X. *The Places.* The firſt has been found growing upon Trees in many *Forreſts* and *Woods* throughout all *England*, as alſo through the whole Continent of *Florida*, where it grows very large upon *Oaks* to admiration, ſo that in *Carolina*, they have to my knowledg made it the *Winter* Proviſion for their Cattel. It grows moſtly upon *Oaks* and that in vaſt plenty. It grows alſo upon other Trees. It grows on the Arms and Bows of the *Ilex*, or *Ever-green-Oak*, as alſo upon the *Larch Tree* which is very white and ſweet: that is an incomparable good Kind which grows on the *Poplar Tree*: but that which grows upon the *Cedar* is ſaid to be the beſt of all others, it being very white and ſweet: and *Matthiolus* declares that to be the beſt, which is the whiteſt and ſweeteſt. Yet ſome others think that to be as good which is found upon the *Firr*, *Pine*, and *Pitch Trees*. The ſecond grows alſo frequently in *England* and other places. The third which grows many times upon old *Beeches* as well as upon *Oaks*, as alſo the fourth, fifth and ſixth, are found frequently in the *Woods* or *Wilderneſſes* through the vaſt Continent of *Florida*, and in many other places of the *Weſt-Indies*. The ſixth and ſeventh are found frequently growing upon *Oak Boards*, *Planks*, *Shingles*, and *Timber*, throughout all the *Britiſh Iſles*.

XI. *The*

XI. *The Times.* They grow and flouriſh all the year, and are in a kind of Vigor, even in *Winter* time, in the middle of Froſt and Snow.

XII. *The Qualities.* They are temperate in reſpect to heat or cold, of a Drying and Digeſtive quality withall, as *Galen* ſays, eſpecially that which grows upon the great *Cedar*.

XIII. *The Specification.* The Virtues which the Ancients attributed unto *Moſs*, are wholly to be underſtood concerning thoſe which grow upon Trees: and each *Moſs* does much partake of the Nature of the Tree on which it grew, or from whence it was taken. As that of the *Oak* is more binding, and better againſt Fluxes of the Bowels, Catarrhs, *&c.* than thoſe of the *Cedar*, *Larch*, *Beech*, *Poplar*, *Fir*, or *Pine Trees*; and is more powerful than any of thoſe againſt Vomitings, and Fluxes of Blood in any part.

XIV. *The Preparations.* You may have therefrom, 1. *An Infuſion or Decoction in Wine.* 2. *A Pouder made of the ſubſtance of the* Moſs. 3. *The Oil or Ointment.*

The Virtues.

XV. *The Infuſion or Decoction in Wine.* Being drank it is good againſt Reachings and Vomiting, ſettles a troubled Stomach, and allays the Hiccough, comforts the Heart, as *Avicen* ſays, and cauſes deep Sleep as *Serapio* affirms. It ſtops all Fluxes of the Bowels, and all internal Fluxes of Blood, whether of the Lungs, Reins or Guts: and ſtops the overflowing of Womens Courſes being taken inwardly, and outwardly uſed as an Injection up the Womb with a proper Womb Syringe.

XVI. *The Pouder.* It has all the Virtues of the *Infuſion or Decoction* afore declared, and may be given from a Scruple to a Dram, made up into a Bolus with a little *Mithridate* or *Venice Treacle*, or given in any other proper Vehicle. It ſtops all inward Bleedings being given as aforeſaid, or in any Stiptick red Wine: And it ſtops any outward Bleeding of Wounds, *&c.* being outwardly applyed dry, either alone, or mixed with fine *Bole*, in fine Pouder. And is ſaid to be available againſt the Dropſie being taken in ſtrong Drink or Wine for ſome time together.

XVII. *The Decocted Oil or Ointment.* The firſt is made by by Boiling in *Oil Olive*, &c. The ſecond by Boiling in *Hogs Lard.* Being applyed to the Temples or Forehead, it wonderfully eaſes the pain thereof which comes from a hot Cauſe: and ſtops the defluxion of hot ſharp Rheums and Humors flowing thence to the Eyes and other Parts. The Ancients much uſed theſe *Tree Moſs*'s in their Ointments, againſt Laſſitudes, to ſtrengthen the Nerves, and comfort Joints and Parts which have been weakned by hurts, blows, and affluxes of Humors.

XVIII. *The Qualities, Specification, Preparations*, and *Virtues* of the ſeventh Species, *viz.* of the *Moſs or Tree Lung-wort*, called by ſome *Oak-Lungs*, you may ſee at large in the afore cited *Chap.* 458. *from Sect.* 7. *ad* 12. *inclusive.* Phyſicians uſe it againſt the moſt inveterate Conſumptions, and that with good ſucceſs, and indeed againſt moſt Diſeaſes of the Lungs, as Colds, Coughs, Stuffings, Wheezings, Hoarſneſs, ſhortneſs of Breath, difficulty of Breathing, as alſo againſt all ſorts of Fluxes of the Bowels. And Shepherds give it to their Cattel for the ſame purpoſes, mixt with a little Salt, and that with good Succeſs. It is profitable alſo, to be put into Lotions, to ſtop a defluxion of Humors upon old Ulcers and running Sores in any part of the Body, as alſo Ulcers in the ſeveral parts of Man or Woman, the ſame being waſh'd therewith two or three times a day.

CHAP. D.

Of MOSS Sea.

I. *THE Names.* It is called in *Arabick*, *Thalaleb & Thaleb*: in *Greek*, Βρύον θαλάσσιον: in *Latine*, *Muſcus Marinus*: and in *Engliſh*, *Sea Moſs.*

II. *The Kinds.* There are ſeveral Species of *Sea-Moſs*; as, 1. *Muſcus Marinus virens Fœniculatus*, *Muſcus Marinus Herbaceus mollior C ſalpini*, ſhort Fennel-like Sea-Moſs. 2. *Muſcus Marinus Ferulaceus*, *Fucus Ferulaceus Lobelij*, long Fennel-like Sea-Moſs. 3. *Muſcus Marinus Abrotonoides*, *Fucus Marinus foliis Abrotani Maris Lobelij*, *Muſcus Marinus foliis Abrotani Lugdunenſis*, Southernwood-like Sea-Moſs. 4. *Muſcus Marinus Neapolitanus*, *Muſcus Marinus Cluſij*; *Palmula Marina Imperati*, Neapolitan Sea Moſs. 5. *Muſcus Marinus Venetus*, *Coſti Indici radicis effigie Pona*, The Venetian Coſtus-like Moſs. 6. *Muſcus Marinus Capellaceus Dioſcoridis*, *Muſcus Marinus Dioſcoridis*, *Fucus Capellaceo folio Theophraſti* (as *Lugdunenſis* thinks) The ſoft Sea-Moſs. 7. *Muſcus Maritimus Tinctorius*, *Alga Tinctoria Lugdunenſis*, *Fucus ſive Alga Tinctoria*, red Sea-Moſs, or red Dying Sea-Moſs. 8. *Muſcus Marinus Argenteus Plumiformis Donati*, Silver Feather-like Sea-Moſs. 9. *Muſcus Marinus Aureus*, *Penna Marina Aurea Donati*, Golden Feather-like Sea-Moſs.

The Deſcriptions.

III. *The firſt, or* ſhort Fennel-like Sea-Moſs. *It grows up from blackiſh, round, and Fibrous Roots, with many fine ſhort Leaves like* Fennel, *of an herby green color, among which comes forth, an herby Stalk, with ſuch like Leaves on it, and having ſeveral ſwoln Eminences thereon.*

IV. *The ſecond, or* long Fennel-like Sea-Moſs. *The Leaves of this* Sea-Moſs *are long and fine, like unto thoſe of the* Ferula, *or* Fennel Giant, *growing from Stalks of almoſt a Foot long, and is divided into many Branches. It ſprings from Stones, Rocks and the like.*

V. *The third, or* Southernwood-like Sea Moſs. *This ſprings up alſo from Rocks with thick Stalks and Branches, having thereon fine cut Leaves, ſomething like unto* Southernwood, *but much bigger, and of a browniſh red color.*

VI. *The fourth, or* Neapolitan Sea Moſs. *This likewiſe grows from ſome Stone or Rock; and riſes up with a Stalk of about* 4 *Inches or more high, with ſeveral Branches on them on both ſides, and they again divided into leſſer, all of them plentifully ſtored with very fine Leaves, as ſmall as* Camomil Leaves, *or finer than they, if any of the two be finer; ſoft in handling at firſt, eaſy to be bended, green below at the lower part, and purpliſh above; and withall Tranſparent, if they be interpoſed to the light. This is not ſo brittle as* Coraline *when it*

is dryed, and grows more rough by the dryneſs: it has a very Salt taſte, and being ſoaked a while in Water, grows pliant and ſoft again.

VII. *The fifth, or* Venetian Coſtus-like Sea-Moſs. *This grows on Rocks in the Sea, which by the often agitation of the Water, is broken from it, and carried to the Shore, not having any Root, but being made as if it were a Tuft of ſmall Sticks ſet together, which being dry, much reſembles the Root of* Coſtus Indicus, *but whiter: and being moiſtned again, opens it ſelf into form, being full of Salt, much like to ſmall Sand.*

VIII. *The ſixth, or* Soft Sea-Moſs. *This is like unto thoſe* Moſſes *which grow upon the Ground or on Trees without any Roots; and grows only upon Rocks, or Shells of ſeveral Shell-Fiſhes, being a ſoft Herb, compoſed wholly of woolly white Hairs without any Branch or Stalk, and is oftener found white than reddiſh or gray, but ſeldom or never green. There is alſo another ſmall ſort hereof, found growing on the Stones by the Sea ſide, as alſo ſometimes on Wood: and is likewiſe ſometimes caſt up by the Sea on the Shore among the* Alga, *or* Sea Wrack, *of ſeveral ſorts growing ſomething like to the former or* Ground Moſs, *but that it is white, and a little ſaltiſh and binding.*

IX. *The ſeventh, or* Red Sea-Moſs, or Red Dying Sea-Moſs. *This is a ſmall ſort of* Moſs, *and much like to the fourth Species, or* Neapolitan Sea-Moſs; *it is furniſhed with a greater ſtore of ſoft Stalks, but fewer Branches, and with as fine ſmall Leaves on them like unto* Fennel, *of a reddiſh color, but with ſome whiteneſs mixed together. This is uſed by ſeveral Dyers to ſtain and ſtrike a deep crimſon color, or a reddiſh purple, which will laſt long.*

X. *The eighth, or* Silver Feather-like Sea-Moſs. *This moſt beautiful* Moſs *grows on Rocks in the Sea, upon the dry Shells of Fiſhes, and is oftentimes found wrapped among the* Alga, *or* Sea-Wrack, *or* Sea-Weeds, *when caſt upon the Shore, growing up with many Stalks, and ſpreading it ſelf out into many particular Branches, made as it were all of Hairs like other* Moſſes, *but very much repreſenting ſeveral ſprigs of Feathers, of ſo pure a white Silver-like color, that it is to be wondred at, that ever any thing ſhould become ſo white by Nature, or be made ſo white by Art.*

XI. *The ninth, or* Golden Feather-like Sea-Moſs. *This is a* Moſs *alſo of excellent form and beauty, Branching it ſelf out into ſeveral Sprigs, reſembling the Natural form of ſmall long Feathers. The Branches are filled with Leaves on both ſides fine like Hairs: and both Stalks and Leaves are of a moſt ſhining* Gold *color, beautiful to behold, and have a great reſemblance of the* Spartum Auſtriacum, Cluſij, *which we call* Feather-Graſs.

XII. *The Places.* The Deſcriptions ſhew that moſt of them grow upon Rocks, Stones, and Shells in the Sea, and on the Shore: ſcarcely any of them growing out of the Ground except the firſt: ſome of them are found in the Seas and on the Shores of other Countrys; and ſome or moſt of them on our own Coaſts.

XIII. *The Times.* They grow and flouriſh all the yeat long, and live *Summer* and *Winter* very much alike.

XIV. *The Qualities.* They are cold and dry in the firſt Degree, are Aſtringent, Anodyn, Vulnerary, and Nephritick.

XV. *The Specification.* They cool Inflamations, gives eaſe in the Gout, kill Worms in the Body, ſtop fluxes, ſtay Vomiting, reſiſt Fluxions of the Eyes or other parts, Stop fluxes of the Belly, prevailagainſt Sand and Gravel in Reins, and Bladder, and cleanſe, dry and heal old running Sores, and foul putrid Ulcers.

XVI. *The Preparations.* You have theretrom only, 1. *A Decoction in Wine.* 2. *A Pouder of the whole Body of the* Moſs. 3. *A Cataplaſm.*

The Virtues.

XVII. *The Decoction of the fourth and ſixth Species in Wine.* Injected into the Bladder or Urethera with a Syringe, it abſterges very much, waſtes Carnoſities or Caruncles in thoſe parts which ſtop the Urine, and heals Ulcers in the Bladder and Urethra; it ſaid to have cured one who was troubled with that Diſeaſe in a very ſhort time. And for this reaſon it is very probable, that it may be very effectual in healing a Virulent *Gonorrhœa* in Man or Woman, univerſals being firſt premiſed.

XVIII. *The Pouder.* Given from a Scruple to a Dram in ſome fit Vehicle, it is ſaid to kill Worms in Children; but it ought to be made of the fourth and ſixth Kinds. The *Pouder* of the fourth Kind is ſaid to be very effectual for Watering Red Eyes, if mixt with *Fennel Water*, and put into them. And the ſame *Pouder* taken with *Vinegar* ſtops Vomiting and ſtrengthens the Stomach. The *Pouder* of the fifth Kind, or *Venetian Sea-Moſs*, is good to cleanſe foul Ulcers of all ſorts, whether inward or outward; and being given to a Dram in Wine, it expels Sand and Gravel from the Reins, and gives eaſe in the Strangury.

XIX. *The Cataplaſm.* It is made of any of the *Moſſes* being green and freſh, by beating a little in a Mortet. Being applyed to Inflamations, it cools them, and eaſes their Pains: And in a hot Gout, it gives preſent eaſe, becauſe it drys, thickens and cools: and withal it reſiſts the Fluxion, and admirably ſtrengthens the part afflicted.

XX. *The Virtues of the eigth Species, or* Silver Feather-like Sea-Moſs. Applyed *Pultiſe-wiſe* with *Vinegar*, it eaſes the Pains of the Spleen; it alſo diſſolves ſtrumous Swellings or Kernels in the Neck and Throat, or other Parts. The *Decoction in Wine*, given to ſix or eight Ounces at a time; or the *Pouder* given to a Dram at a time in White *Port* or *Lisbon* Wine, abundantly provokes Urine, and are profitable againſt the Dropſy: they cleanſe the Reins, Ureters, and Bladder, from ſmall Stones, Gravel, Sand, and other Tartarous Matter. The *Pouder* may be given in *Wine* as aforeſaid, or in *Diſtilled Water* of *Eryſimum*, or *Hedg-Muſtard*, or of *Sea Holly*, or of *Parſly*, or of *Hydropiper*, mixt with an equal proportion of *Juice of Limons.*

CHAP. DI.

Of MOTH-WORT.

OR,

Golden CUDWEED.

I. *THE Names.* It is called in *Greek*, Ἐλίχρυσον: in *Latin*, *Helichryſum*, *Eliochryſum*, *& Tinearia*, alſo *Coma aurea*, *Gerardi*, *& Aurelia Gazæ*: in *Engliſh*, *Mothwort*, *Golden Moth-wort*, *Golden Cudweed*, and *Gold-Flower.*

II. *The*

II. *The Kinds.* It is ſuppoſed to be a Species of the *Cudweeds*, but ſeems to me, to be a ſingular Plant of its own Kind, and is the *Helichryſum* of *Dioſcorides*. But *Parkinſon* gives us three other ſorts of it alſo.

The Deſcriptions.

III. *This Plant has a long Root, of a conſiderable thickneſs, and furniſhed with ſeveral Fibres or Strings, ſpringing from the ſides thereof round about, from which ſpring forth ſlender ſtalks ſomething hard and woody, divided into ſeveral ſmall Branches; upon which do grow* Leaves *ſomewhat rough, of a white color, and much jagged, not much unlike to thoſe of* Southernwood. *The Flowers ſtand on the tops of the Stalks, joined together, of a yellow color glittering like Gold, in form reſembling the ſcaly Flowers of* Tanſie, *or the middle bottom of the* Camomil *Flower, which being gathered before they be ripe or withered, remain beautiful for a long time after. For which cauſe of long laſting, the Carved Images of Heathen Gods or Idols were wont to wear Garlands thereof. For which reaſon* Ptolomy *King of* Egypt, *did much obſerve it as* Pliny ſays. Thus *Gerard.*

IV. Parkinſon *thus deſcribes it.* Heliochryſum *or* Golden Flower of Life, *has a Root which is ſmall and Woody, ſpreading under the upper cruſt of the Earth, living long in its own Natural place, but very hardly endures the cold of our* Winters, *unleſs they be mild, or well defended. From this Root riſe up many hard, round, white Stalks, a Foot and half high, on which at certain diſtances ſtand many fine cut Leaves, or rather one Leaf cut into many fine and ſmall parts, almoſt as ſmall as* Fennel; *but of a grayiſh color, like unto the* Cudweeds *or* Cottonweeds, *(whereof certainly this is a ſpecial Kind.) At the tops of the Stalks ſtand many round Flowers, of a pale gold color, in an Umble cloſe together, yet every Flower upon its own Stalk, and all of an even height, which will keep the color (being gathered and kept dry) for a long time after, and are of an hot quick ſmell.*

To this *Parkinſon* gives us alſo the Deſcriptions of three other Plants, (which he will have to be Species of the ſame Kind,) and which we here deliver you, as follows.

V. Heliochryſum Creticum, Candy Gold-locks, or Golden Flower. *It has two or three ſmall, ſlender Branches, which are white, and ſet here and there very ſcatteringly, with ſmall, long, and narrow hoary Leaves, having yellow Heads of Flowers at the tops, made into Umbles or Tufts, not ſo round and even as the former, but long-wiſe, one above another, the Heads being made as it were of Scales, looſly and not ſo cloſely ſet together, as in the next following: which when they are full ripe do paſs into Down, and are blown away with the Wind, having a ſmall reddiſh Seed at the end: but will abide a long time, as the others in its beauty, being gathered in its due ſeaſon.*

VI. Helichryſum Orientale, Oriental Gold-Locks, or Golden Flower. *Its Root dies not every Year, but lives long, eſpecially in the Southern and Eaſtern Countries, which have no cold Froſts; but with us, in our cold Climates, it requires much care and dilgence to keep and preſerve it. It is a beautiful Plant, and much like to the former* Cretick *Kind laſt deſcribed, but grows up higher, with many more Branches, and more hoary, white and woolly, having alſo long and narrow white Leaves, but ſomewhat broader, and thicker ſet on the Branches. The Tuft of Flowers or Umbles do likewiſe conſiſt of longer and larger Heads, more ſcaly and cloſer compact together, of an excellent pale yellow color, and ſhining, with ſome yellow threads or thrums in the middle.*

VII. Heliochryſum Citrina, Chryſocome, Stæchas Citrina, Gold Tufts, Gold Caſſidony. *Its Root is ſmall and Black; and the Plant is ſomewhat like to the* Candy Gold-locks, *at* Sect. 5. *above, having hoary Stalks, and Leaves ſtanding confuſedly on them, being long and narrower than thoſe of* Creet *or* Candy. *The Tops of the Stalks are divided into many parts, each bearing a ſmall, long, yellow* Head *or* Flower *at the top, with ſome yellow* Thrums *in them, which Heads being many, are diffuſedly ſet together, like a looſe or ſparſed Umble, keeping their color long long before they wither; and when they are ripe, have thin, ſmall, reddiſh* Seed, *like* Marjerom Seed, *but leſſer. The whole Plant (as well Leaves, and Flowers, as Roots, is of a ſtrong, and ſharp, but pleaſant ſmell.*

VIII. *The Places.* They all grow in Hot Countries, as in *Barbary*, *Candy*, *Italy*, *Provence* in *France*, and in *Spain:* where they grow in untilled Grounds, and in Barren Meadows, as alſo about the Banks of Rivers. With us they only grow in *Gardens*, and are very carefully to be lookt after in *Winter.*

IX. *The Times.* Poſſibly in their Native Countries they may Flower in the latter end of the *Spring* or *Summer* Months, as *Theophraſtus* and *Pliny* ſay; but with us, they all Flower in the end of *Auguſt*, or rather in *September*, to the time called *Michaelmas.*

X. *The Qualities.* They are hot and dry in the ſecond Degree, incide, attenuate, and are Diuretick.

XI. *The Specification.* They are (chiefly the firſt and laſt) peculiar againſt the Strangury, Congelation of the Blood, and Bitings of Serpents and other poiſonous Creatures.

XII. *The Preparations.* You may have herefrom, 1. *An Infuſion or Decoction in Wine.* 2. *A Pouder of the Herb and Flowers.* 3. *A Spirituous Tincture of the ſame.* 4. *An Acid Tincture.*

The Virtues.

XIII. *The Infuſion or Decoction in Wine.* It heats and drys, and is profitable againſt Catarrhs, provokes Urine powerfully, and gives eaſe in the Strangury: comforts a cold Stomach, and helps Digeſtion. It is good alſo againſt the Bitings of Serpents and other Venomous Creatures, and being drank diſſolves congealed Blood.

XIV. *The Pouder of Leaves and Tops or Flowers.* It has all the Virtues of the *Infuſion* or *Decoction*; and may be given Morning and Night, from half a Dram to a Dram, in a Glaſs of Generous Wine. *Dioſcorides* ſays, that the tops thereof being drank in Wine, are good for ſuch as can hardly make Water, againſt Bitings of Serpents, and Pains of the Huckle Bones, by which I ſuppoſe is meant the Sciatica: and being taken in ſweet Wine it Diſſolves congealed Blood.

XV. *The Spirituous Tincture.* It is good againſt weakneſs of the Stomach and Bowels, expels Wind, and prevails againſt the Colick and Griping of the Guts: ſtrengthens the Head, Brain, and Nerves, comforts the Bowels and Womb, and admirably provokes Urine. Doſe from one Dram to three Morning and Night, in a Glaſs of Wine, or ſome other proper Vehicle.

XVI. *The*

XVI. *The Acid Tincture.* It Stops Vomiting, ſtrengthens the Stomach, creates an Appetite and cauſes a good Digeſtion. It opens obſtructions of the Reins, Ureters and Bladder, and expels the Morbifick cauſe of Fevers by Urine. It opens alſo obſtructions of the Lungs, and cauſes free Breathing. Doſe ſo many Drops in Ale, Beer, or Wine, as to make it gratefully Acid; and to be repeated as often as the Sick drinks, till the Diſaffection is removed.

XVII. *Nota.* Any of theſe Herbs, (but chiefly the firſt of them) being laid in Cheſts among Cloaths it keeps them from Moths; and from thence came the Name of *Moth-wort*.

MOTHER of TIME, *ſee* Time Wild, *Chap.*

CHAP. DII.

Of MOTHER-WORT.

I. THE *Names.* I do not find that this Plant was known to the Ancient *Greeks*, or *Latines*: Our Moderns call it *Cardiaca* (from comforting and ſtrengthning the Heart) and might very well be called *Matricis Herba and Matricaria altera* (from its curing of Diſeaſes of the Womb:) The *prime Matricaria*, being that which we call *Parthenium*, or *Featherfew.* And in *Engliſh* we call it *Mother-wort*, from its curing *Fits of the Mother.*

II. *The Kinds.* Moſt of our *Botaniſts* have made but one Species hereof, and a ſingular Plant of its Kind: But Mr. *Ray* has added many more, but they being all Strangers to us, and not poſſible to be met withall here, we ſhall wholly paſs them by. That which we ſhall here Deſcribe is *Cardiaca vulgaris*, or *Matricaria altera*, Our Common Mother-wort. Theſe, *viz.* 2. *Cardiaca Criſpa*, Curled or Criſped Mother-wort. 3. *Cardiaca Americana annua Nepetæ folio*, Annual American Mother-wort with Nep or Cat-mint Leaves. 4. *Cardiaca Americana minor Nepetæ foliis*, The leſſer American Mother-wort with Nep or Cat-mint Leaves. Theſe I ſay, are the chief of thoſe which he has added, beſides which he has enumerated about ſeven other Kinds, all which being Foreign (as the Plants themſelves are) to our deſign, we ſhall paſs them all over.

The Deſcriptions.

III. Our Common Mother-wort *has a ſlender Root which ſends forth and is compact of a great Number of ſmall Fibres or long ſlender Strings, which are of a dark yellowiſh or browniſh color, taking ſtrong hold in the Ground, and periſhes not, but well abides the coldneſs of the* Winter. *From whence riſes up a hard ſquare browniſh, rough, ſtrong Stalk, riſing to be ſometimes three or four Feet high, and ſpreading into many Branches, on which grow Leaves on each ſide upon long foot Stalks, two at every Joint, which are ſomething broad and long, and as it were rough, or crumpled, with many great Veins which ſhew themſelves therein, of a*

MOTHER-WORT.

ſad green color, and deeply dented in about the edges, and almoſt torn or divided. From the middle of the Branches up to the tops of them, which are very long and ſmall, grow the Flowers round about them at diſtances, in ſharp pointed, rough, hard Husks, which are more purple or red, than in any of the Bawm's, *or in any* Hore-hound; *but in the ſame manner, form, and roughneſs as thoſe of the* Hore-hound *are; after which come ſmall, round, blackiſh Seed in great plenty.*

IV. *Gerard* has another kind of Deſcription of this Plant, which ſomething better pleaſes me, and it is this. *Its Root is compact of many ſmall Strings, which ſends forth a Stalk four ſquare, thick, hard, and about two Cubits high, of an obſcure, or over-worn red color. The Leaves are ſomewhat black like thoſe of* Nettles, *but greater and broader than the Leaves of* Hore-hound, *deeply indented, or cut in on the edges. The Husks are hard and pricking, which do encompaſs the Stalks like Wharles, or little Coronets, out of which grow purpliſh Flowers, not unlike to thoſe of* Dead-Nettles, *but leſſer. The whole Plant has a bitter Taſte and rank Smell*

V. *The Places.* It grows among Rubbiſh and by the ſides of Walls, and Hedges, and Banks of Ditches, in many places beyond Sea. And *Parkinſon* ſays, he never knew or heard that it grew with us any where but in *Gardens* where it had been once Sown or Planted. But *Gerard* ſays, that it joys only in Rubbiſh, Stony, and other Barren places, and has been found in ſome places about *Oxford*: I my ſelf in Travelling about *England*, have ſometimes found it growing Wild, in ſeveral places.

VI. *The Times.* It Flouriſhes, Flowers, and Seeds from *June* to *September*, yielding a plentiful quantity of Seed. The Root endures all *Winter*, though the Leaves and Stalks dye away and periſh.

VII. *The Qualities.* It is hot and dry in the ſecond Degree, Abſterſive, Aſtringent, Diuretick, Vulnerary, Cardiack, and Hyſterick.

VIII. *The Specification.* It prevails againſt Faintings and Swoonings, as alſo Hyſterick Fits, Convulſions

vulsions, Cramps, and Palsies, opens Obstructions eases the Strangury, provokes Urine and the Terms, and facilitates the Birth, in Women in Labor.

IX. *The Preparations.* You may make therefrom, 1. *A Liquid Juice or Essence of the Herb.* 2. *An Infusion or Decoction of the same.* 3. *A Pouder thereof.* 4. *A Spirituous Tincture.* 5. *A Distilled Water.*

The Virtues.

X. *The Liquid Juice or Essence.* It may be given from one Spoonful to three in a Glass of *Canary*, or other Generous Wine, against Faintings, Swoonings, sickness at Heart, Convulsions, Palsies, Lethargies, *&c.* Given in *Pennyroyal-Water*, or in its own *Distilled Water*, it is good against Vapors and Hysterick Fits. Given in white *Port* or *Lisbon* Wine, it facilitates the Birth of Women in Labor, induces the Terms, provokes Urine, and gives ease in the Strangury.

XI. *The Infusion or Decoction in Wine.* It has all the Virtues of the *Liquid Juice or Essence*, but much weaker, and may be given Morning and Night, from four to six or eight Ounces, according to the condition of the Patient.

XII. *The Pouder.* The *Pouder* has all the former Virtues, and may be given from half a Dram to a Dram, or Dram and half in a Glass of Generous Wine, Morning and Night: It cleanses the Breast and Lungs of cold Flegm, and causes it to be easily expectorated; and kills Worms in the Stomach and Belly.

XIII. *The Spirituous Tincture.* This is much more Cordial than any of the former Preparations, and therefore more effectual against Diseases of the Nerves, Heart, and Stomach; it warms and drys up cold Humors, dispersses and digests them in what part of the Body soever, and gives present relief in Cramps and Convulsions.

XIV. *The Distilled Water.* It has the Virtues of the former Preparations, but in a weak Degree, and is chiefly used as a Vehicle, to convey the former, or other Preparations in relating to the same Diseases.

CHAP. DIII.

Of MOUSE EAR.

I. *THE Names.* This Plant is called in *Greek*, Μυοσῶτα: in *Latine*, *Pilosella*, *Myosotis*, & *Auricula Muris*; in *English*, *Mouse Ear.* They are called *Pilosella* from the hairiness of their Leaves and Stalks.

II. *The Kinds.* They are manifold, as, 1. *Piloſella minor vulgaris repens*; *Pilosella major repens* (so called in respect to the eighth Kind;) *Holostium Lacunæ*; Our common small creeping Mouse Ear. 2. *Poliſella media vulgaris erecta*; *Pilosella major quorundam* (so called in respect to the eighth Kind, as aforesaid:) *Lactucella Sylvestris repens Camerarij in horto*, Our common upright Mouse Ear. 3. *Pilosella altera erecta*, The second or other upright Mouse Ear. 4. *Piloſella minima*, The smallest Mouse Ear. 5. *Auricula Muris tertia Tragi*, *Myosotis Scorpioides hirsuta*, *Alsine Myosotis Lobelij*, (referring it to the kinds of *Chick-weed*) Blew Mouse Ear with a turning top. 6. *Myosotis Scorpioides repens*, *Helitropium minus alterum Cæsalpini*, Small creeping blew Mouse Ear. 7. *Piloſella Americana*, *Piloſella Americana odorata*, *Piloſella Indica odorata*, Sweet Indian or American Mouse Ear. 8. *Piloſella minor*, *Piloſella Montanum*, *Piloſella minor Montanum flore albo & flore purpureo*, *Gnaphalium Montanum flore albo & purpuero*; The lesser Mouse Ear, or Mountain Mouse Ear, with white and purple Flowers, or Cats-Foot, or Mountain Cudweed with white and purple Flowers. 9. *Piloſella Rosea*, *Gnaphalium Roseum*, The Rose Mouse Ear, Rose Cudweed, or Cotton Rose.

The Descriptions.

III. *The first, or* Our common small creeping Mouse Ear. *Its Roots are small with some Fibrous strings, whence shoots forth a low creeping Herb, running upon the Ground, and Rooting with small strings from several Joints, almost after the maner of the* Strawberry *Plant: at or from which grow upon the Ground many small and somewhat short Leaves set in a round form together, hollowish in the middle,*

Creeping Mouse Ear.

where they are broadest, of a hoary color all over, as well above as below, and very hairy; which being broken do yield a white Milk, or milky Juice. From among these Leaves spring up two or three small hoary Stalks, about a Span high, with a few smaller Leaves thereon. At the top of which stand usually but one Flower, consisting of many pale yellow Leaves, broad at the points, and a little dented in, set in 3 or 4 rows, the greater outermost, and the smaller inwards,

inwards, very like a Dandelion *Flower, and a little reddiſh underneath about the edges, eſpecially if it grows in a dry and not moiſt Ground, which after they have ſtood long in Flower, do turn into Down, which with the Seed is carried away with the Wind.*

IV. *The ſecond, or* Our common upright Mouſe Ear. *This is very like the former: the chief difference between them conſiſting in this, that the Leaves are longer and greener on the upper ſide, and ſomewhat hoary underneath, ſofter in handling, and not ſo much hairy; the Stalks of Flowers ſtanding more upright and higher: this Plant, if its Stalk or Leaf be broken, does give a white or Milk-like Juice as the former.*

V. *The third, or ſecond, or* other upright Mouſe Ear, *which* Gerard *calls* Piloſella major, *or* great Mouſe Ear. *It has a ſmall, tough, and fibrous Root, whence ſhoot forth a few hoary and hairy broad and long Leaves, lying upon the Ground; among which riſes up a ſlender hairy Stalk, bearing long and narrow Leaves thereon; and at the top two or three ſmall, pale, yellow Flowers, like in faſhion to the former, which turn into Down as thoſe do.*

VI. *Gerard* has this Deſcription of it. *Its Roots are hard, woody, and full of Strings. It has great and large Leaves greater than the* common (creeping) Piloſella, *or* Mouſe Ear, *thick and full of Subſtance. The Stalks and Leaves are hoary and white, with a ſilken Moſſineſs in handling, and feel ſoft as* Silk, *Pleaſant and fair in View. It bears three or four four ſquare Stalks ſomewhat knotty, and about a Foot in height. The Flowers come forth at the tops of the Stalks, like unto the ſmall* Dandelion *or* Piſſabed *Flowers, of a bright yellow color.*

VII. *The fourth, or* ſmalleſt Mouſe Ear. *This is in all things like unto the ſecond Kind, or* Our common upright Mouſe Ear, *before deſcribed at* Sect. IV. *and is ſmaller by half than the firſt common Kind, both in Leaf and Flower, but creeps not by ſtrings as that does.*

III. *The fifth, or* Blew Mouſe Ear with a turning top. *It has a ſmall and thready Root, from whence riſes up, uſually but one Stalk, (ſeldom any more) which is round, hairy, and about half a Yard high or better; at the bottom of which grow ſomewhat long and broad hairy Leaves, very like as well for roughneſs, as for ſhape and color unto the* Wild Borage *Leaves. The Stalk is ſometimes Branched, and ſometimes not, with ſeveral ſuch like Leaves, but growing leſſer and leſſer thereon, as they grow up to the tops of the Flowers, which turn or wind themſelves inward like unto a Scorpions Tail, or the Herb* Heliotropium: *The Flowers conſiſt of five ſmall Leaves apiece, which are round, and of a pale blew color, very much reſembling the Flowers of* Bugloſs, *or* Wild Borage, *with a yellow ſpot or Eye in the middle, and ſtand all on one ſide of the Stalk and Branches, after they are paſt, there come in their places, ſmall rough flat heads, in which the Seed is contained.*

IX. *The ſixth, or* Small creeping blew Mouſe Ear. *This is very like the laſt Kind, but that it is ſmaller; and moſt commonly has ſmaller Leaves and Flowers on the Branches, which do not ſtand ſo upright, but trail or creep more on the Ground. The Flowers alſo ſtand not on one ſide only, but on both, and open by degrees. The turning tops, which are like the laſt do grow up, and dilate themſelves; and the Flowers are of a blew color, but ſome of them are more purple, with a yellow Eye in the middle.*

X. *The ſeventh, or* Sweet Indian or American Mouſe Ear. *This Plant has a fleſhy Root creeping under Ground, not growing deep, with many Fibres adjoining thereto; from whence ſhoot forth ſeveral ſomewhat long Leaves, ſet with very long Hairs. The Hairy Stalk which riſes from them, grows to be about half a Foot high, at the top of which ſtands ſeven or eight fair Flowers, like thoſe of* our common Mouſe Ear, *but of a deeper yellow or orange color, ſmelling very ſweet like* Musk.

XI. *The eighth, or* Leſſer Mouſe Ear, or Mountain Mouſe Ear with white and purple Flowers, or Cats-Foot. *This* Mouſe Ear *may be accounted a certain Kind of* Mountain Cudweed, *or* Cotton-weed. *Its Root is compoſed of ſeveral ſmall blackiſh Fibres, Threads or Strings. From which ſpring forth many ſmall, white, woolly Leaves, lying upon the Ground, ſomewhat like unto the Leaves of the* ſmall Mouſe Ear, *but ſmaller than them. From among which riſes up a ſmall Stalk of about half a Foot high, beſet here and there with ſome few Leaves; at the top of which comes forth a Tuft of ſmall Flowers, ſet cloſe together, in ſome of a pure white, in others of a purple or reddiſh color; in ſome of a pale red or bluſh, and in others of a white and purple mixt together. This Plant for its beauty is much commended, but will ſcarcely abide all* Winter *with us in our* Gardens, *unleſs the Seaſon is mild.*

XII. *The ninth, or* Roſe Mouſe Ear, Roſe Cudweed, or Cotton Roſe. *Its Root is ſmall, long and Thready. And from the ſame ſpring up ſuch like woolly Leaves as in the former, growing upon ſmall ſhort Branches, ſcarcely an Hand breadth high, in ſhape ſomething like unto* Daiſy *Leaves, but leſſer and round pointed. At the top of every Stalk or Branch, ſtands one Flower, compoſed of two rows of ſmall white Leaves, laid open like a* Star *or* Roſe, *whence came the Name, having a round Head in the middle, made of many yellow Threads or Thrums, which falling away, a ſmall round Head riſes up, full of ſmall Seeds.*

XIII. *The Places.* The firſt and ſecond grow promiſcuouſly on Ditch Banks, and ſometimes in or near to Ditches, if they be dry, as alſo on Sandy Grounds, and untill'd places, which ly open to the Air. The third is more rare, and but now and then to be met with in *England*, but is more plentiful in *Germany*. The fourth is found growing upon dry barren Heaths, eſpecially upon *Hampſtead* Heath, where it grows in ſuch plenty, that one can hardly ſet a Foot but upon the Heads of it. The fifth and ſixth grow in dry and barren Grounds in many places of our Land; the fifth *Parkinſon* found in the back Cloſe of formerly Sir *John Tunſtal* his Houſe near *Croydon*. The ſeventh, its Title or Name ſhews where it naturally grows, and whence it came to us; I have found much of it growing in the Continent of *Florida*. The eighth and ninth grow in *France* and othern Southern Countries; but grow alſo as well in the colder Countries of *Germany*, and with us are only Nurſt up in *Gardens*.

XIV. *The Times.* The firſt and third are ſaid by *Gerard*, to Flower in *May* and *June*: but the firſt ſeven, generally ſpeaking, Flower in *June* and *July*, and abide green all the *Winter*. The eighth and ninth Flower very late, towards the latter end of *September*; ſometimes they ſhew not their beauty at all with us, it is ſo late.

XV. *The Qualities.* The firſt ſeven are hot and dry in the firſt Degree; Abſterſive, Aſtringent, Conſolidative, Diuretick, Traumatick or Vulnerary, Pectoral, Nephritick, and Hyſterick. The two laſt are ſaid to be cold and dry in the firſt Degree.

XVI. *The*

XVI. *The Specification.* It is powerful against the yellow Jaundice, Stone and Gravel, Tortors and gripings of the Bowels, the Dropsy, obstructions of the Spleen, stops the overflowing of the Terms, or any Flux of Blood: is good against Coughs, a Phthisis, or Ulceration of the Lungs, and Consumptions; prevails against Quartan Agues; cures Green Wounds, as also Ulcers in any part of the Body. The first is what we intend here, and next to that the second Kind, and then the third.

XVII. *The Preparations.* You may have herefrom, 1. *A Liquid Juice of the Herb.* 2. *An Essence of the same.* 3. *A Decoction in Wine.* 4. *A Pouder of the Herb.* 5. *A Syrup of the Juice.* 6. *A Balsam or Ointment.* 7. *A Cataplasm of the Green Herb.* 8. *A Distilled Water of the same.* 9. *A Spirituous Tincture.* 10. *An Acid Tincture.* 11. *An Oily Tincture.*

The Virtues.

XVIII. *The Liquid Juice of the Herb.* It may be taken from an Ounce to 2 or 3 Ounces, Morning and Night, in a Glass of such Wine as is most proper against the Disease it is given for. It is good against the yellow Jaundice, and cures the Disease tho' of long continuance, but it is more powerful in this case, if a quarter part of the *Black Tincture of Mars* be mixed with it. And if a few Grains of *Salt of Tartar* is dissolved in it, it is a special remedy against the Stone and Gravel and other Tartarous Matter bred in the Reins, Ureters, and Bladder. And so also given in the *Decoction of Centory and Succory*, it is said to be effectual against the Dropsy: and to ease all Tortors and Griping pains of the Bowels.

XIX. *The Essence.* It has all the Virtues of the *Liquid Juice*, and may be taken from 1 Ounce to 2 in the same manner. It contributes to the curing of Green Wounds and Ulcers, inwardly taken, and outwardly applyed, by way of *Lotion.* It gives ease in the Colick and Griping of the Guts, and is of singular use in curing a Diarrhæa, Dysenteria, Lienteria, and Hepatick Flux. It stops Fluxes of Blood either at Mouth or Nose, as also pissing Blood, and the overflowing of the Terms in Women. Taken to 4 Ounces or more, before the Fit of a Quartan Ague, it keeps the Fit Back, and lessens it, and by the constant use of it for some time, it takes it quite away and cures it.

XX. *The Decoction in Wine.* It has all the Virtues of the *Juice* and *Essence*, and may be given from 4 to 8 Ounces, sweetned with the *Syrup* of the same Plant: outwardly applyed, it is an incomparable thing to cleanse, incarnate, dry, and heal up old Ulcers: The *Pouder of the dry Herb* being strewed upon the same, after washing with it.

XXI. *The Pouder of the Herb.* It has the Virtues of the *Juice* and *Essence*, and may be given from half a Dram to a Dram and a half in *Syrup* of the same, and that Morning and Night. It is said to cure the Pain of the Stomach, tho' never so inveterate, to stop Vomiting, and to strengthen it.

XXII. *The Syrup of the Juice.* Being made with double refined Sugar, or Clarified Honey, it is an excellent thing against Coughs, Colds, Hoarseness, Wheezing, Asthma's, Phthisicks or Ulcerations of the Lungs; and indeed is prevalent against a *Tabes*, Pining, or Consumption of the whole Body, and most other Distempers of the Lungs, and Thorax or Breast; it is also said to be good against Ruptures or Burstenness: Dose two or three Spoonfuls Morning and Night, in a Glass of Styptick red Wine, or other proper Vehicle.

XXIII. *The Balsam or Ointment.* They cure simple Green Wounds at the first intention; digest, cleanse, incarnate, dry and heal old running Sores, and putrid, or eating Ulcers. It gives ease in the Gout, and other Pains, being duly applyed to the parts affected.

XXIV. *The Cataplasm of the green Herb.* Being laid to any simple Green Wound, it quickly conglutinates the Lips thereof: it also is prevalent against simple Contusions, and either prevents or discusses the Tumor, if any arises, and reduces it to its natural color.

XXV. *The Distilled Water.* It is available against all the Diseases afore named, in the *Juice, Essence, Pouder, Decoction, or Syrup*, but must be given in much greater Dose, as to 8 Ounces or more, sweetned with the *Syrup*: and if a little of the *Spirituous Tincture* is added to it, it will heal Sores and Wounds which are outward, being washed therewith, and Tents, or Cloths wet therein being applyed.

XXVI. *The Spirituous Tincture.* It takes away the pain of the Stomach, eases the Belly ach, and strengthens all the Viscera: It mixed with the *Pouder* to the thickness of a *Cataplasm*, and applyed, it is singular good to stay the Malignity of spreading, fretting, or eating Cankers, Sores, and Ulcers wheresoever, as well in the Mouth, as in the secret parts of Men or Women.

XXVII. *The Acid Tincture.* It is good against the Plague, and all sorts of Burning and Malign Fevers: It quenches Thirst, stops Vomiting, strengthens the Stomach, causes a good Appetite, and a strong Digestion, and kills Worms in the Bowels whether in old or young Dose 40 Drops or more in any thing the Patient drinks.

XXVIII. *The Oily Tincture.* It is prevalent against the yellow Jaundice, the Cholick, Gripings of the Guts, the Stone, Sand, Gravel, and Tartarous Humors in the Reins Ureters and Bladder, and prevails against Convulsions, and the Palsie, and is a potent thing to give present ease in the Strangury. Dose from 20 to 60 Drops, Morning and Night in a Glass of White Port Wine.

XXIX. *Nota.* The *Juice of Mouse Ear*, is said to be so powerful to harden Iron or Steel, that if any edged or pointed Tool, shall be often quenched therein, that it will cut all other Iron, Steel or Stone very easily, without turning the edge or point.

CHAP. DIV.

Of MOUS TAIL.

THE *Names.* It is called in *Greek*, Μυοσκύαμος, ἢ μυοσκύαμος; in *Latine*, *Cauda Muris*, *Holosteum Loniceri*, *Holosteo affinis Cauda Muris Bauhini*: *Coronopus Sylvestris Tragi*; *Myoscuros quorundam*: in *English*, *Mouse Tail.*

II. *The Kinds.* It is a singular Plant of its Kind, but enumerated both by *Bauhinus*, *Lonicerus*, and *Parkinson*, among the *Holostea*, because it is, as they say, in Taste and Property like them.

The Descriptions.

III. *It has a small, bushy, Fibrous Root; from whence spring up many small grassy Leaves (for which reason it might have been placed as well among the* Grasses) *which Leaves are very short, rough and hard: from among which spring up several small, slender Stalks, with small, long, blackish green, spiked Heads, like unto a small* Plantain

Mouse Tail.

Head, but smaller, having white Flowers on them, which quickly fade and fall away; after which there is found very small blackish Seed in the long Heads, which then in some are a little crooked, and in others straight, resembling a Mouse Tail, from whence it took its Denomination or Name.

IV. *Gerard* thus describes it. *It has a small and thready Root, from whence spring up many small grassy Leaves spread on the Ground, an Inch long, or somewhat more: among which does rise up small tender naked Stalks, about two Inches long, bearing at their tops, a little blackish Torch, or spiked Knob, in shape like that of the* Plantains, *resembling very notably the Tail of a Mouse.*

V. *The Places.* It grows in many fertile Pastures and Medows, as also on dry Banks, and by the Path sides in many places of *England.* It has been found growing upon a barren Ditch Bank, near unto a Gate leading into a Pasture, on the right Hand of the Way, going from *London* to *Hamstead:* and in a Field as you go from *Edmonton* in *Hartford-shire*, unto a House near to it, called *Pims*, by the Foot Path sides. Also in *Woodford Row* in *Waltham Forrest*, and in several places in *Essex*, and other parts of the Kingdom.

VI. *The Times.* It Flowers often in *April*, and is almost gone in *May*; but if the Weather is not too hot and unseasonable, it is sometimes found in *June.*

VII. *The Qualities.* It is cold and dry in the first Degree: and of an Astringent or Binding quality: much of the nature of *Plantain.*

VIII. *The Specification.* Country People apply it for the stopping of Hemorrhages, whether of the Nose or Wounds, and find it a very excellent thing.

IX. *The Preparations.* You may make therefrom, 1. *A Juice or Essence.* 2. *A Decoction in Wine.* 3. *A Pouder of the Herb and its Heads.*

The Virtues.

X. *The Juice or Essence.* Syringed up the Nostrils it stops an Hemorrhage, or Bleeding at the Nose: and given inwardly from a Spoonful to two Spoonfuls, it stops any inward Bleeding, Spitting or Vomiting, Pissing Blood or the Bloody Flux: it may be given in *Alicant*, or some strong Bodied Styptick Wine.

XI. *The Decoction in Wine.* It has the same Vertues, but much weaker, and may be given Morning, Noon, and Night, from 4 to 8 Ounces, sweetned with *Syrup of Comfrey.*

XII. *The Pouder.* Blown up the Nostrils thro' a Quill, it is said to stop the Bleeding of the Nose: given inwardly in Styptick Red Wine from a Dram to two Drams, it performs all that the *Juice* and *Essence* will do: Applyed outwardly upon Bleeding Wounds it stops the Hemorrhage; and being made into a stiff *Cataplasm* with the *Juice or Essence*, it secures them against their future bleeding.

CHAP. DV.

Of MUGWORT.

THE Names. It is called in *Greek*, Ἀρτεμισία: in *Latine*, *Artemisia* (from *Artemisia* the Wife of *Mausolus* King of *Caria*:) formerly it was called *Parthenis, quasi, Virginalis*, i. e. *Maidenwort:* and as *Apuleius* says, was also called *Parthenium*, which is indeed the proper Name of another Plant, *viz. Fetherfew.* But some think the Name came from ἄρτεμις (one of the Names of *Diana*) because it is chiefly applyed to Womens Diseases: and in *English*, it is called only, *Mug-wort.*

II. *The Kinds.* There are four Species of this Plant, usual with us, *viz.* 1. *Artemisia vulgaris*, called by some *Mater Herbarum*, Our common Mugwort: and this is common almost in all Countries. 2. *Artemisia minor*, The lesser or small Mugwort. 3. *Artemisia Montana, Artemisia tenuifolia Montana*, Fine Mountain Mugwort. 4. *Artemisia Virginiana*, Virginian Mugwort.

The Descriptions.

III. *The first, or* Our Common Mugwort, *has a Root which is long and hard, with many small Fibres growing from it, whereby it takes firm hold*

in

in the Ground; but both Leaf and Stalk dye and perish every Year, the Root remaining all Winter, *and shooting out anew the next* Spring. *From this Root spring forth divers Leaves, lying upon the Ground, very much divided or cut in deeply about the edges, something like unto* Wormwood, *but*

MUGWORT.

much larger, of a sad or dark green color on the upper side, and of a very hoary white underneath. The Stalks, (which grow in some to be purplish, and in some to be deeper colored) rise to be sometimes three, four, or five Feet *high, on which grow such like Leaves as those below, but something smaller, Branching forth very much towards the top, on which grow very small, pale, yellowish Flowers like Buttons, which fall away, after which comes small Seed, inclosed in small round Heads. The whole Plant has a reasonable good smell, and is more easily propagated by slips, than by the Seed.*

IV. *The second, or* Lesser, or small Mugwort. *It has a Root much like the former, but lesser, from whence spring forth Leaves like unto the former also, (the whole Plant being like it) which Leaves are divided or cut in on both sides, as that; green on the upper side, and whitish underneath, but much smaller than they. The Stalk likewise, (for many times it has but one) rises up, not so high, nor is so great, but bears like Flowers, yet paler; the smell of the whole Plant is like the other.*

V. *The third, or* Fine Mountain Mugwort. *It has a Root which is long and black, spreading it self in the Ground; from whence springs up a Plant, not much unlike the former, having several square brownish Stalks, or Branches, about a Foot and half high, on which do grow such like Leaves almost for form, but longer, narrower, and much more crumpled or jagged on the edges. The Flowers are small and pale, like the aforegoing, and the smell of the whole Plant differs very little.*

VI. *The fourth, or* Virginian Mugwort. *It has a Root much like the* Common English Kind, *and the whole Plant very much resembles it, in its divided Leaves: but it rises up something higher, and spreads it self larger out, and its jagged or deeply cut Leaves are somewhat bigger.*

VII. *The Places.* The first grows plentifully throughout all *England*, as well as in other Countries by the Way sides, by Ditch sides, on Banks also, and by Brook sides, or Water courses, almost in an infinite number of places; as also in the borders of Fields. The second is also found in some of those places but not so frequently. The other two are only Nurst up with us in *Gardens*. The last according to its Title or Name grows very plentifully in *Virginia*, and other parts of *Florida*.

VIII. *The Times.* They all Flower and Seed in *July* and *August*, or in the end of *Summer*.

IX. *The Qualities.* *Mugwort* is hot and dry in the second Degree. Aperitve, Absterstive, Astringent, Anodyn, Diuretick, Discussive, Nephritick, Hysterick, and Emmenagogick.

X. *The Specification.* It is prevalent against Vapors and Fits of the Mother: it powerfully provokes the Terms, brings away both Birth and After-Birth, and expels the Dead Child; it is good against the Palsie, as also Cramps and Convulsions; it cures the Strangury, as also the Poyson of the *Black Poppy*, or the over-much taking of *Opium*.

XI. *The Preparations.* You may have herefrom, 1. *A Liquid Juice of the Herb.* 2. *An Essence of the same.* 3. *An Infusion or Decoction.* 4. *A Pouder.* 5. *A Balsam or Ointment.* 6. *A Cataplasm.* 7. *A Pessary, made of the Root, or of the Juice.* 8. *A Distilled Water.* 9. *A Spirituous Tincture.* 10. *An Acid Tincture.* 11. *An Oily Tincture.*

The Virtues.

XII. *The Liquid Juice of the Herb.* Being taken every Morning Fasting, and every Night at Bed time, from two Spoonfuls to four, in a Glass of White *Port*, or *Lisbon* Wine, or in *Madera* Wine, it provokes the Terms powerfully, and facilitates the Birth of Women in Labor, bringing away the After-Birth, and causing a due cleansing. It is good to expel a *Mola*, when the Woman has gone beyond her Time; as also the Child when it is Dead. It suppresses Vapours, being duly taken; and I have cured Hysterick Fits with it to admiration; but then in these two last cases, it ought to be given in its own *Distilled Water*, or in fair Spring Water.

XIII. *The Essence.* It has all the Virtues of the *Liquid Juice*, but more Powerful, and more Stomatick: it opens all obstructions not only of the Womb, but also of the Reins, Ureters and Bladder, provokes Urine admirably, gives ease in the Strangury, and expels small Stones, Sand, Gravel, and other Mucilaginous or Tartarous Matter from those Parts: if any one is poysoned with the *Juice of the Black Poppy*, or has taken too large a Dose of *Opium*, this is said to be a present remedy. Dose from one Spoonful to four, in a Glass of Generous Wine.

XIV. *The Infusion or Decoction in Wine.* They have all the Virtues of the *Juice* or *Essence*, but must be given in larger proportion, as from 4 to 6 or 8 Ounces Morning and Night: and it may be sweetned or made pleasant with double refined Sugar. If the *Decoction* is made in Water,

it may ſerve as a Bath for Women to ſit in, or to ſit over its fumes, it looſens the Womb, opens the obſtruction thereof, and cauſes the Courſes to come down, and alſo facilitates the Birth: and if ſat in, as a Bath, it not only opens the obſtructions of the Womb, but alſo takes away the Inflamation thereof, if any be. If the *Decoction* is made with the addition of *Agrimony* and *Camomil*, whether in Wine or Water, it has an Anodyn power and quality, for if any part which is pained, if the Nerves are hurt, or are troubled with the Cramp, and they be bathed and fomented herewith, as hot as it can well be endured, it gives preſent eaſe and relief.

XV. *The Pouder of the Herb.* It has the Virtues of the *Juice*, *Eſſence and Decoction*, and may be given from 2 Scruples to 2 Drams in Generous Wine, or other proper Vehicle. If it is given to three Drams in Wine, Authors ſay, it is the beſt, and a certain help for the Sciatica. But I ſuppoſe it ought to be given Morning and Evening, with a *Continuando* for fifteen or twenty days; taking now and then, a proper Purge between whiles. When it is to be given in ſo large a quantity, it ought to be given in a Meſs of hot *Water Gruel*, or *Mutton Broth*, or in three or four Spoonfuls or more, of *Syrup of Clove Gilliflowers*, or of *Violets*.

XVI. *The Balſam or Ointment.* They cure Green Wounds excellently well: they being applyed to Wens, or Gums, or hard Knots, or Kernels which happen about the Neck and Throat, it eaſes their pains and takes them away; and they are ſaid to be more effectual, if ſome *Field Daiſies* be added to the Compoſition: I am ſure, they will be then the better for the curing of Wounds and Ulcers.

XVII. *The Cataplaſm.* It is made of the Green Herb, and is of good uſe to diſſipate the Fluxion, and cure a ſimple Contuſion. And if it is applyed to the Joints and Limbs of ſuch as are very much wearied with Travelling, it eaſes and gives them much relief, as *Pliny* ſays: and that they ſhall feel no wearyneſs, in their Journying.

XVIII. *The Peſſary.* It is made either of the Raw *Root*, either whole, or beaten into a Maſs in a Mortar: or of the *Juice*, mixed with fine *Pouder of Myrrh*, enough to bring it into a Body, of ſuch a conſiſtence as may be formed into a *Peſſary*. Being put up the Womb, it induces the Terms which have been ſtopt; and if a Woman is at the time of her Labour, it facilitates the Birth, and afterwards brings away the After-Birth.

XIX. *The Diſtilled Water.* Tho' poſſibly it has the Virtues of the *Juice*, *Eſſence*, *Decoction*, and *Pouder*; yet it is weak in its Operation, and may be given (ſweetned with *Syrup of Violets*) to half a Pint or more: but it is chiefly uſed as a Vehicle, to convey the other Preparations in.

XX. *The Spirituous Tincture.* It is of excellent uſe to be given to Women in Labor to facilitate the Birth, as alſo after Delivery, to prevent After Pains, and to cauſe a full and compleat cleanſing, for the want of which thing a great many Women ſuffer much, incur many Weakneſſes and Diſtempers, and are many times ruined by it. It is good alſo, againſt the Colick, as alſo Tortions and Gripings of the Bowels. Doſe 2 or 3 Drams at a time in a Glaſs of Wine.

XXI. *The Acid Tincture.* It prevails powerfully againſt the Poyſon and Malignity of *Poppies* and *Opium:* rectifies the Stomach, ſtops Vomiting, and cauſes a good digeſtion. It allays Vapors, opens all ſorts of Obſtructions of the Bowels, and cures the Rickets in Children: It likewiſe cleanſes the Reins and Bladder of Tartarous Mucilage. Doſe from twenty to ſixty Drops or more, according to the quantity of the Vehicle it is taken in: it may be given in *Canary*, or other Generous ſort of Wine, two, three, or four times a day.

XXII. *The Oily Tincture.* If it is inwardly given from half a Dram to two Drams, it gives preſent eaſe in the Colick, and Gripings of the Guts, as alſo in the Strangury, powerfully provokes Urine, and cleanſes the Urinary parts of all kinds of Heterogeneous Matter: is good againſt Fits of the Mother, and many times cures the Palſie (if not in old People) as alſo inward Convulſions of the Stomach and Bowels. In the Palſie, it ought to be Anointed alſo outwardly Morning and Night on the Back Bone from the *Vertebræ* of the Neck, to the *Anus* almoſt: Anointed likewiſe upon the part afflicted with the *Sciatica*, it has been found to give eaſe; and many times a cure.

CHAP. DVI.

Of MUGWORT Sea.

I. *THE Names.* It is called in *Greek*, Ἀρτεμισία θαλάσσια: in *Latine*, *Artemiſia Marina:* and in *Engliſh*, *Sea Mugwort*.

II. *The Kinds.* It is a ſingular Plant of its own Kind: but is thought by ſome good Authors to be a Species of the *Mugworts*, and therefore being a Sea Plant they called it *Artemiſia Marina*, as *Gerard:* and *Artemiſia folio Lavendulæ*, as *Cluſius*, becauſe it has a kind of *Lavender* like Leaf: *Lobel* and *Tabernæmontanus* call'd it alſo *Artemiſia Marina:* Others taking it to be a Species of *Wormwood*, of the Sea Kinds, have call'd it, *Abſinthium Marinum latifolium*, as *Camerarius*, and he thinks it to be ſo: *Dodonæus* calls it *Abſinthium Anguſtifolium, viz.* Narrow Leaved Wormwood, and narrow Leav'd it may well be thought, in reſpect to the *Common Wormwood.* But *Parkinſon* calls it, *Abſinthium Maritimum Lavendulæ folio*, Lavender Leav'd Sea Wormwood.

The Deſcriptions.

III. *Gerard* thus Deſcribes it. *It has a woody Root, from whence riſe up many Branches, ſtanding upright in diſtances one from another, of an aſhie color, beſet with Leaves not much unlike to thoſe of* Sea Purſlane: *theſe Leaves are of two ſorts, for ſome of them are long and narrow, like thoſe of* Lavender, *whence* Cluſius *called it* Artemiſia folio Lavendulæ, *otherſome are cut in or divided, almoſt to the middle Rib; about the lower parts of the Stalks, and towards the Tops of the Branches, they are narrower and leſſer, and cut with great and deep jaggs, thick in Subſtance, and of a whitiſh color, as all the reſt of the Plant is. The Flowers are many and yellow, which fading away, there follows* Moſſie *Seed like unto that of* Our Common Wormwood. *It yields a pleaſant Smell like unto* Abrotanum Marinum, *and in Taſte is ſomewhat Saltiſh or Brackiſh.* [*As to the Taſte I fear that* Gerard *is a little out*; *I have ſome-*

MUGWORT &c.

ſometimes taſted of it, but could obſerve no ſuch Saltiſhneſs; yet for all that I know of it, the Taſte may vary, according to the differing places in which it may grow.]

IV. *Parkinſon* Deſcribes it thus. *It ſhoots forth many ſlender, weak, woody, and brittle Stalks, bending a little downwards, whereon do grow divers hoary, white, long Leaves, ſomewhat broader than* Lavender *Leaves, having ſometimes ſome cuts or diviſions at the Bottoms of them, which are but ſeldom ſeen, and in a very few of the loweſt next the Ground. Thoſe which are ſet on the Stalks are ſmaller, and ſometimes are cut or divided at the ends, of a reaſonable weak ſcent, between* Lavender *and* Southernwood, *and of an unpleaſing taſte. The Flowers grow after the ſame manner of thoſe of the* Common Wormwood, *and of a yellow color; and the Seed is not unlike thereto alſo.*

V. *The Places.* It grows about the Sea Coaſts, as on thoſe of the *Venetian Gulph*, and likewiſe in the Iſland of *Chio*. It has been found growing alſo about *Rye* in *Suſſex*, and *Winchelſea* Caſtle, and at *Portſmouth*, in the *Iſle of White*, as *Gerard* ſays.

VI. *The Times.* It Flowers in *July* and *Auguſt*, or towards the latter end of *Summer*, in which time it perfects its Seed.

VII. *The Qualities, Specifications, Preparations* and *Vertues*, are ſaid to be the ſame with thoſe of the *Common Mugwort*, in the former Chapter, and thither we refer you. Some will have it to be of the nature of the *Common Wormwood*, but that it can ſcarcely be, becauſe it wants much of that bitterneſs, Aſtringent, and Stomatick property.

CHAP. DVII.

Of MULLEIN Common.

OR,

HIGTAPER.

I. *THE Names.* It is called in *Greek*, φλόμος, from φλέγω, *Uro*, to Burn; and φλόξ, φλογος, *Flamma* a *Flame*; for that it ſerved as a Wick to put into Lamps to burn, from whence ſome of the *Latines* called it *Candela regia*, and *Candelaria*, becauſe in the Ancient times, they uſed to dip the Stalks hereof in Suet, Tallow, or Wax, to make Candles, Tapers, or Torches of. It is called alſo in *Latine*, *Thapſus*, *Thlapſus*, *Tapſus barbatus*, *Verbaſcum*, and *Lanaria*: and in *Engliſh Mullein*, *Higtaper* or *High Taper*, becauſe it was uſed ſometimes as a Taper or Torch at Funerals.

II. *The Kinds.* There are three Principal Kinds of this Plant, *viz.* I. *Verbaſcum vulgare, ſive Tapſus barbatus communis*, our Common Mullein, of which in this Chapter. II. *Verbaſcum Nothum*, *Tapſus Nothus*, Baſtard Mullein, or Baſe Mullein, of which in *Chap.* 508. III. *Blattaria*, Moth Mullein, of which in *Chap.* 509. following.

III. *The Kinds of the Common Mullein.* There are, 1. *Verbaſcum Mas*, *Verbaſcum Mas Latifolium*; *Verbaſcum album vulgare*; *Tapſus barbatus communis*, our Common white Mullein, which is the Male white Mullein. 2. *Verbaſcum Fœmina Lobelij*; *Verbaſcum album Fœmina*; *Verbaſcum ſoliis longioribus Mas quorundam*; *Phlomos alter Lobelij*; *Verbaſcum Lychnite Matthioli*; *Verbaſcum Candidum Mas Fuchſij*; *Verbaſcum album Fœmina Geſneri*; *Verbaſcum auguſtius Dodonæi*, our white Mullein with long Leaves, Female white Mullein. 3. *Verbaſcum Fœmina flore albo vel pallido*; *Tapſus barbatus maximus odoratus meridionalium flore albo*, Sweet white Mullein.

The Deſcriptions.

IV. *The firſt, or* Out Common white Mullein, which is the Male white Mullein. *Its Root is long, white, and woody, periſhing every Year after it has born its Seed: from whence ſpring up many fair, large, white, woolly* Leaves, *lying next the Ground, ſomething longer than broad, pointed at the ends, and as it were dented about the edges: the Stalk riſes up to be four or five* Feet *high, covered over with ſuch wooly* Leaves *as the loweſt, but leſſer; ſo that no Stalk can be ſeen, for the multitude of* Leaves *thereon, up to the Flowers, which come forth on all ſides of the Stalk, without any Branches for the moſt part, and are many ſet together in a long Spike; in ſome of a gold yellow color, in others*

more

MULLEIN *Common Male.*

more paler, consisting of five pointed Leaves; which afterwards give small round Heads, which contain within them small browniſh Seed.

V. *The ſecond, or* Our white Mullein with long Leaves, which is the Female white Mullein. *Its Root is ſomewhat long, thick and hard, but not woody, with ſeveral long Fibres adjoining thereto. From whence riſe up many thick, white, woolly*

MULLEIN *Female.*

Leaves, lying upon the Ground, like unto the Common Male white Mullein *in the former Section, but that they are ſomewhat narrower, and thereby ſeeming longer: from among which, ſprings up, a round, hard, woolly Stalk, about three Feet high, ſet with the like Leaves, as thoſe which grow below, but ſmaller unto the middle thereof, where it begins to give Flowers; and in ſome Plants and Places, to divide it ſelf into Branches, whereon grow many Flowers, Standing round about the Stalks or Branches, thick ſet together; conſiſting every one of five round pointed Leaves, of a whitiſh color, and in ſome Plants and Places more yellow, with a few yellow Threads in the middle; which being paſt away, round, hard, Seed Veſſels come in their places, very like unto the Seed Veſſels of* Fox-Gloves, *or* Finger Flowers, *but not ſo long, in which is contained very ſmall and browniſh Seed.*

VI. *The third, or* Sweet white Mullein. *It has a Root like the former, from which ſpring up white, hoary, and woolly Leaves, like the other, but longer, narower, and more indented about the edges, and not ſo many growing below on the Ground. The Stalk is woolly, and riſes higher than the former, having greater Flowers growing at the tops, much ſweeter alſo than it, and of a white color, wherein ſometimes ſome reddiſh lines are to be ſeen: in other particulars, it differs not from the former.*

VII. *The Places.* The firſt grows plentifully in *Florida* in the *Weſt-Indies*, and I ſaw it grow in great plenty in the Southern *Carolina.* It grows by Way ſides and in Lanes, as alſo in the borders of Fields and Paſtures, Ploughed Fields, Cawſies, and in dry ſandy Ditch Banks, and other untilled places in moſt parts of *England.* The two laſt grow alſo in many places in *England*, but not ſo univerſally and plentifully as the firſt.

VIII. *The Times.* They all Flower about *July*, and from *July* to *September*, and bring forth Seed, the ſecond year after their Sowing.

IX. *The Qualities.* *Mullein* is Temperate in reſpect to heat or cold, and dry in the firſt Degree: Aperitive, Aſtringent, Pectoral, Hyſterick, and Nephritick.

X. *The Specification.* It prevails againſt Coughs, Colds, Obſtructions of the Lungs, Aſthma's, Fluxes of the Bowels, the Strangury; cures Agues and the Piles, and gives eaſe in pains of the Gout.

XI. *The Preparations.* They are manifold, as, 1. *A Liquid Juice or Eſſence of the Herb.* 2. *A Decoction in Wine or Water of the ſame.* 3. *A compound Decoction.* 4. *A Pouder of the Roots.* 5. *A Pouder of the Flowers.* 6. *A Fume.* 7. *Tapſimel.* 8. *Tapſivalentia.* 9. *An Inſolated or Decocted Oil.* 10. *An Ointment of the Flowers.* 11. *A Cataplaſm.* 12. *A Diſtilled Water.* 13. *A Spirituous Tincture.* 14. *An Oily Tincture.*

The Virtues.

XII. *The Juice or Eſſence.* Taken from a Spoonful to three Spoonfuls in a ſtrong Bodied or Styptick red Wine, it cures Diarrhea's, Dyſenteria's, Lienteria's, and the Hepatick Flux; and is good againſt a Rupture or Burſtenneſs: they cure Catarrhs, and Defluxions of Rheum upon the Lungs; and uſed as a Gargle, heal a ſore Mouth and Throat. And being drunk Morning and Night for 30 Days together, it cures the Gout. *The Juice or Eſſence of the Roots*, made before it bears a Stalk, and taken in a draught of *Muskadine*, for three or four times

times or oftner, an hour before the coming of the Fit of a Quartan Ague, will certainly cure it. The *Juice of the Leaves and Flowers* being put upon rough Warts, and rubbed on, quickly takes them away, as *Matthiolus* says, but does no good to those which are smooth.

XIII. *The Decoction in Wine or Water.* It is profitable for those which are Burſten, and for such as have Cramps and Convulsions, and likewise for such as are troubled with an old Cough. Being used as a Gargle, it eases the Tooth-ach. The *Decoction of the Root* in Red Wine or Water, is good against an Ague, as also the Bloody Flux, more especially, if Gads of red hot Steel or Iron has been often quenched therein. The same opens obstructions of the Reins and Bladder, and is good against the Strangury. It is of great force to dissolve Tumors or Swellings, and Inflamations of the Throat. The *Decoction of the Herb in Water*, Country People give to their Cattel, when troubled with a Cough, or by reason of a Looseness of the Bowels have a falling out of the *Inteſtinum rectum* or Fundament.

XIV. *The Compound Decoction. Take Leaves of* Mullein *two parts*, Camomil Flowers, Marjoram, Sage, *of each one part, make of all these a Decoction in Wine.* With this bathe Morning and Night where the Veins are Swoln, or the Nerves are contracted, or where the Cramp commonly afflicts, it gives relief, ease and comfort.

XV. *The Pouder of the Roots.* Given to a Dram in a strong or Stiptick red Wine, Morning and Night, it stops all sorts of Fluxes of the Belly. If it is rubbed often on rough Warts, it will take them away in a short time, but it does no good to such as are smooth, as was said before of the *Juice.*

XVI. *The Pouder of the Flowers.* It is an especial remedy, for such as are afflicted with Belly-aches, and such as are troubled with the Colick, tho' periodical. It may be given from a Dram to a Dram and half, Morning and Night, in any proper Vehicle.

XVII. *The Fume. Take Seeds and Flowers dryed of* Mullein, *of each three parts*; white Rosin *two parts*; Camomil Flowers, *and* Caraway Seeds *of each one part*; *mix them, and put them upon live Coals in a Chasing Dish, or some Earthen Pan*, and set it in a Close-Stool, and let the person who is troubled with the Hemorrhoides or Piles, or falling down of the Fundament, sit over it, to receive the Fumes up the Body; it gives much ease and relief; and is also very profitable for such as are troubled with a *Tenasmus*, which is a desire to go often to Stool, and can do nothing.

XVIII. *Tapsimel, Hony of* Mullein. *Take Juice of* Male Mullein, *Juice of* Celandine, *of each one part*; *Clarified* Hony, *two parts*; *boil them by Degrees, till the Juices are consumed*; *adding* (if the Physician shall so prescribe) Vitriol *and* Alum *burnt, a sufficient quantity*; Ink *enough to make a thin Body that they mix well*; *boil again to a consistence of an Ointment according to Art.* The simple *Tapsimel* (without the *Vitriol, Alum*, and *Ink*) being taken three times a Day, an Ounce or Ounce and half at a time stops Catarrhs powerfully, and is good against the Falling-Sickness. That with the *Vitriol, Alum*, and *Ink*, is good to cleanse old Sores, Ulcers, Fistula's, take away a Calous, and consume proud and dead Flesh.

XIX. *Tapsivalentia*, an Ointment containing the Powers, Force, or Strength of *Mullein. Take Juice of* Mullein, Hogs Lard, *of each equal quantities*; *mix and beat or grind them together in a Stone Mortar*; *keep it in a convenient Vessel nine or ten days, then beat it well twice, once more with fresh Juice, until it be green, and another time without Juice, first casting away what is thin and discolored, then keep it close covered for use.* It softens hard Tumors, and eases their pain; anointed on the Belly, it stops a Looseness and a Bloody Flux; so also given in a Clyster. Anointed on the Crown of the Head and Sutures, as also on the Nape of the Neck and Stomack, it Stops Catarrhs, and is an excellent thing against Coughs of the Lungs. And it has been found by experience to cure the Hemorrhoids or Piles.

XX. *The Infolated or Decocted Oil. It is made by an Infusion or Decoction of the Flowers in pure* Oil Olive, *often repeated.* It is very powerful against the Hemorrhoides or Piles, being often anointed on the part affected.

XXI. *The Ointment. It is made of the bruised Flowers, the Yolk of an Egg, Juice of* Leeks, *and Crumbs of white Bread, beaten together into the form of an Ointment.* Applyed to the Piles when they swell, and their pains are most vehement, it gives wonderful ease upon the spot, and in a short time cures them.

XXII. *The Cataplasm.* 1. *Made of the Leaves and Seed boiled in Wine*, and laid upon any Dislocation, after it is set, it eases all the Pains and discusses the Swelling. 2. *Made of the Leaves and Tops of the* Lesser white Mullein *boiled in Water*, and applyed to the Gout, it gives wonderful ease, and discusses the Tumor. 3. *Made of the green Leaves beaten in a Mortar*, and applyed or bound to a Horse Foot, which is very much pricked with a Nail, or Thorn, or Splinter, it eases the Pain, and heals it in a short time.

XXIII. *The Distilled Water of the Flowers.* Taken to 3 Ounces at a time or more, Morning and Night for some days together, it is said that there is not a better remedy found out for the hot Gout. Dropped into the Eyes, it takes away the watering of them, and also cures the redness of the Face, called in *Latin, Gutta Rosacea*, or the *Rose*, if it be washed therewith often; more especially if a little *Camphorated Spirit of Wine* be added to it. This Water is also used against creeping and running Sores or Ulcers, or any other deformity of the Skin.

XXIV. *The Spirituous Tincture.* It cures a vehement pain of the Stomack, and is profitable against Convulsions, Fainting and Swooning Fits, Palpitation of the Heart, Sickness at Heart, and Vomiting, a vehement Diarrhea, and the Bloody Flux. Dose from 1 Dram to 3 in a Glass of *Madera, Sherry*, or *Canary.*

XXV. *The Oily Tincture.* Outwardly applyed to the Piles, it eases the pain, heals and cures them. Applyed to the Gout, it eases the pain and cures it: Anointed on the Back Bone and other parts affected, it prevails against the Palsie, Numbness of the Limbs, and a Trembling. Inwardly taken from a Scruple to a Dram, Dram and half, or more, according to the Exigency, it gives ease in the most Vehement Colick, prevails against inward Convulsions of the Bowels, induces the Terms in Women if stopt, facilitates the Birth, gives ease in the Strangury, and provokes Urine powerfully, expelling all Heterogeneous things, as Stone, Gravel, Sand; or Tartarous Mucilage from the Reins, Ureters and Bladder.

CHAP. DVIII.

Of MULLEIN Baſtard *or* Baſe.

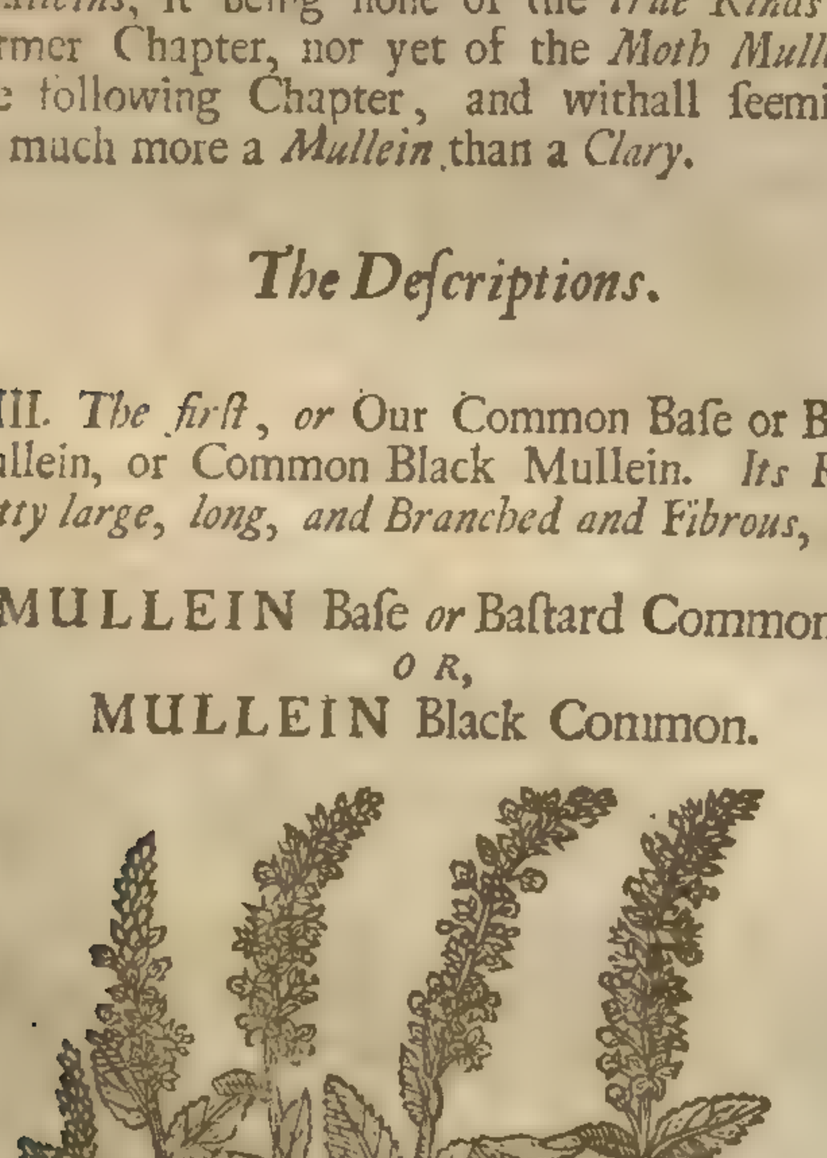
I. *THE Names.* It is called in *Greek*, φλόμος νόθος: in *Latine*, *Verbaſcum nothum*, *Verbaſcum vile*, *Tapſus nothus*, *Tapſus vilis*: and in *Engliſh*, *Baſe Mullein*, *Baſtard Mullein*.

II. *The Kinds.* There are three Kinds of this Plant, *viz.* 1. *Verbaſcum nigrum vulgare*, *Verbaſcum nigrum*, *Verbaſcum nothum vulgare*, Our Common Baſe or Baſtard Mullein, or Common Black Mullein. 2. *Verbaſcum nigrum odoratum*, *Tapſus nothus odoratus*, Sweet Baſe Mullein, or Sweet Black Mullein. 3. *Verbaſcum nothum Laciniatum*, *Verbaſcum aliud Matthioli*, *Verbaſcum Erucæfolium Lobelij*, *Verbaſcum Laciniatum Matthioli*, *Verbaſcum folio Papaveris cornuti Camerarij*, Jagged Mullein, or Jagged Baſe or Baſtard Mullein. To theſe we may add, 4. Αἰθιοπὶς, *Æthiopis*, *Verbaſcum Æthiopium*, *Verbaſcum Laciniatum*, *& non Laciniatum*, *Sclarea Æthiopica*, Ethiopian Mullen Jagged and not Jagged; which *Parkinſon* will have to be a Kind of *Clary*: but we thought it very proper to be enumerated among the *Baſtard* or *Baſe Kinds of Mullеins*, it being none of the *true Kinds* in the former Chapter, nor yet of the *Moth Mulleins* in the following Chapter, and withall ſeeming to be much more a *Mullein* than a *Clary*.

The Deſcriptions.

III. *The firſt*, *or* Our Common Baſe or Baſtard Mullein, or Common Black Mullein. *Its Root is pretty large, long, and Branched and Fibrous, which*

MULLEIN Baſe *or* Baſtard Common;
OR,
MULLEIN Black Common.



perishes after Seed time. Its Leaves are nothing woolly or Hairy, but of a dark green color, ſomewhat large, longer pointed, and a little dented about the edges. The Stalk or Stalks riſe up almoſt as high as the Common Mullein, *and ſometimes parted at the tops into a few Branches, bearing long ſpiky Heads of Gold yellow Flowers, and in ſome tending to purple, like the other, with ſome Threads in the middle, which are reddiſh in ſome and purpliſh in others, with Seed following them like to the* true Kinds *in the former Chapter. The whole Plant has a ſtronger ſmell than that in the* White Kinds.

IV. *The ſecond*, *or* Sweet Baſe Mullein, or Sweet Black Mullein. *Its root is ſomething great and long, with ſeveral Fibres adjoining to it, which periſhes not, but abides many Years. It has four or five Leaves lying upon the Ground ſomewhat long and broad, ending in a long point, ſomewhat hard, and*

MULLEIN Baſe *or* Baſtard Sweet;
OR,
MULLEIN Black Sweet.

as it were crumpled, of a dark green color, without any manifeſt dents or notchings on the edges, but only unevenly waved; from among which riſes up a round, hard, green Stalk, and ſometimes two, about three Feet high, oftentimes without any Branches, and ſometimes again divided into two or three; on which grow many yellow Flowers, ſmaller and thicker ſet together, viz. *two or three at a place, than in any other, and ſmelling pretty ſweet, which for the moſt part fall away without giving any Seed; and when it does bear Seed, it is very ſmall, and contained in ſmall round Heads.*

V. *The third*, *or* Jagged Baſe or Baſtard Mullein. *Its Root is much like the former; and it has large and long Leaves unevenly cut in on the edges, ſomewhat like the Leaves of* Horned Poppy, *of a dark green color, and a little hairy withall. The Stalk is ſmall and green, but high, and variouſly Branched, bearing ſmaller yellow Flowers, and more ſparſedly ſet than in the two former* Black ſorts, *and having after them Seed much alike.* Lobel *ſays, the*

the Flowers are ſet under the Stalks, as Sage *or* Wild Clary *are, and of the ſame form and color.*

VI. *The fourth, or* Ethiopean Mullein, Jagged and not Jagged. *Their Roots are Woody, and periſh as ſoon as they have born their Seed, which is uſually the ſecond Year after their Sowing and Springing up, for the firſt Year they ſeldom run up to Flower. Each of theſe have divers very large Leaves ſpread upon the Ground, every one near a Foot long, and almoſt half a Foot broad, ending in a point; in the one, very much torn in on the edges on all ſides, and dented thereabouts, and in the other ſmooth and not dented or jagged: both of them are of a whitiſh, hoary, green color, with much white hoarineſs or woollineſs upon them, far ſurpaſſing any of the* White Mulleins, *which grow wild abroad in Our Country, or beyond Sea; for they are of a yellowiſh white hoarineſs, and are nothing ſo pleaſant to look on as this. In the middle of theſe Leaves riſes up a hoary, ſquare, ſtrong Stalk four or five Feet high, ſet full of ſuch like Leaves as grow below, but much leſſer, and leſſer ſtill up to the top, all hoary and woolly as the reſt. This Stalk towards the top, is ſpread out into ſeveral Branches, on which alſo grow divers ſmaller Leaves like the former up to their tops, which Branches ſpread far, and take up a great compaſs or room. On each of the Stalks and Branches, at ſet diſtances are ſet two ſmall Leaves, and with them round the Stalks ſeveral large white hooded or gaping Flowers, and ſome ſay they are of a pale, black, blew, color: after which comes the Seed; two Seeds always joined to gether in one Seed Veſſel, which are browniſh, and thoſe of the jagged like thoſe of the not jagged.*

VII. *Gerard* Deſcribes the ſmooth and not jagged Kind thus. *It has a Root which is black and hard, and of a Woody ſubſtance. From which ſpring forth many very broad hoary Leaves, ſpread upon the Ground, very ſoft and downy, or rather woolly like thoſe of our* Common white Male Mullein, *but far whiter, ſofter, thicker, and fuller of woollineſs; which Wooll is ſo long, that one may with his fingers pull the ſame from the Leaves, even as Wooll is pulled from a Sheeps Skin: from among which Leaves, riſes up a four ſquare downy Stalk, ſet with like Leaves but ſmaller: which Stalk is divided at the top into ſeveral Branches, ſet about and orderly placed at certain diſtances, with many Flowers like thoſe of* Arch-Angel, *of a white color, tending to blewneſs: which being paſt, there follows a three cornered brown Seed.*

VIII. *The Places.* The firſt grows in many places of *Eſſex*, *Kent*, and *Surry:* The ſecond is ſometims alſo found growing Wild in our Country, but not commonly to be met with, unleſs carefully lookt after. The third *Lobel* ſays he found near the Ruines of an old Church, by the *Baths* at *Bath* in *England.* The fourth *Dioſcorides* ſays, grew upon *Mount Ida* in *Phrigia* near *Troy*, and in *Meſſenia* a Province of the *Morea*; and has of late been gathered upon ſome Hills in *Greece* and *Illyria* which are near the Sea: but it alſo grows naturally in *Æthiopia*, from whence it took its Name: it alſo grows in *Meroe*, an Iſland in the River *Nilus:* from ſome of theſe places it has been brought to us, and grows here in our *Gardens*; *Gerard* ſays, he had it growing in his *Garden:* I have alſo ſeen it grow Wild, upon ſome of the Southern Parts of the Continent in *Florida*, where it is in abundance.

IX. *The Times.* They all Flower in *July* and *Auguſt*, or latter end of *Summer*, as the other *Mulleins* do; and their Seed is ripe in ſome little time after.

X. *The Qualities, Specification, Preparations,* and *Vertues.* of theſe *Mulleins*, are the ſame with thoſe of the *Common Mullein* in the former Chapter ſo that no more need be ſaid of them here.

XI. *Obſervations. A Decoction of the Golden Flowers of the* Black Mullein *in Lye*, is ſaid to dye the Hair of the Head yellow, and to make it fair and ſmooth. And a *Decoction of the Leaves in Wine with a little Honey*, is good to waſh and cleanſe old and putrid Ulcers, and foul, rotten, and running Sores, and to induce their healing. *A Decoction in Vinegar alſo*, is very profitable to ſtop the bleeding of Green Wounds, and to heal them; and it it is made with *Rue*, it is a Remedy againſt the Stinging of Scorpions. *The Decoction of the Leaves and Flowers in Wine or Water*, is good againſt Diſeaſes of the Breſt and Lungs, and for ſuch as Spit corrupt and rotten Matter. *An Ointment made of the Leaves*, is uſed with good Succeſs againſt Scaldings and Burnings with Fire or Water. *A Cataplaſm of the Leaves made by boiling in Water and ſtamping them in a Mortar*, &c. being applyed, is profitable againſt an *Oedema*, and other cold Tumors: it cleanſes and cures Ulcers alſo, and is of excellent uſe againſt an *Ophthalmia*, or Inflamation of the Eyes.

XII. *The Virtues of the* Ethiopian Mullein. *The Decoction of the Root in Wine or Water*, is good againſt corrupt and rotten matter of the Lungs: helps the aſperity or roughneſs in the Throat, and is ſaid to be profitable againſt the *Sciatica. An Electuary or Loboc, made of the Root with Hony* has alſo the ſame Vertues, and cauſes an Expectoration of the purulent or rotten Matter in a Pleurifie.

CHAP. DIX.

Of MULLEIN Moth.

I. *THE Names.* It was unknown to the *Greeks*, and therefore has no *Greek* Name: but it is called in *Latine*, *Blattaria* from *Blatta*, a Moth: *hæc abjecta Blattas in ſe contrahit unde nomen accepit*, as Pliny ſays, *lib.* 25. *cap.* 9. And in *Engliſh*, *Moth Mullein.*

II. *The Kinds.* Authors have made twelve or thirteen Species of them, or more; but as many of them are perfectly Forreign to us, and not at all to be come by, we ſhall here omit them, and give you only the Deſcription of ſuch, as either grow Wild in our Country, or are commonly Nurſt up in our *Gardens*; and they are the following ſeven, *viz.* 1. *Blattaria lutea odorata*, Sweet yellow Moth Mullein. 2. *Blattaria lutea minor ſive vulgaris*, Our Common yellow Moth Mullein. 3. *Blattaria Flore albo*, White Moth Mullein. 4. *Blattaria lutea major, ſive Hiſpanica*, The greater yellow Moth Mullein. 5. *Blattaria Flore luteo purpuraſcente*, Cloth of Gold Moth Mullein, or yellowiſh purple Flowered Moth Mullein. 6. *Blattaria Flore purpureo*, Purple Flowered Moth Mullein. 7. *Blattaria Flore Cærûleo*, Blew Flowered Moth Mullein.

The Deſcriptions.

III. *The firſt*, *or* Sweet yellow Moth Mullein. *It has a long Branched Root, pretty thick with ſome Fibres adjoining to it, which abides all the* Winter, *and lives many Years, which few or none of the others do. It has many hard, grayiſh, green Leaves lying on the Ground, ſomewhat long and broad, little or*

Moth Mullein.

nothing ſnipt about the edges, but pointed at the ends. The Stalks are two or three Feet high, with ſome ſmaller Leaves on them; branching forth from the middle upwards into many long Branches, furniſhed with many ſmall, pale, yellow Flowers, having a pretty ſweet ſmell, ſtronger than in the others, which paſs away, very rarely giving any Seed.

IV. *The ſecond*, *or* Our Common yellow Moth Mullein. *It has a Root pretty thick and long, with ſeveral Fibres coming from its ſides, which periſhes every Year after Seed time. It has ſuch like long Leaves as our fourth Species at* Sect. VI. *following, but narrower, and roundly dented about the edges: The Stalk is uſually ſingle, and without Branches: on which towards the top, grow ſuch like Gold yellow Flowers as thoſe are, but leſſer, with the like purple Threads in the middle. The Seed Veſſels are ſingle, and the Seed ſmall, both ſo like to that fourth Species following, that they cannot be diſtinguiſhed.*

V. *The third*, *or* White Moth Mullein. *The Root of this is like the laſt or* Common yellow Moth Mullein: *but the Leaves of this are of a little freſher green color, and ſharper dented about the edges. The Stalk riſes as high as the former, and has now and then ſome Branches about it. The Flowers hereof are pure white, as large and great as thoſe laſt Deſcribed, or ſomewhat larger, with the like purple threads like Flies creeping up in the middle, as are in the* Common yellow: *and the Seed is like the ſame: in all other reſpects, it differs nothing from the former.*

VI. *The fourth*, *or* Greater yellow Moth Mullein. *This is a* Spaniſh Kind, *whoſe Root is not great or full of Fibres, but periſhes almoſt every Year, after it has given Seed, except the* Winter *is very mild: It has longer and greener Leaves than the firſt Kind, and rounder alſo at the ends than the ſecond Kind. The Stalk is ſtronger and higher than it alſo; on which beſides the Leaves, grow towards the top, many Gold yellow Flowers, conſiſting of five Leaves apiece, as all the reſt do; not ſo thick ſet as the firſt Species, but a pretty deal larger, with ſome purpliſh threads in the middle, formed ſomewhat like unto a Fly: after which come in their places, round Heads, two or three, or more ſometimes together, but moſt uſually one, in which ly ſmall dusky Seed.*

VII. *The fifth*, *or* Cloth of Gold Moth Mullen; *or* yellowiſh purple Flowered Moth Mullein. *This abides longer in its Root than ſome others, tho' in a hard* Winter *it will periſh like the laſt. The greateſt difference between this and the ſecond Species, conſiſts, firſt in the Flower, which is of a yellowiſh purple, or the ground yellow, over-ſhadowed with a bright crimſon color, which is very pleaſant and delightful. Secondly, The threads in the middle are not ſo purple, as in that ſecond Species, but near unto the color of the Flower. Thirdly, It ſeldom bears Seed, which that Kind for the moſt part does.*

VIII. *The ſixth*, *or* Purple Flowered Moth Mullein. *Its Root is long, thick, and blackiſh on the out ſide, abiding many years, and much encreaſes by the Sowing of its own Seed. Its Leaves are broader, ſhorter, and of a grayer green color, than the third Species or* white Moth Mullein, *and without any denting on their edges for the moſt part, yet pointed at the ends: The Stalk riſes not ſo high as that, but is ſometimes Branched, bearing ſuch like Flowers; of a fair deep blew, or purple color, tending to redneſs, the threads in the middle of the Flower being yellow. The Seed Veſſels hereof are ſmaller alſo, than thoſe of that third kind.*

IX. *The ſeventh*, *or* Blew Flowered Moth Mullein. *This blew Kind is in all reſpects like unto the former purple Kind, ſaving only in the color of the Flower, which is of a blewiſh* Violet *color; and is not much inferior either in the greatneſs of the Plant, or in the largeneſs of its Flower, unto the ſaid purple Kind, and endures many Years in like manner.*

X. *The Places.* The three firſt have been found growing Wild in ſeveral places of *England*, as on *Black-Heath* in *Kent*, and near *Deptford*, and in other places: the four laſt grow only in *Gardens* with us; and ſo does ſometimes the third ſort alſo.

XI. *The Times.* They all Flower in the *Summer* time, as in *July* and *Auguſt*, and yield their ripe Seed not long after.

XII. *As to their Qualities, Specifications, Preparations*, and *Vertues*, Authors have ſaid nothing, ſave what *Pliny* aſcribes to them, eſpecially to the Common ſort, which is, to gather Moths to it whereſoever it is laid. And what *Camerarius* alſo ſays of the ſaid firſt Species, That the *Decoction of its Flowers or Leaves* opens Obſtructions of the Bowels and Meſeraick Veins.

CHAP.

CHAP. DX.

Of MUSHROMS.

OR,

TOAD-STOOLS.

I. *THE Names.* This Plant is called by the *Arabians*, *Fater*, and *Hatar*: in *Greek*. Μύκης. Pl. μυκήτες: in *Latine*, *Fungus*. Pl. *Fungi*: in *Engliſh*, *Muſhrome*, Pl. *Muſhroms*; *Toad-Stools*.

II. *The Kinds.* There are ſeveral Species of *Muſhroms*, ſome of which we have already Treated, or ſhall hereafter Treat of, in their particular and proper Chapters, *viz.* I. *Such as grow upon or in the Earth*, as, 1. *Tubera Terræ*, Earth Balls, which ſee in *Chap.* 238. aforegoing. 2. *Capita Terræ*, *Lupi Crepitus*, Fuſs-Balls, which ſee in *Chap.* 306. aforegoing. II. *Such as grow upon Trees*, as, 3. *Auriculæ Judæ*, *Fungus Sambucinus*, Jews Ears, which ſee in *Chap.* 404. aforegoing. 4. *Lichen Arborum*, *Pulmonaria Fungoſa*, *Muſcus Pulmonarius*, Tree Lungwort, which ſee in *Chap.* 458. aforegoing. 5. *Fungus Arboreus igniarius*, *Fungus igniarius*, *Fungus incendiarius*, Touch-Wood, or Match-Wood, of which in *Chap.* following. 6. *Agaricus*, Agarick, or Muſhrom of the Larch Tree, which ſee in the *Third Book* of this our *Botonologia*, or Hiſtory of Plants. Of all or any of theſe, we have nothing to ſay in this place. Thoſe which we ſhall Treat of in this Chapter are the *Fungi Terrei*, or Muſhroms of the Earth, which we divide into two Claſſes, *viz.* I. *Fungi Eſculenti*, The Edible Muſhroms. II. *Fungi non Eſculenti*, The non Edible Muſhroms; which are ſaid to be *Pernitioſi vel Deleterij*, Dangerous or Deadly. Now becauſe there is a great number of both theſe Kinds; to avoid as much as may be being tedious, we ſhall forbear the enumerating of them here in particular, and give you their Names, as we ſhall Treat of them, or Deſcribe them, in the order following.

The Deſcriptions.

I. Of the Edible, or Wholſome *Muſhroms.*

III. The General Deſcription. *Our common ſorts of* Muſhroms *have ſmall, ſmooth, round Heads, ſtanding upon thick ſhort Stalks, and are for the moſt part white; yet in ſome the upper Skin is browniſh or yellowiſh; but generally more yellow, after they have ſtood long and are decaying; moſt of them are ſomewhat flat, and hollow underneath, with many Lines, or thin Feather-like Subſtances, running directly from the Center or middle of the Head, to the Edges round about. Their Subſtance is generally looſe and ſpongy, eaſily yielding to be broken between the Fingers, if but preſſed a little hard.* The Taſte and Reliſh is according to the Soil and place where they grow. *Cluſius* ſays, The *Hungarians*, *Germans* and others, do eſteem thoſe moſt, which grow in the Woods, and chiefly thoſe under *Firr Trees*; and next to them, thoſe which grow under *Oaks*: But doubtleſs, thoſe which grow in the open Air, in Champian Fields and Meadows, are not only ſafer from danger, but of better reliſh than thoſe which grow in Woods and under Trees, eſpecially with us in *England*: and herewith agrees *Horace* in his *Satyrs*, *lib.* 2. *ſatyr* 4. *ver.* 20. *and* 21.

——— *pratenſibus optima fungis*
Natura eſt: alius male creditur.

Mushroms Wholsom

IV. 1. *Favaginoſi*, *Spongioſus Dalechampij*, The Honey Comb Muſhrom. *Some of this Kind grow bigger than others, and ſome more Topped or Spiring, and ſome are parted as it were all over into ſundry diviſions, making it ſeem like an* Honey Comb, *and its Head many times reſembles a* Mulbery. Theſe are not dangerous as *Gerard* ſays; and *Cluſius* accounts them as one of the firſt or principal Kinds of *Edible Muſhroms*, and *Camerarius* ſays, that the *Germans* are much delighted with them.

V. 2. *Fungi altiuſculi & parvi. Theſe are higher than any of the reſt, and ſmall withall*, But good of the Kind.

VI. 3. *Fungus Pyramidalis*, Spear or Pyramidal faſhioned Muſhrom. *Its out-ſide is of a whitiſh brown color, is more Steeple faſhioned and larger, than ſome others*, and as good as any of the former; being the greateſt of the fourth ſort of *Cluſius* his *Edible Muſhroms.*

VII. 4. *Fungus Georgij*, St. George's Muſhrom. *It is round, ſomewhat ſoft and whitiſh, having a ſlit moſt uſually on the Edges: They are called by this Name, becauſe they Spring up much about that time of the Year.*

VIII. 5. *Fungus Populneus, growing under* Poplar Trees and Elme Trees. *It is cornered either more or leſs, and ſome jagged about the Edges, having longer and ſhorter Stalks, and ſome of them fuller, and lanker than others.*

IX. 6. Πεζικαὶ, *Pezicæ Plinij*, Cup Muſhroms. *They grow out of the ſolid Ground, unto which they adhere ſo ſtrongly, that they can ſcarcley be got up without breaking; ſticking to the Earth by certain ſmall Fibres, ſcarcely to be diſcerned, and ſpreading low upon the Ground without any Stalk, into broad, deep, and hollow Cup-like Pieces, the Brims or Edges whereof are either plain or crumpled, or Cornered; and containing many times within the hollowneſs, three or four ounces of Rain Water, eſpecially the greater of them, which by reaſon of the thick skinny, or fleſhy Subſtance thereof, corrupts not, nor yet the Water contained therein, for a long time, being white on the out-ſide, and reddiſh within.*

X. 7. *Fungus Muliebris*, The Womans Muſhrom: *It is ſomewhat flat on the Head, a little turn'd in like a Navel. They are of an unequal ſize, being browniſh, greeniſh, or yellowiſh Coated.*

XI. 8. *Fungus Tuberoſus*, The Tuberous Muſhrom. *It is not flat throughout, but round in the Body, and ſometimes torn on the edges, of a pale brown color, ſpotted with white.*

XII. 9. *Fungus vel Fungi nemorum; Boletus vel Boleti Cordi:* Muſhrom of the Woods. *It is almoſt round and white, Spotted with yellow brown ſpots, ſome of them bigger than others: thoſe growing under* Beech-Trees, *are redder than others: ſome chuſe for eating, the pale ſort, rather than the redder.*

XIII. 10. *Fungi Capreolini*, The Goats Muſhrom. *They differ not much from ſome of the laſt, but in being yellower above, and browner underneath.*

XIV. 11. *Fungi rubei*, Red Muſhroms, *They grow in Woods about the beginning of* Summer, *and for their redneſs above, are called* Red Muſhroms; *altho' both the Stalk and the under part be not ſo full of ſtrikes.*

XV. 12. Ἀμανῖτης, *Amanitæ vulgares Tragi; Boleti Tragi: Theſe are the* Fungi *Species, or kind of* Muſhrom, *which are ſaid to be the moſt Common both by* Lobel *and others.*

XVI. 13. *Fungi Villoſi, Fungi hirſuti cervini*, The Hairy Muſhroms. *Theſe are round, and a little flat above, are all hairy, and of a bluſh color: ſome of them will alſo be blackiſh, and ſome will likewiſe grow two together.*

XVII. 14. *Fungi abietini*, Fir Muſhroms, *becauſe they grow in the* Fir Tree *Woods. Theſe are leſs hairy, but otherwiſe much like the laſt; of which ſome are mixed with white, pale, and brown; and ſome ſmooty with all, or many blackiſh with purple Lines underneath.*

XVIII. 15. *Fungi ungulati, Caprei ungulati*, Goats Hoof Muſhrom. *They are cut in on the edges into ſuch parts, that they very well reſemble a* Goats Hoof, *being brown above, and white beneath; and is more torn on the edges, when it grows old, than when it is new ſprung up, or is but young.*

XIX. 16. *Aminitæ Pauli Æginetæ. Theſe have their Stalks ſometimes bigger in the lower part, than the upper Bole is: and are much diſcolored with blew, green, and brown, or yellowiſh, as in ſome; the upper part of the Bole being brown; and without any Lines underneath.*

XX. 17. *Fungi Lactei*, Milky Muſhrom. Theſe are of ſo delicate a Taſte, that they are eaten raw: *it is flat at the Head, and of a reddiſh color, yielding a ſweet Milk when it is broken.*

XXI. 18. *Fungi Regales*, Kingly Muſhrooms. *Theſe are great, white, and round, ſmelling very ſweet*, and of as pleaſant a Taſte as the former, and may be given to ſuch as are Sick, without any danger.

XXII. 19. *Fungi lingulati, Lingua Cæſalpini. It grows on the Bodies of* Cheſnut Trees, *or near them: its head is ſomething red: and its Stalk is red, but not ſo red, as that of the true* Boletus.

XXIII. 20. *Boletus Verus*, The true Boletus. *This is white as an Egg, and of the ſame form when they firſt ſpring up: but after two or three days, the white Skin or Coat breaks above, and ſhews yellow like the Yolk of an Egg, which then grows greater, and into the form of a* Muſhrom (*the white Skin falling away by little and little*) *being raiſed ſomewhat higher in the middle, and ſo much of a gold yellow color, that it ſeems deeper colored, than* Saffron *it ſelf, but leſs yellow underneath, with as many Feather-like Lines or Diviſions, or* Septa *as in other* Muſhroms. *The Stalk likewiſe is yellow, and an inch thick: when it grows old, it breaks into three or four parts, and looſes the freſh color above, becoming more pale, and underneath almoſt white. Theſe are of ſo delicate a Taſte, that thoſe who are accuſtomed to feed on* Muſhroms, *deſire them more than any other Kind, nor can they eaſily be ſatisfied with them. They are accounted by all Hands to be very wholeſome, and yet it is ſaid that* Claudius Cæſar, *was kill'd with eating them. This might chance indeed after the eating of this Kind: but the queſtion is, whether the* Muſhroms *were the cauſe of his Death, or that there might be ſome other cauſe thereof going before, or unknown, which might effect it:* It is good to lay the Saddle on the right Horſe. *Cluſius* ſays, That ſome of theſe being dreſt, and Served up, as a Diſh at Table, that they ſeemed unto him, as if they had been colored with *Saffron.*

XXIV. 21. *Fungi Porcini, Fungi Suilli*, Swines Muſhroms. *They are ſomewhat pointed, of a ſmoaky color, ſpotted with white ſpots, and underneath with blackiſh ſepts, or Feather-like lines or diviſions and the upper part in ſome will be red. But* Ceſalpinus *ſays, that with them, ſome were of a browniſh yellow above; and of an Aſh color underneath.*

XXV. 22. *Scarogia Cæſalpini: Theſe grow in Meadows, the Head being broad, and the Stalk very long, and of divers colors.*

XXVI. 23. *Fungus Quercinus dipſacoides*, The Baſon or Teaſel Muſhrom growing among Oaks. *Its Head is white, and like unto the common ſort in form, but that the top is brown and grows to be ſpotted: but the chiefeſt matter of difference is in the Stalk, which has about the middle of it, or higher, a certain hollow Diſh, like as the* Teaſel *has, being rough and brown about the brims. The lower part of the Stalk is as it were knobbed, and blackiſh next to the Ground, with ſome hairy Fibres thereat.*

XXVII. 24. *Fungus acris vel Piperitis*, *Fungus Piperitis Sapore*, The Pepper taſted Muſhrom, as *Cordus* on *Dioſcorides* calls it. *It is white in color, and taſts ſharp and hot like* Pepper.

XXVIII. 25. *Fungi Prunuli Cæſalpini. It is a very ſmall* Muſhrom, *of an Aſh color and very ſweet in ſmell.*

XXIX. 26. *Fungi ramifici vel ramoſi, Barba Hirci*, The Branched Muſhrom. *It is ſpread out large into many Branches, being in ſome yellow, in others reddiſh, and in others of a pale white, which they call the* Goats Beard. *The moſt conſpicuous is that that which is yellow, and has white ſpots upon it.*

XXX. 27. *Fungus Digitatus major & minor: Fungi Digitelli*, as the *Italians* call them. The Finger Muſhrom. *It is of a large Size, and parted as it were into long whitiſh Fingers*, one of which will ſuffice a Man for a Meal.

XXXI. 28.

XXXI. 28. *Fungus dentatus*, pl. *Fungi dentati*, The Toothed Muſhrom. *This is a ſmall* Muſhrom, *and a little long, being formed like unto a Tooth.*

XXXII. 29. *Fungi artificiales producti*, Muſhroms produced by Art. *They are made to grow at the Foot of the white* Poplar Tree, *within four days, by ſprinkling warm Water in which ſome Leaves have been Decocted, and Pouder of the ſame Leaves mixt therewith, or rather the green Leaves beaten into a ſoft Pulp, and ſo mixt with the warm Water: I ſay if the Water thus ordered ſhall be poured in upon the Root, which muſt be ſtit before hand, eſpecially upon thoſe parts of the Root which ly above Ground, or even with the ſurface of the Earth,* Muſhroms *will be produced in a very ſhort time.*

XXXIII. *The Preparations.* The order of Dreſſing them is various. 1. Some Boil them, and drein or preſs the Water out of them, and then ſlice them, and put Oil and Vinegar to them with a little Salt, or Sugar, as ſome will, and a little Spice, and ſo eat them. 2. Others Boil them ſoft in Water mixt with Vinegar and Salt, then Butter, Sugar, and Spice them, and ſo eat them. 3. Others Boil them in Milk, or Cream, or Fat Broth, till they are tender, then dreſs them up with ſweet Butter, Vinegar, Salt, Pepper, or other Spice. 4. Others having cleared them, and Skin'd them, ſlice them, and ſtrew fine Flower on them, and then Fry them with Oil, or Suet, or Butter, and ſo eat them. 5. Some Pickle them by firſt Boiling them ſoft in fair Water, mixt with ſome Vinegar and Salt, then taking them out they let them cool, and make a Pickle of the Liquor they were Boil'd in, by adding more Vinegar and Salt, ſome Spices, and a fifth part of choiſe Brandy; into this Pickle when cold, they put the former Boil'd *Muſhroms*, which will preſerve them good for a Year or more, being kept cloſe ſtopt up. 6. Some ſtring them and dry them, and ſo keep them, as *Cluſius* ſays, and ſome Salt them, and ſo keep them until *Winter*, and then Boil, Dreſs and Eat them. 7. Some Boil them with Wild, Choaky, Sower *Pears*, and then Dreſs them as aforeſaid, and ſo Eat them; for thus (as Authors ſay) they may be Eaten without any danger: and if Wild *Pears* cannot be gotten, the Sowerer and Harſher ſorts of other *Pears* may be uſed: *Garlick*, *Onions*, and Vinegar are alſo conducing to the ſame purpoſe.

II. The Non-Edible or Poiſonous *Muſhroms.*

XXXIV. 1. *Pruneoli*, *Fungi Pruneoli*, The Plum-Tree Muſhroms. *Some grow under the Trees in the beginning of the Year, of differing Forms and largeneſs: and ſome grow many together, from one and the ſame Root, as it were, with little or no Stalk at all: ſome are round faſhioned; ſome are Cornered; ſome are larger, and ſome ſmaller than others, all of them being mixt with white, pale, yellowiſh, and brown together.*

XXXV. 2. *Fungus Fimetarius*, *Fimetarij*, The Dung Muſhrom, becauſe found growing among Dung. *It is of a round flatneſs, ſomewhat thin, white, and covered as it were with* Meal *all over, having brown Septs underneath.*

XXXVI. 3. *Fungus Coryleti*, *Fungi Avellanei*, The Muſhrom growing under Haſle Trees. *It is ſometimes of a whitiſh red, and as it were ſmoaked over; it is round, and ſomewhat broad.*

XXXVII. 4. *Fungus Corneolus*, Fleſh colored or Coral-like colored Muſhrom. *It is full of round yellowiſh Spots above, and pale yellow underneath full of blackiſh Septa, or Diviſions, found much in* Wales.

XXXVIII. 5. *Buſonei*, *Fungi Buſonei*, The Toads Muſhrom. *It is of a wan color, and round like an Helmet, or more yellowiſh, but ſmoaky; or elſe more flat and reddiſh with ſome Spots.*

XXXIX. 6. *Fungus Ruber parvus.* The ſmall red Muſhrom. *It is very ſmall and round, not exceeding the Nail of ones Finger: reddiſh above, and very hollow underneath.* It is called alſo *Fungus Hircinus.*

XL. 7. *Boletus nothus*, *Fungus Boleti ſimilis*, The Muſhrom which is like to the true Boletus. *It is about half an Inch broad, ſpiring a little at the top; of a whitiſh color, with a long Stalk, and of the bigneſs of ones little Fingger.* This is alſo called, the *Foolls Muſhrom.*

XLI. 8. *Fungus Muſcarius*, The Fly-bane Muſhrom. *Of this there are two or three ſorts, ſome of them being greater and broader than others; ſome much redder and ſpotted with white Spots, all which grow in Woods which have been fell'd. They are ſaid to kill as many Flys as ſit and feed on them, as well when they are dry, as when they are freſh.*

XLII. 9. *Fungi Lethales albi. Theſe are found in fell'd Woods about* Auguſt: *One whoſe Stalk is larger below than above, and the Head or Top round and of a pale whitiſh color, but no bigger than the bottom of the Stalk.*

XLIII. 10. *Fungus Lethalis niger*, The black Deadly Muſhrom. *This Kind is much frequent with us, and is of a blackiſh color, much rent or torn on the edges, and hanging lank about a ſmall long Stalk.*

XLIV. 11. *Fungi Lethales Varij*; *Fungi Lethales edulis ſimiles. Theſe are of divers ſorts, which becauſe they are ſo like to ſome of the* Edible Kinds, *have deceived many which have gathered them, and are often a ſudden Death to ſuch as eat them. Of which ſome are reaſonably ſmall, others very large; and moſt of them are of a beautiful Aſpect, either whitiſh or reddiſh, or more red, and as it were ſmoaked over.*

XLV. 12. *Fungi abietales hirſuti*, Muſhroms growing under Firr-Trees. *Theſe are like to the* Edible *ones which grow in the ſame places, and have no other difference, but that theſe are hairy underneath, for which reaſon they are refuſed to be eaten.*

XLVI. 13. *Phallus Holandicus* (*as Adrianus Junius* cals it) The *Hollanders* Tool, or Working Tool. *At its firſt riſing up, it is ſomewhat round; but the Skin breaking, there riſes up a Stalk of the thickneſs of ones Thumb, and of a Fingers length, ſomething like to the* Penis *of a Dog, having a Nut, or Cap on the top, an Inch thick, of a blackiſh green color at firſt, and after blacker, with certain Cells or hollow places in it. The lower part or Purſe from whence the Stalk riſes, is of an Aſh color, and ſometimes browniſh: the Stalk at firſt is white, but afterwards of divers colors and ſpotted. This Kind ſtinks at the beſt, but withering, it is turned into a moiſt blackneſs, coloring the very Ground on which it falls: and Flys are kill'd which feed thereon. Junius* ſays, It is plentifully found on the *Dutch* Sea Shores.

XLVII. 14. *Fungus imbricatim diſpoſitus verſicolor.* The folded changeable Muſhrom. *This grows on* Cherry Trees *which begin to putrify: It is a Kind which riſes up many together laid flat one upon another, about an Inch or more broad below, and ſpreading to be 3 or 4 Inches above, and about half a Foot high, being of divers colors on their tops, the edges being of a deep red color, with a mealy white Liſt*

or Border about. The lower part for an Inches breadth upwards, is a pale whitiſh color; up higher it is yellow and red mixt together, croſſing it athwart; then yellowiſh, and above it red and yellow mixt again; and then yellow to the very edge, but marked with ſeveral ſmoaky Spots, pale or yellowiſh underneath. This is deleterious being given to Men; but dryed and made into *Pouder*, it is ſaid to be ſafe to be given to Cattel.

XLVIII. 15. *Fungi rotundi & albi magni. They are large, round, and whitiſh, full of black Septa or Lines from the Center to the Circumference, both above and below; but thoſe which are above are greater, and not ſtraight as thoſe below, and a little waved; the edge alſo is finely dented about.*

XLIX. 16. *Fungus Hacknienſis*, The Hackney Muſhrom. *It is ſmall, dented in like manner about the edges, and of a black Cheſtnut color, but not ſtriped above*, and has been found about *Hackney.*

L. 17. *Fungi Ligni. Theſe grow on rotten Boards and Timber, which ly, or are ſet into the Earth, and are ſmall like a green* Fig, *having ſmall Seed within them.*

LI. 18. *Fungus Capitibus Terræ ſimilis*, The Muſhrom much like to a Fuſs Ball. *It is round like a* Fuſs Ball, *of a browniſh color above, and of a dark red underneath, which when they are broken are of a blewiſh green color.*

LII. 19. *Fungus Clypeo vel Scutulo ſimilis. Theſe are ſome of them like Brimleſs Hats, many growing together: and ſome of them broad like Shields, with their Brims turned up.*

LIII. 20. *Fungus cancellatus, Lupi crepitus efflorescens Columnæ. It has a ſmall ſtringy Root, differing from all others, and is a round white* Fungus *at firſt; which afterwards breaking open, divers reddiſh Branches do ariſe from it, which do all join together, making round Arches of hollow netted Bars, or Latteſſes as it were, ſeparated one from another. It has a very ſtinking ſmell, from whence came the Name. It is much eaten by Flys.*

LIV. 21. *Fungi Auriculis Judæ ſimiles*, Muſhroms like to Jews Ears. *Theſe grow upon the Arms, Bodies, or Stocks of Trees, which are rotting or dead, or at their Roots, or upon dry Boards. They are very much differing, yet none of them are of the hardneſs of* Touch-wood: *Some of them are like unto* Jews Ears, *either whitiſh or yellowiſh, crumpled, and of a skinny ſubſtance like them.*

LV. 22. *Fungus multicaulis, Fungus multiplex. This Grows like the* Common Muſhroms *very many together, on ſeveral Stalks, differing in brownneſs, whiteneſs and redneſs one from another, and all riſing from one and the ſame Root: They grow either on the rotten Arms of Trees, or dead rotten Bodies of Trees, lying upon the Ground.*

LVI. 23. *Fungus Fruticoſus argenteus*, The Silver colored Shrub-like or Branched Muſhrom. *It grows like a Shrub with many Branches, which are of ſo pure a whiteneſs that they ſeem as if they were made of pure* Silver, *if they were ſhining withall. This has oftentimes no Stalk, or of it has one, 'tis not above half an Inch long, and grows on the rotten Bodies of Trees, which ly rotting upon the Ground.*

LVII. 24. *Fungus Cinaræ formæ*, Artichoke-like Muſhrom. *Its Stalk is like unto other* Muſhroms, *but the Head is made of Scales, like unto an* Artichoke, *of a faint yellowiſh color.* It is found growing in *Kent*, near *Aſhford*, alſo on *Bromly-Green*, and at *Wareborn* in *Rumney-Marſh.*

Cluſius, Bauhinus, and *other Authors*, have given us a great many more than we have Deſcribed, they are too numerous for our deſign, and ſerve for no purpoſe, and therefore it would be in vain for us to exhibit all their Varieties here. For as much, as they have no peculiar properties yet known, for the benefit of Man-kind, and withall, are moſt of them perfect Strangers in our Climate.

CHAP. DXI.

Of MUSTARD Garden.

I. *THE Names.* It is called in *Arabick, Cardel:* in *Greek*, Σίναμι; Σίναπι; Νάπυ *Ariſtophanis & Athenæi:* in *Latine*, *Sinapi*, and *Sinapis:* and in *Engliſh*, *Muſtard.*

II. *The Kinds.* There are three Generick Kinds of *Muſtard, viz.* 1. *Sinapi Sativum vel Commune*, Our Common or Garden Muſtard, of which in this Chapter. 2. *Eryſimum, ſive Irio*, Hedge Muſtard, of which in *Chap.* 512. 3. *Thlaſpi, & Thlaſpe*, Treackle Muſtard, of which in *Chap.* 513. following.

III. *The Kinds of our Common Muſtard.* There is, 1. *Sinapi ſativum, Sinapi primum Matthioli*, Garden Muſtard. 2. *Sinapi Sativum Rapifolio, Sinapi Burſæ Paſtoris folio Lobelij, Sinapi tertium Matthioli, Sinapi Sylveſtre Dodonæi & Lugdunenſis, Eruca ſativa Fuchſij, Eruca hortenſis Turneri*, Common broad Leav'd Muſtard. 3. *Sinapi album, Sinapi ſativum alterum Lobelij, Sinapi album, Officinarum*, White Muſtard. 4. *Sinapi agreſte, Sinape agreſte Burſæ puſtoris folio, Sinapi Sylveſtre Dodonæi, Sinapi Erucæ folio Bauhini*, Wild Muſtard: of all which in order.

The Deſcriptions.

IV. *The firſt, or* Garden Muſtard. *It has a Root which is tough and white, running deep into the Ground, with many ſmall* Fibres *adjoining to it. From whence riſes up great rough, long, divided, Leaves, of an over-worn green color, like to thoſe of the* Turnep (*as* Gerard *ſays*) *but rougher and leſſer. The Stalk is round, rough and hairy, three, four, or five Feet high, divided into many Branches, on which grow many ſmall, pale, yellow Flowers, in a great length, which turn into ſmall, ſlender, long, rough Pods, in which is contained ſmall blackiſh Seed inclining to redneſs, of a fiery, ſharp, biting Taſte.*

V. *The ſecond, or* Common broad Leav'd Muſtard. *Its Root is ſmall, long, and Woody when it bears Stalks, and periſhes every Year. Its Leaves are long, large, and broad, and very much jagged, with uneven and unorderly gaſhes, much like to* Turnep Leaves, *but leſſer, and not ſo rough: The Stalks are round and ſmooth, and grow ſometimes to be four, five, or ſix* Feet *high (according to the goodneſs of the Soil) ſpreading themſelves out into many Branches from the middle up to the top, having ſuch like Leaves as the former, but ſmaller, and towards the tops, growing long and narrow, growing on ſhort foot Stalks. Upon theſe Branches grow ſmall,*

MUSTARD Common.

small yellow Flowers one above another, to the tops; after which come small Pods standing upon short foot Stalks, in which are contained round reddish or yellowish Seed, which is sharp, hot, and biting upon the Tongue.

VI. *The third, or* White Muſtard. *This in its Root, Leaves, and Stalks is much like to the firſt*

MUSTARD White.

deſcribed, but as it is leſſer, and grows not ſo high; the Stalks are more ſtiff; its Flowers are yellow like the former, and its Pods are rough and crooked, in which are contained white Seed, which is alſo very ſharp and biting. Theſe three Kinds of *Muſtard*, juſt now deſcribed, have been ſo briefly treated of by all Authors, that it is hard to give the true difference of them: and a matter of more difficulty than could have been expected in a thing ſo commonly known and uſed as *Muſtard* is.

VII. *The ſecond* or Wild Muſtard. *It has a Root which is long, not very large, but Fibrous, from whence ariſe many Leaves like thoſe of* Shepherds-Purſe, *but larger, and more deeply gaſh. The Stalk is round, riſing up to be about two Feet high, (but the whole Plant is leſſer than any of the former:) It is ſpread out into Branches towards the Top, and its Spikes are furniſhed with ſmall yellow Flowers, made of four Leaves apiece; after which follow the Pods, which are ſmall and ſlender, wherein is contained browniſh or reddiſh Seed, leſſer than any of the former, and not half ſo ſharp or biting.*

VIII. *The Places.* The firſt is not found Wild with us, but grows only in *Gardens*. The ſecond and third, grow alſo in *Gardens*, but are oftentimes found growing Wild in the Borders of Fields, and in low Rills and Furrows: the laſt only grows Wild. *Johnſon* upon *Gerard* ſays, that our *Common Muſtard*, and the other two ſorts, *viz.* the three firſt Kinds, grow Wild in many places of this Kingdom, and might all three be found on the Banks of Ditches, about the back of *Old Street* near *London*, and in the way to *Iſlington*; in which laſt I have for ſeveral years together found them growing.

IX. *The Times.* They are all Annual Plants, and may be Sown in the beginning of the *Spring*: they come to perfection in the ſame Year they are Sown, they Flower in *July*; and their Seed is ripe in *July* and *Auguſt*.

X. *The Qualities. Muſtard Seed* (which is part of the Plant which is chiefly uſed) is according to *Galen* hot and dry in the fourth Degree: it is Aperitive, Abſterſive, Attractive, Anodyne, Carminative, Coſmetick, Digeſtive, Diſcuſſive, Diuretick, Inciſive, and Suppurative: Cephalick, Neurotick, Stomatick, Pectoral, Nephritick, Hyſterick, Arthritick: Ptarmick, Alexipharmick, and Spermatogenetick.

XI. *The Specification.* It is found by Experience to be of eſpecial uſe, to provoke the Terms in Women, provoke Urine, and give eaſe in the Strangury, Stone and Gravel: it Cures Hyſterick fits, pains of the ſides and Spleen, Tooth-Ach, Kings Evil, Gout, Cramp, and Convulſions of the Bowels; and prevails alſo againſt Agues, Epilepſy, Lethargy, Cauſus, Vertigo, expels Poyſon of all ſorts, is good againſt Impotency in Men, and removes Scabbineſs, and other Deformations of the Skin.

XII. *The Preparations.* Theſe are all of them taken from the Seed: and conſidering the exceeding uſefulneſs of it, they are not many neither, being theſe few following, *viz.* 1. *A Powder.* 2. *A Condiment.* 3. *An Infuſion.* 4. *A Cataplaſm.* 5. *A Spirituous Tincture.* 6 *An Acid Tincture.* 7. *An Oily Tincture.* 8 *A Saline Tincture.* 9. *A Spirit.* 10. *A Diſtilled Water* both from the Seed alone, and from the Leaves alone: alſo from Seed and Leaves together. 11. *An Oil of the Seed by Expreſſion.* 12. *An Errhine.*

The

The Virtues.

XIII. *The Pouder of the Seed.* Given from a Scruple to 2 Scruples or a Dram, mixt with ſome proper *Syrup*, or in Wine, or other fit Vehicle, it provokes Urine, and the Terms in Women, is good againſt Epileptick, Lethargick and Hyſterick Fits, the Noſtrils, Temples, and Forehead being rubbed with the *Condiment*, for ſo it allays the Vapours, and quickens thoſe dull Spirits, which were aſleep as it were, or almoſt dead; for by its Volatile and Sharp Particles, it pierces to the Brain, and purges it of the Recrements which offend, by Sneezing, and drawing down the Rheum, and other Viſcous and Clammy Humors which hurt the Nerves, and cauſe a perturbation of the Spirits, and may otherwiſe fall upon the Lungs and Thorax, and ſo cauſe Coughing, Wheezing, Hoarſneſs and ſhortneſs of breath. It comforts and Warms the Stomach, helps Digeſtion, and cleanſes the Head, Brain, Thorax, and Lungs, of cold, viſcid, pituitous Humors. Taken to the quantity of a Dram, made up into a *Bolus* with *Syrup of Citron Peels*, reſiſts and expels Poyſon, and does wonderfully provoke Luſt, and being continued for ſome time, cures Impotency in Men: warms and comforts the Womb in Women, and cauſes Fruitfulneſs. It alſo eaſes the Pains of the Spleen and Hypochonders, the Gnawings and Tortions of the Bowels, and reſiſts and expels Poyſon of all Kinds.

XIV. *The Condiment or Sauce.* It is made of the *Seed* by Grinding it with White Wine Vinegar, or with warm Water, adding a little Brandy to either of them; and it is Ground either in a ſmall Quern, or Mill, or in a large Bowle, with a Cannon Iron Bullet by rouling it up and down upon the Seed. It is uſed as a general Sawce both for Fleſh and Fiſh, and is indeed a very wholeſome and excellent thing; and has all the Vertues of the *Pouder* aforegoing: being given as a Medicine, it may be taken from a Dram to two or three Drams in a Glaſs of Wine; and ſo it is profitable againſt Convulſions, the Palſie, Megrim, and all ſorts of Poyſon, it reſiſts the Malignity of *Muſhroms*, the Venom of the Scorpion, the bitings of Vipers, Mad Dogs, and other Poiſonous Creatures.

XV. *The Infuſion or Decoction.* It is commonly made in Wine, and has all the Virtues of the *Pouder*, being given from 2 Ounces to 4. It provokes Urine powerfully, gives eaſe in the Strangury, expels watery Humors from the whole Body, and evacuates them by the Reins and Bladder, and ſo has been found of admirable Uſe in curing the Dropſie. It powerfully reſiſts Poyſon, not ſuffering the Virulency thereof to ſmight the Spirits or Vital parts, to the overthrow of Life; but immediately Maſters or overcomes it, if taken in time. Taken an Hour or two, before the Fits of Agues, it ſo warms the Blood and Spirits, that it keeps back, and leſſens the cold Fit, and ſo thereby alters the courſe thereof, and at length cures it. Made into a Gargle with ſome of the *Condiment*, it helps the weakneſs or hanging down of the Uvula, commonly called the Palate of the Mouth, and as an Apophlegmatiſm draws Humors from the Head, Brain, Jaws, Teeth, Almonds, and parts adjacent to the Neck, whereby it prevails againſt Lethargy, Carus, Palſie, Convulſions, and Strumous Swellings about the Neck and Throat, commonly called the Kings Evil. The *Infuſion* prevails againſt Impotency in Men, and ſtirs up bodily Luſt in Women, and is admirable againſt Wind in the Bowels, and Pains and Stitches in the Sides.

XVI. *The Cataplaſm.* It diſcuſſes, rarifies, and draws out Thorns, Splinters of Bones, or other things out of the Fleſh. Applyed to the warm Forehead, and Temples, it warms and quickens the Animal Spirits, and is good againſt all cold and ſleepy Diſeaſes of Head, Brain, and Nerves. Applyed to Scrophulous Tumors or Kernels in the Neck, and about the Throat, it is ſaid to Diſſolve or Diſcuſs them. Applyed upon the pained place in a Sciatica, as alſo in the Gout, and other Joint Diſeaſes, it eaſes or leſſens the Pain, and diſcuſſes the Humors abounding in the part. It eaſes Pains in the Side, as Stitches, Spleen, *&c.* pains in the Back and Loins, Shoulders, and other parts of the Body; it many times raiſes Bilſters (if mixt with Leaven) and by drawing the Pains to the place from the inward or more remote parts, it many times cures the Diſeaſe, or diverts it to thoſe outward places where Topicks being applyed may do the Cure. Being immediately applyed upon the Biting of a Mad-Dog, or of a Viper, Rattle Snake, or other poiſonous Creature, it attracts and draws forth the Poiſon, and ſo prevents the danger which might enſue. Applyed alſo (mixed with a little Honey) it takes away black and blew ſpots or marks of Beatings and Bruiſings or the like, it diſcuſſes ſimple Contuſions, and removes the roughneſs of the Skin, alſo Scabbineſs, Scurf, Morphew, Leproſie and the Louſie Evil: it gives eaſe alſo to the Crick in the Neck, or when it is ſo pained, that the Head cannot be turned, without turning the whole Body.

XVII. *The Spirituous Tincture.* It is an excellent thing againſt the Palſie and Gout, and has all the Virtues of the *Pouder*, and *Infuſion* aforegoing, and may be given inwardly from a Dram to two Drams, in a Glaſs of *Canary* or other Generous Wine, two or three times a Day; and outwardly it may be Bathed upon the parts affected. It is an incomparable Stomatick, warming and comforting the ſame, and gives preſent eaſe in all extream pains and griefs of the Stomach and Bowels, proceeding from an Acid Humor.

XVIII. *The Acid Tincture.* It prevails againſt all internal Poiſons, is good againſt loathing, Vomiting, and other weakneſſes of the Stomach; it cauſes a good Appetite, and a ſtrong Digeſtion, and puts a good color into the Face. It opens obſtructions of the *Viſcera*, allays Vapors powerfully, and by a continuall uſe of it for ſome time, it cures Fits of the Mother: It may be given in a Glaſs of Ale, Beer, or Wine, ſo many Drops at a time as to make it Pleaſantly Acid, and to be taken, two or three times a Day, or in all that the Patient drinks. It is much better in Wine than in any other Vehicle: and I am apt to believe (from my own great Experience of it) that it is one of the beſt Remedies againſt the Scurvy in the World, and for which it ought to be eſteemed as a Jewel.

XIX. *The Oily Tincture.* It is good againſt the Colick tho' never ſo extream, as alſo againſt the Stone, Gravel, Sand or Tartarous Mucilage whether in Reins or Bladder. It provokes Urine powerfully, eaſes the Strangury, induces the Terms in Women, and facilitates the Birth of a Woman in Labour, and forces away the After-birth: and being prudently uſed, it not only cauſes a due cleanſing, but alſo prevents After-pains: It has all the Virtues of the *Pouder and Infuſion*, and may be given from 12, to 20, 30, or more Drops, according as the exigency and occaſion may require. Outwardly anointed upon any part, it eaſes all pains proceeding from a cold cauſe, and is of

singular use against the Palsie, Trembling, Numbedness, Convulsions, Cramps, and other like Diseases of the Nerves and external parts.

XX. *The Saline Tincture.* It is a good discussive and absterssive, is profitable against Spots, Freckles, Sunburnings, Tanning, and other discolorings of the *Cuticula:* It is excellent against Scurfs, Morphew, *Leuca*, Leprosie, as also good against Scabs, Itch, Pimples and other Breakings out, and cleanses the Face and Skin from all other Deformities thereof.

XXI. *The Spirit.* It comforts the Head, Brain, Nerves and Heart, revives the Spirits Animal, Vital, and Natural; Dissolves all congelations of the Blood and Humors, makes them thin and fluid, and to run freely in their Vessels; and is profitable against Asthmas, and most Diseases of the Stomach and Lungs, causing a free and easy respiration; and is a powerful thing against all sorts of Convulsions in young or old, as also the Palsie, or other like Distempers of the Nerves. Dose from one to two Drams in a Glass of Wine, Morning, Noon, and Night.

XXII. *The Distilled Water.* It has the Virtues of the *Pouder*, *Infusion*, *Tincture* and *Spirit*, but nothing near so powerful, and may be given from two to four Ounces, in a Glass of Wine. It provokes Urine, and gives ease in the Strangury: It is good to make a Gargle for a sore Mouth and *Uvula*; and used outwardly in a Wash, it is a Cosmetick, and is good against all Defœdations of the Face and Skin, cleansing and clearing them from their Deformities. If it is Distilled also from the *Herb when in Flower*, it is good, and may be used to all the purposes aforesaid; but it is not full out so prevalent, as that which is distilled from the *Seed.*

XXIII. *The Oil of the Seed by Expression. Schroder* says, it is good in cold Diseases of the Nerves: it certainly eases pains arising from a cold and moist cause, is good against Palsies and Convulsions, and strengthens parts which are weak.

XXIV. *The Errhine.* It purges the Head admirably, of cold, moist, viscous, and pituitous Humors, is good against Catarrhs and distillations of Rheum upon the Lungs, clears the Eye sight, and draws off Humors which settle upon the *Amigdalaes* and parts adjacent belonging to the Throat; and being often used is of singular use against the Kings Evil, because it attracts and draws away much of the Morbifick Matter causing the same.

CHAP. DXII.

Of MUSTARD Hedg;

OR,

BANK-CRESS.

I. THE *Name.* It is called in *Greek*, Ἐρύσιμον; ἀπὸ τῦ ἐρύειν *quod ob suam caliditatem attrahendi facultate præditum est:* also Χαμαιπλιον *Chamæpitys Dioscoridis:* in *Latine*, *Erysimum*, & *Irio Plinij*, lib. 28. chap 10. *quod ab acrimonia sua irruit in gallam:* in *English*, *Hedge Mustard* and *Bank-Cress.*

II. *The Kinds* Authors have made many Species of this Plant: there are but three which we shall take notice of in this Work, *viz.* 1. *Irio, sive Erysimum Vulgare, Herabetane Fœmina Brunfelsij; Sinapi septimum Tragi; Sinapi alterum Sylvestre Fuchsij; Erysimum Sinapi Sylvestris Species Gesneri, Irio Matthioli, Cordi, Lonicери, Lugdunensis, Cæsalpini & Lobelij; Cleone Octavij Horatij Anguillarâ; Erysimum vulgare Baubini;* Our Common Hedg Mustard. 2. *Erysimum Verum, sive Montanum, Irio alter Matthioli, Lugdunensis; & Camerarij, Erysimum verum Angulare; Irionis tertia Species Cæsalpini; Saxifraga Romanorum Lugdunensis, Erysimum Polyceration vel corniculatum Baubini;* The True Hedg Mustard. 3. *Erysimum alterum siliquis Erucæ Baubini; Erysimum secundum Tabernæmontani; Erysimum Latifolium Parkinsoni;* Our broad Leav'd Hedg Mustard.

The Descriptions.

III. *The first, or* Our Common Hedg Mustard. *Its Root is slender and Woody, running down deep into the Earth, abiding all* Winter, *and Springing up again every Year. From this Root, it usually Springs up, with but one blackish green Stalk, tough or limber, easy to bend, but not to break, spread out into several Branches; and sometimes with divers Stalks, set full of Branches, on which grow long, rough or hard rugged Leaves, very much cut in or torn on the edges into many parts, some bigger and*

Hedge Mustard Common.

ſome leſſer, of a dirty or dull green color. The Flowers are ſmall, and of a yellow color, conſiſting for the moſt part of four ſmall Leaves, which grow at the tops of the ſeveral Branches in long Spikes, Flowering by degrees: ſo that continuing long in Flower, the ſaid Stalks, or Branches will have ſmall round Cods at the bottom, growing upright, and cloſe to the Stalk, whileſt the top Flowers yet ſhow themſelves: in which Cods or Pods, are contained ſmall yellow Seed, which is ſharp and ſtrong, as the Herb it ſelf alſo is.

IV. *The ſecond, or* True Hedg Muſtard. *Its Root is ſmall, and periſhes after Seed time; but by ſowing it ſelf, it never miſſes to be in the Ground where it once has Seeded. From this Root ſpring up divers large winged Leaves, of a freſher green color than the former, and ſomthing ſmaller than the following third Kind; which are cut in on both ſides into ſeveral parts, but ſmaller, reſembling the diviſions of ſome of the Leaves of*

True Hedg Muſtard.

Dandelion, *or rather, like to* Rocket *Leaves, each part or corner looking downwards, the end diviſion of the Leaf being largeſt, almoſt oval, but ſharp pointed, and unevenly dented upon the edges. From among thoſe Leaves riſe up ſometimes two, ſometimes three Stalks, and ſometimes but one, as is moſt uſual, which is round and about half a Yard high, having on them a pretty many of thoſe like Leaves, but ſmaller; the Stalk or Stalks, ſpread themſelves out into Branches towards the top, from all which come forth very ſmall yellow Flowers, conſiſting of four Leaves apiece; after which follow whitiſh, yellow ſmall Cods or Pods, growing like the former cloſe to the Stalk, making a pretty long Spike, which has alſo Flowers continuing at the top, till the Flowering time is over. Theſe Pods contain within them ſmall yellow Seed; not full out ſo ſharp or ſtrong as the former, yet ſomething quick and biting upon the Tongue.*

V. *The third, or* Broad Leav'd Hedg Muſtard. *Its Root is not ſo long, nor Woody as the firſt is; but it is more Fibrous, an Annual, not abiding above a Year. From this Root ſpring up two, three, or more dark green Leaves, which are winged, pretty large, bigger than either of the former, and divided into ſeveral unequal parts down to the very middle Rib, viz. into three or four ſeveral diviſions, with almoſt equal gaſhes on each ſide, each of which diviſions are ſmall towards the bottom or foot Stalk of the*

Muſtard Hedge broad Leav'd.

Leaf; growing larger as they are higher, but the end diviſion or Leaf is the largeſt of all, which is alſo gaſht ſomewhat deeply on each ſide, and ſharp pointed at the very ends; each ſeveral part of theſe winged Leaves, are unevenly dented about their edges, the leſſer in like manner dented as the greater. The Flowers are ſmall and yellow, conſiſting of four ſmall Leaves apiece: which being paſt away, leave long round Pods ſtanding upright and cloſe to the Stalk like the former, making a Spiked Head like the two firſt, not altogether ſo long, but a little bending withall, the Pods themſelves being a little ſhorter, almoſt like thoſe of Rocket.

VI. *The Places.* The firſt is very frequent thro' all *England* by High-ways, and Hedge and Ditch ſides, and ſometimes on the tops of open Fields: It grows in Gravelly and Stoney Places among Rubbiſh, as alſo upon Earth or Mud-Walls, and in other Untilled places. The ſecond grows in like Places as the firſt as *Matthiolus* ſays, and is very frequently found wild in *Italy*; with us it many times grows in *Gardens: Gerard* ſays, he found it growing at a place by *Chelmsford* in *Eſſex*, called little *Baddow*, and in ſundry other places. The third, is not altogether ſo common as the firſt, but is more rare to be met withall; yet it is ſometimes found,

but

but ſtill in the better Grounds, for which reaſon it grows ſo large.

VII. *The Times.* It Flowers in *June* and *July*, but moſt uſually in the latter Month: and the Seed is ripe in *Auguſt*, or not long after.

VIII. *The Qualities.* The Seed is chiefly in uſe, and is ſaid to be hot and dry in the ſecond Degree: it is like in Taſte to *Garden Creſs*, and is as *Galen* ſays, of a heating Quality, conſiſting of a thin Subſtance, does exceedingly attenuate, and is of a cutting, cleanſing nature. It is Aperitive, Abſterſive, Vulnerary, Pectoral and Alexipharmick.

IX. *The Specification.* It is a ſingular thing againſt Aſthma's, for it not only helps Wheezings, Hoarſneſs, and difficulty of breathing, but alſo is ſaid to reſtore ſuch as have loſt their Voice, and therewith their Spirits almoſt alſo. It is prevalent againſt the Jaundice, Griping of the Guts and Poiſon; gives eaſe in the Gout and Sciatica, and induces the healing of hollow Ulcers, Fiſtula's, running and eating Sores, Cankers in the Mouth and Throat, *&c.*

X. *The Preparations.* You may have herefrom, 1. *A Liquid Juice or Eſſence.* 2. *A Decoction in Water or Wine.* 3. *A ſimple Syrup or Lohoch.* 4. *A Compound Syrup.* 5. *A Pouder of the Seed.* 6. *A Cataplaſm of the Seed.*

The Virtues.

XI. *The Liquid Juice or Eſſence.* They are made of the whole Plant when in Flower. They are very good for ſuch as have the yellow Jaundice, the Plurifie, pains in the Back and Loins, as alſo for Tortions and Gripings in the Belly, and the Colick, or for ſuch as have taken Poiſon; being given inwardly from two Spoonfuls to four, in any proper Vehicle; or given by Clyſter in double that quantity, in a ſufficient quantity of Mutton Broth.

XII. *The Decoction of the whole Plant in Wine or Water.* It has the Virtues of the *Juice* or *Eſſence*, comforts and warms the Stomach and Bowels, and is good to heal Excoriations of the Guts: eſpecially being uſed Clyſter-wiſe. Old running Sores and Ulcers, Fiſtula's and eating Cankers in the Mouth or other parts, being waſhed therewith it induces their healing.

XIII. *The ſimple Syrup or Lohoc of the Juice of the Plant.* It is made with *Hony or Sugar, by gentle boiling them together, and deſpumating the mixture.* It is inciding and cleanſing, and cauſes an Expectoration of Viſcid, or tough, or Salt Flegm from the Stomach and Lungs, making it eaſy to be ſpit forth: and indeed it is a very good thing in moſt Diſeaſes of the Lungs, as Hoarſneſs, Wheez-ing, Vehement Coughs, Aſthma's, or difficulty of Breathing, and ſhortneſs of Breath: as alſo for ſuch as have utterly loſt their Voice, with a kind of ſinking of the Spirits, it being taken every day, four or five times a day or oftener, for ſome reaſonable time.

XIV. *Syrupus de Eryſimo Compoſitus.* The Compound Syrup of Hedg Muſtard. *Take Hedge Muſtard (the whole Plant) freſh gathered when in Flower 6 Handfuls; Leaves of Borage, Cichory, Maiden-Hair, of each 2 Handfuls; of the Cordial Flowers, Roſemary, Betony, of each half a Handful; Raiſons ſtoned, Roots of Elecampane, Colts-foot, Liquorice, of each 2 Ounces; Aniſeeds half an Ounce; Water, Hydromel, of each 2 Pound and half; Juice of Hedge Hyſſop deparated 8 Ounces: Digeſt a whole Day; afterwards Boil in Balneo, preſſing out the Liquor ſtrongly: to 4 Pounds of which Clarified Liquor, add Sugar Candy 4 Pounds and a half, and make them into a Syrup in Balneo according to Art.* It is a very good Pectoral, and cauſes eaſie Expectoration of Viſcid Flegm, or other putrid Matter out of the Lungs, curing moſt Diſeaſes of that *Viſcus*; as Aſthma's, Hoarſeneſs, Wheezing, ſhortneſs of Breath, ſpitting Blood, Ulcers in the Lungs, Vehement Coughs, *&c.* Doſe an Ounce and half or more at a time, twice a Day, either alone, or mixt with ſome proper Vehicle.

XV. *The Pouder of the Seed.* It is held to be a ſpecial remedy againſt Poiſon, being inwardly taken from half a Dram to a Dram or more, mixt with *Hony*, or in *Syrup of Green Ginger*, or of *Citron Peels*; it is alſo prevalent againſt the Colick, and all other inward Pains, and Tortions of the Stomach and Bowels: it provokes Urine and the Terms; gives eaſe in the Strangury, facilitates the Birth, and forces away the After-Birth, given in a Glaſs of White *Port* or *Lisbon* Wine: made into a *Lohoc* with *Hony*, it cauſes eaſie expectoration of cold pituitous or corupt Matter, out of the Breſt and Lungs, is prevalent againſt Coughs, Catarrhs, Aſthma's, and other like Diſtempers of thoſe parts, and has all the Virtues of the *Juice*, *Eſſence*, *Decotion* and *Syrup*, aforegoing.

XVI. *The Cataplaſm.* It is made of the *Seed bruiſed and mixed with Honey.* Applyed, it is ſingular good for pains, in the Hips, or Huckle Bones, called the *Sciatica*, the Gout, and all other pains of the Joints; as alſo for Fiſtula's, hollow Ulcers, running Sores, and eating Cankers, in Mouth or Throat, or behind the Ears, as alſo for the hardneſs or ſwellings of Womens Breaſts, or in the Teſticles or Stones.

CHAP. DXIII.

Of MUSTARD Treacle; OR, Mithridate MUSTARD.

I. *THE Names.* It is called in *Greek*, Θλάσπι, ἢ θλάσπη, *Thlaſpi*, *& Thlaſpe*, *quod fructus quaſi infractus*: & θλασπίδιον, *Thlaſpidion*, *quaſi fructum Clypeatum*: alſo Σίναπι ἄγριον, *Sinapi agreſte*: in *Latine*, *Thlaſpi* alſo: yet ſome do call it *Capſella*; *Scandulaceum*; *Naſturtium Tectorum*; *& Sinapi ruſticum*: In *Engliſh*, *Treacle Muſtard, and Mithridate Muſtard*, becauſe the Seed hereof is uſed to be put in *Treacle* or *Mithridate*.

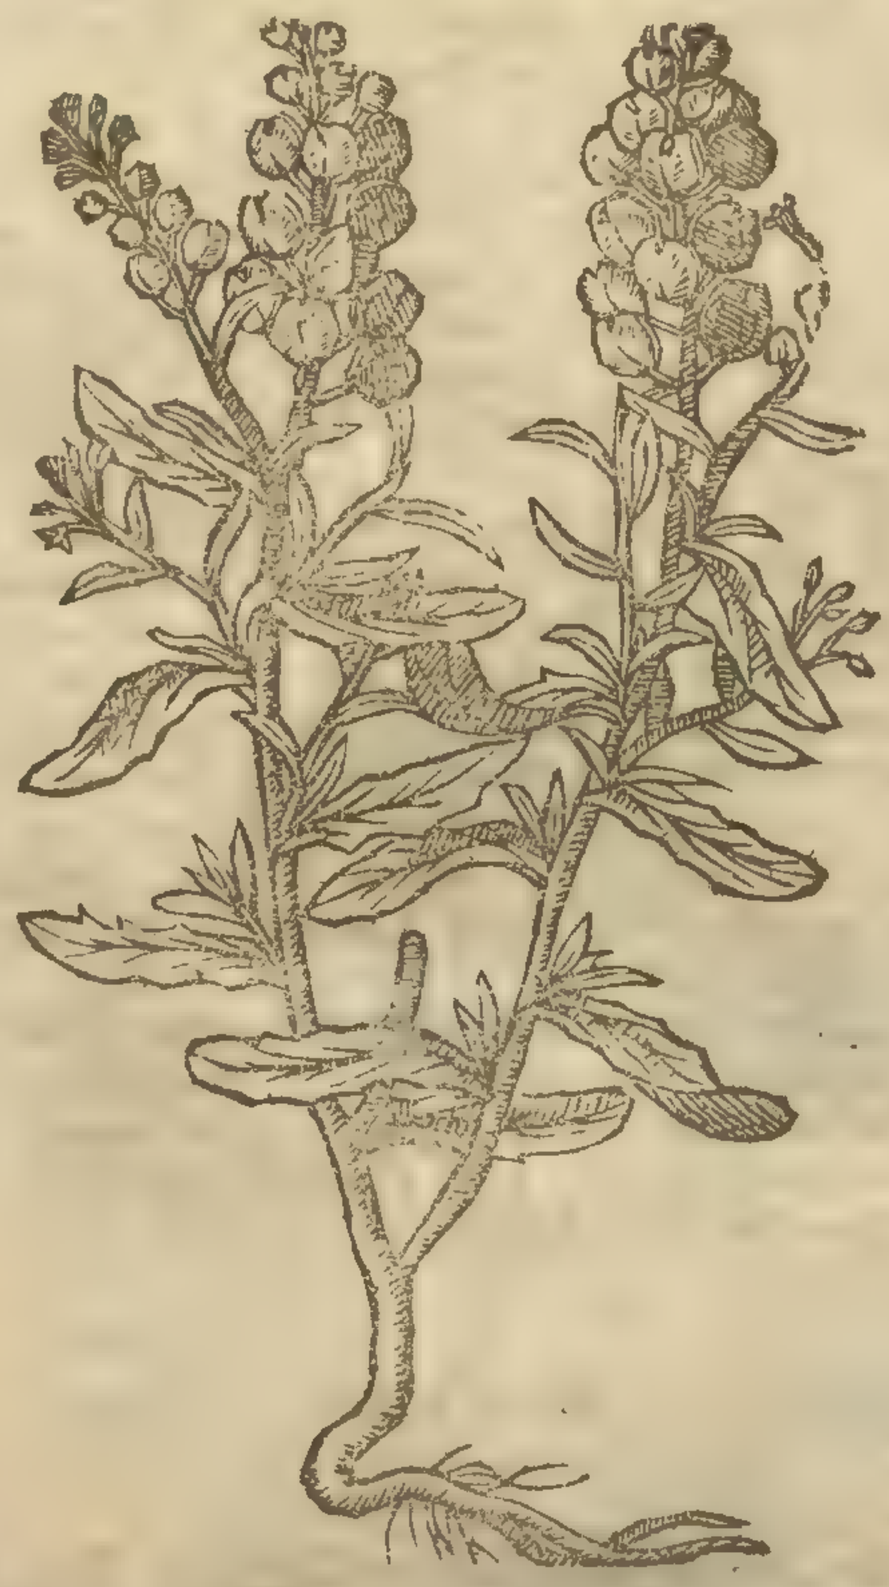
II. *The Kinds.* There are at leaſt Nine Generick or Principal Kinds of this Plant, as, *Thlaſpi arvenſe*, the Field Kind: *Umbellatum*, the Umbelliferous: *Creticum*, the Candy Tufts: *Montanum*, the Mountain: *Clypeatum*, the Buckler-like: *Fruticoſum*, the Shrubby: *Exoticum*, the Strange: *Dra-*

ba, vel Arabis, the Arabian: And *Turritis vel Turrita*, the Towering. Each of theſe diverſifie themſelves again, into ſeveral other Species; ſo that of them all, or in the whole, there are *about threeſcore ſeveral Kinds*. But whereas the greateſt part of them are unknown to us, and neither grow in the compaſs of our *Britiſh Iſlands*, nor yet in our Plantations abroad in the *Weſt-Indies*, We ſhall prætermit the greater part of them, and only Deſcribe ſuch as grow either Wild in our Fields and by Ways: or in the *Gardens* of our Country and Plantations, and are daily uſed in Phyſick, which are theſe following, *viz.* 1. *Thlaſpi Drabæ folio Lobelij*; *Scorodo-Thlaſpi Dodonæi & Dalechampij*; *Thlaſpi ſecundum Matthioli*; *Platycarpon Camerarij*; *Thlaſpi arvenſe ſiliquis latis Bauhini*, Treacle Muſtard with broad flat Pouches. 2. *Thlaſpi Majus Tabernæmontani*; *Thlaſpi arvenſe Acetoſa lato lævique folio Gerardi & Bauhini*, The greater Treacle Muſtard. 3. *Thlaſpi Vaccariæ folio Vulgatiſimum*, *Thlaſpi Mithridaticum*, *Thlaſpi primum Matthioli*, *Thlaſpi Vulgatum Bauhini*; *Thlaſpi verum cujus ſemine utimur in Theriaca Camerarij*; *Thlaſpi Cardaminoides Cordi*; *Thlaſpi Vulgatum & Thlaſpidion Vulgare Tragi*; *Thlaſpi arvenſe incano ſolio majus Bauhini*; The greater Mithridate Muſtard. 4. *Thlaſpi minus*, *& Thlaſpi minus Vaccariæ ſolio*, *Thlaſpi Theriacum vel Mithridaticum minus*, the leſſer Mithridate or Treacle Mudſtard, French Treacle Muſtard. 5. *Thlaſpi arvenſe perfoliatum majus Bauhini*; *Thlaſpi primum Dalechampij*, *Thlaſpi oleraceum Tabernæmontani* (becauſe it is almoſt without Taſte) *Thlaſpi alterum burſæ paſtoris fructu Columnæ*, the greater Treacle Muſtard with Throughwax Leaves. 6. *Thlaſpi Americanum*, *Thlaſpi Spanoſpermon Americanum Cortuſi* (as he calls it in his Hiſtory of *Canada*) American Thlaſpi bearinglittle Seed, or rarely bearing Seed. 7. *Thlaſpi Creticum flore albo & Purpureo*, Candy Tufts with white and purple Flowers. 8. *Thlaſpi Bæticum Marinum*, Spaniſh Tufts. 9. *Thlaſpi Creticum album umbellatum majus*; the great white Candy Treacle Muſtard. 10. *Thlaſpi Hederaceum*, Ivy Leav'd Treacle Muſtard. 11. *Turritis ſive Turrita Lobelij*; *Turritis Vulgatior Cluſij*, Common Towers Muſtard, or Towering Muſtard. 12. Δεάβη, ἢ Ἄρεβις, *Draba, & Arabis*, *Naſturtium Orientale*, *Draba vulgaris*, *Draba Umbellata Bauhini*, Arabian Muſtard, or Turkey Creſs.

The Deſcriptions.

III. *The firſt, or* Treacle Muſtard with broad flat Pouches. *It has a ſmall and Fibrous Root, which periſhes every Year, from which riſes up a hard round Stalk, about a Foot more or leſs high, which then is parted or ſpread out in ſome Branches, which are long and brittle, having ſeveral ſoft green Leaves, ſomewhat long and narrow, ſet thereon, waved but not cut in on the edges, broadeſt towards the ends, and ſomewhat round pointed.* The Flowers *grow at the tops of the Branches one above another Spike faſhion, after which come large round Pouches, parted in the middle with a Furrow, having one blackiſh brown Seed on either ſide, ſomewhat thicker and larger than in any of the other* Thlaſpies, *ſharp in Taſte, and ſmelling ſomething like* Garlick, *eſpecially that which grows in the Fields, where it is natural; but that which is nurſt up in* Gardens *is*

Treacle Muſtard Common.



leſs acute in its Taſte, and not of ſo Garlick *like ſcent.*

IV. *The ſecond, or* Greater Treacle Muſtard. *It has a Root long and Fibrous like the former, from whence riſe up ſeveral pretty large Leaves,*

Greater Treacle Muſtard.

pointed

pointed at the ends, and unevenly waved, and sometimes dented unequally about the edges, which are larger, smoother, and broader than the first; Those which grow upon the Stalks, or Branches, are longer, narrower, sharper pointed, and come from the Stalks at the Joints without any foot Stalk, having at their lower end two sharp points, and divided into two parts, not much unlike to the Narrow Leav'd Arrow-Head; *It rises up with one or more Stalks about* 3 *Feet high, on which grow the said smaller Leaves, with the Flowers on the tops of the said Stalks or Branches, in long Spiked Heads, growing one above another, small, and of a whitish color: The Seed Vessels are round, containing brownish Seed: the whole Plant is of a strong unpleasant Taste and Smell.*

V. *The third, or* the Greater Mithridate Mustard. *Its Root perishes after Seed time, but abides the first* Winter *after Springing. This grows higher than the first, spreading more, and having longer Branches: its Leaves are also smaller and narrower, and sometimes unevenly dented about the edges. The Flowers are small and white, and growing on long Branches, with much smaller and rounder Seed Vessels after them, and parted in the middle,*

Mithridate Mustard Greater.

in the same manner, with the said first Kind, and containing within them smaller brown Seeds, which are much sharper in Taste, than the Seed of the said first described.

VI. *The fourth, or* Lesser Mithridate or Treacle Mustard. *Its Root is a little long, and Fibrous towards its lower part; from whence spring up several sharp pointed Leaves, which are long and not very broad, very like to the Leaves of the third Kind, being smooth, and of a dark green color. From among which springs up one Stalk, (seldom any more) about half a Yard high, which is covered up almost to the top with such like Leaves, but that they are lesser, as they grow higher up, unevenly dented upon the edges, and in some places almost like a Saw. Towards the top, the Stalk spreads it self out into many Branches, as four, five, six, seven, or more; each of which are filled and almost covered with such like Leaves, some of them dented in*

Mithridate Mustard Smaller.

on the edges, and some no[illegible] grow shorter and shorter, also very narrow, and very sharp pointed. The Flowers are small and white, and grow one above another, at the tops of the several Branches, making each of them a long Spike: these being past away, the Seed Vessels appear, which are broad at the Head, and not much unlike to those of Shepherds Purse, *but a little larger.*

VII. *The fifth, or* the Greater Treacle Mustard with Throughwax Leaves. *Its Root is long, white, Woody, and Fibrous: From which spring forth Leaves which ly upon the Ground, and are small and somewhat round, like to those of* Basil, *but yet a little cut or notcht on the edges at the bottoms, where they are smallest, and a little dented about the other part, of a grayish green color, every one upon a small foot Stalk, among which rise up a round Stalk or Stalks a Foot high, more or less, purplish at the bottom, and sometimes spotted, on which grow single Leaves at the Joints one above another, at certain distances, which encompass it at the bottom, in the manner of* Thorough-wax Leaves; *and whereat likewise come forth, other smaller Leaves upon short Branches, on which at the tops of the Stalks, stand several small white Flowers, which break forth out of reddish Husks; after which small flat Pouches appear, like unto those of* Shepherds Purse *parted in the middle, as is usual in most of the* Thlaspies, *on each side whereof lie small flat yellowish Seed. The whole Plant is more milde, or less sharp than any of the former. There is another of this sort something lesser, which has a few Leaves lying upon the Ground, of a grayish green color, not much unlike to the* Smaller Mouse Ear; *or to* Codded Through-

Throughwax, *but much lejer: thoſe which grow up higher upon the Stalk, which is ſcarcely a Foot high, and but few ſet thereon, are ſtill ſmaller, pointed at the ends, and broad at the bottoms, encompaſſing it like the laſt: the Flowers are ſmall and white, and the Seed Veſſels flat, and ſomewhat ſharp pointed.*

VIII. *The ſixth, or* American Thlaſpi rarely bearing Seed. *Its Root is hard, with many Fibres adjoining thereto, which taſtes ſharp like* Creſſes. *This Plant Branches from the Root divers ways ſomewhat thick, ſet with fat green Leaves, ſomething long, not very broad, and ſharp pointed, not notched, dented, or waved on the edges: The tops of the Branches or Stalks are without Leaves, but ſtored vaſtly with ſmall yellowiſh Flowers, conſiſting of four Leaves, which endure only one day, falling away for the moſt part, without bearing any Seed, or if any yet very ſparingly: ſo that on the whole Plant, there will ſcarcely be four or five husks of Seed gathered any Year, which are flat and a little long, like thoſe of the* Manured Woad, *in which is contained a ſharp taſted Seed.*

IX. *The ſeventh, or* Candy Tufts, with white and purple Flowers. *Its Root is ſmall and hard, and Periſhes every Year, after giving its Seed. It is but a ſmall Plant, and ſeldom riſes above a Foot and half high, having ſmall, narrow, long, and whitiſh green Leaves, notched or dented with three or four notches on each ſide, from the middle to the point-wards: from among which, riſe up the Stalks, Branched from the Bottom almoſt, into divers ſmall Branches; at the tops whereof ſtand many ſmall Flowers, put thick together in an Umble or Tuft, making them ſeem to be ſmall, round, double Flowers, of many Leaves, when as every Flower is ſingle, and ſtands apart by it ſelf, of a fair white color, in ſome Plants, without any ſpot: and in others, with a purpliſh ſpot in the Center or middle, as if ſome of the middle Leaves were purple. In others again, the whole Flower is purpliſh all over, which appears beautiful in a* Garden. *The Seed is contained in many ſmall and flat Seed Veſſels, which ſtand together in an Umble, as the Flower did: in which are contained, ſomewhat reddiſh Seed, like unto ſome of the other ſorts of* Thlaſpies, *or* Treacle Muſtard.

X. *The eighth, or* Spaniſh Tufts. *The Root of this is much like the former: from whence come Leaves (before any Stalk ſprings up) which are a little toothed or finely dented about the edges: the Stalk is about the height of the former, but ſpreads not it ſelf out ſo much into Branches; but carries an Umble of purpliſh Flowers like unto the former; after which comes the Seed, which is of ſomething a paler yellow color.*

XI. *The ninth, or* Great white Candy Treacle Muſtard. *Its Root is ſmall and Fibrous, and abides many Years, not dying Annually as the others do. From whence ſpring up ſeveral hard and ſmall Stalks, bearing a few long and narrow ſharp pointed ſmooth Leaves, ſet one above another up to the tops, where grow Umbles of white Flowers, in broad round Tufts, ſomewhat larger than in thoſe of the former Kind at* Sect. IX. *aforegoing. The Seed Veſſels are greater alſo, with a Pointel in the middle of them*

XII. *The tenth, or* Ivy Leav'd Treacle Muſtard. *Its Root is ſmall, long, and Fibrous, periſhing every Year: which ſends up many weak, ſlender Stalks, leaning downwards, or rather creeping upon the Ground, ſcarcely raiſing it ſelf above a Span high, or not much higher; theſe Stalks are diſperſedly ſet, with ſmall broad Leaves, thick and ſhort, broad at the bottom, cornered about the middle, and pointed at the end, ſomewhat reſembling* Ivy Leaves. *The Flowers are ſmall and white, growing Spike faſhion at the tops of the Stalks or Branches: which being paſt away, ſmall Seed Veſſels come in their places, which are parted at the ends, and contain ſmall Seed, ſharp and hot like the other* Thlaſpies.

XIII. *The eleventh, or* Common Towers or Towering Muſtard. *Its Root is compoſed of many white Fibres or Strings, abiding after it has given its Seed: but being ſhed, there ſprings up ſeveral Plants before* Winter, *which ſo abide, and Flower and Seed the next* Summer. *This* Common Kind *has many rough hairy Leaves, full of Sap or Juice, of a deep green color, about two Inches long, and and more than one broad, pointed ſharp at the ends, broadeſt in the middle, nothing dented about the edges, lying round about the Head of the Root upon the* Ground. *From among which riſe up, ſeveral rough and hairy Stalks almoſt two Feet high; ſet orderly with ſuch like Leaves, one above another on all ſides, but encompaſſing them at the bottom, which are narrower than the afore deſcribed* Ground Leaves, *longer, or ſharper pointed, broader at their joining to the Stalk, with two round corners. At the tops of the Stalks, which are ſeldom Branched, come forth very many ſmall white Flowers, as it were in a Tuft, together; but Flowering by degrees, the lowermoſt firſt, and ſo gradually upwards, they bring forth long ſlender Pods preſently after, which ſtanding upright, round about the Stalks, before the higheſt Flowers are blown, each whole Stalk ſeems like a Pyramid, or Spire Steeple or Tower, from whence came its Name. In which Cods or Pods are contained, ſmall, brown, and ſharp biting Seed.*

XIV. *The twelfth, or* Arabian Muſtard, or Turkey Creſs. *The more common or known* Arabian Muſtard (*for there are* 8 *or* 9 *Kinds more, all*

Arabian *Muſtard, or* Turky *Creſs.*

Strangers

Strangers to us) has a long, white, creeping Root, with many Fibres adjoining to it, which abides all Winter, *and perishes not: but creeping along under Ground, it sends up in several places many strait Stalks, which are streaked, and set about with grayish green Leaves, somewhat broad, and not very long, a little pointed at the end, and broad at the bottom compassing them; but those which grow at the foot of them have each of them a short foot Stalk, and are all of them unevenly dented about the edges: the tops of the Stalks are spread into some Branches, all of them rising to an equal height, with many small white Flowers set thereon, consisting of four Leaves apiece, and forming a large Umble or Tuft, where after they are past, come forth small round Seed Vessels, divided into two parts, like some of the former* Thlaspies, *with a small Pointel at the end; in each part of which is contained one Seed; which is hot and sharp, as are also the Leaves.*

XV. *The Places.* The first and third have been found growing Wild in several parts of *England*, as half a Mile from *Hatfield* by the Rivers side under an Hedge, as you Travel to *Hatfield*, and in the Street of *Peckham* on *Surry* side. The second and fourth are also Natives of our Land, and have been found growing Wild in several places; these four first Kinds grow Wild in Corn-Fields, upon Ditch Banks, and in Sandy, dry, and Barren Grounds, and in Stony and Untilled places. The first of them *Gerard* says, he found in Corn-Fields between *Croydon* and *Godstone* in *Surry*; at *South-fleet* in *Kent*; and by the Path which leads from *Hornsey* (near *London*) to *Waltham-Cross*, and in many other places. The others he says were also found growing Wild in *England* in several places, which he gathered, and placed in his *Garden*. The fifth, sixth, seventh, eighth, ninth, and Twelfth, grow with us only in *Gardens*, as do also the first four. The tenth, *Lobel* says grows in *Portland*, and about *Plimouth*, and upon other Rocky places, on the Sea Coasts of *England*. This says *Johnson*, is a little creeping Herb, having small, red, crested Stalks, about a Span high; its Leaves are thick, and fashioned like *Ivy*; and the white Flowers and small Seeds do in shape and taste resemble the *Thlaspies*. The eleventh, delights to grow more in the open Sun upon Hilly Grounds: it has been found growing in the West of *England*, upon Dunghills and such like places: *Gerard* says, he found it by the City Walls of *West-Chester*: also in a *Flax Ground* near *Cambridge*: and at *Pyms* near *Edmondton*, not far from *London*.

XVI. *The Times.* They most of them Flower from *May*, through *June* and *July* to *August*, and their Seed is ripe about a Month after. The seventh, eighth, ninth, and tenth, Flower about the end of *June* or beginning of *July*; and their Seed is ripe not long after. The eleventh Flowers for the most part early, sometimes in *April*, but usually in *May*, and the Seed is ripe in *June*. The twelfth Flowers about the end of *May*, through *June* and *July*, its Seed ripening in the mean Season.

XVII. *The Qualities.* *Treacle Mustard* (the four first Kinds are chiefly used, and of them the third Species is principal, and that which is always used in *Venice Treacle* and *Mithridate*) is hot and dry in the end of the third Degree, or beginning of the fourth: *Parkinson* determins it to be absolutely hot in the fourth Degree, and near unto *Cresses*. It is Attenuating, Attractive, Aperitive, Absterfive, Inciding, Cosmetick, Carminative, Digestive, Diuretick, Stomatick, Neurotick, Nephritick, Hysterick, and Alexipharmick; for that its Seed is an Ingredient in *Mithridate*, and *Treacle* as aforesaid, being of it self an Antidote resisting Poison, Venom, and putrifaction, where, by its sharpness it acuates those Compositions.

XVIII. *The Specification.* It provokes the Terms powerfully, and facilitates the Birth of Women in Labor, and expells the After-Birth. And has all the other Specifick properties of *Common Mustard Seed*, which see in *Chap.* 511.

XIX. *The Preparations* and *Virtues*, are the same also with those of the *Common Mustard Seed*, in the aforecited *Chap.* 511. to which you are referred, but it is thought that the *Treacle Mustard* is the weaker (if any difference is) of the two.

XX. *Nota.* 1. *The Pouder of the Seed*, given to a Dram or more, forcibly brings down the Terms in Women, and causes Miscarriage, for which cause Women with Child ought to forbear it. 2. *A Clyster made of it with Mutton Broth*, and Exhibited, gives ease in the Sciatica. so also, 3. *A Cataplasm of it* applyed to the Hip or Huckle Bone, draws out the Humor, and eases the Pain. 4. *The Arabian Mustard* is as hot and sharp as any of the *Thlaspies*, and is effectual to the same purposes, and according to *Dioscorides*, is used instead of *Pepper* to be put among Broths and Meats. 5. *The Ptisane made of its Seed* is available to cut tough Flegm, which stuffs up the Brest and Lungs, and cause an easie Expectoration thereof.

CHAP. DXIV.

Of the MYRTILL.

I. *THE Names.* It is called by the *Arabians*, *As*, *Aes*, *& Alas*: in *Greek*, Μυρσίνη, ἡ μυρρίνη: *Pena* says, *sic vocatum volunt, propter æmulam Myrrhæ odoris gratiam, in ejus baccis recentibus*: others *à Myrsine Atheniensi puella amica Palladis.* Also Μύρτος ἀπὸ μυρσίνης, *ab odore Myrrhæ*; *vel* ἀπὸ μυρῶν, *redolens*: in *Latine*, *Myrtillus*, *Myrsine*, *& Myrtus*: in *English*, the *Myrtle*.

II. *The Kinds.* There is the *Myrtle Tree* or *Shrub*, of a considerable Magnitude, of which we shall not treat in this Chapter, but refer you to the proper place, in the second Book of this Work. What we shall discourse of here, is a small bushy Plant, scarcely removed from the degree of an Herb, and is called *Myrtus Nobilis*, also *Myrtillus*, from the smallness of the Plant being compared with the *Myrtus Arbor*: This also is an Inhabitant of our *Gardens*, for which reason we give it a Place here. There are two Kinds of it, *viz.* 1. *Myrtus minor Tarentina. Myrtus minor vulgaris Lobelij*, *Myrtus Nobilis prima*, *Myrtillus Nobilis primus*, *Myrtus minor acuto folio*, *Myrtillus Nobilis acuto folio*, The prime Noble Myrtle, or small sharp pointed Myrtle. 2. *Myrtus minor folio rotundiore*, *Myrtillus Nobilis alter*, The other Noble Myrtle, or small roundish or BoxLeav'd Myrtle.

The Descriptions.

III. *The first, or* Prime Noble Myrtle, or sharp pointed Myrtle. *It has a Branched Woody Root, spread*

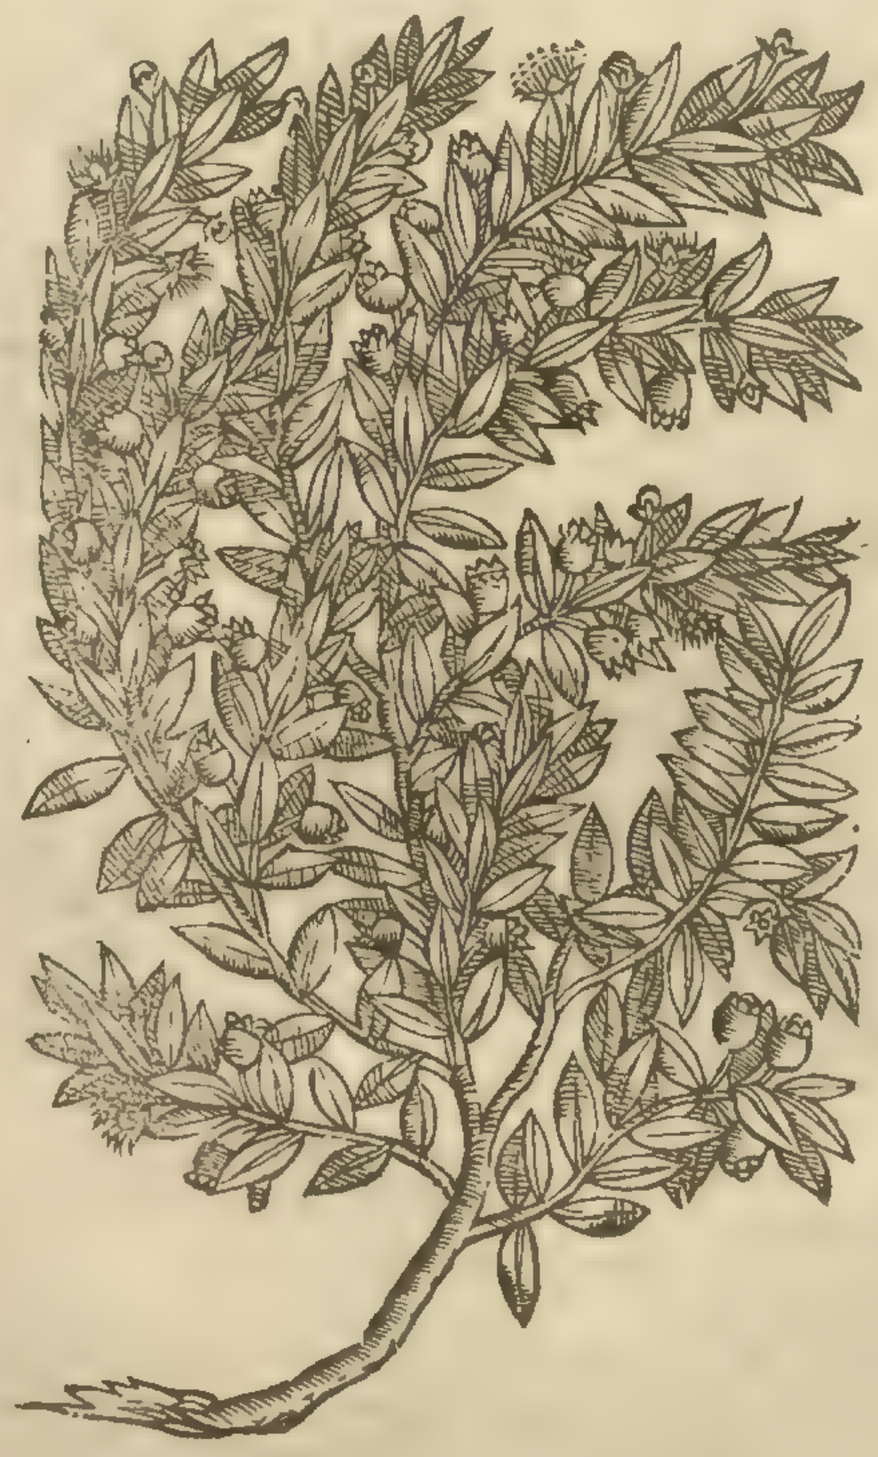
ſpread out into many Arms, with ſeveral Fibres adjoining to them. It is a little low buſhy Plant riſing up to be two or three Feet high, which ſpreads it ſelf out into many Branches from the main Stalk, whereby it looks like a ſmall Buſh; every Arm or Branch, and Twig of which, are thick ſet with ſmall, fine and green, narrow, ſhining Leaves, with ſmooth edges, and a little ſharp pointed at the ends,

Myrtle Noble Common.

very much in ſhape reſembling the Leaves *of* Marum or Herb Maſtick, *but of a little deeper, or freſher green color, which abide green* Summer *and* Winter, *even through the whole Year, as all the ſorts of* Myrtles *do, which is of a very ſweet and odoriferous Smell, very much gratifying that Sence, for which reaſon it is called* Myrtillus Nobilis, *The* Noble *or* Excellent Myrtle. *The Flowers are white, and very ſweet alſo, not differing in form, from the Flowers of other* Myrtles, *but grow not plentifully on the Branches, in our Country, by reaſon of the coldneſs of our Climate: The Flowers being paſt away ſmall Berries ſucceed, which when ripe, are in warmer Climates of a black color, but ſeldom come to perfection in our Country, by reaſon of the coldneſs thereof, how well ſoever Houſed or defended.*

IV. *The ſecond, or other* Noble Myrtle, *or* Box Leav'd Myrtle. *This grows in its Roots, Stalks, Branches, and in all other points like the former; in reſpect to its magnitude, placing of its Leaves, deep greenneſs of their color, thick growing of the Branches, and thick ſetting of the Leaves thereon, that it might be thought, by the looker on, to be the ſame with the former, without good heed to, and obſervation thereof, by comparing the one with the other; but the Leaves of this are a little broader, and ſomewhat rounder at the ends, not very much*

Myrtle Noble Box-Leav'd.



unlike to the ſmalleſt Leaves, of the ſmalleſt ſort of Box, *now called* Dutch Box; *by which alone, it appears to be a differing* Kind *from the former, and in nothing elſe. The Flowers are like the firſt, and grow as ſparingly, and the ſweet Smell, and beautiful Aſpect of the Plant, are full as much and pleaſant, and altogether the ſame with that juſt before deſcribed.*

V. *The Places.* Theſe *Myrtles* grow naturally in *Spain, Portugal, Italy,* and other hot Countries in great abundance. Theſe here with us are Nurſt up in *Gardens*; or put into Pots, which may be removed into Houſes, and ſo taken care of, that as ſoon as cold Weather begins to come, they may be ſheltered from the ſame. They are a pleaſant delightful Plant, and great Ornaments to a *Garden*, as being among the Number of the moſt deſirable *Ever-Greens.*

VI. *The Times.* In their native places, they Flower in *May* and *June*; and their Fruit or Berries are ripe in *September*; but with us, they Flower not untill *Auguſt* at ſooneſt; which is the reaſon that they ſeldom or never bear Fruit in *England.*

VII. *The Qualities.* The *Noble Myrtle* is hot and dry in the beginning of the ſecond Degree; and of fine, thin, and Volatile parts, as well as Earthy. It is Abſterſive, Aſtringent, Diuretick and Vulnerary: Pectoral, Nephritick, Hyſterick and Alexipharmick.

VIII. *The Specification.* It reſiſts Poiſon, ſtops the Terms and Whites in Women, provokes Urine, gives eaſe in the Strangury, Stops all ſorts of Fluxes of the Bowels, and heals Wounds and Ulcers.

IX. *The Preparations.* You may have from the Leaves or Fruit, or both, 1. *A Liquid Juice.* 2. *An Inſpiſſate Juice.* 3. *A Decoction in Wine.* 4. *A Decoction in Water.* 5. *A Syrup.* 6. *A*

6. *A Pouder of the Leaves or Fruit.* 7. *A Lotion.* 8. *Myrtidanum.* 9. *A Decocted Oil.* 10. *A Balsam.* 11. *A Syrup Compound.* 12. *A Compound Oil.*

The Virtues.

X. *The Liquid Juice or Essence.* They stop all effusions of Blood in what part soever, whether inward or outward both in Men and Women. They stop Catarrhs, and the most vehement Coughs, and are good to heal Exulcerations in the Lungs. They stop spitting or pissing of Blood, the Bloody Flux, and all other Fluxes of the Bowels, and are incomparable Medicaments against the Whites, as also the overflowing of the Terms in Women. Drank in Wine they resist Poison, the Bitings of Venomous creatures, and the malignity of *Mushrooms*, and cause a sweet Breath, where it is fœtid or stinking. Dose 1, 2, or 3 Spoonfuls Morning and Night in a Glass of Red *Port* Wine.

XI. *The Inspissate Juice.* It has all the Vittues of the former, and may be given Morning and Night, from 1 Dram to 3 Drams in a Glass of Generous Red Wine, Mull'd and sweetned with white Sugar. It is a most excellent thing for the Cure of a *Gonorrhœa*, whether simple or virulent, Universals being first premised: for it not only stops the *Gonorrhœa*, but also strengthens the parts, tho' they have been much weakned through the long continuance of the Disease.

XII. *The Decoction in Wine.* It has all the Virtues of the *Essence* and *Juice*, whether *Liquid* or *Inspissate*. It cures a stinking Breath, resists and expels Poison, is good against the Palpitation and Passions of the Heart, the Bitings of Serpents, Mad-Dogs, and other Venomous Creatures, and heals Ulcers of the Reins, Ureters, and Bladder; bathed very hot upon the Nerves, Tendons, and Joints, it takes away their weaknesses, and admirably strengthens them. And so it helps to consolidate broken Bones; and restore Srength to Joynts that have been dislocated. *A Decoction of the Berries* cures a Scald or Scabby Head, and cleanses it from Scurff and Morphew, being often washed therewith: it also keeps the Hair from falling, and makes it of a black color: and being daily drank, it is said to cure Ruptures or burstenness.

XIII. *The Decoction in Water.* It is good for any one to sit in, who are troubled with the falling down of the Fundament, as also for Women to sit in, who are afflicted with the falling down of the Womb. It makes also an excellent Injection to cast up the Womb with a Womb Spring, 2, 3, or 4 times a Day, to stop and cure the overflowing of the Whites, it cleanses and very much strengthens the parts.

XIV. *The Syrup made of the green Leaves, or Juice, or of the Fruit.* It is a most excellent thing against spitting or pissing of Blood, exulcerations of the Lungs, and other Bowels, Ulcers of the Reins, and Neck of the Bladder: stops the most vehement Coughs and Catarrhs, and after Universals, prevails against the most obdurate Asthma's, causing an easie expectoration of the Morbid Matter: and being constantly taken for some considerable time, it is said to consolidate Ruptures in Children. Dose is 2 or 3 Spoonfuls Morning, Noon and Night, in a Glass of Red *Port* or *Barcelona* Wine; or alone, drinking a Glass of the same Wine after it, but in a Vehement Cough, the Patient must be often taking of it, or licking it, even as often as the Cough is violent upon them, or troubles them.

XV. *The Pouder of the Leaves or Fruit.* It may be given in a Glass of Red *Port* or *Barcelona* Wine, or in the former *Syrup*, either with the *Syrup* alone, or mixt with any of those Wines, Morning and Night from 2 Scruples to a Dram and half, or more, for all the purposes and Intentions for which the *Essence*, *Juices Liquid or Inspissate*, *Decoction* or *Syrup* are given for; tho' I do not think it to be of equal power with the *Juices* or *Essence*. Strewed upon bleeding Wounds it stops their bleeding: and put upon old rotten or putrid Sores and Ulcers, it destroys the putridity, cleanses them, incarnates, drys and induces their healing. Put upon a Whitlow, or Fellon, which is laid open, it cures them. And applyed to the Groyns, Privy parts, and Armpits which stink, or are affected with a stinking Sweat, it drys them, and takes away the ill Smell.

XVI. *The Lotion. Take of Red Port Wine a Quart; of the Inspissate Juice 2 Ounces; or for want of it, of the Liquid Juice 6 Ounces; of the Syrup 3 Ounces; Pouder of Roch Alum, half an Ounce; mix and dissolve.* It is good against moist, running, and fretting Sores and Ulcers in any part of the Body; and indeed it has been found by experience to cure all Ulcers which are hard and difficult to be healed; it is profitable against Blains, and Wheals and other breakings out in the Skin: as also to Foment hot withall in the falling down of the Fundament; it heals Whitlows and Fellons on the Fingers ends, and Ulcerated Kibes in Childrens Feet: it heals all sorts of Ulcers in the Mouth, Throat, and Private parts: and put into the Eyes takes away their Inflamation, Watering and Sorenes, and clears the Eye Sight, taking away any Cloud or Film, which is beginning to grow over them.

XVII. *Myrtidanum.* This *Pliny lib.* 14. *cap.* 18. *lib.* 15. *cap.* 29. *& lib.* 22. *cap.* 9. makes to be a *Myrtle Wine*, or *Wine of Myrtle Berries*; which according to him has almost all the Virtues ascribed to all the former Preparations: It may be made of the Leaves as well as of the Fruit, by beating the green Leaves in a Wooden Mortar, then adding Red Wine in a sufficient quantity, and therewith they press out the *Juice*, and so make a Wine thereof by a gentle Fermentation: But new Wine ought to be chosen, *viz.* that which is new pressed from the Grape called *Must*, and is yet unfermented. If it is made of the Berries only, they ought to be thorough ripe: and so they ought to be if the Leaves be joyned with them.

XVIII. *Myrtidanum Apophyas*, The Excrescence growing upon the *Myrtle*. It is often found upon old *Myrtles*. It has all the Virtues of the *Myrtle* and *Myrtle Berries*; and is said to be of greater force to dry, bind, stop Coughs, Bleeding, Fluxes, *&c.* than either the *Leaf*, *Juice*, *Essence*, *Pouder*, or *Berries* of the *Myrtle:* And you may make thereof all the aforegoing Preparations, and give them in like manner, for all the same intentions and purposes.

XIX. *The Decocted Oil.* It is good to discuss and give ease to the Hemorrhoids or Piles, being anointed thereon; it discusses also Swelling in the Testicles, as also Tumors in other parts of the Body, and is good to heal Wheals, Boils, Pimples, and other breakings out in the Skin, and gives ease to the Gout, and other pains of the Nerves and Joints.

XX. *The Balsam.* It heals simple Green Wounds at a few times dressing; cleanses old putrid Ulcers, incarnates, drys and induces their healing. Ap-

plyed

plyed to the Gout, it gives eaſe in a ſhort time, and in ſome reaſonable time after cures it: It is alſo good to cure Punctures or Wounds of the Nerves and Tendons, being applyed very hot to them according to Art.

XXI. *The Compound Syrup. Take Myrtle Berries 2 Ounces and half; Sanders white and red, Sumach, Balauſtian, Barberries, of each an Ounce and half: Medlers cut half a Pound: bruiſe and boil all in fair Water 8 Pounds, till half is conſumed; then ſtrain out, and add Juice of Quinces, Juice of four Pomgranets, of each 6 Ounces: and with white Sugar 4 Pounds, boil them into a Syrup, adding the Juices towards the end.* It is good againſt all ſorts of Fluxes of the Bowels and Hemorrhages, chiefly Spitting of Blood: it is cooling, binding and ſtrengthning, reſiſts Vomiting and Nauſeouſneſs, comforts and ſtrengthens the Stomach, and is profitable againſt a Catarrh and an old Cough; it is ſaid to cure Ruptures and ſtop the Whites in Women. Doſe 2 Spoonfuls.

XXII. *The Compound Oil. Take Myrtle Berries well bruiſed a Pound: ſharp Wine a Pint: Juice of Quinces, and Juice of Mint, of each a quarter of a Pound: Oil Omphacine 4 Pounds: mix them well and ſet all in the hot Sun, or in an equivalent Sand heat for a Week, then boil and preſs out the Berries; and repeat this Operation twice more with freſh Berries, inſolating, boiling and preſſing out as before, and then keep it for uſe.* It admirably ſtrengthens weak Limbs and Joints, faſtens looſe Gums and Teeth; and anointed on the Temples, Cheeks, Jaws, and Gums, gives eaſe in the Tooth-ach: The Hair of the Head being Shaved off, and this *Oil* being anointed thereon, it faſtens the Roots of the Hair, and hinders the ſhedding thereof: it ſtrengthens the Nerves, Brain, Stomach and Joints, ſtays Vomiting, and ſtops Fluxes, being anointed on the Stomach and Belly, and uſed Clyſterwiſe.

NAILE-WORT, *ſee* Whitlow-Graſs. *Chap.*

CHAP. DXV.

Of NAVEL-WORT; *OR,* PENNY-WORT.

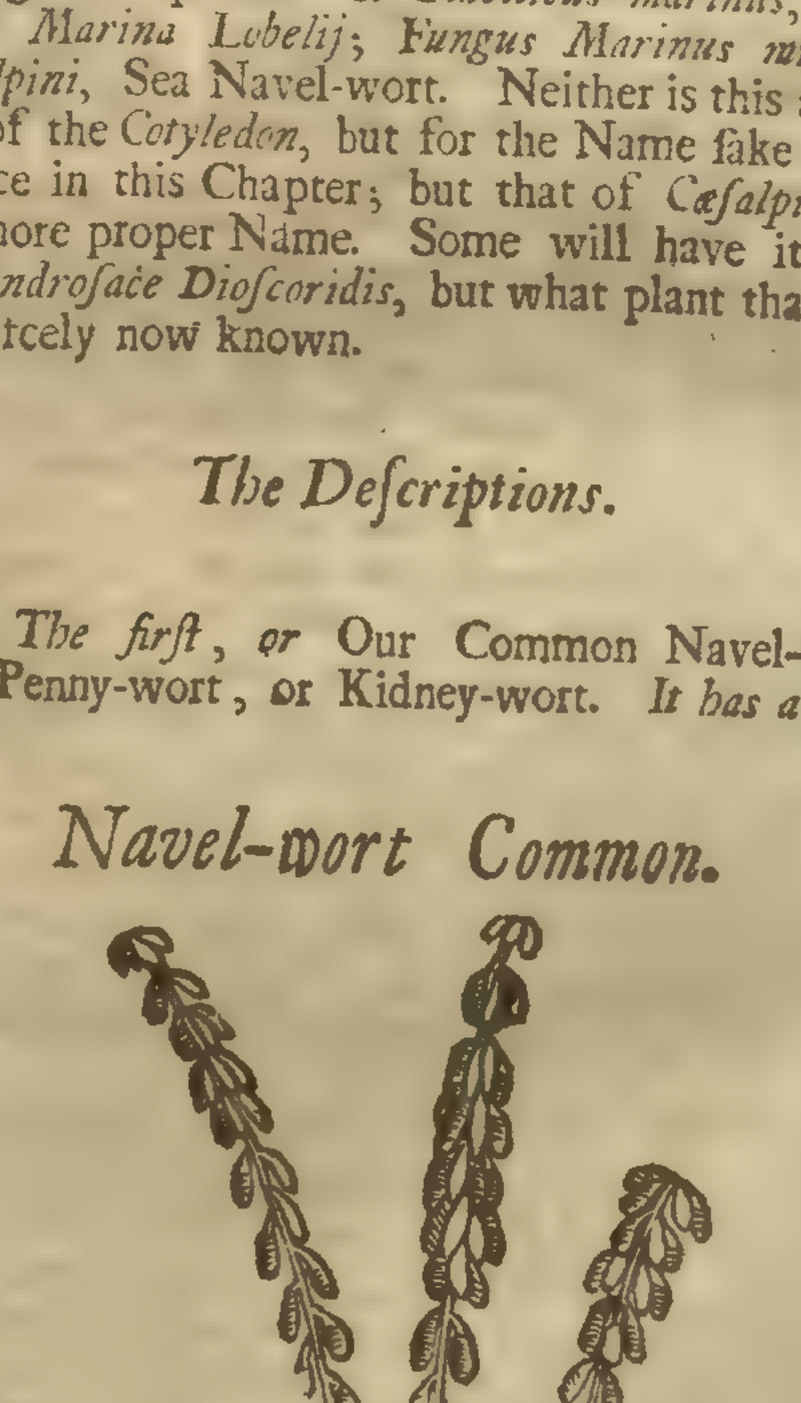
I. *THE Names.* It is called in *Greek*, Κοτυλεδών, *Cotyledon, ab Acetabuli ſive Umbilici figura:* in *Latine, Umbilicus Veneris, Acetabulum, Cotyledon, Scatum Cœli, Scutellum, Terræ Umbilicus, Hortus Veneris, Herba Coxendicum*; in *Engliſh, Navel-wort, Penny-wort, Kidney-wort, Hip-wort*, and *Venus Navel.*

II. *The Kinds.* This Plant ſeems to be a Species or ſort of *Sedum*, or *Houſleek*: and thereof Authors have given us many Kinds, ſome of which, becauſe they are total ſtrangers in our Country, we ſhall pretermit, and deſcribe to you only theſe following, which are found to grow either Wild, or elſe Nurſt up in our *Gardens.* 1. *Umbilicus Veneris vulgaris, Cotyledon, Terræ Umbilicus, Scutellum, Hortus Veneris*, our Common Navel-wort, Wall Penny-wort, or Kidney-wort. 2. *Cotyledon altera Matthioli; Umbilicus Veneris alter*, Spotted Navel-wort. 3. *Cotyledon altera minor folio ſubrotundo; Cotyledon minor Montana altera*, ſmall Navel-wort, with roundiſh Leaves. 4 *Cotyledon altera Floribus verſicoloribus*, ſmall Navel-wort with party color'd Flowers. 5. *Cotyledon ſeu Sedum latifolium ſerratum guttato flore; Sedum Montanum, vel Sedum ſeratum Flore rubente Maculato*, ſpotted Navel-wort with Saw-like broad Leaves, The Princes Feather. To theſe may be added, 6. *Cotyledon paluſtris*, Water Navel-Wort or Penny-wort. *Columna* and *Bauhine* refer this to the *Ranunculi* or Crowfeet, for it has no affinity with the *Cotyledons*, but only in the roundneſs of the Leaf; the former of them call it *Ranunculus aquaticus Umbilicato folio:* and the latter *Ranunculus aquaticus Cotyledonis folio*; in the North of *England* they call it *White Rot:* and in *Norfolk*, *Flock-wort.* 7. *Umbilicus Veneris Officinarum Loniceri; Cotyledon hederaceo folio, Cymbalaria hederacea Lobelij; Cymbalaris, Cymbalaria, Linaria hederæ folio Columnæ*, Ivy Leav'd Navel-wort, or Ivy-wort; this is likewiſe no more a *Cotyledon* than the former, but *Gerard* has placed it among the Species. 8. *Umbilicus marinus, Cotyledon Marina Lobelij; Fungus Marinus minimus Cæſalpini*, Sea Navel-wort. Neither is this a Species of the *Cotyledon*, but for the Name ſake it has a place in this Chapter; but that of *Cæſalpinus* is the more proper Name. Some will have it to be the *Androſace Dioſcoridis*, but what plant that was, is ſcarcely now known.

The Deſcriptions.

III. *The firſt, or* Our Common Navel-wort, Wall Penny-wort, or Kidney-wort. *It has a Root*

Navel-wort Common.



which

which is round, ſomething like unto the ſalt Root of an Orchis *or* Dog Stone, *moſt uſually ſmooth, but ſometimes rugged or knobbed, grayiſh without, and white within, having a great many ſmall Fibres, (not at the bottom of the Root, but) at the top of the Root, or foot of the Stalk, more reſembling the Root of an* Orchis *than the Root of an* Houſleek. *This* Our great Navel-wort, *has many thick, flat, and round Leaves growing from the Root, every one having a long foot Stalk, faſtned underneath, about the middle thereof, ſometimes a little unevenly waved about the edges, of a pale green color, and ſomtimes hollow on the upper ſide like a Spoon or Sawcer; from among which riſe up, one or more tender, ſmooth, hollow Stalks, half a Foot high, with two or three ſmall Leaves thereon, not uſually round, as thoſe below, but ſomething long, and divided at the edges: the tops are ſometimes divided into long Branches, bearing a great number of Pendulous Flowers, ſet round about a long Spike, one above another, which are hollow and like a little Bell, of a whitiſh green color. After which come ſmall Heads, containing very ſmall browniſh Seed, which falling on the Ground, will plentifully Spring up before* Winter, *if the Seaſon is moiſt.*

IV. *The ſecond, or* Spotted Navel-wort. *Its Root is ſmall, long, and thready, ſhooting out ſuch Heads of Leaves as are under deſcribed, which abide all the* Winter, *thoſe bearing Flowers periſhing. This* Spotted Navel-wort *(as many call it) has many thick ſmall Leaves, not ſo broad as long, of a whitiſh green color, lying on the Ground in Circles, after the manner of the Heads of* Houſleek, *and finely dented about the edges. From the middle whereof ſometimes (for it does not Flower every Year in many places) riſes up a Stalk nearly a Foot high, beſet with ſuch like Leaves as are below, but ſomewhat longer. From the middle of the Stalk up to the top, it Branches forth variouſly, with a Leaf at every Joint, bearing three or four Flowers at every Branch, conſiſting of five white Leaves, ſpotted with ſmall red Spots; like unto the* Spotted Sanicle, *but with fewer and greater Spots, having a yellowiſh Circle or Eye in the bottom of every Flower, and many whitiſh Threads, with yellowiſh tips in it. The Seed is ſmall and black, contained in round Heads.*

V. *The third, or* ſmall Navel-wort, with roundiſh Leaves. *Its Root is ſmall and Fibrous like the former, ſending forth Heads of the like Leaves, as thoſe of the other Head round about it. This ſmall* Navel-wort *has much rounder and ſmaller Leaves in the Heads than the former, not ſo big as the Nail of ones* Thumb, *and of as pale a green color, or more white, and finely dented about the edges, in the ſame manner; of an aſtringent Taſte like the other* Houſleeks. *From the middle of ſome of the Heads, Yearly riſe up, ſlender, hard, rough Stalks, about an hand length high, ſet with a few ſmaller, and longer Leaves thereon: at the tops whereof appear ſmall Flowers upon long foot Stalks, conſiſting of five and ſometimes ſix Leaves apiece; ſometimes wholly white, and ſometimes ſpotted with red Spots; and ſometimes having three purple Lines, running down the back of every Leaf, ſo that it makes the whole Leaf ſeem of a purpliſh color, which being paſt away, ſmall Heads follow, containing within them ſmall Seed.*

VI. *The fourth, or* Small Navel-wort with particolored Flowers. *This has a Root like the laſt, and grows in like manner with many Heads of ſmall Leaves circlewiſe as that does, of which this is a peculiar ſort, greater than the ſmaller* Cotyledons, *or ſmaller than the greateſt: each of which Leaves is ſomething long and narrow, of a whitiſh green color, dented as it were about the edges; or rather ſet with Silver white Spots about their Brims, making them ſeem like unto white Teeth, (or as Gefner compares them, to the Silver like Finns of Fiſhes) very pleaſant to behold: for in the* Winter *when no Flowers appear, this and the laſt, as alſo the ſecond Species being all of one Genus, give as much delight, as when they are in Flower, which are many ſtanding on ſeveral foot Stalks, each Leaf whereof is part white, and part Purple, variouſly diverſified in every one of them.*

VII. *The fifth, or* Spotted Navel-wort, with Saw like broad Leaves, called by ſome the Princes Feather. *Its Roots are ſmall threads, which ſpread under the Ground, and ſhoot up again, with ſeveral Heads round about the Mother Head. This kind of* Navel-Wort, *or* Houſleek, *is compoſed of Heads of larger, broader, and thinner Leaves, than any of the former, of a ſadder green color, ſomewhat unevenly indented about the edges, and not ſo cloſe ſet together, but ſpreading forth into ſeveral Heads, like as the former ſorts do, altho not ſo plentifully. From the middle of divers of which Heads, riſe up browniſh or reddiſh Stalks, ſet with ſmaller Leaves thereon, to the middle thereof, and then Branch forth into ſeveral Sprigs, ſet with ſeveral ſmall reddiſh Flowers, conſiſting of five Leaves apiece: the inner ſides of which, are of a pale red, ſomewhat whitiſh, ſpotted with many ſmall Blood red Spots, as ſmall almoſt as Pins points, with ſome ſmall Threads in the middle, ſtanding about a ſmall green Head, which turns into the Seed Veſſel, parted four ways at the Head, in which is contained ſmall blackiſh Seed.*

VIII. *The ſixth, or* Water Navel-wort, *or* Penny-wort. *This is called by the Husband Men in ſome places* Sheep-Bane, *becauſe it kills Sheep which eat thereof. The form of the Leaf is not much unlike to the third Species aforegoing, but it is not of a fleſhy thickneſs like it, nor are the round edges of the Leaves ſo even as that. It has a ſmall Fibrous Root, and is a creeping Plant, lying and creeping upon the Ground, and taking Root almoſt at every Joint: From every Joint of which alſo ſprings forth a Leaf, round, and as it were Scollop'd, having about ſeven Scollops, round the edge of it; it ſtands upon a pretty long ſoot Stalk, which is faſtned to the lower ſide of the Leaf, about the middle thereof. And from moſt of the Joints with the Leaves, comes forth a Flower, ſtanding alſo upon a long foot Stalk.*

IX. *The ſeventh, or* Ivy Leav'd Navel-wort, or Ivy-wort. *Its Root is ſmall and Fibrous, which ſends forth a ſmall Herb creeping upon the Ground, with ſlender ſtringy Branches, all about, taking hold of Walls, or any thing it meets; ſhooting out again at every Joint ſmall Fibrous Roots into the Earth, all along as it runs. At the ſeveral Joints grow ſmall broad Leaves, cut in on the edges into corners, ſomewhat like unto a corner'd* Ivy *Leaf, each ſtanding upon a ſmall and ſtringy foot Stalk: at the Joynts likewiſe come forth ſeveral ſmall Flowers upon ſlender foot Stalks, faſhioned like unto a* Snap Dragon, *or* Fluellen *Flower, with a Tail or Spur behind it; mixed with yellow, whitiſh, and purple colors; and the Spurs as it were, waſhed over with a purpliſh color alſo; which being paſt away, in their places ſucceed ſmall round Heads, containing within them ſmall blackiſh Seed.*

Navel-wort Ivy *Leav'd.*

X. *Johnson* upon *Gerard*, Describes the last Plant thus. *It has a Root which is small, creeping and threaddy. The Branches of this Plant are many, long, slender, and creeping, upon which grow without any certain order, many little, smooth, thick Leaves, fashioned like those of* Ivy, *and fastned to foot Stalks of about an Inch long: and together with these Stalks, come forth other Stalks of the same length, that bear Spur-fashioned Flowers, of the shape, and bigness of those of the* Female Fluellen: *their outside is purple, their inside blew, with a Spot of yellow in the opening.*

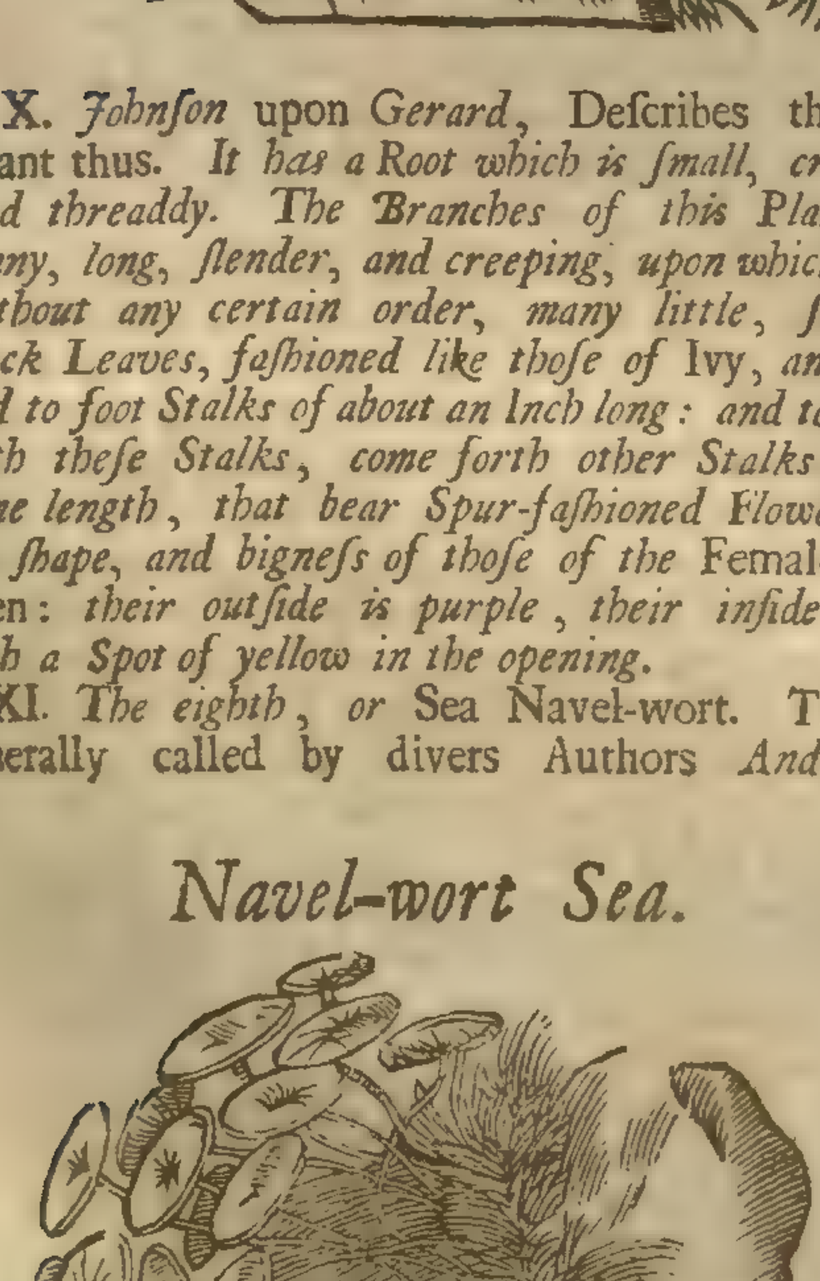
XI. *The eighth, or* Sea Navel-wort. This is generally called by divers Authors *Androsace Matthioli*, because he first set it forth, being sent to him from *Pisa* in *Italy*; but it no ways agrees with the *Androsace Dioscoridis. This is a Sea Excrescence, formed like small round Saucers, hollowish in the middle, like unto a Navel, and born up by small, smooth Foot Stalks, about two Inches long, every one by its self, springing from some Stone, Rock, or Shell in the Sea, or Salt Lakes, being of a pale greenish Ash color, whilest growing under Water, but afterwards grow as white almost as* Coral, *or the like, and of a Stony Substance.*

XII. *Gerard* Describes it thus. Sea Navel-wort *has many round thick Leaves, like unto little Saucers, set upon small and tender Stalks, bright, shining, and smooth, of two Inches long; for the most part upon the furrowed Shels of Cockles, or the like: every small Stem, bearing upon its end or point, one little Buckler and no more, resembling a Navel. The Stalk and Leaf are set together in the middle of the Leaf, upon which it was called,* Umbilicus Marinus, *or* Sea Navel-wort. *The Leaves and Stalks of this Plant, whilest yet in the Water, are of a pale Ash color; but taken forth, they presently grow white and hard, as* Sea Moss *called* Corallina, *and are of a Saltish Taste.*

XIII. *The Places.* The first grows very plentifully in many parts of *England*, but especially in all the West of this Land, upon Stone and Mud Walls, upon Rocks also, and in Stony places upon the Ground, at the bottoms of old Trees, and sometimes on the Bodies of them which are decayed and rotten. It has been found to grow plentifully in *Northampton*, almost upon every Stone Wall about the Town; as also at *Bristol*, *Bath*, *Wells*, and other Places, upon Stone Walls. The second, third, fourth, and fifth, upon the *Pyrenæan Hills* and *Alps* of *Switzerland*, on Rocks, Mountains and Stony places in *Germany*, *Hungaria*, *Austria*, and other Countries, where they grow upon the Rocks, and among the very Stones, where there is scarcely any Earth for the Roots to fix in, or to nourish them: but with us they all grow in *Gardens* very well, if they be Planted in shadowy places, and not in the Sun. The sixth or *Water Navel-wort* grows and creeps upon the surface of the Earth in Swamps and other moist places; it grows on the Boggs upon *Hamsted-Heath*, and on many such moist and rotten Grounds in other places. The seventh, or *Ivy* Leav'd *Navel-wort*, grows naturally in divers places of *England* Wild, as at *Hatfield* in *Hartford-shire*, and in other places which are shady, in which it delights to grow; as also upon Thatcht Houses in the North parts, as it is said, and most abundantly in *Lancashire*; it also grows in many *Gardens* throughout the Kingdom, and if it is planted near any Wall, it will run up the same to a considerable height. The last will not grow but in the Sea, as the name thereof imports.

XIV. *The Times.* The first Flowers sooner than any of the others, as at the beginning of *May*; and the Seed ripening quickly after, sheds it self, so that about the end of *May* usually, the Leaves and Stalks are withered and gone, untill *September*, that the Leaves Spring up again, and so abide all *Winter*. The second, third, fourth, and fifth Flower about the beginning of *June*, and through the whole Month, and sometimes in *July*, according as the Seasons fall out; and their Seed is ripe in *August*. Those Heads which bear Stalks, usually perishing together, and the others which bear not, abiding all the extremity of *Winter*. The sixth Flowers in the beginning of *Summer*, and its Seed ripens not long after, the Plant it self being green all *Winter*. The seventh seldom Flowers till the

Navel-wort Sea.



the end of *July*, and in *August*, and continues many times Flowering, till a Frosty Season comes and nips it; and the Seed is soon ripe after the Flowers are withered and gone.

XV. *The Qualities.* The five first are cold and moist in the second Degree; Absterstive, Discussive, and Repercussive, Anodyn, and Diuretick. The sixth, is hot and dry in the fourth Degree, and has all the other Qualities of *Water Crowfoot.* The seventh is cold and moist in the second Degree, and has all the other Qualities of the first five.

XVI. *The Specification.* The first five cool Inflamations, repel fluxes of Humors, provoke Urine and cleanse the Urinary parts, yet heal Ulcerated Kidnies: They give ease in the Gout and Sciatica; and are profitable against Scrophulous Tumors, as also to cure Green Wounds. The seventh has the like Specifick Vertues; besides which, it is said to cure the Whites in Women.

XVII. *The Preparations.* You may have from the first five and the seventh, 1. *A Liquid Juice.* 2. *A Decoction in Water or Wine.* 3. *A Syrup of the Green Herb, or Juice.* 4. *An Oil by Insolation or Decoction.* 5. *An Ointment.* 6. *A Cataplasm of the Green Herb.* 7. *A Distilled Water.*

The Virtues.

XVIII. *The Liquid Juice.* It cools, repels, cleanses, and eases pain. It is effectual against all Inflamations and unnatural Heats, whether inward or outward. Inwardly taken to a Spoonful or more in a Glass of *Barley Water* or Broth in which a little of the *Juice* of an *Orange* or *Limon* is squeezed, it abates the heat of Fevers, quenches Thirst, refreshes a fainting Stomach, cools the heat of the Liver and Bowels, opens obstructions and cleanses the Reins, Ureters, and Bladder, and takes away the heat and scalding of the Urine. The *Juice* of the *Ivy-wort*, taken to 2 Spoonfuls Morning and Night in Red Wine cures the Whites in Women.

XIX. *The Decoction in Water or Wine.* In Water it has all the former *Virtues*, and may be given Morning and Night from 4 to 8 Ounces. In Wine, it more effectually cures inward Ulcers in Reins or Bladder: made with Water, and mixed with white *Port* Wine when drank, it provokes Urine, and is avaliable against the Dropsie: and in the Hemorrhoids or Piles, it gives present ease, the parts being fomented hot therewith. The *Decoction in Water* is good against heat, redness, and Pimples in the Face, as also *Anthonies* Fire, the parts being well Bathed therewith, Morning, Noon, and Night: and being drank, it admirably cools the heat of the Stomach and Liver.

XX. *The Syrup of the Green Herb, or Juice.* It has all the Virtues of the *Decoction* and *Liquid Juice*, but not near so powerful as it: mixt with *Syrup* or *Juice* of *Limons*, it is good against Fevers, quenches Thirst, and comforts a weak and fainting Stomach. It heals also exulcerations of the Lungs, excoriations of the Bowels, and other inward parts. Mixt with the *Decoction* made in White Wine, it powerfully provokes Urine, and is profitable against the Dropsy.

XXI. *The Oil by Insolation or Decoction.* It is made with *Oil Omphacine*, or of *Unripe Olives.* It cools Inflamations admirably, eases the pain of the Piles, and cures Chilblains: and being applyed, it gives ease in the Gout and Sciatica. Anointed upon Scrophulous Tumors in the Neck and Throat, it eases the pain, wastes, and consumes them; anointed upon Chilblains, it takes them away

XXII. *The Ointment.* It has all the Virtues of the *Juice* and *Oil* outwardly used. If to every Ounce of it two Drams of *Scammony* in fine *Powder* is added, it will be a most effectual thing for the cure of all old running Sores and Ulcers, and will heal ulcerated Kibes almost to a Miracle. And above all things, it will digest, draw, cleanse, and induce the healing of strumous Ulcers, beyond most other Topick Medicaments, being skilfully applyed. It also quickly cures ulcerated Hemorrhoids or Piles; and is an excellent thing against redness, Scurff, Morphew, Pimples, Scabs, and other like Defœdations of the Skin.

XXIII. *The Cataplasm of the green Herb.* Being immediately applyed upon a simple Contusion, it discusses it, or repels the present afflux of Humors. It eases pains of the Gout and Sciatica, abates the Inflamation and Tumor in the Testicles and *Penis*, giving in a little time ease and relief.

XXIV. *The Distilled Water.* It is Cosmetick, and good against most Defœdations of the Face and Skin, taking away, Heat, Redness, and Inflamation. Inwardly taken being sweetned with the *Syrup*, it abates the heat of Fevers, cools the Stomach, Liver and Reins, gives ease in the Strangury, cleanses the Reins and Bladder, and takes away the heat and scalding of the Urine. Dose from 2 to 4 Ounces, or more, Morning and Night. It is said also to heal Ulcers of the Reins and Bladder, being duly taken for some considerable time.

CHAP. DXVI.

Of NAVEW;

OR,

Long TURNEP.

I. *THE Names.* It is called in *Greek*, Βῦνιας *Bounias:* in *Latine*, *Napus* and *Bunias*; in *English*, *Navew*, or *Long Turnep.*

II. *The Kinds.* We may very well take *Navew* to be a Species of the *Turnep*, for the *Sweet Garden Kind*, eats like it, and full as well or rather better and sweeter, being dresst like the *Common Turnep.* This Plant is either 1. Βῦνιας ἥμερος, *Bunias sive Napus Hortensis*, *Napus dulcis*, Garden Navew, or Sweet Navew, or Navew Gentle. 2. Βῦνιας ἄγρια, *Bunias agrestis*, *Napus Sylvestris Dodonæi & Lugdunensis*, *Rapum Sylvestre Tragi*, *Napus agrestis Turneri*, Wild Navew.

The Descriptions.

III. *The* Garden Navew, or Navew Gentle, *is like unto the* Turnep, *in its Stalks, Leaves, Flowers, and Seed, as also in its shape and manner of growing; but the Leaves of the* Navew *are much smoother: it also differs in the Root, for the* Turnep *is round, almost like a Ball, but the Root of the* Navew

Navew *is long, and much ſtretched out in length, whereby it ſeems to be degenerated from the form of the* Common Turnep. *This* Garden Navew, *or* Navew Gentle *is alſo of two Kinds, viz. The greater and the leſſer. The greater is long and great, almoſt as large as the ſhort* Carrot, *but for*

Navew Gentle, or *Garden ſmaller.*

Navew Gentle Garden greater.

the moſt part of an uneven lenth and roundneſs, to the very end, where it ſends from its ſides ſeveral ſmall long Fibres. The ſmaller in its growth and appearance above Ground, is in all things like the former, differing only in its Root, which is very much leſſer, for it is ſomewhat round with its length, and is about twice as big as a Mans Thumb, ſome bigger, ſome leſſer; both theſe are ſo like to the Common Garden Turnep, *in Stalks, Leaves, Flowers, and Seed, that they are hardly to be known aſunder,*

IV. *The* Wild Navew. *Its Root is likewiſe ſomewhat Tuberous, round and long withall, of the bigneſs of a Mans Thumb, or ſomewhat larger, with ſeveral Fibres ſpringing from it towards the bottom Its Leaves are long, ſmooth, and not Hairy, and more deeply jagged than the* Garden Kind. *The*

Navew Wild.

Flowers are alſo yellow, and the Seed in ſmall Pods *like the former, but more hot, ſharp, and biting, Whoſoever ſays* Lobel *has ſeen or known the* Garden Navew, *or* Navew Gentle, *will even upon the ſight of this, judge it to be the* Wild *ſort, it is ſo like thereto.*

V. *Nota.* There is a difference between *Bunias*, and *Bunium*, (tho' *Pliny* by a miſtake makes them but one Plant) for *Bunias* is truly the *Navew*, of which we treat in this Chapter; whereas *Bunium*, is a kind of *Daucus Petroſelini vel Coriandri ſolio*, of which opinion are *Bauhinus & Dalechampius*. *Galen* likewiſe puts no difference between Γογγύλη, *Gongule*, *Rapum*, a Turnep: and Βουνιας, *Bunias*, *Napus*, Navew. *(i.e.* the *Garden Kind)* becauſe there is but little difference in their form, manner of growing, greatneſs of the Root, and ſweetneſs alſo: but there is really a difference between the Plants, which is chiefly determined by the Root, which is much longer than any *Turnep*, and ſcarcely ever ſo thick

as

ſome of the ſmaller *Turneps*; beſides, ſome Authors do aſſert, that the Root of the *Navew Gentle*, is yet ſweeter than the ſweeteſt *Turnep* that grows.

VI. *The Places.* The firſt is only planted, and to be found in *Gardens*, in many places of the Kingdom: it requires a gentle, ſoft, looſe and yellow Mould, like as the *Turnep* does, and proſpers in a fruitful Soil; it is Sown in *France* and ſome parts of *Germany*, in the Fields, for the Seed ſake, as is likewiſe that of the *Wild Cole-wort*, or *Cole-Rape*; for the plentiful encreaſe of the Seed, is very profitable to the Husbandmen of thoſe Countries. becauſe that being preſs'd forth in their *Oil-Mills*, a great quantity of *Oil* is produced, which they uſe not only in Lamps, but alſo for the making of Soap; and amongſt ſome of the poorer ſort of People, it is there eaten, and uſed inſtead of *Sallet Oil*. In *Holland* and *Flanders* and other places it is boiled into Soap, by mixing it with a ſtrong Lye, made of Pot Aſhes. It is ſaid, that it is alſo Sown in ſeveral places of *England* for the ſame purpoſes. The ſecond or *Wild Navew* grows Wild by Hedg ſides, High-ways, Ditch Banks, as alſo in Clay Grounds, and the Banks ſides of Freſh Marſhes, near to Towns and Villages, in many parts of the Kingdom.

VII. *The Times.* They are Sown in the end of *Auguſt*, and beginning of *September*, as alſo in the *Spring*; and Flower and Seed about the ſame time as *Turneps* and *Charlock* do.

VIII. *The Qualities.* *Navew Gentle* is temperate in reſpect of heat or cold, and moiſt in the firſt Degree; but this is underſtood of the Root; for the Seed is hot and dry in the ſecond Degree. The *Wild Navew* is hotand dry in the firſt Degree, but the Seed (which is only uſed) in the third Degree. The *Garden Kind* is Aperitive, Abſterſive, and Reſtorative in Conſumptions. The *Wild Kind* has the ſame Virtues, as to its Seed, which is alſo Alexipharmick, or a Reſiſter of Poiſon.

IX. *The Specification.* The Roots of the *Garden Kind* encreaſe Seed, provoke Luſt and reſtore in Conſumptions. The Seeds of both Kinds expel Wind, give eaſe in the Strangury and Colick, and are good againſt the Poiſon of Vipers, Rattle-Snakes, Mad-Dogs, and other Venemous Creatures: They provoke the Terms, facilitate the Delivery of Women in Labor, and remove Obſtructions of the Lungs.

X. *The Preparations.* You may have 1. *A Liquid Juice of the Root of the Garden Kind.* 2. *An Eſſence of the ſame.* 3. *A Syrup of the Juice.* 4. *A Decoction of the Roots.* 5. *A boiled Sallet of the Roots.* 6. *A Cataplaſm of the Roots.* 7. *A Sallet of the firſt Sprouts.* 8. *An Oil by expreſſion from the Seeds of both Kinds.* 9. *An Infuſion in Wine of the Seeds of both Kinds.* 10. *A Pouder of the Seeds of both Kinds.* 11. *An Oil of the Root of the Garden ſort by Decoction.* 12. *A Wine of the Root of the ſame Kind.*

The Virtues.

XI. *The Liquid Juice of the Root of the Garden Kind.* It nouriſhes, reſtores in Conſumptions, is good againſt Coughs, Colds, Hoarſeneſs, Wheezings, Aſthma's, and Ulcers of the Lungs, encreaſes Seed, Provokes Luſt, and provokes Urine, giving eaſe in the Strangury, Stone, Gravel, *&c.* Doſe 2 or 3 Spoonfuls at Morning, Noon, and Night, or 3 or 4 times a Day, in a good Draught of warm new Milk.

XII. *The Eſſence of the ſame Root.* It has all the Vertues of the *Juice*, and may be given two Spoonfuls at a time in the ſame manner, or in a Diſh of ſtrong Meat Broth, or Gelly Broth: This does moreover ſtrengthen all the *Viſcera*, and heal excoriations of the Bowels, Reins, Bladder, *&c.* and is good for healing of a *Gonorrhœa*.

XIII. *The Syrup of the Juice.* It is ſingular good againſt Rickets in Children, and prevails wonderfully againſt a Cough, and ſtuffing of the Lungs, cauſing an eaſie Expectoration. It has all the Virtues of the *Juice*; beſides which, being long uſed, it reſtores the Voice to ſuch as had loſt it.

XIV. *The Decoction of the Roots in Water.* It has the Virtues of the *Juice*, *Eſſence*, and *Syrup*, but may be taken from 4 to 8 Ounces, ſeveral times a Day: it powerfully provokes Urine, and gives eaſe in the Strangury, expelling Tartarous Mucilage from the Reins, Ureters and Bladder. Being taken for ſome time, ſweetned with fine white Sugar or Clarified Honey, it cures an habitual Coſtiveneſs of Body, and withal, it heals Excoriations of the Bowels.

XV. *The Sallet of the Roots.* It is made either by boiling, baking or roaſting; and then being chopt ſmall with a Knife, it is ſeaſoned with Pepper, Salt, and Butter, adding if you ſo pleaſe a little *Juice* of *Oranges* or *Limons*. Being thus eaten for about five or ſix Weeks together, with only a little white Bread, and forbearing all other Food whatſoever, whether Fleſh, Fiſh, Eggs, Cheeſe, *&c.* and only drinking either the *Decoction of the Root*, or new Milk, for the whole time; I have known it cure ſeveral times, the moſt inveterate Rheumatiſm, beyond all hope or expectation: and all this it does purely by ſweetning all the Juices of the Body, deſtroying their acerbities.

XVI. *The Cataplaſm of the Roots.* Being made of the green Root by beating it in a Mortar, and applyed to Kibed Heels, it cures them. Being made of the Roots Baked or Roaſted, and applyed to the Tumors of the Teſticles or *Penis*, or Swelings in any other part of the Body, it allays the Inflamation if any, eaſes the Pain, and in a ſhort time diſcuſſes the Tumor.

XVII. *The Sallet of the firſt Sprouts out of the Ground.* It is eaten raw, as other green Salleting: it purifies and cleanſes the Blood, ſtrengthens the Stomach, Liver, Spleen, and Lungs; opens Obſtructions of the Reins, and frees them from Tartarous Matter powerfully, with all provoking Urine.

XVIII. *The Expreſſed Oil from the Seed, of both Kinds.* It facilitates the Birth, prevents or gives eaſe and takes away the After-Pains of Women in Childbed: and given to young Children againſt the Worms, it kills and drives them forth. If the *Oil* is waſhed well with fair warm Water, it becomes ſweeter and ſofter, and is then good to anoint the Skin withall; it allays Inflamations, and takes away roughneſs of the Skin, and other Deformities thereof.

XIX. *The Infuſion in Wine, of the Seeds of both Sorts.* It gives preſent eaſe in the Colick, and Gripings of the Guts; opens Obſtructions of the Reins, cleanſes them of Tartarous Matter, gives eaſe in the Strangury, provokes Urine, and powerfully reſiſts and expels Poiſon, whether the Poiſon is taken inwardly by the Mouth, or by the Bitings of Serpents, Mad-Dogs, or other Venomous Creatures: for which reaſon ſake the Seed is always put into the Compoſitions of *Treacles*, and other Counter-Poiſons.

XX. *The Pouders of the Seed, of both Kinds.* It ſtrengthens the Stomach, cauſes a good Appetite and

and Digeſtion, eaſes the Colick, provokes Urine, gives relief in the Strangury, and induces the Courſes in Women. It is good againſt all ſorts of Poiſon, and is ever an Ingredient in *Venice Treacle*, viz. the Seed of the *Bunias dulcis*, and both *Dioſcorides*, and *Pliny* ſay, that the Seed of the *Garden Bunias* is put into Antidotes, not the Seed of the *Wild*: and yet that of the *Wild* is certainly the ſtronger and the more effectual: it kills alſo Worms in Children. Doſe from half a Dram to a Dram or more in any fit Vehicle, Morning and Night.

XXI. *The Oil of the Garden Root, by Inſolation or Decoction.* It allays Inflamations, diſcuſſes hot Tumors, and is profitable againſt Chilblains and Kibes, they being anointed therewith.

XXII. *The Wine made of the Juice of the Root of* Navew Gentle. The Root is to be Ground in an Engine or Mill, and the Juice to be preſſed forth, which is to be put into Wooden Fats or Veſſels, and left to Ferment, as Wine or Cyder, are: The Fermentation being over, and the Liquor grown Fine, you will have a noble delicate Liquor for drinking, very Pleaſant beyond Cyder, and much ſtronger; and not much Inferior to Wine. This Wine if well made, by reaſon of the ſtrength of its Body will keep ſome Years.

CHAP. DXVII.

Of NEP; *or*, CAT-MINT.

I. *THE Names.* It was unknown to the *Greeks*, ſo far as we can Learn; the *Latins* ealled it *Nepeta*, *Mentha felina*, *Mentha Cattaria*, and by ſome is ſimply called *Cataria*, and *Cattaria*, alſo *Herba Gattaria:* we in *Engliſh* called it, *Nep*, *Neppe* and *Cat-Mint*.

II. *The Kinds.* Authors make many Kinds hereof, but the following ſix are Principal, *viz.* 1. *Nepeta major Vulgaris*, *Herba Gattaria Matthioli*; *Nepeta Cordi & Tragi*; *Cattaria*, & *Mentha Cataria Lobelij*; Common Garden Nep, or Cat-Mint. 2. *Nepeta Media*, *Cattaria Media*; The middle Kind of Nep, or Cat-Mint. 3. *Nepeta minor Camerarij*, *Mentha Cataria minor Bauhini*, *Cattaria tenuifolia Hiſpanica Cluſij*; Our ſmall Nep or Cat Mint. 4. *Nepeta Peregrina latifolia*, *Mentha Cattaria Peregrina latifolia Lobelij*, *Mentha ſelnia ſativa latifolia Tabernæmontani*, *Nepeta Perigrini Beſleri*, *Cattaria altera Gerardi*; Strange Nep, or Cat-Mint with broad Leaves. 5. *Nepeta Peregrina auguſtifolia*, *Mentha Cataria auguſtifolia minor Bauhini*; *Mentha Cattaria Peregrina aguſtifolia Lobelij*, *Cattaria folio longiore Dodonæi*, *Salvia Romana Gerardi*; Strange Nep or Cat-Mint with narrow Leaves. 6. *Mentha Cataria minor Alpina*, *Nepeta minor Alpina*, Small Mountain Nep, or Cat-Mint.

The Deſcriptions.

III. *The firſt*, *or* Common Garden Nep or Cat-Mint. *Its Roots are compoſed of many long Strings and Fibres, faſtning themſelves ſtrongly in the Ground, and abide with green Leaves thereon all the* Winter. *From this Root ſhoot forth a hard four ſquare Stalk, or Stalks, with an hoarineſs on them, a yard high, or more, full of Branches, bearing at every Joint, two broad Leaves, for form and largeneſs ſomewhat like unto* Bawm, *but longer pointed, ſofter, whiter, and more hoary, and notch'd alſo about the edges, which have a ſtrong ſweet ſmell, not offenſive to any, but very pleaſing to Cats,*

Nep: or, Cat-Mint Common.

who will rub themſelves thereon all over, and alſo eat the Leaves thereof, they are ſo much delighted with it, whence came the Name. The Flowers grow in large Tufts at the tops of the Branches, and underneath them likewiſe on the Stalks, many together, of a whitiſh purple color. In this particular of the Flowers, our Figure here inſerted is defective.

IV. *The ſecond*, *or* Middle Kind of Nep, or Cat-Mint. *Its Roots are greater, longer, and more Woody than the former, abiding many Years in the Ground, but retaining no green Leaves thereon in the* Winter *Seaſon. It has likewiſe hard ſquare Stalks, not ſo great as the former, but rather more in number, and ſometimes as high: the Leaves are ſmaller almoſt by half, harder, greener, and nothing ſo ſtrong ſcented, and are ſet by couples on the Stalks, which ſpread not themſelves out in Branches, in that manner which the firſt does. The Flowers are fewer, ſmaller, and growing only by ſpaces, along them, up to the tops, of a faint purpliſh color, gaping like the other, and after them ſuch like ſmall round Seed in the Husks.*

V. *The third*, *or* Our ſmall Nep, or Cat-Mint. *It has a long, ſmall, Fibrous, Woody Root, which ſends forth ſeveral four-ſquare, hard and hoary Stalks, which die not away after Seed bearing, but ſhoot forth again freſh Branches, not above a foot high; with two ſmall and long narrow Leaves, ſnipt or dented about the edges, and hoary alſo, of a ſtronger Smell than the firſt or* Common Kind, *and of a hotter Taſte. The Stalks ſhoot forth into many*

Nep; or, Cat-Mint small.

many Branches, *at the tops whereof ſtand ſmall white gaping flowers, in Spike faſhion like thoſe of the firſt, or* Common Kind, *after which come ſmall black Seed like as in the other.*

Nep broad Leav'd.

VI. *The ſixth, or* Strange Nep, or C.. with broad Leaves. *It has a long ſmall ſ.. Root, ſpread out into many Branches with ſeveral Fibres adorning them. From which Root ſprings up a ſquare hairy Stalk, ſpreading into Branches on all ſides, from the bottom almoſt to the top; ſet with two Leaves at every Space, which are broader than thoſe of the next kind following, but not much, but longer than our firſt or* Common Nep, *dented about the edges, and of a hairy green color. The Flowers ſtand in the ſpaces about the tops of the Stalks, almoſt of a pure white color, like in form to thoſe of our firſt* Common Nep, *but biger, after which comes the Seed, which is alſo black like it: The ſmell of the whole Plant, is likewiſe ſtronger and ſharper, and more pleaſing, than that of our ſaid* Common ſort.

VII. *The fifth, or* Strange Nep *or* Cat-Mint with narrow Leaves. *This is a Species of the ſame Kind with the former, and is like it in its Root, Stalks, Branching out, Flowers, Seed, color, ſmell, and manner of growing, and differs from it in nothing but in the Leaves, which are ſmaller and narrower than theſe are.*

VIII. *The ſixth, or* Small Mountain Nep, or Cat-Mint. *This has a ſmall Fibrous Woody Root, which ſends forth a Plant ſmaller than our third Kind or* ſmall Nep *aforegoing. It has ſquare brownish Stalks of about a Foot high, ſpreading themſelves forth into branches, on which grow ſmaller Leaves, than thoſe of the former ſmall ſort, but they are ſomewhat broad, almoſt three ſquare, and hairy withall. The Flowers are ſmall and reddiſh, ſet or placed Spike-faſhion at the Tops of the Stalks and Branches, like unto thoſe of the* Common Kind.

IX. *The Places.* The firſt grows about the Borders of *Gardens* and *Fields* (as *Gerard* ſays) near to rough Banks, Ditches and Common Ways, and is delighted in moiſt and watery places, from whence it was brought into *Gardens*. *Parkinſon* ſays, that the firſt and ſecond grow Wild in other Countries, but are Nurſt up with us only in *Gardens*, as all the reſt are. The third, fourth, and fifth grow naturally in *Spain*, from whence they were brought to us in their Seeds; and notwithſtanding the coldneſs of our Climate, grow here to be goodly ſort of Plants. The ſixth grows in *Italy*, about *Naples*, from whence the Seed was brought hither.

X. *The Times.* They all come forth in the *Spring* Seaſon, Flower in *July* and *Auguſt*, and their Seed is ripe ſoon after.

XI. *The Qualities.* *Nep* or *Cat-Mint* is hot and dry in the third Degree; Aperitve, Abſterſive, Aſtringent, Anodyn, Carminative, Digeſtive, and Traumatick; alſo Cephalick, Neurotick, Stomatick, Hepatick, Cordial, Ptarmick, Emmenagogick, Sudorifick, Alexipharmick, and Analeptick.

XII. *The Specification.* It provokes the Terms in Women, haſtens and facilitates the Labor, ſtops Catarrhs and cold thin Rheums, expels Wind, gives eaſe in the Colick, cures Aſthma's or difficulty of Breathing, as alſo Cramps, Convulſions, and all cold and moiſt diſaffections of the Nerves.

XIII. *The Preparations.* You may have therefrom, 1. *A Liquid Juice.* 2. *An Eſſence* 3. *An Infuſion.* 4. *A Powder of the Leaves and Heads of Flowers.* 5. *A Syrup.* 6. *A Lotion.* 7. *An Ointment or Balſam.* 8. *Peſſary.* 9. *A Cataplaſm.* 10. *A Diſtilled Water.* 11. *A Spirit.* 12. *A Diſtilled Oil.* 13. *A Spirituous Tincture.* 14. *An Acid Tincture.* 15. *An Oily Tincture.*

The Virtues.

XIV. *The Liquid Juice.* Taken one or two Spoonfuls at a time in a Glaſs of choice *Canary*, or other proper Wine, it cures ſuch as are inwardly Bruiſed by any Blow, Fall, or other Accident. It expells Wind out of Stomach and Bowels, gives eaſe in the Colick; and being conſtantly taken for ſome time, it provokes the Courſes in ſuch Virgins as never had them, and brings them down in ſuch Women as have had them ſtopt for ſome time, it alſo takes away Sterility or Barrenneſs in ſuch Women, in whom it is cauſed through a coldneſs, over-moiſture or flipperineſs of the Womb, and other weakneſſes of thoſe parts: Given alſo to Women in Travel in a Glaſs of White *Lisbon* Wine, it haſtens and facilitates the Birth, brings away the After-Birth, and prevents, or eaſes After-Pains.

XV. *The Eſſence.* It has all the Virtues of the *Liquid Juice*, beſides which, it prevails againſt all cold and moiſt Diſeaſes of the Head, Brain and Nerves; is profitable againſt Apoplexies, Vertigo's, Megrims, Epilepſies, Lethargies, Carus, Palſies, Convulſions, and other like Diſeaſes of thoſe parts. Doſe a Spoonful or two every Morning faſting, and every Night going to Bed, in a Glaſs of Generous Wine. It alſo expels Poiſon, whether inwardly received, or externally by the Stinging or Biting of any Venemous Creatureas, Vipers, Rattle-Snakes, Mad-Dogs, *&c.* if it is preſently given in a proper Vehicle, and a *Cataplaſm* of raw *Garlick*, be alſo applyed forthwith to the Wound.

XVI. *The Infuſion in Wine.* It has the Virtues of the *Juice* and *Eſſence*, but nothing near ſo powerful: yet it is a ſingular Cordial, defends and chears the Heart, enlivens the Spirits, and is profitable againſt deliquiums of the Vital Spirits, as Faintings, Swoonings, Vapors, Hyſterick-Fits, *&c.* Doſe 4 Ounces, at time of the *Paroxyſm.*

XVII. *The Pouder of the Leaves and Heads of Flowers.* It has all the Virtues of the *Juice* and *Eſſence*, but acts not with that ſpeed which they do: yet it ſeems to comfort the Stomach and Bowels after a wonderful manner: it provokes Appetite, and cauſes a good Digeſtion: is a ſingular expeller of Wind, and ſtops Fluxes of the Belly. It is alſo good againſt Coughs, Colds and Catarrhs, or thin diſtillations of Rheum, which diſaffect the Lungs. It alſo warms, drys and ſtrengthens the Womb, and is ſaid ſtrongly to provoke Luſt, and induce Conception. Doſe one Dram at a time in *Syrup of Citron Peels*, Morning and Night, drinking a Glaſs of ſtrong Wine after it.

XVIII. *The Syrup of the Juice or Green Herb.* It is a moſt admirable Pectoral, and is ſaid to alleviate the moſt vehement Cough, being taken often in the day time with a *Liquorice Stick*; it profligates a Cold, and cauſes an eaſy expectoration of the viſcid pituitous matter lodg'd in the Stomach and Lungs. It is good to cure an Aſthma or difficulty of Breathing, ſtuffing of the Stomach, Hoarſneſs, Wheezing, ſhortneſs of Breath, and a continual diſtillation of Rheum, which is very obnoxious to moſt of the *Viſcera.* It may be taken particularly Morning and Night, and as often in the day time as need requires.

XIX. *The Lotion. Take of the Eſſence 3 parts of* Madera *or other Generous Wine 2 parts, Spirit of Wine 1 part, mix them.* Being uſed as an Injection up the Womb, with a proper Womb Syringe it cleanſes, warms, comforts, drys, and ſtrengthens it, takes away its flipperineſs, and makes it apt for Conception; and if this *Lotion* be ſet in a Copper or Earthen Pan over live Charcole in a Cloſe-Stool, ſo that the Fumes thereof may be received up the Womb, it does alſo the ſame things, takes away the overflowing moiſture of the Mother, diſcuſſes the Wind, and eaſes the Pains of thoſe parts, and by the frequent uſe thereof takes away thoſe cauſes of Sterility or Barrenneſs. It is alſo good to waſh the Head, to dry up running Humors, and cure the Scabs thereof, and is effectual for the like affects in other parts of the Body. Bathed or Fomented on the Piles, it eaſes their Pain, and in a ſhort time diſcuſſes them.

XX. *The Ointment or Balſam.* They are good Vulneraries being applyed to moiſt and running Sores and Ulcers; they ſtrengthen the Nerves, or any Limb or Member weakned through Cold, or moiſture, or blows, or any over-ſtraining: and applyed to Ulcerated Piles, they diſcuſs the remaining Tumor, eaſe the Pain, and in a ſhort time heal them: the ſame thing they do, being alſo applyed to Ulcerated Kibes.

XXI. *The Peſſary. It is made of the Green Herb, with its Tops or Heads of Flowers, and a little Wool.* Being put up the *Vagina Uteri*, it eaſes the Pains of the Womb, draws down the Vapors, prevents Fits of the Mother, provokes the Terms; and in a Woman with Child, if it is near the Moments of Delivery, it haſtens the Birth.

XXII. *The Cataplaſm.* Applyed to the Fundament in the Hemorrhoids or Piles, it gives preſent eaſe tho' the pain be never ſo Vehement: applyed to the Joints it alſo eaſes the pains of the Gout, proceeding from a cold cauſe, or an accidental weakneſs of the part.

XXIII. *The Diſtilled Water.* It has the Virtues of the *Juice*, but very much weaker in its effects, and may be given to 6 Ounces ſweetned with the *Syrup* aforegoing; otherwiſe, it is uſed for the moſt part as a Vehicle to convey the other *Preparations* in. It is a very good Stomatick.

XXIV. *The Spirit.* It is a great Neurotick and Cordial, good againſt Palſies, Convulſions, Tremblings, Numbneſs, Vertigo, Lethargy, Carus, Fainting and Swooning Fits, Vapors, Fits of the Mother, and the like Nervous, Cardiack, and Hyſterick Diſtempers. Doſe one, two, or three Drams dulcified with the *Syrup* at *Sect* 18. aforegoing.

XXV. *The Diſtilled Oil.* It has all the Virtues of the *Juice*, *Eſſence*, *Infuſion*, and *Spirit* aforegoing: it provokes the Terms powerfully, brings away the Birth (when ripe) momentarily, and prevents and cures After-pains upon the ſpot: It has not many equals for the Diſeaſes of the Head, Brain, Heart, Nerves and Womb. Doſe from 6 Drops to 12, 20, 30, or more, according to Age, Strength, and Neceſſity; drop them firſt into fine pouder Sugar, mixing both very well together; then give the mixture in a Glaſs of Wine.

XXVI. *The Spirituous Tincture.* It has all the Virtues of the *Juice*, *Eſſence*, *Spirit* and *Oil*; It is ſtronger and more powerful than the three firſt, but weaker much than the *Oil.* It may be given in the Colick, Fainting and Swooning Fits, Lethargy, *&c.* from one Dram to two Drams, in a Glaſs of Generous Wine; but if it is given againſt Vapors, or Hyſterick Fits, it will be beſt to give it in a Glaſs of the *Diſtilled Water*, which may be repeated Morning and Night.

XXVII. *The Acid Tincture.* This has all the Virtues of the *Spirituous Tincture*, and more powerful

powerful than it, in suppressing Vapors and Hysterick Fits, also Vomitings, Sickness at Heart, and other Diseases of the Stomach,; and exceeds all the other *Preparations*, in curing Calentures, burning Fevers, the Plague, and all sorts of Malign and Pestilential Fevers, for which it is a kind of Specifick. Dose so many Drops as to make the Vehicle it is given in gratefully Acid, and to be repeated as often as need shall require.

XXVIII. *The City Tincture.* It is a powerful Antiparalytick, Neurotick, Hysterick, and Nephritick; outwardly it is good against the Palsie, Lameness, Numbness, and Trembling, being anointed very well all along the Back Bone Morning and Night, taking some few Drops of it also inwardly, and anointing withall the parts affected. It facilitates the Birth, and powerfully provokes the Terms in Women. And is a singular Medicament against the Stone, Gravel, Sand, Tartarous Mucilage in the Reins and Bladder, Strangury, scalding and heat of Urine, in all which Cases it gives present relief. Dose from one Dram to three Drams in any proper Vehicle.

XXIX. *Nota.* The first Kind is most used, but *Lobel* says, the fourth and fifth sorts are more effectual to all the Purposes and Intentions than the first Kind: And if my Observation may signifie any thing, I am of Opinion, that the third Kind is not inferior in goodness to any of them all.

NENUPHAR, *see* Water Lilly, *Chap.* 442.
NESPITE, *see Calamint*, *Chap.* 104.

CHAP. DXVIII.

Of the NETTLE.

I. *The Name.* It is called in *Arabick*, *Huniare*, & *Angiara*: *Serapio* calls it *Hamure Uraith*: in *Greek*, Ἀγαλύφη (*quia tacta aspera & injucunda est*:) also Κνίδη, (*quod vellicet & pungat*:) *in Latine*, *Urtica*, *ab Urendo*, *quod pruritum pustulasque igni similes excitet*: and in *English*, *Nettle*, and *Stinging Nettle*.

II. *The Kinds.* There are said to be four Kinds of *Nettles*, *viz.* 1. *Urtica Hortensis*, *Urtica Romana*, *Urtica Italica*, *Urtica prima Dioscoridis*, *Urtica Legitima Clusij*, *Urtica Mas*, *vel Mascula*, The Garden or Roman Nettle. 2. *Urtica Sylvestris major*, *Urtica major*, *Urtica Urens*, *Urtica Fœmina*, our great common stinging Wild Nettle. 3. *Urtica media Sylvestris*; *Urtica urens vulgaris altera Tragi*; *Urtica Olygophyllus* (*à paucitate foliorum*) our middle sort of stinging Wild Nettle. 4. *Urtica minor Sylvestris*, *Urtica minor*, *Urtica Exigua Cæsalpini*; *Urtica urens minima*, *Urtica tertia Lugdunensis*, *Matthioli & Tragi*, *Urtica Canina*, *vel Canina Plinij*; our lesser or small stinging Nettle.

The Descriptions.

III. *The first*, *or* Garden or Roman Nettle. *Its Root is yellowish, and spreads under Ground with many long Fibres or strings, whereby it takes fast hold, yet perishes every Year, requiring to be new Sow'd every Spring. It springs up with one or more great Stalks, which spread themselves out into many round hairy Branches, rather leaning down, than standing perfectly upright, sometimes rising to be four or five Feet long, spreading out into several Ramifications: whereon at the Joints, are two Leaves set together, very rough: and tho' it has no sharp Prickles, yet it has a hairy Down thereon, which will sting the Skin egregiously, if but touch'd therewith, and raise it full of Blisters, as if it was burnt with Fire: and dented round the edges somewhat deeply. At several places of the Branches come forth small Stalks of reddish and yellowish Flowers, made of threads which fall away, without bearing any thing else: but at the Joints with the Leaves in other Places, from the middle of the Branches upward, come forth small, round, rough, green, prickly pellets bigger than* Pease, *in which are contained several flat, smooth, slippery, glittering or shining Seed, much like to* Line *or* Flax-Seed, *but rounder and smaller.*

IV. *The second*, *or* Great common stinging Wild Nettle. *The Root of this perishes not like the former, but continues all the* Winter, *with some green Leaves upon it, if the Season be not too extream: It is pale and yellow, and spreads it self, running very deep into the Earth, with long strings and small Fibres. From this Root shoots forth one,*

Nettle Garden.

and ſometimes more Stalks, which ſpread themſelves cut into many Branches, any of which if they lye upon the Ground, will take Root again, and ſpread abroad, and take up a great deal of room. The

Nettle Stinging Great.

Leaves are of a darker color than the former, and ſometimes browniſh, or red, as large, rough, and ſtinging as the former, but not ſo deeply dented on the edges. At the tops of the Branches and likewiſe, from the Joints with the Leaves underneath, come forth ſmall, long, Branches of Flowers, and Seeds after them, in faſhion very like to the Branches of the Female Mercury, *in which is contained, ſmall, flat, whitiſh Seed.*

V. *The third, or* Our middle ſort of Stinging Wild Nettle. *This in its Creeping, ſtringy and Fibrous Root, Stalk, Branches, Flowers, Seed, and manner of growing ſeems not to differ from the former laſt deſcribed, excepting that this is lower, and ſmaller, and thinner ſet with Branches: for this reaſon, it is thought by many, that it is one and the ſame Kind with the Greater laſt deſcribed, and differs nothing from it, ſaving that it grows not full out ſo great, which may be with reſpect to the Soil, being poorer, and not ſo fat and good.*

VI. *The fourth, or* Our Leſſer, or ſmall ſtinging Nettle. *Its Roots are ſmaller than any of the former, and periſh every Year, yea twice or thrice ſometimes in a Year, for it has been obſerved to ſhed its Seed twice in a hot Year, and ſpring up again the third time of the ſhed Seed, which being near* Winter, *periſhes with the firſt Froſts, but ſprings up again the next Year.* This Nettle *is in moſt things like to the two laſt, but riſes ſeldom above half a Yard high, and is nothing ſo much Branched as the great Kind. Its Leaves alſo are much ſmaller, rounder, much ſharper notched on the edges, and of a freſher or lighter green color, and more ſharply ſtinging than any of the others. The Seed is ſmall and white like to the others.*

Nettle ſtinging ſmall.

VII. *The Places.* The firſt is uſually Sown in *Gardens* with us, as it is alſo in Upper and Lower *Germany*, and in moſt places of *France*: but in *Italy* Wild in the Woods. It has alſo been found naturally growing Wild, time out of mind, both at the Town of *Lidde* by *Romney*, and in the Streets of the Town of *Romney* in *Kent*, where it is ſaid that *Julius Cæſar* with his Soldiers Landed and ſtaid for a time, whence it is thought the place took its Name, being by them called *Romania*, and we for ſhortneſs *Romney*, and alſo obtained the firſt produce of the Plant; ever ſince which time, it is thought that it has continued there, growing, and riſing Yearly of its own Sowing. But it has been found growing Wild alſo in other parts of this Kingdom, as in the Street of *Bardney* in *Lincolnſhire*. The other three ſorts grow in waſte Grounds, by Hedges, and on Ditch Banks, by High-ways and Walls ſides, and in many other places both till'd and untill'd, and in Paſtures, and in *Gardens*, and in all ſorts of Grounds both rich and poor, good and bad, where if they be ſuffered to grow a while, it will be difficult to clear the place of them.

VIII. *The Times.* They come up plentifully early in the *Spring*, and through all the *Summer* Months, and they Flower and Seed in *July*, *Auguſt*, and *September*; but the ſmaller Kind more early, becauſe it many times Flowers and Seeds twice a Year, as was before obſerved.

IX. *The Qualities. Nettle* is hot and dry in the firſt Degree, and is of thin and ſubtil parts: now it does not burn and ſting, becauſe of its extream heat; but becauſe its downy or ſmall prickles are hard and ſtiff, piercing like a Sting or the fine Points of Needles; for if it is once withered, it ſtings not at all, becauſe its fine hard Prickles

grow

grow Moist and ſhady. It is Aperitive, Diuretick and Hyſterick. Pectoral, Nephritick Hyſterick and Alexipharmack.

5. *The Preparations.* You may make hereof, 1. A *Liquid Juice* 2. *An Eſſence of the whole Plant.* 3. *A Decoction of the Plant.* 4. *A Wine of the Herb.* 5. *A Lohoch of the Juice of the Plant.* 6. *An Electuary.* 7. *A Powder of the Leaves and of the Seed.* 8. *A Lotion.* 9. *An Ointment.* 10. *An Oil by Decoction.* 11. *A Cataplaſm.* 12. *A Diſtilled Water.*

The Virtues.

XI. *The Liquid Juice.* Taken inwardly to 2 or 4 Ounces or more, according to Age, it will make the Belly Soluble, it opens obſtructions of the Stomach and Lungs, helps Wheezing and shortneſs of Breath; It provokes the Terms, diſpels Vapors, and prevents Hyſterick-fits: it provokes Urine, and expels Sand, Gravel and Tartarous Matter out of the Reins and Bladder. It kills Worms in Children, eases and takes away Stitches in the ſide, removes the oppilation of the Spleen expelling the windineſs thereof; and is ſaid alſo to provoke to Venery. being taken for two or three Days together it ſtops Spitting or Vomiting Blood, coming from the Lungs or Stomach, being put into Green Wounds or old Sores, it cleanſes them and induces their healing The common Doſe is 2, 3, or 4 Spoonfuls at a time in a Glaſs of Wine, or other fit Vehicle.

XII. *The Eſſence.* It has all the Virtues of the *Liquid Juice*, and more powerful than it, for which reaſon it may be given in a leſs Doſe, as from 1 Spoonful to 3 in Water, Broth or Wine. It warms the Stomach, heals Sores and Ulcers in the Mouth or Throat, and given with 10, 15, or 20 Grains of *Myrrh in fine Pouder*, it helps moſt cold and moiſt Diſeaſes of the Womb. It eaſes Pleuritick Pains. helps the Cholick, expels Wind from the Viſcera, reſiſts Poiſon, and is good againſt the Stinging or Biting of any Venomous Creature as of Serpents. Mad Dogs, Scorpions, Hornets, *&c.* and reſiſts the Poiſonous qualities of *Hemlock*, *Henbane*, *Mandrake*, *Muſhromes*, *Nightſhade*, &c. Bathed upon overwearied Members it refreſhes them, eaſes Pains, and Diſcuſſes ſimple Contuſions.

XIII. *The Decoction in Water or Wine.* It has all the Virtues of the *Juice* and *Eſſence*, but nothing near ſo powerful, and therefore may be given Morning, Noon, and Night from 3, to 6, or 8 Ounces, made pleaſant with a little double refined Sugar.

XIV. *The Wine. It is made by a cold Infuſion of the Green Herb or Plant in Wine for 3 or 4 Days. and then preſſing out the Wine; and repeating this Infuſion in the ſame Wine, 3 or 4 times or more. till the Wine is very ſtrong thereof, and at laſt preſſing it out again; after which, letting it ſtand till its fine, the clear is to be decanted and kept for uſe.* It may be done with *Madera Wine*, *White Port*, *White Liſbon*, *Sherry*, or *Canary*, as every one likes beſt. It has the Virtues of the former *Preparations*, is very Stomatick, and a ſafe and ſure Medicine to open Obſtructions of the *Viſcera*, but chiefly of the Womb, which it warms and ſtrengthens very much.

XV. *The Lohoch of the Juice. To every Pint of the Juice, half a Pound of Honey is to be put; and they are to be melted together in a Sand heat, or in Balneo, and the humidity is to be evaporated till it comes to the conſiſtency of a* Lohoch: It opens the obſtructions of the *Bronchia* of the Lungs, and cures Coughs, Wheezings, Heaviſes, ſhortneſs of Breath, Aſthma's, and helps to expectorate cold, tough and impacted Humors in the Lungs or Stomach; and to ſpit forth the particles of a Conſumption, and to heal it that way: it is alſo good to diſcuſs the Tumors or Swellings of the Almonds and Throat, to ſtrengthen the Uvula, and reduce it to its place. Drunk after meat with White Port Wine, from an Ounce to 2 Ounces it provokes Urine and cleanſes the Reins and Bladder it in Sand, Gravel, Stone, and Tartarous Slime.

XVI. *The Electuary. Take of the Pouder of the Seed 2 Ounces; of the Leaves in Pouder, Myrrh in fine Pouder, of each 1 Ounce; Clarified Honey 16 Ounces; mix and make an Electuary.* It has all the Virtues of the *Juice*, *Eſſence*, *Wine* and *Lohoch*, and may be given from 1 Dram to 2 or 3, in any proper Vehicle: It is an excellent Hyſtorick, provokes the Terms, ſtirs up Venery, facilitates the Birth, and brings away the After-birth

XVII. *The Pouder of the Leaves or Seed.* That of the Seed is the ſtrongeſt, or more effectual: It provokes Urine, Stone and Gravel, from the Reins and Bladder, kills Worms in Stomach and Belly, eaſes Pleuritick pains, opens obſtructions of the Liver and Spleen, and provokes Luſt; it is alſo a Remedy againſt the Stinging of Venemous Creatures, the Bitings of Mad-Dogs, the Venom of *Toads*, and other cold Poiſons which ſtupifie and dull the Senſes. It is good againſt the Lethargy, being taken with a little Salt, the Forehead and Temples being rubbed alſo therewith. Doſe a Dram or Dram and half in a Glaſs of Generous Wine. If it is blown up the Noſtrils, it is ſaid to ſtop their Bleeding: and takes away the *Polypus* or fleſhy Excreſcence growing therein. Given to Hens in their Meat in *Winter* time, it is ſaid to make them to lay Eggs all *Winter* more plentifully.

XVIII. *The Lotion. Take of the Juice or Eſſence a Pint; of the Decoction, and Wine, of each half a Pint; Clarified Honey 6 Ounces; mix and diſſolve.* It is good againſt Coughs, Colds, Wheezings, Aſthma's, cauſes expectoration from the Stomach and Lungs, and has all the Virtues of *Juice*, *Eſſence* and *Lohoch*. It is good to gargle with when the Almonds and Throat are Swelled, aſſwages the Tumor of the *Uvula*, and reſtores it to its place, heals Inflamations, Sores and Ulcers of the Mouth and Throat, and ſtops ſpitting of Blood ariſing from the Stomach. It is good alſo for outward Wounds and Sores, they being waſhed therewith. And if it is made without the Honey, it is good to cleanſe the Skin from Scurf, Morphew, Leproſie, and other Deſœdations; and is profitable to waſh old, rotten and ſtinking Sores, or Fiſtula's, and Gangrenes, and ſuch as are fretting and corroding: It heals Green Wounds by waſhing them therewith, and injecting it with a Syringe into them, if they be deep.

XIX. *The Ointment. It is made of the Juice by adding Oil and a little Wax, boiling gently to the conſumption of the humidity.* It eaſes the Gout, and other Pains, and is good to Anoint cold and benummed Members therewith, to bring them to their proper Activity again.

XX. *The Oil by Decoction. It is made of the Juice, or Green Herb bruiſed and boiled to Criſpneſs in Sallet Oil, and then preſt forth, reiterating the Operation three times.* Being Anointed upon a place ſtung with *Nettles*; it is ſaid to be a preſent Remedy, to take away the pain and ſtinging.

XXI. *The Cataplaſm. It is made of the Green Herb being bruiſed in a Mortar.* Being put up the Noſtrils, it ſtops their Bleeding. Applyed to places affected with Scurf, Morphew, Leproſie,

Scab-

Scabbineſs, it cures them; and is ſaid to cure old rotten Sores and Ulcers, tho' the Fleſh was ſeparated from the Bones; Applyed to Diſlocations after the Setting of the Joint, it ſtrengthens the part, drys up Humors, hinders defluxions, and gives eaſe in the Gout, and other like Pains. If it is made with equal parts of the *green Leaves of Nettles*, and *Dwarf Elder Leaves*, and applyed to the Gout, *Sciatica*, or Joint aches in any part, it quickly gives admirable eaſe, and in a little time Cure.

XXII. *The Diſtilled Water from the whole Plant.* It is ſaid to be good for all the purpoſes to which the *Juice* and *Eſſence* are applyed, but nothing near ſo powerful. But outwardly it is Coſmetick, and an excellent thing to waſh Wounds and Sores with, and to cleanſe the Skin from Scurff, Morphew, Leproſy, Scabs, and other Defœdations thereof.

XXIII. *Nota.* The *Garden* or *Roman Nettle* is ſaid to be the moſt effectual of them all: yet where that cannot be had, the others may very well be uſed in its place; and are thought by ſome to be no leſs powerful: and ſome likewiſe think the leaſt of the three, to be no leſs effectual than the greater, and it may be to exceed them in efficacy too.

CHAP. DXIX.

Of NIGELLA; *OR,* FENNEL-FLOWER.

I. *THE Names.* It is called in *Arabick*, *Xamin*; *Sunis*; *Sunici*, or *Sunizi*: in *Greek*, Μελανθιον, ϗ μελάνσπερμον: in *Latine*, *Melanthium*, *Nigella*, *Saluſandra*, *papaver Nigrum*: in *Engliſh* *Gith*, *Fennel Flower* and *Nigella*: *Fuchſius* and *Cordus* took this Plant to be *Cuminum Sylveſtre alterum Dioſcoridis.*

II. *The Kinds.* There are two principal Species of this Plant, *viz.* I. *The Garden Kind*, which are, 1. *Melanthium Hortenſe Nigella hortenſis Flore ſimplici*, Our Garden Nigella with a ſingle Flower. 2. *Nigella Cretica latifolia odorata*, broad Leav'd ſweet Scented Nigella. 3. *Nigella Cretica tenuifolio odorata*, narrow Leav'd ſweet Scented Nigella. 4. *Nigella Citrina Flore albo ſimplici*, ſingle Flowered white Nigella with yellow Seed. All the former are ſingle Flowered; theſe following are double Flowered. 5. *Nigella Damaſcena Flore multiplici*, Blew Nigella with a Double Flower. 6. *Nigilla Citrina Flore albo multiplici*, white Nigella double Flowered. II. *The Wild Kind.* 7. *Melanthium Sylveſtre*, *Nigella Sylveſtris.* Wild Nigella.

The Deſcriptions.

III. *The firſt, or* Garden Nigella with a ſingle Flower. *It has a long ſlender Root, with ſome fibres adjoining to it, from whence ſprings forth a weak and brittle Stalk, and ſome times Stalks, about a foot high, full of Branches; beſet with Leaves, very much cut or jagged, much reſembling the Leaves of* Fumitory, *but much greater. The Flowers grow at the top of the Branches, of a whitiſh blew color, each Flower being divided into five ſmall Leaves Star faſhion. The Flowers being paſt away,*

Nigella Garden.

there come up ſmall Knobs or Heads, having at the ends thereof, 5 or 6 little ſharp Horns or Pointels; and every Knob or Head is divided into ſeveral ſmall Cells or partitions, in which the Seed is contained, which is of a blackiſh color, very like unto Onion Seed, *ſharp in taſte, and of an excellent ſweet ſmell.*

IV. *The ſecond, or* broad Leav'd ſweet ſcented Nigella. *Its Root is yellowiſh, thready and Annual; from whence ſprings up a ſlender weak Stalk, divided into ſome Branches, having long and divided Leaves ſet thereon, but not of the form of ſome of the other* Nigella, *which are* Fennel *like, or Lark Spur-like, but much broader, and parted into ſeveral Diviſions, ſomewhat like to thoſe of* Groundſel, *but cut into leſſer and finer parts. At the tops of each of the Branches grows a ſingle white Flower, like unto the other* Nigella's, *and Heads ſomewhat like them ſucceeding, containing black Seed alſo, and having a ſweet ſmell.*

V. *The third, or* narrow Leav'd ſweet Nigella. *The Roots of this* Candy Nigella, *are ſaid to be harder than the reſt, yet Annual like them: the Stalks which riſe from thence are many, upright and ſlender, parted into ſeveral Branches, with but few Leaves ſet thereon, thoſe below not being ſo finely cut or divided, as are thoſe which are higher. The Flowers are ſmall, yellowiſh, and white, growing at the Tops of the Branches, after which come cornered black Seed, ſharp, and ſomething ſweet, contained in ſmall biformed Seed Veſſels or Heads, which are much like to two ſmall Berries.*

VI. *The fourth, or* ſingle Flowered white Nigella, with yellow Seed. *This ſort of* ſingle Nigella

gella *as has also in our* Gardens, *proceeding first from Seed sent from divers more Southern Countries: but it differs so little from the other named sorts, that it can scarcely be discerned, except it be in the fresher greenness of the Leaves, before it comes to Flower, which then is small like the* Nigella Romana arvensis, *or* Wild Katherin Flower *in* Chap. 410. Sect. 6. *aforegoing of this Book; but of a white color. The Heads also are small, but formed alike, having smaller Seed within them, not black as others are, but yellowish, and without smell, and herein it is something like the* double white Kind *described in* Sect. 8. *following.*

VII. *The fifth, or* blew Nigella with a double Flower. *Its Root is small and yellow, perishing every Year, as the others do: from which spring forth several Green Leaves, finely cut, and into so many parts, that they are finer than* Fennel, *and divided somewhat like to the Leaves of* Larks-heel, *from among which rise up Stalks with many such like Leaves upon them, Branched forth into several parts, at the tops of which, upon each grows one fair large Flower, which consists of three or four rows of Leaves, laid one upon another, of a pale blew color, with a green round Head, compassed with several short threads in the midst, and having five or six such small green* Fennel *like Leaves, under the Flower, to bear it up (as it were) below, adding thereby a greater grace to the Flowers, which at the first shew sometimes white, but quickly after change. The horned Heads hereof are like to the Heads of the* Wild Kind, *which are somewhat rounder and greater, having within them black uneven Seeds, without the least Smell.*

Nigella Blew double Flower'd.

VIII. *The sixth, or* white Nigella double Flowered. *Its Root is yellow, and perishes every Year, as the other does. This* double white Nigella, *has such like Leaves as the last has, but of a yellower green color, and much larger and broader, and very much jagged, being nothing like the fine cut of the Flower, as you may perceive in the single Leaf of this Plant placed near the bottom of the Cut, belonging to that last described in* Sect. 7. *foregoing. The Flowers are formed at first, and later double than the former, and in color white, having no green Leaves under the Flower, as the former has: the Head thereof in the middle, is very like also to that of the last described, but not so great; in which is contained for the most part black Seed, and smelling sweet like the* Roman Nigella *in* Chap. 410. Sect. 4. *aforegoing; which is the only sweet Scented besides this: but the Seed of this is sometimes not so black, but rather a little more white, or yellowish.*

IX. *The seventh, or* Wild Nigella. *It has a long slender Root, with many long strings and fibers adjoining to it, which perish every Winter. The Stalk or Stalks, are a Foot or more high, beset full of grayish Leaves, very finely jagged, almost like the Leaves of* Dill; *the Flowers are like to*

Nigella Wild.

those of the first or Garden Kind *described at* Sect. 3. *aforegoing in this* Chapter, *excepting that these are blewer. The Cods or Pods are like the Heads or Husks of* Columbines, *in which is contained a sweet and pleasing Seed, tho' not so sweet smelling as the last.*

X. *The Places.* The first is the *Garden Kind*, and grows with us in *Gardens*, and so do all the other six Kinds: which in *Candia*, *Italy*, and other hot Countries grow Wild in the Fields.

XI. *The Times.* They are all Annually to be Sown in the *Spring*, if they do not Sow themselves; they Flower in *June* or *July*, and the Seed is ripe in *August*.

XII. *The*

XII. *The Qualities, Specification, Preparations.* and *Virtues* of theſe, are the ſame with thoſe of *Katharine Flower*, or *Roman Nigella* in *Chap.* 410. aforegoing, ſo that we ſhall ſay no more thereof in this place; ſaving that the *Garden ſweet ſmelling Roman Nigella*, is rather to be choſen than any of the others, as being very much the ſtrongeſt, but if that is wanting, then the *firſt Kind* in this *Chapter* is to be firſt admitted, and after that the *ſixth Species* aforegoing or *white double Flower'd Nigella*,

This Cut ſhould have come in, in *Chap.* 140. *Sect.* 3. But was there over-lookt: We have thought good to put it in this place, that it might not be loſt.

CHAP. DXX.

Of NIGHT-SHADE.

OR,

MORELLE.

I. THE *Names.* It is called in *Arabick*, *Hamebathanaleb*; *Hamebalchaick*, & *Hamebalthaleb:* in *Greek*, Στρύχνος, alſo τρύχνος, and τρύχνος; but the firſt is more uſual and is accounted the true Writing: in *Latine*, *Solanum*, & *Solatrum*, *Uva Lupina*, & *Uva Vulpis:* and in *Engliſh*, *Nightſhade* and *Morelle.*

II. *The Kinds.* There are 1. Στρύχνος κηπαῖος, *Solanum Hortenſe vel commune*, The Common or Garden Night-ſhade: of which in this Chapter. 2. *Solanum Lethale*, or *Solanum Majus*, The Deadly Night-ſhade. 3. *Solanum Halicacabum*, or Winter Cherries, of which we have diſcourſed in *Chap.* 122. 4. *Solanum Lignoſum*, *Dulcamara*, or *Amaradulcis*, Woody Nightſhade or Bitter-Sweet, of which we have already ſpoken in *Chap.* 77. aforegoing.

III. The Garden or Common Kinds are, Στρύχνος κηπαῖος ἢ ἥμερος, *Solanum Hortenſe vel Sativum*, *Solanum commune*, *Solanum Vulgare*, Our Common Night-ſhade; it is alſo called *Garden Night-ſhade*, becauſe formerly it was Planted in *Gardens*, tho' not now; but it is yet found plentifully in almoſt all *Gardens* tho' not Planted there, it generally coming up of its own accord. 2. *Solanum Vulgare baccis rubris*; *Solanum puniceum Cordi*; *Solanum rubrum & luteum Geſneri*, Common Night-ſhade red Berried. 3. *Solanum ſomniferum Dioſcoridis*, *Matthioli*, *Geſneri*, *Lacunæ*, *Cluſij*, *Dodonæi*, *Lobelij*, *Cæſalpini*, *Camerarij*, *Lugdunenſis*, *aliorumque*, Sleepy Night-ſhade. 4. *Solanum ſomniferum antiquorum verum*, The true Sleepy Night-ſhade of *Theophraſtus* and *Pliny*. 5. *Solanum Magnum rubrum Virginianum*, Red Night-ſhade, or Red Weed of *Virgina*; this referred to the Kinds of *Solanum* for the likeneſs of the Leaves, altho' much larger; and it is called *Rubrum*, both from the color of the Stalks, and the color which it gives, with which the *Indians* color both their Skins, and the Barks of Trees, with which they make their Baskets, and ſuch like things. 6. *Solanum Circæum majus Circæa major* (becauſe in its outward form it is like the *Circæa Dioſcoridis:*) *Circæa Lutetiana major Lobelij & Penæ*; *Lappa Sylveſtris Tragi* (from its rough Heads and Seed like Burrs:) *Helxine Sylveſtris, ſive fluviatilis major Thalij*, (for that the Leaves are like to *Helxine* or *Paritaria:*) *Ocimaſtrum Verrucarium Geſneri*; *Herba Divi Stephani Tabernæmontani*, *Solanifolia Circæa dicta major Bauhini*, The greater Inchanters Night-ſhade. 7. *Solanum Circæum minus*, *Circæa minor*; *Circæa Lutetianum minor*; *Helxine Sylveſtris minor*; *Solanifolia Circæa minor*, & *Alpina*, The leſſer Inchanters Night-ſhade. 8. *Solanum fruticoſum Americanum*; *Amomum Plinij*; *Pſeudocaſſicum Dodonæi*; *Strichnodendron*, i. e. *Solanum arboreſcens*; *Solanum Americum Dalechampij*; *Solanum Indicum*; *Arboraſa Indiana*, Tree Night-ſhade, or Tree Winter Cherry. *Dioſcorides* his Στρύχνος ὑπνωτικὸς is, *Solanum ſomniferum*; but what his Στρύχνος μανικὸς, *Solanum furioſum*

...ora ad mare, is very doubtful; some will have it to be the *Solanum Lethale*, but others deny it, and will have it to be another Plant, of which we shall speak more in the next Chapter.

The Descriptions.

IV. *The first*, or Our Common or Garden Night-shade. *Its Root is white and a little Woody (after it has perfected its Flowers and Fruit) with many small Fibres adjoining to it: and it sends up an upright, round, green hollow Stalk, about a Foot, half a Yard, or two Feet high, spreading itself forth into many Branches, on which grow many dark green Leaves, something broad, and pointed at the ends, soft and full of Juice, larger than the Leaves*

Night-shade Garden.

of Basil, *else something like, and a little unevenly waved about the edges. At the Tops of the Stalks and Branches, come forth three or four, or more white Flowers, made of five small pointed Leaves apiece, standing on a Stalk together, one by, or above another, with yellow Pointels in the middle, composed of four or five yellow Threads set together, which afterwards turn into so many pendulous Berries, hanging like those of* Ivy, *which are green at first, and black afterwards when they are ripe, and are of the bigness of a small* Pea, *full of Juice, and containing within each Berry small whitish round flat Seed. The whole Plant is of a waterish insipid Taste, but the Juice within the Berries is somewhat Viscous, like unto a thin Mucilage, and is of a cooling and binding quality.*

V. *The second*, or Common Night-shade Red Berried. *This is in all respects like the former* Common Night-shade, *in its Roots, Stalks, Branches, Leaves, Flowers, and manner of growing, excepting that its Leaves are somewhat harder and rougher, and the Berries when they are ripe are of a yellowish red color; the whole Plant growing also a little bigger than the former. In hot Countries its Root abides many Years, but scarcely so with us: it seems that this Plant is but a degenerate Species from the former, by reason of our Climate, as it happens in* Sweet Fennel Seed, *which being Sown with us, in a short time becomes (by transplantation into our Country) changed into our* Common Fennel.

VI. *The third*, or Sleepy Night-shade. *Its Root is thick, long, and hard, and of a brownish color on the out side. It rises up with several thick, round, soft, Woody Stalks, divided into other Branches, on which grow many soft, woolly, but green, broad, round Leaves, very like unto* Quince Leaves; *two always set at a Joint, one against another, of a something hot Taste, as* Clusius *says. The Flowers come forth at the Joints with the Leaves, all along the Stalks and Branches, 3 or 4 together, round about them, which are long and hollow, ending in 4 somewhat long and pointed Leaves, of a pale white color; which being past, green Berries come forth in their places set in woolly Husks, which being ripe are of a yellowish red color, and larger than those of the former.*

VII. *The fourth, or* True Sleepy Night-shade of *Theophrastus* and *Pliny*. *Its Root is somewhat great and Woody, covered with a whitish Bark, not very thick, of an ill Smell, and insipid Taste. It springs up with 2, or 4, or more thick, round, straight, whitish Stalks, about a Yard or more high, spread out into some other Branches, hard to break; set with somewhat broad Leaves very like unto* Quince Leaves, *standing on small foot Stalks, not always 2 at a Joint, but many standing singly at the Joints: from the middle of the Stalks upwards, come forth several reddish Flowers together, consisting of 4 Leaves a piece; after which follow small striped and pointed greenish Husks, but red when they are ripe, very like unto Bladders of* Winter Cherries, *but much less, with a red Berry within it in like manner, containing within it several small Seeds.*

VIII. *The fifth, or* Red Night-shade, *or* Red Weed of *Virginia*. *Its Root is white, and grows very great with us, but perishes if it is not defended from the Frost in* Winter, *which usually rot it: but in its Native places, it grows as big as a Man's Leg, (and such I have seen of it in* Carolina, *and other Southern parts of* Florida) *and above a Foot long, which being cut cross has like a* Bryony Root, *many circles to be seen in the middle. It is a large Plant, and takes its Name of* Solanum *from the likeness of its Leaves. It rises up with a great thick, round, reddish Stalk, of the thickness of ones Thumb at least; and four or five Feet high, or more; set with many very large, fresh, green Leaves full of Veins (but without any order,) some greater, and some smaller, and sometimes many of them turning reddish; from the Joints where the Leaves stand, from the middle of the Stalk upwards, come forth many small foot Stalks with Flowers, which are very small, consisting of four Leaves apiece, of a pale red, or blush color, divers standing together as it were in a small long cluster, which afterwards bring forth small blackish round Seed, 4 usually set in one Husk; which seldom come to ripeness with us in* England.

IX. *The sixth, or* Great Inchanters Night-shade. *Its Root is small, very white, and full of Joints and Branches, by which it shoots forth and creeps every way under Ground, quickly taking up a great compass. It rises up with one or more*

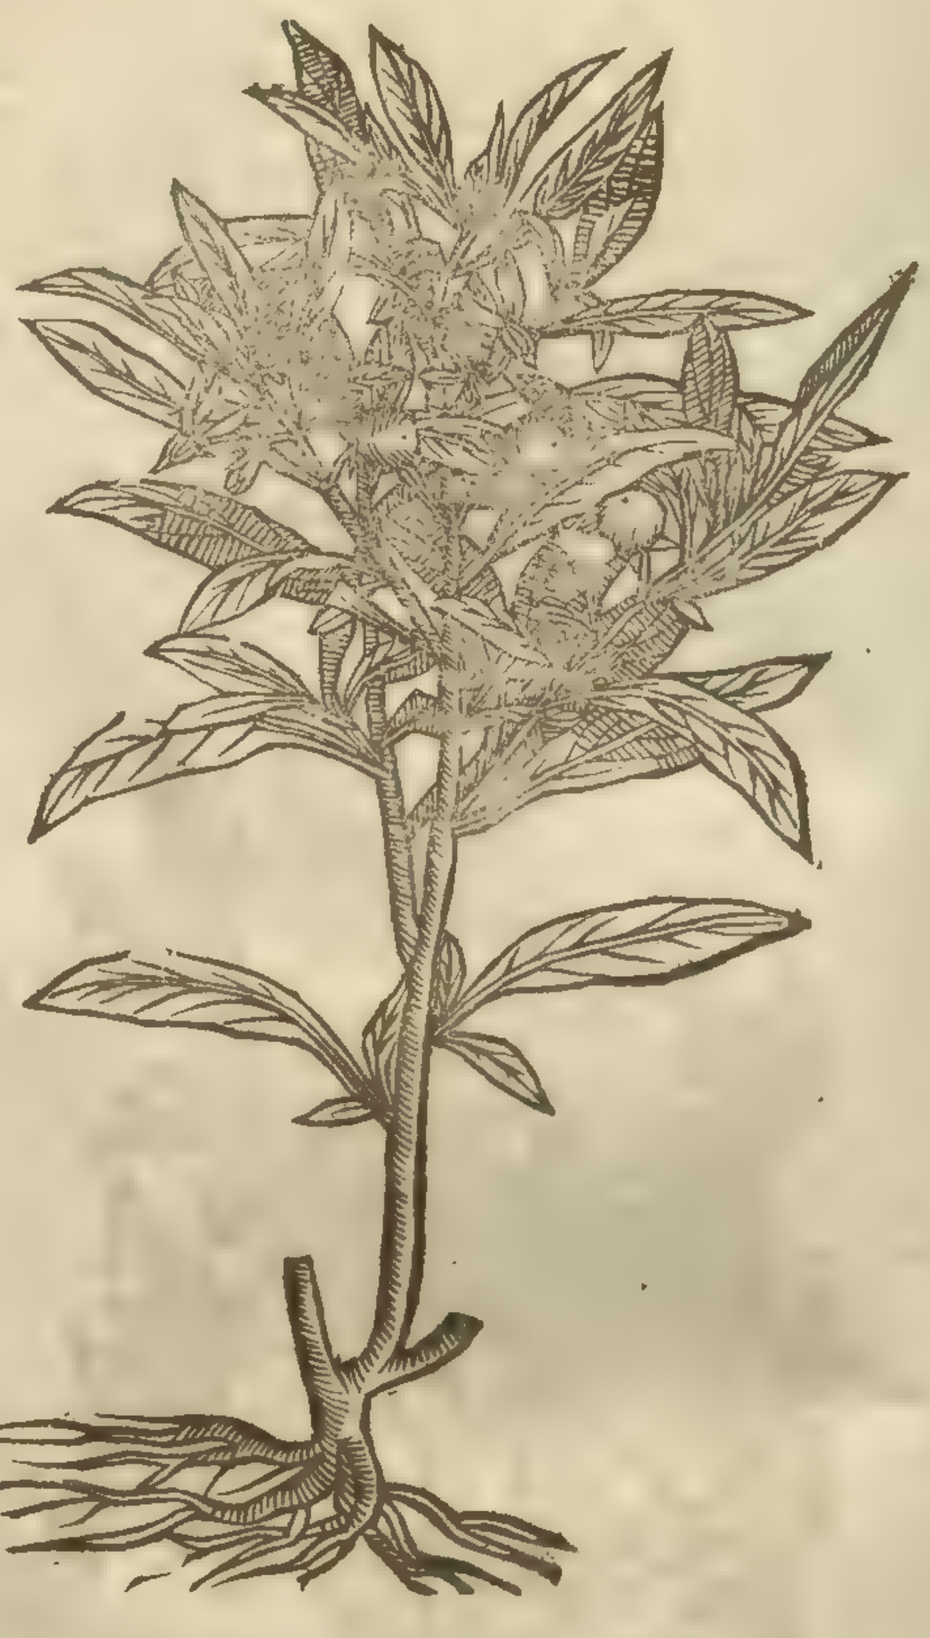
round and jointed Stalks, moſt commonly ſtanding upright, yet ſometimes leaning down to the Ground, and taking Root again at the Joints: it grows about a Foot or half a Yard high, eſpecially if it grows in a moiſt ſhady place, with two Leaves ſet at every Joint, each of them growing upon a pretty long foot Stalk, which are broad, and round almoſt at the bottom, but very long pointed at the end, ſomething waved about the edges, much like to the Leaves of Nightſhade *as ſome think, or rather like to thoſe of* Pellitory of the Wall, *being of a ſhining green color on the upper ſide; and tender, ſoft and gentle in handling; but a little hairy, and of a dark grayiſh color underneath. From the middle of the Stalk almoſt upwards, the Flowers grow in Spiek faſhion, many ſet together, one above another, which ſhew to be of a dark brown color, whileſt they continue Budds, not blown open, but being blown are ſmall Star like Flowers, conſiſting of five Leaves apiece, daſht over, eſpecialy at the brims or edges, with a light ſhew of bluſh, with many brownish yellow Threads in the middle; where, after they are paſt, ſmall, rough, round Heads come forth, like unto ſmall* Burrs, *ſticking to Garments in like manner, in which are contained ſmall ſhining black Seed, ſomething like unto the Seed of* Parietaria, *but leſſer.*

Inchanters Nightſhade.

