VII. *The Specification.* It ſtops fluxes of Blood of all ſorts, whether inward or outward, Vomitings, and other fluxes of the Bowels, fluxes of the Womb, and heals all ſorts of ſimple Wounds, whether inward or outward, Ruptures, Fractures, *&c.*

VIII. *The Preparations.* You may have therefrom, 1. *A Juice or Eſſence.* 2. *A Decoction or Infuſion in Wine.* 3. *A Balſam or Ointment.* 4. *An Oil.* 5. *A Cataplaſm.*

The Virtues.

IX. *The Juice or Eſſence.* They are moſt excellent things for all Wounds whether inward or outward, they ſtop the Whites in Women, as alſo the overflowing of the Terms, and all ſorts of Fluxes, of the Bowels as Diarrhæa, Dyſenteria, and Lienteria, as alſo the Hepatick Flux, and all other fluxes of Blood, whether, by Spitting, Vomiting, or by Urine, as alſo inward Fluxes of Blood, made by Wounds. They ſtop Vomiting, ſtrengthen the Stomack, and other Viſcera, and reſtore the Tone of the Bowels being hurt. Doſe from 2 Ounces to 4, in any fit Vehicle.

X. *The Infuſion or Decoction in Wine.* They have all the Virtues of the *Liquid Juice* or *Eſſence*, and may be given Morning, Noon, and Night, from 4 to 6 or 8 Ounces, ſweetned with *Syrup* of *Red Roſes*, or of *Gilliflowers*.

XI. *The Balſam or Ointment.* They are excellent for healing of Green Wounds, digeſting, cleanſing, incarnating, and drying, or healing of old, rotten, putrid, and running Sores and Ulcers, bringing them to a ſpeedy Cure: They are good alſo to conſolidate Ruptures, Fractures, and Diſlocations, being duly outwardly applyed, the *Juice* or *Eſſence* being alſo taken at the ſame time.

XII. *The Oil by Infolation.* It is an excellent thing againſt Burnings and Scaldings however made, and being timely applyed, preſently takes out the fire, eaſes the Pain, and in a ſhort time after cures the ſame.

XIII. *The Cataplaſm.* It is good againſt Ruptures, Gaulings in any part, Inflamations, and conſolidates Fractures and Diſlocations. And timely applyed, it diſcuſſes ſimple Contuſions whereſoever, prevents Inflamation and Apoſtemation, and ſpeedily reſtores the part.

CHAP. CCCCXCVIII.

Of MOSS Ground, *or* Land.

I. *THE Names.* *Moſs* is called in *Greek*, Βρύον ἢ σπλάχνον; in *Latine*, *Muſcus*, which is *Byron Plinij*: in *Engliſh*, *Moſs*.

II. *The Kinds.* There are three Generick Species of this Plant, *viz.* 1. Βρύον χερσαῖον, *Muſcus Terreſtris*, Ground or Land Moſs, of which in this Chapter. 2. Βρύον δενδρειτὴς, ἢ Τύπνον, ἢ, σφάγνος, *Muſcus Arboreus*, Tree Moſs, of which in *Chap.* 499. 3. Βρύον θαλάσσιον ἢ ἑλώδες, *Muſcus Marinus*, Sea Moſs, of which in *Chap.* 500, following.

III. *The Species of the* Land *or* Ground Moſs. 1. *Muſcus Terreſtris vulgatiſſimus, vel Terreſtris Lobelij & Dodonæi*; *Muſcus Hortenſis Tragi Bauhini*, Our common Ground Moſs. 2. *Muſcus Terreſtris vulgaris alter Gerardi, Muſcus denticulato ſimilis Bauhini*, *Muſcus montanus Tabernæmontani*, Our other ordinary or common Ground Moſs. 3. *Muſcus Terreſtris ſcoparius*, *Muſcus ſcoparius Lobelij*; *Selago tertia Thalij*, Beeſom Moſs. 4. *Muſcus Clavatus, ſive Lycopodium, Lobelij & Dodonæi*; *Muſcus Terreſtris, Matthioli & Tragi*; *Selaginis Species altera Thalij*; *Muſcus Urſinus Geſneri*, Club Moſs, or Wolfs Claw Moſs, greater and leſſer. 5. *Muſcus denticulatus major & minor*; *Muſcus Terreſtris aliorum*; *Muſcus Luſitanicus Cluſij*, Toothed or Dented Moſs, greater and leſſer. 6. *Muſcus Pennatus major & minor*, Winged Moſs greater and leſſer. 7. *Muſcatus ſpicatus repens.* Creep-