X. *The ſeventh, or* Leſſer Inchanters Nightſhade. *This in its Root, Stalks, Leaves, Flowers, Seed, form, and manner of growing, and indeed in all reſpects is like to the former, and differs from it only in that it grows much leſſer in every part, and this, altho' it grows in the ſame Ground or place. Theſe two Plants obtained the Name of* Inchanters, *from* Circe *the Inchantreſs, they being ſomething like the* Circea Dioſcoridis, *and not from any Inchanting Power or Virtue that is in them.*

XI. *The eighth, or* Tree Night-ſhade, *which is a beautiful Plant in reſpect to its green Leaves and red Berries. It has a ſmall long woody yellow ſtringy Root, with many Fibres adjoining to it: from whence ſprings up a Woody Stem or Stalk as thick as one's finger or Thumb, and about 3 or 4 Feet high, covered with a whitiſh green Bark, ſpread out into many green Branches, having on them many fair green Leaves,*

Tree Nightſhade.



ſometimes unevenly waved on the edges, narrower than any Nightſhade *Leaves, and very near reſembling the Leaves of* Capſicum *or* Guinny Pepper, *(whence the Name* Pſeudo Capſicum, *for it has nothing of the nature of that Plant in it) but ſmaller, and narrower, falling away in the* Winter, *and ſhooting freſh again in the* Spring. *The Flowers grow often 2 or 3 together at the Joints of the Branches with the Leaves; they are white and Star faſhioned, but ſometimes turning themſelves back, with a yellow Pointel in the middle, very like to* Nightſhade *Flowers; when they are paſt, ſmall green Buttons come in their places, which afterwards come to be pleaſant round red Berries, of the bigneſs of ſmall* Cherries *when they are ripe, which with us ripen not till about* Chriſtmas; *in which are contained many flat, ſmall, whitiſh Seed. All the whole Plant, as well Leaves and Flowers as Seed, are without either Smell or Taſte.*

XII. *The Places.* The firſt grows Wild with us under old Walls, and among Rubbiſh, by common Path Ways, by Hedge ſides, and banks of Ditches, both in hot and cold Countries; and in all Climates it grows naturally or ſpontaneouſly in moſt *Gardens*, without any Sowing it, or Planting it. The ſecond and third grows Wild only in hot Countries, as *Spain*, *Italy*, &c. The fourth *Alpinus* ſays, grows in *Candia*. The fifth in *Virginia*, *Carolina*, *New-England*, and other Provinces of *Florida*. But theſe laſt four grow with us only

in

in *Gardens*. The fixth and feventh grow in moift and fhady places, and fome times at the Roots of old rotten Trees in Woods, and fometimes by Hedg-fides, and borders of Fields. The laft is thought to come from the *Weft-Indies*, but it has been an Inhabitant a long time in our *Englifh Gardens*, where it Lives and continues reafonably well, fo that fome care be taken of it in Extremity of *Winter*.

XIII. *The Times.* They all except the laft dye away in *Winter*, and come up freſh again in the *Spring*. The third or *Sleepy Nightſhade*, by reaſon it comes out of a warmer Country, will ſcarcely endure, but periſh by the extremity of our *Winters*, unleſs it be well fenced or defended. The two firſt which dye every Year, and riſe of their own Sowing, ſpring not out of the Ground, till late in the Year, as about the latter end of *April* or beginning of *May*. The firſt five, Flower in the *Summer* Months, and continue Flowering till *Autumn is well ſpent*, after which their Berries come to ripeneſs. The ſixth and ſeventh ſpring up in *April*, are in Flower in *June*, and give their ripe Seed in *Auguſt*, then dye away to the Ground. the Roots abiding ſafe all *Winter*. The eighth Flowers ſometimes in *June*, but generally in *July* and *Auguſt*; and the Fruit is ripe about the latter end of *December* or begining of *January*.

XIV. *The Qualities.* Of all theſe Plants before deſcribed, the firſt is only, or chiefly uſed in Phyſick. It is cold in the third Degree, and dry in the ſecond: Anodyn, Aſtringent, Coſmetick. Diuretick, Repercuſſive, Hyſterick, Nephritick and Arthritick.

XV. *The Specification.* It is prevalent againſt Inflamations of the Throat and Tonſils, eaſes the Head-ach and Gout, provokes Urine, and gives eaſe in the Strangury.

XVI. *The Preparations.* You may have herefrom, 1. *A Liquid Juice.* 2. *A Decoction in Water.* 3. *An Inſolated Oil.* 4. *An Ointment.* 5. *A Peſſary.* 6. *A Cataplaſm.* 7. *A Pouder of the Bark of the Root.* 8. *A Pouder of the Seed.* 9. *A Decoction of the Root in Wine.* 10. *A Diſtilled Water of the whole Herb.* 11. *A Collyrium.* 12. *A Lotion.*

The Virtues.

XVII. *The Liquid Juice of the Herb or Berries.* It is of uſe to cool vehement Inflamations, whether inwardly given or outwardly applyed, being no ways dangerous as that of the *Solanum Lethale* is, or as the *Solanum Somniferum*, which is ſcarcely ſafe for internal uſes. But however the Juice of this *Common Kind* by reaſon of its great coldneſs, muſt be given in due proportion; being firſt clarified, it may be given (mixed with a little Honey) to a Spoonful or ſomething more: It cures an Eryſipelas by Bathing therewith, and dipping double Linnen Cloths in it, and laying it over the Sore, and is good againſt creeping and corroding Ulcers. Bathed upon the Temples, it takes away the heat and Inflamation of the Eyes. The *Juice of the Somniferous*, comes nearly to the Quality of *Opium*, to procure Sleep, but it is ſomething weaker: dropt into the Ears, it preſently eaſes their pain.

XVIII. *The Decoction in Water.* It has all the Virtues of the *Juice*, but not full out ſo powerful, and may be given inwardly againſt Fevers to three or four Spoonfuls. The Eyes waſhed therewith, it takes away their heat, inflamation, and eaſes their pain.

XIX. *The Inſolated, or Decocted Oil. It is made of the Juice or bruiſed Herb, with Oil Olive or Oil of Roſes.* Anointed upon Inflamations, Shingles, and Fiery breakings out, it cools, eaſes, and heals them.

XX. *The Ointment. It is made of the Juice mixed with Wine Vinegar, Oil of Roſes and Ceruſe, ground together for a conſiderable time in a Leaden Mortar, till it comes to the conſiſtence of an Ointment.* It is good to Aneint with in all Heats and Inflamations, *Anthonies* Fire, Shingles, Fiery Puſtules, and other like eruptions, in which ſo part vehemently afflicted with heat: it eaſes the Head-ach, gives relief in Frenzies, the Temples and Fore-head being Anointed therwith, and cools Inflamations of the Eyes. And is profitable alſo againſt Ringworms, Tetters, Shingles, Herpes and all ſorts of running, fretting, eating Sores or Ulcers, weeping and moiſt Fiſtula's, &c.

XXI. *The Peſſary. It is made of the Green Herb and Root beaten together, and formed with Flax or Cotton, and then dipt into the Juice.* Being put up the Womb, it ſtops the overflowing of the Terms, and the Flux of the Whites in Women.

XXII. *The Cataplaſm. It is made of the Green Herb, beaten in a Mortar, and brought to a moderate Conſiſtency with Barley Flower.* Applyed to the Teſticles or Cods, it eaſes the pain and diſcuſſes the Swelling. Applyed to the place in a Megrim, or other Head-ach, it preſently eaſes the Pain: and diſcuſſes hot Tumors in the Throat: It gives preſent eaſe alſo in the Gout.

XXIII. *The Pouder of the Bark of the Root.* Taken to a Dram in Wine, it eaſes pain like *Opium*, and procures Reſt and Sleep, but this Doſe is not to be exceeded for fear of danger.

XXIV. *The Pouder of the Seed.* It may be taken in White *Port* or *Lisbon* Wine, from half a Dram to a Dram: ſo taken, it powerfully provokes Urine, and is profitable againſt the Dropſy, and takes away heat and ſcalding in Piſſing: but it ought not to be taken too often, nor in too great a quantity, becauſe it is apt to induce a Frenzy: The remedy of which is (as Authors ſay) to Drink liberally of Warm Honied Water.

XXV. *The Decoction of the Root in Wine.* Being held in the Mouth, it gives eaſe in the Tooth-ach: and *Pliny* ſays, it is good to faſten looſe Teeth.

XXVI. *The Diſtilled Water of the whole Herb.* It has all the the Virtues of the *Liquid Juice*, and may be uſed in the ſame manner, but in a greater quantity or Doſe: And Authors ſay, that the *Water* is fitteſt and ſafeſt to be taken inwardly, and in that reſpect prefer it before the *Juice*.

XXVII. *The Collyrium. Take of the Juice of the Root* 3 *Ounces*; *Clarified Hony* 2 *Ounces*; *Vinegar half an Ounce*; *mix them.* Put into the Eyes, it eaſes their pain and ſmarting, cools their heat or Inflamations; it ſtrengthens weak Eyes, and clears the ſight.

XXVIII. *The Lotion. Take of the Clarified Juice* 8 *Ounces*; *Red Port Wine* 4 *Ounces*; *Clarified Hony* 2 *Ounces*; *mix them for a Lotion.* It eaſes the pains of the Teeth, cleanſes old, running and putrid Sores and Ulcers, and heals Cankers, and other like Sores in the Mouth and Throat, they being often waſht and gargled therewith.

CHAP. DXXI.

Of NIGHT-SHADE DEADLY.

OR,

DWALE.

I. *THE Names.* It is called in *Greek*, Στρύχνος θανατώδης; καὶ Στρύχνος θανάσιμος: in *Latine*, *Solanum Lethale*; *Solanum Lethiferum, vel Lethificum*: *Solanum Deleterium*: in *Engliſh*, *Deadly Nightſhade*, and *Dwale*.

II. *The Kinds.* There is, 1. *Solanum Lethale* (properly ſo called) *Solanum majus Matthioli, Cæſalpini & Camerarij*; *Solanum hortenſe nigrum Tragi*; *Solanum ſomniferum, Lobelij & Lugdunenſis*; *Solanum Lethale Cluſij, Dodonæi, & Thalij*; *Solanum Sylvaticum Geſneri, Anguillaræ, Guilliandini, & Dodonæi*; Deadly Nightſhade, or Dwale. 2. *Solanum Lethale minus*, The leſſer Deadly Nightſhade. 3. *Solanum Somniferum alterum Matthioli, Camerarij, Geſneri & Lugdunenſis*; *Solani Lethali aliud genus Dodonæi*, The other Sleepy Nightſhade, which *Dodonæus* calls, an other Kind of the Deadly Nightſhade.

The Deſcriptions.

III. *The firſt, or* Deadly Nightſhade, or Dwale. *Its Root is great, growing down deep into the Ground, and ſpreading great Branches therein;*

and beſides creeping under Ground, riſing up in ſeveral places diſtant, quickly ſpreading over a Ground. It grows ſometimes to the height of a Man, but uſually it riſes up not above 3 or 4 Feet high or ſomething more, having round green Stalks, ſet with divers large Leaves much greater than any of thoſe before, ſmooth and of a dark green color, ſet upon very ſhort foot Stalks; among which at the Joints with the Leaves, come forth ſeveral long hollow Flowers, dented at the brims, of a faint deadiſh purple color, in a green Husk, growing upon a ſhort foot Stalk, which being fallen away, round Berries ſucceed, which are at firſt green, but afterwards when ripe, come to be of a ſhining black color, like ſhining or poliſhed Jet, full of a purpliſh Juice, many whitiſh Seeds being contained within it; the whole Plant has no good Taſte nor Smell, but unſavory, bitter, and very pernicious; the Berries are a little ſweetiſh and luſcious, but not pleaſant to an acute Palate.

IV. *The ſecond,or* Leſſer Deadly Nightſhade. *This in its Roots, Stalks, Leaves, Flowers, Berries, Seed, Smell, Taſte, form and manner of growing, is much like the laſt, ſaving that in this the Leaves are leſſer,*

Nightſhade Deadly leſſer.

and of a darker green color, and ſtand upon longer foot Stalks, and the Flowers which are Bell faſhioned as the other, are not ſo great and large as they are.

V. *The third, or* other Sleepy Nightſhade, called by *Dodonæus*, the other Kind of Deadly Nightſhade. *Its Root is great, and ſpreads it ſelf out into many Branches under Ground, with many Fibres adjoining to them. It has an upright creſted or cornered Stalk, with many Leaves thereon, being longer and narrower, than thoſe of the* True Sleepy Nightſhade, *and more inclining downwards to the Ground, full of Veins running longwiſe and Traverſe therein. At the Joints of the Stalk, from the middle part upwards, come forth ſeveral pendu-*

lous

Other Sleepy Nightshade.

lous Flowers, *hanging by very long Stalks, being long and hollow like unto a* Bell-Flower, *of a purpliſh color, each of them ſet in a large green Husk, dented or cüt into five parts at the edges, but not very deep: in which after the Flower is paſt, comes forth a round Berry, of a deep blackiſh purple color, encloſed therein to the middle, and having a Crown like form at the Head of the Berry, which has a Wine like Juice, and many ſmall white Seeds within it.*

VI. *The Places.* The firſt and ſecond grow Wild, not only in ſeveral Woods in *Germany*, but alſo in a great number of places in *England*, as in the Caſtle Yard of *Framingham* in *Suffolk*; under the Wall of *Jeſus Colledge* in *Cambridge*, and in many other places of that Country: at *Ilford* in *Eſſex:* at *Croydon* among the *Elms*, at the end of the Town: in *More Park:* in the *Park* of formerly Sir *Percival Heart*, at *Lellinſtone* in *Kent*, on the *Conny Borrows*; in *Barling Park* likewiſe: alſo in the Way going from S. *Mary Cray*, to *Foots Cray*, over againſt a great Field called *Wenael.* In former Years it was found growing in an *Orchyard* in *Lyn-Regis* in *Norfolk*, near the *South Gate*; where it bore noble and great Berries as large, as large *Black Cherries*; of which I remember a little Boy of about 7 Years old, (*Job Taylor* by Name, a Gardiners Son there by) eat ſeveral of them, by which he was Poiſoned, and died in a violent Fever, ſwelled in the Stomach and Belly, the whole Body being as red as Fire, and all in about 2 Hours time; the number of the Berries, according to the beſt of my remembrance, did not exceed a dozen; for this Accident ſake, the Owner of the *Orchard*, rooted it out of his Ground. The laſt grows in the Eaſt Countries in *Syria*, as alſo in *Italy* near *Trent*; but with us only in *Gardens*, where it is Nurſt up by the more Curious. The firſt is alſo found plentifully in *Holland* in *Lincolnſhire*, and in the *Iſle of Ely*, at a place called *Wal-*

ſoken in *Norfolk* near *Wisbich:* it was alſo found growing near *High-Gate*, not far from the Pond on the left Hand, as *Gerard* ſays: It grows generally in untill'd places, near High-ways, near Hedges and in the corners of Wood-land Grounds, and ſometimes in Marſhy places.

VII. *The Times.* Theſe Plants flouriſh all the *Spring* and *Summer:* They Flower in *July* and *Auguſt:* and their Fruit is ripe in *Auguſt* and *September*, after which they fade and dye away.

VIII. *The Qualities. Deadly Nightſhade* is ſaid to be cold in the fourth Degree, and dry in the third: Anodyn, Narcotick, Repercuſſive, Arthritick, and Deleterious.

IX. *The Specification.* It is prevalent againſt Inflamations, Shingles, *Anthonies* Fire, Ophthalmies, and to cauſe reſt; but by reaſon of its Mortiferous quality, is ſcarcely ever given inwardly.

X. *The Preparations.* You may have herefrom, 1. *A Liquid Juice of the Leaves.* 2. *An Ointment.* 3. *A Cataplaſm.* 4. *A Diſtilled Water.*

The Virtues.

XI. *The Juice of the Leaves.* Uſed either alone, or mixed with a little Vinegar, and Bathed upon the Fore-head and Temples, upon any great Diſtemperature, or in a Frenzy, long watchings, or in a long Sickneſs and Weakneſs, it cauſes Reſt and Sleep. It takes away the Violent pains of the Head from a hot cauſe, allays Inflamation, and is good againſt the Shingles and an Etyſipelas or *Anthonies* Fire, and all other Fiery and running Cankers, it cools them, and ſtops their ſpreading: applyed alſo in the Gout, it eaſes the pain, and repells the Humors, if in the begining, but is not proper to be Applyed if the Diſeaſe has been of any continuance, leſt it ſends it up into the Stomach, to the Patients farther dettiment.

XII. *The Ointment.* It has all the Virtues of the *Juice*, it cools, allays Inflamations, eaſes pain, cauſes Reſt and Sleep, being anointed upon the proper parts; and is found to be a very good thing againſt the Diſtemper of the Spleen, being anointed upon the Region thereof.

XIII. *The Cataplaſm.* It has all the Virtues of the *Liquid Juice*; beſides which, being applyed to ſimple Contuſions, it repercuſſes the flowing Humor, and cures them. It eaſes the pains of the Gout upon the ſpot; and in the beginning prevents the afflux of the Humor.

XIV. *The Diſtilled Water.* It has all the Virtues of the *Juice*, but much weaker. It may be given inwardly from 1 Ounce to 2 (as Authors ſay) and that without any danger: it is good againſt Heart burning, and Inflamations of the *Viſcera*, and being bathed upon the Eye Lids, or put into the Eyes, it is good againſt Ophthalmies, or Inflamations there: but it is much more powerful for this purpoſe, if it is mixed with equal parts of the clarified, or filtrated Juice. It cools and removes the Fluxion, to admiration.

XV. *Nota.* This Plant is of ſo Malign and Deſtructive Qualities, that neither its *Juice*, *Roots*, *Leaves*, or *Berries*, ought to be given inwardly; but the *Berries* are a certain Poiſon even upon the ſpot, as appears by the ſad Example of the Boy, before related, who was our next Neighbors Son, and my Play Fellow, my ſelf being much about the ſame Years: I eat one or two of the *Berries* at the ſame time, but by reaſon of their Luſhious

or Maukiſh Taſte, eat no more of them, and for that reaſon eſcaped the danger.

This Cut ſhould have been placed in *Chap.* 77. aforegoing; but that it might not be loſt, we have put it at the end of this Chapter.

Wood-Night-shade.

CHAP. DXXII.

Of NIPPLE-WORT;

I. THE *Names.* It is called in *Greek*, Λαμψάνη: in *Latine*, *Lampſana*, alſo, and is thought to be the true *Lampſane Dioſcoridis:* in *Engliſh Nipple-wort.*

II. *The Kinds.* Some will have this Plant to be a Species of *Sonchus* or *Sowthiſtle*; others of *Hieracium*, or *Hawkweed*; if it is a Species of either, it ſeems rather to be of the latter; I rather think it to be a peculiar Plant *ſui generis*, or of its own kind. The three following Species we ſhall deſcribe to you, *viz.* 1. *Lampſana Vulgaris*, *Lampſana Dioſcoridis*; *Lampſana Lobelij*, *Dodonæi*, *Lugdunenſis*, *Thalij & Camerarij*; *Papillaris Camerarij*; *Sonchis Cognatum Geſneri*, *& Sonchi genus*; Our Common Nipple-wort. 2. *Soncho affinis Lampſana Sylvatica*; *Bauhini*; *Sonchus Sylvaticus ſecundus Tabernæmontani*, Wild or Wood Nipple-wort, Baſtard Nipple-wort. 3. *Lampſana Auſtriaca Parkinſoni*; *Sonchus Lævior Pannonicus quartus Flore purpureo Cluſij*; *Lactuca Montana Flore purpureo Bauhini*, Cluſius his Auſtrian Nipple-wort.

The Deſcriptions.

III. *The firſt*, *or* Our Common Nipple-wort. *Its Root is ſmall and thready, and being broken or cut, yields a white bitter Milk or Juice. From whence ſpring up one or more upright hard Stalks, on which grow dark green Leaves, from the bottom to the tops, but leſſer ſtill as they grow higher: in ſome places whole without dents on the edges, and in others with a few uneven cuts therein, ſomething after the manner of* Hawkweed. *The tops of the Stalks have ſmall long Branches, which bear many ſmall Star like yellowiſh Flowers on them, which convert into ſmall Seed.*

Nipple-wort Common.

IV. In *Gerard*, the former is thus Deſcribed. *Its Root is ſmall Fibrous and white; its Leaves are roughiſh and hairy, of an over-worn green color, deeply cut or indented, on both ſides like the Leaves of ſmall* Turneps. *The Stalks grow to the height of two or three Cubits, and ſometimes higher, dividing themſelves towards the top, into ſundry little Branches, whereon grow many ſmall Flowers, like thoſe of* Hieracium *or* Hawkweed: *which decaying are ſucceeded by little Creſted Heads, containing a longiſh ſmall Seed, ſomewhat like to* Lettice *Seed, but of a yellowiſh color. The Plant is alſo Milky, and the Stalk Woody.*

V. *The ſecond, or* Wild, *or* Wood, *or* Baſtard Nipple wort. *This* Wild *or* Wood Kind *differs not much either in Root, Stalks, Leaves, Flowers, Seed, or manner of growing, from the former, being*

being very like unto it; but its Leaves are somewhat broader; and it has a greater store of Branches, but in its Flowers and other particulars, it differs not much.

VI. *The third*, or Clusius his Austrian Nipplewort. *Its Root is small, fibrous, and enduring many Years. And it has several slender smooth and soft Stalks, not easy to break, a Cubit high or more; on which are set without any order, somewhat long and narrow Leaves, broadest in the middle, and sharp at the ends, waved a little about the edges, and compassing them at the bottom, yielding a little Milk. From the upper Joints with the Leaves, spread forth small firm Branches, yet a little bending, bearing each of them four or five long green Husks, and in them small purplish Flowers, of five Leaves apiece, nicked in at the broad ends, with some small Threads in the middle, which turn into Downe, which is carried away with the Wind.*

VII. *The Places.* The first grows almost every where by High-ways, upon Walls made of Mud or Earth, in Stony places, upon the Banks of Ditches, and Borders of Fields, in most Counties of *England*. The second near Wood-sides and Hedge-rows. The third *Clusius* found in *Hungaria*, and in *Saxonies Hareynia Sylva*, and other places; but with us it is only found Nurst up in *Gardens*.

VIII. *The Times.* The first Flowers from *May* to the end of *August*, and the Seed is ripe in *July*, *August*, and *September*. The second and third Flower in the *Summer* Months, and their Seed is ripe soon after.

IX. *The Qualities.* The first which is that which is only used, is temperate in respect to heat or cold, dryness or moisture. Digestive, Abstersive, of thin parts, and able to absorb the Virulency of sharp and corroding Humors.

X. *The Specification.* It is peculiar against Shingles, breakings out of the Lips after Fevers, sharp and running Sores, and the exulcerated Nipples of Womens Breasts, whence it came to be called *Papillaris* or *Nipple-wort*.

XI. *The Preparations.* You may have therefrom, 1. *A Liquid Juice.* 2. *An Ointment.* 3. *A Cataplasm.*

The Virtues.

XII. *The Liquid Juice.* It cools Inflamations, discusses Tumors, and is good against sore Eyes, Shingles, Pimples, and breakings out of the Face and other parts; applyed to the Sore Nipples of Womens Breasts, it heals them.

XIII. *The Ointment made with Hogs Lard, and a little Bees Wax.* It is one of the best things in the World to heal Womens sore Breasts and sore Nipples being applyed: it also heals superficial running Sores in other parts.

XIV. *The Cataplasm.* It has all the same Virtues of the *Liquid Juice* and *Ointment*: Absorbs the acid and corroding Humor, and cures simple Contusions.

CHAP. DXXIII.

Of OAK of CAPPADOCIA.

I. *The Names.* It is called in *Greek*, Αμβροσία: (*quasi τὸ τῶν θεῶν βρῶμα, Deorum Cibus*, the Food of the Gods, from its excellent fragrancy, and for that it seems to give long life to such as eat thereof, that they might be held to be in a manner Immortal.) In *Latine*, *Ambrosia Hortensis*; *Ambrosia vera*; *Ambrosia Maritima Bauhini*, *Ambrosia Sativa Camerarii*, *Dodonæi*, *Lobelii*, & *Tabernæmontani*; *Artemisia secunda Plinij*; *Artemisiæ genus Gesneri*, who with *Anguillara* and *Camerarius* suppose it also to be *Conyza Hippocratis*; *Artemisia monoclenes Lugdunensis*. in *English*, *Oak of Cappadocia.*

II. *The Kinds.* It is a singular Plant. *Unius generis*; I know other Authors make two or three sorts of *Ambrosia*, but two of them are other Herbs, which have no relation with this, as the *Coronopus rectus & Creticus ramosus Raelij*, *Bucks-Horn*, or *Wart-Cresse*, of which we have already discoursed in *Chap.* 91. aforegoing: but what we treat of here is the first Kind, both of *Lobel* and *Gerard*, which is the True *Garden Ambrosia*, those other being *Ambrosiæ agriæ*, and Plants of another Species.

The Descriptions.

III. *This Plant*, or Oak of Cappadocia *has a long slender Root, spreading itself forth into many Branches and Fibres; from which comes forth one hoary, white, striped, or streaked Stalk, rising to be two Feet high at least, in any good sort of Ground, which divides or spreads it self out into many Branches, from the very bottom, on which grow without any certain order, Leaves somewhat large, upon pretty long foot Stalks, very much cut in on the edges, somewhat resembling the divisions of* Mugwort *Leaves, especially the ends of them, but much smaller than they, being all whitish or hoary upon the green, and of a very pleasing Smell, not so hot or strong as* Botrys *or* Oak of Jerusalem. *At the tops of all the Branches both great and small, grow the Flowers, which are small, round, yellow, Mossie Buttons, never opening abroad, nor bringing any Seed, but fall away like Chaff. But under these Flowers from among the Leaves, come forth small short Stalks, bearing two or three or four small rough and pointed Heads, without any Flowers before them, in which is contained small, round, blackish Seed, almost like the Kernels or Stones of Raisons or Grapes.*

IV. *Gerard* gives us another description, which being compared with the former, will more excellently declare and set out the Plant; and it is as follows. *The Root and whole Plant perishes with us in* England *at the first approach of* Winter. Dioscorides *says, that it grows about three Handfuls high, but in* Gerards *Garden, it grew to be about three Feet high, yielding many weak, crooked, and streaked*

ſtreaked Branches, dividing themſelves into ſeveral other ſmaller Branches, having from the midſt to the top thereof, many Moſſie, yellowiſh Flowers, not much unlike to thoſe of Our Common Wormwood, *ſtanding one before and above another in good order. And the whole Plant is as it were covered over with Bran or a Mealy duſt. The Flowers do change into ſmall, prickly, cornered Buttons, much like unto* Tribulus Terreſtris (*in* Chap. 106. *aforegoing*) *in which is contained black, round Seed, not unpleaſant in either Taſte or Smell. The Leaves are in ſhape like unto the Leaves of* Mugwort, *but thinner and more tender: all the whole Plant is hoary, and yields a pleaſant ſcent.*

V. *The Places.* It grows Naturally in *Cappadocia*; and it is a Native alſo (as *Bellonius* ſays) in many Places of *Aſia Minor:* but with us, and ſo likewiſe thro' all *Europe*, it is only Nurſt up, and found growing in *Gardens.*

VI. *The Times.* It ſeldom Flowers in our Country till *Auguſt*, and very rarely gives us any ripe Seed; for the leaſt cold Night coming before it Seeds, makes it preſently dye away and periſh, ſo that for the moſt part (without very great care) we are to ſeek out for Seed, from *Spain*, *Italy*, and other like places.

VII. *The Qualities.* It is hot and dry in the ſecond Degree, and of thin and ſubtile parts. It Incides, is Abſterſive, Aſtringent and Pectoral.

VIII. *The Specification.* It ſtops a Fluxion of Rheum or Humors into the Stomach and Lungs, cures Fluxes of the Bowels: and (as *Gerard* ſays) cuts tough Flegm, and is good for ſuch as are ſhort Winded, and cannot eaſily draw their Breath.

IX. *The Preparations.* You may make herefrom, 1. *A Liquid Juice.* 2. *A Decoction in Water or Wine.* 3. *A Conſerve of the Green Herb.* 4. *A Pouder of the dryed Herb.* 5. *An Ointment or Balſam.* 6. *A Cataplaſm.*

The Virtues.

X. *The Liquid Juice.* It is Abſterſive and cleanſing, and ſtops the Flux of Humors into any part, and therefore is of excellent uſe to ſtrengthen the Stomach and other Bowels, and cure Fluxes of all kinds in thoſe parts. Externally applyed to any part, it repells the flowing Humor, cleanſes old running Sores and Ulcers, and induces their healing. Doſe 1, 2 or 3 Ounces morning and Night in any proper Vehicle.

XI. *The Decoction in Water or Wine.* It has all the Virtues of the *Liquid Juice* but not ſo powerful: it may be given from 4 to 6 Ounces, ſweetned with white Sugar, or Sugar Candy; and ſo exhibited, it is profitable againſt Coughs, Colds, Wheezings, ſhortneſs of Breath, difficulty of Breathing, and cauſes an eaſy Expectoration of the pituitous matter lodged in the Breſt and Lungs.

XII. *The Conſerve of the green Herb.* It has the Virtues of the *Juice* and *Decoction*, and is uſed as an excellent thing by ſuch as are in Conſumptions, and have lain under the the tedious languiſhment of an inveterate Cough. Doſe as much as a Cheſtnut.

XIII. *The Pouder of the dryed Herb.* It is given to a Dram or more in any proper Vehicle againſt the Bloody Flux, and all other Fluxes of the Bowels: outwardly being plentifully ſtrewed upon old, putrid, running Sores and Ulcers, it cleanſes and drys them, repreſſes the farther Flux of the Humor, and diſpoſes them to a ſpeedy healing.

XIV. *The Ointment or Balſam.* They are Vulnerary and of great uſe in healing not only of Green Wounds, but alſo of old Sores and running Ulcers, of difficult cure, for they digeſt, cleanſe, incarnate, dry, and induce the healing to a wonder.

XV. *The Cataplaſm of the Green Herb.* It repels the Humor and cures ſimple recent Contuſions. According to *Dioſcorides*, it has a property to ſtop, repel and bind thoſe Humors, which fall into any part of the Body, being outwardly applyed; and of the ſame opinion alſo is *Galen* himſelf.

CHAP. DXXIV.

Of OAK of JERUSALEM.

I. *THE Names.* It is called in *Greek*, Βοτρὺς: in *Latine*, *Botrys* alſo: and in *Engliſh*, *Oak of Jeruſalem.* All Authors call it *Botrys*; but *Dioſcorides* ſays, that in his time, The *Cappadocians* called it *Ambroſia*, and ſome others called it *Artemeſia. Cordus* upon *Dioſcorides* calls it *Ambroſiæ altera Species*; and he ſays that in ſome Apothecaries Shops in *Germany*, the Seed was taken for *Amomum.* In the *Hortus Eyſtetenſis* it is called *Artemeſia Turcica:* and *Camerarius* ſays, the *Italians* call it *Patientia.*

II. *The Kinds.* Formerly there was but one ſort of *Botrys* known, but now we have found out another, growing in *Virginia*, 1. The firſt is called ſimply *Botrys* (*à Floribus & Seminibus in Botryos formam ramulis inſidentibus*, from the Flowers and Seed growing like unto a Bunch of Grapes.) Alſo *Botrys vulgaris*; but *Bauhinus* calls it *Botrys Ambroſioides vulgaris*, Our Common Oak of Jeruſalem. 2. *Botrys Americana*, which *Bauhinus* alſo calls *Botrys Ambroſioides Mexicoana*; it is likewiſe called *Botrys Virginiana, & Botrys Frutiçoſa Americana*, American, or Virginian Oak of Jeruſalem, or Shrubby Oak of Jeruſalem.

The Deſcriptions.

III. *The firſt*, *or* Our Common Oak of Jeruſalem. *Its Root is long and hard after giving Seed, periſhing Yearly. It is a ſmall Buſhy Plant full of Branches, about a Foot and half high, with ſome few, and not many Leaves thereon, which at the firſt ſpringing up, are reddiſh on the underſide, and afterwards grow to be of a yellowiſh green color, more eſpecially when they grow old, and in the time of Flowering and Seeding, which are much cut in on the edges, like unto* Groundſel, *but larger.* Gerard *ſays, that the upper ſide of the Leaf is of a deep green, and ſomewhat rough or hairy; and that the Branches are beſet with ſmall Leaves deeply cut in or jagged on the edges, very much reſembling the Leaf of an* Oak, *which cauſed our* Engliſh *Women to call it* Oak of Jeruſalem. *From the middle of the Branches upwards to to the very tops, grow ſmall, pale, yellow, Flowers like the Bloſſoms, or young Blowings or Cluſters of the* Vine, *which turn into ſmall browniſh Seed. The whole Plant is of a very pleaſant Smell and of a kind of*

Aro-

Aromatick Scent; and whileſt it is green is ſomething clammy in handling.

IV. *The ſecond, or* American, *or* Virginian Oak of Jeruſalem. *Its Root is ſmall, Fibrous and and Woody. It riſes up alſo higher than the former, and its Branches are more Ligneus and durable. The Leaves are ſomething like unto* Wild Arach, *but larger, and much cut in on the edges, like unto the former. The whole Plant both Flowers and Seed; is moſt like to the firſt or our* Common Kind; *and where it is a Native, as in* Virginia, Florida, Mexico, &c. *it will abide the* Winter *Seaſon, becauſe it is nothing ſo violent as ours; but it will not endure the* Winters *cold with us, without much care in Houſing and preſerving it: but it will ſpring up again of the Seed ſown the next Year, as ſome other Plants do. The Smell hereof is ſomething ſtrong, but very pleaſant, and comes very near to that of the former.*

V. *The Places.* The firſt grows plentifully in *Italy*, as alſo in the Southern parts of *France*, both by Water ſides, and in dry Sandy Grounds, but with us it is Nurſt up only in *Gardens*. The Second is a Native of *Mexico*, *Florida*, *Carolina*, *Virginia*, from ſome of which places, it has been brought home to us, and planted in our *Gardens*, or in Pots, that it may be Houſed, and ſo be preſerved againſt the coldneſs of the *Winter*.

VI. *The Times.* They both Flower and Seed in *Auguſt* and *September*, and do often times raiſe themſelves of their own ſowing, more eſpecially the former.

VII. *The Qualities.* They are hot and dry in the ſecond Degree: they are both Aperitive, Attenuating, Inciding, Pectoral, Arthritick, Hyſterick, and a little Cathartick as ſome Authors hold.

VIII. *The Specification.* They are of extraordinary uſe in the curing of Aſthma's, Coughs, Wheezings, and other obſtructions of the Breſt, Lungs, Reins and Womb.

IX. *The Preparations.* You may make, 1. *A Liquid Juice.* 2. *An Eſſence.* 3. *A Decoction, or Infuſion in Wine.* 4. *A Pouder of the Herb.* 5. *An Ointment or Balſam.* 6. *A Fumigation.* 7. *A Cataplaſm.* 8. *A Spirituous Tincture.* 9. *An Acid Tincture.* 10. *An Oily Tincture.* 11. *A Syrup.*

The Virtues.

X. *The Liquid Juice.* It is a very good thing againſt an Aſthma, Wheezing, and ſhortneſs of Breath, being taken with an equal quantity of Honey Morning and Evening: It opens obſtructions of the Breſt and Lungs, and cauſes an eaſie expectoration of the tough Flegm, and other crude Humors which oppreſs them: It cleanſes alſo filthy and corrupted Lungs, cauſing the putrid Matter to be ſpit forth, and if they be exulcerated, it very much conduces to the healing. Doſe from two to three Spoonfuls Morning and Night.

XI. *The Eſſence.* It has all the Virtues of the *Juice*, and may be given from 1 Spoonful to 2, mixt with an equal quantity of Clarified Honey, or with as much *Syrup of Violets*, and ſo to be taken twice a day as the former. It is an excellent thing againſt a Cough or Catarrh, or continual defluxion of thin, ſalt, and ſharp Rheum.

XII. *The Decoction or Infuſion in Wine.* If a little of *Liquorice Root* bruiſed, be added to it, it will be ſo much the better; and then taken from 3 to 6 Ounces mixed with a Spoonful or 2 of Clarified Hony, or *Syrup of Violets*, it will have all the effects of the *Juice* or *Eſſence*. Outwardly uſed as a Gargle for ſore Mouths and Throats, or for old running Sores, or putrid Ulcers in any other parts, it cleanſes them, drys, and admirably induces their healing.

XIII. *The Pouder of the Herb.* Taken to a Drum (in any fit Vehicle) it ſtrengthens the Stomach, expels Wind, gives eaſe in the Cholick, and ſtops all ſorts of Fluxes of the Bowels, and ſtrewed very thick upon external moiſt and running Ulcers, it cleanſes them, corrects the acrimony, drys and heals them.

XIV. *The Ointment or Balſam.* They are good Anodyns and Vulneraries, digeſt and heal ſimple Green Wounds, and that in a little time; diſcuſs flatulent Tumors, digeſt, cleanſe, and incarnate (where need is) old Ulcers, dry, and diſpoſe them to a ſpeedy cure, if in places eaſily admitting the Operation.

XV. *The Fumigation.* It is made of the *Decoction or Infuſion in Water or Wine, which being put into a Copper Pan is to be ſet upon a Chafing Diſh of throughly kindled Charcole, in a Cloſe-ſtool:* Then a Woman ſitting over it, ſo as the Fumes may be received up the Womb, it is ſaid to bring down the Courſes, and to expel the Dead Child.

XVI. *The Cataplaſm. It is made of the Green Herb, being heated in a Frying-pan, or otherwiſe, and moiſtned with a little Canary, Muſcadine, or other Wine,* and applyed hot to the Region of the Womb, it gives eaſe in pains of the Mother. Or, you may make it of the *Green Herb, with the addition of Fetherfew and Camomil Flowers, and Fryed together with the Oil of Lillies, or of Roſes, or Camomil.* This being applyed hot to the Belly, of a Woman in Child-Bed, preſently gives eaſe in, and takes away the After-Pains.

XVII. *The Spirituous Tincture.* It warms and comforts the Stomach, expels Wind in the Bowels, is good againſt Convulſions of the *Viſcera*, and gives eaſe in the Cholick.

XVIII. *The Acid Tincture.* It powerfully opens obſtructions of the *Thorax*, cuts tough Flegm, and makes it fit for expectoration, ſtrengthens the Stomach, cauſes a good Appetite and Digeſtion, and kills Worms in Children. Doſe 20 or 30 Drops in any fit Vehicle.

XIX. *The Oily Tincture.* It is good againſt Convulſions of the Stomach and Bowels, prevails againſt Paralytick Diſtempers, opens obſtructions of the Reins, Ureters and Bladder, gives relief in the Strangury, powerfully provokes Urine, and gives preſent eaſe in After-pains, to Women in Child-Bed. Doſe 20 or 30 Drops.

XX. *Syrupus Botryos.* Syrup of Oak of Jeruſalem. *Take Oak of Jeruſalem, Hedge Muſtard, Nettles, of each 2 Handfuls, Coltsfoot a Handful and half: Boil them in a ſufficient quantity of Spring Water till half be conſumed; ſtrain out, and to 2 Pounds of the Decoction add 2 Pounds, (ſome ſay 1 Pound) of the Juice of Turneps baked in an Oven in a cloſe Pot: and with 3 Pounds of white Sugar, boil it to the Conſiſtency of a Syrup.* It is a good Pectoral, deſigned againſt Aſthma's, Coughs, Colds, Shortneſs of Breath, Ulcers of the Lungs, Spitting of Blood, Conſumptions, and other like Infirmities of the Breſt and Lungs, proceeding from cold, ſalt, ſharp Rheums, and tough Flegm, obſtructing thoſe Parts. Doſe from an Ounce to 2 Ounces, to be ſuckt in leiſurely with a *Liquorice Stick.*

XXI. *Nota.* This Plant or Herb, (as alſo *Oak of Cappadocia*) are much uſed to be laid in Wardrobes, or Preſſes and Chefts, both to kill and drive away Moths, and by their ſweet Smell to Perfume the Garments.

CHAP. DXXV.

Of OATS Manured *and* Wild.

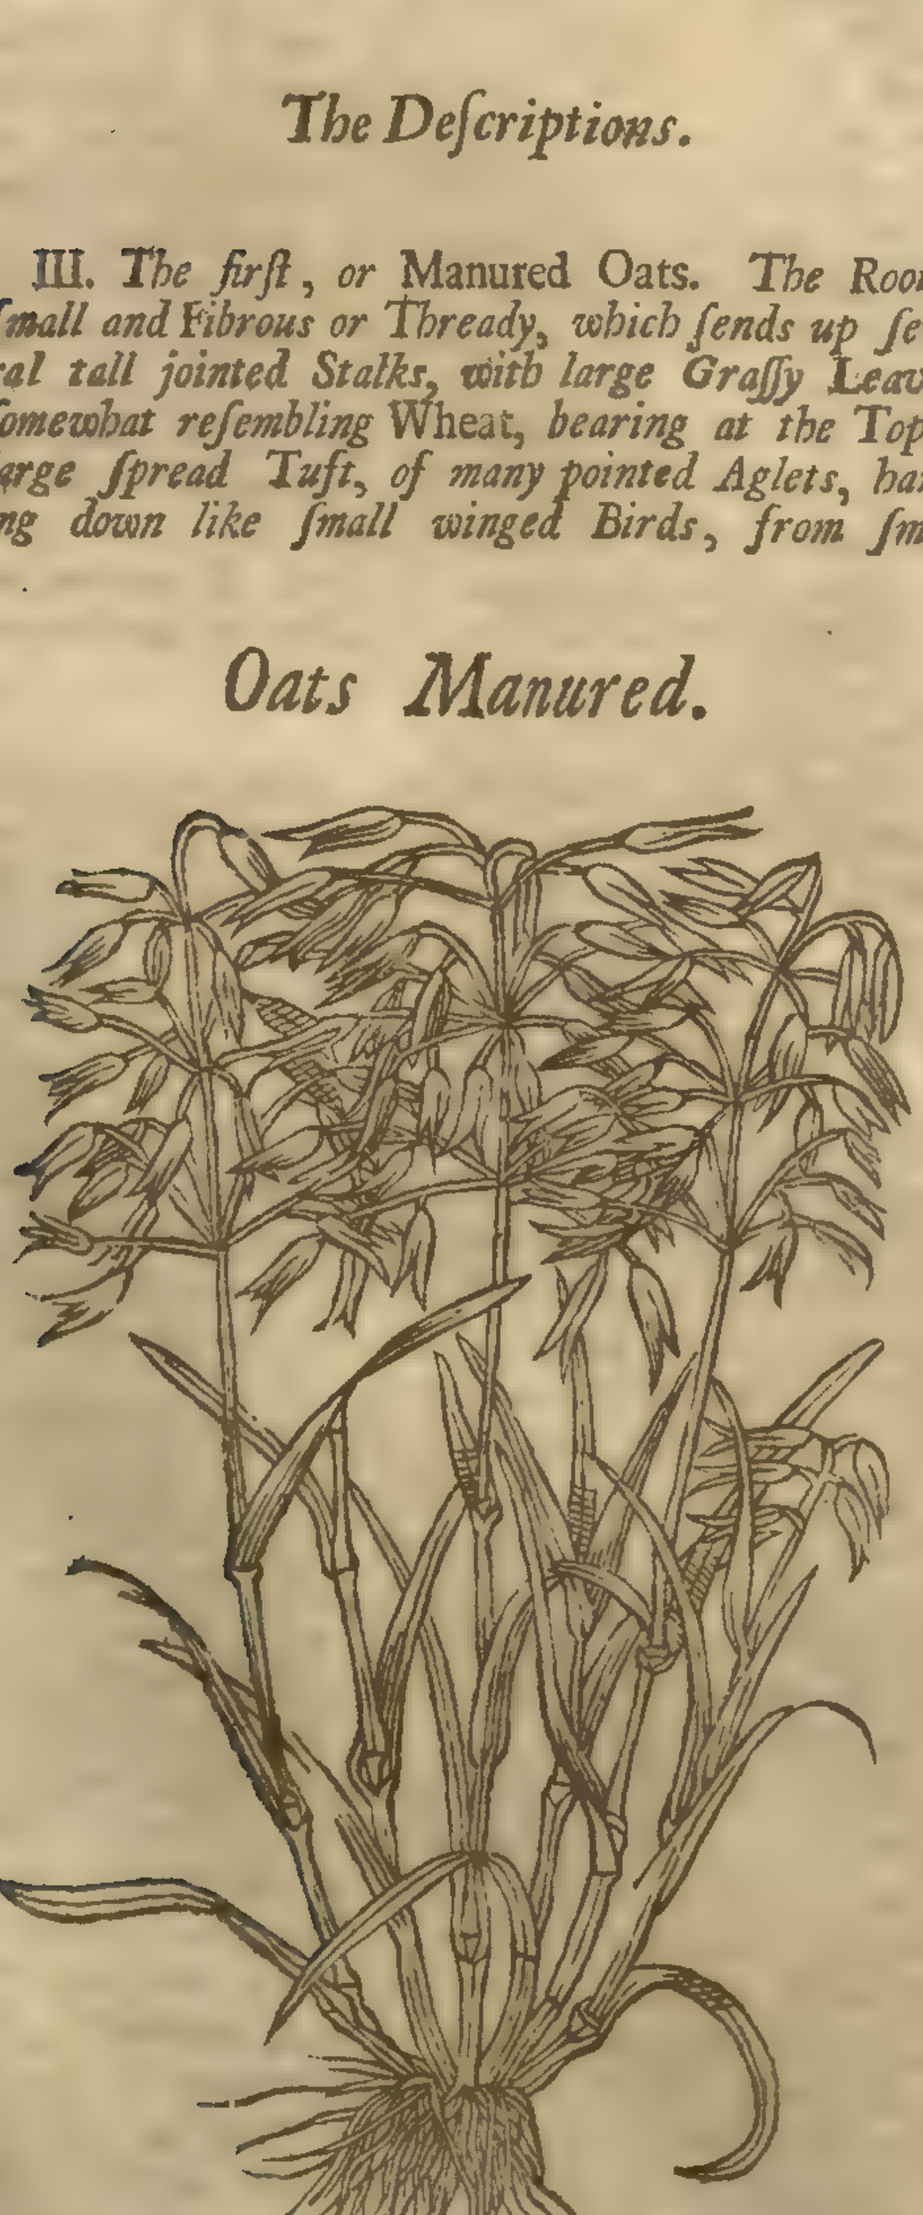
I. *THE Names.* This Plant is called by the *Arabians*, *Chartal*; in *Greek*, Βρόμος, and Βρῶμος, *à* Βρῶμι, *quod Cibum ſignificat:* in *Latine*, *Avena:* and in *Engliſh*, *Oats.*

II. *The Kinds.* It is two fold, I. *Manured*, viz. 1. *Avena Veſca*, Manured Oats. 2. *Avena nuda*, Naked Manured Oats. II. *Wild Oats*, viz. 3. Βρῶμος πόα, *Avena Sylveſtris*, *Avena Sterilis*, *Bromos Herba Dodonæi*; *Bromos Sterilis longiſſimus ariſtis Lobelij*; *Feſtucago Gazæ*; *Feſtuca & Avena fatua*, *Avena Græca*, *aliorum: Lolij primum genus Tragi*; *Ægilops Matthioli*; Common Wild Oats, or Wild Bearded Oats. 4. *Avena Sterilis minor*; *Bromos Sterilis altera Lobelij*; *Feſtuca altera Dodonæi*; *Syphonium & Bromos herba Tabernæmontani*; Small Wild Oats.

The Deſcriptions.

III. *The firſt*, *or* Manured Oats. *The Root is ſmall and Fibrous or Thready, which ſends up ſeveral tall jointed Stalks, with large Graſſy Leaves, ſomewhat reſembling* Wheat, *bearing at the Tops a large ſpread Tuft, of many pointed Aglets, hanging down like ſmall winged Birds, from ſmall*

Oats Manured.



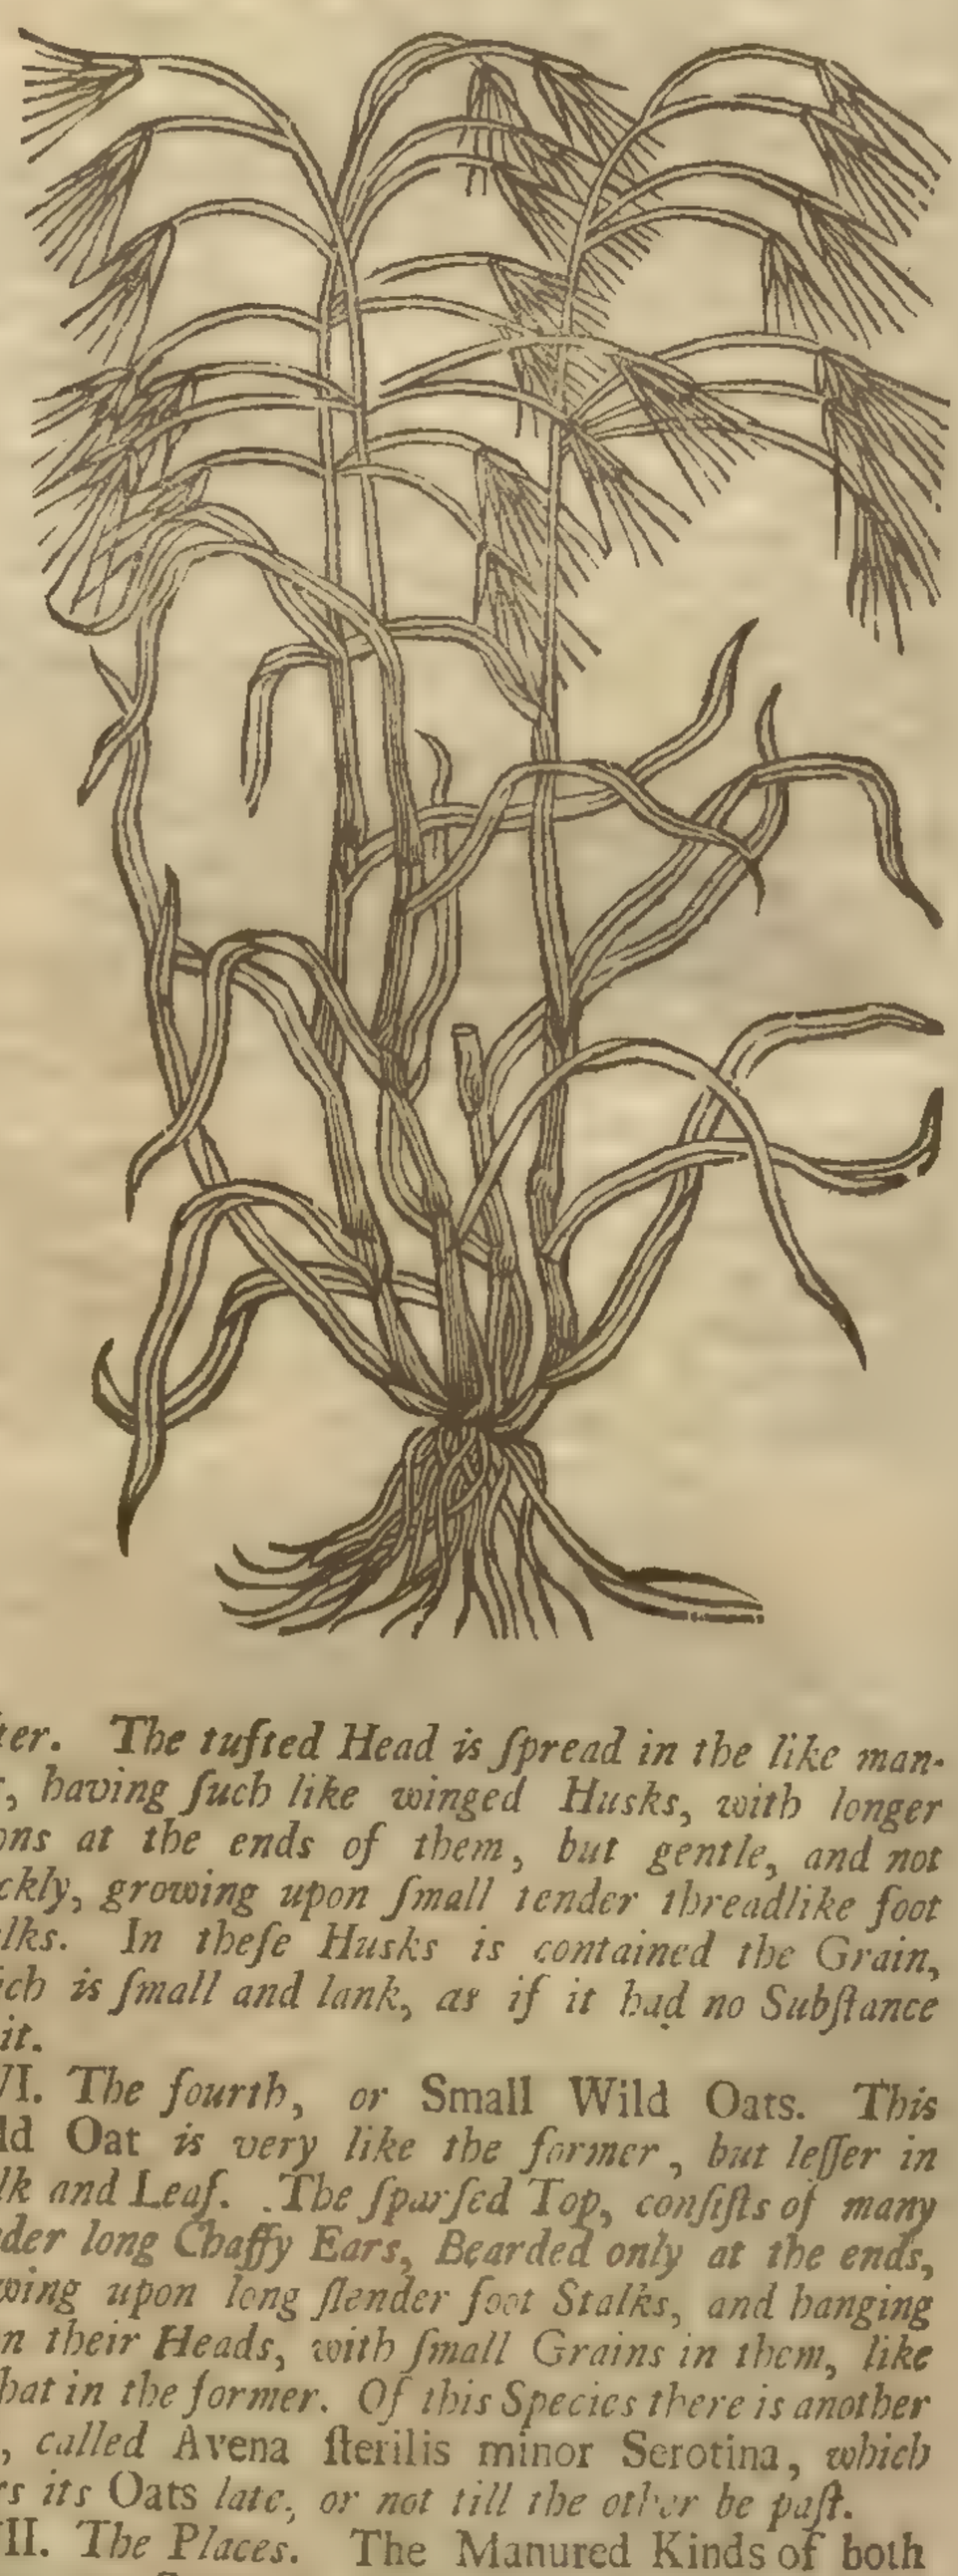
Threadlike foot Stalks; within every one of which Husks lies a ſmall and long round Grain, ſomewhat like unto Rye, *but longer, and more pointed, cover-*

ed with a hard, horny, ſhining Husk, ſticking cloſe to it.

IV. *The ſecond*, *or* Naked Manured Oats. *This Plant grows in all reſpects like the former; ſaving that the Grain being ſomewhat ſmaller and whiter, lyes not ſo faſt encloſed in the Husk, but is very eaſily rubbed out with ones Hand.*

V. *The third*, *or* Common Wild Oats, *or* Wild Bearded Oats. *Its Root is ſmall and Fibrous or Thready like the firſt: and this* Common Wild Oat, *grows both in Stalk and Leaves, ſomething like unto the firſt* Manured Oat, *but that it ſeldom riſes ſo high, being lower, ſlenderer, ſmaller, and*

Common Wild Bearded Oats.



ſofter. The tufted Head is ſpread in the like manner, having ſuch like winged Husks, with longer Awns at the ends of them, but gentle, and not prickly, growing upon ſmall tender threadlike foot Stalks. In theſe Husks is contained the Grain, which is ſmall and lank, as if it had no Subſtance in it.

VI. *The fourth*, *or* Small Wild Oats. *This* Wild Oat *is very like the former, but leſſer in Stalk and Leaf. The ſparſed Top, conſiſts of many ſlender long Chaffy Ears, Bearded only at the ends, growing upon long ſlender foot Stalks, and hanging down their Heads, with ſmall Grains in them, like as that in the former. Of this Species there is another ſort, called* Avena ſterilis minor Serotina, *which bears its* Oats *late, or not till the other be paſt.*

VII. *The Places.* The Manured Kinds of both ſorts, are Sown in Fields, for both Mans and Horſes Food, but the *Naked Oats* are nothing ſo frequent as the firſt Kind, and they delight in a cold and moiſt Ground, rather than in a hot and dry: They are uſually the firſt Seed which are Sown upon Woodland Grounds after their Stocking up,

up. The *Wild kinds* are found in many places with us among *Rye* and *Barly*; and the Fourth Kind many times plentifully by Hedge-sides.

VIII. *The Times.* The *Manured kinds* are *Summer* Grains, Sown in the *Spring*, and Reaped or Cut down in *Autumn*. The *Wild Sorts* are ripe in *July* and *August*.

IX. *Nata.* The *Avena Vesca*, are so called *à Vescendo*, because in many Countries they are eaten, being made into *Oat-Meal*, of which they make Bread, Cakes, Puddings, &c. and being Malted, are also by some People made into Ale or Drink, very good, and exceeding in pleasantness that made of *Barly*. The *Avena nuda*, is like unto the former *Oat*, but differs in that these *Naked Oats*, as soon as they are Thrashed or Rubbed out, without help of a Mill, become *Oat Meal*, and fit for use; for which reason, in *Norfolk* and *Suffolk* they are called *Unhulled* or *Naked Oats*.

X. *The Qualities.* *Oats* (according to *Galen*) are cold and dry, and acording to our Opinion in the beginning of the first Degree, Abstersive, Astringent and Nutritive.

XI. *The Specification.* Authors say, they stop Fluxes of the Bowels: and yet made into Water Gruel, or Milk Porridge, they certainly open, and loosen the Belly.

XII. *The Preparations.* You may have therefrom, 1. *Oat-Meal.* 2. *Bread, Cakes, Pudding.* 3. *Gruel or Broth.* 4. *A Cream.* 5. *A Cataplasm.* 6. *Malt.* 7. *Ale or Beer.* 8. *A Decoction.*

The Virtues.

XIII. *The Oat-Meal. It is hulled in a Mill:* Eaten in any quanty raw by Young Virgins, it gives them the Disease *Chlorosis*, or that called the Green Sickness, causing a fresh and well colored Maid to look white, or of a Tallow Complexion, and almost as pale as Death. Made very hot in a Frying-Pan, and put into a Linnen Bag, and applyed to the Stomach or Side pained, it gives ease in the Colick, and takes away Pains and Stitches in the Side: but this ought to be done with whole *Oat-Meal*, or with *Oats* unhulled.

XIV. *The Bread, Cakes, or Pudding. They are made of the Flower of the Oat-Meal, according to the usual Method.* They stop Fluxes of the Bowels, nourish much, and restore in Consumptions. But *Puddings made of the Oat-Meal, whether whole or Ground, and filled very full with Beef Suet shred small, and blew Currants, or Raisons of the Sun,* always loosen the Belly.

XV. *The Gruel or Broth.* If made savory with Salt, and eaten with a good quantity of fresh Butter, it loosens the Belly, and by continuing thereof makes it soluble; it sweetens the Juices and *Lympha*, and takes away the Acrimony of the Humors: the thicker it is made the more it nourishes, but if made to take with Purging Physick, it ought to be the thinner. If Milk is added to it, tho' it loosens the Belly, yet it nourishes much more than the simple *Gruel* alone.

XVI. *The Cream of Oat-Meal. It is made by boiling with Water, the Head being continually scumm'd off: or it is made with the very finest of the Flower, first boiled with a little Water, then adding Milk to it, it is boiled to a Consistency.* It has all the Virtues and goodness of the *Gruel* or *Broath*, but much more delicious or pleasant: Mixt with fine Sugar or Sugar Candy, and so given, it is profitable for such as have gotten a Cold or Cough.

XVII. *The Cataplasm. It is made by boiling in Milk, and till it comes to a Consistency.* It moderately discusses, and that without biting or any sharpness: it allays Inflamations, and strengthens the part it is applyed to. It mixt with *Oil of Bays* and applyed, is good against the Itch and Leprosie: it dissolves or discusses hard Apostems; and is profitable against a *Fistula in Ano*, or in the Fundament. *If the Cataplasm is made of White Vinegar*, it discusses hard Tumors, Strengthens weak parts, and takes away Spots, Freckles and Morphew in the Face, or other places of the Skin.

XVIII. *The Malt. A strong Decoction of it made into a Syrup with Honey*, is good against an *Asthma*, as also for Coughs, Colds, Wheezings, shortness of Breath, &c. *Mixt with Turpentine and Yolk of an Egg*, it Digests old, running and eating Ulcers, and facilitates their Cure.

XIX. *The Ale or Beer.* It has all the Virutes of those made with *Barly Malt*, but this is much pleasanter, and is not so Heady: it quenches Thirst more, and inflames less, by which means, those who drink it, Live in good Health and Strength of Body: and passes much better off by Urine, carrying away with it the Recrements of the Reins, Ureters and Bladder.

XX. *The Decoction of the Oat-Meal.* If such as have a *Scrpigo*, or *Impetigo*, in their Hands or Feet, shall daily twice or thrice a day for some considerable time, Bathe them here in, for half an Hour at a time or more, it will at length heal those Chops, Clifts, or Rifts: but it ought to be done as hot, as the Patient can well endure it. So also if such Hands or Feet be held over the Fumes hereof, it is very profitable forthe same Purpose; more especially if the *Decoction is made with White Wine Vinegar.*

CHAP. DXXVI.

Of OISTER-GREEN,

OR,

SEA-LUNGWORT,

OR,

SEA-LETTICE.

I. *THE Names.* It is called in *Greek*, Θαλασσα ἐλάδες ἢ θαλασσα θαλάσσια: in *Latine*, *Lactuca Marina*, *Fucus Marinus Lactuarius*: in *English*, *Oister-Green*, *Sea-Lettice*, and *Sea-Lungwort.*

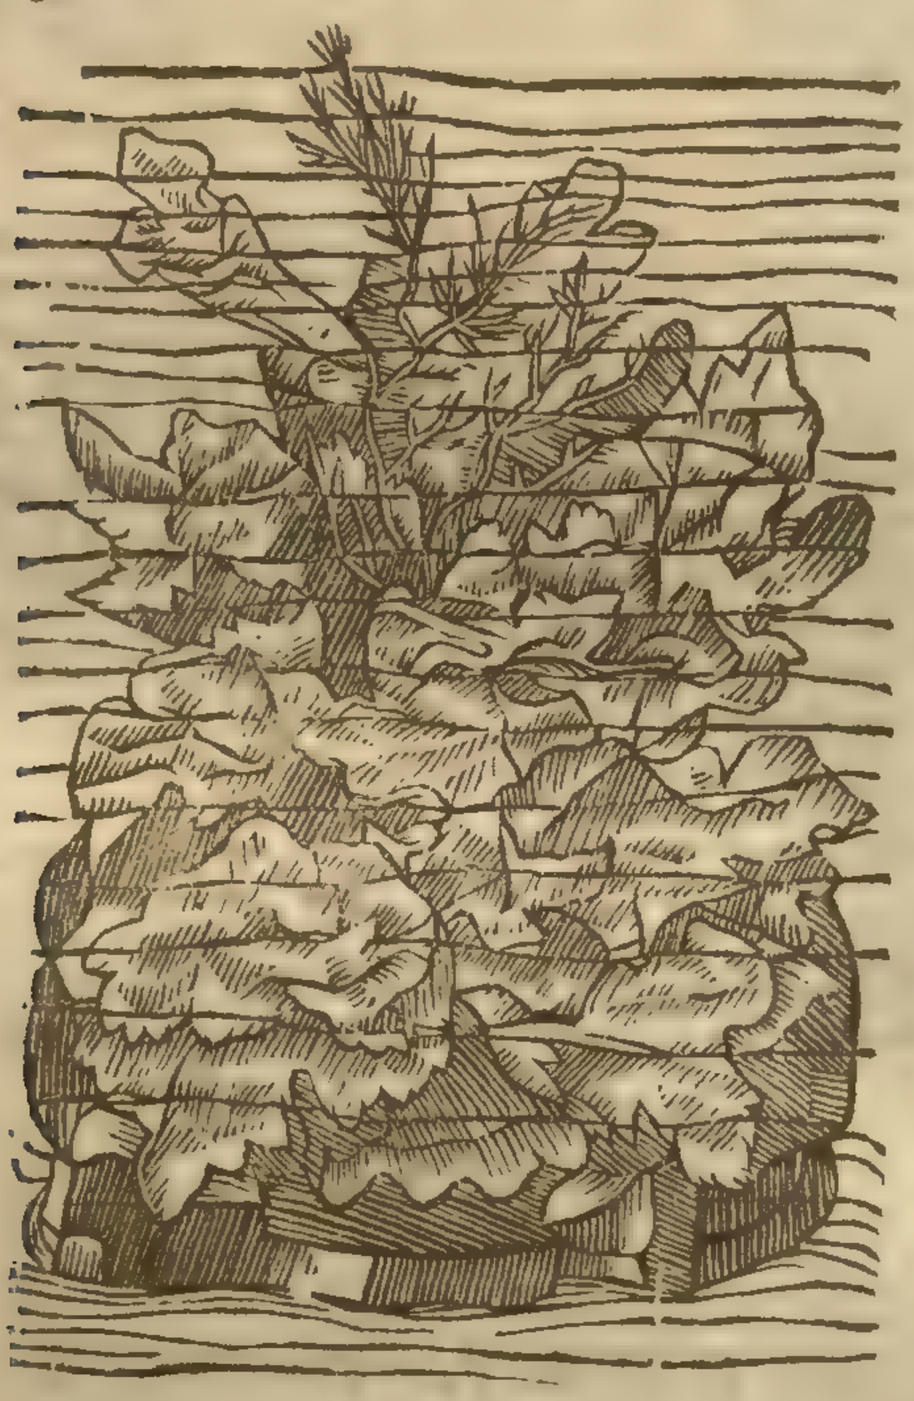
II. *The Kinds.* There are two several Species of this Plant, *viz.* 1. *Lactuca Marina*, *Fucus Marinus Dioscoridis*; *Muscus Marinus altera Matthioli*, *Fucus Marinus prior Dodonæi*, *Muscus Marinus Theophrasti*; *Fucus Marinus primus Dioscoridis & Theophrasti*; *Bryon Lactucæ foliis Plinio & Lobelio*; *Lichen Marinus Gerardy*. Our Common

Oiſter-Green, Sea-Lettice, *or* Sea-Lungwort. 2. *Lichen Marinus rotundiſolius Gerardi*, *Opuntia Marina Cortuſi*; *Corallina Latiſolia*; *Sertularia Imperati*, *Lichen Marinus Cluſij*; *Fucus Maritimus*, *& Fucus folio rotundo Bauhini*; Oiſter-Green, or Oiſter-Weed round Leav'd; Sea-Lung-wort round Leav'd; Sea-Garland.

The Deſcriptions.

III. *The firſt*, *or* Our Common Oiſter-Green, or Sea-Lungwort, *is a Kind of* Sea Fucus, *or Herby Subſtance*, *like unto* Liverwort, *or* Lungwort, *altogether without Stalk or Stem*, *bearing many green Leaves*, *very uneven or crumpled*, *and full of Wrinkles*, *ſomthing broad*, *not much differing from the*

Oiſter-Green, or *Sea Lung-wort.*



Leaves of curled Lettice. *It grows upon Rocks within the Sea*, *but more eſpecially among* Oiſters, *and in great plenty among thoſe called* Wall-Fleet Oiſters. *It is very well known even to* Oiſter *Women*, *who make uſe of the ſaid* Moſs *for ſetting off their* Oiſters, *that they may Sell the better. It is a tender Herb*, *with dark green Leaves*, *thin and crumpled*, *growing upon Rocks or Stones*, *and is a kind of* Food *for* Oiſters.

IV. *The ſecond*, *or* Oiſter-Green, *or* Oiſter-Weed round Leav'd. *It is a delicate Plant growing up from ſome Rocks or Stones*, *in or near the Sea*, *ſpreading ſeveral flat*, *thick*, *ſhort and round Leaves*, *one ſet on the top of another*; *and ſome alſo growing from the ſides*, *forming Branches of Leaves leaning downwards*, *each being as it were ſtrung on a* Thread, *which yet is ſcarce to be diſcerned*, *like as a Country Garland of Field and Corn Flowers*, *made for the Ornament of Country Houſes*; *ſo as the whole* Plant *ſeems to be made of nothing but ſtrung Leaves*, *bearing a large yellow Flower at the top*, *as* Bauhinus *ſays*. *The lower Leaves are ſomewhat brown*, *the reſt are of a whitiſh green*, *and thoſe which are new ſprung forth are green*, *and all of them ſmooth and ſhining*, *which may be kept between Papers for a long time: yet by long keeping*, *they will grow rougher*, *and full of Wrinckles*, *but ſtill tough*, *and not brittle like* Coralline, *which by ſteeping in Water will become ſoft and ſmooth again*, *and retain their firſt* Taſte, *which is very Salt.*

V. Gerard *ſays*, *That the Branches of this Elegant Plant*, *are about a Handfull or better high*, *ſpread abroad on every ſide*, *and only conſiſting of ſundry ſingle roundiſh Leaves*, *whereto are faſtned ſometimes one*, *ſometimes two*, *or more ſuch Leaves*, *ſo that the whole* Plant *conſiſts of Branches made up of ſmall round Leaves*, *faſhned together by divers little and very ſmall Threads*, *the lower Leaves which ſtick to the Rock*, *are of a browniſh color*; *the other of a whitiſh or light green*, *ſmooth and ſhining.*

VI. *The Places.* They are generally found on our *Engliſh* and *Scotch* Rocky-Shores, chiefly where Oiſters are Bred, and indeed in other Seas whereever Oiſters grow. But the ſecond grows upon Rocks in divers parts of the *Mediterranean*, upon the Coaſt of *Corſica*, and in many other Seas.

VII. *The Times.* They are in the prime of their Beauty in the end of *Summer*, and all the time Oiſters are in Seaſon,

VIII. *The Qualities.* They are cold and dry in the firſt Degree, Aperitive, Abſterſive, Anodyn, Diuretick, and Arthritick.

IX. *The Specification.* They are both good to expell Sand, Gravel, and ſmall Stones out of the Reins, Ureters and Bladder: and the ſecond is ſaid to kill Worms in Children.

X. *The Preparations.* You may make from theſe Plants, 1. *A Decoction.* 2. *A Pickle.* 3. *A Pouder.* 4. *A Fricaſie.* 5. *A Cataplaſm.*

The Virtues.

XI. *The Decoction in Water or Wine.* Being given to 3 or 4 Ounces or more, well ſweetned with Hony 2 or 3 times a Day, it is good againſt Coughs and Wheezing, ſhortneſs of Breath, and difficulty of Breathing; and cleanſes the Urinous parts of any kind of Tartarous Matter logded in them.

XII. *The Pickle.* Either of them are an excellent Sallet, being *Pickled in a mixture made of white Port Wine*, *Brandy*, *Vinegar and Water*, *in an equal proportion:* They ſtrengthen the Stomach much, and cauſe a good Digeſtion.

XIII. *The Pouder.* That which is made of the firſt ſort is much Commended by Learned Phyſicians againſt Diſeaſes of the Lungs, eſpecially againſt Inflamations and Ulcers of the ſame, being taken to about a Dram in fair Water or ſome proper Vehicle. Being given in Red *Barcelona* Wine, or other Red Styptick Wine, it ſtops the Terms, and prevails againſt the Bloody Flux, and other Fluxes of the Bowels, as alſo it ſtops Vomiting, and all theſe things more eſpecially if they proceed of Choler. Given alſo in *Parſly* or *Hydrapper Water*, it cures the Strangury, provokes Urine, gives eaſe in the Stone, and expels Sand, Gravel, and ſmall Stones out of the Reins and Bladder. Outwardly applyed, it heals Bloody and Green Wounds, and cures Ulcers in the Secret parts. *The Pouder made of the ſecond ſort*, *or round Leav'd Kind.* Given from half a Dram, to a Dram, mixed with Hony, or in any other proper liquid Vehicle, kills Worms in Children.

XIV. *The*

XIV. *The Fricasie.* The first Kind, or both the sorts, being Fried with Eggs, as you Fry *Clary Leaves*, and so eaten, it is said to be a singular Medicine to cure the Weakness of the Back.

XV. *The Cataplasm.* Being made of either of the Green Herbs, and applyed to places affected with the Gout, it cools, eases the Pain, stops the afflux of Humors to the Part; and in some reasonable time cures the Patient.

CHAP. DXXVII.

Of ONE BERRY;

OR,

HERB TRUE LOVE.

I. *THE Names.* It knows no *Greek* Name: But the *Latines* call it *Herba Paris*, and so it is generally called by all *Herbarists*; and in *English*, *One Berry*, *Herb True Love*, and *Herb Paris*. Some have thought it to be a kind of *Aconitum*, but were deceived, and therefore *Fuchsius* called it *Aconitum Pardalianches*, and *Cordus* seems to be of the same Opinion, and therefore calls it *Aconitum Pardalianches monococon*, they accounting it to be dangerous and deadly: but *Matthiolus* contradicts all this, for that it has been found by Experience, not to be hurtful but Salutiferous, for which reason *Tabernæmontanus* called it *Aconitum Salutiferum*, which yet I think to be an improper Name also, for that it is no Species of the *Aconites*. Some have thought it to be a kind of *Aster*, or *Starwort*, and therefore *Tragus* called it *Aster sed non Atticus*, but it is no Species of the *Starworts*: he also called it *Uva Lupina*, and *Uva Canina*. Others have thought it to be a Kind of *Solanum* or *Night-shade*, but it is no more a Species of that Plant than it is of the two former; but upon this supposition *Pena* and *Lobel*, in their *Adversaria* call it *Solanum Tetraphyllon* (from the form of the Leaves and Berry:) and *Bauhinus*, as leaning to the same Opinion, *Solanum quadrifolium Bacciferum*; both of which so call it very improperly: and I think the first Name *Herba Paris*, is the fittest we can bestow upon it.

II. *The Kinds.* There are three Species of this Plant very well known, *viz.* 1. *Herba Paris vulgaris*, *Herba Paris Tetraphyllos*; Our Common Herb True Love or One Berry. 2. *Herba Paris Floridensis*, *Herba Paris Floridiana*, *vel Brasiliana*, *Herba Paris Triphyllos Brasiliana*, *Solanum Tryphyllium Brasilianum Bauhini*, Herb True Love, or One Berry of *Florida*, or of *Brasil*. 3. *Herba Paris Canadensis radice rotunda*, *Herba Paris Floridensis radice tuberosa*: *Solanum Triphylium Canadense Cortusi*; Herb True Love of *Canada*.

The Descriptions.

III. *The first, or* Our Common Herb True Love, *or* One Berry. *Has a Root which is long and tender, small and creeping under the Earth, dispersing it self hither and thither; its Taste is Styptick or Astringent, and very unpleasant, and by its Branches and Fibres spreads it self under the upper Crust of the Ground, something like a* Couch-Grass *Root, but not so white, and not much lesser than the Root of the* White Wild Anemony, *or* Wind-Flower, *and almost of as dark a color, being much like thereto in its creeping. This Root shoots forth Stalks with*

One Berry: or, Herb True Love.

Leaves, some of which bear no Berries, and some do, every Stalk being smooth, without Joints, and of a blackish green color, rising to about six Inches high, if it bears its Berry; but seldom so high, if it bears none. This Stalk bears at the Top four Leaves, set directly one against another, in manner of a Cross, or a Cross-Knot, commonly called a True Loves Knot: *which are each of them a-part, something like to a* Night-shade Leave, *but a little broader; and in some places, twice as broad as in others, for they oftentimes vary much. and tho' the stinted number of the Leaves is generally four: yet sometimes there are but three, and sometimes five, and sometimes six, which are sometimes smaller, and sometimes larger, and that by a quarter or half part, and sometimes they are (as is before said) twice as large. This Plant has been seen sometime to alter or degenerate, and that the four Leaves have not only been twice as large, as the ordinary, but they have also been dented in, both on the edges, and at the points, which have been parted, or forked, and have born larger Berries, than commonly this Plant is used to bear: all which are of a fresh green color, not dented about the edges. In the middle of these four Leaves, there rises up a small slender Stalk, about an Inch high, bearing at the top thereof, one Flower, spread open like a Star; consisting of four small and narrow long pointed Leaves, of a yellowish green color; and four other lying between them, lesser than they. In the middle where-*

of

grows a round dark purpliſh Button or Head, encompaſſed with eight ſmall yellow mealy Chives, *or Threds, which three colors make it the more Conſpicuous and Beautiful to behold. This Button, or Head, or rather Berry in the middle, when the other Leaves are withered, becomes a blackiſh purple Berry full of Juice, of no hot nor evil flavor, nor yet of any ſweetiſh or fulſome Taſte, of the bigneſs of a reaſonable* Grape, *having within it, many white Seeds. The whole Plant is almoſt inſipid, without any manifeſt Taſte, and by its effects, in repreſſing hot Inflamations and Humors, it is accounted as cold as* Nightſhade, *tho' no Species of that Plant.*

IV. *The ſecond, or* Herb True Love, *or* One Berry of *Florida*, or of *Braſil. The Root hereof is ſmall and creeping like the former under the upper Cruſt of the Earth; from which ſprings forth a Stalk of four or five Inches high, having three ſuch like Leaves as the other, but broader and longer growing thereon. The Stalk riſes up about 3 Inches above them, bearing at the top, 3 much narrower Leaves, which are as it were the Husk of the flower ſtanding in the middle, conſiſting of three white Leaves, having ſome Veins in them, and are about three Inches long, and one broad.*

V. *The third, or* Herb True Love of *Canada. The Root of this Plant creeps not as the former do, but grows into a ſmall round Tuberous Subſtance, having ſeveral ſmall Fibres iſſuing out from its ſides almoſt round about. From this Tuberoſe Root ſprings up one Stalk, with three large Leaves like to the laſt, from the middle of which, the Stalk riſes up, yet ſome few Inches farther, at the top of which is one Flower, conſiſting of ſix Leaves, three whereof are green and ſmall, which are as it were the Husk to the other three Leaves, growing in the middle, which are larger and longer, of a dark purple color, and in ſome white: in the middle whereof grows a ſmall round blackiſh Berry, full of ſmall Seed, like* Nightſhade Seed.

VI. *The Places.* The firſt grows in our Woods and Copſe, as alſo ſometimes in the corners and borders of Fields, and waſte Grounds, in many places throughout *England. Gerard* ſays, it grows plentifully in *Chalkney* Wood, near to *Wakes Colne*, ſeven Miles from *Colcheſter* in *Eſſex:* in the Wood by *Robin Hood*'s Well, near to *Nottingham:* in the Parſonage Orchard, at *Rodwinter* in *Eſſex*, near to *Saffron Walden:* in *Blackborn* at a place called *Merton* in *Lancaſhire:* in the *Moore* by *Canterbury* called the *Clapper:* in *Dingly* Wood, ſix Miles from *Preſton* in *Alderneſs:* in *Bocking Park* by *Braintree* in *Eſſex:* at *Heſſet* in *Lincolnſhire:* and in *Cotting Wood*, in the North of *England.* It it has alſo been found growing (as *Parkinſon* ſays) in *Hinbury* Wood, three miles from *Maidſtone* in *Kent:* in a Wood by *Chiſſelhurſt* in *Kent*, called *Longwood:* in the next Wood thereto, called *Iſeets-Wood*, eſpecially about the skirts of a *Hop Garden* bordering thereon: in the Wood called *Harwarſh*, near to *Pinnendon Heath*, about a mile diſtant from *Maidſtone:* and in a Wood alſo overgainſt *Boxly Abby*, a mile from *Maidſtone* aforenamed, where it grows in great abundance, not far from the Hedge ſide of that Medow, thro' which a ſmall River or Rivulet runs. The ſecond *Bauhinus* ſays was found growing in the Woods in *Braſile:* but both the ſecond and the third have been found growing in *Canada*, as *Cortuſus* and others affirm, and I my ſelf have alſo found them growing, in the Southern Provinces of *Florida*, as in the *South Carolina*, in ſome of the Woods adjacent to *Wadmala* and *Stonoro* Rivers, *&c.*

VII. *The Times.* They ſpring up about the latter end of *March*, Flower in *April* and *May*, and the Berry is ripe not long after, *viz.* in the end of *May*, or before the middle of *June.*

VIII. *The Qualities. One Berry* is cold and dry in the firſt Degree, Anodyn, Vulnerary, and Alexipharmick, or Reſiſting Poiſon.

IX. *The Specification.* It cauſes Reſt and Sleep, gives eaſe in the Colick, expels Poiſon, and cures the Plague or Peſtilence.

X. *The Preparations.* You may have herefrom, 1. *An Eſſence.* 2. *A Pouder of the Leaves.* 3. *A Pouder of the Roots.* 4. *A Pouder of the Berries.* 5. *An Infuſion or Decoction of them in Wine.* 6. *An Ointment or Balſam of the Leaves and whole Plant.* 7. *A Cataplaſm of the Leaves.* 8. *A Diſtilled Water of the Leaves and Roots.* 9. *A Spirituous Tincture of Leaves, Roots, and Berries.* 10. *An Acid Tincture of the ſame.*

The Virtues.

XI. *The Eſſence of Herb, Root, or Berry.* It is Anodyn, gives eaſe in the pains of the Colick, expels Poiſon, and powerfully reſiſts the Plague or Peſtilence, and all ſorts of Peſtilential and Malign Fevers. Particularly it is ſaid to be an Antidote againſt the Poiſon of the *Aconites* and all other like ſorts of Poiſons. It is profitable for ſuch as have lain long in a lingering Sickneſs, and for ſuch who have been thought to have lain under the Power of Witchcraft, ſo as to become half Fooliſh or wanting their Senſes. Doſe 1 Spoonful in Wine, or other fit Vehicle, Morning faſting, and at Night going to Bed, for a Month together.

XII. *The Pouder of the Leaves.* It has all the former Virtues, but not ſo effectual as the *Pouder of the Berries or Seed*, and may be given to a Dram Morning and Night, in a Spoonful of *Syrup of Citron Peels*, or other like Vehicle.

XIII. *The Pouder of the Berries or Seed.* It is a Potent thing and performs all that the *Eſſence* does. Given to a Dram at a time Morning and Night in a Glaſs of *Tent*, or old *Malaga* Wine, every Day for 20 Days or more together, it reſtores ſuch to their Healths, who have lain under long, languiſhing Sickneſſes, and reſtore them to their priſtine health. Both this *Pouder*, and the *Pouder of the Leaves* are good for the Cure of Green Wounds, and to cleanſe and heal old running Sores and Filthy Ulcers.

XIV. *The Pouder of the Roots.* Being given from half a Dram to a Dram in a Glaſs of Wine it gives immediate eaſe in the moſt extream, Colick, and other vehement pains of the *Viſcera.*

XV. *The Infuſion or Decoction of the Leaves, Roots, and Berries in Wine.* They have all the Virtues of the *Eſſence* and *Pouders*, reſiſt all ſorts of hot Poiſons and malign Diſeaſes. Being given at Bed-time, they procure Reſt and Sleep: Outwardly uſed as a *Lotion*, (with a third part of the *Eſſence* being added) they are very effectual for the cure of ſimple Green Wounds: They alſo cleanſe, dry, and heal old filthy running Sores and putrid Ulcers: and are very powerful to diſcuſs all Tumors and Swellings, and ſpeedily to allay all Inflamations, and to abate thoſe Tumors which happen in the Groin, Teſticles and Privy parts.

XVI. *The Ointment or Balſam of the Leaves and whole Plant.* They are exceeding good Vulneraries, Abſterſive, Deſiccative and Healing: abate

Infla.

Inflamations in Wounds, repreſs the flux of Humors, and eaſe their pain and anguiſh: and are excellent good againſt Felons, Whitlows, and the like happening to the Fingers ends and Nails of thoſe parts. They Suppurate or Ripen Apoſtems and make them break, or fit to be opened in a little time.

XVII. *The Cataplaſm of the green Leaves.* It is effectual to cure ſimple Contuſions, and to heal Green Wounds, cleanſe and dry old running Sores, and putrid Ulcers, abate Inflamations, diſcuſs Tumors, and to eaſe the Gout and any other kind of pain in any part of the Body, being duly applyed: It alſo is good againſt an Ophthalmy, and heals all Inflamations and Soreneſs of the Eyes, eaſing their Pain almoſt upon the ſpot.

XVIII. *The Diſtilled Water.* Being put into the Eyes it cools Inflamations therein, eaſes their Pains, and takes away their Soreneſs and redneſs, more eſpecially if alſo Cloaths two or three times double, be dipt therein and applyed. But the *Juice or Eſſence of the Herb*, performs this yet more effectually.

XIX. *The Spirituous Tincture of Leaves, Roots and Berries.* Being taken from one Dram to two Drams in any proper Vehicle, it alleviates the pains of the Colick, gives eaſe in the griping of the Guts, comforts the Stomach, and obtunds ſharp Humors, cauſing Heavineſs and Melancholy.

XX. *The Acid Tincture.* It may be given to a pleaſing Acidity 3, 4, 5, or 6 times a Day in *Water Gruel*, or in the *white Decoction*, or other like Vehicle againſt the Purples, Spotted Fever, all ſorts of Malign and Peſtilential Fevers, and the Plague it ſelf: it deſtroys the malignity and Poiſon of the Diſeaſe, and in a ſhort time ſecures the Life of the Patient againſt all dangers accrewing from the ſame.

CHAP. DXXVIII.

Of ONE BLADE.

OR,

MONOPHYL.

I. *THE Names.* It ſcarcely appears that this Plant was known to the Ancient *Greeks*. But it may be called in *Greek* Μονοφύλλον, *Monophylon*, after the *Latin* Name *Unifolium*; from whence it is called in *Engliſh*, *One Blade*.

II. *The Kinds.* This is *Planta ſingularis ſui generis*, unleſs you would have *Ophioglofſum* or *Adders Tongue*, to be a Species of it, which no Author that I know of has ever yet admitted. *Dalechampius* upon *Dioſcorides*, ſuppoſes it may be the *Cyclaminus Plinij.* in *lib.* 25. *chap.* 19. but doubtleſs this is a miſtake. *Tragus* calls this Plant (beſides *Unifolium*) *Cotyledon Sylveſtre*: but moſt of our latter Writers call it *Monophyllon*, or *Unifolium*; but *Bauhinus* referring it to the *Lilium Convallium*, calls it, *Lilium Convallium minus*, or leſſer *Lilly of Vally*; I will not diſpute the point with him, but rather give him his way.

The Deſcriptions.

III. *This ſmall Plant, has a very ſmall Root of the bigneſs of a* Ruſh, *lying and creeping under the upper Cruſt of the Earth, having ſeveral Fibres or ſmall Threads adjoining to it, which ſhoot forth out of the Earth again in ſeveral places. From this*

One-Blade.

Root ſprings forth one Stalk, which never bears more than one Leaf, but only when it riſes up with its Stalk, above that Leaf, in order to the bearing a Head of Flowers, and then it bears another Leaf, ſeldom any more, which are of a blewiſh green color, and therein very like unto the Leaf of the Lilly Convally, *but ſomthing broader at the bottom, having many Ribs or Veins in it, and pointed at the end, not much unlike to a* Plantain *Leaf. At the top of the Stalk, grow many ſmall white Flowers, Star faſhion, ſmelling ſomewhat ſweet; after which come ſmall reddiſh Berries when they are ripe.*

IV. *Gerard* deſcribes it after this manner. *Its Root is ſmall, tender, and creeping far abroad under the upper face of the Earth. Its Leaf is not much unlike the greateſt Leaf of* Ivy, *with many Nerves or Ribs, like thoſe of the* Plantain *Leaf, which ſingle Leaf does always ſpring forth of the Earth alone, but when the Stalk riſes up, it brings upon its ſides two Leaves, the latter in faſhion like the former. At the top of which ſlender Stalk, come forth fine ſmall Flowers like* Pyrola, *which being faded away, ſmall red Berries ſucceed.*

V. *The Places.* It grows in moiſt, ſhadowy and Graſſie places of Woods and Groves or Copſes, in many parts of *England*. *Gerard* ſays it grows in *Lancaſhire* in *Dinglywood*, ſix miles from *Preſton* in *Alderneſs*; and in *Harwood* near to *Blackburn* likewiſe.

VI. *The Times.* It Flowers about *May*, and the Berries are ripe in *June*, and then it quickly periſhes untill the next Year, it ſpringing afreſh, from the ſame Root again.

VII. *The*

VII. *The Qualities.* It is hot and dry in the firſt Degree, Abſterſive, Vulnerary, Sudorifick, and Alexipharmick.

VIII. *The Specification.* It is a peculiar thing for reſiſting Poiſon, profligating the Plague or Peſtilence, and all manner of Malign and Peſtilential Fevers, and for the curing of ſimple Green Wounds, old running Sores and Malign putrid Ulcers.

IX. *The Preparations.* You may have herefrom, 1. *A Liquid Juice, or an Eſſence.* 2. *A Pouder of the Root.* 3. *A Balſam from the whole Plant.* 4. *An Acid Tincture of the Root, and whole Plant.*

The Virtues.

X. *The Liquid Juice or Eſſence of the Root and whole Plant.* It is a potent thing to expel all ſorts of Vegetable Poiſons taken into the Stomach, and to defend the Heart from their Malignity: it is alſo a cure for all ſorts of Malign and Peſtilential Fevers, being given a Spoonful at a time in *Canary*, made pretty ſharp with *Juice of Limons*, and repeated as need requires: and ſo uſed it cures alſo the Plague it ſelf.

XI. *The Pouder of the Root.* Being given from half a Dram to a Dram at a time, in a mixture of Wine and Vinegar, of each equal parts, and the Patient (being in Bed) laid preſently to Sweat thereupon, it is ſaid to be a Soveraign Remedy for thoſe that are infected with the Plague, and have a Sore upon them, by defending the Heart and Vital Powers from the danger of the Malignity and Infection, and expelling the Poiſon of the Diſeaſe: it has alſo all the Virtues of the *Juice* or *Eſſence.*

XII. *The Balſam from the whole Plant.* It is a ſingular good Vulnerary, admirable for the curing of Wounds whether recent, or old; as alſo for the curing of malign, putrid and Inveterate running Sores and Ulcers, more eſpecially thoſe of the Nerves and Tendons.

XIII. *The Acid Tincture of the Root and whole Plant.* It may be given to a grateful acidity in any proper Vehicle 3, 4, 5, or 6, times a Day againſt the Purples, Spotted Fever, Calenture and Plague it ſelf, as alſo in all other Malign Fevers, it reſiſts the Poiſon and Malignity, and performs the Cure to a Wonder.

CHAP. DXXIX.

Of ONIONS.

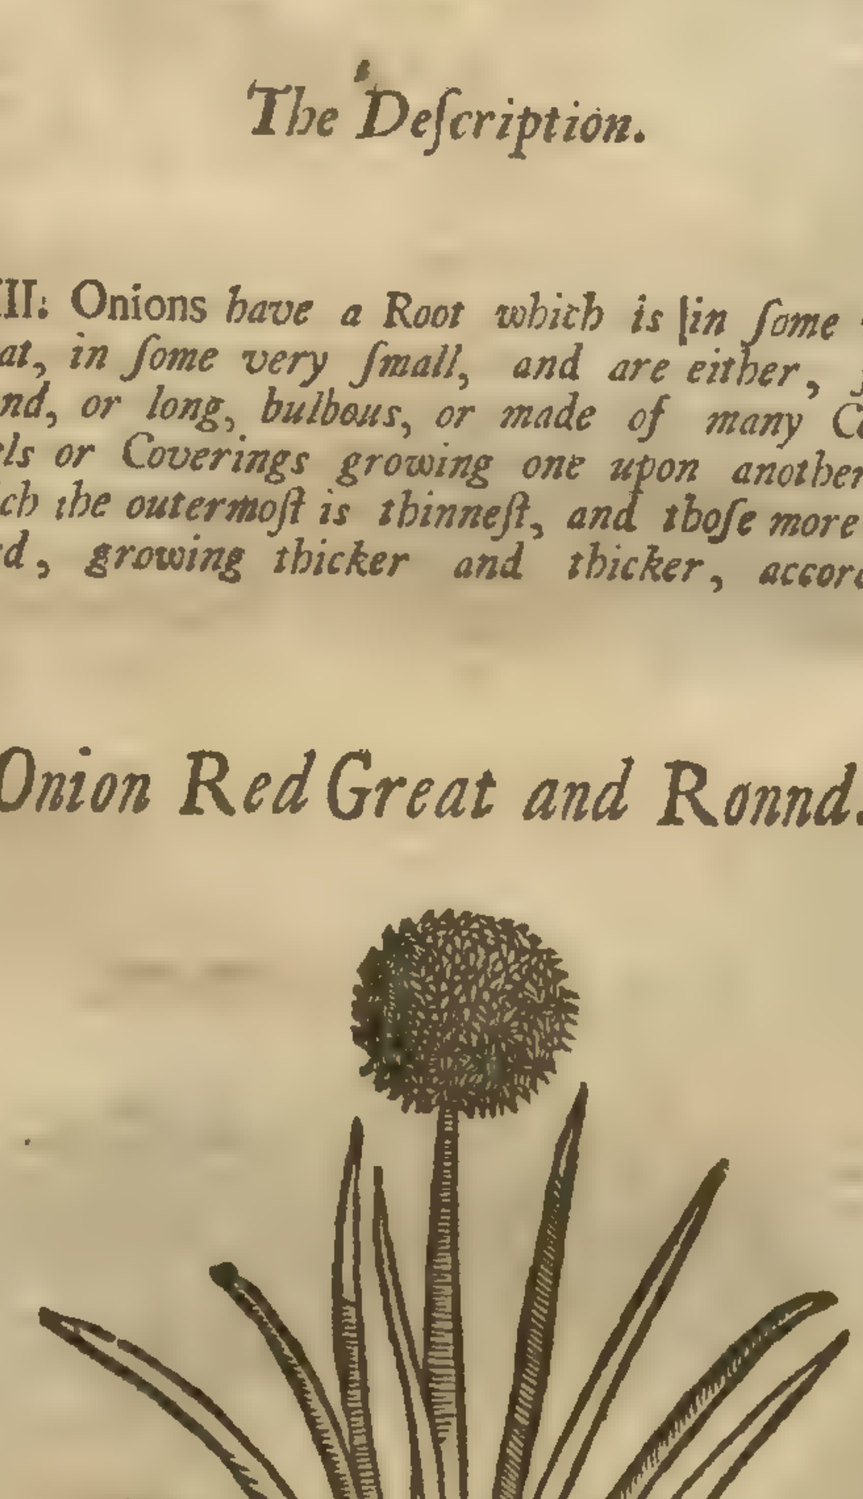
I. *THE Names.* This Plant is called in *Arabick*, *Baſil*, and *Baſſal:* in *Greek*, Κεφμμυον: in *Latine*, *Cæpa*, *Cæpe*, & *Cepe:* and in *Engliſh*, *Onion*, which ſeems to be derived from the *Latine* word *Unio*, becauſe the Root is ſingle or but One.

II. *The Kinds.* *Onions* are either *Red* or *White:* and of both theſe Kinds, 1. *The flat Red Onion.* 2. *The long Red Onion.* 3. *The round Red Onion*, or *Sweet Spaniſh Onion.* 4. *The flat White Onion.* 5. *The long White Onion.* 6. *The round white Onion*; all which *White Onions* are almoſt like to *Chalk-ſtones*, lying upon the Ground when they are ripe and fit to be gathered. 7. *Aſcalonica*, or *Aſcalonitis*, The Scallion, which is thought to be the *Gethyum*, or *Gethyllis* of *Theophraſtus*; theſe *Aſcalonitides*, are ſaid to be our *Set Onions*, the leſſer ſort of which are called *Chibols*: all the other Kinds are produced from Seed. The *Flat Red Onion* is the ſtrongeſt of all, ſome of them are Red throughout, very large and pleaſant to Eat. The *Long Red Onion* is the St. *Omers Onion*, commonly called St. *Thomas Onion.* The *Round Red Onion*, called the *Strasburgh Onion*, is red only on the out ſide, and is very ſharp and ſtrong. All theſe variety of *Onions*, have one and the ſame manner of growing above Ground, and the ſame Form, and therefore One Deſcription may ſerve for them all, which take as follows.

The Deſcription.

III. Onions *have a Root which is [in ſome very great, in ſome very ſmall, and are either, flat, round, or long, bulbous, or made of many Coats, Peels or Coverings growing one upon another, of which the outermoſt is thinneſt, and thoſe more inward, growing thicker and thicker, according*

Onion Red Great and Round.



to their remoteness from the first outward Coat: at the lower part or bottom of which Bulb, is a Beard of Fibres or Strings like a Tassel. Some are red on the outside only, others are red quite thro' out. Some are white, and these are either small or great, flat, long, or round. Some are very sharp and strong, others milder and more pleasant: and some of those growing in Spain, *are so pleasant that they may be eaten as an* Apple. *All these* Kinds *of* Onions, *contrary to the Nature of all other Bulbous Roots, have no off-sets, or other Roots growing to them, but are every one alone single by themselves; and therefore it seems the* Latines, *as* Columella, *did give to the Plant the Name of* Unio, *from whence as I conceive came our* English *Name* Onion: *This Root if it remains on the Ground after Seed*

Onion White flat or round.

time, dies, rots, and perishes every Year. From this Root spring up several green, long, hollow Leaves, *seeming half flat: among which rises up a great, round, hollow Stalk, thicker and bigger in the middle than any where else: at top whereof stands a close round Head, covered at the first with a thin skin which breaks of its own accord, as the Head grows larger and larger, and shews forth it self as a very large Globular Umble of white Flowers, which being past away turn into black Seed. This Head is many times so heavy, that the Stalk cannot bear it, but must be up held by some convenient prop from falling to the Ground, that it may not rot or perish.*

IV. *Some will have it that there is no* Wild Onion. *Others that there is, which they make to be an* Onion *which is long, and has a very long Neck: and this they will have to be the* Cepæ Ascalonitides, *which is also called by some* Gethyllides, *and this is that of which they say* Theophrastus *makes mention under the Title of* Gethyum, *as is aforementioned.*

Scallion not Headed.

Scallion Headed.

V. *The Places.* All ſorts of *Onions* are Sown, Planted, and Nurſt up in *Gardens* not only in *England*, but in almoſt all Countries throughout the World; and they grow and proſper beſt in a Fat and Rich Soil, which has been well Dunged and Digg'd, or turn'd up and made mellow and looſe. The *Scallion* takes its Name from *Aſcalon* a City in *Paleſtine*, where they grew plentifully, and from whence they are ſaid to be brought into all parts of *Europe*, and from thence Tranſplanted into *America*, where all the other Kinds of *Onions* grow alſo very plentifully, and come to great perfection.

VI. *The Times.* Thoſe which are Sown for Store ſhould be Sown in *February*, or before the latter end of *March* at fartheſt, and in the increaſe of the *Moon*; and are to be gathered when the Blades begin to flag towards the Root. Thoſe that are for Seed, are to be Set at the ſame time, when the former are Sown: This Seed tho' it is perfected in *England*, and will grow again with us, and produce good *Onions*, yet it is apt to degenerate, for which reaſon we commonly make uſe of Seed brought to us from beyond Sea.

VII. *The Qualities.* *Onions* are hot and dry in the fourth Degree, yet not thought to be full out ſo hot as *Garlick*. They are Attenuating, Aperitive, Abſterſive, vehemently Attractive, Digeſtive, Diſcuſſive, Diuretick, Inciſive, Emollient and Suppurative: Stomatick, Pectoral, Nephritick, Hyſterick, Arthritick, Ptarmick, Emmenagogick, Alexipharmick and Spermatogenetick.

VIII. *The Specification.* They ſtrengthen the Stomach, create Appetite, cauſe good Digeſtion, give eaſe in the Strangury, provoke Urine and Womens Courſes, and prevail againſt Sand, Gravel Stones, or any Tartarous Matter in the Reins, Ureters or Bladder: Cure the Bitings of Mad-Dogs, Serpents, or other Venomous Creatures, as alſo Coughs, Colds, Hoarſeneſs, Wheezing, Aſthma, and ſhortneſs of Breath. They ripen Apoſtems, give eaſe in the Gout, prevail againſt the Lethargy, *Carus* and all cold and moiſt Diſeaſes of the Head, being uſed as an *Errhine*, and take out the Fire in Scaldings, or Burnings by Water, Oil, Fire, or Gun-Pouder, *&c.*

IX. *The Preparations.* 1. *Raw* Onions *eaten as a Sallet.* 2. *A Liquid Juice.* 3. *An Infuſion in Water.* 4. *An Infuſion in Wine.* 5. *A Decoction.* 6. *An Errhine.* 7. *A Loboch.* 8. *An Electuary.* 9. *A Lotion.* 10. *Roaſted or Baked* Onions. 11. *A Pouder of the Seed.* 12. *A Cataplaſm of Raw* Onions. 13. *A Cataplaſm of Roaſted or Baked* Onions. 14. *A Diſtilled Water from* Onions. 15. *A Spirit from* Onions.

The Virtues.

X. *Raw* Onions *eaten as a Sallet.* They are of Heating, Volatile and Subtil parts, ſtrengthen the Stomach, cauſe Appetite, and a good Digeſtion, eaſe pains in the Stomach and Bowels, encreaſe Seed, provoke Luſt, gives eaſe in the Strangury, and force away the Urine; and are good againſt Sand, Gravel, Stones, or any Tartarous Matter lodged in the Reins, Ureters and Bladder. They make thin, and ſcatter groſs and clammy Humors, open Obſtructions of the Viſcera, and make the Body ſoluble.

XI. *The Liquid Juice.* The *Juice mixt with the Pap of an Apple*, and applyed, provokes the Hemorrhoids. The *Juice* dropt into the Eyes, takes away the Dimneſs of Sight; and if uſed at the beginning, takes away Miſts, Clouds, Spots, Haws, *&c.* in them. Dropt into the Ears, it is good againſt Deafneſs, Noiſe and Ringing in them, and cleanſes them from filthineſs and corrupt Matter. A *Peſſary* imbibed in the *Juice*, and put up into the Womb, it provokes the Terms, and brings away the After-Birth. The Head and other parts of the Body troubled with Scabs, Itch, Scalds, Scurff, Morphew, Leproſie, *&c.* being often waſhed or bathed therewith, it cures them. It ſtops the falling of the Hair, and cures Baldneſs, *&c.* being often applyed. The *Juice mixed with Juice of Penny-Royal*, and applyed to the Gout, gives eaſe in the pain, Cloth dipt therein, being alſo put upon the ſame. *Beaten up with Oil*, and applyed, it is good againſt Burnings with Fire or Gun-Pouder, and heals Wounds made by Gun-Shot.

XII. *The Infuſion in Water.* The *Onions being thin ſliced and ſteeped in Water all Night*, and the *Infuſion* given to Children which are troubled with Worms, it kills them.

XIII. *The Infuſion in Wine.* It may be made in *White Port Wine, or White Liſbon.* It provokes Urine powerfully, gives preſent eaſe in the Strangury, and forces away Sand, Gravel, Stones and Tartarous Matter from the Urinary parts: I gave this *Infuſion* to a miſerable Patient, who had not made Water in eight Days, and in an Hours time after it, they piſt above a Gallon, and were cured of their Strangury.

XIV. *The Decoction.* If it is *made ſtrong of the Onions, and in Veal Broth:* it eaſes pains and gripings in the Stomach and other Bowels, Strengthens the Stomach, cauſes a good Appetite, and makes the Belly Soluble.

XV. *The Errhine. It is made of the Juice mixed with Pouder of Scammony; a Dram of the Scammony to an Ounce of the Juice.* Snuft up the Noſtrils it cures the Lethargy, *Carus*, dulneſs and heavineſs of Head and Brain, Megrim, and other cruel and inveterate Headachs, and prevails againſt an Apoplexy, becauſe it draws away the Morbifick Matter through the *Os Ethmoides*, by the Noſtrils.

XVI. *The Loboch. It is made of the Juice mixed with Honey and Oil.* It cuts tough Flegm and looſens; it is good againſt Coughs, Colds, Wheezing, Hoarſeneſs, Shortneſs of Breath, Aſthma's, *&c.* and being often taken, it cauſes eaſie Expectoration.

XVII. *The Electuary. Take Pulp of Baked Onions (Baked in their Skins) a Pound, Honey 3 quarters of a Pound; Pouder of Elecampane, and of Onion Seed, of each 3 Ounces; Rue cut ſmall and bruiſed, or Pouder of Rue 2 Ounces: mix and make an Electuary.* It has all the Virtues of the *Loboch*, and much more Powerful to all the Intentions: beſides which, it expels Poiſon inwardly taken, and outwardly applyed, it is good againſt the Bitings of Mad Dogs, Serpents, and other Venemous Creatures. Doſe as much as a *Cheſt-Nut* Morning and Night.

XVIII. *The Lotion. Take Juice of Onions 2 parts; Wine Vinegar 1 part: mix them.* It takes away Spots, Marks, Scurff, Morphew, Leproſie, and other blemiſhes of the Skin, being often bathed therewith. Applied in the Gout, with Cloths dipt in the ſame, it gives preſent eaſe.

XIX. *Roaſted or Baked Onions.* They ought to be Baked dry in their Skins, once or twice, or oftner, till they are perfectly ſoft. Their Pulp being then taken from the Skins, and dreſt up with choiſe

choise Butter, Sugar, and a little Salt, and so eaten with Bread, Morning Fasting, and at Night going to Bed, so much at a time, as to make a Meal thereof, for 2, 3, or 4 Days running, it never fails of curing the most extream Cold, eases the Cough, causes easy Expectoration, takes away Asthma's, Hoarsness, Wheezings, and shortness of Breath, and restores the Voice to such who had almost lost it, or could scarcely speak so as to be understood.

XX. *The Powder of the Seed.* It strongly provokes Urine, gives ease in the Strangury, cleanses the Reins, Ureters and Bladder, of Sand, Gravel, or Tartarous Matter; provokes the Terms in Women, facilitates the Birth, and brings away the After-Birth. And being constantly taken for some time, it very much increases Seed, provokes Lust, and heightens the pleasure of Coition. Dose from half a Dram to a Dram, at Bed time in a Glass of Wine, or other fit Vehicle

XXI. *The Cataplasm of raw* Onions. *It is made by beating the Onions with Green Rue, and a little Salt, and brought to a consistency with Orobus Meal, or Powder of Elecampane Roots.* Applyed upon the Bitings of a Mad Dog, Viper, Rattle-Snake, or other Serpent, or stinging of any Venomous Creature, whilest the Wound is recent, it powerfully draws forth the Venom or Poison, and secures the Life of the Patient from danger. It gives also present ease in the most extream pains of the Gout, draws it out of the Stomach, if it is flown upwards, and in a short time after cures the Disease.

XXII. *The Cataplasm of Roasted or Baked* Onions. It is thus made. *Take of the Pulp 5 parts; Rue 3 parts; Pulp of Figs and Mithridate 2 parts; Salt 1 part; beat all well together for a Cataplasm.* Applyed very hot, and repeated every six Hours, as long as need requires, it will ripen and break any Apostem, and suppurate Pestilential Bubo's, and other Tumors of the like nature; it is also good for the Biting of a Mad-Dog, being presently laid thereto; it is profitable against Kibes and other putrid Sores of the Legs and Feet, which are hard to heal: and being applyed to the Piles or Hemorrhoids, it eases the Pain, discusses the Tumor, if not broken, and cleanses and heals them if Ulcerated. *Take a great Onion, make it hollow in the middle, and fill it with Mithridate or Treacle of* Andromachus; *close up the hole, and Roast it throughly in the Embers: then taking away the outwardmost Skins, let them be beaten together to a Cataplasm.* This Applyed to any Plague Sores, or putrid Apostems, it brings them to suppuration, draws forth the Poison or Malignity, cleanses them, and induces their healing.

XXIII. *The Distilled Water of* Onions. It is one of the noblest Nephriticks and Diureticks in the World, superior to *Parsly Water*, *Hidropiper Water*, or any other Vegetable Water of that kind; nor does it seem inferior to the *Decoction of Hops*, or *Infusion of Lignum Nephriticum.* It provokes Urine powerfully, gives ease in the Strangury, and cleanses the Reins and Bladder of Sand, Gravel and Tartarous Mucilage. Dose from 4 to 8 Ounces, either alone, or mixt with a little white *Port* Wine. If it is given with the *Powder of the Seed*, it will be yet much more effectual.

XXIV. *The Spirit.* It is exceeding Volatile, sharp and piercing, and a noble Antiscorbutick, Nephritick, and Arthritick, in a cold habit of Body: it ought not to be given to hot Constitutions, for in those, it may put all into a Flame, and kindle such a Fire, as may not easily be extinguished. It is a good Stomatick, creates an Appetite, and causes a good Digestion: expels Wind out of the Stomach and Bowels, and gives ease in the Colick: and is a very profitable thing for such as are inclinable to a Dropsie, or are newly cured of one. because it warms and comforts the Blood, and strengthens its Tone or Crasis. Dose from 1 Dram to 2, in any proper Vehicle.

XXV. *Vera.* Authors say, that if an *Onion* be sliced, and dipped in the *Juice of Sorrel*, and given to be eaten by one that is sick of a Tertian Ague, that it will take away the Fit, at once or twice so taking it.

CHAP. DXXX.

Of ORCHIS FLIES; *OR,* FLIE-FLOWER; *OR,* FLIES-STONES.

I. *THE Names.* It is called in *Greek*, Ὄρχις μυϊνὴς: in *Latine*, *Orchis Muscaria*; *Testiculus Muscarius*: in *English*, *Flies-Orchis*; or *Flies-Stones.*

II. *The Kinds.* These are Species of *Fox-Stones*, in *Chap.* 298. aforegoing, of which we gave you nine several Kinds: The rest which are wanting there, we shall supply you withall here in this Chapter, which are the following nine Varieties. 1. *Orchis Serapias bifolia, vel trifolia minor Clusii & Thalij*, The lesser Twa Blade, or three Leav'd white Butter-Fly Orchis. 2. *Orchis Sphegodes altera, vel secunda Lobelij*, The Wasp Orchis. 3. *Orchis minor culicem exprimens*; *Culices minores Triphyllæ Lobelij*; The lesser Gnat Flower. 4. *Orchis Sphegodes, sive Testiculus Vulpinus primus Lobelij*, The greater Gnat Flower. 5. *Orchis Melittias, sive apifera Lobelij*; The Honey Bee Flower. 6. *Orchis Myodes minor, vel Myodes prima Lobelij*, The lesser Fly Flower. 7. *Orchis Myodes minima, Orchis Serapias tertius Dodonæi*, The least Fly-Flower. 8. *Orchis Myodes lutea Narbonensis Lobelij*, The great Fly Flower of Narbone. 9. *Orchis Myodes angustifolia Bauhini, & minor Tabernæmontani*, The narrow leav'd Fly Flower.

The Descriptions.

III. *The first, or* lesser Twa-Blade or Three Leav'd white Butter Fly Orchis. *From two long Testicles or Stones, with a long Tail at the bottom of its Root, spring up two or three large Leaves less than those of the* Hungarian or greatest Twa-Blade Fox Stones *in* Chap. 298. Sect. 4. *The Stalk is more than half a Foot high, with 2 or 3 small, long, narrow Leaves thereon, and a small Tuft or Spike of white Flowers at the top thereof, thinly set thereon, somewhat resembling white Butter-Flies, with their Wings spread, each Flower having a crooked Tail behind it, full of a sweet or Honey Liquor.*

IV. *The second, or* Wasp Orchis. *The Roots or Stones are pretty large and more roundly Tuberous. The Leaves are a little narrower than the former. The Flowers stand in the same manner and almost of the same fashion, but something greater, and of a brown yellow color, the Wings being a little inclinable to purple. This* Gerard *makes the* Bumble Bee Orchis.

V. *The third, or* Lesser Gnat Flower. *It has two longish Testicles of a mean magnitude, having three Leaves usually standing below the Stalk, with some few short ones up higher. The Flowers are but small, but much resembling a small Gnat or Fly, of a yellowish brown color, whose lower part is smaller than the* Greater Gnat Flower *following.*

VI. *The fourth, or* Greater Gnat Flower. *The Testiculous Root or Stones are a little larger than in the last, and pointed at the Bottom. The Stalk hereof is greater and higher; the Leaves also are larger and longer than in the two last, but much smaller upon the Stalk. The Flowers are fewer at top, but larger by much: and their color differs not much, but is rather sadder.*

VII. *The fifth, or* Honey-Bee Flower. *Its Testiculous Root consists of two small round Tubers. The Stalk is seldom a Span high. The Leaves thereon are few, narrow and small, but pretty long, turning sometimes inward, some growing upon the Stalk. At top stands usually two or three Flowers, seldom more, each whereof is in shape much like to the Honey or Hive Bee; that many who have not seen it before, would verily believe, that it were either a living or the Carkase of a dead Bee; but that the upper Leaves, which are like Wings, are of a pale blewish purple color; and the Head yet paler; the Body being full and round and of a dark brown color, with some Spots of yellow thereon.*

VIII. *The sixth, or* the Lesser Fly-Flower, *or* Flesh Fly-Flower. *Its Testiculous Root is a round Tuber and sometimes longish, with Fibres springing from its top. It has lesser Leaves and more ribbed than the* Greater Flesh Fly-Flower, *in* Chap. 298. Sect. 6. *The Stalk rises not fully so high; the Flowers in form, are like to those, but lesser, and of a little darker color, both at the bottom and about the middle part; but paler between the Wings, being of a pale color, enclining to blew.*

IX. *The seventh, or* Least Fly Orchis, or Fly-Flower. *Its Testiculous Root consists of two round Tubers and small. It has three narrow Leaves and Ribbed, growing closer to the Stalk than in the last. Its Stalk is smaller and lower than it, having two or three small Flowers at top like the other, but smaller, and of a browniſh purple color, somewhat spotted.*

X. *The eighth, or* Great Fly-Flower of Narbone. *Its Testiculous Root consists of two small, round Tubers, or a little longish towards the upper parts; it has three or four Leaves, which are larger than the last and full of Ribs. The Stalk is higher. And the Flowers much larger or greater, and of a yellow color, like some Flys with us.*

XI. *The ninth, or* Narrow Leav'd Fly-Flower. *Its Root consists of two small, round, longish, tuberous Testicles, a little pointed at the bottom, with many small Fibres at the tops. It has several Leaves upon the Stalk, as six, eight, or ten, which are very narrow and very long, and grow upon the Stalk, even to the very top, where grow the Flowers which very much resemble a small short Fly.*

XII. *The Places.* They grow in open Grounds and in Wood-land Grounds, in Clay Grounds, as also in a moist fertil Earth; in Marsh Grounds and in dry sandy Soils, and barren Fields, in many parts of *England*; and all of them are found Nurst up in the *Gardens* of some of our Florists.

XIII. *The Times.* They Flower from the middle or latter end of *April* to the end of *May.*

XIV. *The Qualities, Specification* and *Preparations* of these *Fly-Flowers*, or *Fly-Stones*, are the same with those of *Dog-Stones* in *Chap.* 226. aforegoing, to which we refer you, and therefore shall say no more thereof in this place.

CHAP. DXXXI.

Of ORCHIS Handed;

OR,

PALMA CHRISTI.

I. *The Names.* It is called in *Greek*, Ὄρχις δακτυλωτός: in *Latine*, *Orchis Palmata*, *Orchis Digitata*, *Palma Christi*: and in *English Handed Orchis, Finger Orchis, and Palma Christi.*

II. *The Kinds.* Of these which are common to us the following nine are chief, *viz.* 1. *Orchis Palmata major, vel Mas*; *Palma Christi Mas Lobelij*, The great Male Handed Orchis. 2. *Orchis Palmata major pratensis angustifolia Baubini*, The great Male Handed Orchis with narrow Leaves. 3. *Orchis Palmata Fœmina*, *Palma Christi Fœmina folio maculato Lobelij*, The Female Handed Orchis. 4. *Orchis Palmata pratensis maxima*; *Conopsæa dicta Lobelio*, The greatest Handed and Hooded *Orchis*. 5. *Orchis Palmata minor Flore rubro, Serapias minor Lobelij*, Small Handed Orchis with red Flowers. 6. *Orchis Palmata angustifolia minor, Orchis Fœmina Tragi*, The lesser Handed Orchis with narrow Leaves. 7. *Orchis Palmata angustifolia minor odoratissima Baubini*, The sweet small Handed Orchis. 8. *Orchis Palmata Caryophyllata Lobelij*, The Clove scented Handed Orchis. 9. *Orchis Palmata Botrachites, vel Myodes Lobelij*, Handed Orchis resembling Frogs or Flies. There are others of the *Orchides Palmatæ*, which grow in Marsh and Fenny places. These are the *Orchides palustres*, Fenny Orchides, or Marsh Palms, of which we have already treated: but the Cuts or Figures of the first and second Kinds, there treated of, were over lookt, and so not inserted in their proper places; we have thought

thought good, that they might not be loſt, to place them here next following.

1. *Serapias, vel Orchis Palmata paluſtris latifolia* Fenny Orchis, *or* Marſh Handed Palms with broad Leaves, *Chap.* 251. *Sect.* 2. N°. 1.

2. *Serapias vel Orchis Palmata paluſtris Leptophylla*, Fenny Orchis Handed, *or* Marſh Palms thin Leav'd, *Chap.* 251. *Sect.* 2. N°. 2.

The Deſcriptions.

III. *The firſt*, *or* Great Male Handed Orchis *The Root is Handed, Palmed, or Fingred, as in the Cut or Figure. flat and broad, two, and two, joined together at the Head, like unto Hands, parted at the bottom into ſhort pieces, as if the Fingers were cut ſhort off by the Knuckles, with ſome Fibres at the Head thereof alſo, one of them being firm,*

Orchis Handed Male Great: or, *Palma Chriſti.*

the other looſe or ſpongy, as in the round Tuberous Orchides, *which riſe and decay in like manner. It has divers large, broad, and long, ſmooth, green Leaves, lying on the Ground, among which riſes up a round Stalk, with ſome ſuch Leaves on it, but leſſer up to the top, where grows a large Head of red purple Flowers, ſpotted with a deep purple color, each Flower having a Heel of the ſame color behind it.*

IV. *The ſecond*, *or* Great Male Handed Orchis with narrow Leaves. *The Roots of this are double Handed like the former, parted into three parts below: the Leaves are long, and narrower than the former, thro' which the Stalk riſes up, as thro' a Pipe, to be a Foot and half high, on which is ſet a ſpiked Head of Flowers of a pale purple color, with a Spur behind, and a ſmall Leaf ſet with every Flower at the bottom.*

V. *The third*, *or* Female Handed Orchis. *Its Root is Handed or Fingered like the others. The Leaves hereof are long and narrow, ſpotted diverſly with black Spots. The Stalk has likewiſe ſome*

narrow

narrower Leaves thereon, and a ſpicked Head of hooded Flowers, ſome reddiſh, either deeper or paler, or bluſh, or elſe white, the loweſt of them being ſpotted, but ſeveral of them have ſometimes none.

VI. *The fourth, or* Greateſt Handed and Hooded Orchis. *The Root is like the former, but larger Palmed and Fingered; from the Head of which riſes up a Stalk 2 feet high, having ſeveral long and narrow Leaves ſet thereon, almoſt encompaſſing it at the bottom, the Flowers whereof are Hooded like the laſt, but of a delicate pale purple color and ſweet withall, but flowering late.*

VII. *The fifth, or* Small Handed Orchis with red Flowers. *Its Root is ſmall and Handed like the others. It is but a ſmall Plant, and has a ſlender Stalk, with a few long and narrow Leaves ſet thereon, ſmaller above than thoſe below, having a ſpiked Head, of ſhining red Flowers.*

VIII. *The ſixth, or* Leſſer Handed Orchis with narrow Leaves. *Its Root is Handed and Fingered much like to thoſe beforegoing, but leſſer, and the lower diviſions of them are longer. The Leaves are very long and narrow, and the Stalk grows to be about a Foot high, the Flowers at top whereof, are of a pale purple color, and the whole Spike ſhorter than the others*

IX. *The ſeventh, or* Sweet ſmall Handed Orchis. *This Kind has ſmall Roots Palmed like the reſt. The Leaves are much narrower, and long almoſt as Graſs, the Stalk is a Hand high, with very ſmall Leaves up to the top, bearing thereon a ſmall Spike of pale purple Flowers, very ſweet, each having a Hood and a Lip hanging down, divided at the bottom into four parts, with a Heel behind.*

X. *The eighth, or the* Clove ſcented Handed Orchis. *Its Root is Palmed or Finger'd, much like the others, but has its lower diviſions much longer, running down deep into the Earth. The Leaves of this Kind are long and narrow. The Stalk is ſlender, with ſeveral ſhort Leaves thereon. The ſpiked Head of Flowers is Purple, each reſembling ſmall Flies, and ſmelling as ſweet as a* Clove, *or* Clove Gilliflower: *after which came great Heads of ſmall Seed.*

XI. *The ninth, or* Handed Orchis reſembling Frogs, or Flies. *Its Palmed or Fingered Root has ſhorter diviſions in one part, and longer in another. Its Leaves which grow on its Stalk, are ſomewhat ſhort and broad, encompaſſing it at the bottom. Its Flowers which grow at top of the Stalk, are ſmall, with Wings as it were above, and a long ſmall Body hanging down, and does in ſome ſort reſemble a Frog, as well as a Fly.*

XII. *The Places.* Theſe *Palmed or Finger'd Orchides*, grow for the moſt part in Fields and Meadows in many parts of *England*, and are alſo Nurſt up in *Gardens*, by the more curious ſort of Herbariſts. The *Marſh or Fenny Palmed or Finger'd Orchides* grow in Marſh, Mooriſh, or Fenny Grounds, as their Name does inculcate, and of which we have already ſpoken in *Chap.* 251. *Sect.* 10 aforegoing.

XIII. *The Times.* They Flower in *April*, *May*, and *June*, but ſeldom after, except they degenerate; or that it has had ſome hinderance at the time when it ought to have Naturally Flowered, which does indeed ſometimes happen.

XIV. *The Qualities, Specification, Preparations,* and *Vertues* of theſe, are the ſame with thoſe of *Cynoſorchis*, or *Dogs-Stones* in *Chap.* 226. *Sect.* 14. *ad* 18. aforegoing, to which we refer you.

ORGANIE, *ſee* Origanum, *Chap.* 532.
OROBANCH, *ſee* Broom Rape, *Chap.* 86.

CHAP. DXXXII.

Of ORIGANUM; *OR,* Baſtard MARJORAM.

I. *The Names.* It is called in *Arabick*, *Faudenigi*, or *Faudenegi*; in *Greek*, Ὀείγανον & Ὀεῖγανος: in *Latine*, *Origanum*: and in *Engliſh*, *Origanum*, *Organy*, and *Baſtard Marjoram.*

II. *The Kinds.* Late Authors make many Kinds hereof, but the moſt uſed in Phyſick are theſe five Species following, *viz.* 1. *Origanum Heracleoticum verius Lobelij, Matthioli, Geſneri, Camerarij, Lugdunenſis, Tabernæmontani, & Dodonæi*; ſome call it by the Name of *Creticum*, and ſome of *Hiſpanicum*: it is alſo called, *Cunila Gallinacea Plinij Bauhino*, and is the *Cunila Dioſcoridis*, Greek Origanum. 2. *Origanum Onitis Matthioli, Geſneri Bauhini & Lugdunenſis*, and called by ſome by Name the of *Italicum*; white Greek Origanum. 3. *Origanum Onitis aliud majus Camerarij & Bauhini*; *Origanum Creticum Gerardi*; The greater white Origanum. This third has ſo great a reſemblance with the former ſecond Species, that they are very much ſuſpected both of them to be but one and the ſame Kind, and that they differ but in the largeneſs of the Leaves, which may be occaſioned by reaſon of the difference of the Soil, or fertility of the Ground in which they may grow. 4. *Origanum Vulgare, Origanum officinum*; *Origianum Sylveſtre*; *Cunila Bubula Plinij Ruellio & Bauhino:* Our Common Origanum. This *Dioſcorides* ſays (if it is his Wild Kind) was called in his time *Cunila*. This is the ſtrongeſt in Smell, and quickeſt in Taſte, and is in *Galens* Opinion, the beſt. 5. *Origanum Anglicum Gerardi*, Our Engliſh Origanum.

The Deſcriptions.

III. *The firſt*, *or* Greek Origanum. *It has a long ſlender Root, with ſome ſmall Fibres adjoining to it; from whence riſes up ſeveral hard, round, reddiſh green Stalks, a Foot and ſometimes more in height, ſpreading forth into many other ſmaller Branches; on which grow many Leaves by couples at the Joints. Theſe Leaves are of a whitiſh green color, more long than round, and ſharp pointed, very like unto thoſe of* Marjoram, *but larger, whiter, and harder, or rougher in handling. At the tops of the Branches ſtand ſmall, long, ſcaled Spikes or Ears, ſuch like as in* Marjoram, *but longer, out of which ſhoot forth ſmall whitiſh purple Flowers, like the Flowering of* Wheat, *after which comes ſmall browniſh Seed. The whole Plant riſes up with us not much higher than*

Marjo-

Origanum Greek.

Marjoram, *but of a hotter and quicker Smell, yet very ſweet, and has a ſharper biting Taſte.*

IV. *The ſecond, or* White Greek Origanum. *This Plant is more tender to keep than the former,*

Origanum Greek white.

ſcarcely abiding the ſharpneſs of our Winters, *tho it be as well defended: it differs ſomething from the former tho not much; but in the color of the Flowers, which in this is white: in its Leaves which are whiter and larger; and in its Magnitude or Stature, this being much higher. The Heads are alſo more divided, and ſeparated into ſmaller Spikes or Ears.*

V. *The third, or* Greater white Origanum. *This is more hardy than the laſt, and will better abide the cold of a* Winter, *if there be care uſed to preſerve it. It has larger and whiter Leaves than the former; the ſpiky Heads are larger alſo, and more ſpread abroad than thoſe, and bear white Flowers in like manner.*

VI. *Gerard* deſcribes this third Species thus. *It has many thready Roots: from which riſe up divers weak and feeble Branches, trailing upon the Ground, ſet with ſad green Leaves, not unlike thoſe of* Penny-royal, *but broader and ſhorter; at the tops of theſe Branches ſtand Scaly or* Chaffy *Ears of a purple color; and the whole Plant is of a moſt pleaſant ſweet Smell. The Root of this,* Gerard *ſays, endured in his* Garden, *and the Leaves alſo green all the* Winter *long, tho ſome have ſaid that it periſhes at the firſt Froſt, as* Sweet Marjoram *does.*

VII. *The fourth, or* Our Common Origanum. *Its Root, ſays* Parkinſon, *periſhes when it has given Seed; It riſes up with divers round hard Stalks, on which are ſet ſomewhat broader, leſſer, and rougher Leaves than the former. The Flowers*

Origanum Common, or *Wild.*

grow at the tops of the Branches, in ſmaller ſpiked Heads, and more diſperſed than the former, of a reddiſh purple color; after which comes ſmall browniſh Seed.

VIII. *The*

VIII. *The fifth, or* Our Engliſh Origanum. *Its Root creeps under Ground, and encreaſes much, abiding from Year to Year, from whence come forth ſeveral browniſh, hard, ſquare Stalks, with ſmall, dark, green Leaves, ſet by couples on them, very like to thoſe of* Sweet Marjoram, *but harder, and ſomewhat broader. At the tops of the Stalks ſtand*

Origanum Engliſh.

Tufts of dark or deep purpliſh red Flowers, which turn into ſmall Seed, like that of the Garden Marjoram, *but blacker. The whole Plant ſmells pleaſantly ſtrong.*

IX. *Gerard* ſays, That this fifth Species or Engliſh Kind, *has a Root which creeps in the Ground, is long laſting, and ſends forth long, ſtiff and hard Stalks of two Cubits high, ſet with Leaves like thoſe of* Sweet Marjoram, *but broader and greater, of a ruſſet green color. On the tops of the Branches ſtand Tufts of purple Flowers, compoſed of many ſmall ones ſet together very cloſely, Umble faſhion. This Plant is called by* Lobel, Origanum Onitis majus, *and* Agrioriganum, *and is the* Origanum Italicum Cæſalpini.

X. *The Places.* All theſe Kinds of *Origanum's* grow Wild in hot Countries, as *Greece*, *Italy*, *Spain*, *Creet*, *Florida* in *America*, and other hot Climates: But with us they are Nurſt up in *Gardens.* The fifth or laſt grows (as well as in *Gardens*) Wild in the borders of Fields, and low Copſes, in moſt places of *England.* I found it to grow Wild in many Plantations in the South of *Carolina*, where it grew ſpontaneouſly, and flouriſhed after an admirable manner.

XI. *The Times.* They bear their ſpiked Heads or Flower about the middle or end of *Auguſt*, or middle of *September* with us; ſo that their Seed (except that of the laſt) does not often come to Maturity in our Country.

XII. *The Qualities. Origanum* is hot and dry in the end of the third Degree: it attenuates or makes thin, incides, is ſomething Aperitive, Attractive, Carminative, Digeſtive, Anodyn; Cephalick, Neurotick, Stomatick, Hyſterick; Prarmick, Emmenagogick, and Alexipharmick.

XIII. *The Specification.* It prevails againſt Poiſon, the Bitings of Serpents, or other Venomous Creatures; Convulſions, the Dropſy, Obſtructions of the Terms, Coughs, Swellings of the Throat, Ulcers of the Mouth, Jaundice, Colick, *&c.*

XIV. *The Preparations.* 1. *A Liquid Juice.* 2. *An Eſſence.* 3. *A Decoction or Infuſion in Wine.* 4. *A Pouder.* 5. *An Errhine.* 6. *A Diſtilled Water.* 7. *A Spirit.* 8. *A Diſtilled Oil.* 9. *A Spirituous Tincture.* 10. *An Acid Tincture.* 11. *An Oily Tincture.* 12. *An Electuary.* 13. *An Emetick.*

The Virtues.

XV. *The Liquid Juice.* Given with Wine, and *Oxymel*, it is good againſt Poiſon, and the malignity of *Hemlock*, *Henbane*, and *Opium*, or the Root of *Colchicum Ephemerum*, which is *Meadow Saffron*, that kills in about a Days time. It may be given from 1 Spoonful to 4: given with *Pulp of Figs* it is good againſt Ruptures, Convulſions, and Cramps: and mixt with an equal quantity of *Honey*, it Purges downwards black and melancholy Humors. Taken in a Glaſs of White *Port* or *Lisbon* Wine, it provokes the Terms in Women, and prevails againſt the Dropſie. Mixt with Honey as aforeſaid, it is good againſt Coughs, Colds, Wheezing, Hoarſeneſs, and Shortneſs of Breath.

XVI. *The Eſſence.* It is given from 1 Spoonful to 2 or 3, againſt all the Diſeaſes afore named, in Wine or ſome other proper Vehicle. Being dropt into the Ears, it eaſes their pain. It is profitable for ſuch as are Itchy, Mangy, or are Scabby: and being taken for ſome conſiderable time, is an excellent thing for the cure of the Jaundice.

XVII. *The Decoction or Infuſion in Wine.* Theſe have the Virtues of the *Juice* and *Eſſence*, but nothing near ſo powerful, and therefore may be given Morning and Night from 4 to 6 Ounces or more, according to the Age of the Patient. They are potent Remedies againſt all ſorts of cold Poiſons whatſoever: as alſo againſt the bitings or ſtingings of Serpents, mad Dogs, Scorpions, Spiders, *&c.* ſecuring the Life of the Patient upon the ſpot.

XVIII. *The Pouder of the Herb and Heads of Flowers.* It has all the Virtues of the former *Preparations*; but operates not with that ſpeed which they do, becauſe it requires ſome time to be digeſted in the Stomach: but being given in *Mead* or *Honeyed Water* from a Dram to 2 Drams, it Purges downwards, black and melancholy Humors, is good againſt the Jaundice, provokes the Terms, and facilitates the Birth of a Woman in Labor.

XIX. *The Errhine. Take of the liquid Juice an Ounce: of the Eſſence* 2 *Drams: of the Pouder half a Dram, mix them, to be ſnuft up the Noſtrils.* It purges the Head and Brain that way, draws forth

forth Pituitous Humors, and other kinds of Matter out of the Cavities of the Brain, and therefore is profitable against the Head-ach, Megrim, Vertigo, Lethargy, Apoplexie, Epilepsie, and other like cold diseases of the Head: in which being often used, Morning, Noon, and Night, it is found to be a thing of great efficacy.

XX. *The Distilled Water.* It has the former Virtues, but is much weaker than either *Juice* or *Essence*, and may be taken from 4, to 6 or 8 Ounces, dulcified with double refined Sugar: it will be much more effectual if half a Spoonful or Spoonful of the *Spirit* is added to it; however it may be used as a Vehiculum to convey the other *Preparations* in.

XXI. *The Spirit Distilled from the whole Plant.* It is Cephalick, Neurotick, Cordial and Hysterick: good against Lethargies, *Cirus*, and all other cold and moist Diseases of the Head and Brain; is prevalent against Palsies, Tremblings, and Numbness of any part, Sickness at Heart, Fainting, Swooning, Palpitation, and all cold and moist Diseases of the Stomach and Womb. Dose from 2 Drams to 6 in a Glass of Wine.

XXII. *The Distilled Oil from the Spiked Heads of Flowers.* It has all the Virtues of the former *Preparations*; and is one of the most powerful Vegetables in the World against the Palsie, tho' universal, being taken inwardly from 3 to 10 or 12 drops in any Antiparalytick Vehicle: and outwardly anointed upon the *Spina Dorsi* and parts affected, Morning and Evening: but by reason of its extraordinary heat, it ought to be mixed with *Chymical Oil of Limons* in equal parts, and then used: and so it is a most excellent thing against Cramps, and Convulsions of the Nerves in what part of the Body soever.

XXIII. *The Spirituous Tincture.* It has all the Virtues of the *Juice*, *Essence*, *Spirit* and *Oil*, but is milder, and more fit to be taken than the last of them, unless in an inveterate Palsie, in which I think, scarcely any Medicine can be too strong. It is a great Stomatick, and this as well as the *Oil* are potent things against the Colick, whether in the Stomach or Guts: it strengthens the *Viscera*, expels Wind, and makes a cheerful Countenance. Dose from 1 to 2 or 3 Drams, or more, in a Glass of Wine Morning and Evening.

XXIV. *The Acid Tincture.* It is a great corrector of all sorts of Poisons of Vegetables or Animals, but more especially against the Poison or Malignity of the Plague or Pestilence, and resists the utmost force of all sorts of Malign or Pestilential Fevers: it very much strengthens the Stomach, causes a good Appetite, and a strong Digestion, and being used for some time, very admirably restores languishing Nature. Dose so many drops at a time, as to make a Glass of Ale, Wine, or Dish of Broth, pleasantly and gratefully Acid.

XXV. *The Oily Tincture.* It has all the Virtues of the *Oil* and *Spirituous Tincture*; besides which it is prevalent against Diseases of the Reins, Ureters and Bladder, cleansing them from Sand, Gravel, Stones, and other Tartarous Mucilage obstructing them. It strengthens the Back, eases the vehement pain thereof, being inwardly taken and outwardly anointed upon the same, provokes Urine powerfully, and gives present relief in the Strangury. Dose from 20 to 40 or 60 drops, in any fit Vehicle.

XXVI. *The Electuary. Take of the Pouder an Ounce, of Sal nitre in fine Pouder 4 Drams, Honey 3 Ounces and half, mix them.* Held in the Mouth, between the Gums and Lips, or Cheeks, it eases the Tooth-ach: and being rubbed upon the Teeth, it makes them white, and fastens them: given inwardly, to 2 Drams or more, in a Glass of Wine; it potently provokes Urine, gives ease in the Strangury, and heat and scalding of the Water; and evacuates the Watery Humor in Dropsies.

XXVII. *The Emetick. It is made of the Juice, and Orris flood, and Sumach infused in it, in a Copper Vessel for the space of 20 Days.* Dose a Dram or 2, more or less, according to Age and Strength, in a Glass of Wine in the Morning Fasting.

XXVIII. *Nota. Galen* says, all the sorts of *Origanum*, are of a cutting, rarifying, and attenuating Faculty, and heat in the third Degree; and that the *Heracleticum* is of more power or force than the *Origanum*, and that the Wild is stronger than either. It is also said that the *Decoction of Origanum, with Cloves, sweetned with Sugar*, helps such as are troubled with the Hiccough.

CHAP. DXXXIII.

Of ORRICE Florentine.

I. *THE Names.* It called in *Greek*, Ἶρις Λευκὴ ουμωδὴς: in *Latine*, *Iris Tuberosa alba*; *Iris Tuberosa Florentina*, *Iris alba Florentina*: in *English*, *White Orrice*, *Florentine Orice*, and *White Tuberous Flower de Luce.*

II. *The Kinds.* We have treated of this Plant already in *Chap.* 287. aforegoing, where we have described three several Species thereof, *viz. Iris alba Florentina*, the Sweet Florentine Orrice: of whose Root Sweet Pouders and Waters are made, and of which they make their *Rasp-Berry Ale*, by putting a little bit of it into each Bottle. 2. *Iris Flore pallido Florentina*, The Straw colored Florentine Orrice. 3. *Iris alba major versi-color*, The white parti-colored Orrice. To these we shall add in this Chapter, 4. *Iris Cærulea odorifera*, *vel odorosa*, *Iris Camerarij Germanica*, Camerarius his Sweet German Orrice; or Sweet blew Flowered Orrice: 5. *Iris Pannonica*, Hungarian or Austrian Flower de Luce, or Orrice. And with these, we here give you the Cut, or Figure, of the *Sweet white or Florentine Orrice*, which was over-past in *Chap.* 287. *Sect.* 3. above mentioned, which is now here placed.

The Descriptions.

III. *The first of these, or* Sweet Florentine Orrice, *has a tuberous Root of a considerable thickness, which is admirable sweet, and being put into Ale, or Wine, does give them an absolute* Rasp-Berry *Flavour or Taste; also being reduced into Pouder, makes a yellowish or Cream white Pouder, of a very pleasant sweet Smell, of which many sweet Pouders and Bags are composed; and which is generally now Sold*

2. *Orrice Florentine Sweet:* or *Sweet white Orrice*; or *Sweet tuberous Flower de luce.*

Orrice Florentine.

in Perfumers Shops: *This* Orrice *in its form and way of growing, is altogether like to the* Common Flower de luce, *saving that the Flowers of this are of a white color, and the Root of an exceeding sweet Smell.* The larger deſcription hereof ſee in the afore cited *Chapter* and *Section.*

IV. *The fourth*, *or* Camerarius his Sweet German Orrice, *or* Sweet blew Flowered Orrice. *Camerarius* in his *Hortus Medicus* ſays, *That it has a great thick and knobby Root, which ſmells as Sweet as the* Florentine Orrice. *The Stalk is ſingle and ſmooth, thick and full of Juice. The Leaves are very large and broad, and twice as broad as any of the other* Flower de luces. *The Flower grows at the top of the Stalk, conſiſting of ſix great Leaves, of a moſt bright ſhining blew color, welted down the middle, with a middle Rib, of a yellowiſh white color, the three upper Leaves being ſomewhat yellowiſh. At the bottom next the Stalk, it is of a white color, with ſome yellowneſs fringed about the ſaid white, as alſo about the brims or edges, which very much expreſſes the Beauty thereof.*

V. *The fifth*, *or* Hungarian, or Auſtrian Flower de luce *or* Orrice. *Its Root is tuberous, and very ſweet when it is dry, out-vying, or contending in ſweetneſs, with the firſt or* Common Sweet Florentine Orrice it ſelf. *It has great broad Leaves, thick and flat, of a purple color near unto the Ground, like to the* Dalmatian Flower de luce, *which it very much reſembles. The Flower is of all the others, the moſt confuſedly mixed with various colors, being very Beautiful, inſomuch as it is very difficult to deſcribe every Line or Stroke, according to the truth thereof. The three Leaves which ſtand upright, do claſp or embrace one another, and are of a yellow color. The Leaves which look downwards, are about the edges, of a pale color, the middle part of white, mixed with a Line of Purple, and has many ſmall purple Lines, ſtriped over the ſaid white Flower, even to the brim of the pale colored edge. This being lightly ſmelt to has a Smell almoſt like to thoſe of the* Hawthorn Flowers.

VI. *The Places.* The Titles or Names of theſe *Orrice*'s ſhew in what Places or Countries they are Natives: with us they are only Nurſt up in *Gardens*, where they flouriſh very well.

VII. *The Times.* They Flower in *July* and *Auguſt*; and their Seed is ripe in *September*, or not long after.

VIII. *The Qualities, Specifications, Preparations,* and *Vertues* of theſe, are the ſame with the *Florentine Orrice*, declared in *Chap.* 287. *Sect.* 8. *ad* 17. aforegoing, to which you are referred.

CHAP. DXXXIV.

Of ORPINE;

OR,

LIVE-LONG.

I. *THE Names.* It is called in *Greek*, Τελέφιον: in *Latine*, *Telephium* alſo (ſo called from *Telephus Rex Miſiæ*, whoſe Wounds received from *Achilles*, and grown almoſt paſt Cure, were healed herewith:) by ſome Authors, *Fabaria*, and by moſt *Craſſula:* in *Engliſh*, *Orpine* and *Live-long*; (becauſe a Branch or Branches of the Plant will live and grow a long time, after they are taken out of the Ground and hung up in any place, more eſpecially if put into a ſhallow Baſon of Water, in which it will ſpring up regularly, and grow beautifully, even to admiration).

II. *The Kinds.* Theſe following ſix Sorts, are the chief, *viz.* 1. *Telephium, ſive Craſſula major vulgaris (à foliorum Craſſite: Scrophularia media, vel Tertia Brunfelſij: Fabaria, Faba craſſa, Faba inverſa Quorundam & Lobelij; à foliorum Fabæ ſimilitudine & craſſitudine; Acetabulum alterum Cordi; Cotiledon alterum Dioſcoridis Columnâ; Anacampſeros Geſneri in hortis;* Telephium, *Telephium vulgare, Cluſij, Dodonæi, Matthioli;* Our Common Orpine. 2. *Telepium ſeu Craſſula minor, Cepæa Matthioli; Cepæa marina aliorum;* Small Orpine. 3. *Telephium, ſive Craſſula major Hiſpanica, Cluſij; & Lobelij Telephium Hiſpanicum Cluſij;* The Great Spaniſh Orpine. 4. *Telephium Floribus purpureis Lobelij; Scrophularia ſeu Portulaca major Tragi; Acetabulum alterum purpureum Fuchſij; Telephium quintum Cluſij; Craſſula Montana Cæſalpini; Rapuntium Umbellatum Columnæ* (for he did not think it to be a Species of *Telephium.*) Orpine purple Flowered. 5. *Telephium minus repens; Dodonæi & Lobelij; Cepæa Pancij Cluſio & Camerario; Telephium ſextum Cluſij* (who thinks it more nearly to reſemble the True *Telephium* or Orpine, than any other.) *Telephium ſemper Virens, Dodonæi & Lobelij;* Small creeping Orpine, or French Orpine. 6. *Telephium Legitimum Imperati, Cluſio; Telephium Imperati Camerario;* The True Orpine of *Imperatus.*

The

The Descriptions.

III. *The first*, *or* Our Common Orpine. *The Roots are manifold, thick, round, and white, with glandulous or tuberous Clogs, not much unlike to those of the* Spanish *Kind following, but lesser. It rises up with several round brittle Stalks, thick set with thick, fat, and fleshy Leaves, without any order, and little or nothing dented about the edges, lesser than those of the* Spanish *sort, and of a paler green color. The Flowers grow in lesser Tufts, and are white, or of a whitish color, which afterwards bear chaffy Husks, containing within them small dust like Seed. This when it is found growing Wild in Fields and Woods sides, does generally grow smaller than when it grows in* Gardens.

Orpine Common.

Orpine Small.

of five Leaves apiece; after which come small Heads, like to the other Orpines, *in which is contained small dusty Seed.*

V. *The third*, *or* Great Spanish Orpine. *Its Roots are thick, white, and tuberous, bigger and longer than those of the first*, *or* Our Common Orpine, *which abide all the* Winter, *with the green Leaves on their Stalks, which have not yet Flowered. From this Root rises up several weak, round sappy Stalks, about two* Feet *high, on which are set, at distances, two large and thick bread Leaves, very like unto the* Common Orpine, *but much larger and sometimes browner of color, and a little unevenly dented about the edges. At the tops of the Stalks grow Tufts of Flowers, larger and more spread, than those in our first or* Common Kind *which consist of five small whitish Leaves apiece; which being past away, small chaffy Husks succeed, with small dust like Seed within them.*

VI. *The fourth*, *or* Orpine purple Flowered. *It has a tuberous Root like the first Kind, but much smaller, and very much fuller of Fibres or Strings. Nor does it much differ from our* Common Kind, *but that the Stalks are more flexible and weak, and the Leaves (which grow without any order) are more finely dented about the edges. The Tuft of Flowers at the tops of the Stalks are of a reddish purple color, consisting of five small Leaves apiece, like the former. This has been found also smaller in all its parts; but not otherwise differing, than in that the Stalks with all the Leaves, utterly perish every Year to the Root, which every Spring sends forth new Stalks.*

VII. *The fifth*, *or* Small creeping Orpine, *called by some* French Orpine. *Its Roots are not tuberous but fiberous or stringy; yet do endure with the green Leaves on them, the greatest extremity of* Winter, *loosing only some few of the lower Leaves of the Branches. This Root sends forth several weak round Stalks, lying on the Ground, and easily*

Leaves, without any order, and little or nothing dented about the edges, lesser than those of the Spanish *sort, and of a paler green color. The Flowers grow in lesser Tufts, and are white, or of a whitish color, which afterwards bear chaffy Husks, containing within them small dust like Seed. This when it is found growing Wild in Fields and Woods sides, does generally grow smaller than when it grows in* Gardens.

IV. *The second*, *or* Small Orpine. *Its Root is long and Fibrous, smelling something sweet, like* Rose-wort Root *as* Camerarius *says, and perishes every Year; so that if it rises not of the shed Seed (which it usually does, if it is suffered to shed it) it must be new Sown every Year. It has a small weak Stalk, scarcely a Foot long, lying almost upon the Ground, spread out into several Branches, and they again into other smaller ones, set with small thick long Leaves, without any order; and sometimes like unto* Purslane. *At the tops of the Branches grow many small white Flowers, in Tufts, but more thinly, or sparsedly set, than in some of the other Kinds, consisting*

ly taking Root again as they lye, thick ſet with thick fat Leaves, like unto Purſlane, *but ſmaller and ſmaller upwards, of a dark or ruſty green color; from among which riſe bare or naked weak Stalks, without any, or with but few Leaves thereon; at the tops whereof ſtand ſmall Tufts of purpliſh Flowers like the other.*

VIII. *The ſixth, or* True Orpine of Imperatus *Its Root is ſmall and long, of 4, 6, or 8 Inches in length, with divers Branches and ſmall Fibres adjoining to it; at the Head whereof ſome Branches of green Leaves, which have not ſeeded, will remain, tho' thoſe that have flowered and ſeeded dye away and periſh. It is a ſmall Plant and ſpreads it ſelf upon the Ground, with many ſmall and long trailing Branches, a Foot or more long: whereof thoſe which will not flower the ſame Year have ſmaller, and ſomewhat longer Leaves on them, and thicker ſet together: but thoſe which will bear Flowers, are ſet ſparſedly with out any order to the tops, and are leſſer in form, and leſs thick and ſappy than any of the others before, and of a ſad bleiviſh green color. At the tops of the Stalks, ſtand thick cluſters of white Flowers of five Leaves apiece, after which come ſmall corner'd Heads containing ſmall browniſh Seed.*

IX. *The Places.* The firſt of both ſorts, both greater and leſſer, are frequently found almoſt in every County of *England*, the greater being generally Nurſt up in *Gardens*; the leſſer ſort is found to grow in the ſhady ſides of Fields and Woods. The ſecond was firſt brought to us from *Padoua*, and is now planted in many places in our *Gardens*. The third *Cluſius* found in *Spain*, as alſo in *Hungary*, and upon the *Alps*. The fourth has been found often in ſeveral places of *Germany*, as *Tragus*, *Camerarius*, *Cluſius* and others affirm. The fifth was a Native of *Italy*, and was ſent thence by *Alphonſus Pancius* an excellent Herbariſt of *Ferraria*. The ſixth came from *Imperatus* of *Naples*; from *Cortuſus* and *Joſephus de Caſa bona*, of whom *Cluſius* ſays, that he received the Seed. Theſe are the Native places of theſe five laſt, but with us in *England*, they are all Nurſt up in *Gardens*.

X. *The Times.* They do all of them Flower thro' the whole Month of *July*, and their Seed is ripe in *Auguſt*.

XI. *The Qualities.* They are cold and moiſt in the ſecond Degree, as ſome ſay; and Vulnerary, as being good to heal Wounds and Ulcers, whether inward or outward.

XII. *The Specification.* They are peculiar for cooling Inflamations in Wounds and Tumors, and eaſing their Pain: They abſorb the acidity of Humors in the Bloody Flux, ſtop fluxes of Blood in Wounds; allay Vapors, and cure Excoriations or Ulcers in the Stomach, Bowels, Liver, Lungs, Reins, Womb, or other inward parts.

XIII. *The Preparations.* You may have therefrom, 1. *A Liquid Juice.* 2. *An Eſſence.* 3. *A Decoƈted or Inſolated Oil.* 4. *A Cataplaſm of the Leaves.* 5. *A Diſtilled Water.*

The Virtues.

XIV. *The Liquid Juice.* Uſed with Vinegar as a Bath or Waſh, it takes away Scurf, Morphew, Leproſy, and all other Deformities of the Skin; and is good to waſh old filthy Sores, and putrid Ulcers, to cleanſe and heal them. It prevails againſt a Quinſey, the Throat being gargled therewith ſeveral times a Day, and outwardly it being bathed therewith double Cloths wet therein, being alſo bound thereto.

XV. *The Eſſence.* Taken inwardly 1, 2, or 3 Spoonfuls at a time, it is good to heal any gnawing, Excoriation, or Ulcer in the Stomach, Inteſtines, Lungs, Liver, Spleen, Reins, Ureters, Bladder, or Womb, or other inward parts, being taken for ſeveral Days together. It alſo abſorbs the acrimony and acidity of the Humors, heals other Bowels in the Bloody Flux, and ſtops all the Fluxes of Blood in the Body, as alſo the bleeding of Wounds outwardly, The Root of theſe Plants, is ſaid alſo to perform the ſame things, *viz.* The *Eſſence* made of the Root: Inwardly taken for ſome conſiderable time, it waſts and conſumes Scrophulous Tumors, or Swellings of the Throat, from the Evil.

XVI. *The Decoƈted or Inſolated Oil. It may be made of the green Herb, or Root. Or it may be made by beating the Juice and Oil Olive together.* It cools Inflamations, gives eaſe in hot Apoſtems, as alſo in inflamed Wounds, and is excellent to heal Scaldings or burnings with Water, Oil, Lead, or Fire, *&c.* Anointed upon Strumous Swellings in the Neck and Throat, it is ſaid to abate them, prevent the afflux of Humors, and in a ſhort time to cure the ſame.

XVII. *The Cataplaſm of the green Leaves or Roots.* Applyed to any ſimple Green Wound in Hands, Arms, Legs, or Feet, or other parts of the Body, it quickly heals them. Being bound to the Throat of One that has a Quinſey, it repels the Humor, ſuddenly puts the Patient out of Peril, and in a ſhort time cures it; the Throat being gurgled alſo with the *Juice* or *Eſſence*, five or ſix times a Day. Applyed to Ruptures, it is ſaid to conſolidate them, eſpecially if the Patient is young.

XVIII. *The Diſtilled Water.* It has all the Virtues of the *Liquid Juice* and *Eſſence*; and may be given to ſix Ounces or more, a little dulcified with double refined Sugar. Mixt with an equal part of Vinegar, it is ſaid to be a ſingular Coſmetick.

CHAP. DXXXV.

Of OX EYE.

I. *THE Names.* It is called in *Arabick, Bihar:* in *Greek*, Βόφθαλμὸν: in *Latine*, *Buphthalmon, & Oculus Bovis:* and in *Engliſh*, *Ox Eye.*

II. *The Kinds.* Authors give us ſeveral Kinds of this Plant, but thoſe which grow with us in *England*, are chiefly theſe following, *viz.* 1. *Buphthalmum vulgare, Buphthalum Matthioli millefolij foliis; Oculus Bovis vulgaris, Cachle Dioſcoridis, Chryſanthemum Cordi, Fuchſij, Geſneri & Turneri*, The Common or Vulgar Ox-Eye. 2. *Buphthalmum alterum Cotulæ folio Camerarij, & Bauhini Buphthalmum Narboneſe*, Camomil-like Ox Eye. 3. *Buphthalmum flore purpuraſcente*, Ox Eye purple Flowered. 4. *Buphthalmum Africanum tenuifolium Boelij*, Ox Eye Fennel Leav'd.

The

The Descriptions.

III. *The first*, or Common or Vulgar Ox Eye. *It has a small and slender Root, and fibrous withall, which perishes yearly, or otherwise abides the second Year after the first Sowing, which* Yarrow *does not. This is the most common* Ox Eye *with us; its Leaves are fair and green, divided very much*

Ox-Eye.

into several other Leaves, somewhat resembling Common Yarrow, *and so taken to be by many who look but superficially upon it; but being carefully observed, it is found plainly to differ from it, the divisions not being so thick nor small. The Stalks tho' they grow upright, yet are not so stiff or strong as those of* Yarrow; *and at their tops they bear but single Flowers, lesser than those of the* Corn-Marigold, *but wholly of a deep yellow, and not shining, after which follows the Seed in the middle yellow Thrum.* The Figure we here exhibit to you is that which is in *Mathiolus* his *Epitome*; but the more Elegant Cut of this Plant, is that which is in *Bauhinus* his Edition of *Matthiolus* his *Dioscorides*.

IV. *The second, or* Camomil-like Ox Eye. *Its root is tough, long and slender, with some Fibres adjoining to it. The Stalks are weak, sappy, flexible or apt to bend, and green withall, which grow sometimes to be about 2 Feet high, with fine* Camomil *or* May-weed-like *Leaves, but a little larger, dispersedly growing thereon, as also on its Branches; every one of which bear a Flower like unto the former* Ox-Eye, *or* Corn-Marigold, *but its Leaves are fewer, yet somewhat larger than those of* Camomil, *and yellow; the yellow Thrum in the middle being of a deeper yellow color, and somewhat hollow withal.*

V. *The third, or* Ox-Eye purple Flower'd. *Its Root is much like the former. The Stalk also (which in the other is green) is more reddish in this. In the main, the Plant differs not much from the last in the manner of its growing, or in the form of its Leaves and Flowers; saving, that in this, the Flowers are either wholly purple, or else purple in the middle.*

VI. *The fourth, or* Ox-Eye Fennel Leav'd. *It has a long slender Root, which is full of Fibres or Strings, and perishes every Year after Seed time. It rises up with one slender Stalk, with several long thin Leaves, variously divided, and cut into small fine parts, coming nearer to the form of* Fennel, *than any other, bearing a large yellow Flower at top of each Branch, Leaves and Flowers growing together.*

VII. *The Places.* They generally grow in moist Grounds, by Water Courses, and the like in other Countries; but with us they grow only in *Gardens*.

VIII. *The Times.* They Flower in *June* and *July*, and sometimes in *August*; the Seed being ripe not long after.

IX. *The Qualities.* Authors are very short in this part; all that they say of *Ox-Eye*, is, that it is Discussive.

X. *The Specification.* It is said to discuss Tumors, and to be helpful against the Jaundice.

XI. *The Preparations.* You may have herefrom, 1. *A Pouder of the Heads of the Flowers.* 2. *A Cerot made of the same.*

The Virtues.

XII. *The Pouder of the Flowers.* It may be given in White Wine, from a Dram to two Drams Morning and Evening, and so it is helpful against the Jaundice: Or it may be so given immediately after Bathing, as *Dioscorides* says, and so it gives a good color to the Skin.

XIII. *The Cerote of the Flowers.* Applyed to cold and hard Tumors or Swellings, it softens and discusses them: and therefore may probably be good against Scrophulous Kernels.

CHAP. DXXXVI.

Of OX-LIPS.

I. *THE Names.* They have no proper *Greek* Name: but are called in *Latine*, *Paralysis absque calicibus*: and in *English*, *Ox-Lips*.

II. *The Kinds.* It is a Species of the *Cowslip*, and of that sort, whose Flower is without any Hose, or green Husk to contain it, or if it has any, it is a very short one. It is threefold, *viz.* 1. *Paralysis absque calicibus simplici*, Ox-Lips single. 2. *Paralysis sine calicibus duplici*, Ox-Lip double. 3. *Paralysis calicibus dissectis*, Ox-Lips with jagged Husks. 4. *Paralysis Flore Viridante, sive, Calamistrato*, Ox-Lip green Rose, *or* Fether Flowered. All these we have treated on already in the Chapter of *Cowslips*, *viz.* *Chap.* 157. *Sect.* 9, 10,

10, 11, 15. aforegoing; ſo that no more need be ſaid of them now, ſaving that we ſhall here give you *Gerards* general Deſcription of them; and then add a fifth Kind, *viz.* 5. *Paralyſis Flore Gemino ito pallidiore inodora*, Ox-Lips double of a paler yellow color without Smell.

The Deſcriptions.

III. *Gerards* general Deſcription. *This well known Flower by the Name of* Ox-Lip, *differs not from the* Cowſlip, *ſaving that the Flowers are not ſo thick thruſt together, and they are fairer, are*

Ox-Lip.

not ſo many in number, and ſmell not ſo pleaſant as the other: (to which we add) and ſtanding naked, or without any green Hoſe or Husk, to contain them, or if they have any, it is a very ſhort one, ſee the Figure.

IV. *The fifth, or* Ox-Lips double of a paler yellow color without Smell. *Its Root is long, ſtringy, and very Fibrous, from whence ſpring forth many green Leaves, very like to thoſe of the* Common Field Cowſlip, *very much of the ſame ſhape and make, rough, ſtiff, and a little Crumpled about the edges, each Leaf ſtanding upon a ſhort foot Stalk. It has Stalks of Flowers, much like the* Cowſlip, *growing in bunches at the tops of the ſaid Stalks. The Flowers themſelves are double, like thoſe of the* Double Cowſlip, *one within another, ſaving that this has no Husk or Hoſe to contain them, no more than the* Single Ox-Lip *has, but ſtand bare or naked, and of the very ſame largeneſs each of them, having very little or no Smell; but with this difference; 1. That the Leaves of this Plant are ſomething larger. 2. That the Flowers are alſo a little larger. 3. And that they are of a paler yellow color.*

V. *The Places.* They are all found growing Wild in Meadows and other Paſture Fields almoſt throughout all *England:* from whence they have been Tranſplanted into *Gardens*, for delight ſake, with ſuch as are Lovers of Flowers, where they abide, flouriſh, and grow fairer than in their natural places.

VI. *The Times.* They Flower in the *Spring* of the Year, at the ſame time when *Cowſlips* are in Flower, ſome earlier, and ſome later, but generally later, or after *Primroſes*; ſo that their Seaſon may be ſaid to be from the beginning of *April* to the end of *May:* But I have ſeen ſome of them in Flower almoſt to the middle of *June*, tho' not often.

VII. *The Qualities, Specification, Preparations*, and *Virtues* of theſe are the ſame with thoſe of *Cowſlips*, which we have enumerated at large in *Chap.* 157. *Sect.* 18. *ad* 32. aforegoing. They are ſingular Cephalicks, and Neuroticks, and therefore muſt be of extraordinary uſe in Diſeaſes of the Head, Brain, and Nerves: and for eaſing pains in the Head, are accounted next to *Betony*. Experience has ſhew'd that they are profitable for the Cure of the Palſie, for which reaſon the whole Tribe of *Cowſlips* (of which theſe are Species) are called by many People *Palſie-worts*. They are alſo profitable againſt pains of the Joints, or Gout, (as are the *Bears Ears* alſo, which are another Species of *Cowſlips*) for which reaſon they have obtained the Name *Arthritica*, as well as *Paralytica* or *Paralyſis*.

VIII. *The Juice of the Flowers.* It is commended by ſome Authors, to cleanſe, ſoften, and whiten the Skin, and to take away the ſpots, diſcolorings, and defœdations of the Face or Skin. The ſaid *Juice* drank Morning, Noon, and Night, from 3, to 5, or 6 Ounces, for ſome Days in a Glaſs of *Madera*, *Sherry*, or White *Liſbon* Wine, is ſaid to prevail wonderfully againſt both Palſie and Gout.

IX. *The Juice of the Leaves.* Snuft up the Noſtrils as an *Errhine*, it purges the Head, Brain, and original of the Nerves, of cold and moiſt Humors, which fall upon other parts, and cauſe Palſies, Gouts, Convulſions, Evil, and many other dangerous Diſeaſes.

CHAP. DXXXVII.

Of PANICK:

OR,

GUINNY CORN.

I. *THE Names.* It is called in *Arabick*, *Dochon*: in *Greek*, Ἕλυμος, *Elymos*: in *Latine*, *Panicum*: and in *Engliſh*, *Panick*, *Guinny Corn*, and *Indian Corn*.

II. *The Kinds.* There are ſeveral ſorts of this Plant, as, 1. *Panicum Indicum*, *Panicum Americanum*, *Panicum Carolinianum*, Μελίνη *Dioſcorides & Galeni*; μελίνος as *Diocles* has it: *Mel frugum Plinij*; *Pliny* ſays *Panicum à Paniculis dictum ſuit*; Indian Panick or Guiny Corn. 2. *Panicum Caruleum Indicum*, Blew Indian Panick. 3. *Panicum Indicum Panicula Villoſa*, Indian Panick with a more hairy Spiked Head. 4. *Panicum Germanicum Panicula minore*, *Panicum album vulgare*, Ordinary or Common Panick, German Panick. 5. *Panicum Sylveſtre Gerardi*, Wild Panick. Of the Manured Panick growing with us in *Europe*, there is but one ſort. But the *Indian* or *Guinny Panick* is manifold, coming from *Eaſt India*, *Guinny*, *Æthiopia*, or *Africa*, and from *America* alſo: *One ſort* has white Heads as big as ones Fiſt, thick and ſhort, with round white Grains, having an hole or dent in every one of them. *Another*, has a Head or Spike a Foot long, with a bowing top, as hairy as the third ſort afore named. *Another* has a ſlender Spike a Foot and half long, larger at the lower part thereof, and ſmaller at the upper part, much like to the firſt Kind. *Another* has a bald ſpiked Head, larger than both ones Fiſts, and 9 or 10 Inches or more long, whoſe Stalk is a full Inch in Diameter, of a fine whitiſh yellow color: beſides all theſe, there are *ſeveral other ſorts* growing in their Native places, too many to be enumerated here; and which to mention would be to little other purpoſe than to fill up Room. We ſhall give you in this Chapter the Deſcriptions only of the five Kinds we have firſt Named, which take as follows.

The Deſcriptions.

III. *The firſt*, *or* Indian Panick, *or* Guinny Corn. *Its Root is Fibrous, conſiſting of many Threads or Strings: Its Stalk is very tall, as tall as the higheſt* Indian Maiz; *Its Leaves or Blades are like to thoſe of* Millet *or* Maiz, *very long and broad, and of a conſiderable thickneſs, with a Rib running all along the length to the middle. Its Ear is thick, cloſe, and compact, made* Taper *faſhion, broader or thicker at the lower end, and ſmall at the top, a* Foot, *or almoſt a* Foot *and half in length. Its* Grain *is much like that in* Sect. 4. *following, ſaving that many of them are contained together in one Hairy Husk, which is faſtned to a very ſhort foot Stalk.*

IV. *The ſecond*, *or* Blew Indian Panick. *It has a fibrous or ſtringy* Root *like the former; which ſends forth Stalks, growing up to the height of a Man, or more, with ſtrong and great Joints, full of a white ſpungy Pith like to the former, or that of* Maiz, *which near the Ground are of a ſhining purpliſh color: it ſpreads it ſelf out into ſundry Branches, with large and long Leaves on them, like to thoſe of the firſt, which encompaſs the Stalk at the bottom, having each a thick Rib running its whole length through the middle. From the Joints towards the top, as alſo at the tops, come forth ſhort round* Panick *like Heads, cloſer ſet together, than in the next following, and of a blewiſh ſhining purple color, as the Stalk below, or rather much more Orient and freſh, full of hairy Husks, and ſmall, long, blewiſh, round Seed, or Grains in them, like unto* Naked Oats.

V. *The third*, *or* Indian Panick, with a more hairy ſpiked Head. *Its Root is a buſh of Fibres or Strings; which ſends up a thick, ſtrong, jointed Stalk, four, five, or ſix* Feet *high, an Inch and quarter or more in thickneſs, whoſe Cavity is filled with white ſpungy Pith, at the Joints of the Stalks, and their Branches, forth long, broad, thick Leaves like to the* [illegible]

Panick Indian; or Guinny *Corn.*

with a thick Rib running through their middle from the one end to the other, which when dry is white like Straw. At the top of the Stalks, comes forth a large ſpiked Head, *almoſt* Corn *faſhion, round, thick below, and ſmall at top, a* Foot *or more long, ſometimes fifteen or ſixteen Inches in length, a little inclining or bending downward, by reaſon of its weight, for it is very full of* Grain *cloſe ſet together, the which is white or yellowiſh, and faſhion almoſt like to* Gromel Seed, *or not much unlike to that of* Millet: *but the whole Spike is much more hairy than either of the former.*

VI. The

VI. *The fourth, or* Ordinary, *or* Common Panick, *or* German Panick. *Its Root is bushy like to those of the former Kinds, but smaller, and dying every Year as they do. It grows up with a reasonable strong jointed Stalk, full of a spungy Pith, but not Downy as* Millet *is, having thereon, somewhat large Leaves, greater by much than those of* Wheat, *and very near to the largeness of those of* Millet, *so that they can hardly be distinguished. At the top of the Stalk comes forth a whitish, long, round, close Spike, round at the end, soft, and as it were hairy, with small short Branches, all the length of it; when it is full ripe and opened, it is full of hairy soft Husks, which include a small white Grain, something less than that of* Millet, *and not so shining. The Ear grows at top, single, not unlike to the Spike or Ear of that last described, but much less.*

VII. *The fifth, or* Wild Panick. *Its Root is small and fibrous or thready. It grows up with long, slender, jointed, Reedy Stalks, set at the Joints with long Leaves, like to those of* Sorghum,

Panick Wild.

or Indian Panick *at* Sect. V. *aforegoing. The Tuft or Feather like top, is like to the* Common Reed, *or Ear of the* Grass *called* Ischæmon, *or* Manna Grass.

VIII. *The Places.* The first three grow in *Guinny*, as also in the *East* and *West Indies*, and flourish admirably well in our Plantations in *America*; but of them the third Species is Principal, and that which is chiefly planted, not only in *Guinny*, but also with us in the *West Indies*, and is Sown in many Places throughout all *Europe*, where it thrives very well. The fourth grows in *Germany*, and with us in many places in *Gardens*. The fifth grows Wild in the hotter Climates, but in *England*, it is preserved only in manured Grounds

IX. *The Times.* They are not to be Sown till *April*, unless the Year be hot: The second Kind does not often come to Maturity here, but the first many times will, if the *Summer* is seasonable and warm, and it be Sown in a strong and fat Ground. But they prosper best in hot and dry Climates, and are apt to wither with much watering. The Grain is ripe about the beginning of *August*, and being full ripe when gathered, may be kept good a long time, if it is carefully preserved from the *Wevil*, or other Vermin which may eat it.

X. *The Qualities, Specification, Preparations* and *Virtues* of the Grain are the same with those of *Millet*, in *Chap.* 491. *Sect.* 8. *ad* 17. aforegoing, to which I refer you. But *Galen* says, That *Millet* is better to all purposes than *Panick*, sweeter also in Taste, and easier of Digestion; but he says, that Country people feed thereon, as we do of *Wheat*, being boiled in Milk, and so eaten. He also says, That that which grows in *Italy*, exceeds in goodness, that which grows in *Asia*.

XI. *Nota. Johannes Leo, Historiâ Africæ*, says, That in some places in those Countries, they make very fine Bread of *Panick*. It is eaten too, in our *West Indies*, where also we Feed our Dunghil Fowls, Ducks, Geese, Turkies, Pidgeons, *&c.* therewith. *The Bread made of the Meal or Flower of Panick* stops Fluxes, by reason of its very drying Quality or Property. *A Cataplasm of the Meal or Flower*, is said also to be cooling, and drying; Strengthens the parrts affected, and represses a Flux of Humors.

XII. *Panick boiled (as* Pliny *says) in Goats Milk, or in Cows Milk*, which for all that I know may do as well, being Eaten twice a Day, stops Lasks or Fluxes of the Belly; but this I suppose is to be understood, whilst the Disease is recent.

CHAP. DXXXVIII.

Of PARNASSUS-GRASS.

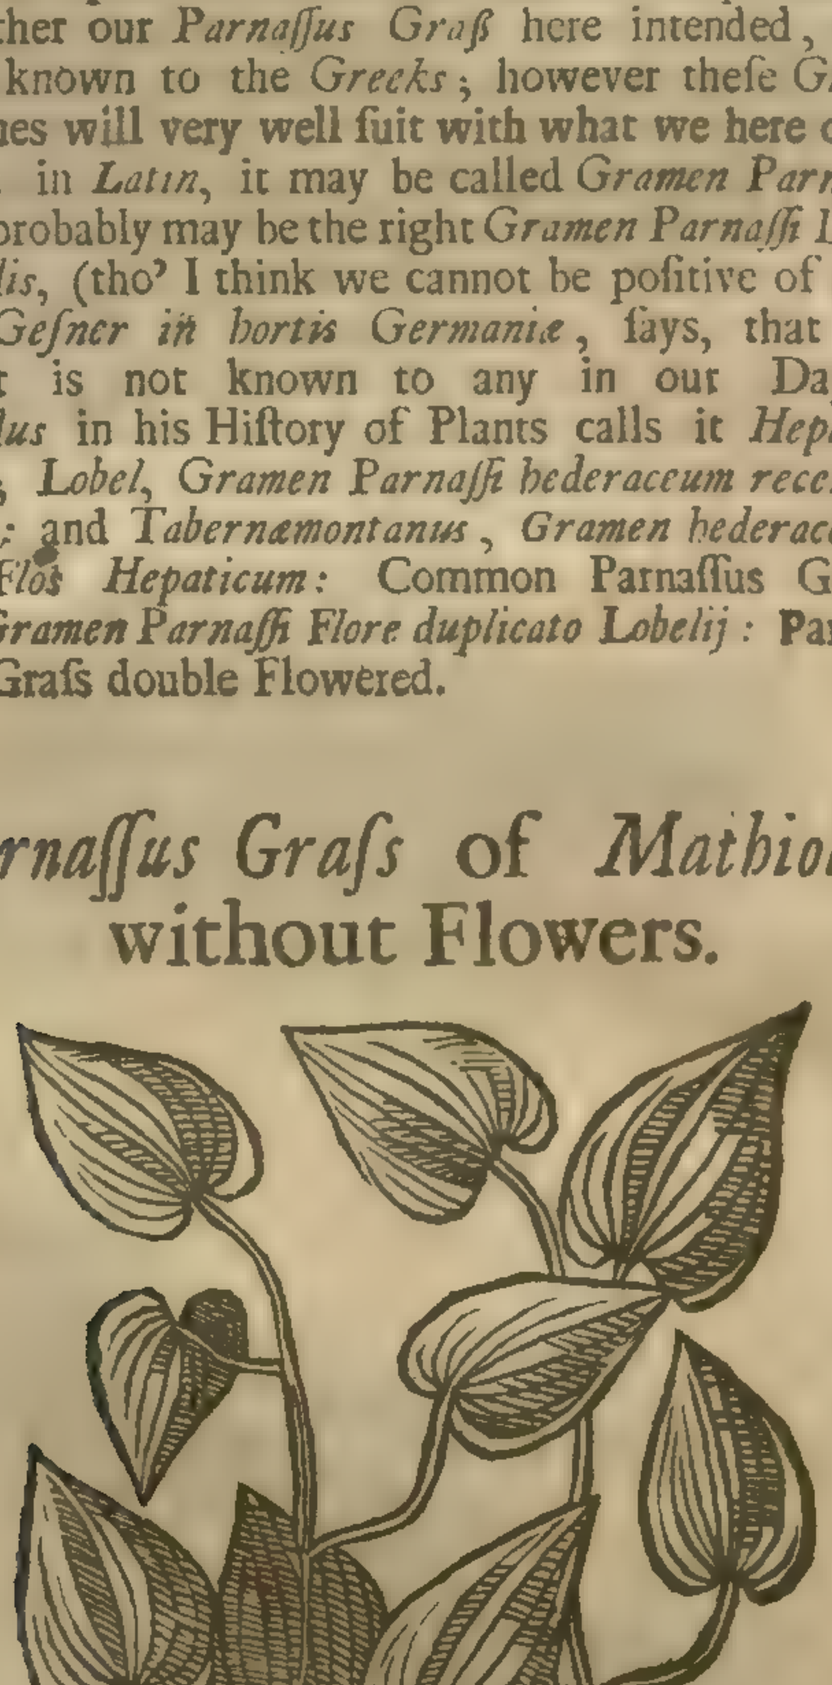
OR,

LIVER-WORT White.

I. *The Names.* It has no *Greek* Name: but is called in *Latine*, *Gramen Parnassi*: and in *English*, *Parnassus Grass*.

II. *The Kinds.* There are two Kinds of this Plant, *viz.* 1. The single Flowered, which may be called in *Greek*, Ἄγρωσις ἡ ἐν παρισσῷ which is the Name *Camerarius*, in his Epitome of *Matthiolus* gives to our *Unifolium* or *One Blade*, but very unjustly: *Matthiolus* himself in his said *Epitome* calls it in *Greek*, Ἄγρωσις παρνάσσου, which he ascribes to the true Plant, but with out any Flower, which we here give you in the first place: so that upon the whole it is much to be questioned whether our *Parnassus Grass* here intended, was ever known to the *Greeks*; however these *Greek* Names will very well suit with what we here offer you: in *Latin*, it may be called *Gramen Parnassi*, and probably may be the right *Gramen Parnassi Dioscoridis*, (tho' I think we cannot be positive of it:) for *Gesner in hortis Germaniæ*, says, that the right is not known to any in our Days:) *Cordus* in his History of Plants calls it *Hepatica alba*; *Lobel*, *Gramen Parnassi hederaceum recentiorum*: and *Tabernæmontanus*, *Gramen hederaceum*, & *Flos Hepaticum*: Common Parnassus Grass. 2. *Gramen Parnassi Flore duplicato Lobelij*: Parnassus Grass double Flowered.

Parnassus Grass of *Mathiolus*, without Flowers.



The Descriptions.

III. *The first*, or Common Parnassus Grass which is single Flowered. *It has a Root consisting of a small blackish fibrous Bush of Threads, enduring all the* Winter. *From the Head of this Root rise up many Leaves, not altogether round, but shaped below like the upper part of a Heart, broad in the middle, and ending in a point, sometimes sharp, and sometimes blunter like the lower part of a Heart, smaller and thicker than* Violet *Leaves, not much unlike to some* Ivy *Leaves, or Leaves of* Asarabacca, *but smaller, and not of so dark a color, yet of a fresh sort of green, every*

Parnassus Grass Common single Flowered.

one standing on a long foot Stalk; among which there rises up several slender weak Stalks about a Foot high, so weak as that they are scarcely able to stand upright, on which grow at the several Joints, such like Leaves as the former, but smaller, and without any foot Stalk; but joining themselves so close to the Flower Stalk, that the said Stalk seems almost to run thro' it. The tops of the Stalk are naked and bare of Leaves, unto the Flowers, for a good way. The Flowers are at the tops of the Stalks, and are white, consisting of five Leaves a piece, round at their ends and not pointed: in the middle of which is a small round green Head or Button, which the Flower being fallen, grows something larger, and contains within it, small reddish Seed.

IV. The *fecond*, or Parnaſſus Graſs double Flower'd. *This ſecond Kind does anſwer the former almoſt in all reſpects, its Root, Leaves, and Stalks being much alike, ſaving that in this, the Leaves of the Plant are ſomething larger; and the Flower has a double row of Leaves one within another, which makes the Flower ſhow double; the Leaves of which Flowers both the inward and outward are long and ſharp pointed, otherwiſe in its form and manner of growing this Plant is like to the firſt; but it ſeldom gives any Seed as the former does.*

Parnaſſus Graſs double Flowered.

V. *The Places.* It is very probable that *Parnaſſus Graſs* grew formerly very plentifully upon Mount *Parnaſſus*, from whence it ſeems to take its Name, where Cattle feeding became fat and in good liking, as they do when they feed upon *Clover Graſs*, or *St. Foine* with us. The firſt grows in moiſt, marſhy Ground, in *England*. It grows very plentifully in *Lanſdall*, and *Craven* in the North parts of *England:* at *Doncaſter*, and in *Thornton* Fields in the ſame County: in the Moore near to *Linton* by *Cambridge:* at *Heſſet* and *Drinkſtone* alſo in *Suffolk*, in the *Butchers* Cloſe thereby: in a Medow cloſe on the back ſide of the *Parſonage-Houſe* at *Burton:* and at the bottom of *Barton Hills* in *Bedford-ſhire:* in the Boggy Ground below the *Red Well* of *Wellingborough* in *Northampton-ſhire:* and in the *Caſtle-Fields* of *Barwick* upon *Tweed*, where it is found plentifully: in the middle of the great *Town Field* of *Haddington*, about a Mile from *Oxford:* in a Paſture next unto *Botley*, in the High-way, on the other ſide of *Oxford*; and in ſeveral other places. The ſecond was found growing in *Brabant* in *Flanders:* but with us only in *Gardens.*

VI. *The Times.* They Flower about the middle and latter end of *July*, and the Seed is ripe about the middle or end of *Auguſt.*

VII. *The Qualities.* It is cold and dry in the beginning of the firſt Degree, Abſterſive, Aperitive, of thin parts, Diuretick, Nephritick, Vulnerary, and Alexipharmick.

VIII. *The Specification.* It is prevalent againſt the Stone, Sand, Gravel, and Tartarous Matter in the Urinary parts, provokes Urine, gives eaſe in the Strangury, ſtrengthens the Stomach, ſtops Vomiting and Fluxes of the Bowels: abates Inflamations, ſtops Bleeding, and cures ſimple Green Wounds.

IX. *The Preparations.* You may have therefrom, 1. *A Liquid Juice of the Herb and Roots.* 2. *A Decoction of the ſame.* 3. *An Ophthalmick* 4. *A Pouder of the Seed.* 5. *A Cataplaſm.*

The Virtues.

X. *The Liquid Juice of the Leaves or Root.* *Paulus Ægineta* ſays, that *Parnaſſus Graſs* is moderately cold, of thin parts, and ſomewhat ſowre. The *Juice* thereof does diſſolve and expel Stones and Gravel from the Reins and Bladder, and provokes Urine abundantly. It eaſes the Torments and Griping pains of the Bowels, and heals Ulcers of the Bladder, it helps alſo againſt the Biting of any Venomous Beaſt. It is good to cool Inflamations of the Eyes, and to dry up the running or watering of them. It is alſo ſaid to be effectual to eaſe the Tooth-ach, being held in the Mouth againſt the Tooth. It is alſo applyed to ſtop the Bleeding of Green Wounds, hinder or abate their Inflamation, and ſuddenly to conſolidate and heal them being outwardly applyed. Doſe inwardly from 2, to 6, or 8 Spoonfuls in any proper Vehicle.

XI. *The Decoction of the Herb and Roots.* It has all the Virtues of the *Juice*, but much weaker, and therefore may be given from a quarter of a Pint to half a Pint or more, ſweetned with white Sugar Morning and Night.

XII. *The Ophthalmick. Take of the Liquid Juice 8 Ounces: Spirit of Wine 4 Ounces: Clarified Honey two Ounces: mix and Diſſolve.* It has all the Virtues of the *Liquid Juice*, as reſpecting the Eyes: It abates their Inflamation and watering, clears them from Miſtineſs, Clouds, and Films, and heals Sores or Ulcers of the Eyes. Uſed as a Gargle it heals a Sore Mouth and Throat, and gives eaſe in the Tooth-ach.

XIII. *The Pouder of the Seed.* It has all the Virtues of the *Juice* in reſpect to the Stone and Gravel in the Urinary parts, Strangury, *&c.* and operates more forcibly than it. It ſtrengthens the Stomach, ſtops Vomiting, and cures any Flux of the Bowels, being given in a convenient Vehicle from 2 Scruples to a Dram, or Dram and half, in the Morning faſting, and laſt going to Bed.

XIV. *The Cataplaſm of the Herb and Roots.* It effectually ſtops the Bleeding of Simple Green Wounds: and in a ſhort time conglutinates their Lips, and heals them.

CHAP.

CHAP. DXXXIX.

Of PARSLY GARDEN.

I. THE *Names.* It is called in *Arabick*, *Chars*, *Chares*, and *Charsi*: in *Greek*, Σέλινον: in *Latine*, *Apium*, & *Petroselinum*: and in *English*, *Parsly*. Here is to be observed, that tho' formerly *Apium*, was the proper and true Name of *Parsly*, even when used singly and alone, yet of late Days, it seems to be rejected, without some other Epithite be joined with it, as *Apium Hortense*, which is our *Common Parsly*, whose vulgar Name now is *Petroselinum*; and *Apium*, simply so called is with us only *Smallage*; tho' it is also called *Apium Palustre*, & *Paludapium*, or *Water Parsly*.

II. *The Kinds.* Authors have given us many Species of *Parsly*, as, 1. Σέλινον κηπαῖον, *Apium Hortense*, Garden Parsly, of which in this Chapter. 2. Πετροσέλινον, *Apium Macedonicum*, *Petroselinum Macedonicum*, Stone Parsly, or Macedonian Parsly, or Stone Parsly, of which in *Chap.* 540. 3. Σέλινον ἄγριον, Σισων *Dioscoridis*, *Apium Agreste vel Sylvestre*, Wild Parsly, of which in *Chap.* 541. 4. Σέλινον νόθον, Καυκαλὶς; *Apium nothum*, *caucalis*, Bastard Parsly, of which in *Chap.* 542. following. To these we may add, 5. Ἱπποσέλινον, ἢ σμύρνιον, *Hipposelinum*, *Equapium*, Horse Parsly or Alexander; of which in *Chap.* 7. aforegoing. 6. Σέλινον ἀγρωτικὸν, *Selinum Segetale*, *Sium Terrestre*, *Sium Segetum*, Corn Parsly, of which in *Chap.* 371. aforegoing. 7. Σέλινον γελοῖον, *Apium Risus*, *Pulsatilla*, Sardonian Parsly, *or* Parsly causing Laughter; Pasque Flower; of which in *Chap.* 542. 8. Σέλινον ἕνυδρον: ἑλαιοσέλινον, *Apium palustre*, *Paludapium*, Smallage, of which in *Chap.* following.

III. *The Kinds of the Garden Parsly.* There are four sorts of *Garden Parsly* common with us, *viz.* 1. *Petroselinum vulgare*, *Apium hortense*, *Selinum hortense Dioscoridis*; *Apium Veterum*, *Apium Domesticum*, Our common Garden Parsly. 2. *Petroselinum Crispum*, *Apium multifidum*, *Apium Crispum*, & *Apium hortense Crispum*, Curl'd Parsly. 3. *Petroselinum majus*, *Petroselinum Virginianum*, *Apium majus Virginianum*, Virginia Parsly. 4. *Petroselinum Creticum*, *Apium Creticum*, Parsly of Crete or Candy.

The Descriptions.

IV. *The first, or* Our common Garden Parsly. *It has a Root which is white and long, with somewhat a rugged Bark, which is as Aromatical as the Herb is, very pleasant to the Taste, and agreeable to the Stomach, and perishes after Seed time. From this Root spring forth many Stalks of fresh, green winged Leaves, divided into several parts, first into three parts or Leaves from the middle Stalk, and then each of them, into three parts or Leaves again, somewhat roundish, and finely snipt about the edges. The Stalk rises much higher in some places than in others, according to the goodness of the Soil in which it grows, with divers smaller Leaves at the Joints, and still finer cut, and at the top long, almost like* Fennel, *so unlike to the former,*

Parsly Garden Common.

that one would not think them to be Parsly *Leaves. The Flowers are white and small, growing in Umbles, and the Seed is small, longish, a little furrowed, of a whitish brown color, and hot and sharp in Taste.*

V. *The second, or* Curl'd Parsly. *This is also a* Garden Parsly, *and is in Taste and Virtue, like and equal to the former. This sort differs not in any thing from the former (for that it grows after the same manner) but only in the Leaves, which are very finely crisped or curled, or folded in, on the edges, seeming like a Ruff, or Fann's of curled Feathers, whence came the Name.*

VI. *The third, or* Virginian Parsly. *The Root of this is greater and shorter than that of the* Common Kind, *and perishes like it. The Plant grows also after the very same manner that the* Garden Parsly does, *but larger, having greater Stalks of Leaves, set by three and three, as in the former, but much larger, even as large as* Smallage, *and of a paler, or yellower green color. The Stalks, Flowers, and Seed, are also like the first, but still larger, the Seed being twice if not thrice as big or large as it. The Root tho' it perishes after Seed time, yet endures usually the first Year of its Sowing: the Leaves as they are much larger, so they are also something rounder: and the Stalk grows to be sometimes three Feet high, which spread themselves out into sundry Branches, on which grow Umbles of whitish Flowers. The Seed when ripe, falls and commonly Sows it self, and springing up, bears Seed the second Year after its Sowing. This* Virginia Parsly *is now become natural to our* English *Clime, and being of as good use as the first, is grown almost as common as it.*

VII. *The fourth, or* Cretick or Candy Parsly. *Its Root is always single, or but one, of the thickness of a Mans Thumb, long and covered with a thin Rind or Bark, of a blackish color, which may*

be rubbed off with ones Fingers, being white underneath, and of a sweetish Taste, like unto our Earth Nuts, *and is often eaten by the Natives: it lives and continues after Seed time, shooting forth a fresh every year. In its manner of growing, it is very like to our* Common Garden Parsly, *but lesser in every part, having Leaves made and cut into such like Divisions, but lesser, and something thicker. The Stalk is like, but shorter than in our* Common Parsly, *bearing such like Tufts or Umbles of white Flowers; after which follows smaller Seed than that of* Parsly, *but blacker.*

VIII. *Nota.* There is another Species of this *Candy Parsly*, but it differs nothing from that last described, but in the color of its Root, which is reddish on the out side, and not black as the former; This Flowers and Seeds also earlier than the others, and its Root is as fit to be eaten. The Country People in *Candy* call it *Agriopastica*, i. e. *Pastinaca Sylvestris*, but it has no likeness to, or resemblance of a *Parsnep.*

IX. *The Places.* The Names of some of these show whence they first came; but they all of them grow in our *Gardens* in *England*, where they thrive admirably well. They delight to grow in moist and watery Grounds, near Fountains and Springs and other moist places: and *Fuchsius* says, that *Parsly* is found growing of it self in many Fenny Grounds in *Germany.*

X. *The Times.* It may be Sown in the *Spring*, but it comes slowly up; and in its growing may be often cut and crop'd: if it Sows it self, yet it brings forth its Stalk but in its second Year, after which, it Flowers in *June* or *July*, and the Seed is ripe in *July* and *August*, after which the Root (except in the *Candy Kind*) dies away and perishes.

XI. *The Qualities.* The Leaves and Roots of *Parsly* are hot and dry in the second Degree, but the Seed in the third Degree. It is Aperitive, Absterfive, Attractive, Carminative, Digestive, Discussive, Diuretick, Cephalick, Neurotick, Stomatick, Nephritick, Hysterick, Emmenagogick, Alexipharmick, Analeptick, and Spermatogenetick.

XII. *The Specification.* It is peculiar against the Cholick in the Stomach and Bowels, expells Wind, opens obstructions of the Liver, Spleen, Reins and Womb, gives ease in the Srangury; provokes Urine, is said to break and expel the Stone, Gravel, Sand and Tartarous Slime; is profitable against the Jaundice, Dropsy, and Falling Sickness, provokes the Terms in Women, facilitates the Birth, and resists and expels Poison.

XIII. *The Preparations.* Of this Plant the Leaves, Roots, and Seed are all used: the Leaves are weakest: the Roots are next in strength: and then the Seed which is the strongest of all. These following forms may be made of the whole, *viz. A Liquid Juice of Leaves or Roots.* 2. *An Essence of the same.* 3. *A Decoction of the Roots.* 4. *An Infusion of the Seed.* 5. *A Pouder of the Seed.* 6. *A Compound Decoction from Tragus.* 7. *An Oil of the Leaves, Roots or Seed by Decoction.* 8. *A Cataplasm of all the three.* 9. *A Distilled Water of the whole Plant.* 10. *A Spirituous Tincture of the Seed.* 11. *An Acid Tincture of the same.* 12. *An Oily Tincture thereof.* 13. *A Chymical Oil of the Seed.* 14. *Potestates or Powers of the Seed.* 15. *An Elixir of the same.*

The Virtues.

XIV. *The Liquid Juice of the Leaves or Roots.* It is comfortable to the Stomach, eases the Strangury, and powerfully provokes Urine and Womens Courses: expels Wind whether in the Stomach or Bowels, and does a little open the Body, making the Belly Soluble. It is a singular Aperitive, and opens Obstructions of Lungs, Liver, Spleen, Reins and Womb; and therefore is mixt with Solutives, or things which move the Belly downwards. The Root is one of the five opening Roots; and therefore the *Juice* thereof must be profitable against all Diseases proceeding from Obstruction. Dose 4 or 6 Spoonfuls Morning, Noon, and Night, either alone, or mixt with a Glass of White *Port*, or *Lisbon* Wine.

XV. *The Essence of the same.* It has all the Virtues of the *Liquid Juice*, and more powerful to the Intentions: besides which, it is said to break the Stone whether in Reins or Bladder, as also to expel Stones, Gravel, Sand or Tartarous Matter from the Reins and Bladder. It eases the pain of the Stomach, resists and expels Poison, and is good against the Bitings of Mad Dogs, Serpents, or other Venemous Creatures: It helps such as have been hurt by taking of *Litharge*; suppresses Vapors in Women, which offend the Head and Eyes, and is profitable against the Dropsy and Yellow Jaundice. Dose 2 or 3 Spoonfuls or more, Morning and Evening in a Glass of Wine.

XVI. *The Decoction of the Root.* It is a powerful Aperitive, and opens all Obstructions of the Viscera, having all the Virtues of the *Juice* and *Essence:* but as it is a much weaker Preparation, so it must be given in a much larger Dose, with a *continuando*, as from 4 to 8 or 10 Ounces Morning and Night.

XVII. *The Pouder of the Seed.* It may be given from a Dram to 2 Drams Morning and Night, against the Stone, Gravel, Sand, and Glutinous Slime in the Urinary parts, and is very effectual to expel the same; and also to provoke Urine and the Terms in Women: to give ease in the Cholick, Gripings of the Guts, and After-pains of Women in Child-Bed: It eases pains in the Stomack and Bowels, proceeding from Wind, and has all the Virtues of the *Juice*, *Essence* and *Decoction.*

XVIII. *The Infusion of the Seed.* It eases the Gripings of Infants, and may be given against all the Diseases for which the *Decoction* is given: Dose Morning, and Evening, from 6 Ounces to 8, a little dulcified with double Refined Sugar.

XIX. *The Compound Decoction of* Tragus. *Take Seeds of Parsly, Anise, Carrawaies, Fennel, of each an Ounce: of the Roots of Parsly, of Saxifrage, of Carrawaies, of Burnet, of each an Ounce and half: let the Roots be washed and chopt small, and the Seeds bruised: let them infuse a Night or two in 2 Quarts of White Port Wine: after which, gently boil altogether in an Earthen Vessel close cover'd with an Alembick Head, till about a third part is wasted: then strain out, and let it stand to settle.* This opens Obstructions of the Liver, Spleen, Reins and Womb, prevails against the Falling-Sickness, and forces away the Morbifick Matter of the Jaundice and Dropsy by Urine, curing those Diseases in a short time. Dose 4 Ounces at a time, first and last Morning and Night.

XX. *The Decocted Oil of Leaves, Roots, or Seed.* It is Anodyn, or an easer of Pain, discusses recent Tumors, alleviates pains of the Gout, and takes away black and blew Marks, coming by means of Bruises, Falls, and the like. Anointed upon Womens Breasts, which are Swelled, Painful and hard with their Milk, it abates the Tumor, Discusses the Humor, and eases the pain thereof.

XXI.

XXI. *The Decoction of the Leaves, Roots, or Seed, or all of them.* Applyed it gives eaſe in the Gout, diſcuſſes and cures ſimple recent Contuſions: laid to Womens ſwoln and hard Breaſts, it ſoftens the Tumor and Diſcuſſes it: and applyed to the Eyes, which are inflamed with heat, or ſwoln, it quickly gives eaſe and relief, more eſpecially if *Barly* Flower be mixed therewith.

XXII. *The Diſtilled Water of the whole Plant.* it is a familiar Medicine with Nurſes to give their Children, when they are griped in their Stomach or Belly with Wind, or ſharp Humors, which they call the Frets, and is no leſs available than *Saxifrage Water* for that purpoſe, as alſo for thoſe which are of elder Years. *Riverius* (as I remember) commends it as an admirable thing, (a few grains of *Salt of Tartar* being diſſolved in it) againſt the Stone, Sand, Gravel, Strangury, and other like Diſtempers of the Urinary paſſages

XXIII. *The Spirituous Tincture of the Seed.* It is admirably Somatick, cauſes a good Appetite and Digeſtion, expels Wind, and eaſes the gnawing pains of that Bowel; and is very profitable againſt Fainting, Swooning, Convulſions, Colick, and the like: Doſe almoſt half a Spoonful in a Glaſs of Wine, Morning and Night.

XXIV. *The Acid Tincture of the Seed.* It is profitable againſt Vapors, and Fits of the Mother, weakneſs and ſickneſs of the Stomach, want of Appetite and Digeſtion: It is ſingular againſt all Sorts of Poiſons; cures all ſorts of Burning and Malign Fevers, and reſiſts the Poiſon and Malignity of the Plague or Peſtilence it ſelf, and all ſorts of Peſtilential Fevers. Doſe ſo many drops at a time (in all that the Sick drinks) as may give it a grateful or pleaſing Acidity.

XXV. *The Oily Tincture of the ſame.* It powerfully provokes Urine and the Terms: gives preſent eaſe in the Strangury, Stone, Gravel, Tartar, *&c.* obſtructing the Urinary paſſages. It facilitates the Birth of a Woman in Labor, forces away the After-Birth, and prevents or eaſes After-Pains: Doſe from 15 to 30, or 40, or more Drops, dropt into Sugar, and then mixt with *Penny Royal Water*, or other Vehicle proper for the Patient.

XXVI. *The Chymical Oil of the Seed.* It potently cures the Cholick, all inward pains of the Stomach and Bowels, Convulſions, Palſys, Carus, Lethargy, and other Diſeaſes of the Head, Brain, and Nerves, proceeding from obſtructions, cold and moiſture, or other remote and hidden Cauſes. It forces away the Birth, and After-birth, and gives preſent relief in the Strangury, Stone, Gravel, or any obſtruction or heat of Urine. Doſe from 8 drops to 16 drops or more, to be taken in the ſame manner, and in the like Vehicle, as is directed in the giving of the *Oily Tincture* aforegoing.

XXVII. *The Powers.* They may be given from a Dram to 3 Drams or half an Ounce in any proper Vehicle Morning and Night againſt the Cholick, Convulſions, Palſy, Stone, Strangury, and all the Diſeaſes for which the *Juice*, *Eſſence*, *Decoctions*, *Tinctures*, or *Chymical Oil* are given: This Medicament is more pleaſant than any of them, and operates with much more ſpeed.

XXVII. *The Elixir.* This has all the Virtues of the Powers, and more potent in its operation, and therefore may be given from 1 Dram to 2 Drams in a Glaſs of Wine, Morning, Noon and Night, or when extreamity or occaſion may require it, either in a Glaſs of Wine, or in any other fit Vehicle. 'Tis indeed an admirable Preparation.

CHAP. DXL.

Of PARSLY Macedonian.

OR,

Mountain PARSLY.

I. *THE Names.* It is called in *Greek*, Πετροσέλινον, ἢ Σέλινον Μακεδονικὸν; Makedonian: in *Latine*, *Apium Macedonicum Petrapium, & Selinum, vel Petroſelinum Macedonicum*: and in *Engliſh*, *Macedonian Parſly*, *Mountain Parſly*, and *Stone Parſly*.

II. *The Kinds.* What the *Macedonian Parſly*, or *Stone Parſly* of *Dioſcorides* was, is hard now to determine, by reaſon he is ſo deficient in his Deſcription thereof: what our Modern Authors account for the ſame, we ſhall here give you; two kinds of which they have Deſcribed to us, *viz.* 1. *Petroſelinum Macedonicum quibuſdam*, The firſt ſuppoſed Stone Parſly of Macedonia, and that it was thought to be, by *Matthiolus*, *Lobel*, *Dodonæus*, *Lugdunenſis*, *Tabernæmontanus*, and *Caſtor Durantes*, in their times, and ſtill continues to be thought ſo in our Days, and that deſervedly; for that the forms of the Roots, Stalks, Leaves, Flowers and Seed, ſo nearly reſembles our *Common Parſly*, and the qualities of the Seed are anſwerable to the properties which *Galen* does appropriate to it. 2. *Petroſelinum Macedonicum ſorte Dalechampij*, The ſecond ſuppoſed Stone Parſly of Macedonia; this ſeems to be the *Petroſelinum Plinij*, and differs from the former, in the form of the Leaves, as being finer cut than any of them, for which reaſon as I ſuppoſe it is that *Bauhinus* calls it *Apium Montanum folio tenuiore*, but agrees much with it, in the qualities, ſharpneſs and bitterneſs of the Seed. Now becauſe theſe *Stone Parſlies* grow upon Hills and Mountains, they may properly enough be called alſo *Oreoſelina*, or *Apia Montana* Mountain Parſlies. III. But of the *Mountain Parſly*, properly ſo called, there are ſeveral Kinds, which by reaſon they are altogether of the ſame Nature and Qualities with the former, we ſhall take the Liberty to Treat of them in this place, the chief of which are the three following, *viz.* 3. Ὀρεοσέλινον δημώδες, *Oreoſelinum vulgatius*, *Montapium*, *Apium Montanum vulgatius*, *Oreoſelinum Dodonæi*; *Oreoſelinum majus Lobelij*; *Cluſij & Lugdunenſis*; *Apium Montanum Dalechampij*, The more Common Mountain Parſly. 4. Ὀρεοσέλινον ἀληθινὸν, *Apium Montanum verius Selinum Peregrinum Cluſij*, *Bauhino*; *Apium Peregrinum Cicutæ folio Bauhini*, The truer Mountain Parſly, or the *Oreoſelinum verum Dioſcoridis*. 5. *Oreoſelinum Pariſienſium Lugdunenſis*; *Apium Montanum Pariſienſium*: *Apium Montanum Nigrum*, The Paris, or Black Mountain Parſly.

The Deſcriptions.

III. *The firſt, or* Firſt ſuppoſed Stone Parſly of Macedonia. *Its Root is ſomewhat thick, ſhort, and white, periſhing in our Country, after it has yielded its Seed, tho' not ſo as it is ſaid, in the warmer*

warmer Climates where it is a Native. From this Root ſpring up ſeveral Stalks of Leaves, next to, or lying upon the Ground, winged and divided into parts, much like to the Common Garden Parſly, *but with greater, broader, and rounder Leaves, dented round about, and in ſome places more deeply cut in*

Parſly Macedonian.

or gaſht, of a bright pale green color: among which riſes up, a ſhort, thick, and ſomewhat hairy Stalk, about half a Yard high or higher, full of Joints and Leaves; and ſo ſpread out into Branches, that it ſeems a ſmall thick buſh: at the tops of all which are ſmall Umbles of whitiſh Flowers, and after them, ſmall, rough, dark, grayiſh Seed, ſomething like unto our Common Garden Parſly Seed, *eſpecially after the roughneſs is rubbed from them, yet ſomewhat longer and darker, of an aromatick or ſharp Taſte, with an unſavory bitterneſs laſt of all, not much unlike to* Cumin Seed.

IV. *The ſecond, or* ſecond ſuppoſed Stone Parſly of Macedonia. *Its Root is long (as* Columna *ſays) like that of our* Garden Parſly, *and black on the out ſide, with a tuft of hairs at the Head thereof, neither ſharp, nor ſweet; (but* Columna *ſays it is more ſharp and bitter, than the Root of the* Garden Parſly:) *From this Root riſe up ſeveral ſlender Stalks of winged Leaves, having ſeveral very thin cut Leaves thereon, all of them like the uppermoſt, and not the undermoſt Leaves of the* Common Garden Parſly, *or like unto* Dill, *of a blew green color, having three of the Leaves always ſet together, at the end of the winged Stalk, as* Parſly *has, and ſmelling ſo like unto* Parſly, *as both* Columna *and* Lugdunenſis *do ſay, that if it is ſmelt to, when a little bruiſed, tho' the Perſon was blinded and did not ſee it, yet they would judge it to be* Parſly, *ſuch as we commonly uſe. At the tops of the Stalks grow ſmall Umbles of pale reddiſh or bluſh colored Flowers; after which follow ſmall Seed, like to that of* Parſly, *ſomething blackiſh, and furrowed or guttered like unto* Cummin Seed, *of a very ſharp Taſte, almoſt burning the Mouth, and of a ſweet Smell. But ſo bitter withall, that it may well be accounted the moſt bitter Seed of all the kinds of* Parſly. *This Kind is taken by* Dalechampius, *to be the* True Parſly of Macedonia, *to which* Columna *ſeems to conſent.*

V. *The third, or* the more common Mountain Parſly. *The Root of this Plant is long, great and thick, with a buſh of Hairs at the top thereof, being ſweet of Taſte, ſharp and Aromatical: from whence ſpring up ſeveral reddiſh Stalks of large ſpread Leaves, winged and divided into ſeveral parts, lying like a buſh upon the Ground next the Root, very like unto* Garden Parſly, *but ſomething larger, and ſmelling well. From among which riſes up a ſhort Stalk of about half a Yard high, with divers the like Leaves upon it, branching or ſpreading it ſelf out towards the top, and bearing thick Tufts or Umbels of white Flowers; after which comes ſmall Seed, like that of* Smallage, *ſmelling a little ſweet, ſharp in Taſte, and bitter withall.*

VI. *The fourth, or* Truer Mountain Parſly of Dioſcorides. *The Root of this is ſmall, long, and white, not much differing from that of* Common Garden Parſly: *from whence ſhoot forth next the Ground ſeveral Stalks of winged Leaves, and among them a hollow* Kexie *Stalk, in ſome places, growing tall and high, in others more ſhort and low, according to the Soil in which it grows; having thereon ſeveral large ſpread Leaves, cut and divided ſomething like to thoſe of* Hemlock, *or* Garden Parſly; *bearing at the top, Umbels of white Flowers; after which comes the Seed, which is long and blackiſh, not much unlike to* Cummin Seed, *being ſweet in Smell, and ſharp in Taſte.*

VII. *The fifth, or* Paris, or Black Mountain Parſly. *Its Root is large, white, and thick, taſting and ſmelling much like to the Root of* Herb Terrible, *which is hot, bitter, and unpleaſant. The whole Plant does reſemble our* Common Garden Parſly, *lying thick, and buſhing on the Ground: the Flowers grow at the Tops of the Stalks and Branches in Umbels, of a white color: after which comes the Seed, which is ſharp in Taſte, but ſmelling very ſweet.*

VIII. *The Places.* The firſt grows in *Candia* and *Venice*, and the Seed has been brought from thence to us. The ſecond grows (as *Lugdunenſis* ſays) on the Rocky Hills of *Gratianopolis*; and (as *Columna* ſays) on the Hills of *Camtoclarenſis* and *Æquicolis:* with us they both grow in *Gardens*, where they flouriſh very well. The third, or *firſt Mountain Parſly* grows near unto *Vienna* in *Auſtria* (as *Cluſius* ſays) and on the Mountains on the Rocks in *Germany*, and other Places. *Dodonæus* ſays, it grows upon the Hills which divide *Sileſia* from *Moravia:* alſo it is ſaid to be found on other Hills and Mountains in the North parts of *England.* The fourth, or *ſecond Mountain Parſly*, is found on the borders of Fields on the Mountains of *Burgundy.* The fifth, or *third Mountain Parſly*, is found on the ſandy top of the *Surene Hill* near *Paris:* but theſe two laſt grow with us only in *Gardens.*

IX. *The Times.* The two firſt Flower in the *Summer* Months, but Seed late with us. The other three Flower alſo in the *Summer* time, and yield their ripe Seed ſoon after.

X. *The Qualities, Specification, Preparations* and *Virtues* of theſe Species; are the ſame with thoſe of *Our common Garden Parſly*, declared in *Chap.* 539. juſt aforegoing, ſo that we need ſay no more of them here.

XI. *Nota*

XI. *Nota.* 1. But it is here to be observed, that the two first Kinds of *Macedonian Stone Parsly* are much stronger, and much exceed our *Garden Parsly*, in their properties and effects. And some have thought that the *Mountain Kinds*, exceed also the *Macedonian* in their Virtues and Operations: however this is certain, that they all of them exceed the *Common Garden Kind* by many Degrees, and are therefore to be chosen before it, if they can be had.

XII. *Nota.* 2. *Galen* says, that the Seed of the *Macedonian Stone Parsly* is most in use: The Herb and Root are also used alike, but are of a weaker property than the Seed, which is very sharp in Taste and bitter also, hot in quality, and of an attenuating and inciding property withall, for which reason it mightily provokes Urine, and Womens Courses: warms and comforts the inward parts, being hot and dry in the third Degree, and therefore expels Wind. It is profitable against Wind and Belchings in the Stomach, as also the Wind Colick, and gives ease in the griping pains and torments of the Bowells; as also in Stitches and pains of the Sides and Spleen, and the excruciating torments of Stone and Gravel, whether in the Reins or Bladder, being put into those Medicaments which provoke Urine.

XIII. *Nota.* 3. *Dioscorides* says, That *Mountain Parsly* provokes Urine, if the Root and Seed be taken in Wine. It brings down also Womens Courses, and is put among those Medicines which expel Sand, Gravel and Stone; and by its heat, warms and comforts such parts as are weakned by cold and moisture. *Galen* says, It operats like to *Smallage*, but it is more effectual. *Dodonæus* says, That the *first Mountain Parsly* is hot and dry in the end of the second Degree, or beginning rather of the third, and is good for many things. That it does incide, and attenuate, or make thin, thick and gross Humors; that it cuts tough and clammy Flegm, opens obstructions of the Liver and Spleen, provokes Urine, and Womens Courses; breaks and expels the Stone; and is profitable against the Yellow Jaundice: And being chewed in the Mouth, that it draws away much watery Humor and eases the Tooth-ach.

CHAP. DXLI.

Of PARSLY Wild.

I. *The Names.* It is called in *Greek*, Σελινον ἀγρειον: in *Latine*, *Selinum vel Petroselinum Sylvestre*; *Apium Agreste vel Sylvestre*; and in *English*, *Wild Parsly*.

II. *The Kinds.* There are several Kinds of this Plant, as, 1. Σίσων χοινὸς, *Sison vulgare*; *Sinon Galeni*, *Sinnon Hippocratis*, (so that *Sison* and *Sinon*, be but one Plant, as *Cordus* does also acknowledg:) *small Wild Parsly*. The Ignorance of many *German* Apothecaries took the Seed of this to be *Amomum*, as *Tragus*, *Gesner*, and others affirm, but very Erroniously; and so they called it *Amomum Germanicum*: *Fuchsius* and *Dodonæus* called it, *Petroselinum Macedonicum*, which is yet as great a Mistake as the former. 2. *Sisum Odoratum Alpini*, Sweet Wild Parsly. 3. Θυσσέλινον, Σέλινον ἄγρειον: *Thysselinum Plinij*, *Apium Sylvestre*, Jagged Parsly, Wild Parsly with small jagged Leaves, Wild Parsly, Wild Milky Parsly *Gesner in Hortis* calls it *Ligusticum Paludosum*; it is the *Oleander* of *Cordus*, (so called from the *German* Name, *Oleander*:) *Apium Sylvestre Dodonæi*, & *Lugdunense*; but both *Dodonæus* and *Lobel* say, that in former times it was used in the Shops for *Meum* or *Spignel*: *Bauhinus* calls it, *Apium Sylvestre Succo lactico turgens*, which we render in *English*, *Wild Milky Parsly*, to distinguish it from the other sorts of Wild Parsly.

The Description.

III. *The first*, *or* Small Wild Parsly, Common Wild Parsly. *Its Root grows down deep, and spreads every way, by which means it takes full hold of the Ground, and abides long. It rises up with a tall slender Stalk, scarcely able to stand upright without help, thinly set with winged Leaves on its Branches, the lower Leaves being largest, and several being set on a Stalk on both sides, each of which is as small almost, as the Leaves of our* Common Ammi, *or* Bishops-Weed; *some whereof will be cut in on the edges more or less, and some not cut in at all; but all of them dented about the edges. At the tops of the Stalks and Branches, grow small Umbels of white Flowers, which turn into small blackish Seed, something lesser than* Parsly Seed, *but of a strong Scent, and of a quicker, and hotter Taste.*

IV. *The second*, *or* Sweet Wild Parsly. *Its Root is long, white and slender; from whence springs forth a single Stalk, about three* Feet *high, with long* Fennel *like Leaves at the joints, which have a sweet Smell, between that of* Dill *and* Fennel. *At the top of the Stalk and Branches, are small Umbels of white Flowers, which are thin set. After which follows the Seed, which is small, black, of a good smell, and bitterish in Taste, somewhat like to* Smallag Seed. *This Plant is called* Odoratum, *or* sweet Scented, *to distinguish it from the former* Sison vulgare, *tho' I am apt to believe, that this is not the* Sison verum Dioscoridis. *Some have thought also that this Herb was the* Seseli Massilense, *or* Hart-wort of Marsellis, *but were mistaken.*

V. *The third*, *or* Jagged Parsly, Wild Parsly with jagged Leaves, *or* Wild Milky Parsly. *Its Root spreads its self out into many long Strings and Fibres, blackish without, but white within, and running deep into the Ground, somewhat like unto* Meum, *or* Spignel, *abiding or living many Years. This Kind of* Wild Parsly, *has several large, well spread winged Leaves, something resembling those of* Garden Parsly, *but are divided into more parts, and each division hath smaller Leaves, which look as if they were cut or jagged into small parts: from among which, rises up an hollow straked Stalk a Yard high, reddish towards the bottom, sometimes with the like Leaves at the Joints, where it Branches out diversely, bearing at the tops of the Stalks and Branches, thick Umbels of white Flowers, reddish on the one side, and pale on the other, and after them flat Seed, somewhat like unto* Parsnep Seed, *but a little less, hot in Taste, and somewhat Aromatical. The whole Plant, and every part thereof, if broken in any part, yields a Milky Juice.*

VI. *The Places.* The first was formerly thought to be a Forraign Plant, the Seed being to be had

in

in the Apothecaries Shops in *Germany*, under the Title of *Amomum*, or as ſome have had it, *Amomum Germanicum*, tho' it was no more that Seed than it was *Aniſe Seed:* but afterwards, as *Geſner in Hortis* ſhews, it was found growing Wild in ſundry places in *Germany*, as it has been found in like manner growing with us, near Hedges, by moiſt Ditches, almoſt every where. The ſecond grows with us only in *Gardens*. The third is found by Ponds ſides, in Ditches alſo having in them ſtanding Water, in moiſt and marſhy or mooriſh Grounds, and in Water-Courſes; alſo in moiſt Woods, near the old Stocks of *Alder* Trees.

VII. *The Times.* They all Flower in *June* and *July*, and the Seed is ripe in ſome ſhort time after.

VIII. *The Qualities, Specification, Preparations* and *Vertues* of theſe ſeveral *Wild Parſlies*, are the ſame with thoſe of our *Common Garden Parſly*, ſaving that in the effects, theſe are, or have been found to be the more potent and operative.

IX. *Nota.* The Root of the third or *Milky Kind*; as it is found to be hot and dry in the third Degree; ſo being chewed in the Mouth, it draws away much Rheum or pituitous Humor from the Head Throat, Tonſils and parts adjacent, and in an eſpecial manner eaſes the Tooth-ach. And this Quality, *Pliny* ſays, the Root of his *Thyſſelinum* is endued withall. The other properties of the other *Wild Kinds*, are, no doubt to be found in this, and that to no leſs effect, as well to incide, as to attenuate, be aperitive, and diuretick, forcibly to provoke Urine, and the Terms in Women when ſtopt.

CHAP. DXLII.

Of PARSLY Baſtard; *OR,* Hedge PARSLY.

I. THE *Names.* It is called in *Greek*, Σέλινον νόθον, ἢ Καυκαλίς: in *Latine*, *Selinum nothum*, *Apium nothum*, & *Caucalis:* in *Engliſh*, *Baſtard Parſly*, and *Hedge Parſly.*

II. *The Kinds.* There are many Species of this Plant, as, 1. *Caucalis vulgaris Floribus albis Lobelij*; *Lappa agreſtis Tragi*, *Lappula Canaria Plinij Anguilarâ*; *Caucalis alba vulgaris & Myrrhis Lappa Dalechampij Lugdunenſe*; *Caucalis Dodonæi*, *Geſneri*, *aliorumque:* πυκνοκάρπος, *Echinophora Columnæ*; *our* Common Baſtard Parſly. 2. *Caucalis Anglica Flore rubente*; *Caucalis Apij foliis Flore rubro Gerardi*; our Engliſh Baſtard Parſly with reddiſh Flowers. 3. *Caucalis Maxima Bauhini*; *Cauculis major Cluſij*; *Caucalis maxima ſemine aculeata*, the Greateſt Baſtard Parſly, or Great rough Parſly. 4. *Caucalis minor Flore Rubente*; *Caucalis minor floſculis rubentibus*, Small Baſtard Parſly with reddiſh Flowers, Hedge Parſly, as Gerard has it. 5. *Caucalis nodoſo ſemine echinato Dauoides minor Cordi in Hiſtoria, & Thalij*, Knotted Parſly, ſmall Baſtard Parſly with knotted Joints. 6. *Caucalis folio Fœniculi*; *Caucalis Anguilaræ Lobelio*; *Caucalis Penæ Lugduneſe*; *Caucalis folio Peucedani Bauhini*; Baſtard Parſly Fennel Leav'd, Hogs Parſly. 7. *Caucalis arvenſis latifolia purpurea*; *Echinophora major platyphyllos purpurea Columnæ*, Baſtard Parſly broad Leav'd, or the Greater with prickly Seeds. 8. *Caucalis tenuifolia purpurea*; *Echinophora Leptophyllon Columnæ*, Baſtard Parſly the Leſſer, Baſtard Parſly fine or ſmall Leav'd. 9. *Caucalis magno fructu echinato*; *Echinophora altera aſperior platy carpos Columnæ*; *Caucalis Monſpeliaca Echinato fructu magno Bauhini*; *Lappa boaria Plinij Lugdunenſe*; *Caucalis ſecundo Tabernæmontani*; Baſtard Parſly with great prickly Seed. 10. *Caucalis major Flore ſaturo rubente Cluſij*, Baſtard Parſly the greater deep red Flowered. 11. *Caucalis tenuifolia Montana*, Baſtard Mountain Parſly, with ſmall fine Leaves. 12. *Caucalis Hiſpanica Camerarij & Cluſij*; *Gingidio congener Cæſalpini*; *Caucalis Peregrina ſemine rugoſo* Spaniſh Baſtard Parſly.

The Deſcriptions.

III. *The firſt, or* Our Common Baſtard Parſly. *It has a Root which is ſtraight and ſingle, running deep into the Ground, of a white color, and having the taſte of a* Parſnep. *It riſes up with a ſhort Stalk, about half a Yard high, and ſet at the Joints, with whitiſh rough Leaves diverſly cut. It is a rough hairy Herb, not much unlike to* Carrots. *The Leaves are parted into many ſmall jaggs, ſmaller than* Parſly, *and much like to thoſe of* Coriander. *At the top of the Branches grow ſweet ſhaded Umbles, or ſpoky Rundles, conſiſting of many ſmall*

Parſly Baſtard; or *Caucalis.*

small white Flowers, the outermost bearg the greatest; which being fall away, there follows rough, prickly, round Seed, like Carrot Seed, *but greater, two always being joined together, which makes them but half round when they are parted.*

IV. *The second, or* Our English Bastard Parsly with reddish Flowers. *Its Root is small and long, white and hard, perishing every Year after Seed time. This* English Kind *grows to be about two Feet high, of an* Olive *green color, with a strong, round, crested, rough and hairy Stalk; set at the Joints (which are two or three Inches asunder)*

Bastard Parsly English, red Flowered.

with Leaves three or four Inches long, consisting of seven or nine narrow hairy Leaves, set by couples, upon one middle Rib or Stalk, and one single Leaf at end, somewhat deeply dented about the edges; the foot of the Stalk being a broad thin Skin or Film: and from between it, and the Stalk, come forth lesser Stalks of Leaves, towards the top, parted into three or four Branches, which at three Inches distance, do each of them, from one Center, shoot forth four, five, or six equal Stems, about an Inch and half long apiece, having a thin Skin, running all the length of them, and the two innermost Strings, being of a dark red color, composing a Spoky Umbel of Flowers. At the tops of each of them, grow five or six long, rough, hairy, small knops or bottoms, crouded with Flowers, of a Pink *red color, consisting of five leaves a piece; the outermost whereof shews like two, by the folding of it inwards: and the inner four with five* Chives, *and a double pointel shew not half so big as it is when they are full blown. In the Center of the Flower sye six or seven such like small Flowers. The Leaves being broken, give little or no Taste. After the Flowers are fall, come the Seed, which are rough Burrs, sticking to any thing they touch, like the Seed of* Hounds-Tongue, *within which are contained two brown Seeds, like unto Husked* Oats, *but larger.*

V. *The third, or* the greatest Bastard Parsly, *or* Great rough Parsly. *Its Root is white, hard and woody. From whence spring up many upright tall crested Stalks, three or four Feet or more high, being hollow within, and with divers Joints on them. These Stalks are spread out into several Branches; and at each Joint they send forth long and large winged Leaves, encompassing their Stalks at the bottom, which Leaves are large, and something like those of* Angelica *but rougher, and of a darker green, set by couples on the middle Rib, and an odd one at the end, all of them finely cut or dented about the edges. At the tops of the Stalks and branches, grow long Tuffes of white Flowers; somewhat of a purple, or bluish, or sky color underneath, after which come very large and flat rough Seed, almost like that of* Cow-Parsnep, *but rougher, which is parted at the Head or Top, with a double point, and prickly round about.*

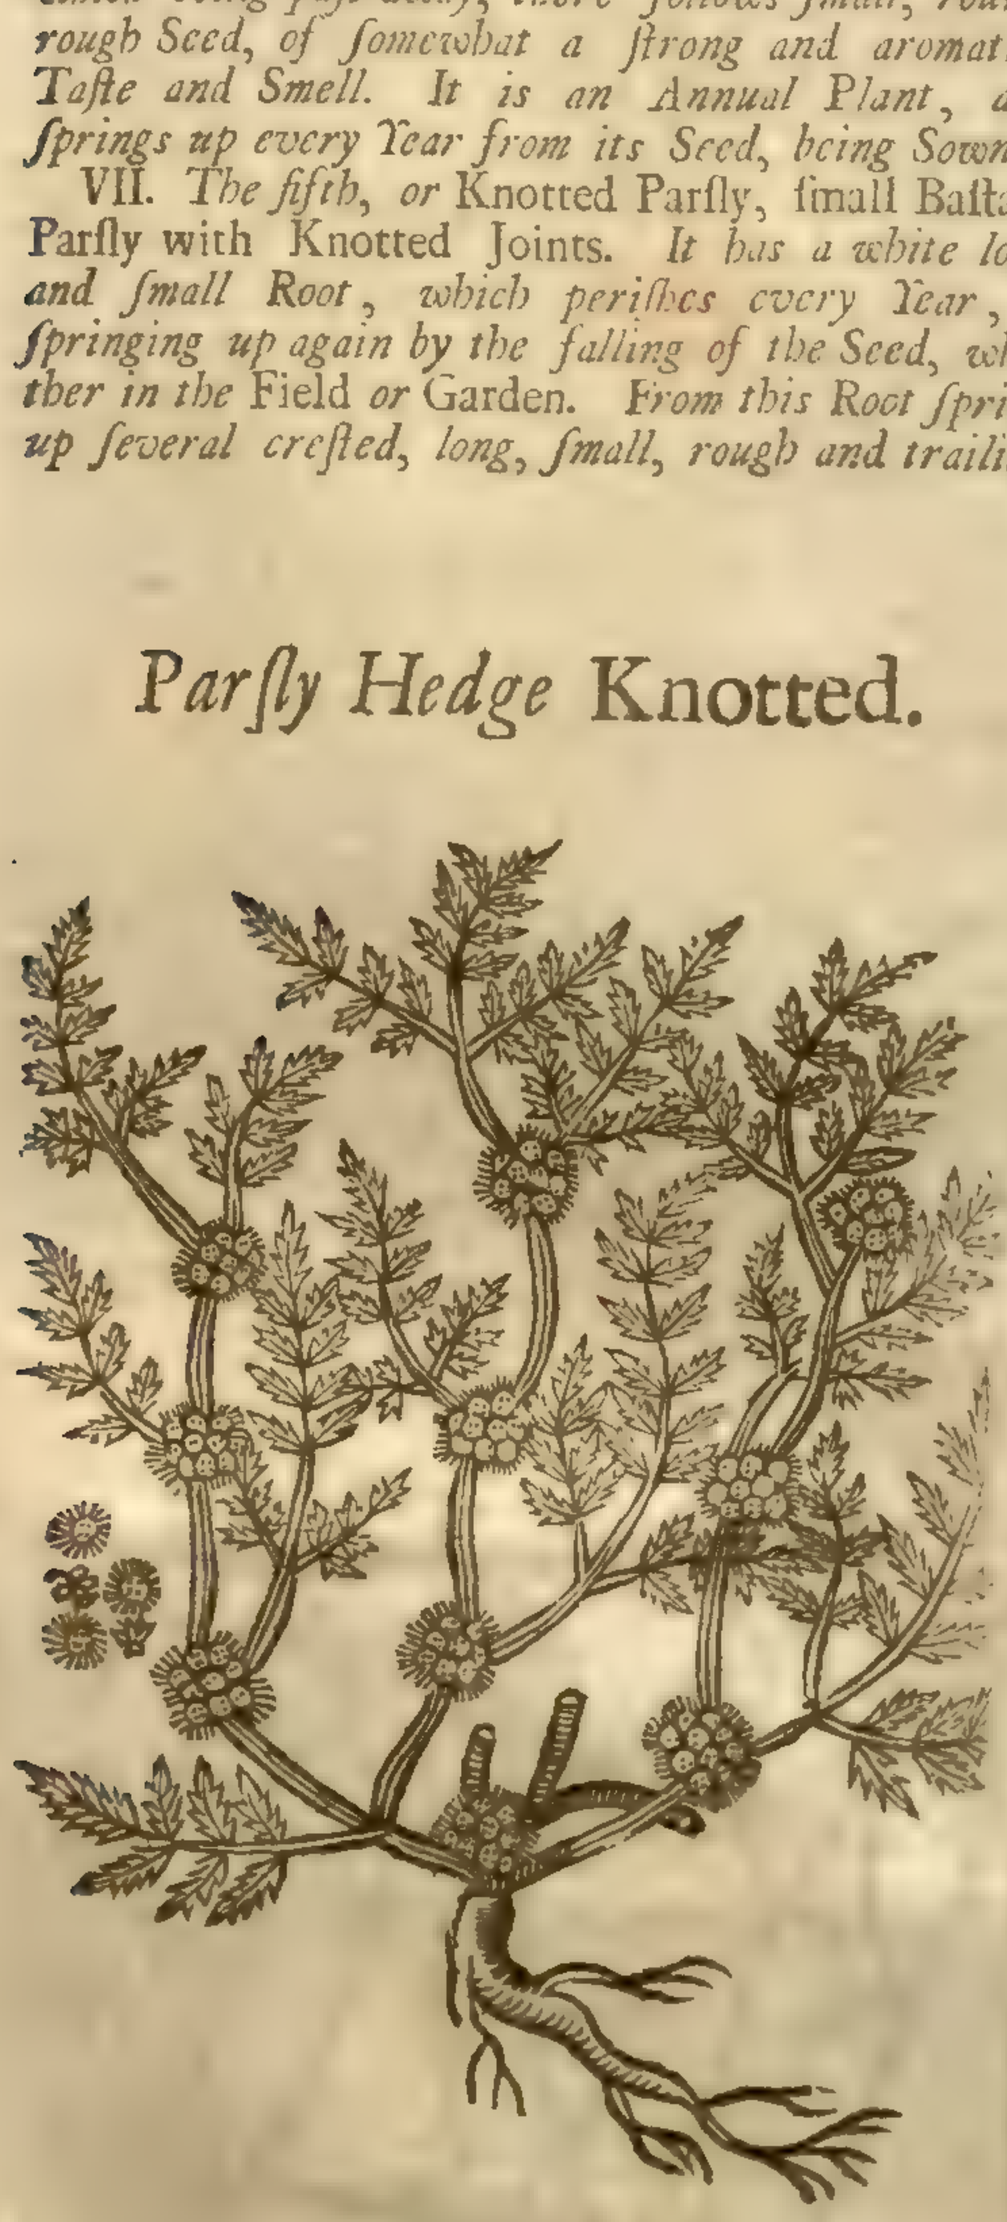
VI. *The fourth, or* small Bastard Parsly with reddish Flowers, or Hedge Parsly *as* Gerard *has it. Its Root is small and white; from whence spring up small and rough Stalks, crested and hollow, growing up to the height of two Feet or more: on which at the Joints grow winged Leaves, made of several*

Parsly Bastard small; OR, *Hedge Parsly.* } Red Flower'd.

little longish ones, set one against another, snipt or dented in about the edges, and ending in a long and sharp pointed Leaf, not much unlike to the winged Leaves of Hemlock, *but each of them broader, and the end Leaf longest: These Leaves, as also the Stalks, are rough and harsh, and of a dark green color. At the upper Joints of the Stalks come forth slender Branches, bearing sparsed small Umbles of reddish Flowers, and sometimes more white, which being past away, there follows small, round, rough Seed, of somewhat a strong and aromatick Taste and Smell. It is an Annual Plant, and springs up every Year from its Seed, being Sown.*

VII. *The fifth, or* Knotted Parsly, small Bastard Parsly with Knotted Joints. *It has a white long and small Root, which perishes every Year, it springing up again by the falling of the Seed, whether in the* Field *or* Garden. *From this Root spring up several crested, long, small, rough and trailing*

Parsly Hedge Knotted.



Branches, which commonly lye along upon the Ground, some longer, some shorter, some a Foot long, some a Foot and half or more in length, which are set at several distances with long winged Leaves, which are small, rough and deeply jagged, pretty deeply cut or dented about the edges, having 3, 4, 5, and sometimes 6 couples or pairs of Leaves upon a Wing, growing upon a middle Rib, with one single Leaf something larger than the rest at the end thereof. These Leaves are rough, or a little crumpled, but not hairy, and of an overworn, or decayed green color. At the setting on of each Leaf at the Joints, close to the Stalks, at every Joint round about it, almost close unto it, usually upon very short foot-Stalks, come forth small whitish or reddish Flowers, out of rough Husks, consisting of five Leaves apiece; after which follows the Seed, which is small, round and rough, hard and prickly, growing close to the Stalk.

VIII. *The sixth, or* Bastard Parsly Fennel Leav'd, Hogs Parsly. *Its Root is single, long and white, running deep into the Earth, thrumed about the upper end, with many Fibres or Threads of a brown color, which Root has the Taste of a* Parsnep. *From which rises up divers Stalks full of Joints, covered with a sheath or skinny Film, like unto that of* Meum, *rising up to be about half a Yard high.* Gerard *says, The Leaves are finely cut or jagged, resembling the Leaves of* Our English Saxifrage: *But* Parkinson *says, That both in Stalk and Leaf it is very like unto* Fennel. *At the tops of the Stalks it bears spoky Rundles, or Umbles of white sweet smelling Flowers, set close together, like those of* Fennel *also; which being past away, the Seed is produced, not rough like the former, but small like that of* Parsly.

IX. *The seventh, or* Bastard Parsly broad Leav'd, or the Greater, with prickly Seeds. *Its Root is white, hard, and Aromatical, which sends forth several Stalks of hard rough Leaves, divided into five parts, each leaf being three Inches long, and an Inch broad, deeply dented in on the edges, somewhat like unto* Oaken Leaves. *The Stalk is rough and hoary, two Feet long, so crested that it seems square, bearing at the tops, Umbles of Flowers, standing three together, upon pretty short and thick Stems. The Flowers are red like the next following, but greater, having small Leaves like Beards under them: after which follows the Seed Vessels, being smaller than the next Species, and not so rough, containing such like Seed within them, but smaller and Aromatical.*

X. *The eighth, or* Bastard Parsly the Lesser, or Bastard Parsly fine or small Leav'd. *The Root is like the former but lesser. The Leaves are most finely cut into several parts like unto* Wild Carrots. *The Umbles of Flowers grow at the tops of the Stalks and Branches, and stand three and three at a place, and so the Seed after them. The Kernel or Seed within the Husk, is something like to Hull'd* Barly.

XI. *The ninth, or* Bastard Parsly with great prickly Seeds. *Its Root is small and white, and something Sweet both in Taste and Smell. The Leaves hereof are divided something like to those of the* Greater Parsly Leav'd Daucus, *and hairy underneath: The Stalk is about two Feet high, and somewhat rough, having the like Leaves at the Joints upward, but smaller, bearing small Umbles of whitish Flowers, standing three together, and perfecting usually but two Seeds on them, which are twice as big as others, and more rough and prickly, having a large flat Kernel within it.*

XII. *The tenth, or* Bastard Parsly the Greater, deep red Flower'd. *This* Great red Flowered Kind *has larger winged Leaves than the twelfth Species, or* Spanish Kind *following, being divided and cut in, after the manner of our* Burnet Saxifrage Leaves. *The Flowers hereof, are larger than those of the first sort, or our* Common Bastard Parsly *but each of an equal bigness, and of a deep red color.*

XIII. *The eleventh, or* Bastard Mountain Parsly with small fine Leaves. *The Root is somewhat long and thick, from which rises a Stalk of a Foot in height, spread out from the bottom into small round smooth Branches, and they again into lesser; whose smallest Branches, even near the Root as well as the others, bear small Umbles of very small or white Flowers, and afterwards small long striped Seeds. The Leaves next unto the Root are divided into very fine and small Leaves; but those above on the Stalk are much more small, even like Hairs.*

XIV. *The*

XIV. *The twelfth, or* Spaniſh Baſtard Parſly. *The Root periſhes after Seed time, and tho' this is a Milky Plant yet being cut or broken, it gives no Milk. From this Root riſe up ſeveral creſted rough Stalks, and Leaves very like to the* firſt Common Baſtard Parſly; *but the Umbels of white Flowers are ſmaller, and grow more round together, as it were into the form of a round Head: and the Seed which follows is greater, very much ſtriped, and rough, but not prickly. The Herb being broken in any part, it yields a ſweet Milk.*

XV. *The Places.* Theſe ſeveral *Baſtard Parſlies* grow Wild in ſeveral Countries of *Auſtria, England, France, Germany, Italy, Spain*, &c. The firſt is common almoſt every where in our Country. The ſecond was found in *Lincoln-ſhire*, on the North Deſcent of the North Field of *Witham* nigh to *Bourn:* it was alſo found growing in the Corn Fields about *Bath.* The third and fourth grows about Hedges, and in Plow'd Fields, almoſt every where. The fifth grows Wild with us in ſeveral places: *Gerard* ſays it grew upon the Banks in the Fields about *St. James*'s and *Pickadilly*, which was before theſe places were Built upon, and made into Streets, *&c.* The reſt Naturally grow upon Rocks and Stoney Grounds, and thoſe which grow not Wild with us, are many times to be found in the *Gardens* of the more Curious.

XVI. *The Times.* They all Flower and Seed very well in *England*, from the beginning of *June* to the end of *Auguſt.* The ſecond and third Flower in *June*, or *July*, and the Seed is ripe in *July* or *Auguſt.* If the Seed is Sown in *September*, it will come up and continue green all the *Winter.*

XVII. *The Qualities, Specification, Preparations* and *Vertues* of theſe *Baſtard Parſlies*, are the ſame with thoſe of our *Common Garden Parſly* in *Chap.* 539. aforegoing, to which you are referr'd.

XVIII. *Nota.* 1. *The Juice of Baſtard Parſly*, not only provokes Urine and the Terms, but as *Matthiolus* ſays, is comfortable to the Heart, opens obſtructions of the Liver and Spleen, cleanſes the Reins of Stones, Gravel, and Tartarous Mucilage; and therefore muſt be profitable againſt all Diſeaſes of thoſe parts, excites Luſt, and ſtrengthens the Inſtruments of Generation.

XIX. *Nota.* 2. *The green Herb.* According to *Dioſcorides*, it was a familiar Sallet Herb, and therefore uſed in his time more for Meat than Medicine: but later Phyſicians have found it to be good for many other Diſeaſes, even for all that the *Common Garden Parſly* is good for, as is before expreſſed: if the whole Herb is eaten with Vinegar, after a Vomit, it cleanſes the Belly, and cauſes a good Appetite, taking away loathing of Meat, and Indigeſtion.

XX. *Nota.* 3. *The Eſſence.* It has the Vertues of the *Juice*, beſides which it prevails againſt Hypochondriack Melancholy, is good againſt Quartan Agues, Scabs, Itch, and *French* Diſeaſe, being given 2 Ounces at a time Morning and Evening either in a Glaſs of Wine, or other fit Vehicle.

XXI. *Nota.* 4. *The Pouder of the Seed.* Given to a Dram, more or leſs in a Glaſs of White *Port*, or *Lisbon* Wine, it is ſaid to clear and ſharpen the Eye Sight, and provoke Luſt exceedingly in both Sexes, as alſo the Terms in Women. It is likewiſe given with *Ceterach* or *Spleen-wort*, and *Seeds of Agnus Caſtus*, againſt the Running of the Reins. The *Pouder* being drank alſo in Wine, cauſes Fruitfulneſs in Barren Women, and is good againſt the Bitings of Venomous Beaſts, more eſpecially if a *Cataplaſm of the green Herb* be alſo applyed to the Wound.

CHAP. DXLIII.

Of PARSLY Laughing; *OR,* PASQUE-FLOWER.

I. *THE Names.* I know no *Greek* Name that this Plant has; but it is called in *Latine*, *Pulſatilla*, alſo *Apium Riſus*, *Apium Sardonium*, *Herba Sardonia*, *& Herba Venti:* in *Engliſh*, *Laughing Parſly*, by ſome, and *Paſque-Flower*, or *Paſſe-Flower*, by others, becauſe of their Flowering about *Eaſter*, or time of the Paſchal Solemnity.

II. *The Kinds.* This Plant is no Species of the *Parſly*'s, tho' (through Cuſtom) it has obtained the Name of *Apium riſus.* Nor do I think it any Species of the *Anemonies*, tho' ſome Learned Men are of that Opinion; nor yet a Kind of *Crowfoot*, which ſome would have it to be, but rather a *Genus* of its own, not related to any other. Of this *Paſque-Flower* there are ſeveral Kinds, as, 1. *Pulſatilla Anglica purpureo, Pulſatilla Vulgaris, Anemone Limonia Daleſchampij; Samolus Plinij*; Our Engliſh purple Paſque Flower. 2. *Pulſatilla Flore rubro, Pulſatilla rubra Gerardi*, The red Paſque Flower. 3. *Pulſatilla Flore luteo*, The yellow Paſque Flower. 4. *Pulſatilla Flore albo*, The white Paſque Flower. 5. *Pulſatilla Danica*, The Daniſh Paſque Flower. 6. *Pulſatilla Danica Flore duplici*, The double Daniſh Paſque Flower.

The Deſcriptions.

III. *The firſt, or* Our Engliſh purple Paſque Flower. *The Root is pretty thick and long, running downwards, or deep into the Ground, and not lying or running under the upper Cruſt thereof, as the* Wild Anemonies *do, having at the top of the ſaid Root, a Tuft of Hair, or kind of hary Beard adjoined thereto. From this Root riſes up many winged Leaves, lying upon the Ground, ſomewhat rough or hairy, hard in feeling, and finely cut into many ſmall Leaves, of a dark green color, in form almoſt like to thoſe of* Carrots, *but finer and ſmaller. From among theſe Leaves, riſe up naked Stalks, rough and hairy, ſet about the middle thereof, with ſome ſmall divided Leaves, compaſſing them; the ſaid Stalks riſe above thoſe Leaves, about a Span high, bearing at the top of every one of them one pendulous Flower, Bell faſhioned as* Gerard *ſays, and very beautiful, of a bright delayed purple color; or conſiſting of ſix Leaves of a fine* Violet *purple color, and ſometimes deep withal. In the middle thereof is a tuft of many yellow Threads or Thrums, ſet about a middle purple Pointel. When the whole Flower is paſt, there ſucceeds a buſhy Knob, or*

Parſly Laughing Common.
OR,
Paſque-Flower putple Flowered.

Head compact of many gray hairy Locks; and in the ſolid part of the Knob, or Head, ly long Seeds, which are ſmall, flat, and hoary, every Seed having at the end thereof a ſmall Hair ſpringing from it, which is gray likewiſe.

Parſly Laughing; OR, *Paſque Flower* } red Flowered.

IV. *The ſecond, or* Red Paſque Flower. *This Plant in its Roots, Leaves, Stalks, and Seeds, as alſo in its manner of growing, differs not from that before deſcribed, ſaving,* 1. *That in this the Leaves are longer and much more finely cut.* 2. *That the Flower is ſomething ſmaller but with longer Leaves, which are of a bright red color, whereas the former was of a purple color.*

V. *The third, or* Yellow Paſque Flower. *Its Root runs deep into the Earth, of about the thickneſs of a Mans Finger. Its Leaves are cut and divided, very like unto the Leaves of the firſt Kind, but ſomewhat more hairy, green on the upper ſide, and hairy underneath. The Stalk is round and hoary, the middle whereof is beſet with ſome ſmall Leaves, as in the others; from among which riſes up the Stalk of the Flower, conſiſting of ſix Leaves, of a very fair yellow color on the inſide, and of a hoary pale yellow on the outſide: after which follows ſuch a Knob or Head of hairy Thrums as in the former.*

VI. *The fourth, or* White Paſque Flower. *Its Root is black, and long, running deep into the Earth, having at its top a Head or Tuft of Hair, ſuch as grow at the top of the Root of the firſt Kind. From among which ſpring up many Leaves which are winged, and ſtanding upon long foot Stalks: they are divided as it were into three Wings or Parts: and each part finely cut and divided, like unto the* Daniſh Paſque Flower *following, but ſomething harder in handling, greeniſh on the upper ſide, and ſomething gray underneath, and very hairy all over. From among theſe Leaves riſe up the Stalks, beſet at the middle of them with three Leaves, as finely cut and divided as thoſe below: from above which grows the Flower, being ſmaller, and not ſo pendulous as the former; but in like manner conſiſting of ſix Leaves apiece, of a Snow white color on the inſide, and a little browner on the outſide, with many yellow Thrums in the middle. After the Flower is paſt, there comes forth ſuch a like hoary Head, compoſed as it were of many Hairs, each whereof has a ſmall Seed, to which it is faſtned, like as the former* Paſque Flowers *have.*

VII. *The fifth, or* Daniſh Paſque Flower. *This in reſpect to its Root, Leaves, Stalks, Flowers, Seed, and form of growing, is very like to the firſt, or* Engliſh Kind, *before deſcribed, and differs from it only in theſe reſpects,* 1. *That in its Root, Leaf and Flower, it is larger.* 2. *That the Flower is of a fairer purple color, and not ſo deep.* 3. *That ſometimes, and in ſome Plants the Flower is found white.* 4. *That it will better abide with us, and be more eaſily manured than our* Engliſh Kind, *tho' ours is a Native of our Country, and grows Wild therein, in many places.*

VIII. *The ſixth, or* double Daniſh Paſque Flower. *This in its Roots, Leaves, Stalks, Flowers, Heads, Seeds, and manner of growing, differs nothing from that laſt deſcribed, ſaving in the duplicity of the Flowers: for whereas the former Flower was ſingle, this is double Flowered, having two rows of Leaves, the one within the other.*

IX. *The Places.* The firſt is found in many places of *England*, upon dry Banks which ly open to the Sun. It did grow very plentiully in a Paſture or Cloſe belonging to the Parſonage Houſe of *Hilderſham*, a ſmall Village, about ſix miles diſtant from *Cambridge:* The firſt four grow Wild in *France*, *Germany*, and other Countries, in untill'd, rough, Stoney and Rocky places. The fifth and ſixth grow in *Danemark*, and were brought from thence into *England*, where they Flouriſh rather better than in their own Country. The

ſecond

second *Red Kind*, *Lobel* says, was brought from *Syria*. The third or *Yellow Kind*, *Clusius* makes to be his third Wild *Anemone*, and says, it was found growing plentifully at the foot of St. *Bernards* Hill near to the Cantons of *Switzerland*. The fourth or *White Kind* is growing on the *Alps* near *Austria*: in *France* likewise, and in other places. Now all these are planted and grow with us in our *Gardens*, where they flourish as well as in their Native places.

X. *The Times.* They all Flower for the most part about *Easter*, from whence came the Name of *Pasque Flower*. They do indeed Flower early in the Year, at the farthest in the beginning or middle of *April*, accordingly as the *Spring* proves seasonable.

XI. *The Qualities.* These are all of them hot and dry in the fourth Degree: vehemently attractive and exulcerating; and therefore not fit to be taken inwardly.

XII. *The Specification.* By external application they are good against the Bitings of Mad-Dogs, Vipers, Rattle-Snakes, and all other sorts of Serpents and Venomous Beasts, drawing forth the Poyson by means of their strong attractive force: and for the same reason they prevail against an inveterate Sciatica.

XIII. *The Preparations.* You may make of the *Pasque Flower*, all the *Preparations* which you make of *Crowfoot*, which you may see in *Chap.* 176. *Sect.* 26. *ad* 33. These having all the same Virtues with those there mentioned. But generally we only make, 1. *A Cataplasm of the fresh Herb or Root.* 2. *A distilled Water of the whole Plant.*

The Virtues.

XIV. *The Cataplasm of Herb or Root.* It is applyed against the Bitings of Mad-Dogs, Vipers, Rattle-Snakes, and other Poisonous Creatures, and to places affected with the Gout, Sciatica, *&c.* with admirable success.

XV. *The Distilled Water of the whole Plant.* *Camerarius* in his *Hortus Medicus* says, that in *Borussia* it is used with good Success, to be given to those who are troubled with a Tertian Ague, for he saith that it is an ἐκπεφρακτικὸν, or *Medicamentum ecphraticum, vel deobstructivum*, a Remedy to open Obstructions.

XVI. *The Danger.* The Herb, Flower or Root, being taken inwardly in substance, are without doubt deleterious, or deadly: It kills by making the Patient look Laughing all the while, whence it obtained the Name of *Apium Risus*. And yet notwithstanding the Standers by, or lookers on, may think, that the Patient is really a Laughing, or in a Laughing Humor, there is indeed no such thing. It only by its Poisonous qualities, hurts the Senses and Understanding, thereby causing Foolishness; and Convulsing the Nerves, especially of the Mouth, Jaws, and Eyes, draws them this way, and that way, and sometimes in a manner all ways, making the Sick seem to the by-standers as if he continually Laughed, whereas, it is only a Convulsive Motion, wringing, or drawing of the Mouth and Jaws awry; and so the poor Patient dying in this Condition, the lookers on, think he dyes Laughing, and so report it; when at the same time there is no such matter, but he goes out of the World under the Sense of violent Convulsions, vehement Pain, and the most extream Torment imaginable.

XVII. *But the chief use that is now made of these Flowers* is for Ornament sake, more than any thing else; and to set off and Adorn a Garden; among such as are curious and delight in things of this Nature; they being very beautiful in their Kind.

CHAP. DXLIV.

Of PARSNEP Garden *and* Wild.

I. THE *Names.* It is called in *Arabick*, *Jezar*, *Gezar*, and *Giezar* in *Greek*, Σταφυλῖνος: in *Latine*, *Pastinaca latifolia*, *Staphylinus latifolius*: and in *English*, Parsnep.

II. *The Kinds.* There are several Species of this Plant, as, 1. Σταφυλῖνος κηπαῖος, *Pastinaca latifolia Hortensis vel Domestica*, The Garden Parsnep. 2. Σταφυλῖνος ἀγριος, *Pastinaca latifolia Sylvestris*, The Wild Parsnep; of both which we shall Treat in this Chapter. 3. Σφονδύλιον, *Sphondilium*, Cow Parsnep, of which in *Chap.* 545. 4. Σίον, *Sium*, *Pastinaca Aquatica*, The Water Parsnep, of which in *Chap.* 546. following.

III. *The Garden and Wild Kinds.* Of the *Garden* sort there are two Species, *viz.* 1. *Pastinaca latifolia sativa communis*; *Pastinaca latifolia Domestica*; *Pastinaca alba sativa*, *Siserum sativum Magnum Fuchsij*; *Siser Dioscoridis Columnæ*; *Elaphoboscum sativum Tabernæmontani*, Our Common Garden Parsnep. 2. *Pastinaca alba sativa altera*; *Pastinaca Pinea*; The Pine Parsnep. 3. *Pastinaca latifolia Sylvestris*; *Pastinaca Sylvestris*; *Pastinaca Sylvestris Gallica Cordi*; *Siser Sylvestre Fuchsij*: Ἐλαφοσκορον *Dioscoridis*, Lib. 2. Chap. 80. *Elaphoboscum*, *Plinij*, Lib. 22. Chap. 22. and so *Dodonæus*, *Matthiolus*, *and Tabernæmontanus*, call it: Our Wild Parsnep. 4. *Pastinaca insana*: Mad-Neps.

The Descriptions.

IV. *The first, or* Our Common Garden Parsnep. *The Root is white, great, long and large, thick at its top or upper part, and sharp or spear pointed at bottom; and as it is white without, so it is also within, of a very sweet and pleasant Taste, being boiled, baked, or roasted, which then are drest up with Butter and Vinegar, as every one likes best. From this Root spring up large winged Leaves, a great many lesser being set on both sides of a long ribbed Stalk, each of them standing for the most part directly one against another, with a single one at the end, being much larger than those of the* Skirret, *and closer set together, and rougher, being also dented about the edges. The Stalk grows four, five, or six Feet high, with divers the like Leaves and*

Parſnep Garden.

Parſnep Wild.

and Branches thereon, but leſſer. The Flowers which grow in Umbels at the tops of the Stalk, and Branches, are yellow, which paſſing away, browniſh, thin, roundiſh, flat Seed comes in their places, having a good, and a kind of Aromatick Smell.

V. *The ſecond, or* Pine Parſnep. *This is not ſo common in every* Garden *as the former, but yet is found in many. The Root is white both within and without, which is not ſo long as the former, but it is thicker at the Head and ſmaller below. The Stalk is neither ſo big, nor ſo high, but Branched forth in like manner. The Umbels of Flowers at the tops of the Stalk and Branches are leſſer than the former, and the Seed ſmaller. The Root hereof is not altogether ſo ſweet in eating, but more flaſhy and inſipid, but its Taſte is more pleaſant, if it grow in a fat and Sandy Soil.*

VI. *The third, or* Our Wild Parſnep. *The The Root (as moſt Writers of every Country affirm,) is ſhorter and more woody, and therefore not ſo fit to be eaten as the former* Garden Kinds *are, but is thought to be more Medicinable. This* Wild ſort *differs very little from the firſt* Garden Kind, *but only as a Wild Plant, and ſo grows not ſo fair and large, nor has it ſo many Leaves, nor ſuch large Umbels of Flowers; it is thought to be the* Garden Kind *found* Wild, (*as the* Garden Kind *is thought by others to be the* Wild Kind *Tranſplanted into* Gardens:) *And it is to be met with in many places of* England, *as ſweet and tender, after the Sowing as thoſe of the* Garden ſort *be. This* Wild Species *grows in ſome* Fields *and places ſo plentifully, that a Sack full of its Seed might be gotten from it, which being Sown in* Gardens (*having a Sandy but yet rich and fat Soil,*) *and there well ordered will prove as good as the former* Garden Parſneps.

VII. *Paſtinaca Inſana*, or *Mad-Nep*, we deſcribe not, for that it is the ſame Plant with our *Common Garden Parſnep*, or *Pine Garden Parſnep*, before Deſcribed, the only difference between them and the *Mad-Neps* is the time of Flowering, as *Parkinſon* ſays; for if (ſays he) the *Common Garden Parſneps* do Flower in the firſt Year after Sowing, the Country People do call them *Mad-Neps*. Theſe are only to be known by the report of the *Gardner*, or ſuch as Gather or Sell them; for they are ſo like to the Choice Landable ones, that there is no diſtinguiſhing them by the outward appearance. They are found by long experience to have an evil and pernicious quality; for they not only cauſe a Vertigo or Swimming of the Head, but Frenſy alſo, and in ſome even Madneſs it ſelf; out of which the Patient is not preſently reſtored, ſome having continued in that Condition for the ſpace of twenty four Hours, and others not having come perfectly to themſelves for the ſpace of 2 whole Days and Nights. *Gerard* ſays, that theſe *Mad-Neps*, are the Produce of our *Common Garden Turneps*, ariſing from the Seed of the *Garden Kind*; which if they Flower the ſame Year they are Sown, they are ſaid to degenerate, and become what the Country People in *Cheſhire*, about *Nantwich*, *&c.* call *Mad-Neps*. But I ſuppoſe this is a miſtake, that being the moſt probable, which *Parkinſon* has declared of our *Common Garden Parſnep*, as is aforeſaid.

VIII. *The Places.* The firſt and ſecond grow only in *Gardens*, where they are Nurſt up for Food, but eſpecially the firſt ſort. The third grows Wild in ſeveral places of *England*; as in the Marſhes by *Rocheſter*, in the Grounds of formerly

merly Sir *John Leveſon*: It grows in Salt Marſhes, and upon the Banks and Borders of the ſame. *Gerard* ſays, That the Seed thereof being gathered and Sown in *Gardens* which have a fertil and fat Soil, does bring forth better Roots, ſweeter and larger, than thoſe which come from Seeds of the *Garden Kind*.

IX. *The Times.* They Flower and Seed generally the ſecond Year after they be Sown: and then it is in the Month of *July*, the Seed being ripe in *Auguſt*, or not long after.

X. *The Qualities.* They are hot and moiſt in the firſt Degree, are Diuretick, Attenuating, Cleanſing and Opening: Stomatick, Nephritick, Chylifick, Analeptick and Spermatogenetick. The Seed is Alexipharmick.

XI. *The Specification.* *Parſneps* reſtore in Conſumptions, make the Body Fat, plentifully encreaſe Seed, and provoke Luſt exceedingly.

XII. *The Preparations.* 1. *The Boiled, Baked or Roaſted Roots.* 2. *Bread made of* Parſneps. 3. *A Decoction of the Roots.* 4. *A Pudding made of the Roots.* 5. *Sanguis or Blood of* Parſneps. 6. *A Pouder of the Seed.*

The Virtues.

XIII. *Boiled, Baked, or Roaſted* Parſneps. Eaten as common Food they ſweeten the Blood and Juices above all other Roots in the World; reſtore in Conſumptions, make the Eater of them grow Fat and Fleſhy, nouriſh much; and indeed much more than either *Carrots*, or *Turneps*; Breed Seed after an admirable manner, and potently provoke Luſt. They ſtrengthen the Stomach, Reins and Bladder, and provoke Urine. But the *Wild Kind* are more Phyſical, being Aperitive, Attenuating, Inciding and more Diuretick than thoſe of the *Garden*. They are dreſt up with Salt, Butter, Pepper, and Vinegar, or Juice of *Lemons*.

XIV. *Bread made of* Parſneps. It has all the former Virtues; it is ſweet, and eats pleaſantly enough, but ought to be eaten whileſt it is new, for then it is beſt. *It is made of Baked or Boiled Parſneps, with the addition of ſome fine pure Wheat Flower or Meal*; as they uſually make *Bread of Eddo Roots* in *Carolina*.

XV. *The Decoction of the Roots. It is commonly made in Water, to which at the end of the Boiling, a little, as a quarter part, of White or Red Port Wine may be added.* It comforts or cleanſes the Stomach, Reins, Bladder, and Womb, opens, incides, provokes Urine, and gives eaſe in the Strangury. *Some make the Decoction by a long boiling them in Milk.* This reſtores in Conſumptions to admiration, and in ſhort time makes a thin, lean, extenuated Body, plump, fleſhy, and in good liking.

XVI. *The Pudding. It is made of the Garden Parſnep half Boiled, then chopt ſmall, and mixt with Eggs, Rice, Beef-Suet ſhred, Salt, and the other proper Ingredients.* It is excellent Food, nouriſhes extreamly, and has all the Virtues of the *Boiled Roots*, *Bread*, and *Decoction*, *made with Milk*, aforegoing.

XVII. *Sanguis Paſtinacæ latifoliæ.* The Blood of Parſneps. *It is made as the Blood of Potatoes, Satyron, Eddo, &c.* after this following manner, *viz. Take of the beſt Garden Parſneps (if they be firſt Boiled or Baked in their Skins, or half Baked it may be ſo much the better, tho' whilſt raw, they will alſo do) cleanſe them well from their Skins, beat them well in a Marble Mortar with a Wooden Peſtel, till they become a Pulp: Take of this Pulp ſix Pounds: Crumbs of White Bread three Pounds: mix them well together: ſprinkle them with White Port Wine, and put all into a Bolt Head, ſtopping it well with Cork and Wax, ſo that nothing may tranſpire: place this Matraſs in warm Horſedung, or in* Balneo, *or in a warm Sand heat, till the Matter is changed into a Rubicund or Bloody Clyle: then force it ſtrongly out with a Preſs, and put the expreſſed Blood into* Balneo Vaporoſa, *or ſuch a like heat again, that by this ſecond Digeſtion it may acquire a greater redneſs, and ſome faces may ſettle, which ſeparate: this Digeſtion and Separation continue, till the Blood becomes abſolutely clear, and of a moſt perfect red. From this you may (if you ſo pleaſe) with an Alembick, ſeparate a thin and clear* Liquor; *ſo have you remaining in the bottom, the Blood of Parſneps of a very glorious color.* It has all the Virtues of the *Roots Boiled, Baked, Roaſted, or made into Bread, Puddings, Broth*, &c. afore enumerated. I do not believe that there is any greater Vegetable reſtorative in Conſumptions in the World beſides, it invigorates to a ſtrange Degree. Doſe from a Dram to two, three, or four Drams, Morning, Noon, and Night, in a Glaſs of choice *Maluga* or *Barcelona* Wine: or if the Patient likes not Wine, in Milk.

XVIII. *The Pouder of the Seed.* It is ſtrongly Aperitive, Abſterſive, Carminative, Digeſtive, Diuretick, Stomatick, Nephritick, Hyſterick, and Alexipharmick: being given from two Scruples to a Dram, or Dram and half in White *Port* Wine, or other proper Vehicle, it ſtrengthens the Stomach ſingularly, expels Wind, gives eaſe in the Colick and Strangury, provokes Urine, cleanſes the Reins and Bladder from Stones, Sand, Gravel, Slime, or any Tartarous Matter obſtructing them: It potently provokes the Terms in Women, and reſiſts Poiſon, and cures the Bitings of Serpents, and other Venomous Creatures. It is an admirable thing alſo againſt Stitches and other Pleuritick Pains, apt to afflict ſuch as are Hypochondriacal.

XIX. *Nota.* You may alſo from *Parſnep Seed* prepare, 1. *A Diſtilled Water.* 2. *A Spirit.* 3. *An Oil by Diſtillation.* 4. *A Spirituous Tincture.* 5. *An Acid Tincture.* 6. *An Oily Tincture.* 7. *Poteſtates or Powers.* 8. *An Elixir.* Every one of which are poſſeſſed with all the Virtues of the Seed, before enumerated in the *Section* immediately aforegoing.

CHAP. DXLV.

Of PARSNEP Cow.

I. *THE Names.* It is called in *Greek*, Σφονδύλιον, ἢ Σπονδύλιον: (for both are extant in good Authors) in *Latine*, by *Dodonæus*, *Geſner*, *Lobel*, *Matthiolus*, and others, *Sphondilium*, & *Spondilium*: in *Engliſh*, *Cow Parſnep*, and *Medow Parſnep*: *Gerard* ſays that it is called alſo *Mad-Nep*.

II. *The*

II. *The Kinds.* Authors make five or six Kinds or more of *Cow Parsnep*; but three only of them being known to us in our Land, we shall only describe them, which are the following, *viz.* 1. *Sphondilium vulgare*; *Branca ursina Cordi & Tragi*; *Acanthus vulgaris sive Germanica Fuchsij*, Our Vulgar or Common Cow Parsnep. 2. *Sphondilium majus, sive Acanthus Germanica major*; *Sphondilium alterum Dodonæi*, The Great German Cow Parsnep. 3. *Sphondilium majus aliud foliis lacinatis* (*Sphondilion hirsutum foliis Angustioribus Bauhini*, as *Parkinson* supposes:) Jagged Cow Parsnep of our own Land.

The Descriptions.

III. *The first*, *or* Our Vulgar or Common Cow Parsnep. *It has a Root which is long and white, with two or three long Strings growing or running down deep into the Ground, of a strong and unpleasant Smell. It springs up with three or four large spread, rough, winged Leaves, lying often upon*

Parsnep Cow.

the Ground, or else raisel a little from it, with long, round, hairy foot Stalks under them, parted usually into five divisions, the two couples standing each against other, and one at the end; and each division or Leaf being almost round, yet cut in somewhat deeply on the edges, in some Leaves and places, and not so deep in others, of a whitish green color, having a strong Smell. From among which rises up a round, crested, hairy Stalk, two or three Feet or more high, with a few Joints and Leaves thereon, and spread out into Branches on the Top: on the tops of which stand pretty large Umbels of white Flowers, something inclining to be a little reddish: which being past away, there follows after them, flat, thin, whitish, winged Seed, two always joined together, as is usual in most of these Umbelliferous Plants.

IV. *The second*, *or* Great German Cow Parsnep. *Its Root is white, and like the other, but greater. The whole Plant it self, differs very little from the former, but in the largeness of its Leaves and Stalks, being nearly twice as great; that is to say every single Leaf or division, which are seldom above three, on a great long foot Stalk, which is about 6 Inches long to the Leaf, which is hairy and rough, and of a dull faded sort of green color, a little folded in or crumpled, and dented besides on the edges. The Stalk grows like the former, and comes to be sometimes 4 or 5 Feet high, spread out towards the top into several Branches. At the tops of all which are like Umbels of Flowers, (for the most part white) the Flowers and Seed being in form much like the first, but larger, of a hot unpleasing Taste, but not so unpleasant as those of the* Common Kind.

V. *The third*, *or* Jagged Cow Parsnep of our own Land. *Its Root is great, thick, and white, living after Seed time, or all the* Winter, *and springing up again anew every Year. It grows as high, or rather higher than the second or last described, and with greater Stalks, having a white hairyness on them. The lower Leaves grow very large, and much spread, winged, and divided into five parts: two couple standing each against another, but of another form; for each of these Leaves or divisions, are parted into distinct parts, yet closely joined at the bottom, the two side Leaves or divisions, being not of half that length that the middlemost is, which is in some above six Inches long, in others above five, and not above half an Inch broad, each of them having a deeper Cut or Notch at the bottom, than is on the rest of the Leaf, which yet is dented with greater Notches than in most usual Herbs, the upper or end Leaf being usually parted into five divisions or Leaves, dented in the like manner, little or nothing hairy, but of a deeper green color on the upper side, and grayish underneath. The Umbles of white Flowers, are as large as in the last, and the flat thin white Seed, is so like that (setting aside their being a little whiter) they are scarcely to be discerned one from another, but only by the Taste and Smell, which in this are little or nothing.*

VI. *The Places.* The first grows in moist Medows, and the Borders and Corners of Fields, and near Ditches generally, throughout *England.* The second is a Native of *Germany*, but I have found it growing in the Borders of Fields or Medows in several places in *Cambridgeshire.* The third was found growing Wild also by one Mr. *George Bowles*, in some places in *Shropshire.*

VII. *The Times.* They all Flower in *June* and *July*, and the Seed is ripe not long after, or in *August.*

VIII. *The Qualities.* The Root is hot and dry in the begining of the second Degree: The Seed is hot and dry in the third Degree, and is Incisive, Aperitive, Cephalick, Arthritick and Hysterick.

IX. *The Specification.* The Seed is prevalent against the Asthma, Epilepsy, Lethargy, Jaundice, and Hysterick Fits. The Root is profitable against Fistula's and Callous Ulcers.

X. *The Preparations.* You may make, 1. *A Drink, or Beer of the Leaves and Seed.* 2. *A Pouder of the Seed.* 3. *A Decoction of the Seed.* 4. *A Spirituous Tincture of the Seed.* 5. *The Fumes*

Fumes of the Seed. 6. *A Juice of the Umbles or Flowers.* 7. *The raw Root.* 8. *A Pouder of the Root.* 9. *A Decoction of the Root.* 10. *An Oil of the Root.* 11. *A Cataplasm of the Root.*

The Virtues.

XI. *The Drink or Beer made of the Leaves or Seed. You must first make a strong Decoction of them with Water; and then, being Blood-warm, you are to Ferment or Work it up with Yest or Leven, as Brewers do their* Ale *or* Beer. It is used in all respects to be drank as *Beer* or *Ale*, for the quenching of Thirst; and is a common Drink at Meals in *Poland* and *Lithuania*.

XII. *The Pouder of the Seed.* Given to a Dram mixt with Honey, it is good against Asthma's, Coughs, shortness of Breath, Hoarseness, Wheezing, Epilepsie, Jaundice, Lethargie, and cleanses the Bowels, from tough, slimy, pituitous humors, sticking in the Passages of the Guts. For according to *Galen*, it is of a sharp and incisive Quality. It prevails also against the Rickets, or such as are Liver-grown, as the Vulgar call it. It provokes the Terms in Women, and prevails against Vapors and Hysterick Fits.

XIII. *The Decoction of the Seed.* It may be made either in Water or Wine: and being sweetned with Honey or Sugar, it has all the Virtues of the *Pouder of the Seed* afore enumerated, being drank inwardly, and bathed with outwardly upon the part affected, it gives ease in a *Cephalæa*, or that which is called an inveterate or old Head-Ach.

XIV. *The Spirituous Tincture of the Seed.* It expels Wind, gives ease in the Colick, provokes Urine and the Terms, and has all the Virtues of the *Pouder* aforegoing, being given from a Dram to two or three Drams in any proper Vehicle: outwardly applyed, it is good against Scabs, Pimples, Shingles, running Sores, and other breakings out.

XV. *The Fumes of the Seed, from the Seed being burnt.* Received up the Mouth or Nostrils, it is good against Carus, Lethargy, Epilepsy, and other cold and moist Diseases of the Head and Brain: received up the Womb by a Funnel, it prevails against Vapors, Faintings, Swoonings, and Fits of the Mother.

XVI. *The Juice of the Umbels or Flowers.* If it is dropt into Ears which are ulcerated or sore, and which run and are full of Matter, it cleanses and heals them. It also cleanses, drys and heals Ulcers and running Sores in any other part of the Body, they being daily washt therewith warm.

XVII. *The raw Root.* Being scraped as you scrape *Horse Radish* Roots, and the scrapings applyed to the Callous of a Fistula, it softens it, and takes it away, disposing the same to a speedy healing.

XVIII. *The Pouder of the Root.* Being strewed upon a Callosity in a Fistula it consumes it: and being taken inwardly to 1 Dram or more, in Honey or any other proper Vehicle, it is said to have all the Virtues of the *Pouder of the Seed* before enumerated. It is said to cleanse and strengthen the Stomach and Bowels, and to give ease in the Colick.

XIX. *The Decoction of the Root in Water or Wine.* It is of like quality to that of the *Seed*, and available to all the same purposes: and either alone, or mixt with Honey, makes a singular good *Lotion* to cleanse Fistulas, Ulcers, and old running Sores with, to dry them and induce their healing, as also to wash Pimples, mattery Pustles, Scabs, and Shingles withall.

XX. *The Oil of the Root. It is made by Decocting it in Oil Olive, as is usual.* The Head being anointed and rubbed therewith, it helps not only such as are fallen into a Frensy, but is profitable for the Cure of such as are sick of a Carus or Lethargy, and who have for a long time been afflicted and grieved with a *Cephalæa*, or old Head-Ach.

XXI. *The Cataplasm of the Roots.* Applyed to the Gout, or any part pained, it gives ease and relief in a very short time; and applyed very hot to the Sides and Hypochonders, it gives present ease in Stitches, and other like Pleuritick pains.

CHAP. DXLVI.

Of PARSNEP Water.

I. *THE Names.* It is called in *Arabick*; *Rochjthalmo*, and *Inhamehanella*, or *Hamehanella*: in *Greek*, Σιον; so called ἀπὸ τῦ οὐρεῖν, *ab Urinis ciendis*; in *Latin*, *Sium*: in *English*, *Water Parsnep*.

II. *The Kinds.* The chief of these we shall treat of in this Chapter are, 1. *Sium, Sium majus; Sium majus Latifolium Bauhini, Gerardi, & Tabernæmontani: Pastinaca Aquatica major, & Aquatica latifolia*, The Greater, or broad Leav'd Water Parsnep. 2. *Sium verum Dioscoridis, Matthioli, Thalio & Lugdunense*; *Sium majus Angustifolium Jansoni*; *Sium odoratum Thalij & Gesneri*; *Sij primum genus quod & Laver Fuchsij*; *Silaum Plinij Anguilarâ*; *Sium & Laver Cordi, Dodonæi & Lobelij*; *Sium Olusatri folio Lobelij, sive Pastinaca Aquatica*; *Sium verum Camerarij* in his Epitome; *Sium erucæ folio Tabernæmontani, Bauhini & Lugdunensis*; *Sium alterum Olusatri facie*; *Pastinaca Aquatica minor*, The Lesser Water Parsnep. 3. *Sium majus Angustifolium*; *Sium minimum Alpini*; *Pastinaca Aquatica Angustifolia, Sium alterum Dodonæi*, Water Parsnep narrow Leav'd. 4. *Sium Umbellatum repens*, Creeping Water Parsnep.

The Descriptions.

III. *The first, or* Greater broad Leav'd Water Parsnep. *Its Root is black with many Fibres at the Joints thereof, and at the Joints of the Stalk under the Water, near the Ground. It rises up with great hollow and crested Stalks, three, four, or more Feet high, spread out into several Branches, on which stand long winged Leaves, made of many long and somewhat brood Leaves, pointed at the ends, and dented about the edges, smooth, thick, and Sappy or juicy; every one of which is as large as those of a* Parsnep. *The Flowers grow at the tops of the Stalks in Tufts or Umbels, and are of a white color; after which comes the Seed, which smells well, and*

Parsnep Water Greater.

is larger and rounder than Aniseed. *The whole Herb is of a strong but sweet and pleasant Smell.*

IV. *The second*, or Lesser Water Parsnep. *Its Root is very Fibrous, and consists of many small*

Parsnep Water Lesser.

Strings or Threads, which are fastened to the Stalk or Root within the Water or Muddy Ground: both it and the Leaves (says Parkinson) *smell strong like* Petroleum. *This Plant is very like the former, but lower and lesser, growing two Feet, or two and a half high. The Leaves smell well, are fat and full of Juice, being long, but narrower than those of the first Kind. They grow winged, upon a long foot Stalk, having sometimes four, five, six, seven, and eight pair of Leaves set one opposite to another upon a middle Rib, and one single one at the end, finely snipt or dented about the edges, and growing as it were bolt upright. The Stalk is smooth, round and hollow like a* Kex, *which towards the top spreads it self into several Branches. At the tops of the Stalks and Branches grow the Flowers, which are white and stand in round Umbles, not much unlike to those of* Fennel. *The Flowers being past away, the Seed follows, which is small, and much like the former.*

V. *The third*, or Water Parsnep narrow Leav'd. *Its Root consists of a great number of small, slender, writhed brown Fibres or Strings, wrapped up as it were, among themselves, and strongly fixed or fastened in the Mud. The Stalks of this Plant are hollow like those of* Hemlock, *and a Cubit, or two*

Parsnep Water narrow Leav'd.

Feet high, (Gerard *says they are about three Cubits high:*) *on which grow several winged Leaves something like the last, but are divided into smaller Leaves, which are long, much narrower, and snipt about the edges, growing commonly two or three together. The Flowers grow at the tops of the Stalk and Branches: they stand in round Tufts or Umbles, and are of a pale, yellowish, green color: which being past away, turn into small Seed, very much like to that of* Parsly; *but in its Taste, something resembling that of* Cumin, *or of* Daucus Creticus,

ticus, *and of a* Citron Peel; *but somewhat better than any of them.*

VI. *The fourth*, *or* Creeping Water Parsnep. *It has a bushy Fibrous Root, not much unlike to the second; but in these things it differs from it,* 1. *The Stalks in this never grow upright, but always lean and creep, and are also less than those.* 2. *The Leaves of this are also less than those of the second Kind, and grow not so many upon one Rib.* 3. *The creeping Stalks put forth an Umbel of Flowers almost at every Joint, whereas the other, bear them only at the tops of the Stalks and Branches.*

VII. *The Places.* The first grows Wild in *Germany*, with us for the most part in *Gardens*, in places apt to have standing Water, or where it is Planted by Ditch sides. The second grows in *Kent* in several standing Waters, and watery Ditches. It has been found between *Redriff* and *Deptford*, in a rotten Boggy place on the right hand of the Way. The third grows (as *Lobel* says) near *Antwerp*, but has been found growing Wild in several parts of this Kingdom: it has been found in the Ponds about *Moor Park*; and in the Ditches about *Ellesmere*, and in divers Ponds in *Flintshire*. The first I have sometimes found growing in *Cambridgeshire*, in watery places on the Borders of the *Fens*, adjoining to the Land Ground, commonly called *Medlands*. The fourth grows almost every where in watery places, thro' the Kingdom.

VIII. *The Times.* They all Spring about the middle and latter end of *March*; spread and grow green in *April*; Flower in *July*; and Seed before the end of *August*.

IX. *The Qualities.* *Water Parsnep* is hot and dry in the third Degree, Aperitive, Absterfive, Carminative, Digestive, Diuretick, Incisive, Neurotick, Stomatick, Hepatick, Nephritick, Hysterick, Alexipharmick, and Spermatogenetick.

X. *The Specification.* It powerfully provokes the Terms in Women, and Urine, breaks and expells the Stone in the Reins and Bladder, gives ease in the Strangury, facilitates the Birth, and expells the dead Child and After-birth.

XI. *The Preparations.* You may make thereof, 1. *A Liquid Juice.* 2. *An Essence.* 3. *A Decoction.* 4. *A Syrup.* 5. *A Pouder of the Seed.* 6. *A Cataplasm of Herb and Root.* 7. *A Distilled Water.* 8. *A Spirituous Tincture.* 9. *An Acid Tincture.* 10. *An Oily Tincture.* 11. *A Spirit.* 12. *A Fixt Salt.*

The Virtues.

XII. *The Juice of the Herb and Root.* It powerfully opens obstructions of the Viscera, especially of the Stomach, Lungs, Liver, Mesentery and Reins: it is good against the Scurvy in a cold habit of Body, provokes Urine and the Courses very powerfully, gives ease in the Strangury, breaks gritty Stones whether in the Reins or Bladder, and expels Sand, Gravel, and other Tartarous Matters from those parts. It facilitates the Birth in a Woman in Labor, and brings away the After-birth. Dose 3, 4, 5, or 6 Spoonfuls in a Glass of warm White *Port* Wine, or other proper Vehicle.

XIII. *The Essence of Herb or Root.* It has all the Virtues of the *Liquid Juice*, and is more powerful to all the Intentions. It resists Poison, and the Bitings of Serpents, or other Venomous Creatures being inwardly given. It is a singular good thing against the *Dropsie Sarcites*, carrying off the Morbifick Matter by Urine: It prevails also against the Jaundice, and carrys off the recrements of the Juices and Blood which breed the Gout. Dose 2 or 3 Spoonfuls Morning and Night, in a Glass of Wine, or Wine and Water, or in the *Distilled Water of the Plant*, or in *Parsly Water*.

XIV. *The Decoction of Herb or Root, or Umbels of Flowers.* It may be made in Water or Wine, and given from 3 to 6 Ounces. Morning and Night. It has all the Virtues of the *Juice* and *Essence*, but operates not so strongly as they, for which reason it is given in larger quantities: it warms, comforts, and rectifies the Stomach, causes a good Appetite and Digestion, and prevails against Vapors and Fits of the Mother.

XV. *The Syrup.* It is Pectoral, good against Coughs, Colds, Wheezings, Hoarseness, obstructions of the Lungs, Asthma's, and other like Distempers, proceeding from a Viscid Mucilage: It is Diuretick, and gives ease in the Strangury.

XVI. *The Pouder of the Seed.* It is Diuretick, Nephritick, Lithontriptick, and an excellent thing against most disaffections of the Reins and Bladder, proceeding from Obstructions, or Tartarous Concretions: it carries off the Jaundice and Dropsie by its Diuretick property: it expels Wind powerfully, and gives present ease in the Colick: and has all the Virtues of the *Juice* and *Essence* aforegoing. Dose from half a Dram to a Dram, or Dram and half, in the *Syrup* aforegoing, or in Wine dulcified with the *Syrup*.

XVII. *The Cataplasm of Herb and Root.* If it is immediately applyed to the Biting of a Mad Dog, Viper, Rattle-Snake, or other Serpent or Venomous Creature, it attracts or Draws forth the Poison, and secures the Patient against the danger thereof. It discusses simple Contusions: and being applyed gives ease in the Gout.

XVIII. *The Distilled Water from the whole Plant.* It has all the Virtues of the *Juice*, *Essence*, and *Seed*: but as it is much weaker in its effects and operation, so it is given in much greater quantities, as to 6 or 8 Ounces, mixed with a little White *Port* Wine. It is used also as a Vehicle to convey, several of the other Preparations in.

XIX. *The Spirituous Tincture.* It warms and comforts a cold and weak Stomach, expels Wind, is good against sickness at Heart, Fainting and Swooning away: prevails against the Colick, weakness of the Intestines, and Flux of the Bowels; and given in a proper Vehicle powerfully provokes Urine. Dose from two to four Drams.

XX. *The Acid Tincture.* It is an Antidote against the Plague, Spotted Fever, and all sorts of Pestilential and Malign Fevers. It takes off the Febritick heat momentarily, destroys the putrid and corruptive Ferment: and if timely taken, secures the Life of the Patient against future danger. It strengthens and fortifies the Stomach, strengthens the Digestion, and causes a good Appetite. Dose so many Drops at a time, as to make the Vehicle gratefully Acid.

XXI. *The Oily Tincture.* It is a present remedy against the Strangury, Stone, Gravel, and all manner of Tartarous Matters obstructing the Reins, Ureters, and Bladder. It gives present ease in the Colick, eases pains in the *Vertebræ* of the Back, and strengthens it, being inwardly taken in any proper Vehicle, from 15 to 30, 40, 50, or 60 Drops, and also outwardly anointed upon the part. It is profitable also against the Palsie being outwardly and inwardly used. It provokes

the Terms, and haſtens and facilitates the Birth, and forces away the After-Birth.

XXII. *The Spirit.* It is Cordial, good againſt ſickneſs at Heart, Fainting and Swooning Fits, and other Diſtempers of the Heart and Stomach. It expels Wind, chears the Spirits, repreſſes Melancholy, and cauſes a kind of Elevation of Soul. Doſe a Dram, two, or three, now and then in a Glaſs of Wine.

XXIII. *The Fixed Salt.* It is highly Diuretick, Nephritick and Hyſterick: and is a Specifick againſt the Stone, Sand, Gravel and Viſcous Slime in the Reins, Ureters and Bladder. It gives preſent eaſe in the Strangury, prevails againſt Vapors and Hyſterick Fits, and cleanſes the Womb of cold, vicid, and putrid Humors which may offend it. Doſe from 8 Grains to a Scruple, in *Parſly* or *Hydropiper Water*, *Onion Water*, White *Port* Wine, or any other fit Vehicle.

CHAP. DXLVII.

Of PATIENCE Garden.

OR,

Monks RHUBARB.

I. *THE Names.* It is called in *Greek*, Ἱππολάπαθον; ϗ λάπαθον κηπαῖον: in *Latine*, *Hippolapathum*, *Lapathum Hortenſe*, *Patientia Hortenſis*, *Rhabarbarum Hortenſium*, *Rhabarbarum Monachorum*: and in *Engliſh*, *Garden Patience*; *Garden Dock*, *Horſe Dock*, and *Monks Rhubarb.*

II. *The Kinds.* Of the *Hippolapathum* or *Horſe Dock*, there are two ſpecial Sorts, *viz.* 1. *Hippolapathum* ϗ λάπαθον ἥμερον, *Patientia Hortenſis*; *Lapathum Sativum*, *Rhabarbarum Monachorum*, Garden Patience, *or* Monks Rhubarb. 2. *Hippolapathum nothum*, *Hippolapathum rotundifolium*, *Lapathum Rotundifolium*; *Lapathum Sativum rotundifolium Cluſij & Camerarij*; *Pſeudo Rha recentitiorum Lobelij*; *Rhabarbaricum Cordi in Hiſtoria Plantarum*, Lib. 4. Fol. 201. Baſtard Rubarb, Garden round Leav'd Horſe Dock, or Great round Leav'd Garden Dock.

The Deſcriptions.

III. *The firſt, or* Garden Patience, *or* Monks Rhubarb. *It has a very long great Root, brown without and yellow within, much like to thoſe of the* Common Wild or Water Docks, *but a little redder; but when Dry, in color and taſte like to the true* Rhubarb; *having alſo a leſs ſtore of diſcolored Veins, than the next following when that is dry. It grows up with very large ſtrong tall Stalks, chamfered or furrowed (and riſes up to be about* 8 *or* 9 *Feet high, as* Gerard *ſays, when it grows in good and fertil ground;) ſet about with great, large or broad and long* Leaves (*not much unlike to thoſe of the* Great Water Dock,) *of a fair green color, and not dented at all about the edges. The Stalks towards their tops, ſpread themſelves out into ſeveral ſmall Branches, which towards their tops bear reddiſh or purpliſh Flowers, or Flowers of a light purple color, declining to brownneſs. Which being paſt away, the Seed follows, contained in thin chaffy Husks, and of a triangular Form, like to the Seed of our* Common Docks. *This* Patience *or* Garden Horſe Dock, *has obtained the Name of* Rhubarb, *for ſome ſmall purging faculty which it has, much like to that of the* True Rhubarb.

Patience Garden, or *Monks-Rhubarb.*

IV. *The ſecond, or* Baſtard Rhubarb, *or* Garden round Leav'd Horſe Dock. *Its Root is exceeding great and thick, very like unto the* Rha Barbaricum, *as well in color and taſte as proportion, and Purges after the ſame manner, if given in a greater Doſe or quantity: it grows much greater than that of the* Patience *before deſcribed, with many great Branches and Fibres adjoining to it: it is indeed yellow on the out-ſide, and ſomewhat of a paleiſh yellow within, with ſome Store of diſcolored Veins therein, like to the* True Rhubarb, *but much leſs, eſpecially when it is dry, which then looſes its freſh color, which the* True Rhubarb *conſtantly retains. This* Baſtard Rhubarb *riſes up with ſeveral large, great, broad, round, thin, and yellowiſh green Leaves, in ſhape like to thoſe of the* Garden Bur-Dock, *a little waved about the edges; they riſe up from the Root, every one ſtanding on a reaſonable thick and long browniſh foot Stalk. From among theſe Leaves, riſes up a pretty large Stalk, much like the former, about two Feet or more high, having ſome ſuch like Leaves as before deſcribed thereon, but ſmaller. Towards the top, the Stalk ſpreads it ſelf out into ſeveral Branches, ſome greater and ſome leſſer, towards the tops of which grow long ſpiked Heads full of ſmall browniſh Flowers; after which follows in thin chaffy Husks the Seed, which is ſhining and triangular like to the* Common Docks, *or of the* Garden Patience *before deſcribed.*

V. The

V. *The Places.* The firſt grows naturally about *Lauſanne* in *Savoy*, as *Tragus* ſays. The ſecond grows naturally upon the Hills not far from *Cana* in *Germany*, as alſo near *Fribarg* in *Switzerland*, and on the Mountains in *Auſtria*: But with us they both grow only in *Gardens*, where they thrive and flouriſh very well.

VI. *The Times.* Theſe Plants when Nurſt up in our *Gardens*, Flower about the beginning or middle of *June*, (much about the time when our *Common Docks* Flower) and their Seed is ripe in *July*. The Roots are not to be taken up, till the Leaves and Stalks are quite withered and gone, which is about the middle or end of *October*: for if they be taken up, either a little before the Leaves do ſpring, or a while after they are ſprung up, the Roots will not retain half ſo good a color in them: It is alſo to be noted, that when they are taken up, they are to be ſcraped very clean, and carefully dryed, ſo as they may not touch one another till they are perfectly dry.

VII. *The Qualities.* Both theſe in reſpect to heat or cold, are ſaid to be Temperate: Authors will have them to be moiſt, with a kind of clamminess: this poſſibly the Leaves may be, whileſt they are young: but the dryed Roots are doubtleſs dry in the firſt Degree. They are Aperitive, Abſterſive and Aſtringent, tho' they have a Cathartick or Laxative force in looſening the Belly, for they certainly Bind after Purging.

VIII. *The Specification.* The Roots and Seeds of both Kinds are prevalent againſt a Bloody Flux, as alſo againſt all other Fluxes of the Bowels; Vomiting and Sickneſs of the Stomach, bitings of Serpents or other Venomous Creatures; the Dropſy, Jaundice, and all manner of Scabs, Leproſy, and breakings out. The Roots of both Purge as the *True Rhubarb* does, ſaving (that they may have the ſame effects,) the Doſe muſt be augmented to treble the quantity. They are alſo ſaid to be abſolute in the Cure of Agues.

IX. *The Preparations.* 1. *A Sallet of the young and tender Leaves.* 2. *A Liquid Juice of the Leaves.* 3. *A Decoction or Infuſion of the Roots.* 4. *A Diet Drink.* 5. *A Pouder of the Roots.* 6. *A Pouder of the Roots compound.* 7. *A Pouder of the Seed.* 8. *A Diſtilled Water.*

The Virtues.

X. *The Sallet of the young and tender Leaves. Being boiled, and eaten with Butter, Vinegar, Salt and Pepper, as you eat* Beets *or* Spinach, (tho' it is not altogether ſo pleaſant) they nouriſh but little, but make a thin Blood, looſen the Belly, and Purge away ſlimy Humors.

XI. *The Liquid Juice of the Leaves.* Given to 2, 3, or 4 Spoonfuls, more or leſs (according to Age and Strength) it is a certain Cure for an Ague, being given in Glaſs of warm Ale, clarified Whey, or the like. One *John Benet* a Chirurgion of *Maidſtone* in *Kent*, cured a Lad of an Ague therewith, which did grievouſly vex him: He took 3 or 4 Leaves (as *Gerard* ſays) of this Plant of *Rubarb*, beat it, and ſtrained out the *Juice* with a draught of Ale, and gave it the Lad in the Morning to Drink: it wrought extreamly both upwards and downwards, within one Hour after, and never ceaſed untill Night: in the end, the Purging faculty of the Medicine abated and gave over working, and the Youth loſt his Ague. Since which time (ſays he) he has cured with the ſame Medicine, many others of the like Diſeaſe, having always a regard to the quantity, which was the cauſe of the Violent working in the firſt Cure. I have ſometimes alſo ſeen that the *Liquid Juice of the green or freſh Roots* being given in like manner, has alſo cured Agues, as well as the *Juice of the Leaves. The Juice of the Leaves or Roots, mixed with a little Vinegar*, is uſed as a moſt effectual Remedy for the Cure of Scabs and running Sores.

XII. *The Decoction or Infuſion of the Roots. The Roots ſliced and boiled in Water of Carduus Benedictus to the conſumption of a third part, and then ſweetned with a little Honey:* Being given to the quantity of 8 or 9 Spoonfuls at a time, before the coming of the Fit of an Ague, generally cures it at 2 or 3 times ſo taking it; ſuch as are of a robuſt or ſtrong Body, may take 12 Spoonfuls of it at a time. The truth of this has been proved by many Experiments, (as *Gerard* ſays.) *The ſimple Decoction of the Roots of Patience or Monks Rubarb* looſens the Belly, Purges gently, helps againſt the Jaundice and Dropſie, and other like Diſeaſes proceeding from a cold cauſe; is good againſt the Stinging of Serpents, helps the Sickneſs of the Stomach ariſing from Choler, and cures the Bloody Flux, as alſo other Fluxes of the Bowels: and being taken with *Acacia*, or *Juice of Sloes*, it is ſaid to cure the ſpitting of Blood. *The Decoction of the Roots in Vinegar*, is effectual to heal inveterate Scabs, and old running Sores. *The Decoction of the Roots of Baſtard Rhubarb in Vinegar* has the ſame Virtues; and being dropt into the Ears it eaſes their pain: gargled in the Mouth it cures Sores and Ulcers therein, and eaſes the Tooth-ach: and being Drank, or taken inwardly it prevails againſt the Jaundice, Dropſie, Gout, Rhumatiſm, Kings-Evil, Stone, Gravel, Sand, Strangury, *&c.* it opens and purges the Liver, Spleen, Reins and Belly, and cleanſes and cools the Blood. But for the general uſe in curing all theſe Diſtempers the *Decoction or Infuſion may be made in Water, or Clarified Whey*; and if the Patient like of it, it may be a little ſweetned with *Syrup of Violets*, or *Syrup of Roſes Solutive.*

XIII. *The Diet Drink. Take Roots of Monks Rhubarb ſliced, and Roots of red Madder, of each 8 Ounces: Sena 4 Ounces: Aniſeed bruiſed, Liquorice bruiſed, of each 2 Ounces: Agrimony, Scabions, of each one Handful, which cut a little with a Knife, put them into an Earthen Steen, or a ſmall Wooden Cask, which may hold 4 Gallons or better: affuſe thereon 4 Gallons of Strong new Ale; which let ſtand for 3 Days.* At the end of that time the Patient may drink of it, as ordinary Drink for 3 Weeks or a Month together, (and the longer it is continued the better) providing another like Cask of the ſame, to have in readineſs, one under another. It is ſaid to Cure the Dropſy, Jaundice, Gout, Rhumatiſm, Spleen, Rickets in Children, Kings-Evil, and all manner of Itch, Manginess, Scabs, Puſtules, and other Breakings out in the whole Body: it purifies or cleanſes the Blood from all Corruption, prevails againſt the Green-Sickneſs, and admirably opens all manner of obſtructions of the Stomach, Lungs, Liver, Spleen, Meſentery, Reins and Womb, provoking the Terms when ſtopt, after a ſingular manner.

XIV. *The Pouder of the Roots. A Dram and half or 2 Drams of the Pouder of Monks Rhubarb mixt with Ginger in Pouder a Scruple*, and taken faſting in a Diſh of warm Broth or Poſſet Drink, Purges Choler and Flegm very gently and ſafely without any the leaſt danger. *The Pouder of the Root of the Baſtard Rhubarb* does the ſame thing, but is more

more effectual, both for inward and outward Diſeaſes. It is good againſt a Quinſy, Baſtard Quinſy, ſcrophulous or ſtrumous Tumors in the Neck and other parts, comonly called the Kings-Evil, as alſo Swellings and Kernels behind the Ears: It gives eaſe in the Strangury, helps ſuch as are troubled with the Stone, Sand and Gravel, provokes Urine, and is good for ſuch as are troubled with dimneſs of Sight.

XV. *The Pouder of the Roots Compound. Take Roots of Monks or Baſtard Rhubarb in fine Pouder 2 Drams: Reſinous Jallap in fine Pouder 2 Scruples: beſt Scammony in ſubtil Pouder a Scruple: Cloves in Pouder 1 Dram: mix them for 4 Doſes for a Man or Woman.* It cures the Scurvy, Dropſy, Gout, Rhumatiſm, Jaundice, Kings-Evil, Pally, Scabs, Itch, and all ſorts of Puſtules and other breakings out whatſoever; It prevails againſt Agues, Purges off Choler, Flegm, and watery Humors, cleanſes throughly the Stomach, and Bowels, and opens all obſtructions of the Liver, Spleen, Meſentery, Reins and Womb.

XVI. *The Pouder of the Seed.* That made of the Seed of *Patience*, cools, aſtringes or binds, and is of extraordinary uſe in ſtopping Fluxes of the Bowels, and in ſpitting of Blood. The Seed of the *Baſtard Rhubarb*, is alſo manifeſtly aſtringent, and is ſaid to cure the Bloody Flux, given in a Glaſs of Red Styptick Wine. It eaſes the gnawing griping pains of the Stomach; and takes away Nauſeouſneſs, and loathing of Food: The *Pouder* of either of them may be given every Morning Faſting, and at Night at Bed time, from a Dram to two Drams, in a Glaſs of Red *Port*, or *Barcelona* Wine.

XVII. *The Diſtilled Water.* Drawn from either of the Plants, it is good to cool and allay Inflamations, cleanſes the Face and Skin from external Defœdations or Defilements, and is very profitable to heal running Sores, foul Ulcers, and Scabbineſs in what part of the Body ſoever.

XVIII. *Nota.* Tho' *Monks Rhubarb* is of the Nature of the *True Rhubarb*, yet the *Baſtard Rhubarb* approaches the neareſt thereto; and is much the ſtrongeſt and beſt of theſe two; it has not only the ſhape and proportion of the *True Rhubarb*, but the ſame color both within and without, with very little difference: they agree alſo as well in Taſte and Smell; and it colors the Spittle of a yellow color, when it is chewed in the Mouth, as *Rhubarb* does; and it Purges the Belly after the ſame gentle manner as the *right Rhubarb does*; only herein it differs, that this muſt be given in at leaſt the double quantity to that.

CHAP. DXLVIII.

Of PEASE Manured.

I. *The Names.* It is called in *Greek*, Πίσον, ϗ Πίσον τῆς γεωργίας: in *Latine*, *Piſum*, & *Piſum Cultatum*: in *Engliſh Peaſe*, and *Manured Peaſe.*

II. *The Kinds.* Of Peaſe there are ſeveral ſorts, as, 1. *Piſum Cultatum*, *Piſum Hortenſe*, Manured Peaſe, of which in this Chapter. 2. *Piſum, vel Cicer, vel Lathyrus Annuus*, Annual Chich-Peaſe, or Chichings, of which we have ſpoken in *Chap.* 126, aforegoing. 3. Πίσον μικρὸν, *Piſum agreſte*, *Piſum Sylveſtre*, Wild Peaſe of which in *Chap.* 549. 4. *Cicer Sativum & Sylveſtre*, Chich Peaſe Garden and Wild, of which in *Chap.* 550. 5. *Cicercula, Lathyrus, Piſum Perenne*, Peaſe Everlaſting, of which in *Chap.* 551. following.

III. *The Kinds of the Manured Peaſe.* There are many ſorts of the Manured Peaſe, as, 1. *The Early Peaſe, or Fulham Peaſe.* 2. *The Green Haſting.* 3. *The White Haſting.* 4. *The Sugar Peaſe.* 5. *The Rouncival.* 6. *The Gray Peaſe.* 7. *The Spotted Peaſe.* 8. *Peaſe without Skins.* 9. *Tufted, or Scotch Peaſe.* 10. *Piſum rubrum, Piſum quadratum, Lotus Siliquoſus Flore rubella, Lotus tetragonolobus*, Square Codded Peaſe. 11. *Piſum cordatum*, Heart Peaſe. Of theſe Species, becauſe of their great likeneſs one to another in their Stalks, Leaves, Flowers, and manner of growing, we ſhall give you but one Deſcription, ſaving the tenth and eleventh Kinds, which ſhall be particularly ſpoken to.

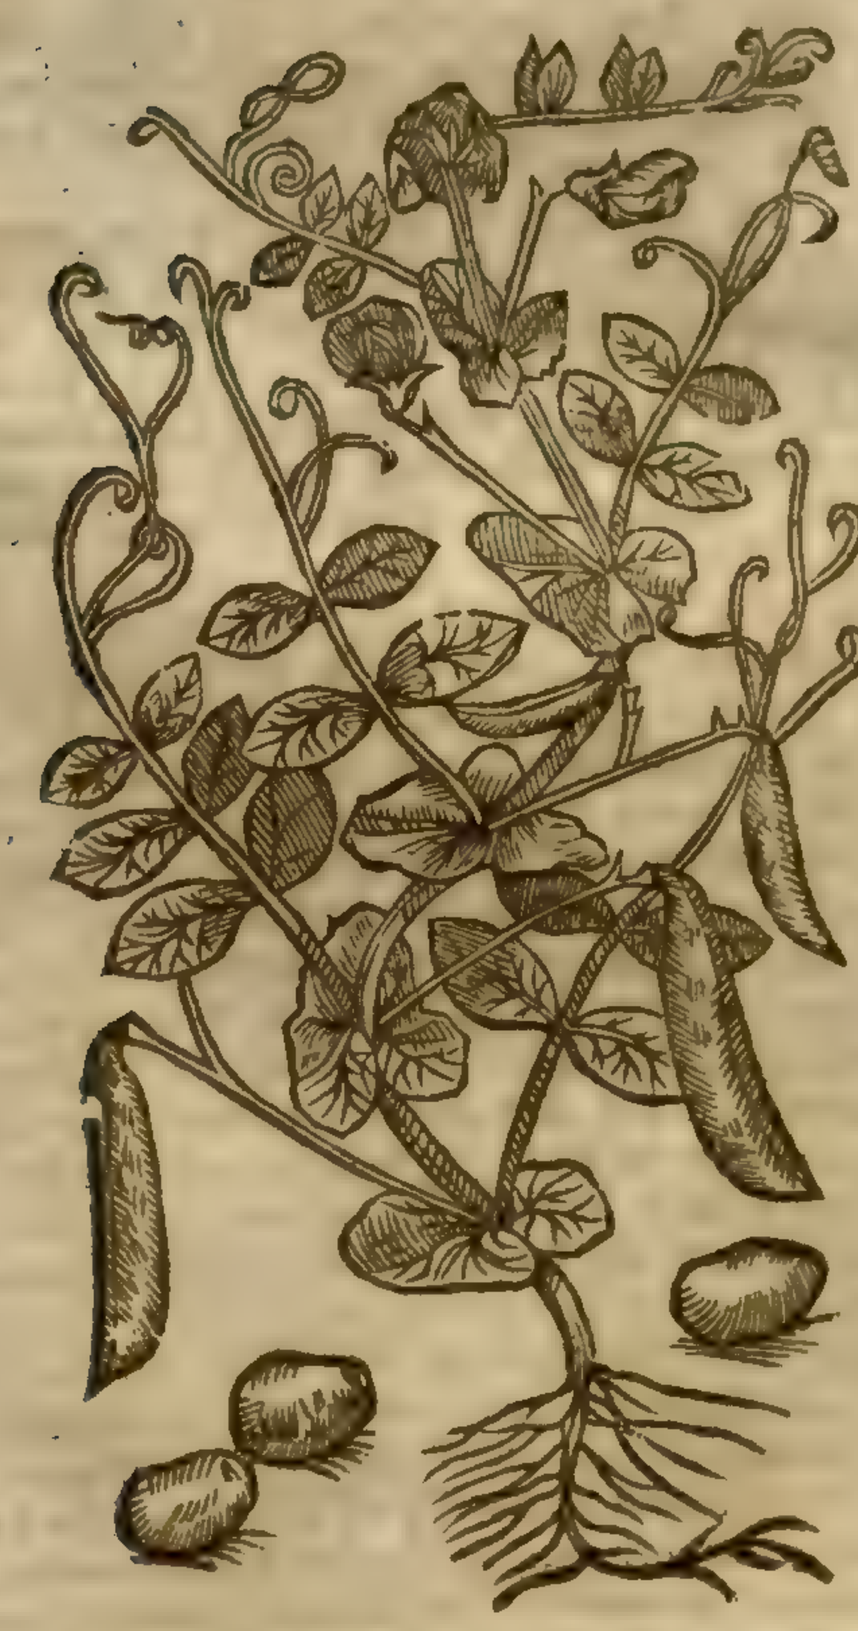
The General Deſcription.

IV. *The Roots of all the ſorts of* Manured Peaſe *are ſmall and Fibrous, and quickly periſh after Seed-time.* Garden Peaſe *are for the moſt part the greateſt, and the ſweeteſt Kinds, and are ſuſtained with Stakes or Buſhes.* The Field Peaſe, *are not ſo managed, becauſe of the almoſt infinite Labor, beſides Charge, and therefore grow as they naturally pleaſe, without any ſuch trouble.* They *(all of them) ſpring up with long weak, hollow, and brittle (while they are young and green) whitiſh green Stalks, branched out into many parts, and at every Joint where it ſpreads out a Branch, there is one round broad Leaf, encompaſſing the Stalk about, ſo that they come as it were through it.* The Leaves *are Winged, made of ſeveral ſmall Leaves, growing from a middle Rib, of a whitiſh green color, with Tendrels or Claſpers at the end of the Leaves, by which it takes hold of whatſoever ſtands next to it. Between the Leaves and the Stalks, come forth the Flowers, ſtanding two or three together, every one by it ſelf, on its own ſeveral foot Stalk, which are either wholly white or purple, or mixt white and purple, or purple and blew:* The Cods *are long, and ſomewhat round or full and bunching out, of which ſome are greater, ſome leſſer, ſome thick and ſhort, ſome plain and ſmooth, others a little crooked at the ends, in which are contained ſeveral forms of* Peaſe *in*

Number

Peaſe Garden Early.

Peaſe Rouncivals.



Peaſe Field.

Number from one to nine inclusive (I never ſaw ten:) of which ſome are round, others almoſt cubical; ſome ſmall, ſome great: ſome white, ſome green, ſome gray, others ſpotted, &c.

V. The *tenth*, *or* Square Codded Peaſe. *Its Root is ſmall and Fibrous like the former, and periſhes every Year. It is a pretty Kind of Paſſe, and might for the form of the Leaves be very well referred to the Kinds of* Lotus *or* Trefoils. *It has three or four ſmall weak Stalks, which ſpread themſelves out into many Branches, having two Stalks of Leaves at every Joint, and three ſmall ſoft Leaves ſtanding on a very ſmall Foot Stalk, coming from the Joints. The Flowers grow for the moſt part two together, of a perfect red or crimſon color; like in form almoſt, to the* Common Garden Peaſe Bloſſom: *after which come long, thick, and round Cods, with two Skins or Films, running all along the Cod, at the Back or upper ſide; and two other ſuch like* Films, *all along the Belly or underſide of the Cod; which makes it ſeem to be four ſquare: in which is contained, round diſcolored* Peaſe, *ſomething ſmaller, and harder than the ordinary* Peaſe.

VI. The *eleventh*, *or* Heart Peaſe, *which ſome call alſo,* Piſum Veſicarium, Bladder Peaſe. *Cor Indum, and Cor Indicum (becauſe they firſt came from the* Indies.) *It has a Root which is very ſmall, Buſhy and Stringy, with many Fibres adjoining to it, and periſhing every Year at the firſt approach of* Winter. *It riſes up and ſpreads much, if it has a good Soil to grow in, having ſeveral ſlender weak Stalks, which will lye down upon the Ground, and entagle it ſelf with the Claſpers which it has, unleſs it be ſuſtained with Stakes, Buſhes, or ſome ſuch like thing. Theſe Stalks ſend forth large,*

Peaſe Heart.

large, long, thin, and very green Leaves on all ſides, upon long foot Stalks, being divided either into three or five parts, each of which is much rent or cut in on the edges. At the Joints with the Leaves from the middle of the Stalks almoſt upwards, and at their tops alſo, come forth ſeveral ſmall whitiſh Flowers, ſet together upon a foot Stalk, each conſiſting of five ſmall Leaves apiece, which being paſt away, ſmall Bladders ſucceed in their places, in which are contained the Grains or Peaſe: *theſe Bladders grow whitiſh as they ripen, having Six Ridges, of which three are the more eminent, and open into three parts, in each whereof lies one round, hard, blackiſh Seed, of the bigneſs of a great* Pea, *ſpotted on the out ſide with a mark, much of the form of a Heart, as it is painted on Cards, whence came the Name.*

VII. *The Places.* All theſe ſeveral ſorts of *Peaſe* grow with us only in *Gardens*, and the worſer ſort of them in *Manured Fields*, for the profit of the Huſband-Man. The tenth is only Sown in *Gardens:* and ſo alſo the eleventh, being firſt brought to us out of *Italy* and other places, being originally (as is ſuppoſed) a Plant of *Indian* growth.

VIII. *The Times.* They are all Sown in the *Spring:* The firſt ten Kinds Flower in *June*, *July*, and *Auguſt*, and the Grain, or *Peaſe* ripen in the mean Seaſon. The eleventh Flowers in *Auguſt* or *September* and the Grain or *Peaſe* is ripe in *September* or *October.*

IX. *The Qualities.* We ſpeak now of the firſt nine or ten Kinds of *Peaſe:* they are hot and moiſt in the firſt Degree, Aperitive, Abſterſive, and Diuretick; Stomatick, Nephritick, and Arthritick; Chylifick, Analeptick and Spermatogenetick.

X. *The Specification.* They are peculiar againſt the Strangury, or ſtoppage of Urine, Sand, Gravel, Stones and Tartarous Mucilage or Slime in the Reins, Ureters, and Bladder: Breed good Chyle, nouriſh much, and reſtore in Conſumptions.

XI. *Hippocrates* ſays, That *Peaſe* are leſs windy than *Beans*, and paſs ſooner thro' the Belly. And *Galen* ſays, That *Peaſe* in their whole ſubſtance are like unto *Beans*, and are eaten after the ſame manner, but that they differ in two things, *viz.* That they are not ſo windy as *Beans*, nor altogether of ſo cleanſing a faculty; and that they are in a mean between thoſe things which nouriſh much, and nouriſh little; and which are windy, and not windy.

XII. *The Preparations.* 1. *An Eſſence of the Leaves and green Cods.* 2. *A Meal or Flower of the dryed* Peaſe. 3. *A Decoction of* Peaſe. 4. *A ſtrong Broth or Pottage.* 5. *A Cataplaſm of* Peaſe *Meal.* 6. *The Aſhes of* Peaſe *Straw and Cods.* 7. *A Diſtilled Water from* Peaſe *Bloſſoms, or from the whole Plant.* 8. *A Volatile Spirit, Oil and Salt. Diſtilled by Retort from dryed* Peaſe.

The Virtues.

XIII. *The Eſſence of the Leaves and green Cods.* It is highly Aperitive, Abſterſive and Diuretick, opens Obſtructions of the Reins, Ureters and Bladder, breaks Gritty Stones, and expels from the Reins and Bladder, Stones, Gravel, Sand, and Slimy Humors in great quantities. Doſe 2, 3, or 4 Spoonfuls or more in a Glaſs of White *Port* or *Lisbon* Wine.

XIV. *The Meal or Flower of* Peaſe. Made into a Pudding with Milk and Eggs, tho' it is Abſterſive and Diuretick, yet it nouriſhes very much, and being much or long eaten, it reſtores in Conſumptions, the Patients Drink being every Day new Milk. *Bread* made thereof, or *Cakes*, and eaten while they are new, are alſo reſtorative; they very much ſtrengthen the whole Body, provoke Luſt and encreaſe Seed.

XV. *The Decoction of the* Peaſe *either green alone, or with the Cods, or dryed.* It is a famous thing againſt the Strangury and all ſtoppages of Urine, Stone Gravel, Sand, Slimy Matter, *&c.* It opens all obſtructions of the Urinary parts, expels the obſtructing matter, and eaſes the Pain. Doſe 6 or 8 Ounces ſweetned with Honey.

XVI. *The ſtrong Broth or Pottage.* It is of great nouriſhment; and if it is made good and ſtrong with Knuckles of Veal, and Legs of Pork, and ſtrained from the Hulls of the *Peaſe*, and then be eaten as daily Food, it wonderfully reſtores in Conſumptions, Cheriſhes Languiſhing Nature, increaſes Seed, and provokes Luſt extreamly. It ſtrengthens the Bowels, and ſtops all ſorts of Lasks or Fluxes: and has ſuch a Power in it as to cure Impotency in the Male Kind, whether it be from a weakneſs in the Inſtruments of Generation, or from a defect of Seed. It may be made pleaſant and ſavory with a little Pepper and Salt, *Juice* of an *Orange* or *Limon*, and a little Sweet Butter.

XVII. *The Cataplaſm of the Meal. If it is made with Vinegar, with a little Oil*, it repreſſes and Diſcuſſes Tumors in Womens Breaſts, proceeding from too great a quantity of Milk, or from its Curdling therein: applyed to the Teſticles which are Swoln, it diſcuſſes the Tumor, and eaſes the pain. *If it is made with Wine and Yolks of Eggs*, and applyed to weak Joints it ſtrengthens them:

applyed

applied also to swoln and watering Eyes it helps them. *If it is made with Wine, Yolks and Whites of Eggs, Double refined Sugar, and Beef Suet: and then Fryed in a Frying-Pan, and so eaten with a little White Sugar and Juice of Oranges*, It good to restore such as are Impotent, encrease Seed, and provoke Lust.

XVIII. *The Ashes of the Straw and Cods.* Being Infused in Ale, Beer, or Wine, the *Infusion* is very Aperitive, and Diuretick; it opens all Obstructions of the Reins and Bladder, is good against Sand, Gravel, Stone and Strangury, and prevails against the Scurvy, Dropsy, Jaundice and Gout. *The Ashes made into a Cataplasm with Hogs Lard*, and applyed, is good against old Aches or Pains, Sciatica and Gout, whether in the Hands, Arms, Knees, or Feet.

XIX. *The Distilled Water from the Blossoms or whole Plant.* It is a Cosmetick, or a beautifier of the Face and Skin: it cools, softens, whitens, and makes smooth the Skin, the Face or Skin being often washt with it, and suffered to dry on. It is also good against Stone, Gravel, Sand and Slime in the Reins and Bladder, and gives ease in the Strangury. Dose 4, 6, or 8 Ounces, sweetned with the *Syrup of Violets*, *Honey*, or the like.

XX. *The Volatile Spirit, Oil, and Salt.* They are made exactly in all respects as those of *Beans*, in *Chap.* 55. *Sect.* 16. aforegoing of this Book. *The Volatile Salt of Pease*, is one of the most Subtil and Volatile Salts, being of the same use with all other Volatile Salts. It prevails against all Diseases of the Head, Brain, Nerves, Spleen, Reins, Womb, and Joints: as Apoplexies, Epilepsies, Vertigo's, Megrims, Head-Aches, Lethargy, Carus, Colds, Vapors, Hysterick Fits, Colicks, Gouts, Rheumatisms, *&c.* and kills Worms in the Stomach and Belly. Dose is from 7 Grains, to 14, in Wine, or any other proper Vehicle, Morning and Night. *The Spirit* has all the same Virtues and may be given from 10 Drops to 30 in Wine, Water, *&c.* *The Oil* is stronger: It ought to be rectified after the usual manner, and is chiefly for outward Applications: you may mix it with *Oil of Ben*, or of *Bitter Almonds*, and anoint the Stomach and Navel for Vapors and Fits of the Mother.

The Virtues of the Heart Pease.

XXI. *Cordus* on *Dioscorides* says, These *Pease* are a great provoker to Sleep, even to the Danger of Life, if the quantity given be too large: he says, That he tryed this upon himself, and found it to be dangerous in provoking Sleep, if taken in too great a Dose; but he also says, it causes a pleasanter and sweeter Sleep than *Opium* does. *Dodonæus* says, that this Plant is the *Abrong*, or *Abrugi* of *Serapio*, in his *Chap.* 153. where he has these Words, *Abrong is a small Grain, spotted with black and white, like unto the Grain Maiz.* It has the form of a Heart upon it in white; and therefore *Tabernæmontanus* calls it *Cardiospermon.* It is also said to be available against Faintings, and other Diseases of the Heart, and this is probable enough to be true, for if it has the properties of *Opium* in it, to cause pleasant and sweet Sleep, as *Cordus* says, it may well have those effects also, as to comfort and chear the Heart, and resist Fainting and Swooning Fits, and other like disaffections of that noble Part. I find not what Dose is given of it, That the industrious Artist is to find out by many Tryals, beginning with a small quantity first, and so increasing it gradually, till he finds how much will sufficiently do, and may be safely exhibited.

CHAP. DXLIX.

Of PEASE Wild.

I. *THE Names.* It is called in *Greek*, Πίσον ἄγριον, & Πίσον ὄρειον: in *Latine*; *Pisum agreste & Pisum Sylvestre*: in *English Wild Pease.*

II. *The Kinds.* Authors have given us several sorts hereof, those which we shall take notice of in this Work, are only these following, *viz.* 1. *Pisum Sylvestre commune, Pisum Sylvestre primum*, The first, or Common Wild Pease. 2. *Pisum Sylvestre alterum*, The second, or other Wild Pease. 3. Ὄχρος, *Ochrus Theophrasti* in his *de causis Plantarum*, *Lib.* 4. *Chap.* 2. *Ervilia Plinij*, in *Lib.* 18. *Chap.* 7. which is now its usual Name: *Aracus niger Matthioli* (which is erronious) *Ervilia Sylvestris Dodonæi, Ochrus Sylvestris, sive Ervilia Lobelij; Cicer ervinum Lugdunensis, Orobas Parkinsoni, Ervilia Flore & Fructu albo, Lobelij*, White winged Wild Pease. 4. *Ervilia altera*, Blackish winged Wild Pease. 5. *Pisum Spontaneum Maritimum Anglicum*, English Wild Sea Pease. 6. *Pisum aliud Maritimum Britannicum*, The other English Sea Pease, or Suffolk Pease. 7. *Pisum Sylvestre nigrum maculatum Bæticum*, Spanish black spotted Wild Pease.

The Descriptions.

III. *The first, or* Common Wild Pease. *It has a Root which is as thick as ones Finger, and long, with many Fibres adjoining. This Plant does little differ from the* Manured, *either in its rambling corner'd Stalks, or in its broad, stiff, green Leaves, two always being set at a Joint, and six or more lesser ones, on the Branches, which end in a Clasper. The Flowers are white, many standing on a foot Stalk together, which turn into so many Cods, each of them much smaller than the* Manured, *and the Seed, Grain, or Pulse within, much less also, and of no Pleasant Taste.*

IV. *The second, or other* Wild Pease. *Its Root abides many Years, and is much like the first; but the Branches of this are scarcely half a Foot long, with broder, and shorter Leaves on them, yet like the former but more pale. The Cods and Pease likewise differ not much in form, but are much less.*

V. *The third, or* White winged Wild Pease. *Its Root is small and long, with some Fibres adjoining, which wholly perishes every Year. This*

kind of Peaſe *has two or three Stalks at the moſt, which are broad and flat, welted or winged at the ſides, with ſomewhat long Leaves ſhooting from them, ſmall at the ſetting on to the Stalk, and broader towards the end, as it were growing from the middle Rib of the other, at the top of which comes forth two or three twining Claſpers. This Plant never ſhoots forth any Branches, but the Leaves from almoſt the bottom of the Stalks upwards*

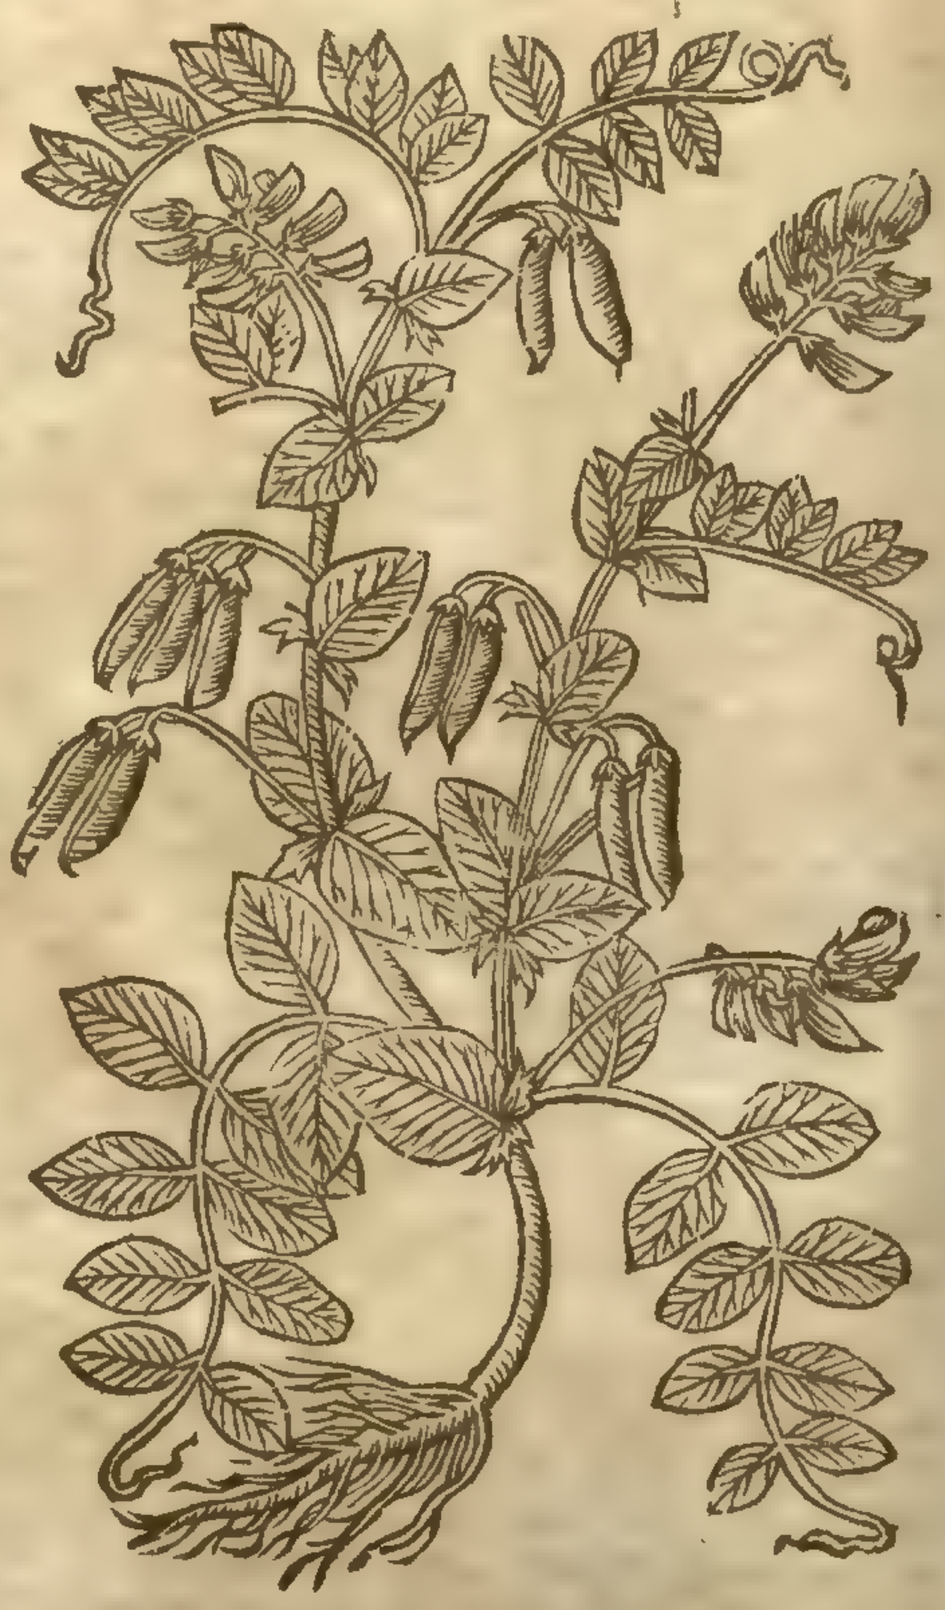
Peaſe Wild Winged.

are parted as it were at their tops into one or two ſmaller Leaves; or rather one or two ſmaller Leaves grow at the top of them with the Claſpers between them. At the foot of theſe Leaves, come forth ſingle Flowers, like to the Cicer *or* Garden Chich Peaſe *in the following Chapter, which are wholly white, and turn into ſmall, round, long Cods, with ſmall crooked points at the end, and Films at the Backs, in which are contained ſmall, round, whitiſh* Peaſe, *a little bitteriſh.*

VI. *The fourth, or* Blackiſh winged white Peaſe. *This in its Roots, Stalks, Leaves, Flowers, and manner and form of growing, differs nothing from the laſt Deſcribed, ſaving in the color of the Flowers, which in this are tending to a reddiſh purple: the* Peaſe *in the Cods alſo are more dusky, tending to black.*

VII. *The fifth, or* Engliſh Wild Sea Peaſe. *The Root of this periſhes not every Year, and in its Roots, Stalks, Leaves, Flowers, and Cods, and manner of growing, differs not much from the ſecond ſort before deſcribed: but herein this differs from that,* viz. *That it grows ſomewhat greater, and bears many Flowers together in a Tuft, mixt of purple and Aſh color: and the ſucceeding Husks or Cods are ſmall and long.*

Peaſe Sea Wild Engliſh.



VIII. *The ſixth, or other* Engliſh Sea Peaſe *or* Suffolk Peaſe. *Its Root runs down incredibly deep into the Ground, even two Fathom, or twelve Feet deep at leaſt, and ſpreading infinitely (as it were) therein, among the very Stones and Beech of the Sea. From the Head of this Root ſprings up a triangular Stalk full of Joints, bending to the Ground, with two Leaves at every Joint, branched forth in divers Places with winged Leaves at them, conſiſting of ten or twelve dark green Leaves, ſet by couples or pairs on a middle Rib, with a ſmall Claſper at the end, each Leaf not being much unlike to* Sea Purſlane. *The Flowers grow towards the Tops of the Branches,* 8 *or* 10 *ſet together in a Cluſter, upon a ſmall long Stalk, which both for form and color, are very like to the firſt Kind of* Wild Peaſe, *but with a whiteneſs in the middle, when it is full blown. The Fruit or Cods which follow, are leſſer than thoſe of the* Common Field Peaſe, *and contain (many times)* 8 *or* 10 Peaſe *in a Cod, each of which has the whiteneſs called the Eye of the* Pea, *which encompaſſes half the* Pea, *like a Semicircle, the which being Ripe and dry are of a darkiſh color. About a Yard deep or more under the Stones, there is found ſome Sand, or ſandy Earth, in which the Roots of this Plant ſpread, which are not great, but ſlender pliant and flexible, not ſweet but bitter, as the whole Plant is, and the* Peaſe *alſo. The old Stalks dye away every Year; but from the old Head of the Root, will ſhoot many long, white Tendrels, like the Root of the* ſmall Bind-weed, *by which it wonderfully encreaſes, and not by the Seed, as has been found by Experience. For that the Seed falling upon, or among the Stones of the Beech, it is ſcarcely poſſible it ſhould grow there, there being no* Pabulum *or Earth to nouriſh the ſame, till you dig two or three*

three feet deep; the Birds alſo for the moſt part devour it all. All this Parkinſon *ſaith ſeems to be true, for that he Sowed ſome of the Seed or* Peaſe *in his* Garden, *but they would never Spring up. However, tho' this matter of fact may be true; yet 'tis probable, that if the Seed or Grain had been Sown in a Ground or Soil proper thereto, it might have grown, notwithſtanding what* Parkinſon *has ſaid.*

IX. *The ſeventh, or* Spaniſh black ſpotted Wild Peaſe. *This Kind differs not much neither in its Root, (which Periſhes every Year) Stalks, Branches, Leaves, Flowers nor Cods, from our firſt ſort of* Wild Peaſe *deſcribed in this Chapter, but in many things it is like. Yet it is leſſer, and the Flowers are of a pale yellowiſh green color: and the* Peaſe *are of a dark color ſpotted with very black Spots like* Velvet.

X. *The Places.* The firſt has been found in many places of *England.* The ſecond, on the Chalky Hills, at *Kings-Hay* in *Kent*, not far from the *Thames*: there is a larger ſort of this ſecond Species, which has been found in ſome Barren Fields in *Eſſex*. The third and fourth grow with us only in our *Gardens*, but *Lobel* ſays, they grow naturally in *Lombardy*. The fifth has been found growing near *Romney* in *Kent*. The ſixth was found growing *Anno* 1555, being the third Year of Queen *Mary* I. between *Orford* and *Aldbrough* where it grew upon the Beech of the Sea, in places where never Graſs or Herbage was ever ſeen to grow, but the neighbouring People thereabouts ſaid, that they had obſerved, and known them to grow there of a long time before. In that Year there was a great Dearth, ſo that many were forced to make Bread of *Acorns*, and the People gathered many Quarters of theſe *Peaſe* (being in great neceſſity) to eat them for Food, and keep them from Starving, which at that time might be accounted a great bleſſing from Heaven. *Stow* in his *Chronicle*; and *Cambden* in his *Britania*, make mention of theſe *Peaſe*: but vainly thought that they might firſt come thither by ſome Shipwrack. But this is falſe, for it is a ſingular Plant *ſui Generis*, ſpecially differing from all the other Kinds: and this is true, from its form and taſte: but beſides it has been found growing in other places about the Sea Shore (which ſeems to be natural to it) as at *Rye* in *Kent*, at *Pemſie* in *Suſſex*; at *Gilford* in *Surry*, over againſt the *Comber*; and at *Ingoine Mills* in *Lincoln-ſhire*. The ſeventh grows in *Spain*, from whence it has been brought into our *Gardens*.

XI. *The Times.* Theſe all Flower, and bear their ripe Fruit with the latter Kind of *Field Peaſe*: The ſixth Kind Flowers about the end of *July*, and the Cods are ripe about the end of *Auguſt*.

XII. *The Qualities, Specification, Preparations*, and *Virtues* of theſe are the ſame with thoſe of the *Manured Kinds*. The third and fourth Kinds (according to *Galen*) are in a mean or middle property between thoſe which nouriſh much, and little, and which are eaſie and hard of Digeſtion, but they are hot and moiſt, and have a drawing, digeſting, cutting, and cleanſing Faculty; that they alſo purge the Liver, Spleen and Reins; cleanſe the Skin from Scurff, Morphew, Leproſie, Tettars and Ringworms, diſſolve hard Tumors in the Cods, and heal Apoſtems, running Sores and putrid Ulcers, the *Meal* being mixt with Honey: and this is ſpoken in General, of all the Kinds.

CHAP. DL.

Of PEASE-CHICH; OR, CICER, Garden and Wild.

I. *THE Names.* It is called in *Arabick*, *Chemps*, *Hames*, *Adames*, or *Halhamos*: in *Greek*, Ἐρέβινθος, & ἐρεβίνθη: in *Latin*, *Cicer*: and in *Engliſh*, *Chich Peaſe*, and *Cicers*.

II. *The Kinds.* Of this Plant there are two Principal Kinds, *viz.* 1. Ἐρέβινθος ἥμερος, *Cicer ſativum, vel hortenſe*, Garden Chich Peaſe, or Cicer. 2. Ἐρέβινθος ἄγριος, *Cicer Sylveſtre*, Wild Chich Peaſe, or Cicer.

III. *The Garden Kinds of Cicers.* There are ſeveral of this Species, as, 1. Ἐρέβινθος λευκὸς *Cicer Arietinum*, White Garden Chich Peaſe, Rams Chiches, Rams Peaſe, and Rams Cicers. 2. *Cicer rubrum*, Red Cicer, or Chich Peaſe. 3. *Cicer nigrum*, Black Cicer, or Chich Peaſe. This is *Matthiolus* his red and black *Cicer*, but the red in time changes into black; theſe three differing only in their colors, will merit but one general Deſcription, which we ſhall give you in *Sect.* V. following.

IV. *The Wild Kinds of Cicers.* There are eight ſorts of the *Wild Kind*, viz. 1. *Cicer Sylveſtre Matthioli, Dodonæi, Lugdunenſis & Dalechampij*; *Cicer Sylveſtre majus Thalij*; *Cicer Sylveſtre Herbariorum Lobelij*; The greater Wild Cicer. 2. *Cicer Sylveſtre minus*, *Cicer Sylveſtre minimum Thalij*; The leſſer Wild Cicer. 3. *Cicer Montanum Languinoſum, Bauhini*; The Woolly Mountain Cicer. 4. *Cicer Montanum ἄγλωκον Bauhini*; Mountain Cicer without any Stalk. 5. *Cicer Sylveſtre Triphyllum*; *Cicer Sylveſtre verius Lobelij*; *Cicer Sylveſtre alterum aliorum*, Trefoil Wild Cicer. 6. *Cicer Sylveſtre alterum triphyllum*; *Cicer Sylveſtre ſecundum Dalechampij Lugdunenſe*; The ſecond three Leav'd Wild Cicer. 7. *Cicera, ἔρακος, ſive Aracus major Bæticus*; The greater Spaniſh Wild Chichling Peaſe. 8. *Aracus minor Luſitanicus*, The leſſer Wild Chichling Peaſe.

The General Deſcription of the Garden Kinds.

V. *They have a ſmall Root which periſhes every Year:* The Ram or white Chich Peaſe, *(and ſo of the others) has Stalks of a Yard long, on which do grow winged Leaves; that is, many ſmall and almoſt round Leaves dented about the edges, ſet on both ſides of a middle Rib. At the Joints come forth one or two Flowers, upon ſhort foot Stalks*, Peaſe *faſhion, either white or whitiſh; or elſe purpliſh red, lighter or deeper, according as the* Peaſe *which follow will be; which are contained in ſmall, thick, and ſhort Pods or Cods, (in which lye one, or two* Peaſe, *more uſually) a little pointed at the lower end, and almoſt round at the Head, yet a little cornered or ſharp. This* White Chich Peaſe *is much uſed in* Spain, *ſo that it is uſually one of their Chief Diſhes at all their Feaſts.*

Peaſe Chich Garden.

The Deſcriptions of the Wild Kinds.

VI. *The firſt*, *or* Greater Wild Cicer. *It has a hard and woody Root, which lives long, and ſpreads far about. It has very long winged Leaves ſet on the Stalks, compoſed of many, every one of them being ſmall, and longer than thoſe of the* Garden Kind *before Deſcribed, not dented at all about the edges, and of a ſad green color. At the tops of the Stalks, come forth many Tufts of Flowers, thick ſet together, of a pale, yellowiſh color, almoſt white, after which follow rough skinny Cods, in Tufts alſo, each of them ſmall pointed at the end; within which are contained other ſmall ſmooth Husks, which have many ſmall, flat, yellow, round Seed, (as* Thalius *ſays,) but* Lugdunenſis, *makes the firſt of* Dalechampius, *to have blackiſh Flat Seed or Grains, and not like to the* Manured Cicers, *(which ſome take to be both one, as alſo that of* Matthiolus.)

Peaſe Chich Wild.

VII. *The ſecond*, *or* Leſſer Wild Cicer. *This in its Roots, Stalks, Branches, Leaves, Flowers, Cods, Grains, and manner of growing, is altogether like the former, but in this it only differs, that it is not altogether leſſer in the whole, but leſſer in every part.*

VIII. *The third*, *or* Woolly Mountain Cicer. *It has upright round Stalks about a Foot high, and ſoft or woolly, ſpreading themſelves forth into ſmall Branches, on which grow winged Leaves, ten or twelve on a ſide, of a middle Rib, with an odd one at the end, each of which is ſoft or woolly; and long like unto the* Vetches, *ſome broader and ſome narrower than others. At the tops of the Branches, grow a Spike of rough pale colored Flowers, and the Cods which follow, are ſomewhat long and woolly, with a crooked Thread at the end, containing within them ſmall black Seed.*

IX. *The fourth*, *or* Mountain Cicer without Stalks. *Its Root runs deep into the Earth, if the Rocky Ground on which it grows does not hinder it: from whence ſpring ſeveral hairy foot Stalks of Leaves, which contain about twelve or more of a ſide, ſomething round yet longer than thoſe of the* Garden Cicer, *their edges being hairy; and ſome of them equally, others unequally ſet one againſt another, with an odd one at the end. The Flowers grow near about the Root, being ſomewhat long and pale; and after them come Swoln Cods having two partitions, full of ſmall yellow Seed, like unto thoſe of the* Medicas, *which are of a Kidney faſhion.*

X. *The fifth*, *or* Trefoil Wild Cicer. *It has a long ſlender Root with ſome Branches and Fibres adjoining; from which riſe up Stalks about two Feet high, divided into ſome Branches ſpreading abroad, on which are ſet upon long foot Stalks one above another, Leaves divided into three parts, like the* Wild Trefoil, *and each of them larger, thicker and rounder than thoſe of the* Garden Cicer, *a little dented about the edges. The Flowers grow two or three together upon a long foot Stalk, at the Joints with the Leaves, which are like the* Garden Cicer *Flowers, but larger. The Cods that follow are ſmall like unto the* Garden Kind, *but ſomething flatter, having ſome ſmall Leaves at their bottoms, within which ly much ſmaller Seed, and more flat, and rather like to thoſe of the* Cicercula, *in* Chap. 126. *aforegoing.*

XI. *The ſixth*, *or* The ſecond three Leav'd Wild Cicer. *This has a thick, long, Branched Root, which is blackiſh without, and whitiſh within. The Stalks are full of Branches, with Leaves like unto* Cicers, *but three always ſet together, and no more. The Flowers are red: and the Cods are like unto the other* Wild Cicers, *but hairy, and ſpotted with red Spots.*

XII. *The ſeventh*, *or* Greater Spaniſh Wild Chichling Peaſe. *It has a Root which is ſmall and Fibrous,*

Fibrous, *and perishing yearly. It spreads on the Ground, with several square, hairy, and crested Stalks; sometimes a yard long or more; at the several Joints of which, grow many dark green hairy pointed Leaves set on each side of a middle Rib, which end in a Cluster, like* Lentils, *or* Vetches. *At the foot of the Leaves, come forth single Flowers on very short foot Stalks, of a dusky, weak purple color, with deeper purple Veins therein; and of a deeper purple at the bottom of the upper Leaves, next to the Stalks: which when they they are past, there come in their places, short, thick, and almost roundish Cods, covered with a short hairiness thereon; within which lyes 3 or 4 round blackish* Peafe, *almost like unto blackish* Velvet, *as big as those of the* Cicercula, *but not cornered.*

XIII. *The eighth, or* Leffer Wild Chichling Peafe. *The Root of this perishes likewise every Year, as the former does. In its Stalks, Leaves, Flowers, Cods, and Grain, it is much like the former, but lesser in all its parts, and nothing hairy. The Flowers are of a pale white (with us in* England) *or of a whitish yellow Color. The Cods are smooth, smaller, and not hairy, with smaller, and blackish colored* Peafe *within them.*

XIV. *The Places.* All the Manured or *Garden Cicers*, or *Chich Peafe*, are Sown with us in *Gardens*, or in *Fields*, as other *Peafe* are, not only in *England*, but in other Foreign Countries, where they are Sown for Food, as in *Spain*, *&c.* The first six forts of the *Wild Kinds*, grow upon Hills and in Woods, and sometimes by Hedge sides in Fields. The seventh grows in *Spain*, and the eighth in *Portugal*, from whence they are brought to us in Seed, and are Nurst up with us in Gardens.

XV. *The Times.* The *Garden Chich Peafe*, tho' they are Sown sooner than Peafe, yet they are gathered at the same time with them, or a little after. The first six *Wild Cicers*, or *Chich Peafe*, Flower in *July* and *August*; and the Cods or Seed are ripe in *August* or *September*. The seventh and eighth Flower with us in the end of *July*, and the Cods or *Peafe* are ripe in *August* or *September*. But *Bock* who first brought them out of those places, *viz. Spain* and *Portugal*, their natural places, says that he gathered their ripe Cods or *Peafe* in *April* and *May*.

XVI. *The Qualities. Garden Cicers* or *Chich Peafe* are hot and dry in the first Degree; Incisive, Abstersive, Diuretick, Nephritick, Hysterick, Emmenagogick, Chylifick, Analeptick, Galectogenetick, and Spermatogenetick. *The Wild Cicers* or *Chich Peafe* are so much more powerful than those of the *Garden*, by how much they exceed them in heat and dryness, perceived by their sharper and more bitter Taste; whereby, it is manifest that they much more open obstructions, provoke Urine, break the Stone, and have all those other properties of Inciding, Opening, Digesting and Dissolving, which are attributed to the *Garden Kinds*, and that both more speedily and more certainly. And *Pliny* says, that if they be taken too largely, they breed Wind, and loosen the Belly, but not without some Pain.

XVII. *The Specification.* They are peculiar in easing the Strangury, breaking the Stone in the Reins, expelling Sand, Gravel and Tartarous Matter from the Urinary parts, and provoke the Courses in Women. They prevail against Pleuritick Pains and Stitches in the Sides, carry off the Dropsy, and Yellow Jaundice by Urine, are Emollient, and cleanse the Belly by Stool. *The white Ram Cicers*, or *Chich Peafe*, are those which are only used as Meat or Food, they are a little windy, but are said to Nourish more than either *Peafe* or *Beans*, for which reason they are of extraordinary use in curing *Consumptions*; They increase Milk in Nurses, and Seed mightily, both in Men and Women, incite Lust powerfully, and cure Barrenness in both Sexes; which things all the Kinds of *Cicers* do; and for which reasons they are commonly given to *Stallion Horses*. The *White* are accounted a Delicacy among the *Spaniards*, and commonly one of their choice Dishes in all their Feasts, as we have before hinted. The other *Garden Cicers*, but chiefly the *Wild Kinds*, are most used as Physick or Medicine.

XVIII. *The Preparations.* You may make therefrom, 1. *A Boiled Mess of the White Cicers or Chich Peafe.* 2. *An Essence of the Leaves and green Cods.* 3. *A Decoction of the green Cods.* 4. *A Meal or Flower of the Grain.* 5. *Bread and Puddings thereof, if of the white Rams Chich Peafe.* 6. *A Cataplasm of the Meal or Flower.* 7. *Ashes of the Straw and Cods:* From which a Fixt Salt may be extracted by Elixiviation. 8. *A Distilled Water from the Flowers, or from the green Cods, or from the whole Plant.* 9. *A Volatile Spirit, Oil, and Salt of the dryed Cicers*, as you make those of *Beans* in *Chap.* 55. *Sect.* 16. aforegoing. 10. *A strong Broth of the White Cicers*, made by Boiling till they break, with Knuckles of Veal, Mutton, Pork, and Beef, *&c.* and then strained out from the Hulls.

The Virtues.

XIX. *The Virtues and Uses* of all the aforegoing *Preparations* are the same with those of *Beans*, in *Chap.* 55. *Sect.* 10. *ad* 18. *Chap.* 56. *Sect.* 12. *ad* 17. *Chap.* 57. *Sect.* 11. *ad* 17. And *Chap.* 548. *Sect.* 12 *ad* 20 to all which you are referred for full satisfaction, these *Cicers* or *Chich Peafe* being altogether of the same Qualities and Nature.

XX. *Nota.* 1. *Galen* says that *Cicers* are windy Food, yet that they Nourish more than *Beans*, provoke Urine more, as also encrease Seed. They are more cleansing than *Peafe* or *Beans*, and thereby are said to break the Stone in the Reins.

XXI. *Nota.* 2. *There is a Cream to be made of them, by boiling them in Water*, which being freely eaten plentifully encreases Seed in both Sexes, as also Milk in Nurses, it provokes Urine, and gently keeps the Belly solouble.

XXII. *Nota*, 3. *The Decoction of any of the Cicers in Water, chiefly of the Wild, made with Rosemary*, *Dioscorides* says is good for the Dropsy and Yellow Jaundice. But tho' the *Wild Cicers* are said to be the most powerful for Medicine, yet the *white Ram Cicers* or *Chich Peafe*, are said more powerfully to encrease Milk and Seed, and provoke Lust.

XXIII. *Nota.* 4. *The Broth Compounded. Take Cicers 3 Ounces; French or Hull'd Barly 2 Ounces; Marsh Mallow Roots 2 Ounces and half; boil them sufficiently in Chicken Broth.* Of this five or six Ounces may be taken in the Morning fasting, against Pains and Stitches in the Sides, Dropsy, Jaundice, Gout, Rheumatism, *&c.* and thereby the Belly will be gently Purged.

XXIV. *Nota.* 5. *Dioscorides* says that *Cicers* are hurtful to such as have Ulcers in their Reins or Bladder; but I know no reason for his so reporting, unless it be from their great abstersive or cleansing Qualities: however from the Experience I have had of the use of them I am of the clear contrary Opinion.

XXV. *Nota.*

XXV. *Nota.* 6. *Plutarch* has alſo this Note. That no Worms breed in *Cicers*, whereas all other Pulces are ſubject to them; by which he ſeems to intimate, that they reſiſt Putridity or Corruption, but he relates this thing upon another account.

CHAP. DLI.

Of PEASE Everlaſting.

I. *THE Names.* It is called in *Greek*, Λαθύρος ἀϊδιος: in *Latine*, *Lathyrus perennis*; *Cucircula, & Cicercula perennis:* in *Engliſh*, *Peaſe Everlaſting.*

II. *The Kinds.* There are but three Species obſerved of this Plant, *viz.* 1. Λαθύρος ἀϊδιος μείζων, *Lathyrus perennis major*, *Cicercula perennis major Bauhini*; *Clymenum Matthioli*; *Eruum Sylveſtre Fuchſii*; *Ervillium Cæſalpini*; *Piſum Græcorum Tragi*; *Lathyrus Latifolius*; *Piſum perenne*, Peaſe Everlaſting the greater. 2. *Lathyrus perennis anguſtifolius*; *Orobus Venetus Cluſii*, (but very improperly, for tho' it came from *Venice*, yet it is no *Orobus:*) Blew upright Peaſe Everlaſting, Peaſe Everlaſting narrow Leav'd. 3. *Lathyrus perennis Sylveſtris Dodonæi.* Wild Peaſe Everlaſting.

The Deſcriptions.

III. *The firſt, or* Peaſe Everlaſting the greater. *Its Root is great, black and rugged on the outſide, running down deep into the Ground; it is of the thickneſs ſometimes of a Mans Arm, and whitiſh within, ſpreading it ſelf out into ſome Branches, with a few Fibres annexed to them. This Plant abides long, and grows every Year greater and greater. It firſt ſprings up with many long, flat, or broad, trailing Branches, or Stalks, winged as it were on both the ſides, which muſt be ſuſtained; and are diverſly divided into ſeveral other ſmaller Branches, at the ſeveral Joints of which, ſtand two hard and not very broad Leaves, but ſomewhat long and green, with divers Claſpers or Tendrels in ſeveral places with the Leaves, from between the Branches and the Leaves, and at the ends of the Branches. At the Joints towards the top, and at the ends of the Branches, come forth pretty long Stalks, with five or ſix or more* Peaſe *like Bleſſoms, of a fine pale purpliſh red color, very beautiful to behold, and of a very pleaſant Smell. After which ſucceed ſmall, long, hard Skin'd, roundiſh, and whitiſh Cods, with ſmall round blackiſh* Peaſe *in them. This is that which* Lobel *calls* Lathyrus folio Latiore, *and has been found growing Wild, in ſeveral places of our Land.*

Peaſe Everlaſting.

IV. *The ſecond, or* Blew upright Peaſe Everlaſting, *or* Peaſe Everlaſting narrow Leav'd. *Its Root is black, hard or woody, abiding after Seed time, as the former does, and ſhooting afreſh every Year. It has divers ſlender, but upright green Branches, ſomewhat corner'd, two Feet high, or more, having at ſeveral diſtances on both ſides of them, certain winged Leaves, ſet together upon long foot Stalks, one againſt another, conſiſting of eight Leaves, a little broadiſh in the middle, and pointed, without any odd one at the end. At the Joints towards the tops, between the Leaves and the Stalks, come forth many Flowers ſet together, upon pretty long foot Stalks, of the faſhion of the former* Peaſe *Bloſſom, but ſomewhat ſmaller, and of a purpliſh blew, or* Violet *color: After which come ſlender or long pointed Pods or Cods, rounder than the aforegoing, in which are contained, ſmall, round, grayiſh* Peaſe. *This in its durability, form, and manner of growing, differs not much, but in having ſomewhat paler Flowers, and in the Leaves thereof, which are narrower than they.*

V. *The third, or* Wild Peaſe Everlaſting. *The Root of this is long, and endures for many Years. It has longer winged Stalks, and ſomething larger Leaves, but ſhorter Claſpers or Tendrels than the laſt: The Flowers are of a deep purple: And the Cods are long and ſlender, with ſmall, hard, round* Peaſe *within them.*

VI. *The Places.* It is ſaid that they have all of them been found growing Wild with us, in ſeveral parts of the Kingdom; but are uſually Cheriſhed and Nurſt up in *Gardens* for the beauty of the Flowers.

VII. *The Times.* They all Flower about the Months of *June* and *July*, to the end of *Auguſt*; and the Grain, or Peaſe are ripe in ſome ſhort time afterwards.

VIII. *The Qualities, Specification, Preparations* and *Virtues* of theſe, are the ſame with thoſe of *Peaſe*, in *Chap.* 548. aforegoing, to which you are referred. *Galen* ſays, That *Lathyrus* is in ſubſtance much like to *Ervilia*, and *Phaſelus*, or *Beans*; and that the Country People in his Country of *Aſia*, did uſe them as they uſed *Phaſeli*, and made them into Pottage, as they did *Lentils:* but *ſays he*, They are of a thicker Conſiſtence than they, and that they Nouriſh more

CHAP.

CHAP. DLII.

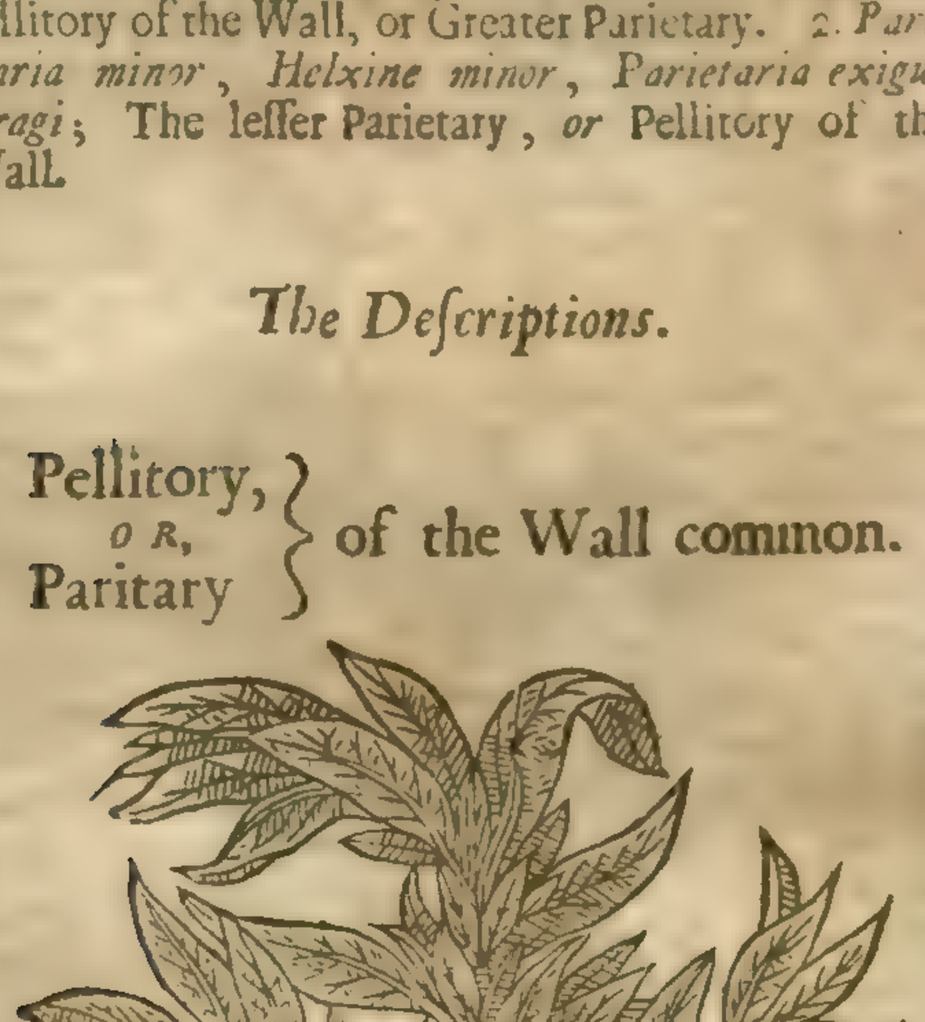
Of PELLITORY of the Wall; *OR,* PARITARY.

I. *THE Names.* It is called in *Greek*, Ἐλξίνη, ἢ Περδίκιον (the first *quod foliorum & seminum hirsutie vestibus adhæreat:* the latter, *quod Perdices ea libenter vescantur:*) in *Latin*, *Helxine*, & *Perdicium.* It is also called *Parietaria*, or *Paritaria*, also *Muralium*, & *Herba Muralis* (because it naturally grows upon Walls.) And by some Authors, *Urceolaris*, *Vitrago*, & *Vitrolaris Herba.* *Galen* and *Paulus Ægineta* said, That in their days (also *Cornelius Celsus*, and *Pliny* out of him) that several did call it *Parthenium*, but this erronious Name is so Foreign to the Plant, that it needs no refutation: in *English* it is called *Pellitory and Paritary of the Wall.*

II. *The Kinds.* There are but two peculiar Kinds used in Physick, *viz.* 1. *Parietaria vulgaris*, *Perdicium commune*, *Helxine vulgaris*, *Helxine major*, *Parietaria major*; Our common or greater Pellitory of the Wall, or Greater Parietary. 2. *Parietaria minor*, *Helxine minor*, *Parietaria exigua Tragi*; The lesser Parietary, *or* Pellitory of the Wall.

The Descriptions.

Pellitory, *OR,* Paritary } of the Wall common.



III. *The first, or* Our Common, *or* Greater Pellitory of the Wall. *Its Root is somewhat long, with many small fibres adjoined thereto, of a dark reddish color, and abides all the* Winter *(altho' the Stalks with their Leaves perish) and springs up again afresh every Year. It rises up with many brownish, red, tender and weak, clear, and almost transparent Stalks, about two feet high. Upon which grow at the several Joints, two Leaves, something broad and long, like unto those of* French Mercury, *or* Amaranthus, *called* Flower Gentle, *of a dark green color, which afterwards turn brownish, and smooth, or not at all dented about the edges, which are a little rough and hairy as the* Stalks *also are. At the Joints with the Leaves, from the middle of the Stalks upwards, where it spreads it self out into several branches; come forth many small pale purplish Flowers, in hairy, or somewhat rough Heads or Husks; after which comes small black and rough Seed, which will stick to any Garment or Cloth it shall touch.*

IV. *The second, or* Lesser Parietary, *or* Pellitory of the Wall. *Its Root is much like the former, and the Plant grows in like manner as that does, but*

Pellitory, *OR,* Paritary } of the Wall small.

not so great or high; having tender, reddish, rough Stalks, smaller and shorter than the other, but with something greener Leaves thereon, yet rougher, (not much unlike to those of Basil) *so that they will stick to any Cloth, or other thing they touch. The Flowers and Seed differ not much from those of the greater, but are smaller, and the Seed is more like unto* Purslane *Seed (when rubbed out of the Husks,) than the former.*

V. *The Places.* The first grows Wild generally throughout all *England*, about the Borders of Fields, and among Rubbish, and by or on the sides of old Walls, chiefly Stone Walls; on the moist Corners

Corners of old Church-Walls, and Stone Buildings, and other like Places. I have ſeen it grow plentifully upon the Stone Walls of the *Cathedral* or *Minſter* of *Ely*, from which I have ſometimes formerly gathered it. It will thrive alſo well enough, when Planted in *Gardens* on the ſhady ſide, and where it is moiſt withall; and if a great deal of Stone of Brick Rubiſh, and old Mortar of Walls be mixed with the Earth, it will thrive admirably well; and if it is ſuffered to Seed and Sow it ſelf, and then to ſpring up of its own Sowing, it will not eaſily be eradicated thence afterwards. The ſecond or leſſer Kind is rare in *England* as alſo in *Germany*, and is not to be found growing naturally with us, but as it is Planted in *Gardens:* theſe two ſeldom grow together in one place: and the latter keeps its green Leaves ſometimes all the *Winter*.

VI. *The Times.* They both Spring up in the middle or end of *April* and in *May*; they Flower in *June* and *July*, and the Seed is ripe in *July* or *Auguſt*, or not long after.

VII. *The Qualities. Pellitory of the Wall*, is ſaid to be cold and moiſt in the firſt Degree. It is highly Aperitive, Abſterſive, Anodyn, Diuretick, Traumatick, Hepatick, Nephritick, Hyſterick, and Arthritick.

VIII. *The Specification.* It cures the Strangury and Dropſy; and is highly profitable againſt the Stone, Sand, Gravel or Tartarous Slime in the Reins and Bladder; is good againſt Coughs, and pains of the Liver, Spleen and Womb.

IX. *The Preparations.* From the whole Plant of *Pellitory of the Wall* you may have, 1. *A Liquid Juice.* 2. *An Eſſence.* 3. *A Syrup.* 4. *A Decoction.* 5. *A Clyſter.* 6. *An Ointment.* 7. *A Cataplaſm.* 8. *A Diſtilled Water.* 9. *An Electuary.* 10. *A Saline Tincture.*

The Virtues.

X. *The Liquid Juice.* Given to the quantity of 6 or 7 Spoonfuls at a time, it gives wonderful eaſe to ſuch as are troubled with the Strangury or ſuppreſſion of Urine, cauſing them very ſpeedily to make Water, and to expel Sand, Gravel, and Stones or Tartarous Slime from the Reins and Bladder, and carries off the Water in Dropſies, to admiration, giving thereby a ſpeedy cure to that Diſeaſe. The *Juice* held a while in the Mouth, gives eaſe in the Tooth-ach; and dropt into the Ears it eaſes their Noiſe and Ringing, and takes away pricking and ſhooting Pains in them. The ſaid *Juice* cools Inflamations, and is good againſt Burnings by Fire, or Scaldings with Water: it prevails againſt *Anthonies* Fire, or any other eruptions of heat, being bathed often therewith, and wet Cloths dipped therein being alſo laid on. It is very effectual to cleanſe Fiſtula's, and to heal them, more eſpecially if a little Honey be mixed therewith.

XI. *The Eſſence.* It has all the Virtues of the *Liquid Juice*, and may be given in the ſame Doſe; It eaſes the pains of the Liver, Spleen, Reins, and Womb: and opens all their obſtructions. Uſed as a Gargariſm, it cures Inflamed, Swoln, Sore, and Ulcerated Throats: and is profitable being inwardly taken, and outwardly applyed, for the curing of old running Sores, and putrid Ulcers in any part of the Body, beyond many other things.

XII. *The Syrup.* It is made of the *Juice* and Honey: It has all the Virtues of the *Juice* and *Eſſence*, and may be given Morning and Night, 2, 3, or 4 Spoonfuls either alone, or mixt with a Glaſs of White *Port* Wine. It is a peculiar thing for the cure of the Dropſy. Therewith my Father cured me of the Dropſy *Anaſarca*, when the hopes of Life were almoſt paſt. I took 3 or 4 Spoonfuls of this *Syrup* Morning and Night for a Month together: It carried off the Water after an admirable manner, and I became perfectly well, without ſo much as taking one formal Purge.

XIII. *The Decoction in Wine or Water.* It has the Virtues of the *Juice*, *Eſſence* and *Syrup*, but nothing near ſo powerful, and may be given Morning and Night, to 6 or 8 Ounces mixt with Honey, it becomes an excellent Gargle for an Inflamed, Sore, or Ulcerated Mouth and Throat.

XIV. *The Clyſter.* It is made of the *Juice* or *Eſſence* mixt with Honey. It eaſes Pains in the Sides, Back and Bowels, proceeding from Wind, or the Stone and Gravel in the Reins. It heals alſo a Bloody Flux, and Excoriations or Ulcers in the Bowels.

XV. *The Ointment or Liniment.* It is made of the *Juice* with *Oil of Roſes* and *Ceruſe*, or *White Lead.* It is good againſt *Ignis Sacer*, hot eruptions in the Skin, cleanſes foul, rotten filthy Ulcers, and ſuch as ſpread or creep; cures running Sores and Scabs in Childrens Heads, and ſtays the falling of the Hair: applyed to the Fundament, it eaſes the Hemorrhoids or Piles and quickly cures them. Mixed with Goats Suet, or a little *Cyprus Turpentine*, it cures the Gout.

XVI. *The Cataplaſm.* The Green Herb beaten up with a little Wine, and applyed as hot as it can be well endured to the Belly; it eaſes the Colick, and pains of the Bowels proceeding from Wind. The *Cataplaſm of the ſimple green Herb*, with a little Salt, cures ſimple green Wounds, cleanſes old running Sores, and putrid Ulcers, and cauſes them to heal; and it is ſo effectual to heal any ſimple green Wound, that being bound thereto for three days, it will heal it without any other Salve, Balſam, Ointment or Medicine. *If the Cataplaſm is made with Mallows, with Wheat Bran and Bean Flower, adding alſo a ſufficient quantity of Wine in the boiling them together, with a little Oil Olive*, and applyed warm to any bruiſed Nerve, Tendon, or Muſcle, it does in a ſhort time reſtore them to their priſtine ſtate of Health and Soundneſs, eaſing the Pain, diſcuſſing the Contuſion, and diſſolving the coagulated Blood.

XVII. *The Diſtilled Water.* It has the Virtues of the *Juice*, *Eſſence* and *Decoction*, but in a much Inferior or meaner degree. Mixt with Sugar and Drank, it works the ſame effects. Applyed to the Face or Skin, it is ſaid to clear it from Spots, Freckles, Pimples, Wheals, Tanning, Sun-burn, Morphew, Scurff, *&c.* leaving the Skin clear, ſmooth and delicate.

XVIII. *The Electuary.* It is made of the *Pouder of the Herb*, and a *Rob of its Juice*, mixt with Honey. It is a ſingular remedy for any old, continual or dry Cough, Aſthma's, ſhortneſs of Breath, Hoarſeneſs, Wheezing, and other Diſtempers of the Breſt and Lungs.

XIX. *The Saline Tincture.* It is excellent to cleanſe the Reins, Ureters, Bladder, and Womb, helps againſt the Strangury, provokes Urine, and brings away Tartar, Sand, Gravel and Stones, from the Reins, Ureters and Bladder.

CHAP. DLIII.

PELLITORY of Spain:

OR,

SNEESEWORT.

I. *THE Names.* It is called by the *Arabians*, *Macarcaraba*, or *Hachartharba*: in *Greek*, Πταρμικὴ, ϗ Πύρεθρον: in *Latine*, *Ptarmica*, & *Pyrethrum*: in *English*, *Pellitory of Spain*, and *Sneesewort*.

II. *The Kinds.* There are several sorts of this Plant, as, 1. *Ptarmica vulgaris Parkinsoni*; *Ptarmica Fuchsij*, *Gesneri*, & *Matthioli*; *Ptarmica Sylvestris Germanica Thalii*; *Ptarmica Pratensis Clusij*; *Ptarmica folio Tanaceti vel Sternutamentoria Lobelij*; *Pyrethrum Tragi Fuchsij*; *Pyrethrum Sylvestre Cordi*; *Ptarmica sive Draco Sylvestris Dodonæi*; *Tanacetum Tragi vel acutum vel Millefolium Primum Tragi*; *Tarachon Sylvestre vel Aquaticum*, & *Draco Aquaticus Gesneri*; *Draccuncul. Pratensis serrato folio Bauhini*; Common Field Pellitory or Sneesewort. 2. *Ptarmica Sylvestris flore pleno*, *Sternutamentoria flore pleno*, *Pyrethrum flore pleno Sylvestre*, Common Field Pellitory with a double Flower. 3. Πταρμικὴ, *Ptarmica vulgaris Officinarum*, *Pyrethrum vulgaris Officinarum*; *Pyrethrum aliorum*, & *Salivaris*; *Pyrethrum alterum Lugdunensis*, *Matthioli aliorumque*; *Pyrethrum Officinarum Lobelij*; & *Flore Bellidis*, *Bauhini*, The Common Shop Pellitory of Spain. 4. Πύρεθρον, (*ob radicis ignem fervorem*, ἀπὸ Πῦρ, *Ignis Fire*) *Pyrethrum*, & *Pyrethrum verum Dioscoridis Matthiolo*, *Pyrethrum alterum Lobelij*; *Salivaris*, (from its quality of attracting Spittle in the Mouth) *Pyrethrum Dioscoridis Camerario*; *Pyrethrum Umbelliferum*, & *Umbelliferum primum*; The true Pellitory of Spain. 5. *Pyrethrum Umbelliferum alterum*, *Pyrethrum Gesneri*, & *Dalechampij*, The other true Pellitory of Spain.

The Descriptions.

III. *The first*, *or* Common Field Pellitory or Sneesewort. *Its Root is long and whitish, Jointed at several distances, creeping far about under Ground. It shoots forth divers little Stalks a Yard high and more, spread out into several Branches, on which are set narrow long Leaves pointed at the ends, and finely dented about the edges, standing one above another up to the tops, where grow many white Flowers, in a round Tuft together, something like to those of* Yarrow *or* Millfoil, *with a very small yellowish Thrum in the middle, bordered about with very short whitish Leaves, dented in at the broad ends, which passing away, leave behind them small Heads, with Chaffy Seed therein. Both Leaf and Root are of an hot sharp biting Taste, like unto the* True Pellitory of Spain *in* Sect. 6. *following, and of which it took its Name.*

Pellitory of Spain Field.

IV. *The second*, *or* Common Field Pellitory with a double Flower. *Its Roots are many long Strings, running here and there in the Ground. It has straight and slender Stalks, beset with long and narrow Leaves, snipt round about the edges, not much unlike the former, and as it were in all points like the first described* Wild Kind, *which grows with us almost every where. On the Tops of the Stalks stand four or five, or more white Flowers, one above another, with a green Leaf at the bottom of the foot Stalk of every one of them, being small, thick, and very double, with a little yellowness in the middle of every Flower, like, both for form and color unto the Flower of the double* Featherfew, *but smaller. This Plant has no Smell at all, but is very pleasant to behold, for its double white Flowers sake.*

V. *The third*, *or* Common Shop Pellitory of Spain. *Its Root is long, and growing down right, of the bigness of a Mans Finger or Thumb, growing in our Country, but not half so great where it grows naturally, with some Fibres and Branches from the sides thereof, of a very hot, sharp, and biting Taste, drawing much Water into the Mouth, after it has been chewed a while. It is a small and low Plant, bearing many fine green Leaves, upon its slender Branches, which lean, or lye down upon the Ground, divided into many parts, yet somewhat larger and broader, than* Camomil, *the Stalks whereof are bigger, and more full of Juice than they. The Flowers grow at the Tops of the Stalks, and are single, but much larger than any* Camomil Flowers, *having a Pale, or Border of many Leaves, white on the upper side, and reddish underneath, set about a middle yellow Head or Thrum; but not standing so close together joining at the*

Pellitory of Spain, Shop Common.

bottom, *as* Camomil *Flowers do*, *but more ſevered one from another. It bears alſo white Seed, which is with difficulty found and diſcerned from the Chaff. This Plant which is very tender, and will ſcarcely,*

Pellitory of Spain, Shop Leſſer.

or not at all, endure the hardneſs and extremities of our Winters, *unleſs it be preſerved with much Care. Of this there is another Species, not differing at all from it but in the Magnitude, this being in its Stalks, Leaves and Flowers much leſs.*

VI. *The fourth, or* True Pellitory of Spain. *The Root grows ſometimes as thick as two Thumbs together, but often of a Thumbs thickneſs, and a Foot or more deep in the Earth; of a browniſh yellow color on the cut ſide, and whitiſh within, of a very hot, burning, ſharp and*

True Pellitory of Spain

biting Taſte, drawing forth much Saliva *or Water into the Mouth, more plentifully and quickly than the* Common Pellitory of Spain, *which has a* Daiſy *like Flower: This Root endures after Seed time, and with us all* Winter, *if it be carefully defended in the* Winter Seaſon. *From the Head of this Root ſpring up ſeveral Stalks of fine cut Leaves, the form and diviſions whereof do ſomething reſemble that of* May-weed, *being ſhort, and not long like* Fennel, *or like* Wild Carrots, *as* Dioſcorides *compares them; from among which riſes up ſome Stalks, with few or no Leaves on them, Branched out into two or three parts, bearing a round Umbel of white Flowers, after which follows ſomewhat round dark colored Seed, larger than that of* Aniſeed.

VII. *The fifth, or the* Other true Pellitory of Spain. *Its Root is ſlenderer and ſingle, in which conſiſts the chief difference: it grows alſo ſomewhat lower than the former: and the Leaves are alſo ſomething longer and finer, more reſembling* Dill. *The Stalks are ſlenderer and full of Leaves. And the Umbels of Flowers are white, but not ſo large.*

VIII. *The Places.* The firſt grows in Fields and Meadows by Hedg-ſides and Pathways, almoſt every where. It was formerly found growing in the three great Fields next adjoining to *Kentiſh Town* near *London*; and in ſeveral Fields in *Kent* about

about *South-ſeet*: and is alſo Nurſt up in ſundry *Gardens*. The ſecond grows only in *Gardens* with us. The third is only Planted with us in *Gardens* and Manured places. The fourth is Native to the hotter Countries, as, *Spain*, *Italy*, &c. The fifth grows in ſome Mountains in *Germany*, and often among Rocks on which there is but a Cruſt of Earth; ſo that the Roots grow in the Chinks and Gutters of the ſame: and in *England* theſe two laſt grow in *Gardens*.

IX. *The Times.* The two firſt Flower in the end of *June*, or in *July*, and give ripe Seed, not long after. The third Flowers not till *Auguſt*, and ſometimes ſo late, that it gives no ripe Seed before it periſhes, unleſs it is carefully preſerved in *Winter*. The fourth and fifth, Flower and Seed in *Auguſt* alſo, or towards the end of *Summer*.

X. *The Qualities.* They are all of them hot and dry in the fourth Degree, Aperitive, and Vehemently Attractive, as alſo by accident Anodyn; Cephalick, Neurotick, Hyſterick, Arthritck, and Antitebritick.

XI. *The Specification.* The Roots of theſe Plants, chiefly of the firſt, third and fourth, more eſpecially of the third and fourth, are peculiar againſt the Tooth-ach, Agues, Catarrhs, Diſtillations upon the Eyes, Apoplexies, Epilepſies, Vertigoes, Lethargy, Carus, Megrim, Head-ach, Gout, Sciatica, Numb and Dead Palſie, Colicks, obſtruction of the Terms in Women, &c.

XII. *The Preparations.* 1. *A Liquid Juice of the Leaves or Roots of the firſt and third.* 2. *An Eſſence of the ſame.* 3. *The dryed Leaves or Roots of the ſame.* 4. *A Decoction or rather Infuſion of the ſame.* 5. *A Pouder of the dryed Leaves or rather Roots.* 6. *A Cataplaſm of the Green Herb or Roots.* 7. *An Ointment or Balſam of Leaves or Roots.* 8. *An Oil of the Roots.* 9. *A Spirituous Tincture of the Roots.* 10. *An Acid Tincture of the ſame.* 11. *An Oily Tincture of the ſame.* 12. *The dried Roots of the fourth and fifth.* 13. *A Pouder of the ſame.* 14. *An Infuſion of the ſame.* 15. *An Oil or Ointment of the ſame.* 16. *A Cataplaſm.* 17. *A Spirit from the Roots.* 18. *A Spirituous Tincture from the ſame.* 19. *An Acid Tincture of them.* 20. *An Oily Tincture.*

The Virtues.

XIII. *The Juice of the Leaves or Roots of the firſt and third.* An Ounce thereof taken in a Draught of *Muſcadine*, or other ſtrong Wine, an Hour or two before the Fit of an Ague, and the Sick preſently laid to Sweat upon it, is ſaid certainly to cure the Patient, at ſecond or third time taking it at fartheſt.

XIV. *The Eſſence of the ſame.* It has the ſame Virtues with the *Juice* aforeſaid, being given in the ſame manner: beſides it warms and comforts the Stomach and other Bowels, gives eaſe in the Colick, and obſtructions from Wind, and powerfully provokes the Terms in Women; It alſo facilitates the Birth of a Woman in Labour: is profita- againſt Catarrhs, Apoplexies, Epilepſies, Vertigo's, Lethargy, Carus, Megrim, Head-ach, Gout, Sciatica, Colick and Palſie, being inwardly taken, and outwardly applyed to the parts affected.

XV. *The dried Leaves or Roots.* Being chewed in the Mouth, they draw down from the Head, Brain, and parts adjacent, much cold Rheum and pituitous matter, give eaſe in the Tooth-ach tho' never ſo extream, help againſt Catarrhs, and Rheums in the Eyes, and are profitable againſt all cold and moiſt Diſeaſes of the Head and Brain, as Lethargy, Carus, Vertigo, Head-ach, Apoplexy, Falling ſickneſs, Palſy, Convulſions, &c. Being thus chewed they wonderfully purge the Head and Brain from theſe cold Humours, cauſing the aforenamed Diſeaſes, and help to conſume theſe ſuperfluous Humours falling upon other parts of the Body, which are the cauſes of many other Diſeaſes.

XVI. *The Pouder of the dried Leaves or Roots.* Being taken inwardly, from a Scruple to a Dram, mixt with a little *Syrup* or any other fit Vehicle, it warms a cold and moiſt Stomach, ſtrengthens it, as alſo the other Bowels, cauſes a good Appetite and Digeſtion, and gives preſent eaſe in the Colick. It provokes the Terms, and cauſes eaſy Delivery to Women in Travel. Snuft up the Noſtrils, it cauſes Sneezing, by which means it many times eaſes the Megrim, Head-ach, and Tooth-ach. and gives relief in Apoplexies, Epilepſies, Lethargy, Carus, Palſy, &c.

XVII. *The Decoction or Infuſion of the ſame.* They have all the Virtues of the *Juice* and *Eſſence*, but in a much inferior Degree, and therefore may be given Morning and Night, to 2 or four Ounces at a time. They are excellent for Women in Labor. And by Bathing with them outwardly gives eaſe in the Gout, and all other pains proceeding from cold and moiſture.

XVIII. *The Cataplaſm of the Green Leaves or Roots.* Applyed to the Gout or Sciatica, they give preſent eaſe of the pain, and being continued (as the Phyſitian ſhall adviſe) will in ſome little time cure the ſame. It is alſo good againſt any ach or pain in any other part of the Body, cauſed by cold and moiſture.

XIX. *The Balſam or Ointment.* They have the Virtues of the *Cataplaſm*, but not altogether ſo powerful againſt the Gout; but being applyed they take away black and blew Spots, which come by Blows, Falls, or Bruiſes, as alſo all other Defœdations or Blemiſhes of the Skin.

XX. *The Oile of the Roots, made by Coction or Inſolation.* *Galen* ſays, That being rubbed on the parts of the Body (I ſuppoſe he means on the Breſt or Stomach and Belly, as alſo on the Back and *Spina Dorſi*) it helps ſuch as have the ſhaking Fits of Agues. It is without doubt, a very warming and comfortable Oil; and therefore of ſingular uſe againſt both Numb, and Dead Palſies, Convulſions, Cramps, and other like Pains and Aches.

XXI. *The Spirituous Tincture.* It is a moſt ſingular thing againſt the Colick, Pains of the Stomach, Sickneſs at Heart, Vomiting and Fainting. It has all the Virtues of the *Juice* and *Eſſence*, and may be given in Poſſet Drink, Broth, or Wine, Morning, Noon and Night, from 50 to 100 Drops, or more.

XXII. *The Acid Tincture of the Roots.* It radically cures the Plague or Peſtilence, and is a moſt excellent thing againſt all Peſtilential, Malign and Burning Fevers, of what kind ſoever. It ſtrengthens and fortifies the Stomach, cauſes a good Appetite and Digeſtion, reſiſts Poiſon, is good againſt Coughs, Colds, Aſthma's, and all obſtructions of the Lungs, or the other Viſcera, provokes the Terms in Women, as alſo Urine, and is profitable againſt the Strangury, Sand, Gravel, Stone, &c. in the Reins, Ureters and Bladder. Doſe ſo much as to give the Vehicle a pleaſant acidity, and may be taken as often as the Patient Drinks.

XXIII. *The Oily Tincture of the ſame.* It is prevalent againſt the Strangury, Sand, Gravel, Stone or Tartarous Matter in the Reins and Bladder, opens Obſtructions of the Womb, provokes the Terms, and facilitates the Birth of Women in Labor. It cleanſes, eaſes After-pains, and is profitable againſt the Gout, Colick and Palſie, being inwardly taken, and anointed on the *Spina Dorſi* and other parts affected. Doſe from 12 to 20, 30, or 40 Drops, or more, in a Vehicle proper againſt the Diſeaſe afflicting.

The Virtues of the fourth and fifth Kinds.

XXIV. *The Liquid Juice, and Eſſence of the Leaves or Roots of the* True Pellitory of Spain. Have all the ſame Qualities and Virtues of the *Common*, and that of the *Shops*, before declared; only with this difference, that as the *True Pellitory of Spain* is more potent and excellent than the *Common*, or that of the *Shops*; ſo alſo are theſe Preparations of this Plant, very much tranſcending them in their Effects.

XXV. *The Dryed Roots.* Chewed in the Mouth often, it eaſes the Vehement pain of the Teeth proceeding from an afflux of Cold Rheum upon them; and ſo uſed, it alſo draws away Rheum from ſore Eyes.

XXVI. *The Pouder of the Root.* Made into a *Bolus* by mixing it with a little *Mithridate*, or made into an *Electuary* with *Honey*, it is effectual againſt all cold and moiſt Diſeaſes of the Head, Brain, Lungs, Stomach, and other Bowels; It prevails againſt the Apoplexy, Falling Sickneſs, Vertigo, Megrim, Lethargy, Carus, Obſtructions of the Lungs, Coughs, Colds, Wheezings, Aſthma's, Colick, *&c.* Doſe from a Scruple to a Dram, Morning Faſting, and at Night at Bed time.

XXVII. *The Infuſion of the Root in Wine.* It has all the Virtues of the former *Infuſion* at *Sect.* 17. aforegoing, but this is much more powerful for all thoſe purpoſes and intentions: If the *Green* or *Dryed Root* is well bruiſed and Infuſed in *Vinegar*, and the Mouth Gargled therewith, it preſently gives eaſe in the moſt Violent Tooth-ach: and reſiſts the affluxes of Rheum from the Head to the Teeth, Eyes, Ears, Tonſils, Jaws, and other parts.

XXVIII. *The Oil or Ointment of the Root.* They are effectual to warm, or heat, comfort and ſtrengthen any part of the Body, Nerves, Tendons, or Muſcles, afflicted with cold and moiſt Humors, or which are affected with Cramps, Convulſions, Palſy, Gout, Sciatica, or the like. *They may be made of the green Roots, by many repeated Inſolations or Boilings*; and will be found very profitable againſt the Shaking and Dead Palſies, or any pain or ach proceeding from Cold, as aforeſaid. Being timely uſed, they are ſaid to prevent a Gangrene when approaching.

XXIX. *The Cataplaſm of the green Roots.* It effectually cures the Gout and Sciatica, if prudently applyed; and has all the Virtues of the *Cataplaſm of the Roots* of the former Kinds, ſpecified in *Sect.* 18. aforegoing.

XXX. *The Spirit of the Root.* It is Cordial, Anticolick, and Antipeſtilential; good againſt Fainting and Swooning Fits, Sickneſs at Heart, Belly-ach, or Griping of the Guts: It expels Wind out of the Stomach and Bowels, and admirably ſtrengthens the Stomach, cauſing a good Appetite and Digeſtion. Doſe a Spoonful or more in a Glaſs of Wine now and than upon occaſion.

XXXI. *The Spirituous Tincture.* It has all the Virtues of the *Spirit*, but Superior to it in efficacy, and may be given from half a Spoonful to a Spoonful in ſome proper Vehicle. It provokes the Terms in Women, facilitates the Birth, brings away the After-birth, and eaſes After-pains. Held for ſome little time in the Mouth, it eaſes the Tooth-ach. And Bathed upon parts affected with the Cramp or Convulſions, it warms and comforts the Nerves and Muſcles, and quickly cures the Diſeaſe.

XXXII. *The Acid Tincture of the Root.* It has all the Virtues of the former *Acid Tincture*, at *Sect.* 22. aforegoing; but with a more exalted efficacy and power. Held in the Mouth it gives preſent eaſe in the Tooth-ach. It ſtops Vomiting, and helps a nauſeouſneſs of the Stomach, or Loathing of Food; and is a ſingular Diuretick, breaking and diſſolving (ſo much as is in the Power of a Medicine to do, the Stone, and Gravel in the Reins, Ureters and Bladder. Being given to Children for ſome time in Broth or Water-Gruel, it cures the Rickets, and opens the Lungs, Liver, Spleen, and Reins, by which means the Morbifick Matter of that Diſeaſe is gradually carried off. Doſe from 20, to 30, 40, or 60 Drops, or ſo many as may make the Vehicle pleaſantly Sharp.

XXXIII. *The Oily Tincture of the ſame.* It has all the Virtues of the former *Oily Tincture*, at *Sect.* 23. aforegoing, but in a more prevalent manner, as being much more ſtrong and potent in its Operation. It gives admirable and preſent eaſe in the Colick and Strangury; and being very well bathed in upon the Hip in the Sciatica, it eaſes the Pain, and in a ſhort time Cures it: given to 30, 40, or 60 Drops (according to Age and other Accidents,) 2, or 3 Hours before the coming of the Fit of the Ague, it in a great meaſure prevents it; and by continuing it in the ſame manner, for ſome few times, it perfectly cures it. Held in the Mouth alſo, it gives preſent eaſe in the Tooth-ach.

CHAP. DLIV.

Of PENNYROYAL; *OR,* PUDDING-GRASS.

I. *THE Names.* It is called by the *Arabians*, *Alnam*, and *Alnegan:* in *Greek*, γλήκων, ϗ βλήκων: in *Latine*, *Pulegium*, *& Pulejum:* in *Engliſh*, *Pennyroyal*, alſo *Pudding-Graſs*; and in the Weſt Parts, about *Exeter*, *Organs.*

II. *The Kinds.* The Six following we ſhall chiefly conſider, *viz.* 1. *Pulegium Vulgare* (*quod flos*

flos recentis Herbæ incensus Pulices necat &c.:) Because it kills Fleas being Burned:) Our Common Pennyroyal. 2. *Pulegium regium vulgare majus*, Great Pennyroyal. 3. *Pulegium sylvestris densis*, Thick or double Pennyroyal. 4. *Pulegium mas Flore albo Plinij*, White Flowered Pennyroyal. 5. *Pulegium angustifolium Bauhini & Lobelij*; *Pulegium Cervinum Gesneri*; *Pulegium alterum foliis oblongis Dodonæi*; Narrow Leav'd, or Hearts Pennyroyal. 6. *Pulegium foliis Nummularia Bauhini*, Round Leav'd Pennyroyal.

The Descriptions.

III. *The first*, or Our Common Pennyroyal. *Its Root is Bushy, long and Fibrous, creeping under the upper surface of the Earth. From whence spring forth many weak round Stalks, divided into several Branches, rather leaning or lying upon the Ground, than standing upright. On which are set*

Pennyroyal.

at several Joints, small, roundish, dark green Leaves. The Flowers of that which grows in Gardens, *are purplish for the most part, yet some on that which grows* Wild, *are white, or more white than purple, set in rundles about the tops of the Branches. The Stalks shoot forth small Fibres or Roots, at the Joints, as it lies upon the Ground, fastning it self therein quickly, and over spreading any Ground, more especially if it grows in the Shade, or in moist places: and it is encreased by breaking off the sprouted Stalks, and putting or thrusting them into the Earth.*

IV. *The second*, or Great Pennyroyal. *Its Root is like to the former. Its Stalks and Branches rise higher, and creep not upon the Ground so much as that does. It is greater than that, and abides so being brought into our* Gardens, *from abroad, where it grows Wild in our* Fields *and* Commons; *it differs indeed but little from the first, but in the largeness of its Leaves and Stalks, and in its growing up higher. The Leaves here of are purple, and grow in rundles about the Stalks, as the others do.*

V. *The third*, or Thick or double Pennyroyal. *This differs very little from the former, either in Roots, Stalks, Leaves, Flowers, or manner of growing; saving that the Leaves are somewhat smaller, and also thicker set on the Stalks, and the Branches grow closer together.*

VI. *The fourth*, or White Flowered Pennyroyal. *The Roots creep under the Ground, with a multitude of Fibres: and this Kind grows more upright with its Stalks than the former, and sometimes a foot higher also, having Leaves thereon, set by couples like it: and in some places, other smaller Leaves likewise growing with them: The Flowers (as the former) grow in rundles, or wharls, round about the Stalks, at the several Joints, but are whitish white; and so abide, being transplanted out of the* Field, *and Planted in* Gardens. *The Smell and Taste of this Plant, as also its Medicinal use, are altogether the same with the first, and other Kinds, and every way as acceptable.*

VII. *The fifth*, or Narrow Leav'd, or Hearts Pennyroyal. *This fine and delicate Plant, has creeping Fibrous Roots under Ground, but shoot forth longer Sprouts than the former Kinds, from whence spring forth many tall, hard, upright Stalks, on which are set at equal distances, many small long and narrow Leaves, all along the Branches up to the Tops. The Flowers grow round about the Stalks, at the Joints with the Leaves, at many of the spaces up towards the height, of a pale purplish color: and the Smell and Taste hereof is stronger and much more pleasing also.*

VIII. *The sixth*, or round Leav'd Pennyroyal. *It has a small Fibrous creeping Root, which sends up slender Stalks, almost as upright as the last: having the Leaves set by couples at each Joint, which are small, and round like unto those of* Money-wort, or Herb Two-Pence, *but much less. The Flowers grow in rundles or rows as the others do, encompassing the Stalks, which are of a pale blewish color. The Smell of this Plant is much more pleasant than that of the* Common *sort.*

IX. *The Places.* Tho' all and every one of these Species or Kinds of *Pennyroyal* grow with us, in our *Gardens*, yet several of them grow also Wild in our *Fields*. The first is Common in many watery or moist places of our Land, which yet for its most excellent use is almost every where Nurst up in *Gardens*. The second is found Wild in *Essex*, in divers Places of the High way, between *London* and *Colchester*, and thereabouts, and yet more abundantly in other Countries, from whence it is Transplanted also into *Gardens*. The third has also been found growing Wild, in many places of *England*, and like the others Transplanted, and made a *Garden* Plant. The fourth is a Native of *Italy*, and found growing in several places of *Piedmont*, from whence it has been brought to us. The fifth grows in moist and mooriſh Grounds about *Mompelier* in *France*, where the Inhabitants scarcely use any of the other Kinds, tho' they have them in great Plenty. The sixth grows in the *Gardens* at *Padua*, from whence it has been Transplanted to us.

X. *The Times.* They all Flower from the beginning of *June* to the end of *August*, and sometimes later.

XI. *The Qualities.* *Pennyroyal* is of Subtil parts as *Galen* says: It is hot and dry in the third Degree:

gree, Aperitive, Abſterſive, Carminative, Digeſtive, Diſcuſſive, Diuretick, Inciſive, Vulnerary, Cephalick, Neurotick, Stomatick, Splenetick, Nephritick, Hyſterick, Emmenagogick, Sudorifick, Alexipharmick, Analeptick and Spermatogenetick.

XII. *The Specification.* It prevails againſt Convulſions, Spaſms, Poiſon, the Bitings of Serpents, or other Venomous Creatures, Coughs, Colds, Swellings in the Throat, Jaundice, Colick, Obſtructions of the Terms, Rickets in Children, Palſie, *&c.*

XIII. *The Preparations.* You may have therefrom, 1. *A Liquid Juice.* 2. *An Eſſence.* 3. *A Decoction or Infuſion in Wine.* 4. *A Pouder.* 5. *An Errhine.* 6. *A Balſam, Ointment, or Oil.* 7. *An Electuary.* 8. *A Diſtilled Water.* 9. *A Spirituous Tincture.* 10. *An Acid Tincture.* 11. *An Oily Tincture.* 12. *A Spirit.* 13. *A Diſtilled Oil.* 14. *Poteſtates or Powers.* 15. *A Cataplaſm.*

The Virtues.

XIV. *The Liquid Juice.* It powerfully digeſts, opens, and provokes the Terms in Women, expels the Birth, Dead Child and After-Birth; it ſtops Vomiting, eaſes the pain and gnawing of the Stomach; is profitable againſt Convulſions, reſiſts Poiſon, and cures ſuch as are bitten or ſtung by Serpents, Mad-Dogs, Scorpions, or other Venomous Creatures. Doſe 2, 3 or 4, Spoonfuls at a time, Morning, Noon, and Night, in a Glaſs of Wine, or other fit Vehicle.

XV. *The Eſſence.* It has all the Virtues of the *Liquid Juice* exalted: is good againſt Aſthma's, Coughs, Colds, Wheezing, Hoarſeneſs, and moſt other Diſeaſes of the Lungs, cauſing an eaſy expectoration (if taken with Honey) it reſiſts Melancholy and cauſes Cheerfulneſs: and drunk with the *Juice of Sivile Oranges, Limons*, or choiſe *Vinegar*, It is good againſt Fainting, and Swooning Fits, Vapors, and ſuch like. It helps the Rickets in Children, is good againſt the Leproſy, opens the obſtructions of the Liver, Pancreas and Meſentery, and eaſes the pain of the Spleen. Being drank in choiſe ſtrong Wine, it gives eaſe in the Colick, and eaſes After-pains of Women lying in. Conſtantly taken for ſome time, it leſſens the Fatneſs and Corpulency of the Body, making the Patient Leaner: yet at the ſame time, it much encreaſes Seed in both Sexes, and ſtrongly provokes Luſt. Doſe 2 or 3 Spoonfuls at a time in a Glaſs of Wine, Morning and Night.

XVI. *The Decoction, or Infuſion in Wine.* It has all the Virtues of the *Juice* and *Eſſence*, but nothing near ſo powerful. It warms the coldneſs of the Stomach and Womb, and other Viſcera, helps againſt the Swelling and Hardneſs of the Womb; cleanſes foul Sores and Ulcers, and mixt with Honey cauſes them to Digeſt. It is good againſt black and blew Eyes, and diſcolorings of the Skin, being outwardly applyed. If a little *Sal Prunella* be diſſolved in it, and it be held in the Mouth, it eaſes the Tooth-ach. It is good againſt Faintings, Swoonings, and Hyſterick-Fits, and provokes Urine ſtrongly. Uſed as a Gargariſm with Honey, it cures Sores, Cankers, and Ulcers of the Mouth and Throat. Drank pretty plentifully it is good againſt the Strangury, Dropſy, and Jaundice, helps to quicken and clear the Eyeſight, is profitable againſt the Falling-Sickneſs, and eaſes all ſorts of pains of the Head. Doſe 6, or 8 Ounces, Morning, Noon, and Night.

XVII. *The Pouder. It is made of the dried Herb when in Flower.* It has all the Virtues of the *Juice*, *Eſſence* and *Decoction*, but acts not with that Celerity. Doſe Morning and Night, from half a Dram to a Dram in Wine. Mixed with a little Honey and *Turpentine*, and applyed to Sores and Ulcers, it digeſts and cleanſes them.

XVIII. *The Errhine.* It is thus made *Take Pouder of Tops of Pennyroyal when in Flower, an Ounce; Aſarabacca Leaves in fine Pouder; Reſinous Scammony in fine Pouder, of each half an Ounce: mix them.* Snufft up the Noſtrils Medicinally, it attracts Humors both thick and thin out of the Head, and clears it effectually, by which means it is profitable againſt the Megrim, Headach, Lethargy, Carus, Sleepineſs, Dullneſs, Drowſineſs, Apoplexy, Epilepſy, Vertigo, Convulſions, Palſies, and other Diſeaſes of the Head, Brain and Nerves, proceeding from cold and moiſture. And if it is taken inwardly twice a Week in the Morning Faſting, from a Scruple to a Dram, or more, according to Age and Strength, it carries off the Morbifick cauſe of all the aforenamed Diſeaſes, and ſo the more effectually contributes to their Cure.

XIX. *The Electuary. It is made of the Errhine, with three times its weight of Honey: adding withall Pouder of Birth-wort Roots, an equal quantity to the Scammony.* It is given inwardly from one Dram to three; and has all the Vertues of the *Juice*, *Eſſence*, and *Errhine* before enumerated: Applyed to old running Sores, Fiſtula's, and putrid Ulcers, it cauſes Digeſtion, eaſes the pain, prevents their eating and ſpreading farther, and very much induces their healing. There is no better Remedy againſt Kibed Heels, than to apply the *Dry Pouder of the Errhine* firſt, and then over it a Plaiſter of this *Electuary*.

XX. *The Balſam, Ointment, or Oil, made by Inſolation or Boiling.* Applyed to ſuch as are troubled with the Gout, they quickly eaſe the pain: warm the parts, and take away cold griefs of the Joints; They gently draw, digeſt alſo, cleanſe, and heal old running Sores, and putrid Ulcers.

XXI. *The Diſtilled Water.* It has the Virtues of the *Juice*, *Eſſence*, and *Decoction*, but in a much Inferior Degree. Mixed with Honey, it is a good Ophthalmick, for Blood-ſhot, Watering and Sore Eyes: and ſo uſed as a Gargle, it heals Sores and Ulcers in the Mouth and Throat: otherwiſe it may ſerve as a Vehicle for conveying the *Juice*, or *Eſſence*, or other Preparations of the Plant down into the Stomach.

XXII. *The Spirituous Tincture.* It has all the Virtues of the *Juice* and *Eſſence*, being given Morning and Evening, from 1 Dram to 2, or 3; in a Glaſs of Wine, or ſome other convenient Liquid. It eaſes the Gnawing of the Stomach, and cures inward Convulſions of the Bowels. Outwardly bathed upon the Head, it eaſes the Headach: and bathed upon other parts, it preſently eaſes their pain, and alſo reſtores the parts troubled with the Cramp. Taken for fourty Days or more together, in *Juice* or *Water of Black Cherries*, it cures the Falling-ſickneſs, and is alſo profitable againſt the Vertigo, Lethargy, Carus, and other like dull Diſeaſes of the Head and Brain.

XXIII. *The Acid Tincture.* It admirably reſtores the Tone of the Stomach being hurt; ſtops Vomiting; deſtroys Putridity, and allays the heat of Fevers. It cuts thick and tough Flegm, and cauſes it to be eaſily expectorated. It is a ſingular Diuretick, and therefore profitable againſt the Strangury, Sand, Gravel, Stone, or Tartarous Mucilage in the Reins, Ureters and Bladder. It

takes

takes away ſtoppages of the Stomach and Lungs, and cauſes eaſy Breathing; it creates a good Appetite, and a ſtrong Digeſtion, expelling Wind and Vapors, out of the Stomach and Bowels. It is alſo profitable againſt all putrid, non-putrid, malign, and peſtilential Fevers, and preſtigates even the Plague, or Peſtilence it ſelf. It may be given in all that the Patient Drinks, whether Ale, Beer, Wine, or Barly-Broth, to a grateful acidity.

XXIV. *The Oily Tincture.* It is good againſt the Gout, Sciatica, Rheumatick Pains, Cramps, Convulſions, and Palſie, being very well anointed Morning and Evening upon the parts affected, as alſo (in the caſe of the Palſie) all along the Back Bone. Taken inwardly it Potently provokes Urine and the Terms in Women, and is good againſt the Strangury, or any ſtoppage of Urine from Tartarous, Gravelly or Lapidiſcent Concretions. It haſtens the Birth of Women in Labor, brings away the Dead Child and After-Birth: and cauſes a plentiful cleanſing afterwards. In the cure of Palſies, as well as to be uſed outwardly, it is to be taken alſo inwardly, becauſe it not only warms and comforts the Nerves and their Original, but carries off the Morbifick Cauſe by Urine. Doſe from a Scruple to a Dram or two Drams in any proper Vehicle, Morning and Night.

XXV. *The Spirit.* It is a moſt admirable Cordial, and an excellent reviver of the Spirits Natural, Vital and Animal. It chears the Heart, comforts Nature, ſtrengthens the Brain and Nerves, is good againſt Fainting, Swooning and Hyſterick Fits; and reſtores the whole Humane Frame, tho' put into the greateſt diſorder. It is a ſingular thing againſt Convulſions of all Kinds, and abſolutely cures them in Children, even when Death ſeems to ſtand at the Door. Doſe from a Dram to 2, 3, or 4 Drams, in ſome of the *Diſtilled Water*, or rather in a Glaſs of Wine, 2, 3, or four times a Day, or as often as is needful.

XXVI. *The Diſtilled Oil.* Inwardly given, and outwardly applyed, it cures Convulſions, the Falling-Sickneſs, Palſy, pains of the Head, Megrim, Vertigo, Lethargy, Carus, Gout, Sciatica, and has, in a word, all the Virtues of the *Juice*, *Eſſence*, *Tincture* and *Spirit*, but in a much more exalted manner. Doſe from 10 Drops to 20, dropt firſt into Sugar, and well mixt with it, and then taken in a Glaſs of Wine, Morning and Evening: as it powerfully provokes Urine and the Terms, ſo, when the Birth is near, it cauſes the Child to be brought forth into the World in a Moment, expels the dead Child and After-birth, and prevents and cures After-pains.

XXVII. *The Poteſtates* or *Powers.* They conſiſt of moſt ſubtil parts, cut, attenuate, open, diſſolve, provoke Urine, break the Concreetions of Gravel and Slime, and expel them, provoke the Terms, facilitate the Birth, whether living or dead, force away the After-Birth, and miraculouſly eaſe and take away After-pains. They are Stomatick, Cordial, Pectoral, give preſent eaſe in the Colick, open obſtructions of the Lungs, being very good againſt Coughs, Colds, Aſthma's, Hoarſeneſs, Wheezing and ſhortneſs of Breath. They are good in an Inveterate Head-ach, Megrim, Vertigo, Falling-Sickneſs, Apoplexy, Convulſions, Palſy, Cramp, Numbneſs, Lameneſs, and weakneſs of the Nerves, Muſcles and Joints, being inwardly taken, and outwardly bathed therewith. They are powerful againſt all manner of Aches, Pains, Strains, or weakneſs of any part, as alſo againſt an inveterate Gout, Sciatica or Rheumatiſm, proceeding from a cold and moiſt cauſe. They are an Antidote againſt Poiſon, the bitings of Mad Dogs, Serpents and other Venomous Creatures. They prevail againſt the Malignity of the Plague, and all other Malign and Peſtilential Fevers, as alſo againſt Scorbutick Boils, Breaches, Scabs, Scurf, Morphew, Spots, Pimples, and other like Symptoms, inwardly taking them every Day for ſome time, and outwardly bathing therewith Morning and Night. They provoke Sweat powerfully, and are a great Alexipharmick in the French Pox, being daily taken in Ale, Wine, Whey or thin Broth, after the manner of Diet; and have performed as much as any *Guaiacum* Diet could do, they being a kind of Specifick againſt that Diſeaſe and its Inveterate and Malign Symptoms. They are ſaid to cure Barrenneſs in Man or Woman, (if there is not a defect of parts) cleanſe, ſtrengthen and fortifie the Womb, and are a Specifick for the Diſeaſes of the Genitals. They are prevalent againſt Catarrhs, and cold Rheums, help defects of the Eye Sight, cure a Stinking Breath, eaſe Pains, and ſotten hard Tumors of the Liver, Spleen, or Meſentery, by bathing thoſe Regions therewith, for they warm, ſtrengthen, and comfort even all the parts of Mans Body. Doſe from 30 to 60 or 100 Drops, or more, as the Prudence of the Phyſician ſhall Preſcribe, and that 2 or 3 times a Day at leaſt (And in caſe of the *French* Pox, 5 or 6 times a Day) in Ale, or Wine, or Wine and Water mixt, or in ſome *Syrup* or *Cordial Julep*, and ſo to be continued for 2 or 3 Weeks; or 2, or 3 Months, as the exigency of the Diſeaſe may require; outwardly bathe the parts affected with them twice or thrice a day as long as you ſhall ſee need for their uſe.

XXVIII. *The Cataplaſm.* Made of the Green Herb, and applyed, it is good againſt the Gout and Sciatica, Blows, Strains, and other pains of of the Joints. It alſo takes away ſpots or marks in the Skin; and applyed to the Regions of Liver or Spleen, it eaſes the pains in thoſe parts; and to the Region of the Womb, it helps the ſwelling and hardneſs of the Mother. Applyed with Vinegar, it cauſes eating Ulcers to digeſt, and cleanſes ſuch as are filthy or putrid: and it is ſaid to be profitable alſo againſt the Leproſy, Morphew, and other like Defedations. Applyed with *Barly Flower*, it heals Burning by Fire, and Scalding with Water. Applyed with Vinegar to the Fore-head and Noſtrils, it is profitable againſt Carus, Lethargy, and Epilepſy, giving preſent relief in the ſame.

PENNY-WORT WALL, *ſee* Navel-wort, *Chap.* 515.

CHAP. DLV.

Of PEONY.

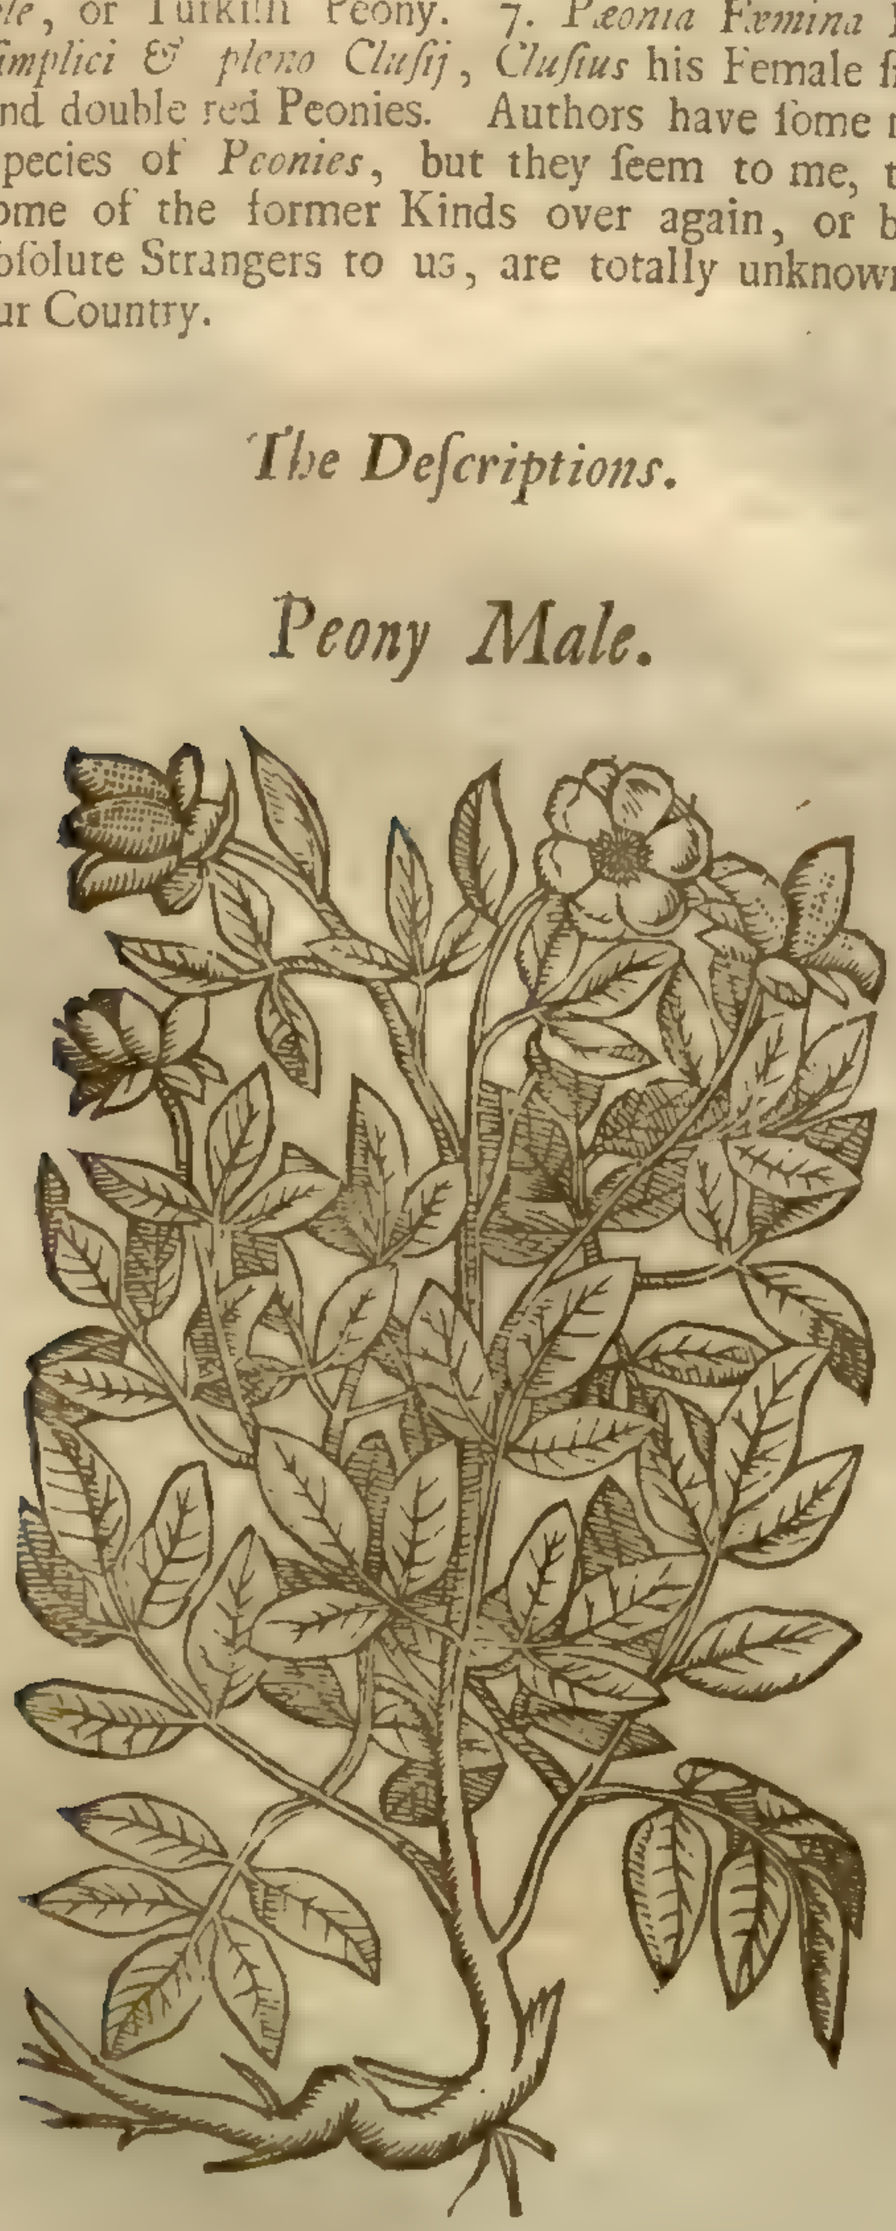
I. *THE Names.* It is called in *Arabick*, *Feonia*: in *Greek*, Παιονία: (from *Paon*, a famous Phyſician in his time) and Γλυκυσίδη: in *Latine*, *Pæonia*, and *Glycyſide* or *Dulciſide* (from the red Grains in the *Pomgranate* called *Sida*.) It has obtained alſo many other *Greek* and *Latine* Names, as, *Pentorobos* or *Pentoboros*, *Orbelion*, *Hæmagogon*, *Pæonion*, *Panthiceraton*, *Theodonion*, *Selenion*, *Selenogonon*, *Agalophotis*, *Idæus Dactylus*,

Roſa Fatuina, *Herba Caſta*, *Haſta Regia*, *Roſa Aſtiarum*, with ſome others; but *Pæonia*, is the general Name, which bears away the Bell: in *Engliſh Peony*, and *Piony*.

II. *The Kinds.* Tho' there are many Species of this Plant, yet there are but two Principal Kinds, *viz.* *Pæonia Mas*, the Male Peony; and *Pæonia Fœmina*, the Female Peony. Of the *Peonia Mas*, or Male Peony, we know but of one only Species, which is thus diſtinguiſhed from the Female. The Leaf of the Male is whole with out any particular diviſion, notch, or dent, on the edge, like to thoſ of the *Wall-Nut-Tree*, its Roots are long and round, divided into many Branches, ſomething like to the Roots of *Gentian* or *Elecampane*, and not Tuberous at all. *The Female* (of which there are a great many ſorts) has its Leaves cut in or divided into parts, more or leſs, and has Tuberous Roots or Clogs, like thoſe of the *Aſphodil*, with many great, thick, round pieces, hanging or growing at the end of ſmaller Strings, and all joined to the top of the main Root. From what has been ſaid, theſe following Kinds are eminent, *viz.* 1. *Pæonia Mas*, the Male Peony, which is a ſingular Species, as aforeſaid. 2. *Pæonia Fœmina vulgaris Flore ſimplici*, the Common Female Peony ſingle Flowered. 3. *Pæonia Fœmina Vulgaris Flore pleno rubro*, the Common double red Peony. 4. *Pæonia Fœmina Flore carneo ſimplici*, the Single bluſh Peony. 5. *Pæonia Fœmina Flore pleno albicante*, the Double bluſh Peony. 6. *Pæonia Fœmina Byzantina Flore ſimplici*, the Single red Peony of *Conſtantinople*, or Turkiſh Peony. 7. *Pæonia Fœmina Flore ſimplici & pleno Cluſij*, *Cluſius* his Female ſingle and double red Peonies. Authors have ſome more Species of *Peonies*, but they ſeem to me, to be ſome of the former Kinds over again, or being abſolute Strangers to us, are totally unknown in our Country.

The Deſcriptions.

Peony Male.



III. *The firſt, or* Male Peony. *Its Roots are great, Thick, and long, ſpreading in the Ground, and running down pretty deep. It riſes up with many brown Stalks, on which do grow winged Leaves,* viz. *many fair green, and ſometimes reddiſh Leaves, one ſet upon another on a Stalk, without a particular Diviſion of the Leaf at all. The Flowers grow at the tops of the Stalks, conſiſting of five or ſix broad Leaves, of a fair, purpliſh, red color, with many yellow Threads in the middle ſtanding about the Head, which after riſes up to be the Seed Veſſels, divided into two, three, or four rough crooked Pods, like Horns; which when they are full ripe, open, and turn themſelves down one edge to another backwards, ſhewing within them divers round black ſhining Seed, which are the true Seed, being full and good, and having alſo many red or crimſon Grains, which are lank and idle, intermixed among the black, as if they were good Seed, which makes them ſhow Beautifully.*

IV. *The ſecond, or* Common Female Peony ſingle Flowered. *The Root conſiſts, as we ſaid before, of many thick and ſhort tuberous Clogs, faſtned at the ends of long Strings, and all from the Head*

Peony Female.

of the Root, which is thick and ſhort, and Tuberous alſo, of the ſame or like ſmell with the Male. *This* Common Female Peony, *has many Stalks, with more ſtore of Leaves on them, than thoſe of the* Male *have: The Leaves alſo are not ſo large, but divided on the edges or deeply cut in, ſome with great and deep, others with ſmaller Cuts or Diviſions, and of a dark or dead green color: The Flowers are of a Strong Heady Smell, and uſually ſmaller than thoſe of the* Male, *and ſomething more purple, tending to a murry color, with yellow Thrums about the Head in the middle, as the* Male Kind *has. The Heads or Horns with Seed in them are like alſo but ſmaller. The Seed is black, but leſs ſhining.*

V. *The*

V. *The third, or* Common double red Peony. *The Roots are Tuberous, like unto the former* Female. *This* double Peony, *as well as the former* single, *is so frequent in every* Garden *of Note, thro' every Country, that it is almost labor in vain to describe it. It is very like unto the former* single Female Peony, *both in its Stalks and Leaves, but that it grows something higher, and the Leaves are of a fresher green color. The Flowers grow at the tops of the Stalks, and are very large, thick, and double; so fair, beautiful, great, and double, that no other Flower comes near them; but abide not blown above* 8 *or* 10 *Days. They are of a more reddish purple color, than the former* Female Kind, *and of a sweeter Smell. After the Flowers are past, the Cods of Seed or Grains follow, which sometimes prove abortive Seed, and sometimes good Seed, which being Sown, bring forth Plants, some of them bearing single Flowers, and some of them double Flowers, as Nature is pleased to dispose them.*

VI. *The fourth, or* Single blush Peony. *Its Roots are like the other* Female Peonys. *Its Stalks are higher, and its Leaves of a paler, or whiter green color than the* Female Blush *next following, and more white underneath; so that it is manifest, that it is of another kind, and not sprung from the Seed of the* double Blush, *as some have thought; its Leaves also have many Veins, which are somewhat discolored, or differing from the color of the Leaf thro' which they run. The Flowers are very large and single, consisting of five Leaves for the most part, of a pale flesh, or blush color, with an Eye of yellow dispersed or mixed therewith, having many whitish Threads, tipt with yellow Pendents, standing about the middle Head.*

VII. *The fifth, or* Double blush Peony. *Its Roots are like unto the former* Female Kinds, *but something longer, and of a brighter color on the out side. This* double blush Peony *has not its Stalks so high as the* double Red, *but something lower and stiffer, bearing such like winged Leaves, cut in, or divided here and there in the edges, as all these* Female Kinds *are, but not so large as the last. The Flowers are smaller, and less double by much, than the former* double Red, *of a faint, shining, crimson color at the first opening, but decaying, or growing paler every Day; so that after it has stood long, (for this Flower sheds not its Leaves in a great while) it will change something whitish; for which reason some have ignorantly called it, the* double white Peony. *The Seed or Grain, which it some times bears, is like to the Seed of the former* Female Kinds.

VIII. *The sixth, or* Single red Peony of *Constantinople, or* red Turkish Peony. *The Roots of this Kind, have longer Clogs, and not so short, as those of the* ordinary Female Kind, *and of a paler color on the out side. This Plant is very like in all things unto the* double red Peony, *but that the Flowers hereof are single, and as large as the last, and that is larger than either the* single Female, *or the* Male Kind. *It consists of eight Leaves, of a deeper red color, than either the* single *or* double Peonys, *and not purplish at all; but rather of the color of an* ordinary red Tulip, *standing close and round together.*

IX. *The seventh, or* Clusius *his* Female single and double red Peonys, *ex semine Floris pleni rubri vulgaris Natæ,* Clusius *says, That having in some Years Seed from the* common double Red Peony, *(which is not very usual) he Sowed them, and within* 3 *Years he had Plants which bore Flowers, some single, and some double. Of the single Sorts, one bore Flowers, for color most like unto the Mother, but was single, consisting only of six Leaves, as the* Ordinary *or* Common Female *does. Another bore a larger Flower, of eight Leaves, whose color was of a deeper red, drawing somewhat to blackness. A third bore a double Flower, as great as the Mother Plant, or greater, and of the same color. A fourth was like the Mother Plant in Leaves, and its Flower was double, but lower, and not so thick Leaves, the color of which was of a deep red, being near the largeness of the* double Blush, *having some black Veins in those Leaves which grew in the middle.*

X. *The Places.* All these several sorts of *Peonies* are originally Natives of Foreign Countries, and have been brought home to us by Travellers, and made Denizons in our *Gardens*, where they have grown and flourished so long, that they are now become Natives of our Land also: and we nourish them, as well for the Beauty and Ornament of their Flowers, as for their most excellent and famed Medical Virtues.

XI. *The Times.* They all Flower in *May*; some of which Flowers abide but some few Days, whilst others abide many Weeks.

XII. *The Qualities. Peony* is temperate in respect to heat or cold, and dry in the first Degree, gently Styptick, or Astringent, Abstersive, Anodyn and Strengthening; Cephalick, Neurotick, Hysterick and Emmenagogick.

XIII. *The Specification.* The *Male Peony* has been oftentimes (even for many Ages) found a certain Cure for the Epilepsie or Falling-Sickness: it also provokes the Terms in Women, and is profitable against the *Ephialtes* or Night-Mare.

XIV. *The Preparations.* You may have, 1. *The fresh or Male green Root.* 2. *A Juice or Essence of the same.* 3. *A Pouder of the same Male Root.* 4. *An Infusion of the said green Male Root.* 5. *A Pouder of the black Grains or Seeds.* 6. *A Syrup of the Flowers.* 7. *A Distilled Water from the Flowers or fresh and green Root.* Where Note, That all these *Preparations* are spoken of the *Male Kind*, that being the only and truly effectual Plant for all the purposes intended; which yet is much more scarce or rare than the Plants of the *Female Kind:* But for want of the *Male Species*, Physicians and Apothecaries often use the *Female*; which tho' probably it may be good for the same purposes, yet doubtless is much weaker in its effects, and therefore cannot be attended with equal Success.

The Virtues.

XV. *The fresh or green Root of the* Male Kind. It is affirmed by *Galen* and others, that a good or large piece of it hung or worn about the Neck of a Child troubled with the Falling-Sickness, will cure it: That a Child was freed from that Disease, that for eight whole Months had worn it about its Neck; and then being taken away for tryal of the Matter, the Child fell into the Disease again; but having a fresh Root hung about its Neck again, he became afterwards perfectly cured.

XVI. *The Juice, or Essence of the* Male *Root.* Either of these are much more available for the cure of the Epilepsie than the Amulet hung about the Neck: it may be given to Children from one Spoonful to two; and to elder Persons from two to four Spoonfuls, in a Glass of Red *Barcelona*, or Red *Port* Wine, Morning and Evening, some few days before and after the Full Moon; and if it

is given ſome few Days before and after the Change likewiſe, it may be ſo much the better; either of theſe *Preparations*, have been found profitable, and more available in elder Perſons, than ſome others, becauſe they have more ſtrength and efficacy with them. They provoke the Terms alſo in Women, where they have been ſtopt, and are effectual for ſuch as have not been ſufficiently cleanſed after their Labor, and are alſo troubled with Vapors, or Fits of the Mother. They are profitable alſo to be given to ſuch as are troubled with the *Incubus* or Night-Mare, called by *Pliny*, *Suppreſſio Nocturna*, being a Diſeaſe which affects People in their Sleep, or between Sleeping and Waking, ſuppreſſing both Voice and Motion, and in a meaſure the Breath likewiſe. It is truly good for ſuch as are troubled with Melancholy, yea, with a deep Melancholy, and affected with Melancholy Dreams.

XVII. *The Pouder of the* Male *Root.* It may be given from a Dram, to a Dram and half, or two Drams, in a Glaſs of Red Wine as aforeſaid, againſt the Epilepſy, *Incubus*, Melancholy, and other Diſeaſes of the Head and Brain, and that Morning and Evening, at the times before directed: but if it is given for cleanſing of Women in Child Bed, provoking the Terms, facilitating the Birth, *&c.* it ought to be given in White *Port*, or White *Lisbon* Wine, and that in the largeſt Doſe.

XVIII. *The Infuſion or Decoction of the green* Male *Root.* The Root is to be taken and waſhed clean, and then ſtamped well, and put to Infuſe in choiſe *Canary* for three or four Days, and then ſtrained out, and ſo given firſt and laſt, a good draught at a time for ſeveral Days together, before and after the Full Moon, it is ſaid to cure the Falling-Sickneſs, eſpecially if there is a due and orderly Preparation of the Body beforehand, with Poſſet-Drink made with *Betony*, as the Learned Phyſitian ſhall direct. Theſe have all the other Virtues of the *Juice* and *Eſſence*, and are likewiſe available in older Perſons, if the Diſeaſe *(i. e.* the Epilepſy*)* be not grown too old and paſt Cure.

XIX. *The Pouder of the black Grains or Seeds of the* Male Kind. Given from half a Dram to a Dram and half in Styptick Red Wine, it prevails againſt the Epilepſy, as the Root aforeſaid does; beſides it effectually ſtops Fluxes of the Belly, as Diarrhœas, Dyſenterias, Lienterias, and the Hepatick Flux, very much ſtrengthen the Head, Brain and Bowels: it alſo cures the *Ephialtes* or *Incubus*, and other Diſtempers of the Brain: *Matthiolus* ſaith, It is available to reſtore Speech to ſuch as have loſt it.

XX. *The Syrup of the Flowers.* It has the Virtues of the *Juice*, *Eſſence*, and *Infuſion*, but in a much weaker Degree, and therefore ought to be given from 2 to 4 Spoonfuls, Morning and Night, in a Wine proper for the purpoſe.

XXI. *The Diſtilled Water of the Flowers or green Roots.* It has all the former Virtues, but very much weaker, and therefore may be given from 4 to 8 ounces or more, Sweetned with the *Syrup of the Flowers*; and is uſed alſo as a Vehicle to convey ſome of the former *Preparations* in.

XXII. *Nota.* The skilful *Botaniſt* and *Apothecary* is to take care, in ſeeking after, and chooſing the *Male Kind*, that he be not cheated with that of *Tragus*, which certainly is no *Peony*, but a kind of *Fraxinella*, or *Baſtard Dittany*.

CHAP. DLVI.

Of PEPPER, Guinny *or* Indian.

I. *THE Names.* It is called in the *Indian* Language, *Axi:* in *Greek*, Καψικὸν (ἀπὸ τοῦ καπτω, *Mordeo:*) in *Latine*, *Capſicum*, *Capſicum Americanum*, *Capſicum & Piper Indicum*, *& Americanum:* in *Engliſh*, *Guinny Pepper*, and *Indian Pepper.* It is generally thought to be the *Siliquaſtrum Plinij*, *(à Siliquis quas producit)* and *Piperitis* of him alſo *(quia fructus Piperis ſapore & acrimonia ſit:)* *Capſicum Alluarij*; *Zingiber Caninum Avicennæ*; *Piper Indicum & Braſilicum*, or *Braſilianum*, *Piper Calecuthium & Hiſpanicum*, and by many *Piper Guinea*, as tho' it came originally from thence, tho' in truth, it came to us in theſe Northern Climates, from the *Weſt Indies*: but I deny not, that it grows in *Guinea* alſo, for that I have had the report thereof, from Eye Witneſſes.

II. *The Kinds.* There are many Species of this Plant, ſeveral of which grow with us in *England*; and moſt, if not all of them, in ſome of our Plantations in the *Weſt Indies*; for which reaſon we ſhall take notice of, and Deſcribe theſe following, *viz.* 1. *Capſicum majus vulgatius oblongis ſiliquis*, *Capſicum longum*, *Capſicum rubrum*, *& Siliquaſtrum majus Fuchſij*, *Piper Indicum majus Matthioli*, Our moſt Common Guinny Pepper with long red Cods. 2. *Capſicum Pyramidale erectum majus*, The great upright Spire faſhioned Guinny Pepper. 3. *Capſicum Pyramidale erectum minus*, The leſſer upright Spire faſhioned Guinny Pepper. 4. *Capſicum Pyramidale erectum exiguum*, The very ſmall or ſmalleſt Pyramidal Guinny Pepper. 5. *Capſicum Cordatum erectum majus*, The greater upright Heart faſhioned Guinny Pepper. 6. *Capſicum Cordatum erectum minus*, The leſſer upright Heart faſhioned Guinny Pepper. 7. *Capſicum Cordatum propendens*, The pendulous, or hanging Heart faſhioned Guinny Pepper. 8. *Capſicum Siliqua Olivaria propendens*, The hanging *Olive* faſhioned Guinny Pepper. 9. *Capſicum Siliqua Olivaria erecta*, The upright *Olive* faſhioned Guinny Pepper. 10. *Capſicum longum erectum majus*, The greater long and upright Guinny Pepper. 11. *Capſicum oblongum majus Siliquis recurvis*, The greater crooked or Horned Guinny Pepper. 12. *Capſicum oblongum minus Siliquis recurvis*, The leſſer crooked or Horned Guinny Pepper. 13. *Capſicum bifurcata Siliqua*, Forked, or double pointed Guinny Pepper. 14. *Capſicum rotundum minus Braſilianum*, Small round Guinny Pepper. 15. *Capſicum rotundum majus ſurrectum*, The greater round upright Guinny Pepper. 16. *Capſicum Siliqua rotunda Ceraſorum*, The round *Cherry* faſhioned Guinny Pepper. 17. *Capſicum Siliqua lata & rugoſa*, Broad crumpled codded Guinny Pepper. 18. *Capſicum Siliqua flava breviore*, The ſhorter Gold yellow Guinny Pepper. 19. *Capſicum Siliqua Flava longiore*, The longer Gold yellow Guinny Pepper. 20. *Capſicum Caule piloſo*, Hairy Stalk'd Guinny Pepper.

The Deſcriptions.

III. *The firſt*, *or* Our moſt Common Guinny Pepper with long red Codds. *It has a Root which*

is

is compoſed of a great Tuft or Cluſter of Fibres or Threads, ſpreading plentifully in the Ground, and periſhing in the Winter Seaſon, even in hot, or its Native Countries, after its Fruit or Cods are ripened; and tells us, upon the firſt ſharp froſt it meets with. The Plant it ſelf riſes up, with an upright

Pepper, Guinny *or* Indian.

firm round Stalk, having a certain Pith within it, and in our Country about two Feet high, and not above three in its Native places of Growth; ſpreading it ſelf out into many Branches on all ſides, even from the very bottom; which divide themſelves again, into other ſmaller Branches: *at each joint of which come forth two long* Leaves *upon ſhort foot Stalks, ſomewhat bigger than thoſe of* Night-ſhade; *elſe very like, with divers Veins in them, not at all dented about the edges, and of a very ſad green color. The* Flowers *ſtand ſeverally at the Joints, with the* Leaves; *very like unto the* Flowers *of* Night-ſhade, *conſiſting moſt uſually of five, yet ſometimes of ſix white ſmall pointed Leaves, ſtanding open like a* Star, *with a few yellow Threads in the middle: After which comes the* Fruit, (*either great or ſmall, long or ſhort, round or ſquare, as the Kinds is; and ſtanding either upright or hanging down, as their Flowers ſhew themſelves, either of this or that form, as ſhall be ſhewed in the following* Deſcriptions:) *In this it is ſomewhat great and long, about three Inches in length, thick and round at the Stalk, but ſmaller towards the end, which is not very ſharp, but roundiſh pointed; green at the firſt, but being full ripe, of a very deep crimſon ſhining red color on the out ſide, which is like a thick Skin, and white on the inſide, ſmelling tollerably well and ſweet; having many flat yellowiſh white Seeds therein, cleaving to certain thin Skins within it, which are broader at the upper end, and ſmaller at the lower; leaving the end or point empty, as not reaching ſo far; the whole Husk or Cod, but eſpecially the Seed, being of ſo hot and biting a Taſte, that it exulcerates and burns the Mouth and Throat extremely, and for a long time after it has been chewed, with ſuch an extremity, aimed to haſten Cheating.* The Deſcription of this *firſt Kind*, is propoſed as a pattern for all the reſt following, and by which you may frame at large all their Deſcriptions, the chief difference conſiſting in the form of the Fruit, whether Husks or Cods, as ſhall be more demonſtrated in every one of them in their before named order.

IV. *The ſecond, or* Great upright Spire faſhioned Guinny Pepper. *This is much alike, or very little differing from the former. The difference of the Fruit is, that this ſtands upright; is great below, and ſmaller and ſmaller to the point, which is ſharper than in the firſt, elſe it might ſeem the ſame inverted, that is, either that turned upwards, or this turned downwards, of as brave and orient a ſhining Coral color, as that other is.*

V. *The third, or* Leſſer upright Spire faſhioned Guinny Pepper. *The Fruit of this Kind is leſſer by half than the laſt, and not ſo ſharp or ſmall at the end, but ſomewhat round: and the green* Leaves *alſo are ſmaller and narrower. The Stalk likewiſe is ſmaller, and not ſo high. The Flowers of this as of all the reſt, which bear their Fruit upright, ſtand upright likewiſe; which is a certain rule to know, what Fruit will be pendulous, and what upright.*

VI. *The fourth, or* the very ſmall or ſmalleſt Pyramidal Guinny Pepper. *The Fruit of this is ſmall and grows upright; the Cods being ſhort and round, an Inch long at leaſt, and of a blackiſh red, before they be thro ripe, but when perfectly ripe, are as red as the reſt. This Plant grows taller, fuller of Branches, and more ſtored, both with Flowers and Fruit, which make the goodlier proſpect. The Leaves are no ſmaller than thoſe of the laſt foregoing; and of the ſame dark green color with the reſt.*

VII. *The fifth, or* Greater upright Heart faſhioned Guinny Pepper. *This Plant grows to be but of a mean height, not ſo high as any of the former: its Leaves are large, but not ſo ſmall at the ends. The Fruit is not hanging downwards, but ſtanding upright, being ſomething great, flattiſh, and as it were bunched out at the upper end, next unto the Stalk, and ſmaller below, ſhort and round pointed, ſomething reſembling the form of a Man's Heart.*

VIII. *The ſixth, or* Leſſer upright Heart faſhioned Guinny Pepper. *This differs not from the laſt, but in the ſmallneſs of the Fruit, ſtanding alſo upright, and being ſmaller by a third part, or near a half, and ſhorter alſo.*

IX. *The ſeventh, or* Pendulous or hanging Heart faſhioned Guinny Pepper. *The form of this is ſomething like to the fifth, or* greater upright Heart faſhioned Pepper, *being near of the ſame bigneſs, but a little more uneven, and not ſo round, and full as red being ripe: it is pendulous, or hanging down, not ſtanding upright as the other. There is another ſort of theſe* Pendulous Peppers, (alterum minus) *differing in nothing from the greater, but in being ſmaller.*

X. *The eighth, or* Hanging *Olive* faſhioned Guinny Pepper. *This has ſmall, long, and round Cods, ſmaller below than above, being very like unto an* Olive Plum, *of full as red a color being ripe, as any of the reſt, and hanging from its foot Stalk downwards.*

XI. *The ninth, or* Upright *Olive* faſhioned Guinny Pepper. *This differs from the laſt, but in being greater than it, and in its Fruit ſtanding upright, and not in any thing elſe.*

XII. *The tenth*, *or* Greater long and upright Guinny Pepper. *This is long and round, yet not like that which carries the form of an* Olive Berry, *but much longer, and of an equal bigneſs all its length, growing alſo upright.*

XIII. *The eleventh*, *or* Greater crooked or Horned Guinny Pepper. *This has great large Cods, about five Inches long, ſometimes little or nothing crooked at the lower end, which is long and ſmall: and ſometimes a little crooked or bended upwards, and ſometimes very much.*

XIV. *The twelfth*, *or* Leſſer crooked or Horned Guinny Pepper. *This differs from the laſt in not being half ſo thick or long, and keeping its end bowed or crooked conſtantly, not varying as that does. Both this and the laſt hang down their Cods towards the Earth. And the whole Plant is likewiſe leſs than the former.*

XV. *The thirteenth*, *or* Forked or double pointed Guinny Pepper. *This is very like the* Long upright Pepper, *and much about the ſame form and bigneſs, being of an equal ſize almoſt all the length thereof: but differs from it in this, that the lower end is parted as it were into two ſhort round Points, and is alſo a little ſmaller there than upwards; neither in color, nor any thing elſe differing from any of the reſt.*

XVI. *The fourteenth*, *or* Small round Guinny Pepper. *This grows in the ſame manner and form that the firſt Kind does, not differing therefrom in any thing, but in the Leaves, which being in the ſame form, are not ſo great and large: and in the Fruit, which in this is ſmall and round, (ſtanding ſome forth right, and ſome upright, but none pendulous or hanging down, each of them upon a long foot Stalk) about the bigneſs of a* Barberry, *but round and nothing ſo red, of dark or blackiſh red color, enclining to red: and in another ſort, almoſt black, having ſuch like Seed within them, but ſmaller. This ſeldom bears ripe Fruit in our Climate. Thoſe Plants or Fruit which we have had from the* Bermudas *where they are Natives, are of a yellowiſh red.*

XVII. *The fifteenth*, *or* Greater round upright Guinny Pepper. *The chief difference in this, conſiſts in the form of the Fruit, which grows upright as the Flowers do, being great and round like an* Apple, *and is the greateſt of all the ſorts which bear round Fruit; of an excellent red color when it is ripe, like unto poliſhed* Coral.

XVIII. *The ſixteenth*, *or* Round *Cherry* faſhion'd Guinny Pepper. *There are two Species of this Plant, one which bears fully round Fruit, like unto an* Engliſh *or* Flemiſh Cherry: *the other which has a little point at the end; this being a little bigger than the other, and both of them hanging down.*

XIX. *The ſeventeenth*, *or* Broad crumpled Codded Guinny Pepper. *The Cods of this Kind are ſomewhat large, greater above, and ſmaller below; ſomething flat alſo, and not round, but crumpled as it were, or ſhrunk half together, ſmelling withall pretty Sweet.*

XX. *The eighteenth*, *or* Shorter Gold yellow Guinny Pepper. *It might be thought by ſome, which ſee only the Cods of this* Pepper, *that it differs from all the reſt, in the manner of growing, as well as in the color of the Fruit, but it is not ſo. For it has like Leaves, Stalks and Flowers in every part, and only differs in that it bears Cods, very like unto the firſt ſort here deſcribed at* Sect. 3. *which is the* Common Kind, *but that they are ſhorter, and ending in a ſmaller or ſharper point, and of a fair Gold yellow color, not red as all the others before are.*

XXI. *The nineteenth*, *or* longer Gold yellow Guinny Pepper. *This differs in nothing from the laſt, but in the Cods, which are not ſo thick as they, but a little ſmaller, from the middle thereof; and a little longer, leſſening very finely unto the pointed end, of as fair a Gold yellow color as the former.*

XXII. *The twentieth*, *or* Hairy Stalk'd Guinny Pepper. *Its Roots are like to the others: and it grows up with round green Stalks, ſet full of white Hairs, in that differing from all the former. At the Joints with the Branches come forth two ſuch Leaves, as the firſt Kind here deſcribed has, but larger than they. The Flowers are white, conſiſting of five Leaves like the reſt, but larger alſo than any of them. After which come the Cods, which are green at firſt, as all the others are: but of as beautiful and glorious a red as the reſt, when they are full ripe. They are pretty great and long, ending in a very long point.*

XXIII. *The Places.* All theſe Kinds of *Pepper* are Natives of the *Weſt-Indies* or *America*, as *Braſil*, *New-Spain*, *Mexico*, *Peru*, *Florida*, *Carolina*, *Virginia*, *Barbadoes*, *Bermudus*, *Jamaica.* &c. and alſo they have been found growing in *Guinny*, and many other parts of the *African* Continent. From the *Weſt-Indies* they were firſt brought to *Spain*, *Portugal*, *Italy*, *England*, *Holland*, &c. and are Nurſt up in our *Gardens*, where they thrive and proſper very well, and are now found in almoſt all the Provinces of *Europe*. *Cluſius* ſays, That this kind of *Cod Pepper*, is not only Planted in *Spain* and *Portugal* in ſeveral places, but alſo in *Moravia*, for the profit ſake they make of the Fruit, which ſerves them in all thoſe parts, inſtead of our *Common Eaſt-India Pepper.*

XXIV. *The Times.* They are commonly Sown about the end of *March*, or beginning of *April*, in their Native Countrys: They uſually Flower about the beginning of *Auguſt*; and the Fruit or Cods ripen not throughly, that is, they come not to the beauty and perfection of their *Coralline* redneſs, until the beginning of *Winter*; and ſo do abide both with Flowers and Fruit, moſt of the *Winter* in thoſe hotter Climates: but with us, as ſoon as the Froſt comes they periſh, and therefore muſt be Houſed if you will preſerve them.

XXV. *The Qualities.* *Guinny Pepper* is hot and dry in the fourth Degree, Aſtringent, Carminative, Anodyn, Diuretick, Neurotick, Stomatick, Hyſterick, Emmenagogick and Alexipharmick.

XXVI. *The Specification.* It cures Vomiting, want of Appetite, weakneſs and Indigeſtion, the Cholick, expels Wind, and powerfully provokes the Terms in Women: it facilitates the Birth, expels the After-Birth, and is profitable againſt Sand, Gravel, Stone, and Tartarous Slime in the Reins, Ureters and Bladder.

XXVII. *The Preparations.* You may have from the Cods or Fruit, 1. *A Pickle.* 2. *A Simple Pouder.* 3. *A Compound or Artificial Pouder.* 4. *An Infuſion*, or *Vinegar.* 5. *A Peſſary.* 6. *A Loboc*, or *Electuary.* 7. *A Balſam.* 8. *A Coſmetick.* 9. *An Emplaſter.* 10. *A Decoction in Wine.* 11. *The Aſhes.* 12. *A Spirituous Tincture.* 13. *An Acid Tincture.* 14. *An Oily Tincture.*

The Virtues.

XXVIII. *The Pickle.* The Cods are Pickled as *Cucumers*, *French Beans*, and other things of like Nature: being ſo preſerved, they are of extraordinary uſe to ſtrengthen and fortifie the Stomach, ſtop Vomiting, remove Nauſeouſneſs, cauſe Appetite, and a good Digeſtion: they expell Wind in the

the Stomack and Bowels, and are good againſt pains in the Intrails, and the Colick. They are commonly eaten with Meat, as a *Pickled Sallet.*

XXIX. *The Compound* or *Artificial Pouder.* The Receipt is from *Georgio de Reggio*, who is the chief Author that has wrote amply of theſe *Guinny* or *Indian Peppers. Take of the ripe Cods of any of the ſorts of* Guinny Pepper, *(being all in Properties or quainties alike) dry them well, firſt by themſelves, and then in an Oven, after the* Bread *is taken out, put into a Pot or Pipkin, with a ſufficient quantity of* Flower, *that they may be ſufficiently dryed: after which cleanſe them from the* Flower, *(and from their Stalks if they have any) cut or clip them very ſmall, both Husks or Cods, and Seeds within them: and to every Ounce of them put a Pound of fine* Wheat Flower, *or the ſame with which they were dryed in the Oven: make them up into Cakes or ſmall Loaves, with ſo much* Leaven, *as may be convenient for the quantity: Bake theſe again as you may do* Bread *of that ſize, and being well Baked, cut it again into ſmaller parts, and Bake it again, that it may be as dry and hard as* Bisket: *which then beat into fine Pouder, and ſift it through a fine Searſe or Sieve, to be kept for uſe, or to be uſed inſtead of ordinary* Pepper, *for Broth, Meat or Sauce, or any other purpoſe our* Common Eaſt-India Pepper *is uſed for.* In my opinion, half the quantity of *Flower* here preſcribed may be enough: and it may be a quarter of a Pound to an Ounce may be fully enough. It gives a good Savor, and it may be a better Taſte and Reliſh to Meat or Sauce, than the *Common Pepper:* and is ſingular good to be uſed with ſuch Meats as are Flatulent or Windy, to break and diſcuſs the Wind both in the Stomach and Bowels, and for ſuch whoſe Bodies abound with Crudities and Moiſture. One Scruple of the ſaid *Pouder* may be taken in a little *Chicken*, *Mutton*, or *Veal-Broth*, for comforting and ſtrengthning a cold and moiſt Stomach, to help Digeſtion and provoke Appetite.

XXX. *The ſimple Pouder of the Cods and Seed. It is made by drying them throughly, (not ſcorching or burning them) which may be done in a Bakers Oven, after the Bread is out, and repeating the drying ſo long, till they will beat to Pouder in a Mortar.* It has all the Virtues of our *Common black Eaſt-India Pepper*, and may be uſed as Spice, in Sauce or otherwiſe, as that is: It diſcuſſes and expels Wind, comforts and warms the Stomach, is good againſt the Colick, and griping of the Guts, provokes the Terms in Women, facilitates the Birth, and forces away the Dead Child, and After-birth; being alſo prevalent againſt Obſtructions of the Reins and Bladder thro' Sand, Gravel, Stones, and Tartarous or Slimy Matter lodged in thoſe parts. Doſe 1 Scruple to a Man or Woman, mixt with ſome proper *Syrup*, or with *Hony*, or other fit Vehicle, Morning and Night, or at time of any Paroxyſm.

XXXI. *The Vinegar or Infuſion. It is made by Infuſing it in the beſt* Dutch Wine Vinegar, 2 *Ounces of the* Pouder *to a Quart of* Vinegar. *If it is made of the freſh ripe Cods, you may put* 5 *or* 6 *Ounces or more, (firſt cut ſmall) to a Quart of the ſaid* Vinegar. It is an admirable Stomatick, ſtrengthens and fortifies it, provokes Appetite, and cauſes a good Digeſtion: it may be uſed at Meals, as Sauce with Meats, and ſuch other things as require *Pepper* and *Vinegar:* and upon occaſion for the purpoſes aforeſaid may be uſed or taken in a Glaſs of Wine, at Meals or otherwiſe. Bathed upon the Region of the Spleen very hot, it diſſolves the hardneſs, and eaſes the pain of that *Viſcus.* Held in the Mouth againſt the place troubled with the Tooth-Ach, it eaſes the pain, and preſerves them from Rottenneſs. Mixt with Red *Port* Wine, and uſed as a Gargle, helps a ſore Throat, and and in a little time heals it.

XXXII. *The Decoction in Wine.* It has the Virtues of the *Vinegar*, eaſes the Tooth-Ach upon the Spot, and makes an Excellent Gargle for a Sore Mouth and Throat. It immediately gives eaſe in the Colick, ſtops Vomiting, and is profitable for ſuch as are troubled with a Quinſey. It is ſaid to be good for ſuch as have a Watery Rupture, outwardly applyed: provokes Urine powerfully, helps againſt the Strangury, Sand, Gravel, Stone, *&c.* Induces the Terms in Women, and cauſes ſpeedy delivery to Women in Labor.

XXXIII. *The Coſmetick. The* Pouder *mixt with an equal quantity of* Levigated Niter, *and diſſolved in* White Wine, *or mixed into a Liniment with* Oil of Ben; and applyed, it takes away Scurff, Morphew, Spots, Freckles; red and fiery Pimples and other hot and ſharp eruptions of the Skin. The Liniment mixed with a little ſharp *Wine Vinegar*, and applyed, eaſes the pains of the Spleen, and diſſolves the hardneſs thereof, it alſo diſcuſſes other cold Tumors, and *Oedematous* Swellings in the Joints.

XXXIV. *The Lohoch or Electuary. It is made by mixing the ſimple* Pouder *with three times its weight of* Clarified Hony, *or rather with the* Syrup of green Ginger. It is good againſt Aſthma's, Coughs, Colds, Wheezings, Hoarſneſs, ſhortneſs of Breath, and other like Diſtempers of the Breſt, and Lungs: it is profitable againſt an inveterate or old Cough, helps the falling down of the Palate, and applyed to the Throat inwardly and outwardly, is good againſt a Quinſy. Taken for 3 or 4 Days together to the quantity of a Dram or Dram and half, Morning, Noon, and Night, it is ſaid to expel the Dead Child.

XXXV. *The Balſam. It is made by mixing the* Pouder *with* Gum Armoniacum, *or* Galbanum, *or* Balſam de Capivi, *or* Balſam de Peru. This laid upon any hard Knots or Kernels, in the Neck, Throat, or any other parts of the Body, it will hinder their growing, and diſcuſs or reſolve them, not ſuffering them to grow any more.

XXXVI. *The Peſſary. Take of the* Pouder 3 *parts; of* Pouder of Gentian 2 *parts;* Gambogia in Pouder 1 *part; mix, and make them into a Peſſary with Wooll, dipping the ſame into* Decoction of Colocynthis *before uſing it.* Being put up the Womb, it induces the Courſes or Terms, eaſes the pains of thoſe parts, and if the time of a Womans Labour is at hand, it haſtens it, and even brings away (as it is ſaid) the Dead Child, and the After-Birth.

XXXVII. *The Emplaſter. Take of the former* Pouder 2 *Ounces;* Pouder of Tobacco 1 *Ounce;* Frankincenſe 4 *Ounces;* Balſam of Peru 3 *Ounces;* Chymical Oils of Saſſafras, *and of* Juniper Berries, *of each one Ounce: Mix and make an Emplaſter according to Art; adding* Bees Wax *ſo much as to give it a due conſiſtence.* It is good (being preſently applyed) againſt the bitings of Mad Dogs, or the biting or ſtinging of any other Venomous Creature. It prevails againſt Cramp, Convulſions, or Palſies, or any Trembling, weakneſs, or pain of the Nerves and Tendons, whether in the Joints, Muſcles, *Spina Dorſi*, or in any other parts whatſoever. Applyed to the Wriſts, Stomach, and along the *Spina Dorſi*, it cures Agues after an admirable manner, ſo as that they return no more.

XXXVIII. *The Aſhes of the Cods, and of the whole Plant.* Being rubbed on the Teeth, they cleanſe them, and make them grow white, if they were

were black. Infuſed in White *Port* Wine, the *Infuſion* provokes Urine powerfully, is good againſt the Strangury, and prevails againſt the Dropſy, Jaundice, Scurvy, Gout, as alſo againſt Sand, Gravel, and Tartarous Mucilage in the Reins and Bladder.

XXXIX. *The Spirituous Tincture.* Taken 60 or 80 Drops at a time in a Glaſs of Wine, it gives immediate eaſe in the Colick: it powerfully provokes the Terms in Women, facilitates the Birth, and expels the After-birth, as alſo the Dead Child. It prevails againſt inward Convulſions; and outwardly Bathed along the Back-Bone, as alſo upon the parts affected, it is very beneficial againſt the Palſy, reſtoring the feeling, eaſing the pains if any be, and adding ſtrength to the Nerves, Muſcles, Tendons, and parts affected. Drank in Wine, ſometimes 30 or 40 Drops at a time, eſpecially faſting, it is ſaid to be good againſt a ſtinking Breath, although of long continuance: and mixed with a little Wine, and held in the Mouth, it gives preſent eaſe in the Tooth-Ach.

XL. *The Acid Tincture.* It has all the Virtues of the *Spirituous Tincture*, but much more Stomatick; it cleanſes the Ventricle, powerfully opens all obſtructions of the *Viſcera*, ſtops Vomiting, takes away Naüſeouſneſs, cauſes a good Appetite, and a ſtrong Digeſtion; and therefore is very good for ſuch as are falling into, or are indeed in a deep Conſumption, becauſe it not only opens all ſorts of Obſtructions as aforeſaid, but it cauſes a good Chylous Juice to be generated for the nouriſhing of all the waſted and conſumed parts of the fleſhy Subſtance.

XLI. *The Oily Tincture.* It is a moſt excellent Diuretick, Lithontriptick, and Antiparalytick. In the Strangury, Gravel, Stone, Palſie, inward Convulſions, Cramps, ſtoppage of the Terms in Women, &c. It may be given from 15 to 30 Drops in *Decoction of Penny-royal*, or of *Parſly*, or in *White Port*, or *Lisbon Wine*, or any other fit Vehicle. It brings away both Birth and After-Birth, and admirably eaſes After-Pains, bathed upon the Back-Bone and parts affected in a Palſie, as alſo in Cramps, it gives ſingular relief.

XLII. *Nota. Guinny Pepper* is ſo fiery hot, and of ſo ſharp and biting Taſte, that it will burn and inflame the Mouth and Throat ſo extreamly, that it is ſcarcely to be endured: if any one ſhould chance to eat a Cod of it raw, it would hazard their choaking: yea, being outwardly applyed (freſh bruiſed) to the Skin, in any place of the Body, it would raiſe Bliſters and exulcerate it, in the ſame manner as if it had been Burnt with Fire, or Scalded with Water. The reducing the Cods (when dry) into Pouder, ought to be done with care, the Eyes being cloathed, and the Noſtrils being ſtopped: for the Atoms of the Pouder by flying up to thoſe Parts, (if they can come at them) will ſo peirce and attract, that they will induce a great Flux of Rheum or Humors by thoſe parts, and cauſe ſuch Vehement Sneezings as may do the party concerned much Miſchief: and if they ſhould preſs into the Throat, they will cauſe ſuch fierce Sneezings, Coughings, and Vomitings withall, and with that Vehemency as to cauſe Convulſions, not only of the Stomach and Bowels, but Univerſally of the whole Body.

CHAP. DLVII.

Of PEPPER-WALL.

I. *THE Names.* It is called in *Arabick*, *Halſebram*, *Handrachabara*, and *Tilaſon*; in *Greek*, Ἀείζωον ἴδιος τρίτον: in *Latine*, *Illecebra minor Lobelij*; *Aizoon acre Cordi*; *Aizoon minus fervidi guſtus Thalij*; *Sedum minus cauſticum*, *Cluſij*; *Gramen Tertium Plinij Anguilariâ*: *Dactylon ſecundum vel tertium Columnæ*; *Sempervivum minimum Lobelij*; but *Columnæ* thinks it not fit to be called an *Aizoon*, or *Sedum*, becauſe they are all extreamly Cold; whereas this is very hot, even in the fourth Degree, and to this Opinion I adhere, knowing it to be no Species of the *Sedum*'s, but a Plant of another Kind. In *Engliſh* it is called, *Wall-Pepper*, *alſo Little Stone-Crop*, *Pricket*, and *Wall Mouſe-Tail.*

II. *The Kinds.* Authors make two Species of this Plant, *viz.* 1. *Illecebra minor*, *ſive Sedum Tertium Dioſcoridis*, to which all the Names in the former Section belong, Our Common Wall Pepper. 2. *Illecebra inſipida*, *Aizoon minus Thalij & Vermicularis inſipida*, *Aizoon minimum Cordi*, Inſipid, or Taſteleſs Wall-Pepper.

The Deſcriptions.

III. *The firſt*, *or* Our Common Wall-Pepper. *It has a Root which is Creeping and Fibrous*, *much like to thoſe of the* Stone Crops. *This Root ſends forth many Stalks*, *which as they lye upon the Earth*, *take Root again*, *and ſpread far. It is a ſmall Plant*, *and grows much like to ſome of the* Stone Crops, *with very many and ſlender Stalks*, *beſet round with ſmall round Leaves growing very thick or cloſe together. At the tops thereof grow ſmall pale yellow Flowers*, *in ſmall Tufts. The Taſte of the Plant is very hot and Sharp upon the Tongue*, *which chiefly diſtinguiſhes it from the* Sedum's, *or* Stone Crops; *tho' it is alſo diſtinguiſhed by its form*, *being ſmall and thick ſet with round Leaves.*

IV. *Gerard* deſcribes it thus. *Its Root is nothing but Strings. It is a low and little Herb*, *whoſe Stalks are ſlender and ſhort. The Leaves about the Stalks ſtand very thick*; *being ſmall in growth*, *full Bodied*, *ſharp pointed*, *and full of Juice. The Flowers ſtand at the top*, *and are very ſmall*, *of color yellow*, *and of a ſharp biting Taſte.*

V. *The ſecond*, *or* Inſipid, *or* Taſtleſs Wall Pepper. *This has a Root only made of Fibres*, *and is as ſmall a Plant as the laſt*, *growing altogether like it in Leaf*, *Stalk*, *and Flowers*, *which are yellowiſh likewiſe: but it is chiefly diſtinguiſhed from the former by the Taſte*; *which in this is nothing biting*, *but utterly inſipid or without Taſte.*

VI. *The Places.* The firſt grows almoſt every where in dry and ſtony places, and in Chinks and Crannies of old Walls, and on the tops of Houſes. It is always green, and therefore was ranked by former Authors among the *Sempervives*, or *Houſe-Leeks.* The ſecond grows alſo in the like Places, on Mud or Stone Walls, or among Rubbiſh, or in ſandy or gravelly Places, and oftentimes on the ſides of old Tiled Houſes, and Pent-Houſes, &c.

VII. *The*

Pepper-Wall Infipid.

VII. *The Times.* They both Flower in the *Summer* Months, in *June* and *July*, and ſometimes ſooner; and the Leaves (if the Seaſon is not very extream) continue green all the *Winter.*

VIII. *The Qualities.* The firſt of theſe is only uſed in Phyſick, and is hot and dry in the fourth Degree, very attractive, ſharp and biting: outwardly applyed it raiſes Bliſters, and at length exulcerates the part it is applyed to.

IX. *The Specification.* It cures the Sciatica and Gout; prevails againſt the Kings Evil, is Alexipharmick or good againſt Poyſon, and cures Quartans and other Agues of long continuance.

X. *The Preparations.* You may have therefrom, 1. *A Liquid Juice.* 2. *An Eſſence.* 3. *An Inſolated or Decoſted Oil.* 4. *A Balſam.* 5. *A Cataplaſm.*

The Virtues.

XI. *The Liquid Juice.* By reaſon of its hot and attractive qualities, it is (being taken inwardly) Emetick. Being taken with Vinegar, or ſome other proper Vehicle, it educes thick and tough Flegm, and other tenacious and viſcous Humors in the Ventricle, by Vomit: it evacuates alſo Cholerick Humors, and thereby cures Quartan Agues, and other Agues inveterate, or of long continuance. And taken in the ſame manner, it expels any ſort of Poiſon, whether Vegetable, as of the *Aconites*, or Animal, from the ſwallowing of any Poiſonous Creature; but, *Caveat qui ſumpſerit*, ſays *Parkinſon*, I ſuppoſe becauſe of its heat.

XII. *The Eſſence.* It has all the Virtues of the *Liquid Juice*, being taken in the ſame manner, or in the ſame Vehicle: and may either of them be given, from a Spoonful to two Spoonfuls, more or leſs, according to the Prudence of the Phyſician. If the Doſe is given in a large quantity of the Vehicle, it will certainly be leſs dangerous; ſo alſo if a good quantity of Poſſet Drink, or Mutton Broth be Drank after it, if it is found to burn much: it much expels wind, and being given in a ſmall quantity warms and comforts the Stomach, and gives eaſe in the Colick.

XIII. *The Inſolated or Decoſted Oil.* It eaſes pains and diſcuſſes Tumors proceeding from cold and moiſt Humors, and is a very beneficial thing, in alleviating pains of the Gout. Anointed upon the *Spina Dorſi*, and parts affected with the Palſy, it diſcuſſes the Flatulent Humor, and cures that diſeaſe, if it is recent: Anointed on the Neck and Throat, it is good againſt the Quinſy, ſwellings of the Almonds, and other Diſtempers of thoſe parts: Anointed on the Piles it cures them.

XIV. *The Balſam. It is made with Beef Suet, Strasburg Turpentine, with a little Frankincenſe.* It is a potent thing againſt the Gout, and all manner of Aches and Pains of the Joints being applyed, (univerſals alſo being at the ſame time exhibited:) it is profitable againſt the Kings Evil; taking away or diſcuſſing Knots and Kernels in the Neck and Throat, before they are broken; or if Ulcerated, digeſting, cleanſing, and healing them in a ſhort time.

XV. *The Cataplaſm. It is made by beating the Herb up with a little Hogs Lard.* Applyed to the Hips, it cures the Sciatica; and to Joints affected with the Gout, it eaſes the Pain and educes the Morbifick Matter, and this it does by drawing Bliſters upon the parts affected. And applied to Kernels or Scrophulous Tumors in the Neck and Throat, commonly called the Kings-Evil, it removes or takes them away after a ſingular manner.

XVI. *Nota. The ſecond of theſe*, is cold and moiſt in the ſecond Degree, and yet it is thought to be aſtringent withal. And to ſtop Fluxes and diſtillations of Rheum, inward Bleeding, and outward hot eruptions of the Skin, and to heal cancerous and fretting Sores and Ulcers, and is ſafely to be uſed, and effectual for all the purpoſes for which our *Common Houſe-Leek* is uſed, its *Qualities*, *Preparations*, *Virtues* and *Uſes*, being much the ſame, which ſee *Chap.* 484. *Sect.* 10, *ad* 19. and *Chap.* 485. *Sect.* 6. aforegoing of this Book.

CHAP. DLVIII.

of PERWINCLE.

OR,

The CLIMER.

I. *THE Names.* It is called in *Greek*, Κλεμα-τὶς δαφνοειδὴς; (*Clematis*, becauſe it brings forth its Stalks which creep or climb like thoſe of the *Vine: Daphnoiedes*, becauſe its Leaves are like thoſe of the *Bay-Tree:*) in *Latine*, *Clematis*, & *Vinca*

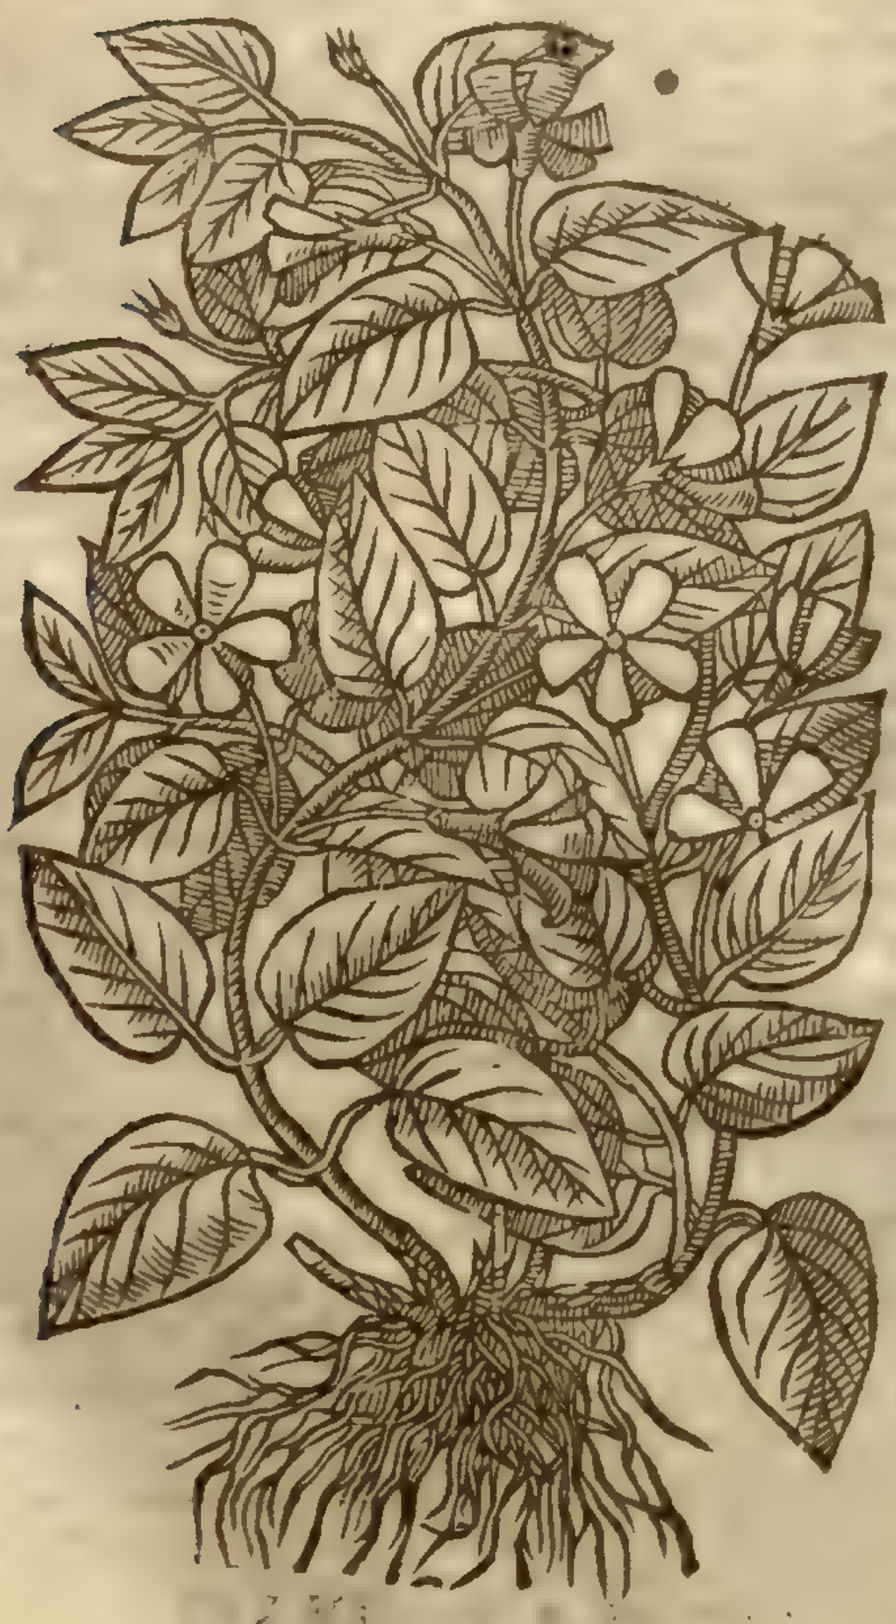
Vinca Pervinca, *Chamædaphne Plinij*; *Centunculus Plinij*: in *English*, *Perwinkle*, or *Climer*, also *Periwinkle*.

II. *The Kinds.* There are three several sorts which are common amongst us, *viz.* 1. *Clematis Daphnoiedes major*, *Vinca Pervinca major*, *Chamædaphne major*, The greater Perwinkle. 2. *Clematis Daphnoiedes minor*, *Vinca Pervinca minor (diversorum colorum) Chamædaphne Plinij*; *Centunculus Plinij*, The lesser Perwinkle, or single Perwinkle of divers colors. 3. *Clematis Daphnoiedes, sive Vinca Pervinca Flore duplici purpuero*, Perwinkle with double purple Flowers.

The Descriptions.

III. *The first, or* Greater Perwincle. *Its Root consists of a great Bush of Fibres, which run and spread themselves much, fastning themselves strongly in the Ground. This greater* Perwinkle *is something like to the next, or smaller Kind, but much larger, yet its Branches creep not in that manner,*

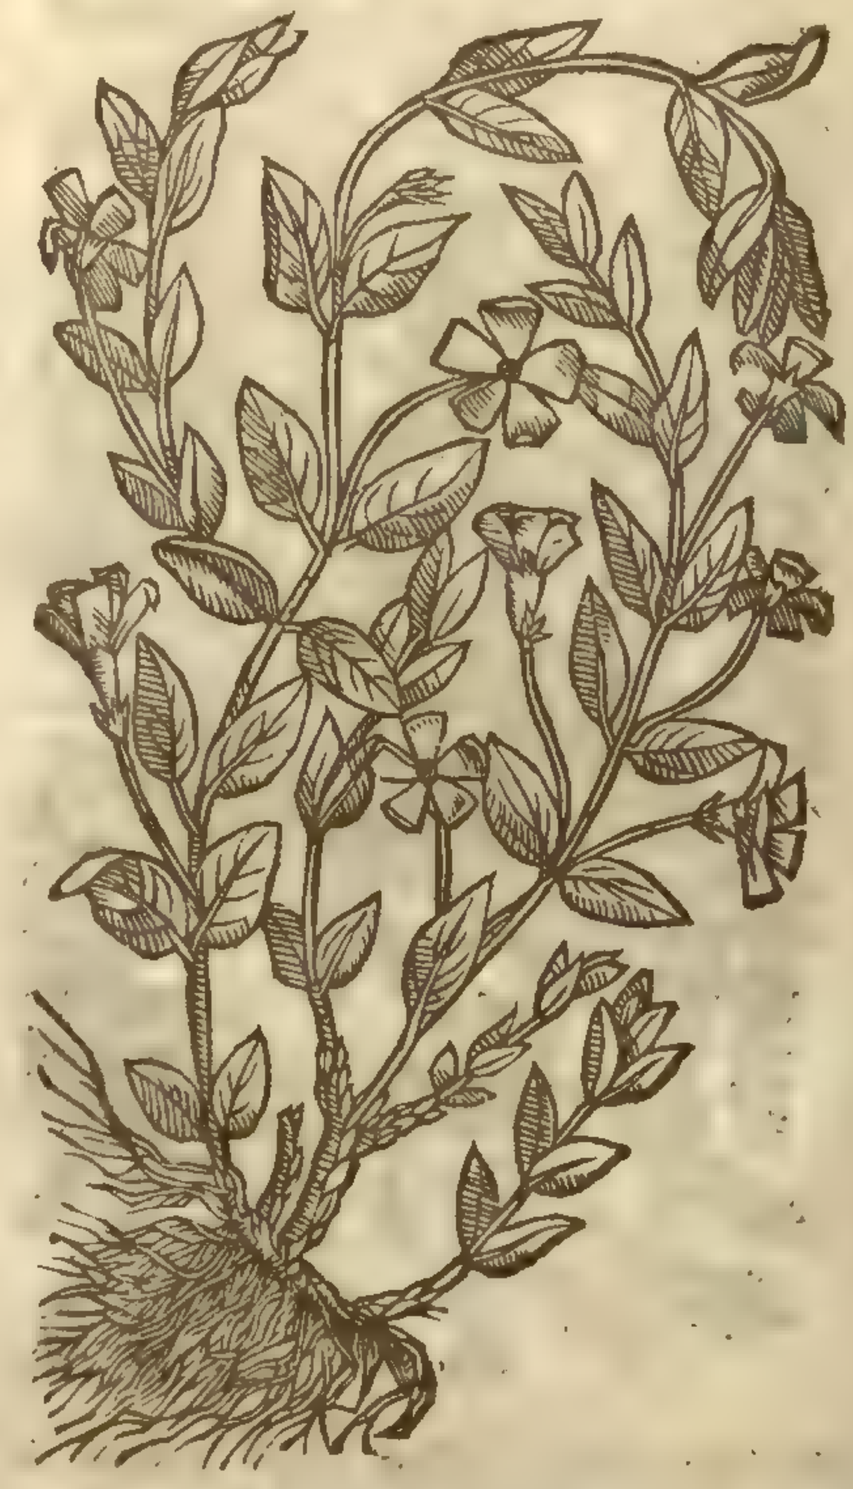
Perwinkle Great.



but stand more upright, or less creeping at the least. The Leaves also hereof stand by couples at the Joints, but they are broader and larger by the half than the next following. The Flowers likewise are larger, consisting of five Leaves, of a blew color, a little deeper than the blew in the lesser Kind. This Plant is far tenderer to keep than the smaller Species, and therefore ought to be Planted in a warmer place, yet a place which is moist and shady.

IV. *The second, or* Lesser Perwinkle, which is a single Perwinkle of divers colors. *Its Root is in its Body, little bigger than a* Rush, *bushing it self*

Perwinkle purple small.



Perwinkle Wild small.

out, in the Ground, and creeping with its Branches and Fibres far about, whereby it quickly takes up a large compass, and is therefore most usually planted under Hedges, where it may have room enough to run in. From this Root spring forth many Branches, trailing

ing upon the Ground, running far about, and shooting out small Fibres at the Joints as it runs, taking thereby fresh hold in the Earth, and rooting it self again in many Places. At the Joints of these Branches grow two small dark green shining Leaves, something like Bay Leaves *but smaller; and with them come forth also the Flowers, one at a Joint, standing upon a tender foot Stalk, being something long and hollow, parted at the brims or edges, sometimes into four, and sometimes into five Leaves. The* Common sort *are of a pale blew color, and some are of a pure white; but some again are of a dark reddish purple color, and these are those which are only planted in* Gardens.

V. *The third, or* Perwinkle with double purple Flowers. *Its Root is very Bushy and Fibrous like the former: and this Plant is very much like to the* second lesser Kind *just now described, in all things, except in the Flower, which is of that dark reddish purple color, which is in the former* single lesser Kind, *but herein it differs, that this has another row of Leaves within the Flower, so that from the two rows of Leaves, it came to be called* double Perwinkle, *but the Leaves of the Flowers of this are lesser than the Leaves of this single Flowered.*

VI. *The Places.* The first or *Great Perwinkle*, grows in *Spain*, *Italy*, *France*, and other hot Countries, from some of which places it has been Transplanted to us, and grows only in our *Gardens*. The second or *Blew smaller Perwinkle*, grows in many Woods and Orchards, by Hedge sides in many parts of *England*; so also does the *white Kind* here and there: but the *Single purple*, and *Double purple*, or *third Species*, grow only in our *Gardens* with us. The second Species whether *Wild* or *Garden*, is said to be the *Common* or *Vulgar Kind*, and that which is only, or chiefly in Use.

VII. *The Times.* They are said to Flower all in *March* and *April*, and the Branches remain or abide always green, more especially if they grow in moist and shady places, in which they chiefly delight.

VIII. *The Qualities. Perwinkle* is hot and dry in the second Degree, Astringent, Emphractive, Styptick and Vulnerary.

IX. *The Specification.* It stops all sorts of Fluxes of the Belly, chiefly the Dysentery or Bloody Flux; as also all other Fluxes of Blood, as Spitting or Vomiting Blood, Pissing of Blood, and the overflowing of the Terms in Women, and the too abundant Flux of the Loches of Women in Child-bed.

X. *The Preparations.* You may have therefrom, 1. *A Liquid Juice.* 2. *An Essence.* 3. *A Decoction or Infusion in Red Wine.* 4. *A Pouder of the Plant.* 5. *A Cataplasm of the green Herb.*

The Virtues.

XI. *The Liquid Juice.* Two or three Spoonfuls of it taken alone, or in a Glass of Red Styptick Wine, it stops all Fluxes of the Belly, and Bloody Fluxes of what kind soever, and in what Part of the Body soever. It is said never to fail in the Cure of a Bloody Flux, Spitting of Blood, or Pissing of Blood, or the Terms; but it ought to be taken Morning and Night, till such time as the Cure is performed: Injected up the Nostrils, it stops the Hæmorrhage there; so also Injected up the Womb with a proper Womb Syringe (as well as taken inwardly by the Mouth) it contributes more immediately to stop the overflowing of the Courses, or Loches in Women as aforesaid.

XII. *The Essence.* It has all the Virtues of the *Juice*, being used in the same Dose, and in the same manner, but is more effectual to the purposes intended; applyed outwardly it stops the bleeding of Green Wounds, and contributes very much to the speedy healing of simple Wounds or Ulcers, more especially, if the *Pouder of the Herb*, be strewed pretty thick upon the same.

XIII. *The Decoction, or Infusion in Red Wine.* It has the Virtues of the *Juice* and *Essence*, and may be given Morning and Night to five or six Ounces. Outwardly, it is Vulnerary and contributes to the speedy healing of Wounds and Ulcers. Used as a Gargle to a Sore Mouth or Throat, it cleanses the same and quickly heals it.

XIV. *The Pouder of the Herb.* It has all the Virtues of the *Juice*, *Essence*, and *Decoction* or *Infusion*, but operates not altogether with that speed they do. Dose from two Scruples to a Dram or Dram and half, in Styptick Red Wine: outwardly applyed to Wounds it stops their Bleeding: and strewed upon Ulcers, it cleanses, drys and heals them.

XV. *The Cataplasm.* Applyed to Bleeding Wounds, it presently stops the Hæmorrhage [illegible] to inveterate running Ulcers, it in a short time [illegible] the Fluxion.

CHAP. DLIX.

Of the PERU-FLOWER.

OR,

MARVEL *of* PERU.

I. *The Names.* This Plant is called by the *Indians* of *Peru*, *Hachal*; and for that reason some Authors call it *Hachal Indi:* It has no *Greek* Name: but our Modern Authors call it *Admirabilis*; *Mirabilia Peruana & Peruviana*; *Planta Admirabilis*; *Gelsimum vel Jasminum Mexicanum*, *Jasminum rubrum & Indicum*; *Solanum Mexicanum Bauhini*; *Solanum Odoriferum*; *Admirabilia Peruviana Clusij:* in *English* it is called, *Marvel of Peru*, *Marvel of Mexico*, and *Marvel of the World.*

II. *The Kinds.* Authors have described two varieties of this Plant, *viz.* 1. *Mirabilia Peruviana major*, The greater Marvel. 2. *Mirabilia vel Mirabilis Peruviana minor*, *Solanum Mexicanum Flore parvo*, The lesser Marvel, whose Descriptions follow.

The Descriptions.

III. *The first, or* Greater Marvel. *It has a Root which is long and round, greater at the Head, and smaller downwards to the end, like unto a* Radish, *spreading out into two or three or more Branches; blackish on the out side, and whitish within. These Roots have often been preserved by Art thro' the* Winter Season, *yea for two or three* Winters *together (for they will perish if they be left abroad*

in the Garden *in those Months, unless it be under a House-side, or where they may be sheltred from the* Winters *cold:) because many times the Year not faling out to be moderate or kindly, the Plants give no ripe Seed; and so we should be to seek both for Seed to Sow, and Roots to Set or Plant again. The Stalk of this Marvelous Plant is great and thick, thicker than any Mans Thumb, bunched out, or Swelling with a Kind of Knee at every Joint; in some Plants the Stalks will be of a fair green color, and those will bring white, or white and red Flowers: and in some a dark green color, which will give yellow Flowers. The Stalks and Joints of those, which will give red and yellow Flowers Spotted, are somewhat browniſh, but not so red as those which give wholly red Flowers. Upon these Stalks which spread into many Branches, there grow at their Joints upon several foot Stalks, fair green Leaves, broad at the Stalk, and pointed at the end. At the Joints likewise, towards the upper part of the Branches, at the foot of the Leaves, come forth several small Flowers, upon short foot Stalks, every one being small, long and hollow, from the bottom to the brim, which is broad, spread open, and round, and consists but of one Leaf without division, like unto a* Bell-flower, *but not cornered at all. These Flowers are of divers colors, and diversly marked and spotted, some being wholly white, without any spot in them for the most part, thro' all the Flowers of the Plant. So likewise some being yellow, and some wholly red. Some Plants again are mixed and spotted so variably, either white and red, or purple (except here and there, some may chance to be wholly white, or red, or purple, among the rest;) or red and yellow thro' the whole Plant (except as before, some may chance in this kind, to be either wholly red, or wholly yellow) that you shall scarcely finde 2 or 3 Flowers in a Hundred, which will be alike spotted and marked, without some diversity; and so likewise every Day, as long as they blow, which will be until the* Winters *or rather* Autumns *Cold puts a stop to their proneness of Flowering. It has also been often observed, that one side of a Plant will give fairer varieties of Flowers than another, which is most commonly the* Eastern, *as the more temperate and shadowy side. All those Flowers do open for the most part, in the Evening or in the Night time, and so stand blown open, untill the next Mornings Sun begins to grow warm upon them, which then close themselves together, all the brims of the Flowers shrinking into the middle of the long Neck, much like unto the* Blew Bind-weed; *which in a manner does so close up at the Suns warm heat. Or else, if the Day is temperate and mild, without any Sunshine upon them, the Flowers will not then close up for the most part of that Day, or until it is towards Night. After the Flowers are past; come several Heads of Seed, that is, but one at a Place, as the Flowers stood before; of the bigness sometimes of a small Pea, but not so round, standing within the green Husks, in which the Flowers grew before; which Seed is a little flat at top, like a Crown or Head, and round below where it is fastened in the Cup; of a black color when it is ripe; but else green all the while it grows on the Stalk: and being ripe, is soon shaken down with the Wind, or any other light blow.*

IV. *Gerard* has another Description, which being compared with the former, will more lively set forth this admirable Plant: and it is in these following Words. *Its Root is thick, and like unto a great* Radish, *outwardly black, and within white, and sharp in Taste, wherewith is mingled a Superficial Sweetness: it brings forth new Flowers from* July *to* October *in Infinite Number, yea even until the Frost does cause the whole Plant to perish; notwithstanding it may be preserved in Pots, and set in Chambers or Cellars that are warm, and so defended from the injury of our cold Clime, provided always that there be no Water cast upon it, or put forth into the Air, to take any moisture in there, untill the* March *following: at which time it must be taken forth out of the* Pot, *and planted again in the* Garden: *by this means many Plants have been preserved, as well as by Sowing of Seeds, which Sown Plats will bear Flowers in as ample manner, and in as good time, as those reserved Plants. This admirable Flower, called the* Marvel of Peru, *or the* Marvel of the World, *springs forth of the Ground, like unto* Basil *in Leaves: among which it sends out a Stalk two Cubits and a half high (viz. about four Feet and half) of the thickness of a Finger, full of Juice, very firm, and of a yellowish green color; knotted or kneed with Joints, somewhat bunching forth, of a purplish color, as in the* Female Balsamina: *which Stalk divides it self into sundry Branches or Boughs, and those also knotted, like the Stalk. Its Branches are decked with Leaves growing by couples at the Joints, like the* Leaves *of* Wild Peasecods, *green, fleshy, and full of Joints; which being rubbed do yield the like unpleasant Smell as* Wild Peasecods *do, and are in Taste also very unsavory, yet in the latter end they leave a Taste, and sharp smack of* Tobacco. *The Stalks towards the Top, are garnished with long hollow single Flowers, folded as it were into five parts, before they be opened; but being fully blown, do resemble the Flowers of* Tobacco, *glittering oftimes with a fine purple or crimson color, many times of an Horse Flesh color, sometimes yellow, sometimes pale, and sometimes resembling an old red or yellow color; sometimes whitish, and most commonly of two colors, which occupy half the Flower, or intercoursing the whole Flower with streaks, or orderly streams, now yellow, now purple, divided thro' the whole; having sometimes great, and sometimes little spots of a purple color, sprinkled and scattered, in a most variable order, and admirable mixture. The Ground or Field of the whole Flower, is either pale, red, yello[illegible] or white, containing in the middle of the hollowness a Prick or Pointal set round about with six small Strings or Chives. The Flowers are very sweet and pleasant, resembling the* Narcissus *or* White Daffodil, *and are very suddenly fading. For at Night the Flowers are wide open, and so continue till* 8 *of the Clock the next Morning, at which time they begin to close (after the manner of* Bind-weed) *especially if the Weather is very hot: but the Air being temperate, they will sometimes remain open the whole Day, and close themselves only at Night, and so perish; one Flower lasting but only one Day, like the* True Ephemerum *or* Hemerocallis. *This wonderful variety does (not without cause) bring admiration to all who observe it. For if the Flowers be gathered, and reserved in several Papers, and compared with those Flowers, which will Spring and Flourish the next Day, you shall easily perceive, that not one Flower is like another in color, tho' you should compare an hundred which Flower one Day, with another hundred which you may gather the next Day; and so from Day to Day, during the time of their Flowering. The Cups and Husks which contain and embrace the Flowers, are divided into five pointed Sections, which are green, and as it were consisting of Skins, wherein is contained one Seed and no more, covered with a blackish Skin, having a blunt point on which the Flower grows; but on the other end next the Cup or Husk, it is adorned with a little fine cornered Crown. The Seed is as large as a* Pepper Corn, *which of it self fades with any light motion. Within*

in this Seed is contained a white Kernel, which being bruised, resolves into a very white Pulp like Starch. Thus *Gerard.*

V. *The second, or* Lesser Marvel. *The Root of this is like to the former, and answerable to it, in proportion to the rest of the Plant. This* Small Marvel of the World, *or* of Peru, *as it is called, grows in the same manner that the former greater does, but nothing so large, or so high; having such like Leaves set on the Stalks, but much leaner and rounder: the Flowers likewise being of a red color for the most part, and made of one Leaf, opening into five parts on the Brims, like the other. They are so small, that the whole Flower of this is scarcely so big, as the one part or division of the greater Flower; and the Seed which follows, is in proportion to the Flower going before it.*

VI. *An Observation.* This larger Plant yields in our *Gardens*, five or six several Varieties of beautiful Flowers, as, 1. Pure White. 2. Pure Yellow. 3. Pure Red. 4. White and Red Spotted. 5. Red and Yellow Spoted. 6. Purple Spotted. But besides these there are some other sorts, among which was, 7. One of a Pale Purple or Peach color. 8. And a Purple or Peach color Spotted, *&c.* all which differences in the color of their Flowers, may be discerned by the Leaves of the Plant, and manner of growing, which are all different one from another: and many of them in their Native Countries different from those which we have growing with us in our *Gardens*; but concerning them all, the chief difference almost consists in the Flowers.

VII. *Observation* 2. Within a while after the first Frosts have taken the Plants, so that the Leaves wither and fall, dig up the Roots whole, and lay them in a dry Place for three or four Days, that the superfluous moisture on the outside may be exhausted or spent and dryed away, which done, wrap them up severally, in two or three brown Papers, and lay them by in a Box, Chest, Tub, or in some other convenient thing or place in the House, all the *Winter* time, where no Wind or moist Air may come to them. And thus you shall have these Roots preserved, and fit to Plant again the next *Spring*, which will spring again afresh the next Year, if you plant them in the beginning of *March*, as has been often times proved.

VIII. *Observation* 3. Some have put them up into a Barrel or Firkin of Sand or dry Ashes, which is also good, if the Sand or Ashes be thro' dry; but if they be any thing moist, or if they give again in *Winter*, as is usual, that moisture of Sand or Ashes, will putrifie the Roots, so that they will be nothing worth, when the time shall come that they should be planted.

IX. *Observation* 4. This is also to be Noted, as to the sowing of the Seed, that if you would have variable Flowers, and not all of one color, you must chuse it out of such Plants as be variable while they grow, and out of such you must always reserve your Seed: for if the Flowers be of one entire color, you will have for the most part from those Seeds, Plants which will bring forth Flowers all of a color, whether they be white, red, or yellow.

X. *The Places.* These Plants grow naturally in *Peru*, *Mexico*, and other Provinces of the *West-Indies*, where there is a perpetual *Summer*, or at the least no cold Frosty *Winters:* and from some of those parts the Seed was first brought to *Spain*, from whence it has been conveyed to most other Countries in *Europe*, and particularly into our *Gardens* in *England*, having now had it with us, for near this Hundred Years, or more; so that now they are almost in every *Garden* of Note.

XI. *The Times.* The Roots ought to be planted in the middle of *March* if the Season is temperate and warm; otherwise in the beginning of *April*, at which time they are to be taken out of the Papers, or from the Sand, in which they lay Buried, and then placed in that part of the *Garden* which is warmest, and withall shady and a little moist. If you raise them from the Seed, it is to be sown or planted about the midst of *April*. They bring forth their Flowers from the end of *July*, and Flower thro' all *August* and *September*, to *October*, or till cold Air and Frosts come, which pull them down; the Seed ripening in the mean Season.

The Virtues.

XII. This Plant is esteemed more for its Rarity and Beauty, than for any Virtues it is known to have; nor have we learnt any thing concerning the same from the *Indians*, among whom it is a Native: Its exceeding and admirable Beauty, and Sweetness of its Flowers, being the only reasons for which it is Nurst up in our *Gardens*; in which it is indeed a pleasant Ornament. However, *Jacobus Antonius Cortusus* of *Padua* says, That he had found out by experience, that the *Pouder of the Root*, taken to two Drams inwardly, in any fit Vehicle, does exceedingly well purge Watery Humors.

CHAP. DLX.

Of PETERS-WORT.

OR,

Square JOHNS-WORT.

I. *The Names.* It is called in *Greek*, Ἀσκυρὸν, ἢ Ἀσκυροειδὲς, *Ascyron & Ascyroides: Dioscorides* saith, it was called also, Ὑπερικὸν & Ἀνδρόσαιμον, *Hypericon*, i. e. *Johns-Wort*, and *Androsæmon*, i. e. *Tutsan*, or *Park Leaves:* and *Galen* therefore, accounted it a kind of *Androsæmum*, but it is truly neither of these Plants: in *Latine*, it has no other Name than *Ascyrum*, from the *Greeks:* and in *English*, it is called *Peters-wort*, or *Johns-wort square Stalked*, *Johns-wort the greatest.*

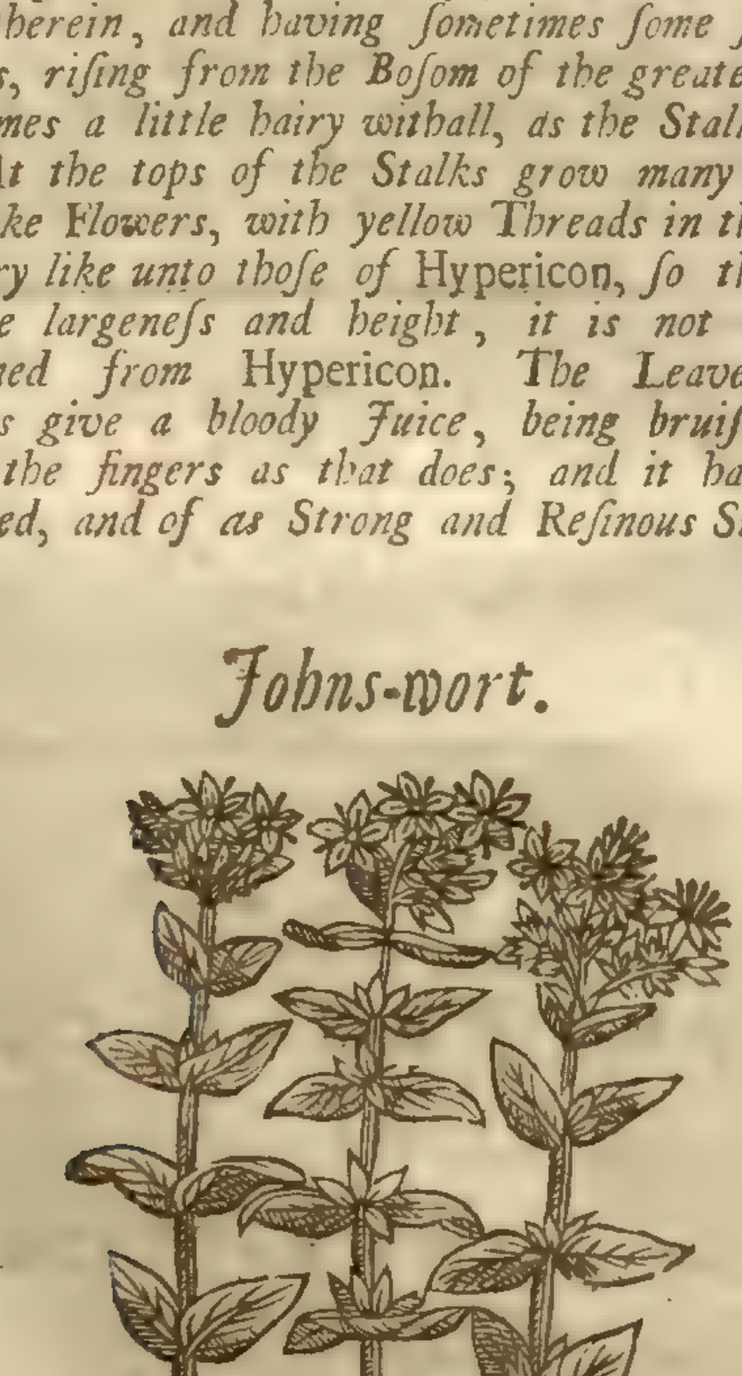
II. *The Kinds.* Authors have many Kinds of this Plant, the three following are eminent, *viz. Ascyrum vulgare*, *Matthioli*; it is, *Androsæmum primum Fuchsij*; *Hypericon Dodonæi*, in his *French* Edition; *Androsæmum alterum Hirsutum Columnæ* (and yet he doubted whether he should call it *Hypericum*, or *Androsæmum*, and said that it came nearest unto *Ascyrum*, tho' something differing

from it, but this miſtake of his might be from the differing Soils and Clime, wherein he ſaw it grow:) *Androſæmum Hirſutum Bauhini*; *Hypericon in dumetis naſcens Tragi*, Our common Peters-wort, or ſquare Johns-wort. 2. *Aſcyrum Supinum villoſum paluſtre*, *Bauhini*; *Aſcyrum Supinum ἑλώδης Cluſij*, Marſh Peters-wort, or Creeping Marſh Peters-wort. 3. *Aſcyrum magna Flore Bauhini*, Great Flowred Peters-wort.

The Deſcriptions.

III. *The firſt*, *or* Our Common Peters-wort, *or* Square Johns-wort. *It has a hard and woody-Root, not very thick, running under the upper ſurface of the Earth, with a great number of Fibres ſpringing from the ſame, and running ſtrait down into the Earth; it ſends forth new ſhoots every Year, and abides a long time, or for many Years. This is that* Peters-wort *which is moſt common with us in* England, *and riſes up with ſquare upright Stalks for the moſt part, ſomething greater and higher than* Hypericon, *or* Johns-wort, *but brown in the ſame manner. At every Joint, it has two* Leaves, *ſomething like thoſe of* Hypericon, *but larger, a little rounder pointed, and with very few or no holes to be ſeen therein, and having ſometimes ſome ſmaller* Leaves, *riſing from the Boſom of the greater, and ſometimes a little hairy withall, as the Stalks will be. At the tops of the Stalks grow many yellow Star like Flowers, with yellow Threads in the middle very like unto thoſe of* Hypericon, *ſo that but for the largeneſs and height, it is not readily diſcerned from* Hypericon. *The* Leaves *and* Flowers *give a bloody Juice, being bruiſed between the fingers as that does; and it has ſuch like Seed, and of as Strong and Reſinous Smell.*

Johns-wort.



Note, That by a miſtake of the Printer, the true Figure of *Peters-wort* is placed in the Chapter of *Johns-wort*, *Chap.* 405. *Pag.* 572. *b.* which ought to be placed here; and this Figure of *Johns-wort*, which is put here, ought to be placed there, of which we deſire the Reader to take notice, to avoid being miſtaken.

IV. *The ſecond*, *or* Marſh Peters-wort, *or* Creeping Marſh Peters-wort. *It ſprings up with Stalks round, woolly, and ſoft, which ſtand not upright, but lean downwards, taking Root at the Joints, having ſomewhat rounder pointed* Leaves, *ſet at the Joints, two for the moſt part together. The Flowers are as yellow, and of the ſame bigneſs as the former, but give not full out ſo red a Juice as they do; and in theſe particulars conſiſts the whole difference from the firſt, ſetting aſide alſo the Natural place of its growth.*

V. *Johnſon* upon *Gerard*, thus deſcribes this ſecond Species. *It ſends forth divers round hairy creeping Stalks, which here and there put forth new Fibres or Roots, and theſe are ſet at certain ſpaces, with very round and hairy Leaves of a whitiſh color, and two at a Joint. And on the tops of theſe Stalks, grow a few ſmall yellow Flowers, which conſiſt of five Leaves apiece. Theſe Stalks ſeldome ſend forth Branches, unleſs it be one or two at the tops. This* (ſays he) *may well be called in* Engliſh, Round S. Peters-wort.

VI. *The third*, *or* Great Flowered Peters-wort. *This Plant is very much like the firſt deſcribed, ſaving that it has a round brown upright Stalk, two Feet high at the leaſt, with ſuch like, but larger* Leaves, *and round pointed, of a paler green color on the upper ſide, and whiter underneath. The Flowers which put forth at the end of the Stalk, are of a pale yellow color like the firſt, but much larger, with yellow Threads therein alſo. There is a larger* Peters-wort *than this, which is ſaid to grow in* Candia, *which they call* Aſcyroides Cretica major; *but it differs in nothing from this, but in the largeneſs of its* Leaves *and* Flowers, *which are three or four times greater: the which difference may ariſe* (for all that I know) *from the different goodneſs of the Soils.*

VII. *The Places.* The firſt grows in many Groves and ſmall low Woods in ſeveral places of *England*, as in *Kent*, *Huntington*, *Northampton*, and *Cambridgſhires*, as alſo near Water Courſes in other places. *Gerard* found it in many places in *Kent*, as in a Cops by the then Mr. *Sidleys* Houſe near *South-Fleet*. It grows alſo plentifully in the North parts of *England*, eſpecially in *Landſdale* and *Craven*. The ſecond grows in the Marſhes in the *Low Countries*, and in divers Boggy Grounds of this Kingdom, as *Johnſon* ſays, and is truely that Plant which *Cluſius* deſcribes in *Auctarium*. The third is a Native of the *Pyrenæan* Mountains, and has been Tranſplanted from thence into our Clime, and is nouriſht up in ſome of our *Gardens*. Yet I have heard ſome excellent *Botaniſts* ſay, that they have ſometimes met with it upon ſeveral of the Mountains in *Wales*.

VIII. *The Times.* They all Flower in *June* and *July*, and the Seed is ripe in *July* and *Auguſt*.

IX. *The Qualities*, *Specification*, *Preparations* and *Virtues* of *Peters-wort*, are the ſame with thoſe of *Johns-wort*, in *Chap.* 405. *Sect.* 5. *ad* 22. of this Book aforegoing, to which I refer you. But *Johns wort* is ſaid to be the more potent and efficacious to the purpoſes intended, and ſo to be prefered before *Peters-wort*.

X. *The*

X. *The Powder of the Seed of* Peters-wort *Dioscorides*, *Pliny*, and *Galen* say, That if it is taken to the quantity of two Drams at a time in *Mead*, or *Horsed Water*, that it purges Cholerick Humors, and thereby helps such as are troubled with the Sciatica or Hip Gout.

PICK-PURSE, *see* Shepherds-Purse, *Chap.*
PIGEONS-FOOT, *see* Doves-Foot, *Chap* 228.
PIGEONS-GRASS, *see* Columbine, *Chap.* 148.
PILD-CORN, *see* Oats Wild, *Chap.* 525.

CHAP. DLXI.

Of PILE-WORT.

OR,

FIG-WORT.

I. *THE Names.* It is called by the *Arabians*, *Memiten:* in *Greek*, Χελιδονιον μικρον: in *Latine Chelidonium minus*, (and yet in truth is no *Chelidonium*, or *Celandine*, nor any Species thereof:) but the most common *Latine* Names are, *Ficaria*, & *Scrophularia* (because it cures the Kings-Evil,) also *Amellus Virgillij Guilandino*; *Testiculus Sacerdotis Sylvatici*; *Ranunculus latifolius Lugdunensis*, (and yet it has no biting Taste as the *Ranunculi* have:) *Chelidonia Rotundifolia Bauhini*; and it is thought to be the *Strumea Plinij:* in *English*, *Pile-wort*, *Fig-wort*, and by some, the *Lesser Celandine*, (tho' improperly.)

II. *The Kinds.* There are two Species of this Plant, *viz.* 1. *Ficaria seu Scrophularia major*, *Hirundinaria major*, The Greater Pile-wort, or Fig-wort. 2. *Ficaria seu Scrophularia minor*, The Lesser Pile-wort, or Fig-wort.

The Descriptions.

III. *The first*, *or* Greater Pile-wort, *or* Fig-wort. *Its Root is Fibrous, full of many small Kernels or Knots, some smaller, some greater, growing without any order, almost like Grains of* Wheat, *but larger, and of a white color. The Leaves are round, thick and smooth, growing almost as large as* Asarum *or* Asarabacca, *sometimes a little waved about the edges, and sometimes not, each Leaf standing upon a longer foot Stalk than those of the following or* Lesser Kind, *yet lying upon the* Ground. *The Flowers which grow severally, as the next or lesser do, stand upon longer foot Stalks, are of a pale yellow color, and larger than they, consisting but of five or six* Leaves, *cut in at the ends unto their middle, and having some reddish Threads in the middle of the Flowers.*

Pile-wort Great.

Pile-wort Great double Flower'd.

IV. *The second, or* Smaller Pile-wort, *or* Fig-wort. *It has a Root which is made up of many small Kernels, or Knobs, like Grains of* Corn, *some of them being twice or thrice as big and as long as others, of a whitish color, with some Fibres at the ends of them. This Plant does spread out with*

many

Pile-wort ſmall.

many round pale green Leaves, ſet on weak and trailing Branches, which lye upon the Ground, and are flat, ſmooth, and ſomewhat ſhining, and in ſome Places (tho' ſeldom) marked with black Spots, each ſtanding on a long ſoot Stalk: among which riſe up ſmall yellow Flowers, (conſiſting of nine or ten ſmall narrow Leaves) growing upon ſlender ſoot Stalks, very like unto a Crowfoot *Flower, to which the Seed alſo is not very unlike, being many ſmall ones ſet together upon one Head.*

V. *There is another ſort hereof, which has as it were double Flowers, conſiſting of two rows of Leaves, in all other things not differing from the former, which* Camerarius in Horto, *only mentions.*

VI. *The Places.* They grow in moiſt Meadows, by common Ways, and Ditch-ſides which are wet, and ſometimes overflowed with Water, and almoſt every where throughout the Kingdom, in Plaſhy, and watery Grounds, in the moiſt corners of Fields, and places which are near the Water ſide: and yet they will alſo grow in ſomething dryer Grounds provided it be in the ſhade withal.

VII. *The Times.* They ſpring forth out of the Ground about the middle or latter end of *Febraary*, and Flower and Seed in *March* and *April*, and are quite gone in *May*, ſo that they cannot be found, till they ſpring up again the next Year.

VIII. *The Qualities.* They are hot and dry in the firſt Degree, and not in the fourth Degree, as *Dioſcorides* and *Galen*, make theirs to be. They are Attractive, moderately Maturative, otherwiſe Diſcuſſive, Abſterſive, and Vulnerary.

IX. *The Specification. Pile-wort* is a ſingular Cure for the Hæmorrhoids or Piles, and the Diſeaſe called the *Struma* or *Scrophula*, vulgarly the Kings-Evil; it ſoftens and diſcuſſes Wens, and other hard Tumors.

X. *The Preparations.* You may make therefrom, 1. *A Liquid Juice or Eſſence of the Leaves and Roots.* 2. *A Decoction of the ſame.* 3. *An Oil, or Ointment.* 4. *A Balſam.* 5. *A Cataplaſm of the ſame.*

The Virtues.

XI. *The Liquid Juice, or Eſſence.* They are Specificks againſt the Scurvy, Jaundice, Gout, Stone, Gravel, Kings-Evil; and productions of the Hæmorrhoids or Piles, being inwardly taken from 2 to 3, or 4 Spoonfuls, Morning and Night, in a Glaſs of White *Port*, or *Lisbon* Wine; and withall bathing and fomenting the parts affected therewith hot, twice or thrice a Day, for half an Hour together.

XII. *The Decoction.* It has the Virtues of the *Juice* or *Eſſence*, but much weaker in its effects and and operation, and may be given for the ſame purpoſes, from 4 to 8 Ounces, ſweetned with *Syrup of Violets*, or of *Roſes Solutive*, Morning and Night. If the *Decoction* 1 part, is mixed with the *Juice* or *Eſſence* 3 parts, and uſed as an *Errhine* up the Noſtrils, it purges and cleanſes the Head and Brain, from cold and moiſt Humors which offend it, and many times prevents an Apoplexy, and Cures the Epilepſy, Vertigo, Lethargy, and other Diſeaſes of like Kind.

XIII. *The Oil or Ointment.* Anointed 3 or 4 times a Day upon the Hæmorrhoids or Piles it cures them; and is wonderfully beneficial in the Cure of the Kings-Evil, and hard Tumors in many parts of the Body, being anointed upon the parts affected, and Cloths dipt in the ſame applyed over them.

XIV. *The Balſam.* If the Piles or *Scrophula* are diſpoſed to break, it will ripen and break them, and afterwards more fully digeſt the indigeſted Matter, cleanſe and heal them after an admirable manner, beyond moſt other Medicaments appropriated to the Cure of thoſe Diſeaſes.

XV. *The Cataplaſm of the Green Herb and Roots.* It diſcuſſes and heals ſimple Contuſions, being applyed whilſt they are Recent; is profitable againſt an *Oedema* in the Knee, and either diſcuſſes (being applyed warm) or maturates, breaks, cleanſes and heals the Hæmorrhoids in a ſhort time, and withal gives preſent eaſe and relief in the pain tho' never ſo extream. In a recent *Scrophula*, it diſcuſſes the Kernels and Knots, tho' never ſo hard, ſo alſo if they be inveterate, if long applyed; but if they tend to ſuppuration, it haſtens it and breaks them, after which they may be waſhed with the *Juice* or *Eſſence*, and then cleanſed and healed with the *Ointment* and *Balſam*.

CHAP. DLXII.

Of PIMPERNEL.

I. *THE Names.* Some take this Plant to be the *Melochia* of *Serapio*, but the *Mas* or Male Kind *Flore Phœniceo*, he calls it in the *Arabian* Tongue *Xintala*; and the *Fœmina Flore Cæruleo*, he calls, *Cardabella*. It is called in *Greek*, Ἀναγαλλὶς (*ex ἀνὰ & γάλλις idque ex Gallo Phrygiæ fluvio ubi oritur:*) in *Latine*, *Anagallis*: in *Engliſh*, *Pimpernel*. Some Authors call it, *Morſus Gallinæ & Morgelina*, but theſe are rather the proper Names of a Species of *Alſine* or Chickweed. *Marcellus* an old Writer calls it *Macia*; which is extant alſo in *Dioſcorides*, among the Barba-

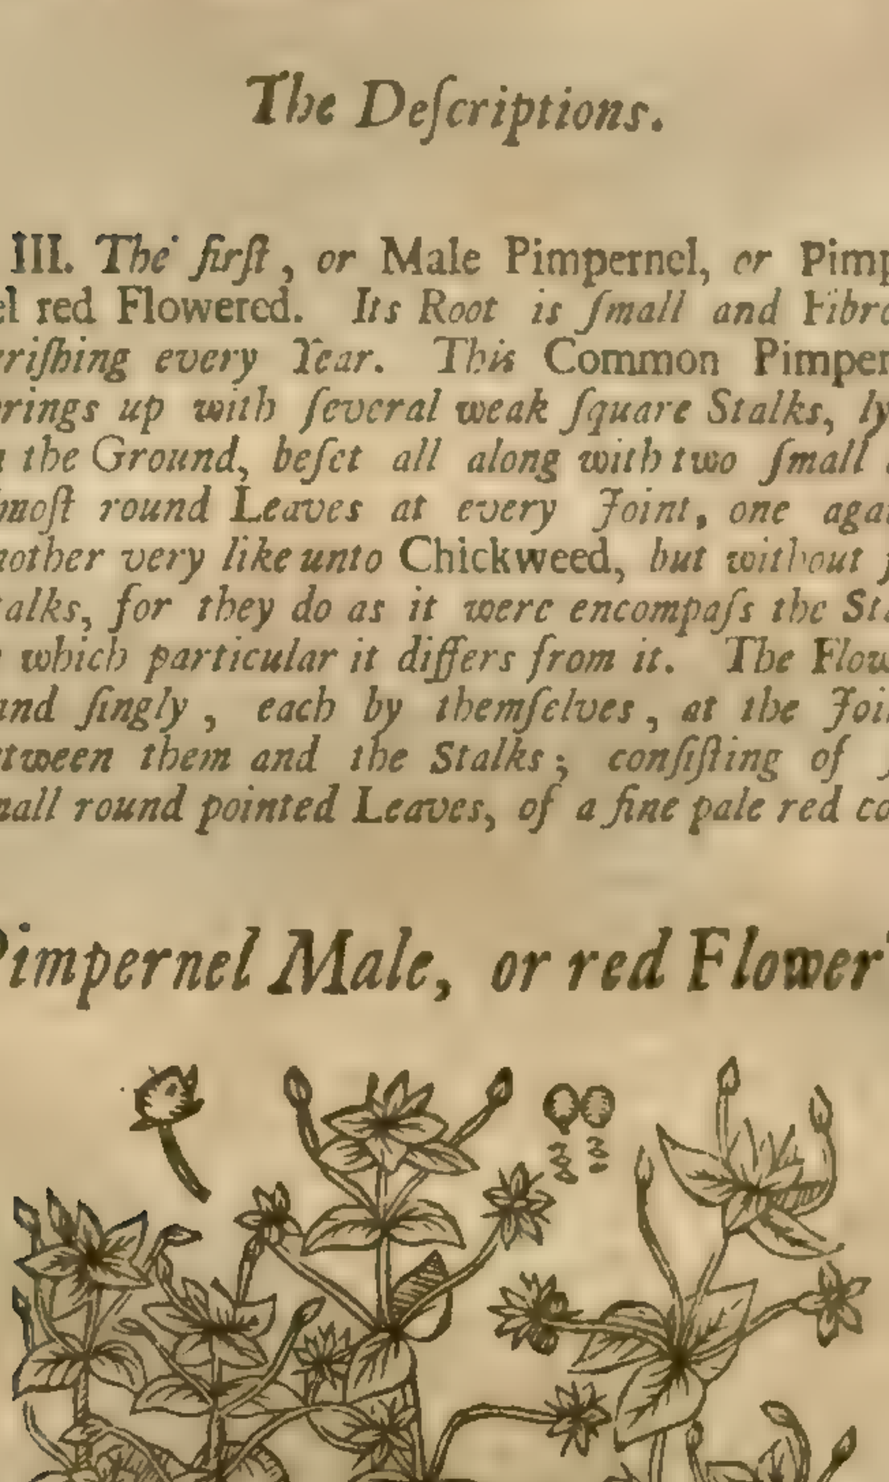
Barbarous Names. Some call it *Corcborus*, or *Corcorus*, ſuppoſing it to be the *Corchorus Theophraſti*, *Lib.* 2. *Chap.* 7. which he accounts *Inter Olera*, among the *Pot Herbs:* and for its bitterneſs became a Proverb. κόρχορος ἐν λαχάνοις, *Corchorus inter Olera*, when we ſpeak of vile or ill Men, who would be accounted of, as among the Good, or deſerving of Mankind. But this is not the *Corchorus Plinij*, *in Lib.* 15. *Chap.* 32. which is the *Alelochia*, or *Olus Judiacum*, the *Jews Mallow*.

II. *The Kinds.* There are ſeveral Species of this Plant, as, 1. *Anagallis Mas*, *Anagallis Floribus Phœniceis*, *vel Flore Phœniceo*, the Male Pimpernel, or Pimpernel red Flowered. 2. *Anagallis Fœmina*, *Anagallis Flore Cæruleo*, *vel Floribus Cæruleis*, the Female Pimpernel, or Pimpernel blew Flowered. 3. *Anagallis Flore purpureo obſolete Cluſij*, the dull red, or purple colored Pimpernel. 4. *Anagallis Flore carneo Parkinſoni*, Pimpernel with bluſh colored Flowers. 5. *Anagallis Flore luteo*, *Anagallis lutea*; *Numularia Sylvatica & Mas Geſneri*, *Alſine lutea Lugdunenſis*, Pimpernel yellow Flower'd. 6. *Anagallis tenuifolia Gerardi*, *Anagallis tenuifolia Flore Cæruleo*; *Anagallis tenuifolia Monelli Cluſio*, Pimpernel narrow Leav'd of Monellus.

The Deſcriptions.

III. *The firſt*, *or* Male Pimpernel, *or* Pimpernel red Flowered. *Its Root is ſmall and Fibrous, periſhing every Year. This* Common Pimpernel *ſprings up with ſeveral weak ſquare Stalks, lying on the Ground, beſet all along with two ſmall and almoſt round Leaves at every Joint, one againſt another very like unto* Chickweed, *but without foot Stalks, for they do as it were encompaſs the Stalk, in which particular it differs from it. The Flowers ſtand ſingly, each by themſelves, at the Joints, between them and the Stalks; conſiſting of five ſmall round pointed Leaves, of a fine pale red color,*

Pimpernel Male, or red Flower'd.

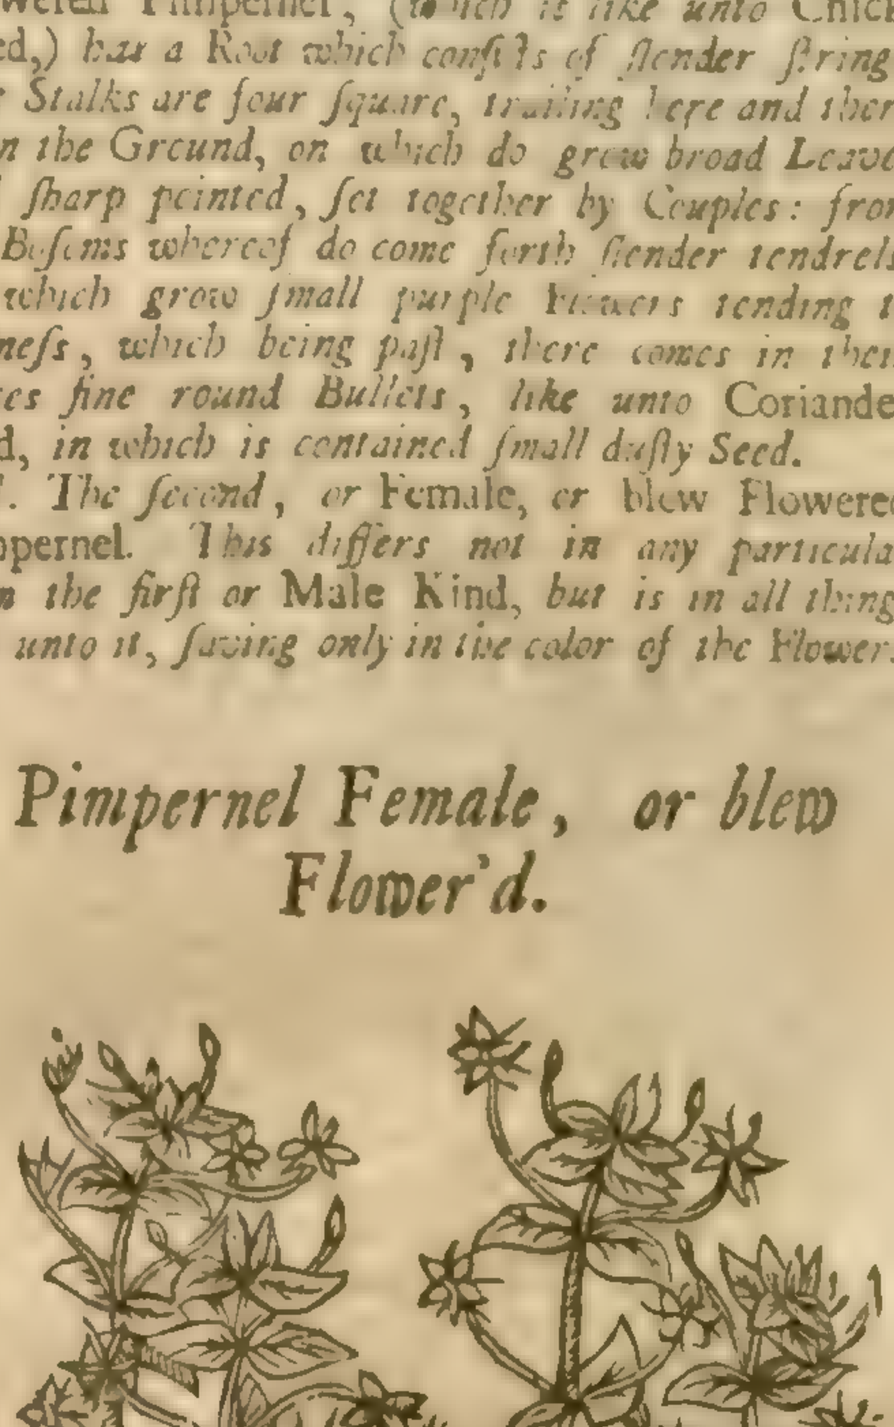


tending to an Orange color, with ſo many Threads in the middle: in whoſe places after they are gone, ſmooth round Heads ſucceed, like thoſe of Chickweed, *in which is contained a ſmall ſort of Seed.*

IV. Gerard *thus deſcribes it.* The Male, *or* red Flowered Pimpernel, (*which is like unto* Chickweed,) *has a Root which conſiſts of ſlender ſtrings. The Stalks are four ſquare, trailing here and there upon the Ground, on which do grow broad Leaves and ſharp pointed, ſet together by Couples: from the Boſoms whereof do come forth ſlender tendrels, on which grow ſmall purple Flowers tending to redneſs, which being paſt, there comes in their places fine round Bullets, like unto* Coriander Seed, *in which is contained ſmall duſty Seed.*

V. *The ſecond*, *or* Female, *or* blew Flowered Pimpernel. *This differs not in any particular from the firſt or* Male Kind, *but is in all things like unto it, ſaving only in the color of the Flowers,*

Pimpernel Female, or blew Flower'd.



the former or Male *being of a red color, but theſe or the* Female, *being of a fair blew color, in which only the difference conſiſts.*

VI. *The third*, *or* Dull red, *or* purple colored Pimpernel. *This does likewiſe in all things reſemble the former, ſaving that the Flowers of this are of a dull or dark red color, having an Eye or glimpſe of purple therein.*

VII. *The fourth*, *or* Pimpernel with bluſh colored Flowers. *This in its Roots, Stalks, Leaves, Flowers, Seed, and manner of growing, is altogether like to thoſe before deſcribed, and only differs from them, in the color of the Flower, which is of a fair bluſh or incarnate color.*

VIII. *The fifth*, *or* Pimpernel yellow Flower'd. *It has a Root which is ſmall and Fibrous, and periſhes not every Year as the others do; for with the Plant when in Flower, there has been gathered dry Stalks*

with

the Heads of Seeds upon them, which have remained all the Winter, *from the former Years growing. This Plant grows in like manner as the others do, with many ſpreading Branches upon the Ground, but they are ſomething greater, and ſo are the Leaves alſo, larger than any of the former ſorts, but ſet by couples at the Joints, where the Flowers come forth upon long foot Stalks, like unto the others, but larger, and of a fair yellow color, with pointed Leaves ſome what like unto* Nummularia, *with round Heads alſo, containing the Seed.*

Pimpernel yellow.

IX. *Gerard* ſays, *Its Root is ſmall and thready, that it has many weak and feeble Branches trailing upon the Ground, beſet with Leaves one againſt another like the great* Chick-weed, *and not unlike to* Nummularia, *or* Mony-wort: *between which and the Stalks come forth ſingle ſmall tender foot Stalks, each bearing at their top, one ſingle yellow Flower, and no more,*

X. *The ſixth, or* Pimpernel narrow Leav'd of Monellus of Tournay. *Its Root is ſmall and Threddy like the others, periſhing in the ſame manner every Year. It grows alſo in the ſame manner which the others do, with ſpreading Branches upon the Ground, and Leaves ſet at the ſeveral Joints, which are longer and narrower, and withall ſharp pointed, ſomething reſembling the Leaves of* Gratiola *or* Hedg-Hyſſop, *not always two at a Joint, but oftentimes three, and ſometimes more, tho' not often. At the Joints likewiſe with the Leaves, ſtand ſeveral Flowers, as in the other ſorts, upon ſmall long foot Stalks, made of five ſmall round pointed Leaves, yet ſomething greater than thoſe of the former blew ſort, having a circle of a purple color in the middle or bottom, which afterwards yield ſuch like round Heads and Seeds.*

XI. *The Places.* The firſt grows in Plowed Fields, near Path-ways, in Gardens, and Vine-yards, in Meadows and Corn-Fields, almoſt every where. The ſecond is not ſo common, yet found in many places, as near *Battle* by *Oxford*, and plentifully in *Rumney Marſh*, at *Higham-Ferries*, *Artilborow*, and *Raunds* in *Northamptonſhire*, and at *Beconsfield* in *Buckinghamſhire*, *Gerard* found it alſo growing in a Chalky Corn-field in the way from one *Swanie*'s Houſe of *South-Fleet* to *Long-field Downs*. The third only grows in *Gardens* at *Franckford*, at *Leyden* in *Holland*, and with us. The fourth, *Parkinſon* ſays, grew of it ſelf, in his own *Garden*, here in *London*, and came up every Year of its own ſowing. The fifth grows in ſhady places, as in *Hampſted Wood*; about *Aſhford*, at a place called the *Park*, and in many places in *Kent*, eſpecially in *Wood Lands*. The ſixth is a Native of *Spain*, about *Cadiz*; and *John Monellus*, had of it growing in his *Garden* at *Tournay* in *France*; *Johnſon* ſays alſo, that he found it growing in *Eſſex*, among the Corn at *Wrightsbridg*, being the then Seat of one Mr. *John Wright*.

XII. *The Times.* They are ſaid to Flower from *May* to *Auguſt*, and the Seed to ripen and fall in the mean time. They Flower chiefly in the Month of *Auguſt* and in Harveſt time, and the Husband-Man has an obſervation of the Weather from the Flowers, and will preſage what ſhall follow the next Day after: if the Flowers be cloſe ſhut up, they ſay that it betokens Rain, and foul Weather: but if they be open and ſpread abroad, it ſhews the contrary, *viz.* that the Weather will be fair.

XIII. *The Qualities.* *Pimpernel (Male* and *Female)* is hot and dry in the firſt Degree, Abſterſive, Anodyn, Aperitive, Attractive, (ſo that *Galen De fac. Simp. Med.* Lib. 6. ſays, *They are of a cleanſing faculty, and have an attractive heat, whereby they draw forth Thorns, Splinters, or other like things, which are gotten into the Fleſh.)* Coſmetick, Digeſtive, Diſcuſſive, Diuretick, Incarnative and Traumatick or Vulnerary; they are Cardiack, Hepatick, Nephritck, Ptarmick, Emmenagogick, Sudorifick, and Alexipharmick.

XIV. *The Specification.* *Pimpernel* is a peculiar remedy againſt the Plague, and all Malign and Peſtilential Fevers, and other Contagious Diſeaſes: it cures the bitings of Serpents, as Vipers, Rattle Snakes, Mad-Dogs, and other Venomous Creatures: is good againſt the Strangury, Stone, and Gravel, and heals all Wounds and Ulcers, whether inward or outward; ſtops the Flux of Humors into any part, eaſes pains in the Ears, and the Piles, and prevails againſt an *O*phthalmy, and other Diſeaſes of the Eyes.

XV. *The Preparations.* You may have therefrom, 1. *A Liquid Juice.* 2. *An Eſſence* 3. *A Decoction* 4. *An Errhine.* 5. *An Ointment or Balſam.* 6. *A Cataplaſm.* 7. *A Diſtilled Water.* 8. *A Spirituous Tincture.* 9. *An Acid Tincture.* 10. *An Oily Tincture.* 11. *An Ophthalmick.*

The Virtues.

XVI. *The Liquid Juice.* Applyed to Green Wounds, it conglutinates their Lips and heals them: to Ulcers, it cleanſes them and incarnates. The Face or Skin being waſhed therewith, it is good to cleanſe it from its roughneſs, ill color, and other deformities thereof, and to make it ſoft, ſmooth and clear.

XVII. *The Eſſence.* It has all the Virtues of the *Liquid Juice*, beſides which it is of great force againſt the Plague or Peſtilence, and all ſorts of Malign and Peſtilential Fevers, being a few times uſed, and Sweating well upon it. It is alſo prevalent againſt the bitings of Mad-Dogs, Serpents, or other Venomous Creatures, the ſtinging of Scorpions, Hornets, and other like Inſects. It gives eaſe in the Strangury, and removes the Pain, heat, and ſtoppage of Urine, and is profitable againſt

againſt inward Wounds and Ulcers, as Ulcers of the Lungs, Reins, and Neck of the Bladder. And applyed outwardly to all Green Wounds, which are ſimple without Fracture or Laceration, it quickly conſolidates and heals them: it alſo cleanſes and heals old, filthy, fretting, and running Ulcers, and ſuch as are made by Poiſonous Bealts, it cleanſes them from their Corruption, reſtrains their malignant corroding, invalidates their venomous qualities, and drys up their Flux of Humors, and ſo quickly brings them to healing. Fomented on the Piles it eaſes the Pain, and diſcuſſes them, and dropt into the Ear on the contrary ſide, it eaſes the Tooth-ach. Doſe 2, 3, or 4 Ounces Morning and Night.

XVIII. *The Decoction in Wine.* Given from 4 to 8 Ounces, it is a good remedy againſt the Plague and other peſtilential Fevers, and Contagious Diſeaſes, ſo as after the taking thereof, as hot as the Patient can well drink it, they ly in their Beds, and Sweat for two Hours after, whereby the Poiſon of the Diſeaſe will be expelled, this being thus uſed for 2 or 3 times. It has all the other Virtues of the *Liquid Juice* and *Eſſence* afore ſpecified, but ought to be given in a larger Doſe, as is before Directed.

XIX. *The Errhine.* Take of the *Juice* 4 *Ounces*, *Scammony in ſubtil Pouder* 2 *Drams*, *mix them.* Snufft up the Noſtrils it Purges the Head and Brain of cold, moiſt and pituitous Humors; gives eaſe in the Head-ach, Megrim, and a *Cephalea*, or inveterate periodical Head-ach, and in a little time cures the Vertigo, Lethargy, Carus, Apoplexy, Epilepſy, Night-Mare, and other like Diſtempers of thoſe parts; as alſo defluxions of Rheum into the Eyes, Ears, Noſe, Jaws, Teeth; *&c.*

XX. *The Ointment or Balſam.* It cures ſimple Green Wounds, at a few times dreſſing; and applyed to a peſtilential Bubo, it ripens and breaks it. Applyed to the Gout it eaſes the pain; and digeſts, cleanſes, incarnates, and heals old filthy and running Ulcers; and Kings-evil Sores, more eſpecially if to every 4 Ounces of the *Ointment or Balſam*, half an Ounce of *Pouder of Tobacco*, and 1 Ounce of *Levigated Mercurius dulcis* be added, the Ulcer being cleanſed at every dreſſing with the *Liquid Juice*, *Eſſence*, or *Decoction*, aforegoing.

XXI. *The Cataplaſm.* It is attractive, and being applyed to any part where there is any Prick, Splinter, Thorn, or the like, it draws it forth: and applyed to a ſimple Contuſion, it diſcuſſes the Tumor and cures it.

XXII. *The Diſtilled Water.* It is a Coſmetick, and has all the Virtues of the *Liquid Juice*, being applyed according to Art to the Face and Skin: but I am of opinion that it is not full out ſo effectual as the *Juice* or *Eſſence:* yet it will be more powerful if a quarter part of the *Juice of Limons* be added to it; and then it will make an excellent *Gargariſm* for a Sore Mouth and Throat, and a good cleanſer of the Teeth.

XXIII. *The Spirituous Tincture.* It has all the Virtues of the *Eſſence* and *Decoction*, and may be given Morning and Night from 2 Drams to 4, in a Glaſs of Wine, or other fit Vehicle, againſt Poiſon, Plague, and Peſtilence, bitings of Mad Dogs, *&c.* as in *Sect.* XVII. is before hinted. It prevails againſt Convulſions, Fainting and Swooning Fits, Vapors, and other Diſtempers of the Heart, Liver, Spleen, and Womb.

XXIV. *The Acid Tincture.* It is a potent thing againſt the Plague, and all malign and peſtilential Fevers, deſtroying the Malignity, and extinguiſhing almoſt in a moment the preternatural Heat. It quenches thirſt, reſtores a loſt Appetite, cauſes good Digeſtion, opens all manner of obſtructions of the *Viſcera*, but chiefly of the Lungs, Spleen, and Reins, and is good againſt the Biting of Mad Dogs, and other Venomous Creatures. Doſe ſo many Drops as will make the Vehicle pleaſantly ſharp, and to be often repeated in the Day time.

XXV. *The Oily Tincture.* It opens all Obſtructions of the Reins and Bladder, powerfully provokes Urine, gives eaſe in the Strangury, and expels Sand, Gravel, Stones, and Tartarous Matter from the Reins and Bladder. It gives eaſe in the Colick, expels Wind powerfully, gives relief in Convulſions, provokes the Terms, and is profitable againſt the Palſy, being taken inwardly from 20 Drops to 60, in any fit Vehicle, according as Age, Strength and other Accidents will admit: It may be given twice a Day inwardly, and applyed outwardly to the parts affected. It alſo cures Wounds and Punctures of the Nerves and Tendons, being applyed by a Skilful Hand.

XXVI. *The Ophthalmick. Take of the Clarified Juice of Pimpernel, Clarified Honey, of each equal parts, mix them in the Heat of a Bath.* Being put into the Eyes Morning and Night, or 3 or 4 times a Day, as the neceſſity may require, it is good to clear them from Clouds, Miſts, and Films, which obfuſcate or hinder the Sight, is profitable againſt an Ophthalmie, helps weeping Eyes, and cures Ulcers therein, being duly applyed.

CHAP. DLXIII.

Of PIMPERNEL Water and Sea.

I. *THE Names.* It is called in *Greek*, Ἀναγαλλὶς ὑδατώδης: in *Latine*, *Anagallis Aquatica:* and in *Engliſh*, *Water Pimpernel:* The Sea Kind is called in *Greek*, Ἀναγαλλὶς θαλάσσιος: in *Latine*, *Anagallis Maritima*, *vel Marina:* and in *Engliſh*, *Sea Pimpernel.*

II. *The Kinds.* There are many ſorts of *Water Pimpernel*, as, 1. *Anagallis Aquatica folio ſubrotundo non crenato*, *Anagallis aquatica Lobelij tertia* (this *Guilandinus* thought it ſometimes to be *Aliſma Dioſcoridis*, and at another time to be *Cochlearia*, but in both was miſtaken:) *Anagallis Aquatica folio rotundo non crenato Bauhini*, Water Pimpernel, *Lobel*'s third Water Pimpernel. 2. *Anagallis Aquatica anguſtifolia*, *Anagallis Aquatica Lobelij quarta*; (*Samolus Plinij*, *Lib.* 25. *Chap.* 11. as ſome think:) Long Chickweed Leav'd Water Pimpernel, or *Lobel*'s fourth Water Pimpernel. 3. *Anagallis Aquatica anguſtifolia Scutellata Bauhini*, Narrow Leav'd Water Pimpernel. 4. *Anagallis Aquatica foliis Pulegij Bauhini*, *Sium alterum Tragi*, *Anagallis Aquatica Tragi*, Small round Leav'd Water Pimpernel. To theſe might be added the ſeveral ſorts of *Brooklimes*, which the *Latines* call *Anagalides Aquaticæ*, but theſe becauſe they are better known by the Name of *Brooklime*, we have treated of before, apart, in a Chapter by themſelves, *viz. Chap.* 88. aforegoing of this Book. 5. *Anthyllis lentifolia*, *Alſine Cruciata Marina*, *Alſines genus Pelagicum Cluſij*, Sea Pimpernel.

The Descriptions.

III. *The first, or* Water Pimpernel, which is *Lobels* third Water Pimpernel. *The Root of this Plant runs or spreads not it self abroad, but is a small Bush of white Fibres, from whence spring many smooth, pale green Leaves, small at the bottoms and broad*

Pimpernel Water of Lobel.

and round at the ends. The Stalk is round, about a Foot more or less high, with several smaller Leaves thereon, set one by one up to the top, where it spreads it self forth into many branched Spikes of white Flowers.

IV. *The second, or* Long Chickweed Leav'd Water Pimpernel, which is *Lobel's* fourth Water Pimpernel. *This is a Fibrous Root consisting of a bunch of white Strings much like the former. It is a small Plant, and rises up not above half a Foot high, with several Branches spreading from a weak square Stalk, having two small Leaves at a Joint, something like unto the* Greater Chickweed, *but somewhat longer. The Flowers are white, consisting of four Leaves apiece, standing on long foot Stalks, after which follow round Heads with small Seed in them.*

V. *The third, or* Narrow Leav'd Water Pimpernel. *Its Root is reddish, Fibrous and Creeping. The Stalks are smooth, streaked, Jointed, and about a Foot and half high, having two very narrow and long Leaves at every Joint, pointed at the ends, without any foot Stalk to them. At every Joint almost, with the Leaves, come forth small upright Branches, winding themselves one within another, as if they had Claspers, from whence spring smaller foot Stalks, on both sides, which sustain small whitish purple Flowers, like unto those of* Chickweed, *consisting of three Leaves apiece. After which come small flat double Pods much like to a Shield (whence the* Latine *Name Scutellata) being two set together with a Thread between them; on both sides whereof the Seed lyes.*

VI. *The fourth, or* small round Leav'd Water Pimpernel. *Its Root is white, fibrous and creeping in the Ground, much like to* Brooklime *The Leaves are small and round, like almost unto* Pennyroyal, *two always at a Joint upon the Stalks, which are four square, and bear blew Flowers, like to those of the* Land Pimpernel.

VII. *The fifth, or* Sea Pimpernel. *Its Root is somewhat long, slender, jointed, and deep thrust into the Ground, like to* Soldanella. *It has many small branches full of Joints, not above an Handfull high, creeping several ways, beset with small thick Leaves, of a pale color resembling* Lenticula,

Pimpernel Sea.

or rather Alsine minor, *the* Lesser Chickweed. *The Flowers grow at the top of the Stalk, Star fashion, of an herby color like* Box, *or* Sedum minus. *It incloses its Seed, which is small, in a three cornered Husk. All the whole Plant is Saltish, bitter in Taste, and somewhat heating. The* Epithite Cruciata *is here added to the Name, because the Leaves which grow thick together by couples, cross each other, as it happens in most Plants which have square Stalks, with two Leaves at each Joint. And it is* Englished, Sea Pimpernel *rather than* Sea Chickweed, *because the Leaves in shape, are liker those of* Pimpernel, *than of any other Plant. And also for that the Author* Lobel, *has called another Herb by the Name of* Sea Chickweed.

VIII. *The Places.* The four first grow by River sides, small running Brooks, and watery Ditches. The first has been found growing in the Marshes of *Dartford* in *Kent*, also between *Sandwich* and *Sandown-Castle*, and in the Ditches on this side *Sandwich*. The second grows in many standing Waters, and watery Ditches, in several parts of the Kingdom. The third and fourth grow in like places, tho' they are not so common; but are Natives of *Germany*. The fifth grows in the *South Island* belonging to *England*, especially in *Portland*, and in the Gravel and Sandy Fords, which lye low, and against the Sea: It has also been found in the *Isle of Shippy* near the Water side, and in *Westgate-Bay* by *Margate* in the *Isle of Thanet*.

IX. *The Times.* They all Flower in *June* and *July*, and sometimes in *August*, and give their ripe Seed the Month after the time of their Flowering as the *Brooklimes* do.

X. *The*

X. *The Qualities, Specification, Preparations,* and *Virtues* of the first four, are the same with those of *Brooklime*, in *Chap.* 88. *Sect* 9. *ad* 21. to which I refer you. These are something weaker than *Water Cresses*, but are much used in *Diet Drinks* with other things, to purge and cleanse the Blood, and *Lympha*, as also the whole Body from those Peccant and Scorbutick Humors which overturn the Health thereof: they are Specifick against the Scurvy, Scrophula, Dropsy, Gout, and Jaundice: and are said to be *Lithontriptick* or Stone Breakers, and cause Sand, Gravel, and Tartarous Mucilage to be expell'd by Urine, easing and helping the Strangury: they also provoke Womens Courses, and expel the Dead Child. *A Cataplasm made of them, being Fried with Butter and Vinegar*, and applyed warm, helps all manner of Tumors or Swellings, and *Anthony*'s Fire also, if it be often renewed.

XI. *The Virtues of the* Sea Pimpernel. It is temperate in respect of heat or cold, dryness or moisture. *The Pouder of the Dryed Leaves*, being given from two Drams to half an Ounce, either in its own *Distilled Water*, or in *Parsly* or *Hydropiper Water*, or in *Onion Water*, it prevails greatly against the heat and Scalding of the Urine, the Strangury, or difficulty of making Water, and purges the Reins. The same *Pouder* taken with *Oxymel* or *Honied Water*, is good against the *Epilepsy* or Falling-sickness, being given first in the Morning fasting, and last at Night going to Bed, and so continued for some considerable time.

PINKNEEDLE, *see* Cranes-Bill Musked, *Chap.* 160.

CHAP. DLXIV.

Of PINKS Great and Small.

I. *THE Names.* I know no *Greek* Names belonging to these Plants; the *Latines* call them *Caryophylli Sylvestres*, or *Cariophylli Nothi*: and in *English*, *Pinks*, or *Bastard Gilliflowers.*

II. *The Kinds.* There are several sorts of *Pinks*, as, I. *Caryophyllus Hortensis Flore simplici, vel minor Flore simplici*, The Garden single Pink. II. *Caryophyllus Hortensis minor Flore multiplex*, The Garden double Pink. III. *Caryophyllus Sylvestris minor*, The Wild Pink. Now each of these three principal Kinds, have several other Species under them, hereafter in this Chapter to be declared.

The Descriptions.

I. *Caryophylli Hortenses minores Flore simplici*, Single Garden Pinks.

III. *Caryophyllus Hortensis minor simplex*, The Common single various colored Pink. *This in its manner and form of growing in all its parts, is like to the* Gilliflower *in* Chap. 318. *aforegoing, saving only that its Leaves are smaller and shorter, in some more or less than in others, and so are the Flowers*

Pinks Garden red single.

also, which consists usually of five Leaves apiece (seldom six) round pointed, and a little snipt for the most part about the edges; with some Threads in the middle, either crooked or straight.

Pinks Garden small single.

IV. *Caryophyllus minor albus*, The ſingle white Pink. *It is the* Common white Pink, *with a ſingle white Flower of five Leaves, finely jagged about edges.*

V. *Caryophyllus Plumarius albus orbe rubro ſive Stellatus*, The ſingle white Star Pink. *It bears Flowers almoſt as deeply jagged in as the following* Plumarius, *of a fair white color, having a Ring or Circle of red, about the bottom or lower part of the Leaves, and are as ſweet as the* Plumarius. *This being ſown of Seed, does not give the Star of ſo bright a red color but becomes more dun.*

VI. *Caryophyllus Plumarius*, Fethered or jagged ſingle Pinks. *Theſe have ſmall woody Roots, and ſuch like Stalks and Leaves as the firſt deſcribed, at* Sect. III. *above, but ſomewhat ſhorter and ſmaller, or* Graſs *like; and of a whitiſh or grayiſh green color. The Flowers ſtand in like manner at the tops of the Stalks, in long, round, ſlender, green Husks, conſiſting of five Leaves, very much cut in on the edges, and jagged almoſt like a Feather, of a light red or bright purple color, with two white Threads ſtanding in the middle, crooked like a Horn at the end, and are of a very ſweet Smell. But there are ſome of this ſort, which have not theſe two crooked Threads or Horns in the middle, but have in their ſtead many ſmall Threads, not crooked at all. The Seeds of them are all like to the Seeds of* Gilliflowers, *or the other* Pinks, viz. *ſmall, black, long, and flat.*

VII. *Caryophyllus Hortenſis minor rubrus*, The ſingle red Garden Pink. *This is like the* White *aforegoing, but that the Leaves are not ſo much jagged, and the Flower is of a pale purpliſh color.*

VIII. *Caryophyllus minor purpureus*, The ſingle purple Pink *This is of a fair purple color, beautiful in its Kind, and almoſt like to the purple* Gilliflower.

IX. *Caryophyllus minor Carneus*, The Bluſh colored Pink. *This has broader and larger Leaves in the Flower, than any other* Pink, *and of a fair bluſh or fleſh color.*

X. *Caryophyllus Plumarius albus*, The white Feathered Pink. *This has the edges of the Flower more finely and deeply cut in than the former, without the Ring or Circle of red at bottom.*

XI. *Caryophyllus minor purpureus Dilutus.* The light red, *or* purple colored Pink. *This is like the former* Feathered Pink, *and differs only from it in its color.*

XII. *Caryophyllus minor Stellatus*, The Star Pink. *This is a beautiful Flower, finely jagged on the edges, but not ſo deep as the former* Star Pink; *and has a fair red Circle at the lower end of the Leaves on the inſide.*

XIII. *Caryophyllus Plumarius albus Auſtriacus, ſive ſuperba Auſtriaca*, The white Feathered Pink of *Auſtria. Its Roots are ſmall and woody like the others. Its firſt or lower Leaves are ſomewhat broader and greener, than any of the former* Pinks, *being both for breadth and greenneſs more like unto* Sweet Johns. *The Leaves on the Stalks are ſmaller, ſtanding by couples at every Joint, at the tops of which ſtand ſuch like jagged Flowers, as the laſt deſcribed, and as large, but more deeply cut in or jagged round about, of a pure white color, and of a moſt fragrant ſweet Smell, comforting the Spirits and Senſes afar off.*

XIV. *Caryophyllus Plumarius purpureus Auſtriacus*, The purple Feathered Pink of *Auſtria. This in its form and manner of growing is altogether like the former, and differs nothing from it but in the color of the Flowers, which in this are of a purpliſh color, and having the ſame ſweet Smell. Some have miſtaken a Kind of* Wild Campion, *growing in our* Woods, *as by the Path ſides in* Hornſie Park, *and other Places, to be this* white *or* purple Auſtrian Feathered Pink: *But by comparing the Flowers, the miſtake will be ſufficiently manifeſt.*

XV. *Caryophyllus minor repens ſimplex*, The ſingle creeping or matted Pink. *This is the ſmaleſt* Pink *both for Leaf and Flower of all the other Kinds which are nouriſhed in our* Gardens, *having many ſhort and ſmall Graſſy green Leaves upon the Stalks, which as they grow and lye upon the Ground (not ſtanding ſo upright as the former) do take Root again, whereby it quickly ſpreads, and covers a great deal of Ground in a little time. The Flowers are ſmall and round, a little ſnipt about the edges, whereof ſome are white, ſome red, ſome white ſpotted with red, and ſome of them red ſpotted with white, all of them ſingle Flowers.*

XVI. *Caryophyllus minor maculoſus*, The ſpeckled Pink. *It is a ſmall Flower, having ſmall ſpots of red here and there, diſperſed over the white Flower.*

XVII. *Nota.* Now here is to be Obſerved, That thoſe ſingle Flowers which are like unto *Pinks*, but do riſe from the ſowing of the *Orange Tawny*, or any other colored *Gilliflower* or *Carnation*, are not to be accounted of as in this *Claſſis* of *Pinks*, but of the Kinds of *Caryophylli majores*, or *Gilliflowers.*

XVIII. *Caryophyllus Marinus*, Sea Thrift *or* Cuſhion. *This our* Common Thrift, *is well known unto moſt which have* Gardens, *becauſe of its general uſe to Empale or Border Knots and Beds in* Gardens, *for that it abides green* Winter *and* Summer, *and that by cutting it will grow thick, and be kept in what form you pleaſe. It has many ſhort and hard green Leaves, ſmaller than many of the* Graſſes, *growing thick together, and ſpreading upon the Ground. The Stalks are naked of Leaves, a Span high, bearing a ſmall Tuft of light purple, or bluſh colored Flowers, ſtanding round, and cloſe thruſt together.*

XIX. *Caryophyllus Marinus major, ſive, Mediterraneus*, Great Thrift, *or* Great Sea Gilliflower. *This is a larger or greater Kind than the former, and of as great beauty and excellency almoſt, as any of the former* Pinks, *whether ſingle or double; as well for that the Leaves are like unto* Gilliflowers, *being longer and larger than any* Pinks, *and of a whitiſh green color, like unto them, not growing long or by couples upon the Stalks, as* Pinks *and* Gilliflowers *do, but Tufting cloſe upon the Ground, like unto the former* Common Thrift. *As alſo that the Stalks, riſing from among the Leaves, (being ſometimes two feet high) are yet ſo ſlender and weak, that they are ſcarcely able to bear the Heads of Flowers, naked or bare, both of Leaves and Joints, ſaving only in one place, where at the Joint each Stalk has two ſmall and very ſhort Leaves, not riſing upwards, as in all other* Gilliflowers *and* Pinks, *but growing downwards; and do bear each of them a Tuft or Umbel of ſmall purpliſh, or bluſh colored Flowers at their tops, ſtanding ſomething like to* Sweet Williams, *but more roundly together; each Flower conſiſting of five ſmall, round, ſtiff, or hardiſh Leaves, as if they were made of* Paper, *the bottom or middle being hollow: They blow not all at once as the* Common Thrift *aforegoing, but for the moſt part one after another, not ſhewing uſually above four or five Flowers open at one time: ſo that it is long before the whole Tuft of Flowers is blown or paſt: but yet the hotter and the dryer the time is, the ſooner their time of Flowering is over. Its Root is ſomewhat great, long and hard, and not ſo much ſpreading in the Earth, as the Roots of* Gilliflowers *or* Pinks *do.*

II. *Caryo-*

II. *Caryophylli Hortenſes minores Flore multiplici.* Double Garden Pinks.

XX. *Caryophyllus Hortenſis minor Flore multiplici variegato*, The Common double various colored Pink. *The form of the whole Plant and manner of its growing is exactly like that at* Sect. 2. *aforegoing, ſaving that this* double Kind *is leſſer, and leſs double than the* double Gilliflowers, *having its Leaves a little ſnipt or indented about the edges, with ſome Threads in the middle, of divers and various colors, and of a fragant ſweet Smell.*

Pinks double.

XXI. *Caryophyllus Plumarius albus multiplex*. The double white Pink. *This is only with more Leaves in it, than is in the* ſingle white Pink, *which makes the only difference.*

XXII. *Caryophyllus Plumarius multiplex*, The double Feathered or jagged Pink. *This in its Roots, Leaves, Stalks, Flowers, color of the Flower, and Seed, is exactly like that at* Sect. VI. *aforegoing, without any difference therefrom, ſaving that the Flowers of this are double.*

XXIII. *Caryophyllus Hortenſis minor rubens multiplex*, The double red Pink. *This is in the ſame manner double as the former, differing in that only,* viz. *in its duplicity, from the ſingle of the ſame color.*

XXIV. *Caryophyllus Hortenſis minor purpureus multiplex*, The double purple Pink. *It differs not from the ſingle purple, for color and form of growing, but only in the doubleneſs of the Flowers.*

XXV. *Caryophyllus Hortenſis minor Granadenſis*, The Granado Pink. *It differs not from the* Gilliflower *of the ſame Name, but in the ſmallneſs of the Leaves and Flowers.*

XXVI. *Caryophyllus Hortenſis minor carneus multiplex*, The double bluſh Pink. *This is almoſt as great as the* Ordinary bluſh Gilliflower; *and ſome have taken it for a* Gilliflower: *but the green Leaves are almoſt as broad as* Pinks, *the ſmooth Reaſon, I rather refer it to the* Pink Kind.

XXVII. *Caryophyllus Hortenſis minor repens multiplex*. The double matted Pink. *This is like the* ſingle matted Pink, *in the form and manner of growing, at* Sect. 17. *aforegoing, not differing in its Leaf, but in its Flowers. The firſt Flowers are but once double, or of two rows of Leaves, of a fine reddiſh color, ſpotted with Silver ſpots; but thoſe which ſucceed are fuller and double, that they oftentimes do break the Pod or Husk, and are not altogether of ſo deep a red color, but more pale.*

XXVIII. *Caryophyllus Plumarius Auſtriacus, albus & purpureus multiplex*, The double white and purple Auſtrian Feathered Pinks. *Theſe differ not from the ſingle at* Sect. 13. *and* 14. *aforegoing, neither in its Leaves, Stalks, nor manner of growing, but only in the Flowers, theſe being double, and the beſt of the double Kinds.*

XXIX. *Caryophyllus Plumarius multiplex macula purpureâ in fundo*, The double Feathered Pink with a purple ſpot in its bottom. *This differs not alſo from that at* Sect. 5. *aforegoing, but only in the duplicity of its Flower.*

III. *Caryophylli Syveſtres minores*, Wild or Field Pinks.

XXX. *Caryophyllus arvenſis proliſer*, Childing Pinks. *Its Root is ſmall, white and hard, periſhing every Year after Seed time, and raiſing itſelf again by its own ſowing, or elſe, it muſt be ſown in the Spring. It has a few pale green, ſhort, blunt, graſſy Leaves, lying on the Ground for the firſt Year, and are the next Year carried up with the Stalks, divided into ſome Branches, and ſet by couples at the Joints, having a ſhort, thick, grayiſh green Husk at their tops, out of which ſhoot forth by degrees, one after another, ſeven or eight ſmall faint Flowers, ſmaller than the ſmalleſt* Garden Pink *by much, which ſcarcely ſhew themſelves above the brim of the Husk: more Flowers than one, ſeldom appear at a time out of the Husk, very rarely two; by reaſon of which, they are long in Flowering. After they have done blowing, there is found in the outward Husk, ſo many ſeveral ſmall long Husks, as there were Flowers, each containing within them ſmall blackiſh Seed. Of this Kind, there is One which has but one Flower riſing out of the Husk, and of a paler reddiſh color than the former.*

XXXI. *Caryophyllus pratenſis noſter major*, Our greater Wild Field Pink. *This grows near* Deptford *and* Redrif, *and in many places of* England *Wild, being a ſmall Kind of* Pink, *as it may be called. It ſpreads much oftentimes, and roots again by the Branches as it grows, with ſmall ſhort green Leaves next the Ground, and by couples on the Stalks, with ſmall reddiſh* Pink *like Flowers on the Tops.*

XXXII. *Caryophyllus pratenſis noſter minor*, Our leſſer Wild Field Pink. *This is leſſer than the former, and grows among the thick* Graſs *in our Meadows near* London, *as towards* Totnam Court, *and other places adjacent to the ſame. Its Root is ſo ſmall and Thready, that it will not bear Tranſplanting. Its Stalks are very ſlender, on which are ſet ſmaller, ſhorter, and greener Leaves, than on the former. The Flowers alſo are ſmaller, and of a clear ſhining red color; ſometimes but One of a Stalk, and ſometimes more, eſpecially if it grows under Hedges and buſhes which may defend it by their ſhadow.*

XXXIII.

Pinks Wild, or Field.

XXXIII. *Caryophyllus arvenſis Umbellatus*, Wild Pink in Tufts. *It much reſembles a* Wild Campion, *having ſhort broad Leaves, ſomething like to* Lobel *his* Catch-Fly, *but of an hoary green color*; *The Stalks have the like Leaves ſet by couples on them, and at the top ſeveral ſmall Flowers, riſing altogether from one Joint, and each ſtanding on a ſhort foot Stalk, compoſing thereby a kind of Umble, ſome of a reddiſh, others of a whitiſh color.*

XXXIV. *Caryophyllus arvenſis holoſtius Hirſutus*, Wild hairy Sea Pink. *This grows very like to a* Garden Pink, *but of a grayiſh or hoary green color, and ſomewhat hairy withall. The Flowers grow not like* Pinks *in long Husks, but more like to a* ſmall Wild Campion, *of a reddiſh color tending to a murry, and gives ſmaller Seed, unlike to that of* Pinks.

XXXV. *Caryophyllus holoſtius tomentoſus*, Hoary Sea Pinks. *Its Root is ſmall and creeping, and ſends forth ſeveral ſlender round Jointed Stalks lying on the Ground, and dividing themſelves into many Branches, a Foot or two, or more long, on which are ſet Leaves by couples, ſome of them broad and long, others more round, yet all of them hoary white, like unto the Leaves of* Gnaphalium Americanum, *called* white Live Long, *or* Life Everlaſting. *The Flowers are white, conſiſting of five Leaves, and round pointed. This abides long, and ſpreads much upon the Ground.*

XXXVI. *Caryophyllus anguſtifolius tomentoſus*, Hoary narrow Leav'd Pink. *This* ſmall low Pink *ſcarcely riſes with the Stalks an Hand breadth high, which are woolly, and Branching into two or three parts. It has very narrow long and woolly green Leaves thereon, one being longer than another. Each of the Stalks has a white Flower conſiſting of five Leaves, ſtanding in a Green Husk.*

XXXVII. *Caryophyllus pumillus latifolius*, The low broad Leav'd Pink. *It riſes up with a ſhort low Stalk, which preſently divides it ſelf into two Branches, about half a Foot high. Its lower Leaves next the Ground, are ſomething broad and ſhort, but a little longer on the Branches, being ſoft, and a pale green color, ſet by couples at the Joints; each of the Branches bear but one ſmall, pale, purpliſh, white Flower, riſing out of a ſmall ſhort Husk.*

XXXVIII. *Caryophyllus Montanus albus*, The white Mountain Pink. *Its Root is great thick and woody, which ſends up very many ſmall and narrow Leaves, finer and leſſer than* Graſs, *not unlike to the ſmalleſt* Ruſh: *among which riſe up tender Stalks, Jointed or Kneed by certain diſtances, ſet with the like Leaves by couples even to the top, one oppoſite againſt another; at the tops of which grow ſweet ſmelling Flowers compoſed of five ſmall white Leaves. The Seed is ſmall and blackiſh.*

XXXIX. *Caryophyllus pumillus Alpinus*, The Dwarf Mountain Pink. *Its Root is long, black, and much ſpreading, by which means this little*

Pinks Mountain Dwarf.

Plant covers the Ground for a good ſpace together, like as a Moſs, *making when the Flowers are blown a beautiful ſhew, which is commonly in* June; *the beauty of its verdure and bluſh, being thick intermixt, makes it look like a wrought Carpet, by which it very much pleaſes the Sight. The Stalk is about an Inch, or ſomething more high, ſet with little ſharp pointed green* Graſſie *Leaves. The Flowers which grow upon theſe Stalks, are compoſed of five little fleſh colored Leaves, a little divided in their upper parts. The Seed is contained in black ſhining Heads, which is ſmall, reddiſh, and Kidney faſhioned.*

XL. *The Places.* The firſt ſixteen *ſingle Garden Pinks*, and the next ten *double Garden Pinks*, are in our Country, only Inhabitants of *Gardens*; tho' in ſome Forreign Southern Countries and warmer Climes, they do often grow Wild in the Fields. The laſt ten grow Wild abroad in Paſtures and Borders of Fields, in many Regions, as in *England*, *France*, *Germany*, *Italy*, *Spain*, &c. The *Common Sea Thrift* grows in the Salt Marſhes

Cattum by *Ruellius*, and in many other places of *England*. But the great Kind was gathered in *Spain* by *Lobel*, and the Seed thereof sent to us, from whence we have had divers Plants. However, the *common small Pink* has been brought into our *Gardens* for its exceeding usefulness, being of great Service for the Bordering of Knots, Beds, Banks, &c. as we have before hinted.

XLI. *The Times.* The *Garden single* and *double Pinks*, as also, the *Wild* or *Field Kinds*, and the *Gramen Polyanthemum* or *Sea Pinks*, do all Flower before any of the *Gillyflowers*, even from *May* through the whole *Summer*, till the end of *August*, and sometimes to the middle of *September*, or later, if the Weather is warm, or milde and gentle.

XLII. The *Qualities*, *Specification*, *Preparations* and *Vertues* of the *Garden Pinks*, are much the same with those of the *Gilliflower* and *Clove-gilli flower*, but not thought to be so effectual as they. *Gerard* says, They are not used in Physick, but in making Garlands and Nosegays. And that they are good to be put into *Vinegar* (I suppose those which are the deepest colored) to give it a delightful color, and a pleasant taste, as *Ruellius* Writes. *Fuchsius* says, That their Roots are commended against the Infection of the Plague; and that the *Juice* thereof is profitable to waste or dissolve the Stone and to expel it; as also to cure such as have the Falling-sickness.

XLIII. As to the *Qualities* and *Virtues* of the *Wild* or *Field Kinds*, Authors have said nothing, so that we have no farther Observations concerning them.

XLIV. *Rea* in his *Flora Lib.* 1. *Chap.* 38. says, That *Pinks* are of many sorts and little esteem, and serve only to set on the sides of Borders in Spacious *Gardens*, and the better sort of them to make Posies of, mixed with Buds of *Damask Roses*. Most of them are single, but there are some which bear double Flowers (as are before described) and of those, they which are called the *Feathered Pinks* are the best both for form, color, and fragrancy of Smell, having broad Leaves, deeply cut in and jagged on the edges, of which Kind there is white, light red, bright purple, light and deep speckled, and some with a deeper or paler purple spot in the middle: and of these the best are the *Feathered Pinks of Austria*, and that with the *large deep purple Spot in the bottom*.

XLV. *Pinks* Flower with *Roses* in *June*, and every ordinary Gardner knows how to Plant and dispose them, as also that vulgar Plant called *Thrift*, the greater Kind of which bears many Flowers on a Head, like the *smaller* or *common Sort*, but by reason of its Flowering by degrees, it is of no very great beauty, besides it is a tender Plant, affects the Vicinity of the Sea, and abides not long in our *Gardens*.

PLANE-TREE, *see it in Lib.* 2. *Chap.*

CHAP. DLXV.

Of PLANTAIN Common OR, WAY-BREED.

I. *THE Names.* It is called in *Arabick*, *Lisen*, and *Lisan alhamel*: in *Greek*, Ἀρνόγλωσσον, ἢ Ἀρνόγλωσσος, (*à forma*, viz. *Agninæ Linguæ*: It is also called Ἡρακλῆς (*multinervia*) and Ἑπτάνευρος (*septinervia*) from the seven Nerves or Ribs, which are in every Leaf. in *Latine* it is called, *Plantago* (*à Planta Pedibus*:) in *English*, *Plantain*, and *Plantane*, also *Way-breed*.

II. *The Kinds.* There are several Generick Species of this Plant, as, 1. *Plantago communis latifolia*, The broad Leav'd Plantain; of which in this Chapter. 2. *Plantago angustifolia*, *vel quinquenervia*, Long Leav'd Plantain, or Rib-wort; of which in *Chap.* 566. 3. *Plantago Cervina*, *Cornu Cervinum*, Bucks-horn Plantain; of which in *Chap.* 567. 4. *Plantago Aquatica*, Water Plantain; of which in *Chap.* 568. 5. *Plantago Marina*, *Heloscum*, Sea Plantain; of which in *Chap.* 569, following; of all which in their order.

III. *The Kinds of the broad Leav'd Plantain.* 1. *Plantago latifolia vulgaris*, *Plantago major*, *Plantago rubra Brunfelsij & Tragi* (because the Seed thereof is redder than the Seed of any of the other Kinds) Our common broad Leav'd Plantain. 2. *Plantago latifolia maxima*, *Plantago maxima tota glabra Bauhini*, The largest or greatest broad Leav'd Plantain. 3. *Plantago major incana Lobelij & Clusij*, *& Plantago Salmaticensis*; *Plantago media Dodonæi*, *Fuchsij & Gesneri*; but *Tabernæmontanus* and *Turner* call it *Plantago minor*, Great hoary Plantain. 4. *Plantago latifolia rosea multiformis*, *Plantago latifolia exotica Clusii*, *Plantago latifolia incana spicis variis Bauhini*, *Plantago spiralis*, *Plantago Paniculâ sparsâ Lobelij*, Rose Plantain, Plantain broad Leav'd variously formed. 5. *Plantago sinuosa exotica Parkinsoni*, *Plantago Umbilicata latifolia Lobelij*, *& convoluta unifolia*, Crumpled Plantian, or Exotick Plantain.

The Descriptions.

IV. *The first*, *or* Our Common broad Leav'd Plantain. *Its Root is made of many white Strings, growing somewhat deep, and taking so fast hold in the Ground, that it is not easie to pull it up. It springs up with many fair, broad, and almost round pointed Leaves, with seven Nerves, or Ribs in every one of them for the most part, running all the length of the Leaf, of a sad green color on the upper side, and of a more yellowish green underneath. Among these Leaves rise up several small slender Stalks, about a Foot more or less high, not easie to break, naked or bare of Leaves unto their tops, where each Stalk bears a small long round blackish green Spike or scaly Head, whose Blomings or Flowers are small whitish Heads, with*

Plantain Common.

Plantain Hoary.

with Aglets hanging at their ends, almost like to the bloomings of Corn, *or* Wheat; *after which come small brown Seed, enclosed in the small Husks, Scales, or Skins.*

V. *The second, or* Largest or greatest Leav'd Plantain. *Its Root is Fibrous and Blackish; and the whole Plant seems in all things to be like the former, saving, that it exceeds it in largeness, or greatness, and height. For the Leaves which ly on the Ground, are six Inches and sometimes more in length, and four Inches broad; and the foot Stalks of every Leaf, are near a Hand breadth long. The naked Stalks which bear the spiked Heads, are like the former, and are some times two or three Feet high; and the Head or Spike, sometimes a Foot long. This sort has been sometimes found to have Leaves a Foot long, and half a Foot broad, which are somewhat torn on the edges, for which reason it is called* Plantago latifolia maxima foliis lacinatis, *and this sort has some small Leaves under the spiked Heads.*

VI. *The third, or* Great Hoary Plantain. *Its Root is like the first, blackish and stringy, so also its Leaves and Spikes; but the Leaves are very hoary, or whitish, especially in the hotter Countries, of* Italy, Sicily, Candia, Spain, Portugal, Florida, Carolina, *&c. much more than in these our colder Climates, and somewhat smaller.* Clusius *says, That in* Spain, *it seldom bears its spiked Heads, but when it does, they are smaller than those of* Our first common Kind: *But in* Carolina, *&c. it bears its spiked Heads as frequently as in* England, *and much about the same magnitude.*

VII. *The fourth, or* Rose Plantain, Plantain broad Leav'd variously formed. *Its Root is like unto the former: and tho' there are many sorts of this Plant, yet all of them have large, and sometimes hoary green Leaves spread on the Ground, either whole, like the former* greater Plantain, *or a little jagged towards the lower parts of the Leaves. From among which rise up, short naked Stalks, bearing every one at the top, either a broad round Head, made of many small, short, green Leaves in fashion of a* Rose: *or a spiked, thick, long Head, made of many shorter green Leaves, bushing thick below, and smaller upwards, sometimes a Plant will have both these forms at once together; and some again out of the middle of the* Rose, *will have another short Spike of green Leaves rising up. Others at the bottom of the* Rose *or Spike, will have one or two other small Tufts, either round or long. One sort there is likewise, whose long spiked Heads are parted into many and sundry several sparsed Spikes, and therefore called* Spiralis. *There are also many other varietes of this Species, as Nature is pleased to play with them in their production.*

VIII. *The fifth, or* Crumpled Plantain, *or* Exotick Plantain. *Its Root is composed of a thick round Head at its top, having at its bottom running downwards, many long Fibres or Strings, whereby it takes good Rooting in the Ground. This upon the first Years sowing of its Seed, rises up, but with one great and large Leaf, almost a Foot long, folded as it were together, and wound about Spire fashion into two parts at the upper end thereof, which opening it self, and remaining somewhat hollow, becomes much*

crump-

crumpled or waved on the edges; the farther end of it shewing something like a Plantain *Leaf. The bottom of the Leaf has on each side thereof, a large piece as it were torn from it, but yet growing to it, which are likewise crumpled and waved, and each of them shewing themselves in the form of a* Plantain *Leaf, its Taste also being not unlike to* Plantain; *so that the whole Leaf seems as if divers great large Leaves were joined together to make one. This Leaf perishing the first Year, there rises up the next* Spring, *several Leaves close together, not formed into one, as the former, but as if divers Leaves were joined together, each having a* Plantain *form, but something a little rounder, and a little crumpled or waved as the former was. The Stalk rises up in the middle of these Leaves, about half a Yard high, bearing thick and short spiked flattish Heads, with Seed therein, much like to the others.*

IX. *The Places.* The first grows almost every where in Fields, and in waste and untilled places, and in Path ways generally. The second grows in *France*, *Italy*, *Carolina*, &c. and with us in some *Gardens*. The third *Clusius* says, grows in *Spain*; I found it growing plentifully in many places of the *South Carolina:* and it has been found growing in several other colder Climates, as also in some places in *England*. The fourth, tho' it is called a Strange or Exotick Plantain, in *Clusius* his Country, yet it is found growing Naturally in *England*, and is thought to rise from the third sort, and is now brought out of the *Fields*, and in many places Planted in *Gardens*. The fifth and last was sent in Seed from *Pelliterius of Mompelier* to *Lobel*, who sowing the Seed, it grew with him in his *Garden* many Years. *Johnson* in *Gerard* says that he found the fourth Kind growing in some places in the *Isle of Tenet*.

X. *The Times.* They spring up from the beginning of *April* to the end of *September*. They are in their Beauty and flourishing State, from the end of *May* to the end of *August*, their Seed ripening in the intermediate times, and not long after their Flowering.

XI. *The Qualities. Plantain* is cold and dry in the end of the first Degree, *Gerard* says in the second Degree. It is dry without biting, and cold without benumming: the Root is said to be dry in the same Degree, but not so cold as the Leaves. The Seed is of Subtil parts, and less cold yet than the Roots. It is Aperitive, Absterfive, Astringent, Anodyn, and Traumatick or Vulnerary.