Creeping Moſs with ſpiked Heads. 8. *Muſcus erectus Ramoſus major & minor Baubini*, Branched Moſs greater and leſſer. 9. *Muſcus parvus ſtellaris Baubini*; *Muſcus in Ericetis provenions Lobelij*, Heath Moſs. 10. *Muſcus Stellatus Roſeus Baubini*, Roſe or Star-like Moſs. 11. *Muſcus Pyxidatus Lobelij*, of which *Baubinus* makes two ſorts, *viz.* *Muſcus Pyxides Terreſtris*, & *Pyxides Saxatilis*, Cup Moſs, or, Cup like Moſs. 12. *Muſcus Corniculatus, Gerardi & Tabernæmontani*; *Muſcus Ceranoides major & minor Baubini*, Horned Moſs. 13. *Muſcus minimis Terreſtris Tragi*, the ſmalleſt Ground Moſs. 14. *Muſcus Abietis facie Baubini*. Firr-like Moſs. 15. *Muſcus Filicinus major & minor, Gerardi & Tabernæmontani, minor Baubini*, Fern-like Moſs. 16. *Muſcus Polytrichoides Baubini*. *Muſcus Capillaris, ſive Adiantbum aureum majus & minus Gerardi*, Maiden-hair Moſs, or Golden Maiden-hair greater and leſſer, as *Gerard* calls it. 17. *Muſcus Saxatilis Ericoides Baubini*, Stone Heath Moſs. 18. *Muſcus Terreſtris Coralloides incanus Baubini*, Hoary Coral-like Moſs. 19. *Muſcus Terreſtris Coralloides rufeſcentibus Cornibus Baubini*, Coral-like Moſs, with reddiſh Horns. 20. *Muſcus Corallinus Montanus*, *Muſcus Corallinus, ſive Corallina Montana Tabernæmontani*, Mountain Coralline-like Moſs. 21. *Muſcus Coralloides Saxatilis*, Rocky Coral-like Moſs: this *Columna* calls *Lithobryon Coralloides*. 22. *Muſcus Clavatas Cupreſſi formis, Sabina Sylveſtris, Geſneri & Tragi*; *Selaginis Plinianæ prima Species Thalij*; *Chamæcypariſſus Gerardi, Tabernæmontani & Turneri*, Moſs Cypreſs, or Heath Cypreſs, called alſo Cypreſs Moſs, of which we have already Treated at large in *Chap.* 188. aforegoing.

The Deſcriptions.

IV. *The firſt, or* Our common Ground Moſs. *Its Roots are very ſhort, which are faſtned in the Earth, from which the Herb ſprings up very thick, together*

with many ſmall ſingle Stalks, about a Foot in height ſometimes, and very oftentimes not half that height, with a great number of ſoft Leaves like Hairs, growing thick and cloſe together; the tops of which, in the hotteſt time in Summer will be ſomewhat round and whitiſh; the whole Tuſſock is often found differing in color, being either green or reddiſh, or of a whitiſh yellow color.

V. *The ſecond, or* Our other ordinary or common Ground Moſs. *Its Roots are like the former, and it grows up with many branched Stalks, of long winged, but ſhort green Leaves, almoſt like* Heath, *ſmooth and ſoft, not hard like* Heath: *it ſpreads much in the Ground, and riſes not above half a Foot high: this Plant is more common in* Germany, *and other Foreign Countries than with us.*

VI. *The third, or* Beeſom-Moſs. *It has a long buſhy fibrous Root, and takes its Name from the manner of its growing, which is from a ſmall Head below, ſending up ſeveral ſhining, blackiſh, purple Stalks, of winged green, Thread-like Leaves, about twelve Inches high, which ſpread themſelves out broadeſt in the middle; at the top of which breaks forth ſometimes ſmall yellowiſh Heads, which quickly fall away, without any Seed following them.*

VII. *The fourth, or* Club-Moſs, or Wolfs-Claw-Moſs, greater and leſſer. *Theſe run upon the ſurface of the Earth to a great length, breaking into other long, round Branches, ſhooting forth Fibres into the Ground as they creep*