XII. *The Specification.* It cures the Scurvy in a hot habit of Body, Heals the excoriations of the Stomach and other Bowels; stops Catarrhs, and all sorts of Fluxes in Man or Woman. It stops also all sorts of Hæmorrhages whether Internal or External, the overflowing of the Courses in Women, Spitting and Pissing of Blood, and therefore is of excellent use in the Curing of a Phthisis, or Ulceration of the Lungs. *Dioscorides* says, It cures Agues, stops Vomiting, and is good against the Epilepsy and yellow Jaundice. It allays Inflamations of the Eyes, cleanses and heals old Ulcers, whether in the Mouth, Throat, or other parts, gives ease in the Piles, Kills Worms in the Belly, and gives ease in the Gout, and cures all sorts of simple Green Wounds, as also old Sores, whether inward or outward.

XIII. *The Preparations.* You may have from these Plants, 1. *A Liquid Juice.* 2. *An Essence.* 3. *A Decoction.* 4. *A Pouder of the Leaves.* 5. *A Pouder of the Root.* 6. *A Pouder of the Seed.* 7. *A Cosmetick.* 8. *A Lotion.* 9. *A Liniment.* 10. *A Cataplasm.* 11. *A Distilled Water.* 12. *A Diet Drink.*

The Virtues.

XIV. *The Liquid Juice.* Being Depurated or Clarified, and drank for several Days together, prevails Wonderfully against all Torments and Excoriations of the Guts or Bowels, helps distillations of Rheum upon the Throat, Glands, Lungs, &c. and stops all manner of Fluxes in Man or Woman, and the overflowing of the Terms in Women. Dose from 3 to 8 Spoonfuls or more, either alone or mixt with some Styptick red Wine.

XV. *The Essence.* It has all the Virtues of the *Liquid Juice*, besides which it is good to cure Spitting of Blood, and all other Bleedings by the Mouth, also Pissing Blood, and is profitable to help a bloody or foul Water, occasioned by any Ulcer in the Reins or Bladder, as also to stop the free bleeding of Wounds; it is likewise an especial Remedy against a Phthisis or Ulceration of the Lungs, and a Vehement Cough arising from the same. It is said to be good against the Fallingsickness, Dropsie and Jaundice, and opens Obstructions of the Liver, Spleen, and Reins. It cools Inflammations of the Eyes, and takes away the Pin and Web (so called) in them. Dropt into the Ears, it eases their Pains, and restores Hearing much decayed. Dose from 3 to 6 Spoonfuls more or less, either alone or with some fit Vehicle, Morning and Night, or oftener.

XVI. *The Decoction.* It has all the Virtues of the *Juice* and *Essence*, but ought to be given in a much larger Dose, as to half or three quarters of a Pint. The *Decoction of the Roots in Wine*, (according to *Dioscorides*) is good to cure Quotidian, Tertian and Quartan Agues: and this is probable enough, for I am apt to believe it performs that Cure, by Vertue of its Natural Stypticity. It may be given an hour or two before the Fit.

XVII. *The Pouder of the Leaves.* It has the Virtues of the *Juice* and *Essence*, yet is not altogether so effectual as they, in the Dropsy, Epilepsy and Jaundice: put upon old putrid and running Sores, it cleanses and drys up the moisture, and in some measure incarnates. Taken in Drink to a Dram or Dram and half, it is said to kill Worms in the Belly: and strewed upon old Ulcers which have Worms in them, it kills them, more especially if white Wine Vinegar be sprinkled upon the same.

XVIII. *The Pouder of the Root.* Given from 1 to 2 Drams, it is said to Cure Agues, to stop Vomiting and Fluxes, and to strengthen the Stomach. Mixed with equal parts of *Pouder of Pellitory of Spain*, and put into a hollow Tooth, it is said to ease the pain thereof: put into Wounds and Ulcers, it drys and heals them.

XIX. *The Pouder of the Seed.* Taken every day Morning and Night, from 1 to 2 Drams in any fit Vehicle, as in the Yolk of an *Egg*, Pulp of a Roasted *Apple*, or in *Mithridate*, or some proper *Syrup*, it is said to heal Ulcers of the Lungs, stop Coughs, and all sorts of Fluxes of the Bowels, Catarrhs, and helps weakness of the Sto-

mach, Indigeſtion, and ſtops Vomiting, is good againſt the Epilepſy, Lethargy, Convulſions, Dropſy, Jaundice, Strangury, and Obſtructions of Liver, Spleen and Reins.

XX. *The Coſmetick. Take Eſſence of Plantain, Eſſence of Houſleek, of each 2 Ounces; Juice of Limons 1 Ounce; mix them.* It is good againſt Burnings and Scaldings, as alſo Inflamations, and all hot pimples and eruptions of the Skin, being bathed therewith twice or thrice a Day.

XXI. *The Lotion. Take Decoction of Plantain 8 Ounces; Eſſence of Plantain 4 Ounces; Alum Water, Tincture of Madder Roots, of each 2 Ounces; Honey enough to Sweeten them: mix all well together for a Lotion.* It is of great uſe, and has a good effect, for the curing of old or hollow Ulcers, which are difficult to be healed, as alſo for Sores, Cankers, and Ulcers in the Gums, Mouth, Throat, or Noſe, or in the privy Parts of Man or Woman; it cleanſes, drys, and heals them in a ſhort time. Fomented alſo upon Tumified *Hæmorrhoids* or Piles, it eaſes their Pain, and quickly diſcuſſes them.

XXII. *The Liniment. It is made with the Juice and Oil of Roſes.* Anointed on the Temples and Forehead, it gives eaſe in the Headach proceeding from heat, and is very profitable for Frantick or Lunatick Perſons, alſo againſt the bitings of Serpents, or Mad Dogs: it gives great eaſe (being applyed) in all hot Gouts, whether in Hands or Feet, eſpecially in the beginning, to cool the heat and repreſs the Humors.

XXIII. *The Cataplaſm of the Green Herb and Root.* It allays the heat of Inflamations, is profitable againſt a hot Gout, cleanſes old and putrid Ulcers, and prevents pains, Tumor, and Inflamations, which are apt to happen in Diſlocations, and over-ſtraining of the Nerves and Tendons.

XXIV. *The Diſtilled Water.* Dropt into the Eyes, It eaſes their pain and ſmarting, and cools them very much being Inflamed; and is ſaid to clear the Eyes from Clouds, Films, and other things which obfuſcate the Sight. *A little Alum and Honey being diſſolved in it,* it is of good uſe for waſhing, cleanſing and healing a ſore and ulcerated Mouth or Throat. *If Plantain Water 1 part is mix'd with Beef Brine 2 parts,* it will be good to heal all ſpreading Scabs, Scald Heads, Tettars, Ringworms, Scurff, Morphew, Shingles, or other running and fretting Sores.

XXV. *The Diet Drink. Take Juice of Plantain 3 Quarts; Juice of Oranges a Pint; Roots of Burdock 8 Ounces; of Angelica, ſharp pointed Dock, and Parſly, of each 4 Ounces; Corriander and ſweet Fennel Seed, of each 2 Ounces; Nutmegs thin ſliced an Ounce; Alexandrian Sena 4 Ounces: New Ale 10 Quarts; put the Juices into the Ale; then put all the other Ingredients, (as the Roots firſt thin ſliced or bruiſed, the Seeds bruiſed, the Nutmegs and Sena) into a long, cloſe Knit Net bag, with a Stone in it, which put alſo into the Ale. Let them work together, and after two or three Days, let the Patient drink of it a Pint at a time Morning and Evening, renewing the Recipe with freſh Ingredients, as oft as need ſhall require.* This is a perfect cure for the Scurvy, and all Scorbutick Taints, and Rheumatick Pains in a hot Conſtitution; it cleanſes and purifies the Blood, makes ſubtil and fine the *Lympha*, and cauſe a due and eaſy circulation of all the Natural Juices of the Body.

CHAP. DLXVI.

Of PLANTAIN narrow Leav'd, *OR,* RIB-WORT.

I. *THE Names.* It is called in *Greek*, Ἀρνόγλωσσον μικρὸν, ἢ πενταύνευρον; *Pentaneuros:* in *Latin*, *Quinquenervia* (from its having five Ribs) and *Plantago Anguſtifolia:* in *Engliſh*, *Narrow Leav'd*, or *Long Leav'd Plantain*, and *Ribwort*, alſo *Ribwort Plantain.*

II. *The Kinds.* There are nine or ten ſeveral ſorts of this Plant, accounted of in ſome Authors, but the moſt of them not being to be found in our Climate, nor yet in our *Weſt India*, or *American* Plantations, we ſhall only Deſcribe to you ſuch as are Natives of our own, which are the four following, *viz.* 1. *Plantago quinquenervia major*, *Plantago anguſtifolia major*, *Plantago minor Dodonæi*, *Fuchſij*, *Geſneri*; *Plantago longa Matthioli & Lugdunenſis*; Our common or greater Rib-wort, or Rib-wort Plantain. 2. *Plantago anguſtifollia minor*, *Plantago quinquenervia minor*, *& longa minor*; The leſſer Ribwort, or Ribwort Plantain. 3. *Plantago anguſtifolia Roſea, & multiformis*, *Plantago toroſa prolifera*, *Plantago anguſtifolia Roſea*, *Plantago quinquenervia Roſea Gerardi*; Roſe Rib-wort; or Roſe Rib-wort Plantain. 4. *Plantago anguſtifolia ſerrata Cluſii*, Rib-wort or Ribwort Plantain with dented Leaves.

The Deſcriptions.

III. *The firſt, or* Our common *or* greater Rib-wort, *or* Ribwort Plantain. *Its Roots are long, fibrous, or ſtringy, like the Roots of the* Common broad Leav'd Plantain. *From which Spring up divers narrow, long, and hairy, dark green Leaves, lying on the Ground, with five Nerves or Ribs for the moſt part, in every one of them, running from one end of the Leaf to the other, and pointed at the ends. And from among which riſe up many naked and ſtriped Stalks, ſomewhat hairy, at the tops of which grow ſuch like long and Spiked dark green Heads, as in the firſt* Common Plantain, *and Flowering in the ſame manner, but greater and ſhorter, wherein ly ſuch Seeds as in theformer, but larger, and of a darker color. This is found ſometimes varying in the Heads, for ſome will have two Heads upon a Stalk, or one Head parted into two parts, or with two or more ſpiked Heads, growing at the bottom of the principal Head.*

IV. *The*

Plantain long Leav'd, or *Ribwort.*

IV. *The second, or* Lesser Ribwort, *or* Ribwort Plantain. *This in its Roots, Leaves, Stalks, Heads, Flowers and Seed, and in every of its parts, as also in its form of growing, is like unto the first before described, and differs only in its magnitude, this growing always much smaller than that.*

V. *The third, or* Rose Ribwort, *or* Rose Ribwort Plantain. *It has a pretty thick long Root, with many Fibres adjoining to it. Its Leaves are like the two former Kinds, so that by its single Leaves it is scarcely to be known from them, before the Stalks with the Heads begin to appear, which when they are full ripe, shew themselves in a variable manner; some having large or long narrow Leaves set together, somewhat sparsedly, imitating a loose or dispersed* Rose: *others having shorter green Leaves, more compact and closed, making a more comely form of a* Rose, *sometimes fully laid open, and somtimes more close, and as it were half closed; and sometimes out of the middle of the* Rose *will arise two or three or more short Stalks, bearing each a small green* Rose, *and therefore called* Prolifera *made of many small Leaves set together in the same manner, and sometimes many short spikes set close together in one Head, or separate each by its self. This Kind has scarcely ever been seen to bear Seed, but is encreased by slipping or parting the Root, and planting or setting it again.*

VI. Johnson *in* Gerard *says, That this* Rose Ribwort *has many broad and long Leaves sharp pointed, and of a dark green color, Ribbed with five Nerves or Sinews like the* Common Ribwort, *among which rise up naked Stalks, furrowed, chamfered, or crested, with certain sharp edges. At the tops whereof grows a great and large Tuft of such like Leaves, as grow next the Ground, making one entire Tuft or Umbel, in shape resembling a* Rose, *(whereof I thought good to give it the Surname) which is from its Flower.*

VII. *The fourth, or* Ribwort, *or* Ribwort Plantain with dented Leaves. *Its Root is small, long and fibrous like the first Kind. In its Leaves and manner of growing, it is very much like the* Second *or* Lesser Ribwort, *but smaller, narrower, and harder in handling, being dented about the edges, and so sharp withall, that they may seem to be Prickles, which has caused some to call it,* Peregrina Spinosa, *tho' I think improperly. The spiked Heads grow upon slender Stalks, about half a Foot high, being somewhat open, or dispersed.*

VIII. *The Places.* The first grows almost every where by Hedge sides, Path way sides, Borders of Fields, and Fertil Medows. The Second grows likewise in divers Medows and Fields, and by Path-ways, and is also found growing in *Gardens* as a Weed. The third is found Wild in several places of this Kingdom, in some places in the North of *England*, and formerly in a Field near *London* by *Hogsdon*, and in many other parts of the Kingdom, from whence for the rarity thereof, it has been Transplanted by some Lovers of Plants, and nourished up in *Gardens*. The fourth grows with us only in *Gardens*, being brought hither in Seed from *Spain:* but I have sometimes found it growing Wild in some parts of *Florida*.

IX. *The Times.* They all Flower and Seed at the same times *(viz.* in *May*, *June*, and *July)* with the former *Broad Leav'd Plantain.*

X. *The Qualities, Specification, Preparations,* and *Vertues,* of *Ribwort Plantain* are exactly the same with the former *Broad Leav'd Plantain*; saving that some Authors are of Opinion, that the *Ribwort* exceeds in Virtue and Efficacy, to all the Intentions for which the *Broad Leav'd* is applyed.

CHAP. DLXVII.

Of PLANTAIN Bucks-horn.

I. *THE Names.* It is called in *Greek* Κορωνοπους *(à Cervino pede quem effigiant folia,* as *Pena* says:) in *Latine, Coronopus* also; but they likewise call it *Cornu Cervi*, and *Cornu Cervinum, Herba Stella, Harenaria, & Sanguinaria,* or *Sanguinalis,* (the one from the place of its growing, the other from its Qualities, Properties or Effects;) I think it might be more properly called, *Plantago Cervina, Plantago Cornigera, Plantago Cornuata vel Corniculata,* a Horned Plantain: in *English, Bucks-horn Plantain,* and by some, *Crow-foot Plantain.*

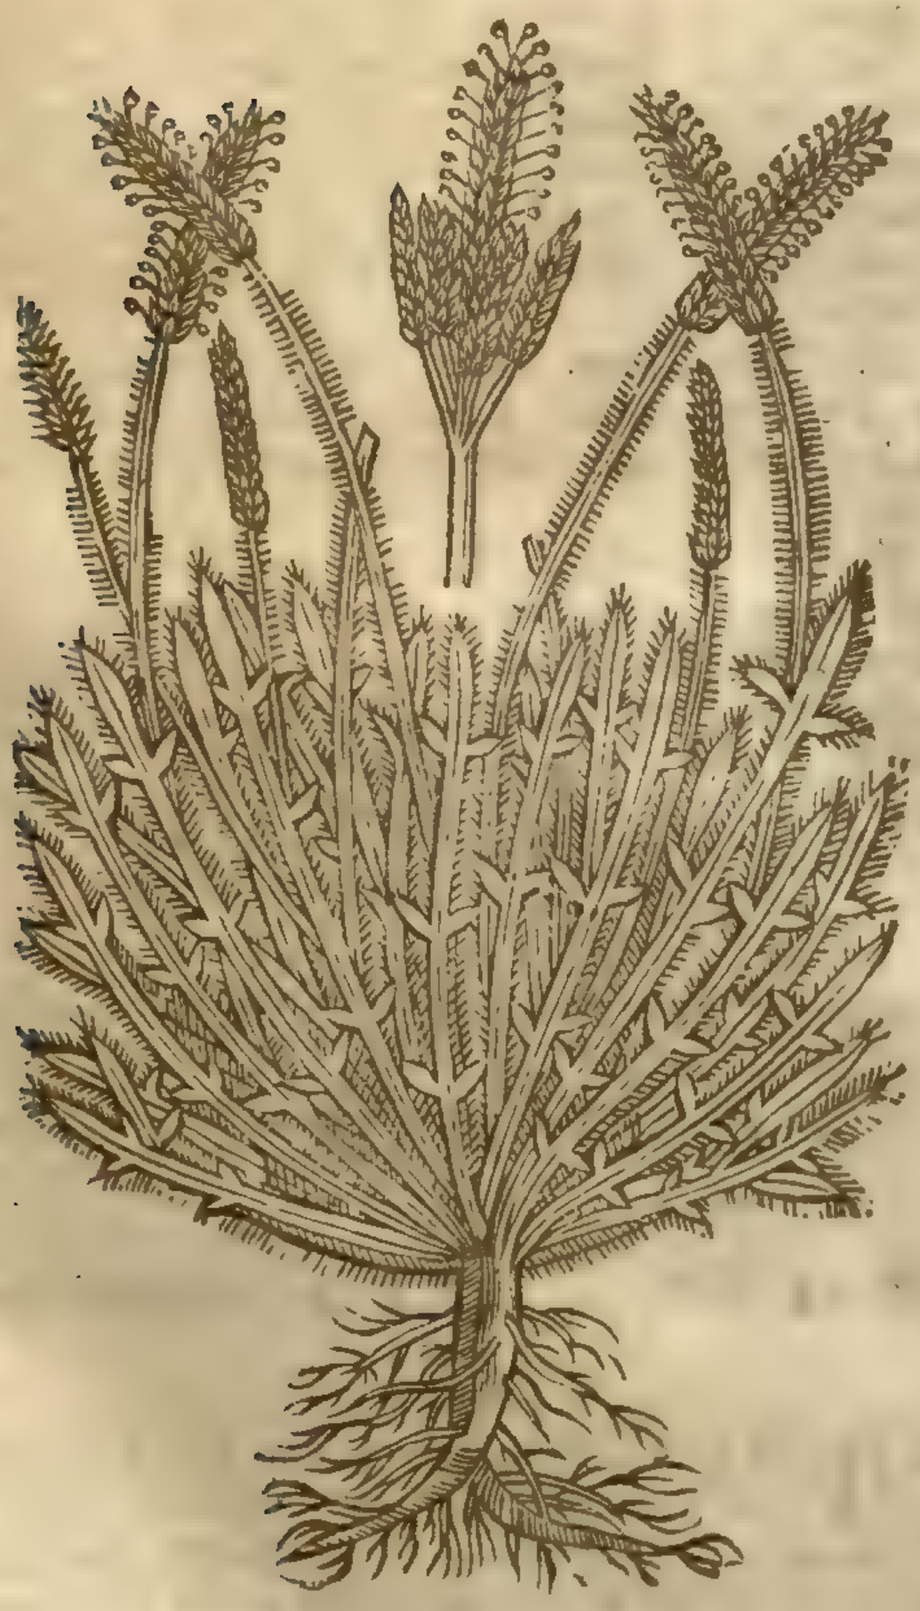
II. *The Kinds.* We scarcely know any more than two Species of this Plant, *viz.* 1. *Coronopus vulgaris, Cornu Cervinum vulgare, Coronopus sativus Cordi, Gesneri, & Camerarij,* (because in *Italy, France, Spain,* and other places it was Nurst up in *Gardens* for a Sallet Herb:) *Cornu Cervi, & Herba Stella Dodonei & Lobelij*; It is also

called, *Coronopus Sylveſtris*; becauſe it is alſo found Wild in ſeveral Countries: Our common Bucks-horn Plantain. 2. *Coronopus Inſulæ Prochytæ Columnæ*; *Coronopus Sylveſtris hirſutio Bauhini*, Prickly Bucks-horn Plantain.

The Deſcriptions.

III. *The firſt, or* Our Common Bucks-horn Plantain. *Its Root is ſingle, long, and ſmall, with ſeveral* Fibres *adjoining thereto. If it is Sown or Planted from Seed, it riſes up at firſt with ſmall, long, narrow, hairy, dark, green Leaves, almoſt like* Graſs, *without any diviſion or gaſh in them; but thoſe which ſucceed are gaſht in, on both ſides of the Leaves, into three or four gaſhes, and pointed at the ends, reſembling the Snaggs of a* Bucks Horn, *from whence it took its Name. And being well grown, theſe Leaves ly round about the Root upon the*

Buckſhorn Plantain.



Ground, in order, one by another; thereby reſembling the form of a Star, and therefore called Herba Stella. *From among which riſe up ſeveral Hairy Stalks, about an Hand breadth high, bearing every one of them a ſmall, long, ſpiky Head, very like unto thoſe of the* Common Plantain, *having ſuch like Bloomings and Seed after them. The Smell and Taſte thereof is very much, or altogether, the ſame with that of the* Common *and* Ribwort Kind.

IV. *The ſecond, or* Prickly Bucks-horn Plantain. *This differs but little from the former; but that its Leaves are ſomething larger, broader and thicker, and more hairy or rough. And the dents or jaggs of the Leaves are more ſharp and prickly. The Stalks and Heads are likewiſe more rough and hairy. Theſe are the chief differences, in all other things, it is like to the former.*

V. *The Places.* The firſt uſually grows in dry ſandy Grounds, in Barren Plains and Untill'd places, in many parts of *England*; as in *Tuttle Fields*, near *Weſtminſter*; at *Waltham Abby*, not far from *London*, as alſo upon *Black-Heath* near *Southwark*, and many other like places. In *Italy*, *&c.* they are wont to Plant it in their *Gardens*, as a Sallet Herb, becauſe they commonly eat it in Sallets. The ſecond Grows on Rocks in the Iſland *Prochyta* as *Columna* ſays: I have had it from Eye Witneſſes, who told me, that they had ſeen it grow upon ſome of the Mountains in *Wales*, and ſome other like Places in *England*.

VI. *The Times.* They both Flower in *May*, *June*, and *July*, their Seed ripening in the mean Seaſon: and their Leaves abide freſh and green in a manner all the *Winter*.

VII. *The Qualities, Specification, Preparations,* and *Vertues* of *Bucks-horn Plantain*, are the very ſame with thoſe of the *Common broad Leav'd Plantain*, (in *Chap.* 565. *Sect.* 11. *ad* 25.) to which I refer you.

VIII. *Obſerv.* 1. *The Juice or Eſſence of this Plant*, Is ſaid to be a peculiar remedy againſt the Bitings of Vipers, or other Venomous Beaſts, by drinking of it either alone, or in a Glaſs of Generous Wine, *a Cataplaſm of the Green Herb* being alſo laid upon the Wound or place bitten. It ſtops alſo all bleedings and eruptions of Blood, whether at Mouth or Noſe, whether by Urine or Stool, cures the Dyſentery or Bloody Flux, and other Fuxes of the Bowels, and is profitable as *Paulus Ægineta*, *Lib.* 7. ſays, againſt the Colick. Given inwardly from 4 to 8 Spoonfuls at a time in Styptick Red Wine, 3 Hours before the coming of an Ague, it cures it, more eſpecially if the Leaves of the Plant be laid to the ſides, and ſo the Fit will ſuddenly vaniſh, as if it had been done by Witchcraft.

IX. *Obſerv.* 2. *The Decoction in Wine.* It has the *Virtues* of the *Juice* or *Eſſence*; beſides which, if it is long drank, it cures the Strangury, and is profitable for ſuch as are troubled with Sand, Gravel, Stones, or Tartarous Matter in the Reins, abating the heat and Inflamation of the Reins, Ureters or other ajdacent parts, and ſtrengthening them. And given Morning and Evening for ſome Days together, it helps all ſorts of Sore Eyes, cauſed from a Defluxion of hot, ſharp, and Salt Rheums, by cooling the parts, abating the acrimony of the humor, and ſtopping the Fluxion.

X. *Obſerv.* 3. *The Root*, whether in *Pouder*, (which may be given from 2 Scruples to 2 Drams, in any fit Vehicle Morning and Night) or the *Decoction in Wine*, or *Infuſion in Spirit of Wine*, have all the *Virtues of the Juice, Eſſence* and *Decoction*, aforeſpecified; ſaving that the Root is thought to be more potent than the Herb or Leaves, and to be a more ſpecifick Remedy for the Colick.

XI. *Obſerv.* 4. *The Cataplaſm of Leaves and Roots with Bay Salt.* Applyed to both Wriſts, and Bound on pretty hard (yet not too hard neither) cures Agues admirably; it preſently ſtops the Courſe of the Fits; and ſoon after ſo profligates the Ague, as to compleat a Cure.

CHAP.

CHAP. DLXVIII.

Of PLANTAIN Water.

The Descriptions:

I. *THE Names.* What *Greek* Name this was called by in *Dioscorides* or *Theophrastus*, is uncertain, but in respect to the *Latine* Name it may be Ἀργόγλωσσον ὕδωρ: in *Latine*, *Plantago Aquatica*, *Arnoglossum Aquaticum*: and in *English*, *Water Plantain.*

II. *The Kinds.* 1. *Plantago Aquatica major*, *Fistula Pastoris*, *Barba Sylvana*, Our common greater Water Plantain. 2. *Plantago minor Aquatica Cæsalpini*; *Plantago Aquatica humilis angustifolia Lobelij*, The lesser Water Plantain. 3. *Plantago Aquatica minor muricata*, *Damasonium Stellatum Lugdunensis*, The lesser Water Plantain, with Calthrope like Seed, Star Water Plantain. 4. *Plantago Aquatica minima Clusij*; *Plantaginella palustris Bauhini*, The least Water Plantain.

III. *The first*, *or* Our common greater Water Plantain. *Its Root consists of a great Bush of many long* Fibres *or Strings set together: which sends forth several long thick green hollow Stalks, with large long green* Leaves *on them, having some shew of Ribs in them, like unto* Plantain: *but they are much greater, fatter, and longer, and with sharper ends. From among these rise up several tall three cornered spongy Stalks, divided in several Branches at the Tops, on which stand a great number of white Flowers, composed of three leaves apiece. After which follow small three cornered green Heads, in which is contained the Seed.*

Plantain Water Star.

IV. *The second*, *or* The lesser Water Plantain. *Its Root consists of many small white Fibres like the former, which sends forth several long Leaves, six times smaller and narrower than the former, from among which rise up divers bare Stalks a foot high, bearing a Tuft of many bluish, colored Flowers, consisting of three Leaves apiece like the former, each standing on a long slat Stalk, and all rising from one Head, like an Umbel, after which follow rough Heads of Seed like to those of the* Crowfoot.

V. *The third*, *or* Lesser Water Plantain with Calthrope like Seed, Star Water Plantain. *Its Root is a bush of long white Fibres or Strings: which sends up several small and long Leaves like to those of the* Ribwort Plantain, *but much smaller, and turning themselves backwards. The Stalks are slender and naked, and about half a Foot high or more, which bear at their tops sparsed small Tufts of white three Leaved Flowers; which being past away, come after them, prickly Heads standing out with ends like to a Star, in which lyes the Seed.*

VI. Johnson *in* Gerard *says*, *That this Plant in its Roots and Leaves is like to our first described, as also in the Stalk, but much less in each of them, the Stalk being about a Foot high; at the top of which stands many pretty Star like skinny Seed Vessels, containing a yellowish Seed.*

VII. *The fourth*, *or* The least Water Plantain. *Its Roots consists of nothing but a Bush of very fine* Fibres *or Threads. This* Least Water Plantain *spreads it self wholly upon the Ground, bringing forth several small, long and narrow* Leaves, *standing on very slender foot Stalks, from among which come many slender Stalks lying down on the* Ground, *being not much above an Inch long, and ending in a small Head, which sending forth small* Fibres, *comprehends a great space of place, and take Root again, shooting forth other smaller* Leaves, *from among which spring forth five or six small round Buttons (no Flowers having yet been observed on the Plant) standing on very fine Stalks, opening into two parts, shewing very small Seed within them. From among these round Buttons grow also other rows or courses of small Heads, bringing forth other smaller* Leaves *and Buttons than the former.*

VIII. *The Places.* These all grow on the brinks of Rivers, in Watery Ditches, Plashes, wet Ponds, and other standing Waters. The first grows almost every where in moist places throughout the whole Kingdom. The second and third are more rare, but in the like places, as in a Ditch on this side *Margate*, in the *Isle of Tenet*. The third has been found growing in the Ditches on the left Hand of the High-Way from *Holloway* to *Highgate*; and a little beyond *Ilford*, in the Way to *Rumford*: Mr. *Goodyer* found it also growing upon *Hounslow-Heath*.

IX. *The*

IX. *The Times.* They Flower all *June*, and *July*, unto *Auguſt*, and the Seed is ripe in ſome little time after.

X. *The Qualities, Specification, Preparations*, and *Vertues*, of *Water Plantain*, are the ſame with thoſe of the *Common Plantain*, deſcribed in *Chap.* 565. *Sect.* 11. *ad Sect.* 25. aforegoing, to which I refer you: but it is very rarely uſed in Phyſick, the others being more common and more eaſy to be had.

CHAP. DLXIX.

Of PLANTAIN Sea.

I. *THE Names.* It is called in *Greek*, Ὁλόσιον ϗ Ὁλόσεον: in *Latine*, *Holoſtium*, & *Holoſteum*, (for it is Written both ways) alſo *Plantago Marina:* and in *Engliſh*, *Sea Plantain.*

II. *The Kinds.* There are many Species of this Plant, but theſe five ſorts are chief, *viz.* 1. *Plantago Marina vulgaris Lobelij, Lugdunenſis & Gerardi*, Our common Sea Plantain. 2. *Holoſteum Salamanticum, Holoſteum Hiſpanicum, Plantago anguſtifolia albida Dodonæi, Plantago Hiſpanienſis major, Holoſteum qorundam Camerarij; Holoſteum hirſutum albicans majus Bauhini*; The greater Spaniſh Sea Plantain. 3. *Holoſteum minus, Holoſteum hirſutum albicans minus Cluſij, Bauhino; Plantago Hiſpanienſis minor, Holoſteum Salamanticum minor*; The leſſer Spaniſh Sea Plantain. 4. *Holoſteum anguſtifolium majus, ſive Serpentaria major; Coronopus Sylveſtris Matthioli; Serpentina marina; Plantago marina Camerarij in horto, Plantago anguſtifolia Dodonæi*, The greater Graſs Leav'd Sea Plantain. 5. *Holoſteum anguſtifolium minus, Serpentina Omnium minima Lobelij, Holoſteum quorundam Lugdunenſis*, The leſſer Graſs Leav'd Sea Plantain. To theſe may be added, 6. *Holoſteum Loniceri, Cauda muris Vocatum, Myoſcuros, Holoſteo affinis Cauda muris Bauhini, Coronopus Sylveſtris Tragi*, Mouſe Tail. This, tho' *Camerarius, Lonicerus, Lugdunenſis, Thalius*, and *Bauhinus* himſelf, accounts among the Kindred of the *Holoſtea*, yet others have been of another Opinion, for which Reaſon we have treated of it alone, in a particular Chapter by it ſelf, *viz.* in *Chap.* 504. aforegoing, and therefore ſhall ſay no more of it in this place.

The Deſcriptions.

III. *The firſt*, *or* Our Common Sea Plantain. *Its Root is ſomewhat white, thick, and long, with long Fibres adjoining thereto, and abides may Years, from this Root ſpring up many narrow, long, and thick green Leaves, having here and there a dent or two on the one edge, and pointed at the end. From among theſe Leaves riſe up ſeveral bare Stalks, with a ſmall ſpiked Head thereon, ſmaller than* Common Plantain, *otherwiſe alike, both in its Blooming and Seed.*

Plantain Sea Common.

IV. *The ſecond*, *or* Greater Spaniſh Sea Plantain. *Its Root is ſomething long and hard, with ſeveral Fibres adjoining to it. It differs not much from the former* Greater Kind; *having many narrow hoary Leaves lying on the Ground, but ſhorter and broader than they. From among which riſe up divers naked ſhort Stalks, little more than an Hand breadth high, furniſht from the middle almoſt to the tops, with many whitiſh green Flowers, ſtanding more ſparſedly in the ſpiked Heads than the former; which contain in their Husks a certain kind of ſmall Seed.*

V. *The third*, *or* Leſſer Spaniſh Sea Plantain. *This in its Root and Fibres, Leaves, Stalks, Heads, Flowers and Seed, as alſo in its manner of growing, is very like the laſt, ſaving that this is much ſmaller, and not ſo gray or Hoary; and the Flowers are like to thoſe of the* Ribwort, *or* Bucks-horn Plantain, *but the Heads are ſmaller, and the Leaves greener and narrower.*

VI. *The fourth*, *or* Greater Graſs Leav'd Sea Plantain. *Its Root is ſomewhat thick, long and woody, with ſome Fibres thereto adjoining. This* Greater Graſſy Leav'd *Plant has a great number of ſmall long Leaves, almoſt like* Graſs, *but that they are ſtiff and hard; ſometimes lying upon the Ground, and ſometimes raiſed a little higher, from a Stem under them. They are of a grayiſh or hoary green color, and having on ſome of them, ſome ſmall gaſhes on the edges. From among which riſe up naked Stalks, about half a Foot high, with ſmall ſpiked Heads, like unto* Plantain *Heads, ſet on their tops, in which is contained alſo ſuch like Seed.*

VII. *The*

Plantain Sea Grass Leav'd great.

VII. *The fifth*, or Leſſer Graſs Leav'd Sea Plantain. *This in its Roots, Leaves, Stalks, Heads, Flowers and Seed differs not much from the former*, or Greater Kind; *but that it is ſmaller, and ſcarcely having any dent on the edges; it grows alſo much lower, not exceeding three or four Inches in height, and the Leaves not above two or three Inches at moſt in length.*

VIII. *The Places.* The firſt grows near the Sea, and upon the Sea Coaſt, in moſt places of *England*, as alſo upon the Sea Shores of many other Countries. The ſecond and third are Natives of *Spain*, the greater of which *Cluſius* ſays, he ſaw by the High-way ſides near to *Valentia*; but ſince his time they have been found to be Natives alſo of our Country, growing at *Baſtable* in the *Iſle of Wight*, and in the *Iſles of Jerſy* and *Gernſey*. The fourth and fifth Kinds are Natives of *Italy*, as *Matthiolus* ſays; and of *Germany* as *Camerarius* ſays, growing by a Lake of Salt Water near *Iſlebia:* ſince thoſe times, we find them to be Natives alſo of our Country, and ſeveral Eye Witneſſes have affirmed, that both the greater and leſſer Sorts grow near the Sea ſide in the Weſt parts of *England*; in all the Tracts of the Marſhes near *Aſtferry* in *Gloceſter-ſhire*; and that they grow upon the Rocks in *Scilly*, *Garnſey*, and the *Iſle of Man*. The firſt Species has been found growing by the Forts on both ſides the Water at *Graveſend*; at *Erith* near *London*; at *Lee* in *Eſſex*; at *Rye* in *Kent*; at *Weſt-Cheſter* alſo; and at, or near *Briſtol*.

IX. *The Times.* They Flower towards the end *May*, and thro' all *June* and *July*, and their Seed ripens in a ſhort time after.

X. *The Qualities, Specification, Preparations*, and *Virtues of Sea Plantain*, are fully the ſame with thoſe of the *Common Plantain* in *Chap.* 565. *Sect.* 11. *ad* 25. to which I refer you.

XI. *Obſervation*, 1. *Gerard* ſays, That theſe Herbs have the ſame Faculties and Virtues which the other *Plantains* have; and that they are thought to be the beſt or moſt efficacious of all the Kinds. And *Parkinſon* ſays, that what has been ſaid of the other *Plantains* may in ſome ſort be juſtly referred to theſe; for in their coldneſs and dryneſs, and other Properties, wherein the *Plantains* are excellent, theſe do but little differ, and therefore, That it needs not to repeat the ſame things here again, which in other places have already been ſpoken.

XII. *Obſerv.* 2. Only ſays *Matthiolus*, That the fourth Kind here mentioned called *Serpentina*, the People of *Garitia* in *Italy* where it grows, uſe it to eſpecial good purpoſe, againſt the Bitings of Serpents eſpecially, and of other Venomous Beaſts (which *Matthiolus* himſelf alſo ſays, That he had found true by good Experience:) as alſo to help thoſe that are troubled with the Dropſy, that chiefly which has poſſeſt the whole Body properly called a *Sarcitis* or *Anaſarca*.

XIII. *Obſerv.* 3. *Galen*, *Dioſcorides*, and *Pliny*, have proved *Sea Plantain*, to be ſuch an excellent Wound Herb, that it preſently cloſes or ſhuts up a Wound, tho' it be very great and large. And by the ſame Authority I ſpeak it (ſays *Gerard*) That if it be put into a Pot wherein pieces of Fleſh are Boiling, it will Soder them together.

CHAP. DLXX.

Of POLEY;

OR,

POLEY Mountain.

I. *THE Names.* It is called in *Greek*, Πόλιον (*ſic dictum propter Canitiem*, πολιὸς *enim Canitiem vel Canum ſignificat*, becauſe it is like to the hoary Hairs of a Mans Head:) in *Latine*, *Polium*, *& Polium Montanum:* in *Engliſh*, *Poley*, and *Poley Mountain*. Some will have *Polium* to be *Leucas*, and that *Dioſcorides* has twice treated of that Herb under divers Names, for that the Kinds, the reaſon of their Names, and the Qualities or Faculties do agree. There are two, *viz.* Λευκὰς ὀρεινὴ, which they will have to be *Polium Montanum*; and Λευκὰς ἡμερὰ which is *Polium Hortenſe*. The Name *Leucas* is from the whitiſh color; and *Polion* from its Hoarineſs, as is aforeſaid, being like to the white Hoarineſs of a Mans Head.

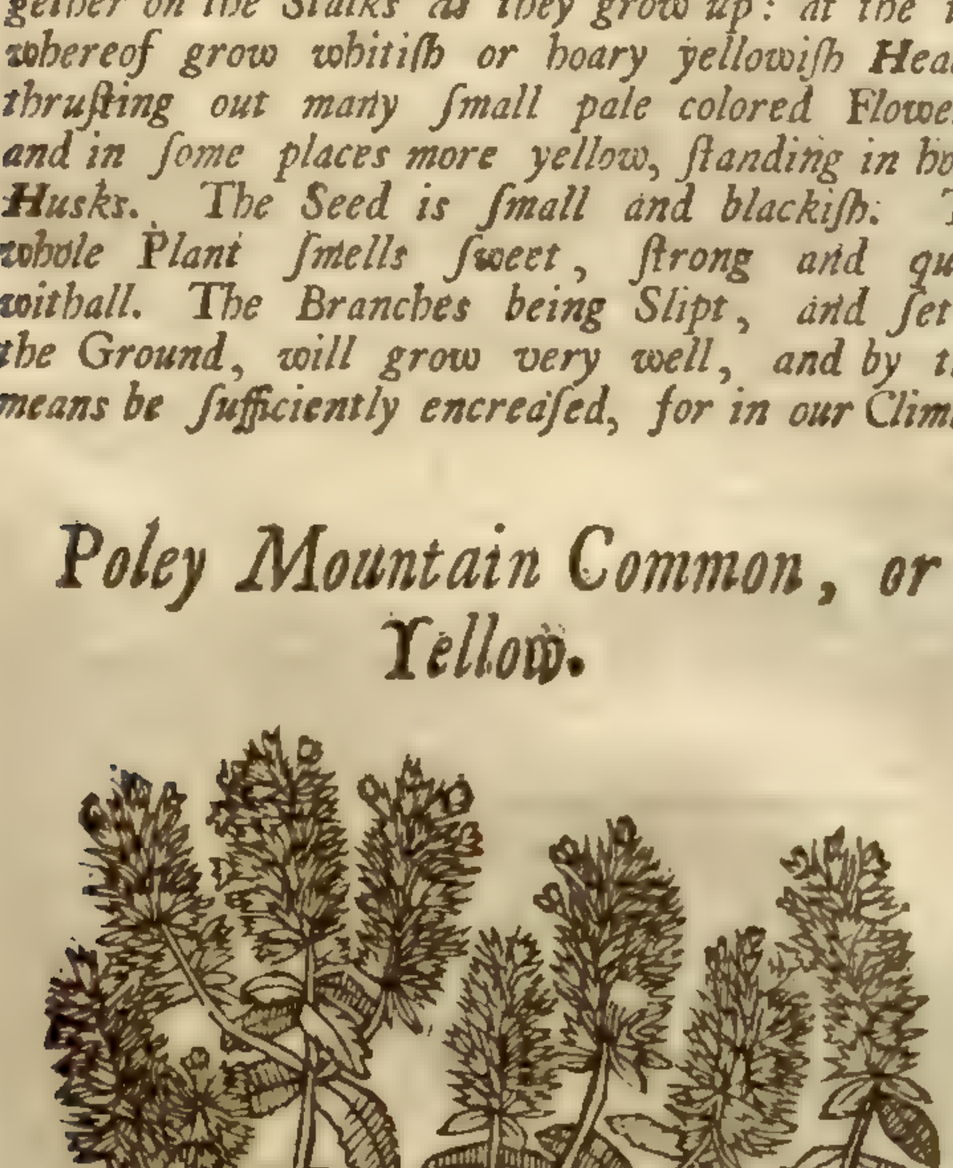
II. *The Kinds.* Authors have made ten or more Kinds of this Plant, but they being moſt of them Strangers

Strangers in our Climate, nor yet found to be growing in our Tranſmarine Plantations, we ſhall only take notice of, and Deſcribe the three Species following, *viz.* 1. *Polium Montanum vulgare*, *Polium Montanum Luteum Lobelij*; *Polium Montanum primum Dodonæi*, Our ordinary or common Poley. 2. *Polium Montanum minus*, *Polium Montanum primum Matthioli*, *Polium Montanum album*, White Poley, or upright Spaniſh Poley Mountain. 3. *Polium Montanum Lavendulæ folio Bauhini*, *Polium Montanum ſecundum Matthioli*, *Polium Montanum ſeptimum Cluſij*, *Polium recentiorum Fœminæ Lavendulæ folio Lobelij*, Spike or Lavender Leav'd Poley.

The Deſcriptions.

III. *The firſt*, *or* Our ordinary *or* common Poley. *Its Root is ſomewhat long and hard, with a few Fibres hanging thereto. It is a ſmall low Plant, not above a Foot high, having ſeveral white or hoary round and hard Branches, on which are ſet divers long and ſmall hoary Leaves, overlaid as it were with a yellowiſh white Down, a little dented about the edges, and ſomething broader or greater than any of thoſe which follow; two always ſet together on the Stalks as they grow up: at the tops whereof grow whitiſh or hoary yellowiſh Heads, thruſting out many ſmall pale colored Flowers; and in ſome places more yellow, ſtanding in hoary Husks. The Seed is ſmall and blackiſh. The whole Plant ſmells ſweet, ſtrong and quick withall. The Branches being Slipt, and ſet in the Ground, will grow very well, and by that means be ſufficiently encreaſed, for in our Climate it ſeldom gives perfect Seed to be Sown. Yet Cluſius ſays, That he had ſome Plants raiſed from the Seed of this Species; but they brought forth Flowers more pale than the Mother Plant, and ſome more white, eſpecially on the outſide, being pale on the inſide.*

Poley Mountain Common, or Yellow.



IV. *The ſecond*, *or* White Poley, *or* Upright Spaniſh Poley Mountain. *Its Root is hard and woody like the former. The whole Plant is ſmaller than it; and riſes up with many ſmall ſlender Branches, ſtanding more upright than the* firſt *or* common Kind, *and not leaning downwards to the Ground, tho' it grows upright, yet it grows not much higher. On its Stalks and Branches are ſet*

Poley Mountain white.

many hoary Leaves, ſmaller than thoſe of the firſt ſort, and ſome ſmall ones together with them, a little dented about the edges towards the ends, and as hoary, or rather more hoary than it. At their tops grow longer and ſmaller Heads, having white Flowers, coming forth out of hoary Cups, larger and more ſpread than the following. The Seed is blackiſh and ſmall, yet greater than that of the juſt before deſcribed, tho' the Plant it ſelf is ſmaller. And the Smell of this is more ſweet and acute than that.

V. *The third*, *or* Spike or Lavender Leav'd Poley. *It has a hard woody Root, ſpreading it ſelf out with many ſmall Fibres. From this Root ſpring forth ſeveral weak Branches, on which are ſet many ſmall long Leaves, two together, one againſt another, as in both the former, which are ſomething green on the upper ſide, and hoary underneath, ſomething like to the Leaves of* Rolemary, *or* Lavender, *and not at all ſnipt about the edges. At the tops of the Branches, come forth many Flowers not buſhing, but looſely ſpread, which are of a white color, not differing in form from the other, but coming forth of a grayiſh Husk, yet not ſo very hoary as the others. The Seed is black like the reſt; and the whole Plant has*

Poley Mountain Lavender *Leav'd*

has a ſmall ſweet Smell, not ſo pleaſant as the former, as ſome Authors ſay: but Matthiolus *ſays it ſmells well, tho' not ſo pleaſant or ſtrong as the laſt, being of leſs virtue and efficacy than it.*

VI. *The Places.* All theſe are Natives of more Southern and warmer Climates, as *Italy, Spain, Candia, &c.* but here they are Nurſt up only in *Gardens*, the firſt of them being the moſt common with us.

VII. *The Times.* They Flower all *June* and *July* to the beginning of *Auguſt*, and the Seed ripens in the mean Seaſon.

VIII. *The Qualities. Poley* is hot and dry in the third Degree: Aperitive, Abſterſive, Diuretick, Vulnerary, Cardiack, and Alexipharmick. The firſt or greater Kind is moſt in uſe.

IX. *The Specification.* It is profitable againſt the Jaundice, Dropſy, Spleen, Bitings of Venomous Creatures, Poiſon, Strangury, obſtructions of the Courſes; cures Green Wounds, as alſo old Sores and putrid Ulcers, cleanſing, drying and healing them.

X. *The Preparations.* You may have therefrom, 1. *A Juice or Eſſence.* 2. *A Decoction.* 3. *A Pouder.* 4. *A Cataplaſm.* 5. *A Spirituous Tincture.* 6. *An Acid Tincture.* 7. *An Oily Tincture.*

The Virtues.

XI. *The Juice or Eſſence.* They are good for ſuch as are bitten or ſtung with any Venomous Creature; and is profitable againſt the Dropſy, Jaundice, Hypochondriack Melancholy, and Pain, Tumor or Swelling of the Spleen. They provoke the Terms in Women, give eaſe in the Strangury, provoke Urine, and force away Sand, Gravel, Stones or Tartarous Matter from the Reins and Bladder. Doſe from 2 Spoonfuls to 6 or more, Morning and Night, in a Glaſs of white *Iſchia* Wine. If they are given in too great a Doſe they are apt to trouble the Stomach a little, and ſometimes (if the Stomach is very foul) to cauſe Vomiting. If the Lips of Cuts or Wounds be waſhed with them, they cauſe Conſolidation, and a ſudden healing.

XII. *The Decoction in Wine.* It has all the Virtues of the *Juice* and *Eſſence*, but not altogether ſo efficacious, and therefore ought to be given in greater Quantity. It opens all obſtructions of the *Viſcera*, as of the Stomach, Lungs, Liver, Spleen, Meſentery, Reins and Womb, thereby carrying off the recrements of thoſe parts by Urine, and curing the Scurvy, Rheumatiſm, Cachexy, and other like Diſeaſes. Uſed as a *Lotion*, it is profitable for the cure of Green Wounds; and it cleanſes, drys and heals alſo old running Sores, and filthy putrid Ulcers.

XIII. *The Pouder of the Leaves and Heads.* It has the Virtues of the *Juice*, *Eſſence* and *Decoction*, and may be given Morning and Evening, from half a Dram to two Drams, in a Glaſs of white *Port*, or *Lisbon* Wine, or a Spoonful or two of *Syrup of Violets*, or *Cloves gilliflowers*. Strewed upon old putrid Sores and Ulcers, it ſtops the flux of Humors, cleanſes, drys, and heals them. Tho' the firſt or greater Kind is moſt uſed with us, yet it is the *Pouder* of the leſſer Kind, (which is the more bitter in Taſte, and the more ſharp or quick upon the Tongue) which is put into *Mithridate* and *Venice Treacle*, and other Antidotes or Counter Poiſons, and is indeed of greateſt Virtue.

XIV. *The Cataplaſm made of the green Herb.* Applyed to great Cuts or Wounds, it quickly Conglutinates and heals them, and this the greater Kind does beſt perform.

XV. *The Spirituous Tincture.* It very much comforts and ſtrengthens the Stomach, Bowels, and Womb, give preſent eaſe in the Colick, and is profitable againſt Convulſions whether in old or young: It reſiſts Poiſon and is good againſt the bitings of Mad Dogs, Vipers, and other Venomous Creatures. Doſe from 1 Dram to 2, Morning and Evening in a Glaſs of Wine.

XVI. *The Acid Tincture.* It opens all manner of Obſtructions of the Bowels, of what kind ſoever, ſtrengthens and fortifies the Stomach, creates an Appetite, and cauſes a good Digeſtion. It is a potent Remedy againſt the Scurvy, and reſiſts the malignity of the Plague or Peſtilence, as alſo the Spotted Fever, Purples, and all other Malign Fevers, more uſually happening to younger People, where there is a high and exalted Temperament of the Blood. Doſe 30 or 40 Drops at a time, in all that the Patient drinks.

XVII. *The Oily Tincture.* It is an Anti-colick, and a potent Diuretick, giving preſent eaſe in the Stone and Strangury: It expels Sand, Gravel, Stones if they be ſmall, and Tartarous Mucilage from the Reins, Ureters and Baldder. It provokes the Terms Women, facilitates the Birth, and gives eaſie Labor: it alſo cauſes a due cleanſing afterwards, and either prevents or cures After-pains, which are ſo very troubleſom to ſome Women, that they exceed the Vehemency of the Labor it ſelf.

Taken alſo daily Morning and Night inwardly in Wine, and the Back Bone being alſo anointed therewith twice a Day, as alſo the other parts affected in a Palſy, it has been found by good Experience to Cure that Diſeaſe, as alſo Numbedneſs, Trembling of the Limbs, and other Paralytick Diſaffections of the Nerves. It helps Lameneſs, gives eaſe in the Gout tho' never ſo extream, prevails againſt the Sciatica, and is a powerful Remedy againſt Rheumatiſms. Doſe from 15 to 30, 40, or 60 Drops at a time, Morning and Night in any fit Vehicle.

CHAP. DLXXI.

of POLYPODY.

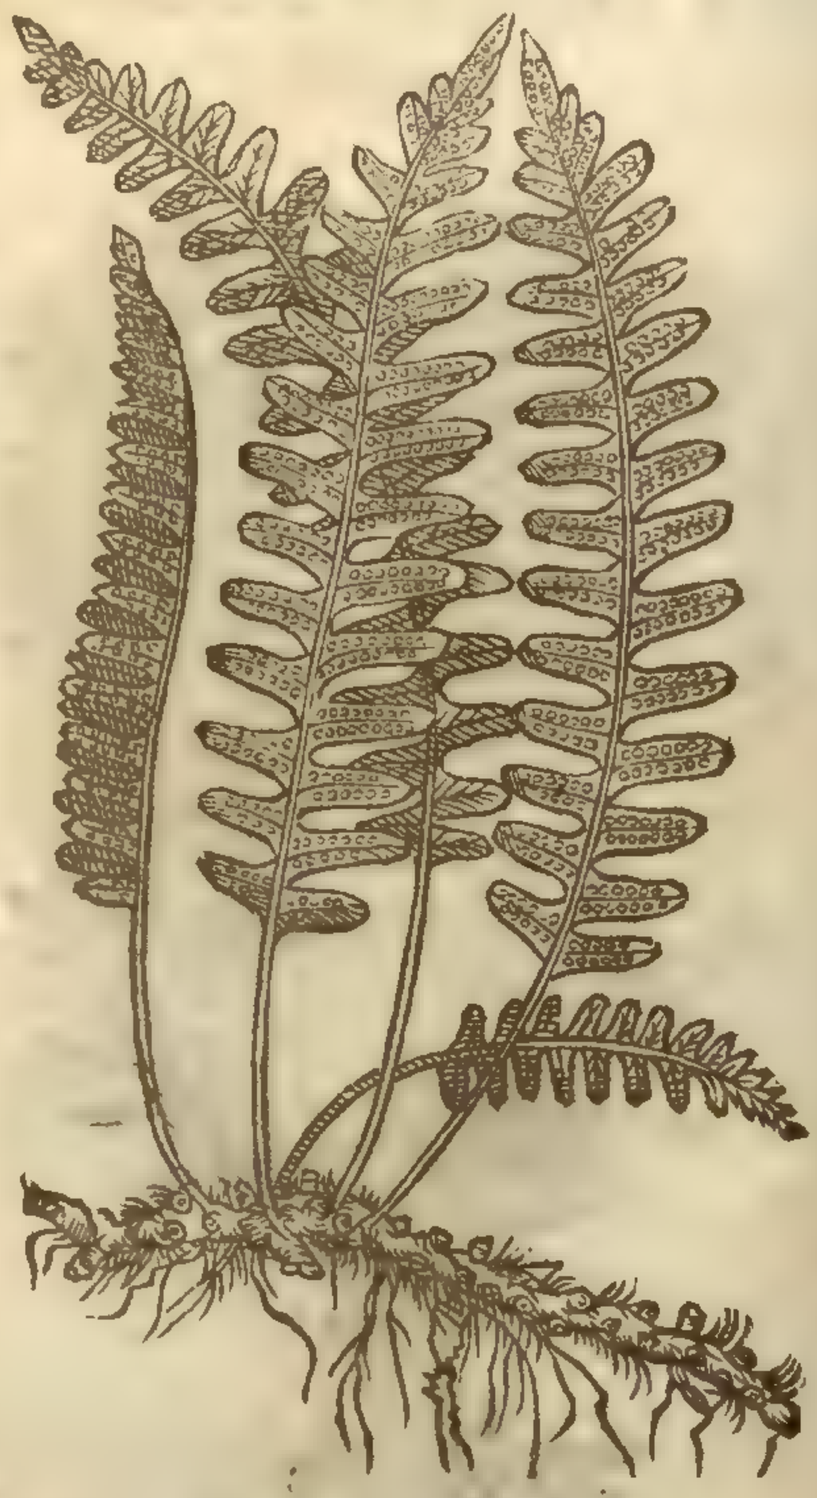
I. *THE Names.* It is called by the *Arabians*, *Bisbera*, as *Serapio* has it: by *Avicen*, *Desbers*, and *Budeig:* by others *Aibeig*, and *Beſſaigi:* in *Greek*, Πολυπόδιον, (*à Polyporum cirrhis*, ſays *Dioſcorides:* or *à cavernoſis acetabulis*, *ſeu cirrhis Polyporum*, ſays *Pliny:*) in *Latine*, *Polypodium*; *&* *Filicula* (*quaſi parva Filix*;) *&* *Filicularis Herba:* in *Engliſh*, *Polipody:* ſome call it *Wall Fern*, and *Oak Fern*, (according to their places of growth) but then they ought to add another Epithite to it, and make it Great, as, *Great Oak Fern*, becauſe there are ſmaller which are properly ſo called, as you may ſee in *Chap.* 260. aforegoing, of which the *Polypody* is no Species.

II. *The Kinds.* We make three particular Species hereof, tho' the two firſt differ not much, one from another, but in their place of growth, and theſe are, 1. *Polypodium*, (and ſo it is called by all Authors,) *Polypodium Murinum*, Wall Polypody, or Polypody of the Wall. 2. *Polypodium quercinum*, *vel quernium*, Polypody of the Oak. 3. *Polypodium alterum*; *Polypodium minus*, The ſmaller Polypody.

The Deſcriptions.

III. *The firſt or* Polypody of the Wall. *Its Root is long, not a Finger thick, creeping a ſlope; on which are ſeen certain little Buttons; like thoſe Pits and Dents which appear in the Tails of* Cuttle Fiſhes; *which has a certain ſweetneſs, with a Taſte ſomewhat harſh. The Leaves of this* Polypody *might be thought to be like thoſe of the* Male Fern, *but that thoſe are far leſſer, and not nickt at all on the edges. Theſe do preſently ſpring up from the Root, being cut in on both the edges, with many deep gaſhes, even to the middle Rib. On the upper ſide they are ſmooth: on the under ſide they are lightly* Poudered, *as it were with duſty Marks. This kind of* Fern (*for it is a Species of the* Fern's) *wants not only Seeds and Flowers, but Stalks alſo.*

Polypody of the Wall.



IV. *The ſecond, or* Polypody of the Oak. *Its Root is ſmaller than ones Little Finger, lying a ſlope, or creeping under the upper cruſt of the Earth, or matter it grows on, brownish on the outſide, and greeniſh within, of a certain ſweetiſh harſhneſs in the Taſte; ſet*

Polypody of the Oak.

with

with certain rough Knags or Excrescences on each side thereof, having also much mossiness, or yellow hairiness upon it, and some Fibres underneath it, by which it is nourished. It is a small Herb, and consists of nothing but Roots and Leaves, having neither Stalk, nor Flowers, nor Seed, as it is thought. It has three or four Leaves rising from the Root, every one singly by it self, of about an Hand length, which are winged, consisting of many small narrow Leaves, cut in, to the very middle Rib, standing on each side the Stalk, each being larger below, and smaller up to the top, very like unto the Osmand Fern, *not having any dents or notches on the edges, as the* Male Fern *has, of a sad green color on the upper side, and smooth; but somewhat rough on the under side, by reason of certain yellowish spots, which are thereon.*

V. *This* Polypody of the Oak, Gerard *thus describes. The Root has many Strings fastned to it, one folded within another, of a mean bigness, and sweet in Taste; which sends forth here and there new Sprouts or Springs, whereby it increases. This* Polypody *is much like that of the* Wall *(before described) yet the Leaves of it are more finely cut, smooth on the upper side, of a pale green color, together with their Stalks and middle Ribs: but on the nether side, it is rough like those of* Fern. *This* Fern *grows also without Stalks, and continues always without Seed.*

VI. *The third, or* Smaller Polypody. *This differs not from either of the former before described, neither in its Root, or Leaf, or Marks on the underside of the Leaves, but only that the Root is smaller, and slenderer, and the Leaves also not so long and large. This smallness, as I suppose, may rise more from the place where it grows, than from the diversity of Kind: for altho', in some places, the Leaves may seem to be a little waved on the edges, yet in respect to the general growth of the Plant, it is but accidental.*

VII. *The Places.* The first grows upon old Mud Walls, as also in Mossy, Stony, and Gravelly places, near unto Woods, and where it has most mellow and moist Earth to spring and live in: also upon old Stone Walls, and the tops of Houses: it is likewise found in the borders of Fields, especially under Trees and Thorns, and now and then in Woods: in some places it grows rank, and with a broader Leaf; in others not so rank, and with a narrower Leaf. The second grows upon old rotten Trunks or Stumps of Trees, as of *Oak*, *Beech*, *Hasle*, *Willow*, and several other sorts of Wood, and in the Woods under them; that which grows upon the Bodies of old *Oaks*, is preferred before the rest; but instead of this, most do use that which grows under the *Oak*, and for all that I know, it may do nearly as well. The third or *Smaller Polypody* grows where the place is hard and dry, or in barren places, where scarcely any other thing will grow or thrive.

VIII. *The Times.* By reason it is green all the Year, and bearing neither Flower, nor Seed as it is thought, it may be gathered for use at any time; yet it sends forth young green Leaves only in the *Spring*.

IX. *The Qualities.* It is hot and dry in the first Degree, and as *Galen* says, without any biting property: Aperitive, Absterstive, Anodyn, Splenetick, Arthritick, and Cathartick.

X. *The Specification.* It purges Melancholy, Choler, and tough Flegm: is good against Agues; Gout in Hands or Feet; hardness, pain and tumor of the Spleen, Colick, Stitches in the Sides, Wind, Coughs, shortness of Breath, Wheezing, Hoarseness, *&c.*

XI. *The Preparations.* The Root is only, or chiefly in Use; and you may make therefrom, 1. *A Simple Decoction in Wine or Water.* 2. *A Compound Decoction in Wine or Water.* 3. *A Pouder thereof.* 4. *A Catapiasm.* 5. *A Distilled Water, not only from the Roots but from the Leaves also.*

The *Virtues.*

XII. *The Simple Decoction in Wine or Water, or in Barly Broth, or Chicken Broth, or in Whey, or Mead, or Honyed Water.* If it is made with other opening and mollifying things, it is of good use to purge the Belly, to Digest tough and thick Humors, and purge Phlegm, whether thick or thin, even from the Joints: and by using this *Decoction* for a considerable time, some who have been troubled with Pains and Tumors in their Hands, Knees, Feet and Joints, have been wholly cured of the same. It purges off also, Colerick and Melancholy Humors, is good against Pains and Tumors of the Spleen, and profitable for such as have been long troubled with Quartan Agues, especially if the *Decoction* is made in *Whey*, *Mead* or *Chicken Broth*, with *Epithymum*, *Beets*, *Mallows*, and *Parsly Roots*. It is profitable also against Prickings and Stitches in the Side, as also against the Colick, tho' inveterate, but then it ought to be taken for a pretty long time, and Seed of *Anise*, *Coriander*, *Carawaies*, and *Fennel*, with *Ginger* ought to be added. It is a safe and gentle Medicine, free from danger, and that brings no trouble to the Stomach, fit for all Seasons and Persons, which daily Experience has confirmed. It may be given from an Ounce to an Ounce and half, or two Ounces in a *Decoction*, for one Dose; which may be given in the Morning Fasting, with due Observation, as in other gentle Purges.

XIII. *The Compound Decoction in Wine, Water, Barly Broth, Chicken Broth, Whey, Mead, or Honyed Water. Take Polypody cleansed and Bruised, from half an Ounce to an Ounce or something more: Alexandrian Sena from a Dram to 2 Drams: Aniseeds, Carawaies, Coriander Seed, Sweet Fennel Seed, Ginger, all bruised, of each a Dram: Cloves slit a Scruple: Wine, Water, or Broth, &c. a sufficient quantity, Boil gently with a simmering Heat, for almost half an Hour, then Strain out thro' a Flannel Bag, which Dulcifie with Syrup of Violets, or of Citron Peels, for one Dose.* It admirably Purges Melancholy, opens the Spleen and expels the malign Hypochondriack Humor: it prevails against Frensies, and radically cures the most profound Madness, whether it be raging or otherwise, provided it be used alternately with Opiates, as with my *Laudanum Volatile*, *Laudanum Specificum*, or my *Gutta Vitæ*, &c. But the purging with this *Decoction* ought to be repeated 6, 8, or 10 times, or more, as the exigency, or necessity of the Disease may require. It carries off the Cause of the Colick, as also of the Gout, gives relief in Obstructions of the Spleen, Asthmas, Coughs, Colds, Hoarseness, shortness of Breath, Wheezing, *&c.* And being continued for some time, is an excellent thing for the speedy profligating of Agues: and has all the Virtues of the *Simple Decoction*, with great advantage, because it more powerfully carries off the Morbifick Matter, or offending Humor.

XIV. *The Pouder of the Root.* Being taken in the Morning Fasting, from a Dram to 2 Drams, in a Glass of *Mead*, or *Honyed Water*, it moves the Belly, and Works gently, and is profitable against all the Diseases, for which the *Simple* or

Compound Decoctions are given; tho' I think the latter of them to be the better Medicine, becauſe *Polypody* of its ſelf is a very weak Purge, and ſo weak, that in ſome Conſtitutions it will not work at all.

XV. *The Cataplaſm. It is made of the freſh Roots beat ſmall and mixt with Honey; or of the Pouder thereof mixed with Honey.* Being applyed to Diſlocations, it Strengthens and Confirms the Joints, Tendons, *&c.* Applyed to the *Polypus* of the Noſe, (which ſometimes grows ſo big as to ſtop the Noſtril up) it is ſaid to cure it. It cures alſo thoſe Clifts or Chaps, which ſometimes happen between the Fingers of the Hands, or Toes of the Feet, as alſo thoſe coming in the very Fundament.

XVI. *The Diſtilled Water, from both Roots and Leaves.* It is much commended for the Cure of the Quartan Ague, being taken many Days together; as alſo againſt Melancholy, or fearful or troubleſome Dreams. If it be dulcified with *Sugar Candy*, it is good againſt all the diſaffections of the Lungs, as Aſthma's, Coughs, Colds, ſhortneſs of Breath, Hoarſneſs, Wheezing, and Catarrhs, or thin Diſtillations of Rheum upon the Lungs, which oftentimes cauſes a Conſumption, as an Atrophia, and Conſumption of the Lungs. If a *Fixt Salt be made of the Herb or Root by Incineration*, and it be added to the *Diſtilled Water*, it makes it more efficacious or powerful to all the purpoſes and intentions aforementioned.

XVII. *Nota.* It is creditably reported, that if the *Decoction of the Roots made with Wine*, or *the Roots themſelves*, be given to Hogs, that it will preſerve them from the *Murrain*, by purging away the poiſonous, deleterious or malign Humor, which cauſes it.

CHAP. DLXXII.

Of POND-WEED.

OR,

RIVER-WORT.

OR,

WATER-SPIKE.

I. *THE Names.* It is called in *Greek*, Ποταμογείτον; (*quaſi Fluminibus vicina:*) and Σπαχύνις (*quaſi Spicata Fontalis.*) In *Latine*, *Potamogeiton*, *Fontalis*, & *Spicata.* In *Engliſh*, *Pond-weed*, *River-wort*, and *Water Spike.*

II. *The Kinds.* Authors give us many Kinds of this Plant, but we ſhall deſcribe only the four following, as being thoſe which are found growing in our Country, *viz.* 1. *Potamogeiton latifolium majus vulgare*; *Fontalis latifolia major vulgaris*; Our common greater broad Leav'd Pondweed. 2. *Potamogeiton latifolium minus vulgare*, *Fontalis latifolia minor vulgaris*; *Spicata latifolia minor Lobelij*; The leſſer broad Leav'd Pond-weed. 3. *Potamogeiton Anguſtiſolium majus*, *Fontalis longifolia major*; The greater long or narrow Leav'd Pond-weed. 4. *Potamogeiton longifolium minus*; *Potamogeiton foliis longis acutis*; *Fontalis longifolia minor*, *Potamogeiton alterum Dodonæi*; The leſſer long Leav'd Pond-weed, or Long ſharp Leav'd Pondweed.

The Deſcriptions.

III. *The firſt, or* Our common greater broad Leav'd Pond-weed. *Its Root creeps too and fro in the Mud, with ſeveral Joints and Tufts of Fibres at them, by which they are faſtned to their place of growing. It riſes up with ſeveral ſlender round Stalks, full of Joints and Branches, and fair*

Pond-weed broad Leav'd great.

broad round pointed dark green Leaves, with long Ribs in them like Plantain, *ſet ſingly at the Joints, and lying flat on the top of the Water. At the tops of the Staks and Branches, uſually (more ſeldom at the lower Joints) come forth long Spiked Heads, of bluiſh colored Flowers upon long ſoft Stalks, like unto thoſe of* Arſmart *or* Biſtort: *on which, after they are paſt, come Chaffie Husks, containing within them blackiſh hard Seed.*

IV. *The ſecond, or* Leſſer broad Leav'd Pondweed. *This differs not much from the former, but that it is leſſer, being the third Species of* Dodonæus *his* Potamogeiton. *Its Root is fibrous and throughly faſtned, as the other is. It ſhoots forth into many ſlender and round Stems, which are divided or ſpread out into ſeveral Branches. The Leaves are pretty broad, long and ſharp pointed, with Ribs running along the length of the Leaf, but they are much leſs than the firſt, or former Kind. Out of the Boſoms of the Branches and*

Leaves,

Pond-weed broad Leav'd ſmall.

Leaves, certain little Stalks ſpring forth, which bear ſeveral ſmall white Moſſy Flowers, which turn into plain and round Seeds not much unlike to the Common Tare *or* Vetch.

V. *The third, or* Greater long or narrow Leav'd Pondweed. *Its Root is long, jointed, and Fibrous. It has alſo longer, narrower, and ſharper pointed Leaves, than thoſe laſt deſcribed, having the Veins running from the middle Rib, to the ſides of the Leaves, as in a* Willow *Leaf, which they ſomething reſemble. At the Tops of the Stalks, grow reddiſh Spikes or Ears, like thoſe in the firſt deſcribed, in ſome more whitiſh; in others of fair bluſh color.*

VI. *The fourth, or* Leſſer long Leav'd Pond-weed; *or* Long ſharp Leav'd Pond-weed. *It has a pretty thick Root (conſidering the magnitude of the Plant) which is long and full of Joints, with many ſmall Fibres at each Joint, which Root runs along under the ſurface of the Mud, and creeping in the bottom of the Water. From the Joints of this Root ſpring up ſlender, jointed, and long, Stalks, ſmaller below, and larger above, having upon them, and ſpringing from their various Joints, and ends of their Stalks or Branches, long, narrow, and very ſtiff, ſharp pointed Leaves. The Flowers grow in a reddiſh Spike, like thoſe in the firſt Deſcribed.*

VII. *The Places.* Theſe Plants grow in Standing Waters, Pools, Ponds, and Watery Ditches, almoſt every where in our Land: The two firſt are the moſt frequent to be met with; the two latter are more rare, and to be ſeen but in few places with us.

VIII. *The Times. Gerard* ſays, They Flower in *June* and *July:* But *Parkinſon* ſays, That they ſhew their Flowers in the end of *Auguſt*, ſeldom ſooner.

IX. *The Qualities. Pond-weed* is cold and dry in the firſt Degree, and *Galen* ſays, it cools and binds as *Knot-Graſs* does, but is of a thicker Eſſence. It is Aſtringent, Anodyn, Coſmetick, Vulnerary, and Arthritick.

X. *The Specification.* It ſtops Fluxes, eaſes the Belly-ach, is good againſt *Anthonies* Fire, aſſwages Inflamations, gives preſent eaſe in the Gout; and heals old running Sores and Ulcers.

XI. *The Preparations.* You may make therefrom, 1. *A Liquid Juice or Eſſence.* 2. *A Decoction.* 3. *A Pouder of the Leaves and Heads.* 4. *An Ointment.* 5. *A Cataplaſm.*

The Virtues.

XII. *The Liquid Juice or Eſſence.* Given to two Spoonfuls, Morning and Evening in a Styptick Red Wine, it eaſes gripings, and ſtops all ſorts of Fluxes of the Bowels: and being Bathed therewith, it is good to help Itches, Ulcers, old running Sores, and corroding Cankers. It allays Inflamations, *Anthonies* Fire, and is good againſt Freckles, Tanning, Sunburning, Pimples and heat of the Face.

XIII. *The Decoction in Wine.* It has all the former Virtues, but may be taken inwardly, to 6 or 8 Ounces; it is a very good Gargariſm for a ſore Mouth or Throat, cleanſes, drys and heals Ulcers, *&c.* But *Made with Water*, It is better for to cool Inflamations, allay the heat in *Anthonies* Fire, *&c.*

XIV. *The Pouder of the Leaves and Heads.* It has all the Virtues of the *Juice* and *Eſſence*, a Dram at a time being given inwardly Morning and Night in ſome Styptick Red Wine. Outwardly being ſtrewed upon old running Sores and Ulcers, it is ſaid to ſtop the Fluxion, cleanſe, dry, and heal them, and this it more effectually does, if it is mixed with an equal weight of the *Pouder of common black Roſin.*

XV. *The Ointment.* It is cooling and Anodyn; is good againſt Inflamations of all ſorts, running Sores and old Ulcers in the Legs, diſcuſſes Pimples and other breakings out in the Face and Skin.

XVI. *The Cataplaſm made of the Leaves or Heads and Roots.* Being *made by boiling them with Oil and Vinegar*, and applyed to places pained with the Gout, it gives preſent eaſe: and *made with Honey and Vinegar*, and applyed, it heals old running Sores and foul Ulcers in the Legs or other parts: *made of the Root alone*, it is ſaid to diſſolve Knots and Kernels in the Neck, and other places of the Body.

CHAP. DLXXIII.

Of POPPY Garden.

I. *The Names.* It is called in *Greek*, Μήκων: in *Latine*, *Papaver:* and in *Engliſh*, *Poppy.*

II. *The Kinds.* There are four principal Species of this Plant, *viz.* 1. Μήκων ἥμερος, ἢ κηπαία, μήκων ἥμερος, θυλακίτης *Dioſcoridis*; in *Arabick*, *Thaythay*, & *Cuſchas*; *Papaver Hortenſe, vel ſativum*, Garden Poppy, of which in this Chapter. 2. Μήκων ῥοιὰς, *Papaver Rhœas vel erraticum, vel Sylveſtre, vel Rubrum,*

Rubrum, The Wild Poppy, of which in *Chap.* 574. 3. Μήκων κεραΐτης, *Almacharam Arabice*; *Papaver Corniculatum, vel Cornutum*, The Horned Poppy, of which in *Chap.* 575. 4. Μήκων ἀφρώδης, *Papaver Spumeum*, Spattling Poppy, of which in *Chap.* 576. following.

III. *The Kinds of the Garden Species.* There are many sorts of this Species, but the following are chief, *viz.* 1. Μήκων λευκὴ, *Papaver album sativum simplex*, The single white Garden Poppy. 2. *Papaver nigrum sativum simplex*, The single black Garden Poppy. 3. *Papaver rubrum sativum simplex*, *Papaver Flore rubro, vel rubente sativum simplex*, The single red Garden Poppy. 4. *Papaver album multiplex*, The double white Garden Poppy. 5. *Papaver rubescens multiplex*, The double red or blush Poppy. 6. *Papaver nigrum multiplex, sive purpureum multiplex*, The double murry or purple Poppy. 7. *Papaver Rhœas Flore multiplici*, The double red or Corn Poppy. 8. *Papaver Spinosum*, The Thorny Poppy.

The Descriptions.

IV. *The first*, *or* Single white Garden Poppy. *It has a Root which is white and woody, which perishes as soon as it has given ripe Seed. This springs up first with four or five whitish green Leaves, lying upon the Ground, which rise with the Stalk, encompassing it at their bottoms, and are very large, as well broad as long, much rent or torn in on the edges, and dented also besides. The Stalk, which for the most part is but one, and some-*

Poppy Garden single white.

times three, or four Feet, or more high, has sometimes no Branches at the top, but usually but two or three, which are the most; each of which bears one Head, wrapped or folded in a thin Filme or Skin, which bows down before it is ready to blow, and then rising and being broken, the Flower which was folded within it, spreads it self open, and consists of four very large white round Leaves, with many whitish round Threads in the middle, set about a small round green Chaplet or Head, having a Crown, or Star-like Cover on its top, which Head growing ripe, becomes as great as a large Apple. Bellonius *says, That in* Natolia, *(where they make* Opium*) the Heads are so large, that they will hold half a Pint. In these Heads are contained great numbers of white small round Seed, in several Partitions or Divisions, next unto the Shell, the middle thereof remaining hollow and empty. This Head keeps close, and opens not at top under the Crown, as all the* black Kinds *for the most part do. All the whole Plant, Stalks Leaves and Heads, whilst they are fresh, young, and green, yield a Milk, or milky Juice when they are broken, which is of an unpleasant bitter Taste, which nauseates the Stomach, almost to Vomiting, and of a strong heady Smell, which being condensate is called either* Opium *or* Meconium. *Of this* white Kind, *there is another in all things like unto it, but that the Flowers, and especially the Heads of Seed, are not so great by the half, and for the most part has more Branches upon the Stalks; its Seed is as white as the other, and full as large or great.*

V. *The second*, *or* Single black Garden Poppy. *Its Root is like to the former, and there is but little difference to be seen between this and that, until it comes to Flowering; for that the Flowers of this are somewhat less, and of a blackish purple color, without any purple Spots in the bottom of the Leaf, as in the next. The Heads of Seed are commonly not so large, as the second sort of* white Ones *before mentioned, and opens it self a little round about the top, under the Crown, so that the Seed which is very*

Poppy Garden single black.

very black, will fall out, if the Head thereof be turned downwards.

VI. *The third, or* Single red Garden Poppy. *This* Poppy *has various Species, with respect to the Variable colors of the Flowers, yet they differ not from the former, but only something in the Leaves, these being lesser, and in some crumpled, and cut in or jagged on the edges; but in the jagged edges also of some of the Flowers, and especially in the colors of the Flower and Seed: for the Flowers of some of them will be very red; of others paler; some of a* Rose *color; others of a murry color,*

Poppy Garden single Red.

either deeper, or paler; yet all of them have a deeper Spot, somewhat large, in the bottom of every Leaf. And as the Flower varies, so does the Seed also; for the Rose *and pale colored Flower brings gray or* Ash *colored Seed; the reddish and deep murry, not so pale Seed, but more inclining to black. The Seeds of all these Kinds, the white as well as the black or gray, if they be suffered to shed, will spring up again the next Year, and bear every Kind, its own color of Flower and Seed, without the least degeneration or varying of their forms or appearances, unless by meer accident.*

VII. *The fourth, or* Double white Garden Poppy. *Its Root is hard, woody, long, and perishing every Year, and must be new Sown every Spring, if they do not spring up of their own Sowing, which if they do, the Flowers are seldom so fair and double, as they which are Sown in the Spring. It has divers broad and long whitish green Leaves, giving Milk, (as all the rest of the Plant above Ground does, wheresoever it is broken or cut.) These Leaves are very much rent or torn on the edges or sides, and notched or indented besides, encompassing at their bottoms, a hard, round, brittle, whitish green Stalk, Branched towards the top, each Branch bearing one fair, large, great Flower, which before it breaks out, is contained within a thin Skin, and being blown open, is very thick of Leaves, and very double, something jagged at the ends, and of a whitish color. In the middle of which stands a round Head or Bowl, with a striped Crown or Cover on its Head, very like a Star, compassed about with some Threads; in which, when it is ripe is contained, in several Cells or Partitions, small, round, white Seed. The whole Plant is of a strong heady smell.*

VIII. *The fifth, or* Double red or blush Poppy. *This Kind of* double Poppy, *differs not in any other thing from the former, but only in the color of the Flowers, which are of a bright red, tending to a blush color, parted, and striped in many places with white, and exceedingly more jagged than the former, almost like a Feather at the ends, the bottoms of all the Leaves being white. The Seed hereof is white as the former, which is not so in any other* Poppy, *which bears not a full white Flower.*

IX. *The sixth,* Double murry or purple Poppy. *This Kind varies both in Flowers and Seed; altho' neither in Leaves, or any other thing from the first. The Flowers are thick and double, and jagged at the ends, in some more, in some less,*

Poppy Garden double white, Sect. VII.

Poppy Garden double black. Sect. IX.

either red, or blush, or purplish red, more or less, or of a sad murry, or tawney color; with brown, or black, or tawney Buttons. The Seed is either of a grayish blew color, or (as in some Plants) more blackish.

X. *The seventh,* Double red, or double Corn Poppy. *This* double Poppy *is like to the* Wild *or* Field Poppy, *which is well known to all. It has longer, narrower, and more jagged green Leaves than the former*

former Kinds; the Stalks are more hairy, and the Flower of a deep yellowish red color. Now this differs nothing from the Corn Poppy, *but in the duplicity of the Flower, which is very thick and double, but not full out so large as the former. This rises from Seed in the like manner as they do, and is so to be preserved.*

XI. *The eighth, or* Thorny Poppy. *Its Root is small and spreading, dying every Year. It rises up at first with three or more whitish green Leaves lying on the Ground, streaked with white Veins, which growing greater, are long, smooth, and not hairy; something long and broad, and diversly rent or torn on the edges, but not to the middle Rib, having many Corners or Dents as it were about them, at which stand many sharp Prickles or Thorns, not having any white Streaks or Veins on the under side, but in the white milky Veins, are like to that which we call* Our Ladys Thistle, *and on the under side are more whitish, with some small Prickles, along the middle Rib and Veins, encompassing the Stalk at their bottoms, which Stalk rises sometimes two or three Feet high, spreading it self forth into several Branches, with the like but lesser Leaves on them, and bearing at every of the Tops one small Head, enclosed in a rough Skin or Film, like as the* Poppies *have, which opening, shews forth a small yellow Flower, consisting usually of five Leaves, yet sometimes having but four, and sometimes again six, with a small, long, green, prickly Head in the middle, tip'd at the top with a red Spot, which quickly wears away, and with many yellow Threads standing about it. After the Flower is past, (for it continues but a while) the Head grows ripe, having five or six Ribs from the top to the bottom, and so likewise between the Ribs, armed with very small, but cruel sharp short Prickles, in which is enclosed, rough round black Seed, twice as large as any* Poppy Seed. *Every part of the Plant yields a yellow Juice.*

XII. *The Places.* The first three, or four *single Flowered Kinds* grow not Wild in any place, that I know of, but are Planted and Nurst up in Enclosures, for the general good they do to Mankind. The Native place of the four double Kinds are unknown, but we have had them for a long time in our *Gardens*; and it is said that they came first from *Constantinople*, or out of *Turky*. The eighth or *Thorny Poppy*, has been found growing in *Florida*, and other parts of the *West Indies*, from whence the Seed was first brought to us.

XIII. *The Times.* The first 7 or 8 *Garden Kinds*, do all Flower from the beginning of *June*, until the middle or end of *July*, according as the Season may be; but if they spring up, of their own Sowing, they may Flower somewhat the earlier, *viz.* in *May*, or end thereof: and their Heads of Seed are commonly ripe in *July* or *August*. The *Thorny Kind* seldom Flowers before *Midsummer*, and the Seed is ripe in *August*; it is to be Sown in *Autumn*, else it scarcely springs up.

XIV. *The Qualities.* Poppy is hot and dry in the second Degree, or rather in the third: Astringent, Anodyn, Narcotick, Cephalick, Splenetick, Arthritick, Antiemmenagogick, Sudorifick, and Anticathartick.

XV. *The Specification. Poppy* (in its several *Preparations*) is effectual for the Cure of Asthma's, Coughs, Colds, Consumptions, Pleurisies, Pains and Stitches in the Sides, Spleen, Womb, Reins, and Bladder; Vapors, Hysterick Fits, Colick, Gripings of the Guts, Stone and Gravel in the Urinary parts; all Fluxes of the Bowels, as, Diarrhæa, Dysenteria, Lyenteria, and Hepatick Flux; all Fluxes of Blood, by the Nose, Mouth, (as Spitting and Vomiting Blood) Secret parts (as Pissing Blood, overflowing of the Terms, *&c.*) of Fundament, (as the Hæmorrhoids, Bloody Flux, *&c.*) bleeding of Green Wounds, Fluxes of Humors to Wounds, old Sores, Ulcers, Fistula's, Joints, or any other parts, *&c.* Gouts in Arms, Hands, Fingers, Hips, Knees, Ankles, Feet, Toes, Rheumatisms, *&c.*

XVI. *The Preparations.* They are almost innumerable, these following, as most Material, we shall Entreat of in their Order, *viz.* 1. *A Liquid Juice of the Leaves, Flowers, and Heads.* 2. *An Essence of the same.* 3. *A Decoction of Leaves and green Heads.* 4. *A Decoction of the black Seed.* 5. *A Decoction of the Shells of the Heads.* 6. *A Pouder of the Seed.* 7. *An Emulsion of the Seed.* 8. *An Oil of the Seed by Expression.* 9. *Syrupus de Papavere magis compositus.* 10. *Syrupus Papaveris albi & nigri minus compositus.* 11. *Syrupus Narcoticus.* 12. *Syrupus de Meconio,* Syrup of Juice of Poppies, 13. *Diacodium Liquidum aliud.* 14. *Diacodium Crocatum Mynsichti.* 15. *Diacodium Montani.* 16. *Diacodium solidum.* 17. *Diascordium.* 18. *Philonium Persicum.* 19. *Philonium Romanum.* 20. *Philonium Magistrale.* 21. *Philonium Taracense Galeni.* 22. *Oil by Infusion.* 23. *An Ointment.* 24. *A Cataplasm.* 25. *White Poppy Water.* 26. *Black Poppy Water.* 27. *Spirit of White Poppies.* 28. *Meconium, The Inspissate Juice.* 29. *Opium, The Tears of the Poppy Heads.* 30. *Extractum Opij.* 31. *Pulvis Opij.* 32. *Tinctura Opij simplex,* Simple Tincture of Opium. 33. *Tinctura Opij composita.* 34. *Tinctura Opij Paracelsi.* 35. *Tinctura Opij Scheferi.* 36. *Spiritus Opij.* 37. *Laudanum of Helmont.* 38. *Laudanum Helmontij aliud.* 39. *Laudanum Specificum Paracelsi & aliud ejusdem.* 40. *Laudanum Londinense.* 41. *Nepenthes Opiatum.* 42. *Requies Nicolai.* 43. *Theriaca Londinensis Salmoniana.* 44. *Our Specifick Laudanum.* 45. *Our Volatile Laudanum.* 46. *Our Cathartick Laudanum.* 47. *Our Gutta Vitæ.* 48. *Laudanum Opiatum Hartmanni.* 49. *Pilulæ de Cynoglosso,* Opiate Pills of Hounds Tongue. 50. *Pilulæ de Styrace,* Opiate Pills of Storax. 51. *Extractum Florum & Capitum Papaveris. German Opium.*

The Virtues.

XVII. *The Liquid Juice.* It is *Medicamentum Anodynum*, giving present ease in any pains in what part of the Body soever, by bathing the parts afflicted therewith warm, two or three times a Day; and bathing the Head, Forehead, and Temples therewith, it eases the Head-ach, and causes Sleep and Rest: the same it does, if a *Rose Cake* be dipped therein, and so bound on upon the Forehead and Temples, and to it stops Catarrhs, and Fluxes of Rheum falling upon the Eyes, Nose, Palate, Tonsils, Jaws, Teeth, *&c.* Applyed upon *Ignis sacer* or *Anthonies* Fire, it allays the Inflamation, eases the pain, discusses the Tumor, and quickly cures the Disease, more especially if it be mixt with a little White Wine Vinegar.

XVIII. *The Essence.* It has all the Virtues of the *Liquid Juice* above named, besides which being dropt into the Eyes, or bathed upon the Forehead, Temples, and Eye Lids, it cools the Inflamation, Stops the Flux of Humors, eases the Pain, and strengthens the weakned part. The

parts

parts afflicted with the Gout being well bathed therewith, and Linnen Cloth six or eight times double being dipt therein and applyed, it eases the pain, cools the Inflamation, if any be; stops the Flux of Humors to the part, and in a short time Cures it. Held in the Mouth, it Cures the Tooth-ach upon the Spot. Bathed upon sore, hard, inflamed and pained Breasts, it softens, cools, and eases their pain almost in a Moment.

XIX. *The Decoction of the Leaves and green Heads.* It has all the Virtues of the *Juice* and *Essence*, but nothing near so powerful. Given inwardly 3 or 4 Spoonfuls at a time, more or less, it is found to stop Catarrhs, and Vehement Coughs, give rest and ease, and cause Sleep, and prevail against pains of the Stone and Gravel, to stop Fluxes of the Belly, and overflowing of the Terms.

XX. *The Decoction of the black Seed in Wine.* Being drank, it eases inward pains of the Bowels, stops all Fluxes of the Belly, as Diarrhœa, Dysenteria, Lienteria, and Hepatick Flux, as also the overflowing of the Courses in Women: and outwardly bathed upon any place pained with the Gout, or Defluxion of Humors, it eases the pain and repercusses the Humor: held in the Mouth, and repeated for some time, it has been found to give ease and relief in the Tooth-ach.

XXI. *The Decoction of the Shells of the Heads in Water.* The Empty *Shells of the Poppy-Heads*, are usually Boiled in Water; the *Decoction* of which is given to 2, 3 or 4 Ounces to procure Rest and Sleep; so also if the Head and Temples be bathed therewith warm, for some considerable time.

XXII. *The Pouder of the Seed.* *Dioscorides*, *Galen*, and others write that the Seed is familiarly eaten in Bread; and made into Cakes, and eaten with pleasure And *Matthiolus* with several others have observed, that in our Days the *White Poppy Seed* is Sown in *Italy* and other places, and much used; yea, and the *Black Poppy Seed* also, which they all agree, *is stronger in Operation, and only Medicinable, or only to be used in Physick for the Cure of Diseases: This Black Poppy Seed* Matthiolus *says, that the Inhabitants about* Trent, *do Sow in their* Fields, *and Grounds, among* Beans *and other Pulse, which they familiarly Eat, being made up with* Wheat Flower *into Cakes, the Seed being cast into the same and so kneaded together; and yet he says, they are not at all the more Sleepy or Drousy, than those who Eat none of them. As also, That in* Stiria, *and the* Upper Austria, *the Inhabitants do Eat the* Expressed Oil out of the Black Seed, *familiarly in their Meats instead of* Sallet Oil, *and find no inconveniency or drowsiness to come upon them thereby.* And hereby he says, That he shook off the Fears of the danger of *Poppy*, which his Wife Masters had, by their grave Admonitions seasoned him withall in former times. *The Pouder of the Seed, whether of the White or Black Poppy*, being given from 10 Grains to a Scruple, or half a Dram, according to the Age, and strength of the Patient, in any proper *Syrup*, is good to stop Fluxes of the Belly, and ease the pains of the Spleen; as also to procure Rest and Sleep, being given at Bed-time, tho' it had no such operation being eaten made up into Bread or Cakes, because (as I suppose) it might so taken, want of its due Dose.

XXIII. *The Emulsion of the Seed.* *Matthiolus* says, That the *Emulsion*, or *Milk of the Seed*, (I suppose of either *White or Black Poppy*) made with *Barly Water*, he had oftenimes given, and in great quantity, in the hot Fits of Agues, and in Burning Fevers, both to assuage Thirst and procure Rest: and no doubt, it has a good Property in it, to procure Rest and Sleep

XXIV. *The Oil of the Seed by Expression.* This *Oil* we have shewn before, in *Seed* 10. The People of *Austria* and *Stiria*, Eat, as others Eat *Sallet Oil*, and therefore without doubt, it can have no dangerous effects. It is good against Hoarseness, Wheezing, and Fits of Vomit, being taken inwardly; and so taken mixt with *Syrup of Gilliflowers*, or *Citron Peels*, or *Flowers*, it prevails against vehement Coughing, and shortness of Breath, Asthma's, &c. outwardly anointed upon any part, it cools Inflamations, eases pain, and takes away redness and Pimples in the Face and Skin

XXV. *Syrupus de Papaveris albi compositus:* Syrup of Poppies the greater Composition. *Take the Heads of White and black Poppies, with their Seed, white green, of each 6 Ounces; Maiden-hair 15 Ounces, Jujubes N° 20; Lettice Seeds 5 Ounces, Seeds of Mallows and Quinces (tyed up in a Rag) of each a Dram and half; fair Water a Gallon; Boil all according to Art, and strain out, to three Pounds of which, put Clarified, or double Refined Sugar 2 Pounds, and make a Syrup according to Art.* It is good against Coughs, Catarrhs, Phthisicks, Consumptions, all sorts of Fluxes, Pleurisies, eases all manner of pains, giving Rest and Sleep. Dose from 1 Ounce to 2.

XXVI. *Syrupus Papaveris albi & nigri minus compositus*, Syrup of Poppies the lesser Composition. *Take Heads of White and Black Poppies, whilst both are green, of each 6 Ounces; Seeds of Lettice and Violets, of each 1 Ounce; fair Water a Gallon; Boil them till the Virtue is out of the Heads, then strain out; and with double Refined Sugar 4 Pounds, make a Syrup.* The Virtues of this are the same with the former, and it may be given in the same Dose: It is an excellent thing against pains and stitches of the Sides, pains of the Spleen, and Gripings of the Guts.

XXVII. *Syrupus Narcoticus Gregorij Horstij*, *Horstius* his Syrup easing Pain. *Take Syrup of Corn Poppies* 16 *Ounces; Laudanum Opiatum a Dram; Dissolve the Laudanum in White Poppy Water* 8 *Ounces; and mix them well together.* It has all the Virtues of the former *Syrups of Poppies*, and gives present ease in the Colick, Gout, and Stone: but it is most commonly used in Vehement and strong Pains of the Head, for which purpose, it was often used by the Author thereof, being powerful for that intention: Dose from half an Ounce, to one Ounce or Ounce and half.

XXVIII. *Syrupus de Meconio sive Diacodium Liquidum*, Syrup of Meconium, or of Condensed Juice of Poppies. *Take Heads of White Poppies, gathered just after the Flowers are fallen off, and kept three Days apart*, 8 *Ounces: Heads of Black Poppies with the Seeds gathered in like manner*, 6 *Ounces; Spring Water a Gallon: digest 24 Hours, then boil a little with a simmering Heat, and gently press out the Juice, which afterwards boil to 3 Pints; and with 2 Pounds of double Refined Sugar, make a Syrup according to Art.* It is Hypnotick, Narcotick and Pectoral, good against Diseases of the Breast, Lungs, and Bowels, Coughs, Colds, Hoarseness, Asthma, Colick, Pleurisy, Consumptions, and stops all sorts of Fluxes of the Bowels, and the overflowing of the Terms in Women. Dose 1 Ounce more or less, according to Age and other accidents.

XXIX. *Diacodium Liquidum aliud, seu Syrupus Hæmoptoicus*, Another Liquid Diacodium, or Syrup of Poppies. *Take Heads and Seeds of White and*

Black Poppies, whilst green, of each 8 *Ounces*; *Spaniſh Juice of Liquorice bruiſed* 2 *Ounces and half*; *fair Spring Water a Gallon*; *extract the Tincture out of the Juice, in a warm Balneo, in* 48 *Hours, let it cool and ſettle well*; *then decant the clear, and put it to the Poppy Heads, boil with a ſimmering Heat, then preſs out the Juice, evaporate again till it comes to about* 2 *quarts, and with* 2 *Pounds of double Refined Sugar, boil it to the Conſiſtency of a Syrup.* It gives eaſe in pains, and cauſes Reſt and Sleep; it ſtops Vomiting, and all manner of Fluxes of the Belly, or Fluxes of Humors, Catarrhs, Coughs, Spitting and Piſſing Blood, *&c.* It gives eaſe in the Colick, Gout and Stone, and prevails againſt Aſthmas, Pleuriſies, pains and Stitches in the Sides, *&c.* Doſe 1 Ounce in any proper Vehicle.

XXX. *Diacodium Crocatum Mynſichti*, Diacodium with Saffron. *Take white Poppy Heads, with the Seeds, whilſt green*, N° 21; *Fat Figs, Dates. Sebeſtens, of each* N° 12; *Pulp of Sweet Carobs. Liquorice raſped of each* 3 *Ounces*; *Seeds of Cotton. of Althæa, of Quinces, of each half an Ounce*; *Flowers of Mallows, of Napweed, of Violets, of each a Dram*; *boil all in a ſufficient quantity of Spring Water, and ſtrain out*; *to the ſtrained Liquor add white Sugar Candy a half part, and make by boiling a very thick Syrup*; *towards the end of which add Syrup of the Juice of Corn Poppy Flowers, Syrup of Jujubes, of each* 2 *Ounces*; *Extract of Engliſh Saffron a Scruple*; *mix and boil all to the thickneſs of Honey, aromatizing it with Gallia Moſchata.* It is an excellent thing in all hot Catarrhs, where the Humor is thin, ſharp, and Salt, in a Vehement and continual Cough, it is a Secret It thickens Rheum, cauſes Expectoration, quenches Thirſt, mitigates the extremity of heat and burning, cools and moiſtens, and gives Reſt and Sleep. It is prevalent againſt the moſt acute pains, chiefly thoſe of the Reins and Bowels, as Stone, Gravel, Colick, and Gripings of the Guts; It gives eaſe in the Pleuriſy, and Baſtard Pleuriſie; and is profitable againſt all Cholerick Fluxes and other Fluxes of the Belly. Doſe from a Spoonful to two Spoonfuls or more.

XXXI. *Diacodum Montani*, *Montanus* his Syrup of Poppies. *Take green Heads of White Poppies with the Seed*, N° 20; *Pulp of ripe Carobs* 3 *Ounces*; *Althæa Roots, or rather Myrtle Berries, Liquorice raſped, of each* 2 *Ounces, Fountain Water* 6 *Quarts*; *mix and boil the Water away till it comes to* 3 *Pints, then ſtrain out by Expreſſion*; *and ſtrain again, and with Sugar of Roſes* 1 *Pound, boil it to the thickneſs of a Syrup, or of New Honey.* It has all the Virtues of the former, yet by ſome not thought ſo powerful: however it is very profitable in all thin, and ſharp Rheums, and other Diſeaſes of the Lungs, and *aſpera Arteria*; it takes away the vehemency of Coughing, and cauſes Reſt; for which effects it was highly celebrated by *Montanus*. I have here Subſtituted *Myrtle Berries*, inſtead of *Althæa Roots*, becauſe the former make the Preparation more fragrant and grateful, and I judge the *Myrtle Berries* to be full as efficacious.

XXXII. *Diacodium Solidum ſive Tabulatum*, Diacodium Solid or made into Lozenges. *Take white Poppy Heads, meanly ripe, and newly gathered*, N° 20, *ſteep them in Spring Water warmed* 3 *Pints, the next Day boil till the Virtue is out, then ſtrain out the Liquor, and with a ſufficient quantity of fine Sugar boil again according to Art, to ſuch a Conſiſtency as it may be made up into Lozenges.* This *Diacodium* thickens and ſtops Catarrhs, helps Coughs, roughneſs and foreneſs of the Wind-Pipe, cauſes Reſt and Sleep, and eaſes all ſorts of Pains; you may carry theſe *Lozenges* in a Box in your Pocket, and Eat them as you ſee occaſion.

XXXIII. *Diaſcordium*, Confection of Scordium. *Take Scordium an Ounce*; *Cinnamon, Caſſia lignea, Dittany of Creet, Tormentil, Biſtort, Gentian, Galbanum, Gum Arabick, Earth of Lemnos, Storax Calamita, of each half an Ounce*; *fine Bole an Ounce and half*; *Long Pepper, Ginger, of each* 2 *Drams*; *Opium, Sorrel Seeds, of each a Dram and half*; *Clarified Honey* 2 *Pounds and a half*; *Sugar of Roſes a Pound*; *Canary* 8 *Ounces*; *mix and make an Electuary according to Art.* It is an excellent thing againſt Plague, Poiſon, Bitings of Serpents, and of Mad Dogs, and all malign Fevers: it ſtops a Looſneſs, and all ſorts of Fluxes of the Belly, Vomiting, Catarrhs, deſtuctions of Rheum and Coughs, is good againſt Watchings, all manner of Pains in any part of the Body, and the Whites in Women. It ſtrengthens the Heart, revives the Spirits, recreates the natural Powers, gives relief in Pleuriſies, and reſtores in Conſumptions. To Infants and Children you may ſafely give from 10 Grains to a Scruple; to elder Perſons from half a Dram to 2 Drams, or more as the neceſſity may require.

XXXIV. *Philonium Perſicum*, a *Perſian* Confect cauſing Reſt and Sleep. *Take white Pepper, white Henbane Seed, of each* 4 *Ounces*; *Opium, Terra Lemnia, of each* 2 *Ounces*; *Blood Stone prepared, Saffron, of each* 1 *Ounce*; *Caſtoreum, Indian Spicknard, Pyrethrum, Pearls, Amber, Zedoary, Elecampane, Troches Ramich, of each* 1 *Dram and* 12 *Grains*; *Camphir* 24 *Grains*; *beſt Hony of Roſes the triple weight of all*, viz. 45 *Ounces*; *mix and make an Electuary according to Art.* Of this Compoſition the one thirtieth part is *Opium.* It ſtops the Flux of the Terms, the Whites, Hemorrhoids, Catarrhs, Bloody Flux, and all other Fluxes of the Bowels, Coughs, and Fluxes of Rheum upon any part, it prevents Miſcarriage, and eaſes all manner of Pains in what part of the Body ſoever, as Colick, Pains and Stitches of the Sides, Pleuriſies, Spleen, *&c.* In the *Auguſtan Diſpenſatory*, there is added, *Euphorbium and Doronicum of each in fine Pouder*, 1 *Ounce and* 48 *Grains*, which are here left out. *Meſue* was the Author of it.

XXXV. *Philonium Romanum*, a *Roman* Confect cauſing Reſt and Sleep. *Take white Pepper, white Henbane Seeds, of each* 4 *Ounces*; *Opium* 2 *Ounces*; *Caſſia, Lignea, Cinnamon, of each* 1 *Ounce and half and* 8 *Grains*; *Parſly Seed* 6 *Drams and* 20 *Grains*; *Seeds of Macedonian Parſly, of Fennel, and of Daucus half an Ounce and* 30 *Grains*; *Saffron* 2 *Drams* 12 *Grains*; *Indian Spicknard, Pyrethrum, Zedoary, of each* 1 *Dram and* 36 *Grains*; *Myrrh, Caſtor, of each* 6 *Drams and* 1 *Scruple*; *Clarified Hony, the triple weight of all*, viz. 40 *Ounces and a half almoſt*; *mix and make an Electuary according to Art.* Of this Compoſition, $\frac{1}{30}$ part is purely *Opium.* In this is left out alſo, the *Prepared Euphorbium* 6 *Drams and* 1 *Scruple.* It is given in the Stone, Strangury, Colick, Pleuriſy, Spleen, griping of the Guts, all ſorts of Fluxes, Gouts, Rheumatiſms, Coughs, Aſthma's, *&c.* and has all the Virtues of the former.

XXXVI. *Philonium Magiſtrale*, the Magiſtral Confect cauſing Reſt. *Take Opium prepared, or Aqueous Extract of Opium* 4 *Ounces*; *Benjamin, Myrrh, Mummy, of each half an Ounce*; *with Spirit of Wine a ſufficient quantity, diſſolve and make an Opiate.* The *Opium* in this will be about $\frac{1}{3}$ one third part of the Preſcript. It has all the Virtues of the two former, or of any prepared *Laudanum*, whether Solid or Liquid. The two former, *viz.* the *Philo-*

Philonium Persicum, and *Romanum*, may be given from a Scruple to a Dram: this *Philonium Magistrale*, may be given from a Grain, to 2, 4, or 6. according to Age, and other Accidents.

XXXVII. *Philonium Taraconje Galeni.* Galens Confect easing Pain. *Take Extract of Opium a Pound; white Pepper, Henbane Seeds, of each 2 Pounds; Saffron half a Pound; Euphorbium, Pyrethrum, Indian Spicknard, of each in fine Powder an ounce and half; Honey the triple weight of all, viz. almost 18 Pounds: mix, and make an Electuary according to Art.* It has all the Virtues of the *Philonium Persicum & Romanum*, aforegoing; and may be given from a Scruple to a Dram: the *Opium* being $\frac{1}{24}$ a twenty fourth part of the Composition. It is indeed a most Excellent thing, to ease all manner of intolerable Pains in any part of the Body, chiefly of Stomach, Pleura, Spleen, Guts, Reins, Womb, Joints, &c. It helps in Suffocations, Fits, Stone, Gravel, Heat and Scalding of the Urine, Coughs, Colds, &c.

XXXVIII. *The Oil by Infusion or Insolation, or Boiling. It is made either of the Flowers; or of the green Heads and Seed; or of the Leaves and Stalks:* But that made with the *Green Heads* is the most efficacious. It cools Inflamations, repercusses a Flux of Humors, it abates the Milk and Pains in Womens Breasts; gives ease in Rheumatism, Gout and Sciatica; prevails against Leprosy, Morphew and Scurf, and eases the pain of the Head, being well anointed upon the grieved parts twice a Day.

XXXIX. *The Ointment of the green Poppy Heads and Seed.* It has all the Virtues of the *Oil* in the last Section, and may be applyed to *Cancers* which are breeding in Womens Breasts, or in any other parts; it qualifies the Humor, eases the Pain, and if proper Internals be given in the mean time, may be of extraordinary Service for that purpose: what we should propose to be taken inwardly in this case is our *Laudanum Catharticum*, the Description of which you have in *Sect.* LXII. following.

XL. *The Cataplasm. It is made of the green Heads and Seed, and for want of them of the green Leaves.* Applyed to the Fore-head and Temples, it gives present ease in the Megrim or Head-ach; and is profitably applyed to the Crown of the Head, (being first Shaved) in a Delirium Frenzy, or Madness. And it gives present ease being applyed to the Spleen or Region of the Womb, or to places pained with the Gout, Rheumatism, &c. It cools Inflamations, and hinders the Flux of Humors to any part.

XLI. *Distilled Water of white Poppies.* It is cooling, and very profitable against violent Burning Fevers, to be drank *ad libitum*, being first acuated with *Spirit of Sulphur*, and then a little dulcified with double Refined Sugar: It makes also a good Vehicle, for conveying other Preparations of *Poppies* in, whether *Diacodiates*, *Electuaries*, or *Laudana*. It is profitable also against Deliriums and Frenzies, also Inflamations in any part of the Body, whether inward or outward. And gives Rest to weary Bodies, and pleasant Sleep.

XLII. *Distilled Water of black Poppies.* It is Drawn from either the Flowers, green Leaves, or green Heads and Seed. It has the Virtues and Uses of the former: mixed with White Wine Vinegar, and the Forehead and Temples bathed therewith, it eases the Megrim and Head-ach, and causes Rest and Sleep; and is a peculiar thing to bath with for the curing of *Ignis Sacer*, or *Anthonies Fire*.

XLIII. *Spirit of white Poppies.* It is made either of the Flowers, or of the green Heads and Seed, or of the whole Plant, as the *Spirit of Corn Poppies* is made. The Virtues is also to give ease in the Colick, and to alleviate pains in any part of the Body. It gives ease in the Stone and Gravel; and is profitable against after-pains of Women in Child-Bed, and with a great deal of pleasure induces Sleep. But these things it does more powerfully, if you make a *Tincture of the Flowers* with the same. Dose from half a Dram to 3 Drams *plus-minus*.

XLIV. *Meconium*, of the Inspissate Juice of Poppies. *It is made of the Expressed Juice of the green Heads and Seed of the white, or black Poppy, or both of them; or of the Expressed Juice of the whole Plant. This is put into a proper Glass Body, and the Poppy Waters afore named are drawn off from it in Balneo, or a gentle Sand heat, till the Magma comes to the consistency of Hony, or of an Extract for making Pills, according as it is to be used.* This *Magma* is *Meconium*. If it is of the consistency of *Hony*, it is then fit to be made into an *Ointment* or soft *Emplaster*, which being Anointed all over the top of the Head, (it being first Shaved) cures Frenzies and Madness it self, tho' never so extream: if applyed to the Sciatica or places pained with Gout or Rheumatism, it eases the pain, and Cures them. That which is brought to the thickness of an Extract, must be prepared as *Opium* is (declared in *Sect.* 46 *and* 47 following,) before it can be used inwardly; and then it will have the Virtues and Effects of *Opium*, tho not altogether so powerful.

XLV. *Opium*, The Tears of Poppy Heads. It is made only in hot *Climates*, in *China*, *India*, *Asia major*, *Turkey*, and other Eastern Countries: The *Thebean Opium* is accounted the best of all, and after that the *Indian*. *Parkinson* says, that he has gathered some of it from the green *Poppy Heads* standing in the *Garden*, and but half grown ripe, here in *England*. The several Heads are slit, cut, or Wounded with a Knife, in two or three places obliquely, towards the lower parts of the Head, which then yield a Milky bitter Juice, at first coming forth, which is gathered gradually every Day, with some convenient Instrument in a proper Vessel; this being dryed in the Sun, (but not at the Fire) becomes that *Opium*, which is brought to us, and which we use, and by its gradual drying, turns to the color we see it of. The Question now is, out of which Kind of *Poppy*, *Opium* is extracted, whether out of the Heads of the *black Poppy*, or out of the Heads of the *white Poppy*? *Gerard* says, that it flows from the Heads of the *black Poppy*; and this he seems to have from *Dioscorides*, for *Matthiolus* in his Epitome, has these Words, *Opium autem, quod è Papaverum nigrorum Capitibus paratur, magis refrigerat, inspissat, siccatque.* And *Matthiolus* in his *Comment*, appears to be of the same opinion, for speaking of the *black Poppy*, he says, *Cæterum ex incisis Papaverum Capitibus opos, sive Succus manat, qui in Opium, vocatum addensatur, ut scitè docuit Dioscorides.* But *Parkinson* will have it to be the Tears flowing only from the *white Poppy*. *The Milky Juice* (says he) *gathered from the Heads only of the great white Poppy, growing in the East Countries of* Asia Major *towards* India, &c. *is the true and best Opium, that is, or should be used in Medicines.* And our Learned *Willis* was of this opinion; for speaking of *Opium*, and *Diacodium*, &c. he says, *I shall not need in this place to describe the* white Poppy, *out of which these are made, nor the Extraction of the Opiate Juice.* Now by reason of this diversi-

ty of Opinions among theſe Learned and Great Men, how ſhall we certainly determin, and by what means ſhall we find out the Truth? *Angelus Sala*, a Wiſe and Learned Man ſeems to determin it for us, *Anatom. Eſſentiarum Vegitabilium*, Sect. 6. Cap. 2. *Opium (dixit ille) nihil aliud eſt, quam lacteus, & acris ille ſuccus, ex Papaveris albi & nigri capitibus, expreſſus, & inſpiſſatus; iſque apud Turcas latiſſimis Natoliæ & aliorum Provinciarum campis, ſtudio excultus, frequenti in uſu, Maſlach dictus, ad nos defertur.* From theſe Words I am apt to believe, that it is indifferently extracted from both the Species.

XLVI. *Extractum Opii*, the Extract of Opium. It is done ſeveral ways. 1. *The Extraction with fair Water.* Take Turkey Opium what quantity you pleaſe, ſuppoſe a Pound, diſſolve it in Spring Water 2 Quarts over a gentle Fire, then let it ſettle 24 Hours, and decant the clear Tincture; add more Water and over a gentle heat extract again and let it ſettle as before, and decant the Tincture again which put to the former: Repeat this Work of extracting, ſo long as the Fœces will yield any Tincture: theſe Tinctures being all put together, evaporate either in Balneo, or a Sand heat, to the conſiſtency of a thick Extract fit for Pills, or almoſt to dryneſs, which *Magma*, keep for uſe. If to the Tinctures before evaporation you add Spirit of Wine Vinegar, 3 or 4 Ounces; or Oils of Salt, Sulphur, or Vitirol 2 or 3 Ounces; mixing them well together, and then evaporate, the Extract will be ſo much the better, and be alſo corrected into the bargain. 2. *Angelus Sala*, makes an Extract of Opium thus. Moiſten Opium in ſlices with Vinegar, and dry it, till it will pouder with your Fingers, which Pouder diſſolve in Vinegar of Roſes in a Sand heat: Strain out and abſtract; diſſolve it again in Rectified Eſſence of Elder, Clarifie it with Whites of Eggs, and inſpiſſate to a conſiſtency fit for Pills. This Sweats powerfully. 3. *Extractum Opii Quercetani.* Cut the Opium into ſlices, and dry them with a moderate heat in Sand (avoiding the Fumes) till it will rub into Pouder with your Fingers; ſo will the ſtinking Sulphur (in which is the Narcotick and Poiſonous force) be gone: diſſolve this Pouder in Juice of Limons, or Lime Juice, or in Spirit of Vinegar, and abſtract to a conſiſtency fit for Pills. 4. *Extractum Opii Crollianum.* Diſſolve the Opium in Hyſſop Water and extract the Tincture, as in the firſt way; which abſtract to the thickneſs of Hony: diſſolve this in Spirit of Wine, and extract a Tincture again, which abſtract to a conſiſtency fit for Pills. 5. *Extractum Opij Hartmanni.* Take Pouder of Opium made by drying at the Fire; from which extract a Tincture with Juice of Limons, or pure Wine Vinegar, ſo long till they will be no longer Tinged; digeſt theſe Tinged Liquors 10 Days, decant the clear, and abſtract to a due thickneſs. By theſe ways of Extraction the *Opium* is purified or cleanſed, prepared and made fit for other Compoſitions, and ſufficiently corrected for general Uſe.

XLVII. *Pulvis Opij*, the Pouder of Opium. *Take either of the former Extracts, dry them by the Fire (being cut into thin ſlices) and gradually increaſe the ſiccity till the Maſs will reduce into ſubtil Pouder, which ſearſe and keep for uſe:* ſo is the *Opium* prepared and made fit for any Preparation of *Compound Pouders, Electuaries, Pills, Laudana*, or *Tinctures*, which the Artiſt ſhall think fit, or have occaſion for. Out of this *Simple Pouder of Opium* thus prepared, you may make *Pulvis Opij Compoſitus, vel Pulvis Optimis*, after this manner: *Take of this ſimple Pouder 5 Ounces; Salt of Tartar Vitriolate, or Sulphurate 15 Ounces; mix them, then add, Chymical Oils of Angelica, Cloves, Limons, Oranges, and Savin, of each 2 Drams; mix the Oils firſt together by themſelves, and then mix them with the Pouder, which keep in a Flint Glaſs Bottle (having a pretty wide Mouth, with a ground Glaſs Stopper) cloſe ſtopt for uſe.* It is a moſt admirable thing to eaſe all manner of Pains whatever, in any part of the Body, whether internal or external, ſtop Fluxes of Humors, eaſe Coughs, helps Aſthma's, and reſolve Pleuriſies. And for this reaſon it is peculiarly good againſt the Stone, Gravel, pain and heat in making Water, the Colick, Megrim, Head-ach, Gout, Rheumatiſm, Venereal Nocturnal Pains, and other Diſeaſes akin to them. Doſe from 1 Grain to 3, 4, 6, or 8, according to Age and other Accidents; beginning with a ſmall Doſe, and ſo encreaſing the Doſe gradually, as need requires.

XLVIII. *Tinctura Opij ſimplex*, ſimple Tincture of Opium. *Take Extract of Opium (at* Sect. 46.) *12 Ounces; Spirit of Wine acuated with Spirit or Oil of Sulphur a Gallon: mix, diſſolve, digeſt in a Bolt-head well ſtopt for 8 or 10 Days, then decant the clear Tincture for Uſe.* Or thus, *Take Extract of Opium 12 Ounces; Powers of Cloves Sulphurated a Gallon; mix, diſſolve, digeſt, for 10 Days, and decant the clear Tincture for Uſe.* Or thus from *Margrave*, *Take Extract of Opium 12 Ounces; Spirit of Wine Vinegar a Gallon, or a ſufficient quantity: mix, diſſolve, and digeſt, for 10 Days, or till the Tincture becomes clear, which decant, and keep it cloſe ſtopt for Uſe.* Being thus prepared, it is fit to make other Compoſitions of; and an Acid Menſtruum is rather to be choſen than one that is not, becauſe it not only corrects the *Opium*, but alſo prevents its making the Stomach Sick, whereby the *Tincture* becomes not only the more Friendly to the Stomach and other Bowels, but alſo to the Univerſal Body in general. Doſe is from 10 to 20 or 30 Drops or more every Night at Bed time in a Glaſs of Canary, or other fit Vehicle. It admirably induces Sleep, and gives eaſe in all manner of tormenting and excoriating Pains in what part of the Body ſoever. It ſtops the Flux and motion of all ſorts of Humors in any part of the Body, partly by thickning the Matter, and partly by conſtringing or ſhutting up the Mouths of the Veſſels. It induces a gentle Sweating, after a very excellent and eaſy manner, gives eaſe in a Pleuriſy, and the moſt exquiſite Colick, and is profitable againſt Catarrhs, Coughs, Colds, Hoarſeneſs, Wheezing, Aſthma's and other Diſtempers of thoſe parts, proceeding from thin, flowing, acrid, ſharp, and Salt Humors. It gives eaſe in the Sciatica, Gout, and Rheumatiſm; and is an approved thing againſt all ſorts of Fevers or Agues, and in a ſhort time puts a ſtop to the Current of the Diſeaſe. Outwardly alſo applyed, it is a ſingular Anodyn, and eaſes all ſorts of pains, the part being bathed therewith, and double Cloths dipt therein being applyed or laid over.

XLIX. *Tinctura Opij compoſita*, Compound Tincture of Opium. *Take Thebian Opium a Pound, cut it into bits, and diſſolve it in fair Water, in a boiling Balneo, digeſt afterwards in a gentle heat for 7 Days to extract the aqueous Tincture, and till all the Fæces have perfectly ſubſided, decant the clear Tinctur; and to the Fæces put more Water, repeating the ſame Work, till they will no more color the Water, which then caſt away. Theſe Tinctures evaporate in a gentle Balneo or Sand heat, or draw off the aqueous parts in a Glaſs Alembick (which Water keep for an Opiatick Vehicle) till the Magma at bottom becomes as thick as New Hony,*

or

or an Extract. Then add thereto choice Lime Juice, choice Canary, pure Spirit of Wine, of each a Pint and half: Powder of Cloves 2 Ounces: Cochinele, Saffron, Winters Cinnamon, of each 1 Ounce: Camphir half an Ounce dissolved in Oil of Oranges 2 Drams; or so reduced to a Pap: mix all and digest for a Month, in a very gentle Sand heat, shaking the Glass once or twice a Day: then let it stand in a cool place, till it is perfectly settled, and decant the clear Tincture, keeping it in a Glass close stopt for Use. The Power and Vertue of this Medicine, flies like Lightning thro' the whole Body; for it is no sooner received into the Stomach, but it presently refreshes the Spirits, chears the Heart, and gives ease and relief in any pain, in what part of the Body soever. Nor is this Preparation subject to those ill effects, which some other *Opiates* retain, because it is freed from the Malign Sulphur of the Concreets, which the Water, in its first dissolution will never resolve, for which reason it is much pleasanter than many other Preparations of *Opium.* It silently and softly as it were, appeases pain in any part of the Body from Head to Foot; allays Grief, procures a quietness of Mind, and a most pleasant Rest and Sleep, restoring Nature to its Pristine state, and repairing the decayed Strength. It is of so noble an applicable, and Kind Nature, that scarce any [illegible] could be given without some few Drops of this Cordial, the Cordial it self is exalted and made more Cordial. It gives ease after an intolerable [illegible] in Stone and Gout, cures Melancholy, alleviates After-pains of Women in Child Bed, giving them rest and ease. It is a Specifick in the Gout, and all raging pains in the Joints, Nerves, Sides, and Bowels, being inwardly taken, and outwardly bathed upon the parts affected. It gives ease in an Exquisite Pleurisy in half an Hours time: stops Catarrhs and Coughs to a miracle, as also all sorts of Bleeding, as spitting Blood, vomiting Blood, pissing Blood, Bloody-flux and Hepatick Flux, Flux of the Courses, and the extream bleeding of Wounds: It is an excellent thing against Wind, Indigestion, Colick, and other Distempers of the Bowels, proceeding from cold and sharp Humors. It gives relief in Asthma's, shortness of Breath, Hoarseness, Wheezing, and the Phthisick, or Ulceration of the Lungs; and dissolves the Tartar or Viscous Flegm, which sticks to the Lungs, Stomach and Guts, and is the cause of Tortions, pricking or sharp Pains: It does indeed extinguish in all Ages and Sexes, the acrimonys, sharpness, and anguish of Diseases, giving relief after a miraculous manner, and this sometimes after all hopes are past. You may give of it from 10, to 20, 30, or 40 Drops, or more, according to Age and other Circumstances, in Wine, as Canary, or in Beer, Ale, or other Liquors, every Night going to Bed.

L. *Tinctura Opij Paracelsi Diaphoretica, Paracelsus* his Sweating Tincture of Opium. *Take of one of the former Extracts of Opium* 12 *Ounces; Tartariz'd Spirit of Wine a Gallon; Saffron, Cochinele, of each* 2 *Ounces; digest and make a very strong Tincture, which decant from the Faces; to this Tincture add of the Tinctura Diaphoretica Paracelsi in our Pharmacopœia Londinensis*, Lib. 4. Chap. 7. Sect. 25. 2 *Gallons: mix, digest, circulate for a Month, and keep the Tincture for Use.* It is a most admirable thing to cause Sweating, and you will find it as good a Sudorifick, as is ordinarily to be met with, expelling Tartarous Diseases, as the Scurvy, Dropsy, Jaundice, Gout, Rheumatism, and Pox. It melts Icy and Refinous Humors, expelling Wind in any part. And by its Balsamick Virtue, it resists putrefaction, expelling the malignity of the Meazles, Small Pox, Poison, and Plague it self. It may be given from 20 Drops, to 40, 60, or more, without any danger, in any Vehicle the Physitian shall see fit.

II. *Tinctura Opii Schroderi.* *Schroder* his Tincture of Opium. *Take Thebaic Opium, (dryed in Quercetan sadness) or, some of the former Extracts of Opium* 12 *Ounces; rectified Spirit of Wine* 1 *Gallon, macerate with Oil of Vitriol* 12 *Ounces; English Saffron, Species Diambræ, Aromaticum Rosatum, of each* 2 *Ounces; Ambergrise* 6 *Drams: Infuse all in a Glass Matrass close kept for* 20 *Days, then decant the clear, filter and it keep for Use.* It is a most admirable Soporifick, eases all pains in a Moment, performing the same in a most admirable manner, and all that the most excellent *Laudanum* can do. Dose from 10, or 12 Drops, to 20, 30, or more, according to Age and other Circumstances

III. *Spiritus Opii*, Spirit of Opium. *Take choice Thebian Opium a Pound cut into bits, and dissolve it in a sufficient quantity of fair Water, so much as may extract all the Tincture of it, and till it will yield no more color; what remains, which will not dissolve in the Water cast away, and let the Tincture settle till it is perfectly clear, which decant, and cast those Faces also away: to this Tincture add an equal quantity of Spirit of Wine; digest* 24 *Hours. and then in a Glass Alembick draw off all the Spirit, and continue the distillation till what comes over tastes Sowerish: draw off the remaining part of the Water (which is a thing of no Use) till the Magma becomes as thick as new Honey; Cohobate the Spirit upon the Magma, and distill as before; which Work of Cohobation reiterat four times, drawing it off at last till an Extract is left at bottom, of a consistence fit for Pills; this Spirit thus drawn off, is Spirit of Opium:* The *Extract* at bottom may serve to make *Laudanum* of. There is also another way to make *Spiritus Opii*, which is done by Fermentation, after this manner. *Take Thebaic Opium a Pound, dissolve it by gentle Boiling in a Gallon of Rain Water; then decant or strain, and cast the Faces away: To this add another Gallon of fair Rain Water, in which dissolve Brown Sugar* 6 *Pounds, and a good large Leven, and with a gentle heat, being about Blood warm, cause them to Ferment for some Days, till all the Liquor becomes of a Vinous Smell: Then put all into a Copper Vessel, with its Head, Serpentine and Receiver, and distill or draw off* 8 *or* 9 *Pounds of Spirit, which keep for Spirit of Opium. Then changing the Receiver, draw off the Water till it begins to Taste sower, this keep for Poppy Water. Afterwards putting more Water to the Magma, wash it all out of the Still, and evaporate it away, till an Extract remains of a consistency for Pills, which may be reserved, to be put into some Opiate Preparation.* There are several other ways also of making *Spirit of Opium*, which you may see at large in the Second Edition, of *Our Pharmacopœia Bateana*, Lib. 1. Chap. 2 Sect. 58. which see at your leisure. These *Spirits* are much pleasanter than either *Tincture or Extract of Opium*, which contain the Body of the Concreet. *Spirit of Opium* never makes the Stomach sick as some other Preparations do, nor yet disturbs the Head, otherwise than it is possible as much *Spirit of Wine* may do, which is a considerable advantage in its Operation. And altho' it is not altogether so strong and forcible as are *Tinctures, Extracts*, or *Laudana*, yet it operates with much more speed and safety than they possibly can. For they fly like Lightning through the whole Body, and give ease and relief, not only to the Spirits, but to the Universal Body almost

in

in a Moment. This *Spirit* ſuppreſſes not the Excretion of Excrements, nor ſtops the Paſſages of Urine, it benumbs not, nor enervates the Limbs, nor changes the natural complexion of the Skin to paleneſs, nor cauſes cold Sweats, ſhortneſs of Breath, nor ſtupifaction of the Animal or Vital Faculties; but it has all the good effects which are attributed to the moſt excellent *Laudanum*, tho' not with the ſelf ſame ſtrength and force: it appeaſes all perturbations of the Mind, and inteſtine and violent Commotions of the Body, as Diſquietings, and the Rage, Fury and Madneſs of the *Archæus* (the principal director of the Spirit of Life) reſtoring again Peace and Concord, Reſt, and Eaſe to the whole Man, and all the faculties of the Body. So that after it has ſoftly and ſilently (as it were) appeaſed the Pain, and allayed the Grief, it procures a quiet and pleaſant Reſt and Sleep, reſtoring Nature to its priſtine State, and repairing its decayed Strength: whereby unthought of Health comes on, with a violent Carreer, and takes poſſeſſion of its ancient Habitation, exterminating in all Ages and Sexes, the Roots of bitterneſs, and the Seminalities of Pain and Diſeaſes. This *Spirit* is of ſuch a kind and amicable Nature, that ſcarcely any Cordial ſhould be given without it; and it may be given from half a Dram, to 1, 2, or 3 Drams, yea to half an Ounce, according as the Age, Strength, Condition, and Neceſſity of the Sick, and other Accidents will admit of.

LIII. *Laudanum Liquidum Helmontij*, *Helmont* his Liquid Laudanum, according to *Joel Langelot*. *Take Thebaian Opium cut ſmall, a Pound; Juice of ripe Quinces newly drawn* 10 *Pints; Salt of Tartar* 1 *Ounce; digeſt all* 2 *Days in a very gentle Sand heat, or till you ſee Bubbles appear above the Liquor, which is a ſign that Fermentation is at Hand; then add thereto fine Sugar in Pouder* 4 *Ounces; and uſe a moderate heat to advance the Fermentation; ſo will the Opium riſe, and totally diſſolve. At the top of the Liquor, will be a filthy, impure and Scummy part which ſwims. At bottom will be an impure and Earthy part. And in the middle will be, a pure and tranſparent Liquor, as red as a Rubie, which ſeparate, filterate, and keep for Uſe.* This is the *True Laudanum of Helmont* from *Langelot*, and may be given *à gut.* 6 *ad* 15, 20, or 30, in any proper Vehicle, as Canary, *&c.* But if you pleaſe you may inſpiſſate the *Tincture* to the conſiſtency of an *Extract* fit for Pills, and either keep it in that Form, or diſſolve it again in pure *Rectified Spirit of Wine*, which being Filter'd, is to be digeſted for a Month, to ripen it and bring it to perfection; then inſpiſſate again, to the conſiſtency of an *Extract*. From this, the ſaid *Langelot* promiſes wonderful things, in all caſes where *Laudanum* is to be uſed, giving at a time not above a quarter, or half a Grain, or at moſt a Grain. This ſmall Doſe is imputed to the union and cloſe binding up of the Particles of the *Opium*, firſt dilated by Fermentation, and then reduced or conſolidated again by bringing the Matter to the Form of an *Extract*. This *Laudanum* induces Reſt, allays the ſharpneſs of Humors, and ſtops their motion. It fortifies Nature, and parts of the Body afflicted, coroborates all the Bowels, cheriſhes the Natural Heat, reſtores the Retentive Faculty debilitated, ſtops all Fluxes of Blood in Man or Woman, as the overflowing of the Terms, and all ſorts of Fluxes of the Belly, Catarrhs, and other thin and corroding Defluxions, either upon the Eyes, Ears, Teeth, Throat, Lungs, Stomach, Joints, or any other part external or internal. It eaſes all pains of the Head, ariſing from attenuated Humors, taken inwardly, or applyed to the Fore-head and Temples. It diſcuſſes and expels Wind, and takes away noiſes in the Ears. It eaſes the Tooth-ach, ſtops Vomiting, and all other violent Purgations and Fermentations of the Humors. It gives eaſe in the Diſeaſe *Cholera*, and the Wind Colick, and in all griping pains of the Bowels in Man or Woman, given as well as by the Mouth, by Clyſter. It is a powerful Remedy againſt the Stone, Gravel and Tartarous Matter in the Urinary parts. It not only allays the Fermentation of the Humors, but abates their Acrimony after due Purgation. It cures a *Gonorrhæa* (Univerſals being premiſed) and ſtrengthens the Spermatick Veſſels. It cures all ſorts of Gouts and Rheumatiſms, and is prevalent againſt all pains in any Age or Sex, ariſing from what cauſe ſoever, eſpecially after general Remedies, or previous Evacuations.

LIV. Another Preſcription of *Helmonts* Liquid Laudanum. *Take Juice of Quinces a Gallon, which put into a Fermentation with Ale Yeſt, with this extract a deep red Tincture from Thebaian Opium* 1 *Pound, which ſtrain and Aromatize; then draw off one half of the Liquor in Balneo, and keep the remaining part for Uſe.* It has the Virtues of all other *Laudanums*, and is given with a happy Succeſs in Dyſenterick affections, and is eſteemed by many Phyſitians, the moſt ſafe of any *Laudanum*. Doſe *à gut.* 8, *ad* 20, 30, or more (according to Age and other Accidents) in Canary or other fit Vehicle at Bed time. There is yet another Preparation of *Helmonts Liquid Laudanum*, the which you may ſee in *Our Praxis Medica*, or *Comment upon Sydenham's Proceſſus Integri.* Lib. 2. Chap. 12. Sect. 24. lately emitted into the World; to which we refer you.

LV. *Laudanum Specificum Paracelſi*, *Paracelſus* his Specifick Anodyn. *Take Thebaian Opium extracted a Pound; Pouders or Extracts of Cinnamon, Cloves, Saffron, of each half a Pound; Juices of Sower Oranges and Quinces, of each* 3 *quarters of a Pound: mix, and digeſt with a gentle heat for a Month, or till the mixture is diſſolved, ſtrain out by preſſing, and abſtract to the conſiſtency of a ſoft Extract for Pills; then add Ambergriſe in fine Pouder an Ounce and half; Musk in fine Pouder* 3 *Drams; Magiſteries of Coral and Pearl, of each* 1 *Ounce; mix and digeſt a while, then add of the Quinteſſence of Gold* 1 *Ounce; mix, and compleat the Great Specifick Anodyn of* Paracelſus. In this *Hartman* leaves out the *Quinteſſence of Gold*, and ſubſtitutes ſome proper *Salt*; we rather adviſe to add in place thereof, an Ounce of pure *Oil of Cinnamon*, as it is extracted in the *Eaſt-Indies*. There is another Recipe of the *Laudanum Paracelſi* given us by ſome Authors, which is the following. *Take Extract of Thebaian Opium a Pound; Inſpiſſate Juice of Henbane, Species Diambræ & Diamoſchi, of each* 10 *Ounces; Mummy* 2 *Ounces; Salts of Pearl and Coral, of each an Ounce and half; Liquor of white Amber extracted with Alcool of Wine, Bone of a Stags Heart, Bezoar Stone, Unicorns Horn, Aurum Potabile, of each an Ounce; Musk* 3 *Drams; Ambergriſe* 2 *Ounces and half; or for want of Aurum Potabile, you may add of the Chymical Oil of Cinnamon and Cloves, of each half an Ounce; mix them well; and digeſt again for a Month, and ſo keep it for Uſe.* It eaſes all manner of Pains in a Moment, ſtops all ſorts of Fluxes of the Bowels, Catarrhs, Coughs, overflowing of the Terms and Whites in Women, ſtops Bleeding, *&c.* And is a Specifick in the Pleuriſy, Colick, Hyſterick-fits, Gripings of the Guts, Gout, Rheumatiſm, Reſtleſſneſs, *&c.* and has all the Virtues of the *Tinctura Opij Simplex* and *Compoſita*, and that of *Paracelſus*, as alſo of the *Laudanum Helmontij* at

Sect.

Sect. 48, 49, 50, and 53, aforegoing. Dose *à gr.* 1, *ad* 6, either in a Pill, or dissolved in any proper Vehicle.

LVI. *Laudanum Londinense*, The *London* Laudanum. *Take Thebaian Opium extracted, a Pound; Extract of English Saffron a Pound and half Extract of Castoreum* 2 *Ounces; Strong Tincture of Species Diambræ, made with Spirit of Wine, half a Pound; Ambergrise, Musk, of each* 5 *Scruples; Oil of Nutmegs* 160 *Drops, or* 2 *Drams: mix them perfectly together, and evaporate in Balneo, or a Sand heat, to a due Consistency.* It is a most excellent Composition, and has all the Virtues of the *Laudanum Paracelsi* in the former Section, and may be given in the same manner and Dose, every Night at Bed-time.

LVII. *Nepenthes Opiatum*, A Confect against Sorrow and Sadness. *Take Tincture of Opium (first prepared with Spirit of Vinegar, then with Spirit of Wine,) Extract of Saffron made with Spirit of Wine, of each a Pound; Salts of Coral and Pearl, of each half a Pound; Tincture of Species Diambræ a Pound; Ambergrise,* 2 *Ounces, mix, and by the gentle heat of a Bath, evaporate to a consistency fit for Pills.* The Virtues are the same with the two former, save that this more chears the Heart and Spirits, causes Gladness, and drives away Melancholy. Dose *à gr.* 2, *ad* 6, *or* 8.

LVIII. *Requies Nicolai*, *Nicholas* his Confect causing Rest and Sleep. *Take red Roses Exungulated, blew Violets, of each* 4 *Ounces; Thebian Opium (dissolved in Wine) Seeds of white Henbane, of white and black Poppies, of Endive, of Purslane, of Lettice, of Psyllium, Roots of Mandrake, Spodium, Gum Tragacanth, of each an Ounce; Nutmegs, Cinnamon, Ginger, red, white, and yellow Sanders, of each* 2 *Ounces; fine Sugar three times the weight of them all, viz.* 92 *Ounces, which dissolve in Rose Water, into a Syrup of the thickness of Honey: mix and make an Electuary according to Art.* In this Composition the *Opium* is about $\frac{1}{152}$, or an Hundred fifty sixth part of the whole. It has all the Virtues of the *Philonium Persicum*, and *Romanum*; and may be given from 2 Scruples to 2 or 3 Drams in any proper Vehicle, as occasion and the reason of the thing may require.

LIX. *Theriaca Londinensis nova, vel Salmoniana*, Our new *London* Treacle. *Take Extract of Opium a Pound; Solid Extracts of Juice of Liquorice, of Elecampane Root, of Gentian, of Zedoary and of Bay Berries, Juice of Alkermes of each* 4 *Ounces; which dissolve in so much Spirit of Wine, as to make them of the Thickness of a Syrup. Take Saffron, Contrayerva, Indian Spicknard, Virginian Snake Root, Ginger, Myrrh, Cochineel, Bezoar Stone, each of them made a part into subtil Pouder, Salts of Coral and Pearl made with Oil of Salt, Volatile Sal Armoniack in fine Pouder, being ground with a little Spirit of Wine, of each* 4 *Ounces; Angelus Mineralis, Panacea aurea, of each* 2 *Drams; Bezoar Animal, Bezoar Minerale, Bezoar Solare, of each* 4 *Ounces; Camphir half a Pound; Chymical Oils of Carraways, Cloves, Juniper, Rosemary, Sassafras, Wormwood, of each* 2 *Ounces; Clarified Honey* 14 *Pounds: mix and make an Electuary according to Art.* It has all the Virtues of the most exalted *Laudanum*, whether of those at *Sect.* 48, 49, 50, *and* 53, aforegoing, or those at *Sect.* 60, 61, and 62, following. The proportion of the *Opium* to the rest of the Ingredients is $\frac{1}{21}$ or one of twenty one parts. So that the Dose may be from half a Scruple to a Scruple, half a Dram, 2 Scruples or more, according to Age, Strength, and other Accidents. It stops the most Vehement Coughs, Catarrhs, and Fluxes of all kinds; is excellent against Gouts, Rheumatisms, Colicks, Agues, Phthisicks, Asthma's, all Fluxes of Blood upwards or downwards, Bitings of Serpents, Vipers, Mad Dogs, or other Venomous Beasts, takes away all manner of Pains almost in a Moment, in what part of the Body soever, and gives pleasant Rest and Sleep.

LX. *Laudanum Volatile Anodynum*, Our Cordial Pills, or Volatile Laudanum. *Take Extract of the best Thebaian Opium a Pound, of the best Mithridate or Venice Treacle* 6 *Ounces; Camphir* 10 *Ounces, made into fine Pouder with a little Spirit of Wine; Extracts of Contrayerva, Indian Spicknard, Virginian Snake Root, Zedoary, Winters Cinnamon, Cloves, Saffron, Castoreum, of each an Ounce; Volatile Salts of Mans Skull, of Harts Horn, of Sal Armoniack, of Vipers, of Amber, and of Tartar, of each* 6 *Drams. Chymical Oils of Cloves, Cinnamon, Limons, Sweet Marjoram, Nutmegs, Oranges, Rosemary, Sassafras, Sevin, Wormwood, of each* 2 *Drams; being all well mixt together, digest in a very gentle, or rather warm Sand heat for a Month; then add Bezoar Lœvigated, Bezoar Mineral, Cochineel, of Coral and Pearls, of each a like quantity as much, as may bring it to a consistency for Pills which keep close in Wooden, or Silver Boxes with Screws for Use.* It is one of the best Anodyns in the World, easing all manner of Pains in a Moment, in any part of the Body inward or outward. It is prevalent against all sorts of Fits and Passions of the Heart, as Palpitation, Trembling, Swooning, oppression of Wind, Fits of the Mother, Convulsions, Vertigo, Frensie, Delirium, Madness, Megrim, Head-ach, &c. It causes pleasant Rest and Sleep; stops all sorts of Catarrhs, Coughs, and distillations of Rheum, upon any Member or part; is good against Colds, Wheezing, Hoarseness, Asthma, soreness of the Throat, Ulcers of the Lungs. It eases Pains of the Teeth presently, and is admirable against the Gout, Rheumatism, Sciatica, and *French* Disease, being an effectual Alexipharmick and Sudorifick. It is good against spitting of Blood, pissing of Blood, and the Bloody Flux, and all other Fluxes of the Bowels, as also all other Sorenesses and Bruises, Pleurisies, Pains and Stitches of the Sides; it stops the Whites, and the overflowing of the Terms in Women; and infallibly cures Agues of all sorts, being given in a Glass of *Canary*, about 3 Hours before the coming of the Fit. Dose from 1 Grain to 4, according to the Age and other Accidents of the Patient. The proportion of the *Opium* to the rest of the Ingredients is $\frac{1}{6}$ or as one to Six.

LXI. *Laudanum Specificum nostrum*, Our Specifick Laudanum. *Take Extract of Thebaian Opium a Pound; Oil of Sulphur* 2 *Ounces; mix them well together; to which add, Oil of Nutmegs by Expression* 1 *Pound; Anodyn Sulphur of Mars* 6 *Ounces; Bezoar Mineral, Pouders of Camphir, Cloves, Catechu, Winters Cinnamon, Indian Spicknard, Jesuits Bark, Saffron, Virginian Snake Root, Cochinele, of each* 3 *Ounces; Salts of Coral and Pearl, of each* 2 *Ounces; Chymical Oils of Amber, Aniseeds, Cloves, Rosemary, Wormwood, of each* 5 *Drams: Mithridate a sufficient quantity, to make it into a Mass for Pills.* The Proportion of *Opium* here is more than $\frac{1}{7}$ and less than one sixth part, so that it may well be given from 2 Grains, to 4, 6, or 8 Grains according to the Age and Condition of the Patient, and that every Night at Bed-time. It comforts the Stomach and Bowels, and is found by Experience, to be admirable against all Fluxes of the Belly, Vomitings, and Sickness at Stomach, Bleeding at Nose, overflowing of the Terms in Women,

Women, ſpitting and piſſing of Blood, vehement Coughs, Colds, Catarrhs, and other defluxions of Humors. It comforts the Viſcera, and all the Internal Members. It is of Wonderful power againſt the Scurvy, Dropſy, Jaundice, Gout, Rheumatiſm, Vapors, Fits of the Mother, and other like Diſeaſes of the Womb; and prevails alſo againſt all kinds of Agues and Fevers, intermitting, remitting, continual, continent, putrid, or Malign; and is given even in the Plague it ſelf, and in all ſorts of Epidemick Diſeaſes, as Meaſles, Small Pox, *&c.* It gives eaſe in all vehement Pains, of what kind, and in what part of the Body ſoever; It prevails againſt the Stone, Gravel, *&c.* in the Urinary parts; is a ſingular thing againſt Aſthma, Pleuriſies, and a Phthiſis or Conſumption of the Lungs. It chears the Heart, revives the Vital and Animal Spirits, reſtores the Faculties, ſtrengthens Nature, and cauſes pleaſant Reſt and Sleep. And it is a Secret in curing a *Gonorrhœa* in Men, and a Running in Women, Univerſals having been premiſed.

LXII. *Laudanum Cathartícum noſtrum*, our Purging Laudanum. *Take Extract of Thebaian Opium* 1 *Pound*; *Extract of Aloes, made with ſimple Fennel or Angelica Water* 7 *Pounds*; *Native Cinnabar Levigated* 2 *Pounds*; *Reſinous Scammony in fine Pouder*, 1 *Pound*; *Camphir*, *Ginger*, *of each in fine Pouder half a Pound*; *Oils of Angelica*, *Cloves*, *and Wormwood*, *of each* 2 *Ounces: mix and make a Maſs for Pills.* It Purges very well, more than treble the quantity of *Aloes* would do, without the *Opium*, and Purging without Pain, eaſes all manner of Pains in any part of the Body: the Belly being bound, it will Purge or gently looſen it, according to the largeneſs or ſmallneſs of the Doſe given. The Virtues of this Medicine are to be admired, never enough to be praiſed. It ſtrengthens the whole Man admirably, and is commended for corroborating the more Noble Bowels; but above all for correcting of corrupt and evil Humors, and its very ſweetly purging the Body, which it does by a very ſafe and pleaſant Operation. I have cured by this Medicine alone indurated Cancers tho' of ſome Years ſtanding, where they have not been broken or ulcerated; for ſince nothing can ſtand at a ſtay, but what does not encreaſe, muſt neceſſarily decreaſe; ſo, ſince this Medicine hinders the *Pabulum* of the *Cancer*, it muſt in time decreaſe, and as it were pine away, and this it does by ſtopping the Fluxion of the Humor to the part, and carrying it off another way. It eaſes the Cough, is good againſt Aſthma's, and ſtops thin Catarrhs: It induces Reſt and Sleep, and prevails againſt Quotidian, Tertian, and Quartan Agues, being given ſome Hours before the Fit. Doſe from half a Scruple to a Scruple, or half a Dram at Bed-time, according to Age and other Circumſtances. The Proportion of the *Opium* here is $\frac{1}{12}$ or as one to twelve.

LXIII. *Guttæ Vitæ Noſtræ*, Our Cordial Drops. *Take Extract of Opium, made as before directed*, 16 *Ounces*; *which diſſolve in Tincture of Salt of Tartar* 8 *Quarts*; *or in Powers of Anniſeeds*, *Angelica*, *Carrawaies*, *Cloves*, *Roſemary*, *of each* 2 *Quarts*; *the Menſtruum being firſt impregnated with the ſtrong Tinctures of Saffron*, *Cochinele*, *Cloves*, *Winters Cinnamon*, *Nutmegs*, *Virginian Snake Root*, *Zedoary*, *of each* 2 *Ounces*; *all of them (the Saffron excepted) reduced into fine Pouder*; *Caſtoreum (freed from Skins and fat) in fine Pouder* 4 *Ounces*; *The Opium being diſſolved in the ſaid Tincture*, *digeſt for a Month*, *ſhaking the Bottle well once a Day*; *let it then ſettle till it is perfectly fine*, *and decant off the clear Tincture into another Glaſs Bottle*, *to which add Narcotick Sulphur of Vitriol* 3 *Ounces*; *Camphir half a Pound: mix and diſſolve*, *and digeſt* 10 *Days*; *and ſo keep it cloſe ſtopt for Uſe.* It has all the Virtues of any of the former *Tinctures of Opium*, or of any of the *Philenium's* or of any the moſt exalted *Laudanum*, which we have diſcourſed of before at large: and is much better to be given to ſuch, who cannot ſwallow *Bolus*'s, or *Pills*, This being to be given only in Drops at Bed-time in a Glaſs of *Canary*, or fair Water, or other Vehicle, the Patient beſt likes, as White Wine and Sugar, Mace Ale, Broth, Poſſet Drink, or a little Syrup. If it is taken for a Cough, which is troubleſome in the Day time, or for a deep Conſumption, or for prevention of any Illneſs, it may be taken in the Morning Faſting, in the deſign'd Vehicle. The Doſe is to be regulated according to the Age of the Sick, and other Circumſtances. To a Child of a Month, Quarter, half Year, or Year old, you may give from 4 Drops to 10. From a Year to 2, 3, 4, or 5 Years old, you may give from 10 to 16 Drops. And to elder Perſons from 6 Years of Age to 12, or 14, you may give from 16 to 24 Drops. From 14 Years of Age, to 20, 30, 40, 60, or 80 Years old and upwards, you may give from 24 Drops to 40, 50, or 60 Drops at a time, which in ordinary caſes may be the higheſt Doſe. But in all Perſons, Ages, and Sexes, it will be better to begin with a ſmaller Doſe firſt, and ſo to encreaſe it every Day gradually till it comes to the higheſt. It may ſafely be given to Women with Child, being a moſt excellent thing to prevent Miſcarriage.

LXIV. *Laudanum Opiatum Hartmanni*, *Hartman* his Laudanum. *Take of any of the former Extracts of Opium a Pound*; *Salts of Coral and Pearls*, *of each half a Pound*; *Extract of Saffron*, *made with the Spirit of Wine a quarter of a Pound*; *mix them well together*, *and then add to them Oil of Cloves*, $\frac{1}{2}$ *Ounce*; *mix them well again*, *and keep it in a Silver Box very cloſe*, *for Uſe.* It has all the Virtues of any of the other *Laudana.* The *Opium* here is $\frac{1}{4}$ or as four to five, to the reſt of the Ingredients, and therefore it may be given from half a Grain, to 1, 2, or 3 Grains, as the Phyſician ſhall adviſe, beginning with a ſmall Doſe firſt, and ſo gradually increaſing it.

LXV. *Pilulæ de Cynogloſſo*, Opiate Pills of Hounds-Tongue. *Take Roots of Hounds-Tongue dryed*, *white Henbane Seed*, *Opium prepared of each a Pound*; *Myrrh in fine Pouder a Pound and half*; *Olibanum in fine Pouder*, *a Pound and quarter*; *Saffron*, *Caſtoreum*, *Storax Calamita*, *of each a quarter of a Pound and half a quarter: let the Roots of Hounds Tongue and Henbane Seeds be Poudered together*, *but the Myrrh*, *Saffron*, *and Olibanum*, *each by themſelves*; *the Opium being cut ſmall*, *diſſolve to the thickneſs of an Extract with Roſe Water*; *then add the Pouders*; *and with Syrup of Stœchas make a Maſs for Pills.* They were invented to ſtop Catarrhs, Coughs, Aſthma's, all ſorts of Fluxes of the Bowels, the overflowing of the Terms, and the Whites in Women. They are good againſt a Phthiſis or ulceration of the Lungs, reſtore in Conſumptions, and are profitable againſt Pleuriſies, Pains and Stitches in the Sides, Colick and Griping of the Guts, and all other internal Pains whatſoever, as of the Spleen, Stomach, Reins, Bladder, from the Stone, *&c.* and cauſe pleaſant Reſt and Sleep. The Proportion of the *Opium* in this Compoſition is $\frac{1}{10}$ as one to ten, or a tenth part of the whole. So that the Doſe may be from 5 Grains to 10, 20, or 30.

LXVI. *Pillulæ de Styrace*, Opiate Pills of Storax. *Take Storax Calamita*, *Olibanum*, *Myrrh*, *Inſpiſſate*

Inspissate Juice of Liquorice, Extract of Opium, or Opium prepared, of each a Pound: Storax a quarter of a Pound; with Syrup of white Poppies make a Mass for Pills according to Art. The Virtues of these *Pills* are the same with the last, and have the same force and effects, with any of the *Laudana* before described and declared, and may be given for those purposes in the same manner. The Proportion of the *Opium* in this Composition is $\frac{1}{7}$ as one to six, or a sixth part of the whole, and therefore the Dose may be *gr.* 2. *ad* 12. or 15. and the larger Dose may be exhibited in vehement Catarrhs, violent Coughs, and inveterate Fluxes of the Belly, Gout, Rheumatisms, &c.

LXVII. *Extractum Thebaicum & Capitum Papaveris*, or *German* Opium. *Take the Heads of Poppies when they begin to flower, bruise them, and digest in Balneo, with Hydromel, Methoglin, or Canary, for* 15 *or* 20 *Days, till the Liquor is very red: then strain forth the Juice or Liquor by strong Pressing: digest in Balneo till a Gummy Magma or Substance remains, which being put into cold Water will be forthwith congealed.* This is *German Opium* no ways Sophisticated, which may be made use of instead of the *True Opium.*

An APPENDIX to, *Sect.* XLVI, *and* XLVII.

LXVIII. Some confound *Opium* with *Meconium*, but erroneously: for *Meconium*, as *Dioscorides*, *lib.* 4 *chap.* 65. Testifies, is an *Expressed Juice* from the *Poppy*, which is *Inspissated*: which according to *Fred. Hoffman*, is thus Prepared. *Papaverum Vascula cum foliis tundentes torcular exprimunt, mox in Mortario tortas pastillos formant, vocaturque illud Meconium.* *Casper Hofman de Medicamentis Officinalibus*, lib. 2. chap. 169 sect. 9. has it thus, *Hoc autem, (μηκώνιον, ἢ ὀπὸς μήκωνος) tota Planta contusa & expressa.* But *Quercetanus* in his *Pharmacopœia Restituta*, chap. 25. makes it after this manner: *Recipe Capitum Papaverum* (which bears the red Flowers, I suppose he means our *Black Poppy Heads*) *q. v. contunde in Mortario marmoreo, affunde Vinum generosum ad duorum digitorum eminentiam: digere in Balneo per aliquot dies, ut incipiat rubescere, exime & inspissa.* *Lemery* says, That *Opium* is a Tear, which distills of it self, or by Incision from the *Heads of Poppies*, and this in *Greece*, as also in the Kingdom of *Cambaia*, and the Territories of *Grand Cairo* in *Egypt*, and that there are three sorts of it, *the Black*, *the White*, *and the yellow*; which the Inhabitants of those Countries do keep for their own Use, and only send us *Meconium*, which is nothing else but the *Juice of the Poppy Heads*, drawn by Expression, and then thickned, and wrapt up in Leaves to Export it the better: but I hope Monsiure *Lemery* will give me leave to believe as much as I think fit of the latter part of his Discourse, and no more.

LXIX. *Opium*, says *Schroder*, is, *Lachryma*, a *Tear*, which Distills from the *Heads of the Poppies*, being gently cut, when they begin to grow ripe. And of this *Opium*, there are three sorts. 1. *White*, which comes from *Cairo* in *Egypt*, and this is said to be the *Thebaian Opium*, which we call *Turkey Opium*, and is accounted the best. *Schroder* says, the *Cabaisan Opium* is the choisest, and that it is heavy, and thick, and burns with a Flame not black, of a *Poppy* like Smell, but stronger, of the color of *Aloes* when broken, and easie to be dissolved. That which the *Turks* daily take from half a Dram to a Dram, which they call *Hadac*, is of a Lyon tawny color, but we have scarcely any of that. *Lemery* says, that the *Opium* which comes from *Thebes*, or else from *Grand Cairo*, is accounted the best, which is blackish, inflamable, bitter to the Taste, a little acrimonious, of a stupifactive and something disagreeable Smell. 2. *Black and hard*, which comes from *Aden*, a Country of *Arabia*, not far from the *Red Sea*, and is brought from *Alexandria* and *Syria*. 3. *Of a reddish yellow color and softer*, which comes from *Cambaia* and *Decan*, and this is the *East India Opium*, and comes from thence, and other parts adjacent thereto, and is in much use with us at this Day. But the *Turky* or *Thebaian Opium* is the most valuable, and that only which is to be chosen.

LXX. *How Opium is made*, *Dioscorides* in the place before cited, has told us, as also, *Pliny lib.* 20. *chap* 24. *Bellonius lib* 2. *chap.* 15. and *Jacobus Bontius in Notis ad Garcium*, with many other Modern Authors. *Fred. Hoffman*, in his Notes upon *Schroder* has it thus, *Capita Papaveris recentia grandia immatura tamen, & succo turgida, mane post Rorem solis dissipatum Cultello in Asterisci forma leviter incidunt, unde liquor lacteus, continuo emanans & identidem concrescens digito in Conchulam subjectum abstergitur: idque tamdiu Continuatur dum Vulnus liquorum plorat, & ex noviter incisis recentes Lachryma coalescunt.* It is called in *India*, and also in *Asia*, by a corrupt Name, *viz Orium*, also *Asian*, *Onsium* and *Anshan*; but in many Compositions, as in *Theriaca Andromachi*, we find ὄπιον μήκωνος; and *Casp. Hoffman* says, Ὀπὸς μήκωνος *indifferenter est vel* ὄπιον, *vel* μηκώνιον: *illudque quidem fieri Capitibus Papaveris incisis, & succo inde Stillante excepto.* *Opium* is said to be adulterated with the *Juice of Glaucium*, which is of a yellow color (and is thought to be the *Juice of the Thorney Poppy* before described:) but this Cheat is easily to be discovered; for if the *Opium* is dissolved in fair Water, it will color it yellow, by reason of the yellow mixture.

LXXI. But yet the Grand Question returns to be resolved, *Ex quo Papavere fit Opium?* We have already said something to it, in what has gone before; to which we add, that according to *Pliny*, and *Avicenna*, it is gathered from the *Heads of the Black Poppy*, being Cut or Wounded. But says *Caspar Hoffman*, *loco citato*, *ex albo fieri tam in Asia, quam in India ex Bellonio & Garzia Constat: atque apud Dioscoridem fit ex Nigro & Sylvestri: Sed in Asia (Author est Pena) hodieque ex utroque fieri.* Yet *Fred. Hoffman* in his Annotations upon *Schroders Dispensatory* says, *Hoc (Maslac, vel Opium) nihil aliud est quam Succus exsudans ex Capitibus Papaveris albi incisis in Vigore Constituti suo Balsamico & Crescente Luna Collectus; formantur inde Pilulæ a Drachma semis, ad Drachmam unam; effectus hujus est pro Constitutionum vel Temperamentorum diversitate, &c.* From what has been said before, and what here, it is manifest that *Opium* is made from the *Black Poppy Heads*, and sometimes from the *White*, and sometimes promiscuously from both.

CHAP. DLXXIV.

Of POPPY Wild.

I. *The Names.* It is called in *Greek*, Μήκων ϕοιὰς: in *Latine*, *Papaver Rhœas vel erraticum, vel Sylveſtre*; and in *Engliſh*, *Wild Poppy.*

II. *The Kinds.* It is of two principal Species, *viz.* 1. *Papaver Sylveſtre verum*, which is alſo called *Papaver Rhœas*, & *Papaver erraticum*, Red Poppy, Corn Poppy, and Corn Roſe. 2. Ἀργεμώνη, *Quia argemas vel oculorum nubeculas tollit*; and of this there are ſeveral Kinds, the chief of which are, 1. *Argemone Capitulo rotundiore, Argemone*, & *Argemonia*, as *Pliny lib.* 25. *cap.* 9. has it, Our Common round Headed Baſtard Poppy; and all Modern Writers agree, that this is the *Argemone* of *Dioſcorides:* it is alſo called *Argemone Capitulo brevi torulis canulato Lobelij*; *Argemone Capitulo Breviore.* 2. *Argemone Capitulo longiore Lobelij* & *Bauhini*; *Argemone Cordi*, Long Headed Baſtard Poppy. 3. *Argemone lutea*, *Argemone Cambro-Britanica lutea Lobelij*, becauſe found out by *Lobel* growing in *Wales:* Yellow Wild Baſtard Poppy of *Wales.*

The Deſcriptions.

III. Our common red Poppy, Corn Poppy, *or* Corn Roſe. *Its Root is ſomething long and ſlender, and periſhes every Year, the Plant riſing every Year of its own Sowing. Its Leaves are long and narrow, very much cut in on the edges into many Diviſions, of a light green color, but not whitiſh, and ſomething Hairy with all. The Stalk is blackiſh, or blackiſh green, and hairy alſo, but riſes not up ſo high as the* Garden Kinds, *having ſome ſuch like Lewes thereon as grow below; it ſpreads it ſelf out ſometimes into three or four Branches, on which grow ſmall hairy Heads, bowing down before the Skin breaks, in which the Flower is encloſed: which when it is full blown open, is of a fair red, or crimſon color, but in ſome much paler, without any Spot in the bottom of the Leaves, having many black, ſoft Threads in the middle, compaſſing a ſmall green Head; which when it is ripe, is ſcarcely ſo big as ones Thumbs end; in which is contained much black Seed, ſmaller by half than that of the* Garden. *Of this Kind, there is one which is leſſer in all the parts thereof, and differs in nothing elſe.*

IV. *The firſt of the Baſtard Kinds, which is* Our common round Headed Baſtard Poppy. *Its Root is ſmall and long with many Fibres adjoining, and periſhes every Year after Seed time. This Kind of* Wild Poppy *has ſeveral hairy green Leaves lying on the Ground, ſomewhat longer, and more divided into parts, than thoſe of the* Corn Poppy, *ſomewhat like to the Leaves of the thin Leav'd* Anemone, *or*

Poppy Corn or red, or Corn-Roſe.

Poppy Wild Baſtard.

Wind Flower, *as* Lobel *ſays, tho it is ſeldom ſo found with us.* From among *which riſe up ſeveral rough hairy Stalks, more than two* Feet *high ſometimes, which bear alſo ſuch like Leaves here and there on them, but leſſer than thoſe below, all yielding when broken, a yellow Milk or Juice. On the top of each Branch grows one Flower, leſſer than that of the* Corn Poppy, *but conſiſting of* 4 *round pointed Leaves, of a more faint or diluted red color, each of them having ſometimes a blackiſh Spot in the bottom, but ſometimes without it, with ſeveral blackiſh Threads ſtanding about a ſmall green Head;*

Head; which when it is ripe, is something short, round, and rough, with some Creſts thereon, and a little round Head or Cover, but not a Crown or Star, at its top, like the other Poppies; *in which is contained such like small blackish Seed as in the* Corn Poppy *Heads, but larger.*

V. *The ſecond of the Baſtard Kinds, or* Long Headed Baſtard Poppy. *This is in its Root, Leaves, Stalks, Branches, Flowers, Seed, and manner of growing, and indeed in all things, like the*

Poppy Wild long Codded.

firſt Baſtard Kind, *ſaving that the Heads of this are longer than thoſe of the laſt, ſmaller below, than above, and having a little round Head or Cover at the top, but no Crown, and is rough and hard like it, and in this conſiſts all the difference.*

VI. *The third of the Baſtard Kinds, which is, the* Yellow Wild Baſtard Poppy of *Wales. Its Root is long and browniſh on the out ſide, ſpreading it ſelf out into ſome Branches, with many ſmall Fibres adjoyning to them, which periſh not every Year as the other ſorts do. This* Yellow Poppy *has many winged large ſpread Leaves lying upon the Ground; that is, many Leaves ſet together on each ſide of a middle Rib, each divided Leaf being ſomewhat deeply cut in, in ſome places of the edges, more than others, and of a deep, but fair green color. From among theſe Leaves, riſe up ſeveral branched Stalks, about 2 Feet high, having ſome ſuch Leaves thereon, but ſmaller, and ſet at ſeveral diſtances. At the tops of the Stalks and Branches grow fair, yellow, and pretty large Flowers, conſiſting each of four round Leaves a piece, with many yellow Threads in the middle, ſtanding about a long green Head, which when the Flower is fallen, and the Head ripe, is then larger than the former long headed* Baſtard Kind, *and in like manner ſmaller at the bottom, and larger at the top, with a ſmall Head or Topping thereon, containing within, much ſmall black Seed, lying within ſeveral Cells, in the ſame manner as in other Poppies.*

VII. *The Places.* The *Corn Poppy* is plentifully enough to be found in almoſt all *Corn fields* throughout all *England*, as alſo on Banks and Ditch-ſides, and under Hedges thro' moſt parts of the Kingdom. The firſt and ſecond of the *Baſtard Kinds* are often found, as well in *Corn fields*, as by the Way ſides, in *Somerſet-ſhire* and *Kent*, and other Counties of this Land, and in the Corners and Borders of Fields, and by the Hedges and Highway ſides, going from *London* to *Lambeth*. *Gerard* ſays, that he and *Lobel*, found them growing in the next Field to *Southfleet* in *Kent*; and *Johnſon* in *Gerard* ſays, that he found them both growing in *Chelſey* Fields, as alſo in thoſe belonging to *Hammerſmith*, in all which places I my ſelf have alſo often found them. The ſhort or round Headed one has a Flower of a more Elegant color, but is not found ſo plentifully as the other long Headed one. The third grows in many Places in *Wales*, in Vallies and Fields, at the Feet of Hills, and by Water ſides, about a Mile from a ſmall Village called *Abbar*; and in the midway from *Denbigh* to *Guider*; as alſo nere a Wooden Bridge, which gives paſſage over the *River Dee*, to a ſmall Village called *Balam*, which is in *North-Wales*; and in going up the Hill which leads to *Bangor*, as alſo near *Angleſey* in the way leading to the Houſe formerly Sir *John Owen's*.

VIII. *The Times.* The firſt Flowers from *May* all the *Summer* Months, and the three laſt about the end of *June* and in *July*, and the Seed is ripe in *Auguſt*, or not long after Flowering; in ſome places earlier, and in ſome Places later.

IX. *The Qualities.* They are all of them of the Nature of the *Garden Poppy*, to which I refer you.

X. *The Specification.* The *Corn Poppy* has the ſame Specifick Virtues with the *Garden Poppies*. The *Baſtard Kinds* cool, are profitable againſt Inflamations of the Eyes, the Bloody Flux, obſtructions of the Spleen, and the bitings or ſtingings of Venomous Creatures. They heal Green Wounds, alſo old Sores, Cankers and Running Fiſtula's, help againſt the Quinſie, give eaſe in Gout and Rheumatiſms, conſume Warts, and take away black and blew Spots, or diſcolorings of the Skin; They are profitable againſt Sore Eyes, and are good to take away Clouds, Miſts, Films, or Skins, which grow over them, and hinder the Sight.

XI. *The Preparations.* From the *Corn Poppy.* You may make 1. *A Juice, and Eſſence.* 2. *A Decoction.* 3. *An Oil or Ointment.* 4. *A Cataplaſm.* 5. *A Diſtilled Water from the whole Plant.* 6. *A Diſtilled Water from the Flowers.* 7. *Spiritus Papaveris erratici*, Spirit of Corn Poppies. 8. *Spiritus Rheadus Crapularius*, The Surfeit Spirit of Poppies. 9. *Tincture of Corn Poppy Flowers.* 10. *Another Tincture of the ſame*, 11. *Syrup of Corn Poppy Flowers*, 12. *Another Syrup of the ſame.*

The Virtues.

XII. *The Juice or Eſſence.* They are Anodyns; and being bathed warm upon any part of the Body give preſent eaſe; bathed on the Head Fore-head, and Temples, they eaſe the Megrim and Head-ach, and cauſe Reſt and Sleep. They allay Inflamations, and prevail againſt *Anthonies* Fire, and

alleviate the ſharp and fiery Heat of Burnings and Scaldings.

XIII. *The Decoction of the Green Heads and Seed:* It has all the Virtues of the *Juice* and *Eſſence*, beſides which, given inwardly it cools the heat of Fevers, is profitable againſt Deliriums and Frenzies, eaſes pains and ſtitches of the Sides, and prevails againſt the Colick; dropt into the Eyes, it is good againſt Inflamations therein, Blood-ſhot, vehement Pains, and defluxions of hot and ſharp Humors. Doſe from 2 to ſix Spoontuls, ſweetned with *Syrup of Violets*, or *White Sugar*.

XIV. *The Oil or Ointment.* It is ſingular againſt the Gout in Hands, Arms, Legs and Feet. The Head and Temples anointed therewith, it eaſes the Megrim and Head-ach, and procures Reſt and Sleep. It is good againſt Delirium or Frenzy; and is profitable to cool and allay Inflamations in what part of the Body ſoever.

XV. *The Cataplaſm.* It is made of the *Green Heads* and *Seed*, and for want of them of the *Seed*. It has in outward Application all the Virtues of the *Juice*, *Eſſence*, *Oil* and *Ointment:* Applyed to the Fore-head and Temples it gives eaſe in the Megrim and Head-ach. Applyed to the Crown of the Head (being firſt Shaved) it is profitable againſt Dotage, and perturbation of the Senſes. Applyed to any part, it repreſſes, and repercuſſes the Flux of Humors, eſpecially to the Joints, eaſing all manner of pains whatſoever.

XVI. *The Diſtilled Water out of the Green Heads and Seed, and indeed from the whole Plant.* It is refreſhing and cooling, and very profitable being taken inwardly againſt burning Fevers, more eſpecially if it is acuated with a few Drops of *Spirit of Salt*, or *Sulphur*, and then dulcified with *Double refined Sugar:* and makes a good Vehicle for conveying other Medicines, (eſpecially *Opiates*) down into the Body: it gives Reſt and Eaſe to weary Bodies, and cauſes pleaſant Sleep. It quenches the heat, and allays the fury of *Anthonies* Fire, by cooling and ſuppreſſing the Humor. Dropt into the Eyes, it prevails alſo againſt an *Ophthalmia* or Inflamation in them, and ſtops the Flux of the Humor.

XVII. *The Diſtilled Water from the Flowers.* It is a ſingular good thing for the cure of the Pleuriſie, and all ſorts of pains and ſtitches in the Side. It is an excellent thing to give Reſt and Eaſe to Women in Child-Bed, after due cleanſing; and to give pleaſant Sleep. It is held alſo to be of good uſe againſt Surfeits, to drink it Evening and Morning, more eſpecially if it is ſweetned with the *Syrup of the Flowers*. *Parkinſon* ſays, It is more cooling in quality than any other *Poppy*, (*vix credo*) and therefore cannot but be as effectual in hot Agues, Frenzies, and other Inflamations either inward or outward.

XVIII. *Spiritus Papaveris erratici*, The Spirit of Corn Poppies. *Take Wild or Corn Poppy Flowers 8 Pounds, rectified Spirit of Wine 16 Pounds, mix, digeſt a Week, and then diſtill in a Glaſs Alembick in Balneo to dryneſs. Affuſe this diſtilled Liquor upon as many more of the ſame Flowers, digeſt again 3 Days and diſtil as before: this diſtilled Spirit affuſe again a third time upon freſh Flowers, and if you ſo pleaſe a fourth time, diſtilling each time to dryneſs; Laſtly, in a gentle Balneo, draw off three parts of the Liquor, which keep as Spirit of Poppies ſimple.* 2. Or thus. *Take French Corn Poppy Flowers 20 Pounds; White Port Wine 16 Pounds; mix, and with Sugar 3 or 4 Pound, and a large Leven diſſolved in the Wine, cauſe a fermentation, till the whole becomes ſomewhat Acid, then diſtil in Balneo to dryneſs. Affuſe the Liquor upon 10 Pounds more of freſh Flowers, digeſt 3 Days, and diſtil in like manner to dryneſs. Then in a gentle Balneo, draw off the one half of the Liquor, which keep for Spirit of Corn Poppy Flowers. If you continue the diſtillation to dryneſs in the ſame Balneo, you may keep the Liquor for Aqua Papaveris, or reſerve it for making more Spirit with.* If you would have a Spirit from the whole Plant, you may proceed with it in the ſame manner, as with the Flowers, by either of the former ways, or otherwiſe you may make it after this manner. *Take Corn Poppies, the whole Plant when in Flowering, as much as you pleaſe, bruiſe it well in a Marble Mortar; add warm Rain Water 4 times the quantity in weight, diſſolving in every Gallon of Water a Pound of brown Sugar; mix well, and cauſe them to ferment to a fit Acidity. Then diſtil in a Copper Veſica Tin'd within, in a proper heat, drawing off the firſt quarter part of the humidity for* Spirit of Poppies: *and half the remaining part for* Poppy Water: *which keep for uſe, or reſerve for making new Spirit of Poppies.* Any of theſe *Spirits* are excellent againſt the Colick, and to alleviate pains in any part of the Body. They give eaſe in the Stone, and are profitable againſt After-pains of Women in Child-Bed, and with a great deal of pleaſure induce Sleep. But theſe things they will do more powerfully, if you make a Tincture of the Flowers with the ſame. They have in a Word, the Virtues of *Spiritus Opij*, in *Sect.* LII, of the former Chapter, but not altogether ſo powerful. Doſe from half a Dram, to 3 Drams, *plus-minus*.

XIX. *Spiritus Rhœadis Crapularius*, The Surfeit Spirit of Poppies. *Take Corn Poppy Flowers new gathered a Pound; Caraway Seeds 2 Ounces; Nutmegs 1 Ounce; Ambergriſe 4 Grains; Spirit of Wine 4 Pounds; digeſt according to Art; ſtrain out, and keep it for Uſe.* Doſe from 4 Drams, to 4 Ounces, at the Hours of Sleep, or in the Morning after Surfeiting. It is a Specifick alſo in a Pleuriſie. The *Spirit of Wine* here intended is only common *Spirit of Wine* or *Brandy*, for otherwiſe the Doſe could not be ſo large as we have here given it. It is not only excellent againſt Surfeiting and Drunkenneſs, as alſo the Pleuriſie, but againſt all manner of pains and ſtitches in the Sides, Breſt and Stomach, the Colick and gripings of the Guts, pains in the Back, Reins and Bladder, but indeed againſt all manner of Pains in what part of the Body ſoever. It gently provokes Sweat, diſſolves coagulated Blood, and gives relief againſt the ſtrongeſt Agonies. It may be given either alone ſweetned with White Sugar, or in Wine, or *Aqua Lactis alexiteria* chiefly at Night going to Bed.

XX. *Tincture of Corn Poppy Flowers. Take Corn Poppy Flowers freſh gathered a Pound: Spirit of Corn Poppy Flowers, choice Canary or Sherry Wine, of each 2 Pounds: Winters Cinnamon in fine Pouder 2 Ounces: Cochinele in fine Pouder, choice Engliſh Saffron, of each half an Ounce: mix, digeſt, and make a Tincture according to Art.* It has all the Virtues and Excellencies of all the *Spirits of the Flowers*, at *Sect.* XIX *and* XX, aforegoing: beſides which it is an excellent Cordial and a potent expeller of Wind, and therefore good againſt Fainting and Swooning Fits, Sickneſs at Heart, *&c.* Doſe from half an Ounce to an Ounce, or more in a Glaſs of *Angelica Water*, well dulcified with white Sugar.

XXI. *Tinctura Papaveris erratici Mynſichti*, another Tincture of the ſame from *Mynſicht*. *Take Corn Poppy Flowers 2 Ounces; ſprinkle them with Spirit of Vitriol a Dram: then with the Diſtilled Water from 20 Ounces of the Juice of freſh Flowers, extract a Rubicund Tincture, which filter,*

filter, and add thereto, Syrup of the Juice of Corn Poppy Flowers Varnished 2 Ounces: mix and keep them for Use. It is excellent in all thin and sharp defluxions of Rheum upon the Lungs and *Asperа Arteria*: It causes Rest and Sleep, cures Coughs, Hoarsness, and Wheezings, eases the Phthisick; is good against Pleurisies, pains and stitches in the Sides; eases all sorts of Dolors and Greefs, abates Inflamations, provokes Sweating, and stops the Bloody Flux, as also the Terms and Whites in Women. Dose 2 Ounces alone, or with some other proper Vehicle.

XXII. *Syrupus de Papavere erratico, seu Rubro.* Syrup of Corn Poppies. *Take Corn Poppy Flowers 2 Pounds; warm Spring Water 4 Pounds: steep or infuse, and the next Day strain it; repeat the Infusion with new Flowers; strain again, and with its equal weight of Sugar, boil it into a Syrup in Balneo.* It is excellent to cool and abate the heat of Fevers, eases all sorts of Pains, causes Rest and Sleep, abates the violence of Pleurisies, Colicks, violent pains of the Stone, and stops all sorts of Fluxes of the Belly, as Diarrhæa, Dysenteria, Lienteria, Hepatick Fluxes, as also the Terms and Whites in Women. Dose from one Spoonful to 2 or 3, either alone, or in some proper Vehicle.

XXIII. *Syrupus Hemopticus, seu Diacodium Liquidum Papaveris erratici*, another Syrup of Corn Poppies. *Take Heads and Seeds of the Wild or Corn Poppy Number 20. Juice of Spanish Liquerice an Ounce; bruise the Heads and Seed, and steep them in Rain Water 8 Pints, for 4 Hours; and then dissolve in it the Spanish Juice; boil gently in Balneo to 6 Pints: strain leisurely thro' a Flannel Bag, and with white Sugar 12 Pound make a Syrup.* It gives ease in Pains, and causes Rest and Sleep; it stops Vomiting, helps in the Colick; is good against a Loosness and all other Fluxes of the Belly, as also Fluxes of Humors to any part; prevails against Asthma's, Coughs, Colds, Phthisicks, spitting and pissing Blood, gives ease in the Stone, Gravel and Strangury, as also in the Gout, and all other Pains wheresoever. Dose from half an Ounce to an Ounce, Ounce and half or more, as occasion requires.

The Bastard Wild POPPY.

XXIV. *The Qualities.* It is hot and dry in the third Degree, Absterfive, Anodyn, Vulnerary, Arthritick and Alexipharmick.

XXV. *The Specification.* It prevails against dimness of Sight, Bloody Flux, the Poyson of Venomous Beasts, obstructions of the Spleen, Quinsey, Belly-ach, Gout, Cramps, Convulsions and the like: It is said to cure Warts also, Green Wounds, old Sores, running Ulcers and Fistula's.

XXVI. *The Preparations.* You have therefrom, 1. *The Green Leaves.* 2. *A Juice.* 3. *An Essence.* 4. *An Infusion in Water.* 5. *A Decoction in Wine.* 6. *An Ointment.* 7. *A Cataplasm.*

The Virtues.

XXVII. *The Green Leaves.* Being oftentimes in a Day, and for several Days together, rubbed upon Warts, they consume them, and take them away: the same they do to Corns, more especially, if they being fresh gathered, are also bound thereto, Morning and Night.

XXVIII. *The Liquid Juice.* Dropt into the Eyes, it takes away Mists, Clouds, and Films, which hinder the Sight, allays Inflamations and Heat, and cures the Disease of the Eye called *Argema* (from which the Herb took its Name) which is the *Hard* in the Eye, the Malady, when it happens on the black of the Eye, it appears white, and contrariwise, when it falls on the white of the Eye, it appears blackish, or of another color. Bathed also on Warts it consumes them.

XXIX. *The Essence of the Leaves and Roots.* Given to 2 Drams or more in Ale, Beer, or Wine, it is good against the Griping of the Guts. Taken in Sherry, Canary, or other strong Wine, it powerfully expels Poison: it opens obstructions of the Spleen, and eases the pains thereof, and is good against the bitings or stinging of Serpents, Mad-Dogs Hornets, Scorpions, or other Venomous Creatures. The *Essence* inwardly taken, and a *Cataplasm of the Leaves* being outwardly applyed: and taken in Red *Port* Wine, is good against the Bloody Flux.

XXX. *The Infusion in Water or Wine.* It prevails powerfully against the Griping of the Guts, a *Diarrhœa*, or Looseness, and other Fluxes of the Bowels: and is said to give ease in the pains of the Hypochonders.

XXXI. *The Decoction in Wine* Bathed upon places black and blew, or otherwise discolored by Blows, Falls, &c. whether on the Face, Eyes, or other parts, it quickly restores them to their rectitude. It is good against the Bloody Flux: and is a present Remedy against the stinging or biting of any Creature

XXXII. *The Ointment, made with Oil, Wax and Turpentine.* It heals any simple Green Wound, running Sore, or old Ulcer; and being applyed to Joints pained with the Gout, it eases the pain, and in a little time cures the Disease. It is good also against Cramps, Convulsions, and other like Diseases of the Nerves.

XXXIII. *The Cataplasm of Leaves and Heads.* It heals Cankers, old Ulcers, running Fistula's: consumes and takes away Warts; cures recent Contusions, as also discolorings of the Skin. And being made with Wine Vinegar, it cures the Quinsey being applyed to the Throat; and eases the Gout, and takes it away being applyed to the place agrieved.

CHAP. DLXXV.

Of POPPY Horned.

I. *THE Names.* It is called in the *Arabick*, *Almacharam:* in *Greek*, Μήκων κερατίτης: in *Latine*, *Papaver Corniculatum & Cornutum* (*à siliquarum effigie Cornicularum modo inflexa*, because the Pods are crooked like a Cornet or Horn.) *Pliny*, and others say, it was also called *Paralion*, i. e. *Marinum*; and of some *Papaver Sylvestre*; in *English* it is called the *Horned Poppy.*

II. *The Kinds.* Of the *Horned Poppy* we make two Principal Kinds, *viz.* I. Μήκων κερατίτης, *Papaver Corniculatum verum*, The true Horned Poppy. II. Μήκων κερατίτης νόθος, *Papaver Corniculatum nothum*, The Bastard Horned Poppy.

III. *The particular Kinds.* Of the I. Species there are these three following, *viz.* 1. *Papaver Cornicu-*

Corniculatum luteum, The yellow Horned Poppy; and Sea Poppy. Many Authors have thought that *Glaucium* was made hereof, as *Dioscorides* himself says, and as *Pliny* likewise thought: But *Dioscorides* in describing *Glaucium*, does not say it is the *Juice of Horned Poppy*; but it is the Juice of an Herb, that has Leaves something like unto those of the *Horned Poppy*, but fatter or thicker, and yielding a yellow Juice: so that being but like to it, it cannot be the same thing. 2. *Papaver Corniculatum rubrum*, The Red Horned Poppy. 3. *Papaver Corniculatum Flore Violaceo*, The blew or Violet colored Horned Poppy. This the Spaniards call *Rosetta*, and some *Amapolos Morados*, because the Flowers give a juice like Mulberries. Of the II. Species, there are the two following sorts, *viz.* 4. Ὑπήκοον ϗ Ὑπόφεον; in Latine, *Hypecoum*, and *Hypopheum*; *Hypecoum legitimum Clusij & Bauhini*, The Bastard Horned Poppy or *Hypecoum Dioscoridis*. 5. *Hypecoum alterum*; *Hypecoi altera Species Bauhini*, The second Kind of Bastard Horned Poppy. Some Authors will have these Bastard Species to be a sort of *Cuminum Sylvestre*, and call each of them, *Cuminum siliquosum*, & *Cuminum Sylvestre siliquosum*, but I think very improperly, for they are not in the least akin, to any of the Species of *Cumin*, but rather a sort of *Wild Poppies*, as is very manifest both from their *Poppy* like Smell and Qualities.

The Descriptions.

IV. *The first, or* Yellow Horned Poppy, *or* Sea Poppy. *Its Root is white, long, and tough, spreading it self out several ways, and enduring many Years, the Plant keeping its Leaves also all the Winter.*

Poppy Horned Yellow.

it has many long, and somewhat large, whitish, or hoary Leaves, lying upon the Ground, very much cut in or torn on the edges, and something rough or hairy; from among which rise up several weak round Stalks leaning down, rather than standing upright, somewhat hairy also, spreading forth into several Branches, and bearing a large Flower, at the top of every one of them, consisting of four Leaves, of a delicate pale yellow color, with a few Threads in the middle, standing about a small crooked Pointel, which in time grows to be a long, naked, round Pod, six Inches or more long, with a small Head or Button, as it were, at the end thereof, in which is contained, small blackish round Seed; every part of this Plant, being cut or broken, sends forth a yellow Juice, and of a bitter Taste.

V. *The second, or* Red Horned Poppy. *Its Root is long and slender, perishing every Year; raising it self again from its own Sowing, or else must be sown every Year in the Spring. This has fewer, lesser, and more jagged Leaves than the former, nothing so whitish, but of a dull green color, something hairy also. The Stalks are slenderer, and lower, bearing Flowers at the tops of them,*

Poppy Horned Red.

like the other, and consisting of four Leaves a piece, but much smaller, and of a pale reddish color for the most part; tho' sometimes they are found ladder: After which come such like crooked or horned Pods, but smaller than the former, containing such like small blackish Seed within them. This Plant when cut or broken yields no such yellow Juice, as the other does.

VI. Johnson *in* Gerard, *gives us another* Horned Poppy, *which he calls*, Papaver Corniculatum Phœniceum glabrum, *or Red horned Poppy with smooth Leaves. This he says is much like the last described, and according to* Clusius *is rather a variety of that second Kind than any differing Species. Its Leaves are with many deep jags in them, much like as* Rocket *has, but are smooth, and without*

Hair

hair: and the color of the Flowers are of a pale yellowish red: both which accidents Clusius *says happen to the former, towards the latter end of* Summer.

VII. *The third, or* Blew, *or* Violet colored Horned Poppy. *Its Root is long and small with a few Fibres adjoyning to it, and perishes every Year. This grows much lower, and with smaller Leaves, very much, and finely cut in, or rather divided into many parts, of a sad green color. The Stalks are low and slender, something hairy, rising not much above a Foot, or Foot and half high at most, with small Flowers at their tops, like unto the second Kind for form,* viz. *consisting of four Leaves, but of a fair deep purple color, and like unto a* Violet: *after which come small, slender and shorter Pods, not above a fingers length, in which lies such like blackish Seed but smaller.*

VIII. *The fourth, or* Bastard Horned Poppy, *or* true Hypecoum Dioscorides. *Its Root is small and a little Stringy, perishing every Year, at the first approach of* Winter, *and is very hardly made to spring again, but by sowing its Seed in* Autumn. *This small Plant has divers long Leaves lying on the Ground, very much divided, and cut into many parts, of a pale or whitish green color, so like unto* Fumitory *in the color of the Leaves, as also somewhat near it, in the many divisions and parts thereof, that it will soon deceive one that does but slightly view it, but is smaller and thinner, and more gentle in Handling, yet is larger in* Spain, *as* Clusius *says, than that which grows with us. In the middle of these Leaves rises up a Stalk, sometime two, with some Leaves thereon, which divide or spread out towards the top into several Branches: at the tops of which stand small yellow Flowers, consisting of six Leaves, two whereof are larger than the rest, and stand opposite to one another, the others being very small and scarcely discerned, till the Flower is fully blown open. After which spring out long, crooked, flat, husky Horns, or Cods, full of Joints, somewhat like unto the Husks or Horns of the* Scorpioides Matthioli, *but greater and longer; in the several Joints of which ly several square yellowish Seed, very difficult to be taken forth or separated from the Husks or Skins. The Plant has a* Poppy *like Smell, and of an unpleasant Taste.*

IX. *The fifth, or* Second Kind of Bastard Horned Poppy. *This Plant is very like unto the former, but that the Leaves thereof are not so broad, nor long, but more finely divided, something like unto the* Seseli, *or* Hartwort of Marseilles, *or* Wild Chervil: *The Stalks are smooth, full of Leaves and Branches, which send forth yellow Flowers, made of five pointed Leaves; which being past away, long Cods come in their places, which stand not upright, but hang down; nor are crooked like the former, but straight, and Jointed, containing greater yellow Seed, not much unlike to those of* Galega *or* Goats Rue.

X. *The Places.* The first or *Sea Poppy*, grows upon the Sands and Banks of the Sea; and Naturally by the Sea side as well beyond Seas, as on the Coasts of our own Country in many Places. *Gerard* says he found it growing near unto *Rye* in *Kent*; in the *Isles of Sheppy* and *Thanet*; at *Lee* in *Essex*, and *Harwich*, and at *White-stable*, and in many other places on the *English* Shore. It is a pleasant Plant, and is now planted in *Gardens*, for its beautiful Aspect, as well as for its Virtues. The second and third are Natives of *Spain*, *Austria*, and *Bohemia*; *Angelus Palea*, and *Bartholomeus ab Urbe Veterum*, say, that the second grows in the Kingdoms of *Arragon* and *Castile* in *Spain*, in the Fields and near Common High-ways; but with us they both Flourish only in *Gardens*. The fourth and fifth grow in *Provence* in *France*, in the way to *Nice* and *Montpelier*, and other places in that Kingdom, as also in divers places in *Spain*, as *Clusius* says: but with us they are only found growing in *Gardens*.

XI. *The Times.* The first Flowers from *May* all the *Summer* long to the beginning of *September*, and its Seed ripens in the mean time. The second Flowers seldom before *June*, and gives ripe Seed every Year, if the Season proves temperate and kindly, otherwise not. The third, as it late before it springs up, so it comes late in the Year to Flowering, for which reason it rarely gives ripe Seed with us. The fourth and fifth Flower about the end of *June*, and in *July*, and the Seed is ripe in *August*; in some places earlier, and in others later.

XII. *The Qualities, Specification, Preparations,* and *Virtues* of the two last, viz. the *Hypecoa*, are much the same with those of the *Corn Poppy* in the last Chapter, so that nothing more need be said of them here.

Of the True Horned Poppy.

XIII. *The Qualities of the Horned Poppy.* It is said to be hot and dry in the third Degree. And is Abstersive, Aperitive, Diuretick and Vulnerary: Hepatick, Nephritick, and Cathartick.

XIV. *The Specification.* It prevails against the Strangury, Obstruction of the Spleen, heals Green Wounds, and old rotten Sores and Ulcers, and by its Cathartick Quality eases the Pains of the Sciatica.

XV. *The Preparations.* You may make, 1. *A Liquid Juice or Essence.* 2. *A Decoction of the Root.* 3. *A Pouder of the Seed.* 4. *An Oil of the Leaves and Flowers.* 5. *A Liniment of the same.* 6. *An Ointment.* 7. *A Cataplasm.*

The Virtues.

XVI. *The Liquid Juice or Essence.* Given to 2 or 3 Spoonfuls (if the *Juice*, being first clarified) in a Glass of *Port* Wine, it provokes Urine, cleanses the Reins and Bladder, and carries off the Morbifick matter of the Gout, Rheumatism, Stone, &c.

XVII. *The Decoction of the Root in Water.* Being boiled to the consumption of the one half, and then strained out and Drank, it opens the Obstructions of the Liver and Reins, and gives ease in the pains of the Sciatica, and admirably provokes Urine, giving ease in the Strangury.

XVIII. *The Pouder of the Seed.* Being given from the quantity of 2 Scruples to 2 Drams, *viz.* about a Spoonful at a time in *Mead* or Honied Water, it is said gently to purge the Belly.

XIX. *The Oil of the Leaves and Flowers made by Insolation, or Coction.* It is good to clear the Eyesight, and to take away Spots and Films upon them; for which purpose it is also used to the Eyes of Cattel.

XX. *The Liniment of the Leaves and Flowers. It is made of their Juice mixed with Honey and Orobus Meal, with an addition of Oil of Hyperion:* cleanses foul and virulent Ulcers, and that so powerfully, that *Galen* advises, that it should not be applyed unto those Sores or Ulcers, which are already cleansed, least it should consume the quick Flesh also. It takes away also by the strength and force

force of its Abſterſive quality, even thoſe Cruſts which grow upon Ulcers, by neglect or ill looking after.

XXI. *The Ointment. It is made of the Leaves and Flowers, by boiling or Infuſing in Oil of Hypericon, adding after Expreſſion, Turpentine a quarter part; Wax, Frankincenſe, of each an eighth part; Pouder of Tobacco a tenth part.* It has all the Virtues of the *Liniment*, cleanſes putrid Sores, old Ulcers, and running Fiſtula's powerfully, and heals ſimple Green Wounds, after an admirable manner.

XXII. *The Cataplaſm of the Leaves and Flowers.* Being applied to filthy putrid Sores, rotten Ulcers and running Fiſtula's, it Abſterges them wonderfully, and diſpoſes them to incarnation or healing.

CHAP. DLXXVI.

Of POPPY Spatling.

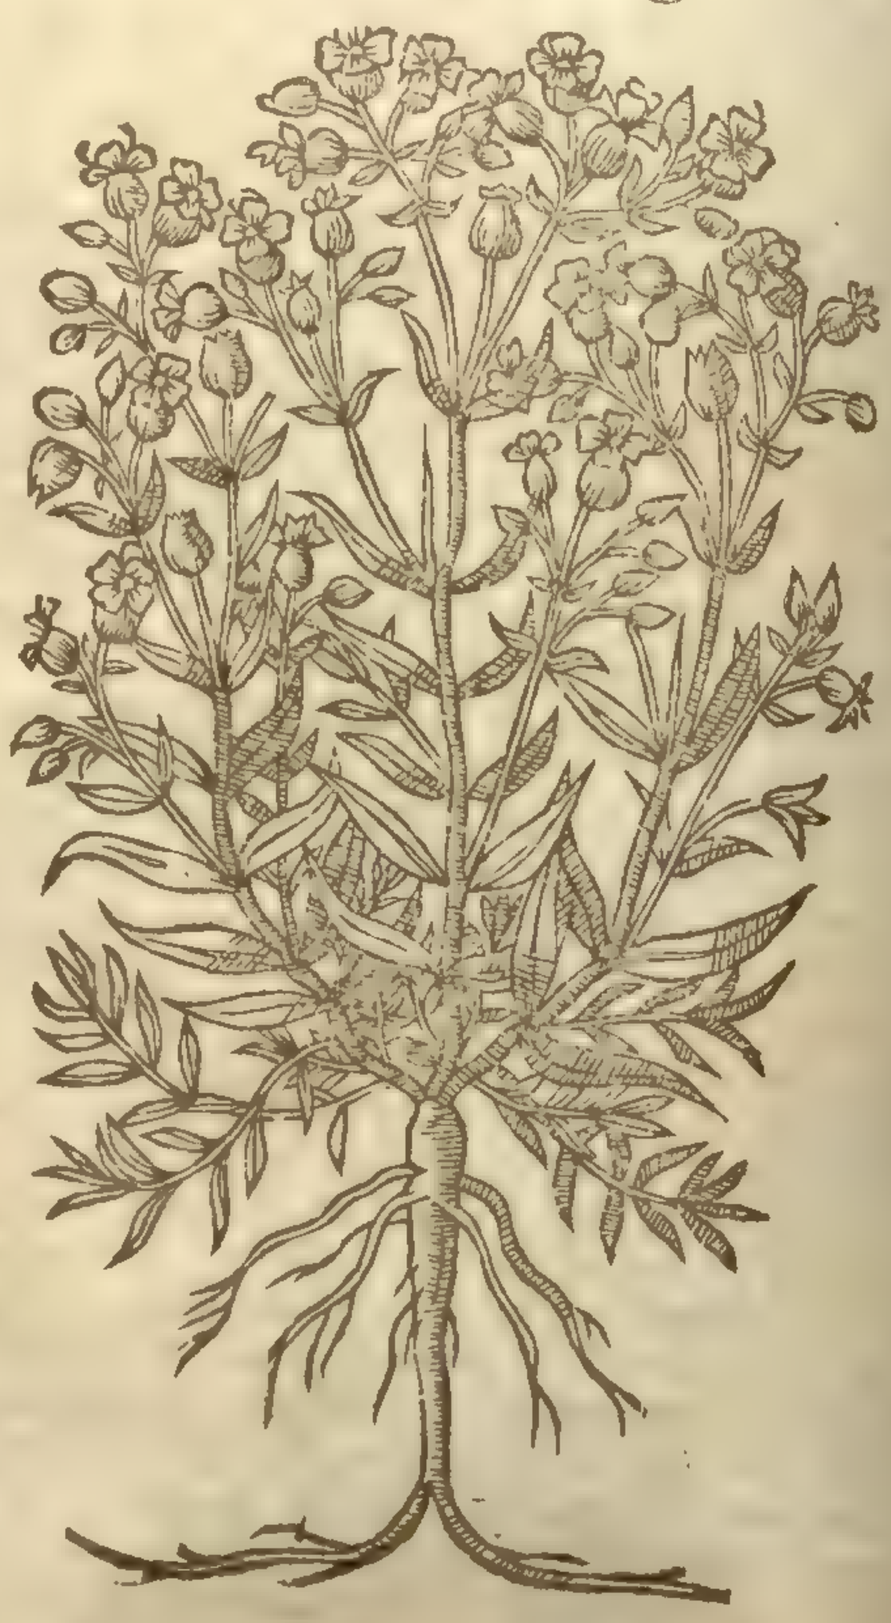
I. *THE Names.* It has no *Greek* Name that we know of: but is called in *Latine*, *Papaver Spumeum:* in *Engliſh*, *Spatling Poppy*, or *Frothy Poppy*, becauſe oftentimes about the Joints a certain frothy kind of Subſtance is ſeen.

II. *The Kinds.* Whether it is of the Kinds of *Poppies* or no, I will not determin. It is a ſingular Plant of the Kind, and ought rather to be accounted a Kind of *Lychnis*, (as moſt *Herbariſts* think it to be:) It is called by ſome *Ben*, or *Behen album* (differencing it from the *Valeriana rubra Dodonæi*, & *muſcipula Lobelij*, each of which is called *Ben*, or *Behen rubrum*:) tho' neither of them is the true *Behen album*, or *rubrum* of the *Arabians*: *Bauhinus* calls it, *Lychnis Sylveſtris quæ Ben vel Behen album vulgo*, which is all that can be ſaid of it as relating to its Speices.

The Deſcription.

III. *Its Roots is white, and ſpreads it ſelf abroad in the Earth abiding many Years. It is a ſmall low Herb, having divers weak tender Stalks, full of Joints, about half a Yard or two Feet in height or length, they uſually lying upon the ground; on which grow many pale whitiſh green Leaves, two always ſet together one againſt another at the Joints: having many times upon the Leaves, but more often about the Joints of the Stalks, a certain white frothy Subſtance, like unto that which is called Cuckow Spittle. At the tops of the Stalks grow many Flowers together, every one on a pretty long Foot Stalk, hanging down their Heads, which are white, compoſed of five ſmall white Leaves a piece with a deep notch in the middle of each one of them, making the Flower to ſeem to conſiſt of more than five Leaves; they all ſtanding in a large Huſe or Holſter ſtriped, the flower ſcarcely appearing above it; wherein afterwards is contained Black Seed.*

Poppy Spatling



IV. *The Places.* It grows generally throughout *England* in many places and paſtures, and Hedgſides; by ſome it is much valued, and therefore planted alſo in *Gardens.*

V. *The Times.* It Flowers almoſt from the beginning of *June* till the end of *July* and ſometimes later; and the ſeed ripens in the mean ſeaſon. And as the Root abides all the *Winter*, ſo alſo do ſome of the Leaves keep green all that Seaſon.

VI. *The Qualities.* It is hot and dry in the ſecond degree. Aperitive Abſterſive, Cephalick, Cathartick and Emetick.

VII. *The Specification.* It is peculiar for the cure of the Epilepſy or Falling ſickneſs, and other cold and moiſt diſeaſes of the Brain.

VIII. *The Preparations. The Pouder of the Seed* is only in uſe.

The Virtues.

IX. It may be given from a dram to two drams, in *Mead* or Honied water: it cauſes vomiting, and purges downwards Pituitous or Flegmy humors, and is eſpecially good for the Cure of the Falling Sickneſs, and other Cold and moiſt diſeaſes of Head and Brain.

POTATO-Canada, *ſee* Hartichoke Jeruſalem, *Chap.* 340.

CHAP. DLXXVII.

Of POTATO, Spaniſh, Virginian, *and* Engliſh.

I. *THE Names.* It has no *Greek* Name that we know of: but it is called by our Modern Authors *Battata*, *Battatas*, *Amotes*, *Cametes*, *Ignanes*, *& Inhames*; and by the *Indians*, *Papas*, *Papus*, and *Pappus*; we in *Engliſh* call it, *Potato*, and *Potatus*.

II. *The Kinds.* There are three ſeveral Species of this Plant, which are almoſt as different one from another, as they are every one of them different from the *Jeruſalem Hartichoke*. 1. The firſt is *Battatas*, *ſive Pappas Hiſpaniarum*, The Spaniſh Potato, becauſe it grows not only in *Spain*, but in all the *Spaniſh Weſt-Indies*; as alſo every where almoſt in our *Weſt-India* Plantations. 2. *Pappas vel Battata Virginiana*, The Virginian Potato, which grows wild not only in *Virginia*, but almoſt every where thro' the whole Continent of *Florida*. 3. *Pappa ſeu Battata Anglicana ſeu Hiberniana*, The Engliſh or Iriſh Potato, which grows in vaſt plenty in many of our *Engliſh Gardens*, ſo that now the Roots are ſold by Buſhels in our *London* Markets.

The Deſcriptions.

III. *The firſt*, *or* Spaniſh Potato. *It has many firm and ſweet Roots, which being boiled, baked, or Roaſted, are of a pleaſant ſweet Taſte, exceeding in deliciouſneſs any other Root whatſoever: it is in ſhape and form ſomewhat like to* Aſphodil *Root, tuberous, knobby, and from two to eight or ten Inches in length, more or leſs, with an anſwerable thickneſs; much greater than* Aſphodil *Roots, and larger at one end than at another: ſome ſorts of them are longer, others rounder and thicker; ſome of them of a white color, ſome of a yellow color, others of a pale brown, and ſome of a kind of reddiſh color; and of a white, or yellowiſh white within, the whole Root being of one ſolid, compact, or uniform Subſtance, without any Heart or Pith in the middle, as* Carrots *and* Parſneps *have; many of them ſpringing and growing as it were from one Head. From the Head of theſe Roots ſpring up many long Branches, which by reaſon of their weight and weakneſs cannot ſtand of themſelves, but trail on the Ground, a Yard or Yard and half in length, or more, on which are ſet at ſeveral diſtances, broad, and in a manner triangular, or three cornered Leaves, not very much unlike to thoſe of* Ivy, *ſoft in feeling to, and of a dark green color, the two ſides whereof are broad and round as to the middle part thereof, but pointed at the end, and growing pretty cloſe together.*

Spaniſh Potatoes

Spaniſh Potatoes.

IV. *The ſecond*, *or* Virginian Potato. *The Root of this is nothing like the former neither in form, magnitude, color, nor taſte, nor reſembles it in any thing but the ſolid, compact, uniform Subſtance thereof. The Roots are ſmall, ſome about the bigneſs of* Wall-Nuts, *green and all, ſome leſſer by much, and others greater; ſome of them almoſt round, ſome oval, ſome of a long round, and almoſt pointed at each end, ſome ſmooth, others knobby, all of them being tuberous, of a dirty brown whitiſh color on the out ſide, and white within; not of a pleaſant ſweet Taſte, as the* Spaniſh *are, but rather of a Flatulent, or inſipid Taſte, which yet being boiled, baked, or roaſted; and eaten with Butter, Salt, Vinegar, and a little Sugar, are moſt admirable Food, and not much inferior to thoſe of the* Spaniſh Kind, *(both ſorts of them, as alſo the* Engliſh *following, being very mealy when they are dreſt, for which reaſon they require a great deal of Butter.) It has many weak and ſomewhat flexible Branches, leaning a little downwards, or eaſily born down with the Wind or other things, beſet with many Winged Leaves, of a dark grayiſh green color, whereof divers are ſmaller, and ſome*

greater than others. The Flowers grow many together upon a long Stalk, coming forth from between the Leaves *and the great Stalks, every one severally, upon a short foot Stalk; somewhat like to the Flowers of* Tobacco *for the form, being one whole Leaf, six cornered at the brims, but something larger, and of a pale bleviſh purple color, or pale Dove color, and in ſome almoſt white, with ſome red Threads in the middle, ſtanding about a thick Gold-yellow Pointel, tipt with green at the end. After the Flowers are paſt, there comes up in their places ſmall round Berries or Fruit, as large as a* Damſon, *or* Bully, *green at the firſt, and ſomething whitiſh afterwards, with many white Seeds therein like to* Night-ſhade; *from the likeneſs of which* Bauhinus *upon* Matthiolus *calls it* Solanum tuberoſum eſculentum.

V. *The third, or* Engliſh, *or* Iriſh Potato. *This is a roundiſh tuberous Root ſometimes ſmooth, ſometimes knobby, of various magnitudes from the ſmallneſs of a* Filbert, *to bigger than a large Fiſt doubled; it is ſolid, compact, and of one uniform Subſtance, white within, and reddiſh without, having a* Cuticula *or Scarf Skin, over the principal Skin, not ſweet in Taſte, like thoſe of the* Spaniſh Kind, *but of a more flatulent or inſipid Taſte, which being throughly boiled, baked or roaſted, are mealy like the others. They are diſperſed under the Ground by many ſmall Threads or Strings, from the Head of the Root, and one from another, each encreaſing in its tuberous bulk, in its ſtation or place where it lyes, without running deeper into the Ground, as long Roots uſually do.*

VI. *The Places.* The firſt grow in *Spain* and *Portugal* and in the *Weſt-Indies*, as well among the *Engliſh* and *Dutch* in our Plantations, as among the *Spaniards*, who plant them univerſally for Food. The ſecond grow plentifully in *Virginia* and through all *Florida*. The third are only Nurſt up in *Gardens* in *England* and *Ireland*, where they flouriſh and come to perfection, prodigiouſly encreaſing to a vaſt plenty.

VII. *The Times.* The firſt bear their green Leaves all the *Summer*, which periſh with the Stalks at the firſt approach of *Winter*, or any great Froſt; The ſecond thruſt forth their Leaves in the beginning of *May*, the Flowers bud forth in *Auguſt*; and the Roots are fit for Food in *September*. The laſt their Roots come to perfection towards the latter end of *Autumn*, and encreaſe in largeneſs and goodneſs, being a good proviſion for Food, through the whole *Winter*.

VIII. *The Qualities.* The Leaves of *Potato* are manifeſtly hot and dry in the beginning of the ſecond Degree, as manifeſtly appear by the Taſte. But the Roots are temperate in reſpect to heat or cold, dryneſs and moiſture: They Aſtringe, are moderately Diuretick, Stomatick, Chylifick, Analeptick, and Spermatogenetick.

IX. *The Specification.* They nouriſh the whole Body, reſtore in Conſumptions, and provoke Luſt.

X. *The Preparations.* You may have therefrom, 1. *The boiled, baked, or roaſted Roots.* 2. *The Broth.* 3. Sanguis, *The Blood.*

The Virtues.

XI. *The Prepared Roots.* They ſtop Fluxes of the Bowels, nouriſh much, and reſtore in a pining Conſumption: Being boiled, baked, or roſted, they are eaten with good Butter, Salt, Juice of *Oranges* or *Limons*, and double refined Sugar, as common Food: they encreaſe Seed and provoke Luſt, cauſing Fruitfulneſs in both Sexes; and ſtop all ſorts of Fluxes of the Belly.

XII. *The Broth of the Roots.* *They are firſt boiled ſoft in fair Water, then taken out and peeled, afterwards put into the ſame Water again, and boiled till the broth becomes as thick, as very thick Cream, or thin Haſty Pudding: ſome mix an equal quantity of Milk with it, and ſo make Broth: others after they are peeled, inſtead of putting them into the Waters they were boiled in, boil them only in Milk, till they are diſſolved as aforeſaid, and the Broth is made pleaſant with ſweet Butter, a little Salt and double refined Sugar, and ſo eaten.* It has all the Virtues of the Roots eaten in Subſtance, nouriſhes more, and reſtores not only in an *Atrophia*, or pining Conſumption, but alſo in a *Phthiſis* or Ulceration of the Lungs.

XIII. Sanguis, *or The Blood of Potato's.* *It is made as the Blood of Satyrion, Parſneps, Eddo's, Comfrey, and other the like Roots.* It may be taken to a Spoonful or two, Morning, Noon, and Night, in a Glaſs of choiſe, *Canary, Tent, Alicant*, old *Malaga*, or other good Wines. It reſtores in deep Conſumptions of all Kinds, nouriſhes to admiration, is good againſt Impotency in Men and Barrenneſs in Women, and has all the other Virtues of both the *Prepared Roots* and *Broth.*

PRICKET, *ſee* Stone Crop, *Chap.*

CHAP. DLXXVIII.

Of PRICK-MADAM.

I. *The Names.* It is called in *Greek*, Ἀειζωον σκωληκοειδὲς: in *Latine*, *Vermicularis, Sedum Vermiculare, illecebra vermiculata:* and in *Engliſh*, *Prick Madam*, (being a certain Kind of *ſmall Houſeleek*, or *Stone Crop.*)

II. *The Kinds.* There are ſeveral Species of it as, 1. Ἀειζωον σκωληκοειδὲς ὁ θάμνῳδες, *Vermicularis Arboreſcens*, Tree Prick-Madam. 2. Ἀειζωον σκωληκοειδὲς θαμνῶδες, *Vermicularis Fruticoſa altera*, Shrubby Prick-Madam, or the leſſer Tree Prick-Madam. 3. *Sedum minus Hematodes; ſempervivum minus primum Dodonæi; Sedum minus mas Fuchſij; Vermicularis ſive illecebra major vulgaris*, The Common greater Prick-Madam. 4. *Sempervivum minus æſtivum Lobelij; Sedum minus ſextus Cluſij; Vermicularis ſive illecebra minor, Aizoon medium Thalij*; The leſſer Prick-Madam, or ſmall Stone Crop.

The Deſcriptions:

III. *The firſt, or* Tree Prick-Madam. *Its Roots are long, woody, and ſpreading in the Ground; this Plant riſes up to be five or ſix Feet high, as I have ſometimes obſerv'd it, when it is planted in* Gardens *in a good Soil; and is plentifully ſtored with Branches, from the bottom to the top, and thick ſet with ſmall, long, and round green Leaves, without any Taſte, very like to thoſe of the* ſmall Houſeleek, *called* Stone Crop, *(but* Lobel *ſays, it has a kind of Saltiſh Taſte) yet leſſer and greener.*

The

The Flowers grow at the tops of the Branches, ſmaller than the next which follows, and of a pale yellow color. The Branches hereof ſlipped and put into the Ground, will quickly take Root and grow.

IV. *The ſecond*, or Shrubby Prick-Madam, or leſſer Tree Prick-Madam. *Its Root is hard and woody; nor does this Plant grow ſo high as the former, not being much above a foot high. It is full of Branches, and covered with an Ash colored Bark, as limber and as ſlight as the former. The Leaves hereof are ſomewhat greater and larger than the other, of a more Saltish Taſte, and of a darker green. The Flowers grow at the tops of the Branches, and are larger than theſe of the firſt, but fewer, and of a yellowiſh color.*

V. *The third*, or Common greater Prick-Madam. *Its Roots are very ſmall and creeping in the Ground, and ſend forth Stalks with Leaves here and there all about. This* Common greater Prick-Madam, *(which ſome call alſo* Common greater Stone Crop*) grows upon the Ground with divers traling Branches, ſet with many thick, fat, and ſomewhat round, whitiſh or yellowiſh green Leaves, a little pointed at the edges. The Flowers grow at the tops of the Branches, many ſet together, yet ſomewhat looſely, and not in a thick Tuft or Cluſter as the* Orpines, *and are of a yellowiſh color.*

Prick-Madam ſmall.

VI. *The fourth*, or Leſſer Prick-Madam, or ſmall Stone Crop. *Its Root is creeping, in like manner as the former*, or Common greater Prick-Madam, *and ſhoots it ſelf forth in divers places alſo. It has ſmall and long Leaves like the laſt going before, which are ſet upon ſhort foot Stalks, not much above an Hand breadth long, which are not ſo thick, but more flat, and of a more Styptick Taſte. The Flowers are of a paler yellow color, and greater than the former, but ſtanding in ſparſed Tufts in the ſame manner. It looſes both Leaf and Stalk in* Winter.

VII. *The Places.* The firſt and ſecond grow by the Sea ſide, and farther off likewiſe, where the ſecond will have a brackiſh Taſte, as well as when it grows near the Sea. The third grows many times in *Gardens*, and in other Places upon Stone Walls, and tops of Houſes, almoſt every where. The fourth grows among Rubbiſh, and in the Borders of Fields open to the Sun, alſo on Mud, or on Stone Walls, and on other Sandy and Gravelly places, and often times upon the ſides of old Tiled Houſes and Penthouſes in many parts of the Kingdom.

VIII. *The Times.* The firſt and ſecond Flower in *Auguſt*, or very late with us: The third and fourth Flower in *June* and *July*, and ſometimes ſooner.

IX. *The Qualities.* They are cold in the third Degree, and dry in the firſt. Abſterſive, Anodyn, Repercuſſive, and Vulnerary.

X. *The Specification.* It is good againſt the Gout, Pains, Aches, Strangury, ſcalding and heat of Urine, Stone, Gravel, burning Fevers, Head-ach, Bleeding at Noſe, Inflamations, Eryſipelas, Pimples, Shingles, Tetters, Ringworms, and other breakings out: as alſo ſtops Fluxes of Humors to any part, and is good to heal fretting Sores, old Ulcers, Cankers, Burnings and Scaldings, with Fire, Water, or other things. It is ſaid to waſte away Warts and Corns, and to free the Skin from Scurff, Morphew, and other defilements and deformities thereof.

XI. *The Preparations.* You may have therefrom, 1. *The green Leaves.* 2. *A Liquid Juice.* 3. *A Syrup.* 4. *A Poſſet.* 5. *An Oil or Ointment.* 6. *A Cataplaſm.* 7. *A Diſtilled Water.*

The Virtues.

XII. *The green Leaves.* Rubbed upon the Teeth and Gums, is good againſt the Scurvy in them, ſo alſo being laid between the Lips and Gums all Night for a Week or Fortnight or more. Rubbed alſo upon Warts or Corns it cauſes them to waſte away.

XIII. *The Liquid Juice.* It cools Inflamations in the Eyes, being dropt into them, as alſo in other parts of the Body: it ſtops Bleeding and all hot Defluxions of Rheum into the Eyes, or Ears, and eaſes the pains of the Ears being dropt into them. Taken inwardly to a Spoonful or more in *Mead*, Spring Water, or in *Barly Water*, or in Red Wine, it ſtops the overflowing of the Terms in Women, and all ſorts of Fluxes of the Bowels, proceeding from heat and ſharp Humors. It Kills Worms in the Stomach and Guts, and being bathed upon the places, is good againſt the bitings of Venomous Beaſts. It is profitable alſo againſt *Anthonies* Fire, Shingles, Tettars, Ringworms, Scurff, Morphew, Tannedneſs, Sun-burning, Yellowneſs, and other defilements and deformities of the Skin, being bathed upon the Places, and double Cloths dipt in the ſame, being alſo applyed over.

XIV. *The Syrup.* It is good againſt Inflamations of Stomach and Lungs, Burning Fevers, and the hot Fits of Agues, being given a Spoonful or two, or more at a time, in a Glaſs of the *Diſtilled Water.*

XV. *The Poſſet Drink made of the Juice.* It has the Virtues of the *Syrup*, being taken in the ſame manner: and is good to cool and heal raw and galled places in Children, the parts being bathed therewith, and then afterwards anointed with the *Oil* or *Ointment*,

XVI. *The Oil or Ointment.* They cool Inflamations in any part, heal Shingles, Burnings and

Scaldings with Fire, Water, Oil, or other things, as alſo Cankers, running Sores, fretting Ulcers, Pimples, Leproſy, and other like Breakings out of the Skin. They give eaſe in the Gout, and all other pains proceeding from heat, and hot ſcalding or ſharp Humors, in what part of the Body ſoever: and have all the Virtues of the *Liquid Juice*, as to outward applications. Anointed on the Fore-Head, Temples, and Crown of the Head, it eaſes the Head-ach, Megrim, and allays the diſtempered heat of the Brain.

XVII. *The Cataplaſm.* Applyed to Inflamations, ſimple Contuſions or Bruiſes, *Anthony's* Fire, or other hot and fiery eruptions in the Skin, it alleviates the heat, and cures them; ſo alſo applyed in the Gout it gives eaſe to the part; and applyed to the Crown of the Head and Temples, it is good againſt Frenzies, Deliriums, and Madneſs, eaſes the pains of thoſe parts, and cools and allays the preternatural heat of the ſame; and has indeed all the Virtues of the *Juice*, *Oil* and *Ointment*, as to external Applications.

XVIII. *The Diſtilled Water.* Drank Inwardly. it has all the Virtues of the *Juice* and *Syrup*, tho' not altogether ſo powerful; it quenches Thirſt: allays inward Heats and Inflamations, and abates the ſharpneſs of Humors in the Stomach. Outwardly, it has all the Virtues of the *Juice*, *Oil* and *Ointment*, and in eſpecial is an incomparable thing againſt an *Eryſipelas*, and all External Heats, Pimples, eruptions of the Skin, and other deformations and deformities thereof. The *Diſtilled Water*, or the *Juice*, being bathed on any place ſtung with Nettles, Bees, or Waſps, or bitten with any Venomous Creature, it preſently gives eaſe, and takes away the pain thereof.

CHAP. DLXXIX.

Of PRIMROSE.

I. *THE Names.* It is called in *Latine*, *Primula veris* (for I know no *Greek* Name it has) which Name I ſuppoſe it has obtained, becauſe it is one of the firſt of thoſe Plants which Flower in the *Spring*; alſo, *Aliſma Sylvarum Columnæ*: and in *Engliſh*, *Primroſe*.

II. *The Kinds.* The *Primroſe* is ſaid to be a Species of *Herba Paralyſis*, or *Cowſlip*: and of this Species, there are two principal Kinds, *viz.* I. *Primula Veris*, or Primroſe, ſpecially ſo called, of which we ſhall treat in this Chapter. II. *Primula Veris pachyphyllos Lugdunenſis*, *Auricula Urſi*, The Bears Ear Primroſe, of which we ſhall treat, God willing, in the next Chapter following.

III. *The Kinds of the Primroſe ſpecially ſo called.* Of this there are theſe following Species, *viz.* 1. *Primula veris Flore albo*, The ſingle white Primroſe. 2. *Primula veris Flore viride ſimplici*, The ſingle green Primroſe. 3. *Primula veris Flore viridante & albo ſimplici*; The ſingle green and white Primroſe. 4. *Primula veris Flore viridi duplici*, The double green Primroſe. 5. *Primula veris Hesketi Flore multiplici ſeparatim Diviſo*, Heskets double Primroſe. 6. *Primula Hortenſis Flore pleno vulgaris*, The common double Garden Primroſe. 7. *Primula veris minor Flore duplici*, The ſmall double Primroſe. 8. *Primula veris Turcica Flore purpureo Tradeſcanti*, The Turky purple Primroſe. 9. *Primula veris Flore chermeſino Turcica*, The Turky crimſon Primroſe. 10. *Primula veris rubra*, The red Primroſe. 11. *Primula veris rubra*, The fair red Primroſe. 12. *Primula veris Phœnicea*, The ſcarlet Primroſe. 13. *Primula veris Flore geminato rubro*, The red Primroſe Hoſe in Hoſe. 14. *Primula veris rubra Flore duplici*, The double red Primroſe.

The Deſcriptions.

IV. *The firſt, or* Single white Primroſe. *It has a long, ſtringy, fibrous and buſhy Root, from the Head of which riſe up many Leaves, almoſt all in a cluſter, which are ſometimes* 2, 3, *or* 4 *Inches long, and ſometimes* 1 *or* 2 *broad, rough, full of Veins, and unevenly waved about the edges, narrow*

Primroſe.

at the bottom, and from thence gradually encreaſing in breadth till they come to their full breadth near the top, after which, they preſently grow narrow, and end in a ſomething obtuſe point. From among theſe Leaves ſpring up ſeveral ſmall whitiſh yellow Stalks, about 3, 4, *or* 5 *Inches in height, at the tops of which the Flowers grow in a ſmall rough whitiſh Husk, and of a pale or whitiſh yellow color, having five roundiſh Leaves dented about the middle of their edges, and of a pleaſant ſweet color. There is another Kind hereof, which is ſomewhat ſmaller, and bears Milk white Flowers, without any ſhew of yellowneſs in them, which are uſually brought into Gardens for their rarity, and differ not from thoſe juſt now deſcribed, either in Root, or Leaf, or any thing elſe, but having theſe yellow Spots ſmaller, and not ſo deep, as in the other* Wild Kinds

V. *The ſecond, or* ſingle green Primroſe. *This has its Leaves very like unto the* Greater double Primroſe, *but ſmaller, and of a ſadder green color.*

and

The Leaves stand severally upon long Foot-stalks, as the first Single Kind does, but longer than they, and more laid open, of the same, or very near the same yellowish green color that the Husk is of, so that at first opening, the Husk and the Flower seem to make but one double green Flower, which afterwards separating themselves, the single Flower grows out of the Husk and spreads it self open, much more than any other Single Primrose *does, growing in the end to be of a pale green color.*

VI. *The third, or* Single green and white Primrose. *The Leaves of this differ in a manner nothing from the former, neither does the Flower, but only in this, that out of the larger pale green Husks, which contain the Flowers of the former, there comes forth, out of the middle of each of them, either a small piece of a whitish flower, or else a larger, sometimes making up a whole Flower, like an ordinary* Primrose.

VII. *The fourth, or* Double green Primrose. *This Plant is in its Leaves, so like the former* Green Kinds, *That the one cannot be known from the other, untill it come to Flower, and then it bears upon every Stalk a double green Flower, of a little deeper green color than the Flower of the former* Single Kind, *consisting but of two rows of short Leaves most usually, and both of them of an equal height above the Husk, abiding a pretty time in Flower, more especially if it stands in a shady place, or where the Sun can come but a little to it.*

VIII. *The fifth, or* Hesket's double Primrose. *It is very like unto the* Double small Primrose, *as well in Root, as in Leaf, and Magnitude, the Stalk not rising much higher than it, but bearing Flowers in a far different manner. For this bears not only single Flowers upon several Stalks, but sometimes two or three single Flowers upon one Stalk and also at the same time a bigger Stalk, and something higher, having one green Husk at top thereof; sometimes broken on the one side, and sometimes whole; in the middle whereof stands sometimes, divers single Flowers thrust together, every Flower to be seen in its proper form. And sometimes there appears with some whole Flowers, others which are but parts of Flowers, as if the Flowers, were broken in pieces, and thrust into one Husk. the Leaves of the Flowers (being of a white or pale* Primrose *color, but a little deeper) seldom rising above the height of the very Husk it self. and sometimes, as I have observed in this Plant, it will have upon the same Stalk, which bears such Flowers as are here described, a small Flower or two, making the Stalk seem Branched into many Flowers, by which it is manifest, that it will diversifie it self into many forms, not abiding constant in any Year, as the other Kinds do.*

IX. *The sixth, or* Common double Garden Primrose, *The Leaves of this are very large, and like unto the* Single Kind, *but something larger, because of its cultivation in* Gardens. *The Flowers do stand every one severally, upon long slender foot Stalks, as the* Single Kinds *do; in greenish Husks. of a pale greenish color, like unto the* Field Primrose: *but very thick and double, and having the same sweet Smell with them.*

X. *The seventh, or* Small double Primrose. *This is in Root, Leaf, and Flower, altogether like unto the last* Double Primrose, *but that it is smaller in every respect, for the Flower rises not above 2 or 3 Fingers high, and but twice double, that is, with two rows of Leaves, yet of the very same* Primrose *color which the former is of.*

XI. *The eighth, or* Turky purple Primrose. *The Leaves of this are so like the other* Primroses. *that they can very hardly be distinguished until the Leaves appear, but the deep purple color; the Leaves of them are [illegible] with a deep Sutton like [illegible] with a greater grace therein in their [illegible] Common or Ordinary Primroses.*

XII. *The ninth, or* Tufty crimson Primrose. *This differs but little from the last, either in its Leaves, Stalks, Flowers, magnitude, and form of growing, nor indeed in any thing, except in the color of the flowers, which in this is crimson, as in the other it is purple.*

XIII. *The tenth,* or Red Primrose. *This is of a newer date than any of the former, but more beauty, and greater variety than the former. In Roots, Leaves and fashion, it differs not from the* Common single Field Primrose, *only the tops of the Roots, and bottoms of the Stalks are of a reddish hue; but the greatest difference is in the colors of the Flowers, there being of them, almost twenty several sorts of reds, some deeper, and others lighter, from blood red, to a pale* Pink *color, some are of a dewish* Rose *color, some fairer and paler, some of a brick color, some of a Deer color, others of the color of an old Buff Coat, and some Hair color. all which Kinds have been raised from Seeds, as also, those more excellent Kinds following.*

XIV. *The eleventh, or* Fair red Primrose. *It is a pleasant Flower, of a most beautiful, rich, shining, Velvet, red color, with a yellow Star in the bottom, as in all the rest.*

XV. *The twelfth, or* Scarlet Primrose. *It is a Flower of very great esteem, and of a bright scarlet color, and more rare than any of the former Kinds.*

XVI. *The thirteenth, or* Red Primrose Hose in Hose. *It has many Stalks rising from one Root, each of which bears a Flower, one in Hose in Hose upon every Stalk. that is two Flowers growing, one standing within the other, the one bigger, and of a deeper red color, the other smaller and paler. Of this Kind Mr. Rea says, he had raised six several diversities, differing from each other, either in size, fashion, or color.*

XVII. *The fourteenth, or* Double red Primrose. *It is the rarest of all the Kinds. The Flower is said to be almost as large, thick and double, as the* common pale yellow Kind, *and of a fair red color. for the sake of this Flower, much Seed has been sown, in hopes to have obtained it.*

XVIII. *The Places.* The first three Kinds have been found growing Wild in most places of this Kingdom. The eighth and ninth came to us out of *Turky*: but now all the various Kinds here Treated of, are found to grow in *Gardens*, and are Nursed up by the diligent lovers of Flowers. The *English Kinds* are hardy and prosper in any place, which is not too hot, or too much in the Sun. The *Red Kinds* are planted, sowed, and ordered in the same manner as we do *Bears Ears*. Yet if sowed in a Bed of good Earth, towards the end of *September*, they will come up in the *Spring*, and soon come to bear Flowers. *Hesket's Primrose* grows in *Clapdale Wood*, 3 Miles from *Settle*, in *Yorkshire*.

XIX. *The Times.* *Primroses* Flower generally very early in the *Spring*, and sometimes again in *Autumn*. Some Flower earlier, some later, and some in the midst of *Winter*, as they are defended from Cold and Frost, and the mildness of the *Winter* will admit. The *Common double Primrose* Flowers

Flowers in *April:* the *Common ſingle* and *red Kinds* in *March:* and many of them will begin in *September*, and continue bearing Flowers all *Winter* unleſs checked by hard Weather.

XX. *The Qualities, Specification, Preparations,* and *Virtues* of *Primroſes*, are the ſame with thoſe of *Cowſlips*, in *Chap.* 157. *Sect.* 18. *ad* 32, aforegoing, to which we refer you.

XXI. *An Obſervation. The Juice of Primroſe Roots.* Being Snuft up the Noſe, or gently Syringed up with a ſmall Syringe, it purges the Head and Brain of cold, moiſt, and pituitous Humors, which afflict the Original of the Nerves, and cauſe Apoplexies, Epilepſies, Vertigo's, Megrim, Head-ach, Carus, Lethargy, Convulſions, Palſies, Rheumatiſms, and other Diſeaſes of like Kind. I cured a Man who had four Fits of an Appoplxey, by the uſe of this Errhine; and a little Youth of an Epilepſy, by the uſe of it ſeven or eight times, and taking the *Pouder of the Root* alſo inwardly: I cured an Ancient Gentlewoman of a Lethargy therewith; and two other Young Gentlewomen, one of a Megrim, the other of an inveterate Head-ach.

XXII. *Another Obſervation. The Pouder of the Roots.* Given to a Dram and half, or more, it purges the Head, Brain, and Stomach, of cold, moiſt and putrid Humors; and is prevalent againſt all the Diſeaſes for which the *Errhine* or *Juice* is exhibited. It purges Choler and Flegm very well. With 10 Doſes of this *Pouder* I cured a middle Aged Woman of the Palſy: and with much the like number of Doſes, I cured a Man of 50 Years old, of the Gout; proper Topicks being alſo in the mean ſeaſon applied.

XXIII. *A third Obſervation. The Decoction of the Roots in Wine.* It is good againſt the Stone in the Reins and Bladder, and heals inward Wounds and Bruiſes; and bathed upon weak Joints it ſtrengthens them. *The Decoction of the Leaves and Flowers in Wine*, being drank, it is good againſt Aſthma's, Coughs, Colds, Hoarſeneſs, Wheezings, ſhortneſs of Breath, and all other Diſeaſes of the Breſt and Lungs; and is ſaid to draw any Thorn or Splinter out of the Fleſh.

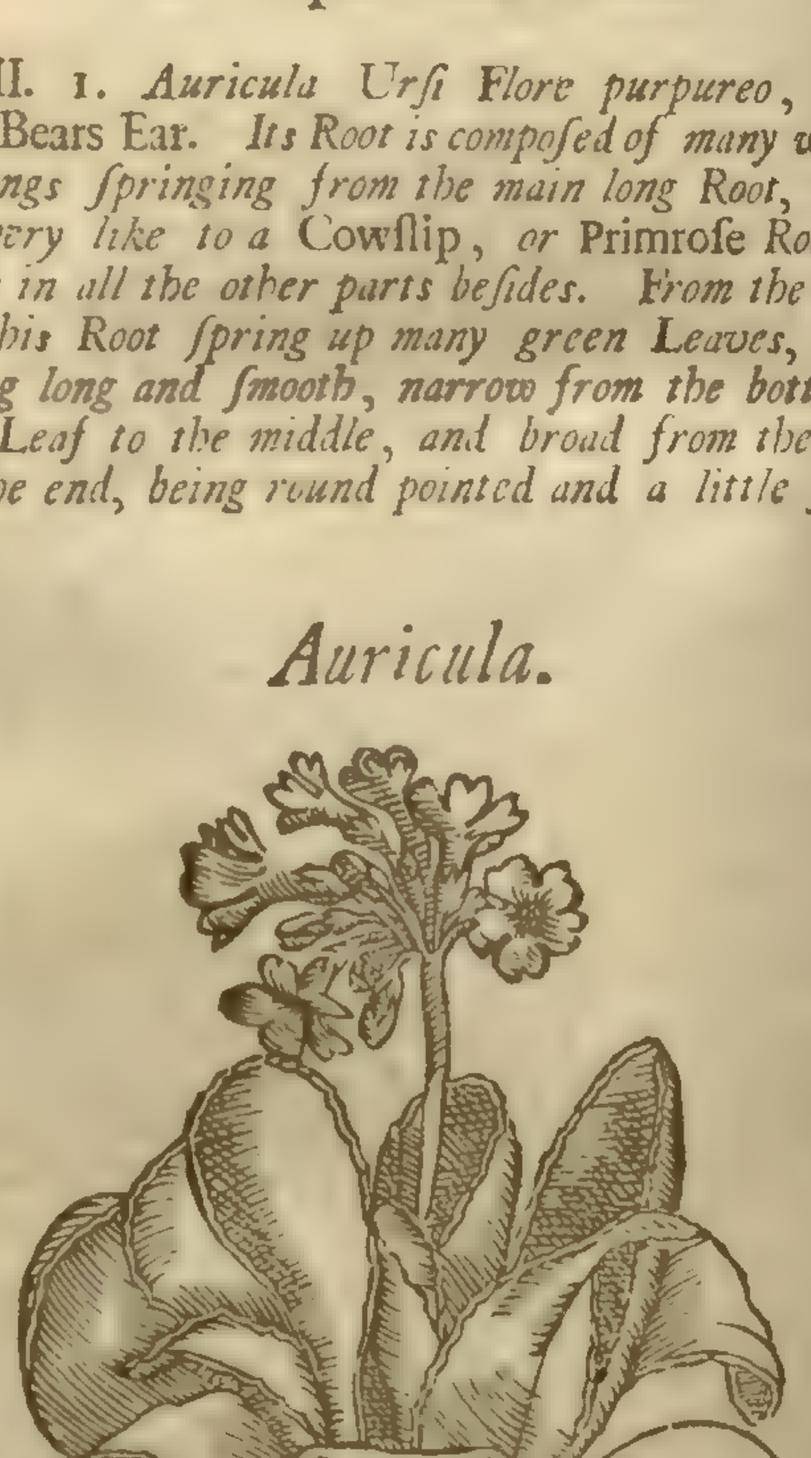
II. *The Kinds.* We have already treated of of theſe *Auricula's* under the Title of *Bears Ear*, in *Chap.* 59. aforegoing, where we have given you a compleat Deſcription of the three principal Kinds, which may ſerve for all the ſeveral individual Species of *Auriculæ.* But they being properly *Primroſes*, and this being the place, in which they ought to be methodically treated of, we ſhall for the ſake of *Floriſts*, and all Lovers of the *Flower Garden*, expatiate our Diſcourſe, and more largely ſhew you a great many of the Individuals, which for brevity ſake we before omitted. We ſhall treat of them, with reſpect to their colors, which are chiefly, 1. *Purple and Blew.* 2. *Red or Scarlet.* 3. *Yellow or Buff.* 4. *White.* In each of which we ſhall ſhew you ſo many fine and delicate Species or Individuals, as may be ſufficient to Stock a *Floriſts Garden*, who from their Seeds, being managed according to the following directions, may raiſe many new Varieties. The number of the various ſorts being many, we ſhall not give you their Names here, but put them to each Plant, in its order, as it is treated of.

The Deſcriptions.

I. Purples *and* Blews.

III. 1. *Auricula Urſi Flore purpureo*, Purple Bears Ear. *Its Root is compoſed of many whitiſh Strings ſpringing from the main long Root, which is very like to a* Cowſlip, *or* Primroſe *Root, as it is in all the other parts beſides. From the Head of this Root ſpring up many green Leaves, ſomething long and ſmooth, narrow from the bottom of the Leaf to the middle, and broad from thence to to the end, being round pointed and a little ſnipt,*

Auricula.



CHAP. DLXXX.

Of PRIMROSE Bears Ear.

Vulgarly called

AURICULA.

I. THE *Names.* This Plant knows no Ancient *Greek* Name; but it is, called by *Lugdunenſis*, *Primule veris* πα*χύφυλλος* (from the thickneſs of the Leaves) *The thick Leav'd Primroſe.* It is alſo called *Sanicula Alpina Bauhini & Geſneri*, for they will have it to be a Species of the *Sanicles*; however it is a very good Wound Herb: by others, *Sanicula altera*, *Paralytica Alpina*, The *Alpine* or *Mountain Cowſlip*, becauſe it is certainly of the Family of the *Cowſlips:* but now in our time it is moſtly called *Auricula Urſi*; and we in *Engliſh* call it, *the Bears Ear Primroſe*, alſo *Bears Ear*, and *Auricula* (without any other addition,) which is the moſt Common and uſual Name.

or indented about the edges. In the middle of these Leaves, *and sometimes at the side, do spring round green Stalks four or five Fingers high, bearing at their tops, many Flowers, the buds whereof, before they be blown, are of a deep purple color, and being open, are of a bright, but deep purple, usually called a Murrey color; consisting of five Leaves a piece, cut in, or indented at the end, as it were into two, with a whitish ring or circle at the bottom of each Flower, which stand in small green Cups: in which after the Flowers are fallen, are contained very small Heads, not rising to the height of the Cups, bearing a small Prick or Pointel at the top of them, in which is small blackish Seed.*

IV. 2. *Auricula Ursi purpurea absque orbe*, The Murrey Auricula without Eyes. *This is another of the former Kind, whose Leaf is somewhat less, as is also the Flower, but of the same color, and sometimes something redder, tending to a Scarlet, without any circle at the bottom of the Flower: but in nothing else, differing from it.*

V. 3. *Auricula Ursi Flore purpureo cæruleo*, The Violet purple colored Bears Ears. *The Leaves of this are something mealy and large; and the Flowers hereof, are of a paler or blewer purple than the first, something tending to a blew.*

VI. 4. *Auricula Ursi Flore purpureo eximio*, The beautiful purple Auricula. *It is a strong Plant with large Leaves, having a big tall Stalk, bearing a great Truss of many fair, fine, rich, purple Flowers, with Snow white Eyes, which will not wash yellow with Rain, as some do, but abide white to the last.*

VII. 5. *Auricula purpurea pulcherrima*, A fine purple Bears Ear. *This is like the former in all the parts, but that the great Head of Flowers stands more erect, and is of a deeper purple color, with broader white Eyes.*

VIII. 6. *Auricula purpurea alia*, Another purple Bears Ear. *It is a very good Flower, fair and large, many on one Stalk, of a lighter purple than any of the former, with fair white Eyes. There is another of this kind, something like this in color, but brighter, and bearing more Flowers, with large round white Eyes.*

IX. 7. *Auricula purpurea bona*, The good purple Bears Ear. *It is an excellent good Flower; and bears a great Truss of rich shining purple Flowers, with very large white Eyes.*

X. 8. *Auricula purpurea colore albo radiata*, The purple striped Auricula. *It is small in all its parts, has a weak low Stalk, bearing 4 or 5 purple Flowers, striped with white. And of this sort and color there is one which bears double Flowers.*

XI. 9. *Auricula Flore Cæruleo folio Boraginis*, The Borage Leav'd blew Auricula. *It is brought into the Kindred of the* Auriculæ *only for the form of the Flowers sake. It has a Root which is long and brownish, with many small Fibres annexed to it. It has several rough, broad, hairy Leaves, spread on the Ground, like to those of* Borage *for the roughness, but much lesser, the Leaves hereof being something rent in some places on the edges. From among these Leaves rises up one Stalk, but sometimes two or more Stalks, which are brown and hairy, five or six Inches high or thereabouts; each bearing at the top three or four Flowers apiece, consisting of five Leaves, which are large and sharp pointed; of a fair rich blew, or bright azure color, with some small yellow threads in the middle, standing in small green Cups. This Plant as it is rare, so it is tender, and impatient of our cold* Winters, *and therefore requires to be planted in a Pot, that it may be Housed in* Winter.

XII. 10. *Auricula Ursi Flore purpureo duplici varia*, The various double purple Flower'd Auricula. *This purple Flowered, has its Flowers but once more double than the single; but is various in its purple color.*

XIII. 11. *Auricula Ursi Flore Cæleste*, The azure or Sky blew Bears Ears. *This has its Leaves broader, and of a dusky yellowish green color; the Flowers being of a blewish color, tending to a purple.*

XIV. 12. *Auricula Ursi Flore cæruleo diluto*, The pale blew Auricula. *It is something like unto the last in its green Leaves: but the Flowers are of a paler blew color.*

XV. 13. *Auricula Ursi Flore purpureo rubro vario*, The fair Collier, or Violet purple colored Auricula. *It has a pale greenish Leaf, without dents, and somewhat a large Flower of a delicate* Violet *purple color, something sad, but very lively.*

XVI. 14. *Auricula Ursi Flore purpureo cæruleo folio incano.* The purple blew Auricula, with a mealy Leaf. *The Flower is of a purplish blew color, with a white bottom, and a mealy Leaf.*

II. Reds, Crimson *and* Scarlet.

XVII. 15. *Auricula Ursi Flore rubro saturo orbe luteo*, Deep, *or* blood red Auricula, with a yellow Eye. *It has small and long green Leaves, nothing mealy, but snipt about the edges, from the middle of the Leaves forwards to the ends. The Flowers hereof are of a deep red color, tending to a Blood red, with a deep yellow circle, or rather bottom in the middle.*

XXVIII. 16. *Auricula Ursi Flore rubro saturo absque orbe*, The deep, *or* Blood red Auricula without an Eye. *This is another Kind, having small and long green mealy Leaves, smaller than any that have mealy Leaves. The Flowers are of the same deep red color with the last described, but without any Eye or circle at bottom, of any other color whatsoever.*

XIX. 17. *Auricula Ursi Flore obsoleto magno*, The Spanish blush Auricula. *This* Great Auricula, *has as large Leaves as any other of this Kindred whatsoever, and whitish or mealy withall, something snipt about the edges, as many others of them are. The Flowers stand at the top of a strong and tall Stalk, larger than any of the others, being of a dusky blush color, resembling the blush of a* Spaniard, *whose tawny Skin cannot manifest so pure a blush, as the* English *can, for which reason it is called the* Spanish blush.

XX. 18. *Auricula Ursi Flore rubello*, Scarlet or light red Auricula, or Bears Ear. *The Leaves of this Kind are very like the Leaves of the first* purple Kind, *but that they are not so thick, of a little paler green color, and little or nothing snipt about the edges. The Flowers are of a bright, but pale reddish color, not half so deep as the two, with white Eyes or circles in their bottoms; in other things it differs not from others.*

XXI. 19. *Auricula Ursi colore Roseo*, The Rose colored Auricula or Bears Ear. *The Leaf of this is almost as large as any of the former, and a little mealy. The Flowers are of a light red,* or Damask, *or* Province Rose *color very near, with a white Eye at botom.*

XXII. 20. *Auricula Ursi Imperialis*, The Imperial Auricula or Bears Ear. *It might be reckoned with the Purples, but is rather a dark or dead*

Red;

Red; it has small Leaves and a short Stalk, but bears many fair Flowers close set together, of so dark a red or purple color, that with out much error it may be called black, with fair Snow white Eyes.

XXIII. 21. *Auricula Ursi Imperator vocata*, The Emperor. *It is like the last, only a little bigger in all its parts, but of as dead or black a red color, with fair white Eyes. This has been lately raised from Seed.*

XXIV. 22. *Auricula Ursi Flore rubro sive Coccineo*, The red or Scarlet Auricula. *This is of divers sorts, it has large Leaves, a strong upright Stalk, bearing a great Truss of fine scarlet Flowers, with Snow white Eyes.*

XXV. 23. *Auricula Ursi Flore Sanguineo*, The Blood red colored Auricula. *It is of two sorts*, 1. Flore Sanguineo saturo, *which is of a deep crimson* Velvet *color.* 2. Flore Sanguineo diluto, *or fair bright Crimson. It has Leaves of a middle size more green than mealy, and Flowers of a bright crimson color, larger than the deep Blood red following.*

XXVI. 24. *Auricula Ursi Flore Sanguineo saturato*, The Crimson, or deep Blood red Auricula. *It has a yellowish green Leaf, something small and long, with a few dents on the edges. The Flowers are of a deep Blood red color with a yellow Eye, and but a few upon a Stalk.*

XXVII. 25. *Auricula Ursi Flore Carneo colore Variegato*, The various Flesh colored Auricula. *Of this* Flesh and bluth colored Auricula; *there are various sorts, some paler, some deeper, more or less beautiful by much than others, and with such wonderful variety of colors, not easily to be expressed, which arise almost every Year from the Seed. There are divers other sorts of Reds inclining to Scarlet, Crimson, Carnation,* Rose *colors, and Blushes, some redder, some yellower than others, some with large Flowers, and many on a Stalk, with white or pale yellow Eyes, for many of which new invented Names have been imposed, not worth our Remembring here.*

XXVIII. 26. *Auricula Ursi versicolor prima, sive Flore rubescente*, The Prime or Chief variegated bluth Auricula or Bears Ear. *Its Leaves are as large, and as hoary and mealy as the third or* Greater yellow *or* Straw colored Auricula, *at* Sect. 31, *following; from among which rises up a Stalk about* 4 *or* 5 *Inches high, bearing from* 6 *to* 12 *or more fair Flowers, something larger than the* Smaller yellow Auricula, *having the ground of the Flower of a dark or dun yellow color, shadowed over a little, with a shew of light purple, which makes a kind of blush color; the edges of the* Flower *being tipt with a little deeper shew of that purple color, the bottoms of the Flowers being wholly yellow, without any Eye or Circle, and is of very great beauty, making an admirable variable colored* Auricula.

III. Yellows, Buff, *and* Tawney.

XXIX. 27. *Auricula Ursi maxima lutea Flore Eleganti*, The greatest fair yellow Auricula or Bears Ear with Eyes. *It has many fair and large thick Leaves, somthing mealy or hoary upon the greenness, being larger than any other Kind, except the* Spanish Blush, *at* Sect. 19, *aforegoing, and the next* Yellow *following, smooth about the edges, and without any indenting at all. The Stalk is large, round, and not higher than in some others of the former, but bearing many more Flowers thereon than in any other Kind, many times to the number of thirty, standing so round and close together, that they seem to make a Nosegay alone, and of the same fashion with others, but that the Leaves are shorter and rounder, yet with a notch in the middle like the rest; of a fair yellow color, neither very pale nor deep, with a white Eye or Circle in the bottom, about the middle of every Flower, which gives it the greater grace. The Seed is of a blackish brown color like unto others, but contained in greater round Heads than any other, with a small pointel sticking in the middle. Its Root is greater and thicker than any other, with long Strings or Fibres but greater than any of the former.*

XXX. 28. *Auricula Ursi major lutea folio incavo*, The greater yellow Auricula, or Bears Ear. *Its Leaves are larger, and more hoary or mealy than the last or any other of these Kinds. The Flowers are not so many, but longer and not so thick thrust together, but of a deeper yellow color, without any Eye, or Circle in them.*

XXXI. 29. *Auricula Ursi major Flore Pallido*, The great Straw colored Auricula, or Bears Ear. *This has almost as mealy Leaves as the last, but nothing so large. The Flowers are of a fair Straw color, with an Eye or white Circle at their bottoms. These three last have no shew or shadow of any other color in any part of the edge, as some others which follow have.*

XXXII. 30. *Auricula Ursi minor Flore pallente*, The lesser Straw colored Auricula. *The Leaves of this are less mealy, or rather of a pale green, a little mealy withal. The Flowers are of a paler yellow, than the last, and it bears almost as many upon a Stalk, as the first* Great yellow.

XXXIII. 31. *Auricula Ursi minor lutea*, The lesser yellow Auricula, or Bears Ear. *Its Leaves are nothing so large, as either of the three former* yellow Kinds, *but rather of the bigness of the first* White Kind, *at* Sect. 43. *following, but yet a little larger, thicker and longer than it, having under the greeness a small shew of mealiness, and something snipt about the edges. The Flowers are of a pale yellow color, with a small white Eye or bottom in them. The Seed and Roots are like the other Kinds.*

XXXIV. 32. *Auricula Ursi Flore flavo*, The deep yellow Auricula, or Bears Ear. *This has something larger Leaves than the last, of a yellowish green color, without any mealiness on them, or indenting about the edges, but smooth and whole. The Flowers are not larger but longer, and not laid open so fully as the former, but of as deep a yellow color, or deep* Cowslip *color, without any Circle in the bottom. Neither of these two last have any shew of other colors than yellow in them, saving the white in the Eye.*

XXXV. 33. *Auricula Ursi minor Flore fulvo*, The tawny Auricula, or Bears Ear. *It has a greater shew of mealiness in its Leaves, than is to be seen in the* Second Kind, *at* Sect. 4 *aforegoing, and snipt or indented at the ends like that, the Flowers are many, of the same fashion with those, but smaller, each of which is of a deep Murrey, or rather Tawney color when it is blown, as the Buds of the above named are before they are blown; having an Eye or white Circle at bottom, which is yellowish in the middle below the Circle.*

XXXVI. 34. *Auricula Ursi Crinis coloris*, The Hair colored Auricula. *Its Leaves are more mealy than those at* Sect. 28. *aforegoing, and somewhat longer and larger, snipt also about the edges in the same manner, from the middle of the Leaf forwards. The Flower is usually of a fine light brown yellow color, by some called Hair color, and sometimes browner. The edges of the Flower have a shew or*

shadow

Shades of a light purple or Gold colour come, but were on the whole Flow as the right. Of the Species are drawn here.

XXXVII. 27. *Auricula Ursi Flore luteo variabili*, The yellow variable Bears Ear. *Its Leaves are green and farinaceous like the* Deep yellow, *at Sect.* 22. *aforegoing, but smaller, of a fresher green, more hairy and finer, more jagged about the edges towards the ends, as most of those before are. The Flowers are of a fair yellow, much laid open, when they are full blown, and they seem single but, duskt about the edges only, with purple, being more yellow in the bottom, than in any other part.*

XXXVIII. 28. *Auricula Ursi versicolore luteo-cente viride Flore*, The Variable yellow green Auricula, *or* Bears Ear. *Its Leaves are green, much like to those last described, and set in the manner about the edges: but in this it differs, that its Leaves do not turn or fold themselves a little inwards. The Flowers are of a yellowish green color, more clased than the former, having purplish edges, especially after they have stood blown some time, and have little or none at the first opening, nor yet any Eyes or circles at all in them.*

XXXIX. 27. *Auricula Ursi Flore luteo eximio*, The Noble yellow Flowered Auricula. *It bears the largest Flower and biggest Trusse, of the deepest yellow color having white Eyes. Of this Species there are some whose Flowers are of a buff color, some yellower and some dunner than others, which are in good Esteem. There is also one, which on a short Stalk bears four or five double Flowers, with three rows of Leaves in each Flower.*

XL. 28. *Auricula Ursi versicolore luteo*, The variable yellow Auricula. *Its Ground is yellow, but it is so diversified or varied with other colors, impossible to be expressed in Words; and they are so many that some Authors have said, they are numberless.*

XLI. 29. *Auricula Ursi Flore luteo Fusco*, The Leather Coat Auricula, *or* Bears Ear. *It is of two Kinds, the greater and lesser, and deeper and paler, one than other. They have all large mealy Leaves, yet not so much as in the* Greatest yellow; *but yet it seems that they are produced from thence, they come so near to it. Of this sort is the Shammy colored.*

XLII. 40. *Auricula Ursi Flore Limoniaco*, The Limon colored Auricula, or Bears Ear. *It is of a delicate pale yellow color, and of a middle size, both for Leaf and Flower. Of this other sort of plain yellows, there are a very great number, impossible to be distinguished.*

IV. Whites.

XLIII. 41. *Auricula Ursi major Flore albo*, The great white Auricula, *or* Bears Ear. *Its Root is like the* Purple Kind, *as all or most of the rest are, or not much differing. It has many fair whitish green Leaves some what paler than the Leaves of any of the Kinds of* Auriculæ, *and a little snipt about the ends, as many others are. From among these Leaves rise up Stalks four or five Inches high, bearing at the top many Flowers, like unto the* Small yellow Auriculæ, *at* Sect. 32. *aforegoing, of a pale whitish color, tending to yellow at the first opening of the Flower; which after 2 or 3 days, change into a fair white color, and so continue all the while it Flowers.*

XLIV. 42. *Auricula Ursi minor Flore albo*, The lesser white Auricula, *or* Bears Ear. *It has smaller Leaves of a more dusky green color. The Stalk and Flowers are lesser than the former, and have no Paps of Farinaceous Meal at all as other Kinds of it have, but is more dusky, and dropping.*

XLV. 43. *Auricula Ursi Flore Nivis*, The Snow white Auricula, *or* Bears Ear. *The Flowers are of a pure Snow white color, but smaller than those in Sect.* 42. *aforegoing, although as to all other things it is much alike.*

XLVI. 44. *Auricula Ursi Flore albido vel Pallido*, The whitish Auricula, *or* White mixt with a pale blush. *Of these there are various kinds according to the different mixture of it is red with the white, pale or deeper.*

XLVII. 45. *Auricula Ursi Flore albo Lactes, seu Virginum, or Ursi Virginis dicti*, The Milk white Auricula, *called also*, Virgins Milk, *which is accounted the best among the Whites. It has large mealy Leaves, a tall strong Stalk, with a great Truss of Milk white Flowers, with Snow white Eyes, which placed among the* Purples *sets off, and adds to their grace. There are many perfectly white, and many Milk whites; but not many of better esteem than the* Yellows.

XLVIII. 46. *Auricula Ursi Flore multiplici albo Lacteo*, The double Milk white Auricula, *or* Bears Ear. *The Leaves are like the former. The Stalk bears but one Flower on its top; but it is very double, and like the* Common double Primrose.

XLIX. *The Places.* These goodly Plants grow Naturally on Mountains, especially on the *Alps* in divers places, for which reason some call them *Primula veris Alpina*: some of them have been found also on the *Pyrenean Mountains*: but that Kind with the *Borage* Leaf, has been found on the Mountains in *Spain*, and on the *Pyrenæans* next to *Spain*. From which places they have been transferr'd to us, into our *Gardens*, and into almost all the *Gardens* of *Europe*, where they thrive admirably well.

L. *The Times.* They all Flower from the beginning of *April* to the beginning of *May*, and the Seed is ripe in the end of *June* or beginning of *July*. And sometimes they will Flower again in the end of *August*, or beginning of *September*; if the Season prove temperate, moist and rainy: but those Flowers which come then, are neither so fair, nor so many on one Stalk, as those which come in the *Spring*.

Directions for Planting them.

LI. The best sort of *Auriculæ* are set in Pots, which they well deserve; the Pots are to be filled almost half full with sifted Neats Dung, the rest with good Sandy Earth, well mixed with sifted Dung. About the end of *August* set the Plants therein, and not too deep, for the Roots will be apt enough to run downwards. Place these Pots in the Sun all the *Winter*, and with Glasses defend them from over much wet, but House them not, they will do better in the open Air. In the *Spring*, when they rise to Flower, remove them into a place more shady; and after the Flowers are past (except those you leave for Seed) you may dispose them in some shady place out of the way, to make room for Pots with *Gilliflowers*.

LII. But if you Plant them in the Earth at large, and not in Pots, let it be in some place a little shaded from the scorching heat of the Sun; the Soil being first made very Rich, if stiff, with Sand and store of well rotted Neats or Cows Dung;

and in this let the Roots be Set, a Foot asunder (for they spread wide, and will not thrive if they want room.) The best way of Planting them, is, open a wide Hole, leaving or raising a little Hill in the middle thereof, then to set the Root thereon, and spread the Fibres round about it; lastly, to cover them with Earth, and so to Water them. After the middle of *August*, every other Year, take them up, and then mend or enrich the Soil where they grow, with sifted Neats or Cows Dung; and having slipped or parted the Roots, and cut off the Fibres which are too long, set them in the same place again. By this means you will not fail to have them thrive, and bear store of Flowers. But if you let them stand too long unremoved, or in poor or stiff Ground, you must expect a crop of Flowers accordingly.

LIII. *The raising variety of them from Seed, is a Secret, with which few are well acquainted, and it is to be performed with something more than common diligence, by the following method.* When the Flowers are past and the Stalks begin to grow yellow, you may observe in the top of the little round Seed Vessel, a small hole, and then you may be sure, that the Seed is almost ripe, and which if you do not carefully look to, will all of it fall before you are aware. So soon therefore, as you perceive it to be ready, cut down the Stalks, and keep the tops upright, for if you turn them downwards all the best Seeds will fall out. Then bind them up in Bundles or Handfuls, and place them upright, to the Glass of some South Window, where (by the warmth of the Sun) they will harden, and be much the better.

LIV. About the end of *August*, or beginning of *September*, prepare some square Box or Boxes, according to your store of Seeds; let them be 9 or 10 Inches deep, and of what breadth you please, with some holes in the bottom to let out the Water, which fill three parts full with fine Sandy sifted Earth, one half whereof let be well rotted Neats Dung, which well mingled together, and laid smooth with your Trowel, lay thereon a Fingers thickness of fine sifted *Willow* Earth, or for want thereof, of dryed Cow Dung beaten small, mixed with a little good Earth and sifted, and sow your Seeds thereon, mixt with Wood Ashes, which by their color will direct you to sow them the more suitably: sow them not too thin, for all will not come up; and if they do, they may easily be removed to another place.

LV. The Seeds being thus sow'd, cover them half a Finger thick with the same Earth, you put next under them, which press down lightly, and let them remain in the Sun and Air, till they begin to come up, which will be about *April* next, and then they must be removed into the Shade, and often gently Watred. As soon as they are grown to any considerable bigness, take some of them up where they are too thick, and set them presently in some Bed prepared for that purpose, eight Inches asunder, where they may remain, till they come to bear Flowers. And those you leave in the Box, may be Transplanted in the end of *August*, after the same manner, and so the Box will be ready again to sow more Seeds in. Some of them will bear the *Spring* following, others about *August* the Year after they were sowed; and the rest, the *Spring* then next following, provided the Earth you set them in be rich and good, otherwise you will fail of your expectation.

LVI. Some think that the best time to sow the Seed in, is, in the beginning of *October*, others at the end of *February*: but having tryed all those Seasons, it has been found that the end of *August* or beginning of *September*, are the best times for that purpose; for the Seeds are so small, that if they be kept any time out of Ground, they will dye and become unprofitable. You are also to observe, that you save the Seed of the choicest and best Flowers, for from thence must come all your Expectations. Such Flowers as you dislike, cast their Seed away, it is not worth saving; by this means having the best Seed, sowing it in due time, and that also in prepared Earth, and then seasonably removing them, into their destinated places, you may reasonably expect not only a great Variety of admirable Plants, but even all that you can desire to result from the same.

LVII. *The Qualities, Specification, Preparations,* and *Virtues* of *Bears Ears*, are the same in all respects with those of *Primroses* and *Cowslips*, which if you please, you may see at large, in *Chap.* 59. *Sect.* 8. *ad* 18. and *Chap.* 157. *Sect.* 18. *ad* 32. as also, in *Chap.* 579. *Sect.* 21. *ad* 23. aforegoing, to all which places we refer you, it being needless to repeat the same things over and over again.

CHAP. DLXXXI.

Of PURPLE-WORT, *OR*, PURPLE-GRASS.

I. *THE Names.* This Plant has no *Greek* Name that I know of: but it is called in *Latine*, *Quadrifolium fuscum*; *Gramen purpureum*; *Lotus Quadrifolia*; and in *English*, *Purple-wort*, or *Purple-Grass*.

II. *The Kinds.* Authors make it a Species of the *Trefoils*, as *Casper Bauhine* in his *Pinax*, who calls it *Quadrifolium hortense album*, as *Lobel* and *Pena* call it *Quadrifolium phæum fuscum hortense, vel hortorum*; which is *Four Leav'd Grass*, or our *Purple-Grass*, and is a singular Plant, *sui Generis*.

The Descriptions.

III. *It has a long stringy Root, furnished with many fibres and knobs, buds or protuberances, as it were springing from them: from this Root rises several creeping Branches, which spread themselves on the Ground, having at their ends several Leaves like those of* Trefoil, *it has for the most part four Leaves (whence the Name* Quadrifolium) *yet sometimes but three, and sometimes five, and sometimes seven*, (Foliis quaternis, quinis, aliquando Septenis donatur, dixit Bauhinus,) *these Leaves are of a sad green color, with a shadow of dark purple*

cast

Purple-Wort.

caſt over them, (whence came alſo our Engliſh *Name* Purple-Graſs.) *The Flowers are in form like the other* Medow Trefoils, *and of a white or whitiſh color.*

IV. *Gerard* deſcribes it thus. *This Kind of* Three Leav'd Graſs, *or rather* Four Leav'd, *has Leaves like unto the* Common Trefoil, *ſaving that they are leſſer, and of a brown purpliſh color, known by the Name of* Purple-Wort, *or* Purple-Graſs, *whoſe Flowers are in ſhape like unto the* Medow Trefoil, *but of a duſky overworn color, tending to whiteneſs; the which does oftentimes degenerate, ſometimes into three Leaves, ſometimes into five, and alſo into ſeven; and yet the Plant of its own Nature has but four Leaves and no more, but* Johnſon *in* Gerard, *ſeems not to admit it to have white Flowers: for that the Plant with white Flowers, he could never find had more than three Leaves upon a Stalk.*

V. To this we may add, *Trifolium pratenſe minus purpureum*, Small Meadow Purple-Graſs, *or* Purple Trefoil. *Its Root is ſlender, white, and woody, which ſends up ſmall hard Stalks about a Foot high, full of Branches, bearing on ſome three Leaves, and on ſome other Branches and Joints, four ſmall Leaves, like a* Lotus. *The Flowers grow many together, at the tops of the Sprigs, being very ſmall, and in a looſe Head, of a purpliſh red color.*

VI. *The Places.* The firſt grows only in *Gardens*, and is ſcarcely ever ſeen any where elſe: for the *Wild* which is thought by ſome to be the true *Purple-Graſs*, is not it. The ſecond grows with us only in *Fields* and *Medows*, in moſt places of this Kingdom.

VII. *The Times.* They both Flower in the *Summer* Months, *viz.* in *July* and *Auguſt*, and their Seed is ripe not long after.

VIII. *The Qualities.* *Purple Grais* is temperate in reſpect to heat or cold, and dry in the firſt Degree; Aſtringent, Stomatick, Cardiack, Antiſeptick and Alexipharmick.

IX. *The Specifick.* It is generally given through the Kingdom, for the cure of the Purple Fever, or the Purples (as it is commonly called) in Children, as alſo in elder People.

X. *The Preparations.* You may have therefrom, 1. *A Liquid Juice.* 2. *An Eſſence.* 3. *A Decoction in Wine or Water.*

The Virtues.

XI. *The Liquid Juice.* Given to 4 Spoonfuls more or leſs, it prevails againſt all ſorts of Burning Fevers, more eſpecially againſt that called the Purple Fever. Dropt into the Eyes it repreſſes or ſtops a Flux of Rheum into them, and cures Redneſs or Inflamations, and Blood-ſhot.

XII. *The Eſſence.* Drank inwardly to 2, or 4, or more Spoonfuls, it is good againſt the bitings of Vipers, or of any other poiſonous ſerpent, waſhing the place bitten with the ſame. It Speedily alſo cures Green Wounds, they being daily once or twice a day waſh'd therewith, uſed Clyſterwiſe, it is good againſt Fluxes of the Bowels, ſtrengthens the Guts, and prevails againſt a *Tenſmus*, or continual provocation or deſire to go to Stool: and is profitable to ſtop the Whites in Women.

XIII. *The Decoction in Wine or Water.* It has been given with good ſucceſs againſt the Purple Fever, commonly called the Purples in Children, and alſo in elder People; and has indeed all the Virtues of the *Liquid Juice* and *Eſſence*, but much weaker, and therefore ought to be given in a larger Doſe, as from a quarter of a Pint to half a Pint.

CHAP. DLXXXII.

Of PURSLANE Garden and Wild.

I. *The Names.* It is called in *Arabick*, *Bakle ancha*, and *Bachele albamica*: in *Greek*, by *Dioſcorides*, Ἀνδράχνη, *Andrachne*: and by *Theophraſtus*; Ἄνδραχνη, *Adrachne*: in *Latine*, *Portulaca*: and in *Engliſh*, *Purſlane*.

II. *The Kinds.* There are two Principal Species of this Plant, *viz.* I. *Portulaca terrena, vel terrigena*, The Land Purſlane, of which in this Chapter. II. *Portulaca Hydatica*, Sea or Water Purſlane, of which in the next Chapter.

III. *The Varieties of the Land Kinds.* Theſe are, I. *Portulaca Hortenſis*, The Garden Purſlane, which is, 1. *Portulaca Hortenſis viridis communis*, Our common Green Purſlane. 2. *Portulaca Hortenſis aurea*, Golden Leav'd Purſlane. II. *Portulaca Sylveſtris*, Wild Purſlane, which is, 2. *Portulaca agreſtis major*; *Portulaca Sylveſtris major*; *Portulaca minor*, *Camerarii & Geſneri*, *Portulaca Anguſtifolia Bauhini & Cæſalpini*; *Cepæa Cordi*, for *Cordus* upon *Dioſcorides* ſays that *Cepæa* is no other than *Portulaca Sylveſtris*, The greater Wild Purſlane. 4. *Portulaca agreſtis minor*; *Portulaca Sylveſtris minor*, *Portulaca exigua Camerarii*, *Portulaca arvenſis Bauhini*, The ſmaller or leaſt Wild Purſlane.

The Descriptions.

IV. *The first*, *or* Our common green Garden Kind. *Its Root is small and perishes every Year: from which Root spring up many thick round shining red Stalks, full of Juice, lying upon the Ground for the most part, on which are set several long, thick, pale green Leaves, sometimes alone by themselves, and sometimes many small ones together with them; among which grow small yellow Flowers, which stand in little green Husks, containing black Seed.*

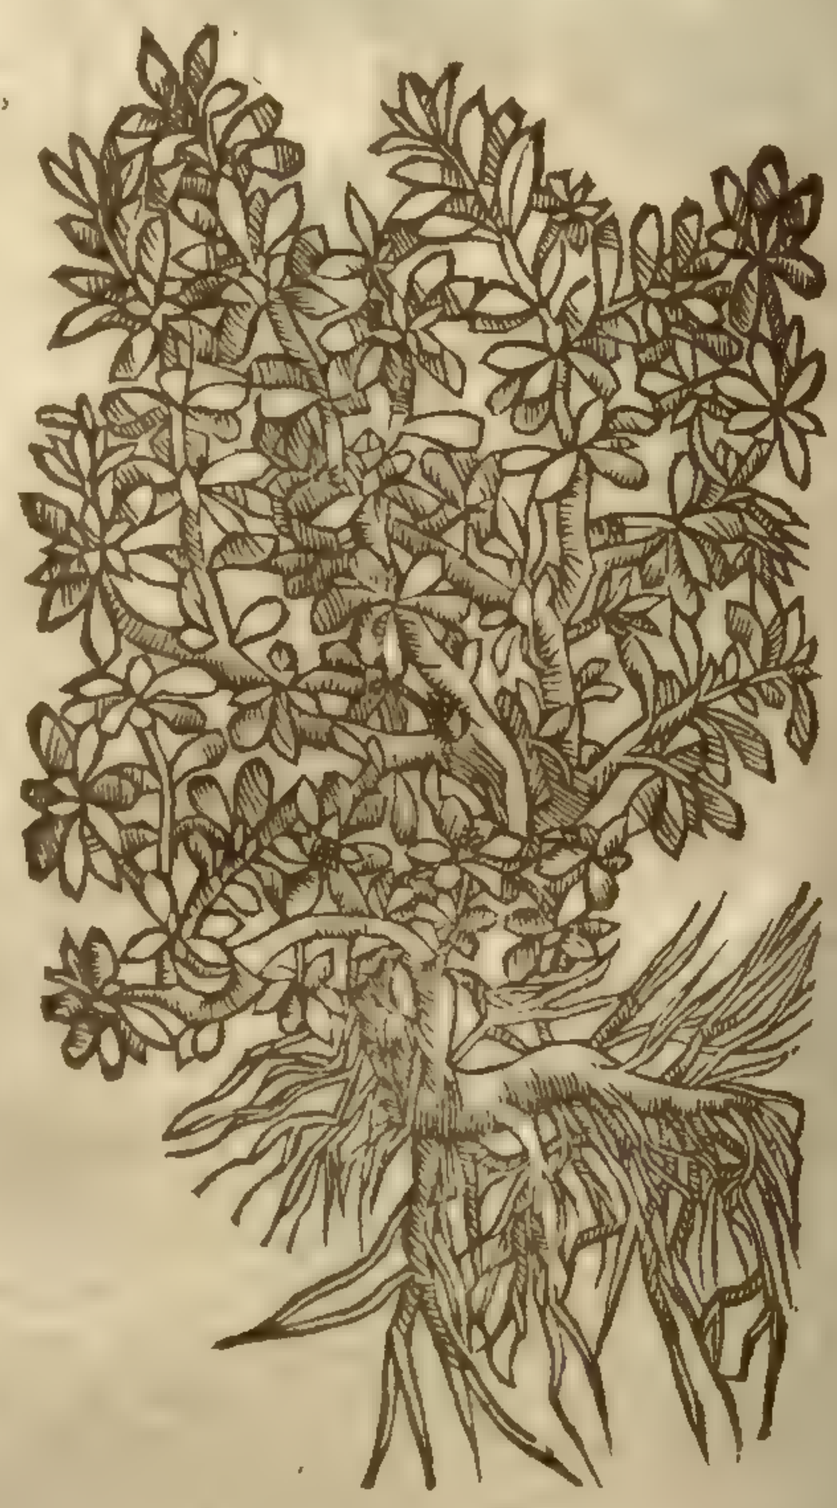
Purslane Garden.

V. *Gerard* describes it thus. *Its Root has many Strings; and the Stalks of this* Great Purslane *are round, thick, somewhat red, full of Juice, smooth, glittering, and parted into certain Branches trailing upon the Ground. The Leaves are an Inch long, something broad, thick, flat, glib, somewhat green, and whitish underneath. The Flowers are small, of a faint yellow, and grow out at the bottoms of the Leaves. After they are past, there Springs up in each Flowers place, a Husk of a green color, of the bigness of almost half a* Barly Corn, *in which is contained small black Seed.*

VI. *The second*, *or* Golden Leav'd Purslane. *This in its Roots, Stalks, Leaves, Flowers, and Seed, as also in its manner and form of growing, is exactly like the former, saving, that the Leaves are of a shinning yellowish, or yellowish red Golden color, and possibly larger than the* Green Kind *before described; that the whole Plant seems to be the larger, and the Stalks to grow something the more upright.*

VII. *The third*, *or* Greater Wild Purslane. *The Root is small and thready, perishing at the first approach of* Winter, *from which rise up sappy reddish Stalks, spreading much upon the Ground, lying almost flat thereon, and covering it a great way about. These Stalks are set with thick, fat, shining green Leaves, like in form or shape, and in all other things, unto the* Garden Kind, *the magnitude only excepted, these being generally smaller, and lesser at the Joints; with the Leaves towards the ends of the Branches come forth very small Star-like yellowish green Flowers, scarcely to be discerned, and as quickly falling away as the* Garden Kind, *having also such like hard Husks, wherein the like small black Seed is contained. This is used for a Sallet Herb, as well as the two former, and differs not from them in Taste, yet some think the Taste is more astringent, than the* Garden Kinds, *as it is for the most part in all* Wild Herbs.

Purslane Wild.



VIII. *The fourth*, *or* Lesser, *or* Smallest Wild Purslane. *It has a Root of a considerable thickness, running under the upper Surface of the Earth, from which a greate number of greater and lesser Strings, and other smaller Fibres proceed, running not only down deep into the Earth, but almost every other way.* This Small Purslane *is like also to the other, but much smaller than it, having always 2 Leaves set together, of a paler yellowish green color, on the thick round Stalks and Branches, which stand a little more upright, and bend down to the Ground again. The Flowers are like the former; and so is the black Seed, but the Husks open themselves before the Seed is ripe, and stand upon smaller and longer foot Stalks. This has little or no Taste, but what is flatulent and watery.*

IX. *The Places.* The first and second grow only in *Gardens* in most places of *England*; by reason the Root perishes every Year, it must be sown every *Spring* in *April:* The Gardeners sow it many times in Allies between the Beds; or in rich Beds of fat Earth, and moist, where it may have plenty of Nourishment; or in those Beds of Dung, which Gardeners have first used for Nursing up their *Cucumbers,*

carriers, *Nickers* and *Lungers*, whereas after thofe have been taken away, they many times ſow their *Purſlane* Seed: where if it is much watered, the warmth of the Dung, and the Water together, makes it grow great and large, and continues it in that State, if it be ſometimes cut, till *Winter*. The third grows many times in our *Gardens* without any previous help of ours. And in moſt of our Plantations, in *New England*, *New York*, *New Jerſie*, *Mary-Land*, *Pennſylvania*, *Virginia*, *North and South Carolina*, when they ly void. It will ſpontaneouſly come up, and over ſpread many Acres of Ground, even in one *Spring*, and in thoſe places where never any has grown from the beginning of the World to that time. and this it does in almoſt all our Fallow Plantations, thro' the whole Continent of *Florida*, which conſidering it does ſo univerſally do it, and that in ſuch vaſt quantities, as ſometimes almoſt to cover a Plantation, it is a Remark worthy the taking notice of. The fourth, *Camerarius in Horto Medico*, ſays, that he found it growing about *Lipſwick*; and I have been informed by ſome, that they found it growing Wild, in ſome of the Northern Counties of *England*.

X. *The Times.* They may be all Sown in *March* or *April*, and they ſpring up in *May*, and are freſh and green in *May* and *June*, they are fit for Salleting in *July*, and ſo continue all *Auguſt*, and ſometimes to the end of *September*, if the Seaſon is favourable and warm, even till the colds nips them, and cauſes them to periſh.

XI. *The Qualities.* All theſe ſorts of *Purſlane* are cold in the third degree; and the two *Garden Kinds* moiſt in the ſecond Degree; but the *Wild Kinds* moiſt only in the firſt Degree. They are Abſterſive, Coſmetick, Diuretick, Emollient, Relaxive, Repercuſſive, Nephritick, Hyſterick, and Galactogenetick.

XII. *The Specification.* *Purſlane* is good againſt Burning Fevers, hot and cholerick Fluxes of the Bowels, Catarrhs, want of Sleep, *Gonorhœa* in Men, and Whites in Women, as alſo the overflowing of the Courſes. It cools the Blood, gives eaſe in the Strangury, and takes away the heat and ſcalding of the Urine. Abates Luſt, extinguiſhes the Seed, ſtops Vomiting, as alſo defluxions of hot, ſalt, and ſcalding Humors into the Eyes.

XIII. *The Preparations.* You may have therefrom, 1. *A Sallet.* 2. *A Liquid Juice.* 3. *An Inſpiſſate Juice.* 4. *An Eſſence.* 5. *A Syrup.* 6. *An Oil or Ointment.* 7. *A Cataplaſm.* 8. *A Diſtilled Water.* 9. *A Pouder of the Seed.* 10. *A Collyrium.*

The Virtues.

XIV. *The Sallet.* It is made of the green Leaves and very young Stalks, with Salt, Sugar, Vinegar and Oil. It is good to cool and attemperate the Blood and *Lympha*, is grateful to hot and fainting Stomachs and is profitable for ſuch as have the Falling-Sickneſs. The *Wild Purſlane* is uſed beyond Seas, and in our Plantations in *Florida*, as familiarly in Sallets and Meats, as the firſt *Garden Kinds*, and with all the ſame good effects, ſaving that it is not altogether ſo moiſt, and therefore the more fit to ſtop ſome ſorts of Fluxes.

XV. *The Liquid Juice.* It is good againſt the burning Fits of Agues and Cholerick Fluxes of the Belly, and is profitable againſt the Whites and Reds in Women, as alſo a *Gonorrhœa* in Men: it ſtops Catarrhs, eaſes pains of the Head proceeding from Heat, and cauſes Sleep and Reſt, and is of good uſe for ſuch as are in a *Delirium* or Frenzy. It is prevalent againſt outragious Luſt, extinguiſhes, at leaſt diminiſhes the Seed, and being over much uſed does ſpoil the Natural power of Procreation. It is good to ſtay Vomiting, and ſweetned with a little white Sugar, is good againſt an old and dry Cough, Aſthma, and ſhortneſs of Breath. It quenches vehement Thirſt, and heals Ulcers of the Lungs. It is good alſo againſt Inflamations and Ulcers of the Secret parts in Man or Woman, and gallings of thoſe parts: and uſed with Honey, it heals excoriations, and even Ulcers of the Bowels, and *Anus*, and obliterates a *Fiſtula*, tho' of ſome Weeks ſtanding. Doſe from 2 to 4 Spoonfuls or more, Morning and Night.

XVI. *The Inſpiſſate Juice.* *Camerarius* ſays, That the thickned *Juice*, Made up into *Pills* with *Powders of Gum Tragacanth*, and *Gum Arabick*, and taken (from a Dram to two Drams, Morning and Evening) prevails much, in helping ſuch as make a bloody Urine, or piſs Blood.

XVII. *The Eſſence.* It has all the *Virtues* of the *Liquid* and *Inſpiſſate Juices*, excepting, that it does not ſo powerfully ſuppreſs Luſt, or Exanimate the Seed. But it more powerfully heals excoriations of the Bowels, *Anus*, Lungs, and other inward parts. Outwardly applyed it gives eaſes in the Gout, and ſoftens the hardneſs of the Nerves. It is good for Womens ſore and pained Breaſts, and other Tumors cauſed by heat and Inflamation. It is good againſt the bitings of Serpents or other poiſonous Creatures, and to draw forth the Poiſon, being bathed upon the part. Applyed to the Navels of Children which ſtick forth, it helps them; it is good alſo for ſore Mouths and ſore Gums, which are much ſwollen, and to faſten looſe Teeth, and take away their pain, when they ſeem to be on edge as it were, after the eating of ſower things. Doſe from 2 to 4 Spoonfuls.

XVIII. *The Syrup.* If made with Honey of the *Juice*, it not only prevails againſt Coughs, Colds, Aſthma's, but is alſo prevalent againſt a Phthiſis, or Ulceration of the Lungs, and has all the other Virtues of the *Juice* and *Eſſence*, being given from 2 to 4 Spoonfuls, Morning and Night.

XIX. *The Oil or Ointment.* They cool Inflamations, heal galling in the Groin and Secret parts, give eaſe in the Head-ach, Gout, and other pains proceeding from heat, and diſcuſs Puſhes, Wheals, Pimples, and other like hot and fiery Eruptions in the Skin. They are alſo good againſt Burnings and Scaldings, and Womens hard, tumified and inflamed Breaſts; as alſo the ſtingings and bitings of Hornets, Waſps, Bees, Serpents, and other venomous Creatures.

XX. *The Cataplaſm of the Green Herb.* It is prevalent againſt *Anthony*'s Fire, Gout Sciatica, ſtrained Nerves if Inflamed, Pimples, Tettars, Ringworms, Shingles, and other hot breakings out of the Skin. *Made with Vinegar, a little Linſeed Oil, and Pouder of Nut Galls*, and applyed, it takes away pains and creeks in the Neck, and other parts; and diſcuſſes and heals ſimple Contuſions in the Muſcular parts.

XXI. *The Diſtilled Water from the whole Plant.* It has all the Virtues of the *Juice*, *Eſſence*, and *Syrup*, but nothing near ſo effectual, and therefore may be given in a double or treble Doſe, or uſed as a Vehicle to Convey other Preparations in, being ſweetned with double Refined Sugar. It prevails againſt *Anthony*'s Fire; beautifies the Face and Skin, and allays the Inflamations of the Eyes.

XXII. *The*

XXII. *The Pouder of the Seed, or Seed bruised.* It is said to be more effectual than the *Herb*, even for all the purposes afore named; it is of singular good use to cool the heat and sharpness of Urine, to suppress Lust, and Nocturnal Pollutions, and even to extinguish the Seed, and abolish the inclination to Venery. Given to Children which have Worms, it is said to kill and expel them. *The Decoction of the Seed being bruised, in Wine*, performs likewise the same things. And the Seed of the *Wild-Purslane*, is more commended for killing of Worms, than the Seed of the other. Dose from a Dram to 2 Drams in any proper Vehicle.

XXIII. *The Collyrium. Take Clarified Juice of Purslane* 2 *Ounces*; *of the Distilled Water* 2 *Ounces*; *of common Spirit of Wine or Brandy* 4 *Ounces*; *Hony* 1 *Ounce*; *mix, dissolve, strain out, and let it settle for* 12 *Days, then decant the purest part, and keep it for Use.* It cools Inflamations of the Eyes, drys up hot and salt Rheums, heals Sores and Ulcers in them, and cures most Diseases happening to them, removing Mists, Clouds, and Films, and very much clearing the Sight.

CHAP. DLXXXIII.

Of PURSLANE Sea *and* Water.

I. THE *Names.* It is called by the *Arabians*, *Molochia*: in *Greek*, Ἄλιμος: and in *Latine*, *Halimus*, and *Portulaca Marina.* The *Water Purslane* is called in *Greek*, Ἀνδράχνη ὑνυδρος: and in *Latine*, *Portulaca Aquatica.*

II. *The Kinds.* There are several Species of the *Sea Purslane* to be found in Authors, but ommitting those which grow not in *England*, or some of our Foreign Plantations, we shall only treat of these two following, *viz.* 1. Ἄλιμος, *Halimus*, *Portulaca marina nostras*, Our Sea Purslane. It is called *Halimus*, because of its saltish Taste, which is as much as if you should call it *Salt-wort.* But *Solinus* calls it, Ἅλιμος, *Alimos* without the Aspirate, and says that its Name is derived from its effects, or operation, which is *to prevent Hunger*; for says *Solinus*, the People in *Candia* tell us, that that Day they eat thereof, they shall not be Hungry, but be free from desiring Food. 2. *Halimus tenuifolius*, *Halimus angustifolius procumbens*; *Halimus minor*, *Portulaca Marina incana minor*, The lesser Sea Purslane, or Sea Purslane less white than the former. 3. Ἀνδράχνη ὑνυδρος, *Portulaca Aquatica*; *Alsine palustris minor folio oblongo Bauhini*; *Portulaca* vel *Andrachne palustris*, Water Purslane.

The Descriptions.

III. *The first*, *or* Our Sea Purslane. *It has a Root which is something woody, with several long Strings joined thereto, and abides with the Leaves on the Branches all the* Winter. *It has several hoary and grayish Stalks, somewhat Woody, about a Foot or more long, lying for the most part upon the Earth, bearing thereon many small, thick, fat and long Leaves, of a whitish green color, set without order, at some Joints more, at some less, Branching forth here and there, and bearing at the tops many long Sprigs, or spiked Stalks, set round about with greenish purple Flowers, which turn into whitish, flat, thin Seeds, like unto those of* Sea Arach.

IV. *The second, or* Lesser Sea Purslane. *Its Root is woody and perennial, or enduring all* Winter *like*

Purslane Sea Common.