CLUB-MOSS *greater.*

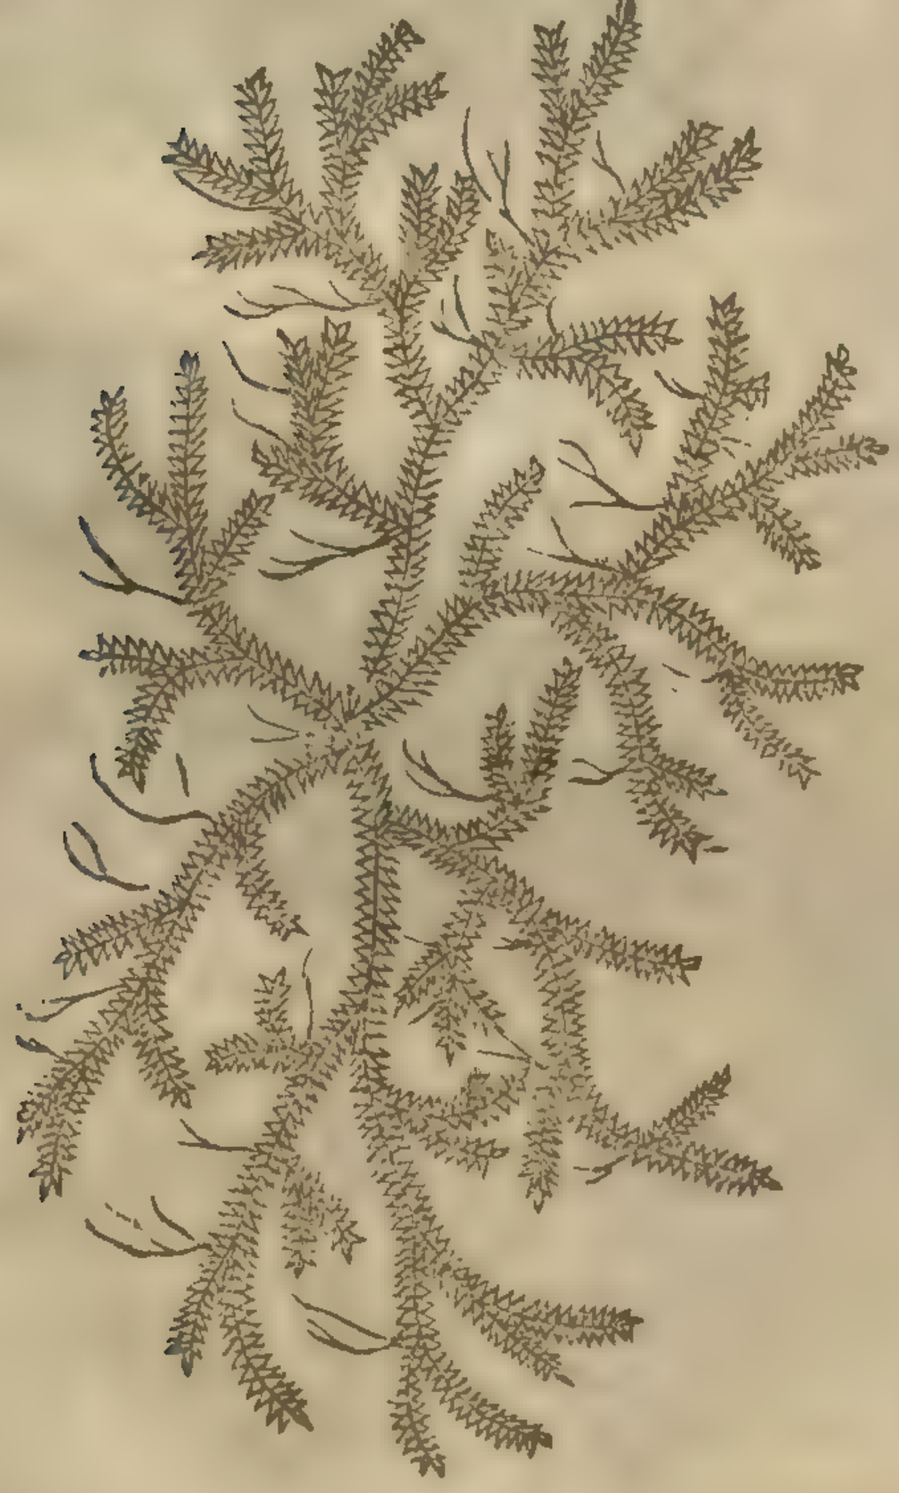
along, being made of many ſhort yellowiſh, green, hairy Leaves: at the Joints of the Branches, grow in ſeveral places, two or three ſmall, round, long, yellowiſh, ſcaly Heads, like

CLUB-MOSS *lesser.*

like the Catkins *or* Bloomings *of the* Hasle-Tree, *which as in all the other* Mosses *come to nothing.*

VIII. *The fifth, or* Toothed or Dented Mosse greater and lesser. *Both these sorts of* Mosses *grow one like the other, but one larger than another, and each of them somewhat like the last,* Rooting *in*

MOSS-TOOTHED.



divers places, as they run on the Ground. The Stalks are almost as small as Hairs, upon which grow small Leaves thick set together, as if they were Scales, laid close one to another; the ends of them, sticking out like Teeth.

IX. *The sixth, or* Winged Moss greater and lesser. *Both these Mosses need also but one Description, not differing but in the largeness and multitude of their branches one from another: they creep on the Ground, and Root as they run: whose Stalks and short Branches are thick set with fine yellowish, green Leaves like Wings on both sides, from whence it took its Name. They grow in Woods, as also upon the Rocks and Stones.*

X. *The seventh, or* Creeping Moss with Spiked Heads. *This grows near to, and under Trees, creeping far abroad, with thick and long Branches, which send forth many fine* Leaves, *set close together, in manner of long Spiked Heads; one sort being green, and another white.*

XI. *The eighth, or* Branched Moss greater and lesser. *The* greater Branched Moss *grows thick and close together like a Turff, or Hassock of high* Grass, *whose Stalks are* 4 *or* 5 *Inches long; spreading into Branches of* 2 *or* 3 *Inches a piece, and those into others again; all which are covered with very fine Hair like* Leaves, *among which shoot forth small naked Stalks of an Inch long, with small yellow round Heads like* Wheat Corns. *The lesser sort hereof has its Stalks shorter, and its Leaves are so small that are they scarcely to be discerned.*

XII. *The ninth, or* Heath Moss. *It grows much on dry heathy Grounds, and being a small sort of* Moss, *it rises up with several*

Heath Moss

hard Stalks of small short Leaves; and at the top, many others set thick and round like a Turff.

XIII. *The*

XIII. *The tenth, or* Roſe or Star like Moſs. *It is a ſmall* Moſs *which grows upon Rocks and Stones, and ſcarcely riſes above an Inch in height, having many ſmall, pale, green, ſharp pointed Leaves, ſet at the tops of their ſmall Stalks, in manner of a* Roſe, *ſpreading forth like a little Star.*

XIV. *The Eleventh, or* Cup Moſs, or Cup like Moſs. *The Leaves of this* Moſs *ly like* Liver-wort, *creeping upon the Ground, and are of a whitiſh yellow color, as are the ſmall hollow Leaves like Cups,*

CUP-MOSS.

which riſe from them. There is another Kind hereof, growing not on the Ground as the former, but on Rocks and Stones, whoſe Cups are ſmaller, more in number, and not ſo white.

XV. *The twelfth,* or Horned Moſs. *This grows on thoſe Rocky Barren Hills, and Stoney or Rocky Grounds, where almoſt nothing will grow. It riſes out of the Ground with ſeveral ſlender, weak, and ſomewhat broad Stalks, three or four inches high, naked and without Leaves, from the bottom to the top, but parted into ſmaller Branches, and they again into leſſer, which are forked at the ends like unto Horns, of a dusky white color.*

XVI. *The thirteenth, or* ſmalleſt Ground Moſs. *This ſmall Kind of* Moſs *uſually grows with us, not only upon thoſe Grounds, which are not ſtirred or turned up for two or three years together, but alſo in Flower Pots of Earth in* Gardens *many times, which have not been lately ſtirred. It is nothing elſe but a number of ſhort green Hairs, matting upon the Ground, which in the heat of* Summer, *and ſometimes ſooner, will ſend forth ſmall ſhort Stalks an Inch high, with ſmall yellowiſh or greeniſh Heads on them. This tho' beſt known to many, has been little regarded by moſt, and not mentioned by any before, except* Tragus, *and them which have followed him.*