Purslane Sea.

the

the former. This Sea Purſlane *has many ſmooth, weak and ſucculent branched Stalks, about a Foot long, not able to ſtand upright, but for the moſt part do fall down, and lye upon the Ground; the Leaves are of a green or blewiſh green color, growing one againſt another in the ſame manner, viz. without order, ſomewhat narrower and ſometimes longer, but not altogether ſo hoary white. The Flowers are made like the firſt Kind before deſcribed, but of a more yellow color, growing at the tops of the Stalks; and afterwards yield ſuch like Seed as theirs, but ſomewhat leſs.*

V. *Gerard* deſcribes the ſecond Kind after this manner. *Its Leaves are like the former, but not altogether ſo white, yet they are ſomewhat longer and narrower, not much unlike to the Leaves of the* Olive Tree. *The ſlender branches are not above a Cubit or Cubit and half long, and commonly lye ſpread upon the Ground. And the Flowers are of a deep overworn Herby color, after which follow Seed, like thoſe of the firſt but ſmaller.* Ramos plures à radice fundit (dixit Matthiolus in Dioſcoriden) lentos & obſequioſos, foliis Olivæ pinguioribus, alticantibuſque, ſalſo ſapore, Semen profert racemoſum in Caulium ſummitatibus.

VI. *The third, or* Water Purſlane *Its Root conſiſts of nothing but a parcel of fine Fibres or Threads. Its manner of growing is ſomething like the* Chickweeds, *eſpecially the* Water Chickweeds; *It is but a ſmall Plant, but has many trailing ſquare Branches, which take Root almoſt every where, as they ſpread; but not ſo thick ſet with Leaves*

Purſlane Water.

as the Chickweeds *are. Its Leaves are ſomething long, narrow, and round pointed, of a pale yellowiſh green color, two always growing at a Joint; the Flowers are ſmall and white, ſet together in long Cluſters, on ſmall foot Stalks, with very ſmall round Seed following them, in little round Seed Veſſels.*

VII. *The Places.* The two firſt grow in Salt Marſhes, and by the Sea ſide, in many parts of the World. The firſt grows in the Salt Marſhes and by the Sea Coaſt in many parts of *England*, as in *Kent*; In the Marſhes by the Sea ſide going over the *Kings-Ferry* unto the *Iſle of Sheppy*, going to *Shoreland* Houſe, and by the Ditch ſides of the ſame Marſh: it grows alſo plentifully in the *Iſle of Thanet*, as you go from *Margate* to *Sandwich*, and in many other places along the Coaſt. The ſecond grows upon the Sea Coaſts of *Spain*, and other hot Countries: *Cluſius* ſays it grows about *Lisbon* in *Portugal*. With us it only grows in *Gardens*. *Dodonæus* ſays, it grows in the Maritime places of *Flanders*, *Holland*, and *Zeland*, and other Sandy places. The *Water Purſlane* grows in or near Water, and Watery Ditches and Grounds in many parts of *England*.

VIII. *The Times.* They Flower in *July* and *Auguſt*, and the Seed is ripe in *Auguſt* or *September*; a good long after the time of Flowering.

IX. *The Qualities.* Theſe Plants are temperate in reſpect to heat or cold, and moiſt in the firſt Degree: Abſterſive, Aſtringent, Anodyn, Galactogenetick and Spermatogenetick.

X. *The Specifick.* *Sea Purſlane* expels or diſcuſſes Wind, gives eaſe in the Colick, ſtrengthens the Bowels, and is profitable againſt Cramps and Convulſions.

XI. *The Preparations.* You may have from the *Sea Purſlane*, 1. *A Sallet.* 2. *The Leaves Pickled.* 2. *The Juice or Eſſence.* 4. *A Decoction in Wine.* 5. *A Powder of the Root.*

The Virtues.

XII. *The Sallet.* *Parkinſon* ſays, it is uſed to be eaten as other *Sallet Herbs*, for that it much pleaſes the Palate, having a little aſtringent reliſh withal. The Leaves *Dioſcorides* ſays, are boiled, and then eaten as a boiled *Sallet*: *Folia, Dioſcorides ait, decoquuntur alterum gratia.*

XIII. *The Pickle.* *Folia autem in Belgio veluti Capparis Sale aut Muria condiuntur*, &c. The Leaves are preſerved with Salt or Pickle, in *Holland* and other parts of the Low Countries, as *Capers* are, to be ſerved up at Mens Tables, and Eaten in their ſtead, having a pleaſant and grateful taſte.

XIV. *The Juice or Eſſence.* They expel Wind in the Stomach and Belly, give eaſe in the Colick, almoſt upon the Spot, looſen the Belly firſt, and then afterwards Bind, ſtop Fluxes and ſtrengthen the Bowels. They are good againſt Ruptures, prevail againſt Cramps and inward Convulſions; cauſe plenty of Milk in Nurſes Breaſts: and very much encreaſe Seed, and Vigor. Doſe 1, 2, 3, or 4 Spoonfuls, Morning and Night, in a Glaſs of Generous Wine.

XV. *The Decoction in Wine.* It has all the Virtues of the *Juice* and *Eſſence*, but as it is weaker ſo it ought to be given in a double or treble Doſe.

XVI. *The Powder of the Root.* Given to a Dram in *Mead* or Honied Water, it is good againſt Ruptures, Convulſions, and torments of the Guts, as *Dioſcorides* ſays: but we find the Leaves to have the ſame effects.

CHAP. DLXXXIV.

of RADISH Garden.

I. *The Names.* It is called in *Greek*, Ῥάφανις: in *Latine*, *Raphanus*, & *Raphanus Hortensis:* and in *English*, *Radish* and *Garden Radish*, or *Reddish*. *Cælius* says, that *Marcellus Empericus* calls the Seed of *Radish*, *Bacanon*; which is also found in *N. Myrepsius*, *lib.* 1. *comp.* 255. but *Cornarius* reads it, *Cacanon*.

II. *The Kinds.* Of *Radishes* there are three Generick Species, *viz.* 1. Ῥάφανις ἡμερὰς, *Raphanus Hortensis*, Garden Radish. 2. Ῥάφανις ἀγρία, *Raphanus Sylvestris*, Wild Radish. 3. *Raphanus Rusticanus*, Horse Radish: of all which in order.

III. *The Garden Kinds.* They are various, as, 1. *Raphanus sativus communis*, Our common Garden Radish. 2. *Raphanus sativus minor*, The lesser Garden Radish. 3. *Raphanus Orbiculatus*, The round Radish. 4. *Raphanus niger*, *Raphanus Pyriformis*, The Pear fashioned, or Black Radish.

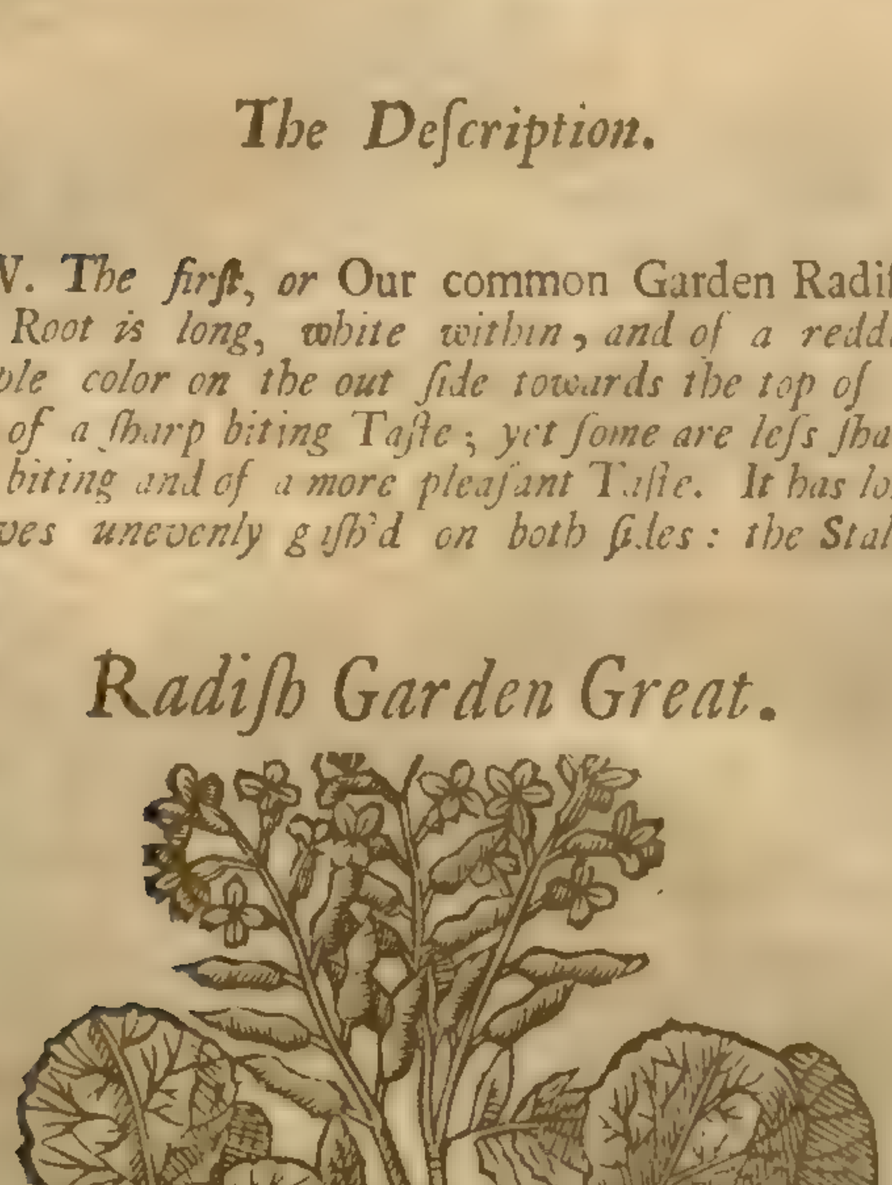
The Description.

IV. *The first, or* Our common Garden Radish. *Its Root is long, white within, and of a reddish purple color on the out side towards the top of it, and of a sharp biting Taste; yet some are less sharp and biting and of a more pleasant Taste. It has long Leaves unevenly gash'd on both sides: the Stalks rise up to the height of three or four Feet, bearing many purplish Flowers at top, made of four Leaves apiece, which turn into thick short Pods, in which are contained round Seed, larger than* Turnep *or* Cole-wort *Seed, and of a pale reddish color.*

V. *Gerard* describes it thus. *Its Root is gross, long and white, both within and without, and of a sharp Taste. It sends forth great and large Leaves, green, rough, cut in on both sides with deep gashes, not unlike to the* Garden Turnep, *but greater. The Stalk is round and parted into many Branches, out of which spring many Flowers of a light purple color, made of four little Leaves; and when they be past, there come in their places, sharp pointed Cods, puft or blown up towards the Stalk, full of a spongeous Substance, wherein is contained the Seed, of a light brown color, somewhat greater than the Seeds of* Turneps *or* Cole-worts.

VI. *The second, or* Small Garden Radish. *Its Root is small, long, white both within and without, except a small part of it, towards its top, which is of a reddish color. Its Leaves are exactly like the former, saving that they are smaller and more brittle in Handling. The Stalk is about a Yard high,*

Radish Garden Great.



Radish Garden small.

having some Branches from the middle upwards like the other, on the tops of which grow the Flowers, very like them also. The Seed is smaller and not so sharp in Taste.

VII. *The third, or* Round Radish. *Its Root is almost Orbicular, and firm, nothing watterish like the* Common Radish, *but more pleasant in Taste, and wholesomer, not so apt to rot in the Stomach, as the others are, or as the* Garden Radishes *do. Its Leaves are like the* Garden Turnep; *from among which spring up a round and smooth Stalk, dividing it self towards the top into two or three Branches, on which grow small purplish Flowers consisting*

consisting of four Leaves apiece: which being fall, there comes in place small Cods, set up, or bunched out, in two, and sometimes in three ranges, full of a soft spongy Substance like to the Common Garden Radish; *in which is contained the Seed, something smaller than* Cole-wort *Seed, but of an hotter Taste.*

VIII. *The fourth, or* Pear-fashioned, *or* Black Radish. *Its Root is formed like a* Pear, *or* Long Turnep, *black without and white within, of a firm and solid Substance; its Taste is quick and sharp, biting the Tongue like the other Kinds of* Radish, *but more strongly. It grows to be four, five, or six*

Radish Pear-fashion'd.

Feet high, of a bright reddish color. The Leaves are deeply cut in or jagged on the edges, like those of the Turnep, *and something rough withall. The Flowers consist of four Leaves apiece, of a light* Carnation, *or Flesh color. And the Seed is contained in small bunched Cods like the former.*

IX. *Parkinson* says, That this Pear-fashion'd Radish, *has a Root which is blackish on the outside, and white within, great and round at the Head, but ending shorter than a* Radish, *and longer than a* Turnep, *so that it is almost* Pear-fashion'd, *of a firmer and harder Substance than our* Common Radish, *but no less sharp and biting, and somewhat strong withal. The Leaves are somewhat smaller and with deeper gashes. The Flowers and Seed are also like the others but smaller. It has been observed also, that some of this Seed, being sown again, has produced Roots, whereof some have been black, but the most part white on the outside. This has been brought to us from* Flanders *and* Holland, *in which places it is accounted a rare* Winter *Root or Sallet, and is there sometimes sold by the Pound.*

X. There is *Raphanus pyriformis minor*, a lesser sort of black Radish, (*like in Leaf and Seed to the former, but its Flower is of a lighter purple color:*) *whose Root is longer and smaller, and sometimes changes also to be white as the other does. It is thought that both these Species have risen from one kind.*

XI. *The Place.* All these Kinds of *Radishes* are generally sown in *Gardens*, where they require a loose Ground, which has been long Manured, and it somewhat fat. They prospet well in Sandy Ground also, where they are not so Subject to Worms as in other Grounds.

XII. *The Times.* These Kinds of *Radishes* are best to be sown after the middle of *June*, *viz.* in *June* or *July*; for being sown betimes in the *Spring*, they yield not their Roots so kindly nor profitably, for that they then quickly run up to Stalk and Seed; whereas otherwise they do not run up to Flower and Seed, till the next *Spring*. They may be sown to Months running in the Year, yet of all those times, in *June* and *July* are the best Seasons.

XIII. *black Radishes* are most used in *Winter*, (yet some, in their natural and not forc'd Grounds, have their Roots good, the most part of the *Summer*,) and therefore they ought to be sown after *Midsommer*; for if they should be sown earlier, there would be no Root, but they would like the others, presently run up to Stalk and Seed. They are very profitable against Stone and Gravel.

XIV. *The Qualities. Radish* is hot and dry in the third Degree, Aperitive, Abstersive, Carminative, Cosmetick, Digestive, Diuretick, Incisive, Cephalick, Pectoral, Nephritick, Emmenagogick, and Lithontriptick.

XV. *The Specification.* The Root is mostly used, after that the Seed, and in the last place the Leaves. They are peculiar for the Cure of Strangury, or pain, heat and stoppage of Urine, by reason of Tartarous Slime, or any other Matter impacted in the Reins, Ureters and Bladder, are peculiar for provoking of Urine, as also of the Courses in Women, and to expel Sand, Gravel, and the Stone from the Urinary parts. To cure the Cough, Asthma, Phthisis, and other Diseases of the Lungs. As also the Scurvy, Dropsy, Gout, obstructions of Liver and Spleen, and Quartan Agues, tho' of long standing.

XVI. *The Preparations.* You may have therefrom. 1. *A Sallet of the Root, and tender Tops.* 2. *A Liquid Juice of Root, or Leaves.* 3. *An Essence of the same.* 4. *A Decoction or Infusion.* 5. *A Syrup of the Juice.* 6. *The Seed.* 7. *A Cataplasm of the Root.* 8. *A Distilled Water of the Herb and Root.* 9. *A Spirit from Root, Herb and Seed.*

The Virtues.

XVII. *The Sallet of the Roots and tender Tops:* They are Eaten raw, either with Salt and Bread and Butter, or with Meat: They strengthen the Stomach and cause Digestion, and are very Diuretick: but are apt with some to rise in the Stomach, yet are great Enemies to Scurvy, Dropsy, Jaundice, and Gout in cold Constitutions.

XVIII. *The Liquid Juice of the Roots or Leaves, (but that of the Roots is best.)* It powerfully opens obstructions of the Stomach, Lungs, Liver, Spleen, Reins, and Womb: resists the Scurvy, Dropsy, and Gout, is good against Asthma's, Coughs, Colds, Hoarseness, Wheezing, and shortness of Breath: resists the putridity of the Blood, and Hypochondriack Melancholy: gives ease in the Strangury and Stone; and expels Sand, Gravel, Stones and Tartarous Slime out of the Urinary

parts, and provokes the Terms in Women where they are ſtop. Doſe from 1, to 3, or 4 Spoonfuls in White *Port* Wine, or the *Diſtilled Water* hereof, Morning and Night: and ſo taken it kills Worms.

XIX. *The Eſſence of the ſame.* It has all the Virtues of the *Liquid Juice*, and may be given in the ſame manner, from 1 Spoonful to 3, according to Age, *&c.* It comforts a cold and raw Stomach, cauſes Appetite and a good Digeſtion; expels Wind, and is good againſt the Colick, *&c.* Given to 4 or 5 Spoonfuls, 2 or 3 Hours before the coming of the Fit of a Quartan Ague, it cauſes in ſome Vomiting, in others Sweating, and ſo thereby alters the courſe of the Ague and cures it.

XX. *The Decoction or Infuſion.* They provoke Urine powerfully, expelling Sand, Gravel, and Tartarous Matter out of the Reins and Bladder. The Root may be ſliced thin, and laid to Infuſe all Night in Rheniſh Wine, or in White *Port*, or *Lisbon* Wines, and drank in the Morning Faſting, and ſo to be continued for ſome Days.

XXI. *The Syrup of the Juice. It is made by diſſolving double Refined Sugar, or Clarified Honey in the Juice, in Balneo; and ſome add to it Vinegar.* It is good againſt Aſthma's, Coughs, Colds, *Phthiſis*, and all other Diſeaſes of the Lungs. It is good againſt an old Cough, and makes thin, thick and groſs Flegm, cauſing it to be eaſily expectorated: it is of good uſe in pains of the Reins, Bladder and Stone, provokes Urine much, and ſo carries off the Jaundice, and has all the Virtues of the *Juice*, *Eſſence*, *Decoction* and *Infuſion* aforegoing.

XXII. *The Seed.* It may be given to a Dram, or two, bruiſed or made up into an *Electuary with Clarified Honey or Oxymel.* It Kills Worms in Children being drank, and provokes Urine. It is ſaid to cauſe Vomiting ſometimes, eſpecially in weak Stomacks.

XXIII. *The Cataplaſm of the Root.* Being bruiſed and laid to the place grieved with the Gout, Sciatica, or other like pains, or to the hard and painful Swellings, it wonderfully gives eaſe to them and helps them. If the *Cataplaſm is made with a mixture of Orobus Meal and Wine Vinegar*, and applyed to the Belly, it kills Worms therein. And ſo made, if it is applyed to other places, it takes away all black and blew ſpots, and other blemiſhes of the Skin.

XXIV. *The Diſtilled Water from Root and Herb.* It has all the Virtues of *Juice*, *Eſſence*, *Decoction*, *Infuſion*, and *Syrup*, but in a much lower Degree, and therefore ought to be given in a much larger Doſe. Uſed as a *Coſmetick*, it is a great beautifier of the Skin, more eſpecially if *Pulp of Coloquintida* be Infuſed therein.

XXV. *The Spirit from Root*, *Seed*, &c. It is made altogether as you make *Spirit of Scurvy-Graſs*, *Creſſes*, &c. It is a potent Remedy againſt the Scurvy, Colick, weakneſs of the Stomach, and Indigeſtion in a cold habit of Body: and has indeed all the Virtues of *Juice*, *Eſſence*, *Infuſion*, and *Syrup*; and may be given from 15 to 30, or 40 Drops, in Ale, Beer, Wine, or other proper Vehicle, Morning, Noon and Night, and in ſome caſes, four or five times a Day.

CHAP. DLXXXV.

Of RADISH Wild.

I. *THE Names.* It is called in *Greek*, Ῥάφανις ἀγρία: in *Latine*, *Armoracia*, *Raphanus Sylveſtris*: and in *Engliſh*, *Wild Radiſh.*

II. *The Kinds.* Of the *Wild Kinds* there are two Sorts, *viz.* I. Ῥάφανις ἄγρια, *Raphanis agreſtis*, which is called alſo, *Armoracia Fuchſij*, *Rapiſtrum album Tabernæmontani*; *Rapiſtrum Flore albo Erucæ foliis Lobelij*, The Field Wild Radiſh. II. Ῥάφανις ὑδρία, *Raphanus Aquaticus vel Paluſtris*, Water Radiſh: and this twofold, *viz.* 2. *Raphanus Aquaticus vel Paluſtris primus*, *Radicula Sylveſtris Dodonæi*; *Raphanus Aquaticus in profundas Lacinias diviſus Bauhini*; *Raphanus Sylveſtris Officinarum Aquaticus Lobelij*; *Raphanus Erucæ foliis Theophraſti*, *Baubino*; *Siſymbrum Sylveſtre Ceſalpini*, Our common Water Radiſh. 3. *Raphanus Aquaticus alter Baubini*; *Rapiſtrum Aquaticum Tabernæmontani & Gerardi*, The other or ſecond Water Radiſh of *Bauhinus.*

The Deſcriptions:

III. *The firſt, or* Field Wild Radiſh. *It has a Root which is about a Fingers thickneſs, white both without and within, and of a ſharp and biting Taſte. It has a ſhorter narrower Leaf than the* Common Radiſh, *and more deeply cut or jagged, almoſt like*

Radiſh Wild.

the

like the Leaves of Rocket, *but much greater. The Stalks are slender and rough, about 2 feet high, divided towards the top into many Branches. The Flowers are small and white. And the Cod (in which is contained the Seed) is long, slender, and jointed.*

IV. *The second, or* Water Radish. *Its Root is very long, and of near a Fingers thickness, which runs far up and down, here and there through the Mud, shooting forth a great many Fibres, and in many places, as also several Leaves under Water. It rises up in the Water with slender weak and bending Stalks, yielding to and fro; on which grow at every Joint, a long and somewhat broad Leaf, very deeply indented, or cut in on the edges unto the middle Rib. At the top of the Stalk, comes forth a small Tuft of yellowish Flowers, consisting of four Leaves apiece. After which follow small and almost round Pods, with round Seed in them.*

V. *Gerard* describes this *Water Radish* thus. *Its Root is long, set at sundry spaces, with small Fibres or Threads like the Rowel of a Spur, but and burning in Taste, more than any of the Garden* Radishes. *It has long and broad Leaves deeply indented, or cut in even to the middle Rib. The Stalk is long and weak, and leans this way and that way, being not able to stand upright, without a prop, insomuch, that you shall never find it, no not when it is very young, but leaning down upon the Mud or Mire where it grows. The Flowers grow at the top, made of four small yellow Leaves.*

VI. *The third, or* Second Water Radish. (*which is the* Rapistrum Aquaticum Tabernamontani & Gerardi.) *It has a long tough white Root, a Fingers thickness or more, running and spreading it self much, not deep into the Ground, but under the upper Crust thereof, having at certain distances almost every where, small bundles of Fibres or Strings proceeding from it, which have long Leaves springing from them. This grows more upright than the last, for that it seldom grows in Ponds or Ditches of Water, as the other does, but on the edge, or near Watery Ditches, or other standing Waters. Its main Stalk or Stalks grow to be sometimes three Feeet or more high, on which grew many long Leaves, much torn, or cut in, on both edges. At the tops of the Stalks grow large Tufts of whitish or purplish Flowers, which being past away, leave in their places, short Pods containing the Seed, which is small, and not round as the former.*

VII. *The Places.* The first grows upon the Borders of Banks, and Ditches cast up, and in the Borders of Fields. The second never grows but in Water, or Brooks, or by Ditches and standing Waters, and by Rivers sides, or where store of Water is continually. The third grows near the Water side, and sometimes in small watery Ditches, where there may be some little Water, and almost dry.

VIII. *The Times.* They all Flower in *June* and *July*, and the Seed is ripe in *August*, in or about a Month after the time of Flowering.

IX. *The Qualities, Specification, Preparations,* and *Virtues*, are the same with those of the *Garden Radish* aforegoing, (except being used as they are for a *Sallet*;) and therefore I refer you to the former Chapter. *Parkinson* says, that the *Water Radishes* are somewhat hot in the Mouth, but the first of them more than the other; and therefore thinks that they may be used instead of *Horse Radish*, to warm a cold Stomach, and to help both to provoke Urine, and to expel Wind: For which purpose the Seed is more effectual than the Herb; and the Root of more force than the Seed.

CHAP. DLXXXVI.

Of RADISH Horse.

I. *The Names.* It was unknown unto the *Greeks*, and therefore has no proper *Greek* Name: but it may well enough be called Ἱπποραφανος: in *Latine*, *Hippophanus*; *Raphanus Rusticanus Lobelii*; *Raphanus magnus*: in *English*, *Horse Radish*.

II. *The Kinds.* It is the third Generick Species of *Radices*, and *Plantæ singularis sui Generis*, a singular Herb of its own Kind. This cannot be the *Raphanus Sylvestris Dioscoridis*, because the Root of that is small, and the Leaves tender and fit to be eaten for a *Sallet*, which the Leaves of this are not. But *Tragus* will have it to be the *Armoracia Plinij*: it is the *Raphanus major*, & *Radicula magna Dodonæi*, *Armoracia*, *aut Raphanus major Brunfelsij*, *Tragi*, & *Gesneri*; *Thlaspi magnum & majus Cordi & Lonicери*; *Raphanus rusticanus Thlaspi alterum Dioscoridis* (Lib. 2. Chap. 12.) *Bauhino*: and the very thing which we in *England* call *Horse Radish*, and by some is called *Mountain Radish*, and in the North of *England*, *Green Radish*, and *Red Cole*.

The Descriptions.

III. *Its Root is great and long, white and rugged, shooting up divers Heads of Leaves, which may be parted or divided for Increase, but it does not creep within the Ground, nor run above Ground, but for the most part runs deep into the Earth. The first Leaves which rise up before* Winter, *are about a Foot and half long, narrower, and very much cut in or torn about the edges into many parts, of a dark green color, with a great Rib in the middle: but after these have been up a while, others follow, which are greater, rougher, broader and longer, whole, and not divided as the first, but only something roundly dented about the edges. The Stalk when it bears Flowers (which it does but seldom) is great; rising up with some few lesser Leaves thereon, till it is 3 or 4 Feet high; spreading at the top into many small Branches of whitish Flowers, made of 4 Leaves apiece: after which come small Pods like those of the* Lesser Shepherds Purse, *but seldom with any Seed in them.*

IV. *Gerard* describes it thus. *The Root is long and thick, white of color, in Taste sharp, and very much biting the Tongue like to* Mustard. *It brings forth great Leaves, long, broad, sharp pointed, and snipt about the edges, of a deep green color, like those of the* Great Garden Dock, *called of some* Patience, *or* Monks Rhubarb, *but longer and rougher. The Stalk is slender and brittle, bearing at the top small white Flowers: which being past, there follow small Cods, in which is contained the Seed.*

V. *The Places. Gerard* says, he has found it growing Wild in several places, as at *Namptwich* in *Cheshire*, in the place called the *Mill-Eye*: as also at *Hogsden* near *London*, in the Field next to a Farm House leading to *Kings-land*, where it flourished for a long time afterwards. But for the most part it is planted and grows in *Gardens*, and delights in moist and shadowy Places.

VI. *The Times.* *Gerard* says that it Flowers for the moſt part in *April* or *May*, and the Seed is ripe in *Auguſt*, but that it is rare or ſeldom to be ſeen; and that *Petrus Placentius* has wrote, that it brings forth no Seed at all. *Parkinſon* ſays, that it Flowers but ſeldom, but when it does, it is in *July*.

VII. *The Qualities.* It is, (*viz.* the Root) hot and dry in the third Degree. Aperitive, Digeſtive, Abſterſive, Attractive, Carminative, Coſmetick, Diuretick, Cephalick, Neurotick, Stomatick, Pectoral, Hepatick, Splenetick, Nephritick, Hyſterick, Ptarmick, and Alexipharmick.

VIII. *The Specification.* It is prevalent againſt the Strangury, and ſtoppage of Urine by Stone, Gravel, Sand, or Tartarous Humors lodged in the Urinary parts: it is good againſt Aſthma's, Coughs, *Phthiſis* and other Diſeaſes of the Lungs; open Obſtructions of Liver, Spleen and Womb, and provokes the Terms in Women. It cures the Scurvy, Dropſy, Gout, and Quartan Agues, kills Worms in Children: and outwardly applyed eaſes pains of the Gout, Sciatica, Liver, Spleen, and Reins, being applyed upon the parts affected.

IX. *The Preparations.* You may have therefrom, 1. *A Sawce.* 2. *A Liquid Juice.* 3 *An Eſſence.* 4. *An Infuſion* 5. *A Loboch.* 6. *A Cataplaſm.* 7. *A Diſtilled Water.* 8. *A Spirit.*

The Virtues.

X. *The Sawce.* It is made of the Root ſcraped very thin, and eaten with Salt and Vinegar, either alone with Meat, or mixt with other *Salleting*. Tho' ſome Perſons cannot away with it, yet it is grateful to many Stomachs, and by ſtrengthning the Viſcera, it cauſes a good Appetite and Digeſtion, prevents breeding of Wind, and eaſes Gripings in the Bowels, being a peculiar Enemy to the Scurvy.

XI. *The Liquid Juice of the Root.* Being given in Drink, it is held to be very effectual for the cure of the Scurvy; and ſo given, it kills alſo Worms in Children; *A Cataplaſm of the Root* being alſo laid upon the Belly.

XII. *The Eſſence of the Root.* It has all the Virtues of the *Juice*, beſides which, it gives eaſe in the Strangury, and eaſes pains in the Reins, Ureters and Bladder; is profitable againſt the Stone, provokes Urine, and expels Sand, Gravel, and Tartarous Matter from the Urinary parts. It is a good Remedy in ſtrong Bodies againſt Aſthma's, Coughs, Colds, *Phthiſis*, and other like Diſeaſes. It provokes the Terms in Women; and being given ſome Hours before the coming of the fit of a Quartan Ague, it alters its Courſe, and many times cures it. Given alſo to a Woman in Childbed, it brings away the After-Birth, and cauſes due Cleanſing. Doſe from one Spoonful to two, or more in Wine, or ſome other proper Vehicle.

XIII. *The Infuſion in Wine.* It has all the Virtues of the *Juice* and *Eſſence*, but muſt be given in a larger quantity, as from 2 to 4 or 6 Spoonfuls, Morning, Noon, and Night. It is good againſt the Colick, Strangury, pain, heat, and difficulty of making Water.

XIV. *The Loboch.* It is made of the *Juice* with the addition of *Vinegar* and *Honey*, and then boiling them to a due Conſiſtency. It has all the Virtues of *Juice*, *Eſſence*, and *Infuſion*, but is peculiarly good againſt Aſthmas, Coughs, Colds, *Phthiſis*, Hoarſneſs, Wheezing, ſhortneſs of Breath, want of Appetite, *&c.*

XV. *The Cataplaſm.* It is made with the Root ſcraped fine and thin, *&c.* Applyed to any place pained, or grieved with the Gout, Sciatica, ſwellings and pains of the Pleura, Liver, or Spleen, it gives wonderful eaſe and Relief. The Leaves boiled ſoft in Wine and a little *Oil Olive* added to them, and ſo made into a *Cataplaſm*, and applyed to the Regions of the Liver and Spleen, it mollifies the hard Swellings thereof, and takes away the pain: and applyed to the bottom of the Belly, it gives help and relief in the Strangury.

XVI. *The Diſtilled Water from the Roots, as alſo from the Herb.* It is profitable for all the purpoſes aforeſaid, being dulcified with fine white Sugar, and taken inwardly from a quarter of a Pint to half a Pint, Morning and Night. The *Water* Dropt into the Eyes, is ſaid to clear the Sight: and if two parts of it be mixt with one part of the *Juice* or *Eſſence*, and the Face or Skin be waſht therewith, and ſuffered to dry on, it will (if uſed for ſome conſiderable time) clear the ſame from Spots, Tannings, Sunburnings, Pimples, Scurff, Morphew, and other Defilements thereof.

XVII. *The Spirit of Horſe Radiſh Roots.* It is made altogether as the *Spirits of Creſſes*, *Scurvy-Graſs*, &c. And taken in the ſame manner as they are taken, it cures the Scurvy abſolutely in a cold habit of Body: cauſes a good Appetite and Digeſtion, warms, comforts, and ſtrengthens the Stomach; invigorates and depurates the Blood and *Limpha*, and cauſes a due Circulation of the ſame through all the Veſſels, and every part of the Body. It is profitable againſt Rheumatiſms, the Gout, Dropſy, Jaundice, and all obſtructions of the Viſcera. Doſe 20 or 30 Drops or more in Ale, Beer, or Wine, 2, 3, or 4 times a Day.

CHAP. DLXXXVII.

Of RAG-WORT.

OR,

JAMES-WORT.

I. *THE Names.* It was unknown to the *Greeks*: the *Latines* call it *Jacobæa*, and *Herba Jacobi*, *Flos Jacobi & Jacobæa*: in *Engliſh*, *Rag-wort*, and *James-wort*: thought by ſome to be a Species of *Groundſel*.

II. *The Kinds.* Authors make near a dozen Kinds of this Plant; but the five following are the moſt uſual with us, *viz.* 1. *Jacobæa vulgaris major*; *Jacobæa Senecio Lobelij*; *Flos vel Herba Jacobi Majoris*, *vel Jacobæa communis*; Our Common Rag-wort. 2. *Jacobæa vulgaris minor*; *Flos Jacobi minor*; Our Leſſer Rag-wort. 3. *Jacobæa Marina*, *Cineraria vulgaris*, *Cineraria Dodonæi*; *Arthemiſia Marina Alpini*, Our common Sea Rag-wort. 4. *Jacobea marina altera*, *ſeu minor*; *Cineraria Lobelij*; *Cineraria altera*, The leſſer Sea Rag-wort. 5. *Jacobæa Maritima latifolia Bauhini*; *Cineraria latifolia Bauhini*, Broad Leav'd Sea Rag-wort.

The Descriptions.

III. *The first*, or Our common Rag-wort. *Its Root is made of many Fibres, some greater, others lesser, by which it is firmly fastned into the Ground, and abides many Years.* This Greater common Rag-wort, *has many large and long dark green winged Leaves lying on the Ground, very much rent and*

Rag-wort Common.

torn on the sides into many pieces even to the middle Rib. From among which rises up sometimes but one, and sometimes two or three square or crested blackish or browniſh Stalks, three or four Feet high, sometimes Branched, bearing divers such like Leaves upon them up to the tops, at several distances, where it branches it self forth, each Branch bearing yellow Flowers, consisting of divers Leaves, set as a Pale or Border, with a dark yellow Thrumb in the middle, which do abide a great while: but in the end growing full ripe, are turned into Down, and with a small blackish gray Seed, carried away with the Wind.

IV. *The second, or* Our lesser Rag-wort. *This in its Roots, Stalks, Leaves, Flowers, form and manner of growing is very like the precedent, so that many who do not well view it, do over-pass it, as judging it the same with the former; but the chiefest differences are these, it usually rises in Stalks not so high, nor is the Plant in the whole so great; the Leaves are not so finely jagged, nor of so sad a green color, but rather somewhat whitish, soft and woolly; and the Flowers are commonly paler, yet in many of them are much alike.*

V. *The third*, or Our common Sea Rag-wort. *Its Root is long and more woody than the others, with several small Fibres adjoining to it; it has hard crested Stalks about two Feet high, all heary or white, on which grow heary white Leaves, much*

Rag-wort Sea.

much jagged, or cut into many parts, yet each part of them broader than any of our Wild Rag-worts, *and somewhat stiff, but yet soft in handling. The tops of the Stalks are furnished with divers Flowers, whose Cups or Husks are heary as the rest of the Plant is; but the Flower it self is of a pale yellow color, with a browniſh Thrum in the middle, which turn into Down, and with the Seed is carried away with the Wind.*

VI. *The fourth*, or Lesser Sea Rag-wort. *Its Root is some thing great and Woody like the other. It grows lesser and lower than the former, yet the Leaves are longer, and much divided, or cut into many other jagged Leaves, each jagg being rounder pointed than in the former, of a grayish or Ash green color above, and very white underneath. The Flowers are many which grow at the tops of the hard woody hoary white Stalks, which are sometimes three or four Feet high, and branched. The Flowers are smaller, and of a dun or darker yellow than the other, and the middle Thrum also browner, which abide in Flower two whole Months at least, before they fall away, and then at last, they turn into Down, as the others do.*

VII. *The fifth*, or Broad Leav'd Sea Rag-wort. *Its Root is long, and thicker than any of the former, with some few Fibres retaining to it, from whence spring up round Stalks, about a Foot and half high, very hoary and woolly, spread out into divers Branches, the lower Leaves whereof are somewhat round and jagged as a Cole-wort, each part being as it were worn about the edges, and each Leaf being about four Inches broad, and (together with its foot Stalk) about a Foot long, of a dark green color on the upper side, and of a heary white underneath, and soft in handling. The Flowers grow at the tops of the Branches upon longer and slenderer foot Stalks, whose Cups or Husks are hoary, and the Flowers themselves greater, and paler, than in the former sorts, the middle Thrum being of a Gold yellow color, which after they are ripe, are turned into Downe, and with the Seed blown away with the Wind.*

VIII. *The Places.* The two first grow Wild in Pastures and untilled Grounds in many places of this Kingdom, and oftentimes both together in one Field; more especially in Fields or Grounds which are something moist, and chiefly near the Borders of Fields. The third grows on our own Coasts, not far from the Sea. in the *Isles of Shep-*

py and *Tenet*, and along the *Kentiſh* ſhore in many places. The fourth grows, as *Dodonæus* ſays, by the Sea ſide in *Zealand*; alſo on the *Mediterranean* Sea ſhore of *Italy*. And I have heard ſome diligent Herbariſts here, ſay, that they had found it growing on the Southern ſhores of this *Iſland* towards the Weſt of *England*. The laſt grows by the Sea ſide as *Bauhinus* ſays, but where is not declared,

IX. *The Times.* They all Flower in *June*, *July* and *Auguſt*; and the Seed is ripe not long after, at which time it is carried away by the Wind, with the Down.

X. *The Qualities.* *Rag-wort* is hot and dry in the ſecond Degree, Abſterſive, Aſtringent, Anodyn, and Vulnerary.

XI. *The Specification.* It cures Green Wounds, old Sores, running Ulcers, Fiſtula's, Catarrhs, Defluxions into the Eyes, Noſe, *&c.* Quinſey, Sciatica, Gout, Kings-Evil.

XII. *The Preparations.* You may have therefrom, 1. *A Liquid Juice or Eſſence.* 2. *A Decoction.* 3. *An Ointment.* 4. *A Balſam.* 5. *A Cataplaſm.*

The Virtues.

XIII. *The Liquid Juice or Eſſence.* By gargling and waſhing the Throat and Mouth therewith, they cleanſe and heal Sores and Ulcers therein. And are good againſt Swellings, hardneſs, and Apoſtemation in thoſe parts; and therefore are ſaid to be profitable againſt the Quinſey and *Struma*, or Kings Evil. Drank in a Glaſs of Wine about 3 or 4 Spoonfuls at a time, they are profitable againſt Catarrhs; and Defluxions of Rheum into the Eyes, Noſe, Mouth, Throat, and other parts. They are ſingular good to heal Green Wounds, and cleanſe old Ulcers, and filthy running Sores, as well in the Privy parts, as in other parts of the Body: and inwardly taken they cure inward Wounds and Ulcers in the Stomach, Lungs, Reins, Bladder and Womb. And outwardly injected into hollow Ulcers and Fiſtula's, they cleanſe, and induce their healing.

XIV. *The Decoction in Wine or Water.* It has all the Virtues of the *Juice* and *Eſſence*, and may be uſed in the ſame manner to all thoſe intentions; but when given Inwardly, it ought to be given in a much larger Doſe, as to 4 or 6 Ounces, adding to every Doſe about half an Ounce of Common Spirit of Wine.

XV. *The Ointment.* After it is made of the *Juice*, or *Green Herb*, according to the uſual manner, you ought to add to every pound thereof 2 Ounces or ſomething more, of pure fine *Pouder of Tobacco Leaves.* It heals Green Wounds, and cleanſes and heals filthy running Sores, old Ulcers and Fiſtula's, not ſuffering them to ſpread farther. It gives eaſe alſo in pains which happen both in the Muſcular and Nervous parts,

XVI. *The Balſam.* It has all the Virtues of the *Ointment*, and being mixed with an eighth part of White Precipitate, it more admirably cleanſes old putrid running Sores and Ulcers, more eſpecially thoſe of the Kings Evil, which Diſeaſe it potently reſiſts, and cures the Ulcers thereof after an admirable manner. It is good againſt pains of the Nervous parts, and gives eaſe in the Gout and Sciatica, being applyed thereto.

XVII. *The Cataplaſm.* It is made of the bruiſed Herb boiled with Hogs Lard and Beef Suet mixt in equal quantities, adding thereto a little *Frankincenſe* and *Mithridate.* It eaſes pains in any part, chiefly thoſe of the Gout, is good againſt Simple Contuſions; and cleanſes old putrid running Sores.

CHAP. DLXXXVIII.

Of RAMPION.

I. *THE Names.* We know no *Greek* Name for this Plant: but it is called in *Latine*, *Rapuntium*, and *Rapunculus*: It is called by *Geſner*, *Dodonæus* and others, *Rapum Sylveſtre*, tho' it is not at all like *Rapum* or the *Turnep*, but in the edibleneſs of the Root: in *Engliſh*, *Rampion.*

II. *The Kinds.* Authors give us many Species of this, theſe following are moſt uſual with us, *viz.* 1. *Rapunculus eſculentus vulgaris*; *Rapuntium parvum*; *Rapunculus minor Matthioli, Camerarij, Dodonæi, aliorumque*; *Rapunculum vulgare Tragi*; *Pes Locuſtæ Avicennæ*; Our common Garden Rampions. 2. *Rapunculus Spicatus Alopecuroides*; *Rapunculum Sylveſtre Tragi*; *Rapum Sylveſtre majus, & Rapunculum Alopecuron Dodonæi. Rapuntium majus Alopecuroides Comoſo Flore Lobelij*; *Rapunculus Alopecuroides ſpica longa Cluſij*; *Rapunculus Sylveſtris ſpicatus Thalij*; *Rapunculus Nemoroſus primus Tabernæmontani*; *Rapuntium majus Gerardi*; Great Rampion, or Long Foxtail Rampion. 2. *Rapunculus Nemoroſus Tabernæmontani, Gerardi, & Parkinſoni*; *Rapunculus Campanulatus Nerij foliis tertius Thalij*, Our Wood Rampion. 4. *Rampunculus Nemoroſus Flore magno minor*; *Rapuntium ſive Erinus Flore magno Columnæ*, Wood Rampions with great Flowers. 5. *Rapunculus Corniculatus Montanus Gerardi*; Our Mountain horned Rampions. 6. *Rapunculus Sylveſtris Flore ex purpureo Candicante Tabernæmontani, Campanula minor alba & purpurea Gerardi*, Our Wild Heath Rampion. 7. *Rapunculus Creticus Bauhini*; *Pyramidali altera, Petromarula*; Candy Rampions.

The Deſcriptions.

III. *The firſt, or* Our common Garden Rampion. *Its Root is ſmall and white, and gives Milk being broken, as all the reſt of the Plant does, ſhooting out two or three Branches, almoſt of an equal bigneſs, which is ſweet in Taſte, and therefore much uſed to be eaten. It is uſually Nurſt up in* Gardens, *and is accounted a better Kind than many of the others which grow Wild; and lying upon the Ground with ſeveral ſmall and long round pointed pale green Leaves, before it ſends up its Stalks, which ſpread out with divers ſuch Leaves thereon, but ſmaller to the top, where break forth ſeveral ſmall pale purpliſh Flowers, ending in five points, like unto the* Throat-worts, *but much ſmaller, having alſo ſuch like Heads, with ſmall browniſh Seed therein.*

IV. *The ſecond, or* Great Rampion, or Long Foxtail Rampion. *Its Root is white, greater than the*

former, but as full of Milk, and as sweet, and fit to be eaten as it, especially when it is boyled, and after stewed with Butter. The lower Leaves of this Rampion *are somewhat broad and round, yet ending in a sharp point, a little dented or carved about the edges, of a dark green color, in some places spotted with black Spots, and standing upon long small Foot Stalks; but those which grow upon the Stalks are something longer and narrower, sparingly set here and there, leaving the top bare, where grows a small spiked Head or Bush of Flowers, almost in fashion of a Foxtail (whence came the Name) at the first of a darkish green color, for so are the Husks of the Flowers which break out of them, being long and small, like unto Horns, bigger below, and smaller above, ending in four, and sometimes in five points, of a bluish purple color, in some paler, in others deeper, and in some of a white color: which being past there appear in their places small round Heads, a little cornered, with brownish Seed therein.*

V. *The third, or* Our Wood Rampion. *Its Root is white and long, but not so tender as the former. Its lowest Leaves are something long and dented about the edges, yet not so long as the next, which are very long also, standing upon short Stalks, with some smaller ones at the Joints with them. The Flowers are like the other* Rampions, *of a pale watchet color.*

VI. *The fourth, or* Wood Rampions with greater Flowers. *Its Root is somewhat thick, and of a whitish color inclining to red, full of Milk and sweet, being as fit to be eaten, and more desired than any other. Its Leaves are small, somewhat long, and round at the ends; the others which follow, and grow after them upon the Stalks are narrower and longer, and pointed also; the Flowers are longer than others, and of a dusky purplish color, with purple Veins in them, many standing together, like unto the ordinary* Rampions, *and of the same fashion with five points, but of a deeper color.*

Rampion Mountain Horned.

VII. *The fifth, or* Our Mountain Horned Rampions. *Its Root grows after an unusual manner; for first or lowermost is a Root like to that of a Rampion, but shorter; and from the top of that, comes forth as it were another Root or two, (as it were Root upon Root) being much smaller than the lower Root, especially where they are joined to the under Root, and all these have small Fibres or Strings proceeding from them. The Leaves which first grow are smooth, and almost like those of a* Rampion, *yet rounder, and made somewhat after the form of a* Violet *Leaf, but nothing so big. At the bottom of the Stalk come forth seven or eight long narrow Leaves, dented about the edges and sharp pointed: and upon the rest of the Stalk grow also three or four narrow sharp pointed Leaves, not much unlike those at bottom of the Stalk, but narrower and lesser. The Flowers are of a purple color, and grow at the top in an Umble or Tuft, and shaped almost like a Chymical Vessel, which we call a Retort, being big, large, or swollen out of their bottoms, and so becoming smaller towards their tops. But afterwards they part themselves into five parts or slender Strings, with Threads in the middle: which decaying, they are succeeded by little Cups, ending in five little pointels, in which is contained a small little Seed.*

VIII. *The sixth, or* Our Wild Heath Rampion. *Its Root is small with some Fibres adorning to it. Its Ground Leaves are small and roundish, almost like unto a* Violet, *but rounder and dented about the edges; from among which rise up weak slender Stalks, about two Feet high, which have very few Leaves thereon, or none at all; each Stalk or Branch having at its top one Flower only, of a perfect blew or white color as any of the former, and almost as large.*

IX. *The seventh, or* Candy Rampion. *Its Root is great and white, parted into many Branches, yielding Milk even as the Leaves and Stalks also do, and abides many Years, altho the Leaves and Stalks perish every Year, fresh springing up before* Winter *again, but with us it requires to be a little defended in* Winter *time as aforesaid. The first Leaves which spring up from the Seed of this Cretick or* Candy Rampion, *are round, like unto Violet Leaves, little or nothing dented about the edges, which so abide the first Year; but those which rise afterwards with the Stalks, are much different from them, being much cut in, and deeper into several parts, set on both sides of the middle Rib, the end being longest, all of them dented, of a dark green color on the upper side, and oftentimes reddish underneath. From among which rise up several Crested Stalks two or three Feet high, bearing such like Leaves on them as below, but smaller from the middle to the tops, furnished abundantly with many small reddish purple Flowers, and sometimes with white Flowers, growing one above another in a long Spike, very like unto the* Spiked Rampion, *but somewhat longer, and more divided or dented in at the corners, and each part turning it self a little back again. After which come very small brownish Seed in Heads, both of them like unto the other* Rampions. This *Pena* in his *Mons Baldus*, and *Honorius Bellus* in his first Epistle to *Clusius*, calls *Petromarula seu Lactuca petræa Cretica.*

X. *The Places.* The first is always Nurst up in *Gardens*, and sometimes the second, both of which are also found growing Wild in *England*, the Roots being eaten in Sallets, and also eaten boiled. The seventh grows with us only in *Gardens*, but requires to be a little defended in the *Winter* with us. The third grows in Woods in many places of *England*. The fourth grows also Wild in Fields sides and

and in Woods. The fifth *Gerard* ſays, that he received Seeds and Roots thereof from Mr. *Goodyer*, who found it growing plentifully Wild in the encloſed Chalky Hill Grounds by *Mapal Durham* near *Petersfield* in *Hampſhire*, and that being Planted in *Gardens*, its Flowers become much longer and fairer. The ſixth grows Wild alſo in many places in this Kingdom.

XI. *The Times.* They Flower in *May*, *June* and *July*, yea even all the *Summer* long, and laſting even to the cold of *Autumn*, which cauſes them to decay.

XII. *The Qualities.* The Roots of theſe *Rampions* are only uſed, and are temperate in reſpect to heat or cold, dryneſs or moiſture; are Abſterſive, Coſmetick, Stomatick, Analeptick, and Galactogenetick, or encreaſers of Milk in Nurſes Breaſts.

XIII. *The Specification.* The Roots encreaſe appetite, cauſe good digeſtion, are Abſterſive, and Coſmetick, clearing the Skin from deformities, and reſtore in Conſumptions.

XIV. *The Preparations.* You may have therefrom. 1. *A Sallet.* 2. *A Decoction.* 3. *A Cataplaſm.* 4. *A Diſtilled Water from the Roots and whole Plant.*

The Virtues.

XV. *The Sallet.* The Roots of all the *Rampions*, if they be of any greatneſs, are uſed for Sallets, either Cold, with Salt, Vinegar, Oil, and Pepper; being cut and ſliced thin. Or being boiled, or ſtewed in Butter, or Oil, and ſo eaten with Salt, Vinegar and Pepper; either way, or any way, they are familiar to the Stomach, ſtir up the Appetite, and cauſe Digeſtion; and ſo cauſe Milk in Nurſes Breaſts; And by reaſon of their Temperate and Analeptick, or Nutritive Qualities, they encreaſe Blood and Fleſh, and ſo reſtore in Conſumptions.

XVI. *The Decoction.* It may be made in Wine. Milk, or Water. It is ſaid to be good againſt Inflamations of the Mouth, Throat and Almonds, and other diſeaſes happening to thoſe parts, in like manner, as the *Throat-Worts* are.

XVII. *The Cataplaſm.* The Roots beaten ſmall and mixed with Meal or Flower of *Lupines* or rather of *Orobus*, cleanſes the Skin, from Scurff, Morphew, Pimples, Spots, Marks, and other like Defœdations or Diſcolorings.

XVIII. *The Diſtilled Water of Roots and the whole Plant.* It has all the Virtues of the *Cataplaſm*, and makes the Face and Skin, very fine, beautiful and clear. Drank conſtantly by Nurſes, either alone, or mixt with Milk or Whey, and a little ſweetned with double Refined Sugar, it encreaſes Milk in their Breaſts, and is good againſt a Pining Conſumption, as alſo for Ulcers of the Lungs.

CHAP. DLXXXIX.

Of RAMSON:

OR,

BEARS-GARLICK.

I. *THE Names.* It has no proper *Greek* Name, but as being a Species of *Wild Garlick*, it may be called Σκόροδα ἄγρια: in *Latine*, *Allium Urſinum*; *Allium Latifolium*; and *Moly Hippocraticum*; in *Engliſh*, *Ramſon*, or *Ramſons*.

II. *The Kinds.* This *Ramſon* is certainly a Species of *Garlick*, as appears by the Smell and Taſte, *Parkinſon* joins it with the *Garden Garlick*. *Gerard* with the *Wild*: for that it has been found growing Wild in Woods: This is *Bears-Garlick*, or *Garden Ramſons*. There is another *Ramſon* called *Allium Montanum*, *Allium Alpinum latifolium Gerardi*; *Allium anguinum Matthioli*, & *Parkinſoni*; *Victorialis longa Cluſij*; (becauſe *Gladiolus* is called *Victorialis rotunda*) *Ophioſcoridon Lobelij*; Snake Ranſom.

The Deſcriptions.

III. *The firſt, or* Bears-Garlick or Garden Ramſon. *It has a Root which is divided into many cloves or parts, by which it much*

Ramſons; Bears Garlick: Allium Urſinum.

encreaſes;

encreases; and is much weaker than the Common Garlick *both in Taste and Smell. It has two or three fair broad Leaves of a pale or light green color, and parted in the end. The Stalk grows to be about as High as high, bearing many small and pale white Star-like Flowers at the tops; and after them small black and smooth round Seed.*

IV. *Gerard* thus describes it. *Instead of a Root, it has a long slender Bulb, which sends down abundance of Strings, and is covered with Skins or thick Coats. From whence Spring two or three broad longish Leaves, sharp pointed round and of a light green color. The Stalk is a span high, smooth and slender, bearing at the Top a cluster of whiter flat fashioned flowers.*

V. *The second, or* Snake Ramson, *is not so bulbous but longer than the other, covered with a brownish outward Skin or Coat, somewhat netted as it were like* Gladiolus, *with a Loft of fibers adhering to it.* Parkinson *says, it has somewhat broader Leaves than the other* Ramson, *resembling like to* Lilly Convally *Leaves, but spotted sometimes with black Spots, as the slender Stalks are, which bear many small white Flowers on their Heads.*

VI. *Gerard* describes this second sort thus. *Its Root is great and long, covered with many scaly Coats, and hairy Strings. The Mountain* Ramson *rises up with a Stalk half a Yard high, and of about a fingers thickness, yet very weak, and full of a Spongy Substance: near to the bottom, it is of a purplish color, and green above, bearing at the top a multitude of small whitish Flowers, Star-fashioned and something Gaping. The Leaves are three or four broad, and Ribbed like the Leaves of* Great Gentian, *but more resembling the Leaves of* Garden Ramson, *or* Bears-Garlick *(before described) saving that they are larger.*

VII. *The Places.* The first, or *Bears-Garlick* or *Ramson*, besides its being Planted in *Gardens*, is found to grow Wild in many parts of *England*, in Woods and Borders of Fields under Hedges, among the Bushes. *Gerard* says, he found it growing in the next Field to *Booby*'s Barn near *London*, under that Hedg which borders upon the Lane: also upon the left Hand under an Hedg adjoining to a Lane leading to *Hampstead* near *London*. The second grows Wild on the Mountains of *Germany* as *Clusius* says; but with us only in the *Gardens* of the Curious.

VIII. *The Times.* They spring up in *April* and *May*, and they Flower in *June* and *July*, and their Seed is ripe in *August*.

IX. *The Qualities.* They both of them have all the Qualities of *Garden Garlick*, but are not full out so strong and efficacious as it, being hot and dry but in the third Degree.

X. *The Specification*, *Preparations*, and *Vertues* are the same with those of *Garden Garlick*, in *Chap.* 307. *Sect.* 9. *ad Sect.* 22. to which I refer you: yet the following particular Observations Authors have made concerning them.

XI. *Observat.* 1. *The Leaves of Ramsons*; In the *Low Countries*. They are stamped and eaten by several People with Fish for a Sawce; just as we eat *Green Sawce* made with *Sorrel*. And the same Leaves may very well be eaten in *April* and *May* with Bread and Butter, for they very much expel Wind, and strengthen the Stomach.

XII. *Observat.* 2. *The Distilled Water of the Roots and whole Plant.* It is of singular good against Stone, Gravel, Sand and Tartar in the Reins and Bladder: it opens obstructions of those parts, and cleanses them very well: it provokes Urine, and is said even to break the Stone and drive it forth. But if it breaks it, I conclude that its hardness or consistence, must be made of a Friable matter.

XIII. *Observat.* 3. *The Root of the Snake Ramson.* It is like *Gerard* as to its Operation. *Camerarius* says, that Country People hang it about the Necks of their Cattle, when they are fallen Blind, and perswade themselves, that by this means they will recover their Sight again. Those who work in the Mines in *Germany*, (as *Clusius* reports,) that they find this Root powerful in defending them from the injuries of Evil Spirits and Devils, which are oftentimes troublesome in those places. I rather think that hereby is meant, that it is good against the Malignity of Poisonous and Pestilential Vapors, and Mortiferous Damps, which are very frequent in the Mines.

RAPE, *see* Turnep, *Chap.*

CHAP. DXC.

Of RAPE-SEED.

AND

COLE-RAPE.

I. *THE Names.* We know no *Greek* Name it has: but it is called in *Latine*, *Rapo-Caulis*, *& Caulo-Rapum*: in *English*, *Rape* and *Cole-Rape*.

II. *The Kinds.* The Species we treat of here are, 1. *Rapo-Caulis*, The Garden Rape-Cole. 2. *Caulo-Rapum*, The Garden Cole-Rape. 3. *Brassica Sylvestris, vel arvensis*, The Wild Rape, or Cole-wort, which yields the *Rape Seed*, and is only sown for Profit sake.

The Description.

III. *The first, or* Garden Rape Cole. *It has one single long Root, garnished with many Thready Strings. From which rises up a great thick Stalk, bigger than a* Great Cucumber, *or* Great Turnep, *at the top whereof shoots forth, great broad Leaves like to those of* Cabbage-Cole. *The Flowers grow at the Top on slender Stalks, compact of four small yellow Leaves, which being past, the Seed follows, inclosed in small long Cods, like the Seed of Mustard.*

Rape-Cole.

IV. *Parkinſon* deſcribes this *Rape Cole* thus. *It has a Root which is ſomewhat long, and very buſhy with Threads. From the Head of this Root, proceeds another white Head, or Headed Stalk above the Ground, as large as a reaſonable* Turnep, *but a little longer: and from the top thereof proceeds or ſprings out divers great Leaves like unto* Coleworts) *for which reaſon it is accounted one of the Kinds of* Coleworts:) *from among theſe Leaves, riſe divers Stalks, which bear yellow Flowers, conſiſting of four Leaves apiece; and Seed in ſmall long pods, almoſt as ſmall as* Muſtard Seed.

V. The *ſecond, or* Garden Cole Rape. *It has a long fibrous Root like unto the former. The Tuberous Stalk is very great and long, thruſting forth in ſome places here and there ſome foot Stalks, on which do grow ſmooth Leaves, ſlightly indented about the edges: on the top of the long* Turnep *Stalk grow Leaves, Stalks, and Flowers like the former. This differs from the firſt chiefly in the length of the ſwoln Stalk, for which reaſon it is called by ſome* Caulo Rapum longum, *or* Long Cole Rape.

VI. *The third, or* Wild Rape, *or* Wild Cole-wort, *(which yields the* Rape Seed, *of which they make* Rape Oil.) *Its Root is white, hard, and ſomewhat Woody. From this Root ſpring up many long grayiſh round Leaves, much gaſhed in, or torn on the edges. From among theſe Leaves riſe up the Stalks, bearing ſuch like Leaves, but ſmaller; and at their tops yellowiſh Flowers, each conſiſting of four Leaves, which are ſucceeded*

Rape Seed Plant.

by ſmall rough Pods, with ſmall round Seed in them.

VII. *Gerard* thus deſcribes this Kind. *This* Wild Rape, *or* Cole-wort *has long broad Leaves,*

Rape Seed Plant.

ent

not unlike to the Tame *or* Garden Cole-wort, *but lesser, as is all the rest of the Plant. This is of its own Nature* Wild, *and therefore not Nurst up for Food: but it is Sown and Husbanded in whole Fields for the Seed sake, by which the Owners oftentimes get great Gain.*

VIII. *The Places.* The two first are Natives of *Italy*, *Spain*, and some places of *Germany*: from some of which places Seed has been sent to us, and they are become Natives in many of our *Gardens*. The third grows Wild on many Ditch bank sides, both in the Up-lands and near the Sea side: but now for the profit sake which is made of the Seed, (by extraction of its *Oil*, by the help of *Oil Mills*, built on purpose for that use) whole Fields are sometimes sown therewith, as we but even now hinted.

IX. *The Times.* They all Flower when other *Coleworts* do, *viz.* about the middle or end of *July*; and the Seed is ripe in the middle or end of *August*.

X. *The Qualities, Specification, Preparations, Virtues and Uses* of these Plants, are the same with those of the *Garden Cole-wort* in *Chap.* 143. *Sect.* 7. *ad* 22. so that no more need be said of them in this place: saving that the *Wild Rape*, or *Rape Seed Plant*, is seldom or never used either as Food or Sallet but is chiefly produced for the *Oil of its Seed*.

XI. *Observation* 1. *The Seed of the Rape-Cole, or Cole Rape.* If it is grosly bruised and boiled a little in *Meat* or *Flesh Broth*, it is a present Remedy for the Colick: The *Seed* and *Broth* being taken together, easing them who are troubled therewith, of all Griping Pains, and gives ease also to those who are troubled with the Stone in the Reins.

XII. *Observ.* 2. *An Electuary of the Pulp of the boiled Stalks.* If the *Turnep* part of the Stalk, is boiled or baked till it is soft, you are to take the Pulp thereof, and with a little *Honey* and *Almond-Milk*, to make a *Lohoch*, or soft *Electuary*. This taken now and then upon a Knives point, is very profitable for shortness of Breath, and such as are entring into a consumption of the Lungs.

XIII. *Oserv.* 3. *Gerard* says, that there is nothing Wrote of the Faculties of these *Rape-Coles*, or *Cole-Rapes*; but he says they are accounted for dainty Food, contending with the *Cabbage* in goodness, and pleasant Taste.

XIV. *Observ.* 4. Not taking notice of the Mechanick Uses for which *Rape Seed Oil* is had in Estimation: its Medical Use is for easing of Pains in any part of the Body; by anointing the parts affected well therewith, and applying Cloths dipt in it over the same. It is Anodyn, Relaxative, and gives ease in the Gout, Cramp, and helps shrunk Sinews, if not of too long continuance. It eases Pains of the Spleen, Reins and Womb, being outwardly apply'd, and inwardly taken to the quantity of a Spoonful or two at a time.

CHAP. DXCI.

Of RASP--BERRY Plant:

OR,

HINDE--BERRY.

I. *The Names.* It is called in *Greek*, Βάτος *idæa*: in *Latine*, *Rubus Idæa*: in *English*, *Rasp-Berry*, and *Hinde-Berry*.

II. *The Kinds.* We shall describe five several Varieties, *viz.* 1. *Rubus Idæus vulgaris vel Hortensis*, Our common Garden Rasp-Berry. 2. *Rubus Montanus Odoratus*, The sweet Mountain Raspis. 3. *Rubus Tricoccos*, Our common Field Dew-Berry. 4. *Rubus Saxatillis Alpinus*, The Stony, Rock Rasp-Berry. 5. *Chamæmorus Anglica*, Our Knot-Berry.

The Descriptions.

III. *The first, or* Our common Rasp-Berry. *Its Root creeps under Ground very far, and shoots up again in many places, much increasing thereby. It is of two sorts,* viz. *one bearing red Berries, the other white; but otherwise they differ not in their form or manner of growing, either as to the*

Rasp-Berry Bush.

whole Bush, or as to the Leaf, Flower or Berry, but only in the color of the Fruit, and a little in the Taste thereof, the white Rasp-Berry *being a little more pleasant than the red.* The Rasp-Berry Bush *has tender whitish Stems, with reddish small Pricks*

like Hairs ſet round them, eſpecially at the firſt when they are young: but when they grow old they become more woody and firm, without any ſhow of Thorns *or* Prickles *upon them, and have only a little hairineſs covering them.* The Leaves *are ſomewhat rough or rugged, and wrinkled,*

Raſp-Berry Garden.

ſtanding three or five upon a Stalk, ſomething like unto Roſes, *but greater; and of a grayer green color.* The *Flowers are ſmall, made of five whitiſh round* Leaves, *with a daſh as it were of bluſh caſt over them, many ſtanding together, yet every one upon its own Stalk, at the tops of the Branches. After which come up ſmall Berries, ſomething bigger than the* Common ſmall red Straw-Berry, *with a kind of downineſs caſt over them, of a pleaſant acid* Taſte, *having a kind of peculiar flavor of their own.*

IV. The *ſecond, or* Sweet Mountain Raſp-Berry. *Its Root creeps and ſpreads much under Ground, as the other does. It has ſeveral long Stalks riſing up from the* Root, *without any* Thorns *on them, but ſet thick with ſoft Hairs, having on them broad and large* Leaves *without order, growing upon long hairy foot Stalks, divided into five parts, almoſt to the midle Rib, and ſometimes but into three, each part a little dented about the edges, of a very ſweet Smell, but falling in* Winter. *The Flowers are ſomething large like the* Eglantine, *of a diluted purpliſh* Violet *color, with ſeveral yellow Threads in the middle, ſtanding at the tops of the Branches: after which come the Fruit, very like to the former, and reddiſh, having much the* Raſp-Berry *Taſte.*

V. *The third, or* Our common Field Dew-Berry. *Its Root creeps under Ground more than the laſt, and has ſlender weak Branches like that, but more often lying down, than riſing up, with a few Thorns or Prickles thereon. The Leaves are uſually but three ſet together, more ſeparate on the Branches, yet almoſt as large, and ſtanding on long foot Stalks. The Flowers are white and ſmall. The Berries uſually conſiſt but of three parts or bunchings out, each having but one Grain or Seed in it, and all making but one Berry; yet ſometimes they may have 4 or 5 of thoſe* Grape *like bunchings out; being of a ſweet and pleaſant Taſte.*

VI. *The fourth, or* The Stony, or Rock Raſp-Berry. *Its Root creeps all about, and ſhoots forth ſeveral Branches from the Joints as they creep. It is but a low Plant, and is more of the* Raſp-Berry *Kind, than of the* Bramble. *It has ſeveral ſlender, reddiſh, twiggy hairy Branches, little more than a foot, ſcarcely half a Yard high, without any Thorns or Prickles at all on them; the Leaves are ſet here and there, on the Stalks, and ſtand on long foot Stalks, being rough, and three always joined together, dented about the edges, and of a very ſtyptick, or harſh binding Taſte. The Flowers ſtand at the tops of the Branches, three or four together, conſiſting ſome of four, and ſome of five Leaves apiece, of a pale, or whitiſh* Roſe *color, which afterwards turn into ſmall Fruit, compoſed of three, four, five, or more ſmall* Grape *like Bunchings out, larger than either in the* Bramble, *or* Garden Raſp-Berry. *The whole Berry is of a reddiſh color when it is ripe, and almoſt tranſparent, full of a moſt pleaſant acid ſweet Juice, very grateful to the Palate, having in each of its bunchings out, a ſmall white rough Grain, or Seed.*

VII. *The fifth, or* Our Knot-Berry. *Its Root creeps much and far, ſhooting forth ſmall Fibres at the knotty Joints, by which it is faſtned in the Ground, and from whence ſpring up divers new Shoots or Stalks. It riſes up with ſlender browniſh Stalks, ſcarcely exceeding a Foot in height, unleſs the Soil be very good, ſet with four or five large Leaves, one above another, at ſeveral Joints, each of them divided into five parts, and each of them ſomewhat deeply jagged, and dented alſo round the edges, rough and as it were crumpled, each upon a long foot Stalk, which at the Joints have 2 ſmall pieces like Ears growing thereto. Each Stalk being furniſhed at top, with one Flower, conſiſting of five round pointed Leaves, of a dark purple color. Being paſt away, there follows a large Berry, like to a* Mulberry, *conſiſting of many Grains, ſet together, of a reddiſh color when it is ripe, and of a ſweet acid Taſte.*

VIII. *The Places.* The firſt grows generally with us in *Gardens* throughout the Kingdom. *Gerard* ſays, that it grew not Wild that he knew of, except in a Field by a Village in *Lancaſhire* called *Harwood*, not far from *Blackburne*; alſo among the Buſhes of a Cawſey near to *Wiſterton*, two Miles from *Nantwich* in *Cheſhire*; I have formerly found it to grow Wild alſo, in ſome parts of the *Fens* in *Cambridgeſhire*, not far from a Town called *Chartres*. The ſecond grows on Hills and higher Grounds in divers places. The third grows in many places in the North of *England*, as, *Cheſhire*, *Lancaſhire*, and *Yorkſhire*, alſo in *Cambridgeſhire*, in many of the Plowed Fields, and Arable Land in ſeveral places. The fourth, in Stoney and Rocky places in the *Iſle of Tenet*, and other places in *Kent*; it grows alſo in *Huntingtonſhire* and *Northamptonſhire*. The fifth grows on the high Hills in *Lancaſhire*, it loves open and Snowy Hills, and Mountains, and grows plentifully upon *Ingleborough* Hills in *Lancaſhire* aforenamed, which is thought to be the higheſt Hill in *England*; as alſo upon *Pendle* Hills in *Yorkſhire*, which is another Hill, nearly as high as the former, and other like places.

IX. *The*

IX. *The Times.* They all Flower about the latter end of *May*, thro' all *June* and *July*; and the Berries are ripe in *August* and *September*.

X. *The Qualities.* The Roots, Stalks, Leaves, Flowers, and unripe Fruit are cold and drying in the firſt Degree, Aſtringent, and Styptick, Vulnerary, and Alexipharmick.

XI. *The Specification.* They ſtop Fluxes of the Belly, and bleeding in the inward parts; are good againſt the overflowing of the Courſes in Women: they cure Sores and Ulcers of the Throat, Mouth and other parts, are profitable againſt the bitings of Serpents, and cure the *Stomacace*, or Scurvy, being uſed according to Art, for ſome conſiderable time.

XII. *The Preparations.* You may have herefrom, 1. *A Liquid Juice of the Roots, Stalks and Leaves.* 2. *A Liquid and Inſpiſſate Juice of the green or unripe Berries.* 3. *A Decoction of the Roots, Leaves, Flowers and unripe Berries.* 4. *A Decoction of the dryed unripe Berries.* 5. *The ripe Berries.* 6. *A Conſerve of the Flowers.* 7. *A Conſerve of the unripe Berries.* 8. *A Conſerve of the ripe Berries.* 9. *A Syrup of the Juice of the ripe Berries.* 10. *A Wine of the ripe Berries.* 11. *A Powder of the Roots and Leaves.* 12. *A Diſtilled Water from the whole Plant and unripe Berries.* 13. *A Vinous Spirit from the Berries.*

The Virtues.

XIII. *The Liquid Juice of Roots, Leaves and Stalks.* Taken to 3 or 4 Spoonfuls at a time in any convenient Vehicle, as Red Wine, *&c.* it ſtops all ſorts of Fluxes of the Bowels, Fluxes of the Womb, and defluxions of Humors to any Sore, Ulcer, or other part of the Body; it is excellent againſt Catarrhs, and mixed with Honey, or *Syrup of the Berries ripe or unripe*, it is good againſt Sores and Ulcers of the Throat, Mouth, and Secret parts; and is alſo very profitable to the ſpeedy healing of Green Wounds.

XIV. *The Liquid and Inſpiſſate Juice of the green or unripe Berries.* They have both of them all the Virtues of the former *Juice*, but much more effectual to all thoſe Intentions. The *Liquid Juice* may be given Morning and Evening from 1 Spoonful to 2, in a Glaſs of Red *Port* Wine, or other proper Vehicle. The *Inſpiſſate Juice* may be given from a Dram to two Drams or more, diſſolved in the *Decoction of the Leaves*, or in Red Styptick Wine, and then ſweetned with the *Syrup of the ripe Berries.* They are both good againſt the heat and Inflamation of the Throat, Almonds, and Mouth, ſtop Spitting of Blood, and all ſorts of Fluxes of Blood whereſoever. And mixt with Honey are good to heal Sore Eyes.

XV. *The Decoction of the Roots, Stalks, Leaves, Flowers and unripe Berries, in Wine or Water.* It has all the Virtues of the former *Liquid* and *Inſpiſſate Juices*, but muſt be given in greater quantity, as to 4 or 6 Ounces or more Morning and Night, mixed with *Syrup of Mulberies*, or *Syrup of ripe or unripe Raſp-berries*, it makes an extraordinary Gargle for a ſore Throat and Mouth, takes off the force of the hot Inflamation, and in a little time cauſes a healing: and being alſo ſwallowed down, it cools and repreſſes inward Fevers.

XVI. *The Decoction of the dried unripe Berries.* It has the Virtues of the former *Decoction* and of the *Juices*, and may be taken in the ſame Doſe of the *Decoction*, either alone ſweetned with the *Syrup of the Berries*, or mixt with ſome proper Wine. It is good againſt the Poiſon of Scorpions, Serpents and other Venomous Beaſts, being both inwardly taken in Wine, and outwardly fomented upon the part ſcalding hot, or as hot as it can be endured, for ſome conſiderable time.

XVII. *The ripe Berries.* They are eaten raw, and ſo they cool, abate the heat of the moſt violent Fevers, even of the Peſtilential, attemperate the Stomach, and refreſh, and chear the Spirits; and are of extraordinary benefit, to be plentifully eaten by ſuch as are troubled with the *Stomacace* or Scurvy, *viz.* the Stomach Diſeaſe, for they cool, cleanſe, and ſtrengthen the Stomach, and reſtore its healthful Tone, and withall rectify the Diſcraſy of the Blood and Juices.

XVIII. *The Conſerve of the Flowers.* It is Styptick or Binding, and of ſingular good uſe againſt all ſorts of Fluxes of the Bowels in Man or Woman, taken to the quantity of a *Cheſt-Nut* Morning and Night.

XIX. *The Conſerve of the unripe Berries.* It has all the Virtues of both the *Liquid Juices* and *Inſpiſſate Juice* aforegoing, and may be taken Morning and Evening, upon a Knives point, to the quantity of a *Cheſt-Nut*. It is very cooling and grateful to the Stomach, and ſtops Vomiting.

XX. *The Conſerve of the ripe Berries.* It is not ſo great an Aſtringent as the former; but is of good uſe to cool and ſtrengthen the Stomach, reſiſt the Scurvy, and to take off the preternatural heat of Fevers, and cauſe a good Appetite.

XXI. *The Syrup of the Juice of the ripe Berries.* It is pleaſant and grateful, effectual to cool a hot Stomach, and to quicken and refreſh ſuch as are overcome with Sickneſs at Heart and Faintings. It reſiſts the Scurvy in a hot Conſtitution, and is very Cordial.

XXII. *The Wine of the ripe Berries.* It is made of the *Juice* by a Natural Fermentation, as the *Wine of Grapes* are made. And when by Age and keeping it becomes fine, it is a noble Cordial, and as much comforts the Spirits as other Wine does. *Parkinſon* ſays, that it is generally held at leaſt by many, that the Red Wine which is uſually Sold by the Vintners is made of *Raſp-Berries.* As to the truth of this I can ſay nothing: but this I can ſay, that the Vintners need not be beholden to the *Raſp-Berry* for Red Wine, for that there is a *Red Grape* which yeilds a *Blood red Juice*, of as deep a Red, as any thing can be imagined to be.

XXIII. *The Powder of the Roots and Leaves.* It is Styptick, but of a thin Subſtance, for which reaſon, (experience having alſo confirmed the ſame) it is ſaid to waſte away the Stone in the Reins; and alſo to break the Stone and drive forth Gravel and Sand out of the Reins and Bladder: and ſtrewed on old Sores and running Ulcers, yea tho' Cancerous, it is ſaid wonderfully to help and heal them.

XXIV. *The Diſtilled Water from the whole Plant and unripe Berries.* It is of extraordinary uſe in cooling the Body, and abating preternatural heat. If it is taken (being impregnated with a few drops of *Spirit of Sulphur,*) it takes away the heat, and extinguiſhes the malignity of all Burning and Malign Fevers, yea of the Peſtilence it ſelf. And ſo uſed it admirably quenches Thirſt, and ſupports the Spirits againſt Fainting, Swooning, and other like accidents of the Vitals.

XXV. *The Spirit.* It is Diſtilled off from the *Wine made of the Berries* in an Alembick, exact-

exactly in the same manner as you make *Spirit of Wine.* If it is well done, it is full as strong and as good as *Spirit of Wine*, and as pure: and when it has Age upon it is scarcely to be known from true *Spirit of Wine.* It serves to all the same uses which *Spirit of Wine* does, both in Chymistry and Physick, and is full as good and as Cordial, being taken as a Dram.

CHAP. DXCII.

Of RATTLE-GRASS Red: *OR,* Red LOUSE-WORT.

I. *THE Names.* It is called in *Greek*, Φθειρον: in *Latine*, *Pedicularis*, and *Fistularia*, also *Crista Galli*, or *Gallinacea rubra:* in *English*, *Rattle-Grass*, *Red Rattle Grass*, *Red Cocks-Comb*, and *Red Louse-wort.*

II. *The Kinds.* There are three Species hereof, *viz.* 1. *Pedicularis Pratensis rubra vulgaris*, *Crista Galli altera*, *sive Phthirion*; Our Common red Rattle. 2. *Pedicularis major montana*; *Pedicularis Alpina filicis folio major Bauhini*; *Alectorolophus major Clusij*, The greater Mountain Rattle-Grass, or greater Red Cocks-Comb. 3. *Pedicularis montana minor*; *Pedicularis Alpini Filicis folio minor Bauhini*; *Alectorolophus minor Clusij*; The lesser Mountain red Rattle-Grass. There is also *Yellow Rattle-Grass*, or *Rattle-Grass* with yellow Flowers, called generally *Cocks-Comb*, and under that Title we have already treated of it in *Chap.* 142 aforegoing, to which you are referred.

The Descriptions.

III. *The first, or* Our Common red Rattle. *Its Root consists of two or three small whitish Strings with some Fibres adjoining to them. It has several reddish hollow Stalks, which are sometimes green also, rising up from the Root, lying for the most part on the Ground, yet some growing more upright, with many small reddish greenish Leaves set on both sides of a middle Rib, finely dented about the edges. The Flowers stand at the tops of the Stalks and Branches, of a fine purplish red color, like small gaping Hoods; after which come flat blackish Seeds in small Husks, which lying loose therein, will Rattle by shaking, whence came the Name.*

Rattle-Grass red; or, *Louse-wort.*

IV. *The second, or* Greater Mountain Rattle-Grass, or Greater Red Cocks-Comb. *Its Root is long, thick, and black. It rises up near half a Yard high, with a thick crested hollow Stalk, set something thick, with long Stalks of Winged Leaves, made after the manner of* Ferne, *notched about the edges, one above another. The Flowers are like the former, but of a whitish color, growing in a long Spike; after which follow broader Husks, containing therein flat Seed much like to Madwort.*

V. *The third, or* Lesser Mountain red Rattle-*Grass. Its Root is long and white, of the thickness of ones Finger, with some great Fibres adjoining to it. This smaller kind grows much lower than the last, and with fewer Leaves on the Stalks, which are slender, but hollow also like unto them. The Flowers likewise are smaller and grow on a shorter Spike, but of a delicate shining red Color. The Husks which follow, are greater than the first, with long beaks at their ends, having corner'd Seed within them.*

VI. *The Places.* They grow the first in our Meadows, the second and third in our Woods and Mountainous and Hilly Grounds, in many parts of this Land; and are rather a Plague and Annoyance to the Land, than of any good use for the Cattle. The first delights in moist and moorish Meadows, where it encreases and becomes hurtful to the Grass.

VII. *The Times.* *Gerard* says the first Flowers in *May* and *June.* *Parkinson* says, they Flower in *June*, and sometimes till *August* is past.

VIII. *The Qualities.* They are cold and dry in the first degree; Astringent, and Vulnerary.

IX. *The Specification.* It heals the Bloody Flux, stops the overflowing of the Courses in Women, or any other Flux of Blood; stops all other Fluxes of the Bowels, as also any Flux of Humors to any old running Sore, Ulcer or Fistula, and is profitable for the speedy healing them up.

X. *The Preparations.* You may have herefrom, 1. *A Liquid Juice of the Plant.* 2. *A Decoction of the same in rough or Styptick Red Wine* 3. *A Powder of the Seed, and Leaves.*

The Virtues.

XI. *The Liquid Juice.* Taken from a Spoonful to two in Red Styptick Wine, Morning and Night, it stops the overflowing of the Courses in Women, and all other Fluxes of the Bowels, as also Catarrhs or Fluxes of Rheum into the Mouth and Throat, and all sorts of Fluxes of Humors upon the Joints and other parts, and thin Distillations upon old running Sores, Ulcers, Fistula's, &c. ending them speedily to heal, more especially if they be duly washed with the same *Juice*, mixed with an eighth part of *Simple Spirit of Wine* or *Brandy.* Inwardly taken also as aforesaid, it cures,

cures Spitting of Blood, Vomiting of Blood, Piſſing of Blood, and other inward Bleedings, and after due cleanſing, heals Ulcers of the Bowels.

XII. *The Decoction in Red Syptick Wine.* It has all the Virtues of the *Juice* aforegoing, but much weaker, and therefore ought to be uſed in larger quantities, as from a quarter to half a Pint Morning Noon and Night, a little ſweetned with double Refined Sugar. Sweetned with Honey, and uſed as a *Gargariſm*, it is an excellent thing to cure Inflamations, Sores, and Ulcers in the Almonds, Throat, Mouth, Tongue and Gums, *&c.* being uſed 2, 4, or 6 times a Day. And ſo uſed alſo as a Waſh for running Sores, or as an Injection for hollow Ulcers and Fiſtula's, it cleanſes, incarnates, and cauſes a ſpeedy healing. It is an excellent thing alſo for an Injection in a Virulent *Gonorrhœa*, Univerſals being premiſed, and cure the Virulent running in Women.

XIII. *The Powder of the Leaves and Seed.* Being taken inwardly to a Dram in Red Wine, it ſtops all Fluxes of the Bowels, even the Bloody Flux, and all other inward Fluxes of Blood: and outwardly applyed to any old running Sore or Ulcer, it very much drys up the Humor, ſtops the Fluxion, and induces a ſpeedy healing.

CHAP. DXCIII.

Of REED-BURR: OR, SEDGE.

I. *THE Names.* It is called in *Arabick*, *Safarheramon*: in *Greek*, Σπαργάνιον: (*Faſciola: quod ex eo faſciæ fierent.*) Alſo ξιφίδιον, *Xiphidion*, *Gladiolus*, *enſiculus*, (becauſe it is Sword like, and double edged:) ſome think it to be Βάτωμος, *Butomos Theophraſti*, *quæ eſt Herba paluſtris*, *acutam habens aciem ſecanſque:* in *Latine*, *Sparganium*, and *Xiphidion*; which is the *Platanaria Dodonæi & Thalij*; becauſe the Burrs of it are like to thoſe of the *Plane Tree:* But *Lonicerus* calls it *Carex*, which to me ſeems the more proper Name: in *Engliſh*, *Burr-Reed*, *Sheer-Graſs*, *Sword-Graſs*, *Burr-weed*, *Sedge*, which laſt, is the proper *Engliſh* Name.

II. *The Kinds.* There are ſeveral ſorts of it, the three following are chief, *viz.* 1. *Carex Ramoſa*, *Sparganium Ramoſum*, *Platanaria Dodonæi & Thalij*; *Butomos Theophraſti Ruellio & Anguilara*, *Xiphidion Dioſcoridis*, Our Sedge, or Burr-Reed Branched. 2. *Carex non Ramoſum*, *Sparganium majus non Ramoſum*; *Sparganium alterum Lobelij*; *Platanaria altera Dodonæi*, Sedge or Burr-Reed not Branched. 3. *Sparganium majus Ramoſum Virginianum*, The great Branched Burr-Reed of Virginia.

The Deſcriptions.

III. *The firſt, or* Our Sedge, or Burr-Reed Branched. *Its Root is Buſhy, conſiſting of a great number of Strings and ſmall Fibres. It has larger, broader and rougher Leaves than thoſe of the* Cats-Tail, *or* Reed-Mace, *yet a little or in ſome ſmall meaſure three ſquare as it were, like them, and ſharp both on the edges and at the points. From among which riſes up a rough round Stalk,* 2 *or* 3 *Feet high, with the like, but leſſer Leaves on them, dividing or branching it ſelf towards the top into ſeveral parts, bearing on them ſeveral ſmall green Burrs, which are not rough at the firſt, but growing ripe, are hard and prickly, ſomewhat reſembling the rough Burrs of the* Platanus, *or* Plane-Tree, *with a Leaf at each Joint up to the top.*

Barr-Reed, or Sedge.

IV. *The ſecond, or* Sedge, or Burr Reed not Branched. *The Root of this is in all reſpects like to that of the former. It grows up alſo in like manner, but with Leaves ſomewhat broader than thoſe, and a ſingle lower Stalk not Branched at all; but bearing the like Balls or Burrs, yet ſomething ſofter, and not ſo prickly, with a Leaf at every one of them likewiſe.*

V. *The third, or* Great Branched Sedge, or Burr Reed of Virginia. *Its Root is ſomewhat knobby at the Head, with ſeveral Fibres or Strings thereat. It has only* 2 *or* 3 *very long and ſomewhat broad, pale green Leaves riſing from the Root, and in the midſt of them a ſtrong round Stalk, without any Leaves thereon; but Branching it ſelf forth near the top into many round and ſomewhat prickly Burrs, of the bigneſs of a* Wall-Nut, *without any ſhew of Flowers appearing thereon.*

VI. *The Places.* They uſually grow in Marſhes, Watery Ditches, Ponds, and in Rivers Salt and Freſh Waters, or by their ſides: the two firſt in ſeveral parts of this Land: The third in *Virginia*, *Maryland*, *New-England*, *New-York*, *Carolina*, and other parts of *Florida*. The two firſt grow plentifully

tifully in the Fenny Grounds of *Lincolnſhire*, and ſuch like places.

VII. *The Times.* They are green all the *Spring* and *Summer*, and bring forth their Burrs or Seedy Knots in *Auguſt*.

VIII. *The Qualities.* They are cold dry in the firſt Degree, and Alexipharmick, or reſiſters of Poiſon.

IX. *The Specification.* Authors have ſaid no more of the Virtues of theſe Plants, but that they are good againſt the Poiſon of Serpents.

X. *The Preparations.* There is only *A Decoction of the Root, or of the Burrs in Wine.*

The Virtues.

XI. *The Decoction.* The Root being made into a *Decoction in Wine* (for ſo I ſuppoſe *Dioſcorides* is to be underſtood, *Datur radix ex vino, contra Serpentium Venena:)* is good againſt the Poiſon of Serpents. But *Gerard* ſays, that the Knobs or rough Burrs of theſe Plants boiled in Wine, are good againſt the Bitings of Venomous Beaſts, if the *Decoction* is either drank, or the Wound waſhed therewith.

CHAP. DXCIV.

Of REED Common.

I. *THE Names.* It is called in *Arabick*, *Caſab:* in *Greek*, Κάλαμος: in *Latine*, *Calamus*, *Harundo*, & *Arundo:* in *Engliſh*, *Reed.*

II. *The Kinds.* We ſhall not here enumerate the vaſt numbers or Species of Reeds, which grow in moſt parts of the World; but thoſe only which grow in *England*, and our Plantations beyond Sea, in the *Weſt Indies*, and theſe are the three following, viz. 1. *Phragmatis Dodonæi & Ruellij*; *Arundo Vallaris Lobelij*, *Harundo vel Arundo Vallatoria*, *Arundo Paluſtris Matthioli*, *Arundo vel Calamus Vulgaris*, Our common Pool Reed. 2. *Harundo vel Arundo multifida Anglica*; Our Engliſh Finger Reed. 3. *Arundo Donax*, Cane Reed; *Calamus vel Arundo Cypria Dodonæi*; *Calamus Italicus major*; *Arunda Italica major Camerarij*; *Arundo major Hiſpanica*; *Calamus vel Arundo major Caroliniana*, *vel Floridiana*, The Carolina, or Weſt-Indian Cane Reed. This without doubt may be the ſame *Cane Reed* which grows in the *Eaſt-Indies*, which by reaſon of the Clime, grows both taller and greater; ſo that they ſerve inſtead of Wood or Timber to make their little Houſes, Hovils, or Huts of, and to cover them.

The Deſcriptions.

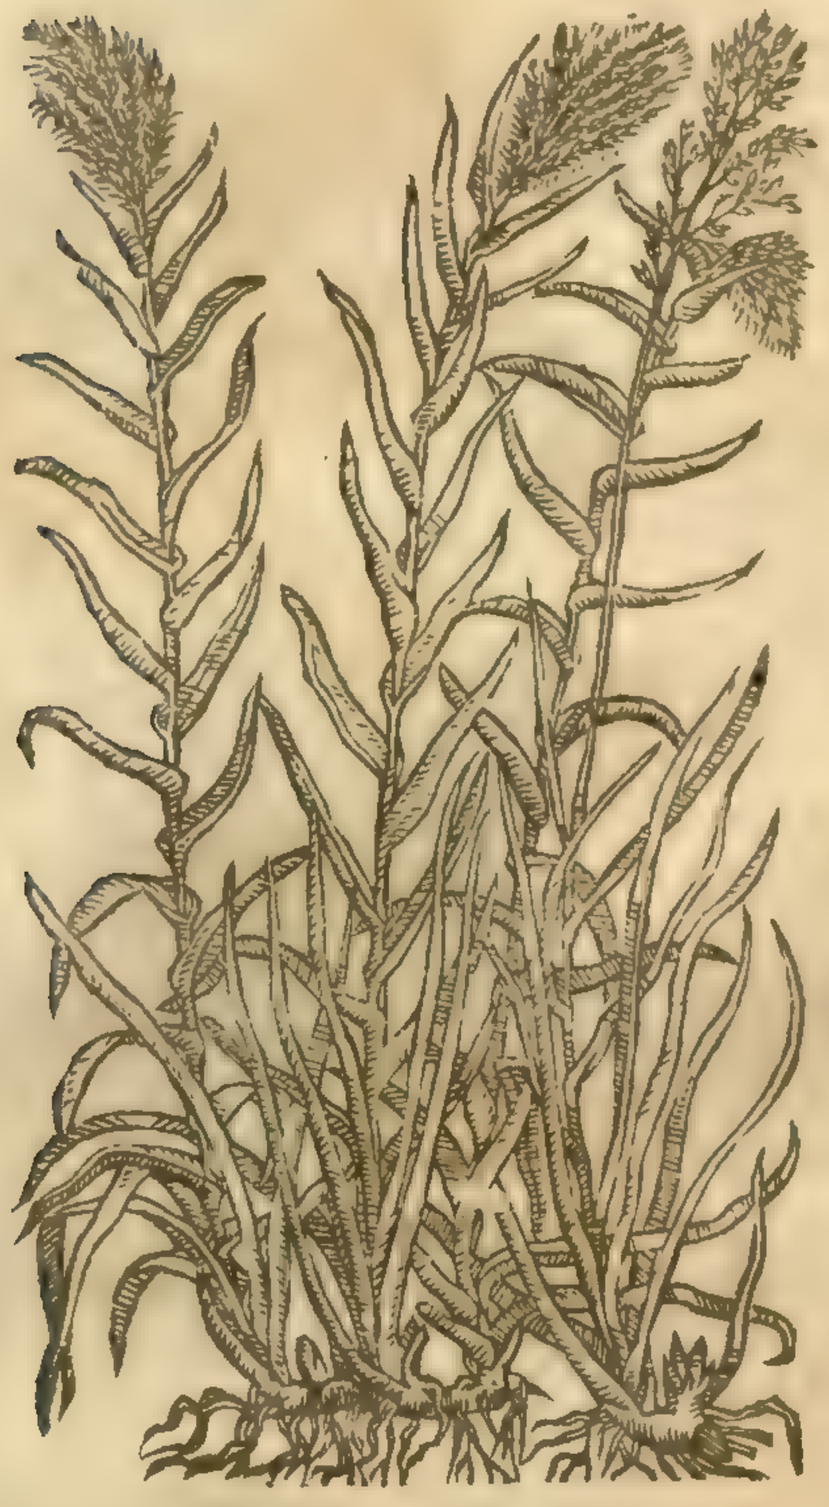
III. *The firſt*, *or* Our common Pool Reed. *Its Root is white, hard, round, long, and with many knobbed Joints, running a ſloop, but not deep, and ſhooting up Stalks from divers of the Joints. Theſe Stalks are manifold, great, round, and hollow, and full of Joints, not diſtant very far one from another, and run up to a conſiderable height, as to 4, 5, or 6 Feet high, or more, but higher in ſome places than in others, with long and ſomewhat broad hard green Leaves at each of the Joints, ſharp on both edges, and ſomewhat encompaſſing the Stalk, at their bottoms; bearing a long, and broad ſpread, ſoft, browniſh Pannicle at top, whoſe Chaffy, or Downy Seed flies away with the Wind. The whole Stalk dies, and periſhes every Year, but is uſually cut down before* Winter, *when as it is grown white, to ſerve for ſeveral Mechanick uſes.*

Reed Pool Common.

IV. *The ſecond*, *or* Out Engliſh Finger Reed. *Its Root, form, magnitude and manner of growing, is much like the former; its difference from that is only in the Leaves, which are each of them half a Yard long, and two or three Inches broad, with ſeveral great Ribs or Veins running along them, and parted at the ends into three or four parts, ſomething like unto our* Finger Harts-Tongue.

V. *The third*, *or* Carolina or Weſt-India Cane-Reed, *called alſo* Spaniſh Cane or Reed. *This in its Root, Stalk, Leaf, and manner of growing, differs not from the firſt deſcribed, but only in its greatneſs, the Canes or Stalks being harder, thicker, and riſing much higher; ſometimes to eight, ten or twelve Feet high, (according to the goodneſs or richneſs of the Soil) more or leſs; whoſe Joints are farther diſtant aſunder than in our* Common Pool Reed; *the Leaves are likewiſe much larger, broader, and longer, having alſo a very much larger Pannicle at top. Theſe* Reeds *or* Canes *are of ſeveral thickneſſes, ſome of them half an Inch thick or leſſer, and ſome three quarters of an Inch thick. Theſe are without doubt the ſame with thoſe* Reeds *or* Canes *which grow in the* Eaſt-Indies; *called* Cane-Reed, *where they grow much greater, thicker, and taller, and are of ſuch a Subſtance as to ſerve them to make their*

Cane-Reed.



their little Houſes or Hutts of, which greatneſs of their growth, I am perſwaded, comes only from the Heat, Soil, and Nature of the Clime where they grow.

VI. *The Places.* All theſe *Reeds* delight to grow in moiſt and Watery places, and Grounds apt to be overflown with Water, as in Watery Ponds and Ditches, by ſoft or ſlow running Rivers ſides, and almoſt every where, through all the Fen Country. The firſt two grow in *England*, the *Pool Reed* almoſt every where. The ſecond is more rare, but has been found growing only in *England.* The third is the *Arundo Domeſtica Matthioli*, the *Arundo Donax, vel Cypria Dodonæi, Lobelij*, and the *Italica major Camerarij*; ſo that it is one and the ſame ſort which grows in *Carolina, Florida, Virginia, Italy, Spain, Cyprus, Turky*, in all which Countries it is to be found growing plentifully, al'ho' in one Country it may grow much greater, and larger, thicker, ſtronger and higher than it does in another, which is according to the Soil and Clime, as I have before intimated.

VII. *The Times.* Theſe all Head and Seed, and the Stalks or Reeds come to their perfection of growth and hardneſs about the end of *September*, or in *October*, but are more Seaſoned if cut down in *October*, or *November*.

VIII. *The Qualities.* They are as *Galen* ſays, hot and dry in the ſecond Degree: Abſterſive, Attractive, and Coſmetick.

IX. *The Specification.* They are good againſt Inflamations, to heal Scald or Scabby Heads, take away Scurff, Morphew, and Dandriff, and to help againſt the falling of the Hair.

X. *The Preparations.* You may have therefrom, 1. *A Decoction of Roots and Leaves in Water or Wine.* 2. *A Cataplaſm of Roots and Leaves.* 3. *The Aſhes of the Roots, and whole Plant.*

The Virtues.

XI. *The Decoction of Roots and green Leaves in Wine or Water.* That made with Wine is beſt; but for the Poorer ſort of People it may be made with Water: bathed as hot as it can be endured upon Inflamations, it cools and abates them. Mixed with Honey and uſed as a *Gargariſm*, it heals Sores and Ulcers in the Throat, Mouth and Gums: applied as a *Lotion* to old running Sores and putrid Ulcers in the Secret parts, or other places, it cleanſes them, in ſome meaſure ſtops the Fluxion, and induces the healing. Uſed as a *Clyſter*, mixt with a quarter part of *Spirit of Wine*, it is good againſt a *Diarrhea*, or Looſeneſs, and a *Dyſenteria* or Bloody Flux, eſpecially if it is often repeated.

XII. *The Cataplaſm of Roots and green Leaves.* It is made by beating them in a Mortar, adding thereto a little ſtrong *Wine Vinegar*. Applyed it cools and eaſes hot and ſharp Inflamations in any part. It eaſes the pain, comforts and ſtrengthens Joints which have been Luxated, eaſes pains in the Loins, and cures *Anthonies* Fire.

XIII. *The Aſhes of Roots and the whole Plant.* Mixed with ſtrong *White Wine Vinegar* and applied, it is profitable againſt Scald or Scabby Heads, Scurff, Morphew, Dandriff, Pimples, Breakings out, and Diſcolorings of the Skin: And prevents the *Alopecia*, or falling of the Hair.

CHAP. DXCV.

Of RHEUBARB True *and* Baſtard.

I. THE *Names.* It is called in *Greek*, Ῥᾶ: and almoſt by all Nations *Rha*, and *Rhabarbarum*, and ſo it is called in *Latine*: and in *Engliſh*, *Rheubarb*.

II. *The Kinds.* There are ſeveral Sorts of *Rheubarb*, as, 1. *Rhabarbarum Verum*, The True Rheubarb, or True Indian or China Rheubarb. 2. *Rhaponticum verum*, The true Turkey Rheubarb, or Rheubarb of *Pontus*. 3. *Rha nothum Rhabarbarum ſpurium*; *Pſeudo Rha*; *Hippolapathum rotundifolium vulgare*, Our Baſtard Rheubarb. To theſe you may add, 4. *Rhaponticum folia. Enulæ latiore*, *Rha capitatum Lobelij*, The broad Elecampane Leav'd Turky Rheubarb. 5. *Rhaponticum Anguſtifolium*, *Rha capitatum Anguſtifolium*, The narrow Elecampane Leav'd Rheubarb. 6. There is

another *Rheubarb*, called *Rhabarbarum Monachorum*, *Patientia*, and *Patientia hortensis*, *Lapathum satium*, Garden Patience, or Monks-Rheubarb: of which we have already Discoursed at large in *Chap.* 547. aforegoing.

III. *Whence the Name might come, or be derived.* The Original Name is *Rha*, which Name it took as is supposed from the River *Rha*, now said to be called *Volga* in *Pontus*, where the true Root did grow. But whence came the Name *Rhabarbarum?* Why, some will tell us it came from *Barbary*, as the Name expresses, and they argue thus, because that which comes from other places is denominated by the place from whence it comes, as *Rhaponticum*, *Rhaturcicum*, *Rhathracicum*, *Rhascenicum*, *vel Rhasceniticum*, which is *Rhaindicum*, for *Mesues* says, that *Scenicum*, or *Sceniticum*, is all one with *Indicum*. But these Discourses are far from Truth, because that neither in *Barbary* it self, nor in the Country of the *Troglodites*, from whence it has been said to be brought into *Barbary*, did ever any *Rheubarb* yet grow. And that the Merchants of our Times Trading into those parts, can hear of no *Rheubarb* growing in those Countries now: moreover the *Scenitæ* are not a People of *India*, but of *Arabia Deserta*, where no Spices or Drugs ever grew. Some again will have it, come from *Barbarum* a City of *India*, above the River *Indus*, and that *Rha-Indicum*, and *Rha Barbarum* are all one. But this may be doubtful, and as far from the Truth as the former Opinion: The most probable Judgement can be made is this, that the *Greeks* and *Romans* accounted, and called all other Nations but themselves, who were not Civiliz'd with their Breeding and Discipline, *Barbarous*, or *Barbarians*: (alluding to those untractable People, Inhabiting the Coast and Country of *Barbary*) and this Root or Drug, being brought from far, and from an uncultivated People, scarcely known to them, they might join to the Name *Rha*, the Epithet *barbarum*, and so make up the Word *Rhabarbarum*, which in process of time became the most usual and known Name, through all the Habitable World.

The Descriptions.

IV. *The first*, or True Rheubarb, or True Indian or China Rheubarb. *The Root of this Plant, which is Tuberous, and in time grows to be very great, has several great spreading Branches, of a dark brownish or reddish color on the outside, with a pale yellow thin Skin under it, which covers the inner Substance of the Root: This Rind and under Skin, being pared away, the Root appears of a fresh and lively color, with Flesh colored Veins running through it. This Root is carefully dried, either in the Sun, or before a gentle Fire, or in the heat of a Stove, and with this Caution or Observation, that every piece be kept from touching one another, as it is done in* India *or* China, *where they put them upon Strings, that they may not touch, and so dry them apart in the Sun; and this is that* True Indian Rheubarb *which is brought to us by the Merchants, and Sold in our Druggists Shops. This Root when not very old, holds its color, almost as well as when it is fresh, and gives a yellow Tincture to the Spittle, when it is chewed in the Mouth. When the* Winter *is past, this Root (in the place where it grows) sends forth young Sprouts, which at their first appearance out of the Ground, have green, round, brownish Heads, rising up from the middle or sides of the Root, which open into sundry Leaves, one after another, very much crumpled or folded together at the first, and brownish; but afterwards spread themselves abroad and become smooth, very large, waved on the edges, and almost round, each Leaf standing on a brownish*

Rheubarb China *and* English.

Stalk, of the thickness of a Mans Thumb, when they are grown to their full bigness: most of the Stalks are two Foot or more in length, (especially if the Plant grows in any good and moist Ground) I mean the length of the foot Stalk upon which the Leaf grows, from the bottom of the Leaf to the Root from whence it springs. The Leaf it self is also about two Feet or more in length; and the breadth thereof is two Feet likewise being measured from edge to edge in the broadest place, being of a sad or dark green color, and thicker in Substance than the Bastard Rheubarb *in* Sect. VII. *following; it is of a fine tart soverish Taste, much more pleasant, than either our* Garden *or* Wood Sorrel. *From among these Leaves rises up sometimes, (but not every Year) a strong thick Stalk, not growing so high as* Patience, *or* Monks Rheubarb, *with such waved round Leavees as grow below, but smaller at every Joint up to the top; and among the Flowers (which are white) spreads forth it self into several Branches, contrary to the manner of the* Bastard Rheubarb *following, or of any other of the* Docks. *The Flowers consist of five or six small white Leaves apiece, hardly to be discerned from the white Threads which are in the middle, and seeming to be all Threads: After the Flowers are past away there comes in small brownish Husks the Seed, which is of a brownish color, and triangular, or tetrahedrical, like unto other* Docks, *but larger, by which it may appear plainly, that the* True Indian *or* China Rheubarb *is only a Species of the* Dock.

V. Query. *It may well be demanded of me, why I should place* Rheubarb, *among our* English *Plants,*

since

ſince it is ſo apparently an Indian *Drug?* To this I Anſwer. The reaſon why I have plac'd it in the *Claſſis* of *Engliſh* Herbs, is, becauſe it has already grown in *England*, where it has been known to proſper and flouriſh: And therefore I placed it here, to encourage our Country Men to continue the propagation thereof: and if poſſible it ſhould not arrive to the height of its perfections in our Clime, and therefore may be thought not to be altogether ſo ſtrong and effectual, yet it has been found by Experience to anſwer all the ſame ends, being uſed only in ſomewhat a greater quantity: beſides it may be Planted and propagated in all or moſt ofour Plantations in the *Weſt-Indies*, where, the Climates being more agreeable to its Native place, it may in ſome ſhort time be brought forth in perfection, and ſo be of a publick Service to our Nation. Our *Parkinſon* was the Man in whoſe *Garden* this *Rheubarb* once grew, and therefore what he has ſaid of it, we will give you in his own Words. *I have* (ſays he) *a kind of round Leav'd* Dock *growing in my* Garden, *which was ſent me from beyond Sea, by a worthy Gentleman, Dr.* Liſter, *one of the Kings Phyſicians, with the Title* Rhaponticum verum, *which firſt grew with me, before it was ever ſeen or known elſewhere in* England, *which by proof I have found to be ſo like to the* True Rheubarb, *or* Rhaponticum, *both for form and color, that I dare ſay it is the very* True Rheubarb, *our Climate making it only leſs ſtrong in Working, leſs heavy, and leſs bitter in Taſte. For this has great and thick Roots, and as diverſly diſcolored with Fleſh colored Veins, as the* True Indian Rheubarb, *which I have to ſhew to any who are deſirous to ſee and know it: and alſo other ſmaller Branches of Roots ſpreading from the main great Root, which ſmaller Branches may well be compared to the* Rhaponticum *which Merchants bring us, and which appear to be longer and ſlenderer, than (the* Great Tuberous) Rheubarb, *but of the ſame color. This our* Engliſh Rheubarb *being trim'd, by taking away its Rind and Skin under it, as you do the* China *or* Indian, *appears with as lively and as freſh a color, with Fleſh colored Veins running thro' it, that the choiſeſt* China Rheubarb *cannot excel it: and if it is dryed carefully as it ought, by the gentle heat of a Fire, or in a warm Oven (becauſe we want the heat of the Sun to do it) and each piece kept one from another, it will hold its color almoſt as well when dried, as when it is freſh, and give a yellow Tincture to the Spittle when chewed, tho' not ſo very yellow, nor with ſo much bitterneſs and aſtriction, as the* True Indian Root *does. I have divers Years taken up theſe Roots, and dryed them carefully, and they have been ſhewed to the Beſt and moſt Skilful, who have approved of them, and divers of our* Phyſicians *have oftentimes uſed them, with many other Perſons, to very good purpoſe.* Thus *Parkinſon.*

VI. *The ſecond, or* True Turkey Rheubarb, *or* Rheubarb of Pontus. *The form of the Root is ſomewhat great, round, and long withal, for the moſt part, (yet there are ſmaller and ſhorter pieces, as well as greater which come together:) whoſe color on the out ſide is not all alike, no more than the Subſtance within: for ſtill ſome is better colored, and ſounder than others. The beſt is firm, and ſomewhat heavy, not ſpongy and light, and ſomewhat brown, but freſh on the out ſide, without many blackiſh ſpots (which are ſuſpicious places, where, often times being broken, it is found rotten, or corrupted and naught; I ſay many, becauſe the beſt pieces have ſometimes this fault in them,) but they do not run far inwards, yet if they ſhould, the reſt of the piece might be excellent good, and not to be refuſed, the bad being to be cut away, as not fit to be uſed; the ſound parts being repleat with Fleſh colored Veins running through it, bitteriſh in Taſte, and a little Aromatick in its Smell (if it be not old) and cauſing the Spittle to be yellow, being a little chewed in the Mouth.* Now theſe are the very Properties which belong to the *True Chineſe*

Rheubarb Pontick; or, Rhaponticum.

or *Indian Rheubarb*, as may appear by the former Deſcription; ſo that we need not ſeek for a new Plant to take this *Pontick Rheubarb* from, nor deſcribe any other Species, than what we have done before at *Sect.* 4. above, for any Perſon of common Reaſon and Ingenuity may eaſily ſee, that as the former (before deſcribed in *Sect.* 4.) is the *True Indian* or *China ſort*; ſo alſo they may as eaſily perceive that this *Pontick Rheubarb* (the true ſort, not the falſe Kind, which is Counterfeited with the *Great Centory Roots*) is but only the greater Ramifications of the true *China* or *Indian*, cut off from the ſame, and ſo Dryed and Sold alone, as another Species of *Rheubarb*. Theſe Reaſons thus offered ought to excite our People, to make the Trial, by Planting it in other hotter Climates, as in our Plantations in the *Weſt-Indies*, where I doubt not, but it would turn to a very good Account.

VII. *The third, or* Our Baſtard Rheubarb. *Its Root grows greater than that of* Patience Rheubarb, *with many Branches, or great Strings adjoining; yellow on the out ſide, and ſomewhat of a pale yellow within, with ſome diſcolored Veins therein, like to thoſe of the* True Indian Rheubarb, *firſt deſcribed but much leſs than it, eſpecially when it is dry; which then has quite loſt its freſh color, which the ſaid* True Indian *conſtantly holds in its perfection. From this Root ſpring up divers large, round, thin, yellowiſh green Leaves, a little waved about the edges, each one ſtanding on a reaſonable thick and long browniſh foot Stalk, from among which riſes up a pretty big Stalk about two Feet high, with ſome ſuch Leaves thereon as grow below, but ſmaller; at the top whereof ſtand in a long Spike, many ſmall browniſh Flowers, which turn into hard triangular*

Rheubarb Baſtard.

or tetrahedrical Seed, of a ſhining brown color, like unto that of the Garden Dock, Patience, *or* Monks Rheubarb.

VIII. *The fourth, or* Broad Elecampane Leav'd Turkey Rheubarb. *Its Root is ſomething long and thick, blackiſh on the outſide, and of a deadiſh color on the inſide, more looſe and ſpongy than either any* Dock *or* Great Centory, *which* Centory Root *has in former times been uſed by the* Apothecaries *for* Rhaponticum. *From this Root riſes up ſeveral Leaves, ſomething large and long (yet nothing ſo large as the Leaves of* Elecampane) *greeniſh on the upperſide, and grayiſh or white and woody underneath, like therein to the Leaves of* Elecampane, *every one ſtanding upon its own Stalk, broadeſt at the bottom, and pointed at the end, and dented, or rather waved about the edges. From among which riſes up a reaſonable large round Stalk about half a Yard or two Feet high, bearing at the top thereof, one great Scaly Head, conſiſting of very broad and looſe or open brown Scales; at the firſt ſhew repreſenting a ſmall* Hartichoke *Head, but that the Scales do not ſtand cloſe together, but are much more open and looſe, eſpecially after the Flower is paſt, which ſtands in the middle, compoſed of many blewiſh red, or purple Threads or Thrums, very beautiful to behold. After which comes blackiſh Seed, long and round, very like unto the Seed of a Jacea, or that of the* Great Centory, *but a little longer, and not altogether ſo thick.*

IX. *The fifth, or* Narrow Elecampane Leav'd Rheubarb. *The Root of this is almoſt exactly like to the laſt deſcribed, there being but ſmall difference between this Plant and that, but only in the Leaves, which are a little narrower and longer than thoſe, being as green above, and as hoary white underneath as they are, and a little unevenly waved on the edges. The Head and Flowers are alike alſo, but only a little larger; ſo that it is very likely, that the chiefeſt cauſe of the difference between them ariſes from the Soil, or places of their growth.* Theſe two laſt Plants cannot properly be accounted *Rheubarbs*, becauſe their form admits them not, but are rather to be referr'd to the *Jacea's*, *Knapweeds*, or *Centaurium majus*, the *Great Centory*, for the likeneſs both to their Flowers and Seed, the Scales of their Heads being ſomewhat different: Yet by reaſon of the Names which they have obtained, and of the Cuſtom or Uſe, which for the Names ſake has placed them with the *Rheubarbs*; we thought good to comply alſo, that we might not be ſingular from all other Authors.

X. *The Places.* The firſt and ſecond, which are Natives of *India*, as *China*, *Indoſtan*, as alſo of *Pontus*, have grown and flouriſht in Our *Engliſh Gardens*, and without doubt are poſſible to be promoted in all our *Weſt-India* Plantations. The third grows with us in our *Gardens* alſo, as likewiſe the fourth and fifth, which are Natives of *Turky*: it is probable that the two laſt, which the *Turks* call *Rhaponticum*, is uſed by them for the *True Kind*, altho' in truth they are not in the leaſt akin to *Rheubarb*; for which reaſon ſome Authors have called them by the Name *Centaurium Helenij folio*, and by that Name *Parkinſon* ſays he received the Seeds from beyond Sea.

XI. *The Times.* They all Flower about the beginning or middle of *June*, and the Seed is ripe in *July*. The Roots are to be dryed, and then may be kept all the Year; but they are not to be taken up before the Stalk and Leaves are quite withered and gone; and that is not untill about the middle or end of *October*; for if they be taken up a little before the Leaves do ſpring, or when they are ſprung up, the Roots will not have half ſo good a color, but look as if they were dead or decay'd things.

XII. *The Qualities.* They are hot and dry in the ſecond Degree, Aperitive, Abſterſive, Aſtringent, Digeſtive, Traumatick, Stomatick, Hepatick, Splenetick, Hyſterick, and Cathartick.

XIII. *The Specification. Indian Pontick* and *Baſtard Rheubarb*, are peculiar againſt the Colick, Gripings of the Guts, and all ſorts of Fluxes of the Bowels, more eſpecially the Bloody and Hepatick Flux: they purge Choler and Flegm, and are profitable againſt the Kings-evil, Jaundice, Scurvy, Gout, Dropſies, and Agues. They cure Spitting and Piſſing of Blood, the Running of the Reins in Men, and the Whites, and overflowing of the Terms in Women; and are of ſingular uſe in the cure of old running Sores, hollow and putrid Ulcers, Fiſtula's, Scabs, and other breakings out in the Fleſh and Skin, from Salt and Acrimonious Humors: they open all obſtructions of the Liver and Spleen, and eaſe the pains and gnawings of the Stomach.

XIV. *The Preparations.* You may make therefrom, 1. *A Liquid Juice of the Green Leaves and Roots.* 2. *A Decoction of the Green Leaves or Roots.* 3. *A Pouder of the Seed.* 4. *An Infuſion or Decoction of the Dryed Roots.* 5. *A Tincture of Rheubarb.* 6. *An Extract.* 7. *A Pouder.* 8. *A Syrup Compound.* 9. *A Diet Drink.* 10. *A Gargariſm with Vinegar and Honey.* 11. *A Diſtilled Water from the Green Leaves and Root.* 12. *Pills of Rheubarb.* 13. *An Oil by Inſolation or Decoction.*

T...

The Virtues.

XV. *The Liquid Juice of the green Leaves and Roots.* It opens the obſtructions of the Liver, Spleen, and Reins; carrys off the ſharp, ſalt, and acrimonious Humors which cauſe Scabs, Puſhes, Itch, running Sores, Scurff, Morphew, Pimples, and other like defœdations of the Fleſh and Skin; being inwardly taken from one Spoonful to two, three, or four, every Morning and Night, and outwardly applied to the parts affected, during all the Spring and Fall of the Leaf.

XVI. *The Decoction of the Green Leaves or Roots made in White Wine, or in Whey.* It has all the *Virtues* of the *Liquid Juice*, but muſt be given in double or trebble quantity, you may correct it by adding towards the end of the *Decction* a little *Indian Spicknard*, or ſome choice *Ginger* very thinly ſliced. If it is done for External uſes, the *Decoction* or *Infuſion* may be made in White Wine Vinegar, and ſweetned with Honey. And ſo it becomes an effectual Remedy to cleanſe and heal old running Sores, and other breakings out in the Skin. Dropt into the Ears it takes away the Pains. Gargled in the Mouth, it is ſaid to eaſe the Tooth-ach, and being drank it cures the Jaundice.

XVII. *The Pouder of the Seed.* Given to a Dram in rough Red Wine, Morning and Night, it ſtops all ſorts of Fluxes of the Bowels, chiefly the Bloody Flux: it eaſes alſo the Gnawings and Gripings of the Stomach, ſtrengthens it, and takes away the loathing of Meat.

XVIII. *The Decoction or Infuſion of the Dryed Roots, in Whey, or White Port Wine. Take Rheubarb which thinly ſlice 2 Ounces: Clarified Whey, or rather White Lisbon Wine 3 Pints: Infuſe in a ſimmering heat, or a Sand heat for 8 Hours cloſe covered: then decant the Infuſion and dulcify it with Honey for 8 Doſes. If it is made in Clarified Whey, it ought to be boiled half an Hour, then ſtrained out and ſweetned with Honey as aforeſaid.* If a little *Cream of Tartar* be added in the *Infuſion* or *Boiling*, it will make the Medicament Work the better. It is an Excellent thing to purge Choler and Flegm, and cleanſe the Stomach and Bowels; and is profitable againſt Aſthma's, Coughs, Colds, Wheezings, obſtructions of the Lungs, Liver, Spleen, and Reins: and is profitable againſt the Dropſie, Jaundice, Gout, Scurvy, Kings-Evil, and other Diſtempers of thoſe Parts; it cleanſes the Stomach, Bowels and Reins, is good againſt Agues, provokes Urine, and clears the Eye Sight. There is a *Compound Infuſion*, which is thus made, *Take Rheubarb very thin ſliced 2 Ounces; which Infuſe in Roſe Water; Extracts of Sena and Carthamus Seeds of each half an Ounce; Syrup of Roſes Solutive 8 Ounces; Cinamon Water 2 Ounces; mix them for 7 or 8 Doſes.* It has all the Virtues of the *Simple Infuſion*, but Works ſomething brisker.

XIX. *The Tincture of Rheubarb. Take the beſt Rheubarb thin ſliced, Liquorice well bruiſed, of each 2 Ounces; Raiſons ſtoned N° 60; Anniſeeds bruiſed 1 Ounce; Sugar Candy 6 Ounces; Spirit of Wine 2 Pounds; mix, digeſt according to Art, and ſtrain out for Uſe.* Doſe 2, 3, or 4 Spoonfuls in a Morning againſt the Cholick, and Griping of the Guts, which it wonderfully Cures. If it be digeſted 8 or 10 Days in a gentle Sand heat, ſhaking the Glaſs 2 or 3 times a Day, and then letting it ſettle, the clear is to be decanted, and kept in a Bottle cloſe ſtopt for Uſe. It Purges gently, and collects and expels Acrid and Tartarous Humors adhering to the Tunicles of the *Viſcera*, which cauſes violent Pains and Gripings; for which it is indeed a Specifick; and one of the Choiſeſt things in Nature againſt all the Weakneſſes and Diſtempers of the Bowels, eſpecially if accompanied with painful dejections. It is of ſingular uſe to Purge ſuch as are troubled with any ſimple *Gonorrhœa*, Weeping or Gleet, as alſo the Whites in Women, Univerſals being premiſed. For tho' it Purges yet it is but gently, and ſo ſtrengthens admirably, and ſtops all ſorts of Fluxes as *Diarrhœa's*, *Dyſenteria's*, *Lienteria's*, to a wonder.

XX. *Tinctura Rhabarbari Abſinthiata*, Wormwood Tincture of Rheubarb. *Take Rheubarb very thin ſliced, or groſly bruiſed 4 Ounces, Wormwood Water Compound a Quart; mix in a Bolt Head, digeſt in a gentle Sand heat for 14 Days, ſhaking the Bottle once a Day, then being ſettled and fine, decant the clear Tincture and keep it for uſe.* You may alſo for want of the *Wormwood Water*, make it with hoiſe *Cinnamon Water*, or any other *Cordial Water*, which may anſwer the Intention of the Medicine. It has both a Purging and an Aſtringent Property, for it Purges gently Choler, Flegm, and clammy Tartarous Humors, which cauſe the Cholick and Gripings of the Guts, from the Stomach and Bowels. Beſides which it has a Cordial and Strengthening Virtue, and is eſpecially good for the Stomach, Heart, Liver and Spleen, and is good againſt Fainting and Swooning Fits, and Sickneſs at Heart. It opens obſtructions of Liver and Spleen, cures the Jaundice, and all ſorts of Fluxes of the Bowels, as alſo the Hepatick Flux, from its Aſtringent Property. And indeed I know it to be a Specifick in the moſt Vehement Fluxes of the Bowels, and will do that (in thoſe caſes) which a Thouſand other Medicines will not do. I have cured Cholicks and Vehement Gripings of the Bowels with it, of ſeveral Months ſtanding, and that after all other Medicines I had uſed, had failed. You may uſe it thus. *Take of this Tincture an Ounce; White Lisbon Wine in which a few Leaves of Seana have been Infuſed 4 Ounces; Syrup of Damask Roſes half an Ounce; mix for a Doſe.* The Body being ſufficiently cleanſed, if you would ſtop a Flux therewith, and ſtrengthen the parts, give it thus. *Take of this Tincture, of Tincture of Catechu, Syrup of Red Poppies, of each half an Ounce; Cinnamon Water, Black Cherry Water, of each an Ounce and half, mix for a Doſe.* And let the Sick take the *Tincture* in Drops all the Day long, in any thing they Drink, about 40 or 50 Drops at a time. In a little time it will ſo alter and corroborate the Bowels, and the whole habit of the Body, that the Patient will think himſelf to be almoſt a new Man.

XXI. *Extractum Rhabarbari*, Extract of Rheubarb. *Take Rheubarb thin ſliced, or rather in groſs Pouder 8 Ounces; Cinnamon, in groſs Pouder 1 Ounce; Rheniſh Wine 2 Quarts; Spirit of Wine a Pint; Juice of Limons a quarter of a Pint; mix, digeſt 30 days in a gentle Sand heat, ſhaking the Bottle 2 or 3 times a day; let it ſettle and decant the clear, which Abſtract in* Balneo *to the conſiſtency of an Extract (reſerving the Spirit drawn off for other uſes,) to every Ounce of the Extract add Chymical Oil of Orange Peels, a Scruple; and keep it cloſe covered for uſe.* Doſe from a Scruple to half a Dram, or a Dram, in the Morning faſting. It expels Choler, Flegm, and Melancholy from Stomach and Bowels, opens obſtructions of Liver, Spleen, and Reins, is good againſt the Rickets in Children, Scabs, running Sores, Jaundice,

dice, Green-ſickneſs, and all kinds of Fluxes of the Bowels, having all the *Virtues* of the *Tincture* aforegoing.

XXII. *The Pouder. It is made of the dryed Root beaten and ſearſed, adding to every Ounce thereof, a quarter of an Ounce of Anniſeeds in fine Pouder.* Doſe from half a Dram to a Dram, or more, according to Age and Strength, in any convenient Vehicle, as in a Glaſs of White Wine. It is an excellent thing againſt the Kings-Evil, Belly-ach, and to Purge Choler and Flegm, cleanſe the Stomach and Bowels, and to open obſtructions of the Inwards. It is profitable againſt Scurvy, Gout, Dropſy, Agues, and Jaundice, and pricking pains of the *Pleura* or Sides.

XXIII. *The Compound Pouder. Take fine Pouder of Rheubarb 2 Ounces; White Roſin in fine Pouder an Ounce and half; Cremor Tartari in fine Pouder half an Ounce, mix them.* It diſſolves clotted Blood in the Stomach, Bowels, Reins or Bladder, or in any other parts cauſed by any Fall or Bruiſe, potently ſtops Fluxes of the Bowels, cleanſes the Reins and ſtrengthens them, and is very effectual to ſtop a *Gonorhœa*, or running of the Reins, as alſo the Whites in Women. Doſe from a Dram to 2 Drams in the Morning faſting in any fit Vehicle.

XXIV. *Syrupus de Rhabarbaro compoſitus*, Syrup of Rheubarb Compound. *Take Rheubarb very thin ſliced, Sena, of each 3 Ounces; Violet Flowers 2 Handfuls; Cinnamon half an Ounce; Ginger 2 Drams; Waters of Betony, Bugloſs, Cichory (or rather Angelica) of each 3 Pints; mix and digeſt in* Balneo *or a Sand heat all Night, the next Morning ſtrain out, and with double refined Sugar 4 Pounds, make a Syrup by boiling; adding when all is done Syrup of Roſes Solutive, 8 or 12 Ounces, mixing them well together.* It gently cleanſes the Stomach and Bowels of Choler, Flegm, and Melancholy, allays the heat of Inflamations, ſtops hot Rheums, and ſharp Fluxes of the Bowels, by leaving a binding quality behind it. Doſe 2 or 3 Ounces in Clarified Whey, or a weak *Infuſion of Sena in White Wine.*

XXV. *The Diet Drink. Take of Choiſe Rheubarb very thin ſliced,* 8 *Ounces; Alexandrian Sean* 4 *Ounces; Yellow of Orange Peels, Horſe Radiſh Roots ſcraped thin, of each* 6 *Ounces; Coriander Seeds, Muſtard Seed bruiſed, of each* 3 *Ounces; Juices of Scurvy Graſs, Garden Creſſes and Angelica, of each a Pint; New Ale* 3 *Gallons; put the Juices into the Ale, and after them, the other Ingredients, in a Net-bag with a ſtone in it; after* 3 *days the Patient may drink of it.* It carries off ſharp Humors which cauſe the Colick, Gout, Jaundice, Scurvy and Rheumatick pains, provokes Urine, and evacuates Hydropick Humors. Doſe a Pint Morning and Evening.

XXVI. *The Gargariſm. Take Decoction or Infuſion of Rheubarb made with White Port Wine a Quart; White Wine Vinegar, Spirit of Wine of each half a Pint; Rheubarb very thin ſliced* 4 *Ounces; Madder Roots in groſs Pouder* 3 *Ounces; Roch Alum* 1 *Ounce; mix and digeſt in a gentle Sand heat for* 24 *Hours; then add Honey* 6 *Ounces; digeſt again* 24 *Hours; preſs out the Juice and keep it for Uſe.* It cures all ſorts of Sores, Cankers, and putrid Ulcers in the Throat, Almonds, Mouth, Tongue and Gums, they being waſht or gargled therewith 2 or 3 times a day. It cleanſes alſo and heals Ulcers in the Secrets or other parts, being rightly applied.

XXVII. *The Diſtilled Water from the Green Leaves and Root.* It is uſed to allay or cool Inflamations, and to heal or dry up Scabs, and foul Ulcerous Sores in any part of the Body.

XXVIII. *Pills of Rheubarb. Take fine Pouder of Rheubarb* 8 *Ounces; Scammony in fine Pouder* 3 *Ounces; Cremor Tartari in fine Pouder* 2 *Ounces; Chio Turpentime, enough to make all up into Pills. Doſe from half a Dram to a Dram or Dram and half.* They cleanſe the Reins and Bowels, carry off ſharp Humors, cure the Scurvy, Gout, Dropſy, Jaundice, Strangury, Rheumatiſm and Kings-Evil, and are prevalent againſt a Recent *Gonorrhœa* in Men, and Whites in Women.

XXIX. *The Inſolated or Decocted Oil of Rheubarb.* It heals Ulcers which happen in the Eyes and Eye-lids; diſcuſſes Inflamations and Strumous ſwellings in the Neck, Throat and other Parts; and takes away black and blew Marks, or other diſcolorings of the Skin.

XXX. *Nota.* The *Baſtard Rheubarb* has the ſame Virtues with the *China Rheubarb*, but not full out ſo ſtrong and effectual, and is uſed in all theſe ſeveral ways or forms. The *Engliſh Rheubarb* (which is the *China* growing in *England*) has likewiſe all the ſame Virtues, but muſt be uſed in double Doſe; in the mean ſeaſon it is the *China*, or *Indian* which we chiefly uſe. The two laſt are no *Rheubarbs*, but of the nature and qualities of the *Great Centory*, to which we refer you.

CHAP. DXCVI.

Of RICE.

I. *THE Names.* It is called in *Arabick*, *Arz* and *Arzi*: in *Greek*, Ὄρυζα: in *Latine*, *Oryza*: and in *Engliſh*, *Rice*.

II. *The Kinds.* *Galen* accounts *Rice*, *inter legumina potius quam inter Cerealia*, as he did *Oats* and *Panick*, but I can ſee no Reaſon for it, nor any force in his Argument for the ſame, for that their forms, manner of growing, and Qualities are every way ſo different. It is a ſingular Plant of its own Kind, but may be denominated, or receive, an Epithite from the Country in which it is produced.

The Deſcriptions.

III. *Its Root is Buſhy, compoſed of many Strings and Fibres, which periſhes every Year, as the Roots of other Grains do. It riſes up with a ſtronger Stalk than* Wheat, *about a Yard high, with ſeveral Joints, and a large thick Leaf at each of them, like unto the* Reed. *At the top it bears a ſparſed* Juba, *Tuft or Head, ſpread out into very many Branches, which has Blooms of a purpliſh color, with the Seed or Grain growing ſingly on them, encloſed in a hard ſtraked and yellowiſh brown Husk, with an Awne at the end of every one of them, which Grain being Hull'd, is very white, blunt at both ends, and nearly as large as thoſe of* Wheat.

IV. *Gerard*

Rice.

IV. *Gerard* deſcribes it thus, from its growing in his *Garden.* The Rice *which (ſays he) did grow in my* Garden, *had Leaves ſoft and Graſſy like* Barly. *The Flower did not ſhew it ſelf with me, by reaſon of the Injury and Unſeaſonableneſs of the Year.* Theophraſtus *ſays, it has a Flower of a purple color. But ſays my Author,* Rice *has Leaves like unto thoſe of* Quitch-Graſs, *or* Barly. *And a ſmall Straw or Stem full of Joints, like to other* Corn: *at the top thereof grows a Buſh or Tuft, garniſhed with round Knobs like ſmall long round* Gooſe-Berries, *in which the Seed or Grain is contained, every one of which has at its end one ſmall, long, rough Awne or Beard adjoined to it, like that of* Barly.

V. *The Places.* *Strabo* reports that *Rice* grew in Water in the Territories of *Bactria*, and near *Babylon*; in *Suſium*, and in the lower parts of *Syria*, where it grew to be near ſix Foot high, and bore plenty of Seed or Grain. It grows now, not only in thoſe Countries, but alſo in the *Fortunate Iſlands*, or *Azores*, and in *Italy* and *Spain*, from whence great quantities have been brought to us, hull'd, and prepared, as we now Buy it; it proſpers beſt in Fenny, Wet, Moiſt and Watery places, which are often overflowed with Water: But it is thought that the Original thereof came firſt to theſe parts of the World, out of the *Eaſt-Indies*, where it is their chiefeſt, if not only *Corn* they Live upon; but it has not been found there only, but through all *Æthiopia* and *Africa*, from whence it was brought into *Syria*, *Ægypt*, *Italy*, *Spain*, *&c.* whereever it has been yet Sown. It Loves only to grow in moiſt Grounds as aforeſaid, and ſuch as may be overflowed with Water in the *Summer* time, and let out again. It is now Sown in *Carolina*, and become one of the great products of the Country: I have ſeen it grow, and flouriſh there, with a vaſt increaſe, it being abſolutely the beſt *Rice* which grows upon the whole Earth, as being the weightieſt, largeſt, cleaneſt and whiteſt, which has been yet ſeen in the Habitable World.

VI. *The Times.* It is Sown in the *Spring* in the *Eaſt-Indies*, as *Eratoſthenes* ſays, and that in a ſhowery and wet time. It is a *Summer Corn*, and is Yearly Sown, and is Reaped or Mowed down, in the middle or end of *Autumn* with us. In ſeveral places in the *Eaſt-Indies* it is Sown twice a Year; and probably it may admit of the ſame in *Carolina*, or the *Weſt-Indies*, in which laſt place its goodneſs is manifeſt by its weight, largeneſs, and whiteneſs, as I ſaid before, where it is Hull'd, as *French-Barly* and *Oat-Meal* are Hull'd, *&c.*

VII. *Nota.* In *Germany*, there is a ſmaller Kind grows, which they call *Oryza Germanica*, and which *Cordus* on *Dioſcorides* ſays, is called *Schwaden*; being indeed a kind of *Rice*, but leſſer, having the ſame Taſte and Uſe, and the ſame form of growing and proportion, in its Stalks, Leaves, and *Juba*, or Tuft, growing in Marſhy, or Plaſhy and Watery places, as the former larger Kind does. This *Hermolaus*, *Ruellius*, and ſome others would have to be the *Hordeum Galaticum Columellæ*, which is a miſtake, for that is neither more nor leſs than our *Common Barly*.

VIII. *The Qualities.* It is temperate in reſpect to heat or cold, and dry in the firſt Degree: Aſtringent, Repercuſſive, and Spermatogenetick.

IX. *The Specification.* It ſtops Fluxes of the Bowels, and reſtores in Conſumptions.

X. *The Preparations.* You may have therefrom, 1. *A Broth.* 2. *A Milk.* 3. *A Pudding.* 4. *Sanguis, or the Blood thereof.* 5. *A Cataplaſm.*

The Virtues.

XI. *The Broth. It is made either with ſimple Water, or with Mutton Broth.* It nouriſhes much, reſtores a weakned and decayed Body, but binds not the Body as that made with Milk.

XII. *The Milk.* It is an excellent thing for ſtopping all ſorts of Fluxes of the Belly, and reſtoring ſuch as are labouring under a Conſumption, eſpecially where there is an Ulcer of the Lungs. *The beſt way of making it is to boil it ſoft firſt in Milk, till it is in a manner perfectly diſſolved and becomes a thick Pap; and then to mix it and make it thinner with Milk warm from the Cow,* and ſo to Drink or Eat, a Quart or Pint of it Morning and Evening.

XIII. *The Pudding. It is made with* Rice, *ſoaked all Night in Milk, and then boiled till diſſolved, after which, with Eggs, Sugar, Raiſons and Nutmeg grated, it is made into a Pudding, either by baking or boiling.* *This* as alſo the *Broth* and *Milk*, nouriſh much, ſtrengthen ſuch as are weak, reſtore ſuch as are Conſumptive, encreaſe Seed, and makes the feeble Vigorous.

XIV. *The Blood of Rice.* It has all the Virtues of the *Broth*, *Milk*, and *Pudding*; *and is made as you make the Blood of Satyrion, Potatoes, Parſneps, Comfrey, &c.* Doſe 2 Spoonfuls, or more, Morning, Noon, and Night, in a Glaſs of Generous Wine.

XV. *The Cataplaſm. It is made of the Meal or Flower of Rice boiled with Milk to the Conſiſtency of a Pultice:* or it may *be made of the whole Rice, boiled to ſoftneſs in the Milk, and then to a conſiſtency, adding to it a little Barly Flower.* It is uſed to be applyed to Tumors to repel Humors flowing

flowing to them; alſo to Womens Breaſts, to repercuſs the Milk, and allay the Inflamation; and this it will beſt do, if it is made of Water only.

RIVER-WORT, *ſee* Pondweed, *Chap.* 572.

CHAP. DXCVII.

Of RIE.

I. *THE Names.* It knows no *Greek* Name. But it is called in *Latine*, *Secale* and *Farrago*, *Plinij Lib.* 18. *Chap.* 16. But Modern Authors underſtand by *Farrago*, only *Barly*. Some have taken it to be *Typha cerealis Theophraſti*: *Cordus* on *Dioſcorides* to be *Olira*: and *Tragus* with ſome other took it to be *Siligo*. But *Siligo*, is truly *Wheat*. In *Engliſh*, we call it only by the Name of *Rie*.

II. *The Kinds.* There are three ſeveral ſorts thereof, *viz.* 1. *Secale vulgatius*, *Secale Hyemale*, Our Common or Winter Rie. 2. *Secale æſtivum*, *Dodonæi*; *Secale minus*, *vel Vernum Bauhini*; *Secale Alterum Lugdunenſis*; *Siligo æſtiva Tragi*, Small or Summer Rie. 3. *Secale Latifolium Bauhini*, Great or broad Leav'd Rie.

The Deſcriptions.

III. *The firſt*, *or* Our common Rie. *Its Root conſiſts of a Buſh of Strings and Fibres, yet not ſo thick buſhing as* Wheat, *nor ſucking out, or conſuming the Fertility of the Soil, ſo ſoon as* Wheat *does. It firſt ſprings up ſome what reddiſh, which afterwards grows green, and brings forth ſeveral Jointed Stalks, ſomething higher than* Wheat, *but bearing at their tops ſmaller Ears than thoſe of* Wheat, *ſet in ſhort Rowes, with ſhorter and ſharper, rougher and more prickly Awns. The Grain within is alſo ſmaller, lanker, or ſlenderer, and blacker than* Wheat, *not wrapped in Husks like it, but eaſily falling out of it ſelf, when the Ear is ripe. Whilſt it Flowers, the Ear ſtands upright, but when it is nearly ripe, it hangs downwards.*

Secale Rie.

Rie broad Leav'd great.

IV. *The ſecond*, *or* Small Summer Rie. *The Root of this is very like the former; as alſo in its Stalks, Leaves, Ears, Flowers, Grain and manner of growing; ſaving that this grows lower, and with fewer Stalks, and has a ſhorter and leſſer Ear, but armed with Awns as the other, but leſſer, as is the Grain, or Corn alſo. This is Sown in the* Spring *only, and therefore called* Summer Rie, *whereas the former is Sown in* Autumn, *as* Wheat *is.*

V. *The third*, *or* Great or Broad Leav'd Rie. *The Root of this buſhes out with Strings and Fibres, like that of* Wheat. This Rie *has whiter Stalks than the two former, round alſo and ſtraked. The Leaves grow at the Joints, and are much larger than the* Common ſort, *being about a Foot and half long, and an Inch broad, much broader than the other, as you may ſee by the Figure: they are ſomewhat ſharp or rough about the edges, like thoſe of the* Common Rie. *The Ear at top, is large and great, ſet with ſharp, long Awns, a full Hand breadth in length; the Grain within is like to the firſt Kind, blackiſh brown in color, but greater than it, and almoſt like to* Wheat.

VI. *The Places.* The firſt grows plentifully enough with us in *England*, and very plentifully in moſt places of *Germany* and *Poland*, as appears by the great quantities of it brought into *England*, in times of Scarcity from *Dantzick*, when we have a general want of *Wheat* and other Grain, as in very wet Years. It is ſown alſo in all the Northern Regions, more eſpecially in *Denemark*, and thoſe more Northerly Countries, than elſe where, their Climates not ſo well ſerving to produce *Wheat*. The ſecond grows alſo with us in *England*. The third is brought out of the *Eaſt Country*, and in times of Scarcity is many times Tranſported from *Dantzick* hither. *Bauhinus* had the Ear with ſome of the Leaves, out of *Signior Contarino* his *Garden*.

VII. *The Times.* The firſt is uſually ſown in *Autumn*, in *October*, and *November*, when *Wheat* is ſown: the ſecond in the *Spring* in *April*, which is not ſo enduring, but more apt to corrupt than the former, becauſe the *Winter* comes upon it before it can attain its full perfection or ripeneſs. The firſt and third are generally ripe in *Auguſt*. The ſecond comes not to its full growth till *September*.

VIII. *The Qualities.* It is hotter than *Wheat*, being hot in the firſt Degree, and temperate in reſpect to dryneſs and moiſture. It is Diſcuſſive, or abſuming and waſting away of Tumors or Humors, to which it is applyed. It is alſo Emphractive, or of a more obſtructive or clammy Nature than *Wheat*, and harder to Digeſt in the Stomach; but to Ruſtick Bodies, which have a briſk Appetite, and a ſtrong and good Digeſtion, it affords good Nutriment, being next in goodneſs unto *Wheat*, eſpecially if the Corn be ſweet and good, and the Bread well made.

IX. *The*

IX. *The Specification.* It maturates Apoſtems, eaſes the Head-ach, and heals Chaps of the Hands and Feet.

X. *The Preparations.* You may make therefrom 1. *A Meal or Flower.* 2. *Bread.* 3. *Bran.* 4. *Leaven.* 5. *A Cataplaſm.* 6. *A Pouder.* 7. *Emplaſtrum è Cruſta panis.* 8. *A Diſtilled Water from Green Rie.* 9. *A Diſtilled Water from the Bread.* 10. *An Acid Spirit made from the Bread.* 11. *The Aſhes of the Straw.*

The Virtues.

XI. *The Meal or Flower.* It heats moderately, and is more forcible than *Wheat*, in waſting and conſuming Tumors, and clammy Humors; yet made in *Broth*, or *Puddings*, and *Cakes*, it gives good Nouriſhment. Made with Vinegar into a *Cataplaſm*, it ſtrengthens the Nerves and Joints over-ſtrained, or lately put out of place: it diſcuſſes Tumors, and eaſes Pains, and prevails againſt an *Oedema*, an *Eryſipelas*, and the Gout. And bound unto the Head in a Linnen Cloth, it eaſes a *Cephalea*, or long continued Head-ach, and the Megrim.

XII. *The Bread. It is generally made with Leaven.* It nouriſhes much, and is Stomatick, yet apt to Gripe ſome People. Applied hot as it can be endured out of the Oven, to the moſt Vehement Head-ach, and left on till it is cold, it preſently eaſes the pain, as if it was by Inchantment; and if repeated ſome few times it perfectly cures it. And ſo applied to the Stomach it helps the weakneſs thereof, and the Palpitation of the Heart.

XIII. *The Bran.* It cleanſes, mollifies, and diſcuſſes Tumors, being laid hot thereon in form of a *Cataplaſm*, *made with Vinegar*, *a little Salt*, *and Brandy.*

XIV. *The Leaven. It is made of the Paſte of Rie Flower mixt with Salt, or laid in the midſt of a Box of Salt.* It does more forcibly digeſt, draw, ripen, and break Apoſtems, Boils and Bubo's than *Wheat Leaven.* Applied to the Head, it eaſes the continual pains thereof, cools, humects, ſoftens, is ſuppurating and abſterſive, yet is ſaid to ſtanch Bleeding, and to diſcuſs ſuch Tumors as will not ſuppurate.

XV. *The Cataplaſm. It is made of the Crums of the Bread with Wine, or Wine Vinegar.* It diſcuſſes Tumors, eaſes Pains, and is profitable againſt an *Oedema*, and [illegible], being fitly applied.

XVI. *The Pouder. It is made of the Cruſt of the Bread almoſt half burnt, and then reduced to a Pouder by beating in a Mortar.* The *Pouder* it ſelf is uſed as a *Dentrifice* to cleanſe the Teeth, they being often rubbed with the ſame dry, laid upon a Cloth. *The Decoction of it in Water, made as Coffee is*, is very Stomachical, and cauſes a good Appetite to Food.

XVII. *Emplaſtrum è Cruſta Panis. Take Rie Bread toaſted very brown and hard, 4 Ounces, which boil in Roſe Vinegar to the thickneſs of a Pultiſe: clear Turpentine of Chio, 2 Ounces: Pouder of Red Roſes one Ounce: Mint, Maſtich, Myrrh, Nutmeg, Storax Calamita, New yellow Wax, Labdanum, Oil of Maſtick, Pouder of Cloves, of each half an Ounce: mix and make an Emplaſter according to Art.* It is hot, dry and ſtrengthening, good againſt Aches and Pains from a cold cauſe; and all cold Diſeaſes of the Head, Brain, Nerves, Stomach, Womb and Joints; Applied to the Stomach much, it cauſes Concoction, and ſtops Vomiting.

XVIII. *The Diſtilled Water from Green Rie. It is made by Diſtillation in Balneo, of the Green Plant, while the Ear is Green.* It is Abſterſive, and Aperitive, and of good uſe to clear the Eye-ſight, and to remove Heats and Inflamations of the Eyes, eſpecially where a hot ſharp Rheum follows them.

XIX. *The Diſtilled Water from the Bread.* It is drawn in *Balneo* from the Bread Crums whilſt New. It is a good *Ophthalmick*, being often dropt into the Eyes, but is more powerful if it is mixed with an equal quantity of *Common Spirit of Wine.* It is commended againſt a *Diarrhea* or Looſeneſs, and a *Dyſentery* or Bloody-Flux.

XX. *The Acid Spirit drawn from the Bread.* It diſſolves *Minerals*, extracts their *Tinctures*, and does many other great things: and therewith an excellent *Eye Water* is made, only by letting it ſtand for ſome few Days in a Copper Veſſel, cloſe covered. This dropt into the Eyes is good againſt Pearls, Films, Clouds and other things which obfuſcate the Sight: it clears the Eyes and very much ſtrengthens them.

XXI. *The Aſhes of the Straw and empty Ears. A Lixivium* being made of them with fair Water, either by Infuſing or Boiling, heals Chaps of the Hands and Feet, as *Matthiolus* ſays: and by often uſing it, it clears the Skin, and makes it ſmooth and ſoft.

CHAP. DXCVIII.

Of ROCKET Garden *and* Wild.

I. *THE Names.* It is called by the *Arabians*, *Jergir*, and *Ergir*: by the *Greeks*, Ἔυζωμον, *ob ſuavitatem in condiendis cibis*: by the *Latines*, *Eruca*, *quod vellicando Linguam quaſi erodat*: and by the *Engliſh*, *Rocket.*

II. *The Kinds.* There are ſeveral Species of this Plant, as, I. *Eruca ſativa*, Garden Rocket. II. *Eruca Sylveſtris*, Wild Rocket. III. *Eruca Sylveſtris notha*, Baſtard Wild Rocket: of which in this Chapter. IV. *Eruca Aquatica*, Water Rocket. V. *Eruca Marina*, Sea Rocket: of both which in *Chap.* 599. next following.

III. *The Kinds of the Land Species.* 1. *Eruca ſativa*, *Eruca Hortenſis*: our Garden Rocket. 2. *Eruca ſativa alba*; *Eruca*, *ſive Erucula marina major Tragi*; *Erucula major Cordi*; *Sinapi Hortenſe ſive album Lugdunenſis*; *Sinapi ſativum ſemine albo duplo quam Thlaſpi vulgaris majore Lobelij*; *Eruca flore & ſemine albo*, Roman Garden Rocket with white Flowers and Seed. 3. *Eruca latifolia*, Great Garden Rocket. 4. *Eruca maxima Americana vel Floridiana*, Great Rocket of Florida. 5. *Eruca Sylveſtris vulgatior Dodonæi*, *Lobelij*, *Matthioli*, *aliorumque*, Our more common Wild Rocket. 6. *Eruca Sylveſtris minor flore parvo*, *Eruca Sylveſtris fœtida Geſneri*; *Eruca paluſtris minor Tabernæmontani*: *Eruca Sylveſtris*, *& Eryſimum verum Lugdunenſis*; *Sinapi paluſtre Gerardi*; The leſſer Wild Rocket with a ſmall Flower. 7. *Eruca Cærulea*; *Eruca paluſtris Cærulea*, *& Eruca Cærulea in arenoſis creſcens Bauhini*, Blew Flowered Wild Rocket. 8. *Eruca Sylveſtris Anguſtifolia Lobelij*; *Eruca Anguſtifolia Auſtriaca*, Narrow Leav'd Wild Rocket. 9. *Reſeda major Plinij*;

Reseda maxima Lobelij (à sedandis doloribus collectiones & inflamationes discutere nomen traxit. Reseda lutea Lugdunensis; Reseda recta Camerarij; Sesamoides magnum Lacunæ; Sesamoides alterum Cæsalpini; Pycnocomon Anguilaræ, Our greater Bastard Wild Rocket. 10. *Reseda minor; Eruca vulgaris; Reseda Plinj Neotericorum Lobelio; Eruca Peregrina Italica & Cantabrica; Reseda supina Camerarij; Reseda Latifolia Tabernæmontani; Sesamoides primum, Cæsalpini; Erucago vulgaris Columnæ*; Our common Bastard Wild Rocket. 11. *Reseda alba minor; Reseda Linariæ foliis Bauhini: Reseda Candida Lugdunensis; Sesamoides parvum Salimanticum Clusij*, Small white Bastard Wild Rocket.

The Descriptions.

IV. *The first, or* Our Garden Rocket, *is but a* Wild Kind *brought into* Gardens, *for the* True Roman Rocket *in the next* Section *has larger Leaves. Its Root is small and long, with some few* Fibres *adjoining to it, and perishes as soon as it has given Seed. It has long Leaves much torn or rent on the edges, smaller and narrower than the* Roman Kind. *The Flowers hereof are of a pale yellowish color, whereas the* Roman *are whitish, consisting of four Leaves. Its Seed is reddish, contained in*

Rocket Garden.

smaller and longer Pods, than the Roman *which are shorter and thicker, whose Seeds are of a whitish yellow color.*

V. *The second, or* Roman Garden Rocket with white Flowers and Seed. *Its Root is like the former, and perishes Annually in like manner. It is a smaller* Plant *than the former, but larger or broader Leaves, which are cut in on the edges, but not so much nor so deep, each part being rounder, and round at the end, and nothing so hot or sharp in Taste. The Stalk has some Leaves thereon lesser, and less jagged, which bears white* Flowers *at the tops, made of four somewhat long and round pointed Leaves; after which come little long round Pods in which is contained yellowish white round Seed.*

VI. *Eruca Hortensis Romana altera semine nigrescente.* We have another Roman Kind also; *whose Root perishes in like manner presently after the Seed is ripe. Its Stalk rises to be* 3 *or* 4 *feet high, Branched into many parts. Its Leaves are very like to the former, and at the tops of the Stalks and Branches are low whitish Flowers made with four Leaves apiece, round pointed, with a black* Line *in the middle of each Leaf. After which come long slender Pods, containing blackish brown Seed within them.*

VII. *The third, or* Great Garden Rocket. *Its Root is much like to the former* Garden Kind, *with Stalks and Leaves like it, but that the Leaves are broader, and the divisions at the Leaves larger, and smaller at the ends than those of our* Garden Kind, *and each part more unevenly dented about the edges.* The Flowers *hereof are more yellow; and enclining to a Gold color, and the Seed smaller, and darker, in smaller and longer Pods.*

VIII. *The fourth, or* Great Rocket of Florida. *It has a considerable thick long Root Branching it self forth every way; from the Head whereof rises up one or more great Stalks, even to a Mans height; with a number of rough hairy Stalks, spreading themselves out on all sides, and set with divers long and pointed Leaves unevenly dented about the edges, and somewhat like unto those of* Lysimachia *or* Loosestrife, *but having a small downy hairiness upon them; tasting something sweet at the first, but sharp afterwards.* The Flowers *are many, which stand at the ends of the Stalks and Branches, consisting of four yellow Leaves apiece, which turn into slender long Pods, containing within them small Seed, which is sweetish, for which reason of its sweetness, we have Class'd it with the* Garden Kinds.

II. *Of* Wild Rocket.

IX. *The fifth, or* Our more common Wild Rocket; *It has a very long and pretty thick Root, with many Strings and Fibres adjoining to it. It has longer and narrower Leaves, much more divided, and into slenderer cuts and jaggs on both sides the middle Rib, than any of the former, and of a sad overworn green color, from among which rises several stiff Stalks, two or three Feet high sometimes, set with the like Leaves but smaller, and smaller upwards; Branched from the middle into several stiff Stalks, bearing divers yellow Flowers, consisting of four Leaves apiece, like the others, which afterwards give small long Pods, containing small reddish Seed, of a more bitter hot biting Taste than the others, as the Leaves also are.*

X. *The sixth, or* Lesser Wild Rocket with a small Flower. *This in its Root, Stalks,* &c. *differs not much from the last, but only in the smallness of the Leaves, Branches, Flowers and Pods, for in all parts it is lesser, and the Leaves are as much divided, but into smaller parts, not smelling well.*

XI. *The seventh, or* Blew Flowered Wild Rocket. *Its Root is long, slender and reddish, with some Fibres adjoining to it. Its lowest Leaves are cut in on both sides, something like to* Rocket, *but in my opinion, more like* Groundsel. *From among which rise up several hairy straked Stalks, scarcely a Foot high, bearing rough hairy Leaves on them, less jagged, and some of them*

them not at all, ſhorter alſo and narrower. At the tops ſtands the flowers one above another in a kind of ſpiked Head, of an excellent purpliſh blew color conſiſting of four Leaves, after which come ſmall long ſmooth Pods, containing within them ſmall ſharp reddiſh Seed.

XII. *The eighth, or* Narrow Leav'd Wild Rocket. *Its Root is long and ſlender. Its Leaves are long and narrow, not much unlike to thoſe of* Tarragon, *but of the color of* Rocket. *Its Flowers are yellow and like thoſe of the former* Wild Rockets, *growing on long ſpiked Heads or Stalks a Foot and half high. After which come in their places long ſlender Cods, like thoſe of* Creſſes *or* Muſtard, *containing within them, hot ſharp Seed, having the appearance of* Eryſimum *or* Bank Creſſes, *but the Taſte of* Rocket.

III. Baſtard Wild Rocket.

XIII. *The ninth, or* Our greater Baſtard Wild Rocket. *Its Root is long and woody, with ſeveral Fibres thereat, abiding many Years. It riſes up with divers creſted bending Stalks, about 2 Feet high, ſet with many and much divided Leaves thereon, ſomething like unto the loweſt Leaves of* Rocket, *of a piercing ſharp Smell and Taſte, like unto* Creſſes; *and many ſuch like Leaves buſhing together at the Foot of them. At the tops of the Stalks grow yellow Flowers in long Spikes ſtanding thick together, which gradually opening at the bottom, ſpread themſelves farther aſunder; and afterwards upon ſhort foot Stalks come ſmall skinny, ſwollen, cornered Cods, turning downwards, in which are contained very ſmall Seed.*

XIV. *The tenth, or* Our common Baſtard Wild Rocket. *The Root is long and woody like the former. It grows more upright, and not altogether ſo high as it, but with whiter green Leaves, deeply cut in, or torn on the edges; yet each diviſion is broader than the former. The Flowers are ſmall and yellow, growing on ſuch Spikes, but ſhorter.*

XV. *The eleventh, or* Small white Baſtard Wild Rocket. *Its Root is ſmall, long and white with Fibres adjoining to it. It ſhoots forth divers whitiſh green Stalks, much about a Foot high, bearing ſeveral long and narrow green Leaves (not much unlike to thoſe of* Linaria *or* Toad Flax*) yet hoary withall, and leſſer than thoſe which grow near the Ground, or at the foot of the Stalk, which are ſomewhat broader, but not leſs hoary. The Flowers are white, growing on the like Spikes, many cluſtering together, with ſmall green Heads in the middle of each, in which (afterwards) is contained ſmall blackiſh Seed.*

XVI. *The Places.* The firſt four are generally Sown and Nurſt up in *Gardens*, but many will have it, that the firſt of them is a *Wild Kind*, and brought into the *Garden* for its uſefulneſs: it grows in moſt *Gardens* of it ſelf, and you may ſee moſt Brick and Stone Walls near *London*, and in many other places abounding with it. The fourth of them was brought to us from *America*. The *Wild Rockets* are found growing Wild in many places in *England*, tho' without doubt they may grow Wild in ſeveral other Countries. The eighth, or *Narrow Leav'd* (tho' ſaid to grow in *Auſtria*) grows with us in ſeveral places, near unto Water ſides, in the Chinks and Creviſes of Stone Walls among Mortar: *Gerard* ſays he found it as you go from *Lambeth-Bridg* to *Lambeth*, and under a ſmall Bridg that you muſt paſs over near the *Thames* ſide. The three laſt, or *Baſtard Kinds*, are alſo Wild Plants; the two firſt of them, *viz.* the ninth and tenth, grow frequently in our Nation in many waſte Grounds, both near *London*, and up and down in the Country, in Sandy, Stony, Gravelly, and Chalky Barren Grounds; as in ſeveral places in *Kent*, at *South-fleet*, upon *Longfield Downs*, which is a very Barren, Chalky, Hilly Ground: and at *Greenwich* upon the Hills, and at other places in *Kent*. The ninth has alſo been found growing upon the *Woulds* in *York-ſhire*. The eleventh being a Foreign or *Italian* Plant, is found with us only in *Gardens*.

XVII. *The Times.* The firſt four Flower in *June* and *July*, and their Seed is ripe in *Auguſt*. The *Wild Rockets*, *viz.* the fifth, ſixth, ſeventh, and eighth, Flower till *Auguſt*, and their Seed is ripe in *July*, *Auguſt* and *September*. The *Baſtard Kinds*, *viz.* the ninth, tenth, and eleventh, Flower about *June*, and all *July* and *Auguſt*, the Seed being ripe in the next Month following their Flowering.

XVIII. *The Qualities.* They are all hot and dry in the third Degree, Aperitive, Abſterſive, Attractive, Carminative, Coſmetick, Digeſtive, Diuretick, Suppurative, Cephalick, Neurotick, Stomatick, Nephritick, Hyſterick, Emmenagogick, Alexipharmick and Spermatogenetick.

XIX. *The Specification. Rocket* is good againſt the Scurvy, Strangury, Stone, Gravel, ſtoppage of Urine, bitings of Serpents and other venomous Creatures, ſtinging of Scorpions, reſiſts Poiſon, is profitable againſt the Jaundice, Cough, obſtructions of the Spleen, Stoppage of the Terms in Women: is excellent againſt Aſthma's, and all obſtructions of the Lungs, and gives eaſe in the Gout, Sciatica, and other like pains of the Joints. Where Note, *The* Wild Rockets, *are ſtrongeſt and moſt uſed in Phyſick: The* Garden Rockets *are of the ſame Nature, but weaker, and moſt uſed in Sallets. The* Baſtard Rockets, *tho' they are of the ſame Nature, are yet weaker, and but very little uſed any way, where the others can be had.*

XX. *The Preparations.* You may have therefrom, 1. *A Sallet of the Herb*, eſpecially of the *Garden Kinds*, tho' the *Wild Kinds* are ſometimes uſed for that purpoſe alſo. 2. *A Liquid Juice.* 3. *An Eſſence.* 4. *An Infuſion or Decoction of the Herb.* 5. *An Infuſion or Decoction of the Seed.* 6. *A Pouder of the Seed.* 7. *A Syrup.* 8. *An Oil or Ointment.* 9. *A Cataplaſm.* 10. *A Coſmetick.* 11. *A Diſtilled Water of the whole Plant.* 12. *A Spirit from the Herb, or Seed.*

The Virtues.

XXI. *The Sallet of Garden Rocket.* It is ſeldom eaten alone, but with other Herbs of a cooling Nature, as with *Lettice*, *Common Cabbage*, and *Roman*, or with *Purſlane*, either *Garden* or *Wild*. but it is in a manner wholly ſpent as a *Condiment*, or *Sawce* for Meat, to pleaſe the Palate, ſharpen the Appetite, and cauſe a good Digeſtion: It admirably encreaſes Seed, removes Impotency and Frigidity, and provokes to Venerial Acts; but the *Wild* is more potent to this purpoſe than the *Garden*, and therefore in the laſt caſe is moſt uſed.

XXII. *The Liquid Juice.* Being taken from a Spoonful to 2 or 3, mixed with Honey, or double Refined Sugar, and half a Pint of Generous Wine, and Drank Morning and Evening, it powerfully provokes Urine and the Terms, cures the Strangury, and is profitable againſt the Stone, Gravel, Sand, or Tartarous Matter, or Slime, obſtructing the Reins,

Ureters and Bladder. It is a wonderful thing for the Cure of the Scurvy and Rheumatisms in a cold habit of Body: and to resist the Poison by reason of the bitings of Serpents, Vipers, Rattle-Snakes, Stinging of Scorpions, *&c.* (*A Cataplasm of the Green Herb* being also applied to the place.) It is good against the Jaundice and obstructions of the Spleen, Vapors and Hysterick fits; and is an excellent thing for the Colick, tho' never so extream, and that upon the Spot; being also repeated as oft as need requires.

XXIII. *The Essence.* It has all the Virtues of the *Liquid Juice*, besides which it is singular against Coughs, Colds, and all Obstructions of the Womb, Belly-achs, Gripings of the Guts; and also kills Worms in Children. Dose from half a Spoonful to two Spoonfuls, in Wine, or other fit Vehicle, sweetned with the following *Syrup of the same.*

XXIV. *The Infusion or Decoction of the Herb in Wine.* It has all the Virtues of the *Juice and Essence*, but must be given in larger quantities, as from half a quarter of a Pint, to almost half a Pint, Morning and Night, sweetned with the *Syrup of the same Plant.* It increases Seed (as do also in a more especial manner the *Juice* and *Essence*) is good against Impotency and Frigidity, and strongly provokes Lust, exciting to Venerial Actions.

XXV. *The Pouder of the Seed.* Mixed a Dram at a time with Honey or some proper *Syrup*, it encreases Seed, provokes Lust, and cures Impotency. It kills Worms in Children, and has all the other Virtues of the *Juice*, *Essence*, and *Infusion. Made into a Cataplasm with Ox Gall*, and applied to the Face or other parts, it clears the Skin from Spots, Freckles, Tanning, Sun-burning, Yellowness and other discolorings thereof, and clears it from Scurff, Morphew and the like. Mixed or made up with Vinegar, it takes away Freckles and other Redness, happening in the Face or other parts, as also black and blew Spots, and the discolorings of the Small-Pox, restoring the Skin to its color again.

XXVI. *The Infusion or Decoction of the Seed.* It has all the Virtues of the *Pouder of the Seed*, and of the *Infusion or Decoction in Wine.* It is a singular good thing for the Cure of the Scurvy and Rheumatism in a cold Constitution, with all their appendent Symptoms; and is very profitable against the Colick, Gripings of the Guts, and inveterate pains of the Stomach. Dose from a quarter of a Pint to half a Pint Morning and Night.

XXVII. *The Syrup. It is made with the Juice of the Herb, or with its Essence, by mixing an equal quantity of Clarified Honey therewith, in a Gentle* Balneo *or Sand heat.* It cures Asthma's, Coughs, Colds, Wheezing, Hoarseness, shortness of Breath, and other Distempers of the Brest and Lungs, and is profitable against the Rickets in Children: and taken mixed with the *Juice* or *Essence*, and an equal part of the *Distilled Water*, it encreases Seed, as also Milk in Nurses Breasts, is good against Impotency and Frigidity, and provokes Lust in both Sexes. Being taken with half a Dram of the *Pouder of the Seed* at a time, it Kills Worms in Children, opens obstructions of the Spleen and Reins and Womb, provokes Urine and the Terms, and takes away the stinking or evil Smell of the Arm-Pits, and the strong Smell of the rest of the Body.

XXVIII. *The Oil or Ointment.* They are Anodyn and Discussive, good to discuss Tumors, and ease Pains arising from cold and moisture, or a Flux of Cold Humors to any part. They give ease in the Gout and Sciatica, and are profitable to be used in the Cure of the Palsy, Cramps, Convulsions, and the like.

XXIX. *The Cataplasm. It may be made of the Green Herb, or of the Herb mixed with the Pouder of the Seed.* Applied to Wounds made by the bitings of Mad Dogs, or of Serpents, as the Viper, Rattle-Snake, *&c.* or stinging of Scorpions, it presently draws out the Poison or Venom, and preserves the Patient from danger. Applied to the Skin, it clears it of any deformity, and takes away Scurff, Morphew, and other discolorings thereof.

XXX. *The Cosmetick. Take of the Liquid Juice or Essence* 8 *Ounces*; *of Bulls Gall made pure and fine*, 6 *Ounces*; *the best White Wine Vinegar* 4 *Ounces, mix them.* It is good against Pimples, Pustules, and other breakings out, as also Freckles, Lentils, Scurff, Morphew, Tanning, Sun-burning, Yellowness, Tettars, Ringworms, and other deformities of the Skin, it being laid on Morning, Noon, and Night, after the Face has been washt clean with warm Water.

XXXI. *The Distilled Water from the whole Plant.* It has the Virtues of the *Juice*, *Essence*, and *Infusion*, but in a much lower or meaner degree: and therefore may be used as a Vehicle to convey the other Medicines down into the Body in. It is Cordial and Stomatick; and withall Cosmetick, and therefore may be used against most of the Vices and deformities of the Skin.

XXXII. *The Spirit drawn from the Herb or Seed. It is made in all respects as you make Spirit of Scurvy-Grass, or Spirit of Cresses.* It is a potent Medicine against the Scurvy in a Cold habit of Body, Dropsy, Jaundice, Rheumatism, Colick, Gripings of the Guts, Pleurisy, Stone, Gravel, Obstruction of the Reins and Womb, and other internal parts. It rectifies and strengthens the Stomach, Stops Vomiting, and causes a good Appetite and Digestion. Dose 50 Drops or more in a Glass of Ale, Beer, or Wine.

CHAP. DXCIX.

Of ROCKET Water and Sea.

I. *THE Names.* It is called in *Greek*, Ἔρυσιμον ὑδατώδης: in *Latine*, *Eruca Palustris*: and in *English*, *Water* or *Marsh Rocket.*

II. *The Kinds.* I. Of the *Water Rocket*, called in *Greek*, Ἔρυσιμον ὑγρόφιλον: in *Latine*, *Eruca Aquatica*: there is but one Species, which is here declared. II. Of the *Sea Rocket* there is, 2. Ἔρυσιμον θαλάσσιον: *Eruca Marina Anglica Lobelij*, *Anguilaræ*, *Camararij*, *Columnæ*, & *Lugdunensis*; and is called by *Serapio*, *Kakile*; in *English*, *Sea Rocket.* 3. *Eruca Maritima Floridiana & Italica*; American, and Italian Sea Rocket.

The Descriptions.

III. *The first, or* Water Rocket. *It has a long slender Root, full of Fibres, set as it were at Joints. Its Leaves and Stalks ly as it were upon the Ground, creeping on the same, with long Branches, of long Winged Leaves, almost like to* Sium Impatiens, *but not so much dented upon the edges, having but two or three dents for the most part, and yellowish Flowers at the tops, with slender Pods following them.*

IV. *The second, or* English Sea Rocket. *It has a long slender Root with some few Fibres adjoining*

Rocket Water.

to it: from which ſpring up divers Stalks, ſome trailing on the Ground, others Standing more upright, (but being Nurſt up in Gardens, *it ſomething varies its form and manner of growing in its Stalks and Leaves:) theſe Stalks are Scatteringly ſet with ſmall long* Leaves, *cut in or dented on the edges like to* Groundſel *or* Rocket *but longer and leſſer, when growing in a* Garden:) *at the tops of the Stalks grow the Flowers of a pale purpliſh color, of the faſhion of* Radiſh *Flowers compoſed of four Leaves apiece: after which comes the Seed, in form like to a* Wheat Corn, *but greater: which Grains are ſomething ſpongy and not ſolid, nor two joined together, (when growing in a* Garden) *but every Seed ſingle by it ſelf, whereas that which grows by the* Sea-ſide, *has always two growing together.*

V. *The third, or* American *and* Italian Sea Rocket. *Its Root creeps under Ground, with ſome Strings or Fibres, and periſhes every Year after it has born its Seed. From this Root ſpring up ſome long and narrow Leaves, lying next the Ground, very much and finely cut into ſeveral parts, not very much unlike to a* Deers Horns: *the Stalk alſo is variouſly ſpread out into many Branches, which are alſo ſet with the like Leaves, but leſſer, and leſs divided ſtill up to the tops of each Arm. The Flowers are of a purpliſh color, conſiſting of four Leaves apiece, and ſtand one above another in ſmall Husks each with two points, upon their ſeveral Stalks or Branches. When they are faded and gone, ſmall pointed Heads in form like to a Spears point ſucceed, in every one of which is contained a white Grain or Kernel.*

VI. *The Places.* The firſt grows oftentimes near Ditches and Water Courſes, and ſometimes alſo in dryer places. The ſecond grows on our own Sea Coaſts, in many places of *Kent* and *Suſſex* eſpecially, yet is not proper to our Clime only, but is alſo found on the Sea Coaſts of ſeveral other Foreign Countries. The third has been found about the Sea Coaſt of *Italy*, near *Venice*, and other places of that Shore: and in Travelling I have ſometimes found it upon the Sea Shores of *Florida*, in and near our *Engliſh* Plantations.

VII. *The Times.* They all Flower in *June*, *July*, and *Auguſt*, and their Seed is ripe within a Month after the time of Flowering.

VIII. As to the *Qualities, Specification, Preparations*, and *Virtues* of theſe Plants, Authors have ſaid nothing: but if we may preſume to judge of them by their Taſte, which is very much like to that of *Rocket*, we may predicate the ſame of them. However they are ſaid to be Anodyn, and Diſcuſſive; and that by a kind of Diaphoretick faculty, they will diſperſe Swellings and Inflamations. *Angulara* ſays, that Our *Engliſh Sea Rocket* Purges exceedingly. *Miconus* ſays, it wonderfully eaſes the Cholick: and that the *Diſtilled Water*, drank 4 Ounces at a time, gives admirable eaſe in the Stone and Gravel, whether in the Reins or Bladder.

CHAP. DC.

Of ROSE-WORT: *OR,* ROSE-ROOT.

I. *THE Names.* It is called in *Greek*, Ῥόδια ῥίζα: in *Latine*, *Rhodia Radix*, and *Roſea Radix* (becauſe of its *Roſe* like Smell:) and in *Engliſh*, *Roſe-Wort*, and *Roſe-Root*.

II. *The Kinds.* Some have thought it to be a Species of *Orpine*, but that is doubtful. There is according to Authors, two ſorts thereof, *viz.* 1. *Rhodia ſerrata*; *Rhodia Radix foliis ſerratis vel dentatis*, Roſe-Wort *or* Roſe-Root with dented Leaves. 2. *Rhodia non dentata, vel ſerrata*; *Rhodia Radix foliis non ſerratis vel dentatis*, Roſe-Wort, *or* Roſe-Root with ſmooth edged Leaves, or Leaves not dented.

The Deſcriptions.

III. *The firſt, or* Roſe-Wort, *or* Roſe-Root with dented Leaves. *Its Root is thick and Tuberous or Knobby at the Head, and Branched out, riſing oftentimes above the Ground; whereas it grows ſomewhat reddiſh, and is long downwards, with divers Fibres annexed to it, which being a little broken or bruiſed whilſt it is freſh, ſmells much like to a* Damask Roſe, *much more than when it is dry, tho' then it retains a great deal of the Scent, and from thence it was that it took its Name. From the Heads*

Rose-wort with dented Leaves.

Rose-wort without dented Leaves.

Heads of this Root spring forth divers Stalks, which grow upright, thick, round, or green, about a Foot thick, set with Leaves up to the tops, which are somewhat long and narrow, like unto those of Orpine, *but smaller, yet as fat and thick, and of the like pale green color, whereby it much resembles* Orpine *in its Leaf, Flower, and manner of growing. The Leaves are dented about the edges. And the Flowers are many, small and yellow, set in a Tuft, or Cluster, but something smaller than* Orpine, *with Seed in Heads like unto it also.*

IV. *Gerard* thus describes it. *The upper end of the Root is thick and knobby, and grows for the most part out of the Ground, and is there of a purplish color, bunched and knobbed like the Root of* Orpine, *with many hairy Strings hanging thereto, of a pleasant Smell when it is broken, like to that of the* Damask-Rose, *from whence it took its Name. From this Root spring forth many small, thick, and fat Stems; about which the Leaves are set round, even from the bottom to the top, like to those of the* Field Orpine, *but narrower, and more snipt about the edges. The Flowers grow at the tops of the Stalks of a faint yellow color.*

V. *The second, or* Rose-Wort, *or* Rose-Root, with Leaves not dented. *This in its Root, Stalks, Leaves, Flowers, magnitude, and manner of growing, is much like the former, and scarcely at first sight to be discerned from it, the only difference being in the Leaves, these being smooth, or even, and not dented on the edges, as the former are. And this it is which answers to the Cut which* Matthiolus *has given us in his* Epitome *of* Dioscorides.

VI. *The Places.* It grows very plentifully in the North parts of *England*, and scarcely any where else, as far as we can understand; as upon the Mountains of *Pendle* and *Ingleborough*, (the very highest Mountains as is supposed in all *England*,) oftentimes on the very raggedest places, scarcely accessible, and very dangerous by reason of their height and steepness, so that one may be in great danger of tumbling down, who does not look wearily to their Footing. *Gerard* says, it grows in a place called *Ingleborough Fels*, near unto the Brook sides. From these places, both *Gerard* and *Parkinson* say, that they have had some Roots or Plants sent them for their *Gardens*.

VII. *The Times.* They Flower about *June* and *July*, and the Seed is ripe in *August*. The Leaves and Stalks perish about the beginning of *Winter*, and spring again every Year anew from the Root, which abides and Lives thro' all extremities of Cold.

VIII. *The Qualities.* It is cold and moist in the first Degree, Anodyn, Cephalick, and Neurotick.

IX. *The Specification.* It has been found by Experience to cool Inflamations, to give ease in the Megrim, and other pains of the Head.

X. *The Preparations.* You may have therefrom, 1. *A Liquid Juice from Leaves, Stalks, and Root.* 2. *A Cataplasm of the green Root, Leaves, or Stalks.* 3. *An Oil or Ointment from the same.* 4. *A Distilled Water from the green or fresh Root.*

The Virtues.

XI. *The Liquid Juice.* It cools and allays the heat and fermentation of a troubled Stomach, and stops

ſtops Vomiting by reaſon of the boiling of Choler; taken in *Mead* or other fit Vehicle, it pleaſantly cools, abates Febritick heat, and very much recreates the Spirits. Doſe from 1 Spoonful to 2 or more, upon any preſſing occaſion.

XII. *The Cataplaſm of the Green Roots, Leaves, and Stalks.* If it is beaten up with *Oil of Roſes*, and applied to the Forehead and Temples, it gives eaſe in the Megrim, and other accidental pains of the Head, eſpecially if it proceeds from a Fever, or hot cauſe.

XIII. *The Oil or Ointment made of the Juice, or green Root and Herb.* If it is beaten up with *Roſe Water*, and the Head, or other parts pained be anointed therewith, it gives preſent eaſe of any pain proceeding from a hot cauſe: and this it will do ſo much the better, if Stuphs dipt in the ſame be alſo applied over after the anointing.

XIV. *The Diſtilled Water.* It cools Inflamations, eaſes pains of the Head and other parts, is a good *Coſmetick*, taking away Pimples, Puſtles, Scurff, Morphew, Tannings, Sunburning, yellowneſs, roughneſs, or any other deformity of the Skin. And this it does more effectual if it is mixed with an equal part of the *Liquid Juice*, and a quarter part of the *Juice of Limons*, or for want of it, of the ſtrongeſt *White Wine Vinegar*.

CHAP. DCI.

Of the ROSE-BUSH.

I. THE *Names.* It is called in *Arabick*, *Nard*, *Naron*, *ſeu Vard:* in *Greek*, Ῥόδον: in *Latine*, *Roſa:* and in *Engliſh*, the *Roſe*.

II. *The Kinds.* There are two Generick Species of *Roſes*, *viz.* 1. *Roſa ſativa*, *Roſa Hortenſis*, the Garden Roſe-Buſh, of which in this Chapter. 2. Ῥόδον ἄγειον; κυνόῤῥόδον: *Roſa Sylveſtris*, *Roſa Canina*, The Wild Roſe-Buſh, or Briar-Buſh, of which in *Chap.* 602. next following.

III. *The Kinds of the Garden Roſes.* There is a great variety of *Garden Roſes*, the whole Stock of them not being eaſy to be deſcribed, Thoſe moſt common in our *Engliſh Gardens* are theſe following, *viz.* 1. *Roſa Anglica alba major & minor*, The Engliſh White Roſe Greater and Leſſer. 2. *Roſa incarnata*, The Carnation Roſe. 3. *Roſa Belgica*, *ſive Vitrea*, The Dutch Roſe. 4. *Roſa Anglica rubra*, The Engliſh Red Roſe. 5. *Roſa Damaſcena*, The Damask Roſe. 6. *Roſa Provincialis*, *Roſa Centifolia Batavica incarnata*, *Roſa Damaſcena Holandica*, The great double Damask Province, or Holland Roſe. 7. *Roſa Provincialis rubra*, *Roſa Centifolia Batavica rubra*, The Red Province Roſe. 8. *Roſa Provincialis alba*, The White Province Roſe. 9. *Roſa verſicolor*, The Party colored Roſe; The York and Lancaſter. 10. *Roſa Cryſtalina*, The Cryſtal Roſe. 11. *Roſa rubra humilis*, The Dwarf Red Roſe, or Gilliflower Roſe. 12. *Roſa Francofurteuſis*, The Franckford Roſe. 13. *Roſa Hungarica*, The Hungarian Roſe. 14. *Roſa Holoſerica ſimplex*, The ſingle Velvet Roſe. 15. *Roſa Holoſerica Multiplex*, The double Velvet Roſe. 16. *Roſa ſine Spinis ſimplex*, The Roſe without Thorns ſingle. 17. *Roſa ſine Spinis multiplex*, The double Roſe without Thorns. 18. *Roſa Cinamomea ſimplex*, The ſingle Cinamon Roſe. 19. *Roſa Cinamoma multiplex*, The double Cinamon Roſe. 20. *Roſa Lutea ſimplex*, The ſingle Yellow Roſe. 21. *Roſa Lutea Multiplex*, *ſive flore pleno*, The Double Yellow Roſe. 22. *Roſa Moſchata ſimplex*, The ſingle Musk Roſe. 23. *Roſa Moſchata multiplex*, The Double Musk Roſe. 24. *Roſa Moſchata multiplex altera*; *alia*, *Roſa Damaſcena alba*; *Roſa Cinamomea verisimilior flore pleno alba*, The Double White Damask Musk Roſe. 25. *Roſa Moſchata ſimplex Hiſpanica*, The Spaniſh ſingle Musk Roſe. 26. *Roſa Eglenteria odora ſimplex*, The Single ſweet Eglantine, or ſweet Briar Roſe. 27. *Roſa Eglenteria odora multiplex*, The Double Sweet Eglantine, or Double ſweet Briar Roſe. 28. *Roſa Menſalis*, The Monthly Roſe. 29. *Roſa Belgica rubicante*, The bluſh Belgick Roſe. 30. *Roſa Damaſcena variegata Eligantior*, The beautiful variegated Damask Roſe. 31. *Roſa Canina Flore pleno*, The double Wild Bryar Roſe. 32. *Roſa mundi*, *Roſa variegata admirabilis*, The Roſe of the World, or admirable variegated Roſe, of all which in order.

The Deſcriptions.

IV. *The firſt, or* Engliſh White Roſe. *This is of two Kinds, the one* the Greater *more thick and double than the other. The one riſes up in ſome ſhadowie places to be about* 8 *Feet high, with a Stock of a great thickneſs for a Roſe: it has ſome what ſmaller and whiter green Leaves than many of the other* Kinds of Roſes, *five moſt uſually ſet on a Stalk, and more white underneath, as alſo a whiter*

Roſe Buſh.

green Bark, armed with ſharp Thorns or Prickles, by which it is eaſily known from other Roſes. *The Flowers are whitiſh, with an Eye or ſhew of a bluſh, eſpecially towards the ground or bottom of the Flower, which is very thick, double and cloſe ſet together, and for the moſt part not opening it ſelf ſo largely and fully as either the* Red *or* Damask Roſe.

V. *The*

V. *The second Kind of the English White Rose.* Rosa Anglica alba minor, *being the lesser sort. This seldom grows higher than a* Damask Rose; *its Leaves in magnitude, number and color are like the former, and the Bush in like manner armed with Prickles. The Flower is whiter, less thick and double, and opening it self more; some of the Flowers are so little double, as not to have above two or three rows of Leaves, that they seem in some manner almost to be single, and having but little Smell. Some judge both these to be but one Kind, and make the diversity to be occasioned from the Air, or Soil, or both: but I confess I am not of that Opinion.*

VI. *Gerard* gives us this general Description of our *White Rose* thus. *Its Root is long, tough, and of a woody Substance. From which spring up very long Stalks, of a woody Substance also, set or armed with divers sharp Prickles; the Branches whereof are likewise full of Prickles, on which grow Winged Leaves, five in number for the most part set upon a middle Rib, by couples, the odd Leaf standing at the point, or end of the same, every one of those Leaves being snipt about the edges, somewhat rough, and of an over worn green color. From the Bosom whereof shoot forth long Foot Stalks, on which grow very fair double Flowers, of a white color, and very sweet Smell, having in the middle a few yellow Threads or Chives, which being past, the Fruit succeeds (as large as a* Horse Bean, *or larger) which is of a longish round form (almost oval) green at the first, afterwards of a shining Coral red color, with a red Pulp within, which when the Berry is ripe, is soft, and of a pleasant acid Taste: and within this Pulp is contained a good quantity of downy choaking Matter, almost like Hair, but short, within which the Seed or Grains ly hid, which are very hard almost, as Stones.*

VII. *The second, or* Carnation Rose. *It is in most things like unto the* Lesser White Rose, *both for the growing of the Stock, and bigness of the Flower; but that it is more spread abroad when it is blown than the* White *is, and is of a pale blush color all the Flower thro' out, and almost of as small a Smell, as the small* White One.

VIII. *The third, or* Dutch Rose. *This sort is not very great, but very thick and double, and is very variable in its Flowers, in that they will be so different one from another. And tho' they may all of them be called* Carnation Roses, *yet some are paler than others, and some are as it were blasted, which comes not Casually, but Naturally to this* Rose. *But the best Flowers (of which there will always be some) will be of a bright pale murrey color, near unto the* Velvet Rose, *but nothing near of so dark a color.*

IX. *The fourth, or* English Red Rose. *We call this* English, *because it is more frequent in* England *than in other Countries. It never grows so high as the* Damask Rose Bush, *but more commonly grows low, and shoots forth many Branches from its Root (seldom growing up as the* Damask Rose *into Standarts) which Branches have a green Bark, thinner set with* Prickles, *and having larger Leaves, and greener on the upper side than the* White, *yet with an Eye of white upon them, five likewise for the most part set upon a Stalk, and grayish or whitish underneath.* The Roses *or Flowers do very much vary, according to their Sight and abiding; for some are of an orient red, or of a deep crimson color, and very double, (altho' never so double as the* White) *which when it is full blown, has the largest Leaves of any other* Rose. *Some of them again are paler, tending something to a* Damask; *and some are of so pale a red, as to resemble almost that of a* Canker Rose; *yet all for the most part having larger Leaves than the* Damask Rose, *and with many more yellow Threads in the middle. The Smell of this* Red Rose *is much better or richer than that of the* White, *but not comparable to that of the* Damask: *but this* Rose *being well dryed, and well kept, it will keep both its Color and Smell longer than the* Damask, *with the best looking after.*

X. *The fifth, or* Damask Rose. The Damask Rose Bush *is more usually Nurst up to a competent height to stand alone (which they call Standarts) than any other* Rose. *The Bark both of the Stock and Branches, is not fully so green, as the* Red *or* White Rose. *The Leaves are green with an Eye of white upon them, so like unto the* Red Rose, *that there is no great difference between them, but that the Leaves of the* Red Rose *seem to be of a darker green. The Flowers are of a fine deep blush color, with some pale yellow Threads in the middle, but are not full out so thick and double as the* White; *nor being blown, have they so great or large leaves as the* Red: *but are of a most excellent sweet pleasant Smell, far surpassing all other* Roses *or Flowers, not being heady or too strong, nor stuffing, or unpleasantly sweet as many other things are.*

XI. *The sixth, or* Great Double Damask Province, *or* Holland Rose. *This Bush has its Bark of a brown reddish color, by which it is easy to be discerned from other* Roses. *The Leaves are also more reddish than in others, and something larger; but it usually grows much like to the* Damask Rose, *and much of the same height. The Flowers or* Roses *are of the same deep blush color, that the* Damask Roses *are, or rather somewhat deeper; but much thicker, broader, and more double, or fuller of Leaves by three parts almost, the outwards Leaves turning themselves back, when the Flower has stood long blown: the middle part it self (which almost in all other* Roses *has some yellow threads to be seen) being folded hard with small Leaves, has scarcely any yellow at all visible. The Smell of this* Rose *comes nearest unto the* Damask Rose, *but yet is by much short of it, tho' many do indeed think it as good as the* Damask. *And some have therefore caused their* Damask Rose *Stocks to be Grafted with* Province Roses. *hoping to have as good* Rose Water, *and more store from them, than from* Damask Roses; *but truly (let such think what they will) the Smell of it is not half so strong or so good.*

XII. *The seventh, or* Red Province Rose. *The difference between this and the last is not very great. The Stock, and the Branches also, in this, seeming not to be so great, but greener, and the Bark not so red. The Leaves are of the same largeness with the former* Damask Province. *The Flowers are not altogether so large, thick, and double; but of a little deeper* Damask *or blush color, turning to a* Red Rose, *yet not coming up near to the full color of the deepest* Red Rose: *nor is the Smell altogether so strong or sweet as the* Damask Province, *but coming something near to the scent of the* Common red Rose, *yet exceeding it: nor is it so plentiful in bearing as the last or* Damask Province.

XIII. *The eighth, or* White Province Rose. *It is very white and double, and very large like to the* Red Province Rose, *or rather like to the double* Damask, *or* Greater white English Rose, *in the form and magnitude of the* Rose, *and manner of its growing, but not in the largeness of its Stock, or Body, this being much the lesser.*

XIV. *The ninth, or* The Party colored Rose, *called the* York *and* Lancaster. *This in its form and*

and order of its growing is neareſt unto the Common Damask Roſe, *as well for its Body or Stem, as for its Branches, Leaves and Flowers. The difference conſiſting chiefly in this; that the* Flower (*being of the ſame magnitude and multiplicity or doubleneſs with that of the* Damask Roſe) *has the one half of it, ſometimes of a pale whitiſh color; and the other half of it, of a paler* Damask *color than the ordinary. This happens thus, many times; and ſometimes alſo the Flower has ſeveral ſtripes and marks in it, as one Leaf white, or ſtriped with white; and the other half bluſh, or ſtriped with bluſh; ſometimes alſo, the whole Flower is ſtriped, or ſpotted over; and at other times, it has few or no ſtripes or marks at all, as Nature is pleaſed to varie it. But this is obſervable, that the longer it abides blown open in the Sun, the paler, and the fewer Stripes, Marks, or Spots, it will have; it has the Smell of a* Damask Roſe, *but weaker.*

XV. *The tenth, or the* Cryſtal Roſe. *This is very like to the laſt deſcribed, both for Stalk, Branch, and Leaf. The Flower hereof is not much different from it, being no great, large or double* Roſe; *but of a mean ſize, ſtriped and marked with a deeper bluſh or red, upon the pale colored Leaf; ſo that it ſeems in the marking and beauty thereof, to be as pleaſant and beautiful as the* Cryſtal Gilliflower. *This even as the former does, ſoon fades and paſſes away, not yielding any great number of Flowers any Year.*

XVI. *The eleventh, or* Dwarf Red Roſe, *or* Gilliflower Roſe. *This always grows low and ſmall; otherwiſe in moſt reſpects it is like unto the* Common red Roſe, *and with few or no Prickles upon it: The Flowers or* Roſes *are double, thick, ſmall, and cloſe, and not ſo much ſpread open as the* Ordinary Red, *but ſomewhat like unto the firſt* Double white Roſe, *before deſcribed. Yet in ſome* Gardens *they blow more open, and are as even at the tops of the Leaves as if they had been clipt off with a pair of Sciſſars, and are not of ſo full a red color as the* Red Province Roſe, *but of as weak and poor a Smell as the* Common red Roſe, *or rather weaker.*

XVII. *The twelfth, or* Frankford Roſe. *The young Shoots of this* Roſe *are covered with a pale purpliſh Bark, ſet with a good number of ſmall Prickles like Hairs, and the elder have but very few Thorns.* The Roſe *has a very great Bud or Button under it, greater than in any other* Roſe, *and is thick and double as a* Red Roſe, *but ſo very much ſwelling in the Bud, that many of them break before they can be fully blown, and then they are of a pale* Red Roſe *color,* viz. *between a* Red *and a* Damask; *with a very thick, broad, and hard Umbone or Pointel, and ſhort yellow Threads or Thrums in the middle; the Huſk of the Flower has long ends, which are called the Beards of the* Roſe, *which in all others, are jagged in ſome of them, but in this has no Jaggs at all. The Smell thereof is neareſt to that of the* Red Roſe.

XVIII. *The thirteenth, or* Hungarian Roſe. *This has green Shoots which are ſet with many Prickles; and ſeldom grows higher than the* Common red Roſe; *the Stem or Stock being much about that bigneſs. The* Roſe *is as thick, great, and double, as the* Common red Roſe, *and of the ſame faſhion, of a paler red color, and being nearly look'd upon, is finely ſpotted with faint Spots, as it were ſpread over the red; the Smell of which is ſomething ſtronger than the Smell of the* Red Roſe *of the beſt Kind.*

XIX. *The fourteenth, or* Single Velvet Roſe. *The old Stock or Stem of the* Velvet Roſe *is covered with a dark colored Bark, and the young Shoots with a ſad green, with very few or almoſt no Prickles upon them. The Leaves are of a ſadder green color, than in moſt ſorts of* Roſes, *and very often ſeven on a Stalk, many of the reſt having but five. The* Roſe *is ſingle, and when blown, is a bread ſpread Flower, conſiſting of five or ſix broad Leaves, with many yellow Threads in the middle.*

XX. *The fifteenth, or* Double Velvet Roſe. *The Stock, Bark and Leaves of this are like thoſe of the* Single Kind. *The Flower or* Roſe *is double, and has two rowes of Leaves; the one large, which are outermoſt, the other ſmaller within, of a very deep red crimſon color, like unto* Crimſon Velvet, *with many yellow Threads alſo in the middle; and yet for all the double row of Leaves, theſe* Roſes *ſeem but like ſingle Flowers.*

XXI. *There is another* Double Velvet Roſe, *much more double than the laſt, conſiſting ſometimes of* 16 *Leaves or more in a* Roſe, *and moſt of them of an equal bigneſs, of the color of the firſt* Single Velvet Roſe, *at* Sect. 19. *above, or ſomething brisker; but all of them a weaker Smell than the* Common red Roſe.

XXII. *The ſixteenth, or* Roſe without Thorns or Prickles ſingle. *This has ſeveral green ſmooth Shoots riſing up from its Root, without any Thorns or Prickles at all upon them, neither when they are young, nor whileſt they are old. The Leaves are not fully ſo large as thoſe of the* Red Roſe. *The* Roſes *are not much bigger than thoſe of the* Double common Roſe; *they are not fully ſingle, but ſhort, and of a pale red* Roſe *color, with divers pale colored Veins, thro' every Leaf of the Flower, which has cauſed it to be called alſo,* The Marbled Roſe. *It has but little Smell, not full out ſo ſtrong as that of the* Red Roſe.

Roſe Buſh without Prickles.

XXIII. *The ſeventeenth, or* Double Roſe without Thorns. *This in its Shoots, Stocks, Branches, Leaves and Buds, as alſo in its form and manner of growing, is altogether like the former; and differs from it only in its Flower. For in this, the* Roſe (*which is a little larger alſo than the* Double Cinamon Roſe) *has its Leaves thick ſet together, and is very full of them, ſhort alſo, and of the ſame pale red* Roſe *color, with pale colored Veins running through every Leaf thereof; the duplicity of the* Roſe *making the chief difference from the former.*

XXIV. *The eighteenth, or* Single Cinamon Rose. *This has its Shoots something red, yet not so red as the* Double Kind, *armed with great Prickles, almost like to those of the* Eglantine Bush, *thereby showing, as well by the multiplicity of its Shoots, as the quickness of its growing, and the height of its Stem, its original Nature, which seems to be of a* Wild Kind *originally. On the Stem and Branches grow winged Leaves, sometimes seven or more together, which are small and green, yet like unto unto other* Roses, *which are single, consisting of five Leaves apiece, something large and of a pale red color.*

XXV. *The nineteenth, or* Double Cinamon Rose. *This in its Stems, Branches, Leaves, Buds, color, and form of growing is altogether like the* Single Cinamon Rose; *and differs chiefly in the doubleness of its Flowers; but in this the Shoots are redder; and it bears small, short, thick and double* Roses; *something like unto the* Rose without Thorns or Prickles, *but a little lesser, of a paler red color at the ends of the Leaves, and something redder and brighter towards their middle, with many short Thrums about the Center of the Flower. The Smell both of this and of the* Single Kind, *is that of* Cinamon, *from whence came the Name.*

XXVI. *The twentieth, or* Single yellow Rose. *This is Planted rather for variety than any thing else. It often grows to a good height, its Stem being great and Woody, with few or no Prickles upon the old Wood; but with a great number of small Prickles like Hairs, and thick set upon the younger Branches, of a dark color, sometimes reddish; and the Bark of the young Shoots being of a sad green reddish color. The Leaves of this* Rose Bush *are smaller, rounder pointed, of a paler green color; finely snipt about the edges, and more in number upon each middle Rib, viz. seven or nine, as it happens. It bears a small single* Rose, *consisting of five Leaves, not so large as the* Single Spanish Musk Rose, *but larger than the* Eglantine, *or* Sweet Briar Rose, *and of a fine pale yellow color, without any great Smell whilst fresh; but a little more (tho' very weak) when it is dry.*

XXVII. *The twenty first, or* Double yellow Rose. *This* Rose, *by reason of its Rarity, and exceeding doubleness of its Flower, had it but an answerable Smell also, would have been one of those which might have obtained the highest Esteem. In the Stem or Stock, the young Shoots or Branches, the small hairy Prickles, and the small winged Leaves, it is altogether like unto the former* Single Kind. *The chiefest difference consists in the duplicity, or rather multiplicity of the Leaves of the Flower or* Rose, *which is so thick and double, that very often it breaks out on one side or another, so that but few of them abide fair and whole with us in our* Gardens. *The cause of which is supposed to be the too great wet, or moisture of our Air or Weather, in the time of their Flowering, too much Rain hurting them, besides it is so plentiful in young Shoots or Branches, as also in Flowers at the top of every Branch, which for the most part, are small and weak, that it is not able to bring all its Flowers to perfection, and therefore most of them fall or wither away without coming to ripeness. The Remedy which many use for this inconveniency is, to nip away most of the Buds, leaving but some few upon a Branch, that so the vigor of the Plant, may be collected into a few Flowers, and so the more easily come to their perfect beauty, which yet even by this means is with difficulty affected. The* Roses *are of a yellowish green color in the Bud, and before they are blown open; but afterwards when fully blown, are of a fair yellow color, very full of Leaves, with many short Hairs rather than Leaves in the middle, and having short, round, green, smooth Buttons or Heps, almost flat under them. The Flower being fully blown open, does scarcely give place for largeness, thickness, and doubleness, unto the* Great double Damask Province, *or* Holland Rose. *This* Rose Bush *or Plant is very tender with us here about* London, *and requires more care than the* Single Kind *does, which is hardy enough. But it thrives very well in a warm, dry and free Air, and that in all or most parts of the Kingdom, more especially if it is planted against a Wall, or be other ways defended from Rain and Wet by covering it.*

XXVIII. *The twenty second, or* Single Musk Rose. *It rises up oftentimes to a very great height, so as to over grow any Arbor in a* Garden, *or being set by an House side, will rise up to ten or twelve Feet or more, with many green far spread Branches, armed with a few sharp and great Prickles, such as the wilder sorts of* Roses *have. The Leaves are Small and of a dark green color, not much bigger than the Leaves of* Eglantine. *The Flowers come forth at the tops of the Branches, many together, as it were in a Tuft, which for the most part do Flower all at a time, or not long one after another, every one standing on a pretty long foot Stalk, of a pale whitish or Cream color. The* Roses *are small, consisting of five Leaves apiece, with many yellow Threads in the middle.*

XXIX. *The twenty third, or* Double Musk Rose. *This in its Stocks, or Stems, Branches, Leaves, height, and manner of growing, is exactly like the former* Single Kind, *the chief difference between them is in the Flowers, which in this are double, and of the same pale white, or Cream color, as the* Single Sort. *The* Roses *are furnished with two or three rows of Leaves, with yellow Thrums also in the middle. Both the* Single *and* Double Kinds *have a very sweet and pleasing Smell, very much resembling Musk.*

XXX. *The twenty fourth, or* Double white Damask Musk Rose. *This more truly may be called the* Double white Cinamon Rose, *from its Smell. It has its Stem and Branches shorter than the former, but as green. The Leaves are somewhat larger, and of a whiter green color: The Flowers or* Roses *are also something larger than the former* Double Kind *at* Sect. 29. *above, but stand in Tufts after the same manner, or something thicker, and of the same whitish color or a little whiter, and something, altho but little, near the Smell of the last described, but nothing so strong. This Flowers at the times of other* Roses, *or rather later, yet much before the two former sorts of* Musk Roses, *which Flower not till the end of* Summer, *or in* Autumn; *both which things as to time of Flowering and Smell, shew that it cannot be of the Species of the* Musk Roses.

XXXI. *The Twenty fifth, or* Single Spanish Musk Rose. *This rises up to the height of the* Eglantine, *and sometimes higher, with several great green Branches, the Leaves of which are larger and greener than any of the former Kinds of* Musk Roses. *The Flowers are* Single Roses, *consisting of five whiter Leaves, than any of the former* Musk Roses, *and much larger, having sometimes an Eye of blush in the white, of a very sweet Smell, coming neerest unto the last sort, at* Sect. 30. *as also for its time of Flowering.*

XXXII. *The twenty sixth, or* The single sweet Eglantine, *or* Sweet Briar Rose. *This is well known for the sweetness of its Leaves, and is Planted almost in all* Gardens, *yet found growing* Wild *in many Woods and Hedges. It has exceeding*

ing long green Shoots, armed with cruel sharp, and strong Prickles, and thicker set upon the Branches and Stems, than on any other Rose Bush, *whether* Wild *or* Garden. *The Leaves are smaller than most of those which grow in* Gardens, *seven or nine most usually set together upon one middle Rib or winged Leaf, which are very green, and Smell sweet, above the Leaves of any other kind of* Rose. *The Flowers are small* Single blush Roses, *having little or no Smell, which being past away leave behind them Heps, which when ripe, are of a shining Coral color, and contain within them a downy substance in which the white hard Seed does lye.*

XXXIII. *The twenty seventh, or* Double sweeet Eglantine, *or* Double sweet Briar Rose. *This is generally where ever it is planted, a Grafted Rose, tho' I doubt not but its Original was Natural, and may be made to grow so, naturally again. It grows and spreads very well, and with a great head of Branches, on which grow such like Leaves as in the* Single Kind, *but a little larger, and not smelling fully so sweet. The Flowers are something bigger than the single, but not much, having but only two rows of Leaves, the inner of which are smaller and the outward larger, of the same pale reddish purple color, but smelling something sweeter than the* Single

XXXIV. *The twenty eighth, or Rosa mensalis, the* Monthly Rose. *It is in all its parts like unto the* Damask Rose; *and in* Italy *is said to bear seven Months in the Year, tho' with us, we rarely find it to bear above three or four,* viz. *in* June, July, August, *even to the end of* September. *The* Roses *are very like to the* Damask, *but something more double, and not altogether so sweet.*

XXXV. *The twenty ninth, or* Blush Belgick Rose, *Rosa Belgica Rubicante. It has bigger Branches and fuller of Thorns or Prickles than most other* Roses. *The Leaves are thicker, stiffer, and and of a whitish green color. The Flowers grow many together on the ends of the Branches, which are about the bigness of the ordinary* Damask Roses, *but very thick and Double, of a fine pleasant pale blush color, and sweet Smell. This is the greatest Bearer of all the* Roses; *and the* Distilled Water *thereof, is almost as good as that of the* Damask.

XXXVI. *The thirtieth, or* Rosa Damascena variegata Elegantior, *the Beautiful variegated Damask Rose. It is something like the* Rosa Crystallina, *but only the Shoots are shorter and redder, and the Leaves smaller. The Flowers are something more double, and often better marked than either the* Versicolor'd, *or* Crystalline, *at* Sect. 14 and 15.

XXXVII. *The thirty first, or* Rosa Canina flore pleno, *or Double Wild Briar Rose. This in its Stems, Branches and Leaves is like to the* Lesser White Rose *at* Sect. 5. *aforegoing; or to those of the* Single Wild Briar; *but the Flowers are double, for which it is esteemed, and are of a faint whitish blush color, having but a weak Smell.*

XXXVIII. *The thirty second, or* Rosa Mundi, *The Rose of the World. This differs not in any of its parts from the* Common red Rose, *but only in the color of the Flowers, which in this are for the most part red, of a pale blush color, diversly spotted, marked and striped thro'out every Leaf of the double Flower, with the same red color which is in the* Ordinary red Rose, *so that it is the most beautiful to behold of all the* Striped *or* Variegated Roses, *yet known. The form of the* Rose *and its Smell, is like to that of the* Common red Rose.

XXXIX. *The Places.* Where many of these were Originally Natives is hard to determin, now they are all Natives with us in *England*, and grow only in *our Gardens*. The first and fourth are *Originally English*, for the *Dryed Red Roses* which come over to us from beyond Sea, are not of the same Kind with our *English*, nor any wise to be compared to them, neither for goodness nor color. The *Double Yellow* came to us first from *Turky*; others from *Holland* and other Countries.

XL. *The Times.* The *Cinamon Rose* is for the most part the earliest: The *Common Musk Roses* both *Single* and *Double*, Flower latest: all the others Flower much about one time, *viz.* from the beginning of *June*, and all *July* till *August*; and the *Red*, many times through the whole Month of *August*, even till *September*.

XLI. *The most Esteemed of all these are*, I. Of the *Red Roses*; the *Rosa Mundi*, *Red Belgick Rose*, the *Variegated*, the *Red Province Rose*, and the *Rose without Thorns*. II. Of the *Damask Roses*; the *Crystal Rose*, the *Beautiful Variegated Damask Rose*, the *Blush Belgick Rose*, the *Monthly Rose*, and the *Damask Province Rose*. III. Of the *Yellow Roses*; the *Scarlet Austrian Rose*, and the *Double yellow Rose*. IV. Of the *White Roses*, the *Blush Rose*, and the *Damask Musk Rose*. These are all excellent *Roses*, and none of them ought to be wanting in any good *Flower Garden*.

Of the Planting and Nursing up of Roses.

XLII. *Note.* 1. All sorts of *Roses* are hardy, and will endure the Frost in *Winter*; and the better the Soil is you set them in, the better they will thrive, and the fairer will be the Flowers. They are generally disposed in Rows and Hedges, and supported and kept in on both sides. And the several colored *Roses*, intermixt and well placed will make an excellent and beautiful Prospect.

XLIII. *Note.* 2. All Stocks of *Budded Roses* are to be carefully kept from Suckers: and if the Buds be placed near the Ground, after one Years growth, they may be laid in the Earth to Root, by which means it will become a Natural Bush; one of which is more worth than three that are Budded, for that every Sucker which comes from them will be of the same Kind, by which they will be encreased. But as all *Rose Bushes* are not apt to yield Suckers, it will therefore be the speediest and most certain way to lay down the Branches, or make Layers of them, and to put old well rotted Dung about the places where they are Lay'd, which will make them take Root the sooner.

XLIV. *Note.* 3. There are some *Roses* which are not fit to be Planted in Hedges, as the *Musk Roses*, which will not Bear at all, unless they grow by some high Wall, or House side, where they may have liberty to grow to their full height, which is commonly eight or nine Feet high. Also the *Double Yellow*, which is the most unapt of all others to bear kindly, and fair Flowers, except it be ordered and taken care of in an especial manner; for whereas all other *Roses* are best Natural, this proves best being Inoculated upon another Stock. And whilest others thrive and bear best in the Sun, this thrives best in the Shade.

XLV. *Note.* 4. The best way then that is known to cause this *Double yellow Rose*, to bring forth fair and kindly Flowers, is done thus; first in the Stock of a *Franckford Rose*, near the Ground, put in the Bud of the *Single yellow Rose*, which will quickly shoot to a good length; then half a Yard higher than the place where the same was Budded,

put into it a Bud of the *Double yellow Roſe*, which growing, the Suckers muſt be kept from the Root, and all the Buds rubbed off, except thoſe of the Kind deſired, which being grown big enough to bear (which will be in two Years) it muſt in *Winter* be Prun'd very near, cutting off all the ſmall Shoots, and only leaving the biggeſt, cutting off the tops of them alſo, as far as they are ſmall.

XLVI. *Note.* 5. Then the next *Spring*, when the Buds for Leaves come forth, rub off the ſmalleſt of them, leaving only ſome few of the largeſt, which by reaſon of the Strength of the Stock, affords more nouriſhment than any other: and by the agreeable Nature of the *Single yellow Roſe*, from whence it is immediately nouriſhed, the Shoots will be ſtrong and able to bear out the Flowers, (if they be not too many, which may be prevented by nipping off the ſmalleſt Buds for Flowers, leaving only ſuch a number of the faireſt, as the Buſh may be able to bring to perfection,) which Buſh ſhould ſtand ſomething ſhaded, and not too much in the heat of the Sun; and in a Standart by it ſelf, rather than under a Wall.

XLVII. *Note.* 6. *Roſes* are alſo encreaſed either by Inoculating the Buds of them into other Stocks, or by laying down the Branches in the Earth, as we before hinted. The beſt Stocks to be Inoculated upon, are, 1. The *Damask*. 2. The *White*. 3. The *Frankford*. 4. And the *Wild Eglantine*. The Beſt time to do it in, is about *Midſomer*, or as ſoon as good Buds can be gotten.

XLVIII. *Note.* 7. After your *Roſe Buſhes* have done Bearing, they ought to be cut with the Garden Sheers, ſomething near, and towards the *Spring*, each Branch is to be cut again with a Knife, cloſe to a Leaf Bud; and what is dead or Superfluous is to be taken away. Theſe Rules being obſerved you may expect to reap a plentiful Crop, and to obtain every Year, a good ſtore of very fair *Roſes*; when many times thoſe which are Natural, may notwithſtanding all the helps of Induſtry, prove poor and mean or blaſted.

XLIX. *Note.* 8. The parts of the *Roſe* it ſelf, have alſo ſeveral particular Names, as, 1. *Viburna*, which are the Shoots of the *Roſe* Plants, as *Strabo Gallus*, in his *Little Garden* is pleas'd to call them. 2. *Alabaſtri*, are thoſe parts of the Cup which are deeply cut, and which encompaſs the Flower cloſe about before it is opened, which be in number five, two of which have Beards, and two have none, and the fifth has but half one. 3. *Calix*, or the Cup it ſelf, which contains and holds in together the yellow part, and the Leaves of the Flower. 4. *Ungues*, or the Nails, which are the lower white parts, of the Leaves of the Flowers, by which they are joined to the Cups. 5. *Anthos*, in Shops *Anthera*, *Flos Roſæ*, The Flower of the *Roſe*, or the middle part thereof, which they call the Chives, and ſome (tho' falſly) the Seeds of the *Roſe*. 6. *Fructus*, *Corallatum*, the Hep or Fruit, which comes after the *Roſe*, and which being ripe is of a bright ſhining Coral like color.

L. *The Qualities.* *Meſues* ſays, that the *Roſe* is cold in the firſt Degree, and dry in the ſecond. Both the *White* and *Red* are cooling and drying, but the *White* is taken to exceed the *Red* in both theſe Properties. *Galen* ſays, the *Red* has a bitter and aſtringent Quality with it; and that the *Antheræ* or yellow Threads in the middle of the *Roſe*, do bind more than the *Roſe* it ſelf, and are more drying alſo. *Meſues* will have the *Roſe* to be compounded of divers parts or ſubſtances, *viz.* of a Watery temperate Subſtance; of Earthy drying Parts; and of a Volatile Aromatick Subſtance, which is hot, whence comes its Redneſs, Perfection and Form. The Bitterneſs in the *Roſes*, *viz.* *Damask*, and *Musk*, whilſt they are freſh, cauſes their Cathartick Quality, and makes them to purge both Cholerick and Watery Humors, which it does not appear that the *Greeks* knew any thing of; but being dry, that bitterneſs vaniſhes, and therewith their purging property, and then they have only an aſtringent, binding or ſtopping Power. Thoſe which are not full blown, do both cool and bind, more than thoſe which are full blown, and the *White* more than the *Red*; and the *Red* more than the *Damask* or *Musk Kinds*. Alſo the *Musk Roſes* both *Single* and *Double*, do Purge more powerfully than the *Damask*, and the *Single* are held to be ſtronger than the *Double*, tho' none of the *Greeks* have taken notice hereof; but *Meſues* the *Arabian* only. And *Camerarius* ſays, that 20 Leaves of the *Single Musk Roſe*, will open the Belly, and Purge the Body, but more are to be taken of the *Double Kind*, to do the ſame.

LI. *The Specification.* The *White* and *Red*, ſtop Fluxes of the Bowels, and Catarrhs, are Vulnerary, drying and healing, good againſt Conſumptions and Ulcers of the Lungs, as alſo internal Ulcers of the other *Viſcera*, as of the Stomach, Gutts, Reins, Bladder, and Womb, comfort the Head, Brain, and Nerves, and are good againſt Diſeaſes afflicting thoſe parts, proceeding from cold and moiſture.

LII. *The Preparations.* Out of *Roſes* the following Medicaments are made, *viz.* 1. *Juice of Red Roſes.* 2. *Liquid Juice of Damask and Musk Roſes.* 3. *Eſſence of Damask and Musk Roſes.* 4. *Decoction of Red Roſes in Wine.* 5. *Infuſion of Damask and Musk Roſes in Wine.* 6. *A Decoction of the Heps.* 7. *A Simple Syrup of Red Roſes.* 8. *A Syrup of dryed Red Roſes.* 9. *A Syrup of the Juice of Damask Roſes.* 10. *Syrupus Roſarum Odoratus.* 11. *Syrup of Damask and Musk Roſes.* 12. *Syrup of Roſes ſolutive ſimple.* 13. *Syrup of Roſes ſolutive with Agarick.* 14. *Syrup of Roſes ſolutive with Hellebor.* 15. *Syrup of Roſes ſolutive with Sena.* 16. *Julapium Alexandrinum*, *vel Syrupus Regius.* 17. *Julapium Roſatum*, Julep of Roſes. 18. *Mel Roſatum Commune*, Honey of Roſes. 19. *Mel Roſatum Colatum.* 20. *Mel Roſatum ſolutivum.* 21. *Acetum Roſatum*, Vinegar of Roſes. 22. *Tincture of freſh Red Roſes.* 23. *Tinctura Roſarum ſiccarum*, Tincture of dryed Red Roſes. 24. *Lohoch Roſatum.* 25. *Conſerve of Damask Roſes.* 26. *Preſerved Damask Roſes.* 27. *Sugar of Roſes.* 28. *Electuarium Roſarum Mynſichti.* 29. *Electuary of Roſes.* 30. *Aloe Roſata.* 31. *Pouder of Red Roſes.* 32. *Aromaticum Roſatum.* 33. *Diarrhodon Abbatis.* 34. *Pouder of the Antheræ.* 35. *Pouder of Damask and Musk Roſes.* 36. *Dryed Leaves of Damask and Red Roſes.* 37. *Roſe Cake.* 38. *An Epithem.* 39. *Oil of Roſes Omphacine.* 40. *Oil of Roſes compleat.* 41. *Ointment of Roſes.* 42. *A Cataplaſm.* 43. *White Roſe Water.* 44. *Red Roſe Water.* 45. *Damask Roſe Water.* 46. *Spirit of Damask or Musk Roſes.* 47. *Oil or Fat of Roſes.* 48. *Poteſtates Roſarum.* 49. *Elixir of Roſes.* 50. *Fixed Salt.* Of all which in order.

The Virtues.

LIII. *The Liquid Juice of Red Roſes.* It ſtrengthens the Stomach, Heart, Liver, and Retentive Faculty, ſtops the overflowing of the Whites and Courſes in Women, Defluxions of Rheum into the Eyes, and all ſorts of Fluxes of

LIV. *The*

the Bowels, as also Ulcers of the Lungs, Guts, Reins, Bladder, and Womb. Dose 2 or 3 Spoonfuls Morning and Night, in a Glass of Red Styptick Wine.

LIV. *The Liquid Juice of Damask and Musk Roses.* It has in a great measure the Virtues of the *Red*, besides which, it purges and cleanses the Body of cholerick and flegmatick Humors; eases pains arising from hear, asswages Inflamations, and causes Rest and Sleep. It also gives ease in the Colick, by purging off those acrimonious and sharp Humors which cause it.

LV. *The Essence of Damask and Musk Roses.* It has all the Virtues of the *Liquid Juice*, Works finely and easily, and may be given Morning and Night, from 2 Spoonfuls to 4, in a Glass of warm White *Port* Wine, or in Posset Drink, or Water-Gruel, or Mutton Broth.

LVI. *The Decoction of Red Roses in Wine.* It is very good against the Head-ach, and pains in the Eyes, Ears, Throat and Gums; as also the *Intestinum Rectum*, and Womb, being Injected into them: and the other parts bathed therewith. Taken inwardly, it is said to give ease in the most excruciating Pains of the Colick. In this last Case, I am of Opinion the *Infusion* would be better to be made in *Anised Water* than in Wine.

LVII. *The Infusion of Damask or Musk Roses in Wine.* It purges and cleanses the Bowels, and whole Body, from Choler, Flegm, and Viscous, Tartarous and Slimy Humors, and therefore is profitable against the Griping of the Guts, Colick, or dry Belly-ach, Stone, Gout, and other like Diseases, proceeding from those Humors.

LVIII. *The Decoction of the Heps. It may be made in White Port Wine, or in Water, or in an equal mixture of those two.* It is of good use against Spitting or Vomiting of Blood, Pissing Blood, or the Bloody Flux, and all other Fluxes of the Bowels.

LIX. *The simple Syrup of Red Roses. It is made altogether as you make Syrup of Clovegilliflowers, in a boiling Balneo. Also if you please, in stead of Water, you may use a strong Styptick sort of Red Wine, as Alicant, Barcelona, or Barabar Wine, &c.* It stops all manner of Fluxes of Blood by Mouth, Urinary parts, Womb, and Fundament; stops Fluxes of the Bowels, a *Gonorrhœa* in Men; and the Whites in Women, is good against nauseousness and Vomiting, and profitable against Coughs, Colds, and Catarrhs. Dose a quarter of a Pint at a time, more or less, 2, 3, or 4 times a day.

LX. *The Syrup of dryed Red Roses. Take Spring Water 4 Pints, let it boil, and then infuse in it, some at a time, of dryed Red Roses 8 Ounces: the next day press them out; and with 2 Pounds of Sugar, make a Syrup by boiling according to Art.* It comforts and strengthens the Heart and Spirits, binds, stops Fluxes, stops Vomiting, and has all the Virtues of the former made of the fresh gathered *Roses*.

LXI. *Syrupus è succo Rosarum Damascenarum*, Syrup of the Juice of Damask Roses. *It is prepared without Maceration, only with the Juice of Damask, or of Musk Roses pressed out and Clarified, with an equal proportion of Sugar.* It purges Choler, Flegm, and watery Humors, which it does without any Violence, cools, and also strengthens the Bowels. It is a *solutive Syrup*, familiar, safe, and gentle, good against the Cholick or dry Belly-ach, being given from 1 Ounce to 2, 3, or 4 Ounces at a time, in Clarified Whey, or some other proper Vehicle.

LXII. *Syrupus Rosarum Odoratus*, Sweet or perfumed Syrup of Roses. *It is made of the Distilled Water of Red Rose Leaves one part, with treble refined Sugar 2 parts; melting them into a Syrup in B. M. to which is added some few Grains of prepared Musk and Ambergrise.* It is refrigerating, cordial and strengthening, and used as a Vehicle to convey other Medicines in. Dropt into the Eyes 4 or 5 times a day, it clears the Sight, and takes off Clouds, Mists, Blood-shot, *&c.* It is many times used with Gargarisms, Washes, and Injections, instead of *Honey of Roses*, to palliate, cleanse, and heal old Sores, running Ulcers, Fistula's, *&c.* The best way to perfume it, will be, by adding to every Pint of the *Syrup*, 50 Drops more or less of the *Tincture of the Perfumes*, and not the Perfumes in Substance. It will be best to be given without being Perfumed, especially if they be apt to have Vapors, Hysterick Fits, *&c.*

LXIII. *Syrup of Damask and Musk Roses. It is made of the Leaves of Damask and Musk Roses in equal quantities, exactly, as you make the Syrup of Roses solutive simple in the next Section.* It purges admirably well, and yet with gentleness or easiness, and is peculiar against the Colick or dry Belly ach, and the vehemency of the cholerick Fermentations. Dose from 1 Ounce to 3, in any proper Vehicle.

LXIV. *Syrupus Rosaceus solutivus simplex*, Syrup of Roses solutive simple. *Take Spring Water boiling hot 2 Quarts; Damask Rose Leaves fresh, as many as the Water will contain, digest in a Vessel close stopt 12 Hours: then press them out, and put in fresh Rose Leaves as many as before, the Water being warmed anew: repeat this again, 3 or 4 times, encreasing the quantity of the Roses, as the Liquor encreases, which will be by almost a third part, every time. Take of this Liquor three parts: double refined Sugar two parts: mix and make a Syrup in Balneo.* It purges Choler, Flegm and watery Humors, gently and easily, cools and softens the Belly, expels Flegm out of the Stomach, and has all the Virtues of the *Syrupus è succo* at *Sect.* 60. aforegoing, you may give from 1 to 4 Ounces of it at a time, according to age and strength, in Clarified Whey, Sack Whey, Posset Drink, Mutton Broth, *&c.*

LXV. *Syrupus Rosaceus solutivus cum Agarico*, Syrup of Roses solutive with Agarick. *Take Agarick very thin sliced 2 Ounces; Ginger very thin sliced half an Ounce; Sal Gem 2 Drams; Polypody grosly bruised 4 Ounces; sprinkle them with White Wine: Digest them 2 days over warm Ashes, or Sand heat, in an Infusion of Damask Roses 3 Pounds: express out the Liquor, and with white Sugar 1 Pound, boil into a Syrup according to Art.* It is stronger and more effectual in Working than the *Simple Syrup*; for one Ounce thereof by it self, will open the Body more than 2 Ounces of the other, and Works as much on Flegm and Water, as on Choler. It cleanses the Stomach and Liver of Choler, provokes Urine, strengthens the Stomcah, and stops Vomiting. Dose from an Ounce to 3 Ounces. If you would have the *Syrup* more effectual, it will be best to take *Agarick 2 Ounces, and to make into a Syrup with Sugar first*, least you loose the force of the *Agarick* by boiling.

LXVI. *Syrupus Rosaceus solutivus cum Helleboro*, Syrup of Roses solutive with Hellebor. *Take the Rinds of all the Myrobalans, of each 4 Ounces; Epithymum, Polypody, of each 6 Ounces: Liquorice 4 Ounces: Seeds of Citrons 2 Ounces; Cloves 1 Ounce, cut and grosly bruise them; put them into a Glass Cucurbit, upon which affuse of the aforementioned Infusion of Damask Roses 6 Quarts; digest 24 Hours, and then Distill off till about 3 Pints remain. The remainder with the Ingredients express strongly, and clarifie it with whites of Eggs. Afterwards take Sena 6 Ounces; Roots of black*

Helleber

Hellebor 6 *Drams*; *Rheubarb*, 2 *Ounces being prepared*; *Extract with the before Diſtilled Water, by a double or trebble Infuſion or Coction, and expreſſing*; *which with the afore clarified Liquor, and fine Sugar Candy* 5 *Pounds, make a Syrup in Balneo, according to Art.* It opens obſtructions of both Liver and Spleen, and prevails againſt Melancholy, Frenzy and Madneſs. Doſe from 1 Ounce to 2 or more, at a time in Clarified Whey, or *Borage* or *Fumitory Water*. It is beſt to be taken in a ſmaller Doſe, and often.

LXVII. *Syrupus Roſaceus ſolutivus cum Sena*, Syrup of Roſes ſolutive with Sena. *Take Sena 6 Ounces*; *Caraway and Sweet Fennel Seed, of each half an Ounce*; *ſprinkle them with White Wine, and digeſt them two days, in the aforementioned Infuſion of Damask Roſes* 2 *Quarts*; *then ſtrain out, and with white Sugar two Pounds, boil it into a Syrup.* It is an excellent thing to purge Melancholy, open obſtructions and eaſe pains of the Spleen, Wind, *&c.* and all Diſeaſes proceeding from thoſe Cauſes: it eaſes the Head and Heart, comforts the Stomach, revives the Spirits, and prevails againſt the Green-ſickneſs in Virgins. Doſe from 1 Ounce to 3, in a weak *Infuſion of Sena in Clarified Whey*, or *White Port Wine.*

LXVIII. *Julapium Alexandrinum, vel Syrupus Regius*, The Cordial Julep. *Take Red Roſe Water* 2 *Quarts*; *double refined Sugar a Pound, mix and make a Julep.* It is a delicate cooling Cordial, refreſhing Nature, chearing the Heart and reviving the Spirits, good againſt Fevers, Faintings and Swoonings. If a few Drops of *Oil of Sulphur* be added to it, it will make it ſo much the gratefuller, and ſo much the more cooling.

LXIX. *Julapium Roſatum*, Julep of Roſes. *It is prepared of Damask Roſe Water, in the ſame manner as the former Cordial Julep.* It has all the Virtues of the former, comforts the Head, Brain and Animal Spirits, beſides which it is ſaid to be binding, and to ſtop all ſorts of Fluxes of the Bowels. And if it is Impregnated with ſome few Drops of *Oil of Sulphur*, it effectually ſtops Vomiting, and repreſſes all Burning and Malign Fevers.

LXX. *Mel Roſatum Commune*, The common Honey of Roſes. *Take Red Roſes not quite opened,* 2 *Pounds*; *Honey* 6 *Pounds: ſet them in the Sun according to Art.* Or thus. *Take of the manifold Infuſion of red Roſes* 5 *Pints: Clarified Honey* 4 *Pounds: mix and boil to the thickneſs of Honey.* It ſtrengthens the Stomach; heals Sores and Ulcers of the Eyes; cleanſes and heals Ulcers of the Mouth and Throat; as alſo Ulcers in the Secret parts of Man or Woman; and is uſed in Clyſters to heal Ulcers of the Guts, being diſſolved in Milk or Fat Broth.

LXXI. *Mel Roſatum colatum*, Honey of Roſes ſtrained. *Take Honey deſpumated in Balneo* 10 *Pounds*; *Juice of Red Roſes* 1 *Pound*; *ſet them conveniently over the Fire, and when they begin to boil, put in freſh Red Roſes (the Whites being cut off)* 4 *Pounds*; *conſume the Juice by boiling and ſtirring, then ſtrain out, and keep it for uſe.* The Virtues and Uſe of this, are altogether the ſame with the former. It is ſometimes mixed with Injections for the cure of a *Gonorrhœa*, and other Venereal Ulcers.

LXXII. *Mel Roſatum ſolutivum:* Honey of Roſes ſolutive. *Take of the manifold Infuſions of Damask Roſes* 5 *Pints: Honey well Clarified* 4 *Pounds: mix and boil them to the thickneſs of Honey.* This has all the Virtues of the former *Honies.* But beſides being taken inwardly, from 1 Ounce to 3 (according to Age, Accidents, *&c.*) It Works gently and eaſily, makes the Belly ſoluble, and purges off Choler, Flegm, and Watery Humors, and gives ſpecial eaſe in the Colick.

LXXIII. *Acetum Roſatum*, Vinegar of Roſes. *Take Red Roſe Buds gathered in a dry time, the whites cut off, and dryed in the Sun a Pound*; *Wine Vinegar* 6 *Quarts*; *ſet them in the Sun* 40 *days: then ſtrain out the Vinegar, and repeat the Infuſion with freſh Roſes.* It comforts the Head and Stomach, ſtops Vomiting, cauſes a good Appetite, repreſſes Inflamations, and cools the heat of Fevers, whether outwardly or inwardly uſed.

LXXIV. *Tinctura Roſarum Bateana*, Tincture of freſh Red Roſes. *Take Red Roſes exungulated an Ounce*; *Fountain Water boiling hot* 5 *Pints*; *Oil of Vitriol*, 60 *Drops*; *Digeſt* 3 *Hours, and to the clear Tincture, add white Sugar Candy in Pouder* 6 *Drams.* It refrigerates in Fevers, and comforts the Liver, helps Concoction, ſtops Fluxes, as alſo the overflowing of the Terms. Doſe 2 Ounces to 4. It is a pleaſing *Julep* to the allay heat in Fevers and quench Thirſt, and is of good uſe to be given in the Meaſles and Small Pox, if any Flux be preſent, or feared. It is alſo of approved ſucceſs in the Plague, and all malign or Peſtilential Fevers, deſtroying the Root of the Morbifick Cauſe. It may be given as a *Cordial* after this manner. *Take of this Tincture or Julep* 3 *Ounces*; *Spirit of Saffron an Ounce*; *Tincture of Antimony* 30 *Drops, mix for a draught* againſt Faintings, Swoonings, ſickneſs at Stomach, Palpitation of the Heart. In all continent, continual, and vehemently burning Fevers, it may be thus given. *Take Spring Water a Pint*; *of this Tincture half a Pint: Syrup of Violets* 4 *Ounces*; *mix them:* and let the Sick drink thereof at Pleaſure.

LXXV. *Tinctura Roſarum Siccarum*, Tincture of Dryed Roſes. *Take exungulated Red Roſes dryed an Ounce*; *Spring Water* 2 *Quarts*; *rectified Oil of Sulphur a Dram*; *Infuſe in a warm Balneo for* 4 *Hours*; *ſtrain, and diſſolve in it fine white Sugar* 6 *Ounces: and then filter through Brown Paper.* It cools, comforts and digeſts, is excellent in all Burning Fevers, and has all the Virtues of the former.

LXXVI. *Tinctura Roſarum Compoſita*, Tincture of Roſes Compound. *Take new made Whey Clarified,* 3 *Quarts: and whileſt it boils, put into it Red Roſes* 6 *Drams (but double the quantity would do better) Tamarinds an Ounce and half*; *Spirit or Oil of Vitriol a Scruple*; *let the boiling ceaſe, but whilſt it is hot, caſt in freſh Red Roſes bruiſed* 3 *Ounces*; *Corn Poppies, and Violets, of each half an Ounce*; *Digeſt in a warm Place for ſome Hours: and being cold, ſtrain and filter*; *and to the filtered Liquor add Damask Roſe Water* 3 *Ounces.* It is intended againſt Melancholy, inward Inflamations, heat of the Liver, Pleuriſy, *&c.* Where note, that inſtead of *Whey*, you may uſe *Lettice, Purſlane*, or *Poppy Water.* Doſe from 1 Ounce to 2 or more.

LXXVII. *Lohoch Roſatum Mynſichti*, Lohoch of Roſes. *Take Conſerve of Red Roſes ting'd with Spirit of Sulphur* 4 *Ounces*; *Lohoch of Colts-foot prepared with Sugar* 2 *Ounces*; *Species Diarrhodon abbatis* 1 *Ounce*; *fine Bole, Juice of Liquorice, of each* 2 *Drams, Saffron* 1 *Dram*; *Flowers of Benjamin, leſſer Cardamoms, Mace, of each, half a Dram*; *Aniſated Balſam of Sulphur a Scruple*; *Chymical Oil or Spirit of Roſes* 6 *Grains*; *mix, and with ſome Pectoral Syrup make a Lohoch.* It is good againſt violent Coughs, Colds, Catarrhs, difficulty of Breathing, Exulcerations of the Breſt and Lungs, Spitting of Blood, Conſumptions, *&c.* Doſe the quantity of a *Cheſt-Nut.*

LXXVIII. Con-

LXXVIII. Conserve of Damask Roses. *Take fresh Damask Roses the whites being cut off a Pound, beat them in a Mortar to a Pulp, adding a double proportion of white Sugar, as they are a beating; but the Apothecaries have now a much better way of doing it, which is by passing them through a Mill, which makes the Mass or Conserve smooth and uniform.* It gently opens the Belly and Purges, and has the Virtues of the *Syrup of Damask Roses*; but is clogg'd with more earthy parts; and therefore Binds after it has done purging.

LXXIX. Damask Roses Preserved. *It is done either by laying the Flowers, Stratum super stratum, with double refined Sugar, and a double quantity of Sugar: Or by making the double quantity of Sugar into a Syrup with Damask Rose Water, and then pouring it on them:* but in this last way, the *Syrup* must be made very high or thick, and be somewhat thicker, than new Honey. It has the Virtues of the *Conserve* aforegoing, and operates exactly after the same manner.

LXXX. *Electuarium Rosatum Mynsichti*, Electuary of Roses, called also *Zinzibar Rosatum*, or Ginger Rosate. *Take Conserve of Red Roses Vitriolated* 12 *Ounces*; *Green Ginger Preserved* 4 *Ounces*; *Oil of Cinnamon, a Scruple*; *Oil of Cloves, half a Scruple: mix, and with Syrup of Violets Vitriolated, make an Electuary.* It comforts the Heart and Stomach, strengthens the Digestion, excites Appetite, takes away Loathing, and stops Vomiting. It recreates the Spirits, chears the Vitals, resists putrifaction, expels Wind, gives ease in the Cholick, and is a famous and present Remedy against all cold Diseases of the Head, Stomach, or Womb. Dose 2 or 3 Drams.

LXXXI. *Saccharum Rosatum Tabulatum*, Sugar of Roses Tabulated. *Take Red Roses exungulated, and dried carefully in the Sun an Ounce; double refined Sugar a Pound; melt the Sugar in Red Rose Water, and Juice of the same, of each 2 Ounces; in a gentle Balneo; consume the humidity by degrees, and put in the Rose Leaves in Pouder, mix them well, then put it upon a Marble, that it may be made into Lozenges according to Art.* These *Lozenges* comfort the Head, Brest, Lungs, and Liver; stay Vomiting, stop Fluxes, and are good for such as are in Consumptions. Dose from a Dram to 2 Drams, or more Morning, Noon, and Night.

LXXXII. *Electuarium Rosarum Mynsichti*, Electuary of Roses. *Take Conserve of Red Roses Vitriolated a Pound and half; Rob of Barberries, Rob of English Currants, of each a Pound; Syrup of the Juice of Citrons, and of the Juice of unripe Grapes, Oxysaccharum, of each half a Pound; Citron Peels Condited, Pulp of Citrons Candied, Species Diarrhodon abbatis sprinkled with Spirit of Vitriol, of each 5 Ounces; Nitre prepared, an Ounce and half: mix and make an Electuary, adding a little strong Cinamon Water.* It cools and moistens the heat of Fevers, allays Thirst, and takes away all preternatural heats whatsoever to a Wonder. It strengthens the Stomach, stops Vomiting, prevails in the Cholerick passion, heals a *Dysentery*, and cures Contagious Diseases. It comforts the more noble Members, as the Heart, Stomach, Liver, Spleen, Reins, and other *Viscera*, it opens their obstructions, and preserves them from Putrefaction. It stops bleeding at Nose, represses the Vomiting of Choler, and is profitable against Calentures. Dose from a Dram to half an Ounce, two or three times a Day, or oftener.

LXXXIII. *Aloe Rosata*, Rosed Aloes. *Take Aloes Succotrina and clear, which reduce into Pouder, 4 Ounces; Juice of Damask Roses depurated a Pound; mix and digest in the Sun, or in Balneo, till the superfluous moisture is evaporated: repeat this digestion and evaporation four times, and make a Mass for Pills according to Art.* It purges Choler and Flegm excellently, cleanses and strengthens both Head and Stomach, frees the the Bowels from evil Humors: causes Digestion, excites Appetite, stops Fluxes, and is good against the Yellow Jaundice. Dose from half a Dram to a Dram in the Morning Fasting.

LXXXIV. *Pouder of Red Roses.* It strengthens the Heart, Stomach, and Liver, fortifies the retentive Faculty, eases pain from a hot Cause, allays Inflamations, induces Rest and Sleep, stops the Whites and Terms in Women, all Fluxes of the Belly, and heals a *Gonorrhœa* in Men. Dose a Dram, or more, in *Syrup of Red Roses*; or made up into *Pills* with *Chio Turpentine*, to be taken at Night going to Bed. It is (so used) profitable also against Ulcers of the Reins, Ureters, and Bladder.

LXXXV. *Aromaticum Rosatum*, The Rose Aromatick. *Take Red Roses exungulated* 15 *Drams*; *Liquorice* 7 *Drams*; *Xyloaloes, Yellow Sanders, of each* 3 *Drams*; *Cinamon* 5 *Drams*: *Cloves, Mace, of each* 2 *Drams and half*; *Gum Arabick, Tragacanth, of each* 8 *Scruples*; *Nutmegs, Greater Cardamoms, Galangal, of each* 1 *Dram*; *Indian Spicknard, Ambergrise, of each* 2 *Scruples*; *Musk* 1 *Scruple*; *make a Pouder according to Art*; *which keep in a Glass close stopt for use.* It is a great Cordial, strengthens the Head, Brain, Nerves, Heart, Stomach, and Womb; makes a good Appetite and strong Digestion, expels Wind powerfully, and prevails against the Cholick, Griping of the Guts, Epilepsy, Apoplexy and Palsie: it drys up Catarrhs, and restores in Consumptions. Dose from a Scruple to a Dram, Morning and Night.

LXXXVI. *Diarrhodon Abbatis*, The Abbats Confect of Roses. *Take Red Roses exungulated* 12 *Drams*; *of Red and White Sanders, each* 2 *Drams and half*; *Ivory, Gum Arabick, Tragacanth, of of each* 2 *Scruples*; *Asarabacca Roots, Indian Spicknard, Mastick, Cardamoms, Cinamon, Liquorice, Saffron, Xyloaloes, Cloves, Gallia Muschata, Seeds of Anise and Fennel, Seeds of Basil, of Barberries, of Succory, of Purslane, the four greater cold Seeds cleansed, White Poppy Seed, of each a Scruple*; *Pearls, Bone of a Stags Heart, of each half a Scruple*; *Camphir* 7 *Grains*; *Musk* 4 *Grains*; *make all into a Pouder according to Art.* It is a delicate cooling Cordial Pouder, Pectoral and Carminative: It is Stomatick, and Stops Fluxes of the Bowels. Dose from half a Dram to a Dram and half.

LXXXVII. *Pouder of the Antheræ.* The *Antheræ* are the yellow Threads in the middle of the *Rose*; (which some tho' erroniously, call the Seed.) These *Antheræ* of the *Red Rose* especially being made into *Pouder*, and drank in the *Distilled Water of Quinces*, stops the overflowing of the Courses in Women; and is a powerful Remedy against Catarrhs, and other defluxions of Rheum upon the Gums and Teeth, and is said to preserve them from Corruption: and fastens them if they be loose, being mixed with *Vinegar of Roses*, and the Mouth and Teeth be washed and gargled therewith.

LXXXVIII. *The Pouder of Damask and Musk Roses.* Taken to a Dram or Dram and half, in Whey of Goats Milk, it opens the Bowels, and Purges the Belly of Flegm, Choler and Watery Humors, much like as the *Syrup* does, as *Costæus* in his Comment upon *Mesues* says.

LXXXIX.

LXXXIX. *The dried Leaves of Damask and Red Roſes.* The dried Leaves of the *Damask* and *Muſk Roſes* ſerve chiefly for Sweet Bags. But their *Infuſion* in Clarified Whey, or White *Port* Wine, gently open and purge the Body, more eſpecially if it is dulcified with *Manna*, or *Syrup of Violets*. The *Dried Leaves of the Red Roſes* are uſed in *Decoctions* and *Infuſions*, both inwardly and outwardly, as a *Cordial*, and to cool, bind, ſtrengthen, ſtop Fluxes of the Bowels, and eaſe the Cholick.

XC. *The Roſe Cake. If it is moiſtned with Vinegar of Roſes, or with Vinegar of Roſes mixt with Roſe Water, and cut fit to the place it is to be applied to*, It is ſaid to eaſe the Head-ach, and unquietneſs thereof, and to procure Reſt and Sleep.

XCI. *The Epithem. Take Damask Roſe Leaves, either freſh or dryed, moiſten them with Vinegar of Roſes, after they have been a little heat between a double folded Cloth or Paper in a Frying Pan, or before the Fire, then ſtrew upon them a little Grated, Nutmegs and Poppy Seed, on that ſide which is to ly next the Skin, and apply it to the Fore-head and Temples*, and ſo bind it on all Night, it eaſes the Head of Pain, and cauſes Reſt, Quietneſs and Sleep.

XCII. *Oleum Roſaceum Omphacinum*, Oil of Roſes Omphacine. *Take Red Roſes exungulated not yet ripe, and bruiſed in a Stone Mortar with a Wodden Peſtle*, 4 *Ounces*; *Oil Omphacine ſeveral times waſhed a Pound: mix, and expoſe them in a Glaſs cloſe ſtopt, to the Sun for a whole Week, ſhaking them every Day, then boil them gently in Balneo: preſs them out, and put in freſh Roſes, doing in like manner, and repeat a third time, and keep the Oil upon one Pound of Juice of Roſes.* It cools and ſtrengthens, and eaſes pain proceeding from a hot Cauſe: it ſtops the Flux of Humors, cools the Head, Stomach, and Joints, and extinguiſhes an *Eryſipelas*.

XCIII. *Oleum Roſaceum completum*, Oil of Roſes compleat. *It is made in the ſame manner of ſweet and ripe Oil Olive, often waſhed, and Red Roſes fully blown, bruiſed, and ſet in the Sun, and gently boiled in Balneo; letting the third Infuſion ſtand in the Sun forty Days, and then to keep the Oil and Roſes together without Expreſſion.* It is Anodyn, Emollient, and Arthritick, and has the Virtues of the former, but is leſs cooling and binding.

XCIV. *Unguentum Roſatum*, Ointment of Roſes. *Take freſh Hogs Lard, cleanſed and well waſhed, a Pound; freſh Red Roſe Leaves a Pound; mix and digeſt 7 Days; then boil with a gentle Fire, and ſtrain out. Repeat the ſame Work with freſh Roſes bruiſed, for 7 Days more, then boil and ſtrain out as before. At length affuſe Juice of Red Roſes half a Pint; Oil of Sweet Almonds 2 Ounces; boil them with a gentle Fire to the conſumption of the Juice: ſtrain out, and make an Ointment according to Art.* It is Anodyn, cooling, and refreſhing: it ſtrengthens weak, pained, and wearied Limbs, heals gaulings and frettings of the Skin, angry Puſtles, Wheals, Tettars, Ringworms, and clears the Head, and other parts from Scurff, Morphew, and other like Leprous Defilements: having all the Virtues of both the *Oils of Roſes*.

XCV. *The Cataplaſm. It is made of freſh Red Roſes beaten to a Pulp, and either boiled ſoft with Vinegar of Roſes; or not boiled, adding Vinegar of Roſes, and Pouder of the Antheræ, or Pouder of Balauſtians.* This being applyed hot to the Throat and Jaws, is good againſt pains in the Ears, Throat, and Gums: applyed to the Fundament, it is good againſt the Piles, and ſtops their exceſſive Bleeding. Applied to the Region of the Heart, it prevails againſt its Palpitation, allays Inflamations, cures *Anthony*'s Fire, and is good againſt moſt Diſeaſes of the Stomach. Applied to the Joints, it ſtrengthens them, and gives eaſe in the Gout.

XCVI. *White Roſe Water.* It is uſed as an Ophthalmick, is excellent good to cool Inflamed Eyes, ſtop the fluxion of Rheum, and eaſe their pain. *Take white Roſe Water a Quart; choiſe Brandy a Pint; Honey 4 Ounces; Pouder of Cochenele half an Ounce; mix, diſſolve, digeſt, and keep the Water upon the Pouder for Uſe.* It is truly a moſt excellent Eye Water.

XCVII. *Aqua Roſarum Rubrarum*, Red Roſe Water. It is well known, and of familiar uſe almoſt upon all occaſions. It is Cooling, Cordial, Anodyn, Refreſhing, and Chearing the weak and fainting Spirits, whether uſed inwardly in Draughts, or Broths, as *Barly* Broth, Chicken Broth, Veal Broth, *&c.* or uſed outwardly to bath with, as the Forehead, Temples, Noſtrils, *&c.* to eaſe their pain, heat, *&c.* beſides it has all the Virtues of the *White Roſe Water*, being uſed as an Ophthalmick.

XCVIII. *Aqua Roſarum Damaſcenarum*, Damask or Musk Roſe Water. *Take Damask or Musk Roſe Leaves, as much as you pleaſe, and without bruiſing put them into a Common Still, and draw off the Water with a gentle Fire without burning, till the Roſe Leaves are dry.* Or thus, *Take whole Damask or Musk Roſes, as many as you pleaſe* (i. e. *The Roſe Leaves not exungulated*) *beat them in a Mortar, and in a fit Veſſel affuſe on them a good quantity of fair Water, which digeſt together for a Day or two, and then Diſtill with a good Fire in a Copper Veſica Tinn'd within, as is uſual:* You will find upon the top of the Water ſome few Drops of a very Sweet and Odoriferous *Oil*, called by ſome *Adeps Roſarum*, which if you pleaſe you may ſeparate from the *Water*. Or thus, *Take Damask or Musk Roſes, bruiſe them as before, and then put them into a Wooden Veſſel with a narrow Mouth, laying them* Stratum Super ſtratum *with Salt in fine Pouder, and ſo much on top, as may over-top all 3 or 4 Inches, ſtop the Veſſel cloſe with Cork and Pitch, and let it ſtand in a Cellar for a Month, 2, or 3, then Diſtill by a Copper Veſica, ſo will you have a moſt odoriferous Roſe Water, much exceeding all thoſe which are Diſtilled the common ways.* Or thus, *Take Damask or Musk Roſes, and macerate them in Canary, or White Lisbon, or Madera Wine, for a Week or more, then Diſtill in a Copper Veſica as before.* This is indeed a much ſhorter way, but far inferior to that of pickling with Salt, becauſe in this you have a mixture of *Spirit of Wine*, with your *Water*; whereas, the other is the pure *Water* alone. It is Cordial, and chears the Heart and Spirits, and is generally mixt with *Cordial Waters* and Medicaments, to make them the more acceptable. *Coſtæus* in his Commentary upon *Meſues*, ſays, that 10 Ounces of *Damask Roſe Water* drank in a Morning Faſting, does open and purge the Belly. If it will do this of its ſelf, it will do it much beter if it be ſweetned with *Syrup of Violets*, or with *Syrup of Roſes ſolutive*.

XCIX. *Spiritus Roſarum Damaſcenarum & Muſchatarum*, Spirit of Damask or Musk Roſes. *Take Flowers of Muſk or Damask Roſes 40 or 50 Pounds, bruiſe them in a Stone Mortar with a Wooden Peſtle, and ſtrew them by degrees with Bay Salt finely Poudered 4 Pounds, put the whole into a large Earthen Jar with a narrow Mouth; croud the Flowers hard in, and ſtop the Mouth of the Veſſel ſo firmly*

firmly with Cork and Pitch, Rosin or melted Wax, that no Air may penetrate it. Set the Vessel so stopt, in a Cellar for 6, 8, 10 or 12 Weeks: so will the Flowers when open have a kind of Acid and Wine like Smell, which is a sign of their Fermentation. Take of these Pickled Flowers 6 or 7 Pounds, put them into a Glass Cucurbit, and in Balneo Distil to dryness. Take the Faces out of the Cucurbit, and put in again 6 or 7 Pounds more of the said Flowers, and the first Distilled Water, and distil in a Sand heat, with a gentle Fire, till the humidity is almost all come over. Then put in new Flowers, pouring upon them the last Distilled Water, and distill again as aforesaid, repeating this Work so long as you have any Flowers. This done, to make a Rectification. Put a small part of the former Water into a Bolt-Head, and in Balneo, with a gentle Fire, draw off about a twelfth part, which keep by it self: put in more of the former Water, and do again as we have just now directed; reapeating the same Work, till all the first Distilled Water is rectified. Put all these twelfth parts together, which keep in a Glass Bottle with a Glass Stopple. All the remaining Waters put also together, and continue Rectifications at several Repetitions, till you have all that is Spirituous: the Spirituous Liquor keep in the Bottle with the Glass Stopple: rectify a new in an evaporating Bath, in a Bolt Head having a long Neck, perfectly luted; so will you have an Ætherial Inflamable Spirit, loaden with Volatil Salt, which is Spiritus Rosarum, *or, Spirit of Roses. The remains of this last Rectification, put to the former remaining Waters after Rectification: so will you have an Excellent Rose Water, much better than any you can draw by any ordinary means, which keep in Glass Bottles close stopt. If you keep these Bottles in a Celler a while, new Oil will ascend by degrees to the top of the Water, and swim above it in little flakes almost like Snow, which you may separate according to Art: This is* Adeps Rosarum, *Fat of Roses. Now if you desire the Oil or Fat, rather than the Spirit, you will sooner have your desire by re-distilling several times the aforesaid Rose Water upon new Roses; for fresh and new Roses yield more Oil or Fat by far, than those which are Pickled or Fermented.* Or thus, *Take Damask or Musk Roses not exungulated 30 Pounds; beat all in a Stone Mortar, and put them into a large Earthen Jar, so as that a quarter part of it may remain empty: affuse thereon Juice of Damask or Musk Roses a Gallon, mixed with a Pint and half of Ale Yest, with a wooden Spatula; stir all well together, and stop all up close with Cork and Wax, digest in warm Horse Dung, or a Sand heat for four or five Days, till the Smell becomes Vinous, then distil in* Balneo Vaporis, *(the Joints being first well luted.) Be cautious of the heat, that it may be gentle, that only the Spirituous parts may ascend. Continue the Distillation till nearly 5 Pounds and a half of Spirit is drawn off: then take off the Receiver, and rectify the Spirit in a Glass Matras with a long Neck, as is directed towards the end of the former Operation or Process.* This *Spirit* is very odoriferous and grateful to the Smell, inflamable in its Substance, and of very Volatile parts, for which reason it is to be put up into Glass Bottles with Glass Stopples, that it may be kept close. It seems to be only an *Oil* raised up, and rarified or dilated with its *Essential Salt*, and therefore the whole *Rose* without Exungulating is taken, as containing more *Oily* Parts, and the Yest in the last Process is added to hasten the Fermentation. *This Spirit* is one of the greatest *Cordials* in Nature, it fortifies the Stomach and other Viscera, chears the Heart, revives the Spirits Natural, Vital, and Animal, and strengthens Nature to a Miracle. It is good against Melancholly, Grief, Palpitation of the Heart, Fainting, and Swooning Fits: it comforts the Head, Brain, Nerves, and Womb, and is an Excellent thing against Convulsions, Palsies, Lethargies, and other cold Distempers of the Brain and Nerves. Dose from 30 to 60 Drops or more, in a Glass of *Damask Rose Water* sweetned with *Syrup of Citron Peels*; or in a Glass of Choice Canary. Besides all this, it is a most admirable Perfume. It is a true Specifick, to exhilerate the Mind, quicken the Senses, and corroborate all the Faculties.

XCIX. *Oleum Rosarum Chymicum*, Chymical Oil or Fat of Roses. *The Noble Oil of Roses is made according to the latter part of the last Process in the former* Section. It has all the Virtues of the *Exalted Spirit* with advantage; for that 1 Drop of the *Volatile Essential Oil or Fat*, is equivalent, to 40 Drops of the most *Subtil* and *Sublime Spirit*; and therefore is never given but from 1 to 2, 4, or 6 Drops. It to be is Dropt first into White Sugar, with which it is to be well mixt; and then you may put that mixture, into a Glass of Generous Wine, or any other proper Vehicle, as some *Spirituous Cordial Water*, and so let the Patient take once, twice, or thrice a Day, as need may require. In the *London Dispensatory*, the *College* gives us this way of making this *Oleum, seu Pinguedo, vulgo Spiritus Rosarum*, Oil, Fat, or Spirit of Roses. *Take as many fresh Damask Roses as you will, steep them 24 Hours in a sufficient quantity of warm Water; Press them out; and repeat the Infusion certain times, till the Liquor is sufficiently strong, which distill in an Alembick with its Refrigeratory, or a Copper with its Worm: separate the Spirits from the Water; and keep the Water for another Infusion.* This *Oil* or Fat, is a great Cephalick, Neurotick, and Cordial, chears and recreates the Animal and Vital Spirits, quickens the Senses, chears the Heart, exhilerates the Mind, expels Melancholy, is wonderful against all Fainting and Swooning Fits, and in a Word, performs whatever any *Cordial* can do.

C. *Potestates Rosarum*, Powers of Roses. *Take of the former Oil or Fat of Roses an Ounce; Volatile Sal Armoniack, Sublimed or Raised from fresh Damask Roses, 4 Drams; rectified Spirit of Wine drawn off also from fresh Damask Roses, and cohobated 2 times, a Quart; mix them, and unite them in a cold Digestion.* It has all the Virtues of the *Spirituous Water, Sublime Spirit*, and *Oil* in *Sect.* 97, 98, and 99. aforegoing, and may be given in any proper Vehicle from 50 Drops to 100. It is an extraordinary Neurotick, and a Secret against Convulsions, and Palsies, but a Medicament fit only for Kings and Princes, and other great Personages, by reason of its great Price.

CI. *Elixir Rosarum*, Elixir of Roses. *Take of the Powers of Damask Roses a Quart; Damask or Musk Roses exungulated, and carefully dryed, 3 Ounces; Ambergrise 10 Grains; Musk 4 Grains; mix, digest cold, for a Month, shaking of the Glass twice every Day, then decant off the clear Elixir, which keep in a Glass with a Glass Stopple, for Use.* This has all the Virtues of the *Water, Spirit, Oil*, and *Powers Exalted*; and may be given from 20 to 60 Drops or more in a Glass of Generous Wine, or some other Spirituous Vehicle, 2 or 3 times a Day. It is an exalted Medicament, and beyond my Commendation.

CII. *Sal Rosarum Fixatum*, The Fixed or Elementary Salt of Roses. *Take the Remains of all the Distillations at* Sect. 97, *or* 98, *aforegoing, which put into a very large Crucible and in a Calcining Furnace reduce them to Ashes, adding in the time of*

Calcining fresh Damask Roses, to 40 times the weight of the Rose Cakes; Calcine to whiteness; and with Distilled Rain Water make a Lixivium, from which educe the Salt according to Art. It is Stomatick, Antiscorbutick, and admirably Diuretick; an excellent thing to dissolve Flegm, and Tartarous mucilage in any part of the Body, whether in the Lungs, Stomach, Liver, Reins, Bladder, Womb, or Joints. I commend it as a Jewel. Dose from 10 Grains, to half a Dram, in *Parsly* or *Hydropiper Water*; or in Rhenish, or White *Port*, or White *Lisbon* Wine, 2, 3, or 4, times a Day.

CIII. *Quintessentia Rosarum Palidarum*, The Quintessence of Damask Roses. *Take of Damask or Musk Roses what quantity you please, bruise them, express the Juice, from which draw a Spirit, which rectify; then impregnate it with so much of the Essential Oil, and Fix'd Salt of Roses, as the Body of the Spirit will Receive; to which, if you please, you may add a small proportion of Ambergrise and Musk.* This Medicine *Daniel Horstius* Commends to the Skies, in respect of which, the most benign Purges, as *Rheubarb*, *Sena*, *Cassia*, *Manna*, says he, are a kind of Malign Poison; for this Medicament, is as well as Cathartick, both Cephalick and Cordial; and from its fragrancy, and most incomparable Odor and Sweetness, comforts both Heart and Brain. It may safely be given to the least Infant, to Women with Child, and the most delicate of all Persons. It is Dedicated to Kings, Princes, Noble-Men, and Great Ladies. It is most powerful in all dejections of the Mind: it cools and comforts the Animal Spirits: it is most prevalent against Swooning Fits, the Epilepsy, Vertigo, Carus, Lethargy, and Suffocation of the Womb. It revives all the Spirits Natural, Vital, and Animal, and is one of the greatest preservatives against the Plague or Pestilence; fortifying the Heart, and defending it against all manner of Poison, Infection, and Pestiferous Atoms. It may be used in all Diseases where Purging is required, for it easily, safely, and pleasantly evacuates all noxious Humors. All other things seem unpleasant, being compared to it, because in its Taste and Odor, it exceeds every other Medicament. Dose is from 2 Drams to half an Ounce or more, in a Glass of Generous Wine, in the Morning Fasting, walking up and down the Chamber after taking it.

CHAP. DCII.

Of ROSE Wild; *OR,* BRIAR-BUSH.

I. *THE Names.* It is called in *Greek*, Ῥόδον ἄγριον, ϗ κυνόῤῥόδον: in *Latine*, *Rosa Sylvestris*, *Rosa Canina*: and in *English*, the *Wild Rose*, *Briar Rose*, and *Dog Rose*, or *Canker Rose*.

II. *The Kinds.* These twelve following Species are found with us, either growing *Wild*, or else Nurst up in our *Gardens*, but being *Wild Plants* in their own Native Countries, *viz.* 1. *Rosa Sylvestris inodora*, *Rosa Canina communis*, Our common Wild Briar Bush. 2. *Rosa Sylvestris Flore odorato carneo*, The Wild blush Briar Rose. 3. *Rosa Sylvestris Russica*, The Muscovia Briar. 4. *Rosa Sylvestris Virginiensis*, The Virginian Briar Rose. 5. *Rosa Campestris Flore albo odoro*, The Sweet white Briar Rose. 6. *Rosa Sylvestris Austriaca Flore Phœnicco*, The Vermilian Briar Rose of Austria. 7. *Rosa pumila rubra Austriaca*, The Dwarf red Briar Rose of Austria. 8. *Rosa Sylvestris pomifera major*, The greater Apple Briar Rose. 9. *Rosa Sylvestris pomifera minor, sive Rosa Sylvestris Pimpinella*, The small Apple Briar Rose, *or* Burnet Briar Rose. 10. *Rosa Sylvestris pumila alba Rosa Campestris humilis alba*, The Dwarf white Briar Rose. 11. *Rosa campestris pumila sine Spina simplex*, The single Dwarf Briar Rose without Thorns. 12. *Rosa semper Virens*, The evergreen Briar Rose.

The Descriptions.

III. *The first, or* Our common Wild Briar Bush. *Has a Root which grows great, and runs far and deep into the Ground. It grows of it self in Hedges very high, with long, straight, upright, woody Stems, covered over with a grayish Bark, especially the older ones, which are set with sharp Thorns or Prickles up to the tops, but not so thick as the* Sweet Briar. *It has divers Leaves something larger, and not so green on the upper side, nor so grayish underneath, as the other; the middle Rib whereof has several small crooked Prickles, and without any Smell at all. The Flowers grow at the tops of the Branches divers set together, of a whitish blush color, made of five round pointed Leaves, something longer than those of the* Sweet Briar *or* Eglantine Rose, *and standing in such like Husks as they*

Rose-Bush Wild Common;
OR,
Common Wild Briar.

they, or other Roſes *do. After the Flowers are paſt, come the Fruit or Heps, ſomewhat long and round, which are firſt hard of a yellowiſh red, or of a reddiſh yellow color, or rather of a bright ſhining* Coral *color, which as they grow ripe, the color grows more perfect, and then the Pulp within, becomes perfectly ſoft and of a pleaſing acid Taſte. Within that ſoft Pulp is a Kind of hairy Down, within which the Seed is incloſed. Upon this* Wild Roſe Buſh *or* Briar, *as well upon the* Eglantine Buſh, *there ſometimes grows* Spongiola Plinij, *a Spongy Burr or Ball of Threads compoſed of many little roundiſh hollow Cells, each one of which, has for the moſt part a live Worm or Maggot in it.*

IV. *The ſecond, or* Wild bluſh Briar Roſe. *This is ſo like to the former, that it is ſcarcely to be diſcerned from it, either for the height of the Stem, or great ſtore of Prickles, or ſmallneſs of the Leaves; but only by the Flowers, which are ſomething larger, and of a deeper bluſh, or pale purple color, and ſomething ſweet withall.*

V. *The third, or* Muſcovia Briar Roſe. *This* Wild Briar *has ſeveral reddiſh yellow Stalks riſing from its Root, ſpotted or rather bunched out as it were with Bliſters in ſeveral places, with Prickles thereon like the firſt* Common Briar *or* Wild Roſe. *The Leaves are not many, but ſmall like the* Common Wild Hedge Briar, *or rather ſmaller, and turning red in* Summer. *The* Roſes *are ſingle and ſmall, of a deep incarnate color.*

VI. *The fourth, or* Virginia Briar Roſe. *It has ſeveral as large Stems and Branches as any other* Wild Roſe, *whoſe young ones are green, and the elder grayiſh, ſet with many ſmall Prickles, and a few great ones among them. The Leaves are very green, and ſhining, ſmall, and almoſt round, many ſet on a middle Rib, one againſt another, ſomething like unto the* Single yellow Roſe. *The Flowers grow at the tops of the Branches, conſiſting of five ſmall Leaves of a pale purple, or deep incarnate color, like unto thoſe of the* Sweet Briar, *which fall away quickly, as they and others do.*

VII. *The fifth, or* Sweet white Briar Roſe. *It has woody Stems, about three Feet high, ſet as thick with ſharp Prickles, as either the* Common Wild Briar *or* Eglantine *is: and ſet with like Winged Leaves, but not ſo green. At the tops of whoſe green Branches ſtand uſually but one Flower apiece, conſiſting of five white Leaves, reaſonable large, and of a ſweet Smell, with ſeveral yellow Threads in the middle. Theſe being paſt away; the Heps (ſuch as in the former) come in their places, ſaving that theſe are black when they are ripe, and not yellow, containing within them a kind of Hairy Down, in which the Seed is incloſed.*

VIII. *The ſixth, or the* Vermilian Briar Roſe of Auſtria. *The younger Branches of this* Roſe Buſh *are ſlender and reddiſh, the elder of a browniſh gray, ſet with ſeveral Prickles, but not very thick, great or ſharp. The Leaves are ſomething larger than thoſe of the* Single yellow Roſe, *elſe not much unlike. The Flowers are ſingle, as large as thoſe of the* Yellow Roſe, *of which this is thought to be a Species, but differing in color, this being of an excellent* Orange *tawney color, with an Eye of Vermillion caſt over it, and of a paler yellow on the out ſide, after which (being paſt away) the Fruit ſucceeds.*

IX. *The ſeventh, or* Dwarf red Briar Roſe of Auſtria. *It grows ſcarcely two Feet high, with ſlender green Stems, ſet with few or no Thorns below, but repleat up higher with many, having whitiſh green Leaves upon them like the* Common red Roſe, *and grayiſh underneath, five or ſeven ſet together upon a Stalk. At the tops of the Branches, come forth very great bearded Husks, wherein are contained the Flowers or* Roſes, *which are large, and conſiſting of five Leaves apiece, ſomething ſweet; red at the firſt, but when decayed with ſtanding, growing much more pale, before they fall away, with yellow Threads in the middle. After the Flowers the Fruit or Heps ſucceed, which are red as the others, but greater than any of the former, and made more in the faſhion of a* Pear, *than any of them.*

X. *The eighth, or* The greater Apple Briar Roſe. *Its Stock or Stem is great, covered with a darkiſh gray Bark, but the younger Branches are ſomething reddiſh, armed here and there with great and ſharp Prickles, but nothing ſo great or plentiful as in the* Eglantine, *altho it be a* Wild Kind. *The Leaves are of a whitiſh green color, almoſt like unto the firſt* White Roſe, *and five always ſet together, ſeldom ſeven. The Flowers are ſmall and ſingle, conſiſting of five Leaves, without any Smell, or very little; and but a little bigger than thoſe of the* Sweet Briar Buſh, *and of the very ſame deep bluſh color; every one of them ſtanding upon a rough or prickly button, Bearded in the manner of other* Roſes; *which when the Flowers are fallen, grow great, ſomewhat long and round,* Pear *fashioned, bearing the Beards on their tops; and being full ripe are red, keeping the ſmall Prickles ſtill on them; with a ſoft Pulp, in which is contained many white hard and roundiſh Seeds, like unto thoſe of the* Eglantine Heps. *The whole Plant conſiſts more in the graceful appearance of thoſe Apples or red Fruit, hanging on the Branches, than in the Flowers, or any other parts thereof; for the beauty of which, it has been brought into* Gardens.

XI. *The ninth, or* Small Apple Briar Roſe, *or* Burnet Briar Roſe. *This ſmall* Roſe *ſeldom riſes above a Foot high, being of two ſorts, whereof the one has but few Prickles on its Stalks; and the other full of ſmall Prickles (both which are oftentimes found in one Ground, but the very prickly, the more frequent.) ſet with long winged Stalks of Leaves, being many ſmall round greeniſh Leaves ſet one againſt another upon a middle Rib, finely dented about the edges, ſeeming much like to a* Burnet *Leaf, for the form and number ſet together, from whence came one of its Names. The Flowers are ſingle, ſmall and white, without Smell; after which come ſmall round Heads, which are black when they are full ripe, and full of Seed, as in the Heps of other* Roſes.

XII. *The tenth, or* Dwarf white Briar Roſe. *Its Root creeps more than the reſt, and it is one of the ſmalleſt* Roſes, *ſcarcely riſing a Foot high, being ſet with ſmall Prickles; and with Leaves alſo, according to the proportion of the Plant, and the wildneſs of the Kind. The Flowers are white and ſmall, giving Heps, or Fruit and Seed, like the reſt.*

XIII. *The eleventh, or* Single dwarf Briar Roſe without Prickles. *It grows very low, even almoſt upon the Ground, with green Stalks without any Prickles on them, and ſet with ſmall winged Leaves, ſo ſmall that they ſcarce ſeem to be Leaves of a* Roſe. *The Flower is ſmall, ſingle, and of a pale reddiſh color; very ſweet in ſome Soils, and as it were without Scent in others; and Flowering in ſome places both in the* Spring *and* Autumn.

XIV. *The twelfth, or* Ever-green Briar Roſe. *It is a Buſh very like to the* Wild ſingle Eglantine, *as having many very long green Branches, but more ſlender and weak; ſo that many times they bend down again, not being able to ſuſtain themſelves without ſome help, and armed with hooked Prickles, as other* Roſes *be. The winged Leaves conſiſt of ſeven ſmaller Leaves for the moſt part, of which ſome two, which are loweſt and oppoſite, are ſmalleſt; the next two bigger than they; the higheſt couple bigger than any of the former, and the end*

Leaf largeſt of all. This proportion it generally holds in every winged Leaf through the whole Plant, which at the firſt coming forth are ſomething reddiſh, with the young Branch which ſhoots out with them; but being full grown, are of a deep green color, ſomewhat ſhining withall, and dented about the edges, which fall not away from the Branches, as other Roſe *Leaves do, but abide thereon, for the moſt part all the* Winter. *The Flowers grow four or five together at the tops of the Branches, being ſingle, conſiſting of five Leaves apiece, of a pure white color, much larger than the ordinary* Musk Roſe, *and of a pleaſing Smell, having many yellow Chives or Threads in the middle.*

XV. *The Places.* The two firſt grow in the Hedges almoſt every where throughout all *England*, but the ſecond not ſo frequent as the firſt. The third came from *Muſcovy*, where it is a Native. The fourth from *Virginia*. The fifth from *Germany*, where it grows Wild in many places. The ſixth and ſeventh was brought to us out of *Auſtria*. The eighth grows, (tho' a Wild Plant in other Countries) with us only in *Gardens*. The ninth is found growing in many Barren and Heathy Grounds by Woods and Hedge ſides, in many parts of this Kingdom. The twelfth, as alſo the third, fourth, fifth, ſixth and ſeventh, (tho' growing Wild in their Native places) yet are Inhabitants with us only in our *Gardens*.

XVI. *The Times.* Some of theſe *Roſes* appear earlier than others, but generally from the end of *May* to the middle of *Auguſt*, and ſometimes longer, according as the Seaſons may prove favourable.

XVII. As to their *Qualities*, *Specification*, *Preparations* and *Virtues* of theſe *Wild Roſes*, they are much the ſame with thoſe of *Red Roſes* in the former Chapter, tho' indeed they are ſeldom or never uſed in Phyſick: however there are ſome other parts of the *Wild Roſe Buſh*, whoſe particular Virtues Authors have taken ſome notice of, *viz.*

XVIII. *The Preparations.* 1. *A Decoction or Infuſion of the Root of the Common Wild Briar.* 2. *A Pulp, or Conſerve of the ripe Heps of the ſame.* 3. *A Pouder made of the ſame Pulp.* 4. *A Pouder of the Briar Balls.*

The Virtues.

XIX. *The Decoction or Infuſion of the Root in Wine.* The Bark of the Root is to be ſhaved or ſcraped very thin, or finely, whilſt freſh and green; and then to be Infuſed or Decocted in Wine 3 or 4 Ounces of it to a Quart. *Pliny Lib.* 8. *Cap.* 4. ſays, that it is good to cure the Biting of a Mad Dog; I ſuppoſe inwardly taken for ſome time, and alſo to be outwardly applyed.

XX. *The Pulp of the ripe Heps.* The *Pulp* is generally uſed whilſt it is freſh: but if it is done for keeping, it muſt be made into a *Conſerve* with Sugar. It is moſt pleaſant and delectable to the Taſte, helps Digeſtion, ſtops Catarrhs, Spitting and Vomiting of Blood, and gently Binds the Belly.

XXI. *The Pouder of the Pulp* It is made of the Inſpiſſate Pulp of the ripe Heps. Taken in Styptick Red Wine, it is good againſt a *Diabetes*; ſtops all Fluxes of Blood whether upwards or downwards; all Fluxes of Bowels, as alſo the overflowing of the Terms, and the Whites in Women. Doſe from 1 to 2 Drams.

XXII. *The Pouder of the Briar Balls.* Being Drank in White *Port* Wine, or in *Mead*, or rather in the *Infuſion of Lignum Nephriticum*, it powerfully provokes Urine, expels the Stone, Sand, Gravel, and Tartarous matter out of the Reins and Bladder, and gives eaſe in the Strangury and Colick; it alſo kills Worms in the Belly and drives them forth. Doſe from half a Dram to a Dram and half. The Balls are firſt to be well dryed in an Oven, and then the whole, *viz.* Worms or Maggots and all which are within them, are to be reduced to a Pouder by beating in a Mortar.

CHAP. DCIII.

Of ROSMARY.

I. *THE Names.* It is called in *Arabick*, ***Elkia gaber:*** in *Greek*, ***Λιβάνωτις στεφανωματικὴ, Libanotis Stephanomatike:*** in *Latine*, ***Libanotis Stephanomatice***, or *Coronaria*, which Epithite is added to the *Libanotis*, to diſtinguiſh it from the other *Libanotides* which are Umbelliferous Plants: it is alſo called ***Roſmarinus***, and ***Roſmarinum:*** in *Engliſh*, *Roſmary.*

II. *The Kinds.* Formerly there was but one Species known, but now there are more, as, 1. *Libanotis Coronaria* (becauſe it is uſed in Garlands) *Roſmarinum Vulgare*, Our common Roſmary. *Dalechampius* on *Pliny*, takes it to be the *Caſia nigra Theophraſti:* and *Anguillaria*, will have it to be the *Caſia Higini*, acceptable to Bees, and therefore Sown near their Hives. *Geſner in Hortis*, calls it *Roſmarinus minor.* 2. *Roſmarinum ſtriatum, ſive aureum*, Gilded Roſmary. 3. *Roſmarinum latifolium; Roſmarinus major Cordi; Roſmarinus alter Geſneri*, Broad Leav'd Roſmary. To theſe you may add, 4. *Roſmarinum Sylveſtre noſtras*, our Wild Roſmary.

The Deſcriptions.

III. *The firſt, or* Our common Roſmary, *has a long woody Root, ſpread out into many Arms or Branches, with a great number of Fibres adjoining to them, of a browniſh color on the out ſide. It ſprings up with a woody Stem, of cloſe, firm, compact Subſtance, and whitiſh, which in time grows up to a great height. It has been well obſerved to grow in divers places of our own Land (as well as in* Spain *and other Foreign Countries, where it is a Native) to grow to the Body of a Tree of a conſiderable magnitude, fit to make Inſtruments of, being cut into long thin Boards for that purpoſe. I ſaw 6 ſuch large bodied* Roſmary Trees, *when I was a Boy, of about* 8 *Inches or more Diameter, and above* 2 *Feet round in the Body, which was ſtraight, and about* 7 *or* 8 *Feet high, with fair, large and ample Heads, with their Arms and Branches, in proportion to thoſe Bodies, theſe grew in the* Garden *of one Mrs.* Wormal, *in* Kings-Lyn, Norfolk, *Living in the Street near to the* South Gate. *However in thoſe Plants, which grow not to ſuch a prodigious Magnitude, the Stem is great and woody, of a cloſe and fine Grain, branching it ſelf forth into ſeveral Arms, and from them again into many other ſmaller Branches, and thoſe again into a vaſt number of yet ſmaller and ſlender Twigs: at the Joints whereof are ſet at ſeveral diſtances, many long and very narrow Leaves, green above, and grayiſh underneath,*

neath, and with them all along the Stalks, towards the tops, many small gaping Flowers, of a pale bleak blewish color, standing in whitish Husks; the Seed is small and reddish, which being Sown with us will grow admirable well, and thrive afterwards, if care

Rosmary Common.

be taken of it the first Winter *after it is Sown, and until it is grown up to some considerable bigness and strength. I have Sown whole Beds with the Seed, which has come up like an ordinary Herb, and being Transplanted and kept in order, has in time come to the common or ordinary Stature and Magnitude of* Rosinary; *but I am apt to believe, it might be kept to be a Dwarf Plant like to our* Dwarf Box. *But our usual way of encreasing the Plant here in* England, *is by slipping it, and setting those Slips, I seldom ever found them to fail growing. The whole Plant, especially when in its Flowering time, is of a pleasing, subtil, sharp, and volatile Smell, and exceeding sweet.*

IV. *The second, or* Gilded Rosmary. *This in its Roots, Woodiness, Body or Stem, Arms, Branches, Leaves, Flowers, and Seed, magnitude, manner and form of growing, differs not at all from the former, but only in the color of the Leaves, which in this are edged or striped, or pointed, with a fair Gold yellow color, which so continues all the Year throughout, yet fresher in* Summer *than in* Winter.

V. *The third, or* Broad Leav'd Rosmary. *This also grows like the former; and tho' it grows very large in its Leaves, with us here in* England, *yet it grows not so great, nor with such woody Branches, as it does in* Spain, Italy, *and other hot Countries. where it is a Native; and withall, with us, it is more tender to be kept. The Leaves are larger, and of a more deep shining green color on the upper side, and little or nothing whitish underneath, more thinly also, or sparsedly set on the Stalks; but its Flowers and Seed are altogether the same in form, magnitude, and color, with the two former.*

VI. *The fourth, or* Our Wild Rosmary. *This* Our North-Country *Plant, grows not to be so high as the former, and has smaller Leaves, nothing so great and long as* Rosinary *Leaves, but thicker and shorter; of a dark green shining color above, and of somewhat a yellowish green underneath, which grew very sparsedly on very slender and pliant blackish green Twigs; at the tops of which grew the Flowers, not out of Scaly Heads but of a reddish color; the whole Plant is either scentless, or the Smell is so small that it is scarcely to be perceived*

VII. *The Places.* The first three are Natives of *Spain, Italy, France, Greece, Asia,* and other hot Southern Climates; and are now also become Natives with us here in *England*, and grow also admirably well in our Plantations in the *West Indies*, where they come to a greater Perfection than they do with us in our more Northern Climate. They grow also in *Germany*, *Denmark*, and other Northern Countries, but will not live or abide, in many of those Northern places, unless Housed in *Winter*, and kept in Stoves. The fourth grows in *England*, in several places of *Lincolnshire* and *Yorkshire*, and other parts bordering upon them, from whence it has been brought, and introduced into some *Gardens*, more for its novelty, than for any special use it has. *The Gilded or Silvered Rosmary*, ought to be Planted in the most Sunny parts of the *Garden*, for the more they are exposed to the Sun, the better they will be Striped or Marked, and the more Florid they will grow.

VIII. *The Times.* The three first Flower sometimes in *April*, but always in *May*; and sometimes again in *August*: and the Seed is ripe not long after. They are encreased also by setting the Slips in *March*, and afterwards again, in the end of *August*. The *Wild Rosmary*, Flowers in *June* and *July*. *Gerard* says, that it was found by Mr. *Hesketh* in a Field called *Little Reed* among *Hurtle Berries*, near to a small Village called *Maudsley* in *Lancashire*, and that it is called by *Cordus*, *Chamæpeuce*.

IX. *The Qualities.* The last or fourth is scarcely ever used in Physick: the first three have all of them, the same *Qualities*, *Virtues*, and *Operations*, and are said by Authors to be hot and dry in the third Degree: Anodyn, Aperitive, Attractive, Carminative, Cosmetick, Digestive, Discussive, Cephalick, Neurotick, Stomatick, Pectoral, Cordial, Hysterick, Arthritick, Emmenagogick, Sudorifick, and Alexipharmick.

X. *The Specification.* It prevails against the Head-ach and Megrim, from a cold cause; the Vertigo, Lethargy, Epilepsie, Apoplexy, Palsy, Convulsions, Catarrhs, Drowsiness, Dullness of the Senses, Loss of Memory, coldness of the Stomach, stinking Breath, Wind, in the Stomach and Bowels, Dimness of the Sight, Jaundice, Obstructions of the Terms, Gout from a cold cause, all external pains and aches from a cold and moist cause, Lameness, Numbedness, Weakness of the Joints; and in Contagious times, prevails even against the Plague it self and all Contagious and Infectious Diseases.

XI. *The Preparations.* You may make therefrom, 1. *A Juice or Essence of the Leaves and Flowers.* 2. *A Decoction or Infusion of the Leaves and Flowers.* 3. *A Pouder of the Leaves and Flowers.* 4. *A Conserve of the Flowers.* 5. *An Insolated Oil of the Leaves and Flowers.* 6. *A Smoak or Fume.* 7. *A Tincture of Leaves and Flowers* 8. *A Distilled Water.* 9. *Hungary Water.* 10. *A Chymical Oil.* 11. *Potestates or Powers.* 12. *A Spirit.* 13. *An Elixir.*

The

The Virtues.

XII. *The Juice or Essence.* They Warm, heat and comfort the Stomach, helping all cold Diseases thereof, as also of the Head, Lungs, Liver, Spleen, and Belly: they are good against all cold Diseases of the Head, Brain, Nerves and Womb, as Vertigo, Dullness, Drowsiness, Lethargy, Carus, Stupidness of the Senses, loss or hurt of the Memory, Dumb Palsie, or loss of Speech, Falling-sickness, Palsie of the Head and extream parts, Convulsions, coldness and weakness of the Womb, Whites, and other Distempers of those Parts. Dose one Spoonful more or less, Morning and Night in a Glass of Wine.

XIII. *The Decoction or Infusion.* These have the Virtues of the former if made in Milk, Whey, or Wine, but nothing near so powerful, and therefore may be taken in four, five, or six times the quantity. They are comfortable to the Stomach in all cold griefs thereof, quicken the Senses, and are good against Loathing and Vomiting, Coughs, Colds, Wheezing, shortness of Breath, Asthma, and expel Wind out of the Stomach and Bowels, Hypochondriack Melancholy, and ease passions of the Spleen. They are good for such as are Liver grown, and open the obstructions there of, by warming its coldness, extenuating the grossness of Humors afflicting it, and withal strengthening it: They are said also to cure the Yellow Jaundice.

XIV. *The Pouder of the Leaves and Flowers.* It has all the Virtues of the *Juice*, *Essence*, *Decoction* and *Infusion*, but exerts not its Power or Effects so soon as they do. It may be given to a Dram every Morning Fasting, and last at Night going to Bed, either mixed with a little Honey, or some proper *Syrup*, as *Syrup of Citron Peels*, or in a Glass of Wine, or some other proper Vehicle.

XV. *The Conserve of the Flowers.* It is an excellent Cephalick, and Stomatick, and has all the Virtues of the *Pouder*, and may be given to 2 or 3 Drams, Morning and Evening, Drinking after it, a Glass of Generous White Port, or *Lisbon* Wine, or Canary.

XVI. *The Insolated Oil of the Leaves and Flowers.* It may be made the common way by *Insolation* or *Decoction*: but *Parkinson* teacheth us to make it after this manner. *Take what quantity you will of the Flowers, and put them into a strong Glass, which stop close, and digest in hot Horse Dung for* 14 *Days; which then being taken forth of the Dung and unstopped, tye a fine Linnen Cloth over the Mouth of the Glass, and turn the said Mouth into the Mouth of another strong Glass, which being set in the Sun, an Oil will distil down into the lower Glass, which is to be kept and preserved as a precious thing for many Uses both inward and outward.* It is good for the cure of all the Diseases before spoken of, and may be given from 8 to 16 Drops first dropt into Sugar, and then mixt with a Glass of choice Wine, or any other fit Vehicle, and so to be taken Morning and Evening. It has been found by experience to clear a dim Sight, to cure the Palsie and Lethargy, and to take away Spots, Marks, and Scars of the Skin.

XVII. *The Smoak or Fume.* The dryed Leaves shred small, and taken in a Pipe, like as *Tobacco* is taken, is profitable for such as are troubled with Catarrhs, or Distillations of Rheum, or Vehement Coughs, Asthma's, Consumptions, *&c.* for it warms and comforts the parts, dryes up the thin Rheum, which causes those Diseases, and helps to restore the weakned and decayed parts.

XVIII. *The Tincture of the Leaves and Flowers.* It has all the Virtues of the *Essence* and *Infusion*, and may be given in a Glass of Wine, or other fit Vehicle, from half a Spoonful to a Spoonful Morning, Noon and Night. It is also an excellent thing to bath withall, any pained, weak, cold, benumed, trembling, or Paralytick Member; and is profitable against a cold Gout, being applyed to the part, and in an especial manner to be taken inwardly, if it be found to have seiz'd the Stomach, and to make approaches thereto.