XVII. *The fourteenth, or* Firr like Moſs. *It grows cloſe upon the Ground, creeping thereon with ſeveral long Branched Stalks, with fine, ſhort, hairy, green Leaves, ſet on both ſides of the middle thereof, reſembling a* Firr-Tree *Branch, from whence it took its Name.*

XVIII. *The fifteenth, or* Fern-like Moſs. *There are ſeveral Kinds of this* Moſs, *ſome bigger, and ſome leſſer than others, all of them riſing up with ſeveral Stalks, ſome blackiſh, ſome reddiſh, and fine Leaves on them, much like to* Fern Leaves; *but in ſome more finely cut or jagged into ſeveral parts, than in others; on the tops of the Branches of the leſſer ſort, hang ſmall, round, pointed, crooked Heads,*

XIX. *The ſixteenth, or* Maidenhair Moſs, or Golden Maidenhair greater and leſſer, as *Gerard* calls it. *There are three Kinds of this* Moſs, 1. *One that has many ſhort Stalks thick covered with ſhort, but ſomewhat hard, rough, Hair-like Leaves, growing in wet Grounds.* 2. *Another which is leſs in each part, and the Leaves not rough or hard at all.* 3. *Another which is the leaſt ſort, and the Leaves ſmootheſt: Theſe two laſt grow upon old Walls.* Gerard *ſays, that the firſt of theſe Kinds has Stalks about an handful high, covered with ſhort Hairs ſtanding very thick together, of an obſcure yellow green color, out of which Stalks ſpring up ſometimes very fine naked Stems, and ſomewhat black, upon the tops of which hang as it were little Grains like* Wheat Corns: *Its Roots are alſo very ſlender and extreamly fine.* 2. *The ſecond differs only in magnitude from the former, and has many hairy Threads upon its Branches.* 3. *The third which is the very leaſt of all (and poſſibly the leaſt of Plants which grow) has only three or four of thoſe hairy Threads cloſe to the Root.*

XX. *The ſeventeenth,* or Hoary Coral-like Moſs. *This ſmall* Moſs *has many ſmall Hair-like Leaves, next the Ground, like unto the* Common Ground Moſs, *among which riſe up, rough Stalks, three or four Inches high, in ſome places bare of Leaves, and covered in the reſt, with many ſuch like Leaves, as are growing on the* Erica Coris folio, *but without order; on the tops of each whereof ſtands a ſmall Head.*

XXI. *The Eighteenth, or* Hoary Coral-like Moſs. *This is all of a hoary white, growing about a Foot high, whoſe upright Branches are thick, ſolid, and not hollow, divided into many Ramifications, each whereof is like unto a Stags-Horn, and ſharp or ſmall at the end.*

XXII. *The Nineteenth, or* Coral-like Moſs with reddiſh Horns. *This* Moſs *grows among the* ordinary, *or* common Ground Moſs. *And is a delicate ſight to behold; the pale, green,* ordinary Moſs *to grow on the ground, and this* Moſs *being all white, to grow out from among it, parted like* Coral *into many Branches, hard or rough in handling; but the ends or tops of them are all of yellowiſh or reddiſh color, like ſmall, hard, or rough Horns.*

XXIII. *The twentieth, or* Mountain Coraline-like Moſs. *This is a ſmall low, whitiſh, dry Herb, with ſmall hollow Stalks, not ſtony or hard at all, but finely cut and divided into many parts, much reſembling the true* Coraline: *this is oftentimes found upon dry heathy Grounds.*

XXIV. *The twenty firſt, or* Rocky Coral-like Moſs. *This grows on Rocky Hills among other* Moſſes *in* Naples, *as* Columna *ſays, whoſe Branches are many, and each ending in a two forked like Horn, ſomething like the double forked Horn of a Stag, being hollow and white within, and green without: but of an ill earthy ſmell.*

XXV. *The Places.* They moſt of them grow upon barren, heathy, dry and rocky, or ſtoney Grounds, according as is expreſt in their ſeveral Deſcriptions. But the *Muſcus Capillaris, viz. the*

ſixteenth

fixteenth Species, is ſeldom found but in wet woody Grounds, upon Bogs and Mooriſh places, yet ſometimes it has been met with in ſhadowy dry Ditches where the Sun does not come. *Gerard* ſays, he found it in great abundance in a ſhadowy Ditch upon the left hand near unto a Gate which leads from *Hampſted-Heath* towards *High-Gate*.

XXVI. *The Times.* They all flouriſh chiefly in the *Summer* Months.

XXVII. *The Qualities.* They are cold in the firſt Degree, and dry in the ſecond; Aſtringent, Repercuſſive, Vulnerary, Diuretick, Stomatick and Nephritick: and of them all, the firſt, fourth, and eleventh, *viz.* the *Common-Moſs*, the *Club-Moſs*, and the *Cup-Moſs*, are ſaid to be the moſt ſingular and effectual.

XXVIII. *The Specification.* The firſt and fourth are good againſt the Strangury, to provoke Urine, and break and expel the Stone. The *Cup-Moſs* effectually helps the Chin-Cough in Children. The *Club-Moſs* is ſaid to recover Loſt or Prickt Wine. They all of them are good to heal Wounds and old Ulcers, to ſtop all ſorts of Fluxes of the Bowels, as alſo Fluxes of Blood.

XXIX. *The Preparations.* You may have therefrom, 1. *A Decoction in Wine.* 2. *A Pouder.* 3. *A Cataplaſm.*

The Virtues.

XXX. *The Decoction of the Common or Club-Moſs in Wine.* Being drank for ſome time is ſaid to be drying and Aſtringent, to ſtop Fluxes and Bleedings of all ſorts, and is a ſingular good thing to break Friable Stones in the Reins or Bladder, and to expel the ſame, as alſo Sand, Gravel, or Tartarous Matter affecting thoſe parts: it opens their obſtructions, provokes Urine, and gives eaſe in the Strangury. *The Decoction of the Cup-Moſs in Water or Whey*, effectually cures the Chin-Cough in Children; being taken for ſeveral days together.

XXXI. *The Pouder.* Made of any of the *Moſſes* and given to a Dram, it has all the former Virtues, and outwardly applyed it ſtops Bleeding upon the ſpot, and drys up old Sores and putrid running Ulcers. The *Pouder* of the *Cup Moſs* given to Children for ſeveral days together, Morning, Noon, and Night, it certainly cures them of the Chin-Cough; more eſpecially if it is given in the *Decoction.*

XXXII. *The Cataplaſm. Moſs* bruiſed and boiled in Water, and applyed to any Inflamation, or pains ariſing from a hot cauſe, allays the heat, and eaſes them; and therefore it is applyed by many to places affected with the Gout, and that as it is ſaid with good ſucceſs.

XXXIII. *An Obſervation. Club-Moſs* being hung in a Veſſel of Wine, that has loſt its Vigor, and is become flat or prickt (ſo much as is convenient for the bigneſs of the Veſſel) is ſaid in ſhort time to recover it again: for which reaſon *Brunfelſius* called it *Weinkraut*, or the *Wine Herb.*

ERATUM.

CHAP. CCCCXCIX.

Of MOSS Tree.

I. *THE Names.* It is called in *Arabick*, *Arnex*, and *Uſnec*: in *Greek*, Βρύον ἢ σπλάγχνον δενδρέων: in *Latine*, *Muſcus Arboreus*, & *Muſcus Quernus*, (becauſe it is moſtly to be found growing upon *Oak* Trees:) By the Apothecaries it is called *Uſnea*, (which is a Name alſo given to the *Moſs* growing upon Humane Sculls:) and in *Engliſh* it is called, *Tree-Moſs*; and if it grows upon *Oak* Trees, then *Oak-Moſs.*

II. *The Kinds.* There are ſeveral Species of this *Moſs*, *viz.* 1. *Muſcus Arboreus vulgaris*, *Muſcus Quercinus vulgaris*, Our common Tree-Moſs, or Oak-Moſs. 2. *Muſcus Arboreus Nodoſus ſive Geniculatus*, Knobbed or Kneed Tree-Moſs. 3. *Muſcus Quercinus Fœniculatus*, Fennel-like Oak-Moſs. 4. *Muſcus Quernus, vel Quercinus fruticoſus capitalis cavis*, Tree or Oak-Moſs with hollow Heads. 5. *Muſcus quernus vel quercinus alter latifolius Coralloides*, Oak Moſs with broad horned Leaves. 6. *Muſcus aridus cruſtatis*, Cruſty dry Moſs or dry Liver-wort or Lung-wort. 7. *Muſcus Pulmonarius*, *Lichen Arborum*, Moſs Lung-wort, or Tree Lung-wort, or Oak-Lungs, of which we have already diſcourſed at large in *Chap.* 458. aforegoing.