XIX. *The Distilled Water.* It is good against sickness and pain at Stomach, and clears the Eye Sight, the Eyes being oftentimes in the Day time washed therewith. You may therewith make an excellent *Eye Water*, after this manner. *Take Water distilled from Rosmary Leaves and Flowers a Quart; Common Spirit of Wine a Pint and half; Clarified Hony* 4 *Ounces; Madder Roots* 6 *Ounces very well bruised; Alum half an Ounce; mix and infuse in a cold Digestion close stopt for a Month, shaking the Glass every Day; then being perfectly settled and fine, Decant the clear Water, and keep it for Use.*

XX. *Aqua Hungarica*, The Hungarian Water. *Take Rosmary Flowers gathered a little after the rising of the Sun a Pound; put them into a double Vessel and affuse on them a Pint and half of Alcoolis'd or Tartariz'd Spirit of Wine, lute exactly the Joints, digest in a gentle heat for* 3 *Days, then distil with a Copper Vesica or Alembick Tin'd within, in Balneo to driness; so have you in the Receiver a subtil Liquor, which is, the Queen of Hungaries Water.* It prevails against all cold and moist Diseases of the Head, Brain, Nerves, Stomach, Heart, Lungs, Spleen, Womb, and other Viscera; as Apoplexies, Epilepsies, Convulsions, Cramps, Numbness, Palsies, Tremblings, weakness of the Nerves and Joints, Head-ach, Megrim, Vertigo, Carus, Lethargy, Sleepiness, and dimness of Sight. It comforts the Head and Brain, refreshes the Senses, chears the Heart, resists Poison, and revives all the Spirits Natural, Vital, and Animal. It is good against Palpitation, Fainting and Swooning Fits, Sickness at Heart and Stomach, stinking Breath, Indigestion, want of Appetite, and other defects of those parts. It opens obstructions of Liver, Spleen, and Womb, and is an excellent thing against the Jaundice. It is good against the most vehement Catarrhs, cold Rheums, windy Gouts, Rheumatisms, old Aches and Pains in any part of the Body, especially those of the Back and Loins. It is famous against Griping of the Guts, the Colick, Wind and sharp or acrimonious Humors in the Stomach and Bowels. It provokes Urine and the Terms, and facilitates both Birth and After-birth. It warms, comforts, and strengthens all parts weakned by cold and moisture, hard Labor, or overe straining, or that have been hurt by any Fall, Bruise or Wound. It causes Watchfulness, and takes away Drowsiness, strengthens the Nerves powerfully; and is said to be a Specifick in After-Pains, the Palsie, Cramp, and other like Infirmities. It preserves Health, and keeps back Old Age, making those who take it, to look always young. It is good against the bitings of Mad-Dogs, Serpents, or Vipers, or other Venomous Creatures, and is an absolute Antidote against the Malignity of the Plague, or any Malign and Pestilential Fever, being an excellent preservative in all Infectious Times and Places. It is prevalent against the Pleurisy, for it attenuates thick Humors, digests Crudities, opens Obstructions, dissolves Congelations, and provokes Sweating. And being given in a large Dose about 2 Hours before the coming of the Fit of an Ague, it has been often found to Cure it. It

takes

takes away by long using it, all manner of Pimples, Scurf, Morphew, Sunburnings, or any other discolorings of the Skin, as also Scurvy Spots, Herpes, and other breakings out, by bathing the Skin therewith. It is not harmful as other Washes are, which are made of *Mercury*, but it makes the Skin so incomparably pure and clear, and so frees it from all its Deformities and Defects, that it is not much inferor to any other *Cosmetick* whatsoever. Dose is from 50 to 80 drops, more or less, 2 or 3 times a Day or oftener, in a Glass of Generous Wine, Sack Whey, Posset Drink, Ale, Beer, or other Liquors which the Sick drinks, continuing its use for some Weeks, or Months, as you see occasion. Outwardly bath the parts pained or hurt, therewith twice a Day, Morning and Evening, and continue it for 10, 15, or 20 Days or more, if need requires.

XXI. *The Chymical Oil.* It is drawn from the Leaves and Flowers, as you draw the *Chymical Oil of Lavender, Sage, Savin, &c.* thus, *Take of dryed Rosmary Leaves, Flowers and Tops 2 Pounds; Spring Water 15 Quarts: digest them 24 Hours, and distill in a great Alembick with its Refrigeratory; or a Copper one with its Worm running through cold Water; so have you Water and Oil, which you may part by the help of a Funnel, or separating Glass; the separated Water may serve for a New Distillation, which then will yield the more Oil; you may take 2 or 3 of the first Pints of Water, to keep for Rosmary Water. The Oil may be drawn out of the Rosmary fresh gathered.* It strengthens the Brain and Memory, fortifies the Heart, resists Poison, and cures all sorts of Agues. It is absolutely the greatest strengthener of the Sight, and restorer of it also, if lost, of any thing in the World, it makes the Heart merry, and takes away all fooliſh Fantasms from the Brain. It eases the Tooth-ach, and all pains from a cold Cause, and removes the causes hindring Conception, and has indeed not only all the Virtues of the *Hungarian Water* beforegoing, but also of the *Potestates* or *Powers* following. Dose *à gut.* 4 *ad* 10 dropt into Sugar, and to be taken in any proper Vehicle, as you take other *Oils.*

XXII. *Spiritus Rosmarini*, Spirit of Rosmary. It is good against all cold Diseases of the Head, Brain, Nerves, Joints, Stomach and Womb, prevails against Rheumatisms, cold Gouts, and pains of the Head arising from Flegm, or any cold Cause. It is good against the Vertigo, and Lethargy, strengthens the Memory and Eye Sight, helps Deafness, and stifles Noises in the Ears. It opens obstructions of the *Viscera*, revives and preserves the Natural heat, and restores the Functions of all the parts of the Body. Dose from 1 to 2 Drams or more, Morning and Evening in any *Cordial Water.*

XXIII. *Potestates Rosmarini*, Powers of Rosmary. *They are made in all respects of the Leaves, Flowers and Tops, as are the Powers of Lavender; uniting the perfectly deflegmated Spirit of Rosmary with its Volatile Oil before Named, and Salt; by Digestion, Circulation, and a repeated Distillation.* Where Note, *The greatest part of the Volatile Salt rises, and mixes with the Spirit and Oil by Distillation; nor is there the tenth part of the Fixt Salt left in the Fæces, which after Calcination may be drawn forth, as you do Salt of Tartar. And that remaining part after putrefaction of the Fæces may, by many Cohobations of the Spirit be wholly drawn forth, and made to ascend, without any Calcination at all. This is evident, for that after Incineration, they will yield no Fixt Salt of any Kind, without very much Labor; and then it will be a quantity very inconsiderable, not being the twenteith part of what might have otherwise been extracted.* This is a Medicine of wonderful Virtues, nor do I know how to praise it enough, my perpetual use thereof, has given me large satisfaction, as to its Excellency, which is indeed above the Force or any ordinary Remedy. It prevails against all cold and moist Diseases of the Head, Brain, Nerves, Stomach, Heart, Womb, and other *Viscera*, as Apoplexies, Epilepsies, Convulsions, Cramps, Palsies, Tremblings, Numbness, and other Diseases of those parts: and indeed it has all the Virtues of the *Spirit, Oil*, and *Hungarian Water*, but in a ten times more exalted Degree. Dose from 30 to 60 Drops, Morning and Night in Wine, or some *Cordial Water.*

XXIV. *Elixir Rosmarini*, Elixir of Rosmary. This has all the Virtues of the *Potestates, Spirit, Oil*, and *Hungary Water*, Elixirated, or yet more Exalted, even to the highest Sublimity; and may be taken Morning and Night, or oftner if need requires, from 20 to 50 Drops in Wine, or some other proper Vehicle.

CHAP. DCIV.

Of RUE Garden *and* Wild.

OR,

HERB-GRACE.

I. *THE Names.* It is called in *Arabick, Sadel:* in *Greek*, Πήγανον, *Peganum, quia caliditate, semen genitale coagmentat:* in *Latine, Ruta:* and in *English, Rue*, and *Herb-Grace.*

II. *The Kinds.* There are many Plants called by the Name of *Rue*, with certain Epithites, which are not *Rue*, nor any of the Kindred thereof. Those which we shall take notice of in this Work, are only these following, *viz.* I. *Ruta Hortensis*, Garden Rue. II. *Ruta Sylvestris*, Wild Rue, of both which we shall treat in this Chapter. III. *Ruta Pratensis*, Meadow Rue, of which in *Chap.* 605. IV. *Ruta Capraria, Galega*, Goats Rue, of which in *Chap.* 606 following.

III. *The Kinds of the Garden and Wild sorts.* Of the *Garden Kinds* there are three Species, *viz.* 1. *Ruta Hortensis major, Ruta Communis, Ruta Sativa, Ruta Domestica, Ruta Latifolia, vel major*, Our common Garden Rue. 2. *Ruta Deaurata*, Gilded Rue. 3. *Ruta Hortensis minor Tragi; Ruta Sativa minor, & Ruta Tenuifolia Cordi; Ruta grave Olens Dodonæi*, The lesser Garden Rue. Of the *Wild Sort*, there are also these Kinds Nurst up in our *Gardens, viz.* 4. *Ruta Sylvestris major Matthioli, Lobelij, Lugdunensis, aliorumque*, The greater Wild Rue. 5. *Ruta Sylvestris minor, Rutula Lobelij; Peganum Sylvestre; Ruta Sylvestris Secunda Dodonæi*, The smaller Wild Rue. 6. *Harmala, Basasan, Ruta Sylvestris Syriaca*, Wild Assyrian Rue.

The Descriptions.

IV. *The first, or* Our Common Garden Rue. *It has a Root which is white and woody, spreading far about in the Ground, and abiding many Years. It grows up with hard woody Stalks, Branching forth on all sides, and bearing thereon several long* Leaves,

Rue Garden.

Leaves, divided into other ſmall ones; being ſomewhat thick and round pointed, of a dark blewiſh green color. The Flowers which grow at the tops, conſiſt of 4 ſmall Leaves which are yellow, with a green Button in the midſt, compaſſed about with ſeveral ſmall yellow Threads, which growing ripe, contains within it ſmall black Seed.

V. *Gerard* gives us a more ample Deſcription of it in theſe Words. *Its Root is woody, and faſtned with many Strings: and is a Shrub full of Branches, now and than a Yard high, or higher. The Stalks whereof are covered with a whitiſh Bark, but the Branches with a more green. The Leaves hereof conſiſt of divers parts, and divided into Wings, about which are certain little ones, of an odd number, ſomething broad, more long than round, ſmooth, and ſomewhat fat of a gray color, or greeniſh blew. The Flowers in the tops of the Branches, are of a pale yellow, conſiſting of four little Leaves, ſomething hollow: in the middle of which ſtands up a little Head or Button four ſquare, ſeldom five ſquare, containing as many little Cells, as it has corners, being compaſſed about with little yellow Threads, in which little Cells the Seed is contained. The Leaf is of a very ſtrong and rank Smell, and has a biting Taſte.*

VI. *The ſecond*, or Gilded Rue. *This in its Roots, Stalks, Branches, form of the Leaves, Flowers, Seed, Magnitude, and manner of growing, is exactly the ſame with the former, ſaving only in the color of the Leaves, which are moſt of them gilded on the edges, or at the ends; ſome of them are wholly green, ſome wholly gilded or of a yellow color, and ſome of them part green, part gilded, either on the edges or ends, or both, as before expreſſed,*

VII. *The third*, or Leſſer Garden Rue. *Its Root is white, woody, and ſtringy, ſpreading it ſelf abroad under the Earth, like the firſt ſort. This whole Plant is ſo like to the* Ordinary *or* Great Garden Kind, *that if not heedfully minded, it may eaſily deceive the beholder. It riſes up not ſo high, nor has it ſo great a Stalk: The Leaves are very like to the* Greater Garden Kind, *but that they are ſmaller, and of a blacker or darker green color. This more ſeldom gives any Flowers with us; nor is the Smell thereof ſo ſtrong, nor the Taſte altogether ſo bitter, as the other, and in theſe things conſiſt the chief differences. Some are of Opinion that this Plant is the firſt or greater ſort of* Wild Rue, *deſcribed in the next* Section, *Tranſplanted and Manured in* Gardens.

VIII. *The fourth, or* Greater Wild Rue. *This is in all things like unto the* Garden Rue, *but that the Leaves are ſomewhat longer and narrower, and*

Rue Wild.

their color darker, more tending to green. The Stalk is ſtrong and woody in its Native places of growth, much more than it is in theſe colder Climates, but riſes not fully ſo high, as our Garden Kind *does; and with us, it ſcarcely attains to any woodineſs. The Flowers are alſo yellow, compoſed of 4 yellow Leaves like unto it, having within them four ſquare Heads (ſometimes but three cornered) in whoſe Cells is contained the Seed like that of the* Garden. *The Leaves and whole Plant are of a more ſtrong and virulent Smell than our* Common Garden Kind.

IX. *The fifth, or* Smaller Wild Rue. *Its Root is long and woody; and the Plant is ſmall, yet like unto the former, ſaving that the Leaves hereof are much more finely cut than it, both ſhorter and ſmaller; but the Smell is as ſtrong, or rather ſtronger than the other; as alſo its Taſte and Qualities. The Stalk hereof, riſes not ſo high as the laſt deſcribed above, but Branches it ſelf out at the top, bearing ſmall yellowiſh Flowers, having four ſquare Heads with Cells therein, like the others, in which is contained ſmall Seed.*

X. *The ſixth, or* Wild Aſſyrian Rue. *Its Root is thick and ſomething yellowiſh, with ſeveral ſmall*

fibres

Fibres adhering to it. It rises up with many dark round green Stalks, about a Foot or more high, on which are set divers long Leaves, *divided into many parts, each of which is longer, thicker and greener than the former* Small Wild Rue, *but not of so strong or virulent a Smell and Taste, yet somewhat strong, and a little sharp and bitter. At the tops of the Stalks grow many Flowers, consisting of five white Leaves, larger than in any of the other sorts of* Rue. *In the middle whereof rises up a green triangular Head, compassed about with many yellow Threads: in the Cells of which is contained small brownish cornered Seed.*

XI. *The Places.* The first three grow only in *Gardens*. The fourth and fifth are Wild Plants, and grow upon the Mountains of *Spain* and *Italy*. The sixth grows in *Syria*, from whence it has been brought into our Northern Climates, as also about the Hedges near to *Constantinople*, as *Bellonius* says, in his *Observations*, *Lib.* 2. *Chap.* 5. But all these three *Wild Kinds* grow with us only in *Gardens*, where they are Planted and Nurst up with much care.

XII. *The Times.* The two first Flower with us in *July* and *August*, but in hot Countries earlier. The third, as also the 3 *Wild* sorts, scarcely ever bear good Seed here.

XIII. *The Qualities.* The *Garden Rue* is hot and dry in the end of the third Degree, and the *Wild Rues* are hot and dry in the fourth Degree. They are all of them of Thin and Subtil Parts; Aperitive, vehemently Attractive, Colmetick, Carminative, Digestive, Discussive, Diuretick, Cephalick, Neurotick, Splenetick, Nephritick, Hysterick, Ptarmick, Emmenagogick, Sudorifick and Alexipharmick. The *Wild Kinds* are so vehemently hot that they may be accounted almost amongst the Number of *Pyroticks*, being apt to raise Blisters, Wheals and other Accidents, for which reason they are seldom used in Meat or Medicine: Their violence is indeed scarcely tolerable, except for outward Griefs and Applications, for the *Epilepsy*, *Palsie*, *Gout*, *Sciatica*, *Rheumatism*, and the like, in all which Diseases they are more Powerful than the *Garden Kinds*: and if they should be taken inwardly by Women with Child, they would destroy the Birth, for which reason especially they ought to be avoided.

XIV. *The Specification.* The *Garden Kinds* provoke Urine and the Courses, bring away the Birth, and After-Birth, are Antidotes against Plague and Poison, destroy the Seed, and cause Barrenness, are good against Pains and Stitches of the Sides, the Pleurisy, Peripneumony; and the most vehement Cholick. They Expel Wind, and are good against Vapors, Hysterick Fits, Epilepsy, kill Worms in the Stomach and Belly and drive them forth, cure Agues, and are profitable against the Gout, and other pains of the Joints.

XV. *The Preparations.* You may make therefrom, 1. *A Liquid Juice.* 2. *An Essence.* 3. *A Decoction or Infusion in Wine.* 4. *A Pouder of the Leaves.* 5. *A Pouder of the Seed.* 6. *An Electuary.* 7. *A Counter Poison.* 8. *A Cosmetick.* 9. *A Collyrium.* 10. *An Errhine.* 11. *A Bath.* 12. *An Oil by Decoction or Insolation.* 13. *An Ointment.* 14. *A Cataplasm.* 15. *A Pickle.* 16. *A Distilled Water.* 17. *A Spirituous Tincture.* 18. *An Acid Tincture.* 19. *An Oily Tincture.* 20. *A Saline Tincture.* 21. *A Spirit.* 22. *An Oil Distilled.* 23. *The Potestates or Powers.* 24. *An Elixir.*

The Virtues.

XVI. *The Liquid Juice.* Being often taken to half a Spoonful or more, in fair water Liquor, or made up into a *Looch* with Honey, it destroys the Seed, and causes Barrenness: For it gives ease in the Colick, and Gripings of the Guts, and expels Wind. Eating all inward pains and ulcers of the Bowels and other *Viscera*. It eases pains and stitches in the Sides, helps the Pleurisy, and Inflammation of the Lungs, and given to a Spoonful for some few times 2 or 3 Hours before the coming of an Ague Fit, it is said to cure it: It is good against Weakness of the Womb, represses Vapors, and is prevalent against Fits of the Mother. It kills Worms in the Belly drank with Honied Water. And drops warm into the Ears, it eases their pain. Drank in *Parsly Water*, it gives ease in the Strangury, Stone, and stoppage of Urine.

XVII. *The Essence.* It has all the Vertues of the *Liquid Juice*, and is much more powerful to the purposes intended. It is said also to prevail against the Plague and all Pestilential Malignity, to cure the Epilepsy, Vertigo, Lethargy, and Megrim from a cold Cause. And is profitable against Coughs, Colds, Hoarseness, Wheezing, Asthma, and hardness of the Spleen, opening Obstructions of Lungs, Liver, Spleen, and Mesentery. Take from half a Spoonful to a whole Spoonful in any proper Liquor.

XVIII. *The Decoction and Infusion in Wine.* They have all the Virtues of the *Juice* and *Essence*, but in a less degree, and therefore may be taken Morning and Evening, to a quarter of a Pint at a time.

XIX. *The Pouder of the Leaves.* It has all they Virtues of the *Juice* and *Essence*, but operates not so speedily, because Nature must first Digest it and draw forth its Virtue in the Stomach: you may give it from a Scruple or 20 Grains, to a Dram, or 60 Grains mixt either with Honey or some proper *Syrup*.

XX. *The Pouder of the Seed.* Being given to a Dram or more in a Glass of Wine, it is an Antidote or Counter Poison, and prevails against all sorts of Poison, whether inwardly or outwardly received, and is good against the pernicious Consequences of dangerous Medicines; but this, as also the *Pouder of the Leaves*, consumes and destroys the Seed, and causes Barrenness being often and long taken.

XXI. *The Electuary.* *Take Pouder of the Leaves and Seeds of Rue, of each 2 Ounces; Cardamoms, Cubebs, Cloves, Nutmegs, Winters Cinnamon, of each in fine Pouder, 2 Drams; Virginia Snake Root, Contrayerva, Zedoary, Saffron, Cochenele, Thebean Opium, of each in fine Pouder, 1 Dram; Clarified Honey 16 Ounces; mix, and make an Electuary.* It is a singular good thing against the Plague and Pestilence, and all Malign and Pestilential Distempers; having the *Vertues* of the *Juice*, *Essence*, and *Pouders*. Dose from a Dram to 2 or 3 Drams, Morning and Evening, drinking a Glass of Wine after it.

XXII. *The Counter-Poison.* It was Invented by *Mithridates* King of *Pontus*, and is thus made. *Take 20 Leaves of Rue; 2 Wall-Nuts; 2 Figgs; a Scruple of Salt; beat all together in a Mortar to a Mass.* This is the quantity to be taken at a time, every Morning Fasting, and was the *Antidote* or *Counter-Poison* of King *Mithridates*, by which he secured himself that Day from any Poison, as also any Infectious Distemper, and from the Plague it self.

It is profitable alſo againſt the Stinging and Bitings of Scorpions, Hornets, Serpents, Mad-Dogs, and other Venomous Creatures.

XXIII. *The Coſmetick. Take Rue Water a Quart; Juice of Rue a Pint; Sal Nitre an Ounce and half in fine Pouder; mix, diſſolve and filter through brown Paper.* It is good againſt Wheals, Pimples, Tanning, Sunburning, Scurff, Morphew, and other Vices of the Skin: Bathed alſo on places pained, it gives eaſe to the ſame. Or thus, *Take of the Decoction in Wine 3 Pints; Sal Nitre an Ounce and half; Pepper in fine Pouder half an Ounce; mix, digeſt 7 Days in a gentle Sand heat, decant the clear, filter and keep it for Uſe.*

XXIV. *The Collyrium. Take Juice of Rue, Juice of Fennel, of each a Pint; Honey 6 Ounces; Gall of a Cock 2 Ounces; mix, diſſolve, digeſt a Week; and being well ſettled, decant off the clear for uſe.* It heals Sore and Running Eyes, and helps Dimneſs of Sight.

XXV. *The Errhine. Take Pouder of the Leaves and Seeds of Rue, Pouder of Nitre, of each equal parts; mix them.* Being Snuft up the Noſtrils, it cleanſes the Head of cold, thick, and glutinous Humors, and being now and than uſed, it is good to prevent Apoplexies, Epilepſies, Lethargies, Vertigoe's, *&c.* by bringing away the Morbifick Matter.

XXVI. *The Bath. A Decoction made of the Leaves of Rue 4 parts; Bay Leaves 2 parts; Southernwood 1 part; by boiling them in a ſufficient quantity of Fair Water*, is of good uſe to Bath ſuch in, and to ſit in the ſame who are troubled with the Jaundice, Gout, Sciatica, Rheumatiſms, and other the like Diſeaſes, the Herbs being alſo applyed warm to the parts affected. It helps alſo the Swelling of the Cods, they being alſo Bathed therewith.

XXVII. *The Oil by Decoction or Inſolation in Oil Olive. It is made of the bruiſed Herb, and ripe Oil Olive, as you make Oil of Roſes.* It warms and heals, comforts the Nerves and Joints, ſtrengthens them, and is prevalent againſt Trembling, Numbneſs Cramps, Convulſions, Palſies and Dead Palſies. It is good againſt the Wind Colick, as alſo the Swelling, Hardneſs and Windineſs of the Womb, Vapors and Hyſterick Fits, if the ſhare and parts thereabouts, and other parts affected, be anointed therewith.

XXVIII. *Unguentum Rutaceum*, Ointment of Rue. *Take green Rue 4 Handfuls; Mint, Origanum, Penny-Royal, Sage, Wormwood, of each 2 handfuls; bruiſe them in a Mortar, put to them old or Salted Hogs Lard 3 Pounds: digeſt 4 Days in an Earthen Veſſel in Horſe-Dung, till the Greaſe is Melted, then preſs it out in a Preſs, and add new Herbs, repeating this Work 4 times. Take of this Digeſted Lard 16 Ounces; Deers Marrow, Oil of Bays, of each 4 Ounces; Tacamahacca, Gum Elemi, of each 3 Ounces; Oil of Nutmegs by expreſſion 2 Ounces; Oils of Juniper Berries, of Roſmary, of Spike and Petroleum, of each an Ounce; of Caſtile or Genoa Soap, 6 Ounces; Eſſence of Caſtor, extracted with Spirit of Wine rectified, 2 Ounces; mix, and melt them which are to be melted, with a gentle Fire; then add the Chymical Oils, at the end and make an Ointment according to Art.* It diſſolves, diſcuſſes, and heals, or elſe it maturates and brings to Suppuration. It is Anodyn, Carminative, and Arthritick: good againſt moſt cold and moiſt Diſeaſes of the Head, Brain, Nerves, Stomach, Belly, Womb, Reins, and Joints. It prevails againſt the Gout, Rheumatiſm, Sciatica, Palſie, Dead Palſie, Cramps, Convulſions, loſs of Memory, Catarrhs, Megrim, Vertigo, Carus, Lethargy, Colick, weakneſs of the Limbs, Rickets in Children. It diſſolves the cold Tumors, Nodes and Gums in the Fleſh, and is of ſingular uſe againſt all cold and moiſt Diſeaſes whatſoever.

XXIX. *The Cataplaſm. It is made of the bruiſed Herb 4 parts; Cumin Seed 2 parts; Oil 1 part; adding a little Vinegar, and ſo much Ceruſe as to bring it to a Conſiſtency.* It is good againſt pains of the Stomach, Sides, Spleen, Reins, Belly, and Womb; as alſo the Gout whether in Hands or Feet, being applyed as hot as it can be endured.

XXX. *The Pickle.* The Leaves are firſt boiled gently in Water, then being taken out and drained, they are put into *Pickle*, ſuch as is uſed to *Samphire.* This is kept by many to eat as Sawce with Meat; it is profitable againſt Dimneſs of Sight, to warm a cold Stomach, and cauſe a good Appetite and Digeſtion.

XXXI. *The Diſtilled Water. It is diſtilled as you diſtill other Waters; or rather after the manner taught in the next* Section. It has the Virtues of the *Juice* and *Eſſence*, but vaſtly weaker. It is a good *Ophthalmick* and *Coſmetick*; and may be uſed as a Vehicle to convey other Preparations of the Plant in. Being taken to 3 or 4 Ounces, a little ſweetned with *Syrup of Citron Peels*; it gives preſent relief in Fainting and Swooning Fits, and to ſuch as are troubled with pain and ſickneſs at Stomach.

XXXII. *Spiritus Rutæ*, Spirit of Rue. *Take freſh Rue bruiſe it well, put it into a Wooden Veſſel, and add to it warm Spring Water a ſufficient quantity; and to every Gallon of the whole Matter, a Pound of Sugar or Meloſſos; let it ferment for 3 Days, then put in more Water, and diſtil in a Copper Veſica, drawing off a third part for Spirit of Rue; and a third part more for Rue Water, for the uſes in the former* Section, *which keep apart; and the Spirit you may rectify according to Art.* Or thus, *Take freſh green Rue bruiſed 4 Pounds; Rectified Spirit of Wine 8 Quarts; mix, digeſt 48 Hours, then diſtil in Balneo to dryneſs. This Spirit put upon as much more freſh Rue bruiſed, digeſt and diſtil as before, which repeat in like manner a third time, if you would have a very ſtrong Spirit, and fully repleat with the Eſſential properties of the Herb.* It is hot and dry, piercing and attenuating, diſcuſſes and expels Wind, is Cephalick, Neurotick, Hyſterick, and Alexipharmick, uſed chiefly againſt the Plague and all other Malign Diſeaſes. It is highly Sudorifick, expels Poiſon, cures the Pluriſie, weakneſs of the Stomack, Colick, Griping of the Guts, bitings of Mad Dogs, and all other Venomous Beaſts. It is profitable againſt Agues, inwardly taken 2 or 3 Hours before the Fit, and outwardly bathed upon the Back Bone; as alſo the Megrim, Head-ach, Vertigo, Sickneſs at Stomach, Palpitation at Heart, Surfeits, and the like. It is a provoker of the Terms in Women, and therefore not be given to Women with Child. Doſe from 1 Dram to 3, in any Cordial Draught, or in a Glaſs of Wine. It facilitates the Birth, and forces away the After-Birth and Dead Child.

XXXIII. *Oleum Rutæ*, Oil of Rue. It is made altogether in the ſame manner as you make *Oil of Roſmary Chymical.* It is filled with the *Eſſential Salt of the Plant*; and by reaſon it is of a quick and penetrating Quality, it ought to be given warily, and in a ſmall Doſe, as from 2, to 6, or 8 Drops; never alone, but mixed with ſome other convenient Medicine, becauſe it has a Vehement heat and burning. It has all the Virtues of the *Juice*, *Eſſence*, *Pouder*, *Infuſion* and *Spirit* aforegoing, and may be given in all thoſe caſes, with the Caution now hinted. The way to take it is to drop the intended quantity upon

upon Sugar, letting it ſoak into it, or mixing it well with it, and then to diſſolve the Sugar in ſome Cordial Water, or Wine, or Sack Whey, or other Proper Vehicle, by which means the *Oil* will be the better incorporated therewith, and then it is to be drunk up.

XXXIV. *Poteſtates*, or *Powers*. Theſe have all the Virtues of the *Juice*, *Eſſence*, *Spirit*, and *Oil* aforegoing, as alſo of the *Elixir* following. But tho they may, and do much exceed the *Juice*, *Eſſence*, and *Spirit* in their ſtrength by their Sublimity and Exaltation; yet they fall below the Force and Excellence of the *Elixir*, in the next *Section*, which anſwers to all the Intentions of the whole Plant. Theſe *Powers* may be given Morning, Noon, and Night, from 40, to 80, or 100 Drops in a Glaſs of Wine, or other Liquor conducing to the Intention for which they are given. They facilitate the Birth, bring away the After-Birth, and cauſe a due cleanſing afterwards.

XXXV. *Elixir Rutæ*, Elixir of Rue. *Take Powers of Rue a Quart: Rue in fine Pouder 4 Ounces: Ground very well in a hot Mortar with 2 Ounces of highly calcin'd Salt of Rue: mix all together, digeſt cold for a Month, ſhaking the Glaſs once or twice a Day: then being fully ſettled, decant the clear Elixir, and keep it in a Glaſs cloſe ſtopt for uſe.* Or thus, *Take of our Spiritus Leptus a Quart; Rue in fine Pouder 6 Ounces; mix and digeſt cold for a Month, ſhaking the Glaſs once or twice a Day; then the Fæces being ſubſided decant the clear Elixir, and keep it cloſe ſtopt for uſe.* It is a great and famous Antidote, and Counter Poiſon, not only againſt all Vegetable and Animal Poiſons, but againſt the moſt contagious Malignity, and mighty force of the Plague and Peſtilence, whether given as a Prophylactick, or as a Curative. It is alſo a powerful thing againſt the Meaſles, Small Pox, Spotted Fever, and all ſorts of Malign, Burning, or Peſtilential Fevers: It effectually cures the Bitings of Mad-Dogs, Rattle Snakes, Vipers, and of all other Venomous Serpents or Creatures, deſtroying their Poiſon in its Root and Effence. It drys up Watery Humors in Dropſies, eaſes pains in the Ears, being mixt with *Oil of Bitter Almonds* and dropt into them. It helps dimneſs of Sight, being mixt with a Gall of a Cock and a little Honey, and ſo dropt into the Eyes. It eaſes all ſorts of Pains and Torments whatſoever, being inwardly taken and outwardly applyed to the place; but it is not too often to be taken inwardly, becauſe it is apt to dry up and conſume the Seed, and deſtroy the Generative Power and Faculty. It helps pains in the Breſt and Sides, Stitches, Pluriſies, inward bruiſes, Coughs, Colds, Hoarſneſs, Wheezing, ſhortneſs of Breath, Aſthma, Inflamation of the Lungs, and the ſhaking Fits of Agues. It is powerful againſt the Wind Cholick, gripings in the Guts, ſickneſs and pain at Stomach, warming, comforting and cheriſhing thoſe parts, prevails againſt Surfeits, and cauſes a good Appetite, and a ſtrong Digeſtion. It is prevalent againſt Vapors, Fits of the Mother, and other diſorders of the Womb: and being given in time of Labor, it facilitates the Birth, and brings away the After-Birth, and after a very admirable manner either prevents or Cures After-pains. It effectually kills Worms of all ſorts, whether in old or young, and outwardly applyed eaſes pains of the Gout, proceeding from a cold Cauſe, whether in the Hands, Knees, Hips, or Feet, for which it is a very admirable thing. Outwardly by bathing it alſo upon the Back Bone, it is very beneficial againſt the Fits of Agues. It may be given from half a Dram, to a Dram or more, mixt with ſome proper *Syrup*, or in *Angelica Water*, or ſome other *Cordial Water*, or in Sack Whey, or in a Glaſs of Generous Wine, in the Morning Faſting, and at Night going to Bed, and ſometimes once or twice in the Day beſides, according to the Exigency of the Diſeaſe.

XXXVI. *The Spirituous Tincture*. It has all the Virtues of the *Juice*, *Eſſence*, *Spirit*, *Powers*, and *Elixir*, but in a much lower degree of Power and Efficacy: but it may be of good Service and and uſe where the *Powers* or *Elixir* are not to be had. It may be given from one Dram to three in any *Cordial Water*, or Generous Wine, Morning, Noon, and Night.

XXXVII. *The Acid Tincture*. Is is a peculiar thing againſt the Plague and Spotted Fever; and in all malign and peſtilential Diſeaſes; it deſtroys the malignity, and ſo extricates the Patient in the greateſt danger, if the hopes of Life be not paſt. Doſe 40 or 60 Drops at a time in *Scordium Water*, *Angelica Water*, or ſome Generous Wine, 3, 4, or 6 times a Day.

XXXVIII. *The Oily Tincture*. It provokes Urine Powerfully, and is profitable againſt the Stone, Sand, Gravel, Strangury, and other Diſeaſes of the Urinary parts; as alſo againſt the Cholick, gripings of the Guts, Wind and other Diſeaſes of the Bowels. Inwardly taken Morning, Noon, and Night, from 15 to 20 Drops or more, it is a moſt excellent thing againſt numbneſs, Trembling of the Limbs, and Palſie, more eſpecially if the parts affected and *Spina Dorſi*, be Morning and Night anointed with the ſame for ſome conſiderable time.

XXXIX. *The Saline Tincture*. It is chiefly for External uſes, gives eaſe in the Gout in Hands or Feet, and other like pains in the External parts of the Body. It is alſo a good *Coſmetick*, and is profitable againſt Tanning, Sunburning, Scurff, Morphew, Pimples, Puſtles, Diſcolorings, Tettars, Ring-Worms, and other Breakings out, and Deformities of the Skin; the Skin (firſt waſht clean with warm Water) being waſht or bathed therewith 2 or 3 times a Day.

CHAP. DCV.

Of RUE Medow.

I. *THE Names.* It is called in *Greek*, Θαλικ-τρον, & Θαλίκτρον, à Θαλλὸς, *Vireo*, as ſome think, *eo quod dum germine protrudit eleganter vireat*: in *Latine*, *Thalictrum*; & *Thalictrum*, alſo *Ruta paluſtris & Ruta pratenſis*: and ſome have called it *Pigamum*, *quaſi*, Πήγανον, which is *Ruta*: others *Pſeudo-rhabarbarum* (but very unproperly, for it is no *Rheubarb* of any kind) but I ſuppoſe they ſo called it from the yellow color of the Root, and its truly purging and binding Qualities, in all which, it is very like to *Rheubarb*. In *Engliſh*, *Medow Rue*.

II. *The Kinds.* Authors make ten or more Kinds of this Plant, but we ſhall deſcribe only the five following, as being Inhabitants of our Country, or of our *American* Plantations. 1. *Thalictrum majus vulgare Lobelij*; *Ruta Sylveſtris Ceſalpini*; *Pigamum Lugdunenſis*; *Thalictrum Germanicum latiſolium Camerarij*; *Saxifraga Lutea Geſneri*; Our common greater Medow Rue. 2. *Thalictrum majus album Hiſpanicum*; *Thalictrum Italicum Camerarij*, Great Spaniſh Medow Rue. 3. *Thalictrum minus*, *Dodonæi*; *Ruta pratenſis tenuiſolia Lobelij*

& *aliorum*; *Hypecoum Lugdunenſis*, The ſmaller Medow Rue. 4. *Thalictrum Americanum*, *Thalictrum Virginianum*, Virginia Medow Rue. 5. *Thalictrum Americanum, vel Virginianum minus purpureum*, The leſſer purple Virginia Medow Rue.

The Deſcriptions.

III. *The firſt, or* Our common Medow Rue. *Has a Root which is yellow and ſtringy, ſpreading much in the Ground, and ſhooting forth new Sprouts round about with many herby green Stalks, two Feet high, creſted or cornered their whole length, ſet with Joints*

Rue Medow great.

here and there, and many large Leaves on them, as well as below, being divided into ſmaller Leaves, nicked or dented in the fore part of them, of a ſad green color on the upper ſide, and a pale green underneath. Towards the tops of the Stalk, ſeveral ſhort Branches ſhoot forth, on every one of which ſtands 2, *or*, 3 *or* 4 *ſmall round Heads or Buttons, which breaking the Skins which encloſe them, ſhew forth a Tuft of pale greeniſh yellow Threads, which falling away, ſmall three cornered Cods come in their places, wherein is contained ſmall long and round Seed. The whole Plant as well Leaves as Flowers have a more ſtrong unpleaſant Smell than the next following Kind.*

IV. *Gerard* deſcribes this Plant thus. *Its Root is yellow, long, round and knotty, diſperſing it ſelf far abroad under the upper Cruſt of the Earth. It has large Leaves parted or divided into divers other ſmall Leaves, ſomewhat ſnipt about the edges, of a black or dark green color. The Stalks are creſted or ſtreaked of a purple color, growing to be two Cubits high; at the tops whereof grow many ſmall and hairy white Flowers, and after them come ſmall narrow Husks like little Cods, four or five growing together.*

V. *The ſecond, or* Great Spaniſh Medow Rue. *Its Root is much like the former; but its Leaves are much larger, and more divided on the edges, being ſo like unto* Columbine *Leaves, that they may eaſily deceive one not well acquainted therewith, yet are they leſſer, and of a ſadder color, ſtanding on long foot Stalks, among which riſes up a ſtrong round Stalk, three Feet high at leaſt, Branching forth into* 2 *or* 3 *parts, with Leaves at their ſeveral Joints; at the tops whereof ſtand many ſmall round yellowiſh Buttons, in a Tuft together encloſed in a white Skin, which breaking, each Button ſhews it ſelf to be a ſmall Tuft of Threads, like the former but greater, and of a white color, but tipt with yellow, and ſomething purpliſh at the bottom, of a ſtrong Smell, and abiding long in Flower, if it grows not too open; and then falls away like ſhort Threads. The Seed is like the former, but greater, and the Roots are yellow like it, which retain neither Stalk nor Leaf all* Winter, *but ſhoot forth a new the next* Spring.

VI. *The third, or* Smaller Medow Rue. *Its Roots likewiſe are yellow, but do not ſpread or creep ſo much as the former. This ſmall kind is in almoſt all reſpects like unto the firſt, but ſmaller*

Rue Medow ſmall.

both in its Leaves, which are of a little freſher green color and ſomewat more ſhining: and in its Stalks, which are round and not creſted: and in its Flowers alſo, which as they are leſſer, are ſomewhat whiter too.

VII. *Gerard* thus deſcribes it. *This ſmall Kind is very like unto the firſt Species, but that it is altogether leſſer; its Stalks are a Span, or Foot long; its Leaves are thinner and tender; its Root is fine and ſlender; and the litle Flowers grow together in ſmall Bundles or Tufts, of a light yellow color, almoſt white, and are of an unpleaſant Savor.*

VIII. *The fourth, or* Virginia Medow Rue. *This in its Face or outward appearance is ſo like the ſe-*

cond

cond or Great Spaniſh Kind, *that they can ſcarcely be known aſunder; but that this is fuller of Stalks and Leaves. The Flowers at the tops of the Branches, are at firſt of a pale bluſh color; but being blown open, conſiſt of five white Leaves; and a great number of white Threads in the middle tipt with yellow.*

IX. *The fifth, or* Leſſer purple Virginia Medow Rue. *This is in almoſt all reſpects much like the former, but ſmaller; and differs moſt in the color of its Flowers, which in this are of a purple color tipt with yellow.*

X. *The Places.* The firſt grows in many places in *England*, in the borders of moiſt and plaſhy Medows and by Ditch ſides. The ſecond is alſo found in our moiſt Medows and by Ditch ſides but near the Sea, as at *Margate* on the *Chalkey Cliff* on the left Hand, as you go from the Town to the Sea ſide, and in other places farther from the Sea. But this grows alſo in *Spain*, from whence it has been brought to us, whence came the Name of *Spaniſh Medow Rue*, but is truly a Native alſo of *England*. The fifth grows alſo in lower Grounds by River ſides. All theſe *Gerard* ſays grow along Ditch ſides leading from *Kentiſh Street* to St. *Thomas Waterings*, (the place of Execution) on the right Hand. They grow alſo upon the Banks of the *Thames* leading from *Black-wall* to *Woolwich*, near *London*, and in ſeveral other places. The two laſt came to us from *Virginia*.

XI. *The Times.* They all Flower in the Months of *July* and *Auguſt*; and the Cods of Seed are ripe in ſome ſhort time after.

XII. *The Qualities.* It is hot and dry in the ſecond Degree, is Abſterſive, Aperitive, and gently Cathartick or Soluble.

XIII. *The Specification.* It is uſed to cure the Plague or Peſtilence, and the Yellow Jaundice: and is profitable for ſuch as have the Falling-ſickneſs.

XIV. *The Preparations.* There is, 1. *The Herb it ſelf, uſed as a Pot Herb.* 2. *A Juice or Eſſence.* 3. *A Decoction of Roots or Leaves in Ale.* 4. *A Decoction of the ſame in Water.* 5. *A Cataplaſm of the Leaves.* 6. *A Diſtilled Water.* 7. *An Acid Tincture of Roots, Leaves, and Flowers.* 8. *A Saline Tincture of the Roots.*

The Virtues.

XV. *The Freſh Herb and Roots.* They are commonly uſed as *Pot-Herbs*, with other Herbs; and if they are put in plentifully, they gently purge the Belly, and provoke to Stool; but the Roots more than the Leaves.

XVI. *The Juice or Eſſence of the Roots and Leaves.* They open Obſtructions of the *Viſcera*, and cleanſe: and being taken from 2 Spoonfuls to 4 or 5, or more, they very pleaſantly and eaſily purge and cleanſe the Belly of thick, clammy and groſs Humors. They are profitably given againſt the Plague, and all other malign, contagious, and peſtilential Diſtempers. In *Saxonie* the *Juice* is uſed againſt the Jaundice; it is indeed profitable in that Cure, if ſome *Antimonial Emetick* be given once or twice beforehand. *Lugdunenſis* in transferring the Name *Pigamum* to *Medow Rue*, does therewith aſcribe to it a Virtue proper to *Rue*, as if it did belong to this, *viz.* that it raiſes or reſtores him out of his Fit, that is troubled with the *Epilepſie* or Falling Sickneſs, if ſome of the *Juice* of it be put up into his Noſtrils, and kept there a while.

XVII. *The decoction of the Roots or Leaves in Ale.* Being drank pretty largely, it provokes to Stool and gently purges: but the *Decoction of the Roots* is more powerful than that of the *Leaves*; and carries off much of the Morbifick Matter of the Jaundice and *Epilepſie*.

XVIII. *The Decoction of the Roots or Leaves in Water.* Being waſhed upon the places troubled with Vermine or Lice, whileſt it is very warm, it is ſaid perfectly to deſtroy them: beſides it drys up old Sores, and moiſt running Scabs, the places effected being bathed therewith very hot, 2 or 3 times a Day or more, for near half an Hour at a time; it warms, comforts, looſens, and opens the Pores of the Scabs, Ulcers, and Fleſh, as alſo the Skin adjacent thereto, and powerfully attracts and and draws forth the Virulent and Morbifick Matter.

XIX. *The Cataplaſm of the Leaves.* It is made by beating them in a Mortar freſh and green; and ſo applied to old Sores it brings them to cicatrizing, and does perfectly cure old Ulcers, as *Dioſcorides* ſays; and *Galen* ſays, it dryes without any heat or ſharpneſs.

XX. *The Diſtilled Water of the Roots, Leaves, and Flowers.* It has the Virtues of the *Juice*, *Eſſence*, *Decoction*, and *Cataplaſm*; but is not ſo powerful in its effects: but if a little *Nitre* be diſſolved in it, it becomes a good *Coſmetick*.

XXI. *The Acid Tincture of Roots, Leaves, and Flowers.* It has all the Virtues of the *Juice* and *Eſſence*; and a Specifick againſt the Plague or Peſtilence, and all ſorts of malign and peſtilential Diſtempers. Doſe 40, 50, or 60 Drops in all that the Patient drinks, as alſo in all his Broth or Spoonmeat, except it is made of Milk.

XXII. *The Saline Tincture of the ſame.* It is very Abſterſive, and a great cleanſer of the Fleſh and Skin from Pimples, Puſhes, Tettars, Ringworms, Scabs, Itch, running Sores, Scurff, Morphew, and other breakings out, and withall kills Lice, and other Vermine, to which the Patient is Subject, being uſed very hot 2 or 3 times a Day, and for ſome conſiderable time, as nearly half an Hour, every time it is uſed; it opens the Pores of the Fleſh and Skin, and draws forth powerfully the Purulent and Morbifick Particles of the ſame.

CHAP. DCVI.

Of RUE-GOATS.

I. *THE Names.* The *Greeks* knew nothing hereof: the *Latines* call it *Galega*, *Ruta Capraria*, alſo *Herba Gallica*, as *Fracaſtorius* does: in *Engliſh* it is called *Goats-Rue*.

II. *The Kinds.* Thoſe which Authors have chiefly taken notice are theſe two, 1. *Galega vel Ruta Capraria Vulgaris*, Our common Goats-Rue: 2. *Galega Montana Lugdunenſis*, Mountain Goats-Rue.

The Deſcriptions.

III. As to the *Deſcriptions* of theſe Plants, their *Places of Growth*, and *Times of Flowering and Seeding*, as alſo their *Qualities*, *Specifications*, *Preparations*, *and Virtues*, we ſhall ſay nothing to in this

Rue Goats.

this place, having largely treated of the ſame in *Chap.* 320 aforegoing: ſaving, that whereas we were ſomething defective in that *Chapter* as to the ſeveral *Preparations* of them, and their reſpective Uſes and Applications; we ſhall endeavour to add and make amends here, for what we were deficient in there.

IV. *The remaining Preparations.* To thoſe ten in the ſaid *Chapter*, enumerated; we add the ſix following particulars, *viz.* 1. *The Green Herb.* 2. *A Rob of the Juice.* 3. *A Syrup of the Juice.* 4. *An Oil of the Flowers.* 5. *A Spirit, from the whole Plant.* 6. *A Waſh.*

The Virtues.

V. *The Green Herb.* It makes good Food or Fodder for Sheep, Goats, Cows, Oxen, and other Cattle; whom it Feeds and Fattens very well: being chopt ſmall, and mixt with *Bran* and *Barly Meal*, and given to Hens, is ſaid to fatten them alſo, and to make them to lay Eggs plentifully. Reduced into *Powder*, and taken to a Dram Morning and Evening in a Glaſs of choiſe Canary, it is a preſervative againſt the Infection of the Plague or of any other Malign, Contagious, Epidemical or Peſtilential Diſeaſe, and to kill Worms in Children.

VI. *The Rob of the Juice,* Take the *Expreſſed Juice*, Clarifie it with Whites of Eggs; then Evaporate it to the thickneſs of new Honey, or ſomething thicker: to every Pound of which add, half a Pound of double Refined Sugar: melt, mix, and keep it for Uſe. It has the Virtues of the *Juice* and *Eſſence*, tho' not altogether ſo powerful, becauſe many of the Volatile Particles are loſt in the abſumption; but is of great uſe in making the *Electuary*, and in that Caſe much tranſcends Honey. It may be taken from half a Spoonful to a Spoonful in Wine or ſome other proper Vehicle to kill Worms in Children.

VII. *The Syrup of the Juice.* It is of good uſe in the Plague, and all ſorts of Peſtilential Diſeaſes being taken in *Treacle Water*, or ſome other Antidotal Vehicle Morning and Night, both as a prophylactick and as a Curative: if the Perſon is Infected it will be good to put them to Bed, and cauſe them to Sweat two or three Hours thereupon. Doſe 3 or 4 Spoonfuls at a time. It is given alſo againſt the Meaſles and Small Pox, with the ſame Succeſs.

VIII. *The Oil of the Flowers by Inſolation or Decoction.* Anointed upon the Navel it is ſaid to kill Worms in the Belly. Anointed on the Stomach, Back Bone, Crown of the Head, and Temples, it has been found profitable againſt the *Epilepſie* or Falling-ſickneſs. Anointed all over the Belly, it gives eaſe in the Colick, gripings of the Guts, and Convulſions of the Bowels.

IX. *The Spirit from the whole Plant.* It is ſingularly Cordial, and profitable againſt all Peſtilential and Infectious Diſeaſes, having all the Virtues of the *Juice*, *Eſſence*, *Infuſion*, or *Tinctures*, and may be given to a Spoonful at a time mixed with the *Syrup*. It preſerves and defends the Heart againſt Palpitations, Faintings, Swoonings, Sickneſs at Stomach, and other like Diſeaſes of the *Precordia*, and is an Antidote againſt Melancholy Vapors oppreſſing the Spirits.

X. *The Waſh. It is made by a mixture of the Spirit, Juice, and Wine Vinegar in equal parts.* Being applyed very hot to the part, it defends it againſt Gangreens, and prevents their running farther; is profitable to cleanſe and heal running Sores and Ulcers, to deſtroy their Malignity, to prevent their fretting and ſpreading; and to defend the Vital Powers from danger, more eſpecially if it be bathed alſo upon the Region of the Heart, and over the whole Belly.

CHAP. DCVII.

Of RUPTURE-WRORT.

OR,

BURST-WORT.

I. *THE Names.* It has no *Greek* Name that we know of, unleſs you will allow of Ἐμπετρον *Empetron*, which *Tragus* and *Lonicerus* give it, yet can ſcarcely be admitted of, becauſe, it is more peculiar to *Sampire*: in *Latine* it is called *Herniaria*, and *Herniola*: in *Engliſh*, *Rupture-wort*, and *Burſt-wort*.

II. *The Kinds.* The Chief Sorts which are moſt uſual with us are, 1. *Herniaria major*, *Herniaria vulgaris*; *Empetron Tragi & Loniceri*; *Polygonum minus Matthioli*, who calls it alſo πολύγονον μικρὸν; *Nonnullis*, *Millegrana*; *Quibuſdam*, *Herniola*; *Epipactis Anguilarae*; *Herniaria multigrana ſerpilli folio Penæ in adverſaria*; *Herba Turca Lobelij & Cæſalpini*; *Herba Cancri minor Cordi*, in his *Scholiaſtes*; & *Millegrana*, in his *Hiſtoria Plantarum*; *Polygonum minus*, *ſeu Millegrana major Bauhini*; but generally *Herniaria* by *Camerarius*, *Dodoneus*, *Geſner*, *Gerard*, *Lugdunenſis*, *Tabernæmontanus*, and *Thalius*, Our common Rupture-wort, or the greater Rupture-wort. 2. *Herniaria major Afri-*

cana

cana, African great Rupture-wort. 3. *Herniaria minor*; *Millegrana minima Lobelij*; *Herniaria altera Thalij*; *Herniola*; *Polygonum minimum*, *sive Millegrana minima Bauhini*. The small or smallest Rupture-wort.

The Descriptions.

III. *The first*, *or* Our common Rupture-wort, *or* Greater Rupture-wort. *It has a Root which is very long and small, thrusting it self deep into the Ground: from which spring up many small Branches, or Stems, round about upon the Ground, about a*

Rupture-wort Common.

Span or more long, which are divided into many other smaller and almost thready parts, full of small Joints, set very thick together; whereat come forth likewise, a great number of exceeding small yellowish Flowers, scarcely to be discerned from the Stalks and Leaves, which turn into Seed as small as the very Dust. This Plant has neither Smell nor Taste at first; but afterwards it has a little Styptick or Astringent Taste, without any heat, yet a little bitter and sharp withall. The Cut which we have given you here is from *Matthiolus* his *Epitome*, but the Cutter has not well represented the vast number of Flowers and Seed at every Joint with which this Plant is usually repleniſhed.

IV. *The second*, *or* African great Rupture-wort. *This in its Roots, Stalks, Leaves, Branches, Flowers, Seed, form and manner of growing, differs little from the former; saving that this is something greater and larger, grows more upright, and is fuller of Branches.*

V. *The third*, *or* Small *or* smaller Rupture-wort. *Its Root is small but not so long as the former: it rises up with small thready Stalks, but with fewer Joints, having long narrow Leaves, something rough and hairy set at them; fuller of Branches towards the tops, where the Flowers and Seed do grow, like as in the other, and in as plentiful a manner also.*

VI. The first of these Plants *Gerard* does thus describe. *It has a Root which is slender and single, a low creeping Herb, having many long slender Branches trailing on the Ground, yet very tough, and full of little knots, somewhat reddish; upon which do grow many small Leaves like those of* Time: *among which come forth, little yellowish Flowers, which turn into very small Seed, and a great quantity thereof, (considering the smallness of the Plant) growing thick and clustering together by certain spaces. The whole plant is of a yellowish green color.*

VII. *The Places.* The first grows in many Countries in *England*, as well as in several others, in dry Barren Grounds, where it will be small; and in the moister Places also; but not in such as are Boggie, or Moorish which are not shadowed. The second grows near *Tunis* in *Africa*, where *Guillaume Boel* gathered it, from whence it has been brought to us and transplanted into our *Gardens*. The third grows in dry Chalky and Stoney Grounds in *Kent* and other Countries. *Johnson* in *Gerard* says, that he found it in *Kent*, on a Heath not far from *Chiſlehurſt*, in the Month of *July*.

VIII. *The Times.* They are fresh and green and Flower in *May*, *June*, *July*, and *August*; and perfect their Seed in the mean time.

IX. *The Qualities.* It is cold in the first Degree, and dry in the second; Styptick or Astringent, Diuretick and Nephritick.

X. *The Specification.* It is said to Cure Ruptures of the *Peritonæum*; to stop all sorts of Fluxes of the Bowels and of the Womb, to give ease in the Strangury, and provoke Urine.

XI. *The Preparations.* You may have therefrom, 1. *A Juice or Essence.* 2. *A Decoction in Wine or Water.* 3. *A Pouder of the Dryed Herb.* 4. *A Cataplasm of the Green Herb.*

The Virtues.

XII. *The Juice or Essence.* They provoke Urine, and are said to break the Stone if it is composed of a Gritty Substance: yet they stop all sorts of Fluxes of the Belly and Womb; and are profitable to conglutinate Ruptures of the Bowels in young people, being taken for 40 Days together, the Patient lying all the time in Bed. Dose 2 Spoonfuls at a time, Morning, Noon and Night, in a Glass of Red Styptick Wine; given in the same Dose in White *Port* or *Lisbon*, it provokes Urine, and is profitable against the Strangury.

XIII. *The Decoction of the Herb in Wine or Water.* It has all the Virtues of the *Juice* and *Essence*, and may be given at like times from a quarter of a Pint to half a Pint.

XIV. *The Pouder of the dried Herb.* A Dram of it taken at a time, Morning and Evening in a Glass of White Wine is good against the Strangury, and for such as are troubled with Gravel in the Reins or Bladder, causing to make Urine plentifully. Taken in Red Styptick Wine, it stops Fluxes of the Bowels, and helps Ruptures.

XVI. *The*

XV. *The Cataplasm of the Green Herb.* It is an excellent thing to conglutinate Green or Fresh Wourds, and to heal them being applyed thereto: and is profitable to stop Defluxions of Rheum, from the Head upon the Eyes, Nose, or Teeth, being bound upon those parts: It is profitable also to dry up the moisture of moist and running Ulcers, being put upon them, they being strewed over first with the *Pouder.*

CHAP. DCVIII.

Of RUSHES.

I. *THE Names.* The *Rush* is called in *Arabick, Dis:* in *Greek,* Σχοῖνος *(à Loris & Funibus:)* in *Latine, Juncus (à Jungendo,)* from the same use, of binding things together: and in *English, Rush.*

II. *The Kinds.* Authors have given us almost thirty several sorts of *Rushes*, most of which grow neither in our *Brittish Islands*, nor yet in any of our Forreign *West-India* Plantations; the most usual with us are the thirteen following, *viz.* 1. *Mariscus Plinij Bauhino & Gazæ*; *Holoschœnos*; *Juncus Floridus*, which some take to be, *Gladiolus Palustris*, as *Lugdunensis* thinks; others call it *Scirpus*, tho' the Ancients (as it is thought) took them to be different Plants: yet *Terence* in *Andria*, says, *Junci Species est Scirpus lævis & enodis:* and such a one is this *Rush*, having *neither Joint or Knot in it*, whence came the Proverb, *Nodum in Scirpo quærere*, speaking of such as scruple or doubt, where none is to be made or found. It is called by *Dioscorides* Σχοῖνος ἰδία, *Juncus lævis*; but some think the Text is there corrupted, and that it ought to be Σχοῖνος ἑλεία, *Juncus palustris*, as *Paulus Ægineta* calls it, which *Hermolaus Barbarus* observed also; *Juncus grandis Holoschœnos Dodonæi & Gesneri*; *Holoschœnos Theophrasti Lugdunense*; *Juncus palustris major Tragi*; *Juncus aquaticus & Lævis maximus Lobelij, aliorumque*; Our common great Bull Rush. 2. *Juncus Lævis vulgaris*; *Juncus sive Scirpus Medius Bauhini*; *Juncus Sylvaticus Tabernæmontani*, Our common sort of smooth Water Rush, or middle sort of Bull Rush. 3. *Juncus Lævis panicula sparsa major, Juncus vulgaris alter Tragi*; *Juncus Lævis & vulgaris Cordi, Dodonæi, & Lobelij*; *Oxyschœnos Anguillaræ & Lugdunensis*, Another sort of great smoot Rush. 4. *Juncus Lævis panicula sparsa minor Bauhini*, The smaller Bull Rush with dispersed Tufts. 5. *Juncus Lævis Flore Glomerato Lugdunensis*, Round Headed Rush. 6. *Juncus acutus vulgaris*, Ὀξυσχοῖνος, *Oxyschœnos*; *Juncus acutus & asper*; *Juncus acutus vulgatior Dodonæi, & Lobelij*, Our common small hard Rush. 7. *Oxyschœnos sive Juncus acutus Cimbro Britanicus*, Our Welch sharp Rush. 8. *Juncus acutus Maritimus Anglicus*, English Sea hard Rush. 9. *Juncus Capitulis Equiseti*; *Juncus aquaticus minor capitulis equiseti Lobelij*; *Juncus clavatus Dalechampij Lugdunense*, The greater Aglet Headed Rush. 10. *Juncus capitulis equiseti alter*; The lesser Aglet Headed Rush. 11. *Juncus Floridus major*; *Calamogrostis secunda Tragi*; *Juncus floridus Camerarij, Lugdunensis & Matthioli*; *Juncus Cyperoides floridus paludosus Lobelij*, The greater Flowering Cyperus Rush. 13. *Juncus Gramineus*; *Juncus Maritimus*; *Gramen Juncus Maritimus Gerardi*, Sea Rush, Marsh Rush Grass, called by some Goose Corn.

The Descriptions:

III. *The first, or* Our common great Bull Rush. *Its Root is of a blackish brown color, grows somewhat great and sloping, with several Fibres or Strings thereat. It sends forth several tall soft, round and smooth Shoots, which are the* Ruthes, *of a fresh pale green color, greater and larger than any of the other sort of* Rushes, *having certain Sheaths like Leaves, encompassing them at the bottom, and pointed at the ends, but not sharp, full of a white Pith, which are serviceable, (the outward Rinde being peeled away) for Lights, to make* Rush Candles *of, being dipt into Suet or Tallow. Towards the tops of which* Rushes *on the one side, break forth several small browniish Chaffie Heads, each upon a short foot Stalk, in which are contained three corner'd blackish Seed.*

Bull Rush great.

IV. *The second, or* Our common sort of smooth Water Rush, or middle sort of Bull Rush *Its Root is not great as the former, but are a Bush of Strings or Threads. This* Rush *is in all things like the first, but much lesser and shorter, having a whitish Pith within, as the other has, which serves for the like Uses; but the Heads are longer; and the Tuft or Panicle is close, and not spread open as the next is.*

V. *The*

Ruſhes ſmooth common.

Ruſhes hard, ſmall, Common.

V. *The third*, *or* Other ſort of great ſmooth Ruſh. *The Root of this is buſhy like the laſt juſt now deſcribed. And this other greater ſort is very like to it, ſaving that it grows with a leſſer ſtore of* Ruſhes, *of a darkiſh green color; and the Tuft, or browniſh Panicle alſo, is more ſpread abroad at large, each part of it ſtanding upon a pretty long ſoot Stalk, and is broad below, and pointed upwards.*

VI. *The fourth*, *or* Smaller Bull Ruſh with diſperſed Tufts. *This differs from the greater ſort juſt before deſcribed, only in the ſmallneſs of the Plant, it growing in drier Ground; which ſome ſuppoſe to be the Cauſe of its ſmallneſs.*

VII. *The fifth*, *or* Round Headed Ruſh. *Its Root is Buſhy like to the ſecond ſort above; from which riſe up ſeveral Shoots, like to that Kind alſo, and pithy within like it: The chiefeſt difference conſiſts in this, that the Tufted Heads ſtand ſomething cloſe together, are round and not pointed at all.*

VIII. *The ſixth*, *or* Our common ſmall hard Ruſhes. *They have a ſhort buſhy, fibrous or ſtringy Root; from whence come forth ſeveral Shoots; they grow in the ſame manner as the others do, but that ſometimes the Stalks or* Ruſhes, *ſend as it were other* Ruſhes *out of their ſides, or one from another, and not all from the Root ſeparately as the others. They are alſo hard and ſharper pointed, with little or no* Pith *within them, yet are they hollow, porous or ſpongy, and their Tufts at the upper end of the* Ruſhes *are ſmall, hard, ſpread abroad, and ſhort, which break out near the tops as the others do.*

IX. *The ſeventh*, *or* Our Welsh ſharp Ruſh. *Its Root conſiſts of a Buſh of browniſh hard Fibres or Strings. The* Ruſhes *of this Kind are about 6 or 7 Inches long or more; ſomething great, hard, and ſharp pointed; from among which riſe up naked* Ruſhes *or Stalks half a Yard high; and from between two ſhort Leaves, breaks forth a ſparſed Panicle, of ſeveral ſmall Chaffy Husks, like unto* Reed Graſs, *of a browniſh Color.*

X. *The eighth*, *or* Engliſh Sea hard Ruſh. *It has a long, hard, creeping and fibrous Root, with ſeveral brown skinny Heads, out of which riſe thick, round, hard, long, and very ſharp pointed* Ruſhes, *from among which riſe up other Ruſhy Stalks two or three Feet high, bearing near the tops, about 3 Inches below them, a ſlender and long Panicle, compoſed of many Chaffie Husks, which when they are ripe, open and ſhew their Seed.*

XI. *The ninth*, *or* Greater Aglet headed Ruſh. *It has a creeping ſpreading Root, repleniſhed with many intricate Fibres, from which ſpring forth ſeveral ſlender naked* Ruſhes, *about a Foot and half long, full of whitiſh Pith, and having at the bottoms of them, certain reddiſh Skins encompaſſing them, and bearing each of them at their tops, a ſmall Catkin or Aglet, like the firſt Head of an* Aſparagus, *blooming with ſmall white Threads like a* Plantain *Head, which quickly fall away.*

XII. *The tenth*, *or* Leſſer Aglet headed Ruſh. *It has a creeping fibrous or ſtringy Root like the former, from which riſe up ſeveral ſhort* Ruſhes; *and from among them other ſlender and taller* Ruſhes *about a Foot high, each of them bearing*

ſuch a like Aglet as the former, but ſomething leſſer.

XIII. *The eleventh, or* Greater Flowering Ruſh, *or* Greater Cyperus Ruſh. *It has a long creeping or ſpreading Root, like the* Ruſhes, *buſhing out with many Fibres; from whence ſpring round ſmooth* Ruſh *like Stalks two or three Cubits high, bearing at the Head or top, a large ſpread Tuft or Umbel of pale bluſh colored Flowers (which yet* Tragus *ſays are white) with ſome Threads tipt with yellow in the middle, which falling away, there come in their places, ſmall, round, blackiſh Heads, which contain within them ſmall Seed. This* Great Flowering Cyperus Ruſh, *as it differs from all the other ſorts of* Ruſhes, *ſo it excels them all in Beauty; and has ſeveral Heads of Leaves riſing from its Root, like to thoſe of* Cyperus.

XIV. *The twelfth, or* Leſſer Flowering Cyperus Ruſh. *Its Root is ſmall, whitiſh, and Jointed; from whence proceeds a ſmall Stalk of a Hand breadth high, having three long ſharp pointed* Ruſh *like Leaves; two whereof riſe higher than the Stalk; and at the top five Flowers; flowering one after another; after which come two ſmall round Heads ſet together on each foot Stalk, of the largneſs of the* Candy bitter Vetch.

XV. *The thirteenth,* Gramen junceum maritimum Gerardi, *or* Sea Ruſh, *or* Marſh Ruſh Graſs, *called by ſome* Gooſe Corn. *It has a Root which conſiſts of many ſmall, long, and tough Strings, making a kind*

Ruſh Graſs.

of buſh as it were; from which riſes up many Ruſhy *Leaves tough and hard, of a brown color, and well reſembling* Ruſhes. *The Stalk or Stalks which are one, two, three, or more, are twice as high as the Leaves, overtopping them as it were, and are bare and naked of Leaves unto the top; which are much thicker and larger than the Leaves, on the tops of which are ſuch Huſks as on* Ruſhes, *with many ſmall pretty chaffie Buttons, or Heads, in which is contained the Seed.*

XVI. *The Places.* The firſt five grow in ſtanding Waters and by River ſides, and in watery plaſhy Places, and overflown Grounds, but the firſt uſually in the deeper Waters, not only all over *England*, but alſo in *Virginia*, *Carolina*, and other of our *Engliſh* Plantations in *Florida*. The ſixth, ſeventh and eighth grow in Fields and by High way ſides, alſo in moiſt and waſte Grounds in all Counties of *England*; but the ſeventh more particularly, *Lobel* found upon a high Hill in *Wales*, called *Brecon*, in ſeveral wet and mooriſh Grounds, in many places thereabouts: and the eighth grows in ſeveral places upon our *Engliſh* Coaſts. The ninth and tenth, both in *Flanders* and *England*, and with us in Brooks, Ponds, and other moiſt places, as alſo in ſeveral parts of *Wales*. The eleventh in watery Ditches, Pools and Plaſhes in moſt parts of this Kingdom, The twelfth grows in moiſt and watery Grounds, and has been found to grow plentifully in ſeveral places of *Switzerland*. The thirteenth grows in watery and marſhy Places near to the Sea or other Fenny Grounds, and in muddy and mirie Ditches in ſeveral places in *England*, not far from the Sea.

XVII. *The Times.* The firſt five flouriſh chiefly all the *Summer* to the end of *September*, but abide green all the Year. The ſixth, ſeventh, and eighth flouriſh all the *Summer* Months alſo, and abide in like manner always green. The ninth and tenth, flouriſh and are to be ſeen towards the end of *Summer*. The eleventh and twelfth, Flower all the *Summer* long, and their Seed ripens in the mean Seaſon. The thirteenth is green, and Flowers in the *Summer* Months to the end of *Auguſt*, and its Seed is ripe in a ſhort time after.

XVIII. *The Qualities.* *Ruſhes* are cold and dry in the firſt Degree, Aſtringent, Narcotick and Hypnotick.

XIX. *The Specification.* The Root is profitable againſt the biting of the *Phalangium:* and the Seed ſtops Fluxes, provokes Urine, and induces Sleep pretty ſtrongly, ſtopping the moſt vehement Cough.

XX. *The Preparations.* You may have therefrom, 1. *A Decoction of the Root in Water.* 2. *A Pouder of the Seed.* 3. *A Cataplaſm of the bottoms of the Leaves next the Root, and of the Root it ſelf.*

The Virtues.

XXI. *The Decoction of the Root in Water.* It induces Sleep, gives eaſe in the moſt vehement Coughs, ſtops all Fluxes of the Bowels, and the Terms in Women. The *Decoction* ought to be boiled two thirds away: Doſe a quarter of a Pint Morning and Night.

XXII. *The Pouder of the Seed.* Given from a Scruple to two Scruples in any fit Vehicle; it provokes Urine, induces Sleep and Reſt, ſtops all Fluxes of the Bowels, and the Terms in Women, and eaſes a violent Cough: it ought to be given with Caution, leſt the Patient ſleeps the Sleep of Death.

XXIII. *The Cataplaſm of the bottoms of the Leaves and Roots.* Being applyed it is ſaid to cure the biting of the *Phalangium*, or poiſonous Spider.

XXIV. *Nota*

XXIV. *Nota.* All the severall sorts of *Rushes* have one and the same *Virtues:* but the *Bull-Rushes* as they are most effectual to the purposes intended, so they are only or chiefly in Use.

CHAP. DCIX.

Of RUSH NUT, OR, EDIBLE CYPERUS.

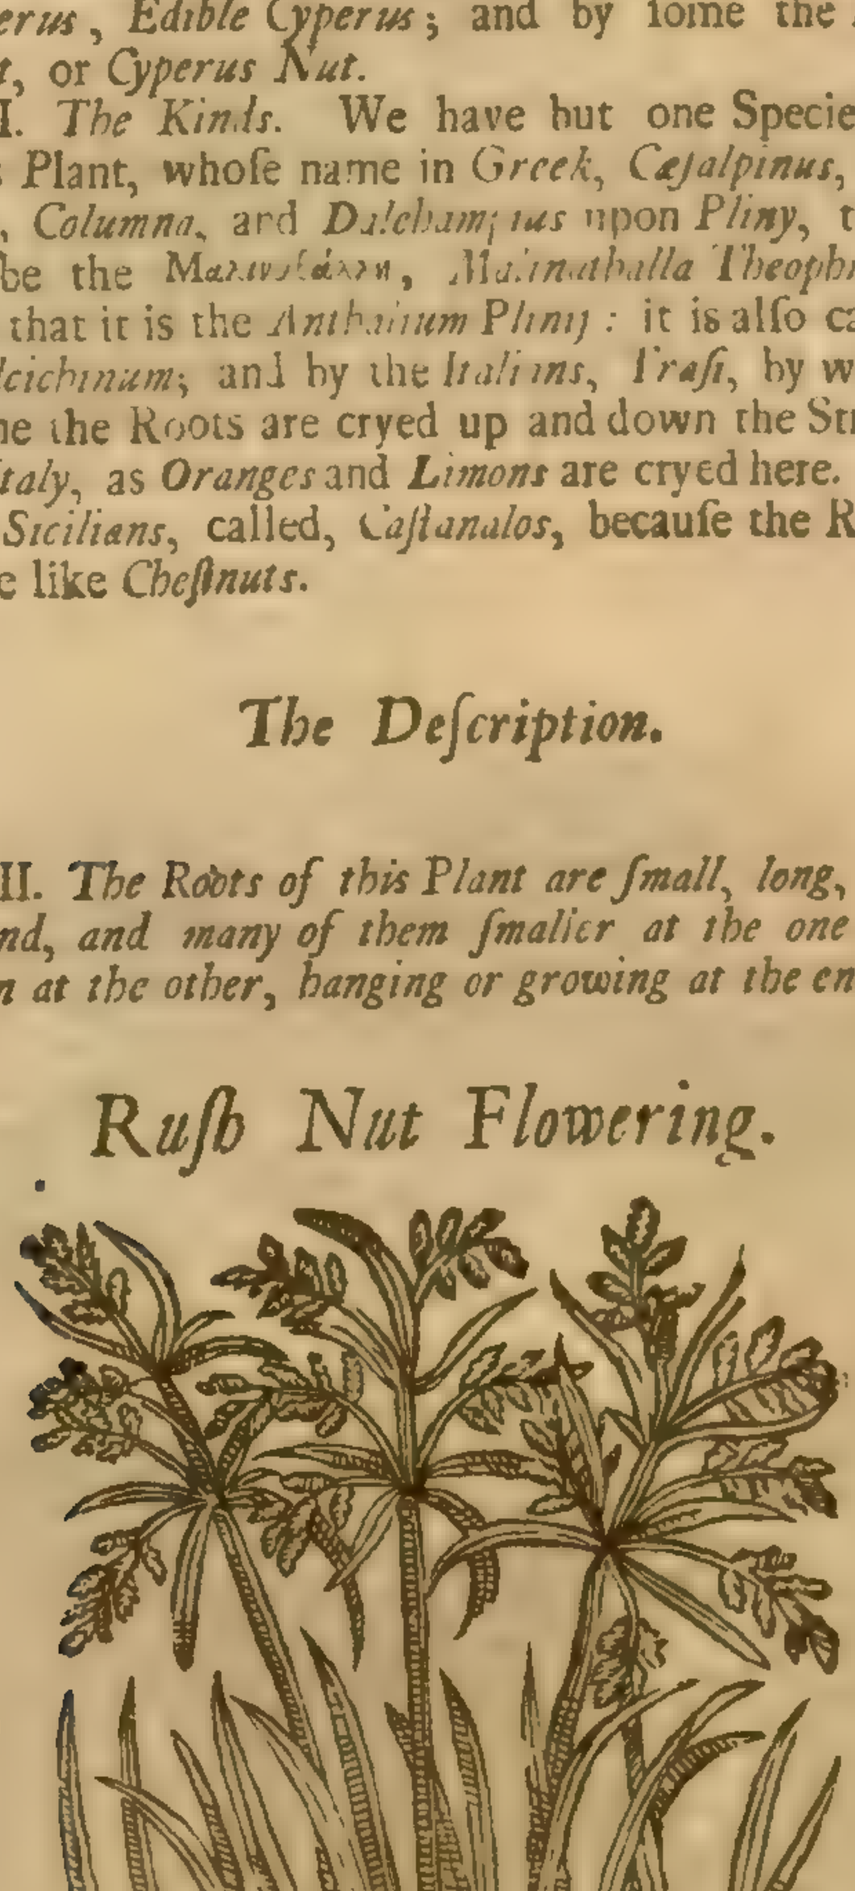
I. *THE Names.* It may be called, in *Greek*, Κύπερος καρυωδὴς, ἢ, Σχοῖνος καρύινος: in *Latine*, *Cyperus dulcis rotundis esculentus*, *Trasi dulce vocatus*; *Cyperus esculentus*; *Juncus nuceus*, *Cyperus nuceus:* in *English*, The *Nut Rush*, *Nut Cyperus*, *Edible Cyperus*; and by some the *Rush Nut*, or *Cyperus Nut.*

II. *The Kinds.* We have but one Species of this Plant, whose name in *Greek*, *Cæsalpinus*, *Clusius*, *Columna*, and *Dalechampius* upon *Pliny*, think to be the Μαντεδάλιον, *Malinaballa Theophrasti*, and that it is the *Anthalium Plinij:* it is also called *Dulcichinum*; and by the *Italians*, *Trasi*, by which name the Roots are cryed up and down the Streets in *Italy*, as *Oranges* and *Limons* are cryed here. By the *Sicilians*, called, *Castanalos*, because the Roots taste like *Chestnuts.*

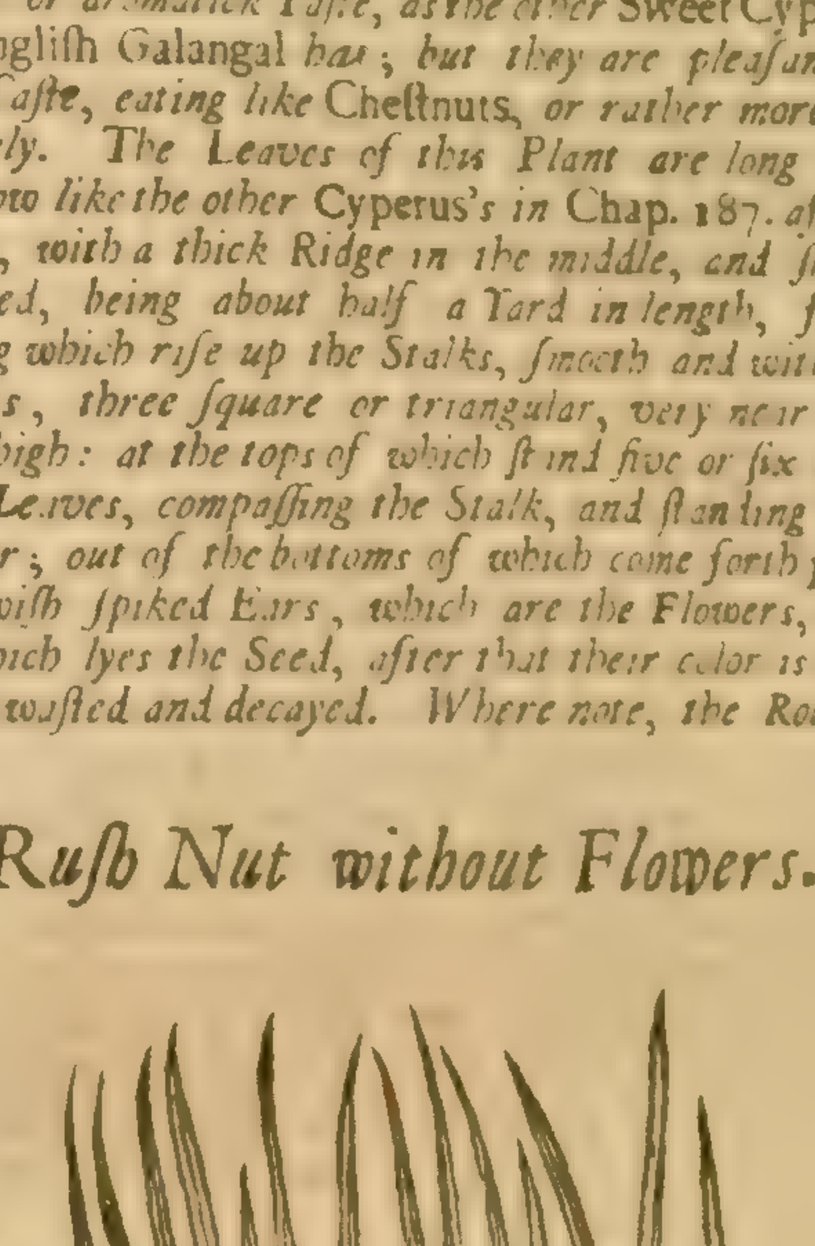
The Description.

III. *The Roots of this Plant are small, long, and round, and many of them smaller at the one end, than at the other, hanging or growing at the ends of long Strings, something like to the manner of growing of the* Virginia Potatoes, *of a pale reddish color on the out side, and white and firm within, of the bigness of large* Beans. *They have a sweet Smell, no bitter or aromatick Taste, as the other* Sweet Cyperus *or* English Galangal *has; but they are pleasant to the Taste, eating like* Chestnuts, *or rather more delicately. The Leaves of this Plant are long and narrow like the other* Cyperus's *in* Chap. 187. *aforegoing, with a thick Ridge in the middle, and sharp pointed, being about half a Yard in length, from among which rise up the Stalks, smooth and without Joints, three square or triangular, very near two feet high: at the tops of which stand five or six narrow Leaves, compassing the Stalk, and standing like a Star; out of the bottoms of which come forth pale, yellowish spiked Ears, which are the Flowers, and in which lyes the Seed, after that their color is perfectly wasted and decayed. Where note, the Root of*

Rush Nut Flowering.



Rush Nut without Flowers.



that without Flowers is not so perfectly deliniated as it should be, for sometimes one String has more than one, yea sometimes, two, three, or more Tubers adjoining to them as in the first Cut.

IV. *Johnson* in *Gerard* Describes it thus. *The* Italian Trasi *is a Plant that has many small Roots, hanging at stringy Fibres, as our* Ordinary Dropwort *Roots do; but they are of the bigness of a little* Medlar, *and have one end flat, and as it were Crowned like a* Medlar: *and it has also several streaks of Lines, seeming to divide it into several parts. It is of a brownish color without, and white within, the Taste whereof is sweet almost like a* Chestnut. *The Leaves are very like those of the* Garden Cyperus, *and never exceed a Cubit in length. It is encreased by setting the Roots, at the beginning of* November, *being first steeped in Water.*

V. *Nota. Pona* in his Description of *Mount Baldus*, confidently affirms, that he had found it by experience, in suffering the Plant to grow un-

removed for three or four Years, that it bears neither Stalk, nor Flower, nor Seed. And *Clusius* in his Annotations on *Bellonius*, *Lib.* 2. *Chap.* 40. gives a Figure without Flowers, as if it bears none; but certainly both *Pona* and *Clusius* (if he thought so) might be both as much deceived in this matter, as they that affirmed the *Colocasia*, or *Arum Ægyptium*, which is the *Carolina Eddo*, in *Chap.* 241. aforegoing, never bore Flower, which *Columna* has disprov'd. But *Matthiolus*, *Cæsalpinus*, *Lobel*, *Dodonæus*, and *Columna*, do all say, that this *Cyperus* or *Juncus esculentus*, has both Stalk, Flowers and Seed, and do give the Figure thereof, in all their Works.

VI. *The Places.* It is said to grow Naturally no where but at *Verona* in *Italy*: But *Amatus Lusitanus* says, that they are brought out of *Æthiopia* and *S. Thomas Island*; and it is said that they grow in *Sicilia*, and other hot Countries where they are Planted as being a pleasant kind of Food. They would grow no doubt naturally and pleasantly in our *West-Indies*, if they were once Planted there: but with us in *England* they grow in *Gardens*, being nurst up with care, but come not up to that absolute perfection which they do in hotter Climates, because they will not abide the extremities of our *Winters*; for as *Camerarius* says, the Roots will Rot, if they be not taken up before *Winter*, and new Planted again in the *Spring* after that they have been for some time before hand laid in Water.

VII. *The Times.* As to the Seasons of its Flowering or Seeding, Authors have observed nothing: but the Roots are taken up for eating, a little before *Winter*, at which time they are then said to be come to their perfection.

VIII. *The Qualities.* They are Temperate in respect to heat or coldness, dryness or moisture, Absterfive, Aperitive, Pectoral, Analeptick, and Spermatogenetick.

IX. *The Specification.* It is profitable against Obstructions of the Lungs; and to stop Fluxes of the Bowels, as Diarrhæa, Dysentery, *&c.*

X. *The Preparations.* You have, 1. *The Raw, or Roasted, or Boiled Roots or Nuts.* 2. *An Emulsion, Cream or Milk.* 3. *A Decoction made in Beef or Mutton Broth.*

The Virtues.

XI. *The Raw, or Rosted, or Boiled Roots.* They are eaten as you eat *Chestnuts*; and so eaten with a Glass or two of *Canary*, *Malaga*, or some other choise Wine, they nourish and restore much, are good against Consumptions; and is said by some Authors to incite to Venery, being eaten for some considerable time. They absorb Acidities, and allay the sharpness of Humors in the Bowels, cool the heat of Urine, and stop Fluxes of the Belly, as Diarrhæa's, Dysenterias and Lienteria's.

XII. *The Emulsion, Cream, or Milk.* It nourishes much and restores in Consumptions, more especially if it is made with the strong Broth of Flesh; and so made and taken with some Generous Wine, it more powerfully excites to Venerial actions: In a word, it has all the Virtues of the *Simple Roots*, but strengthens more speedily and with greater vigor: It eases a violent Cough, and expectorates Flegm out of the Lungs.

XIII. *The Decoction in Beef or Mutton Broth. It is made of the Roots sliced or bruised, and so boiled all to a Pap, or Pulp.* It has all the Virtues of the *Simple Root*, and *Emulsion* or *Cream*, and may be taken from half a Pint to a Pint, (according to Age, *&c.*) Morning and Evening, as ordinary Food. It is an excellent thing, and restores Consumptive Persons admirably.

CHAP. DCX.

Of SAFFRON Garden.

I. *THE Names.* It is called in *Arabick*, *Zahasaran* and *Zaffaran:* in *Greek*, Κρόκος: in *Latine*, *Crocus:* and in *English*, *Saffron.*

II. *The Kinds.* Authors make many Species of this Plant: but we shall give you the History only of the four following sorts, *viz.* 1. *Crocus Hortensis & verus*, The true or Garden Saffron, of which in this Chapter. 2. *Crocus Sylvestris*, The Wild Saffron, commonly called Crocus, of which in *Chap.* 611. 3. *Crocus Pratensis Colchicum*, Medow Saffron, of which in *Chap.* 612. 4. *Crocus nothus, Carthamus*, Bastard Saffron, of which in *Chap.* 613. following.

III. *The Garden Kind.* This is the *True Saffron*, and is simply called *Crocus:* That which grows in *England* exceeds all others, growing in what part of the World soever: It is a singular Plant of the Kind, and is called *Crocus verus*, *Crocus Hortensis*, and *Crocus Sativus Autumnalis*, The True Saffron.

The Description.

IV. *Its Root grows often to be as great or greater than a* Green Wallnut, *with its outward Shell or Green on it, covered with a grayish, or* Ash *colored*

Saffron Garden Flowering.

Skin,

Skin, which breaks out into long hairy Threads, otherwise than in any other Root or Crocus. *From which Root spring forth first some narrow, long, green Leaves, and after a while, about the end of* August, *in* September *and* October, *the Flowers come forth from among their middle, which are mean, or large and fair, according to the goodness of the Soil, and Climate, in which they grow. These Flowers are as large as any of the Flowers of the* Wild Kinds *in the following Chapter, composed of*

Saffron Garden True.

six Leaves apiece, of a murry or reddish purple color, having a shew of blew in them: in the middle of these Flowers there are some small yellow Chives standing upright, which are as unprofitable, as the Chives in any of the other Crocus's *or* Wild Saffrons *in the following Chapter. But besides these, each Flower has two, three, or four greater and longer Chives, hanging down upon, or between the Leaves, which are of a fiery red color, which are the true Blades of* Saffron, *which we daily used in Food and Medicine, and no others. All these Blades being pickt from the several Flowers, are laid together in Cakes, and so pressed, and then dryed cautiously in a Kiln, or Stove, to preserve them, just as you see the* Saffron *Sold in the Shops. We never saw or heard that the Flowers yielded Seed whether in* England, *or any other Country where ever it yet grew.*

V. *Gerard* describes this plant after this manner. *Its Root is small, round and bulbous. The Flower does first rise out of the Ground nakedly in* September, *and consists of six small blew Leaves, tending to purple, having in its middle many small yellow Strings or* Threads; *among which are two, three, or more thick fat Chives, of somewhat a reddish and fiery color, and of a strong Smell when they are dryed. Shortly after the Flowers, come forth small, long, grassy Leaves; the Plant never bearing its Flowers and Leaves at once or together.* We have here given you two Figures of the *True Garden Saffron*, which do yet set forth but one and the same Plant, the first shewing it in its prime state of Flowering; the second in its small, long, grassy Leaves.

VI. *The Places.* It is a Native of *England*, and in our Island the best *Saffron* in the World grows. The best *Saffron* is said to grow at *Saffron Walden* in *Cambridg-shire*, and places adjacent thereto; also most excellent *Saffron* grows in several places in *Wales*: but besides it grows plentifully in *Spain*, *Italy*, *Barbary*, *Germany*, *Flanders*, *France*, and several other Countries of *Europe*.

VII. *The Times.* The Times of its Flowering are at the end of *August*, and through all the Month of *September*, and sometimes in *October* if the Weather is mild: presently after the Leaves spring up, and remain green all the *Winter*. It looses its Fibres with its Leaves, and may then be taken up, and kept dry until *August*; but the Roots of this *Garden Kind* (which are bigger than of any other *Crocus*, and are covered with a hairy Skin: and so easily to be distinguished from all others) are generally taken up but once every third Year, which is often enough; and then the Ground is to be prepared again for their replanting.

VIII. *The Qualities.* It is hot in the second, and dry in the first Degree; a little Astringent or Binding, Digestive, Cardiack, or Cordial, Analeptick, and Alexipharmick.

IX. *The Specification.* It is profitable against Convulsions, Fainting and Swooning Fits, Palpitation of the Heart, Measles, Small Pox, Spotted Fever, and the Plague or Pestilence, as also all other Malign and Contagious Distempers: It is said also to cure Consumptions, or Ulcers of the Lungs, and most dangerous Asthma's, the Yellow Jaundice, and all Diseases of the Eyes: It provokes Urine and the Terms, facilitates the Birth, and brings away the After-birth, and causes a due cleansing.

X. *The Preparations.* You may have therefrom, 1. *A Pouder of the Saffron.* 2. *An Infusion in Wine.* 3. *An Infusion in Fennel, or Damask Rose Water, or Milk Water, or in Womens Breast Milk.* 4. *A Tincture.* 5. Tinctura Croci Composita, *A Compound Tincture of Saffron.* 6. *A Spirit.* 7. *A Distilled Oil.* 8. *An Extract, or Essence.* 9. *An Oil by Insolation, or Infusion.*

The Virtues.

XI. *The Pouder.* Given from 10 Grains to a Scruple in a little *Syrup of Citron Peels*, or in a Glass of Generous Wine, it is said to cure the Astthma, even the most dangerous shortness of Breath, and difficulty of Breathing, and that when it is said that Death as it were stands at the Door. It is also a special Remedy for Consumptions, or Ulcers of the Lungs, taken Morning and Night, more especially if exhibited in a half a Dram, or a Dram of *Balsam of Peru*. And given in a Glass of *Madera*, or other Generous Wine, it is good against Surfeiting, Concocts crude and raw Humors of the Stomach, opens Obstructions of the Lungs, Liver, Spleen and Womb, revives the Spirits, and chears the Heart.

XII. *The Infusion in Wine.* It has all the former Virtues; but is not altogether so powerful as the *Tincture* following. And is thus made, *Take choise Canary a Quart; of the best English Saffron an Ounce; mix, and Infuse in a cold Digestion for 40 Days or more, shaking the Bottle once every Day; let it settle, and decant the clear: to the*

Faces

Feces put a Pint more of the same Wine; digest 3 Weeks, shaking the Bottle once every Day; and then letting it stand till it is settled, decant the clear into the former Infusion, and so keep it for use. Sixty or eighty Drops may be given of it at a time in a Glass of Wine, against Fainting and Swooning Fits; as also it may be given in *Barly Broth*, or other proper Vehicle, as *Aqua Mirabilis*, against the Measles, Small Pox, Spotted Fever, and the Plague or Pestilence, as also against all other Malign and Contagious Diseases, both as a Prophylactick or Preservative, and as a Curative. It provokes the Terms in Women, and facilitates the Birth of Women in Labour, bringing away the After-birth, and causing a due cleansing afterwards; but then it ought to be given from half a Spoonful to a Spoonful at a time, in a. Glass of White *Port* Wine Mull'd, and to be repeated according at you see need requires. Dropt into the Ears it is good against Pain and Deafness.

XIII. *The Infusion in Fennel, or Damask Rose Water, or in Milk Water, or in Womens Breast Milk.* It cures Diseases and Soreness of the Eyes, Blood-shot, and the like; and is of excellent use to preserve them from being hurt in the Small Pox or Measles, being dropt into them, defending them from the Flux of Humors, which is apt to fall upon them.

XIV. *The Tincture. It is made by mixing an Ounce of the best English Saffron with a Quart of Spirit of Wine in a cold Digestion for* 40 *Days, shaking the Bottle once every Day; if half an Ounce of Cochinele be added to the Saffron, and* 2 *Ounces of the best rectified Spirit of Salt, digesting cold, as aforesaid, and then decanting the clear Tincture; it will be of double strength, and have all the Virtues of the Pouder and Infusion in a superabundant manner.* It chears the Heart, resists Melancholy, and enervates the Venom of Malign Diseases: being profitable against the very Plague or Pestilence it self, defending the Head, Brain, Nerves, Stomach, Heart, and Vital Powers from the Contagion, and the very extream force of the Disease. It may be given from half a Dram to a Dram, or 2 Drams, according as the exigency requires, in any proper Vehicle. You may also make it thus, *Take choise English Saffron an Ounce; Spirit of Saffron, or Tincture of Salt of Tartar a Quart; put them into a Bolt Head, and digest cold, or in a very gentle heat for* 8 *or* 10 *Days, then decant the clear Tincture, and keep it for use.* It has all the former Virtues, besides which it is good against Hysterick Fits, Convulsions, Palpitation of the Heart, Sickness at Stomach, and other like Distempers. *Take Angelica, or Bawm, or Borage Water,* 3 *Ounces, Syrup of Citron Peels* 1 *Ounce; Tincture of Saffron* 1 *Dram; mix for a Cordial* in Fainting and Swooning Fits, Convulsions, *&c. Take Angelica Water, Treacle Water, of each an Ounce; Syrup of Clovegilliflowers* 6 *Drams; Tincture of Saffron a Dram and half; mix for a Dose,* to be given in Malignant Fevers, Small Pox, Measles, Plague, *&c.*

XV. *Tinctura Croci composita,* The Compound Tincture of Saffron. *Take choise English Saffron an Ounce and half; Cochinele in fine Pouder an Ounce; Cloves, Nutmegs, Virginia Snake Root, Winters Cinamon, Mace, of each* 6 *Drams all in Pouder; Spirit of Saffron, or Tincture of Salt of Tartar,* 3 *Pints, or something more: Spirit of Salt* 2 *Ounces: mix, digest in a Bolt Head close stop for* 8 *or* 10 *Days, then decant the clear Tincture and keep it for use.* It has all the Virtues of the *Pouder, Infusion,* and *Simple Tincture,* but is more potent to all the said purposes and Intentions, and may be given in the same manner and Dose. *Take Hydropiper Water, choise Canary, of each* 2 *Ounces; Syrup of Pennyroyal an Ounce; of this Tincture* 2 *Drams, or more; mix them for a Dose,* to facilitate the Birth, or bring away the After-birth.

XVI. *Spirit of Saffron. It is made as you make Spirit of Lavender, and other like things.* It strengthens and fortifies the Heart, comforts all the Spirits, Natural, Vital, and Animal, provokes the Terms, and facilitates both Birth and After-birth. The *Elixir* is much better than the *Spirit*, being the *Potestates Croci* impregnated with the *Saffron* it self; but it is a thing rare, or very difficult to be obtained, by reason it is so chargeable a Medicine.

XVII. *The Distilled Oil of Saffron. It is Drawn like other Vegetable Oils with Water; so have you a Water and Oil of Saffron together, from which the Oil is to be separated, with a separating Funnel.* It is very costly, for a Pound of *Saffron* will yield but one Dram of pure *Oil.* It has all the Virtues of the *Pouder, Tincture,* and *Spirit*, and may be given from 2 to 6 Drops in any proper Vehicle. But some cheating People make a *Counterfeit Oil of Saffron,* thus, *Take choise Saffron a Pound, impregnate it with Oil of Turpentine an Ounce; Spirit of Wine* 10 *Drams: Distill from Water with many Cohobations, then separate the Oile from the Water.* It is useful for the purposes aforementioned, and for external Disaffections of the Nerves, Muscles, and Joints, as Pains, Aches, Gouts, Cramps, Palsies, *&c.*

XVIII. *An Extract, or Essence. It is made by evaporating the Tincture to a due Consistence.* It has all the Virtues of the *Tincture* but not so potent, because many of its Volatile and Spiritual parts are lost; but if the *Spirit be evaporated or drawn off in Balneo*, you may keep it for *Spirit of Saffron. Take Extract of Saffron an Ounce; Mithridate half an Ounce; Virginia Snake Root, Cochinele in Pouder, of each* 3 *Drams; mix them.* Dose 1 Dram Morning and Night, against Fainting and Swooning Fits, Measles, Small Pox, Plague, difficult Labor, *&c.*

XIX. *Oil of Saffron by Insolation or Infusion.* It is Anodyn, comforts the Nerves, Muscles, and Joints, eases pains of the the Stomach and Spleen, and ripens Apostems, *&c.* See more of *Saffron*, in our *Seplasium; Or, Druggists Shop, Lib.* 8. *Chap.* 4. *Sect.* 4.

CHAP.

CHAP. DCXI.

Of SAFFRON Wild;

Commonly called,

CROCUS.

I. *THE Names.* It is called in *Greek*, Κρόκος ἄγριος: in *Latine*, *Crocus Sylveſtris*: and in *Engliſh*, *Wild Saffron*, but more commonly by our Gardiners and Floriſts, *Crocus*, and *Crocus's* when ſpeaking of the ſeveral Kinds thereof.

II. *The Kinds.* There are ſeveral Species of this Plant, As they are denominated from their Times or Seaſons of Flowering, which are, *Firſt*, *thoſe of the Vernal Kinds*, or which Flower in the *Spring*, which are I. *Thoſe of a white Color*, II. *Thoſe of a Purple Color.* III. *Thoſe of a Yellow* under every one of which Colours there are ſeveral Varieties. *Secondly*, *Thoſe of the Autumn Kind*, or which Flower in the Fall of the Leaf. The ſeveral Varieties of all theſe general Species are ſo many that we ſhall not trouble you with the Catalogue of their Names in this Paragraph, but rather give you each of them in their order as we ſhall now deſcribe them.

The Deſcriptions.

I. Vernal White Crocus's.

III. 1. *Crocus vernus albus perfectus minor*, The Vernal or Spring ſmaller pure white Saffron Flower, or Crocus. *Its Root (by which it is plentifully encreaſed) is ſmall, round and flat at Bottom, ſomething White on the outſide, but whiter within, ſhooting out ſmall Sprouts on every ſide thereof, which is the beſt Obſervation to know this kind, and the leſſer Purple by their Roots being both alike, and differing from all other, the Roots of the* Saffron *Flowers or* Crocus's. *This ſmall* Crocus *ſprings up in the beginning of the Year, with three or four ſmall green Leaves, ſomething broader, and much ſhorter then the true* Saffron *in the former Chapter, each Leaf having a white Line down its middle, between theſe Leaves out of a white Skin, riſes up one or two ſmall Flowers, conſiſting of ſix Leaves a piece, as all the reſt in general are, of a pure white Color, without any Mixture in it, which abide not in Flower above a Week or ſcarcely ſo much, ſo quickly is the delightful Appearance of this, and the purple* Crocus, *leſt. It flowers not for the moſt part untill a Month after the flowering of the yellow* Crocus, *and ordinary ſtript* Crocus's *are paſt. The Seed is ſmall, round and reddiſh, yet not ſo Red as the Seed of the* Yellow, *contained in three cornered Heads; which yet notwithſtanding, very ſeldom bears ſo as to be fruitful.*

IV. 2. *Crocus albus major multiflorus*, The great Snow White Crocus. *This greater* Saffron Flower *or* Crocus *riſes up uſually with three or four green* Leaves, *larger than the former, with a white Line in every one of them. The Flowers are greater and more in Number, riſing together, but flowering one after another, of a pure Snow white Color, and continuing but a little longer in Flower than the former.*

V. 3. *Crocus albus major alter*, *Maſſilius Dalus*. The other great White Saffron Flower *or* Crocus, *or* Crocus *of Media. Its Root is not covered with any reddiſh Skin, but rather with a pale Tunicle or Coat. This great White Median Crocus riſes up out of the Earth, almoſt as early as the firſt ſort of the yellow, with four or five Leaves, being very like unto the Leaves of the Yellow Crocus, and as large, with white Lines in them. The Flowers alſo are as large as the Flowers of the Yellow, and many likewiſe, riſing one after another, like unto it, but not of ſo pure a white Color, as the former laſt deſcribed, but rather tending to a Milky or Cream Color.*

VI. 4. *Crocus albus Maſſacus fundo purpureo*, The great Meſian white Crocus with a blew Bottom. *This Kind is like unto the former in all things, ſaving that the bottoms of the Flowers, with ſome part of the Stalk next the Flower, are of a pale ſhining purple color, and riſing up a pretty way into the Flower: whereas another alſo of this Kind, has a little ſhew or mark of blew, and not purple, at the bottom of the Flower only, which makes the difference.*

VII. 5. *Crocus albus fundo purpureo*, The white Crocus with a purple bottom. *This is of the ſame Kind with the firſt, as well in its Root, as in its Leaf and Flower, in none of them differing from it; but that in the bottom of this Flower, with that part of the ſhort foot Stalk next unto it, is of a Violet or purple color, and ſometimes having here and there ſome ſmall purple Lines or Spots in the white Leaves. It Flowers alſo with the firſt White, or ſomething later.*

VIII. 6. *Crocus Vernus albus ſtriatus*, The ſtriped white Crocus. *Its Root is white on the out ſide like the firſt* White, *but greater, with young ones growing round about it. This* Stri'p'd Crocus *is likewiſe near a kin to the firſt* White Kind, *having the like Leaves and Flowers, ſomewhat larger, but fading almoſt as ſoon as they: but herein this Flower differs, that it has pale blewiſh Lines and Spots, in all the Leaves thereof, but more eſpecially on the three outward Leaves.*

IX. 7. *Crocus Vernus albus polyanthos verſi color*, The greater particolored white Crocus. *Its Root is ſomething like the* Second White, *but of a little more dusky color on the out ſide, and not budding out on the ſides, or but very little. This* Greater particolored Crocus *has its green Leaves like unto the* Second great white Crocus *before deſcribed, at* Sect. 5. *having more Flowers than any of the former, except the* Firſt great White *at* Sect. 4 *above, the Leaves whereof have greater Stripes than the laſt deſcribed* Crocus, *but of a purple* Violet *color, making each Leaf ſeem oftentimes to have, as much purple as white in them.*

X. 8. *Crocus Vernus albus verſicolor minor*, The leſſer particolored white Crocus. *Its Root is like unto the laſt; and its Leaves and Flowers are for their bigneſs equal in a manner with them: but it has not ſo many Flowers riſing together from the Root. The Flower is finely mark'd with blew Strakes on the white Leaves, but nothing ſo much as in the former.*

XI. 9. *Crocus Epiſcopalis*, The Biſhops Crocus. *This Flower is particolored, and is very like both in its Leaves and Roots unto the* Neapolitan blew Crocus, *but ſomething larger. The Flowers do abide not ſo long a time blown, and have all their Leaves wholly white, with blew Stripes on both ſides of them, or wholly of a fine delayed blew* Violet *color, and the three inmoſt more blew, and finely Striped, both on their inſides and outſides; and ſometimes it has been ſeen to have 3 Leaves white, and 3 Leaves of a pale blew.*

XII. 10.

XII. 10. *Crocus Vernus ſtriatus vulgaris*, The common ſtriped Crocus. *This is another ſort of ſtriped Flower, which is the moſt common and plentifull in almoſt every ones* Garden; *it is here brought under the Claſſis of the* White Kinds, *tho it differs ſignally in its Root, Leaf and Flower from them all. Its Root is differing from all the former, being rounder and bigger than any of them, except the* Meſian Kinds, *yet ſomething flat withal, not having any Shoots from the ſides, but ſetting off into Roots or little Bulbs plentifully, having a round Circle encompaſſing the bottom of the Root, which eaſily falls away, when it is taken up out of the Ground, and covered with a brown Coat, ſomething near the color of the* Yellow Crocus, *but not altogether ſo bright. The Leaves of this riſe up ſooner than the Leaves of the* Yellow *or* White Crocus's, *lying ſpread upon the Ground for the moſt part, and narrower than any of the former. From among theſe Leaves ſpring up ſeveral Flowers, almoſt as large as the former* Great white Crocus, *of a very bleak or pale purple color, tending to white on the inſide, and in many almoſt white, with ſome ſmall whitiſh Chives, tipt with yellow in the middle. The three outward Leaves are of a yellowiſh white color on their back ſide, ſtrip'd every one of them with 3 broad Stripes, of a dark murry or purple color, and a little ſprinkled with ſome ſmall purple Lines on both ſides thoſe Stripes; but on the inſide, of the ſame pale purple or white color with the reſt. The Seed hereof is ſomewhat darker colored, than that of the* White, *and is more plentiful in bearing.*

XIII. 11. *Crocus Vernus ſtriatus Turcicus*, The Turky ſtriped Crocus. *The Flower of this Kind is a little larger, and of a deeper purple color, both on the inſide, and on the outſide: the green Leaf is alſo bigger, and of a more whitiſh hue.*

XIV. 12. *Crocus Vernus capillarifolio albus*, The ſmall Leav'd, *or* Graſs Leav'd white Crocus. *This* White Crocus *is in all things like unto the purple of the ſame Kind in* Sect. 27. *following, but that the Flower of this is wholly white; the full Deſcription whereof, therefore we ſhall here forbear, for that you will have it at large in the ſaid* Sect. 27. *to which I refer you.*

XV. 13. *Crocus plumatus pallidus*, The pale Feathered Crocus. *It is ſomething like the* White Crocus Mæſiacus, *but larger, and not ſo round pointed. The Stalk and bottom of the Flower is blew, like unto it. The three outward Leaves on the backs or outſides are all white, or Silver colored; and on their inſides finely ſtriped with ſmaller and longer Stripes of a pale blewiſh purple. The three inner Leaves are ſtriped with the ſame color, but ſmaller on both the ſides thereof: this is not ſo common as many of the others are, and is indeed one of the beſt we have.*

XVI. 14. *Crocus Imperialis*, The Imperial Crocus. *It has many Flowers riſing from one Root, which are of a Silver color, ſtriped on the backs of the Leaves with purple, which when they are open, are ſeen through on the other ſide. This encreaſes ſo faſt, that it is grown very common. Of this Kind there are two other; the one larger, and the other ſmaller, and of the ſame faſhion, and color, and marking.*

XVII. 15. *Crocus Regalis*, The Royal Crocus. *It is like to the* Imperial *but larger, and better ſtriped with deep purple, more eſpecially on the backs of the three outward Leaves. From the Seeds of this, ſeveral varieties have been raiſed, differing from the Original, ſome being larger, others ſmaller, and ſtriped with deeper or paler purple: but in all theſe Flowers the* White *has the Maſtery, and therefore they are numbred with that color.*

II. Vernal Purple Crocus's.

XVIII. 16. *Crocus Vernus purpureus minor*, The ſmaller purple Crocus. *This has its Root, and green Leaves ſo like unto the firſt* White Flower'd Crocus, *that they can ſcarcely be diſtinguiſhed, only they ſeem to be a little narrower. The Flower is alſo much about the ſame bigneſs, or a little bigger, and ſeldom bears above one Flower from a Root, even as the firſt does, of a deep purple* Violet *color, the bottom of the Flower with the upper part of the Stalk next thereunto, being of a deeper or blacker purple; in the middle of the Flower, are ſome ſmall pale Chives, tipt with yellow Pendents, and a longer Pointel, divided or forked at the the top. It bears Seed very ſparingly as the* White *does, and is reddiſh like unto it, but recompenſes that defect with a plentiful encreaſe by the Root; and Flowers at the very ſame time with the* White, *and enduring as little a while. Its Root is in all things ſo like unto the firſt* White, *that it is impoſſible for the wiſeſt and moſt converſant therein, to know the one from the other.*

XIX. 17. *Crocus Vernus purpureus maximus*, The greateſt purple Crocus. *Its Root is like unto that of the* Greater blew Neapolitan Crocus, *which is flat and round, with a dusky colored outſide, whoſe Head for ſpringing in it, is ſcarcely to be diſcerned. It is of the ſame Kind with the* Neapolitan *as well in its Leaf as its Root, but greater: for the green Leaves hereof are the greateſt and broadeſt of all other* Crocus's, *with a large white Line in the middle of every one: it ſprings up much later than the former, and does not ſhew its Flower till a good while after the other is paſt. The Flowers alſo are the largeſt of all theſe* Spring Crocus's, *and equalling, if not ſurpaſſing that* Purple Kind *which Flowers in* Autumn, *hereafter deſcribed, of a very fair, and deep* Violet *color, almoſt as deep as the former. The Seed Veſſels are large alſo and white, in which is contained pale reddiſh Seed, like unto the* Neapolitan blew Kind, *but ſomething greater.*

XX. 18. *Crocus Vernus purpureus alter Apicibus albidis*, The purple Crocus the tops of whoſe Flowers are whitiſh. *This Species of the* Purple, *has the tops of its purple Flowers whitiſh for the breadth of half the Nail of a Man's Hand, and abides conſtant every Year in that manner, and in that thing it only or chiefly differs from the laſt before deſcribed, being of the ſame Species.*

XXI. 19. *Crocus Vernus Neapolitanus, ſive, Cæruleus major*, The greater blew Crocus of Naples, or Greater Neapolitan blew Crocus. *Its Root is not very great, but a little dark on the outſide, being round and flat withal, ſo that one can hardly know which is the upper ſide thereof. It riſes up with divers green Leaves broader than any of the former, except the* Purpureus maximus *at* Sect. 19. *above, with a white Line running down the inſide of every Leaf, as in that: from among which riſes up (out of divers great long white Skins) ſeveral large white Flowers, but not fully ſo great as thoſe of the* Maximus *at* Sect. 19. *conſiſting of ſix Leaves apiece, of a paler blew or* Violet *color than in the ſaid* Maximus; *having in the middle of the Flowers, a few pale Threads tipt with yellow, and a longer Pointel of a Gold yellow color, forked or divided at the top, ſmelling ſweeter than the* Maximus, *and abiding a great while longer, being in Flower uſually even with the* Stript yellow Crocus, *or before the* Maximus, *and yielding greater plenty of Seed.*

XXII. 20.

XXII. 20. *Crocus Neapolitanus præcocior*, The more early Neapolitane Crocus. *This Species differs very little from the former, either in its Root, Leaf, or Flower, whether for Largeness or Color; saving that it seems to be of a little bleaker or paler blew; and that it Flowers something earlier.*

XXIII. 21. *Crocus Vernus purpureus striatus*, The strip't Purple Crocus. *Its Root is like unto the first* Neapolitane, *and Flowers much about the same time with it: Its Leaves are also as large and broad as those, and rather a little longer. The Flowers are also as plentiful and as large, of a fine Dilated Purple Colour on the out-side, with three broad streaks or lines down the back of the three outward Leaves, and of a little deeper Purple on the inside, as the other three Leaves also are, and striped with the same deep Purple about the ground or bottom of the Leaves. This sometimes yields three square Heads, containing in them brown-ish Seed.*

XXIV. 22. *Crocus Vernus purpureus verior*, The Silver striped Purple Crocus. *The Root of this is not so flat as that of the* Neapolitane; *tho' like it, and covered with a dark Ash Coloured Skin. It is in its Leaves and Flowers something like unto the last before Described, but a little smaller: The Flowers are of a little deeper Purple through the whole Leaves, striped with white Lines, both on the Leaves and towards their edges, which makes it a peculiar Species from all the rest, and it Flowers about the same time.*

XXV. 23. *Crocus Purpureus Flammeus major*: The greater Purple Flame Coloured Crocus. *Its Root is White on the outside, somewhat flat and round, but not so flat as the* Neapolitane Crocus *before described. Its green Leaves are of a reasonable length and breadth, and of a Pleasant fresh Greenness, with a fair broad white Line down their middles, but not rising out of the Ground so early as the next described* Crocus. *The Flowers are likewise of a mean bigness, of a pale Purple on the out-side, something whitish, especially the three outward Leaves, but on the inside of a deeper Purple, and striped with great Stripes like Flames, having some Chives in the middle, and a longer one also feathered a little at the top.*

XXVI. 24. *Crocus Purpureus Flammineus minor*, The lesser Purple Flame Coloured Crocus. *Its Root is very like unto the former, but a little lesser. It has almost as broad and long green Leaves as the former, and of the same Greenness, which rise up earlier than they. It is in Flower something before that, and its Flower is a little smaller, but of as deep a Purple on the outside, as on the inside: Flamed with fair broad Stripes from the middle of the Leaves, or somewhat lower, unto the Edges; each of these give Seed of a pale reddish Color.*

XXVII. 25. *Crocus Vernus Purpureus Capillarifolio*: The Purple Crocus, with small or almost Grass like Leaves. *Its Root is very small and round, having one side at bottom lower than the other, very like the Roots of* Colchicum, *or* Medow-Saffron; *and something near resembling also the Hoof of an Horse Foot, covered with a very thick Skin, of a dark or blackish brown color. This small* Crocus *rises out of the Earth with two or three long and small green Leaves, very like unto the Leaves of the fine* Feather-Grass, *standing upright at first, but afterwards lying upon the Ground. From among which, come forth the Flowers, sometimes three, but most usually two upon one Stalk, if the Root be not Young, which then will bear but One on a Stalk, which is very short, so that the Flowers scarcely rise above the Ground, yet laying themselves open in the Day time if it is Fair, and the Sun Shines; otherwise they remain close, and open not at all. And after one Flower is past, which does not continue above 3 or 4 Days at most, the others follow, which are of a bleak blewish Purple in the middle of the Flower, and of a deeper Purple towards the ends or points of the Leaves, but of a more dull or dark Purple on their outsides, and yellowish at bottom, with some yellow Chives in the middle. The Seed is small, and darker coloured than any of the former* Crocus's, *contained also in small Heads, standing one by another upon the same short Footstalk, which then rises up a little higher, shewing the manner of the standing of the Flowers, which in their Flowering time could not so easily be discerned. This Flowers the last of all the former sorts of* Crocus's, *even when they are all past.*

XXVIII. 26. *Crocus Vernus Purpureus Striatus Capillarifolii*, The Striped Purple Crocus with Capillary or small Leaves. *The Root of this is somewhat larger than the former, and rounder, but covered with as thick and as brown a Skin. This small* Crocus *has such like Leaves as the last Described; from among which, rises up the Flower upon as short a Foot-stalk, consisting of six Leaves like the former, of a fair Purple color on the outside of the outward Leaves, with three Lines or Streaks down each Leaf, of a deeper Purple color; and on the inside of a paler Purple, as the other three Leaves also are, with some Chives tipt with yellow Pendents, and a forked Pointel in the middle. It Flowers about the same time with the former.*

XXIX. 27. *Crocus Plumatus Purpureus*, The Purple Feathered Crocus. *This is like the greater Purple, but a little bigger and rounder pointed, the three outward Leaves of the Flowers, are of the same Purple color, and feathered with white on both sides thereof; the three inner Leaves are thick Striped with White upon a paler Purple on both sides likewise: And this is accounted the best of all the sorts of* Crocus's, *which have hitherto come to our Knowledge.*

III. Vernal Yellow Crocus's.

XXX. 28. *Crocus Vernus luteus, sive Mæsiacus*; The yellow Crocus, *or* Mesian Crocus. *Its Root is great and round, as great or greater than a* Wallnut *sometimes, and covered with reddish Skins or Coats. It rises up with 3 or 4 Leaves out of the Ground, being somewhat near the breadth of the* Great purple Kinds, *with a white Line in them, as in most of the rest. The Flowers grow out from the middle of of these Leaves, and are very large, of a Gold yellow color, with some* Chives, *and a forked Point in the middle. The Seed hereof is of a brighter color, than in any of the other. This Plant yields more store of Flowers than most of the former, and begins to blow with the first sorts, or presently after, yet out lasts many of them, the Flowers being of a pleasant good Smell.*

XXXI. 29. *Crocus Vernus luteus Flore aureo*, The yellow Crocus of a deeper Gold yellow color. *This is of the same Kind with the former, but its Flowers are of a deeper Gold yellow; so deep, that they appear reddish withal.*

XXXII. 30. *Crocus Vernus luteus Flore pallido*, The pale yellow Crocus. *This is another Kind very like the former, whose Flowers are very pale, between a white and a yellow, but not differing from it, in any thing else.*

XXXIII. 31. *Crocus Vernus luteus Flore viredante luteo*, The greenish yellow Crocus. *This is a* Crocus *something smaller than the former; and its*

its Flower has a ſhew of greenneſs in the yellow, and alſo more green at the bottom.

XXXIV. 32. *Crocus Vernus luteus maximus*, The greateſt yellow Crocus. *This is like the* Firſt yellow Crocus *at* Sect. XXX. *above, being a variety raiſed from the Seeds thereof. The Flowers are of a deep yellow color, and as large as the* Greateſt Purple, *for which thing it is very much eſteemed.*

XXXV. 33. *Crocus Vernus flavus ſtriatus*, The yellow ſtriped Crocus. *Its Root is very like the Root of the* Firſt yellow Crocus *at* Sect. XXX. *aforegoing, but ſomething ſmaller and ſhorter, and covered with the like reddiſh Skins, but a little ſadder. It riſes up with a greater ſtore of narrower and greener Leaves than the* Firſt Yellow; *and after the Leaves are ſpread, many yellow Flowers riſe up from among them, which are not of ſo bright and fair yellow color, but more dead or dull, having on the backſide of each of the 3 outermoſt Leaves, 3 ſmall Stripes of an overworn or dull purple color; with ſome Chives, and a Pointel in the middle. It Flowers not ſo early as the* Firſt Yellow, *but abides almoſt as long as it.*

XXXVI. 34. *Crocus Vernus luteus verſicolor primus*, The beſt Cloth of Gold Crocus. *Its Root is eaſily known from the Roots of any other* Crocus, *becauſe the outward Peelings or Shells, are hard and as it were Netted on the outſide, having certain Ribs, riſing up higher than the reſt of the Skins, made in the form of Network, of a dark brown color, and withal, it is ſmaller and rounder than the former* Yellow, *and encreaſes not ſo plentifully by the Root. This is the faireſt* Cloth of Gold Crocus, *and riſes up very early, even with the firſt* Crocus's, *with 3 or 4 very narrow and ſhort Leaves, of a whiter color than any of the former, which quickly after ſends forth its Flowers, riſing from among the Leaves out of the ſame white Skin, which includes alſo the ſaid Leaves; but they are not ſo plentiful as the former* Yellow, *being but 2 or 3 at moſt, of a fair Gold yellow color, yet ſomething paler than the* Firſt Yellow; *having on the back of the 3 outward Leaves, 3 fair and great Stripes, of a fair deep purple color, with ſome ſmall Lines at the ſides or edges of thoſe purple Stripes. On the inſide of theſe Flowers there is no ſign or ſhew of any Line or Spot, but wholly of a fair Gold yellow, with Chives, and a Fether top Pointel in the middle. The Seed of this is like the former, but not ſo red.*

XXXVII. 35. *Crocus Vernus luteus verſicolor alter*, The ſecond Cloth of Gold Crocus, *or* Duke Crocus. *There is no difference either in the Root, Leaf, or color of the Flowers, or time of Flowering, in this* Kind, *from the laſt before deſcribed: for the Flowers of this are of the ſame bigneſs and color; the chief variation of this from that, being in the marking of the three outward Leaves, which in this have not 3 Stripes as they have, but are wholly of the ſame deep purple color on their backs, ſaving that their edges are yellow, which is the form of a* Duke Tulep, *from whence came the name of a* Duke Crocus.

XXXVIII. 36. *Crocus Vernus verſicolor palido luteus*, The pale Cloth of Gold Crocus. *The Root of this is Netted like the others, which ſhews that this is but a variation of the ſame Kind. This third ſort of* Cloth of Gold Crocus *has Leaves and Flowers like the former, but differs in this, that the color of the Flower is of a paler yellow by much, but Striped in the ſame manner as the firſt of this Kind, with a fainter purple color.*

XXXIX. 37. *Crocus Vernus verſicolor albo diluteus*, The Cloth of Silver Crocus. *The Root of this is alſo Netted as the others are, which ſhews it is a variety alſo of the ſame Kind. The chiefeſt note of difference in this is, that being as large a Flower as any of the former of this Kind, it is of ſo pale a yellowiſh white, that it is more white than yellow, which ſome do call a Butter color. The 3 outward Leaves are ſtriped on their backs with a paler purple blew ſhining color; the bottom of the Flower, and the upper part of the Stalk, being of the ſame purple blew color.*

IV. Autumnal Crocus's.

XL. 38. *Crocus Byzantinus argenteus*, The Silver colored Autumn Crocus. *Its Root is pretty big, and rounder than any other* Crocus, *without any Flat bottom, and covered with a dark ruſſet Skin. It ſprings up in* October, *and ſeldom before, with 3 or 4 ſhort green Leaves at firſt; but growing longer afterwards, and in the midſt of them, preſently after they have appeared, one Flower for the moſt part, and but ſeldom two come forth, conſiſting of ſix Leaves, the three outwardmoſt whereof, are ſomething larger than the other three within, and are of a pale bleak Blew Color, almoſt White; which many call a Silver Color; the three innermoſt Leaves being of a pure White, with ſome yellow Chives in the middle, and a longer Pointel, ragged or feathered at the top. This very ſeldom bears Seed, but when the Year falls out to be very mild, and then it is ſmall, round, and of a Dark color.*

XLI. 39. *Crocus Pyrenæus Purpureus*, The Purple Mountain Crocus. *Its Root is ſmall and white on the outſide, ſo like unto the Root of the leſſer* Vernal Purple *or* White Crocus *aforegoing, that it cannot be diſtinguiſhed, until about the end of* Auguſt, *when it does begin to ſhoot, and then by the early ſhooting up a white long Sprout for Flower, it may be known. This* Purple Crocus *riſes up but with one Flower uſually, but ſometimes with two, one after another, without any Leaves at all, ſometimes in* Auguſt, *but generally in* September, *ſtanding upon a longer Footſtalk than any other kind of* Crocus's, *either of the Spring or Autumn; and is as large as the Flower of the greateſt* Vernal Purple Crocus; *of a very deep Violet Purple color, which decays after it has ſtood blown three or four* Days, *and becomes more Pale, having in the middle ſome yellow Chives, and a long feather-topt Pointel, branched, and riſing ſometimes above the edges of the Flowers. About a Month after the Flowers are paſt, and ſometimes not until the beginning of the Spring; there riſe up three or four long and broad green Leaves, with a white Line in every one of them, like unto the firſt* Vernal Purple *kinds, which abide until the end of* May *or* June. *It has not been obſerved to give any Seed, the Winter coming ſo quickly on after the Flowering, which hinders its coming to Perfection.*

XLII. 40. *Crocus Montanus Autumnalis*, The Autumn Mountain Crocus. *Its Root is very great and flat bottomed, covered with a duskiſh grayiſh Coat or Skin, and very little, or ſeldom encreaſes. It Springs up later than any of the former, and does not appear until the middle or end of* October, *when all the Flowers of the former are paſt; appearing firſt with three or four ſhort green Leaves, like unto the* Byzantine Crocus, *and afterwards the Flowers between them, which are of a pale or bleak Blew, tending to a Purple; their Footſtalks being ſo ſhort, that at firſt they ſcarcely appear above Ground; but two or three Days after, they grow a little higher.*

XLIII. *The Places.* Some of theſe have been found out in one Country, and ſome in another, as the

the ſmall *Purple and White*, and *Straw Colour* in *Spain*. The *Yellow* in *Meſia* about *Belgrade*; the *great Purple* in *Italy*. But the ſeveral places of theſe *Crocus's*, are in part ſet down in their Titles. Theſe by the help of Friends, have been ſent to us from their Native Countries, and proſper extreamly well with us, and Flourith as well in our Gardens, as in their Primary Native Places. But this is to be Obſerved, that ſome of the Species here Deſcribed in this Chapter, have been raiſed up by us, from the Sowing of their Seed. The beſt place to Plant Spring *Crocus's* in, is cloſe up to a Wall or Pale, or by the edges of Border Beards, round about the Garden, mingling the Colors of theſe of a Seaſon together, as the *Whites* with the *Purples*, The *Cloth of Gold*, with the *Roſe*, the *deep Purple* with the *Lighter*, and ſo of the reſt. By Obſervation, moſt of them may be diſtinguiſhed by their Roots, and ſo placed according to the Mind of the Planter; but the aforementioned places are beſt, for that few other Flowers appear until they are paſt. Should they be ſet among *Tulips*, the Graſſey Leaves after the Flowers are gone, would more trouble and Diſgrace the place, than the Flowers did before Adorn it.

XLIV. *The Times.* Their ſeveral Times are alſo expreſt in their Deſcriptions, for ſome bring forth their Delectable Flowers in the Spring, in which for the firſt three Months, our Gardens are Furniſhed with one Variety or another: The others in *Autumn*, ſo that both early and late in the Year, we have an Ornamental Appearance. All theſe ſeveral *Crocus's*, both of *Spring* and *Autumn*, looſe their Fibres with their Leaves, and muſt then be taken up and kept dry; thoſe of *Autumn* until *Auguſt*, and of the Spring, until *Octobor*. They are hardy, and will proſper in any place. The *Vernal* increaſe exceedingly, if they ſtand any time unremoved; but the *Autumnal* encreaſe very little. Many more Varieties than are yet Diſcovered, may be raiſed from the Seeds of the beſt Kinds, being Sowed in *September*, and every other Year in *July* removed and ſet wider, until they bear Flowers, making the Ground light and rich, into which you tranſplant them, which will make a great addition to their Beauty.

XLV. *As to their Qualities, Specification, Preparations and Virtues*, Authors have ſaid nothing, nor do we know any thing of them by Experience: They are the Floriſts property, and more uſed as Ornaments for the Adorning of Gardens, than for any thing elſe; and if Wiſely managed, will give a ſingular Delight and Pleaſure to the Eyes of the Beholders. And for this Reaſon it was that we took this Trouble upon us, to inſert them into this Herbal.

CHAP. DCXII.

Of SAFFRON-MEDOW,

OR,

COLCHICUM.

I. *The Names.* It is called by the *Greeks*, Κολχικὸν, (ſo Named from the Iſland *Colchis*, where it was firſt found growing;) alſo Ἐφήμερον, from its Killing in one days ſpace; in *Latine*, *Colchicum*; and by ſome *Ephemeron*: but there are other Plants called by that Name, which are *non Lethale*, or not Deadly, as 1. a Species of *Digitalis* or Fox-Glove. 2. *Lilium* [illegible]. Lilly of the Vallies. 3. *Gramen Serratum* [illegible], or a kind of Silk Graſs, (of which we ſhall ſpeak in its proper place.) It is alſo called [illegible] *Colchicum Strangulatorium*, from its ſuffocating or choaking Quality;) and by ſome *Bulbocaſtanum*, and *Bulbocaſtanum Patrum*. The Sun before the Flower, becauſe it is ſaid to give the Seed before the Flowers: But the Roots of this, as of moſt other Bulbous Plants, after the Stalk of Leaves and Seed are dry and paſt, may be tranſplanted, and then it Springs again, and gives Flowers before Leaves: but the Leaves and Seed follow ſucceſſively after the Flowers, before it can be removed again. So that here is not Seed before Flowers, but certainly, Flowers upon the firſt Planting or Springing up, and the Seed afterwards, as in other Plants, tho' in a different manner. In *English* it is called *Medow-Saffron*, and as often *Colchicum*, which is the *Greek* and *Latine* Name, brought into our Language.

II. *The Kinds.* They are manifold; as Firſt, *ſome Flowering in the Spring*: Secondly, *ſome Flowering in Autumn*, which are moſt in number. Again, 1. *ſome are Single Flowered*, which are the greateſt part. 2. *Some few are double Flowered*. of all which, becauſe of the many Varieties, we ſhall here (as in the former Chapter) give you their Appellations or Names, with their Deſcriptions, as following.

The Deſcriptions.

III. 1. *Colchicum Anglicum album*, The white Engliſh Colchicum, or Medow-Saffron. *It is common to all the Colchica's*, or, *Medow-Saffrons*, (ex-

Saffron Medow Engliſh *White.*

cept that of the Spring, and one other) to bear their Flowers alone in Autumn, *or later, without any Green Leaves with them, and afterwards in* February *their Green Leaves: So that we shall not need to make many long Descriptions, but having given you a full Description of the first, to shew you the differences, which chiefly consist in the Leaves and color of the Flowers; and so briefly to pass from one to another, taking notice only of those Variations which are most worthy of Note. The Root of this our first* English *kind, is Bulbous or round, and is White within, but without covered with a thick blackish Skin or Coat, having one side thereof, at the bottom, larger than the other, with an hollowness also on the one side of that long Eminence, where the Flowers rise from the bottom, and shooting down from thence a number of White Fibres, by which it is fastned in the Ground. This Root remains in the Earth, without shew of Leaf above Ground, most part of the Winter, and in* February *there Spring forth from it, three or four large and long green Leaves, rising from the top or head of the Root, long after the time of its Flowering, which is the* Autumn *before: These Leaves when they are fully grown up, stand on the top of a round, weak, green and short Footstalk, something like unto the Leaves of* White Lillys, *but not so large; and in the midst of these Leaves, after they have been up some time, appear two or three loose Skinny Heads, standing in the midst of the Leaves, upon short thick green Stalks, which being ripe, contain in them small round browniſh Seed, which lyes as it were loose therein, and when the Head is dry, being shaken, may be heard to rattle. But the Flowers which are not more than three or four at most, appeared the* Autumn *before, or just before Winter, standing severally upon weak Footstalks, a Fingers length or more above the Earth, which consist of six white Leaves, something long and narrow, and not so large as most of the other kinds, with some* Threads or Chives *in the middle, like unto the Spring* Crocus's *in the former Chapter, without any color of* Saffron *in them, or any* Saffron *like Virtues: These Flowers being past, the Leaves appear not yet, but the* Root *lying without the least appearance of them, most part of the Winter, they afterwards Spring up in* February, &c. *as was before declared.*

English Purple Meadow Saffron.

IV. 2. *Colchicum Anglicum pupureum,* The Purple Englisſh Colchicum, or Medow Saffron. *This both in its Roots, Flowers, Leaves and Seed, Magnitude, manner and form of Growing, differs not at all from the former, saving only in the color of the Flowers; which as those in the first were wholly White, are in this of a diluted* Purple Color, *with a small appearance of Veins therein.*

V. 3. *Colchicum Pannonicum album,* The White Hungary Medow Saffron. *This in its Root, Leaf, Flower, manner and form of Growing, is like to the first or* White Englisſh Colchicum; *the greatest difference between that and this is, that the former White, is in all particulars lesser than this, and besides, that this has a greater store of Flowers together, which continue longer in their Beauty, without fading, so soon as the former, and are also something of a fairer white color.*

VI. 4. *Colchicum Pannonicum purpureum,* Purple Hungary Medow Saffron. *It is something like unto the White of this kind, but that it bears not so plentifully as the White does, nor does the Root grow so great; but the Flowers are in a manner as large as they, and of the like Pale diluted* Purple *color, or somewhat deeper, as is in the* Purple Englisſh, *with some Veins or marks upon the Flowers, making some shew of a checker on the out-side, but not so conspicuous as in the true checquer'd kinds.*

VII. 5. *Colchicum Pannonicum versicolor,* Party coloured Hungarian Medow Saffron. *This is a Species of the fourth or last kind before Described, and differs only from it in this, that the Flowers hereof are Party-colored with white Streaks and Edges, which abide constant: It is thought that this was first raised from the Seeds of the former.*

VIII. 6. *Colchicum Byzantinum,* The Byzantine or Constantinople Medow Saffron. *Its Root is in the middle greater and rounder than the others, with a longer Eminence, whereby it may be easily known from all other sorts. Its* Leaves *are so broad and large, so that one who had never seen* Colchicum, *could scarcely judge it to be a Species thereof, for that they are much larger than any* Lilly Leaves, *and of a dark green color. The Flowers are correspondent to the Leaves, larger, and more in number than in any of the former Purple kinds, of the same color with the last Purple kind, but of a little deeper Purple on the inside, with divers Marks running thro' the Flowers, like unto it, or like to Checquers, but yet somewhat more apparently.*

IX. 7. *Colchicum*

IX. 7. *Colchicum Illyricum*, The true Colchicum, or true Greek Medow Saffron. *This has a great thick and bulbous Root, full of Substance; from which rises up a fat thick and gross Stalk, set about from the lower part to the top with Leaves by equal distances, which Leaves are long, thick and gross, sharp pointed, and not much un-*

Saffron Medow Illyrick,

OR,

The true Greek Colchicum.

like to the Leaves of Leeks; *from among which Leaves, come forth yellowish Flowers, very like to the* English Colchicum, *or* Medow Saffron, *but smaller.*

X. 8. *Colchicum Lusitanicum Fritillaricum*, The Portugal Checquer'd Medow Saffron. *Its Root is like to the Root of the* English *or* Hungarian, *without any Difference, but that this grows something greater. Its Leaves do rise up sooner than in any other of the* Autumn *kinds, for they are always up before Winter, and are four or five in Number, short rather than long, broad below, and pointed at the end, canalled or hollow, and standing round above the Ground, one encompassing another at the bottom, like the great* Spanish Star Jacinth, *called the* Jacinth of Peru, *but shorter, and of a pale or grayish green color, differing from the color of all the other* Medow Saffrons. *The Flowers are larger and longer than the Flowers of either* English *or* Hungarian, *and almost as large as the sixth kind at Sect.* VIII. *aforegoing, and of the same color, but a little deeper; the Spots and Marks whereof, are something more easie to be seen, even afar off, like unto the Flowers of a* Fritillary, *from whence it took part of its Name. This is one of the first* Medow Saffrons, *or* Colchicums *which Flower in the Spring.*

XI. 9. *Colchicum Neapolitanum Fritillaricum*: The Checquer'd Medow Saffron of Naples. *The Root of this is like unto the Root of the last before Described, but a little bigger, by which the Species is multiplied. This* Neapolitan *kind is very like unto the* Portugal *Species last Described, but that its Flower is something larger, yet sometime very near of equal bigness with that; the greatest Note or Mark to distinguish them by is, that the Flowers of this are of a deeper color, and so are the Spots on the Flowers likewise; which are so conspicuous, that they may be discerned a great way off, more like unto the Flowers of a deep* Fritillary, *than the former, and make a more goodly and more Glorious Show. The Leaves of this do rise up earlier after the Flowers, and are something longer, of a darker green color, yet enclining to a grayish color, as those other, not lying so neatly or round, but stand up one by another, being as it were folded together. Neither this nor the* Portugal, *have given any Seed with us that I have yet heard of, but are both increased by the Root as aforesaid.*

XII. 10. *Colchicum Fritillaricum Chiense*, The Chio or Scio Checquer'd Medow Saffron. *Its Root is like unto the others of this kind, but small and long, and not so great. This most Beautiful Flower or Plant, rises up with its Flowers in* Autumn, *as the others before specified do, altho' not of so a large a size, yet far more Pleasant and Delightful in the thick, deep blew, or Purple coloured Beautiful Spots therein; which make it to excel all others whatsoever. The Leaves rise up in the Spring, being smaller than the former, for the most part three in Number, and of a paler or fresher green color, lying close upon the Ground, broad at the bottom, a little pointed at the end, and turning or folding themselves in and out at the edges, as if they were indented. It has not been seen to bear Seed here. It Flowers later for the most part, than any of the others, not till* November, *and is very difficult to be preserved with us; for that its Root grows less and less every Year: Our cold Climate being so different from its Native place of Growth, (when by reason of the Warmth of the Season, it Flowers any thing early, that it may have the comfort of the warm Sun, it is the Glory of all these kinds of Flowers.*

XIII. 11. *Colchicum versicolor*, The party-coloured Medow Saffron. *Its Root is like the former* English *or* Hungarian *kinds, but thicker and greater for the most part, and shorter also. Its Flowers do not usually appear, till most of the other* Autumn *sorts are past, except the last, which are very low, scarcely rising with their Stalks three Fingers breadth above the Ground, but oftentimes half hid within the Earth: The Leaves hereof are smaller, shorter, and rounder than in any of the others before specified; some being altogether White, and others wholly of a very pale Purple or Flesh color; and some again parted, the one half of a white Leaf, and the other half of the same Purple; and sometimes strip'd Purple and White, in divers Leaves of one and the same Flower. And again, some will be the most part of the Leaf white, and the bottom Purple, thus varying as Nature is pleased; for that many times, from one and the same Root, may be seen to arise all these Varieties before mentioned. These Flowers do stand long before they fade and pass away, and have been sometimes observed to keep their Flowers fair until the beginning of* January, *or till the Extremities of Winter Frosts and Snows have made them hide their Heads. The Leaves therefore do rise up accordingly, after all others, and are of a brownish or dark green color,*

at their first springing up, which afterwards grow to be of a deep green color.

XIV. 12. *Colchicum variegatum alterum:* Another party coloured Medow Saffron. *This is another Plant, whose party-colored Flowers rise a little higher, diversly striped and marked, with a deeper Purple color, and a pale or whitish blush throughout all the Leaves of the Flowers, in other particulars it is much like the former.*

Saffron Medow Indian, *or* Assiyrian.

XV. 13. *Colchicum Indicum, Colchicum Syriacum, Colchicum Alexandrinum:* The Assyrian or Indian Medow Saffron. *This has a bulbous Root, and made as it were of two pieces; from the middle cleft whereof, rises up a soft and tender Stalk, set with fair broad Leaves, from the middle thereof, to the top; from among which, come forth one single Flower, like unto those of the* Common Medow Saffron, *or the* White Anemone *of* Matthiolus's *Description.*

XVI. 14. *Colchicum Montanum Hispanicum minus,* The small Spanish Medow Saffron. *Its Root is small and long, according to the the rest of the Plant, and like in Form to the others. The Flowers are narrower and smaller than any of the former, and of a deeper reddish Purple color, than either the* English *or* Hungarian *kinds: The green Leaves are also smaller than any other, lying upon the Ground, of a deep or sad green color, rising up within a while after the Flowers are past, and abide green all the Winter long.*

XVII. 15. *Colchicum Montanum minus Flore versicolor,* Small party-colored Medow Saffron. *This small sort differs not from the small sort last Described, but in the Variety of the Flower, which is as small as the former, the three inner Leaves being all White; and the three outward Leaves, some of them Pale or Blush, and some party-colored, with a little green on the back of some of them.*

XVIII. 16. *Colchicum Hermodactylum.* The Hermodactyl, like Medow Saffron. *It has a bulbous or round Root, not much unlike to the* Hermodactyl, *(which in truth is no* Hermodact, *but a* Colchicum.) *It Springs up with its Leaves in* Autumn, *before its Flowers appear, which none of the former kinds do. The Flower does (after the Leaves are up) shew it self in the middle of them, consisting of six white Leaves, with divers Chives in the middle, and passes away without giving any Seed, that has yet been observed. The Green Leaves abide all Winter and Spring following, decaying about* May; *and appear, or Spring not up again until* September *following, when (as is said) the Flowers shew themselves, and that presently after the Leaves are Sprung up.*

XIX. 17. *Colchicum atropurpureum:* Dark Purple colored Medow Saffron. *Its Root, as also its Seed, are like to those of the* English Purple *kinds. The greatest difference in this Species, consists in the Flower, which at the first appearance, is of as pale a Purple as the Flower of the former* Hungarian *kind; but after it has stood in Flower two or three Days, it begins to change, and will after a while, become of a very deep reddish Purple, as also the little Footstalk on which it does stand. The Flower is of the bigness of the* Hungarian Purple, *and so also is the green Leaf.*

XX. 18. *Colchicum atropurpureum variegatum:* The Party colored dark Purple Medow Saffron. *This is another sort of the former kind, differing chiefly in the Flower, which is variously striped thro' every Leaf of the Flower, with a paler Purple color, so that the Flower is of great Beauty. This might seem to be a degenerate Plant from the former, but that it has abode constant in its appearance, in some Gardens for many Years, and gives Seed as plentifully as the former.*

XXI. 19. *Colchicum flore pleno:* Double Flower'd Medow Saffron. *This in its Root and Leaf, is very like unto the* English *kind, the Flowers are of a fine, pale, diluted color, consisting of many Leaves set thick together, which are somewhat smaller, as in the* English *Flower, being narrow and long, and as it were round at the points, which make a very double Flower, having some Chives with their yellow Tips, dispersed as it were among the Leaves in the middle. It Flowers in* September, *a little after the first shew of the earlier* Medow Saffrons *are past.*

XXII. 20. *Colchicum variegatum pleno flore:* The Party color'd double Medow Saffron. *This Plant is diversified from the former in the dividing of its colors, as is seen in the single party colored* Medow Saffron *before Described, having some Leaves white, and others pale Purple, and some Leaves half white and half purple, diversly set or placed in the double Flower, which does consist of as many Leaves as the former; yet sometimes this party color'd Flower, does not shew it self double like the former; but has two Flowers, one rising out of another, making each of them to be almost but single Flowers, consisting but of eight or ten Leaves apiece. But this diversity is not constant; for the same Root, which this Year appears in that manner, will the next Year return to its former kind of double Flowers again.*

XXIII. 21. *Colchicum variegatum dictum Agrippina:* The variegated Medow Saffron, *commonly called* Agrippine. *This is of later Discovery than the rest, and has more Variety than any of the former; the Difference chiefly consisting in the color, and marking of the Flowers, which in this, are White and Red interspers'd, or variegated like a* Tulip.

XXIV. 22. *Col-*

XXIV. 22. *Colchicum maximum flore pleno:* The greateſt double Flower'd Medow Saffron. *Theſe have Flowers much bigger and doubler than any of the former, containing very many round pointed Leaves, of a pale purpliſh bluſh color, ſpreading open, and forming a Gallant double Flower, far tranſcending any of the former double kinds.*

Medow Saffrons of the Spring.

XXV. 22. *Colchicum Vernum flore carneo:* Spring Medow Saffron, of a pale red or deep bluſh color. *Its Root is ſmall, ſomething like unto the Roots of the former, but ſhorter, and not having ſo long an Eminence on one ſide of the bottom. It riſes up very early in the Year,* viz. *in the end of* January *ſometimes, or in the beginning of* February, *or middle thereof at ſartheſt; preſently after the deep Froſts and Snows are paſt, with its Flowers incloſed within three green Leaves; which opening themſelves, as ſoon almoſt as they are out of the Ground, ſhew their Buds for Flowers within them; very white oftentimes before they open far, and ſometimes alſo purpliſh at their firſt appearing, which never ſhew above two at moſt upon one Root; and never riſe above the Leaves, nor the Leaves much higher than they, while they laſt. The Flower conſiſts of ſix Leaves, long and narrow, every Leaf being divided both at the bottom and top each from other, and joined together only in the middle, having alſo ſix Chives, tipt with yellow in the middle, every Chive being joined to its proper Leaf, which is of a pale red, or deep bluſh color, when it has ſtood a while blown, and is a ſmaller Flower than any other* Medow Saffron, *except the ſmall* Spaniſh *kinds only; but continues in its Beauty a conſiderable time, if the extremity of ſharp Froſts do not ſpoil it. The Leaves wherein theſe Flowers are incloſed, at their firſt coming up, are of a brownish green color, which ſo abide for a while, eſpecially on the outſide; but on the inſide they are hollow, and of a whitiſh or grayiſh green color, which after the Flowers are paſt, grow to be of the length of a Mans middle Finger, and narrow withal. There riſes up likewiſe in their middle, the Head or Seed Veſſel, which is ſmaller and ſhorter and harder than any of the former, in which is contained ſmall round brown Seed.*

XXVI. 24. *Colchicum Vernum atropurpureum:* Purple Medow Saffron of the Spring. *The Flower of this, is in the riſing up of its Leaves and Flowers together, and in all things elſe, like unto the former; only the Flowers of this kind, are at their firſt appearing, of a deeper Purple color; and when they are blown, are alſo much deeper than the former; divided in like manner both at bottoms and tops, as the other are; ſo that they ſeem, like as if ſix looſe Leaves were joined in the middle parts to make one Flower: It has alſo its ſmall Chives tipt with yellow, cleaving in the like manner to every Leaf.*

XXVII. *The Places.* Where they all grow naturally, is expreſſed in the Title of almoſt every Plant: Some grow in Fields and Medows, and Champion Grounds; and ſome on Mountains and hilly Grounds. The *Engliſh* kinds grow in the Weſt Parts of our Land, as about *Bath*, *Briſtol*, *Warmiſter*, and other places alſo. The Double kinds are ſaid to be brought out of *Germany*; all the Foreign kinds have been tranſplanted from their Native Soil into our Gardens, where they now grow as well as in their Natural places.

XXVIII *The Times.* Theſe are alſo declared in their Deſcriptions, thoſe which Flower earlieſt in *Autumn*, Flower in *Auguſt* and *September*; the later in *October*; and the lateſt in the end of *October* and in *November*. The two laſt Flower in the Spring, after the depth and hardneſs of Winter is paſt, as in *January* and *February*, if Froſt and Snow prevent not.

XXIX. *Nota* 1. The Roots of the *Colchica* being ſet about the end of *Auguſt*, or beginning of *September*, will ſuddenly put forth Fibres, and ſhortly after Flowers; being the firſt blown from the Time of the Setting of the dry Roots, of all others; altho' vulgarly accounted the laſt, which are indeed the firſt which Flower; ſome of them in *September*, others in *October*; the firſt are the Party-colored; the lateſt are thoſe of *Cho*.

XXX. *Nota* 2. They are eaſily Planted, the Roots looſing their Fibres, which may be taken up as ſoon as the green Leaves are dryed down, and then kept out of the Ground, until the aforementioned time for their Planting. They delight in a moiſt Earth, but being hardy, will thrive and increaſe almoſt in any Soil; only that of *Cho* is tender, and will not proſper unleſs Planted in a warm place, where it may have the Comfort of the Sun, and be ſhelter'd from Froſts, Wet, and Cold in Winter, all which it very ill endures. It is not doubted, but that other fine Varieties may be raiſed from Sowing of the Seeds of the beſt kinds. The manner of managing them, is the ſame with that of *Tulips*, and other bulbous Roots which looſe their Fibres.

XXXI. *The Qualities, Specification, Preparations and Virtues*, Authors have ſaid nothing of, ſave that they are deadly, or very dangerous at leaſt, having a Suffocating Quality. The only uſe we make of them is for an Ornament to our Gardens, and ſo to gratifie the Floriſts, and others which delight in things of this Nature, we thought good to introduce them into this preſent Work.

CHAP. DCXIII.

Of SAFFRON BASTARD:

OR,

SAFF-FLOWER.

Called alſo,

CARTHAMUS.

I. *THE Names.* It is called in *Arabick Kartam*, (whence our *Latine* Name *Carthamus*: in *Greek*, Κνίκος & Κνήκος, either ἀπὸ τῦ κνίζειν, *quod eſt pungere vel modere*: or, ἀπὸ τῦ κνησμῦ, *quod pungendo pruriginem excitet*: or, ἀ *floris colore*, *cum* Κνίκος *exponatur Croceus vel rutilus*: in *Latine*, *Cnicus*, and ſometimes *Cnecus*, but for the moſt part *Carthamus* in Apothecaries Shops, ἀπὸ τῦ καθαίρειν, *quod eſt Purgare* as ſome think. In *Engliſh*, Baſtard Saffron, *alſo* Carthamus *and* Saff-Flower.

II. *The Kinds.* It is I. *Cnicus vel Carthamus Sativus*, Garden or Manured Baſtard Saffron. II. *Cnicus vel Carthamus Sylveſtris*, *Atractylis*, Wild Baſtard Saffron, or Diſtaff Thiſtle.

III. *The*

III. *The Kinds of the Manured.* It is threefold. 1. *Cnicus Sativus, vel Urbanus, Cnicus vel Carthamus vulgaris*, our most common or Manured Bastard Saffron, or Carthamus; which is also called *Saff-Flower*, and is a peculiar Name, distinguishing it from all the other kinds. 2. *Cnicus singularis Alpini, Cnicus alter Creticus*, Bastard Saffron of Candy. 3. *Cnicus alter Cæruleo flore Clusij*, (as most Authors call it) and *Cnicus alter perennis Clusij*, Clusius his Everlasting Bastard Saffron. These are the chief Manured Kinds yet taken notice of.

IV. *The Kinds of the* Atractylis, *or* Wild Cnicus. Of this there are three sorts. 1. Ατραξυλις & ατραξυλις ἄγρια, *Atractylis, Atractylis flore Luteo, Cnicus alter Clusij*, (because it is so like the first *Cnicus Sativus*) *Cnicus cæruleus Camerarij, Lobelij, Lugdunensis, aliorumque*: The yellow Wild Carthamus, or Cnicus, or Distaff Thistle. 2. *Atractylis flore Purpureo*, Purple Distaff Thistle. 3. *Atractylis purpurea Cypria*, Purple Distaff Thistle of Cyprus.

The Descriptions:

I. Garden Cnicus, Carthamus, or Saff-Flower.

V. *The first, or our most* Common Manured Bastard Saffron, or Carthamus Sativus, *called also* Spanish Bastard Saffron, and Saff-Flower. *It has a Root which is long, great and woody, perishing quickly with the first Frosts, or after Seed time.*

Saffron Bastard Garden.

It has several large broad Leaves, lying next the Ground, without any Prickles upon them in our Country, or with very few white ones, at the Corners of the Leaves and Divisions; from among which, rises up a strong hard and round Stalk, 3 or 4 Feet high, with shorter Leaves thereon up to the top, and towards the top branching it self forth, which bear yet shorter Leaves, sharp pointed, and sometimes prickly about the Edges; bearing at the end of each Branch, a great open scaly Head, out of which come forth a great many Gold Yellow Threads, of a most Orient and Shining color; which being gathered in a warm dry time, and kept dry; will abide in the same Delicate color, (which they had whilst fresh) for a long time: And this Flower is that which is called Saff-Flower, *and Sold for the same every where by our* Druggists and Dry-Salters. *It is Manured in* Spain *for the profit which is made of it, for the Dying of Silks and other things, and for the Merchandise thereof, Transporting great Quantities of it into several other Countries; but the Flowers which grow with us here in* England *in our Gardens, are of a fairer and more lively color. When the Flowers are past, the Seed comes, which when it has attained its Maturity, is white and hard, somewhat long and round, and a little corner'd.*

VI. *The second or* Bastard Saffron of Candy. *Its Root is thick, long and black, from whence rises up one strait round Stalk, half a Cubit high, or somewhat more; set here and there with long sharp pointed Leaves, thick set with Prickles at the Dents of the Edges: At the top of this Stalk grows a scaly Head, encompassed with prickly Leaves, of the bigness of the* Atractylis *or* Distaff-Thistle; *out of which spring forth a great many thick, yellow* Saffron *like Threads, close thrust together; after which comes the Seed, which grows therein, of a white color, and as large as the Seed of the* Greater Centory.

VII. *The Third, or* Clusius his Everlasting Bastard Saffron. *Its Root runs down deep into the Ground, and being there increased, does run and*

Saffron Bastard Everlasting.

spread

spread it self, taking up a great deal of room. It rises up with several hard strong and round Stalks, without any Branches at all from them, to the height of three or four Feet, bearing thereon at several places, somewhat large and long Leaves, dented about the edges, of a sad or dusky green color. At the top of every Stalk, stands one great ovate hard prickly Head, but not prickly at all; not so great as the other Cnicus or Bastard-Saffron, *never opening the Scales of the Head, as it does. From the middle of which, comes forth a great many Threads (yet nothing so many as in the other) of a sad blewish Ash color, and whitish at their bottoms. The Seed which lyes in the Down in these Heads, is greater (as it grows with us) somewhat thick and short, of a brownish color, and fewer in number in each Head.*

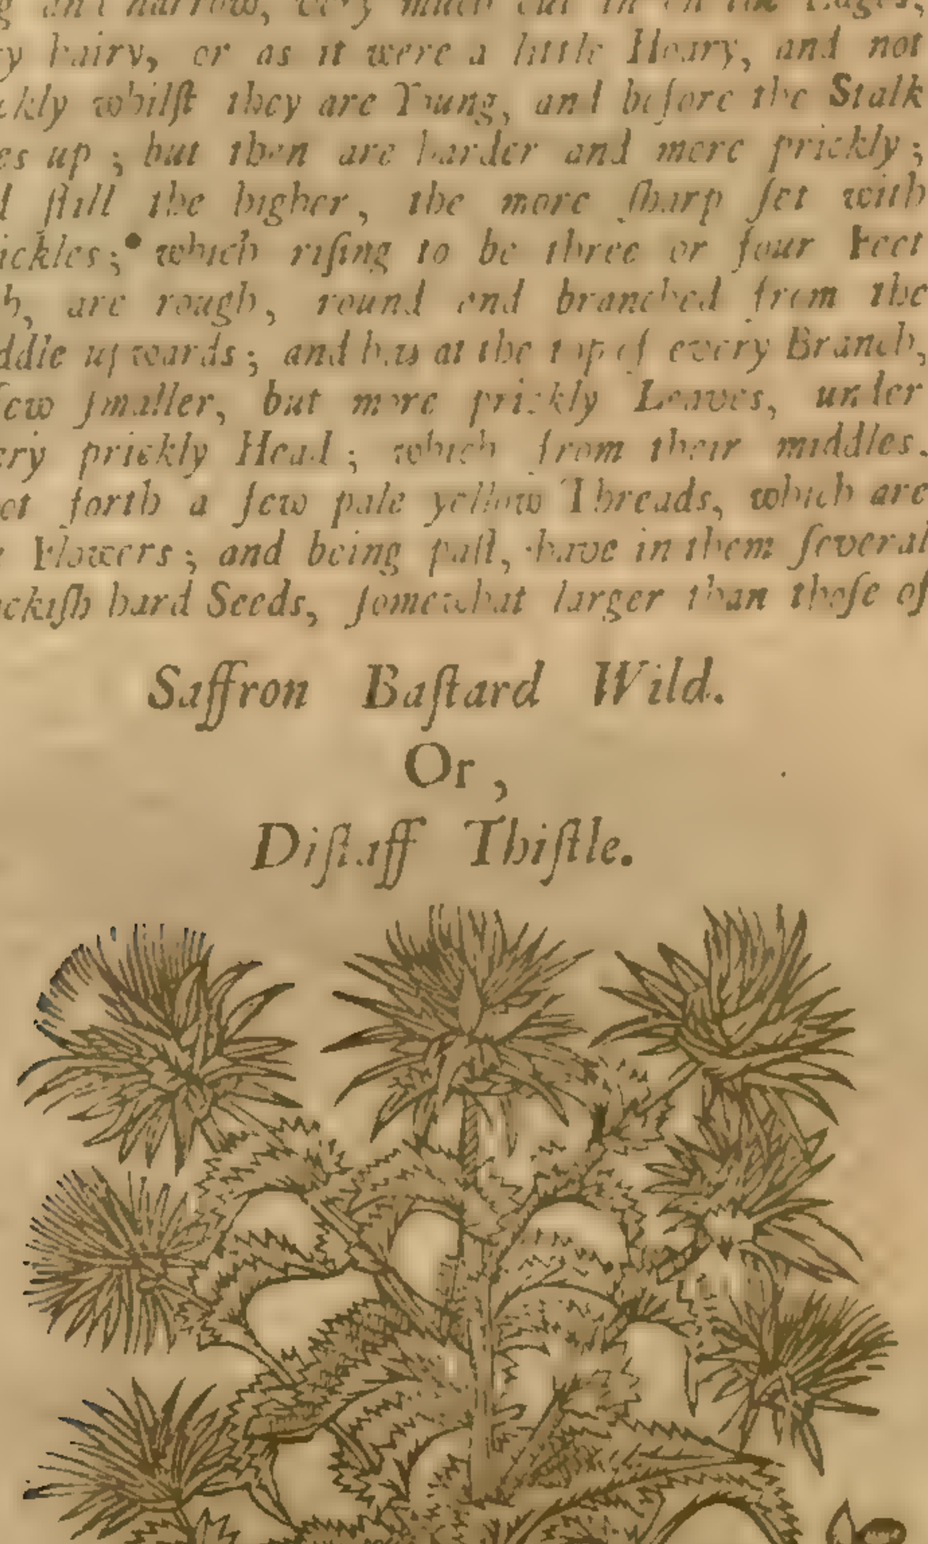
II. Wild Bastard Saffron, Atractylis Or Distaff Thistle.

VIII. *The first of this Wild Kind, or* Yellow Wild Carthamus, Cnicus *or* Distaff Thistle. *Its Root is whitish and woody, perishing every Year after Seed time. Its lower Leaves are winged, long and narrow, very much cut in on the Edges, very hairy, or as it were a little Hoary, and not prickly whilst they are Young, and before the Stalk rises up; but then are harder and more prickly; and still the higher, the more sharp set with Prickles; which rising to be three or four Feet high, are rough, round and branched from the middle upwards; and has at the top of every Branch, a few smaller, but more prickly Leaves, under every prickly Head; which from their middles, shoot forth a few pale yellow Threads, which are the Flowers; and being past, have in them several blackish hard Seeds, somewhat larger than those of*

Saffron Bastard Wild.

Or,

Distaff Thistle.



the Garden Cnicus *or* Carthamus, *but lesser than those of the* Bastard Saffron *of Candy, lodged in Down, but nothing so much in it. The leaves hereof being gently broken (but not bruised) before they grow hard and old, will yield a reddish or bloody Juice.*

IX. *The second*, or Purple Distaff Thistle. *This differs not from the last in the form of the Flower, but only in its color, this being of a purplish Red; nor in its Leaves, saving that these are not hairy or Hoary; nor in its Stalk, excepting that it seldom rises so high. In all other things it is so like the former, yea even in the Bloody Juice also, that one would say (without a particular Observation,) that it were the very same plant.*

X. *The Third*, or Purple Distaff Thistle of Cyprus. *The whole Stalk and Branches rise to be about a foot and a half in height, it has Leaves like unto the Garden or Manured* Cnicus *or* Bastard-Saffron, *but lesser, and something Rugged or Crumpled, from among which rises up the Stalks aforesaid, bearing a Thistle-like head at the Top; which sends forth also slender Branches bare or without Leaves, half a foot long or more, having on each of them a small prickly Head, like that on the top of the main Stalk. The Flowers are Purple in the middle, but in some Countries inclining to yellow: and the Seed is White, like to that of* Cnicus or Carthamus Sativus, *or* Garden Bastard Saffron.

XI. *The Places.* The first of the Garden Kinds are Sown in Fields in divers places of *Spain*, *Italy*, *Germany*, *England* and *France*: but *Pliny*, *Lib.* 25. *Cap.* 15. says that in the Reign of *Vespasian* it was not known in *Italy*; and is accounted by *Theophrastus* and *Dioscorides* to be a Manured Plant, so generally Sown for the many uses thereof. The second *Alpinus* says was brought out of *Candy*. The Third is a Native of *Spain* about *Sevil* and *Cerduba*, and as *Clusius* says, grows in other places; *Pena* says upon Mount *Baldus*.

XII. *The Wild Bastard Saffron or Distaff Thistle.* The first Species there of *Clusius* says grows about *Sevil and Cerduba* in *Spain*. The Second and Third kinds grow in many Countries, as about *Mompelier* and *Narbon* in *France*; as also in *Italy*, *Greece*, &c. *Anguilara* says the Third is found growing in *Cyprus*; and *Lugdunensis* says he found it in *France*, but something differing in the color of the Flower. The first of these Wild Kinds more especially grows in our *English Gardens*.

XIII. *The Times.* The Three Garden Kinds Flower in the latter end of *July* or beginning of *August*; and the seed is ripe about the end of *August* or beginning of *September*. The Three Wild sorts Flower about the end of *Summer*, and the seed is ripe towards the end of *August*, or in *September*; but the last of the three flowers and seeds something sooner than the other two sorts.

XIV. *Nota.* 1. Of these plants the *Atractylis* or *Wild Bastard Saffron*, has few or no Virtues ascribed to it by Authors, yet *Galen* says, That it is of a Drying faculty, and moderately digesting. *Dioscorides* says that if any one is Stung by a Scorpion, he shall feel no pain so long as he holds it in his hand, but being laid by, that the pain will immediately return again. *Pliny* says, that it is very good against the poison of all kind of Creatures, and is good for such as are poisoned by eating of Mushromes.

XV. *Nota.* 2. Of the *Cnicus*, *Carthamus*, or *Garden Kind*, the firſt *Species*, called peculiarly by the name of *Saff-flower*, is the chief and principal, and that which is only *Sold in Shops*, and uſed in *Phyſick*, and chiefly Cultivated in all our Fields and Gardens, both in *England* and *beyond Sea*, in many other Countries; and of this firſt kind it is, that all the Sections of the following Diſcourſe relate to. But it is true, that the *Second Species*, as *Alpinus* ſays, is uſed by ſome in the ſame manner, and to the ſame purpoſes, to purge with, as that firſt is. Of the *Third Species* there is little or nothing written by Authors, but by reaſon of its likeneſs in form to the firſt Species or *Saff-Flower*, it is thought to poſſeſs ſome of the ſame *Qualities* and *Virtues*.

The Qualities, Specification, Preparations, Virtues, Culture, and Cure of Cnicus, Carthamus *or* Saff-Flower.

XVI. *The Qualities.* The Flowers are hot and dry in the firſt Degree, as *Meſues* writes: Aperitive, Abſterſive, Vulnerary, Pectoral, Arthritick, Emetick, Cathartick, and Spermatogenetick. But the Seed *Galen* ſays, is hot in the third degree.

XVII. *The Specification.* Formerly the Seed was only uſed in Phyſick, which as *Galen* ſays, Purges: Now in our Days the Flowers are uſed, and to all the ſame Intentions, beſides their Mechanick Application for Dying of Silks, Coloring, Staining, *&c.* They are ſaid to Cure an Aſthma, and all other Diſeaſes of the Lungs. The Jaundice, Dropſy, Gout, Rheumatiſm, Kings Evil, Impotency in Men, and Barrenneſs in Women.

XVIII. *The Preparations.* You may make therefrom, 1. *An Infuſion of the Flowers in Chicken, Mutton, or Veal Broth.* 2. *A Tincture of the Flowers in Canary, White Lisbon, White Madera, or White Port Wine.* 3. *An Extract of the Flowers with Spirit of Wine.* 4. *An Emulſion of the Seed in Mead or Honied Water, or Chicken Broth.* 5. *Cnicimel or a Lohoch of the Seed with Honey, or Extracted Juice of Juniper-Berries.* 6. *Diacarthamum.* 7. *Diacarthamum novum.* 8. *Enema, or the Clyſter.* 9. *A Pouder of the Flowers.* 10. *A pulp of the Seed.*

The Virtues.

XIX. *The Infuſion of the Flowers in Chicken, Mutton or Veal Broth.* A dram of the Flowers in Infuſion, opens Obſtructions of the Liver and Spleen, purge the Bowels gently, and are profitable againſt the Yellow Jaundice, Green-Sickneſs, and other Diſeaſes proceeding from the Obſtruction of the Womb.

XX. *The Tincture of the Flowers in Canary, White Lisbon, Madera, or White Port Wine.* It has the Virtues of the former Infuſion, but much more agreeable to the Stomach and Bowels, and therefore is more profitable againſt the Jaundice: it opens, cleanſes and purges, but in a more gentle manner than the Tithymales or Spurges, and ſo alſo is good againſt Aſthmas, Coughs, Colds, and Obſtructions of the Lungs.

XXI. *The Extract of the Flowers.* It may be made with Wine, or Spirit of Wine, Mead, and other things of like nature. It is good againſt the Dropſy, Jaundice, Gout, Scurvy, Rheumatiſm, Kings Evil, Obſtructions of the Womb: Purges gently, and may be given from a Scruple to two Scruples, or more, according to Age, and other Accidents, and repeated every other Day, for 5 or 6 times together.

XXII. *The Emulſion of the Seed in Mead, Honied Water, or Chicken Broth.* It provokes to Stool and ſo Purges Viſcous Flegm, and ſharp Humors; prevails againſt the Colick, Aſthma's, and ſhortneſs of Breath; as alſo againſt the Scurvy, Dropſy, Gout, Rheumatiſm and Kings Evil, Coughs, Colds, and other Diſtempers of the Breſt and Lungs. But by reaſon of its harſhneſs it ought to be corrected with Aniſeeds, Caraways, Cardamoms, Cloves, Galangal, Ginger, Sal Gem, *&c.*

XXIII. *Cnicimel. Or Lohoch of the Seed made with Honey.* Take the Inner Kernels of *Cnicus or Carthamus Seed* 3 *Drams*: *Almonds Blanched* 1 *Dram*: *Pine Kernels half a Dram*: *Honey a ſufficient quantity*; *Aniſeeds, Caraways, Galangal, Ginger, of each in fine pouder a Scruple*: *Sal Gem Levigated gr.* 12. *mix and make a Lohoch.* It is good againſt all the Diſeaſes for which the Emulſion is given: it takes away Aſthma's, Hoarſneſs, Wheezing, and moſt other diſeaſes of the Lungs, and cauſes a clear Voice, beſides which it very much encreaſes Sperm or Seed in both Sexes, and therefore is profitable againſt Impotency in Men, and Barrenneſs in Women. If it is made with the Honey like Extract of Juniper-Berries, it will be yet much more powerful to all the purpoſes and Intentions aforeſaid.

XXIV. *Diacarthamum.* An Electuary of Carthamus Seeds. *Take Carthamus Seeds husked, Hermodacts, of the Species Diatragacanthi frigidi, of each half an Ounce*: *White Turbith in fine Pouder 6 Drams*: *Diagridium in fine Pouder 3 Drams*: *White Ginger in Pouder 2 Drams*: *Pure White Sugar 12 Ounces, Manna in Grains 2 Ounces*: *Honey of Roſes ſolutive ſtrained, Sugar Candy, Pulp of preſerved Quinces, of each 1 Ounce*: *mix the Honey, Manna, and Pulp of Quinces with the Sugar whilſt hot, being Boiled to a Conſiſtency*; *then add the Pouders, and make a ſolid Electuary, to be formed into Tables according to Art.* It is an Excellent thing to purge Choler, Flegm, Wind and watery humors from all parts of the Body, but chiefly from the Head and Joints. It is good againſt the Scurvy, Dropſy, Jaundice, Gout, Rheumatiſm, King's-Evil, Palſie, and an inveterate or old head ach: and being made up into Lozenges, it may be given to Children to Kill Worms. Doſe from half an Ounce to an Ounce; and in very ſtrong Conſtitutions to an Ounce and half.

XXV. *Diacarthamum Novum. Take Carthamus Seeds Husked an Ounce*: *Diagridium, Hermodacts, Reſinous Jallap of each half an Ounce*; *Cambogium 2 Drams*: *Cloves, Ginger, Nutmegs, Winters Cinnamon, Zedoary, of each 3 Drams*: *all being in fine Pouder, mix them with the Triple weight of Honey of Roſes ſolutive ſtrained, or Syrup of Peach-flowers, and make an Electuary according to Art.* It has all the Virtues of the former, but much more powerful to every intention; and may be given in the morning faſting, from half an Ounce to an Ounce, to be ſwallowed alone, or in ſome convenient Vehicle cold.

XXVI. *Enema*, Or the Clyſter. *Take fat Mutton or Chicken Broth three quarters of a Pint*; *of the Emulſion at Sect.* 22. *above a quarter of a Pint or ſomething better*: *Sal Gem in fine Pouder half a Dram*; *mix for a Clyſter.* It Evacuates the Bowels, and gives eaſe in the Colick and Griping of the Guts; cleanſing the Bowels from Viſcous Flegm, and other Acrid and ſharp humors.

XXVII. *The*

XXVII. *The Pouder of the Flowers.* Given to a Dram in Barly Water, or Mead, or Honied Water, it prevails admirably againſt the yellow Jaundice.

XXVIII. *The Pulp of the Seed.* Given to a Dram in an Ounce of Syrup of Wormwood; it is ſaid to cure the Jaundice, gives eaſe in the Colick, and kill worms in the Stomach and Bowels.

XXIX. *Nota.* Some Authors ſay that the Seeds of *Cnicus or Carthamus* which are brought to us out of the *Levant* Countries are more quick in their Cathartick or purging Qualities, and more powerful in their Operation, than thoſe which grow in *England*, or our more Northern *Climates.*

XXX. *As to its Vulnerary Vertue.* It is very manifeſt in its effects, being uſed either *in its Pouder*, which may be conſtantly given inwardly, and outwardly ſtrewed upon the Sore; Or, *in its Tincture*, given inwardly daily, and waſhing the Wound with it; Or *in its Extract*, in like manner given and applyed; Or, *in its Infuſion in Wine*, or Wine and Water, Or *in Syrup*, inwardly and outwardly uſed, by which it abſorbs the acid particles by which the Wound or Ulcer is kept open, and gently carries off the Recrements of the humors, diverting them another way; and for theſe very reaſons, it is of Admirable uſe in Cureing Sores and Ulcers of the *Kings Evil*, being uſed in the ways above-mentioned; or thus. *Take the Balſam of Peru*, 4 *Ounces: Pouder or Extract of Saff-flower* 2 *Ounces, mix them.* Outwardly lay it upon the Sore or Ulcer: and inwardly give it from half a Dram, to a Dram or more, according to Age and other Accidents, ſo long as need requires.

XXXI. *The Culture of Saff-flower*, or *Carthamus.* What we ſhall ſay to this ſhall be from a Letter of *Henry Hall* Eſq; whoſe Experience in the management thereof is worth Obſervation. This flower in my Opinion (ſays he) is improperly called *Saffi* or *Zaffi-flower*, for its Seed is the ſame we call *Carthamus*, and is Cultivated after this following manner. The ground being prepared and made fine, the Seed is ſowed in Rills, as Peaſe here about *London* are moſt uſually ſowed; but this at a greater diſtance, that with more conveniency it may be howed and cleanſed from the Weeds; beſides it muſt be Sowed very thin, for it is a ſtrong plant, and requires room to ſpread, one Stalk producing *Seven, Ten, or Twelve Heads of Buttons*, all which bear Flowers. The exact quantity of Seed to an Acre (for want of my Notes) I dare not affirm; but to the beſt of my remembrance, it was about five Pecks to an Acre. After it is come up, about 6 inches in height, the ground muſt be well cleanſed from Weeds; from which afterwards, for the moſt part, the plant defends its ſelf; but if once riſen, they muſt be carefully weeded out; other looking to it needs not, until the Flower grows ripe, which is known by its color, for then it will be of a deep Orange Tawney; it ripened here with us in the beginning of *Auguſt.*

XXXII. *The Gathering of the Flower.* Such hands as are cheapeſt got, are made uſe of in this work, as Women and Children, who with little ſpud knives, take out the Flower from the Buttons which they put into Baskets they carry on their left Arm, which when filled, they empty into other great Baskets, in which it is carried home to be cured. The ripeſt of the Flowers muſt firſt be gathered; the others will ripen ſucceſſively. The work may take up a Week or Ten Days, before all will be fit to gather. The planters thereof affirm, that the gathering the Flowers, does not impede the ripening of the Seed: but in this I am a little doubtful, for ſome Experiments I have made, have evinced to me the contrary. After the Flowers are gathered, the Seed ripens, which is known by the cleaving of the Buttons, or ſome other tryal. Then they cut the Plant, and allowing it time to dry, having bound it in ſheaves and bundles, they houſe it, and at convenient times Thraſh it.

XXXIII. *The Curing of the Flower.* There is no other Ceremony in this, than the laying it on a clear Floor, where the Air may have a free Acceſs; it is lay'd about 2 inches in Thickneſs, and ſtirred about 2 or 3 times a day, to accelerate the drying, and avoid Fermentation, which would ſpoil the color of the Flower. In performance of this, I think a *Stove* would with more advantage, and quicker diſpatch, prepare the Flower for packing, which when thorow dry they put into Canvaſs Bags.

XXXIV. *Nota.* 1. *Saff-flower* is a Drug which now uſually comes from *Germany*, and is chiefly Cultivated about *Straſburgh*: here it is much uſed by Silk Dyers, who give a good price for it, which encouraged a Gentleman of my Acquaintance, to procure ſome Seed from thence, which he ſowed in ſome Grounds not far from him, with ſo good ſucceſs, that notwithſtanding ſeveral Diſcouragements he met with, he ſent an Agent purpoſely to get a conſiderable parcel of Seed, which was diſpoſed of in ſeveral places.

XXXV. *Nota* 2. Some ſmall quantity of this Seed I got, to make ſome experiments with; but recommended for the ſowing of a Quantity, a piece of Ground in the Valley of *Eversham* in *Gloceſterſhire*, belonging to a Siſter of mine, who the year before had from this Ground a Crop of Wheat. The Ground was a mixt Sand, of about 15 ſhill. *per* Acre value, and was then dreſſed as is uſual in that Country for *Barley*, only it had a Harrowing extraordinary, for the better and finer lying of it. This piece of Ground conſiſting of about 25 Acres, was taken for 2 years by an Adventurer in this Seed, at the Rate of 25 ſhill. *per* Acre, in conſideration that the plant is ſaid to be a great impoveriſher of Land: he ſowed his Seed in *April*, and gathered the *Flower* in *Auguſt*; which having cured, was put into Bags and Sold at *London*, at Ten Pounds per Hundred Weight; a price he ſaid, much below his Expectation; but at that Rate we computed he might gain above 30 ſhillings per Acre clear profit, all charges diſcounted, excepting the price of the Seed. There was alſo a plentiful return of *Seed*, which had it been well managed would have amounted to a conſiderable Value, perhaps as much as the *Flower*, which for want of Experience was a little too timely gathered. This Field might yield by Eſtimation 140 Buſhels, for only ſome part of it was Thraſht; the reſidue was put up in a *Stack*, in the open Air, but Thatch't, to preſerve it from Wet.

XXXVI. *Nota.* 3. What I have here writ, is from the relation of ſome of the planters, and the perſon that Sowed the Ground here mentioned and gathered the Flower. Now ſince the ſowing of this Seed, and propagating of the Plant, may arrive to a very great improvement if rightly managed, I will offer ſome Experiments of my own, for the encouragement of this Plantation; and which ſeem to me to Obviate the main Objections which have been made a-

against it; as first, That the Plant being a hardy and strong Plant, will endure to be sowed much sooner without any prejudice, so that the Flower will come to be ripe before Wheat Harvest, when plenty of hands may be had to get it in. I Sowed some in *February*, and some about the middle of *March*, both thrived very well, Flowered, and was ripe to be gathered in *July*, before the 20th day. That which was Sowed in *February* was not so well colored, as the other Sowed in *March*; but that I impute more to the neglect of my Gardner than to any premature Sowing of the Seed. That which is Sowed in an open place, and constantly exposed to the Sun and Air, produces a larger Flower, much better colored, and more upon a Stalk than that which is Sowed in the shade.

XXXVII. *Nota* 4. Secondly, It is Objected, that our *English* Seed is not so good as the *German*, and will hardly serve one year, and then double the quantity must be Sowed, so that the procuring of more Seed every second year out of *Germany*, would be too great a charge to answer expectation. To which I answer, that I think this may be a great mistake; for the gathering of the Flower does without doubt impair the ripening of the Seed. For having left some Flowers standing purposely, that nature might do her own work, I gathered the Seed when ripe, which proved brighter, larger, and much heavier than any of the other, whose Flower was forced from it: therefore am confident, that if some part be left to stand, to have its full time of ripening, without gathering the Flower, and the Seed preserved to a second Sowing; that that Seed will be full as good as what is brought from *Germany*.

XXXVIII. *Nota* 5. Thirdly, It is Objected that it is a great impoverisher of Land, for after a Crop of *Saff-Flower*, it will hardly bear any thing. I believe it impoverishes the ground, but not so as to disable it to bear another Crop: The piece of ground afore-mentioned which was Sowed with *Saff-Flower*, did the year following, bear a good Crop of Oats; and had it been the third year, followed and well dressed, would have been fit for *Wheat* or *Saff-Flower* again.

XXXIX. *Nota* 6. This I also observed, that very much of the Seed where the Flower was gathered from the Stalk, was not only light, but hollow and black within; for which reason, I am of Opinion, that if some part of a piece of Ground was left standing to ripen of it self, the goodness of the Seed would fully compensate in its product, the loss of the Flower, and the remaining Seed might be very profitable for other uses, for the Fatning of Turkeys, Geese, and other Creatures, being well fed therewith, for that it causes them to grow Fat much sooner than when they are Fed with other Grains.

XL. *Nota.* 7. The Novelty of this Flower, as it drew several Spectators in the Country, to see it in the field; so it likewise begot an Opinion in some of the more Ignorant, that it was *Saffron*, in which they were confirmed from the Name, and the Tincture of it: so that they privately stole considerable quantities, when it was ripe, and used it in their *Puddings*, *Cakes*, yea even in their *Bread* it self; till they were convinced by its purgative quality, which to some was very Troublesome.

XLI. *Plot* in his *Natural History of Oxfordshire*, *Chap.* 6. *Parag.* 35. *page*, 155. says, that Cnicus, five Carthamus Sativus, Manured Bastard Saffron or Saff-Flower, used for dying of Scarlets, and therefore by some called Scarlet Flower; was once Sown at *North Aston*, by *Collonel Vernon*; the Seeds being planted in Rows, about a Foot distance, for the more convenient howing, and keeping it clean from Weeds. In these Rows it rises with a strong round stalk, three or four Feet high, branching it self to the Top: where it bears a great Scaly Head, out of which it thrusts forth many Gold yellow Threads, of a most Orient and shining color; which they gather every day as fast as they ripen, and dry them well; which done, it is fit for Sale, and dying of Scarlet.

CHAP. DCXIV.

Of SAGE GARDEN.

I. *THE Names.* It is called, by the Arabians *Ælifacos*, and *Aelisfacos*: In Greek Ἐλίσφακος, (derived I suppose from the Arabick Name:) in Latine *Salvia* (*quia Salvos homines & incolumes efficiat:*) and in English, *Sage*.

II. *The Kinds.* There are two principal species of Sage, *viz.* 1. *Salvia hortensis*, Garden Sage, of which in this Chapter. 2. *Salvia agrestis vel sylvestris*, Wild or Wood Sage, of which in the Chapter following.

III. *The Kinds of the Garden Sage.* There are many species of this sort, some of which grow not with us; the chief of them which we have in our Gardens are these following, *viz.* 1. *Salvia major alba Vulgaris*, *Salvia alba latifolia*, our common greater white or Green Leav'd Sage. 2. *Salvia major rubra vulgaris*, *Salvia rubra angustior*, our common red Sage. 3. *Salvia maxima latifolia*, *Salvia latifolia serrata*, great white Sage. 4. *Salvia Virtutis*, *Salvia minor Matthioli*, *Salvia pinnata*, *Salvia nobilis Gesneri*, *Salvia angustifolia*, & *tenuifolia*; *Salvia aurita*, *Salvia auriculata*, Sage of Virtue. 5. *Salvia aurita minor odoratissima*, *Salvia aurita Hispanica*, the most odoriferous small Sage, or Spanish Sage. 6. *Salvia absinthites*, *Salvia minor altera Clusij*, Wormwood Sage, Roman Sage. 7. *Salvia Variegata*, Party-colored Sage. 8. *Salvia Variegata altera*, speckled Sage, of all which in order.

The Descriptions.

IV. The first or our common greater white or Green Leav'd Sage. *It has a long and pretty thick Woody Root, with many Strings adjoining to it, which sends forth four square Woody Stalks in some green, and in others of a whitish green, as are also the Leaves, which stand by pairs or couples at the joints, being somewhat long and broad Rough and, Wrinckled, of a strong but pleasant aromatick scent, at the tops of the Stalks come forth the Flowers, set at certain spaces, one above another, which are long and gaping, like unto the Flowers of* Clary, *or* Archangel, *but of a blewish purple color: after which come small round Seed in the bottom of the husk which contained the Flower. This Plant is more usually propagated by Slips, thrust into the Ground in the Spring time, than by the Seed.*

V. The

V. The Second, or our common red Sage. *It is the same as to its Roots, Stalks, Branches, Leaves, Flowers and Seed little differs from the*

Sage Garden Common and Red.

former, saving that in this the Leaves *are of a red or purplish color, of the same length but narrower; and it seems to be the more generous and fragrant* Plant *of the two.* Parkinson *thinks, that both the former and this are but one and the same* Plant *or Species; or that they both rise from the same* Plant *being slipt off, and set.*

VI. The Third, or great white Sage. *This differs not much from the first, or our common white or green Sage before described in the manner of the Growing, or the color of the* Leaves, *or sweetness of the whole* Plant. *The chief difference consists* 1. in the Leaves, *which are much larger and a little dented about the edges; and sometimes much more, making them seem curled, divers of the* Leaves *being four Inches long, and three Inches broad.* 2. in the Flowers, *some* Plants *bearing purplish Flowers, like the common sort, and others Milk white Flowers, which is the more rare.*

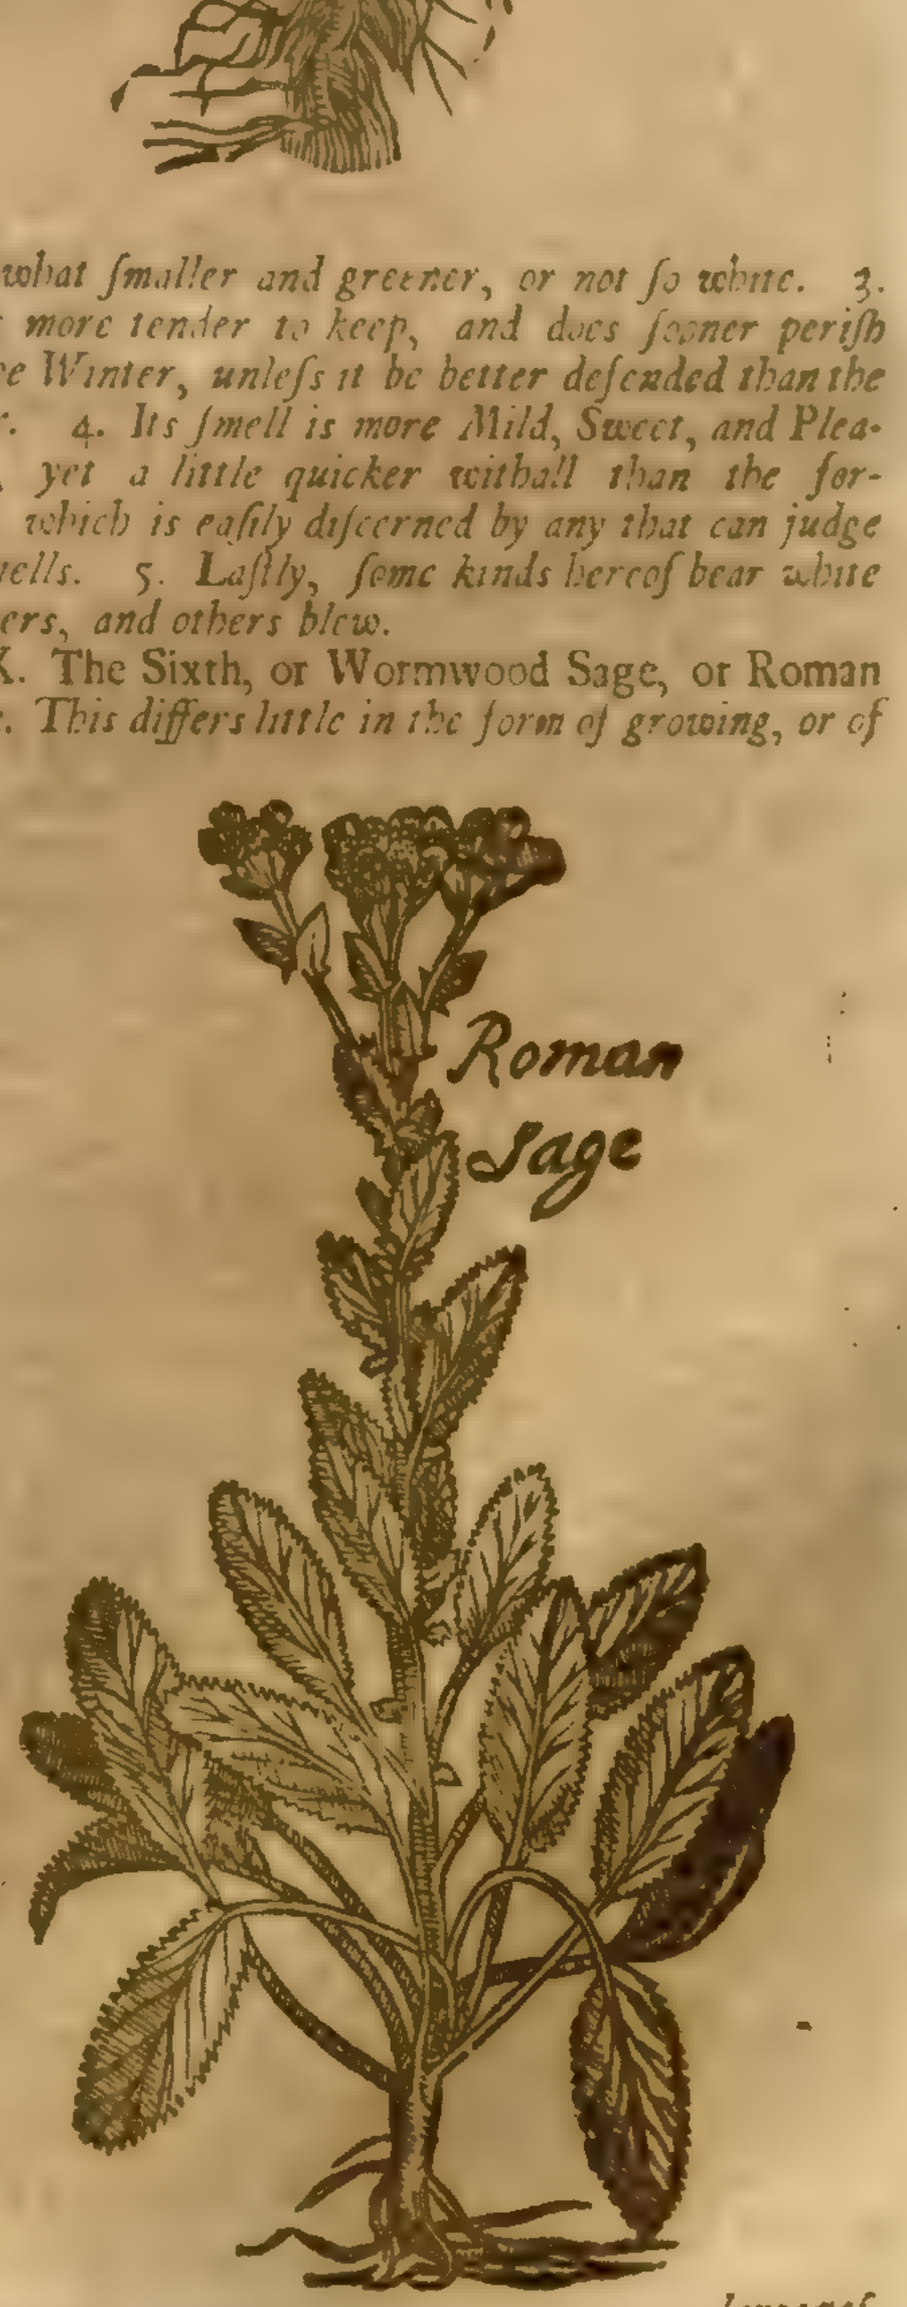
VII. The Fourth or Sage of Virtue. *This in its* Root, Stalks, *and* Branches, *grows like unto our first or common green Sage, but that the* Branches *are longer and slenderer; the* Leaves *also whitish, and never red, and much smaller and narrower, having for the most part at the bottom of each* Leaf, *on each side, a small piece of a* Leaf, *which makes it seem like Finns or Ears. The* Flowers *are also of a blewish purple color but lesser. There is another of this kind which bears white* Flowers, *differing in nothing else from the other.*

VIII. The Fifth or most odoriferous small Sage, or Spanish Sage. *This small Sage is in most things, like unto the former Sage of Virtue with Ears; so like, that unless it be well heeded or considered, it may be thought all one with the other: but herein consists the Difference.* 1. *It seldom grows so great or large as that.* 2. *Its* Leaves *are*

Sage of Virtue.

somewhat smaller and greener, or not so white. 3. *It is more tender to keep, and does sooner perish in the Winter, unless it be better defended than the other.* 4. *Its smell is more Mild, Sweet, and Pleasant, yet a little quicker withall than the former, which is easily discerned by any that can judge of smells.* 5. Lastly, *some kinds hereof bear white Flowers, and others blew.*

IX. The Sixth, or Wormwood Sage, or Roman Sage. *This differs little in the form of growing, or of*



largeness,

largeneſs, or color of the Leaves, from the ordinary ſmall Sage of Virtue, but that it has not Ears ſo frequently as that has; but the chiefeſt difference is, that its Flowers are red, and that this Plant in both its ſmell and taſte is like unto Wormwood.

X. The Seventh, or party colored Sage. *This kind grows with Roots, Branches and Leaves very like unto our firſt or common Sage, but ſomewhat ſmaller: the chief difference conſiſts in the color of the Leaves, being diverſly Marked and Spotted, with white and red among the Green. For upon one Branch you ſhall have the Leaves ſeverally Marked one from another, as the one half of the Leaf white, and the other half green, with Red ſhadowed over them both; or more white than green, with ſome red in it, either parted, or ſhadowed, or daſht here and there: Or more green than white, and red therein, either in the middle, or end of the Leaf; or more or leſs parted or ſtriped with white and red in the Green; or elſe ſometimes wholly Green, the whole Branch together; as Nature is pleaſed to exhibit the Varieties. This manner of Growing, riſing from one and the ſame Plant, becauſe it is ſo much Variable, is the more delectable and Valuable.*

XI. The Eighth, or Speckled Sage. *This in its Roots, Stalks, Branches, Leaves, Flowers, Seed, form and manner of growing, as alſo in its magnitude, is very like the laſt deſcribed, being really a ſpecies thereof; but in this kind the Leaves are ſpeckled as it were, partly with white and green; but it has not the beauty of the former, becauſe that has three colors evidently to be diſcerned in every Leaf almoſt, the red adding a ſuperabounding beauty to the reſt; whereas this is only ſpotted with two colours white and green. The two laſt, or ſeventh and eighth kinds, are only different ſorts of the firſt or common kind before declared.*

XII. *The Places.* The firſt, ſecond, third, fourth, fifth and ſixth grow naturally in *Spain* and *Italy*; and all of them, as alſo the ſeventh and eighth are now Natives of *England*, and grow and flouriſh admirably in our Gardens.

XIII. *The Times.* Almoſt all theſe ſeveral kinds of Sage Flower in *July*, and have ripe Seed in *Auguſt*, or not long after their times of flowering. But the *Sage of Virtue*, tho' moſt commonly and in many places, it yields no Seed at all, yet in ſome Countries and in ſome Years it does: however its defect of Seed is ſupplyed, in its increaſe by ſetting of ſlips in the proper ſeaſon.

XIV. *The Qualities.* Sage is ſaid to be hot and dry in the third Degree, Aſtringent, Anodyn, Carminative, Digeſtive, Diſcuſſive, Diuretick, and Traumatick: Cephalick, Neurotick, Stomatick, Hyſterick, Arthritick, Emmenagogick, Sudorifick, Alexipharmick and Analeptick.

XV. *The Specification.* It is good againſt a Vertigo, Lethargy, Headach, from a cold Cauſe, Palſie, Convulſions, ſpitting Blood, weakneſs of the Nerves, Barrenneſs in Men or Women, Poiſon, the bitings of Serpents and other Venomous Creatures, the Plague, and other Malign and Peſtilential Diſeaſes, Catarrhs, Rheumatiſms, *&c.*

XVI. *The Preparations.* You may have therefrom, 1. *The Green Leaves.* 2. *The Juice.* 3. *The Eſſence.* 4. *An Infuſion in Wine or Water.* 5. *A Pouder of the Leaves.* 6. *An Oil, or Ointment.* 7. *A Cataplaſm.* 8. *Pills.* 9. *A Gargariſm.* 10. *A diſtilled Water.* 11. *A Spirituous Tincture.* 12. *An Acid Tincture.* 13. *An Oily Tincture.* 14. *A Spirit.* 15. *A diſtilled Oil.* 16. *Poteſtates or Powers.* 17. *An Elixir.* 18. *A Conſerve of the Flowers.*

The Virtues.

XVII. *The Green Leaves.* They are uſually eaten in the Spring as a Sallet, with a little Vinegar, Salt, and Pepper, with good Butter and Bread; ſo eaten it ſtrengthens the Stomach, expells Wind, comforts the Bowels, and reſiſts Poiſon, and is profitable for ſuch as are Dull and Drowſie, and apt to be afflicted with Vapors from the Spleen or Womb.

XVIII. *The Juice.* It ſtops the Bleeding of Wounds, and cleanſes foul putrid Sores and Ulcers. *Agrippa* ſays, that if it be taken with a little Salt by Childing Women, for ſome days before they accompany with their Husbands, whoſe Wombs are too moiſt and ſlippery, and are unfruitful by reaſon of that default, that it will help them to conceive; and ſuch as have conceived, and are ſubject often to miſcarry upon any ſmall occaſion, it will prevent the Abortion, and cauſe them the better to retain the fruit in the Womb, and alſo make it the more lively. Therefore in *Cyprus* and *Ægypt*, after a great Plague, Women were ordered to drink the Juice of Sage, to cauſe them to be the more fruitful. And *Orpheus* ſays, that three Spoonfuls of the Juice of Sage, ſweetned with a little Honey, and taken faſting, does preſently ſtop the Spitting or Vomiting of Blood. *Matthiolus* ſays, that it is very profitable for all manner of Pains of the head coming of Cold, and Rheumatick humors, as alſo for all pains of the Joints, whether uſed inwardly or outwardly; and for ſuch as have the Falling Sickneſs, Lethargy, or drouſie Evil, and ſuch as are dull and heavy of ſpirit, and for thoſe who have the Palſie, or are troubled with Defluxions of their Rheum upon the Lungs, as alſo for other Diſeaſes of the *Thorax* or Breſt. *Dioſcorides* ſays that it provokes Urine, brings down the Courſes, and forces away the dead Child. *Pliny* ſays that it provokes Womens Courſes; and yet that it ſtops them, when they come down too faſt; helps the ſtinging and bitings of Serpents, and kills Worms breeding in the Ears, as alſo in Putrid Sores or Ulcers.

XIX. *The Eſſence.* It has all the Virtues of the Juice, and is more potent to all thoſe Intentions; beſides which, it is of good uſe in the Plague it ſelf, and againſt all Malign and Peſtilential Diſeaſes, being taken Morning and Evening, and at other times as the Phyſician ſhall adviſe, from a ſpoonful to 3 ſpoonfulls, according to Age and other Accidents, in any proper Vehicle.

XX. *The Infuſion or Decoction in Wine or Water.* They have all the Virtues of the Juice or Eſſence, but much inferiour to them in Potency, and therefore may be given from a quarter of a Pint to half a Pint at a time, as the occaſion may require; and may be uſed Ordinarily, infuſed in Water, after the manner of *Tea*, by which many have found very good Effects. Bathed upon the Cods it abates their Itching.

XXI. *The Pouder of the Leaves.* Taken to a Dram, it rectifies the evil diſpoſition of the Stomach, corrects and expels Wind, is good againſt Scrophula or Struma; and outwardly applyed ſtops the bleeding of Wounds, and alſo cleanſes and drys up old Putrid and running Sores or Ulcers. It alſo ſtops the immoderate Flux of the Courſes, and ſtays Vomiting.

XXII. *The Oil or Ointment.* They are Anodyn, or eaſers of Pain, diſcuſs Tumors in their firſt appearance,

pearance, are profitable againſt the Gout from a cold cauſe, ſtrains and weakneſſes of the Joints, and to cleanſe, dry and heal old running Sores.

XXIII. *The Cataplaſm.* If it is made of freſh Sage Leaves and Nettles, beaten together, and it be laid upon an Apoſteme behind the Ears, it does much diſcuſs and help it. And if it is made of Sage Leaves alone, by ſcalding them in Wine, and bruiſing them, and ſo applyed to any Paralytick Part, it does much good; more eſpecially, if at the ſame time the Patient takes inwardly Morning and Night, the Eſſence, Powers, or Elixir of Sage alſo.

XXIV. *The Pills. Take Sage Seed reduced to Pouder ten Drams: Long Pepper* 12 *Drams; Ginger, Spicknard of each two Drams: All being in fine Pouder, with Juice of Sage make them up into a Maſs of Pills.* Theſe Pills are commended for the Cure of Conſumptions, being taken every Morning faſting, and every Night going to Bed, a dram at a time in any convenient Vehicle. They alſo expell Wind, gives eaſe in the Colick, provoke the Terms, and facilitate the Birth.

XXV. *The Gargariſm. Take Juice of Sage* 4 *parts, Juices of Hony Suckles, of Plantane, of each* 2 *parts: Juice of Columbines one part: in which diſſolve a little Alum, and ſweeten with Honey.* It cures Cankers, Ulcers, and Sores in the Throat, Mouth and Gums, by gargling therewith, as alſo in the ſecret parts of Man or Woman, by waſhing therewith often.

XXVI. *The Diſtilled Water.* It has the Virtues of the Juice and Eſſence, but in a much lower degree, and may be given to ſix or eight Ounces at a time ſweetned with Honey, otherwiſe it is uſed only as a Vehicle to convey other of the preparations down in.

XXVII. *The Spirituous Tincture.* It has all the Virtues of the Juice and Eſſence, but more Stomatick, Digeſtive, Cordial; it comforts the Head, Brain, Nerves, Womb and Joints, and reſiſts all Diſeaſes affecting thoſe parts, occaſioned by cold, moiſt, acid and ſharp humors or weakneſs: Doſe 60 or 80 drops, Morning, Noon, and Night, in a glaſs of Generous Wine.

XXVIII. *The Acid Tincture.* It is a noble Medicament againſt the Plague and all ſorts of Peſtilential and Malign Diſeaſes whatſoever, deſtroying the poiſon in its Root. It prevails alſo againſt the poiſon of Vipers, Rattle-ſnakes, and other Serpents; as alſo againſt the Malignity of the biting of Mad Dogs and other Venomous Creatures: and being bathed upon any part troubled with the Gout, gives eaſe to the part. Doſe inwardly 60 Drops or more, twice or thrice a day, in a Glaſs of White Lisbon, or other fit Vehicle.

XXIX. *The Oily Tincture.* It prevails againſt the Stone, Gravel, Sand, and Tartarous Mucilage in the Reins, Ureters and Bladder, provokes Urine, and gives eaſe in the Strangury and intolerable pains and Weakneſſes of the Back. It provokes the Terms, opens obſtructions of the Womb and cleanſes it, it gives eaſe in the Colick and Gripings of the Guts, and is a potent Remedy againſt moſt diſeaſes of the Brain and Nerves, proceeding of cold, as Carus, Lethargy, Headach, Palſie, Convulſions, Cramps, and other like diſeaſes of thoſe parts, being anointed along on the Back Bone, and upon the parts affected, and taken inwardly Morning and Night, in ſome proper Vehicle, from 20, to 30 or 40 Drops, as the Phyſician ſhall adviſe.

XXX. *The Spirit.* It is made as you make Spirits of Lavender, Pennyroyal, Roſemary, *&c.* It is highly Cordial and Neurotick, and has all the Virtues of the Juice and Eſſence. Doſe half an Ounce or more in a Glaſs of generous Wine. It comforts and warms the Womb, and promotes Conception

XXXI. *The Diſtilled Oil.* It is Cephalick, Neurotick; Cardiack, Uterine, Carminative, Anodyn, Alexipharmick, and Analeptick: quickens the Senſes and Memory. Strengthens the Head, Nerves, and Joints, is good againſt Apoplexies, Convulſions, Epilepſies, Lethargies, Megrims, Palſies, Vertigo's, helps againſt Catarrhs, Rheumatiſms, Pleuritick pains, Coughs, Colds, Spitting of Blood, Conſumptions, and pains of the Sides; it expels Wind, drys up watery humors, and is good againſt the Bitings of Mad Dogs, Serpents, and other Poiſonous Creatures; it provokes Urine wonderfully, brings down the Terms, and haſtens the Birth, cauſing eaſy Delivery; and in a word has all the Virtues of the Juice, Eſſence, and Spirit aforegoing. Doſe à gut iij. ad x. in ſome convenient Vehicle. It muſt never be given alone, becauſe of its exceeding heat.

XXXII. *The Potentates or Powers.* Theſe have all the Virtues of the Juice, Eſſence, and Diſtilled Oil, and may be given to all thoſe purpoſes and Intentions, twice a day, in a Glaſs of Generous Wine, from a quarter of a Spoonful to half a Spoonful. They facilitate the Birth and After-Birth, force away the Dead Child, and potently reſiſt a Paralyſis.

XXXIII. *The Elixir.* This is yet ſtronger than the Powers, and of more exalted properties, but may be given in the ſame Doſe with them, and after the ſame manner.

XXXIV. *The Conſerve of the Flowers.* It is uſed to warm and comfort the Brain and Nerves, to help and reſtore the memory, quicken the Senſes, and Stop Fluxes of the Bowels.

CHAP. DCXV.

Of SAGE WILD.

I. *The Names.* It is called in Greek Ελιτροχρυσος: in Latine *Salvia Syluestris*: and in Engliſh, *Wild Sage.*

II. *The Kinds.* We ſhall Treat but of three Species in this Chapter, *viz.* 1. *Salvia agreſtis, Salvia Syluestris, Salvia Montana Geſneri, Salvia Boſci Loniceri, Tabernæmontani & Tragi; Scordonia, & Scorodonia Cordi, Gerardi & Thalii, Melinum alterum Ceſalpini, Scordium alterum quibuſdam; Ambroſia quibuſdam*; Wood Sage, Wild Sage or Garlick Sage. 2. *Salvia lutea latifolia; Salvia fruticoſa lutea latifolia*, Yellow wild Sage with Broad Leaves, called by ſome alſo French Sage. *Anguillara, Caſtor Durantes, Cluſius*, and others do call it, *Verbaſcum Syluestre*, and *Verbaſcum quartum Mattioli*, making it a Species of the *Mulleins*; but it is certain, it is not a kin to them; for tho the Leaves are Wooley like *Mullein*, yet their form and ſhape, with the Flowers and other Circumſtances ſhew it to be a kind of *Sage*, and ſo it is called in *England, Flanders, France, and Italy*, viz. Wild Sage. 3. *Salvia fruticoſa anguſtifolia, Phlomis; Lychnitis Dioſcoridis Cluſio.* The greater Wild Sage.

The

The Description.

III. The First, or Wood Sage, Wild Sage, or Garlick Sage. *Its Root is long and Stringy, with many Fibres adjoining, abiding many years. It rises up with Square Hoary Stalks, two feet high at least, having two Leaves set at every Joint thereon, which are something like unto Sage Leaves, but smaller, softer, whiter, and rounder, a little dented about the edges, and smelling somewhat strongly. At the tops of the Stalks and Branches grew flowers on a slender long spike, turning themselves all one way when they blow, and are of a Pale or Whitish Color, smaller than Sage, but hooded, and gaping like to them. The Seed is blackish and round, four usually set together in a husk.*

IV. Gerard *describes it thus.* Its Root is full of Strings, from whence spring up Stalks 4 square, somewhat hairy, upon which are set *Leaves like those of Sage, but shorter, broader, and softer. The flowers grow up all upon one side of the Stalk, open and forked like those of Dead Nettle, but lesser, of a Pale White Color: after which comes the Seed, four together in one husk. It is a plant which lives but a year, and smells of Garlick when it is bruised, being thought to be a kind of Garlick Germander, as it its Garlick smell testifies.*

V. The Second, or Yellow Wild Sage with Broad Leaves, called by *some French Sage. Its Root is Woody with divers Strings and Fibres adjoining to it. It has several square Woody hoary Stalks, on which grow at several spaces, rugged, hoary*

Sage Wild Yellow Broad Leav'd.

Sage Wood or Garlick.

broad, and almost round pointed leaves, many set together, very like unto the great Sage, but larger. The Flowers grow likewise, in Rundles or Spaces towards the Tops of the Stalks, very like also unto the Flower of Sage, or Archangel, but of a Yellow color. The Seed is greater than of any Sage, somewhat brownish, and round like the next or third kind following. The whole Plant smells somewhat strong and heady.

VI. Gerard *describes this second kind thus.* Its Root is thick, tough and of a Woody substance, as is all the rest of the Plant. *It grows up like a small Woody Shrub, having many Woody Branches, of a Woolly and Hoary color, soft and downy: On which are placed thick hoary Leaves, of a strong Pontick Savor, in shape like to the Leaves of Sage, whereupon the Vulgar People call it French Sage. Towards the Tops of the Branches are placed Roundles or Coronets of Yellow gaping Flowers, like those of Dead Nettle, but much greater.*

VII. The third or great Yellow Wild Sage with narrow Leaves. Its Root is blackish and Woody. *This Species has very many hoary and woolly Leaves, the lowersides especially, more than the upper; longer and narrower also, than those of the small Sage; from among which rise up square hoary and hairy Stalks, about a Foot high, on which do grow such like long hoary Leaves as grow below, two always set together, at the Joints, one against another; where the Flowers grow at spaces, about the Tops of the Stalks, with two Leaves under them, broad at the bottom, and encompassing the Stalks, being shorter than the rest. The Flowers are large, open and gaping, like unto Sage, or somewhat more like to those of the Dead Nettle or Archangel, of a Yellow color, and coming forth out of hoary, woolly Husks, covered with pale colored Hairs; the Tops by reason of their length and weakness, bending*

ing a little downwards, after which come the rough Seed inclosed in Woolly Husks.

VIII. *The Places.* The firſt grows in many wet Grounds and by Water ſides in many places of *England*. *Dioſcorides* ſays, it grows as well on Hills, as by Water ſides, and it will thrive well if it be Tranſplanted into Gardens. *Camerarius* ſays, that it is found to be ſtronger and ſharper which grows on high Grounds, than that which grows on the lower. *Gerard* ſays, it grows on Heaths and barren places, and is found alſo in Woods, and near unto Hedge rows, about the borders of Fields. It delights in ſomewhat a lean Soil, and yet not altogether barren and dry. The ſecond and third grow plentifully throughout *Portugal* and *Spain*, and in ſome parts of *France*, on dry banks and ſtoney places: but with us they grow only in Gardens. All theſe ſorts will grow by Slips taken from them, and Planted in *March* or *April*.

IX. *The Times.* They all Flower in *June* and *July*, and ſometimes in *Auguſt*; but much about the Times when the Common Sage Flowers, and the Seed is ripe in ſome ſmall time afterwards.

X. *The Qualities.* They are all of them hot and dry in the ſecond degree, Cephalick, Neurotick, Stomatick, Cardiack, Hepatick, Hyſterick, and Arthritick; Aperitive, Subaſtringent, Alexipharmick and Analeptick.

XI. *The Specification.* The firſt is good againſt Ruptures, Contuſion, Wounds, Strangury and the French Pox. The two laſt are good againſt Burnings and Scaldings.

XII. *The Preparations.* From the Scorodonia or Wood Sage, you may have 1. *A Juice.* 2. *An Eſſence.* 3. *A Decoction.* 4. *A Pouder.* 5. *A Diſtilled Water.* 6. *A Spirituous Tincture.* 7. *An Acid Tincture.* 8. *An Oily Tincture.*

The Virtues.

XIII. *The Juice.* It is good againſt Ruptures or Burſtenneſs, Contuſions, and Wounds. It is good alſo for moiſt Ulcers and Sores in the Legs or other parts, to cleanſe and dry them, and cauſe them ſpeedily to heal.

XIV. *The Eſſence.* It has all the former Virtues; beſides which being uſed daily mixt with a proper Vehicle, or otherwiſe Dietetically it has been found ſucceſsful in curing the *French Pox*, being mixt with a Decoction of *Guaiacum*: and being taken for 20 or thirty days together, it cauſes Sweat, drys up Ulcers, digeſts Humors and diſcuſſes Tumors or Swellings. It is an incomparable thing againſt the Scurvy in a cold habit of Body, as alſo againſt the Plague and all Malign and Peſtilential Diſeaſes. bitings of Mad Dogs, Serpents, and other Venomous Creatures. It opens Obſtructions of the Liver, Spleen, Reins and Womb, repreſſes Hypochondriack Melancholly, provokes Urine, gives eaſe in the Strangury, provokes the Terms, and facilitates the Birth. Doſe 3 or 4 ſpoonfuls in a Glaſs of Wine, or other proper Vehicle.

XV. *The Decoction.* Made whether in Water or Wine, (but the latter is more effectual) it has all the Virtues of the Juice and Eſſence, but muſt be given in much a greater quantity, as to half a Pint two or three times a Day. *Gerard* ſays it is given to ſuch as have had a Fall, and are inwardly bruiſed, and alſo provokes Urine. And that this Decoction is given to drink with good ſucceſs to ſuch as are infected with the *French Pox*, for that it cauſes Sweat, drys up Ulcers, cauſes Digeſtion, and conſumes Tumors in Nodes in the Flesh, being taken for thirty or forty Days together, or put into the Decoction of *Guaiacum*, with the other Ingredients. *Pancratius* ſays, it provokes Urine if it is kept. as all Women's Courſes. The Decoction is to be made rather of the Green Herb, than of the Dryed, and in Water rather than in Water, for feet, as are bruiſed by Falls, or Blows, or where ſome inward Veſſel is broken; becauſe it diſperſes and expels the congealed Blood, and conſolidates the Veſſels.

XVI. *The Pouder of the Herb.* It has all the former Virtues, but not ſo effectual as the Juice or Eſſence, being put upon running Sores and old Ulcers in the Leggs or other parts, it cleanſes, drys and heals them, cauſing them to come to a ſpeedy Cure. And it is no leſs effectual in curing of Green Wounds, becauſe it ſtops the Blood and cauſes them to conſolidate preſently.

XVII. *The Diſtilled Water.* It has the Virtues of the Decoction but leſs powerful, and may be uſed as a Vehicle, to convey the Eſſence, or Tinctures following in. If 2 grains of white Vitriol be diſſolved in it, it becomes a good Ophthalmick for Weak, Sore and running Eyes.

XVIII. *The Spirituous Tincture.* It is Cordial and Antiſcorbutick, good againſt the Colick, and Gripings of the Guts: It expels Wind, is good againſt Fainting and Swooning Fits, and is profitable for ſuch to take who are troubled with the Palſie, Rheumatiſms, and ſickneſs at Stomach.

XIX. *The Acid Tincture.* It prevails againſt the Scurvy in a hot conſtitution of Body, profligates the Plague and all Malign and Peſtilential Diſeaſes, and is of great power againſt the bitings of Mad Dogs, Serpents and other Venomous Creatures, by obliterating their Volatile Poiſons, &c. It reſtrines the diſcraſy of the Blood and *Lympha*, and reſtores the Tone of the Stomach, &c. Doſe ſo many Drops at a time as may give the Wine or other Vehicle a grateful Acidity.

XX. *The Oil Tincture.* It opens the Obſtructions of the Reins and Womb, provokes Urine gives eaſe in the Strangury, Stone and Gravel, removes Tartarous Mucilage from the Urinary parts, and provokes the Terms in Women; it haſtens and facilitates the Birth, and brings away the After-Birth, as alſo the Dead Child if any be. It is of ſingular uſe alſo againſt Pains, Aches, Numbedneſs and other weakneſſes of the Nerves, Limbs, and Joints, gives eaſe in the Gout from a cold Cauſe, and is of extraordinary uſe in the Cure of the Palſie, being anointed Morning and Evening upon the Back Bone, as alſo upon the parts affected. Doſe (in any proper Vehicle) from 15 to 30 or 40 Drops Morning and Night.

XXI. *Nota.* The two latter Plants called *Wild yellow Sage with both broad and Narrow Leaves*, have all the Virtues of *Our Common Sage*, declared in the former Chapter, ſo that we need not ſay much of them in this place: but beſides all that is ſaid there, *Dioſcorides* ſays that a *Cataplaſm* made of the Green Leaves by beating them in a Mortar, and applyed to burnings and ſcaldings, Cures them.

CHAP. DCXVI.

Of SAMPIRE, *OR,* SEA-FENNEL.

I. *THE Names.* It is called in Greek Κείθμον, ϗ κείδαμον, & Κρέθμον *Galeni:* in Latine, *Crithmum*, *Fæniculum marinum:* in Engliſh, *Sampire.* Some will not have this to be *Crithmum Dioſcoridis*, for that he ſaith that his has Whiter and Broader Leaves than *Purſlane*, whereas this has ſmall, long, and narrow Leaves; and that the *Crithmum* of *Dioſcorides* is rather *Portulaca marina*; and that this our *Sampire* ought rather to be called *Fæniculum Marinum*, for as much as not only the form of the Leaf, but the Umbles and Heads of Flowers, and the whole face thereof does aſſimilate a Fennel-like form. *Petrus Creſcentius* calls it *Crethmum & Rincum Marinum.*

II. *The Kinds.* There are five kinds of Sampire, *viz. Crithmum marinum vulgatius*, *Crithmum ſive Fæniculum marinum minus Bauhini*; *Baticulæ alterum genus ex Sicilia Ceſalpini*; and is thought to be that which *Pliny* calls *Batis*, as *Geſner in hortis* does, who alſo calls it *Crithmum marinum.* The *Italians* call it *Herba de San Petro*, and ſome from thence *Sampetro*, whence comes our Engliſh word *Sampire.* This firſt kind is doubtleſs *Our Common Rock Sampire.* 2. *Crithmum marinum majus*, *Crithmum ſive Fæniculum marinum majus Bauhini*, The greater Rock Sampire. 3. *Crithmum marinum*, *Crithmum tertium Matthioli*, Marſh or Sea Sampire of Matthiolus. 4. *Crithmum maritimum ſpinoſum*, *Dodonæi*, *Paſtinaca Marina Lobelij*, *Lugdunenſis*, *aliorumque*; *Anguilara* took it to be *Seracul*, and *Camerarius* calls it *Cachry marinum*; and *Bauhinus* thinks it is the *Tribulus maximus quorundam of Dalechampius*; Thorny Sampire, or Sea Parſnip. 5. *Crithmum Chryſanthemum Dodonæi*; *Cryſanthemum littoreum Lobelij*; *Anthyllis prima Dioſcoridis Cæſalpino*; *Anthyllis major Cordi*, *Crithmum maritimum flore Aſteris Attici Bauhini*, *& Aſter atticus maximus* of ſome others, Golden flowered Sampire.

The Deſcriptions.

III. The Firſt, Or our common Rock Sampire, *has a Root which is Great, White, and Long, of a hot ſpicy taſte, enduring long, and continuing ing many years. It grows up with a Tender green Stalk, about half a yard, or two feet high at moſt; branching forth almoſt from the bottom, and ſtored with ſeveral Thick, ſomewhat long, and almoſt round Leaves, of a deep green color; ſometimes two and ſometimes three together, and ſometimes four or five or more on a Stalk, which are fleſhy or ſappy, and of a pleaſant hot or ſpicy taſte. At the tops of the Stalk and Branches come forth Umbles of White Flowers, and after them come large Seeds bigger than Fennel, and ſomewhat like to that Seed.*

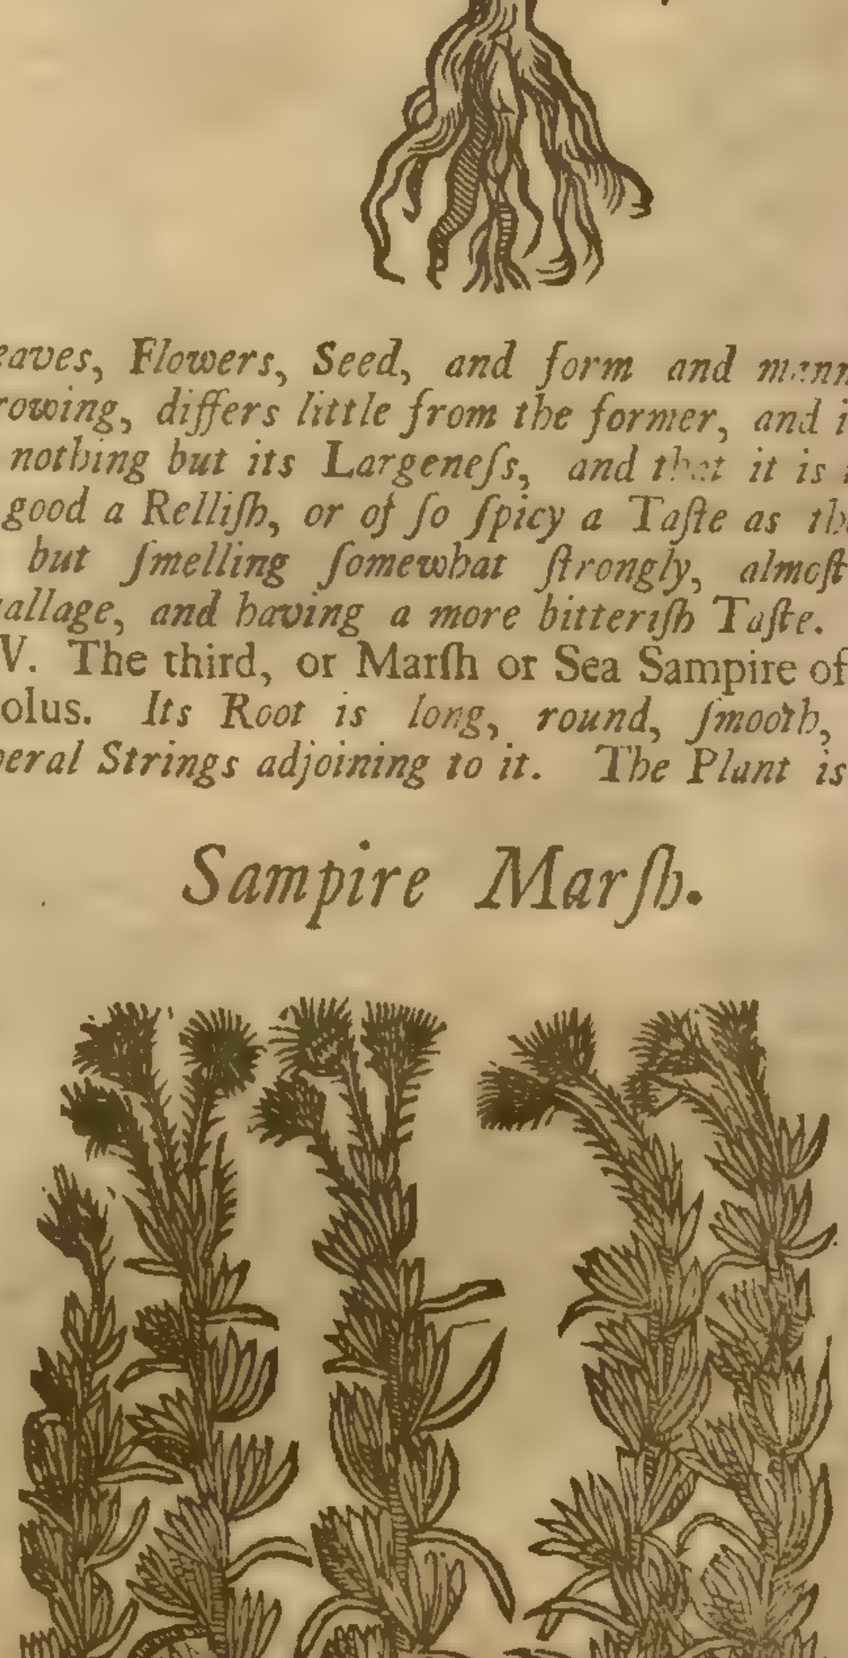
IV. The Second, Or Greater Rock Sampire. This plant in its *Root*, *Stalk*, *Branching forth*,

Sampire Rock Commom.

Leaves, *Flowers*, *Seed*, *and form and manner of Growing*, *differs little from the former*, *and indeed in nothing but its Largeneſs*, *and that it is not of ſo good a Relliſh*, *or of ſo ſpicy a Taſte as the firſt is*, *but ſmelling ſomewhat ſtrongly*, *almoſt like Smallage*, *and having a more bitteriſh Taſte.*

V. The third, or Marſh or Sea Sampire of Matthiolus. *Its Root is long*, *round*, *ſmooth*, *with ſeveral Strings adjoining to it. The Plant is of a*

Sampire Marſh.



Shrubby

Shrubby or Woody kind of Substance, having many Stalks rising up from one Root, which are straight or upright, yet a little enclining towards their Tops, all which are replenished with many Leaves set round about them, by spaces or distances as it were Joints, many Leaves rising together from one Stock or Footstalk which are a little long, and thick of substance, having a saltish Taste. Underneath the springings forth of these Leaves, come forth other single Leaves of nearly twice the length of the other. The Flowers grow at the Tops of the Stalks, and are round, and hairy or downy, and of a pale whitish red Color.

VI. The fourth, or Thorny Simpire, or Sea Parsnep. *Its Root is long and white, somewhat like unto a Parsnep, but more divided into parts,*

Thorny Sampire.

and is of a good relish, somewhat resembling that also of a Parsnep. This is very like the two first kinds of Sampire, but it grows greater and higher, with shorter and narrower Leaves, much more divided, and sharp and pricking at the ends. The Stalks are more sappy, and of a fresher green color, breaking into 3 or 4 Branches, towards the Tops, where grow large Umbles of white Flowers, and afterwards Fennel like Seed in prickly Husks.

VII. The fifth, or Golden Flower'd Sampire. *Its Root is pretty thick, divided into several Branches, having many strings adjoining thereto. It rises up with several hard round Stalks, very thickly covered or replenished with very narrow, long, and somewhat thick Leaves cut in at the ends. At the Tops of the Stalks stand single Flowers like unto Aster, or Chrysanthemum, wholly Yellow, both*

Sampire Golden Flower'd.

the Border and the Thrum in the middle, in which lyes the Seed when they are ripe, and are blown away with the Wind.

VIII. *The Places.* The first and second grows upon Rocks and Clifts near the Sea; The third, *Nascitur in littore Maris, locis planis, non clivosis:* grows not on Rocks and Clifts as the former two do, but upon the Sea shore, on plain Ground. The first and second grow on the Rocky Clifts at *Dover*, *Winchelsey* by *Rie*, about *Southampton*, the *Isle of Wight* and *Purbeck*, and most Rocks about the *West* and *North* parts of *England*; more especially on such Rocks, as are often moistned at the least, if not overflown with the Sea Water. The third, fourth and fifth in other grounds not far from the shore; The fourth or Thorny kind, grows upon the Sands and Beaches, between *Whitstable* and the *Isle of Tenet* by *Sandwich*; and by the Sea near *West Chester*. The Fifth and last grows in the Muddy Marsh in the *Isle of Sheppy*, going from *Kings-ferry* to *Shetland-house*.

IX. *The Times.* *Rock Sampire* is said to Flower in *May*, *June* and *July*; and must be gathered to be kept in Pickle in the beginning of *August*; all the others Flower in *July*, and their Seed is ripe in *August*.

X. *The Qualities.* Sampire is hot and dry in the end of the first degree; Absterstive, Aperitive, Digestive, Diuretick, Stomatick, Splenetick, Nephritick, Hysterick, Emmenagogick, Analeptick, and Spermatogenetick.

XI. *The Specification.* It is used to provoke Urine, give ease in the Strangury, open obstruction of the Viscera, chiefly of the Spleen and Womb,

provoke the Terms, ſtrengthen the Stomach and help Digeſtion.

XII. *The Preparations.* You may have therefrom, 1. *A Juice and Eſſence.* 2. *A Decoction in Wine or Water.* 3. *A Pickle or Sallet.*

The Virtues.

XIII. *The Juice or Eſſence.* They provoke Urine and the Courſes, are helpful againſt the Yellow Jaundice, open obſtructions of the Stomach, Liver, Spleen, Meſentery, Reins and Womb, and ſo remove thoſe diſeaſes which afflict thoſe parts. They are profitable againſt the Strangury, and carry off any Tartarous mucilage, which afflicts the Urinal Veſſels. Doſe 2 or 3 Spoonfuls in a Glaſs of White Port or *Lisbon* Wine morning and night.

XIV. *The Decoction in Wine.* The Roots, Stalks, and Leaves boiled in Wine and Drunk, provokes Urine, removes the difficulty of making Water, and is good againſt the Jaundice: It has an excellent properry to open, cleanſe and dry: It helps Digeſtion, cleanſes the Urinary parts from Srones, Gravel, Sand, and Slimy matter, is good againſt Hypochondriacal Melancholy, and has all the Virtues of the Juice and Effence. Doſe half a pint morning and night.

XV. *The Pickle or Sallet.* It is a very pleaſant thing both to the Palate and Stomach, helps Digeſtion, opens obſtructions of the Viſcera, provoking Urine and cleanſing thoſe Veſſels of all Heterogeneous matters obſtructing them. It ſtrengthens the Stomach, provokes Appetite; and is a moſt excellent and familiar Sawce, of extraordinary advantage and moſt agreeable to the Bodies of Human Kind.

CHAP. DCXVII.

Of SANICLE, *OR,* HEAL-WORT.

I. *THE Names.* We do not find that this Plant, or any of its Species were ever known to the Ancient *Greeks* or *Latines*, and therefore no Names can be derived from thoſe Fountains; but our Modern Authors have called it in Latine, *Sanicula (à potiore ſanandi munere)* and by ſome *Sanicula mas*, becauſe thoſe make the *Aſtrantia nigra Dioſcoridis*, or the *Helleborus niger Saniculæ folio major*, to be *Sanicula fœmina:)* It is the *Diapenſia Brunfelſij, Gerardi, Lobelij & Matthioli*; *Sideritis tertia Dioſcoridis Columnâ*; *Conſolida quinquefolia Tabernæmontani*; *Quinquefolium Quartum Matthioli*, in Engliſh *Sanicle*, *Healwort*, and *Self-heal* by ſome.

II. *The Kinds.* Beſides the *Sanicula major* or *Alchimilla*, or *Great Sanicle*, commonly called *Ladies Mantle*, of which we have treated already in *Chap.* 421 aforegoing; we have theſe following Species of this Plant, *viz.* 1. *Sanicula*, *Sanicula Vulgaris*, *Diapenſia Gerardi*, Our Common Sanicle. 2. *Sanicula Guttata*; *Sanicula Montana altera Cluſij*; *Sanicula Alpina & Guttata Camerarij aliorumque*; *Sanicula Cariophyllata, ſive, Geum Alginum recentiorum folio hederaceo Lobelij*; Spotted Sanicle and *London Pride*. 3. *Sanicula Alpina*, *Sanicula Cortuſa* (from its Author) *Matthioli*; *Caryophyllata Veronenſium flore Saniculæ Urſinæ Lobelij*; *Sanicula Montana prima Cluſij*, Bears Ear Sanicle. 4. *Sanicula fruticoſa Americana*, *Sanicula ſive Cortuſa Americana fruticoſa*, Shrubby Sanicle of *America*. To theſe add, 5. *Sanicula Eboracenſis Pinguicula*; *Cucullata Geſneri*, *Sanicula Montana flore calcari donata*, *Yorkſhire* Sanicle, or Butterwort, of which we have already diſcourſed in *Chap.* 102. aforegoing, and therefore ſhall ſay nothing of it in this place, ſaving, that the Cut there inſerted is error, and belongs to the *firſt Sanicle* in this Chapter.

The Deſcriptions.

III. The Firſt, Or our Common Sanicle. *Its Root is compoſed of many black Fibres or Strings as it were ſet in a Bunch together, proceeding from a little long head, which abides with the Green Leaves vpon it, all the Winter and periſh not. From this head of the Root riſe up many great round Leaves, ſtanding upon long browniſh Stalks, every one ſomewhat deeply cut or divided into five or ſix parts, and ſome of thoſe cut in alſo, ſomewhat like the Leaf of a Crowfoot, or ſome of the kinds of Dovefoot, and finely dented about the Edges, ſmooth, and of a dark ſhining green color, and ſometimes reddiſh about the brims; from among which riſe up ſmall round green Stalks, without any joint or Leaf thereon, ſaving at the Top, where it Branches out into Flowers; having a Leaf divided into three or four parts, at that joint with the Flowers, which are ſmall and white, ſtarting out of ſmall round greeniſh yellow Heads, many ſtanding together in a Tuft, in which afterwards the Seeds are contained, which are ſmall, round, rough Burrs, ſomething like unto the Seeds of*

Sanicle Common.

of Clevers, *and Stick in the ſame manner upon Cloaths or other things which they touch.*

IV. The Second, or Spotted Sanicle, or *London* Pride. *Its Root is Scaly or covered with a Chaffie matter, having many ſmall white Fibres underneath, by which it is faſtned in the Ground. It has many ſmall round Leaves bluntly indented about the edges, ſomething like unto the Leaves of our White Saxifrage, of a full green color above, and whitiſh hairy, and ſomewhat reddiſh withall underneath. The Stalks are ſet here and there, with the like Leaves, riſing a foot and half high or more, very much divided at the Top into ſeveral ſmall Branches, bearing very many ſmall white flowers, conſiſting of five ſmall Leaves, in which are many ſmall red ſpots to be ſeen, as ſmall almoſt as Pins points, or very ſmall Pins heads, of a pretty ſweet ſmell, almoſt like the ſmell of Haw-Thorn Flowers; in the middle whereof are many ſmall Threads compaſſing a head, which when it is ripe, contains ſmall black Seed.*

V. Of this Second Species there is a Second Sort, called *Sanicula guttata minor, being a ſmaller kind than the former, both in its Leaf and Flower; the Leaves whereof are ſmaller, but rounder, and more finely Snipt or Indented about the edges, like the Teeth of a fine Saw; the Stalk is but a little above a ſpan high, having many ſmall white flowers, ſpotted as the firſt, but with fewer Spots.*

VI. There is alſo a Third Sort of this kind, called *Sanicula minor non guttata; This in its Root, Stalk, Leaf, Flower, form and manner of growing is like to the firſt ſort of this ſpotted kind at* Sect. 4 *above, as well in its Root, as its Stalks, Leaf and flower, but the only difference is, that this is leſſer than that firſt ſort, and has no Spots in the Flowers, as that has.*

VII. The Third, or Bears Ear Sanicle. *Its Root conſiſts of a Tuft of ſmall Whitiſh threads, rather than Roots, much interwoven one among another. The Leaves which ſpring up firſt are much Crumpled, and as it were folded together which afterwards open themſelves into fair broad and roundiſh Leaves, ſomewhat rough, or hairy, not only cut into five ſections, but ſomewhat Notched or dented alſo about the edges; of a dark green color, on the upperſide, and more Whitiſh green underneath; from among theſe Leaves, riſes up one naked round Stalk, and ſometimes two or more, five or ſix Inches high, bearing at the tops ſeveral ſmall Flowers, ſomewhat ſweet, like unto the purple Bears ears, hanging down their heads, conſiſting of five ſmall pointed Leaves apiece, of a dark reddiſh purple color, with a White Circle or Bottom in the middle, and ſome ſmall threads therein. After the Flowers are paſt, there come ſmall round heads, ſomewhat longer than any of the Bears ears, ſtanding upright upon their ſmall Footſtalks, in which is contained ſmall round and Blackiſh Seed. The Leaves of this plant dye down every year, and ſpring up anew in the beginning of the Year following, whereas the* Bears Ears, *hold their Leaves Green all the Winter, ſtanding like a cloſe head, the outermoſt only periſhing after Seed time.*

VIII. The Fourth or Shrubby Sanicle of America. *This has ſeveral almoſt round Leaves lying upon the Ground, each upon a little long Footſtalk, divided at the edges into two parts, dented likewiſe about the brims. From among which riſe up hard woody Stalks, near two feet high, having ſuch like Leaves thereon, as grow below; and branching forth with ſeveral ſmall white, Starlike Flowers in a tuft together at the Tops.*

IX. Gerard *deſcribes the* Bears Ear Sanicle *thus. The Leaves ſhoot forth in the beginning of the Spring, very thick and fat, and are like a Purſe or round Lump at their firſt coming forth; and when it is ſpread abroad, the upper part thereof is full of Veins or Sinews, and hollow or curled like the Crumpling of a Cabbage Leaf, and are not only indented about the edges, but each Leaf is divided into ſix or more Jags or Cuts, deeply hackt; greeniſh above, and of an overworn green colour underneath; and hot in Taſte. From the middle whereof ſhoots forth a bare or naked Stalk, ſix Inches long, ſomewhat purple in color, bearing at the Top, a Tuft of ſmall hollow flowers, looking or hanging downwards, like little Bells, not unlike in form to the common Cowſlips, but of a fine deep red color tending to Purple, having in the middle a certain Circle of White, and alſo certain pointels or ſtrings, which turn into an head, in which is contained the Seed. The whole Plant is covered as it were with a rough Woollineſs. The root is Fibrous and Theady.*

X. *The Places.* The firſt or Common Sanicle grows in ſhady Woods and Copſes almoſt every where, and delights in a fat fruitful and moiſt Soil. The ſecond grows in ſhady Woods on the *Alps* in ſeveral places; but with us in *Gardens* in many places, where they Thrive very well, but delight more in the ſhade then the Sun. The third grows alſo in many ſhady Woods both in *Italy* and *Germany*, *Anſtria* and *Stiria*; but with us in *Gardens*. The fourth was brought to us from the back parts of *Virginia* called *Canada*.

XI. *The Times.* The Firſt Flowers in *May* and *June*, and the Seed is ripe in *July* or *Auguſt*. The Leaves of the Herb are green all the year, and are not hurt with the cold of Winter.

The

Sanicle Bears Ear'd.

The Second Sorts Flower in *May* and continue Flowering until *June*, and the Seed ripens ſoon after, the Roots abide all the Winter with ſome Leaves on them, ſpringing afreſh in the beginning of the year. The Third Flowers in *April* and *May*, and ſometimes in *June*, and the Seed ripens in the mean ſeaſon. The Fourth Flowers in *July*, and its Seed is ripe in *Auguſt*.

XII. *The Qualities.* Sanicle is hot and dry in the ſecond degree, Abſterſive, Aſtringent, Traumatick or Vulnerary, and Hyſterick.

XIII. *The Specification.* It is a ſpeedy healer of all ſorts of Green Wounds, Cleanſes Apoſtems or foul Ulcers, helps Tumors in the Body, repreſſes humors and diſcuſſes them. It is good againſt Spitting Blood, and the Bloody Flux, Ulcers of the Reins or Bladder; and ſtops the overflowing of the Terms in Women.

XIV. *The Preparations.* You may make therefrom, 1. *A Liquid Juice.* 2. *An Eſſence.* 3. *A Decoction in Wine or Water.* 4. *A Pouder of the Leaves and Root.* 5. *A Cataplaſm of the ſame.*

The Virtues.

XV. *The Juice.* It is exceeding good for the ſpeedy healing of all ſorts of Green Wounds, or any Apoſtem, Ulcer, or Bleeding inwardly; It cleanſes the Sore or Ulcer, and induces the healing by its aſtringency, being inwardly taken and outwardly applyed, for it repreſſes a Fluxion of Humors to the part, and diſcuſes the Tumor thereof.

XVI. *The Eſſence.* It has all the former Virtues exalted; beſides which it heals any Wound or Ulcer of the Lungs, or other Viſcera, cures the Flux and Bloody Flux, as alſo Spitting, Vomiting and Piſſing of Blood, Ulcers in the Reins and Bladder; gives eaſe in the Belly-ach, and ſtops the overflowing of the Terms in Women; and is profitable for ſuch as are troubled with any Rupture or Burſtenneſs.

XVII. *The Decoction in Wine or Water.* It has all the Virtues of the *Juice* and *Eſſence* but much weaker, and therefore muſt be given in a larger proportion, as from a quarter of a pint to half a pint. It gives preſent help when the diſeaſe falls upon the Lungs or Throat, and cleanſes and heals all manner of putrid, ſtinking and Malign Ulcers of the Mouth, Throat, and private parts, by gargling and waſhing with a Decoction made of the Leaves and Roots, in Water or Wine, and Sweetned with a little Honey. It is profitable alſo againſt a Virulent Gonorrhœa or running of the Reins, being drank Morning Noon and Night after due cleanſing.

XVIII. *The Pouder of the Leaves and Root.* It has the Virtues of the Juice and Effence, and being ſtrewed upon old putrid Sores and Ulcers, it cleanſes, drys and heals them.

XIX. *The Cataplaſm of the ſame.* It diſſolves and diſcuſſes cold Tumors or Swellings, is Anodyn, and gives eaſe in a recent Gout.

XX *Nota.* In ſhort, *Sanicle* is as effectual in binding, reſtraining, heating, drying, conſolidating and healing, as Bugle, Comfrey, Self-heal, or any other of the Conſounds or Vulnerary Herbs whatſoever, and is uſed in Vulnerary Diets and Wound Drinks, for the healing of all inward and outward Wounds and Ulcers.

CHAP DCXVIII.

Of SATTIN FLOWER, *OR,* HONESTY.

I. *THE Names.* It was unknown to the Ancient *Greeks* and *Latines*: But modern Authors have call'd it *Bolbonac*, and *Bolbonach*; alſo *Lunaria Græca*, *Lunaria major*, *Lunaria odorata*; *Viola Lunaris*, *Viola latifolia*, *Viola peregrina*, in Engliſh we call it *Satin Flower*, alſo *Heneſty*, *Money Flower* and *Penny Flower*.

II. *The Kinds.* Some Authors think it to be a kind of *Thlaſpi* or *Treacle Muſtard*, *Thlaſpi Cratervæ*; for *Dioſcorides* ſays that *Cratevas* makes mention of a certain *Thlaſpi*, with broad Leaves, and large Roots, ſuch as this Plant has; but it is generally taken for *Lunaria major*, or the *greater Moon Wort*. 1. *Viola Lunaria Vulgaris*, *Bolbonac*, Our Common white Sattine Flower, or Honeſty. 2. *Viola Lunaris altera ſeu peregrina*, Long living, or long Codded Sattine Flower. To theſe we may add, 3. *Hedyſarum clypeatum*, *Securidaca*, *Onobrichis altera Dodonæi*, The Red Sattine Flower, which ſome fooliſhly call the Red or French Hony-Suckle.

The Deſcriptions.

III. The firſt, or our common white Sattine Flower or Honeſty. *Its Root is ſomething round,*

Sattin Flower; or Honeſty.

lors,

long, and thick, resembling the Roots of Lilium non bulbarum, *or* Day Lilly; *It perishes after Seed time, but is eaten, as divers other Roots are, for Sallets, both in* England *and many other Countries besides. The Leaves are broad below, and pointed at the end, snipt about the Edges, and of a dark green color. The Stalks are round and hard, two feet high, or higher, divided into many Branches, set with the like Leaves, but smaller, the Tops of the Branches are beset with many purplish Flowers, like unto Dames Violets or Stock Gilliflowers, but larger, having no great Smell. After the Flowers are past, there come in their places, round, flat, thin Cods, of a dark color on the outside, but having a thin middle Skin, which is white and clear, shining like unto pure white Sattine it self, whereon lye flat and round brownish Seed, somewhat thick and great.*

IV. Gerard *thus describes it.* Its Root is compact of many Tuberous parts, like Key Clogs, or like the great Asphodel. *It has hard and round Stalks, dividing themselves into many other small Branches, beset with Leaves like to those of Dames Violets, or Queens Gilliflowers, somewhat broad and snipt about the Edges, and in fashion almost like* Sawce alone *or* Jack by the Hedg, *but that they are longer, and sharper pointed. The Stalks are charged or loaden with many Flowers, like the common Stock Gilliflower of a purple color: which being fallen, the Seed comes forth, contained in a flat thin Cod, with a sharp point or prickle at one end, in fashion of the Moon, but somewhat blackish. This Cod is composed of three films or Skins, of which the two outmost, are of an over worn Ash color, and the innermost in the middle, on which the Seed does hang or cleave, is thin, and clear, shining like a piece of white Sattin. The whole Plant dies the same Year that it has born Seed, and must be sown yearly.*

V. The second, or long living, or long Codded Sattin Flower. *Its Root is composed of many long strings, which die not as the former, but abide all Winter, and shoot out new Stalks every Spring. This has broader and longer Leaves than the former, the Stalks also are greener and higher, Branching out into Flowers, of a pale purple color, almost white, consisting of four Leaves in like manner, and smelling pretty sweet, bearing such like Pods, but longer and slenderer than they*

VI. Gerard *thus describes this second Species. Its Root is Thick, whereunto are fastned an infinite number of long thready strings, which Root dies not every Year as the other does, but multiplys it self as well by falling of the Seed, as by new shoots of the Root. It has many great and broad Leaves, almost like those of the Great Bur-Dock. From among which rises up a very tall Stem or Stalk about four Cubits high, stiff, and of a whitish green color, set with like Leaves but smaller. The Flowers grow upon the slender Branches of a purple color, compact of four small Leaves, like those of the Stock Gilliflower. After which come thin long Cods of the same substance and color with the former.*

VII. The third, or Red Sattin Flower, which some follishly call the Red or French Hony Suckle. *Its Root perishes the same Year it bears Seed, for often times it Flowers not the first Year it is Sown. This Red Sattin Flower (which some call a Red Flower'd Fitchling) has many Stalks of Winged fair green Leaves, many of them set on both sides of a middle Rib, whereof that at the End is the largest of them all. From the Joints where the Leaves stand, come forth pretty long small Stalks, bearing on them very many Flowers, up to the Top, one above another, of an excellent shining red or Crimson color, very like to Sattin of that Color, and sometimes of a white or whitish Color, which are somewhat large, and when they first appear are shut, and not open, not much unlike the Flowers. After the Flowers are past, rough, hairy and Husks come forth, something like unto the head of Steeled Bucklers, without Pikes, three or four standing upon one another, in which are contained small brownish Seed.*

VIII. *The Places.* The first is frequent in *Our Gardens*, and is found Wild in some places of *England* as *Gerard* says, viz. in the Woods about *Pinner* and *Harrow on the Hill*, and in *Essex* likewise about *Horn Church*. The second is not so common in Gardens, but grows about *Watford*, fifteen Miles from *London*. The third is generally Sown in Gardens for an Ornament to the same.

IX. *The Times.* The two first flower in *April* or *May* and sometimes more Early. *Gerard* says they flower in *April* the next Year after they are Sown. The third flowers in *June* and *July*, and its Seed is ripe soon after

X. *The Qualities.* The Seeds of the first and second are hot and dry in the end of of the second, or beginning of the third degree, of a sharp and biting Taste, as are also the Roots: and are said to have the Qualities and Nature of Treacle Mustard, being eaten in Sallets, as other like things are.

XI. *The Specification.* White Sattin Flower is said to Cure the Falling Sickness and heal green Wounds.

XII. *The Preparations.* You have 1. *A Sallet of the Root.* 2. *A Pouder of the Seed.* 3. *An Ointment of the Leaves.*

The Virtues.

XIII. *The Sallet of the Roots.* It is made of the young Roots before they run up to Flower, and is eaten as Rampions with Oil and Vinegar.

XIV. *The Pouder of the Seed.* It is given to a Dram or more at a time, mixed with Honey, or some other convenient Vehicle, Morning and Evening, for the Cure of the Epilepsy or Falling Sickness.

XV. *The Ointment of the Leaves.* It is made of the Leaves of our common white Sattin Flower, and Leaves of Sanicle, of each a like quantity stamped together, which is boiled in Oil Olive to Crispness, then strained out and repeated 3 times; and afterwards a sufficient quantity of Wax is to be added to bring it to the consistency of an Ointment. It is a singular thing for the Curing of Green Wounds.

CHAP DCXIX.

Of SATYRION.

I. *THE Names.* It is called in Greek Σατύριον Σατύριον τετράφυλλον: in Latin, *Satyrium*; and in English, *Satyrion*, it having yet obtained no other Name.

II. *The Kinds. Gesner* first, and after him *Camerarius*, *Clusius*, *Lobell*, *Parkinson*, *Gerard*, and many others refer this Plant the *Satyrion Dioscoridis*, to the *Tulipa* or *Tulip*, (of which we shall here-

hereafter particularly ſpeak) and this Opinion is very probable for ſeveral reaſons. 1. For that the *Tulip* grows in many places of *Greece* and the leſſer *Aſia*, which could not but be known both to *Theophraſtus* and *Dioſcorides*, and was accounted among the *Bulbous Roots*, although by ſeveral Names. 2. As *Dioſcorides* ſays of his Satyrion, ſo this moſt commonly bears three leaves upon a Stalk (altho' ſometimes it has with us four or five like unto a *Lilly*,) of which ſome are often ſeen to be both in the firſt ſpringing up, Red; and alſo in the decaying, eſpecially in a dry time, and in a dry ground. 3. The Flower likewiſe of ſome is White, and ſomething like a *Lilly*. 4. The Root is round, and as white within as the white of an Egg, covered with a Brown Coat, having a ſweetiſh, but not unpleaſant Taſte. 5. From ſome Experiments which

Satyrion Triphillon verum.

have been made of its Root, it appears to have the ſame Virtues with the *True Satyrion*, which the *Tulip* is ſuppoſed by our Modern Authors to have. This Deſcription here given does ſo lively ſet forth this Plant, that we need not any longer to be in doubt, but that our *Tulip* is the true *Satyrion Triphyllum Dioſcoridis:* and that our red Flower'd *Tulip* may very well agree with his Σατυριον ἐρυθρόνιον, or *Satyrium Erythronium* for that the Deſcriptions in *Dioſcorides*, *Lib.* 3. *Cap.* 143 and 144. are both alike as to their Qualities. The greateſt Objection which is made againſt this Opinion is from the deſcription of the Seed: for the Seed of the *Tulip* is very like unto the Seed of *Lilly*'s, as may eaſily be ſeen by comparing them, as being flat, hard, and ſlimy: Whereas *Dioſcorides* ſays, the Seed of his *Satyrion* is like to *Flax* or *Line-Seed*: it is true as to the hard and ſhining properties, tho' not to its form, magnitude, and color, they being more like to that of the *Lilly*. But it is not impoſſible but that there may be a miſtake in the *Orthography* or true writing of the Name in the Greek Text, putting Λινοσπέρμῳ for Κεινοσπέρμῳ a fault very ſubject to ſuch as Coppy other Mens Writings, and know nothing of the reaſon of the matter.

III. Then as to the Species of *Tulips*, tho' the whole Progeny of them may be accounted as ſo many Kinds of *Satyrion*, yet Modern Authors give the Title of *Satyrion* chiefly to theſe following. *viz.* 1. *Satyrion Bolonienſe*, *Tulipa Bolonienſis*. The greater Red Satyrion, or Bolonian Tulip. 2. *Satyrium Bolonienſe flore luteo, ſive Tulipa Bolonienſis flore Luteo.* The Yellow Bolonian Satyrion or Tulip. 3. *Satyrium Pumilum*, *Tulipa Pumila lutea.* The Dwarf Yellow Satyrion, or Tulip. 4. *Satyrium Italicum*, *ſive Tulipa Italicum major & minor.* The Italian Satyrion or Tulip, greater and leſſer. 5. *Satyrium Pumilum*, *Tulipa Luſitanica*, *ſive Pumilio verſicolor*, The Dwarf ſtrip'd Satyrion or Tulip. 6. *Satyrion, ſive Tulipa pumila alba*, The White Dwarf Satyrion or Tulip. 7. *Satyrium minus ſive Tulipa Bicolor*, The ſmall partly colored Satyrion or Tulip. 8. *Satyrium, ſive Tulipa de Caffa*, The Satyrion or Tulip of Caffa. 9. *Satyrium Pumilum rubra, ſive Tulipa Bergomenſis rubra media & minor.* The Red Dwarf Satyrion, or Bergomo Tulip, greater and leſſer. 10. *Satyrium Byzantinum, ſeu Tulipa Byzantina duobus floribus Cluſij.* The ſmall Satyrion of Conſtantinople, or ſmall Turky Tulip. 11. *Satyrium Perſicum*, *Tulipa Perſica*, The Perſian Satyrion or Tulip. 12. *Satyrium Creticum*, *Tulipa Cretica*, Satyrion or Tulip of Candia. 13. *Satyrion Armenicum*, *Tulipa Armenica*, The Satyrion or Tulip of Armenia.

The Deſcriptions:

IV. The Firſt, or Greater red Satyrion or Bolonian Tulip. *Its Root is plainly diſcerned to differ from all others, for that it is longer, and has not ſo plain an Eminence at the bottom thereof, as ſome of the earlier and later Tulips have,*

Satyrion Bolonienſe, or Tulip Bolonian.

but

but more especially because the top is plentifully covered with a yellowish Silk-like Whiteness, the outside likewise, or Skin of it, is of a brighter or paler Red, not so easily to be peeled away, and runs under ground both downright and sideways (especially in Country Ground and Air, where it encreases abundantly, though not so in our London *Air and fertile grounds.) It is something like to the yellow Bolonian Tulip next following. It shoots out of the Ground, with broad and long Leaves, like the* Caffa Satyrion or Tulip, at Sect. 11. *following, but neither so broad nor of so White or Mealy a Green color as it, but more dark than the late flowering Tulips; so that this may easily be discerned by its leaf from any other Tulip above ground, by such as are skilful in them. It bears likewise 3 or 4 Leaves upon the Stalk like the* Caffa Satyrion; *and a Flower also at the Top, of the same Fashion, but that the Leaves hereof are always long, and somewhat narrow, having a large black bottom, made like unto a Cheveron, the point of which rises up unto the middle of the Leaf, higher than in any other Tulip. The Flower is of a pale red color, nothing so lively as in the early or late Red Tulips, yet sweeter for the most part than any of them, and nearest unto the yellow Bolonian Tulip next following, which is much of the same smell.*

V. The Second, or Yellow Bolonian Satyrion or Tulip. *The Root of this may be known from the former, (or any other Tulip) in that it seldom grows to such a largeness, and is not so wooly at the top; and the skin or outside is somewhat paler, harder, and sharper pointed, but the bottom is like the former Red, and not so eminent as the early or late Tulips. This has much longer and narrower leaves than any (except the Perfian and Dwarf yellow Satyrion or Tulip's following in Sect. 9. and 12.) and of a Whitish green color. It bears sometimes but one Flower, one Stalk, and sometimes two or three yellows, but smaller and more often than the other kinds, and as is said, smells sweet. The Head for Seed is smaller than in the others, and has not that Green at the head thereof, yet the Seed is like but smaller.*

VI. The Third or Dwarf Yellow Satyrion, or Tulip. *This is very like unto the last, as well in its Root, as in its Leaf and Flower, as also in the color thereof, being yellow. The only difference is, that it is in all things lesser and lower, and is not so apt to bear, nor so easily nor plentifully to be encreased by the Root.*

VII. The Fourth, or Italian Satyrion or Tulip, greater and lesser. *Both these kinds, do so near resemble the last kind, that we might almost say they were the same, but that some difference which is seen in them, makes them to be looked of apart, and it consists in these particulars. The Stalks of neither of these rise up so high as of the first yellow Bolonian Tulip. The Leaves of both these sorts are writhed, in and cut at the edges, or made like to a wave of the Sea, lying nearer the ground; and the Flower being yellow within, is brownish or reddish on the back, in the middle of the three outward Leaves, the edges appearing yellow. Both these sorts do differ one from another in nothing, but in that one is bigger and, the other smaller, &c.*

VIII. The Fifth, or Dwarf Strip'd Satyrion or Tulip. *This is also of the same Kindred with the three last described; nor is there any other difference from them, than that the Flowers in this has some red Veins running in the Leaves thereof.*

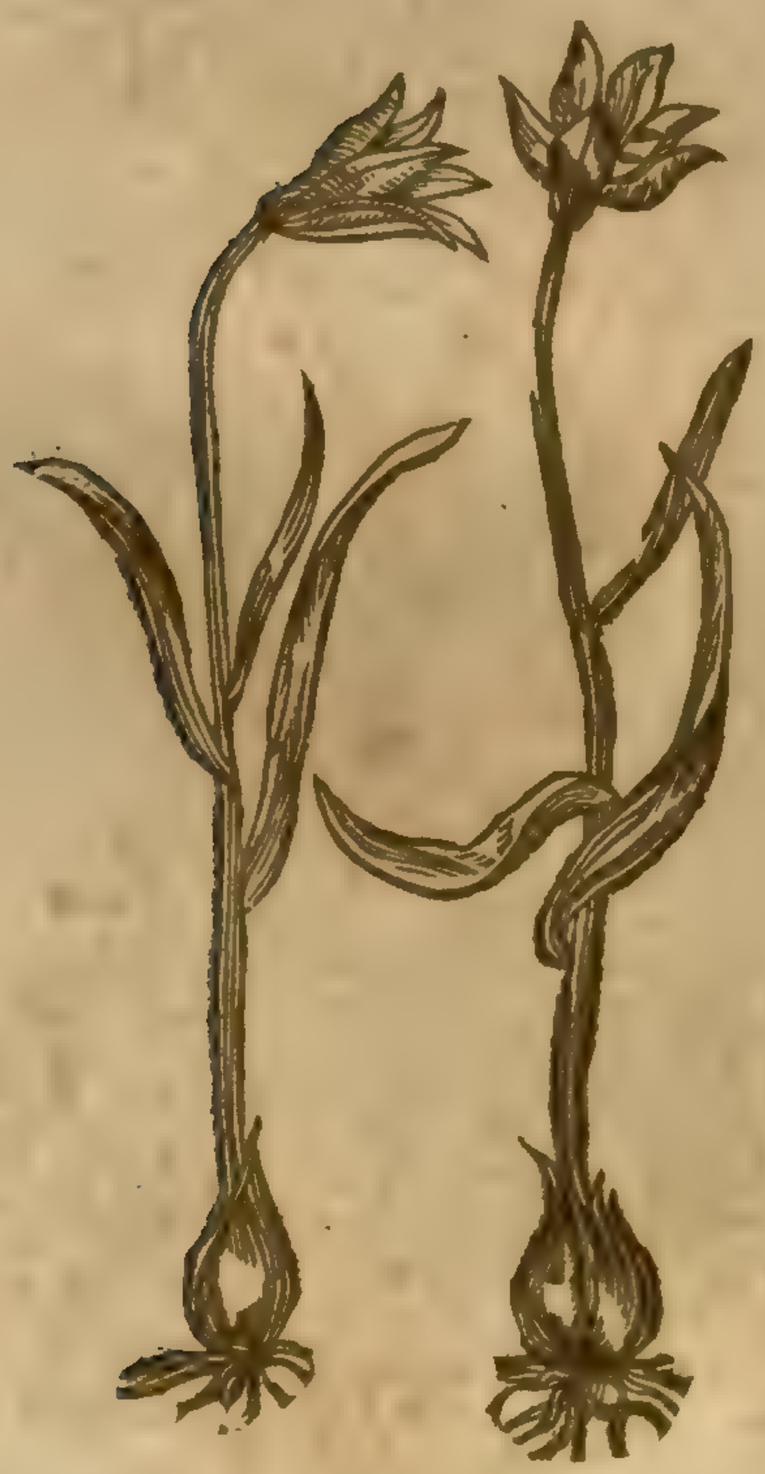
IX. The Sixth, or White Dwarf Satyrion or Tulip. *The Stalk of this is longer than of other Dwarfs; its Leaves are narrower than those of the White Tulips; its Flower is also larger and of a White Color.*

X. The Seventh, or small party colored Satyrion or Tulip. *This is one of the former Species, and was brought to us out of* Italy. *Its Leaves are small, long and narrow, of a dark green color, something like unto the Leaves of an Hyacinth. The Flower also is small consisting of six Leaves, as all other Tulips do; three of which are wholly of a Red Color, and the other three wholly of a Yellow.*

XI. The Eighth, or Satyrion or Tulip of Caffa. *Its Root is like unto others of this kind, so that they cannot be distinguished: It is an early Tulip, yet differs from other early Tulips: its pale green Leaves are as broad and large as they, and sometimes crumpled or waved about the edges: in some the edges of the said Leaves only are of a whitish, or whitish yellow color for a good breadth, but in others the Leaves are listed or parted with whitish yellow and green. The Stalk rises not up so high a: the other early Tulips, but bears at the top, a Flower like unto them; in some of a reddish yellow color, with a russet colored ground or bottom, and in others of several colors: the Seed is also like unto the early flowering Tulips. Of this Caffa Species there are both* Præcoces *and* Serotine, *early Flowering and late flowering which the Diligent Florist may easily observe.*

XII. The Ninth, or Red Dwarf Satyrion or Bergomo Tulip, greater and lesser. *These are a Species of the first kind, or greater Red Satyrion or Bolonian Tulip, and are called by this Name, because they were found about Bergomo; of which the one Species is the bigger; the other Species the*

Satyrion Dwarf,
OR,
Tulip Dwarf.



leſſer, yet neither of them ſo large or great as that firſt kind aforenamed; and have very little other differences in them, than that they are alſo ſmaller in all their reſpective parts.

XIII. The Tenth, or ſmall Satyrion of Conſtantinople, or ſmall Turky Tulip. *Its Root is very like to that of the yellow Bolonian Tulip at* Sect. V. *aforegoing. It is a ſmall Plant, and bears for the moſt part but two Leaves on the Stalk, which are fair and broad, almoſt like unto the* Candia *Satyrion or Tulip, anon to be deſcribed. The Stalk it ſelf riſes not to be above a foot high, bearing ſometimes but one flower, but moſt commonly two thereon, one below another, and are no bigger than the Flowers of the yellow Bolonian Satyrion or Tulip, but differing in Color; for this on the outſide, is of a purpliſh Color, mixed with White and Green, and on the inſide of a fair bluſh color, the bottom and Chives being yellow; and the Tips or Pendents blackiſh.*

XIV. The Eleventh, or Perſian Satyrion or Tulip. *Its Root is but ſmall, covered with a thick hard blackiſh ſkell or skin, with a yellowiſh Woolline ſs both at the top, and under the ſhell. The Roots alſo for the moſt part (in our Climate) grow always leſs and leſs, decaying every year, and ſo periſh for the moſt part, by reaſon of our Froſts and Cold, although we have many times ſet them deep in the earth to defend them; but they are apt of their own accord to run deep into the Ground: nor are they ſo apt in parting or ſetting off of buds or little Roots, as the Bolonian or Dwarf yellow Tulips are, nor do they ever grow or abide ſo great, as when they are brought unto us from abroad, and ſeldom Flower with us after the firſt year, It riſes out of the Ground at the firſt with one very long and ſmall round Leaf, which when it is 3 or 4 Inches high, does open it ſelf, and ſhew forth another ſmall Leaf (as long almoſt as the former) breaking out of the one ſide thereof, and after it a third, and ſometimes a fourth and a fifth; but each ſhorter than other, which afterwards be of the breadth of the Dwarf Yellow Satyrion or Tulip or ſomething broader, but much longer than any other, and abiding more hollow, and of the color of the early Tulips on the inſide. The Stalk riſes up a foot and a half high ſometimes, bearing one Flower thereon, compoſed of ſix long and pointed Leaves, of the form of other ſmall Tulips, but not ſhewing much bigger, than the Yellow Italian Tulip; and is wholly white both inſide and outſide of all the Leaves, except the three outermoſt, which have on their backs from the middle towards the edges, a ſhew of a browniſh bluſh, or pale red color, yet deeper in the midſt, the edges remaining wholly white. The bottoms of all theſe leaves are of a Dark or Dun Tawny Color. And the Chives and Tips of a Darkiſh purple or Tawny alſo. This does ſeldom bear Seed with us in* England; *but when it does, it is ſmall like to the Seed of the Bolonian, or Dwarf yellow Tulip, aforenamed.*

XV. The Twelfth, or Satyrion or Tulip of Candy. *Its Root is ſmall and ſomewhat like to the Root of the Dwarf Yellow Satyrion or Tulip, but a little larger. This plant has come later to our knowledge than the Perſian laſt deſcribed, and does more difficultly thrive, with reſpect to our Cold Climate. It has fair broad leaves, reſembling the Leaves of a Lilly, of a greeniſh color, and not very whitiſh. The Stalk bears at its top one Flower, larger and more open than many others; which is either wholly White, or of a deep red color, or elſe is variably mixed, White with a fine Reddiſh Purple, the bottoms being yellow, with Purpliſh Chives, tipt with Blackiſh Pendents.*

XVI. The Thirteenth, or Satyrion or Tulip of Armenia. *Its Root is not much bigger than the ordinary Yellow Bolonia Tulip, or Satyrion, before deſcribed. It is a ſmall Satyrion or Tulip much differing from all the former (except the ſmall or Dwarf White one before deſcribed) in that it bears 3 or 4 ſmall, long, and ſomewhat narrow green Leaves, altogether at one joint or place. The Stalk is not high, and is naked or without Leaves, from them to the Top, where it bears one ſmall Flower, like unto an ordinary Red Tulip, but ſomething more Yellow, tending to an Orange color, with a black bottom.*

XVII. *The Places.* The Titles ſhew from whence many of them came; but now they are all of them Nurſt up in our Gardens, where they thrive and flouriſh very well.

XVIII. *The Times.* Theſe are all of them *Precoces*, or early Flowers; and Flower in thoſe times and Months with the other ſorts of early Tulips: They Flower from the beginning of *March* (if the Seaſon is Warm or Temperate) and continue Flowering ſometimes to the end of *April*, the Seed being ripe in about a Month after the time of Flowering.

XIX. *The Qualities.* Satyrion is Temperate in reſpect to heat or cold, moiſture or dryneſs, rather inclining to hot and moiſt in the firſt degree: Digeſtive, Relaxive, Pectoral, Hepatick, Chylifick, Analeptick, and Spermatogenetick.

XX. *The Specification.* Its ſaid to reſtore in Conſumptions, and Excite Luſt, and ſtrengthens the Spermatick and Generative parts.

XXI. *The Preparations.* You may have therefrom. 1. *The prepared Roots.* 2. *A Juice or Eſſence.* 3. *Sanguis or Blood.*

The Virtues.

XXII. *The prepared Roots.* They are done by baking in a Pan or Pot in an Oven, covered over with Paſte; or by boiling or ſtewing over the fire. When baked or boiled ſoft, the pulp is eaten with Milk or Cream; or with Pepper, Salt and Sweet Butter, adding a little Vinegar, or Wine, as is moſt agreeable to the Palate. It nouriſhes much, reſtores in Conſumptions, encreaſes Seed in both Sexes, excites Luſts, and is good againſt Barrenneſs.

XXIII. *The Juice or Eſſence.* It has all the former Virtues, but more effectual being drank 3 or 4 Spoonfuls at a time, morning noon and night, in a Glaſs of choiſe Canary. Drank in ſtrong red Wine, it is ſaid to be good againſt Convulſions in the Neck.

XXIV. *Sanguis*, Or the Blood of Satyrion. It is made as that of Comfrey, Parſneps, Potatoes, *&c.* It has the Virtues and Excellencies of the Pulp, Juice or Eſſence, aforegoing; but more excellent than them all; for it reſtores weak and decayed nature admirably, breeds Seed, provokes to Venereous Acts, and mightily refreſhes the Spirits. Doſe one Ounce or more, morning, noon, and night, in a Glaſs of Canary, or other Spirituous and Generous Wine.

CHAP. DCXX.

Of SAVINE.

I. *THE Names.* It is called in Arabick, *Abhel*, in Greek, Βρᾶθυ, Βρᾶθος, ἡ Βραθύη, *Brathos*, *Brathy*, *Barathron*; in Latine, *Sabina*, and *Savina*, and of some *Savinera*; in English, *Savin*, and is a Shrubby kind of Plant.

II. *The Kinds.* Authors make three Sorts of this Plant. *Sabina Vulgaris*, *Savin: Germanis*, our common Savine. 2. *Sabina Baccifera Matthioli*, *Camerarij*, *aliorumque*, *Sabina altera Dodonæi*; *Sabina Cupressi similis Cordi & Lugdunensis*, Berry bearing Savine. 3. *Sabina altera baccifera Dodonæi & Lugdunensis: Sabina fœmina major Italorum tani*, *Sabina alterius altera icon Dodonæi*. Savine Gentle, or the greater Berry bearing Savine.

The Description.

III. The first, Or our Common Savin, *has a long, Branched out, woody Root, from which springs up a small low Bush or shrubby Plant, three or four Feet high: having a Woody Stem, with many woody Branches on it, crooked or bending; on which are set many small, short, hard, thick, and prickly Leaves of a dark green color, which are fresh and green both Winter and Summer. The Leaves are small, in great Numbers, and almost like Cypress or Tamarisk, but thicker and more sharp or prickly, of a very strong, but yet not unpleasing Smell. It is said to be Barren, because it is seldom seen to bear any Seed or Berries with us; but* Lobel *says, that it does bear Berries, altho but in a few places and but seldom, and holding the Fruit on its Branches all Winter till green Fruit grows on them again the next Year; and this is confirmed by good experience, as* Cordus, Dodonæus, Fuchsius, Gesner and Lugdunensis *do testifie: in its Native Countries it bears small Black Berries like unto Juniper.*

IV. The second or Berry bearing Savine. *This is the greater plant of the two; it spreads not so much as the former, but grows somewhat higher, as to the height of four, and sometimes of five feet, spreading forth Arms and Branches fully furnished with Leaves, which at their first coming forth, are somewhat like unto Tamarisk Leaves, but being grown old, are more like unto the Leaves of the Cypress Tree, hard and pricking, and of a dark green color, with an eye of blew shadowing them; having a less strong smell, and nothing so sharp as the common kind before described. It has not been observed to bear any Flowers, but small round Berries, like unto Juniper Berries, but larger, and of a sharper taste, black when they are ripe, with an eye of blew upon them, like to the Juniper, or those of the common* Savine *before described, which Berries remain on the Branches all Winter also, till new green ones come upon them again.*

V. The third, or Savine Gentle, or greater Berry bearing Savine. *This grows somewhat higher than the second, with us; spreading out more slender and weak Branches, on which are set small and*

Savine bearing Berries.

long Leaves, of a more pleasing and gentle smell than the others. On the Branches among the Leaves, came forth such like Berries, as on the other, and very like unto Juniper, black also when they are ripe, and but a little bitter in Taste, not altogether unpleasant.

VI. *The Places.* The first is planted in our *English Gardens* almost every where. The second and third grow upon Hills and in Woods in *Candy*, *Misia*, and in other parts of *Greece*, and other those Eastern Countries; The third on *Mount Taurus*, *Olympus*, *and Amanus*; as also upon the Mountains in *Apulia and Calabria*, as also upon the Plains of the *Alps*, near unto *Gratianople*. *Gerard* says, that both these latter grew in his Garden They are all planted by the Slip; but the second both by the Seed and the Slip, which must be set in a ground somewhat Moist and Shadowy, till they have taken Root. The Plants growing from the Slips, decline towards one side, still retaining the Nature of the Bough: but the Savine which is produced by the Seed grows more upright.

VII. *The Times.* These all of them, continue always green both Winter and Summer. And those which bear Berries, have them ripe commonly in Winter; but they have fruit at all times; for before that the old Berries fall off, new come on upon the same Branches.

VIII. *The Qualities.* Savin is hot and dry in the third degree and of subtil parts: Aperitive, Abstersive, Anodyn, Attractive, Diuretick, Neurotick, Hysterick, Emmenagogick, and Alexipharmick.

IX. *The Specification.* Savine is held to be a very good Remedy against the Kings-Evil, Stone, Sand, Gravel, and Tartarous matter in the Reins or Bladder,

der, the Pleurifie, Colick, obſtructions of the Terms, Worms in Children, *&c.*

X. *The Preparations.* You may make therefrom, 1. *A Juice or Eſſence of the Leaves.* 2. *A Decoction of the ſame in Water or Wine.* 3. *A Pouder of the Leaves.* 4. *A Fume.* 5. *A Decocted Oil.* 6. *An Ointment.* 7. *A Cataplaſm.* 8. *A Diſtilled Water.* 9. *An Oil Diſtilled.* 10. *Oleum Sabinæ Crocinum Mynſichti.* 11. *Poteſtates or Powers.* 12. *An Elixir.* 13. *A Fixt Salt.*

The Virtues.

XI. *The Juice or Eſſence of the Leaves.* They are of thin parts, and by reaſon of their ſtrong drying and heating qualities, they have no conſolidating or glewing property in them; but by reaſon of their great acrimony, they digeſt more, and reſiſt putrefaction as powerfully as thoſe preparations of the Cypreſs; mixed with Honey and applyed, they cleanſe the filth of Ulcers, and take away their blackneſs, and break or diſſolve Carbuncles, or Plague Sores. They provoke the Courſes, and force away both Birth and After-Birth. They are alſo profitable againſt the Kings-Evil. Doſe one or two Spoonfulls or more Morning and Night, in a Glaſs of White or Rheniſh Wine.

XII. *The Decoction in Wine or Water.* It has all the Virtues of the Juice or Eſſence, but much weaker, taken to half a pint, it expells blood by Urine, and is profitable againſt the Stone, Sand, Gravel, or any Tartarous Mucilage in the Reins, or Urinary parts. Given with 30 Drops of Spirit of Hartſhorn, or Tartariſed Sal Armoniack it is a preſent help againſt the Pleurifie, and Wind Colick, *&c.*

XIII. *The Pouder of the Leaves.* It has the Virtues of the Juice, Eſſence and Decoction, and may be given from half a Dram to a Dram, in any proper Vehicle; ſome give it as a Specifick to Kill Worms in Children. *Take Savine in Pouder a Dram: Nitre finely poudered* 3 *Ounces: Honey* 2 *Ounces, mix them.* It wonderfully helps ſuch as are Aſthmatick and ſhort winded, being taken upon a Knives point morning and night.

XIV. *The Fume.* It is made of the Green Herb cut ſmall and flung upon live Charcole; received up the Body with or without a Funnel, it induces the Terms, and Loches ſtopt, haſtens the Birth, and Facilitates the Delivery.

XV. *The Decocted Oil.* It eaſes pains, is good againſt Tumors, and King-Evil, Swellings, and is ſaid to Kill Worms in Childrens Bellies being anointed therewith.

XVI. *The Ointment. It is made of the Green Herb, as is uſual after which, to every pound of the Ointment* 3 *Ounces of the fine Pouder of the Leaves is added.* It has all the Virtues of the aforegoing Oil, and is more powerful than it to all intentions; anointed on the heads of Children which are vehemently Scabby, commonly called Scald Heads, it throughly cleanſes them, ſtops their running, drys, and perfectly heals them, and is good againſt Anthonies Fire.

XVII. *The Cataplaſm.* It is made of the Green Leaves by bruiſing them in a Mortar. Laid upon Old Ulcers, running Sores, and fretting Cankers, and ſuch like, it digeſts, cleanſes, deſtroys their malignity, drys and heals them, being firſt Bathed or Waſhed with a ſtrong Decoction of the Leaves.

XVIII. *The Diſtilled Water.* It is a proper Vehicle to convey ſome of the former Medicines in; it is alſo of ſingular good uſe to cleanſe the Skin, and clear it from diſcoloring, ſpots, marks, and other like deformities; and is profitable for the Vertigo, or a Giddineſs of the Head and Brain, being taken inwardly morning and night to 4 Ounces or more, ſweetned with double refined Sugar.

XIX. *The Diſtilled Oil.* It powerfully provokes the Terms, haſten and facilitates the Birth, forces away the After-Birth, and dead Child, provokes Urine, gives eaſe in the Stone, Gravel, Strangury, or any Obſtruction of the Urine, gives preſent eaſe in the Colick, and is profitable againſt the Pleurifie, as alſo the Gout proceeding from a cold cauſe, being anointed thereon. Doſe from 5 Drops to 10, Dropt into fine Sugar, and ſo drank, with a quarter of a Pint of the Diſtilled Water, or ſome other proper Vehicle.

XX. *Oleum Sabinæ Crocinum Mynſichti.* Mynſichts Oil of Savin with Saffron. *Take of the former Diſtilled Oil of Savine* 3 *Ounces: Oriental Saffron, or the beſt Engliſh Saffron* 3 *Drams, rectified Spirits of Mugwort, Centory the leſs, and Cinnamon, of each one Ounce; digeſt* 10 *days, then abſtract the Spirit and keep the Oil for uſe.* It has all the Virtues of the Diſtilled Oil, and much more powerful for all the intentions. It may be given morning and evening (after due purging) from iij. drops to x. in Rheniſh Wine, or ſome appropriate Water or Decoction.

XXI. *Poteſtates*, Or *the Powers of Savine.* Theſe are poſſibly one of the greateſt Hyſtericks in the whole Vegetable Kingdom, for ſuppreſſing Vapors and curing Fits of the Mother. They are admirably Nervous, and cure cold diſeaſes of the Head, Brain, Nerves and Womb, proceeding from too much moiſture. They are of thin and ſubtil parts, provoke Urine and the Terms, haſten the Birth, force away the After-Birth, and expell the dead Child if any be. They open and cleanſe the Womb ſo powerfully, that they are not to be taken by Women with Child, leſt they cauſe Abortion or Miſcarriage. And yet they have this Excellent quality (if a Woman is not with Child) as well to comfort and ſtrengthen the Womb, as to open and cleanſe it. Tho' they potently provoke the Terms when Stopt, yet when they flow too much, they will as well ſtop them again, becauſe they warm, comfort, and ſtrengthen the Nerves; and the Womb being very Nervous, it receives the ſame advantage thereby. They famouſly eaſe pains, in what part of the Body ſoever, eſpecially thoſe of the Colick, of the Stone, and after-pains; and all ſuch as proceed from Cold, Bruiſes, Strains, Blows, or other Contingent cauſes. They are of extraordinary force in Curing Barrenneſs in both Sexes, but chiefly in Women, for they warm, comfort, reſtore and ſtrengthen the Inſtruments of generation, acuate and enliven the Seed, making it brisk, potent and fruitful, and that in both Men and Women. They cure Cramps and Convulſions, as alſo a cold Gout and Sciatica, and ſtrengthen all the parts weakned by thoſe diſeaſes, or any external Violence. They cure the Palſie, trembling of the Hands, Arms, or Feet, and the benummednes of any part, if taken inwardly in due doſe, and be alſo outwardly applied to the parts affected, as alſo bathed on the back Bone, as often and as long as the Vehemency of the diſeaſe requires. They become a cure for the Palſie, if diligently uſed according to theſe directions. *The Doſe.* They may be given from 40 to 50 or 100 Drops, yea to half a Spoonful or more, if

to

to a Woman in Labor to excite the pains and haſtens the Expulſion of both Birth and After-Birth, and to be repeated again, if the Midwife thinks needful. For Vapors and Fits of the Mother, give them in fair water in the time of the Fit, and at other times only Morning and Evening. In Convulſions, Faintings, Swoonings, Palſies, &c. give them in Canary, Madera, White Port, or White *Lisbon* Wines, or any other ſtrong and generous Wine, two or three times a day or oftner if need requires.

XXII. *The Elixir.* It has the ſame Properties, Qualities, and Virtues with the Powers, ſaving that this is much ſtronger, yet may be given in the ſame manner and doſe without exception

XXIII. *The Fixed Salt.* It is Hyſterick and Antipleuretick, being given in proper Vehicles. It abſorbs the acidities of the Stomach and other Viſcera, chiefly of the Womb, and gives eaſe in Vehement pains of the Stomach and Bowels, Womb, Reins, and Bladder. Doſe from gr. 10 to 20 in Savin Water, Decoction of Winter Cherries, or other fit Vehicle.

CHAP DCXXI.

Of SAVORY.

I. *THE Names.* It is called in Arabick, *Sabuter*, and *Sabutar*; in Greek, Θύμος or Θύμβρα: in Latine, *Satureia*, alſo *Thymbra*: and in Engliſh, *Savory*.

II. *The Kinds.* There are about five ſorts of Savory commonly to be met with in our Gardens, *viz.* 1. *Satureia Vulgaris, Satureia hyberna, Satureia perennis Camerarij*; *Satureia, ſive Thymbra altera Lobelij*; *Satureia hortenſis Cæſalpini*; *Hyſſopus agreſtis Brunfelſij*; *Thymbra Sylveſtris Anguilara*; *Thymbra agreſtis Geſneri, & Satureia Montana Bauhini*; Our Common Winter Savory. 2. *Satureia æſtiva, Satureia hortenſis, & Sativa* or *Thymbra Sativa* by moſt writers; *Cunila Cæſalpini & Tabernæmontani, Thymbra agreſtis Cæſalpini, Thymbra vera Geſneri*; *Satureia hortenſis Bauhini, Cunila Columellæ*; Our Summer Savory. 3. *Satureia Critica, & Legitima*; *Thymbra Cretenſis Alpini*; *Thymbra Legitima Cluſij*; *Thymbra Legitima Dioſcoridis Porâ*, Dioſcorides his True Savory of Candy. 4. *Thymbra Spicata Penæ*; *Thymbra vera Lobelij Lugdunenſe & Tabernæmontano*; *Thymbra Vera Juliani, Thymbra vel Satureia Rupis vel Saxatilis*, Rock Savory.

The Deſcriptions.

III. The firſt, or our Winter Savory. *It has a Woody Root, with divers ſmall ſtrings adjoining to it, and abides with green Leaves all the Winter, which is more uſually encreaſed by ſlipping or dividing the Root, and new ſetting it again in the ſpring, than by ſowing the Seed. It is a ſmall Low, and Buſhy Herb, very like unto Hyſſop, but not much above a Foot high, with divers ſmall hard Branches, and hard dark green Leaves thereon, as thick ſet as the Leaves of Hyſſop, and ſometimes with but four Leaves at a Joint, of a reaſonable ſtrong aromatick or ſweet ſmell, yet not ſo ſtrong or ſweet as the ſummer kind following. The Flowers are of a Pale Purpliſh color, ſet at ſeveral diſtances, towards the tops of the Stalks, and with Leaves alſo under them.*

Savory Winter.

Savory Summer.

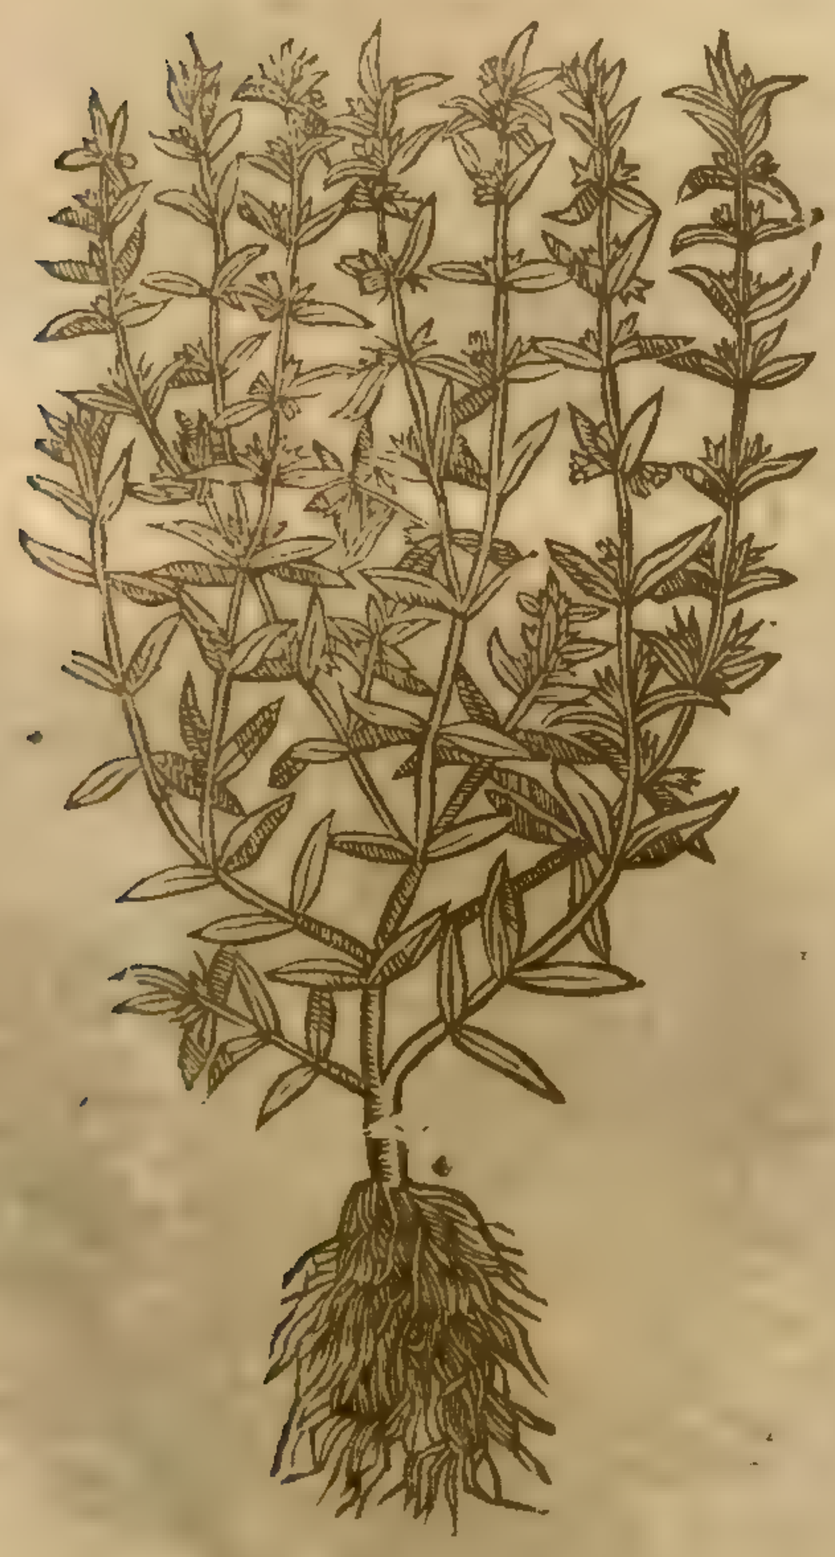
IV. The ſecond, or our Summer Savory. *Its Root is Woody, and has many ſtrings, yet fewer than the former, which periſhes wholly every year, and muſt be Sown again every Spring, if you will*

have

have it. It is a ſmall tender herb, growing not above half a yard high or thereabouts, riſing up with divers brittle Branches, ſlenderly or ſparſedly ſet with ſmall long narrow Leaves, two at every joint, one againſt another, ſoft in handling, and of a pleaſant, ſtrong and quick ſmell and taſte, ſtronger, ſweeter, and pleaſanter than the former. The Flowers are ſmall and purpliſh, growing at the tops of the Stalks, and with two ſmall long Leaves at the joints, under them. The Seed is ſmall and of a dark color, and larger than Time Seed by half, which muſt be Sown every Spring for the encreaſe of the Herb.

V. The Third, or Dioſcorides his true Savory of Candy. *Its Root is ſomewhat woody, long, and hard, with ſome ſmall blackiſh Fibres ſpreading from it, and will as hardly endure the Winter with us as the laſt, although the lower branches which lye on the ground are apt to take Root, which ſhews, that in its native place of growth, where it feels no cold Winter, it can by that means ſpread, and encreaſe it ſelf. It branches*

Savory of Candy.



forth from the ground like Time, with many purpliſh ſquare Stalks or Branches, covered over with a rough or hairy down. From the lower joints of the Stalks come always two Branches, and two Leaves ſet at them; and ſo in the like manner all along the Branches, two at every joint one againſt another on the contrary ſide, and are very like unto the Leaves of the true Time, but ſomething larger and a little hairy, of a ſweet ſmell, and ſharp taſte, between thoſe of Time and Savory. On the Tops of the Branches, at certain diſtances one above another, grow forth heads or Tufts of green Leaves; from among which come forth many purpliſh flowers like to thoſe of Time, ſtanding in browniſh husks. The Seed is of a blackiſh brown color, and very like alſo to the Seed of Time.

VI. The fourth, or Rock Savory. *It has a ſomewhat long and woody Root, with Fibres adjoining to it towards its lower end; from which riſe up many ſlender, hard, and woody Stalks, about a foot high, on which do grow at ſeveral ſpaces, many very ſmall and narrow Leaves, very like to the Leaves of the true Time, but ſomething longer, of a ſharp quick Taſte, and of a ſtrong ſweet ſmell. At the Tops of the Branches come forth many ſpiked heads of ſmall Leaves, and out from among them, come forth purpliſh Flowers, which afterwards yield a ſmall browniſh Seed, more like to the Seed of Time than of Savory. The whole Plant will be ſometimes, of a ſad purpliſh color, daſht over with a white mealineſs, as for the moſt part all Sea plants are. This is a very tender plant, and does ſeldom endure the Winter with us.*

VII. *The Places.* Theſe Plants grow wild in ſeveral parts of the South of *Europe*, and in *Aſia*, eſpecially in Groves, where many times they are to be found very plentifully; but with us they all grow in Gardens.

VIII. *The Times.* They all Flower the firſt year of their Planting or Sowing; the firſt two and the fourth in *July* and *Auguſt*; the third (in its native places) in *October* and *November*.

IX. *The Qualities.* They are all hot and dry in the third degree, Abſterſive, Aperitive, Aſtringent, Attractive, Carminative, Digeſtive, Diuretick, Cephalick, Neurotick, Pectoral, Cardiack, Hyſterick, Ptarmick, Emmenagogick, Alexipharmick, and Analeptick.

X. *The Specification.* Savory expells Wind, is good againſt the Colick, Vapors, and Fits of the Mother, provokes Urine and Womens Courſes, ſtirs up Luſt and cauſes Fruitfulneſs in both Sexes; it cauſes a good Appetite, and as good a Digeſtion, taking away loathing, and an inclination to vomiting, it cuts tough flegm in the Breſt and Lungs, and helps to expectorate it eaſily. It is good alſo againſt Cramps, Convulſions, Palſies, Lethargies, Dullneſs of the Spirits, Vertigo's, and moſt other cold and moiſt Diſeaſes of the Head, Brain, Nerves, Womb, and Joints, as Gout, Sciatica, *&c.*

XI. *The Preparations.* You may have therefrom. 1. *A Juice or Eſſence.* 2. *A Decoction, or Infuſion.* 3. *A Pouder of the Leaves.* 4. *A Cataplaſm.* 5. *A Spirituous Tincture.* 6. *An Acid Tincture.* 7. *A Spirit.* 8. *An Oil.* 9. *Poteſtates or Powers.*

The Virtues.

XII. *The Juice or Eſſence.* Taken from an Ounce to two Ounces in a Glaſs of Canary or Madera Wine, it gives eaſe in the Colick, provokes Urine and the Courſes, and Excites Luſt in both Men and Women. They cut tough Flegm in the Breſt and Lungs, and cauſe an eaſy expectoration thereof; the juice being uſed as an Errhine, by Snuffing it up the Noſtrils, enlivens the Spirits, takes away dullneſs and heavineſs, and is profitable againſt a Carus, Lethargy, and other ſleepy diſeaſes; by drawing out, and purging the head and brain of cold, viſcous and Pituitous humors: and dropt into the Eyes, it is a good Ophthalmick to clear the Sight, if it proceeds of thin cold humors diſtilling from the

Brain.

Brain. The fame Juice or Effence, mixed with a little Oil of Roſes and dropt into the Ears, it eaſes their pain, and takes away Deafneſs, Noiſe, and Singing in them.

XIII. *The Decoction or Infuſion in Wine.* It has the former Virtues, but is weaker and therefore may be given to 4, 6, or 8 Ounces at a time; it is good againſt loathing and Vomiting, creates an Appetite, and cauſes a good Digeſtion.

XIV. *The Pouder of the Leaves.* It may be given to a Dram at a time, morning and evening either in a Glaſs of Wine, or mixt with Honey, or ſome proper Syrup. It has the Virtues of the Juice, Effence and Decoction, but operates not with that Celerity and Excellency as they do, by reaſon of its earthy ſubſtance which very much clogs it; beſides it muſt be firſt digeſted in the Stomach before it can exert its Virtue in remedying thoſe Diſtempers againſt which it is given.

XV. *The Cataplaſm.* The Juice made into a Poultice with Wheat Bread, or Rye Bread, and applyed to the Joints or Hips, is ſaid to give eaſe to the raging pains of the Gout and Sciatica, as alſo diſcuſſes ſimple contuſions, and takes away the Stinging of Bees, Hornets, Waſps, &c.

XVI. *The Spirituous Tincture.* It is excellent againſt the Colick, and all Windy Diſeaſes in the Stomach and Bowels; is good againſt Hypochondriack Melancholly, and prevails againſt Fainting, Swooning, Convulſions, Vertigo, Lethargy, and other cold and moiſt Diſeaſes of the Head, Brain and Nerves, and has all the Virtues of the Juice, Effence and Decoction or Infuſion. Doſe a quarter of a Spoonful at a time Morning and Evening in a Glaſs of Generous Wine.

XVII. *The Acid Tincture.* It is a moſt admirable Stomatick, not inferior to that of Mint, it is good againſt an Aſthma and ſhortneſs of Breath cauſed by Obſtructions of the Lungs thro' Flegm and other cold and Viſcid Humors, inciding or cutting them, and ſo cauſing them to be eaſily Spit up. It is profitable againſt all Burning, Malign and Peſtilential Fevers, and even againſt the Plague it ſelf; reſiſts Poiſon and the bitings of Vipers, Rattle-ſnakes and other Venomous Creatures, it creates an Excellent Appetite to Food, and cauſes a good Digeſtion thereof, ſtrengthening after a ſingular manner the Tone of the Stomach. Doſe ſo many Drops as to give a Glaſs of Wine or orher Liquor a grateful acidity, and to be repeated 2, 4, or 6 times a Day or oftner.

XVIII. *The Spirit.* It is a ſingular Stomatick and Cordial, good againſt Fainting and Swooning Fits, Fits of the Mother, pains and gripings in the Stomach and Bowels, and all the Diſorders of the *Viſcera* proceeding from Cold, Moiſture, Wind, and Obſtructions. Doſe from a Dram to two Drams in a Glaſs of Wine.

XIX. *The Oil by Diſtillation.* It may be given from 2 Drops to 10, being dropt into Sugar and mixt well therewith, and then put into a glaſs of Wine or other fit Vehicle to be taken in. It is good againſt Vapours, Fits of the Mother, Obſtructions of the Terms and other cold and moiſt Diſtempers of the Womb. It warms and comforts the Inſtruments of Generation, excites Luſt, and is ſaid to Cure Barrenneſs in both Sexes. It facilitates the Delivery of Women in Labor, brings away both Birth and Afterbirth, and either prevents or eaſes after-pains cauſed either by hard Labor, or taking Cold. It is alſo good againſt all cold or moiſt Diſeaſes of the Head and Brain, as vehement Headaches, Megrim, Cross Lethargy, Vertigo, Apoplexy, Epilepſie, Convulſions, Palſies, either particular or univerſal, &c. inwardly taken and outwardly applyed, as the prudent Phyſician ſhall adviſe. It is alſo good againſt Fainting and Swooning Fits, Cardialgia, and the moſt ſevere Colick, proceeding from what cauſe ſoever. It alſo reſiſts Poiſon and the ſtings of Poiſonous Creatures, as alſo the Malignity of the Plague or Peſtilence, and all ſorts of Malign and Peſtilential Fevers.

XX. *Pot-herbs* or *Pot-herbs*. Theſe have all the Virtues of *Juice*, *Eſſence*, *Tinctures*, and *Oil*, but are much more ſubtil than them all; and not being ſo concentrated as the *Oil* is, may be given in a larger Doſe, as from 50 to an hundred Drops in Wine, or ſome other proper Liquor. They have a mighty power upon the Brain and Animal Spirits, as alſo on the Heart and Vitals, acting as it were in a Moment, and ſo giving many times preſent Relief

---

CHAP. DCXXII.

Of SAW-WORT.

I. *THE Names.* It has no Greek, nor ancient Latine Name: The Moderns call it *Serratula (à foliis minutim ſerratis)* and we in Engliſh, *Saw-wort.*

II. *The Kinds.* Some will have this to be a Species of the *Jacea's* or *Knapweeds*, from its Scaly Heads; but *Thalius* takes it to be a kind of *greater Centory*: and *Lonicerus* thinks it to be a Species of *Solidago Saraſenica* Saracens Conſound, from its Effects. Some have called it *Serratula Tinctoria*, or *Tinctoris*, becauſe it was formerly uſed by Dyers in Dying and ſetting of a green color; but *Parkinſon* thinks it was called *Tinctoria* by a miſtake of *Tragus*, applying it to another Plant, *viz.* his *Hos Tinctorius*, into which error, *Bauhinus* was led, as he himſelf ſays, by *Thalius*. There are three kinds of this plant ſometimes found, *viz.* 1. *Serratula Vulgaris flore purpureo*, our common Saw-wort with Purple Flowers. 2. *Serratula flore albo*, White Flowered Saw-wort. 3. *Serratula flore rubro*, Red Flowered Saw-wort.

The Deſcriptions.

III. The firſt or our common Saw-wort with Purple Flowers. *Its Root is a buſh of many ſtrings, which encreaſes into many heads, which ſhoot forth every one of them, many like leaves, whereby it grows quickly to be a great Tuft or Buſh. It riſes up with many of its firſt Leaves ſomewhat broader and longer, than thoſe of Betony, and ſharper dented and pointed, all of them ſet upon long foot Stalks; but thoſe which riſe up after them, are longer and broader, and deeply cut in, or gaſhed on the ſides into many parts, and each part finely dented alſo in the ſame manner. From among which Spring up many browniſh Stalks, with divers Leaves on them, the lowermoſt whereof are divided in the ſame manner aforeſaid, and ſo the*

the higher they grow upon the Stalks, the less divided they are unto the Tops, which are branched forth into many parts, bearing Scaly Heads like to the Knapweeds, (but nothing so great,) round and hard, with divers Purple Thrums or Threads in the middle, like unto them but shorter.

Saw-Wort.

The Seed is small and black, like to that of the Jacea *but lesser than it, and lying in Down, which sheds and falls away. This plant when it is young has many, or most, or all its first and lowest Leaves whole and not jagged or divided into parts; but when it grows older, and higher the leaves which come forth afterwards higher upon the Stalks, are many, or most of them divided into several parts.*

IV. The second or White Flowered Saw-wort. *This in its Root, Stalks, Leaves, Branches, Flowers and Seed, and form and manner of growing is very like to the former; nor is there any difference or distinction between this and that, but only in the color of the flower, or of the Threads in the middle of the Scaly Heads, which in this is White; and the heads themselves, and the Stalks of a fresh green color.*

V. The third or Red Flowered Saw-wort. *This is also in all respects as to the form of its Root, Stalks, Branches, Leaves, Flowers, Seed, and manner of growing, like unto the two former, the difference between them being chiefly in the flower, which is of a deeper Red Color. This is more rare than any of the former, and not so easy to be found, or in so many places, as the two aforegoing are.*

VI. *The Places.* They all grow in Woods and Shadowy places, and sometimes in Meadows. The first is common in the corners of fields and Wood sides, both open and Shadowed; that with a White Flower has been found growing at the farther end of *Hampsted Wood*, near unto a Rill of Water, running by the side of a Cottage there; as also upon *Water Down* Forrest in *Sussex*, near unto the path which leads from *Eridge* unto *Ivy Bridg* by a Brook side. The last is not so common to be met with.

VII. *The Times.* They all Flower in *July* and *August*, or towards the end of *Summer*, and the Seed is ripe not long after.

VIII. *The Qualities.* Saw-wort is hot and dry in the end of the first degree, or beginning of the second; Absterfive, Astringent, Anodyn, Vulnerary, and Arthritick.

IX. *The Specification.* It heals Contusions, Green Wounds, Old Ulcers, Hemorrhages, Colick, and all inward Torments of the Bowels, Ruptures, Hemorrhoids or Piles, *&c.*

X. *The Preparations.* You may make thereof, 1. *A Juice or Essence.* 2. *A Decoction or Infusion in Wine.* 3. *A Pouder of the Leaves.* 4. *An Oil or Ointment of Herb and Root.* 5. *A Cataplasm of Herb and Root.* 6. *A Fomentation.*

The Virtues.

XI. *The Juice or Essence.* They are Singularly good for such as are Bruised by a Fall, and have thereby any Vein broken within them; or are much Bruised by cruel Blows, or otherwise much hurt by any violence or over straining or lifting; they ease their Pains and Soreness, and stop the said inward Bleeding, by conglutinating the mouths of the Vessels. And for the same reason they are commended to heal Ruptures, or Burstenness, being as well as taken inwardly, bathed warm outwardly upon the Place. They are good also for all Wounds new or old, to cleanse, dry, heal, and consolidate them; or being old and filthy Ulcers, to digest, cleanse, incarnate and Cicatrize them, they being often washt therewith, and after washing, the Ointment or Balsam of the same Herb being applyed.

XII. *The Decoction or Infusion in Wine.* They have all the same Virtues with the Juice and Essence, but much Inferior, as being weaker in their effects, and therefore may be given from a quarter of a pint, to half a pint, morning and evening; besides which, they are of good use against the Colick or Gripings of the Guts, and all inward Pains and Torments of the Bowels proceeding from Wind or sharp Humors.

XIII. *The Pouder of the Leaves.* Inwardly given (in any fit Vehicle) to a dram at a time, morning and evening, it has the Virtues of the Juice or Essence, but operates not with their speed, nor does it pierce so far, nor so effectually; but is an extraordinary thing for the present stopping or pissing of Blood, or of a Bloody Flux. Outwardly, it stops bleeding also, heals green wounds; and cleanses, drys and heals old running Sores, and foul Ulcers though of long standing.

XIV. *The Oil or Ointment of the Herb and Roots.* They ease pains in any external part, being anointed upon the same. And the Ointment is good to heal Green Wounds, they being first washt with the Essence or Decoction, then strewed over with the Pouder, and after all the Ointment

ment being applyed spread upon fine Tow, and after the same manner they digest, cleanse, incarnate, dry, and heal foul running Sores, and old fœtid Ulcers, if dreft therewith twice a day.

XV. *The Cataplasm of the Herb and Root.* It is good to heal simple Contusions as also simple new Wounds; and to cleanse fœtid and putrid Sores. And to Consolidate Ruptures in Children and Young Men, being applyed to the part, after bathing of the same with the Juice or Essence.

XVI. *The Fomentation. Take of the Decoction or Infusion two parts; of the Juice or Essence one part, mix them.* It is of singular effects in easing the Hemorrhoids or Piles, when they are very painful, by fomenting them therewith very hot for an hour together, twice or thrice a day: and if they be very full of Blood, after Leeches have been applyed, by fomenting them very hot, it perfects the Cure.

CHAP. DCXXIII.

Of SAXIFRAGE English.

I. *THE Names. Saxifrage*, (as to the general) was scarcely ever known to the Ancient Greeks or Latines, yet there is Σαξίφραγον *Dioscoridis*, which what that Plant was, is scarcely known to us, but some of the Moderns have applyed that Name to those Plants which we call *Saxifrage*: And by late Writers it is called in Latine *Saxifraga*; and in English, *Stone-break*, and *Saxifrage*.

II. *The Kinds.* There are several Species of *Saxifrage*, the chief of which are. 1. *Saxifraga facie Seseli pratensis Saxifraga Anglicana Lobelij, Seseli pratense nostra Parkinsoni, Saxifraga Anglorum*, Our English Saxifrage. 2. *Saxifraga Palustris Anglicana*, Our Marsh Saxifraga; of these two Species we shall Treat in this Chapter. 3. *Saxifraga Alba*, Our White Saxifrage, of which in Chapter. 624. 4. *Saxifraga Pimpinella*, Our Burnet Saxifrage, of which in Chapter 625. following.

III. *The Kinds of the English so called.* 1. *Saxifraga Anglicana Lobelij*, Our English Saxifrage specially so called; it is a singular Plant of the Kind, and by *Parkinson* enumerated among the *Hart-worts*. 2. *Saxifraga Anglica Occidentalium Lobelij*, Our West Country Saxifrage, which *Lobel* thinks to be a Species of *Matthiolus* his *Italian* great Saxifrage. 3. *Saxifraga palustris Anglicana, Saxifraga palustris Alsinæ folia*, Marsh Saxifrage, or small Water Saxifrage. 4. *Saxifraga major Italorum Matthioli*, The great Italian Saxifrage.

The Descriptions.

IV. The first, Or our English Saxifrage, specially so called. *It has a Root which is long, thick, Black without, and White within, and of a good savor. It rises up with Stalks two or three feet high, and something Crested, from which spring Stalks of Winged Leaves, finely cut, almost like to Fennel, but thicker and broader, and not so*

Saxifrage English Common.

largely spread, not much unlike to Seseli pratense monspelliensium, *and of a deep green color; the Stalks bear at the Tops Umbels of small Whitish Yellow Flowers, and the Seed after them is like to Common Fennel Seed, both for form and magnitude, but of a browner color, and lesser Taste.*

V. The second, Or, Our West Country Saxifrage. *It rises up with pretty thick woody Stems, some of them standing upright, and other some creeping as it were upon the Ground, towards their lower ends full of Chinks or Clefts, spreading themselves out very thick, and are full of Joints, out of which grow two small long whitish green Leaves, out of whose Bosoms come divers lesser Leaves, smaller and shorter growing with them. The Flowers grow at the Tops of the Branches or small Stalks, in small Tufts, of a White, or Whitish color, the whole plant being also white.*

VI. The third, or Marsh Saxifrage, or small Water Saxifrage. *Its Root is small and Fibrous, growing in the Mire with its Strings. It rises up from the Root, with several very small grass like leaves, about an Inch long, very small and narrow, (a great deal smaller and slenderer than small Pins, says Gerard) from among which spring up divers slender, round, smooth, firm Stalks, about six or seven Inches high, full of Joints, which are sometimes branched here and there with small Branches: at the Joints of all which both Stalks and Branches grow small Leaves, many together almost like the former (but two for the most part longer than the rest) set by couples, with others shorter coming forth of their bosoms; which Leaves the higher they grow toward the Tops, grow still shorter and shorter,*

Small Water Saxifrage.

ſo that the Top of this Plant reſembles the hard branched Thyme. At the Tops of the Stalks and Branches grow the Flowers, which are white, and conſiſt of five round pointed Leaves, with ſome ſmall Chives in the middle; which Flowers are great, conſidering the ſmallneſs of the Plant.

VII. The fourth, or great Italian Saxifrage. *Its Root is long, and Woody, with ſome Fibres adjoining to it, from which Springs forth a great Woody Stem, of the thickneſs of ones finger, which is full of Clefts as it were below, which ſpreads it ſelf out very thick, with many ſlender hard whitiſh Branches full of Joints, and two ſmall whitiſh green pointed Leaves ſet at every Joint like unto Pinks, and many other ſmaller and ſhorter growing with them. The Flowers ſtand at the Tops of the Branches, out of white greeniſh husks, conſiſting of five, and ſometimes ſix ſmall white leaves, indented at the ends, of a ſweet ſmell, ſtanding above the husks, and laid open like a little Star, after which follow ſmall round and ſomewhat long heads, full of ſmall reddiſh round Seed, much leſſer than that of Poppy: but this Plant grows not with us in* England *ſo great and Woody,*

VIII. *The Places.* The firſt grows in Fields and Medows, in moſt places of this Kingdom. The ſecond and fourth, in the Weſt parts of *England* as *Lobel* ſays, who relates in his *Adverſaria*, that he found the ſecond between *Chipnam* and *Marlborough* in the high way from *London* to *Briſtol*, on a Chalky hill. The third Mr. *Goodyer* found on a boggy Ground below the *Red Well* of *Wellinborough* in *Northamptonſhire*. The fourth, alſo *Matthiolus* ſays grows on *Mount Baldus* in *Italy*.

IX. *The Times.* The firſt flowers from the beginning of *May*, to the end of *Auguſt*. The others flower (all of them) late in the Year, as in *July* and *Auguſt*, and their Seed is ripe not long after.

X. *The Qualities.* Saxifrage is hot and dry in the third Degree, Aperitive, Abſterſive, Anodyn, Carminative, Digeſtive, Diuretick, Neurotick, Stomatick, Nephritick, Hyſterick, Emmenagogick, Alexipharmick, and Lithontriptick.

XI. *The Specification.* It is good againſt the Strangury, Sand, Gravel, Stone, and Tartarous Mucilage in the Reins, Ureters, and Bladder, to expel Wind, give eaſe in the Colick, provoke the Terms, *&c.*

XII. *The Preparations.* You may have therefrom. 1. *A Juice.* 2. *An Eſſence.* 3. *A Decoction of the Herb in Wine or Water.* 4. *A Pouder of the Seed and Root.* 5. *A Diſtilled Water.*

The Virtues.

XIII. *The Juice.* Drank from 2, to 4 or 6 Spoonfuls in White Port or *Lisbon*, Wine it provokes Urine powerfully and is ſaid by Authors to break and expell the Stone in the Reins or Bladder, (which I ſuppoſe to be a Gritty one, for that of a Flint-like Subſtance, can never be broken by a Medicament) and to expell it, as alſo Gravel, Sand, or any Tartarous matter in thoſe parts.

XIV. *The Eſſence.* It has all the Virtues of the Juice, beſides which it expels Wind, is good againſt the Colick, provokes the Terms, in Women, haſtens and facilitates the Birth, ſtrengthens a weak Back, and eaſes the Pain thereof. Doſe from 2 to 4 Spoonfuls. If taken with Honey, it eaſes Coughs, and cauſes Expectoration.

XV. *The Decoction in Wine or Water.* It is made of the Root and Herb together, and has all the Virtues of the Juice and Eſſence, but muſt be taken in much greater Quantity, (becauſe it is weaker in Operation) as from 4 to 8 Ounces, or from a quarter to half a Pint Morning and Night, ſweetned with Honey or Sugar.

XVI. *The Pouder of the Seed and Root.* Taken to a dram at a time morning and night for a month together, it eaſes the Pain of the Reins and Bladder, proceeding from Tartarous matter, Sand, Gravel or Stone, provokes Urine, gives eaſe in the Colick, and has all the other Virtues of the Juice and Eſſence.

XVII. *The Diſtilled Water.* It is of the ſame Nature, and has the ſame Virtues with all the aforenamed Preparations; but as it is much weaker than any of them, ſo it is given in greater quantity: you may give half a Pint or more at a time morning and night ſweetned with Honey; but it is chiefly uſed as a Vehicle for other Preparations.

CHAP. DCXXIV.

Of Saxifrage White and Golden:

OR,

BREAK-STONE.

I. *THE Names.* Theſe were, as far as I can find, unknown to the Greeks. The Latines call them *Saxifraga alba*; and we in Engliſh *White Saxifrages.*

II. *The Kinds.* We ſhall deſcribe the three following Varieties. 1. *Saxifraga alba Vulgaris*; *Saxifraga alba Chelidonides Lobelij*; *Saxifraga rotundifolia Baubini*, *Saxifraga radice tuberoſa Cluſij*; Our Common White Saxifrage. 2. *Saxifraga alba bulboſa altera, & bulbifera Montana Columnæ*, *Saxifraga adfolia bulbos gerens Baubini*, Mountain White Saxifrage. 3. *Saxifraga aurea Gerardi*, *Saxifraga Lichenis facie & Natalitijs Lobelij*; *Hepatica Paluſtris Beſleri*; *Chryſoſplenium Tabernæmontani*, Our Golden Saxifrage.

The Deſcriptions.

III. The firſt, Or our Common White Saxifrage. *It has a few ſmall reddiſh Kernelly Roots, covered with ſome Skins, lying among many ſmall blackiſh Fibres, which ſend forth ſeveral round faint, or yellowiſh green Leaves, of a grayiſh color underneath, lying above the Ground, unevenly indented about the Edges, and ſomething hairy, every one growing upon a ſmall Foot Stalk; from whence riſes up a round browniſh hairy green Stalk, two or three Feet high, with a few ſuch like round leaves thereon, as grow below, but ſmaller; and branched at the Top, whereon ſtand pretty large White Flowers, conſiſting of five Leaves a piece, with ſome Yellow Threads in the middle, ſtanding in long cornered Greenish green Husks. After the Flowers are paſt, ſome time, ariſes a round hard head, byſtked at the Tops, in which is contained ſmall blackiſh Seed, which uſually fall away without any Seed at all. That which is commonly called White Saxifrage Seed, are the Kernels or Grains of the Roots, which are always uſed for the ſame.*

IV. Gerard *deſcribes the aforegoing Plant after this manner. It has a Root compoſed of a Number of black Strings, whereunto are faſtned very many ſmall reddiſh grains, or round Roots, as big as Pepper corns, which are uſed in Medicine, and are called* Semen Saxifragæ albæ, *or* White Saxifrage Seed. *From this Root ſpring up round leaves ſpread upon the Ground, and ſomewhat jagged about the Edges, not much unlike the Leaves of Ground Ivy, but ſofter and ſmaller, and of a more faint yellowiſh green. Among which riſes up a round hairy Stalk a Cubit high, bearing at the Top ſmall white flowers, almoſt like Stock Gilliflowers. The Seed ſolows the Flower which is ſmall, and contained in little Husks.*

V. The ſecond, or Mountain White Saxifrage. *The Roots of this, although they are round, red, and bulbous like the other, yet are they twice as great, and made as it were of Scales or Cloves, laid one upon another, like the Root of a Lilly; in all other things, almoſt in every part it is like the former; the Leaves are round and hairy, but ſomething leſſer, with browniſh Foot Stalks. The Stalks are greater, having leaves thereon, as in the firſt; but at every joint with the leaf comes forth a ſmall Bulb, Tuber, or Kernel*

Saxifrage White.

Saxifrage White Mountain.

(which the Cutter has omitted in the Figure) like unto those at the Root, which when it is through ripe, will encrease to be Plants, as the Bulbs of the Bulbed Lilly, or of the bulbed Coral Root will.

VI. The third, Or our Golden Saxifrage. *Its Root is Bushy, composed of a great number of small Strings or Fibres. It is a small low Herb, having many round Leaves lying upon the Ground, bluntly indented about the edges, something like the former common White Saxifrage, but not hairy, somewhat thicker also, and of a darker green color. From among which rise up several slender and weak Stalks, little above an hand bredth high, with such like Leaves on them, as grow below, up to the Tops; where among the Leaves come forth small Gold Yellow colored Flowers, not easily observed, because they fall away so soon, that they are seldom seen. After they are past, there appear in their places, round heads, in which is*

Saxifrage Golden.

contained small rouud reddish Seed. The whole Plant is almost insipid, or without Taste, and nothing hot, which does not shew any property it has to operate upon the Stone or Gravel, either to dissolve or expell it; unless it be by some occult or Specifick Quality. It can scarcely be thought that so many Authors as have wrote of it should ascribe a Stone Breaking property *to it, unless it had been confirm'd to them by much Practice and Experience, but I having observed nothing concerning it, shall say no more of it at this time.*

VII. *The Places.* The first grows plentifully in many parts of *England*, in the lower moist, as also in the upper dry corners of Medows, and Grassy Sandy Places. It is said that it has grown on the back side of *Grays-Inn*, not far from *Lamb*'s *Conduit Head*: also in a Field on the left hand of the high way going from *Thomas Watering* unto *Deptford* near *London*: in the great Field by *Islington* called the *Mantles*; in the Green Places by the *Sea side at* Lee *in* Essex, among the Rushes in *Georges Fields* near *Southwark*, and in thousands of other places in this Kingdom. The second grows on the Hills and Mountains of *Italy* in the Kingdom of *Naples*; and I have been informed by a Traveller and singular Herbarist, that he has found it growing on some of the Hills and Mountains in *Wales*. The third grows in Moist places by Well sides, or other standing, and sometimes running Waters, and sometimes also in Moorish or Fenny Grounds; as about *Tidnaham* in the *Forrest of Dean*, at *Ashford* and *Iden* in *Kent*; in moist and Marsh grounds about *Bath and Wells*; in the Fenns and Moors by *Boston* in *Lincolnshire*, and *Wisbich in Cambridgshire*; at *Chisselhurst in Kent*; and abundantly in the Shadowy Moist Rocks by *Mapledurham in Hampshire*; as also in the like places in *Yorkshire*.

VIII. *The Times.* They Flower sometimes in *April*, but generally in *May*, in which Month the first is gathered for the Grains or Kernels upon the Roots, or those upon the Stalks, as also for Distillation, quickly withering away when any heat comes. The latter continues Green all the Year.

IX. *The Qualities.* The first and second kinds are hot and dry in the second degree, Abstersive, Incisive, Diuretick, Neurotick, Stomatick, Nephritick, Hysterick, Emmenagogick, and Lithontriptick.

X. *The Specification.* It is peculiar to break or dissolve the Stone in the Reins and Bladder, and to expell it, and cleanse those parts of any Tartarous Substance, or obstructive matter lodg'd in them. It gives ease in the Strangury, provokes Urine and the Terms powerfully, and cleanses the Stomach and Lungs from Pituitous humors offending them.

XI. *The Preparations.* You may have therefrom, 1. *A Juice or Essence of the Leaves and Roots.* 2. *A Decoction of the same in Wine or Water.* 3. *A Pouder of the small Kernelly Roots.* 4. *A Distilled Water of the whole Plant, Roots, Stalks, Leaves, and Flowers.*

The Virtues.

XII. *The Juice or Essence.* They cleanse the Reins, Ureters and Bladder, and are said to break or dissolve the Stone, (if consisting of a Gritty Concretion) in those parts, and to expel it, as also Sand, Gravel, and Mucilaginous Matter, of which the Stone is bred. They cure the Strangury or pissing by drops, and provoke Urine to admiration, open obstructions of the Lungs, and Womb, and provoke the Terms, cleansing the same from the Pituitous matter lodg'd in them. Dose from two Spoonfuls to four or six in White Port Wine, or in the Decoction of the Leaves and Roots.

XIII. *The Decoction of the Leaves and Roots in Wine or Water.* It has all the Virtues of the Juice or Essence, but less powerful and therefore may be taken from a quarter to half a pint at a time, Morning and Night, for a Month together, sweetned with *our Syrupus Nephriticus*, or with *despumated Honey.*

XIV. *The Pouder of the Kernelly Roots, commonly called the Seed.* It may be given to a Dram, or Dram and half in White Wine every morning fasting, and at Bed time, for 40 days together, for all the Intentions and purposes for

which

which the Juice or Essence are given. It mixed with *Honey* and so taken, it is an Excellent thing to open Obstructed Lungs, and to cause an easie expectoration of the Pituitous matter afflicting them.

XV. *The Distilled Water of Roots, Leaves, and Flowers.* It has the Virtues of the Juice and Essence, but in a much inferior degree, and may be given half a Pint at a time, sweetned either with our *Syrupus Nephriticus*, or with *Purified Honey*, and so taken Morning, Noon, and Night. It causes Flegm to be easily voided from the Lungs.

CHAP DCXXV.

Of SAXIFRAGE Burnet.

I. *THE Names.* The Ancient Greeks and Latines knew nothing of this Plant: Our Modern Authors have call'd it, *Pimpinella Saxifraga*: And we in English, *Burnet Saxifrage*.

II. *The Kinds.* Five following are the Chief, *viz.* 1. *Pimpinella Saxifraga major nostras*, Our Greater English Burnet Saxifrage. 2. *Pimpinella Saxifraga minor nostras*; *Pimpinella Saxifraga tenuifolia Bauhini*, Our Smaller English Burnet Saxifrage. 3. *Pimpinella Saxifraga hircina major*; *Pimpinella Cordi, Fuchsij, Gesneri, Lobelii, Tragi*; *Pimpinella Saxifraga Matthioli, Camerarij*; *Saxifraga hircina Gesneri & Clusij*; *Bipenula Locuna*; *Bipinella Saxifraga Lobelii*, *Tragoselinum majus Tabernæmontani*, The great German or Hircinian Burnet Saxifrage. 4. *Pimpinella Saxifraga hircina major flore rubente Gesneri*, The great German or Hircinian Burnet Saxifrage with a reddish Flower. 5. *Pimpinella Saxifraga hircina minor*; *Saxifraga hircina minor*; *Pimpinella Tragi*; *Daucus selinoides Cordi*; *Dauci tertium genus Lugdunensis*; *Tragium Dioscoridi Columnâ*; & *Pimpinella minor*, by divers, The small German or Hircinian Burnet Saxifrage.

The Descriptions.

III. The first, or our greater English Burnet Saxifrage. *It has a long whitish Parsnep like Root, of a hot and biting Taste like Ginger, which continues many Years. It grows up in the same manner like the great German Saxifrage at Sect. V. following, having an hollow Stalk two or three Feet high, with joints and knees, beset with large Winged Leaves, which do more nearly resemble Smallage than Burnet; which consists of many small Leaves growing upon one Stem, snipt or dented about the Edges like a Saw. The Flowers grow at the tops of the Stalks and Branches in white round Tufts, or Umbels: The Seed is like Common Parsly Seed, saving that it is better, and biting upon the Tongue, being sharper and hotter than that at Sect. V. following.*

IV. The second, or our smaller English Burnet Saxifrage. *This is the best known of all the rest. Its Root is long and white, smaller than the former, and puts it self forth into Branches, being of a hot, sharp and biting Taste also. It springs up with Leaves almost like unto Burnet, or Common Parsly of a dark green Color, and smooth or void of hairs, which if tenderly broken with your Hands, you may draw forth small Threads, like those of a Spiders Web, and such as you may draw from the Leaves of Scabious. The Stalk is hollow, dividing it self from its Joints or Knees, into several small Branches, at the Tops of which do grow small Tufts or spokie Umbels of white Flowers, after which come small blackish, round Seed, like unto Parsly Seed, but much better in Taste, and sharper upon the Tongue. The Leaves of this species are greater cut in or dented than our great English kind at Sect. III. above, and at least double their Breadth, they both being indented after the same manner.*

Saxifrage Burnet Greater.

V. The third, or great German or Hircinian Burnet Saxifrage. *Its Root is from a long and white, very like unto a Parsnep or rather a Parsly Root, but much better in Taste, which perishes not after Seed time, but endures several Years. It springs up with several large and long Stalks of Winged Leaves, one set directly opposite to another, on both sides the middle Rib, each being somewhat broad, a little Pointed, and somewhat deeply dented about the Edges, of a fresh green color and shining. From among which rise up one or more round hollow Stalks, three Feet high or better, set at the Joints with the like but lesser Leaves, and bearing at their several Tops, small Umbels of small white Flowers, after which come small blackish, round Seed, like unto Parsly Seed, but much better in Taste, and sharper upon the Tongue. The Leaves of this species are greater cut in or dented than our great English kind at Sect. III. above, and at least double their Breadth, they both being indented after the same manner.*

VI. The fourth, or great German or Hircinian Burnet Saxifrage with a Reddish Flower. *This sort differs little or nothing from the former, neither in its Roots, Stalks, Leaves, Branches, Flowers, no Seed, nor yet in its Magnitude or form of Growing, saving only that the Flowers in this are of a reddish, or blush color.*

VII. The fifth, or smaller German or Hircinian Burnet Saxifrage. *Its Root is long and White, but smaller than the Roots of the two last described; also more hot, quick, and sharp.*

as is alſo the Seed hereof. It has ſeveral ſhorter Stalks of finer cut Leaves by much than thoſe of the third and fourth kinds, every one ſet againſt another, being very narrow, and much cut in, or deeply dented about the Edges, which makes the Leaf ſeem as if it were made of many fine cut and jagged Leaves, ſet on both ſides of a middle Rib, or Stalk, which ſometimes grows Reddiſh, and is very near of the ſame freſh green color which is ſeen in the third or great German kind before deſcribed. The Stalks riſe as high almoſt; and the Umbels of Flowers are white like thoſe: the Seed alſo is blackiſh, but ſmaller than the Seed of that third Species.

VIII. An Obſervation. Parkinſon *ſays, that there is growing at the Roots of theſe Saxifrages, in ſome Countries, certain Grains, which will give a Scarlet Die, as* Lacuna *and* Anguilara *have related, and by them called* Coccus Radicum: *but* Amatus Luſitanus *ſays that the like Grains are found at the Roots of many other Herbs.* Tragus *calls this Saxifrage* Piper Germanicum, *and ſays that no other Plant, can be more fitly referred to the* Petroſelinum Macedonicum Dioſcoridis, *than it, who compared the Seed to the Seed of* Ameos, *yet to be ſweeter, and in ſmell like to Spice, being very ſharp and hot in Taſte: and truly the Seed hereof is ſo Aromatical, and very ſharp and piercing withall, that he had Reaſon to ſay as he did: And* Gerard *ſays, it anſwers to the true* Phellandrium *of* Pliny, *more than any other Plant.*

IX. *The Places.* The two firſt are found growing very plentifully in moſt Medows throughout *England*, and are eaſily ſeen of ſuch as know them, and look for them, tho' they lye hid among the Graſs, and often times ſcarcely to be diſcern'd. The other three grow in the Fields, in *Germany*, as alſo on their Mountains and Rocky Grounds, but very much in *Sylva Hircinia*, or the *Hircinian Wilderneſs* or *Woods*, from which place it takes part of its Name: Yet notwithſtanding, they have been found by divers, to grow as well in *England* as in thoſe other places.

X. *The Times.* They all flower from the end of *June* to the end of *Auguſt*, and their Seed ripens in the mean Seaſon.

XI. *The Qualities.* They are hot and dry in the end of the third degree, being indeed as hot as Pepper, and (as *Tragus* ſays by his often experience) more wholeſome: They are of thin and ſubtil parts, being Inciſive, Aperitive, Abſterſive, Attractive, Carminative, Digeſtive, Diſcuſſive, Diuretick, Coſmetick, Neurotick, Stomatick, Nephritick, Hyſterick, Emmenagogick, Lithontriptick and Alexipharmick.

XII. *The Specification.* They provoke Urine and the Terms, give eaſe in the Strangury, cure the Colick, expel Wind from the Stomach and Bowels, are good againſt pains and fits of the Mother; break or diſſolve gritty Stones, in Reins and Bladder, and expel the ſame, reſiſt and expel Poiſon, ſtrengthen the Stomach, cauſing a good appetite and digeſtion, and an Expectoration of cold Pituitous Humors from the Breſt and Lungs. They are alſo Coſmetick, freeing the Skin from many Deformities.

XIII. *The Preparations.* You may make therefrom 1. *A Juice.* 2. *An Eſſence.* 3. *An Infuſion or Decoction in Wine or Water.* 4. *A Pouder of Seed, Leaves and Roots.* 5. *Comfits of the Seed.* 6. *A Cataplaſm.* 7. *A Spirituous Tincture.* 8. *An Acid Tincture.* 9. *An Oily Tincture.* 10. *A Saline Tincture.* 11. *A Diſtilled Water.* 12. *A Spirit.*

The Virtues.

XIV. *The Juice of Leaves and Roots.* It provokes Urine and the Terms powerfully, facilitates the Birth and expels the Afterbirth, gives eaſe in the Colick, and breaks or diſſolves gritty Stones in the Reins and Bladder, ſuppreſſes Vapors, and helps fits of the Mother. Doſe from one Spoonful to three, Morning and Night, in a Glaſs of white Port or Lisbon Wine.

XV. *The Eſſence.* It ſtrengthens the Stomach, fortifies the natural faculties, cauſes a good appetite and a ſtrong Digeſtion, and is an excellent thing againſt Coughs, Colds, Aſthma's, ſhortneſs of Breath, Hoarſneſs, Wheezing and other cold and moiſt Diſeaſes of the Breſt and Lungs, and has indeed all the other Virtues of the Juice. Doſe one or two Spoonfuls ſweetned with *Syrupus Nephriticus*, or with Honey, Morning and Night.

XVI. *The Infuſion or Decoction in Wine or Water.* They are given for all the former purpoſes, from a quarter to half a Pint, ſweetned as aforeſaid; beſides which, they reſiſt and expel Poiſon, and if made with Wine, comfort the Heart, expel Wind, and are good againſt Fainting and Swooning Fits.

XVII. *The Pouder of the Seed, Leaves and Roots.* It may be given to a Dram for all the aforeſaid Intentions; and if it is made into an Electuary with Clarified Honey, it cauſes Expectoration of Viſcous tough Flegm ſticking in the Stomach and Lungs, expels Wind, and abſorbs acid and acrimonious Humors which vellicate the Bowels.

XVIII. *The Comfits made of the Seed.* They are made as Caraway Comfits, according to the Art of the Confectioner. They warm and comfort a cold Stomach, cauſe good Digeſtion, take away nauſeouſneſs and reſiſt Vomiting.

XIX. *The Cataplaſm.* Applyed to green Wounds, it ſtops their Bleeding, drys, conſolidates and quickly heals them; more eſpecially if the Wound was firſt Waſhed with the Juice of the Herb or Root, and this it does even in Wounds of the Head, where there is no fracture of the Scull.

XX. *The Spirituous Tincture.* It is Cordial, comforts the Heart, revives the Spirits, refreſhes Nature, warms the Stomach, Bowels and Womb, potently expels Wind, and is good againſt the Belly-ach, and gripings of the Guts. Doſe half a Spoonful or more in a glaſs of Wine, eſpecially if the Patient is Sick at Heart, or in any Fainting or Swooning Fit.

XXI. *The Acid Tincture.* It reſiſts the malignity and Poiſon of the Plague and all ſorts of Malign and Peſtilential Fevers, is good againſt the bitings of Vipers, Rattle-ſnakes, Mad Dogs, and other Venomous Creatures; ſtrengthens the Stomach, cauſes a good Appetite and an excellent Digeſtion, and is a very potent Medicine againſt Stone, Sand, Gravel, or Tartarous ſlime in the Urinary parts; provokes Urine, allays Vapors, and reſiſts fits of the Mother: Doſe ſo many Drops at a time as to give the Vehicle, Wine, Ale, Broth, *&c.* a pleaſing acidity.

XXII. *The Oily Tincture.* It is ſtrongly Diuretick, gives preſent eaſe in the Strangury, or piſſing by Drops; breaks gritty Stones in the Reins or Bladder, and expels them, as alſo Sand, Gravel, *&c.* Doſe from 15 to 30 Drops firſt dropt into Sugar, and then mixt with Wine.

XXIII. *The Saline Tincture.* It has the Virtues of the Oily Tincture, but is for the moſt

part

part uſed Externally againſt deſedations of the Skin, as Freckles, Pimples, Tanning, Sunburning, Scurff, &c.

XXIV. *The Diſtilled Water from the whole Plant.* It is uſed for the more nice Stomachs for all the purpoſes for which the Juice, Eſſence, Infuſion and Tinctures are uſed, being ſweetned with Sugar: It is alſo uſed by Ladies to take away Freckles, Scurff, Morphew, Tanning, Sunburnings, and other Deformities of Skin or Face, and to make it more ſmooth and clear.

XXV. *The Spirit.* It is Cordial and a reſiſter of Poiſon, good againſt Fainting and Swooning Fits, Convulſions of the Nerves, Cramps, Numbedneſs, Paralytick Diſeaſes, and other weaknеſſes of the Body: it expells Wind, and gives preſent eaſe in the Colick. Doſe from half a Spoonful to a Spoonful in a glaſs of Wine upon occaſion.

CHAP DCXXVI.

Of SCABIOUS, *OR,* SCAB-WORT.

I. THE *Names.* This was a Plant unknown to the Greeks, but *Matthiolus* in his Epitome calls the leſſer Species of it ψώρα, which is as much as to ſay *Scab-wort*; in Latine it is called *Scabioſa*, and in Engliſh *Scabious* or *Scab-wort.*

II. *The Kinds.* Authors have multiplied the Species to a great number; but we ſhall take notice only of ſuch as are to be found growing Wild in *England*, or in our *Gardens*, viz. 1. *Scabioſa Vulgaris pratenſis*, *Scabioſa communis*, *vel*, *Officinarum*, our Common Field Scabious. 2. *Scabioſa minor campeſtris*, *Scabioſa media*, (by ſome) *Columbaria Lobelij*; *Scabioſa quinta Cluſij*, our leſſer Field Scabious. 3. *Scabioſa major ſegetum*; *Scabioſa Campeſtris ſeu ſegetum Lobelij*, alſo *major Satorum Vulgatior*, Our Common Corn Scabious. 4. *Scabioſa Ovilla Dodonæi*; *Scabioſa montana omnium minima Lobelij*, Our ſmalleſt Sheeps Scabious. 5. *Scabioſa Ovilla major*; *Scabioſa media Dodonæi*; *Scabioſa Ovilla hirſuta*, The Greater, or Middle, or hairy Sheeps Scabious. 6. *Scabioſa minor hortenſis Vulgaris*; *Scabioſa flore albo gemino*; Our Common ſmall Garden Scabious. 7. *Scabioſa media*, The middle ſort of Scabious. 8. *Scabioſa flore albo*, White Flowered Scabious. 9. *Scabioſa rubra Auſtriaca*, Red Scabious of Auſtria. 10. *Scabioſa rubra exotica*, *ſeu Indica*, Exotick or Indian red Flowered Scabious.

The Deſcriptions.

III. The firſt or Our Common Field Scabious. *It has a Root which is great, white and thick, growing down deep into the Earth, and abides many years. It grows up with many hairy, ſoft, whitiſh, green leaves, ſome of which are either not at all Jagged, or divided on the Edges, or very little; others are much Rent and Torn on the ſides, and have Threads in them, which upon the breaking may be plainly ſeen, and are not in ſeveral of the other kinds: from among which riſe up, one or more, round, hairy, green Stalks 3 or 4 feet high, with ſuch like hairy green leaves on them, but more deeply and finely divided, branched forth a little. At the Tops of which, which are Naked*

Scabious Field Common.

and bare of leaves for a good ſpace, ſtand round heads of Flowers, of a Pale bluiſh colour, many ſet together in a head or knob, the outermoſt of which are larger than thoſe inward, with many Threads alſo in the middle, ſomething flat at the Top, and not ſo round or Globe like, as are the heads of ſome other ſorts.

Scabious Field leſſer.

IV. The

IV. The second, or Our lesser Field Scabious *It is like in its Root, Stalks, Branches, Leaves, Flowers, form and manner of growing, to the first, saving that the Leaves are not so large, or deeply jagged, nor do the Stalks rise so high, nor are the Flowers so great or large, but yet of the same bleak blewish color. Some think this to be the same Species with the former, but differing only in the rankness of the Ground where they grow.*

V. The third, or, Our Common Corn Scabious. *Its Root runs not deep into the Ground, but rather creeps under the upper Crust of the Earth. It differs but little from the first before described, saving that it is greater in all respects, the Leaves being larger, with greater Divisions, and some whole leaves with them also. The Stalks are greater and stronger, and the Flowers larger and more laid open, and not so closely thrust together, but of the same blewish color, yet a little more declining to Purple.*

VI. The fourth or Our smaller Sheeps Scabious. *The Root is like unto the other Field Scabious's but lesser. It has divers whitish green leaves at the ground, divided on both sides of the long pointed leaf, only into one Division, on each side, making every leaf seem like the small Sage leaf, called Sage of Virtue, which has small pieces of leaves like Ears on each side thereof; but a little dented about the ends. The Stalks are small and low, and are furnished likewise with such like Leaves, but lesser; and small blewish Flowers or heads on them, like unto the other Field Scabious.*

VII. The fifth, or the greater, or middle or hairy Sheeps Scabious. *This is greater than the former just now described, growing a foot high or better. Its Root is single, and like that of a Rampion (whence Fabius Columna referr'd it to the Rampions, its Seed and Milky Juice inducing him thereto.) It has slender rough Stalks, or Branches, set with leaves not so much divided, but only nick't about the Edges. The Flowers are in Color and shape, like those of the last described, of a blewish color, consisting of much Thrummy fibres close thrust together like a Button, not much unlike to that of the blew daisy.*

VIII. The Sixth, or Our Common small Garden Scabious. *Its Root is long, and abides many years. It has long smooth Leaves below notched about the edges, but otherwise not much divided, in form almost like a Sage Leaf; from among which rise up a Stalk or Stalks almost two Feet high, pretty stiff or strong, and branching themselves out, not leaning their heads downwards. The leaves upon the Stalks are pretty large ha-*

Scabious Sheeps Greater.

Scabious Garden small Common.

ving two or more long smooth Leaves divided to the middle rib on both sides, and each part divided also, or pretty deeply Notched. The Flowers, which are two upon long foot Stalks at the head of each Stalk or Branch, are of a pretty large size, and round at the head. Sometimes there is but one Flower at the tops of the Branches, and sometimes three, but most usually two, of a fair pure white color, which being put away, the heads with Seed appear more round and not flat, but rather a little Corn fashion'd, rising a little higher in the middle.

IX. The seventh, or Middle sort of Scabious. *This kind is almost in all things like unto the second or our lesser Field Scabious before described, saving that the knob, or head, does not spread it self so much abroad, nor is its Thrums so thick or closely thrust together; nor are the lower Leaves so deeply cut or jagged, but the upper are much smaller, and also more divided.*

X. Th

Scabious Middle.

X. The Eighth or White Flower'd Scabious. *This has many long Leaves, very much jagg'd or gasht in on both sides, of a mean or middle bigness being neither so large as many of the Field, nor so small as any of the small kinds. The Stalks rise about a Foot and half high, or somewhat more, at the Tops whereof grow round heads, thick set with Flowers, like in all respects to the Field Scabious, but of a Milk white color.*

XI. The Ninth, or Red Scabious of Austria. *Its Root is composed of a Number of slender Strings fastned to the head thereof. It has many Leaves lying upon the Ground, very like unto Dewils bit, but not so large, being shorter and snipt, not gasht about the Edges, of a light green color: (yet there is another of a darker green color, whose Flower is of a deeper red:) the Stalks have divers such like Leaves on them, (set by couples at the Joints) as grow below; and at the Tops small heads of Flowers each consisting of five Leaves; the biggest Flowers standing round about in the outer compass, as is usual almost in all kinds of Scabious, of a fine light purple or red color. After the flowers are past, comes the Seed, which is something long and round, set with certain hairs at the head thereof like unto a Star.*

XII. The tenth, or Exotick or Indian Red flowered Scabious. *Its Root is long and round, compassed with a great many small Strings, which perishes usually as soon as it has lost its Flowers and Seed: otherwise if it does not flower the first year of its sowing, if it be carefully defended from the Extremity of the Winter, it will flower the sooner the next year, as has been often found (with us in England) by Experience. It has many large fair green Leaves lying on the Ground,*

[illegible] Stalks [illegible] Branches, bearing [illegible] Flowers like unto the [illegible] other Scabious, but of a very [illegible] deep red Purple Color, and sometimes more pale [illegible] bearing no Seed at all. After which come small [illegible] Seed, like unto the [illegible] Scabious.

XIII. *The Places.* The fifth, sixth, and seventh, grow in Pastures, Medows, and Corn-Fields, and barren Stony Grounds, almost every where, as Ground Pine; the other two are Nurst up in our Gardens, where they flourish very well. The fifth grows usually in most Medows in this Land, especially about *London* almost every where. The second grows likewise in some of the Dry-Fields about the City, but not so plentifully as the former. The third grows both in the Grounds where Corn is standing, and in such Grounds as have been formerly Sown and now lye Fallow, as also in the borders of such like Fields. The fourth is found in many dry Gravelly and Heathy Grounds throughout almost all *England*. The fifth likewise grows also in such like places. The Sixth is not known where it grows Wild, but with us it is Nurst up in Gardens. The seventh sort grows in Fields, and Medows. The eighth, ninth, and tenth, grow Wild in hotter Climates; but with us they are brought up in Gardens, yet the eighth has been often found growing in Medows, and Marshes near the Sea side, in several parts of *England*.

XIV. *The Times.* They all, except the last flourish in the Summer Months, and Flower in *June*, and *July*, and abide Flowering till it is late in *August*, and the Seed ripens in the mean time. The Tenth Flowers not until *September* or *October*; and sometimes is not apt to Flower with us the first year; so that many times it perishes without bearing Seed, whereby we are oftentimes to seek for Seed from beyond Sea, to supply our selves with it again, unless great care be taken of it in the Winter time.

XV. *The Qualities.* Scabious is said to be hot and dry in the end of the second Degree, and is of thin and subtil parts. It incides, attenuates or makes thin, digests, is Anodyn, Cosmetick, Vulnerary, Cardiack, Pectoral, and Alexipharmick.

XVI. *The Specification.* It is peculiar to cure all manner of Pustules, Pimples, Scurf, Scabs, Tetters, Ringworms, and other like breakings out; it prevails against Obstructions of the Lungs, Asthma's, Coughs, Colds, Wheezings; Pleurisies, inward Ulcers, and Apostems, and potently resists the Infection of the Plague or Pestilence, exterminating its malignity or Poison.

XVII. *The Preparations.* You may make therefrom, 1. *A Juice.* 2. *An Essence.* 3. *A Decoction or Infusion.* 4. *A Syrup.* 5. *A Pouder.* 6. *A Balsam or Ointment.* 7. *A Cosmetick.* 8. *A Cataplasm.* 9. *A Distilled Water.* 10. *A Spirituous Tincture.* 11. *An Acid Tincture.* 12. *A Saline Tincture.*

The Virtues.

XVIII. *The Juice.* It is very effectual for Aſthma's, Coughs, Colds, ſhortneſs of Breath, Hoarſeneſs, Wheeſing, and all other Diſeaſes of the Breſt and Lungs, ripening and digeſting cold Flegm, and other Viſcous humors, expectorating them by Coughing and Spitting. Four Ounces of the Clarified Juice of Scabious, taken in the morning faſting, with a Dram of *Mithridate* or *Venice* Treacle, frees the perſon from any Infection of Plague or Peſtilence, yea though already ſeized therewith, if after the taking of it, the patient Sweat for two or three hours in their Bed, and it be repeated again, as the Phyſitian may adviſe. Drank likewiſe to the quantity aforeſaid, it is good againſt Scabs, and all manner of breakings out, as Tettars, Ringworms, Scorbutick Boils and Puſtules, yea tho' they proceed from the *French* Pox, which *Matthiolus* ſays he has proved by Experience.

XIX. *The Eſſence.* It has all the Virtues of the Juice, but being ſtronger and a more deputated ſubſtance; ſo it may be given in a leſſer quantity, as to 3 Ounces, in ſome proper Vehicle, as its own diſtilled water, or the ſame water mix'd with half as much Wine; and it ought to be taken morning and night ſo long as need requires.

XX. *The Decoction or Infuſion in Wine or Water.* It is made of the whole Plant, Roots and all. If mixed with an equal quantity of the Juice or Eſſence, and ſo taken, it has all the Virtues of the ſaid Preparations, beſides which it ripens all ſorts of inward Apoſtems, cleanſes inward Ulcers, heals internal Wounds, and Cures Pleuriſes, being drank morning and night for ſome days together. It is good againſt Pains and Stitches in the ſides; and taken for Forty days together, it is good to heal all ſorts of breakings out, Sores and Ulcers, proceeding from the *French* Pox. Outwardly the head being waſhed therewith warm, it cleanſes it from Dandriff, Scurf, Morphew, Sores, Scabs, and the like.

XXI. *The Syrup.* It is generally made of the Juice with Honey or Sugar, and has all the Virtues of the ſaid Juice; but more particularly it is Specifick againſt Diſeaſes of the Stomach and Lungs, curing their Diſeaſes, and cauſing an eaſy Expectoration. It hath been told by an old Practiſer of Phyſick and Chirurgery, that this Syrup is an excellent Cure for Ulcers of the Lungs, cleanſing, drying and healing them, and that he had cured ſeveral therewith, by giving ſix Spoonfuls thereof morning and night in a Glaſs of Styptick Red Wine, *&c.*

XXII. *The Pouder.* It has the Virtues of the Juice and Eſſence: a Dram of the Pouder of the Roots taken for 6 or 7 Weeks together, in Whey, Clarified with the Herb, is good againſt all manner of breakings out proceeding from what cauſe ſoever, yea though from the Foul Diſeaſe it ſelf.

XXIII. *The Balſam or Ointment.* They are excellent againſt Scurf, Morphew, Dandriff, Puſtules, Ring-worms, Tettars, Scabs, and all other Cuticular Defilements, being anointed upon the parts affected morning and night. Tents alſo being dipt therein heal not only green Wounds, but likewiſe Old Sores and running Ulcers. They help all ſorts of cold and hard ſwellings in any part, and are effectual to reſtore contracted or ſhrunk up Sinews, if not of very long ſtanding.

XXIV. *The Coſmetick. It is made of the Juice mixed with Camphir made into Pouder, with a little Spirit of Wine, and Pouder of Borax.* It cleanſes the Face and other parts of the Skin from Freckles, Tanning, Sunburning, and other diſcolorings, Morphew, Leproſie, Pimples, Scabbineſs, and other like breakings out.

XXV. *The Cataplaſm of the Green Herb.* Applied to a Carbuncle or Plague Sore, it has been found by Experience, to diſcuſs or maturate and break it in ſome ſhort time. It diſcuſſes cold and hard Tumors, and being applyed does in a ſhort time looſen and draw forth any Splinter, Thorn, broken Bone, or ſuch other like things, which may ſtick and lye in the fleſh.

XXVI. *The Diſtilled Water.* It has the Virtues of the Juice, Eſſence, Decoction or Infuſion, but nothing near ſo powerful as they be, and therefore may be taken a quarter or half a Pint at a time, ſweetned with the Syrup of the Herb; but it is moſt uſed as a Vehicle.

XXVII. *The Spirituous Tincture.* It is Alexipharmick, reſiſts Poiſon, ſtrengthens the Heart, revives the Spirits, and comforts the Univerſal frame of the Body. Doſe 2 Drams, mixt with ſome of the Syrup.

XXVIII. *The Acid Tincture.* It prevails againſt the Poiſon of Venomous Creatures, Bitings of Mad Dogs, the malignity of the Plague or Peſtilence, and all ſorts of Malign and Peſtilential Fevers; it is a ſingular thing alſo againſt Aſthma's, Coughs, and all other diſeaſes of the Breſt and Lungs, proceeding from Obſtructions, Colds, Bi[illegible] and the like. It reſiſts Vomiting, cleanſes and ſtrengthens the Stomach, and cauſes a good Appetite, and a ſtrong Digeſtion. Doſe ſo much at a time as to make the Drink, Wine, Liquor, or Vehicle gratefully pleaſant.

XXIX. *The Saline Tincture.* It is chiefly uſed in all Defœdations of the Skin, abſorbing the acrid and acid humors, cleanſing, drying, and healing the ſame, and ſo reſtoring the Skin to its priſtine Smoothneſs, Softneſs, Whiteneſs, and Beauty, by only Bathing therewith Morning and Night.

CHAP. DCXXVII.

Of SCORPION HERB, *OR,* CATERPILLERS.

I. *THE Names.* Tho' it ſcarcely appears whether the Ancient Greeks knew any thing of this Plant, yet our Modern Herbariſts have given it the Greek Name, Σκορπιοειδὲς, in Latine, *Scorpioides:* and in Engliſh, *Scorpion Herb*, *Scorpion Graſs*, and *Caterpillers.*

II. *The Kinds.* There are various ſorts of this Plant, *viz.* 1. *Scorpioides major*, *Scorpioides bupleurifolio major Lobelij*, great Scorpion Graſs, or rough Caterpillers. 2. *Scorpioides minor*, *Scorpioides bupleurifolia minor*, the leſſer Scorpion Graſs or Caterpillers. 3. *Scorpioides bupleurifolia pluribus Corniculis*

Cruciata asperis, Scorpioides baccifera, Scorpioides Isatidis, small ordinary Caterpillers with many Cods. Some, as *Cruciatus*, *Anguinus*, *Isatidis* and *Cariophyllus*, will have this to be *Leguminosa Dodonæi*, but *Dodonæus* was of another [illegible] 4. *Scorpioides Bupleuroides scapis striatis*, French Crooked small Caterpilers. 5. *Scorpioides Matthioli*, *Scorpioides Portulacæ folio*, Matthiolus his Scorpion Grass with Purslane like Leaves. 6. *Myosotis Scorpioides palustris*, Water Scorpion Grass. 7. *Myosotis Scorpioides arvensis*, Moule Ear Scorpion Grass.

The Descriptions.

III. The first or great Scorpion Grass, or rough Caterpillers. *Its Roots are small and fibrous, perishing every Year. It is but a small low Plant, with branches lying upon the Ground, about a span long, broad and hard Leaves growing thereon; from among which come forth small Stalks, bearing at their ends for the most part, two small pale yellowish Flowers, like unto Lads or Vetches, but smaller, which turn into Winding or crooked round Cods, pretty thick, round, and short, and not so much turned or wound together as those of the smaller next following; in which are contained brownish yellow Seed, much like unto a Medica.*

IV. The second, or lesser Scorpion Grass, or lesser Caterpillers. *This in its Roots, branches, Leaves, Stalks, Flowers and Seed, is much like the former, saving that it is every way less: but in this the Cods are more Writhed or Crooked, much slenderer and rounder, and more wound or turned together than those of the greater, yet not closing like unto Snails, but blacker and more like unto a Caterpiller than the former.*

V. The third, or small ordinary Caterpillers with many Cods. *The Root is Annual and very Stringy. This small Caterpiller grows in the same manner with trailing long Branches as the first small rough sort does. The Leaves are likewise of a fresh green Color, and of the same fashion, but somewhat lesser. The Flowers also are small, and of a deep Yellow, four or five oftentimes standing together, which are of the same largeness and fashion with the other, only this has as many Crooked Cods together as there are Flowers.*

VI. The fourth or smooth Codded small Caterpilliers. *This is in all things like the former sort, saving that it has seldom two Flowers together on a Stalk, and the Caterpillers which follow as few, being Crooked and Winding in the very same manner, and small and smooth without any roughness at all upon them, and of the same pale brown Color.*

VII. The fifth or Matthiolus his Scorpion Grass with Purslane like Leaves. *Its Root is long and Fibrous perishing Yearly. It has several upright pale green Stalks, with pale green Leaves set thereon each of which is something long, broad, and round pointed, like a Purslane Leaf, sometimes having two small Leaves joined together at the bottom of the greater, and oftentimes in many without them. At the Tops of the Stalks, and out at the joints likewise, come forth small pale yellow Flowers, much resembling those of* Medica *or Snail Clover Grass. After which follow small long slender and Crooked Horns, small at the end, jointed or parted as it were, all the length of it, something resembling the long Crooked Cods of the* Colutæa Scorpioides, *but that this is more conspicuously jointed, and of a pale Color, within which lye small long whitish yellow Seed.*

Scorpion Herb.

VIII. *This fifth kind, because it has some resemblance of Pease, and therefore called by some* Scorpioides Leguminosa, *as* Gerard *says, is by him thus described.* It has small and tender Roots like small Threads. It has many Branches, weak and tender Trailing upon the Ground, if there is nothing for it to take hold of with its Clasping and Crooked Seed Vessels; otherwise it rumpeth upon whatsoever is near unto it. Its Leaves are few and small. The Flowers very little and yellow of Color. And the Seed follows little and blackish, contained in little Cods like unto a Scorpions Tail.

IX. The sixth or Water Scorpion Grass. *This grows in almost every Ditch or gently running Stream, having Leaves like to Brooklime. The Flowers grow at the Top of tender but green Stalks, of a Blew Color, and sometimes with a spot of yellow among the blew, and the whole Branch of Flowers does turn it self round like a Scorpions Tail. There is another species of this Water Plant, which has Leaves like unto* Anagallis aquatica, *or Water Chickweed, having like slender Stalks and Branches as the former, and the Flowers not unlike, saving that these are of a Whitish or light blew Color, something bigger and laid more open, wherein the yellow spot is seen.*

X. The seventh, or Moose Ear Scorpion Grass. *It has a Root which consists of a Bush of small Fibres or Strings. It has rough and hairy Leaves of an Overworn russet Color. The Flowers grow upon weak feeble rough Branches, as is all the rest of the Plant. And they grow likewise for the most part on one side of the Stalk of a blew Color with a little spot of yellow on the same, turning the tops round backwards, not much unlike the Tail of a Scorpion. There is another sort of this species, much like to us now described, called* Myosotis Scorpioides repens, *in which the Flowers are thicker thrust together, and do not Grow all upon one side as the former do.*

alſo part of the Flowers are blew, and part Purple, confuſedly mixed together. Gerard.

XI. *The Places.* The Native places of the two firſt are unknown, but with us they grow only in Gardens The third and fourth were brought out of *Spain* by *Boel*, and grow Wild both in their Mannured Fields and Vineyards, and with us in Gardens. The fifth grows not Wild in *England*: but *Gerard* ſays he had Seed of the firſt and fifth from beyond Sea, by which they are now diſperſed thro' *England*, and are eſteemed for the Beauty of their Flowers, and ſtrangeneſs of their Crooked Cods reſembling Caterpillers. The ſixth grows in Waters and ſhallow running Streams in many parts of this Kingdom. The ſeventh, grows for the moſt part upon dry, gravelly and barren Ditch Banks, and other like barren places in many parts of this Kingdom.

XII. *The Times.* They Flower in *June* and *July*, and their Seed ripens in the mean ſeaſon, or in ſome little time after.

XIII. *The Qualities.* They ſeem to be Temperate in reſpect to Heat, Cold, Dryneſs or Moiſture; Abſterſive, Vulnerary and Alexipharmick.

XIV. *The Specification.* Authors aſcribe but few Virtues to them, being much of the Nature of the Medow Trefoils. Yet they are ſaid to remedy the ſtinging of Scorpions, the bitings of Serpents and other Venomous Creatures, and heal green Wounds.

XV. *The Preparations.* You may have therefrom, 1. *A Juice.* 2. *A Decoction in Wine.* 3. *An Ointment.* 4. *A Cataplaſm.*

The Virtues.

XVI. *The Juice of the Herb.* Drank to the quantity of 3 or 4 Ounces, it is good againſt the bitings of Serpents, or other Venomous Beaſts, being repeated Morning and Evening, ſo long as need requires.

XVII. *The Decoction in Wine.* It has the ſame Virtues, and may be taken to half a Pint or more, Morning and Night.

XVIII. *The Ointment.* It is made of the Juice or green Herb, with Oil, Wax, and a proportional quantity of *Gum Elemi.* It is good to diſcuſs Simple Contuſions, and to heal green Wounds being applyed.

XIX. *The Cataplaſm.* It is made of the green Leaves being beaten in a Marble or Wooden Mortar. Being applyed upon the place hurt, it is ſaid to be a preſent Remedy againſt the ſtinging of Scorpions.

CHAP DCXXVIII.

Of SCURVY GRASS: OR, SPOON-WORT.

I. *THE Names.* This Plant was unknown to the Ancient *Greeks* and *Latines*: but our Moderns have called it *Cochlearia* (from the form of its Leaf) and in Engliſh *Scurvy Graſs* and *Spoon-wort.*

II. *The Kinds.* There are ſeveral Species of this Plant; but theſe three following are chief. 1. *Cochlearia Vulgaris*, *Cochlearia Marina*, *Cochlearia Anglicana*, Sea Scurvy Graſs; or, Our Common or Engliſh Scurvy Graſs. 2. *Cochlearia rotundifolia Cochlearia hortenſis*; *Cochlearia Belgica*, *Telephium Lacunæ*, *Cochlearia rotundifolia major*, Our Great Garden or Dutch Scurvy Graſs. 3. *Cochlearia rotundifolia minor*, Small Dutch Scurvy Graſs.

The Deſcriptions.

III. The firſt, Or Sea Scurvy Graſs, Or Our Common or Engliſh Scurvy Graſs. *It has a ſhort thick Root, repleniſhed with a great many Fibres, even to a Buſh as it were of White Strings, which Stick deep in the Mud, in which it chiefly delights to grow; yet it will flouriſh very well in the more upland and dryer grounds, Taſting a little Brackiſh even there, though nothing ſo much as where it has the Salt Water to Nouriſh it. It has many thick fat Leaves more long than broad, and ſome-*

Scurvy-Graſs Common, or Sea.

times longer and narrower; ſometimes alſo ſmooth on the edges, and at other times a little Waved, for in all theſe forms it is to be ſeen, as alſo plain, ſmooth, and pointed, and ſometimes a little hollowed in the middle and round pointed, of a ſad green color, and ſometimes a little browniſh, every Leaf ſtanding by its ſelf, upon a long foot Stalk, which is greeniſh or browndiſh alſo; from among which Leaves, riſe up ſmall ſlender Stalks, having a few Leaves thereon like the other, but longer and leſſer for the moſt part. At the Tops whereof grow many whitiſh flowers, with yellow Threds in the middle, ſtanding about a green head, which becomes the Seed Veſcel, and will be ſome-

what

what flat when it is ripe, very like unto ſome of the kinds of Thlaſpi *or* Treacle Muſtard, *wherein is contained reddiſh ſmall Seed* [illegible] *ſomething hot.*

IV. The ſecond, or Our great Garden or Dutch Scurvy Graſs. *It has a Root which is ſmall, white, and Thready, from which riſe up ſeveral freſh, green, and almoſt round Leaves, nothing ſo thick as the former, yet in ſome places, viz. in a rich and well dunged or manured Ground, they will be very large, even twice as big as in others not at all dented about the edges, nor with any*

Scarvy Graſs Garden or Dutch.

ſenſible hollowneſs to be perceived in the middle, every one of them ſtanding alſo upon a long ſoft Stalk. *From among theſe riſe up divers long, ſlender, weak Stalks, higher than the former, and with a greater ſtore of ſmall white Flowers, at their Tops, which convert into ſmaller Pods, and ſmaller browniſh Seeds than the former. The Taſte of this Plant is not Salt or brackiſh at all, but has an hot Aromatick Taſte almoſt like Spice.*

V. The third, Or ſmall Dutch Scurvy Graſs. *Its Root is very ſmall, conſiſting of a few Fibres, which periſh as ſoon as it has perfected its Seed. It grows like the laſt, with many ſmall, roundiſh Leaves, ſometimes a little Crumpled at the edges, not bigger than the Nail of ones little Finger, every one growing upon its own ſoft Stalk, which abide all the Winter, if it is Sown before Winter, or that it is riſes up of its own Sowing: otherwiſe, if it is Sown in the Spring, it ſhoots forth divers long, ſlender Stalks lying on the Ground, a foot long or better, on which grow ſuch like ſmall round leaves, very thinly ſet, up to their Tops, whereon do grow many ſmall White Flowers, like to the laſt, but much ſmaller, according to the proportion of the Plant, and ſmall Seed in ſeverals Pouches. This will ſpring up again if the Seed be ſuffered to fall, or Sow it ſelf, in the ſame place, towards the latter end of Summer, or before Winter: and do what you can ſtill, if you will gather any ripe Seed there at, there will be ſome of it fall, before you can gather it.*

VI. *The Places.* The firſt grows along on the *Thames*-ſide, on both the *Eſſex* and *Kentiſh* ſhores, from *Woolwich*, where the Water begins to be Saltiſh, round about the Sea Coaſt to *Dover*, and alſo from *Dover* round about the Coaſt to *Portſmouth*, and even to *Briſtol*, where it is to be had in great plenty. It has not been obſerved yet to grow on our Northern ſhores, but on many other places on the Weſtern Coaſt. The ſecond, or our Garden Scurvy Graſs, grows in the Marſhes in *Holland* in *Lincolnſhire*, and in many places thereabouts by the Sea ſide. It grows by the Sea ſide at *Hull*, at *Boſton*, and at *Lynn* in *Norfolk*, and in ſeveral place in *Lincolnſhire*, as in *Whaplode*, and *Holbeach* Marſhes in the ſame County. It has been found of late, growing many Miles from the Sea ſide, as upon a great Hill in *Lancaſhire* called *Ingleborough* Hill; (one of the higheſt Hills in *England*) but indeed it will grow in any Soil, Place, or Climate whatſoever. It is ſaid to grow alſo near to a Caſtle in the Peak in *Derbyſhire*, full 20 Miles from the Sea; but it is now Sown in moſt Gardens (for its uſefulneſs) throughout the Kingdom, it will grow in Moiſt and Cold ſhadowy places, and yet will proſper very well in the Sun alſo; and in many upland Countries of this Land, it is Sown in great Quantities, not only for the peoples own ſpending, but to ſell to others for Profit: And in our Gardens it flouriſhes, and bring forths its Seed, as Naturally as by the Sea ſide, and retains the ſame hot and Spicy Taſte, which ſhews that it refuſes no place of growing, as many other Maritime Plants will. The third grows in the *Low-Countries*, but proſpers well enough in *Our Gardens*, if Planted or Sown therein.

VII. *The Times.* They all Flower early in the Year, as in *April*, and many times in *May*, and their Seed is ripe not long after, as in *June*, and the latter end of *May*.

VIII. *The Qualities.* It is hot and dry in the fourth degree, plentifully ſtored with a Mercurial Volatile Spirit, and both a Volatile and fixt Salt, whereby it becomes Aperitive, Abſterſive, Attractive, Coſmetick, Digeſtive, Diſcuſſive, and Diuretick, Stomatick, Pectoral, Hepatick, Splenetick, and Hyſterick; Emmenagogick, Sudorifick, and Alexipharmick.

IX. *The Specification.* It is peculiar for curing the Scurvy in a cold habit of body, with all its Symptoms; it opens obſtructions of the Liver, Spleen and Womb, Cures the Palſie, and all ſorts of Sores and Ulcers in the Mouth, and cleanſes the Skin of Spots, Scurff, Morphew, and other like defilements thereof.

X. *The Preparations.* You may make therefrom. 1. *A Liquid Juice or Eſſence.* 2. *A Diet Drink.* 3. *An Infuſion or Decoction in Wine or Water.* 4. *A Conſerve.* 5. *A Tincture.* 6. *A Diſtilled Water.* 7. *A ſimple Spirit.* 8. *A purging Spirit.* 9. *A fixed Salt.* Where Note, that the Garden Scurvy Graſs is the ſtrongeſt and moſt effectual to the purpoſes intended and that which is moſt uſed.

The

The Virtues.

XI. *The Liquid Juice or Essence.* It may be taken from one to two Spoonfuls or more, every morning fasting, in a Glass of Ale, Beer, or Wine, for the Cure of the Scurvy; it cleanses the blood, open all obstructions of the Liver, Spleen and Womb, rectifies, warms and comforts the Stomach, causes a good Appetite and Digestion is good against Surfeits, and takes away the Swelling, Pain, and hardness of the Spleen, and is profitable for such as are subject to, or troubled with Botches, Boils, Scabs, Scurff, Morphew, or other defilements, from the Corruption or Putrifaction of the blood.

XII. *The Diet Drink. Take Juice of Garden Scurvy Grass five Pints: Juice of Angelica, a Pint: Burdock Roots, half a Pound: Horse Radish Roots* 4 *Ounces, all Bruised or thin shaved: Mustard Seed Bruised, Coriander Seed Bruised, of each* 4 *Ounces: Cloves Bruised, Nutmegs thin sliced, of each half an Ounce: Yellow of Orange Peels, cleared from the White* 2 *Ounces: Choice Sena* 4 *Ounces: New Ale Ten Quarts. Put the Juices first into the Ale; then put all the other Ingredients into a long close knit Net Bag, with a Stone in it, which put also into the Ale. Let them work together, and after two days let the Patient drink of it,* a Pint (or less according to Circumstances) at a time Morning and Evening, Squeezing into every Draught as it is Drank the Juice of a *Sevil or Soure Orange.* The Recipe may be repeated with fresh Ingredients, 3 or 4 times Spring and Fall, according as necessity may require. It has all the Virtues of the Juice and Essence aforenamed, and is a most excellent thing to cleanse the Blood of all its defilements, which it many times manifests in various sorts of breakings out in the Flesh and Skin.

XIII. *The Infusion or Decoction.* They may be made in Wine or Water, or in half Wine, half Water; but made with White Port or *Lisbon* Wines they are best. They have the Virtues of the Juice or Essence, but not altogether so powerful; but are good for the Cure of the Scurvy in a cold Constitution. If the Infusion or Decoction be mixed with an equal part of the Juice or Essence, and then very well sweetned with Honey, it makes a most excellent Gargarism for the healing of Sore Mouths and Throats, and curing of the Scurvy in the Mouth and Gums.

XIV. *The Conserve.* It is made of the round or Garden Kind (which is much the more preferable sort) according to the usual Method. It is a delicate Medicine for weak and tender Stomachs, and for such as are over-run with the Scurvy, and are apt to be sick in a Morning, or after Eating, or cannot digest their Food: It causes a good Appetite, and has all the Virtues of the Juice and Essence aforegoing.

XV. *The Tincture.* It is made of the Green Herb, by digesting it in Spirit of Wine, either simple or acuated with Spirit of Salt or Sulphur. It is a potent thing against the Scurvy in a cold Constitution, as also for the Cure of the Palsie, and restoring of Paralytick Members. It gives ease in the pains of the Stomach, Liver, and Spleen, and in the Colick proceeding from Wind and sharp humors. Dose half a Spoonful to a Spoonful in a Glass of Wine, or Wine mixt with Water, morning and night, or upon point of Extremity.

XVI. *The Distilled Water. Take Garden Scurvy Grass* 30 *Pounds: Horse Radish Roots cut into thin slices* 6 *Pounds: Fair Water* 3 *Gallons, infuse warm for Twenty Four Hours, then draw off* 3 *Gallons of Water.* Bate's Pharm. This ought to have a different distillation from that of Aromaticks: for as Scurvy Grass, *&c.* abounds with more Volatile Spirits, and more Volatile Salts so it admits of less Fermentation; and therefore ought to have a proper Menstruum (if stronger than Water, as Perry, Mead, not sowre or hard, *&c.*) which may attract, dissolve, and join with the Essential parts of the Ingredients, and carry them along with it in Distillation, without changing their Natures and Virtues. It is essentially good against the Scurvy, Dropsy, Gout and Stone, or any Tartarous Concretions in the Reins or Bladder, as also against the Colick, Rheumatism, Surfeits and other like general diseases, which hardly admit of any singular Name or Denomination. Dose one Ounce or more in a Glass of Ale.

XVII. *The Simple Spirit. Take Garden Scurvy Grass as much as you please, which cut or shred in pieces, put the same into a Copper Vesica Tinn'd within, and affuse thereon Rhenish, White Port, White Lisbon, or Madera Wine, so much as may over-top the Ingredients four or five Inches, digest* 24 *Hours, and distill through a Serpentine or Worm, with a very gentle Fire, that the Spirituous and Volatile parts may ascend, continuing the Distillation, till the falling Drops are almost insipid. To this Water put the same Quantities of the Ingredients again in like manner, with the former Quantity of Wine, digest and distill again as aforesaid, repeating this Distillation with fresh Herbs only, so long till the Spirit is strong enough. This done, rectifie the Spirit in* Balneo, *keeping that which is repleat with Sulphur and Volatile Salt, and ascends first, a part by it self. Then continue the Distillation, till the Drops are almost insipid, which is also a Spirituous Water, and keep that by its self.* This Spirit, and Water have all the Virtues of the former distilled Water. The Water may be given in the same Dose in Wine, Ale, or other proper Vehicle; but the first Volatile Spirit is to be given in Drops only, from 20 to 50, once or twice a day.

XVIII. *Another way to make this Simple Spirit of Scurvy Grass. It is made of Garden Scurvy Grass whilst in Flower, fermented, or not fermented, then distilling it in an Alembick with its Worm; that which comes first, save by it self for Spirit: what follows is only Scurvy Grass Water.* Some make this Simple or plain Spirit thus. *Take Proof Spirit a sufficient quantity, put into it as much Scurvy Grass as it can contain: digest* 3 *or* 4 *Hours, then distil in an Alembick with its Worm, saving the first half or draught for Spirit: and what comes after for Scurvy Grass Water.* Another way of making Simple Spirit of Scurvy Grass. *Take fresh and large Garden Scurvy Grass when in Flower, as much as you please, Bruise it well in a Mortar, then put it into a Wooden Vessel; affuse thereon so much Water as may cover it; add to it* 2 *or* 3 *handfuls of Salt, and a little Yest, and let it ferment a day or two, and so distil it in a Copper Alembick Tinn'd within, saving the first running by it self for the true Spirit, which you may distill again from fresh Scurvy Grass, saving the first running as before, so will you have a very strong Essential*

Spirit

Spirit of Scurvy Grass. But *Rulandus* diffuses this way by Fermentation, and makes it thus. *Take fresh Garden Scurvy Grass as much as you please, bruise it grossly, gently and speedily, add to it Generous White Wine (not fermenting it before hand, by which means there is made of the Volatile Spirit left) and draw off the Spirit in an Alembick according to Art, separating the Oil, if any be found supernating.* The Spirit he Exhibits in any proper Vehicle. The Oil he mixes with Sugar and makes thereof an *Elæo-saccharum Cochleariæ*, which may be given in small Dose and in a proper Vehicle for the same purposes for which the Spirit is given, but they are only to be administred to people of a Cold and Moist Constitution; in a hot habit of Body, they will put all into a flame.

XIX. *The true way of making this simple Spirit.* *Take Leaves and Flowers of Garden Scurvy Grass, as much as you please, bruise them, and make them up into balls (like those of Woad, which Dyers use) or being Bruised, put it into an Earthen Jar, pressing it in; upon which affuse Strong Scurvy Grass Water, or rather, Scurvy Grass Wine, made of the Juice of Scurvy Grass, so much as may supernate four or five Inches: stop all with a Cork, and lute it firmly for three or four days; then put all into an Alembick with its Head and Worm, drawing off first the Spirit, and then the Water according to Art: which rectify in a Glass Cucurbit; so will the pure subtil and Volatile Spirit ascend first, which keep by it self in a Glass close Stopt.* The remaining Water you may draw off to dryness, to make fresh Spirit with all. The Dose of any of these are from 20, to 30, 40, or 50 Drops (as Circumstances and necessity may require) for the Cure of a Cold Scurvy, Palsie, Tremblings, Numbness of the Limbs, Lechargy, Cachexia, *&c.* having all the Virtues of the former *simple Spirit and Water* at *Sect.* XVI. *and* XVII. aforegoing.

XX. *The Purging Spirit.* Or *Golden Spirit of Scurvy Grass* so called. *Take of the best Spirit of Wine* 24 *Pounds: fresh Garden Scurvy Grass whilst in Flower, so much as may fill the Spirit: digest twelve hours, and then distill off the one half. With this Spirit and the Resin of Scammony or of Jalap (extracting the Tincture and filterating) you may prepare* Spiritum Cochleariæ purgantem, *the Purging Spirit of Scurvy Grass.* Or thus. *Take of some of the former Simple Spirit of Scurvy Grass* 4 *Pounds: Pouder of Scammony six Ounces; or in place thereof Pouder of Jalap* 9 *or* 10 *Ounces; digest in a warm sand only, or in a very gentle* Balneo, *in a large Bolt head, so long till you see the Tincture grow very Red, which decant and keep for use.* It is highly Antiscorbutick, Antiparalytick, Antilethargick, Splenetick, and Diaphoretick, making fixt and crude ihumors Volatile, and resisting putrifaction. It is profitable against Hypochondriack Melancholy, Rheumatism, Gout, and other Tartarous Diseases. It destroys Acidities and prevails against obstructions of Liver, Spleen, Reins and Womb, comforting and restoring those parts. It is not to be given to such as abound with Choler, or are of a hot Constitution, but only to gross bodys of a cold and moist habit, much abounding with humors. Dose 20, 30, or 40 Drops, or more, in the morning fasting, in Ale, Beer, or Wine, or some other proper Vehicle. Where Note, that in this latter prescription of the purging Spirit, we use the Drugs themselves, instead of their Extracts or Tinctures, which is much Cheaper, and full as well, considering the Spirit is fully strong enough, to extract the Tincture.

XXI. *The Ashes.* It is made of the Ashes according to the usual or common way. It enters into the Mass of Blood and *Lympha*, separates or cleanses them, makes them thin, pure, and Limpid, facilitates the Circulation, strengthens the Stomach, causes a good Appetite and Digestion, opens Obstructions of the Lungs, though obdurate, dissolves Tartar and Gravel in the Reins, and Bladder, and is excellent against the Scurvy, Cachexy, Dropsie, Palsie, Lethargy, Jaundice, and Gout, opens Obstructions of the Stomach, Liver, and Spleen, and is profitable against the most Vehement Colick, and other pains of the Bowels. Dose from 10 Grains to 20 or 30 in any proper Vehicle, morning and night.

CHAP. DCXXIX.

Of SELF-HEAL.

I. *THE Names.* This Plant was generally unknown to the *Ancient Greek* and *Latine* Authors; but our Modern writers call it *Prunella*, from the German Name *Brunella*, or *Brunel*, because it cures that Disease which the *Bruen*, which is an Inflamation [illegible] Throat, and Tongue, with [illegible] companied for the most part with [illegible] ver, common to Soldiers in Camps and [illegible] It is also called *Consolida minor*, and *Sanicula minor*; *Consolida minima Camerarii*, in English *Self-Heal.*

II. *The Kinds.* There are several Species of this Plant, but those which are to be found with us are these three, *viz.* 1. *Prunella Vulgaris Tragi*; *Brunella Brunfelsii*, *Dodonæi*, & *Lobelii*, Our common Self-Heal. 2. *Prunella Vulgaris flore albo*, Self Heal with a White Flower. 3 *Prunella laciniato folio Bauhini*, *Symphytum tetræum Lobelij*, Self-Heal with Jagged Leaves.

The Descriptions.

III. The first, or Our common Self-Heal. *Its Root consists of many Strings or Fibres running downwards; and spreading sideways under Ground, whereby it encreases. The small Stalk, with the the Leaves creeping upon the Ground shoot forth Fibres, which take hold of the Earth, by which means it is made a great Tuft in a little time. It is a small low creeping herb, having many small and something round yet pointed Leaves, somewhat like the Leaves of Wild Mint, of a dark green color, without any Dents on the Edges at all, or very seldom: from among which rise up divers square hairy Stalks, scarcely a foot high,* which

Self-Heal, or Prunella.

which ſpread ſometimes into Branches, with divers ſuch ſmall Leaves ſet thereon, up to the Tops, where ſtand brown ſpiked heads, of many ſmall browniſh Leaves like ſcales, and flowers ſet together, almoſt like the heads of Stæchas *or* Caſſidony, *which flowers are gaping and of a blewiſh purple, or more pale blew color, and in ſome places ſmelling ſweet, tho' not ſo in ſome others.*

IV. The ſecond, or Self-Heal with a White Flower. *This differs little or nothing from the former, neither in its Root, Stalk, Leaves, Branches, Flowers, Seeds, Magnitude, nor in its manner and form of growing, ſaving that in this the ſmall ſcales of Leaves are not brown, but green, the flower is of a pure white color; and it encreaſes or ſpreads not ſo much.*

V. The third, or jagged Leav'd Self-Heal. *The Root is long with many Fibres or Strings, and encreaſes by the ſhooting of its ſtrings, which put forth freſh Leaves every Year. The Stalks are likewiſe ſquare and hairy, as the Leaves are, which grow thereon, by couples at the Joints, the loweſt of which are long and whole, without any cut or jagg in them; all the reſt being longer and narrower, are cut in or jagged on the ſides. and the higher Leaves more divided or Cut. The heads are like thoſe of the firſt common ſort, and of the ſame form and magnitude, but varying in color as the former ſorts do; for ſome plants are found with purpliſh flowers, others more dilated, like blew, ſome between blew and white, like an Aſh color, and others all together White.*

VI. *The Places.* The firſt and ſecond are found in Woods and Fields every where almoſt throughout all *England.* The third grows naturally upon Rocks, Stoney Mountains and Gravelly Grounds, and is found alſo on many Hills and Mountainous Places in ſeveral Parts of *France* and *Germany.*

VII. *The Times.* The two firſt flower in *April, May, and June, Gerard* ſays, for the moſt part all the Summer long. The laſt, later than the other two, as moſt Mountain Herbs do, *viz.* in *June* and *July*, the Seeds of them all ripening in the mean ſeaſon.

VIII. *The Qualities.* Self-Heal is Temperate in reſpect to Heat or Coldneſs, Dryneſs or Moiſture, yet rather enclining to Dryneſs, Abſterſive, a little Aſtringent, and Traumatick or Vulnerary.

IX. *The Specification.* It cures Sore Mouths, and Throats, and the burning diſeaſe in the Throat at the Root of the Tongue, called *Prunella*; ſtops bleeding, and cleanſes and heals all ſorts of Wounds and Ulcers whether inward or outward.

X. *The Preparations.* You may make therefrom. 1. *A Juice or Eſſence of the Herb.* 2. *A Decoction in Wine or Water.* 3. *A Mixture.* 4. *An Ointment.* 5. *A Cataplaſm.*

The Virtues.

XI. *The Juice or Eſſence.* The Juice is good to heal that Soreneſs in the Throat or Root of the Tongue, called *Prunella*, by gargling the Mouth and Throat therewith, and ſwallowing ſome of the Decoction down; but becauſe there is a ſevere Inflamation in the Mouth and Throat, with a roughneſs, or ruggedneſs and blackneſs of the Tongue, and a hot burning Fever withall, they commonly bleed under the Tongue with the uſe of theſe means, without which the Cure is ſcarcely effected. It is good for inward Wounds and Bruiſes, diſſolves congealed Blood, and opens obſtructions of the Liver and Spleen. *The Eſſence*, has the ſame Virtues, ſtops Fluxes of Blood in any Wound or Part, and cleanſes whether inward or outward, and cauſes them to heal. Doſe of either 3 or 4 Spoonfuls, morning, noon, and night.

XII. *The Decoction in Wine or Water.* It is uſed as an Excellent Wound Drink; and is good to heal the *Prunella* in the Throat, and other Ulcers in the Mouth, Gums and Tongue, as alſo all Wounds inward or outward, being inwardly taken, and outwardly uſed as a Waſh or Gargle, or as an injection into hollow Ulcers and Fiſtula's, and ſo cauſes them ſpeedily to be healed; it cures inward Wounds, Pricks, or Stabbs into the Body or Bowels, opening the obſtructions of the *Viſcera*, and ſtrengthning the parts.

XIII. *The Mixture.* It is made, 1. *With the Juice or Eſſence mixt with Honey of Roſes.* This uſed as a Gargle, it cleanſes and heals all Sores and Ulcers, in the Mouth and Throat; and as a Waſh it heals Ulcers in the ſecret parts. 2. *Made with the Juice and Oil of Roſes*: it is good to anoint the Temples and Forehead with, to eaſe pain and Cure the Head-Ach, and ſtop defluxions into the Eyes. 3. *The Juice mixed with Wine Vinegar, and ſome of the Decoction*, it makes a good Gargle for a Sore Throat, Tongue, Mouth, and Gums; and eaſes all pains and Inflamations in thoſe parts.

XIV. *The Ointment.* It is good for all ſorts of Simple Contuſions, Hurts, Sores, Wounds, and Ulcers, in any part of the Body. It alſo helps to conſolidate broken Bones; and ſtrengthen and confirm ſuch as have been lately out of Joint, and newly reduced. It heals alſo Sores and Ulcers, in the Secret parts of Man or Woman.

XV. *The Cataplaſm.* It is made of the Green Leaves by beating in a Mortar. It cures Simple

ple Contuſions, Pains, Aches, Sore Ulcers, whether New or Old, repreſſes defluxions of humors, as alſo their heat and ſharpneſs, flowing to any part, abates the Inflamation, and prevents a Gangrene, whereby it preſently reſtores the parts to their Priſtine health.

CHAP. DCXXX.

Of SHEPHERDS NEEDLE.

OR,

VENUS COMB.

I. *THE Names.* It is called in Greek Σκάνδιξ, in Latine, *Scandix*, alſo and *Acus Veneris*, *Acus Paſtoris*, *Pecten Veneris*, *Acula*, and *Scanaria*: and in Engliſh, *Shepherds Needle* and *Venus Comb.*

II. *The Kinds.* There are ſeveral ſorts of this Plant, *viz.* 1. *Scandix Vulgaris*, *Pecten Veneris*, *Scanaria*, Our Common Shepherds Needle. 2. *Scandix Minor*, *Anthriſcus Plinij*, *Aniſomarathum Columnæ*, *Scandix Cretica Minor*, Small Shepherds Needle. 3. *Scandix Major*, *Scandix Cretica major.* The Greater Shepherds Needle. 4. *Scandix altera Capite Glomerato*, round headed Shepherds Needle.

The Deſcription.

III. The firſt, Or our Common Shepherds Needle. *Its Root is very ſmall and Fibrous or Thready. It riſes up with ſeveral long, hard, large, green Stalks of Leaves, much divided, and into more parts, and of a ſadder brown green color, than Chervil, having no ſmell. The Stalks grow a foot high, bearing ſmall Tufts of white Flowers, and after them five or ſix, more or leſs, of long Seeds, ſomething round, and pointed at the ends, a little rough as if they were dented, and all of them coming from one Head, or Umbel, with a few ſmall Leaves under them.*

IV. Gerard ſays, *its Root is white and of a fingers length; that it does not much differ in the Quantity of the Stalks, Leaves and Flowers, from Chervil, but has no ſuch pleaſant ſmell as*

Shepherds Needle or Venus Comb.

that has; the Leaves are leſſer, more finely cut, and of a brown green color. The Flowers grow at the tops of the Stalks in ſmall white Tufts; after which come up long Seeds very like unto Pack-Needles, and orderly ſet one by another like the great Teeth of a Comb, from whence come the Name Pecten Veneris, *Venus Comb, or Venus Needle.*

V. The ſecond, or ſmall Shepherds Needle. *Its Root is ſmall, long and white. It has ſeveral Stalks of very fine cut leaves, not buſhing thick like the former, but more ſparſed and thin, coming ſomething near to Camomil, but finer, and a little hairy, of a pleaſant ſmell and taſte; from among which riſe up ſlender ſhort Stalks, ſomewhat hairy or hoary, with but few Joints or Leaves on them, at the tops of which ſtand five or ſix ſmall white flowers cloſe ſet together, conſiſting of five Leaves apiece: in the middle whereof is a dark purpliſh ſtile or leaf longer than the reſt, ſpreading forth like a blazing ſtar; after which follow long Seeds, like the former, but ſmaller, bigger below, and ending above in two ſmall points, whoſe edges are more rough, and ſeem more dented, and are a little Purpliſh, as the young ones are, before they be ripe, which are the Seeds themſelves. This has been obſerved to have a better ſmell growing in void, untill'd and gravelly Ground, than that which grows in the fields.*

VI. Gerard, *deſcribes it thus. From a long, ſlender, and whitiſh Root, it ſends up many ſmall Leaves, like thoſe of the former, but of a pleaſing ſmell and taſte, ſomething like that of*

the Common Chervil. From amongst these Leaves, grow up slender Stalks, a little hairy, divided into short green and slender Branches, carrying at their Tops little Umbels of Flowers, consisting of four, six, seven, or eight small flowers, composed of five Leaves apiece, with a dark purple Chive in the middle; the flowers are succeeded by, or rather grow up, with long slender Cods, of about an Inch long, resembling those of the first kind. Clusius *says, it flowers in* June, *and that he received it from* Honorius Bellus *out of* Candy, *who writes that there, in the Spring time, it is much used in Sallets; and this Plant he takes to be* Anthriscus Plinij, *by which Name* Clusius *sets it forth; and* Columna *calls it* Anisomarathrum, *because its smell is between that of Anise and Fennel.*

VII. The third, or greater Shepherds Needle. *Its Root is long, small and fibrous. It has a Crested small Stalk a Cubit high, parted into divers Branches, a little hairy at the very joints, having its lower leaves broad, and somewhat round, divided much like to the lesser Burnet Saxifrage, one set opposite to another, standing upon long* Foot Stalks, *which together with the Leaves are a little hairy; but those which stand at the joints are much more finely cut in, and like unto the Leaves of the first described. The Umbels are a little spread, and small, yet greater than those of the first described; which are succeeded by a greater store of long, rough, dented and pointed Seed than the last described, having each of them two small Pricks at the end.*

VIII. The fourth, or round headed Shepherds Needle. *Its Root is like that of the Wild Parsnep, white and of a bitter and sharp taste. It has Stalks of larger Leaves than the Wild Carrot, coming something near to Parsly, smooth, and of a Pale Green Color. Those which grow at the joints of the stalks, come forth out of a broad Film or Skin, as it were, and as is seen in many Ferulous and Umbelliferous Plants, and bearing at the Top a round head, of many greenish white threads set close together.*

IX. *The Places.* The first grows plentifully almost every where in Corn-fields among Wheat and Barly, throughout all *England.* The other three grow wild in *Candy, Greece, France, Italy,* and *Spain,* but with us only in *Gardens.*

X. *The Times.* They flower in *May* and *June*; and the Seed is ripe in *July* and *August.*

XI. *The Qualities.* Shepherds Needle is sharp and bitter, and said to be hot and dry in the beginning of the third degree: Aperitive, Attractive, Diuretick, Hepatick, Stomatick, and Nephritick.

XII. *The Specification.* It opens obstructions of the Stomach, Liver, Reins, and Womb, cleansing those parts; and by its Attractive Virtue, draws forth Thorns, Pricks, Splinters, and other things sticking in the flesh.

XIII. *The Preparations.* You may make therefrom, 1. *A Liquid Juice or Essence.* 2. *A Decoction in Wine or Water.* 3. *A Pouder of the Seed.* 4. *A Sallet of the second kind.* 5. *A Cataplasm of the Root.*

The Virtues.

XIV. *The Liquid Juice or Essence.* They are good for the Stomach, Liver, Spleen, Bowels, Reins, Bladder, and Womb. They provoke Urine admirably, increase Seed and Lust, and free the *Viscera* from Obstructions, being profitable also against the Colick. Dose 3 or 4 Spoonfuls in a Glass of Generous Wine, or some other Vehicle.

XV. *The Decoction in Wine or Water.* It has the Virtues of the Juice or Essence; but being much weaker, must be given in a great deal larger quantity, as from a quarter of a Pint to half a Pint, morning and night, a little sweetned with white Sugar.

XVI. *The Pouder of the Seed.* It is astringent, stops Fluxes of the Bowels, and taken with Vinegar, it presently stops the Hiccough: and mixt with Hogs Lard and Sheeps Suet in equal Quantities, it is said to Cure Burnings with Fire.

XVII. *The Sallet of the second kind.* It breeds Seed, provokes Lust, and excites to Venery; yet is said to restore such persons as are spent therein, or weakned thereby: and by cleansing the Womb, opening its obstructions, and strengthening the seminal parts, it is said to cure Barrenness and cause Conception. And all these things do the Liquid Juice or Essence do, in a more admirable manner, being daily taken.

XVIII. *The Cataplasm of the Root.* It draws forth the fire in places burnt or scalded: and being applyed to parts having Thorns, Pricks, Splinters, or other like matters gotten into the flesh, it draws them forth.

CHAP. DCXXXI.

Of SHEPHERDS PURSE.

The Names.

I. THE *Names.* This Plant was unknown to the *Greeks*, at leastwise it has no *Greek* Name that we know of: but it is called in Latine, *Bursa Pastoris*, and *Pera Pastoris*; by *Castor Durantes*, *Herba Cancri*; and by *Gesner*, *Thlaspi fatuum:* and by us in English, *Shepherds Purse, and Shepherds Pouch*; and in the North parts of *England*, *Toy-wort*, *Pick-Purse, and Case-weed.*

II. *The Kinds.* We have growing with us, 1. *Bursa Pastoris major vulgaris*, Our greater common Shepherds Purse. 2. *Bursa Pastoris minor*, Our small Shepherds Purse. 3. *Bursa Pastoris major folijs non sinuatis*, Great Shepherds Purse with undented or whole Leaves.

The Descriptions.

III. The first, Or our Common Greater Shepherds Purse. *Its Root is small and white, with some Fibres annexed to it, and perishes after Seed time. It springs forth with several small and long Leaves, something deeply jagged or cut in*

in on both ſides, into ſeveral parts; of a Pale green color. From among which riſes up a ſmall round Stalk, parted into ſome Branches, having ſmaller and leſſer divided Leaves on them, and towards the Tops not divided at all. At the Tops or upper ends of the Stalks and Branches

Shepherds Purſe.

grow many white flowers one above another, almoſt in a ſpiked manner; after which follow whitiſh flat pouches or Seed Veſſels, ſmall at the Footſtalk, *and broad at the other end, almoſt like a* Triangular Purſe, *ſave that it is a little dented in on the middle, almoſt reſembling a Heart: theſe* Purſes *or* Pods *are parted like the* Thlaſpi; *in each ſide of which lies ſmall browniſh yellow* Seed. *There is no ſharpneſs in this Plant, and but a very little Heat in it, or in its Seed, tho' ſome Authors ſay, it has ſome little Acrimony; but it is certainly Aſtringent and drying.*

IV. The ſecond, Or our ſmaller Shepherds Purſe. *Its Root is like the former. It comes forth of the Ground like the Cuckow Flower, or Ladies Smocks, having ſmall Leaves, deeply jagged or indented about the Edges. From among which riſe up many ſmall tender Stalks with Flowers at the Tops, as it were chaff: The Pods or Caſes and Seed are like the former before deſcribed. It is in all things like to that, but that it is leſs in every part thereof. There is alſo* Burſa Paſtoris minor folio integro; *another ſmall one, which is in all things like the other, ſaving that there is no diviſions in the* Leaves.

V. The third, or great Shepherds Purſe with undented or whole Leaves. *It has a ſmall Root with Fibres adjoin'd to it like the firſt, from whence uſually riſes up one ſmall Stalk a Span long, Branched into two or three parts, whoſe lower Leaves are whole, without diviſion, having long Footſtalks to them; and theſe upon the Stalks, encompaſs them at the bottoms; the Flowers are ſmall; and the Pods or Seed Veſſels are like to thoſe firſt deſcribed.*

VI. *The Places.* The firſt and ſecond ſorts are found frequently in a great many places throughout the whole Kingdom; for the moſt part near Common High ways, in defert and untill'd places, and among Rubbiſh, and near Old Walls: The third grows not in *England* but only in *Gardens*.

VII. *The Times.* They Flouriſh, Flower, and Seed all the Summer long; and ſometimes they are ſo early that they Flower and Seed twice in the ſame Year.

VIII. *The Qualities. Dodonæus, Matthiolus, and Ruellius* ſay, that Shepherds Purſe is cold and dry: But *Lobel and Pena* hold them to be hot and dry, judging ſo from the taſte of the Seed, it having a little heat upon the tongue. Doubtleſs tho' *the Seed* may be hot and dry in the firſt degree; yet *the Plant* it ſelf is temperate in reſpect to heat or cold, and dry in the ſecond degree. It is Aſtringent, Incraſſating and Vulnerary.

IX. *The Specification.* It ſtops all ſorts of bleeding whether inward, as Spitting, Vomiting, Piſſing of Blood, or Overflowing of the Loches or Courſes in Women; or outward, as out of Wounds; and Cures all ſorts of Fluxes of the Belly of what kind ſoever. It cools and repreſſes Inflamations and *Anthonies* Fire; cleanſes mattering or running Ears, and heals Green Wounds, conglutinating or cloſing their Lips; and is an eſpecial thing for Wounds of the Head.

X. *The Preparations.* You may make therefrom. 1. *A Juice.* 2. *An Eſſence.* 3. *A Decoction.* 4. *A Syrup.* 5. *A Balſam or Ointment.* 6. *A Cataplaſm.*

The Virtues.

XI. *The Juice.* Dropt into Sore or running Ears, it drys and heals them. Drank to 3 or 4 Spoonfuls morning and night, either alone, or in ſome Styptick Red Wine, it ſtops all ſorts of inward Bleeding, as by the Mouth, Noſe, *Anus*, Bladder and Womb, and cures all ſorts of Fluxes of the Belly, as Cœliaca, Diarrhœa, Dyſenteria and Lienteria, as alſo the Fluxus Hepaticus. Bathed upon *Anthonies* Fire, or other Inflamations, it cools and repreſſes them.

XII. *The Eſſence.* It has all the former Virtues with advantage, and ſingular for healing the Bloody Flux, and Conglutinating the Lips of Green Wounds. And being mixed with a third part of Juice of Plantane, it powerfully ſuppreſſes, the overflowing of the Loches, as alſo of the Terms in Women. Doſe 3 or 4 Spoonfulls morning and night in a Glaſs of the Decoction made in Smiths Forge Water.

XIII. *The Decoction.* It may be made in Styptick Red Wine, or rather in Smiths Forge Water, adding after the Boiling a quarter part of the ſaid Styptick Red Wine. It has all the Virtues of the Juice and Eſſence, being taken morning and night, 6 or 8 Ounces at a time, either alone or ſweetned with the Syrup thereof: It is good alſo to heal inward Wounds, and Ruptures in Children.

XIV. *The Syrup.* It has the Virtues of the Juice, Effence and Decoction, but not ſo powerful as they; and is fit to be given to Children in all thoſe caſes; as alſo to ſweeten thoſe ſeveral preparations, to make them more palatable, and eaſie to be ſwallowed. It is made of the Clarified Juice, with its equal quantity of Clarified Honey or double refined Sugar, if it be not for long keeping; otherwiſe, it requires double quantity, *&c.*

XV. *The Balſam or Ointment.* They are Abſterſive, drying and healing; admirable for the Curing of ſimple Green Wounds, and that upon the ſpot, in what part of the Body ſoever: applyed alſo to parts overſtrained, or where there is any weakneſs, it ſtrengthens them, and reſtores them to their former ſtrength.

XVI. *The Cataplaſm.* Being laid upon *Anthonies* Fire, or other Inflamations, it cools, and repreſſes them, very much refreſhing the parts: Applyed (pretty hard bound on) to the Wriſts, and Soles of the Feet, it is ſaid to help the Yellow Jaundice; but how true this laſt is, I cannot tell, for I never tryed it. It is made of the Green Herb cut, and beaten in a Mortar.

CHAP. DCXXXII.

Of SHEPHERDS ROD.

I. *THE Names.* It has no known Greek Name: but is called in Latine, *Virga Paſtoris:* and in Engliſh, *Shepherds Rod*, or *Shepherds Staff.*

II. *The Kinds.* Authors account it to be a Species of the *Dipſacus Sylveſtris*, or Wild Teaſle: *Bauhinus* calls the *Dipſacus Sylveſtris*, or common Wild Teaſle, *Virgo Paſtoris Major*, and this, Our Shepherds Rod, *Virga Paſtoris minor*, which is thought to be the *Galedragon Plinij, Lib.* 27. *Cap.* 10. and the *Dipſacus fatuus Camerarij.*

The Deſcriptions.

III. It has a Root which is long, branched out, and furniſhed with ſeveral Fibres or Strings. *Its Leaves are large, dented about the Edges, and of a ſad green color; a little prickly on the back, but not ſo prickly as the Wild Teaſle. The Stalks grow higher but not with ſuch large Prickles, and the Leaves are ſet by Couples at the Joints, but not encompaſſing the Stalk ſo as to hold water, as the Teaſle does. The Stalk and ſeveral Branches bear at their Tops, ſmall heads, not much bigger than Wallnuts, with ſoft Prickles thereon, and bluſh colored Flowers, much like to thoſe of the Wild Teaſle. The Stalk cleared from its Prickles, Shepherds formerly made uſe of to hold in their hands to guide their Sheep withal, whence came the Name of* Virga Paſtoris, *or Shepherds Rod, or Staff.*

IV. *In* Gerard *it is deſcribed thus. It is a kind of Wild Teaſle, and accounted among the Thiſtles, but growing higher than that, but much like it, ſaving that its knobbed Leaves are no bigger than a Nutmeg. Its lower Leaves are deeply cut in with one Gaſh, on each ſide, at the bottom of the Leaf, which make them to have (as it were,) little Ears,*

Shepherds Rod.

which the Cutter has careleſsly omitted in the Figure. The Leaves alſo are leſs than thoſe of the Wild Teaſle, narrower at their ſetting on, and hold no water at the other does, the whole Plant in its form being leſs. But Bauhinus *ſays, it grows four or five Cubit high.*

V. *The Places.* It grows in many places thro' the Kingdom, which are moiſt, and in moiſt high ways; as in the high way leading from *Braintree* to *Hemmingham-Caſtle* in *Eſſex*; and here and there in the high way from *Much-Dunmore* to *London.* It has been found growing alſo in great plenty at *Edgecomb* by *Croydon*, in ſeveral Places thereabouts.

VI. *The Times.* It flowers for the moſt part in *July*, and the Seed is ripe in *Auguſt*, or not long after the flowering.

VII. *As to its Qualities, Specification, Preparations and Virtues.* Authors have ſaid nothing, yet it is ſuppoſed to have the ſame with thoſe of the Common Wild Teaſle. And the *Diſtilled water* thereof is commended to be drank after eating by Women who have a depraved Appetite.

CHAP DCXXXIII.

Of SKIRRET.

I. *THE Names.* It is called in Arabick, *Iſarum, & Seiſaron*; in Greek, Σίσαρον, in Latine, *Siſarum, & Siſer:* in Engliſh *Skirret.*

II. *The Kinds.* There are but two kinds generally taken notice of by Authors, *viz.* 1. Σίσαρον κή-

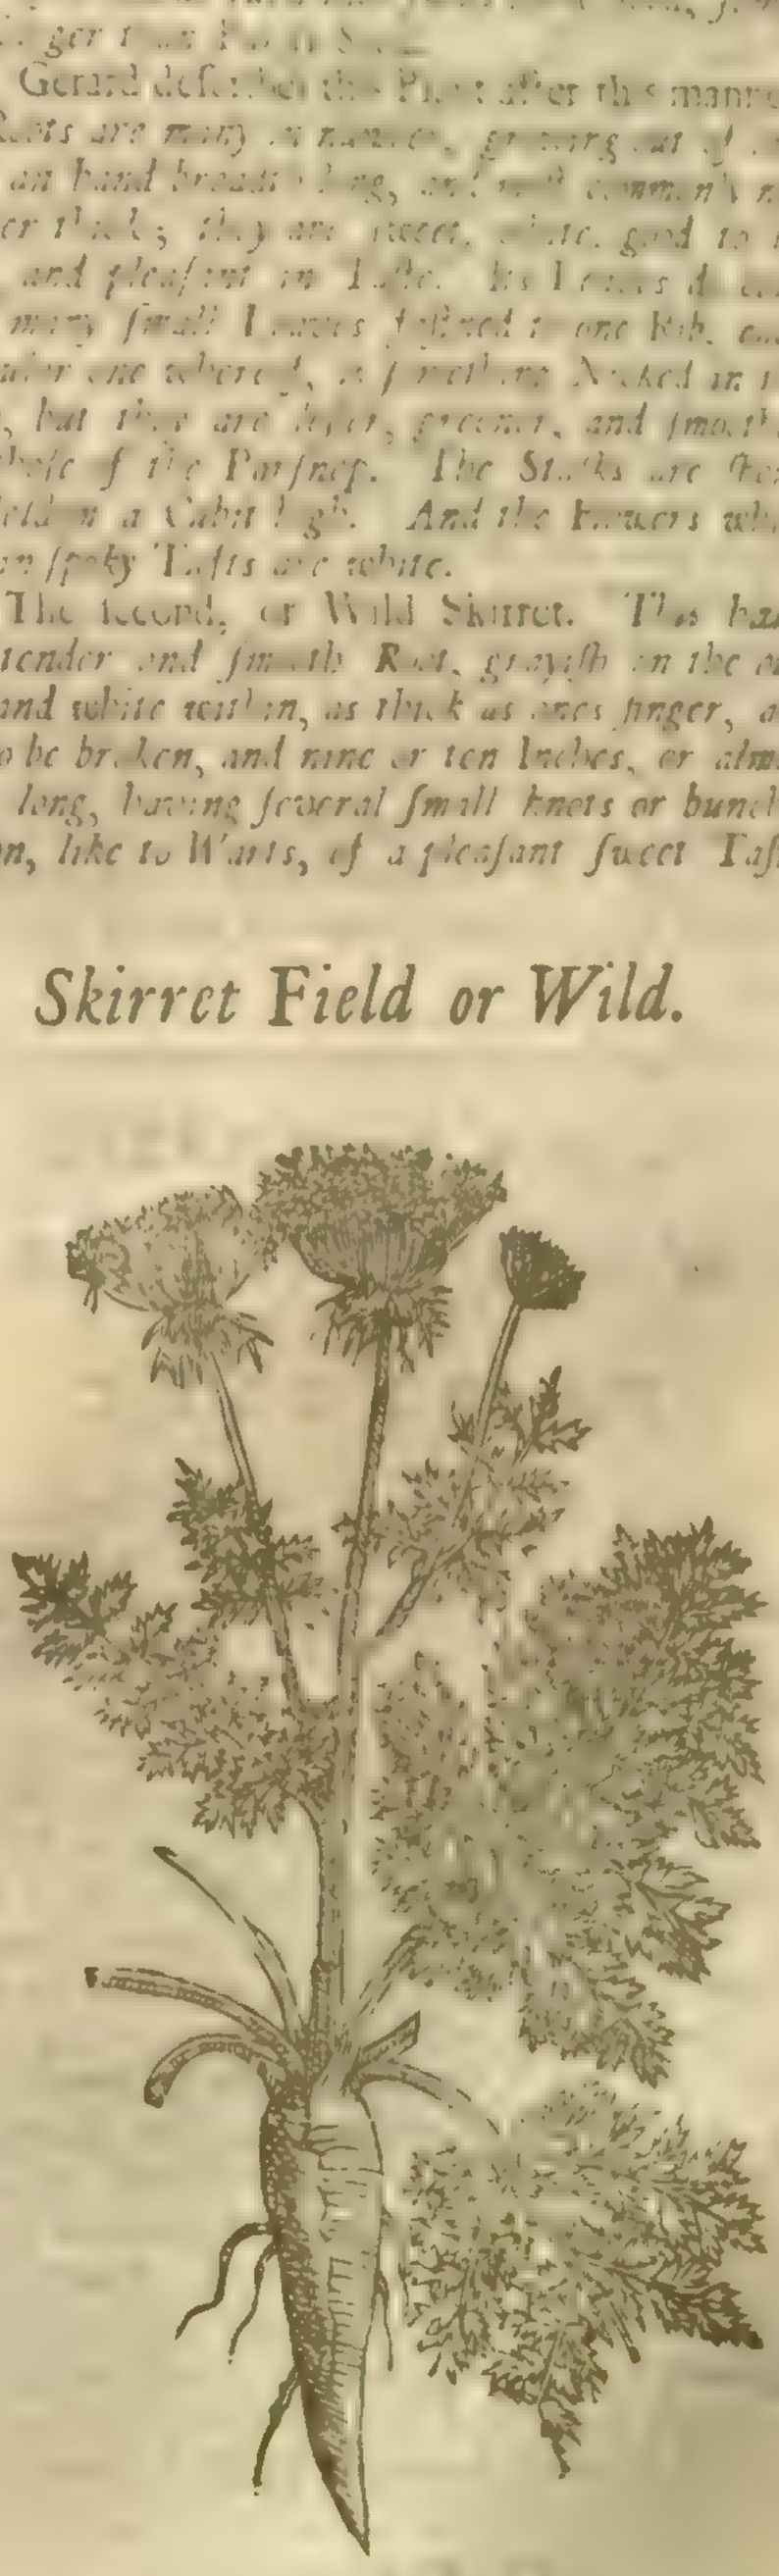
nariæ, *Sium Hortense*; *Sisarum Dodonæi*, *Lobelii*, & *Tragi*; *Sifer Camerarii*, *Cordi*, *Gesneri*, & *Matthioli*; *Sifer Germanicum Caſalpini*. Our Common Garden Skirret. *Tiberius* the Emperor was ſo in Love with this Root, that he ſent for it out of *Germany*, from *Gelduba*, a Caſtle or Place about the *Rhine*, as *Plin. Lib.* 18. *Cap.* 5. ſays, this *Emperor*, was ſo much taken with it, that he cauſed it to be brought to him every year out of *Germany*. *Columna* and ſome others took this plant to be the *Elaphoboſcum Dioſcoridis*, but they were deceived, for this Herb is neither Ferulous, nor has it Umbels of Yellow Flowers, nor Seed like the Parſnep; but it has white flowers, and Seed like *Parſly*. *Pliny* his *Siſer*, which is all one with the *Siſarum Dioſcoridis*, has a ſtrong tough ſtring, almoſt Woody, running through the middle of each Root, which is to be taken away after the boiling, that they may be eaten with the more pleaſure, which this *Our Common Skirret* has alſo, and which no other Root, that was then, or is now edible, has beſides, for which alone reaſon there is no doubt but this *Our Skirret* is the true *Siſer*, or *Siſarum* of the Ancients. 2. The other is called by the *Arabians*, as *Seraſie*, *Secacul*; in Greek Σισαρον ἄγριον, in Latine; *Siſarum Sylveſtre*; *Siſer alterum*, *Siſer Syriacum*; in Engliſh *Wild Skirret*, *and White Carrot*. *Rauwolfius* ſays that this grows in *Ægypt*, and is there called alſo *Secacul*, by the *Arabick* Name.

The Deſcriptions.

III. The Firſt, Or Our Common Skirret. *It has a Root which is compacted of ſeveral ſmall, long, round, white Roots, ſet together at one head, like to Aſphodil: bunched out or uneven in many places, and rugged, or as it were wrinkled withall, and not ſmooth, as divers other Roots are, each of which*

Skirret Garden.

Skirret Field or Wild.



like unto our Carrots. *From this Root riſe up many Stalks of Winged Leaves, much divided and cut into many parts, not very unlike to Carrot Leaves. The Stalks have alſo ſuch like Leaves at the joints, and Umbels of Flowers at the Tops, like unto them for form, but of a yellowiſh color.*

VI. *The Places.* The firſt grows at *Narbonne* in *France*, as *Lobel* ſays, but is ſown with us, almoſt every where in Gardens. *Parkinſon* ſays, that it is rather Sown than Planted; for Sown among *Onions*,

nions, the one will not hinder the Growth of the other; the *Onions* being ſtill drawn away, to make room for the *Skirrets*, that they may have their full growth againſt *Winter*. But *Gerard* ſays, they are Planted (in Gardens) by the Roots, for the greater and thicker ones being taken away, the leſſer are put into the Earth again, which is beſt to be done in *March* or *April*, before the Stalks come up. The ſecond grows Wild in *Ægypt*; but with us in Gardens.

VII. *The Times.* They Flower and Seed later than the *Parſnep*, *viz.* about the latter end of *July*, or beginning of *Auguſt*, and the Seed is ripe about the end of *Auguſt* or beginning of *September*. And the Roots are taken up to be eaten about the end of *February* and all *March*, and ſometimes in *April*.

VIII. *The Qualities*, Specifications, Preparations, Virtues, and Uſes, are altogether the ſame with thoſe of our Garden Parſneps in *Chap.* 544. to which you are referred, ſo that no more need be ſaid of them here.

IX. The *Wild Skirret* is more Phyſical having Aperitive, Attenuating, Inciding and Abſterſive Qualities. It reſiſts poiſon, is good againſt the Bitings of Vipers, expels Wind both in Stomach and Bowels, eaſes pains and ſtitches in the ſides, helps in the Colick, and provokes Urine. The Root is often uſed for the former purpoſes, but the Seed much more.

CHAP DCXXXIV.

Of SMALLAGE OR, *Water* PARSLY.

I. *THE Names.* It is called in Arabick, *Aſſilis*: in Greek Ἐλειοσέλαινον: in Latine *Paludapium*, *Apium*, *Apium Paluſtre*, *Apium Aquaticum*, *Apium Ruſticum*, *Elæoſelinum*; in Engliſh *Smallage*, or *Water Parſly*.

II. *The Kinds.* We make three ſeveral kinds thereof, tho' there are no more than two properly, viz. 1. *Apium*, *Apium Vulgare*, *Apium Paluſtre*, *Paludapium*, *Elæoſelinum Dodonæi*, & *Lobelij*; Our Common Smallage. 2. *Apium Hortenſe*, *Apium Criſpum*; this *Columna* will have to be *Apium Spontaneum*, which *Quatramius* calls *Geoſelinum*, and that it is only the firſt or *Common Smallage* altered by Tranſplanting. Our *Garden or Curled Smallage*, which being *whitned*, by laying the Stalks in Sand or Earth, is then called *Sallary*, as being then a Sallet Herb. 3. *Apium Dulce*, *Selinum Dulce*, Sweet Smallage. The Stalks of this being alſo laid in the Earth or Sand for ſome time, will become *White* as the former, and is then called likwiſe *Sallary* or *Sweet Sallary*.

The Deſcriptions.

III. The firſt, or Our Common Smallage. *Its Root is greater than that of Parſly, but not ſo long and ſlender, with a number of Fibres or Strings adjoining to it. It grows up with greater hollow, and more Creſted Stalks than Parſly, and greater and larger Winged Leaves, ſet one againſt another, broader, and of a darker green color, and ſhining more than Parſly, ſomewhat unevenly dented about the Edges. At the Tops of the Stalks ſtand large*

Smallage Common.

Tufts of ſmall White Flowers, which turn into Seed, very like, but ſmaller than Parſly Seed. *The whole Herb and Root is ſtrong in ſmell, and much more unpleaſant and bitter in Taſte than Garden Parſly, not well to be eaten alone, unleſs eaten as a Boiled Sallet.*

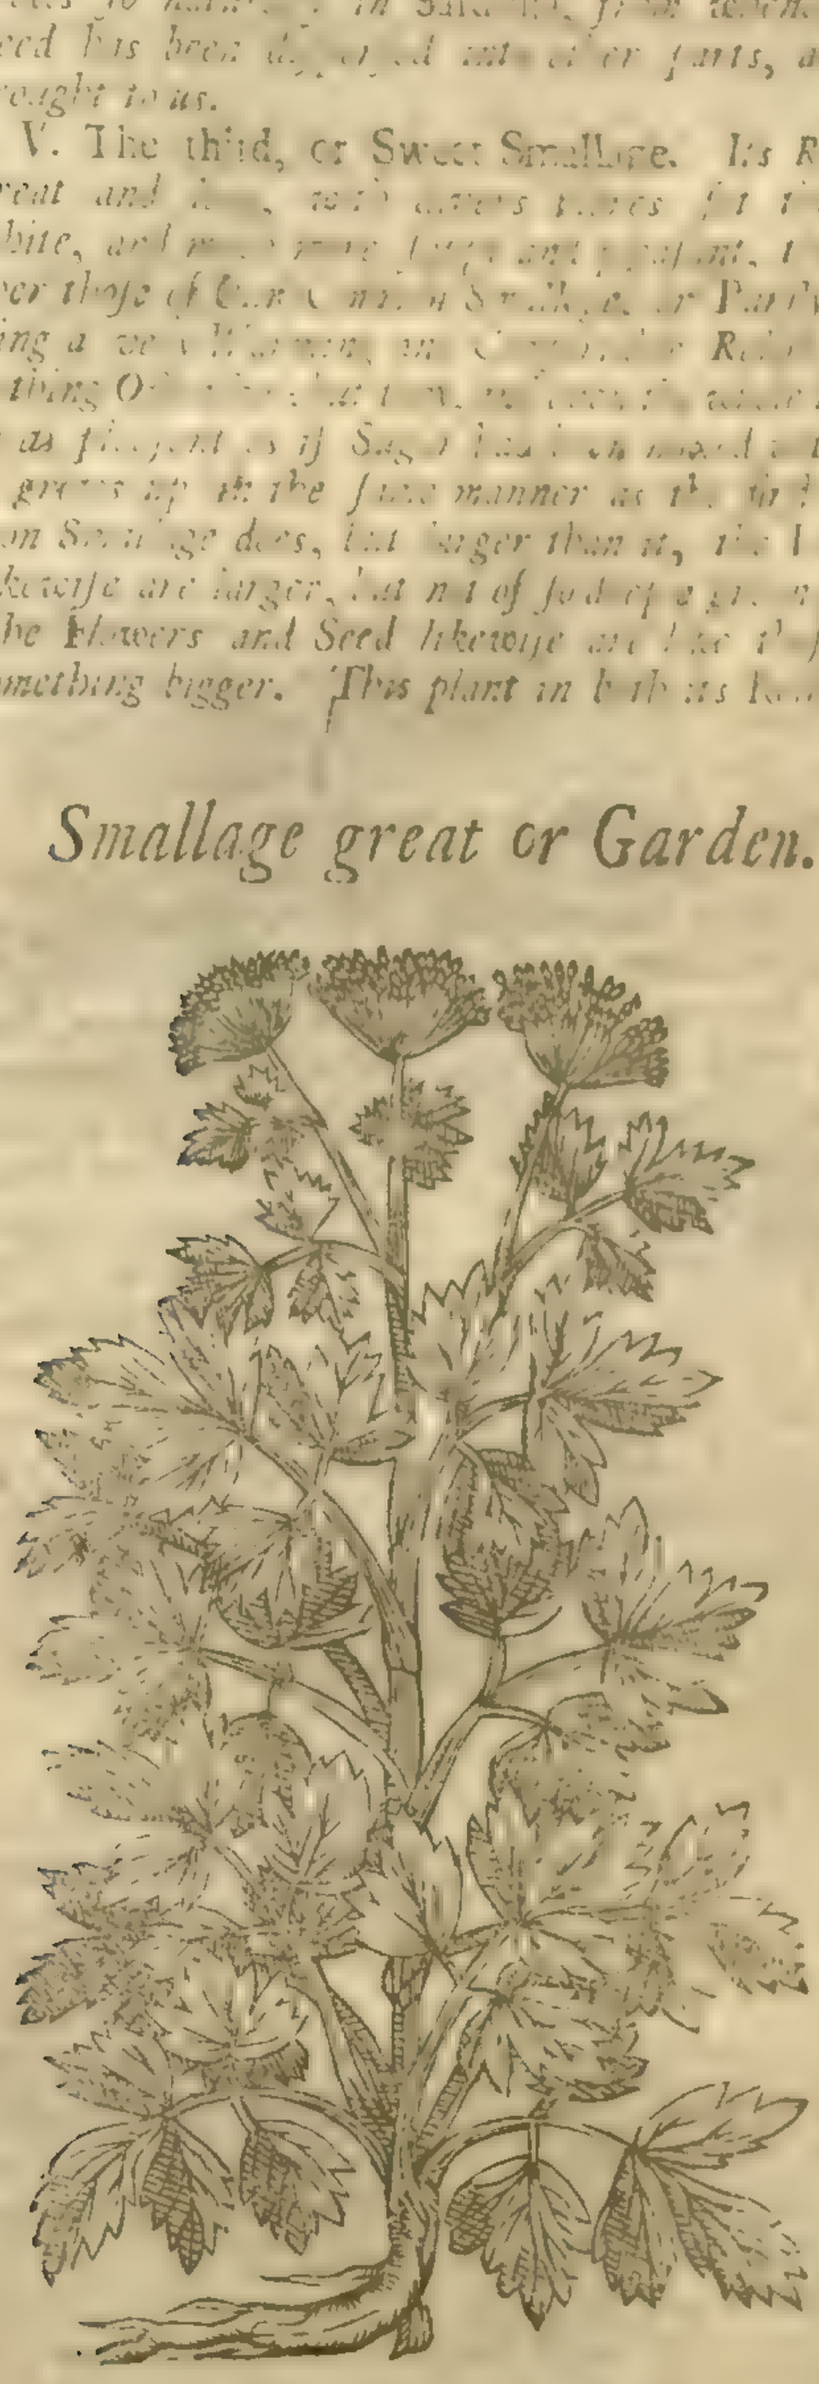
Smallage Curld.

IV. The

IV. The [illegible] Common Smallage, called Sellery. [illegible] *the former, having but the Leaves are of a greater green color, and cloathed a great way Corasted toward, which being [illegible] covered with Earth or Sand, become white and edible, and are [illegible] the Leaves of the former common kind, altered by transplanting out of that Moist Dirty [illegible] Parkinson is not [illegible] and [illegible] grows to naturally in* Sardinia, *from whence the Seed has been dispersed into other parts, and so brought to us.*

V. The third, or Sweet Smallage. *Its Root is great and long, with divers tuberous fibres, white, and more large and pleasant, than either those of the Common Smallage, or Parsly, having a very pleasant* Aromatick *Relish, and nothing Offensive but [illegible] of this sweet Herb, is as pleasant as if Sugar had been mixed with it: it grows up in the same manner as the first Common Smallage does, but larger than it, the Leaves likewise are larger, but not of so deep a green color. The Flowers and Seed likewise are like those but something bigger. This plant in both its Kinds or*

Smallage great or Garden.



Taste and form, has been found to hold, for the first or second year, from the Seed which has been Sown, coming from beyond Sea. But as Sweet Fennel *does degenerate, more and more when Sown in* England, *which always continues sweet whilst growing in its Native warm Countries: so is it with this* Sweet Smallage; *the Leaves also decay in their Verdure, and loose of their freshness, becoming more sullen or sad, like to those of our Common Smallage. If the Stalks of this be laid in the Ground, and covered with Earth or Sand as the former, they become white like them, and so are more pleasant to be eaten raw as a Sallet with Salt, Vinegar and Oil, and then it is called* Sallary *as the former.*

VI. *The Place.* The [illegible] grows in moist and wet Grounds, and by Ditches and Brooks sides, which are [illegible] but it Planted in Gardens will [illegible] and prosper well. The Second and third [illegible] being Natives of [illegible] Countries, but is found to grow also [illegible] both Herb and Root are [illegible] as a Sallet, even as [illegible] in *England*, in which places they are Sown, and replanted again.

VII. *The Time.* They [illegible] when the Garden *Parsly* does, and their Stalks come up the next year after they are Sown, and then they bring forth Flowers and Seed, which are ripe [illegible] and *August*.

VIII. *The Qualities.* Smallage is Hot and dry in the beginning of the [illegible] Aperitive, Attractive, Attractive, Concoctive, Digestive, Detersive, Diuretick, Incisive, Separative, Nephritick, Stomatick, Pectoral, Nephritick, Hysterick, Emmenagogick, Alexipharmick, and Spermatogenetick.

IX. *The Specifications.* Smallage opens all Obstructions of the Viscera, provokes Urine and the Terms, is good against Stone, Gravel and Strangury; it cleanses the Blood, and prevails against the Yellow Jaundice, Tertain and Quotan Agues, as also the Strangury, Sand, Gravel, Stone, or Tartarous Miscelage in Reins, Ureters or Bladder. It dissolves congelations of the humors, and thick Flegm, and powerfully provokes the Terms in Women [illegible] taken Morning and Night for several days together.

XII. *The Effence of the whole Plant.* It has all the former Vertues, and more powerful to the Intentions. It comforts and warms the old Stomach, expels Wind, gives ease in the Colick, and Gripings of the Guts proceeding from Cold, as also from acrimonious and sharp humors: mixt with Honey of Roses it cleanses old Ulcers in the Mouth and Throat, or in what other part of the Body soever. Dose 3, 4, or 5 Spoonfuls morning and night, in a Glass of White Port or *Lisbon* Wine.

XIII. *The Decoct. n of the whole Plant in Wine or Water.* It has all the Virtues of Juice and Effence, but much weaker, and therefore is to be given in a much larger Dose, as from a quarter of a Pint, to half a Pint, morning and evening.

XIV. *The Syrup.* It has the Virtues of the Juice and Effence, besides which, it is an excellent Pectoral, opening all obstructions of the Lungs, and easing Coughs, Colds, and pains in the Lungs and Stomach; it causes easie expectoration, and breath-

ing.

VI. *The Place.* The [illegible] grows in moist and wet Grounds, and by Ditches and Brooks sides, which are [illegible] but it Planted in Gardens will [illegible] and prosper well. The Second and third [illegible] being Natives of [illegible] Countries, but is found to grow also [illegible] both Herb and Root are [illegible] as a Sallet, even as [illegible] in *England*, in which places they are Sown, and replanted again.

VII. *The Time.* They [illegible] when the Garden *Parsly* does, and their Stalks come up the next year after they are Sown, and then they bring forth Flowers and Seed, which are ripe [illegible] and *August*.

VIII. *The Qualities.* Smallage is Hot and dry in the beginning of the [illegible] Aperitive, Attractive, Attractive, Concoctive, Digestive, Detersive, Diuretick, Incisive, Separative, Nephritick, Stomatick, Pectoral, Nephritick, Hysterick, Emmenagogick, Alexipharmick, and Spermatogenetick.

IX. *The Specifications.* Smallage opens all Obstructions of the Viscera, provokes Urine and the Terms, is good against Stone, Gravel and Strangury; it cleanses the Blood, and prevails against the Yellow Jaundice, Tertain and Quotan Agues, as also the Strangury, Sand, Gravel, Stone, or Tartarous Miscelage in Reins, Ureters or Bladder. It dissolves congelations of the humors, and thick Flegm, and powerfully provokes the Terms in Women [illegible] taken Morning and Night for several days together.

X. *The Preparations.* You may make therefrom. 1. *A Juice.* 2. *An Infusion.* 3. *A Decoction.* 4. *A Syrup.* 5. *A Mundificative.* 6. *A Gargle or Lotion. All these of the whole Plant, or of the Root.* 7. *A Powder of the Seed.* 8. *A Tincture of the Seed.* 9. *A Sallet of the Stalks and Roots.* 10. *A Cataplasm.* 11. *Unguentum ex Apio.*

The Virtues.

XI. *The Juice.* Taken to 2, 3, or 4 Ounces, in a Glass of White Wine, it opens all obstructions of the Stomach, Lungs, Womb, Reins and other *Viscera*, is very effectual against the Yellow Jaundice, Tertain and Quotan Agues, as also the Strangury, Sand, Gravel, Stone, or Tartarous Miscelage in Reins, Ureters or Bladder. It dissolves congelations of the humors, and thick Flegm, and powerfully provokes the Terms in Women [illegible] taken Morning and Night for several days together.

XII. *The Effence of the whole Plant.* It has all the former Vertues, and more powerful to the Intentions. It comforts and warms the old Stomach, expels Wind, gives ease in the Colick, and Gripings of the Guts proceeding from Cold, as also from acrimonious and sharp humors: mixt with Honey of Roses it cleanses old Ulcers in the Mouth and Throat, or in what other part of the Body soever. Dose 3, 4, or 5 Spoonfuls morning and night, in a Glass of White Port or *Lisbon* Wine.

XIII. *The Decoct. n of the whole Plant in Wine or Water.* It has all the Virtues of Juice and Effence, but much weaker, and therefore is to be given in a much larger Dose, as from a quarter of a Pint, to half a Pint, morning and evening.

XIV. *The Syrup.* It has the Virtues of the Juice and Effence, besides which, it is an excellent Pectoral, opening all obstructions of the Lungs, and easing Coughs, Colds, and pains in the Lungs and Stomach; it causes easie expectoration, and breathing.

ing, takes away hoarſneſs and ſhortneſs of breath, as alſo obſtructions of the Urine. If it is made of the Juice with Honey, it is admirable to cleanſe Ulcers, Cure the Jaundice, and Dropſy, by expelling the Water by Urine, and to provoke the Terms in Women. Doſe 4 or 6 Spoonfuls morning and night in a Glaſs of White *Lisbon* Wine, or in the Decoction of the Herb and Root in Wine.

XV. *The Mundificative. Take of the Juice 4 Ounces: Honey, or Honey of Roſes, 2 Ounces. Bean Flower 2 Ounces, mix them.* Or thus from *Aquapendens. Take Juice of Smallage 3 Ounces. Syrup of Roſes, or Mel Roſarum an Ounce: Turpentine half an Ounce: Meal or Flower or Barly and Lupins, ana, a ſufficient quantity, to bring all to a conſiſtence; mix them.* Theſe are excellent Abſterſives, and cleanſe old, running, fœtid, and foul or rotten Ulcers admirably, in what part of the Body ſoever. But if *Red Precipitate* in an eight part be added to it, it will be ſo much the more effectual in ſordid and putrid Ulcers. The firſt of theſe applyed, ſtops the weeping of hurt Nerves or Sinews, in ſimple Members which are not fat, or very fleſhy, and brings the ſame to perfect digeſtion.

XVI. *The Gargle or Lotion. Take of the Decoction eight Ounces: of the Juice 6 Ounces: Mel Roſarum 4 Ounces; mix them.* It Cures malignant Ulcers of the Throat, Tonſils, Mouth, and Gums, by gargling and waſhing them therewith ſeveral times a day: It heals exulcerated Cankers, and removes their Putrifaction. If to the former Quantity 2 *Ounces of Spirit of Wine* be added, it will be ſo much the more potent and healing.

XVII. *The Pouder of the Seed.* It has all the Virtues of *Parſly-Seed* but much more potent in every reſpect. It prevails againſt the Colick, Wind, Strangury, Sand, Gravel and Stone in Reins and Bladder, obſtructions of the Lungs, Wheezing, Hoarſneſs, Shortneſs of Breath, Stinking Breath, provokes Urine and the Courſes, and kills Worms in the Stomach and Belly. Doſe from half a Dram to a Dram mixt with Honey and ſo taken morning and night.

XVIII. *The Spirituous Tincture of the Seed.* It has all the former Virtues, but more Stomachical, and may be taken from 2 to 4 Drams, mixt with a Glaſs of the Decoction, dulcified with Syrup of Smallage.

XIX. *The Sallet of the Whited Stalks and Roots.* They are cut or ſliced and eaten with Salt, Vinegar and Oil, raw, they make a pleaſant Sallet, are grateful to the Palate and Taſte, ſtrengthen the Stomach, and cauſe a good Appetite and Digeſtion.

XX. *The Cataplaſm.* It is made by boiling the Bruiſed Leaves and Roots in Hogs-Lard. Applyed warm, it is diſcuſſive, takes away the Pain of Fellons and Whitloes in the Fingers; and Ripens and heals them.

XXI. *Unguentum ex Apio.* Ointment of Smallage. *Take Juice of Smallage a Pint: Honey 9 Ounces: Wheat Meal or Flower 3 Ounces: mix and make an Ointment by Boiling to a juſt Thickneſs according to Art.* It is an admirable and gentle cleanſer of Wounds and Ulcers: opens obſtructions of Liver and Spleen, applyed to the Hypochonders; provokes Urine anointed on the Regions of the Kidnies and Share; is good againſt the Colick, anointed on the Belly; and helps the Stuffing of the Lungs applyed to the Breſt.

CHAP. DCXXXV.

Of SNAP-DRAGON, *OR,* CALVES SNOUT.

I. *THE Names.* It is called in Greek Ἀντίῤῥινον: in Latine, *Antirrhinum*, alſo *Orontium, Os Leonis, Herba Simiania, Leo herba, Venuſta minor, Opalis grata*, and *Canis Cerebrum Apuleij*; in Engliſh, *Snap Dragon*, or *Calves Snout.*

II. *The Kinds.* There are ſeveral ſorts thereof, as 1. *Antirrhinum album*, White Snap Dragon. 2. *Antirrhinum purpureum ſive Roſeum*, Purple Snap Dragon. 3. *Antirrhinum Variegatum*, Variable Snap Dragon. 4. *Antirrhinum Luteum*, Yellow Snap-dragon: theſe four are all of the large Garden kind, the following are of the ſmaller ſorts, called the wild kinds. 5. *Antirrhinum Sylveſtre medium vel majus*, The Greater Wild Snap Dragon. 6. *Antirrhinum rubrum Bæticum*, Small Red Spaniſh Snap Dragon. 7. *Antirrhinum flore albo alterum*, Small White Flower'd Snap Dragon. 8. *Antirrhinum Sylveſtre minus*, The leſſer Wild Snap Dragon.

The Deſcriptions.

III. The firſt, or White Snap Dragon. *Under this Deſcription We ſhall comprehend in the main, the firſt four Garden kinds. Its Root conſiſts of many White Strings, which periſh in moſt places after they have given Seed, unleſs they be carefully defended in the Winter againſt the Cold. The Leaves of theſe Snap Dragons are broader, longer, and greener, than the Leaves of the Manured Flax, or of the Wild Flax, and are ſet confuſedly upon the tender Green Branches, which are ſpread on all ſides from the very bottom, bearing at the Tops many Flowers, ſomewhat reſembling thoſe of Toad Flax, but much larger, and without any heel or Spur, of a fair white color, with a Yellow Spot in the Mouth, or Gaping place. After the Flowers are paſt, in their places come hard round Seed Veſſels, faſhion'd ſomewhat like unto a Calves head, the Snout being cut off, wherein is contained ſmall black Seed.*

IV. The ſecond, or Purple Snap Dragon. *This is in Stalks, Leaves, and Flowers altogether like the former, and as large and great in every part or greater; the only difference is, that this bears pale Stammel, or Roſe colored Flowers, with a Yellow Spot in the Mouth, and ſometimes of a Paler color, almoſt Bluſh.*

V. The

V. The third, or Variable Snap Dragon. *The Roots in this are smaller than either of the former, and also perish after Seeding time. This Plant is something less than the former, and renderer than the last described, having also a Reddish or Blush colored flower, lesser than the former, but much bigger than the middle kind described in* Sect. VII. *following. The Yellow Spot in the Mouth of the flower, has some white about it, and extending to both sides of the Spot; and their Heads and Seeds are like the former.*

VI. The fourth, or Yellow Snap Dragon. *It is like in form to the former kinds, and has Leaves as large as any of them, and very fair yellow flowers as large likewise as they, not differing in*

Snap Dragon White and Yellow.

any thing else from the first described. Let none imagine this to be a Linaria *or* Toad Flax, *for in all its parts it is agreeable to the* Snap Dragons.

VII. The fifth, the middle kind, or Greater Wild Snap Dragon. *Its Root is small, and perishing every year, springing up again from the falling Seed. This greater wild kind rises up usually, but with one Stalk, branching forth on all sides into some other, on which are set long, and somewhat narrow thick dark green Leaves by couples; at the Tops of the Stalks and branches stand (in several places) reddish purple gaping flowers, in shape like those of the Garden kinds, but far less, and without any white color therein, after which come such like heads, like Calves Snouts, as in the other, but not half so big, wherein is contained very small and brown Seed.*

Snap Dragon Wild greater.

VIII. The sixth, or small Red Spanish Snap Dragon. *The Flower of this is much more Beautiful, being of a bright Crimson color, the Mouth or Chaps being of a yellowish White, much like to some of the Garden kinds, but more lively for its color.*

IX. The seventh, or small White Flowered Snap Dragon. *This differs very little from the*

Snap Dragon white flower'd wild.

fifth and ſixth kinds, ſaving, that it ſpreads abroad a little more than they, and that its flowers are of a pleaſant Milk White Color.

X. The eight, or leſſer Wild Snap Dragon. *The Middle or greater kind we have deſcribed at* Sect. VII. *above: this leſſer ſort grows lower by one half, yet Buſhes out thicker with Branches, having long narrow Leaves not half ſo great,*

Snap Dragon Wild leſſer.

flowers ſmall alſo and whitiſh, and the Seed ſmall and blacker than the Seed of that. Its Root likewiſe periſhes after Seed time, and the Plant is raiſed the next year again of the Seed.

XI. *The Places.* The firſt four are called the Garden kinds: the latter four, the Field or Wild kinds; altho' they all grow Wild in *Spain*, *Italy*, and other *hot Regions*: but with us they all of them grow only in Gardens, the firſt four of which are chiefly ſet by.

XII. *The Times.* The firſt four flower for the moſt part the ſecond year after Sowing, from *April*, even to *July*, and the Seed is ripe not long after. The *Wild* flower alſo much about the ſame times, thro' *June and July* even to the end of *Auguſt*. All theſe ſeveral ſorts of this Plant, if they be once Sown in Gardens, they will grow continually there of their own accord, if they be ſuffer'd to ſhed their Seed.

XIII. *The Qualities, Specification, Virtues and Uſes* of theſe Plants are as yet unknown in the Art of Phyſick: But *Matthiolus* ſays, that given (I ſuppoſe he means their Juice) mixed with Roſe-water; or the Pouder of the Seed; in like manner, they are good againſt Fits of the Mother. And *Apuleius* ſays, that the Diſtilled Water or Decoction of the Herb and Root in Water, is a ſpeedy remedy againſt the Rheum or Watering of the Eyes coming of a Hot Cauſe, by waſhing them therewith, and bathing the Forehead, Temples and Eye-Brows with the ſame.

CHAP. DCXXXVI.

Of SNEES-WORT.

I. *THE Names.* It is called in Greek, Πταρμικη, in Latine, *Ptarmica*, *Ptarmica Sylveſtris*, and *Sternutamentoria*: in Engliſh, *Snees-wort.*

II. *The Kinds.* There are ſeveral ſorts hereof, as, 1. *Ptarmica agreſtis vel ſylveſtris*, *Sternutamentoria Sylveſtris.* Wild or Common Snees-wort. 2. *Ptarmica Sylveſtris flore pleno.* Snees-wort with Double Flowers. 3. *Ptarmica auſtriaca Cluſij.* Snees-wort of Auſtria. 4. *Ptarmica Imperati*, *Ptarmica minor.* Spaniſh or Naples Snees-wort.

The Deſcriptions.

III. The firſt, or Wild or Common Snees-wort. *Its Root is tender, and full of Strings, creeping far about in the Earth; and in no long time takes up much Ground. It ſprings up for the moſt part with but one Stalk, which is repleniſhed with many round and brittle Branches, beſet with long and narrow Leaves, dented about the Edges like a Saw. At the Tops of the Stalks do grow*

Snees-wort Wild Common.

ſmall

small single flowers, like those of the Wild Daisy. The whole Plant is sharp, biting the Tongue and Mouth. And the smell thereof provokes Sneesing, from whence it took its Name Sternutamentoria, *or Snees wort.*

IV. The second, or Snees-wort with double flowers. *Its Roots are many long strings, running here and there in the Ground. It has straight and slender Stalks, beset with long and narrow leaves, snipt round about the edges in all respects like to the former single Wild Kind, which grows common with us almost every where: on the Tops of the Stalks grow four, five, or more white flowers, one above another, with a green leaf at the Bottom of the footstalk of every one of them; being small, thick, and very double, with a little yellowishness in the middle of every flower, like both for form and color to the flower of the Double Feverfew, but smaller. This Plant has no smell at all, but is delightful only for the double white flowers.*

V. The third, or Snees-wort of Austria. *Its Root is hard and black, with some fibres adjoining to it, perishing every year. It sends forth many Leaves, lying upon the Ground, being soft and smooth, somewhat long and narrow, green on the upper side, and hoary underneath, of a little sowre relish or Taste. From among which rises up an hoary Stalk, about two feet high or better, having divers such like Leaves thereon, but lesser, spreading out into some few slender Branches, with every one for the most part, a small scaly white Silver head on them; from whence spring forth about twelve or fourteen hard, and small long pointed leaves, as a border or Pale, about a number of small short Thrums in the Middle, almost like, or as if they were made of Parchment; whitish at the first appearing; but afterwards being come to their maturity, of a most fair bleak blewish purple color, without any smell to commend it; pleasant only by the Prospect of its form and color, and by its Durability; for being gathered in its perfection, it withers not, or looses its color in a long time; but keeps the same hue and aspect without changing, for many years together, being put into a Paper Book: otherwise being let stand upon the Stalks, they become something brownish, having many small blackish long Seeds, lying among a great deal of White Down.*

VI. The fourth, or small Spanish or Naples Snees-wort. *Its Root is like the former, but smaller, and perishes in the same manner every year. It has such like long and narrow soft hoary Leaves, but not full out so large as the former: the Stalk rises not so high, but is divided into more, and more slender hard Branches: at the Tops whereof stand such like Scaly heads, but not so white or Silver like, from whence shoot forth such like stiff hard Leaves, as the Border or Pale, but neither so large nor so many, being seldom above* 8 *or* 10: *neither are they of so fair a blewish purple color, but of a more pale diluted color, having many Thrums in the Middle. The Seed which follows is like the last aforegoing, but smaller. This Plant being a little handled or rubbed between ones fingers, gives forth a pretty sweet smell, or what is not unpleasant.*

VII. *This last in* Gerard, *is thus described. The Root is small, whitish, hard and threddy, perishing when the Seed is ripe; soon springing up again by the fall of the Seed. It rises up with a small, hard, tough, corner'd, whitish woody Stalk, divided into many branches, and those again divided into other branches like those of Cyanus, or blew bottle, about two feet high, on which grow long, narrow, whitish Gray leaves, without order, and of a bitter Taste; rougher below than above, of the color of Wormwood leaves, having but one Rib or Sinew, and that in the middle of the leaf, and commonly turn downwards: on the Top of each slender Branch, grows one small Scaly head or knobb like that of Cyanus, which brings forth a pale Purple flower, without smell, containing six, seven, eight, or more, small, hard, dry, sharp pointed leaves: in the middle of which grows many Stiff Chives, their Tops being of the Color of the flowers, which flowers fall not away, till the whole Herb perishes, but change into a Rusty color. Among these Chives grow long, flat, blackish Seed, with a little beard at the Top. It remains green all the Winter, and the next spring sends forth a Stalk as aforesaid. The Herb being touched or rubbed, sends forth a pleasant Aromatick smell.*

VIII. *The Places.* The first grows Wild in dry and barren Pastures and other places: and has been found in the three great Fields next adjoining to *Kentish-Town* near *London*, and in several fields in *Kent* about *Southfleet*. It is also brought into Gardens in many places. The second grows here in Gardens. The third grows, as *Matthiolus* says, in *Italy*; *Clusius* found it in *Austria*; it has been found growing also in *Hungary*, and as *Lobel* says in *France*. The fourth grows in *Spain* and *Naples*, from whence the Seed has been brought to us, these two last grow with us only in Gardens.

IX. *The Times.* They flower in the end of *June*, and in *July* and *August*, and the Seed is ripe in some little time after, as in *August* or *September*.

X. *The Qualities, Specification, Preparations, Virtues and Uses* of the first and second Species we have declared at large in *Chap.* 552. aforegoing, under the Title of Pellitory of Spain, Wild: so that we shall say nothing more of them in this place.

XI. The two latter, *Parkinson* says have not been much used in Physick, but *Clusius* says, that about *Vienna* in *Austria*, the People sell it to the Apothecaries for *Scabious*; and that the *Decoction of them*, given to Children, is very good to ease them of pains and Torments in the Stomach and Bowels: and some Authors think, that it may have some of the Properties of *Scabious*, or of *Jacea* at least, because it so near approaches to them both in its form and Temperature.

CHAP DCXXXVII.

Of SOLOMONS-SEAL.

I. THE *Names.* It is called in Greek, Πολυγόνατον: in Latine, *Polygonatum* (*à Radicis geniculorum frequentibus nodis*, from the many Nodes or Knots in the Roots;) of some *Scala Cœli*, Heavens Ladder, from the form of the Stalks of Leaves, being set one above another: also *Sigillum Solomonis*; in English, Solomons Seal,

from the White Knobs in ſome places of the Root, with a flat round Circle, repreſenting a Seal, whence came this Name.

II. *The Kinds.* Authors have made a dozen ſeveral ſorts or more, but we ſhall content our ſelves, with what grows in Our Own Nation, or in *Our Weſt-India* Plantations in *America.* viz. 1. *Poligonatum Vulgare*, by ſome *Polygonatum latifolium*, by others *majus*; and by many *Sigillum Solomonis*, Our Common Solomon Seal. 2. *Polygonatum Majus flore majore*, *Polygonatum latifolium ſecundum Cluſij*, The Greater flowered, or ſweet ſmelling Solomons Seal. 3. *Polygonatum, Virginianum*, Solomons Seal of Virginia. 4. *Polygonatum racemoſum Americanum*, Cluſter like Solomons Seal. 5. *Polygonatum Racemoſum perfoliatum Americanum majus & minus.* Throleav'd Solomons Seal of America greater and leſſer.

The Deſcriptions.

III. The firſt, or Our Common Solomons Seal. *The Root is of the thickneſs of a Mans Finger or Thumb, white and knobbed in ſome places, with a flat round Circle, repreſenting a Seal, lying along under the upper face of the Ground, and not growing downwards, but with*

Solomons Seal Common.

many Fibres underneath. It riſes up with a round Stalk, about half a yard high, bowing or bending down the Top, ſet with ſingle leaves one above another, which are ſomething large, and like unto the Leaves of Lilly Convally, and of the ſame color, viz. *with an Eye of blewiſhneſs upon the Green, but more yellowiſh underneath, with ſome Ribs running through them. At the foot of every Leaf almoſt, from the bottom of the Stalk up to the Top, come forth ſmall, long, white, and hollow pendulous flowers, ſomething like the Flowers of Lilly-Convally, but ending in five longer Points, for the moſt part two together, at the end of a long foot Stalk, and ſometimes but one, and ſometimes alſo, two Stalks with Flowers at the foot of a Leaf, which have no ſmell at all, and ſtand all on the one ſide of the Stalk. After they are paſt, come in their places, ſmall round berrics, green at the firſt, and blackiſh green, tending to blewneſs, when they are ripe; in which lye ſmall, white, hard, and ſtony Seed.* Camerarius *in his Epitome ſays, (citing* Matthiolus *as his Author) that it is ſometimes found with red Berries, and alſo with Purple. Theſe Berries being ripe are of the bigneſs of Ivy Berries, of a very ſweet and pleaſant Taſte. The Root alſo is ſweet at the firſt taſting, but afterwards of a bitter Taſte with ſome ſharpneſs.*

IV. The ſecond, or greater flower'd, or ſweet ſmelling Solomons Seal. *The Root if this is exactly like the former, but larger if it grows in good Ground, otherwiſe leſſer. The Stalks are ſhorter, not much above a foot high, and ſomewhat flatter. The Leaves are flatter, and rounder pointed, ſet on one ſide of the Leaf, as the*

Solomons Seal greater Flower'd.

the former, but ſtand cloſe together. The Flowers are larger than the aforegoing (but by a Fault of the Cutter, in this Figure they are made leſſer) of a greeniſh white color, ſmelling ſweet like thoſe of the Haw-thorn, ariſing from the boſoms of the Leaves, upon ſhort foot Stalks, which being paſt, Seeds or Berries follow, which are firſt Green, but afterwards black, containing within a ſmall

small Seed, as big as a Vetch or Tare, and as hard as a Stone.

V. The third, or Solomons Seal of Virginia. *The Root of this is slender, long and Creeping, like as many others of the Virginia Plants, and not Tuberous as the former are. It rises up with a Stalk or Stalks, a foot or more high, with Leaves of the same fashion, long, Narrow, very green and shining, standing one above another upon a single upright Stalk, which is sometimes a little branched. These leaves are not of so sad a green as the other, nor discolored underneath; at the very Top of the Stalk come forth the flowers, and many of them grow together, which are whiter and smaller, and hang so long and Pendulous, ending in small fine pointed Leaves. After which come the Berries, which in this are smaller than any of the former, and of a most Orient Red, or Scarlet color (which some by a mistake formerly took for Cromes Berries, but were in truth no such thing, these not being fit to dye withal) which while they are white, and before they are ripe, have six black Streaks on every of them, equally distant, but are quite worn out being ripe; within which are contained, white, hard, Stony grains or Seeds, like those of the others.*

VI. The fourth, or Cluster-like Solomons-Seal. *Its Root is thick, white, Tuberous, long, and jointed, as it were by distances, with several Fibres thereon. It shoots up a round brownish single Stalk, and sometimes parted or branched, about 2 or 3 feet high, set with many fair, broad Leaves, some ribs being of a reddish, others of a sad green color, harder than others, and compassed about the edges with a rougher and darker List. At the Tops of the Branches, grow in open Clusters, many small pale colored Threds, like unto Vine Blossoms, which passing away, there succeed several small Berries, in form almost of a Cluster of Grapes, and each of the largeness of a Juniper Berry, yellowish before they be ripe, and finely spotted with blood speckles, which after they have hung so long to be ripe, wear out, and the whole Berry grows red like a Cherry, whose Pulp or Juice is sweet, and contain within them small white roundish Grains or Seed.*

VII. The fifth, or Thro-leaved Solomons Seal of America, the greater kind. *Its Root is nothing so thick or white, as the last described, but is fastned by many strings into the Earth. It has a slender smooth Stalk or two, about half a foot high or more, parted about the middle into two branches, and each of them again into others, having fair, broad and long, and very pale green ribbed Leaves, encompassing the Stalk wholly at the bottom; at each of which joints, with the Leaves, and at the Tops, also stand the flowers singly, composed of six long and narrow yellow Leaves hanging downwards, in the middle whereof is a crooked head or horn, compassed with six yellow heads or Chives, when the flower, is past the foot Stalk thereof rises up, bearing that Crooked or horned, three cornered skinny Cod on the end, having whitish Seed within it. The lesser sort is in all things and respects like to the greater, but every ways lesser, the Leaves being not only smaller but much narrower also.*

VIII. *The Places.* The first grows Wild frequently in many places of *England*, as on the North side of *Mendip* in the Parish of *Shepton-Mallet*, in *Somersetshire*; upon a Row Hill by *Crayford in Kent*, in *Odiam Park* in *Hampshire*, in *Bradford Wood* near a Town four Miles from *Bath*, in *Wiltshire*, in a Village near *Devizes* five Miles from *Cranford in Surrey*, in a Wood by *Enfield*, two Miles from *Canterbury*, in a Bushy Hedge belonging to the Parsonage at *Adesham* near *Canterbury*, two Miles from *Sittingbury*, and in *Copsewood* in *Chesthill*, between *Newington* and *Sittingbury in Kent*, as also in several other places. The second grows Wild in *Our Gardens*; and I found it still growing in *Canaan*. The other three, grow in several places in *America*, but with us only in Gardens.

IX. *The Times.* They all spring up in *March*, and the first flowers in *May*; the other *American* kinds in *June* and *July*, the Berries are ripe in *September*, and continue on the Stalks till the Frosts come, and then they fall down with the Stalks, which rot and perish with all above Ground, the Root abiding all Winter, and shooting forth a new every year.

X. *The Qualities.* *Solomons Seal* is temperate in respect to heat or cold, but dry in the second degree. It is Astringent, and as *Galen* says, of a mixt property, being partly binding, and partly of a sharp and biting quality, with a little bitterness, which properties we perceive not in those which grow in Our Gardens.

XI. *The Specification.* The Root is chiefly used and that principally, of the first kind. It heals Ruptures and broken Bones, stops Flixes of the Belly, the Reds and Whites in Women, and running of the Reins in Men, as also Vomitings, Bleedings, and defluxions of humors upon any part; and is very available to heal simple Green Wounds, running Sores, and other like Hurts whether outward or inward.

XII. *The Preparations.* You may have therefrom. 1. *A Juice or Essence of the Root and Herb.* 2. *A Decoction of the Root in Wine or Water.* 3. *An Infusion of the Root in Wine.* 4. *A Pouder of the Root.* 5. *An Ointment or Ballsam of the Root.* 6. *A Cataplasm of the Root.* 7. *An Apophlegmatism of the Root.* 8. *A Distilled Water.* 9. *A Spirituous Tincture.*

The Virtues.

XIII. *The Juice or Essence.* A Spoonful of either of them, or something more, taken at a time morning and evening in a Glass of Styptick Red Wine, or in Smiths Forge Water; is said to Cure Ruptures when the Guts fall into the Cods, a Cataplasm of the Root being applyed outwardly to the same. They are also available, to cure the over-flowing of the Terms and Whites in Women, and a Gonorrhœa in Men, and incomparably good to knit and conglutinate broken bones inwardly taken: outwardly applied being made into a Cataplasm with Rye or Wheat Meal. They dry up and conglutinate the lips of Green Wounds, and stop the flux of humors upon Ulcers, they being washed and cleansed therewith. Snuffit up the Nostrils, they are said to draw flegm out of the head, and so ease the pain thereof.

XIV. *The Decoction in Wine or Water.* It has all the former Virtues; is available for outward and inward Bruises, Falls or Blows, ease pains, dissolve congealed blood, and take away the black and blew marks made by Contusions, or other hurts. Dose half a Pint.

XV. *The*

XV. *The Infuſion in Wine.* It is made of the Root being Bruiſed, and ſteeped all Night in the Wine. It has all the Virtues of the Juice, Eſſence, and Decoction: taken to a quarter of a Pint or more, morning and night, it ſodders and glews together broken Bones very ſpeedily and ſtrongly, tho' the Bones be but ſlenderly and unhandſomly placed; a Cataplaſm of the Juice, or Root, being applied alſo to the ſame.

XVI. *The Pouder of the Root.* It is given to a Dram or more, morning and evening, in Drink or Broth, againſt Ruptures, broken Bones, Wounds and Inward Bruiſes, and being alſo made into a Cataplaſm with the Juice, and outwardly applied to the parts affected.

XVII. *The Ointment or Balſam.* They wonderfully dry, heal and conglutinate ſimple green Wounds, and Knit, and join together ſimple fractures of bones, eaſe pains, and ſtrengthen a weak Back whether in Men or Women.

XVIII. *The Cataplaſm of the Root.* It is applied outwardly in ſimple Contuſions or Bruiſes, Falls, Blows, Ruptures of the Peritonæum, Fractures of the Bones, Diſlocations, Defluxions of Humors, and weakneſſes in any part. It has been found by late Experience, to be incomparably good to knit and join broken Bones in any part of the Body, and is profitable for thoſe which by any weakneſs, have their Bones often out of joint, or will not ſtay long in when they are ſet; being applied for ſome conſiderable time.

XIX. *The Apophlegmatiſm of the Root.* The ſimple raw Root being chewed in the Mouth, draws away much Flegm and Viſcous Humors fram the parts adjacent, and gives eaſe in the Tooth-ach.

XX. *The Diſtilled Water of the whole Herb and Root.* It is ſaid to cleanſe the Skin from Scurff, Morphew, Tanning, Sunburning, Spots, Freckles, and other Marks and Defœdations, leaving the places ſoft, freſh, and fair, after it has been for ſome time uſed; and is uſed alſo as a Vehicle to take the other preparations in.

XXI. *The Spirituous Tincture.* It has all the Virtues of the Juice, Eſſence, Decoction and Infuſion, being inwardly taken to a Spoonful at a time in any proper Vehicle, and outwardly applied to the parts affected. It alſo ſtops all Fluxes of the Bowels after an admirable manmanner, chiefly the Bloody Flux.

CHAP. DCXXXVIII.

Of SOLDIER-WATER.

I. *THE Names.* It is called in Greek Στρατιώτης, & Στρατιώτης ποτάμιος vel ὕδατος: in Latine, by *Matthiolus*, *Stratiotes aquaticus*, and ſo alſo by *Lugdunenſis*, it is the *Stratiotes ſive Militaris Aizoides Lobelij*; *Stratiotes potamios & Sedum aquatile Dodonæi*: in Engliſh *Water-Soldier*, *Freſh Water Soldier*, and *Water Houſleek.*

II. *The Kinds.* It is a ſinglar Plant of the ſort; but *Bauhinus* accounts it among the ſorts of *Aloes*, and calls it, *Aloes paluſtris*, Water or Marſh Aloes.

The Deſcriptions.

III. *At the bottoms of the Leaves there is a ſmall ſhort head, broadeſt next unto the Leaves and ſmalleſt downwards, from whence proceed ſeveral long Strings like ſmall Worms (wherewith as* Dodonæus *ſays, ſome Crafty Quack Salvers, putting them into Glaſſes, with water, to make them ſhew the greater, make others believe, that they are Worms which came out of the Bodies of their Patients:) theſe Strings having ſeveral Fibres at their Ends, take Root in the*

Water Soldier.

Mud under the Water. From the aforeſaid head upwards, ſpring forth many long narrow Leaves, ſharp pointed, and ſet cloſe together, ſomething like to the Leaves of Aloes, for the form: but much leſs, and ſharply toothed about the Edges like it alſo. From among theſe Leaves riſe up ſhort Stalks, not much higher than the Leaves, and ſometimes not ſo high, bearing one green threeforked head only at the Top, much like a Lobſters Claw, which is the husk; out of which comes a white flower, conſiſting of three Leaves, with ſeveral yellowiſh hairy Threds in the middle.

IV. Gerard deſcribes it thus. *Inſtead of Roots there are long Strings round and White, very like to great Harp-ſtrings, or long Worms, which falling down from a ſhort head, (which ſends forth the Leaves) go to the bottom of the Water, even to the Mud, and yet are ſeldom faſtned there, from whence come forth alſo other ſmaller Strings or threds aſlope, by which the Plant is Multiplyed, after the manner of Frog-bit. The Leaves are like thoſe of the Herb Aloes, or ſempervium, but ſhorter and leſſer, ſet round about the*

the edges with certain ſtiff and ſhort prickles: among which come forth divers Stalks with caſes or huſk very like to Crabs Claws; out of which when they open grow white Flowers, conſiſting of three Leaves, altogether like thoſe of Frog-bit, having little yellowiſh Threds in the Middle: The Leaves and Flowers grow upon the Top of the Water.

V. *The Places.* It Grows in *Italy*, *Germany*, *Flanders*, *Holland* and other Countries plentifully: and in *Gerard* it is ſaid to be found growing plentifully in the Ditches about *Ratſey*, a ſmall Village in *Holderneſs in Yorkſhire*; and one Mr. *William Broad* found it in the *Fenns in Lincolnſhire*.

VI. *The Times.* It Flowers in *June* and *July*, and ſometimes in *Auguſt*, the Seed ripening in the mean ſeaſon or not long after.

VII. *The Qualities.* It is cold in the ſecond degree, and dry in the firſt; but *Galen* ſays, it is moiſt. It is Aſtringent, Obſtructive, Repercuſſive, and Vulnerary.

VIII. *The Specification.* It ſtops Fluxes of Blood from the Reins and Womb, abates Inflamations, prevails againſt *Anthonies* Fire, and cures Wounds, Ulcers, and Fiſtula's.

IX. *The Preparations.* You may make therefrom, 1. *A Juice or Eſſence from the Leaves.* 2. *A Decoction of the ſame.* 3. *A Pouder of the Leaves.* 4. *A Cataplaſm of the Leaves.* 5. *An Ointment or Balſam.* 6. *A Diſtilled Water.*

The Virtues.

X. *The Juice or Eſſence.* Taken to One or Two Spoonfuls or more at a time, in any proper Liquor, as ſome Styptick Red Wine, or in Smiths Forge Water, or in its own Diſtilled Water, it cures Piſſing of Blood, as alſo the Bloody Flux, and the overflowing of the Terms in Women; but *Pliny* adds, *Olibanum in Pouder* thereto. Bathed upon *Anthonies* Fire, and Inflamations, it cools them, and eaſes the Pain; and is good to heal ſimple Wounds, foul running Sores, Ulcers, and Fiſtula's.

XI. *The Decoction in Wine or Water.* It has all the former Virtues, but may be given in a much larger Doſe, as from a quarter of a Pint to half a Pint: If Honey is diſſolved in it, it makes a good Gargariſm for a Sore Mouth and Throat; and being Bathed very hot upon any Inflamation or painful Tumor, it abates it, and gives eaſe in the Pain.

XII. *The Pouder.* It has the Virtues of the Juice and Decoction; and may be given a dram at a time, morning and evening, for all the purpoſes aforeſaid, in any proper Vehicle, ſtrowed thick upon any foul running Sore or Ulcer, it cleanſes, drys up the humors, and induces the healing. *Alpinus* ſays, it is given every morning faſting, to ſtop the overflowing of the Courſes in Women, as alſo other Fluxes of Blood, in any part of the Body.

XIII. *The Cataplaſm.* It is made of the Bruiſed Leaves, and is applyed by Country people, to heal any ſimple green Wound, which it is ſaid to do, to admiration. Applied in the Extremity of the Gout, it is a ſingular thing to eaſe the Pain, and that in a ſhort time.

XIV. *The Ointment or Balſam.* They are good Vulneraries, repreſs the flux of humors to the part, eaſe pain in a Wound, running Sore or Ulcer, cleanſe, dry, and heal the diſaffected part, being alſo waſhed with the Juice or Decoction.

XV. *The Diſtilled Water.* It is uſed as a Vehicle, to take the Juice or Effence in; and mixed with Honey makes a Gargariſm for a Sore Mouth and Throat. a little Camphir diſſolved and mixed with it, makes a good Ophthalmick, for Sore, Rheumy, and Watering Eyes; and ſo alſo it is a very good thing to clear the Skin from any kind of Deformity.

CHAP. DCXXXIX.

Of SOPE-WORT, *OR,* BRUISE-WORT.

I. *THE Names.* It is called by ſome in Greek Στρύθιον *Struthium* (from its ſcouring and cleanſing quality, but it is not the *Struthium* of *Dioſcorides*, *Galen*, *Pliny*, or *Theophraſtus*) in Latine, *Saponaria* (from its great ſcouring faculty) *Viola agreſtis Tragi*; *Struthium Fuſchij*: and in Engliſh, *Sope-wort* or *Bruiſe-wort*.

II. *The Kinds.* We have but three ſorts of it growing with us in *England*. viz. 1. *Struthium Vulgare*, *Saponaria Vulgaris*; Our Common Sopewort. 2. *Saponaria flore duplici*, Sopewort Double Flowered. 3. *Saponaria Anglica folio convoluto*, which *Gerard* calls *Gentiana Cornea*. Hollow Leav'd Sopewort. He plac'd it next to the *Gentians*, thinking it a Species of them; but it is plainly manifeſt to agree in its form with *Saponaria*, as in its Roots, Leaves and Flowers, and not at all with *Gentian*, but only in its bitterneſs, which is no diſtinguiſhing ſign.

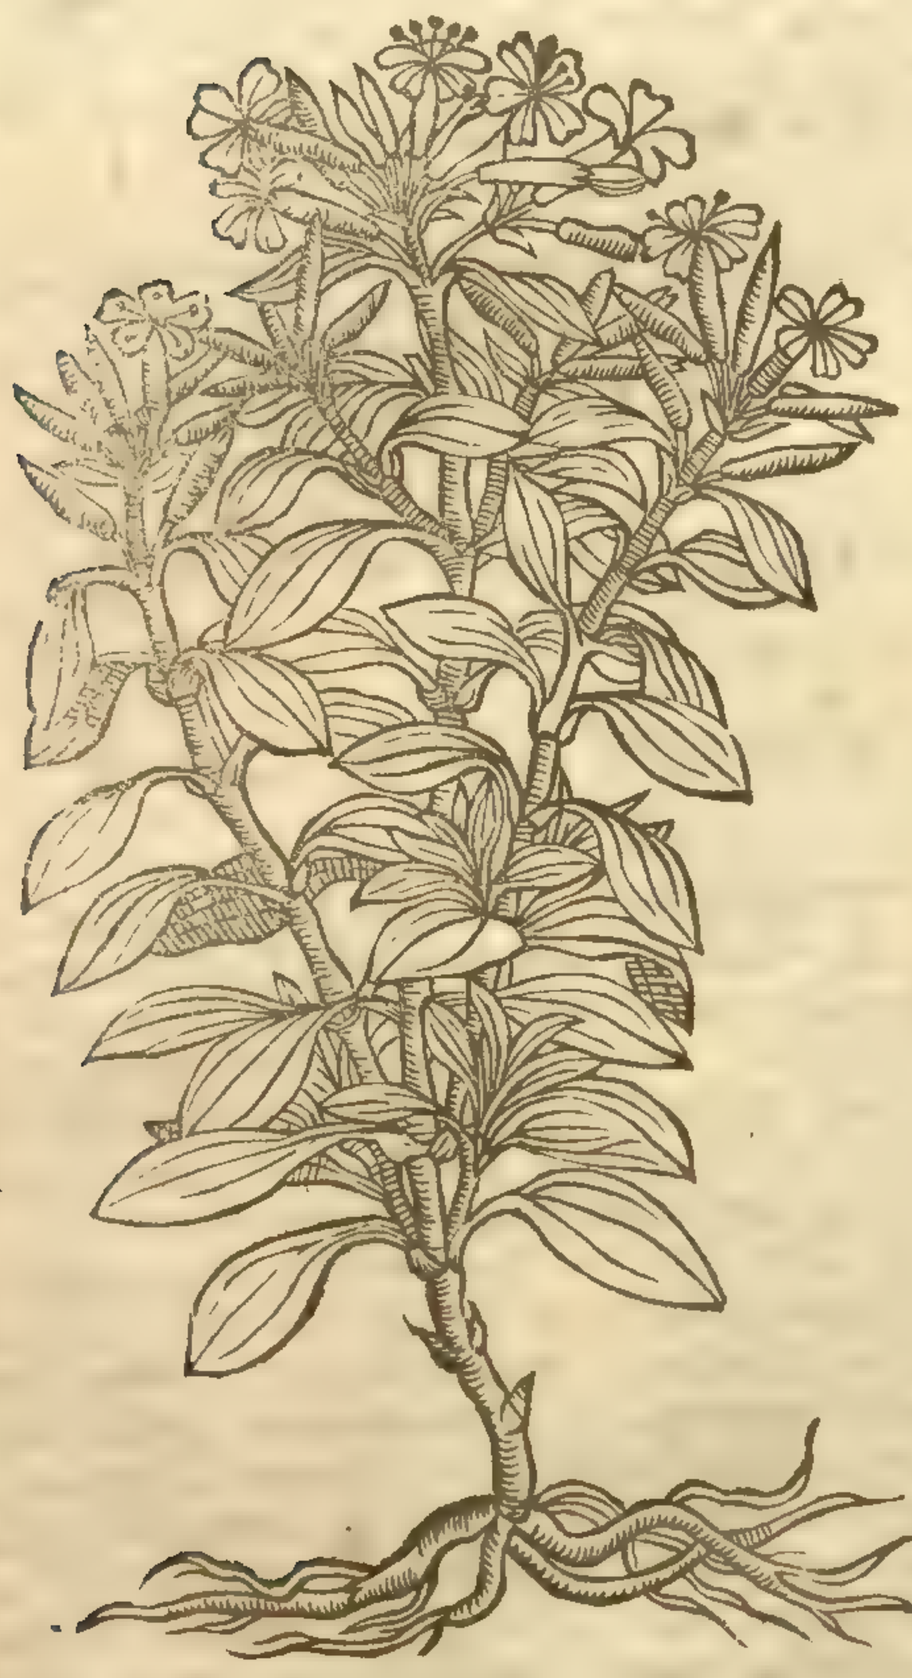
The Deſcriptions.

III. The firſt, or Our Common Sopewort. *Its Root creeps under ground far and near, with many Joints, of a brown color on the outſide, and yellowiſh within, ſhooting forth in divers places many weak round Stalks, full of joints, ſet with two Leaves apiece at every one of them, on the contrary ſide, which are Ribbed ſomething like unto Plantane, and faſhioned like the Common field white Campion Leaves, ſeldom having any Branches from the ſides of the Stalks, but ſet with divers flowers at the Top, ſtanding in long husks like the Wild Campion, made of five Leaves apiece, round at their ends, and a little dented in their middles, of a pale Roſe color, almoſt White, ſometimes paler, and ſometimes of a deeper color, having a reaſonable good ſmell.*

IV. Gerard deſcribes it thus. *Its Roots are thick, long, creeping aſlope, having certain ſtrings hanging at them, like the Roots of black Hellebor, which if they have once taken good and ſure footing in any ground, it is almoſt impoſſible to deſtroy the Plant. The Stalks are ſlippery, ſlender, round, jointed, and a foot and a half high or higher: the Leaves are broad, ſet with Veins, very like broad Leav'd Plantane, but leſſer,*

growing

Sope-wort or Bruiſe-wort.



growing out of every joint by Couples for the moſt part, thoſe eſpecially which are neareſt the Roots bowing backwards. The Flowers in the Tops of the Stalks, and about the uppermoſt joints, are many, well ſmelling, and ſometimes of a beautiful red color like a Roſe; ſometimes of a light Purple or White, which grow out of long Caps, conſiſting of five Leaves in the middle of which are certain little Threds.

V. The ſecond, or Sopewort Double Flower'd. *The Root is like the former, ſpreading it ſelf within the Ground, and riſes up in ſeveral diſtant places like the ſingle. It has many long and ſlender round Stalks, ſcarcely able to ſuſtain themſelves, or ſtand upright, being full of joints, and ribbed Leaves at them, every one ſomething like a ſmall* Gentian *or* Plantane *Leaf. At the Tops of the Stalks ſtand many Flowers, conſiſting of two or three rows of Leaves, of a Whitiſh or Pale Purple color, and of a ſtrong ſweet ſmell, ſomething like the ſmell of Jaſmin or Jeſſamy Flowers, ſtanding in long, thick, pale, green husks, which fall away without giving any Seed, as moſt other double flowers which increaſe by the Root do.*

VI. The third, or Hollow Leav'd Sopewort. *This Plant (which is peculiar to our Own Land) has a Root which in its form and manner of running, is very like unto the firſt deſcribed, but much ſmaller. It ſends forth divers weak, round ſtalks, with fewer joints than in the firſt kind, and at every one of them One Leaf, ſeldom more; which either encompaſſes the Stalk at the bottom (as many of them do) or being hollow, the whole Leaf like a Pipe or Trunk, encompaſſes it before it opens it ſelf on the outſide, and ſometimes it opens not it ſelf at all. Theſe Leaves are Ribbed like the former, ſomewhat broader and rounder at the ends. The Stalks have no Branches at all, but from ſome of the upper joints, and at the Tops, grow three or four flowers upon ſlender Footſtalks, in long husks, conſiſting of five Leaves for the moſt part, ſomething broader at the ends than the ſingle ſort, and uneven, which many times break the husks, in which they ſtand, either on the one ſide or the other, and are of a Pale White color tending to a Bluſh, eſpecially on the ſides.*

VII. *The Places.* The firſt grows Wild in many low and wet grounds in ſeveral parts of this Land, and near to Rivers and running Brooks in Sunny places; but is now brought into Gardens for the flower ſake, ſerving chiefly for the decking up of Houſes. The ſecond or Double flower'd was brought to us from beyond Sea, and is only Nurſt up in Gardens. The third is a Native of *England*, and has been found growing in a little *Grove*, called the *Spinny* near *Litchborrow* in *Northamtonſhire.*

VIII. *The Times.* They flower in *June* and *July*, and ſo continue all *Auguſt*, and part of *September*, before they are quite ſpent.

IX. *The Qualities.* They are hot and dry in the firſt degree; Aperitive, Abſterſive, Diuretick, Emollient and Vulnerary, Stomatick, Hepatick, Nephritick, and Laxative, from their ſcowring faculty.

X. *The Specification.* They open obſtructions of the Reins and Womb, cleanſe the Bowels, and are good againſt Sand, Gravel and Tartar in the Reins and Bladder: profitable for the healing of Wounds; and is ſaid by ſome to be a Cure for the Lues Venerea, or *French* Pox.

XI. *The Preparations.* You may make thereof, 1. *A Juice or Eſſence.* 2. *A Decoction of the Leaves according to* Septalius. 3. *An Oinment or Balſam.* 4. *A Cataplaſm.*

The Virtues.

XII. *The Juice or Eſſence.* They provoke Urine, and cleanſe the Urinary paſſages from Sand, and Gravel, and Tartarous matter, give eaſe in the Strangury, looſen the Belly, and are ſaid to be profitable againſt the Dropſie and the foul Diſeaſe. Doſe 2 Spoonfuls or more mixt with any proper Vehicle.

XIII. *The Decoction of Septalius. Take freſh or green Sopewort 2 handfuls: Infuſe for a night in a Gallon of Water, the next morning boil them together, and ſtrain out by preſſing, the one half of the Water ſweeten with Raiſons or white Sugar, to be drank as ordinary drink at Meals: the other half is to be reſerved to be taken 7 or 8 Ounces at a time every morning faſting whilſt in bed, and gently to ſweat upon it. To ſuch as are Cholerick, it is to exhibited being made with the addition of a handful of* Sow-Thiſtles, or Navel-wort, *and in Womens caſes with the farther addition of half a handful of* Filipendula. Valet (dixit ille) & pro mulieribus ad menſtrua alba abſumenda. *Septalius* ſays, that one *Zapata* a Spaniard found out the Virtue of this Plant, ſince whoſe time it has been written of by *Euſtachius Rudius de morbis occultis & venenatis,*

tis Lib. 5. *Cap.* 18. and by *Cæsar Claudinus de ingressu ad infirmus pag.* 411. *and pag.* 417. but principally by *Ludovicus Septalius Animadvers. Med. lib.* 7. *Numb.* 214. where Treating of Decoctions in Use against the *French* Pox, he mentions the singular Effects of this Herb against that foul Disease. His words are these: I must not in this place omit the use of another Alexipharmical Decoction, being very effectual and useful for the poorer sort, namely that which is made of Sopewort, an Herb common, and known to all: Moreover I have sometimes used it with happy success in the most contumacious diseases: but it is of somewhat an ingrateful Taste, and therefore is reserved for the poorer people. This Decoction *Septalius* says, he has used *Sæpè ac sæpius*, oftentimes, or over and over again many times.

XIV. *The Ointment or Balsom.* Being applied they heal simple green Wounds to admiration: and if they be foul, they cleanse them after a singular manner, and then heal them in a short time after.

XV. *The Cataplasm of the Green Herb.* Country people in divers places, do use to bruise the green Leaves, and apply them to their fingers, hands, legs, or other parts, when they are cut, to heal them again. It hinders Inflamations, and a flux of humors, and speedily induces the Cure.

CHAP. DCXL.

of SORREL *Garden and Wild.*

I. *THE Names.* It is called by the *Arabians*, as Sarapio, *Humaath*: in Greek, Ὀξαλὶς, and by *Galen*, Ὀξυάμαδον, i. e. *Lapathum acidum* or *Rumex acidus*; in Latine, *Oxalis* from the Greek, and *Acetosa*: in English *Sorrel.*

II. *The Kinds.* There are several species of this Plant. 1. *Oxalis sive Acetosa hortensis*, also simply *Acetosa*, Our Common Garden Sorrel. 2. *Acetosa maxima Germanica.* Great German Sorrel. 2. *Oxalis* five *Acetosa Sativa* vel *Romana rotundifolia*, Round Leav'd or Roman Sorrel. 4. *Oxalis radice Tuberosa*, Tuberous Rooted Sorrel. 5. Ὀξαλὶς μικρὰ, *Acetosa Sylvestris*, *Acetosella*, *Lapatiolum acidum*, *Acetosa minor* Lanceolata, Sheeps Sorrel, or Field Sorrel. 6. *Acetosa Cambro-Britanica Montana*, Mountain Sorrel of Wales. 7. *Acetosa Americana*, *Acetosa Vesicaria Americana*, West-India Sorrel, or American Sorrel.

The Descriptions.

III. The first, or Our Common Garden Sorrel. *Its Root is smaller than any Dock Root, brown, and full of Strings, abides all Winter without decaying, and has green Leaves all the while, except in the very extremity of Frost and Snow, which many times causes its Leaves to perish. It springs up with tender long green Leaves, fat and full of Juice, broad, and bicorn'd as it were, next unto the Stalk like Arach, Spinage, or Our English Mercury, having a pleasant sharp Sowre Taste. The Stalks are slender, bearing purplish long heads, in which lye three corner'd shining, brown Seed, like, but lesser than that of Docks.*

IV. The second, or Great German Sorrel. *Its Root and manner of growing is like the former, but the Leaves thereof are much larger, and sometimes a little Curl'd at Edges, the joints of the Stalks are great and Tuberous, sticking out like knots, which being taken from the Stalk, and put into the Ground, will take Root, and bring forth Leaves like the Mother Plant, the Seed, and so all its other parts, are answerable to the proportion of the Leaves.*

V. The third, or Round leav'd, or Roman Sorrel. *Its Root is small and threddy, creeping about for the most part every where, and shooting up heads of Leaves round about. In the Leaves of this Sorrel the chief difference consists, which are short and almost round in some plants, and in others somewhat round pointed, with Ears or pieces on both sides next the Footstalk, of a paler green color than the former. The Stalks are weaker, not standing upright, but the flowers and Seed differ not from the Common Garden sort. The Taste is of a much more pleasant sharpness than the others, and therefore the more desirable in Sallets and Sawces.*

VI. The fourth, or Tuberous Rooted Sorrel. *Its Roots are many Tuberous clogs fastned by strings to the lower part of the stem, not much unlike to those of Peony, or Filipendula; from the head of the Root the Leaves spring forth, which are in form something like to the Ordinary or Common Garden Sorrel, but larger, sharp pointed, and not so broad next to the Footstalk. The Stalks, Flowers and Seed, are answerable to the Common Kind; but the Leaves grow confusedly upon the Stalk, without any order, not differing much in form, from those of* Patience, Garden Dock, or Monks Rhubarb.

VII. The fifth, or Sheeps Sorrel, or Field Sorrel. *Its Root is long, branched out and stringy. It does not much differ from the Common Garden*

Sorrel, but in its ſmallneſs, and length of its Leaves, which are ſomething ſmall, pointed at the farther end, broadeſt in the middle, with two ſmall ears at the lower end next to the Footſtalk, of a pale green color, ſomewhat whitiſh, and of

Sorrel Field or Sheep.

a ſowre taſte like the Garden Sorrel, but not full out ſo acute, but more Styptick or Aſtringent. In its Stalks, Seed, and form of growing it is much like to the firſt Garden kind.

VIII. The ſixth, or Mountain Sorrel of Wales. *Its Root is ſmall and threddy, abiding many years. It grows up with ſmall Stalks, branched forth diverſly with round Leaves ſet thereon, as alſo growing at their bottoms, every Leaf upon a long Footſtalk; in form ſomething like to the Wall Penny-wort, out that they cut in on the lower part, which ends on both ſides, almoſt like to the third Species aforegoing. The flowers are whitiſh, and not red like others; but the husks with Seed which comes afterwards are reddiſh, and contain brown, ſhining Triangular Seed, almoſt in ſhape like a Tetrahedron, and very like to the Seed of the Common Garden and Field Kinds.*

IX. The ſeventh, or Weſt-Indian, or American Sorrel. *Its Root is ſmall and Threddy, periſhing for the moſt part every year. It has ſlender ſtraked Stalks of about a Foot and a half high, leaning ſometimes down to the Ground, and ſpreading themſelves into many Branches, ſomething reddiſh towards the Tops. The Leaves are ſmooth and thick, of a reaſonable ſize, ſomething like a Garden Sorrel Leaf, but that the lower points are not ſo long, but rather ſhort like an Arach Leaf, of a pale green color, and ſomething Mealy withall, every one, upon a long Footſtalk, and of a more ſharp ſowre Taſte, than our Sorrel. At the Tops of the Stalks and Branches, the flowers grow in a long Spike, like our Common Sorrel, but greater, and of a greeniſh red color. After which come round, yet cornered skinny ſwoln husks hanging downwards, of a reddiſh color, ſtriped with redder Veins, very beautiful, in which are contained two, or three Triangular ſhining Seed.*

X. *The Places.* The firſt four grow only in *Gardens*, tho' the firſt has been ſaid to have been found growing Wild. The fifth grows wild in many of the Medows of this Kingdom; I have alſo found it growing Wild in ſeveral places in the *South Carolina.* The ſixth grows upon barren Sandy grounds, and has been found growing upon ſeveral of the Mountains in *Wales.* The ſeventh grows in ſeveral parts of *America*, and our *Weſt-India Plantations.*

XI. *The Times.* They Flower and Seed in *May* and *June*, much about the time when the common ſorts of Docks, Flower and Seed.

XII. *The Qualities.* Sorrel is Cold in the firſt degree, and temperate in reſpect to moiſture or dryneſs, It is Abſterſive, Aſtringent, Stomatick, and a reſiſter of putrefaction. It is much uſed in Sawces both for the Well and the Sick, cooling a hot Stomack and Liver, provoking Appetite and refreſhing the Spirits when almoſt ſpent. It is of a pleaſant Acid Taſte, and if well Cook't up, gratifies the Stomach Admirably.

XIII. *The Specification.* It is good againſt Fevers and Inflamations, Quenches Thirſt, ſtops vomiting, removes Nauſeouſneſs and loathing, encreaſes Appetite, heals foul Ulcers and Cankers in the Mouth and Throat, and is of excellent uſe againſt all malign, contagious and peſtilential Diſeaſes.

XIV. *The Preparations.* You may make therefrom, 1. *A Juice or Eſſence.* 2. *A Decoction.* 3. *A Conſerve.* 4. *A Syrup.* 5. *A Cataplaſm.* 6. *A Diſtilled Water.* 7. *A Pouder of the Seed.*

The Virtues.

XV. *The Juice or Eſſence.* Given from one Spoonful to three, either alone, or with ſome proper Vehicle, they cool the heat of Fevers, quench Thirſt, and take away the malignity of Infectious and Peſtilential Diſtempers; ſtop vomiting, given with Syrup of Mint, or mixt with Mint Water; abate the heat and overboiling of Choler in the Stomach, provoke Appetite, and after a ſingular manner refreſh the Spirits. Mixt with Honey, or Syrup of Mulberries, and a little Styptick Red Wine, they cure Cankers and Ulcers in the Mouth and Throat.

XVI. *The Decoction in Water or Wine.* It has all the Virtues of the Juice or Eſſence, but nothing near ſo powerful, and therefore may be taken to half a pint or more at a time. Mixt with the Honey of Roſes, and Wine, it makes a good Gargariſm for a ſore Mouth or Throat; and it will be ſo much the more excellent if in every Pint thereof two or three drams of *Sal Prunellæ* be diſſolved in it, more eſpecially if it proceeds from heat and Inflamation.

XVII. *The Conſerve.* It is cooling, grateful to the Stomach, creates Appetite, ſtops Vomiting, and applyed outwardly, abates the pain and heat of Inflamations; it alſo ſtops Bleeding being outwardly applied

XVIII. *The*

XVIII. *The Syrup.* It is generally made of the Juice, and is effectual in all the cafes aforeſaid; and is profitable againſt a hot Catarrh, or flux of Rheum falling upon the Throat, and Lungs, &c. reſiſts putrifaction

XIX. *The Cataplaſm.* It may be made either of the Cold Green Herb, a little bruiſed: or of the Green Herb, ſcowed by it ſelf without any addition in a Sawce-pan, or between two Pewter Diſhes; it is good againſt Wounds and Ulcers made by Punctures, Thruſts, Cuts and the like, ſtops their bleeding, cleanſes and heals them ſpeedily. It alſo eaſes pains of the Gout, and cools the heat of Inflammations, &c. It is good againſt frettings and galling of the Skin, Ringworms, Tetters, &c. The Leaves wrapped up in a Colewort Leaf, and ſo roaſted under the Embers, and then applied as a Cataplaſm to any hard Apoſtem, Botch, Boil, or Plague Sore, it ripens and breaks them, and helps alſo to diſcuſs Strumous or ſcrofulous ſwellings in the Throat and other parts.

XX. *The Diſtilled Water.* It is good for all the purpoſes aforeſaid, but muſt be taken in larger quantities, as four or ſix Ounces at a time, ſweetned with the Syrup aforegoing. *Take Juice of Sorrel ſix Ounces: of the Diſtilled Water two Ounces: Syrup of Sorrel one Ounce and a half, mix them.* Of this the Patient may take two or three Spoonfuls now and then, in any hot diſeaſe, or burning Fever: it cools Inflamation and heat of the Blood in Agues, reſiſts peſtilential diſeaſes, abates the heat and Boiling of Choler, reſtores the Craſis of the Blood, revives the fainting Spirits, repreſſes the violence and furious hot fits of Agues, quenches Thirſt, provokes Appetite, Kills Worms, and is truly Cordial; expells Gravel and Stone from the Reins and Bladder, and is profitable againſt the Jaundice.

XXI. *The Pouder of the Seed.* Given to a Dram in any proper Vehicle, it chears the heart revives the Spirits, Kills Worms in the Body, ſtops Catarrhs, and the Terms in Women, alſo the Bloody flux, and all other fluxes of the Bowels, Vomiting, &c. likewiſe being taken 2 or 3 times a day, it is ſaid to reſiſt the Poiſon of the Scorpion.

CHAP. DCXLI.

Of SORREL WOOD, *OR,* SOUR TREFOIL.

I. *The Names.* It is called in Greek Ὀξὺς: and in Latine, *Oxys*, *Oxys Pliniana Lib.* 27. *Cap.* 12. *Oxytriphyllum Tragi* and *Lacuna*, (but *Oxytriphillum*, is a more proper Name for the ſharp pointed *Treſoil*:) *Triſolium acetoſum*, *Panis Cuculi*, (Cuckows meat) alſo *Alleluia*, (becauſe it was in flower, when in Ancient times, *Alleluja* was wont to be Sung in Churches:) and *Lujula* (a corrupted word from *Juliola*, as in *Calabria* in the Kingdom of *Naples* it is called:) in Engliſh, *Wood Sorrel*, or *Sour Treſoil.*

II. *The Kinds.* The chief ſorts common with us are, 1 *Oxys Lutea. Germanica*, *Lutea*, *Oxys alba Germanica*, *Trifolium acetoſum Lutea*; Our Common Wood Sorrel. 2. *Oxys flore Lutea Cydia*, *Oxys* [illegible] *Trifolium acetoſum Luteum*, Cays *America*, Yellow Flowred Wood Sorrel.

The Deſcriptions.

III. The firſt, or Our Common Wood Sorrel. *Its Roots are nothing but Strings fained to the end of a ſmall long Piece, all of them being of a yellowiſh color, not periſhing every year, but abiding with ſome Leaves lurking in the Winter. It grows low upon the Ground without any Stalk, ariſing from it, having a number of Leaves coming from the Root, which Leaves are made of three parts like a Trefoil, but broad at the ends, and cut or dented in their middle (almoſt in form of a Heart) of a faint yellowiſh green color, each one ſtanding on a long footſtalk, which at*

Sorrel Wood Common.

their firſt coming up, are cloſe folded together to the Stalk, but opening themſelves afterwards, and are of a pleaſing ſour reliſh, more grateful and pleaſing than any of the former Sorrels, and yielding a juice, which will turn red when it is clarified, and make a moſt delicate clear Syrup. Among theſe Leaves riſe up divers ſlender weak Footſtalks, not growing higher than them, each one having a Flower at its Top, conſiſting of five ſmall and pointed Leaves, Star faſhion, of a white color in moſt places, or in ſome diſht over with a ſmall ſhew of bluſh, and in ſome (but on the backſide only) of ſome other colors. The flowers being paſt, there follow ſmall round heads, with ſmall yellowiſh Seed in them.

IV. Gerard deſcribes it thus. *Its Root is very Threddy, and of a reddiſh color. It is a kind*

of three Leav'd grass, and is a low and humble herb, without Stalk: the Leaves immediately rising from the Root upon short stems: at their first coming forth folded together, but afterwards spreading themselves abroad, of a fair light green color, in number three, like the rest of the Trefoils, but that each Leaf has a deep cleft in the middle. Among these Leaves come up small and weak tender stems, such as the Leaves do grow on, which bear small Starlike flowers of a white color, with some brightness of Carnation dasht over the same. The flower consists of five

Sorrel Wood Yellow Flowered.

small Leaves, after which come little round knaps or husks, full of yellowish Seed. The whole Herb is in Taste like Sorrel, but much sharper and quicker, and makes better Green Sawce than any of the former Sorrels. Johnson *in* Gerard *says, that he had some of these Plants sent him, with very fair red flowers, which were gathered in a Wood of Sir* Thomas Walsingham's, *called Stockwell Wood, at* Chissel-hurst *in* Kent, *and in a little round Wood thereto adjoining.*

V. The second, or Yellow Flower'd Wood Sorrel. *Its Root is a bush of Fibres, and abides all Winter without perishing, if it be not too Violent or Cold, the Extremity making them rot and perish, so that then the Plant must be raised from Seed sown again. It shoots forth several slender, weak, reddish Stalks, trailing upon the Ground, yet growing in a heap as it were, the Stalks take Root at the Joints as they lye, spread into many Branches, with many Leaves on them, standing singly one above another, and made of three Leaves, cut in at the ends like the former, but are much smaller, and of a Paler Green Color: at the Joints with the Leaves come forth three or four small flowers together, at the end of a long Footstalk, yet each separate from the other, consisting of small and Pointed Leaves like the former, but contained in smaller, and longer heads, like Cods or Horns, yet not Crooked but pointed small, which quickly fall away being touched when they are ripe, and spring up again all about where it grew.*

VI. *The Places.* The first grows very plentifully in many places in *England*, in Woods and by Wood-sides, where it may be moist, and shadowed from the Sun, also in other places not too open to the Sun Beams. The second grows in *Spain, Italy and Sicily*; but in a vast plenty in almost all our worne out Plantations of Maze, in *South Carolina*, and other places adjacent thereto, where I have gathered it many times: there is scarcely any Herb which grows in greater plenty in those Countrys than this.

VII. *The Times.* The first Flowers early in *April* and *May*; the other in *June, July* and *August*, and so continues in flower, till the Cold of *Autumn* causes it to perish, the Seed ripening in the mean time.

VIII. *The Qualities.* These are of the Temperature, and properties of Common Sorrel in the former Chapter; but more Potent to all those purposes, and are special Alexipharmicks or Antidotes against the Plague, and all sorts of Pestilential, Malign, and Burning Fevers.

IX. *The Specification.* Wood Sorrel resists Vomiting, strengthens the Stomach, hinders putrifaction of the Blood, quenches Thirst, provokes Appetite, and is effectual against the Plague, Spotted Fever, Calentures, and other like Malign diseases.

X. *The Preparations.* You may make therefrom, 1. *A Juice.* 2. *A Decoction or rather Infusion.* 3. *A Syrup.* 4. *A Conserve.* 5. *A Cataplasm.* 6. *A Distilled water.*

The Virtues.

XI. *The Juice.* It has all the before Specified Virtues, cools Inflamations, takes away all preternatural heats, whether in the Stomach, Bowels, or habit of the Body, resists putridity, and is most singularly excellent against any Contagious sickness, or Pestilential Fever. Mixt with a fit quantity of double refined Sugar, it makes most incomparable Green Sawce.

XII. *The Decoction or Infusion.* They have the Virtues of the Juice, but not so effectual, and may be given half a Pint at a Time: if they are made in Wine (whether White or Red,) they will be so much the more effectual in some cases, more especially where no Fever is present.

XIII. *The Syrup.* It is effectual in all the Cases aforementioned, does exceedingly cool, and abate the heat of Fevers; and mixed with the Juice, makes an excellent Gagarism for a Sore Mouth and Throat, being Gargled therewith and spit out, and then fresh taken in; it wonderfully helps a stinking foul Canker, or Ulcer in those parts; and is singular good in Wounds made by Cut or Puncture, stopping their bleeding, and causing them speedily to heal.

XIV. *The*

XIV. *The Conserve.* It is Cordial, refreshing in hot Fevers, stops Vomiting, and strengthens a weak Stomach, and is profitable against Catarrhs or hot defluxions of Rheum upon the Stomach and Lungs.

XV. *The Cataplasm.* It is made either of the whole green herb bruised: or made of the Herb, stewed between two Pewter Dishes, and brought to a Consistence with Crumbs of white Bread. It abates the heat of Inflamations and other hot Tumors, cures simple Contusions, being presently applyed, *viz.* whilst they are recent; applyed to simple green Wounds also, it heals them in a short time, by stopping the Hemorrhage and conglutinating their Lips.

XVI. *The Distilled Water.* It has all the Virtues of the Juice and Decoction or Infusion, but very much weaker: It quenches thirst, and cools inward heats of the Stomach, Lungs and Liver, being taken morning, noon, and night, half a Pint at a time, sweetned with the Syrup aforenamed; and so mixed it makes a good Gargarism for Sore and Cankerous Mouths and Throats.

CHAP. DCXLII.

Of SOUTHERNWOOD.

I. *THE Names.* It is called in Arabick, *Carbsum, Kesum*, or *Gaissum:* in Greek, Ἀβρότονον: in Latine *Abrotonum*, after the Greek, but more usually *Abrotanum* as the Shops call it: and in English, *Southernwood.*

II. *The Kinds.* Authors have a great many Species of this Plant; we shall only Treat of the four following, as being more usual with us. 1. *Abrotanum mas, Abrotanum vulgare, Abrotanum nigrum Cordi*, Our Common Southernwood. 2. *Abrotanum mas Angustifolium Bauhini*; *Abrotanum Magnum Camphoratum quibusdam Incensaria Cinerarij*, Great Southernwood. 3. *Abrotanum Fœmina arborescens Dodonæi*; *Abrotanum latifolium arborescens Bauhini, Absinthium arborescens Gerardi, Lobelij, Lugdunensis, and Tabernæmontani.* Tree Southernwood, or Female Southernwood; formerly, and by some Authors *Lavender Cotten* was accounted to be the *Female Southernwood*, and called *Abrotanum fœmina*, but that is error. 4. *Abrotanum odoratum humille, Abrotanum humile & densè fruticosum Lobelij*; *Abrotanum Tertium Tragi*; *Abrotanum mas angustifolium minus*; Small sweet Southernwood.

The Descriptions.

III. The first, or Our Common Southernwood. *Its Root grows not very deep, but is Woody with several strings adjoining to it. It rises up with many weak and Woody Branches bending downwards, if they be not held up, especially while they are small, for the elder stems are more strong and great, rising in time to be higher than a Man; from which grow out many small and long Branches, on which are set many small, fine and short Leaves, as fine as Fennel, but not so*

Southernwood Common Male.

long, of a Grayish or Russet green color, of a strong pleasant smell, and somewhat bitter taste. From the middle almost to the Tops of the upper sprigs, grow small round yellow Flowers, hanging like little Buttons, which never open much, but pass away, and after them come the Seed, which is smaller than that of Wormwood. The Stalks and Branches lose all their Leaves every Year, and shoot forth afresh in the spring. This is our Common Garden Southernwood, the others being not so usual, and for the most part called by other Names, scarcely being acknowledg'd to be any Species hereof.

IV. The second, or Great Southernwood. *The Root is like the first which is woody, and runs under ground in the same manner. This greater kind is altogether like the former, growing as high, or rather higher, and with Leaves like thereunto, but somewhat larger and greener, and of a strong resinous smell, not altogether so pleasant as that, but coming something near to Camphir or Frankincense: The flowers and Seed differ not from the first common, but are like to them in all respects.*

V. The third, or Tree Southernwood, or Female Southernwood. *Its Root is woody, spreading it self out with many Strings and Fibres. It is a rare Plant, grows upright with one stem or stalk, to a Mans height, if the lower small sprigs be cut off from it in the growing, and shoots forth many Branches on all sides, on which grow many leaves, very much cut in, and divided, but are nothing so fine and small as the former; but yet a little quicker, and nearer resembling Wormwood, as it does also in its taste, and more Aromatick than common Southernwood. The flowers stand at the Tops of the Branches, being more plentiful, and larger*

than

than the former; but yellow like them, after which comes the Seed, which is alſo ſomewhat larger. This Plant is more tender than the others, and requires ſome care to preſerve it in Winter, more than thoſe do.

VI. The fourth, or Small ſweet Southernwood. *Its Root is woody, made of many little ſtrings, and ſpreads like the others. It ſhoots up with many ſmall woody Branches, riſing ſeldom above half a yard high, but very thickly ſpreading into other ſmaller ſprigs, ſet full of ſmall Leaves, ſomewhat longer, greater, and greener than the Common. The Tops of the Stalks are repleniſhed with many ſmall round heads, which yield ſmall yellow greeniſh flowers. The whole Plant, as well Leaves as Flowers and the Sprigs, give a very good and pleaſant ſmell, more than the others do, but a little inclining to the Wormwood ſcent.*

VII. *The Places.* *Theophraſtus* ſays, that *Southernwood* delights to grow in Places open to the Sun. *Dioſcorides* ſays, it grows in *Capadocia* and *Galatia* in *Aſia*, and in *Hierapolis* a City of *Syria*. *Pliny* commends that moſt which grows in *Galatia* and *Sicily*. They are all of them Planted in *Gardens* with us, and the firſt grows almoſt in all Gardens every where. The ſecond grows in *Germany*, from whence it was brought to us. The third grows in *Italy*, and other warm and Southern Countries. The fourth is only found in the *Gardens* of Exact and Curious Herbariſts.

VIII. *The Times.* They moſt of them flower in *July and Auguſt*, and ſometimes in *September*. When they flower late they ſeldom bear Seed; and the Seed of the third is ſeldom ſeen.

IX. *The Qualities.* Southernwood is hot and dry in the end of the third degree. It is Aperitive, Attractive, Abſterſive, Diſcuſſive, Carminative, Anodyne, Diuretick, and Rarefactive; Cephalick, Neurotick, Cardiack, Hyſterick, Nephritick, and Alexipharmick.

X. *The Specification.* It cures Cramps and Convulſions, is good againſt the Strangury, Iſcuria, Stone and Gravel, provokes the Terms, is an Antidote againſt Deadly Poiſon, the biting of Serpents and other Venomous creatures: Cures Agues, Kills Worms in Children, eaſes the Spleen, is good againſt Fits, heals Ulcers in the Privities, and draws Splinters and Thorns out of the Fleſh.

XI. *The Preparations.* You may make therefrom, 1. *A Liquid Juice.* 2. *An Eſſence.* 3. *A Decoction or Infuſion of the Leaves, Tops and Flowers.* 4. *A Pouder of the Herb.* 5. *A Pouder of the Seed, or Seed Bruiſed.* 6. *An Oil by Inſolation or Decoction.* 7. *A Balſam.* 8. *A Cataplaſm.* 9. *The Aſhes.* 10. *A Diſtilled Water.* 11. *A Spirit.* 12. *A Diſtilled Oil.* 13. *A Spirituous Tincture.* 14. *An Acid Tincture.* 15. *An Oily Tincture.*

The Virtues.

XII. *The Liquid Juice.* It is a counter-poiſon, or Antidote againſt all deadly poiſon, the bitings of Serpents, of the *Phalangium* or other Venomous Creatures; provokes Urine, and the Terms in Women, facilitates the Birth, and brings away the Afterbirth. Doſe one or two Spoonfuls in a Glaſs of Wine.

XIII. *The Eſſence.* It is good againſt Convulſions, obſtructions of the Terms, Strangury, Sand, Gravel and Tartarous matter in the Reins, Ureters and Bladder; and taken to 2 Spoonfuls or more in a Glaſs of Vinegar, or Brandy, ſometime before the coming of the fit of an Ague, it is ſaid to cure it. It has indeed all the Virtues of the Liquid Juice, but more potent, and withal more pleaſant to take. It rectifies the Crudity of the Stomach, is good againſt Surfeits, Obſtructions of the Liver and Spleen, and Kills Worms in the Bodies of human kind.

XIV. *The Decoction or Infuſion of Leaves, Tops, and Flowers in Wine or Water.* They have all the Virtues of the Liquid Juice, and Eſſence, but may be given in a much larger doſe, as from a quarter of a Pint to half a Pint, morning, noon, and night. The Plant is a ſingular good Wound Herb, and therefore theſe preparations may be of exceeding good uſe in curing ſimple Wounds, and other ill conditioned Sores, not eaſie to be healed.

XV. *The Pouder of the Herb.* It is often given to a half Dram to Kill Worms in Children: and taken in Wine it is a counter-poiſon, and profitable againſt the Stinging of Scorpions, and bittings of Spiders, Mad Dogs, or other Venomous Creatures.

XVI. *The Pouder of the Seed.* Infuſed in warm water and drank, it is ſaid to help ſuch as are Burſten, and are troubled with Cramps, Convulſions, Sciatica, and Strangury, or difficulty of making Water, and provokes the Terms in Women. The ſame pouder taken in Wine has the Virtues of the Juice and Eſſence, and is an Antidote againſt Poiſon, gives eaſe in the Colick, and other pains of the Stomach and Belly, and Kills Worms in Children. Doſe from half a Dram to a Dram in any proper Vehicle, morning and night.

XVII. *The Oil by Inſolation or Decoction.* Anointed on the Back-Bone, before the coming of Ague fits, it is ſaid to take them away, and allays the Inflamations of the Eyes being mixed with the Pulp of a Roaſted Quince and applyed: anointed alſo upon other Parts pained from a cold and moiſt cauſe, it eaſes the Pain, and ſtrengthens the part: and is ſaid to Kill Lice alſo in the Head.

XVIII. *The Balſam.* It is Abſterſive, Anodyn, drying, healing, and therefore good for the curing of ſimple Green Wounds, and old running Sores, and putrid Ulcers, more eſpecially if a little pouder of Scammony be mixed with it and applyed, beſides which, it ſtrengthens the parts, and hinders defluxions of humors upon the ſame.

XIX. *The Cataplaſm.* Made by boiling the Herb with Barly Flower, it is good againſt Pimples, Puſhes or Wheals, which appear or riſe in the face, or other parts of the Body. Made of the Bruiſed Herb and applyed, it draws forth Splinters and Thorns out of the Fleſh. The Pouder of the Herb, or its Tops and Seed made into a Cataplaſm with Pulp of Quinces and Crumbs of White Bread, and applyed to Inflamations in any part, it cools, allays, and eaſes the Pain.

XX. *The Aſhes.* They dry, and heal old Ulcers which are without Inflamation, although they be ſharp and bite much; they alſo heal Sores and Ulcers in the private parts of Man or Woman: mixed with Old Oil Olive, and a little Chymical Oil of Savin, and anointed upon a Bald

Bald Pate, it is ſaid to cauſe the Hair to grow again; and ſome ſay, that the juice thereof mixed with Oil does the ſame thing.

XXI. *The Diſtilled Water.* It is Diuretick, and ſaid to help them much which are troubled with the Stone; and prevails alſo againſt Wind, Vapours, and obſtructions of Liver, Splern, Reins, and Womb. It is not ſo grateful as Wormwood Water, yet ſtrengthens the Stomach, and other *Viſcera*.

XXII. *The Spirit.* It comforts and ſtrengthens the Head, Brain, Nerves, Eyes, Stomach, Spleen, Reins, and Womb, is good againſt Faintings, Swooning, Convulſions, and other diſtaſtfections of the Præcordia, &c.

XXIII. *The Diſtilled Oil.* It is prevalent againſt Palſies, Numbneſs, Tremblings, Cramps, Convulſions, Pains, Aches, and other like Diſtempers of the Head, Brain, Nerves, and other parts, being anointed upon the Sinus Dorſi and places affected: ſo alſo taken inwardly from 5 to 10 Dropts in any convenient Vehicle. It provokes Urine and the Terms, haſtens and facilitates the Birth and After-Birth, eaſes or prevents, after pains and coſtes due cleanſing, &c.

XXIV. *The Spirituous Tincture.* It has all the Virtues of the Juice, Eſſence and Infuſion, but is much more Stomachical, and may be given from 2 Drams to 4, in any convenient Vehicle.

XXV. *The Acid Tincture.* It is prevalent againſt the Plague or Peſtilence, Spotted Fever, Calenture, and all other Contagious and Infectious Diſeaſes; ſtrengthens the Stomach, and other *Viſcera*, cauſes a good Appetite and Digeſtion; and after an Emetick, is a ſingular good thing againſt Surfeiting and Drunkenneſs; and has indeed all the other Virtues of the Liquid Juice, Eſſence, Decoction and Pouder. Doſe, ſo many Drops as to make the Vehicle gratefully Acid.

XXVI. *The Oily Tincture.* It is a potent thing againſt Sand, Gravel, Stones, and Tartarous matter in the Reins, Ureters, and Bladder, gives eaſe in the Strangury, takes away Pain, Heat, and Scalding of Urine, is profitable againſt the Colick, expels Wind, provokes the Terms, haſtens and facilitates the Birth, After-Birth, &c. Doſe à gut. x. ad xxx. or more, (upon an Exigency) in any proper Liquor.

CHAP. DCXLIII.

Of SOW-BREAD.

I. *THE Names.* It is called in Greek, Κυκλάμινος: by the Arabians, *Buchomarien*: in Latine, *Cyclamen*, *Cyclaminos*, *Artanita*, *Panis Porcinus*, *Tuber Terræ*, *Terræ Rapum*: in Engliſh, *SowBread*.

II. *The Kinds.* Authors have given us many Species of this Plant, at leaſt a Dozen ſeveral kinds thereof; but we ſhall chiefly Treat of thoſe which are moſt common with us, which are the following, *viz.* 1. *Cyclamen Vulgare folio rotundo*; *Artanita Communis*, Our Common Sow-Bread. 2. *Cyclamen folio hederæ autumnale*, Ivie Leav'd Sow-Bread. 3. *Cyclamen Vernum flore purpureo*, Spring Sow-Bread Purple Flower'd. 4. *Cyclamen Vernum flore albo*, Spring Sow Bread White Flower'd. 5. *Cyclamen Romanum Rotundifolium*, Roman Sow Bread round Leav'd. 6. *Cyclamen æſtivum*, Summer Sow Bread.

The Deſcriptions.

III. The firſt, Or Our Common Sowbread, (which is moſt uſed in Apothecaries Shops.) *Its Root is round and not flat, of a brown color, and not ſo black on the Outſide as ſome of the others. It has many Leaves ſpread upon the Ground, riſing from certain ſmall long Heads, which grow from the greater round Roots, as thoſe of the following do, being in like manner with them folded together, and afterwards ſpread themſelves into round green Leaves ſomething like to the Leaves of Afarum, but not ſhining, without any white ſpots (for the moſt part) on the upperſide, and red or purpliſh underneath, and very ſeldom greener. The Flowers ſtand upon ſmall Foot-ſtalks, and ſhew themſelves open for the moſt part, before any Leaves do appear, being ſmaller and ſhorter than thoſe with the Ivy Leaves next following, and of a pale purple color, yet ſomewhat deeper, hanging down their Heads, and turning up their Leaves again, as all the others do, but more ſweet than any of the Autumn flowers. After the flowers are paſt, come the heads, turning or winding themſelves down in like manner as the others do, having ſuch like Seed as they have, but ſomewhat larger, and more uneven, or at leaſt not ſo round.*

Sowbread Common.

IV. Gerard, deſcribes this firſt Species after this manner. *Its Root is round like a Turnep, black without, and white within, with many ſmall ſtrings annexed thereto. It has many green and round*

Leaves, like unto Asarabacca, saving that the upper part of the Leaves are sometimes mixed here and there confusedly with white spots, and under the Leaves next the Ground of a purple color. Among which rise up little Stemms like unto the Stalks of Violets, bearing at their Tops small purple Flowers, which turn themselves back; and (being full blown) are in form of a Turks Cap or Tulip, having but a small smell, or almost none at all; which being past, little round knobs or heads succeed, in which are contained slender brown Seed. These knobs are wrapped after a few days in the small Stalks, as thread about a bottom, where they remain so defended upon the Ground, from the Injury of the Winters cold, covered also with the green Leaves aforesaid, by which means it is kept from the Frost, even from the time of its Seeding (which, is in September) *until* June; *at which time the Leaves fade away, the Stalks and Leaves remaining bare and naked; whereby having the power of the Sun upon them, they are the sooner brought to Maturity.*

V. The second, or Ivy Leav'd Sow-Bread. *Its Root grows to be great, being round and flat, and of a blackish brown color on the outside. It grows in the same manner which the others do; and brings forth flowers with the Leaves sometimes, or most commonly before them: whose flowers are greater than the common round leav'd Sow-Bread, somewhat longer than the Roman or Italian Sowbreads, and of a Paler purple color, almost blush, without that Sweet Scent as is in the next following. The greater Leaves hereof,*

Sow-Bread Ivy Leav'd.

are more long than round, pointed at the ends, and having also one or two corners on each side, sometimes much spotted on the upperside with white spots and marks, and sometimes but a little or not at all. And so likewise, sometimes more or less Purple underneath. All the Leaves and Flowers do stand usually every one severally by themselves upon their own slender Footstalks, as most of all the other kinds do. But sometimes it happens that both Leaves and Flowers are found growing from one and the same Stalk, which I take rather to be Accidental than Natural, so to continue. The Seed hereof is like the Seed of the other kinds, which being Sown produces Variety, both in the form of the Leaves, and color and smell of the Flowers, some being paler or deeper, and some more or less sweet than others. The Leaves are some of them more or less corner'd than others.

VI. The third, or Spring Sow-Bread Purple Flower'd. *This has a smaller Root than most of the others, yet round and blackish on the outside, as all or most of the rest are. From whence rise up divers round, but pointed Leaves, and something corner'd withal, green above, and spotted with white spots Circlewise about the Leaf, and reddish underneath, which at their first coming up, are folded together. From among which come forth the flowers, of a reddish purple color, and very sweet, every one upon a small, long, and slender reddish Footstalk, which hanging down their heads, turn up their Leaves again. After the Flowers are past, the Head or Seed Vessel shrinks down, winding its Footstalk, and Coiling it self like a Cable, which when it touches the Ground, abides there, hid among the Leaves, till it is grown great and ripe; in which are contained a few small round Seeds, which being presently Sown, will grow first into round Roots, and afterwards from them, shoot forth Leaves.*

VII. The fourth, or Spring Sow-Bread white Flower'd. *This is almost in all respects like the former; the chiefest differences being in its Leaves, which though they are much like the last described, yet are not fully so much corner'd: the flowers are also small, and Snow White, being full out as sweet as the former Purple Flower'd.*

VIII. The fifth, or Roman round Leav'd Sow-Bread. *Its Root is round and Black, and not so flat as some are, but growing sometimes to be greater than any other kind of Sow-Bread. It has round Leaves, something like unto the first or Common Sow-Bread, but not fully so round pointed at the ends, a little corner'd sometimes also, or as it were indented, with White spots round about the middle of the Leaves, and very conspicuous, which makes it seem the more beautiful. The Flowers come forth in Autumn, and are shorter, and of a deeper purplish red color, than the Ivy Leav'd Sow-Bread, rising up for the most part before the Leaves, or at least with them, and little or nothing sweet. There is sometimes some Variety to be seen both in the Leaves and Flowers of this kind, for that sometimes the Leaves have more corners, and are either more or less spotted with white. The flowers are likewise some larger or lesser, some longer or rounder, and some paler or deeper colored one than another; which happens very likely from the Sowing of the Seed, and quality of the Soil, as is oftentimes also seen in the Ivy Leav'd Sow-Bread. The Seed of this, (as of all the rest) is small and round, contained in such like heads as the former, standing almost like the head of a Snake, which is twined or folded within the Body thereof. This and the other Autumnal kinds, presently after their Sowing in Autumn, shoot forth Leaves, and so abide all the Winter, according to their kind.*

IX. The

IX. The fixth, or Summer Sow Bread. *Its Root is likewise ſmall, black, and round. It has round Leaves like unto the Roman Sow-Bread, but ſomewhat corner'd, yet with ſhorter corners than the Ivy Leav'd Sow Bread; full of white ſpots on the upperſide of the Leaves, and very purple underneath; ſometimes they have fewer ſpots, and little or no Purple underneath. The flowers are ſmall and as Purple, and as ſweet as the purple Sow-Bread of the Spring, at* Sect. VI. *aforegoing.*

APPENDIX.

There are ſome few other Species of this Plant, which though not common, yet becauſe they are to be found in the Gardens of ſome curious Floriſts, we ſhall adventure to add in this place.

X. *A ſeventh Species. Cyclamen vernum Creticum flore albo:* Candy Spring Sow-Bread white flower'd. This is almoſt in all things like to the former white flowered Spring Sow-Bread at *Sect.* VII. aforegoing, ſaving that the Leaves grow much larger and longer, with more corners at the Edges, and more eminent ſpots on them. The flowers are white alſo but ſomething longer and larger, in which things conſiſt the chief differences.

XI. *An eighth Species. Cyclamen folio hederæ autumnale flore albo:* Ivy Leav'd Sow-Bread white flower'd. This has its Leaves rounder, and not ſo much corner'd as the former Ivy Leav'd, at *Sect.* V. aforegoing. It flowers in Autumn as that does, but its flowers are wholly White, and has no other notable difference.

XII. *A ninth Species. Cyclamen anguſtifolium Autumnale:* Long leav'd Sow-Bread. Its Root is Tuberous and blackiſh; and by reaſon its Leaf is longer and narrower than others, it is eaſily to be diſtinguiſhed from all other kinds, it being faſhioned at its bottom with Points, ſomething like to Aron or Wake Robin Leaves. The flowers are like the other ſorts for form, but of a purple color. There is alſo another of this kind, in all things like this now deſcribed, ſaving that the flowers are white.

XIII. *A tenth Species. Cyclamen Antiochenum Autumnale flore purpureo duplici*: Double flower'd Sow-Bread of Antioch. Its Leaves are ſomething round, like unto the Leaves of the Summer Sow-Bread at *Sect.* IX. aforegoing, but with leſs notches or corners, and full of white ſpots upon them. It bears flowers on its Stalks like unto others, ſaving that they are double; and likewiſe ſome Stalks which have two or three of thoſe double flowers on them, which are very large, with ten or twelve Leaves apiece, like unto the flowers of the Spring Purple Sow-Bread, at *Sect.* VI. above, being of a fair Peach color, and deeper color'd at bottom.

XIV. *An eleventh Species. Cyclamen Antiochenum Autumnale flore ſimplici*: Single flower'd Sow-Bread of Antioch. This Species is alſo like the laſt deſcribed in its Roots, Stalks, Leaves, and Flowers, ſaving that the flowers of this are ſingle. There is alſo a Spring Sow-Bread of this kind with ſingle flowers, exactly like the eleventh ſort, differing from it only in the ſeaſon or time of flowering.

XV. *A twelfth Species. Cyclamen Antiochenum [illegible] duplici.* White [illegible] flower'd Spring Sow-Bread of Antioch. This is exactly like the tenth Species at [illegible] going, ſaving that this flowers in the Spring, which flowers are as large and as double as thoſe, and of a pure white color.

XVI. *The Places.* All or moſt of theſe grow in Foreign Countries as *Spain, Candy, Greece, Italy, France, and Germany*; but with us they are generally Nurſt up in *Gardens*. *Gerard* ſays, that he had heard it from Men of good Credit that *Sow-Bread* (the firſt common kind) grows upon the Mountains of *Wales*: on the Hills of *Lincolnſhire*, and in *Somerſetſhire*, upon a Fox Burough near to a Town called *Hardington*.

XVII. *The Times.* The Spring kinds flower in *March and April.* The Summer kind in *May, June and July*; and the Autumn kinds in the latter part of *Auguſt* and through the whole Month of *September*, when the Plant is without Leaf; which does afterwards ſpring up, continuing Green all the *Winter*, covering and keeping warm the Seed till *Midſummer* next, at which time it will be ripe.

XVIII. *Obſervat.* 1. Of the Spring *Cyclamen's*, ſome have round Speckled Leaves, Red Flowers and ſmell Sweetly, others have long Leaves, and White Flowers; others Yellowiſh Flowers, and others, whoſe Leaves are like Violet Leaves, and their Flowers Pale.

XIX. *Obſ.* 2. Of the *Autumn Cyclamen's* there are ſome whoſe Root is round and as broad as the Palm of Ones Hand, bearing a red Flower with a ſweet Smell. There blows one in this Seaſon, called the *Conſtantinople Cyclamen*, which the firſt year bears twenty flowers; the ſecond, fifty; the third, two hundred: but they have no ſmell. Others of them bear White Flowers: Other Flowers of a Carnation color. The *German* Cyclamen has a very great Root, and red flowers, but without any ſmell.

XX. *Obſ.* 3. They are raiſed by Seeds, but the Spring Cyclamens are to be Sown in the Spring, and thoſe of the Autumn, in the Autumn. They are rarely Sown in Borders or Beds, but in Pots, fill'd with a very light Earth mix'd with Mould, which when it is well prepared, the Seed is to be Sown in it; which ought to be full ripe, *viz.* when the Leaves are fallen, the Footſtalk quite ſhrunk up, and the head or Caſe containing the Seed opens of it ſelf.

XXI. *Obſ.* 4. They are to be ſet in the Ground an inch deep, and two inches diſtance aſunder; and then they are to be expoſed to the Sun, and prudently watered; that the heat and humidity which contribute to Vegetation, may cauſe them the ſooner to ſpring up. other Plants bring forth their Leaves firſt, but the *Cyclamen* firſt forms its Bulbs, and afterwards it Flowers.

XXII. *Obſ.* 5. They are not to be Tranſplanted till three years after they are Sown; and then they are to be put into Pots fill'd with Subſtantial Earth, abounding with Nitrous Salt: the larger the Pots are, the more room they will have to grow in, whereby they will the more extend themſelves, and produce the greater quantity and the finer flowers.

XXIII. *Obſ.* 6. When you Tranſplant them put their Bulbs two Inches deep in the Ground, not deeper, leſt they ſhould ſink, ſo as to deprive the Eye of theſe Plants from the Enjoyment of the Air, whereby hurting their ſpringing, you may for that reaſon hinder them

from producing their Flowers; they ought alſo to be kept warm, and Hous'd in Winter, for the Winters Cold is a Mortal Enemy to them in reſpect both to its Flowers and Leaves.

XXIV. *Obſ.* 7. The *Spring Cyclamen*'s ought to dwell in an Airy place, and where the Sun Beams ſtrike directly upon them, becauſe they begin to bring forth flowers at the end of Winter, when the heat of the Sun is very feeble or ſmall, and has no great power on Vegetables. But the *Autumnal Cyclamen*'s, are to plac'd in a little ſhade, becauſe they blow better, where the Sun Beams are not over piercing, than where they are expoſed to greater heat.

XXV. *Obſ.* 8. If the *Cyclamen* thus put into a Pot, ſhoots out abundance of new Branches, and you find it too cloſe therein, or that it begins to droop a little, you muſt immediately change the Pot for a larger, full of new Earth, and abounding with Salts, and then it will certainly thrive to your content.

XXVI. *Obſ.* 9. Always be ſure alſo, when you diſplant your *Cyclamens*, not to take away the Earth which is about their Roots; for if it happens that their Fibrous Roots are put out of order, they will not grow, and their Roots will decay and rot: wherefore the ſafeſt way will be, when you remove them, to take up Earth and all.

XXVII. *Obſ.* 10. Theſe Plants, tho' they may be multiplyed by Seed; yet they are ſooner propagated by Roots ſlipp'd of. One Stock is enough to produce a great many, becauſe it is a Vivacious Plant.

XXVIII. *Obſ.* 11. They are Multiplyed thus. As ſoon as the Leaves are fallen, pull up your Stocks, and cut them ſo when you ſlit them, that there may be one good Bud upon each Stock: then put them into a cool dry place; and let them remain there, till they are dry'd ſo much, that there will appear a ſort of Skin, on the part where you made the Inciſion.

XXIX. *Obſ.* 12. Then you muſt cover the cut place with Turpentine, or *Spaniſh* Wax, and ſo replant them, taking care to ſupply them at firſt with lean Earth; but afterwards, to fill the Pot, with a fatter ſort of Earth, not watering them preſently, or for ſome time, *viz.* till it begins to ſhoot; and then it is to be look't to, as before directed.

XXX. *The Qualities.* Authors ſay that Sow-Bread is hot and dry in the beginning of the third degree. And *Galen* ſays, it is Attenuating, Aperitive, and Abſterſive, Attractive, and Digeſtive, and an opener of the Mouth of the Veins, all which properties are manifeſt from the particular operations thereof. It is alſo Cathartick, given by Clyſter, or external Application: And tho' it may and has been given inwardly, yet it ought to be given with Caution by reaſon of its danger.

XXXI. *The Specification.* It opens Obſtructions, provokes the Terms, eaſes the Head-ach, helps the Spleen, gives eaſe in the Colick and Torments of the Bowels, is profitable againſt running Sores and Ulcers, and a ſingular thing againſt the Yellow Jaundice.

XXXII. *The Preparations.* You may make therefrom, 1. *A Liquid Juice.* 2. *A Decoction.* 3. *A Gargariſm.* 4. *An Ophthalmick.* 5. *An Otalgick.* 6. *A Pouder of the Root.* 7. *An Ointment Compound.* 8. *A Peſſary.* 9. *A Cataplaſm.* 10. *A Diſtilled Water.*

The Virtues.

XXXIII. *The Liquid Juice of the Root or Herb.* It opens the Hemorrhoids or Piles, and ſtrongly moves to Stool, being put up with Wool or ſome ſuch like, as a ſuppoſitory. And Clyſterwiſe *Meſues* ſays, it cauſes tough Flegm to be avoided. It is alſo mixed with ſuch Medicines as diſcuſs Swellings, Kernels, and other hard knots, in any part of the Body; and Snuffed up the Noſtrils as an Errhine, it purges (as the ſame *Meſues* ſays) the Head and Brain from evil humors which offend it; it eaſes alſo the Head-ach and the Megrim. *Galen* alſo farther ſays, that if the Belly be Bathed with the Juice, it will forceably move it downwards, and Kill the Child in the Womb.

XXXIV. *The Decoction in Water.* It has the former Virtues, but much weaker; It heals Wounds and running Sores in the head, eaſes pains in the Bones, and ſtrengthens Limbs out of Joint. It is ſaid alſo to cure Chilblains and Kibes, and give relief in the Gout.

XXXV. *The Gargariſm. It is made of the Juice,* 4 *Ounces mixed with Honey an Ounce, by diſſolving or melting the Honey in it.* It draws Rheum and Humors from the head and parts adjacent, gives eaſe in the Tooth-ach, and heals Sores in the Mouth and Throat.

XXXVI. *The Ophthalmick.* The Juice mixt with equal parts of Honey, it draws away the offending Humors in the Eyes by the Noſtrils being Snufft up, and outwardly applied to them, it removes that diſeaſe of the Eyes called the Pin and Web.

XXXVII. *The Otalgick.* Let the Root be Beaten with Peachſtone Kernels, and Bitter Almonds, and then ſteeped in a little Brandy for three days, after which preſs out the Milk or Cream. Two or Three drops of this being put into the Ears which are Deaf, or have a great Noiſe in them, gives relief after a ſhort time of uſing it.

XXXVIII. *The Pouder of the Root.* The Root either drank in Pouder, or uſed as a Peſſary, provokes the Terms in Women, and is profitable for ſuch as have the Yellow Jaundice, driving the diſeaſe forth thro' the Pores of the Skin. It may be given from 2 Scruples to a Dram, or Dram and half, in Mead, or Honied-water, and ſo it purges downwards tough and groſs Flegm; and other ſharp Humors. Taken in Wine it is ſaid to be profitable againſt all ſorts of Poiſon, and the Bitings of Venomous Creatures, being alſo outwardly applyed to the Part, and taken inwardly in White Port Wine, it opens obſtructions of the Liver and Spleen, and helps ſuch as are Purſy and ſhort winded; but ſome ſay it ought to be corrected with Pouder of Maſtich or Nutmeg, which hinders its Violence in purging; and thereby many have had help of the hardneſs and ſwelling of the Spleen, which could find no Remedy by the uſe of other things. It gives eaſe alſo in the Colick, Belly-Ach, and other Torments of the Bowels.

XXXIX. *The Ointment Compound, called* Unguentum de Artanita. *Take Juice of Sow-Bread* 3 *Pounds: Oil of Orrice* 2 *Pounds, freſh ſweet Butter, Juice of Wild Cucumbers, ana,* 1 *Pound: Polypodium* 6 *Ounces: Pulp of Coliquintida* 4 *Ounces: Euphorbium half an Ounce: The things*

to

to be heated over hot coals; let them be steeped in a Glass Bottle with Oil of Roses, set near the fire in a Table Height, and the Glass close stopped, then pour out the Liquor, and dip five Linen Rags in it, lay the Ointment ad ℔ *ss with* ℥ *ss of Sagapenum dissolved in Vinegar, Bull's Gall dittoed to the thickness of Honey,* ana *an Ounce: Ten fat inner Thighs of Wethers roasting in Powder, Summ. Turbith, Colocynth.* ana, *Roseroot Berries or Leaves, Aloes,* ana, 7 *Drams: Sal Gem half an Ounce: Euphorbium, long Pepper, Myrrh, Ginger, Camomil flowers,* ana, 3 *Drams; mix and make an Ointment.* It purges by anointing it upon the Stomach and Belly, and therefore is good for such as cannot take Purges by the Mouth; and so used it is good against the Dropsy, because it plentifully evacuates the Watery Humor. So anointed it also Kills Worms, and drives them out. Anointed upwards to the Pit of the Stomach it causes Vomiting. It is a strong kind of Purge, and doubtless is of extraordinary service in curing such as have the Dropsy, for the reason before Specified.

XL. *The Pessary.* It is made either of the Green Root, or of the Pouder of the Root. It strongly provokes the Terms, endangers miscarriage, facilitates the Birth, brings away the After-Birth, and forces away the Dead Child.

XLI. *The Cataplasm.* The Root made into a Cataplasm with a little Honey, and applyed, draws forth Splinters and Thorns out of the Flesh, and gives ease in the Pains of the Gout.

XLII. *The Distilled Water from the Roots. Matthiolus* says, that being Snuft up the Nostrils it wonderfully stays their Bleeding; and that if six Ounces of it be drank sweetned with an Ounce of fine Sugar; it will stop any Flux of Blood from the *Viscera*, as Stomach, Lungs, Liver, &c. after an admirable manner, yea tho' some Vessel or Vein be broken. If two Ounces of the Water is mixed with four Ounces of the Juice, and the Skin be Bathed therewith, and suffer'd to dry in, it cleanses it, takes away Freckles, Pimples, Scurff, Tanning, Sunburning, and all other deformities thereof.

CHAP. DCXLIV.

Of SOW-THISTLE.

I. *THE Names.* It is called in Greek Σόγχος (ἀπὸ τῦ σῶν γένειν, *quod Salubrem fundat Succum:*) in Latine, *Sonchus:* and in English, *Sow-Thistle.*

II. *The Kinds.* We make but two principal kinds of this Plant, *viz.* 1. *Sonchus Levis*, The Smooth Sow-Thistle. 2. *Sonchus asper*, The Prickly Sow-Thistle. Of the *first Species* there are several sorts, of which these are chief, *viz.* 1. *Sonchus Lævis vulgaris, Lactuca Leporina Apuleij, Brassica Leporina, Lactucella* being accounted by some as a kind of Wild Lettice.) *Intybus Sylvestris sive erratica Tertia Tragi*; *Endivia Sylvestris Lonicери*; *Andryala minor Dalechampij*; *Sonchus Lenis seu Lævis Cordi, Sonchus non asper, Sonchus vulgaris, Sonchus foliis Laciniatis*; Our Common Smooth Sow-Thistle. 2. *Sonchus Levis alter, Sonchus Levis floribus parvis*; *Sonchus alter profundis Laciniis Sinuato* [illegible] *Sonchus Lævis Sonchus Lævis Sonchus Sonchus parvus Lactucæ [illegible] Sonchus Sonchus Lævis Lactucæ Sonchus [illegible] Lactucæ Sonchus [illegible] Sonchus Lactucæ Sonchus [illegible] Lactucæ Sonchus [illegible] Sonchus Lactucæ Sonchus [illegible] Sonchus Lactucæ Sonchus [illegible] Sonchus

The Descriptions.

I. *Of the Smooth Kinds.*

IV. The first, or Our Common Smooth Sow-Thistle. *Its Root grows downright, and has many Fibres adjoining to it, perishing every year, and raising it self from the Sowing of its own Seed every Spring. It is a plant well known, and rises up with a round hollow Stalk, two, three, and sometime even four Feet high, if it grows in good ground, or in Gardens, as usually it does, set with many long and much torn leaves, of a whitish green color, not having that roughness, or those sharp prickles on them, which are in the Prickly Kinds. It Branches forth towards the Top into divers arms, all which bear pale yellow flowers, which pass away into down, which with the Seed are carried away with the Wind. The whole Plant being cut or broken, gives forth plentifully a White or Milky juice, which is more pleasant than that of the Prickly kinds, and not so bitter.*

V. The second, or Our Common lesser Smooth Sow-Thistle. *The Root of this is like the former, and it grows much like it, but not so high, nor has it so many Leaves set on its Stalk, but they are long and more torn on the Edges, else not unlike to the aforegoing. The many Branches of the Stalk have fewer and smaller leaves. The flowers are like, but much smaller than the first,*

Sowthistle Smooth small Common.

of the same pale yellow color in most, which pass into down, with the Seed are blown away with the Wind. And the whole Plant has the same, or like Milky juice with that.

VI. The third, or Broad Leav'd Sow-Thistle with White Flowers. *The Roots, Stalks, and*

Sow-Thistle broad Leav'd.

Sow-Thistle narrow Leav'd.

Leaves of this are like the laſt, but the Leaves are ſomething larger and broader, with fewer rents, cuts, or dreſſions on the Edges; the flowers hereof are like in form, but white, which with the breadth and roundneſs of the Leaves, make the principal differences. The Root and other parts of the Plant are Milky; and the leaves are great, ſmooth, green of color and ſharp pointed. And Johnſon *in* Gerard *ſays, that the flowers of this are for the moſt part yellow like as the former: and indeed all that ever I have yet ſeen have been of the yellow color; nor ever ſaw any of them white tended to white; though poſſible in ſome other Foreign Countries and Climates they may be really White.*

VII. The fourth, or Narrow Leav'd Sow-Thiſtle, *Its Root is long and ſlender, and gives Milk, as the whole Plant does beſides. It has but few Leaves, and thoſe very long and narrow, whoſe lower parts are narroweſt, and have no inciſure at all: but from the middle almoſt forwards, they are broader and have divers Gaſhes on both ſides, greater and deeper, and others ſmaller, eſpecially towards the ends where they are broadeſt. The Stalks grow ſomething low, and ſpread out into but one or two branches, which are ſet ſparingly with Leaves, the uppermoſt whereof are long, but not divided, or very little, and encompaſs the Stalk at the foot; which bear one large yellowiſh flower, upon a long ſtraked top branch, which being ripe, with the Seed fly away with the Wind.*

VIII. The fifth, or Great, or Tree Sow-Thiſtle. *Its Root is great and whitiſh, accompanied with many great Fibres or ſtrings, not periſhing in the Winter but encreaſing every year. It grows to the height of a Man, with a ſtrong Stalk,*

Sow-Thiſtle Tree, or Great.

as in Ind. or more rank in its Leaves, ſmooth, ſtraked, and without any prickles, about two or three many Leaves, divided into four, and sometimes into five divisions, placed on each side, one against another, and ſtanding as it were at the lower end, where they [illegible] ſtanding ſomewhat beyond the [illegible] The upper Leaves have no divisions, but ſtraked on the backs, but ſmall ones on the edges upon the dents, and are green on the upper ſide, and of a duſky underneath, the whole Plant being full of Milk. The Stalk is parted at the top into ſeveral branches, bearing at their tops many flowers ſet together, as it were in an Umbel, all of them being of an even height, which are ſmall in compariſon of the leaves of the Plant, elſe not much unlike thoſe of the Common Sow-Thiſtle firſt deſcribed, compoſed of many narrow Leaves, cut in at the ends, encompaſſing a middle thrum, which is more yellow, and when they are ripe falls into down with great ſtriped Seed therein, both which are carried away with the Wind.

IX. The ſixth, or Tree Sow-Thiſtle or Branched. *It has a great blackiſh Root with ſeveral Strings adjoining to it; from whence ſpring up ſeveral ſtrong, tall, round Stalks three or four feet high, without any Branches at all, but thick ſet with broad Leaves from the bottom to the top on both ſides, waved or cut in on the edges, ſmaller at the bottoms, and broader towards the ends, which are parted from the Tops of the Stalks, and likewiſe from the joints with the Leaves, come forth ſhort Foot-Stalks, with 2 or 4 ſmall Lettice, or Sow-thiſtle like flowers on them, which turn into down, which is carried away with the Wind.* Gerard *ſays, the Root is great, thick and hard, the Stalk of a Woody ſubſtance, the Leaves not unlike Langue-beef but not ſo rough and more deeply cut in about the Edges: that it has double yellow flowers, and the whole Plant being replenished with a Milky juice, ſhews it to be of the kind of Herby Sowthiſtles, otherwiſe that it might have been referred to the* Hawkweeds, *wherunto in face and ſhew it is very like. And* Johnſon *ſays, the heads and tops of the Stalks are very rough and hairy.*

II. *Of the Prickly Kinds.*

X. The firſt, or Greater Prickly Sow-Thiſtle with whole Leaves. *Its Root is long, yellowiſh, and ſomewhat hard when its grown up with a Stalk, having a number of ſmall fibres adjoining to it. Its Leaves are ſomething long and broad, of a whitiſh green color, unequally dented, but not gaſht or torn on the edges, and every dent ſet with a ſharp prickle, ſomewhat hard, and ſometimes prickly alſo along the middle rib, on the under ſide, yielding a more bitter Milky juice in every part, when cut or broken, than thoſe of the ſmooth kind. The Stalk is hollow, ſomewhat tender, and as it were winged, with a Film running upon it, rough and ſharp, ſet with ſuch like leaves, as grow below, diverſely branched; with ſmall pale flowers growing at their Tops, which turn into Down and are blown away with the Wind.*

XI. The ſecond, or Leſſer Prickly Sow-Thiſtle. *This is in all things like the former, but leſſer in every part, having a round Stalk, ſeldom above*

above a Foot high, somewhat firmer, and not so tender, with smaller leaves, but as sharp and prickly as the former, which are for the most part whole, and not rent or divided.

XII. The third, or Our Common Prickly Sow-Thistle. *Its Root is like to the others. Its Leaves are very much cut or torn on the Edges into three or four parts, much separate asunder one from another, and smaller pieces of Leaves set between them, of a whitish green color like the former, and having prickles on the dented Edges likewise. The Stalk grows very high sometimes, also rough and prickly, with such leaves thereon, as are below; branched at the Top, on which grow such like pale yellow flowers turning into down.*

XIII. The fourth, or Cretick Prickly Sow-Thistle. *Its first Leaves are little or nothing divided on the edges, of about an hand breadth long or more, but those which rise up with the Stalk, are very much torn in, into great and deep gashes, set with some prickles likewise. The Stalk is rough, straked and hollow, half a yard high, branched from the middle upwards, with such like leaves, set at the joints, but smaller. At the Tops stand large yellow Flowers, in rough green husks upon long Footstalks, which convert into down as the other do.*

XIV. *The Places.* The first four grow in Gardens and Manured Grounds, as also in Fallow Lands and Fields, and sometimes by Old Walks and path sides of Fields, and High ways. The fifth and sixth, grow among Willows and Reed, and sometimes by Old Walls, and Places of Rubbish, not often frequented, and many times in our Gardens. The Prickly Sow-Thistle grow in unmanured as well as in manured Soils, also in Pastures, Medows, Woods, Ditch sides, and moist Grounds, in Orchards also and Gardens, where the Leaves are usually lesser, and lesser divided, than in the rough and unmanured Grounds. The last grows naturally in *Candy*, and as I am informed has also been found growing in *England*, in several places.

XV. *The Times.* The first four Smooth ones flower quickly after they are sprung up, for it is late before they rise out of the Ground, and continue flowering till *August*. The Tree or Great Sow-Thistles flower in *July* and *August*. The Prickly kinds flower and shed their Seed from the middle of *June* all the Summer long, and sometimes even to the end of *August*.

XVI. *The Qualities.* They are cold and dry in the first degree, Anodyn, Deobstructive, and Diuretick, Pulmonick, Stomatick, Nephritick and Uterine.

XVII. *The Specification.* They cure Nauseousness at Stomach, and want of Appetite, Obstructions of the Lungs, shortness of Breath, and difficulty of breathing, help a Stinking Breath, provoke Urine, and are profitable against Stone, Gravel, Sand, or Tartarous matter in the Reins, Ureters and Bladder, causing the Strangury; facilitate the Birth, and cause speedy and easie Delivery to Women in Travel, ease pain in the Ears, help the Hæmorrhoids or Piles, take away Warts, and by a Cosmetick property cleanse the Skin from most defœdations usually attending it.

XVIII. *The Preparations.* You may make therefrom. 1. *A Liquid Juice or Essence.* 2. *A Decoction of the Herb in Wine or Water.* 3. *An Otalgick.* 4. *A Cataplasm.* 5. *A Distilled Water.*

The Virtues.

XIX. *The Juice or Essence.* The Milk or Juice taken from the Roots or Stalks, &c. helps such as are short Winded, and have a Wheezing withall. *Erasistratus* (as Pliny says) did therewith cause the Stone and Gravel to be voided by Urine, and that the eating of the Herb is profitable against a Stinking Breath. The Juice taken to the quantity of three Spoonfuls in a Glass of White Wine warmed (putting a little Oil Olive thereto) causes speedy and easie delivery to Women in Labor, and will make them to Walk presently after. The said Juice taken in Warm drink, or White Port Wine helps the Strangury, or Pissing by drops, and eases the pain in making Water.

XX. *The Decoction in Wine or Water.* It has the Virtues of the Juice or Essence, but not altogether so powerful, and therefore may be taken to half a Pint at a time, given to Nurses it causes them to have abundance of Milk, prevents their Milk curdling in their Breasts, and makes their Children healthy and well colored in the Face.

XXI. *The Otalgick.* It is made of the Juice mixt with a quarter part of Oil of bitter Almonds beaten together, and heat in the Peel or Shell of a Pomegranate. This being dropt into the Ears, is said to be a sure Remedy for Deafness, Noise, Ringing, and other Diseases of the Ears.

XXII. *The Cataplasm of the Herb* &c. The Herb bruised and bound upon Warts, is said quickly to take them away; and applied, (or the Juice of the Herb) to hot Inflamations of the Eyes, or other parts, as also to Pustules, Wheals, and other erruptions of the Skin, proceeding from heat, as also in the heat and pricking or Itching of the Hæmorrhoids or Piles, and heat and sharpness of Humors happening in the Secret parts of Man or Woman, it gives ease in all these cases, allays the heat or Inflamation, alleviates the pain, discusses the Tumor, and prevents farther mischief.

XXIII. *The Distilled Water.* It is not only effectual for all the Diseases aforesaid, to be taken inwardly a quarter of a Pint or more at a time, dulcified with a little white Sugar; but it is that which the most Nice Stomach will not refuse. Outwardly applied with Cloths or Spunge; wetted or dipt therein, it cools Inflamations, and abates the fiery heat of an *Erysipelas* or *Anthonies* Fire. And it is said to be wonderfully good for Women to Wash their Faces and Skins with, because it clears them of any defœdation or defilement, and adds a Lustre or Beauty thereto.

CHAP DCXLV.

Of SPEAR-WORT: *OR,* BANE-WORT.

I. *THE Names.* It has no Greek Name that we know of: but it is called in Latine, *Flammula* and *Ranunculus Flammeus:* in English, *Spearwort*, and *Banewort*, because it is said to

rot

rot, or exulcerate the Entrails of Sheep if they eat it, and kill them.

II. *The Kinds.* There are various sorts hereof, as, 1. *Ranunculus major*, The Greater Spearwort. 2. *Ranunculus minor*, The lesser or Our Common Spearwort. 3. *Ranunculus Scoticus*, Scotch Spearwort. 4. *Ranunculus Aquaticus*, Marsh-Spearwort. 5. *Ranunculus folio in undulato*, *Sceleratæ Apulei*, round leav'd Marsh Spearwort. This some will have to be the true *Apium risus*, or *Apium Sardonium*, whilst others are of another Opinion, taking that to be a kind of *Pulsatilla* or *Pasque-flower*.

The Descriptions.

III. The first, or Greater Spearwort. *It has a long jointed Root, stored with many blackish Fibres, from whence rise up a thick jointed smooth Stalk, two feet high, furnished with large and long shining and smooth Leaves, thicker than those in the next; some of them being more than half a foot long, and two or three Inches broad, but smaller up towards the top, where stand a few pale yellow Crow-foot like flowers, but larger than in the others.*

IV. This Plant Gerard describes thus. *Its Root is compact of divers bulbs, or long clogs mixed with an infinite number of hairy Threds It has an hollow Stalk full of Knees or Joints,*

Spearwort Greater.

on which do grow long Leaves a little hairy, not unlike those of the Willow, of a shining green color. The flowers are very large, and grow at the Tops of the Stalks, consisting of five Leaves, of a fair yellow color, very like to the Field Gold Cup, or Wild Crowfoot. After which come

round Seeds or Seed Vessels, in which the Seed is contained

V. The Second, or Lesser, which is Our Common Spearwort. *Its Root consists of an infinite number of Strings, but in its Stalks, Leaves, and Flowers it is much like the Greater, differing only it is altogether lesser. Its Root is small but*

Spearwort Common or less.

Spearwort Sawlike.

a bush of Fibres or Threds, which grow and run deep into the Mud. It grows up with a greater store of sappy green stalks, with thicker, narrower, and sharper pointed Leaves thereon, and a greater store of pale yellow flowers, like to those of Crowfoot; and the Vessels, Knobs or Seed, are also like to those of the Crowfoot.

VI. The third, or Sawlike Spear-wort. *Its Roots consists of a great number of hairy Strings. It is almost like the last, saving that this is oftentimes found, having the Leaves dented about the Edges, in more plenty than in the other, because both of them are often seen, the plain with some dented Leaves, and the dented with some plain Leaves among them. Its Stalk or Stalks, are thick, fat, and hollow, dividing themselves into divers Branches, on which are set sometimes by Couples two long Leaves sharp pointed, and cut in about the Edges like the Teeth of a Saw. The flowers grow at the Tops of the Branches of a yellow color, in form like those of the field Crowfoot.*

VII. The fourth, or Marsh Spearwort. *Its Root is like the former; and it has such like long Leaves as the lesser Spearwort has at* Sect. V. *above: which grow upon long Footstalks, but lesser and narrower by much. The Stalk is bare without Leaves, saving that at the Top where the flowers break forth, it has no small long Leaves. The flowers are smaller than those of the common small sort, but purely white, the Knobs and Seed being also alike. There is another sort of this kind, which we have had from* Bayon *in the Bay of* Biscay, *which grows in their Marshes near the Sea Coast; whose Roots are like the former, Stalk Branched, Leaves long and narrow, and sharp pointed at the ends, bearing larger yellow flowers than the former.*

VIII. The fifth, or round Leav'd Marsh Spearwort. *Its Root is a bush of small white strings growing in the Waterish Mire or Mud. From which shoots forth a Stalk round and hollow, about half a yard high, spreading it self forth into several Branches, the lower Leaves of which are rounder than those above, and are divided much like to those of Doves Foot, or Cut Mallow, but something greater, of a bright shining color. These Leaves are divided some into 3 parts, which are the first and lowest, and others which are higher on the Stalk, into five divisions, and each of them dented about the edges, somewhat like unto Coriander Leaves, which are smooth, and of a paler green color. Those which are yet higher on the Stalks and Branches, are still more and more divided, and some of the highest, have no division or Dent in them at all. At the Tops of the Stalk and Branches stand small yellow flowers, like unto those of Water Crowfoot (but* Cordus *says that he has observ'd some to bear Purplish Flowers:) after which come small long round heads, in which many Crooked Seeds are set together, as in the other sorts is to be seen.*

IX. *The Places.* They all grow in Moorish and Wet Grounds, and sometimes by standing Waters, Ponds and Ditch sides, almost every where. The first is more scarce to be met withall, but the two next are plentifully enough in many parts of *England.* The two last are not so common, but are also to be found in Marsh and Wet places, in several parts of this Land.

X. *The Times.* They flower in *May, June,* and *July,* and give their Seed in *June, July* and *August,* or soon after.

XI. *The Qualities.* It is hot and dry in the fourth degree; raises Blisters, and being taken inwardly kills without Remedy. It opens Apostems, is profitable against Rooted and Putrid Ulcers, drawing out their Superfluous moisture. It is said to be good against the Palsy, and help Quartans, as *Paracelsus, Dodonæus* and others say. And the last or round Leav'd sort is as sharp and virulent, as any of the other kinds. They are in Faculties and Virtues like to the *Water, Field,* and other *Crowfeet,* whose *Specification, Preparations,* and *Medical Uses,* see in *Chap.* 176. *Sect.* XXV. *ad* XXXIV. aforegoing of this Book.

CHAP DCXLVI.

Of SPE'ED-WELL: *OR,* PAULS BETONY.

I. *THE Names.* It has no *Arabick* nor *Greek* Names that I know of: but it is called in Latine, *Veronica, Veronica Pauli, Veronica Mas*: in English, *Speedwell,* or *Pauls Betony.*

II. *The Kinds.* Authors make two kinds hereof, *viz. Mas & Fœmina.* The *Mas* or Male kind is called *Speedwell Pauls Betony,* and by Dodonæus, *Betonica Pauli Æginetæ*: of which in this Chapter. The *Fœmina,* or Female kind is called *Fluellin and Elatine,* of which we have already Treated in *Chap.* 295. aforegoing of this Book, this being another Herb, of a differing form (as *Parkinson* says) from *Speedwell.*

III. *The Kinds of Speedwell.* Authors make at least half a Score Species thereof, but most of them growing on the *Alps*, and in *Austria,* Mount *Baldus, Hungary, Styria* and other Forreign places far distant from us, I shall overpass them, and only Treat of such as grow in *England,* which are the two following, *viz.* 1. *Veronica, Veronica Vulgaris Veronica Mas, Veronica Mas Vulgaris Supina, Veronica Pauli, Betonica Pauli, Tencrium Tragi,* Our Common Speedwell. 2. *Veronica minor, Veronica pratensis minor, Veronica minima,* Our small Medow Speedwell.

The Descriptions.

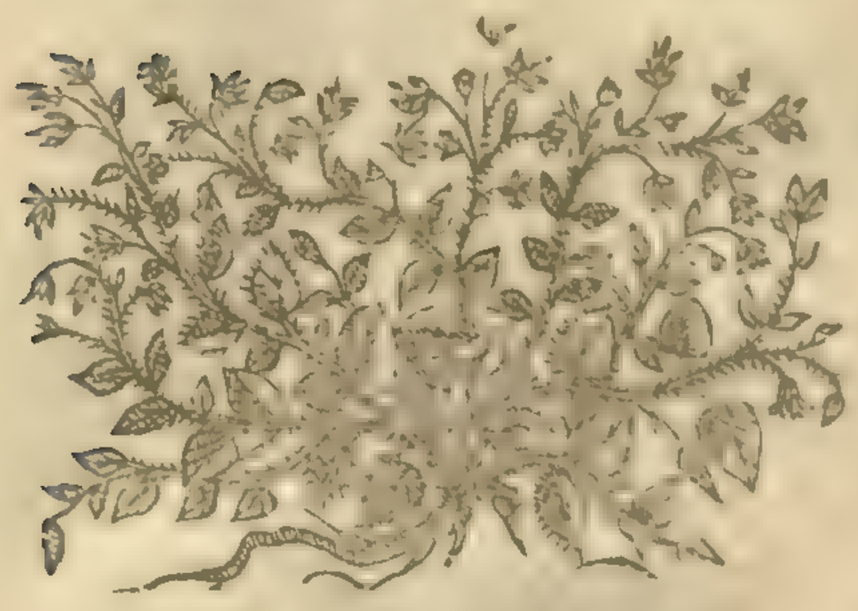
IV. The first, or Our Common Speedwell. *It has a Root running under Ground, and consisting of many Fibres. It rises up with divers soft Leaves, of an hoary green color, a little dented about the Edges, and somewhat hairy also, set by couples at the joints of the hairy browniish Stalks, which lean down to the Ground, never standing upright, but shooting forth Roots as they lye upon the Ground at divers joints. The Flowers grow one above another at the Tops, being of a blewish purple color, and sometimes of a white color; after which come small flat husks in which is contained small blackish Seed.*

V. The second, or Our small Medow Speedwell. *Its Root is Woody, creeps with small Fibres*

or

or Swangy, in the same manner as the former. It has many Roots, smaller, slender, and rounder than that, growing by Couples on the downs spreading Strings, and in the 4 g. several

Speedwell Medow Small.



small blew flowers, succeeded by very small brownish Seed, in small Seed Vessels. Gerard *says at the Tops of the Stalks or Branches come forth slender Spikes, closely thrust together, and full of bleeish flowers, which are succeeded by many horned Seed Vessels.*

VI. *The Places.* The first grows almost in all parts of *England* upon dry Banks and Wood sides, but more especially upon other waste Sandy Grounds: in Borders of Fields, in Woods and on Grassy Mole Hills, almost every where. The second is more scarce, but has been found in a close by *Barns* near *London*, and in several other Places: I have formerly found it also in some Medow Grounds near *Lyn Regis* in *Norfolk*.

VII. *The Times.* They flower all *June* and *July*, and sometimes in *August*, and their Seed is ripe in *July*, *August* and *September*.

VIII. *The Qualities.* Speedwell is temperate in respect to heat or coldness, dryness, or moisture; but is said to be a little inclining to dryness: it is Aperitive, Abstersive, Cosmetick, Diuretick, Vulnerary. Pectoral, Stomatick, Nephritick, Sudorifick and Alexipharmick.

IX. *The Specification.* It prevails against the Scurvy and all foulness and Corruption of the Blood and humors. opens Obstructions of the Stomach, Lungs, Liver, and Reins, prevails against old Coughs, Ulcers, and Inflamations of the Lungs, and other Diseases of these parts; is an excellent Antidote against the Measles, Small Pox, Purples, all Malign, Spotted and Pestilential Fevers, and the very Plague or Pestilence it self; it also prevails against fretting Old Sores, consuming or eating Ulcers, spreading Ringworms and Tettars, malign herpes, and other like distempers of the External parts.

X. *The Preparations.* You may make therefrom, 1. *A Liquid Juice.* 2. *An Effence.* 3. *A Decoction in Wine or Water.* 4. *A Pouder of the Herb and Flowers.* 5. *A Cosmetick.* 6. *A Balsam or Ointment.* 7. *A Cataplasm.* 8. *A Spirituous Tincture.* 9. *An Acid Tincture.* 10. *An Oily Tincture.* 11. *A Distilled Water.* 12. *A Spirit.*

The Virtues.

XI. *The Liquid Juice.* Drank to the quantity of four Spoonfuls morning, noon and night, [illegible] *a Drunk Dog* [illegible] *the Liquor was used of in for the use of this Sign, being advised thereto by one of the Brethren* [illegible] *Worshipful Helps the Memory, and all Conclusions or Swimming of the Head and other Headach.* It is [illegible] *Pectoral which we Brew, and Cosmetick Drams* [illegible] *taken with a good part of Posset Ale.* It is good for all grievances of Coughs, Colds, [illegible] *Breast and Lungs.* This thing [illegible] *by Shepherds, who give this Juice with a little Salt, to their Sheep which are troubled with the Cough.* It opens [illegible] *and Spleen, and prevails against the Yellow Jaundice, being taken for* [illegible] *and a Cataplasm of the Herb* [illegible] *plied to the Region of the Spleen* [illegible] *It cures Ulcers of the Reins, Bladder, and Womb, or any other Inward Wound or Ulcer, provokes Urine, and helps such as are troubled with the Stone. Pimples in the Face,* [illegible] *it is of good use for Diseases of the Paps and Breasts.* It is of good use to heal all [illegible] *Green Wounds, as well inward, and is no less effectual against spreading Tetters, Scald Head, Fretting, and Running Sores and Ulcers* [illegible] *been of long continuance and* [illegible] *to be cured.* It stops the Bleeding of Wounds [illegible] *all other Issues of the Blood in any part, and dissolves Tumors of Swellings* [illegible] *in the Neck, &c.*

XII. *The Essence.* It has all the former Vertues, but much stronger, and may be daily given as the former, from two to three Spoonfuls in any convenient Vehicle.

XIII. *The Decoction in Wine or Water.* It has all the Virtues of the Juice and Effence, but is much weaker, and therefore may be given from four to eight ounces at a time; it is truly an excellent Vulnerary.

XIV. *The Pouder of the Herb and Flowers.* It has the Virtues of the Juice and Essence, but acts not with that speed and facility, because it is first to be digested in the Stomach. It is a singular thing against the Plague, and all Pestilential Fevers and Infectious Diseases, to defend the Heart and expel their Poyson and Malignity, to corroborate the Heart and Stomach, and preserve them from Noysom and Infectious Vapors, being daily given morning and night a Dram or two at a time [illegible] *me,* or mixt with a Dram or two of [illegible] *Treacle or Mithridate,* in a small [illegible] *of Wine,* and so laid down to sweat upon it.

XV. *The Cosmetick. It is made of the Depurated Juice mixed with an equal quantity of the Distilled Water.* It cleans the Skin from yellowness, Sun burning, Tanning, and other discolorings thereof. And if White Vitriol 2 or 4 Drams to a quart of the mixture be dissolved in it, it is admirably good against Scabs, Itch, Scurff, Morphew, Tettars, Ring-worms, and all other defœdations of the Skin.

XVI. *The Balsam or Ointment.* The Juice or Effence being daily taken inwardly, and either of these used outwardly, they heal all simple Green Wounds, many times at the first Intention, and digest, cleanse, incarnate, and heal all Putrid Ulcers, and other running Sores in what part of the Body soever.

XVII. *The Cataplasm.* It is made of the

Green Herb, and is of ſingular good uſe to heal all ſimple Green Wounds, in what part of the Body ſoever, to take away hot and ſharp humors, diſcuſs Contuſions, *&c.*

XVIII. *The Spirituous Tincture.* It is good againſt Faintings, Swoonings, indigeſtion of the Stomach, Sickneſs at heart, and other indiſpoſitions of the *Viſcera*, and has all the other Virtues of the Liquid Juice or Eſſence. Doſe 2 Drams to 4 in a Glaſs of Wine, morning and night, or at time of the *Deliquium.*

XIX. *The Acid Tincture.* It is an incomparable thing againſt the Plague or Peſtilence, and all Peſtilential or Infectious Diſeaſes, as Meaſles, ſmall Pox, Calenture, Purples, Spotted Fever, and the like, it ſtrengthens and fortifies the Stomach, reſiſts putridity of the Blood and Juices, cauſes a good Appetite and ſtrong digeſtion. Doſe ſo many drops as may give a Glaſs of Wine, or other Vehicle, a pleaſing Acidity.

XX. *The Oily Tincture.* It is a ſingular thing to open Obſtructions and cleanſe the Reins, Ureters and Bladder, of ſmall Stones, Gravel, Sand, and Tartarous matter lodged in thoſe parts, to give eaſe in the Strangury, and help pains and weakneſſes of the Back, *&c.* Doſe à gut. xvi. *ad* xxx. in any fit Vehicle.

XXI *The Diſtilled Water, ſimple or diſtilled from Wine.* It has the Virtues of the Juice, but in a much inferior degree, taken inwardly ſweetned with Honey, or Sugar Candy, it is good againſt Coughs, Colds, Conſumptions, and other Diſeaſes of the Lungs.

XXII. *The Spirit.* It is Stomatick, Cordial and Alexipharmick, good againſt Faintings, Swoonings, Palpitation of the heart, Sickneſs at Stomach, Colick, and other inward pains of the Bowels. Doſe from 2 Drams to 4, in a Glaſs of Wine.

CHAP. DCXLVII.

Of SPIKNARD *European.*

I. *THE Names.* It is called Greek Νάρδος κελτικὴ: in Latine, *Nardus Celtica*, *Nardus Spuria*, and *Pſeudonardus:* in Engliſh, *Celtick*, or *European Spiknard.*

II. *The Kinds.* Authors have given us almoſt half a Score Sorts, of this Plant: we ſhall only deſcribe thoſe which are moſt common, and ſuch as are to be had with us: which are, 1. Νάρδος κελτικὴ, *Nardus Celtica Dioſcoridis*, *Spica Celtica*, *Nardum Gallicum Cæſalpini*, Mountain or Celtick Spiknard. 2. Νάρδος ὀρεινὴ; *Nardus Montana*, *Nardus Celtica Cluſij*, *Spica Celtica Matthioli*, *Nardus Celtica altera*, The other Celtick Spiknard. 3. *Nardus Montana Tuberoſa*, Tuberous Mountain Spiknard. 4. *Nardus Spuria Narbonenſis*, *Nardus Gallica*, *Nardus Spuria Gallica*, *Nardus Gangitis* (from the Town *Ganges* near which it grows in *France*) Baſtard *French* Spiknard.

The Deſcriptions.

III. The firſt, or Mountain or Celtick Spiknard. *It creeps upon the Ground under the looſe Leaves and Moſs, with ſmall, long, and hard ſlender Roots, (which ought to be ſo called rather than Stalks) in which conſiſts the whole Virtue and Efficacy of the Plant, and are only uſed (by the beſt Apothecaries) in Mithridate, and no part of the Plant elſe. Theſe Roots are covered with many ſhort, ſmall, dry Leaves like Scales; and ſend forth in divers places as they creep and ſpread, here and there, ſmall blackiſh Fibres into the Earth, whereby it is nouriſhed. At the head or heads of which come forth ſeveral ſmall buttons, or heads, from whence ſpring many ſmall, narrow, and ſomewhat thick green leaves, not divided or dented at all, which are ſmalleſt at the bottom and broad towards the end, and change yellow in the end of Summer or beginning of Autumn. From among theſe Leaves riſe up ſometimes more, and ſometimes but one ſlender ſtalk, without any Leaves thereon; at the Top whereof ſtand many ſmall whitiſh Flowers, like unto the ſmaller ſorts of Valerian, every one on a ſlender Footſtalk, which afterwards yield ſmall Seed like to them alſo. The whole Plant is ſweet and Aromatical, more than the Indian Spiknard, hotter alſo, and ſharper in Taſte.*

Spiknard Celtick.

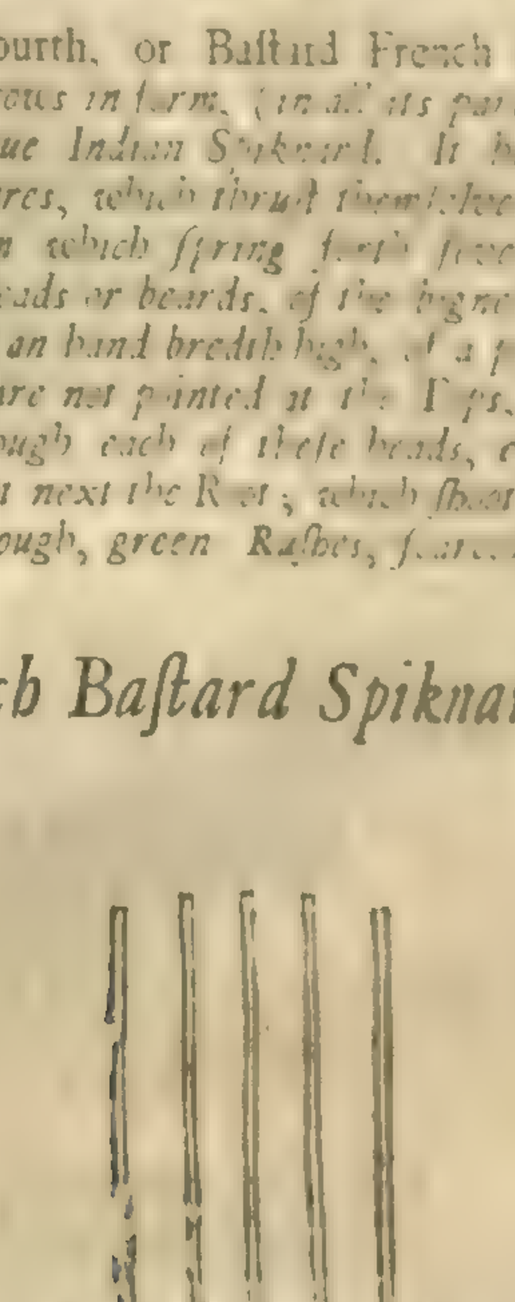
IV. The ſecond, or other Celtick Spiknard. *This in its Roots, Fibres, Leaves, Stalk, Flowers, and Smell, differs nothing from that firſt deſcribed, but in its Stalk of Flowers, which in this is branched towards the Top, bearing three or four Flowers together in a Tuft, at the end of every ſmall branch.*

V. The third, or Tuberous Mountain Spiknard. *Its Root is Tuberous or Knobbed both above and below, and round about it, with ſome Fibres ſhooting from them, by which it is increaſed, and ſmells very like the Root of the Garden Valerian or Setwall, yet not altogether ſo ſtrong being green, as when it is dry. This kind of Spiknard or Valerian (call it which you will) has its firſt Leaves lying on the Ground, without any diviſion in them at all, being ſmooth and of a dark green color, which ſo abide all the Winter; but thoſe which ſpring up afterwards upon the Stalk when it runs up to flower, are cut in on the Edges, like unto the Jagged Leaves of the great Garden Valerian, and ſo the elder*

elder they grow, the more cut and Jagged they are. The Stalk and Flowers are much like the Stalk with Flowers of the Garden Valerian, or as Gerard says like those of the Wild Valerian, in Shape and color, growing in an Umbel or Tuft; the Flowers are of a dark or deep red color, and a greater part of them shut together; the Seed also not being unlike to that of the Valerian.

VI. The fourth, or Baſtard French Spiknard. *This Plant grows in form, (in all its parts almoſt) like to the true Indian Spikenard. It has a few ſmall hard Fibres, which thruſt themſelves into the Ground, from which ſpring forth ſeveral hairy round ſpiky heads or beards, of the bigneſs of ones finger, and of an hand breadth high, of a pale brown color, which are not pointed at the Tops, but dat, or blunt, through each of theſe heads, even from the loweſt part next the Root; which ſhoot forth divers long, rough, green Rushes, ſcarcely a foot*

French Baſtard Spiknard.



high, many of them growing cloſe one to another, ſo that they make the form or ſhew as it were but of one Plant, which are likewiſe ſaid to be altogether without ſmell, except theſe hairy ſpiky heads or Beards, which being larger than the Indian kind, do ſmell ſomething like to the Moſs growing upon Oak Trees, or that other which grows upon the Ground. Theſe heads being half way in the Ground, do ſend forth each of them in the middle of thoſe Rigid Rushes, a tall ſlender and ſmooth Stalk, riſing about a Cubit higher than the Rushes; from the middle whereof up to their Tops, on each ſide, come forth many ſmall, Green Cods, pointed at the ends, ſtanding in Cups, like to thoſe of Cranes Bill. The whole form hereof does ſo nearly reſemble the true Indian Spiknard, as Pena, *and others have obſerved, that among a number of bundles*

of Indian Spiknard, they have found [illegible] and the parts of Indian Spiknard, [illegible] and is [illegible] makes it use of Duke, than the true Indian Baſtard Spiknard of the Indies.

VII. *The Forms.* [illegible] on the Sandy Mountains and Rocks in many parts of France, as Pena and others [illegible] in Italy and many places [illegible] Mediterranean Sea, and not far from a [illegible] lage in France, call'd Gonet. Gerard [illegible] the firſt and ſecond grow [illegible] of England, called [illegible] the Mountain Ingleborough [illegible] Mountain in England. But that we [illegible] up in Gardens with us.

VIII. *The Times.* They all [illegible] in the Summer Months viz. in June, July and Auguſt, ſome earlier, and ſome later than others. The Leaves begin to Wither in September, at which time they ſmell moſt pleaſantly, then when they flouriſhed and were green.

IX. *The Qualities.* [illegible] and dry in the ſecond Degree. Diuretick, Emmenagogick, Stomatick, Neurotick, Cephalick, Nephritick, and Alexipharmick.

X. *The Specifications.* It is good againſt Wind, Gripings in the Bowels, Colick, Fainting, Swooning, Convulſions, Strangury, Obſtructions of the Spleen, Reins and Bladder, Bites of Venomous Beaſts, Peſtilential Diſeaſes, and expels poiſon.

XI. *The Preparations.* You may make three from, 1. *An Infuſion or Decoction in Wine.* 2. *A Powder.* 2. *An Infolated or Dryed Oil.* 4. *A Spirituous Tincture.* 5. *An Acid Tincture.* 6. *An Oily Tincture.* 7. *A Diſtilled Oil.* 8. *A Diſtilled Water.*

The Virtues.

XII. *The Infuſion or Decoction in Wine.* It ſtops fluxes of the Bowels, but provokes Urine, is Stomatick, and good againſt loathing of Food, or Nauſeouſneſs, gnawings in the Stomach, ſickneſs at heart, and Wind oppreſſing the Bowels. The Decoction in Water uſed as a Bath, is good againſt Fits of the Mother and weakneſs of the Womb, drying up humors in thoſe parts. The Infuſion or Decoction in Wine with a quarter part of Wormwood, is a moſt excellent Stomatick, profitable againſt the Colick, want of Appetite, ill Digeſtion, Vomiting, &c. Drink a quarter of a Pint at a time, morning, noon, and night.