The Deſcriptions.

III. *The firſt*, *or* Common Tree-Moſs, or Oak-Moſs. *This generally grows on all Trees, and is nothing elſe but a number of Hairs or ſmall Threads, proceeding from the Bodies and Branches of them, in*

Oak or Tree Moſs.

ſome ſhorter, in others longer; all for the moſt part hoary, or of a whitiſh gray color, which have neither Root, nor Stalk, nor Flower, nor Seed. Some-

times this Moſs *is of a reddiſh color, and ſometimes blackiſh, which is the worſt of all.*

OAK MOSS.

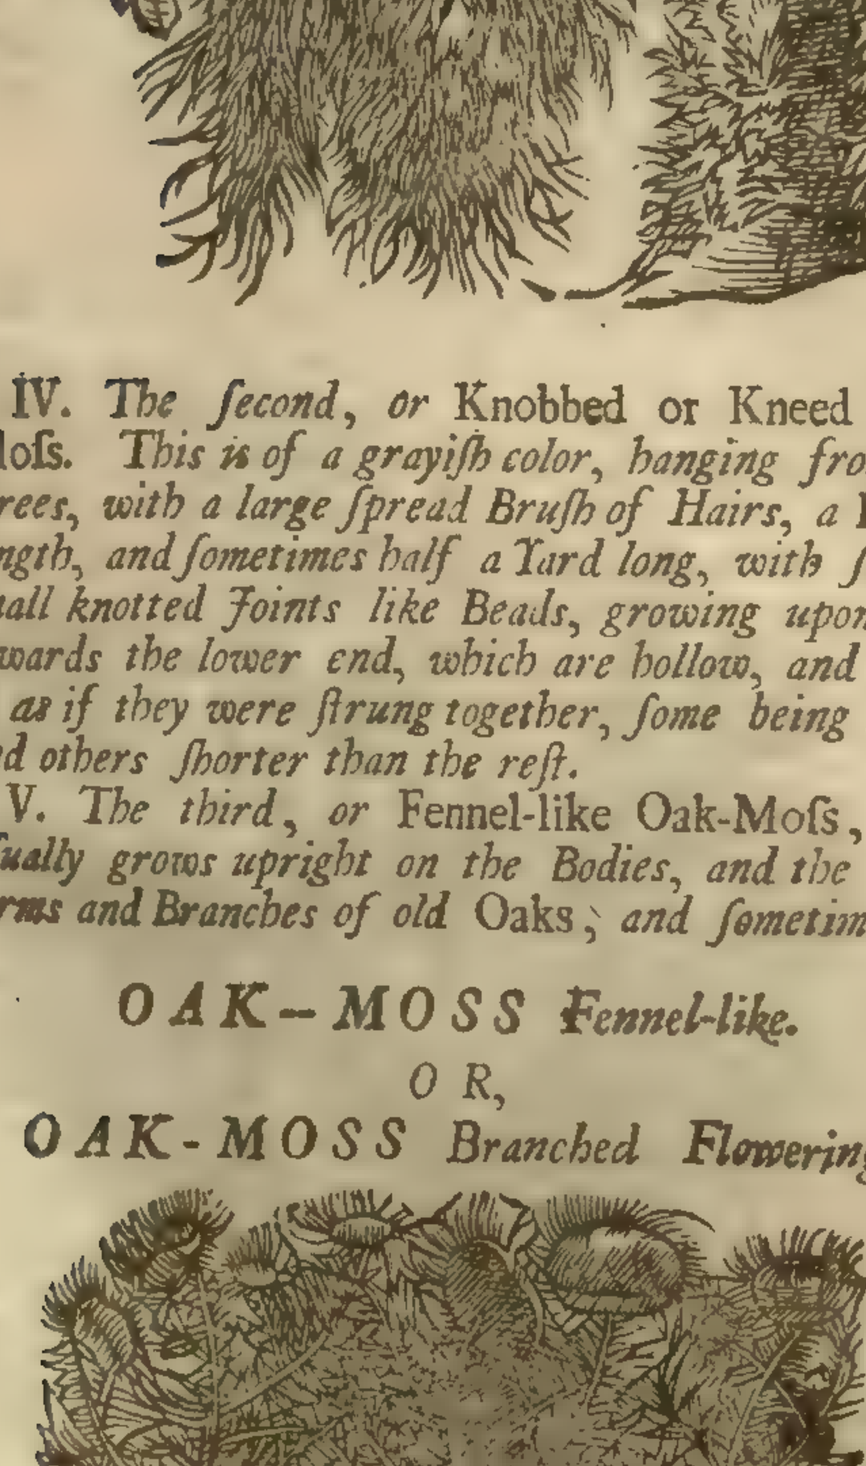
IV. The *ſecond, or* Knobbed or Kneed Tree-Moſs. *This is of a grayiſh color, hanging from the Trees, with a large ſpread Bruſh of Hairs, a Foot in length, and ſometimes half a Yard long, with ſeveral ſmall knotted Joints like Beads, growing upon them towards the lower end, which are hollow, and grow ſo as if they were ſtrung together, ſome being lower, and others ſhorter than the reſt.*