XIII. *The Powder.* It may be given from a Scruple to a Dram, mixt with Honey, or any other convenient Vehicle, and has all the Virtues of the Infuſion or Decoction. It is a ſingular ingredient in Mithridate, that chiefly made of the firſt Species; for tho' the Indian Spiknard is always intended there, yet when that cannot be had, this firſt kind always ſupplys its place. It is ſaid to be good for ſuch as are Liver-grown, or have the Rickets, and alſo for the yellow Jaundice, Bloody Flux, and the ſtinging or biting of any Venomous Creatures, as alſo to expel poiſon, being inwardly taken. Snuft up the Noſtrils, it excellently purges the Head and Brain.

XIV. *The Infolated or Dryed Oil.* It is warming, Anodyn, and comfortable to the Nervous parts: It thins thick and congealed humors, digeſts thoſe which are crude and moderately [illegible] and ſtrengthens the parts which are looſe, [illegible] and

and weak, and is ſaid to be profitable againſt Tremblings, Palſies, and the like.

XV. *The Spirituous Tincture.* It has the Virtues of the Infuſion and Decoction, is good againſt malign Fevers, and the Poiſon and Infection of the Plague or Peſtilence, and all Peſtilential Diſtempers; it comforts the Head, Brain, Nerves and all the *Viſcera*, chiefly the Stomach and Heart, warms, digeſts, ſtops thin diſtillations of Rheum, eaſes pains proceeding from cold, as alſo the Colick, and is profitable againſt Palſies, Convulſions, Cramps, &c. Doſe from one to two Drams in a Glaſs of generous Wine.

XVI. *The Acid Tincture.* It is a potent thing againſt all ſorts of hot Burning Fevers, and more excellent than the former againſt all ſorts of malign Fevers; the Plague, and all kinds of Peſtilential Diſeaſes, becauſe beſides the deſtroying the Putridity, it takes off (as it were upon the ſpot) the preternatural heat, and reſtores the Sick to their natural temper. Doſe ſo many drops as to make the Vehicle pleaſant, and to be repeated as often as the Patient drinks.

XVII. *The Oily Tincture.* It is a good againſt the Colick and Gripings of the Guts, Pain and weakneſs in the Back and Reins, the Strangury, the Stone, Gravel, Sand and Tartarous matter in the Bladder, and other Urinary parts. It comforts all the lower *Viſcera*, and is of ſingular good effect, againſt Tremblings, Palſies, pains and weakneſſes of the Nerves and external parts proceeding from Colds, over-ſtraining of the Limbs, or any other external hurt, or defluxions of Cold humors from other parts; It is good to diſſolve Nodes, and other hard ſwellings, and is profitable againſt Diſeaſes of the Spleen, Reins and Bladder. Doſe gut. xx. ad xl. or more dropt into Sugar, and then mixt with any convenient Vehicle.

XVIII. *The Diſtilled Oil.* It is antiparalytick almoſt in the laſt degree, and a potent medicament againſt trembling of any part, weakneſſes of the Nerves and Tendons, Cramps, Convulſions, and other like Diſeaſes of the Neurotick parts, as the Stomach, Bowels, Meſentery, *&c.* giving eaſe in the Colick, and other inward pains, Fits of the Mother, Fainting, Swooning, *&c.* almoſt in a moment. Inwardly it may be taken morning and night from vj. to xij. or xx. drops, in any fit Vehicle. Toaſt ſome white Bread very hard and then pouder it; drop this Oil upon it; mix them well together, and then with the Vehicle you intend to give it in, and ſo let the Patient drink it. Outwardly anoint it upon the Back Bone, and the other Parts affected twice a day.

XIX. *The Diſtilled Water.* Let the Groſs Pouder a Pound of it, be digeſted in White *Lisbon* Wine a Gallon, for 6 or 7 days, and then diſtilled in Balneo. The Water hereof is of ſingular good uſe for Palſies, Tremblings, Convulſions, Weakneſſes, and all cold indiſpoſition of the Members, uſed both inwardly and outwardly. It comforts the Head, Brain, Nerves, Stomach, Heart, and other *Viſcera*, ſtops Catarrhs, eaſes pains from a cold cauſe; and helps alſo in all ſuddain paſſions of the heart, and gives eaſe in the Colick, 2 or 3 Spoonfuls thereof being taken upon the occaſion.

Where Note: *That the French Baſtard* Spiknard *is never uſed, as being a Plant which has little or no Virtues obſerved to be in it.*

CHAP. DCXLVIII.

Of SPIKNARD *Plowmans.*

I. *THE Names.* It is called in Greek, Βακχαεὶς, *Baccharis*; or as ſome will have it Νακχαεὶς *vel* Νανγαεὶς, *Paccharis* or *Pancharis* (from its excellent ſmell:) in Latine, *Baccharis*; and in Engliſh, *Plowmans Spiknard*, and *Baccbar*.

II. *The Kinds.* *Pliny* ſays that in his time it was called *Nardus Ruſtica*, but as he ſays, and ſo we alſo ſay, it was an error in them which did ſo call it: but its general Name is *Baccharis*, and *Baccharis Monſpelienſium* (altho' it alſo grows in *England*:) *Conyza major altera Dodonæi*; *Conyza major Matthioli Lugdunenſe*, *Conyza major vulgaris Bauhini*, (in his *Pinax*) in Engliſh, *Bacchar* and *Plowmans Spiknard*. *Parkinſon* tells us of two ſorts of this Plant, *viz.* This treated of in this Chapter, and a *Syrian kind*; but the latter being unknown in our Climates, we ſhall ſay no more of it in this work. Tho' Cuſtom has prevailed upon us, to call it *Spiknard*, yet it is no ſuch thing, nor in the leaſt akin, or has it any relation to that Plant.

The Deſcriptions.

III. *Its Root conſiſts of many Strings and Fibres, buſhing ſomewhat thick, not running deep into the Ground, but ſo taking hold of the upper Face of the Earth, that it may eaſily be pull'd up with ones hand, the ſmell whereof is ſomewhat like to* Avens, *but the Scent is leſs ſtrong when growing in Gardens, than growing Wild; like as* Avens *when made a Garden Plant, and ſeveral other ſweet Herbs, which are of thin and ſubtil parts. It ſprings up with divers ſomewhat long and large* Leaves, *full of Veins, lying upon the Ground, which make it ſeem as if it were Crumpled; ſoft and gentle in handling, and of an overworn green color, ſeeming to be Wooly. From among which, (in the Summer time) riſes up a ſtrong ſtiff Stalk, three or four Feet high, ſet with divers ſuch like Leaves, but ſmaller up to the Top; where it is divided into many Branches, at the ends whereof comes forth ſeveral flowers, three or four, for the moſt part, at the end of every ſeveral branch, and every one on a ſmall Footſtalk. Which flowers conſiſts wholly of ſmall* Threads or Thrums, *ſtanding cloſe and round, and never laid open like other flowers, which conſiſt of* Leaves: *They are of a dead or purpliſh yellow color, appearing out of greeniſh Scaly heads, which Thrums turn into a Whitiſh Down. At the bottom whereof is the Seed, ſmall and chaffy, which together with the Down, is carried away with the Wind, and riſes or ſprings up in ſeveral places of the Garden where it is once Planted, and bears Seed.*

IV. *Gerard* deſcribes it after this manner. *Its Root is thick, groſs and fat, ſpreading about in the Earth, full of Strings; the fragrant ſmell that this Plant yields may well be compared to the ſavor of* Cinnamon, *or* Helenium, *being a Plant known unto very many or moſt ſorts of People, in moſt parts of* England. *It has many blackiſh rough* Leaves *ſomething bigger than* Primroſe Leaves; *among which riſes up a Stalk two Cubits high, bearing at the Top, little Chaffy or Scaly flowers in ſmall Bunches, of a dark yellowiſh or purple color, which turn into Down, and*

and are carried away with the Wind, like unto the kinds of Thistles. Johnson *in* Gerard *says, that this Plant here described is the* Conyza major Matthioli, Tragi, *and others.*

V. *The Places.* It grows plentifully about *Mompelier* in *France*, and in many other Countries. It delights in rough and Craggy places, and in a lean and dry Soil, where there is no moisture. And *Gerard* says, that it grows in divers parts of the Welt of *England.*

VI. *The Times.* It flowers with us, about the end of *July*, or beginning of *August*. *Gerard* says, it springs up in *April*, flowers in *June*, and perfects its Seed in *August*.

VII. *The Qualities.* It is Temperate in respect to heat or cold, and dry in the first degree; Astringent or Binding, Pectoral, Nephritick, and Alexipharmick.

VIII. *The Specification.* It is a remedy for Asthma's, Coughs, Colds, Inflamations of the Eyes, swelling of Womens Breasts, Stops Fluxes of the Bowels, and as *Pliny* says, helps to break the Stone.

IX. *The Preparations.* You may have therefrom, 1. *The Green Root.* 2. *A Decoction of the Root.* 3. *A Pouder of the Root.* 4. *A Cataplasm of the Green Leaves.* 5. *A Bath.*

The Virtues.

X. *The Green Root.* Authors say, that being bound, or hanged to, (I suppose they mean the Thighs) it brings away the Birth, and facilitates the Delivery. This Root for its sweet smell is oftentimes put among Cloths, to give them a kind of perfumed scent.

XI. *The Decoction of the Root in White Wine.* It opens obstructions of the Vessels (as *Paulus Ægineta* says) provokes Urine and the Courses, is good against Convulsions, and for such as are inwardly bruised by falling from an high place. It is good also against Asthmas, Coughs, Colds, shortness of Breath, and other distempers of the Brest and Lungs. Bathed upon Womens Breasts which are swell'd, and pained, it gives ease and discusses the Tumor. It is good against pains of the *Pleura* and sides, opens Obstructions of the Spleen, and breaks the Stone (as *Pliny* says) expelling Gravel, Sand and Tartarous Mucilage out of the Urinary parts, and so gives ease in a Dysuria and Stranguria. Dropt into the Eyes it cools the Inflamation and stops the flux of Rheum into them. It may be given to half a Pint Morning and Night, very well sweetned with Honey. It is also Alexipharmick, resists Poison, and is good against the bittings of Serpents and Mad Dogs, and other Venomous Creatures.

XII. *The Pouder of the Root.* It has the Virtues of the former Decoction, and may be given to a Dram morning and night, against Violent Catarrhs, and to break and expel the Stone whether in the Reins or Bladder.

XIII. *The Cataplasm of the Green Leaves.* Applied to the place of the Head pained, it eases the Head-ach. It also stops a flux of humors flowing to any Part, and strengthens weak Joints.

XIV. *The Bath made of the Roots and Leaves in Water.* Drank to half a Pint, it stops Catarrhs; applied as a fomentation it stops a flux of Rheum to the Part, Cools Inflamations, and Cures Anthonies, Fire, being Bathed therewith, and Cloths wet therein being also applyed to the same. Made in great Quantity, so as the Patient may sit over the Bathing Tub, or otherwise put into a Vessel or a Close Stool, so as the Patient may receive the hot Vapors thereof, up into the Womb, it is said to ease the Coarles, when flux or flow too much, as also to provoke, hasten and facilitate the Birth. Taken inwardly it is said to be profitable against Ruptures.

CHAP. DCXLIX.

Of SPIDER-WORT.

I. *The Names.* It is called Greek, [illegible] in *Latine*, *Phalangium* & *Phalangites*: and in English, *Spiderwort.*

II. *The Kinds.* There are several sorts of this plant, as, 1. *Phalangium Alpinum, Phalangium antiquorum*, The Savoy Spiderwort. 2. *Phalangium majus Italicum album*, The Greater Italian Spiderwort. 3. *Phalangium ramosum Vulgare*, Unbranched Spiderwort. Clusius calls it *Lilago*. 4. *Phalangium ramosum*, Branched Spiderwort. 5. *Phalangium Virginianum, Phalangium Ephemerum Virginianum Johannis Tradescanti*, The Virginian Spiderwort, The soon fading Spiderwort, and Tradescants Spiderwort, because Tradescant first brought it into our English Gardens. It has been thought by some to be the *Silk-Grass* which grows there.

The Descriptions.

III. The first or Savoy Spiderwort. [illegible] *consists of many white, [illegible] joining together* [illegible]

Spiderwort Savoy.

as those of the other Spiderworts. It springs up with four or five green Leaves, long and narrow, yet broader at the bottom, narrower upwards, and pointed at the end, like those of the Lilly Asphodil being a little hollow in the middle. From among which arises up a round stiff Stalk, a Foot and a half high, bearing at the Top, one above another seven or eight or more flowers, every one as large as the day Lilly, but much greater than in any of the other Spiderworts, of a pure white color, with some Threads in the middle, tipt with yellow, and a small forked Pointel. After the flowers are past, the head or Seed Vessels grow almost Triangular, yet something round, in which is contained blackish Seed.

IV. The second, or Greater Italian Spiderwort. *Its Roots are long and white like the next following, but something larger. It has divers long and narrow Leaves spread upon the Ground, and not rising up as the former, nor yet so broad, but something larger than the next following. The Stalk is bigger, but seldom rises up so high as the next third Species, being long and unbranched, set full of white flowers towards the Top of a Starlike fashion, but somewhat larger.*

V. The third, or Unbranched Spiderwort. *Its Root consists of long white Strings running under Ground, like those of the last described, but smaller. It has small Grass-like Leaves, but larger than those of Grass, of a whitish or grayish green color, rising immediately from the head or Tuft of Roots. From among which rise up one or two Stalks, two or three feet high sometimes, beset towards the Top, with a great many small white Starlike flowers, which after they are past, turn into small round heads, containing black Seed, like to the Seed of the little yellow Asphodil, but lesser.*

VI. The fourth, or Branched Spiderwort. *Its Root consists of many Strings, tough and white, like the third: but its Leaves are something broader, and of a yellowish green color, much like in form to Couch or Quitch Grass, yet something thicker and fatter, and of a more whitish green color. The Stalk, which comes up from among the Leaves grows to be about a foot and a half high, and spread out with small branches towards the Top, replenished with many small white Starlike flowers, consisting of six Leaves apiece like the former, with Threads in the middle, of a whitish color mixed with a fair yellow: which being fallen, small roundish Triangular Knobs follow, containing black colored Seed.*

VII. The fifth, or Virginian Spiderwort, supposed by some to be the Virginian Silk-Grass. *Its Root is stringy, and creeps far under ground, rising up again in many places with divers heads of long folded Grass-like Leaves, of a greyish overworn green color, two or three for the most part together, and not above, compassing one another at the bottom, and abiding green in many places all the Winter, and in some places perishing and rising anew in the Spring, which Leaves rise up with the great round Stalk, being set thereon at the joints, commonly but one at a joint, broad at the bottom, where they compass the Stalk, and growing gradually smaller towards the end which terminates in a sharp point. At the upper joint which is the Top of the Stalk, there grows two or three such like Leaves, but smaller, from among which break out 12, 16, or 20 or more, round green heads, hanging themselves down by little Footstalks, which when the flowers begin to blow open, grow longer, and stand upright, having three small pale green Leaves for a husk, and three other Leaves within them for a flower, which lay themselves flat open, of a deep blew purple color, having a small Pointel or head in the middle, closely set about with six reddish hairy, or feathered Threads, tipt with yellow pendents. This flower opens it self in the day time and shuts it self usually at night, and never opens again, but perishes, and then bangs down its head again. The green husk of three Leaves, closing it self again, in the form of a head, as it was before, but greater; the Pointel in the middle, growing to be the Seed Vessel, in which is contained small blackish long Seed. Of these flowers seldom more than one or two are seen blown at a time upon the Stalk, for which reason it is a long time in flowering, before all the heads are fully blown open.*

VIII. *The Places.* Their Names for the most part shew their Native Soil, or Place of growth, but with us they all grow in *Gardens.* The *Virginian* is a great encreaser, and thereby is now grown Common almost in every Garden. It was first brought to us out of *Virginia*: since we have received from thence several other Varieties, differing chiefly in the color of the flowers; for besides this blew Purplish here described, we have another which bears bigger and fairer Blew flowers: two also, *viz.* a greater and lesser, which have Red flowers: and one with Snow White flowers. In some Years the flowers of the Greater Red will come forth double.

IX. *The Times.* The third or Unbranched Spiderwort flowers before all the rest: and the Branched a Month after it: the other two about one time, *viz.* towards the end of *May*, and not much after the Unbranched kind. *Gerard* says, that first and fourth flower in *June*, and the third about the beginning of *June*, and the second about *August*. The fifth or *Virginian*, from the end of *May* until *July*, if it has had green Leaves all the *Winter*, but later, if the Coldness of the *Winter* puts a stop to its Vivacity. These Plants are all hardy, and will live and thrive almost in any Soil, but best in that which is moist. The time to take them and Transplant them is in *August*; the several heads of Roots may be placed where they may grow 2 or 3 Years unremoved. As they are Seed bearers, so from the Seed, Plants of the best kind are to be raised, but they which spring from the Seed are long before they bear flowers, yet it is worth the labour and attendance.

X. *The Qualities.* They are hot and dry in the first degree, of thin parts, and Alexipharmick.

XI. *The Specification.* They resist poison, and are pecularly good against the biting of the Phalangium or Poisonous Spider, as Authors say, from whence it is thought they derived their Name. That of Virginia, is of no known Virtues or Use.

XII. *The Preparations.* You may have from the Common Spiderwort, 1. *A Decoction in Wine or Water of the Roots, Leaves, Flowers, and Seed.* 2. *A Pouder of the same.* 3. *A Diet Drink.*

The Virtues.

XIII. *The Decoction in Wine or Water.* *Dioscorides* says, that being made in Wine, and Drank, it prevails against the bitings of Scorpi-

ons, and the biting of the Spider *Phalangium*, and of other Venomous beasts.

XIV. *The Powder.* It has all the same Virtues, being taken in Wine morning and evening to the quantity of a Dram; or mixed with an equal quantity of Mithridate and so swallowed, drinking a Glass of Wine after it.

XV. *The Diet Drink.* The Roots being tun'd up with new Ale, and then drank for a Month together, it expels Poison, yea tho' it be universally spread throughout the whole Body.

CHAP. DCL.

Of SPIGNEL.

I. *THE Names.* It is called in Arabick, *Mee*: in Greek Μέον ἢ μάον: in Latine, *Meum*, and by some Ancient Authors, *Athamanticum*, either from *Athamantes* who first found it out, or from the Mountain *Athamantes* in *Thessalia* where the best grew; *Pliny* calls it *Macedonicum* and *Hispanicum*, from the places where the best was found in his time; for says he in *Italy* it is only sown by some few, tho' now it is known to grow wild in several places of that Country. In English it iscalled *Spignel* and *Spicknel*.

II. *The Kinds.* Formerly there was but one sort of this Plant known, now there are many Species thereof, the chief of whichare the following, *viz.* 1. *Meum Vulgatius*, *Meum Antiquorum*, *Terdylion Cordi*, *Anethum Sylvestre*, *Anethum tortuosum aliorum*, *Meum foliis Anethi*, Our Common or ordinary Spignel. 2. *Meum Spurium Italicum Matthioli*, *Meum adulterinum Bauhini & Tabernæmontani*, *Meum Spinum alterum Italicum Lobelij*, Bastard Spignel. 3. *Meum Germanicum, illis Muttelina dictum*, *Meum Alpinum*, German Spignel or Mountain Spignel.

The Descriptions.

III. The first, or Our Common or Ordinary Spignel. *Its Roots do spread much and deep in the Ground, many strings or branches springing from one head, which is hairy at the Top, of a blackish brown color on the outside and white within, smelling of a strong good scent and of an Aromatick taste. From whence rise up several long Stalks of very fine cut Leaves, smaller than Dill, set thick on both sides of the Stalk, and of a good smell. From among these Leaves rise up round stiff Stalks a foot and half and sometime two feet high, with few joints, but beset with Leaves resembling Fennel or Dill, but finner cut; and at their Tops an Umbel of fine pure white flowers at the edges, on which will sometimes be seen a shew of a Reddish or blush color, especially before they are full blown, and are succeeded by small, longish and somewhat round Seed, larger than the ordinary Fennel Seed, and of a browner color, divided into two parts, and crested on the back, as most of the Umbelliferous Seeds are.*

Spignel true or Common.

IV. The second, or Bastard Spignel. *Its Root branches out like to that of the former true Spignel, but smaller, somewhat like to Sow or Hog-*

Spignel Bastard or Italian.

Fennel.

Fennel. In its form and manner of growing it is ſomething like unto the true or former kind, yet more like unto Dill with longer and thicker Leaves: the Stalks riſe as high as that with white Umbels of Flowers, and larger Seed on them. The whole Plant and every part thereof, is of a more ſtrong ſmell and taſte than the firſt, and the Stalks ſpread themſelves out like the former.

V. The third, or German or Mountain Spignel. *Its Root is of about a fingers length, covered with a rough or rugged blackiſh bark, and but few Fibres adjoining to it, with a buſh of hair at the Top, of a ſtrong ſharp ſmell like to the firſt or Common Spignel, but much weaker. It has but few Stalks of Winged Leaves riſing from the Root, but they are ſomething broader than the Leaves of the firſt or Common Spignel and ſhorter, being a mean between them and* Carum *or Caraway. From among which riſes up a ſlender ſtraked Stalk a Foot high, bare of Leaves for the moſt part up to the Top, where grow two or three ſmall Umbels of Purpliſh flowers, conſiſting of five ſmall Leaves apiece, bearing Seed afterward ſomething long and pretty large, with reſpect to the former.*

VI. *The Places.* The firſt grows Wild in many Places in the Northern parts of *England*, as *Lancaſhire*, *Yorkſhire*, &c. but is Planted almoſt every where in Gardens. The ſecond grows Wild in *Italy*, but with us only in *Gardens*. The third is ſaid by ſome Authors to be growing Wild in *England*; it grows Wild in *Germany*, and on the *Alps* and other Mountains, but with us is for the moſt part a Nurſery. The two firſt I have found growing in *South Carolina* up *Cooper River*, by a Pathway leading to *Capt. Cumins*'s Plantation, from a right hand branch of the ſaid River, where (when I was there) they grew Wild and in vaſt plenty.

VII. *The Times.* They Flower in *June* and *July*, and perfect their Seed in *Auguſt*.

VIII. *The Qualities.* The Roots of the true Spignel are ſaid to be hot in the third degree and dry in the ſecond. Aperitive, Diuretick, Stomatick, Hepatick, Nephritick, Hyſterick, and Alexipharmick.

IX. *The Specification.* Spignel reſiſts poiſon, and the bitings of Venomous Creatures, provokes Urine and the Courſes, eaſes pains in the Reins, Womb, and Bladder, is profitable againſt the Strangury and all Stoppages of Urine, expels Wind out of the Stomach and Bowels; is good alſo againſt Catarrhs, Rheumatiſms, Arthritick pains, and Colick pains of the Stomach and Bowels, Vapors, Hyſterick Fits and the like. The Root is only uſed with us, but the Seed is very Aromatick, and has the ſame Virtues.

X. *The Preparations.* You may have therefrom, 1. *A Decoction or Infuſion of the Roots or Seed in Wine or Water.* 2. *A Pouder of the Roots or Seed*, which is an Ingredient in *Mithridate* and *Venice-Treacle*.

The Virtues.

XI. *The Decoction or Infuſion of the Roots or Seed in Wine or Water.* Taken morning, noon, and night, to the Quantity of half a Pint, it gives eaſe in the Strangury, helps all ſorts of Stoppage of the Urine, and provokes the Terms in Women when ſtopt; it eaſes alſo pains in the Reins, Womb, and Bladder, opens Obſtructions of the Stomach, Liver, and Spleen, gives eaſe in the Colick, and other like pains of the Stomach and Bowels, repreſſes Vapors, and gives relief in Fits of the Mother, as alſo in Catarrhs, Rheumatiſms and the like. It is an Antidote againſt Poiſon, as alſo againſt the bitings or Stinging of Vipers, Mad Dogs, Scorpions, Hornets, and other Venomous Creatures.

XII. *The Pouder of the Root or Seed.* It may be given to a Dram morning and evening, againſt all the aforenamed Diſtempers; in any proper Vehicle. Or it may be made into a *Lohoch* with *Honey*, and ſo taken: and then it is proper to open Obſtructions of the Stomach and Lungs, cut tough flegm and expectorate it, and to dry up Catarrhs affecting thoſe parts.

CHAP. DCLI.

Of SPINAGE.

I. *THE Names.* It is called by the latter *Grecians* Σπάναχια: in Latine, *Spanachia (à ratitate in uſu medico)* but by moſt *Spinachia*, *Olus Hiſpanicum Tragi*, (ſuppoſing it a Pot-herb which firſt came from *Spain:)* and in Engliſh, *Spinage* or *Spinach*.

II. *The Kinds.* Some Authors will have it to be a Species of the *Araches*; others of the *Beets*; others again of the *Blites*: but I think it has no Relation to any of theſe Plants, but is a particular kind of its own. Some make four Species of this Herb, accounting that which bears *no Seed* to be One, which is indeed but accidental, as it happens ſeveral times to divers other Plants, as *Hemp*, *Herb Mercury*, &c. There are indeed three ſorts hereof, *viz.* 1. *Spinachia ſemine aculeato minor*, The leſſer Spinage with prickly Seed, which is our Common Spinage. 2. *Spinachia ſemine aculeato major*, The greater prickly Seeded Spinage, which is alſo Common to be had. 3. *Spinachia ſemine non aculeato*, *Spinachia ſemine Lævi*, Smooth Seeded Spinage, which is a more rare kind, and Nurſt up but in a few Gardens.

The Deſcriptions.

III. The firſt or leſſer Spinage with Prickly Seed which is (as before is ſaid) Our Common Spinage. *Its Root is long, white and ſmall with many Fibres adjoining to it. It has long green Leaves, broad at the Stalk, and rent or torn as it were into four Corners, and ſharp pointed at the ends. It quickly runs up to Stalk, if it is Sown in the Spring time: but elſe, if Sown at the end of the Summer, it will abide all the winter green, and then ſuddenly in the very beginning of the Spring run up to Stalk, bearing many Leaves both below, and at the Top, where there does appear many ſmall greeniſh flowers in Cluſters, and after them a ſmall prickly Seed. If it be after cut, it will grow the thicker, or elſe Spindle up very ſmall, and with but few Leaves upon the Stalk.*

IV. *Gerard* deſcribes it thus. *Its Root conſiſts of many Threads, from which Spring forth ſoft and tender*

SPINAGE

tender Leaves of a dark green color, full of juice; which are sharp pointed, and in the largest part or lower end square: parted oftentimes with a deep gash on either side next to the Stem or Foot-stalk. The Stalk is round, about a Foot high, and hollow within; and on the Tops of the Branches grow little flowers in Clusters, in whose places come afterwards prickly Seeds.

V. The second, or Greater prickly Seeded Spinage. *This in its Roots, Leaves, Stalks, Flowers, and Seed, and in its form and manner of growing, is like to the former, saving that in all its parts of Stalk, Leaf and Seed it is larger.*

VI. The third, or Smooth Seeded Spinage. *It is in its Root like the former, but its Leaves are broader and a little rounder pointed than the first, especially the lower Leaves; for those which grow upwards upon the Stalk are more pointed, and as it were three square, of as dark a green color as the former. At the several joints of the Stalks and Branches stand clustering many small greenish flowers, which turn into clusters of round whitish Seed, without any prickles at all upon them.*

VII. *This last kind* Gerard *says is called* Wild Spinage, *but is found in* Our Gardens, *and is like to the other kinds in goodness, as also in shape, saving that the leaves are not so great, nor so deeply gasht or indented, the Seed having no prickles at all.*

VIII. *The Places.* They are all Sown and grow in *Gardens*, without any great labour and industry, and thrive in any Ground which is but moderately fertil.

IX. *The Times.* Spinage may be Sown almost at any time of the Year; but being Sown in *Spring*, it quickly Springs up, and comes to perfection in about two Months space: but that which is Sown in the *Autumn*, is longer in coming to its growth, yet continues all *Winter*, and Seeds presently upon the beginning of the *Spring*.

X. *The Quantities.* It should not stand above the second degree, and by reason it is of a Watery substance, almost without Salt, and therefore quickly defects out of the Stomach into the Belly, being withal Diuretick and Laxative, keeping the Belly loose.

XI. *The Specifications.* There are no compounds! Names ascribed to the Herbs, but a good big Coal gratifies a hot Stomach, Quenches Thirst, and is good against Fevers.

XII. *The Preparations.* It is an Herb for the Sallets, and other uses of the Table. Many People Stew the Herb in a Pot or Pipkin, or in a Sawce Pan, or between two Plates, without any other moisture than its own, and after the moisture is a little prested from it, is dealt as a *boyled Sallet*, with Butter, Vinegar, Pepper, and Salt and so made a very palatable Dish. Some Cooks make it into *Tarts*, by mixing with it Currans very thin sliced, with the addition of a little *Sugar* and some Spice, which are Palatable enough. But besides these Kitchin Preparations you may make thereof, 1. *A Liquid Juice of the Herb.* 2. *An Antisebritick.* 3. *A Conserve.* 4. *A Distilled Water.*

The Virtues.

XIII. *The Liquid Juice.* Mixed with half its weight of Honey and so taken to 4 or 6 Ounces in the morning, fasting it loosens the Belly, and cleanses the Stomach and Guts of Cold slimy and Pituitous humors, and evacuates Tartarous matter from the Reins, Ureters, and Bladder.

XIV. *The Antisebritick.* It is made thus *Take of the Liquid Juice clarified a Pint. Juice of Limons half a Pint: double refined Sugar enough to make it pleasant.* Dose a quarter of a Pint or more now, and then especially in the coming of the burning fit, as also in the height thereof, and to quench thirst when necessity requires.

XV. *The Conserve.* It is good against Coughs, roughness and hoarsness of the Breast and Lungs, cools and quenches thirst in hot burning Fevers, and very much refreshes the fainting Spirits, caused from the wasting heat of the Stomach and humors.

XVI. *The Distilled Water.* It may be taken to a quarter of a Pint, acuated with a few drops of Spirit or Oil of Sulphur and made pleasant with double refined Sugar: it cools admirably, and is good against all sorts of Malign and Pestilential diseases; quenches thirst and cleanses the Lungs, Stomach and Bowels of acrid, sharp and Pituitous humors.

CHAP. DCLII.

Of SPLEEN-WORT, *Smooth and Rough.*

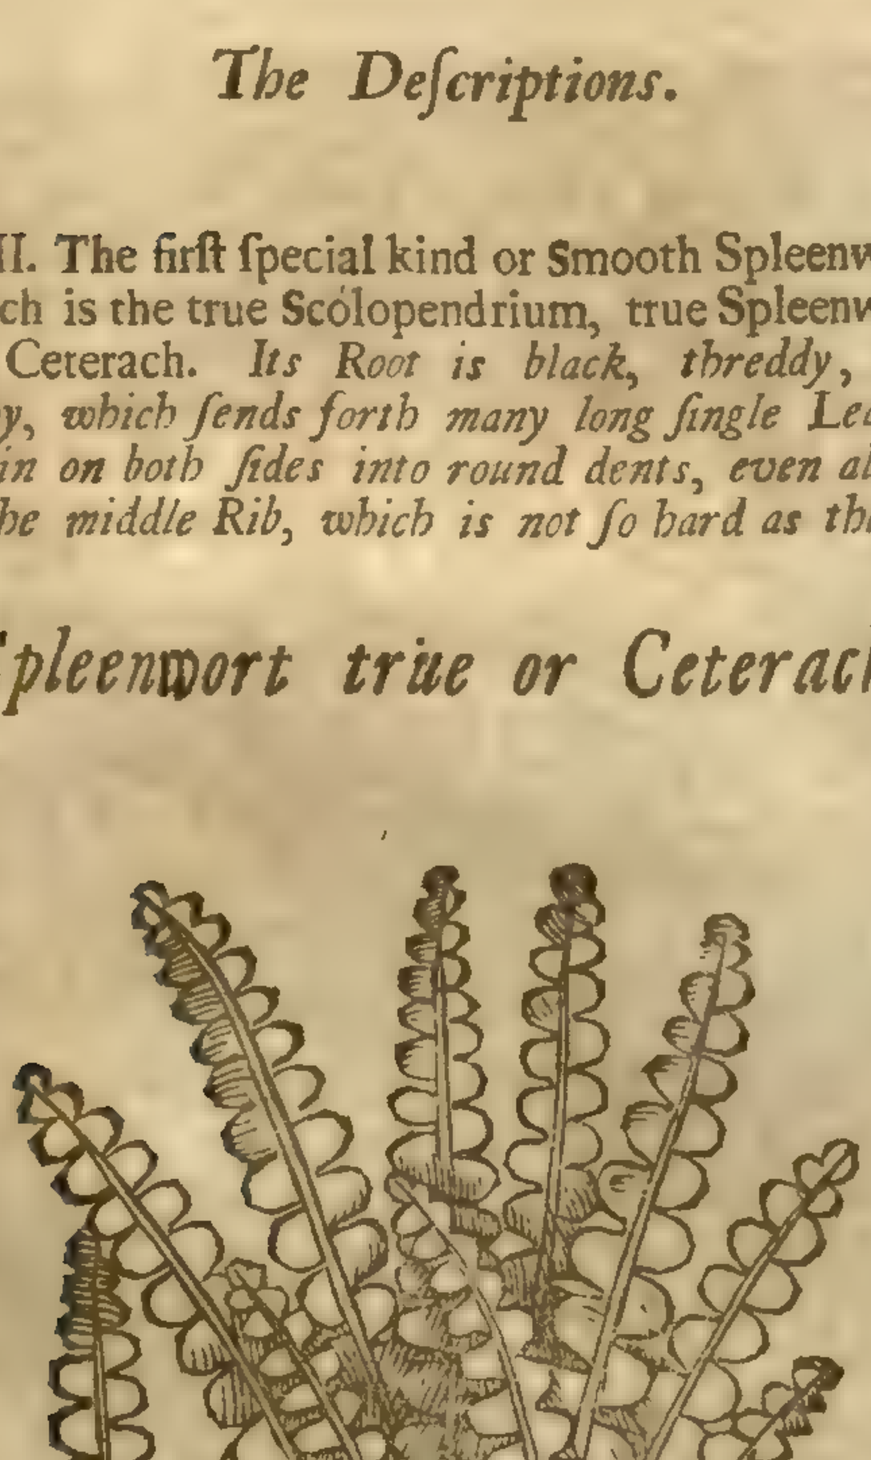
I. *THE Names.* It is called of the latter Arabians, *Scolopendrium* in Greek, Σκολόπενδριον, ἢ Ἀσπλήνιον: in Latine, *Asplenium* and *Splenium*: in English, *Spleenwort*, *Mill-waste*, and *Scale-Fern.*

II. *The Kinds.* There are two ſpecial Kinds thereof, *viz.* 1. Ἀσπλήνιον λεῖον, *Aſplenium*, *Aſplenium Lævе*, Σκολοπένδειον, *Scolopendrium*, and *Scolopendra* (from the likeneſs of the Leaf to the *Scolopender* worm ſo called:) alſo Πτέρις ἡ πτερυς (as it is in the Vulgar Copies) *Theophraſti*, *Scolopendrium*, Arabice; and Ἡμίονον, *Hemionum*, which *Galen* calls *Mula Herba:* in Latine, it is called *Aſplenium*, *Scolopendrium*, *Scolopendria* and *Ceterach:* and in Engliſh, *Spleenwort*, *Smooth Spleenwort* and *Milt waſt*. In former times Apothecaries and Phyſicians held *Harts Tongue* to be the *Scolopendrium verum* of the Ancients, and that *Aſplenium* was not *Ceterach*; but theſe errors are now ſufficiently made manifeſt. 2. Ἀσπλήνιον τραχύ, *Aſplenium aſperum*, Rough Spleenwort, and this is threefold, *viz.* 1. Λογχῖτις ἑτέρα ἡ τραχεῖα, *Lonchitis altera ſive aſpera major Matthioli*, Matthiolus his greater rough Spleenwort. 2. *Lonchitis aſpera minor Matthioli*, *Aſplenium Sylveſtre Tragi*; *Struthiopteris*, *Cordi & Thalij* (that is to ſay, Oſtrich Fern, from the reſemblance of the Leaves to Oſtrich Feathers:) *Lonchitis altera Neotericorum*, *& Aſplenium Magnum* by ſome, The leſſer or ſmaller Rough Spleenwort. 3. *Lonchitis Maranthæ*, *Lonchitis aſpera Maranthæ*, *Cluſij*, *aliorumque*; *Pſeudolonchitis Maranthæ* by *Matthiolus*, Baſtard Rough Spleenwort.

The Deſcriptions.

III. The firſt ſpecial kind or Smooth Spleenwort, which is the true Scolopendrium, true Spleenwort, and Ceterach. *Its Root is black, threddy, and buſhy, which ſends forth many long ſingle Leaves, cut in on both ſides into round dents, even almoſt to the middle Rib, which is not ſo hard as that of Polypody, each diviſion being not always ſet right oppoſite to the other, but as it were between each, ſmooth and of a light green on the upper ſide, and with a dark yellow roughneſs on the back, folding or rouling it ſelf inward at the firſt ſpringing up, as many other Ferns do, therein reſembling thoſe Worms which anglers uſe.*

Spleenwort true or Ceterach.



IV. Gerard deſcribes it after this manner. *Its Root is ſmall, black, and rough, much platted or interlaced, having neither Stalk, Flowers, nor Seed. It has Leaves a ſpan long, jagged or cut on both ſides, even near to the middle Rib, every cut or inciſure being as it were formed half round (by which it is known from the rough Spleenwort:) not one cut right againſt another, but one beſides another, ſet in their ſeveral orders, being ſlippery and green on the upper ſide, and ſoft and downy underneath: which when they be withered are folded up together like a ſcroul, and hairy without, much like to the rough or hairy Bear-Worm, wherewith Anglers bait their hooks to catch Fiſh.*

V. The firſt of the Rough kind, or Matthiolus his greater Rough Spleenwort. *Its Root is compoſed of many Reddiſh Strings or Fibres like thoſe of Harts-Tongue. It has ſeveral Stalks of leaves, ſome are like unto the Smooth Spleenwort or Ceterach, but more like unto thoſe of Polypody, about a ſpan long, cut to the middle Rib on both ſides, making as it were ſo many ſeveral little Leaves upon one great Winged Leaf, and each ſmall Leaf dented about the Edges with ſharp points, and rough on both ſides, but without ſuch ſpots on the backs of them as Polypody and Ceterach have.*

Spleenwort rough greater.

VI. The ſecond rough kind, or leſſer or ſmaller Rough Spleenwort, *Its Root has a thick head which is covered with Scales lying one upon another, with divers Fibres adjoining to them. It is ſomething like to the former or firſt rough kind, but that the divided Leaves ſet on each ſide of the ſoft brownish*

breadth Stalks are narrower and longer, each ſtanding next from the other, but not ſtanding to the middle Rib. In the middle of theſe ſeveral Leaves, riſe up others which are longer, and having ſmaller Stalks of Narrower Leaves than are them, but fully ſeparated, and ſtanding as if they were Circled, with brownish Spots or Specks on the backs of them, as in other Ferns. There is another of this ſecond kind, which is taller than this, and is found about Colcheſter in Eſſex, and in other places, growing in the wet borders of fields, and by Hedge ſides.

VII. Gerard *ſays, that the Root of this ſecond rough kind is black and ſet with a number of ſlender ſtrings, and that it is partly like the other Ferns in ſhew, bearing neither Stalk nor Seed, having narrow Leaves a foot long, or ſomething longer, ſlaſhed on the edges even to the middle Rib, ſmooth on the upperſide, and of a ſwarth green color underneath, and rough as are the Leaves of Polypody.*

VIII. The third rough kind, or Baſtard Spleenwort. *Its Root is ſmall, compoſed of many ſtrings. It has brown rough Stalks, with winged Leaves on them, ſomthing like to the Female Fern, but thicker and greater by much; green on the upperſide,*

Spleenwort Baſtard.

and ſpotted with brown rough Scales on the other ſide, much like to Ceterach or the ſmooth kind. Gerard *ſays, its Root is thick, black, and buſhy like as it were a Crows Neſt. And is not only barren of Stalks and Seeds, but alſo of thoſe marks and ſpots with which the others are ſpotted. The leaves are few in number, growing* Pyramid *or Steeple faſhion'd, greater and broader below, and gradually ſharper towards the Top.*

IX. *The Places.* The Smooth Spleenwort, or *Ceterach* grows as well upon Old ſtone Walls and Rocks, as in moiſt and Shadowy places in many parts of *England*, as at the Weſt end of the Church of *Hadley* [illegible] and in many other Places. It is alſo found upon *Leith Hill*, *Kent*, and *Shooter's hill*, where it grows in great plenty. The laſt of the *Small Spleenworts* in moiſt places, and Moiſt [illegible] is found growing in *Leith*, and I have found it growing plentifully in ſeveral low and moiſt places in the South *Country*. The ſecond and third grows in moiſt places and Groves, as alſo in ſeveral Woods in ſeveral places both in *England* and *Germany*. The ſecond grows not only in dry barren Woods, but on Sandy Banks and ſhadowy places in moſt parts of *England*, but eſpecially on *Hamſtead-Heath* near *London*, where it grows in great abundance.

X. *The Times.* The *Ceterach* or *Small Spleenwort*, like *Polypody*, abides green all Winter, and the *Rough kinds* flouriſh and appear in their Vigor, at the ſame times and ſeaſons in which the other *Ferns* do.

XI. *The Qualities.* They are all temperate in reſpect to heat or cold, moiſt or dry, or if they exceed it any ways, they are rather hot and dry in the beginning of the firſt degree; they are Aperitive, Abſterſive, and vulnerary, or conſolidating. Diuretick, Hepatick, and Splenetick.

XII. *The Specification.* Spleenworts of all the kinds, but the Ceterach or Smooth kind, more eſpecially, (and which is moſt uſed) doth chiefly cures all ſorts of pains, Tumors, or Swellings, and Obſtructions of the Spleen, is good againſt the Yellow Jaundice, Hiccough, and the Strangury or Piſſing by drops, and is ſaid alſo to waſte the Stone in the Bladder, to cure Melancholy, and ſpeedily to help a Virulent *Gonorrhœa*, and other Symptoms ariſing from the *French Pox*.

XIII. *The Preparations.* From the Ceterach or Scolopendrium, you may have, 1. *A Decoction of the whole Plant in Wine or Water.* 2. *A Powder of the ſame.* 3. *A Puſt from the backſides of the Leaves.* 4. *A Lye from the Aſhes.* 5. *A Diſtilled Water.* And from the *Lonchitis* or rough kind, you may have, 6. *A Powder of the Dryed Leaves.* 7. *A Cataplaſm of the Green Leaves.*

The Virtues.

XIV. *The Decoction of Ceterach, (the whole Plant) in Wine or Water. Dioſcorides* ſays, that the Decoction of the Leaves in Wine, being drank for the ſpace of forty days, Cures Melancholy, takes away Infirmities of the Spleen, helps the Strangury and Yellow Jaundice, and cauſes the Stone in the Bladder to moulder and paſs away, this Plant being of thin and ſubtil parts. He ſays likewiſe, that it ſtops the Hiccough, cures Venereal diſeaſes, but induces Barrenneſs in Women, and therefore by them is to be avoided.

XV. *The Powder of the ſame.* It may be taken to a Dram morning and night in any convenient Vehicle for all the purpoſes aforeſaid. It is alſo by ſome affirm'd, that is is not only good againſt ſwelling and hardneſs of the Spleen, but that all Diſtempers of the Liver may in a very ſhort time be cured therewith.

XVI. *The Duſt from the backſides of the Leaves. Matthiolus* ſays, that if a Dram thereof be mixed with Amber in fine Powder half a Dram, and taken in the Juice of Purſlane or Plantane,

(4 Ounces) it will ſpeedily cure the *Gonorrhœa* or running of the Reins.

XVII. *The Lye elixiviated from the Aſhes of the whole Plant. Camerarius* ſays, that being drank for ſome time (I ſuppoſe it muſt be made of ſuch a ſtrength that it may be drinkable) it cures ſuch as are troubled with the Spleen: I am ſure it is of good uſe againſt the Strangury, Stone, Gravel, and Tartarous matter, the in Reins, Ureters, and Bladder, and is profitable againſt the Yellow Jaundice.

XVIII. *The Diſtilled Water. Camerarius* ſays, that being given (to half a Pint or more) is very effectual againſt the Stone and Gravel, in both Reins and Bladder. I ſuppoſe that if it be mixed with an equal part of White Wine and a *Scruple of the Salt of* Spleenwort, or 2 Drams of the former Lye, it will be much more effectual to all the purpoſes intended thereby.

XIX. *The Pouder of the Dryed Leaves of the leſſer rough Spleenwort*, or Lonchitis, given to a Dram in White Wine Vinegar morning and night for ſome time, it is held to be very good to diſſolve the hardneſs of the Spleen.

XX. *The Cataplaſm of the Green Leaves.* Applied to ſimple Green Wounds, it prevents Inflamations and Flux of Humors, and induces their healing.

SPOON-WORT, *ſee Scurvigraſs.* Chap.

CHAP. DCLIII.

Of SPONGE.

I. *THE Names.* It is called in Greek Σπόγγος: in Latine, *Sponga:* and in Engliſh, *Sponge:* from the Greek Name.

II. *The Kinds.* It was the opinion of ſome that Sponges were *Zoophyta*, i. e. *Plantanimantes* vel *Plantanimalia*, viz. *Animal or Senſible Plants:* and tho' this was the thoughts of ſome in *Ariſtotles* time, yet he ſeems not to be of that Opinion, for in his *Hiſtoria Animalium*, *Lib.* 5. *Cap.* 16. He ſays, *that tho' divers did think and ſay in his time that Sponges had Senſe in them, for that as they ſay, they would ſhrink if any did pluck them, and were hard to be pull'd up, and that they do ſo likewiſe, when the Surges of the Sea would break them off from their Seats or Reſidence; yet (ſays he) divers did doubt of the truth of that Relation.* 'Tis doubtleſs a fooliſh and falſe Opinion, for a *Sponge* is no more *a Senſitive ſubſtance* than a *Muſhroom*, and is nothing elſe, but a Plant like Excreſcence, bred from the matter it grows upon, as *Agarick* is from the *Larch-Tree*, and *Jews-Ears* from the *Elder.* We have no more to Treat of here, but of the Common or Ordinary *Sponges* which are daily in uſe, of which ſome are greater, ſome are leſſer, ſome round, ſome cornered, ſome flat, ſome Tuberous: ſome cloſe and hard, others more looſe and open, ſome of a fine and thin ſubſtance, others of a courſer and thicker: ſome of a brown yellow color, others of a pale yellow, or almoſt white, And *Bauhinus* ſays, that ſome were called. 1. *Hircina*, Goat Sponges, from a hairyneſs they had upon them. 2. *Velaria*, from the ſmallneſs of their holes, being almoſt as cloſe and narrow as thoſe in Vails. 3. *Ramoſa Fiſtuloſa*, from their being branched with a great Pipe-like hollowneſs.

The Deſcriptions.

III. *Sponge is of a light, hollow, ſoft ſubſtance, neither Stony, Woody, nor Herb-like, but rather like a hollow matted ſubſtance made of fine Wool or Cotton wrought together by nature, full (in all parts of it) of ſmall holes, ſome greater, ſome leſſer, which are ready to receive and hold much Water, and by preſſing or wringing it hard, to yeild it out again; but as it encreaſes in the Water,* viz. *in its place of Growth, it ſomtimes gathers into it, or elſe there is driven into its holes, ſeveral ſmall gritty Stones, which are commonly found therein, which ſhew the breeding and growth thereof, is upon ſome Rocky, or Gravelly Places, or not far from the Earth.*

IV. *The Places.* It is uſually found in the Sea, and upon ſome ſhoars, after it has been by ſome accident broken off from the place on which it had Grown, which poſſibly might have been on the ſide of ſome Stone, or Rock, or Gravelly or Rocky Creek, or hole near the bottom of the Sea or Sea ſhoar, which lyes always covered with Water.

V. *The Times.* The Seaſons of its flouriſhing and Age is unknown, its poſſible it may equally grow through all the parts and days of the Year, the external Air not penetrating, or much operating upon the bottom of the Sea, or thoſe parts which are always pretty deeply covered with Water, ſo as to cauſe any difference in the times of the flouriſhing of ſuch things as grow, and are always overwhelmed with the Waters of the Deep.

VI. *The Qualities.* It is temperate in reſpect to heat or coldneſs, dryneſs or moiſture, Aperitive, Abſterſive, Diuretick, and Nephritick.

VII. *The Specification.* It is ſaid to be a peculiar Remedy for the Kings Evil, Sand, Gravel, Stone, or any Tartarous matter in the Reins or Bladder: Profitable againſt Blains, Botches, Boils, Puſhes, and other breakings out in the Face and Skin, and to clear the Eye-ſight.

VIII. *The Preparations.* You may make therefrom, 1. *A Decoction* 2. *A ſimple Pouder of Sponge.* 3. *Helmonts Pouder.* 4. *Aſhes.* 5. *Pouder of the ſmall Stones in Sponges.* 6. *Volatile Spirit, Salt and Oil of Sponge.* 7. *A Compound Pouder.* 8. *Tents of the ſubſtance thereof.*

The Virtues.

IX. *The Decoction in Wine or Water.* It is uſed for a Fomentation or Bathing; it eaſes pain, diſcuſſes recent Tumors, and ſoftens ſuch as are hard: after Bathing the Sponge it ſelf may be applied as hot as it may be well endured and ſo bound on.

X. *The ſimple Pouder of Sponge.* It is made by drying the Sponge throughly by the Fire, or in an Oven, almoſt to ſcorching it, and then beating it to pouder in an Iron Mortar. Doſe a Dram in any fit Vehicle; taken in Wine, it is ſaid to Purge like Cremor Tartari, cutting thick, groſs and Viſcous humors; it eaſes pains of the Stomach, Griping of the Guts, Colick, Strangury, Stone, Gravel, *&c.*

XI. *Helmonts Pouder of Sponge. Take Sea*

Sponge

Sponge burnt up to a Coal 2 *Ounces. Cattle Fish-Bone Calcin'd, Egg-shells Calcin'd, Sal Gem, Galls, Ginger, Long Pepper, Pellitory of Spain, ana. an Ounce: all being in fine Powder, mix them together with the Water it filled from the aforesaid Sponge, which defecate or dry by degrees.* It cures the Kings-Evil, being taken for a Month together, half a Dram at a time mixt with half an Ounce of White Sugar; beginning to take it when the Moon begins to decreafe, or prefently after the Full. It alfo is faid to cure Puthes, Botches, Boils, and Swelling Pimples in the Face and other Parts.

XII. *The Afhes. They are made by a fimple and naked Calcination in an open Fire; or of the Caput Mort. at the bottom of the Retort after the Spirit and Volatile Salt are afcended or drawn off.* Mixed with a little Wine, it is ufed to clear the Eye-fight, and to cure them when Blood fhot, or troubled with a Rheum or Watering.

XIII. *The Powder of the fmall Stones in the Sponge.* It is given to fuch as are troubled with Stone, Gravel, Sand, and Tartarous Mucilage in the Reins and Bladder: to help to break the Stone, and to cauſe it to paſs away with the Urine. Dofe a Dram morning and night in a Glafs of White Wine, *&c.*

XIV. *The Volatile Spirit, Salt and Oil of Sponge. They are made by diſtillation in a Glafs Retort, Take as much Sponge as you pleaſe, cut it very fmall, put it into the Retort, which place in a cloſe Reverberatory, with its receiver: Lute the juncture well, and give Ire Gradatim, like as in diſtillation of Tartar; and continue to increaſe it by little and little, till the white and Oily Clouds begin to come, and that you ſee the Volatile Salt does ſublime, and ſtick to the ſides of the Receiver; continue the fire in the ſame degree, till all is come forth, and the Receiver grows clear of its ſelf. Then waſte the fire, and all being cold, take away the Veſſels, pour out the Spirit and Volatile Salt together, and ſeparate the Oil by a Funnel, or ſome Cotton, which keep in a Glaſs by its ſelf. Put the Spirit and Volatile Salt into a low Glaſs Body, and rectify them in Sand, keeping them together.* This Spirit is a ſingular Lithontriptick, or breaker of the Stone. The Salt alſo is good to break the Stone in the Reins and Bladder. It is powerful alſo to diſcuſs and cure all Strumous Swelling or Kings-Evil, in the Neck or any other part, being given from gr. 6. *ad* 16. in any proper Vehicle. This Volatile Salt and Spirit of Sponge are ſaid to be ſome of the greateſt Specificks in Nature for the Cure of the King-Evil, being given morning and night in the proportion aforeſaid, in any proper Vehicle Univerſals being premiſed. And indeed the Spirit, Volatile Salt, and fœtid Oil of Sponges, are not only excellent againſt the *Evil*; but alſo to diſſolve and cure the *Bronchocele*, which is a Bunch or great Swelling round the Throat, to open Obſtructions in the Reins, Ureters, and Bladder, to break the Stone, and to expel it, as alſo Sand, Gravel, and the like from the Urinary parts. By following theſe Medicines for ſome time, you will daily and evidently ſee theſe *Scrophulous, Strumous*, and *Bronchocele* Tumors to decreaſe and vaniſh to nothing. *In the Diſtillation, part of the Volatile Salt will ariſe and ſtick to the Top and Neck of the* Retort, *and part of it will mix, and be diſſolved in the Spirit. You may rectify each apart if you ſo pleaſe, or diſſolve all the Salt in the Spirit, and rectify them together from the Oleaginous particles, as we have in many places taught in* Our Seplaſium, *or Druggiſts Shop. The Cal-*

cin'd Sponge in the Lixivium of the Salt made from Powder of Nettles for the ſpace of Sect. XII. [illegible] *Volatile Parts of the Salt from the Caput Mortuum, as it is uſually done in Salts, but little fixt Salt, almoſt as much as the Salt, and the Oil is to be ſeparated from the Salt as it is drawn in a Chymical Still, or by melting, when you have dryed from the Salt from the Lixivium for Medicine.* This fixt Salt is of the nature of other fixt Alcalies, as Salt of *Tartar*, Salt of *Oyſter Shells*, and the like, and may be given in the ſame Cafes a gr. 12 *ad* 20 in Broth, Barley, or Onion Waters, againſt Obſtructions of the Reins, Ureters and Bladder, Stone and Gravel, and to abſterſe Acid humors, which are the cauſes of many pernicious Diſeaſes. See more at large hereof in the Third Edition of *Our Engliſh Herbs*. Lib. 1. Cap. 2. Sect. [illegible] and Cap. 10. Sect. 40. where you will find much to this Purpoſe.

XV. *The Compound Powder. Take Powder of Sponges, Powder of Stags or Hart Horn, ana. an Ounce, Powders of Crabs-Eyes and Winter Cherries, ana. half an Ounce, mix them.* Doſe from 2 Scruples to 1. or a Dram and half in White Ale, Ale-mart or Partly Water, ſweetned with Syrup of Marſh Mallows, againſt the Stone, Gravel, Strangury, Kings Evil, Bronchocele, *&c.* to be given morning and night, *&c.*

XVI. *Pledgets or Tents made of Sponge. The Sponge being Dipt into a thin Gum Water, is then to be ſqueezed hard, and preſt ſtrongly in a Preſs, and ſo kept till they are perfectly dry, and then to be cut out into Tents, or Pledgets, of what form or bigneſs you pleaſe.* They are put into hollow Ulcers which are ready to cloſe, before they are throughly cleanſed, and to open and widen the Orifices of Fiſtulas, hollow Ulcers, *&c.* a Thred being firſt tyed to them before they are put in, thereby to pull them out again.

CHAP DCLIV.

Of SPURGE *Garden.*

I. *The Names.* It is called by the Arabians, *Mandana*, and *Mabendane*: in Greek, [illegible]: in Latine, *Lathyris*, and *Cataputia minor* (becauſe the Seed of *Ricinus* or *Palma Chriſti* in *Chap.* 656. following, is called *Cataputia major*) and in Engliſh, *Garden Spurge.*

II. *The Kinds.* There are above half a hundred particular ſorts of this Plant, but we in this work ſhall not take notice of above Eight Generick Species thereof, and under each of their Titles, we ſhall Treat only of ſuch as either grow and are Nurſt up in Our Gardens, or Grow Wild abroad in Our Fields, Woods, Marſhes, *&c.* or are found growing in Our *Weſt-India* Plantations, and *American Iſlands.* 1. *Tabers, Lathyris, Cataputia minor*, Garden Spurge, of which in this Chapter. 2. *Tithymalus, Peplus, Eſula*, and *Exula minor*, ſmall Spurge, of which in *Chap.* 655. 3. *Cherva, Ricinus, Palma Chriſti*, Great Spurge, of which in *Chap.* 656. 4. [illegible], *Mezereon, Chamæa Germanica*, Dwarf Spurge Olive, of which in *Chap.* 657. 5. Τιθύμαλος χαμαιακη, *Tithymalus. Tithymalus Characias*,

cias, (i. e. *Vallaris*, becauſe it uſually grows in Valleys and low moiſt places.) Wood Spurge, of which in *Chap.* 658. 6. *Tithymalus Paluſtris*, five *Eſula major Germanica*, Marſh Spurge, or Greater Eſula, of which in *Chap.* 659. 7. *Tithymalus paralicis*, *Lactaria*, *herba Lactaria*, Sea Spurge, of which *in Chap.* 660. 8. Δαφνοειδὲς, *Laureola*, Spurge Laurel, of which *in Chap.* 661. following: of all which in their order.

III. *The Kinds of the Garden Species.* The moſt common are theſe three, *viz.* 1. Λάθυρις, *Lathyris major hortenſis*, *Cataputia minor*, The Greater Garden Spurge. 2. *Lathyris minor hortenſis*, *Calaputia minor*, The leſſer Garden Spurge. 3. *Lathyris minima*, *Lathyris minor Dalechamphij*; *Lathyris minor flore conglomerato Bauhini*, The ſmalleſt Garden Spurge, and this very probably is the *Cataputia puſilla Cæſalpini.* The Name *Spurge*, is ſuppoſed to be derived from its Purging Quality, it being an exceeding great and very Vehement Purger.

The Deſcriptions.

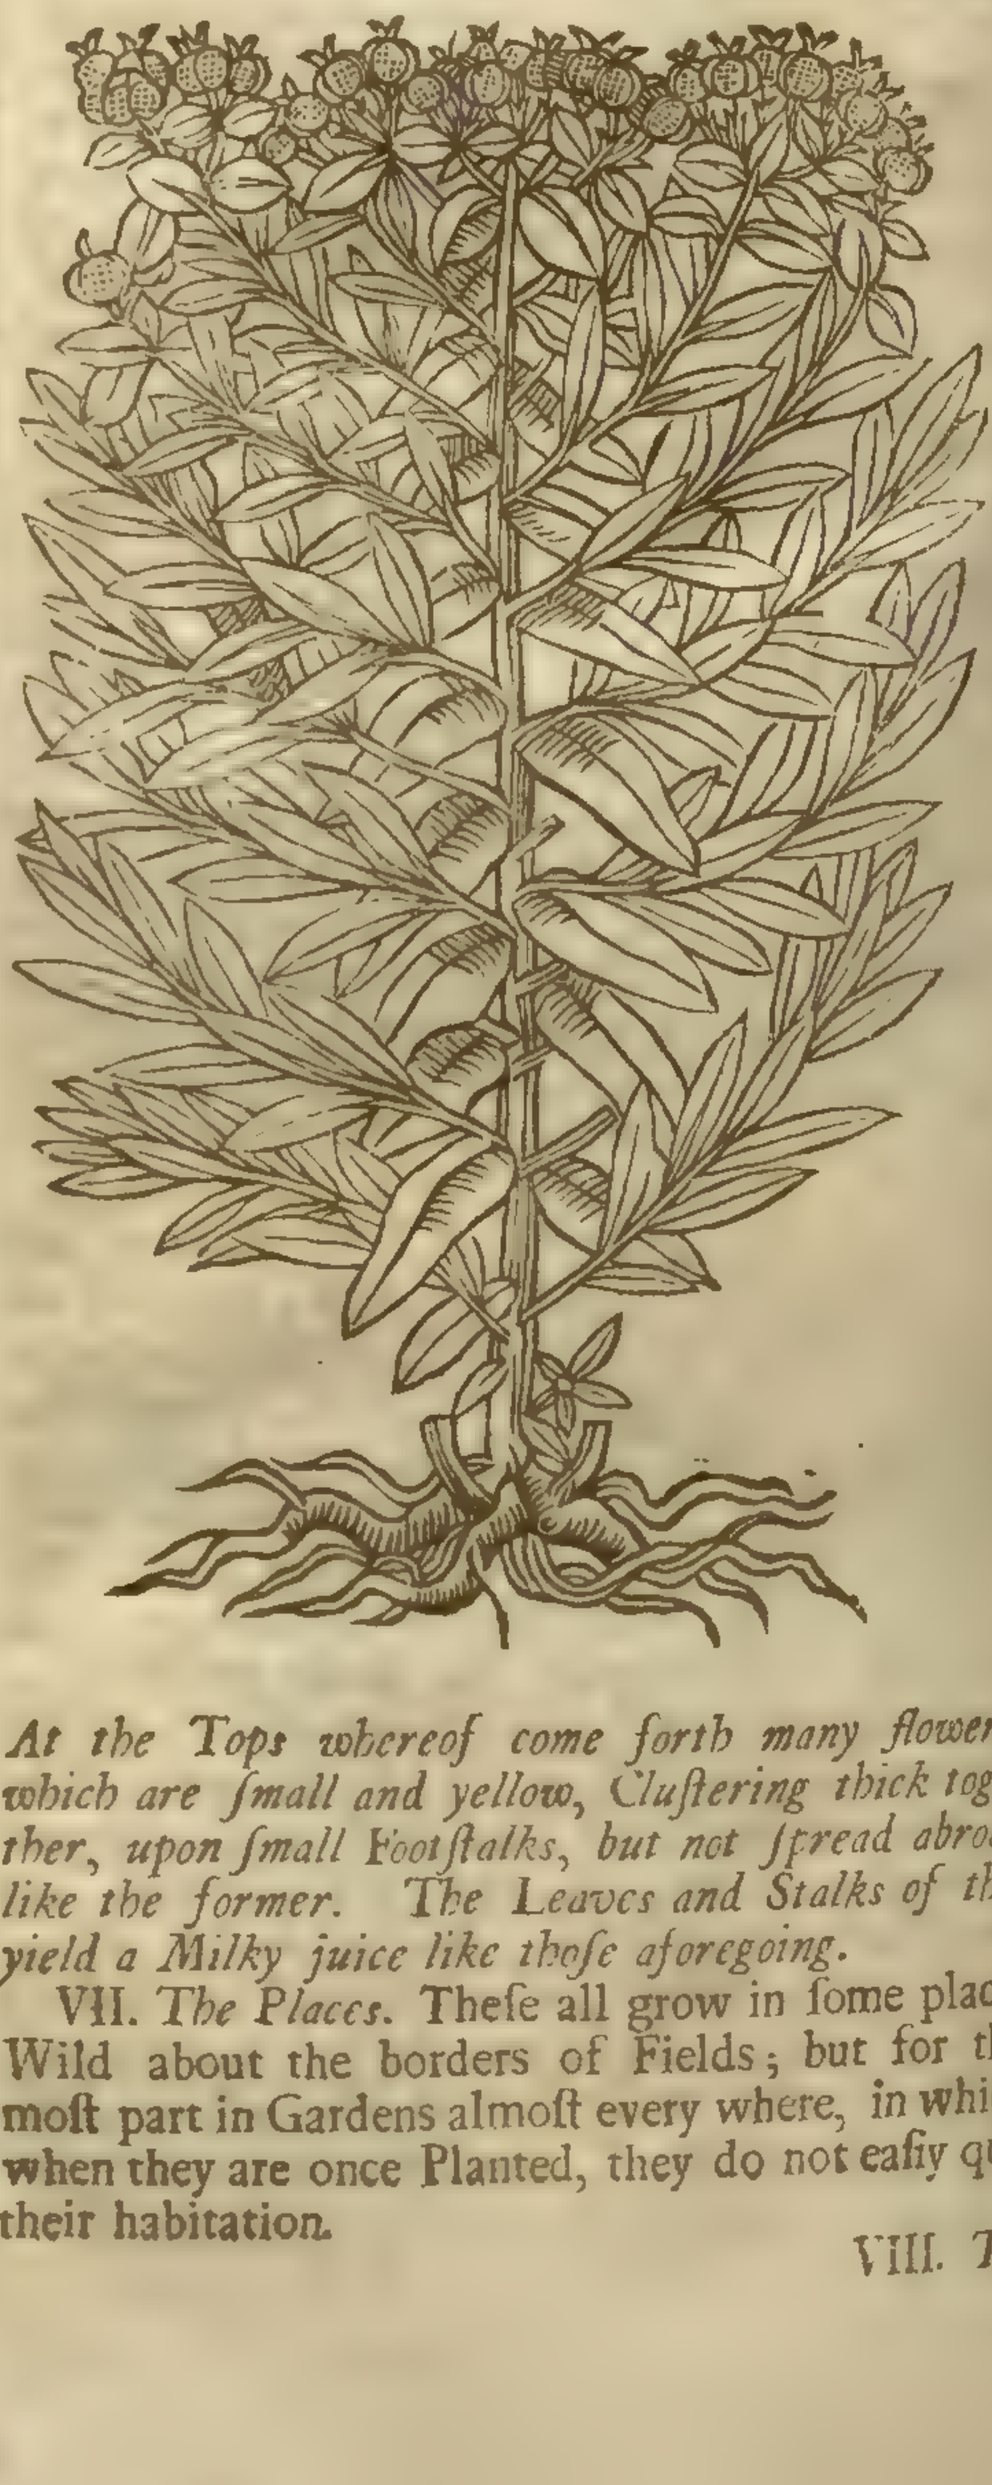
IV. The firſt, Or Our greater Garden Spurge. *Its Root is long and Woody, periſhing as ſoon as its Seed time is over, and ſprings again every year of the Seed of its own Sowing. It riſes up with one hollow ſtrait whitiſh Stalk, of a fingers thickneſs, ſhadowed over as it were with a brown color; on which grow up to the Top for the firſt year, many thick fat long and ſomewhat narrow Leaves, of a blewiſh green color on the upperſide, and more whitiſh underneath, ſomething like unto Willow Leaves for the form, which being cut or broken yeild Milk as plentifully as any of the other Spurges. The next year after, it ſpreads it ſelf into many ſmall Branches, with ſmaller Leaves at every partition, every part whereof yield Milk as the others do. The flowers are of a Pale yellow color, and ſtand in Cups, as the other kinds do, but are ſmaller than ſome of them, yeilding ſweet, and nothing near ſo hot and burning Seed, which is encloſed in Triangular heads or husks, ſomething like to thoſe of* Palma Chriſti; *but rounder and larger, than in many other of the Spurges, which in the hot Sun (the heads or husks cracking or dividing) will fall out of their own accord.*

V. The ſecond, or Leſſer Garden Spurge. *This in its Roots, Stalks, Leaves, Branches, Flowers, Seed and form and manner of growing is wholly like the former, ſaving that in every part thereof it is leſſer, and can only be diſcriminated from it by that very ſign, and by which it is diſtinguiſht from the other.*

VI. The third, or Smalleſt Garden Spurge. *Its Root is ſmall, having many Strings with Fibres adjoining to them. It ſprings up with many ſlender branches lying on the Ground, ſet full of ſmall Leaves, no bigger than thoſe of Knotgraſs, from among which riſes up a Stalk, about a Foot high, having many other Branches ſpringing from it, almoſt from the bottom to the top, which are ſet full of ſuch like ſmall Leaves, as grew below.*

Spurge Garden.

Spurge Garden Smalleſt.



At the Tops whereof come forth many flowers, which are ſmall and yellow, Cluſtering thick together, upon ſmall Footſtalks, but not ſpread abroad like the former. The Leaves and Stalks of this yield a Milky juice like thoſe aforegoing.

VII. *The Places.* Theſe all grow in ſome places Wild about the borders of Fields; but for the moſt part in Gardens almoſt every where, in which when they are once Planted, they do not eaſiy quit their habitation.

VIII. *The*

VIII. *The Times.* They all flower about the latter end of *June*, and throughout *July*, and their Seed is ripe in *August*.

IX. *The Qualities.* They are hot and dry in the fourth degree, Cathereticks, and very ſtrong Emeticks and Cathartick. Of which the Seed is for the moſt part in uſe with us, to purge with, both by Vomit and Stool.

X. *The Specification.* Spurge is proper againſt the Scurvy, Dropſy, Jaundice, Gout, and Rheumatiſm ariſing from a Cold cauſe.

XI. *The Preparations.* You may have therefrom. 1. *A Liquid Juice or Milk.* 2. *Troches of the Juice.* 3. *A Decoction in Wine or Water or Broth.* 4. *The whole Seed.* 5. *A Diſtilled Water of the whole Plant.*

The Virtues.

XII. *The Liquid Juice or Milk.* It works more Violently than the Seed, and therefore is ſcarcely fit to be taken inwardly, but to be outwardly applyed, and that carefully too; and ſo it is a depilatory, and helps to take away hair on the Eye-brews, Fore-head, Temples and other parts; but it ought not to touch any other part of the Face or Skin. Being alſo Cautiouſly applied, it takes away proud and dead fleſh in Wounds, hard Callous ſubſtances, Knots, Corns, or Warts in the fleſh (if they be firſt pared to the quick, and then applyed) It is alſo good againſt running Scabs and Sores, as alſo to obliterate Scars, Spots, and blemiſhes or other marks of the Skin. If it is put into an hollow Tooth, (which you muſt do with that Caution, ſo as it may touch no other Tooth, Gums, nor Mouth) it will eaſe the Pain thereof.

XIII. *The Troches.* If the Milk is made up into Troches or little Balls, with Meal or flower of Beans, Peaſe, Barly, or Wheat, and kept dry, it will ſerve all the Year to uſe, as occaſion is offer'd for the purpoſes aforeſaid.

XIV. *The Decoction in Wine, Water, or fat Broth.* It has all the Virtues of the Liquid Juice, but much more gentle, and is good to remove moſt external deformities of the Skin. Taken inwardly it works to ſome purpoſes (as in the Scurvy, Dropſy, Jaundice, Gout, Evil, and Rheumatiſms,) more ſafely than the Seed, and ſomewhat more weakly.

XV. *The Seed.* It is given 5, 7, 9, or 10 grains or Seeds at a time, according to the Age and Strength of the Patient, which purges both ways, *viz*, both by Stool and Vomit, and evacuates tough Flegm, Choler, Melancholy, and Water as *Dioſcorides* ſays, and ſo cures thoſe diſeaſes cauſed by the abounding of thoſe humors. The uſual manner is to ſwallow the Seeds whole, without breaking either Husk or Kernel, and then they work the more gently and weakly: but if the husks are broken, and the Kernels ſwallowed whole or Chewed, or otherwiſe bruiſed and mixed with Drink or Broth, they will then work the more violently, and therefore are to be taken with the more Caution.

XVI. *The Diſtilled Water of the whole Plant.* It is of an eſpecial uſe to cleanſe the Skin from Freckles, Scurff, Morphew, or any other diſcoloring, defilement or deformity of the Skin, uſed either by it ſelf, or mixed with Bean flower or Baſtard Dittany, or Crowfoot water, being gently Bathed on the affected places, removing the Diſ-

affections of the parts in a ſhort ſpace of time. The ſimple water is alſo profitable againſt putrid and foul Ulcers and running Sores.

Nota. *The Garlick Sauces are found to be of ſingular good uſe for the purpoſes to which the Paſtes of Chalk or greaſie Sponge may be applyed.*

CHAP DCLV.

Of SPURGE *ſmall,* OR, ESULA *ſmall.*

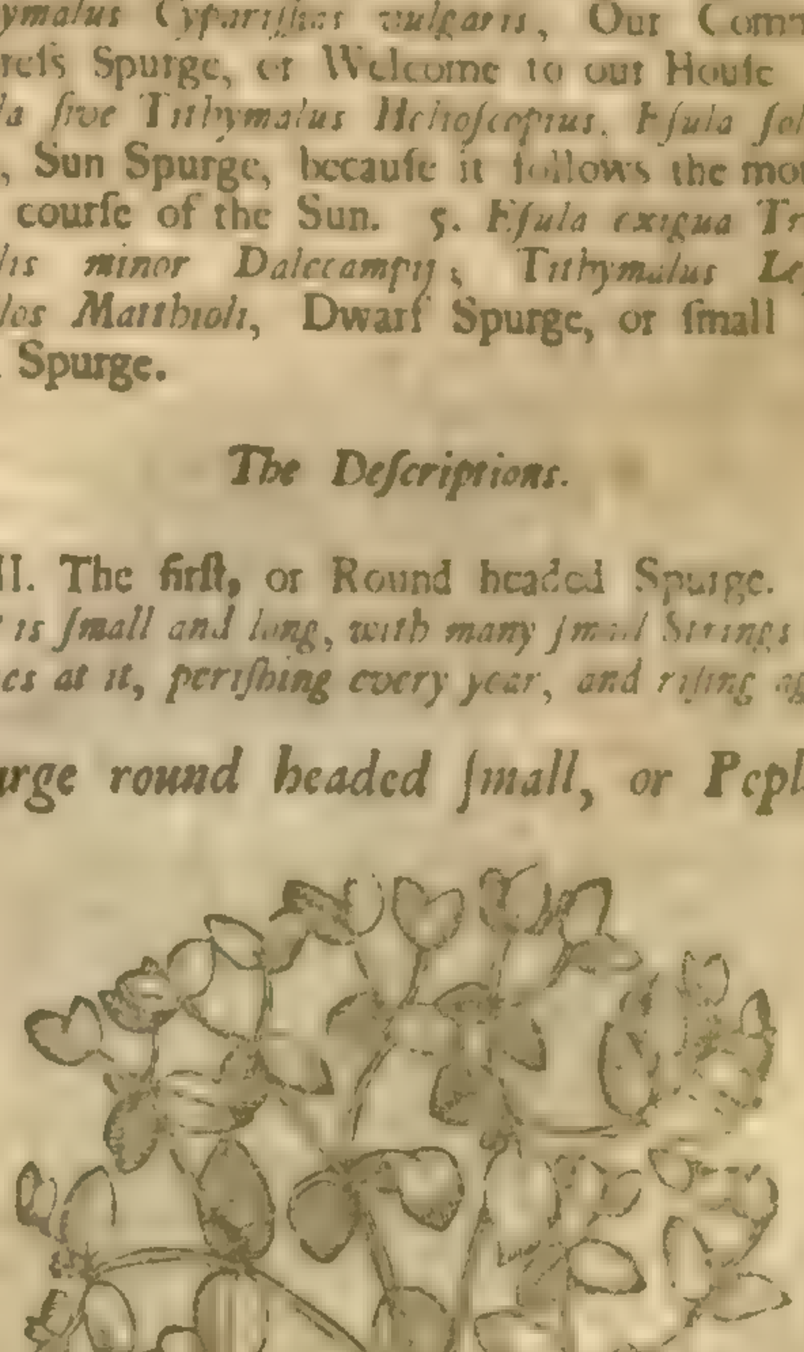
I. *The Names.* It is called in Greek Τιθύμαλος: in Latine, and in the Shops *Eſula, Eſula minor, Pityuſa*, (as if it was a Pine Spurge) and in Engliſh, *ſmall Spurge* and *ſmall Eſula*.

II. *The Kinds* There are Twelve or Thirteen ſeveral ſorts of this Plant, but the five following are chiefly known to us. viz. 1. *Eſula minor, Eſula rotunda, Eſula minor rotunda, Peplus* round headed Spunge. 2. *Eſula minor, Pityuſa minor, Tithymalus ſpinoſa*, ſmall Eſula or Pine Spurge. 3. *Eſula Cyprina, Cyparitias vulgaris, Tithymalus Cyparitias vulgaris*, Our Common Cypreſs Spurge, or Welcome to our Houſe. 4. *Eſula ſive Tithymalus Helioſcopius, Eſula ſoliſequia*, Sun Spurge, becauſe it follows the motion and courſe of the Sun. 5. *Eſula exigua Tragi, Peplis minor Dalecampij, Tithymalus Leptophyllos Matthioli*, Dwarf Spurge, or ſmall Annual Spurge.

The Deſcriptions.

III. The firſt, or Round headed Spurge. *Its Root is ſmall and long, with many ſmall Strings and Fibres at it, periſhing every year, and riſing again*

Spurge round headed ſmall, or Peplus.



of

of its own Sowing. It ſhoots forth round about the Root, many ſmall weak reddiſh upright branches, with ſmall Leaves ſet by Couples for the moſt part, ſomewhat like to the Leaves of the Sun Spurge at Sect. VI. *following, but rounder pointed, and ſmaller, of a grayiſh green color on the upper ſide; and a little reddiſh or purpliſh underneath, which will oftentimes change to be wholly Purple, in the Summer time. The flowers are very ſmall and yellow, ſtanding more round or cloſe together, as it were in an Umbel, otherwiſe like unto the reſt. The Seed is very ſmall and contained alſo in a kind of Triangular heads. There is another ſort of this with red flowers.*

IV. The ſecond, or ſmall Eſula, or Pine Spurge, (which is thought to be *Rulandus* his Eſula.) *Its Root is ſmall and long, of the bigneſs of ones finger, ſomething blackiſh on the outſide, but white within, and abiding many years; yet the Extremity of Winter does ſometimes rot it, and cauſe it to periſh. The Root of this Eſula, is accounted by the moſt learned Phyſicians to be the true* Eſula minor *and that out of which the* Extractum Eſulæ Rulandi *is to be made. This ſmall Spurge has divers weak and ſlender Stalks, half a yard high, on which grow many ſmall, long, and narrow pointed Leaves without order, round about them, very like unto the Leaves of Toad-Flax; at the Tops of the Stalks grow yellow flowers, ſometimes daſht over with Purple, like ſome of the other Spurges, but leſſer, and growing in the like Cups: which falling away, the Seed comes after, which is ſmall and round and contained in Triangular heads or husks.*

V. The third, or Our Common Cypreſs Spurge. *The Root of this is very like the ſecond kind juſt before deſcribed, inſomuch that many have miſtaken it, for the true* Eſula minor *out of which the Extract ought to be made. And have uſed it inſtead thereof. But this Cypreſs Spurge is ſo like to that Pine Spurge, that it has deceived many, who have not carefully view'd it, and obſerv'd the differences: for this has alſo ſeveral ſlender brownish Stalks, on which grow ſmall narrow Leaves, but ſomething ſhorter and thicker than thoſe former, and thicker ſet upon the Stalks. And in its Flowers and Seed, it is like the ſame alſo.*

VI. The fourth, or Sun Spurge. *Its Root is ſmall and Threddy, periſhing every year after Seed time, and riſing again of its own Sowing. It has for the moſt part but one reddiſh Stalk, half a yard high, bare of leaves at the bottom, almoſt half way upwards, and then ſpreading it ſelf into two or three ſmall Branches, on which grow Sparſedly divers yellowiſh green Leaves, ſmaller at the bottom, and broader at the ends, ſomething like unto Purſlane Leaves. The flowers are yellow like unto the reſt, ſtanding in hollow Cups of two Leaves apiece, the Stalk running through them, as is to be ſeen in moſt of the others. The whole Top or head of flowers is ſaid to turn with the Sun, (whence the Name* Tithymalus Helioſcopius five Soliſequius.) *The Seed is ſmall and round, contained in like Triangular heads as the former.*

VII. The fifth; or Dwarf Eſula, or ſmall Annual Spurge. *Its Root is ſmall, long, hard, and Woody, periſhing every year, as ſoon as it has given its Seed. It has many ſmall ſlender weak Stalks about two handfuls high, buſhing forth into many Branches, and ſpreading far upon the Ground: on which grow very ſmall, long, and narrow Leaves, ſtanding upright, and which grow pretty thick thereon, which oftentimes are not ſharp but flat pointed; the uppermoſt whereof are ſomewhat broad at the bottom, and compaſs about the Stalks, ending in a long ſharp point for the moſt part. The flowers are yellow like unto the others, and very ſmall, after which come Triangular heads, which are ſmall and contain ſmall round grayiſh Seed, not much bigger than Poppy Seed.*

VIII. *The Places.* *The firſt* grows in Vineyards in *France*, as alſo in Ditches and borders of Fields: *Gerard* ſays, it grows in Salt Marſhes near the Sea, as in the *Iſle of Thanet* by the Sea ſide, between *Reculvers* and *Margate*, in great Plenty, it alſo grows in many of *Our Gardens*. *The ſecond* and *third* grow in ſome places in *Germany and France*, both by Rivers ſides and borders of Fields, but with us only in *Gardens*. *The fourth*, grows wild with us in many places, *Gerard* ſays, it grows in barren and waſte grounds, and in earable Land, almoſt every where. *The fifth* grows in many Chalky grounds in dry hilly places, as alſo in our Cornfields.

IX. *The Times.* The third kind commonly flowers in *May*; all the others in *June, July, and Auguſt*, and their Seeds are ripe in the months following.

X. *The Qualities.* Eſula is hot and dry in the fourth degree; Inflaming, Catheretick, ſtrongly Emetick and Cathartick; of theſe the ſecond kind is chiefly uſed.

XI. *The Specification.* The Seed and Root are chiefly in uſe with us, and are good to evacuate Viſcous humors of all kinds, and Cure the cold Scurvy, Dropſy, Jaundice, Evil, Rhuematiſm, Sciatica, and Gout. The Milky juice has all the Properties but much more violent.

XII. *The Preparations.* There are of Uſe, 1. *The whole Seed.* 2. *A Decoction of the ſame in Fat Broth.* 3. *The Root prepared.* 4. *The Milk or Juice.* 5. *Pills of Eſula.* 6. *A Diſtilled water of the whole Plant.* 7. *A Pouder of the Seed and Leaves.* 8. *An Extract.*

The Virtues.

XIII. *The whole Seed.* They may be given hull'd from 3 to 8 (tho' *Dioſcorides* ſays they may be taken to a dram, which is too large a Doſe by much for our Engliſh Conſtitutions) againſt the Scurvy, Dropſy, Sciatica, Gout, Rheumatiſm, pain in the Stomach, and Hypochondriack Melancholy, they both Vomit and Purge briskly and expel Water, Flegm, Melancholy, Choler, and other Viſcous humors and Tartarous matter from all parts of the Body.

XIV. *The Decoction of Seed or Leaves in Fat Broth.* By Bathing with it, it cures the Stingings or Bitings of Scorpions, Hornets, Serpents, and other Venomous Creatures, and purges ſtrongly downwards Choller and Flegm, eaſes the pains and takes away the hardneſs of the Belly, and ſwelling of the Breaſts. And is ſingular againſt the Dropſy, Sciatica, Rheumatiſm and Gout, being taken every other morning inwardly.

XV. *The Root prepared.* It is done by bruiſing it, and ſteeping it in Vinegar, and ſo reducing it to pouder. *Dioſcorides* ſays, it may be given to 2 Drams: but I am ſatisfied that given from half a Dram to a Dram, according to Age and Strength may be a ſufficient quantity: it may be given in Mead or Honied Water, for all the purpoſes aforeſaid.

XVI. *The Milk or Juice.* It is dangerous to be taken inwardly: but outwardly, it is good againſt the Stinging of Scorpions and Hornets, the Bitings of Serpents, Mad Dogs, *&c.* and applied to Warts

Warts, Corns, and other Excreſcencies, it takes them away. And mixed with a ſufficient quantity of Honey, it is good to clear the ſight, help dimneſs of the Eyes, watering and running of them, and to take away Films or Scars growing in them. The Juice is made by beating in a Morrar and Expreſſing it; but *Dioſcorides* ſhews us another way of doing it: Thus. Beat the Roots, and put them into a Veſſel full of water, ſtirring or beating them well therein, and with a feather gather the uppermoſt upon the Water, which being dryed and kept, ſerves for the uſes aforeſaid, and for thoſe which have the Dropſy.

XVII. *Pills of Eſula. Take the Root prepared by ſteeping a night and day in White Wine Vinegar, reduced to Pouder, an Ounce: Aloes two Ounces: Maſtick 2 Drams: all being in Pouder make them up into Pills with Fennel Water.* Doſe from a Scruple to 2 Scruples. *Tragus* ſays, theſe Pills are good againſt the Dropſy, and ſuch as are ſhort winded, and may be taken without pain or danger.

XVIII. *The Diſtilled Water of the whole Plant.* It makes a good Waſh againſt Tanning, Sunburning, Yellowneſs, Freckles, Lentils, Scurff, Morphew, and all other kinds of diſcolorings and deformities of the Skin, it being waſht therewith 3 or 4 times a day; the Pores of the Skin being firſt opened, by waſhing with warm Water. It may be made much more potent, if a little of the Juice be added thereto.

XIX. *The Pouder of the Seed and Leaves.* They are firſt to be prepared by ſteeping them in ſtrong White Wine Vinegar, then drying them, and afterwards reducing them to Pouder by beating. *Diaſcorides* ſays, the Pouder may be given to 3 Drams; but in our Climate, if it is given from half a Dram to a Dram it will be Doſe large enough. It is given againſt the Dropſy and Gout.

XX. *The Extractum Eſulæ Rulandi.* It has all the former Virtues; and may be given from a Scruple to Dram, with fat Broth, according to Age and Strength. With this *Rulandus* did wonders, and almoſt incredible Cures in the moſt rebellious, inveterate, and deplorable Diſeaſes.

CHAP. DCLVI.

Of SPURGE *Great,* *OR,* PALMA CHRISTI.

I. *THE Names.* It is called by the Arabians, *Cherva*, and *Kerva:* in Greek, Κίκι ἡ Κρότων, *Cici* and *Croton*, *à Crotonis ſive Ricini animalis ſimilitudine, quod refert ſemen: Arias Montanus* in his Commentary upon *Jonas Cap.* 4. ſays, that this Plant is ſignified by the Hebrew word *Kikajon*, tho' in our Bibles it is tranſlated *a Gourd.* In Latine *Ricinus*, *Palma Chriſti*, *Cataputia major*, *Granum Regium* by *Meſues*; and by ſome, *Pentadactylus.* In Engliſh, *The Great Spurge*, and *Palma Chriſti.*

II. *The Kinds.* There are ſeveral ſorts of this Plant, but the chief are, 1. *Ricinus*, *Cataputia major vulgatior*, *Palma Chriſti*, The more Common Great Spurge, or vulgar Palma Chriſti. In the Seed of this Plant is [illegible] the moſt part called *Cataputia maior*, and by ſome *Ricus arborarius* and its Oil in the Shops is called *Oleum de Cherva*, and by ſome, *Oleum Cicinum*. 2. *Ricinus minor*, *Palma Chriſti minor*. The leſſer Species of the great Spurge, or Palma Chriſti: the Seed of this which *Parkinſon* firſt ſaw, he ſays came from *Bermudas*, where they made Oil thereof. 3. *Ricinus Americanus*, *Curcas Indorum*, The American great Spurge, or Palma Chriſti.

The Deſcriptions.

III. The firſt, more Common Great Spurge or Vulgar Palma Chriſti. *Its Root conſiſts of long and great ſtrings and ſmall Fibres, which with us periſh quickly after it has felt the firſt Froſts, and muſt be ſet new every year by ſuch as will have it, but abides all Winter in Warm Countries which have no Froſt. This great Spurge ſprings up in our Country, to be Eight and ſometimes Nine or Ten Feet high, with a hollow Stem, as big almoſt as our Ordinary Canes, of a brownish color, with an Eye of blew hoarineſs upon it. The Leaves which ſtand upon the Stem, and upon the branches it ſends forth every one ſeverally on all ſides upon long Foot-ſtalks, are very broad or large,*

Spurge great common: or Palma Chriſti.

and divided into 5, 7, 8, or 9 parts or diviſions (repreſenting the hand of a Man with the fingers ſpread abroad, of a dark or deep green color on the upperſide, and of a whitiſh green underneath. The flowers are many round buttons, ſhooting forth together, and ſtand all along upon a long

Stalk, at the Tops of the Stem and Branches, consisting of many pale yellow Threads, which fall away without bearing any Seed, but farther or higher up, upon the Stem, or main Stalk, and sometimes upon the Branches, break forth other heads, which are the Seed, upon long Footstalks, being Triangular, rough and ashcolored on the outside, or outward shell, which opening it self, or being opened, there lies within it the Seed, whose outward husk is discolored, or as it were spotted and shaped like unto a Tick or Tike, which contains within it, a pretty large, round, somewhat long and flat shining Seed, of a brown color, having a white Pulp or Kernel within it, of a Fiery hot Taste, *burning the Mouth and Throat of such as eat it, but very Oily, and from which (in the* West-Indies, *as in* Carolina, *&c.) they press forth an Oil, which is used for External purposes, and serves also to burn in Lamps, but is hurtful to be used with food, as* Dioscorides *says; and yet I have been told by some in those* West-Indies, *that they eat it as* Oil Olive, *without any hurt or detriment; this may be true for all that I know, and yet I should be loath to make the Experiment.*

IV. *Gerard* describes it after this manner. Ricinus, Palma Christi *or* Kik, *from a long well branched Root, springs up with a great round hollow Stalk, five Cubits or seven or eight Feet high, of a brown color, dyed of a blewish Purple upon green. The Leaves are great and large, divided into several sections or parts, fashioned like unto the Leaves of a Figtree, but greater, and spread wider open like a Mans hand. Towards the Top, there comes forth a bunch of flowers clustering together like a bunch of Grapes, of which the lowermost are of a pale yellow color, and wither away without bearing any fruit, but the uppermost are reddish, bringing forth three cornered heads or husks, in which are contained the Seed as big as a kidney bean, of the color and shape of a certain Vermin which haunts Cattel, called a Tick or Tike.*

V. The second, or lesser Species of the Great Spurge or Palma Christi. *It is like the former, but lesser in every part, altho it grow in the same ground, whose Seed being ripe is manifestly much lesser than that of the former. This Plant* Clusius *in his* Exoticks, Lib. 2. Cap. 21. *has taken notice of; and* Beslerus *in his* Hortus Eystettensis, *has largely prefigured.*

VI. The third, or American Great Spurge, or Palma Christi. *This differs from the two former sorts, not only in the greatness, but also in the form; for as* Monardus *and* Aldinus *say, it grows to be much greater than any growing in* Spain, *whose first Leaves are almost round, and larger than those of the first Species, but those which follow are broad like to the Palm of an hand, and cut in or Torne on the edges for the most part into five divisions, something resembling or answering to the five fingers of a hand (whence probably came the Name* Pentadactylus, *and is an appellation more proper for this Species, than for either of the former.) In the Seed there is some difference also, which tho' the heads or husks are Triangular as other Spurges are, and the former* Ricini, *yet the outward husk is not prickly or rough, but smooth, and of an Ash color, the innermost Seed it self being somewhat like the former but more black, and not spotted at all, and is full as Oily as the first before described, and of which a great quantity of Oil is made for outward uses. Its substance is woody and is of the magnitude of a Hedg Shrub.*

VII. *The Places.* The first grows with us in *England* in our *Gardens*, and was brought to us from *America:* but it grows also in the hotter Countries of *Europe, Asia, and Africa*, as in *Syria, Ægypt*, and other parts adjacent to them, where as *Bellonius in Observat. lib.* 1. *cap.* 18. says, the Stalk grows to be as big as the Body of a Man, and as Tall as a reasonable great Tree, whose Seed cannot be gathered without a Ladder, its leaves not falling away in Winter; nothing of which we know in our Colder Climates. This *Syrian* or *Ægyptian* Seed contains a violent heat in it; for the half part of one Seed being taken by a strong young Man of about 20 Years of Age, very much troubled with the Head-ach, purged him very forceably and eased the Pain: But by accident chewing the Seed in his Mouth (which he ought to have swallowed whole without Chewing) it so vehemently inflamed his Chaps and Throat, and Mouth of the Stomach, that it put him into a Fever and gave him an intollerable Thirst with a Fainting of the Spirits, which continued for the space of nine days, and then he dyed, notwithstanding he was under the care of three Physitians, who used all the means imaginable. The second and third kinds, grow in several parts of *America*; the second in particular I found in some Plantations in South *Carolina*, and *Parkinson* says, his first Seed thereof came from the *Bermudas*, as before is hinted.

VIII. *The Times.* With us in *England* they are Sown in the beginning of *April*, and flower in the end of *July* and beginning of *August*, their Seed being ripe towards the latter end of the same Month.

IX. *The Qualities.* The Seed is only used being hot and dry in the fourth degree. It is inflaming, extreamly Attractive, and strongly Emetick and Cathartick.

X. *The Specification.* It is peculiar for the Cure of a cold Scurvy, Cephalalgia, Dropsy, Jaundice, Scrophula, Sciatica, Rheumatism and Gout.

XI. *The Preparations.* You may have, 1. *The hull'd Seed.* 2. *A Decoction thereof in Broth.* 3. *An Expressed Oil of the Seed.* 4. *A Cataplasm.*

The Virtues.

XII. *The hull'd Seed.* *Dioscorides* says, that 30 Seeds freed from the Husks, being bruised and taken in Drink, or other proper Vehicle, does purge choler, water and flegm, and expel Aqueous humors abundantly from the Belly, provoking Urine also; but as *Dioscorides* himself confesses, it troubles the Stomach, and overturns it mightily; yet with good Advice it may be given to strong and Vigorous Bodys, corrected with Aniseed, Carraways, Fennel Seed, or Winters Cinnamon; and so may be given to such as are troubled with the Dropsy, Sciatica, Gout, Rheumatism, Kings-Evil, Melancholy, Jaundice, Madness, *&c.* because it draws water and flegm strongly from the remote Parts. *Costæus* in his Commentary upon *Mesues*, thinks that the Dose of 30 Grains or Seeds to be a fault in those who Coppied out *Dioscorides*, setting down 30 for 3, which latter number is the utmost Dose, which may be safely given. *Clusius* says, he knew divers Empyricks give of the small Seed, which came out of

of *America*, in a small quantity, as a Purge in many Diseases, which they held as a secret of Worth, because by its purging the Body well, they found it a great Remedy.

XIII. *The Decoction of the Seed in Cock Broth.* It is good for all the purposes of the hull'd Seed before related, the Dose of which is to be regulated according to the number of the Seeds.

XIV. *The Expressed Oil of the Seed.* *Durantes* says, put into Clysters, it opens obstructions of the Bowels, expels Wind, eases the Colick, and helps Fits of the Mother. *Monardus* says, the Oil of the *Indian Seed*, is found by daily Experience to Cure all diseases proceeding from Cold Causes, dissolve Tumors or Swellings, discusses Wind, eases the Colick and Mother, if the places grieved be anointed therewith, and some few drops of it be taken in fat Chicken Broth. It wonderfully helps the Cramp, and Convulsion of the Nerves, and shrunk up Sinews, being anointed upon the places: It eases the Spleen, opens its obstructions, and takes away the hardness of the Belly by anointing the Sides and Belly therewith; it also helps Scabs and running Sores of the head, and cleanses the Skin from all manner of Spots, Blemishes, Scurff, Morphew, and other Deformities thereof. A Drop two, or three, given to Children troubled with the Worms, in Milk or Fat Broth, it kills and expels them. And Dropt into the Ears, it cures deafness and takes away the Pain, Noise, or Ringing therein.

XV. *The Cataplasm of the Green Leaves* Applied of themselves, or Beaten up with Barly Meal or Flower, it cools and allays Inflamations and Swellings of the Eyes; and applyed to Womens Swoln and hard Breasts after lying in, it softens them, abates the Tumor or Swelling, and dissolves the Coagulated Milk, making it to run, or be drawn freely.

CHAP. DCLVII.

Of SPURGE *Olive,* *OR,* MEZEREON.

I. *THE Names.* The Arabians call it *Mezereon*, or *Mesereon*: the Greeks Θυμέλαια in Latine, *Thymelæa, (quasi Tithymelæa, ex Tithymalo & Olea deducta) Chamælea, and Mezereon:* in English, *Spurge Olive*, and *Mezereon.*

II. *The Kinds.* Authors make many Species of this Plant; we shall only Treat of the four following, *viz.* 1. *Mezereon, Chamælea, Germanica, Camerarij & Dodonæi*; *Daphnoides Fuchsij*; *Daphnoides nostrum vulgare Gesneri*; *Laureola fœmina Lugdunensis*; *Piper Montanum Anguillaræ*; *Lauras Pusilla, & Mesereon Germanicum Lobelij*: Our Mezereon, Dwarf Bay, or Dwarf Olive. 2. *Mezereon verum Arabum, Chamæleavera, Chamælea tricoccos*, Widdow Waile. 3. *Thymelæa, Mezereon* also by the *Arabians*, for they promiscuously call this Species by this Name, with the *Chamelææ* of all Kinds, Spurge Olive, or Spurge Flax. The Berries of this, as also of the first kind, are called by the Greeks: κόκκος κνίδιος, and in Latine, *Coccum Cnidium*, which tho' they are Berries of differing Species, yet are made of one and the same nature, and have the same Cathartick qualities. *a Camerario primum inventa & descripta*; *Chamælea altera C. Bauhino*, Mountain Spurge Olive.

The Descriptions.

III. The first, or Our Mezereon Dwarf Bay, or Dwarf Olive, called also Flowering Spurge Olive. *Its Root spreads out into many woody Roots and long tough branches, which are covered with a yellow bark. It rises up with a woody Stem two or three feet high, and sometimes higher, according to the goodness of the Ground, of the thickness (if they be old) of a Childs or Boys Wrist, at the Ground, which rising up, spreads it self out into many tough woody or Timber Branches, covered with a tough grayish bark or Rinde, beset with small long Leaves, something like unto Privet Leaves, but smaller, paler, thicker, and fatter, and rounder pointed The flowers appear before the Leaves, oftentimes in January and February, clustering together about the Stalks at certain distances, which are small, consisting of four Leaves, very many growing together, and breaking out of the Branches (as it were) by themselves, of a whitish color tending to Purple, and of a fragrant pleasant sweet smell. After the flowers are past come the Berries, which are at first green, but being ripe, of a shining red color, which if they stand too long upon the branches become of a blackish red, of a very hot and burning taste, inflaming the Mouth and Throat with danger of Choaking.*

Spurge Olive or Mezereon.

IV. The second, or Widdow Wail. *Its Root spreads*

ſpreads its ſelf in the Earth, but not very far, being of a hard and Woody ſubſtance, which eaſily periſhes, if it be not carefully defended from the Extremity of ſharp Winters. It has no great Stem, but a ſmall ſhrub of about three Feet high. The whole Plant ſpreads it ſelf from the Ground, into many flexible tough green Branches, with many ſmall twigs, on which ſtand ſeveral ſmall, narrow, long, dark, green Leaves, like Privet, but ſmaller and blacker, which abide green all the Winter. The flowers grow at the ends of the Branches and are very ſmall, ſcarcely to be ſeen, of a pale yellow color, and come forth between the Leaves and the Stalk, made of three Leaves a-piece. Which being paſt there comes a ſmall, blackiſh triangular berry, very like to the Tithymales, three uſually ſet together, for which reaſon the Plant is called Tricoccos. *Theſe Berries are green at firſt, afterwards red; and brown, when they be withered: which contain in them an Oily fatneſs, like that of the Olive, and are of a hot biting taſte, burning the Mouth and Tongue, as do alſo both the Rinde and Leaves.*

V. The third, or Spurge Olive, properly ſo called, or Spurge Flax. *Its Root is ſoft and tender whilſt it is young, very like unto a Radiſh Root as* Cluſius *ſays; but woody when it is grown elder, covered with a tough thick bark. It riſes up with divers tough Stalks, a Cubit or two* Feet *high, ſometimes in very good ground a yard high, of about the thickneſs of ones thumb, covered with an Aſh colored bark, and ſpread out into many Branches, covered round in a manner with Leaves, which are many, ſmall, narrow and long like Myrtle Leaves, or rather like unto the narrow Leaves of the Olive tree, narrower and leſſer than the Leaves of Widdow Wail; ſomething like to thoſe of Flax, to which many compare them, but that they are larger and broader, being alſo clammy, flat, and pointed, continually abiding on the branches, without falling off as thoſe of the* Chamælea *do. At the Tops of the branches grow many ſmall Starlike flowers, conſiſting of four white Leaves apiece, after which come ſmall round berries, which at firſt are green, and when ripe of a red Coral-like color, but are a little more long than round, of the bigneſs of a Myrtle berry, with a pulp or ſubſtance like unto a Hawthorn or Cherry, in which is a white Kernel covered with a black and ſoft, yet brittle ſhell or skin. Theſe are very hot and burning in the Mouth, like* Mezereon.

VI. The fourth, or Mountain Spurge Olive. *Its Root is long, and ſpreads about, under the upper part of the Earth. It riſes up with a ſmall Woody Stem, 3 or 4 or more feet high, branching out towards the* Top, *into many ſmall ſlender and tough branches, covered with a rough, hoary and green bark, beſet at the ends thereof with flatter, fuller, and ſmaller round pointed Leaves than the firſt or Our* Mezereon, *of a grayiſh green color on the upperſide, and hoary underneath, which fall away before Winter, as Our* Mezereon *does. The flowers are many, ſet together at the ends of the branches, greater than the former, conſiſting likewiſe of four Leaves apiece, of a light bluſh color, ſtanding in ſmall grayiſh husks, of very little ſmell. The berries are ſmall long grains, of an excellent red color, which afterwards turn black.*

VII. *The Places.* The firſt grows very plentifully in many places of *Germany*, and naturally in moiſt and ſhady Woods in *Poland* and thoſe Eaſtern Countries; and in great abundance in moſt of our *Engliſh Gardens.* The ſecond grows in *Spain*, and in *Provence* in *France*, as alſo in *Languedock*, in rough and deſart places, but with us only in Gardens. The third grows in *Spain*, and in *Tuſcany* in *Italy*, and about *Trent*, in rough Mountains, and untill'd places, and in *England* in Gardens. The fourth grows on the *Alps*, in the Mountains of *Savoy*, from whence it has been brought to us, and Nurſt up in manured Grounds.

VIII. *The Times.* The firſt flowers in *December*, *January* and *February*, and their berries are ripe in *Auguſt.* The ſecond flowers Early in the Spring, as in *April* and *May*, and the fruit is ripe in *Autumn*, as *July*, *Auguſt*, and *September.* The third flowers not in *Spain* till *July* and *Auguſt*, and its fruit is ripe in *September.* The fourth flowers in *April*, if the weather be temperate, and the fruit is ripe in *Autumn.*

IX. *The Qualities.* They are all of them in their Roots, Barks, Leaves and Berries, hot and dry in the fourth degree; Aperitive, Inflaming, Attractive, and violently Emetick and Cathartick.

X. *The Specification.* They are eſpecially good againſt inveterate, ſtubborn and rebellious Scorbutes, Dropſies, Jaundice, Scrophula's, Gouts, Sciatica, Rheumatiſms, as alſo the obſtructions of the Terms in Women, and Madneſs.

XI. *The Preparations.* You may have therefrom. 1. *A Decoction of the Roots or Leaves in Fat Broth.* 2. *A Pouder of the Leaves.* 3. *Pills of Mezereon.* 4. *A Juice of the Berries.* 5. *The Grains or Seeds.* 6. *The Ointment.*

The Virtues.

XII. *The Decoction of the Roots or Leaves in Fat Broth.* It purges Pituitous and watery humors from the moſt remote parts of the Body, and that ſtrongly, and therefore is good againſt the Gout, Sciatica, Rheumatiſm, Dropſy, Scurvy, Leproſy, Evil, *&c.*

XIII. *The Pouder of the Leaves.* When the Leaves are groſly beaten, the Strings are to be taken away out of it, and then it is to be reduced to a ſubtil pouder. Doſe half a Dram in any convenient Vehicle: if given to a Dram, it works as ſtrongly as Colocynthis, but it does wonders in inveterate and rebellious Diſeaſes, being effectual for all the purpoſes for which the former Decoction may be given. The fine Pouder may be kept all the year, if it be made up into *Troches*, or Balls, with a little Spaniſh Juice of Liquorice, and then carefully dryed.

XIV. *Pills of Mezereon: Take of the Pouder one Ounce: Wormwood in Pouder 2 Ounces: with Honied Water make a Maſs of Pills, which dry carefully.* They diſſolve not in the Stomach or Belly, but are for the moſt part voided whole. *Meſues* makes them thus. *Take Pouder of Mezereon Leaves; Pulp of yellow and Chebula Myrobalans, of each an Ounce: with Manna and Pulp of Tamarinds diſſolved in Endive water make a maſs of Pills.* Theſe Pills are commended againſt the Dropſy, and Gout: they expel watery and Tartarous humors, but work violently.

XV. *The Juice or Pulp of the Berries.* Given to half a Dram in Wine, or Broth which is better, it purges abundantly all watery humors, and has all the Virtues of the Decoction and Pouder aforenamed. If taken alone it burns the Jaws and Throat, and therefore it ought to be ſwallowed in Honey or in a Raiſon Stoned.

XVI. *The*

XVI. *The Grains or Seeds.* Taken to 20 grains as *Dioscorides* says, they purge by Stool, Choler, Flegm and Water: but unless taken in a Ration they burn the Mouth and Throat: for some persons half this Dose may be sufficient, and to some others too much. It Cures Melancholy and Madness. They ought to be used with Caution, otherwise the Medicament may be dangerous, and therefore not to be taken without Correctives.

XVII. *The Balsam. It is made of the Pouder of the Leaves mixt with Honey.* Or, *It may be beaten up with a little Nitre and Vinegar.* It opens Crusty Sores, and cleanses and heals Old and Filthy Ulcers.

CHAP. DCLVIII.

Of SPURGE *Wood,* *OR,* TITHYMAL.

I. *THE Names.* It called by the Arabians *Xuuser*, and *Ethuia*, also *Ethutis*, and by *Mesues, Scebran and Alscebran*: in Greek Τιθύμαλος χαρακίας: in Latine, *Tithymalus*, and *Tithymalus Characias* (i. e. *Vallaris*, from its growing in Valleys and low and moist places of the Woods) also *Tithymalus nemorosus*: in English, *Wood Spurge* or *Tithymal*.

II. *The Kinds.* Authors make 14 or 15 Species of this Plant, but we shall only take notice of the following five, as being most familiar with us, *viz.* 1. Τιθύμαλος χαρακίας δημώδης, *Tithymalus Characias vel nemorosus vulgaris*, Our Common Wood Spurge. 2. *Tithymalus Characias major*, *Tithymalus Characias legitimus Clusij*, The Greater Wood Spurge. 3. Τιθύμαλος δενδροειδὴς, *Tithymalus dendroides*, *Tithymalus nemorosus minor*, The lesser Wood Spurge. 4. Τιθύμαλος μυρσίτης ἢ μυρσινίτης, *Tithymalus Myrsinites*, Myrtle Spurge. 5. *Tithymalus dendroides Camerarij*, *Gesneri*, *Matthioli*, *aliorumque*; *Tithymalus dendroides sive arboreus Myrtiformatus non insolijs sed in frutice Lobelij*; *Tithymalus Characias Tertius Dodonei*, Shrub Spurge.

The Descriptions.

III. The first, or Our Common Wood Spurge. *It has for its Root a small bush of Fibres or Threads, spread every way under the Earth, from whence rises up larger Stalks, with several other lesser, a foot and half, two feet or more high, beset with small, long, narrow Leaves, but shorter and lesser than the next following, not much unlike to the Leaves of the Almond-tree, for which reason I suppose*, Lobel *called it* Tithymalus Characias Amygdaloides; *the flowers are yellow, standing in such Cups of Leaves as other Spurges do, after which come Triangular heads, or Seed, Vessels in which the Seed is contained.*

Common Wood Spurge.

IV. The second, or Our Greater Wood Spurge. *Its Root is long and somewhat woody, spreading it self under ground but not creeping. It has divers*

Spurge Wood Great.

tough,

tough, woody, browniſh, red branches about two feet high or more, bare or naked of Leaves for a ſpace from the Root, and afterwards ſet up to the Tops with many narrow and long Leaves, yet broader than thoſe of the Sea Spurge, and nothing ſo large as the Garden Spurge, almoſt like to the Leaves of the Almond Tree; ſomething ſmooth in handling, and without any dents about the Edges, turning reddiſh in the Spring; and more in the Summer time. At the Tops of ſome of the Stalks (for all of them do ſeldom flower at once, being very much branched) ſtand many yellow flowers, whoſe under Cups (viz. the two almoſt round Leaves encompaſſing the Stalk) are yellow alſo. After which come ſmall roundiſh Triangular heads, ſtanding up a little higher in thoſe Cups, than the flowers did upon the Stalks, each head by it ſelf, in which is contained ſmall browniſh round Seed.

V. The third, or Our Leſſer Wood Spurge. *It has a long Root deſcending deep into the Ground, with ſeveral Fibres or Strings ſpringing from it. It is but a ſmall Plant, and has ſeveral ſlender Branches or Stems pretty thick ſet with Leaves, which are whitiſh, long, and narrow, much like to*

Spnrge Wood ſmall.

the firſt Wood Spurge, but nothing ſo large, narrower alſo, and nothing at all hoary. The Umbels or Tufts of flowers are of a greeniſh yellow, which before they be open'd do repreſent the long ſhape or form of a very ſmall Damſon, but in its color it is like to the reſt of the Leaves; which opening it yields its flowers and Seed, which in color, form, or ſhape, are like to the former but ſomething leſſer.

VI. The fourth, or Myrtle Spurge. *Its Root is ſmall and long and accompanied with many Fibres, Strings, or Threds. It has many upright reddiſh Stalks riſing from the Root, about a Foot high or more, fat and ſlender, on which grow without any order many hoary and whitiſh green Leaves, like*

Spurge Myrtle.

in form, but not in hardneſs to thoſe of Knee-holm, or of the Myrtle buſh (whence came the Name) which Leaves are ſmall at bottom, larger in the middle, and ending in a ſomewhat ſmall and ſharp point. The flowers are ſmall and yellow, but not ſo many, ſtanding at the Tops of the Stalks, like the other Spurges, of which follow like heads and Seed. Dioſcorides *deſcribes it after this manner.* Ramulos (Dixit ille) ab Radice mittit dodrantales. Folijs creſcit Myrti proximis, ſed majoribus, firmis, in Cacumine acutis, & pungentibus. Fructum fert alternis Annis, Nuci ſimilem, mordaci guſtu. *The Figure We have given you from* Matthiolus, *which is before it comes to its Flowering and Seeding.*

VII. The fifth or ſhrub Spurge. *Its Roots are not ſo great and long as ſome of the former, yet ſufficiently ſpread in the Ground to ſuſtain the whole Plant, which* Lobel *compares to a Myrtle Shrub, for its magnitude, and form of growing, but not as to the form of its Leaves. The Stem of this ſhrub grows upright to the thickneſs of a Mans Thumb, almoſt like to that of the Pine Spurge, from the bottom, being there bare without Leaves for 6 or 8 inches, and then ſpreads it ſelf forth into divers branches of a fingers thickneſs, ſomewhat hairy, and not red as the others, but white; on which grow narrow long Leaves of a whitiſh color, ſomething like to the Sea Spurge, or rather the Marſh, or Great* Eſula; *having larger yellow Flowers and Seed, but in other points like to the reſt of this kind.*

VIII. *The Places.* The firſt, which is Our Common, kind grows in moſt Woods in *England*, which are dry and warm; I have gathered it in *Hornſey* Wood near *London*. The ſecond and third grow in Woods in many parts of Our Land, as alſo in *France* and *Spain*, and in ſeveral of Our Gardens.

Gardens. The fourth and fifth, grow with us only in Gardens.

IX. *The Times.* They all flower in the Summer Months, in *June* and *July*; and their Seed is ripe in the Months following.

X. *The Qualities.* They are all hot and dry in the fourth degree: Vehemently Attractive, heating and burning, and ſtrong Emeticks and Cathartick, like the others.

XI. *The Specifications.* They are good for the Cure of Dropſies, Colds, Sciatica, Rheumatiſms, Kings-Evil, Leproſie, Leuce, Jaundice, and other like inveterate and deſperate Diſeaſes.

XII. *The Preparations.* The *Milky Juice* is the ſtrongeſt worker; *the Seeds* and *Leaves* are next to them; and *the Roots* of moſt of them have the ſame Operation, but not ſo violent. The *Myrtle Spurge* has the ſame effects but is weaker, and Vomits not ſo much. Now from all theſe you may have, viz. 1. *The Milk or Liquid Juice.* 2. *A Decoction.* 3. *The Grains or Seed.* 4. *A Powder of the outward Bark of the Root.* 5. *An Oil by Inſolation or Decoction.* 6. *The Correction.* 7. *A Diſtilled Water.*

The Virtues.

XIII. *The Milk or Liquid Juice.* It purges with great violence both by Vomit and Stool, Pituitous and Watery Humors, as alſo Cholet and Melancholy from the Stomach, Bowels, and Joints; Evacuates the Humidities in Dropſies, and takes away the Tartarous matter which breeds the Stone in Reins or Bladder, Gout, Rheumatiſms, Sciatica, or Kings-Evil; but it Emaciates and Waſtes the Body, and if often uſed, is apt to induce a Conſumption. Three or four Drops of the Milk taken freſh, is often put into a Fig, and mixt with its Pulp, and ſo uſed by ſtrong Country People to purge them. The Milk put into Hollow-teeth with a bit of Lint, (ſo as it touch none of the others) eaſes the Tooth-ach both effectually and ſpeedily. The Milk laid upon any hairy place, takes away the hairs; but it ought not to lye long at a time, and the places afterwards ought to be preſently anointed with Oil of Roſes or Nightſhade. It alſo takes away Callous or hard Skin, Knots, Warts, Corns and the like, being cautiouſly applyed, they being firſt pared near to the quick.

XIV. *The Decoction in Fat Broth.* It has all the Virtues of the Juice, but acts with much more gentleneſs, and ought to be given in ſmall Doſe, firſt, as in one or two Ounces, and ſo gradually encreaſed, as you find the Body is able to bear it.

XV. *The Grains or Seeds.* You may give them from 3 to 20, according to Age and Strength, they work roughly and with a great force, and are good againſt all the Diſeaſes the Milk or Juice is good againſt

XVI. *The Powder of the Outward Bark of the Root: (or of the Leaves.) They ought to be firſt ſteeped a day and night in White Wine Vineger to abate their Acrimony, then dryed, and afterwards reduced to Powder.* Half a Dram of it taken in Wine or Honied Water, purges all watery humors downwards, as alſo Choler and Melancholy, and is very profitable to be given to ſuch as have the Dropſy, Gout, Rheumatiſm, Sciatica, Kings-Evil, Leproſy, Jaundice, Stone, Gravel, &c. And

applyed to Green Wounds and Recent Ulcers, it cleanſes and heals them.

XVII. *The Oil by Inſolation or Decoction.* It is made of the Milk, or of the Herb, Roots or Seed beaten in a Mortar and boiled in Oyle (after Almonds to Ointment. The Ingredients are boiled 2 or 3 times. It cleanſes the Skin of all its deformities, as Freckles, Leuce, Tetters, Scurfs, Itching, Blemiſhing, Wall-worts, Scurfy Morphew, and other like Cutaneous Infections, being anointed therewith.

XVIII. *The Correction.* All theſe Spurges are heating and Exulcerate the Skin, if not corrected ly applyed: and taken inwardly, Operate vehemently and ſometimes excoriate the parts, without great care and caution be taken. Moreover they, they are offenſive to the Heart, Stomach and Liver, that they break the Veins, and ſtop the Guts of their Mucus, and heat the whole Body ſo much that many times they cauſe Fevers. The firſt ill qualities are taken away (viz. by adding ſuch things as ſtrengthen the Stomach Heart and Liver. Their ſecond and third ill qualities are taken away by adding things which have a glutinous quality, as Gum Tragacanth, Mucilage of Fleawort Seeds and Purſlane. The fourth ill quality is taken away, by adding cold and moiſt things, as juices of Endive, Nightſhade, Purſlane, Sowthiſtles, or Mucilage of Quince Seeds made with Vinegar, &c.

XIX. *The Diſtilled Water.* It cleanſes the Face and Skin from all manner of deformities, being daily applyed, more eſpecialy if an Eighth part of the Liquid Juice be added to it, as the inveteracy of the affect may require.

CHAP. DCLIX.

Of SPURGE *Marſh.*

I. *THE Names* It is called by the Arabians *Seebran*, and *Pthias*: in Greek Πίτυον ἕλειον: in Latine: *Tithymalus paluſtris*, *Pityuſa paluſtris*: and in Engliſh, *Marſh Spurge*, or *Marſh Eſula*.

II. *The Kinds.* There are 1. *Eſula major*, *Eſula major Germanica*, *Pityuſa paluſtris major*, Great Marſh Spurge, or Greater Eſula, which ſome will have to be *Rulandus* his *Eſula*, of which he made his *Extract*: whether the *Greater Eſula*, or the *Leſſer Eſula*, be the *Eſula* of *Rulandus* is very doubtful; nor can I find any Author which can truly or certainly determine it, they are both of them very ſtrong and potent Medicaments, and therefore in my opinion may indifferently be made uſe of: however that which any one by Experience has found to be beſt, he may ſtick to. 2. Πίτυον ἄμορον, *Peplis*; *Pityuſa purpurea paluſtris*; *Peplion Dalechampii*; *Peplis maritima folio obtuſo Baubini*, *Peplium Ceſalpini*; Small Marſh Spurge, or ſmall Purple Marſh Spurge.

The Deſcriptions.

III. The firſt, or Great Marſh Spurge, or Greater Eſula. *Its Root is of a blackiſh color on the outſide*

ſide and white within, great, thick, and ſpreading divers ways; the bark whereof is thicker, and more fleſhy, than in any of the reſt, and endures the extremities of Winter, tho' the branches thereof periſh for the moſt part every Autumn, and riſe anew every ſpring. It riſes up with

Spurge Marſh.

many great round reddiſh Stalks, on which are ſometimes thick ſet, many long, and ſomewhat broad green Leaves, yet not ſo broad, nor ſo long as thoſe of Wood Spurge, otherwiſe not much unlike. The Tops of the Stalks are furniſhed with fewer and ſmaller yellow flowers, than ſuch a great Plant might be expected to have. Some flowers break forth alſo below the Tops, at the under joints, ſtanding upon their Stalks, three or four together at moſt; after which come ſmall round Seed like unto the others. This great Marſh Spurge, is alſo called Eſula major, *to diſtinguiſh it from the* Eſula minor, *and the other Spurges.*

IV. *Gerard* deſcribes it thus. *It has very many and great Roots, covered over with a thick Bark or Rinde, plaited as it were with many Surculous Sprigs; from which riſe up ſeveral ſtrong and large Stems of a fingers thickneſs, and about three feet high, beſet with many pretty large and long Leaves like* Lathyris, *or Garden Spurge, but that they are not ſo thick: and the Seed and flowers are not unlike the other Tithymals or Spurges. This Plant ſays* Gerard *called* Eſula major, *is that which* Martinus Rulandus *had in great Veneration, out of which he made* his Extract *for the cure of many inveterate diſeaſes, as may and does appear at large in his* Centuria curationum Erpericamum, *dedicated to the* Duke *of* Bavaria. *'Tis true he in that Book often ſpeaks, and makes uſe of* Extractum Eſulæ, *with which he did wonderful Cures; but in none of all his works has he left behind him, or diſcovered whether that his* Extract *was made from the* major *or* minor Eſula, *ſo that the true Plant is left only to conjecture.*

V. The ſecond, or ſmall Marſh Spurge. *Its Root is ſingle, ſmall, and ſlender, and of no uſe. It ſpreads its ſmall purpliſh Branches upon the Ground, more plentifully than the other, and much leſſer; for it brings forth a greater ſtore of branches more cloſely knit, and as it were wound together with ſhining twiſts an handful and half long. The Branches are ſet with many ſmall Leaves, almoſt like, but leſſer than thoſe of* Peplus, *but not ſo round at their ends, of a Purpliſh color underneath and oftentimes above, and not much unlike to Wild Purſlane, eſpecially in the beginning and heat of the Year. The flowers are ſmall and yellow: and the Seed is great like that of* Peplus, *but bigger, and ſtanding two together for the moſt part, not only upon the Tops, but here and there upon the Branches alſo. As in Name, ſo in Shape, this reſembles* Peplus, *(ſaving that it is fuller of Branches) and comes in moſt reſpects nearer to the ſignification of* Peplum *or* Flammeolum *than* Peplus *doth.*

VI. *The Places.* The firſt grows in many Places of *Germany*; and as *Lobel* ſays in his Obſervations, in a Wood formerly belonging to one *Mr. John Coltes*, nigh to *Bath*, very plentifully; but but for the moſt part it grows with us in *England* in *Gardens.* The ſecond grows near the Sea Side, in *Narbone*, and about *Marſeilles* in *France*, and near the Sea Coaſts of other Nations.

VII. *The Times.* They both flower in *June* and *July*, and their Seed is generally ripe in *July* and *Auguſt.*

VIII. *The Qualities, Specification, Preparations, and Virtues* of theſe Plants, more eſpecially of the firſt, are the ſame with thoſe of ſmall Eſula in *Chap.* 655. aforegoing, to which we refer you.

CHAP DCLX.

Of SPURGE *Sea.*

I. *THE Names.* It is called in Greek, Τιθύμαλος παράλιος: in Latine, *Tithymalus paralius*; *Maritimus*; *herba lactaria, and Lactaria maritima* (from its Milky juice;) by ſome, *Lac Lupinum*, Wolfs Milk; by others *Lactuca marina, and Caprina*, becauſe *Goats* delight to eat it: and in Engliſh, *Sea Spurge*, and *Sea Tithymal.*

II. *The Kinds.* Thoſe which are moſt known and of uſe to us, are, 1. *Tithymalus Paralius, ſive maritimus, Lactaria marina*, Our Common Sea Spurge. 2. *Tithymalus maritimus Venetus, Tithymalus maritimus Americanus vel Floridanus* (becauſe I have found it upon ſome of the *Floridan* ſhoars) *Alypum Dioſcoridis Auguillarâ, Eſula rara Venetorum Penâ & Lobelio*, Sea Spurge of Venice, or American. 3. *Tithymalus Liniſolius Paralio congener, vel cognatus Camerarij*; *Tithymalus maritimo affinis Linariæfolio Bauhini*; *Tithymalus amygdaloides anguſtiſolius Tabernæmontani*; Baſtard Sea Spurge.

The

The Descriptions.

III. The firſt, or Our Common Sea Spurge. *Its Root is long and Woody, abiding long, and ſo do the Leaves on the Branches, not falling away in Winter. It riſes up with ſeveral reddiſh woody Stalks, a foot or foot and half high, thick ſet with Leaves from the bottom to the Top, which are*

Spurge Sea, or Sea Tithymal.

ſmall, long, and narrow, yet broadeſt in the middle, ſomething like to the Leaves of Line or Flax, but thick and whitiſh, full of a white Milk, if any part of it be cut or broken; which is ſo hot, that being taſted, it burns the Mouth and Throat intollerably. At the Tops of the Stalks, ſtand many pale yellowiſh flowers, with two Leaves under them, encompaſſing the Stalk, as is common to all the other kinds of Spurges, after which come ſmall Triangular heads, in which is contained round diſcolored Seed.

IV. The ſecond, or Sea Spurge of Venice, or American. *Its Root is great, long and woody, perannual and ſending forth branches every year. It has longer or taller and thicker Stalks than the former, ſomewhat hollow and reddiſh, branching forth into divers parts, beſet with ſmall long Leaves, two always ſtanding together, all along the branched Stalks, not much unlike the growing of Liquorice. The flowers are ſmall, penduleus and of a ſad Purpliſh color, conſiſting of five ſmall Leaves apiece, like a ſmall Star, without any round Leaves under them, as is uſual to other Spurges; yet the heads of Seed are Triangular like the others, and contain like Seed.*

V. The third, or Baſtard Sea Spurge. *Its Root* [illegible] *woody and fibrous. And it ariſes up with ſeveral Stalks, having many narrow Leaves growing thereon, much like to the firſt, or Our Common Sea Spurge, but that they are ſomething larger and longer, and a dark green. The flowers and Seed are like that.*

VI. *The Places.* The firſt grows by the Sea ſide both in Languedoc Countries and in divers places of the *Engliſh* ſhore. The ſecond grows on the ſhores of the *Adriatick Sea*, and in the Island *Lo*, belonging to the *Venetians*, as alſo in many places of the *American* Sea Coaſts, where I have found it in perfection. The third in *Provence*, and other parts adjacent to it, and near to the Banks of the River *Mayne*, but with us it grows only in Gardens.

VII. *The Times.* They flower about the latter end of *June*, and through the Month of *July*, and the Seed is ripe in *Auguſt*.

VIII. *The Qualities, Operations, Preparations and Vertues* of theſe are the ſame with thoſe of the *Garden Spurge*, and *ſmall Spurge* called *Eſula*, being all hot and dry in the fourth degree. Burning and Exulcerating. The firſt of theſe *Sea Spurges* is not mentioned by any Author Ancient or Modern, to be uſed in Phyſick, becauſe of its vehement and ſharp Exulcerating Quality, and for that it is ſo violent a purger both upwards and downwards, that it is ſcarce ſafe to uſe it inwardly, it Burning and Exulcerating the Skin being outwardly applyed, but ſo uſed it is profitable to take away Scabs, Scurf, Morphew, Leproſy, Scars, Warts, and other Deformations and deformities of the Skin, being prudently applyed. Yet I know by Experience, that if it be corrected and prepared by a wiſe and skilful hand, the preparations thereof may be given inwardly, as the preparations of the other Spurges may, and nearly in the ſame Dole, But I own, it is not fit for an unskilful perſon to meddle with it, becauſe of its violence. *Galen* ſays, that the *Milk or Juice thereof mixed with Meal of Wheat or Barly, and made into a Paſte, and then caſt into the Water for the Fiſh to eat it*, that it will ſo much overcome them, as to make them lye for dead, and to riſe and Swim on the Top of the Water, ſo that they may be taken with ones hand.

IX. *The Venetian Sea Spurge.* The Roots are uſed at *Venice* by the Phyſicians and Apothecaries there, inſtead of *Eſula*, where they put them into the *Benedicta Laxativa*, *Purging Pills*, and other Cathartick Medicaments, becauſe as *Pena* ſays, it purges forcibly, and with great violence. Of the laſt, Authors have ſaid nothing; tho' it may be judged to have the ſame qualities with other *Spurges*.

CHAP DCLXI.

Of SPURGE *Laurel.*

I. *The Names.* It is called in Greek. Δαφνοειδὲς (ἢ Χαμαιδαφνοειδὲς: in Latine. *Daphnoides*, (*à Lauriſcharum ſimilitudine:*) alſo *Laureola*, (*quaſi puſilla Laurus vel Laurus minor*) in Engliſh, *Spurge Laurel*; and this Plant is that which *Dodonæus* thinks to be the *Cnecorum nigrum Theophraſti*.

II. *The Kinds.* The chief Species Authors have

taken notice of are, 1. Δαφνοειδες, *Daphnoides*, *Laureola*, *Cneorum Nigrum Theophrasti Dodonæo*, Our Common Spurge Laurel. 2. Χαμαιδαφνοειδες, *Chamædaphnoides*, *Laureola Cretica Alpini*, Candy Spurge Laurel.

The Descriptions.

III. The first, or Our Common Spurge Laurel. *Its Root grows down deep into the Ground, and spreads also abroad with tough, long, white strings, something woody. It rises up usually with but one Stem, a foot and half, or two feet high, yet sometimes with more, which are very tough and pliant, covered with a whitish, thick, tough bark, branching forth into several Arms towards the Tops, on which are set many long, smooth, thick, somewhat broad and shining dark green Leaves, something like to very small Bay Leaves, but longer, smoother, softer, and not with hard Veins therein as Bay*

Spurge Laurel.

Leaves have. The flowers come forth towards the Tops of the Stalks and Branches, and at the Joints with the Leaves, many set together, which are something long and hollow, ending or spreading into four small Leaves, of a whitish, yellow green color. After which come small, round and something long black Berries when they are ripe, in which lies a white Kernel. Both Leaf and Flower, also Bark and Root, are very hot and sharp in Taste, heating and burning the Mouth and Throat of such as Taste them. It keeps its green Leaves also, without shedding, all the Winter.

IV. *Gerard* describes it after this manner. *Its Root is woody, tough, long, and diversly parted, growing deep into the Earth. It is a Shrub of a Cubit height, and sometimes two or three feet high, spreading it self out into many little boughs, which are tough and pliant, and covered with a thick Rinde. The Leaves are long, broad, gross, smooth, and of a blackish green, shining like Laurel or Bay Leaves, but lesser, thicker, and without smell, very many at the Top clustering together. The flowers are long, hollow, of a whitish green color, hanging beneath and among the Leaves. The Berries when they are ripe, are black, with a hard Kernel within, which is a little longer than the Seed of Hemp, whose pulp or inner substance is White. The Leaves, Fruit and Bark, as well of the Root as of the Stalks and Branches, do by their sharpness and burning quality, Bite and Inflame the Tongue and Throat.*

V. The second, or Candy Spurge Laurel. *Its Root is white, small and crooked; from whence spring up three or four Crooked and bending blackish Stalks, thick set with Leaves without any order, covering them almost wholly, which are long and small towards the bottoms, but broader towards the ends, being thick and hard, green above, and grayish underneath, Tasting very hot, and burning very vehemently both Mouth and Throat. The Fruit is very hot also like the former, and the whole Plant of low growth.*

VI. *The Places.* The first grows Wild in many Foreign Countries, as well as in many parts of *England*; but being brought into Gardens, it will abide and flourish very well there: but it is said to grow abundantly in the Woods in most parts of this Kingdom. The second was brought to us out of *Candia*, and prospers well enough with us.

VII. *The Times.* The first flowers very early in the Year, even upon the *Winter* Tropick thro' all *December*, *January* and *February*, if the *Winter* is mild: and the Fruit is ripe in *May*, and *June*; and the Plant is always green, enduring the coldest Seasons in Winter. The other Flowers more early in its Native Clime, but something later with us.

VIII. *The Qualities, Specification, Preparations, and Virtues* of *Spurge Laurel* are the same with *Spurge Olive*, or *Mezereon* in Chap. 657. aforegoing, to which you are referred: but a few other Observations Authors have made thereon: *viz.*

IX. *The Green Leaves.* Being chewed in the Mouth, they attract or draw much flegm and humors from the Head, Brain, and Eyes, which offend and hurt those parts.

X. *The Decoction of the Green Leaves.* It purges Pituitous and watery humors by Stool, cleanses also the Stomach by Vomit, if Foul, and provokes the Terms in Women when Stopt.

XI. *The Pouder of the Leaves.* It may be given from a Scruple to a Dram in broth. *Dioscorides* says, it evacuates watery humors from the whole body, and has all the Virtues of the Decoction aforegoing; and as a Sternutatory purges the Head by Sneezing.

XII. *The Berries or Grains.* They are given to 15 Grains (more or less) as also the Pouder of the Leaves by Empyrical Physicians, to purge with, and to evacuate watery humors in a Dropsie, and that with good success, as also to ease the Pains of the Colick.

XIII. *The Decocted Oil.* The Berries or Leaves boiled in fresh Oil Olive, or Oil of Bitter Almonds, and the Belly being anointed therewith, it gives ease in the Colick. Anointed on the Reins of the Back, and on the Hæmorrhoids or Piles,

Piles, it eaſes pains of thoſe parts and provokes Urine. It is alſo good againſt Scurf, Morphew, Scabs, Scald Heads, Freckles, Tannings, Sunburnings, Diſcolorings, and other like defœdations of the Skin.

XIV. *Nota.* *The Leaves and Berries* of this Plant are violent purgers, and do heat and inflame the Stomach, by whomſoever taken, and excite as many dangerous Symptoms as any of the other *Spurges*; and therefore are to be given only by a prudent hand, and with much Caution, with proper and good Correctives.

CHAP. DCLXII.

Of SPURRY, *OR,* SPURRWORT.

I. *THE Names.* It has no Greek Name that I know of, but a Modern Author *Thalius*, calls it Ἀνθυλλόειδες, *Anthoyloides:* in Latine, it is called by almoſt all Authors *Spergula:* and in Engliſh, *Spurry*, or *Spurrwort*.

II. *The Kinds.* There are ſeveral ſorts hereof, *viz.* 1. *Spergula major*, *Spergula Sagina major*, and by *Fabius Columna*, *Alſine tenuifolia altera*, vel *Alſine Sylveſtris altera*, (yet it is no Species of the Chickweeds) *Tricophyllos*; *Spergula Sagina Lobelij* (*à Saginandis pecoribus*, from its good feeding or fattening of Cattel:) The *Greater Spurry*, or *Spurrwort*; Frank-Spurry, or Fattening Spurry, becauſe in *Brabant* and other parts of the *Low Countries*, Husbandmen Sow their Grounds therewith for the ſame purpoſe, as alſo to cauſe their Cows, and Ewes to give the greater ſtore of Milk. 2. *Spergula minor*, *Spergula Sagina minor*, *Spergula marina Dalechampij*, The leſſer Spurry, or Sea Spurry. 3. *Spergula minima*, *Spergula Sagina minima*, *Alſine Spergillæ facie Bauhini*, as it is called in his *Prodromus*, The ſmalleſt Spurry, Red Spurry, or Chickweed Spurry. 4 *Spergula Stellaris*, *Aſterias*, *Stellaria*, *Spergula monſpelienſis*, Star like Spurry, *French* Spurry.

The Deſcriptions.

III. The firſt, or Greater Spurry or Spurwort. *Its Root is ſmall and Fibrous, periſhing every year after Seed time. It ſends forth ſeveral ſmall, round and upright Stalks, not above half a foot high, on which at ſeveral diſtances or joints grow many ſmall and narrow Leaves, ſet together in form of a Star, or of the Rowel of a Spur, from whence came the Name. The flowers are many, ſmall, and white, ſtanding at the Tops of the Stalks, which turn into ſmall round heads, containing therein ſmall black Seed.*

IV. *Gerard* deſcribes it after this manner. *Its Root is ſmall and Threddy; from whence riſes up a mean and low herb, very tender, having many jointed Stalks, on which grow Leaves in round Circles, like thoſe of Woodroof, but leſſer and ſmoother, in form like the Rowel of a Spur. At the Tops of the Stalks, grow ſmall white Flowers; after which come round heads, with ſmall round Seed like that of Turneps. This herb is ſown in* Brabant, Flanders, and Holland *for that peculiar uſe of Fattening Cattel, and to cauſe them to give much Milk.*

Spurry Greater.

V. The ſecond, or leſſer Spurry, or Sea Spurry. *Its Root is ſmall, long, woody, hard and rough, with ſmall Fibres adjoining to it. This in its form of growing does not much differ from the former, but that it has not ſo many long and narrow Leaves ſet together at the joints of the Stalks. Theſe Stalks are many, ſpringing from the Root, which riſe not to above a Span high, but do ſomewhat more lean downwards to the Ground, which together with the Leaves are more white, and of a ſaltiſh or brackiſh taſte, if it grows near the Sea ſide; otherwiſe nothing ſo hoary, white or brackiſh at all. The flowers are fewer, of a white color, and the Seed black like the other.*

VI. The third, or Smalleſt Spurry, or Red Chickweed Spurry. *Its Root is ſmall and long, which is yet large conſidering the ſmallneſs of the Plant, with ſome Fibres or Threds adjoining to it. From which riſe up ſeveral weak ſlender Stalks 3, 4, or 5 inches long, bowing down, or commonly lying flat upon the Ground, full of joints, and at every one of them two ſmall, ſhort, white Scaly Leaves, encompaſſing the Stalk at bottom; out of whoſe boſoms, between the Stalks and the ſaid Leaves, come forth other ſmall, green, ſharp pointed Leaves without number. Towards the Tops of the Branches come forth at the joints the flowers, each upon a ſmall Foot-ſtalk, which are ſmall and red, and ſometimes tending to a blewiſh purple, which being paſt away,*

ſmall round heads (ſmaller than the former) ſucceed, which contain ſuch like round black Seed alſo in them.

VII. The fourth, or Star like Spurry. *This differs not much from the laſt ſort, ſaving that the ſmall, ſhort and narrow Leaves, which ſtand at the joints of the low Stalks, are all of an equal length, and are ſtiffer and harder, ſtanding ſtraight out, in an equal diſtance, one from another like a Star. The flowers hereof are ſmall, having five narrow pointed Leaves, laid open abroad like a Star alſo, but of a reddiſh color: ſo that whether you have reſpect to the Leaves or the flowers, they are both in the form of a Star, and from thence the Plant took its Name: but there are many other Herbs ſo called, which very much differ one from another.*

VIII. *The Places.* They all grow in dry Sandy Grounds in divers Countries, as well among Corn, as in untilled and ſhady places, eſpecially the firſt and ſecond of them; altho' the ſecond is alſo found growing near the *Sea Shoar*, in the like places: it has been found growing in the *Salt Marſhes* about *Dartford* in *Kent*, and ſuch other like places. The third has been found growing in Sandy Grounds, as in *Tuthil-Fields* near *Weſtminſter*, and that, as alſo the fourth, have been found growing in many other the like places of this Kingdom.

IX. *The Times.* They all generally flower in *June* and *July*, and their Seed is uſually ripe in *Auguſt* or before Harveſt time.

X. *The Qualities.* They are hot and moiſt in the firſt degree: Glutinative, a little Emetick, Lactogenetic, and Spermatogenetick,

XI. *The Specification.* The Seed evacuates Pituitous, vicid, ſlimy and putrid humors out of the Stomach by Vomit: the Herb encreaſes Milk in Nurſes; reſtores in Conſumptions, and makes the Body fat.

XII. *The Preparations* You may have therefrom. 1. *A Pouder of the Seed.* 2. *A Liquid Juice of the Herb.* 3. *A Decoction of the Green Herb, in ſtrong Chicken Broth, Cock Broth, Pork or Veal Broth,* &c. 4. *A Cataplaſm of the Green Herb.*

The Virtues.

XIII. *The Pouder of the Seed.* It may be given from half a Dram to 2 Drams in the morning faſting in Mutton Broth. It evacuates flegmatick and ſlimy humors out of the Stomach by Vomit; ſtrengthens the Stomach, and rectifies the Diſcraſy of the Juices, which in their depraved State, hinder digeſtion, corrupt the Blood, and overturn the healthful State of the Body.

XIV. *The Liquid Juice of the Herb.* Given to Nurſes in White Wine, or Wine mixt with pure clear Ale, or with clear Ale alone, it admirably increaſes Milk in Nurſes Breaſts: and being taken for ſome time in that manner, very much increaſes Seed in both Male and Female, and reſtores in Conſumptions. And this is in ſome meaſure manifeſt for the effect it has upon Cattel in *Brabant*, *Flanders* and *Holland*, and other parts thereabouts, where they Sowe it on purpoſe for their Cattel to feed on, for that it cauſes their Cows to give a greater ſtore of Milk than otherwiſe without it, makes their Oxen and Sheep fat, and cauſes their Poultry to lay a greater ſtore of Eggs, which ſays *Parkinſon* is no idle conceit, for that theſe people have found it ſufficiently true by their daily uſe thereof.

XV. *The Decoction of the Green Herb in Broth,* &c. It has all the Virtues of the Liquid Juice, but not altogether ſo powerful; but if the Broth be ſtrong, it makes good Milk in Nurſes Breaſts, and reſtores wonderfully in Conſumptions.

XVI. *The Cataplaſm of the Green Herb.* Being made of the Green Herb bruiſed, and then applyed to Cut fingers, or other places which are Cut or Wounded, if the Wound is ſimple and not complicate with Accidents, it quickly heals it.

CHAP DCLXIII.

Of STARFLOWER

OR,

STAR *of* BETHLEHEM.

I. *THE Names.* It is called in Greek, Ὀρνιθόγαλον: in Latine, *Ornithogalum*: and in Engliſh, *Star-flower*, or *Star of Bethlehem.*

II. *The Kinds.* They are manifold, as, 1. *Ornithogalum Vulgare*, Our Common Star-flower, or Star of Bethlehem. 2. *Ornithogalum Luteum, Bulbus Eſculentus, Bulbus Sylveſtris. Cepe agraria*, The Yellow Star-flower. 3. *Ornithogalum Arabicum*, The Turks calls it *Zumbul Arabi*, The great Arabian Star-flower. 4. *Ornithogalum Æthiopicum*, The Æthiopian Star-flower. 5. *Ornithogalum Neopolitanum*, The Star-flower of Naples. 6. *Ornithogalum album unifolium, Bulbus Unifolius*, The One Leav'd Star-flower. 7. *Ornithogalum Hiſpanicum minus*, The ſmall Spaniſh Star-flower. 8. *Ornithogalum maximum album*; (this *Parkinſon* ſays, might more fittly be called *Aſphodelus bulboſus albus*, if ſays he, there be any *Aſphodelus bulboſus* at all, becauſe this does ſo nearly reſemble an *Aſphodel*, both in the early ſpringing and decay of the green Leaves when the Stalk of Flowers riſe up:) *Ornithogalum Pannonicum maximum Album*; The greateſt white Star-flower. 9. *Ornithogalum Pannonicum* (ſo called from its Original or Native place of growth) The Hungarian Star-flower. 10. *Ornithogalum, majus Spicatum album, Ornithogalum Magnum Myconi Dalechampio*, The great white Spiked Star-flower. 11. *Ornithogalum majus flore ſubnigreſcente, Aſphodelus bulboſus Galeni*, The great green Star-flower. Several Authors refer this to the *Aſphodils*, becauſe its flowers are ſtraked on the back, and its Leaves long and narrow like to the *Aſphodils*; but it is certainly of the kinds of the *Ornithogala*, becauſe of its Bulbous Root, and for that the *Star-flowers* have alſo ſtrakes on the backs of the flowers, and the like long narrow Leaves. 12. *Ornithogalum luteum parvum*, The Dwarf yellow Starflower.

The Deſcriptions.

III. The firſt, or our Common Star-flower. *Its Root is bulbous, white both within and without, and encreaſes abundantly. It has many narrow leaves,*

leaves, thick, fat, full of juice, and of a very green color, with a White streak down the middle of each Leaf; from among which rise up small naked Stalks, at the Tops of which grow flowers consisting of six little Leaves, striped on the backside with Lines of Green, the insides being Milk white. These flowers open themselves at the rising of the Sun, and shut again at Sun setting; for which this Plant has been called by some Bulbus Solsequius. *The flowers being past, the Seed follows, enclosed in Triangular husks. This Plant is so common and so well known in all Countries and Places, that it was almost needless to have described it, saving that the order and course of Our History require it.*

Star-flower Yellow.

IV. The second, or Yellow Star-flower. *It has a Cloven Bulbous* Root, *round, whitish, and somewhat clear, and very apt to perish, if it be any little while kept dry out of the ground, as has been found by Experience. It rises up at first with one long round greenish Leaf, which opens it self somewhat above the Ground, and gives out another small Leaf, lesser and shorter than the first: afterwards the Stalk rises from thence also, being 4 or 5 inches high, bearing at the Top three or four small green Leaves, from whence among them come forth 4 or 5 small yellow Starlike flowers, with a greenish Line or Streak down the Back of every Leaf, and some small reddish yellow Threds in the middle, which seldom yield any Seed.* Gerard *says, that the flowers of this are on the back side of a pale yellow, striped with Green, and on the inside of a bright shining yellow color, with Saffron colored Threds in their middles, and that the Seed is contained in Triangular Vessels.*

V. The third, or Great Arabian Star-flower. *Its Root is great and white with a flat bottom, after its Fibres are gone, which it yearly looses: it is very impatient of Frost, and will not abide with us unless carefully preserved and defended against the cold of Winter. And tho' sometimes it abides the Winter, yet it often lyes without springing forth into a Blade, or any thing else for a whole year, and then perishes; or if it does spring up, yet many times it does not bear; but most after their first bearing do decay and perish. Let therefore the Root be either Planted in a large Pot or Tub of Earth, and housed all the Winter, that so it may be defended from the Frosts. Or else, (which is the easier way) let the Root be taken out of the Ground every year, from* September, *after the Leaves and Stalks are past, until* February, *and laid in some dry, but not hot or windy place, and then planted in the Ground under a South Wall, or such like defended places, which will then spring up and prosper well, for that the greatest and hardest Frosts are generally past after that time,* &c. *It springs up with many broad and long green Leaves, very like unto the Leaves of the Oriental Jacinth, but lying for the most part upon the ground; from among which rises up a round green Stalk about two feet high, bearing at its Top divers large flowers standing upon long Foot-stalks, and at bottom of every one of them a small short pointed green Leaf. These flowers consist of six purely White Leaves apiece, with six white Threds with yellow pendents, which are laid open as large as an ordinary Daffodil, with shining blackish heads in the middle, in form of a Starry Jacinth, or of the first common Star-flower, having a pretty sweet smell but weak, which open every day at Sun rise, and close themselves again at Sun set, especially if they grow in the Sun.*

VI. The fourth, or Æthiopian Star-flower. *Its Root, is thick round and white, somewhat like the* Asphodelus Galeni, *and impatient of bearing cold, as the great Arabian Star-flower. The Leaves of this Plant are a Foot long, and about an Inch broad, which being broken, are no less Woolly than the Wooly Jacinth. The Stalk is about a foot and half high, strong, and green: from the middle whereof unto the Top, stand large Snow white Starlike flowers, upon long, green, thick foot Stalks, and yellowish at bottom of the flower: in the middle of which stands a Triangular head, which is long and containing the Seed, the which is surrounded with six white Threds, Tipt with yellow pendents.*

VII. The fifth, or Star-flowers of Naples. *The Root is Bulbous, great and white, and something flat at bottom, as divers of these kinds are, which multiplies its self as plentifully into small Bulbs, as the first or Common Star-flower, or any other; increasing indeed too much, and therefore requires to be yearly taken up, and freed from its off sets, with which it is apt to be pester'd. This beautiful Plant rises out of the Ground very early, with 4 or 5 long hollow pointed whitish green Leaves, standing round together, with a white Line down the middle of every Leaf on the inside: these Leaves are something narrow, but long (three feet long in* Italy, *as* Columna *says, but not of such an extended length with us.) In the middle of these Leaves rises up the Stalk, about a foot and half or two feet high, bearing many flowers at Top, each flower standing in a little Cup or husk, which is divided into 3 or 4 parts, hanging down very long about the heads for Seed: each flower is large, and consists of six long narrow Leaves, of a shining white color on the inside, and of a blewish or whitish green on the outside, the edges of each Leaf being white on both sides, and turning backwards towards the*

Stalk

Stalk, with six other small Leaves in the middle, of a white color, standing round together like a Cup; in the midst of which is a small white Pointel, about which stands six white Threads, Tipt with yellow pendents on their Tops; the whole flower being without any smell. After the flowers are past, come forth great roundish Triangular heads, which are too heavy for the Stalk to bear, and therefore lye down upon the Leaves or Ground, having certain Lines or Stripes on their outside, in which is contained round, black, rough Seed.

VIII. The sixth, or the One Leav'd Star-flower. *It has a small Bulbous or round white Root, which sends forth one very long Rush like, or round green Leaf, but that for 2 or 3 inches above the Earth it is a little flat, and guttered; which sends forth a small or little Stalk about 3 or 4 inches high, bearing at its Top 3 or 4 small white flowers, consisting of six very white Leaves apiece, within which are six white Chives, Tipt with yellow pendents, standing about a small Triangular head, which has a white Pointel sticking as it were in the midst thereof: the smell of which flowers is much like the smell of the flowers of the Hawthorn.*

IX. The seventh, or small Spanish Star flower. *It has a small white Bulbous Root which sends forth in the beginning of the year, five or six small long green Leaves, much like those of the first common sort, but narrower, and without any white Line or Streak, wherewith those others are striped or marked. From among which rise up one or two small Stalks, about two handfuls high, bearing at their Tops, each Stalk about seven or eight flowers or more, growing each, one above another, yet so that they seem to make a Tuft or Umbel, with small long Leaves at the foot of every Stalk, the lower flowers being equal in length with the uppermost; each of which flowers has six Leaves of an Ash or whitish blew color, with a strake or line down the back of every one of their Leaves, and so many white Chives or Threads standing about a blewish Pointel or head in the middle; which flowers quickly pass away without giving any Seed.*

X. The eighth, or Greatest white Star-flower. *Its Root is Bulbous, great, thick and short, somewhat yellowish on the outside, with a flat bottom like that of the Arabian Star-flower, but more hardy to endure the Winter; and more apt to encrease, whereby it is now grown common. It has many fair, broad, long, and very fresh green Leaves, which spring up out of the Ground very early, and are greater, longer, and greener than the Leaves of any Oriental Jacinth, which do abide green from the middle of* January, *or beginning of* February, *to the end of* May, *at which time they begin to fade, and the Stalk with the head of flowers, begins to rise, so that it will have few or no Leaves at all, when the flowers are blown. The Stalk is strong, round, smooth and firm, and rises by flowering time, to be 2 or 3 feet high, bearing at the Top a great bush or spike of flowers, upon long Footstalks; which seem at the first to be a great green Ear of Corn, for it is made spike fashion; which when the flowers are blown, it rises up to be very high, slender or small at the Top of the head, and broad spread, and bushing below, so that it is long in flowering. The flowers open by degrees, for they flower first below, and so gradually upwards, consisting each of six white Leaves, spread open like a Star. These flowers are Snow white, without any line or streak on the backside, but not near so large as those of the Arabian kind, with a white Pointel or head in the middle, beset with many white Threds Tipt with yellow Pendents. And the Seed is black and round contained in the Triangular heads.*

XI. The ninth, or Hungarian Star-flower. *Its Root is Bulbous, long and white; and is greater, thicker, and longer than the Root of the first or Common kind, for the most part two joined together, and somewhat grayish on the outside.* It *shoots forth several narrow, long, whitish, green Leaves, viz. five or six, and that before Winter, which spread themselves upon the Ground, narrow and of about a fingers length, much resembling the Leaves of Clove Gilliflowers, but somewhat roughish, and so abide above Ground; from the midst of which the the next Spring, about* April, *when the Leaves are decaying, rises up a Stalk, about half a Foot high, bearing at its Top, a spike of many white flowers, consisting of six Leaves apiece, with green lines down their backs, very like to the first or Common Star-flower, which shew themselves open in* May.

XII. The tenth, or Great White Spiked Star-flower. *It has a large Bulbous Root, usually larger and whiter on the outside than that of the greatest white Star-flower, at* Sect. X. *aforegoing: and in its form and manner of growing is much like the same eighth kind. It springs not up so early, nor are its Leaves so green or large; but it has broad, long, hollow, whitish green Leaves, pointed at the end; from among which rises up the Stalk, which is strong, and from a Foot and half to three Feet high, whereon at the Top grows a great spiked head, or bush of Star-flowers, standing spike fashion, somewhat like the eighth Species aforenamed, flowering in the same manner by degrees, beginning first below, and gradually upwards to the very Top. But it is not so thick set with these Star like flowers, nor so far spread at the bottom, as that kind, nor are the flowers so white, but each of their Leaves a line or streak of green down their backs, and their edges on both sides are White. After the flowers are past, come Triangular heads like the others, containing within them such like black Seed.*

XIII. The eleventh, or Great Green Star-flower. *Its Root is yellowish, something like to the eighth Species at* Sect. X. *aforegoing. It has many whitish green Leaves, long and narrow, spread upon the Ground, which spring up in the beginning of the Year, and abide untill* May: *and then withering away, the Stalk springs up almost as high as that greatest white Star-flower, having many pale, yellowish green Starlike flowers, but smaller, and growing more sparsedly about the Stalk upon short Footstalks, but in a reasonable long spiked head; after which comes the Seed, which is like that in the last Section aforegoing.*

XIV. The twelfth, or Dwarf Yellow Star-flower. *Its Root is Bulbous, white, and covered with an Ash colored Film. It sends up one only Leaf, two or three inches long, which is narrow, of a whitish color, and of an Acid Taste. Nigh to which rises up a small Stalk, about two inches high, having one or two Leaves thereon; between which come forth small Starlike flowers, yellow within, and of a greenish purple without. The flowers being past, their come Triangular heads, in which is contained small reddish Seed.*

XV. *The Places.* The Titles or Names of many of them shew their Original or Native Places; but with us in *England* they are all Nurst up in *Gardens.* The first grows Wild in *Germany*, *Flanders* and other Foreign Countrys, as also in several parts of Our Land. The second, *Lobel* says, he found in the Corn-fields in *Somersetshire.*

ſhire, but they are alſo generally Planted in *Gardens*.

XVI. *The Times.* The *Arabian* flowers in *May*, and ſometimes in *June*. The *Æthiopian* flowers in *Auguſt*, or the end thereof. The *ſmall Spaniſh* flowers in *April* and *May*. The *Neapolitan*, tho' it oftentimes begins to Spring out of the Ground in *November*, but moſt uſually in *January*, yet it flowers not till *May*, and the Seed is ripe in *July*. The *Hungarian* flowers in *May*, and ſometimes in *June*. All the reſt flower from the middle of *April*, and ſometimes ſooner, to *June*, and the Seed is ripe in the Months following.

XVII. *The Cultivation.* It is to be obſerved, 1. That the Roots of theſe Plants looſe their Fibres quickly, and they may be taken up out of the Ground, as ſoon as their Stalks are dry, and ſo kept till the end of *September*, except thoſe of the Yellow, which will not endure out of the Earth, but a little time.

XVIII. 2. As theſe Plants are only or chiefly multiplyed by their Bulbs, which encreaſe in abundance in the Summer time; ſo they are to be Planted in an Earth compoſed of two thirds Mould, and one third light Earth full of Salts, ſuch as are ſome blackiſh Sands, which by the productions they yield, you may eaſily find have a great deal of ſubſtance in them.

XIX. 3. The *Arabian*, *Æthiopian*, *Spaniſh and Neapolitan*, or others which come from hot Countries, as they are tender and will not endure our long, cold, and froſty Winters, ſo they ought to be Planted in Boxes, in rich, hot, dry Sandy Earth, and Houſed in Winter, and are to be expoſed to the greateſt heat of the Sun, for which reaſon they are rather to be put in Pots or Boxes, than into the firm Ground; and ſo they are eaſy to be removed from place to place, and put there which beſt ſuits with their Natures.

XX. 4. The Time of Planting the Bulbs is in the Month of *September*: they are to be put into the Earth 2 inches deep, and to be well watered when you think they want it. The *Yellow*, may be ſet among other tender Roots, which require to be covered, and defended from Froſts in Winter: all the reſt are hardy, and may be ſet in any place, among other Roots which looſe their Fibres.

XXI. 5. Thoſe kinds which are very apt to be affected with cold, you are to be very careful of when Winter approaches, and to place them in your Green Houſe, that the Cold and Froſt may not hurt or injure them. Theſe Star-flowers will not bear to be often tranſplanted: and when you do it, you muſt ſtay, till its flower is quite paſt, and its Seed ripe, and then being removed at the Time mentioned, they will ſhoot forth new Roots.

XXII. Their *Qualities*, *Specification*, *Preparations*, *and Virtues*, as Phyſically conſidered, Authors have taken no notice of, nor are they known to have any Medical properties; but are rather of Ornamental uſe, for the adorning of Gardens, for which cauſe, and the ſakes of ſuch as are admirers of all ſorts of flowers, we have inſerted them in this Our Herbal, that it might not have a deficiency in thoſe things, which a great many Ladys and Gentlemen ſo ſingularly affect.

XXIII. Yet *Tragus* ſays, that the Roots of the Star-flower (I ſuppoſe he means thoſe of the common kind) roſted in hot Embers, and made into a Cataplaſm with Honey, and ſo applyed, heals old eating Ulcers, and ſoftens and diſcuſſes hard Tumors. By their *Signature*, they may be ſuppoſed to be good againſt *Scrophulous* and *Strumous Tumors*, and Ulcers of the *Kings-Evil*.

XXIV. *Matthiolus* ſays, that the firſt or Common kind, are much eaten by poor people in *Italy*, both raw and roſted, being ſweeter to Taſte than any Cheſtnut, and ſerve as well for a neceſſary food for the Belly, as for delight and Ornament in the Garden: But whether any of the reſt may be ſo uſed, is as yet unknown.

CHAP DCLXIV.

Of STARWORT: *OR,* BUBO-GRASS.

I. *The Names.* It is called in Greek Ἀστὴρ, Β. *Cónyza* in Latine, *Aſter*, *Bubonium*, and *Inguinalis*: in Engliſh, *Starwort* and *Bubo-wort*.

II. *The Kinds.* Authors have given us between twenty and thirty kinds of this Plant, but the moſt of them growing in Foreign Places, and ſcarcely ever to be come at by us, we ſhall here give you only ſuch as either grow in Our Gardens at home, or in ſome of Our *Floridan* Plantations in *America*, or *Weſt-Indies*, which are the nine following, *viz.* 1. Ἀστὴρ Ἀττικὸς, *Aſter Atticus*, (ſo called I ſuppoſe from the place, *viz. Athens*, where it grew in great Plenty) *Aſter Atticus luteus verus*, *Aſter Atticus Legitimus*, *Herba Stellaria*, *Bubonium and Inguinalis*, The true After Attick, or Yellow Starwort. 2. *Aſter Atticus Italorum*, *Aſter Atticus flore purpureo*, *vel flore cæruleo*, Purple Italian Starwort, or the Purple Marigold. 3. *Aſter Conyzoides Lobelij*, Fleabane like Starwort. 4. *Aſter Virginianus latifolius luteus repens*, (called by the Natives, *Aquaſcomenſe*) Yellow creeping Starwort of Virginia. 5. *Aſter Virginianus luteus caule membranaceo*, Yellow Starwort of Virginia with a Skinny Stalk. 6. *Aſter Virginianus luteus alter minor*, A leſſer Yellow Starwort of Virginia. 7. *Aſter Virginianus latifolius præcocior flore parvo purpurante*, The more early broad Leav'd Purpliſh Virginian Starwort. 8. *Aſter Virginianus anguſtifolius ſerotinus flore parvo albente*, The later flowering narrow Leav'd Virginian Starwort. 9. *Aſter minor Anguſtifolius*; *Aſter minor Narbonenſium flore Tripolij Lobelij*; *Aſter minor purpureus folio medio Linariæ*. The leſſer Purple Starwort, or *French* Purple Starwort.

The Deſcriptions.

III. The firſt or true After Attick, or Yellow Starwort. *Its Root is Fibrous conſiſting of a Bunch of Strings, of a ſharp and biting Taſte, dying every year after Seed time is over. It riſes up with two or three rough hairy Stalks a foot and half high, with long rough or hairy browniſh dark green Leaves on them, divided into two or three Branches; at the Top of every one of which grows a flat Scaly head, compaſſed underneath with five or ſix long, brown, rough green Leaves ſtanding like a Star, the flower it ſelf ſtanding in the middle thereof, is made as a border of narrow, long, pale, yellow Leaves, ſet with browniſh yellow Thrums.*

IV. *Gerard*

IV. *Gerard* deſcribes it after this manner. *It has a Fibrous Root of a biting and ſharp Taſte. It has large broad Leaves like* Verbaſcum Salvifolium, *or the Great* Conyza. *From among which riſes up a Stalk four or five handfuls high, hard, rough and hairy, beſet with Leaves like Roſe Campions of a dark green color. At the Tops of the ſaid Stalks, come forth flowers of a ſhining and glittering Golden color. And underneath about theſe flowers grow five or*

Starwort yellow true.

ſix long Leaves, rough and ſharp pointed, not much in ſhape unlike the Fiſh called Stella marina; *which flowers turn into Down, and are carried away with the Wind.*

V. The ſecond or Purple Italian Starwort, or Purple Marigold. *It has a Root compoſed of many white ſtrings, which periſh not as the former, but abide many years, with green Leaves on their heads, and ſpring freſh again every year. It has many woody, round, brittle Stalks riſing from the Root, ſomething higher than the former, or about two feet in height, ſometimes ſtanding upright, and ſometimes leaning downwards; on which are ſet without order up to the Tops, many ſomething hard, rough, and long Leaves, for the moſt part round pointed; near the Tops they are divided into ſeveral Branches, at the Tops of each of which grow ſingle flowers, made like unto a ſingle Marigold, the outward border of its Leaves being of a blewiſh purple color, which are ſet about a middle Thrum of a browniſh yellow, breaking out of a green Scaly head, like to thoſe of Knapweed, but leſſer. Theſe flowers abide long in their Beauty, and in the end wither and yield a ſoft Down, in which lye ſmall, black, and flat Seeds, not much*

Starwort purple Italian.

unlike Lettice Seed, which with the Down, are carried away with the Wind.

VI. The third or Fleabane like Starwort. *Its Root is a ſmall buſh of Strings and ſmall* Fibres. *It riſes up with brown Stalks, which are branched, about a foot in height or more, on which grow long and*

Starwort Fleabane.

narrow

narrow Leaves, ſet ſingly thereon without order, not much unlike to thoſe of the ſmall Conyza. *The flowers grow ſingly at the Tops of the Stalks and Branches, compoſed of many dark or dusky yellow Leaves, with a browner Thrum in the middle, which turn into Down, and their ſmall Seed, is carried away with the Wind. There is another ſort alſo of this Species, which has been brought to us from* Virginia, *and is very like to this now deſcribed, but it has ſmaller flowers.*

VII. The fourth, or Yellow Creeping Starwort of Virginia. *Its Root is Stringy, creeping under Ground, and ſpreading much. It riſes up with a ſtrong round Stalk 2 or 3 feet high, bearing at the joints two fair broad Leaves, like the Leaves of a ſmall* Flos Solis, *but more pointed at the ends, and harder in feeling, being full of Veins: at the Top of the Stalk, which ſeldom Branches out, grows one large flower, (riſing out of a green husk, made of Nine or Ten green Leaves) compoſed of many long and narrow yellow Leaves, with a browniſh Thrum in the middle: which being paſt, there follows Seed like to that of a ſmall* Flos Solis.

VIII. The fifth, or Yellow Starwort of Virginia with a Skinny Stalk. *Its Root is knobbed and woody, with ſeveral long Strings adjoining thereto, and encreaſes much at the ſides, but creeps not, taking faſt hold in the Ground. It grows to be 6 or 7 feet high, with many Stalks, whoſe lower parts thereof, almoſt to the half, is round, hard, and ſtrong, the other part upwards, having a ſmall film or skin on four ſides thereof (as is to be ſeen in ſome other Plants) up to the Top, which branches not, but bears ſeveral ſmall flowers, as if they were Tufts at the firſt, but being blown open, each flower is a yellow Star, conſiſting of 5 or 6 ſmall and long yellow Leaves, with ſmall, thick, yellow Pointels in the middle, each having a blackiſh Tip or Point, reſembling flowers, which afterwards turn to be flat Seed, broad at the head, which are ſo ſingly ſet together, that they reſemble the head of Seed of a Ranunculus, but greater. The Leaves ſtand ſingly on a ſmall Footſtalk, on each ſide of the Stalk, being very like to the former, of a dead or ſullen green color, yet not altogether ſo large and broad, but a little longer pointed, and more rough in handling.*

IX. The ſixth, or Leſſer Yellow Starwort of Virginia. *Its Root conſiſts of ſeveral white and long hardiſh Strings, with ſmall Fibres adjoining to them, abiding many years, and encreaſing it ſelf by the ſides. This as alſo the two former Virginia kinds at* Sect. VII. *and* VIII. *looſe all their Stalks and Leaves every year, and ſhoot forth the next Spring from the Old Root. It grows up but with one upright ſmall round Stiff Stalk 4 or 5 Feet high, bearing two fair, green, long, ſhining Leaves at every joint, dented about the edges, but ſmaller than the former, ſtanding on ſmall Footſtalks, and ſomewhat hard in feeling. At every joint with the Leaves on both ſides, from the very bottom, come forth Branches half a yard long at leaſt, with the like Leaves on them. At the Top of each Stalk and Branch, grows one flower, whoſe ſmall, round, green button under it, has ſeveral ſmall green Leaves on the head thereof, out of which breaks the flower, conſiſting of a dozen yellow ſmall and long Leaves, encompaſſing a middle deep yellow Thrum. The Seed, by reaſon it flowers late with us in* England, *has not been obſerved.*

X. The ſeventh, or more early broad Leav'd Purpliſh Virginian Starwort. *Its Root is hard and Woody at its head, ſending forth long whitiſh Strings, and abides all Winter with green Leaves upon it, when the Stalks are withered, and dead. Its Leaves ſtanding upon ſhort Footſtalks, grow ſingly on the ſeveral hard, ſtiff, brown greeniſh Stalks of a yard high, they are broad and round at the bottom, growing narrower towards the Point, and a little dented about the edges, of a freſh green color on the upper ſide, and ſomething yellowiſh underneath. Each great Stalk towards the Top, Branches forth into flowers, which ſtand in a Tuft or Spike, with ſeveral ſmall green Leaves below them on the Stalk: and the flowers being many, ſet on ſeveral ſmall Branches, have a ſmall greeniſh Scaly husk, and a ſmall pale Purpliſh flower coming out of it, conſiſting of ſeveral ſmall Leaves laid open like a Star, with ſeveral pale yellow Threds riſing up like a Thrum, which turn into Down, with ſmall Seed therein.*

XI. The eighth, or later flowering narrow Leav'd Starwort of Virginia. *Its Root is compoſed of ſeveral long white Strings, which lives long and encreaſes much, looſing all its Stalks in the Winter, but keeping a Tuft of green Leaves all the cold ſeaſon, till it ſhoots forth new Stalks the next Spring. It grows up with many Stalks, and higher than any of the others, bearing ſingle Leaves at every joint, which are long and narrow, without any dents on their edges; and without any Footſtalk at the bottom. At every joint, from the middle upwards, it ſhoots out very long Branches, and they oftentimes branched again: at each joint whereof ſtand ſingle Leaves, but much ſmaller, and thicker ſet than below. The Flowers ſtand ſingly at the joints and Tops of every Stalk and branch, which are ſmall and Starlike in form, of a pale white color, with a ſingle Purple Thrum in the middle, riſing out of a ſmall green husk, which turn into Down like the former.*

XII. The ninth, or Leſſer Purple Starwort. *Its Root conſiſts of a buſh of Strings and ſmall Fibres; from which riſe up many ſlender, ſtraight, upright Stalks half a yard high, each Stalk ſet with many Leaves up to the Top, longer and narrower than any of the Blew or Purple Starworts, and ſomething like to the Leaves of* Linaria, *or* Toad-Flax. *At the Top of each Stalk, ſtand three or four flowers, conſiſting of many ſmall Leaves in a Starlike form, of a very pale blewiſh color, with a yellow Thrum in the middle, which paſſes into Down, and is carried away with the Wind as the others are.*

XIII. *The Places.* The firſt, ſecond and ninth grow in *Germany, France and Italy*, but with us only in *Gardens*. The third grows in many places in *England*, in moiſt and ſhady grounds, but is alſo Nurſt up in *Gardens*. All the reſt grow in *Virginia*, as their Titles declare, as alſo in ſeveral other parts of *Florida*.

XIV. *The Times.* The three firſt and the laſt or ninth, flower in the Summer Months, *viz.* in *June* and *July*: The fourth and fifth flower in *July*, the ſixth in *Auguſt*, the ſeventh in the end of *Auguſt*, or later if the year prove not warm; and the eighth, much later, *viz.* ſometimes not till the end of *October*, or beginning of *November*, but yet ſometimes a Month ſooner, if the ſeaſon be warm.

XV. *The Qualities.* They are temperate in reſpect to heat or coldneſs, dryneſs or moiſture, digeſtive and maturative.

XVI. *The Specification. Starwort* is dedicated to the Cure of *Buboes* and other Tumors in the Groin, as *Galen* ſaith, whence came the Names, *Bubonium* and *Inguinalis*. It alſo abates Inflamations and eaſes pain.

XVII. *The Preparations.* You may make there-

from. 1. *A Liquid Juice of the Herb.* 2. *An Oil or Ointment of the Herb.* 3. *A Cataplasm of the Herb.* 4. *A Decoction of the Purple Leaves of the Flowers in Water.*

The Virtues.

XVIII. *The Liquid Juice of the Herb.* Bathed warm, or fomented upon places affected, it abates Inflamations, asswages Tumors, and eases pains in the part, particularly, it is of special use in Buboes and other Swellings of the Groin: The Throat being also outwardly fomented with it, and inwardly Gargled with the same, it is said to be profitable against Inflamations of those parts, and the Quinsey. It is also good against the Piles or Inflamation of the Fundament, and the falling out of the *Intestinum Rectum.*

XIX. *The Oil or Ointment of the Green Herb, and Hogs Lard.* It cools Inflamations of the Fundament, also Inflamation of the Eyes, and the bitings of Mad Dogs, as *Cratevas* says. It consumes Swellings of the Throat, Scrophula's, *&c.* being anointed therewith; but for these purposes I should advise to chuse that fifth Species at Sect. VIII. because of its *Signature* in the Root (which if *Crollius* is to be believed, is much to be considered.) It is also good against Bubo's in the Groin, according to *Galens* Opinion.

XX. *The Cataplasm of the Green Herb.* Applyed it is good for all the purposes of the Liquid Juice, or Oil or Ointment, more especially if it be applyed immediately after the fomentation or Unction. It has not only a digestive, but a cooling quality, and is very good to suppurate Venerial Bubo's in the Groin, as all Antiquity has affirmed. It also cures or gives ease in the Piles, and in a *Ficus in Ano*, after fomentation or Unction as aforesaid being applyed.

XXI. *The Decoction of the Leaves of the Purple flowers in Water.* It is good for the Pains and Sores in the Groin (applying after it, the Oil, Ointment or Cataplasm) and gives relief in a *Quinsey*, abating and taking away the Inflamation and swelling in those parts. Drank it takes away the heat and burning of the Stomach, and is said to cure the *Epilepsy* or Falling Sickness in Children. The Eyes being bathed therewith, and being also often in the day time, put into them, it abates their Inflamation, cools them and eases their pain.

CHAP. DCLXV.

Of STAR-WORT *Sea* and *Water.*

I. *THE Names.* It is called in Greek Τετράλιον by *Dioscorides*: and in Latine, *Tripolium*: in English, *Sea Starwort.*

II. *The Kinds.* Authors make six or more kinds hereof, we shall only Treat of those which are more Common with us, *viz.* 1. *Tripolium majus, sive vulgare*; *Anthyllis major Cordi*; *Amelli Species paluſtris Columnæ*; The Common greater Sea Starwort. 2. *Tripolium vulgare minus*; *Anthyllis minor Cordi*, The Common lesser Sea Starwort. 3. *Tripolium minimum*, *Anthyllis brevior Cordi*, *Tripolium minus Germanicum*, The small Sea Starwort of Germany. 4. *Stellaria Aquatica*, Water Starwort.

The Descriptions.

III. The first, or Our Common greater Sea Starwort. *Its Root is composed of several greater Strings, and many smaller Fibres, which grow deep, and stick fast in the Mud of the Marsh Ditches where it grows. It has many long and something broad Leaves rising from the Root next the ground, smooth, fat, and thick, and of a blewish green color, somewhat like to the Leaves of* Dorias Wound Wort, *but much lesser. From among which rises*

Satrwort Sea Great.

up a smooth herby, or fleshy green Stalk, 2 or 3 feet high, branched towards the Top into several smaller Branches, with such like Leaves on them as grow below, but lesser. The flowers which stand at the Tops, are somewhat larger and greater than of the Attick or Italian Starworts, in the former Chapter, and almost of the same color, having a blewish Purple Border of Leaves standing about a yellow middle Thrum, which after it has done flowering, turns into Down, which with the small Seed it contains, is blown away with the Wind.

IV. *Gerard* describes it after this manner. *Its Root is long and Threddy. From whence spring up long and large Leaves somewhat hollowed or furrowed, of a shining green color, declining to blewness, like the Leaves of* Woad. *Among which rises up a Stalk two Cubits high or more, which towards the Top is divided into many small branches, garnished*

garnished with many flowers like Camomil, *yellow in the middle, and set about, or bordered with small blewish Leaves, as in* Camomil *Flowers, which turn into a whitish rough Down, that flies away with the Wind.*

V. The second, or Common lesser Sea Starwort. *This is in all things like unto the former greater, but much lesser and lower, in its Root, Leaf, Stalk, and Flower; and in its Original or Native Places, has been observed not to exceed the greatness of the small* Conyza, *or* Fleabane.

VI. The third, or small Sea Starwort of Germany. *This is also very like unto the last, but yet less than it, having a shorter Stalk, and narrower Leaves: The flower is also small, and of a more Purplish color.*

VII. The fourth, or Water Starwort. *It has a long Fibrous Root, which sends forth several weak, slender, flexible Stalks, bending too and fro, in the Water, full of joints, from the bottoms to the Tops, having two small fine Leaves, almost like those of* Fennel *(whence some have call'd it* Water Fennel*) set at every one of them: and at Top of each Branch a small white Flower, consisting of eight Leaves, which when laid open are in form of a Star, whence the Name.* Gerard *says, it has many small Grassy Stems like Threds, coming from the bottom of the Water, to the upper face of the same, upon which grow small double flowers of a greenish Herby color. This* Johnson *in* Gerard *will have to be a Water Chickweed, having says he long narrow Leaves at every joint, and half a dozen or more lying close together at the Top of the Water, in fashion of a Star.*

VIII. *The Places.* The two first grow in the *Ditches* of the Salt Water *Marshes* near the *Sea Coasts*, in many parts of this Land: and the First is scarcely to be miss'd in any Salt Marsh, if you look well for it. The second *Lobel* says grows near the Mouth of the River *Padus* or *Po* in *Italy*. *Gerard* says, these Herbs grow plentifully along the *English Coasts* in many Places; as by the Fort against *Gravesend*; in the *Isle of Sheppy* in several parts; in a *Marsh* under the Town Walls of *Harwich*; in the *Marsh* by *Lee in Essex*; in a *Marsh* between the *Isle of Sheppy* and *Sandwich*, especially where the Tide or Water Ebbs and Flows: and being brought into *Gardens*, they flourish a long time, but grow very great and rank, changing their greater Roots into Strings. The fourth grows in the very Water it self in Watery Ditches, and shallow Rills or running Springs, and in other moist and plashy places.

IX. *The Times.* They flower in the Summer Months, *viz.* in *May*, *June*, and *July*, for the most part.

X. *The Qualities.* Sea Starwort or *Tripolium* is as *Galen* says, hot in the third degree: it is also drying in the same degree, and as *Dioscorides* says, it is hot in Taste and sweet in Smell: and that it purges the Belly, which yet *Lobel* denys: but is truly Alexipharmick, for which reason it is put into Antidotes against Poison.

XI. *The Specification.* It is singular good to heal fresh green Wounds, as also to cleanse and heal Old Sores and Ulcers, to Cure inward bruises and hurts, and to resist Poison.

XII. *The Preparations.* You may have therefrom. 1. *A Liquid Juice of the Herb and Root.* 2. *A Pouder of the Root.* 3. *An Ointment or Balsam.* 4. *A Cataplasm of the Leaves.*

The Virtues.

XIII. *The Liquid Juice of Herb and Root.* Injected into Green Wounds or hollow Sores and Ulcers, it cleanses, drys, and heals them, and mixed with Honey or Sugar, and so swallowed, it is good to heal any inward Wound, Ulcer, or Bruise, to help against Coughs, Colds, and Hoarseness, and other Distempers of the Brest and Lungs.

XIV. *The Pouder of the Root.* Taken to two Drams in any proper Vehicle it provokes Urine, and is good to cleanse the Reins, Ureters, and Bladder of any Slimy or Tartarous matter lodg'd in them. It resists poison, and therefore is put into Antidotes for the same purpose. *Dioscorides* says it purges, but *Pena* and *Lobel* deny it; yet it is certain it expels watery humors from the Bowels, corrects Wind, and gives ease in the Griping of the Guts, by discharging an Acrimonious Water from the same, especially in Dropsies.

XV. *The Ointment or Balsam.* They have the Virtues of the Liquid Juice, in healing simple Green Wounds and Ulcers, and ease pain proceeding of cold in the Nervous parts, being applyed and bound on upon the same.

XVI. *The Cataplasm of the Green Herb.* The Leaves being only bruised and bound to the place, heal Green Wounds after a singular manner, which Authors say, has been confirmed by Experience.

CHAP. DCLXVI.

Of STAVESACRE:

OR,

LOUSE-WORT.

I. *THE Names.* It is called by the Arabians, *Alberas*; *Habebras*, *Muibazagi*, *Muibezegi*; *Muthuzagi*, and *Mibbezegi*: in Greek, Σταφὶς ἀγρία, but by *Galen*, Ἀσταφὶς ἀγρία: in Latine, *Staphis agria*, *Pedicularis*, *Peduncularis*, and *Pituitaria (sic dicta, à viribus quas habet pediculos enecando, & Pituitam educendo:)* and in English, *Stavesacre*, and *Louse-wort*.

II. *The Kinds.* It is a singular Plant *sui generis*, which at this day, is called by the Natural Greeks, ψειδόκοκκον, or more properly φθειρόκοκκον, i.e. *Granum Pedicularium*; and thereupon *Cordus* on *Dioscorides* calls it *Phthirocoktonon*: *Pliny lib.* 26. *cap.* 13. calls it *Uva Taminia*; but *lib.* 23. *cap.* 1. he says it is corruptly so called.

The Descriptions.

III. *Its Root is long and Woody, perishing every year, after it has born Seed. It rises up with a short, but strong blackish green Stalk, spreading it self forth divers ways: on which do grow great large Leaves, cut at the edges into five or*

seven divisions, something like unto the Leaves of the great yellow Aconite or Wolfs bane, but deeper edged, and of a sad or dark green color, every one standing upon a long Footstalk. The flowers grow at the Tops of the Branches one above another, upon short Footstalks, being something like to

Savesacre.

a Larks Spurflower, for it has a Spur or Heel behind it, of a very deep or dark blew color but much larger. After which come in their Places three or four horned Seed Vessels, like unto the Aconites, but greater, in which are contained great rough Triangular Seed.

IV. *Gerard* describes it after this manner. *Its Root is of a woody substance, perishing after it has perfected its Seed. It has straight Stalks of a brown color, with Leaves cloven or cut into several parts, almost like the Leaves of the Wild Vine. The flowers grow upon short Stems, in form somewhat like unto our Monks-hood, of a perfect blew color. Which being past, welted husks succeed, like to those of Wolfs-bane, in which is contained browniſh rough Triangular Seed.*

V. *The Places.* It is Nurst up in Our Gardens; but is with very great difficulty preserved in Our Cold Climates; yea scarcely in very mild Winters, if not well defended: and although covered with Straw or *Fern*, in the very Month of *March*, those March Winds will do it much harm, if sharp and severe, as they do to all those Plants which are brought to us out of hot Countries. In *Italy* and the Kingdom of *Naples*, as also in *Istria* and *Sclavonia*, it grows in the open Champion Grounds or Fields.

VI. *The Times.* It never rises to flower and Seed the first year it is Sown, but the Year after, and flowers in its Native Places in *June*, but not with us till it is late in the year, tho' it has continued all the preceeding *Winter*, nor ever gives here any perfect Seed.

VII. *The Qualities.* The Seed (which is the only matter of the Plant which is used) is hot and dry in the fourth degree: of a Biting and Attractive quality, and burning withall; and being given inwardly is strongly Emetick and Cathartick.

VIII. *The Specification.* It is proper for the Curing of Scabs, Itch, Scurff, Morphew, Leprosie, foul Ulcers, running Sores, Kings-Evil, to kill Lice in the Head, and provoke the Terms in Women.

IX. *The Preparations of the Seed.* They are chiefly, 1. *A Posset Drink.* 2. *A Decoction in Wine or Water.* 3. *A Decoction in Vinegar.* 4. *An Electuary.* 5. *A Pouder.* 6. *An Apophlegmatism.* 7. *An Ointment.* 8. *A Paste.*

The Virtues.

X. *The Posset Drink.* A few of the Seeds about 14 or 15 of them bruised and strained into Posset Drink, and so taken, work very strongly upon the Stomach, expelling much viscous slimy gross flegm. But it ought to be used with great Caution, because it heats extreamly, and endangers Suffocation by the Violence thereof: nor indeed ought it to be used without Correctives, and things which may mittigate the force thereof, that it may do no harm; and then it may be given to such as are troubled with Scabs, Itch, Scurff, Morphew, Leuce, Leprosy, Herpes, *&c.* Also used outwardly, it kills Lice, Crab-lice, Vermin, Worms in the head, share, or Armpits, or any other parts of the Skin.

XI. *The Decoction in Wine or Water, or Honied Water.* It is Emetick, and brings up gross flegm, but with great Violence. When taken, much Honied Water ought to be taken afterwards, and the Patient to walk up and down to avoid Suffocation, for which cause the Seeds of Stavesacre, are very rarely used inwardly. This has all the Virtues of the former, whether used internally, or outwardly applyed. It is good for all external defœdations of the Skin. as also to cleanse and heal foul Sores and Ulcers in the Mouth and Throat: If it is too strong, it may be weaken'd by mixing it with *Vinegar.*

XII. *The Decoction in Vinegar.* If the Gums and Teeth be washed therewith it eases the Toothach, by drawing away the Rheum which caused it, in great abundance. Any running Old Sore, or foul Ulcer being often washt therewith, it cleanses, drys and heals them, and comforts and strengthens any weak part, or Nerves overstrained, or hurt by any Accident.

XIII. *The Electuary. First a strong decoction is made of the Seed in Water (proper Correctives being also added.) Then to the strained Decoction, Pouders of Aniseeds, Cinnamon and Liquorice, of each a sufficient quantity, with twice their weight in Honey, are added to make a thin Electuary.* Dose is a Dram at a time; it has all the Virtues of the Posset Drink and Decoction, and provokes the Terms in Women: being also dissolved in Plantane or Rose Water, it heals foul Ulcers in the Mouth and Throat, by washing therewith.

XIV. *The Pouder of the Seed.* Strewed upon Heads over-run with Lice and Nits, it kills and destroys them. Mixt with Vinegar or Wine, it is good to be rubbed upon Lousy Heads, also Lousy Apparel, and to drive away and destroy Lice, Crab-lice, *&c.*

XV. *The*

XV. *The Apophlegmatiſm.* The Seed chewed in the Mouth alone, or mixed with a few bits of the Root of *Pyrethrum* or *Pellitory of Spain*, draws away abundance of Rheum from the Head, Brain, Nerves, Eyes, Noſe, Jaws and Teeth, and thereby eaſes the Tooth-ach, and the pains and diſtempers of thoſe other parts.

XVI. *The Ointment.* The Seed in Pouder mixed with Oil or Hogslard, and made into an Ointment, is good againſt Itch, Scurff, Morphew, Scabs, Leproſie, Lice, Crab-lice, and other Vermin, being anointed morning and night on the parts affected, after they have been firſt bathed with the *Decoction*.

XVII. *The Paſte.* The Seed beaten with Meal, and made up into Paſte with a little Honey, has the Virtues of the former Ointment and Electuary: and laid in places where Rats and Mice frequent, will effectually kill or rid the place of thoſe kind of Vermin, by their eating thereof.

XVIII. *Nota.* The Seeds are very truly dangerous to be taken inwardly, unleſs prepared, corrected, and given by a very skilful hand; and therefore, my Advice is, that ſuch as are ignorant in Phyſick, ſhould forbear their internal uſe, for that many times Death enſues upon the taking of them: but as to all their External uſes, they are effectual and ſafe enough.

CHAP. DCLXVII.

Of STITCH-WORT.

I. *THE Names.* It has no known Greek Name, yet ſome, as *Dodonæus* and *Lobel*, call it Ὁλόσεον, *Ruellij*: in Latine, *Gramen Leucanthemum Dodonæi & Fuchſij*; *Gramen Floridum Camerarij*; *Gramen Eufraſia Tragi*; *Gramen alterum Matthioli*; *Eufraſia major Loniceri*; *Caryophyllus arvenſis Bauhini*; and in Engliſh, *Stitchwort*. But why *Dodonæus* and *Lobel*, or *Ruellius* ſhould call it *Holoſtium*, i. e. *tota Oſſea*, or *All-bone*, there is little reaſon for, ſeeing it is one of the moſt tender Herbs, and has no hardneſs at all in it.

II. *The Kinds.* There are two ſorts of this Plant, *viz.* 1. *Gramen Leucanthemum majus*, *Gramen floridum majus*, *Caryophyllus arvenſis glaber flore major*, *Bauhini*, The greater Stitchwort. 2. *Gramen Leucanthemum minus*, *Gramen floridum minus*, *Caryophyllus arvenſis glaber flore minor Bauhini*, The leſſer Stichwort. But why *Bauhinus* ſhould account them in the kindred of the *Caryophylli*, I ſee no reaſon; nor yet why they ſhould be accounted any Species of the *Gramina*, there is as little argument, for that they differ ſo much in form from them.

The Deſcriptions.

III. The firſt, or greater Stitch-wort, *has a Root which is ſmall, jointed and Threddy, runs or Creeps in the Ground all about, with many ſmall Fibres adjoining to it. From whence riſe up ſeveral*

Stitchwort Great.

round ſlender Stalks, ſcarce able to ſuſtain themſelves, but by the help of Hedges, or other things which grow or ſtand near it, being full of joints, from which two ſmall, long, hard, rough and pointed green Leaves ſpring, without any Footſtalks. At the Tops of the Stalks and Branches come forth many ſmall flowers, conſiſting of white Leaves, and in form of a Star, with ſome white Threds in their middles. Of this ſort, there has been ſome Varieties obſerved, as well in the Stalks, as in the Leaves and Flowers; ſome Plants growing greater or higher than others; in ſome the Leaves larger, and in others the flowers being greater or leſſer, and the Threds in the middle, ſome being paler, and ſome redder than others. The Seed is contained in ſmall heads, ſomewhat long and ſharp at their upper ends; and when it is ripe, it is very ſmall and brown.

IV. The ſecond, or leſſer Stitchwort. *This in its Roots, Stalks, Leaves and Flowers, grows very like unto the former, its chief difference being in that it is leſſer, the Leaves leſſer, the Flowers ſmaller, and each Leaf divided as it were into two, making it ſeem to have more Leaves than the former. Otherwiſe in the ſhape of the Leaves and flowers they are much the ſame; the Leaves are orderly placed by couples together, and in good proportion, being of a whitiſh color: and the flowers are made in form of a Star, which when they are faded the Seed follows, which is encloſed in knobs or ſmall round heads, like Lin-Seed, but not ſo abſolutely round; and the Chives or Threads in the middle of the flower, are ſometimes of a reddiſh or blackiſh color. In this leſſer Species there is alſo ſome diverſity in the Stalks, growing more upright, or elſe lying upon the ground, and in the flowers, ſome having white Threds in the middle Tipt with black*

Stitchwort Small.

black, ſo that it makes the whole flower ſeem to be black, or elſe they are of a pale yellow

V. *The Places.* They grow in the borders of Fields upon, Bank ſides and under Hedges, almoſt every where. The firſt kind grows more uſually under Hedges, and upon dry Banks of Ditches, or the like. The ſecond is more Common in Corn Fields, and elſewhere, in the more open and Champion Grounds.

VI. *The Times.* The firſt flowers a Month earlier than the ſecond, which is in *April.* The ſecond flowers not until *May* or *June.* But when they begin to flower, they continue flowering for about two Months together running.

VII. *The Qualities.* Stitchwort is hot and dry in the firſt degree, a little ſharp and biting as *Galen* ſays, and in its uſe, very like to Millet, and of an Anodyn Property.

VIII. *The Specification.* It is ſaid to eaſe pains and ſtitches in the ſides, and to take away the Dimneſs of the Eyes, or clear the Eye-ſight.

IX. *The Preparations.* You may make therefrom. 1. *A Liquid Juice of the whole Plant.* 2. *A Pouder of the Herb.* 3. *A Pouder of the Seed.*

The Virtues.

X. *The Liquid Juice.* It is much commended to clear the Eyes of Dimneſs, and to take off Films which begin to grow over the Sight, being daily three or four times a day dropt into them.

XI. *The Pouder of the Herb.* It is accounted of, to help Stitches and Pains in the ſides, being drank in White Wine from a Dram to 2 Drams: ſome adviſe it to be taken with the Pouder of *Acorns.*

XII. *The Pouder of the Seed.* It may be given from a dram to 2 drams morning and evening, in White Port or *Lisbon* Wines, for the former purpoſes and intentions. Some ſay drank 2 or 3 times a day for many days together, that it cauſes fruitfulneſs in Women.

CHAP. DCLXVIII.

Of STOECHAS OR, CASSIDONY.

I. *THE Names.* It is called by the Arabians, *Aſtochodos, Aſtochodes; Aſtuborados, Aſtuchudes:* in Greek, by *Dioſcorides* Στίχας: by *Galen* Στοιχὰς: In Latine *Stœchas* and by moſt *Stichados*; alſo *Stœchas Arabica*, (becauſe the beſt was brought out of *Arabia. Dioſcorides* ſays, it took the Name *Stœchas*, from the Iſlands *Stœchades*, (over againſt *Maſſilia*) where it grew in great plenty: in Engliſh, *Stœchas, Caſſidony, Stachadove* and *French Lavender.*

II. *The Kinds.* There are two principal ſorts of this Plant, *viz.* 1. *Stœchas* properly ſo called, of which we ſhall Treat in this Chapter. 2. *Stœchas Citrina Chryſocome*, Yellow Stœchas, Gold Locks, or Golden Tufts, called alſo Yellow Tufts, of which we have already Treated, in *Chap.* 322. aforegoing: in which Chapter there is a groſs error committed by the Printer, *in the Title of the firſt Figure*, page 432. col. 2. which is there, *True Gold Locks of Dioſcorides*, whereas that being the Figure of the ſecond Species, its Title ought to be, *Yellow Tufts: or Yellow Caſſidony*, and ſo you are entreated to Correct it with your Pen. Of the *Stœchas* properly ſo called, of which we Treat in this place, there are many kinds, but thoſe which are chiefly to be found in our Gardens, are theſe following, *viz.* 1. *Stœchas Vulgaris*; *Stœchas Matthioli*; *Stœchas Arabica*; *Stœchas purpurea*, Our Common Stœchas or French Lavender. 2. *Stœchas Vulgaris flore albo Bauhini*, Our Common Stœchas with White Flowers. 3. *Stœchas longioribus ligulis Cluſij*; *Stœchas nudis Caliculis ſummis Lobelij*; *Stœchas capitulis foliatis Lugdunenſis*; *Stœchas caliculis non foliatis Bauhini*, Stœchas Caſſidony or French Lavender with long Leav'd Heads. 4. *Stœchas folio ſerrato, folio criſpo Cluſij*, Stœchas, or French Lavender with dented Leaves. 5. *Stœchas purpurea odorata*, Sweet Purple Stœchas.

The Deſcriptions.

III. The firſt, or Our Common Stœchas or French Lavender. *Its Root is ſomewhat woody, and will ſcarcely abide our Cold Winters; after it has flower'd and Seeded, except in ſome places, unleſs an eſpecial care be taken of it. As it grows with us, it is a more tender Plant than Lavender, and the whole Plant is ſomething ſweet, but nothing ſo much as Lavender; it grows more like an Herb than a Buſh or Shrub, and is ſeldom above*

above half a yard high. It has long, narrow, whitish green Leaves like unto Lavender, but softer and smaller, set at several distances about the Stalks, which spread into several Branches: at the Tops of which come forth long and round, and sometimes four square heads, of a dark green-

Stœchas common or Cassidony.

ish purple color, compact of many Scales: from which come forth the flowers of a blewish purple color, after which follow the Seed Vessels, which are a little whitish when they are ripe, and contain within them blackish brown Seed.

IV. *Gerard* describes it thus. *Its Root is hard and woody; it has a Body like Lavender, short and of a woody substance; but slenderer, beset with long narrow Leaves of a whitish color, lesser than those of Lavender. It has in its Top bushy or spiky heads, well compact or thrust together; out of which grow forth small purple flowers of a pleasant smell; the Seed is small and blackish.*

V. The second, or Common Stœchas with white flowers. *This differs not much in its Roots, Stalks, Leaves, Seed, form and manner of its growing, from Our ordinary Garden Cassidony before described, but only in its flowers, which are much like those also in shape, but not in color. In this Plant the Leaves grow thick together upon the Branches, a little larger, and not altogether so white; the heads are short likewise, but the flowers starting from among the Scales are larger than in the former, and of a pure white color. This sort is very rare to be met with.*

VI. The third, or Stœchas, or French Lavender with long Leav'd Heads. *Its Root is woody, long, slender, and accompanied with Branches, Strings, and Fibres like the first, from which the whole Plant in its form differs not much. In this the Tops of the Branches are bare, without Leaves upon them for the space of 4 or 5 Inches or more, unto the heads. And the heads of these are not fully so large as in the other, but longer having divers hard, stiff, and longer skinny purplish Leaves, rising up above those heads, than at any time are seen in any of the former; which in some places have a shew of some short pieces, like unto the skinny Leaves, of a purple or blew color. The Flowers and Seed are also like the first, and so is its smell or odour.*

VII. The fourth or Stœchas or French Lavender with dented Leaves. *Its Root is much like the Roots of the former kinds. And it has such like Stalks, with square, brittle, slender, hoary branches, on which grow very long narrow Leaves, nicked round about the edges, or Toothed like a Saw, not much unlike those of Lavender Cotton: of these Leaves many grow together, and they are so dented or notched about the edges, that they appear Curl'd or Crumpled, green on the upper side and hoary underneath, of a hot taste, somewhat bitter. The Tops of the Branches end in somewhat long square Stalks, which are naked and without Leaves unto the spiked heads, which are Scaly, slenderer and longer than any of those before described. The flowers are like unto those also, but of a more purple color, and the Seed is without any difference. At the Tops of the heads, comes forth also, such like skinny Leaves, of a blewish purple color like the former.*

VIII. The fifth or Sweet Purple Stœchas. *Its Root is woody, hard, long, and blackish: from whence shoot forth woody and hoary branches, on which do grow many long and narrow Leaves, of a dark green color on the upperside, and a little hairy withall, but of an hoary white underneath, and very woolly, a little dented about the edges, or rather rough. It rises up to be about half a yard high, leaning down its branches, spreading it self more in compass than it extends its self in height. At the Tops of the Branches comes forth sometimes but one flower or head; but more often two long heads together, composed of many Scales, at the Tops whereof stand the flowers, which are nothing but long Thrums or Threds, of an excellent purple color, and very sweet in smell, being very pleasant to the sight. After the flowers are past, follows the Seed wrapped up in Down, within those Scaly Heads, somewhat like to the small Pine Thistle Seed. This Plant* Parkinson *thinks ought to be placed with the* Jacea's *or* Knapweeds, *as being a Species of them, rather than here with the* Stœchas's: *but if you consider the form of the leaf and manner of its growing, it seems to be rather of the kindred of the* Stœchas's, *than any thing else, for which reason it is put here.*

IX. *The Places.* The first grows in *Arabia, Spain, Italy,* and *France.* The second in *Castile* in *Spain.* The third in *Italy,* and *Spain,* and *France.* The fourth and fifth, in *Italy* and *France*: They all of them grow also in *England,* but with us they are Nurst up in Gardens.

X. *The Times.* Tho' most of these flower more early in their own Native Climates, than with us, as the three first in *March* and *April,* and the two last in *July* and *August.* Yet in Our Gardens the two first flower not till *May* or *June*; and the two latter not till *August,* if they do abide. They are tender Plants and must be Sown in the end of *April,* and covered in Winter from the Cold, or else set in Pots, Tubs, or Wooden Chests, fill'd with Earth, to be carried into Houses when the Cold Season begins; by reason of

of their tenderneſs, they ought to be lookt after with great care and diligence.

XI. *The Qualities.* They are hot and dry in the third degree: Aperitive, Attractive, Diuretick, Stomatick, Hepatick, Pectoral, Cephalick, Neurotick, Cardiack, Uterine; Emmenagogick and Alexipharmick: but the firſt of theſe plants is chiefly in uſe.

XII. *The Specification.* It opens obſtructions, cleanſes, ſtrengthens, expels poiſon, reſiſts putrifaction, comforts the Senſes, ſtrengthens the Head, Brain, and Nerves, is good againſt all Cold Aches, Pains or Griefs, as Apoplexies, Epilepſies, Palſies, Convulſions, Vertigo's, Melancholy, is profitable againſt all ſorts of Agues, provokes the Terms, reſiſts Vapors and Fits of the Mother, and is good againſt Coughs, Cold, Rheum, Catarrhs, provokes Urine, and cleanſes all the Urinary Veſſels. *Pena* ſays it is good againſt diſeaſes of the Liver proceeding from bad Concoction: and is profitable againſt the Colick proceeding from Acid, Salt and Glaſſy Flegm, *&c.*

XIII. *The Preparations.* You may have therefrom. 1. *A Liquid Juice.* 2. *An Eſſence.* 3. *A Decoction or Infuſion of Heads and Flowers.* 4. *A Syrup.* 5. *A Pouder of the Herb or of the Heads and Flowers.* 6. *An Oil by Inſolation or Decoction.* 7. *The Fumes of the Herb Burnt.* 8. *An Acid Tincture of the Herb Heads and Flowers.* 9. *A Spirituous Tincture of the ſame.* 10. *An Oily Tincture of the ſame.* 11. *A Spirit of the Heads and Flowers.* 12. *An Oil of the ſame by Diſtillation.*

The Virtues.

XIV. *The Liquid Juice.* Stœchas is ſaid to be as effectual as Hyſſop, for the Breſt and Lungs, for Colds, Coughs, Catarrhs, Hoarſneſs, Wheezing, *&c.* It is alſo a reſiſter of poiſon, and the Infection of the Plague, and all other Infectious Diſeaſes. *Galen* ſays, it has a quality of binding and opening, for which reaſon it is good againſt all thoſe diſeaſes of the Lungs. The juice taken to 2 Spoonfuls or more in Wine or any other proper Vehicle, extenuates, cleanſes, and ſtrengthens all the inward parts and Bowels, as alſo the whole frame of the Body. *Meſues* ſays, it cleanſes, purges, and reſolves all Obſtructions of the Liver, Spleen and other *Viſcera*, hinders putrefaction, and corrects their intemperature.

XV. *The Eſſence.* It has all the former Virtues, beſides which it ſtrengthens the Brain, Nerves, Heart, and all other inward parts, corrects and expels Flegm, and Melancholy, comforts the Senſes, chears the Heart, revives the Spirits, and is effectual againſt all cold griefs in any part of the Body, all Aches or Pains whether internal, as Colicks, or external as Gouts, *&c.* by taking it inwardly morning and night from one Spoonful to two in any fit Vehicle; and outwardly bathing with it, the parts affected. Authors ſay, that *Stœchas* has a Cathartick faculty, but I could never find it; and therefore they ſay or adviſe it to be given with Vinegar of Squills (either the Juice or Eſſence) againſt Vertigo's, Epilepſies, Megrims, and other pains of the Head, as alſo of the Stomach: and given with *Lapis Cyaneus*, or *Sal Indicum*, it prevails againſt Melancholy, and terrors and fears accompanying the ſame: ſo alſo, if taken with Juice of Bugloſs and Pippins; it takes away the oppreſſion and ſadneſs at heart.

XVI. *The Syrup.* It has all the Virtues of the Liquid Juice, and is a more excellent Pectoral, more eſpecially if it is made with Clarified Honey, or Sugar Candy; it is truly an excellent thing againſt all diſtempers of the Breſt and Lungs: and uſed as a Vehicle to take either the Juice or Eſſence in, it is not only effectual for all the purpoſes they are intended for; but ſo mixed, they prevail againſt all ſorts of Agues, whether Quotidian, Tertian, or Quartan, more eſpecially where Flegm abounds. But they are ſaid to be hurtful for ſuch as are hot and dry, and of a Cholerick habit of Body, cauſing in ſuch both Thirſt and Fainting. This Syrup may be made of the Clarified Juice; or of the heads, and flowers boiled in Water, according to the uſual method.

XVII. *The Pouder of the Herb, or of the Heads and Flowers.* It has all the Virtues of the Juice, Eſſence, Decoction and Syrup; but operates not with that ſpeed, by reaſon of the groſsneſs of its parts, and being clog'd with ſo many Earthy particles. If it has any Cathartick Quality in it, it is very weak and ſlow, and therefore they adviſe it to be mixt with *Myrobalani Indi*, or *Chebuli*, or *Sal Gemma*, or *Vinum Sciliticum*, to excite its purgative property and quicken it. They ſay it is made ſtronger, if it is before-hand Infuſed in Whey, or in Wine, or Juice of Pippins, with a few Raiſons of the Sun. The Doſe is from half a Dram to 2 Drams, morning and evening in the Syrup, or other convenient Vehicle.

XVIII. *The Decoction or Infuſion in Whey, Wine, or Water.* It has all the Virtues of the Juice, Eſſence, Syrup, and Pouder; but much weaker, and therefore is given in the larger quantity, as to half a Pint or more, and if the Deſign it to Purge, it is mixt with ſome of the aforenamed Catharticks, by which it is made the more forcible. It provokes Urine and the Terms, and cleanſes the Urinary parts.

XIX. *The Oil by Inſolation or Decoction.* It is good againſt Aches, and pains from a cold cauſe, gives eaſe in Cramps and Convulſions of the Nervous parts, and prevails againſt Palſies, and other like Weakneſſes afflicting the extream parts: anointed upon the Region of the Womb, or put up with a Peſſary, it is good for the pains and cold diſtempers of that Bowel.

XX. *The Fumes of the Herb or heads burnt.* Taken up the Noſtrils through a Funnel, it is good againſt colds in the head, and opens ſtoppages of the head and brain. Received in the ſame manner into the Ears, it is good againſt pains there, as alſo againſt thickneſs of Hearing, and Deafneſs: and ſo taken up the Womb, it comforts and ſtrengthens a cold and moiſt Womb, and ſometimes induces the Terms.

XXI. *The Acid Tincture.* Taken to a Grateful Acidity in any proper Vehicle, it prevails againſt the Plague, Spotted Fever, and all ſorts of Malign and Peſtilential Diſeaſes. It ſuppreſſes Vapors in Women, and is good againſt Fits of the Mother. It ſtrengthens the Stomach, and cauſes a good Appetite and Digeſtion, and is indeed an excellent thing againſt the biting of a Mad Dog, both inwardly taken and outwardly applyed.

XXII. *The Spirituous Tincture.* It comforts a cold and weak Stomach, is good againſt Fainting and Swooning Fits, prevails againſt the Palſie and cold diſeaſes of the Nerves and is ſingularly good againſt the Colick, Gripings of the Guts and Bloody Flux. Doſe a Spoonful at a time in the aforegoing Syrup.

XXIII. *The*

XXIII. *The Oily Tincture of Heads and Flowers.* Inwardly taken from 10 to 30 Drops, and outwardly applyed it is good againſt the Palſie, and all cold and moiſt diſtempers of the Nerves: It gives eaſes in the Sciatica and Gout from a cold cauſe; and eaſes pains and aches in any part of the body being anointed thereon. Inwardly taken it provokes the Terms, facilitates the birth, cauſes due cleanſing after delivery, gives eaſe in After-pains and in the Colick, is profitable againſt Sand, Gravel, Stone, or Tartarous matter in the Reins and Bladder, eaſes the Strangury, and cleanſes all the Urinary Veſſels from Heterogeneous matter lodged in them.

XXIV. *The Spirit.* It has all the Virtues of the Eſſence, and Spirituous Tincture, but much more pleaſant and Cordial and may be given from half a Spoonful to two Spoonfuls mixt with the former Syrup, againſt Melancholy, Vertigo's, Epilepſies, Palpitation of the heart, and other diſeaſes of the Head, Brain, Nerves, and Viſcera.

XXV. *The Diſtilled Oil from the heads and flowers.* It is no ways inferior to the Oils of Lavender, Roſemary, Pennyroyal, Angelica, Oranges, or Limons. A potent Medicament againſt the Palſie, Convulſions, Catarrhs, Colick, Epilepſy, and all cold and moiſt diſeaſes of the Head, Brain, Nerves, Reins, and Womb. It may be given from *gut.* iij. *to* vj. *or* viij. in any proper Vehicle: or it may be dropt upon poudered Sugar, and well mixt with the ſame, and given in a Glaſs of Wine morning and night. It wonderfully comforts and ſtrengthens the Womb, is good againſt Barrenneſs, provokes the Terms, facilitates the Birth, brings away the After-birth, eaſes After-pains, ſuppreſſes Vapors, and prevails againſt Fits of the Mother; and has alſo all the other Virtues of the Juice, Eſſence, Decoction, Syrup, Tinctures and Spirit aforeſaid, being cautiouſly given as the learned Phyſician ſhall direct.

See the Yellow Stœchas, *or* Gold Locks, *in Chap.* 322. *as aforementioned, whoſe Qualities, Properties and Virtues, tho' they may be ſomething like to theſe, and may ſerve to moſt of the ſame Intentions and Purpoſes; yet 'tis certain, 'tis nothing ſo effectual as the* True Stœchas, *of which We have Treated in this Chapter.*

CHAP DCLXIX.

of STOCK-GILLIFLOWERS *Garden.*

I. *The Names.* This Plant is called in Greek, Λευκόιον (i. e. *Viola alba, ex* λευκὸν *album*, and ἴον, *Viola:*) in Latine, *Leucoium:* and in Engliſh, *Stock-Gilliflower.*

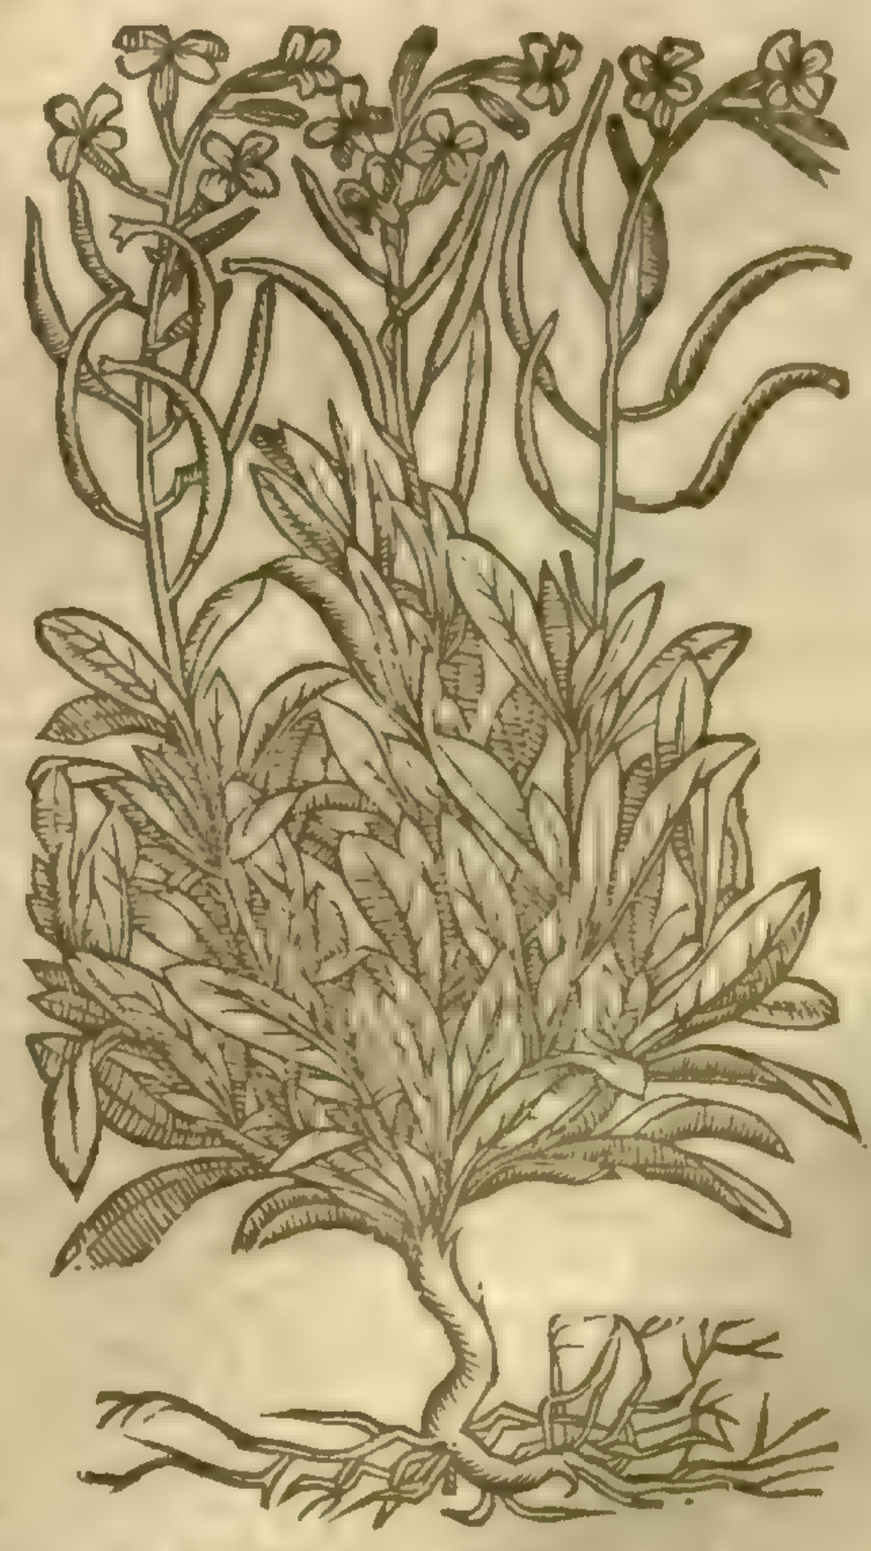
II. *The Kinds.* We make but three generick kinds hereof, *viz.* 1. *Leucoium Hortenſe*, Garden Stock-Gilliflowers, of which in this Chapter. 2. *Leucoium Marinum*, Sea Stock-Gilliflower, of which in *Chap.* 670. next following. 2. *Leucoium Murale*, *Leucoium Luteum*, *Keiri*, Wall Stock-Gilliflower, or Wall flower, of which in its proper place in the Alphabet, W.

III. *The Garden Kinds.* Theſe are firſt ſingle, as 1. *Leucoium ſimplex, ſativum colorum diverſorum.* Single Garden Stock-Gilliflowers of ſeveral colors. 2. *Leucoium Luteum multi Luteum Implex*, The ſingle pale yellow Stock-Gilliflower. 3. *Leucoium Murale luteum*, The Dark or Dull ſingle yellow Stock-Gilliflower. 4. *Leucoium album genus flore ſimplici*, another kind of ſingle Stock-Gilliflower. Secondly the Double kinds as, 5. *Leucoium flore pleno diverſorum colorum*, Double Stock-Gilliflowers of divers colors. 6. *Leucoium ſativum Luteum flore pleno*, The double yellow Stock-Gilliflower. 7. *Leucoium flore pleno variegatum*, The double ſtriped Stock-Gilliflower. 8. *Leucoium alterum flore pleno*, The other double Stock-Gilliflower, of all which in Order.

The Deſcriptions.

IV. The firſt, or ſingle Garden Stock-Gilliflower of ſeveral colors. *Its Root is long, white and Woody, ſpreading divers ways: Theſe ſingle Stock-Gilliflowers tho they differ in the color of their flowers, yet are in leaf and manner of growing one ſo like unto another, that until they come to flower, the one colored cannot be known, from another Stock; that which bears red flowers cannot be known from that which bears purple, nor either of them from that which bears white: and therefore One Deſcription of the Plant will ſerve. It riſes up with round Woody whitiſh Stalks, two,*

Stock-Gilliflower Common.



three, feet or more high; on which grow many long and not very broad, ſoft, and whitiſh or grayiſh green Leaves, ſomething round pointed, and parted into divers branches, at the Tops of which grow many flowers one above another, ſmelling very ſweet, conſiſting of four ſmall, long, and round pointed Leaves, ſtanding in ſmall long husks,

which turn into long and flat Pods, two, three, four, and sometimes five inches or more long, in which is contained flat, round, reddish Seed, with grayish Rings or Circles about them, lying flat all along the middle Rib or Pod on both sides. There is great Variety in the colors of the flowers: for some are wholly of a pure white color: others of a most excellent Crimson red color: others again of a fair red color, but not so bright or lively as the other: some of a Purplish or Violet color, without any spot, mark, or line in them at all. There are again of all these colors, very variably mixed, as White mixed with great or small spots, strakes or lines, of a pure or bright red; or dark red and white with purple spots and lines: And of either of them, whose flowers are almost half white, and half red; or half white, and half purple: The red of both sorts, and the Purple also in the same manner spotted, striped and marked with white, differing neither in form, nor substance in any other point.

V. The second, or single pale yellow Stock-Gilliflower. *This is of no great regard, but only for its rarity and diversity from the rest, there being but little difference in this kind from the former, whether as to its magnitude, leaves, or flowers, or manner of growing; only this has greener leaves, and a pale yellow flower, almost white; but in all other respects alike.*

VI. The third, or Dark, Dull single yellow Stock-Gilliflower. *This seems to be a Wild kind of this Plant, and has like Roots with the former, but larger, longer, and greener Leaves than any of them, unevenly gasht or sinuated on both edges, lying on the Ground, and a little rough or hairy withall. From among which rise up the Stalks a yard or more high, and hairy likewise, bearing thereon, here and there, some such like Leaves as are below, but smaller; and at the Top a great number of flowers, as large or larger than any of the former single kinds, made of four large Leaves apiece, standing in such like long husks, but of a dark, dull or sullen yellowish color: after which come long roundish Pods, in which lye somewhat long but rounder and greater Seed than in any other Stock-Gilliflower, and nearer both in Pods and Seed unto the* Hesperis, *or Dames Violet. The Root of this does not usually perish after Seed bearing tho' sometimes it does.*

VII. The fourth or other single kind of Stock-Gillflower. *Its Root is like to all the former, and dyes every Winter for the most part, after it has born Flowers and Seed, being seldom preserved. This kind differs neither in form of Leaves, Stalks, or Flowers from the former, saving that it oftentimes grows much larger and taller; so that whosoever shall see both these growing together, shall scarcely discern the difference; only it bears flowers, wholly, either White, Red or Purple, that is, of One color, without mixture of other colors in them, which are either single like unto the former, or very thick and double, like unto the next following; but larger, and growing with a greater store of Flowers on the long Stalk. But this is to be understood, that these kind of Plants which bears double flowers, as they bear no Seed at all, so the double flower'd proceeding from the Seed of this single flower'd (which of all the single flower'd kinds, is that only whose Seed gives both single and double flowers) is very seldom encreased by slips or cuttings (as the next double kind is) because this sort dyes every Winter for the most part; but is to be produced every year, from the Seed of this single kind, which promiscuously brings forth, some Plants single flower'd, and some double flower'd, which cannot be distinguish'd one from another, viz. which will be single, and which will be double, till they are seen in flower, or in bud at least; for which reason the Seed of this single kind is always to be saved; which is the only way to preserve the Species. But of the Seed of any of the former single kinds, never any double flowers were ever known to be produced, and therefore you ought to be carefull in saving the Seed, to distinguish it from the Seeds of those.*

VIII. The fifth or Double Stock-Gilliflower of Divers colors. *This kind which bears only double flowers, grows not so great, nor spreads its branches so far, nor are its Leaves so large as the double flowered of the former single kind, but is in all things smaller, and lower, and yet is Woody or Shrubby like that: bearing its flowers in the like manner, many upon a long Stalk, one above another, and very double, but not so large as those former double, altho' it grows in a fertil soil, which are wholly either White, or Red, or Purple, without any mixture, or else mixed with Spots and Stripes, like the single flowers of the first kind, but more variably, and not in all places alike, never bearing Seed, but is to be encreased by the cuttings of the young Sprouts or Branches only, taken in a fit Season. This kind perishes not, as the former double kind does, provided it be defended in Winter from the Extremities of Frosts, and Cold North and North East Winds, and from the Snow falling or resting upon it. The former Stock-Gilliflower of divers colors, raised from the Seeds of the single kind at* Sect. VII. *above, are in all parts so like the single, and so well known, that they need no Description. The chief difference consists in the flowers, which in this double kind are large, thick, and double, bearing many upon one Branch, and one Stalk having many branches of flowers, which are either of a sadder or lighter purple color, or of a paler, or deeper reddish Murrey. There is also one which has greener Leaves than any of the rest, bearing pure white flowers: but all these (as we said before) come from the Seeds of the single kind at* Sect. VII. *aforemention'd.*

IX. The sixth, or Double Yellow Stock-Gilliflower. *It has long Leaves somewhat hoary or white, like unto the Stock-Gilliflowers, the Stalks and Branches being also like the same (and not Green like unto the Wall-flower, to which else it might have been referred.) The flowers are fair and double of a pale yellow color The whole Plant is tender, as the double Stockgilliflowers are, and ought carefully to be preserv'd in Winter from the Cold, and that rather more than the next double, lest they perish.*

X. The seventh, or Double Striped Yellow Stock-Gilliflowers. *It is in all things like the former single Striped, and has the same diversity of Colours, only differing in that the Flowers of these are all striped or marked more or less with white, which adds very much to their beauty and esteem.*

XI. The eighth, or other Double Stock-Gilliflower. *This has no single of the kind, and is lesser in all the parts thereof, than those raised from Seeds: the Flowers are also smaller, but thick and double, of the same or like colors with the other, both for single colors and mixed; many of them much more, and better striped with white than those of the former kind.*

XII. *The Places.* They grow with us only in Gardens, and that almost throughout all *England*: But it is said that some of the single kinds in Foreign

Foreign Countries and Warm Climates grow Wild.

XIII. *The Times.* They begin to Flower in *April*, and are in their greateſt Glory in *May* and *June*; but many of them continue flowering all the Summer, till they are Check'd by Froſts. Some of the ſingle kinds will continue flowering in a manner all the Year throughout, in ſome places, if they ſtand warm and are defended from Froſts and Cold Winds. The ſingle kind, at *Sect.* VII. whoſe Seed bears double Flowers, as well as ſingle, Flowers uſually late, and keeps flowering until *Winter*, till the cold Weather or Froſty Seaſons nip it. The double as well as the ſingle are raiſed from Seed, which if the Seed is good, and of the right kind, is to be Sown at the Full of the Moon in *April* in your Flower Nurſery, not too thick, by any means. But if they are Sown in *March*, it ought to be on hot Beds, in ſmall ſtrait drills, drawn croſs, and then covered with Ones hand (after the Seed is Sown) as thin as poſſible.

XIV. *The Cultivation.* 1. Being Sown in their proper Seaſons, when the Plants are grown to be about 4 or 5 Inches high, you ought (in ſome Rainy Seaſon) pull them up, then turn the Bed over where they grew, and ſet them again in Rows at convenient diſtances. After they have ſtood ſome time, and begin to grow high, take them up again as before, and ſet them again the ſecond time; by this means they will become more hardy, not grow ſo high, and ſpread out more into Branches, have more ſtrength to endure Winter, and at Spring, be far better Plants to remove, than thoſe which run up to a great height with long Stalks, which are ſeldom able to endure the Froſts in Winter.

XV. 2. Among theſe raiſed from Seed, you will have many with double flowers, which may be perceived in the buds, which will be rounder and larger than thoſe which will prove to be ſingle: theſe double ones you ought to remove into your Garden, taking them up carefully, not breaking the Roots, and with ſome Earth about them, which being a while Shaded and Watered, will grow and bear flowers, as well as if they had not been at all removed. Thoſe with ſingle flowers muſt ſtand for Seed, which is to be Sown every year, to preſerve the kinds; for after they have born flowers both double and ſingle commonly dye.

XVI. 3. The other ſort of double Stock-Gilliflowers, which bear no Seed, nor have any ſingle of the kind, are to be encreaſed by ſlips only: Theſe double kinds, being not only more apt to grow, but alſo continue longer than thoſe which are raiſed from Seed; but as it is in Carnations and Clovegilliflowers, ſo it is in theſe; thoſe from ſets, being more eaſily obtained, has cauſed the latter from Seed, to be neglected, and almoſt quite loſt; notwithſtanding that one Plant from ſetting, is a much more noble kind, and worth five of thoſe raiſed from Seed.

XVII. 4. Some think that the Double kind raiſed from Seed, are not to be preſerv'd longer than their firſt year of bearing flowers, but that is a miſtake; for many of thoſe double Plants have been raiſed from the ſlips or cuttings of this kind, as well as the other. 'Tis true, the Old Plant being run up all to flower, dies commonly the next Winter; but the cutting will grow, and bear the next Spring following, almoſt as well as thoſe raiſed from Seed, which is to be done in this manner following.

XVIII. 5. Make choiſe of ſuch Branches as do not bear Flowers, which cut off ſome diſtance from the Stock, ſo that they be not too long: then ſlit down the bark at the end of the ſlip, about half an Inch, in 3 or 4 places, equally diſtant from each other, according to the bigneſs thereof, which Peel as far as it is ſlit, and turn up; then cut off the naked woody part cloſe to the Rind which is turned up: make a wide Hole in the Earth, and ſet the ſlip therein 3 Fingers deep, with the bark ſpread open, round about the end thereof: then cover it, which let be ſhaded for ſome time, and watered; if the Ground is any thing good, it will grow and proſper very well. This certainly is the beſt and moſt abſolute way to raiſe double Stocks of any of the kinds: and in like manner you may cut and ſet Slips of *Wallflowers*, or of any other Woody Plant, which will grow of ſlips. They may alſo be encreaſed by laying the ſlips after the manner of *Carnations* and *Clovegilliflowers*.

XIX. 6. When the Plants begin to riſe out of the Earth from Seed, you ought to ſecure them from Froſts, and Cold Nipping Eaſterly Winds, by covering them with dry Dung, Mats, or Glaſſes. If you cover them with Glaſſes in order to forward their growth, take care not to uncover them all at once: for after having been encloſed in a Warm place for ſome time, if you expoſe them to the Air too ſuddenly, you run the hazard of killing them: whereas if you gradually expoſe them to the Air, they will the better encounter the hardſhip thereof, and gather a ſufficient ſtrength, ſo as the more eaſily to admit of a Tranſplantation.

XX. 7. The fourth ſingle Stock, which we preſerve for Seed, we always retrench in its Pods, leaving no more to ripen than we think fit for our neceſſity; ſo will the remaining Seed be fairer, larger, and ſtronger, and make more noble and beautiful production of Flowers. It ought alſo to be gathered when the Pods are quite dry, and begin to open of themſelves: for the Seed being then in no danger of ſhrinking, you may Sow it with expectation of excellent Plants.

XXI. 8. Before you Plant your young Stocks, do not ſet them immediately in the deſigned places for them, but fill whole Beds with them, placing them at half a Foot diſtance one from another, where they continue as in a ſhort Nurſery. The Stocks begin to diſcover themſelves towards the latter end of *September*, if Planted in ſeaſon: ſometimes it is later, and now and then not before Winter. For they are in no Eſteem, unleſs they be double; and ſince Nature has not imparted to them all that advantage, this Method is taken; that having raiſed them, and found out which of them are double, we may order them according to the following Directions.

XXII. 9. As ſoon as the Stock appears to be double, prepare Pots or Boxes 16 Inches Wide every way, which fill with one half Earth, the other half Old Mould mingled together, and preſs'd down with your hands, leſt it ſhould chance to ſink after the Flowers are Planted, and ſo make an unevenneſs in the ſuperficies, which ought to be avoided: fill the Pots, *&c.* no higher than within four inches of the Top, for the Vacancy which is left is to receive the Foot of the Gilliflower, which we draw up either in Turf, or with no more than its Roots.

XXIII. 10. If it is raiſed with the Turf or Earth about it, then ſink a Spade down, within 4 inches of the Maſter Stem, and plucking the Spade up, do the ſame on the other ſide, directing it ſo, that it may go ſloping under the Roots: and at every turn heave the flower a little, by

ſome ſmall Shocks of the Spade at the Top of the handle. Now obſerve, if the Roots of the flower be quite diſingaged from the Earth; if ſo, thruſt down your hands on both ſides of the Turf, and with your fingers opened or ſtretch'd as wide as poſſible, raiſe up the whole; and before it is placed in the Pot, Tub, or Caſe deſigned, let another perſon be ready to cut off thoſe ends of Roots which are too long for the Turf.

XXIV. 11. Then ſet the Foot of the Stock in its deſign'd Place, directly in the middle of the Veſſel, taking care that the Turf or Earth fall not aſunder from it: But if it chances to be disjoin'd a little, keep one hand cloſe upon it, and in the other take ſome of the Compounded Earth as before directed, with which cover the Turf all round, preſſing it gently down, and ſo fill up the Pot within an Inch of the Top, caſting pure Mould over it, and uniting the ſuperficies as evenly as may be, which done, Water the Plant, and remove it into the ſhade, till it has taken Root again, after which place it in the Sun, in the Place where you deſign it ſhall ſtand.

XXV. 12. If you don't deſign to Plant your Stocks with the Turfs about them: then only pluck them up by the largeſt Stem, and carefully clip the Roots which are too long, after which Plant them, according to the Method before preſcribed.

XXVI. 13. Since we only uſe that Seed, which is of the beſt kind, you muſt take care, before Winter comes, to have ſome of the Production in Pots, to the end you may be able to ſave the Seed the year following: for know, that Stock-Gilliflowers are only in Preparation (the firſt year after they are Planted) to produce Flowers and Seeds the year following; ſo that without this care, you will often be unfurniſhed.

XXVII. 14. We Plant them in Pots or Caſes, either, 1. becauſe we deſign they ſhould continue there always, or, 2. with an intent to remove them again in the Spring, to replant them in the borders, or other parts of the Garden, where they may make the beſt ſhow. But when we would have them remain long in flower, we place them in Pots *&c.* that they may be removed upon occaſion, into the ſhade: and if the Pots are of right *Dutch Ware*, and of handſome ſize, and placed in good order, they will be a ſingular Ornament to the Garden.

XXVIII. 15. In caſe the Stocks are not marked the firſt year, after they are Planted, ſo that you cannot judge whether they will be ſingle or double; you muſt be careful during the Winter, to preſerve them with a covering from hard Froſts and Cold North and North-Eaſt Winds, which might poſſibly Kill them. And thoſe which are in Pots are to be ſecured from the ſame Inconveniences, either in Green-Houſes, or in ſome other place, of a Southern Scituation, which is warm and not moiſt.

XXIX. 16. Stocks onght to be Sown in *Hot Beds*, as we have declared at *Sect.* XIII. aforegoing, but you may Sow them in the *Naked Ground* alſo, which is well Till'd, but then it ought not to be done till the middle of *April* or later, by reaſon of the Cold Weather, which is not over many times before that time: but whether they be Sown in *Hot Beds*, or in *Naked Ground*, they ought to be ſufficiently Watered and Weeded, that nothing may hurt their growth.

XXX. 17. The Flowers ſet in Pots to be preſerv'd from Froſts, and Cold Weather, are thus to be removed. Dig a Hole with a Spade or large Trowel, about as broad and deep as a Hat Crown; then lay your hand flat upon the ſuperficies of the Earth in the Pot, in ſuch a manner, that the lower part of the Stem, may be juſt in the middle of your fingers; turn the Pot upſide down, and ſhake it a little, till you perceive the Earth to deſcend; bring your hand down a little, take the Pot quite off, and holding the Plant in both your hands, carry it gently to the Hole Dug for it, where having plac'd it as it ought to be, fill the whole up with Earth, and water it, after which, you will find it thrive and flouriſh to your Satisfaction.

XXXI. *The Qualities.* According to Authors, they are of the ſame Qualities, Specification and Virtues of the Wallflower, of which in its proper place; and as their Natures are much the ſame, ſo they are eſteemed as Effectual to all intentions and purpoſes; they are hot and dry in the firſt degree, Abſterſive, Anodyn, Hepatick, Splenetick, Nephritick, Hyſterick, and Neurotick, and of thin and ſubtil parts.

XXXII. *The Specification.* The Flowers eaſe the hardneſs and pains of the Womb, provoke the Terms, expel the Birth, Afterbirth and Dead Child, open Obſtructions of Liver and Spleen, cleanſe the Reins and Urinary paſſages, provoke Urine, help in the Strangury, and are ſaid to add ſtrength to Paralytick Members.

XXXIII. *The Preparations.* You may make therefrom. 1. *A Liquid Juice or Eſſence of the Heads of Flowers, rather than of the green Leaves.* 2. *A Decoction of the ſame in Wine.* 3. *A Pouder of the Seed.* 4. *A Gargariſm.* 5. *An Ophthalmick.* 6. *A Diſtilled Water of the Heads of Flowers.* 7. *A Cataplaſm.*

The Virtues.

XXXIV. *The Liquid Juice or Eſſence.* According to *Galen*, they are of a cleanſing quality, and of thin parts; they open the Obſtructions of Liver, Spleen, Reins, and Womb, provoke the Terms, help the hardneſs and pain of the Mother, expel Birth, and Afterbirth, and Dead Child, ſtrengthen and reſtore the Viſcera, and any external part weakned by the Palſie, oveſtraining or any other Accident. Drop'd into the Eyes, they cleanſe them from Miſts and Clouds, which ſeem to hinder the ſight; and take away ſuch Films, which are beginning to grow over the Eye. Doſe two Spoonfuls or more morning and night, in a Glaſs of the Diſtilled Water ſweetned with Sugar; or with *Syrupus de Althæa* in caſe of the Stone or Gravel, or other Tartarous matter in Reins or Bladder.

XXXV. *The Decoction of the Heads of Flowers in Wine.* It may be made of them either Green or Dry; it rectifies the Indiſpoſition and hardneſs of the Liver and Spleen, and has all the Virtues of the Juice or Eſſence. Doſe from a quarter to half a Pint morning and night.

XXXVI. *The Pouder of the Seed.* It has the Virtues of the Juice, Eſſence and Decoction: and may be given from a Dram to two Drams, made up into an Electuary, with Rob, or Pulp of *Juniper Berries*, or any other proper Vehicle, which has Abſterſive, Diuretick, Hyſterick, and Deobſtructive qualities.

XXXVII. *The Gargariſm.* It is made of the Decoction of the Heads of Flowers in Vinegar, and ſweetned with a third part of Honey, and

an

an eighth part of Roch Alum dissolved in it: it is good to heal Ulcers in the Mouth and Throat, they being often Gargled therewith. A Decoction of the Roots in Vinegar is held good for the hardness of the Spleen, being outwardly applyed, whilst some of the former Preparations are given inwardly.

XXXVIII. *The Ophthalmick. Take of the Liquid Juice or Essence* 4 *Ounces: Clarified Honey* 1 *Ounce: mix and dissolve.* It gives relief in Pains, Waterings, and Inflamations of the Eyes, clears the Eye-sight, and takes away Clouds, Mists, Films, or other things which may obfuscate the Sight, being dropt into the Eyes two or three times a day.

XXXIX. *The Distilled Water of the Heads of Flowers.* It is available to all the purposes aforesaid, and is a good thing to cleanse the Blood, comfort the inward parts, ease pains, and to cause a pleasant, merry, and chearful Mind: If in eight Ounces of the Water, three or four Drams of *Saccharum Saturni* be dissolved, it makes an excellent Wash for the Face and Skin, taking away Scurf, Morphew, Tanning, Sunburning, Pimples, Soreness, Scabs, and other like Defœdations and Deformities thereof, being duly applyed and suffered to dry on.

XL. *The Cataplasm.* The Leaves beaten in a Mortar with a little Salt, and applyed as a Cataplasm to the Wrists, being tyed pretty hard on, is said to be a Remedy and Cure for an Ague. The Leaves and Heads of Flowers boiled also soft in a little Vinegar, to the consistence of a Cataplasm, and applyed warm, upon any place Pained with the Gout, eases the Pain, and discusses the humor, and strengthens the Weakned Parts. Applyed also to the Joints, Nerves and Tendons, troubled with any Pain or Weakness, hard Tumors, Swelling, or Inflamations, it give ease, strengthens, softens, discusses and reduces them to their Pristine State.

CHAP. DCLXX.

of STOCK-GILLIFLOWER *Sea.*

I. *THE Names.* It is called in Greek, Λευκοιον Θαλλάσσιον, in Latine, *Leucoium Marinum*; and in English, *Sea*, or *Marsh-Stock-Gilliflower.*

II. *The Kinds.* Authors have made a dozen kinds or more, most of which are not to be found in our Countries: Those more usual with us, are, 1. *Leucoium Marinum purpureum Lobelij:* The Purple Sea Stock-Gilliflower. 2. *Leucoium Marinum Syriacum*; The Levant Stock-Gilliflower. 3. *Leucoium Marinum latifolium Bauhini*; *Leucoium Marinum alterum Lobelij latifolium*; *Leucoium Marinum aliud Camerarij*; *Tripolium Anguillaræ Camerario*; broad leav'd Sea Stockgilliflower. 4. *Leucoium Marinum majus Clusij*; *Leucoium marinum latifolium Bauhini*, Great Sea Stock-Gilliflower. 5. *Leucoium marinum maximum*, The greatest Sea Stock-Gilliflower. 6. *Leucoium Marinum minus Clusij & Lobelij*, The small Sea Stock-Gilliflower.

The Descriptions.

III. The first or Purple Sea Stock-Gilliflower. *It has a very long tough root, thrusting it self deep into the Earth; from which rise up thick, fat, soft and hoary Stalks. The leaves coming forth from the Stalks next the Ground, are long, soft, thick, full of juice, covered with a downey hoarness, and sinuated somewhat deep on both sides. The Stalk is set here and there with like Leaves, but lesser. The Flowers grow at the tops of the Stalks, compact of four small leaves, of a light Purple Colour. The Seed is contained in long crooked Cods, like those of the Garden Stock-Gilliflower.*

IV. The second, or Levant Stock-Gilliflower. *Its root is white, and grows deep into the Ground, spreading it self about, growing woody when it is in Seed, but perishing afterwards. It rises up at first with several long and somewhat broad leaves, a little unevenly dented or waved about the edges, which so continue the first Year after Sowing. The Stalk rises up the next Year to be about two feet high or more, bearing all those leaves on it which it first had, which do then grow less sinuated or waved than before. At the top stands many Flowers made of four Leaves a peice, of a delay'd Purple Colour; having but a little smell, which turn into very long and narrow flat Pods, in which are contained flat Seed, like that of the common Garden Stock-Gilliflower, but much larger, and of a dark or blackish brown colour.*

V. The third, or broad leav'd Sea Stock-Gilliflower. *It has a long root, running very deep into the Earth, with a vast number of Fibres or Strings coming from the same: From which spring forth many hoary leaves lying upon the Ground shorter and broader than those of the other Sea kinds; harder also in feeling, and as it were rugged, more hairy, and finely dented about the edges. From among which, rise up several round hairy Stalks, about a Foot high, bearing at their tops several Flowers of a purplish blew colour, much like those of the Garden; after which follow small long Pods with brownish flat Seed in them.*

VI. The fourth, or Great Sea Stock-Gilliflower. *Its Root is long, running deep into the Ground, with many branches springing from the same. It has divers long thick hoary leaves, lying on the Ground for the first Year; some of them being cut in on the one edge, and some on both, with but one gash, and some not at all. The Stalk rises up the next Year about a Foot high or more, which spreads it self into divers branches, yet all of them weak, and rather bending downwards, than standing upright; on which grow but few leaves, little or nothing dented or cut in; at the tops of which, grow several Flowers of a pale purple Color, drawing near to the Color of Red Wine Lees, which smell sweeter after the Sun is down, than in the daytime. The Cods which follow, are long and somewhat flat, with reddish flat Seed in them.*

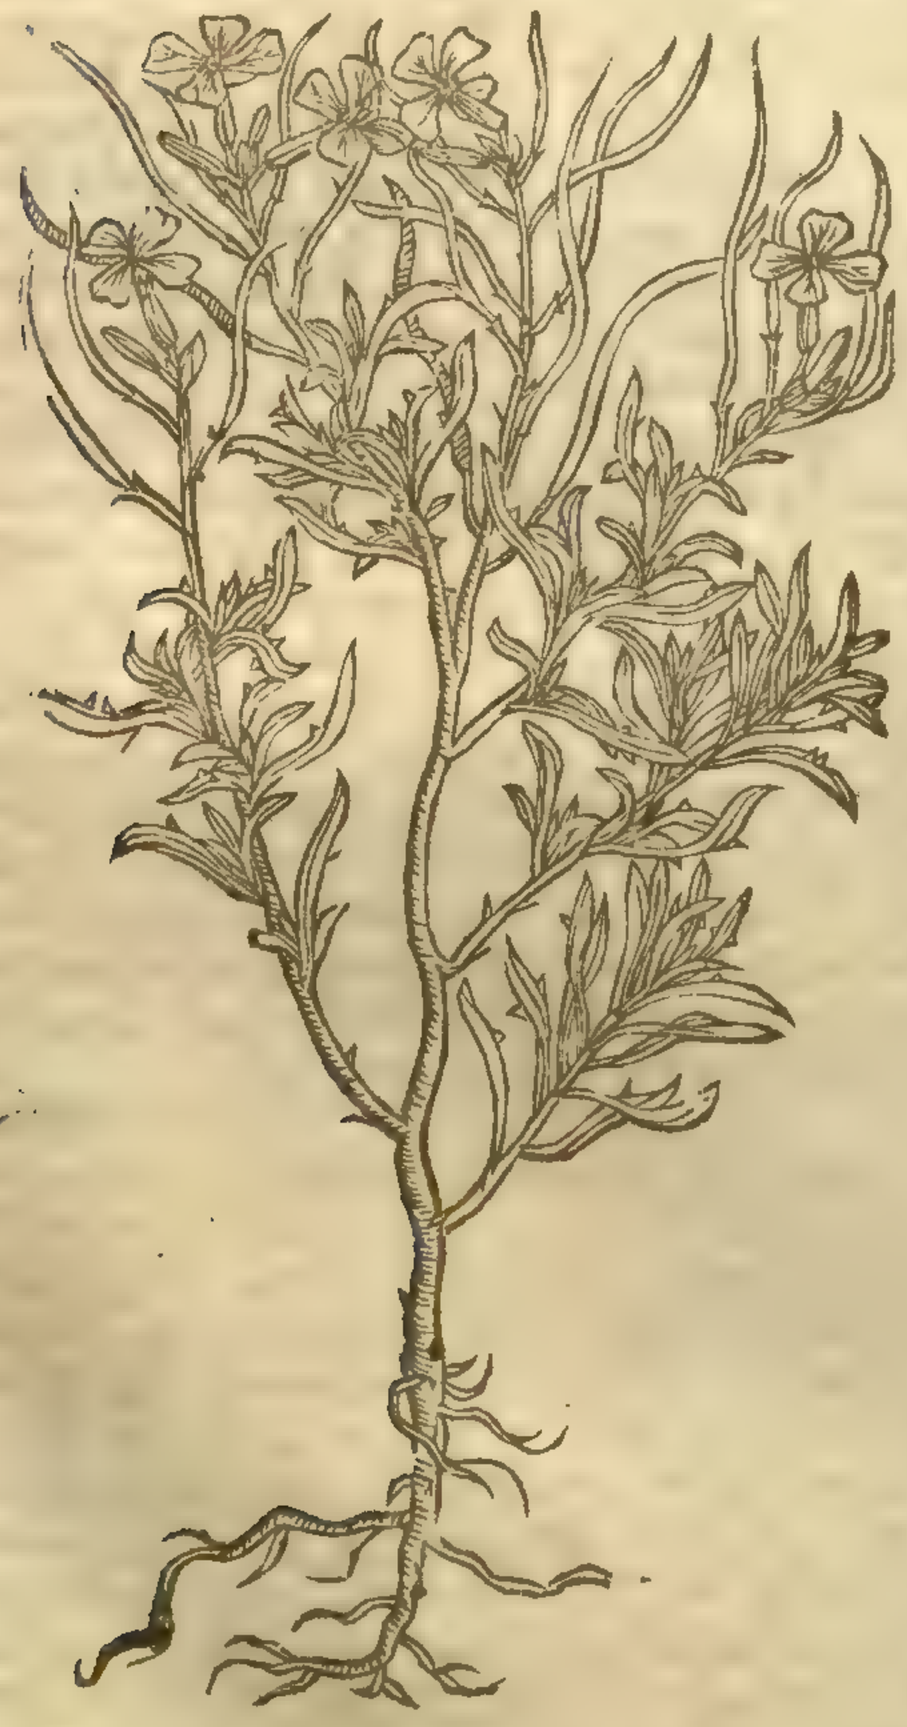
VII. The fifth, or Greatest Sea Stock-Gilliflower. *Its Root is white, hard, long, and spreading into many Branches, which abides not after it has yielded Seed, but perishes as the other Sea kinds do. It has divers long, thick, whitish soft leaves lying upon the Ground, one within another in a round compass, and are stiffer than the other Sea kinds, or those of the Garden kinds in the former Chapter; jagged also, or cut in evenly on both sides, into deep dents, not much unlike to the Snaggs of a*

Bucks

Bucks Horn, which makes it ſeem the more beautiful. Thus it abides for the firſt Year; but the next Year it bears or ſends forth a hoary white Stalk, three Feet high or more, ſpreading it ſelf out into many Branches, pretty thick, but weak, being ſcarcely able to ſtand upright; on which grow narrower leaves, little or nothing jagged about the edges. At whoſe tops grow a great number of Flowers one above another, for a great length together; each Flower conſiſting of four broad pointed leaves a peice, not altogether ſo ſweet as thoſe of the Garden Stocks, but ſomewhat larger, and of a pale blewiſh purple color, almoſt like the color of a Dove or Pidgeon: After which, come forth long Seed pods like the others, with Seeds lying in a double row in the ſame manner, but larger, and of a darker color.

VIII. The ſixth, or ſmall Sea Stock-Gilliflower. *Its Root is woody like the other, and periſhes after Seeding time. This has more upright Stalks than any of the former, divided from the bottom into*

Stock-Gilliflower Sea-Small.



many Branches, on which grow ſoft woolly leaves, ſmaller, narrower and leſſer jagged, than thoſe of the Great Sea-Stock. The Flowers which grow at the tops of the Branches, are ſmaller than the others which grow lower, but conſiſt of four Leaves only like the reſt; of a freſh red or Crimſon color, which upon their fading, ſeem yet to be deeper; and having a weaker Smell than thoſe of the other kinds: After which, in their places, come forth long Pods, in which are contained the like red Seed.

IX. *The Places.* The firſt was gathered by Mr. *George Bowles*, upon the Rocks at *Aberdovy*, in *Merionethſhire* in *Wales*, and poſſibly may be found near the Sea-ſhore about *Colcheſter*, alſo in the *Iſle of Man*, near *Weſt-Cheſter*, and near to *Preſton* in *Olderneſs*, *Yorkſhire*. All the reſt are found growing on the Sea-Coaſts of the *Levant*, and other Forreign Countries; but with us they grow only in Gardens.

X. *The Times.* They all Flower all the Summer Months, from *May*, through all *June*, *July* and *Auguſt*; and the Seed comes to ripeneſs in leſs than a Month after.

XI. The *Qualities*, *Specification*, *Preparations* and *Virtues* of theſe, are accounted the ſame with thoſe of the Garden Kinds, treated of in the former Chapter, ſaving that they have not altogether ſo ſweet a Smell; but in *Galens* Judgment they have all of them a cleanſing property, and are of thin and ſubtil parts.

STONNARD, *ſee* Stone-Crop, *Chap.* ibid.

CHAP. DCLXXI.

Of STONE-CROP, *AND* WALL-PEPPER.

I. *THE Names.* It is called in Greek, Αεί ζωον μικρον: *quaſi Sedum minus*, (becauſe it is a *ſempervive*) in Latine, *Illecebra*, and *Vermicularis*: in Engliſh, *Stone-Crop*, and *Wall-Pepper.*

II. *The Kinds.* Authors make many ſorts of this Plant, as, 1. *Illecebra*, *Illecebra minor Lobelij*, *Sedum tertium Dioſcoridis*, *Sedum Cauſticum Cluſij*; *Sempervivum minimum*; *Dactylon ſecundum vel tertium Columnæ*; *Aizoon acre Cordi*; *Aizoon minus fervidi guſtus Thalij*; ſmall Stone-Crop, or Wall-Pepper. 2. *Illecebra inſipida*; *Vermicularis inſipida Thalij*; *Aizoon minimum Cordi*: Inſipid Stone-Crop, or Wall-Pepper. 3. *Sedum minus æſtivum Lobelij*, Summer Stone Crop. 4. *Vermicularis flore albo Camerarij*; *Sedum minus fœmina Fuchſij*, *Lugdunenſis*, *aliorumque Sempervivum minus album Brunfelſij*; *Sedum minus primum Cluſij*. The Greater White-Flowered Stone-Crop with round pointed Leaves. 5. *Sedum minus Cluſij*; *Vermicularis Daſyphyllon*; *Aizoon Daſyphyllum ſive denſifolium Lugdunenſis*; A ſmaller White-Flowered Stone-Crop. 6. *Vermicularis ſcorpioides*; *Sedum minus quartum Cluſij*; *Aizoon ſcorpioides Lobelij*; *Aizoon minus flore luteo reflexo Camerarij*; Stone-Crop with turning heads. 7. *Sedum minus flore rubente Bauhini*; *Sedum minus tertium Cluſij*; *Sedum paluſtre Cluſij*; *Sedum minus quartum Tragi*; Field or Marſh Stone-Crop.

III. *The*

The Descriptions.

III. The first or small Stone-Crop, or Wall-Pepper. *It has a long, slender, fibrous or stringy Root, creeping under the Earth not very deep. It grows like the other Stone Crops, with very many and slender Stalks, and small roundish fat thick leaves set thick upon them; at the tops of which, grow small pale yellow Flowers in Tufts, as the others do. The taste hereof is very sharp, hot and biting upon the Tongue, by which it is chiefly distinguished from all the rest; tho' it is also distinguished in some measure by its form, being a small Plant, and its Stalks very thick set with small, fat, or thick leaves as aforesaid, its Root springing up from its Fibres, and so spreading very far, quickly taking up much Ground.*

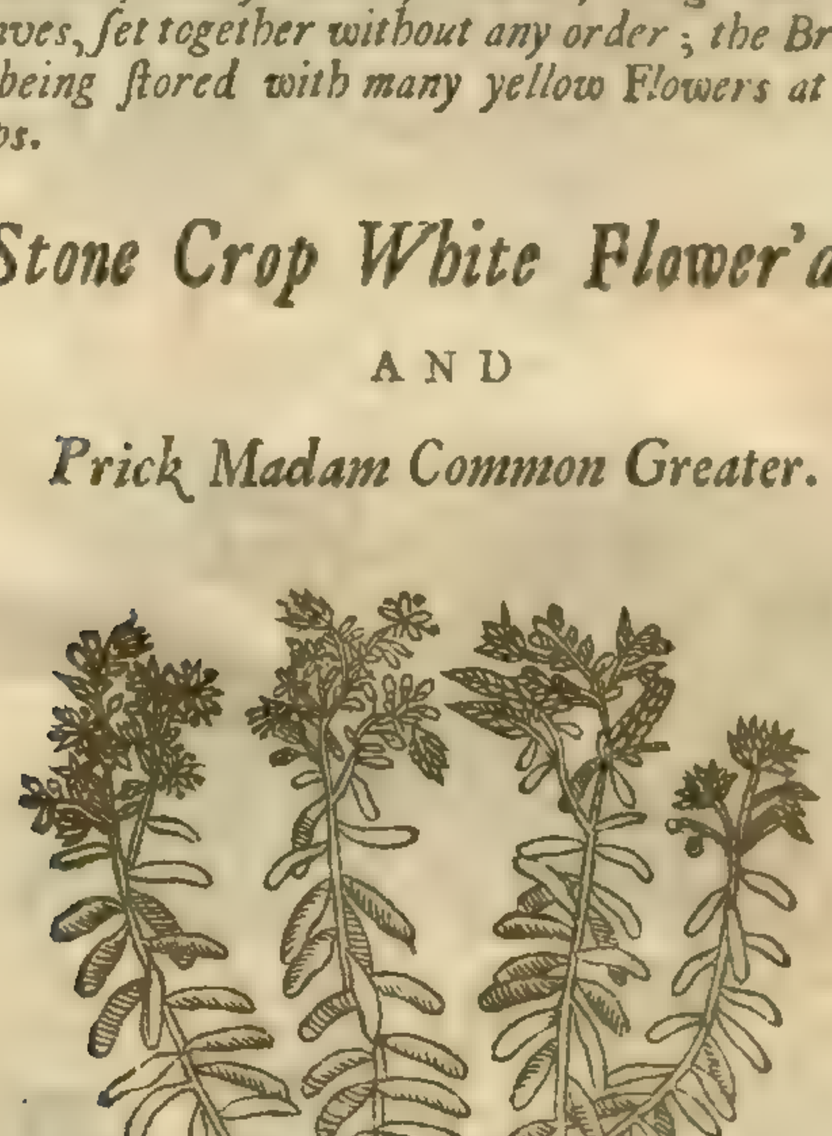
IV. The second, or Insipid Stone Crop, or Wall-Pepper. *It is a small Plant like the former, growing altogether like it, in Leaf, Stalks, and Flowers, which are as these, yellowish: and is only distinguished by the Taste from the first; this being nothing biting, but as it were unsavory, and without any Taste.*

V. The third, or Summer Stone-Crop. *Its Root is small, fibrous and perishing. It has on small Stalks, which spread themselves out into many Branches, many thick, round, long and juicy Leaves, set together without any order; the Branches being stored with many yellow Flowers at their Tops.*

Stone Crop White Flower'd:

AND

Prick Madam Common Greater.



VI. The fourth, or Greater White Flower'd Stone Crop, with round pointed Leaves. *Its Root creeps like the rest, and its Leaves perish with its Stalks every Year. It creeps upon the Ground in the same manner as the others do, with slender Stalks and long round Leaves upon them, of a blewish green color, not sharp, but round pointed, seeming like Wheat-Corns, or Pine Apple Kernels; being sparsedly set thereon: at the tops of which, stand small white Star like Flowers, in small Tufts, or sparsed Umbels. This very much resembles the* Greater Prick-Madam, *in* Chap. 578. Sect. 5. *aforegoing, and differs chiefly from that in the Flowers; these here being white, those being yellow: And therefore the Cut here placed, may indifferently serve for both Species.*

VII. The fifth, or smaller White Flower'd Stone-Crop. *It in its Roots, Stalks, Branches, Leaves and Flowers, are like the last, but it grows lower, and has a greater store of those small round Leaves like Wheat Corns, which are thicker set thereon, it differing in nothing else therefrom.*

VIII. The sixth, or Stone-Crop with Turning heads. *Its Root in like manner as the former, creeps and shoots forth in divers places. This has such like Stalks with Leaves thereon, as that at* Sect. VI. *above; so that it is hard to distinguish this Plant from that, or the* Greater Prick-Madam in Chap. 578. Sect. 5. *aforegoing of this Book, until it comes to Flower, which then may be discerned to differ from them, only in the turning of its Tops of yellow Flowers, which turn or bend like the Tail of a Scorpion (whence the Name;) or other Herbs which are resembled to it.* Lobel *has another whose Heads turn not, which he calls* Hæmatodes.

IX. The seventh, or Field, or Marsh Stone-Crop. *Its Root is long, slender, creeping and fibrous like the former Kinds; which sends up several reddish Stalks set with small fat long Leaves, something hairy, and much greener than any of the former. The Flowers are small, standing like Stars, many in a Tuft together, of a pale red or Carnation color. It abides green all the Winter, and has as little Taste, as any of the five former.*

X. *The Places.* The first tho' it grows naturally on Old Brick, Stone, and Mud Walls, and other Barren, Wast and Untill'd places, yet it is generally nurst up also in Gardens; as are also many of the following sorts. The next five grow either on Mud or Stone, or Brick Walls, or among Rubbish; as also in Sandy, Gravelly, Barren and Untill'd Places; and oftentimes upon the sides of old Tiled Houses and Penthouses; but the last grows only in moist Meadows and Marshes.

XI. *The Times.* They all Flower in the Summer Months, viz. *June*, *July* and *August*, and sometimes in *May*; and the Leaves of many of them continue Green all the Winter.

XII. *The Qualities, Specification, Preparations* and *Virtues* of the *Six last Kinds*, are in all respects the same with those of *Prick-Madam* in *Chap.* 578. from *Sect.* IX. ad *Sect.* XVIII. inclusive, to which we refer you.

The Virtues of the *First Kind*, viz.

Stone-Crop Biting, Or, *Wall-Pepper.*

XIII. *The Qualities.* It is hot and dry in the fourth Degree, exulcerating the Skin, and raising Blisters on it, if applyed thereto; and will do it as strongly as *Ranunculus* or *Crowfoot*. And inwardly taken, it is Emetick.

XIV *The*

XIV. *The Specification.* It cleanſes the Stomach of groſs and tough Flegm, and is ſaid to cure Quartan Agues, as alſo Struma, or Scrophula, and the Sciatica, by external application.

XV. *The Preparations.* You may have therefrom, 1. *A Liquid Juice.* 2. *A Syrup.* 3. *An Oil by Decoction or Inſolation.* 4. *A Cataplaſm of the Herb.*

The Virtues.

XVI. *The Liquid Juice.* Taken to a Spoonful or two, mixt with as much Vinegar, in ſome proper Vehicle, it provokes Vomiting, and ſo by educing thick tough Flegm and other clammy Humors, it conduces to the Cure of old Quartan Agues, the Kings Evil, and the Sciatica, and other Chronick Diſeaſes, or ſuch as have been of long continuance. And it is ſaid to expel Poiſon, or the force of any Venomous Herbs, as of the Aconite, *&c.* But *Parkinſon* ſays, *Caveat qui ſumpſerit*, yet I know no reaſon for that precaution, provided it be not taken in too great a Doſe.

XVII. *The Syrup of the Juice*, or *Green Herb*, It is made with Vinegar and Honey, and has all the Virtues of the *Liquid Juice.* Doſe two or three ſpoonfuls or more, according to Age and Strength, in the Morning faſting.

XVIII. *The Oil by Decoction or Inſolation.* It is good againſt all cold and moiſt Diſeaſes of the Nerves and Joints, as Aches or Pains, Gouts, Sciatica, Over-ſtrainings, Palſies, Convulſions, Cramps, Strumous Knots or Kernels in the Neck, Throat, and under the Chin or Jaws, or other parts of the Body; and anointed upon the Piles it gives them preſent eaſe, and in a ſhort time cures them.

XIX. *The Cataplaſm.* Made of the Green Herb and applyed, it draws ſtrongly, raiſes Bliſters and exulcerates, and therefore is very profitable being applyed to any vehement or extream Gout or Sciatica; and cures thoſe Diſeaſes by drawing forth the Morbifick Humor. If it is made into a Cataplaſm by boiling it with Hogs-Lard, adding a little Crumbs of Bread, and applyed to Scrophulous ſwellings, knots and kernels in the Neck, or other parts, it is ſaid to diſcuſs, diſſolve, or take them away.

CHAP. DCLXXII.

Of STRAWBERRY.

I. *THE Names.* It has no Greek Name that we know of: but it is called in Latine, *Fragaria:* and in Engliſh, *Strawberry.* The Fruit is called *Fraga*; (*à fructu fragrantia odoris & guſtus:*) Strawberries. *Pliny, lib.* 25. *cap.* 9. makes mention of *Fraga*; and *Servius* calls them *Mora terreſtria*: yet it is no Species of the *Morus*, whether you underſtand by it the *Mulberry* or *Bramble.*

II. *The Kinds.* Authors make many Kinds hereof, but thoſe which are moſt common with us, are 1. *Fragaria Sylveſtris vel Nemorenſis*, Wood-Strawberry. 2. *Fragaria vel Fraga Hortenſis*, Garden Strawberry. 3. *Fragaria vel Fraga Magna & Alba*, *Fraga maxima & Bohemica*, The great white Strawberry. 4. *Fragaria Viridis*, The Green Strawberry. 5. *Fragaria minime veſca*, five *Steri lis*, The Wild, *or* Barren Strawberry.

The Deſcriptions.

III. The firſt, or Wood-Strawberry. *The Deſcription of this Plant is the general Deſcription of all the Kinds, the material or chief difference being in the Form of the Fruit: Its Root then is reddiſh and long, with ſeveral ſmall Fibres or Threads at it: which ſends forth from the head thereof long reddiſh Strings, running upon the Ground, which ſhoot forth Leaves in many places, by which it is much increaſed. Its Leaves are cloſed together at firſt ſpringing forth, which afterwards ſpread themſelves into three divided Parts or Leaves, every one ſtanding upon a ſmall long Footſtalk, green on the upperſide, grayiſh underneath, and ſnipped or dented about the edges: From among which, riſe up ſmall Stalks, bearing four or five Flowers at the tops, conſiſting of five white round pointed Leaves; ſomething yellowiſh in the bottom, with ſome yellow threads therein: After which, come the Fruit, made of ſeveral ſmall Grains ſet together, in a Fleſhy Subſtance (not much unlike in ſubſtance to a Mulberry, Raſpberry or Brambleberry;) which are very red when they are ripe, and of a pleaſant Winy taſte, (as are all the Kinds) in which are encloſed many ſmall blackiſh Seed. The Berries of the Wood Kind are very red, and the ſmalleſt of all the ſorts.*

Strawberry Garden Red.

IV. The ſecond, or Garden-Strawberry, (which is our moſt Common Kind. *This according to the Opinion of* Parkinſon, *is only the Wood-Plant Tranſplanted into our Gardens, where by the richneſs of the*

the Soil it is advanced in Goodness, being full as red, if not redder; almost as large again, and also meliorated in its Winy Taste.

V. The third, or great white Strawberry. *This is a very large Strawberry, extreamly Fleshy, and of an admirable Taste, and for Beauty surpasses all others:* Parkinson *says, it may be had seen some of the Berries measured, which had been near five Inches about: I have seen them of an extraordinary bigness, admirable to behold. I am apt to believe, that this is the so much admired* Virginia *kind, which I have seen grow to an admirable perfection in*

Strawberry White Great.

the Gardens in Carolina, *exceeding any that ever I saw in* England. *It has been no long Inhabitant with us, being first brought hither from* Bohemia. *At first for want of Skill in managing it, it very rarely bore any Fruit; but now, if Planted in a good Ground, it bears in a vast plenty. Formerly a Gardiner (one* Vincent Sion,) *living by the* Bank-Side, *near the old* Paris Garden-Stairs, *said that from seven Roots, in one Year and a half, from their increase, he had Planted an Acre and a half of Ground, besides those which he gave away to his Friends, which bore Strawberries of that Magnitude or Greatness before mentioned. If you would have them bear kindly, you must not suffer them to grow with many Strings, but still cut them away. The Fruit of this differs not from the Garden red, but in its Magnitude, this being so very much bigger, and not so globular, but of a more Oval Form; and in its Color, it being much whiter,* viz. *of a yellowish White on one side, and enclining to redness on the other, when it is full ripe.*

VI. The fourth, or Green Strawberry. *It differs not from the second kind, or Garden Strawberry, but in its Fruit only, which is green on all sides when it is ripe, except on the Sunny side, where it is a little red, or reddish; and in Magnitude is much equal to the second or Garden kind.*

VII. The fifth, or Wild, or Barren Strawberry. *Its Root is like the former, and in its Leaf much like to the first Wood kind, but differs in its Flower (if it has any, which is Green, bearing rather a small head of green Leaves, many set thick together like unto a double Ruff, in the midst of which stands the Fruit, which when ripe, shews it self to be first, and something reddish, like unto a Strawberry, but with many small harmless prickles on them, which may be eaten and chewed in the Mouth, without any manner of hurt, and is pleasant like a Strawberry; but it is truly without any great Sap or Juice, and a little Styptick or harsh upon the Taste. It is no great*

Strawberry Barren or Wild.

Bearer, but those it does bear, are set at the tops of the Stalks close together, pleasant to behold; and which a Gentlewoman may wear in her Bosom as a rarity, instead of a Flower.

VIII. Gerard says, *Its Roots and Leaves are like the others, but somewhat less, its Leaves softer, slightly indented about the edges, and of a light green color: Among which, rise up slender Stems, bearing such Flowers as the common Strawberry does, but lesser; which wither away, leaving behind a barren or chaffy head, in shape like a Strawberry, but of no worth or value.*

IX. *The Places.* The first grows in Woods both in *England* and *America*; upon Hills, Vallies, Woody and Shadowy places: But the four first kinds are Inhabitants in our Gardens, all which I have seen grow admirably in *Carolina*, exceeding in Beauty, Largeness and Pleasantness, any I ever saw grow in *England*. The Barren kind is a Wild sort, and has been found growing (as *Gerard* says,) on *Black-heath*, *Greenwich-Park*, &c. but for its rarity has been brought into Gardens.

X. *The Times.* The Leaves are ſaid to continue Green all the Year: In the Spring they ſpread farther with their Strings, and Flower in *May*, the Berries being ripe in *June* and *July*. The Barren one Flowers in *April* and *May*, but never bears any Edible Fruit.

XI. *The Qualities.* The Roots, Leaves and Berries whilſt green, are cold and dry in the firſt Degree, but the Roots more than the Leaves. Abſterſive, Aſtringent, Arthritick and Vulnerary. The ripe Berries are temperate in reſpect to heat or cold, and moiſt in the firſt Degree: Cool the Blood, Liver and Spleen, Comfortative and Cordial.

XII. *The Specification.* The Leaves and unripe Berries ſtop Fluxes and Catarrhs, cool the heat of Fevers, heal Ulcers in the Mouth, Throat, and Tonſils; and ſtop the Courſes in Women.

XIII. *The Preparations.* Of the Roots, Leaves, and Green Berries are made, 1. *A Liquid Juice.* 2. *A Decoction in Wine or Water.* 3. *A Lotion or Gargariſm.* 4. *A Diſtilled Water.* 5. *An Ophthalmick.* 6. *The Ripe Berries.* 7. *A Syrup of the ſame.* 8. *A Diſtilled Water from the ſame.*

The Virtues.

XIV. *The Liquid Juice.* Taken to the quantity of 3 or 4 Spoonfuls or more, either mixed with the Syrup of the ripe Berries, or with a little Mutton Broth, Morning and Night, it cools the Blood and Liver, allays Inflamations of the Reins and Bladder, provokes Urine, takes away the heat, ſharpneſs and ſcalding thereof; ſtops Womens Courſes and the Bloody Flux, and diſcuſſes the Tumour or Swelling of the Spleen. Applyed to the Gums it faſtens looſe Teeth, ſtops Catarrhs, or Defluxions of Rheum to the Mouth, Throat, Teeth, and other parts; and is ſingular good for hot, red, and inflamed Eyes, being dropt into them: As alſo to repell hot, red, and ſharp Humors or Eruptions in the Skin, whether Face, Hands or other parts; and to take away redneſs of the Face, Spots or other Deformities of the Skin.

XV. *The Decoction of Roots, Leaves, or unripe Fruit in Water and Wine.* It has all the former Virtues, being uſed in the ſame manner, and may be taken to half a Pint at a time Morning and Night.

XVI. *The Lotion or Gargariſm. Take of the Liquid Juice or Decoction a Pint, Honey three or four Ounces: Spirit of Wine two Ounces, mix and diſſolve.* It cleanſes and heals foul Ulcers in the Mouth, Throat, Privities or other parts, heals Ulcerated and ſpungy Gums, and faſtens looſe Teeth.

XVII. *The Diſtilled Water of the ſame Roots, Leaves and Berries.* It is good for hot and inflamed Eyes, redneſs of the Face and Skin, and other Deformities of the ſame; hot Eruptions of the ſame, *Anthonies* Fire, *&c.*

XVIII. *The Ophthalmick. Take of the former Diſtilled Water a Pint, Honey three Ounces, Spirit of Wine two Ounces; mix and diſſolve.* Dropt into the Eyes 3 or 4 times a Day, it is good againſt an Ophthalmy, redneſs, inflamation, and hot Rheums in the Eyes.

XIX. *The Ripe Berries.* They cool a hot and cholerick Stomach; as alſo the Blood, Liver and Spleen: quench Thirſt, and refreſh weak and Fainting Spirits.

XX. *The Syrup of the ſame Berries.* It has all the ſame Virtues, and may be given two or three Ounces at a time upon Occaſion.

XXI. *The Diſtilled Water of the ripe Berries.* It is a Coſmetick for the Skin, good againſt Fevers, and Inflamations of the Eyes; *Anthonies* Fire, and other like hot Eruptions; Melancholy, Faintings and Paſſions of the Heart.

CHAP. DCLXXIII.

Of SUCCORY *Garden* and *Wild.*

I. *THE Names.* It is called in Greek by *Theophraſtus*, Κιχώρη, ἡ κιχώριον: alſo Σέρις, (which laſt Greek Name ſignifies *Endive* as well as *Succory*:) in Latine, *Cichorium*, alſo *Cichoreum* or *Cichorea*, as *Horace* has it *Lib.* 1. *Ode* 31.

Me paſcunt Olivæ,
Me Cichorea, leveſque malvæ.

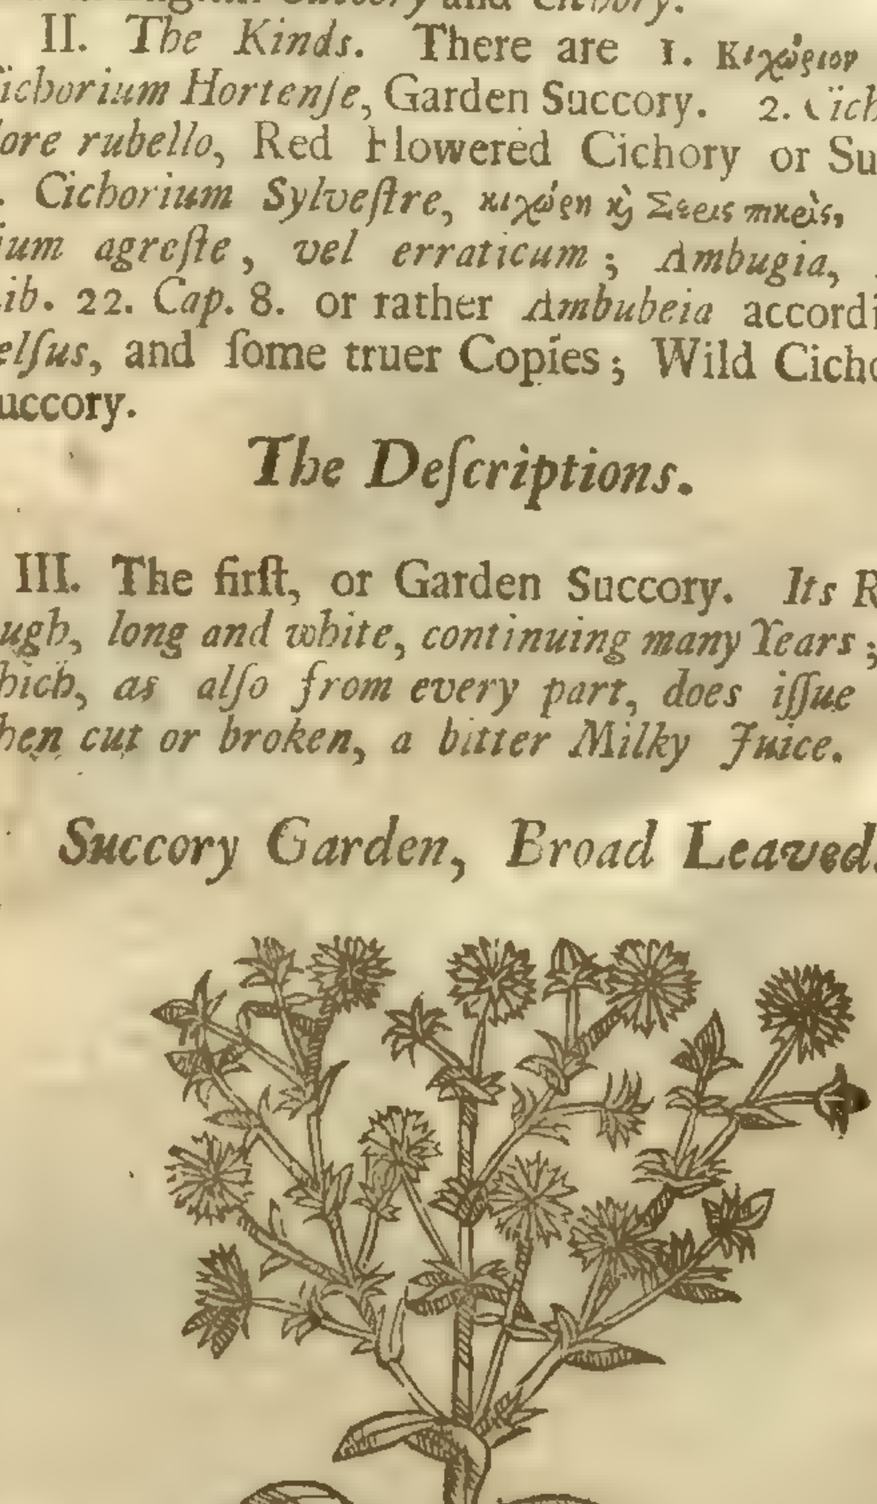
It is alſo called in Latin *Intubum*, but that is the more proper Name (in my Opinion) for *Endive*: and in Engliſh *Succory* and *Cichory*.

II. *The Kinds.* There are 1. Κιχώριον ἥμερον, *Cichorium Hortenſe*, Garden Succory. 2. *Cichorium flore rubello*, Red Flowered Cichory or Succory. 3. *Cichorium Sylveſtre*, κιχώρη ἡ Σέρις ἀγρία, *Cichorium agreſte, vel erraticum*; *Ambugia*, *Plinij Lib.* 22. *Cap.* 8. or rather *Ambubeia* according to *Celſus*, and ſome truer Copies; Wild Cichory or Succory.

The Deſcriptions.

III. The firſt, or Garden Succory. *Its Root is tough, long and white, continuing many Years; from which, as alſo from every part, does iſſue forth when cut or broken, a bitter Milky Juice. It is*

Succory Garden, Broad Leaved.



of

of two sorts, the one with broad Leaves, the other with narrow Leaves deeply cut or gasht in on both sides. The first with broad Leaves is something like unto Endive, but narrower, among which rise up Stalks, on which grow the like Leaves but smaller. The Stalk divides it self towards the top into many Branches, on which grow small blew Flowers consisting of many small Leaves, after which follows the Seed; which is so like unto Endive-Seed, that it is very hard to distinguish them asunder by Sight; but the Curled Endive Seed is blackish, the Seed very like unto black Lettuce Seed; whereas the Seed of the Garden Succory *is whitish.*

IV. The second, or red Flowered Succory. *This is that with the narrow Leaves. Its Root is like the former, long, white, and abiding many Years. The Leaves are long, and more divided or gasht in on the edges; and yet longer in the tall, high, round*

Succory Garden Narrow Leaved.

Stalks. The Flowers are like the former, with this only difference, that these are of a pale red decayed color, which many times degenerates, and turns to be blew, being produced from the Seed of this red Kind. Of this sort, there is one also which bears white Flowers, not differing else, but the Seed of this white Kind, as well as of the red Kind, will sometimes give blew flower'd Plants, and is in form like to the Seed of the broad leav'd Garden Succory.

V. The third, or Wild Cichory or Succory. *Its Root is white, but more hard and woody than the former. It has divers long Leaves lying upon the Ground, very much cut in or torn on the edges on both sides, even to the middle rib, ending in a Point. Sometimes it is found to have a red Rib or Vein down the middle of the Leaves, from among which, rises up a hard, round, woody Stalk, spreading into many Branches, set with smaller and*

Succory Wild.

less divided Leaves on them, up to the tops, where stand the Flowers, both for Form and Color like to the first Garden Kind, viz. *blew, after which comes like fashion'd Seed.*

VI. *The Places.* The first two grow with us only in Gardens; but the second sort has been found growing wild in *Italy*, and that with white Flowers Wild in *Germany*. The third is found growing Wild in many places in *England*, in waste, untill'd and barren Grounds.

VII. *The Times.* They are all Sown in the Spring, and quickly come up, Flowering in the Summer Months, and Seeding in *August* or Harvest time, and then dies down; but being Sown in *July*, it remains till Winter; at which time it is taken up by the Roots, and laid in the Sun or Air for the space of two Hours: after which time it will be tough, and may be wrapped up in a heap, and buried in the Earth with the Roots upwards, so as no Earth can get within it; which if it should, it would become rotten: and being thus covered, it may be taken up again, when occasion for its use requires it; and so to be used in Sallets all the Winter, and then is called *whitned Succory*. *Parkinson* says, it is usually buried a while in Sand, and so grows white, by which means it becomes both more tender in the Eating, and also looses some part of its bitterness.

VIII. *The Qualities. Succory* is temperate in respect to heat or cold, or rather hot in the beginning of the first Degree, and drying in the same; Aperitive, Abstersive, Diuretick, and a little Binding: Stomatick, Hepatick, Splenetick and Nephritick.

IX. *The Specification, Preparations, Virtues and Uses,* are altogether the same with those of *Endive*, in *Chap.* 244. *Sect.* IX. *ad* XVIII. to which we refer you. But as *Succory* is less cold, and more drying than *Endive*, so it is more opening.

X. *The Decoction of Roots or Leaves*, in Wine or Water, drank every Morning faſting to a Pint more or leſs, expels Flegmatick and Cholerick Humors out of the Stomach and Bowels; opens the Obſtructions of Liver, Spleen, Gall, Reins and Womb; and is profitable againſt the yellow Jaundice, heat of the Reins, ſharpneſs and ſcalding of Urine: It prevails alſo againſt the Cachexia, or evil Diſpoſition of the Body, Dropſies, Weakneſs by long Sickneſs, and inveterate or lingering and long continued Agues; Peſtilential Fevers, Fainting, Swooning, and other Paſſions of the Heart.

XI. *The Juice or Eſſence* have all the former Virtues, and beſides being outwardly applyed, abate Inflamations in any part, chiefly in the Eyes; are profitable againſt *Anthonies* Fire, Wheals, Pimples, or other Breakings out; Peſtilential Sores, being mixed with Wine Vinegar and ſo applyed. Doſe a quarter of a Pint, more or leſs Morning and Night, either alone, or mixt with any fit Vehicle.

XII. *The Diſtilled Water.* All the former Virtues are aſcribed to it, but in a much meaner or lower Degree. It is good for ſore Eyes, being red or inflamed; and for Nurſes ſore Breaſts, which are hard and pained thro' abundance of Milk.

XIII. *The Wild Succory*, as it is more bitter, ſo it is more Opening and Abſterſive, and alſo a greater ſtrengthener of the Stomach, Liver, and other Bowels.

CHAP. DCLXXIV.

Of SUCCORY *Baſtard.*

I. THE *Names.* It is called in Greek, Κιχώριον νόθον: in Latine, *Cichorium Nothum*, and *Cichorium Sylveſtre floribus luteis*; *Pſeudo-Cichoria*: and in Engliſh, *Baſtard Succory.*

II. *The Kinds.* Out of the great Number which Authors have preſented us with, we ſhall only give you the ſeven following, *viz.* 1. *Cichorium Luteum Gerardi & Tabernæmontani*; *pratenſe luteum*; *Hieracium pratenſe aſperum Geſneri*; *Intubus Sylveſtris ſive Cichorium Sylveſtre flore luteo Thalij*; *Cichoria Tertia flore luteo Tragi*; *Lacturiola altera Cæſalpini*, Rough yellow, or Baſtard Succory. 2. *Cichorium pratenſe luteum, Hedypnois dictum*; *Cichorium pratenſe luteum Lævius Baubini & Lobelij*; *Hedypnois Plinij*; *Aphaca Theophraſti*; *Endivia Sylveſtris Cæſalpini*; *Dens Leonis Cichorizata Gerardi*; Smooth Yellow or Baſtard Succory. 3. *Cichorium dulce Neapolitanum*; *Sonchus latifolius leviter hirſutus Baubini*; *Cichorium Sylveſtre aſperum ἀπαλὸς, ſive, Cichorium Dulce*; Sweet Yellow, or Baſtard Succory of Naples. 4. *Cichorium Montanum aſperum*; *Hieracium nonum, vel Hieracium Intubaceum aſperum Tabernæmontani, Hieracium aſperum Gerardi*, Our Rough Mountain Succory. 5. *Cichorium tomentoſum fœtidum*; ſtronger ill ſcented hoary Succory. 6. *Cichorium Verrucarium Matthioli*; *Zacyntha Cluſij & Matthioli*; *Verrucaria Seridis ſpecies Geſneri*; *Chondrilla Verrucuria foljis Intubaceis viridibus*; *Chondrilla ſpecies Cæſalpini*, Wart Succory. 7. *Hypocharis Porcellia, Cichorium Porcinum, Hieracium minus dentis Leonis ſubaſpero Baubini*; Swines Succory.