V. The *third, or* Fennel-like Oak-Moſs, *This uſually grows upright on the Bodies, and the older Arms and Branches of old* Oaks; *and ſometimes on*

OAK-MOSS *Fennel-like.*

OR,

OAK-MOSS *Branched Flowering.*



Beeches *alſo, faſtned by a ſmall brackiſh Root into their Bark, and from thence ſends forth ſeveral ſlender, blackiſh, branched Stalks about two Inches or more high, with a number of moſt fine grayiſh* Fennel *like Leaves, which ſmell ſomething ſweet: at the tops whereof ſtand ſmall, round, hollow Veſſels, a little rough or hairy about the Brims, which quickly fall away, without any Seed following them.*

VI. *Johnſon* upon *Gerard* thus Deſcribes this third ſort. *There is oftentimes found upon old* Oaks *and* Beeches *and ſuch like over grown Trees, a kind of* Fennel *like* Oak-Moſs, (*called alſo* Oak-Moſs Branched Flowering) *having many ſlender Branches, which divide themſelves into other leſſer Branches, on which are placed confuſedly, very many ſmall* Threads *of a greeniſh aſh color: upon the ends of whoſe tender Branches ſometimes there comes forth a Flower, in ſhape like unto a little Buckler, or hollow* Muſhroom, *of a whitiſh color tending to yellowneſs, and garniſhed with the like Leaves of thoſe upon the lower Branches.*

VII. The *fourth, or* Tree or Oak-Moſs with hollow Heads. *This has hollow Stalks, with broad flat Leaves, ſomewhat hairy on the edges. The Heads are alſo hollow with a blackiſh Stile or Peſtel in the midſt of them, and ſometimes encompaſſed about with a dented Verge. This has ſeveral ſhort Branches ſpread divers ways, and is wholly of a grayiſh aſh color.*

VIII. The *fifth, or* Oak Moſs with broad horned Leaves. *This is of a whiter aſh color, branching it ſelf into many thick and broad parts, like unto the Horns of a Stag, bearing at the tops of them, certain ſmall Veſſels, of the bigneſs of* Cicers *or* Chich Peaſe *at biggeſt. This* Moſs *does ſometimes grow Luxurious ſwelling greater from the bottom to the top.*

IX. The *ſixth, or* Cruſty dry Moſs, or Dry Liver-wort or Lung-wort. *This does not much differ in form and color from the* Moſs *or* Tree Lung-wort, *of which we have already treated in* Chap. 458. *but in its being dryer, or more cruſty or hard: It grows as well on Trees as on the cleft Pales and Shingles made of* Oak, *as alſo ſometimes upon Stones and Rocks on the* Ground, *and ſometimes upon the very* Common Moſs *it ſelf, as it has been found ſometimes growing in* Windſor Park.
